小儿遗传性小脑共济失调的影像学诊断思路

叶滨滨
广州市妇女儿童医疗中心

小脑性共济失调，包括散发性和遗传性共济失调。症状表现类似，增加的临床诊断及鉴别诊断的困难。而神经影像学，可以清晰显示其结构变化。影像学诊断思路:小脑萎缩：小脑整体萎缩或仅累及小脑蚓部及半球；单纯小脑萎缩还是合并幕上结构的改变；需要鉴别的是小脑发育不全。以小脑萎缩为主：1、Friedreich 共济失调：常染色体隐性遗传。持续性的共济失调；伴发肥厚性心肌病和糖尿病。MRI 显示颈髓变细， T2WI 可见脊髓后索和侧索高信号；小脑蚓部及小脑半球的萎缩。2、共济失调毛细血管扩张症是常染色体隐性遗传病，是累及神经系统、免疫系统等多系统损伤的综合征，属于 DNA 修复缺陷病。临床特点是进行性共济失调、免疫功能缺陷、眼结膜和皮肤毛细血管扩张以及罹患肿瘤倾向、早老。影像学表现：MRI：小脑蚓部发育异常；小脑半球萎缩；第 4 脑室扩大。小脑萎缩累及基底节脑干：1、考坎综合征：常染色体隐性遗传病。表现为早老、身材矮小；视网膜变性、视神经萎缩、传导性耳聋；光敏感和白内障等。影像学的特点：小脑萎缩；颅内钙化。2、橄榄体桥小脑萎缩（OPCA）是一种以小脑性共济失调和脑干损害为主要临床表现的神经系统慢性变性疾病。常染色体显性遗传。CT、 MR 表现：桥脑萎缩，小脑体积变小，脑沟裂增宽加深；脑池及脑室扩大; T2WI 上桥脑的十字形高信号即“十字征”。3、肝豆状核变性：脑的病变主要位于基底节的豆状核（壳核、苍白球）及尾状核。晚期小脑齿状核也受累。4、脑腱黄瘤病：脂代谢障碍的常染色体隐性遗传病。进行性共济失调、痴呆、癫痫、腱黄瘤等。影像特点：侧脑室旁 T2WI 高信号，小脑齿状核、中脑黑质、苍白球对称性高信号。小脑萎缩。跟腱可见 T1WI 类肌肉信号毛刷样改变；T2WI 较低信号影，伴或不伴内部斑点状高信号。小脑萎缩合并进行性脑白质病变的常见疾病：1、以额叶为主的亚历山大病；2、白质病变以顶叶为主的球形细胞脑白质营养不良等。

儿童脑梗塞的病因及影像学表现分析

徐树明,白娟
山西省儿童医院/山西省妇幼保健院

目的 探讨儿童脑梗塞的病因分类、临床表现及影像学特点；
方法 回顾性分析山西省儿童医院 2016 年 7 月至 2018 年 7 月间经临床及磁共振检查确诊为脑梗塞的 21 例住院患者的临床及影像学资料。其中男性 12 例，女性 9 例，年龄：1 月-15 岁，所有患者均在发病后 7 日内行颅脑 MRI 检查；
结果 病因分类：明确病因 13 例（61.0%）：外伤 5、烟雾病 3、感染（结核性脑膜炎、EB 病毒性脑炎、化脓性脑膜炎）3、甲亢 1、术后 1，病因不明确 8 例(39.0%)。临床表现：肢体无力 12、肢体抖动 1、抽搐 6、口眼歪斜流涎 4、呕吐 2、头痛 2、发热 2、精神差睡眠增多 2；影像学表现：病变部位：单侧基底节区 11、双侧基底节区 2、单侧大脑半球 6、额叶 3、大脑脚 3、胼胝体 2、双侧背侧丘脑 1、岛叶 1、小脑半球 1；其中外伤后脑梗塞病变部位主要在基底节区，病因不明确的病例病变主要位于基底节区及一侧大脑半球，烟雾病主要集中在大脑中动脉供血区域，其它感染、甲亢及术后脑梗塞病变部位无明显好发部位；MRI 信号特点：所有病例均显示为稍长或长 T1、长 T2 信号，FLAIR 序列呈稍高或高信号，DWI 序列显示为明显高信号，ADC 图呈低信号，其内部信号可均匀或不均匀；15 例行颅脑 MRA 检查，其中 2 例未见明显异常，另 13 例均出现不同程度脑供血动脉的狭窄或闭塞，其中烟雾病主要表现为颈内动脉、大脑中动脉狭窄闭塞，以及侧支血管形成。

结论 儿童脑梗塞的病因种类多样，进展迅速，影像学表现具有一定特征性，MRI 可做为首选检查能对儿童脑梗塞做出早期诊断，另需结合其他相关检查以明确病因，对于指导临床治疗以及促进预后都有很大的帮助。

S-03

儿童后颅凹肿瘤影像诊断策略

李玉华
上海交通大学医学院附属新华医院

儿童颅内肿瘤发生率仅次于白血病,后颅凹和鞍区是其最好发部位,后颅凹肿瘤以颅高压表现为主、脑干肿瘤常表现为颅神经症状或呛咳、运动障碍等。CT 平扫非常重要，MRI 及 DWI 对良恶性鉴别很有意义。

髓母细胞瘤

髓母细胞瘤是儿童最常见的 CNS 胚胎性肿瘤，也是 CNS 最常见的恶性肿瘤，约 25%发生在成人。小脑蚓部发生率最高，其次是第四脑室

小脑半球常发生在年长儿童或成人，脑脊液播散发生率高。CT：肿瘤呈等高密度，可伴有少许钙化或囊变。MRI: T1Wl: 等低信号、

T2WI:等信号或稍高信号、DWI: 高信号，增强扫描：从轻微强化到显著强化。

儿童室管膜瘤

幕下占 70%，肿瘤主要长在脑室内，可通过侧隐窝延伸之桥小脑角或通过正中孔进入枕大池。CT: 第四脑室混杂密度灶，50%见多发斑点状或砂粒状钙化灶，MRI: T1W 不均匀等低信号,T2W 混杂高信号

增强: 中到重度强化。间变室管膜瘤和髓母细胞瘤较难鉴别。

小脑星形细胞瘤

后颅凹肿瘤中发病率仅略低于髓母细胞瘤，90%以上是毛细胞型星形细胞瘤。毛细胞型星形细胞瘤 CT：实质部分低密度为主，不典型可以等信号，MRI：T1 囊液呈低信号，壁结节呈等信号，T2 囊液呈明显高信号，壁结节稍高信号，增强后典型实质部分显著强化，不典型强化多样性，一般瘤周水肿不明显，MRS: Cho 明显升高、可出现 Lac,Lip。

脑干肿瘤

DIPG 为主 80%伴有 H3K27M 突变，脑干胶质瘤也可表现局限性或外生性肿瘤，往往是毛细胞星形细胞瘤。DIPG CT:桥脑为中心得脑干增粗明显密度减低，MRI:T1W 低信号、T2W 明显高信号或混杂信号。

生殖细胞源性肿瘤

新生儿、小婴儿小脑肿瘤需要考虑生殖细胞源性肿瘤，CT 平扫寻找肿瘤钙化及脂肪非常重要。3 个月内婴儿 AFP 意义不大。

S-04

儿童脑梗塞动脉介入溶栓若干问题探讨

赖灿
浙江大学医学院附属儿童医院

目的 了解儿童脑梗塞动脉溶栓的方法、意义、效果、并发症和预后，对术中及术后出现的若干问题进行探讨。

材料和**方法**浙江大学医学院附属儿童医院神经内科、血液科患儿 4 例动脉溶栓患者行溶栓治疗，患儿脑梗塞的时间 2-4 天，患儿均有不同程度的神经功能障碍。首先行全脑血管造影，导管尽快超选择插入初步判断责任病灶，确定动脉闭塞部位，了解侧枝循环情况。微导丝引导下将微导管送至血栓近端或血栓内，脑皮质血管闭塞者仅将微导管置入颈内动脉或椎动脉内，然后通过微导管注入尿激酶。术中全程心电监护，术后 24 小时内全程心电监护，术后及 24 小时后常规复查头颅 CT 以了解有无颅内出血。 术后即予低分子右旋糖酐 500ml 静脉点滴，以提高缺血组织周围灌注和改善局部脑组织循环。另外，给予钙通道阻滞药以防止导管或血栓刺激引起的血管痉挛。

结果 4 例动脉溶栓患者，术前通过磁共振平扫、弥散成像、灌注成像、不打药 ASL 成像，明确诊断为脑梗塞，1 例同时行不打药 ASL 成像，显示脑梗塞区域与其显示的范围有较大差异，两者的差异为缺血半暗带，为缺血区域，为溶栓治疗的非常适合的病例。有一例行脑灌注成像，也是为评价患者的缺血半暗带存在与否。全部 4 例患儿经动脉溶栓治疗，患者脑梗塞的血管均为三级分支梗塞，其中两例为大脑中动脉深穿支梗塞，1 例为小脑后下动脉梗塞，1 例为大脑中动脉皮层支梗塞。溶栓后均显示为部分再通，4 例术后 24 小时内头颅 CT 均未见出血，1 术后 17 天后颅内发生大范围出血。术后患儿神经系统症状都有所缓解。

结论 1、动脉溶栓治疗脑动脉血栓形成是一种行之有效的方法，能提高闭塞血管的再通率，改善急性期临床症状和预后。

2、术前磁共振弥散、不打药 ASL 或灌注成像必不可少，在有条件的医院审慎开展。

S-05

儿童后颅凹先天发育异常的 MRI 诊断

张小安,赵鑫,程美英
郑州大学第三附属医院

目的 回顾性分析 2016.1-2018.12 诊断的后颅凹先天异常的 MRI 表现，总结后颅凹先天异常的影像学表现。

方法 总结 2016.1-2018.12 诊断的后颅凹先天性异常的患儿 58 例的 MRI 影像特点。**结果** 基于神经影像学将后颅凹先天异常分成了四大类，小脑为主型，小脑和脑干型及脑干为主型及中脑为主型，其中 DANDY-WALKER 畸形 18 例，大枕大池 5 例，后颅凹蛛网膜囊肿 11 例，孤立性小脑下蚓部发育不全 1 例。累及小脑的神经元移行异常 2 例，菱脑融合畸形 3 例。巨小脑畸形 1 例，小脑无发育 1 例，全小脑发育不全 1 例，小脑裂畸形 3 例，桥脑小脑发育不全 2 例。JOUBERT 综合 5 例。先天性肌营养不良 2 例。脑桥被盖帽发育不良 2 例。渐进性脊柱侧弯水平凝视麻痹 1 例。

结论 MRI 在鉴别小脑、脑干及中脑为主的后颅凹疾病鉴别诊断方面有较大的优势。

S-06

黏多糖病影像学表现

李欣
天津市儿童医院

目的 黏多糖病是溶酶体贮积症（LSD）的一种，因缺乏溶酶体酶而不能分解体内的黏多糖导致全身多系统受累疾病，本文分析各型黏多糖病典型影像学表现，为早诊断早治疗提供影像学依据。**材**

料与方法 分析 13 例黏多糖患者影像学表现结合文献，归纳出一型至七型黏多糖病主要累及的器官和主要影像学表现、基因类型、依据酶替代疗法后的影像学变化。
结果 黏多糖（MPS）神经系统表现，蝶鞍扩大，鞍结节变平，呈“J”形，但不特异，矢状缝早闭、头颅增大。脑室周围白质局灶性或弥漫性 T2WI 高信号，随着年龄逐渐增长，血管周围间隙增宽，脑萎缩，脑积水。血管周围间隙增宽表现为增多、减少、稳定（常见），脑白质异常高信号（双侧顶枕区）、胼胝体（特征性）、基底节、脑干，血管周围间隙增宽表现为小而圆、梭形，直径 2～8 毫米（正常血管周围间隙<2mm）；lMPS II 型脑白质内为筛子状，基底节和丘脑为蜂窝状；lMPSIH 和 IS 型灰白质交界区串珠状。lMPS 脊椎表现包括椎间盘、椎骨、齿状突、硬脊膜，颅颈交界处三大典型异常表现包括导致椎管狭窄和脊髓压迫，1、齿状突发育不良或发育不全；2、寰枢椎半脱位 C1 后弓前移；3、齿状突周围组织、硬脑膜、韧带葡萄糖胺聚糖蓄积增厚。
讨论：MPSⅠ型：颅缝早闭；呈舟状；蝶鞍前后径增大，呈仰卧的“J”形，颅骨板致密，板障增厚；MPSⅡ型蝶鞍呈“J”形扩大；MPSⅢ型颅骨异常轻微，顶骨及枕骨增厚；MPSⅣ型：头颅、蝶鞍正常；MPSⅥ型类似于 MPSⅠ型；MPSⅦ型类似于 MPSⅠ型。脑积水 MPS I、II 型最明显，原因分析黏多糖蓄积在蛛网膜粒，脑脊液再吸收障碍；MPS II 轻型枕大池增宽明显；颞极蛛网膜囊肿。颈椎不稳定最常见，脊髓压迫应在屈曲、伸展、中位评估。判断标准为屈曲和伸展位，齿状突后缘与 C1 后弓间（后寰齿间隙）差异超过 2mm。椎体病变表现为圆形、子弹形、楔形，骨质疏松。

S-07

白血病患儿颅内静脉窦血栓的影像学分析

盛茂,刘玉奇,贾慧惠
苏州大学附属儿童医院

目的 总结 4 例白血病患儿脑静脉窦血栓的临床表现和影像学特点。
方法 通过对 2017 年 1 月至 2018 年 12 月苏州大学附属儿童医院血液科新科收治的 4 例白血病患儿出现脑静脉窦血栓的临床资料进行回顾性病例总结,了解白血病患儿脑静脉窦血栓的危险因素、临床表现、影像学改变。
结果 4 例患儿均为急性淋巴细胞性白血病，其中男 3 例、女 1 例，年龄最大 11 岁，8 月最小 5 岁 5 月。临床表现：均为准备第二疗程前出现无明显诱因突发惊厥，第一疗程三例为 VDLD 方案，一例为 VDLP 方案。磁共振及静脉成像显示颅内出血 3 例；3 例头部 CT 平扫出现上“高密度三角征”、“束带征”，4 例头部 MRI 平扫发现血液流空现象消失，静脉性脑梗死、脑出血 3 例， 4 例性 MRV 出现静脉血管充盈缺损现象，血栓位于上矢状窦 4 例， 直窦 2 例，横窦 2 例，乙状窦 1 例。
结论 急性白血病患儿静脉窦血栓与化疗药物相关，突发惊厥是脑静脉窦血栓的重要临床表现。仔细观察头部 CT 平扫可以发现“高密度三角征”、“束带征”，观察头部 MRI 平扫血肿的位置，发现血液流空信号的缺失可尽早提示脑静脉窦血栓的形成，及时 MRV 成像有助于脑静脉窦血栓早期诊断和治疗。

S-08

儿童动脉缺血性脑卒中影像诊断及临床特点

张欣贤[1],徐超[1]
1.徐州市儿童医院
2.徐州市儿童医院

儿童脑卒中的定义:

脑卒中是由于各种原因导致脑血液循环障碍，致使脑组织缺血、缺氧、坏死，导致神经功能障碍，是儿童终身残疾的一个重要原因
分为缺血性脑卒中和出血性脑卒中：
（1）缺血性脑卒中包括动脉缺血性脑卒中(arterial ischemic stroke,AIS)、脑静脉窦血栓形成；
（2）出血性脑卒中包括脑内出血和蛛网膜下腔出血。
儿童动脉缺血性脑卒中（AIS）常见病因:
儿童 AIS 通常是诸多因素相互作用导致，在许多情况下，卒中不止一个风险因素。
新生儿 AIS 有关的危险因素包括产前、围生期、分娩期和产后因素
儿童动脉缺血性脑卒中（AIS）临床表现:
新生儿及小婴儿临床表现极不典型，局灶神经系统受损症状少见，常表现为易激惹、嗜睡、拒食、反复呼吸暂停、抽搐等
年长儿童也常存在不典型症状，如失语、共济失调、构音障碍、颅神经麻痹、头痛等。
儿童动脉缺血性脑卒中（AIS）影像诊断:
儿童 AIS 急性期无特异性标志性临床症状，正确诊断需依赖神经影像学检查，MRI 是目前诊断儿童 AIS 的金标准。最常用的诊断图像有 T1、T2 加权像、弥散加权像（DWI）和磁共振血管造影(MRA)。
磁共振弥散加权(DWI)是目前唯一能够检测活体组织内水分子扩散运动的无创方法，对急性脑梗死的超早期诊断具有很好的敏感性和特异性，成为 AIS 首选诊断方法。
超急性期(<6h)脑梗死由于脑供血不足，T2WI 上多无异常变化，但 DWI 上能表现为清晰的高信号。
磁共振血管造影（MRA）可直接发现血管阻塞部位，对诊断脑梗塞定位更精确。MRA 仍诊断不清时，可考虑 CT 血管造影（CTA）或数字减影脑血管造影技术(DSA)。
此外，弥散张量成像技术（DTI）是在 DWI 的基础上发展起来的技术，能够直观地观察脑白质纤维束损伤情况，特异性评估脑梗塞程度，其反应组织完整性的最常用的参数是各向异性分数 FA 值，FA 值越大，代表神经传导功能越强。

S-09

儿童自身免疫性脑炎的影像诊断思路

肖江喜
北京大学第一医院

自身免疫性脑炎(AE)是一类由自身免疫机制介导的 CNS 炎性疾病，其临床症状主要包括癫痫发作、精神行为异常、语言运动障碍等。AE 的病理学特点虽与病毒性脑炎改变相似，与成人相比，儿童 AE 相对少见，且临床表现多样。按抗原成分分布部位不同，可以将 AE 分为细胞内抗原抗体相关脑炎和细胞表面抗原抗体相关脑炎。临床上常见的儿童 AE 主要包括抗 NMDA R 脑炎和自身免疫性边缘叶脑炎，以抗 NMDA R 脑炎最为多见。90%的抗 NMDA R 脑炎患儿不伴发肿瘤，但随年龄增长合并肿瘤的概率逐渐增大。但近些年关于非肿瘤性边缘叶脑炎的报道越来越多，并发现儿童边缘叶脑炎多以非肿瘤性为主。儿童边缘叶脑炎不仅累及边缘系统，同时小脑、新皮质也可受累。早期对自身免疫性脑炎患者实施颅脑 MRI 扫描，图像并不具有特异性，超过半数的患者 MRI 扫描结果显示正常。约 50%的患者，在 MRI 扫描时，T2WI 或者是液体衰减反转恢复图像在小脑、到脑皮质、海马、前额叶、脑干、基底核可以观察到异常的高信号病灶，脊髓中一般不会观察到病灶。依据病变部位不同，可将 AE 分为灰质受累为主型、白质受累为主型以及血管炎型。抗 NMDA R 脑炎患儿头颅 MRI 异常率较成人低，仅 31%～45%的患儿呈现异常，多表现为颞叶中部、额叶岛回及海马在 T2 Flair 上信号增高。与抗 NMDA R 脑炎的患儿相比，仅少数边缘叶脑炎患儿的头颅 MRI 正常，大部分患儿海马、杏仁核处 T2 或 Flair 像呈高信号，异常信号区在随访时经常有萎缩改变，局灶性病灶或脑膜增强也见于个别报。AE 需要与下列疾病鉴别：单纯疱疹病毒性脑炎、EB 病毒感染性脑炎、精神

病和抗精神病药后反应 AE、儿童线粒体脑病（包括 Leigh 综合征、MELAS、及 Alpers 综合征）、原发性脑血管炎、系统性红斑狼疮及桥本氏脑病等。

S-10

MRI 在儿童晚期视网膜母细胞瘤分期的应用价值

石浩,张高峰
昆明市儿童医院

目的 分析和探讨 MRI 在儿童晚期视网膜母细胞瘤分期的应用价值。
方法 回顾性研究。选择昆明市儿童医院 2017 年 3 月至 2018 年 12 月收治的 47 例(51 只眼)儿童晚期视网膜母细胞瘤患儿病历资料、眼球摘除术前 MRI 检查结果，参照 International intraocular retinoblas—toma classification(IIRC)对所有病例进行术前分期，对比患眼眼球摘除术后病理检查结果。采用 Kappa 一致性检验对术前 MRI 检查结果与术后病理报告的分期结果进行一致性比较。
结果 47 名(51 只眼)视网膜母细胞瘤患儿中仅有 3 例 (3 只眼)术前 MRI 检查分期与病理分期不相符。Kappa 值为 0．807(Kappa>0 说明有意义，Kappa≥0．75 说明已经取得相当满意的一致程度)。
结论 MRI 是晚期视网膜母细胞瘤病情分期的重要检查手段。确诊晚期视网膜母细胞瘤后，应行眼眶以及颅脑 MRI 检查，有助于治疗前视网膜母细胞瘤的分期和分级，避免漏诊和误诊。

S-11

儿童听小骨创伤的 CT 表现

刘俊刚
厦门市儿童医院

目的 探讨听小骨创伤的 CT 表现。
方法 回顾性分析 2015 年 9 月~2018 年 12 月经我院 CT 确诊的 12 例听小骨创伤的 CT 表现。其中，男 8 例，女 4 例。
结果 12 例患者中，发生于左侧 5 例，右侧 7 例。本组病例中最常见损伤为锤砧关节脱位，共 8 例，轴位图像上可见锤骨头与砧骨体间隙增宽，二者失去正常“冰激凌”样形态，其中 2 例合并锤骨骨折，3 例合并砧骨骨折；砧骨脱位 3 例，其中 2 例砧骨脱位至上鼓室，1 例脱位至乳突窦；砧蹬关节脱位 1 例，表现为砧骨、镫骨关节间隙增宽，砧骨向外侧移位。
结论 听小骨损伤为颞骨骨折严重的并发症，临床表现为传导性听力损失。更常见于纵行骨折，可为直接损伤，或由于镫骨肌和鼓膜张肌同时强直收缩间接导致。听小骨损伤包括锤砧关节脱位、砧蹬关节脱位、砧骨脱落、听小骨骨折、镫骨前庭关节损伤，通常为多种损伤并存。本组中以锤砧关节脱位最常见。
由于结构较小，听小骨损伤有时很难发现，特别是在急诊中，若传导性听力损失情况被忽视，患儿仅进行头颅 CT 检查时，由于层厚因素，听小骨损伤很容易漏诊。当创伤部位位于颞区，头颅 CT 发现不能解释的中耳鼓室、乳突内积液时，尤其是发现颅内积气时，应进一步进行颞骨 CT 检查，采用薄层多平面重建的方法，能提高听小骨损伤发现。

S-12

影像学检查在儿童 CND 人工耳蜗植入术中的应用价值

燕飞
首都医科大学附属北京同仁医院

目的 探讨 CT 及 MRI 在儿童蜗神经发育不良（cochlear nerve dysplasia,CND）患者人工耳蜗植入术前的诊断价值；分析 CND 耳蜗植入术后听觉康复效果与耳蜗形态正常患者之间的差异，为 CND 患者人工耳蜗植入术后效果预测提供参考方法。

方法 回顾性分析 2017-2018 年行人工耳蜗植入患者的影像及临床资料，选取手术侧诊断 CND 的患者（12 耳）及耳蜗形态正常语前重度及极重度感音神经性耳聋患者（10 耳），总结 CND 患者 CT、MRI 影像表现特点；对两组患者术后 6 个月的听觉行为分级标准（categories of auditory performance,CAP）、言语可懂度分级标准（speech intelligibility rating, SIR）得分进行分析比较。

结果 1.12 例 CND 均行颞骨高分辨力 CT（HRCT）检查，内耳道狭窄 9 耳、正常 2 耳、扩大 1 耳。蜗神经管狭窄 5 耳，闭塞 7 耳，伴发耳蜗畸形 4 耳，前庭半规管畸形 5 耳；2.CND 中 9 例行内耳 MRI 检查，蜗神经纤细 2 耳，缺如 7 耳；3.耳蜗形态正常组 HRCT 显示耳蜗骨性结构正常，1 例伴前庭半规管异常，内耳道及蜗神经管显示正常；4.CND 组术后 6 个月的 CAP 和 SIR 得分均低于耳蜗形态正常组，两组间 CAP 和 SIR 差异均具有统计学意义（$p<0.05$）。

结论 蜗神经发育不良是少见的引起先天性感音性神经性耳聋的病因。MRI 可明确诊断蜗神经发育不良；HRCT 表现为蜗神经管狭窄及闭塞高度提示 CND，内耳道形态正常者不能排除 CND。影像学检查能提供可靠的解剖信息，对选择耳蜗植入侧别、评估预后具有重要的临床意义。蜗神经发育不良耳蜗植入术后康复效果较耳蜗形态正常患者差，远期效果期待进一步随访。

S-13

儿童心肌炎的磁共振诊断

钟玉敏
上海儿童医学中心

目的 探讨心脏磁共振（CMR） 在儿童心肌炎诊断中的价值。

方法 自 2016 年 5 月至 2019 年 6 月收集 41 例心脏磁共振检查儿童，其中 27 例临床诊断心肌炎，男孩 14 例，女性 13 例，年龄中位数 10 岁（年龄范围 7-16 岁），急性期患儿 16 例，慢性期患儿 11 例； 非心肌炎患儿 14 例，男孩 6 例，女孩 8 例，年龄中位数 11 岁（年龄范围 5－12 岁）。41 例 CMR 检查序列如下：稳态自由进动（SSFP)序列进行心脏横断面、左心室二腔心、四腔心以及短轴面扫描以评估心脏功能；分别进行左心室短轴位 T2 加权三翻转恢复序列、T1 加权注射对比剂前后以及延迟强化序列扫描；进行左心室功能测定及心肌骨骼肌心肌信号比定量分析；统计方法采用 SPSS17.0 软件进行统计学分析。

结果 本组心肌炎发病年龄趋于学龄期，男女比例相当。心肌炎组射血分数（EF）60.5%(45.35%-72.05%), T2 加权(T2W)心肌异常信号与骨骼肌心肌信号比 2.5(2.04-3.79), 延迟强化(LGE)病变显示率 50%；非心肌炎组射血分数 72.25%(64.23%-75.48%) , T2 加权心肌异常信号与骨骼肌心肌信号比 1.85(1.77-2.15),延迟强化显示率 6.7%； 心肌炎组与心肌炎组之间在左心室 EF、T2W、LGE 序列显示心肌病变上有统计学差异；磁共振序列 T2 加权心肌异常信号与骨骼肌心肌信号比、延迟强化显示率、早期强化诊断心肌炎的敏感性分别为 73.2%，46.3%，58.5%；特异性分别为 56.3%，100%，86.7%；准确性分别为 84.0%，15.4%，42.3%；综合三种序列诊断心肌炎的敏感性、特异性、准确性分别为 65.9%，86.7%，53.8%。

结论 CMR 是目前诊断儿童心肌炎重要的非创伤性检查方法，各扫描扫描序列的综合评估可提高诊断的准确性。

S-14

儿童青少年异常体动脉供血肺：影像与临床

马睿,李继军,尚建强
山东省医学影像学研究所

【目的】异常体循环动脉供血肺在临床不少见，被供应的肺组织可以是完全实变的（称为肺段隔离症）或者是基本正常的（曾被称为叶内型肺段隔离症），从临床特点到病理机制，这 2 种情况还是有根本差异的，现在后者被称为异常体动脉供血的正常左肺下叶，常被忽略或与肺段隔离症混淆。其症状与治疗方式也有很大差异与争论。本文总结一组相关病例，归纳分析其影像、临床特点和治疗体会，提醒同道关注两者的诊断鉴别，提高对该类疾病的认知水平。【方法】回顾分析总结 12 例存在异常体循环动脉供血肺的病例，男 2 例，女 10 例，年龄范围 5 岁-30 岁。患者症状包括咯血及胸闷、憋气或咳嗽偶然查体发现。均行肺动脉、主动脉 CT 血管造影检查（CTA），分析其影像特点，包括肺叶状态、患侧肺动脉径线、体循环供血动脉特点、治疗方式和预后。**【结果 】4 例**左肺下叶基底段实变伴支气管缺如闭塞，8 例是异常体循环动脉供血正常左肺下叶（咯血较前者常见），均见供血动脉来自胸降主动脉前壁、较粗大迂曲，后者可见引流静脉均为肺静脉汇入左心房，所示左下肺动脉基本正常或略细或明显纤细缺如。5 例咯血者行 DSA 下体循环供血动脉介入栓塞治疗，2 例因局部肺出血合并感染行局部肺段手术切除，4 例观察随访。【结论】肺段隔离症和异常体动脉供血的正常左肺下叶均可在 CTA 上表现为异常体循环供血动脉征象，需要注意鉴别诊断，咯血常见于后者。

S-15

儿童横纹肌肉瘤的影像诊断和鉴别诊断

何玲
重庆医科大学附属儿童医院

横纹肌肉瘤（Rhabdomyosarcoma，RMS）是儿童期最常见的软组织肉瘤，恶性程度高，预后差，可发生于全身的任何部位，以头颈部、泌尿生殖道最常见，其次为四肢、躯干 、腹膜后和胆道等部位,临床及实验室检查缺乏特异性。依据组织学特点将 RMS 分为 4 型：胚胎性横纹肌肉瘤(embryonal RMS,eRMS)、腺泡性横纹肌肉瘤 (alveolar RMS,aRMS)、梭形细胞/硬化性横纹肌肉瘤(spindle cells/sclerosing RMS,ssRMS)及多形性横纹肌肉瘤(pleomorphic RMS,pRMS)。
随着影像学技术的不断发展，超声、CT、MRI、PET/CT 等已广泛应用于 RMS 的诊断和治疗中，超声主要用于肿块的初步评估和随访监测，CT 和 MRI 可全面显示肿块的位置、范围，结合患儿年龄和发生部位，具有一定特征性。MRI 是评价 RMS 局部浸润和区域淋巴结肿大的首选方法,而 CT 评估 RMS 的骨质破坏和肺转移更敏感，两者为 RMS 的临床分期和治疗提供了更全面的影像信息。DWI 目前主要用于头颈部 RMS 的诊断及鉴别诊断；动态对比增强 MRI 可间接帮助判断病变强化特征及性质；PET/CT 显示肿瘤的代谢活性，提高 RMS 的临床分期准确性和预测预后。DWI、DCE-MRI 及 PET/MR 等技术的快速发展和应用，将更好地反映 RMS 的影像特点及其内部生物化学信息，对 RMS 的早期诊断、后续治疗及评估预后等方面提供更有价值的依据，从而提高患儿长期生存率。

S-16

儿童腹部脏器外囊性病变的诊断价值

赵鑫,程美英,尚红磊
郑州大学第三附属医院

目的 探讨 CT 对儿童腹部脏器外囊性病变的诊断价值。
方法 回顾性分析 45 例经手术病理证实的儿童腹部脏器外囊性病变的 CT 表现。
结果 淋巴管瘤 18 例，其中肠系膜淋巴管瘤 11 例，腹膜后淋巴管瘤 7 例，肿块形态不规则，囊壁菲薄，边缘清晰，增强扫描均未见强化，肠系膜囊肿 8 例，均为先天性肠系膜囊肿，形态规则，囊壁薄而均匀，5 例为单房，3 例为多房。2 例囊壁呈线状强化。肠重复畸形 8 例，均与肠管关系密切，4 例呈管状，4 例呈类圆形，4 例囊壁可见强化，囊性畸胎瘤 5 例。腹部脓肿 4 例。膀胱壁囊肿 2 例，大网膜囊肿 2 例，长径均大于 6cm,病灶位于腹腔前方，紧贴前腹壁，形态不规则。
结论 CT 对腹部脏器外囊性病变的形态特征，大小，范围及周围组织结构的关系显示清晰，能对大多数病变做出精确诊断。

S-17

CT 三维重建对小儿肝母细胞瘤术前评估的价值研究

袁新宇,徐兆慧
首都儿科研究所附属儿童医院

目的 利用肝母细胞瘤患儿肝脏术前的 CT 三维重建资料，评估肝脏肿瘤体积及其与周边血管关系，并结合术中所见和术后肝功能恢复状态，探讨 CT 三维重建对小儿肝母细胞瘤术前评估的应用价值。
方法 本研究为前瞻性研究，符合纳入标准的肝母细胞瘤患儿共 40 例，平均年龄 1.8±0.8 岁。所有患儿术前均接受增强 CT 检查，进行动脉期、门脉期、静脉期三期扫描，并对肝脏、肿瘤及肝内血管行三维重建。观察评估肝内血管走行、测量全肝体积、预切除肝体积、计算标准化肝脏体积以及残余肝脏体积比。术中以水浸法测量实际手术切除的肝脏体积，并与 CT 测量预切除的肝脏体积比较两者一致性。以受试者工作特征曲线（ROC）评价残余肝脏体积比与术后肝功能损伤之间的相关性。
结果 基于增强 CT 扫描，重建全部患儿的术前肝脏、肿瘤及肝内血管的三维图像。所得图像准确显示肿瘤大小与位置，显示肿瘤-血管关系的准确性达 90%。CT 测量预切除肝脏体积为 393.62±216.54cm^3，术中水浸法测量实际肝脏切除体积为 388.38±207.56cm^3，两者之间呈高度相关性，r=0.920，P<0.05，差异无统计学意义（t=1.679，P=0.101）。测量残余肝脏体积为 234.55±70.42cm^3，残余肝脏体积比为 63.64%±13.70%。ROC 曲线显示，残余肝脏体积比预测术后肝功能中重度与轻度损伤的曲线下面积（AUC）为 0.837（P=0.016），临界值为 56.32%，敏感度为 86.7%，特异度为 70.0%。
结论 CT 三维重建技术可预测切除肝脏体积、剩余肝脏体积以及残余肝脏体积比，可有效评估肝功能储备情况。在手术方案选择、术中操作以及术后肝功能评估等方面具有重要参考意义。

S-18

儿童卵巢颗粒细胞瘤 CT、MRI 诊断

杨秀军
上海交通大学附属儿童医院

目的 探讨儿童卵巢颗粒细胞瘤的 CT、MRI 影像学特点及其诊断价值。
方法 回顾性分析我院 9 例经手术病理证实的卵巢颗粒细胞瘤的临床影像学资料，着重分析 CT、MRI 表现及特征。
结果 发病年龄 48 个月-144 个月，平均年龄 71.2 个月，可伴不同程度性早熟及骨龄提前。病理上 8 例幼年型颗粒细胞瘤、1 例成年型颗粒细胞瘤。8 例单发、1 例双发共 10 个病灶，其中左侧 7 个病灶、右侧 3 个病灶，瘤体长径 38mm-190mm、平均 94.7mm，8 个类圆形、边界较清晰，2 个分叶状、边界较模糊。病灶呈多房囊实性肿块 7 个、囊性肿块 2 个、实质性肿块 1 个。肿块密度/信号不均，囊性部分 CT 上呈低密度、MRI 上呈长 T1、长 T2 信号改变，增强后无明显强化；实性及囊间分隔呈软组织密度/信号改变，增强后轻度-中度非均质强化，血供来源于同侧增粗卵巢动脉或子宫动脉卵巢分支。子宫见不同程度异常发育及肥大改变。2 例术后 2 年左右复发。
结论 儿童卵巢颗粒细胞瘤的 CT、MRI 表现具有一定特征，结合其子宫异常发育，术前诊断非常有帮助。

S-19

胎儿脊柱脊髓发育异常的 MRI 诊断

王静石
大连市妇女儿童医疗中心

目的 探讨 MRI 在显示胎儿脊柱解剖及发育畸形的价值。
方法 回顾性分析我院于 2017 年 6 月至 2019 年 6 月期间收治的 72 例脊柱脊髓病变的产前 MRI 影像结果，且均结合产前超声及生后（或引产）随访，孕龄 24～31 周，平均 27.5 周。均行胎儿脊柱脊髓 MRI 常规扫描及 EPI、SWI 序列扫描。
结果 72 例胎儿脊柱脊髓 MRI 病例中，共检出椎体结构异常 25 例（其中半椎体 13 例，蝴蝶椎 5 例，多发椎体异常 6 例）；脊髓发育异常 26 例（其中脊髓低位 21 例，脊髓椎管内囊肿 3 例，脊髓纵裂 2 例）；神经管闭合不全 9 例（隐性脊柱裂 4 例，脊膜膨出 3 例，脊髓脊膜膨出 2 例）；尾退化综合征 2 例，脊柱脊髓未见异常 10 例。72 例中，4 例常规 MRI 漏诊，而 EPI、SWI 及 3D-MR 序列检出，3 例失访，其余 69 病例均由出生/引产后影像学（CT 三维重建）证实，结果均与产前 MRI 一致。
结论 胎儿脊柱脊髓病变是较常见的胎儿先天性异常，其预后不同。目前，超声是最常用的产前诊断脊柱脊髓病变的检查方式，而胎儿 MRI 在常规 T2WI 序列几乎难以发现病变，EPI、SWI 序列可较清晰的描绘出胎儿脊柱的骨质轮廓，易于鉴别；另外，3D-MRI 对脊髓解剖及发育异常具有更高的诊断价值。因此，MRI 与超声联合能提高胎儿脊柱病变的检出率及诊断符合率，是评价胎儿脊柱病变的重要检查手段。

S-20

胎儿心脏磁共振的再思考

朱铭
上海交通大学医学院附属上海儿童医学中心

胎儿磁共振检查是在上世纪八十年代中期出现，到上世纪九十年代中期国外开始应用于胎儿临床检查。胎儿磁共振作为胎儿畸形的新兴影像检查手段，已经在胎儿畸形诊断中已经显示了独特的优势。胎儿磁共振视野大，软组织对比分辨率高，不受母体情况如孕妇过于肥胖、子宫肌瘤、羊水过少和多胎等可能导致超声不能清晰显示胎儿结构改变的影响，经常能提供超声没有发现或不能完全确定的胎儿诊断信息。目前无论国内外胎儿磁共振检查效果最好的无疑是神经系统，磁共振空间分辨率高，对比分辨率高，可用多种序列来确定病变的性质和磁共振不受孕晚期颅骨影响等的特点在胎儿神经系统检查中能得到最充分的体现。胎儿心脏是难点,因为心脏小,心率快,不能用门控和对比剂，产科医院的超声室只有少数医生或主任能做胎儿心脏超声。
先心病是我国第一位的出生缺陷，发生率远高于第二、三位，疾病也远远严重于第二、三位的出生缺陷. 胎儿心脏 MR 虽普及度不高，但临床需求强烈,也是科研热点.MRI 是有效的儿童心脏病和许多胎儿诊断方法，这是共识.如同在出生后检查中一样，超声很有效，但若在超声检查后做 MRI，仍然经常会得到更多的诊断信息，胎儿也是如此。先心病产前诊断需求强烈，但诊断确实比较难.作为放射科医生要尽量去诊断这最多最重的出生缺陷,世界各国的胎儿磁共振都在向心脏方面努力.柳叶刀杂志今年 3 月发了 2 篇胎儿心脏磁共振文章。
目前美国和欧洲先心病产前超声实际检出率都在 30%左右。我国湖北省妇幼在《2010-2017 年湖北省出生缺陷发生顺位及发生率》中，发病率最高为先心病,，先心病超声产前诊断率为 65.2%. 个人认为这一数字可能比较可靠,由于湖北省妇幼保健院在这一调查前做了大量培训工作,其先心病超声产前诊断率应该是高于全国平均水平的.诊断医生是否熟悉心血管畸形对的检查效果影响明显.平心而论,虽然临床需求存在,目前我国胎儿心脏磁共振的开展还很不理想，需要进一步努力。

胎儿消化道梗阻的磁共振诊断及梗阻平面判断

兰为顺
湖北省妇幼保健院

目的 探讨胎儿消化道梗阻的磁共振表现及梗阻平面的判断方法；
方法 总结我院胎儿消化道梗阻的病例，分析其磁共振表现，并与出生后磁共振表现及手术结果对照，总结不同平面胎儿消化道梗阻的磁共振表现特征，从而进行梗阻平面的判断；
结果 胎儿十二指肠，空肠，回场，结肠梗阻在磁共振上表现不同，十二指肠梗阻表现为双泡征，空肠梗阻表现为连续扩张的肠管与胃泡想通，在 T2WI 上多表现为高信号，亦可表现为低信号。回场梗阻表现为连续扩张的肠管位于中下腹部，在 T2WI 上表现为稍高信号，在 T1WI 上亦表现为稍高信号；结肠梗阻在 T2WI 上表现为低信号，在 T1WI 上表现为高信号，肠管分布表现为典型的结肠圈。
结论 胎儿不同平面的肠梗阻在磁共振上表现不同，磁共振可对胎儿肠梗阻平面进行判断，对胎儿的产前超声诊断是一个有效的补充。

特发性快动眼睡眠行为障碍脑功能成像研究进展

黄飚
华南理工大学附属广东省人民医院

快动眼睡眠期行为障碍（rapid eye movement sleep behavior disorder, RBD）是一种深睡眠异常行为状态，患者在快速动眼期（rapid eye movement, REM）骨骼肌失迟缓，频发噩梦，伴与梦境相关异常肢体动作，容易对自身及床伴造成伤害。RBD 好发于中老年男性，发病率约 0.38-0.5%。特发性 RBD（iRBD）指的是患者无明显诱因出现 RBD 症状，无伴发其他神经系统疾病，基于体素的形态测量学(voxel based morphometry, VBM)可以定量测量脑实质的灰白质体积，可无创性发现未知的脑区结构是否存在异常。而基于体素分析(voxel based analysis, VBA)方法结合了 VBM 技术，可以对 DTI 各种参数图进行全脑体素水平的统计分析，可以无创性地显示活体脑白质纤维束，探索 iRBD 患者可能的病理生理学机制。研究发现，联合使用 VBM 及 DTI 研究有利于发现 iRBD 出现结构异常的脑区，并且发现额叶前部、丘脑、颞叶前部、枕叶及海马旁回有可能参与到 iRBD 的病理生理机制中。

甲状腺相关眼病的 MRI 诊断及进展

吴飞云,许晓泉,胡昊,陈文,吴倩
江苏省人民医院（南京医科大学第一附属医院）

甲状腺相关眼病（TAO）是临床常见的眼病。因为软组织分辨率高且没有电离辐射，磁共振成像越来越多地被应用于 TAO 的诊断和分期。
本讲座拟:
1. 介绍甲状腺相关眼病的流行病学特征
2. 甲状腺相关眼病的可能机制
3. 甲状腺相关眼病诊疗过程中需要影像学提供的信息
4. 多模 MRI 技术（脂肪抑制 T2WI（多成像方式），T2mapping，DWI（多成像方式），脂肪定量）在 TAO 诊断和分期中的研究进展。
旨在提高影像医师对 TAO 的认识，提高 TAO 的影像诊断水平，为内分泌和眼科医师提供需要的诊疗信息。

MSCT 及 X 线平片对人工耳蜗植入术后电极的评价

马辉

华中科技大学同济医学院附属协和医院

目的 评价 MSCT 及 X 线平片在人工耳蜗植入术后电极评估中的应用价值。**资料和方法** 对 288 例已行人工耳蜗植入术的患者做 MSCT 检查及 DR 反斯氏位检查。260 例植入 Combi40＋（MED-EL，奥地利）标准型电极，28 例植入 Combi40＋短电极。对感兴趣耳以 0.1mm 重建间距、FOV＝50mm 进行重叠放大重建，将图像传至工作站以容积再现技术（volume rendering technique，VRT）对感兴趣耳进行三维重建。
结果 MSCT 横断面图像显示电极在耳蜗内呈断续点状高密度影，并见少许金属伪影。VRT 图像显示电极在耳蜗内呈螺旋状走行，与耳蜗走行一致。260 例植入 Combi40＋标准型电极患者 VRT 可清晰分辨每个电极在耳蜗内的位置，28 例植入 Combi40＋压缩电极的患者 VRT 图像上只能分辨插入耳蜗前段的 4～5 个电极，其它的插入电极相互之间难以区分。
结论 MSCT 结合 VRT 重建可清晰、直观、准确的显示电极在耳蜗内的形态和位置，能准确显示大部分病例植入电极数目，是人工耳蜗植入术后观察植入电极直观而较准确的方法。X 线片可清晰的分辨出各电极，但不能直观显示耳蜗内的插入电极的数目。

内耳畸形新分类及术前评估

周正根
广东省人民医院

1. 耳蜗正常影像解剖关键点：蜗轴，间隔，蜗神经孔，正常耳蜗的判断。
2. 内耳畸形分类（2017 版）：8 大分类，分类依据，影像要点，临床处理要点。
3. 耳蜗畸形：关键结构-蜗轴、蜗神经孔及不同畸形的表现。
4. 蜗神经：正常及异常，MRI 表现。
5. 术前评估要点：面神经位置，内耳腔内异常。

S-27

面神经功能障碍的影像诊断

杨军乐
西安交通大学附属西安市中心医院

目的 探讨正常面神经管、面神经及面神经功能障碍各节段的强化方式。
方法 选取 35 例临床诊断为面神经功能障碍的患者及 6 例无面神经症状而由于其他颞骨病变前来做 CT 及 MR 增强的患者。CT 扫描层厚 0.625mm，1024x1024 扫描。MR 横轴位快速三维扰相梯度回波序列（ 3D-FSPGR） T1WI 平扫及增强、横轴位快速自旋回波序列（ FSE） T2WI，横轴位稳态采集快速成像序列（ FIESTA） 。
结果 CT 双侧正常面神经管对称，MR 双侧正常面神经强化节段及强化程度均一致。面神经功能障碍病变可分为原发病变：面神经瘤、面神经血管瘤等；邻近病变侵犯：脑膜瘤、副神经节瘤、内淋巴囊肿瘤、成软骨性肿瘤；继发病变：转移瘤等。也可分为先天性、炎性、外伤性、肿瘤性病变，邻近组织如颞骨、腮腺等病变及术后。表现为面神经管不同程度骨质破坏及面神经强化、增粗损坏等。

结论 面神经细小、结构复杂、走行曲折 CT 成像显示面神经管及骨质破坏范围、程度，MR 增强成像显示面神经强化程度及病变范围，结合有助于明确面神经功能障碍原因、显示周围病变与面神经的关系，对术前评估、术中保护面神经具有重要临床应用价值。

走出耳聋病因诊断误区：“肯定之否定法”诊断思路浅析

巩若箴
山东省医学影像学研究所

1、分析思路类型：顺向思维、逆向思维、肯定之否定法、否定之否定法。
2、耳聋病因诊断存在的问题：误诊、漏诊，后者为主要原因。
3、漏诊原因：检查方法选择不当、展示解剖结构不到位、思路中断。
4、解决**方法** 掌握正确分析思路，肯定之否定法最适合耳聋病因诊断，可有效避免漏诊。

鼻咽与口咽病变临床影像诊断思路

李恒国
暨南大学分子与功能影像研究所

一、 鼻腔后鼻孔息肉和内翻乳头状瘤
小气泡影，肿块边缘光滑或分叶状，平扫肿块密度低于邻近鼻咽肌肉。
二、鼻咽炎与腺样体肥大
鼻咽粘膜肿胀增厚，呈线带状，腭帆提肌正常，无肿块占位效应。
三、鼻咽结核
1、临床多有开放型肺结核。2、可局限于鼻咽浅层，亦可侵及深层。
四、鼻咽纤维血管瘤
1、反复鼻血，出血量多。2、局部大肿块，呈紫红色。3、鼻咽部大肿块，其中有钙斑。4、周围骨质膨胀性破坏。5、增强扫描强化明显。
五、鼻咽恶性淋巴瘤
1、常为全身性淋巴瘤的一部分。2、局部见苍白色肿块。3、鼻咽部边界清楚的肿块。4、累及骨质结构边缘，沿孔道蔓延。5、放射治疗肿块缩小速度较快，这与鼻咽癌放疗时肿块缩小不明显不同。
六、鼻咽癌（NPC）
1、鼻咽癌发病部位：91%发生于咽隐窝，而原发于鼻咽侧壁、顶后壁和翼腭窝者少见。2、早期鼻咽癌影像表现：咽隐窝变浅或消失，腭帆提肌肿大。3、鼻咽癌与鼻咽炎鉴别：（1）鼻咽癌：腭帆提肌增粗，粘膜线中断，咽缝间隙消失， 深层侵犯。（2）鼻咽炎：局限于鼻咽浅层，粘膜线完整，腭帆提肌正常。

七、涎腺混合瘤
患侧鼻咽腔变窄，局部粘膜正常，咽旁间
2、良性者为卵圆形、边
3、肿块呈中等密度，明显强化，可
鼻咽总结：1、鼻腔后鼻孔良性肿块突向鼻咽腔，呈间断性接触表现（“小气泡”征）。2、鼻咽良性病变多位于顶后壁，其前缘平直或凹陷，黏膜线影连续。3、鼻咽腔恶性肿块前缘多呈弧形前突，鼻咽癌多有腭帆提肌受累。4、鼻咽结核有时需结合临床、病理活检诊断。5、鼻咽壁混合瘤致同侧鼻咽腔和咽旁间隙变窄，粘膜规整
口咽总结：1、 炎性肿块一般边界模糊，T2WI 压脂周围软组织水肿。**2、**炎性肿块呈多房囊状改变，房隔薄而清楚。**3、**口咽癌肿块边界不规则，坏死区不规则并且大小不一，界限模糊。**4、**淋巴瘤多见于双侧，常伴有颈部淋巴结肿大，肿块无坏死或大的肿块伴少许坏死区。

腮腺影像解剖与良恶性肿瘤的鉴别诊断

欧陕兴[1],欧舒斐[2],李华雨[2]
1.中国人民解放军南部战区总医院
2.中国人民解放军空军医院

目的 通过对腮腺解剖与常见肿瘤的影像特征分析，应用影像解剖与检查技术提高腮腺肿瘤诊疗水平，识别血管与神经结构对指导手术有临床意义。
材料与方法
1.解剖要点：面神经、腮腺导管、下颌后静脉与筋膜与脂肪间隙、颈外动脉与静脉血管、淋巴结。
2.病变侵犯范围判断位置，基于间隙脂肪推移判断肿瘤生长方向。
2.技术显示能力
2.1 平片主要显示骨骼的变化与钙化的改变
2.2CT 主要是对血管的判断与诊断的主要方法
2.3MRI 对于导管与神经性肿瘤的转移帮助非常大
2.4 导管造影对于腮腺导管病变诊断，定性与定位帮助大。
结果
3.1 诊断与判断：如肿瘤直接征象 、间接征象、周围累及病变范围等；
3.2 合理应用影像技术方法实现诊断效益的最大与最优化。
结论 识别正常腮腺解剖结构对良恶性肿瘤定位诊断重要，观察血管神经，淋巴结侵犯，有助于良恶性肿瘤定及肿瘤分期，识别影像解剖血管与神经结构对制定手术方案有指导作用。

分子探针 USPIO-PEG-sLeX 监测西咪替丁干预后鼻咽癌裸鼠移植瘤 ELAM-1 表达的价值研究（讲座）

金观桥
广西医科大学附属肿瘤医院

目的 利用磁共振分子探针 USPIO-PEG-sLeX 监测西咪替丁干预后裸鼠鼻咽癌移植瘤 ELAM-1 的表达的应用价值。
方法 制作多时间节点（尾静脉注射分子探针后 0h、1h、2h）裸鼠鼻咽癌移植瘤模型，使用 USPIO-PEG-sLeX 作为造影剂进行 3.0T 磁共振扫描，测量西咪替丁干预组与非干预组的 T2*值、ΔT2*值及强化率。扫描完成后处死裸鼠，行免疫组化染色分析移植瘤 ELAM-1 表达情况。
结果 两组荷瘤裸鼠平扫 T2*值无统计学意义（22.40±7.61 VS 29.54±9.52，P＞0.05），强化后 0h、1h、2h，两组间 T2*值无统计学意义（16.59±5.38 VS 16.81±6.08、13.44±4.57 VS 12.27±3.49、12.30±3.69 VS 12.18±3.98），P 值均＞0.05。两组ΔT2*值在增强后各时间点有统计学意义（6.08±5.65 VS 13.04±9.83、8.96±6.54 VS 17.28±9.52、10.11±6.07 VS 17.37±9.57），P 值均＜0.05。两组强化率在增强后在注射造影剂后 0h、1h 有统计学意义（21.23±14.68 VS 40.79±20.05、36.39±20.26 VS 55.37±15.54），P 值均小于 0.05。增强后 2h 差异无统计学意义（42.12±16.14 VS 55.69±16.08，P＞0.05）。干预组移植瘤 E-selectin 表达低于对照组（0.04032±0.002687 VS 0.06805±0.002305，P＜0.05），差异有统计学意义。
结论 分子探针 USPIO-PEG-sLeX 可以监测西咪替丁干预后裸鼠鼻咽癌移植瘤 ELAM-1 的表达。

干燥综合征的 MR 研究进展

潘初,刘思敏
华中科技大学同济医学院附属同济医院

腮腺是人体最大的一对唾液腺，腮腺疾病是颌面外科的常见疾病， 腮腺疾病通常累及导管系统。传统的检测手段为涎腺造影术，这种技术的是一种有创性检查，需要注入对比剂，易引起导管狭窄和感染，并且依赖操作者的插管技术和病人腺体发育等因素。随着影像学技术的发展， MRI 影像学检查在腮腺疾病中有了更广泛的应用，MRI 可以观察唾液腺的位置、形态、大小，同时 MRI 水成像技术为涎腺导管系统的观察提供了一种无创、方便的检测手段。
腮腺腺体分泌涎液经各级分支导管汇入叶间导管及主导管，主导管最终开口于口腔排泌涎液。在此基础上加上多期涎腺水成像（MRS），不仅能反应出涎腺导管结构变化，也可反应涎腺分泌功能，具有“功能”成像意义
本研究 35 例志愿者中，32 例志愿者在酸刺激后观察到腮腺导管总体积的增加，其中 16 例腮腺导管最大体积出现在酸刺激后 2 期以内，另外 16 例腮腺导管最大体积出现在酸刺激后第 3-6 期。3 例志愿者在酸刺激后表现出腮腺导管体积的下降。
动态涎腺水成像较传统的检测手段（涎腺造影术）具有无创及操作简易的优势，有望成为临床评估腮腺分泌功能的一大检查方法。本研究显示了在正常人中酸刺激引起的腮腺导管体积变化的类型，为评价病理状态下腮腺功能变化提供理论依据。动态涎腺水成像有望应用于干燥综合征患者及放疗损伤所致腮腺病变的机理研究、临床评估及疗效观察。

双层探测器能谱 CT 在头颈肿瘤的初步临床应用

杨智云
中山大学附属第一医院

目的 探讨双侧探测器能谱 CT 在头颈肿瘤的临床应用价值。
方法 收集 30 例头颈肿瘤病例，所有病人术前经双层探测器能谱 CT 平扫及增强扫描，比较虚拟平扫与常规平扫图像质量及信噪比。以手术病理为金标准，对比常规增强图与碘图，各单能图、有效原子序数图多参数图评估肿瘤的范围，细节及软骨侵犯情况。
结果 虚拟平扫与常规平扫图像质量及信噪比两组差异无显著性。对比常规增强图，结合碘图，各单能图、有效原子序数图多参数图评估肿瘤的范围，细节及软骨侵犯情况更准确。
结论 双层探测器能谱 CT 在头颈肿瘤的有广泛的应用价值。

S-38

翼腭窝影像解剖及常见疾病 CT、MR 诊断

王飞,郭珊熹,张程程
海南省人民医院

目的 探讨翼腭窝及其通道和常见疾病 CT、MR 的表现。
方法 翼腭窝 CT 显示轮廓锐利，横断面形态多变，冠状面多呈四方形，重建矢状面近似漏斗形，也能清楚显示翼腭窝的通道圆孔、眶下裂、蝶腭孔、翼管、翼上颌裂、翼腭管、腭大孔及腭小孔。翼腭窝常见原发病变包括纤维血管瘤、神经鞘瘤、非特异性炎症，继发病变包括鼻咽癌等等。
结果 纤维血管瘤 CT 表现为等密度，颅底孔道扩大，临近骨质受压，可伴侵蚀性骨质破坏。T2WI 表现为胡椒-盐征，增强明显强化。神经鞘瘤表现为边界清楚、圆形肿块，密度或信号不均匀，增强不均匀强化。非特异性炎症 T2WI 表现为明显低信号。鼻咽癌是累及翼腭窝的最常见的恶性肿瘤。
结论 翼腭窝 HRCT 检查应包括横断面和冠状面，两者结合能清晰、准确地显示其本身及通道。CT 结合 MR 检查有助于翼腭窝.常见疾病的诊断和鉴别。

S-39

经鼻蝶入路手术之蝶窦-中颅窝底病变影像价值及临床关注点

邬海博
北京大学第三医院

目的 本文通过内镜下经鼻蝶入路的蝶窦-中颅窝底手术患者术前 CT、MRI 等影像的精细解剖分析，为内镜下处理该区域病变术前提供影像参考，进一步明确该手术入路的重要解剖学标志，探索手术操作的安全范围，从而达到降低该区域的手术风险和术后并发症。
方法 本文回顾了 2014.3-2019.7 我院耳鼻喉科通过内镜下经鼻蝶入路的蝶窦-中颅窝底 37 例手术患者的术前影像，其中包括蝶窦囊肿 13 例，蝶窦恶性肿瘤 5 例，垂体瘤 8 例、真菌性鼻窦炎 5 例、脊索瘤 2 例、软骨肉瘤 2 例、骨化性纤维瘤 1 例、蝶窦囊肿合并脑膜脑膨出 1 例，详细分析该区域的 CT 平扫及增强、MRI 平扫、常规增强和动态增强等精细解剖的影像学表现。
结果 1 .全鞍型或鞍枕型气化的蝶窦可以选择内镜下经鼻蝶入路手术，甲介型不可以。2.蝶窦内颈内动脉隆起骨壁破坏情况，病变累及颈内动脉海绵窦段的情况。3. 蝶窦内视神经管隆起的情况。4. 病变累及海绵窦区域的情况。
结论 内镜下经鼻蝶入路进入蝶窦-中颅窝底区域的过程中涉及到的重要解剖结构主要有:蝶窦分型、蝶窦开口、鞍底、斜坡隐窝、蝶窦内颈内动脉隆起及视神经隆起、颈内动脉海绵窦段、海绵窦累及情况等。熟知该区域的精细解剖及病变累及情况对于临床手术有重要的指导意义。精细的断面影像学检查、细致的影像学征象分析有助于对该区域的结构及病变做出正确的诊断，术前详细解读患者的 CT、MRI 影像学资料，两者的充分结合可获取更多的病变解剖信息，才能提高手术的安全性和有效性。

S-40

颈静脉孔肿瘤影像评价

徐雷鸣,涂景恋,周勤,孙秀娟
浙江大学医学院附属第二医院

目的 颈静脉孔肿瘤在临床工作中容易误诊这漏诊。结合我科近年病例，展开回顾分析，提出诊断要点，以期提高诊断。
方法 回顾分析我科近年 26 例手术临床证实颈静脉孔区病例，观察以下内容：事先定位是否正确；病变范围累及颅外颈部时，病变观察是否漏诊颅外部分；颈静脉孔区描述和分析是否充分；病史和全身情况结合是否合理。
结果 这些病例中定位不确切 5 例，常定位桥小脑角区；当肿瘤骑跨颈静脉孔扩展到颅外是，漏诊颅外部分 5 例；颈静脉孔区描述和观察不充分误诊 4 例，与全身情况结合不恰当导致误诊 3 例。事先分析充分且诊断完全正确 9 例。
结论 颈静脉孔区肿瘤是后颅窝常见病变之一，定位不正确，漏诊颅外部分，颈静脉孔区观察不充分和不恰当结合临床，是常见的误诊和漏诊原因。

S-41

颈静脉孔区肿瘤的 CT 和 MR 诊断

邬小平,马鸣岳,张宏,杨想春,高明,董季平
西安交通大学附属西安市中心医院

目的 探讨颈静脉孔区肿瘤的 CT 和 MR 影像学表现，提高对其影像学特点的认识。
方法 回顾性分析 34 例经手术病理及临床证实的颈静脉孔区肿瘤影像学表现特点，34 例均行 CT 薄层扫描及面神经管多平面及曲面重建；25 例行 MR 平扫及增强扫描，13 例行面神经多平面及曲面重建。

结果 （1）颈静脉孔的扩大及骨质异常，副神经节瘤：骨质侵蚀、破坏；神经鞘瘤：压迫性骨质吸收、外观多呈膨胀性或扇贝样、边缘较清晰光滑；脑膜瘤：继发多以骨质硬化为主要表现、原发呈渗透一硬化性改变、即颈静脉孔的骨皮质消失、但是骨纹理尚可见；软骨肉瘤：不规则骨破坏及可伴有肿瘤内及肿瘤壁钙化；内淋巴囊肿瘤：骨质破坏、中心钙化、后部环状钙化。（2）密度或信号改变，副神经节瘤：T1 为低或等信号，T2 为高信号，可伴血管流空(椒盐征)；神经鞘瘤：无脑膜尾征及血管流空；脑膜瘤：脑膜尾征、无血管流空；软骨肉瘤：T1 等低信号、T2 高低信号、不均匀；内淋巴囊肿瘤：T1 可有高信号、T2 高信号、不均匀。（3）肿瘤位置、形态及生长方式，副神经节瘤：中心位于颈静脉孔的血管部；神经鞘瘤：常位于颈静脉孔前内侧部，颈静脉球部受压后移；脑膜瘤：常紧贴颅骨、硬脑膜宽基底；软骨肉瘤：以岩枕裂为中心；内淋巴囊肿瘤：常位于岩骨后缘。

结论 颈静脉孔是颅底最复杂的孔道之一，解剖变异及图象伪影常导致图像缺乏特征性，仔细分析图像表现及相关临床表现，CT 有利于显示颈静脉孔区肿瘤的骨质改变而 MRI 可很好地显示颈静脉孔区肿瘤的部位、形态、范围和内部结构特征，两者结合有助于不同类型颈静脉孔区肿瘤的鉴别诊断及其定位诊断，为临床制定手术方案和手术途径提供依据。

S-42

多层螺旋 CT 及 MRI 在腮腺混合瘤中诊断的价值

许尚文
中国人民解放军联勤保障部队第 900 医院

目的 探讨多层螺旋 CT 及 MRI 检查在腮腺混合瘤定位和定性中的诊断价值，探讨各类腮腺肿瘤的诊断指征，从而指导临床医师制订正确手术方案。

方法 对我院 2012 年 1 月至 2017 年 5 月确诊的 34 例不同性质的腮腺肿瘤进行 CT 或者 MRI 平扫及增强检查，MRI 检查行多序列并 DWI 成像。然后对肿瘤表现进行回顾性对比分析。

结果 34 例患者中，其中有 22 例 CT 或 MRI 检查呈边缘清楚、密度/信号均匀、强化均匀，形态为圆形或类圆形，其中 CT 检查的肿瘤全部密度高于正常腮腺，其内有时可伴有囊变或斑点状钙化，手术证实为良性混合瘤；其中有 8 例 CT/MRI 呈分叶、密度/信号不均匀且内有囊性密度影/信号影、边缘较清晰；其中有 4 例 CT/MRI 呈分叶状或圆形密度不均匀，边缘模糊，轮廓不清者，部分与周边组织分界不清，增强扫描表现为不均匀强化，其中部分肿块内囊变坏死区未见强化，均为恶性肿瘤。其中有 8 例既行了 CT 检查又行了 MRI 检查。

结论 CT/MRI 对腮腺混合瘤的检查，方法简便、快捷、无创及具有特异性影像学表现的优势，腮腺混合瘤 CT/MRI 特点表现为边缘清楚、肿块密度/信号均匀或不匀，其中表现密度/信号均匀、强化均匀、边缘清晰者为良性，另病灶呈分叶状圆形密度/信号不均匀、环形或均匀强化、边缘模糊、轮廓不清者为恶性。CT/MRI 检查对腮腺混合瘤具有重要的诊断价值，是目前诊断腮腺混合瘤极为重要的方法，对临床外科手术治疗有重要指导价值。

S-43

腮腺常见良性肿瘤 CT 表现及鉴别

乔英
山西医科大学第一医院

目的 观察分析腮腺常见良性肿瘤 CT 表现特点及与恶性肿瘤鉴别征象，提高诊断水平。

方法 分析经手术病理证实并有完整 CT 资料腮腺病变 55 例，CT 扫描设备为 64 排螺旋 CT 及第 3 代双源 CT。多形性腺瘤 27 例，腺淋巴瘤 15 例，基底细胞腺瘤 3 例，上皮源性恶性肿瘤 10 例。主要观察多形性腺瘤及腺淋巴瘤的 CT 表现，并进行 3 组良性肿瘤组间对照，以及与恶性肿瘤对照。图像观察分析指标：3 组良性肿瘤：病变部位，形态，数目，内部结构，增强表现，包膜；良恶性肿瘤鉴别：病变界线，与周围结构关系。

结果 一般资料：腺淋巴瘤好发于男性，余性别无明显差异；腺淋巴瘤及恶性肿瘤老年为主。3 组良性肿瘤：腺淋巴瘤多位于腮腺后下极，另 2 种良性肿瘤多位于腮腺上中或前部；均可表现为类圆形、类椭圆形；病灶均可为 1 个，但腺淋巴瘤常为多个；平扫均略低于咬肌密度，多均为均匀密度，增强扫描基底细胞瘤密度多均匀，多形性腺及腺淋巴瘤多密度不均， 但腺淋巴瘤内低密度区界线清楚（穿凿样），而多形性腺瘤低密度界线欠清；增强表现：程度从高到低依次为：基底细胞瘤、腺淋巴瘤、多形性腺瘤，后二者多为不均匀强化。动态表现：腺淋巴瘤多表现为动脉期高于静脉期，多形性腺瘤多表现为静脉期高于动脉期。肿瘤边缘“贴边血管征”：贴边血管强化程度及数量从高到低依次为：基底细胞瘤、腺淋巴瘤、多形性腺瘤。“肿瘤内部血管征”：3 种肿瘤区别不明显；包膜：均可有包膜，多数增强时明显，清晰度及完整度依次为：基底细胞瘤，腺淋巴瘤及多形性腺瘤，后二者无明显区别。良恶性病变鉴别：良性肿瘤均界线清楚，均位于腮腺包膜或封套筋膜内；恶性肿瘤界线模糊，可突破腮腺包膜或封套筋膜至皮下脂肪内，可进入腮腺深叶或沿腮腺导管生长，肿瘤内血管征可明显、肿瘤血管粗细不均，无包膜、贴边血管征不明显。

结论 腮腺常见良性肿瘤 CT 表现有一定特点，某些征象可进行良恶性鉴别；增强扫描有重要价值。

S-44

大涎腺先天异常的影像诊断策略

谢琦
广州市第一人民医院南沙医院

目的 结合临床影像诊断中的实际情况，分析大涎腺区先天性占位性病变的超声、 CT 及 MRI 表现及特点，提高对该区域先天性异常的认识及诊断水平。

方法 回顾性分析经临床及病理证实的 41 例大涎腺区先天性占位性病变的超声、CT 和 MRI 资料，结合文献，系统梳理各影像表现优势、不足，各种病变的影像特点；包括大涎腺区囊性站位、实性占位、异位甲状腺，迷走大涎腺，大涎腺发育不良或肥大、多囊腮腺等。

结果 大涎腺区的先天异常主要分为结构异常为主、组织学异常-真性占位。其超声、CT 及 MRI 表现为腮腺区肿块影，肿块位于腺体内或腺体旁，多为单发，多呈囊性，边界清晰。表皮样囊肿、鳃裂囊肿、单纯囊肿、淋巴上皮囊肿超声、CT 及 MRI 均表现为形态规则、无血供、无强化肿块，但各自又有不同影像表现，其中单纯囊肿表现为无回声，表皮样囊肿和鳃裂囊肿囊壁可强化，表皮样囊肿一般位置表浅，较鳃裂囊肿小，鳃裂囊肿内可见典型分层征象；淋巴上皮囊肿回声/密度/信号较前两者高，CT 可呈多房样改变；淋巴管瘤分叶状、可跨叶匍匐生长，边界欠清，增强无强化；血管瘤的超声、CT、MRI 多表现为不规则肿块，内回声/密度/信号不均匀，CT 内可见点状钙化，超声可见丰富血流，CT、MRI 增强可见不均匀渐进性强化。超声对囊性病变的鉴别诊断、对血管瘤的定性诊断有较大的优势。

结论 超声、CT 和 MRI 可以显示病变的位置、形态、大小、回声/密度/信号变化、与周围结构的关系，综合三种影像表现有助于提高对大涎腺区先天性占位性病变定性诊断。

S-45

中老年骨肉瘤的影像学特点与误诊分析

田军,黄世廷,张殿星,巩武贤,李晓
山东省医学影像学研究所

目的 探讨中老年骨肉瘤的发病特点与影像学特点，分析误诊原因。
方法 回顾性分析经手术病理证实的 56 例中老年骨肉瘤的影像学表现。男 34 例，女 22 例。年龄 41 岁~76 岁，均龄 54 岁。影像资料平片、CT 和 MR 均有的 26 例，CT 和 MR 兼有的 12 例，单有平片 9 例、单有 CT 5 例、单有 MR 4 例。
结果 发病部位：长骨 33 例（其中股骨 24 例、胫骨 6 例、腓骨 2 例、肱骨 1 例）。扁骨 17 例（骨盆 8 例、肋骨 2 例、肩胛骨 2 例、颌骨 3 例、颅骨 2 例），脊柱 3 例（胸椎、腰椎和骶骨各 1 例），跗骨 1 例（跟骨、距骨各 1 例），髌骨 1 例。影像学分型：成骨型 33 例（表面骨肉瘤 2 例）、混合型 8 例、溶骨型 15 例。本组继发性骨肉瘤 6 例，其中继发骨纤维异常增殖症 3 例、Paget 病 1 例、骨母细胞瘤 1 例、继发于陈旧性骨折 1 例。27 例缺少典型的瘤骨，对肿瘤骨的显示 CT 最为优越，单有 MR 的 4 例均误诊。术前诊断情况：诊断骨肉瘤 26 例（仅占 46%），只诊断恶性骨肿瘤 3 例，误诊转移瘤 12 例、软骨肉瘤 6 例、骨巨细胞瘤 4 例、骨母细胞瘤和骨纤维异常增殖症各 1 例，误诊率 44.6%，其中长骨病变误诊率达 51%。误诊原因：1.中老年骨肉瘤溶骨型和继发性较多，约半数缺少典型瘤骨，或对碎小的瘤骨认识不足，误认为软骨钙化或被忽略；2.中老年骨肉瘤发病率低，在诊断和鉴别诊断中容易首先考虑转移瘤或软骨肉瘤。病理诊断情况：普通型骨肉瘤 44 例，骨纤恶变 3 例，特殊类型包括成纤维性骨肉瘤 3 例、纤维母细胞型 2 例、软骨母细胞型 2 例、富巨细胞型和去分化型各 1 例。
结论 中老年骨肉瘤发病部位除长骨股骨最常见外，扁骨和不规则骨较多，继发性骨肉瘤较多，长骨病变溶骨型和不典型病例约占半数，误诊率较高。因此重新认识老年骨肉瘤的特点，注意识别瘤骨，各种检查相互印证，方能减少误诊。

S-46

马拉松的影像诊断价值

丁建平,姚婉贞
杭州师范大学附属医院

在全民健身、健康中国的号召下，马拉松热潮正席卷全国。马拉松主要有全程、半程马拉松、10 公里跑、迷你跑、超级马拉松、越野跑及团队接力跑等。
马拉松运动对人们的心、肺、肾、消化、神经和骨肌等系统都具有挑战性的影响；运动引起的猝死时有发生，运动中和运动后急性肾损伤的发生率也不少，马拉松的成瘾性和依赖性也被人们不断提及。
骨肌系统损伤在马拉松运动员中的发病率较高，软骨、半月板、肌腱、韧带及肌肉等损伤较为常见。其中，膝关节（28%）、踝关节（26%）和小腿（16%）的损伤所占比例最高。
常见的膝关节损伤有髌股疼痛综合症、半月板损伤、骨髓水肿、髌腱炎及韧带损伤等。踝关节和足也是马拉松运动的易损部位，除了上述损伤还有足底筋膜炎等。马拉松运动对髋关节的影响尚不确定，可能的损伤有髋关节炎、骶髂关节损伤、骨盆应力性骨折及肌肉过度使用损伤等。
马拉松运动对关节软骨的影响一直是研究的难点，针对跑量与关节损伤的相关性，观察相关运动数据，来指导马拉松运动十分重要和迫切。

马拉松运动中肌肉软组织损伤也很常见，主要有急性肌肉损伤、胫骨内侧压力综合症、髂胫束综合征等。长跑运动员中最常见的下肢肌肉损伤部位为腘绳肌，其次是股四头肌，且肌肉重复损伤的概率较高。
虽然有报道运动可预防骨质疏松症，但马拉松运动对骨密度影响如何尚不清楚。
另外值得注意的是，参赛经验、跑前训练、跑量、配速、足弓高度、下肢力量、甚至跑鞋的类型等都是间接引起损伤不可忽视的因素，MR 成像技术还有助于分析确定各种危险因素，为指导马拉松运动员训练、康复治疗提供有效依据。
马拉松运动的影像研究除了常规运动损伤，还要动态观察运动过程中功能形态变化，不断提供各种影像数据，为训练及比赛提供科学指导，为马拉松事业及全民健身做出应有的贡献。

S-47

手指和拇指解剖及损伤的 MR 诊断

白荣杰,钱占华,詹惠荔
北京积水潭医院

目的 研究手指和拇指肌腱韧带正常解剖及损伤的 MR 表现。
方法 1.利用大体标本断层解剖图像及相应的 MR 图像，详细介绍手指屈肌及伸肌断层解剖结构及 MR 表现。（1）手指正常断层解剖与影像表现的相关性。（2）介绍手指正常 MR 表现，为损伤的早期诊断奠定基础。2.研究手指损伤机制及影像学表现的相关性。（1）介绍手指和拇指肌腱韧带损伤常见的影像学表现。（2）介绍手指和拇指肌腱韧带损伤的 MR 表现与功能变化的相关性。
结论 手指和拇指损伤临床上常见，MR 可清晰显示手指肌腱韧带正常解剖结构，以及损伤的影像学表现，为损伤的早期诊断和治疗，提供精准的解剖学和影像学依据。

S-48

重视色素沉着绒毛结节性滑膜炎的早期诊断

龚向阳
浙江省人民医院

色素沉着绒毛结节性滑膜炎（ PVNS）1852 由 Chassaignac 首先报告手指屈肌腱发生的结节状病变；1864 Simon 描述了膝关节病例；1909 Moser 详细描述了弥漫性（diffuse）PVNS 的表现；1941 Jaffe 命名了 PVNS；Granowitz 和 Mankin 提出了局限型（LPVNS）和弥漫型（DPVNS）的分型。目前 WHO 将 PVNS 和腱鞘巨细胞瘤（tenosynovial giant cell tumor）归为同一疾病。
PVNS 的临床特点：发病率约为 1.8/百万；性别倾向性不明确；发病年龄 30-50 岁；报道最小年龄 12M；常累及单关节；局限型多累及小关节，腕关节最常见；弥漫型常累及大关节，膝关节最常见；弥漫型通常关节内累及，也可侵犯到关节外。
影像特点：X 线表现为关节面非负重部位囊样缺损；但 32~54%的患者表现正常，X 线早期诊断 PVNS 价值不大。MRI 是 PVNS 的主要诊断技术，根据病灶累及的范围分为局限型和弥漫型、关节内型和关节外型。
病例 1~10 分析。
PVNS 的治疗：治疗方法包括保守治疗、开放手术、关节镜、放疗等；合适的治疗方法却决于对病灶的准确诊断和评估。LPVNS：关节镜和开放手术效果相当，复发率<10%； DPVNS：单纯关节镜手术复发率 92~94%；联合关节镜和开放手术，复发率 19~33%。
PVNS 的早期诊断和准确影像学评估对患者的预后有重要的意义。

S-49

管状骨皮质内少见病变的影像学诊断

刘吉华
青岛大学附属医院

管状骨皮质内病变的定义

影像学上，包括：起源于骨皮质的膨胀性骨破坏； 与骨皮质表面相贴的膨胀性病变；伴或不伴有小于相邻皮质厚度且宽基底与原骨皮质相贴软组织肿块和（或）MR 骨髓取代，范围小于 1/2 环周的非膨胀性骨皮质破坏 。

临床及影像学特点

1.软骨母细胞瘤：皮质区膨胀性类圆形骨破坏，长轴与骨干一致，长径多≦4cm，周围髓腔和软组织可斑片状水肿信号。

2.成骨细胞瘤：骨皮质内梭形或类圆形膨胀性骨破坏，长径与骨干一致，多大于 1.5cm，周围髓腔和软组织可斑片状水肿信号。

3.骨肉瘤：骨干皮质内边界较清类圆形或不规则形膨胀性骨破坏，长径 1～4.2cm 不等 。

4.血管瘤：皮质类圆形膨胀性或不规则骨破坏，可伴有相邻皮质三角形增厚和网格状骨嵴，T2WI 多明显高信号 。

5.骨纤维异常增殖症：皮质内沿长轴走行的膨胀性破坏，内软组织密度和（或）磨玻璃密度

6.郎格汉细胞组织细胞增生症：累及皮质少见，多发病灶一部分。圆形、类圆形、分叶状或不规则形皮质破坏，边界较清楚，可轻度不规则，可伴层状或条带状骨膜增生，轻微软组织肿块 。

7.畸形性骨炎（Paget 病）：血碱性磷酸酶增高。多起于骨端软骨下区，并经干骺达骨干，边界清楚。

8.血友病假肿瘤：反复多部位出血史，化验检查凝血因子减少或缺乏。皮质表面的膨胀性病变，骨壳多不完整，相邻皮质凹陷，可累及松质骨和髓腔，相邻骨质可硬化。

9.肌腱牵拉性病变（皮质旁硬纤维瘤）：最长见股骨远侧干骺端后内侧皮质，邻近股骨髁。

10.骨皮质脓肿：局部疼痛和压痛。骨皮质圆形类圆形骨质破坏，边界清楚 。位于骨端者，破坏松质骨侧伴硬化缘。周围髓腔和软组织可轻度或明显水肿。

11.囊性结核：弥漫性多发病变,单骨或多骨受累,部分病灶位于皮质内。

12.杆菌性血管瘤病：见于 AIDS 病人，少见其它免疫抑制患者。骨皮质溶骨性破坏，边界清楚或模糊，可伴骨膜反应。

13.内固定物反应：手术病史及内植物。

S-50

CT 碘对比剂安全使用

余日胜
浙江大学医学院附属第二医院

目的 碘对比剂是高危药品，探讨如何安全使用碘对比剂，防止对比剂副作用及并发症发生。

方法 通过分析对比剂副作用，包括对比剂肾病、过敏样反应及对比剂外渗的临床表现，提出预防及治疗的方法。

结果 对比剂肾病预防：基础肾功能检测与水化，建议在使用碘对比剂前 4 小时至使用后 24 小时内，对患者给予水化；紧急时，可在没有评估肾功能情况下进行使用碘对比剂。

对比剂外渗处理原则：轻、中、重度对比剂外渗处理方法均不一样，重度者可能要手术治疗；对比剂外渗预防主要包括选择穿刺部位、控制注射流速等。

碘对比剂全身不良反应与应对措施：轻、中、重度对比剂不良反应包括观察、适当对症治疗等，严重者需要进行心肺复苏。一般性预防主要包括对比剂使用前加温到 37℃；患者注射对比剂后需留观 30 分钟才能离开检查室。
告知患者碘对比剂禁忌症及知情同意书。
结论 重视 CT 碘对比剂副作用及并发症的预防措施及治疗原则，有助于明显减少副作用及并发症的发生以及降低对人体的危害。

S-51

MR 多参数成像诊断肝纤维化分期的实验研究

邹立秋[1],张豪[2]
1.深圳市第六人民医院深圳市南山人民医院
2.广东医科大学附属深圳第六医院

目的 探讨 MR 弹性成像（MRE）、磁敏感加权成像（SWI）和 $T_1\rho$ 成像诊断肝纤维化（LF）分期的价值。
方法 将 80 只新西兰白兔采用随机区组分组法分为 LF 组（n=60）和对照组（n=20）。LF 组按 0.1 ml/kg 每周皮下注射 50%四氯化碳油溶液，第 4、5、6、15 周末任意选取 LF 组 12 只及对照组 5 只行轴面肝脏扫描，获得肝脏弹性硬度值（LS）、肝脏/肌肉信号比（$SIR_{肝/肌}$）和 $T_1\rho$ 值，取肝组织进行病理学 Scheuer 纤维化分期，并将 LF 组和对照组分为不同群组。采用单因素方差分析评价不同 LF 分期组间 LS、$T_1\rho$ 和 $SIR_{肝/肌}$值的差异，采用 Spearman 法进行各特征值与病理分期的相关性分析，采用 ROC 评价三种 MR 成像方法（单一方法，结合两种方法、结合 3 种方法）诊断 LF 分期的效能。
结果 55 只兔纳入研究，F0 期 14 只、F1 期 11 只、F2 期 10 只、F3 期 9 只、F4 期 11 只。不同 LF 分期组间，LS 值、$SIR_{肝/肌}$及 $T_1\rho$ 值差异均有统计学意义（P<0.05）。LS 值与 LF 分期呈正相关（r=0.910，P<0.01）；$SIR_{肝/肌}$值与 LF 分期呈负相关（r=－0.808，P<0.01）；$T_1\rho$ 值与 LF 分期呈正相关（r=0.512，P<0.01）。MRE 诊断效能最高，诊断≥F1、≥F2、≥F3、F4 期的 ROC 下面积分别为 0.953、0.949、0.986、0.979；结合两种成像方法，MRE+SWI 诊断≥F1、≥F2、≥F3、F4 期 LF 的 ROC 下面积分别为 0.965、0.983、0.991、0.950；3 种 MR 特征值结合在诊断≥F1、≥F2、≥F3、F4 期的 ROC 下面积分别为 0.969、0.985、0.996、1.000。
结论 MRE 作为诊断效能最高的手段，与 SWI 组合在肝纤维化早期诊断优于其他两两组合，结合 3 种方法能发挥最佳的诊断效能。

S-52

AIDS 和非 AIDS 患者并发 PCP 的临床与影像特点

李莉,李宏军
首都医科大学附属北京佑安医院

目的 探讨 AIDS 和非 AIDS 患者并发 PCP 的临床与影像特点。
方法 回顾性分析 50 例经实验室检查确诊的 PCP 患者的临床与影像资料，其中 AIDS 组 32 例，非 AIDS 组 18 例。
结果 PCP 常见的 CT 表现有双肺磨玻璃样密度影，小叶间隔增厚，肺气囊等，重症患者可发生气胸、纵隔气肿。AIDS 组以肺门为中心双肺对称分布的样密度影最为多见（26/32），其中 14 例可见月弓征；小叶间隔增厚 18 例，其中 8 例出现碎石路征；条索影 9 例；肺气囊 6 例；肺门、纵隔

淋巴结肿大 5 例；实变和气胸各 4 例；纵隔气肿和胸腔积液各 3 例。非 AIDS 组主要表现为双肺弥漫分布磨玻璃样密度影（13/18）；实变 8 例，其中 3 例可见空气支气管征；条索影 7 例；小叶间隔增厚 5 例；肺门、纵隔淋巴结肿大 3 例；气纵隔气肿 2 例，气胸 1 例。2 组患者临床表现均以发热、憋喘、干咳最为常见。AIDS 组和非 AIDS 组有 6 例和 2 例患者无任何临床表现。

结论 PCP 的 CT 表现多种多样。AIDS 和非 AIDS 患者均以双肺磨玻璃样密度影最为多见，空气支气管征仅见于非 AIDS 组。2 组患者主要临床症状均为发热、憋喘、干咳，无任何临床表现均见于 2 组患者。

S-53

早期 HIV 感染及 HAART 对脑灰白质微观结构及内在自发脑活动的影响

李瑞利,李宏军
首都医科大学附属北京佑安医院

目的 利用 3D T1 结构像的 VBM、弥散张量成像的 TBSS、静息态脑功能的低频振幅方法研究早期 HIV 感染及 cART 对大脑灰白质微观结构及内在自发脑活动的影响。

方法 49 名 HIV 感染者，其中 26 名接受 cART 治疗（HIV+/cART+）、23 名未接受治疗（HIV+/cART-），以及 25 名年龄、性别、受教育年限匹配的健康志愿者进行了 3D T1 结构像、DTI 及静息态脑功能 MRI 检查。利用单因素方差分析比较三组间结构（灰质体积、白质的各向异性分数 FA，平均弥散值 MD，轴向弥散值 AD，径向弥散值 RD）及功能（ALFF 值）的差异。此外，提取三组之间显示出显著差异脑区的患者的结构及功能参数分别与患者临床变量和神经心理学测试结果做 spearman 相关分析。

结果 ANOVA 分析显示，三组间结构差异（灰质体积，FA、MD、AD、RD 值）无显著性。三组间 ALFF 值差异具有显著性的脑区位于枕叶皮层。进一步进行多重均数的两两比较显示，与对照组相比，治疗组和未治疗组患者枕叶的 ALFF 值均显著降低，但治疗和未治疗两组之间枕叶的 ALFF 值差异没有显著性。此外，与对照组相比，治疗组在右侧尾状核和额顶叶皮层的 ALFF 值显著升高，未治疗组在双侧尾状核的 ALFF 值显著升高。与未治疗组相比，治疗组患者在听觉皮层的 ALFF 值显著升高。此外，相关性研究发现，未治疗组患者右枕叶皮质中的 ALFF 值与 CD4/CD8 比值和执行功能正相关。

结论 早期 HIV 感染，脑灰白质尚未发生微观结构改变，大脑功能改变可能早于结构改变；或受本研究观察方法的灵敏度所限，已发生的结构变化尚不足以被观察到。早期 HIV 感染患者自发性大脑异常活动主要在枕叶皮质，表现为自发性大脑活动减低。cART 似乎无法阻止 HIV 诱导的神经退行性变，但可能会在一定程度上延缓神经损伤的进程。ALFF 可能是监测 HIV 和 cART 对大脑功能影响的潜在生物标志物。

S-54

颅内真菌感染影像征象分析

刘强
山东省医学影像学研究所

真菌性脑炎影像学表现

（1）40%的真菌性脑膜炎 CT 表现并没有特异性，与结核性脑膜炎相似，慢性感染者可见脑积水；

（2）MR 表现与 CT 类似，MR 增强更容易分辩脑表面软脑膜的异常强化；

（3）与结核性脑膜炎鉴别困难，但如果鞍区或鞍上发现不规则小斑点状钙化则有助于诊断。
新型隐球菌感染
CT 表现
1. 肺部：类结核样病灶或肺炎样改变
2. 头颅：弥漫性脑膜强化、脑水肿、肉芽肿、囊肿、钙化或软化坏死灶等
3. 25-30%可无明显异常
MR 表现
1. 假囊肿形成（血管周围间隙扩大）：直径≥3mm，簇状分布于基底节、中脑，长 T1、长 T2，DWI 低，不强化
2. 增强：软脑膜和脉络丛强化，脑内环形或斑片状强化
3. 可伴脑积水、脑梗死
新型隐球菌脑内感染
簇状胶质囊肿，呈皂泡样改变

神经人工网络自动分割技术在评估胶质瘤分级及预后中的临床应用

胡万均,张静
兰州大学第二医院

目的 应用神经人工网络(ANN)自动分割技术对胶质瘤进行肿瘤动态体积计算，并结合肿瘤动态体积变化的时间及空间相关性进行机器学习，从而预测胶质瘤分级及预后的疗效评估。
方法 对我院 232 名胶质瘤患者进行磁共振数据采集，包括 T2WI、T1WI、T2-Flair、增强 3D-T1 序列扫描，利用神经人工网络框架下开发的全自动定量分析软件对所有被试进行肿瘤增强以及非增强 T2 上的异常信号的自动识别和体积分割；将自动量化的肿瘤空间和时间体积动态计算进展时间，并与 RANO 确定的进展时间的可靠性和肿瘤分级两方面进行比较，进而评估胶质瘤的预后疗效。
结果 与 RANO 确定的进展时间的可靠性的肿瘤分级比较得出，基于神经人工网络的自动化定量分析是确定肿瘤分级以及疗效评估更好的替代方法，其置信区间分别为 RANO-[1.46-2.92]vsANN[1.86-3.60] p<0.0001;我们发现 ANN 能够以高通量对胶质瘤的分级及预后疗效评估进行客观和自动化评估，并能最终成为高通量成像生物的标志物和其他疾病的扩展应用。

中枢神经系统胚胎性肿瘤影像学表现

陈静,李欣,王春祥,赵滨,张孟杰
天津市儿童医院

目的 探讨中枢神经系统胚胎性肿瘤影像学特点，提高对其影像学表现的认识。
方法 根据 2016 年 WHO 中枢神经系统肿瘤分类，对重新命名的肿瘤实体及新增加的肿瘤实体的影像学表现进行分析。
结果 2016 年 WHO 中枢神经系统肿瘤分类，更新增加了基因定义的髓母细胞瘤的亚型，用中枢神经系统胚胎肿瘤取代了中枢神经系统原始神经外胚层肿瘤（无特殊说明），并用遗传学定义的胚胎肿瘤伴多层菊形团取代了室管膜母细胞瘤。2016 年 WHO 中枢神经系统肿瘤分类中胚胎性肿瘤包括髓母细胞瘤（遗传学分类）：WNT 激活型、SHH 激活伴 TP53 突变型、SHH 激活伴 TP53 野生型、非 WNT/非 SHH 型、group3 型、group4 型；髓母细胞瘤（组织学分类）：经典型、多纤维性 / 结节增生型、广泛结节型、大细胞型 / 间变型；髓母细胞瘤 NOS；胚胎性肿瘤伴有多层菊形团；髓上皮瘤；中枢神经系统神经母细胞瘤；中枢神经系统节细胞神经母细胞瘤；非典型畸胎样 / 横纹肌样肿瘤。
结论 不同类型的中枢神经系统胚胎学肿瘤影像学表现具有特点，同一种肿瘤的不同亚型间，其发生部位及影像学表现均具有特点，对于鉴别诊断有一定帮助。

三维动脉自旋标记联合扩散加权成像在儿童脑肿瘤分级中的应用

王冬,张增俊,胡文,陈超,陈华
西安市儿童医院

目的 评价三维动脉自旋标记(3D-ASL) 联合扩散加权成像（DWI）在儿童脑肿瘤分级中的价值。
方法 回顾性分析 35 例经手术病理及免疫组化证实的脑肿瘤患儿，术前行 3D-ASL 及 DWI 成像。在 GE AW4.6 工作站测量肿瘤血流量(TBF)、TBF 比值(rTBF)、ADC 值，采用独立样本 t 检验比较高级别（Ⅲ、Ⅳ级）、低级别（Ⅰ、Ⅱ级）肿瘤的 TBF、rTBF 及 ADC 值，利用受试者工作特征曲线(ROC 曲线）评价各参数的诊断效能。
结果 高级别肿瘤 TBF 值显著高于低级别肿瘤（t=4.991，$P<0.001$）。高级别肿瘤 rTBF 值显著高于低级别肿瘤（t=4.687，$P<0.001$）。高级别肿瘤 ADC 值显著低于低级别肿瘤 （t=-6.362，$P<0.001$）。TBF、rTBF、ADC 值对肿瘤分级的曲线下面积(AUC) 分别为 0.892、0.918、0.971。rTBF 联合 ADC 值对肿瘤分级的 AUC 为 0.985，rTBF 联合 ADC 值诊断的敏感度和特异度分别为 100%及 95%。
结论 3D-ASL 及 DWI 对儿童脑肿瘤分级有重要价值，联合分析 rTBF 及 ADC 值能进一步提高儿童脑肿瘤分级的敏感性和特异性。

OR-004
儿童药物中毒性脑病的 MRI 表现及应用价值

于啸,张欣贤
徐州市儿童医院

目的 探讨小儿误服药物引起的中毒性脑病的 MRI 表现及临床应用价值。
方法 回顾性分析经临床确诊的 12 例病因明确的中毒性脑病患儿，均行 MRI 平扫检查,其中 11 例行增强检查，分析其 MRI 特征。
结果 12 例患儿,11 例 MRI 检查有阳性发现，另 1 例检查为阴性。12 例药物中毒性脑病患儿的 MRI 影像表现可归纳为：①仅基底节灰质核团受累（2 例）；②基底节及脑白质同时受累（5 例）；③基底节、脑白质及脑皮层受累（2 例）；④基底节、脑白质、小脑及脑干广泛受累（2 例）；⑤阴性（1 例）。 受累区域 MRI 表现为稍长 T1 稍长 T2 信号，常为对称性分布，水抑制序列（FLAIR）均为高信号。 弥散加权成像（ＤＷＩ）表现分为高信号（10 例）。增强扫描：受累区域病灶明显强化（10 例），与 DWI 表现一致。
结论 药物中毒性脑病主要累及基底节灰质核团及大脑白质纤维，常对称性分布。MRI 检查敏感性及准确性高，能早期全面了解药物中毒患儿脑部受累情况，有助于临床医生对此类疾病发展及预后的评估。

小儿胶质母细胞瘤影像学特征与病理亚型相关性研究

李莉红,杨秀军
上海交通大学附属儿童医院

目的 探讨小儿胶质母细胞瘤 CT、MRI 影像学表现及其与病理亚型的关系，提高其术前诊断的准确性。
方法 回顾性分析 19 例手术病理证实的胶质母细胞瘤（GBM）及其亚型的 CT（n=13）、MRI（n=17）资料，比较各型影像学所见。

结果 GBM12 例、巨细胞胶质母细胞瘤（GCG）5 例、小细胞胶质母细胞瘤及胶质肉瘤各 1 例，病灶长径 1.6cm-9.44cm，平均 4.77cm，肿瘤主体部分位于脑叶 8 例、脑干 4 例、脑室 4 例、丘脑 2 例、小脑 1 例。75%（9/12）GBM 瘤周水肿不明显但 50%（6/12）伴明显囊变，80%（4/5）GCG 出现显著瘤周水肿但囊变不明显，SCG 广泛瘤内出血但几无瘤周水肿，GSM 呈边缘条片状钙化的显著非均质强化的巨大实性分叶肿块。

结论 胶质母细胞瘤及其亚型的影像学表现有一定的特征，结合肿瘤的发病部位、水肿情况以及囊变钙化等特点，有助于该病的术前准确诊断。

儿童低钠血症诱发的渗透性脱髓鞘综合征 MRI 表现

彭雪华,邵剑波
华中科技大学同济医学院附属武汉儿童医院

目的 总结渗透性脱髓鞘综合征的 MRI 特点。

方法 分析我院 2016-2017 年期间 2 例ＯＤＳ患者临床资料和影像特点。2 例均行平扫+增强，平扫行 T1WI、T2WI、T2Flair 及 DWI 序列检查。

结果 第 1 例患儿，男，2.6 岁，因“间断发热 27 天，精神反应差 10 天”入院，其它查体正常，血常规正常。查电解质：K1.85mmol/L，Na104.0mmol/L，Cl61.0mmol/L,提示三低。MRI 示双侧尾状核和豆状核及邻近内囊前肢对称性受累，DWI 明显，脑桥正常，表现为脑桥外髓鞘溶解症。第 2 例患儿，女，4.4 月，因“发育迟缓、生长缓慢 4 月，间断呕吐 1 月余”入院。血常规正常，查电解质：Na100.6mmol/L，Cl72.4mmol/L。MRI 示桥脑、双侧大脑脚、双侧基底节及内外囊、双侧丘脑对称弥漫异常信号，表现为脑桥中央髓鞘溶解症和脑桥外髓鞘溶解症。2 例增强阴性。

结论 渗透性脱髓鞘综合征是一种少见的急性非炎性中枢脱髓鞘病变，分为脑桥中央髓鞘溶解症和脑桥外髓鞘溶解症，两者可以单独存在也可以同时发生。低钠血症纠正过快可诱发渗透性脱髓鞘综合征，以桥脑基底部、尾状核、壳核、丘脑为常见好发部位，多对称发病，ＤＷＩ序列有助于早期诊断。

Abnormal spontaneous brain activity and functional connectivity in children with new-onset type 1 diabetes mellitus: a resting-state fMRI study

Kun Liu
The Second Affiliated Hospital and Yuying Children’s Hospital of Wenzhou Medical University

Purpose Type 1 diabetes mellitus (T1DM) can cause visual and cognitive impairments, and depression, which may be due to deficits in brain functions. However, it is unclear whether brain activity and functional connectivity (FC) will change in T1DM children. Here, we aimed to investigate brain activity and FC changes in children with new-onset T1DM based on fractional amplitude of low-frequency fluctuation (fALFF) and subsequently seed-based FC analysis. **Materials and Methods** Thirty-five new-onset T1DM children and thirty-three age-, sex-matched healthy controls underwent resting state

functional MRI. The characteristics of fALFF and seed-based FC were analyzed in children with new-onset T1DM compared with the healthy controls. The correlations between fALFF and clinical data and intelligence quotient (IQ) were examined. **Results** Compared with control subjects, children with new-onset T1DM showed significantly increased fALFF values in left middle temporal gyrus (MTG) and right calcarine and decreased fALFF value in right thalamus ($p<0.05$, corrected for multiple comparisons). The FCs between right calcarine and right thalamus and between left MTG and right hippocampus were significantly higher, while FC between right thalamus and left superior temporal gyrus was significantly lower. In the T1DM group, fALFF value of left MTG was positively correlated with IQ, while fALFF value of right thalamus was negatively correlated with blood glucose level at imaging. **Conclusion** These results suggest that brain spontaneous activity and FC is altered in several brain regions in children with new-onset T1DM. fALFF value may be related to blood glucose level of T1DM. The altered brain spontaneous activity and FC may be potential mechanisms of visual impairment, cognitive dysfunction, and depression in T1DM patients.

OR-008

儿童肺炎链球菌性与大肠杆菌性化脓性脑膜炎 MRI 影像学特点对比分析

胡迪,郜英子,刘钢,彭芸
首都医科大学附属北京儿童医院

目的 探讨儿童肺炎链球菌性与大肠杆菌性化脓性脑膜炎 MRI 表现特点。
方法 收集 2010 年 1 月至 2014 年 12 月我院感染科收治的肺炎链球菌性及大肠杆菌性化脓性脑膜炎共 47 例患儿病例临床资料及 MRI 影像学检查。采用 X2 检验、Fisher 精确概率法、t 检验或秩和检验进行统计学分析。P＜0.05 认为具有统计学意义。
结果 肺炎链球菌组共 34 人，1 岁以下幼儿 21 人（61.8%），1 岁以上 13 人（38.2%）；大肠杆菌组 13 人，均为 1 岁以下。 肺炎链球菌性脑膜炎多见于 9-11 月（44%），大肠杆菌性脑膜炎多见于 6-8 月（46%）。两种病原菌发病时间分布有明显统计学差异（p=0.01）。肺炎链球菌与大肠杆菌性脑膜炎临床表现中在发热、意识改变这两项（p=0.036）具有统计学差异。两细菌组硬膜下积液发生概率及分布情况无明显统计学差异（p＞0.05），大肠杆菌组较肺炎链球菌组硬膜下出血或积脓(50%:27.2%)概率略高。大肠杆菌组较肺炎链球菌组侧脑室积脓（8.3%:3.3%）、室管膜炎（16.7%:3.3%）更为多见，而肺炎链球菌组侧脑室旁水肿（30%）更为多见。肺炎链球菌组较大肠杆菌组软脑膜及硬脑膜增厚（56.7%:41.7%）概率略高，分布广泛，且伴随明显的血管流空信号增多（56.7%），但大肠杆菌组硬脑膜增厚程度略高。肺炎链球菌组较大肠杆菌组脑实质异常信号累及范围更广，脑出血（6.7%）更常见且伴有静脉窦血栓（6.7%）形成。
结论 肺炎链球菌性脑膜炎发病年龄大，冬季常见，易出现发热和意识改变，以清亮大量硬膜下积液伴脑积水、大范围脑膜受累伴大脑表面血管增多为主要特征，脑实质出血、坏死、软化、脓肿形成显著，且易伴随静脉窦血栓形成；而大肠杆菌性脑膜炎发病年龄小，夏天多见，易抽搐，以浑浊硬膜下积液伴室管膜炎、局部脑膜明显增厚为特征改变。

OR-009

儿童弥漫性中线胶质瘤伴 H3K27M 突变 MRI 表现

郑慧,李玉华,汪登斌
上海交通大学医学院附属新华医院

目的 探讨儿童弥漫性中线胶质瘤伴 H3K27M 突变的磁共振表现。
方法 回顾性收集本院经术后病理证实的儿童弥漫性中线胶质瘤伴 H3K27M 突变 38 例。其中男 21 例，女 17 例，年龄 2~11 岁。临床症状因肿瘤部位不同而异，脑干受累者表现为饮水呛咳、四肢乏力，累及丘脑者头痛呕吐，累及脊髓者腰部疼痛、大小便失禁。分析 38 例患儿术前磁共振表现。
结果 38 例儿童弥漫性中线胶质瘤伴 H3K27M 突变患儿中，位于脑干者 34 例，丘脑 3 例，脊髓 1 例。累及脑干者旧称弥漫内生型脑桥胶质瘤，仅累及脑桥者 16 例，累及全脑干 8 例，脑干延伸至丘脑 4 例，累及脑桥、中脑 3 例，脑干延伸至桥臂、小脑半球 3 例。
34 例脑干肿瘤均表现为边界不清的浸润性肿块，最大径 6 厘米至 3.2 厘米不等。32 例没有瘤周水肿，1 例明显水肿，1 例轻度水肿。2 例内见少许出血。14 例内见范围大小不一的囊变坏死区，增强后囊变坏死边缘环形强化，6 例内见结节样实性强化。29 例有明显的占位效应，表现为幕上脑室扩张，周围脑组织受压变形。弥散加权序列仅见 1 例内有斑片状弥散受限区，其余均无弥散受限，肿瘤表现为低信号。仅 1 例播散至左侧小脑幕。
1 例表现为脑桥、中脑弥漫浸润性占位，延伸至左侧丘脑，形成肿块，且脑干与丘脑两部分肿瘤磁共振表现不一致。脑干部分与弥漫内生型脑桥胶质瘤相似，丘脑部分表现为弥散明显受限、强化明显且不均匀。1 例位于三脑室两侧丘脑、延伸至松果体区浸润性生长肿块，三脑室明显变窄，平扫信号均匀，弥散不受限，无囊变坏死区，无出血，无瘤周水肿，增强后无强化。1 例位于右侧丘脑、基底节区，延伸至右侧大脑脚，弥散明显受限，信号均匀，无囊变坏死区，无出血，轻度瘤周水肿，增强后无强化。1 例位于胸段脊髓，较长节段受累，边界不清，环形强化。
结论 儿童弥漫性中线胶质瘤伴 H3K27M 突变可位于中线任何位置，不同位置者肿瘤磁共振表现各异，明确诊断应结合组织学病理及免疫组化。

Monitoring postoperative neurocognitive dysfunction through the use of radiomics based on MRI in children with moyamoya disease

Meijiao Zhu,Ming Yang
Children’s Hospital of Nanjing Medical University

Purpuse *To assess the value of radiomics based on MRI in the identifcation and quantitative evaluation of postoperative neurocognitive dysfunction in Children with moyamoya disease.*
Materials and Methods *A prospective study was conducted in 13 subjects with moyamoya disease (of whom all underwent direct arterial anastomosis) in Nanjing Children’s Hospital, China in 2018. 14 normal subjects were enrolled as control group. Neurocognition was measured using Wechsler Intelligence Scale for Children (WISC) scale to estimate IQ. Histograms of apparent diffusion coefficient (ADC) and texture features of the whole brain were extracted and correlated to age, time of operation and IQ scores. Diagnostic performance of all features was then evaluated and compared through independent-samples t test and receiver operating characteristics.*

Results *In the moyamoya group, the 10th-50th ADC was negatively correlated with the age of the children, the 10th-45th ADC was negatively correlated with the duration of the disease, and the histogram value of 80th-95th was negatively correlated with the operation score of the patients, while the parameter value in the control group was not significantly correlated with the age and intelligence scale scores. In addition, the operation score of moyamoya group was lower than that of the control group, and the difference was statistically significant. The ADC mean, skewness, kurtosis, variance and 25th-95th ADC in the two groups were statistically different, and the histogram value of moyamoya group was higher than that of the control group. Texture analysis results did not differ between the two groups. ROC results showed that the area under the curve of the 75th ADC value was the largest, 0.920.*
Conclusion *Postoperative neurocognitive dysfunction exists in patients with moyamoya disease, radiomics has excellent performance in the identifcation of impaired cerebrovascular reactivity in patients with moyamoya disease, and it has the potential to serve as a noninvasive imaging analysis tool to monitor cerebrovascular reactivity in patients with moyamoya disease.*

Quantitative diffusion tensor MRI of the premature with hypoxic-ischemic brain damage (HIBD)

Xueyuan Wang,Xin Zhao,Xiaoan Zhang
The Third Affiliated Hospital of Zhengzhou University

Hypoxic-ischemic brain damage (HIBD) is considered a major contributor to mortality and morbidity and leads to neurological deficits in premature infants, which has a significant negative impact on patients' quality of life, including cerebral palsy, mental retardation, and epilepsy[1]. So Early diagnosis and timely intervention can significantly improve the prognosis, so early diagnosis of HIBD in children is very important. Therefore, it is very important for pediatric patients to have an early diagnosis and timely treatment. In the present study, we examined the application of diffusion tensor imaging (DTI) in premature infants with HIBD. Our results showed that DTI was an important imaging method for early diagnosis and prognosis of premature infants with HIBD. Premature infants with HIBD and full-term infants with no HIBD (as control group) were selected from the Third Affiliated Hospital of Zhengzhou University. The conventional MRI and DTI scan was obtained at term in preterm infants. The FA of HIBD group had significantly injury within posterior limb of internal capsule (PLIC), splenium of corpus callosum (SCC), white matter of frontal

lobe (FWM), white matter of parietal lobe (PWM), white matter of occipital lobe (OWM), thalamus, lenticular nucleus (LN) and cerebral peduncle (CP) compared to the control group without HIBD. There was no significant correlation between FA of PLIC and the Apgar score (1 minutes and 5 minutes). Bayley scales of infant development (BSID) was used for follow-up at the corrective age of 7 to 8 months. We found that the higher FA of ROI, the better the prognosis. And the FA of PLIC had the largest area under the curve (AUC) in the prognosis study. These results suggest that DTI can detect latent damage and predict prognosis in HIBD of premature infants. This indicates that DTI can be used as an imaging index to evaluate the premature infants with HIBD.

亚急性硬化性全脑炎（SSPE）的 MRI 表现

关冲霄,肖江喜,朱颖
北京大学第一医院

目的 亚急性全脑炎（SSPE）早期诊断较为困难。但早期诊断及治疗对延长患儿生命尤为重要,笔者总结 SSPE 患者 MRI 图像的特征，以提高对该病的认识。
方法 对我院 2 例明确诊断为 SSPE 的患儿进行回顾性分析，对其 MRI 结果进行分析，找出该病的特征性 MRI 改变，结合以往文献，对该病进行进一步认识。
结果 MRI 均表现为双侧大脑皮层下、侧脑室前后角旁多发斑片状 T1WI 低信号、T2WI 高信号、T2FLAIR 高信号，一例患者部分病灶 DWI 呈高信号，而另一例患者还伴有脑萎缩。
结论 SSPE 的 MRI 表现具有高度敏感性，但缺乏特异性，确诊需要结合其临床表现、脑电图表现及实验室检查。

OR-014

CT 和 MR 对小儿脑性瘫痪诊断中的价值研究

杨贵福
青海妇女儿童医院

目的 对电子计算机断层扫描（CT）和核磁共振检查（MR）在小儿脑性瘫痪诊断中的应用价值进行分析和研究。
方法 以我院 2015 年 2 月—2017 年 2 月收治的 50 例经临床确诊的脑性瘫痪患儿为研究对象，入组后采用随机数表法对患儿平均分组，观察组和对照组各 40 例，分别给患儿 MR 检查和 CT 检查，以病例检查结果为金标准，比较 CT 和 MR 检查诊断本病的临床价值。
结果 观察组患儿检测阳性率为 90.00%，显著高于对照组患儿的 67.50%（P<0.05）；此外，两组均以脑软化灶，双侧额部硬膜下积液和脑白质萎缩为主要征象（P<0.05）；同时，对于脑缺血灶、脑白质变性的漏诊率，观察组明显低于对照组（P<0.05）。
结论 MR 检查小儿脑性瘫痪的阳性率高于 CT 诊断，但临床应将二者有机结合，以进一步提高检测有效和准确性。

Congenital Nasal Pyriform Aperture Stenosis

Xinzi Li,Jing Chen,Chunxiang Wang
Tianjin Children's Hospital

As we know, the pyriform aperture is a pear-shaped bony inlet of the nose bounded by the nasal bones superiorly, the nasal processes of maxilla laterally, and the horizontal processes inferiorly. The pyriform aperture is the narrowest portion of the nasal cavity. Nasal development occurs during the fifth to eighth weeks of gestation. Bony overgrowth of the nasal processes of the maxilla will result in narrowing of the pyriform aperture and usually bilateral. A pyriform aperture of less than 11mm axial width in a term infant can be diagnosed as Congenital Nasal Pyriform Aperture Stenosis(CNPAS).
We know that the neonates are obligate nasal breathers until the age of approximately 4 months. So, the CNPAS is a very important cause of neonatal nasal obstruction that occurs around 1 in 25000 births. The symptoms depend on the severity of stenosis, including labored breathing, cyclic cyanosis and apnea that can be relieved by crying. Traditionally, faliure to pass a nasogastric tube of thickness 4mm should raise the suspision of a nasal obstruction caused by CNPAS. CNPAS can present in association with other congenital anomalies such as holoprosencephaly, hypopituitarism, and up to 75% of CNPAS could coexist with median maxillary single incisor. CNPAS can be confirmed with bone CT of nasal cavity. Measurement should be performed parallel to the hard palate. Meanwhile, the hard palate is usually hypoplastic and in the shape of a triangle. AS CNPAS may associated with intracranial abnormalities above-mentioned, further evaluation with MRI of the brain is indicated in these patients.
Well, it's important
to differentiate CNPAS from choanal stenosis or atresia in this age group although they may coexist.
The latter disorder is obstruction of the posterior nasal passage, but CNPAS is the obstruction of the anterior opening of bony nasal cavity and typically with a normal caliber of choanal.
when the PA width is less than 6mm in neonate, a surgical intervention may be need for.

小儿外中耳畸形伴感音神经性耳聋诊断的 256 排高分辨率 CT 扫描及图像后处理技术的影像诊断价值

徐守成,朱凯
哈尔滨市儿童医院

目的 通过对临床诊断为感音神经性耳聋患者进行高分辨率 CT 扫描，并在 CT 工作站对外中耳等结构进行多种图像后重建， 探讨高分辨率 CT 成像对小儿外中耳畸形伴感音神经性耳聋的应用价值。
方法 回顾分析我院临床诊断感音神经性耳聋患儿 32 例，患儿多自幼听力下降，全部行 256 排多层螺旋 CT，检查病人仰卧,头位摆正，以听眶上线为扫描基线自外耳道下缘扫至岩骨上缘，获得横

轴面 CT 图像。层厚、层距均为 0.67mm, 窗位 500-600Hu,窗宽 3500-4000H，并进行多平面重建（MPR），容积再现（VR）等后处理技术，依次观察外耳、中耳及面神经等结构。
结果 本组 32 例患儿中，共计 58 耳，进行多平面重组等多种图像后处理，发现外耳及中耳畸形单独或合并存在共计 21 例。其中外耳道骨性闭锁 16 耳，膜性闭锁 5 耳，骨性狭窄 11 耳，骨性狭窄伴膜性闭锁 2 耳。中耳鼓室腔狭小 9 耳，乳突窦未发育 3 耳，听小骨发育不良 1 耳。颈静脉球窝高位 28 耳，颈静脉球裸露 1 耳，中颅窝低位 2 耳。面神经鼓室段下移 4 耳；乳突段前移 17 耳。
结论 256 排高分辨率 CT 能够清晰地显示小儿伴感音神经性耳聋的外、中耳畸形，通过图像后处理重建能够进一步的诊断和分类，为临床治疗提供了重要依据。

弯刀综合症的 CT 影像表现多样性

胡喜红,吴琳
复旦大学附属儿科医院

目的 探讨儿童弯刀综合症 CT 影像表现的多样性。
方法 回顾性分析经本院就诊的 15 例弯刀综合症病例，其中男 7 例，女 8 例，年龄 2d～12y，中位数年龄 3.9m，体重 3.5kg～13.0kg，中位数体重 6.0kg。所有患儿均行超声心动图及多排 CT 检查，其中 5 例进行心血管造影。所有 CT 图像均由复旦大学附属儿科医院 2 名具有 5 年以上心血管影像阅片经验的放射科医师在 AW 4.5 工作站进行阅读和评估。分析 CT 图像的肺静脉异常引流部位、是否合并狭窄，是否存在体肺侧枝、隔离肺、伴发气道异常，测量左右肺体积、左右肺动脉管径，是否合并的心内外畸形情况。
结果 3 例存在右下肺静脉异位引流，12 例右侧肺静脉异位引流；1 例引流至上腔静脉，其余 14 例皆引流至下腔静脉；其中 4 例存在肺静脉回流梗阻；8 例存在体肺侧枝，隔离肺 2 例；伴发气道畸形 4 例；8 例存在心内心外畸形。
结论 CT 可以提供弯刀综合症的详细解剖信息和影像表现的多样性。

低剂量 MSCT 血管成像在婴幼儿肺动脉吊带诊断中的临床应用

林开武,周作福
福建省妇幼保健院

目的 探讨低剂量多排螺旋 CT(MSCT)在婴幼儿肺动脉吊带（pulmonary artery sling，PAS）术前诊断中的临床应用价值。方法选取 2013 年 8 月—2018 年 10 月经手术证实的 9 例肺动脉吊带，回顾性分析其术前低剂量 MSCTA 影像特点。结果 9 例 PSA 患儿术前低剂量 MSCTA 均正确诊断，其中合并室间隔缺损 2 例，动脉导管未闭和房间隔缺损各 1 例，左上腔静脉 1 例，气管性支气管 1 例，气管或支气管狭窄 6 例，气管分叉角度增大 3 例；合并肺部感染 8 例。结论 应用低剂量 MSCTA 能明确诊断婴幼儿 PAS 及其合并心血管畸形，同时能清晰显示 PAS 患儿合并气管和或支气管狭窄程度及范围，有助于临床术前明确诊断并制定手术方式。

儿童纵隔神经母细胞瘤的临床特点及磁共振成像特征分析

白娟,徐树明
山西省儿童医院/山西省妇幼保健院

目的 探讨儿童纵隔神经母细胞瘤的临床特征及磁共振成像（MRI）影像特点，旨在进一步提高其术前诊断准确水平；
方法 回顾性分析自 2012 年 1 月至 2016 年 12 月经重庆医科大学附属儿童医院收治的 16 例经病理证实的儿童纵隔神经母细胞瘤的临床及 MRI 特征，包括发病年龄、病变大小、肿瘤形态及边界、MRI 平扫及增强信号特点等，并与术后病理进行对照，对所获得数据进行分析。
结果 发病年龄：30d 至 11 岁，平均年龄：1.98 岁；发生部位：所有病例均发生于后纵隔，其中：左上后纵隔 7 例，右上后纵隔 4 例，左下后纵隔 3 例，右下后纵隔 1 例，右后纵隔 1 例，延伸至颈部 1 例，延伸至肾上腺区 2 例；病变大小：肿瘤最大径线为 3-10cm，平均为 6.4 cm；肿瘤形态、边界：形态不规则 10 例，规则 6 例；呈多结节融合状 10 例；呈纵长者 12 例；边界清 12 例；肿瘤跨越中线 1 例；肿瘤为多发者：2 例；肿瘤与椎管相交通 15 例；MRI 信号：平扫 T1WI 呈低信号 4 例，等信号 12 例；平扫 T2WI 呈均匀高信号 9 例，混杂高信号 7 例；肿瘤内部伴出血坏死囊变 11 例；增强扫描呈轻度强化 2 例，中等程度强化 5 例，明显强化 5 例；术后病理所见：肿瘤有完整包膜 9 例；侵犯周围脏器 2 例，其它部位转移 7 例，其中转移到骨骼 5 例，骨髓 2 例，淋巴结 2 例，左肺 1 例，骨及软组织多发 1 例。肿瘤切面呈灰白 4 例，灰褐 6 例，灰白灰褐 4 例；肿瘤内发生出血 2 例，钙化 2 例，坏死 3 例，囊变 1 例，出血坏死 2 例，坏死钙化 2 例，出血钙化 2 例；合并症：合并胸水 4 例，肺炎 4 例，肺实变或肺不张 1 例，Horner 综合征 4 例。
结论 儿童纵隔神经母细胞瘤的 MRI 表现具有一定特征性，结合其临床特点，可为临床早期、准确诊断提供重要的依据。

Assessment of left ventricular subclinical dysfunction in acute myocarditis by three-dimensional cardiac magnetic resonance (CMR) feature-tracking myocardial strain analysis

Lingyi Wen,Ran Sun,Yingkun Guo
Department of Radiology， Key Laboratory of Obstetric & Gynecologic and Pediatric Diseases and Birth Defects of Ministry of Education， West China Second University Hospital， Sichuan University， China

Aims: This study aimed to assess the subclinical left ventricular dysfunction in acute myocarditis with normal ejection fraction and without early or delayed enhancement by 3.0 T three-dimensional cardiac magnetic resonance feature-tracking, comparing with myocarditis patients with early or delayed enhancement and normal control.
Methods: Study population consisted of 3 groups. Group 1 included 18 consecutive acute myocarditis patients with normal ejection fraction and without early or delayed enhancement. Group 2 included 20 acute myocarditis patients with normal ejection fraction and with early or delayed enhancement. Group 3 concluded 15 normal controls. All patients underwent CMR examination within 5 days after their admission. Three-

dimensional myocardial feature-tracking strain analysis was performed according to AHA myocardial segmentation and compare among groups.
Results: There were no significant difference in age (14.0±7.0 vs 14.4±4.7 vs 17.8±5.1 years, p=0.45) and ejection fraction (61.8±7.0 vs 69.6±24.3 vs 65.6±3.2%, p=0.18) among three groups. Acute myocarditis patients with normal ejection fraction and without early or delayed enhancement demonstrated significantly lower peak circumferential displacement (PCD) (-1.6±3.8 vs 2.3±3.5 vs 4.8±1.7 mm, p=0.015), peak longitudinal displacement (PLD) (1.9±7.2 vs 9.1±1.8 vs 10.0±2.1 mm, p=0.002) and peak longitudinal systolic velocity (PLSV) (10.8±52.7 vs 61.7±18.5 vs 67.8±30.8 mm/s, p=0.008) in basal segment, lower PCD(2.6±2.8 vs 5.7±1.3 vs 6.5±1.3 mm, p=0.028) and PLD(7.1±40.1 vs 45.2±16.4 vs 49.4±24.7 mm, p=0.003) in middle segment, lower PCD (0.27±3.2 vs 3.3±2.0 vs 4.7±1.4 mm, p=0.01), PLD (1.7±4.1 vs 5.7±1.2 vs 6.4±1.4 mm, p=0.003), peak circunferential systolic velocity (PCSV) (-4.2±36.8 vs 33.0±29.3 vs 53.7±23.5 mm/s, p=0.022) and PLSV (13.5±32.4 vs 44.2±15.4 vs 48.0±23.9 mm/s, p=0.013) in global when compared with group 2 and 3, while there is no significant difference between group 2 and 3 in those parameters.
Conclusions: In patients with acute myocarditis with atypical MRI sign, three-dimensional cardiac magnetic resonance (CMR) feature-tracking myocardial strain analysis appears to be a useful tool for diagnosis, since it seems to be able to identify subclinical myocardial deformation early in the disease.

OR-021

NCE-MRA 冠状动脉成像在儿童川崎病中临床应用

胡万均,张静,梁娟
兰州大学第二医院

目的 探讨 NCE-MRA 在儿童川崎病中的可行性及临床应用，并评价 NCE-MRA 对儿童川崎病的诊断效能。
方法 对 2017 年 10 月至 2018 年 10 月我院临床怀疑川崎病儿童[1]均行 NCE-MRA 冠状动脉成像检查；共 43 例（男：20 例，女：23 例）因不配合检查及图像质量差排除 11 例，其中平均年龄为 6±1.15 岁，最小年龄为 2 岁；心率：90-130 次/分；所有患者均行全心冠状动脉成像及单支左、右冠状动脉成像，所有数据均进行全心 MPR 重建，由两名高年资磁共振诊断师对图像进行双盲法阅片，最后一受试者工作特性（ROC）曲线评价 NCE-MRA 的有效统计参数对儿童川崎病的诊断效能；并分析其临床可行性及其临床应用。
结果 NCE-MRA 的临床可行性较高，在川崎病的诊断当中具有较高准确性及特异性；而 ROC 曲线研究表明 NCE-MRA 有效统计参数对川崎病的诊断效能具有较高的准确性（AUC 曲线下面积为 0.65）。
结论 NCE-MRA 冠状动脉成像对儿童川崎病的诊断具有较高准确性，且其无辐射、无需对比剂等优点表明其临床可行性较高，在川崎病的临床、应用研究中具有较高的研究价值。

儿童腺病毒肺炎的 CT 影像表现特点

莫亚宁,林剑军,王映飞,梁玄菁
广西壮族自治区妇幼保健院

目的 以 35 例腺病毒肺炎患儿作为研究对象，分析其胸部 CT 检查影像表现的特点，以提高报告医生对腺病毒肺炎的诊断水平。
方法 回顾性分析 2019 年 5 月-2019 年 7 月我院收治的 35 例腺病毒肺炎儿童的临床资料，均行 CT 扫描检查，分析各研究对象的 CT 影像学表现特点。
结果 35 例受试患儿的呼吸道病原体抗体检测腺病毒均为阳性，且所有受试患儿均符合国家卫生健康委会同国家中医药管理局组织制定的《儿童腺病毒肺炎诊疗规范（2019 版）》。胸部 CT 检查结果显示：35 例受试患者中肺实质改变患者 35 例，其中 29 例患者为双侧受累，受累肺叶数≥3 患者 24 例，18 例患者为实变向心分布，26 例患者为团簇状影，21 例患者为斑片影，27 例患者见空气支气管征，5 例患者为肺气肿改变，4 例患者有胸膜病变，5 例患者为淋巴结肿大。另有 4 例患者在临床治疗过程或者治疗后的随访过程中出现小气道改变。
结论 儿童腺病毒肺炎的胸部 CT 检查影像表现特点为多发团簇状肺实变，向心分布，双肺受累常见，肺外表现如胸膜肥厚、胸腔积液、气胸少见。若患者在治疗的过程中发生小气道改变则可诱发患者发生闭塞性细支气管炎。提高影像报告医生对腺病毒肺炎 CT 影像表现特点的认识，对临床治疗有一定帮助作用。

OR-023

儿童常见呼吸系统单基因病的胸部影像表现

陈欣,刘恩梅,程香,何玲
重庆医科大学附属儿童医院

目的 探讨儿童原发于肺部的常见单基因病的影像表现。
方法 回顾性分析 48 例临床或基因证实的原发于肺部的单基因的表现，分析其影像特点。
结果 原发性纤毛不动障碍 19 例，变异基因包括 DNAH5、DNAI1、DNAAF1 等，主要以支气管扩张、肺部斑片影、模糊影等病变为主。肺囊性纤维化 3 例，CFTR 突变引起，先主要表现为模糊影、支气管及细支气管扩张、肺气肿为为要表现，先天性肺泡蛋白沉积症 6 例，变异基因包括 SFTPB、SFTPC、ABCA3 等，主要以磨玻璃影伴小叶内线状影、小叶间隔增厚的典型铺路石征为主要表现。遗传性毛细血管扩张症 1 例，为 ACVRL1 变异，肺部表现为肺部感染合并肺栓塞，及肝脏动静脉异常分流何毛细血管扩张多发小结节、融合血管团灶。
结论 儿童常见呼吸系统单基因病的胸部影像主要以长期反复感染为主，部分有支扩、铺路石征、肺栓塞等特殊影像表现。

Prediction of Pulmonary Pressure After Glenn Shunts by Computed Tomography-Based Machine Learning Models

Yuhao Dong
Department of Catheterization Lab， Guangdong Cardiovascular Institute， Guangdong Provincial Key Laboratory of South China Structural Heart Disease， Guangdong Provincial People's Hospital， Guangdong Academy of Medical Sciences， Guangzhou， P.R. China

Objectives: This study aimed to develop non-invasive machine-learning classifiers for predicting post-Glenn shunt patients with low and high risk of a mean pulmonary

arterial pressure (mPAP) >15 mmHg based on preoperative cardiac computed tomography (CT).

Methods: This retrospective study included 96 patients with functional single ventricle who underwent a bidirectional Glenn procedure between November 1, 2009, and July, 31, 2017. All patients underwent post-procedure CT, followed by cardiac catheterization. Overall, 23 morphologic parameters were manually extracted from cardiac CT images for each patient. The Mann-Whitney U or chi-square test was applied to select the most significant predictors. Six machine-learning algorithms including logistic regression, Naive Bayes, random forest (RF), linear discriminant analysis, support vector machine, and K-nearest neighbor were used for modeling. These algorithms were independently trained on 100 train-validation random splits with a 3:1 ratio. Their average performance was evaluated by area under the curve (AUC), accuracy, sensitivity, and specificity.

Results: Seven CT morphologic parameters were selected for modeling. RF model obtained the best performance, with mean AUC of 0.840 (confidence interval [CI]: 0.832-0.850) and 0.787 (95% CI: 0.780-0.794); sensitivity of 0.815 (95% CI: 0.797-0.833) and 0.778 (95% CI: 0.767-0.788), specificity of 0.766 (95% CI: 0.748-0.785), 0.746 (95% CI: 0.735-0.757) and accuracy of 0.782 (95% CI: 0.771-0.793) and 0.756 (95% CI: 0.748-0.764) in the training and validation cohorts, respectively.

Conclusions: The CT-based RF model demonstrates good performance in the prediction of mPAP, which may reduce the need for right heart catheterization in post-Glenn shunt patients with suspected mPAP >15 mmHg.

OR-025

Eosinophilic gastroenteritis with involvement of the urinary bladder

Hai chun Zhou
Children's Hospital of Zhejiang University School of Medicine

Eosinophilic gastroenteritis with eosinophilic infiltration of the urinary bladder wall is rare in children. We describe the CT findings of eosinophilic gastroenteritis accompaniedbybladder involvement inan11-year-old boy.CT imaging showed diffuse wall thickening of the entire gastrointestinaltract fromthe esophagus tothe colon and revealeda halo sign, irregular fold thickening and luminal narrowing without obstruction of the gastrointestinal wall. Another CT finding was the diffuse thickening of the bladder wall with moderate enhancement on postcontrast CT. The boy underwent endoscopic biopsy from various sites of the gut wall and histology revealed increased eosinophiliac infiltration in the mucosa. After corticosteroid therapy, the boy recovered gradually. The case emphasizes that not only the gastrointestinal tract but also the urinary bladder may be involved in children with eosinophilic gastroenteritis and that recognition of CT features of this disease aids in early diagnosis and therapy.

OR-026

CT and MRI Appearances of the malignant vaginal tumors in children: endodermal sinus tumor and rhabdomyosarcoma

Fan Sun,Shuhui Zhao
Department of Radiology, Xinhua Hospital affiliated to Shanghai Jiaotong University School of Medicine

Purpose: The aim of this study is to analyze retrospectively the CT and MRI features of pediatric vaginal endodermal sinus tumor (EST) and rhabdomyosarcoma (RMS) in a case series.
Methods:7 children with vaginal EST and 2 children with vaginal RMS underwent MRI and (or) CT examination before the biopsy and treatment. Images were evaluated by two observers for the following features: (a) tumor extent; (b) margin; (c) tumor shape; (d) tumor size; (e)architecture: solid, cystic or mixed cystic-solid; (f) hemorrhage, necrosis, calcification; (g) MR T2 signal intensity ; (h) pattern of the enhancement; (i) signal intensity on DWI and ADC value.
Results: All of the 7 ESTs showed as a round-shaped solid mass with a location limited to the vagina without vulva and bladder invasion, while RMS have an irregular grape-like appearance filling the whole vagina with vulva and bladder invasion. The invasion to the cervix were not observed in EST or RMS. Both EST and RMS were heterogeneously hyperintense on T2-weighted MR images and enhanced remarkably and heterogeneously . Heterogeneous high signal on DWI were observed in vaginal EST and RMS. The ESTs showed a lower ADC value(mean,1.04× $10^{-3}mm^2$ /s), while RMSs showed a relatively high ADC value (mean,1.51× $10^{-3}mm^2$ /s).
Conclusions:CT and MRI may be useful tools in diagnosing the vaginal RMS and EST.

OR-027

MRI, MRCP characteristic of hepatic involvement by LCH inChildren

Yingyan Shi
Children Hospital of Fudan University

Objective: To demonstrate imaging characteristic of hepatic involvement by LCH in children on MRI, MRCP.
Materials and methods: The institutional ethics review board approved this retrospective study. This retrospective study included seven children with hepatic involvement by LCH in our imaging database. The patient population included three boys and four girls. The mean age is 26.1 months. MRI was performed in six patients and MRCP in seven patients. Imaging findings including distributions of hepatic lesions (lesion in periportal region and parenchyma), signal intensity and enhancement pattern and bile duct abnormalities on MRCP imaging were evaluated.
Results: The abnormalities were distributed in both left and right liver lobes extending from portis to peripheral regions in all the seven patients. Bile duct

abnormalities included intrahepatic bile duct stenosis (7/7), followed by intrahepatic ductal dilatation and extrahepatic bile duct stenosis(5/7); bile duct wall irregularities(3/7) in descending incidence. Periportal lesions were found in all the seven patients (7/7). Periportal lesion appeared as bandlike abnormal signal intensity/density. On MRI T1-weighted image, they appeared as hypo signal intensity (3/6), slightly hyper signal intensity patchy co-existed with hypo signal intensity (3/6). On T2-weighted image, they appeared as hyper signal intensity (3/6), hypo to hyper signal intensity (3/6). Moderate enhancement of the peripotal lesion in the portal vein phase was found all the patients with contrast administration. Hepatic parenchymal nodular lesions were found in six patients (6/7), multiple cysts were found in two patients. Similar enhancement degree was found between periportal lesions and nodular lesions in hepatic parenchyma.
Conclusions: Our initial observation demonstrated that periportal lesions, bile duct stenosis or dilatation combined with nodular lesions in the hepatic parenchyma were the important features in children with hepatic involvement by LCH. Although these characteristics implicated hepatic involvement by LCH, further interpretation based on clinical history should be performed. Also biopsy and histiochemical analysis should be done to confirm LCH.

OR-028

儿童肠壁增厚的 MSCT 诊断分析

闫喆,王春祥,赵滨
天津市儿童医院

目的 总结儿童肠壁增厚的 MSCT 表现，以提高对引起肠壁增厚的各类疾病的认识。
方法 收集近 3 年来我院行 CT 检查表现为肠壁增厚患儿的临床及影像学资料，共 36 例，男 22 例，女 14 例，年龄 6 天～12 岁。观察内容：①肠壁增厚部位（单发或多发、小肠和/或结肠）、范围（局灶性、节段性、弥漫性）、程度（轻中重度）、密度（较正常肠管一致、减低或增高）、强化表现及受累肠腔改变；②肠周改变；③伴发征象，如淋巴结肿大、腹腔积液、实质脏器异常。
结果 ①感染与炎症：NEC7 例，新生儿期表现出节段性肠壁增厚，典型者见肠壁积气和门静脉积气；克罗恩病 5 例，常表现为末端回肠节段性肠壁增厚，病变黏膜纵行溃疡即“卵石征”，肠系膜血管呈“梳征”，晚期肠管僵硬伴肠腔狭窄，可形成瘘道或脓肿；过敏性紫癜 7 例，最常累及空肠，单发或多节段性肠壁轻度增厚，增强前后密度均低于正常肠壁，周围伴有渗出，合并典型下肢皮疹、紫癜肾改变。②肿瘤：淋巴瘤 6 例，受累肠管较广泛，肠壁环形增厚或为肠腔内息肉样肿块，轻度均匀强化，部分肠管呈特征性的动脉瘤样扩张，很少继发肠梗阻，肠系膜淋巴结常肿大；间质瘤 2 例，肠壁来源的软组织包块，同时向腔内外生长，渐进性轻中度强化。③机械性因素：外伤致肠壁血肿 4 例，多发生在十二指肠降段及水平段的高密度肿块，向腔内外突出，肿块前沿部包膜下显示“空气裂隙征”，部分病例可同时显示其他腹部脏器的损伤。肠扭转 5 例，除肠壁增厚外，梗阻处肠管呈鸟嘴样狭窄，肠系膜脂肪密度增加。增强后扩张肠袢的肠系膜血管呈放射状向闭袢根部聚拢。
结论 无论肠道原发疾病或是肠外疾病累及肠道，肠壁增厚是一种常见而重要的病理改变。在肠道准备充分的条件下，MSCT 及其后处理技术能整体显示病变本身及肠外异常，增强后还可观察肠系膜血管的走行，进一步评价病变部位的血供情况。正确认识肠壁增厚的 CT 表现，同时结合临床有助于疾病的鉴别诊断。

OR-029
DCE-MRI 定量参数在儿童先天性胆总管囊肿所致肝纤维化中的应用

易盈,金科,伍光春
湖南省儿童医院/湖南省红十字医院

目的 探讨 DCE-MRI 定量参数对儿童先天性胆总管囊肿（CCC）所致肝纤维化诊断并分期的价值。
方法 纳入肝纤维化患儿 33 例，正常对照组 14 例。经肝脏 DCE-MRI 扫描后，拟合 Tofts 模型获得参数 Ktrans、Kep 及 Ve。分析不同肝纤维化的定量参数差异及其相关性，ROC 曲线分析各参数诊断肝纤维化的曲线下面积和最佳截界值。此外，经常规 MRI 图像测量 Todani Ⅰ型囊肿大小。分析不同肝纤维化亚组囊肿大小差异及其相关性。P <0.05 为差异有统计学意义。
结果 不同纤维化亚组的 Ktrans、Kep 具有统计学差异(P <0.05)，且随肝纤维化程度增加而下降（r=-0.838、-0.745，P <0.05）；Ve 在不同纤维化亚组中无统计学差异（P >0.05），与肝纤维化程度无明显相关（r= -0.210，P >0.05）。Ktrans、Ke 判别正常 vs 肝纤维化和轻度 vs 重度肝纤维化的 ROC 曲线下面积分别为 0.944、0.913 和 0.839、0.772，截界值分别为 0.228、1.823 和 0.210、1.676。重度肝纤维化组的囊肿大小高于轻度肝纤维化组（P <0.05），Todani Ⅰ型（27 例）中囊肿直径与长度和纤维化程度均称正相关（r=0.0.588，0.554，P <0.05）。 结论 1 DCE-MRI 定量灌注参数 Ktrans、Kep 对儿童 CCC 所致肝纤维化诊断并分期具有一定价值。2Todani Ⅰ型囊肿越大，对肝脏损害程度越高。

OR-030
儿童胰母细胞瘤的影像特点

陶晓娟,彭芸
首都医科大学附属北京儿童医院

目的 探讨儿童胰母细胞瘤的影像学特点。
方法 回顾性分析经手术或活检病理证实的胰母细胞瘤术前的 CT 及 MRI 表现。共 15 例患儿，其中男 9 例，女 6 例，年龄 4~10 岁（中位年龄 6 岁）。1 例仅做 CT 平扫，9 例行 CT 平扫及增强检查，5 例患者行 MRI 检查，其中 3 例完成 MRI 平扫及增强检查。
结果 8 例（8/15，占 53.3%）位于胰腺头部，3 例（3/15，占 20%）位于胰腺体尾部，4 例（4/15，占 26.7%）位于胰腺尾部。其中 10 例病变呈分叶状（10/15，占 66.7%），5 例病变呈类圆形（5/15，占 33.3%）。所有病变均表现为边界清楚，伴囊变和（或）坏死。CT 平扫表现为混杂密度实性肿块，其内坏死囊变表现为更低密度。其中 8 例（8/15，占 53.3%）有散在不同形态的钙化。增强后病变表现为不均匀强化，坏死囊变无强化，病灶内和（或）病灶周边可见小血管影。MRI 表现为混杂信号，T1WI 以等低信号为主，T2WI 以高信号为主，常合并出血坏死，病灶内和（或）病灶周边可见小血管影。DWI 病变实性部分呈高信号。其中 1 例 MRCP 显示胰管及胆管扩张。MRI 增强扫描病变实性部分明显强化，囊变坏死及出血成分不强化。
结论 胰母细胞瘤肿瘤通常较大，肿瘤内钙化多见，容易发生坏死囊变，增强肿瘤呈不均匀强化，肿瘤内部和（或）周边可见小血管影。胰母细胞瘤的影像学具有一定特征性，有利于术前做出正确的诊断，从而对临床治疗方案的制定有一定的指导作用。

OR-031
应用 Bosniak 分级系统评价儿童肾脏囊性病变的临床价值

肖伟强,刘鸿圣
广州市妇女儿童医疗中心

目的 探讨 Bosniak 分级标准在评价儿童肾脏囊性病变 CT 诊断及临床处理中的价值。
方法 由 2 位儿科放射诊断医生和 2 位儿科超声医生并按 Bosniak 分级方法共同讨论后分别对 58 个肾脏囊性病灶进行回顾并分级,然后根据其手术及病理结果(单纯囊肿 3 例,多囊性肾发育不良 23 例,多囊肾瘤 4 例, 部分囊变肾母 6 例,中胚叶肾瘤 12 例,透明细胞肉瘤 4 例,横纹肌样瘤 4 例,肾细胞瘤 2 例),计算其评价病理良恶性、决定手术与否的敏感性、特异性、符合率及阳性预测值、阴性预测值。
结果 本组病变中, 按 Bosniak 分级标准诊断为 I 级 11 个, II 级 16 个, IIF 级 20 个, III 级 5 个, IV 级 6 个。增强 CT 对肿瘤良恶性判断的敏感性、特异性、符合率、阳性预测值和阴性预测值分别是 97.9%、81.8%、79.7%、95.8%和 90%。而超声对肿瘤良恶性判断的敏感性、特异性、符合率、阳性预测值和阴性预测值分别是 93.6%、63.6%、57.3%、91.7%和 70%。
结论 按 Bosniak 分级标准的 CT 增强和超声表现, 能较准确地判断儿童囊性病变的良恶性, 而 CT 增强较超声更能显示细节情况, 从而更为准确地为病灶分级, 指导病灶的临床处理工作。

基于 dixon 技术的肝脏脂肪分数测量方法 在诊断肥胖儿童脂肪肝的价值及其与临床指标的相关性分析的前瞻性研究

田丰钰
浙江大学医学院附属儿童医院

目的 探讨基于 dixon 技术的肝脏脂肪分数用于肥胖儿童脂肪肝诊断的价值，并分析其结果与临床指标的相关性。
方法 前瞻性分析 2018 年 8 月起本院收治的肥胖儿童 100 例（5 岁以上儿童），记录年龄、身高、体重、血压，计算身体质量指数 BMI。并测定空腹血糖 FPC、总胆固醇 TC、甘油三酯 TG。行腹部横断面 dixon 水脂分离 T1WI 扫描、T2WI 压脂扫描和肝脏波谱扫描，以测量肝脏脂肪分数和肝内脂肪含量。
结论 采用 dixon 技术对肥胖儿童的肝脏脂肪分数测量方法可行，且测量结果与 BMI、血压、肝内脂肪含量以及血脂代谢指标具有一定的相关性。

OR-033
儿童 Castleman 病的影像分析

孙雪峰
首都儿科研究所附属儿童医院

目的 分析儿童 Castleman 病的超声、CT 及 MRI 影像学表现，结合病理情况分析，探讨其影像学特点，以提高对该病的认识水平。

方法 对我院 2009 年 3 月至 2017 年 12 月期间诊治并经病理证实的 5 例儿童 Castleman 病的患儿超声、CT 及 MRI 影像资料进行回顾性分析，总结其影像学特点。
结果 患儿男 3 例，女 2 例，年龄为 7 至 15 岁（中位年龄为 10 岁）。5 例儿童 Castleman 病中 2 例位于颈部、1 例位于纵隔、2 例位于腹部；均为单发，肿块最大径 3.5~11.0cm，平均值（4.3±2.6)cm。5 例 Castleman 病的临床分型均为局灶型，病理类型均为透明血管型。5 例患儿均行超声及 MRI 增强检查，联合采用 CT 增强检查 4 例；超声表现为低回声或中等回声肿块，边界清，内部有血流信号或血流丰富；CT 平扫表现为等密度或低密度均质肿块，未见囊变、坏死及钙化，增强后呈类似血管样强化，强化明显并有延迟，可与同层面动脉同步增强，即动脉期显著强化，门静脉期和延迟期扫描仍持续强化，可见丰富的滋养血管；MR 表现为边界清楚肿块影，肿块内或其周围可见扭曲扩张的流空血管影；T1WI 序列呈低或等信号，T2WI 序列为等或高信号，增强后均匀强化，强化模式与 CT 相仿，延迟仍中度强化。
结论 儿童 Castleman 病罕见，术前容易误诊，透明血管型 Castleman 病影像学表现有一定特征性，了解其影像特点，结合临床特征，有助于早期诊断。

基于 MSCT 数据的 CAS 三维重建胰胆管合流部及毗邻结构在小儿 Roux-en-Y 术前初步研究

郭万亮,陈伟
苏州大学附属儿童医院

目的 先天性胆总管囊肿是一种罕见的先天性胆道发育畸形,手术切除是先天性胆总管囊肿的唯一根治方法，我们研究的目的是探讨海信计算机辅助手术系统（Hisense CAS）在先天性胆总管囊肿患儿胰胆管合流部及毗邻结构的三维重建结果，提高患儿 Roux-en-Y 手术的精准性。
方法 回顾性分析 2016 年 1 月至 2019 年 5 月苏州大学附属儿童医院收治的 20 例先天性胆总管囊肿患儿的腹部 CT 增强影像资料，利用海信计算机辅助手术系统（Hisense CAS）对患儿腹部增强 CT 图像进行 CT 三维重建，根据三维重建结果分析胆总管囊肿类型、胰胆管合流部及其与毗邻结构的关系，从而制定个体化最佳手术方案。
结果 三维重建结果清晰显示胆总管囊肿的类型、胰胆管合流部及其毗邻结构的关系，可以多角度观察肝脏及其脉管系统、胆总管囊肿及胰腺的空间位置关系。20 例患者中，男患儿 5 例，女患儿 15 例，年龄 16 月至 12 岁，其中有 6 例为 Ia 型胆总管囊肿，3 例为 Ic 型胆总管囊肿,11 例为 IVa 型胆总管囊肿；1 例患儿胆总管囊肿较大，2 例患儿胰管扩张，胰胆管共同管明显增长，3 例患儿肝右动脉在囊肿前壁走行并形成压迫，7 例存在肝右后静脉。
结论 海信计算机辅助手术系统（Hisense CAS）有助于研究小儿复杂的肝脏解剖，可以从任意的角度对胆总管囊肿、胰胆管合流部及其毗邻结构进行观察，了解胆总管囊肿与肝脏及其脉管系统的空间关系，使影像诊断更加精准，并且能够为手术者提供直观的解剖结构信息，从而制定个体化最佳手术方案，提高小儿 Roux-en-Y 手术的精准性。

Prenatal diagnosis of meconium peritonitis in 35 cases with fetal magnetic resonance imaging

Yuanting Lu,鸿圣 Liu

Department of radiology , Guangzhou Women And Children’s Medical Center, Guangzhou Medical university

Background: Meconium peritonitis (MP) is a rare fetal disease that needs to be urgently identified for surgical intervention. *Objectives*: We report on a series of 35 cases with MP diagnosed prenatally on MRI and illustrate the imaging findings and investigate the predictive value for postpartum management. *Method*: A consecutive cohort of 35 cases diagnosed with MP born at Guangzhou Women and Children’s Center over 10 years (2008-2018) was enrolled retrospectively. The prenatal ultrasound and MRI findings were analyzed. Chi-square test was used to evaluate MRI’s predictive value for surgical intervention. *Results*: Ascites (30/35) was the most common prenatal MP-related finding on fetal MRI, followed by gathering bowel loops (27/35), bowel dilatation (15/35), hydroceles (13/35), micro-colorectum (13/35), peritoneal calcification (10/35) and meconium pseudocyst (7/35). Of 35 infants, 26 received surgical intervention. All fetuses with MRI scanning showing bowel dilatation and micro-colorectum required operation. The overall survival rate was 91.43% and all 9 infants with non-operative therapy were successfully treated. *Conclusion*: Ascites and gathering bowel loops were two of the most common abnormalities of MP on MRI. Bowel dilatation and micro-colorectum on MRI showed the need of surgical intervention.

Application of MR imaging in the evaluation of fetal intestinal obstruction

xu li
APCH

Abstract Objective: To retrospectively analyze the imaging findings of fetal intestinal obstruction diagnosed by MRI in our hospital and compared with postnatal surgery, to explore the application value of MR in diagnosis of fetal intestinal obstruction. Methods: 46 cases of fetal intestinal tract obstruction were diagnosed by MRI in our hospital from April 2014 to July 2019, among which 7 cases were lost to follow-up, 11 cases were intrauterine fetal death or termination of pregnancy, and 28 cases were operated after birth. Results: 28 cases had postnatal surgery after birth, and diagnosed as annular pancreas (n=5) , duodenal atresia or stenosis (n=10), jejunal septal stenosis (n=4) or atresia(n=5), ileum atresia (n=3) , intestinal volvulus (n=4), intestinal malrotation (n=4). 2 case of duodenal stenosis with malrotation of the intestine (one case also with multiple atresia of the jejunum), 2 cases of the midgut volvulus with malrotation (one case also with ectopic pancreas); 2 cases of duodenal septal stenosis of the with 21-trisomy syndrome (one case also with anus atresia). The sensitivity of fetal MR imaging diagnosis of small intestinal obstruction was 100%(28/28), and the accuracy of pathological causes of obstruction was 91.4%(32/35).Prenatal MRI showed annular pancreatic, duodenal or jejunal septal stenosis presenting as low signal T1 and high signal T2 in the upper proximal of obstruction, filling of intestinal fluid could be seen in the distal part, and jejunal or ileal atresia presented as short T1 and other T2 signals in the proximal part. Fetal intestine volvulus showed sausage like distortion of intestine, MRI intestine

volvulus showed equal T1 and T2 signal, DWI showed uneven high signal. Malrotation of the intestine was characterized by abnormal duodenal fame. Conclusion Prenatal MRI can accurately determine the site of intestinal obstruction, and further qualitatively diagnose the possible etiology of intestinal obstruction according to the changes of MR signals in different sequences, providing guidance for postnatal counseling.

DTI 对中晚孕周胎儿脑微结构改变的定量研究

蔡先云,王光彬
山东省医学影像学研究所

目的 分析中晚孕周胎儿脑微结构的改变随孕周变化的规律，并探讨使用 DTI 量化建立中晚孕期胎儿颅脑微结构改变的可行性
方法 前瞻性收集 20-40 周中晚期孕周胎儿 15 例，行常规 MRI 及 DTI 扫描，在 MRI 标准层面测量额叶白质 (FWM)、颞叶白质(TWM)、顶叶白质 (PWM)、枕叶白质(OWM)、小脑半球 (CH)、基底节区(BGR)、丘脑 (TH)、脑桥 Pons FA 值、AD 值、RD 值、MD 值，利用多因素方差分析比较不同感兴趣区之间各值之间的差异，组间均值比较采用两独立样本 t 检验，并对各指标与孕周进行 Pearson 相关分析与回归分析
结果 不同感兴趣区间 FA 值（F=41.922,P=0.000）、MD 值（F=14.628,P=0.02）存在差异且有统计学意义，AD 值（F=34.015,P=0.131）、RD 值（F=31.288,P=0.137）差异没有统计学意义。FA 值随着孕周的增加而增加，MD（r^2=0.0182，P=0.0002）、AD（r^2=0.2206，P=0.0002）、RD（r^2=0.2245，P=0.0492）值随孕周的增加而下降
结论 DTI 参数可定量测量胎儿脑发育微结构改变，建立胎儿颅脑生物学指标的 MRI 参考标准是可行的。

3T 磁共振 3Dstarvibe 序列胎儿颅脑扫描应用研究

曲海波,李学胜,贾凤林,宋燕,叶芷君,廖怡,宁刚
四川大学华西第二医院

目的 本研究旨在通过应用 3T 下的 3Dstarvibe 序列的胎儿神经系统成像研究，通过提高组织对比度等方法，得到参数优化且适合应用于临床的 T1 加权序列。
方法 应用 3TMR 扫描，纳入 32 例中晚孕（孕 25 周-孕 38+1 周）胎儿针对性颅脑检查，胎儿颅脑 T1WI 序列应用 3DStarvibe、TFL 序列，1）采用不同的翻转角度进行胎儿脑部 3DStarvibe 成像，分别在 5.5 度，9 度， 12 度，15 度不同的翻转角下得到的 T1WI 图像成像； 2）应用 Star-vibe 得到的 T1 加权成像与 2DTFL 得到的 T1WI 序列进行成像进行成像对照；3）根据最终图像的分析情况最确定合适的图像反转角，从而得到稳定的符合相应孕周的 T1 加权成像参数。
结果 通过优化 3TMR 的 T1 加权 3DStarvibe 成像，结果如下： 1）不同翻转角下 T1 加权成像的影像质量比较，发现通过翻转角的设置会影响图像的对比度及成像质量，在翻转角 9 度的情况下能够得到更好的图像；2）3DStarvibe 序列 9 度、12 度及 15 度翻转角下在伪影产生上均好于 TFL 序列；
结论 应用 3TMR 的 3Dstarvibe 序列 T1 加权成像能够在自由呼吸状态下，克服胎儿运动及孕妇呼吸的干扰短时间内得到优良的 T1 加权图像，小角度激发均能可以产生较好的图像质量，本研究所

得到的最适翻转角是通过多个角度的设定进行成像后的成像质量进行分析评估，最终在多个脑组织的观察成像能力水平上进行统计分析。

Typical and atypical dural sinus malformation imaging in the fetus: based on 4 cases

Wei Xia[1],Jianbo Shao[1],Xinlin Chen[2],Wenzhong Yang[2]
1.Wuhan Children's Hospital (Wuhan Maternal and Child Healthcare Hospital), Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China
2.Hubei Maternal and Child Health Hospital

Objective: To describe the atypical imaging characteristic of dural sinus malformation in fetuses by ultrasound and MRI.
Materials and methods: We report a series of four fetuses with dural sinus malformation in Hubei Maternal and children's hospital from July, 2013 to February 2016. All the mothers undertook the prenatal MR imaging because of the intracranial space occupying lesions discovered by prenatal ultrasound.
Results: In all four cases, two of them represented the typical MR imaging of dural sinus ectasia with thrombosis in the vicinity of torcular Herophili (also known as sinus confluence), while in the other two cases lesions located mainly in superior sagittal sinus and transverse sinus separately. Two pregnancies were terminated, while the outcomes of other two cases were not available.
Conclusion: Atypical location of the dural sinus malformation, such as superior sagittal sinus and transverse sinus, should be paid special attention to. Sonographer should realize the atypical sign of dural sinus malformation, and prenatal MRI is necessary to identify the lesion.

Diffusion weighted magnetic resonance imaging of the fetal brain in complex congenital heart disease

Suzhen Dong,Hui Ji,Yumin Zhong,Ming Zhu
Shanghai Children's Medical Center, Shanghai Jiaotong University School of Medicine

Objectives: Diffusion weighted magnetic resonance imaging (DWI) is a sensitive method to evaluate brain maturation and detect brain lesions by Apparent Diffusion Coefficient (ADC) values. Abnormal ADC values are seen in ischemic brain lesions. The aim of this study was to assess whether ADC values in the fetal brain were different in a group of fetuses with complex congnital heart disease (CHD), compared to normal controls.
Methods: Fetal brain diffusion MR imaging was performed in 50 fetuses with complex CHD, Fetal brain MRI examinations with single-shot DWI (b = 0 and b = 700 s/mm²) were performed. ADC values in frontal white matter (FWM), centrum semi-ovale (CSO), thalami

(T), basal ganglia and pons were compared with 50 normal controls at the same gestational age.
Results: We found no significant differences between gestational age between our 2 groups (CHD 26.6 ± 3.2w and control 26 ±2.8w). All fetal brain morphology and signal were normal. Fetuses with complex CHD had higher ADC values in FWM (2.34 ±0.18 vs 2.19 ±0.17 x10-3 mm2/sec; p<0.05), thalami (2.20 ±0.16 vs 2.06±0.19; p<0.001), centrum semi-ovale (2.34 ±0.19 vs 2.22 ±0.19 x10-3 mm2/sec, p<0.05), basal ganglia (2.16 ±0.18 vs 2.03±0.16, p<0.001), and pons (2.14 ±0.18 vs 2.04 ±0.15 10-3 mm2/sec, p<0.05).
Conclusion: Fetal diffusion MR imaging is a feasible modality of evaluating abnormal brain diffusivity in fetuses with complex CHD.

儿童恶性骨巨细胞瘤的影像学表现与病理对照

李洋,宋修峰
青岛市妇女儿童医院

目的 分析发生于儿童的恶性骨巨细胞瘤（Malignant giant cell tumor of bone，MGCTB）的影像学特征，结合病理组织学，探讨其影像表现的病理基础，提高诊断准确率。
方法 2004 年 3 月-2019 年 7 月在我院经手术病理证实为 MGCTB 的 12 例患者纳入本次研究，其中男性 5 例，女性 7 例，年龄 5-12 岁，平均年龄 9 岁。8 例患者有骨巨细胞瘤手术切除史。12 例 MGCTB 患者主要临床症状包括关节疼痛乏力伴软组织肿胀 5 例（膝关节 3 例，髋关节 2 例），伴有发热 2 例；腰背部疼痛 5 例、髋部疼痛 2 例，疼痛均呈进行性加重伴活动受限，合并双下肢麻木无力 6 例，小腿疼痛 2 例，排尿困难 2 例，大小便失禁 1 例，发热 3 例。12 例 MGCTB 患者行 X 线检查 6 例，CT 平扫检查 10 例，MRI 平扫检查 9 例，MR 增强扫描检查 5 例。回顾性分析 12 例经手术病理证实的 MGCTB 的影像学征象及病理资料。
结果 12 例 MGCTB 位于膝关节 3 例，累及骨端，横向生长；髋关节 2 例，累及骶髂骨、髋臼；脊柱 7 例，均呈偏心性生长，累及单侧附件，3 例呈压缩性改变。X 线上均呈膨胀性溶骨性骨质破坏，伴骨膜反应。CT 上肿瘤边缘示不完整骨性包壳，伴混杂密度软组织肿块，肿块内含骨嵴影。MRI 上肿呈混杂 T1、混杂 T2 信号，伴小囊状短 T1、长 T2 信号，T2WI 上伴有更高信号区；3 例并多发条索状低信号影；软组织受累范围广；肿瘤呈明显不均匀强化。
结论 发生于儿童的 MGCTB 保留有良性 GCTB 的部分特点，如典型的发病部位、皂泡状外观、肿瘤内部骨嵴及周边骨壳、膨胀性溶骨性骨质破坏等，但 MGCTB 的骨嵴排列杂乱，形态不规则，骨壳不完整且见软组织突出，可见骨膜反应，MRI 可见低信号索条影，这些特征有助于提高对本病的认识。

OR-042
磁共振 T2* mapping 诊断血友病性关节病骨的临床应用价值

曾伟彬
深圳市儿童医院

目的 探讨磁共振 T_2* mapping 成像技术技术在血友病性关节病诊断中的价值。

方法 采用临床对照研究，研究组为 32 例（膝）关节血友病性关节病患者，对照组为 25 例（膝）关节健康志愿者，采用西门子 SKYRA 3.0T 磁共振扫描仪对 57 例关节进行磁共振扫描，T_2*mapping 成像测量膝关节研究组和对照组的髌骨、股骨远端内侧面、股骨远端外侧面、胫骨近端内侧面、胫骨近端外侧面 5 处软骨的 T_2 值。同时分别测量 T_2*mapping、T1WI-SE、T_2WI-TSE-FS 序列显示关节内含铁血黄素沉积最大截面的面积，比较这三个序列在评估血友病性关节病含铁血黄素结果的差异，P<0.05 具有统计学意义。

结果 研究组膝关节的髌骨、股骨远端内侧面、股骨远端外侧面、胫骨近端内侧面、胫骨近端外侧面 T_2 值均高于对照组相应关节面软骨 T_2 值，差异具有统计学意义；T_2*mapping 显示含铁血黄素沉积最大截面面积明显大于相应层面常规 SE 序列所显示的，差异具有统计学意义。

结论 磁共振 T_2*mapping 成像通过 T_2 值的测量，可以发现血友病性关节病早期的关节软骨异常改变；T_2*mapping 序列能够敏感的发现关节内含铁血黄素沉积，对血友病性关节病的含铁血黄素沉积准确评估具有较高临床应用价值。

儿童急性骨髓炎的影像学表现

王立英,王春祥
天津市儿童医院

目的 探讨儿童急性骨髓炎的影像学表现，提高影像诊断及鉴别诊断水平，为临床治疗提供帮助。

方法 回顾性分析我院 2015 年 6 月至 2018 年 10 月诊断急性骨髓炎的 48 例患儿的影像资料，其中 48 例均行 x 线检查，29 例行 MRI 扫描，2 例行 CT 扫描，通过影像资料回顾性分析骨髓炎影像特征。

结果 本组 41 例为单发病变，7 例为多发病变，累及胫骨 16 例，股骨 11 例，肱骨 8 例，跗骨 7 例，指骨 6 例，骨盆骨 5 例，桡骨 4 例，腓骨 4 例，尺骨 1 例，趾骨 1 例，共计 63 个骨骼。长骨 44 个占 69.8%，短骨 7 个，占 11.1%，其他骨 12 个，占 19.1%。急性期 X 线表现为阴性 22 例，随诊 2～4 周后逐渐出现阳性征象，表现为局灶性骨质破坏 32 例、广泛虫蚀样骨质破坏 16 例、骨质增生硬化伴骨皮质增厚 20 例、层状或线样骨膜反应 16 例，软组织肿胀 20 例。CT 显示骨盆、跗骨等复杂部位骨质破坏较平片敏感。MRI 于疾病早期即可发现不同程度骨髓水肿及软组织肿胀，平扫 T_1WI 骨髓腔信号减低，T_2WI 脂肪抑制像呈明显高信号，增强后呈明显强化，骨破坏区可见边缘强化或无强化，周围肌群水肿明显，出现脓腔时表现为环形厚壁强化（4 处）。48 例患儿手术治疗 12 例，随诊复查半年，临床症状好转，病变区呈不同程度增生硬化；36 例抗感染治疗后复查，病变好转。

结论 儿童急性骨髓炎好发于长骨骨干及干骺端，早期 X 线可见表现为阴性，MRI 对骨髓炎具有较高敏感性，结合临床表现，MRI 可明显提高诊断率，为早期有效治疗、减少并发症提供帮助。

OR-044

人工智能在儿童骨龄评估的临床应用

于泓,王静石
大连市妇女儿童医疗中心

目的 应用人工智能（artificial intelligence，AI）深度学习法对儿童骨龄进行评估。

方法 收集本院 2018 年 10 月至 2019 年 7 月收集的 100 例进行骨龄 DR 摄影的儿童（2-12 岁）作为观察对象,分为 2-6 岁组，7-12 岁组）。由四名经验丰富的放射科医生采用中华 05 方法对儿童

骨龄评估，随后在人工智能辅助下进行评估，骨龄准确性和标准误差（RMSE）被用作测量准确性的指标。

结果 100 例儿童中，2-6 岁组及 7-12 岁组 AI 评估组准确率为 68.2%，95.6%，单独使用医生组准确率分别为 66.6%和 90.4%，在人工智能的帮助下，所有个体均下降，2-6 岁组差异性不明显。

结论 人工智能通过提高准确性、降低变异性和 RMSE 来提高放射科医生的骨龄评估。放射科医生利用人工智能比单独使用放射科医生组有更好的表现。这表明人工智能可以作为放射科医生评估骨龄的重要辅助手段，以提高儿童骨龄准确率。

磁共振对儿童急性白血病与幼年特发性关节炎的四肢骨骨髓改变的鉴别诊断价值研究

徐琳,钟玉敏
上海交通大学医学院附属上海儿童医学中心

目的 探讨儿童急性白血病与幼年特发性关节炎的四肢骨骨髓改变的磁共振特征性表现，以提高其鉴别诊断能力。

方法 回顾性分析 2015 年 1 月至 2018 年 1 月，以骨关节疼痛为主诉，经临床及骨髓穿刺活检确诊为急性白血病的患儿 25 例与同时期确诊为幼年性特发性关节炎的患儿 28 例。所有患儿均行疼痛部位的磁共振扫描，分析其病变部位的形态及磁共振信号表现，并定量分析其 ADC 值。

结果 25 例急性白血病患儿疼痛部位均可见信号异常，20 例表现为骨髓浸润，呈较均匀的 T1 低信号、T2 高信号，范围较广泛；5 例呈不均匀斑片状 T2 高信号、T1 呈等低信号。28 例幼年特发性关节炎患儿疼痛部位中，21 例可见干骺端不均匀 T2 高信号、T1 低信号，范围较局限，与正常骨髓分界不清；7 例未见明显异常信号。急性白血病患儿骨髓平均 ADC 值为（0.886±0.223）$x10^{-3}mm^2/s$，幼年特发性关节炎患儿骨髓平均 ADC 值为（1.187±0.214）$x10^{-3}mm^2/s$。急性白血病组 ADC 值明显低于幼年特发性关节炎组，具有统计学差异（$P<0.05$）。

结论 以骨关节疼痛为主诉的急性白血病患儿较幼年特发性关节炎患儿骨髓改变更广泛，信号变化更显著，ADC 值更低，MRI 可作为两者临床鉴别的指标之一。

OR-046

CT 三维重建对儿童颈椎畸形的诊断价值

卢健添
昆明市儿童医院

目的 讨论 CT 三维重建对童儿颈椎畸形的诊断价值。

方法 回顾分析 2017 年 4 月 1 日至 2019 年 6 月 30 日期间我科 14 例颈椎畸形三维重建病例，用多平面重建（MPR）法和容积渲染成像（VR）进行三维重建。

结果 14 例患者共检出寰枕融合畸形、颅底凹陷、阻滞椎、蝴蝶椎、半椎、脊柱裂等 6 种畸形。

讨论 MPR、VR 均能对病变显示清晰，MPR 对细节显示有优势，VR 对整体形态显示有优势。

Screening of radioactive tracer for colorectal cancer liver metastasis based on tumor-related biological behavior

Hao Jiang[1],Huijie Jiang[1],Rongjun Zhang[2],Mingyu Zhang[1]
1.The Second Affiliated Hospital of Harbin Medical University
2.Jiangsu Institute Of Nuclear Medicine

Objective: Positron emission tomography (PET) is extensively used in clinical oncology for tumor detection. This study aimed to explore the application of radiotracers ^{18}F-FDG, ^{18}F-FLT, and ^{18}F-FMISO in diagnosis and monitoring of hepatic metastasis in human colorectal cancer (CRC). **Methods:** A mouse model of human CRC with hepatic metastasis was established by intrasplenic implantation of human CRC cell lines LoVo or HCT8. Metastatic potential of these two cell lines was evaluated by wound healing assay *in vitro* and survival analysis plus liver metastasis rate determination *in vivo*. Cellular uptake of each radiotracer was compared between LoVo and HCT8 cells. Radiotracer-based micro-PET imaging was performed to examine the distribution and amount of each tracer taken up by mice. Retention of each radiotracer in hepatic metastatic lesions was quantified and compared using maximum standardized uptake value (SUVmax) and SUVmax ratio. Protein expression of multiple tumor biomarkers, including glucose transporter protein 1 (GLUT-1), hypoxia inducible factor 1 alpha (HIF-1α), Ki67, and metastasis associated in colon cancer 1 (MACC1), was determined in metastatic lesions. The correlation between tracer uptake and tumor marker expression was evaluated using linear regression. **Results:** LoVo cells exhibited a stronger metastatic potential and a higher radiotracer uptake ability than HCT8 cells, as evidenced by significantly greater wound closure percentage, shorter survival, higher incidence of liver metastases, and higher cellular radiotracer levels in LoVo cells or LoVo cell-xenografted mice. The values of SUVmax and SUVmax ratio of ^{18}F-FLT and ^{18}F-FMISO, but not ^{18}F-FDG, in LoVo cell-derived metastatic lesions were significantly greater than those in HCT8 ones. Mechanistically, the expression of MACC1, HIF-1α, and GLUT-1 in LoVo cell-derived metastatic lesions was more effectively induced than that in HCT8-derived ones. A linear regression analysis demonstrated significantly positive correlations between ^{18}F-FLT/^{18}F-FMISO uptake and tumor biomarker expression in metastatic tissues. **Conclusion:** ^{18}F-FLT and ^{18}F-FMISO-based PET imaging may server as a promising method for early detection and monitoring of hepatic metastasis in patients with CRC.

OR-048

Recurrence after curative resection of HBV-related Hepatocellular Carcinoma: Diagnostic algorithms on Gadoxetic Acid-enhanced MRI

Wentao Wang,Li Yang,Ying Ding,Mengsu Zeng,Shengxiang Rao

Department of Radiology， Zhongshan Hospital， Fudan University， Shanghai， China

Background and Purpose:
Small recurrent hepatocellular carcinoma (HCC) could show more atypical imaging patterns while we lack specific diagnostic algorithm. The study aimed to better characterize postoperative recurrent HCC <20mm by gadoxetic acid-enhanced MR imaging.
Methods:
We retrospectively evaluated 373 new developed nodules after hepatectomy in 204 HCC patients with chronic hepatitis B virus (HBV) infection. Diagnostic performance of the LI-RADS v2018 were calculated for characterizing recurrence on gadoxetic acid-enhanced MRI. The modified diagnostic algorithms were proposed by combining significant imaging biomarkers respectively related to subcentimeter and 10-20mm recurrences and were then compared with the LI-RADS system.
Results:
A total of 256 recurrent HCCs (108 recurrences of <10mm; 148 recurrences of 10-19mm) were confirmed by histology or follow-up imaging. Nonrim arterial phase hyperenhancement and the three LI-RADS ancillary features (hepatobiliary phase hypointensity, mild-moderate T2 hyperintensity and restricted diffusion) were significantly related to recurrences <20mm in multivariate analyses. For subcentimeter recurrences, combining at least two of the three ancillary features achieved better diagnostic performance (sensitivity: 83.3%; specificity: 87.7%) than LI-RADS 4 criteria (sensitivity: 88.9%, P=0.211; specificity: 70.8%, P=0.006). For 10-19 mm recurrences, combining nonrim arterial phase hyperenhancement and at least one of the three ancillary features achieved significantly enhanced sensitivity of 85.1% but lower specificity of 86.5% than LI-RADS 5 criteria (sensitivity: 63.5%, P<0.001; specificity: 94.2%, P=0.134).
In conclusion:
the diagnostic algorithms for subcentimeter and 10-19mm recurrent HCCs should be stratified. Combining at least two ancillary features demonstrated comparable sensitivity with significantly enhanced specificity than LI-RADS 4 criteria for characterizing subcentimeter recurrences.

OR-049

Evaluation of multiple-arterial-phase aquisition and image quality in Gadoxetate acid disodium enhanced liver MRI using differential sub-sampling with cartesian ordering (DISCO) technique: a comparative study with single arterial phase

Hehan Tang,Yi Wei,Bin Song
West China Hospital

Objective To investigate the application value of multiple-arterial-phase imaging technique with DISCO (differential sub-sampling with Cartesian ordering) in the Gadoxetate acid disodium enhanced liver MRI.

Methods From September 2017 to March 2018, 56 patients with suspected malignant focal liver disease diagnosed by ultrasound or CT in West China Hospital of Sichuan University were enrolled prospectively, and underwent preoperative enhanced MRI with Gadoxetate acid disodium. Patients were divided into 2 groups by random-number-table method. 29 patients in group A underwent liver multiple-arterial-phase imaging with DISCO. 27 patients in group B underwent single-arterial-phase imaging with LAVA-Flex (liver acquisition with volume acceleration-flex). The display rate of late-arterial-phase and respiratory motion artifacts of dynamic enhancement images were evaluated. The categorical variables was compared by chi-square test. The respiratory motion artifacts between the single-arterial-phase and multiple-arterial-phases was compared by Mann-Whitney U test. The artifact scores among the various phases of the multi-arterial phase were compared by Kruskal-Wallis H.

Results Compared to LAVA-Flex (74.1% [20/27]) , a higher display rate of late-arterial phase (96.6% [28/29]) was found in DISCO (Group A), and the difference was statistically significant (x^2 = 5.77, P = 0.016). In the evaluation of respiratory motion artifacts, the motion artifacts of the late-arterial images obtained by LAVA-Flex [3(3,4)] were more severe than the DISCO [2(2,3)], and the difference was statistically significant (Z =-3.250, P <0.01). Among the scores of motion artifacts in the 6 phases of DISCO, the artifact scores of phase 1, 2, 3, 4, 5, 6 were [3(3,4)], [2(2,3)], [2(2,3)], [3(2,3)], [3(3,4)] and [3(3,4)]respectively. The motion artifacts of phase 2, 3, 4 were better than phase 1, 5, 6，which difference was statistically significant (P <0.05)， but there was no statistical difference among phase 2, 3 and 4 (P>0.05).

Conclusion Compared with single-arterial-phase imaging, multiple-arterial-phases with DISCO using Gadoxetate acid disodium can improve the capture rate of late arterial phase and reduce motion artifacts.

OR-050

Small Pancreatic Ductual Adenocarcinoma (≤20 mm) of the Head: Quantitative CT imaging features Correlate with the Stroma Proportion and predicts the Prognosis after Resection

Xiaoli Cai,Yu Shi,XianYi Zhang,RuoYun Ji
Shengjing Hospital of China Medical University

Objectives To quantitatively analyze the volumetric tumor-parenchyma attenuation difference (Deltas) on both pancreatic and portal venous phase images, and the tumor attenuation changes across pre-contrast, pancreatic and portal venous phases (ratios), so as to evaluate the level of stroma and predict the prognosis of small head Pancreatic ductal adenocarcinoma (PDAC).

Methods We performed a retrospective study included 212 patients with pathologically confirmed head PDAC with diameter smaller than 30 mm. The pre-operative CT images were imported into the open source software 3D Slicer 4.10 for delicate image registration of the non-enhanced phase, pancreatic phase and portal venous phase for

each patient. Both rigid and deformable registration (Elastix registration toolbox) was performed using pancreatic phase images as the fixed volume and other two phases as the moving volumes.The volume of interest (VOI) of both tumor and the surrounding pancreatic parenchyma were segmented manually by one radiologist,avoiding the surrounding tissues, the pancreatic duct, and artifacts.The registered volumes (NIFTI formatted image volumes) and the VOI (binary formatted image) were saved and imported into Matlab R2018a to acquire the CT attenuation at each pixel and calculate the volumetric mean attenuation values for tumor and parenchyma at all phases.Finally, 4 Deltas, 4 ratios and Clinical-pathologic findings for predicting disease-free survival (DFS) and overall survival (OS) were identified by using a Cox proportional hazards model.

Results Tumor size was associated with both DFS and OS (hazard ratio, 1.97;95% confidence interval:1.37, 2.83; P <0.001and hazard ratio, 2.00; 95% confidence interval: 1.36, 2.95; P <0.001, respectively).Patients with high delta3 tumors was associated with worse DFS and OS(hazard ratio, 1.49; 95% confidence interval: 1.09, 2.03; P =0.011and hazard ratio, 1.49; 95% confidence interval:1.06,2.10; P=0.021,respectively).The high Delta3 tumors had more aggressive histologic tumor grades,less stroma compared with those with low Delta3 tumors(P=0.023 and P=0.018).

Conclusions Greater tumor size and high Delta3 tumors were associated with lower DFS and OS rates after completed surgical resection of head PDACs.

OR-051

The correlation between apparent diffusion coefficient and histological differentiation and microvascular invasion of hepatocellular carcinoma

Linsheng Song[1],Qian Zhang[2],Xinxiang Zhao[2],Hong Pu[1]
1.Sichuan provincial people's hospital
2.The second affiliated hospital of kunming medical university

Objective To investigate the relationship between apparent diffusion coefficient (ADC) and histological grade of hepatocellular carcinoma (HCC) and microvascular invasion (MVI).

Methods Sixty-six cases with pathologically confirmed HCC were divided into three groups according to histopathology: well-differentiated, moderately differentiated and poorly differentiated. According to the MVI risk classification, they were divided into M0 (MVI negative group), M1 (MVI low risk group), And M2 (MVI high-risk group). The ADC values of different groups were measured. The Kruskal-Wallis test was used to analyze the groups and Mann-Whitney test was used for further comparison.

Results There were 10,49,and 7 cases in well,moderately,and poorly differentiated groups,respectively. The mean ADC values of each group were （1.397±0.456）$\times10^{-3}mm^2/s$, （1.186±0.292）$\times10^{-3}mm^2/s$, （1.172±0.435）$\times10^{-3}mm^2/s$, and the difference was not statistically significant (p=0.145). The minimum ADC values of each group were （1.206±0.410）$\times10^{-3}mm^2/s$, （1.022±0.263）$\times10^{-3}mm^2/s$, （1.040±0.410）$\times10^{-3}mm^2/s$, respectively,and the difference was not statistically significant (p=0.307).

There were 28, 22, and 16 cases of M0, M1, and M2, respectively. The mean ADC values of each group were （1.230±0.478）×$10^{-3}mm^2/s$,（1.195±0.295）×$10^{-3}mm^2/s$,（1.138±0.233）×$10^{-3}mm^2/s$, respectively, and the difference was not statistically significant (p=0.626). The minimum ADC values of each group were （1.090±0.372）×$10^{-3}mm^2/s$,（1.038±0.274）×$10^{-3}mm^2/s$,（0.992±0.225）×$10^{-3}mm^2/s$, respectively,and the difference was not statistically significant (p=0.820).

Conclusion The average ADC value and the minimum ADC value were not significantly different in different differentiation degree and MVI risk classification. It is still difficult to predict the presence of MVI and predict the risk classification by preoperative ADC values.

OR-052

Radiomics nomogram for the preoperative prediction of lymph node Metastasis in pancreatic ductal adenocarcinoma

Yun Bian,Li Wang,Jianping Lu
Department of Radiology, Changhai Hospital, The Second Military Medical University, Shanghai, China

Purpose: To develop and validate a radiomics nomogram for the preoperative prediction of lymph node (LN) metastasis in pancreatic ductal adenocarcinoma (PDAC).

Materials and Methods: In this retrospective study, 180 patients with surgically resected, pathologically confirmed PDAC underwent multislice computed tomography (MSCT) between January 2014 and January 2017. Radiomics features were extracted from arterial CT scans. The least absolute shrinkage and selection operator method was used to select the features. Multivariable logistic regression analysis was used to develop the predictive model, and a radiomics nomogram was built and internally validated in 45 consecutive patients with PDAC between February 2017 and December 2017. The performance of the nomogram was assessed in the training and validation cohort. Finally, the clinical usefulness of the nomogram was estimated using decision curve analysis (DCA).

Results The radiomics signature, which consisted of 13 selected features of the arterial phase, was significantly associated with LN status (p<0.05) in both the training and validation cohorts. The multivariable logistic regression model included the radiomics signature and CT-reported LN status. The individualized prediction nomogram showed good discrimination in the training cohort [area under the curve (AUC), 0.75; 95% confidence interval (CI), 0.68-0.82] and in the validation cohort (AUC, 0.81; 95% CI, 0.69-0.94) and good calibration. DCA demonstrated that the radiomics nomogram was clinically useful.

Conclusions: The presented radiomics nomogram that incorporates the radiomics signature and CT-reported LN status is a noninvasive, preoperative prediction tool with favorable predictive accuracy for LN metastasis in patients with PDAC.

OR-053

CT radiomics signatures of Liver for predicting gastroesophageal variceal bleeding secondary to Hepatitis B related cirrhosis as given by feature analysis

Jianqiong Yang
Affiliated Hospital of North Sichuan Medical College

Aim: To develop liver CT radiomics model to predict gastroesophageal variceal bleeding (GVB) secondary to Hepatitis B related cirrhosis.
Materials and Methods: We retrospectively collected 295 patients with first-diagnosed cirrhosis from two hospitals. 236 and 59 patients were randomly enrolled into the training and the validation cohorts, respectively; and 75 in the training cohort and 16 patients in the validation cohort endured GVB. Radiomics features of liver were abstracted from the venous-phase CT, and clinical features came from Electronic Medical Records. We used Tree-based method and Univariate feature selection to select the useful features. Radiomics model, clinical model, and integration of both radiomics and clinical models were built using the effective image and/or clinical features. Predicting performance of the models was evaluated with area under receiver-operating characteristic curve (AUC), accuracy and F-1score.
Results: 21 radiomics useful features and/or 3 clinical features were used to build the prediction models that correlated with GVB. The AUC of the integration of radiomics and clinical models was larger than of clinical or radiomics model for the training (0.83 ± 0.09 vs. 0.64 ± 0.08 or 0.82 ± 0.10) and the validation (0.64 vs. 0.61 or 0.61) cohorts. The integration of both radiomics and clinical models obtained good performance in predicting GVB for both the training and validation cohorts (Accuracy: 0.76 ± 0.07 and 0.73, and F-1 score: 0.77 ± 0.09 and 0.72, respectively).
Conclusion: Integration of both radiomics and clinical model may be a non-invasive method to predict GVB.

OR-054

Improved display of hepatic arterial anatomy using differential subsampling with cartesian ordering (DISCO) with gadoxetic acid-enhanced MR imaging: comparison with single arterial phase MR imaging and computed tomographic angiography

Yi Wei,Bin Song
Department of Radiology, West China Hospital, Sichuan University, Chengdu, China

Purpose: To prospectively evaluate whether multiple arterial phase (MAP) images from patients who underwent DISCO acquisition would improve the hepatic arterial display compared with single arterial phase (SAP) and computed tomographic angiography (CTA).
Materials and methods: From 08/2017-08/2018, prospectively acquired data of 130 patients who were divided into two study parts were analyzed. Two readers independently assessed the hepatic arterial display on a four-point scale. The *kappatest* was used to determine the interobserver agreement. c^2or*Fisher's*exact test was used for the categorical variables. *Student's t*test or the *Mann-Whitney U*test was used for the comparison of the motion artifacts. *Kruskal-Wallis*test was used to compare the difference between arterial displays.
Results: A moderate-to-excellent interobserver agreement was obtained for hepatic arterial display (all *kappa*values > 0.65). For **study part I,** the mean arterial display scores for the common hepatic artery (CHA), proper hepatic artery (PHA), left hepatic artery (LHA), right hepatic artery (RHA), left gastric artery (LGA) and gastroduodenal artery (GDA) obtained with DISCO were higher than those obtained with SAP imaging (all$p$<0.01).For **study partII**, comparable image quality for the arterial display of CHA (p=0.798), PHA (p=0.935), LHA (p=0.122), RHA (p=0.809) LGA (p=0.710) and GDA (p=0.659) was obtained with DISCO and CTA.
Conclusion: In conclusion, the use of MAP acquisition with DISCO is superior to the use of SAP in hepatic arterial display and compares favorably with CTA; in the future, DISCO possibly can replace the latter ionization-related method to provide a more comprehensive evaluation of the liver lesions.

胰腺影像诊断在临床决策中的意义及常见误诊

方旭,边云,王莉,陆建平
海军军医大学第一附属医院（上海长海医院）

目的 就多种胰腺常见误诊疾病的影像学并结合临床病理资料做一总结，提高对胰腺疾病的全面认识，为临床治疗决策指明方向。
方法 基于我院胰腺病多学科中心，总结影像学易误诊并影响到治疗方法的病例：(一)易误诊胰腺癌并行不必要手术切除：局灶性自身免疫性胰腺炎(AIP)、胰腺原发性淋巴瘤、胰腺局灶性脂肪浸润；(二)易误诊胰腺神经内分泌肿瘤(pNET)并影响不同治疗方法的胰腺富血供病种：胰腺副脾、胰岛细胞增生、实性浆液性囊性肿瘤(SCN)、肾癌胰腺转移瘤；(三)影像鉴别胰腺导管内乳头状黏液性肿瘤（IPMN）良恶性的重要性；(四)外生型胰腺癌的特征影像表现。
结果 局灶性 AIP 通过胰管非阻断性炎性狭窄、肿块渐进性强化、胰腺外 IgG4 相关表现并结合血清 IgG4 与胰腺癌鉴别，行内科激素治疗；胰腺原发性淋巴瘤体积大且质地均匀、增强后强化均匀、血管漂浮征等特征与胰腺癌鉴别，行化疗；胰腺局灶性脂肪浸润无占位效应，胰胆管无扩张，周围无浸润征象，CT 易误诊，MRI 同反相位可确诊，无需治疗。胰腺副脾多位于胰尾部、体积较小、增强各期强化与脾脏相似，热变性红细胞显像诊断的敏感性和特异性高，无需手术；胰岛细胞增生呈局灶性结节，强化较明显，多位于胰腺轮廓边缘，定期随访；实性 SCN 看似实性却富含液体，CT 难以与 pNET 鉴别，但在 MRI T2WI 呈明显高信号，即囊内清亮液体，是实性 SCN 影像学特征表现，无恶性倾向、定期随访；肾癌胰腺转移瘤平均发生于肾癌术后 120.2 个月，单纯从影像学难以与单发或多发 pNET 鉴别，病史是影像诊断的关键，首选手术切除、预后好。IPMN 是交界性肿瘤，规范的影像随访和良恶性影像评估，对治疗时机和选择具有重要意义。外生型胰腺癌多起源于

胰头钩突部，嗜神经嗜血管生长特征，多数不累及胰胆管，常误诊为腹膜后淋巴结、腹膜后纤维化，给治疗方向带来误导。

结论 精准诊断和治疗，需要影像科医生结合多学科共同努力。

高斯分布（单指数、双指数）DWI 模型与非高斯分布 DWI 模型对低分化胰腺癌诊断价值的对比研究

彭盛坤
四川省医学科学院·四川省人民医院

目的 探讨不同 DWI 模型（单指数、双指数 DWI 模型与非高斯分布 DWI 模型）对胰腺低分化导管细胞癌的诊断价值。

方法 收集 52 例经手术证实的低分化胰腺导管细胞癌患者，术前均行 MRI 成像，应用 ADC、IVIM 及 DKI 序列进行后处理得到相应的参数值：慢速表观扩散系数（ADC_{slow}）、快速表观扩散系数（ADC_{fast}））、快速扩散成分所占比例（f 值)、平均扩散值（MD 值）、平均峰度值（MK 值）及常规 ADC 值。采用 ANOVA 方差分析及 mann-whitney 非参数检验对数据行统计学分析并通过受试者曲线评价不同 DWI 模型的诊断效能。

结果 所有病灶均可在三种 DWI 序列（$ADC_{standard}$、DKI 及 IVIM）均可分辨病灶与非病灶组织。病灶组织 $ADC_{standard}$ 值、ADC_{fast} 值、f 值低于病灶周围正常组织；而 MD 值高于周围正常组织。 $ADC_{standard}$，MD 值、ADC_{fast} 及 f 值 ROC 曲线下面积分别为（0.705、0.665、0.648、0.614）。通过回归分析得到 $ADC_{standard}$ 值与 MD 值整合后的 ROC 曲线具有较好的诊断效能（ROC 曲线下面积约 0.754）。

结论 $ADC_{standard}$ 值、ADC_{fast} 值、f 值及 MK 值均可分辨胰腺癌的肿瘤组织与周围正常组织。磁共振 DWI 高斯分布模型与非高斯分布模型联合可以较好的区别肿瘤与非肿瘤病变。

不同压缩感知加速因子对 3D mDIXON Quant 序列定量分析胰腺脂肪的影响

邹宇航[1],刘爱连[1],张钦和[1],王家正[2]
1.大连医科大学附属第一医院
2.飞利浦医疗公司 中国

目的 探讨不同 CS 加速因子对胰腺脂肪定量的影响，寻找最佳的 CS 加速因子。

方法 前瞻性纳入 10 名志愿者，男 4 名，女 6 名，平均年龄 24.91±1.64 岁；年龄范围 22-27 岁；平均体重指数 21.75±3.35kg/m^2；体重指数范围 17.71-28.73kg/m^2。所有志愿者行 3.0T 磁共振扫描仪（Ingenia CX，Best，The Netherlands）3D mDIXON quant 序列扫描。扫描参数为：FOV=375mm×300mm×168mm，TR=6ms，层厚= 5.0mm，层间距=2.5mm，加速因子参数分别设置为：SENSE=2、4，COMPRESSED SENSE=2、4、5、6。图像导入飞利浦 ISP 工作站进行数据测量。两名放射医师（诊断经验分别为 3 年和 5 年）在脂肪分数图像上的胰腺钩突部、胰腺头颈部、胰体部、胰尾部分别放置 3 个 ROI（面积约为 25-64mm^2），ROI 放置时尽可能避免血管、胰管和腹部脂肪组织。通过计算 ROI 的平均脂肪分数值得到全胰腺脂肪分数值。数据经 SPSS 19.0 进行统计学分析。

采用组内相关系数（ICC）评估两位观察者所测得数据的一致性。采用 Friedman 检验比较各组使用不同 CS 加速因子所测得的胰腺脂肪分数是否具有统计学差异。P<0.05 被认为具有统计学意义。
结果 两位观察者所测得的数据一致性良好。使用不同的 CS 加速因子时，胰腺钩突部、胰腺头颈部、胰体、胰尾、全胰腺平均脂肪分数均无显著差异（P>0.05）。采用 CS=6 序列扫描比 CS=2 序列，扫描时间减少了 65.54%。
结论 不同的 CS 加速因子对胰腺脂肪分数无影响，本研究认为最佳加速因子为 CS =6。CS-SENSE 6 序列可以显著缩短屏气时间，同时保证测得胰腺脂肪含量的准确性。

基于 CT 影像的纹理分析预测原发性肝细胞癌微血管侵犯的临床研究

许旭茹[1,2],李跃明[2]
1.厦门大学附属中山医院
2.福建医科大学附属第一医院

目的 探讨 CT 图像纹理分析在预测原发性肝细胞癌(HCC)微血管侵犯(MVI)中的临床价值。
方法 回顾性分析 2017 年 5 月至 2018 年 11 月 102 例手术病理证实的 HCC 患者的 CT 图像。图像特征包括肿瘤边缘、有无包膜、肿瘤周围强化、低密度晕征、瘤内动脉和肿瘤-肝差值。HCC 组分为 MVI 阴性组(34 例)和 MVI 阳性组(68 例)。将术前 CT 图像导入 Mazda 软件中，人工绘制病变感兴趣区域，根据术前平扫期、动脉期、门静脉期和平衡期 CT 图像提取病变的纹理特征，采用 Fisher 系数、分类错误概率联合平均相关系数（POE+ACC）、交互信息（MI）三者联合的方法对 30 个最优纹理参数进行评价。最后，对所得参数进行受试者工作特征曲线（ROC）分析。
结果 两组患者的 Edmonson-Steiner 分级、肿瘤大小、肿瘤边缘及瘤内动脉特征有显着性差异(P=0.012，<0.001，<0.001，=0.003)。MVI 阴性和 MVI 阳性患者部分直方图、灰度共生矩阵和灰度游程矩阵参数的差异有统计学意义，共有 58 种纹理参数。通过 ROC 曲线分析比较，基于 CT 各期相最佳纹理参数都是源于灰度游程矩阵，其中基于平扫 CT 图像的最佳纹理参数 135dr_GLevNonU（AUC，0.766；截断值，1055.00；），基于动脉期 CT 图像的最佳纹理参数 Vertl_RLNonUni （AUC，0.764；截断值，5974.38）；基于门静脉期 CT 图像的最佳纹理参数 45dgr_GLevNonU（AUC，0.762；截断值，924.34）；基于平衡期 CT 图像的最佳纹理参数 Vertl_RLNonUni（AUC，0.754；截断值，4867.80）。
结论 肿瘤大小、肿瘤边缘及瘤内动脉可作为预测 HCC 微血管浸润的影像学征象，术前 CT 图像纹理分析可作为预测原发性肝细胞癌微血管侵犯的无创方法。最有价值的参数是灰色级游程矩阵。

OR-059
七期增强 CT 扫描评估肝癌血流灌注特性的可行性研究

雷萍,悦笑斐,扈雪晗,李骞,卢玉婷,马桂娜,韩萍
华中科技大学同济医学院附属协和医院

目的 通过对比肝癌患者七期增强 CT 与常规 CT 灌注成像所得到的灌注伪彩图、灌注参数及辐射剂量，探索七期增强 CT 评估肝癌血流灌注特性的可行性。
方法 对 30 例肝癌患者行 25 期 CT 灌注扫描，将得到的图像导入后处理工作站，获得各灌注参数的伪彩图并测量肿瘤区、肿瘤活性区及相对正常肝实质区的灌注参数，包括肝动脉灌注量（hepatic arterial perfusion,HAP）、门静脉灌注量（portal vein perfusion,PVP）、肝动脉

灌注指数（hepatic perfusion index,HPI），同时记录扫描辐射剂量；选取 25 期 CT 灌注图像中的 7 期导入 CT Kinetics 后处理软件，得到相应的灌注伪彩图及肿瘤区、肿瘤活性区、相对正常肝实质区的灌注参数，并计算辐射剂量。比较七期增强 CT 扫描与常规 CT 灌注成像灌注伪彩图质量评分的差异，探究七期增强 CT 扫描及常规 CT 灌注成像中肿瘤区、肿瘤活性区及相对正常肝实质区各灌注参数的相关性，并比较七期增强 CT 扫描与常规 CT 灌注成像辐射剂量的差异。

结果 1）七期增强 CT 与常规 CT 灌注各灌注参数伪彩图所得质量评分差异无统计学意义（P＞0.05）；2）七期增强 CT 与常规 CT 灌注在肿瘤区及肿瘤活性区的 HAP、PVP、HPI 相关性较好；相对正常肝实质区的 HAP、PVP、HPI 有一定的相关性；3）七期增强 CT 扫描的辐射剂量明显低于常规 CT 灌注扫描，差异有统计学意义（P＜0.05）。

结论 七期增强 CT 扫描可以模拟常规 25 期 CT 灌注评价肿瘤的血流灌注特征，同时显著降低辐射剂量。

OR-060
基于 11.7T Bruke MRI UTE 序列结合 QSM 技术的大鼠肝脏重度铁沉积定量测量的准确性评估

肖红,严福华
上海交通大学医学院附属瑞金医院

目的 探讨 11.7T Bruke MRI UTE 序列结合 QSM 技术用于大鼠肝脏重度铁沉积的定量测量的准确性评估。

方法 将 15 只 6w 的 SPF 级 SD 大鼠随机分为 5 组，每组 3 只，腹腔内注射剂量分别为 0.9%生理盐水，25mg/kg，200mg/kg，500mg/kg，1g/kg 的右旋糖酐铁（Sigma，浓度 100mg/ml）。给药一周后处死，取部分离体肝脏组织固定于 4%多聚甲醛中，用 11.7TBruke 磁共振做 UTE 扫描，参数如下：矩阵大小为 128×128，层厚 0.47mm，TE=0.01ms，TR=4ms，ETL=1，FA=2.17°，NEX=2，扫描完成后用磁敏感行加权成像做后处理对图像重建。用等离子发射光谱技术定量测铁含量，同时取部分组织做 HE 染色，普鲁士蓝染色和 Masson 染色。

结果 ①大鼠给药剂量与肝脏铁沉积量相关性 R^2=0.94； ②ICP 测量肝铁含量与基于 UTE 序列的 QSM 后处理重建测得的肝铁含量相关性 R^2=0.99；③HE 染色示肝细胞损伤程度随着给药剂量增加而更严重，普鲁士蓝染色结果与 ICP 和 QSM 定量测量铁沉积量结果相符。

结论 UTE 序列结合 QSM 技术对肝脏铁定量测量有较高的准确性。

OR-061
低管电流联合迭代算法对上腹部 CT 扫描图像质量和辐射剂量影响的体模和临床研究

胡仕北
四川省肿瘤医院

目的 探讨低管电流联合迭代算法对上腹部 CT 扫描图像质量和辐射剂量的影响，优化上腹部 CT 扫描参数。

方法 体模实验：采用 5 种不同扫描条件(管电压 120kV，管电流 120、140、160、180、200mAs)对腹部仿真体模行 CT 扫描。分别采用 7 种不同水平 idose4 迭代算法(0、1、2、3、4、5、6)进行图像重建。比较不同管电流和不同水平 idose4 重建图像的噪声值(SD)。临床实验：连续收集行上腹

部 CT 平扫的患者 100 例，按随机数字表法分为实验组(48 例)和对照组(52 例)。实验组管电流为 120mAs，采用 idose4(6)重建获得 A 组图像。对照组管电流为 200mAs，分别采用 idose4(0)、idose4(6)重建，获得 B 组和 C 组图像。比较实验组和对照组的图像质量[对比噪声值(CNR)、SD、主观评分]和有效剂量(ED)。

结果 体模实验中，在相同管电流下，随着 idose4 水平增加，图像 SD 逐渐降低，差异均有统计学意义(P<0.05)。在相同重建算法下，随着管电流的增加，图像 SD 逐渐降低，差异均有统计学意义(P均<0.05)。120 mAs 条件下 idose4 (6)重建组的 SD 低于 200 mAs 条件下 idose4(0)重建组，高于 200 mAs 条件下 idose4 (6)重建组，差异均有统计学意义(P<0.05)。临床试验中，A 组图像的 SD 低于 B 组，高于 C 组，差异均有统计学意义(P<0.05)。A 组图像的 CNR 高于 B 组，低于 C 组，差异均有统计学意义(P均<0.05)。3 组图像主观评分均>3 分。A、B 组图像主观评分差异无统计学意义。C 组图像主观评分高于 A、B 组，差异均有统计学意义(P>0.05)。实验组的 ED 低于对照组，差异有统计学意义(P<0.05)。

结论 上腹部 CT 扫描中，采用 120 mAs 联合 idose4 (6)水平重建可获得满足诊断要求的图像质量，且有效降低辐射剂量。

血氧水平依赖 MR 成像对兔肝热缺血后肝脏再生能力的评价

李婧瑶[1],季倩[2]
1.天津医科大学一中心临床学院
2.天津市第一中心医院放射科

目的 讨论血氧水平依赖磁共振成像对兔肝热缺血后肝脏再生能力的评价。

方法 12 只新西兰大白兔，随机分为 2 组，n=6。假手术组(N):解剖肝十二指肠韧带，切除肝尾叶；热缺血 20min 组(T)：用无损伤血管夹夹闭肝十二指肠韧带，阻断血流 20min，切除肝尾叶。手术当天及术后 7 天行常规 T2WI 及 BOLD-MRI 检查(Siemens Magnetom Trio Tim 3.0T MR)。将 T2WI 图像传至 IQQA-Liver 肝脏影像解读分析系统，半自动法获得全肝体积，肝再生率(LRR)＝(术后 7 天肝体积-术后初始肝体积)/术后初始肝体积×100%。西门子后处理软件后处理获得自旋-自旋弛豫时间(T2*)图像，各组 T2*值根据公式(R2*=1/T2*)计算表观自旋-自旋弛豫率(R2*)值。扫描后取耳缘静脉血，检测血清 ALT、AST、LDH 水平，处死实验兔，获取病理切片。独立样本 t 检验评价各组 R2*值及 LRR 是否存在统计学差异，Spearman 相关性分析评价 R2*值与肝功能指标的相关性。

结果 各组 R2*值：N 组术后当天 N(0)=134.95±15.04,N 组术后 7 天 N(7)=116.75±10.75,T 组术后当天 T(0)=152.09±10.61，T 组术后 7 天 T(7)=116.40±11.90(sec^{-1})。T 组 R2*值升高，N(0)与 T(0)差异有统计学意义(P<0.05)。R*与 AST、ALT 及 LDH 均呈显著正相关，r 分别为 0.680、0.692、0.618，P均小于 0.05。术后 7 天 R2*值均减低，N(0)与 N(7)差异有统计学意义(P<0.05)，T(0)与 T(7)差异有统计学意义(P<0.001)。N 组 LRR 为 24.94%，T 组 LRR 为 27.61%，两组间差异无统计学差异(P=0.823)。

结论 BOLD MRI 可用于评价热缺血损伤肝脏的再生能力，但对于热缺血时间的限度仍需进一步探索。

OR-063
基于肝泡球蚴囊泡影像特征分型与免疫指标的相关性研究

韩宇,王静,刘文亚
新疆医科大学第一附属医院

目的 通过分析肝泡型棘球蚴病（ hepatic alveolar echinococcosis， HAE）小囊泡特征与免疫指标的相关性，评估肝泡型包虫病的 MRI 分型对 HAE 的生物学活性判断的特征。
方法 回顾性分析 45 例肝部泡型包虫病人的 MRI 影像资料，将收集的 45 例病例的包虫病灶依据 Kodama 分型将泡球蚴病灶分成 5 型，同时通过抽取病人外周血检测体内包虫的 EsCF 抗原、 EgP 抗原、 EgB 抗原、 Em2 抗原，这四个抗原的抗体水平，研究 MRI 分型特征与各项免疫指标之间的相关性；统计过程中计量资料采用均数标准差(xs)表示，计数资料组间比较采用卡方检验。
结果 结果收集肝泡球蚴病例型 2 例、型 9 例、型 22 例、型 10 例、型 2 例；肝脏泡球蚴病灶的 Kodama 三种分型与抗 EgP 抗体具有相关性（ p=0.005），抗 EsCF 抗体（ p=0.060）、抗 EgB 抗体（ p=0.181）和抗 Em2 抗体（ p=0.360）与肝泡型包虫分型无相关性。
结论 MRI 泡球蚴囊泡分型与包虫四项检查中抗 EgP 抗体具有相关性，通过分型有望对泡型包虫病的生物学活性进行评判。

OR-064
肝泡型包虫病的钙化特点及其生物学活性

叶帅,张铁亮,刘文亚
新疆医科大学第一附属医院

目的 探讨肝泡型包虫病（HAE）的钙化特点及其生物学活性。**材料及方法** 回顾性分析新疆医科大学第一附属医院 2016 年 6 月至 2017 年 4 月，包虫实验阳性或手术病理证实为 HAE 的 60 例患者。患者均行腹部 CT 平扫及双期增强扫描、PET-CT 检查。60 例病灶均为单发。观察 CT 与 PET-CT 表现，并测量 PET-CT 上浓聚病灶部位的最大标准摄取值（SUVmax）。根据肝泡型包虫病患者的钙化形态分为 A、B、C 型。采用 Kruskal-Wallis H检验比较不同分型肝泡型包虫病灶间 SUVmax 的差异。**结果** 60 例 HAE 分为 A、B、C 共 3 型，每型均为 20 例。A 型 CT 检查病灶内可见散在少量小结节状钙化，PET-CT 表现为病灶边缘 ^{18}F-FDG（氟代脱氧葡萄糖）摄取及浓聚弱；B 型 CT 病灶内可见弥漫分布的结节样、斑块样钙化，PET-CT 表现为病灶边缘 ^{18}F-FDG 摄取及浓聚强；C 型 CT 病灶中央液化坏死区，边缘钙化，PET-CT 表现为病灶边缘 ^{18}F-FDG 摄取及浓聚较强。A、B、C 型病灶的 SUVmax 分别为 3.41（2.17-3.75）、7.45（6.77-9.01）、6.67（6.28-9.01）），3 组间差异有统计学意义，采用 Kruskal-Wallis H检验， x^2=4.429，P<0.05）。**结论** 不同 HAE 钙化分型病变的生物学活性有所不同。

OR-065
能谱 CT 碘值测定评价肝泡状棘球蚴患者残肝功能初步研究

王贝[1],张源[2],刘文亚[1]
1.新疆医科大学第一附属医院
2.新疆医科大学第四附属医院

目的 探讨应用宝石能谱 CT 在 HAE 患者不同肝功能分级中残余肝实质内碘浓度变化规律及其与 Child-pugh 分级评分的相关性。

方法 研究组纳入对象选取 2015 年-2017 年间的 31 例明确诊断为 HAE 的患者，具体分组依据：采用肝功能 Child-Pugh 分级标准并结合临床病例收集实际情况，其中 A 组 20 例，B 组 11 例，同时记录肝功能评分。对照组纳入对象选取 15 例经相关检查证实无肝脏疾患且临床医师开具腹部常规 CT 检查者。要求研究组及正常对照组中所有患者均行 HD 750 宝石能谱 CT 动态三期增强扫描。数据采用 GE 后处理软件重建出基于以水和碘为基础物质的能谱 CT 图像，在碘基图像上分别测量正常对照组和研究组增强扫描前两期（包括动脉期及门脉期）残余肝实质内碘含量及同期腹主动脉、门脉主干内碘含量平均值，计算肝动脉期及门脉期标准化碘含量，并对结果进行单因素方差分析，同时采用 spearman 法分析在增强扫描后前两期残余肝实质内碘含量与 Child-pugh 分级评分的相关性。

结果 门静脉期研究组和正常对照组残余肝实质内碘含量均高于动脉期，比较各组间分别在肝动脉期和门静脉期残肝实质内碘含量发现对照组最高，A 组次之，B 组为最低；研究组和对照组肝动脉期、门脉期残肝实质内碘含量的差异具有统计学意义，不同组间差异有统计学意义；spearman 法分析结果显示：肝动脉期及门脉期残肝实质内碘含量与 Child-pugh 分级评分呈负相关，且相关程度较强。

结论 HAE 患者增强后前两期残余肝实质内碘含量变化规律可以提示肝功能状态改变，并且同 Child-Pugh 分级评分相关程度较强，能成为临床常用 Child-pugh 评分系统的补充。

OR-066
体素内不相干运动在肝癌 TACE 术后随访中的初步研究

悦笑斐,韩萍,宋松林,袁锋,孔祥闯,卢玉婷,岑春媛
华中科技大学同济医学院附属协和医院

目的 探讨体素内不相干运动扩散加权成像（IVIM-DWI）在肝癌 TACE 术后疗效评估中的应用价值。

方法 搜集本院 TACE 术后复查的患者 35 例，对所有患者行常规 MRI 平扫、IVIM-DWI 扫描（b 值 =0、 10、 20、30、50、80、150、200、400、600、800、1000s/mm ^{2}）及动态增强扫描，并在一周内行 DSA 检查。以 DSA 及 MRI 增强结果为参照，通过用 MITK-Diffusion 软件勾画肿瘤活灶 37 例、临近肝实质 37 例及坏死区域 32 例，得到相应区域的体素内不相干运动参数纯扩散系数 D 值、伪扩散系数 D*值和灌注分数 f 值，并对各参数进行统计学分析。

结果 肿瘤活灶、临近肝实质及坏死区域在参数 D 中的值分别为（0.95±0.18）×10^{-3} mm^2/s、（1.07±0.13）×10^{-3} mm^2/s、（1.31±0.33）×10^{-3} mm^2/s，两两比较均有显著性差异，P＜0.05；在 D*值中分别为（73.75±54.63）×10^{-3} mm^2/s、（73.60±41.75）×10^{-3} mm^2/s、（28.87±40.10）×10^{-3} mm^2/s，其中肿瘤活灶与坏死区域、临近肝实质与坏死区域比较均有显著性差异，P＜0.05，肿瘤活灶与临近肝实质比较统计无显著性差，p＞0.05；在参数 f 值中分别为（21.64±8.40）%、（11.88±3.99）%、(7.65±6.30)%,两两比较均有显著性差异。受试者工作特征曲线显示，f 值对鉴别肿瘤与实质（敏感度 0.963、特异度 0.833）及肿瘤与坏死组织（敏感的

0.889、特异度 0.926）的效能最高，ROC 曲线下面积分别是 0.896、0.932。D 值对鉴别肿瘤与实质及肿瘤与坏死组织的效能次之，ROC 曲线下面积分别是 0.708、0.854。
结论 体素内不相干运动有助于 TACE 术后不同组织之间的鉴别，在 TACE 术后评价中有重要作用。

Utility of CT Radiomics Features for Estimation of Stroma Proportion and the Prognosis of Pancreatic Ductal Adenocarcinoma

Kai Cao,Hui Jiang,Yun Bian,Xu Fang,Jing Li,Ri Liu,Jianping Lu
Shanghai Changhai Hospital

Purpose:
To determine the utility of radiomics features for estimation of stroma proportion and the prognostic value in PDAC.
Materials and Methods:
A total of 122 resected pancreatic cancer patients and 13 borderline pancreatic cancer patients were enrolled in this study according to the inclusion criteria. The 3D volume of the pancreas was manually segmented from the preoperative CT scans by four trained researchers and verified by three abdominal radiologists. Four hundred seventy-one radiomics features were extracted to express the phenotype of the pancreas. Forty-five features were selected for analysis because of redundancy of computed features. The dataset was divided into 68 training cases (61 resected pancreatic cancer patients and 7 borderline pancreatic cancer patients) and 67 validation cases (61 resected pancreatic cancer patients and 6 borderline pancreatic cancer patient). A random forest classifier was used for classification. Masson trichrome staining was used to evaluate the stromal proportion. Survival rates were calculated according to the Kaplan–Meier method and were compared using the log rank test. Multivariate analysis was performed with a Cox regression model.
Results:
The radiomics features were positively associated with the stromal proportion of pancreatic cancer ($R = 0.898$, $P < 0.001$). Radiomics features were confirmed as an independent prognostic factor for pancreatic cancer based on multivariate analysis (hazard ratio =1.921, $P = 0.017$). For borderline patients who received nab-paclitaxel and gemcitabine, high radiomics features were associated with improved prognosis (OS: 12.7 vs. 10.1 mo, $P = 0.045$), but this positive association was not observed in patients treated with other gemcitabine-based regimens (OS: 11.1 vs. 12.6 mo, $P = 0.434$).
Conclusions:
A high radiomics features were associated with poor prognosis of resected pancreatic cancer but predicted improved survival for PDAC patients treated with the nab-paclitaxel and gemcitabine regimen.

OR-068
利用 Gd-EOB-DTPA 动态增强磁共振成像术前预测肝细胞肝癌微血管侵犯

李晓明
陆军军医大学第一附属医院（西南医院）

目的 探讨术前 Gd-EOB-DTPA 动态增强 MRI 的影像学特征是否能在术前预测肝细胞肝癌（HCC）微血管浸润(MVI)的存在。
方法 回顾性分析我院 2017 年 1 月至 2018 年 12 月术前行 Gd-EOB-DTPA 动态增强 MRI 的 120 例患者，影像学特征包括肿瘤长径、形态、数目、包膜、边界、动脉期瘤周异常强化、强化方式、弥散表观系数（ADC）值、肝胆期瘤周低信号，所有患者经过术前充分评估后均行肝癌切除术，大体标本送至病理科镜下观察 MVI 情况。
结果 120 例患者 58 例行解剖性肝癌切除术，60 例患者行非解剖性肝癌切除术，2 例行 ALPPS 术，术后病理结果诊断 MVI 阳性 55 例，MVI 阴性 65 例，单变量分析肿瘤长径（P=0.002）、形态（P=0.003）、数目（P=0.008）、包膜（P=0.015）、边界（P=0.020）、动脉期瘤周异常强化（P=0.037）、肝胆期瘤周低信号（P=0.001）与 MVI 显著相关，多变量回归分析肿瘤长径、数目、动脉期瘤周异常强化、肝胆期瘤周低信号是预测肝细胞肝癌 MVI 存在的独立危险因素，其阳性预测值和阴性预测值分别为 76.8%和 87.9%。
结论 利用 Gd-EOB-DTPA 动态增强 MRI 术前评估，如果存在大的肿瘤长径、多个肿瘤、动脉期瘤周异常强化、肝胆期瘤周低信号，能够预测 HCC 是存在 MVI。

OR-069
胰腺癌伴发胰腺炎的 MRI 表现

吴佳隆,邓艳,周婷,陈勇,张小明
川北医学院附属医院

目的 研究胰腺癌伴发胰腺炎患者的 MRI 特征及评估其胰腺炎严重程度。
方法 回顾性分析川北医学院附属医院 2016 年 1 月至 2019 年 6 月的胰腺癌伴发胰腺炎患者。对照组为同期的非肿瘤性急性胰腺炎患者。基于 MRI 影像资料，对比分析两组患者胰腺形态，胰腺炎累及范围，胆道系统及胰管扩张情况。用 MRSI 和 APACHE II 评分预测胰腺炎的严重程度。采用卡方检验及 U 检验进行统计分析，$p<0.05$ 有统计学意义。
结果 本次研究共纳入 55 例胰腺癌伴发胰腺炎患者[男性 39 例(70.9%)，女性 16 例(29.1%)，平均年龄 63.1 岁]。同期对照组急性胰腺炎患者 62 例[男性 38 例(61.3%)，女性 24 例(38.7%)，平均年龄 50.5 岁]（p=0.274）。胰腺癌伴发胰腺炎组与对照组，胰腺实质坏死分别为 6 例（10.9%）和 22 例（35.5%）（$p<0.05$）；仅胰腺周围坏死分别为 2 例（3.6%）和 26 例（41.9%），（$p<0.001$）；右肾筋膜增厚分别为 15 例（27.2%）和 38 例（61.3%）（$p<0.001$）；左肾筋膜增厚分别为 43 例（78.2%）和 53 例（85.5%）（$p=0.304$）。胰腺癌伴发胰腺炎组主胰管扩张 49 例（89.1%），对照组 28 例（45.2%）（$p<0.001$）；分别为 32 例（58.2%）和 41 例（66.1%）（p=0.376）。胰腺癌伴发胰腺炎组 MRSI 评分（3，2~3）明显低于对照组（4，4~6），差异有统计学意义（$p<0.001$），APACHE II 评分两组差异无统计学意义（p=0.496）。
结论 胰腺癌合并胰腺炎的患者 MRI 表现有其特异性，其伴发胰腺炎严重程度与非肿瘤性胰腺炎有差异。

OR-070
基于对比增强 MR 的影像组学模型鉴别胰腺导管腺癌和慢性肿块型胰腺炎

邓艳[1],张仕勇[2],明兵[2],张小明[1]
1.川北医学院附属医院
2.德阳市人民医院

目的 探讨基于对比增强磁共振成像(CE-MRI)门静脉期提取的组学特征能否鉴别胰腺导管腺癌(PDAC)与慢性肿块型胰腺炎(MFCP)

方法 回顾性收集 2016.01-2019-03 川北医学院附属医院和德阳市人民医院经病理证实的 84 例 PDAC 患者与 23 例 MFCP 患者的临床资料及 CE-MRI 图像，其中训练组包括 45 例 PDAC 和 13 例 MFCP，验证组包括 39 例 PDAC 和 10 例 MFCP。收集两组不同的影像学特征(病灶大小、强化程度、胆总管直径、主胰管直径)。使用三线插值重采样进行图像预处理。于 CE-MRI 门静脉期勾画病灶的最大截面。基于灰度直方图、纹理（灰度共生矩阵和灰度游程矩阵）以及形状计算影像组学特征。使用 z-score 标准化进行数据预处理，所有的特征经信度检验后，然后采用主成分分析进行降维，用支持向量机（support vector machine）进行影像组学建模分析。然后用受试者工作特性曲线(ROC)评价模型的诊断效能。

结果：4 项 CE-MRI 影像特征，在 PDAC 组与 MFCP 组无显著性差异(P>0.05)。共提取 412 个影像组学特征，经信度检验后，56 个纹理特征在 PDAC 组和 MFCP 组之间存在显著性差异(P<0.05)。经主成分分析后，选择判别能力最强，累计频率达 90%的四个主成分特征进行建模。模型训练组的分类器准确率达 83.2%，灵敏度为 74.4%，特异性为 90.0%，ROC 曲线下面积(AUC)为 0.862，模型验证组的分类准确率达 80.0%，灵敏度为 73.4，特异性为 82.1%，ROC 曲线下面积为 0.844。

结论:基于 CE-MRI 门静脉期的影像组学模型有助于鉴别 PDAC 和 MFCP。

OR-071
不同来源肝转移瘤多层螺旋 CT 影像学特征分析

姜昊,姜慧杰
哈尔滨医科大学附属第二医院

目的 探讨肝转移瘤多层螺旋 CT 增强特点，比较不同来源肝转移瘤囊变、钙化特征性表现发生率及病灶肝内分布情况，从而来提高对不同来源肝转移灶患者诊断以及鉴别诊断能力。

方法

收集 2015 年 3 月~2016 年 12 月我院不同来源肝转移瘤患者 109 例，包括结直肠癌转移 60 例，胃癌肝转移 29 例，肺癌肝转移 20 例，分析其影像学表现，重点观察不同时相强化特点，记录不同时相病灶的 CT 值、肝转移瘤位置、数目及肝左、右叶分布情况。

结果

（1）不同来源肝转移灶三期增强特点为胃癌呈慢升慢降型；结直肠癌及肺癌则为持续上升型。（2）109 例肝转移灶患者，囊变 42 例；出现钙化 26 例。门静脉来源的消化系统恶性肿瘤（结直肠癌及胃癌）肝转移瘤的囊变率和钙化率明显高于经肝动脉转移的肺癌患者。两种不同血行途径、不同来源的肝转移瘤的囊变（c^2=5.61, *P*=0.018; c^2=11.79, *P*=0.001）、钙化（*P*=0.039）出现率不同，差异具有统计学意义。（3）60 例大肠肝转移患者，右半大肠癌肝转移病人 38 人，肝右叶优势者占 74%（28/38），肝左叶优势者占 26%（10/38）。左半大肠癌肝转移病人 22 例，肝右叶优势者占 45%（10/22），肝左叶优势者占 55%（12/22）。

结论

（1）不同来源肝转移瘤三期增强特点不同（2）囊变和钙化常见于门静脉来源的消化系统恶性肿瘤引发的肝转移瘤，此特点对判断肝转移瘤由来有一定的引导价值。（3）左、右半结肠癌肝转移在肝内位置情况不同，差异有意义（*P*=0.029），检查肝内是否存在转移灶时，除了观察特征性表现，也可根据肝内病灶的分布特点进行分析。

OR-072

基于 MRI 影像组学特征在鉴别胰腺神经内分泌肿瘤与实性假乳头状瘤中的价值

史燕杰,刘玉良,朱海涛,张晓燕,李晓婷,孙应实
北京大学肿瘤医院

目的: 构建基于 MRI- DKI (diffusion kurtosis imaging)和 T2WI 影像组学特征鉴别胰腺神经内分泌肿瘤和实性假乳头状瘤的最佳模型。

材料与方法: 回顾性收集本院 57 例胰腺肿瘤病人，手术病理证实胰腺神经内分泌肿瘤 25 例，实性假乳头状瘤 32 例。所有病人均行 3.0T 扫描，包括常规序列和 DWI-DKI 序列。两名经验丰富的腹部 MRI 诊断医师，独立盲法手动勾画肿瘤感兴趣区域；应用 ITK-SNAP 软件，于 T2WI 与 DWI 图像勾画肿瘤的所有层面。计算胰腺肿瘤的平均扩散系数（mean diffusivity，MD）和 平均扩散峰度（mean kurtosis，MK）。应用最小绝对收缩和选择算子-Logistic 回归模型筛选特征并构建影像组学模型。应用受试者工作特征计算曲线下面积及诊断准确性。应用 kappa 检验评估两名医师的一致性。

结果: 两名医师勾画感兴趣区域一致性较好。胰腺神经内分泌肿瘤和实性假乳头状瘤之间的 MD 和 MK 值差异有统计学意义；应用 MD 和 MK 值鉴别两种疾病的诊断效能，曲线下面积（area under curve，AUC)分别为 0.732 和 0.650。筛选出 10 个特征在鉴别两种疾病的效能优于 MD 和 MK 值，其 AUC 0.94。在训练组中，基于 T2WI 和 DKI 影像组学模型鉴别这两种疾病的效能较好，AUC 0.950，灵敏度 94.12%，特异度 85.19%。在验证组中，应用该模型鉴别这两种疾病的效能较好，AUC 0.925，敏感度 100%，特异度 80%。

结论 基于 DKI 和 T2WI 的影像组学模型鉴别胰腺神经内分泌肿瘤与实性假乳头状瘤的效能高于 MD 值和 MK 值，能够为临床治疗策略的制定提供参考。

OR-073

容积 ADC 直方图对胆囊癌的诊断价值

吴思思,李震
华中科技大学同济医学院附属同济医院

目的 探讨 DWI 所得的容积 ADC 直方图对胆囊癌的诊断价值。

材料与方法 收集华中科技大学同济医学院附属同济医院 2017 年 9 月-2018 年 12 月确诊并有完整的 MRI 资料的胆囊病变患者 789 例。经过随访，排除不合格样本，最终 86 例胆囊病变患者纳入研究。由两位医师测量病理证实的 86 例胆囊疾病患者术前进行的 DWI 检查，通过第三方软件生成 ADC 值灰度直方图，并计算出胆囊癌的灰度平均值、第 10 百分位数、第 25 百分位数、第 50 百分位数、第 75 百分位数、第 90 百分位数、标准差、峰度、偏度、熵。对两位医师的测量结果采用 weighted K 检验评估一致性。用曼-惠特尼 U 检验对比两组病变均值差异的显著性，并根据受试者

操作特性曲线(ROC)下面积（AUC）来判断其诊断准确性，评价直方图参数对于良恶性病变的鉴别诊断效能。

结果 1.一致性分析：两名医师的测量数据一致性分析具有较好的可信度，ICC 为 0.715-0.872。2.胆囊癌的灰度平均值、第 10 百分位数、第 25 百分位数、第 50 百分位数、第 75 百分位数、第 90 百分位数均低于胆囊良性病变（p 均<0.001）。

3.恶性病变的 SD 和熵显著高于良性病变，但是良恶性病变间的峰度和偏度没有显著差异（p<0.05）。

4.ADC 的平均值、第 10 百分位数、第 25 百分位数、第 50 百分位数、第 75 百分位数、第 90 百分位数、标准差、峰度、偏度和熵在 ROC 曲线上对应的 AUC 分别为 0.856、0.963、0.959、0.942、0.908、0.721、0.861、0.526、0.513 和 0.612。第 10 百分位数具有较高的鉴别诊断效能，其 AUC 范围为 0.959-0.968。当临界值为 95 时具有最大的约登指数，其特异度、准确度分别为 89.5%、95.4%。

结论 ADC 容积定量直方图可以对胆囊良恶性病变鉴别诊断提供一定的帮助，直方图参数在胆囊癌诊断中具有较大价值。

OR-074
术前 CT 影像预测肝内胆管细胞癌瘤周 Glisson 鞘侵犯

毛应凡,何健
南京大学医学院附属鼓楼医院

目的 探索有瘤周 Glisson 鞘侵犯（PGSI）和无 PGSI 的肝内胆管细胞癌（ICC）的临床病例特点和计算机断层扫描（CT）指标的差异，并且建立术前预测 ICC 伴有 PGSI 的诺谟图。

方法 回顾性分析了 84 个 ICC 患者的临床病理特点和 CT 指标，比较有 PGSI 的 ICC(30/84, 35.7%)和无 PGSI 的 ICC(54/84, 64.3%)的临床病理特点和 CT 指标的差异。用多因素逻辑回归分析来探索 PGSI 的术前独立危险因素。

结果 有 PGSI 和无 PGSI 的 ICC 患者在是否伴有腹痛、血清胚抗原（CEA）和糖类抗原 19-9（CA19-9）水平、TNM 分期、T 分期、肿瘤位置、肿瘤内钙化、肝内胆管扩张、肝内胆管结石、大体分型和动态增强模式具有显著差异。腹痛、血清 CEA 水平、肝内胆管扩张和大体分型是 ICC 伴有 PGSI 的独立危险因素。基于这些独立危险因素构建术前预测 PGSI 的诺谟图，受试者工作特征曲线下面积是 0.908。

结论 有 PGSI 和无 PGSI 的 ICC 患者临床病理特点和 CT 指标有显著差异。由腹痛、血清 CEA 水平、肝内胆管扩张和大体分型构建的诺谟图可以术前准确地预测 PGSI。

OR-075
急性胰腺炎相关腹壁改变的 CT/MRI 成像及尸体标本解剖学研究

肖波[1,2],徐海波[1],胡金香[1]
1.武汉大学中南医院
2.川北医学院附属医院

目的 探讨急性胰腺炎所致的腹壁改变的影像学表现、临床特征和解剖学机制。方法 前瞻性收集 2017 年 12 月至 2019 年 1 月期间 155 例（男 94：女 61）连续性急性胰腺炎患者且住院治疗，所有患者均在发病 24h 内入院就诊且在发病 5 天内行 CT 和（或）MRI 检查。收集所有患者的影像检查结果和实验室检查资料（包括血淀粉酶、脂肪酶、血清白蛋白水平）。在武汉大学基础医学院解剖

学教研室观测大体标本 10 具及断面标本 2 具。结果 按照新亚特兰大国际共识分类，轻度（MAP）占 38.7%[60 例（男 34，女 26）]；中度（MSAP）占 41.3%[64 例（男 40，女 24）]；重度（SAP）占 20%[31 例（男 20，女 11）]。在 CT/MRI 上，总共检查腹壁水肿患者占 56.1%（87/155）；其中，腹壁水肿在轻度、中度、重度的发生率分别为 20%（12/60）、68.8%（44/64）、100%（31/31）。CT/MRI 上腹壁水肿严重度与 CTSI/MRSI 呈中度正相关 （r = 0.64, p < 0.001）。腹壁改变程度与患者血清白蛋白水平呈中度负相关 （r = -0.63, p < 0.001）。尸检发现急性胰腺炎相关的腹壁改变存在两条重要的解剖学通路：（1）腹前外侧壁通路：右侧经由肝周腹膜腔-镰状韧带旁-腹直肌深面-膈肌中心腱-腹外斜肌与膈肌间隙-肋间肌间-皮下浅筋膜深层；（2）腹后壁通路：肾后平面-肾旁后间隙-腹横筋膜-狭窄通道-胸腰筋膜-皮下浅筋膜深层-皮肤。结论 急性胰腺炎相关的腹壁改变是一项常见且重要的临床体征和影像学征象，腹壁改变程度与胰腺炎的严重程度成正相关，即可作为反映胰腺炎严重性的简单且可靠的指标。腹壁改变一方面与低蛋白血症密切关联，另一方面为存在着两个腹壁解剖学通道机制。

比较以不同组织为感兴趣区域测得肝脏灌注参数的异同

徐佳,王萱,王士阗,薛华丹,金征宇
中国医学科学院北京协和医院

目的 比较以胃壁、胰腺为感兴趣区域所得的灌注参数与以脾脏为感兴趣区域（region of interest, ROI）所得灌注参数的差异，探索对于脾脏切除患者，是否可以其他脏器为感兴趣区域替代脾脏测量肝脏灌注参数。

方法 回顾性纳入在我院进行肝脏灌注 CT 扫描的肝局灶性病变患者共 38 例。扫描采用第 3 代双源 CT（SOMATOM Definition Force, Siemens Healthcare）,患者屏气呼吸，扫描范围自肝上缘 1-2cm 起向下 20cm，共扫描 18 期图像，层厚 1.5cm。后处理采用西门子工作站 CT body perfusion 软件，勾画主动脉及门脉 ROI，之后分别利用脾脏、胃壁、胰腺为感兴趣区域处理获得 3 组灌注伪彩图。在 3 组伪彩图上，在肝右叶、肝左叶相同位置分别勾画 ROI，得到 3 组灌注参数，包括肝动脉灌注量（arterial liver perfusion, ALP）、门静脉灌注量（portal venous liver perfusion, PVP）、肝动脉灌注指数（hepatic perfusion index, HPI）。利用配对 T 检验比较三组灌注参数的异同，P<0.05 为差异有统计学意义。

结果 以胰腺为 ROI 处理测得的 ALP、PVP、HPI 与以脾脏为 ROI 处理测得的参数无统计学差异（P=0.136、0.321、0.762）。以胃壁为 ROI 处理测得的 ALP、HPI 显著高于以脾脏及胰腺为 ROI 测得的参数（胃壁 vs 脾脏，P=0.008、0.007; 胃壁 vs 胰腺，P=0.022、0.002）。以胃壁为 ROI 处理测得的 PVP 与脾脏、胰腺无统计学差异（P=0.849、0.587）。

结论 以胰腺为 ROI 测得的灌注参数与以脾脏为 ROI 测得的灌注参数无显著差异，对于脾脏切除的患者，利用胰腺作为 ROI 测得的肝脏灌注参数可一定程度上反应肝脏的灌注参数。

多期磁共振图像的纹理特征在预测肝细胞癌组织学分级中的临床价值

严川,李跃明
福建医科大学附属第一医院

目的 探讨多期磁共振图像的纹理特征在预测肝细胞癌组织学分级中的作用，为临床术前制定治疗方案提供影像学依据。

材料与方法 连续性纳入我院 2014 年 9 月至 2017 年 12 月经组织病理确诊的肝细胞癌患者 83 例。肝细胞癌的组织学分级根据 Edmondson-Steiner 分级法分为 I-IV 级，把 I 级和 II 级归为“低级别组”，III 级和 IV 级归为“高级别组”。评估肝细胞癌形态学表现包括动脉期强化程度、肿块形态和弥散受限情况等；并将所有研究对象术前磁共振图像导入后处理软件，手工勾画感兴趣区，提取肝胆期、T2WI、动脉期及门脉期图像中病灶的纹理特征。运用统计学方法，对所得的参数进行 Spearman 相关性分析，并进行受试者工作特征曲线（ROC）分析。
结果 83 例肝细胞癌患者中男性 72 例，女性 11 例，年龄 23-85 岁，中位年龄 52 岁。其中“低级别组”54 例，“高级别组”29 例。研究结果显示年龄在低级别组及高级别组之间差异具有统计学意义（P=0.032；P＜0.001）。对于影像学特征的评估，肿瘤大小、形态不规则、出血及动脉期高强化差异均具有统计学意义（P 值均＜0.05），观察者间一致性 Kappa 值 0.631-0.888。基于肝胆期图像的纹理参数曲线下面积为 0.383-0.701，曲线下面积最大的纹理参数为 Horzl_RLNonUni；基于 T2WI 图像的纹理参数曲线下面积为 0.333-0.670，曲线下面积最大的纹理参数为 Teta3；基于动脉期图像的纹理参数曲线下面积为 0.322-0.713，曲线下面积最大的纹理参数为 WavEnLH_s-1；基于门脉期图像的纹理参数曲线下面积为 0.305-0.755，曲线下面积最大的纹理参数 Perc.10%。
结论 多期磁共振图像的纹理特征能够预测术前肝细胞癌的组织学分级，为临床评估肝细胞癌的侵袭性提供影像学依据，有助于评估患者的预后。

【摘要】 目的 探讨肝细胞癌（hepatocellular carcinoma，HCC）治疗前 CT 图像的纹理分析预测经导管肝动脉化疗栓塞（transcatheter arterial chemoembolization, TACE）早期疗效的临床价值。 **材料与方法** 收集 67 例 HCC 病人的资料，均在 TACE 治疗前 4 周内和治疗后 4-8 周内行行 CT 检查，治疗前后 CT 检查均为三期动态增强扫描。对比 TACE 治疗前后 CT 图像，按实体肿瘤反应评价标准改良版（Modified Response Evaluation Criteria in Solid Tumors， mRECIST）标准行疗效评价，为完全缓解(CR)8 例、部分缓解(PR)15 例、 疾病稳定(SD)27 例和疾病进展(PD)17 例，缓解组（CR+PR）23 例，非缓解组（SD+PD）44 例；稳定组（CR+PR+SD）50 例，非稳定组（PD）17 例。对 TACE 治疗前 CT 三期图像进行感兴趣区(region of interest, ROI)全容积人工勾画，使用 FireVoxel 软件对 ROI 进行纹理分析，获得关于灰度直方图的 16 项纹理参数。使用 SPSS 软件比较缓解组和非缓解组之间、稳定组与非稳定组之间的各项灰度直方图参数的差异。对于有统计学意义的纹理参数，采用受试者工作特征曲线分析其诊断效能，计算各参数用于预测缓解或稳定的曲线下面积等各项数值。 **结果** 治疗前 CT 三期的 48 组纹理参数，对比缓解组与非缓解组，只有动脉期图像的熵和最大值有统计学意义；对比稳定组与非稳定组，只有门静脉期图像的峰度和熵有统计学意义。四个纹理参数的 ROC 曲线上对应的 AUC 分别为 0.663、0.720、0.686、0.673。 **结论** TACE 治疗前 CT 的纹理分析，可以获得相关灰度直方图参数，用于预测 TACE 治疗 HCC 的早期疗效。

血管内皮抑制素联合 TACE 治疗的疗效及对纹理分析中影像特征的影响

吕银章,朱海丹,李震,胡道予,海玉成,胡学梅,沈亚琪,王梓,王南,徐安辉
华中科技大学同济医学院附属同济医院

目的 探讨血管内皮抑制素联合 TACE 治疗 HCC 的疗效，及其对 HCC 肿瘤组织的影像特征的影响。

材料与方法 收集 70 例 HCC 病人的资料，28 例接受了血管内皮抑制素联合 TACE 治疗作为观察组，42 例接受了常规 TACE 治疗作为对照组，于治疗前 4 周内和治疗后 4-8 周内行 CT 检查，治疗前后 CT 均为三期动态增强扫描。按 mRECIST 标准评价两组疗效。使用 FireVoxel 软件对两组治疗后 CT 的门静脉期薄层图像进行全容积感兴趣区(region of interest, ROI)人工勾画，获得关于灰度直方图的 16 组参数。使用 SPSS 软件比较两组疗效和灰度直方图参数的差异。对于有统计学意义的纹理参数，采用 ROC 曲线分析其诊断效能，计算其 AUC 等各项数值。

结果 观察组 28 例中疗效为 CR、PR 和 SD 为 6 例、10 例、8 例，对照组对应疗效分别为 4 例、10 例、16 例，两组疗效的差别有统计学意义。两组的灰度直方图参数中有七项的差异有统计学意义，包括标准差、不均一性、峰度、熵、及第 75、90、95 百分位数，采用 ROC 曲线的 AUC 对其进行排序，前三位为：第 95 百分位数、熵、峰度，对应的 AUC 分别为 0.747、0.744、0.728，最大的约登指数分别为 0.440、0.500、0.405。

结论 与单纯 TACE 治疗相比，血管内皮抑制素联合 TACE 治疗可以提高疗效，并改变肿瘤组织影像特征。

BSP TI 值与非对比剂增强 MR 门静脉成像质量关系探讨

竺笛,沈亚琪,胡道予
华中科技大学同济医学院附属同济医院

目的 探讨利用多翻转空间标记脉冲（spatial labeling with multiple inversion pulses，SLEEK）的非对比剂增强磁共振门静脉成像（non-contrast-enhanced magnetic resonance portography，MRP）中血流抑制翻转时间（blood suppression inversion time，BSP TI）参数设置与门静脉成像质量的关系。

材料与**方法** 纳入 25 名门静脉高压患者先后行利用多翻转空间标记脉冲的非对比剂增强磁共振门静脉成像（non-contrast-enhanced magnetic resonance portography，MRP）检查。SLEEK-MRP 序列采用不同血流抑制翻转时间（blood suppression inversion time，BSP TI）：600ms，900ms，1200ms，1500ms。由两位放射学医师对 SLEEK-MRP 序列图像门静脉显示质量以四分法进行主观评分并计算两者评分一致性。对 SLEEK-MRP 序列图像门静脉分支显示级别进行评分并对各 BSP TI 值下门静脉显示评级进行统计。

结果 两位医师对 SLEEK-MRP 序列图像门静脉显示质量主观评分显示出良好的一致性。在 BSP TI 值为 600ms、900ms 及 1200ms 时相较 1500ms 时图像质量主观评分更好。各患者门静脉分支级别显示评分随 BSP TI 值升高而呈增加趋势，BSP TI 值由 1200ms 升高至 1500ms 时在多数患者分支显示增加不明显。

结论 SLEEK-MRP 对门静脉分支的显示随 BSP TI 值的升高而增加，而 BSP TI 值达到 1500ms 时图像信噪比有所下滑，而分支显示增加不明显。对于 SLEEK-MRP 进行门静脉成像，推荐设置 BSP TI 值为 1200ms，既能得到清晰锐利的高信噪比图像，又能较大限度地对门静脉细小分支进行显示。

LI-RADS 征象及 MRI 定量参数对肝细胞癌 MVI 术前预测价值的研究

谢斯敏,李文政
中南大学湘雅医院

目的 探讨 LI-RADS 定义的影像征象、IVIM-DWI 及 DCE-MRI 的定量参数对术前预测 HCC MVI 价值。
材料与方法 收集我院 2018 年 3 月至 2019 年 3 月共 146 名临床初诊为肝占位的病人，行 T2WI、T1-VIBE-Dixon，IVIM-DWI 和 DCE-MRI。纳入术后病理为 HCC 的患者，根据 MVI 个数及位置分为 M0 组（无 MVI），M1 组（≤5 个 MVI，且发生于近癌旁肝组织），M2 组（＞ 5 个 MVI，或 MVI 发生于远癌旁肝组织区域（＞1cm））。参考 2018 版 LI-RADS 获得影像征象，包括 APHE（no-rim）、非边缘廓清、强化包膜、病灶多发、T2WI 中等或稍高信号、DWI 弥散受限、病灶内含脂质、出血、周围肝实质晕状强化、结中结、马赛克。通过后处理软件获得 D、D^*、f、 K^{trans}、K_{ep}、V_e、V_p、 TTP ，Max Concentration、Max Slope 和 iAUC。对比分析 LI-RADS 征象及 MRI 参数在 MVI 组间的差异及其预测效能。
结果 共收集 HCC 50 例（M0 组 24 例，M1 组 20 例，M2 组 6 例）。病灶多发的出现率在有 MVI 组中高于无 MVI 组（$P<0.01$）。有 MVI 组的 D、D^*、f、K^{trans}、V_e显著低于无 MVI 组（$P<0.05$）。各参数对 MVI 的预测效能由高到低依次为 $D+K^{trans}>K^{trans}>D>f>D^*>V_e$，D 和 K^{trans}联合预测 MVI 时，灵敏度 96.15%，特异度 95.83%，AUC0.99。病灶多发的出现率在 MVI 组间的差异有统计学意义（P=0.01）。D、f、K^{trans}、V_e在 M1 组显著低于 M0 组，D、D^*、f 和 K^{trans}在 M2 组中显著低于 M0 组（$P<0.01$）。
结论 LI-RADS 辅助征象中病灶多发和 MRI 定量参数中 D、D^*、f、K^{trans}、V_e对于 HCC 是否存在 MVI 有一定的预测价值。

OR-082
3.0T 磁共振钆塞酸二钠增强检查评估华支睾吸虫病胆管周围肝损伤的价值

林晓庆
广西医科大学第一附属医院

目的 探讨华支睾吸虫病胆管周围肝损伤的 3.0T 磁共振钆塞酸二钠增强扫描影像学特点。
方法 回顾性搜集本院 18 例经临床或病理证实的华支睾吸虫病所致肝损伤。所有患者行 3.0T 磁共振钆塞酸二钠增强扫描，两名不同年资放射科医生独立对 MRI 所有图像进行判读，包括 T1WI、T2WI、DWI 及增强扫描动脉期、静脉期、平衡期及肝胆特异期胆管及胆管周围信号的改变，胆管扩张分布的情况，对两人的判读结果进行 Kappa 分析，分析钆塞酸二钠对局灶性病灶组和弥漫性病灶组检出率并进行统计学分析。
结果 局灶性病灶组共 5 例，表现为类圆形病灶，增强扫描动脉晚期为环形强化，肝胆期为低信号，细胞内、外对比剂特性对病灶检出率无统计学差异；弥漫性病灶组 13 例，增强扫描动脉晚期明显强化，肝胆期为低信号，呈楔形分布于肝包膜下，细胞内对比剂特性对病灶的检出率明显优于细胞外对比剂特性，差异有统计学意义（P=0.003）。
结论 钆塞酸二钠具有细胞外对比剂和细胞内对比剂的双重特性，细胞内对比剂特性能明显提高病灶的检出率，对于华支睾吸虫病胆管周围肝损伤具有更高的价值。

不典型无功能神经内分泌肿瘤与胰腺导管腺癌的鉴别诊断分析

何铭,徐进,薛华丹,金征宇
中国医学科学院北京协和医院

目的 分析不典型无功能神经内分泌肿瘤（NF-pNET）及胰腺导管腺癌（PDAC）的影像学表现及临床指标，探讨对两者鉴别有价值的征象及指标。**方法** 从 2014 年 7 月至 2017 年 12 月，回顾性收集我院经手术病理证实的 PDAC(n=55)和不典型 NF-pNET(n=45)患者。所有患者均术前 1 月内行胰腺增强 CT 检查，且术前未接受任何治疗。由两名影像科医生独立分析上述两组病例的影像学表现。同时收集其临床指标包括 CA199，CA125 和 CEA 水平。利用 kappa 值分析两名观察者间一致性。定性征象的分析采用卡方检验或 Fisher 精确概率法，定量指标的分析采用 Mann-Whitney U 检验。采用单因素和多因素分析筛选独立的实验室指标和影像学征象。采用 ROC 曲线分析、灵敏度、特异度评估鉴别诊断价值。**结果** 所有影像征象均有较好的一致性(kappa 值范围：0.758-0.937)。不典型 NF-pNET 与 PDAC 两组病例中有统计学差异的征象有：病变大小(46mmvs.36mm)，形态规则(62%vs.16%)，密度均匀(20%vs.53%),突出胰腺轮廓（89%vs.40%）,钙化（24%vs.6%）肝转移(31%vs.9%)(P 均小于 0.05)。是否包绕血管、胰胆管是否扩张和胰腺实质萎缩对于两者鉴别均不具有统计学意义(P 均大于 0.05)。联合突出胰腺轮廓，形态是否规则及 CA199 水平的鉴别 AUC 值为 0.937(95%CI: 0.913, 0.959)，灵敏度为 91.7% (95%CI:87.4%, 96.3%)，特异度为 83.9%(95%CI:79.1%, 88.6%)。**结论** 病变形态是否规则、是否突出胰腺实质及 CA199 水平可以帮助两者鉴别。是否接触血管、胰胆管扩张及胰腺实质萎缩对不典型 NF-pNET 及 PDAC 的鉴别价值有限。联合临床及影像学表现时，大多数不典型 NF-pNET 能与 PDA 进行鉴别。

OR-084
双能 CT 对早期急性胰腺炎血流灌注定量评价

卢玉婷,韩萍,杨明,彭涛,岑春媛,悦笑斐
华中科技大学同济医学院附属协和医院

目的 评估使用双能 CT 碘浓度值定量评价早期各级急性胰腺炎的诊断性能。
方法 前瞻性收集 2018 年 12 月-2019 年 5 月早期急性胰腺炎患者 46 名（男性 29 名，女性 17 名；平均年龄 47.7±13.3），所有患者在双能 CT（SOMATOM Force，Siemens Healthcare）上行双能量增强 CT 扫描。根据 Balthazar CT 严重指数将病人分为两组：轻度 21 人（A 组），中度及重度 25 人（B 组）。测量并比较增强扫描动脉期、门脉期及延迟期碘浓度值及标准化碘浓度值的差异，绘制所有参数诊断 A 组与 B 组的 ROC 曲线并计算曲线下面积，确定各参数对各级急性胰腺炎的诊断阈值。P<0.05 时有统计学意义。
结果 1、两组门脉期碘浓度值、动脉期碘浓度值及延迟期标准化碘浓度值差异均有统计学意义（$F_{门脉期碘浓度值}$=1.51，P<0.0005；$F_{动脉期碘浓度值}$=0.63，P<0.0005；$F_{延迟期标准化碘浓度值}$=3.67，P<0.005）；其余各参数两组间差异无统计学意义（P>0.05）；2、A 组与 B 组的最佳门脉期碘浓度阈值为 2.39mg/ml，敏感度 71.4%，特异度 88.0%，ROC 曲线下面积（AUC）为 0.82；A 组与 B 组的最佳动脉期碘浓度阈值为 2.62mg/ml，敏感度 66.7%，特异度 88.0%，ROC 曲线下面积（AUC）为 0.79。
结论 双能量 CT 碘浓度值能够定量分析早期各级急性胰腺炎，其中门脉期碘浓度值在早期各级急性胰腺炎中具有最高的诊断效能。

MRI 动态增强减影技术联合 DWI 在原发性肝 Ca 局部介入治疗术后疗效评估的应用

赵梦,王青
山东大学齐鲁医院

目的 对比肝脏常规 MRI 动态增强、动态增强减影及 DWI 在评价经局部介入治疗术后表现为 MRI 平扫 T1 高信号的原发性肝癌治疗疗效的差异；探讨肝脏 MRI 动态增强减影技术联合 DWI 在原发性肝癌综合介入术后疗效评估的临床应用优势。**资料和方法** 收集经临床病理证实为原发性肝细胞癌未经手术治疗，仅接受射频消融、微波消融、动脉内化疗栓塞等局部介入手术且术后病灶表现为 MRI 平扫 T1 高信号的患者 56 例。由两位高年资腹部影像诊断专家，根据患者临床实验室及影像学检查，将患者治疗后 6 个月病灶分为治疗完全组（病理坏死组-强化 MRI 或 CT 病灶无强化或薄环状强化；病变范围不变或缩小)和治疗不完全组（肿瘤组织残留或复发组-病灶边缘结节状或不规则强化；病变范围扩大）。由另外三名不同年资影像诊断医生对患者介入术后 6 个月 MRI 动态增强、动态增强减影及 DWI 图像进行定性分析，比较不同方法评价疗效的信心度水平；分别测量病灶与肝实质组织在 MRI 增强动静脉期与动静脉减影图像上的信号强度值（$SI_{病灶}$、$SI_{肝实质}$）、背景噪声标准差（$SD_{背景}$），计算病灶在不同期相的图像对比信噪比（CNR）。测量病灶 ADC 值，比较组间差异。**结果** MRI 动态增强减影医师信心度水平显著高于常规动态增强与 DWI。治疗完全组病灶在动静脉期与动静脉减影图像的 CNR 分别为 13.33±9.8/41.87±25.57/14.00±11.07/53.42±17.74，治疗不完全组 47.79±29.09/34.24±22.09/77.08±35.95/44.15±21.02.治疗不完全组病灶动脉期减影 CNR 明显大于动脉期 CNR(P=0.000);两组病灶静脉期减影 CNR 均明显大于静脉期 CNR.治疗完全组/不完全组病灶 ADC 值为 1.60±0.33/1.18±0.17,两组间有显著差异.**结论** 减影技术可显著提高医师信心度水平，有效鉴别坏死与复发，不同疗效 ADC 值不同。

OR-086

Multi-parametric MR Relaxometry of Adenomyosis: Assessment of Symptom and Prediction of Response to Gonadotropin Releasing Hormone Agonists

Chengyu Lin[1],Yonglan He[1],Yafei Qi[1],Xiaoqi Wang[2],Hailong Zhou[1],Huadan Xue[1],Zhengyu Jin[1]
1.Peking Union Medical College Hospital
2.Philips Healthcare

PURPOSE
To investigate whether MR relaxometry can evaluate symptoms of adenomyosis including dysmenorrhea and abnormal uterine bleeding, and to explore whether MR relaxometry can further predict the therapeutic response to gonadotropin-releasing hormone agonists (GnRH-a) in patients with adenomyosis.
METHOD AND MATERIALS
Between Nov 2017 and Aug 2018, 52 patients clinically diagnosed as adenomyosis underwent multi-parameter uterine MR examinations including T_1, T_2 and T_2* relaxometry on a 3T MR scanner (Ingenia CX, Philips Healthcare, the Netherlands) during the peri-ovulatory period. Visual analogue scale (VAS) of dysmenorrhea and blood haemoglobin level were collected before GnRH-a injections and 6 months after. T_1, T_2, and T_2*

relaxation times of lesions were measured blindly by two radiologists via Intellispace Portal (version 10.1.0.64190, Philips Healthcare, the Netherlands) on slices showing maximum lesion area, as well as maximum diameters of lesions on sagittal T2W images. Spearman rank correlation coefficients were calculated to determine the relationship between relaxation times and VAS. Student t-tests were performed to compare the difference of lesions' features between patients with different therapeutic responses. A p-value <0.05 was considered statistically significant.

RESULTS

A moderate, negative correlation was found between T_2* relaxation time of lesions and VAS (r=-0.4808, p=0.0004). Twenty-three patients received GnRHa injection, and 14 of them achieved complete response (CR, VAS=0 and normal Hgb) after 6 months, while 9 patients with partial response (PR, VAS>0 or anaemia). T_2* relaxation times of lesions were shorter in patients with CR than those with PR (43.73±2.019 ms vs. 55.43±5.465 ms, p=0.0295). Differences were found regarding T_2 relaxation times and lesion maximum diameters but they were not statistically significant (63.12±1.913 ms vs. 71.07±3.685ms, p=0.0501, and 61.46±6.899 mm vs. 41.69±5.721 mm, respectively).

CONCLUSION

T_2* relaxation time of lesions can quantitatively assess dysmenorrhea severity in patients with adenomyosis. Furthermore, T_2* relaxometry showed potential as a quantitative imaging marker to predict GnRHa therapeutic response in patients with adenomyosis.

OR-087

Pre-treatment multiparametric MR for disease free survival predicting in advanced cervical cancer treated by chemoradiotherapy: A radiomics approach

Bo Zhao,Kun Cao,Ying-shi Sun
Department of Radiology, Key Laboratory of Carcinogenesis and Translational Research, Ministry of Education, Peking University Cancer Hospital and Institute

Purpose: To investigate the potential value of pre-treatment multiparametric MR using radiomics analysis in predicting long-term effect presented by disease free survival (DFS) after chemoradiotherapy in advanced cervical cancer patients. **Materials and methods:** Biopsy proven uterine cervical squamous cell carcinoma patients who received chemo-radiation therapy during 2009-2013 in a single institute were followed up. Valid MR images including T2WI, diffusion (DWI) and dynamic contrast-enhanced (DCE) images were retrieved to a house-made texture analyzing software developing on 3D slicer. Region of interests were drawn manually on DWI along the rim of tumors on every slice so as to achieve whole-tumor volumetric data, with reference to T2WI on side and applied to parametric maps including ADC and eADC from DWI, SER, PEI, MSI and MSD from DCE. A total of 1026 features (including first-order, shape-and size-based, textural and wavelet) for each set of parametric map were extracted. T est and least absolute shrinkage and selection operator (LASSO) method were used to select features, and ROC curves were used to analysis the diagnostic efficiency. **Results:** The follow-up time for 73 patients were 7.1 to 94.6 months (median 50.6 months), with 55 patients free of recurrence or metastasis at the end of follow-up. 13 features were selected as having

significant association with DFS. The area under the ROC curve, the sensitivity and specificity for predicting DFS were 0.86, 0.83 and 0.85 respectively. **Conclusion:** In this long-term follow up cohort, using pre-treatment multiparametric MR and radiomics approaches, imaging derived values has good potential in predicting disease free survival for cervical cancer patients that treated with chemoradiation. However, large sample is needed for further validation and it is subject to change with improvement of radiomics models in future study.

超高 b 值扩散加权成像及 IVIM 成像在前列腺癌诊断中的应用价值初步研究

印隆林[1],曾桔[1],王益双[1],孙菊[1],王少彧[2]
1.四川省医学科学院·四川省人民医院
2.西门子医疗系统有限公司磁共振科研市场部

目的 探讨超高 b 值扩散加权成像（DWI）及体素内不相干运动（IVIM）成像在前列腺癌（PCa）诊断中的应用价值。**方法** 前瞻性纳入 2018 年 11 月～2019 年 5 月在我院行前列腺 IVIM-DWI（b=0、50、100、150、200、400、600、800、1000、1500、2000s/mm^2），且之后经病理确诊为 PCa 或前列腺增生（BPH）的 44 名患者作为研究对象。比较 ADC 值(b=0、2000s/mm^2)、D 值、D*值及 f 值在 PCa 与 BPH 组间、PCa 低分组（Gleason 评分≤6）与高分组（Gleason 评分≥7）间的差异，并绘制受试者工作特征曲线（ROC）。并分析各参数与 Gleason 评分的相关性。**结果** ① PCa 组 24 例，BPH 组 20 例，ADC 值、D 值在两组间的差异有统计学意义（P<0.05）。ADC 值及 D 值诊断 PCa 的曲线下面积（AUC）分别为 0.998、0.995，差异没有统计学意义（P>0.05）。② PCa 低分组 6 例、高分组 18 例，ADC 值、D 值在两组间的差异具有统计学意义（P<0.05）。ADC 及 D 值区分 PCa 低分组与高分组的 AUC 分别为 0.759、0.880，差异有统计学意义（P<0.05）。③ ADC 值及 D 值与 Gleason 评分均具有相关性，相关系数(r)分别为-0.441、-0.560。**结论** 超高 b 值扩散加权成像及 IVIM 成像在 PCa 诊断中均有一定价值，但二者价值有所不同。

盆腔 MR 水成像指导梗阻性无精症患者治疗方法 的临床价值研究

姜航
中山大学附属第三医院

目的 梗阻性无精症在不育症男性中检出率达 6.1%-13.6%；多数患者可手术纠正，不需要额外辅助生殖技术；而对于梗阻范围广、梗阻时间长的病例，手术重建输精管的治疗方式存在远期通畅率不佳的问题。本研究尝试利用 MR 所示阴囊结构形态学差异筛选适合输精管复通术的患者，为治疗方式的选择提供依据。**方法** 回顾 2017.2 至 2019.2 因不育症于我院放射科行盆腔 MR 检查的男性患者，筛选出梗阻性无精症患者。记录患者临床资料。根据盆腔 MR 图像观察患者两侧的睾丸、附睾及输精管，评估附睾形态是否正常，附睾管是否扩张及扩张程度；输精管是否缺失或细小，输精管是否扩张及扩张程度。记录睾丸大小，计算睾丸体积，测量扩张的附睾管及输精管内径。根据后续的治疗方式分成：取精组和重建组。比较两组患者的病因及 MR 征象是否存在差异。采用 ROC 曲

线评价有统计学差异的参数在筛选梗阻性无精症患者治疗方式的临界值、敏感性、特异度、阳性预测值、阴性预测值及准确性。**结果** 本研究共纳入 23 例患者：取精组 9 例和重建组 14 例。分析患者病史、实验室检查、MR 报告及术中探查情况，将梗阻病因分成炎症、结核、先天性及医源性因素。两组患者的病因学分类有明显的统计学差异，其中结核感染和先天性发育不良患者更多采用辅助生殖技术，普通炎症和医源性所致的患者更倾向选择输精管复通术。两组间睾丸体积及输精管内径差异无明显统计学意义，而附睾管内径、附睾及输精管发育不良有统计学差异。以附睾管扩张内径作为独立指标，ROC 曲线下面积为 0.931（95%CI：0.892，0.971）；以附睾管内径 0.55mm 作为临界值，敏感性 87.5%，特异度 86.7%，阳性预测值 77.8%，阴性预测值 92.8%，准确性 87.0%。**结论** 在梗阻性无精症患者中，当观察到 MR 图像中附睾管内径＞0.55mm，附睾形态异常，输精管细小或缺失等征象时，此类患者输精管重建术效果不佳，可采用精子抽吸术。

多频三维高分辨率 MRE 对前列腺癌病理分级的价值

李梦思[1],李文政[1],胡平[1],Guo Jing[2],刘文广[1],李韵甜[1],张利娟[1]
1.中南大学湘雅医院
2.Department of Radiology， Charite-Universitatsmedizin Berlin

目的 探讨多频三维高分辨率 MRE 技术对前列腺癌病理分级的价值。
方法 前瞻性收集 2018 年 11 月至 2019 年 7 月经组织病理证实并行 Gleason（GS）评分的 40 例前列腺癌患者，所有病例均行多频（40HZ，50HZ，60HZ，70HZ）MRE 成像。根据 GS 评分将患者分为低危（GS≤6 分），中危（GS=7 分）及高危（GS≥8 分）三组，测量并记录三组的 MRE 参数剪切波速度（c），收集三组的血清 TPSA（Total PSA，总前列腺特异性抗原）资料。比较前列腺癌高危组、中危组及低危组 3 组间 c 及 TPSA 的差异，并评价 c、TPSA 分别鉴别高危与中危组、中危与低危组、高危与低危组的诊断效能。
结果 高危组（n=16）、中危组（n=16）及低危组（n=8）的 c 分别为 2.06±0.20m/s，2.59±0.09m/s，3.17±0.25m/s，TPSA 分别为 14.75±8.02 ng/ml，22.73±26.88ng/ml，61.43±33.74ng/ml。c、TPSA 随着前列腺癌病理分级增加而增加，且 2 者在 3 组之间的差异具有统计学意义（P 均＜0.05）。c、TPSA 鉴别高危与中危组的曲线下面积分别为 0.992、0.918（P 均＜0.05）。c、TPSA 鉴别中危与低危组的曲线下面积分别为 1.000（P＜0.05）、0.556（P＞0.05）。c、TPSA 鉴别高危与低危组的曲线下面积分别为 1.000、0.977（P 均＜0.05）。c 鉴别前列腺癌高危组与中危组、高危组与低危组的价值均优于 TPSA。TPSA 无法鉴别前列腺癌中危组与低危组，而 c 鉴别诊断前列腺癌中危组与低危组效能显著。
结论 应用多频三维高分辨率 MRE 评估硬度能预测前列腺癌病理分级，且其价值优于 TPSA，尤其在区分前列腺癌中危组与低危组方面，表明 MRE 在无创预测前列腺癌病理分级上具有良好的临床应用前景。

未成年患者 CT 扫描后碘对比剂相关急性肾损伤（PC-AKI）的大样本回顾性研究

马丽娅
华中科技大学同济医学院附属同济医院

目的 探讨未成年人进行 CT 扫描后碘对比剂相关急性肾损伤（PC-AKI）的发生率、与各相关危险因素及年龄相关性。**材料和方法** 回顾性分析未成年住院病例 CT 扫描前、后 SCr 值，并使用倾向值匹配进行数据处理，比较匹配前、后 PC-AKI 发生率以及各相关危险因素在增强组与平扫组中的差异，以及患 PC-AKI 与不患 PC-AKI 两组间的差异，并对年龄进行分层以研究年龄与 PC-AKI 的相关性。PC-AKI 的诊断标准 CIN（对比剂肾病）及 AKI（急性肾损伤）两种，定义分别为 CT 扫描前、后血清肌酐值（SCr）升高 0.5mg/dL 或 25%、0.3mg/dL 或 50%以上。**结果** 共搜集 1081 例平扫 CT 和 299 例增强 CT 病例，进行倾向值匹配（PSM）后平扫组及增强组各 262 例。匹配后两组之间倾向得分的分布更为相似（图 1）。匹配前，两组患者的部分危险因素有统计学差异，包括年龄、先天性心脏病、肾肿瘤、肾脏手术、心脏手术和化疗，匹配后均无统计学差异。匹配前 CIN 和 AKI 的总发生率分别为 1.2%（平扫组 1.1%，增强组 1.7%）和 6.8%（平扫组 7.4%，增强组 4.7%），无统计学差异。匹配后，总 CIN 的发生率为 1.3%（平扫组 1.1%，增强组 1.4%），AKI 为 5.9%（平扫组 7.3%，增强组 4.6%），无统计学差异。匹配前，进行心脏手术、怀疑肾脏肿瘤、进行肾脏手术、接受化疗的患儿更倾向于进行增强 CT 检查，增强组患者平均年龄更大，患先天性心脏病、进行心脏手术的患儿 CIN 发生率更高，患泌尿系结石的患儿 AKI 发生率更高。进行年龄分层后，各分层内平扫组与增强组相比、各年龄层间相比，CIN 及 AKI 发生率均无统计学差异。**结论** 碘对比剂的使用并未明显增加 PC-AKI 的发生率，部分危险因素（先天性心脏病、心脏手术、泌尿系结石）与 PC-AKI 可能有一定的相关性，不同年龄层内及层间的 PC-AKI 发生率无明显统计学差异。

宫颈癌磁共振弥散加权成像中感兴趣区选择方法　对表观扩散系数影响的重复性研究

陈长春
湖北省肿瘤医院

目的 评价宫颈癌磁共振弥散加权成像(DWI)中相同观察者应用不同勾选感兴趣区(ROI)方法的测得表观扩散系数(ADC)的可重复性研究.
方法 15 例宫颈癌 DWI 图像采用 4 种 ROI 选取方法获得 ADC 值：10 点法,在肿瘤病灶范围内随机选取 10 处圆形 ROI, 面积 15～25mm^2.容积法,在各层面依次沿病灶内缘手动勾选感兴趣区；最大层面法,勾选病变的最大横截面.3 点法,在肿瘤最大截面及邻近层面,随机选取 3 处 15～50mm^{2}面积的圆形 ROI.均排除肿瘤内坏死及空腔,按面积计算加权 ADC 平均值.同一医生 10～15 天后同样方法再次测量.方差分析比较各方法 ADC 值差异.可重复性评价采用 Bland Altman 法,计算两次测量中不同 ROI 选取方法 ADC 值的变异系数(CV),组内相关系数(ICC)及其 95%变化区间.
结果 第一次测量中 10 点法,容积法,最大层面法,3 点法 ROI 的 ADC 值(平方毫米/秒)分别为 1.247±0.436,1.400±0.345,1.476±0.384,1.289±0.526.第二次测量的 ADC 值分别为 1.240±0.450,1.404±0.362,1.421±0.439,1.271±0.46.方差分析 F=1.594,P=0.195.四种方法前后测量的 CV(%)分别为 13.247,6.026,9.006,19.961;组内相关系数(ICC)及其 95%变化区间分别为 0.920(0.762,0.973),0.969(0.906,0.989),0.949(0.847,0.983),0.836(0.510,0.945).
结论 10 点法,容积法,最大层面法,3 点法所测得 ADC 值无统计学差异.10 点法,容积法,最大层面法的重复性好,可应用于取得宫颈癌感兴趣区 ADC 值.

CAD 在前列腺多参数 MRI 诊断中的辅助诊断效果研究

朱丽娜,高歌,王蕊,刘婧,张晓东,王霄英
北京大学第一医院

目的 探讨计算机辅助诊断（CAD）系统作为“第二读片者”在前列腺多参数 MRI（mpMRI）诊断中的辅助诊断效果。**方法** 从本院前列腺 MRI 数据库中筛选出临床资料及病理结果完整的前列腺疾病初诊患者 64 例（癌 36 例，非癌 28 例）。2 位读片者对入组的病例进行独立盲法读片：首先只浏览 mpMRI，按照前列腺影像报告及数据系统（PI-RADS v2）对病灶进行评分；然后读片者参考 CAD 预测图后修改评分结果。以病理结果为金标准，评价 2 位读片者使用 CAD 前、后的诊断效能。**结果** 使用 CAD 后，两位读片者诊断前列腺癌的 ROC 曲线下面积（AUC）分别从 0.79、0.81 提高到了 0.88、0.89，差异均有统计学意义（Z=2.112，*P*=0.0347；Z=2.087，*P*=0.0369）；以 PI-RADS≥3 分为诊断前列腺癌阳性，两位读片者使用 CAD 后的灵敏度、特异度及正确率均高于使用 CAD 前；两位读片者 PI-RADS 评分一致性提高（weighted kappa 系数，0.59；0.73）；诊断信心均显著提高（*P*＜0.05）。**结论** 前列腺 MR CAD 以“第二读片者”角色承担辅助诊断功能，读片者的诊断效能有一定的提高。

OR-094

MRI 在早期宫颈癌间质浸润深度判定中的价值

朱汇慈,曹崑,李晓婷,孙应实
北京大学肿瘤医院

目的 探讨 MRI 对早期宫颈癌间质浸润深度测量的准确性。**方法** 回顾性分析 66 例 FIGO 分期为 IA 至 IIA 期患者的术前 MRI 资料。所有患者均未行术前放化疗，直接行根治性子宫切除术。在轴位 T2WI、T1 增强图像和 DWI 图像上测量宫颈间质浸润的最大深度，并将所有病例大体分为浸润型（包括深层浸润型和双侧浸润型）和腔内生长型。两名医生测量结果之间的一致性、MRI 测量值与病理测量值之间的一致性使用 Bland-Altman 图和组内相关系数 ICC（intra-class correlation coefficient）来评价。不同生长方式的宫颈癌间质浸润最大深度测量的准确性和差异比较使用单因素方差分析，两两比较使用 bonferroni 法校正 P 值。**结果** T2WI、T1 增强和 DWI 测量宫颈间质浸润的最大深度与病理结果的差值分别为 1.0±4.0mm、1.3±4.6mm、0.6±4.3mm，三种序列上的测量值与病理测量值的一致性均为中等，ICC 无显著差别。MRI 测量结果与病理结果的差异性，三种序列之间无明显统计学差异（P=0.051）。对于不同生长方式的宫颈癌，MRI 与病理测量值的一致性存在显著差异。对于浸润型肿瘤，MRI 与病理测量一致性为很好或中等；对于腔内生长型的肿瘤，MRI 与病理测量一致性较差。**结论** MRI 对早期宫颈癌间质浸润深度测量的准确性较好，其中浸润型肿瘤测量准确性优于腔内生长型。

体素内不相干运动（IVIM）扩散成像及弥散峰度成像（DKI）在宫颈癌中的应用

戚亚菲[1],何泳蓝[1],林澄昱[1],王小奇[2],周海龙[1],薛华丹[1],金征宇[1]
1.中国医学科学院北京协和医院
2.飞利浦公司

目的 探索 IVIM 及 DKI 模型在宫颈癌诊断中的应用，同时探索 IVIM-DKI 参数 D-IVIM, D *, f, D-k, K 与宫颈癌类型、分化程度的相关性，并分析各参数间相关性。

方法 前瞻性纳入确诊宫颈癌的患者 64 例；鳞癌 54 例，腺癌 9 例，其他 1 例；病理 39 例有分化程度：高分化 9 例，中分化 18 例，低分化 12 例。同时纳入非宫颈癌患者 21 例。在 3T MR 扫描仪上进行了女性盆腔 MR 的弥散成像，应用 IVIM-DKI 模型，获得了 b= 0,10,50,100,200,800,1200 和 2000 s / mm2 的轴位图像。IVIM 参数（D, D *, f）由 b 值为 0~800 s/mm2 中信号强度经双指数模型拟合导出，DKI 参数（D, K）由 b 值为 0,800~2000 s/mm2 中信号强度经单指数模型拟合导出。计算 D 值对宫颈癌的诊断效能，采用 Spearman 相关性分析病理与各参数间相关性。

结果 D-IVIM 宫颈癌组（0.92±0.20）低于正常组（1.37±0.25）（p=0.000），D=1.145 时预测宫颈癌敏感性为 88.2%，特异性为 92.2%；f 值在宫颈癌组（0.11±0.05）低于正常组（0.20±0.09）（p=0.000）。 D-DKI 值在宫颈癌组（1.19±0.24）低于正常组（1.82±0.27）（p=0.000），D=1.47 时预测宫颈癌敏感性为 95.2%，特异性为 92.2%。K 值在宫颈癌组（1.05±0.24）高于正常组（0.89±0.18）（p=0.003）。D-DKI 值与分化呈正相关（r=0.33, p=0.05），K 值与分化呈负相关（r=-0.472）。D-IVIM 与 D-DKI 高度正相关（r=0.911）。K 值与 D-IVIM 及 D-DKI 均呈负相关（r=-0.650,-0.657）。

结论 IVIM 及 DKI 模型用于宫颈癌，显示了良好的诊断效能，IVIM-DKI 参数与宫颈癌分化程度有相关性。

基于动脉自旋标记的功能 MR 评价肾部分切除术后残余肾功能

张莎莎[1,2],宋彬[2]
1.贵州省人民医院
2.四川大学华西医院放射科

背景及目的 探究 ASL 对不同类型肾细胞癌定性及诊断的价值，评估肾肿瘤患者腹腔镜部分切除术前后患侧残余肾组织及健侧肾脏血流的变化，帮助临床评估术后的残余肾功能。
材料与方法 肾细胞癌患者共 55 名，其中女性 22 名，男性 33 名，年龄 23-80 岁，平均(54.89±14.84)岁，患者术前 1 周内及术后 3 个月华西医院放射科 3.0TGE750W 磁共振仪上完成 T1WI、T2WI、ASL 扫描。两名医生采用感兴趣区勾勒测值法盲法测量 ASL 后处理数值。计量资料用“均值±标准差”表示，t’检验用于各项测量值之间的统计分析，RBF 与 GFR 间采用 spearman 相关检验。
结果 55 个肾肿瘤中含透明细胞癌 29 个，嫌色细胞癌 26 个。1.透明细胞癌平均 RBF 值（187.10±36.55ml/min/100g）高于嫌色细胞癌平均 RBF 值（151.45±33.93ml/min/100g），统计学有显著的差异（t=3.35，p<0.001）。2.55 例患者术前患侧、健侧及术后患侧、健侧肾皮质 RBF 值与 GFR 均呈显著正相关(r=0.637，P<0.001)，(r=0.783，P<0.001)，(r=0.705，P<0.001)，(r=0.737，P<0.001)。3.55 例患者术后、术前患侧残余肾组织 RBF 分别为(265.46±28.83)ml /(100g·min)、(223.43±27.63)ml /(100g·min)，差异有统计学意义(t=7.806，p<0.001)。55 例患者术后、术前健侧 RBF 值分别为(251.62±28.63)ml /(100g·min)、(268.19±28.71)ml/(100g·min)，差异有统计学意义(t=3.032，p<0.001)。
结论 ASL 可利用肾肿瘤灌注值的差别区分透明细胞癌与嫌色细胞癌，并可用于评估肾癌患者进行腹腔镜部分切除术前后肾血流灌注的变化。

OR-097
探讨 SE-EPI-T2 Mapping 技术与传统 CPMG-T2 Mapping 技术在前列腺癌侵袭性分级中的应用价值

可赞[1],严序[2],李亮[1],查云飞[1]
1.武汉大学人民医院
2.（中国上海）西门子医疗

目的 本研究引入一种基于 SE-EPI 序列的 T2 Mapping 技术[1-3]，将其与传统的 CPMG-T2 Mapping 技术进行比较，以探讨（1）两种序列方法在不同 b 值下的 T2 值的一致性；（2）不同 b 值下的 T2 值以及不同 TE 条件下的 ADC 值对前列腺良恶性病变的诊断及鉴别中的作用；以及（3）两种序列方法在 PCa 侵袭性分级中的应用价值。
方法 目前已纳入 PCa 组及非 PCa 组各 42 例。其中 SE-EPI 扫描序列包括 8 次独立采集，b 值范围为 0~2000 s/mm²，TE 范围为 32~100 ms，使用内部软件绘制每位患者的 ROI。采用 Mann-Whitney U 检验和两样本 t 检验来分析基于 SE-EPI 序列的 T2 值（不同 b 值下）和 ADC 值（不同 TE 条件下）在 PCa 组和非 PCa 组之间的差异；不同 b 值下 CPMG 的 T2 值与 SE-EPI 的 T2 值的相关性由 Spearman’s rho 或 Pearson 分析方法来确定；采用 Bland-Altman 分析用于比较两种方法之间的一致性。计划采用 ROC 曲线分析两种序列方法在 PCa 侵袭性分级中的诊断效能，但有待于后续纳入更多的 PCa 病例。
结果 目前结论如下：基于 SE-EPI 方法和基于 CPMG 方法的两种测量结果具有较好的一致性。CPMG 的 T2 值与 SE-EPI 的 T2 值的平均相关性为中度正相关，其中相关性最好的 b 值是：非 PCa 组，b=100 s/mm²（r=0.603，P = 0.000）；PCa 组，b=0 和 100 s/mm²（r=0.513，P = 0.000；r=0.508，P = 0.000）。基于 SE-EPI 方法的 T2 值和 ADC 值（不同 TE 条件下）在 PCa 组和非 PCa 组间具有明显的统计学差异（P = 0.000）。
结论 基于 SE-EPI 的 T2 Mapping 序列对前列腺具有潜在的临床应用价值，具有替代传统的 CPMG 方法的潜能。

OR-098
膀胱癌多参数 MRI：基于 VI-RADS 评分评估膀胱癌肌层侵犯可能性的验证性研究

王焕军,罗程,关键,李树荣,张繁,郭燕
中山大学附属第一医院

目的 探讨 VI-RADS（Vesical Imaging-Reporting and Data System）评分在术前行多参数 MRI 检查的膀胱癌患者中，评估膀胱癌肌层侵犯的应用价值。材料与**方法** 回顾性分析 2011 年 11 月至 2018 年 8 月在我院行膀胱多参数 MR（T2 加权成像+扩散加权成像+动态增强成像）检查的 340 例膀胱癌患者，在 MRI 检查前均未行膀胱癌手术、放化疗或其他治疗措施。在多灶性肿瘤患者中选择负荷最大（如体积最大，或最有可能侵犯肌层）的肿瘤。由两位具有 10 年以上阅片经验的放射科医生根据 VI-RADS 评分系统对每一位患者的膀胱肿瘤进行了回顾性分析并评分，两位阅片者均不知肿瘤的病理。最后将每个肿瘤的 VI-RADS 评分与术后病理进行比较，并采用 Cochran-Armitage 检验分析 VI-RADS 评分系统对判断肿瘤侵犯肌层的诊断价值。**结果** 340 例患者(男性 296 例)中，年龄中位数为 64.0 岁，四分位数间距(IQR)为 57.0~87.0 岁。75.0%(255/340)的肿瘤被证实为肌层浸润性尿路上皮癌，25.0%(85/340)为非肌层浸润性尿路上皮癌。VI-RADS 评分及其组成序列与肿瘤的肌层浸润状态均具有相关性(p<0.001)。VI-RADS 评分对肌层侵犯的受试者工作特征曲线下面积

(AUC)为 0.94(95%可信区间[CI]：0.90，098)。VI-RADS≥3 对于诊断肌层侵犯的敏感性和特异性分别为 87.1%(95%CI：0.78，0.93)和 96.5%(95%CI：0.93，0.98)。**结论** VI-RADS 评分可有效确定膀胱癌逼尿肌侵犯的可能性，应用于肿瘤的术前评估。

Ki67 在预测前列腺癌预后中的作用

黄婷[1],刘佳佳[1],张家伟[1],朱子超[1],王涛[1],蔡磊[2],陈志强[2]
1.宁夏医科大学临床医学院
2.宁夏医科大学总医院

目的 探讨前列腺癌患者预后影响因素及 Ki67 在预后中的作用。 **方法** 收集 2008 年 1 月至 2014 年 12 月经宁夏医科大学总医院病理确诊为前列腺癌（PCa）的患者共计 141 例，并对所有患者的预后进行随访，选择 6 个(年龄、民族、PSA、Gleason 评分、临床分期、Ki67)可能影响前列腺癌患者预后的因素进行分析；采用 Kaplan-Meier 方法进行单因素分析，Cox 比例风险回归模型进行多因素分析，包含乘积项的 Cox 比例风险回归模型进行交互作用分析。 **结果** Kaplan-Meier 单因素分析显示 Ki67（ x^2=38.507，P<0.05）、临床分期（ x^2=59.486，P<0.05）、Gleason 评分（ x^2=9.062，$P<0.05$）是影响前列腺癌患者预后的主要因素；Cox 多因素分析显示 Ki67(RR=1.877, P<0.01)和临床分期（RR=1.924，P<0.01）属于影响前列腺癌患者预后的危险因素；交互作用分析显示 β>0，P<0.05；Ki67 与临床分期、Ki67 与 Gleason 评分存在协同作用。 **结论** Ki67 可作为前列腺癌患者预后的危险因素, Ki67 与临床分期、Ki67 与 Gleason 评分结合，可更好的评估前列腺癌患者预后。

探讨 IVIM-DWI 参数值预测宫颈鳞癌 Ki-67 高低表达水平的价值

李翠平,董江宁
中国科学技术大学附属第一医院西区，安徽省肿瘤医院

目的 探讨 IVIM-DWI 各参数值预测宫颈鳞癌 Ki-67 高低表达水平的价值。
方法 回顾性分析我院 2016 年 1 月-2019 年 1 月经手术病理证实并行 IVIM-DWI 检查的宫颈鳞癌，入组 78 例，中位年龄为 50 岁。所有患者术前均行 MRI 检查，并行多 b 值（b=0，10，20，50，100，200，400，800，1000，2000 s/mm^2）DWI 扫描，通过 GE ADW 4.5 后处理工作站，利用双指数 IVIM 模型获得 IVIM-DWI 各参数值：ADC_{stand}、D、D^*及 f 值。按 Ki-67 表达水平将其分为低表达组(Ki-67＜50%)和高表达组(Ki-67≥50%)，比较两组间 IVIM 各定量参数值有无差异，并探究其预测 Ki-67 高低表达水平的价值。采用 SPSS 统计软件分析数据，采用独立样本 t 检验，探究两组间 IVIM-DWI 各参值数（ADC_{stand}、D、D^*、f）值与宫颈癌免疫组化指标中 Ki-67 高低表达水平之间是否具有统计学差异，对差异有统计学意义的参数值进行 ROC 曲线分析其诊断效能。
结果 两组中 D、D* 值组间差异具有统计学意义（ p＜0.05）及较高诊断效能（AUC＞0.5）。高表达组中 D、 D*值均低于低表达组（p=0.037、AUC=0.684；p=0.001、AUC=0.760 ）。高表达组中 f 值高于高表达组（p=0.011），但其诊断效能较低（AUC=0.232）。两组中 ADC_{stand}值的组间差异无统计学意义。
结论 IVIM-DWI 中 D、D*参数值对术前预测宫颈癌 Ki-67 表达水平具有一定的价值，有助于评估宫颈癌手术后复发风险和预后。

3.0T 的体素内非相干运动扩散加权成像（IVIM-DWI）：评估糖尿病肾病早期肾功能的变化

张喜荣,陈静,韩冬,田骞,贺太平,于勇
陕西中医药大学；陕西中医药大学附属医院

目的 本研究的目的是评估 IVIM-DWI 参数在鉴别早期糖尿病肾病（DN）中的效用。
方法 选择 14 例确诊为Ⅰ期 DN 的患者作为观察组，35 名健康志愿者作为对照组。在 3T 扫描仪（Skyra，Siemens Healthineers）上获得 IVIM（b = 0,50,100,150,200,400,600,800sec / mm 2）和扩散加权成像（DWI，b = 50,800sec / mm 2）序列。在上极，肾门和肾的下极的皮质和髓质区域中，每个受试者共绘制了 12 个感兴趣的区域。所有结果的平均值用于确保测量结果的一致性.ADC 执行 DWI 序列后，在 Siemens MRWP 工作站上自动生成映射。通过使用原型软件体扩散工具箱（Siemens healthineers）生成 IVIM 参数（ADC，D，f 和 D *值）。使用双样本 t 检验来比较观察组和对照组的两组皮质和髓质之间的 ADC，D，f 和 D *值的差异。 p 值小于 0.05 被认为对所有分析具有统计学意义。通过 ROC 曲线分析 ADC，D，f 和 D *值在早期 DN 诊断中的敏感性和特异性。
结果 在两组中，肾皮质的 ADC，D，f 和 D *值均高于髓质。与对照组相比，观察组肾皮质 ADC，D，F 和 D *值均降低，差异有统计学意义（p <0.05）。观察组肾皮质的 ADC，D，f 和 D *值均降低，但只有肾髓质的 D 值具有统计学意义（p <0.05）.ROC 分析后，D 值为肾皮质是区分健康志愿者和Ⅰ期 DN 的最佳参数，ROC 曲线下面积为 0.835，诊断敏感性和特异性分别为 74.3％和 92.9％。
结论 IVIM 可以为 DN 引起的肾脏损害提供有用的信息。肾皮质的 D 值可以作为区分健康志愿者和Ⅰ期 DN 的有用指标。
临床意义：IVIM 可为糖尿病患者的临床变化提供更科学的依据，反映微观结构的变化，对肾功能的评价具有潜在的应用价值。

扩散峰度成像定量参数直方图分析鉴别子宫癌肉瘤与变性子宫肌瘤的价值

田士峰,刘爱连
大连医科大学附属第一医院

目的 探讨扩散峰度成像（DKI）定量参数直方图分析鉴别子宫癌肉瘤（UCS）和变性子宫肌瘤（DH）的价值。**方法** 回顾性分析经手术病理证实的 11 例 UCS 和 22 例 DH 的患者资料。患者均行盆腔 DKI 扫描，经后处理获得 DKI 定量参数，包括平均弥散峰度（MK）、平均弥散系数（MD）、各向异性分数（FA），后采用 Omni-Kinetics 软件进行直方图分析，获得 DKI 各参数的中位数、平均值、标准差、偏度、峰度、25%位数、75%位数、能量、熵等直方图参数。采用独立样本 t 检验（正态分布）或 Mann-Whitney 秩和检验（偏态分布）比较 UCS 和 DH 的各直方图参数的差异，采用 ROC 评价有统计学差异的直方图参数对 UCS 和 DH 的鉴别效能。**结果** 两组间 MK（标准差、75%位数、熵）、MD（中位数、平均值、25%位数、75%位数）、FA（中位数、平均值、标准差、25%位数、75%位数、能量、熵）差异具有统计学意义（P 均<0.05），两组间 MK（中位数、平均值、偏度、峰度、25%位数、能量）、MD（标准差、偏度、峰度、能量、熵）、FA（偏度、峰度）差异无统计学

意义（*P*均>0.05），FA（中位数、75%位数）的 ROC 下面积最大（均为 0.921），FA（75%位数）的敏感度最高（100.0%），MK（标准差）的特异度最高（100.0%）。**结论** DKI 定量参数直方图分析有助于鉴别 UCS 与 DH。

OR-103
体素不相干运动多模型参数对子宫内膜癌术前风险评估的价值

田士峰,刘爱连
大连医科大学附属第一医院

目的 探讨体素内不相干运动（Introvoxel Incoherent Motion，IVIM）多模型参数术前预测子宫内膜癌（endometrial carcinoma，EC）风险的意义。**方法** 回顾性分析 40 例行 1.5T MRI 检查（含 IVIM 序列），经手术病理证实为 EC 的影像资料。根据病理类型、病理分级、侵袭程度等因素，分为高风险组（18 例）和低风险组（22 例）。测量病灶的 IVIM 多模型参数值，包括单指数模型的 Standard ADC 值，双阶单指数模型的 D-mono、D*-mono、f-mono 值，双阶双指数模型的 D-Bi、D*-Bi、f-Bi 值，以及拉伸指数模型的 DDC、α 值。比较各参数值的差异，采用 *ROC* 曲线评估有统计学差异的参数对高、低风险组 EC 鉴别诊断的效能。**结果** 高风险组的 Standard ADC 值、D-mono 值、D-Bi 值及 DDC 值均小于低风险组，差异具有统计学意义（*P*<0.05）；两组间的 D*-mono 值、f-mono 值、D*-Bi 值、f-Bi 值及 α 值无统计学差异（*P*>0.05）。Standard ADC 值、D-mono 值、D-Bi 值及 DDC 值预估高风险组 EC 的曲线下面积（*AUC*）分别为 0.816、0.788、0.830、0.847，临界值分别为 $0.608\times10^{-3}mm^2/s$、$0.436\times10^{-3}mm^2/s$、$0.373\times10^{-3}mm^2/s$、$0.738\times10^{-3}mm^2/s$。**结论** IVIM 序列单指数模型的 Standard ADC 值、双阶单指数模型的 D-mono 值、双阶双指数模型的 D-Bi 值、拉伸指数模型的 DDC 值能够有效术前预测 EC 风险性，对临床手术方案选择及预后评估具有一定价值。

前列腺癌患者根治术后发生早期尿失禁的盆底磁共振研究

吴玥,车英玉
郑州大学第一附属医院

目的 利用磁共振检查观察前列腺癌术后发生早期尿失禁患者的盆底形态学特点，了解术前盆底结构差异对术后控尿情况的影响因素。
方法 回顾性分析 57 例 2017-2019 年在我院行腹腔镜前列腺癌根治术（RP）并完整随访的患者(年龄 65.71±7.53 岁)的术前盆腔磁共振资料。其中 32 例患者在 RP 术后 3 个月及以上仍出现尿失禁症状，作为尿失禁组；25 例患者在 RP 术后 3 月以内尿控恢复，作为尿控组。在患者术前盆腔 MRI 平扫上测量以下参数：膜性尿道长度(MUL)、膀胱颈口宽度（BN）、膀胱内前列腺突出长度（IPP）、耻骨直肠间距离（PRL）、膜性尿道角度(AMU)、耻骨直肠肌厚度(PRM)以及膀胱颈、球部尿道分别相对耻骨尾骨连线(PCL)和耻骨的距离，比较两组间各参数变化。
结果 尿失禁组 MUL8.50±2.34mm，尿控组 MUL12.75±4.40mm，两组间存在显著差异(p＜0.000)。BN、IPP、PRL、AMU、PRM、膀胱颈、球部尿道分别相对耻骨尾骨连线(PCL)和耻骨的距离，两组间均无显著差异(p=0.156、p=0.176、p=0.158、p=0.435、p=0.062、p=0.771、p=0.924、p=0.792、p=0.500)。

结论 术前膜性尿道长度较长的患者在前列腺癌根治术后尿控恢复更快，术中最大限度的保留膜性尿道长度对患者术后早期尿控功能的恢复可能有帮助。盆底磁共振检查可以清晰的观察到这些结构变化，为临床完善手术方式，并改善术后控尿症状提供客观依据。

磁共振 DKI、DWI 及 DCE 成像在宫颈癌诊断中的价值分析

王莉莉,黄刚
甘肃省人民医院

目的 利用磁共振功能成像 DKI、DWI 与 DCE-MRI 研究宫颈癌与正常子宫壁组的影像表现及对比研究三种磁共振成像技术对宫颈癌术前诊断的准确性；同时比较 DKI 成像参数在宫颈癌与子宫肌瘤组的诊断价值。**方法** 收集确诊宫颈癌的病人 37 例，子宫肌瘤 15 例。选取宫颈癌患者的正常子宫壁参数作为正常子宫壁组。利用西门子 3.0T 超导型磁共振成像扫描仪，于 DCE-MRI 之前做 DKI 及 DWI 扫描。将 DKI 原始图像通过 DKE 软件处理后，测得 DKI 定量参数 MK 等；DCE-MRI 原始图像传输到灌注评估专业软件，利用 Tofts 血流动力学模型处理分析肿瘤感兴趣区，计算定量参数：Ktrans、Ve 和 Kep；测得 DWI 参数 ADC 的值。分别测三次，取其平均值。两组间比较利用独立样本 T 检验；利用 ROC 曲线评价三种成像参数对宫颈癌的诊断价值，采用曲线下面积分析 ADC、MK、Ktrans 值对宫颈癌的诊断效能。同时，测得子宫肌瘤组的 DKI 参数，对比其与宫颈癌组的差异。**结果** 宫颈癌组与正常子宫壁组的 K//、MK 值差异有统计学意义；D//、MD、D⊥在两者之间没有明显统计学差异，(P>0.05)；宫颈癌脉管阳性组与脉管癌栓阴性组的 MK 值分别为 0.84±0.09、0.95±0.16，有统计学差异(P<0.05)；正常子宫壁组与宫颈癌组 MK、Ktrans、ADC 值有明显统计学差异(P<0.01)。ADC、Ktrans 和 MK 评价宫颈癌的曲线下面积分别为：0.72、0.75、0.82。统计得到宫颈癌组与子宫肌瘤组的 DKI 参数 K//、MK 与 K⊥有明显统计学差异。**结论** DKI 成像可反映宫颈癌组织微环境的复杂程度，在诊断宫颈癌中优于 DCE-MRI 及 DWI 技术；MK 可以预判宫颈癌的病理特征，如脉管内是否有癌栓浸润。DKI 参数在宫颈癌的诊断中有重要的意义，其中 MK 等参数可用于鉴别诊断宫颈癌与子宫肌瘤。

体素内不相干运动成像对宫颈鳞癌的评估：与病理对照研究

郝光宇,陈蒙,胡粟,胡春洪
苏州大学附属第一医院

目的 探索体素内不相关运动成像（IVIM）对宫颈鳞癌的评估价值。
材料和**方法** 经病理证实并未接受任何治疗的 42 例宫颈鳞癌患者，接受 IVIM 成像。运用双指数模型计算出不同临床分期、病理分级及不同淋巴结状态组的扩散系 D 值、灌注系数 D*值和灌注分数 f 值。运用独立样本 t 检验进行比较分析，并运用 ROC 曲线分析以上指标的诊断能力。
结果 低分化组的 D 值和 f 值低于中高分化组，差异有统计学意义（p 值分比为＜0.001 和 0.008），而 D*值无显著性差别（*P*=0.201），D 值和 f 值的曲线下面积分别为 0.830、0.712。淋巴结转移组的 D 值低于无转移组（*P*=0.007），而 D*和 f 值无显著差异，D 值的 ROC 曲线下面积为 0.851,。不同临床分期之间的 D 值、D*值和 f 值均没有统计学差异。
讨论：IVIM 对宫颈鳞癌不同病理分级和淋巴结转移状态有良好的鉴别诊断能力。

3.0T MRI 结合血清标记物对卵巢肿瘤的定性诊断价值

袁晓春,郑林丰,王夕富
上海市第一人民医院

摘要： 目的 回顾性分析 3.0T MR 多序列扫描并结合血清标记物对卵巢肿瘤的定性诊断价值。**材料与方法** 经手术病理证实的 106 例，共 135 个卵巢肿瘤，采用 3.0T MRI 成像系统进行 FSE T_1WI、脂肪抑制 T_2WI；LAVA 动态增强扫描，DWI(b=0,800s/mm^2）成像。术前所有患者均行血清 CA125，AFP，β-hCG 检查。由两名医师独立分析图像，MR 影像分析评判标准为：卵巢肿块的大小，单房或多房改变，肿块中囊性或实性成分在 T_1WI、T_2WI、DWI 上的信号强度，实性成分增强后在 LAVA 上的强化曲线，实性成分的 ADC 值；盆腹膜播撒，淋巴结肿大，腹水症。并结合术前血清标记物的升高与否综合判断肿瘤的良恶性与病理分型。**结果** 135 个卵巢复杂肿瘤中，良性肿瘤 43 个，恶性或交界性肿瘤共 92 个。其中上皮性肿瘤 73 个，占比 54.1%，性索间质肿瘤 28 个，占比 20.7%，生殖细胞瘤 31 个，占比 23.0%，其它肿瘤 3 个，占比 2.22%。MRI 多序列诊断卵巢肿瘤良恶性的准确性、敏感性、特异性、阳性预测值、阴性预测值分别为 82.5%、85.3%、78.3%、85.3%、78.3%；对各组卵巢肿瘤的 ADC 值及血清 CA125 值进行均数统计，ADC 值判断肿瘤的良恶性区间值为 1.358± 0.279×10^{-3} mm^2/S vs 0.848 ± 0.286×10^{-3} mm^2/S, P < 0.001)。血清 CA125 升高患者（52-5000IU/ml）45 例占比 42.5%，判定卵巢浆液性腺癌的准确性为 85.4%（35/41），AFP 升高 2 例患者均为卵黄囊瘤， 1 例绒癌患者β-hCG 升高。**结论** MRI 多序列对卵巢肿瘤良恶性的鉴别有较高价值，ADC 值下降及血清标记物 CA125 升高可以提高卵巢恶性肿瘤的诊断准确率，AFP、β-hCG 升高对卵巢恶性生殖细胞肿瘤具有特异性价值，可为临床选择治疗方案提供可靠的信息。

CT 增强全容积纹理分析方法 在鉴别肾脏嫌色细胞癌与嗜酸细胞腺瘤的应用价值

孟晓岩,李震,胡道予
华中科技大学同济医学院附属同济医院

目的 探索 CT 增强全容积纹理分析方法在鉴别肾脏嫌色细胞癌与嗜酸细胞腺瘤的应用价值。
方法 回顾性分析我院经病理证实的 25 例肾脏嫌色细胞癌（平均年龄 48 岁）及 16 例肾脏嗜酸细胞腺瘤（平均年龄 52 岁）CT 增强影像学资料，选取静脉期图像，手动逐层划取全肿瘤图像，避开钙化、出血、坏死及肾周脂肪，对比其纹理分析的参数特征（包括最大值、最小值、方差、均值、不均质性、偏度、峰度、熵等）。
结果 肾脏嫌色细胞癌组最小值（993.32±41.95）、均值（1115.32±36.02）、熵（3.81±0.12）低于肾脏嗜酸细胞腺瘤组（1023.94±44.51，1164.12±48.22，3.93±0.15），肾脏嫌色细胞癌组偏度（-0.05±0.22）高于肾脏嗜酸细胞腺瘤（-0.30±0.33），差异具有统计学意义（p＜0.05）；最小值、均值、偏度及熵对于鉴别肾脏嫌色细胞癌与肾脏嗜酸细胞腺瘤的 ROC 曲线下面积分别为 0.70、0.80、0.74、072。
结论 CT 增强全容积纹理分析方法有助于鉴别肾脏嫌色细胞癌与嗜酸细胞腺瘤，为临床诊疗方案的制定提供可靠依据。

睾丸肿瘤及肿瘤样病变 69 例 CT 及 MR 表现

何玉芳
广州市第一人民医院

摘要:目的 提高对睾丸肿瘤 CT 或 MRI 影像特征的认识及鉴别诊断的准确性。方法回顾性分析我院及外院 2015 年 6 月至 2019 年 6 月 20 日 PACS 系统上所有表现为睾丸肿物的腹部 CT 或 MRI 影像资料，排除无明确病理诊断及术前影像资料的患者。收集其临床资料（包括临床症状及肿瘤指标等），统计相关临床信息及病理结果，将睾丸肿物的病理诊断类型、肿瘤标志物、临床症状与影像特征进行对照分析。同时对我院及收集的其它医院的有病理结果的睾丸肿物病例的影像资料及病理类型进行对比分析。 结果 共收集睾丸肿物 69 例，其中睾丸肿瘤 57 例，睾丸肿瘤样病变 12 例（9 例附睾炎、2 例结核、1 例皮样囊肿）。睾丸肿瘤包括精原细胞瘤 32 例、混合型生殖细胞瘤 12 例、淋巴瘤 5 例、畸胎瘤 3 例、胚胎性癌 1 例、内胚窦瘤 1 例、间质瘤 1 例、平滑肌瘤 1 例、多形性未分化肉瘤 1 例。其中精原细胞瘤患者年龄范围为 18～60 岁，平均 34.4 岁；混合型生殖细胞瘤患者年龄范围为 18～63 岁，平均 35.7 岁；淋巴瘤患者年龄范围为 45～90 岁，平均 68.6 岁。该组病例中精原细胞瘤等生殖细胞肿瘤 20～40 岁高发，淋巴瘤、平滑肌瘤、间质瘤等非生殖细胞瘤常见于 40 岁以上患者。患者多因睾丸无痛性肿大就诊。精原细胞瘤影像表现多样，可表变为轻中度强化均匀实性肿块、也可出现不同程度坏死、囊变、纤维化改变。影像检查可以帮助与其它肿瘤或肿瘤样病变鉴别。结论 睾丸肿瘤病理类型多样且具有明显的年龄分布及标志物特征，结合患者影像资料及临床起病症状、肿瘤指标有助于睾丸肿瘤及肿瘤样病变的鉴别诊断。

泌尿系结石成分双源双能 CT 分析及其安全性评估

陈晶[1],张武[2],陈红[1],杨光[1]
1.海口市人民医院/中南大学湘雅医学院附属海口医院
2.中南大学湘雅二医院

目的:探讨双源计算机断层扫描（dual source computed tomography,DSCT）双能量在泌尿系结石体内外成分分析中的可行性及安全性。
方法 将收集的 684 例泌尿系体外结石标本均行 CT 常规单能量成像、DSCT 双能量成像和红外线光谱结石成分分析，所有标本先行双源 CT 双能量成像，双能薄层影像经 MMWP 工作站中 kidneystone 选项卡处理结果作为实验组，红外线光谱分析结果作为对照组，比较分析 DSCT 双能成像在结石成分分析中的灵敏度、特异度及准确度。对比 CT 单能量常规成像与 DSCT 双能成像的容积 CT 剂量指数 (CT dose index volume，CTDvol*mGy)、剂量长度乘积 (Dose length product，DLP)和有效辐射剂量(Effective dose，ED)评估 DSCT 扫描的安全性。
结果 相同成分结石的 CT 值在散点图中分布的位置相对集中，草酸钙结石密集分布于散点图的右上方，尿酸结石主要集中分布于散点图的左下方；双源 CT 双能结石成分分析分析准确率为 94.74%（648/684）。DSCT 双能成像对泌尿系结石成分分析具有较高的灵敏度、特异度和准确度，双源 CT 双能成像结石成分分析与红外线光谱结石成分分析的准确性二者无统计学差异（c2=2.008，P=0.734）。不同成分结石双能量扫描(80kV 与 140kV)CT 值差值及 DEI 存在统计学差异（P<0.05）。DSCT 双能在体成像能全面评估结石成分，不同成分泌尿系结石 DSCT 双能量扫描体内外成分差异存在统计学意义（c2=10.252，P=0.036），双能量扫描较单能量常规扫描有效辐射剂量更小（t=40.658,P<0.001）。

结论 依据不同的 CT 值、DEI 值，双源双能 CT 能对不同成分的泌尿系结石进行在体分析，与红外线光谱结石成分分析比较，有较高的灵敏度、特异度和准确度，且辐射剂量较小。

时间-空间反转标记脉冲序列在原发性高血压患者肾皮髓质分离中最佳黑血反转时间的优化

朱丽,段庆红
贵州省肿瘤医院

目的 探讨磁共振时间-空间双重标记反转脉冲（Time-SLIP）序列在原发性高血压（EH）患者肾脏皮质和髓质分离中的初步应用及肾脏皮髓质分离时的最佳黑血反转时间（BBTI）值。**方法** 从 2017 年 4 月-2018 年 11 月，招募经我院体检健康的成年志愿者和确诊原发性高血压病 5 年以上的患者，共 65 人。分为健康成人正常对照组（C 组）、患原发性高血压但肾功能损害组（B1 组）和原发性高血压引起肾功能衰竭组（B2 组）。C 组共 31 人、62 个肾脏，志愿者在我院近期体检健康且无肾脏疾病病史及超声检查肾脏无器质性病变者；B1 组共 23 人、46 个肾脏，患原发性高血压但肾功能损害且服降压药血压控制良好的患者；B2 组共 11 人、22 个肾脏，患原发性高血压且肾功能衰竭的患者；三组受检者再逐个行 MRI T2WI 扫描；然后在 T2WI 冠状位及横断位行定位相，以肾门为定位标准，分别采用 5 组 BBTI 值（分别为：800ms、1000ms、1200ms、1400ms、1600ms）行 Time-SLIP 序列扫描，将图像传到传到 Toshiba Vantage Elan 后处理工作站进行数据测量，记录左肾和右肾的长度、宽度、皮质厚度、皮质和髓质信号强度，结合肾皮髓质信号强度（SI）计算出皮髓质对比度，从而得出肾脏皮髓质分离最佳的黑血翻转时间（BBTI 值）。**结果** 1.肾皮髓质最佳 BBTI 值：C 组和 B1 组随年龄段的增加 BBTI 值呈增长趋势；C 组和 B1 组比较，B1 组的最佳 BBTI 值更高。2.肾皮质厚度：C 组和 B1 组中年龄段最小的比年龄段大的肾皮质更厚；B1 组中高血压 1 级比高血压 2/3 级的肾皮质更厚。3.肾皮髓质分离清晰度：C 组中年龄段的增长与肾皮髓质分离清晰度呈线性关联。**结论** 一定的 BBTI 值时,Time-SLIP 技术可分别获得正常成人、原发性高血压肾功能损害的皮髓质分离图像，原发性高血压肾功能衰竭组肾功能无最佳 BBTI。

Can Lémann Index Predict Penetrating Lesions or Surgery in Patients with Strictured Crohn's Disease?

Jixin Meng,Yiming He,Xuehua Li,Canhui Sun,Minhu Chen,Ziping Li
First Affiliated Hospital of Sun yat-sen university

Purpose: To evaluate the prognosis of patients with strictured Crohn’s disease (CD) by using Lémann Index (LI) and verify whether LI and its related indices could predict penetrating lesions and surgery in CD patients with stricturing lesions.
Methods and Materials: This retrospective cohort study was performed at a single tertiary hospital. From 2007 to 2018, patients diagnosed with CD and classified as Montreal Behavior type 2 who were conducted at least 2 computed tomography enterography (CTE) or magnetic resonance enterography (MRE) with at least 3 months interval were recruited before surgery. LI_1(LI at first imaging examination), LI_2(LI at last imaging examination before surgery), LI changes between two imaging examinations

($\Delta LI = LI_2 - LI_1$) and its rate of change [ΔLI/time interval(dt)] were calculated combining imaging and endoscopy. Wilcoxon signed ranks test was applied to test difference between LI_1 and LI_2. Fisher's exact test, log-rank test, univariate Cox regression analysis and Kaplan-Meier survival curve were used for testing correlation between LI various indices and penetrating lesions as well as surgery.
Results: 92 CD patients with stricturing lesions were included in this study. The medians for LI_1 and LI_2 were 5.605 and 8.543, respectively. There were 58 cases of $\Delta LI > 0$, 18 cases of $\Delta LI < 0$ and 16 cases of $\Delta LI = 0$, accounting for 63.1%, 19.6% and 17.4% respectively. The statistical difference was significant in $LI_2 > LI_1$ with $P<0.001$. Correlations between LI_2 and incidence of penetrating lesion($P=0.029$) as well as surgery($P=0.043$) and Correlations between $\Delta LI > 0$ and penetrating lesion incidence($P=0.036$) as well as its occurrence time(hazard ratio [HR] 3.008; 95% CI, 1.015-8.921; $P=0.037$) were found. The Kaplan-Meier survival curves of $\Delta LI > 0$ and $\Delta LI \leqslant 0$ for the occurrence time of penetrating lesions and surgery were shown in Figure 1 and 2. However, there was no correlation between LI parameters (LI_1, ΔLI, $\Delta LI > 0$, ΔLI/dt) and surgery incidence as well as its occurrence time, respectively.
Conclusion: $\Delta LI > 0$ indicating the progression of bowel damage might not predict surgery but could prognose disease progression such as occurrence of penetrating lesions in patients with strictured CD.

OR-113

Detection of gastrointestinal venous malformations: comparison of MR imaging and CT enterography in patients with Blue rubber bleb nevus syndrome

Wei Liu,Jing juan Liu,Chen xue Ma ,Qin Wang ,Shuo Li,Zheng yu Jin
Peking Union Medical College Hospital

Objective Blue rubber bleb nevus syndrome (BRBNS) is a rare entity that consists of multiple venous malformations involving several organs, particularly the skin and the gastrointestinal tract. The objective of our study was to assess the utility of MR imaging (MRI) using negative oral contrast agents compared with peroral CT enterography (CTE) for the detection of bowel venous malformations in patients with BRBNS.
Methods Our study enrolled 11 patients (mean age, 20.5 years) with BRBNS. They underwent MR imaging using ferric ammonium citrate as negative oral contrast agent and peroral CTE. Datasets were reviewed independently by 2 radiologists on axial and coronal views. Inter-observer agreement for MRI and CTE was calculated. Patient comfort, convenience and test preference were assessed.
Results All venous malformations showed markedly high signal intensity on fat-suppressed T2-weighted MR images, ranging in size from 3 to 38mm. CTE demonstrated multiple contrast-enhanced polypoid bowel lesions, ranging in size from 6 to 35mm. Some lesions contained millimetric calcifications representing phleboliths. Concordance between MRI and CTE was 68.4% for lesions <10mm, 91% for lesions >10mm. However, in 3 patients, large venous malformations (>10mm) detected on MRI were not detected on CTE. Interobserver agreement was high for MRI but only fair for CTE

(k=0.83 and 0.62, respectively). Patients rated MR imaging as more comfortable than CTE. There was no significant difference between the techniques with regard to patient convenience or preference.

Conclusion MR imaging using negative oral contrast agents was useful to demonstrate the extent of bowel lesions of BRBNS. MR imaging may be less prone to missing small venous malformations and may be more reproducible in lesion detection. MR imaging using negative oral contrast agents outperformed CTE.

CT Radiomics Nomogram for the Preoperative Prediction of Lymph Node Metastasis in Gastric Cancer

Yue Wang[1],Wei Liu[1],Yang Yu[2],Jing-Juan Liu[1],Hua-Dan Xue[1],Jing Lei[1],Jian-Chun Yu[1],Zheng-Yu Jin[1]
1.Peking Union Medical College Hospital
2.Siemens Healthineers

Purpose: *To investigate the role of computed tomography (CT) radiomics for the preoperative prediction of lymph node (LN) metastasis in gastric cancer.*
Materials and methods: *This retrospective study included 247 consecutive patients (training cohort: 197 patients; test cohort: 50 patients) with surgically proven gastric cancer. A dedicated radiomics prototype software was used to segment lesions on preoperative arterial phase (AP) CT images and extract features. A radiomics model was constructed to predict the LN metastasis by using a random forest (RF) algorithm. Finally, a nomogram was built incorporating the radiomics scores and selected clinical predictors. Receiver operating characteristic (ROC) curves were used to validate the capability of the radiomics model and nomogram on both the training and test cohorts.*
Results: *The radiomics model showed a favorable discriminatory ability in the training cohort with an area under the curve (AUC) of 0.844 (95% CI: 0.759 to 0.909), which was confirmed in the test cohort with an AUC of 0.837 (95% CI: 0.705 to 0.926). The nomogram consisted of radiomics scores and the CT-reported LN status showed excellent discrimination in the training and test cohorts with AUCs of 0.886 (95% CI: 0.808 to 0.941) and 0.881 (95% CI: 0.759 to 0.956), respectively.*
Conclusions: *The CT-based radiomics nomogram holds promise for use as a noninvasive tool in the individual prediction of LN metastasis in gastric cancer.*

The value of b-value threshold map in the evaluation of rectal adenocarcinoma

Luguang Chen[1],Shen Fu[1],Li Zhihui[1],Lu Haidi[1],Chen Yukun[1],Wang Zhen[1],Fu Caixia[2],Lu Jianping[1]
1.Changhai Hospital of Shanghai
2.Siemens Shenzhen Magnetic Resonance Ltd

Purpose

To investigate the value of the b-value threshold ($b_{Threshold}$) in the evaluation of rectal cancer by comparing it with diffusion-weighted images and ADC maps regarding lesion detection and the prediction of pathological features.

Materials and Methods

Thirty-five patients with rectal tumours were enrolled and underwent cross-sectional DWI using a 3-Tesla MRI system. The contrast-to-noise ratio (CNR) between the lesions and normal tissues was assessed on diffusion weighted images and $b_{Threshold}$ maps. Reproducibility for ADC and $b_{Threshold}$ values were assessed using intraclass coefficients, coefficients of variability and Bland-Altman plots. Significant differences between different groups for pathological prognostic factors, including the pathologic differentiation, T stage, N stage, cancer nodule, nerve invasion, CEA and CA199, were evaluated using independent sample t-tests. The diagnostic performance of ADC and $b_{Threshold}$ values for those factors were assessed using the receiver operating characteristic (ROC) curves.

Results

The interobserver reproducibility was excellent for the ADC and $b_{Threshold}$ values measured by the two observers, and the intra-class coefficients were 0.985 and 0.922, respectively. The CNR between lesions and normal tissues on $b_{Threshold}$ maps was significantly higher than that on diffusion-weighted images ($p < 0.05$). There were significant differences in the ADC and $b_{Threshold}$ values between different pathologic differentiation degrees and T stages ($p < 0.05$); moreover, a significant difference was observed in the $b_{Threshold}$ values between the different N stage groups ($p = 0.012$). No significant differences were observed between the ROC curves of ADC and the $b_{Threshold}$ values of rectal lesions for pathologic differentiation and T stage. However, $b_{Threshold}$ values showed good diagnostic performance for N stage.

Conclusion

$b_{Threshold}$ values could differentiate between pathologic differentiation degrees and T stages, and have a good diagnostic performance for N stage, with improved detection capability for rectal adenocarcinoma.

The Value of Pre-/post-treatment MRI and Clinicopathological Characteristics in Predicting Survival in Locally Advanced Rectal Cancer Patients Treated with Neo-adjuvant Chemoradiotherapy

Yankai Meng[1], Hongmei Zhang[2], Kai Xu[1], Chunwu Zhou[2]
1. the Affiliated Hospital of Xuzhou Medical University
2. National Cancer Center/Cancer Hospital, Chinese Academy of Medical Sciences and peking Union Medical College

Purpose: The aim of this study was to investigate the value of pre-/post-treatment MRI and clinicopathologic characteristics in predicting 3-year disease-free survival (DFS)

in patients with locally advanced rectal cancer (LARC) treated with neo-adjuvant chemoradiotherapy (nCRT).
Material and Method: Pre- and post-nCRT MRI and clinicopathologic characteristics were evaluated in this retrospective study. 3-year DFS was estimated using Kaplan-Meier product-limit method. The Cox proportional hazards modeling were constructed and used to determine associations between MRI or clinicopathologic variabilities and survival outcomes.
Results: 171 patients (112 males and 59 females, with a median age of 55 years; age range, 27-82 years) with LARC treated with nCRT were enrolled. With a median follow-up of 47.6 months, overall DFS in the cohort was 76.6%, 74.5% and 73.7% in 36, 48 and 60 months, respectively. During follow-up, 28 patients died, 41 patients experienced relapse (37 distant, 3 local and 1 both), and 108 patients did not experience any end point event. mrEMVI positivity was the significantly independent adverse factor of long term survival with HR was 2.589 (95% CI 1.398-4.794, P=0.002) on multivariate analysis. The 3-year DFS in patients with positive mrEMVI compared with negative were 52.6 months vs 65.1 months (P= 0.003), respectively. Post-nCRT MRI evaluated tumor regression partial response (ypmrPR) patients showed worse DFS compared to those with complete response (ypmrCR) (HR=4.914, 95% CI 1.176-20.533, P=0.029). The 3-year DFS of ypmrCR and ypmrPR were 74.3 months and 58.9 months, respectively.
Conclusion: In conclusion, mrEMVI positivity was the independent adverse prognosis indicator for 3-year DFS. And ypmrTRG may also as a biomarker for predicting prognosis of LARC patients.

Correlation of pathological T and N staging with tumor deposits in colon cancer

Chen Wang[1,2], Shaodong Li[1], Yankai Meng[1,2], Jiangshan Li[1], Jingjing Gao[1], Libin Yao[4], Guangjun Cheng[1], Yingying Cui[3], Kai Xu[1,2]

1. Department of Radiology, the Affiliated Hospital of Xuzhou Medical University, Xuzhou, Jiangsu Province, People's Republic of China
2. Xuzhou Medical University, Xuzhou, Jiangsu Province, People's Republic of China.
3. Department of Pathology, the Affiliated Hospital of Xuzhou Medical University, Xuzhou, Jiangsu Province, People's Republic of China.
4. Department of General Surgery, the Affiliated Hospital of Xuzhou Medical University, Xuzhou, Jiangsu Province, People's Republic of China.

Abstract **Purpose** To investigate the association between pathological TN staging and tumor deposits in colon cancer. **Methods** Pathological data of 257 colon cancer cases from 2017 to 2018 was retrospectively analyzed. According to the 8th edition of the American Joint Committee on Cancer (AJCC) staging manual, all patients were devided into T_2, T_3 and T_4 three groups, N_0, $N_+(N_1+N_2)$ two groups, tumor deposits positive and negative group. Comparison among groups were analyzed by chi-suqare test. **Results** Of which, 2 cases (5.6%) with tumor deposits positive in T_2 group, 30 cases (14.6%) in T_3 group, 10 cases (66.7%) in T_4 group. Chi-suqare test showed that tumor deposits during three groups were statistically different (c^2 was 31.327, $P<0.05$ respectively). Pairwise comparison showed that the incidence of tumor deposits in T_2 and T_3 groups was

lower than those of the T_4 group, the difference with statistical significance(c^2 was 21.976, 25.606, respectively and P＜0.016, P＜0.016 respectively). Nevertheless, there was no significant difference between T_2 and T_3 groups (P=0.141). In the N staging, 7 cases(4.2%) with tumor deposits in N_0 group, 21 cases(22.8%) in N_1 group, 14 cases(15.2%) in N_2 group. Chi-suqare test showed significant different between N_0 and N_+ groups(c^2 was 49.360, P＜0.001 respectively). Subgroup analysis was carried by N_+ group, the difference between N_1 and N_2 groups was not statistically significant(c^2 was 3.091, P=0.079). **Conclusions** pathological T and N staging are associated with tumor deposits in colon cancer. T_4 and N_+ staging colon cancer patients have the higher risk of tumor deposits than other stages, more attention should be paied to the groups.

Rectal gastrointestinal stromal tumors Treated with Imatinib Mesylate: Quantitative tumor T2-Wegihted Imaging in the Evaluation of Therapy Response in Patients

Jianbo Xu,Wuteng Cao,Huaiming Wang,Jie Zhou,Wenli Li,Wenyi Zhang,Zhiyang Zhou
The Sixth Affiliated Hospital of Sun Yat-sen University

Purpose: Quantitatively analyze Rectal gastrointestinal stromal tumors before and after treating by Imatinib Mesylate via 3D-volume on MRI T2-wegihted Imaging,discuss the effect on Rectal gastrointestinal stromal tumors via Imatinib Mesylate treatment

Materials and Methods: 16 patients with Rectal gastrointestinal stromal tumors in our center were included.T2-weigihted MRI was performed in all the patients before and after Imatinib Mesylate treatment,and measured the 3D-volume and LD(longest diameter)of the 20 lesions.The baseline and post-therapy percentage changes(△%) of 3D-volume and LD(longest diameter) were compared using ROC curves.Finally,good-response group and poor-response group was differentiated between those parameters and pathology which was regarded as gold standard.

Results: There were 14 lesions in good-response group and 6 leisons in poor-response group. After Imatinib Mesylate treatment to rectal GISTs,3D-volume and LD(longest diameter) percentage changes(△%) were significantly different between good-response group and poor-response group.3D-volume（%△mm^3）:68.96% VS 12.34%,F=27.953,p<0.001;LD（%△mm）32.32% VS 17.75%,F=6.137,p=0.023).The AUCs on ROC for %Δ3D-volume,%ΔLD after therapy were 0.964 and 0.869, respectively, for response differentiation.When %△mm^3 ≥45.34 was used to predict good-response,the PPV was 93.33%.

Conclusion: Quantitatively analyze by 3D-volume percentage changes after targeted therapy to predict good-response of rectal GIST was significant ,which was better than LD(longest diameter) percentage changes.

建立回结肠克罗恩病活动度评估的 CTE 评分系统（CTEs）

程赛明,冯琦,严赟奇,童锦禄,许建荣
上海交通大学医学院附属仁济医院(东院)

目的 建立一套客观的、操作性强的 CTE 评分系统，用以评估克罗恩病的活动度。
方法 本研究回顾性纳入了从 2015 年 3 月至 2018 年 5 月在我院治疗的 49 名根据 Lennard-Jones 标准确诊的克罗恩病患者。所有患者在 24 小时内完成了 CTE 检查及回结肠镜检查，完善 Harvey - Bradshaw 评分和 CRP 水平。研究中评估末端回肠、升结肠、横结肠、降结肠、乙状结肠和直肠 6 个节段，对每个节段及总体肠道情况进行相应评分。内镜评分依据克罗恩内镜严重度指数（CDEIS），参数包括：是否存在溃疡、溃疡或病变范围的比例及有无狭窄。CTE 评分的参数包括：肠壁强化程度、肠壁增厚程度、溃疡、假息肉、肠壁靶征强化、肠壁脂肪沉积、假憩室形成、肠腔狭窄、木梳征、爬行脂肪、肠系膜脂肪渗出。采用二元 Logistic 回归来分析判断疾病活动度和发生溃疡、采用 Tobit 回归模型分析判断肠壁 CEDIS 的独立预测因子。运用 ROC 曲线评估 CTE 评分预测疾病活动度和严重程度的准确性，并对 CDEIS、HBI、CRP 和 CTEs 进行 Spearman 秩相关分析。
结果 本研究共纳入 49 名患者，中位 HBI 为 5，中位 CRP 水平为 18.2mg/l。共评估了 279 段肠道，内镜检查发现 106 个肠道节段正常，62 个轻度病变，111 个严重病变。CTE 发现病变肠道节段数分别为溃疡 92、假息肉 37、肠壁靶征强化 128、肠壁脂肪沉积 10、假憩室 7、狭窄 2、木梳征 37、爬行脂肪 65、肠系膜脂肪渗出 16。其中肠壁厚度和靶征强化可作为 CD 活动及是否发生溃疡的独立预测因子，肠壁厚度、靶征强化和木梳征为 CDEIS 的独立预测因子（$P<0.005$）。CTE 评分与 CDEIS 高度相关（$r = 0.81$，$p=0.001$），CTE 评分对发现 CD 活动及溃疡的 ROC 曲线下面积分别为 0.857 和 0.901。
结论 CTE 评分系统对评估克罗恩病的活动度敏感且特异，将来有潜力广泛用于临床。

MR 影像组学对直肠癌 KRAS 基因突变的预测价值

刘欢欢,李金凝,张财源,汪登斌
上海交通大学医学院附属新华医院

目的 探索 MR 影像组学（radiomics）预测直肠癌患者 KRAS 基因突变的价值。
材料和方法 收集经手术和病理证实、术前行高分辨率 MR 成像、术前无放化疗的 87 例直肠癌患者，将患者按 7:3 比例随机分为训练组（60 例）和验证组（27 例）。采用 ITK-SNAP 勾画病灶感兴趣区（VOI），采用 A.K 软件提取病灶内直方图、形态及纹理特征等放射组学特征。采用独立样本 T 检验、Kruskal-Wallis 检验、Pearson 相关分析进行特征降维。采用多因素回归分析对筛选的影像组学特征参数以及相关的临床-影像特征建立最优模型，用于预测直肠癌患者 KRAS 基因突变。采用受试者工作特征曲线（ROC）、曲线下面积（AUC）以及决策曲线分析评估模型的价值。
结果 通过后处理软件提取病灶内部 385 个影像组学特征参数，经过特征降维后 6 个特征参数纳入研究，联合 2 个临床-影像特征参数，建立 KRAS 基因突变的预测模型。采用临床-影像特征参数预测淋巴结转移的诊断效能中等（训练组为 77.0%，验证组为 67.0%），联合 MR 影像组学参数后，训练组和验证组的诊断效能可分别提高至 86.0%、83.0%。经决策曲线分析后，联合 MR 影像组学参数后的预测模型亦优于仅采用临床-影像特征参数建立的模型。
结论 MR 影像组学有助于预测直肠癌 KRAS 基因突变，有助于患者术前治疗方案的选择。

腹腔干肠系膜上动脉共干多层螺旋 CT 成像：新的解剖定义和胚胎发育机制

唐伟,王毅
陆军军医大学大坪医院

目的 分析腹腔干肠系膜上动脉共干解剖变异的多层螺旋 CT 血管成像的征像，提出新的解剖定义和分类，并探讨各种类型解剖变异的胚胎发育机制。
方法 回顾性分析 5580 例腹部多层螺旋 CT 血管影像，腹腔干肠系膜上动脉共干被定义为腹主动脉发出单一共干，单一的共干发出肠系膜上动脉和腹腔干，腹腔干发出的分支至少包括胃左动脉、脾动脉、肝总动脉三支中的两支。按照新的解剖定义对腹腔干肠系膜上动脉共干解剖变异进行分型。
结果 5580 例腹部多层螺旋 CT 血管成像中，171（3.06%）例被发现存在腹腔干肠系膜上动脉共干的解剖变异。按照新的解剖定义分为 5 型。其中 I 型、II 型、III 型、IV 型和 V 型分别为 96 例(56.14%)、57 例(33.33%)、4 例(2.34%)、3 例(1.75%)和 8 例(4.68%)。按照共干的长短分为长型和短型，分别为 106 例（61.99%）和 65 例（38.01%）。171 例腹腔干肠系膜上动脉共干解剖变异按照胃左动脉起源变异对其进一步分为 a、b、c、d 四种类型，其中 3 例无法识别胃左动脉起源被排除在外。其中 a 型为 92 例（53.80%），b 型为 57 例(33.33%)，c 型为 11 例(6.43%)和 d 型为 8 例(4.68%)。
结论 基于腹部多层螺旋 CT 血管成像的征像，按照新的解剖定义及分类系统阐述了腹腔干肠系膜上动脉共干解剖变异的类型。错位中段、不完全中段、永存纵向吻合是各种类型腹腔干肠系膜上动脉共干解剖变异的胚胎发育机制。

基于 CT 影像组学精准预测可切除性食管鳞癌无病生存期的研究

谭显政[1,2],刘鹏[1],梁长虹[2]
1.湖南省人民医院/湖南师范大学第一附属医院
2.广东省人民医院

研究目的
探讨 CT 影像组学在预测可切除性食管鳞癌无病生存期（Disease-Free Survival，DFS）的潜在价值，为临床医师术前筛选出复发高风险人群提供佐证，从而辅助临床医师制定个体化的治疗方案。
材料与方法
回顾性收集食管鳞癌患者 124 例，其中训练样本 83 例，验证样本 41 例。使用开源软件 3D-Slicer 手动分割肿瘤体积，基于 Python 3.6.2 软件中的 PyRadiomics 工具箱提取影像组学特征，每位病人共提取特征 1576 个。基于训练样本，通过 Lasso-cox 算法筛选出关键影像组学特征，用于构建影像组学分类器，并比较影像组学分类器与第 8 版 TNM 分期的预测效能。在验证样本中对分类器的效能进行验证。所有的统计分析均使用 R 语言实现，P＜0.05 被认为有统计学意义。
结果
由 6 个关键特征建立的影像组学分类器是预测 DFS 独立的风险因子（HR=2.854，p=0.004）。影像组学分类器在预测 DFS 方面表现出较高的辨别效能，在训练集和验证集中的 C-index 分别为 0.822 和 0.795。尽管在两个数据集中影像组学分类器的 C-index 高于病理分期，但差异无统计学意义（p 均大于 0.05）。
结论

影像组学分类器能在术前获取与病理分期无统计学差异的辨别度，能为病人术前危险分层及个体化治疗方案的制定提供辅助信息。

3.0T MRI 体素内不相干运动扩散加权成像对直肠腺癌壁外血管侵犯的评估

高飞
中国科学技术大学附属第一医院西区，安徽省肿瘤医院

目的 探讨体素内不相干运动扩散加权成像（IVIM-DWI）对直肠腺癌壁外血管侵犯（EMVI）的评估价值。
方法 回顾性收集直肠腺癌患者 45 例，直肠癌 EMVI 阳性患者 21 例、EMVI 阴性患者 24 例，术前均接受 IVIM-DWI 扫描。 应用 GE ADW 4.5 工作站分别测量病灶的标准扩散系数（ADC_{stand}）、单纯水分子扩散系数（ADC_{slow}）、灌注相关的扩散系数（ADC_{fast}）和灌注分数（f）。采用统计学分析软件 SPSS 23.0 对上述参数值分别进行两两比较统计学分析；采用 ROC 曲线确定诊断阈值，评估上述参数对直肠腺癌 EMVI 诊断效能。
结果 直肠腺癌 EMVI 阳性组 ADC_{slow}、 ADC_{fast} 值参数分别是（0.69±0.21）×$10^{-3}mm^2/s$、14.10（10.70，19.70）×$10^{-3}mm^2/s$，高于阴性组 ADC_{slow}、 ADC_{fast} 值参数（0.58±0.08）×10^{-3}mm2/s、6.30（3.56，6.36）×$10^{-3}mm^2/s$，两组间具有统计学意义（$P < 0.05$）；直肠腺癌 EMVI 阳性组 ADC_{stand}、f 值分别是（0.92±0.12 ）×$10^{-3}mm^2/s$、0.48（0.21，0.52）；阴性组 ADC_{stand}、f 值分别是（0.90±0.08）×$10^{-3}mm^2/s$、0.38（0.38，0.45）；两组间无统计学意义（$P>0.05$）。在评估直肠腺癌 EMVI 阳性方面，ADC_{fast} 的 ROC 曲线下面积最大（0.948），具有较高的诊断准确性，以 6.678×10^{-3} mm^2/s 为诊断阈值时，其敏感度及特异度分别为 95.2%、91.7%。
结论 磁共振 IVIM-DWI 参数 ADC_{slow}、ADC_{fast} 对直肠腺癌 EMVI 的评估有一定价值,其中反映微循环灌注的 ADC_{fast} 具有较高的准确性，诊断效能最大。3.0T 磁共振 IVIM-DWI 参数能够为直肠腺癌 EMVI 的评估提供有价值信息。

基于能谱 CT 成像碘（水）图的组学分析术前预测结直肠癌微卫星不稳定性的初步研究

武敬君,刘爱连,赵莹,张钦和,刘义军
大连医科大学附属第一医院

目的 探讨基于能谱 CT 成像碘（水）图的组学分析术前预测结直肠癌微卫星不稳定性（microsatellite instability, MSI）的价值。**方法** 回顾性收集 102 例术前使用 Revolution CT 或 Discovery CT 750HD 行腹部 GSI 扫描的结直肠癌患者，根据术后病理的免疫组化检测，获取其 MSI 信息。在 AW4.6 工作站，使用 GSI Viewer 分析软件获得静脉期碘（水）图像，将 DICOM 格式的图像导入 ITK-SNAP (version 3.6.0)软件勾画 ROI，并进一步使用 AK（Artificial Intelligent Kit）软件提取基于碘（水）图像的组学参数。将来源于 Revolution CT 扫描仪的数据用于建立预测 MSI 状态的组学模型（随机选择 70%样本作为训练集，其余样本用于验证）；来自 Discovery CT 750HD 扫描仪的数据用于外部测试。通过 Student's t 检验或 Mann-Whitney U 检验，Spearman 相关性检验，Min-Max 标准化，独热编码和 LASSO 算法进行特征降维。建立多参数逻

辑回归模型以预测 MSI 状态。通过 ROC 分析评估诊断性能。**结果** 基于训练数据集，将 9 个对结直肠癌贡献度最高的特征构建多参数 Logistic 回归模型。采用 ROC 进行评价，在训练集中，AUC 为 0.971（准确度：0.896;敏感度：0.875;特异性：0.906）; 在验证集中，AUC 为 0.908（准确度：0.810;灵敏度：0.714;特异性：0.857）。 在外部测试集中，诊断性能略低，AUC 为 0.880（准确度：0.788;灵敏度：0.909;特异性：0.727）。 三组病例 AUC 值无统计学差异（p>0.05）。**结论** 基于能谱 CT 成像碘（水）图的组学分析对术前无创预测结直肠癌 MSI 状态有一定的价值。

扩散峰度成像预测胃癌新辅助化疗疗效研究

付佳,唐磊,李佳铮,李晓婷,李子禹,孙应实
北京大学肿瘤医院

目的 探讨扩散峰度成像（DKI）与化疗前胃癌病理分化程度及 Lauren 分型的相关性；预测及判断胃癌新辅助化疗疗效的价值。材料与**方法** 前瞻性纳入 52 例行 DKI 检查的局部进展期胃癌,所有患者在新辅助化疗前接受磁共振检查。经连续随访，52 例患者中 28 例患者手术前一周内行 DKI 检查。由后处理软件自动计算 DKI 定量参数（ADC、MD、MK）。在治疗前后分别测量 DKI 相应的指标（Xpre 和 Xpost），同时计算上述定量参数治疗前后的差值（△X）及变化率（%△X）。比较各基线参数在 Lauren 分型及分化程度的差异性。统计学分析采用 SPSS 22.0，双侧 P＜0.05 代表有统计学意义。采用 Mann-Whitney U 检验和 Spearman 秩检验比较有效组与反应不良组治疗前后各参数及其变化的差异及相关性。受试者工作特征曲线(ROC)用于比较诊断效能。**结果** DKI 各参数（ADC、MD、MK）评估新辅助化疗前弥漫型胃癌，曲线下面积（AUC）分别为 0.884、0.842、0.765。DKI 各参数(ADC、MD、MK)在胃癌中分化及中高分化、中低分化、低分化中具有统计学差异（P＜0.05）。28 例 DKI 患者中有效组 16 例，反应不良组 12 例。DKI 多参数值（MKpre、MKpost、ADCpost、MDpost、△MD、△MK 和%△MK）在两组间存在差异显著性(P＜0.05)。MKpre、MKpost、%△MK 与反应不良正相关，△MD、△MK、ADC_{post}、MD_{post} 与反应不良呈负相关。AUC 曲线显示 MKpost 具有最佳诊断效能，AUC 为 0.958，敏感性 83.30% ，特异性 93.80%。**结论** DKI 相关参数有助于治疗前评估胃癌生物学行为，DKI 可以多参数区分 Lauren 分型，具有较高的准确性。DKI 可以用于筛选胃癌新辅助化疗反应不良组的患者，新辅助化疗后 MK_{post} 值的预测效能最佳。

OR-126

3.0T 磁共振 IVIM-DWI 预测局部进展期直肠癌新辅助放化疗疗效的初步探究

胡鸿博
哈尔滨医科大学附属第二医院

背景及目的

本研究的目的为初步探究治疗前 IVIM-DWI 预测 LARC 患者 nCRT 疗效的可行性，分析其定量参数在病理完全缓解（pCR）与非 pCR 患者间分布是否具有差异性。

方法

选择生成依据单指数模型的表观扩散系数（ADC）图和依据双指数模型的 IVIM-DWI 定量参数真性扩散系数（D）、假性扩散系数（D^*）和灌注分数（f）。

依据术后的病理情况将患者分为 pCR 组和 non-pCR 组。应用统计学软件对两组患者治疗前肿瘤区域 ADC 及 IVIM-DWI 定量参数结果进行比较。

结果

pCR 组和 non-pCR 组患者的一般资料无显著性差异，两组患者具有可比性；两位放射科诊断医师对多 b 值 DWI 图像后处理所得定量参数结果有良好的一致性；pCR 组 nCRT 治疗前肿瘤区域 D 值为(0.903±0.138) ×$10^{-3}$$mm^2$/s，non-pCR 组为(1.013±0.233) ×$10^{-3}$$mm^2$/s，t=-1.661，*P*=0.103，*P*>0.05，差异不具有统计学意义；pCR 组 nCRT 治疗前肿瘤区域 D*值为（42.213±26.344) ×$10^{-3}$$mm^2$/s 小于 non-pCR 组(61.452±35.495) ×$10^{-3}$$mm^2$/s，t=-1.853，*P*=0.070，*P*>0.05，差异无统计学意义；pCR 组 nCRT 治疗前肿瘤区域 f 值为 0.25±0.09 大于 non-pCR 组 0.21±0.07，t= 2.559，*P*=0.013，*P*<0.05，差异有统计学意义；pCR 组 nCRT 治疗前肿瘤区域 ADC 值为(1.157±0.255) ×$10^{-3}$$mm^2$/s，non-pCR 组为(1.311±0.287)×$10^{-3}$$mm^2$/s，t=-1.775，*P*=0.082，*P*>0.05，没有统计学意义上的差异。

结论

治疗前 IVIM-MRI 部分双指数模型定量参数在 pCR 与非 pCR 患者间分布存在统计学差异，满足预测局部进展期直肠癌患者新辅助放化疗疗效的可行性。

OR-127

基于单源双能 CT 平扫图像的纹理分析对肿块型胃癌和高风险胃间质瘤的鉴别

王学东,刘爱连,田士峰
大连医科大学附属第一医院

目的 探讨单源双能 CT 平扫单能量图像的纹理分析相关参数在鉴别肿块型胃癌和高风险胃间质瘤的价值。**方法** 回顾性分析我院接受单源双能 CT 平扫和三期增强扫描的患者，并经病理和胃镜证实的 16 例高风险胃间质瘤和 17 例肿块型胃癌患者，在能谱 ADW4.5 后处理平台将 40～100 keV 各单能量下的胃癌和间质瘤的平扫图像导出，然后将这些单能量图像分别输入 Omni-Kinetics（OK 软件）。分别在胃间质瘤和肿块型胃癌平扫图像的最大层面放置一个感兴趣区（region of interest，ROI），ROI 的大小为全肿瘤。计算出所有的纹理参数后，从纹理分析的灰度直方图中提取出峰度值和偏度值，从共生矩阵中提取出熵值。根据是否符合正态分布，采用独立样本 t 检验或者采用 Mann-Whitney U 检验，采用 ROC 曲线分析差异有统计学意义参数的诊断效能。**结果** 40～100 keV 单能量平扫图像的纹理分析中，40keV 时胃间质瘤的平均峰度值高于胃癌，分别为 3.18（3.02，3.38） vs 3.03（2.78，3.16），差异有统计学意义（P<0.05），以 3.07 为鉴别两者的阈值时，敏感度和特异度分别为 68.8%，70.6%，曲线下面积为 0.721。40 keV 时胃间质瘤的平均熵值低于胃癌，分别为 1.93±0.07 vs 2.02±0.07，差异有统计学意义（P<0.05），以 1.96 为鉴别两者的阈值时，敏感度和特异度分别为 82.4%，68.7%，曲线下面积为 0.765。其余各个单能量下的峰度值、熵值和各个单能量下的偏度值均无统计学意义（P>0.05）。**结论** 纹理分析中的定量参数结合单源双能 CT 的平扫图像在鉴别肿块型胃癌和高风险胃间质瘤中有一定的临床价值，其中 40 keV 单能量下的熵值为最佳参数。

OR-128

建立改良影像学肿瘤退缩分级评估直肠癌新辅助治疗效果

管真,张晓燕,李晓婷,孙应实
北京大学肿瘤医院

目的 对于局部进展期直肠癌，通过术前新辅助放化疗，近 30%的患者可达到病理完全缓解并实施“等待观察”[1-3]，因此能否准确评价新辅助放化疗效果，对于选择下一步治疗方案至关重要。2011 年 MERCURY 依据病理肿瘤退缩分级（pTRG）提出 MRI 肿瘤退缩分级（mrTRG）[4]，但由于阅片者主观经验不同，其与 pTRG 之间总体一致性低于 30%[5]，导致其临床应用受限。本研究拟通过结合其他有效评价指标，建立改良 mrTRG 以实现术前准确预测 pTRG，并精准评估远期预后。
方法 改良 mrTRG 采用分别测量疗后影像 T 分期（ymrT）、肿瘤长径缩短率、疗后 T2 信号强度变化、疗后 DWI 有无高信号，设定相应临界值并评分 0 分/1 分，最终计算累计得分。改良 mrTRG4 分认为病灶完全缓解；2-3 分为部分缓解；0-1 分为无缓解。原 mrTRG1-2 级为病灶完全缓解；3-4 级为部分缓解；5 级为无缓解。pTRG（AJCC）0-1 级为病灶完全缓解；2 级为部分缓解；3 级为无缓解。回顾性分析我院 268 例局部进展期直肠癌行新辅助治疗联合 TME 手术并评价 pTRG 的患者，按照上述方法，分别评价改良 mrTRG、原 mrTRG，并评估改良 mrTRG、原 mrTRG 与 pTRG 符合率以及与远期预后的相关性。
结果 回顾性分析我院 268 例患者，以 pTRG 为金标准，改良 mrTRG 准确率为 58%，原 mrTRG 的准确率仅为 46%。改良 mrTRG、pTRG 均可区分总生存（OS）、无病生存（DFS），但改良 mrTRG 区分的风险组优于 pTRG；然而，原 mrTRG 并不能区分 OS 及 DFS。
结论 通过纳入既往研究证实能够有效评价直肠癌新辅助治疗疗效的指标，建立的客观、定量、全面的改良 mrTRG，与原 mrTRG 相比，能够有效预测 pTRG，且其与预后具有良好的相关性，借此实现术前准确预测新辅助放化疗效果并指导下一步治疗方案，为个体化治疗提供可靠依据。

OR-129
MRI 纹理术前预测直肠癌新辅助放化疗治疗抵抗的初步研究

张兰,聂壮,李欣,黄艾,韩萍
华中科技大学同济医学院附属协和医院

目的 评估新辅助放化疗前的 MRI 纹理特征对于局部晚期直肠癌治疗抵抗的预测价值，以期尽可能避免有治疗抵抗的患者进入新辅助放化疗流程。评估新辅助放化疗后的 MRI 纹理特征对于局部晚期直肠癌治疗反应的评价价值，为完全缓解的患者避免手术提供依据。**材料与方法** 52 例术前接受了新辅助放化疗的晚期直肠癌患者纳入研究，该回顾性研究获得伦理委员会批准。于术后结合临床及病理信息评价肿瘤的退缩分期及降期。所有患者在 MR3.0 扫描仪上进行直肠标准序列扫描（T2WI STIR，T1W_ FS 增强，DWI），扫描时间点分别是初诊及术前 1-2 周。导出两次检查的动脉早期增强图像 T1_contrast 及 T2WI 图像进行纹理分析。MR 纹理分析：图像分割使用 ITK-SNAP（version 3.4.0; http://itksnap.org），采用 python 进行特征提取，采用随机森林法建立分类模型并进行验证（支持向量机，CV=10）。**结果** 偏度是区分治疗反应与治疗抵抗的最相关纹理特征，新辅助放化疗反应组的治疗前 MR T2WI 偏度显著高于治疗抵抗组（P<0.05）。新辅助放化疗前 T2WI、T1W_contrast 及新辅助放化疗后 T2WI、T1W_contrast 的纹理特征判断治疗敏感的曲线下面积分别为 0.64、0.86、0.63、0.77。**结论** 基于 MR T2WI、T1W_contrast 的纹理特征对于预测局部晚期直肠癌新辅助放化疗的治疗反应及治疗抵抗有潜在价值；相对于新辅助治疗后的 MR 纹理特征，治疗前的 MR 纹理特征的诊断效能更具潜在价值。

Value of dual-energy CT imaging for evaluation of intestinal activity and severity in Crohn's disease

张宇,李欣,韩萍
华中科技大学同济医学院附属协和医院

Purpose: To investigate the clinical value of dual-energy CT imaging in assessing the activity and severity of Crohn’s disease compared with the simple endoscopic score. **Methods**:60 patients suspected to have Crohn's disease received both colonoscopy and dual-energy computed tomography (DECT) were involved in this study. The interval time between the two examinations was less than one week. According to the Simple Endoscopic Score for Crohn's Disease, 60 patients were divided into 4 groups. Mean values of the iodine concentration of lesions and surrounding adipose tissue, the fat fraction of lesions and surrounding adipose tissue were used for the evaluation. **Results**: The fat fraction of lesions and the fat fraction of surrounding adipose tissue of four groups were found statistically significant different .

OR-131
侧方淋巴结对低风险直肠癌预后的影响：一项 MRI 回顾性研究

孙瑞佳,王林,李晓婷,卢巧媛,朱汇慈,孙应实
北京大学肿瘤医院

背景：侧方淋巴结(lateral lymph node, LLN) 转移为直肠癌患者较差的预后指标，目前对于 LLN 的处置仍存在争议。对于 MR 可见的 LLN，其不同的 MR 特征是否提示不同的预后，有待进行深入探讨。

方法 回顾性连续纳入从 2011 年 6 月到 2015 年 12 月于本院直接进行根治性全直肠系膜切除术（TME），术前未进行新辅助放化疗，术后病理证实直肠癌，术后病理分期≤pT3，pEMVI、pCRM 阴性患者共 684 例。评估所有患者 MR 检出最大 LLN 特征以及其他传统 MR 指标，与总生存（OS）、无转移生存（MFS）、无复发生存（LRFS）比较。

结果 低复发风险组（pN0）患者中，MR-T 分期，术后治疗情况，MR-LLN 的有无，以及 MR 检出最大 LLN 的短径是否≥8mm 与复发显著相关（p≤0.01）。pN0，MR-LLN（+）患者中，最大 MR-LLN 短径≥8mm 患者的 MFS 和 OS 分别为 58.3%和 35.9%，二者均显著差于最大 MR-LLN 短径<8mm 的患者（MFS 和 OS 分别为 88.8%和 85.4%，p<0.01）。与 pN1-LLN（-）患者相比，pN0-LLN（+）且 SAmax≥8 的患者的 OS 及 MFS 均显著降低（p＜0.05）。与 pN2-LLN（-）患者相比，pN0-LLN（+）且 SAmax≥8 的患者 OS 及 MFS 无显著差异。

结论 MR 显示存在 LLN 会降低低风险直肠癌人群的 OS 和 MFS，MR-LLN（+）患者中，pN0 且 MR-LLN 短径≥8mm 的病人预后与 pN2 患者无显著差异，提示 MR-LLN（+）是影响低复发风险直肠癌患者 OS 和 MFS 的潜在不良因素，应在临床诊疗中加以重视。

256 排螺旋 CT 在诊断小肠血管畸形的临床应用

梁友发,何海波
中南大学湘雅三医院

目的 探讨肠系膜动脉 CTA 对小肠血管畸形的临床诊断价值。

方法 回顾性分析经手术病理证实并行肠系膜动脉血管 CTA 检查的 51 例小肠血管畸形患者影像资料。观察：CTA 图像表现，包括畸形血管团供血动脉、引流静脉、系膜侧直小血管情况。并由 2 名放射诊断医师分别盲法对照手术病理结果，分别采用小肠畸形供血动脉定位法和 Coles 分组定位法

对血管畸形进行定位诊断。采用 McNemar 配对 X2 检验评价医师分别采用 2 种定位诊断方法诊断准确性的差异，采用一致性检验评价 2 名医师诊断结果的一致性。

结果 小肠血管畸形 CTA 表现为供血动脉增粗 12 例，引流静脉早显 9 例，小肠系膜侧支小血管增粗 22 例，畸形血管团形成 11 例。2 名医师采用 Cole 分组法和供血动脉法定位诊断的准确率分别为 84.31％(43 / 51)和 98.03％(50 / 51)。2 名医师采用 Coles 分组法诊断具有中度一致性(Kappa=0.49，P<0.5)，采用供血动脉法诊断具有高度一致性(Kappa=1.00，P<0.01)。2 名医师分别采用 Coles 分组法和供血动脉法定位诊断的准确性差异均无统计学意义(P 值分别为 0.062 和 0.125)。

结论 肠系膜动脉 CTA 可显示小肠畸形的供血动脉和引流静脉，具有定位、定性诊断价值。

OR-133

肛瘘高分辨率 MRI 技术及图像质量影响因素分析 附 150 例图像质量分析

王能伟,蔡香然
暨南大学附属第一医院

目的 探讨肛瘘高分辨率 MRI 规范化扫描技术，分析影响图像质量因素

方法 分析 150 例肛瘘患者高分辨率 MR 图像，根据 P A R K 进行分型：括约肌间型；经括约肌型；括约肌上型；括约肌外型。对所有序列的图像质量进行分级及计分，分析伪影产生原因，分析内容为内括约肌、纵行肌、外括约肌、耻骨直肠肌、括约肌间隙、坐骨肛门窝、肛提肌、肛管的黏膜层、黏膜下层、肌层的显示程度，分级评价参照 BEETSTAN 等的方法并做了一些改进，将图像质量和评价及计分分为 3 个层次：甲级，显示清晰：在 MRI 图像上肛管结构尤其各肛门括约肌清晰可辨且无伪影存在，结构显示清楚，可明确诊断，计做 2 分；乙级，可显示但图像存在伪影：肛管结构尤其是各肛门括约肌可分辨但存在伪影，显示较清楚，有伪影但不影响诊断计做 1 分；丙级，显示不清：肛管结构，尤其各肛门括约肌分辨不清，伪影较严重，影响诊断计做 0 分；对 117 例横断位 T2WI 图像进行 CNR 和 SNR 检测。

结果 Ⅰ型，108 例 72%；Ⅱ型，33 例 22% ；Ⅲ型，7 例 4.6%；Ⅳ型 2 例 1.3%;肛周脓肿 18 例。150 例共 658 个序列，各序列均可显示或清晰显示肛管及肛周软组织结构。甲级 610 个，占 92.7%；乙级 48 个，占 7.3%，卷折伪影 38 个,运动伪影 6 个,异物伪影 4 个 ,无丙级片序列。计分

结果 Sag T2WI (1.919±0.274),AX T2WI (1.930±0.26), AX fsT2WI (1.918±0.275), COR T2WI (1.977±0.149), AXT1WI(1.927±0.262)。横断位 T2WI 成像序列的 SNR 和 CNR，分别为 40.768±16.074 和 111.610±48.341。

结论

肛管的高空间分辨率磁共振成像可清晰显示肛管及其肛周解剖结构，对于肛管及肛周病变具有重要的意义。各种伪影对图像质量均有不同程度的影响。消除或减少图像伪影，对提高 MRI 图像质量有重要作用。

OR-134

用于术前预测结直肠癌淋巴结转移的临床-影像组学列线图的建立和验证

李梦蕾
复旦大学附属肿瘤医院

目的 开发和验证用于术前预测结直肠淋巴结转移的临床-影像组学组合模型。
方法和材料：我们收集了 767 例经临床病理证实的结直肠癌患者(训练组 537 例，验证组 230 例)。我们纳入了 9 个重要临床危险因素（年龄、性别、CEA 水平、CA19-9 水平、肿瘤位置、肿瘤大小、组织学类型、分化程度和 M 分期）来构建临床模型；采用最小绝对值收敛和选择算子（LASSO)算法构建放射组学特征（包括原发病灶和周围淋巴结的影像学特征），用以建立各自的影像组学模型（原发灶影像组学模型、周围淋巴结影像组学模型；并应用逐步逻辑回归选择重要变量来构建 3 个临床-影像组学模型（临床-原发灶影像组学模型、临床-周围淋巴结影像组学模型、临床-原发灶-周围淋巴结影像组学模型）。然后使用 Akaike 信息准则（AIC）来比较不同模型的相对强度，以及用曲线下面积（AUC）来量化预测准确性。最后应用决策曲线分析（DCA）来评估该模型的临床应用价值。
结果 临床-原发灶-周围淋巴结影像组学模型的 AUC 值最高(AUC= 0.7430)，为最佳模型。该临床-影像组学模型在训练队列和验证队列中也显示出良好的鉴别和校正能力。决策曲线分析表明，临床影像组学列线图在临床上具有应用价值。
结论 本研究提出了一种基于影像组学特征和临床危险因素的临床-影像组学列线图，可应用于结直肠癌患者术前预测淋巴结转移。

OR-135
小肠 CT 在克罗恩病与肠结核鉴别诊断中的价值

潘景润
安徽医科大学第二附属医院

目的
初步建立 CD 的 CTE 评分方法，与内镜、临床评分比较并观察其可行性，探讨 CTE 在克罗恩病（CD）和肠结核（ITB）诊断及鉴别中的价值。
制定综合评分系统（包含临床、内镜及 CTE），与单一评分系统比较，观察各评分系统效能。
方法
收集 CD 及 ITB 病例 84 例（CD61 例、ITB23 例），回顾性分析其临床、内镜及 CTE 资料。
求出有统计学意义指标，根据特异度高低赋予分值，按照拟定评分标准对两组患者进行评分，计算各评分结果。
绘制工作特征曲线（ROC 曲线），比较几种不同评分方法的灵敏度及特异度。
结果
临床及内镜指标中，5 项指标倾向于 CD 诊断，4 项倾向于 ITB 诊断。2.CTE 指标中，多节段病变等 10 项指标利于 CD 诊断；肠系膜对侧肠壁增厚等 5 项指标提示 ITB 可能大。
3.最终临床+内镜中纳入指标 CD、ITB 组分别为腹泻、肛周病变史、节段性病变、纵行溃疡及盗汗、PPD 强阳性、肺结核、环形溃疡、回盲瓣固定开放。CTE 中纳入 CD 诊断指标为节段性病变、肠系膜侧增厚、假憩室征、分层强化、回盲瓣闭塞、肠粘连及梳状征，纳入 ITB 诊断指标为系膜对侧肠壁增厚、回盲瓣挛缩或固定开放、淋巴结沿右半结肠动脉分布及淋巴结中心坏死。
4.通过 ROC 曲线比较得出，CTE 评分标准对 CD 诊断的灵敏度及特异度分别为 83.6%及 100%，较临床及内镜高。而联合评分时，综合评分系统曲线下面积最高（0.993），约登指数最大时其特异度及灵敏度分别为 100%及 93.4%，而临床+内镜评分分别为 78.3%及 88.5%，但均较单纯临床内镜指标高。
结论
CTE 在 CD 诊断中有较高价值，可提供肠壁以外的信息以助于判断疾病的综合情况。
CTE 评分标准对 CD 诊断的特异度及灵敏度较高，可提供较多量化指标。

综合评分系统较单一评分系统可提高 CD 诊断的灵敏度及特异度，多征象联合应用更有利于 CD 与 ITB 的鉴别诊断，为临床综合诊断提供更全面的信息。

OR-136
多层螺旋 CT 血管三维造影术前评估髂内动脉变异的临床应用价值

方鑫,伍兵
四川大学华西医院

目的 探讨在直肠癌腹腔镜术前，用多层螺旋 CT 血管三维重建造影评估髂内动脉分支的变异情况，以指导手术操作，避免术中严重出血的临床应用价值。
方法 搜集华西医院 2019 年 1 月-2019 年 7 月临床诊断为直肠癌且均进行 CT 髂血管三维重建造影的 69 例患者资料，使用 Yamaki 分类方法（依据髂内血管主要分支情况分为 A-D 四组）进行初步分类，在此分类基础上进行小血管分支变异情况评估。
结果 在本次研究中以 Yamaki 分类方法为基础，得出髂内血管分类中最常见的为 A 组，其次为 B 组和 C 组，研究中未能见到 D 组，双侧未见明显差异。其中闭孔动脉以髂内动脉 A 组分出臀上动脉或 B 组分出阴部内动脉后所分出的第一支动脉最为常见，其次为由髂外动脉或臀上动脉直接分出；直肠中动脉以起自阴部内动脉第一分支最为常见；直肠下动脉最常起自于阴部内动脉第二分支。我们研究发现，双侧闭孔动脉在 B 组时变异情况有明显差异，(左侧变异变异率 42.9%，右侧变异率 93.8%，P=0.003)；其余髂内动脉分支左右两侧变异未见明显差异。
结论 术前应用多层螺旋 CT 血管三维重建造影能够为临床医生提供更多髂内血管及其分支动脉起源、形态、走形等信息，对术前评估髂内血管变异情况具有较高价值。

OR-137
基于 ESGAR 和 ESPR 技术共识的 CT 肠道成像的临床实践细节

沈亚琪,胡道予,李震,周紫玲
华中科技大学同济医学院附属同济医院

目的 基于 2017 年欧洲胃肠和腹部放射学会(European Society of Gastrointestinal and Abdominal Radiology，ESGAR)及欧洲儿科放射学会(European Society of Paediatric Radiology，ESPR)首次联合发布 CT 肠道成像（CT enterography,CTE）技术共识, 联合本研究中心应用体会，探讨适用于国人的肠道准备及扫描技术方面的细节。
材料和方法 回顾性分析我院 2018 年 1 月至 12 月期间，符合 ESGAR 和 ESPR 技术指南推荐的 CT 肠道成像图像，与同期非肠道充盈全腹部增强 CT 对比。其中，肠道成像常规采集动脉期（膈顶水平主动脉 CT 阈值触发 25-30s）及肠期（阈值触发 55～60s）。全腹部增强 CT 增加延迟期（延迟 210s）。回顾性分析肠道充盈情况，分组评价各扫描时期对肠道不同疾病检出情况。
结果 基于 ESGAR 和 ESPR 技术指南推荐的 CT 肠道成像图像，肠腔充盈情况明显优于未对肠腔充盈严格要求的全腹部增强 CT。充盈后的 CT 肠道成像，对肠道病变检出率高于全腹部增强 CT，肠外病变检出大致相仿。CT 肠道成像动脉期对于检出隐源性消化道出血，消化道变异及富血供病变显示率较高。静脉期对于肠道炎性病变与动脉期显示率一致，部分更佳。增加了小肠疾病的诊断信心。
讨论：与 ESGAR 和 ESPR 技术指南共识相一致，本中心采用水作为肠道阴性充盈，患者接受度高，容易实施，且肠壁对比好。肠道充盈可，但对于检出活动性隐源性消化道出血效果好。基于本研究中心的经验分析表明，动脉期及肠期扫描能够满足绝大部分肠道疾病的诊断要求。目前国内暂无基

于证据的指南表明 CT 肠道成像的技术细节，不少中心仍在采用阳性对比剂充盈肠腔。肠道清洁虽然有助于增加诊断信心，但使患者接受度下降。

OR-138
MR 扩散峰度成像对伴上皮间质转化的结直肠癌早期化疗疗效的评估价值

刘欢欢,汪登斌
上海交通大学医学院附属新华医院

目的 上皮间质转化（epithelial mesenchymal transition, EMT）可促进结直肠癌（CRC）的转移和化疗耐药。本研究探讨 MR 扩散峰度成像（DKI）评估伴有 EMT 的 CRC 对 5-氟尿嘧啶（5-Fu）早期化疗疗效的价值。
方法 采用 HCT116/Control 和 HCT116/EMT 细胞建立 24 只裸鼠 CRC 皮下移植瘤模型（CRC/Control 组和 CRC/EMT 组，每组 12 只）。待瘤体体积达 250 mm^3时，将 CRC/Control 和 CRC/EMT 组裸鼠随机分成 2 组，经腹腔隔日注射 5-Fu（10mg/kg）或二甲基亚砜 14 天，隔日测量肿瘤大小，计算肿瘤相对体积（$RTV=V_{dx}/V_{d0}$）。于 Day0 和 Day7、Day14 行 T2WI 和 DKI 后得到表观弥散系数（ADC）和 DKI 相关弥散系数（D）、峰度系数（K）值，测量各组皮下移植瘤相对应的 ADC、D 和 K 值。比较各组内和组间肿瘤 ADC、D 和 K 值的差异，以及与 Ki-67 表达的相关性。
结果 5-Fu 治疗 Day14 时，CRC/Control 治疗组 RTV 显著低于 CRC/EMT 治疗组（P<0.001）。CRC/Control 治疗组肿瘤的 ADC 和 D 值在 Day0、Day7、Day14 逐渐升高，而 K 值逐渐降低，差异均具有统计学意义（P均<0.001）。治疗 Day14 时，CRC/Control 治疗组肿瘤的 ADC 和 D 值显著高于 CRC/Control 对照组，而 K 值显著低于对照组（ADC，P=0.022；D，P=0.021；K，P=0.009）。ADC 和 D 值与 Ki-67 表达呈显著负相关（P=0.003, P=0.002），K 值与 Ki-67 表达呈显著正相关（P=0.004）。
结论 CRC 皮下移植瘤伴 EMT 后对 5-Fu 化疗耐药，DKI 有助于评估 EMT 后 CRC 的 5-Fu 早期化疗疗效，有助于早期调整治疗方案。

OR-139
食管鳞癌新辅助化疗后动态对比增强 MRI 定量参数与病理分级的相关性研究

鲁亚南,曲金荣
郑州大学附属肿瘤医院

目的 探讨食管鳞癌新辅助化疗后动态对比增强-MRI（DCE-MRI）定量参数与病理分级间的相关性。
方法 前瞻性分析 2015 年 9 月至 2017 年 12 月郑州大学附属肿瘤医院，经食管镜检查确诊为食管鳞癌，术前接受新辅助化疗，且在术前 1 周内行 DCE-MRI 扫描的 56 例患者的临床及影像资料。所有患者均行常规 MRI 和 DCE-MRI 扫描，测量 DCE-MRI 定量参数，包括容积转移常数（K^{trans}）、速率常数（K_{ep}）及血管外细胞外间隙容积比（V_e）。对手术后活体标本进行病理分级，根据病理结果分为高分化组、中分化组、低分化组及未分化组。对 2 名医师测量所得 DCE-MRI 各定量参数结果进行一致性分析，计算组内相关系数（ICC）。采用 Kruskal-Wallis H检验比较不同病理分级间 DCE-MRI 各定量参数的差异，两两比较采用 Mann-Whitney U检验。采用 Spearman 秩相关分析评价 DCE-

MRI 各参数值与食管鳞癌病理分级的相关性，采用 ROC 曲线评价各参数诊断食管鳞癌病理分级的效能。

结果 56 例患者中，高分化组 8 例、中分化组 39 例、低分化组 9 例、未分化组 0 例。不同病理分级组间平均 K^{trans}、75%K^{trans}、最大 K_{ep}、平均 K_{ep}、75%K_{ep}值的差异均有统计学意义（P均＜0.05），且与病理分级呈正相关（r值分别为 0.778、0.632、0.594、0.725、0.489，P均＜0.05）。平均 K^{trans}、75%K^{trans}诊断食管鳞癌病理分级的 ROC 曲线下面积分别为 0.750、0.856，其中 K^{trans}75%的诊断效能最佳，诊断阈值为 0.693/min，敏感度为 87.5%，特异度为 78.5%。

结论 食管鳞癌新辅助化疗后 DCE-MRI 定量参数对预测病理分级有一定的价值。

OR-140

GRASP 对术前新辅助化疗食管癌患者的 DCE-MRI 定量参数和纹理分析的影响

鲁亚南,曲金荣
郑州大学附属肿瘤医院

摘要
目的
比较 DCE-MR 图像的两种重建方式（（GRASP）和视野共享）对药代动力学参数和纹理特征，并探讨它们在评估食管癌（EC）患者对新辅助化疗（nCT）的反应的价值。
方法和材料
该研究前瞻性地研究了在手术前接受 nCT 的 EC 患者。在 nCT 之前和手术前 1 周内进行 DCE-MRI 扫描。根据 RECIST 1.1 和肿瘤消退等级（TRG）评估化疗反应。 Mann-Whitney U 检验用于比较评估反应的 GRASP 和视野共享重建特征。对每个重要特征进行接受者操作特征（ROC）曲线以评估其预测肿瘤反应的准确性。
结果
本研究中包括 30 名患者（28 名男性,2 名女性;平均年龄 58±8 岁）。 根据实体肿瘤的疗效评价标准 1.1 版本(RECIST 1.1)评估出 18 名为反应组和 12 名为非反应组。根据术后病理肿瘤消退程度分级(TRG)标准评估出 0 例患者为 TRG1,1 例患者为 TRG2,3 例患者为 TRG3,8 例患者为 TRG4,18 例患者为 TRG5。
从每个肿瘤中提取总共 72 个药代动力学参数和纹理特征。其中，29 个新辅助化疗前的纹理特征和 24 个新辅助化疗后的纹理特征显示 GRASP 和视野共享重建参数之间存在统计学上的显着差异。在视野共享上的 1 个 nCT 前纹理特征和 37 个 nCT 后药代动力学参数和纹理特征显示反应组和非反应组之间存在显着统计学差异。
结论
GRASP 可以影响 DCE-MR 成像的药代动力学参数和纹理特征。使用 GRASP 和视野共享重建的一些 nCT 前和之后的药代动力学参数和纹理特征显示了评估 EC 中对 nCT 反应的能力。

胃癌病理分级及其相关表型对 EMT 过程影响的 CT 表现研究

刘现伟
上海交通大学医学院附属同仁医院

目的 探讨胃癌不同病理分级及相关分子表达对 EMT 过程的影响及其 CT 表现。**方法** 1、回顾性收集经手术病理证实的 114 例胃癌患者的临床资料进行分析。所有患者术前均行 CT 平扫及增强扫描。术后胃癌组织标本均行 HE 染色，分析病灶位置、最大直径、肿块分叶、腔内溃疡、浸润深度、强化特点、淋巴结转移等 CT 指标，分析不同分级胃癌的 CT 表现；2、选取 31 例胃癌标本对其进行 E-cadherin、Vimentin 分子表达的免疫组化检测。结合 CT 表现，评价 E-cadherin、Vimentin 分子表达对 EMT 过程的影响。**结果** 1、 比较 114 例胃癌高分化、中分化、低分化 3 组之间 CT 表现之间的差异性，胃癌大小、肿块分叶、强化程度、淋巴结转移差异有统计学意义（p 值均＜0.05），病灶的部位、边缘、腔内溃疡差异无统计学意义，（p 值均＞0.05）。2、31 例胃癌的侵袭转移情况与其 E-cadherin、Vimentin 分子表达之间相关性，胃癌部位、最大直径、腔内溃疡、强化程度及淋巴结转移情况等 CT 征象与 E-cadherin、Vimentin 分子表达差异无统计学意义（p 值均＞0.05）；胃癌 CT 表现肿块分叶征、淋巴结转移均与 E-cadherin 分子表达差异有统计学意义（p 值均＜0.05），与 E-cadherin 表达呈正相关（r=0.437，p=0.014）；而肿块分叶征、淋巴结转移均与 Vimentin 分子表达差异无统计学意义（p 值均＞0.05）。**结论** 1、胃癌的 CT 表现与其分级具有一定的相关性，借此表现有助于术前分级、分期；2、胃癌的侵袭转移情况与 E-caderin 分子表达具有一定相关性，而与 Vimentin 分子表达无明显相关性，结合 CT 表现，对胃癌新型治疗方案研究有一定的帮助。

利用深度学习和放射组学模型预测结直肠癌 KRAS 突变

何刊
吉林大学第一医院

目的 我们提出了一个残余神经网络(ResNet)模型,使用常规预处理对比增强 CT 图像为研究 CRC 患者的 KRAS 突变状况,并与 CT-based radiomics 模型。
方法 将 157 例经病理证实的结直肠癌患者随机分为主队列(117 例)和验证队列(40 例)。治疗前进行 KRAS 突变检测和增强 CT 扫描。我们开发了一个基于 ResNet 的深度学习模型，利用门静脉期 CT 图像预测 CRC 患者在主要队列的轴向、冠状和矢状方向的 KRAS 突变，并在内部验证队列中验证了该模型。我们还探索了一种利用随机森林分类器(RFC)预测 KRAS 突变的放射组学模型。用 AUC 值评估预测性能。
结果 验证队列中，轴向 ResNet 模型 AUC 值最高(0.90)，峰值为 0.93，输入“ROI 和 20 像素”周边区域。放射组学签名包括四个放射组学特性。在验证队列中，放射组学模型的 AUC 为 0.82。
结论 利用 CRC 患者治疗前 CT 图像的深度学习(DL)和放射组学模型具有预测 KRAS 突变的潜力。ResNet 模型简化了传统放射组学从图像中提取多步信息的过程，具有较高的诊断精度。

3D CUBE T2WI-FS 序列替代 T2WI-FS 序列作为肛瘘 MRI 常规检查序列的可行性分析

韦鑫,陈维娟,陈金华
重庆医科大学附属第二医院

目的 研究三维超长回波链采集 FSET2WI 抑脂序列（3D CUBE T2WI-FS）替代常规 T2WI-FS 序列作为肛瘘患者术前 MRI 检查的常规检查序列的可行性。

方法 回顾性分析 2018 年 1 月～2019 年 7 月我院收治的 46 例经手术病理证实为肛瘘患者的临床资料，所有患者术前均接受盆腔磁共振检查，分析术前 MRI 显示肛瘘瘘管、外口、内口和伴发脓肿情况，以手术所见及病理结果为标准，分析两种序列对肛瘘显示的准确率。
结果 46 例肛瘘患者手术病理检查结果发现：17 例高位肛瘘，29 例低位肛瘘；26 例单纯性肛瘘，20 例复杂性肛瘘；Parks 分型**结果** 括约肌间型 27 例，经括约肌型 17 例，括约肌上型 2 例，括约肌外型 0 例。主瘘管 47 例，分支瘘管 11 例，外口 57 例，内口 53 例，脓肿 10 例。经 MRI 诊断结果与手术病理检查结果对照，发现 3D CUBE T2WI-FS 序列与常规 T2WI-FS 序列对肛瘘分型的准确率分别为 93.4%（43/46）、78.3%（36/46），差异具有统计学意义（P ＜ 0.05）；对瘘管支数诊断的敏感性分别为 93.1%和 72.4%，对内口总数诊断的敏感度分别为 94.3%和 75.5%，差异具有统计学意义（P ＜ 0.05）。两种序列对外口数目和伴发脓肿与手术病理结果一致。
结论 磁共振 3D CUBE T2WI-FS 序列能更准确显示肛瘘瘘管、外口、内口和伴发脓肿，且对细小分支瘘道和瘘道内口的检出率明显优于常规 T2WI-FS 序列，可提供更加全面的解剖和病理信息，建议将 3D CUBE T2WI-FS 序列作为肛瘘疾病 MRI 检查的常规序列。

基于 CT 的细胞外体积分数预测结肠癌区域淋巴结转移及肝转移

邵瑞丽,王微,张孟超
吉林大学第三医院(中日联谊医院）

目的
本文旨在探讨利用对比增强多层螺旋 CT （MDCT） 平衡期评估细胞外体积分数(ECV)能否作为结肠癌区域淋巴结转移及肝转移的预测因子。
方法
回顾性分析于我院行 MDCT 增强扫描及肠镜检查，并经组织学确诊为腺癌的 94 例结肠癌患者，其中 64 例患者接受手术治疗。根据有无肝转移（包括同步肝转移或异时肝转移）分为结肠癌无肝转移组（n=66）、结肠癌肝转移组（n=28）。根据术后病理分为结肠癌区域淋巴结转移组（n=27）、结肠癌无区域淋巴结转移组（n=37）。通过对 MDCT 平扫期和增强后平衡期结肠癌病灶和主动脉感兴趣区 CT 值的测量，计算肿瘤 ECV 分数，并比较组间差异。采用受试者操作特征曲线（ROC 曲线）分析 ECV 与结肠癌肝转移、淋巴结转移的关系。
结果
结肠癌肝转移组 ECV 明显高于结肠癌无肝转移组（34.5% vs 28.5% ， P= 0.000<0.05），ECV 预测结肠癌肝转移的曲线下面积（AUC）为 0.792（ P=0.000<0.001），最佳临界值为 32.9%，灵敏度、特异度、阳性预测值（PPV）、阴性预测值（NPV）、正确率分别为 57.1%、90.9%、72.7%、83.3%、80.8%。结肠癌区域淋巴结转移组 ECV 明显高于结肠癌无区域淋巴结转移组（31.3% vs 28.4% ,P=0.009<0.05），ECV 预测结肠癌区域淋巴结转移的曲线下面积（AUC）为 0.677（ P=0.016<0.05）,最佳临界值为 31.8%，灵敏度、特异度、阳性预测值（PPV）、阴性预测值（NPV）、正确率分别为 55.6%、81.1%、68.2%、71.4%、70.3%。
结论
利用对比增强 MDCT 平衡期评估细胞外体积分数(ECV)能够作为结肠癌区域淋巴结转移及肝转移的影像学预测指标。

Differentiation intracranial hypervascular tumor with mean apparent propagator (MAP) MRI

Ankang Gao[1], Huiting Zhang[2], Xu Yan[3], Jie Bai[1], Jingliang Cheng[1]
1. the First Affiliated Hospital of Zhengzhou University
2. MR Scientific Marketing, Siemens Healthcare, Wuhan, China
3. MR Scientific Marketing, Siemens Healthcare, Shanghai, China

Purpose: To differentiate intracranial hypervascular tumors using diffusion spectrum imaging (DSI) sequence and mean apparent propagator (MAP)-MRI model, the parameters of which include the mean squared displacement (MSD), return-to-the-origin probability (RTOP), return-to-the-plane probability (RTPP), return-to-the-axis probability (RTAP), Q-space Inverse Variance (QIV) and non-Gaussianity (NG).

Methods: Four patients with brain tumors which have high intensity on contrast enhancement (CE) were recruited. The tumors were diagnosed using histopathology (2 meningeoma, 1 pituitary adenoma and 1 neurilemmoma). All the four patients underwent the DSI scan before surgery on a 3T MR scanner (MAGNETOM Prisima, Siemens Healthcare, Erlangen, Germany) with a 64-channel head-neck coil. The DSI sequence was used with following parameters: FOV = 220 × 220 mm^2, matrix = 128 × 128, slice thickness = 2 mm, slices = 66, TR/TE = 3900/72 ms, b = 0 and 3000 s/mm^2, 95 different gradient directions. The diffusion parameters derived from MAP-MRI model were calculated using an in-house developed post-processing software, which is based on an open-resource too DIPY (http://nipy.org/dipy). The calculated parameters include the RTOP, RTAP, RTPP, QIV, MSD and NG. All the parameters were calculated in Regions of interest (ROIs) which were manually drawn around the solid part of the tumor and the normal-appearing white matter (NAWM). The mean value and standard deviation of each parameter were calculated for differentiating intracranial hypervascular tumors.

Results: Figure 1 shows the maps of the CE T1W image and the parameters derived from MAP-MRI for one patient with meningeoma. The tumor can be easily recognized in all the maps. All the parameters of MAP-MRI in tumor and NAWM are listed in Table 1. For the different type tumors, the parameters have bigger differences.

Discussion: All the parameters in different diagnosis tumors showed obvious differences, as shown in Table 1. Especially, NG was more sensitive than other parameters in revealing the tumor because of its high contrast ratio. The RTAP is more stability than other parameters in the NAWM, and with a larger difference among the three kinds of intracranial hypervascular tumor. However, in this study, only four patients were recruited. So we may need more samples to verify these results.QIV and RTOP are beneficial for observing the structure of the white and gray matter, but if them helpful to observe the lesion of white matter such as multiple sclerosis (MS), microinfarcts and microbleeds is another question need to be explored.

Conclusions: MAP-MRI may be useful to observe the microstructure of the tumor, which may contribute to differentiate intracranial hypervascular tumor and reveal the intracerebral minor lesion.

Intravoxel incoherent motion diffusion-weighted imaging for monitoring the immune response to cyclophosphamide in C57bL/6 mice with GL261 gliomas

Junjiao Hu,Xiangran Cai
Medical Imaging Center, the First Affiliated Hospital, Jinan University,

Aim

To assess whether IVIM-DWI can predict the immune response to anti-neoplastic agents, six C57BL/6 mice with GL261 mouse gliomas were applied using Metronomic cyclophosphamide. Our results indicated that IVIM-DWI is sensitive to detect the Cyclophosphamide-induced Immune Response.

Materials

A total of 12 mice with GL261 glioma cells were randomly allocated to either the control group (n = 6) or the CPA-treated group (n = 6). Mice in the treated group were administered with CPA monohydrate every 6 days at a dose of 140 mg/kg-body weight per injection (CPA-140) as specified. Mice bearing GL261 underwent IVIM DWI scan (Signa HDxt, GE Medical System, USA) at baseline (T0) and 6 (T6) and 12 days (T12) after treatment with Metronomic cyclophosphamide (N = 6) with a custom-built-4-channel receiver coil with 3cm inner diameter. The IVIM DWI sequence was obtained using a single-shot echo-planar imaging with 12 b-values of 0, 20, 50, 100, 150, 200, 400, 600, 800, 1200, 1600, and 2000 s/mm2 (Fig. 1). The following parameters were used for this sequence: TR/TE, 3000 ms /102.4 ms; flip angle, 90° ; matrix, 64 × 64; field of view, 80 × 80 mm2; section thickness, 2.9 mm; NEX, 4; and total scanning time, 6 mins and 35 s. After all experiments, there were two rats died in the control group. Region of interests (ROI) were placed on the lesions based on IVIM images by one experienced radiologists, then the ROIs were copied onto IVIM metrics (apparent diffusion coefficient, ADC; true diffusion coefficient, D.) and mean values were recorded. The results were then analyzed by Wilcoxon rank-sum tests.

Result

At baseline, there was no statistical significance between the two groups of the ADC and D values (Table 1). However, the ADC and D value of the treatment group were significant higher than that in control group at both T6 and T12 (Table 1). Furthermore, the ADC and D values of the treatment group showed an increasing trend, while ADC and D values in control group showed a decreasing trend. Finally, the tumor volume of the treatment group began to decrease or not increase significantly at T6, while the control group showed a significant increasing trend.

Conclusion

Our study indicate that the ADC and D parameter could predict early immune response to anti- neoplastic treatment. we can use the MRI to evaluate the immune response to anti- neoplastic treatment with clinical chemotherapy in tumor patients.

Quantification of penumbra volume in acute ischemic stroke of middle cerebral artery using susceptibility weighted imaging mapping

Yu Luo[1], Xiudi Lu[2], Linglei Meng[1], Yongming Zhou[1], E. Mark Haacke[3], Meiyun Wang[4]
1. 同济大学附属上海市第四人民医院
2. First Central Clinical College Tianjin Medical University
3. Wayne State University
4. Zhengzhou University People's Hospital

Background and Purpose Asymmetric prominent cortical veins (APCVs) is associated with ischemic penumbra but there are no quantifications its volume. We aimed to quantitatively evaluate volume of the ischemic penumbra from a new perspective on susceptibility weighted imaging mapping (SWIM) in patients with acute ischemic stroke.
Methods we randomly enrolled 41 eligible patients with acute ischemic stroke who had available MRI data and with SWI_{volume}-DWI mismatch before treatment within 12 hours from symptom onset. The volume of APCVs was quantitatively and semi-quantitatively calculated separately. Comparative analysis of the diagnostic performance of penumbra for APCVs on SWIM between quantitative volume mismatch and semi-quantitative ASPECT mismatch was performed. The mismatch volume of penumbra between SWI-DWI and PWI-DWI was quantified. Correlation between SWI-DWI mismatch and PWI-DWI mismatch was performed and both of them were analyzed with National Institute of Health Stroke Scale (NIHSS).
Results All the 41 patients had SWI_{volume}-DWI mismatch while there was only 22 cases who had $SWI_{ASPECTS}$-DWI mismatch. The accuracy of SWI_{volume}-DWI was obviously higher than $SWI_{ASPECTS}$-DWI (100% *vs* 53.66%) reference to PWI-DWI mismatch. There was significant positive correlation between SWI_{volume}-DWI mismatch and PWI-DWI mismatch ($r=0.522$, $p<0.01$) while no correlation was found between $SWI_{ASPECTS}$-DWI mismatch and PWI-DWI mismatch ($p>0.05$). There was negative correlation between SWI_{volume}-DWI mismatch, $SWI_{ASPECTS}$-DWI mismatch and NIHSS ($r=-0.315$, -0.485, $p=0.045$, 0.001, respectively).
Conclusions SWI_{volume}-DWI mismatch was more accurate than $SWI_{ASPECTS}$-DWI in evaluating the ischemic penumbra, and it was an alternative to PWI-DWI mismatch in acute ischemic stroke cases. Quantitative measurement of the volume of APCVs from SWIM was a good modality to reflect the hypoperfusion area as well as PWI.

Structural and functional substrates underlying serum high density lipoprotein cholesterol change in major depressive disorder

Cun Zhang, Jiajia Zhu, Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Aims: There is evidence that major depressive disorder (MDD) is related to serum lipid level alterations. However, the neural correlates underlying this association remain unclear. In this study, we aimed to identify the neurobiological underpinnings of the relationship between depression and serum lipids.
Methods: 49 patients with MDD underwent structural and resting-state functional magnetic resonance imaging (MRI) scans. Voxel-based morphometry (VBM) and functional connectivity (FC) analyses were performed to assess brain structure and function, respectively. Peripheral venous blood samples were collected to measure serum levels of lipid profiles including total cholesterol (TC), triglyceride (TG) and high density lipoprotein cholesterol (HDL-C). Correlation and mediation analyses were used to investigate the associations of serum lipid levels with brain structure and function in MDD patients.
Results: A majority of MDD patients had lower HDL-C serum level but normal serum TC and TG levels. Serum HDL-C level was positively correlated with gray matter volume (GMV) in the bilateral ventromedial prefrontal cortex, and negatively correlated with FC between the bilateral ventromedial prefrontal cortex and the left angular gyrus. Moreover, mediation analysis revealed that the ventromedial prefrontal cortex-angular gyrus FC significantly mediated the relationship between GMV in the ventromedial prefrontal cortex and serum HDL-C level.
Conclusion: These findings help to identify structural and functional substrates underlying serum HDL-C change in patients with MDD, which may provide new insight into the relationship between depression and serum lipids from the perspective of neural regulation.

Study ofmagnetic resonance neurography in evaluating the influence of maxillofacial tumor on peripheral branches of cranial nerves

Feihong Wu,Wenjun Wu,Lixia Wang,Xiangquan Kong,Chuansheng Zheng
Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To explore the value of magnetic resonance neurography (MRN) in evaluating the influence of maxillofacial tumor on peripheral branches of cranial nerves.
Methods: 35 volunteers and 44 patients with maxillofacial tumors confirmed by pathology were enrolled. They underwent the three-dimensional (3D) sampling perfection with application-optimized contrasts using different flip-angle evolutions (SPACE) and the short time inversion recovery (STIR) sequence as MRN method on 3.0T MRI scanner. In volunteers, the signal to noise ratio (SNR) of inferior alveolar nerve, mandible bone marrow, medial pterygoid muscle, subcutaneous fat, submandibular gland and standard deviation of background noise (σ_0) were obtained. The contrast signal-to-noise ratio (CNR) and contrast ratio (CR) of inferior alveolar nerve relative to other tissues were calculated, and the parameters between conventional MRN (cMRN) and contrast-enhanced MRN (ceMRN) group were compared. Three radiologists were used MPR and MIP on ceMRN images to evaluate the continuity of 10 major branches of the cranial nerves on ceMRN based on the 5-score (0-4) subjective score. In patients, the

relationships between maxillofacial tumors and adjacent peripheral nerves were classified as isolated, compressed, invaded, embodied or spread perineurally, the number of involved peripheral branches of cranial nerves in various relationships was recorded.

Results:16 volunteers were examined by cMRN. The $SNR_{(nerve,\ bone\ marrow,\ muscle,\ fat,\ gland)}$ of cMRN were significantly higher than those on ceMRN. The $CNR_{(nerve\text{-}bone\ marrow,\ nerve\text{-}muscle,\ nerve\text{-}fat)}$ of cMRN were significantly higher than those on ceMRN. $CR_{(nerve\text{-}bone\ marrow,\ nerve\text{-}muscle,\ nerve\text{-}gland)}$ of ceMRN were significantly higher than those on cMRN (all $P<0.05$). The interobserver consistency of all nerves across the 3 readers was excellent, with an average κ value > 0.8. According to the 44 patients, there were 17 cases of nerves isolated to tumor, a total of 63 abnormal nerves were identified, there are 25, 25, 5, 8 in relationship of compressed, invaded, embodied, and spread perineurally.

Conclusion: 3D SPACE STIR sequence can be used as a method for visualizing cranial nerves, and it can display the relationship between maxillofacial tumor and peripheral branches of the cranial nerves.

Robust prediction of individual personality from brain functional connectome

Huanhuan Cai,Jiajia Zhu,Yongqiang Yu
安徽省中医院

Neuroimaging studies have linked inter-individual variability in the brain to individualized personality traits, suggesting a neural substrate of personality. However, only one or several aspects of personality have been effectively predicted based on brain imaging features, perhaps due to small sample sizes, limited image quality, and non-specific methodologies. The objective of this study was to construct a reliable prediction model of personality in a large sample by using connectome-based predictive modeling (CPM), a recently developed machine learning approach. High-quality resting-state functional magnetic resonance imaging data of 810 healthy young participants from the Human Connectome Project dataset were used to construct large-scale brain networks. Personality traits of the five-factor model (FFM) were assessed by the NEO Five Factor Inventory. CPM with leave-one-out cross-validation was conducted to predict individual personality from whole-brain functional connectivity patterns. CPM successfully and reliably predicted all the FFM personality factors (agreeableness, openness, conscientiousness and neuroticism) other than extraversion in novel individuals. At the neural level, we found that the personality-associated functional networks mainly included brain regions within default-mode, frontoparietal executive-control, visual, and cerebellar systems. Moreover, different feature selection thresholds and parcellation strategies did not significantly influence the prediction results. Our finding of robust personality prediction from an individual’s unique functional connectome may help advance the translation of “brain connectivity fingerprinting” into real-world personality psychological settings.

OR-151

The relationship between high density lipoprotein cholesterol (HDL-C) and depressive symptoms is mediated by white matter integrity in major depressive disorder

Ying Yang, Jiajia Zhu, Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Background: Major depressive disorder (MDD) is a significant problem in public health issues, and approximately 340 million people are suffering from this mental illness at any time. There is great consensus that dyslipidemia including high serum levels of total cholesterol (TC) or triglyceride (TG) or low serum level of high density lipoprotein cholesterol (HDL-C) is a proven risk factor for atherosclerosis, cardio-cerebrovascular disease, metabolic syndrome, and cognitive impairment. In recent years, emerging clinical studies have shown that serum lipid level alterations occur in patients with MDD. However, the neural substrates underlying this association remain poorly understood.
Methods: 49 patients with MDD underwent diffusion tensor imaging (MRI). Multiple diffusion parameters were calculated to measure brain white matter integrity. Peripheral venous blood samples were collected to measure serum levels of lipid profiles including TC, TG and HDL-C. Correlations between serum lipid levels and white matter integrity were investigated by using tract-based spatial statistics (TBSS). Further mediation analysis was performed to determine whether micro-structural integrity in those affected white matter regions mediates the relationship between serum lipid levels and scores of Hamilton Rating Scale for Depression ($HAMD_{24}$) by using the PROCESS macro installed in SPSS.
Results: A majority of participants had lower serum level of HDL-C but normal serum levels of TC and TG. According to the established serum lipid cut-off points of Adult Treatment Panel III (ATP III), 22% of the participants had serum levels of TC > 200 mg/dL (5.17 mmol/L), 29% serum levels of TG > 150 mg/dL (1.69 mmol/L) and 88% serum levels of HDL-C < 60 mg/dL (1.55 mmol/L). There were positive correlations between serum HDL-C level and fractional anisotropy (FA) in the left anterior corona radiata (ACR) (pr = 0.561, P < 0.001), genu of corpus callosum (CC) (pr = 0.472, P < 0.01), left superior corona radiata (SCR) (pr = 0.444, P < 0.01), body of CC (pr = 0.426, P < 0.01), left external capsule (EC) (pr = 0.426, P < 0.01), right ACR (pr = 0.352, P < 0.05), right SCR (pr = 0.328, P < 0.05) and splenium of CC (pr = 0.316, P < 0.05). There were negative correlations between serum HDL-C level and radial diffusivity (RD) in the left ACR (pr = -0.514, P < 0.001), genu of CC (pr = -0.509, P < 0.001), body of CC (pr = -0.481, P < 0.01) and left SCR (pr = -0.460, P < 0.01). Moreover, the relationship between serum level of HDL-C and $HAMD_{24}$ scores was significantly mediated by the FA in the genu of CC (indirect effect = -6.6121, 95% CI = -15.4260 to -1.4320) and the RD in the genu of CC (indirect effect = -7.1874, 95% CI = -15.8293 to -1.5613).
Conclusions: In conclusion, we found that higher serum level of HDL-C was associated with greater micro-structural integrity in multiple white matter regions in patients with MDD. Moreover, white matter integrity in the genu of CC significantly mediated the relationship between serum level of HDL-C and severity of depressive symptoms.

These findings may provide new insight into intervention, treatment and prevention of MDD from the perspective of regulating serum lipids.

OR-152

Identification of specific brain regions altered in major depressive disorder with poor sleep quality

Ying Yang, Jiajia Zhu, Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Background: Major depressive disorder (MDD) is a prevalent psychiatric illness, affecting more than 300 million people of all ages worldwide. It is well established that sleep problems (insomnia and hypersomnia) are very common complaints in MDD and up to 90% of the patients with MDD may experience sleep problems. Importantly, sleep disturbances, a risk factor for developing depression, can increase the severity of various symptoms of depression and lead to poor response to treatment for depression. Thus, identification of the relevant features specific to sleep disturbances in MDD is important for precise clinical diagnosis, treatment, and research. However, neural mechanisms underlying sleep disturbances in MDD remain largely unknown.
Methods: 96 patients with MDD underwent polysomnography (PSG) monitoring and magnetic resonance imaging (MRI) scans. According to the value of sleep efficiency (SE), participants were divided into two groups, 42 MDD patients with SE ≥ 90% and 54 well-matched MDD patients with SE < 90%. Inter-group differences in the analyses of voxel-based morphometry (VBM) on 3D T1 structural MRI, reginal homogeneity (ReHo) and functional connectivity strength (FCS) on resting-state functional MRI were tested.
Results: Compared with MDD patients with SE ≥ 90% group, MDD patients with SE < 90% group had significant decreased ReHo in the bilateral-lingual gyri of visual network (VIS) and right-postcentral gyrus of sensorimotor network (SMN), and increased FCS in the left-angular gyrus of default mode network (DMN). There was no significant difference in gray matter volume between the two groups.
Conclusions:
The present study suggests that network dysfunction in MDD patients with poor sleep quality is independent of structural changes and, more important, that lower local connectivity and higher global connectivity in different networks may reflect imbalanced network function, which may modulate different forms of sleep, emotional and cognitive dysfunction in MDD patients with poor sleep quality.

OR-153

1H-NMR -based metabolomic study of metabolic profiling for chronic manganism

Jingjing Lu, Jinwei Qiang
Jinshan Hospital of Fudan University

Objective: To assess the metabolic profile of brain samples of chronic manganism rats (CHM) and magnesium-treated CHM rats.
Methods: A total of 18 female Sprague-Dawley rats were divided into three groups as follows: a control group (n = 6); the CHM group (n = 6, with Mn^{2+} administered orally at a dose of 20 mg/kg/day in the form of $MnCl_2 \cdot 4H_2O$ for 6 weeks) and the Mg-treated CHM group (oral administration, $MnCl_2 \cdot 4H_2O$ at same dose and $MgSO_4$ at a dose of 496 mg/kg/day for 6 weeks). A ^1H nuclear magnetic resonance (NMR)-based metabonomics approach was used to obtain the brain metabolic profiles of basal ganglia and cortex. For multivariate statistical analyses, the normalized data were analyzed using SIMCA-P software. The acquired data were analyzed by Principal component analysis (PCA), partial least-squares discriminant analysis (PLS-DA) and orthogonal partial least-squares discriminant analysis (OPLS-DA). The differences in metabolites among the three groups were assessed.
Results: The 600 MHz ^1H NMR spectra demonstrated resonances arising from glutamine, lactic acid, leucine, histidine, isoleucine, citrate, etc. The OPLS-DA model in basal ganglia was capable of distinguishing between the CHM rats and the control rats with an R^2Y of 0.969 and Q^2Y of 0.393, between the CHM rats and Mg-treated rats with an R^2Y of 0.946 and Q^2Y of -0.272, between the Mg-treated rats and the control rats with an R^2Y of 0.885 and Q^2Y of 0.364. Three metabolites in basal ganglia, glutamine, lactic acid and asparaginic acid were identified as the most influential factors for the difference between groups. The validation of the diagnosis prediction showed that the accuracy of the OPLS-DA model in basal ganglia was 95%. The OPLS-DA model in cortex was capable of distinguishing between the CHM rats and the control rats with an R^2Y of 0.941 and Q^2Y of 0.16, between the CHM rats and Mg-treated rats with an R^2Y of 0.889 and Q^2Y of 0.213. Three metabolites in cortex, glutamine, lactic acid and asparaginic acid were identified as the most influential factors for the difference between groups.
Conclusion: ^1H NMR spectra has the potential to be developed into a useful diagnostic tool that could contribute to a further understanding of the mechanism of manganism.

Patient-derived orthotopic xenograft glioma models in mice can’t replicate the magnetic resonance imaging features of the original tumor

Wei Xue,Weiguo Zhang
Daping Hospital, Army Medical University

Patient-derived orthotopic glioma xenograft models are important platforms for pre-clinical research of glioma. In this study, we explored whether the MRI biomakers obtained from patient-derived glioma xenografts are equally applicable to the original tumors. Seven pairs of original tumors and corresponding xenografts in NOD-SCID mice were performed conventional MRI, DWI and DCE-MRI. Tumor samples were collected for transcriptome sequencing, and differentially expressed genes were screened between original tumors and corresponding xenografts, GO analysis was performed to analyze the functions of those genes. Tumor boundary, edema around the tumor mass, intratumoral signals, contrast enhancement, rADC values and K_{trans} values of the original tumors were quite different from those of xenografts, so did the genes expression. GO analysis showed that expression of tumor cell characteristics and extracellular matrix-related genes, angiogenesis-related genes and immune-related genes in original tumors were higher than those of the corresponding xenografts. In conclusion, patient-derived orthotopic xenograft glioma models in mice can't replicate the MRI features of original tumors, and differential genes expression may be an important cause of the differences of MRI features between original tumors and corresponding xenografts.

Radiomic features based on susceptibility weighted imaging can improve the grade classification of meningiomas

Yijing Zhao, Jianping Hu, Mengcheng Li, Jianyi Liu, Dairong Cao
the First Affiliated Hospital of FujianMedical University

Objectives: To investigate the value of radiomic susceptibility weighted imaging (SWI) features in the grade classification of meningiomas and whether the classification performance can be improved when combined with radiomic conventional magnetic resonance imaging (cMRI) and apparent diffusion coefficient (ADC) features.

Methods: This retrospectively study enrolled 249 low-grade [Grade I] and 109 high-grade [Grade II/III] patients with pathologically diagnosed meningiomas. Radiomic features were extracted from volume-based data of the entire tumor. Four machine-learning classifiers with nested cross-validation, including random forest (RF), k-nearest neighbor (KNN), support vector machine (SVM) and generalised linear models (GLM), were used to evaluate different radiomic models (SWI model, cMRI model, ADC model, SWI + cMRI model, SWI + ADC model, cMRI + ADC model and SWI + cMRI + ADC model). The classification performance of different radiomic models were assessed using receiver operating characteristic (ROC) analysis and areas under the ROC curves (AUC) of them were compared.

Result: According to RF classifier, the AUC of radiomic SWI model was significantly higher than radiomic cMRI or ADC model ($P<0.05$). Both radiomic SWI + cMRI model and SWI + ADC model showed higher AUCs than radiomic cMRI + ADC model ($P<0.05$). The radiomic cMRI + ADC + SWI model yielded the highest AUC (AUC = 0.877, 95% CI: 0.866

- 0.888) in the grade classification of meningiomas with sensitivity and specificity of 52% and 96%, respectively. For KNN, SVM and GLM classifiers, the radiomic cMRI + DWI + SWI models revealed the same trend toward the excellent grade classification performance but the lower AUC values (AUC = 0.845, 95% CI: 0.830 - 0.859; AUC = 0.859, 95% CI: 0.846 - 0.872; AUC = 0.843, 95% CI: 0.828 - 0.859, respectively), compared with RF classifier (P<0.05).

Conclusion: Radiomic SWI features can be useful for differentiating low-grade from high-grade meningiomas and can improve classification performance when combined with radiomic conventional cMRI and ADC features.

OR-156

Comparable efficacies in differentiating WHO grade II from III oligodendrogliomas with radiomic strategy and radiologist's evaluation

Shasha Zhao, Linfeng Yan, Yuchuan Hu, Guangbin Cui, Wen Wang
空军军医大学唐都医院

Purpose
The treatment and prognosis of WHO Grade II and III oligodendrogliomas are different, and the preoperative diagnosis is very important, however, their imaging differentiation remains a challenge. The purpose of this study is to evaluate whether the strategies of combining T1-Weighted contrast enhanced image (T1CE) with radiomics can improve the effectiveness of differential diagnosis.
Materials and Methods
Thirty-six patients with histologically confirmed ODGs who underwent the T1CE MR examination before any intervention between January 2015 and July 2017 were recruited in the current study, including 19 cases of WHO grade II oligodendrogliomas, 17 cases of WHO grade III oligodendrogliomas. The volume of interest (VOI) covering the whole tumor enhancement region were manually drawn on the T1CE slice by slice using ITK-SNAP and a total of 1044 features were extracted using Analysis-Kinetics software. Random forest (RF) algorithm and 5-fold cross validation were applied to differentiate WHO grade II from III oligodendrogliomas. The diagnostic efficacies of radiomics and radiologist's assessment were also compared.
Results
WHO grade III oligodendroglioma tended to present with prominent necrosis and nodular/ring-like enhancement (P < 0.05). There was no significant difference between the anatomical locations: 10 cases of oligodendroglioma (10/19, 52.6%) and 10 cases of anaplastic oligodendroglioma (10/17, 58.8%) in the frontal lobe. In addition, there were no significant differences in other conventional imaging features and clinical characteristics of grade II and III oligodendrogliomas. The RF strategy with radiomics features produced the stable diagnostic efficiency, with an AUC, ACC, sensitivity, and specificity of 0.765, 76.3%, 82.8% and 70.0%, respectively. The AUCs of radiologists 1, 2 and 3 with intermediate titles were 0.700, 0.687, and 0.714, respectively. The efficacy of radiomics is comparable to that of radiologist.

Conclusions
T1-weighted contrast-enhanced image combined with radiomics offered comparable efficacy to that of radiologist in differentiating WHO grade II from III oligodendrogliomas; RF classifier model can assist clinicians in diagnosis.

OR-157

Altered whole-brain functional connectivity in patients with periventricular nodular heterotopia related epilepsy: A resting-state functional MRI study

Xinyu Hu,Wenyu Liu,Dong Zhou,Qiyong Gong
West China Hospital of Sichuan University

PURPOSE
Periventricular nodular heterotopia (PNH) is a neural migration disorder which often present clinically with seizures. Despite awareness of PNH-related epilepsy, the underlying functional pathophysiological bases of this disorder remain poorly understood. Thus, the current study aims to investigate the alterations of whole-brain functional connectivity (FC) in patients with PNH-related epilepsy using a novel graph-theory approach known as functional connectivity strength (FCS)[1]to identify brain regions displaying high-degree centrality of connectivity, which represents cortical hubs in the whole-brain networks[2].

METHODS AND MATERIALS
The resting-state fMRI sensitized to changes in the blood oxygen level dependent (BOLD) signal levels were obtained for 38 patients with PNH-related epilepsy and 38 healthy control subjects (HCS) using a 3.0 T MRI system. Image preprocessing was performed using DPABI software. Whole-brain functional connectivity analysis for FCS map calculation was implemented in REST toolbox running under Matlab. Additionally, regions with FCS alterations were selected as regions of interest (ROI) in the following seed-based FC analyses to explore more specific abnormalities of FC patterns related to the identified hubs. Pearson correlation analyses were performed to explore associations between these functional neural correlates and clinical features.

RESULTS
Compared with HCS, PNH patients showed lower FCS in bilateral insula ($P < 0.05$, family wise error (FWE) correction); higher FC in the default mode network and lower FC in the fronto-limbic-cerebellar circuits ($P < 0.05$, FWE correction). Pearson correlation analyses revealed FCS in bilateral insula were negatively correlated with the epilepsy duration (left insula: $r = -0.39$, $P = 0.016$; right insula: $r = -0.36$; $P = 0.028$).

CONCLUSION
Using the resting-state FCS analytical approach, we identified significant insular hypoactivation in PNH patients, which suggested the insula might represent the cortical hub of whole-brain networks in this condition. Additionally, disruption of

resting-state FC in large-scale neural networks pointed to a connectivity-based neuropathological process in PNH.

OR-158

A combination of dynamic community structure and machine learning methods in tracking Alzheimer's disease-related functional reorganization

Jing Li,Wenliang Fan,Xin Li
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose

To proposed a consensus modularization approach to detect functional modules for dynamic brain network and evaluated the algorithm by machine learning based classification.

Methods

A sample set of 50 adults, including 25 normal controls and 25 AD subjects was drawn from the Alzheimer's Disease Neuroimaging Initiative (ADNI) dataset. For each subject, resting state fMRI images were obtained. The raw fMRI data were preprocessed with SPM8 and DPARSF software package. Then the whole brain was partitioned into 90 regions using AAL atlas to obtain the brain static network. For each subject, we constructed a series of time-dependent brain subnetworks from resting-state functional MRI by sliding window, and then adopted a consensus algorithm to extract dynamic information and integrate multiple partitions corresponding to dynamic subnetworks into an optimized modularization partition. Based on the approach proposed, we analyzed the modularization of functional brain network of healthy individuals and patients with Alzheimer's disease (AD). To evaluate the results from the consensus algorithm, machine learning based classification was performed on a new AD data sets.

Results

At subject level, evaluations in normalized mutual information (NMI) suggested that approach proposed can get a consensus modular structure of brain network which contains dynamic variations of modular organization over time. On the other hand, analysis of network properties and simulations of module attack demonstrated that consensus modularization results are more in accordance with the mechanism of functional segregation and integration of the brain. In addition, AD classification results based on features from modularization also verified that the consensus modularization result did describe the key characteristics of modular organizations in AD. In group analysis, the results indicated that the consensus algorithm can extract more consistent modular information over individuals with differences and get a concordant and rational group-level modular pattern structure.

Discussion and Conclusion

The consensus modularization approach we proposed could capture dynamic brain network information and can be taken as an effective dynamic modular method.

Quantitative susceptibility mapping based hybrid feature extraction for diagnosis of parkinson's disease

Naying He[1], Bin Xiao[2,3], Zenghui Cheng[1], Feng Shi[3], Qian Wang[2], Fuhua Yan[1]
1. Department of Radiology, Ruijin Hospital, Shanghai Jiao Tong University School of Medicine
2. Med-X Research Institute, School of Biomedical Engineering, Shanghai Jiao Tong University, Shanghai 200240, China
3. Shanghai United Imaging Intelligence Co., Ltd., Shanghai, China

Purpose: Parkinson's disease is the second largest neurodegenerative disease in the elderly after Alzheimer's disease. The aetiology and pathogenesis of Parkinson's disease (PD) are still unclear, but the loss of dopaminergic cells and the excessive iron deposition caused by the disorder of iron metabolism are one of the most significant factors. This phenomenon is particularly evident in the substantia nigra (SN) region of the midbrain. As an imaging technique that can quantitatively reflect the amount of iron deposition, quantitative susceptibility mapping (QSM) has been shown to be a promising modality for the diagnosis of PD. However, existing research mainly explores the signal intensity of images and does not extract specific unique imaging features. In the present work, we propose a hybrid feature extraction method for PD diagnosis using QSM images.

Methods: Eighty-seven cases of idiopathic PD (IPD) patients and 53 normal controls (NC) were collected at the Department of Radiology, Shanghai Ruijin Hospital. Data were collected using a 16 echo, gradient echo imaging sequence on a 3T GE Signa HDxt from an eight-channel receive-only head coil. QSM was reconstructed for each subject. First, we extracted radiomics features from the SN using QSM and employed machine learning algorithms to classify PD and NC. This approach allows us to investigate which features are most vulnerable to the effects of the disease. Then, we proposed a Convolutional Neural Network (CNN) based method which can extract a different kind of features from the QSM image for accurate diagnoses of PD. Finally, we combined these two types of features for the diagnosis of PD

Results: CNN gives the best classification performance: AUC = 0.93, Accuracy = 0.85, Sensitivity = 0.86, and Specificity = 0.83. Besides CNN, logistic regression and SVM also have comparable results. We combined the features extracted from the last convolution layer of CNN with the radiomics features extracted by RFE method, and re-train the LR and SVM models to get the classification results. The integration of the two features helps produce better performance in classification. With the help of radiomics features and deep features, we found that the SVM model provided the best results with the AUC. In the final experiment, we found that the radiomics features and CNN features are complementary to each other, which helps further improve the classification performance.

Conclusion: The findings from this work showed that hybrid features based on QSM of the SN from radiomics and CNN are consistent with previous histological and imaging studies, and provided reasonable diagnostic performance with AUC as high as 0.96. This may provide a comprehensive imaging diagnostic biomarker for PD.

Signal intensity in dentate nucleus on unenhanced t1-weighted mr images does not always correlate with cumulative doses of linear gadolinium-based contrast agent: impact of whole-brain radiotherapy in patients with brain metastasis

Rongbiao Tang[1], Yibin Zhang[2], Qingrou Wang[1], Ke-min Chen[1], Fuhua Yan[1]
1. Department of Radiology, Rui Jin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, People's Republic of China.
2. Department of Radiation Oncology, Rui Jin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, People's Republic of China

Objectives: To explore how whole-brain radiotherapy (WBRT) affected T1 signal intensity (SI) changes in the dentate nucleus (DN) in patients who suffered from brain metastasis (BM) and who underwent repeated exposure to linear gadolinium (Gd)-based contrast agents (GBCAs).

Materials and Methods: This study was approved by the institutional review board of Rui Jin hospital and written informed consent was waived because this was a retrospective study. A total of 32 patients with BM who had undergone WBRT (all of them received chemotherapy in addition to WBRT) and at least five GBCA-enhanced MR examinations and 32 control patients (received chemotherapy only) were enrolled. The SIs in the DN and cerebellar white matter (CWM) were measured on unenhanced T1-weighted image (UT1WI) or contrast-enhanced image (CEI). The DN/CWM ratio and its relative percentage change (R) for each patient were calculated and compared between groups. Associations of DN/CWM ratio or R with dependent variables including sex, age, total number of injection doses (IDs), number of IDs after WBRT, and radiation dose (RD) to the DNs were explored.

Results: Group 1 included 32 patients. Group 2 included 29 patients. In Group 1, DN/CWM ratio from the last UT1WI (DN/CWM_L ratio), R on CEI between before and after WBRT (R_{CEI}), or R on UT1WI between the first and last MR examination (R_{FL}) from WBRT group was higher than that from control group ($P < 0.001$ for both sides of DNs). There was a significant relationship between the DN/CWM_L ratio ($r = 0.5202$, $P = 0.0023$ for the left DNs; $r = 0.4046$, $P = 0.0216$ for the right DNs) or R_{FL} ($r = 0.4421$, $P = 0.0113$ for the left DNs; $r = 0.4268$, $P = 0.0149$ for the right DNs) and the total number of IDs. The DN/CWM_L ratio ($r = 0.6771$, $P < 0.0001$ for the left DNs; $r = 0.7528$, $P < 0.0001$ for the right DNs) or R_{FL} ($r = 0.5599$, $P = 0.0009$ for the left DNs; $r = 0.6148$, $P = 0.0002$ for the right DNs) also had a positive correlation with the number of IDs after WBRT. In Group 2, no correlation between DN/CWM_L ratio ($r = 0.3661$, $P = 0.0508$ for the left DNs; $r = 0.2184$, $P = 0.2549$ for the right DNs) or R_{FL} ($r = 0.2683$, $P = 0.1593$ for the left DNs; $r = 0.2441$, $P = 0.2019$ for the right DNs) and the total number of IDs was found. However, DN/CWM_L ratio ($r = 0.5741$, $P = 0.0011$ for the left DNs; $r = 0.6784$, $P < 0.0001$ for the right DNs) or R_{FL} ($r = 0.4224$, $P = 0.0224$ for the left DNs; $r = 0.5035$, $P = 0.0054$ for the right DNs) still had a positive correlation with the number of IDs after WBRT.

Conclusions: The promoted Gd enhancement after WBRT might indicate the increased permeability of blood-brain-barrier (BBB) to accelerate Gd leakage into the DN. SI in DN on UT1WI does not always correlate with the total number of IDs in patients with BM, possibly due to the uncertainty of irradiation time and the impact of WBRT on increasing T1 SI by extra Gd deposition.

OR-161

Localization of habenula and Gpi in pre DBS surgery patients and stimulating electrodes via unique geometric distortion artifacts in post DBS patients using MRI

Yan Li[1], Naying He[1], E. Mark Haacke[1,2], Fuhua Yan[1]
1.Department of Radiology, Ruijin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China
2.Department of Radiology, Wayne State University, Detroit, Michigan, USA

Purpose

Deep Brain Stimulation (DBS) of the lateral habenula or Gpi is one current treatment for movement disorder, refractory depression and other psychiatric diseases[1]. Placing the stimulating electrodes as close to the targets as possible is critical so that the physician can select appropriate stimulus parameters for the best patient response[2, 3]. Our goal was to set up the best MRI protocol for preoperative visualization of the habenula/Gpi and postoperative visualization of the DBS electrodes.

Materials and Methods

Two pre-DBS patients, three healthy controls and nine post- habenula/Gpi DBS patients were scanned using a 1.5T MRI scanner (Magnetom Aera; Siemens Healthineers, Erlangen, Germany). The study was approved by the ethics committee of our hospital. All participants provided written informed consent. The imaging parameters were: 1) Coronal 3D T1-weighted magnetization prepared rapid acquisition gradient echo (MPRAGE): TR/TE/TI=2200/1.94/900 ms, FA=8° , FOV= 240×240 mm^2, Matrix=320×320, slice thickness (TH)=1.5mm; 2) Coronal and transverse T2 WI: TR/TE =6590/95 ms, FA=150° , FOV= 240×217 mm2, Matrix=320×320, TH=1.5mm; 3) Transverse 3D gradient echo imaging (GRE): TR/TE1/TE2 =20/5/11 ms, FA=24° , FOV= 240×240 mm^2, Matrix=320×320, TH=1.5mm.The GRE sequence was used to collect both magnitude and phase data, and to generate quantitative susceptibility mapping (QSM) images.

Results

T1W MP-RAGE images provided detailed images of the whole brain in 3D and were able to clearly show the habenula. High resolution coronal T2W TSE images were able to show both left and right habenula thanks to the contrast with the cerebral spinal fluid (CSF). The transverse T2W TSE images were able to show the habenula clearly in two or three successive slices.The internal globus pallidus (Gpi) can be depicted in the QSM images. The GRE images were able to visualize the electrodes through the unique geometric distortion artifacts that highlighted each electrode and the end of the wire could be determined using the phase information highlighting the dipole effect. In all

cases with DBS treatment, the artifacts were consistently seen and both the location of the electrodes and the end of the wire were clearly identified.

Conclusion

In conclusion, 3D T1 MPRAGE, T2W TSE and GRE provided a rapid protocol for imaging the brain for the patients pre/post-DBS treatment.

Noninvasive IDH1 status prediction in grade Ⅱ/Ⅲ gliomas based on conventional MRI images: a transfer learning strategy

Jin Zhang,Guang-Bin Cui,Lin-Feng Yan,Wen Wang
空军军医大学唐都医院

Purpose: This study was to evaluate the performance of transfer learning combined with the varied convolutional neural networks (TL-CNNs) in predicting the Isocitrate dehydrogenase 1 (IDH1) status of grade Ⅱ/Ⅲ gliomas using the conventional MR images.
Method and Materials: 110 pathologically confirmed grade Ⅱ/Ⅲ glioma patients receiving preoperative MR examinations of fluid attenuation inversion recovery (FLAIR) and contrast-enhanced T1-weighted images (T1CE), were retrospectively included. A random selection of 20% patients were leaved out as test dataset for external validation. AlexNet, GoogLeNet, ResNet and VGGNet, were pre-trained on the large scale natural image database (ImageNet) and fine-tuned with FLAIR and T1CE images, respectively. Then the FLAIR and T1CE network efficacies were integrated with three methods: (1) averaged sigmoid probabilities, (2) logistic regression (LR) and (3) support vector machine (SVM). Besides, fused FLAIR and T1CE images were used to fine-tune TL-CNNs.
Results: Using TL-CNNs, the areas under the ROC curve (AUCs) for IDH1 prediction of AlexNet, GoogLeNet, ResNet and VGGNet models achieved 0.660, 0.620, 0.710, 0.720 for FLAIR and 0.744, 0.656, 0.633, 0.700 for T1CE images, respectively. Besides, all three methods of integrating FLAIR with T1CE networks did not confer higher predictive values than the individual ones. However, improved performances were obtained by fine-tuning the four TL-CNNs using fused images with the AUC increased to 0.778, 0.733, 0.778 and 0.800 for AlexNet, GoogLeNet, ResNet and VGGNet models, respectively.
Conclusion: TL-CNNs (especially VGGNet) are promising in predicting IDH1 genotype of grade Ⅱ/Ⅲ gliomas. Image fusion improves diagnostic performance.

OR-163

Brain developmental differences between preterm twins and singletons: a multi-model MRI study

Tingting Liu[1],Hongxi Zhang[2],Ruibin Liu[1],Weihao Zheng[1],Dan Wu[1]
1.Department of Biomedical Engineering, College of Biomedical Engineering & Instrument Science, Zhejiang University, Hangzhou, Zhejiang, China

2.Department of Radiology, Children's Hospital, Zhejiang University School of Medicine, Hangzhou, China

Purpose

Twins studies allow the exploration of genetic influences on human brain development, e.g., the contribution of genetic factors and environment to human brain structure. The generalizability of those studies is based on the assumption that brain development in the twins is comparable to that of the singletons. Our purpose is to evaluate the structural and functional differences between preterm-born twins and singletons at term age.

Methods

Sixty-five preterm neonates (eighteen twins and forty-seven singletons) were scanned using a Siemens 1.5T Avanto MRI scanner at term age. 3D T1-weighted images, DTI and rsfMRI were acquired to evaluate the structural and functional differences. 3D T1-weighted images were segmented using a multi-atlas algorithm to gain the brain volumes. For structural connectivity, the degree, transitivity, local efficiency, global efficiency, modularity, characteristic path length and small-worldness were calculated, based on tensor-based probabilistic fiber tracking. For rsfMRI, ALFF and fALFF values were calculated, and functional connectivity were obtained using DIPABI toolbox.

Results

No significant difference in volume was found after multiple comparison correction. The MD value of cingulum cingular part, lateral fronto-orbital gyrus, cingulate gyrus as well as gyrus rectus in the twin group were significantly higher than the singleton group (adjusted $p < 0.05$), while no significant difference was found in FA values between groups. The twin brains showed a significantly higher transitivity of structural connectivity compared to the singletons, indicating increased local connectivity. For rsfMRI, although no difference was found in ALFF values, the twins showed greater fALFF values in several regions, e.g., the bilateral lateral fronto-orbital gyrus, gyrus rectus, inferior fronto-occipital fasciculus, genu of corpus callosum, etc., compared with the singletons, while while an opposite result was observed in the right middle frontal gyrus. No difference was found in functional connectivity.

Conclusion

At term age, preterm twins showed greater MD values, transitivity of structural connectivity and mfALFF of most regions with significant difference, which indicate that preterm twins may have a delayed brain development compared with preterm singletons.

OR-164

Wall enhancement on black blood MRI is an independent predictor of symptomatic status of unruptured intracranial saccular aneurysm

Xinrui Wang[1], Jianping Lu[2]

1.General Hospital of Northern Theater Command

2.Changhai Hospital of Naval Medical University

Purpose: Aneurysmalwall enhancement (AWE) on high-resolution magnetic resonance imaging (HR-MRI) has been described in ruptured aneurysms and symptomatic unruptured intracranial saccular aneurysms(UIAs). However, the sample size of previous symptomatic UIA studies are very limited (n<30) and whether AWE is an independent predictor of symptoms is still not clear. This study aims to investigate whether AWE is independently associated with symptomatic status of UIA in a larger cohort of patients using multivariate analysis.

Methods:147 consecutive patients (71 male, mean age 58±11 years) with 87 symptomatic and 87 asymptomatic UIAs were recruited. Symptoms associated with UIA were carefully identified including oculomotor nerve deficit, visual acuity loss, acute/chronic headachewith a marked improvement after surgical intervention of the aneurysm and other symptoms such as hemiparesis due to brain parenchyma compression. All patients underwent 3T MRI and 3D rotational DSA. Pre- and post-contrast T_1-weighted 2D/3D black-blood fast-spin-echo MRI was performed. Scanning parameter: TR/TE 700-1000ms/10ms; resolution: 0.4mm*0.4mm in-plane and 2mm slice thickness (2D) and 0.5mm isotropic (3D). ***Image analysis:***The degree of AWE was categorized into 3 grades: grade 0 indicates no AWE, grade 1 represents enhancement less than that of the pituitary infundibulum, and grade 2 is greater than that of the pituitary infundibulum. The extent of AWE was assessed as four grades (0-3): none, focal, heterogeneous and complete enhancement. Aneurysm morphological parameters were measured on DSA, including size, aspect ratio and size ratio. Univariate and multivariate logistic regression analysis were performed to determine the factors associated with symptoms.

Results: In 87 UIAs with related symptoms, there were 6 oculomotor nerve deficit,11 visual acuity loss,31 acute headache, 33 chronic headache and 8 other symptoms. In symptomatic UIAs, aneurysm size, size ratio, enhancement ratio and extend are significantly larger than asymptomatic UIAs. In multivariate analysis, only aneurysm size (OR 1.1) and AWE (OR 20.7) are independently associated with symptoms. AWE has 92% specificity and 74% sensitivity for symptoms. Figure shows a patient with persistent headache and an ICA aneurysm with AWE.

Discussion and Conclusions: To our knowledge, this is the largest study of AWE of symptomatic UIAs. Our results agree with previous smaller studies that AWE is more common in symptomatic UIAs, which may indicate vasa vasorum and inflammation as shown in histology. The unique advantage of our study is we demonstrate AWE is an independent and strong predictor that provides additional value to the current clinical risk model. AWE is a promising marker that should be included in future clinical trials to study its potential value to improve patient outcome.

Track-density imaging (TDI): Evaluating the peritumoral white matter areas of glioblastoma

Ankang Gao[1],Qianqian Chen[1],Jinxia Zhu[2],Xianchang Zhang[2],Stefan Huwer[3],Jie Bai[1],Jingliang Cheng[1]
1.the First Affiliated Hospital of Zhengzhou University
2.MR Collaboration, Siemens Healthcare Ltd., Beijing, China
3.Siemens Healthcare GmbH, Erlangen, Germany

Purpose: Glioblastoma cell invasion may lead to peritumoral edema and cause the disruption of fibers, leading to changes in track density. This study evaluated the changes in track density of different peritumoral white matter areas to infer potential glioblastoma invasion.

Methods: 14 patients with pathologically confirmed IDH-wild-type glioblastoma were recruited. All patients underwent High Angular Resolution Diffusion Imaging (HARDI) on a 3T system (MAGNETOM Prisma, Siemens Healthcare, Erlangen, Germany) less than one week before surgery. The HARDI images were acquired using the following parameters: TR/TE =3800/72ms, FOV = 220×220mm^2, matrix = 128×128, slice thickness = 2.2mm, slices = 60, 64 directions, and b-value = 0, 3000 s/mm^2. Whole-brain track-density maps were generated using a post-processing prototype "syngo.via frontier TDI and Tractography" (Siemens Healthcare, Erlangen, Germany) [1] with the following parameters: number of tracks: 1000000, voxel resolution of TDI map: 0.5mm, degree of response function and fiber orientation density (FOD): 6*. Regions of interest (ROIs) were manually drawn around the peritumoral white matter areas according to the position (ENT: distance to tumor < 2mm; EFT: distance to tumor > 4mm; ORE: near to the boundary of edema; NWMD: area with doubtful normal white matter). Contralateral normal areas were chosen as standards of reference. The ratios between the contralateral normal white matter and peritumoral white matter areas were calculated, and named as rENT, rEFT, rORE, and rNWMD. All values are expressed as mean ± standard deviation. Comparative analyses between different areas were performed using paired-sample t-test with SPSS V21.0 (IBM Corp., Armonk/NY, USA). A value of $P < 0.05$ was considered to be statistically significant.

Results: Both rENT (0.49±0.17) and rEFT (0.60±0.21) were significantly lower than rORE (0.96±0.15) and rNWMD (1.0±0.23) (all $P < 0.05$). However, there were no significant differences between rENT and rEFT or between rORE and rNWMD (both $P > 0.05$).

Conclusions: The application of TDI can quantitatively evaluate the track density, which may be an important reference to assess tumor invasion.

OR-166

A radiomics nomogram based on multiregional features might predict MGMT promoter methylation of glioblastoma patients

Qiang Tian, Wen Wang, Linfeng Yan, Guang-bin Cui
空军军医大学唐都医院

Purpose: To investigate multiregional features from multimodal MRI in reflecting O6-methylguanine methyltransferase (MGMT) promoter methylation status, and to establish visualized nomogram for MGMT methylation prediction of glioblastomas (GBM) patients.

Methods: Multimodal MRI data (T1C, T1, T2, FLAIR) of 139 GBM patients were retrospectively collected from TCIA and our institution respectively. After image preprocessing, four heterogenous subregions were manually drawn: **(1)**entire abnormality (rEA) on FLAIR image, **(2)**contrast-enhanced tumor (rCET) and **(3)**necrosis (rNec) on T1C

image. In addition, (4)the region of edema/non contrast-enhanced (rE/nCET) as defined by rEA－rCET－rNec. Then, 4000 radiomics features were extracted for all the subregions of each subject. Elastic Net Regression was used to determine the optimal features and to calculated a radiomics signature from each patient. The radiomics nomogram was constructed based on multivariate logistic regression, which integrated both radiomics signature and clinical factors. The C-index and calibration curves were used to validate generalization of the nomogram. Decision curve analysis (DCA) was performed to estimate the clinical utility of the radiomics nomogram.
Results: Among 139 patients, 92 and 47 were as training and validation cohort, respectively. The radiomics nomogram exhibited promising discrimination in the training (C-index, 0.854) and validation (C-index, 0.892) sets. The favorable calibration and DCA indicated the clinical usefulness of the radiomics nomogram. The regression coefficient analysis of optimal features showed that the sum of absolute coefficients of features from rEA and rNec areas were 1.597 and 0.766, respectively, which were larger than others.
Conclusion: The radiomics nomogram based on multiregional features from multimodal MRI was proposed in our study, and could individually and visually predict MGMT status of GBM patients. In addition, the rEA and rNec areas of GBM play an important role in the prediction of MGMT methylation.

OR-167

Patterns of gray matter volume, cortical thickness, and gyrification changes in olfactory brain regions in Parkinson's disease with and without cognitive impairment

Hui Yu,Jing Liu
Guizhou medical university

Objective: To investigate patterns of olfaction-related morphological changes in the GM of PD patients with and without cognitive impairment and reveal the roles of these changes in olfactory dysfunction.
Methods: 28 PD patients with cognitive impairment (PD-CI), 25 PD patients with normal cognition (PD-NC), and 25 healthy controls (HC) were recruited. The reformed Connecticut Chemosensory Clinical Research Center test was used to measure the odor threshold (OT). The GM volume alterations, cortical thickness and gyrification changes in olfactory brain areas were detected. The relationship between the abnormal MRI morphological changes and as well as between OT and the MMSE score were analyzed.
Results: The PD-CI patients showed significant GM volume reduction in the left hippocampus and thalamus, the right inferior orbitofrontal cortex (OFC) and insular cortex, and the bilateral parahippocampal cortex (PHC). The PD-CI patients showed more GM atrophy than the PD-NC patients in the OFC. The PD-CI patients showed significant cortical thinning in the left PHC, and the obvious cortical thinning was observed in the left PHC in PD-CI patients. The PD-CI patients showed significantly decreased gyrification in the left entorhinal cortex and the left PHC . The more decreased

gyrification was observed in the left lateral OFC, the right PHC, and the right entorhinal cortex in the PD-CI patients. Positive correlations were observed between the cortical thickness in the left PHC and the left OT, the right OT, the average OT in the PD-CI patients.

Conclusions: The PD patients had heterogeneously distributed patterns of decreased GM volume, as well as reduced cortical thickness and gyrification in olfaction-related brain areas. The PHC and the OFC may represent the key role of the primary olfactory cortex in olfactory dysfunction in PD patients.

Elevated hemoglobin a1c is associated with intracranial plaque enhancement: novel findings from magnetic resonance imaging study in stroke patients

Xiao Li
Renji Hospital, School of Medicine, Shanghai Jiao Tong University

PURPOSE

Few study reported the association between Hemoglobin A1c (HbA1c) level and intracranial plaque vulnerability by magnetic resonance imaging (MRI). The present study of MRI-identified intracranial atherosclerotic lesions in patients with ischemic symptom therefore sought to determine the association between HbA1c level and intracranial plaque morphological and compositional characteristics and cerebral infarction severity.

METHOD AND MATERIALS

108 patients with intracranial ischemia were recruited. All patients were stratified into high (>6.5%) and low (<6.5%) HbA1c groups and underwent both intracranial vessel wall MRI and brain MRI scans. Intracranial plaque features and intracranial ischemic lesions were assessed.

RESULTS

More intracranial plaques (2.38±1.50 vs. 0.96±0.75, P=0.001), higher incidence rate of intracranial symptomatic plaque enhancement (88.24% vs. 45.95%, P=0.001), more acute cerebral infarct (50.00% vs. 25.67%, P=0.013) and more recurrent infarct (67.65% vs. 45.95%, P=0.036) were in the high as compared to the low HbA1c group. High HbA1c was the independent risk factor for the presence of intracranial symptomatic plaque enhancement [odds ratio (OR)=7.05].

CONCLUSION

Our study suggested that an elevated HbA1c might have an adverse effect on intracranial plaque enhancement, which might induce acute cerebral infarct.

Individualized structural radiomics biomarkers for diagnostic and prognostic prediction of alzheimer's disease

Yineng Zheng,Lijuan Zhang,Haoming Guo,Fajin Lv
The First Affiliated Hospital of Chongqing Medical University

Background: Hippocampal is an established structural marker in patients suspected with dementia disease, and its measurement has been shown to improve diagnostic confidence. Structural MRI is able to offer multi-dimensional information about the underlying pathology related to differential diagnosis. Here we tested utility of structural radiomics biomarkers in predictive modeling of AD.
Methods: Open source ADNI-2 data were used as a train set: 109 individuals with the baseline structural MRI were included (49 AD, 22 MCI-to-AD converter and 38 stable MCI). Automated hippocampal segmentation was performed by freesurfer and individualized structural radiomics biomarkers were computed by using self-developed software. Machine learning models were trained on the train set and tested on the test set which consists of 60 AD confirmed by two chief physicians of our hospital.
Results: The experimental results demonstrate that random forest model achieved an encouraging performance with accuracy (ACC) value of 89.75% (AUC=0.886, 95% CI = 0.847-0.925) for the diagnostic and prognostic prediction of AD.
Conclusions: The combination of structural MRI and radiomics can support clinical decision making in diagnostic and prognostic prediction of AD.

A preliminary in vivo study of oxidative stress levels in multiple sclerosis (MS) lesions by proton exchange rate (Kex) MRI imaging

Haiqi Ye[1],Mehran Shaghaghi[2],Kejia Cai[2],Qianlan Chen[1],Wenzhen Zhu[1],Weiwei Chen[1]
1.Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science & Technology, Wuhan, Hubei, China
2.Department of Radiology, Bioengieering, University of Illinois at Chicago, Chicago, IL, USA

Background and Purpose:Oxidative stress has been reported to play an important role in the pathogenesis of MS recent years, which requires further in vivo research to confirm. In this study, we aim to investigate the oxidative stress levels in MS lesions by proton exchange rate(Kex) MRI imaging.
Materials and Methods:16 MS patients were included in this IRB-approved study.All patients underwent T1WI,T2WI,T2FLAIR, contrast-enhanced and single-slice Kex mapping sequences on a 3.0-T MR scanner.MS lesions were identified by T2 hyperintensities.All MS lesions were classified into two groups, the enhanced group and the non-enhanced group, based on their performance on the enhanced sequence.Two neuroradiologists

reviewed all the images and evaluated the signal changes of the MS lesions on the Kex images based on visual impressions. Differences between the two groups were analyzed with the x2 test.
Results: A total of 152 MS lesions were identified in 16 MS patients, of which 77 (50.7%) were enhanced, and 75 (49.3%) were not enhanced. In the enhanced group, all lesions (100%) showed increased signal on the Kex compared to the normal white matter area.In the non-enhanced group, 53 (70.7%) lesions showed increased signal on Kex, and 22 (29.3%) lesions showed similar signals on Kex with normal white matter. There was a statistically significant difference in the performance of the two groups on Kex ($p < 0.001$).
Conclusion: In the enhanced group,all MS lesions showed an increased signal on Kex,which indirectly reflects that oxidative stress is closely related to the pathogenesis of acute active MS lesions. In the non-enhanced group, some of the MS lesions showed an increased signal on Kex,but some did not, the difference may indicate that they are in different sub-stages of non-acute MS lesions,Such as chronic active phase and chronic quiescent phase that cannot be identified on T1 enhancement sequence,which needs further longitudinal studies and pathology to confirm.

Pineal volume in subjective cognitive decline diseases: a mr imaging study with pineal gland abnormality in SCD

Jie Zhang[1],Zhe-Sheng Shi[2],Ke Xu[2],Guang-Bin Cui[1],Wen Wang[1]
1.空军军医大学唐都医院
2.Student Brigade， Air Force Medical University

BACKGROUND:
Subjective cognitive decline (SCD) refers to the decrease of patients' subjective evaluated cognitive function level, but the objective neuropsychological examination is usually normal. SCD patients are often suffering from cognitive, irritability, sleep and language disorders. Melatonin, which is secreted by the human pineal gland, is positively related to pineal parenchymal volume. Melatonin is responsible for the regulation of the antioxidant defense, immune response, neuroprotection, antiamyloid effect, and antiapoptotic activity. The aim of the present study was to evaluate and compare pineal gland volumes in SCD patients and healthy controls as well as to correlate the results of cognitive testing and brain volumes.
SUBJECTS AND METHODS:
Pineal gland volumes of 64 cases were retrospectively evaluated, including 30 cases of SCD patients and 34 age, sex and BMI matched healthy controls (HC), in which 24 were women. The total pineal gland volume of all cases was measured via three-dimensional volumetric magnetic resonance imaging (T1-weighted magnetization-prepared rapid gradientecho sequence, sagittal view) by using 3D slicer software, and the total mean pineal volume of each group was compared. Images were segmented into gray matter (GM), white matter (WM) and cerebrospinal fluid (CSF) with a bias field correction by using Statistical Parametric Mapping 8, then total brain volumes were evaluated. Cognitive

function was evaluated by using Mini-Mental State Examination (MMSE) and Montreal Cognitive Assessment (MoCA).
RESULTS:
The mean pineal volume in patients with SCD (90.55±45.11mm³) was smaller than that in health controls (110.73±52.90 mm³). Multiple regression analyses demonstrated that the pineal volume was negatively correlated with most psychological measurements.
CONCLUSIONS:
The results of our study demonstrated that pineal volume in patients with SCD was smaller than that in healthy control subjects, and pineal gland volume is negatively related to emotional disorders. We hypothesize that volumetric changes in the pineal gland of SCD patients may be involved in the reduced melatonin secretion in these patients. Further studies will be necessary to investigate the potential role of the pineal gland in the pathophysiology of SCD.

Whether bone marrow mesenchymal stem cell can treat the glioma growth in vivo studied by MR

肖叶玉[1,2],方宜芝[2],陈杰[2],梁晓莹[2]
1.广州市中西医结合医院
2.汕头大学医学院第二附属医院

Objective To investigate whether Mesenchymal Stem Cell for the treatment of glioma in vivo is helpful.
Methods we used ferritin gene to track the BMSCs by 7.0T combined with MRI and metabolite concentration of Cholineto investigate the effect of BMSCs on tumor growth by MRS in a rat model of C6 glioma. BMSCs transfected by Ad-GFP-FTH were intertumoral injected in rats model of C6 glioma. Before, after intertumoral injections 3 and 7 day, MRS were performed on central and border of tumor.
Results After Intertumoral orthotopic injection, Ad-GFP-FTH-BMSCs were detected as hypointense signals on a 7.0T MRI of T2WI, migrated from the center to the tumor border, as confirmed by histology. The metabolite concentration of Cho is no obviously different between the experimental and control groups.
Conclusions BMSCs could migrate to the tumor border and showed no promotional impact on the progression of the tumor.

探测基于傅里叶变换的速度选择性动脉自旋标记成像对 ATT 的敏感性：与 PCASL 和 DSC-PWI 的对比研究

屈耀铭[1],秦勤[2],温志波[1]
1.南方医科大学珠江医院
2.美国约翰·霍普金斯大学

目的 基于傅立叶变换的速度选择性动脉自旋标记（Fourier-Transform based Velocity-selective ASL, FT-VSASL）是一种对灌注信号具有高灵敏度的灌注成像方法[1]，原则上可以消除动脉通过时间(ATT)延迟的问题。本研究目的是采用 DSC 残余函数的峰值时间 Tmax 参数[2]评估 FT-VSASL 对 ATT 的敏感性。
方法 前瞻性收集经病理证实的 14 例高级别胶质瘤 HGG 的 MRI 资料。除常规序列外，MRI 检查还包括 DWI 和 3 个灌注序列（VSASL、PCASL 和 DSC-PWI）。使用 Matlab 及 Olea Sphere 软件进行量化处理。在 Gd-TIWI 上选取 15 个 ROI(瘤核心区 10 个，瘤周脑区 5 个)并配准到 ASL/DSC CBF 和 DSC Tmax 图。采用配对样本 t 检验比较 HGG 瘤核心和瘤周脑区的 DSC CBF 和 Tmax 值。采用 spearman 相关系数评估瘤核心 ASL CBF 与 DSC CBF、ASL/DSC CBF 与 DSC Tmax 的关系。根据 Tmax 测定不同区域内 ASL 和 DSC-PWI 技术之间在 HGG 瘤核心区平均 CBF 值的测量误差，以评价 ASL 法对 ATT 的敏感性。
结果 瘤核心区 CBF 值明显高于瘤周脑区(P<0.001)，瘤核心区 Tmax 大于瘤周脑区，但差异无统计学意义(P=0.167)。与 PCASL 相比，VSASL 与 DSC CBF 的相关性更高(r=0.67 vs 0.65)，而 VSASL、PCASL 及 DSC CBF 均与 DSC Tmax 呈负相关(r 为-0.47、-0.57 和-0.42)。根据 Tmax 值分组，140 个 ROI 中，0-2s 区占 41.4%、2-4s 区占 50%及＞4s 区占 8.6%。VSASL CBF 的定量对 Tmax 的敏感性最小，而随着 Tmax 增加，误差趋于减小。
结论 HGG 瘤核心亦存在大部分血流缓慢区域；VSASL 对 ATT 的敏感性低于传统 ASL 技术，在慢血血流 CBF 定量具有前景。

基于全脑白质磁共振影像组学预测脑白质高信号进展及其相关危险因素分析

舒震宇,邵园,龚向阳
浙江省人民医院

目的 基于全脑白质的 MR 影像组学预测脑白质高信号(WMH)进展及其相关危险因素分析。方法 回顾性分析行两次头颅 MRI 检查的 152 例患者资料，选取每例患者的基线 T1WI 图像使用 SPM12 软件包切割出全脑白质并导入 MTK 分析软件进行纹理特征提取和降维，最终使用最小绝对收缩与选择算子算法（LASSO）计算每例患者的影像组学标签值。依据改进 Fazekas 量表将 WMH 进展患者分为任何区域进展（AWMH）、侧脑室旁高信号进展（PWMH）和深部高信号进展（DWMH）三种状态，比较各个状态 WMH 进展亚组和非进展亚组之间各临床因素和影像组学标签值差异，使用多变量逻辑斯回归结合影像组学标签构建预测模型，使用 ROC 曲线评估模型诊断效能，同时分析独立危险因素的临床指标与构建影像组学标签纹理值的相关性。结果 预测 AWMH 进展、PWMH 进展和 DWMH 进展的影像组学模型的 ROC 曲线下面积分别为 0.818、0.778 和 0.824。其中年龄是 AWMH 进展和 DWMH 进展的独立危险因素，体质指数是 DWMH 的独立危险因素，高脂血症是 AWMH 和 PWMH 的独立危险因素。 在 AWMH 亚组中，SurfaceArea 与年龄和低密度脂蛋白呈负相关（r=-0.401, -0.312），InverseDifferenceMoment_ALLDirection_offset1_SD 与年龄呈负相关（r=-0.412）。在 PWMH 亚组中，Compactness1 与低密度脂蛋白呈负相关（r=-0.198），InverseDifferenceMoment_angle0_offset7 与低密度脂蛋白呈正相关（r=0.252）。结论 基于全脑白质影像组学可以预测 WMH 进展并确立高风险人群的危险因素，可以为常规磁共振预测 WMH 进展提供早期额外信息。

Feasibility of diffusion tensor imaging in the evaluation of the long-term efficacy of hyperbaric oxygen therapy in rats after traumatic spinal cord injury with different degrees of injury

Fang Liu,Yingyan Zheng,Yijing Zhao,Dairong Cao
the First Affiliated Hospital of Fujian Medical University

Objective: This study explored the feasibility of diffusion tensor imaging (DTI) in the evaluation of the long-term efficacy of hyperbaric oxygen (HBO) therapy in rats after traumatic spinal cord injury (TSCI) with different degrees of injury.
Method: Adult Sprague-Dawley rats (totally n = 90) were randomly separated into mild, moderate and severe TSCI groups (30 rats per group). Each group was then randomly divided into sham-operated (SH), TSCI and TSCI+HBO subgroups (10 rats per subgroup). Basso Beattie and Bresnahan (BBB) scores and DTI parameters including fractional anisotropy (FA), mean apparent diffusivity (MD), radial diffusivity (RD) and axial diffusivity (AD) were collected at pre-TSCI and at 0 h, 6 h, 24 h, 3 d, 7 d, 14 d, 21 d, 28 d and 56 d post-TSCI. Two-way repeated measure analysis of variance was used for comparison between the TSCI and TSCI+HBO subgroups over time in mild, moderate and severe TSCI groups. Pearson correlation analysis was applied to analyze the correlations between BBB scores and DTI parameters.
Results: BBB scores, FA, MD and RD values showed significant differences between the TSCI and TSCI+HBO subgroups over time in mild, moderate and severe TSCI groups (all $P < 0.01$). FA, MD and RD values were positively correlated with BBB scores in all TSCI and TSCI+HBO subgroups (all $P < 0.05$).
Conclusion: DTI parameters, especially MD, could quantifiably assess the long-term efficacy of HBO therapy and reflect the functional recovery in rats after TSCI with different injured degrees.

Alteration of brain resting state-function connectivity in patients with neuropathic pain after complete spinal cord injury: a pilot MRI study

Xuejing Li,Nan Chen
Department of Radiology, Xuanwu Hospital, Capital Medical University

Purpose
To investigate brain resting-state function connectivity (FC) alterations related to neuropathic pain (NP) after complete spinal cord injury (CSCI), and to further study their associations with severity of NP.
Materials and methods

Ten patients with complete SCI (5 with NP and 5 without NP) and ten age- and sex-matched healthy controls (HCs) were recruited. Resting-state fMRI data were obtained using a 3.0 Tesla MRI system. The regional homogeneity (ReHo) value of each voxel in the brain was calculated and compared between patients with CSCI and HCs, and between the SCI sub-groups (SCI-pain and SCI-no pain). The significantly changed ReHo regions were set as regions of interest (ROIs) for the whole brain FC analysis. The correlations between the ReHo change and the severity of pain were also determined.

Results

There was no ReHo value differences in brain between HCs and patients with CSCI. Compared with the SCI-no pain (SCI-N) group, the ReHo values of the bilateral calcarine cortex and left lingual gyrus significantly increased in patients with SCI-Pain (SCI-P) (**Fig. 1**). The ReHo values of anterior cingulate cortex and right fusiform gyrus decreased (**Fig. 2**). When the changed ReHo regions were set as ROIs, the FC in right paracentral lobule, right tri-inferior-frontal gyrus, bilateral mid-frontal cortex and bilateral calcarine cortex increased (**Fig. 3**). Subsequent correlation analyses revealed that increased ReHo values in bilateral calcarine cortex and left lingual gyrus positively correlated with the VAS score (**Fig. 4**). Whereas decreased ReHo values in anterior cingulate cortex and right fusiform gyrus negatively correlated with pain intensity (**Fig. 5**).

Conclusion

In conclusion, CSCI can change the regional synchronism of brain activity in the visual network. Further, the FC between the visual network and somatosensory areas was significantly enhanced in SCI-P group. These findings may help us to understand the potential pathophysiological changes in the central nervous system under pain condition after CSCI.

OR-177

Comparison of the ultrasound and MRI in the detection of fetal corpus callosum abnormalities

Cong Sun,Guangbin Wang
Shandong Medical Imaging Research Institute

Purpose: To compare the accuracy of ultrasound and MRI in the detection of fetus corpus callosal (CC) agenesis.

Materials and methods Pregnant women with prenatally suspected with fetal CC agenesis screened by ultrasound were enrolled in this retrospective study. All the subjects underwent fetal brain ultrasound and MRI examinations, and the results were confirmed by pathology or postnatal neuroimaging. The CC abnormalities were classified into six groups, including isolated complete agenesis of the corpus callosum (CACC), isolated partial agenesis of the corpus callosum (PACC), isolated hypoplasia of the corpus callosum (HCC), CACC, PACC, and HCC respectively with additional intracranial malformations. The findings detected on ultrasound and MRI were compared to pathology or postnatal neuroimaging. Chi-square test was used to compare the diagnostic accuracy between ultrasound and MRI.

Results: A total of 375 fetuses were included in the final analysis, which comprised of 173 cases of isolated CACC, 39 cases of isolated PACC, 41 cases of isolated HCC, 45 cases of CACC with additional abnormalities, 29 cases of PACC with additional abnormalities, 11 cases of HCC with additional abnormalities, and 37 normal fetuses.The diagnostic accuracy of US for isolated CACC, PACC, HCC; CACC, PACC, HCC with additional malformations were 84.4%, 69.2%, 58.5% and 68.9%,51.7%,45.5%, respectively. The total accuracy of US was 66.1% (248/375). The diagnostic accuracy of MRI for isolated CACC, PACC, HCC; CACC, PACC, HCC with additional malformations were 100.0%, 87.2%, 90.2%,93.3%,86.2%, and 81.8%, respectively. The total accuracy of MRI was 95.2% (357/375). MRI was more sensitive than ultrasound (MRI 96.2%, ultrasound 66.1%) in the diagnosing fetal corpus callosum abnormalities. Chi-square test showed there was significant difference in the diagnostic accuracy between MRI and Ultrasound with p-value<0.0001.

Conclusion: MRI enables a precise demonstration of the normal and abnormal fetal corpus callosum,and is significantly better than ultrasound in the diagnosing of CC abnormalities, is an effective complement of ultrasound. Also, fetal MRI can be helpful to assess for associated anomalies and enhance prognostic counseling.

基于静态 fMRI 的原发性闭角型青光眼脑功能连接密度改变的研究

陈玲珑[1],曾献军[2],徐海波[1]
1.武汉大学中南医院
2.南昌大学第一附属医院

目的 利用基于体素的功能连接密度(functional connectivity density，FCD)图方法观察原发性闭角型青光眼(Primary Angle-Closure Glaucoma，PACG)患者静息状态下脑网络水平各脑区重要程度的异常改变，并评价其与各临床指标等的相关性。

材料与方法 搜集 45 例 PACG 患者(53.28 ± 10.79 岁)及 46 例年龄、性别相匹配的健康志愿者(52.67±11.01 岁)静息态功能磁共振(resting state functional MRI, rs-fMRI)数据和相关眼科检查的数据，包括眼内压、视神经纤维层厚度、垂直杯盘比和水平杯盘比。所得 fMRI 数据利用基于 Matlab 平台的 DPARSFA 软件进行预处理，利用其度中心度选项计算出长程及短程 FCD 值计算出组间差异脑区，同时取长程功能连接有显著差异的脑区为感兴趣区计算与全脑的功能连接。最后分析有差异的脑区 FCD 值与各项临床指标的相关性。

结果 PACG 组及 HC 组长程及短程 FCD 的组内空间分布基本相同。与 HC 组相比，PACG 组双侧大脑半球额下回、左侧大脑半球边缘叶、海马旁回、右侧大脑半球岛叶表现为短程 FCD 显著上升，枕叶、楔叶、楔前叶、上顶叶、中央后回表现为短程 FCD 显著减低；在右侧额中回的长程 FCD 显著增高(以上结果均经过 GRF 矫正，体素水平 $p<0.01$，簇水平 $p<0.05$)。长程 FCD 下降的脑区与右侧额中回的 rsFC 减弱。并且短程 FCD 减低脑区与视神经纤维层厚度呈正相关，双侧短程 FCD 升高脑区与水平杯盘比呈正相关。

结论 PACG 患者具有广泛的脑功能连接异常，长程和短程 FCD 具有不同的空间分布，进一步证明异常长程和短程 FCD 在 PACG 患者大脑中具有不同的意义。

Structural MRI-based atlas of scalp-to-cortex distance: the implications for non-invasive brain stimulation

HANNA LU
The Chinese University of Hong Kong

Objective: Non-invasive brain stimulation (NIBS), including transcranial electrical stimulation (tES) and transcranial magnetic stimulation (TMS), encompass a broad array of treatments that target a variety of brain regions to achieve desired outcomes in psychiatric disorders [1]. It should be noted that NIBS use coils or electrodes placed on the scalp to deliver a magnetic or electrical current through the scalp to the cortex where the power levels are attenuated with the distance. Scalp to cortex distance (SCD), as a key parameter, has been shown to impact on the electric fields induced by NIBS. There remains a dearth of data on how SCD differs between different cortical regions. Thus, this study aimed to examine the region-specific SCD in individuals with young age, middle age and old age.
Methods: In 2018, we launched an MRI-based project named as “Localized Analysis of Normalized Distance from Scalp to Cortex and Personalized Evaluation” (LANDSCAPE) to systematically investigate the region-specific SCD [2]. We analyzed the SCD of left dorsolateral prefrontal cortex (DLPFC) and primary motor cortex (M1) in 643 cognitively normal adults from the Cam-CAN database. We localized the left M1 using the Montreal Neurological Institute (MNI) coordinates as [x=-42, y=-16, z=68], and left DLPFC using the MNI coordinates as [x=-46, y=45, z=38]. The SCD was directly measured in the Brainsight system as the distance from scalp to cortex. Computational head model was developed to simulate the impact of SCD on the electric field.
Results: Gender ratio and global brain volume among four groups were similar. We found age-related increased SCD in the left DLPFC ($p < 0.001$), but not M1 ($p = 0.134$). The electric field induced by stimulation was consequently decreased with the increased SCD across normal aging individuals.
Conclusion: Impetus for measuring SCD has largely focused on understanding and optimizing the key parameter in NIBS combined with individual MRI data. By using a localized and normalized measurement, we presented that age have differential impacts on the SCDs of left DLPFC and M1. The findings suggest that it is important to be aware of region-specific distance measures when conducting neuromodulation in individuals with old age, such as life-life depression.

Imaging the nigrosome 1 in the substantia nigra using susceptibility weighted imaging and quantitative susceptibility mapping: application to parkinsonism and essential tremor patients

Zenghui Cheng[1], Naying He[1], E. Mark Haacke[1,2], Fuhua Yan[1], Shengdi Chen[1]

1.Shanghai Jiao Tong University School of Medcine, Rui Jin Hospital
2.Wayne State University

Parkinson's disease (PD) is a clinically heterogeneous chronic progressive neuro-degenerative disease with loss of dopaminergic neurons in the nigrosome 1 (N1) territory of the substantia nigra pars compacta (SNpc). To date, there has been an effort to identify changes in the N1 territory by monitoring increases of iron in the SNpc. However, there is no standard protocol being used to visualize or characterize the N1 territory. Therefore, the purpose of this study was to determine an optimal imaging protocol, create a slice by slice characterization of the appearance of N1 (the "N1 sign") and evaluate the loss of the N1 sign in order to differentiate healthy controls (HC) from patients with PD. Firstly, 6 healthy controls (HCs) were used to determine an optimal imaging protocol. Secondly, 80 HCs were used to characterize the appearance of the N1 sign and train the raters. In this step, the magnitude, susceptibility weighted images (SWI), quantitative susceptibility maps (QSM) and true SWI (tSWI) images were all reviewed using data from a 3D gradient recalled echo sequence. A resolution of 0.67 x 0.67 x 1.34 $mm^3$was chosen based on the ability to cover all the basal ganglia, midbrain and dentate nucleus with good signal-to-noise with echo times of 11ms and 20ms.Thirdly, 80 PD patients and 80 age matched HCs were blindly analyzed for the presence or absence of the N1 sign for a differential diagnosis. Of the first 80 HCs, 76 (4 were excluded due to motion artifacts) showed the N1 sign in one form or another after reviewing the first 5 caudal slices of the SN. For the second 80 HCs, 78 showed the N1 sign in at least 2 slices. Of the 80 clinically enrolled PD cases, 32 PD and 6 PD syndrome (PDS) showed a bilateral loss of the N1 sign, 12 PD and 6 PDS showed the N1 sign unilaterally and 13 PD and 2 PDS showed the N1 sign bilaterally. Also, all 9 essential tremor (ET) patients showed the N1 sign bilaterally. The mean total structure and mean high iron content region susceptibilities for the SN for both PD and PDS patients with bilateral loss of N1 were higher than those of the HCs ($p< 0.002$). In conclusion, the N1 sign can be best visualized using tSWI with a resolution of at least 0.67 x 0.67 x 1.34 $mm^3$and can be seen in most HCs. The fact that not all PD subjects show bilateral loss of the N1 sign may help understand why some PD patients still show normal levels of iron content in the SN.

The relationship of arterial wall enhancement ratio on MRI with the degree of inflammation in a rabbit aneurysm model: a pilot study

guang-xian wang,Dong Zhang
Department of radiology, Xinqiao Hospital, Third Military Medical University

Objectives: To identify the relationship between enhancement ratio (ER) of aneurysm walls and degrees of inflammation.
Materials and Methods: Twenty-five white rabbits were used in this study; all underwent surgery to isolate the right common carotid artery (RCCA). Twenty rabbits

underwent an aneurysm creation procedure, and 5 underwent a control procedure. In the aneurysm creation procedure, there was surgical exposure of the origin of RCCA and temporary occlusion with an aneurysm clip. The distal RCCA was ligated, and the trapped segment was infused with elastase for 20 minutes, after which the clip was removed. In the control procedure, the trapped segment was infused with saline. High-resolution magnetic resonance imaging (HRMRI) was performed at weeks 2, 3, 4, and 5 after the procedure, and wall ER was calculated. After MRI, aneurysms were harvested and stained with hematoxylin-eosin. Pearson correlation analysis and scatter plots were used to evaluate the relationship between wall ER and the degree of inflammation. The relationships between the wall ER, the number of inflammatory cells and time were analyzed by linear graphs.

Results: Wall ER positively correlated with inflammatory cell count of the aneurysm wall (r=0.877, P<0.001). The relationships between wall ER, the number of inflammatory cells and time increased and then decreased according linear graphs.

Conclusions: In this study, the aneurysm wall ER was confirmed to be associated with the degree of inflammation on the rabbit aneurysm model.

Multi-delay ASL with reduced-resolution pre-scan transit time maps for assessment of cerebral perfusion in Moyamoya disease: Comparison with conventional 3D-ASL

Yanwei Zeng[1], Shuyi Zhou[1], Xin Zhang[1], Yixin Chen[1], Junyan Fu[1], Shaofeng Duan[2], Jianxun Qu[2], Daoying Geng[1], Jun Zhang[1]

1.Huashan Hospital, Fudan University

2.GE Healthcare China

Background and Purpose: The cerebral hemodynamics of Moyamoya disease (MMD) is complex, and conventional arterial spin labeling (ASL) with fixed post-labeling delay (PLD) time can easily misestimate the cerebral perfusion. We aimed to explore the value of a multi-delay ASL with a reduced-resolution pre-scan transit time (TT) maps in obtaining cerebral perfusion information in MMD, compared to the conventional 3D-ASL.

Materials and methods: Forty-six patients with MMD underwent both multi-delay ASL and 3D ASL-MRI. All brain regions based on the Automated Anatomical Labeling (AAL-90) atlas were divided into five groups according to the TT values measured in TT maps from multi-delay ASL-MRI. The cerebral blood flow (CBF) values in 4140 brain regions in all patients were also measured.

Results: The CBF values in multi-delay ASL and 3D-ASL were significantly different ($p<0.001$). At TT ≤ 1000 ms, 1000 ms <TT ≤1500 ms, and 1500 ms <TT ≤ 2000 ms, the respective CBF values in multi-delay ASL were lower than the corresponding CBF values in 3D-ASL value ($p<0.001$ for all comparisons). However, at 2000 ms < TT ≤2500 ms, the multi-delay ASL value was higher than the 3D-ASL value ($p<0.001$). Although the fifth group (TT>2500 ms) included only five brain regions of three patients, the CBF values from multi-delay ASL were all higher than those from 3D-ASL.

Conclusion: The CBF can be corrected by using a series of low-resolution TT maps from the multi-delay ASL-MRI. This approach possibly provides more accurate cerebral perfusion information for assessment of MMD.

OR-183
基于磁共振影像的烟雾病直接血管重建术血流灌注定量分析

陆万鑫[1],梁立[1],雷宇[2],苏佳斌[2],马婷[1]
1.哈尔滨工业大学（深圳）
2.复旦大学附属华山医院

目的 烟雾病是一种病因不明、以双侧颈内动脉末端及大脑前动脉、大脑中动脉起始部慢性进行性狭窄或闭塞为特征，并继发颅底异常血管网形成的一种脑血管疾病。颅内外血管重建手术是烟雾病和烟雾综合征的主要治疗方法。烟雾病患者脑内血流动力学的病理性改变十分复杂多变，利用多模态神经影像可以对烟雾病患者大脑血流灌注特性的改变进行检测和量化分析，这对于手术预后有重要意义。
方法 本研究针对烟雾病患者直接血管重建术的术后评估，提出了基于磁共振神经影像的精准定量评估分析方法。本研究使用 Brain Label 影像处理云平台对 T1 影像进行自动分割。基于最精细的分割粒度，对受试者的大脑中动脉流域和流域内重要功能脑区进行自动分割。通过 T1 和 ASL 影像之间的配准，可以对每个受试者的动脉流域以及流域内灌注的功能脑区血流灌注特性进行量化分析。在 ASL 使用单一标记后延迟时间参数的情境下，本研究使用空间变化系数检测局域动脉血流到达时间的异常。本研究含 47 名受试者，其中 27 名术前基线影像采集数据和基线后 8.00±3.69 天的短期随访影像数据；20 名术前基线影像采集数据和术后 164.10 ± 81.29 天的长期随访影像数据。
结果 在直接血管重建术后长期随访时间点，非术侧脑区血流灌注未呈现显著变化。在手术侧，中动脉灌注的皮层脑区，呈现显著血流灌注的改善。然而在术侧神经核团区域，呈现接近显著的灌注下降，此现象可能与该区域内代偿性增生的烟雾状异常血管网的退化有关。在术后短期随访发现，非术侧大脑中动脉区域和颞上回区域呈现接近显著的灌注下降（p 值分别为 0.07 和 0.06），在颞中回区域呈现显著的灌注灌注下降（p 值为 0.03）。而在手术侧，顶上小叶区域呈现显著血流灌注的改善（p 值为 0.02）。
结论 此结果表明 MCA 流域各功能脑区手术后灌注恢复状况并不一致，与术后量表等诊疗信息深度融合将能够更好地进行手术预后评估。

高分辨磁敏感图加权成像（SMWI） 对帕金森病和帕金森叠加综合征的诊断价值

刘学玲,李郁欣,吴仆射,王娜,耿道颖
复旦大学附属华山医院

目的 基于高分辨磁敏感图加权成像（SMWI）评估双侧黑质“燕尾征”对帕金森病和帕金森叠加综合征的诊断价值。**材料与方法** 2017 年 9 月-2019 年 1 月在复旦大学附属华山医院前瞻性搜集临床确诊帕金森病（PD）患者 35 例、进行性核上性麻痹（PSP）13 例、多系统萎缩（MSA）10 例、以及性别年龄相匹配的正常人 26 例，对其行高分辨定量磁敏感加权成像（QSM），并重建为高分辨（1×1×1mm）的 SMWI 图像。由两名高年资医生对双侧黑质“燕尾征”进行双盲的视觉评价，完全

消失为 0 分，部分消失（仅一个层面显示）为 1 分，清晰显示（至少两个层面显示）为 2 分。两位医生的评价一致性采用肯德尔检验，组间比较采用卡方分析及非参数 Kruskal-Wallis 检验，并以双侧黑质“燕尾征”消失作为诊断标准，对早期 PD 和 PD 叠加综合征进行敏感性、特异性和准确性的分析。统计软件采用 STATA (SE15.1),$p<0.05$ 为显著统计差异。**结果** 两位医生对左、右侧黑质“燕尾征”评价的一致性相关系数分别为 0.776 和 0.838。以双侧黑质“燕尾征”消失作为标准，诊断帕金森叠加综合征（含 PD,MSA,PSP）的敏感性、特异性及准确率分别为 63.79%， 100%，75%；诊断早期 PD 的敏感性、特异性及准确率分别为 56.25%， 100%，75.86%。双侧黑质“燕尾征”消失在 PD,MSA,PSP 三组中具有显著差异（ $p=0.011$）,比例分别为 60%，40%和 92%。单侧黑质“燕尾征”部分消失在诊断早期 PD 的敏感性、特异性及准确率分别为 96.88%，88.46%，93.10%。**结论** 双侧黑质“燕尾征”消失是一种高特异性的诊断帕金森综合征的影像学标记物，在帕金森病及帕金森叠加综合征的鉴别诊断中也具有潜在价值。单侧黑质“燕尾征”部分消失可作为诊断早期帕金森病的影像学标记物，具有很高的敏感性。

DWI 梗死体积与体积增长在评估卒中血管再通术后预后中的价值

邱建博
南京市第一医院

【摘要】目的 探讨 DWI 梗死体积及梗死体积增长在预测卒中血管再通术后的预后中的价值。方法 前瞻性纳入在我院接受血管再通治疗的急性脑卒中患者 38 例。所有患者发病时间为 6h，均于治疗前及治疗后 24h 内接受 MRI 检查。收集治疗前弥散张量成像（diffusion-weighted imaging；DWI）梗死体积（VDWI）、治疗后 VDWI、梗死体积增长（VDWI-G）、3 个月功能功能预后（mRS 评分）及一般临床资料。统计学分析预后良好组与预后不良组间各参数差异及 DWI 梗死体积及梗死体积增长在预测卒中预后中的价值。结果 38 例患者中 23 例（60.53%）预后良好，15 例（39.47%）预后不良。与预后不良组相比，预后良好组具有较小的治疗 VDWI(13.54±15.17 vs 59.32±53.27；$p=0.000$)、较小的治疗后 VDWI(28.04±21.72 vs 107.69±90.37；$p=0.000$)及 VDWI-G 较小(14.50±17.88 vs 48.37±42.89；$p=0.010$)。Spearman 相关分析显示治疗前 VDWI($r=0.414$，$p=0.010$)、治疗后 VDWI($r=0.486$，$p=0.002$)、VDWI-G($r=0.467$，$p=0.003$)均与 3 个月 mRS 间呈正相关。ROC 分析显示当治疗前 VDWI 的最佳临界值为 33.50 时，预测卒中功能预后的敏感性和特异性分别为 60%和 95.65%；当治疗后 VDWI 的最佳临界值为 32.80 时，预测卒中功能预后的敏感性和特异性分别为 80%和 78.26%；当 VDWI-G 的最佳临界值为 13.2 时，预测卒中功能预后的敏感性和特异性分别为 86.7%和 60.87%。结论 综合评估治疗前 DWI 梗死体积、治疗后 DWI 梗死体积及 DWI 梗死体积增长可有助于预测血管再通治疗的卒中患者的功能预后。

帕金森病扣带回结构与功能网络的改变及其代偿关系

周诚,高挺,郭涛,吴晶晶,管晓军,张敏鸣
浙江大学医学院附属第二医院

目的 ：帕金森病(PD)是第二大神经退行性疾病，其相关的脑改变并不局限于某个孤立的区域，而是存在于多个脑区构成的网络之中。因此探索帕金森病大尺度结构和功能网络的变化对理解疾病机制非常重要。此外，进一步探索结构网络破坏是否引起功能代偿效应具有重要意义。

方法 ：本研究纳入 104 例 PD 患者和 77 例健康对照。采用基于形变的形态学测量和独立成分分析(ICA)对 PD 患者和正常对照的大尺度结构网络进行比较。然后，对受试者的功能磁共振数据进行相同成分数（20）的 ICA 分析。选择与破坏的结构网络空间重叠性最好的组分作为相应的功能网络，评估 PD 患者功能连接的变化。并进一步评估结构网络的共变性与功能连接强度之间的关系。最后，对 37 例随访 PD 进行纵向分析（15 个月），进一步验证其结构网络和功能网络的改变。
结果 ：与健康对照相比，PD 患者扣带回网络的结构共变性下降。且扣带回结构网络和与认知密切相关的默认模式网络(DMN)具有较好的空间一致性。而 PD 患者扣带回网络前后部功能连通性增加。功能连通性的增加与扣带回结构网络共变性的降低呈负相关，说明功能网络和结构网络的变化之间可能存在代偿效应。健康对照的结构网络完整性与功能连接之间没有相关性。在纵向分析中,PD 患者在基线时前后扣带回网络之间的功能连通性增加,平均随访 15 个月后其功能连通性下降,这意味着潜在的代偿效应在疾病进展中减弱。
结论 ：本研究揭示了 PD 患者大脑退行性变过程中复杂的脑网络调控机制。我们的研究结果表明，扣带回结构网络在 PD 患者中具有较高的易感性。前后扣带结构网络共变性的降低可能是认知功能障碍的结构基础，而前后扣带功能网络之间连接的增强可能对结构网络破坏具有代偿作用。纵向研究表明，扣带回结构网络破坏引起的功能代偿在 15 个月后减弱，这可能意味着患者将来出现失代偿，临床表现为认知损伤。

4d flow MRI 评估烟雾病患者血流动力学的应用研究

张金戈
四川大学华西医院

目的 利用磁共振 4d flow 技术对烟雾病患者术前术后的血流动力学改变进行分析，本研究旨在探索其可行性与价值。

方法 回顾性分析 29 例行直接血管重建术的烟雾病患者术前术后 MRI 资料，利用 4d flow 序列的原始相位图与后处理软件得到血液流速。测量每位患者术前与术后双侧颈内动脉虹吸部、末段、大脑中动脉起始部及近段、大脑前动脉起始部及近段（每位患者共测量 10 处）的平均血流速度、最大血流速度。患者术前术后血流动力学参数的比较采用配对 t 检验，以 P＜0.05 为检验水准。

结果 患者术后主要血管的平均血流速度均较术前下降（P＜0.05），重建血管有效降低了烟雾病患者前循环血管的血流速度，在改善脑灌注的同时降低了血管破裂的风险。

结论 4d flow 作为一种无创、无辐射的成像技术，可以定量地评估脑血管血流动力学状态，在烟雾病患者的手术决策、手术疗效评估中具有较高临床价值。

颅内静脉窦血栓的 3D-CUBE T1 管壁成像与 SWI 的对比研究

赵兵[1],赵建设[1],张超[2],朱梅佳[2],王新怡[2],马高亭[2]
1.山东大学齐鲁儿童医院/济南市儿童医院
2.山东省千佛山医院

目的

通过联合应用颅脑常规磁共振成像方法、SWI 及高分辨率血管壁成像 3D-CUBE T1 磁共振序列对颅内静脉窦及其内血栓的显像，评价 SWI 和 3D-CUBE T1 序列在对颅内静脉窦血栓诊断的诊断效能及应用价值。

方法

前瞻性纳入山东省千佛山医院 2016 年 3 月-2017 年 9 月怀疑颅内静脉血栓的 34 例患者。首先行常规磁共振扫描，包括：颅脑 MRI 平扫、MRV，同时行颅脑 SWI、3D-CUBE T1 序列平扫。将颅脑常规磁共振影像检查结果作为确诊 CVT 的参照诊断，分别评估 SWI 及 3D-CUBE T1 序列在患者及静脉窦血管节段水平诊断 CVT 的真阳性、真阴性例数，计算其对 CVT 的敏感性、特异性、阳性预测值、阴性预测值、ROC 曲线下面积。

结果

最终评价诊断 30 例可疑 CVT 的患者，共计 240 处静脉窦血管节段。将常规磁共振诊断 CVT 阳性的结果作为评价 SWI 与 3D-CUBE T1 磁共振序列对 CVT 准确性的参照标准。3D-CUBE T1 序列在患者水平诊断 CVT 的敏感性和特异性分别为 100%和 95.2%，阳性预测值和阴性预测值分别为 90%和 100%，ROC 曲线下面积为 0.98；在静脉窦节段水平诊断 CVT 的敏感性和特异性分别为 95.8%和 97.7%，阳性预测值和阴性预测值分别为 82.2%和 99.5%，ROC 曲线下面积为 0.97。SWI 在患者水平诊断 CVT 的敏感性和特异性分别为 66.7%和 76.2%，阳性预测值和阴性预测值分别为 54.6%和 84.2%，ROC 曲线下面积为 0.71；在静脉窦节段水平诊断 CVT 的敏感性和特异性分别为 70.8%和 95.4%，阳性预测值和阴性预测值分别为 63.1%和 96.7%，ROC 曲线下面积为 0.83。

结论

与 SWI 相比，3D-CUBE T1 序列对 CVT 的诊断具有更高的敏感性及特异性，准确性高，能够为 CVT 的临床诊断及治疗提供可靠的诊断信息，具有很好的临床实用价值及应用前景。

联合 CBF 和 SWI 研究定向视觉疲劳视区改变

吴丽芳,欧阳林
中国人民解放军联勤保障部队第九〇九医院（厦门大学附属东南医院）

目的 利用功能磁共振技术探索人视觉的三种状态（闭眼静息、自由视觉及定向视觉）视区（即布劳德曼第 17 区） 脑血流和血氧含量的变化。

方法 21 例健康志愿者参与本试验。应用磁共振脑血流速（MRI CBF）和磁敏感成像（SWI）分别测量三种视觉状态中双侧视区脑血流和血氧水平改变。 各个视觉状态试验 50 秒后开始 MRI 检测。采用单因素 ANOVA 方差分析，对组间差异进行数据分析。

结果 与闭眼静息比较，自由视觉引起视区 CBF 升高，但定向视觉容易疲劳，引起视区 CBF 显著下降（$p<0.001$）；SWI 值在依次三种状态中呈增高趋势，尽管自由视觉较比闭眼静息没有显著性增加，但定向视觉疲劳时显著升高($p<0.05$)。

结论 定向视觉视区脑血流和氧饱和度快速下降可能是其容易疲劳的病理生理基础。

In vivo MR and fluorescence dual-modality molecular imaging of vulnerable atherosclerotic plaques with SR-AI-targeted ultrasmall nanoclusters

Jiahui Wang,Shuang Liu,Lin Cao,Xuening Zhang

The second hospital of tianjin medical university

Objective: Early and accurate visualization and diagnosis of vulnerable atherosclerotic plaques is extremely critical for prevention of acute cardiovascular events. However, the limitations of current imaging techniques, such as inadequate targeting specificity, deficient imaging sensitivity, and the insufficient spatial resolution, may seriously hinder their development and application for precise plaque characterization, thus greatly increased the sufferings and economic bear of patients. In order to solve the problems above, a novel multifunctional nanotechnology-based contrast agent with highly specific targeting efficiency and high-resolution imaging ability was elaborately designed for early noninvasive and accurate detection of vulnerable atherosclerotic plaques through MRI and fluorescence dual-modality imaging in this research.

Materials and Methods: Herein, scavenger receptor AI (SR-AI), a secreted biomarker associated with foam macrophages, was selected as a target for identifying vulnerable plaques. A biocompatible and high-performing molecular imaging probe (PP1-Au:Gd@GSH NCs) was synthesized via a facile and environmentally friendly strategy, through covalently conjugating the SR-AI-specific peptide PP1 to gadolinium-functionalized gold nanoclusters (AuNCs), using glutathione (GSH) as a bio-template under mild conditions. Murine atherosclerosis model was induced in $ApoE^{-/-}$ mice by high fat and cholesterol diet (HFD) for 20 weeks. During HFD feeding time, body weight and serum lipid profile were monitored and histological examinations including H&E, Oil Red O and immunofluorescent staining were carried out to verify the vulnerable plaques were successfully induced. To observe the imaging effect of the probe, in vivo MRI and NIRF imaging of atherosclerotic plaque were carried out before and after intravenous injection of PP1-Au:Gd@GSH NCs at different time points. After that, aortic artery segments aligned to the MR/NIRF imaged region were excised for histopathology and immunohistochemistry tests to confirm probe deposition.

Results: The resulting PP1-Au:Gd@GSH NCs possessed superior stability, favorable biocompatibility, as well as negligible cytotoxicity. With highly loaded Gd and Au species, it exhibited both remarkable MR and NIRF signal enhancements *in vitro*. Incubation of activated RAW264.7 foam macrophages with PP1-Au:Gd@GSH NCs led to significantly higher uptake *in vitro* than with nontargeted NCs, indicating this incremental uptake was strictly mediated by SR-AI. After fed HFD for 20 weeks, Oil Red O staining showed the plaque area was significantly increased in HFD group ($p<0.05$), immunofluorescence staining revealed that SR-AI protein was highly abundant within plaque, and almost co-localized with foam macrophage marker, demonstrating $ApoE^{-/-}$ mouse atherosclerosis model was successfully constructed. In vivo MR/NIRF imaging revealed that PP1-Au:Gd@GSH NCs presented robust and prolonged contrast enhancement in aortic vulnerable plaques of the $ApoE^{-/-}$ mice compared to nontargeted NCs. At 8 h post PP1-Au:Gd@GSH NCs injection, plaque area became extremely apparent thanks to favorable targeting efficacy, and such a single injection could render plaque macroscopic for a long period of 32 h, allowing guidance during the entire period, including pre-therapeutic detection and therapeutic intervention. Subsequent histologic staining further verified that PP1-Au:Gd@GSH NCs indeed accumulated in the atherosclerotic plaque region, where the SR-AI over-expression as well as foam macrophages infiltration were clearly seen. More importantly, the preliminary study on hematology test and H&E staining suggested no observable cell necrosis or inflammatory infiltrate after PP1-Au:Gd@GSH NCs administration. Pharmacokinetics and biodistribution analysis

demonstrated that PP1-Au:Gd@GSH NCs displayed prolonged circulation time, increased accumulation in atherosclerotic plaques and natural clearance capabilities through urinary system.
Conclusion: In summary, a sensitive, specific and biocompatible molecular probe (PP1-Au:Gd@GSH NCs) had been successfully established for noninvasive atherosclerosis dual-modality imaging. *In vitro* and *in vivo* experiments showed they could be effectively internalized within atherosclerotic lesions and enhance plaque imaging contrast because of their high affinity for SR-AI. Most importantly, no observable toxicity or side effects of PP1-Au:Gd@GSH NCs were found in a variety of toxicity studies. From our data, we can anticipate this MR/NIRF molecular diagnostic strategy with PP1-Au:Gd@GSH NCs may evolve into a clinically translational, a noninvasive tool for precisely detecting and monitoring rupture-prone atherosclerotic plaques in vivo.

Clinical features and cardiovascular magnetic resonance characteristics in danon disease

jian He,Jing Xu,Minjie Lu
Chinese Academy Of Medical Sciences & Peking Union Medical College fuwai hospital

Abstract
Aims: Danon disease is a rare X-linked dominant disease, with lysosomal associated membrane protein 2 (LAMP2) gene mutation, causing clinical presentation like cardiomyopathy, skeletal myopathy and intelligence retardation. Yet the existing reports were based on case reports, it still lacks detailed and comprehensive description, especially in CMR tissue characterization of T1 and extracellular volume (ECV) in Danon disease. We aimed to comprehensively investigate the clinical spectrum, cardiovascular magnetic resonance (CMR) characteristics including T1 and extracellular volume fraction and outcomes of Danon disease, thus facilitate the further understanding of the phenotype of patients with Danon disease.
Methods: Our study included 6 male patients aging from 8 to 23 years old between 2014-2019. The clinical presentation, lab examinations, pathology/genetic analysis, electrogram (ECG), echocardiography and CMR characteristics were summarized.
Results: 5 out of 6 patients suffered from hypertrophic myocardiopathy (HCM) phenotype of Danon disease, while 1 patient had dilated cardiomyopathy (DCM) phenotype. The left ventricle (LV) and left atrium (LA) function were impaired to large extents from strain measurement. Diffuse and focal late gadolinium enhancement (LGE) were separately observed in LV walls of 3 patients and right ventricular (RV) insertion points of remaining 3 patients. Furthermore, native T1(mean 1313.3ms) and ECV (mean 39.17%) values of three patients were increased evidently.
Conclusions: Both dilated and hypertrophic cardiomyopathy may be the phenotypes of Danon disease. Comprehensive CMR imaging played a unique role in the diagnosis and grading severity and risk factors of Danon disease in vivo in patients, especially by using robust quantitively strain analysis, T1 mapping and further ECV calculation.

3.0TMRI 对高原与平原地区健康正常人心脏结构及功能的对比研究

颜春龙[1],齐先龙[1],唐桂波[2],杨国财[2],马金凤[1],徐辉[2],郑宁[1]
1.济宁市第一人民医院
2.青海省人民医院

目的 通过心脏磁共振成像（cardiac magnetic resonance imaging，CMRI）比较高原与平原地区健康正常人在心脏结构及功能方面的差异。**方法** 对 25 例高原健康正常人和 20 例平原地区健康正常人进行 CMRI 检查，测量心脏结构参数：前室间隔厚度(AWOIVS)、左房内径(LAD)、左室舒张末期内径(LVEDD)、主动脉根部内径(AOD)、主肺动脉内径（MPAD）、右房横径(RATD)、右房长径(RALD)、右室横径(RVTD)、右室长径(RVLD)，另通过心脏专用后处理工作站测量左心功能参数：左室舒张末期容积（LVEDV）、左室收缩末期容积（LVESV）、左室每搏输出量 （LVSV）及左室射血分数（LVEF）。采用独立样本 t 检验对比分析两组间各参数的差异。**结果** 高原组 AWOIVS、MPAD、RATD 和 RVTD 指标大于平原组，其中 AWOIVS 和 MPAD 两组间差异有统计学意义（$p<0.05$）；高原组 LAD、LVEDD、AOD、RALD、RVLD 指标小于平原组，其中 LVEDD 两组间差异有统计学意义（$p<0.05$）；高原组 LVEDV、LVESV 和 LVSV 小于平原组，其中 LVEDV 两组间差异有统计学意义（$p<0.05$）；高原组 LVEF 大于平原组，差异无统计学意义（$p>0.05$）。**结论** 相对于平原地区健康人，高原地区健康正常人在心脏结构及功能方面已有改变，前室间隔厚度增加，主肺动脉内径增宽，左心室容积缩小，高原地区健康正常人具有强大的心脏储备能力和摄氧能力。

Aortic flow quantification in cardiac mri: comparison of aortic volume of 4D-flow and stroke volume derived from short-axial cine

Xiaoqian Ge,Chenze Tian,Bin Qiao,Lixin Sun,Ruozhen Gong
Department of Radiology, Shandong ENT Hospital, Shandong University

Background and purpose: Currently, cardiac MRI is the accepted gold standard for stroke volume (SV) with short-axis slices [1]. In addition, quantification of flow in 3D over time (4D-flow) is increasingly used to assess blood flow hemodynamics in diverse cardiovascular territories [2]. The purpose of this study was to compare aortic flow using 4D-flow and stroke volume with short-axis slices in young health adults.

Material and Methods: From June 2019 to July 2019, sixteen young health volunteers (27.4 ± 3.8 years, 6 females) were consecutively recruited and underwent cardiac MRI by using 3.0T scanner (GE, MultiSync P242W), including 4D-flow, 2D CINE phase-contrast (PC) and short-axis CINE slices. The ethics board approved the study and written informed consents were obtained from all participants. The aortic volume of 4D-flow and 2D PC were measured by using CVI^{42} (release 5.10.1). SV was the difference of left ventricular end-diastolic (EDV) and end-systolic volume (ESV) derived from short-axis

cine planes. Bland-Altman analysis and the intraclass correlation coefficient (ICC) were used to assess the correlation between aortic total volume of 4D-flow and SV.

Results: Excellent agreement was found between aortic total volume of 4D-flow and SV (ICC, 0.87; 95% confidence interval [CI]: 0.65, 0.95), and between 2D PC and SV (ICC, 0.89; 95% CI: 0.68, 0.96). Bland-Altman analysis for aortic total volume and SV agreement showed a significant variance using 4D-Flow compared to 2D PC ([mean, -3.16; 95% CI: -6.14, -0.18; p=0.039] vs. [mean, 0.36; 95% CI: -2.98, 3.76; p=0.819]).

Conclusions: 4D-flow is a noninvasive and accurate way to quantify aortic volume compared to the reference standards SV in young health adults. With multi-planes of cardiovascular territories and large coverage, 4D-flow has the potential to become an alternative imaging approach in evaluating the cardiovascular flow.

OR-194

Comparison of 4D-flow and 2D-flow sequences for aortic and pulmonary flow quantification in young health adults

Chenze Tian,Xiaoqian Ge,Bin Qiao ,Lixin Sun,Ruozhen Gong
Shandong Provincial western hospital

*Background and purposes:*2D-flow sequence of Cardiac Magnetic resonance imaging (CMRI) has become the standard for noninvasive quantification of blood flow. Recently, quantification of flow in 3D over time (4D-flow) is increasingly used to assess blood flow hemodynamics in diverse cardiovascular territories such as the aorta, pulmonary arteries, ventricles and atria[1,2]. In this study, we aimed to assess the accuracy of 4D-flow for quantification of aortic and pulmonary flow parameters compared to the reference standards 2D-flow in young health adults.

Material and Methods: From June 2019 to July 2019, sixteen young health volunteers (27.4 ± 3.8 years, 6 females) were consecutively recruited and underwent CMRI by using 3.0T scanner (GE, MultiSync P242W), including 4D-flow and 2D-flow sequences. The ethics board approved the study and written informed consents were obtained from all participants. The aortic and pulmonary flow of 4D-flow and 2D-flow were measured by using CVI[42] (release 5.10.1). The total volume, regurgitant fractions, and peak velocities were calculated. Pearson's correlation coefficient (r) was calculated. Linear regression analysis comparison of 4D-flow and 2D-flow hemodynamic parameters was performed. $p<0.05$ was considered significant.

Results: Linear regression analysis showed excellent agreement between 4D-flow and 2D-flow in aortic total volume ($r=0.892$, $p<0.01$), pulmonary peak velocity ($r=0.856$, $p<0.01$), and Q_P/Q_S ($r=0.854$, $p<0.01$). Good agreement was found in pulmonary total volume ($r=0.704$, $p<0.01$). Moderate agreement was found in aortic peak velocity ($r=0.574$, $p<0.01$). There was no correlation in aortic and pulmonary regurgitant fractions between 4D-flow and 2D-flow ($r=0.108$, $p=0.134$; $r=0.297$, $p=0.097$).

Conclusions: In conclusion, we found good agreement for 4D-flow in aortic and pulmonary total volume, peak velocity and Q_P/Q_S compared with 4D-flow. However, we found no correlation in aortic and pulmonary regurgitant fractions.

3.0T 磁共振对高海拔地区正常人心肌特性的初步研究

袁月,鲍海华
青海大学医学院附属医院

目的 通过心脏磁共振成像技术探讨高海拔地区健康正常成人左室心肌组织特性，对高海拔地区正常人左室心肌 T1 值 T2 值及 ECV 值范围进行初步研究以供参考。**方法** 选择长期生活在海拔 2500 米以上高原的世居健康志愿者 42 例(其中男性 23 例，女性 19 例)进心脏磁共振定位相扫描、快速自旋回波序列 T1 对比扫描、look-locker 反转恢复（Modified Look-locker Inversion Recovery，MOLLI）序列对比剂注射前 T1mapping 扫描、T2mapping 扫描、基于梯度回波的多时相电影序列扫描、T1scout 序列扫描、对比剂注射后相位敏感反转恢复的 T1WI 序列扫描、MOLLI 序列对比剂注射后 T1mapping 扫描。分别获得左室心肌不同节段的 T1 值及 T2 值，并计算出相应 ECV 值。**结果** 左室总体平均增强前 T1 值、增强后 T1 值、ECV 值和 T2 值分别为（1235.16±26.7）ms、（475.93±34.2）ms、（34.45±3.5）%、（45.28±3.8）。其中，男性增强前 T1 值高于女性[T1 值：（1322.35±20.4）ms:（1230.18±23.8）ms(P＞0.05)]；女性 ECV 值及 T2 值高于男性[ECV 值：(35.5±2.9）%:(33.4±1.5）%；T2 值：(47.31±3.1)：(43.82±2.9)(P＜0.05)]；心尖段 ECV 值及 T2 值（36.87±3.3）%、（47.21±3.3）均高于基底段（33.54±2.3）%、（43.25±2.9） 和中间段（33.7±2.5）%、（44.11±3.0）（ P＜0.05）。 **结论** 正常人左室心肌增强前 T2 值、ECV 值存在性别以及节段差异。

Delta-flow 非增强 MR 血管成像在足部动脉病变中的应用:与 DSA 的对照研究

徐笑双[1],罗良平[2]
1.深圳市人民医院
2.暨南大学附属第一医院

目的 通过与 DSA 对比，探讨 Delta-flow 非增强 MR 血管成像在足部动脉病变中的应用价值。
材料与方法 19 例下肢动脉病变（其中 4 例为双足，2 例为介入治疗前和后）共计 25 次足部均行 8 通道足部线圈的 NCE-MRA 和 DSA 检查。两位放射科医生独立评价 NCE-MRA 的图像质量。以 DSA 为标准，动脉管腔狭窄≥50%为有临床意义的狭窄，分析 NCE-MRA 对足部动脉狭窄的诊断效能。采用 Kappa 检验评价 NCE-MRA 和 DSA 对评估狭窄程度及显示血管长度结果的一致性。
结果 图像质量优良率为 72%(18/25)。足部 125 个动脉节段中，以动脉管腔狭窄≥50％为有临床意义的狭窄，NCE-MRA 诊断的平均准确率为 90.4%，平均敏感性为 94.4%，平均特异性为 80.6%，阳性预测值为 92.3%，阴性预测值 85.3%。以 DSA 为标准，NCE-MRA 评价血管狭窄程度的符合率为 72%(90/125)，高估狭窄程度 20 条，低估 15 条，其 Kappa 值为 0.622；NCE-MRA 显示足部血管长度符合率为 71.2%(89/125)，其 Kappa 值为 0.471。

结论 使用 8 通道的足部线圈和基于 Delta-flow 技术的 NCE-MRA 可有效显示足部动脉的全貌，对有意义的动脉狭窄具有较高的诊断效能，可成为 CE-MRA 和 CTA 的重要补充。

基于压缩感知的 MRI 定量灌注成像评估肺癌微血管密度

陈利华[1,2],王健[2],冯犁[3]
1.解放军联勤保障部队第 904 医院
2.西南医院
3.纪念斯隆凯瑟琳肿瘤中心

目的 探讨基于黄金角径向稀疏采样（GRASP）动态增强 MRI 灌注成像在临床上评估肺癌血管生成的价值，以及前瞻性评价肺癌灌注参数与微血管密度（MVD）之间的相关性。
方法 前瞻性对 40 例明确有肺部占位的患者采用脂肪抑制层叠黄金角径向采样序列进行检查。对原始数据进行 GRASP 图像重建，重建的时间分辨率为 3 秒。最终 25 例经病理证实为肺癌的患者（16 男性，9 例女性）被纳入研究。采用 Tofts 模型进行定量灌注分析。对肺癌标本进行 CD34 免疫组织化学染色并测量 MVD。采用组内相关系数分析（ICC）定量灌注参数测量的可重复性。采用单因素方差分析和多重比较来分析不同组织学类型肺癌的容积转移常数（K^{trans}）值、V_e值和 MVD 之间的差异。用皮尔森相关系数分析定量灌注参数（K^{trans}和 V_e）和 MVD 之间的相关性。
结果 两次定量灌注参数测量的 ICC 分别为 0.976 和 0.964。腺癌的 K^{trans}、V_e和 MVD 的平均值分别为 0.36±0.26 min^{-1}、0.27±0.13 和 49.09±29.84 条/0.723mm²；鳞状细胞癌的 K^{trans}、V_e和 MVD

的平均值分别为 0.34±0.17 min^{-1}、0.26±0.12 和 53.85±23.53 条/0.723mm²；小细胞肺癌的 K^{trans}、V_e和 MVD 的平均值分别为 0.13±0.15 min^{-1}、0.14±0.06 和 37.20±28.28 条/0.723mm²。定量灌注参数（K^{trans}和 V_e）和 MVD 在组织学类型、肿瘤大小以及是否转移等方面均没有显著差异（P>0.05）。肺癌的 K^{trans}值与 MVD 呈显著正相关(r=0.739，P<0.001)，而 V_e值与 MVD 无显著相关(r=0.158，P=0.449)。

结论 GRASP 高分辨率 DCE-MRI 成像为临床定量评估肺癌肿瘤血管生成提供了一种简单的、无需屏气的和没有电离辐射的灌注成像选择。

The value of IVIM-DWI in early prediction of efficacy of neoadjuvant chemotherapy for breast cancer

Tingting Lin, Jiangning Dong

Department of Radiology, Anhui Provincal Cancer Hospital, West Branch of the First Affiliated Hospital of USTC, Division of Life Sciences and Medicine, University of Science and Technology of China, Hefei, Anhui, 230031, P.R. China.

Objective: To investigate the early predictive value of IVIM-DWI in neoadjuvant chemotherapy for breast cancer.

Methods: 43 cases of breast cancer confirmed by pathological biopsy in our hospital were collected. IVIM-DWI was performed after each chemotherapy. IVIM-DWI parameters included standard apparent diffusion coefficient (ADC), slow apparent diffusion coefficient (D), fast apparent diffusion coefficient (D*) and perfusion fraction (f). Referring to RECIST criteria, the study cases were divided into two groups: (1) effective group: complete remission (CR) and partial remission (PR); (2) ineffective group: progress disease (PD) and stable disease (SD). Multivariate analysis of variance was used to compare IVIM-DWI parameters before and after treatment, between effective and ineffective groups. The ROC curve was used to calculate the optimal diagnostic threshold for the effective group and the ineffective group.

RESULTS: A total of 49 lesions were studied, including 33 in the effective group (CR: 7, PR: 26) and 16 in the ineffective group (SD: 11, PD: 5). There was significant difference in the volume of tumors in the effective group of pretherapy and the third treatment course, but there was no significant difference in the ineffective group. There were significant differences in D value, D* value and F value of IVIM-DWI parameters among pretherapy, 1^{st} treatment and 3^{rd} treatment in the effective group (F value was 30.487, 6.752 and 8.983, respectively, $P < 0.05$). There were significant differences in D value, D* value and F value of IVIM-DWI parameters between effective group and ineffective group before treatment (F value was 30.487, 6.752 and 8.983 respectively, $P < 0.05$). The area under curve (AUC) of D value, D* value and F value were 0.889, 0.910 and 0.879 respectively. The diagnostic thresholds were 0.716 mm2/s (specificity and sensitivity were 75.1% and 95.2%, respectively), 37.85 mm2/s (specificity and sensitivity were 71.2% and 98.3%, respectively) and 0.292 (specificity and sensitivity were 89.4% and 81.5%, respectively). (Table 1, Figure 1-2)

Conclusion: IVIM-DWI can predict the early curative effect of neoadjuvant chemotherapy for breast cancer and evaluate its effectiveness. It can assist conventional MRI to evaluate the curative effect.

Whole-Lesion Texture Analysis of Magnetic Resonance T2 Weighted Images in T1a Renal Cell Carcinoma Subtyping

Yichen Wang,Yan Chen,Xinming Zhao
National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital， Chinese Academy of Medical Sciences

Background
With more widespread of cross-sectional images, renal cell carcinoma (RCC) is increasingly diagnosed as low-stage incidental finding. Compared with clear cell RCC (ccRCC), non-clear cell RCC including chromophobe RCC (chRCC) and papillary RCC (pRCC) tends to have more indolent behavior and better prognosis. For T1a(≤4cm) renal cell carcinoma, accurate prediction of pathological type is an important issue. In this study, we aimed to use whole-lesion texture analysis of MR T2WI to differentiate T1a RCC subtypes.
Material and methods
This retrospective study included 115 RCC patients (42 ccRCC, 45chRCC and 28pRCC) with complete T2 weighted imaging before treatment. Axial fat-suppressed T2-weighted

imaging was acquired using FSE on a 3-T scanner. Tumor were segmented manually slice by slice by an experienced radiologist blindly to pathology. Whole-lesion texture parameters were calculated by software GE Omni-kinetics. Parameters were compared among RCC subtypes. Parameters with significant differences among groups was selected and ROC curve were plotted to analyze the diagnostic efficacy. AUC, specificity, sensitivity, were then calculated. A predictive model was established using combination of these parameters. P<0.05 was considered to be statistically significant.

Results

ChRCC had significantly more female patients than ccRCC and pRCC. Age, tumor diameter had no significant difference among subtypes. Among all these parameters, variance, kurtosis, uniformity, inertia, cluster prominence (CP), haralick correlation (HC), energy, entropy, correlation and InverseDifferenceMoment (IDM) had significant differences among subtype (p<0.05). In differentiating ccRCC with non-ccRCC, several parameters (energy, entropy, inertia, CP and HC) reached good diagnostic efficacy with AUC over 0.7. Predictive model with combining parameters had better performance with AUC 0.82(0.74~0.90), p<0.05. In differentiating ccRCC with chRCC, predictive model with combining parameters had very good performance with AUC 0.88(0.81~0.95), p<0.05.

Conclusion

Different RCC subtypes had different patterns of T2 weighted imaging showing different levels of texture parameters. Whole-lesion texture analysis is a practical, convenient, efficient method in pretreatment subtyping RCC.

融合 MR-T2WI 和 T1 增强的影像组学特征的卵巢癌复发风险预测

李海明,龚敬,彭卫军
复旦大学附属肿瘤医院

目的 探讨基于 MR-T2WI 和 T1 增强早期序列的组学特性预测进展期卵巢癌复发风险的可行性研究。

方法 本研究回顾性的搜集 116 名卵巢癌患者（28 名未复发和 88 名复发）的 T1 增强和 T2 磁共振影像。利用交互式分割方法分别提取 T1 和 T2 影像中的肿瘤区域，并量化计算 1046 种影像组学特征。选用基于 L1 的特征选择方法筛选出有效的影像特征，并利用 SMOTE 重采样方法对数据样本进行重采样，排除数据不平衡的干扰。选用 SVM 分类分别构建预测模型，并留一法交叉验证方法对模型进行测试。采用信息融合方法对 T1 和 T2 影像预测模型的预测结果进行融合，进一步提高模型的准确率。

结果 利用 T1 增强图像和 T2 影像构建模型的 AUC 值分别为 0.74±0.06（95% CI：[0.63, 0.83]）和 0.72±0.06（95% CI：[0.61， 0.81]），融合两种不同的影像特征模型的 AUC 达到 0.80±0.05，（95% CI：[0.71， 0.87]）。与使用单种影像特征的模型相比，融合模型能够有效医生卵巢癌复发风险的预测准确率（p<0.05）。

结论 本研究通过提取和分析高通量的影像信息，并融合不同种类的影像特征，有效提升了卵巢癌复发风险预测的准确率。

MR 多模态功能成像对于宫颈癌新辅助化疗疗效的预测价值

董越,庞慧婷,张晓苗,罗娅红
辽宁省肿瘤医院

目的 探讨 MR 多模态功能成像对于宫颈癌新辅助化疗疗效的预测价值。
材料与**方法** 60 例接受新辅助化疗并进行手术的宫颈癌患者，年龄范围 35-65 岁。所有患者于治疗前、化疗 2 周期后手术前行常规 MR、DWI 和 DCE-MR 检查，测量病灶最大径，病灶 ADC 值和 ktrans、kep 和 Ve 值。新辅助化疗组的治疗方案：奥沙利铂（或顺铂）+多西他赛（或紫杉醇脂质体）。治疗前 MR 图像显示的宫颈癌灶大小与术后病理癌灶大小进行对比，按照实体瘤治疗评价 RECIST 标准得出有应答组（包括 CR 及 PR）和无应答组（包括 PD 及 SD）。有应答组 48 例，无应答组 12 例。使用卡方检验及 Fisher 确切检验、t 检验对治疗有应答组与无应答组的 FIGO 分期、分化程度、病理类型、治疗前和治疗后 ADC 和 DCE 相关参数进行分析。
结果 （1）两组病例的 FIGO 分期之间的差异存在统计学意义（$p<0.05$）；两组病例的病理类型及分化程度之间差异无统计学意义（$p>0.05$）。（2）有应答组和无应答组治疗前和治疗后 ADC 值相关参数均无统计学差异（p 值均>0.05）。（3）有效组治疗前 Ktrans 最大值为 3.02±1.35，大于无效组 Ktrans 最大值（1.96±1.44），差异具有统计学意义（$p<0.05$）；其他参数均无统计学意义（$p>0.05$）。（4）化疗 2 个周期手术前 DCE-MR 参数进行比较，有效组 Ktrans 最大值为 3.08±1.25，明显大于无效组 Ktrans 最大值（0.81±0.70），差异具有统计学意义（$p<0.05$）；两组病例的 Kep 平均值之间的差异存在统计学意义（$z=-2.569$，$p<0.05$）；其他参数均无统计学意义（$p>0.05$）。
结论 接受新辅助治疗的宫颈癌患者，治疗前的 Ktrans 最大值、化疗后的 Ktrans 最大值和 Kep 平均值对于反映新辅助治疗的效果有一定价值。

OR-204
Optimal Simultaneous Multislice Diffusion-Weighted Imaging of liver at 3.0T MRI: Measurement of Different Breathing Schemes in Comparison to Standard Sequences

Yigang Pei
Xiangya Hospital Central South University

Purpose: To obtain the optimal simultaneous - multislice (SMS) - accelerated diffusion-weighted imaging (DWI) of liver at 3.0T MRI by systematically estimating the reproducibility of apparent diffusion coefficient (ADC), signal-to-noise ratio (SNR) and image quality of different breathing schemes in comparison to standard DWI(STD) and other SMS sequences.

Materials and Methods: In this institutional review board‐approved prospective study, hepatic DWIs (b=50, 300, 600 sec/mm^2) were performed in 23 volunteers on 3.0 T MRI using SMS and STD with breath-hold (BH-SMS, BH-STD), free breathing (FB-SMS, FB-STD) and respiratory-triggered (RT-SMS, RT-STD). Reduction of scan time with SMS-acceleration was compared. ADC and SNR were measured in nine anatomic locations and image quality were assessed on all SMS and STD sequences. An optimal SMS-DWI was

obtained by systematically comparing the ADC reproducibility, SNR and image quality of above all DWIs.

Results:
SMS-DWI sequences reduced scan time significantly by comparison with STD-DWI (27 vs. 42 sec for BH, 54 vs. 99 sec for FB and 42 vs. 97 sec for RT). In all DWIs, BH-SMS had the greatest intra-observer agreement (intraclass correlation coefficient: 0.920 ~ 0.944) and good inter-observer agreement (interclass correlation coefficient: 0.831~ 0.886) for ADC measurements, and the best ADC reproducibility in nine locations (mean ADC absolute differences : 0.046~ 0.058×$10^{-3}mm^2/s$; LOA: 0.010 ~0.013×$10^{-3}mm^2/s$). BH-SMS had the highest SNR in three representative sections (Superior: 29.81 ± 20.49 for reader1, 29.14±19.48 for reader2; Central: 38.37 ± 17.36 for reader1, 37.13 ± 21.07 for reader2; Inferior: 35.33 ± 13.84 for reader1, 34.90 ± 16.69 for reader2) except RT-STD. There were no significant differences in image quality between BH-SMS and other DWI sequences (median BH-SMS: 4.75, other DWI: 4.5-5.0; P>0.0.5).

Conclusion:
BH-SMS provides considerable scan time reduction with good image quality, sufficient SNR and highest ADC reproducibility on 3.0T MRI, which is thus recommended as the optimal hepatic DWI sequence for those subjects with adequate breath-holding capability.

OR-205

MRI-Gray Scale Ratio in Differential Diagnosis of Small Hepatocellular Carcinoma (SHCC) from Focal Nodular Hyperplasia (SFNH)

Xiuhong Ge,Zhongxiang Ding,Zhijiang Han,Qianqian Xia
the Affiliated Hangzhou First People's Hospital, Zhejiang University School of Medicine

Purpose: The objective was to explore the value of the MRI-gray scale ratio (GCR)between the lesion and the surrounding normal liver parenchyma, and the MRI-gray scale ratio (GCRL) between the enhance-lesion and the plain scan-lesion to differentiate the SHCCfrom theSFNHin the hepatic arterial (AP), portal (PP), and delayed phases (DP).
Materials and Methods: In this study, 434 SHCC lesions in 426 patients and 132 SFNH in 118 patients, confirmed by clinically and/or pathologically, were retrospectively analyzed. All the patients underwent triple-phase MRI enhanced. The lesions' MRI gray-scale values (GCV) of the plain scan (GCV-p) and the enhanced MRI scan (GCV-c), and normal liver parenchyma's GCV around the lesion (GCR-n) were measured, calculate the GCR = GCV-c / GCV-n, GCRL = GCV-c / GCV-p. The GCR and GCRL were separatelyanalyzed by the Wilcoxon rank sum test and the receiver operating curve (ROC).
Results: The medium age of 111 SHCC lesions in 434 SHCC lesions in 426 patients and 132 SFNH in 118 patients was 57(49～63) vs.35(28～44) (P< 0.01),the male/female ratio was (352 vs.74) and (44 vs.74)(P< 0.01), and the size of the lesions

was 2.1(1.5～2.675) vs. 2.1(1.5～2.5) (P = 0.09). The GCR of the AP, PP, and DP of the SHCC and the SFNH lesions 1.62 (1.34～1.88) vs. 1.90(1.69～2.22) (Z = -7.546, $P<$ 0.01), 0.89 (0.80～0.95) vs. 1.01 (1.00～1.16) (Z = -14.943, $P<$ 0.01), 2.40 (2.06～2.79) vs. 2.68 (2.27～3.08) (Z = -4.521, $P<$ 0.01),respectively. When the GCRs of the triple-phase contrast-enhanced MRI scan of SHCC and SFNH were 1.649, 0.889 and 0.983, the maximum You-den indexes were 0.331, 0.648 and 0.869, respectively. The area under the curve (AUC) values were 0.717, 0.851 and 0.929, respectively. Besides, the corresponding values of sensitivity and specificity were 80.3% and 52.8 %, 92.2% and 72.4%, 97.7% and 89.2%, respectively, and the positive likelihood ratio(+LR) and negative likelihood ratio(-LR) were 1.701 and 0.373, 3.348 and 0.105, 9.046 and0.026, respectively. The GCRL of the AP, PP, and DP of the SHCC and the SFNH lesions 0.93 (0.83～1.00) vs. 1.10 (1.03～1.22) (Z = -12.206, $P<$ 0.01), 2.78 (2.18～3.41) vs. 3.39(2.40～4.07) (Z = -6.210, $P<$ 0.01), 2.05 (1.80～2.40) vs. 2.30 (1.98～2.67) (Z = -4.461, $P<$ 0.01),respectively. When the GCRLs of the triple-phase contrast-enhanced MRI scan of SHCC and SFNH were 2.960, 2.907 and 2.190, the maximum You-den indexes were 0.290, 0.236 and 0.243, respectively. The area under the curve (AUC) values were 0.678, 0.630 and 0.628, respectively. Besides, the corresponding values of sensitivity and specificity were70.5% and 58.5 %, 40.9% and 82.7%, 61.4 % and 62.9%, respectively, and the positive likelihood ratio(+LR) and negative likelihood ratio(-LR) were 1.699 and 0.504, 2.364 and 0.715, 1.655 and 0.614, respectively.

Conclusions: GCR is more valuable than GCRL in differentiating SHCC and SFNH, and the SHCC is highlysuggestedwhen the GCR of AP, PP, and DP are no more than 1.649, 0.988, 0.983, respectively, in the middle-aged and elderly male patients.

OR-206

Characterizing Computer Tomography and Magnetic Resonance Imaging Features for detection of Struma Ovarii

Yueming Li,Rongping Ye
The First Affiliated Hospital of Fujian Medical University

Abstract

Background: To analyze the computer tomography (CT) and magnetic resonance imaging (MRI) features of struma ovarii (SO) and explore the corresponding pathological basis to improve diagnostic accuracy.

Methods: A retrospective analysis was made on the basis of the clinical and imaging data of 28 cases of struma ovarii with pathological confirmation. The location, size, morphology, margin, configuration, attenuation/signal intensity and enhancement pattern of all cases were analyzed. Imaging features were compared with pathological results.

Results: All 28 tumors were unilateral (right, n=12; left, n=16) with well-defined margins, which were multilobulated surfaces in 20 cases and round-like in eight cases. Focal fatty tissue was present in 14 (14/28,50%), and calcification was present in ten cases (10/28,35.7%).On the CT group, the solid components of the tumors presented as

iso-densities or hyper-densities on non-contrast CT and were markedly enhanced due to abundant blood vessels and pathological fibrous tissue. The cystic component displayed multiple cysts of different sizes and varying densities, with CT values ranging from 13 to 63 HU. On the MRI group,the punctuate foci of high signal intensity inside the solid components on T1-weighted images (18/22,81.8%) represented fat tissue or mucinous material within the thyroid follicles.The areas of extremely low signal intensity with no enhancement on T2WI were recognized in 12 tumors (12/22,54.5%), representing viscid gelatinous colloid material. The solid portion of SOs showed a high apparent diffusion coefficient (ADC) value, indicating unrestricted diffusion, excepting for two showing obvious diffusion restricted with markedly enhancement and eight showing small nodule of diffusion restricted without enhancement.
Conclusion: Typical features of struma ovarii on CT scans include smooth margin cystic or cystic-solid masses with fat and calcification, hyper attenuation lesions on pre-contrast images, and marked enhancement in solid portion after enhancement. On MRI scans, the characteristic demonstrations include foci of high signal on T1WI, extremely low signal intensity on T2WI, and diffusion restricted small nodule without enhancement on DWI.

OR-207

Contrast-enhanced MR cholangiography with Gd-BOPTA: Using Biliary System Visualization to evaluate Liver Function

Yan Sun,Wang Tao
Shandong Medical Imaging Research Institute affiliated to Shandong University

Objectives: To evaluate the relationships between biliary system visualization and liver function with Gd-BOPTA-enhanced MR Imaging in the hepatobiliary phase.
Materials and Methods: In our study, 220 patients were classified into four groups: patients with normal liver function without liver cirrhosis (the NLF group); and cirrhosis patients with Child-Pugh classes A, B, and C (LCA, LCB, and LCC groups). All the patients underwent Gd-BOPTA by MR imaging. The relative enhancement ratio (RE) of the biliary system was calculated from measurements of the signal intensities (SI) of the bile duct and the SI erector spinae muscle. Statistical analysis was used to evaluate the relationship between the RE ratios of the biliary system and liver function parameters. The different RE ratios of the biliary system among the NLF, LCA, LCB, and LCC groups were analyzed.
Results: The RE ratios of the biliary system were associated with total bilirubin ($r = -0.592$, $P < 0.01$), prothrombin time([PT] [$r = -0.601$, $P < 0.01$]), and albumin ($r = 0.526$, $P < 0.01$). The RE ratios of the biliary system were significantly higher for the NLF and LCA groups compared with the LCB ($P < 0.001$) and LCC ($P < 0.001$) groups.
Conclusions: The present study showed that the lower the biliary system visualization contrast enhancement, the worse liver function on Gd-BOPTA-enhanced MR imaging in the hepatobiliary phase. Thus, biliary system visualization might be a direct and noninvasive technique for evaluation of liver function.

The Effect of Maternal Hyperoxygenation on Placental Perfusion in Normal and Fetal Growth Restricted Pregnancies Using Intravoxel Incoherent Motion

Ting Chen[1], Jiacheng Song[1], Meng Zhao[1], Yongming Dai [2], Xuanyi Zhou[2]
1.First Affiliated Hospital of Nanjing Medical University, 300 Guang Zhou Road, Nanjing, 210029, Jiangsu Province, China
2.United Imaging Healthcare, MR collaboration, Shanghai 201302, China

Abstract
Purpose: To evaluate the effect of maternal hyperoxygenation on placental perfusion in normal and Fetal Growth Restricted (FGR) pregnancies using Intravoxel Incoherent Motion (IVIM).
Methods: Ten FGR pregnancies and twenty-five normal pregnancies underwent IVIM examinations before and after maternal hyperoxygenation (95% O_2, 5% CO_2) using a 1.5T MR scanner. The IVIM parameters (fp, Dp, Dt) were determined for the placentas of both groups. The IVIM parameters within and between groups and their correlations with Doppler findings were statistically analyzed. ROC analysis was performed to evaluate the diagnostic power of IVIM derived parameters.
Results: Before maternal hyperoxygenation, the perfusion fraction was significantly lower in the FGR group than that in the normal group (22.88+—10.29 (%) vs.36.28+—9.70 (%), p = 0.000). After maternal hyperoxygenation, decreased significantly in the normal group (36.28+—9.70 (%) vs.29.93+—10.25 (%), p = 0.032), whereas it remained relatively stable in the FGR group (22.88+—10.29(%) vs.24.38+—13.67(%), p = 0.508). An increase of was found only for the normal group and did not changed significantly after maternal hyperoxygenation. There existed a negative correlation between and umbilical artery pulsatility index (PI) (r = -0.385, p < 0.05) as well as and PI (r = -0.574, p < 0.01). The displayed a best diagnostic power of all parameters with the area under curve (AUC) of 0.912.
Conclusion:
The perfusion fraction, , is able to distinguish FGR from normal pregnancies by its value pre and by its change (or lack thereof) post maternal hyperoxygenation. IVIM may potentially help improve the diagnosis of placenta function as it relates to disease.

OR-209

Comparison of amide proton transfer imaging versus diffusion weighted imaging in predicting the recurrence of early stage of hepatocellular carcinoma treated by transcatheter arterial chemoembolization

Fei Jia, Dongming Han
First Affiliated Hospital of Xin Xiang Medical University

Objective: This study aimed to compare the amide proton transfer imaging (APT) versus diffusion weighted imaging (DWI) in predicting the recurrence of early stage of hepatocellular carcinoma (HCC) treated by transcatheter arterial chemoembolization (TACE). **Methods** : APT and DWI date of 50 patients with untreated HCC and 50 patients treated by TACE were retrospectively analyzed, and MTRasym and ADC values were measured. Recurrence rate of HCC was recorded after a median follow-up of 12 months. The differences of the parameters between treated and untreated HCC groups were analyzed, as well as among different recurrence and non- recurrence groups. The predictive values of APT and DWI were analyzed using ROC curves. **Results**: MTRasym of untreated HCC group was higher than that treated HCC group, while ADC was lower than those of treated HCC group (all P<0.05). MTRasym of recurrence of TACE treated HCC group was higher than that non- recurrence group, while ADC was lower than those of non- recurrence group (all P<0.05). MTRasym had the higher AUC in predictive the recurrence of early stage of HCC treated by TACE, but combined ADC will be the best (all P<0.05). **Conclusions**: The prediction efficacy of APT for the recurrence of early stage HCC was better than that of DWI.

OR-210

Correlation of intravoxel incoherent motion parameters and computer tomography perfusion parameters in insulinoma: a preliminary study

Ming He, Jin Xu, Huadan Xue, Zhengyu Jin
Department of Radiology, Peking Union Medical College Hospital

Purposes: To prospectively evaluate the correlation between IVIM-derived parameters and CT perfusion parameters as well as the pathological grades in insulinoma and to investigate heterogeneity of IVIM-derived parameters in different anatomical regions of the normal pancreas.

Methods: From October 2017 to September 2018, a total of 79 consecutive patients with hypoglycemia and endogenous hyperinsuliemia disorders underwent pancreas MRI and CT perfusion examination were prospectivelyenrolled. The b values for IVIM scan were as follows: b values: 0, 10, 20, 50, 100, 150, 200, 500 and 800 seconds/mm^2. The IVIM data was postprocessed using in-house-developed software script by Matlab 2014ato obtain IVIM parameters, including the value of apparent diffusion coefficient(ADC), pure diffusion coefficient (D), perfusion coefficient (D*)and perfusion fraction (f). The CT perfusion data was transferred toexternal workstation (Multi-Modality Workplace, Siemens) for analysis to obtain the perfusion parameters, including blood flow(BF), blood volume(BV) and permeability(PM). The pathological specimens were stained to obtain pathological parameters, including WHO grading, ki-67 index and the mitotic count. All the postprocessing and imaging analysis was performed independently by two radiologists. All the measurement was repeated three times and the average of them served as final results. The IVIM derived parameters of normal pancreas including head, body and tail were compared by Kruskal-Wallis H test and post hoc analysis applied. The comparison between normal pancreatic parenchyma and lesion was evaluated by Manny Whitney U test. Spearman rank correlation analysis test

was performed to evaluate the relationship between the IVIM-derived parameters and the CT perfusion parameters and the histopathological parameters. Interclass correlation coefficient (ICC) was used to measure the interobserver reliability.
Results: There was no significant difference among different anatomical regions for D* and f values, While ADC value of pancreatic tail was significant lower than that of the pancreatic head and body (tail:1.304±0.136×$10^{-3}$$mm^2$/s vs head (1.364±0.125×$10^{-3}$$mm^2$/s) and body (1.366±0.134×$10^{-3}$$mm^2$/s), both p<0.05). There were significant differences in all IVIM parameters between insulinoma (ADC: 1.045±0.227×$10^{-3}$$mm^2$/s, D:0.809±0.206×$10^{-3}$$mm^2$/s, D*: 89.500±58.608×$10^{-3}$$mm^2$/s and f: 32.2±12.3%) and normal pancreas (ADC, D: 1.133±0.099×$10^{-3}$$mm^2$/s, D*:89.500±58.608×$10^{-3}$$mm^2$/s and f: 16.7±5.1%) (all p<0.05). The ADC value of the normal pancreas was positively correlated with BF (r=0.437, p=0.003). No significant correlation was observed between the IVIM-derived parameters and the histopathological parameters including the mitosis, Ki-67 index as well as the grade(all p > 0.05). All the quantitative measurement reached good to excellent agreement (range: 0.611-0.984) for both the different anatomic regions of the normal pancreas and the lesion.
Conclusions: There are certain heterogeneities in the IVIM parameters of different anatomical parts of the normal pancreas, but this part requires consolidation by a larger sample size study. IVIM parameters can distinguish between normal pancreatic parenchyma and insulinoma. The ADC value was related to the CT perfusion parameter BF. Exact measurement of IVIM-derived parameters for normal pancreas in different anatomic regions would establish a solid foundation to help better understand the abnormal diffusion and perfusion properties in different kinds of pancreas disease. The IVIM perfusion method might be applied to clinical practice if it can be proving that IVIM perfusion correlated to standards perfusion methods, which might reduce the necessity of IV contrast injection.

OR-211

Combination of intravoxel incoherent motion imaging with diffusion kurtosis imaging and conventional DWI in predicting the chemotherapeutic response of colorectal liver metastases: an interim analysis of the FDZL-MRinCLM study

Huan Zhang,Tong Tong
Fudan University Shanghai Cancer Center

Background and Purpose: A few previous studies have reported that intravoxel incoherent motion imaging (IVIM-DWI) has potential value for assessing the treatment response of colorectal liver metastases (CRLMs), and there has been no reported research regarding the role of diffusion kurtosis imaging (DKI) in CRLMs until recently.
Purpose: To assess the usefulness and performance of IVIM-DWI, DKI and conventional DWI for predicting the chemotherapeutic response of CRLMs.

Methods: A prospective clinical study was conducted to evaluate the value of functional MRI parameters in predicting the early efficacy of standard first-line chemotherapy for CRLMs. Up to February 2018, forty patients were enrolled, and MRI was performed within 1 week before chemotherapy, as well as one cycle and two cycles after chemotherapy. The apparent diffusion coefficient (ADC) map, IVIM and DKI parameter maps were calculated using a prototype postprocessing software. The response was assessed by the Response Evaluation Criteria in Solid Tumors. The mean values of the parameters were compared between the responding group and the nonresponding group.
Results: A total of 15 responding and 25 nonresponding patients were evaluated. Low baseline ADC, Dslow, and D values (P = 0.001, <0.001, and =0.003, respectively) and a high baseline K value (P = 0.002) were independently associated with a good response to chemotherapy with areas under the ROC curves of 0.845, 0.832, 0.819, and 0.787, respectively. The area under the curve of a predictive factor fitted by the above factors reached 0.867. After treatment, the ADC, Dslow, and D values all showed an upward trend, while the K value showed a decreasing trend, but there were no significant differences (P > 0.05).
Conclusion: The interim analyses of our study showed that the pretreatment IVIM-DWI (Dslow), DKI (D and K), and conventional DWI (ADC) parameters all demonstrated a good diagnostic performance in predicting the chemotherapeutic response of CRLMs.

OR-212

DWI and DCE-MRI for differentiating rat serous borderline ovarian tumors from ovarian cancers

Xiuying Yang,Jinwei Qiang,Ying Li,Cui Zhang
Jinshan Hospital

Objective: To explore the differential diagnosis value of diffusion-weighted imaging (DWI), dynamic contrast-enhanced MRI (DCE-MRI) and their combination for differentiating rat serous borderline ovarian tumors (SBOT) from serous ovarian cancers (SOC).
Materials and methods: The conventional MRI, DWI and DCE-MRI sequences were performed in 41 DMBA induced rat ovarian tumors (23 SOC and18 SBOT). The region of interest were put in the solid component or thickened septation and cystic wall. ADC value derived from DWI, TIC pattern, Ktrans, kep, ve and IAUC) derived from DCE-MRI were acquired. The differences of the parameters between SBOT and SOC were compared. The diagnostic performances of DWI and DCE-MRI parameters, and the combination of ADC value and the most effective DCE-MRI parameter were investigated.
Results:The mean ADC values of SBOT and SOC were 1.284±0.183 (10-3mm2/s) and 0.889±0.134 (10-3mm2/s), respectively, with a statistically significant difference (P = 0.000). The optimal diagnostic cutoff value was 1.160 (10-3mm2/s) with a sensitivity of 83.3%, a specificity of 100.0%, and an AUC of 0.947. Three patterns of TIC were observed: type-I, slowly rising curve; type-II, moderately rising curve; type-III, sharply rising curve with a platform or slowly washout. The TIC for SBOT mainly consisted of type-II, whereas for SOC mainly consisted of type-

III. Compared with SBOT, the Ktrans, ve value and IAUC in SOC were significantly larger (0.13±0.06 min-1 vs 0.081±0.02 min -1, P=0.000; 0.656±0.198 vs 0.421±0.284, P=0.007; 23.740±11.882 mmol.kg-1.s vs 12.288±5.318 mmol.kg-1.s, P=0. 001, respectively), with a sensitivity and specificity of 94.4% and 82.6%, 50.0% and 95.7%, 94.4%, and 69.6%, respectively. The Ktrans value was most effective with an AUC of 0.949 when the optimal cutoff value was 0.118 (min-1). The AUC for the combined ADC value and Ktrans was 0.986, with a sensitivity of 94.4% and a specificity of 95.7%. Conclusions: DWI and DCE-MRI were accurate imaging tools for differentiating serous borderline ovarian tumors from serous ovarian cancers, and the combination of both tools could achive the best differentiatial diagnostic efficiency.

响应 MPO 的 MRI T1 对比剂 Mn-EDTA 在大鼠急性胰腺炎中的应用

梁蕊,朱江,曾梅,陈勇,李增晖,张菊,刘佩,张小明
川北医学院附属医院

【摘要】目的 Mn 的络合物 Mn-EDTA 是一种 T1 造影剂，可潜在与中性粒细胞中的髓过氧化物酶（MPO）响应，增强磁共振图像上炎性病灶的信号对比。本研究的目的是利用 Mn-EDTA 磁共振造影剂诊断急性胰腺炎，研究其信号强度与急性胰腺炎严重程度之间的关系。
材料与方法 把 20 只 SD 大鼠分为对照组 1、对照组 2（各 3 只）和实验组 1、实验组 2（各 7 只）。实验组利用雨蛙素和 LPS 构建急性胰腺炎大鼠模型，其中根据注射雨蛙素次数将其分为轻度组（3 只）和重度组（4 只）；对照组注射同等剂量的生理盐水；各分组 1 均尾静脉注射 0.2mmol/kg 的造影剂 Mn-EDTA，各分组 2 均尾静脉注射等浓度等剂量的造影剂马根维显，通过 3.0T 磁共振 T1 加权成像测量对比噪声比（胰腺信号强度/同层面肌肉信号强度），采用病理切片及紫外光度法测量 MPO 活性。
结果 在两个分组 1 中，同样注射 Mn-EDTA 的情况下，实验组胰腺的信号比对照组的信号明显增强；在两个分组 2 中，同样注射马根维显的情况下，实验组胰腺的信号相比对照组增强不明显。在实验组中，无论轻症还是重症急性胰腺炎大鼠，注射 Mn-EDTA 的分组 1 的急性胰腺炎大鼠的对比噪声比是注射同等剂量马根维显分组 2 的对比噪声比的 1.5 倍；病理切片检测炎性细胞及紫外法测 MPO 活性结果显示，MPO 活性越高，炎性程度越重，注射 Mn-EDTA 后 T1 图像上信号越强。
结论 针对急性胰腺炎， Mn-EDTA 比马根维显具有更好的增强效果，同时 Mn-EDTA 信号强度与急性胰腺炎炎症的严重程度呈正相关。Mn-EDTA 能与 MPO 响应，在 T1 加权能增强炎症病灶的对比，MPO 活性越强，病灶信号越高。

MRI 及 DWI 对宫颈癌正常大小盆腔淋巴结转移的诊断价值

宋庆玲,董越
辽宁省肿瘤医院

目的 探讨 MRI 及弥散加权成像（diffusion weighted imaging，DWI）对宫颈癌正常大小盆腔淋巴结转移的诊断价值。

方法 回顾性收集本院 2014 年 12 月至 2018 年 7 月经手术治疗的ⅠB1-ⅡA2 宫颈癌患者 90 例，共纳入 114 个淋巴结。患者在术前均行 MRI 常规扫描及 DWI 检查。测量并计算形态学标准即淋巴结短径、长径、短长比、ADC 标准即淋巴结 ADC_{max}、ADC_{mean}、ADC_{min}。采用独立样本 t 检验比较转移性淋巴结与非转移性淋巴结诊断指标的差异。采用 Logistic 回归分析淋巴结形态学指标与 ADC 指标联合的作用。采用受试者操作特征曲线（ROC）分析有统计学意义的指标诊断淋巴结转移的诊断效能。
结果 转移性淋巴结的短径、短长径比值高于非转移性淋巴结（$P<0.001$）；转移性淋巴结的长径与非转移性淋巴结无明显差异（$P>0.05$）。转移性淋巴结的 ADC_{max}、ADC_{mean}、ADC_{min}均低于非转移性淋巴结（$P<0.001$）。Logistic 回归预测模型 Logti(P1) = 2.01 +(-0.10 × ADC_{min})+ (0.49 × 短径) + (3.73 × 短长比)。淋巴结短径、短长径比、淋巴结 ADC_{max}、ADC_{mean}、ADC_{min}值和 P1 鉴别盆腔淋巴结转移的 ROC 曲线下面积分别为 0.801、0.722、0.769、0.837、0.870 和 0.913。上述有统计学意义指标鉴别盆腔淋巴结转移的敏感度分别为 79.3%、55.2%、87.1%、70.6%、65.9%和 89.7%，特异度分别为 68.2%、83.5%、55.2%、79.3%、93.1%和 80%。
结论 MRI 及 DWI 对宫颈癌正常大小盆腔淋巴结转移的鉴别具有诊断价值。淋巴结 ADC_{min}值是诊断淋巴结转移的参考价值最大的单指标，淋巴结短径、短长比与 ADC_{min}值联合在所有指标中具有最佳诊断效能。

流入反转恢复序列在肝移植血管成像中的应用研究

柳计强[1,2],穆学涛[2],杨春华[1],刘跃娜[1],王芳芳[1]
1.新乡医学院第三附属医院
2.中国人民解放军总医院第三医学中心

目的 探讨流入反转恢复序列（IFIR）在肝移植血管成像中的应用价值。
方法 1.肝移植术前需行肝动脉血管成像的 31 例患者纳入研究，31 例患者均依次行上腹部 IFIR 和对比增强磁共振肝动脉成像。由 2 名医师采用盲法对两组肝动脉图像质量进行评分并评估显示肝动脉最大分支级别的差异。比较 IFIR 与 CE-MRA 在肝动脉各级血管图像质量评分的一致性及最大显示分支级别上的差异；评价医师间图像质量评分和显示肝动脉最大分支级别的一致性。
2.对 26 例肝移植术后患者依次行上腹部 IFIR 和对比增强磁共振门静脉成像。由 2 名医师采用盲法对门静脉图像质量进行评分并比较 2 组图像评分的差异，测量吻合口直径并比较 2 组图像测量值的差异；评价医师间图像质量评分和测量吻合口直径的一致性。
结果 1.2 名医师对 31 例患者的腹腔干、肝总动脉、肝固有动脉、肝右动脉及肝左动脉在 IFIR 和 CE-MRA 中图像质量评分差异均无统计学意义，对肝右前动脉、肝右后动脉、肝左内叶动脉和肝左外叶动脉图像质量评分差异均有统计学意义。在 31 例患者中，2 名医师在 IFIR 和 CE-MRA 中均发现肝动脉变异 3 例，其中 1 例肝右动脉起源于肠系膜上动脉，肝左动脉起源于脾动脉；1 例肝总动脉先天发育细小，两种检查方法均显示不清；1 例肝左动脉起源于腹腔干。
2.在 IFIR 和 CE-MRA 中，26 例患者的门静脉主干及门静脉左、右支近端血管均能显示，图像质量≥3 分者分别为 92.31%和 96.15%。2 名医师对 IFIR 组与 CE-MRA 组图像质量评分差异均无统计学意义。2 组图像吻合口直径测量值间差异均无统计学意义。2 名医师图像质量评分和测量吻合口直径的一致性好。
结论 IFIR 序列作为一种无创伤、无电离辐射、无需对比剂、无需屏气扫描的磁共振肝脏血管成像技术，不仅在肝移植术前评估肝动脉解剖结构及变异中具有一定的应用价值，而且可以成为肝移植术后门静脉追踪和管理的一种有效方法。

Diffusion tensor imaging in a rat model of preclinical diabetic nephropathy

Xiaoyan Hu[1],Yinghua Wu[2],Wei Lin[1]
1.Chengdu First People's Hospital
2.Chengdu University of Traditional Chinese Medicine

Objectives: The aim of this study was to investigate the value of diffusion tensor imaging (DTI) in assessment of renal injury in a rat model of preclinical diabetic nephropathy. **Materials and Methods**: Twenty-eight male Sprague-Dawley rats were divided into two groups: the normal control group (NC) of 10 rats and diabetic group (DN) of eighteen rats. Eight weeks later of diabetes induction with streptozotocin, MR imaging was performed in a 3.0-T scanner using 32-channel knee coil. Morphological images and diffusion tensor imaging were obtained (b = 0 and 600 s/mm2, 15diffusion directions). At the end of the MR scan, we collected the blood sample to exam the serum creatinine and double kidney tissues for pathological examination. Renal cortex and medulla apparent diffusion coefficient (ADC) and fractional anisotropy (FA) values were calculated for all kidneys by two experienced radiologists under blind method. Physiological parameters, laboratory parameters and imaging results were compared between the two groups. **Results**: All animals in DN group developed hyperglycemia, polyuria and emaciation. The serum creatinine were no significant difference between the two groups (p>0.05). The urinary albumin at 2,4,8 weeks of DN group were higher than those of NC group, but less than 20 ug / min, and there was statistical difference between the two groups (p<0.05). The renal pathological damages in DN rats, such as tubule disappeared, tubule epithelial cells swelling and inflammatory cell infiltration were observed. ADC value was significantly increased in DN animals in the cortex and medulla compared with NC group. FA value was significantly reduced in DN animals in the cortex and medulla compared with NC group. **Conclusions**: Diffusion tensor imaging by increase of ADC and reduction of FA value identified renal injury of preclinical diabetic nephropathy. DTI might serve a potential role in early, non-invasive and quantitative detection and therapy monitoring of diabetic nephropathy.

MRI 纹理分析术前预测胰腺导管腺癌病理分化程度

刘佩,张小明
川北医学院

目的 探究 MRI 平扫及增强纹理分析能否术前预测胰腺导管腺癌病理分化程度。
方法 回顾性收集川北医学院附属医院 2016.01-2019.06 间病理诊断为胰腺导管腺癌患者 60 例（男/女=39/21，30~78y），所有患者均于术前一周行 MRI 检查；根据病理分化结果，将病人分成高、中、低分化三个组。收集患者的基本信息，包括性别、年龄、肿瘤部位、肿瘤最大径、是否有淋巴结转移及是否有血管浸润。利用拉普拉斯滤波对 MRI 图像进行预处理，逐层勾画 T1WI、T2WI

及增强扫描动脉期、门脉期及延迟期图像肿瘤感兴趣区，提取灰度直方图、灰度共生矩阵、灰度游程矩阵及形状共 174 个特征。利用主成分分析进行降维，提取累积频率达到 95%的主成分。采用人工神经网络进行建模，模型评价指标为平均受试者特征工作曲线下面积。

结果 临床指标中，年龄在胰腺导管腺癌病理分化中具有统计学意义（p＝0.046），性别、肿瘤部位、肿瘤最大径、是否有淋巴结转移及是否有血管浸润均无统计学意义（p＞0.05）。利用 MRI 纹理分析鉴别胰腺癌分化程度中，T1WI 提取了 3 个有效主成分，平均曲线下面积为 0.653；T2WI 提取了 4 个有效主成分，平均曲线下面积为 0.782；动脉期提取了 4 个有效主成分，平均曲线下面积为 0.737，门脉期提取了四个有效主成分，平均曲线下面积为 0.833，延迟期提取了 3 个有效主成分，平均曲线下面积为 0.740。

结论 MRI 纹理分析，尤其门脉期可以术前预测胰腺导管腺癌病理分化程度。

关键词：胰腺导管腺癌 纹理分析 病理分化 磁共振成像

Whole-Tumor Histogram Analysis of Diffusion Kurtosis Imaging as A Predictive Biomarker of Tumor Response in Locally Advanced Rectal Cancer Treated with Neoadjuvant Chemoradiation

Yiqun Sun, Yajia Gu, Tong Tong
Shanghai Cancer Center

Purpose: The purpose of this study was to explore predictive value of whole-tumor histogram analysis in diffusion kurtosis imaging to assess tumor response to neoadjuvant chemoradiation therapy in locally advanced rectal cancer.

Materials and methods: Between June 2016 and November 2017, totally 43 patients with rectal cancer were retrospectively collected in our study. All patients received neoadjuvant chemoradiation followed by total mesorectal excision. All enrolled patients were examined using MRI at two timepoints: 1-7 days before neoadjuvant chemoradiation (pre-MRI), within 1-7 days of NCRT completed (post-MRI). Pretreatment T stage, N stage, mesorectal fascia (MRF), extramural vascular invasion (EMVI), tumor location and length, pretreatment CEA and CA19-9 levels were recorded. According to tumor response, we classified the patients into pCR and non-pCR groups. Whole tumor volume of interest (VOI) was obtained by semi-automatic segmentation method in both pre- and post-MRI . Then, ADC, K and D histograms and corresponding parameters, difference histograms value between pre-MRI and post-MRI were calculated. Histograms metrics of ADC, K and D, tumor characteristics and their relationship with tumor response were evaluated by using Logistics regression.

Results: Pre-K_{ske}, post-tumor volume, and ADC_{sd} (pre-post) were correlated with tumor response by using Lasso regression model and then radiological signature score was build. Pretreatment EMVI(+) (OR=9.231 (1.015-83.938), p=0.048), MRF(+) (OR=5.317 (1.136-12.488), p=0.030), higher rectal cancer (OR=4.110 (1.234-13.688), p=0.021), CEA≥5ng/ml (OR=9.231(11.015-83.938), p=0.048) and low radiological signature score (OR=14.428(1.833-113.588), p=0.011) could be associated with non-pCR in univariate analysis. Multivariate analysis identified that the pretreatment CEA≥5ng/ml

(OR=42.311 (1.098-1630.20), p=0.044) and low radiological signature score (OR=1.312 (1.077-1.597), p=0.007) would be independent factors to indicate patient with non-pCR. **Conclusion:** Whole-tumor histogram analysis of diffusion kurtosis imaging is a valuable and easily available tool to predict tumor response. It will be helpful to stratify patients who are sensitive to neoadjuvant chemoradiation in locally advanced rectal cancer.

OR-219
原发性痛经患者子宫形态学在不同月经周期阶段的异常变化

王柯
西安交通大学第一附属医院

目的 原发性痛经（Primary Dysmenorrhea, PDM）是由于子宫肌层异常收缩导致子宫缺氧缺血而产生的痉挛性疼痛。目前关于子宫结构的检查方法不一致，研究结果尚存在争议。由于缺乏有效、非侵入性的精细检查手段，痛经的潜在病理生理机制仍不明确。本研究基于子宫磁共振 T2WI 图像运用纹理分析(Texture Analysis，TA)方法，探讨不同月经时期下原发性痛经患者与健康女性的子宫形态学特征变化差异。
方法 选取符合加拿大妇产科学会的诊断标准（Primary Dysmenorrhea Consensus Guideline）的原发性痛经患者 51 例及正常健康志愿者 49 例，分别采集排卵期、月经期子宫 T2WI 磁共振图像及疼痛评分（VAS），选择子宫内膜、子宫肌层和结合带为感兴趣区进行纹理特征分析，采用重复测量分析方法分析原发性痛经女性和健康对照在两个时间点的子宫纹理特征差异，并探讨原发性痛经患者 VAS 疼痛评分与子宫纹理特征的相关性。**结果** 子宫肌层区域百分比（ZP）、小区域重点度（SZE）均存在时期*分组的交互效应（P_{SZE}=0.001; P_{ZP}<0.001），原发性痛经组子宫肌层的 ZP、SZE 从排卵期到月经期的变化幅度较健康对照组小（P_{SZE}=0.006; P_{ZP}=0.007），排卵期与月经期的 ZP、ZSE 变化值与月经期的 VAS 呈正相关(ZSE: r = 0.371, p = 0.009; ZP: r=0.328, p=0.021)；子宫内膜、结合带的纹理参数无交互效应，仅存在时期主效应。**结论** 原发性痛经女性子宫结构在月经周期中存在异常变化模式，提示子宫结构异常可能贯穿整个月经周期，痛经不仅存在于月经期，而是发生于整个月经周期的疾病；子宫肌层的纹理特征异常变化可能作为 PDM 的有效特征标志，有可能为评估治疗效果提供客观影像学依据。

OR-220
Prostate MRI: comparison of reduced field-of-view (rFOV) and full FOV (fFOV) in clinical application of diffusion-weighted imaging at 3 T

Liang Li, Zan Ke, Changsheng Liu, Yunfei Zha
Renmin Hospital of Wuhan University

Purpose: Reduced field-of-view (rFOV) diffusion imaging has been suggested as an alternative to conventional single-shot echo-planar diffusion-weighted imaging (DWI) with reduced distortion[1-4]. However, clinical comparisons of rFOV and full FOV (fFOV) DWI are limited by unmatched imaging parameters and reconstruction procedures. The

purpose of this study was to compare the clinical utility of rFOV DWI with fFOV DWI for visualization of the prostate at 3.0 T MRI.
Material and Methods: The local Institutional Review Board (IRB) approved this retrospective study and waived the requirement of informed consent. Between April 2016 and October 2018, 96 consecutive patients (mean age, 62 years; range 45-87 years) were enrolled in the study. The clinical indications for prostate MRI included characterization or follow-up of prostate lesions and oncologic follow-up. All MR examinations were performed on a 3.0 T MR system (Discovery MR 750Plus, GE Healthcare, Waukesha, WI, USA). Images were obtained using rFOV and fFOV DW imaging with an identical scanning time, acceleration factor, target resolution, and image postprocessing procedure. DWI was performed with b-values of 0 and 800 s/mm^2. The two datasets were independently reviewed by two blinded urogenital radiologists. Imaging studies were evaluated for resolution, signal-to-noise ratio (SNR), contrast-to-noise ratio(CNR), distortion, lesion conspicuity, and diagnostic confidence using a 7-point Likert scale: 1, nondiagnostic; 2, poor; 3, acceptable; 4, standard; 5, above average; 6, good; and 7, outstanding. Observer agreement was assessed using a linearly weighted kappa statistic. Tests for differences in ratings between rFOV and fFOV DW imaging were performed using a two-tailed Wilcoxon signed-rank test, $p<0.05$ considered significant.
Results and Discussion: The readers were in good agreement in their scores (κ = 0.68; 95%CI, 0.56-0.79). The mean scores for rFOV and fFOV DW imaging, respectively, were as follows: resolution, 3.4/5.8; distortion level, 2.9/5.9; SNR, 3.8/4.2; CNR, 3.2/3.8; lesion conspicuity, 4.0/5.6; and diagnostic confidence, 3.2/5.1. Overall, rFOV DW imaging was superior to fFOV in resolution, distortion reduction, lesion conspicuity, and diagnostic confidence (P =0.006), whereas fFOV imaging scored better in SNR and contrast. rFOV DW imaging was considered the better sequence overall in 98.7% of the cases. Moreover, the higher spatial resolution as well as reduced blurring and distortions on rFOV imaging scans helped to better reveal important anatomic details such as central zone, peripheral zone, surgical capsule, benign hyperplastic nodule, extracapsular extension and lymph node metastasis of prostate cancer.
Conclusion: Reduced field-of-view diffusion imaging enables robust prostate imaging with an short acquisition time, providing improved resolution and reduced distortion in evaluating the prostate.

Classify prostate transitional zone cancer and hyperplasia using deep transfer learning from disease-related images

Bo Hu,Lin-feng Yan,Wen Wang,Guang-Bin Cui
空军军医大学唐都医院

Purpose
The diagnosis of prostate transition zone cancers (PTZC) remains a clinical challenge due to its similarity to benign prostatic hyperplasia (BPH) on MRI. The Deep Convolutional Neural Networks showed high efficacy in medical imaging but was limited

by the small data size. A transfer learning method was combined with deep learning to overcome this challenge.

Materials and Methods

A retrospective study was conducted on 217 patients enrolled from our hospital database (208 patients) and The Cancer Imaging Archive (9 patients). Based on the T2 weighted images (T2WIs) and apparent diffusion coefficient (ADC) maps of these patients, DCNN models were trained and compared between different TL database (ImageNet vs. disease-related images) and protocols (from scratch, fine-tuning or transductive transferring).

Results

Using the model trained from scratch (TFS-model), T2WIs were associated with the AUC of 0.73 (95% CI = 0.63-0.83), as well as the sensitivity, specificity and accuracy of 69%, 75% and 81%, respectively. ADC images were associated with the AUC of 0.94 (95% CI = 0.90-0.99), as well as the sensitivity, specificity and accuracy of 84%, 97% and 89%, respectively. The diagnostic efficacy of Alex-Net DCNN model using ADC images was quite satisfying, but that using T2WI needed to be improved further.

Using the model trained from the disease-related dataset (TLR-model), T2WIs were associated with the AUC of 0.86 (95% CI = 0.79-0.93), as well as the sensitivity, specificity and accuracy of 90%, 69% and 80%, respectively. The diagnostic efficacy of TLR-model was significantly higher than that of TFS-model (P = 0.00014) or TLI-model (P = 0.00046). ADC images were associated with the AUC of 0.97 (95% CI = 0.90-0.99), as well as the sensitivity, specificity and accuracy 90%, 94% and 92%, respectively. However, there was no significant difference between AUCs of TLR-model and TLI-model (P = 0.88), or between TLR-model and TFS-model (P = 0.29).

Conclusion

Deep transfer learning from disease-related images is a powerful tool to build an automated diagnostic system for PTZC.The accurate diagnosis of PTZC can be achieved via the transductive deep transfer learning from disease-related images.

Can we do one-stop-shop evaluation of conditions both of liver and lesion with gadoxetic acid disodium-enhanced magnetic resonance and IDEAL-IQ image?

Chunyu Zhang,Huimao Zhang,Yu Fu,Shuang Zheng
The First Hospital of JILIN University

Purpose

To explore one-stop-shop evaluation of conditions both of liver and lesion with gadoxetic acid disodium-enhanced magnetic resonance (Gd-EOB-DTPA-enhanced MRI) and IDEAL-IQ image.

Materials and Methods

783 patients underwent Gd-EOB-DTPA-enhanced MRI and IDEAL-IQ scan. These patients either had high risk factors of hepatocellular carcinoma (HCC), history of tumor in other organs, or liver lesion found by Ultrasound. We drew interested area at each segment in the liver to avoid intrahepatic bile ducts, blood vessels, and lesions. We

evaluated lipid deposition with fat-fraction images, and evaluated liver iron deposition with R2* images. We drew interested area at the same location of the lesion at in-phase and out-of-phase images to identify if the lesion contained fat or lipid. For suspected malignant or unsure intrahepatic lesions, we evaluated vein and bile duct in liver with Gd-EOB-DTPA-enhanced MRI. We measured the signal intensity at right lobe of liver and erector spinae, respectively, in pre-enhancement and hepatobiliary phase images in cirrhosis patients.

Results

45 patients with suspected malignant or unsure lesions needed surgery, we evaluated artery, vein and bile duct in liver before surgery. Artery phase can display artery branches above grade 4 and venous phase can show venous branch above grade 4, which can provide useful information before surgery. Two patients had hepatic artery variation. For 56 patients, we spotted lesions, at hepatobiliary phase, that were not found by common enhancement scan, and changed our treatment accordingly. 24 patients could not receive surgery due to bad liver function. Among them, only one malignant lesions was found in the liver. 241 patients have no lesions, we assessed lipid and iron depositions and liver functions. 33 patients had different degrees of fatty liver and five patients had different degrees of iron deposition in the liver. The degree of enhancement in one patient due to high blood bilirubin significantly reduced like delay phase and no contrast agent in biliary tract at hepatobiliary phase.

Conclusion

One-stop-shop Gd-EOB-DTPA-enhanced MRI and IDEAL-IQ scan can provide a lot of valuable information and can increase diagnostic confidence.

探讨基于整个肿瘤联合使用纹理特征和多变量逻辑回归分析在卵巢交界性和恶性上皮性肿瘤鉴别诊断中的价值

叶榕平[1],翁淑萍[2],李跃明[1],陈建炜[1],严川[1],温丽婷[1],朱月珉[1]
1.福建医科大学附属第一医院
2.福建省妇幼医院

目的 探讨基于整个肿瘤的 MRI 纹理特征和多变量逻辑回归分析的联合应用在卵巢交界性上皮性肿瘤（BEOTs）和恶性上皮性肿瘤（MEOTs）鉴别诊断中的价值。

材料与方法 回顾性分析从 2014 年 9 月至 2019 年 5 月 88 例经病理证实的 BEOTs 和 MEOTs。采用 MaZda 软件分别在 T2WI，DWI 及增强 TIWI 上逐层勾画整个肿瘤。每个序列分别提取出 314 个纹理特征值后再自动选择 30 个最优纹理特征值。用随机森林计算每个最优纹理特征的权重。根据权重将 3 个序列上的前五个纹理特征值各自纳入二分类逻辑回归分析。比较 4 个逻辑回归模型的诊断效能。

结果 与 BEOTs 相比，MEOTs 的 CA-125 水平和实性成分的最大径显着高于 BEOTs（$p < 0.001$）。此外，MEOTs 更常表现为境界不清和不规则增厚的分隔（$P < 0.001$），而表现为圆形或椭圆形的囊性或囊性为主则常见于 BEOTs（p 值分别为 $p = 0.001$，$p < 0.001$）。30 个最优纹理特征值主要来源于共生矩阵（25/30）。4 个二分类逻辑回归模型均具有较高的拟合优度， Hosmer-Lemeshow 检验的 P 值分别为 0.674（T2WI），0.877（DWI），0.997(增强 T1WI)和 0.959（临床资料和 MRI 特点）。模型的 AUC，敏感度和特异度分别为 T2WI（0.794, 91.2%，62.1%），DWI（0.915, 89.7%，71.4%），增强 T1WI（0.934, 91.4% and 72.4%），临床资料和 MRI 特点（0.793, 84.5% ，50.0%）。在 BEOT 和 MEOT 的鉴别诊断中，从整个肿瘤中提取的 MRI 纹理特征比临床资料和 MRI 特

征的组合诊断效能更优。 此外，与 T2WI 和 DWI 相比，从增强 T1WI 中提取的 MRI 纹理特征具有最佳的鉴别诊断性能。

结论 MRI 纹理特征和多变量逻辑回归分析的联合应用能够有效地鉴别 BEOT 与 MEOT。

Utility of whole-volume histogram and texture analysis on T1 maps for the prediction of advanced fibrosis in NAFLD

Xinxin Xu, Ruokun Li, Fuhua Yan
Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Purpose

To assess the utility of whole liver texture analysis on T1 maps for the prediction of advanced fibrosis in patients with suspected NAFLD.

Methods

This retrospective study was approved by Institutional Review Board and the requirement of informed consent was waived. The cases of 45 patients with suspected NAFLD were retrospectively analyzed. Quantitative parameters with texture features (Volume, Mean, SD, Median, 5%, 95%, Skewness, E.Kurtosis, Diff.Entropy, Diff.Variance, Contrast, Entropy) were calculated using T1 mapping data with a semiautomatic whole volume region of interest (ROI). A two-step approach of combining the Nonalcoholic Fatty Liver Disease Fibrosis Score or Fibrosis-4 Index with the Liver Stiffness Measurement for the Diagnosis of Advanced Fibrosis were used. Diagnostic performance was evaluated with receiver operating characteristic (ROC) analysis.

Results

16 (36%) subjects had significant fibrosis and 29 (64%) had advanced fibrosis. The following significantly different values were obtained for the low risk and high risk of advanced fibrosis groups: mean (1039 ± 309 vs. 1272 ± 348), SD (352± 196 vs. 522 ± 198), median (982± 297 vs. 1167 ± 332).5% (643±185 vs. 759± 147), 95% (1538±705vs. 2097 ± 934), DiffEntropy (1.38± 0.33 vs. 1.66 ± 0.37), DiffVariance (2.81± 2.78 vs. 4.6 ± 3.66), Contrast (6.21± 4.82 vs. 13.4 ± 10.6), Entropy (2.19± 0.44 vs. 2.67 ± 0.42) . The TA parameters with the best performance were contrast and entropy, respectively, with AUROC 0.800 (95% CI 0.663 - 0.936, p =0.000981) and 0.786 (95% CI 0.647 - 0.924, p=0.00168) for significant fibrosis.

Conclusions

Parameters obtained by histogram and texture analysis of T1 maps may be useful for noninvasive prediction of advanced fibrosis in NAFLD patients.

The performance of magnetic resonance T1ρ imaging for monitoring liver fibrosis: compared with ultrasound elasotography in a rat model

Jinning Li[1], Caiyuan Zhang[1], Huanhuan Liu[1], Shuyan Yang[1], Yanshu Wang[1], Weibo Chen[2], Dengbin Wang[1]
1. Xinhua Hospital, Shanghai Jiao Tong University School of Medicine
2. Philips Healthcare

Purpose: To compare the performance of magnetic resonance (MR) T1ρ imaging for detecting the progression and regression of liver fibrosis with ultrasound elasotography in a rat model with carbon tetrachloride (CCl_4).
Materials and methods: All the experimental procedures were approved by the Local Animal Care and Use Committee. Twelve rats were injected with CCl_4 for 7 weeks to induce liver fibrosis and underwent MR T1ρ imaging and acoustic radiation force impulse (ARFI) to acquire T1ρ value and shear wave velocity (SWV). Then they were randomly divided into 2 groups (n=6 each group), and received CCl_4-injection/CCl_4-withdrawal for 4 weeks to make fibrosis progress or to allow fibrotic livers regress spontaneously. The 12 rats were then performed the second liver T1ρ imaging and ARFI. METAVIR system (F0–F4) was used for staging fibrosis. Wilcoxon rank test and receiver-operating characteristic (ROC) analysis was performed for statistical analysis, area under the ROC curve (AUC) and DeLong test was used to compare accuracy of two imaging method for monitoring fibrosis.
Results: Both T1ρ values and SWV increased significantly after the progression of liver fibrosis ($P \leqslant 0.045$) and decrease slightly after the regression of liver fibrosis ($P \geqslant 0.35$). The AUC of T1ρ for detecting fibrosis progression and regression respectively was 0.72 and 0.62, and the AUC of SWV for detecting fibrosis progression and regression was 0.74 and 0.6 respectively. There was no significant difference of the performance between two imaging methods for monitoring liver fibrosis ($P \geqslant 0.752$).
Conclusion: MR T1ρ imaging provides a similar accuracy for detecting the progression/regression of liver fibrosis with ultrasound elasotography.

Advanced Gastric cancer: Functional MRI for assessment of aggressiveness—Comparison between DCE-MRI and Diffusion Kurtosis Models

Jia Fu[1,2], Tang Lei[1], Shi Qinglei[1], Li Ziyu[1], Wang Yinkui[1], Zhu Haifeng[2], Sun Yingshi[1], Ji Jiafu[1]
1. Peking University Cancer Hospital
2. Civil Aviation General Hospital

Purpose: To explore the application of functional MRI in predicting histopathological features of gastric cancers.
Materials and Methods: This study was approved by the local institute review board. Forty-three patients with biopsy proved gastric cancer were enrolled in prospective study. The DCE-MRI images were blindly determined by radiologists using Tofts -model. The DKI images (b=0,200,500, 800, 1000, 1500, 2000s/mm^2) and maps of apparent diffusion coefficient (ADC) (0-800sec/mm^2) were blindly determined by radiologists respectively using Body Diffusion Toolbox software. All region of interests was manually drawn on the specific slice showing the largest area of tumor. The following

parameters were calculated in tumors: (ADC) obtained with mono-exponential model, Diffusion(D) and Kurtosis(K)obtained with DKI, K_{trans}, K_{ep} and Ve obtained at DCE-MRI with Tofts model. Metrics were compared between diffuse , intestinal and mixed type in Lauren type, between poorly differentiated and non-poorly differentiated, by using analysis of Spearman correlation , receiver operating characteristic (ROC) analysis. **Results**: ADC,D, K_{trans} and Ve showed significantly correlations with differentiation(r=0.387,0.477,-0.341,-0.309 ,p＜0.05,respectively).ADC and K showed correlated significantly with Lauren type(r=0.343, -0.326, p＜0.05).However, no significant difference was observed in K from differentiations and all DCE-MRI parameters from Lauren type(p＞0.05). ADC and K were highly correlated (r = -0.822; p=000). ADC showed the highest area under the curve (AUC = 0.813,p=0.001), followed by D(AUC = 0.758,p=0.006),K(AUC = 0.719, p=0.014), Ktrans(AUC = 0.711, p=0.019),Ve(AUC=0.690, p=0.034),),Kep(AUC=0.510, p=0.410) for poor differentiated type versus non-poor differentiated type. All DWI parameters were higher AUC(D 0.801,K 0.817,ADC 0.876) than DCE-MRI parameters(K_{ep} 0.429,K_{trans} 0.608,Ve 0.777) for evaluation of diffuse type in Lauren type.
Conclusion: These observations did not show a clear added value of DK imaging compared with standard DW imaging for different histopathologic factors. DCE-MRI and DKI-derived parameters have similar performance compared with conventional ADC in differentiating gastric cancers.

7.0T 磁共振波谱检测下肢腓肠肌代谢物对 SD 大鼠早期糖尿病足周围神经病变的诊断价值

陈杰[1],梁晓莹[1],肖叶玉[1,2],夏学文[2]
1.汕头大学医学院第二附属医院
2.广州市中西医结合医院

目的 利用 7.0T 磁共振波谱（MRS）研究 SD 大鼠早期糖尿病足腓肠肌代谢物浓度的变化，探讨其对 SD 大鼠早期周围神经病变（DPN）的诊断价值。**材料与方法** 将 40 只 5 周龄，体重约 150g 雄性 SD 大鼠分为对照组与实验组（每组各 20 只），其中对照组以普通饲料喂养 30d，实验组以高脂饲料喂养 30d 后按 45mg/kg 剂量于实验组 SD 大鼠腹腔注射 STZ 溶液，对照组 SD 大鼠腹腔注射等体积的柠檬酸-柠檬酸钠缓冲液，测量注射药物前及注射药物后 1d、3d、7d 实验组 SD 大鼠随机血糖，注射药物后 1d、3d、7d 实验组 SD 大鼠随机血糖稳定且均大于 16.7mmol/L 代表糖尿病大鼠模型造模成功。40 只 SD 大鼠均于实验组成模后 3d、1w、2w、3w、4w、5w、6w 行右小腿常规 MRI（T_1WI，T_2WI）、并选 SD 大鼠右小腿腓肠肌作单体素 MRS 检查。于第 6w 后行右侧坐骨神经离体电生理及病理检查。采用 LCModel 软件对右侧腓肠肌波谱结果进行定量分析，比较不同组间及组内右侧腓肠肌的肌酸复合物（Cr）、胆碱复合物（Cho）等代谢物绝对浓度及 Cho/Cr 代谢物比值的差异。应用 SPSS22.0 行统计学分析，利用双样本 t 检验及单因素方差分析行差异性分析，当 P<0.05 时表示差异有统计学意义。**结果** 成模后各时期实验组大鼠 Cho 及 Cho/Cr 值均高于对照组（P<0.05）；各时期对照组组间 Cho 及 Cho/Cr 值无统计学差异（P＞0.05）；实验组组间 Cho 及 Cho/Cr 值随时间推移呈逐渐升高，差异有统计学意义（P<0.05）；成模后 6w 实验组大鼠坐骨神经传导速度显著低于对照组（P<0.05），病理结果显示实验组大鼠坐骨神经出现早期脱髓鞘改变。**结论** MRS 可以用于 SD 大鼠早期糖尿病足周围神经病变的诊断，且具有较高的诊断价值与临床意义。

3.0T MRI 的 T1 FSE、T1 IDEAL 与 LAVA-Flex 三种序列成像在四肢软组织增强效能对比

方昕
中国科学技术大学附属第一医院西区，安徽省肿瘤医院

摘 要：目的 评价 3.0T HDXT 磁共振成像（MRI）系统的 T1 FSE、T1 IDEAL 与 LAVA-Flex 这三种序列成像在四肢软组织增强检查的价值。方法 对 37 例患者在常规平扫检查后分别予以这三种不同的增强序列检查。计算采用 SPSS18.0 进行统计学处理对比图像质量,测量三种序列分别在同一位置四肢软组织、皮下脂肪及背景噪声信号值,运用测量公式计算信噪比(SNR)、对比噪声比(CNR) 。**结果** 在 31 个患者检查中测量 T1 FSE、T1 IDEAL 和 LAVA-Flex 序列的信噪比分别为（14.3752±3.1967、129.0486±33.0956 和 22.2052±4.29631），T1 IDEAL 序列的信噪比明显高于 FSE 和 LAVA-Flex 序列。FSE、IDEAL 和 LAVA-Flex 序列对比噪声比分别为(6.2796±1.71896、30.9083±12.6670 和 18.7348±4.49985)，T1 IDEAL 序列的对比噪声比明显高于 FSE 和 LAVA-Flex 序列。通过方差齐性检验三组数据方差均齐，采用方差分析 SNR F 值为 405.335，(P<0.01),CNR F 值为 91.655，(P<0.01),三组图像数据有统计学差异，再通过 LSD 法进行两两比较，IDEAL 序列与 FSE 及 LAVA-Flex 序列分别比较(P<0.01)均有统计学差异,而 FSE 序列与 LAVA-Flex 序列之间无统计学差异。结论 ：T1 IDEAL 序列作为一种改进的三点式 DIXON 水脂分离成像技术可以在一个像素内任意的水和脂肪比例都可以进行精确水脂分离，不仅有较高的信噪比及对比度，而且无明显的运动伪影，可以作四肢关节及软组织增强的首选序列。而 LAVA-Flex 序列采用超短的 TR、TE 和小角度的射频脉冲以及运用多种快速采集技术可以大大减少扫描时间，当病人因各种原因不耐受时可以用此序列替代。

股骨滑车发育不良对中青年股四头肌内脂肪含量影响——mDIXON-Quant 测量

陈思然,雷新玮,展影,屈瑾
天津市第一中心医院

目的 运用 mDIXON-Quant 定量 MR[1]，探讨股骨滑车发育不良（FTD）对股四头肌内脂肪含量影响，为临床提供影像学依据及后期治疗提供指导方向。

方法 收集 2016.1 -2017 .12 天津市第一中心医院 18-45 岁膝关节疼痛者，诊断为 FTD 并行股四头肌 MR 检查者 43 例（平均 30.5±7.6 岁，男 18 例，女 25 例；A 型 FTD24 例，B-D 型 FTD19 例），对照组 43 例（平均 30.4±7.2 岁，男 17 例，女 26 例）。采用 Philips Ingenia 3.0T MR 扫描仪进行膝关节常规序列及股四头肌 mDIXON-Quant 序列扫描，股四头肌影像图经飞利浦后处理系统，分别手动画取股直肌、股中间肌、股外侧肌、股内侧肌 ROI，生成相对应 ROI 脂肪分数。分别比较 FTD 组与对照组、不同 FTD 分型组内、不同性别中不同 FTD 分型组内股四头肌及其内四块肌肉脂肪分数值的差异。

结果 （1）不同 FTD 分型组间，股四头肌内脂肪分数 A 型 FTD 组（4.126±2.217%）低于对照组（4.533±2.164%），*P*=0.011；股四头肌内脂肪分数 A 型 FTD 组（4.126±2.217%）低于 B-D 型 FTD 组（4.581±2.142%），*P*=0.018。

（2）在男性组中，股四头肌内脂肪分数 A 型 FTD 组（3.411±1.859%）低于对照组（4.257±2.264%），*P*=0.000；股外侧肌内脂肪分数 A 型 FTD 组（3.676±1.928%）低于对照组

（4.799±2.591%），*P*=0.035；股直肌内脂肪分数 B-D 型 FTD 组（4.883±2.239%）高于对照组（3.828±2.013%），*P*=0.041。差异有统计学意义（*P*<0.05）。
结论　FTD 导致中青年股四头肌脂肪含量改变，在男性中有显著差异，A 型 FTD 股四头肌、股外侧肌脂肪含量减低，肌力增加；B-D 型 FTD，股直肌肌脂肪含量增加，肌力减弱。

超短回波序列（UTE）磁共振动态增强成像评估骨皮质灌注：可行性研究

万丽娣[1,2],Vipul Sheth[2],Hyungseok Jang[2],Graeme Bydder[2],Jiang Du[2],汤光宇[1]
1.同济大学附属第十人民医院
2.美国加州大学圣地亚哥分校

目的　探究动态增强 IR-UTE 序列评估皮质骨灌注的可行性，促进皮质骨灌注和骨病的相关性研究。
方法　本研究对 12 只兔和 3 名健康志愿者进行实验研究，图像均在临床 3T 扫描仪上使用 2D UTE 和 IR-UTE 序列进行扫描。实验中兔子的 Gd 注射剂量为 0.06mmol / kg，而人受试者的剂量为 0.2mmol / kg。在注射 Gd 造影剂前后，均采用~0.5×0.5 mm2 的面内分辨率及 3 mm 的层厚扫描兔子的动态数据，而志愿者的图像扫描层厚为 10 mm；兔子 UTE 成像时间分辨率为 23 秒，人体 UTE 成像时间为 28 秒；兔子和志愿者的 IR-UTE 成像时间分辨率均为 60 秒。获得动态增强图像数据后，对 UTE 及 IR-UTE 进行基于 Brix 模型的动力学分析，以及最大增强（ME）和增强斜率（ES）的简单计算。
结果　12 只家兔的 2D UTE 序列股骨平均 Ktrans 为 0.36±0.07 min-1，Kep 为 8.42±3.17 min-1，ME 为 28.30±6.83，ES 为 0.35±0.18，而 2D IR-UTE 序列的股骨平均 Ktrans 为 0.45±0.10min-1，Kep 为 9.80±0.50min-1，ME 为 48.84±12.12，ES 为 0.69±0.28。与兔相比，在健康人志愿者的胫骨中轴中观察到较低的 ME 和 ES 值。
结论　上述结果表明 2D UTE 和 IR-UTE 序列能够检测兔子和健康志愿者的骨皮质的动态增强对比度，使用这些技术进行骨皮质的灌注研究将是可行的。

OR-231
单体素波谱分析与多回波 Dixon 序列定量评估慢性腰背痛患者椎旁多裂肌脂肪含量的对比研究

鲁燕芬,赵骏,杨森,陈伟
陆军军医大学第一附属医院（西南医院）

目的　运用磁共振单体素波谱(Magnetic Resonance Spectroscopy, MRS)序列和多回波 Dixon 序列定量评估慢性腰背痛(Low back pain, LBP)患者 4-5 椎间盘椎旁多裂肌脂肪含量(Fat%)与最大背伸展力相关性，并与正常志愿者比较对应部位 Fat%的差异性。
方法　20 名 LBP 侧突畸形患者(4 男，16 女，平均年龄 62.40±7.63 岁)，20 名正常志愿者(4 男，16 女，平均年龄 60.85±6.75 岁)行腰椎磁共振检查，4-5 椎间盘行多回波 Dixon 序列扫描。测量 40 名纳入者左右椎旁多裂肌 MRS 和 Dixon 序列 Fat%，比较 LBP 组和正常志愿者组的差异性，计算 LBP 组多裂肌 MRS 和 Dixon 序列 Fat%与最大背伸展力的相关性。校正卡方检验分析两组间男女

分布差异性， Wilcoxon 秩和检验分析两组年龄、体重指数和多裂肌 Fat%的差异性，Spearman 相关分析 Fat%与最大背伸展力的相关性。

结果 两组纳入人群性别分布，年龄和体重指数无显著性差异(P=1, P=0.364, P=0.433)，两组间 MRS 和 Dixon 序列 Fat%无显著性差异(P=0.279, P=0.108)。MRS 序列多裂肌 Fat%和 Dixon 序列多裂肌 Fat%分别与最大背伸展力呈弱负相关和中等负相关 (R=-0.281, R=-0.325)。

结论 多回波 Dixon 序列可定量鉴别诊断 LBP 侧突畸形患者，Fat%略高于正常人，与单体素 MRS 序列相比更好地反应患者最大背伸展力变化情况。

OR-232

Whole-body diffusion-weighted MRI for evaluation of response in multiple myeloma patients following bortezomib-based therapy: A large single-center cohort study

Yu Zhang
the First Affiliated Hospital of Soochow University,

Objectives: To determine the feasibility of Whole-body diffusion -weighted (WB DWI) MRI for evaluation of response in multiple myeloma (MM) patients following bortezomib-based therapy and to explore the direction of apparent diffusion coefficient (ADC) changes on treatment.

Methods: Seventy-two MM patients who underwent WB-DWI MRI before and after bortezomib-based induction chemotherapy (week 21) were evaluated retrospectively. The Estimated tumour volume (eTV) and ADC values before and after chemotherapy were calculated and compared between deep (very good partial response or complete response) and non-deep responders (progressive disease, stable disease, minimal response, or partial response). Predictive value of baseline ADC_{mean} was calculated to predict the trend of ADC_{mean} change following treatment.

Results: Fifty-five patients were classified as deep responders and 17 as non-deep responders. In the per-lesion analysis, 1173 lesions from the 72 patients were included. A different trend of ADC_{mean} change following bortezomib-based treatment was observed in patients with different DWI MRI infiltration patterns. For 327 focal lesions, the ADC_{mean} value increased significantly from baseline to post-treatment ($0.93 \pm 0.26 \times 10^{-3}$ mm^2/s *vs* $1.52 \pm 0.81 \times 10^{-3}$ mm^2/s, p = 0.000). However, ADC_{mean} value decreased significantly following treatment ($0.75 \pm 0.19 \times 10^{-3}$ mm^2/s *vs* $0.60 \pm 0.41 \times 10^{-3}$ mm^2/s, p = 0.000) in 846 representative diffuse lesions. Diffuse lesions showed a significant decrease in ADC_{mean} value in deep responders, whereas no significant variation in ADC_{mean} value changes in focal lesions between deep responders and non-deep responders group. Baseline ADC_{mean} at a specific value (0.808×10^{-3} mm^2/s) yielded a maximum of specificity (68.05%) plus sensitivity (54.09%) in predicting increase of post-treatment ADC_{mean}.

Conclusions: ADC_{mean} value decreased significantly in patients with diffuse pattern MM while increased significantly in patients with focal pattern MM following bortezomib-based treatment. WB DWI MRI can be used to discriminate deep response to induction

treatment in patients with diffuse infiltration pattern MM. Baseline ADC_{mean} may have a potential to predict the trend of ADC_{mean} change following treatment.

OR-233

Impact of age and menopausal status on apparent diffusion coefficient of pelvic bone marrow in adult women

Huiting Pang, Yue Dong
Liaoning Cancer Hospital

Objective: *To evaluate the effects of age and menopausal status of pelvic bone marrow in adult women with apparent diffusion coefficient (ADC) quantification.*
Materials and Methods: *From August 2017 to January 2018, a total of 124 adult females (mean age 51.4 ± 9.2 years; age range, 31–71 years) underwent diffusion weighted imaging (DWI) of the pelvic bone marrow, who were divided into premenopausal group (n=51) (* ≤*40 years, n=19;* >40 years, n=32) and postmenopausal group(n=73) (≤60 years, n=46; >60 years, n=27). *The subjects aged between 45-55 years were further grouped into middle-aged premenopausal group (n=22) and middle-aged postmenopausal group (n=30) based on their menopausal status. The ADCs of pelvic bone marrow were measured. Clinical factors, such as age, menopausal status were recorded. The image data were analyzed to evaluate the variance of pelvic ADCs among different menstrual status and age groups. The relationships between the ADCs of pelvis and menopausal status were evaluated through Independent-sample t test or Mann–Whitney U test, and correlations of ADCs with age were analyzed through the Pearson's correlation analysis.*
Results: *Higher* ADC value was demonstrated for premenopausal women compared with postmenopausal women ($P<0.001$). The ADC of pelvic bone marrow showed significant negative correlation with age ($r= -0.581$, $P<0.001$), and a weak linear correlation had been found in premenopausal group ($r= -0.301$, $P= 0.032$), and there was no significant correlation between age and ADCs in postmenopausal women when analyzed separately. In premenopausal group, the ADC value of the ≤40 years subgroup was higher than that in the >40 years subgroup *($P = 0.031$). No significant difference was found in pelvic ADC value between the ≤60 years and* >60 years subgroups of postmenopausal women ($P> 0.05$).
Conclusion: *The ADCs in pelvic bone marrow were significantly higher in premenopausal women than in postmenopausal women, and the pelvic ADCs showed a descending trend with age which was more pronounced in premenopausal women.*

对比分析 MRI T2-mapping 成像序列及 3D CUBE T2WI 序列在膝关节软骨损伤早期诊断中的应用价值

陈维娟, 刘玥希, 韦鑫, 陈金华, 罗银灯, 郭大静
重庆医科大学附属第二医院

目的 探讨 MRI T2-mapping 成像序列及 3D CUBE T2WI 序列在膝关节软骨损伤的早期诊断中的应用价值。**方法** 选取 2019 年 1 月至 7 月临床有外伤史疑似软骨损伤的患者 30 名。所有病例均采用 GE 1.5T Signa HDXT2012 磁共振行 T2-mapping 序列、3D CUBE T2WI 序列及常规平扫序列扫描。两名以上高年资医师比较两种序列图像显示半月板、髌软骨、股骨头软骨等关节软骨的解剖结构显示情况并进行优、良、差分级评价及统计学分析；应用 GE ADW4.6 工作站 Functool T2-Map 软件测量关节软骨正常区域及疑似损伤区域 T2 值，两组数据进行配对 t 检验，P< 0.05 被认为差异有统计学意义。MRI T2-mapping 成像序列所得 T2 值逐一与 3D CUBE T2WI 序列相应区域图像信号进行比对，探讨符合率。**结果** 正常关节软骨区域平均 T2 值为 38.35±1.68；疑似软骨损伤区域平均 T2 值为 55.28±2.74。两组关节软骨 T2 值差异有统计学意义（P< 0.05）。以图像质量为优作为满意标准，两种序列对髌软骨及股骨头软骨的满意度分别为：MRI T2-mapping 成像序列 87.5%、3D CUBE T2WI 序列 89.2%，差异无统计学意义（P>0.05）；对半月板的满意度分别为 MRI T2-mapping 成像序列 85.0%、3D CUBE T2WI 序列 56%，评分结果有显著统计学差异（P<0.05）。**结论** MRI T2-mapping 成像序列与 3D CUBE T2WI 序列对髌软骨及股骨头软骨早期损伤的诊断均具有较高应用价值；对半月板的损伤判断，MRI T2-mapping 成像序列有显著优势，而 3D CUBE T2WI 序列由于其超薄的层厚反而削弱了半月板及病变的显示，故在显示半月板的病变显示及诊断方面不及 MRI T2-mapping 成像序列。

Characterization of the Microstructure of the Intervertebral Disc in Patients with Chronic Low Back Pain by Diffusion Kurtosis Imaging

Li Li[1],Alessandro Scotti[2],Kejia Cai[2]
1.Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology. Wuhan, Hu Bei, China
2.Radiology Dept. &Bioengineering Dept., College of Medicine, University of Illinois at Chicago, Chicago, IL, United States

PURPOSE: Multivariate analysis of T2-weighted signal, diffusion ADC, and DKI parameters and tractography were used to differentiate chronic non-specific low back pain (CLBP) patients and asymptomatic controls (AC).
METHODS: 30 patients with CLBP and 23 AC underwent Diffusion Kurtosis Imaging (DKI) of lumbar spine with a 3T MRI scanner to get the ADC values and seven parameters of DKI in the nucleus pulposus (NP) of the intervertebral disc. The tractography and the tract-related parameters as other parameters were also generated to indicate the intactness of annulus fibrosus (AF). T2-grades of the discs were also quantified based on an eight-grade degeneration grading system. ADC and T2-grades were compared with DKI parameters for the differentiation of CLBP and AC groups.
RESULTS: There was no difference in the T2 grades, ADC value and multiple parameters in DKI of NP between CLBP and AC groups (P >0.05). The average FA values in NP in AC group was found significantly higher than them the CLBP group (P<0.05). The scores for the intactness of AF of the intervertebral discs was significantly different in CLBP and AC groups, with 90% of sensitivity and 70% specificity (P<0.05).

Additionally, there were significantly differences in the length and volume values of the AF in CLBP and AC groups (P <0.05).
CONCLUSION: DKI is a good noninvasive method and it might help to differentiate CLBP from AC. Particularly, the continuation of DKI tractography reflects the presence of annulus fibrosus fissures, an important character in the generation of the low back pain.
CLINICAL RELEVANCE/APPLICATION: DKI can noninvasively show the microstructural change of the degenerated intervertebral discs in humans. DKI parameters provide a quantitative measurement of the microstructural modifications in the NP, while the tractography and the tract-related parameters (length and volume) from DKT can directly show the integrity of the AF, which has been confirmed to be an important character in the generation of low back pain. Therefore, we conclude that DKI can be used to assess and monitor the status of intervertebral discs and the causes of pain in CLBP patients.

基于信息流和机器学习的产后抑郁预测研究

毛宁,车凯莉,谢海柱
山东省烟台毓璜顶医院

目的 构建的优势信息流方向分析产后抑郁患者大脑信息流特征。最后，基于机器学习的方法对产后抑郁患者进行临床鉴别诊断和预测评估。
方法 基于产后抑郁患者的静息态 *fMRI* 数据。首先，采用皮尔森相关构建的功能连接和图论分析了产后抑郁患者的大脑全局和局部的信息流模式改变。同时，采用 *NPMR GCA* 构建的优势信息流方向分析产后抑郁患者大脑信息流特征。最后，基于支持向量机分类和回归对产后抑郁患者进行临床鉴别诊断和预测评估。
结果 产后抑郁患者在杏仁核、扣带回、脑岛、海马、额叶、顶叶和枕叶部分区域的信息流模式发生明显改变，尤其杏仁核区域以及与颞叶和额叶之间的信息流方向与临床评估（*HAMD* 和 *EPDS*）存在显著相关。同时基于优势信息流方向的预测分析表明，信息流模式的改变对抑郁状态具有很好的评估能力。
结论 产后抑郁患者杏仁核相关信息流模式的改变是造成抑郁症状的主要神经病理机制，同时也为临床抑郁状态的评估提供稳定可靠的影像学指标。

Differences in the brain network topology between methamphetamine and heroin use disorder individuals: A fMRI study

Yan Liu[1,2],Wei Li[2],Lei Wang[2],Jiajie Chen[2],Tianyi Zhang[3],Wei Wang[2]
1.Department of Radiology, Changqing Oilfield Staff Hospital of PetroChina
2.Department of Radiology, Tangdu Hospital, the Air Force Medical University, Xi'an, Shaanxi
3.Eighteen Teams of Students of Basic Medical College, the Air Force Military Medical University

Purpose Both methamphetamine and heroin cause addiction by activating the dopamine reward loop, but heroin use disorder (HUD) individuals show obvious physical symptoms and negative emotions, while methamphetamine use disorder (MAUD) individuals show psychotic symptoms. The neurological mechanism of mental impairment caused by methamphetamine is still unclear.
Methods 19 MAUD patients, 21 HUD patients and 20 healthy volunteers were participate. Using graph theory to construct the resting functional networks, comparing small world characteristics, node attributes and network connection strength among three groups. The correlation between the three variables and psychological scale was analyzed.
Result 1.The scores of hostile items in MAUD group was significantly higher than those in HUD group.
2. All three groups have small world attributes.
3. The degree centrality of drug groups is different. Compared with HUD group, the increase in MAUD group included left insular lobe, right heschl gyrus and bilateral superior temporal gyrus, and the decrease in right parahippocampal gyrus.
4. Functional connectivity: The brain network with differences of MAUD and HUD group was composed of 7 nodes and 9 edges. Compared with HUD group, the nine connections of MAUD group were significantly decreased.
5. Correlation: The functional connection between left superior frontal gyrus and left middle occipital gyrus was negatively correlated with depression, while the functional connection between right cuneus and bilateral olfactory was negatively correlated with depression and interpersonal sensitivity in MAUD group.
Conclusion MAUD group showed decreased node attributes and function connections in inhibitory control, cognitive and memory related brain areas, while increased in somatosensory, visual and auditory related brain areas. The correlation analysis further indicated that the decreased brain functional connectivity in MAUD group might be related to its stronger depression and interpersonal sensitivity.

OR-238

Integrated analysis of 13 microarray datasets reveals CCT6A as a diagnostic and prognostic biomarker in high-grade glioma

Siqi Wang,Ping Han
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose
Through screening glioma microarray datasets in public databases, to identify diagnostic and prognostic biomarkers in high-grade glioma.
Materials and Methods
The integrated analysis was performed using MetaOmics software package in R software. The combined effect and p-value were used to screen differential expressed genes. To identify the more meaningful biomarker for high-grade glioma, 20 genes were selected for high-content screening. A total of 20 kinds of siRNA lentivirus were designed respectively and transfected into U251 cells. U251 cells with transfecting 20 kinds of

siRNAs were seeded in 96-well plates, and cell growth was monitored. Gene expressional and clinical data in TCGA database were used for validating the differential expressed genes, and performing ROC curve analysis. Kaplan-Meier survival analysis was performed using data from TCGA database, and Log-rank tests were performed.
Results
After screening, finally 13 glioma datasets were included, including 862 high-grade gliomas, 263 low-grade gliomas, and 110 non-glioma brain tissues. In three comparisons (high-grade glioma versus normal brain tissue, low-grade glioma versus normal brain tissue, and high-grade glioma versus low-grade glioma), 5575, 5300, and 2516 different probe sets were aberrantly expressed, respectively. Finally 163 genes differentially and specially over-expressed in high-grade glioma were obtained. High-content screening results showed that down-regulation of CCT6A decreased the total number of cells and cell growth rate was slowed down. The validation in TCGA showed that the expression of CCT6A were significantly different between high-garde glioma, low-grade glioma and normal brain tissues. Further analysis of the ROC curve showed that CCT6A has good predictive power for distinguishing high-grade glioma from low-grade glioma and normal brain tissues. Kaplan-Meier survival curve analysis showed that the survival time of glioma patients with high expression of CCT6A was shorter.
Conclusion
CCT6A was differentially and specially over-expressed in high-grade glioma, and patients of glioma with high expression of CCT6A had a shorter survival time. Our study provided reference value for the research of molecular imaging targeted biomarkers of glioma.

Pineal gland alteration in smartphone addiction students receiving mindfulness therapy

Ke Xu,Zhesheng Shi,Wen Wang,Guangbin Cui
the fourth military medical university

Background
Smartphone addiction in young adults is closely associated with anxiety, depression and sleep disorders. Melatonin, which is secreted by the human pineal gland, plays an important role in sleep and circadian rhythm. The aim of the present study was to evaluate and compare pineal gland volumes in smartphone addiction college students before and after mindfulness therapy in comparison with healthy control.
Methods
We prospectively evaluated the pineal gland volumes of 30 students, including 15 smartphone addiction students and 15 health control. Before and after the 8-week mindfulness therapy, the total pineal gland volume of all students was measured via magnetic resonance images using 3D slicer software, and the total mean pineal volume of each group was compared. The correlation between pineal volume and psychological measurements was also investigated.
Results

There were significant differences in mean pineal volume between students with smartphones addiction and health control before mindfulness therapy. While after the 8-week mindfulness therapy, there was no significant difference between these two groups. Meanwhile, 8-week mindfulness therapy significantly alleviated the anxiety and depressive symptoms.

Conclusion

Our data shows that smartphone addition students have smaller pineal gland volume and 8-week mindfulness therapy had significant effect on both the psychological measures and the recovered pineal gland volume.

Dysfunctional interactions between the default mode network and the dorsal attention network in subtypes of amnestic mild cognitive impairment

Junkai Wang[2],Peipeng Liang[2]
1.Capital Normal University
2.Capital Normal University

An anticorrelated relationship in the spontaneous *fluctuations* between the default mode network (DMN) and dorsal attention network (DAN) is a robust feature of intrinsic brain organization in healthy individuals. Prior studies have reported a modified anticorrelation between the DMN and the DAN in Alzheimer's disease (AD) and mild cognitive impairment (MCI). However, it is unclear how this anticorrelation changes as MCI progresses to AD. We hypothesized that dysfunctional connectivity between the DMN and DAN may reflect the gradual decline from MCI to AD. To test this hypothesis, we investigated alterations in functional connectivity between the DMN and DAN in subtypes of amnestic mild cognitive impairment (aMCI) by comparing with the same functional pattern in healthy elderly individuals and patients with AD. We retrospectively collected brain imaging and neuropsychological data from 20 AD participants, 22 participants with multiple-domain aMCI (aMCI-m), 29 participants with single-domain aMCI (aMCI-s) and 23 sex-matched normal controls (NC) in this study. Resting-state functional connectivity analysis revealed that aMCI-s and aMCI-m groups demonstrated different magnitudes of increased anticorrelation between the DMN and DAN relative to the AD group. Furthermore, in aMCI-s, aMCI-m and AD participants, hypoconnectivity was found in specific regions within the DMN, including the precuneus and angular gyrus, and hyperconnectivity was found in areas outside the typical DMN networks, including the middle occipital gyrus, lingual gyrus and visual cortex, which indicated disease-related adaptations of brain networks that may subsequently disturb functional interactions between the DMN and DAN. Our findings suggest that DMN-DAN anticorrelation may play an essential role in understanding the adaptations in brain function during the progression from MCI to AD and may serve as a potential biomarker to detect AD in the preclinical stage.

抑郁症的多模态神经影像技术研究

孔令梅[1],李慧[2],陈彦孜[1],徐畅[2],沈苑玉[1],吴仁华[1]
1.汕头大学医学院第二附属医院
2.汕头大学精神卫生中心

目的 应用 DKI、多体素 MRS、GLUCEST 评估单相和双相抑郁以及首发和复发抑郁脑部代谢水平和微观结构的改变情况，探索鉴别单相与双相抑郁的客观影像学指标，以及寻找指导首发抑郁患者治疗的影像学依据。

材料与方法 20 例健康志愿者，24 例单相抑郁和 12 例双相抑郁病人入组，抑郁患者又分为首发抑郁 (10 例)及复发抑郁患者 (26 例)。对照组和病例组均接受 DKI、多体素 MRS 及 GLUCEST 的检查。

结果

单相和双相抑郁病人不同脑区出现了较一致的 FA 值、MK 值、Kr 值降低，Ka 值升高，MK 值降低的脑区更加广泛，而且双相抑郁患者前扣带回、双侧背外侧前额叶白质、左侧丘脑 MK 值降低更严重。首发抑郁患者脑微观结构已经出现损伤。单相、双相抑郁患者不同脑区出现了较一致的 NAA、Ins 降低，而单相及双相抑郁 Cho、Glu 值的改变在不同脑区则有所不同。初发抑郁患者已经出现前扣带回、双侧背外侧前额叶白质、双侧丘脑 NAA、Glu 等脑代谢物的降低。单相抑郁患者不同脑区出现了较一致的 GLUCEST%降低，而双相抑郁患者 GLUCEST%改变则不一致。首发抑郁患者部分脑区已经出现谷氨酸水平的降低，复发抑郁患者谷氨酸水平降低的脑区更加广泛。

结论

1. 单相和双相抑郁患者均存在脑微观结构及代谢物的异常，而且在不同脑区 DKI 参数、MRS 和 GLUCEST 改变并不完全一致，提示二者的病理生理学不同，并有助于二者的鉴别。
2. 初发抑郁患者已经出现部分脑区 NAA、Glu 等代谢物降低，以及脑部微观结构损伤，前扣带回是首发抑郁最早累及的脑区，双侧背外侧前额叶白质纤维结构完整性较早出现损伤，这对于指导首发抑郁患者的临床治疗有重要意义。
3. GLUCEST%对单相和双相抑郁的鉴别，以及检测首发和复发抑郁患者谷氨酸水平的改变比 MRS 更敏感，前扣带回、双侧背外侧前额叶白质 GLUCEST%改变的不一致可能有助于鉴别单相和双相抑郁。

An amyloid-β targeting chemical exchange saturation transfer probe for in vivo detection of Alzheimer's disease

Runrun Wang,Renhua Wu
Department of Medical Imaging, 2nd Affiliated Hospital, Shantou University Medical College, Shantou

Abstract

Background and aims: A reliable and reproducible detection of Aβ deposits would be beneficial for the early diagnosis of Alzheimer's disease (AD).

Methods: In the present study, the feasibility of applying chemical exchange saturation transfer (CEST) for Aβ deposit detection using angiopep-2 as a probe was evaluated.
Results: It was demonstrated that CEST could detect angiopep-2 and Aβ-angiopep-2 aggregates in vitro. Furthermore, APP/PS1 mice injected with angiopep-2 exhibited a significantly higher in vivo CEST effect, when compared to controls. The distribution of Aβ deposits detected by CEST imaging was consistent with the histological staining results.
Discussion: The present study is the first to report a reliable exogenous CEST probe to noninvasively evaluate Aβ deposits in APP/PS1 mice. Furthermore, these results demonstrate the potential for clinical AD diagnosis and Aβ-targeted drug therapy assessment using CEST imaging with the angiopep-2 probe.

Using Multimodal MRI to Track the D-mannose Therapeutic Effect for Multiple Sclerosis

Jing Wang[1,2], Negin Jalali Motlagh[2], Helen Wang[2], Zhenwei Yao[1], John Chen[2,3]
1. Huashan Hospital, Fudan University
2. Center for Systems Biology, Massachusetts General Hospital and Harvard Medical School, Boston, Massachusetts
3. Department of Radiology, Massachusetts General Hospital, Boston, Massachusetts

Purpose: To study if D-mannose is able to treat experimental autoimmune encephalomyelitis (EAE), a commonly used mouse model for multiple sclerosis using multimodal MRI with the molecular imaging agents MPO-Gd (targeting the pro-inflammatory enzyme myeloperoxidase [MPO]) and iron oxide nanoparticle (for phagocytosis).

Materials and Methods: The protocol for animal experiments was approved by the institutional animal care committee. A total of 24 female C57BL/6 mice were induced with EAE with myelin oligodendrocyte glycoprotein 35-55 peptide (200 μg/mouse) and were randomly separated into PBS control and D-mannose treatment groups (n=12 for each group). Clinical scores and weights were recorded daily blinded to treatment methods. Mice underwent MPO-Gd and iron oxide nanoparticle (cross-linked iron oxide [CLIO] enhanced MR imaging on day 15. On day 19, spinal cords were harvested from all survived mice for flow cytometric evaluation. Statistical analysis was performed. $P < 0.05$ was considered statistically significant.

Results: D-mannose improved EAE clinical symptoms ($P< 0.0001$ for clinical score, $P= 0.0023$ for weight) and reduce mortality ($P= 0.019$) compared to PBS-treated control mice. Flow cytometry showed that D-mannose treated mice had significantly fewer infiltrating macrophages/activated microglia than those of PBS control mice ($P= 0.032$), among which pro-inflammatory macrophages/microglia were greatly reduced ($P= 0.0028$) while anti-inflammatory cells increased ($P = 0.034$). MPO-Gd MR imaging demonstrated that D-mannose treated mice had significantly smaller total MPO+ (pro-inflammatory

macrophages/microglia were MPO+) lesion area than PBS control mice. CLIO MR imaging indicated that D-mannose treatment might block macrophage phagocytosis.

Conclusion:D-mannose treatment for EAE shows improved clinical symptom and reduced mortality by suppressing the inflammatory response and skewing macrophages/microglia toward anti-inflammatory subtype in CNS.

一体化 TOF-PET/MR 检查对肺部小结节（≤10mm）的检出及 18F-FDG 代谢显示价值的探讨

宋天彬,杨宏伟,帅冬梅,梁志刚,卢洁
首都医科大学宣武医院

目的 ：评价一体化 TOF-PET/MR 对于肺部小结节（≤10mm）的检出能力，并探讨 TOF 技术在一体化 PET/MR 检查中对肺部小结节（≤10mm）的 ^{18}F-FDG 代谢显示的影响。
方法 ：回顾性分析 20 例患者胸部的 ^{18}F-FDG PET/CT（联影 uMI510）和胸部一体化 PET/MR 检查（联影 uPMR790）的图像，MRI 序列采用 GRE 3D T1WI 和 FSE T2WI，T1WI 层厚为 2mm，T2WI 层厚为 4mm。将 PET/CT 胸部检出的肺结节数目作为评价肺结节检出数目的金标准。统计一体化 PET/MR 中对肺部小结节 A 组（<5mm）和 B 组（5-10mm)总的检出率，比较一体化 PET/MR 中 TOF PET 和 nonTOF PET 图像上肺部小结节的 ^{18}F-FDG 代谢显示情况。
结果 ：本研究 PET/CT 共检出 156 个肺部小结节，其中 70 个小结节小于 5mm（A 组），86 个结节的最长径为 5-10mm（B 组）。一体化 TOF PET/MR 对 A 组（<5mm）肺部小结节总检出率为 2.8%(2/70)，对于 B 组（5-10mm)肺部小结节总检出率为 98.8%(85/86)。对于 A 组（<5mm）肺部小结节而言，TOF PET 图像发现 2 个小结节为 ^{18}F-FDG 高代谢，而 nonTOF PET 图像仅发现 1 个小结节为高代谢，其中 1 个小结节出现 ^{18}F-FDG 代谢假阴性。对于 B 组（5-10mm)小结节而言，TOF PET 图像上能够发现 84 个小结节为 ^{18}F-FDG 高代谢，而 nonTOF PET 图像上仅仅发现 78 个结节为 ^{18}F-FDG 高代谢，其中 6 个结节出现 ^{18}F-FDG 代谢假阴性。
结论 ：一体化 TOF-PET/MR 对肺部 5-10mm 的小结节可以较好地检出，而对于肺部＜5mm 小结节不能较好的检出；TOF 技术有助于降低一体化 PET/MR 检查中肺部小结节 ^{18}F-FDG 代谢假阴性发生。

Contrast enhanced CT image -based radiomics analysis to predict pathological classifications and stages of thymic epithelial tumors: A retrospective study

Xiulong Feng[1],Linfeng Yan[1],Ke Xu[2],Wuxun Cui[1],Zhesheng Shi[2],Dongliang Cheng[2],Tao Zhang[2],Li Mao[3],Xiuli Li[3],Yuchuang Hu[1],Guangbin Cui[1],Wen Wang[1]
1.Tangdu Hospital， Fourth Military Medical University
2.Student Brigade， Fourth Military Medical University
3.Deepwise AI Lab， Deepwise Inc.

Objective Because of the importance of the World Health Organization (WHO) pathological classification and TNM stages when determining appropriate clinical management of thymic epithelial tumors (TETs), it is urgently needed to confirm them

by imaging diagnosis. We aimed to develop a computational approach integrating clinical factors and imaging features of modalities, especially radiomic features of contrast-enhanced Computed Tomography (CT), in order to predict pathological classifications and stages of TETs.
Methods In this retrospective study, we used 303 single-institutional patients with pathologically proven TETs to develop and validate a machine learning based model to predict pathological classifications and stages by combining contrast-enhanced CT images and clinical data. To develop the Radiographic-Radiomic (RR) model, 3726 radiomic features were quantified from the tumor region, and 4 clinical factors, 13 radiographic features were considered. L1 based feature selection was implemented, and Logistic Regression with L1 regularization were trained and validated by repeated stratified 5-fold cross validation. Area under the curve (AUC) of receiver operating characteristics was calculated as model performance value.
Results Logistic Regression models showed efficient discrimination performance for WHO pathological classification and TNM stage of simplified grades. For pathological classification task, the Radiographic-Radiomic (RR) model achieved best performance with AUC of 0.85, when using radiomic, clinicoradiologic or radiographic features separately, micro averaged AUC can only reach 0.79, 0.81 and 0.83. On the other hand, for classification task of TNM stages, the Radiographic-Radiomic (RR) model and the model using radiographic features achieved AUC of 0.96 and 0.95, which is the best performance. However, the model using radiographic or clinicoradiologic features only leaded to a micro averaged AUC of 0.84. When discriminating the pathological classification, sensitivities of Radiographic-Radiomic (RR) model for discriminating LRT, HRT and TC were 68.50%, 65.00% and 70.27%, while specificities of it were 76.27%, 71.95% and 92.43%. When discriminating the TNM stage, sensitivities of Radiographic-Radiomic (RR) model for discriminating early and advanced stage were 87.22% and 92.74%, while specificities of it were 92.74% and 87.22%.
Conclusion The Radiographic-Radiomic (RR) model achieved higher performance than radiomic or radiographic model in discriminating WHO pathological grades. However, the radiographic model and Radiographic-Radiomic (RR) model achieved best in discriminating simplified TNM stages.

The study of radiomics in predicting NSCLC tumor molecular marker P63

Qianbiao Gu[1],Zhichao Feng[1],Mustafa Jumbe Mwajuma[2],Haixiong Yan[1],Pengfei Rong[1],Wei Wang[1]
1.The Third Xiangya Hospital， Central South University
2.Department of Radiology， Muhimbili National Hospital， Dar es Salaam

Objective: To establish a radiomics signature based on CT images of non-small cell lung cancer (NSCLC) tumors to predict the expression of NSCLC molecular marker P63.
Methods: 245 NSCLC patients who underwent CT scans from January 2014 to March 2018 at our hospital were retrospectively included. All patients had disease confirmed by histopathological examination and had P63 expression test within 2 weeks after CT examination. Radiomics features were extracted by MaZda software and subjective image features were defined from original non-enhanced CT images. The Lasso-logistic regression model was used to select features and to develop radiomics signature, subjective image features model and combined diagnostic model, respectively. The predictive performance of each model was evaluated by the area under the curve (AUC), and Delong test was used to evaluate the difference among the three models.
Results: Among the 245 patients, 96 were P63 positive, and 149 were P63 negative. The subjective image features model consisted of six image features. Through feature selection, the radiomics signature consisted of eight radiomics features. The area under the ROC curve of the subjective image features model and the radiomics signature in predicting P63 expression statue was 0.721, 0.755, respectively., There was no significant statistic difference ($P > 0.05$). The combined diagnostic model had the best predictive power (AUC=0.821; $P < 0.05$).

Conclusions: The radiomics based on CT scan images can predict the expression status of NSCLC molecular marker P63; The combined model combining the radiomics features and subjective image features can significantly improve the predictive performance of the predictive model, which maybe helpful to provide a non-invasive means for understanding the molecular level information of lung cancer cells

Correlation study of 18-fluordeoxyglucose positron emission tomography/computed tomography in pathological subtypes of invasive lung adenocarcinoma and prognosis

Bin Yang,Guangming Lu
Jinling Hospital, Medical School of Nanjing University

Abstract

Purpose: To investigate correlations between 18-fluordeoxyglucose positron emission tomography/computed tomography (PET/CT) metabolic parameters among pathological subtypes of invasive lung adenocarcinoma and prognosis.

Methods: Clinical and pathological data from 176 patients with invasive lung adenocarcinoma were retrospectively analyzed. Invasive lung adenocarcinoma was divided into five pathological subtypes: lepidic predominant adenocarcinoma (LPA); acinar predominant adenocarcinoma (APA); papillary predominant adenocarcinoma (PPA); solid predominant adenocarcinoma (SPA); and micropapillary predominant adenocarcinoma (MPA). Differences in metabolic parameters (maximal standard uptake value[SUVmax]; mean standard uptake value[SUVmean] ; total lesion glycolysis[TLG]; and metabolic tumor volume [MTV]) and largest tumor diameter of the various pathological subtypes were analyzed. Patients were divided into two groups according to their prognosis: group A (good prognosis [LPA, APA, PPA]); and group B (poor prognosis [SPA, MPA]). Logistic regression was used to filter influencing factors, and multivariate analysis of predictors was used to construct an optimal model, and areas under the receiver operating curve (AUC) were calculated. Cox regression analysis was performed on prognostic factors.

Results: Metabolic parameters and the largest tumor diameter of each pathological subtype were statistically significant factors ($P<0.05$). The predictive model constructed using multi-factor (stage, thyroid transcription factor-1 [TTF-1], MTV) had good classification performance for groups A and B. The AUC for MTV was 0.681, and 0.747 when combined with clinical pathological information. Cox survival analysis revealed that staging, TTF-1, MTV, and pathological subtype were independent risk factors for patient prognosis. The hazard ratio for group B was 1.948 (95% CI 1.042–3.641) compared with group A (i.e., the risk for death in group B was higher than in group A). The mean survival times in groups A and B were 50.2621 (95% CI 47.818–52.706) and 35.8214 (95% CI 27.483–44.159) months, respectively, while the median survival time was 47.00 (95% CI 45.000–50.000) and 31.50 (95% CI 23.000–49.000) months, respectively.

Conclusion: PET/CT metabolic parameters and clinical pathological data were different among the different pathological subtypes of invasive lung adenocarcinoma, and

demonstrated good classification performance for the different pathological subtypes, and could improved evaluation of prognosis, all of which may provide a reference for treatment and prognosis of patients.

ESWAN 对良性前列腺增生伴炎症诊断价值评价

王宗英,李凤致,程启超,李菲,王锡臻
潍坊医学院；潍坊医学院附属医院

目的 探究单纯前列腺增生与前列腺增生伴炎症 ESWAN 不同参数的差异，探究 ESWAN 对良性前列腺增生伴炎症诊断价值。
方法 随机选取 2018 年 12 月-2019 年 4 月于我院就诊并经组织病理学证实单纯 BPH 患者 35 名，BPH 伴炎症 30 例，所有 BPH 均排除前列腺其他病变，例如前列腺癌等。患者临床症状主要为尿频、排尿困难、尿潴留等，临床指诊表现为前列腺体积增大。患者年龄在 51~83 岁之间，平均年龄为 63.5±18.6 岁。血清 PSA 水平在 0.7~23.1ng/ml 之间，平均为 6.92±0.74ng/ml。使用 GE HDxt 3.0TMR 成像仪，对所有研究对象行常规磁共振及 ESWAN 成像检查。经 ESWAN 后处理软件进行分析处理分别得到相应的磁矩值、相位值、R2*值、T2*值。统计学处理采用 SPSS 17.0 进行，对单纯 BPH 组及 BPH 伴炎症组相应磁矩值、相位值、R2*值、T2*值分析采用独立样本 t 检验，$P<0.05$ 认为差异具有统计学意义。
结果 单纯 BPH R2*值（19.521 ± 2.973）较 BPH 伴炎症（20.636 ± 2.837）减低；单纯 BPH T2*值（53.683 ± 8.752）较 BPH 伴炎症（50.980 ± 7.033）升高；单纯 BPH 磁距值（1636.408± 230.124）较 BPH 伴炎症（1711.067 ± 154.767）减低；单纯 BPH 相位值（0.035 ± 0.060）较 BPH 伴炎症（0.024 ± 0.086）升高，但均不具有统计学意义（$P>0.05$）。
结论 ESWAN 对单纯 BPH 与 BPH 伴炎症诊断及鉴别诊断价值不明显，可能与本研究样本量太少有关，需要进一步探索。

Influence of obesity on tumor inflammation in early stages of tumor progression was observed by using new iron oxide nanoparticles

Xiaoxuan Xu[1,2], Shenghong Ju[1,2]
1.Medical School of Southeast University, Nanjing, China; Jiangsu Key Laboratory of Molecular and Functional Imaging, Department of Radiology, Zhongda Hospital
2.Jiangsu Key Laboratory of Molecular and Functional Imaging, Department of Radiology, Zhongda Hospital

Influence of obesity on tumor inflammation in early stages of tumor progression was observed by new iron oxide nanoparticles

Aim: Pancreatic cancer is one of the most malignant tumors, and inflammation plays an important role in tumor progression and metastasis. The effects of obesity on tumor inflammation were observed dynamically and in real time by imaging methods.

Methods:Two groups of mice: WT mice and obese mice (n=8) were studied. The disease model was in situ pancreatic cancer. Octapod-30, a novel iron nanoparticle with high r2 coefficient, was used as the T2 weighted contrast agent for magnetic resonance imaging. The target-background ratio of tumor areas after nanoparticle injection was calculated. The mice were killed at the appropriate time, and the tumors was removed, embedded and sliced. Prussian blue staining and CD68 immunohistochemical staining were performed. The tumor metastasis and related molecular biological indexes of the two groups of mice were detected.

Results:In vivo imaging showed rapid, noninvasive observation of obesity-induced macrophage proliferation and increased inflammatory response in early pancreatic cancer, which was also confirmed by histopathological analysis. In terms of metastatic foci, obese mice were more than wild-type mice, and some tumor-related molecular biological indicators were statistically significant compared with wild-type mice.

Conclusion:We have confirmed that obesity, as a metabolic disorder, releases a large number of cytokines in the early stage of tumors, recruiting more macrophages, leading to increased tumor inflammatory response, and thereby promoting the progress and invasion of tumors.

基于硒代半胱氨酸修饰的硒化铋纳米颗粒同步实现放疗增敏与放疗防护

杜江锋,张辉
山西医科大学第一医院

目的 目前，如何开发对肿瘤放射治疗具有较强增敏效果的放疗增敏剂，已经成为科研人员的重点研究对象。已有的文献报道了众多具有放疗增敏效果的纳米放疗增敏剂，但是如何开发一种纳米放疗增敏剂，使其对肿瘤放疗增敏的同时增强正常组织的辐射抗性却未见有相关报道。
方法 本文通过使用一种简便的方法制备了一种符合上述要求的纳米放疗增敏剂——聚乙烯吡咯烷酮（polyvinyl pyrrolidone, PVP）和硒代半胱氨酸修饰的 Bi_2Se_3 纳米颗粒。通过对该纳米材料体内和体外的生物安全性进行评价，发现其具有良好的生物相容性，没有明显的细胞和动物毒性。进而研究发现，该纳米材料对 X 射线和近红外（near infrared reflection, NIR）光都具有较强的吸收能力，不但可以增强放疗效果，还可降低放疗副作用的影响。该纳米颗粒在 X 射线的照射下可以显著增强细胞内自由基的产生，同时在 808 nm 激光的照射下具有良好的光热转换效应。
结果 在动物实验中，通过瘤内注射的方式将纳米材料注入到肿瘤中，结果发现，肿瘤在 X 射线和近红外 808 nm 激光的照射下可以有效的杀死肿瘤细胞，同时发现硒可以持续不断的从肿瘤部位被释放进入血液循环系统。通过对放疗毒副作用指标的分析，发现血液中的超氧化物歧化酶（superoxide dismutase, SOD）、谷胱甘肽过氧化物酶（glutathione peroxidase, GSH-Px）、细胞因子 IL 2，IL-6，G-CSF 和 TNF-α、血液中的白细胞数（white blood count, WBC）、骨髓 DNA 含量等，相对单独 X 射线照射组都有显著升高，表明该纳米材料可以增强免疫力，降低放疗副作用。
讨论：该纳米材料以一种天然的硒代胱氨酸为硒源，实现了其在生物体中的有效转化和利用，为开发新型无机纳米放疗增敏剂提供了一种新的设计思路。

Purpose: To investigate the correlation between amide proton transfer-weighted (APTw) MR imaging and Ki-67 labeling index of cervical cancer.
Materials and Methods: This prospective study was approved by the institutional review board. Between September 2017 and December 2018, 24 patients (age 46.3 ±11.6 years, range 29-73 years), who were pathologically confirmed cervical cancer, underwent three-dimensional (3D) turbo-spin-echo (TSE) APTw MR imaging with dual radiofrequency transmits interleave labelling on a 3T MR scanner (Ingenia CX, Philips Healthcare, the Netherlands). The B0 artifact was corrected in APT post processing with extra measurements near ±3.5ppm and Z-spectrum shift. The APT values, calculated based on asymmetry of resulting Z-spectrum with respect to water frequency, were independently measured by two radiologists. Inter-observer inter-class correlation coefficient was computed. Pearson's correlation analysis was performed between the APT values and Ki-67 labeling index.
Results: The APT values of cervical cancer were 2.918±0.092 with mean region of interest area of 630.7 mm^2. Inter-observer ICC was 0.986 (95% CI 0.967-0.994). The APT values were positively moderately correlated with Ki-67 labeling index ($r = 0.533$, $p = 0.007$).
Conclusion: APT values in current technology positively moderately correlates with Ki-67 proliferation status of cervical cancer.

PD-L1 核酸适配体修饰的锆金属有机框架结构在结直肠肿瘤中的诊疗价值探究

齐亚飞[1],杜洋[2],薛华丹[1],雷晶[1],田捷[2],金征宇[1]
1.中国医学科学院北京协和医院
2.中科院自动化所中科院分子影像重点实验室

目的 探究 PD-L1 核酸适配体修饰的锆金属有机框架结构在结直肠肿瘤中的诊疗价值。
方法 结肠癌细胞系 CT26 与 MC38 与锆金属有机框架结构（MOF）和 PD-L1 核酸适配体修饰的锆金属有机框架结构（Aptamer@ MOF）共孵育不同时间， CCK-8 鉴定细胞毒性；CT26 与 MOF 及 Aptamer@ MOF 共孵育 4h 后，与 DCFH-DA 共孵育后近红外激光器照射，荧光显微镜测定单线态氧产生情况；CT26 与 MOF 及 Aptamer@ MOF 共孵育 4h 后，近红外照射或不照射后再培养 2h，Calcein-AM/PI 染色荧光显微镜观察细胞凋亡状态；构建 MC38 细胞系 C57BL/6N 荷瘤小鼠，尾静脉注射不同探针及 PBS，IVIS 采集注射前、注射后图像，观察肿瘤部位荧光信号；分别于注射后 72h 处死小鼠，观察各脏器荧光分布情况。
结果 CCK-8 细胞毒性试验结果表明，MOF 及 Aptamer@ MOF 与 CT26 及 MC38 共孵育 24h 内，细胞活力大于 80%；单线态氧检测试验表明，MOF 及 Aptamer@ MOF 组均可产生荧光信号；细胞凋亡试验表明，MOF+照射组及 Aptamer@ MOF+照射组引起细胞凋亡情况较非照射组及 PBS 组严重；体外靶向试验表明，肿瘤部位荧光信号：Cy5.5-Aptamer@ MOF 组>Cy5.5-non Aptamer@ MOF 组>Cy5.5-Aptamer 组；不同时间点处死小鼠后发现，Cy5.5-Aptamer@ MOF 组及 Cy5.5-non Aptamer@ MOF 组荧光信号主要聚集在肝脏，而 Cy5.5-Aptamer 组荧光信号主要聚集在肾脏。
结论 PD-L1 核酸适配体修饰的锆金属有机框架结构可实现对结直肠肿瘤的诊疗，为进一步载药研究奠定基础。

基于芬顿反应的多功能焦糖化 Mn@USPIO 纳米球在胰腺癌磁共振成像及治疗一体化研究

张高瑞[1,2],李念露[3],赵雨萱[1],王方青[1],于德新[1]
1.山东大学齐鲁医院
2.潍坊医学院
3.山东大学化学与化工学院

目的 探究多功能焦糖化 Mn@USPIO 纳米球（Mn@USPIO@CNSs）在胰腺癌 MR 成像及铁死亡协同化疗的增敏效果和机制。
方法 制备 Mn@USPIO 纳米材料，采用共价键结合及静电吸附的方法制备 Mn@USPIO@CNS 纳米探针；3.0T 磁共振验证不同浓度 Mn@SPIO@CNS 及 Mn@USPIO 纳米材料弛豫率；验证不同浓度纳米材料细胞成像及不同时间点经尾静脉注射小鼠胰腺癌模型在不同时间点 T2 值。利用 hTERT-HPNE 及 Pan02、PANC-1，通过 CCK-8 验证不同浓度及时间点下 Mn@USPIO@CNS 及载吉西他滨（GEM）纳米体系在对细胞活力影响。通过普鲁士蓝染色、TEM 观察不同时间材料的摄入及亚细胞定位情况；倒置显微镜检测纳米体系活性氧(ROS)产生情况进行分析；Western Blot 测定铁转运蛋白（Fpn）及葡萄糖转运体蛋白（GLUT1）等摄入蛋白受体的表达；制备 FITC 标记的 Mn@USPIO@CNS 纳米探针及 Mn@USPIO@CNS@GEM 纳米体系，荧光倒置显微镜观察肿瘤组织内分布情况；细胞刮痕实验验证纳米体系对肿瘤迁移的抑制作用;验证经尾静脉注射 balb/c 小鼠胰腺癌模型不同组织分布及肿瘤组织治疗情况。

结果 ；成功制备 Mn@USPIO@CNSs 纳米体系；普鲁士蓝显示细胞内肿瘤细胞较正常胰腺细胞对材料摄取量明显上升，CCK-8 显示纳米材料对肿瘤细胞有较强抑制作用；酶标仪及倒置荧光显微镜显示不同浓度下胰腺癌细胞内 ROS 显著增高；Western Blot 显示 Fpn 及 GLUT1 等细胞蛋白受体的表达量提高；动物实验表明该纳米体系对肿瘤组织生长有明显抑制作用。

结论 Mn@USPIO@CNSs 纳米体系具有高度生物相容性和生物降解性，可以在实现高 T2 弛豫率的同时通过芬顿反应催化肿瘤细胞内 ROS 的产生促进吉西他滨对胰腺的化疗效果，实现基于芬顿反应的胰腺癌铁死亡及凋亡协同治疗。

3.0T 磁共振 3D TRICKS 序列前列腺动脉成像的可行性研究

张晓晶,张爱莲,王海屹,叶慧义,张金龙,马林
中国人民解放军总医院第一医学中心

目的 探讨 3.0T MR 扫描仪上 3D TRICKS 序列进行前列腺动脉成像的可行性。

方法 收集 2017 年 12 月-2018 年 6 月 15 例前列腺增生患者应用 3D TRICKS 序列进行前列腺动脉的磁共振增强扫描，采用 GE Discovery MR750 3.0T MRI 超导型磁共振扫描仪，8ch 心脏线圈，采集时间约 3～4min，所有患者均无磁共振扫描的禁忌症并签署增强扫描知情同意书；每位患者先以 3.0ml/s 的速率注射 20ml 钆贝葡胺后，再以 0.5ml/s 的速率注射 10ml 钆贝葡胺磁共振造影剂，随后以 2.0ml/s 的速率注射 30ml 生理盐水以冲刷血管，并在高压注射器开始工作后 8S 启动扫描 3D TRICKS 系列。将所得数据传输至 ADW4.6 工作站，在此工作站上行最大密度投影(MIP)重建，对前列腺动脉各级分支显示程度及清晰度由两位放射科医师进行双盲法评分。评分采用 5 分制：0 分：图像质量差，血管轮廓不清，完全不能用于诊断分析；1 分：图像质量差，血管轮廓不清，信号不均匀，不满足诊断要求；2 分：图像质量一般，血管轮廓毛糙，信号不均匀，不影响诊断分析；3 分：图像质量好，血管轮廓清楚或少许毛糙，信号较均匀，符合诊断要求；4 分：图像质量极好，血管轮廓清晰锐利，信号均匀，完全符合诊断要求。

结果 15 例受试者中,图像质量 4 分 13 例(86.67%，13/15)，3 分 1 例(6.67%，1/15)，2 分 1 例(6.67%，1/15)，1 分 0 例(0%，0/15)。低分(1～2 分)受试者中 1 例患者前列腺动脉发育变异，未能将动脉全部显示。

结论 3.0T 磁共振 3D TRICKS 序列可清楚显示前列腺动脉的各级分支，为临床及患者提供良好的图像质量，此技术具有很好临床应用前景。

Integrin αvβ6-targeted USPIO nanoparticles in an application of MR molecular imaging of pancreatic cancer cell lines

dengfeng Li[1],Xiaohong Ma[1],Chengyan Dong[2],Xinming Zhao[1]
1.National Cancer Center/Cancer Hospital， China Academy of Medical Sciences and Peking Union Medical college， Beijing
2. GE Healthcare， Beijing， China

Purpose: The motif RXDLXXL-based nanoprobes allow specific imaging of integrin αvβ6, a protein overexpressed during tumorigenesis. Therefore, this study applied a novel RXDLXXL-coupled peptide conjugated with ultrasmall superparamagnetic iron oxide (USPIO)

(referred to as cFK-9-USPIO) in order to detect pancreatic cancer by magnetic resonance imaging (MRI).
Materials and methods: N-amino(-NH2)-modified ultrasmall superparamagnetic iron oxide nanoparticles (USPIO) were conjugated with integrin αvβ6-targeted peptide cFK-9 by dehydration esterification reaction to create a novel MR targeted nanoparticle probe cFK-9-USPIO. Integrin αvβ6 positive pancreatic carcinoma cell lines (BxPC3) and integrin αvβ6 negative human embryonic kidney cell lines (HEK293) were incubated respectively with cFK-9AbFlour 647 (targeting group) and then imaged using laser scanning confocal microscopy (LSCM) and 3.0 Tesla MRI (GE healthcare). The mean fluorescent intensity was applied to semi-quantitatively analyze affinity of cFK-9 targeting αvβ6 and changes of T2 values (ΔT2) were measured to evaluate targeting effect in vitro MR imaging. The in vivo imaging capability of cFK-9-USPIO was investigated in the BxPC3 xenograft models.
Results: In vitro LSCM imaging showed that the difference of fluorescent intensity between targeting group and blocking group in BxPC3 was significantly greater than in HEK293 cells($P<0.01$). In vitro MRI showed a more remarkable T2 reduction in BxPC3 cell lines than HEK293 cell lines($P<0.01$). Similar results are also showed in the BxPC3-bearing nude mice.
Conclusions: Our data demonstrated that novel nanoparticles cFK-9-USPIO can specifically bind with integrin αvβ6 overexpressed pancreatic carcinoma cell lines in vitro and in vivo, which showed great potential to be used in early detection of pancreatic cancer with MR molecular imaging.

磁共振 DWI、IVIM 与肝癌病理学特征相关性研究

刘伟,石鸣琪,孙振博,王培源（通讯作者）
滨州医学院烟台附属医院

目的 探讨体素内不相干运动（IVIM）与磁共振扩散加权成像（DWI）在鉴别肝细胞癌与正常肝组织及肝癌病理分级中的价值。
材料与**方法** 收集我院手术病理证实的 35 例肝细胞癌患者，术前行肝脏常规 MRI 及 IVIM 序列扫描，所有患者在磁共振检查前均未采取过任何治疗措施。根据术后肝癌病理分级不同，将患者分为低、中、高分化 3 组；在同层面肿瘤内与正常肝组织内勾画出感兴趣区，经图像后处理软件得到真性扩散系数（D）、假性扩散系数（D*）、灌注系数（f）及 ADC 值。通过两独立样本 t 检验对同层面不同组织的各参数值及 Kruskal-Wallis 秩和检验对高中低分化组间各参数值的差异进行统计分析；并通过 ROC 曲线显示各参数的诊断效能。
结果 1.相较于正常肝组织，肝癌组织的 D 值、ADC 值降低而 D*值、f 值升高，且各参数的变化差异均具有统计学意义（P=0.01，P＜0.001，P=0.02）；D*具有最佳诊断效能，ROC 曲线面积为 0.806（P＜0.001）。2.IVIM 参数 D 值在高、中、低分化组中分别为(1.02±0.03)×10-3mm2/s、(0.84±0.12)×10-3mm2/s、(0.81±0.12)×10-3mm2/s，在高分化与中-低分化的鉴别中差异有统计学意义(P<0.001)。ADC 值在高、中、低分化组中分别为(1.03±0.03)×10-3mm2/s、(0.94±0.13)×10-3mm2/s、(0.87±0.32)×10-3mm2/s，两两对比差异有统计学意义(P<0.001)。D 值在鉴别高、中分化肝癌具有最佳诊断效能，ROC 曲线面积为 0.75；ADC 值在鉴别中、低分化肝癌中具有最佳诊断效能，ROC 曲线面积为 0.77。**结论** 1.IVIM 各参数对鉴别肝细胞癌与正常肝组织有重要意义。2.IVIM 与 DWI 在鉴别肝癌分化程度上各有优势；D 值与 ADC 值与肝癌分化程度呈正相关。

Superstable Homogeneous System of Drug-Iodine Oil and Its Application in Transarterial Embolization and Fluorescence Surgery of Hepatocellular Carcinoma

Hongwei Cheng[1], Jingsong Mao[2], Hu Chen[1], Yi Cheng[1], Qixuan Dai[1], Yang Sun[2], Chengchao Chu[1], Gang Liu[1]
1. State Key Laboratory of Molecular Vaccinology and Molecular Diagnostics & Center for Molecular Imaging and Translational Medicine, School of Public Health, Xiamen University
2. The Xiang' an Hospital affiliated to Xiamen University

Objective: To accurate distinguish cancerous from normal tissue at the edge of the solid tumor remains a challenge in the surgical therapy of cancer, this study is to develop a platform to achieve the combination of transarterial chemoembolization (TACE) therapy and the precise fluorescence-guided surgical resection. **Methods:** A superstable homogeneous iodinated formulation technology (SHIFT) was designed and indocyanine green (ICG) was sufficiently dispersed into iodized oil. Rabbit VX2 tumor model was used to evaluate the computed tomography (CT) and magnetic resonance imaging (MRI) capability of solvent. Computer-aided ICG fluorescence imaging technology is applied to evaluate the efficiency of the prepared solvent in surgical resection. **Results:** The novel pharmaceutical is designed in a green physical mixture, thereby exclude the potential toxicity of carrier introduction. The ICG-iodine solvent has a controlled morphology, long-term stability, and a sustained drug release rate. Furthermore, the viscosity of the synthetic solvent has no significant difference with iodine oil, the incorporation of ICG and the SHIFT could not affect the CT and MRI capability. Further *in vivo* evaluation shows excellent performance in the fluorescence navigation of rabbit VX2 tumor model for the three weeks of TACE-combined therapy. The solvent has a specific targeting function for tumors, even in the small lesions. **Conclusion:** The solvent with SHIFT performs enhanced fluorescence stability and excellent anti-bleaching ability. The combined of near-infrared fluorescence navigation in surgical resection and TACE could effectively improve the tumor resection rate in hepatocellular carcinoma. The developed drug-iodine solvent with SHIFT can provide a valuable platform to achieve the combined therapeutic effect of TACE and precise surgical resection.

OR-259

Evaluation the Efficacy of Superparamagnetic Iron Oxide Labeled Bone Marrow Mesenchymal Stem Cells in the Treatment of Myocardial Infarction in Rats by 7.0T MRI

Xiaoxin Liu[1], Yushu Chen[1], Lei Wang[1], Xue Li[2], Ziqian Xu[1], Xuejun Ping[3], Fabao Gao[1]
1. Department of Radiology, West China Hospital of Sichuan University
2. Laboratory of stem cell biology, West China Hospital of Sichuan University.
3. Department of Radiology, General Hospital of Ningxia Medical University.

Purpose: To evaluated the efficacy of bone marrow mesenchymal stem cells (BMSCs) in the treatment of acute myocardial infarction (AMI) in rats by 7.0T MRI.
Methods and material: 14 male SD rats were randomized into experiment group (n = 7) and normal control group (n = 7). Rats were anesthetized with chloral hydrate (0.3ml/100g). Opened the rats' chest and ligated the left anterior descending coronary artery to modeled AMI. 25μg/ml Superparamagnetic Iron Oxide (SPIO) combined with 0.75μg/ml L-poly-lysine labeled BMSCs 48h, then BMSCs were collected and directly injected into the infarcted area. MRI scans were performed on D1 and D14 after modeling. Left ventricular ejection fraction (LVEF) and other cardiac function indexes, myocardial strain, the morphological changes of the infarcted area and the signal of infarcted area were used CVI^{42} software to analysis, then objectively evaluated the therapeutic effect of BMSCs on AMI. The rats were euthanized after D14 scanning, and the hearts were taken for histopathological staining to observe the presence or absence of cardiomyocytes and neovascularization.
Results: The signal intensity of SPIO-labeled area in experimental group was significantly lower than control group and muscle ($P<0.001$). The values of end diastolic volume (EDV), end systolic volume (ESV), LVEF, peak strain radial (PSR) and peak strain circumferential (PSC) on D1 were 0.35 ± 0.12ml, 0.19 ± 0.09ml, 0.46 ± 0.08, 54.93 ± 15.83 and 24.50 ± 3.82 respectively in control group and were 0.38 ± 0.13ml, 0.21 ± 0.06ml, 0.46 ± 0.05, 59.16 ± 12.23 and 26.24 ± 2.51 respectively in experiment group. Left ventricular wall thickness on D14 was significantly thinner than D1, and the values of EDV, ESV, LVEF, PSR and PSC on D14 became to 0.7 ± 0.22ml, 0.46 ± 0.18ml, 0.35 ± 0.11, 38.84±15.84 and 20.24 ± 6.43 respectively in control group and were 0.54 ± 0.12ml, 0.33 ± 0.07ml, 0.38 ± 0.05, 65.48 ± 14.35 and 27.21 ± 2.06 respectively in experiment group. The EDV, ESV and LVEF on the D1 and D14 of the control group were no significantly different from the experimental group ($P>0.05$). There was no significant difference in PSR and PSC between the experimental group and the control group on D1 ($P>0.05$), but PSR and PSC on D14 of the control group were significantly lower than the experimental group ($P<0.05$). There were no cardiomyocytes and neovascularization by histopathological staining in experimental group.
Conclusion: BMSCs have no significantly improvement in EDV, ESV and LVEF in the treatment of AMI, but delay the myocardial strain impairment. MRI can be used to evaluate the effect of SPIO-labeled BMSCs transplanted into AMI.

基于化学交换饱和转移技术示踪纳米药在乳腺癌的初步研究

贾岩龙[1],王超超[2],郑杰华[1],沈智威[1],张婷[1],李雁[1],吴仁华*[1]
1.汕头大学医学院第二附属医院
2.华东理工大学化学与分子工程学院

目的：合成一种新型纳米药兼具化学交换饱和转移(chemical exchange saturation transfer, CEST)效应，并利用 CEST 技术示踪纳米药在乳腺癌肿瘤内的分布情况及治疗作用。
方法：将含有酰胺质子的丙烯酰胺在可逆加成-断裂链转移聚合作用下与丙烯腈结合并通过自组装构建一种两亲性嵌段共聚物(PEG-b-(PAM-co-PAN))。在 PEG-b-(PAM-co-PAN 基础上采用纳米沉淀

方法将化疗药阿霉素包埋在纳米粒内从而制备了一种兼具 CEST 效应的新型纳米药（PEG-PAM-PAN@DOX）。对纳米粒的表征、细胞毒性及活体毒性进行测定。20 只 BALB/c 裸鼠乳腺癌模型（原位肿瘤 12 只，异位肿瘤 8 只）用于示踪纳米药在肿瘤内的分布情况及疗效的评价。
结果 ：(1) 位于丙烯酰胺上的酰胺质子在 2.75 ppm 处产生了明显 CEST 效应，而纳米药 PEG-PAM-PAN@DOX 在 0.5ppm 具有 CEST 效应，其效应的大小与物质的浓度、pH、饱和脉冲能量及脉冲持续时间有关；（2）对 PEG-PAM-PAN@DOX 进行表征证明该方法是可行的，且纳米药呈球形稳定地分散在水中，直径在 100-120 nm 之间；（3）体内、外实验未发现 PEG-PAM-PAN 具有明显的毒副作用（$p>0.05$），生物安全性好且可降解；（4）利用 CEST 成像技术于尾静脉注射后 1 h（4 只），2h（3 只）及 2.5 h（1 只）示踪到纳米药在肿瘤内达到峰值；（5）细胞吞噬实验发现纳米药更容易进入细胞内并与细胞核结合抑制癌细胞的增殖，同时活体实验证明纳米药物具有与游离 DOX 相同的治疗效果，且副作用小。
结论 ：纳米药 PEG-PAM-PAN@DOX 不仅具有治疗的功效还可以利用 CEST 技术示踪其在肿瘤内的分布情况，为筛辨出对化疗药敏感患者并制定个体化治疗方案奠定了基础，具有广阔的应用前景。

外源性波谱标志物进行肿瘤 MRS 分子成像初探

霍天龙
北京大学人民医院

[摘 要] 目的 探讨外源性波谱标志物进行肿瘤 MRS 分子成像的可能性。方法 用高场 MR 检测不同浓度苏木素溶液，分别用点解析波普法（Point Resolved Spectroscopy，PRESS）和激励回波获取法（Stimulated Echo Acquisition Mode，STEAM）法进行 MRS 成像，分析不同扫描方法和浓度苏木素 MRS 信号特点。结果 无论 PRESS 和 STEAM，苏木素均可检出特征性波谱谱线，峰位固定，但峰高和峰面积和浓度相关，浓度越高，谱线越清晰。结论苏木素有特征性 MRS 信号，有可能为肿瘤分子成像提供合适的外源性靶标物质。

Ultrasmall Biocompatible WO 3-x Nanodots for Multi-Modality Imaging and Combined Therapy of Cancers

Ling Wen[1],Zhu xin Wei[1],Chunhong Hu[1],Ming yuan Gao[2]
1.The Frist Affiliated Hospital of Soochow University
2. Center for Molecular Imaging and Nuclear Medicine School for Radiological and Interdisciplinary Sciences (RAD-X) Soochow University

Objective: With the assistance of WO_{3-x} nanoprobes, complementary multi-modal molecular iamging has been uesd to study the early breast cancer, and provide insights for the precise diagnosis and treatment of breast cancer.
Method: a novel nanotheranostic agent was developed for multi-modal imaging and therapy of early breast cancer. First, ultra-small WO_{3-x} nanoprobe with strong localized surface plasmon resonance (LSRP) in the near-infrared region was prepared by a one-pot reaction method, and their LSRP was enhanced under weak acidic and hypoxia conditions. The resultant ultrasmall biocompatible WO_{3-x} nano-probe was employed as a contrast agent for photoacoustic imaging, and as a transducer for photothermal therapy. Owing

to the high atomic number of W and strong X-ray attenuation coefficient, ultrasmall WO_{3-x} nano-probe was also as contrast agent for CT imaging, and as a radiosensitizer for radiotherapy.

Result: The experimental results show that ultrasmall biocompatible WO_{3-x} nanodots not only have excellent attenuation and sensitization to X-rays for CT imaging and radiaotherapy of breast cancer, but also exhibit high photothermal conversion efficiency for its photoacoustic imaging and photothermal therapy. Combination of photothermal therapy and radiation therapy is the most effective method for killing tumor and preventing it recurrence.

Conclusion: With the assistance of ultrasmall novel nanotheranostic WO_{3-x} nanodots, breast cancer can be detected at an early stage through multimodal imaging, and treated by combined photothermal therapy and radiotherapy. The results could provide guidance for clinical treatment of breast cancer.

Biocompatibility Red-Emissive Carbon Dots for Fluorescent Bioimaging, Reactive Oxygen Species Produce and Accumulation property in Mice Brain

Lijuan Chen[1,2], Yan Bai[1,2], Haiyan Gao[1,2], Meiyun Wang[1,2]
1. Henan Provincial People's Hospital
2. Henan Key Laboratory of Neurological Imaging

Objective

An ideal and novel materials for tumors theranostics are still trying to explore. In this research, we are attended to report the novel biocompatibility red-emissive carbon dots, which possess good water dispersibility, strong red fluorescence emission (deeper tissue penetration). the low cytotoxicity, biochemical safety and biocompatibility, and further could be used as cell imaging agents and animals living imaging materials *in vivo*. Moreover, the excellent CDs can accumulate in brain and solid tumor, which expected to help with surgical navigation. Furthermore, CDs can produce the reactive oxygen species (ROS) once light-inspired which act as an excellent property in tumor photodynamic therapy (PDT) aspect. The as-prepared CDs nanoparticles can be used as an ideal tumor theranostics material in the future [1-2].

Methods

Preparation and Characterization of CDs. The CDs were prepared by one-step hydrothermal method with P-Phenylenediamine and thiourea were dissolved into ultrapure water, further heating at 200 ^{0}C for 10 h and immediately dialysis. The mean particle size, the morphological (TEM), An UV-vis spectrum, XRD and XPS were confirmed to the physicochemical properties of CDs.

Cellular Fluorescent Imaging *in vitro*. To explore the cellular fluorescent imaging application, A549 and MCF-7 cells were seeded in a 6-well culture plate, incubated for 24 h, CDs were added at final concentration of 100 μg/mL. After further 12 h incubation. Detected fluorescence intensity via flow cytometry. for the visual analysis, after CDs and cells 4 h incubation, fixed with 70% ethyl alcohol, and after stain with DAPI, the cells were observed by confocal laser scanning microscope.

***In Vivo* Bio-Distribution.** we collect the CDs in EP tube for fluorescence imaging *in vitro,* and further investigated the feasibility of CDs for fluorescence imaging *in vivo*. BALB/c-nu mice with subcutaneous MCF-7 human breast cancer was selected as the animal model. the mice were treated with intravenous injection of CDs (60mg/kg, 0.2mL). The certain interval fluorescence distribution of samples in mice were obtained with IVIS Lumina Series Ⅲ (excitation=480, emission=620). At 24 h, the organs were harvested for *ex vivo* imaging to tissue/organ distribution. All the reported animal experiments were performed by strictly following the IACUC-approved protocols.

CDs-promoted ROS production and cell apoptosis *in vitro*. 2, 7-Dichlorodi-hydrofluorescein diacetate (DCFH-DA), which is applied to detect ROS inside the cell of biological systems. CDs (3mg/mL) was added into MCF-7, after incubated 4 h, the DCFH-DA (10 μm) was introduced with the five groups, (1) DCF alone as blank; (2) laser only; (4) CDs only; (5) CDs with laser at 660 nm (0.9 mA/ cm^2, 2 min). The DCF fluorescence was detected by Flow Cytometry and confocal laser scanning microscope. Alexa Fluor 488 Annexin V-FITC/PI Cell Apoptosis Kit was used to quantify apoptosis, MCF-7 cells were seeded in a 6-well culture plate with a 1 x 10^5 cells/well, incubated for 24 h, reinfused into the serum-free culture medium with the sterile CDs solutions (20 μg/mL, 40 μg/mL). After 2 hs' incubation. Collect the culture as well as the cells. Annexin V-FITC/PI were detected fluorescence intensity via Flow Cytometry.

Cellular Cytotoxicity and Safety Studies *in vivo*. MTT assay was conducted on 3T3, A549 and MCF-7 to determine the cytotoxicity and biocompatibility of the CDs. Cell culture method as described above, the optical density (OD) of the samples was monitored by an ELISA micro plate reader at 570 nm (n= 6). The typical method of complete blood count (CBC) to evaluate safety about myelosuppression and blood compatibility for foreign materials. And obtain serum for blood chemistry tests (AST, ALT, ALP, TP, CRE, and BUN). Subsequently, the main organs of the mice (heart, liver, spleen, lung, and kidney) were harvested and fixed using 4% neutral paraformaldehyde for H&E stained. All the obtained biopsy samples were imaged using an optical microscope.

Results

Characterization of CDs. As is typical, the as-prepared CDs were a homogeneous and red-clear solution. As displayed in the TEM image, CDs give a uniform diameter of 7-8 nm, which also can be proved straightway by the DLS analysis, and the PDI distribute is 0.161 with a good momodispersity. In addition, the crystalline property of CDs was confirmed by XRD. A broad peak centered at 23.2° can be associated with highly disordered carbon atoms and attributed to graphite lattice spacing (002) showing a *d* spacing as to 0.38 nm. The FTIR analysis further confirmed the presence of oxygen-containing (C-O, OH, C=O, C=O-C), nitrogen-containing (NH_2, C-N) and sullied-containing (C-S) groups on the surface of CDs. The UV-vis absorbance and fluorescent property were displayed that UV–vis spectrum of C-dots shows broad absorption from 200 to 750 nm and possesses a sharp characteristic peak at 250 nm corresponding to the π－π＊ transitions of C=C in CDs, which do not generate fluorescence. Furthermore, this UV-vis spectrum exhibited distinct absorption bands at 301 nm, 511 nm, and 600 nm in the lower-energy region, demonstrating the different surface states and corresponding to fluorescent property. Moreover, the excitation-dependent nature can be discovered for each concentration of as-prepared CDs. In brief, the emission peaks are shifted from 420 nm to 620 nm with increase of excitation wavelength from 360 nm to 600 nm using 0.5 mg/mL of CDs as an example, which was similar with previous reported CDs. The full-scan XPS spectrum is further investigate the surface chemistry

of CDs. Five characteristic peaks at 160.3, 225.2, 285.5, 401.8 and 529.5 eV can be founded obviously, which are associated with the characteristic peaks of S2p, S2s, C1s, N1s, and O1s, respectively. These results revealed a small amount nitrogen atoms and sulfur doped into CDs. The high-resolution spectra of C1s, reveals three different types of carbon atoms corresponding to C-C/C=C (284.8 eV), C-N/C-O/C-S (285.9 eV) and carboxyl carbons (COOH) (288.8 eV), respectively. The detail analysis of N1s demonstrate two types of nitrogen atoms at 399.4 eV and 401.2 eV, which is accordance of pyridinic N and pyrrolic N, respectively. In addition, the O1s analysis includes two peaks at 531.6 eV and 533.2 eV, corresponding to C=O and C-O, respectively.

Cellular Fluorescent Imaging Studies. Cellular fluorescent imaging studies were conducted at the safe concentration, 12 h co-incubation with cells and sterile CDs solutions (600 μg/mL), confocal images of MCF-7 at bright field, and with DAPI together positioning the cells. At 480 nm excitation and 620 nm emission filters, it shows that most CDs distributed and agglomerated inside the cell's cytoplasm but not cell nucleus. The results are likely to the gather of CDs, which lead to the particles size increased and cannot cross nuclear pore. The qualitative results show that CDs can demonstrate the bright and enduring red fluorescence imaging for cells. Meanwhile, flow cytometry demi-quantitative analysis results reveal that CDs were uptake in cells and perform positive rate 70.67 % compared to the control group.

In Vivo Bio-Distribution Study. CDs shown strong FL intensity in tube, furthermore, *in vivo*, sterile CDs solutions (6000 μg/mL, 200 μL) was intravenously injected into tumor-bearing mice, results suggest that the CDs primarily accumulated into the brain after post-intravenous, and gradually metabolized out of the brain within 48 h. at the 2 h, the strong FL signal displayed in the kidneys suggest that the CDs can be excreted from the body by renal. The organs were harvested at 48 h post-intravenous injection for imaging analyses ex *vivo*. Only brain and tumor exhibited relatively meaningful and brighter fluorescence than other organs (kidneys, liver, cervical lymph nodes, lung, spleen, and heart). Importantly, combining the images and quantitative brain exhibit higher fluorescence intensity than the tumor, we hypothesis that CDs can pass the blood brain barrier (BBB) maybe because of its ultra-small size. what's more, the brain accumulate may contribute to the CDs were prepared by organic materials and consisted of (C, N, O, S) elements, which might reduce the rejection from BBB towards exogenous materials. And possibly owing to the brain capillary endothelial cells expressing the glucose and glutamate receptors[3].

CDs-promoted ROS production and cell apoptosis *in vitro*. For ROS generation studies[4,5], CDs exhibit excellent ability to produce ROS in MCF-7 in qualitative and quantitative. Compared with control group, which show that the positive rate of 34.15 %, and the laser only group generated only 1.26 %, co- treated cells with laser and CDs, the group generated ROS at 54 %. CDs induced the cells produce ROS, and Light-induced the CDs produce more than one times ROS. Visualization results show that CD-promoted ROS production were shown in the corresponding picture with green (DCF), with the DAPI positing cells. a laser irradiation can have the generation of reactive oxygen species, improve the tumor site of oxygen environment, leading to tumor cell apoptosis, and even death. CDs lead to 38 % MCF-7 cells early apoptosis at 20 μg/mL, and at 40 μg/mL, cell apoptosis rate increased about 15%. And at the same concentration, the laser irradiation inducement of apoptosis rate increased about 10 %. The results showed that CDs themselves cause cell apoptosis, and at the lower concentration, CDs plus laser more significantly induced cell apoptosis, the cytotoxic

effect on MCF-7 cells could be boosted by the laser irradiation. And the higher concentration showed the same trend. The ROS production and cell apoptosis property provide the potential applications on tumor photodynamic therapy *in vivo*.

Cellular Cytotoxicity and safety studies *in vivo*. MTT assay results show that the IC50 of 3T3 at 42.9 μg/mL, A549 at 432.4 μg/mL, MCF-7 at 458 μg/mL and 4T1 at 405 μg/mL, respectively. The results of hemolysis test revealed that CDs performed good blood compatibility, there is no hemolysis occurred at 800 μg/mL (hemolysis rate was less than the international level 5%). Moreover, biochemical and organization safety evaluation were also conducted, with the results that the mice complete blood count was within the normal range compared with the control group. Blood chemistry tests revealed that intravenous injection CDs lead to neither hepatic nor renal dysfunction, and no inflammatory cells were found in heart, liver, spleen, lung, and kidney cells in H&E histological stained tissues.

Conclusion

In summary, we have shown one-step hydrothermal synthesis method to prepare fluorescent CDs in pure water solution. The CDs with nanoparticle size and emit strong red light under irradiation The CDs showed good overall three-in-one properties, good fluorescence image performance, photo-produce the reactive oxygen species and bioimage in brain. The fluorescence image performance enabled CDs to be superior choice as visualize biological systems probe both *in vitro* and *in vivo*. Furthermore, the CDs across the blood brain barrier and accumulate in brain, the superior ability could be used for noninvasive brain imaging, and further for diagnosing brain diseases, such as glioma, cerebral parasitic disease, meningitis. Moreover, CDs also demonstrate photo-produce the ROS which act as an excellent property in tumor PDT therapy, which could be used for glioma therapy. The present works provide a multifunctional application of CDs in both bioimaging and PDT therapy.

Polyphenol/MnO2 Hybrid Theranostic Agents for MRI-guided Photothermal Therapy

Xiaoxuan Zhou[1,2],Bin Xiao[2],Jianbin Tang[2],Yue Qian[1],Hongjie Hu[1],Youqing Shen[2]

1.Sir Run Run Show Hospital

2.Key Laboratory of Biomass Chemical Engineering of Ministry of Education, Center for Bionanoengineering, and College of Chemical and Biological Engineering, Zhejiang University

Purpose:

we exploited polyphenols as direct photothermal sources and developed a epicatechin-derived polyphenolic and biomineralization incorporated nanotheranostic agents with functional magnetic resonance imaging (MRI) and photothermal therapy (PTT).

Materials and Methods:

The polymer and manganese dioxide hybrid nanoparticles were synthesized through a facile and one-step method according to our previous research.[1] For the orthotopic 4T1 tumor model, 5×10^5 cells in 200 μL PBS were injected into the mammary gland of each Balb/c mouse, and all the corresponding experiments *in vivo* were performed till the tumor volume reached about 60 mm^3. For *in vivo* MRI of orthotopic tumor, Balb/c mice bearing 4T1 tumors were intravenously injected with BME (56 μmol Kg^{-1} in terms of

Mn for each mouse). All the images were collected at predetermined timed intervals, followed by the measurement of signal intensities. For *in vivo* PTT, Balb/c mice with orthotopic 4T1-bearing tumors were randomly allocated into 4 groups (n = 5, each group): (a) PBS treated, (b) NIR laser treated, (c) BME treated, and (d) BME with NIR laser treated. Meanwhile, the tumor sizes were measured and body weight were also monitored.
Results:
The epicatechin-MnO_2-BSA (BME) nanocomposites demonstrated ultra-high MRI (longitudinal relaxivity up to 30.01 $mM^{-1}s^{-1}$) *in vitro*. Meanwhile, a greatly hyper-enhanced rim was observed around the tumor contrasted by BME in 5 min, following centripetal fill-in enhancement of the whole tumor site last for at least two hours, which provided precise differentiation between the tumor and normal tissues. The signal changes of tumor were quantitatively calculated, showing T1-wighted signal enhancement of 68% at 30 min post injection. Furthermore, the group treated with BME and laser exposure showed complete tumor ablation without recurrence, which showed excellent photothermal therapy efficacy with complete ablation of orthotopic tumors.
Conclusion:
Efficient integration of epicatechin-based polyphenols and albumin-templated biomineralization presents a promising strategy for the production of facile nanotheranostic agentswith MRI-guided PTT.

Theranostic Mn(Ⅲ)/Mn(Ⅳ) Dual-valence MRI Nanoprobe with Ultrasensitive Tumor Microenvironment Response: Preparation and Application

Kai Xu[1],Heng Liu[2],Weiguo Zhang[1]
1.Department of Radiology, Daping Hospital, Army Medical Center of PLA, Army Medical University
2.Department of Radiology, PLA Rocket Force Characteristic Medical Center

Objective To develop novel theranostic MRI nanoprobe with ultrasensitive tumor microenvironment response, investigate the effect of comprehensively alleviating tumor microenvironment and the mechanism of ultrasensitive tumor-target MRI imaging. **Methods** Theranostic Mn(III)/Mn(IV) dual-valence MRI nanoprobe was synthesized via biomineralization process, the morphological structure, average particle size and the ratio of manganese valence were detected. Then, the cell viability test and MR scanning in vitro were used to observe the biocompatibility and the sensitivity of pH changes. The MR scanning in vivo, HE and immumohistochemical staining were applied to detect the ability of rapid and sensitive imaging and the effect of alleviating tumor microenvironment. **Results** The dual-valence MRI nanoprobe was prepared, with the average size of (80.6±24.9) nm, the ratio of Mn(III) was 52.2% and Mn(IV) was 47.8% and the cell viability test demonstrated the good biocompatibility. In vitro MR scanning proved the sensitivity of detecting the pH changes. In vivo MR scanning showed the excellent ability of penetrating blood brain barrier and the rapid (15min) and lasting tumor imaging. HE staining, HIF-1α immumohistochemical staining and Western-Blot showed the ability of alleviating tumor microenvironment. **Conclusion** Due

to the combination of two valence states of manganese, the prepared theranostic Mn(Ⅲ)/Mn(Ⅳ) MRI nanoprobes via albumin biomineralization process overcome the shortcome of single valence state of manganese and exhibit the excellent capability for ultrasensitive tumor microenvironment response imaging and tumor microenvironment alleviation

前列腺癌诊疗一体化 Fe304 纳米探针的构建与应用

孙振博,杨彩霞,李佳,孙旭成,刘宇威,李祥林（通讯作者）
滨州医学院

目的 探讨前列腺癌诊疗一体化 Fe_3O_4 纳米探针的构建方法和理化性质，并评价对前列腺癌细胞光动力治疗作用的体外生物学特性及 MRI 的可行性。**方法** 将超顺磁性氧化铁（SPIO）溶于水中，通过氨基化修饰组装前列腺癌特异性靶向基团叶酸，再组装可用于肿瘤治疗的光敏剂 Ce6，从而构建用于前列腺癌“诊疗一体化”的多功能纳米探针；后期经过材料表征、体外实验、体内实验对探针进行检测，得出探针诊疗效果及相关数据。**结果** 成功构建 Fe_3O_4 纳米探针，其粒径在（100±4.7）nm，电位在-8 mV；MR 扫描结果显示随着 NPs 浓度的增加，T_2 弛豫时间缩短，T_2 信号强度降低，说明探针具有良好的 MR T_2 成像效果。经体外实验得到结果如下，利用四唑盐比色法（MTT）实验结果表明探针暗毒性小，光毒性强，生物相容性高又可以用于光动力治疗；DAPI 染色和普鲁士染色结果表明探针的入胞效果好，具有准确的靶向性；经体内实验得到结果如下，进行 7.0TMR 扫描，实验组较对照组其 T_2 信号强度均有明显下降，注射 9 h 后靶向聚集效果最强，12 h 后基本代谢完毕，说明该探针在体内有较好的 MR 成像效果，并且其代谢速度较快，对体内微环境影响较小；经过光动力治疗后，肿瘤生长速度得到了明显的抑制，并且随着治疗总时间累积，肿瘤体积明显减小，具有良好的光动力治疗效果。**结论** 通过对材料进行表征、体外实验以及动物体内实验验证了该纳米探针理化性质优良，具有良好的 MR 成像效果，对前列腺癌细胞具有准确的靶向性并可结合光动力治疗准确杀伤肿瘤细胞。

Alters of DTI at animal MR and expression of the CREB signaling pathway in rat models of depression

Wei Zhang,Caixia Yang,Xianglin Li,Xiaodan Wei,Zhenbo Sun,Jie Zhang,Bin Wang
Binzhou Medical University

Objective: This study was performed by establishing the accepted chronic unpredictable mild stress (CUMS) rat model,considering the hippocampus and the prefrontal lobe as the region for research. The changes in the brain of depressive rats were observed with diffusion tensor imaging (DTI). In addition, the pathogenesis of depression was analyzed and discussed from the perspective of cAMP-response element binding protein(CREB) signaling pathway combined with Western Blot(WB) .
Materials and Methods: The CUMS rat model of depression was used in this study. All model and control rats were anaesthetized and scanned using the 7.0T MRI. Axial, sagittal, and coronal images were scanned separately.The fractional anisotropy(FA) values and mean diffusivity (MD) values of cerebellar white were measured in the hippocampus and the prefrontal cortex. After scanning, the target antigen was detected by WB.
Result: The sucrose consumption in the model group was significantly decreased, compared to that of the control group ($P < 0.05$). The level and vertical scores of the model group in an open field experiment were significantly lower than those of the control group ($P < 0.05$). The FA values of cerebellar white in the left and right hippocampus and the left prefrontal cortex decreased in the model group compared to controls ($P < 0.05$). The MD values in the left hippocampus and the left prefrontal cortex of the model group were both increased compared to controls ($P < 0.05$). The expression of BDNF and p-CREB significantly decreased in the left and right hippocampus and the left and right prefrontal cortex of model group ($P < 0.05, p<0.01$).
Conclusion: The study used DTI and WB in bilateral hippocampus and bilateral prefrontal cortex of depressive rats. The alters of DTI were consistent with histological changes, therefore proving that both the hippocampus and prefrontal cortex are essential in the pathogenesis of depression. This study has shown that white matter integrity in the hippocampus and the prefrontal cortex is impaired in the rat depression model compared to the control rat.In addition, the study of DTI showed that there was a difference in the bilateral hippocampus and bilateral prefrontal cortex. Consequently, this study supports the view of the imbalance in hemispheres during the pathophysiological process of depression. This study proves that CERB signaling pathways are important targets for studying the mechanism of antidepressants.

18F-FDG PET/MRI 与 PET/CT 在淋巴瘤诊断价值比较的初步研究

肖悦,马全美,王鹏远,杜名,辛军
中国医科大学附属盛京医院

目的 比较 PET/MRI 与 PET/CT 对成人淋巴瘤的诊断效能。次要目的是评价 ^{18}F-FDG 摄取参数与多参数功能 MRI 指标的相关性，探讨淋巴瘤糖代谢的异质性，即 PET/MR SUV 值与体素内不相干运动扩散加权成像（IVIM-DWI）的 D 值、D*值及 F 值之间的关系。
方法 收集我院 2017 年 10 月 1 日至 2019 年 3 月 31 日经病理证实的霍奇金淋巴瘤和非霍奇金淋巴瘤患者 45 例的前瞻性研究。获得 PET/MRI 与 PET/CT SUVmax 以及最高代谢病灶对应的 D 值、D*值及 F 值，评估疾病的分期及状态（缓解或者活跃期），采用 Spearman 相关分析分析两种技术 SUVmax 以及 SUVmax 与对应的 D 值、D*值及 F 值相关性。
结果 PET/CT 和 PET/MRI 均检出 71 个结节和 6 个结外点， IVIM-DWI 中测出 43 个病灶对应值，其中 3 个结外位点在 PET/CT 上不确定是否侵犯，在 PET/MRI 上确定侵犯。对于阳性病灶的检测，PET/CT 与 PET/MR 的一致性几乎完全一致(k > 0.965)。PET/CT 与 PET/MRI 在淋巴瘤分期上一致性也近乎一致 k =(0.912-1.000)。PET/CT 与 PET/MRI 的相对应的 SUVmax 呈显著相关性(相关系数 r=0.923，P < 0.001)。D 值与 SUV 值有弱相关性（相关系数 r=-0.242,P < 0.05)、F 值与 SUV 值有中等强度相关性（相关系数 r=0.520,P < 0.001）。
结论 ： PET/MR 与 PET/CT 的 SUVmax 高度相关，提示 PET/MR 对淋巴瘤的半定量分析具有很好的稳定性和准确性。功能磁共振序列参数 D 值、D*值及 F 值可以提供肿瘤缺氧状态、血液灌注、分子扩散等方面的信息，可用于评价淋巴瘤糖代谢的异质性，但数据较少，仍需要进一步研究。

Study on targeted imaging of dual-modal albumin nanoparticles in glioma

Fan Lin,Yi Lei
The First Affiliated Hospital of Shenzhen University， Health Science Center， Shenzhen Second People’s Hospital

Objective : Preparation and characterization of dual-modal targeted albumin nanoparticles for glioma; In vitro targeting effect of mouse glioma cell G422 by dual-modal targeting albumin nanoparticles; In vivo targeting effect of glioma dual-modal targeted albumin nanoparticles on in-situ glioma mouse model.

Methods: Magnetic albumin nanoparticles loaded with indocyanine green (ICG) were prepared by dissolvation-crosslinking method, and their size, surface Zeta potential and fluorescence intensity were characterized by transmission electron microscopy (TEM), laser particle size analyzer (DLS) and fluorescence spectrometer. Fe content was detected by o-diazophane method. Angiopep2 targeted peptide was coupled to the surface of albumin nanoparticles by EDC/NHS method to prepare glioma dual-modal targeted albumin nanoparticles, and the amount of targeted peptide coupling was detected by UV-vis spectrometer. In vitro cell experiment: the targeted group and the non-targeted group were set and incubated with mouse glioma cell G422 for 24h, and

the nanoparticle targeting effect was verified by Prussian blue staining and laser confocal microscope. In vivo animal experiment: the in situ glioma model of nude mice was established, and the targeted group and the non-targeted group were set up. The distribution of nanoparticles in vivo and the glioma targeting situation were monitored by MRI and in vivo fluorescence imaging system.

Results : First, the prepared glioma dual-modal targeted albumin nanoparticles were spherical in shape, uniform in size and about 80nm for TEM detection. DLS showed hydrated particle size of about 120nm and surface zeta potential of about 20mV. The emission peak of nanoparticles was detected at 830nm by fluorescence spectrometer. The content of Fe was 1.5mg/mL by o-diazophane method. The coupling amount of the targeted peptide detected by UV-vis spectra was 0.8mg/mL. Sencond, in vitro experiments: Prussian blue staining showed that after co-incubation of the targeted group with G422 cells, there were a large number of iron nanoparticles in the cells. The non-targeted group had fewer iron nanoparticles. After co-incubation with G422 cells, the ICG fluorescence signal of the targeted group was significantly stronger than that of the non-targeted group. Third, in vivo experiment: in vivo MRI imaging results showed that after the targeted group was injected through tail vein, the T2WI signal intensity of the brain and tumor decreased significantly. There was no significant reduction in the non-targeted group. In vivo fluorescence imaging results showed that after the targeted group was injected through tail vein, the fluorescence signal was mainly concentrated in the liver and gradually enhanced in the brain. In the non-targeted group, no fluorescent signals were detected in the brain.

Conclusion: Dual-modal targeted albumin nanoparticles were successfully prepared for glioma. The dual-modal targeting albumin nanoparticles of glioma had a better targeting effect on mouse G422 cells in vitro. The dual-modal targeting of albumin nanoparticles in glioma showed a better targeting for in-situ glioma in mice.

942 例颅内动脉瘤血管内治疗围术期出血并发症分析及防治

蒋业清,黄磊,鲁刚,葛亮,狄若愚,万海林,张晓龙
复旦大学附属华山医院

目的 分析 942 例颅内动脉瘤行血管内治疗的围术期出血并发症发生情况，并探讨其处理措施。**方法** 收集 2011 年 1 月至 2019 年 4 月复旦大学附属华山医院收治的 942 例颅内动脉瘤患者（1055 个动脉瘤），分析围术期出血并发症发生原因，探讨围术期用药方案，总结防治措施。**结果** 本组 942 例患者出血性并发症共 12 例（1.27%），其中术中出血 9 例、术后出血 3 例。9 例术中出血致死率及致残率均为 0，其中因弹簧圈损伤瘤腔致动脉瘤破裂 6 例，微导管损伤瘤腔致动脉瘤破裂 2 例，微导丝损伤远端小分支导致出血 1 例。9 例患者均预后良好，出院前 mRS 评分较入院时未增加。术后出血 3 例均死亡，其中 2 例蛛网膜下腔出血可能与瘤腔栓塞不全或术后肝素化有关，1 例基底节区血肿可能与术后血压一过性增高有关。**结论** 术前不常规应用抗血小板聚集药物及肝素化可降低术中出血导致的致死率，及时识别及处理，多数患者预后良好。术后出血发生率低，但预后差，病死率高。术前充分评估危险因素，术中致密填塞瘤腔，术后慎用抗凝治疗，可改善出血患者的预后。

OR-272
Stanford B 型主动脉夹层覆膜支架腔内修复术远期疗效分析

向东桥,王莉霞,郑传胜
华中科技大学同济医学院附属协和医院放射科

目的 探讨胸主动脉腔内修复术（TEVAR）治疗 Stanford B 型主动脉夹层的长期疗效。
方法 回顾性收集武汉协和医院 2008 年 3 月至 2018 年 3 月收治的 300 例行 TEVAR 治疗的 Stanford B 型主动脉夹层患者的临床及影像学资料，分析短期（在院/术后 30 天）及长期死亡率、并发症发生率及主动脉重塑情况。
结果 技术成功（覆盖主要破口）率 100%。左锁骨下动脉完全覆盖 29 例，烟囱支架重建左锁骨下动脉 11 例，烟囱支架重建左颈总动脉 7 例。术毕即刻造影发现 53 例 I 型内漏，21 例予以球囊扩张后内漏减少或消失，13 例加放 cuff；术后 30 天死亡率 0.7%（2/300），并发症发生率 14.0%（42/300）。随访截止 2018 年 9 月，中位随访时间 35 个月（6-126 个月）。1、3、5 年累积全因死亡率分别为 2.0%、6.7%、12.8%，主动脉夹层相关死亡率分别为 1.7%、4.5%、8.4%；晚期并发症发生率 14.7%（44/300），胸主动脉段假腔完全血栓化率 83.7%（251/300）。
结论 应用覆膜血管内支架行 TEVAR 是治疗 Stanford B 型主动脉夹层安全有效的方法，随访期间病死率低，长期疗效令人满意。

OR-273
基于腔内介入的下肢动脉源性溃疡个体化治疗策略

王鹏
江南大学附属医院（原无锡三院）

目的 :结合腔内针对病因治疗，本院烧伤科 VSD 负压吸引、诸氏中医外科换药、我科臭氧浴换药，提高患者动脉源性溃疡愈合率。建立下肢动脉源性溃疡多学科综合治疗技术规范和临床路径。**方法** : （1）完成患者分类入组：分别选取糖尿病性溃疡 Wagner 不同分级患者组、动脉硬化闭塞性溃疡 Fontaine 不同分级患者组各 30 例进入 MDT 模式，另外选取不进入 MDT 诊疗模式的对照组 30 例。CTA 明确血供情况，拟定腔内手术方案。（2）按照治疗计划，对入选 MDT 组的不同患者，每一亚组按照不同分级进行针对性的腔内操作，开放阻塞的动脉血管后联合我科臭氧浴换药。对比测量术前、术后踝肱比指数及创面血氧分压水平。（3）介入疗效满意后转到烧伤科/诸氏中医外科进行 VSD 操作/中医换药；对照组仅执行腔内治疗联合臭氧浴换药。进行多因素方差分析，比较组间疗效。扩大样本量，对入选 MDT 组患者多学科治疗，总结其疗效影响因素，进行多因素逻辑回归分析，（4）组间对照研究，制表格分析，评价溃疡愈合疗效。**结果** :多学科治疗组溃疡愈合率明显优于仅采用腔内治疗联合臭氧浴换药对照组(P＜0. 05)。**结论** : 医学认为血管灌注不良、动脉粥样硬化、水肿和反复的局部损伤通过不断启动炎症级联反应在创面溃疡形成中有重要的致病作用。实践已经证明通过减轻创面水肿、增加富含氧份的血液灌注可以显著改善创面愈合。最常见的动脉源性溃疡存在着血流不畅、微循环障碍，这恰恰是血管腔内治疗可以发挥特长的地方。本研究基于腔内治疗微创高效优势针对病因治疗——开通堵塞的动脉血管，充分整合了我院多学科综合治疗实力，发挥特长，利用无锡市伤口治疗中心坐落我院的独特优势，创立了针对不同类型溃疡分层分级 MDT 治疗模式。我中心建立了溃疡治疗的多学科、全程、高效理念，优化了多学科诊疗流程，明确了各型患者实行血管内治疗/VSD 治疗/中医换药/臭氧治疗的最佳干预时机，明显提高了患者溃疡愈合率。

药涂球囊对不同部位下肢动脉粥样硬化闭塞疗效观察

刘亚民
西安交通大学第一附属医院

【摘要】 **目的** 评价药物涂层球囊扩张术对不同部位下肢慢性动脉粥样硬化闭塞性症的安全性和有效性。**方法** 采用随机病例对照研究方法对实施药物涂层球囊扩张术治疗慢性下肢动脉硬化闭塞症的有效性和安全性进行评价，随机抽取 55 例患者，分为股-腘动脉组 32 例，腘-膝下动脉组 25 例，应用导管、导丝、普通球囊相配合行闭塞管腔开通后药物涂层球囊扩张。观察两组患者术后 3、6 及 12 个月的再狭窄率、目标病变在再干预率和保肢率及术中治疗部位相关并发症。**结果** 两组患者的年龄、性别及动脉粥样硬化危险因素构成、治疗前踝肱指数、靶病变的狭窄、闭塞状况和长度，Rutherford 分类均具有可比性($P > 0.05$)。术后 3、6 和 12 个月彩超复查股-腘动脉组与腘-膝下动脉组再狭窄率为：0（0）*vs.* 4.7%（1 例）（$X^2=1.12$, $P > 0.05$）；3.5%（1 例）*vs.* 9.5%（2 例）（$X^2=1.96$, $P > 0.05$）；10.7%（3 例）*vs.* 33.3%（7 例）（$X^2=6.59$, $P < 0.05$）；12 个月的目标再干预率 7.1%（2 例）*vs.* 33.3%（7 例）（$X^2=7.48$, $P < 0.05$）；12 个月的保肢率 100%（28）*vs* .23.8%（5 例）（$X^2=4.98$, $P < 0.05$）。围手术期两组均无死亡病例，治疗部位相关并发症无统计学意义[非限流性夹层 17.8%（5 例） *vs.* 19.0%（4 例）（$X^2=1.82$, $P > 0.05$）；急性血栓形成 3.1%（1 例）*vs.*4.0%(1 例)（$X^2=1.79$, $P > 0.05$）；远端栓塞 10.7%（2 例）*vs.*4.0%(1 例)（$X^2=1.69$, $P > 0.05$）]。**结论** 药物涂层球囊治疗股-腘动脉型和腘-膝下动脉型慢性下肢动脉硬化闭塞症的近期效果和安全性相似；股-腘动脉组中远期效果和保肢率优于腘-膝下动脉组。

模板辅助 CT 引导放射性粒子植入治疗胰腺癌的临床应用

李超杰
上海交通大学医学院附属瑞金医院卢湾分院

目的 比较共面模板辅助 CT 引导放射性粒子植入治疗胰腺癌的术前与术后剂量学验证差异，探讨其治疗精确性。 方法 回顾性分析 22 例 CT 引导下放射性 125I 粒子植入治疗的中晚期胰腺癌患者，年龄 47-84 岁，平均（66.4±11.3）岁，其中 10 例患者为共面模板辅助粒子植入，12 例患者为非模板辅助粒子植入。所有患者进行术前计划、术后剂量学验证。采用配对 t 检验比较手术前后 90%靶体积的最小吸收剂量（D90%）、最小周边剂量（MPD）、100%处方剂量覆盖的体积占靶体积的百分比（V100%）、V150%、V200%。并比较两组患者手术操作时间的差异。 结果 22 例患者均成功完成治疗，未发生与手术相关的严重并发症。平均植入粒子 25 颗。共面模板辅助粒子植入组和非共面模板辅助粒子植入组 V100%术后较术前减小，差异有统计学意义（P＜0.05）。两组术后 D90%、V150%均值较术前减小，而 MPD、V200%均值较术前增大，但各指标手术前后比较差异均无统计学意义（P＞0.05）。共面模板辅助粒子植入组手术操作时间（44.30±12.37）min，非模板辅助粒子植入组手术操作时间（60.00±12.78）min，两组手术操作时间比较差异有统计学意义（P＜0.05）。结论 共面模板辅助 CT 引导放射性粒子植入治疗胰腺癌术后剂量验证的主要指标均较好达到了术前计划的要求，有良好的治疗精确性，且与非模板辅助植入方法比较，使用模板辅助粒子植入可以更精确地达到术前规划的优化，且缩短了手术操作时间，提高了患者的耐受度，值得临床推广。

Purpose: To develop, validate and compare the early-warning models of the 30-day mortality risk for patients with malignant biliary obstruction (MBO) undergoing percutaneous transhepatic biliary stent placement (PTBS).

Materials and Methods: Between January 2013 and October 2018, this multicenter retrospective study included 299 patients with MBOs who underwent PTBS. The training set consisted of 166 patients from four cohorts, and another two independent cohorts were allocated as external validation sets A and B with 75 patients and 58 patients, respectively. The logistic and artificial neural network (ANN) models were developed to predict the risk of 30-day mortality after PTBS. The predictive performance of these two models was validated internally and externally.

Results: The ANN model had higher values of area under the curve than the logistic model in the training set (0.819 versus 0.797) and especially in the validation sets A (0.802 versus 0.714) and B (0.732 versus 0.568). Both models had high accuracy in the three sets (75.9-83.1%). Along with a high specificity, the ANN model improved the sensitivity. The net reclassification improvement (12.0-16.5%) and integrated discrimination improvement (5.9-13.5%) also demonstrated that the ANN model led to improvements in predictive ability compared with the logistic model.

Conclusions: Early-warning models were proposed to predict the risk of 30-day mortality after PTBS in patients with MBO. The logistic model is easier to use, while the ANN model has higher accuracy and better generalizability.

经皮胆道内射频消融治疗胆道支架狭窄的初步研究

夏宁
上海交通大学医学院附属瑞金医院卢湾分院

目的 采用经皮胆道射频消融的方法，治疗胆道支架狭窄，探讨该方法的可行性和有效性。**方法** 选取 43 例因胆道支架狭窄引起胆道梗阻病例，用经皮肝穿刺胆道的方法，将 EndoHPB 导管放置于胆道支架狭窄处进行射频消融，术后留置胆道引流管，经造影确认支架通畅后拔除引流管。**结果** 术后所有患者经胆道造影证实胆道支架通畅，无相关并发症发生，存活患者狭窄支架的再通畅时间中位数为 107 天（12～180 天）。**结论** 经初步临床研究表明经皮胆道内射频消融对胆道支架狭窄的治疗具有良好的有效性和安全性，但仍需有效的随机对照试验来进一步证实。

胆道内照射支架应用于肝门部胆管癌致恶性梗阻性黄疸的初步临床研究

贡桔
上海交通大学医学院附属瑞金医院卢湾分院

目的 评估携带 ^{125}I 粒子的胆道内照射支架治疗肝门部胆管癌致恶性梗阻性黄疸的有效性及安全性。**方法** 选取 43 例因肝门部胆管癌致恶性梗阻性黄疸患者，采用经皮经肝分别穿刺左右侧胆道分支，于肝门部狭窄处植入 ^{125}I 粒子胆道内照射支架，术后留置引流管 3～5 天，经造影确认支架通畅后予以拔管，封闭穿刺道。记录患者术前与术后的肝功能变化，并观察术后患者生存时间。**结果** Bismuth Ⅰ型 5 例，植入支架 5 个；Ⅱ型 18 例，植入支架 36 个；Ⅲ型 4 例，植入支架 8 个；Ⅳ型 16 例，植入支架 25 个，患者术前血清总胆红素和直接胆红素分别为（145.54±65.35）μmol/L 和（124.73±35.04）μmol/L，术后分别为（65.91±29.43）μmol/L 和（35.50±15.12）μmol/L；与术前相比，术后丙氨酸氨基转移酶、天冬氨酸氨基转移酶、碱性磷酸酶、C-反应蛋白、γ-谷氨酸转肽酶均显著降低（P值均<0.05），乳酸脱氢酶显著升高（P=1.05）。患者中位生存期为 13 个月(3.0~22.5 个月)，未出现相关胆道穿孔、胰腺炎、严重胆道感染以及胆道出血等并发症。**结论** ^{125}I 粒子胆道内照射支架不仅可引流胆汁，减轻黄疸症状，还可近距离内照射胆道肿瘤，起到治疗作用，可延长患者生存时间，有效治疗肝门部胆管癌致恶性梗阻性黄疸。

CT 导向下经皮纳米刀消融术在腹膜后肿瘤中的临床应用

张肖,肖越勇
中国人民解放军总医院第一医学中心

目的 评估 CT 导向下纳米刀消融术治疗腹膜后肿瘤的有效性及安全性。 **方法** 筛选腹膜后肿瘤 25 例，分别为胰腺癌、肾上腺嗜铬细胞瘤、结肠癌腹膜后转移瘤患者，因侵犯临近血管及肠管无法行外科手术切除，全面评估患者心脏、呼吸、肝肾功能等全身状况，术前行 CT、MRI 及 PET-CT 检查制定手术方案，并完善血液实验室检查（血常规、凝血四项、血清四项、血生化及肿瘤标记物）。手术在全身麻醉下进行，使用大孔径多层螺旋 CT（层厚 3cm，120kV，250mAs）、心电同步仪及麻醉监护装置，根据术前计划经皮适形穿刺置入纳米刀消融电极，根据电流波形判定消融程度。术后即刻行 CT 检查排除并发症，并持续全面监测患者生命体征，术后 3 天及 5 天分别行影像

学检查观察疗效及并发症，复查各项血液实验室检查。**结果** 25 例手术均顺利完成，患者生命体征平稳，无严重并发症发生。影像学检查显示消融区域完全，边界清楚，消融区域未见强化，周围可见轻度炎性改变，邻近血管、胰胆管及肠管未见损伤；实验室检查胰腺癌患者脂肪酶及淀粉酶呈一过性增高，肿瘤标记物轻度增高，其余患者实验室指标均未见异常。**结论** 纳米刀消融术在腹膜后肿瘤消融过程中，在灭活肿瘤的同时能够保护血管、胰胆管及肠管等结构，此技术安全、有效，可在临床进一步推广应用。

肝癌分子靶向药物及免疫抑制剂治疗的研究现状及进展

熊斌
华中科技大学同济医学院附属协和医院

肝癌（HCC）是全球癌症发病率第六位，死亡率第三位的恶性肿瘤。肝癌发病隐匿且发展迅速，多数患者发现时病情就已经进展到中晚期，丧失了手术根治的机会。索拉非尼作为抗血管生成的分子靶向药物开启了肝癌分子靶向治疗的先河，在随后的近十年内，针对肝细胞癌的靶向药物不断涌现，瑞戈非尼、乐伐替尼、卡博替尼、雷莫芦单抗以及一些免疫抑制剂在III期临床试验上取得了不错的成绩。本文就新出现的抗血管分子靶向药物及免疫抑制剂治疗肝癌的现状、挑战以及未来的发展方向进行综述。

Chemoembolization of liver cancer with doxorubicin-loaded CalliSpheres Microspheres: Plasma pharmacokinetics, intratumoral drug concentration and tumor necrosis in a rabbit model

梁斌,赵丹,郑传胜,冯敢生
华中科技大学同济医学院附属协和医院

英文摘要共 264 字单词 1560 个字符，无法在此处上传，通过全文附件上传了。

Abstract

Purpose: To investigate the plasma pharmacokinetics, intratumoral drug concentration and tumor necrosis after transarterial chemoembolization (TACE) with doxorubicin-loaded CalliSpheres Microspheres (CSM).

Methods and Materials: Sixty rabbits with liver VX2 tumors were assigned into five groups of 12 rabbits each, which received 4 mg of doxorubicin via intravenous injection (IV group), hepatic arterial infusion (IA group), conventional TACE (cTACE group), CSM-TACE (CSM low dose group), and 8 mg of doxorubicin via CSM-TACE (CSM high dose group), respectively. Doxorubicin concentrations in plasma, tumor and adjacent hepatic parenchyma were measured at various timepoints after treatment, and tumor necrosis percentage and liver enzymes were also assessed.

磁共振引导聚焦超声刀治疗器官局限性中危组前列腺癌安全性和有效性评估

阳青松[1],陈士跃[1],毛佳明[1],陈玉坤[1],王振[1],王海峰[2],高旭[2],周懿[3],余永伟[4],孙颖浩[2],陆建平[1]
1.海军军医大学第一附属医院（上海长海医院）
2.海军军医大学第一附属医院（上海长海医院）泌尿外科
3.海军军医大学第一附属医院（上海长海医院）麻醉科
4.海军军医大学第一附属医院（上海长海医院）病理科

目的 评估磁共振引导高强度聚焦超声刀（MR-Guided Focused Ultrasound MRgFUS)）治疗中危组前列腺癌（prostate cancer PCa）的安全性和有效性。
材料和方法 按照全球多中心 PCA006 方案前瞻性招募中危组 PCa 患者。入组标准：年龄＞50 岁，PSA≤20ng ，Gleason 评分=7（3+4/4+3）且局限在单侧叶的中危组 PCa 患者，入组前未行任何 PCa 相关的治疗。穿刺采用经会阴 20 针模板+3 针磁共振超声融合靶向穿刺。治疗采用腰-硬联合麻醉下 MRgFUS 治疗。治疗区域依据术前穿刺结果制定，治疗区的温度控制在 75-85℃。统计分析术后即刻非灌注区体积（Non-Perfused Volume NPV），术前及术后 1 月患者 IPSS 评分、IIEF 评分、PSA 及术后 6 月治疗区穿刺病理结果。
结果 2018 年 7 月-2019 年 7 月共入组受试者 3 名，受试者平均年龄 58（55-63 岁），术前平均 IPSS 评分 7（5-8），IIEF 评分 20（18-22），PSA：9.27ng /ml（5.52-16.31ng /ml），平均阳性穿刺针数 6（4-7 针），其中 Gleason 评分=3+4 分 10 针，Gleason 评分=3+3 分 6 针。依据穿刺结果制定消融计划，术中平均超声辐照次数 10 次（9-12），辐照能量 36.4KJ（31.9-43.4KJ），治疗辐照总时间 83min（70-93min），计划治疗体积 5.9cc（3.6-9.1cc），术后即刻非灌注区域体积 7.5cc（5.2-11.2cc），术后 1 月平均 IPSS 评分 5 分、IIEF 评分 22 分，PSA：1.05ng/ml，其中 2 例满治疗后 6 月患者行治疗区域穿刺，结果均为阴性，1 例患者尚在随访中。
结论 MRgFUS 治疗中危组 PCa 安全有效，在避免手术相关并发症的同时达到了较好得短期肿瘤控制效果。

肺癌的氩氦刀冷冻术治疗

白伟
中国医科大学附属第一医院

首先我们要对 CT 机进行预热这样会保证在治疗的过程中可以顺利的完成扫描工作。其次我们要准备好手术所需要的氩气（两瓶）和氦气（一瓶），还要将氩氦刀冷冻机准备好，将气体和冷冻机通过连接线连接好，确认连接点都已经连接好，将冷冻机开机，然后打开气体阀门，再次检查连接点是否连接好。让患者上床配合医生将患者的体位摆好，因为手术时间较长必须让患者有舒服的体位，这样才能保证患者在手术过程中保持不动。扫描患者在不影响诊断的情况下，尽可能减少扫描次数，配合医生对进针点的定位，入针的方向还有进针的深度，测量一定要准确，否则会影响手术的效果。确定好手术方案后，将针与冷冻机进行连接，确认连接好。在连接的过程中一定要与医生配合好，这个过程对无菌的要求很高，必须保证针的无菌，否则会出现感染的可能。对针进行测试，先用氦气将连接管内的空气排出来，这样保证连接管内的气体纯度较高，然后再开启氩气（冷冻模式）将针放到无菌注射用水中，当看到针尖部位出现冰球后，证明我们的连接正常，可以开始手术了。这时配合医生将针固定在所需要的位置上，（冷冻机有针固定的功能）可以保证治疗的过程中针不会出现位移，

如果是多针的情况下可以保证针的位置相对固定。否则影响治疗效果。在治疗的过程中还要密切的观察气体瓶中的压力，压力太低达不到温度也会影响效果，必须保证零下 130 度一下。再治疗的过程中 还要进行 CT 扫描，这样可以随时观察治疗效果，在治疗过程中氩氦刀冷冻机会排出一些气体，对人体是没有坏处的，最好要保持屋子通风良好。冷冻达到时间后关闭冷冻功能，待残余气体排空后，开启复温功能（打开氦气）让针尖的冰球融化，这样才能取出针。一般冷冻复温需要两三次。手术结束后必须先将气体阀门关闭，然后按冷冻机的排气键，待气体排空后才可以卸掉连接管，然后关机。

MicroRNA-205 通过靶向血管内皮生长因子 A 对肝癌细胞的影响

王黎洲,周石
贵州医科大学附属医院

目的 ： 探讨 miR-205 在肝细胞肝癌（hepatocellular carcinoma，HCC）中的作用机制与癌症进展之间的关系，以及 miR-205 是否通过靶向血管内皮生长因子 A（vascular endothelial growth factor A，VEGF A），从而影响肝癌细胞的增殖。**方法** 通过逆转录-定量聚合酶链反应（Reverse transcription-quantitative polymerase chain reaction，RT-qPCR）检查 HCC 和相邻正常肝组织以及肝癌细胞株 HepG2、HuH-7、SMMC-7721、BEL-7402 和正常肝细胞株 LO2 中 miR-205 的表达水平。使用 RT-qPCR 检测转染了 miR-205 激动剂和空白对照的 HepG2 和 HuH-7 细胞中 miR-205 的表达水平，随后通过 Transwell 和 MTT 法检测转染后肝癌细胞的增殖、迁移和侵袭情况。使用荧光素酶测定系统了解 VEGF A 是否为 miR-205 的直接作用靶标。最后用 VEGFA siRNA 敲低 VEGFA 表达来研究 VEGFA 是不是 miR-205 在 HCC 细胞增殖、迁移和侵袭中起调控作用的关键介质。**结果** miR-205 在肝细胞癌组织和肝癌细胞株中的表达水平下降。miR-205 的过表达能够抑制肝癌细胞的增殖、迁移和侵袭。VEGFA 是 miR-205 在 HCC 中的直接作用靶标，miR-205 能够通过靶向 VEGF A 来抑制肝癌细胞的增殖、迁移和侵袭。**结论** 我们的研究表明 miR-205 能够通过下调 VEGFA 的表达来抑制 HCC 的生长、迁移和侵袭，将来可能是肝癌治疗的一个潜在靶点。

腹主动脉球囊阻断辅助瘢痕妊娠清宫术的应用初探

张建好,郭瑞霞,李留霞
郑州大学第一附属医院

摘要 目的 瘢痕妊娠是一种特殊部位的异位妊娠，指受精卵在剖宫产瘢痕部位着床发育，是剖宫产远期并发症，可导致胎盘植入、子宫破裂、子宫出血，清宫时极易发生大出血，对患者的生命安全造成严重威胁，III型 CSP 危害更大，治疗更为棘手。近年来为防止清宫术中大出血，预先行子宫动脉栓塞（uterine artery embolization，UAE），但 UAE 术后发生月经量少甚至闭经、宫腔黏连等并发症也不容忽视。本研究通过球囊阻断腹主动脉辅助瘢痕妊娠清宫术的应用分析，探讨腹主动脉球囊阻断在清宫术中的临床应用价值。**方法** 回顾性分析郑州大学第一附属医院妇科就诊住院的瘢痕妊娠患者 42 例，其中观察组 21 例，DSA 下置入球囊导管至肾动脉下方腹主动脉，即时在宫腔镜或宫腹腔镜联合下清宫，术中间断阻断腹主动脉血流，清除胚胎及电凝止血。对照组 21 例，术前行子宫动脉栓塞，1-3 天在宫腔镜或宫腹腔镜下行清宫术。对比分析两组患者 DSA 下透视时间、患者体表辐射剂量、清宫术中出血量、手术时间、术后不良反应发生率、住院时间及术后随访月经情况。**结果** :所有患者手术顺利，成功保留子宫。观察组 1 例患者术后出血量较大，行子宫动脉

栓塞术，出血得到控制，未发生不良反应。对照组 21 例患者 UAE 术后均发生不同程度疼痛、发热等栓塞症状。观察组、对照组 DSA 下透视时间及体表辐射剂量、住院时间差异显著（P<0.05）；清宫术中出血量、清宫手术时间无明显差异（P>0.05）；随访期均大于 3 个月，观察组随访期间未出现任何不良反应，对照组随访期间发现 2 例月经量减少、1 例宫腔粘连。**结论** :腹主动脉球囊阻断、子宫动脉栓塞辅助瘢痕妊娠清宫术，均可有效减少术中出血，而腹主动脉球囊阻断术相对于子宫动脉栓塞术，可大大减少 X 线辐射剂量、缩短住院时间及更少的不良反应发生率。

细节决定成败之前列腺增生动脉栓塞治疗

应世红,彭志毅,周先勇,龚绍林,黄强,郑祥义
浙江大学医学院附属第一医院

目的 探讨前列腺增生动脉栓塞治疗的有效性和安全性，探讨前列腺动脉栓塞术的手术细节控制。
方法 回顾性分析本院 18 例前列腺增生栓塞治疗的患者，包括患者年龄、术前症状、治疗病史、术前 MRI 平扫+弥散图像、术前髂动脉 CTA 图像、术后症状、术后 MRI 平扫+弥散图像、术后反应，用 t 检验分析患者治疗前后各参数的差异。
结果 患者平均年龄 81.2 岁，术前均有下尿路症状及药物治疗史，17 例因各种原因不能行外科手术治疗。术前 MRI 显示前列腺增生，前列腺体积 12ml-327ml，平均 86ml。术前髂动脉 CTA 显示 4 例髂外动脉异常迂曲（行肱动脉入路治疗），一例显示单侧髂内动脉闭塞。一例患者因术前 CTA 显示双侧髂内动脉闭塞而放弃介入栓塞。18 例患者中，13 例完成双侧前列腺动脉栓塞，5 例完成单侧前列腺动脉栓塞。术后 18 例患者临床成功率 100%，其中 16 例拔除导尿管，2 例拔除膀胱造瘘管。术后前列腺 MRI 显示前列腺体积较术前缩小 25.6%，差异具有统计学意义。患者术后严重并发症发生率为 0%。8 例患者术后有短暂的轻度发热，持续时间 0.5-2 天。2 例较大前列腺的患者术后 2 周内有尿频的炎症表现。
结论 前列腺动脉栓塞术是前列腺增生安全且有效的治疗方式。以下 10 个细节的处理可以提高手术的成功率：1 术前术后的 MRI 检查、2 术前胸腹主动脉 CTA、3 术中 CBCT 的应用、4 纤细前列腺动脉的处理、5 非靶血管的处理、6 微导管及微导丝的选择、7 栓塞剂的选择、8 术后导尿管留置的时间、9 突破以往适应症的禁锢、10 特殊情况的处理。

OR-287

经颈静脉肝内门体分流术治疗土三七相关性肝窦阻塞综合症

张利捷,梁斌,郑传胜,冯敢生
华中科技大学同济医学院附属协和医院

目的 研究经颈静脉肝内门体静脉分流术（Transjugular Intrahepatic Portosystemic Shunt，TIPS）治疗土三七相关性肝窦阻塞综合症（hepatic sinusoidal obstruction syndrome, HSOS）的疗效和安全性。
方法 连续性收集 2014 年 1 月-2019 年 6 月间在我院确诊为 HSOS 并行 TIPS 术治疗的 9 例患者。记录患者 HSOS 疾病严重程度，TIPS 术前、术后的 CT、肝功能及凝血指标，并随访患者生存时间。比较术前、术后的门腔压力梯度、总胆红素、腹水、肝脏大小、门脉主干直径。
结果 9 例患者 3 例为中度 HSOS、6 例为重度 HSOS。9 例患者均成功实施 TIPS 术，未出现任何技术相关并发症。TIPS 术后门腔压力梯度为 13.0±4.1，较术前 30.4±5.2 显著性减低

（P=0.008）。除 1 例患者失访外，8 例患者中位随访时间 8 月(1，35 月)，该 8 例患者至今存活。患者 TIPS 术后 5-7 天总胆红素较术前显著性增高（60.76±26.9 vs 82.8±35.0, P=0.017），但术后 1-3 个月与术前相比则降到基线水平（60.0±46.2 vs 82.8±35.0，P=0.401）。术后 1-3 个月腹水较术前显著性减少或完全吸收（P＜0.001）、肝脏大小显著性缩小（16.7±2.2 vs 13.7±1.7，P=0.018）、门脉主干直径显著性增大（10.7±2.5 vs 13.4±2.4，P=0.017）。

结论 TIPS 是治疗土三七相关性 HSOS 的安全、有效方法。

OR-288
婴幼儿颈部淋巴管畸形介入硬化治疗的安全性及疗效分析

刘珍银,申刚,张靖
广州市妇女儿童医疗中心

目的 探讨 DSA 与超声引导下经皮穿刺介入硬化治疗婴幼儿颈部淋巴管畸形临床疗效及安全性。**方法** 收集我院 2015 年 6 月至 2017 年 5 月间进行全麻下介入硬化治疗的 81 例婴幼儿颈部淋巴管畸形患儿临床资料，所有患儿术前均行超声等影像学检查，并结合术中穿刺抽液检查进一步确诊为淋巴管畸形。根据术前影像学检查及介入术中造影，将淋巴管畸形分为大囊型、微囊型以及混合型。在超声引导下经皮穿刺病灶成功后抽液，注入平阳霉素或盐酸博莱霉素、造影剂混合液。术后随访 6～18 个月。 疗效评判标准如下：①完全缓解：瘤体完全消失。②显著缓解：瘤体体积缩小≥75%，超声或 MRI 检查示病灶区无液性暗区，仅组织较对侧增厚；③部分缓解：瘤体体积缩小 50%～75%，超声或 MRI 检查显示病灶区少许散在≤0.5 ml 液性暗区；④轻微缓解：瘤体体积缩小 25%～50%；⑤病情稳定：瘤体体积缩＜25%。 **结果** 81 例淋巴管畸形患儿 34 例为大囊型，40 例为混合型，7 例为微囊型；共行介入硬化治疗 186 次，其中①完全缓解 30 例；②显著缓解 28 例；③部分缓解 10 例；④轻微缓解 7 例；⑤病情稳定 6 例。186 例次介入硬化治疗中，13 例次患儿术后因颈部淋巴管瘤较前明显肿胀，压迫上呼吸道，入我院 PICU 继续对症治疗后拔管，157 例次患儿术后 1-2 周包块较前肿大，143 例次术后第二天出现干咳，咽喉不适，136 例次术后出现发热，均给予对症治疗后明显缓解；1 例术后淋巴管瘤增大较前显著，血常规提示血红蛋白较术前显著下降，给予输红细胞治疗。无皮肤破溃、过敏反应、周围脏器损伤、神经损伤病例。 **结论**： 应用介入硬化治疗婴幼儿颈部淋巴管畸形是一种安全、有效及并发症小的治疗方法，其中大囊型淋巴管畸形疗效优于混合型与微囊型，术后需注意患儿气道压迫状况，对于体重小病例大的患儿，需特别注意介入术后淋巴管瘤囊腔出血可能，密切监测患儿血红蛋白状况。

CT 引导下颅脑占位穿刺活检的临床应用价值分析

练延帮,董军强,卢振威,李祥周
郑州大学第一附属医院

目的 探讨 CT 引导下颅脑占位穿刺活检的临床应用价值及安全性。
方法 收集 2017 年 03 月至 2019 年 7 月郑州大学第一附属医院 13 例 MRI（MRI 增强+MRS）确诊颅内多发占位患者，其中男 7 例，女 6 例，年龄 22-71 岁，平均 51.9 岁。13 例患者均行 CT 引导下穿刺活检，CT 机器采用 GE Lightspeed 大孔径 CT，管电压为 120KV，管电流为智能毫安秒（Auto mAs），设置层厚为 2.5mm，扫描范围为 2cm。采用骨科专家破颅骨，安捷泰 18G 活检针取适量颅内病变组织。统计其扫描次数、手术时间及病理类型、并发症情况。

结果 13 例患者中，双侧颅内多发病变者 10 例，左侧大脑半球多发 1 例，右侧大脑半球多发 1 例，双侧丘脑多发 1 例。穿刺部位需选取避开颅内和脑膜血管、静脉窦及脑实质重要功能区。其中取右侧额叶 5 例，右侧基底节区、右侧岛叶及右侧放射冠各 1 例，右侧丘脑 1 例，左侧顶叶、左侧枕叶、左侧小脑、左侧颞叶各 1 例。病理报告弥漫大 B 细胞淋巴瘤 4 例，胶质母细胞瘤 3 例，星形细胞瘤 3 例，炎性感染性病变 2 例，转移性复合型小细胞癌 1 例。穿刺成功率 100%。所有患者平均操作时间为 27min，平均扫描 5.6 次，平均 DLP 为 201.6mGy*cm，平均辐射剂量为 0.42mSv。所有患者未出现神经功能损伤、癫痫、颅内大出血等严重并发症，4 例患者出现穿刺部位少量出血，量约 0.5～1.5ml，术后 3～5 天复查出血吸收。

结论 CT 引导下颅脑穿刺活检可灵活设计进针入路，创伤小、并发症少，辐射剂量低且病理阳性率高，在颅脑病变穿刺活检中具有很大的临床应用价值。

大脑中动脉斑块 HRMRI 特征与急性脑缺血的相关性研究

黄娟,焦晟,宋焱,陈玉辉,王宏,陈敏
北京医院

目的 应用高分辨率磁共振成像技术（HR-MRI）探讨大脑中动脉（MCA）粥样硬化斑块特征与急性脑缺血症状之间的关系。**方法** 共有 136 名（100 名男性；平均年龄 60.8±11.4 岁）经 HR-MRI 证实 MCA 具有粥样硬化斑块的患者被纳入本研究。根据患者两周内 MCA 供血区是否具有急性缺血症状，将其分为急性症状组与无急性症状组；比较两组之间的基本人口学特征、临床危险因素、MCA 斑块强化程度、斑块最大长度、斑块最大厚度、斑块最大长度与最大厚度的比值及管腔狭窄程度等；二元逻辑回归用于分析 MCA 斑块特征与相应血管供血区急性缺血症状之间的关系。 **结果** 与 MCA 供血区无急性缺血症状的患者相比，MCA 供血区有急性缺血症状的患者糖尿病患病率显著增加（50.7% vs.30.2%，P=0.015），明显强化斑块的发生率明显增加（87.7 % vs.46.0%，P< 0.001），并且具有更大的斑块最大长度（6.7±3.7mm vs.4.9±2.3mm，P=0.001）、斑块最大厚度（1.5±0.8mm vs.1.0±1.0mm，P =0.027）及更严重的管腔狭窄程度（66.4±31.3% vs.30.7±25.3%，P<0.001）。Logistic 回归分析显示 MCA 明显强化斑块 (OR=4.492，95%置信区间=1.762-11.449，P=0.002)及管腔狭窄程度（OR=1.032， 95%置信区间=1.018-1.047，P< 0.001）与急性缺血症状独立相关。**结论** 相对于管腔狭窄程度，明显强化斑块与急性缺血症状之间存在更强的关联，斑块明显强化可能是其不稳定性的重要指标。

zTE ASL MRA 在颅内动脉瘤血管内治疗后随访中的研究

杨京东,宋焱,黄娟,焦昇,郭锬,祁鹏,陈敏
北京医院

目的 以 DSA 作为金标准，比较 zTE ASL MRA 和 TOF MRA 这两种磁共振血管成像技术对颅内动脉瘤栓塞术后评估的价值。

方法 研究对象为 2015 年 12 月至 2016 年 7 月在北京医院神经外科门诊及病房就诊的颅内动脉瘤介入治疗术后的患者，所有患者均同时进行颅内血管 TOF MRA 和 zTE ASL MRA 检查，并于 MR 检查后一周内进行 DSA 检查。用 Cohen’s kappa 分析比较不同影像学检查方法对动脉瘤残存的评估能力，图像判读者之间及判读者自身的可重复性检验也采用 Cohen’s kappa 分析，应用卡方检验比较两种磁共振血管成像技术对载瘤动脉支架内管腔显示的差异，

p<0.05 认为差异有统计学意
义。

结果 共入组 24 例患者、27 个动脉瘤中，金标准 DSA 检查最终确定 13 例具有瘤腔残存，zTE ASL MRA 发现有 15 例具有瘤腔残存，TOF MRA 发现 12 例有瘤腔残存，两种磁共振检查方法与 DSA 对动脉瘤残存评估结果的一致性具有统计学意义（p<0.001），Kappa 值分别为 0.702 和 0.852。与传统的 TOF MRA 相比，zTE ASL MRA 的动脉瘤评估结果与 TOF MRA 亦具有良好的一致性，Kappa 值为 0.710。对于 zTE ASL MRA 这项新技术，不同读片者之间的一致性良好，Kappa 值为 0.705。在 27 例动脉瘤中，有 23 例为支架置入的患者，zTE ASL MRA 仅 2 例由于伪影较大，无法显示支架内的通畅情况，而 TOF MRA 有 11 例由于支架内管腔无信号，或者虽然有信号，但伪影较大，而无法评估支架内的管腔，二者之间的差异具有显著统计学意义（p<0.001）。

结论 与 TOF MRA 比较，zTE ASL MRA 在动脉瘤残存的评估上与 DSA 有更好的一致性，而且与 TOF MRA 比较，zTE ASL MRA 对载瘤动脉支架内管腔的显示有更好的图像质量。

探讨 3D Cube Flair 并压缩感知技术在颅脑皮层下微小病变诊断中的应用

臧晓[1],吴涛[2],胡坚兴[1],李萌[1],李金锋[1]
1.解放军总医院第一医学中心放射诊断科
2.GE

目的 探讨 3D Cube Flair 并压缩感知技术在颅脑皮层下微小病变诊断中的应用。

材料与方法 使用 MRI GE750W 设备 ,搜集 20 例来我院就诊的有颅脑病变的患者，年龄 40-80 岁，男女各半。扫描颅脑常规序列(轴位 T2WI/T1WI/DWI/冠状位 T2 Flair)及 3D Cube Flair 并压缩感知序列。扫描参数：常规冠状位层厚:5.0mm,层间距:1mm,TR:8000,TE:140,NEX:2.0,Phase:2.75,；3D Cube Flair 并压缩感知序列：层厚为 1.8mm，TR:6300,TE:105,NEX:1,Phase 为 2。扫描方式：首先为患者进行颅脑常规检查，其次加扫 3D Cube Flair 并压缩感知序列，扫描结束后，分别从主、客观比较图像质量，主观：由两名具有十年以上诊断经验的副主任医师从图形从图像有无伪影、均匀度、病变-正常脑组织对比度进行双盲主观评分。客观：主要从图像信噪比、病灶与脑实质对比度及病变检出个数三方面入手。

结果

主观评分：伪影主观评分的统计结果 4.90±0.31、2.80±0.42
（$\bar{}(X)^2$=40.83, P＜0.05），图像均匀度主观评分结果 4.70±0.48、3.80±0.63，
（$\bar{}(X)^2$=46.97, P＜0.05），病变-正常脑组织对比度主观评分结果为 5.00±0.00,、3.20±0.42
（$\bar{}(X)^2$=49.12, P＜0.05）。客观评价：图像信噪比评价（灰质）135.91±9.73、94.66±6.74（t=6.97, P＜0.05），病变与白质对比度 51.07±5.85，38.11±4.51（t=11.07, P＜0.05）病变检出个数 10.13±1.92、4,98±1.27（t=13.01, P＜0.05）。

结论

3D Cube Flair 并压缩感知技术可以提高颅脑皮层下微小病变的检出率，提高扫描速度，有效避免伪影，优化扫描流程。

三维伪连续动脉自旋标记灌注成像评估抗 N-甲基-D-天冬氨酸受体脑炎灌注改变及其与临床评分的相关性

曾春,向雅芸,李咏梅,罗天友
重庆医科大学附属第一医院

目的 应用三维伪连续动脉自旋标记灌注成像（3D pCASL）灌注成像技术探讨稳定期抗 N-甲基-D 天冬氨酸（NMDA）受体脑炎患者的脑血流量（CBF）值变化，分析其与改良 Rankin 量表（mRS）评分、各临床认知量表评分的相关性。

材料与方法 （1）纳入 48 例稳定期抗 NMDA 受体脑炎患者（病例组）和 40 名年龄、性别、受教育程度相匹配的健康对照组，两组在 MRI 扫描前均行 mRS 评分和各临床认知量表评分。（2）两组被试均行全脑常规 T_2WI、FLAIR、3D-T_1WI 及 3D pCASL 扫描，平扫后常规增强扫描。（3）应用 SPM 8 软件对图像进行预处理，并以性别、年龄、受教育程度为协变量，使用 REST 软件进一步提取显著差异脑区的 CBF 值，分析其与 mRS 评分和各临床认知量表评之间的相关性。

结果 （1）与对照组相比，病例组左内侧和旁扣带脑回、左补充运动区（supplementary motor area, SMA）、左侧额上回、右侧额中回、右侧额下回三角部、右侧额下回岛盖部及中央沟盖 CBF 值下降，二者差异有显著统计学意义（P < 0.001）。（2）相关分析结果显示，病例组右侧额叶（额中回、额下回三角部、额下回岛盖部）CBF 值与 mRS 评分呈负相关（r 分别为-0.516、0.49、-0.468，P 均 < 0.05）；病例组右侧额叶（额中回、额下回三角部、额下回岛盖部）和左内侧和旁扣带脑回 CBF 值与简易智力状态检查量表（mini-mental state examination, MMSE）评分呈正相关（r 分别为 0.465、0.492、0.568、0.452，P 均 < 0.05）；这些 CBF 值显著下降脑区与其它临床认知量表评分均无相关性（P 均 > 0.05）。

结论 3D pCASL 技术显示稳定期抗 NMDA 受体脑炎患者脑灌注减低区，其 CBF 值与 mRS 评分呈负相关、与 MMSE 评分呈正相关，具有一定的临床应用前景。

千变万化之神经梅毒的 MR 表现

刘颖
武汉大学中南医院

目的 通过阅读近 10 年国内外神经梅毒影像相关的文献，对神经梅毒的临床特点、影像表现进行综述。

方法 数据库搜索近 10 年国内外主题神经梅毒的文献，选取神经梅毒影像相关的文献。

结果 约 2-10%未经治疗梅毒患者会发生中枢神经系统的梅毒感染。神经梅毒可发生于梅毒感染后的任一阶段。神经梅毒根据其影像特点主要分为 4 型：脑实质型、脑膜炎型、血管炎型及梅毒树胶肿型。脑实质型：临床上表现为麻痹性痴呆、脊髓痨，MR 上常为主要累及额颞叶的萎缩以及小灶的白质病变，与一般的脑实质缺血灶相似。血管炎型：最常累及大脑中动脉及基底动脉分支，表现为与大脑中动脉走形分布一致的脑实质梗死；脑膜炎常累及脑膜小血管，表现为轻度的、慢性的软脑膜炎症；梅毒树胶肿发生于大脑凸面的软脑膜，常形成结节，增强可有“脑膜尾”征，需与脑膜瘤鉴别。神经梅毒的影像表现常没有特异性，需要鉴别的疾病有病毒性脑炎、结核性脑炎、脑白质疏松、颞叶硬化、脑膜瘤等。发生在年轻病人的脑白质病变，病灶分布不一、新旧不一，则需警惕神经梅毒的可能。

结论 神经梅毒的影像表现形式多样，常需要与一些中枢神经系统常见疾病相鉴别。目前尚无神经梅毒的特异性诊断实验，神经梅毒的诊断依赖于临床资料、CSF 检测、实验室血清检查、影像检查等多种手段的融合及综合评估。

Differentiating radiation-induced brain injuries from glioma recurrence: using intravoxel incoherent motion (IVIM) imaging

yulin wang,Lin Ma
The Chinese PLA General Hospital

purpose: The study was performed to validate the value of intravoxel incoherent motion (IVIM) imaging in distinguishing radiation-induced brain injuries from glioma recurrence in patients with diagnosed glioblastoma multiforme (GBM) with an aim to see whether IVIM can be used as an alternative to DSC-MRI or DWI for the distinguishing.
Methods: The MR examinations were performed on a 3.0 Tesla scanner (Discovery MR 750, GE Healthcare, Waukesha, Wisconsin) at the Chinese PLA General Hospital. Patients with previously resected and irradiated glioma, presenting newly developed abnormal enhancement, were included in the study. Sixty-four patients who developed contrast-enhancing lesions were assessed by IVIM, and classified into groups of radiation-induced brain injuries (n.32) or tumor recurrence (n.32) based on pathologic analysis or clinical–radiologic follow-up. The IVIM indices values were quantified from the ROI region. Student independent t test was used to compare indices between groups.
Results: The IVIM indices:(the STD adc/slow adc(D)/fast adc(D*)/fraction of fast adc(f)/DDC)were significantly higher in radiation-induced brain injuries groups than in tumor recurrence groups, while the fast adc value was lower in radiation-induced brain injuries groups. On Student *t* test, all the above mentioned indices values were found to be significantly different in 2 groups. IVIM-derived indices STD adc values stronger correlated with DWI-derived ADC values.
Conclusion: intravoxel incoherent motion (IVIM) imaging appear to be a reliable technique in current form and may be a suitable imaging in differentiating radiation-induced brain injuries from glioma recurrence .

A point-to-point biopsy study based on intraoperative MR-guided navigation:IVIM derived fast diffusion correlates with quantitative VEGF expression in gliomas

Yan Ren[1],Haopeng Pang[2],Hua Zhang[1],Zhenwei Yao[1],Xiaoyuan Feng[1]
1.Radiology Department of Huashan Hospital, Fudan University
2.Interventional Radiology Department of Ruijin Hospital, Shanghai Jiao Tong University

Purpose: To expore the correlation of intravoxel incoherent motion (IVIM)-derived perfusion with vascular endothelial growth factor (VEGF) and CD34 expression in gliomas.

Methods: Twenty-one patients of newly-diagnosed gliomas with 32 biopsy samples were retrospectively enrolled, who underwent diffusion-weighted MRI with 22 b-values (0-5000 sec/mm^2) followed by intraoperative MR-guided biopsy surgery. All 32 biopsy samples were employed for immunohistochemical staining followed by quatitative analysis of CD34 and VEGF. Based on the coregistered localized biopsy, four perfusion parameters of Dfast1500, PF1500, Dfast5000 and PF5000 were developed, respectively. Dfast1500 and PF1500 were calculated by a group of 15 b-values (0-1500 sec/mm^2). Dfast5000 and PF5000 were calculated from a group of 22 b-values (0-5000 sec/mm^2).Positive expression ratios of VEGF (pVEGF) and CD34 (pCD34) were quantificated by multispectral phenotyping microscope. Correlative analyses were performed between perfusion parameters and pathological indices of pVEGF and pCD34.
Results: Significant positive correlations were revealed for Dfast5000 and pVEGF (rho=0.466, P=0.007) and Dfast1500 and pVEGF (rho=0.371, P=0.037), respectively. No significant correlatiions were shown between IVIM-derived perfusin parameters with pCD34.
Conclusions: IVIM derived fast diffusion correlates with histological pVEGF in gliomas.

Machine learning-based analysis of magnetic resonance radiomics for classification of gliosarcoma and glioblastoma multiforme

Xuzhu Chen
Beijing Tiantan Hospital Capital Medical University

Objective:
We aimed to identify optimal machine-learning methods for preoperative differentiation of gliosarcoma and glioblastoma multiforme based on magnetic resonance radiomics.
Methods:
A total of 210 patients were divided into a training set and a validation set. Radiomics features were extracted from tumor mass and peritumoral edema, respectively. Three best feature selection methods (Relief, least absolute shrinkage and selection operator (LASSO) and Random Forest (RF)) and three classification methods, including generalised linear models (GLM), support vector machines (SVM) and RF, were compared for their performance in distinguishing gliosarcoma and glioblastoma multiforme. The performance of the radiomics model was investigated via area under the receiver-operating characteristic curve (AUC) and accuracy (ACC) analysis.
Results:
The selection method LASSO + classifier GLM had the highest AUC of 0.984 and ACC of 0.897 in the validating set, followed by Relief + GLM (AUC = 0.909, ACC = 0.862) and LASSO + SVM (AUC = 0.900, ACC = 0.862) based on tumor mass features. For peritumoral edema features, RF + GLM had the highest AUC of 0.889, while LASSO + GLM achieved a high ACC of 0.793 in the validating set. Regardless of the methods, tumor mass features significantly outperformed those from peritumoral edema for

the differentiation of gliosarcoma and glioblastoma multiforme (ZAUC = -3.029, ZACC = -4.553; p < 0.05).
Conclusions:
Our study demonstrated tumor mass features performed better than peritumoral edema features. The selection method LASSO + classifier GLM had the best performance in differentiation of gliosarcoma and glioblastoma multiforme, which could enhance the application of radiomics methods in fetal brain tumours preoperatively.

A radiomics nomogram may improve the prediction of IDH genotype for astrocytoma before surgery

Yan Tan,Hui Zhang,Jiangbo Qin,Le Wang
The first hospital of Shanxi medical university

Abstract Objectives: To develop and validate a radiomics nomogram to preoperative prediction of isocitrate dehydrogenase (IDH) genotype for astrocytomas, which might contribute to the pretreatment decision-making and prognosis evaluating.
Methods: One hundred five astrocytomas (Grades II - IV) with contrast-enhanced T1-weighted imaging (CE-T1WI), T2 fluidattenuated inversion recovery (T2FLAIR), and apparent diffusion coefficient (ADC) map were enrolled in this study (training cohort: n=74; validation cohort: n=31). IDH1/2 genotypes were determined using Sanger sequencing. A total of 3882 radiomics features were extracted. Support vector machine algorithm was used to build the radiomics signature on the training cohort. Incorporating radiomics signature and clinic-radiological risk factors, the radiomics nomogram was developed. Receiver operating characteristic (ROC) curve and area under the curve (AUC) were used to assess these models. Kaplan - Meier survival analysis and log rank test were performed to assess the prognostic value of the radiomics nomogram.
Results: The radiomics signature was built by six selected radiomics features and yielded AUC values of 0.901 and 0.888 in the training and validation cohorts. The radiomics nomogram based on the radiomics signature and age performed better than the clinico-radiological model (training cohort, AUC=0.913 and 0.817; validation cohort, AUC=0.900 and 0.804). Additionally, the survival analysis showed that prognostic values of the radiomics nomogram and IDH genotype were similar (log rank test, p<0.001;C-index=0.762and0.687;z-score test, p=0.062).
Conclusions: The radiomics nomogram might be a useful supporting tool for the preoperative prediction of IDH genotype for astrocytoma, which could aid pretreatment decision-making.

Application Value of MR Radiomics in Grading of Cerebral of Gliomas

Wei Wei,Lihua Fan,Nan Yu,Zhaoguo Zhang,Yong Yu
Affiliated Hospital of Shaanxi University of Chinese Medicine

Objective: To evaluate the value of radiomics in distinguishing grade II and III of gliomas from T2-weighted MR images.
Methods: In this study, 159 gliomas patients,who underwent non-enhanced MR from the Cancer Genome Atla (TCGA) data portal, including grade Ⅱ(n=104)and Ⅲ(n=55) of gliomas.Patients were divided into training cohorts (n=111) and validation cohorts (n=48) in a ratio of 7:3. Gliomas were imported into the ITK-SNAP to manually delineate volume of interest (VOI) on T2-weighted images. Each VOI produced 396 radiomics features including Histogram, GLCM, GLSZM, RLM, Form Factor, Haralick. LASSO regression was used for feature screening. A formula was generated using a linear combination of selected features that were weighted by their respective LASSO coefficient. A radiomics score was calculated for each patient by the formula.The predictive accuracy of radiomics signatures was quantified by the area under curve (AUC) of a ROC curve in both cohorts.The calibration degree (CD) of theradiomics was evaluated by Hosmer-Lemeshow test. The clinical usefulness of theradiomics signatures was assessed by decision curve analysis.
Result: Fourradiomics features with non-zero coefficients were chosento build a radiomics model that distinguished grade II and III of gliomas with an AUC, sensitivity,specificity and CDof0.723, 75%, 89% and 0.120 in training cohort; and 0.800, 73%, 82%and 0.561in the validation cohort, respectively. DCA for the radiomics label showed that if the threshold probability was between 0.17 and 0.99, using radiomics label to distinguish grade II and III of gliomasadded more benefit than treating either all or no patients.
Conclusion: The radiomics label can distinguish grade II and III of gliomas, providing a non-invasive technique forassessing the invasiveness and prognosis forgliomas patients.

OR-300

Novel insights into multifocal gliomas: A new evidence from the probabilistic fiber tracking by diffusion tensor imaging

Simin Zhang,Weina Wang,Xiaorui Su,Xinyue Wan,Qiang Yue,Qiyong Gong
Huaxi MR Research Center (HMRRC), Department of Radiology, West China Hospital of Sichuan University

Object: Multifocal gliomas are uncommon lesions of the central nervous system; the overall incidence of multifocal gliomas is approximately 8–10% among all patients with gliomas [1]. Till now, the evolution of multifocal gliomas is poorly understood. Previous studies have grouped the tumor into one of the 2 categories (multicentric

glioma vs multiple glioma) based on whether a physical connection was presumed or not [2]. However, due to the invasive nature of glioma, it is hard to exclude the existence of a connection in cases deemed to be multicentric. As yet there remains lack of methods to elucidate the lesions are totally separated unless surgical biopsy. A non-invasive method involving a probabilistic approach may help us to identify the white matter dissemination routes. In the current study, we use probabilistic fiber tracking to depict pathway and quantify the probability connection of two lesions in patients with multicentric glioma and patients with multiple glioma.

Method: *Study type*; Retrospective. *Subjects*; Twenty-three patients with multifocal glioma divided into multicentric gliomas (group A) and multiple glioma (group B) based on classification suggested by previous study [2]. *Acquisition of neuroimaging data*; All patients underwent a diffusion tensor imaging (DTI) sequence and enhanced 3D T1-weighted MRI preoperatively (Siemens skyra 3.0T, 30 diffusion directions , b = 1000 s/mm^2 , 30 slices , thickness 3 mm), High-resolution contrast-enhanced T1 weighted images are acquired with a 3D MPRAGE sequence (TR/TE/ Flip angle =1540 ms/2.4 ms/8° , matrix =256 ×256, 1 mm thickness). *Data processing*; Firstly, the lesions served as the seeds and target for probabilistic tractography were segmented using ITK-SNAP software (www.itksnap.org) from each patient. Secondly, the DTI images for all patients were pre-processed using the FSL 5.0.9 Diffusion Toolbox (FDT) (http://fsl.fmrib.ox.ac.uk/fsl/fslwiki/FDT). Diffusion parameters at each voxel in the whole brain were first estimated using latest version of BEDPOST [3]. The resulting distributions were then used for probabilistic fiber tracking using the latest version of PROBTRACK [4]. The algorithm evaluates connectivity values between the seed and the target masks defined a priori. Finally, the probabilistic value and fractional anisotropy (FA) between multiple lesions was extracted from the probabilistic fiber tracking. *Statistical analyses;* Intergroup comparison of clinical characteristics was performed with T-statistics and Chi square test. The probabilistic value and FA between the two groups were assessed using the Mann-Whitney test.

Results: In Group A, patients were 4 glioblastomas,1 oligodendroglioma,3 diffuse astrocytomas,1 H3K27 mutant diffuse midline gliomas, 2 anaplastic astrocytoma; in Group B, patients were 4 glioblastomas, 1 anaplastic oligodendroglioma, 2 anaplastic astrocytoma,3 diffuse astrocytoma, 1 oligodendroglioma, 1 H3K27 mutant diffuse midline glioma. There was no difference between patients with group A and group B in gender, age and disease duration. There was also no difference between the two groups in status of isocitrate-dehydrogenase (IDH) mutation, ATRX, the Ki67 expression and FA value. However, their probabilistic value of multiple lesions was different (patients with multicentric gliomas =0.008658 ± 0.02643; patients with multiple gliomas = 0.266738 ± 0.194286, p = 0.000).

Conclusions: Immunohistochemical data based on IDH mutation status have redefined glioma as a whole-brain disease, while occult tumor cell invasion along white matter fibers is inapparent in conventional MRI. We used probabilistic fiber tracking to quantify the fiber connections between lesions, the results showed that the probabilistic values of the lesions in patients with multicentric gliomas were significantly lower than the lesions in patients with multiple gliomas. From a methodological point of view, the probabilistic value represents a quantitative

indication of the likelihood of a path existing between the seed and target region. The higher the value, the higher the likelihood that seed and target region are well connected, thus providing an indication of the connectivity existing between them. Thus, our preliminary investigation provides new insight and proof into multifocal gliomas which may aid in accurate classification of the multicentric glioma and the multiple glioma in vivo.

OR-301

Prediction for Grading of Stereotactic Biopsy Glioma Targets Based on Preoperative MRI Textural Analysis

Wenting Rui[1],Haopeng Pang [2],Xie Qian[3],Ren Yan[1],Yao Zhenwei[1]
1.Radiology Dept, Huashan Hospital, Fudan University, Shanghai
2.Radiology Dept, Ruijin Hospital, Shanghai Jiaotong University
3.Radiology Dept, Central Hospital in Jingan District, Shanghai

PURPOSE
To explore the value of textural analysis based on T1 BRAVO+C images for grading of glioma targets by stereotactic biopsy (WHO grade II and III).
METHOD AND MATERIALS
A total of 36 diffuse glioma cases and 64 puncture targets were included in this study. All underwent preoperative MR scanning and intraoperative MR-guided stereotactic puncture biopsy. Histopathological diagnosis was WHO grade II or III diffuse glioma. By Omni Kinetics software, regions of interest (ROIs) which were consistent with the puncture target were delineated on 3D T1 BRAVO+C images, size of which was about 10×10 mm. Texture features of each ROI were automatically calculated by the software. Mann-Whitney rank sum test was used to analyze the texture differences between WHO grade II and III ROIs. Receiver operating characteristic curve (ROC) was used to evaluate the diagnostic value of textural analysis for grading glioma targets. Cutoff value was set according to Youden index, and sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) were all calculated.
RESULTS
Texture features Maxintensity (P=0.001), Quantile 95 (0.002), Range (< 0.001), Variance (< 0.001), Standard deviation (< 0.001), Sum variance (0.022) and Cluster prominence (< 0.001) were higher in WHO grade III gliomas than those of WHO grade II. While WHO grade II gliomas had higher Uniformity (P=0.001) and ShortRunLowGrayLevelEmphasis values (0.018) than WHO grade III ones. First-order features Maxintensity (area under the curve (AUC) = 0.751, sensitivity = 96.6%, NPV = 94.2%), Quantile 95 (0.737, 86.2%, 80.0%) and Range (0.801, 89.7%, 87.0%); AUC value was the highest in Variance and Standard deviation (0.826); Uniformity (AUC = 0.746, specificity = 82.8%, PPV = 76.2%). Second-order gray-level co-occurrence matrix features Cluster prominence (AUC = 0.784, specificity = 89.7%, PPV = 85.8%), and Sum variance (0.675, 96.6%, 91.0%). Diagnostic efficiency of high-order gray-level run-length matrix features was slightly lower than first-order and second-order features. AUC was 0.887 (95% confidence interval: 0.805-0.969, P<0.001) by combined ROC analysis with multiple texture features.
CONCLUSION

Textural analysis on T1 BRAVO+C images may be helpful in grading glioma targets by stereotactic biopsy (WHO II and III).

OR-302

Noninvasive IDH1 status prediction for grade Ⅱ/Ⅲ gliomas using diffusion tensor imaging: a transfer learning strategy

Jin Zhang,Lin-Feng Yan,Wen Wang,Guang-Bin Cui
Department of Radiology & Functional and Molecular Imaging Key Lab of Shaanxi Province, Tangdu Hospital, the Military Medical University of PLA Airforce (Fourth Military Medical University)

Purpose: This study was to evaluate the performance of transfer learning combined with convolutional neural network (TL-CNN) in predicting the isocitrate dehydrogenase 1 (IDH1) status of grade Ⅱ/Ⅲ gliomas using diffusion tensor imaging (DTI).
Method and Materials: 73 pathologically confirmed grade Ⅱ/Ⅲ glioma patients receiving preoperative DTI examination were retrospectively included. For each patient, the eigenvalues (k1, k2, k3) of DTI data were calculated and were used to construct the p and q maps. VGGNet was pre-trained on the large scale natural image database (ImageNet) and fine-tuned with p map and q maps, respectively. The classification task was evaluated with five-fold cross-validation on patient-level split.
Results: Using TL-CNN, IDH1 predictive performance of q maps achieved 0.926 for the areas under the ROC curve (AUC) and 0.933 for accuracy. However for p maps, rather bad performance were obtained with 0.5370 for AUC and 0.667 for accuracy.
Conclusion: TL-CNN using q maps is promising in predicting IDH1 mutant status of grade Ⅱ/Ⅲ gliomas.

OR-303

3D Segmentation Based Radiomics Analysis of Multimodal MRI Combined with Quantitative Analysis in Grading Brain Gliomas

Kun Lin[1],Wangjiu Cidan[2],Ying Qi[1],Xiaoming Wang[1]
1.Shengjing Hospital of China Medical University
2.People’s Hospital of Tibet Autonomous Region

Objective To evaluate the efficacy of 3D segmentation based radiomics analysis of multimodal MR combined with quantitative analysis in the grading of gliomas. **Methods** One hundred histologically confirmed glioma patients (50= WHO II, 24= WHO III, 26 =WHO IV) who underwent a 3T-MRI tumor protocol with conventional (T1 pre/post-contrast, T2) and advanced (Diffusion Tensor Imaging and 1H-MR Spectroscopy) techniques, were studied. Whole-tumor 3D and 2D segmentations of T1, T1+Gad, T2, ADC map, FA map were performed using freehand drawing tool. Totally 396 radiomics features, including

primary, secondary and high order features, were extracted. Logistic regression with LASSO regularization and 10-fold cross-validation was used to determine the optimal model for each sequence in differentiating high-grade gliomas (HGGs) from low-grade gliomas (LGGs). The extracted features in the model of each sequence were combined for receiver operating characteristic (ROC) curve analysis. MRS metabolic ratios, MD values, FA values were obtained. Based on the Akaike Information Criteria (AIC), a radiomics nomogram model including radiomics signature, quantitative parameters and clinical features was further presented. **Results** T1+Gad sequence performed best when used alone, with an area under the ROC curve (AUC) of 0.902 (sensitivity 84.0%; specificity 86.0%). Correlated with Ki-67, T1+Gad model showed the highest correlation coefficient (r=0.649). The combined model was significantly better with AUC of 0.966 (sensitivity, 100%; specificity 88.0%). The nomogram including the Radscore of the combined model, Cho/NAA, MD, age, sex and lesion location, was optimal in the grading of gliomas. **Conclusion** Radiomcs features combined with quantitative parameters as well as clinical features can discriminate HGG versus LGG, which may guide surgical and medical management.

OR-304

In situ formation of nanotheranostics to overcome the Blood-Brain-Barrier and enhance treatment of orthotopic glioma

Haiyan Gao[1],Chengchao Chu[2],Yi Cheng[2],Yan Bai[1],Lijuan Chen[1],Gang Liu[2],Meiyun Wang[1]
1.Department of Medical Imaging, Henan Provincial People's Hospital
2.State Key Laboratory of Molecular Vaccinology and Molecular Diagnostics & Center for Molecular Imaging and Translational Medicine, School of Public Health, Xiamen University, Xiamen 361102, P. R. China

Purpose

Glioblastoma is one of the most lethal cancers with few available therapeutic options [1]. The blood-brain barrier (BBB) and Blood-Brain Tumor Barrier (BBTB) still present obstacles which stop nanomedicines reaching diseased areas of the brain, conventional therapies can often damage normal tissues and may induce drug resistance rapidly in cancer cells [2]. A safer strategy is therefore to use small particle size nanocarrier delivery system to pass through the BBB, then nanocarrier responds to stimuli in the local tumor environment so as to be integrated into a larger molecule via self-assembly in the tumor tissue, thereby increasing the retention of the drug at the tumor site for enhanced therapy. Taking advantage of RGD-mediated neovascular targeting, the Bis(DPA-Zn)-RGD selectively navigate to the tumor site, and then assembles into large nanoclusters with subsequently administered Au-ICG nanoclusters which can successfully cross the BBB due to ultrasmall particle size, with further image-guided photothermal ablation of glioblastoma without damaging the scalp and skull in an orthotopic primary mice model.

Experiment

Bis(DPA-Zn) was chemically conjugated with RGD was obtained from professor Gang Liu in Xiamen university [3]. The Au-ICG nanoparticles were synthesized by one step method, due to their particle size these particles could cross the BBB and further in situ formed Bis(DPA-Zn)-RGD-derived nanoclusters with strong NIR absorption for precise orthotopic glioma imaging. Before animal testing, ten male athymic nude mice at 5 week old were anesthetized with isoflurane and fixed on stereotaxic frame. U87 cells expressing firefly luciferase (U87-Fluc) were inoculated to the brain (5 × 103 cells in the striatum: Bregma +1.0 mm, right lateral 2.0 mm, depth 2.5mm). After 7 days, the MRI combining a bioluminescence imaging was used to monitor the tumor location and growth (Bruker, Germany). Bis(DPA-Zn)-RGD selectively navigate to the tumor site, then with subsequently administered a novel ultrasmall Au-ICG nanoparticles, Furthermore, in the case of Au-ICG triggering by Bis(DPA-Zn)-RGD in the tumor environment produces self-assembly of an R/Au-ICG nanocluster with further enhanced optical properties and targeted thermal ablation of brain tumors (Figure 1a).

Results

HAuCl4 solution was mixed with the green ICG solution, it turned red in just a few minutes. When the ICG:HAuCl4 ratio was 1:1, the size of the nanoparticles was ~7 nm, which provided excellent dispersal and crossing of the BBB, R-Au-ICG nanoclusters are achieved when Bis(DPA-Zn)-RGD interacts with the sulfonate anions of the Au-ICG, Transmission Electron Microscopy (TEM) revealed that the morphology of nanoclusters were conglobate (i.e. ball-like), with an average diameter of 114 nm. By applying the MRI and bioluminescence imaging, the formation of intracranial tumors in mice can be also determined. After the injection of Bis(DPA-Zn)-RGD and Au-ICG, mice were exposed to laser irradiation (808 nm, 1.0 W/cm2 for 5 min). MRI revealed that tumor size was much more reduced in the R/Au-ICG group.

Conclusion

In summary, a new type of nanocluster has been synthesized by Bis(DPA-Zn)-RGD instructed self-assembly of small Au-ICG nanoparticles. The Au-ICG nanoparticles were prepared by a one-step approach, crossed the BBB upon systemic administration, and were triggred by Bis(DPA-Zn)-RGD in the tumor environment to self-assemble into nanoclusters, which is suitable for image-guided photo-thermal cancer therapy. R/Au-ICG nanoparticles induced a hyperthermal effect in response to NIR laser irradiation at 808 nm, to effectively suppress brain tumor growth in mice. The high photo-thermal effect of the newly developed Au nanoclusters provides substantial opportunities for broad biomedical applications and further clinical translation.

Comparative study of adult and pediatric diffuse midline glioma with the H3K27M mutation: Radiology, pathology and prognosis

Dong Cao,Weihua Liao,Xianting Sun
Xiangya Hospital, Central South University

Purpose: Diffuse midline glioma with H3K27M mutation, which is commonly observed in children, was defined by the WHO classification of central nervous system tumors in 2016. This paper aims to explore the clinical, pathological and imaging differences between adults and children's diffuse midline glioma with the H3K27M mutation.
Materials and Methods: Forty patients with newly diagnosed diffuse midline glioma with H3K27M mutation were enrolled. After the MRI features, molecular pathological features, and individual prognoses were analyzed, differences between the adult and pediatric groups were assessed.
Results: There were 26 adults (≥18 years) and 14 children (＜18 years). The tumor location in the pediatric cohort was concentrated, in which the majority of lesions were centered in the brainstem (79%), while the adult tumors were scattered in various central locations. The differences in imaging features weren't statistically significant. However, the P53 mutation rate and prognosis were significantly different between the two. The pediatric group had more P53 mutations (P=0.009) and worse prognoses (P=0.022) than adult group did. Meanwhile, the P53 mutation group had a poorer prognosis than the P53 wild-type group did (P=0.040).
Conclusion: Diffuse midline glioma with H3K27M mutation was more common in adults. There were significant differences in anatomic location, P53 expression, and prognosis between adults and children's diffuse midline glioma with the H3K27M mutation. However, there were no significant differences in tumors' MRI imaging characteristics. The P53 mutation rate in children was higher than that in adults, which leads to a worse prognosis in the pediatric group.

OR-306

Diffusion kurtosis imaging in evaluation of gliomas: Effects of Region of Interest Selection Methods on Time Efficiency, Measurement Reproducibility, and Diagnostic Ability

Jing Zhao,Yisu Tian,Haishan Qiu,Yingqian Huang,Jianping Chu
The First Affiliated Hospital of Sun Yat-sen University

Purposes: Comparing the diagnostic efficacy of different ROIs in the tumor parenchyma to grading, predicting the *IDH-1* mutation status of glioma and correlated with its survival data.

Materials and methods: Sixty-six patients (36 HGG; 29 females; median age, 46y) with pathologically proved gliomas were prospectively included and their clinical data was collected. All cases underwent DKI examination. DKI and DTI maps of each metric was derived. Three group of ROIs (ten spots: ROI-10s, three biggest tumor slicers: ROI-3s and 3D-full tumor parenchyma: ROI-full) were manually drawn by two independent radiologists. Time spent, interobserver consistency, diagnostic efficacy and survival analysis of these three ROIs were analyzed.

Results: The intra-examiner reliability for all parameters among these three ROIs were excellent and the time spent on ROI-10s (73±10.2 s) was significantly less than those other two ROIs (ROI-full: 457±109 s; ROI-3s: 124±35 s, $P < 0.002$). For grading glioma, ROIs based on different tumor parenchyma demonstrated an comparable diagnostic value ($AUC_{ROI-10s}$: 0.81, AUC_{ROI-3s}: 0.80 and $AUC_{ROI-full}$: 0.79); Further, with the predicting of IDH-1 mutation status, the diagnostic value of ROI-10s (AUC: 0.84) slightly better than the other two methods (AUC_{ROI-3s}: 0.81 and $AUC_{ROI-full}$: 0.79), but without reach the significant point. In addition, with the survival analysis, the model based on ROI-10s included patient age and mean diffusion showed the highest prediction value, and the C index was 0.81 (95%CI: 0.73-0.89).

Conclusions: Different ROIs in tumor parenchyma demonstrated comparable diagnostic efficiency in evaluating gliomas and predicting glioma survival. However, ROI-10s is an effective way to process DKI data and it is highly recommended in clinic evaluation of glioma.

OR-307

Remodeling Tumor Microenvironment by Inhibition of Glycolytic Activator PFKFB3 to Synergize with Antiangiogenic Therapy in Glioblastoma: Insights from Multiparametric MRI and Proteome Profiling

Junfeng Zhang,Weiguo Zhang
Daping Hospital, Institute of Surgery Research, Army Medical University

Purpose: To investigate whether targeting tumor glycolysis by PFKFB3 blockade is a novel potential strategy to enhance antiangiogenic therapy in glioblastoma (GBM), and to evaluate treatment-related molecular characterization and clinically translatable MR imaging biomarkers of tumor response.

Methods and Materials: Patient-derived orthotopic GBM xenografts in mice were established and imaged before and different time points(day2,day5,day8,day12,day20) after treatment with bevacizumab(BEV), 3PO(PFKFB3 inhibitor), BEV and 3PO, and saline. Tumor volume, cellularity, neovascularization, and metabolites were monitored by T_2WI, IVIM, DCE-MRI, and ^{1}H-MRS, respectively. Pathology and proteome microarray were analyzed to correlate with imaging parameters and evaluate post-treatment molecular profiling.

Results: BEV treatment induced remarkable PFKFB3 expression compared with control (P<0.05).3PO enhanced BEV therapeutic efficacy by sustained vascular normalization, improved oxygenate status and reduced expression of matrix metalloprotein-9. K^{trans} and f was positively correlated with microvascular density(r=0.8776; r=0.9177) and hypoxia(r=0.5566; r=0.5681), and negatively vascular maturation(r=-0.4898; r=-0.5884). Only co-treatment improved vascular perfusion corresponding to increased D*. Mechanismly, BEV activated glycolysis with a rising trend of Lac/Cr and Lactate dehydrogenase-A level. Co-treatment inhibited multiple proangiogenic factors by downregulating VEGF-independent pathways.

Conclusion: Targeting PFKFB3 has much potential to abate BEV-induced glycolysis by sustained tumor microenvironment remodeling and could be monitored by multiparametric MRI thoroughly. IVIM is a promising alternative to DCE-MRI to characterize tumor response.

AIM: To preliminarily analyse the prediction efficiency of multimodal MRI-based radiomics model for preoperative glioma IDH1 gene expression type. Methods The MRI data of 108 surgery-proven glioma patients from May 2015 to January 2019 were retrospective

wenting lan[1],Zhan Feng[2]
1.NingBo First hospital Zhejiang province
2.The first affiliate hospital of Zhejiang University Medical college

AIM: To preliminarily analyse the prediction efficiency of multimodal MRI-based radiomics model for preoperative glioma IDH1 gene expression type.
Methods The MRI data of 108 surgery-proven glioma patients from May 2015 to January 2019 were retrospectively analyzed, including axial T_1WI、T_2WI、fluid attenuated inversion recovery (FLAIR)、Diffusion Weighted (DWI) imaging and enhanced T_1WI sequence.47 cases were IDH1 mutant type, 61 cases were IDH1 wild type,all patients were divided into training group and validation group according to the 7:3 ratio of random forest model. 73 cases were in training group (33 cases were IDH1 mutant type, 40 cases were wild type), and 35 cases were in validation group (14 cases were IDH1 mutant and 21 cases were wild type). Shapiro-Wilktest normality test and homogeneity test of variance were used to test the general clinical information and morphological parameters of patients with IDH1 mutation and IDH1 wild type by R language statistical software. Univariate logistic regression screening (P<0.01) was used to identify independent predictors of IDH1 expression type, in order to construct a random forest diagnosis model of General clinical information and conventional MRI morphological features.General clinical information and conventional MRI morphological features including gender,age,umbers of cases of left and right hemispheres, location of tumors, maximum diameter of tumors, peritumoral edema, intratumoral cystic degeneration, enhancement and ADC value of tumors. The ROI was manually outlined by MaZda software(MaZda forWindows, B11 version4.7, www.Eletel.p.Lodz.PI/mAzda) in the most obvious level of 5 sequences of tumor mass and the radiomics features were extracted,including GLCM (the gray-level co-occurrence matrix)、RUN (the run-length matrix)、GRA (the absolute gradient)、ARM (the auto-regressive model) and WAV (wavelets transform).The least absolute shrinkage and selection operator (LASSO)regression was used to to select image radiomics features with a method of 10 fold cross -validation and to reduce the dimensionality .The screened image radiomics labels were combined with the conventional morphological feature independent predictors to construct a multimodal MRI-based random forest model, and the validation data set was used to evaluate the accuracy and diagnostic efficiency of each model.The sensitivity and specificity of conventional MRI

morphological feature model and multimodal MRI-based radiomics prediction model were evaluated dynamically by drawing ROC curves, and the prediction efficiency of the two models was quantified by using AUC statistical indicators. The model classification error rate under different outcomes and the classification error rate of OOB (out of bag) were used to evaluate the stability of the multimodal MRI-based random forest model.The contribution rate of each variable to the model was reflected by the characteristic variables importance assessment map.Mean Decrease Accuracy and Mean Decrease Gini index were used to evaluate the importance of each variable in the multimodal MRI-based random forest model. **Results** Univariate regression analysis of conventional MRI morphological characteristics showed that peritumoral edema, cystic degeneration and enhancement were the three independent predictors of IDH1 gene expression (P<0.01).LASSO algorithm and 10-fold cross-validation selected six robust radiomic features including WavEnHH_s-4 (high frequency coefficients of wavelet transform) of T_2WI, S(4,4) InvDfMom (inverse difference of gray uniformity measurement)、S(5,0) Entropy (entropy)、WavEnHH_s-4 (high frequency coefficients of wavelet transform)of T_1WI enhancement, S(1,1) InvDfMom (inverse difference of gray uniformity measurement)、S(1, -1) DifEntrp (Entropy Difference)of Flair.The error rate of classification for different outcomes and classification error rate of random forest OOB (out-of bag) data of multimodal MRI radiomics diagnosis model finally stabilized at 10%. The results of Characteristic Variable Importance Assessment Map: Mean Decrease Accuracy and Mean Decrease Gini index were consistent which showed that besides three conventional MRI morphological predictors peritumoral edema, enhancement and cystic degeneration, the radiomics labels also played a key role in the model. The results of ROC curve showed that the accuracy, specificity, sensitivity and AUC of conventional MRI morphological feature model were 82.7%, 68.4%, 90.9% and 83.5%, and multimodal MRI-based radiomics model were 88.5%, 89.5%, 87.8% and 95.6% respectively. **Conclusion** Multimodal MRI-based radiomics random forest model can improve the predictive efficiency of preoperative glioma IDH1 gene expression type more quantitatively.

Longitudinal Resting-State Functional MRI study in mild cognitive impairment Conversion to Alzheimer's Disease

Yuxia Li,Ying Han
Department of Neurology, XuanWu Hospital of Capital Medical University

Objective
Individuals diagnosed as mild cognitive impairment (MCI) are at high risk of conversion to Alzheimer’s disease (AD). More than 70% of patients with MCI will eventually develop AD, and the rate of MCI conversion to AD reaches 10% to 15% annually. Given lack of effective treatment at the stage of dementia recently, it is of great significance to investigate and discover the conversion from MCI to AD. However, little is known about the functional characteristic of the conversion from MCI to AD.
Methods

In the study, the data of resting state functional magnetic resonance imaging (rs-fMRI) was acquired and analyzed in 37 MCI patients and 31 well-matched normal controls (NC) at baseline and at follow up. Functional connectivity strength (FCS) was used to assess the functional differences among the groups. Then we compared the trajectory of longitudinal rs-fMRI in the three groups and analyzed the correlation between rs-fMRI and neuropsychological assessment.
Results
The FCS in right ventral medial prefrontal cortex and orbitofrontal cortex were significantly lower in the MCI-c group at the follow-up as compared to at the baseline. While in MCI-nc group, decreased FCS in left paracentral lobule was observed at follow up, as compared to at the baseline. There was a significantly negative correlation between the score of Montreal Cognitive Assessment and the decreased FCS in right orbitofrontal cortex, and right middle occipital gyrus in MCI-c.
Conclusion
This dynamic functional change is likely to be an important characteristic of rs-fMRI for the conversion from MCI to AD dementia. It is a gradually process for the destruction of the FCS in the conversion from MCI to AD dementia, and the prefrontal cortex might be impaired at last from MCI develop AD in our study. These findings extend our understanding of the underlying indicators for the dysfunction and progression in the early stage of AD, the progressive functional changes may predict MCI-to-AD conversion and monitor disease progression.

Structural and diffusional MRI-based predictions between multiple sclerosis (MS) and neuromyelitis optical spectrum disorder (NMOSD)

Xiaoya Chen,Yongmei Li,Tianyou Luo,Qiao Zheng,Min Xie
The First Affiliated Hospital of Chongqing Medical University

Objective: The application of machine learning techniques to neuroimaging offers the possibility to identify robust, reliable and objective disease biomarkers. Here, we describe predictions of patients between multiple sclerosis (MS) and neuromyelitis optical spectrum disorder (NMOSD) diagnosis using structural T1-weighted and diffusion tensor imaging.

Method: Forty-six patients with MS and 38 patients with NMOSD were recruited. The brain volume was calculated using CAT12 and the maps of FA and MD value were calculated by FSL. We used a binary support vector machines (SVM) conducted in Pattern Recognition for Neuroimaging Toolbox (PRoNTo) with a reliability filter for feature selection.

Result: The SVM classifier of FA model report 71.43% accuracy with sensitivity of 67.39.0 % and specificity of 76.32 % of individual subject diagnostic prediction. The SVM classifier of MD model report 78.57% accuracy with sensitivity of 73.91 % and specificity of 84.21 %. The SVM classifier of gray matter volume model report 74.73%

accuracy with sensitivity of 74.51 % and specificity of 75 %. The area under the ROC curves (AUC) of the proposed methods about FA, MD and gray matter volume were 0.81, 0.85 and 0.88, indicating that these models can be regard as related good classification powers. In the FA model, the regions with the greater weight included the bilateral corticospinal tract and left superior cerebellar peduncle. The weight of the three regions were 4.80, 4.43 and 3.47. In the MD model, regions included the left posterior corona radiata and left tapetum. The weights were 4.80, 5.48 and 5.22. In the gray matter volume model, regions included the bilateral thalamus, left paracentral lobule and right cerebellum inferior. The weights were 3.77, 3.47, 2.14 and 2.10.

Conclusion: It is possible to use white and grey matter MR images to predict diagnostic status when comparing MS and NMOSD subjects. The bilateral corticospinal tract, left superior cerebellar peduncle, left posterior corona radiata and left tapetum of white matter and bilateral thalamus, left paracentral lobule and right cerebellum inferior of gray matter are identified as region of interest. These results provide encouragement that machine learning methods can increase the understanding of the neurobiology between the MS and NMOSD.

OR-311

Structural MRI-Based Predictions in Patients with neuromyelitis optical spectrum disorder (NMOSD)

Xiaoya Chen,Yongmei Li,Tianyou Luo,Qiao Zheng,Min Xie
The First Affiliated Hospital of Chongqing Medical University

Objective: Regions identified using voxel-based morphometry provide information about group-level differences in previous study about patients with neuromyelitis optical spectrum disorder (NMOSD). Here, we describe predictions of patients with NMOSD diagnosis using structural T1-weighted brain scans obtained from health control.

Method: Thirty-four patients with NMOSD and twenty-nine age and sex-matched HCs were recruited. The whole brain was divided into 68 regions from the 3D T1-weighted MR images using FreeSurfer software. We used a standard nu-support vector regression (nu-SVR) model conducted in LIBSVM toolbox with linear kernel with a reliability filter for feature selection and default set of parameters. SVM analysis consisted of two stages: training the classifier, then testing the accuracy using data not used for training. Within-study replication ('leave-one-out' cross-validation, LOOCV) was used for training. To assess whether the computed classification accuracy is statistically significant, the statistical significance of the classification results is evaluated using permutation test.

Result: The linear SVM classifier report 79% accuracy with sensitivity of 79.0 % and specificity of 65 % of individual subject diagnostic prediction. The area under the ROC curve (AUC) of the proposed method was 0.79, indicating a related good

classification power. Some regions showed greater weights than others. Specifically, we defined a region having significantly higher weight if its weight was at least one standard deviation greater than the average of the weight of all the regions. The regions with the greater weight included the left rostral middle frontal, right fusiform, right pars opercularis grey matter. The weight of the three regions were 2.73, 2.24 and 2.23.

Conclusion: To summarise, it was possible to use grey matter MR images to predict diagnostic status when comparing NMOSD subjects and healthy controls. And the left rostral middle frontal, right fusiform, right pars opercularis grey matte were identified as a region of interest. These results provide encouragement that machine learning methods can increase the understanding of the neurobiology of NMOSD.

OR-312

Selective effect of cognitive status and the APOE ε4 allele on the hippocampal subfield volume and AD-signature cortical thickness in non-demented older subjects

Bing Zhang, Xue Liang, Zhenyu Yin
Affiliated Drum Tower Hospital of Nanjing University Medical School, Nanjing, China

Purpose There is no consensus on the effect of the APOE ε4 allele on the hippocampal subfield volume or Alzheimer's disease (AD)-signature cortical thickness in both patients with mild cognitive impairment (MCI) and older subjects with normal cognition. Additionally, there exist no data on the APOE ε4 allele's effect on the association between neuropsychological scale upon testing and the hippocampal subfield volume or AD-signature cortical thickness in non-demented older subjects. This study used an automated volume analysis technique to: (1) investigate patterns of hippocampal subfield volume loss and AD-signature cortical thinning in MCI patients and APOE ε4 carriers; (2) explore the association between the neuropsychological scale and the hippocampal subfield, as well as cortical thickness; and (3) determine whether these associations were modified by the APOE ε4 gene and cognitive status.
Materials and Methods A cohort of 45 participants, including 22 MCI patients and 23 older subjects of normal cognition (normal controls, NC), were recruited from the Memory Clinic of the Geriatrics Department at the Nanjing Drum Tower Hospital. The FreeSurfer software was used for automated segmentation of bilateral hippocampal subfields and "AD-signature" cortical thickness. Hippocampal subfield volume and cortical thickness, as well as the neuropsychological scale, were compared using two sample *t*-tests between the NC and MCI groups. Several pearson correlation coefficients between the hippocampal volumes were calculated, as were the cortical thickness and memory measures. Linear regression models, controlling for eTIV (estimated total intracranial volume), were used to determine the association between the neuropsychological scale and the hippocampal subfield volume, as well as the AD-

signature cortical thickness, considering the interaction with APOE or the cognitive status.

Results. There was a reduction in the bilateral hippocampal subfield volume and some AD-vulnerable regions of cortical thickness in the MCI patients compared with the normal control group. Compared with healthy controls, MCI patients showed decreased volume of the left presubiculum and subiculum, right CA1, bilateral CA2_3 and CA4_DG, and decreased cortical thickness of the left entorhinal area (all $P < 0.05$, uncorrected). However, considering the Bonferroni corrected ($P<0.01$for hippocampal subfield volume and $P<0.0055$ for AD-signature cortical thickness), only reduced left presubiculum volume ($P=0.006$) was noted for MCI patients compared with NC group. The left presubiculum volume was positively correlated with the Mini-Mental State Examination (MMSE), Montreal Cognitive Assessment (MOCA), and Digit span backward scores (adjusting for eTIV as covariates). Of note, these associations (MMSE and left presubiculum, MOCA and left presubiculum) depended on the cognitive status but not on the APOEε4 status. The left subiculum volume was positively correlated with the MMSE and MOCA scores only in the MCI patients (P=0.025 and P=0.003, respectively).

Conclusion. Atrophy of the left presubiculum volume is a more powerful biomarker for MCI than other hippocampal subfields and AD-signature cortical thickness. Also, the deficits in total cognition (MMSE and MoCA) were associated with reduced left presubiculum volume. The association between neuropsychological tests and the hippocampal subfield volume could be modified by the cognitive status, and this association could be found only in the MCI patients, providing a window on the objective understanding of the mechanism of the AD pathological processes.

OR-313

Dynamic functional connectivity reveals altered intrinsic functional variability of thalamocortical connectivity system among patients with acute and remitting multiple sclerosis

Muhua Huang,Fuqing Zhou,Lixin Huang,Xianjun Zeng,Honghan Gong
The First Affiliated Hospital of Nanchang University

Objectives: Disruptions in thalamic connectivity are believed to underlie the symptoms of multiple sclerosis (MS), regardless of the stage of the disease. The dynamic functional connectivity (dFC) of the distinct thalamocortical system among in acute and remitting phase MS are poorly understood. Therefore, thalamocortical dFC may provide new insights into the mechanism of intrinsic functional plasticity in a large-scale neural network.

Methods: Using sliding window correlation to captured the dFC pattern of thalamocortical in the MS (acute MS, n=18; remitting MS, n=26) and sex- and age-matched healthy controls (HC, n=23) during rest. We quantified dFC variability between seven paired thalamic connectivity-defined regions and exclusive cortical regions using their standard deviation and to identify correlations with clinical markers.

Results: Compared with HC and remitting MS, the acute MS patients exhibited:1) excessive variability (increased dFC variability) in the left calcarine and cuneus of occipital cortices, left middle frontal gyrus of prefrontal cortices, left superior temporal pole of temporal cortices. By contrast, excessive stability (decreased dFC variability) was found in the left postcentral gyrus of primary and secondary somatosensory cortices, right superior frontal gyrus of prefrontal cortices, left superior parietal lobule of posterior parietal cortices; 2)significant decreased static functional connectivity values of the cuneus, left superior temporal pole and increased static functional connectivity values of the left superior parietal lobule. 3) In addition, we also found significant correlations between increased dFC variability of right superior frontal gyrus and slowed cognitive processing ($p=0.02, r=-0.361$) or increased the impact of fatigue (Modified Fatigue Impact Scale-5, MFIS-5)($p=0.022, r=0.574$) and also revealed that the excessive variability in the cuneus was related to MFIS-5 ($p=0.027, r=-0.461$).
Conclusion: Our finding show that an excessive variability and excessive stability thalamocortical patterns was vulnerable to acute onset of MS, and dFC may help to further understand the disease progress associated interaction of large-scale network.

OR-314

Effect of ROI methods on consistency and reproducibility of measured values in Diffusion Tensor Imaging of lumbosacral plexus nerve roots

Chengyan Huang, Zhibo Wen
Zhujiang hospital

Abstract
Background: Diffusion tensor imaging (DTI) provides a new method for displaying and quantitatively analyzing peripheral nerves. However, previous studies often arbitrarily employed a delineation method for determining regions of interest (ROIs), ignoring the impact of the delineation method itself on results.
Objective: To investigate the effects of ROI methods on the consistency and repeatability of measured values in DTI of lumbosacral plexus nerve roots.
Material and method: Prospectively collected thirty healthy volunteers did MRI scans, and MRI sequences including DTI along with conventional MRI sequences, and 3D-Fast-Field Echo using a Philips 3.0T Ingenia. We manually delineated ROIs using the following 5 methods in lumbosacral plexus nerve root ganglions: outline method, center method (2 mm^2, 4 mm^2, 6 mm^2 in size) and 4-circle mean method. DTI parameters were measured, including fractional anisotropy (FA) values and apparent diffusion coefficient (ADC) values. One-way ANOVA was performed to detect differences among different ROIs. ICC was used to evaluate the consistency of the 2 radiologists' results. ICCs between 0.41-0.60 were considered a moderate correlation, between 0.61-0.80 were considered a high correlation, and between 0.81-1.00 were considered an extremely high correlation. The Bland-Altman method was used to evaluate the reproducibility of the results from 2 radiologists. $P<0.05$ was considered indicative of statistical significance.

Result: There were significant differences in FA and ADC values among different methods (p<0.05). In L5 nerve roots, a moderate correlation of ADC values was observed in the 4-circle mean method while high correlations of FA and ADC values were seen in other methods. In S1 nerve roots, high correlations of all methods were observed. The optimal consistency was obtained with the outline method. Bland-Altman scatter plots show outline method has small variability and good precision.
Conclusion: In DTI analysis of lumbosacral plexus nerve roots, the ROI methods using affects the consistency and reproducibility of the measurements. Of these methods, the outline method is recommended because of its superior consistency and reproducibility.

OR-315

Correlation between Hippocampus MRI Radiomic Features and Resting-State Functional Connectivity in Alzheimer's Disease

Qi Feng,Zhongxiang Ding
Affiliated Hangzhou First People's Hospital, Zhejiang University School of Medicine

Alzheimer's disease (AD) is a neurodegenerative disease with main symptoms of chronic primary memory loss and cognitive impairment. The study aim is to investigate the correlation between hippocampal functional connectivity (FC) and MRI radiomic features in AD. A total of 67 AD patients and 44 normal controls (NC) were enrolled in this study. Using one method of resting-state functional MRI (rs-fMRI), the whole-brain FC with bilateral hippocampus as seed was performed, and the FC values were extracted from the bilateral hippocampus respectively. We observed that AD patients demonstrated disruptive FC in some brain regions in the left hippocampal functional network, including right gyrus rectus, right anterior cingulate and paracingulate gyri, bilateral precuneus, bilateral angular gyrus, and bilateral middle occipital gyrus. In addition, decreased FC was witnessed in some brain regions in the right hippocampal functional network, including bilateral anterior cingulate and paracingulate gyri, right dorsolateral superior frontal gyrus, and right precentral gyrus. Bilateral hippocampal radiomics features were calculated and selected respectively using A.K software. Pearson correlation analysis suggested that two gray level run-length matrix (RLM) radiomic features and one gray level co-occurrence matrix (GLCM) radiomic features weakly associated with FC values in the left hippocampus. However, there were no significant correlations between radiomic features and FC values in the right hippocampus. Compared with the NC group, the AD group showed abnormalities of FC level in the bilateral hippocampal functional network. This is a prospective study revealed the correlation between the MRI radiomic features and the rs-fMRI in AD patients.

OR-316

Progressive alterations in structural topological properties in T2DM with and without mild cognitive impairment

Ying Xiong
Department of Radiology, Tongji Hospital, Tongji Medical College, HUST

Introduction/Purpose

Type 2 diabetes mellitus (T2DM) is a chronic metabolic disease. Patients with T2DM have considerably higher risk of developing cognitive impairment. Diffusion Tensor Imaging (DTI) studies have revealed widespread white-matter integrity alterations and its correlation with neuropsychological function for T2DM patients.[1] Moreover, graph theory studies have shown disrupted topological organization of both functional and structural brain networks.[2,3] However, whether the cognitive dysfunction will have impact on the topological properties of brain networks for T2DM patients is still not clear. Thus, the purpose of this study is to investigate the topological organization alterations in T2DM patients with and without cognitive impairment, and characterized its relationships with clinical measurements.

Methods:

Patients: With approval of the Institutional Review Board, 40 T2DM patients (based on diagnostic criteria of American Diabetes Association; 52-72 years) were recruited and divided into mild cognitive impairment (DM-MCI, n=20, 62.9±5.5years) and normal cognition (DM-NC, n=20, 59.1±6.4years) groups based on clinic symptoms and a battery of neuropsychological tests (Montreal Cognitive Assessment, Mini-Mental State Examination, Trail Making Tests, Auditory Verbal Learning Test, Hachinski test, and Activity of Daily Living test. These tests were performed at 2-week intervals in 10 patients, and the intra-rater reliability was 92%). Ten healthy controls (50-70 years) were also enrolled in the study for comparison. Measurement of blood biochemistry, including plasma fasting/postprandial glucose and glycated hemoglobin A1c (HbA1c) levels were recorded. *Imaging*: On a 3T MRI scanner (Discovery MR750, GE Healthcare, Waukesha, Wisconsin, USA) with a 32-channel head coil, axial DTI images were obtained using a single-shot diffusion-weighted echo planar imaging sequence (TR/TE = 8500/66.3 ms, FOV = 25.6×25.6 cm^2, 70 slices, 64 diffusion-weighted directions with a b-value of 1000 s/mm^2). *Data preprocessing* Procedures included the eddy current and motion corrections, diffusion tensor tensor (fractional anisotropy, mean diffusivity, and eigenvalues) calculation. *Brain network construction* The 90 regions of interest (ROIs) from Automated Anatomical Labeling (AAL) template[4] were defined as network nodes. The seed number was set as 2. Diffusion MRI tractography was performed using the Diffusion Toolkit software (http://www.trackvis.org/dtk/). All tracts in the DTI dataset were computed by seeding each voxel with the threshold of FA>0.2 and turned an angle < 45 degrees. As a result, all fiber pathways between the 90 ROIs in the brain were constructed using deterministic tractography method. Several common graph measurements were analyzed, including global efficiency (Eg), local efficiency (Eloc), clustering coefficient (Cp), shortest path length (Lp), and small-word parameters (λ, γ, σ). To determine the regional characteristics of the structural network, we also computed the nodal efficiency in T2DM patients with and without MCI. The network analyses were

performed and visualized using GRETNA[5] and BrainNet Viewer[6] softwares. For global parameters, a 2-tailed Student's t-test was applied with a statistical significance set at $p<0.05$; for nodal parameters, a false-discovery rate (FDR) correction was applied for multiple comparisons. The flowchart of structural network construction was showed in Fig.1.

Results:

The DM-MCI group had higher level of HbA1c (8.22±1.60%) than the DM-NC group (6.97±1.26%, p=0.003), longer duration (8.18±1.55 years) than the DM-NC group (6.83±1.07 years, p=0.040). ***Global network properties:*** All the three groups exhibited economical small-world organization (σ=2.73±0.20, 2.68±0.18, and 2.71±0.153, for DM-MCI, DM-NC and HC, respectively). No significant between-group difference was detected. Compared with the controls and DM-NC group, the DM-MCI group exhibited significant decrease in Eg (p=0.027) , Eloc (p=0.050) values, and significant increase in Lp (p=0.032) value. The DM-NC group didn't show significant difference in Eg, Eloc, or Lp than the controls. (Fig.2). ***Regional efficiency:*** Schematic drawings (Fig.3) showed brain regions with significant reduced group effect in nodal efficiency between DM-MCI and DM-NC groups (p<0.05 , FDR corrected). The most significantly decreased nodal efficiency were found in the left superior frontal gyrus(medial orbital). Other regions with decreased nodal efficiency were mainly distributed in the left gyrus rectus and the right inferior occipital gyrus. Decreased clustering coefficients has been correlated with the neuropsychological assessment and disease duration in all the T2DM patients (Fig.4).

Discussion and Conclusions:

The disrupted topological organization of structural networks (measured by Eg, Eloc, Cp and Lp) were found in T2DM patients with MCI compared with HCs. However, these topological properties were relatively preserved in those T2DM subjects with normal cognition compared with HCs. The small-world properties were exhibited preserved in T2DM patients with or without MCI. Moreover, decreased nodal properties were detected in the DM-MCI group than the DM-NC group. The structural topological properties research can contribute to understand the intrinsic alterations of diabetic encephalopathy, including cognitive impairment.

Age and location related hemodynamic changes in the carotid artery of healthy adults assessed by 4D flow MRI

Guiling Zhang, Zhenxiong Wang,Wenzhen Zhu
Tongji Hospital.Tongji Medical College of HUST

Purpose: To evaluate the changes of normal carotid hemodynamic parameters (volume, velocity, wall shear stress, pressure gradient, energy loss) in different ages and locations using 4D flow MRI. To explore the possible influence of these factors and provide age and location matched control cohorts for the assessment of carotid artery disease.**Materials and Methods:** Sixty-two normal volunteers aging from 20 to 75 were enrolled in our study. 4D flow MRI examination was performed for each subject and analyzed using CVI42 platform to get hemodynamic parameters. Hemodynamic parameters

were then compared in different ages and locations (proximal CCA, distal CCA, proximal ICA and distal CCA, energy loss was compared across the bifurcation and not). Besides, age corrected hemodynamic parameters were also explored. ANOVA was performed in age and location groups, while paired t-test was respectively used to estimate the difference between left and right vessels. The relationship between age and hemodynamic parameters was then qualified by Pearson's correlation coefficient.**Results:** Left and right carotid artery showed no difference in hemodynamics (P>0.05), so we set each vessel as an independent sample. Proximal ICA showed significant lower volume, velocity, wall shear stress and pressure gradient than other locations (P<0.05), energy loss showed no difference in different location . Wall shear stress(except in distal ICA), velocity, pressure gradient and energy loss decreased with age (P<0.05).**Conclusion:** The multi-parameter analysis of 4D flow MRI identified age and location changes of hemodynamic parameters in carotid artery of healthy adults. Proximal ICA, where the atherosclerotic plaque happened mostly, showed significantly lower hemodynamic parameter changes, which may be associated with disease breeding . In addition, the hemodynamic parameters in different location were all inversely correlated with age may provide age matched control cohorts for carotid artery disease.

基于定量磁化率成像(QSM)的多发性硬化病变磁化率动态演变规律

张顺
华中科技大学同济医学院附属同济医院

目的 多发性硬化(MS)病变的磁化率与 MS 病变所处的时期密切相关。本研究的目的是来观察 MS 病变的动态演变规律，同时比较 QSM 图上有环形高信号（rim+）改变的 MS 病变与无环形高信号（rim-）的 MS 病变之间的动态演变差异。

材料和方法 在基线位至少有 1 个 T1+C 强化的 MS 病变，且至少含有 3 次 QSM 扫描（时间跨度 1.1-6 年）的 MS 病人纳入本研究。在任何一次 QSM 图中出现 QSM 环形高信号的 MS 病变被定义为 rim+，反之则为 rim-。采用多级增长曲线模型(multilevel growth curve model)的统计学方法来比较 rim+和 rim-之间的动态演变规律。.

结果 19 个 MS 病人中共 32 个 T1+C 强化病变纳入本研究，其中 16 个 MS 病变为 rim+（50%）。QSM rim+的病变体积大于 rim-病变（P<0.001）。在所有病变中，MS 病变的磁化率从基线位强化时开始逐渐升高，至 1~2 年达到峰值，随后逐渐减低。Rim+病变的磁化率演变曲线高度比 rim-病变高 4.27ppb（P=0.01）。Rim-病变的曲线斜率高于 rim+病变（P=0.023），但磁化率降低速度更快（P=0.005）。Rim-病变的磁化率比 rim+病变大约早 2 年开始降低。

结论 在 MS 病变形成的最初 6 年内，rim+和 rim-病变的磁化率动态演变存在很大的差异，Rim+病变在最初的几年内都存在铁沉积。

5. MR Collaboration NE Asia, Siemens Healthcare, Beijing, China
6. MR Collaboration NE Asia, Siemens Healthcare, Shanghai, China
7. Department of Imaging Sciences, University of Rochester, Rochester, NY, USA

Objective: Large-scale multi-site brain morphometry studies are becoming increasingly important to characterize both normal and disease groups. While previous studies have explored the reproducibility of structural MRI from various scanners and protocols, we cannot be certain which difference we detect attribute to diseases without knowing the fluctuations of a single subject in multi-site studies. Hence, a well-controlled study with structural MRI images acquisition would be necessary to understand the reliability of brain structures from multi-site studies.

Methods

We have established a well-controlled dataset to assess the reliability of brain segmentation and analysis methods in multi-site study. We firstly acquired 30 T1-weighted volumes from 3 subjects (10 volumes/subject) in 10 sites, spanning approximately from 2 weeks to 14 months, using the same type of scanners, standard 64 channel head coil and the protocol recommended by Human Connectome Project. T1-weighted volumes generated by manual tracing and the automated segmentation tool using publicly available FreeSurfer software. Statistical analyses were then conducted to assess reliabilities of structural volume and asymmetry index using the intraclass correlation coefficient.

Results

All volumes and asymmetry indexs of ROIs with manual tracing method achieved ICC scores > 0.8 across the multi-site. The results also showed that hippocampal volume and asymmetry index had ICC scores of 0.6 or higher by auto-segmentation method. Whilst, asymmetry index and bilateral volume of amygdala presented relatively low ICC scores (0.349-0.529) by auto-segmentation method.

Conclusion

The present study suggested that a well-controlled multi-site study could obtain a fairly reliable MRI dataset. However, the reliability of volume and AI varied by structure and segmentation method. Even though a well-controlled study, amygdala and entorhinal cortex presented a relatively poor between-site reliabilities by auto-segmentation method. This also suggested manual tracing should be advised for multi-site studies which require high levels of precision such as those with small sample size, especially amygdala.

OR-320
海马硬化型内侧颞叶癫痫患者静息态下大脑半球功能连接的不对称性研究

赵旭,周志强,朱文珍
华中科技大学同济医学院附属同济医院

目的 分析海马硬化型内侧颞叶癫痫患者（MTLE）静息态双侧大脑半球功能连接（FC）的不对称性特征。
方法 采集 23 例 MTLE（左侧 12 例，右侧 11 例）及 23 例健康对照的静息态功能磁共振数据。利用 FSL Harvard-Oxford Atlas 模版将大脑分区，并以左右半球各 50 个脑区作为感兴趣区（ROI），分别计算各 ROI 与左侧半球内 ROIs 的功能连接强度（lFC）及右侧半球内 ROIs 的功能连接强度（rFC），对各 ROI 的 rFC 及 lFC 进行双样本配对 t 检验，P <0.05 认为有统计学差异。另外，利用公式 AI＝100*(rFC－lFC)/［（rFC＋lFC）/2］计算各 ROI FC 的不对称指数（AI），并对三组间 AI 值进行 ANOVA 分析， P <0.05 认为有统计学差异。最后将病例组癫痫首次发作年龄，癫痫病程分别与差异脑区的 AI 值进行 Spearman 相关性分析。
结果 在 100 个 ROIs 中，对照组共有 49 个 ROIs（49/100）的 FC 存在不对称性，其中 30 个 ROIs 存在右侧化不对称（RA），19 个左侧化不对称（LA）；病例组存在不对称性的 ROIs 数量减少： LMTLE 共 36 个（36/100），其中 RA12 个，LA24 个；RMTLE 仅 23 个（23/100），其中 RA17 个，LA6 个。三组间 AI 值的 ANOVA 分析显示，共 25 个 ROIs 的 AI 值存在组间差异，以双侧岛叶、额叶皮层、颞叶皮层及颞叶内侧等结构为主，其中 LMTLE 组的癫痫首次发作年龄与右侧额下回岛盖部的 AI 值呈负相关（r=-0.621，P=0.031），RMTLE 组的癫痫病程与左侧颞极 AI 值呈正相关（r=0.633，P=0.036），癫痫首次发作年龄与额叶内侧皮层呈正相关（r=0.654，P=0.029）。
结论 MTLE 患者双侧大脑半球 FC 的不对称性减弱，且左侧与右侧 MTLE 的改变不完全一致，可为 MTLE 发病机制的解读提供新的依据。

Early identification of schizophrenia via high-resolution MRI and machine learning

Longbiao Cui[1],Yin Hong[2]
1.Department of Clinical Psychology， Fourth Military Medical University
2.Department of Radiaology， Fourth Military Medical University

Aims: “Living with schizophrenia,” in the words of Trevor Turner, “remains hard work,” as Barnett recently mentioned (Barnett, 2018). Evidence from neuroimaging has implicated abnormal cerebral cortical patterns in schizophrenia (Brugger and Howes, 2017). Application of machine learning techniques is required for identifying structural signature reflecting neurobiological substrates of schizophrenia at the individual level (Cui et al., 2018). We aimed to detect and develop a method for potential marker to identify schizophrenia via the features of cerebral cortex using high-resolution magnetic resonance imaging (MRI) (Cui et al., 2016; Cui et al., 2017a). **Methods:** In this study, cortical features were measured, including volumetric (cortical thickness, surface area, and gray matter volume) and geometric (mean curvature, metric distortion, and sulcal depth) features. Patients with first-episode

schizophrenia (n = 52) and healthy controls (n = 66) were included from the Department of Psychiatry at Xijing Hospital (Cui et al., 2015; Cui et al., 2017b; Cui et al., 2019a). Multivariate computation was used to examine the abnormalities of cortical features in schizophrenia. Features were selected by least absolute shrinkage and selection operator (LASSO) method. The diagnostic capacity of multi-dimensional neuroanatomical patterns-based classification was evaluated based on diagnostic tests. Mean curvature (left insula and left inferior frontal gyrus), cortical thickness (left fusiform gyrus), and metric distortion (left cuneus and right superior temporal gyrus) revealed both group differences and diagnostic capacity. **Results:** Area under receiver operating characteristic curve was 0.88, and the sensitivity, specificity, and accuracy of were 94%, 82%, and 88%, respectively. Confirming these findings, similar results were observed in the independent validation. There was a positive association between index score derived from the multi-dimensional patterns and the severity of symptoms (r = 0.40, P < .01) for patients. **Conclusions:** Our findings demonstrate a view of cortical differences with capacity to discriminate between patients with schizophrenia and healthy population. Structural neuroimaging-based measurements hold great promise of paving the road for their clinical utility in schizophrenia (Cui et al., 2018; Cui et al., 2019b).

Observation of microstructural changes in spinal cord gray matter and white matter in patients with cervical spondylotic myelopathy and correlation of JOA scores by diffusion kurtosis imaging (DKI) values

Bingyang Bian,Dan Li
First Hospital of Jilin University

Objective: To explore the feasibility of the metrics of diffusion kurtosis imaging (DKI) for investigations of the microstructural changes of spinal cord injury in patients with cervical spondylotic myelopathy (CSM) and the correlation between Japan Orthopaedic Association (JOA) scores and DKI metrics.
Methods: Fifty-seven patients with CSM and thirty-eight healthy volunteers underwent 3.0T magnetic resonance (MR) imaging with routine MRI sequences and DKI from echo-planar imaging sequence. Based on the JOA score, CSM patients were divided into four subgroups. Data of DKI metrics of the CSM group and control group, including fractional anisotropy (FA) values, mean diffusivity (MD), and mean kurtosis (MK) values, were obtained and compared, separately for the white matter (WM) and the gray matter (GM).
Results: The FA and MK values in WM and GM in the CSM group were lower (P < 0.05) than those in the control group, whereas the MD values in WM and GM in the CSM group was higher (P < 0.05) than those in the control group. In the WM, the JOA scores were negatively correlated with the FA values but were positively correlated with the MD values. In GM, the JOA score was negatively correlated with the MK values but was positively correlated with the MD values.

Conclusion: DKI provides information on the microstructure of the spinal cord injury in patients with CSM. In addition, DKI metrics quantitatively assessed the degree of cervical spinal cord injury, and should thus be considered as a reference for clinical treatment plans and prognosis.

Characteristics of temporal dynamics of intrinsic brain activity in unmedicated bipolar II disorder with suicidality

Jiaying Gong[1], Guanmao Chen[1,2], Ying Wang[2]
1. The Six Affiliated Hospital of Sun Yat-sen University
2. Medical Imaging Center, First Affiliated Hospital of Jinan University

Background: Bipolar disorder (BD) is associated with a high risk of suicide. Routine neuroimaging examination exhibited that BD with suicidality was associated with brain structural and functional changes. However, the alterations of brain dynamics are still unknown.
Purpose: To investigate the alterations of brain dynamics in unmedicated BD II depression with suicidality and to predict the severity of suicidality.
Materials and Methods: The prospective study included 106 BD II participants (20 with suicidal attempt (SA), 35 with suicidal ideation (SI), 51 without SI (NSI)) and 50 healthy controls (HCs) who underwent resting-state functional magnetic resonance imaging (rs-fMRI) between February 2016 and December 2017. We first used sliding window analysis to evaluate the dynamic amplitude of low-frequency fluctuations (dALFF). Then we predicted the severity of suicidality using a multivariate regression model.
Results: One-Way ANOVA analyses revealed that the dALFF in the right temporal pole (TP), inferior temporal gyrus (ITG), superior temporal gyrus (STG), and the bilateral precuneus/posterior cingulate cortex (PCC) was significantly different among the 4 groups. Post hoc comparisons revealed all BD groups showed decreased dALFF in the bilateral precuneus/PCC compared with HCs. Increased dALFF was found in the right STG and ITG in the SA group compared with the others, and in the right TP in the SA group compared with SI and HCs groups. Importantly, these temporal variabilities could be used to predict the severity of suicidality (r = 0.330, p = 0.036), whereas static ALFF couldn' t (r = -0.050, p = 0.532).
Conclusion: Our findings suggest that alterations of temporal variability in the precuneus/PCC is a common feature of BD participants, the right temporal lobe involved in impulsivity, social and emotional processing are associated with suicidality in BD II depression participants. This predictive model using the dynamics of intrinsic brain activity may be helpful for clinical applications.

基于 fMRI 的首发强迫症患者动态功能连接分析

刘俊宏,程敬亮
郑州大学第一附属医院

背景和**目的** 强迫症是一种精神疾病，其特征是功能失调或远脑区域之间的异常整合。自发波动是神经信号记录的一个标志，随时间尺度发生，跨越毫秒和数十分钟。然而，传统的基于静息状态功能磁共振成像的内在脑组织研究在很大程度上没有考虑到时间变异性的存在和潜在性。本研究通过基于空间独立成分分析、滑动时间窗相关和 k-均值聚类窗相关矩阵的方法实现对强迫症患者全脑动态功能连接改变的评估。
材料**方法** 通过对 29 例首发强迫症患者和 29 例年龄和性别匹配的健康对照者进行静息状态闭眼功能成像和独立成分分析，我们将功能性脑数据分解为 28 个成分。动态功能网络使用滑动窗口（长度为 20 s）和 k 均值聚类计算，描述四种离散功能连接状态之间的动态演变。耶鲁-布朗强迫症量表（Y-BOCS）用于评估强迫症状严重程度。
结果 总共从 28 个独立成分中选择了 14 个成分，与标准的功能网络模板具有较高相似性，且位置落在灰质上，与脑室及血管有较低的空间重叠。相关的功能网络分别为默认网络（default mode network, DMN），突显网络（salience network, SAN），听觉网络（auditory network, ADN），执行控制网络（executive control network, ECN），视觉网络（visual network, VN），语言网络（language network, LAN），感觉运动网络（sensorimotor network, SMN），基底节区（basal ganglia, BG）和楔前叶（precuneus, PCUN）。在动态功能连接指标组间差异比较中发现：四种功能连接状态之间的转换次数具有显著差异，而时间分数和平均停留时间组间无显著差异。且四种状态间的转换次数与 Y-BOCS 总分呈正相关。
结论 首发强迫症患者动态功能连接演变的存在频繁切换状态的特征，且切换次数越多者强迫症状越重。

Magnetic resonance-guided focused ultrasound thalamotomy for Essential Tremor:the first Pilot Study in China

Jianfeng He,Rui Zong,Dekang Zhang,Longsheng Pan,Xin Lou
The First Medical Center of Chinese PLA General Hospital

Background and objective: Essential tremor (ET) is the most common movement disorder and is often refractory to medical treatment. Recent advances have proved the favorable efficacy and safety in treatment of refractory ET with Magnetic resonance-guided focused ultrasound (MRgFUS) thalamotomy. The objective of this study is to verify the efficacy and safety of MRgFUS in treatment of refractory ET.
Methods: From January 2019 through April 2019, in an open-label, uncontrolled study, we used transcranial MRgFUS to target the unilateral ventral intermediate nucleus of the thalamus in 10 patients with severe, medication-refractory ET. We recorded all safety data and measured the effectiveness of tremor suppression using the Clinical Rating Scale for Tremor to calculate the total score (ranging from 0 to 160), hand

subscore (primary outcome, ranging from 0 to32), and disability subscore (ranging from 0 to 32), with higher scores indicating worse tremor.
Results: Thermal ablation of the thalamic target occurred in all patients. Scores for hand tremor improved from 21.8±5.1 at baseline to 6.0±5.6 at 3 months (P<0.001). Total tremor scores improved from 58.3±11.8 to23.3±18.0 (P<0.001). Disability scores improved from 16.0±3.4 to 3.6±7.1 (P<0.001). Adverse events that transiently occurred during sonication included short-lasting vertigo (n=2) and burning scalp sensation (n=2), vomiting (n=2). Adverse events that lasted after the procedure included gait ataxia (n=1), unsteady feeling (n=1), asthenia(n=2), lip paresthesia (n=5). No adverse event lasted beyond 3 months.
Conclusions: MRgFUS thalamotomy to relieve medication-resistant ET was safe and effective. Large randomized studies are needed to assess prolonged efficacy and safety.

OR-326

Neuropsychiatric Systemic Lupus Erythematosus(NPSLE): MRI features in 48 patients

Sirong Piao,Hao Wu,Yuxin Li,Daoying Geng
Huashan Hospital, Fudan University

Purpose

To study the MRI manifestations of neuropsychiatric systemic lupus erythematous, for better improving the possibility of early detection and early diagnosis of NPSLE.

Methods

The brain MRI manifestations of 48 SLE patients were retrospectively analyzed. The medical history and imaging data of the patients who were admitted to the department of Neurology and Nephrology of Huashan Hospital affiliated to Fudan University from January 2014 to March 2019, with the diagnosis of SLE together with the positive MRI manifestations were collected.

Results

48 cases were collected in total, including 13 males and 35 females. According to the 1999 American College of Rheumatology (ACR) diagnostic criteria for NPSLE, 6 were diagnosed with NPSLE.

The main MRI manifestations of neuropsychiatric lupus are cerebral infarction (4 in NPSLE, 3 in non-NPSLE), lacunar ischemic (4 in NPSLE, 34 in non-NPSLE), malacia (1 in NPSLE, 1 in non-NPSLE), hemorrhagic foci (3 in NPSLE); brain atrophy and demyelinating could also be observed.

We noticed that the lesions involved all lobes of brain, para lateral ventricle and basal ganglia, the lesions in the frontal and parietal lobe were significantly more than others. The shape of the lesions were mostly punctate or flaky. Interestingly, most of the lesions were involved on both sides of the brain, a small number of cases involved only one side.

Conclusions
The MRI manifestations of NPSLE are varied, and brain MRI is beneficial for early diagnosis and early intervention for NPSLE, especially for those SLE patients without neuropsychiatric symptoms.

OR-327

Machine learning analysis in diagnosis of medication overuse headache: a resting-state functional Magnetic Resonance Imaging Study.

Chengmin Yang[1,2], Li Yao[1,2], Gui Fu[1,2], Jiaxin Zeng[1,2], Biqiu Tang[1], Su Lui[1,2]
1. West China hospital of Sichuan university
2. Huaxi MR Research Center(HMRRC)

Purpose—Medication-overuse headache (MOH) is a psychiatric comorbidity associated with chronic migraine. Although, brain functional changes have been demonstrated in MOH(1) subjects, questions if magnetic resonance imaging (MRI) could be used as a biomarker still remains unanswered. As machine learning is capable of identifying subtle disease patterns on a single subject level, we therefore sought to determine the differences between MOH patients from healthy controls by using machine learning classifier on resting state functional MRI (rs-fMRI).

Methods—Thirty-four patients with MOH, and 41 age and sex-matched healthy controls were recruited. rs-fMRI images were acquired on 3.0 T MR system. Smooth mean Regional Homogeneity (smReHo) was obtained via DPARSFA. Support Vector Machines (SVMs) algorithms based on PRoNTo toolbox(2) was used to explore the utility for smReHo in the differentiation of MOH patients and healthy controls individually. The two sample t-test was conducted to compare smReHo between patients and controls within SPM yielded. Finally, Pearson correlation between the MOH patients and clinical measurement was investigated.

Results—The balanced accuracy of correct classification of MOH and controls was 72.03% for smReHo ($p < 0.001$ during 1000 permutation testing). Areas contributing to classification accuracy mainly included in right heschl's gyrus (3.23%), left temporal pole, and right inferior temporal gyrus. The direct comparison showed that MOH patients had significantly decreased smReHo activation in the right heschl's gyrus ($p < 0.05$, FDR corrected) which was corresponding to the highest weight area by machine learning classifier. A negative correlation was observed between the duration of medication intake and smReHo activation in the right heschl's gyru ($r = -0.433$, $p< 0.05$).

Conclusion—By using machine learning computational analyses, our study was able to diagnose MOH patients on a single subject level by demonstrating decreased regional function in MOH patients at the univariate level, notably involving the right heschl's

gyrus, suggesting right heschl's gyrus might play an important role in the pathogenesis of MOH.

OR-328

Subregions of Temporal Gyrus Related Increased Functional Connectivity in Type 2 Diabetes Mellitus Patients

Jia-Cheng Han,An-Ding Zhang,Ying Yu,Wen Wang,Guang-Bin Cui
Department of Radiology , Tangdu Hospital, Fourth Military Medical University

Background
Type 2 diabetes (T2DM) is emerging as a major global health issue. T2DM can adversely cause mild cognitive impairment (MCI) and increase dementia risk. In our previous research, absolute neurovascular couplings in T2DM patients decreased significantly in subregions of temporal gyrus [1]. However, these subregions role in whole brain function in T2DM patients remains unknown.
Methods
To illuminate this problem, resting-state fMRI functional MRI scans were obtained from 30 T2DM patients without MCI and 30 healthy controls (well matched for age, sex and education) in this study. Subregions in temporal gyrus/hippocampus were characterized using a seed-based whole-brain correlation method and to calculate the functional connectivity (FC) between subregions in temporal gyrus/hippocampus and the other cerebral voxels. To evaluate the certain direction of altered FCs, Granger causality analysis was also performed. Correlation analysis was used to calculate the relationship between FCs and cognitive performance.
Results
Though without global group differences, T2DM patients displayed significantly increased FC between the gyrus/hippocampus and several cerebral regions, including the right superior temporal gyrus, left inferior temporal gyrus in comparison to hippocampus. Furthermore, the increased FC between subregions in temporal lobe/hippocampus and other cerebral cortex was all associated with the mini-mental state examination (MMSE) total score ($P < 0.05$).
Conclusions
Our study provides further evidence of subregions in temporal lobe/hippocampus-cerebral functional connectivity disturbances to play a pivotal role in neuropathological features and might be a promising indicator for cognitive impairment in T2DM patients.

OR-329

A Quantitative Susceptibility Mapping Study of Brain Iron Accumulation in Alzheimer's Disease

Xiang Fan

The Chinese University of Hong Kong

Objective To observe the changes of iron accumulation by quantitative susceptibility mapping (QSM) in patients with Alzheimer's disease (AD) and mild cognitive impairment (MCI), and to explore if early deposition of iron could be an imaging biomarker.

Methods Thirty seven patients with AD, 20 patients with MCI, and 43 normal controls (NC) were recruited. All subjects were examined by magnetic resonance imaging (MRI) to analyze the difference of iron accumulation among groups with QSM sequence. (1) Analysis based on region of interest (ROI): Using one-way analysis of variance (ANOVA) test, the difference in iron deposition between the three groups was studied based on ROI comparison, and pairwise multiple comparison was made with the least significant difference (LSD) method. ROIs were set on bilateral caudate nucleus, putamen, hippocampus and amygdala. (2) Whole brain analysis: We applied a voxel-based analysis using one-way analysis of variance (ANOVA) followed by a post hoc analysis. A significant level of family-wise error (FWE) corrected $p < 0.05$ with a cluster size of 30 voxels was applied to locate those brain regions with significant differences among 3 groups. (3) We planned using paired sample t test within 6-month follow-up data to see if there is any difference.

Results (1) Based on ROI analysis: average susceptibility of the bilateral caudate and left putamen were significantly different among groups ($p<0.001$, respectively). Maximal susceptibility of the left caudate was significantly different among groups ($p<0.001$). Also, the average susceptibility of the bilateral caudate and the left caudate and the maximum susceptibility of the left caudate were significantly different between AD and MCI, MCI and NC, AD and NC($p<0.05$). Besides, there are poor reproducibility in hippocampus and amygdala of each subjects because the standard deviation is obviously higher than the average value, which indicates iron is very unevenly distributed in those areas. In addition, there was no significant correlation between susceptibility and age in the elderly NC group. (2) Whole brain analysis: significantly different regions of iron deposition in AD, MCI and NC brain differences include hippocampus, caudate, putamen, insula, cingulate gyrus, cuneus, precuneus, angular gyrus, thalamus, fusiform, lingual gyrus, corpus callosum, cortex and subcortical white matter, some cerebellum structure and so on. (3) There is no significantly difference in paired sample t test within 6-month follow-up data.

Conclusion This study describes the AD brain iron deposition pattern of QSM, supporting hippocampus, caudate, putamen, DMN main structure (cingulate, precuneus, angular gyrus), thalamus are increased iron deposition regions which are supported by the previous study. This sign may be useful for revealing secondary neuronal changes due to pathologic processes including oxidative stress in AD. The QSM change of left insula may be an imaging biomarker for early diagnosis of AD. This study is the first report of some certain cerebellar QSM changes, which significance needs further study to illuminate.

OR-330

The effect of lesion filling on reproducibility of brain volumetric measurements

Chunjie Guo[1],Yishan Luo[2],Lin Shi[2],Leongtim Wong[2],Liying An[1],Li Zhang[1],Huimao Zhang[1]
1.The First Hospital of Jilin University
2.The Chinese University of Hong Kong

INTRODUCTION

Brain volumetry can be influenced by several physiopathologic factors, such as dehydration status, inflammation or clinical therapy [1-3], technical factors such as scan-rescan procedure, field strength, scanner model, imaging protocols,scanner software [4-6], and also post-processing algorithms[7]. In addition, the presence of white matter (WM) lesions may affect brain volume segmentations since they can be misclassified as grey matter (GM) or cerebrospinal fluid (CSF) [8, 9].
WM lesions are commonly found in a number of neuropsychiatric disorders, including multiple sclerosis (MS), stroke, and vascular dementia, *etc*. Understanding the effect and magnitude of lesion filling on brain volume segmentations is important to be able to take it into consideration when planning MRI studies and processing the data, particularly in high brain lesion load subjects. While the effect of lesion filling on reproducibility of brain volumetric measurements is still unknown.
In this study, we set out to compare the effects of lesion filling on brain volumetric measurements and evaluate the reproducibility on both scan-rescan, imaging protocols, scanner model and software in assisting multicenter and longitudinal study design

METHODS

Six post-stroke patients (4 Male and 2 Female; range 58-72 years) were prospectively recruited. All participants were scanned within 12 hours across four clinical MRI systems: MR1, MR2: both 1.5-T Siemens Avanto (software: syngo MR B15 and B17) ; MR3: 3.0-T Philips Ingenia, and MR4: 3.0-T Siemens Trio. 3D T1W MPRAGE MRI sequence was obtained for assisting accurate WMH segmentation. 3D T2-FLAIR and 2D T2-FLAIR were acquired twice with repositioning in-between on each MRI system, resulting in a total of eight T2-FLAIR MRIs and four T1-MRI per participant.
T1-MRI of each subject were segmented using AccuBrain®(Brainnow Medical Technology Ltd.) using a tissue probability priors based segmentation method. It employs a tissue probability map that aligned with the subject image space as a prior, the tissue segmentation is further refined with expectation maximization (EM) algorithm using a Gaussian mixture model. It segments each brain into WM, GM and CSF, with the brain volume calculated as the combination of WM and GM. Given T2-FLAIR MRI, AccuBrain®also segments WM lesions and refine the tissue segmentation results using the obtained WM lesion maps [10, 11].
The tissue segmentation results of all the scans with or without lesion filling were compared to examine the effect of lesion filling in brain tissue quantification. Paired comparisons were tested using the Wilcoxon signed ranks test with two-tailed exact significance. Correction for multiple comparisons was performed using FDR correction. Inter-scanner reproducibility of brain volumetry was compared before and after lesion filling procedure using coefficient of variation (Cov) index.

RESULTS

Figure 1 shows an example of tissue segmentation result with and without lesion filling. Table 1 shows the statistics of the tissue volumes (both absolute and ICV normalized volume). The mean and standard deviation is taken over the measurements of all the scans. It is shown that lesion filling changed the tissue volumetry with significant difference. For the six subjects, the lesion volume varies from 6.32 to 23.88 ml. It is further demonstrated in Table 2 that although lesion filling has significant effect on brain volumetry, it does not show significant effect on inter-scanner reproducibility.

DISCUSSION

Many lesion segmentation algorithms have been reported, but due to the different tissue contrasts, the results based on diverse datasets may be unpredictable[12]. Lesion filling was found mainly affected the voxel-based statistical analysis software - SPM and its extension SPM-CAT, and also registration-based brain segmentation tool-FSL-SIENAX, but no effect was seen on the FreeSurfer volumes with lesion filling [13]. In our study, different with previous software that fills WM lesions before segmentation with intensities similar to those of WM, AccuBrain® directly fills the tissue segmentation results with WM lesion maps. For comparability of the brain volumetrics from scan-rescan, different scanners, and imaging protocols, our results suggested that lesion filling procedure did change the WM and GM volumetry, but did not show significant effect on inter-scanner reproducibility.It illustrated that despite of different lesion appearances, if the software can reliably segment lesions and fill it with the tissue maps, lesions can have little effect on the inter-scanner tissue volumetry reproducibility. However, lesion filling can have large effect on the tissue volumetry accuracy.

CONCLUSION

The accuracy of brain volumetric measurements is affected by lesion filling, particularly inhigh WM lesion loadsubjects. Therefore,lesion filling is an essential step to accurately monitor the progression of brain volume change in subjects have WM lesions.

OR-331

Cerebral Damage after Carbon Monoxide Poisoning: A Longitudinal Di usion Kurtosis Imaging Study

Yanli Zhang,Shunlin Guo,Junqiang Lei
The first hospital of lanzhou university

PURPOSE: The primary aim of this study was to assess evolution of brain damage with diffusion kurtosis imaging (DKI) in different clinical phase after CO poisoning; and the secondary aim was the correlation between DKI-derived parameters and neuropsychiatric outcomes.

MATERIALS AND METHODS: 17 patients with CO-poisoned and 30 sex- and age-matched healthy volunteers were enrolled in the study. Patients were scanned within acute

(within 1 wk), delayed neuropsychiatric (DNS, 3-8 wk) and chronic phase (> 6 mo). The DKI-derived parameters were measured in gray matter (GM) and white matter (WM) including 11 regions of interest, and further correlated with neuropsychiatric scores.

RESULTS: In WM, mean kurtosis (MK) showed a trend of increasing from acute to DNS phase, and then turned to decrease at chronic phase. Contrary to MK, mean diffusivity (MD) firstly decreased in succession and subsequently inclined to increase. In GM, from acute to chronic phase, MK showed continually decreasing while MD constantly increasing. Whether WM or GM, the value of fractional anisotropy (FA) and kurtosis fractional anisotropy (KFA) progressive reduction over time. In terms of diagnostic, KFA had the best performance to differentiate patients in DNS phase from controls with an AUC of 0.812 (P=0.000). With neuropsychiatric scores, KFA of centrum semiovale (CS) and Digit Span-Backward were most relevant (r=0.476, P=0.000).

CONCLUSION: Longitudinally, in WM and GM, the change of brain damage associated with CO intoxication was inconsistent over time. DKI provide important complementary to identify neuropathologic and neuropsychological changes. The KFA of CS was capable of reflecting the performance of cognitive and executive correlated with prognosis.

Inconsistency between cortical reorganization and rest-state functional connectivity change in sensorimotor cortex after spinal cord injury

Qian Chen[1], Nan Chen[2], Zhenchang Wang[1]
1. Beijing Friendship Hospital, Capital Medical University, Beijing, China
2. Xuanwu Hospital, Capital Medical University, Beijing, China

To investigate possible changes in brain structure and functional connectivity (FC) after spinal cord injury (SCI) combined with voxel-based morphometry (VBM), tract-based spatial statistics (TBSS) and resting-state functional magnetic resonance imaging (rs-fMRI), and to further study their association with clinical variables.
21 traumatic SCI patients (10 with complete and 11with incomplete SCI) and 21 age- and sex-matched healthy controls (HCs) were recruited. The 3D whole-brain structural and resting-state functional images were acquired from all participants using a 3.0 Tesla MRI system. Voxel-based morphometry (VBM) and tract-based spatial statistics (TBSS) analysis were carried out to investigate the differences in gray matter volume (GMV) and white matter volume (WMV) and white matter integrity between SCI patients and HCs, separately. Seed-based FC analysis was performed to explore the whole brain functional changes using the results of VBM as seeds. Association between brain changes and clinical variables was performed.
Compared to HCs, SCI patients showed GMV decrease in the dorsal anterior cingulate cortex (dACC), bilateral anterior insular cortex (aIC), bilateral orbital frontal cortex (OFC), and right superior temporal gyrus (STG), instead of changes in areas directly related to sensorimotor function. No statistic difference in white matter was found. When the seeds were located in the left aIC, SCI patients showed decreased FC

between the seed and right primary sensorimotor cortex and between the seed and left inferior parietal lobule (IPL), separately. When chosen the right STG as seed, its FC with the left primary sensorimotor cortex decreased. Additionally, the FC value between the left aIC and the right primary sensorimotor cortex was positively correlated with the total motor score, while the FC value between the right STG and the left IPL was positively correlated with the left/right/total motor score in SCI patients.
These findings indicate that SCI can cause brain cortical reorganization in some higher cognitive areas which are not related to sensorimotor function directly. The cognitive processing-related brain regions may be a key factor in sensorimotor dysfunction through the decreased FC with sensorimotor areas after SCI.
Cognitive processing-related functional training may play an important role in rehabilitation for sensorimotor dysfunction after SCI.

基于功能磁共振成像的乳腺癌术后抑郁患者大脑皮层活动性与临床相关量表评分的相关性研究

黄锦文[1,2],曹志坚[1,2],许茂盛[1,2]
1.浙江中医药大学附属第一医院
2.浙江中医药大学第一临床医学院

目的 采用基于低频振幅(ALFF)及局部一致性(ReHo)方法的静息态功能磁共振成像技术(rs-fMRI)探讨乳腺癌术后抑郁患者大脑皮层活动性的改变及其与临床相关量表评分之间的关系。**方法** 对23 例乳腺癌术后抑郁患者行静息态功能磁共振扫描，应用低频振幅及局部一致性方法分析受试者大脑皮层活动性的改变。基于 SPSS 25.0，pearson 及 spearman 相关分析用于评估 ALFF 值及 ReHo 值与临床相关量表评分的相关性。**结果** 乳腺癌术后抑郁患者右侧楔前叶的低频振幅值与 HAMA 评分存在负相关；左侧角回及右侧缘上回的低频振幅值与综合注意力商数存在正相关；右侧后扣带回的低频振幅值与综合控制力商数存在正相关。右侧角回的 ReHo 值与 SAS 及 HAMA 评分存在正相关。**结论** 静息状态下乳腺癌术后抑郁患者多个功能脑区皮层活动性的改变与临床相关量表评分存在相关性联系，这可能与抑郁症的病理生理改变相关，并提示抑郁患者大脑活动性的改变可用来评估临床症状。

视神经鞘直径与动脉瘤性蛛网膜下腔出血诊断和分级的相关性研究

陈巍,许晓泉,施海彬,吴飞云
江苏省人民医院（南京医科大学第一附属医院）

目的 探讨基于头颅 CT 测量的视神经鞘直径（ONSD）与动脉瘤性蛛网膜下腔出血（SAH）诊断和分级的相关性。 **方法** 回顾性分析了 2018 年 5 月至 2019 年 4 月间 132 例因颅内动脉瘤破裂导致的 SAH 患者的头颅 CT 和临床资料，并纳入同期 132 例健康人群的头颅 CT 作为对照组。测定 ONSD，及眼球最大横径（ETD），以校正 ONSD（ONSD/ETD）。 **结果** SAH 组 ONSD 和 ONSD/ETD 均

大于对照组（P ＜ 0.001）。以 ONSD ＞ 5.80mm（敏感度，81.82%；特异度，87.12%； 曲线下面积（AUC），0.920）或 ONSD/ETD ＞ 25.58%（敏感度，83.33%；特异度，88.64%；AUC，0.919）为阈值诊断 SAH 可获得最优的诊断效能。不同 Hunt-Hess 分级组间的 ONSD 和 ONSD/ETD 差异具有统计学意义（P ＜ 0.001）。高 Hunt-Hess 组患者的 ONSD 和 ONSD/ETD 均大于低 Hunt-Hess 组（P ＜ 0.001）。以 ONSD ＞ 6.45mm（敏感度，90.00%；特异度，59.82%；AUC，0.790）或 ONSD/ETD ＞ 29.07%（敏感度 80.00%；特异度 72.32%；AUC 为 0.782）预测高 Hunt-Hess 分级可以获得最优的诊断效能。 **结论** 基于头颅 CT 测量的视神经鞘直径与动脉瘤性 SAH 患者的诊断和分级相关，可以作为评估动脉瘤性 SAH 的有效影像学指标。

锰离子增强磁共振监测视神经放射性损伤的实验研究

杨军[1,2],韩丹[2]
1.云南省肿瘤医院（昆明医科大学第三附属医院）
2.昆明医科大学第一附属医院

目的 探讨锰离子增强磁共振（MEMRI）在视神经放射性损伤中的应用价值。
材料及方法 采用 2 次分割剂量 10Gy×2 次照射法建立大鼠放射性视神经损伤模型。照射后 5 周、10 周、20 周、30 周连续进行磁共振检测，在 MRI 扫描前 24 小时眼球内注射氯化锰溶液，剂量为 30mmol/L×2μL。视神经及视上丘进行 T1WI 成像，采用对比噪声比计算**方法**
CNR=0.655*(Smn－S0)/SDair 测量视神经和上丘的信号强度。在 30 周扫描结束后行 Western blot 检测视神经交叉部轴突运输动力相关的驱动蛋白-1（kinesin-1，-2，-3）、胞质动力蛋白-1（cytoplasm dynein 1）。免疫荧光检测轴突完整性的骨架蛋白，α-Tubulin，β-Tubulin 和 SMI 31。电镜检测轴突的形态变化。
结果 视神经 CNR 在 5 周和 10 周时无明显变化，从 10 周-30 周 CNR 呈逐渐下降（P<0.05），上丘 CNR 从 5 周-30 周呈逐渐下降，在 30 周时下降最为显著（P<0.05）。
实验组的胞质动力蛋白-1、Kinesin-1、Kinesin-2 明显下降（P<0.05），而 Kinesin-3 升高明显（Kinesin-3）。免疫荧光结果显示α-Tubulin，β-Tubulin 和 SMI 31 实验组和对照组差异不明显（P>0.05）。电镜结果显示，实验组神经出现不同程度的髓鞘空泡和髓鞘丢失、密度下降、张力下降。
结论 视神经放射性损伤后会造成轴突转运功能下降，而轴突的转运结构尚完整，MEMRI 在视神经放射性损伤中可以检测视神经轴突转运功能的变化以及观察轴突结构的完整性。

MRI 常规联合多 b 值 DWI 扫描对眼眶淋巴组织增生病变诊断及鉴别诊断价值

韩庆贺,弓婷婷,袁庆海
吉林大学第二医院

目的 探讨眼眶 MRI 常规扫描及联合多 b 值 DWI 扫描对眼眶淋巴组织增生病变的诊断、鉴别诊断能力，为临床诊断、治疗工作的开展提供更多信息。**材料与方法** 本研究收集术后病理诊断为眼眶淋巴组织增生病变患者 67 例，将所有患者分为良性组、恶性组两组，对进行 MRI 常规扫描联合多 b 值 DWI 检查的患者，在工作站上进行不同 b 值下 ADC 值的测量。通过 SPSS.25.0 统计软件，对定量结果进行分析，分析不同 b 值下 ADC 值之间是否具有差异；不同 b 值下良性肿块间、恶性肿块间

ADC 值间是否具有差异；相同 b 值间良恶性肿块间 ADC 质是否具有差异；并根据不同 b 值下 ADC 值判断眼眶淋巴组织增生病变的良恶性的敏感性（Se）、特异性（Sp）绘制 ROC 曲线，得出曲线下面积（AUC）分析判断眼眶肿块良恶性的最佳 b 值及 ADC 阈值。**结果** 在累及泪腺区、肌锥内间隙、肌锥外间隙区域 A、B 两组病变间差异存在统计学意义（P<0.05），A、B 两组间关于累及眶隔前间隙差异不存在统计学差异 P>0.05）；在病变边界、包绕结构、累及眼外肌、累及骨质、信号强度等方面，A、B 两组间差异不存在统计学差异（P>0.05）。不同 b 值下 ADC 值间差异存在统计学意义（P<0.05），且 ADC 值由小到大为 b=400<b=800<b=1000s/mm^2；不同 b 值下，良性肿块、恶性肿块 ADC 值间存在差异（P<0.05）；相同 b 值下，良性肿块与恶性肿块间 ADC 值差异存在统计学意义（P<0.05）。b=1000s/mm^{2}时，AUC（曲线下面积）最大。**结论** MRI 常规扫描对眼眶淋巴组织增生病变诊断能力有限，但某些影像特征对鉴别病种间良恶性存在统计学意义；多 b 值 DWI 扫描对眼眶肿块良恶性鉴别存在意义，当 b 值为 1000s/mm^{2}时，诊断效能最佳。

颈静脉球区搏动的紫红球—颈静脉球瘤的影像学表现

李浚利,韩丹
昆明医科大学第一附属医院

临床 中年女性多见；多单发且多单侧发病；搏动性耳鸣、进行性耳聋。体检发现鼓膜呈蓝色，内见搏动紫红球。
影像表现 CT 表现：颈静脉孔区不规则软组织肿块影并推压破坏周围骨质，骨质呈溶冰状骨质破坏，穿过鼓室突向外耳道表现为“冰山顶”征，增强后明显均匀强化。MRI 表现：颈静脉孔区软组织，T1WI 低或等信号，T2WI 高信号，DWI 高信号，其内可见“胡椒盐征”，盐代表慢血流和肿瘤细胞，盐代表快速血流造成的流空信号。DSA 显示肿瘤明显染色，为富血供肿瘤，由颈外动脉分支咽升动脉、耳后动脉或枕动脉供血。

The evaluation of CT and MRI in preoperative staging of middle ear cholesteatoma based on EAONO/JOS joint consensus Statements

Xiuying Chen
the second hospital of JILin University

Objective

To evaluate the ability of CT and MRI in preoperative staging of middle ear cholesteatoma based on EAONO/JOS joint consensus statements.

Methods

A retrospective analysis of patients undergone both ear MR(scan and non - EPI DWI and enhancement) and HRCT examination before surgery from May 2018 to December 2018 in our hospital, and 39 cases of middle ear cholesteatoma were included, we use imagings to stage the middle ear cholesteatoma based on EAONO/JOS joint consensus statements, what seen in the surgery is the gold standard, statistics of imaging for phase I to IV

of cholesteatoma in the diagnosis of sensitivity, specificity, positive predictive value and negative predictive value are analyzed respectively.

Result

The Se, Sp, PPV and NPV of the diagnosis for Ⅰ/Ⅱ/Ⅲ/Ⅳ period of cholesteatoma are 80.0%, 96.6%, 88.9%, 93.3%;93.8%, 91.3%, 88.2%, 95.5%;100.0%, 100.0%, 100.0%, 100.0%;100.0%, 100.0%, 100.0%, 100.0% respectively.

Conclusion

1. HRCT combined with MRI has a good ability in preoperative staging of middle ear cholesteatoma , and can fully accurate diagnose the intracranial and extracranial complications, roughly positioning of cholesteatoma.

2. HRCT and MR are complementary to each other in the examination of cholesteatoma and its complications. Currently, HRCT is the routine examination of the middle ear cholesteatoma before surgery, but MR examination is not paid enough attention to. MR examination should also be a routine pre-surgery examination.

3. restricted by MR scanning thickness, sometimes there are inaccurate positioning problems, so the staging accuracy for stage Ⅲ/ Ⅳ is better than stage Ⅰ/ Ⅱ .

OR-339

Ramsay-Hunt 综合征患者面神经强化程度与面神经功能预后的临床分析

赵慧,孙立新,田静,于学文,巩若箴
山东省立医院耳鼻喉医院

目的 探讨周围性面瘫患者面神经强化程度与面神经功能分级及预后相关性的临床分析。

方法 回顾性分析来我院就诊的 36 例临床确诊为 Ramsay Hunt 综合征的患者，所有患者均在发病 7 天内行面神经 MRI 强化扫描，观察患侧面神经各节段的强化情况，面神经强化情况包括面神经的强化程度和面神经强化后的相对信号值。将强化程度分为三度：无强化（未见强化）、轻度强化（强化程度明显低于邻近血管强化）、重度强化（强化程度接近邻近血管强化），面神经的相对信号值测量方法为测量同一患者一侧面神经每一节段增强后面神经的信号值及同层面脑干的信号值，将两者的比值定义为该段面神经的相对信号值。同时治疗前及治疗后均采用 House-Brackmann（HB）评分系统对患者面神经功能进行评价。治疗后随访 3~6 个月。

结果 （1）Ramsay Hunt 综合征患者治疗前面神经 HB 分级与患者面神经内听道底段、迷路段、膝状神经节段及鼓室段强化情况有统计学差异（$p<0.05$），面神经 HB 分级与患者面神经乳突段强化情况没有统计学差异（$p>0.05$）。（2）治疗前面神经各段强化情况与治疗后面神经 HB 分级有统计学差异，以面神经鼓室段为著（$p<0.05$）。

结论 Ramsay Hunt 综合征患者面神经强化情况与面神经功能分级及预后有相关性，这对面神经疾病的诊断和治疗有重要价值。

结外鼻型 NK/T 细胞淋巴瘤的 MRI 表现及临床价值研究

夏贤武[1,2],王雅琪[2],袁建军[1,2],孙文结[2], 林叶青[1,2], 叶芳芳[1,2],马学军[2]
1.台州市立医院

2.复旦大学附属肿瘤医院

目的

分析结外鼻型 NK/T 细胞淋巴瘤的 MRI 影像特征及临床价值。

方法

回顾性分析 2010 年 1 月至 2015 年 12 月复旦大学附属肿瘤医院放疗科收治的 193 例首发结外鼻型 NK/T 细胞淋巴瘤患者的临床特征及 MRI 影像，总结 MRI 表现。通过卡方检验探究 MRI 表现与各项临床预后因素的关系。

结果

在 193 例患者中，原发鼻腔者 166 例（86.0%），原发非鼻腔者 27 例（14.0%）。鼻腔原发者中 72 例局限鼻腔内（37.3%）； 94 例侵犯鼻腔外（48.7%），以鼻咽、筛窦、口咽、鼻背及面部皮肤、上颌窦受累最多。193 例患者的 MRI 表现可为浸润型（104 例，53.9%）、肿块型（29 例，15.0%）和混合型（60 例，31.1%）。全部患者均为 T1WI 等信号和 T2WI 呈稍高信号。大多数边界不清（183 例，94.8%）、信号均匀（117 例，60.6%），以非鼻腔组及局限鼻腔组信号均匀较多，侵出鼻腔组最少（P=0.001）。增强后以轻度和中度强化为主（P=0.002）。骨质破坏者有 59 例（30.1%），以鼻中隔、副鼻窦壁破坏为主，侵出鼻腔组明显多于局限鼻腔组及非鼻腔组（P<0.001）。颈部淋巴结肿大者 64 例（33.2%），多为区域受累，易坏死，以 IIA 区、IIB 区、咽后淋巴结累及为主，其中以浸润型和混合型的原发灶为多。相对于局限鼻腔和非鼻腔者，原发灶侵出鼻腔者与 B 症状、ECOG 评分、LDH 升高呈正相关。淋巴结阳性者也与 B 症状、ECOG 评分、LDH 升高呈正相关。相对于肿块型，浸润型和混合型者与 B 症状呈正相关。信号不均匀者与 B 症状呈正相关。骨质破坏者与 PINK 评分相对较高呈正相关（以上 P 均<0.05）。

结论

结外鼻型 NK/T 细胞淋巴瘤 MRI 表现具有一定特征，对其早期诊断有较高价值，并能清晰显示肿瘤部位及侵犯范围，以及淋巴结受累范围，与临床特征有相关关系，对于评估疾病预后、指导临床治疗有重要的意义。

OR-341

基于双能 CT 碘图的喉癌甲状软骨侵犯相关危险因素分析

瞿姣,杨亚英（通讯作者）,吴莉,冯瑶杰
昆明医科大学第一附属医院医学影像科

【摘要】目的 探讨喉癌甲状软骨侵犯的相关危险因素。**方法** 纳入 2013 年 5 月-2019 年 5 月行术前双能量 CT 增强检查并经手术病理证实的喉癌 108 例，根据手术病理结果将其分为甲状软骨受侵组（49 例）和甲状软骨未受侵犯组（59 例）。记录所有患者的病程、喉癌分型、分化程度（分化良好：高分化、中高分化及中分化，分化不良：中低分化及低分化）以及前联合侵犯情况，并计算基于双能 CT 碘图的病灶体积，采用二元 logistic 回归分析喉癌甲状软骨侵犯的危险因素。进一步绘制 ROC 曲线并计算曲线下面积（AUC）及最佳诊断阈值以分析基于双能 CT 碘图的病灶体积诊断喉癌甲状软骨侵犯的效能。**结果** 甲状软骨受侵组与甲状软骨未受侵组的喉癌分型、前联合侵犯情况及病灶体积存在统计学差异（*P* 均<0.05）。Logistic 回归分析显示前联合侵犯（c*OR* 值=4.288，a*OR* 值=7.975）及病灶体积（c*OR* 值=1.943，a*OR* 值=1.849）与喉癌甲状软骨侵犯呈正相关（*P* 均<0.05)。基于双能量 CT 碘图的病灶体积诊断喉癌甲状软骨侵犯的 AUC 为 0.968，以病灶体积=3.91cm^3 为临界值诊断甲状软骨侵犯的灵敏度及特异度分别为 93.9%及 89.8%。**结论** 伴有甲状软骨侵犯的喉癌以贯声门型多见，常伴前联合侵犯，且前联合侵犯及病灶体积大是喉癌甲状软骨侵犯的危险因素。

高级别淋巴结包膜外侵犯增加 II 期鼻咽癌患者远处转移风险的预后价值

肖友平[1],郭巧娟[2],黄少翠[3],胡羽君[2],卢天柱[2],林少俊[2],陈韵彬[1],陈英[1],方燕红[1],周晗[2],宗井凤[2],张瑜[2]
1.福建省肿瘤医院放射诊断科
2.福建省肿瘤医院放疗科
3.加拿大多伦多大学玛格丽特公主癌症中心放疗科

目的 影像学诊断的淋巴结包膜外侵（rENE）已被证实为头颈部鳞癌一个重要的预后因素。本文探讨 rENE 的影像诊断一致性以及 rENE 和融合淋巴结在 II 期鼻咽癌的预后价值。
方法 回顾性分析我院 2005-2011 年期间接受调强放疗的 II 期鼻咽癌患者。根据 rENE 等级将患者分为无 rENE 组、可疑 rENE 组、确切 rENE 组。随机选择 100 例进行诊断一致性检验。比较不同等级 rENE 的无远处转移生存率(DMFS)、无区域复发生存率(RRFS)和总生存率(OS)。
结果 入组患者(n=365)的 7 年 MDFS、OS 和 RRFS 分别为 87.76%、89.1%和 95.7%。无 rENE、可疑 rENE、侵犯周围脂肪间隙、融合淋巴结和侵犯周围结构的评分者间一致性为 0.700，0.293, 0.513, 0.861 和 1.0；评分者内部一致性为 0.820, 0.621, 0.733, 0.919 和 1.0。无 rENE 组与可疑 rENE 组之间 7 年 DMFS 无统计学差异(93.5% vs. 89.3%，p=0.306)，而确切 rENE 组对比前二者存在更差的 DMFS(84.4% vs. 92.6%, p=0.009)。在确切 rENE 亚组中，侵犯周围脂肪间隙组的 7 年 DMFS 与无 rENE 组及可疑 rENE 组无统计学差异(92.6% vs.94.7%, p=0.650)，而融合组及侵犯周围结构组的 7 年 DMFS 均较侵犯周围脂肪间隙组差 (80.4% vs.94.7%, p=0.016; 63.6% vs. 94.7%, p=0.001)。因此，将融合淋巴结和侵犯周围结构定义为高级别 rENE, 对比非高级别 rENE，二者的 7 年 DMFS 及 OS 具有显著统计学差异(DMFS: 78.5% vs.93.0%, p<0.001; OS: 81.9% vs.89.9%, p=0.048)。
结论 II 期鼻咽癌患者中，高级别 rENE 在诊断上具有良好的一致性，可作为 II 期鼻咽癌患者的一个独立预后因素。

MSCT 在不同类型慢性鼻窦炎骨炎中的研究价值

车子刚[1,2],王振常[2]
1.南京同仁医院
2.北京友谊医院

目的
通过 MSCT 评估慢性鼻窦炎合并鼻息肉(CRSwNP)与非鼻息肉性慢性鼻窦炎(CRSnNP)骨炎的差异。
方法
通过对 2018.1-2019.7 我院经临床及影像诊断慢性鼻窦炎伴骨炎患者，分别纳入 CRSwNP 组、CRSnNP 组和对照组三组进行研究。根据中华放射学会发布的头颈部扫描规范（2007）、改良 GOSS 评分系统，制定了鼻窦 CT 骨重建标准，并应用于三组进行评价比较。CRSnNP 和 CRSwNP 患者各 50 例，对照组 30 例，三组分别进行 CT 值、厚度的测量及改良 GOSS 评分。
结果
三组分别测量筛窦、额窦、上颌窦骨炎固定解剖位置的 CT 值、厚度及 GOSS 评分。CRSwNP 组与对照组、CRSnNP 组与对照组比较均有显著性差异（p＜0.05）；CRSwNP 组与 CRSnNP 组间，CT 值有显著差异（p＜0.05），厚度、GOSS 评分比较无显著差异（p＞0.05）。
结论

不同类型的 CRS 在骨炎的表现有一定的差异，MSCT 精确的测量与术前评估有助于治疗方式的选择，也可以为下一步探讨其发病机制提供帮助。

治疗前扁桃体癌 MRI 影像征象对于治疗后复发及转移的预测价值

宋庆玲,董越
辽宁省肿瘤医院

目的 探究治疗前扁桃体癌 MRI 影像征象对于治疗后复发及转移的预测价值
材料与方法 对 36 例行同步放化疗的扁桃体癌患者进行治疗后随访，观察患者治疗后复发及转移情况。将 36 例同步放化疗的扁桃体癌患者根据是否存在复发及转移分为两组，包括疾病稳定组和疾病进展组，稳定组 26 例，进展组 10 例，通过单因素分析对比两组临床及影像资料的差异，将单因素鉴别有意义的因素纳入 Logistic 回归分析，确定影响扁桃体癌治疗后转移及复发的独立影像因素。
结果 36 例同步放化疗的扁桃体癌患者中，随访时间为 2-153 个月，中位随访时间为 50.6 个月，随访率为 100%。其中疾病稳定组共 26 例（72.2%），治疗后病灶较前明显缩小或基本消失，趋于稳定；疾病进展组共 10 例（27.8%）患者，出现治疗后复发或转移，包括单纯局部复发 4 例，局部复发伴颈部淋巴结转移 1 例，颈部淋巴结转移伴邻近皮肤受累 1 例，肺转移 2 例，多发骨转移 2 例。单因素分析两组患者年龄（P<0.001）、病灶大小（P<0.001）及临床分期（P=0.008）差异具有统计学意义，Logistic 回归分析结果显示病灶大（P<0.001,OR=24.295）、临床分期（P<0.001, OR=0.127）是影响扁桃体癌治疗后复发及转移的独立影响因素。
结论 扁桃体癌病灶大小和临床分期是影响预后的独立影像因素，扁桃体癌病灶越大、临床分期越晚，越容易出现复发与转移。

中国科学院大学重庆医院（重庆市人民医院）

目的 探讨磁共振成像（MRI）在喉癌和下咽癌放化疗评价中的应用价值，为喉癌和下咽癌放化疗效果评价提供新的思路。
方法 收集经病理证实的喉癌及下咽癌 98 例初治患者纳入此次前瞻性研究。患者均于我院接受放化疗综合治疗，分别于治疗前、治疗后行磁共振检查，记录其扩散加权成像（DWI）半定量参数，以及 MR 动态多期增强扫描（DCE-MRI）定量参数，比较完全缓解（CR）者与非完全缓解（CR）者上述参数差异，运用患者工作特征曲线（ROC），计算各项参数预测喉癌和下咽癌放化疗效果的价值。
结果 98 例患者均顺利完成治疗，治疗结束后，CR 43 例，非 CR 55 例，CR 率为 43.88%。CR 组治疗前 ADCmean、ADCmax 低于非 CR 组，两组患者治疗后 ADCmean 均较治疗前上升，CR 组治疗后 ADCmean 高于非 CR 组，差异有统计学意义（P＜0.05）。CR 组治疗前 Kep 高于非 CR 组，两组患者治疗后 Kep 均下降，Ve 均上升，CR 组治疗后 Ktrans 下降，非 CR 组治疗后 Ktrans 上升，差异有统计学意义（P＜0.05）。以治疗前 ADCmean≤ 1.05 预测 CR 的 ROC 曲线下面积为 0.625（灵敏度为

92.64%、特异性为 53.98%），以治疗前 Kep≥1.205 min 预测 CR 的曲线下面积为 0.564（灵敏度为 94.15%、特异性为 52.36%）。

结论 治疗前 DWI 半定量参数及 DCE-MRI 定量参数均可为喉癌和下咽癌患者放化疗效果的预测提供一定参考，值得进一步研究。

基于多序列 MRI 的影像组学模型预测鼻咽癌复发或转移结局的应用价值

包丹[1],罗德红[1],耿亚媛[2],代双凤[2]
1.中国医学科学院肿瘤医院
2.慧影医疗科技（北京）有限公司

目的
探讨基于 MRI 影像组学模型在治疗前预测鼻咽癌复发或转移中的价值。
方法
回顾性分析 2012 年 1 月至 2015 年 12 月我院经病理证实为鼻咽癌，并且治疗前无远处转移的 166 例患者，按 9:1 比例随机分为训练集和验证集。治疗前均行 MRI 检查，在 T2WI/FS 序列和增强 T1WI 序列逐层勾画病变的体积感兴趣区（VOIs）。从每个 VOI 提取影像组学特征，先后应用基于方差(阈值：0.8)及 LASSO 方法在 T2WI/FS、增强 T1WI 序列以及两序列联合中进行特征筛选。采用 XGBoost 方法构建预测模型。模型的预测效能由受试者工作特征（ROC）曲线评估，评价指标包括灵敏度、特异性和曲线下面积（AUC）。
结果
每个 VOI 可提取 1409 个影像组学特征，从 1409 个 T2WI/FS 特征、1409 个增强 T1WI 特征和 2818 个两序列组合特征中分别筛选获得 6 个、11 个和 5 个与鼻咽癌转移或复发相关特征，分别构建 3 组模型，包括 T2WI/FS 模型、增强 T1WI 模型和最优特征模型。最优特征模型表现出更高的 AUC 值（验证集/测试集：增强 T1WI 模型 0.88/0.86；T2WI/FS 模型：0.87/0.74；最优特征模型：0.93/0.79），三个模型均表现出比较好的敏感性及特异性（敏感性：增强 T1WI 模型：0.85/0.76，T2WI/FS 模型：0.83/0.76，最优特征模型：0.82/0.67；敏感性：增强 T1WI 模型：0.76/0.71，T2WI/FS 模型：0.77/0.64，最优特征模型：0.82/0.78）。
结论
影像组学能够从治疗前无复发转移的鼻咽癌 MRI 图像中提取有临床价值的信息。利用影像组学和机器学习算法，建立一个高灵敏度、特异度的模型在治疗前预测出现复发或转移的风险是可行的。此外，基于 T2WI 压脂序列与增强 T1WI 序列提取的影像组学特征相结合建立的模型具有更高预测效能。

甲状腺乳头状癌原发灶 CT 值 联合形态学预测中央组淋巴结转移的价值初探

闵蕊,韩丹,赵雯,李浚利,刘顼,蔡雅倩
昆明医科大学第一附属医院

目的 探讨甲状腺乳头状癌（PTC）原发灶 CT 值联合形态学预测中央组淋巴结转移（CLNM）的价值。
方法 回顾性收集经手术病理证实为单发甲状腺乳头状癌且行中央组淋巴结清扫术患者 340 例，分为中央组淋巴结转移组（178 例）及未转移组（162 例）。测量两组间原发灶平扫、动脉和静脉期 CT 值，计算动脉及静脉期净增 CT 值、标准化 CT 值（NCT 值），利用 t 检验比较两组间上述 CT 值差异。绘制受试者工作特征（ROC）曲线，计算其曲线下面积（AUC），选取最佳敏感度及特异度的临界值；比较两组间四个形态学特征，包括原发灶位置、直径、钙化、包膜接触范围；利用二元 Logistic 回归分析有统计学意义的 CT 值参数联合形态学预测 CLNM 的敏感度与特异度。
结果 （1）两组间原发灶 CT 值：仅原发灶静脉期的 CT 值、净增 CT 值及 NCT 值差异有统计学意义（P<0.05），转移组为 112.62±14.11HU、58.95±12.09HU、0.67±0.25，未转移组为 103.59±9.68HU、50.59±13.81HU、0.52±0.23，其预测 CLNM 临界值分别为 107.5HU、53HU、0.761，敏感度、特异度分别为 71.4%、81.8%；76.2%、59.1%；71.4%、72.7%。而两组间平扫及动脉期 CT 值比较差异无统计学意义（P >0.05）；（2）原发灶形态学分析：两组间原发灶直径及包膜接触范围比较差异有统计学意义（P<0.05），且 d>2cm 或包膜接触范围≥1/2 者较易出现 CLNM（P<0.05）；（3）联合预测：原发灶静脉期 CT 值参数（静脉期 CT 值、净增 CT 值、NCT 值）联合形态学（d>2cm、包膜接触范围≥1/2）预测 CLNM，敏感度为 75.3%，特异度为 78.4%，准确度为 76.8%。
结论 甲状腺乳头状癌原发灶静脉期 CT 值参数对预测中央组淋巴结转移有一定价值，联合形态学可进一步提高预测效能。

磁共振 IVIM 序列对大鼠急性期放射性颌下腺血管损伤的评估价值

陈晴,马婕,罗宁斌,金观桥,康巍,韦雯娟,苏丹柯
广西医科大学附属肿瘤医院

目的 探讨体素内不相干运动磁共振扩散加权成像（IVIM-DWI）在评估大鼠急性期放射性颌下腺血管损伤的价值。 **方法** 将 20 只雌性 SD 大鼠随机分成对照组（4 只）、照射组（16 只），照射组大鼠双侧颌下腺照射剂量为 15Gy，对照组照射剂量为 0Gy。照射组于照射 15Gy 后 2h、6h、12h、24h，每 4 只为一组行常规 MR 及 IVIM 扫描，对照组于照射 0Gy 后立即进行常规 MR 及 IVIM 扫描，观察各组大鼠之间颌下腺 IVIM 参数（D 值、D*值和 f 值）的差异。MRI 检查结束后，立即取大鼠双侧颌下腺标本，进行免疫组化染色，观察对比各组大鼠颌下腺微血管密度（MVD）的差异，并分析 MVD 与 D 值、D*值和 f 值之间的相关性。 **结果** 五组大鼠颌下腺 MVD 进行比较，差异具有统计学意义（F=8.262，P<0.001）。照射 6h 后 MVD 持续减低，照射后 6h、12h、24h 的 MVD 与对照组相比显著降低，均有统计学差异（P 值均<0.05）。五组大鼠的 ADC 值（F=3.176，P=0.027）和 D 值（F=7.694，P<0.001）差异具有统计学意义。照射后 2h、6h、12h、24h 的 ADC 值和 D 值分别与对照组进行比较：照射后 6h、12h 的 ADC 值与对照组相比，差异具有统计学意义（P 值均

<0.05）；照射后 2h、6h、12h、24h 的 D 值与对照组相比，差异均具有统计学意义（*P* 值均<0.05）。五组大鼠的 D*值（*F*=1.372，*P*=0.266）和 f 值（*F*=2.052，*P*=0.111）差异无统计学意义。五组大鼠颌下腺的 D 值与 MVD 呈正相关（*r*=0.345，*P*=0.046）；D*值与 MVD 无相关性（*r*=-0.153，*P*=0.386）；f 值与 MVD 无相关性（*r*=-0.205，*P*=0.244）。 **结论** 大鼠颌下腺急性期放射性损伤中的 MVD 会发生变化。IVIM 在一定程度上可以反映大鼠急性期放射性颌下腺微血管损伤的情况。

III 期尘肺与尘肺合并肺癌累及纵隔淋巴结的 MSCT 影像对比研究

梁卡丽
西南医科大学附属中医医院

目的 运用多层螺旋 CT（MSCT）增强扫描技术，探讨 III 期尘肺及尘肺合并肺癌累及纵隔淋巴结的形态特征及强化特点，以及其优势解剖分布，以提高对尘肺纤维斑块合并肺腺癌患者的检出。**材料与方法** 对本院 2016 年 3 月至 2018 年 11 月经临床及病理证实的 40 例 III 期尘肺和 13 例尘肺合并肺癌的受累纵隔淋巴结在 MSCT 上的特点及解剖分布进行回顾性总结、分析。**结果** 40 例 III 期尘肺增大淋巴结 176 个，36 例、142 个（80.7%）可见局部钙化，27 例、103 个（58.5%）呈均匀

强化，13 例、53 个（31.1%）呈不均匀强化，4 例、20 个（11.4%）呈环形强化；1、2L、9 区未见分布，累及淋巴结 2R 区 13 个(7.4%)、3 区 16 个(9.1%)、4R 区 13 个(8.5%)、4L 区 8 个(4.5%)、5 区 24 个(13.6%)、6 区 8 个（4.5%）、7 区 33 个(18.7%)、8 区 7 个（4.0%）、10R 区 31 个(17.6%)以及 10L 区 23 个(13.1%)。13 例尘肺合并肺癌的增大淋巴结 67 个，11 例、51 个（76.1%）可见局部钙化，2 例、12 个（17.9%）呈均匀强化，3 例、16 个（23.9%）呈不均匀强化，10 例、39 个（58.2%）呈环形强化； 8、9 区未见分布，累及淋巴结 1 区 3 个（4.5%）、2R 区 5 个(7.5%)、2L 区 4 个（6.0%）、3 区 5 个（7.5%）、4R 区 6 个（8.9%）、4L 区 9 个（13.4%）、5 区 2 个（3.0%）、6 区 3 个（4.5%）、7 区 11 个（16.4%）、10R 区 9 个（13.40%）以及 10L 区 10 个（14.9%）。**结论** 依据患者纵隔增大淋巴结的特点及解剖分布，MSCT 增强扫描对尘肺合并肺腺癌的检出有诊断指导价值。

非小细胞肺癌免疫检查点抑制剂相关肺炎 CT 诊断

邢宁,马俊勋,聂永康
中国人民解放军总医院第一医学中心

前言：免疫治疗是继手术、放疗、化疗后第四类恶性肿瘤治疗手段， 其中免疫检查点抑制剂（check-point inhibitor， CPIs）是近年来肿瘤治疗领域取得的重大进展，为多种晚期恶性肿瘤的患者带来了福音。随着该类药物应用于临床，其导致的副作用，如导致免疫相关性肺炎的病例时有报道，而该类不良反应有潜在致死性、增加患者的死亡率，早期识别、及时治疗对于患者有重要意义。

材料与**方法** 回顾性分析 56 例非小细胞肺癌免疫治疗相关肺炎的 CT 表现，年龄 38-79 岁，平均年龄 57.4 岁，男性 38 例，女性 18 例。出现免疫治疗相关肺炎的时间为 2 个月-2 年。诊断依据包括：①使用 CPIs 治疗的用药史；②咳嗽，呼吸困难，伴或不伴有发热；③影像学表现为快速进展的磨玻璃影、实变影等；④除外感染、肿瘤进展、肺栓塞、心功能不全等；⑤抗菌药物无效，激素有，再次使用 CPIs 治疗或停用激素可复发。

结果 56 例免疫治疗相关肺炎中最常见表现为机化性肺炎（21 例），急性间质性肺炎（16 例），非特异性间质性肺炎（11 例），寻常性间质性肺炎（6 例），呼吸性细支气管炎（2 例）。

结论 免疫检查点抑制剂相关肺炎的 CT 表现有一定的特征性，结合临床相关信息能够做出早期诊断，从而降低这一副反应造成的不良后果。

Systemic lupus erythematosus: Chest computed comographic findings in 89 patients, and CT visual scores as predictor of prognostic

Yilei Chen
Shanghai Shuguang Hospital Affiliated With Shanghai University of TCM.

Purpose: To evaluate chest computed tomography(CT) findings in patients with systemic lupus erythematosus (SLE), delineate the characteristic CT features in various subsets of SLE, and investigate the prognostic factors.

Materials and methods: Retrospectively identified 89 SLE patients who underwent chest CT from 2010 through 2012 (median follow-up period, 16 months; range, 2－30 months) were included in this study. Chest CT findings were qualitatively and semiquantitatively analyzed at the initial and follow-up CT scans, and correlation with anti-Sm antibodies, anti-double-stranded DNA antibodies, and antiphospholipid antibodies. Overall changes in disease extent at the follow-up CT findings were classified as improved (i.e., ≥ 10% decrease in extent), Stable, or progressed (i.e., ≥ 10% increase in extent), we evaluated the change of the chest CT findings with logistic regression in 89 SLE patients to determine the prognostic factors.
Results: Chest CT abnormalities were identified in 77 (87%) patients, the most frequent CT
findings at the initial CT scans was axillary lymphadenopathy(60%), followed by interlobular septal thickening (45%), ground-glass opacities (39%), subpleural curvilinear line (35%),
reticulation (35%). No correlation was found between the presence of anti-Sm antibodies and the initial chest CT findings. It showed a significant association between axillary lymphadenopathy and the presence of anti-double-stranded DNA antibodies, independent and significant associations between ground-glass opacities or ill-defined centrilobular nodules and the presence of antiphospholipid antibodies were observed. The presence of anti-double-stranded DNA antibodies and the extent of axillary lymphadenopathy were significant association with the progression of chest CT abnormalities at the follow-up CT findings.
Conclusion: The presence of anti-double-stranded DNA antibodies and the extent of axillary lymphadenopathy were significant association with the progression of chest CT abnormalities, anti-double-stranded DNA antibodies seropositive and axillary lymphadenopathy might be poor prognostic factors in SLE patients with pulmonary involvement.

OR-357
呼气相 CT 定量分析肺内血管体积在慢性阻塞性肺疾病患者中的应用

曹宪宪[1],高小燕[1],于楠[2],师美娟[3],魏霞[4],金晨望[1],郭佑民[1]
1.西安交通大学医学院第一附属医院
2.陕西省中医药大学附属医院影像科
3.西安交通大学医学院第二附属医院影像科
4.西安市第九医院呼吸内科

目的 基于呼、吸双气相 CT 定量分析慢性阻塞性肺疾病患者肺内血管体积（Intrapulmonary vascular volume , IPVV），研究不同严重程度 COPD 患者在呼、吸状态下 IPVV 变化情况，进一步探讨呼气相 CT 定量肺血管在 COPD 中的应用价值。**方法** 回顾性收集“数字肺”数据库中行呼、吸双相 CT 扫描肺 COPD 患者 89 例，通过计算机辅助测量双相 CT 扫描下 IPVV、肺气肿程度（LAA%-950）、3-6 代支气管壁厚（WT）及壁面积百分比（WA%）。应用独立样本 T 检验比较轻、重度 COPD 在呼、吸气相下 IPVV 参数变化。呼、吸状态下 IPVV 与 PFT 参数、LAA%-950 及支气管参数的相关性采用 Pearson 或 Spearman 相关系数及多元逐步回归分析。**结果** 不同严重程度 COPD 的 IPVV 比较，呼气相中，重度组大于轻度（P<0.05）；吸气相下无差异。在所有 COPD 患者中，吸气相下各肺叶 IPVV 与 PFT 参数呈负相关（r=-0.215～-0.292），与第 3-6 代支气管 WT 呈正相关

（r=0.233～0.557），与各肺叶 $LAA\%_{-950}$ 呈正相关（r=0.238～0.409）；呼气相下各肺叶 IPVV 与 PFT 参数呈负相关（r=-0.238～0.360），与第 3-6 代支气管 WT 呈正相关（r=0.260～0.566），与各肺叶 LAA%-950 呈正相关（r=0.241～0.362），P 值均<0.05。多元逐步回归显示，在呼气相与吸气相时，不同肺叶下 IPVV 与年龄、BMI 及各定量参数回归方程的 R^2 值最大分别为 0.426、0.505（P 值均<0.05），WT 可独立相关于 IPVV（P<0.05）。**结论** 呼气相 CT 可有效评估不同严重程度 COPD 肺内血管改变，且与 COPD 定量指标的相关性较吸气相大，对 COPD 定量评估存在一定潜在价值。支气管壁厚可能是 COPD 肺内血管体积的独立预测指标。

Quantitative study of emphysema and airway remodeling in COPD rat model by micro-CT

Di Zhang,Yu Guan,Yi Xia,Li Fan,Shiyuan Liu
Changzheng Hospital， Second Military Medical University， China

Objective To analyze the dynamic changes of COPD by quantitatively measuring emphysema and trachea related parameters with Micro-CT. Methods There were 8 rats in control group, 9 in smoked group and 9 in protease group. The control group underwent Micro-CT examinations and pathological examinations at the 4th, 8th, 12th and 24th week after modeling. The smoking group and the protease group underwent Micro-CT examinations and pathological examinations at the 4th, 12th, 24th week and the 4th, 8th, 12th week respectively. Micro-CT quantitative parameters included lung density, air volume to total lung volume radio, bronchial lumen diameter and wall thickness. Pathological quantitative parameters included (tracheal area-lumen area)/tracheal area (MA%), wall thickness/radius of the trachea (MT%), mean alveolar area, and mean liner intercept. Results In the 12th week, the lung density in smoke group and protease group was significantly lower (P<0.001, P<0.001), and $LAA\%_{-928}$ was significantly higher (P=0.031, P=0.013) than the control group. In the 24th week, the lung density in the smoke group was significantly lower (P=0.001), and $LAA\%_{-928}$ was significantly higher than the control group (P=0.028). The bronchial wall of the 4th grade bronchus in the 12th week and the 3rd, 4th grade in the 24th week of rats in the smoked group were significantly thicker than those in the control group (P=0.04, P=0.033, P=0.008). Lung density negatively correlated with mean alveolar area and mean liner intercept (P = 0.001, R = -0.838; P = 0.043, R = -0.592). $LAA\%_{-928}$ positively correlated with mean alveolar area and mean liner intercept (P <0.001, R = 0.926; P = 0.029, R = 0.629). The bronchial wall thickness measured by Micro-CT was positively correlated with MT% (P=0.026, r=0.638). Conclusion The results of Micro-CT can reflect the real condition of the rat lung. Emphysema and bronchial remodeling exist in rats with COPD in the 12th week after modeling.

OR-359

Impact of hybrid iterative reconstruction on quantitative analysis with pulmonary CT

Zhuolu Zhang
Peking University People's Hospital

Objectives: This study aimed to investigate the impact of hybrid iterative reconstruction blending levels on quantitative analysis and objective image quality of pulmonary CT.
Methods: Pulmonary CT images were acquired from 52 subjects and reconstructed using different hybrid iterative reconstruction blending levels including FBP, ASIR-V30%, ASIR-V50%, ASIR-V70% and ASIR-V100%. Quantitative analysis were compared including emphysema index(EI),total lung volume, luminal area, wall area, wall thickness, diameter of airway and nodule volume. CT value and standard deviation (SD) were also measured and compared.
Results: EIs were found statistically different [FBP (3.34 %), ASIR-V30% (2.13 %), ASIR-V50% (1.46 %), ASIR-V70% (0.98 %) and ASIR-V100% (0.57 %)(P<0.001)]. SDs decreased dramatically with the increase of ASIR-V percentage [air in trachea: FBP (29.8HU), ASIR-V30% (25.5HU), ASIR-V50% (22.6HU), ASIR-V70% (19.6HU), ASIR-V100% (15.2HU), descending aorta: FBP (35.2HU), ASIR-V30% (27.6HU), ASIR-V50% (22.7HU), ASIR-V70% (18.0HU), ASIR-V100% (12.1HU) (P<0.001)]. There was no statistically significant difference of CT values, airway dimensions, nodule volumes and lung volumes among different blending levels (P>0.05).
Conclusion: With the increase of blending level of ASIR-V, EI and SD decreased significantly, while volumetric quantification of lung nodule and airway dimensions were not affected.

超极化 129Xe 磁共振成像在 COPD 患者中的应用

杨昊[1],吴光耀[2],周欣[3]
1.武汉大学中南医院
2.深圳大学总医院
3.中国科学院武汉物理与数学研究所

目的 ： 定性分析人体肺部超极化 ^{129}Xe MRI（hyperpolarized ^{129}Xenon magnetic resonance imaging，HP ^{129}Xe MRI）肺通气成像可行性和安全性。
方法 8 例受试者（5 例健康志愿者、3 例 COPD 患者）行低剂量 CT 扫描和及 HP ^{129}Xe MRI 肺通气成像；并与低剂量 CT 图像对照，分析 HP ^{129}Xe MRI 肺通气成像特征，分析检查前后心率、收缩压、舒张压及血氧饱和度等生理指标变化。
结果 所有受试者检查前后心率、血氧饱和度及血压等生理指标未见明显变化，受试者除 2 例主诉头昏外，无其他不适（P>0.05）。8 例受试者肺通气 HP ^{129}Xe 相肺气体信号分布呈由前向后递增趋势，反应其重力顺应性梯度。5 例健康自愿者双肺 HP^{129}Xe 分布均匀，第 1 例 COPD 患者 CT 显示左下肺片状的低密度区，HP ^{129}Xe MRI 不仅显示 CT 上已发现病变，同时还发现肺内更小通气缺损区。第 2 例 COPD 患者 CT 未见异常，而 HP ^{129}Xe MRI 显示肺内多发通气缺损区。第 3 例患者 CT 显示双上肺胸膜下低密度区，HP ^{129}Xe MRI 能显示双肺胸膜下广泛通气缺损区。
结论 HP ^{129}Xe 肺部 MRI 通气成像能安全有效评估 COPD 患者的肺通气缺陷，可视化显示 CT 未能显示的早期、多发、小灶性肺通气缺陷病变，亦能反应肺部重力顺应性梯度。

肺结节圆度—预测纯磨玻璃结节浸润性的 CT 新征象

巴文娟,伍建林
大连大学附属中山医院

目的 探讨 CT 形态学量化指标肺结节圆度在预测纯磨玻璃结节（pGGN）浸润性中的应用价值。 **方法** 回顾性分析经病理证实的 111 例患者的 116 枚 pGGN 的术前 CT 表现。根据临床管理策略将其分组为浸润前病变和浸润性病变，前者包括非典型腺瘤样增生（AAH）、原位腺癌（AIS），后者包括微小浸润性腺癌（MIA）、浸润性腺癌（IAC）。使用 Photoshop 软件测量肺结节圆度，比较两组肺结节圆度的差异，并用 ROC 曲线分析评估肺结节圆度、长-短比率、分叶征深度在两组鉴别中的最佳界值及诊断性能。肺结节圆度、长-短比率及分叶征深度间的相关性采用 Pearson 或 Spearman 相关性分析。**结果** 肺结节圆度在 pGGN 浸润前、后病变的差异具有统计学意义（P＜0.001）。ROC 分析显示肺结节圆度、长-短比率、分叶征深度的 cutoff 值分别为：73.44%、1.204、0.08，对应的 AUC 分别为：0.902、0.635、0.753。肺结节圆度与长-短比率（r=-0.498，P＜0.001）、分叶征深度（r=-0.672，P＜0.001）呈中度负相关。**结论** 肺结节圆度在预测 pGGN 浸润性中可作为 CT 形态学特征的量化指标。

OR-362

Application of a deep-learning based computer-aided diagnosis (DL-CAD) in distinguishing benign and malignant lung nodules: compared with conventional double reading by radiologists

Zhou Liu,Li Li,Douqiang Luo,Dehong Luo
Cancer Hospital Chinese Academy of Medical Sciences, Shenzhen Hospital

Purpose: To evaluate the performance of a commercial deep-learning based computer-aided diagnosis (DL-CAD) in differentiating benign and malignant lung nodules detected on baseline CT, by comparing with conventional double reading by radiologists.
Method: In this retrospective study, 233 patients (March 2017 - June 2019) with 261 pathologically confirmed lung nodules (malignant: benign = 192: 55) were selected. Blind to the results by the DL-CAD system, two radiologists finalized the diagnosis using a four-scale malignancy score system, including unlikely to be malignant (0-25%); malignancy cannot be completely excluded (25-50%); highly likely to be malignant (50-75%) and considered as malignant (75-100%). Intraclass correlation coefficients (ICC) was used to evaluate the agreement in malignancy risk rating between CAD and double reading, with ICC value of < 0.5, 0.5 to 0.75, 0.75 to 0.9, and > 0.9 indicating poor, moderate, good and perfect agreement, respectively. With malignancy likelihood > 50% as cut-off value for malignancy and the pathological result as gold standard, sensitivity, specificity and accuracy were calculated for double reading and CAD, separately.
Results: Among the 261 nodules, 247 nodules were successfully detected by DL-CAD with detection rate of 94.7%. In terms of malignancy rating, DL-CAD was in moderate agreement with double reading (ICC = 0.555, 95% confidence interval: 0.424 to 0.655). DL-CAD misdiagnosed 40 true malignant nodules as benign nodules and 30 true benign

nodules as malignant nodules with sensitivity, specificity and accuracy of 79.2%, 45.5% and 71.7%, respectively. In contrast, double readings achieved better performance with 16 true malignant nodules misdiagnosed as benign nodules and 26 true benign nodules as malignant nodules with sensitivity, specificity and accuracy of 91.7%, 52.7% and 83.0%, respectively.
Conclusion: Although DL-CAD shows high detection rate, its performance in differentiating malignant and benign nodules is still inferior to conventional double reading, which needs further improvement.

OR-363
肺内多发磨玻璃结节中主病灶的影像特征与 5 年预后的相关性研究

车思雨,李智勇
大连医科大学附属第一医院

目的 旨在探讨肺内多发磨玻璃结节中主病灶的影像特征与 5 年预后的相关性情况。**方法** 回顾性分析 2012 年 12 月~2013 年 12 月期间在我院手术病理证实的肺内多发磨玻璃结节（ground glass nodules，GGNs）患者 50 例，最短随访时间超过 5 年。参照 2015 年版肺腺癌病理新分类将肺内多发 GGNs 分为主病灶为浸润性腺癌（invasive adenocarcinoma，IA）组和主病灶为微浸润腺癌（minimally invasive adenocarcinoma，MIA）或原位腺癌（adenocarcinoma in situ，AIS）组。比较两组预后的差异性，分析各组内主病灶大小、是否临近胸膜、分叶征与 5 年预后的相关性情况。**结果** 主病灶为 IA 组 30 例，主病灶为 MIA 或 AIS 组 20 例，主病灶为 IA 组在 5 年随访中剩余结节存在增大和新发的病例数均高于主病灶为 MIA 或 AIS 组（$P<0.05$）。主病灶为 IA 组中，剩余结节存在增大与主病灶的大小有相关性（$r=0.455$，$P<0.05$），剩余结节存在新发与主病灶临近胸膜、分叶征有相关性（$r=0.434$、0.384，$P<0.05$）。主病灶为 MIA 或 AIS 组中，剩余结节存在增大和新发均与主病灶临近胸膜有相关性（$r=0.459$，$P<0.05$）。**结论** 肺内多发 GGNs 患者术后随访 5 年发现：主病灶为 IA 组的预后明显低于主病灶为 MIA 或 AIS 组；主病灶的大小、临近胸膜、分叶征是主病灶为 IA 组患者预后的影响因素；主病灶临近胸膜是主病灶为 MIA 或 AIS 组患者的预后影响因素。

The implications of internal vascular and bronchial changes of pure ground-glass nodules(pGGNs) lung adenocarcinoma on CT

Xuemin Tao[1],Yueqing Yang[2],Xin Jin[1],Mei Jin[1],Rui Fang[1],Shaohong Zhao[1]
1.Chinese PLA General Hospital
2.Tangshan workers' Hospital

Objective: To investigate the implications of vascular and bronchial changes within lung adenocarcinoma with pure ground-glass nodules (pGGNs) on CT.
Methods: From April 2014 to February 2016, 157 patients with 165 pGGNs lung adenocarcinomas were included. The patients' age, sex and the size, density, position,

bronchial changes and vascular changes of pGGN were analyzed. Univariate and multivariate analysis were used to assess the relationship between CT characteristics of pGGN and lesion invasiveness, respectively. The differences of vascular and bronchial changes among histopathological subtypes and the relations with the size and density of pGGNs were analyzed by using Pearson Chi square test, Mann-Whitney test and t-test.

Results: There were 70 non-invasive lung adenocarcinomas and 95 invasive lung adenocarcinomas, with vascular changes in 25 and 65 lesions and bronchial changes in 14 and 47 lesions, respectively. Univariate analysis revealed significant differences of patients' age, the size of pGGN, vascular and bronchial changes between non-invasive lung adenocarcinomas and invasive lung adenocarcinomas(*P<0.05*).Logistic regression analysis showed that the patients' age(≥56y), pGGNs' size (≥12mm), vascular changes were significant predictive factors for lesion invasiveness(*P<0.001*). There was a significant difference in the lesion size between vascular change and no-change groups (P<0.001), bronchial change and no-change groups (P<0.001), while no difference was found in density (P>0.05). Vascular changes were found in 90 lesions, which were pulmonary vein in 78 lesions and pulmonary artery in 15 lesions (3 invasive adenocarcinomas with both pulmonary vein and artery changes), and there was a significant difference in vascular changes between the pulmonary vein and pulmonary artery (P<0.001).

Conclusions: Vascular and bronchial changes within the lesions may indicate the invasiveness of pGGN lung adenocarcinomas and were correlated with the size of the lesions. Vascular changes are more common in pulmonary vein than in pulmonary artery

孤立性囊腔类肺癌 CT 表现特征及病理基础对照研究

薛新颖[1],伍建林[2]
1.首都医科大学附属北京世纪坛医院
2.大连大学附属中山医院

目的 回顾性观察囊腔类肺癌 CT 和病理特征，总结该类型肺癌 CT 表现规律和探讨其囊腔形成病理机制并提高诊断水平。

方法 回顾性分析 2011 年 1 月至 2017 年 12 月收治孤立性囊腔类肺癌患者 114 例，99 例经手术、纤维支气管镜和经皮穿刺病理活检证实，另 15 例患者在胸部 CT 随访中病灶进展出现典型表现而综合诊断为囊腔类肺癌。114 例患者中男性 74 例，女性 40 例，年龄范围 30~82 岁，平均年龄 59.14±10.68 岁。全部收集患者临床资料、CT 图像和病理学资料，记录相关数据。

结果 114 例肺内孤立性囊性恶性肿瘤患者中，75 例（65.79%）病灶位于双肺周边部位；65 例（57.02%）囊腔的形态规则，其中呈圆形者 43 例（66.15%, 43/65）、类圆形者 22 例（33.85%, 22/65）。另有 104 例（91.23%）显示囊壁厚薄不均，其中 57 例（54.81%，57/104）可见壁结节；有 69 例（60.53%）囊腔内可见分隔或血管分支影；有 76 例（66.67%）囊壁外可见贴边血管征；有 59 例（51.75%）病灶含有多少不等的磨玻璃成分。99 例获得病理组织学诊断的患者中有 88 例为肺腺癌（88.89%）。此外，为探究此类肺癌的囊腔形成机制，在多方位的后处理重建 CT 图像上发现有 69 例（60.53%）囊腔病灶的边缘处可显示狭窄的细支气管与囊腔相通。镜下观察 48 例（48.48%, 48/99）显示完整的囊腔，其中特殊发现 32 例（66.67%）病灶内狭窄小支气管的管壁及其周围伴有肿瘤细胞及大量纤维组织。

结论 囊腔类肺癌具有以囊腔及相应表现为特征并有助于提示诊断的重要征象，包括囊壁不均匀增厚、囊内分隔与细小血管分支、囊壁结节、贴边血管征、细小支气管与囊腔相通及囊腔动态性增大或缩小。囊腔类肺癌中囊腔形成的可能病理机制是细支气管周围大量纤维组织及肿瘤组织包裹并压迫形成的局部狭窄导致“活瓣”效应。

磁共振 eDWI 技术联合图像纹理特征对评估周围型肺癌的血管构筑的价值初探

李则锋
广西医科大学第一附属医院

目的 探讨磁共振 eDWI 技术联合图像纹理特征对周围型肺癌的血管构筑的评估的价值，以期对肺癌的诊治及预后提供有价值的影像学依据。
材料与方法 收集我院就诊并获得术后病理的周围型肺癌患者患者 12 例，机器型号为 GE Discovery 750 3.0T，扫描序列：eDWI 序列（b 值=0、30、50、100、150、200、300、500、800、1000、1500s/mm^2）。图像传至 GE ADW 4.6 工作站，获得 Standard ADC、Slow ADC、Fast ADC、F 值；将 eWDI 图像上传至汇医慧影放射组学云平台（http://mics.radcloud.cn/），获得二阶特征（GLCM，GLRLM）和高阶特征（NGTDM，GLSZM）；采用免疫组织化学方法对肺癌标本分别行 CD31、VEGF、SMA 染色，并应用图像分析软件 Image J 进行 CD31、VEGF、SMA 表达量测定，计算 MPI。采用统计学方法对 eDWI 各参数值、图像纹理特征与 CD31、VEGF 表达量/评分、SMA、MPI 进行相关性分析。**结果** 1、12 例肺癌患者 eDWI 参数值均与 CD31、SMA、MPI 无显著相关性（P>0.05）；2、12 例肺癌患者 eDWI 参数值中 Standard ADC、Slow ADC 及 Fast ADC 均与 VEGF 表达量/评分均无显著相关性（P>0.05）。F 值与 VEGF 评分呈正相关，r=0.592，P=0.042<0.05。
3、血管构筑参数中 VEGF 和 CD31、CD31 和 SMA 呈正相关，r 值分别为 0.718、0.849，P 值分别为 0.009、0.000（P<0.05），VEGF 评分和 MPI 值呈负相关，r 值为-0.615，P 值为 0.033<0.05。4、eDWI 图像中有 7 个纹理特征与 MPI 呈负相关。
结论 磁共振 eDWI 技术联合图像纹理特征分析能间接反映周围型肺癌更多的血管构筑信息。

OR-367
18F-FDG PET 和 CT 征象对 1A 期非小细胞肺癌复发的预测价值

李然
陆军军医大学大坪医院

目的 没有淋巴和血管侵犯的 1A 期非小细胞肺癌经手术切除后也有复发的可能性，明确有复发高风险的因素以早期选择辅助性治疗非常重要。本研究收集了 179 例 IA 期非小细胞肺癌患者的临床和影像学资料，评价肿瘤在 ^{18}F-FDG PET 的 SUV 值、薄层 CT 上的形态学征象与肿瘤复发的相关性。
方法 所有 179 例经病理证实的 1A 期非小细胞肺癌患者均在术前行 ^{18}F-FDG PET 和 MSCT 扫描，收集肿瘤的组织学分化程度、肺癌的最大 SUV 值、CT 征象包括肿瘤最大直径、最小直径、磨玻璃影所占比率、支气管束血管束增厚、分叶、肿瘤所在部位（叶）、毛刺、充气支气管征、胸膜牵拉等 CT 征象。采用单变量和多变量分析评价各个征象与肿瘤复发有无相关性，并采用 ROC 曲线以确定各 CT 征象的预测值。
结果 179 例 1A 期非小细胞肺癌中， 161 例为腺癌（89.9%），11 例为鳞状细胞癌（6.1%），7 例为其他癌。肿瘤平均直径为 2.01cm（0.6—3cm）。有 27 例（15.1%）出现复发和转移，其中 19 例

出现肺部复发，7 例次出现局部淋巴结转移，4 例出现胸膜转移，2 例出现骨转移，1 例出现肝脏转移。患者 5 年生存率为 76.3%，通过单变量分析得出最大 SUV 值、肿瘤组织学分化程度、肿瘤最大直径、支气管血管束增粗是最重要的预测因子（P < 0.05），通过多变量分析得出较高的 SUV 值（≥2.5）（P = 0.021），较低的磨玻璃影比率（≤17%） (P =0.014),支气管血管束增粗(P = 0.003)等征象是肿瘤复发独立的预测因子。通过 ROC 曲线得出 AUC 值为 0.855 (95% CI: 0.80, 0.92)，证明以上指标有更高的预测意义。

结论 ：较高的 SUV 值、较低的磨玻璃影比率和支气管血管束增粗等 CT 征象是 1A 期非小细胞肺癌复发的重要指标，该结果可为 1A 期非小细胞肺癌患者术后行化疗等辅助治疗提供重要的信息。

不同碘定量测量方式评价非小细胞肺癌 EGFR 突变状态：截面法 vs. 体积法

徐晓莉[1],宋伟[2],隋昕[2],宋兰[2],蒋涛[1],金征宇[2]
1.首都医科大学附属北京朝阳医院
2.北京协和医院

目的 探究应用最大截面法、体积法测量获得的双能量 CT 碘相关定量参数预测 NSCLC EGFR 突变状态的可行性，并探究两种方法所测碘相关定量参数之间的相关程度。

方法 58 例 NSCLC 患者于活检或手术前行动脉期双能量 CT 扫描。由两位观察者采用最大截面法及体积法勾画感兴趣区，分别获得最大截面碘浓度（areal iodine content, IC_{areal}）、最大截面标准化碘浓度（areal normalized iodine content, NIC_{areal}）以及体积碘浓度（$IC_{volumetric}$）、体积标准化碘浓度（$NIC_{volumetric}$）。比较 EGFR 突变组与 EGFR 野生组间碘相关定量参数的差异，比较最大截面法及体积法所测碘相关定量参数预测 EGFR 突变状态的诊断效能差异，并对两种碘定量测量方法行相关性分析。

结果 58 例 NSCLC 病变中，28 例 EGFR 突变阳性，30 例 EGFR 突变阴性。EGFR 突变组 NIC_{areal}（0.16±0.06）明显高于 EGFR 野生组（0.12±0.05）（t=2.869, P=0.006）。EGFR 突变组内部及内层 $NIC_{volumetric}$ 均明显高于 EGFR 野生组（t=2.415-2.699, P=0.009-0.019）。但 EGFR 突变组与野生组之间病变整体及边缘部分的体积碘相关定量参数无统计学差异。ROC 曲线示 NIC_{areal}（AUC=0.693）的诊断效能稍高于内部及内层 $NIC_{volumetric}$ （AUC=0.655-0.677）。NIC_{areal} 与内部的 $NIC_{volumetric}$ 明显相关（r=0.818-0.821）。

结论 最大截面及体积法测量碘相关定量参数可用于预测 NSCLC 的 EGFR 突变状态，最大截面碘相关定量参数测量在临床应用中更简便，推荐用于临床常规评估中。

双能量 CT Rho/Z 在肺小结节良恶性鉴别诊断中的价值

阚晓婧[1,2],葛英辉[1,2],刘霄静[1,2]
1.华中阜外医院
2.河南省人民医院

目的 探讨双能量 CT 电子云密度/等效原子系数(Rho/Z)在鉴别肺小姐姐良恶性中的价值。**方法** 回顾性收集 2019.1 月-2019.5 月在我院行双能量增强肺部检查并发现小结节、取得穿刺或手术病理结果的病人，其中肺部单发小结节者 45 名，2 个小结节者 11 名（22 个小结节），共 67 个小结节，良性者 26 个，恶性者 41 个。应用双能量 CTRho/Z 对所有结节进行评估，记录 90KV，Sn150KV,

混合 0.6，Rho，Z 和 DEI 值。比较良性结节和恶性结节各个值的差异。**结果** Rho 在良性结节和恶性结节之间具有显著性差异（P=0.001），Z 和 DEI 均不具有显著性差异（P=0.602,0.958），Sn150 页具有显著性差异（P=0.001）.**结论** 在双能量增强扫描中，获得的 Rho 和 Sn150 值有助于确定肺小结节的良恶性。

Clinicopathologic features and lymph node metastatic characteristics in patients with adenocarcinoma manifesting as part-solid nodule exceeding 3cm in diameter

Wei Li[1],Fei Zhou[2],Lei Zhang[5],Meiling Li[5],Ziwei Wan[3],Yuan Zhang[4],Xiao Bao[1],Jingyun Shi[1]
1.Department of Radiology， Shanghai Pulmonary Hospital， Tongji university
2.Department of Oncology， Shanghai Pulmonary Hospital， Tongji University School of Medicine
3.Department of Thoracic Surgery， Shanghai Pulmonary Hospital， Tongji University School of Medicine
4.Department of Respiratory Medicine， Shanghai Pulmonary Hospital， Tongji University School of Medicine
5.Department of Radiology， Shanghai General Hospital(South Branch)， Shanghai Jiao Tong University School of Medicine

Purpose: The purpose of this study was to elucidate the clinicopathologic and lymph node metastatic characteristics in patients with adenocarcinoma manifested as persistent ground glass mass (GGM, ground glass opacity [GGO] exceeding 3cm in diameter).
Materials and Methods: 304 patients with adenocarcinoma manifested as persistent GGM >3cm, who underwent complete surgical resection between November 2013 and December 2017 were included in this study. We elucidated the lymph node metastatic incidence and characteristics according to the primary tumor lobe location and extracted the associated clinicopathological factors, especially thin-section computed tomographic findings, with lymph node involvement.
Results: All of the GGMs were invasive adenocarcinoma in histopathology. The total incidence of lymph node metastasis was 2.0% (6/304). All of the 6 cases with hilar or mediastinal lymph node metastasis were manifested as solid-predominant GGM >3cm and no cases with lymph node metastasis were identified in GGO-predominant GGM >3cm. Lymph node metastases were more likely to present in younger patients (p=0.032), tumors with solid size >2.0cm (p=0.000), more advanced clinical T stage (p=0.000), radiological solid-predominant tumors (p=0.002) and acinar-predominant or papillary-predominant adenocarcinoma (p=0.002). As for solid-predominant GGMs >3cm, lymph node metastases were more likely to be found in tumors with solid size >2.0cm (p=0.026), more advanced clinical T stage(p=0.026), acinar-predominant or papillary-predominant adenocarcinoma (p=0.029). Whole tumor size was not associated with the presence of lymph node metastases. There were 2 right upper-lobe cases with upper mediastinal lymph nodes skip metastasis without intrapulmonary, interlobar, and hilar lymph node metastasis.
Conclusion: All of the GGMs were invasive adenocarcinoma. The incidence of lymph node metastasis in GGO-predominant GGMs >3cm was extremely low . Solid size would be a

better predictor of lymph node metastasis than whole tumor size in sold-predominant GGMs >3cm.

能谱 CT 影像组学在鉴别肺癌结节与炎性结节中的价值

郁义星,王希明,诗涔,胡粟,胡春洪
苏州大学附属第一医院

目的 探讨能谱 CT 影像组学特征在鉴别肺癌结节与炎性结节中的价值。**方法** 回顾性分析在我院行肺部能谱 CT 扫描的 96 例肺癌结节和 45 例炎性结节患者的资料。按照 2：1 的比例随机分配为训练组和验证组。利用 MaZda 软件对训练组动脉期和静脉期 70keV 单能量图像进行影像组学分析。提取特征包括灰度共生矩阵（GLCM）、灰度游程矩阵（GLRLM）等六大类特征。采用费希尔参数法（Fisher）、分类错误率联合平均相关系数法（POE+ACC）和相关信息测度法（MI）对提取的特征进行筛选，得到三组最优特征子集。然后用线性（LDA）和非线性判别分析法（NDA）对最优特征子集进行分析，计算其鉴别肺癌结节和炎性结节的准确率、敏感性和特异性。利用人工神经网络（ANN）建立预测模型，并对验证组两种病变进行鉴别。利用两样本 t 检验和 ROC 曲线分析确定最佳定量参数。**结果** 在动脉期，MI-NDA 法选择的最优特征子集鉴别训练组肺癌结节和炎性结节的准确率最高，为 87.69%，其敏感性和特异性分别为 87.5%和 88.0%。最佳定量参数对比度 S(1,-1)鉴别两者的敏感性和特异性为 87.5%和 60%。两者敏感性的差异无统计学意义（P=1.00），而两者特异性的差异有统计学意义（P<0.001）。在静脉期，（POE+ACC）-NDA 法选择的最优特征子集鉴别训练组肺癌结节和炎性结节准确率最高，为 86.15%，其敏感性和特异性分别为 92.5%和 76.0%；最佳定量参数差分方差 S(0,1)鉴别两者的敏感性和特异性为 72%和 57.5%。两者敏感性和特异性的差异均有统计学意义（P<0.05）。利用 ANN 算法对 MI-NDA 法选择的动脉期最优特征子集建立预测模型，其鉴别验证组肺癌结节与炎性结节的准确率、敏感性和特异性分别为 80.85%、81.25%和 80.0%。**结论** 能谱 CT 影像组学定量特征可用于鉴别肺癌结节与炎性结节，具有较高的诊断价值。

探讨神经网络诊断模型预测纯磨玻璃样肺腺癌浸润程度的价值

尹柯,黄雪洁,伍建林
大连大学附属中山医院

目的 本研究旨在建立一种诊断模型，以利用计算机断层扫描（CT）数据区分肺腺癌的浸润程度，识别浸润前病变（PIL）和浸润性腺癌（IAC）可以辅助临床治疗方式的选择。
方法 由 2015 年 1 月至 2018 年 10 月期间，本市内 3 家大学附属三甲医院行手术治疗的纯磨玻璃结节样肺腺癌及其癌前病变（不典型腺瘤样增生）共 442 例作为诊断模型建立组，建立基于 SPSS 统计软件的神经网络诊断模型。由 2019 年 6 月行手术治疗共 89 例 pGGN 病灶作为模型验证组验证神经网络预测模型的诊断效能。利用受试者操作特征（ROC）曲线下面积及模型总体预测准确率、敏感性及特异性评估其诊断效能。
结果 神经网络预测模型建立组的 AUC 值（ROC 曲线下面积）、总体预测准确率、敏感性，特异性分别为 0.900、82.1%、75.5%和 87.0%。神经网络预测模型验证组的 AUC 值（ROC 曲线下面积）、总体预测准确率、敏感性，特异性分别为 0.883，89.8%，83.3%和 93.2%。

结论 基于 SPSS 统计软件建立的神经网络预测模型对于区分纯磨玻璃结节样肺腺癌中 PIL 和 IAC 有着较高的诊断价值，是 pGGN 患者术前规划的重要指导方式之一。

OR-373
增强 CT 术前预测肺腺癌脉管癌栓及神经侵犯的价值

乔香梅,周科峰
南京大学医学院附属鼓楼医院

目的 探讨手术切除的肺腺癌脉管癌栓及神经侵犯与 CT 特征之间的关系，为判断预后及调整临床治疗提供指导。**方法** 回顾性分析 143 例手术切除的肺腺癌患者术前胸部增强 CT 图像，共评估 16 个 CT 分类变量及 7 个连续变量。采用 ROC 曲线分析 CT 参数对脉管癌栓及神经侵犯的诊断效能。通过拟合建立最终多参数模型提高诊断效能。**结果** 脉管癌栓多发生于实性成分，呈分叶状及有钙化的肿瘤中（P 均<0.05）；神经侵犯多见于伴支气管充气征的肿瘤中（P<0.05）。平扫 CT 值对脉管癌栓及神经侵犯的诊断效能最高。多参数模型预测脉管癌栓和神经侵犯的 AUC 值（曲线下面积）分别为 0.79、0.88，准确度分别 76.22%、81.82%，较单因素分析诊断效能更高。**结论** 增强 CT 可术前预测肺腺癌脉管癌栓及神经侵犯，多参数模型预测脉管癌栓和神经侵犯的诊断效能较单因素分析更高。平扫 CT 值是肺腺癌神经侵犯的独立危险因素，可为临床治疗提供相应参考价值。

OR-374
晕征的再认识：肺混合磨玻璃结节的 CT 鉴别征象

马伟玲,谭明瑜,赵伟,高丰,孙英丽,陈武飞,肖立,李铭
复旦大学附属华东医院

目的 探讨不同表现的晕环征象在肺混合磨玻璃结节(Mixed Ground-glass Nodule, mGGN)中的诊断和鉴别诊断价值。**方法** 回顾性研究 215 例直径小于 2cm 的 mGGNs，其中良性组 60 例，浸润前组(包括非典型腺瘤样增生和原位腺癌) 22 例，微浸润腺癌组(MIA)70 例和浸润性腺癌(IAC) 63 例。根据磨玻璃内、外边界情况将晕环征分为四种类型：I 型，晕环的外边界模糊，内边界清晰；II 型，晕环的外边界清晰，内边界模糊；III 型，晕环的内外边界均模糊；Ⅳ型，晕环的内外边界均清晰。记录并分析各组结节的磨玻璃成份、实性成份大小和基本影像学特征。运用 SPSS 软件(IBM SPSS Statistics 23.0)进行统计学分析。**结果** 215 例肺结节依据晕环类型分为：I 型 24 例；II 型 84 例；III 型 81 例；VI 型 26 例。晕环分型在非浸润组、MIA 组、IAC 组间的差异具有统计学意义(x^2=45.226, P=0.000)；晕环分型在良性组和腺癌组间的差异亦具有统计学意义(x^2=54.684, P=0.000)。晕环外边界清晰在良性组和浸润前组、非浸润组和浸润组以及良性组和腺癌组之间的差异均具有统计学意义(P=0.000)，而晕环内边界是否清晰在该 3 组间差异均无统计学意义(P=0.285, P=0.330, P=0.145)。患者年龄、磨玻璃成份的比例在良性组和腺癌组之间的差异具有统计学意义。患者年龄、磨玻璃成份的比例及晕环外边界清晰在鉴别良性与腺癌的受试者工作曲线的 AUC 值分别为 0.614、0.655、0.771。**结论** 详细分析混合磨玻璃结节周围晕环的边缘特征可为肺 mGGN 的定性诊断提供帮助。

OR-375

Preliminary study of the clinical application value of energy spectrum CT in distinguishing the adherent growth main component and non-adherent growth main component of ground-glass opacity pulmonary nodules

Mengying Li,Zhiyong Li,Ailian Liu,Yijun Liu
Department of Radiology, First Affiliated Hospital of Dalian Medical University

Objective:
To study the clinical application value of energy spectrum CT in distinguishing the adherent growth main component and non-adherent growth main component of pulmonary nodules under the conditions of mixed energy and single energy scanning.

Materials and methods:
Twenty patients with ground-glass opacity pulmonary nodules (GGO), confirmed by surgery and pathology, were collected in our study, including invasive adenocarcinoma and microinvasive adenocarcinoma. And there were 12 cases pure GGO(pGGO) and 8 cases mixed GGO(mGGO). According to the pathological results, the average proportion of adherent growth components in pulmonary nodule was calculated. All cases underwent energy spectrum CT scanning under the conditions of mixed energy and 40-140Kev single energy scanning. On the lung window image, ROI was drawn at each level of the lesion from the appearance of the lesion to the disappearance of the lesion. The ROI area was selected based on the maximum coverage of the lesion, with no less than 80% of the lesion, avoiding the vacuolar area. According to the post-processing software, every pixel point CT value of each ROI is automatically obtained on mixed energy image and single energy image.To arrange all pixel point CT values from small to large. According to the proportion of adherent growth component, all pixel points CT values arranged were divided into adherent growth group and non-adherent growth group. To compare the difference of CT values between the two groups by t test of two independent samples.To calculate the diagnostic efficiency of distinguish adherent growth component on mixed energy image and 40-140kev single energy image by ROC curves.

Results:
In the pixel points CT values analysis, there was a significant difference between the adherent growth group and the non-adherent growth group, whatever under the conditions of mixed energy and 40-140kev single energy scanning ($P < 0.05$), and the mean CT values of the adherent growth group were smaller than the non-adherent growth group under the different energy scanning .
ROC curves had the diagnostic efficiency of distinguish adherent growth component ($p=0$), whatever under the conditions of mixed energy and 40-140 kev single energy scanning. Especially, there was the most significant diagnostic efficiency under the condition of mixed energy scanning, and, the area under the curve was 0.919, the best threshold value was 613.5 HU, and specificity and sensitivity were 0.863 and 0.814 respectively.

Conclusion:
Energy spectrum CT can distinguish the adherent growth main component and non-adherent growth main component of GGO, which had certain clinical value. And the diagnostic efficiency was best under the condition of mixed energy scanning.

基于 CT 影像组学及薄层 CT 鉴别表现为纯磨玻璃结节的微浸润性腺癌与浸润性腺癌

潘小环,李靖煦,关玉宝
广州医科大学附属第一医院

目的 探讨基于 CT 影像组学特征及 TSCT 形态学表现对鉴别表现为纯磨玻璃结节的微浸润性腺癌（MIA）与浸润性腺癌（IAC）的价值。
方法 回顾性分析 2013 年 1 月～2017 年 10 月广州医科大学附属第一医院 TSCT 表现为 pGGN，并术后病理证实为 MIA（233 个）、IAC（115 个）的肺结节，比较这两组结节在 TSCT 形态学上的差异；另取同一层厚（2mm）、同一算法（I30）图像条件的 103 个 MIA 及 76 个 IAC 进行影像组学特征分析，按 7:3 随机分成训练组及测试组，用 L1 正则化 Logistic 回归模型比较两组结节的影像组学特征差异，采用 ROC 曲线及曲线下面积（AUC）评价其鉴别效能。
结果 :表现为 pGGN 的 MIA 最大直径为 10.29±4.10mm, IAC 最大直径为 16.50±5.62mm, MIA 与 IAC 最大直径的最佳截断值为 11.75mm，AUC=0.834，敏感性 80.6%，特异性 73.8%。MIA 平均 CT 值为-575.1±110.5HU，IAC 平均 CT 值为-517.1±128.7HU；平均 CT 值最佳截断值为-489.3HU，AUC=0.636，敏感性 44.7%，特异性 79.9%。MIA 与 IAC 的最大直径、平均 CT 值二者联合 ROC 曲线 AUC=0.863，敏感性 85.4%，特异性 76.9%。MIA 与 IAC 在 TSCT 形态学表现上，形状不规则、毛刺征、分叶征、胸膜牵拉征、空气支气管征的差异有统计学意义（P＜0.05）。基于影像组学特征上，MIA 与 IAC 两组比较，训练组 AUC=0.8480，敏感性 75.00%，特异性 81.13%，总精确度 77.60%；测试组 AUC=0.8289，敏感性 90.32%，特异性 65.22%，总精确度 79.63%。
结论 TSCT 形态学征象对鉴别表现为 pGGN 的 MIA 与 IAC 是有意义的，影像组学特征对其鉴别亦有一定的价值。

DWI 在不同肺癌类型中的诊断价值及其病理对照研究

程瑞新,宋璟璟,黄俊,徐玮,龚志刚
上海中医药大学附属曙光医院

目的 探讨扩散加权成像（DWI）在不同肺癌类型中的诊断价值。**方法** 选取 2014 年 3 月~2017 年 3 月我院收治的肺癌患者 58 例，所有患者均行 DWI 扫描，扩散敏感因子 b 值取 500 s/mm^2，比较不同类型肺癌的表观扩散系数（ADC）。**结果** 58 例患者中，中央型肺癌 19 例，周围型肺癌 39 例；小细胞肺癌（SCLC）11 例，非小细胞肺癌（NSCLC）47 例，其中 NSCLC 包括腺癌 32 例，鳞癌 15 例；肺癌实性部分在 T1WI 上呈等信号或稍低信号，在 T2WI 抑脂上呈高或不均匀高信号；腺癌及鳞癌在 DWI 上呈等或高信号，ADC 呈低或偏低信号；SCLC 在 DWI 呈高信号，ADC 呈偏低信号；中央型肺癌 ADC 值与周围型肺癌比较，差异无统计学意义（*P*>0.05）；NSCLC 患者 ADC 值明显高于

SCLC 患者（$P<0.05$），腺癌 ADC 值明显高于鳞癌（$P<0.05$）；DWI 诊断不同病理类型肺癌的 AUC 为 0.848。**结论** 当 b 值为 500 s/mm^{2}时，DWI 在腺癌、鳞癌、SCLC 鉴别诊断中具有一定价值。

OR-378

变应性支气管肺曲霉菌病 CT 表现及与侵袭性肺曲霉菌病重叠综合征的 CT 征象分析

袁怀平,朱赤,陶健 ,孙明华
安徽医科大学附属阜阳医院

目的 探讨变应性支气管肺曲霉菌病（ABPA）的 CT 表现及与侵袭性肺曲霉菌病(IPA)重叠综合征影像学特点，进一步提高对该病的认识。 **资料与方法** 回顾性分析 15 例按目前诊断标准进行诊断的 ABPA，其中 6 例临床诊断为 ABPA 与 IPA 重叠综合征患者的资料，观察 ABPA 治疗后的 CT 动态变化，及 ABPA 与 IPA 重叠综合征的影像学特点，包括：中心性支气管扩张，支气管内粘液栓，受累远端肺通气情况，经糖皮质激素治疗后支气管管径恢复情况及遗留扩张支气管形态和支气管管壁厚度。**结果** 15 例患者均有中心性支气管扩张并有气管内黏液栓形成，其中 4 例为高密度粘液栓；15 例患者病变远端肺组织通气均正常；经糖皮质激素治疗粘液栓排出后，其中 8 例患者支气扩张程度较治疗前明显改善， 13 例遗留有静脉曲张样支气管扩张；9 例患者治疗后症状消失，另外 6 例患者仍有发热咳嗽咳痰症状，复查 CT 显示粘液栓排出后支气管管壁增厚，考虑 ABPA 与 IPA 重叠，此 6 例患者接受抗真菌治疗后复查，支气管壁变薄，周围炎症吸收。 **结论** ABPA 的 CT 动态变化及与 IPA 重叠综合征的影像表现具有一定特点，可以为临床进一步治疗及疗效评价提供依据。

3.0T MRI magnetic resonace for adult pulmonary tuberculosis

Qinqin Yan
Shanghai Public Health Clinical Center, China

Objectives: To optimize lung protocols of 3.0T magnetic resonance imaging(MRI) for evaluation of pulmonary tuberculosis(TB) in the clinical routine.
Methods: 42 patients who were diagnosed as pulmonary tuberculosis underwent CT and 3.0T MRI respectively. MRI lung protocols including the free-breathing T1WI StarVIBE, the multiple breath-hold VIBE, T2WI fBLADE and 3D SPACE were choosed and compared with image quality. The evaluation of image quality include SNR(signal to noise ratio), CNR(contrast to noise ratio) and 5-points scoring scale. 5-pionts scoring scale was evaluated by two radiologists and inter-observers agreement was calculated by cohen’s kappa(k). The SNR, CNR and 5-points scoring scale were compared using a two-tailed pared t-test. The detection rates and imaging findings were compared between CT and MRI. The detection rate of pulmonary abnormality was evaluated by Pearson’s Chi-square test.
Results: Inter-observers showed moderate agreement on 5-points scoring scale. T1WI free-breathing StarVIBE and multiple breath-hold VIBE performed as well with rare

artifacts.T2WI fBLADE had significantly less artifacts than 3D SAPCE. T1WI free-breathing StarVIBE had better SNR and identical CNR comparing with multiple breath-hold VIBE. T2WI fBLADE had statistically higher SNR but inferior CNR comparing with 3D SPACE. MRI performed as good as CT in detecting most of pulmonary abnormality, with overall sensitivity of 51.29%, 90.62%, 100% for non-calcified nodules of size＜5mm, 5-10mm, ≥10mm, 91.07% for calcified nodules and 78.57% for tree-in-bud sign. MRI has more advantages to show caseous necrosis, liquefaction, necrosis within cavity, alternations of lymph nodes and pleura.
Conclusions: T1WI free-breathing StarVIBE and T2WI fBLADE with satisfied image quality is feasible for lung imaging especially for patients who have poor breath and wide range of lesios. Radiation-free MRI is an alternative tool for pulmonary TB imaging, especially for children, the elderly,the pregnant and patients who need long-term follow-up.

局限性 Castleman 病影像分型与病理相关性分析

侯代伦[1],孙小丽[1,2],王仁贵[2]
1.首都医科大学附属北京胸科医院
2.首都医科大学附属北京世纪坛医院

【摘要】 目的 对局限性 Castleman 病（LCD）进行影像分型，探讨不同分型与临床、病理的相关性。**方法** 回顾性收集确诊为 LCD 的患者 63 例，根据影像学征象进行分型，由两名放射诊断医师分别将不同分型的影像征象与临床表现、手术情况及病理特征进行对照分析。**结果** 63 例 LCD 患者影像上分为 I~IV 型：I 型，边缘光整的单发肿块（n=5）；II 型，边缘不规则或分叶状单发肿块（n=33）；III 型，边缘模糊呈浸润性单发肿块（n=20）；IV 型，边缘模糊多发融合肿块（n=5）。Ⅰ型和Ⅱ型 38 例，手术切除完整，病理均为透明血管型；Ⅲ型 20 例，手术分离较困难，其中 8 例只能部分切除，病理 17 例为透明血管型，3 例为混合型；Ⅳ型 5 例，手术无法完全切除，病理上 4 例为透明血管型，1 例为浆细胞型。**结论** LCD 临床表现无特异性，增强 CT 检查是发现和诊断 LCD 的最佳影像学检查方法，其影像分型为判断肿瘤的浸润范围和生长方式、手术方案的选择以及预测预后提供可靠的影像学依据。

OR-381
不同免疫状态下肺隐球菌感染的临床特点和影像表现

程爱兰
上海市东方医院（同济大学附属东方医院）

目的 总结分析 23 例不同免疫状态下肺隐球菌感染患者的临床特点和影像表现，以提高对该病诊断能力。
方法 收集 2012.12-2019.06 我院 23 例经病理或临床证实为肺隐球菌感染病例，分析其宿主因素、临床表现和影像学表现，纳入标准：病理或临床生化检查确诊，临床及影像资料齐全；其中 16 例行胸部 CT 平扫检查，7 例行胸部 CT 平扫+增强检查。
结果 13 例男性，10 例女性，男女比 1.3:1（P>0.05）,发病年龄 31-74 岁（平均 55 岁），11 例（11/23）有宿主因素（糖尿病、肿瘤、乙肝、肾病综合征）；12 例（12/23）体检发现。有免疫

损害患者肺部大多以斑片状渗出影为主（11/23），免疫正常患者以孤立性结节/肿块为主（12/23）；绝大多数（16/23）局限于一侧肺叶，以胸膜下分布为主；病灶边缘出现晕样改变 18 例（18/23），空气支气管征阳性 11 例（11/23），2 例出现空洞，另毛刺、浅分叶、胸膜牵拉各一例，7 例强化值范围 20-34HU;其中 3 例孤立结节误诊为肺癌。

结论 免疫力损害患者肺部隐球菌感染的影像学表现类似于炎症性表现，大多以斑片状渗出影为主，而免疫力正常患者肺部影像表现以孤立性结节、肿块为主，多数边缘伴晕样改变。表现为孤立性实性结节与肺癌鉴别困难。

OR-382
感染性心内膜炎致脓毒性肺栓塞 19 例的临床及影像特点

刘彬
广东省人民医院

目的 分析感染性心内膜炎致脓毒性肺栓塞的特点，提高对该病的诊断水平。**方法** 回顾性分析 2015 年 3 月至 2019 年 5 月在广东省人民医院治疗的 19 例感染性心内膜炎致脓毒性肺栓塞患者的临床表现和心脏 B 超和胸部 CT 特点。**结果** 19 例患者平均年龄（40±22）岁，其中 5 例（26.3%）有左向右分流型先天性心脏病，3 例先天性心脏病患者合并左心感染性心内膜炎，2 例先天性心脏病患者合并右心感染性心内膜炎，其余患者均为右心感染性心内膜炎。患者主要临床表现为发热、咳嗽、胸痛、呼吸困难以及咯血。11 例（57.9%）患者血培养阳性，血培养阳性患者中，致病菌为金黄色葡萄球菌 4 例（3 例 MRSA 及 ESBL 阳性），白色念珠菌 2 例。所有患者均接受胸部 CT 扫描，其中增强扫描 17 例，CT 平扫例。CT 表现为胸膜下分布的结节影、楔形阴影，结节或楔形阴影内可伴有空洞或者“反晕”征。增强扫描可见肺小动脉栓塞、截断征象，2 例患者可见肺动脉瘤形成。1 例患者合并脓胸。**结论** 感染性心内膜炎致脓毒性肺栓塞患者多为右心心内膜炎，左心心内膜炎患者若合并左向右分流性先天性心脏病可引起脓毒性肺栓塞。脓毒性肺栓塞 CT 表现具有一定特征，具有典型 CT 表现患者应当警惕血行来源感染性病变，提示临床进行相应检查以排除感染性心内膜炎引起肺内播散可能。

OR-383
肺真菌感染与微小肺癌影像诊断及鉴别诊断

欧陕兴[1],欧舒斐[2],刘盼丽[3],李华雨[2]
1.中国人民解放军南部战区总医院
2.中国人民解放军南部战区空军医院
3.广州市第一人民医院附属南沙医院

1.目的 探讨肺真菌感染与微小肺癌鉴别诊断，旨在提高诊断水平。
2.材料与方法
胸片与肺 CT 检查，收集本院 36 例临床病例，微小肺癌 13 例，通过图像工作站随访分析及鉴别诊断。
3.结果
1.定义：肺部真菌感染由真菌感染引起支气管-肺部疾病，由不同病原体引起过敏、化脓性炎症或慢性肉芽肿。
2.病因与病理：引起下呼吸道真菌感染致病菌，包括原发性和继发性肺部真菌感染。真菌胞壁酶类，侵入宿主细胞。真菌有抗吞噬能力及致炎成分，对机体器官有倾向性侵袭作用。曲霉菌易侵犯呼吸道，隐球菌-易侵犯脑膜。

3.临床表现：肺部真菌感染继发严重原发病，临床无特异症状、体征：1.隐匿性感染无明显临床症状，可自愈。2.流感症状　　发热、畏寒、头痛、流涕、关节痛、肌痛等。

4.诊断标准：侵袭性肺真菌感染分为三级：

1.确诊：需组织学或无菌体液检测，确定微生物学证据（涂片和培养），不涉及宿主因素。2.临床诊断：综合宿主因素、临床特征、微生物学。　3.拟诊：符合宿主因素、临床特征，缺乏微生物学证据者。　免疫学检测血清中细胞壁成分（1，3）-β-D-葡聚糖抗原检测（G 试验）、半乳甘露聚糖抗原检测（GM 试验）阳性定性诊断价值。

5.微小肺癌特征：毛刺征、GGO、血管征、胸膜征等，大小 5-9 毫米、分布以肺周边为主、累及胸膜组织、少有淋巴结增大。

6.肺真菌感染特征：随机分布肺部各部，沿着支气管走形分布，成片的融合，GGO，片状影和空洞壁薄且张力高，多个病灶同时并存。晕征、曲菌球征、小空洞征等为其影像特征。容易误诊主要原因是影像征象有重叠。鉴别：1.肺炎 2.周围与中央型肺癌　3.浸润性肺结核　4.急性肺脓肿　5.肺错构瘤　6.AVM　7.类炭疽等。

4.**结论**　　肺部真菌感染影像征象无特异性，征象有重叠，结合病原学方可确诊；肺真菌轻度感染与微小肺癌鉴别困难。

Virtual Monochromatic Dual-Energy Pulomonary CT Angiography With Reduced Iodine Dose:Quantitative and Qualitative Assessment

Xiaohong Zhu,Xiaohu Li,Hua Chen,Bin Liu,Jian Song,Zhao Gao ,Xiaomin Wang,Yongqiang Yu
The First Affiliated hospital of anhui Medical University

Objective: The purpose of this study was to assess the feasibility of performing pulmonary angiography(CTPA) with 7.0g of iodine contrast medium acquired with low-energy(40 and 50kev) virtual monochromatic(VMC) images with rapid-kilovoltage-switching dual-energy CT.

Subjects and methods:A tatal of 123 adults with suspected pulmonary embolism were enrolled in this study performed on GE Revolution CT.Subjects were randomly assigned to a contrast medium protocol for CTPA examinations:one group(n=41)　received 14.0g iodine with an standard DE CTPA protocol,the other(n=41) received 7.0g iodine with a low CM injection DE CTPA protocol,another(n=41)received 17.5g iodine with a standard CTPA protocol. DE CTPA uses 50% ASIR-V and low mAs scanning to greatly reduce radiation dose.Two readers independently assessed the image quality of the CTPA and VMC DE CTPA datasets using the 5-point scale.CT attenuation,SNR ,CNR　and subject image quality were compared between the three groups.

Results: For the DE CTPA virtual monoenergetic spectral datasets(40-140kev)were reconstructed. The CT attenuation of the low CM DE CTPA at 50kev has no difference with the standard CTPA protocol group(low CM DE CTPA : 444.5+185.7; standard CTPA : 455.1+126.3; p=0.603).Main and lobar pulmonary arteries at 40kev datasets provided the highest signal-to-noise-ratio(SNR) and contrast-to-noise-ratio(CNR)for both the standard DE CTPA protocol and the low CM injection protocol. the standard DE CTPA protocol had significantly higher CNR and SNR values than the standard CTPA protocol($p<0.05$),which the low CM DE CTPA was slightly lower than the standard

CTPA,while its subjective score meets the diagnostic requirements.No pulmonary embolism was missed on the three protocols.
Conclusion:DE CTPA utilizing image reconstruction at 40-50kev are optimal when reducing the total iodine amount down to 7.0g(reduction of 60%) and the total radiation exposure(reduction of 78%)while maintaining adequate intravascular attenuation and diagnositic quality for pulmonary embolism evaluation.

能谱 CT 在肺动脉、肺静脉及肺结节融合中的应用

余娜,周代全
重庆医科大学附属第三医院

【摘　要】**目的**　通过对比分析探讨 CT 能谱技术在肺动脉、肺静脉与肺结节融合成像中的临床价值。**方法**　本院 56 例直径小于 3　cm 的肺磨玻璃（ground　glass　nodule，GGN）结节术前行肺血管与结节融合成像的患者，随机分为对照组和观察组，每组 28 例；对照组使用 CT 常规扫描，观察组使用 CT 能谱扫描及能谱后处理技术，对比分析 2 组血管成像图像质量的优劣，另外观察组内用能谱扫描的数据分别生成一组 60　keV 和 74　keV 的单能量数据，进行组内对比。**结果**　28 例 60keV 单能量成像观察组肺动脉、肺静脉及肺结节全部清晰显示，利用融合成像技术能明确展示三者的关系。对照组有 7 例不能完整显示远端供血及回流血管与肺结节的联系，另外 21 例虽能显示三者关系，但远端血管结构显示清晰度均不及 60keV 单能量成像观察组，通过 CT 值、信噪比(signal　noise　ratio，SNR)的客观评价和主观评分，观察组 60　keV 和对照组比较，及观察组内的 60　keV 和 74　keV 比较，差异均具有统计学意义（P<0.05）。**结论**　能谱 CT 60　keV 单能量成像在肺动脉、肺静脉与肺结节融合成像中效果优于常规 CT 扫描。
【关键词】肺动脉；肺静脉；肺结节；能谱 CT；融合成像

Comparison of Delayed Contrast-Enhanced MR Imaging to 18F- fluorodeoxyglucose PET/CT in the Assessment of Takayasu's Arteritis with Pulmonary Artery Involvement

Xiaojuan Guo,Mingxi Liu,Zhanhong Ma,Minfu Yang,Yuanhua Yang,Juanni Gong,Tao Jiang
Beijing Chaoyang Affiliated Hospital of Captial Medical University

Purpose
The purpose of this study was to compare delayed contrast-enhanced magnetic resonance imaging (DE-MRI) to ^{18}F-fluorodeoxyglucose positron emission tomography－computed tomography (^{18}F-FDG PET/CT) in the assessment of Takayasu’s arteritis (TAK) with pulmonary artery involvement.
Methods
Nineteen TAK with pulmonary artery involvement were recruited into a prospective, observational study. All patients underwent both thoracic DE-MRI with a 3D IR Turbo FLASH and whole-body ^{18}F-FDG PET/CT within one week. Only thoracic arteries were evaluated and divided into 15 segments per person. MRI features (DE, stenosis,

occlusion and aneurismal dilatation) were visually evaluated, and vascular ^{18}F-FDG uptake > liver uptake was considered PET-positive. In a per-segment analysis, the relationships between the ^{18}F-FDG activity and arterial features on MRI were evaluated. In a per-patient analysis, the relationships between the imaging data and clinical index and NIH criteria for active TAK were evaluated.

Results

Of 285 arterial segments in 19 patients, there was a 60% agreement (171/285; k = 0.20) between DE-MRI and ^{18}F-FDG PET/CT. Of 114 arterial segments with incosistent results, DE-MRIs demonstrated disease in more arterial segments than ^{18}F-FDG PET/CT (144 versus 58). There were statistical significances between the consistently negative group, the consistently positive group and the inconsistent group (F:87.40,P<0.001)). There were no significant differences in stenosis (x^2 =0.613, P=0.433), occlusions (x^2 =0.420, P=0.517) and aneurismal dilatation (x^2 =1.224, P=0.269) between the consistent group and the inconsistent group. The positive ratio per patient in ^{18}F-FDG PET CT and in DE-MRI were not correlated with systemic inflammation or NIH criteria. Using NIH criteria, the sensitivity and specificity of DE-MRI and ^{18}F-FDG PET CT in detecting disease activity were 100%, 44%, 80% and 100% respectively.

Conclusions

Although there is much complexity in evaluating disease activity in PTA by image methods, DE-MRI with 3D IR Turbo FLASH sequence and ^{18}F-FDG PET CT provide unique and complementary information in the assessment of patients with PTA. Overall, DE-MRI scans are better suited to assess disease activity than ^{18}F-FDG PET CT in PTA patients. In addition, arterial morphological changes are not a factor in judging PTA activity.

OR-387

Global and regional biventricular strain in idiopathic inflammatory myopathy: a cardiac MRI study

Lu Huang,Peijun Zhao,Liming Xia
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: Subclinical cardiac involvement in idiopathic inflammatory myopathy (IIM) is difficult to detect by conventional imaging. Myocardial strain has proved more sensitive in identifying subtle heart dysfunction than conventional function parameter, i.e. ejection fraction (EF). The aim of this study was to investigate if global and regional biventricular strain, measured by cardiac MRI, can reveal subclinical remodeling in IIM patient without overt cardiac symptoms.

Materials and Methods: Fifty consecutive IIM patients (age 43±16, 70% F) without overt cardiac symptoms, and 20 age-(38±12) and sex- (70% F) matched healthy controls were enrolled in the study. All subjects underwent cardiac MRI examination on a 3.0T MR scanner. Four-chamber and short-axis steady state free precession (SSFP) cine were performed to evaluate the cardiac function and myocardial strain. Biventricular volume, mass, and EF were computed from the cine images. Global circumferential strain (GCS) and global longitudinal strain (GLS) were computed by the deformable image registration approach. Regional strain was differentiated at the left ventricular free

wall (LVFW), septal wall (SW) and right ventricular free wall (RVFW), in three sections: base, mid, and apex.

Results: Compared to the controls, biventricular volume, mass, and ejection fraction showed no significant difference in IIM (P >0.05 for all). LV GLS, RV GLS and RV GCS both reduced significantly in IIM (-13±5% vs. -16±4%, P=0.005; -10±5% vs. -15±3%, P<0.001; -10±7% vs. -15±4%, P=0.001, respectively), while LV GCS had no significant changes (P=0.452). In regional strain analysis, when compared to controls, RVFW basal LS and mid CS had significant impairment (P=0.01 and P=0.01). RVFW apical LS and CS reduced in the IIM group (P=0.036 and P=0.002). SW mid LS decreased significantly (P=0.009).

Conclusion: While LV/RV EF remained unchanged, the biventricular myocardial strain showed significant changes in IIM, indicating subclinical cardiac involvement. In particular, regional strain analysis showed that RV impairment is more pronounced in IIM compared to LV.

Intracardiac Flow during Early and Late Left Ventricular Filling in Adolescent Volunteer: Quantitative Characterization Using 4D Flow MRI

Liwei Hu[1,2], Yumin Zhong[1], Francois Christopher J[2]
1. Shanghai Children's Medical Center
2. Radiology, Wisconsin-Madison, USA

Background: Left ventricular(LV) intracardiac flow has been suggested to critically contribute to efficient blood pumping function. However, there are no standards for the evaluation of intracardiac blood flow. Recent improvement of the measurement on the velocity accuracy at the peak mitral inflow in 4D flow CMR analysis made it possible to establish the quantitative criteria of intracardiac blood flow. **Purpose:** The aim of the study is to assess quantitative method of intracardiac blood flow including flow component, vortex formation time, valve circularity index and index vortex size using 4D flow MRI in adolescent volunteer. **Methods:***Subjects*: 4D flow CMR data from adolescent volunteer (15 years, Male) were retrospectively identified from studies performed. The volunteer had normal blood pressure and were free of cardiovascular disease. This case-control study was approved by our institutional review board and research images was performed after signed informed consent. *CMR analysis*: CMR analysis was performed with commercially available software (Cvi42, Circle Cardiovascular Imaging, Canada). The EDV, ESV, EF and SV of the LV were determined from short-axis cine images. The mitral valve is defined as the inflow slice and the aorta is defined as the outflow slice by three-chamber cine images, its ability to track mitral valve plane motion. The flow component was calculated by different flow pattern including direct flow, delayed ejection flow, retained in flow and residual volume (Figure 1). The trans-mitral valve velocities and time to peak of E-wave and A-wave were determined from the 4D flow CMR data. The orientation of the mitral valve and the ring shape were quantified by the circularity index (CI). We defined the ratio between the valve's short to long as circularity index (Figure 2). :

where, : with the diameter of the mitral valve(D) calculated as the mean of maximum distance between the leaflet tips during the rapid filling phase, perpendicular to the flow direction, in the three-chamber view, and the distance between the commissures on a short-axis slice through the mitral valve (Figure 2). The E-wave volume (EWV) was defined as the difference in volumes of the LV at the end of the E-wave and ESV. The E/A was defined the ratio between the velocity of early phase diastole and late phase diastole. The vortex size was defined the diameter of clockwise vortex in the left ventricle center at the end of diastole phase. We use 4D flow images to measure vortex diameter by using MATLAB Laplacian filtered (Figure 3). **Results:** The results of flow components were highly related with ejection fraction (Direct Flow + Delayed Ejection Flow=Ejection fraction) . The value of vortex formation time and E/A ratio were in normal range compared with echocardiography (Figure 5). The CI of peak early filling mitral valve was lower than the peak late filling, it appeared like a circular (1.28 < 1.5).

Conclusion: The study provides quantitative characterization by 4D flow MRI which may allow early quantitative evaluation of intracardiac flow in patients with cardiac disease.

主动脉瓣关闭不全患者心脏磁共振成像特征及其发生心肌纤维化的影响因素分析

郑育聪,赵世华
中国医学科学院阜外医院

[摘要]目的 探讨主动脉瓣关闭不全(AI)患者心脏磁共振成像（CMR）的特征，并通过 CMR 判断此类患者心肌纤维化发生的情况，并在此基础上分析 AI 患者发生心肌纤维化的影响因素。**方法** 回顾性分析 2011 年至 2015 年在阜外医院经影像资料确诊为慢性 AI 患者 59 例，入选者均接受了心脏磁共振和经胸超声心动图检查。根据是否合并 BAV 将入选者分为 BAV 组和非 BAV 组，以手术病理为金标准判断患者是否合并 BAV；通过临床门诊及住院电子资料收集入选者的一般资料。采用 kappa 检验评估 TTE 和 CMR 检测 AI 反流程度的一致性；多因素 logistic 回归分析评估 AI 患者发生心肌纤维化的影响因素。**结果** BAV 组患者 LVEF 低于非 BAV 组，而 LVEDVi、LVESVi 和 LGE 比例均高于非 BAV 组（*P* 均＜0.05）。强化组患者合并 BAV 共 19 例，其中 L-R 型 10 例（52.6%）、R-N 型 5 例（26.3%）、L-N 型 4 例（21.1%）；强化组患者 LVEF 和 BSA 均低于非强化组，而 LVEDVi、LVESVi 和 LVMi 均高于非强化组，合并 BAV 的比例高于非强化组（*P* 均＜0.05）。BAV 组患者中 AI 反流程度Ⅱ级及以上者占比明显高于非 BAV 组（*P*=0.015）。CMR 与 TTE 对 AI 严重程度分级评价的符合率为 81.4%（48/59），*Kappa* 值为 0.624，95%*CI* 0.402~0.831，*P*＜0.001，提示二者一致性较好。多因素 logistic 回归分析结果显示，在调整了年龄、LVEF 等因素后，BAV 仍是 AI 患者发生心肌纤维化的独立影响因素（*OR*=5.050，95%*CI*=1.220~20.908，*P*=0.025）。**结论** 多参数无创 CMR 能检测 AI 患者发生心肌纤维化、心室重构的程度，BAV 是 AI 患者发生心肌纤维化的独立影响因素。

目的 基于冠状动脉 CTA 图像，探讨冠状动脉周围脂肪组织直方图参数在鉴别急性冠脉综合征及稳定性冠心病中的价值。
方法 回顾性分析 93 例行冠状动脉 CTA 检查患者的临床资料及 CTA 图像。其中 39 例为急性冠脉综合征患者，54 例为稳定性冠心病患者。在狭窄冠脉周围勾画感兴趣区（ROI），取 CT 值范围为[-30HU]~[-190HU]以剔除非脂肪组织。测量剔除非脂肪后的 ROI 的 CT 值，行直方图分析，所获参数包括平均值、中位数和第 5、10、45、55、70、95 百分位数。比较两组之间的直方图参数的差异，随后基于 ROC 分析，评价各参数鉴别急性冠脉综合征和稳定性冠心病的价值。
结果 急性冠脉综合征组与稳定性冠心病组间平均值、中位数和第 5、10、45、55、70、95 百分位数差异有统计学意义（*P*均＜0.05）。其中中位数的 ROC 曲线有最高的 AUC 值 0.73。通过多元逻辑回归构建的诊断模型的灵敏度为 82.1%，特异度为 89.1%，曲线下面积为 0.9。
结论 冠周脂肪直方图分析在鉴别急性冠脉综合征和稳定性冠心病具有较高价值。

Application of coronary CT in Primary prevention of coronary heart disease during patients with Dyslipidemia

Xuechun Guan
First Affiliated Hospital of Guangxi Medical University

Abstract ***Purpose*** To investigate the role of coronary CT artery imaging in Primary Prevention of Coronary Heart Disease(CHD) in Patients with Dyslipidemia. ***Materials and Methods*** Eighty-seven patients (66 males and 21 females, mean age 61.5 ± 13.18 years)with dyslipidemia and no typical angina symptoms underwent 64-slice CT coronary imaging examination. All cases were grouped into High-risk (n=28), intermediate-risk (n=27) and low-risk (n=32) according to Chinese adult dyslipidemia Prevention Guide about Adult dyslipidemia risk stratification scheme. Observation of coronary plaque and its vulnerability and ratings, then blood Lipid risk stratification. Total cholesterol(TCh), low density lipoprotein(LDL) and plaque score values between Pearson correlation analysis; comparison between the three groups of plaque score differences. ***Results*** In patients with dyslipidemia, LDL and TCh value and the risk of coronary atherosclerotic plaques was no significant correlation (r = 0.049,0.004, P = 0.591,0.967); while dyslipidemia risk stratification and coronary plaque risks associated (r = 0.67, P = 0.000). Scores among the three groups of patients was statistically significant (F = 34.150 P = 0.000), the difference between the each two groups was also statistically significant (P<0.01). ***Conclusion*** According to Chinese adult dyslipidemia prevention guidelines in primary prevention of CHD, coronary CT

screening should be the first choice for the group of patients with intermediate-risk and should be the focus for the high-risk group patients within blood lipid risk stratification.

Tearing Pattern of aortic dissection in descending aorta: A quantitative study

Lei Zhao, Aishi Liu
the Affiliated Hospital of Inner Mongolia Medical University

Background: The tearing pattern of intimal tear in descending aorta may be regular.
Objective: The purpose of this study was to quantitatively analyze the distribution of intimal tear in descending aortic dissection by refering to the relative position of vertebral count, in order to clarify the tearing pattern of intramural separation.
Material and Methods: Sixty-five patients with aortic dissection were enrolled and underwent Aorta CT angiography in this retrospective study (median age: 54 years, 49 males and 16 females). The data acquisition planes were located by the vertebral counts on the midsagittal images. Axial images of vertebral counts order were used for true lumen clock direction (TLCD) calculating. The area and attenuation of true and false lumen were measured. The nonlinear least squares method as the main statistical method was used for curve fitting. P values<0.05 were considered as significant.
Results: TLCDs of different vertebrae counts for both type A and B dissections were no differences (all $P>0.05$). TLCD curves for type A and B were regression parabol. The cubic equations were $y=8.256+0.124x-0.028x^2+0.01x^3$ and $y=7.890+0.194x-0.021x^2+0.0002x^3$ for type A and B, respectively. The ROC curves showed that the area under curve of absolute area, relative area and average attenuation were 0.846, 0.950 and 0.525, P values were <0.001, <0.001 and 0.092, respectively.
Conclusions: The intimal tear in descending aorta in Stanford type A and B dissections rotated spirally in a clockwise, counterclockwise and clockwise order. The true and false lumen could be accurately distinguished by the relative area.

OR-393

CT morphological index provides incremental value to machine learning based CT-FFR for predicting hemodynamically significant coronary stenosis.

Mengmeng Yu
Shanghai Jiao Tong University Affiliated Sixth People's Hospital

AIMS: To study the diagnostic performance of the ratio of Duke jeopardy score (DJS) to the minimal lumen diameter (MLD) at coronary computed tomographic angiography (CCTA)

and machine learning based CT-FFR for differentiating functionally significant from insignificant lesions, with reference to fractional flow reserve (FFR). METHODS AND RESULTS: Patients who underwent both coronary CTA and FFR measurement at invasive coronary angiography (ICA) within 2weeks were retrospectively included in our study. CT-FFR, DJS/MLDCT ratio, along with other parameters, including minimal luminal area (MLA), MLD, lesion length (LL), diameter stenosis, area stenosis, plaque burden, and remodeling index of lesions, were recorded. Lesions with FFR </=0.8 were considered to be functionally significant. One hundred and twenty-nine patients with 166 lesions were ultimately included for analysis. The LL, diameter stenosis, area stenosis, plaque burden, DJS and DJS/MLDCT ratio were all significantly longer or larger in the group of FFR</=0.8 (p<0.001 for all), while smaller MLA, MLD and CT-FFR value were also noted (p<0.001 for all). CT-FFR and DJS/MLDCT ratio showed the largest AUC among all single parameters (AUC=0.85 and AUC=0.83, respectively; p<0.001 for both) for diagnosing functionally significant stenosis. Combining CT-FFR and DJS/MLDCT ratio provided incremental value for discrimination between flow-limiting and non-flow-limiting coronary lesions and yielded the best diagnostic performance (accuracy of 83.7%). CONCLUSIONS: The combination of ML-based CT-FFR and DJS/MLDCT allows accurate non-invasive discrimination between flow-limiting and non-flow-limiting coronary lesions.

白塞病累及冠状动脉与大血管所致假性动脉瘤的 CTA 表现

周慷
中国医学科学院北京协和医院

目的 评估 CTA 成像对白塞病所致冠状动脉与大血管假性动脉瘤的诊断效能。 **方法** 回顾性分析 2012 年 1 月至 2015 年 1 月我院单中心因白塞病行全身各部位 CTA 成像患者 48 例，其中 32 例存在全身不同部位的假性动脉瘤。分析 CTA 图像质量；假性动脉瘤部位、瘤颈大小、瘤体深度、瘤内附壁血栓、载瘤动脉受累情况。**结果** 32 例假性动脉瘤患者 CTA 图像质量均为优，其中 8 例为冠状动脉动脉瘤、7 例为四肢动脉动脉瘤、3 例为肺动脉动脉瘤、12 例为内脏动脉动脉瘤、2 例为头颈动脉动脉瘤。80%的动脉瘤内有附壁血栓形成。平均瘤颈大小 3.2±0.8mm、平均瘤体深 5.3±2.6mm。57%的载瘤动脉受累，表现为血管壁增厚、血管腔狭窄或串珠样改变。**结论** CTA 成像对白塞病所致冠状动脉与大血管假性动脉瘤的诊断具有定性和定量的诊断价值。

Low-kilovolt coronary CTA imaging for low-density plaque, a Dual-Energy coronary CTA examination

jun li,Yonggao Zhang,Jie Liu,Peijie Li
The first affiliated Hospital of Zhengzhou University

Objective: Low-kilovolt (70-90KV) imaging is widely used in the imaging of coronary CTA, and the previous studies focus only on the quality of the image. The quantification of images that can be provided is less, and the definition of low-

density patches (<30 HU) in the coronary artery disease-report and data system (CAD-RADS) is based on the 120KV image, and we use dual-Energy coronary CTA imaging to analyze non-calcified plaques, It is known whether low-density patches will be missed at low KV conditions. Method:15 subjects were prospectively registered. Dual-energy coronary CTA imaging was performed using a third-generation dual-source CT scanner (SOMATOM Force, Siemens Healthcare) at 90/ Sn150kVp. A dual energy image is reconstructed by a linear combination of a)90 and Sn150kVp data, b) a virtual single energy algorithm of 40 to 120 keV (at a 10 keV interval). The CT value of non-calcified plaque under different kev conditions and the attenuation curve of the plaque were measured manually. The results were compared using a linear mixed model that takes into account the correlation of subjects within the plaque. Results: The 40-60 keV image significantly underestimated the low-density plaque (P <0.01), the subjective score of 70-90 keV image was high, but it still underestimated the low-density plaque (P <0.05). Conclusion: Low-kilovolt imaging is likely to miss low-density plaque, and should be paid attention to in clinical diagnosis.

OR-396

Vulnerable Plaques hide in heavily Calcified Coronary arteries

Yan Zhang

1.Department of Radiology, Affiliated Hospital of Guizhou Medical University, Guiyang, PR China. 2.Department of Radiology, Fuwai Hospital, State Key Laboratory of Cardiovascular Disease, National Center for Cardiovascular Diseases, Chinese Academy of Medical Sciences and Peking Union Medical College, #167 Bei-Li-Shi Street, Beijing, 100037;

ABSTRACT

OBJECTIVES: The aim of this study was to assess the accuracy of CCTA plaque patterns *in vivo* to detect vulnerable atherosclerotic lesions in comparison with histopathological findings.

METHODS: Eight heart transplant recipients (8 male; mean age, 48.5±11.6 years; range 37-65 years) underwent CCTA exams prior to heart transplant surgery. Segment-based CCTA sections were independently evaluated for various plaque patterns including non-calcified plaque (NCP) with napkin ring sign (NCP-NRS), NCP without napkin-ring sign (NCP-non-NRS), mixed plaque with diamond-attenuation sign (MP-DAS), MP without DAS sign (MP-non-DAS), and calcified plaque (Ca-plaque).

RESULTS: NCP-NRS plaques in 6.4% (23/358), NCP-non-NRS plaques in 24.0% (86/358), MP-DAS plaques in 18.2% (65/358), MP-non-DAS plaques in 20.1% (72/358), and Ca-plaques in 7.0% (25/358) of all cases. The specificity and positive predictive values of the MP-DAS and NCP-NRS signs to identify vulnerable plaque features were excellent (97.1% vs. 98.6%, 90.8% vs. 87.0%, respectively). DAS plaques were more frequently seen on CCTA exams than that of NRS (39.3% vs. 13.3%, respectively, p=0.001). The diagnostic performance of the plaque-calcification-pattern (PCP) which include both MP and Ca-plaque to identify coronary lesions with vulnerable features was high [area under the curve (AUC), 0.883; 95% CI, 0.845-0.914, p<0.001]. The diagnostic performance of MP-DAS to identify vulnerable coronary lesions was superior compared to NCP-NRS (AUC, 0.756 vs. 0.558, respectively, p<0.001).

CONCLUSIONS: The assessment of PCP improves the diagnostic accuracy of CCTA to identify vulnerable coronary atherosclerotic lesions hiding in heavily calcified coronary arteries. Both the DAS and NRS had a high specificity and positive predictive value for the presence of vulnerable lesions.

OR-397

Feasibility of low-Dose coronary CT angiography with a 16cm Wide-detector dual-energy spectral CT: A prospective randomized controlled study

Haifeng Mi,Qing Zhang
Beijing Tongren Hospital, Capital Medical University

Objective: To validate the feasibility of low-dose coronary CT angiography (CCTA) by using Revolution CT and high concentration iodinated contrast medium.
Methods: 180 patients with suspected coronary heart disease underwent CCTA scans on a 16cm wide-detector dual-energy CT (GE Healthcare). Patients were randomly divided into 3 groups: Group A, tube voltage 100 KV with noise index (NI) 25; Group B, tube voltage 80 KV with NI 25; and Group C, tube voltage 80 KV with NI 30. The total volume of contrast medium injected was set as 60 ml with a flow rate of 5ml/s, and the contrast medium for Group A, B and C were Iohexol 350, Iohexol 350, and IOM 400，respectively. The total effective radiation dose (ED) during CCTA period were recorded. The subjective image quality of CCTA was assessed by two experienced radiologists using a 4-point ranking scale. CT values and SD values of starting point of the ascending aorta, the left main trunk, the left anterior descending branch, the left circumflex branch and the right coronary artery were measured to evaluate the objective image quality of CCTA. The corresponding image quality and ED among 3 groups were compared for statistical analysis.
Results: There was no significant difference in age (33-83 years old) and body mass index (BMI, 15.6~29.7kg/m^2) ($P>0.05$)among 3 groups.Significant differences in ED of CCTA were obtained among 3 groups (1.31±0.48 mSv，1.10±0.30 mSv，and 0.76±0.18 mSv, respectively) ($P<0.05$). No significant differences were found in subjective image quality of CCTA among 3 groups ($P>0.05$). ED of group B was 37.78% lower than that of group A, and ED of group C was 10.36% lower than that of group B.
For objective image quality comparison, significant differences of signal-to-noise ratio of the starting point of the ascending aorta (AA) left main trunk (LM) were observed between group A and B and group A and C ($P<0.05$), significant differences of signal-to-noise ratio of the starting point of the right coronary artery (RCA) were also observed between group A and C ($P<0.05$), and no significant differences of signal-to-noise ratio of the starting point of AA, LM, RCA, the left anterior descending branch (LAD) , the left circumflex branch (LCX) were found among B and C groups.
Significant differences of contrast-to－noise ratio of the starting point of AA and LM and RCA were observed between group A and B and group A and C ($P<0.05$), Significant difference of contrast-to－noise ratio of the starting point of LCX were found among between A and B groups. Significant differences of contrast-to－noise ratio of the

starting point of LAD were observed among 3 groups. however no other significant difference were observed between group B and C (P>0.05).
Conclusion: The new 16cm wide-detector dual-energy CT enables low-dose CCTA. This study demonstrates that it is feasible to achieve further dose reduction of 13.8% by using IOM 400 as a routine injection protocol while still maintaining satisfactory image quality.
Clinical significance: The Low-dose CCTA simplifies the workflow, and using IOM 400 may reduce the dose to a level similar to the routine CCTA, promoting the clinical application on a large scale.

OR-398

clinical significance of coronary CT angiography myocardial flow index (CCTA-MFI) in diagnosis of ischemic calcified plaque.

Qingfeng Xiong,Xiaojing Ma
Wuhan Asia Heart Hospital

Objective To evaluate the clinical significance of coronary CT angiography myocardial flow index (CCTA-MFI) in diagnosis of ischemic calcified plaque. **Methods** 570 patients with suspected coronary artery disease (CAD) were collected from February, 2018 to December, 2018. The GRACE hospital mortality risk score was low. Heart rate, blood pressure were measured three times at intervals of 10 minutes. At the same time, BMI was calculated. Then the CCTA protocol was performed. 182 high-quality images were enrolled with obvious calcified plaque in the proximal and middle segments of coronary artery.
Left ventricular myocardial mass was calculated by post-processing software. Contrast agent tracing technique was used to calculate the cycling time, and the CCTA-MFI was completed. There were 94 patients who underwent invasive coronary angiography within 1 week after CCTA. Using ICA as the gold standard (stenosis degree > 70%), the stenosis of CCTA with a value of > 50% or CCTA-MFI with less than twice the standard deviation of average was used to predict coronary artery disease (ICA, stenosis degree > 70%). The ROC curves of CCTA and CCTA-MFI were analyzed. Chi-square test was used for nonparametric data, $P < 0.05$ showed significant statistical difference. **Results** Among 94 patients, 50 were males and 44 were females (mean age 63.3 ± 9.31 yrs). 53 (56.38%, 53/94) were diagnosed by ICA with the degree of stenosis of more than 70%. Twice the standard deviation of CCTA-MFI was 0.088. The correlation coefficients of CCTA and CCTA-MFI to ICA are -0.4351 and 0.4854, and the cutoff values are 50% and 0.097, respectively. The stenosis degree with CCTA was above 50% in 83 cases. 58 were less than 0.097 of CCTA-MFI. The sensitivity and specificity of CCTA and CCTA-MFI in evaluating CAD were 98.31%, 28.57% and 81.54%, 82.76%, respectively. The positive predictive value and negative predictive value were 69.88%, 90.91% and 91.38%, 66.67%, respectively. The accuracy was 72.34%, 81.91% respectively (χ^2 =2.429, P = 0.1191). The area under ROC curve was 0.5000, 0.732 (Z = 2.367, P = 0.0179). Of the 94 patients, 26 (49.06%) underwent successfully percutaneous coronary intervention, 2 (3.77%) underwent coronary artery bypass grafting, and the symptoms of angina pectoris were

significantly alleviated. 25 (47.17%) underwent the best drug conservative treatment with stable condition. 41 cases received primary prevention of coronary heart disease.
Conclusion CCTA-MFI can significantly improve the diagnostic accuracy of CCTA for coronary artery calcified plaques. It may be necessary to receive active clinical intervention for the patient with an obviously calcifying coronary artery and a reducing CCTA-MFI.

OR-399

New Indicators that Impact the Outcome of TEVAR in Complicated Type B Aortic Dissection

Shuo Zhao, Ximing Wang, Hui Gu, Baojin Chen, Xinxin Yu, Yan Gao, Xiao Cui, Fanfan Cai
Shandong Provincial Hospital， Shandong University

Background: Few studies have evaluated the influence of morphological parameters obtained by dynamic CT angiography (CTA) on outcomes after thoracic endovascular aortic repair (TEVAR). Thus, we investigated the predictive roles of dynamic variables on TEVAR outcomes in patients with complicated type B aortic dissection (*cTBAD) and* the effect of TEVAR timing on prognosis.
Methods: Seventy-nine patients with cTBAD who underwent TEVAR from July 2009 to March 2018 were retrospectively enrolled. *Patients were classified into three groups by the length of time between symptom onset and TEVAR* (hyperacute: <2 days; acute: 2-14 days; subacute: 14-90 days). Dynamic morphological variables obtained by multiphase imaging were reviewed , and endpoints included early (≤30 days) and late (>30 days) outcomes after intervention.
Results: The highest mortality (13.9%, 11/79) and adverse event (24.1%, 19/79) rates occurred within 30 days after the procedure in the total cohort. Survival and event-free rates were significantly worse for TEVAR performed during the hyperacute phase than during the acute and subacute phases (all p<0.001). The time of relative true lumen area (r-TLA) <25% in one cardiac cycle (p=0.049) and differences between the maximum and minimum r-TLA (D-TLA) (p<0.001) were associated with increased early death. D-TLA (p=0.006) and TEVAR performed in the hyperacute phase (p=0.006) strongly predicted early mortality. Survival during long-term follow-up was worse for the D-TLA >21.5% group than for the D-TLA ≤21.5% group (p<0.001).
Conclusion: A larger D-TLA is associated with worse postoperative survival, and the time window associated with the worst TEVAR outcomes may be the hyperacute phase.

Remission of “Mistletoe sign” after treatment

Xiao Xu[1,2], Wei Bai[1], Heng Ma[1,2,3], Peng Dong[2], Haizhu Xie[1], Yinghong Shi[1], Chunjuan Sun[1], Jun Yang[1]
1.Yuhuangding Hospital， Qingdao University School of Medicine
2.Weifang Medical University
3.Binzhou Medical University

We are the first to describe a 55-year-old man in whom first manifestation of retroperitoneal fibrosis (RPF) was only coronary arterial involvement, which have no periaortic or peri-iliac and urinary system retroperitoneum involvement in general and other systemic clinically manifestations. On images, the coronary manifestation was termed the “mistletoe sign.” Recent reports have shown that to some extent, that cases of idiopathic retroperitoneal fibrosis (IRPF) included immunoglobulin G4-related retroperitoneal fibrosis (IgG4-related RPF). MU et al. described a young woman in whom first manifestation of IRPF was coronary arterial involvement. Horvat et al. reported a 69-year-old woman presented with symptoms of presumed cardiac involvement of IRPF with a normal IgG4 level, and CT images demonstrated a confluent, irregularly shaped, retroperitoneal soft-tissue mass growing around the aorta and the common iliac arteries, obstructing both ureters. Yamakaw et al. demonstrated a case, which the first description of remission of retroperitoneal mass in a patient with IgG4-related RPF.We here in report a case of remission of IgG4-related RPF that was only coronary arterial involvement after treatment.

校正的管腔内密度变化对冠状动脉支架内再狭窄的诊断价值

方正,陈林丽
重庆医科大学附属第二医院

目的 以侵入性冠状动脉造影（ICA）为参照标准，评价校正的冠状动脉管腔内密度变化（CCO）与冠状动脉 CT 血管成像（CCTA）在诊断冠状动脉支架内再狭窄（ISR）中的价值。
资料与方法 回顾性分析 2015 年 1 月至 2017 年 10 月重庆医科大学附属第二医院有 CCTA 和 ICA 结果的冠状动脉支架置入术后的 86 例患者，136 支血管，以 ICA 结果将支架狭窄程度分为通畅组、狭窄组和闭塞组。计算支架近远端 CCO，和 CCTA 目测法评价 ISR。计算 CCO、CCTA 和 CCO+CCTA 诊断 ISR 的敏感度、特异度和受试者工作特征（ROC）曲线下面积。
结果 通畅组 76 支，狭窄组 38 支，闭塞组 22 支，3 组的 CCO 分别是 0.222±0.083、0.317±0.085 和 0.485±0.097，差异均有统计学意义（P<0.01）。CCO、CCTA 和 CCO+CCTA 诊断 ISR 的 ROC 曲线下面积分别为 0.859、0.811 和 0.882，CCTA 与 CCO+CCTA 比较，差异有统计学意义（P=0.001）；诊断支架闭塞的 ROC 曲线下面积分别为 0.947、0.842 和 0.972，其中 CCTA 与 CCO+CCTA 比较，差异有统计学意义（P=0.006）。
结论 CCO 随支架狭窄程度增加而增高；CCO+CCTA 显著提高了 CCTA 对 ISR 的诊断准确性。

Feasibility of epicardial fat measurement for the prediction of metabolic syndrome using screening low-dose chest CT

Zhiran Liang,Zhipeng Gao,Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

Objective: To explore the feasibility of epicardial fat measurement for the prediction of metabolic syndrome (MetS) in lung cancer screening patients using low-dose chest CT.
Methods: 120 asymptomatic male lung cancer screening subjects who underwent chest nonelectrocardiography (ECG)-gated low-dose CT were randomly divided into two groups, the analysis group (Group A, N=67) and the validation group (Group B, N=53). They were further divided into 2 subgroups according to whether they have MetS or not (non-MetS), respectively. The semiautomatic quantification of epicardial fat volume (EFV) and epicardial fat area (EFA) were calculated by post-processing software. Intraclass correlation coefficient was used to test the consistency of inter- and intra-observer EFV and EFA measurements. Comparisons of measurement data between the two groups were conducted by independent sample t test, and Chi-square test was used for the comparison of counting data. The diagnostic performance of EFV and EFA were compared by the area under ROC curve. Youden index was used to calculate the best predictive values of EFV and EFA, and the sensitivity, specificity, accuracy, positive predictive value (PPV) and negative predictive value (NPV) were all calculated.
Results: There were significant differences in both EFV and EFA between the MetS and non-MetS subgroups in group A (P<0.001). The AUC of EFV was significantly larger than that of EFA (0.912 and 0.807 respectively, P<0.05). With a cutoff value of 93.67 and 4.91 for EFV and EFA respectively, the sensitivity, specificity, accuracy, PPV and NPV for the prediction of MetS were 85.1% and 84.7%, 93.2% and 65.1%, 91.2% and 69.8%, 81.2% and 45.1%, 95.2% and 92.1%, respectively. The cutoff values of EFV and EFA in group A have a good diagnostic performance in group B, and there was no significant difference in the cutoff values and diagnostic performance between the two groups.
Conclusion: The quantification measurement of epicardial fat is feasible for the prediction of MetS using chest low-dose CT, and EFV may have a higher and better diagnostic performance than EFA.

心脏磁共振组织追踪技术评价急性心肌炎 左室整体心肌应变的应用价值

陈海霞,鲁宏
重庆市第七人民医院

目的 应用心脏磁共振组织追踪技术评价急性心肌炎左室整体心肌应变及其与左室射血分数和延迟强化节段数的相关性。
方法 收集 2016 年 1 月至 2018 年 8 月期间在我院住院并临床诊治为 ACM 为病例组 35 例，选取性别与年龄相符的健康志愿者为对照组 27 例；将病例组根据 CMR 影像特征分为阳性组 21 例、阴性组 14 例。所有研究对象接受心脏磁共振检查。用 Argus 后处理软件测量左室心功能参数；CVI42 软件测量左室整体心肌应变参数。按照美国心脏协会左心室心肌 17 节段划分方法，观察左心室心肌出现延迟强化的节段及数目；收集病例组临床和 CMR 影像特征。两组间定量资料比较用 t 检验或非参数检验。运用受试者操作特征曲线分析两组间存在差异的参数，左室整体心肌应变与 LVEF 和 LGE 节段数的相关性分析采用 Spearman 相关；分析左室整体心肌应变在观察者间及观察者内的一致性。
结果 病例组与对照组比较，病例组 GRSP、GLSP、GCSP 明显减小，差异均具有统计学意义（$P<0.05$）。CMR 阴性的 ACM 与对照组比较，GRSP、GCSP 明显减小，差异具有统计学意义（$P<$

0.05）。相关性分析：病例组 GRSP、GLSP、GCSP 与 LVEF 呈较强相关，病例组 GRSP、GLSP、GCSP 与 LGE 节段数呈较强相关。左室整体心肌应变对 ACM，尤其是 CMR 阴性的 ACM 有一定的预测价值。左室整体心肌应变在观察者间及观察者内均具有较好的一致性。

结论 （1）ACM 患者 LGE 多位于左室侧壁，其次是间壁，主要为心外膜下延迟强化。（2）心脏磁共振组织追踪技术能定量评估 ACM 左室整体心肌应变；与 LVEF 相比，左室整体心肌应变能早期发现心肌功能受损；且与 LVEF、LGE 节段数有较强的相关性，可成为评估心功能的新参数。（3）左室整体心肌应变对 ACM，尤其是 CMR 阴性的 ACM 有一定的预测价值；可为临床及时诊断、治疗，改善预后提供影像依据。

Association B-type natriuretic peptide (BNP) of and Dialysis Vintage with CMRI- derived cardiac indices in Stable hemodialysis patients with Preserved Left Ventricular Ejection Fraction

Xiaoyu Han,Heshui Shi
Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, China

Background: Cardiovascular disease (CVD) is a major cause of morbidity and mortality in (HD) patients. Native T1/T2 mapping and tissue-tracking strain analysis by cardiac magnetic resonance imaging (CMRI) are proved to be useful as early quantitative techniques for evaluating myocardial tissue and mechanical alterations in HD patients. We aim to assess the left ventricular myocardial native T1/T2 values and systolic strains and the associations with B-type natriuretic peptide (BNP) and dialysis vintage in HD patients with a preserved left ventricular ejection fraction (LVEF).

Methods: Forty-three stable HD patients (mean age: 59±11 years; 28 males)with end-stage renal disease but a preserved LVEF (≥50%) and 28 healthy volunteers (mean age: 61±7 years; 14 males)matched for sex, age, and body mass index. The native T1/T2 values of the left ventricular myocardium were measured on the T1 and T2 maps. The left ventricular global systolic strain was evaluated on routine cine images using prototype postprocessing software. BNP was measured at the time of CMR measurements.

Results: Compared with controls, the global native T1 and T2 values were significantly higher in the HD patients than in the controls (native T1: 1056±32 ms vs. 1006±25 ms, $p<0.001$; T2: 50±3 ms vs. 46±2 ms, $p<0.001$). The mean peak global circumferential strain (GCS) and global longitudinal strain (GLS) were both significantly reduced in the HD patients compared with the controls (GCS: -13±3 vs. -16±3, $p<0.001$; GLS: -12±4 vs. -15±3, $p=0.001$). However, no significant difference was found between two groups regarding LVEF(61±8 vs 64±8, $p=0.057$). In HD patients, a significant positive correlation was found between T2 value and BNP levels ($r=0.402, p<0.001$).The GLS was independently correlated with the dialysis vintage in HD patients (standardized $\beta=-0.321$, $p=0.044$).

Conclusion: The HD patients with preserved LVEF have increased native T1/T2 value and decreased strain, with T2 values relates to high BNP. GLS may be improved in long-term HD patients.

CT 动态负荷心肌灌注检查相对心肌血流量参数对冠状动脉粥样硬化性疾病心肌缺血的诊断价值

徐橙,易妍,吴伟,金征宇,王怡宁
中国医学科学院北京协和医院

目的
探讨 CT 动态负荷心肌灌注检查诊断冠心病心肌缺血的最佳相对心肌血流量（MBF）参数。
方法
前瞻性入组 86 例有临床症状的冠心病患者，所有患者均在第三代双源 CT 上接受 ATP 负荷动态心肌灌注检查。将重建图像传至西门子数据后处理工作站(Syngo.via VB10)上进行初步分析。心肌灌注节段依据美国心脏学会（AHA）的 17 节段标准，每一节段对应相应的冠状动脉供血区。在心内膜下心肌血流量牛眼图上以冠状动脉供血分布为依据，感兴趣区域勾画在不同供血区内的灌注缺损区域，获得半自动 MBF 值。相对 MBF 比值定义为半自动绝对 MBF 值除以参考 MBF 值。根据参考 MBF 值不同，定义三种相对 MBF 值。比值 1：参考 MBF 值为所有节段 MBF 的平均值；比值 2：参考 MBF 值为所有节段中最大 MBF 值的 75%；比值 3：参考 MBF 值为所有节段中最大 MBF 值。金标准为冠脉造影时测量的 FFR 值。
结果
86 例进行 CT 心肌灌注检查的患者中有 60 例患者（男性 43，女性 17）进行了冠脉造影检查并测量 FFR 值，共计 151 支血管。以所有节段中最大 MBF 值为参照的相对比值 3 诊断缺血效能最高。曲线下面积为 0.906（95% CI: 0.857-0.954），比值 1 和比值 2 的曲线下面积分别为 0.879 及 0.906，差异有统计学意义。比值 3 的敏感性、特异性、阳性预测值、阴性预测值、诊断准确率分别为 74.1%、93.6%、87.8%、85.3%、86.1%。
结论
以所有节段中最大 MBF 值为参照计算出的心内膜下心肌相对 MBF 比值诊断冠心病心肌缺血的效果最佳。

磁共振组织跟踪技术评价心肌淀粉样变性与其他左心室肥厚疾病的左室应变

郭杨钰,曾牧,谭利华,刘军,姜孟春,谢幸芷,邓淇予
中南大学湘雅二医院

目的 探讨心脏磁共振组织追踪技术(CMR-TT)定量评估心肌淀粉样变(CA)与其他左室肥厚疾病的心肌收缩功能及鉴别诊断价值。 **方法** 对 30 例 CA、30 例肥厚型心肌病（HCM）、29 例高血压所致左室肥厚（HLVH）及 30 例对照组（CON）行 CMR 检查，并使用 CVI42 后处理软件得到整体和各水平（基底部、中间部、心尖部）的 3D 左室径向应变(RS)、周向应变(CS)、纵向应变(LS)，计算左室心尖相对纵向应变比值（RSSR）及基底-心尖的纵向应变梯度差，并制作 ROC 曲线。 **结果** （1）CA 组、HCM 组、HLVH 组整体及各水平 RS、CS、LS 大多低于正常对照组（$P<0.05$）。（2）CA 组基底段 RS、CS、LS 均低于其他三组（$P<0.05$），中间及心尖部部分应变参数差异无统计学意义。（3）四组中基底到心尖的 LS 均是递增的，CA 组最为显著。RSSR 诊断 CA 及鉴别 CA 与 HCM、HLVH

准确度高（AUC=0.873,0.837,0.773，P<0.05）。RSSR 在＞0.7525 时，对于诊断 CA 的敏感度及特异度分别为 83.3%和 93.3%；用 RSSR 鉴别 CA 和 HCM、CA 和分别在＞0.7686 及＞0.828 时敏感度及特异度为：CA vs HCM: 83.3%和 90%；CA vs HLVH: 70%和 79.3%；基底-心尖的纵向应变梯度差在诊断 CA、鉴别 CA 与 HCM、HLVH 的准确度相对低:AUC=0.692，0.688，0.752，P<0.05。 **结论** CMR-TT 可以定量评价 CA 和其他左室肥厚疾病左室心肌收缩功能，且 RSSR 可作为鉴别 CA 较为实用的方法。

Comparison of the T1 values of three T1 mapping sequences in native, stress and post-contrast conditions of myocardium

Hui Zhou[1,2],Valentina Puntmann[2],Eike Nagel[2]
1.Department of Radiology, Xiangya Hospital, Central South University, Changsha, China
2.Institute for Experimental and Translational Cardiovascular Imaging, Goethe University Hospital Frankfurt, Germany

Purpose;
To compare the native, stress and post-contrast T1 values obtained from different sequences for T1 mapping of the myocardium.
Materials and Methods;
We compared three T1 mapping sequences (FFM, MPI and LONG/SHORT) of 211 consecutive populations (patients and healthy volunteers) using conservative septal technique as the standardized approach. We calculated ventricular septum and related blood T1 in vivo through subsequent parametric mapping. We also analyzed the T1 differences of these sequences in native, stress and post-contrast conditions.
Results;
T1 values differed significantly depending on the sequence, with MPI providing consistently higher mean values than FFM (1310±62 ms vs. 1150±63 ms in native condition, 1327±63 ± 28 ms vs. 1153±61 ms in stress condition and 604±65 ms vs. 588±64 ms in post-contrast condition, mid-ventricular, respectively; p < 0.001), LONG providing higher and SHORT providing lower mean values than FFM (1075±109 ms vs. 1042±80 ms in native condition, 519±77 ms vs. 535±68 ms in post-contrast condition, mid-ventricular, respectively; p < 0.001) . T1 values also differed significantly depending on the stress, with stress FFM and MPI providing higher mean values than the native (1147±69 ms vs. 1135±63 ms, 1327±63 ms vs. 1302±57 ms, mid-ventricular, respectively; p < 0.001). On Passing-Bablok regression analysis, MPI is significantly correlated with FFM in native, stress and post-contrast (r=0.501, 0.450, 0.871, respectively; p < 0.001). FFM is significantly correlated with LONG, SHORT in mid-ventricular segment (r=0.805, 0.966, respectively; p < 0.001). On Bland-Altman analysis, the mean difference (95% limits of agreement) between MPI and FFM in native, stress and post-contrast is 160.1ms(48.8ms-271.4), 173.8ms(46.1ms-301.6ms), 16.8ms(42.4ms-75.9ms), respectively. The mean difference (95% limits of agreement) between FFM and LONG, SHORT in mid-ventricular segment is 32.3ms(-79.3ms-144.0), -17.2ms(-58.3ms-23.9ms), respectively.
Conclusion.

FFM and MPI showed good agreement with MPI values are much higher than FFM. FFM and LONG/SHORT showed good agreement with LONG values are higher than FFM and SHORT values are lower than FFM. Stress increase the T1 values of myocardium in FFM and MPI.
CLINICAL RELEVANCE/APPLICATION
T1 values differed significantly depending on the sequence and therefore it is necessary to respectively establish the T1 normal reference range according to different sequences.

扩张型心肌病左室游离壁心肌延迟强化表型的初步研究

李睿[2,1],赵世华[2]
1.川北医学院附属医院
2.中国医学科学院阜外医院

【目的】探讨扩张型心肌病（Dilated Myocardiopathy, DCM）左室游离壁心肌延迟强化（Late Gadolinium enhancement, LGE）的不同表型，为进一步分析其组织学特征及病因学提供影像学依据。
【方法】回顾性分析中国医学科学院阜外医院 2018 年 1 月-12 月符合纳入标准及排除标准、且冠状动脉造影或冠脉 CTA 结果阴性的连续性 DCM 患者 134 例。所有纳入者均行 3.0 T CMR 检查，分析患者 LGE 的发生部位、左室心肌游离壁 LGE 类型、累及范围及分布特征。
【结果】134 例患者中，LGE 阴性占 30 例，单独室间隔强化占 44 例，单独游离壁强化占 3 例，室间隔和游离壁多发强化占 57 例。与 LGE 阴性患者相比，室间隔和游离壁多发强化患者 LVEF 减低，LVEDD、LVEDVi、LVESVi 明显升高。60 例游离壁强化患者中，37 例表现为单一强化；23 例合并两种强化方式。其中透壁强化 21 例，心外膜下强化 19 例，心内膜下强化 9 例，心室肌壁间强化 30 例，斑片状强化 4 例。心外膜强化患者累及心肌节段最多（6.32±3.65），其次为透壁性强化（3.81±1.83）及肌壁间强化（3.57±2.60）。心外膜强化最常累及广泛侧壁（73.6%）和心中间层及心尖区的前壁（71.1%）及下壁（52.6%），透壁性强化最常累及左室基底段和心中间层的侧壁

（67.9%）及下壁（38.1%），肌壁间强化最常累及基底段和心中间层的前壁（61.7 %）及下壁（50 %）。
【结论】DCM 患者左室心肌游离壁不同 LGE 表型的分布、累及范围存在明显的差异，准确识别各种 LGE 表型有助于进一步判断患者的组织学及病因学，为精准治疗提供影像学依据。

Clinical application of dark blood late gadolinium enhancement imaging in patients with myocardial infarction: a study using a 3T MR scanner

Sainan Cheng[1,2], Shihua Zhao[1], Keshan Ji[1], Yang Fan[1]
1. Fuwai Hospital
2. Cancer Hospital Chinese Academy of Medical Sciences
3. General Electric Company

Objectives: The objective of this study is to evaluate the clinical usefulness of the segmented TRAMINER dark-blood late gadolinium enhancement (DB-LGE) technique in myocardial infarction (MI) patients on a 3.0 T MR scanner.
Methods: LGE imaging with both dark-blood or traditional bright-blood techniques were prospectively performed in fifty-nine MI patients using a 3.0 T MR scanner. Subjective (four-point grading scale) and objective (contrast-to-noise ratio) assessments of contrast among MI, blood and normal myocardium were performed. Results: There was no significant difference in subjective overall image quality ratings between two readers (p=0.162). Both of the visual and objective assessments showed that MI-blood contrast of DB-LGE technique was superior to bright blood-LGE, but MI-normal myocardium contrast and normal myocardium-blood contrast were inferior to bright blood-LGE ($p<0.05$). There was no significant difference in LGE extent and patterns between two techniques ($p>0.05$). DB-LGE technique detected four more papillary muscle enhancement, while bright blood-LGE technique detected five more midwall enhancement patterns, one more mural thrombus and three more microvascular obstructions.
Conclusions: Segmented TRAMINER DB-LGE on a 3.0 T MR scanner provides superior signal contrast between MI and blood pool and may thus act as an complementary technique to conventional bright blood-LGE. But DB-LGE should not be considered as replacement for bright blood LGE as for its limitations. Attention should be paid when assessing microvascular obstructions, mural thrombus or midwall enhancement on DB-LGE images.

OR-411

A comparative study of left and right ventricular myocardial strain in hypertensive heart disease by MR tissue tracking technique

Mengyao Hu, Sisi Yu, Jingyang Wen, Tian Zheng, Lianggeng Gong
The Second Affiliated Hospital of Nanchang University

Objective: To explore the differences and elucidate the effect of hypertension Of left and right ventricular strain and remodeling in patients with hypertensive heart disease (HHD) by MR tissue tracking technique.

Methods:36 HHD patients and 20 healthy volunteers were grouped according to left ventricular ejection fraction (LVEF≥50%,LVEF<50%), left ventricular diameter(LVD)[whether LVD was enlarged (female LVD > 54mm, male LVD > 59mm)divided to centripetal or centrifugal remodeling group] and atrium area(atrial area > 24 cm^2:the bilateral atrium was normal, only the left atrium was enlarged,the bilateral atrium was enlarged), respectively.

Results: Overall 36 HHD patients were finally analyzed,the global radial, circumferential and longitudinal peak strain(GPSR,GPSC,GPSL) of left and right ventricles were lower than those in normal group and with the decrease of ejection fraction,all showed decreasing trends (P<0.05).Left ventricular concentric remodeling changed to acentric remodeling, LPSR 25.23±6.85vs.11.37±4.03,LPSC-12.71±3.82vs.-6.94±3.08,and RPSR 21.06±5.06vs.11.02±4.80, RPSC-9.89±2.96vs.-4.55±2.13, RPSL-16.11±4.71vs.-9.98±3.80,(P<0.05,respectively).From normal biatrium, only left atrium enlargement to biatrial enlargement, LPSR27.20±6.80vs.22.19±6.60,10.58±4.56;LPSC-13.53±4.86vs.-10.85±2.84,-7.13±1.53(P<0.05) and RPSR 23.38±5.33vs.17.43±4.71, 11.04±3.59;RPSC -11.30±4.07vs.-7.54±3.17,-4.78±1.75(P<0.05).ROC curve showed that GPSL has the best diagnostic effect.The cut-off values were - 13.43% and - 16.74%, respectively,with a sensitivity of 89% and 82%, a specificity of 90% and 89%(AUC = 0.90 and 0.86, respectively).

Conclusions:HHD not only affects the left ventricle, but also contributes to right ventricular remodeling. There are differences in left and right ventricular remodeling and synergy in the evolution process. The degree of bilateral ventricular remodeling can be determined from the perspectives of ejection fraction retention, left ventricular configuration and atrial involvement. MR myocardial strain quantification, as a sensitive index of functional remodeling, especially longitudinal strain, can provide earlier and more accurate information for ventricular remodeling in HHD.

OR-412

Identifying early stages of doxorubicin-induced cardiotoxicity in rat model using 7.0 tesla cardiac magnetic resonance and creatine kinase isoenzymes

Shiyu Wang,Fabao Gao,Lei Wang
West China Hospital of Sichuan University

Objectives:the aim of this study is to identify early stages of doxorubicin (DOX)-induced cardiotoxicity in rat model using 7.0 tesla cardiac magnetic resonance (CMR) combining creatine kinase isoenzymes (CKMB).

Methods: Twenty rats included. Twelve of these rats were injected DOX (2.5mg/kg) through vena caudalis weekly and were divided into four group. First group received DOX four weeks and underwent CMR examination after 4 weeks. The other groups received DOX six weeks and underwent CMR examination after 6, 8, 10 weeks, respectively. Two rats injected physiological saline (2.5ml/kg) also performed CMR examination at the same time of each experimental group. Thus, controls contained eight rats. All these rats were sacrificed after CMR examination and were collected venous blood to detect CKMB.End-diastolic volume indexed to body surface area (EDVi) , end-systolic volume indexed to body surface area (ESVi) , stroke volume indexed to body surface area (SVi) and ejection fraction (EF) for LV were quantified from all CMR images. Global radial (GRS), circumferential (GCS) and longitudinal strain (GLS) parameters of LV were also obtained by CMR tissue tracking (CMR-TT). All these parameters above were compared between treatment groups and controls.
Results: The earliest DOX-induced cardiotoxicity CMR parameter was GCS(-18.68±0.88 vs -22.44±0.53, p=0.010) decreasing at week 6, at this time, the other CMR parameters were unaffected. However, ESVi was increased and EF and SVi were declined at week 8 and week 10 (2 and 4 weeks after final DOX treatment), as well as GCS and GRS. For CKMB, it was significantly increased at week 4 (976.00±166.55U/L vs 399.00±16.97U/L). At this early time point, all CMR parameters were not affected. CKMB continued to rise at week 6 and week 8, however it had no significantly difference between treatment groups and controls at week 10 (387.67±57.88 vs 374.50±53.03, p=0.814).
Conclusion: CKMB, as a sensitive marker, can detect DOX-induced cardiotoxicity at the earliest time. Decreased GCS during treatment identifies impaired LV mechanic as an early marker of DOX-induced cardiotoxicity, in the absence of EF. CKMB can reverse after DOX treatment, although the impairment of LV mechanic and function still existed. CKMB and CMR-TT are an effective method to evaluateDOX-induced cardiotoxicity at early stage.

OR-413
Native T1-mapping 联合定量评估儿童杜氏肌营养不良患者心肌损伤及大腿肌肉脂肪替代

徐蓉,郭应坤,许华燕,刘慧
四川大学华西第二医院

目的 通过磁共振 native T1mapping 定量评估儿童杜氏肌营养不良（DMD）患者心脏及腿部肌肉的脂肪-纤维化，并探讨心肌损伤与肌肉脂肪替代程度的相关性。
材料与方法 纳入 2018 年 3 月-2019 年 2 月经基因检测或肌肉活检确诊为 DMD 的患者 75 名（平均年龄：8.9 岁，均为男性）。所有患儿进行心脏及臀部/大腿肌肉扫描。心脏图像包括电影序列及 native T1mapping，大腿/臀部扫描包括 T1WI、T2WI 及 mapping 序列。心脏后处理分析使用后处理软件进行心功能及 Native T1 值的分析（心基底部、中间部及心尖部）。臀部/大腿肌肉分别在 native T1mapping 和 T1WI 序列相匹配的图像上选取不同程度脂肪替代的肌肉勾画感兴趣区（包括臀部肌肉、股外侧肌、大部分收肌群、缝匠肌、阔筋膜张肌、大收肌及股薄肌），记录 T1 值以及 T1WI 图像信号值量并对脂肪替代程度进行分级（0-4 级）。首先通过独立样本 T 检验对比不同程度脂肪替代的肌肉的 T1WI 信号值以及 T1 值，随后将 T1 值与 T1WI 上信号值以及心肌和臀部/大腿肌肉脂肪替代程度进行相关性分析。

结果 患者主要受累的肌肉从 1 级到 4 级 T1WI 上信号值逐渐增高，且差距有统计学意义 *(P<0.05)*；从 1 级到 4 级 T1mapping 图像上定量测量 T1 值逐渐减少 *(P<0.05)*。通过相关分析显示，T1WI 信号值与 T1ms 呈负相关(r=-0.65)，T1ms 与脂肪替代呈负相关(r=-0.73)。臀大肌、阔筋膜张肌、股直肌、缝匠肌及闭孔肌 Native T1 值与心肌 Native T1 值存在一定相关性（R：0.29-0.36，P＜0.05）

结论 Native T1mapping 技术能定量评估儿童 DMD 患者的心肌及臀部/大腿脂肪替代情况，有助于更准确的分级；其次，心脏损伤可能与肌肉病变存在联系，对早期评估疾病累及程度具有更重要的意义。

Comparative study of diagnostic value of STIR and SPAIR technology combined with T2WI black blood technique in myocardial edema

Guofei Zeng,Hua Yang
Chongqing Traditional Chinese Medicine Hospital

Objective To analysis SPAIR and STIR technology in the advantages and disadvantages of cardiac magnetic resonance imaging in the evaluation of myocardial edema.**Methods** Retrospective analysis of 34 patients with viral myocarditis cardiac magnetic resonance image characteristics, all of the patients in myocardial parameter scan using STIR technology and SPAIR technology combined with left ventricular T2WI sequences of black blood. Scores by naked eye and CNR value measurement, according to the rhythm of the cardiac group, the application of repetitive measure analysis of variance and simple effect analysis in statistics.

Results For patients with regular rate, the image quality of SPAIR was better than that of STIR,The difference between simple effect analysis is positive, $p < 0.05$. In the detection of arrhythmia in short axis, naked eye observation showed that the score of STIR was higher than that of SPAIR, but there was no difference in long axis. The score of STIR in CNR evaluation of long axis and short axis was lower than that of SPAIR technology,The difference between simple effect analysis is positive, $p < 0.05$.
Conclusion For patients suspected of myocardial edema, in order to obtain a clear and satisfactory T2 WI suppression of fat sequence in left ventricular myocardium, SPAIR scan should be preferred, and STIR technique can be used as a supplement.

Sub-aortic Complex is Associated With Left Ventricular Outflow Tract Obstruction in Hypertrophic Cardiomyopathy: A New Parameter Predicts LVOT Obstruction

Zixian Chen[1],Chen Cui[2],Gang Yin[2],Junqiang Lei[1],Shunlin Guo[1],Shihua Zhao[2],Minjie Lu[2]
1.Department of Radiology，First Hospital of Lanzhou University
2.Department of Magnetic Resonance Imaging， Cardiovascular Imaging and Intervention Center， State Key Laboratory of Cardiovascular Disease，Fuwai Hospital， National Center for Cardiovascular Diseases， Chinese Academy of Medical Sciences and Peking Union Medical College， Beijing， 100037，People’s Republic of China

Purpose
To investigate athe sub-aortic complex, a new cardiac magnetic resonance CMR derived parameter, for the detection and grading of left ventricular outflow tract (LVOT) obstruction in hypertrophic cardiomyopathy (HCM) patients, compared with conventional parameters.
Methods
This is an observational retrospective study of 157 consecutive patients with HCM who underwent CMR between April 2017 and January 2018. The “sub-aortic complex(SAC)” parameters including D1, D2 and D3 were measured on the LV 3-chamber steady-state free precession (SSFP) cine imaging at the end-systolic phase. HCM patients were divided into subgroups based on maximal anterobasal septal thickness≤18mm and SAC parameters.
Results
Among HCM patients, conventional CMR parameters such as LVOT diameter, anterior mitral valve leaflet (AMVL) length and SAC were significantly different between obstructive (n=87) and non-obstructive (n=70) group. Pearson correlation analysis demonstrated that these newly parameters were correlated with the conventional parameters like AMVL length and LVOT diameter. Of all the CMR parameters, ROC analysis identified that D3, defined as LVOT effective width, was able to discriminate the obstructive and non-obstructive patients with the best predictive accuracy (AUC=0.946) compared to LVOT diameter (AUC=0.773) and AMVL length (AUC=0.767). And the index defined as D3/AAD ratio was the best indicator for identifying LVOT obstruction patients. A cutoff value of D3/ aortic annular diameter (AAD) of 0.49 yielded a sensitivity and specificity of 89.66% and

90.00% respectively in detection of obstruction. Further Pearson correlation analysis demonstrated significant inverse relationship between D3 (r^2=0.623, p<0.001), D3/AAD (r^2=0.512, p<0.001) and the resting LVOT pressure gradient.

Conclusion

The SAC is an accurate, effective, reproducible and relatively simplistic parameter, which can detect and severity of LVOT obstruction in patients with HCM.

MRI-FT 早期监测合并或不合并高血压 T2DM 患者的左房和双室心肌应力改变

邵国柱,史河水
华中科技大学同济医学院附属协和医院

目的 是通过 CMR 特征跟踪（CMR-FT）评价 2 型糖尿病（T2DM）合并或不合并高血压患者早期左心房（LA）、左心室(LV)和右心室(RV)心肌应变及其与临床指标间存在的潜在关系。**方法** 将 50 例糖尿病患者按是否高血压分为两组。单纯糖尿病 27 例（组 1），糖尿病合并高血压 23 例（组 2）。31 名年龄、性别和体重指数相匹配的志愿者作为对照组（组 3）。结果: 三组间的左心室心肌应力值无显著差异。组 2 的 LA 周向应变（GCS）明显高于组 3（ECC:27.2±2.1% VS 33.5±2.4%，P<0.05）。组 1 的 LA 心内膜整体周向（GCS）、径向（GRS）和纵向应变（GLS）显著低于组 3（GCS:27.2±2.1% VS 33.5±2.4%；GRS:28.6±1.1% VS -31.9±1.3%；GLS:24.3±1.3% VS 31.4±1.5，P<0.05）。组 2 LAGCS、LAGRS 和 LAGSL 显著高于组 1（GCS:40.4±3.8% VS 27.2±2.1%；GRS:36.8±2.0% VS -28.6±1.1%；GLS:32.3±2.4% VS 24.3±1.3%，P<0.05）。组 1 和组 2 的 RV 心内膜纵向应（RVGLS）显著低于组 3（-21.4±1.2% VS -26.3±1.1%、-21.4±1.4% VS -26.3±1.1%；P<0.05）。此外，LAGCS 与微量白蛋白尿（MA）水平呈显著负相关，并且 LAGLS 与糖化血红蛋白之间也呈负相关。LA 心内膜应力的改善可能与应用利尿剂治疗有关。**结论** 早期糖尿病心肌病对左室心肌应力无明显变化，但左房和右室心内膜应力有明显影响，左房心内膜应力应力异常早于左室心肌应力异常。高血压对左房和双室心肌应力有不同的影响。MA 和糖血红蛋水平的降低,分别与 LAGCS 和 LAGLS 增加有关。利尿剂能够明显改善 LA 心内膜应力。

Value of CT features for predicting EGFR mutations and positive ALK expression in patients with lung adenocarcinoma: a retrospective analysis of 827 patients

Xiaoyu Han,Heshui Shi
Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, China

Objectives: The associations between CT features and epidermal growth factor receptor (EGFR) mutations, anaplastic lymphoma kinase (ALK) status and lung adenocarcinoma are conflicting. The aim of this retrospective study was to identify the relationships of EGFR mutations and ALK status with CT characteristics in adenocarcinoma using the largest patient cohort to date. **Materials and Methods:** Preoperative chest CT findings were retrospectively evaluated in 827 surgically

resected lung adenocarcinomas. All patients were tested for EGFR mutations and ALK status and underwent chest CT prior to treatment. **Results:** EGFR mutations (EGFR+) were found in 489 (59.1%) patients, and ALK rearrangements (ALK+) were found in 57 (7.0%) patients. EGFR+ status was more common in females ($p<0.001$), those who had never smoked ($p<0.001$), tumors with lepidic predominant subtypes ($p<0.001$) and less lymph node metastasis ($p=0.006$), smaller tumors ($p<0.001$), peripheral lesions ($p=0.035$), tumors that presented with ground-glass opacity (GGO) ($p<0.001$), air bronchograms ($p<0.001$), pleural retraction ($p<0.001$), pleural thickening ($p=0.024$) and a well-defined margin ($p=0.022$) and those without lymphadenopathy ($p=0.001$). The most important and significant independent prognostic factors of EGFR+ for the model with both clinical and CT features were having never smoked and tumors with GGO, air bronchograms and pleural retraction. ALK+ status was found more frequently in younger patients ($p<0.001$) and was associated with solid tumors ($p=0.009$) and lesions without air bronchograms ($p<0.001$) and distant metastasis ($p<0.001$). The absence of air bronchograms was only independent predictor of ALK+. The receiver operating characteristic (ROC) curve yielded area under the curve (AUC) values of 0.758 and 0.739 for clinical and CT features, respectively, for the prediction of EGFR+ status and ALK+. **Conclusion:** Clinical and CT features can be used to predict EGFR mutation status and ALK rearrangements in lung adenocarcinoma patients.

后纵隔髓外造血组织增生的影像诊断并文献复习

付靓
广西中医药大学第一附属医院

目的 探讨后纵隔髓外造血组织增生（EMH）的 CT、MRI 影像特征。方法 回顾分析我院经病理证实的 25 例后纵隔 EMH 患者的临床资料、病理检查及 CT、MRI 表现并结合文献对其病理、影像特征分析讨论。 结果 本组后纵隔 EMH 病例 CT 和 MRI 扫描多表现为双侧胸椎旁多发或单发结节状软组织肿块，肿块边缘光滑，密度均匀，CT 增强扫描表现明显强化或轻中度强化；MRI 上多呈等 T1 信号和等长 T2 信号，增强后多呈明显均匀强化。 结论 后纵隔髓外造血组织增生（EMH）的 CT、MRI 表现有一定的影像特征，可以结合临床病史及影像学特点进行正确鉴别诊断。

Assessment of the relationship between the coronary venous and arterial systems using 256-slice computed romography

Wei Bai[1], Xiao Xu[2], Heng Ma[1,2,3], Haizhu Xie [1,3], Chunjuan Sun[1], Yinghong Shi[1], Kaili Che [1], Meijie Liu[3]
1. Yuhuangding Hospital, Qingdao University School of Medicine, Yantai, Shandong Province, China.
2. Weifang Medical University, Weifang, Shandong Province, China.
3. Binzhou Medical University, Yantai, Shandong Province, China.

Objectives: To investigate the coronary venous system (CVS) and its spatial relationship with coronary arteries by using 256-slice computed tomography (CT).
Materials and Methods: 101 patients underwent coronary CT angiography by using a 256-slice CT. In each patient, the coronary venous system and its spatial relationship with coronary arteries were analyzed. We measured the diameters and angulations of the coronary sinus (CS), great cardiac vein (GCV), anterior interventricular vein (AIV), left marginal vein (LMV), posterior vein of the left ventricle (PVLV) and posterior interventricular vein (PIV), and the distances respectively from the CS ostium and from the crossing point to the ostium of corresponding tributaries.
Results: The following five pairs of veins and arteries had a higher frequency of intersecting compared with others: the CS/GCV and the left circumflex coronary artery (LCX) (97.1%), the AIV and the diagonal or ramus branch (92.1%), the PIV and the posterior branch of left ventricle artery (LPA) (88.1%), the LMV and the circumflex or circumflex marginal (73.9%), and the PVLV and the circumflex or circumflex marginal (31.6%). The other two pairs had a higher frequency of running parallel to each other: the AIV and the anterior descending artery (LAD) (76.2%) and the PIV and the posterior descending artery (PDA) (54.4%). Most tributaries were lateral to their corresponding arteries at the crossing point except for the AIV. For the PVLV and PIV, the distances from the crossing point to the ostium of corresponding veins when the veins were lateral to the arteries were smaller than that when the veins were medial to the arteries ($P<0.05$).
Conclusion: The CVS and its tributaries, and the spatial relationship between the coronary venous and arterial systems were examined with details by using a 256-slice CT. The anatomical relationship between the coronary venous and arterial systems is variable in location and proximity. Invasive procedures performed on the coronary venous system, such as cardiac resynchronization therapy, radiofrequency catheter ablation, percutaneous in situ coronary artery bypass and percutaneous in situ coronary venous arterialization, should be done with knowledge of the potential risks of injuries to the coronary arteries and awareness of anatomical variations.

基于 CT 征象的线列图模型预测纯磨玻璃结节样浸润性肺腺癌的临床研究

邱太春[1],伍建林[2],明兵[1]
1.德阳市人民医院
2.大连大学附属中山医院

目的 回顾性分析经手术病理证实的肺纯磨玻璃结节（pGGN）CT 征象，利用二元 logistic 回归分析筛选确定浸润性肺腺癌的独立危险因素，并利用独立危险因素构建线列图模型，通过采用组内与组间数据来验证模型的预测效能。
方法 回顾性分析收集 2015 年 1 月至 2018 年 6 月间本地区两家三甲医院经手术病理证实的肺 pGGN 患者 300 例，按照 3:2 的比例随机分为模型训练组（180 例）和模型验证组（120 例），记录分析患者的一般临床信息以及 pGGN 的各种 CT 征象。利用二元 logistic 回归分析及 R 软件（rms 软件包）建立线列图模型，并采用校正曲线验证模型预测效能。

结果 在模型训练组中，浸润前病变与浸润性肺腺癌患者在病灶的大小（0.74±0.23cm vs 1.22±0.53cm，P=0.000，<0.05），平均 CT 值（-611.71±99.38HU vs -578.65±93.83HU，P=0.028，<0.05），病灶的形状（P=0.000，<0.05），边缘（P=0.000，<0.05），异常空气支气管征（P=0.000，<0.05），空泡/空腔（P=0.029，<0.05）以及病灶与血管之间的关系（P=0.000，<0.05）方面的差异均具有统计学意义。经过二元 logistic 回归分析结果显示，pGGN 病灶的大小（OR=76.96，95%CI：11.540-513.286，P=0.000）、平均 CT 值（OR=1.006，95%CI：1.002-1.011，P=0.005）是预测表现为 pGGN 样浸润性肺腺癌的独立危险因素。其组内、组间校正曲线 C-指数分别为 0.841、0.836。

结论 基于 pGGN 病灶的大小和平均 CT 值构建的线列图模型在预测表现为 pGGN 样肺腺癌的恶性浸润程度方面，具有很好的诊断效能，具有良好的临床应用前景。

Effect of multi-model iterative reconstruction technique on imaging quality of low-dose GE revolution CT in early lung cancer

Xi Li
Beijing Shijitan Hospital, Capitial Medical University

Objective: To investigate the effect of multi-model iterative reconstruction technique on imaging quality of low-dose GE revolution CT in early lung cancer.
Methods: 240 patients with early lung cancer were collected for observation. All patients underwent low-dose GE revolution CT imaging, and the images were reconstructed by multi-model iterative reconstruction technique. The image quality of lung window, mediastinal window and image quality parameters before and after image reconstruction were compared.
Results: Compared with low-dose GE revolution CT images, the image quality of lung window and mediastinal window reconstructed by multi-model iterative reconstruction technique was improved with reduced image noise and increased signal-to-noise ratio (SNR) with statistical differences (all P < 0.05), while there's no statistical difference in the CT value (P>0.05).
Conclusion: Multi-model iterative reconstruction technique can improve the imaging quality of low-dose GE revolution CT for early lung cancer, and it has important clinical value for screening early lung cancer.

18F-FDG PET/CT 代谢参数预测非小细胞肺癌患者 EGFR 基因突变的诊断价值

姜阳,王云华,董楚宁,李娴
中南大学湘雅二医院 PET-CT 中心

目的 通过系统性回顾和 meta 分析，探讨 ^{18}F-FDG PET/CT 代谢参数对非小细胞肺癌患者 EGFR 基因突变的诊断价值。

方法 检索 PubMed、Embase 和 Cochrance Library 数据库，时间截止至 2019 年 4 月 20 日，评价 ^{18}F-FDG PET/CT 代谢参数对 NSCLC 患者 EGFR 基因突变的诊断价值。
结果 12 项研究共计 1913 例 NSCLC 患者被纳入，所有患者均完善 ^{18}F FDG PET/CT 检查和 EGFR 基因检测。结果显示 ^{18}F-FDG PET/CT 代谢参数诊断 EGFR 基因突变的合并敏感度为 0.65(*95%CI*: 0.59－0.70)且无异质性(I^2 = 43.98, p = 0.05)；合并特异度为 0.64(*95%CI*: 0.58－0.69)且异质性较小(I^2 = 57.39, p = 0.01)；合并的阳性似然比和阴性似然比分别为 1.80(*95%CI*: 0.58－0.69)和 0.55(*95%CI*: 0.48－0.64)；分层汇总受试者工作特征曲线（SROC），曲线下面积（AUC）为 0.69(*95%CI*: 0.65－0.73)。
结论 ^{18}F-FDG PET/CT 代谢参数是预测 NSCLC 患者 EGFR 基因突变的潜在生物标记物，但未来仍需通过多参数、多特征联合以进一步提升诊断效能。

肺外支气管源性囊肿的影像诊断与误诊分析

陈光文,李杭,钱蓉
四川省人民医院

目的 探讨发生在肺外的（纵隔型和异位型）支气管囊肿的影像表现特征，分析导致误诊的原因。**方法** 回顾性分析 66 例经手术病理证实、发生在肺外的支气管囊肿的 CT、MRI 资料。35 例行 CT 增强扫描，28 例行 CT 平扫，3 例行 MRI 平扫。总结影像表现特点，并寻找导致误诊的原因。**结果** 纵隔型 54 例，分别为前纵隔 27 例、中纵隔 11 例、后纵隔 16 例；异位型 12 例，分别为颈部 5 例、胸壁 1 例、腹部 6 例。纵隔型中，3cm 以下 29 例，3cm 及以上 25 例；49 例为圆形或椭圆形，2 例锥形、3 例不规则形；7 例为液性密度，44 例为软组织密度，2 例呈 T1 低 T2 高信号、1 例双高信号；8 例伴有钙化。异位型中，3cm 以下 4 例，3cm 及以上 8 例；圆形或椭圆形 9 例，锥形、葫芦形和不规则形各 1 例；3 例为液性密度，9 例为软组织密度，3 例伴有钙化。纵隔型中，8 例被诊断为支气管囊肿，分别为前纵隔 1 例、中纵隔 4 例、后纵隔 3 例，其余被误诊为心包囊肿 2 例、神经鞘囊肿 1 例、胸腺瘤 20 例、淋巴结肿大 5 例、神经源性肿瘤 12 例、平滑肌瘤 3 例和炎性假瘤、硬化性血管瘤各 1 例。异位型全部被误诊，包括神经源性肿瘤 6 例、淋巴管囊肿 3 例和甲状舌骨囊肿、甲状腺囊肿、间质瘤各 1 例。**结论** 。发生在肺外的支气管囊肿发生部位、影像表现不典型，影像诊断误诊率高。影像学检查能够显示病变的发生部位及形态学改变，确诊依赖于病理。

The value of myocardial strain in heart transplant (HT) patients with normal LVEF

xuehue shen,Yating Yuan,Ming Yang,Bo Liang
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: Over the decades, many papers[1,2]on myocardial strain reported that abnormal myocardial strain was associated with higher risks of adverse cardiovascular events in patients with cardiovascular diseases with normal LVEF. Nowadays there has few researches about myocardial strain in HT patients. Our aim is to investigate whether myocardial strain has difference between the HT patients and the controls with normal LVEF.

Method: Between September 2018 and July 2019, 72 HT patients were referred for CMR scan at our Hospital. The exclusion criteria included reduced LVEF (<50%), significant coronary artery stenosis, severe rejection, severe renal insufficiency. 20 controls were recruited in this study. All these subjects underwent standard CMR examinations with a 1.5T scanner (Aera, Siemens, Germany). A balanced steady-state free procession (bSSFP) sequence was performed to acquire LV long-axis cine(2-, 3-, 4-chamber) and a stack of short-axis cines. The LV epi- and endocardial borders, RV endocardial borders were traced manually from short-axis slices. Global longitudinal strain (GLS), global circumferential strain (GCS) and global radial strain (GRS) were from four-chamber long-axis view and short-axis views, RVLS was from right ventricular free wall. These parameters were based on DRA (TrufiStrain, version 2.0, Siemens Healthcare).
Result: RVEF in HT patients was smaller (47.8±7.5 vs. 52.1±3.4, p=0.01) than controls while LVEF had no significant differences (LVEF: 66.0 ± 6.8 vs. 62.1±5.3, p=0.07). Significant difference were found in the LVGLS (-10.8±2.3 vs. -14.9±1.6; P<0.001) and LVGCS (-13.7±3.8 vs. -16.9±2.2; P=0.001) while RVLS (-14.7±3.4 vs. -16.2±2.3; P=0.1) and LVGRS (32.8±9.3 vs. 36.8±8.7; P=0.1) had no significant difference, time to peak of all myocardial strain were smaller (P<0.05 for all) in two groups. AUC of the ROC for LVGLS was 0.93, the cutoff value was -12.58% and sensitivity and specificity were 75.9%, 100%. AUC of the ROC for LVGCS was 0.82, the cutoff value was -15.98% and sensitivity and specificity were 80.7%, 71.4%.
Conclusion: LVGLS and LVGCS allowed discrimination between HT patients and control when with normal LVEF. This indicated that myocardial strain may be sensitive biomarker for the early deformation change of the ventricular wall in HT patients.

胸腺瘤瘤周结节 CT 定量特征预测其侵袭性价值研究

郭炜
北京大学第三医院

目的 探讨胸腺瘤瘤周结节 CT 定量特征预测其侵袭性的价值。**方法** 回顾性分析 2013 年 3 月至 2018 年 10 月北京大学第三医院具有完整临床、影像及手术病理资料的 110 例胸腺瘤（男性 65 例，女性 45 例，中位年龄 45 岁）。根据胸腺瘤 2004 年 WHO 标准，按侵袭性程度分为高危组(男性 23 例，女性 15 例，中位年龄 52 岁)与低危组（男性 42 例，女性 30 例，中位年龄 42 岁）。分析胸腺瘤瘤周结节的长径、双期增强 CT 值、 ΔCT 值及与主瘤体距离。有预测价值的 CT 定量参数及阈值通过 Mann-Whitney U 检验和受试者特征曲线(ROC)分析和确定。**结果** 110 例胸腺瘤中，28 例增强 CT 表现有瘤周结节，B1 型 12 例，B2 型 7 例，B3 型 6 例，C 型 3 例，A 型及 AB 型中未发现瘤周结节。瘤周结节出现在高危组 16 例，低危组 12 例。高危组瘤周结节长径、双期增强 CT 值、ΔCT 值及与主瘤体距离分别为(9.8±3.7)mm、(48.5±27.2)Hu、(51.4±21.0)Hu、(16.7±10.1)Hu 及 6.3±6.5mm；低危组瘤周结节长径、双期增强 CT 值、ΔCT 值及与主瘤体距离分别为(5.5±1.6)mm、(54.6±18.4)Hu、(51.7±18.6)Hu、(13.7±10.1)Hu 及(3.9±2.2)mm。低危与高危组比较，瘤周结节的双期强化 CT 值、ΔCT 值及与主瘤距离均无显著差异(P均>0.05)，而高危瘤周结节的长径显著大于低危组(P<0.05)。ROC 曲线分析，以瘤周结节长径为 6.9mm 为阈值，预测胸腺瘤高危，相应的曲线下面积 AUC、敏感度和特异度分别为 0.862、75% 和 75%。**结论** 胸腺瘤瘤周结节长径有助于预测其侵袭性。

OR-427

胸部双能减影成像的临床应用

李明磊
陆军军医大学附属新桥医院放射科

目的 胸部双能减影（dual energysubtraction)在胸部的检查技术和诊断价值。**方法** 从 2016 年 11 月份开始，收集急诊室胸部外伤并送科里检查摄片的病员，从中抽取 1000 例患，利用 DDR 系统设备，进行胸部双能量减影，分别获得标准影像、骨骼影像和软组织影像并且与诊断医师一起分析起胸部外伤情况，并在临床中进一步检验。**结果** ，本组 DDR 标准胸片和能量减影胸片对胸部损伤的诊断比较明确，全肋骨影和肺组织和软组织影像结构都显得十分清楚，满足临床诊断要求。DR 标准胸片可显示骨性胸廓结构和肺纹理，图像质量优良；骨骼影像显示骨性胸廓方面优于标准影像，特别是心影和膈下结构重叠的肋骨；软组织影像在显示肺内病灶方面优于标准影像。1000 例双能量减影胸部摄影检查结果发现，616 例双侧肋骨骨折，320 例单侧肋骨骨折伴液气胸，60 例肋骨骨折伴双上肺结核，4 例肋骨骨折伴左上肺肺癌。**结论** :DR 能量减影胸部摄影可清晰显示肋骨骨折，对胸部外伤有重要诊断价值。

OR-428

左心耳功能 CT 定量评估对心房颤动 射频消融术后复发的预测价值

李彩英,袁迎芳,卓利勇,田伟伟,杨兰,陈琛
河北医科大学第二医院

目的 应用 256 层螺旋 CT 定量评估左心耳功能对房颤射频消融术后复发预测价值，为临床术前选择治疗方案提供依据。

方法 研究纳入 63 例首次进行射频消融术的房颤患者，平均年龄 59.43±10.67 岁，BMI：25.99±3.60kg/m^2，男性 38 例（60.3%），中位随访时间 19（4-24）月，20 例（31.7%）复发。根据房颤射频消融术后有无复发，分为复发组（n=20 例）和未复发组（n=43 例）。所有患者术前均行 256 层螺旋 CT 检查，将原始图像按心动周期从 5%-95%，每间隔 10%重建一个时相，测量并计算整个心动周期中左心耳最大容积（LAAVmax）、左心耳最小容积（LAAVmin）、左心耳排空分数（LAAEF），左心耳排血量（LAAEV），左心房最大容积（LAVmax）、左心房最小容积（LAVmin），左心房排空分数（LAAEF），左心房排血量（LAAEV），将获得的数据运用统计学方法进行处理。

结果 对患者临床资料进行对比，复发组 CHA_2DS_2-VASc 评分高于未复发组外（$P<0.05$）。对左心耳及左心房功能分析，复发组 LAAVmax、LAAVmin、LAVmax、LAVmin 较未复发组增大（$P<0.05$），但复发组 LAAEF、LAEF 较未复发组减小（$P<0.05$）。多因素 Cox 比例风险回归分析显示 LAAEF 是房颤射频消融术后复发的独立预测因子（*HR* :0.790 95%*CI*：0.657-0.950 *P*=0.012）。ROC 曲线分析显示，LAAEF＜44.68%对射频消融术后复发预测价值最高（曲线下面积 0.817），敏感性 90%，特异性 67.4%。

结论 心房颤动射频消融术后复发患者左心耳体积增大，功能减低。LAAEF 是房颤射频消融术后复发的预测因子。

Signed kinetic energy of left Intraventricular blood flow for dilated cardiomyopathy evaluation

Menglu Li,Liuquan Cheng
Chinese PLA General Hospital

Purpose Two-dimensional phase-contrast flow imaging (2D flow) was used to investigate the left intraventricular hemodynamics, and the expression parameters of normal left ventricular blood flow characteristics were explored and optimized. The changes of signed kinetic energy (SKE) in left ventricular blood flow in patients with dilated cardiomyopathy (DCM) were evaluated for its cardiac function analysis.
Materials and Methods Twenty-one healthy volunteers and twenty-five DCM patients were enrolled in the study. The Philips 1.5T Multiva magnetic resonance scanner was used with an 8-channel Torso SENSE coil, electrocardiogram vector (VCG) triggering and respiratory monitoring. After completing the conventional cine imaging using with balanced steady-state fast gradient echo (b-TFE) sequence, double inversion recovery TSE black-blood sequence and late Gd-DTPA enhancement(LGE) examination on DCM patients, 2D-PC flow imaging was performed on the left ventricle short axis at the level of basal, middle-cavity and apical, as well as the left ventricular outflow track. The velocity encoding of the intraventricular flow was preset to 120 cm/s, and the flow direction was vertical imaging plane. Each cardiac cycle was divided into 24 phases. The cine data and blood flow data were post-processed using Segment software to obtain left hemodynamic parameters, including velocity, flow, blood and signed kinetic energy (SKE) as well as left ventricular ejection fraction (LVEF). The accuracy and reproducibility of each blood flow parameter measurement were analyzed, and the blood flow characteristics of the left ventricle were summarized. The changes of SKE in DCM patients were analyzed and proper hemodynamic interpretation was performed.
Results On visual inspection, the left intraventricular flow on normal volunteers showed in-and-out two-way patterns flow during the whole cardiac cycle. The flow curve showed positive and negative blood flow coexisting. This two-way blood flow characteristic gradually weakened toward the apex. Quantitatively, the measurement of blood flow velocity and flow rate was affected by endocardial irregularities and

velocity heterogeneity within the ROI range, and the reproducibility was poor. However, these effects on SKE were less than level of 10^{-3} ,making the SKE repeatability relatively stable. The blood flow velocity, peak flow rate and time-to peak (TTP) have large variation coefficient between individuals. SKE curve was close to 0 at the apex level, there was a gradient difference between the middle and the basal level. The SKE had a consistent systolic TTP of 0.21(0.21, 0.21) RR interval and diastolic TTP of 0.58 (0.54, 0.63) RR interval. For DCM patients, the ventricular volume enlarged and the LVEF significantly reduced. However, the systolic SKE peaks had no significant difference between DCM patients and the normal controls. For diastolic SKE peaks, only SKE peak at the middle cavity decreased significantly although overall values were lower than the normal group. The SKE curve of DCM patients was rather complex. According to the curve shape, synchrony and peak, the curve can be divided into I, II and III to explain the intraventricular hemodynamics of DCM.

Conclusions The intraventricular blood flow is bi-directional. The peak and TTP of SKE can be used as a simple and straightforward index for the hemodynamic characteristics at different levels in the left ventricle. The SKE curve can directly reflect the systolic and diastolic function and explain the pathophysiological mechanism of the heart failure in DCM. The SKE curve is expected to be a new indicator to grading heart failure.

不同设备肺癌筛查低剂量 CT 图像质量标准化的探讨

冉姗姗,綦维维,张淼,张卓璐,陈雷,洪楠
北京大学人民医院

目的 使用不同的 CT 设备进行低剂量肺癌筛查时，探讨使得不同设备的扫描图像质量统一标准化的方法实践。

材料与方法 通过模体实验已设置了图像质量的客观参考标准，即 Catphone500 模体空间分辨率 7 LP/cm，低对比度分辨率 15 mm@supra-slice1.0%，并确定 iCT（Philips）、RCT（GE）及 Sensation（Siemes）在 FBP 算法、自动曝光控制下的扫描参数分别为管电压 100 kV、参考毫安秒 25 mAs，管电压 100 kV、NI 27 HU，管电压 100 kV、参考毫安秒 60 mAs；选取胸部低剂量 CT 筛查的 150 例志愿者，随机分为 A、B、C 三组，分别采用 iCT、RCT、Sensation 设备及上述参数进行扫描。所有扫描图像均采用 FBP 算法进行肺窗及纵隔窗图像的重建。比较 3 组受检者的图像质量及有效剂量。

结果 3 组受检者肺窗及纵隔窗的图像质量间差异均无统计学意义（P 均>0.05）；A、B 组的有效剂量分别为 0.82±0.21、0.76±0.20 mSv，两组间差异无统计学意义（P>0.05），C 组的有效剂量最高，为 1.22±0.27 mSv，且与 A、B 组比较差异存在统计学意义（P 均<0.05）。

结论 设置图像质量的客观参考标准，可以使不同设备的肺癌筛查低剂量 CT 的扫描图像质量统一标准化。

OR-432

原发性肺脑膜瘤的 CT 表现

何青,李仕广
遵义医学院第三附属医院（原:遵义医院）

目的 原发性肺脑膜瘤(Primary Pulmonary meningioma，PPM）又称肺异位脑膜瘤 （Lung ectopic meningioma），是于中枢神经系统以外、原发于肺内的异位脑膜瘤，为肺内极罕见的肿瘤。到目前为止，文献中仅报告了 50 余例 PPM。绝大多数 PPM 无临床症状且生长缓慢，在影像学上常表现为孤立性肺结节，但伴有肺内、胸膜多发转移的原发性肺脑膜瘤尚未见报道。本文报道少见影像表现的 PPM1 例，复习既往文献报道，以提高对 PPM 的认识和诊断水平。
方法 收集 1 例住院患者（女，71 岁，）临床资料、影像资料（X 摄影、CT 检查）及穿刺活检术后组织病理形态学及免疫组化检查资料。
结果 X 线胸部摄影示右侧胸腔积液；胸部 CT 检查示右肺及胸膜见多发软组织密度结节及肿块，最大病灶位于右肺下叶后基底段，大小 5.6cm×6.0cm，边界清楚，平扫 CT 值 39HU，增强扫描动脉期 CT 值为 47HU，静脉期 CT 值为 66HU，右侧胸腔积液。最后行右肺肿块穿刺活检术，术后病理回示原发性肺脑膜瘤。
结论 原发性异位脑膜瘤极为罕见，通常见于头部、颈部皮肤和周围神经，而原发性肺脑膜瘤(PPM)更是非常罕见，由 1982 年 Kemnitz 等人首次报道。多大数 PPM 表现为良性，生长缓慢，之前仅报道了 7 例具有恶性特征的 PPM。PPM 没有临床及放射学特异性，因此需要结合胸部 CT、头颅 MRI、PET-CT、气管镜、经皮肺穿、手术切除、免疫组化等对其进行综合诊断。本文仔细分析该例影像特点，最终认为原发性肺脑膜瘤伴胸膜种植转移可能性大，体现出不同以往的影像表现形式。结合文献报道，以期提高对 PPM 的再认识。

实性肺结节低剂量 CT 影像组学的图像质量控制-体模研究

高志鹏,梁志冉,叶兆祥
天津医科大学肿瘤医院

目的 探讨影像组学在低剂量 CT 扫描条件下实性肺结节 CT 图像质量控制中的应用价值。**方法** 使用 CT750 HD CT 分别在不同管电压及不同管电流下对胸部肺结节人体仿真模型进行扫描，记录不同扫描条件下的容积 CT 剂量指数（$CTDI_{vol}$），测量并计算图像中结节的信噪比（SNR）和对比噪声比（CNR），分析辐射剂量、噪声与管电压管电流变化的规律，将所有扫描数据通过影像组学分析软件对实性结节的全部特征进行提取，使用 R 语言统计学软件对提取的特征参数进行主成分分析，选择贡献率最大的主成分中载荷较大的特征参数进行分析。对确定的重要特征参数进行单因素方差分析，揭示不同管电压下特征参数的差异，再进一步通过事后检验对不同管电压组之间进行两两比较，找出组间差异。**结果** 辐射剂量在研究的范围内随管电压、管电流的增加而线性增加。肺结节的 SNR 和 CNR 总体变化趋势虽然与管电压及管电流的变化呈线性关系，但在低剂量下没有明确的变化趋势阈值存在，无法准确评价低辐射下图像质量。影像组学提取的所有特征参数中 Uniformity、VoxelValueSum 及 HaralickCorrelation 是 3 个主要成分，其方差累计的贡献率为 89.20%且特征值均>1。特征参数 Uniformity 曲线显示出其变化趋势与管电压及管电流变化成相关性，且稳定性和一致性较好。Uniformity 单因素方差分析结果显示在管电压 140 kVp 及 120 kVp 时，Uniformity 无显著差异（P = 0.117），而在其他管电压间 Uniformity 均有明显差异（P = 0.000）。管电压在 100 kVp 时，当管电流≥60 mA 或管电压在 80 kVp 管电流≥90 mA 时，

Uniformity 无明显变化，可以得到满意的图像质量。**结论** 影像组学分析方法可以有效定量化地评价和控制低辐射剂量下实性肺结节 CT 图像质量，其评价结果优于常规 CT 图像质量评价方法。

同步辐射光源相衬成像显示肺部细微结构： 与病理组织学的对照研究

夏艺,王凤卓,张迪,范丽,刘士远
海军军医大学第二附属医院（上海长征医院）

目的 利用同步辐射光源相衬成像评价肺癌病人离体肺标本及 $PM_{2.5}$暴露大鼠的肺部细微结构的变化，以病理组织学为对照，明确影像特征与病理组织学间的对应关系。**方法** 共 4 例肺腺癌病人及 4 只胰蛋白酶+$PM_{2.5}$滴注 12 周暴露大鼠，于上海同步光源(SSRF) X 射线成像及生物医学应用光束线/实验站(BL13W1)进行基于同步辐射的相衬成像（PCI）。X 射线能量为 16KeV，光束大小为 45mm× 5mm，成像距离 25cm，CCD 分辨率即像素大小为 5.2×5.2μm，对应 CCD 视场 11mm。图像处理软件包括 CT 重构软件（PITRE）、三维后处理显示软件（Amira 6.1.1）。对已扫描的肺标本行 H-E 染色，观察镜下病理变化。根据扫描病理图片的改变，通过三平面重建的方法建出与扫描病理图片一一对应的图像。**结果** ：（1）肺癌组织标本的 PCI 可清楚显示局部细微结构的改变。肺肿瘤标本典型者可见沿着肺泡壁生长的条片样高密度影，病理对应沿着肺泡壁生长的肿瘤细胞；还可以点状的致密影，与病理对照，对应为肿瘤基质内的细微钙化，而常规胸部 CT 提示该肿块密度均匀。相对正常肺组织可见小血管壁的增厚，小血管腔的变窄，病理对应小血管的收缩伴管壁炎性细胞浸润及碳末或煤焦油等的沉着。（2）胰蛋白酶+$PM_{2.5}$滴注 12 周组大鼠离体相衬成像可见小气道管壁的增厚，支气管远端见少许小斑片状的渗出影；另可见胸膜下小斑片状磨玻璃密度影即肺泡间隔增厚；实性小结节，即肺间质内的碳末沉积；小气道扩张，即小气道的远端管腔较近侧扩张；肺气肿即肺泡间隔的明显扩大。 **结论** 本研究表明同步辐射光源可显示肿瘤细胞沿着腺泡结构的生长情况及较好显示小血管的改变，而且可以评价大鼠肺细微结构的改变，与病理组织学结果具有高度的一致性。

胸腺神经内分泌肿瘤临床及 CT 特征分析

付聪,王梅云
河南省人民医院

目的 探讨胸腺神经内分泌肿瘤（TNETs）的 CT 特征性表现，提高对本病的 CT 诊断水平。

资料与方法 回顾性分析 11 例经病理证实的 TNETs 患者的临床资料、病理资料及 CT 影像学资料。分析其 C T 影像学特征（主要包括大小、形状、密度、强化程度、有无坏死、转移和邻近结构侵犯等）。并参照国际胸腺肿瘤协作组织标准术语及第 8 版美国癌症联合会和 国际抗癌联盟胸腺上皮肿瘤 TNM 分期系统，对 11 例病变进行分期。

结果 男性 8 例，女性 3 例，平均年龄 56.2 岁。组织病理学亚型：典型类癌 1 例，不典型类癌 2 例，小细胞癌 2 例，大细胞神经内分泌癌 1 例，未明确病理学亚型 5 例。病变主体均位于前纵隔，最大径 6.8~20.9 cm，平均最大径 8.5 cm。C T 影像学特征：病灶呈分叶状 7 例、类圆形 4 例，内部密度不均匀 9 例，囊变坏死 7 例，钙化 1 例，增强后多为不均匀性轻-中度强化，其中轻度强

化 4 例，中度强化 5 例，2 例胸腺典型类癌出现显著强化，6 例可见瘤内血管强化。常见肿瘤沿纵隔血管间隙生长，不同程度侵犯包绕纵隔大血管， 10 例出现纵隔结构侵犯，5 例存在上腔静脉癌栓，7 例可见纵隔肿大淋巴结， 6 例侵犯邻近肺组织， 1 例侵犯胸骨。临床分期： Ⅰ期 1 例，ⅢA 期 4 例，ⅣB 期 6 例。

结论 TNETs 以中老年男性多见， CT 表现为前纵隔较大体积肿块，多分叶状，坏死囊变常见，钙化少见，不均匀强化，具有明显侵袭性，ＣＴ对 ＴＮＥＴｓ的鉴别诊断和术前评估具有重要价值。

人工智能肺结节筛查系统中不同分类阈值对肺结节检出效能的影响

闫玉伟
内蒙古自治区人民医院

目的 探究基于深度学习的人工智能（Artificial Intelligence，AI）肺结节筛查系统中不同分类阈值对肺结节检出效能的影响。
方法 回顾性收集 117 例胸部 CT 平扫病例数据，层厚均为 1 至 1.25mm 的薄层扫描序列。研究入组病例中的肺结节数。即金标准由两位具有超过 15 年胸部 CT 图像阅片经验的放射科专家共同制定，共计标注 563 个肺结节。在此基础上，利用基于深度学习的 AI 肺结节筛查系统（北京推想科技有限公司）进行结节检测，记录其在不同模型分类阈值（0.65，0.75，0.85）下检测到的肺结节数。通过与金标准对比，分析不同分类阈值下，AI 系统检测到的真阳性结节（TP），假阳性结节（FP）和假阴性结节（FN）的数量。通过计算比较不同分类阈值下 AI 系统检测灵敏度，FP / TP 值和假阳性率（假阳性结节数/CT），探索最适合临床工作的模型分类阈值。
结果 AI 系统在阈值为 0.75 的情况下检测到 1285 个结节，包含 500 个 TP 和 785 个 FP， FN 个数为 63 个，检测敏感性为 88.81%，假阳性率和 FP/TP 值分别为 6.71FP/CT 和 1.57。当调整分类阈值至 0.85 时，AI 系统检测到的结节有所减少，总数降至 1085 个，其中 TP 为 478 和 FP 为 607 个，然而 FN 个数却增加至 85 个，检测敏感性降低至 84.9%（p=0.052），假阳性率和 FP/TP 值分别为 5.19FP/CT 和 1.27，有所下降。相比之下，当分类阈值调整到 0.65 时，多达 1492 个肺结节被 AI 系统预测，其中包含 510 个 TP 和 982 个 FP，虽然 FN 数目降至 53 个，但检测敏感性却提高至 90.59%（p>0.05），但假阳性率和 FP/TP 值均明显增加，分别为 8.39FP/CT 和 1.93。
结论 本研究中分类阈值为 0.75 时，AI 系统具备与低阈值相当敏感性的同时，预测了更少的假阳性结节，因此是 AI 肺结节筛查系统临床应用时的最佳选择。

OR-437
Correlation Between Gated 13N-NH3•H2O PET and 18F-FDG PET for Assessment of Left Ventricular Ejection Fraction, End-diastolic Volume, and End-systolic Volume in Patients with Myocardial Infarction

zhuozhi Chen
The first affiliated hospital of jinan university

Objective:
To evaluate myocardial electrocardiography (ECG) gated ^{13}N-ammonia positron emission tomography (^{13}N-NH_3•H2O PET) and gated ^{18}F-fluorodeoxyglucose (^{18}F-FDG) PET for the assessment of left ventricular ejection fraction (LVEF), end-diastolic volume (EDV), and end-systolic volume (ESV) in patients with myocardial infarction.
Methods:
^{13}N-NH_3•H2O and ^{18}F-FDG PET scans were performed in 50 patients (47 men and 3 women; mean age, 58.1±10.8 years) for the evaluation of myocardial perfusion and viability. For both ^{13}N-NH3•H2O and ^{18}F-FDG imaging studies, quantitative gated single photon emission computed tomography (QGS) and quantitative perfusion single photon emission computed tomography (QPS) software were used to reconstruct the images and to calculate the left ventricular parameters, namely, LVEF, EDV, and ESV.
Results:
The LVEF determined by gated ^{13}N-NH3•H2O PET and gated ^{18}F-FDG PET were 26.0 ± 12.6% and 27.4 ± 13.6%, respectively. The EDV determined by gated ^{13}N-NH3•H2O PET and gated ^{18}F-FDG PET were 236.0 ± 89.4 mL and 222.8 ± 101.4 mL, respectively. The ESV determined by gated ^{13}N-NH3•H2O PET and gated ^{18}F-FDG PET were 183.2 ± 86.7 mL and 171.5 ± 95.1 mL, respectively. The correlation between gated ^{18}F-FDG PET and gated ^{13}N-NH3 • H2O PET imaging with regard to measurement of LVEF, EDV, and ESV was excellent.(EDV determined by ^{13}N-NH3•H2O = 0.75 EDV determined by ^{18}F-FDG + 68.6, r = 0.85, $P < 0.0001$; ESV determined by ^{13}N-NH_3•H2O = 0.79 ESV determined by ^{18}F-FDG + 47.4, $r = 0.87$, $P < 0.0001$; EF determined by ^{13}N-NH_3•H2O = 0.79 EF determined by ^{18}F- FDG +4.4, $r = 0.85$, $P < 0.0001$).
Conclusion:
Gated ^{13}N-NH_3•H2O PET had good correlation with gated ^{18}F-FDG PET with regard to LVEF, LVEDV, and LVESV in patients with myocardial infarction.

放射组学在鉴别纵隔淋巴结良恶性中的应用

董梦实,徐克*,张立娜*
中国医科大学附属第一医院

【目的】放射组学已广泛被应用于肿瘤的诊断以及评估预后等临床决策中。然而，很少有人使用放射组学的方法对纵隔增大淋巴结的良恶性进行鉴别。本研究目的是探索放射组学是否可以鉴别纵隔淋巴结的良恶性。

【方法】本研究为回顾性研究。我们从我院 PACS 系统筛选了 129 名淋巴结增大患者的 CT 影像，共有 201 个淋巴结具有 EBUS-TBNA 结果。其中 120 个淋巴结为良性，81 个淋巴结为恶性。我们对入组的淋巴结进行手动 ROI 勾画，并对 ROI 的放射组学特征进行提取，得到了 396 个特征。我们将 201 个淋巴结（研究对象）分为训练组（140 个淋巴结，70%）和测试组（61 个淋巴结，30%）。在训练组内，我们使用 LASSO 回归对 396 个特征进行降维，最终得到了 26 个特征。我们选择逻辑回归算法来进行机器学习建模，输入特征为上述 26 个放射组学特征，输出为肿瘤良性或恶性（label=0 或 1）。最后在测试组内评估模型的分类性能。

【结果】模型在训练组内的分类 ROC 曲线下面积、敏感度以及特异度分别为：0.922、0.821、0.893。模型在测试组内的分类 ROC 曲线下面积、敏感度以及特异度分别为：0.850、0.806、0.800。

【结论】本研究提示放射组学对鉴别纵隔淋巴结的良恶性具有良好的效果。

OR-439

Clinical significance of DWI and ADC values in imaging diagnosis of soft tissue tumors

Lin Xu, Song Wang, Xin Lou, Lin Ma
Chinese PLA General Hospital

Objective To study the clinical significance of DWI and ADC values in imaging diagnosis of soft tissue tumors.
Methods 249 cases of soft tissue tumors confirmed by pathology in our hospital were retrospectively analyzed, including 85 cases of benign tumors and 164 cases of malignant tumors. 50 normal volunteers were randomly selected to measure the ADC values of lesions and quadriceps femoris.
Results The average ADC values of quadriceps femoris in 50 normal volunteers were （1.448± 0.109）×$10^{-3}mm^2/s$, and those of 85 benign soft tissue tumors were（1.805± 0.395）×$10^{-3}mm^2/s$. The average ADC values of benign soft tissue tumors with or without mucus were （1.769± 0.417）×$10^{-3}mm^2/s$ and（1.850±0.357）×$10^{-3}mm^2/s$, respectively. The average ADC value of malignant soft tissue tumors was （1.251± 0.540）×$10^{-3}mm^2/s$. The average ADC values of malignant soft tissue tumors with or without mucus were （1.908± 0.465）×$10^{-3}mm^2/s$ and（0.968 ±0.233）×$10^{-3}mm^2/s$，respectively; the average ADC values of low-grade and medium-high-grade malignant soft tissue tumors with or without mucus were （1.971±0.382）×$10^{-3}mm^2/s$、（1.137±0.274）×$10^{-3}mm^2/s$，（1.866±0.516）×$10^{-3}mm^2/s$、（0.941±0.215）×$10^{-3}mm^2/s$，respectively. There were statistical differences in ADC values between benign and malignant soft tissue tumors and normal quadriceps femoris (P=0.045, P=0.017, P=0.019, P<0.05). There were no statistical differences in ADC values between benign soft tissue tumors and those without mucus, benign and malignant soft tissue tumors with mucus, low-grade malignant and medium-high-grade malignant soft tissue tumors with mucus (P=0.061, P=0.060, P=0.055, P>0.05) , respectively. There were statistical differences in ADC values between malignant soft tissue tumors and those without mucus, benign and malignant soft tissue tumors without mucus, low-grade malignant and medium-high-grade malignant soft tissue tumors without mucus, low-grade malignant and medium-high-grade malignant soft tissue tumors (P=0.000, P=0.000, P=0.031,P=0.045,P<0.05) , respectively.
Conclusion DWI and ADC values play an important role in the diagnosis of benign and malignant soft tissue tumors, and can assist morphological diagnosis. Mucous components can improve the average ADC values of malignant soft tissue tumors.

OR-440

Accuracy evaluation of intraoperative imaging planning based on image registration

Xiaomin Li,Yang Qu,Songtao Ai,Xiaofeng Tao
Shanghai Ninth People's Hospital, Shanghai Jiao Tong University School of Medicine

Objective:
To explore the accuracy of intraoperative osteotomy in pelvic bone tumors via 3D printed individualized guides based on point-to-point registration method.

Methods:
A retrospective analysis was performed on the cases with pelvic bone tumors between January 2015 and December 2018. CT/MRI examinations were routinely performed before surgery. Medraw software was used to achieve registration of Pre- and post-operative CT images, the design prosthesis models and the postoperative prosthetic models, in order to assess the accuracy of intraoperative osteotomy. The angle and distance between the planned and the actual bone resection planes were used as the evaluation indexes.

Results:
A total of 8 patients (13 osteotomy planes) were included in the study. The median age was 44 (33-54) years, including giant cell tumor of bone (4 cases), chondrosarcoma (2 cases), metastatic tumor (1 case), and Ewing's sarcoma (1 case). The mean angle between the actual osteotomy and the planned osteotomy was 6.57±3.36 (1.05~11.88). The distance between the actual osteotomy surface and the planned osteotomy surface is 5 mm on average, the distance distribution is concentrated between ±5 mm, and the maximum distance is no more than 14 mm.

Conclusion:
Using registration method between the preoperative design prosthesis model and the postoperative prosthesis model is useful to eliminate the effect of metal artifacts on postoperative CT images in a certain extent. With the help of 3D printed individualized osteotomy guide, surgeon can achieve accuracy of osteotomy in the pelvic tumor to reconstruct the function of the limb.

MRI 在评价韧带样纤维瘤病疗效中的价值

朱汇慈,李晓婷,李舒,孙应实
北京大学肿瘤医院

目的 探讨 MRI 在不同疗效的韧带样纤维瘤病（DF）中的信号变化特征。**方法** 回顾性分析我院 2008 至 2015 年经病理证实的术后复发 DF 患者 124 例的 MRI 资料，MRI 资料包括确诊复发后发病部位的基线 MRI 图像，至少每半年随访 1 次 MRI，随访满 3 年且有第 3 年末的 MRI 扫描图像。采用基于肿瘤大小的实体瘤疗效评价标准（RECIST）评价其疗效，将患者分为进展（PD）、缓解

（PR）、稳定（SD）组。采用单因素方差分析、Kruskal-Wallis 或 x^2检验比较 PD、SD 和 PR 组中特征的差异，多重比较采用 Bonferronei 校正 P 值，采用 Spearsman 相关系数检验信号评分与肿瘤最大径的相关性。**结果** PD 组 17 例、SD 组 37 例、PR 组 70 例。3 组间患者年龄、性别分布和部位的差异无统计学意义（P>0.05），治疗方案的差异有统计学意义（P<0.05），3 组患者的基线检查病灶最大径和末次检查最大径的差异也有统计学意义（P均<0.05）。PD、SD 和 PR 组的 T_2基线评分、T_1基线增强评分差异均无统计学意义（P均＞0.05），3 组的末次随访 MRI 图像的 T_2评分、T_2评分变化、末次 T_1增强评分和 T_1增强评分变化的差异均有统计学意义（P均<0.05）。末次随访时，肿瘤最大径与 T_2评分呈中度正相关（r=0.434，P<0.01），肿瘤最大径与 T_1增强评分呈强正相关（r=0.743，P<0.01）。**结论** MRI 在评价韧带样纤维瘤病的疗效方面具有价值。

骨巨细胞瘤影像表现的对比分析

陆善金
南宁市第二人民医院

［摘要］目的 探究骨巨细胞瘤 X 线、CT 及 MRI 综合检查方法与影像诊断对比分析。**方法** 选取 2015 年 1 月—2019 年 2 月我院收治 22 例怀疑骨巨细胞瘤患者，其中，男性 10 例，女性 12 例，年龄范围 15 岁—48 岁，平均年龄为 32.7 岁，平均病程为 9 个月；22 例患者均进行 X 线平片检查，其中 12 例行 CT 扫描，8 例行 MRI 检查。**结果** 7 例患者为股骨，8 例患者为胫骨，1 例患者为髂骨,2 例患者为肱骨。X 线平片主要影像表现为膨胀性、偏心性及溶骨性骨质破坏；CT 显示病灶内无钙化灶，无硬化边，可见分隔样骨嵴，肿块与周围软组织分界清；MRIT1 加权肿瘤为低信号，T2 加权为高信号，MRI 能较为清晰显示骨外侵犯及关节累及程度。**结论** 平片检查为首选，检查结果准确率高， CT、MRI 检查可提供病灶内及病灶外更多信息，综合各种影像表现并进行对比分析，能够对骨肿瘤的诊断较为清晰反应，为临床制定治疗方案提供更为完整影像学信息；以上三种方法是目前骨肿瘤常用综合检查方法。

Rapid-kilovoltage-switching dual-energy CT for differentiation of spinal osteolytic metastases from spinal infections

Yuan Yuan,Huishu Yuan
Peking University Third Hospital

Objectives To investigate the value of rapid-kilovoltage-switching dual-energy computed tomography (RDECT) for differentiating spinal osteolytic metastasis (SOM) from spinal infection (SI) during arterial phase (AP) and venous phase(VP).
Methods This study was institutional review board approved. 47 patients were examined by RDECT during AP and VP. 18 patients (median age 64 years; age range 26~77 years) had SI. Among them,11 patients had chronic non-specific infections (CNSI) and 7 patients had tuberculosis (TB) which were diagnosed after biopsy or diagnosed on basis of response to antibiotic therapy. 29 patients (median age 58 years; age range44~82 years) had pathologically confirmed spinal metastases. The iodine/water

densities for the lesion, the lesion-to-muscle ratio(LMR) and lesion-to-artery ratio(LAR) for iodine density measurements were calculated and compared between the two groups with the 2-tailed Student t test. The CT attenuation values on traditional CT images during AP and VP were measured. A P-value < 0.05 was considered statistically significant. Receiver operating characteristic (ROC) curves were used to determine the sensitivity and specificity of all the parameters for differentiating SOM from SI. ***Results*** During the AP, the iodine density, LMR and LAR for SI were 1.97±0.68 mg/ml, 6.03±2.21, and 0.23±0.07,respectively. These values were significantly different from the respective values of 2.81±1.34 mg/ml, 8.42±3.77 and 0.90±0.10 for SOM (all p＜0.05). During the VP, the iodine density, LMR and LAR for SI were 2.20±0.56 mg/ml, 4.63±1.59,and 0.46±0.14, respectively. These values were significantly different from the respective values of 3.21±0.72 mg/ml, 7.58±2.63, and 0.70±0.19 for SOM(all p＜0.05). The water densities and traditional CT attenuation values during AP and VP were not significantly different between the two groups. On ROC analysis, LAR during the VP (LAR_{VP})—with area under ROC curve (AUC) of 0.862—showed the best diagnostic performance. LAR_{VP} of 0.54 had sensitivity of 82.80% and specificity of 77.80% for differentiating SOM from SI. ***Conclusions*** RDECT may provide additional information for differentiating atypical SOM from SI.

单、双指数模型扩散加权成像对脊柱肿瘤射波刀治疗的疗效评估及相关性分析研究

陈永晔[1],张恩龙[2,1],张家慧[1],王奇政[1],庄洪卿[1],袁慧书[1],郎宁[1]
1.北京大学第三医院
2.北京大学国际医院

目的 初步探究单、双指数模型扩散加权成像（DWI）在脊柱肿瘤射波刀治疗疗效评价方面的应用价值及其相关性分析。

材料与方法 收集了 2017 年 8 月至 2019 年 5 月在本院接受射波刀治疗的脊柱肿瘤患者共 15 例，其中剔除了接受过肿瘤切除手术或入院前曾经接受过放化疗的患者，每位患者治疗前及治疗后均接受了多 b 值 DWI 序列检查；感兴趣区域（ROI）由对患者治疗结果不知情的骨肌放射学专家勾画，参照抑脂 T1WI 增强图像，于病灶的最大横截面勾画 ROI，尽量避开出血、坏死、囊变以及邻近血管区域，ROI 至少包含全肿瘤范围的 2/3；利 FUNCTION TOOL 后处理软件中的单指数模型计算得到表观扩散系数(ADC)，利用双指数模型得到 D、D^*、f 值；随访时间为治疗后的第 3 个月，随访时再次进行多 b 值 DWI 序列检查，临床症状评估使用疼痛数字评分法(NRS)、QLQ-BM22 及 QLQ-C30 生存质量调查量表，每例患者均由神经外科、放射学及肿瘤放疗学专家组成的脊柱肿瘤多学科专家小组进行评审，根据患者治疗前后肿瘤体积改变、临床症状改变评定治疗是否有效；统计学方法采用配对 t 检验。

结果 12 例患者治疗有效，3 例治疗无效，治疗有效组治疗后的 ADC 较治疗前上升 24.2%（p＜0.05），D^*较治疗前下降 25.8%（p＜0.05），D 值和 f 值改变则没有统计学意义。

结论 治疗前后单指数模型 DWI 的 ADC 值以及双指数模型的 D^*改变对于脊柱肿瘤射波刀疗效评价具有指导意义，可以为临床上脊柱肿瘤患者治疗方案的个体化制订提供有价值的依据。

骨原发性淋巴瘤影像学征像分析（附 4 例报告）

周敏,陈兴灿
解放军联勤保障部队第 903 医院

【摘 要】 **目的** 分析骨原发性淋巴瘤的影像学征像。**方法** 复习国内外相关文献并回顾分析经我院病理证实的 4 例骨原发性淋巴瘤（PLB）的 X 线、CT 和 MR 表现。**结果** 3 例单骨病变（股骨、髋臼、髂骨），1 例多骨多部位病变（胸椎、腰椎、髂骨），临床上局部疼痛和肿胀为主要症状，而全身症状轻或无；以溶骨性破坏为主，X 线平片和 CT 可显示筛孔样骨质破坏和“浮冰征”，周围较大软组织肿块包饶尚存外形的病变骨，坏死不明显；肿瘤可破坏关节软骨侵犯关节，增强扫描显示轻、中度强化； MRI 显示信号均匀的软组织肿块，T_1WI 低信号，T_2WI 等或稍低信号。**结论** 影像学检查对骨原发性淋巴瘤诊断具有重要价值，X 线平片、CT 和 MR 应互相配合、补充，相互印证，多数骨原发性淋巴瘤可正确诊断。

A comparative study of two MR sequences on the effect of metal artifact reduction

Hanqi Wang,Yaling Pan,Tongtong Chen,Yong Lu
Ruijin Hospital， School of Medicine， Shanghai Jiao Tong University

Objective: To compare the effect of syngo-WARP sequences and simple parameter adjusted sequences in metal artifacts reduction on MR images of prosthesis.
Methods: MR scans with syngo-WARP sequences, simple parameter adjustment sequences and FSE sequences were performed on 3 prosthesis phantoms and 22 patients after joint replacement. The artifact area of the prosthesis was measured on the largest plane of the artifact in each sequences of MR images , and the MR image quality of patients in each sequences is evaluated. Wilcoxon signed rank test was used to evaluate the differences of image quality between syngo-WARP sequences and FSE sequences, simple parameter adjusted sequences and FSE sequences, and syngo-WARP sequences and simple parameter adjusted sequences, respectively.
RESULTS: The artifact area of the prosthesis phantom was largest in the FSE sequences, the artifact area in the simple parameter adjusted sequences was the second, the artifact area in the syngo-WARP sequences was the smallest, and the artifact area on the T1WI images was larger than the corresponding STIR images. The image quality of coronal T1WI ($P_{\text{syngo-WARP vs FSE}}<0.001$, $P_{\text{simple parameter vs FSE}}<0.001$), coronal STIR ($P_{\text{syngo-WARP vs FSE}}<0.001$, $P_{\text{simple parameter vs FSE}}<0.001$) and transverse STIR ($P_{\text{syngo-WARP vs FSE}}<0.001$, $P_{\text{simple parameter vs FSE}}<0.001$) of patients after joint replacement in syngo-WARP sequences and simple parameter adjusted sequences were significantly better than the corresponding FSE sequence. There was no statistical difference in the image quality of the coronal T1WI (P=0.642) and coronal STIR (P=0.337) between the syngo-WARP sequences and the simple parameter adjusted sequences. The image quality of transverse STIR in the syngo-WARP sequences was better than the simple parameter adjusted sequences (P=0.004).
Conclusion: Syngo-WARP sequences and simple parameter adjusted sequences can reduce the area of metal artifact and improve the image quality compared with conventional

FSE sequences. The effectiveness of the two sequences in diagnosing complications after joint replacement and its clinical value still require further exploration.

第三代双源双能 CT 显示椎体成骨性骨转移瘤的最佳单能量水平

田晓娟,乔英
山西医科大学第一医院

目的 探讨第三代双源双能 CT 显示椎体成骨性骨转移瘤的最佳单能量水平；**材料和方法** 回顾分析 48 例恶性肿瘤患者的骨转移情况，均行双源 CT 双能成像，获得 MIxed0.5 线性融合图像（简称“融合图像”）和 40Kev—140Kev 单能量图像（间隔 10Kev），由两名医师采用双盲法独立选择融合图像椎体上的高密度病灶。以两评阅者漏诊的所有高密度病灶为研究对象，分别计算融合图像和各单能量图像的信噪比（SNR）、对比噪声比（CNR），采用配对样本 t 检验比较不同能量图像间的 SNR、CNR；根据以上结果，由同两名医师评阅 40Kev、60Kev 图像，并再次评阅融合图像椎体上的高密度病灶（每次评阅间隔 3 周），做相应评分（0 分为肯定非成骨性骨转移瘤，1 分为怀疑成骨性骨转移瘤可能，2 分为成骨性骨转移瘤可能性大，3 分为确诊为成骨性骨转移瘤），采用卡方检验比较两评阅者在不同能量图像上高密度病灶的检出率，采用加权 Kappa 分析检验在不同能量图像上两评阅者间对椎体成骨性骨转移瘤主观评分的一致性。所有统计结果均认为 $P<0.05$ 有统计学意义。**结果** 1、40Kev、50Kev、60Kev、70Kev 单能量图像的 SNR 均高于融合图像，其中 60Kev 单能量图像 SNR 最高，与其他各能量图像间存在统计学差异；40Kev、50Kev、60Kev 单能量图像的 CNR 高于融合图像，其中 60Kev 单能量图像 CNR 最高，与 40Kev 单能量图像间无统计学差异。2、比较不同能量图像两评阅者自身病灶检出率，60Kev 单能量图像的病灶检出率均高于融合图像，差异有统计学意义；Kappa 一致性分析：两评阅者对融合图像主观评分一致性差，对 40Kev 图像主观评分一致性较好,对 60Kev 图像主观评分一致性很好。**结论** 60Kev 单能量图像提高了图像质量；在 60Kev 图像上病灶检出率最高、主观评分一致性很好，研究表明 60Kev 为最佳单能量水平。

OR-448
基于 MRI-病理对照的软组织肉瘤 IVIM 及 DKI 与其组织病理学分级对照研究

赵晓宇,王绍武,戴越,席亚维
大连医科大学附属第二医院

目的 在 MRI-病理对照的基础上，探讨 IVIM 及 DKI 用于判断软组织肉瘤组织病理学分级的应用价值。

材料与方法 收集经手术病理证实为软组织肉瘤患者 18 例，所有患者行常规 MRI 平扫、IVIM、DKI 及常规增强检查，并由两名放射科医师在肿瘤强化最明显及 DWI 信号最高区域勾画 ROI，获取 StandardADC、Dslow(mono)、Dfast(mono)、f(mono)、Dslow(bi)、Dfast(bi)、f(bi)、MK、MD 等参数值。采用 MRI-病理对照的方法，按照 FNCLCC 评分系统和 2 级分级系统，将 STSs 分为两组：高级别 STSs（Ⅱ级、Ⅲ级）和低级别 STSs（Ⅰ级）。分析各参数与软组织肉瘤组织病理学分级的相关性和诊断效能。

结果 18 例软组织肉瘤 IVIM 参数 StandardADC 值、Dslow(mono)值及 DKI 参数 MK 值、MD 值在鉴别高、低级别组间差异具有显著性（P<0.05），并且高级别软组织肉瘤的 StandardADC 值、Dslow(mono)值、MD 值低于低级别组；MK 值高于低级别组。IVIM 参数 StandardADC 值、

Dslow(mono)值及 DKI 参数 MK 值、MD 值对鉴别高、低级别软组织肉瘤的阈值分别为 1.442 x10^{-3}mm^2/s，1.061x10^{-3}mm^2/s，0.642，1.713 um^2/ms，该阈值对鉴别高、低级别软组织肉瘤的敏感度分别为 66.7%，91.7%，83.3%，100%，特异度分别为 100%，66.7%，100%，83.3%。

结论 IVIM 参数 StandardADC 值、Dslow(mono)值及 DKI 参数 MK 值、MD 值能够区分高、低级别软组织肉瘤。IVIM 及 DKI 两者联合应用较两者任何一种单独应用的诊断效能更好，其中 DKI 的参数 MK 值联合 IVIM 的参数 Dslow(mono)值用于鉴别高、低级别软组织肉瘤的诊断效能最好。

粘液纤维肉瘤的 CT 及 MRI 表现

徐景景
济宁医学院附属医院

【摘要】 目的 探讨粘液纤维肉瘤（MFS）的 CT 及 MRI 表现。方法 回顾性分析 20 例经手术病理证实的 MFS 患者的 CT 及 MRI 资料（4 例行 CT 检查，17 例行 MRI 检查，其中 1 例同时行 CT、MRI 检查），观察其形态、大小、密度/信号、强化特点及瘤周浸润等征象。结果 20 例 MFS 中 8 例为低度恶性，2 例中度恶性，10 例高度恶性。18 例位于浅筋膜下，2 例位于肌间隙内，10 例呈类圆形，7 例呈梭形，3 例呈不规则形，肿瘤最大径约 3.5~13.2cm，平均（7.58±2.76）cm；CT 扫描，3 例呈均匀等或稍低密度，增强扫描呈中重度均匀延迟强化，1 例病灶呈不均匀中度强化，内见斑片状低密度影，增强扫描呈轻度延迟强化；MRI 上，2 例呈 T_1WI 呈均匀稍高信号，15 例呈混杂等/低信号，2 例 T_2WI 呈均匀高信号，15 例呈混杂高信号，11 例病变呈 DWI 混杂高信号，10 例增强扫描呈不均匀明显强化；18 例可见“筋膜尾征”，13 例见瘤周水肿，11 例病灶内见“双低信号征”，10 例见囊变、坏死，6 例见粘液样变 结论 MFS 的 CT 及 MRI 表现具有一定特征性，有助于术前诊断，最终确诊依赖病理。

肺癌骨转移的影像表现研究

马锦涛,董越
辽宁省肿瘤医院

目的 探讨肺癌骨转移瘤的影像学特点。

方法 收集辽宁省肿瘤医院病理证实为肺癌骨转移患者的临床及影像资料。共收集 27 例患者，所有患者在检查前均未接受相关治疗，其中男性 14 名，女性 13 名，男女比例 1:1，平均年龄约为 59 岁，范围为 43-84 岁；其中 48-70 岁，大约占 81.2%。临床大多以肢体疼痛肿胀入院（20 例），少数为发现原发灶后，偶然发现转移灶。

结果 发病部位发生于右侧肱骨者共 10 例，其中肱骨上段 7 例，中段 1 例，下段 2 例；左侧肱骨 3 例，其中上段 1 例，中段 1 例，全段 1 例；右侧股骨共 5 例，全部位于上段；左侧股骨共 7 例，上段 5 例，中段 2 例；右侧胫腓骨 2 例，胫骨上段 1 例，腓骨下段 1 例。发生在骨端者共 22 例。X 线与 CT 上病灶大多位于骨端，偏心性生长(17 例)，均为溶骨性。骨皮质多为穿凿样或虫蚀样破坏，可伴一侧或四周骨质破坏（1 例患者四周骨质明显破坏，残余骨组织似苹果核样），破坏的骨皮质可轻度膨胀，其中有 5 例骨皮质与松质骨出现多发片状破坏，部分有融合，破坏骨之间伴有斑片状硬化。1 例出现梭形骨质破坏。髓腔及骨外多有软组织肿块影，范围相对局限时，可见软组织突破骨皮质到达骨外形成的类似束腰征的影像表现。横断面上骨的轮廓大致可见，较多病例可见层

状骨膜反应，当肿块较大时，骨膜反应可消失或可见骨膜三角，肿块内有时可见液性低密度影，同时可伴骨的轮廓破坏消失或病理性骨折。
MR 上骨皮质虫蚀样骨破坏较 CT 更加明显，多为斑点、片状、不规则状稍长 T1 长 T2 信号，脂肪抑制像呈高信号，肿块与髓腔间有时可在 T1、T2 上见线状低信号影。肿块较大时，其内可见片状长 T2 信号区，甚至可见液液平面。增强扫描可见片状异常强化区，有的病灶周围可见环状高信号影（2 例）。周围正常软组织常伴有炎性反应。
结论 肺癌骨转移在影像上的虫蚀样骨质破坏特征可以帮助临床诊断。

Texture analysis based on diffusion kurtosis imaging in distinguishing benign from malignant soft tissue tumors

Ying Li,Cuiping Ren,Jingliang Cheng
The first affiliated hospital of Zhengzhou university

Purpose: Recent studies have shown that DKI providesa new method to evaluate the non-gaussian diffusion behavior in complex biological tissues in various brain diseases and breast tumors. And the distribution of the DKI-derived parameters within the tumors might have the potential to describe the characteristics of the whole lesions. In this work, a 3D whole volume texture analysis based on DKI-derived parameter maps were carried out to investigate the application on soft tissue tumors and furtherly evaluate the ability of these texture parameters to differentiate benign and malignant tumors by using support vector machine (SVM) classifier.
Methods: Twenty-six patients (16 males and 9 females aged 38.0±20.6 years old) with soft tissue tumors (all have been diagnosed as soft tissue tumor according to pathological biopsy) were included in this study. And based on the WHO Classification of Tumors of Soft Tissue and Bone(2012) criteria, 26 patients were divided into two groups:15 for benign tumors and 11 for malignancies. All the patients were scanned by MR DKI sequence based on a 3T MR scanner (Ingenia, Philips Healthcare, Best, the Netherlands). The DKI scanning was performed with 3 b-values of 0, 600, 1,200 s/mm^2 and 15 motion-sensitive gradient directions. The DTI related parameters of mean diffusivity (MD),fractional anisotropy(FA), axial diffusivity (AD), radical diffusivity (RD) and DKI related parameters of mean kurtosis (MK), axial kurtosis(AK), radical kurtosis(RK) were calculated by using DKE software (Version 2.6.0, website:www.musc.edu/cbi).The whole volume 3D ROIs of the lesions were drawn on the b0, b600 or b1200 image and then the 3D ROI were copied to other DTI and DKI-derived parameter maps. Three dimension texture calculations were carried out by using a modified radiomics-master Matlab toolbox for each parameter map and b0, b600 and b1200 images. And for each parameter, 43 textures (Table 1)were extracted and finally 43×10 textures were obtained. Firstly, for all the 43×10 textures, Two sample student’s T test were performed to find the difference between benign and malignant groups. A P value of less than 0.05 was considered statistically significant. SVM classification with the first 100 leading features (reordered by fisher score) was performed to identify the malignant from the benign soft tissue tumors.

Results: The results revealed that many texture parameters showed a significant difference between benign and malignant soft tissue lesions ($P<0.05$) and the details were summarized in Figure 1 (because there are too much texture parameters, so we just showed the P value distribution of the features).The reordered features by using fisher score value were shown in Figure 2. The results showed that the SVM showed a good performance with a high classification accuracy of 73%, sensitivity of 76% and specificity of 72%.
Conclusions: Texture analysis based on DKI-derived parameters is helpful to provide useful information related to soft tissue tumors microstructure. And SVM classification based on textures was helpful for the diagnosis of soft tissue tumors.

单指数、双指数、拉伸指数模型扩散加权成像及扩散峰度成像在评估软组织肉瘤组织病理学分级及 Ki-67 表达中的应用

张凯[1,2],王绍武[1,2],戴越[1,2],赵晓宇[1,2],刘亚洁[1,2],陶娟[1,3]
1.大连医科大学附属第二医院
2.放射科
3.病理科

目的 探讨单指数、双指数、拉伸指数模型扩散加权成像（DWI）及扩散峰度成像（DKI）各参数在软组织肉瘤（STS）组织病理学分级中的应用及与 Ki-67 表达水平的相关性。
方法 回顾性分析 30 例手术病理（免疫组化指标含 Ki-67）诊断为 STS 患者，术前均行 3.0T MRI 检查（含 DWI 及 DKI 序列），测量 DWI 不同指数模型及 DKI 参数值，包括标准表观扩散系数（Standard ADC）、慢速扩散系数（D）、快速扩散系数（D*）、灌注分数（f）、分布扩散系数(DDC)、扩散异质性指数（α）、平均扩散峰度（MK）、平均扩散系数（MD）、各向异性分数（FA）值。根据法国癌症中心联合会（FNCLCC）分级系统，将 STS 分为高级别（Ⅱ级、Ⅲ级）和 STS（Ⅰ级）两组，其中高级别 19 例，低级别 11 例。采用两独立样本 t 检验比较两组各参数值差异；采用 ROC 曲线评估有鉴别价值参数的诊断效能。采用 Pearson 相关分析探讨各参数值与 Ki-67 表达指数的相关性。
结果 高级别 STS 的 Standard ADC、D、DDC、MD 值低于低级别 STS（$P<0.05$）；MK 值高于低级别 STS（$P<0.05$）。Standard ADC、D、DDC、MK、MD 值鉴别高、低级别 STS 曲线下面积（AUC）分别为 0.833、0.852、0.847、0.919、0.909，阈值分别为 1.231x10^{-3}mm^2/s、1.100 x10^{-3}mm^2/s、1.135 x10^{-3}mm^2/s、0.621、1.680um^2/ms。Standard ADC、D、DDC、MD 与 Ki-67 表达指数呈负相关（$P<0.05$），MK 值与 Ki-67 表达指数呈正相关（$P<0.05$）。
结论 单指数、双指数、拉伸指数模型 DWI 及 DKI 部分参数可预估 STS 组织病理学分级及 Ki-67 表达水平，DKI 对鉴别高低级别 STS 及预估 Ki-67 表达水平能力较不同模型 DWI 更佳。

周围神经重组图像在评价骨肌肿瘤与邻近神经关系中的应用研究

吕喆[1],臧杰[2],张滨[1],那曼丽[1]
1.北京大学首钢医院
2.北京大学人民医院

目的:应用曲面重组（CPR）技术得到周围神经重组图像，在其基础上观察骨肌系统肿瘤与邻近神经的关系，并探讨其在手术治疗中的价值。
方法：收集 2016 年 5 月至 2019 年 4 月间 27 例与周围神经关系密切并行手术治疗的骨肌系统肿瘤病例。术前先进行 CT 容积扫描，应用 CPR 技术对周围神经进行重建，观察病灶与邻近神经关系，根据其影像特点判断神经是否受侵，以术中所见为金标准，进行统计学分析。
结果：27 例（15 例原发软组织肿瘤、9 例原发骨肿瘤、3 例转移瘤）病例中有 25 例（25/27，92.59%）可以在同一层面显示肿瘤与邻近神经的关系，其中有 22 例术前影像判断与术中所见相符（22/25，88.00%）。在神经重组图像中，周围神经呈连续的条索状结构，并与肿瘤在同一层面上中，受侵神经增粗、边缘模糊，增强扫描可见强化。应用神经重组判断肿瘤侵犯神经的敏感性为 100%、特异性为 89.47%、阳性预测值为 75%、阴性预测值为 100%。
结论：周围神经重组图像可以帮助临床医生快速、直观的评价病灶与邻近神经的关系，指导术式的选择、减少术中神经损伤的风险，对神经是否受到侵犯有较高的敏感性和特异性。

OR-454
业余马拉松运动员足部疼痛的 MR 表现及相关因素分析

钱占华,白荣杰,李亚雄,赵海竹,詹惠荔,张恒
北京积水潭医院

目的 研究业余马拉松运动员足损伤的 MRI 表现及 MRI 对足损伤的诊断价值。**方法** 本研究经北京积水潭医院伦理委员会审核批准，并经患者知情同意，于 2018 年 10 月~2019 年 3 月间，招募 48 名业余马拉松运动员，对参与者足部疼痛按足踝损伤程度量表（FASS）分级表进行分级，并行双足 MRI 检查。研究业余马拉松运动员足部疼痛的 MRI 表现特点，并将性别、年龄、参加马拉松运动时间、每周跑步量、完成全程马拉松运动次数与足痛症状进行相关性研究。**结果** FASS 分级 0 级 28 侧，其中男性 8 侧，女性 20 侧，第 1 跖趾关节积液 8 侧、骨髓水肿 6 侧、软组织水肿 4 侧、腱鞘积液 4 侧、无异常发现 6 侧；FASS 分级 1 级 68 侧，其中男性 42 侧，女性 26 侧，跟腱炎 38 侧、足底筋膜炎患者 14 侧、跟腱滑囊炎 12 侧、后踝撞击综合征 4 侧。业余马拉松运动员中足部疼痛的发生率与性别相关（*OR* 值*=1.060，P*=0.043），与年龄（*OR* 值*=0.248，P*=0.078）、完成马拉松次数（*OR* 值*=1.006，P*=0.956）、参加马拉松运动时间（*OR* 值*=1.008，P*=0.944）及每周跑步量（*OR* 值*=0.971，P*=0.407）不相关。 **结论** 在业余马拉松运动员中，足痛者主要是跟腱和足底筋膜损伤，而无足痛症状者主要表现为关节积液、腱鞘积液和骨髓水肿等。性别是业余马拉松运动员足部疼痛发生率的唯一影响因素。MR 检查是明确足损伤的有效方法，在足损伤的诊断和治疗方面具有重要的临床应用价值。

基质诱导的自体软骨细胞移植术的 MRI 评估及其与软骨下骨的相关性

吕嘉玲,林伟强,张隐笛,雷益,李顶夫,朱伟民
深圳市第二人民医院（深圳大学第一附属医院）

摘要 **目的** 探讨基质诱导的自体软骨细胞移植（matrix-induced autologolus chondrocytes implantation, MACI）治疗股骨滑车大面积软骨损伤的疗效以及初步探讨移植物预后是否与软骨下骨的质量相关。**方法** 选取从 2015 年 1 月至 2016 年 11 月在我院接受 MACI 手术的 30 例患者进行随访；用 Lysholm 评分及国际膝关节文献编制委员会分级评估标准（International Knee

Documentation Committee, IKDC）评分问卷行膝关节主观功能评估，在术前及术后进行；软骨移植物的磁共振结果采用软骨修复组织 MR 观察评分（magnetic resonance observation of cartilage repair tissue, MOCART）及 T2*值表示。采用两配对样本的 t 检验评估术前、术后 Lysholm 评分、IKDC 的均值差异；采用 Mann-Whitney U 检验比较分析两组别患者术区软骨移植物与术区旁 6mm 区域 T2*值的差异；采用 Pearson 检验分析软骨下骨的受损面积与移植物 MOCART 评分、T2*值评分的相关性。**结果** 30 例患者术前、术后 Lysholm 为 58.92 ± 10.41、90.15± 6.66（P <0.01），IKDC 评分术前、术后为 56.23±7.81、93.22±5.51（P < 0.01）；软骨移植物 MOCART 评分为 61.63 ±18.47 分；软骨下骨的受损面积与移植物的 MOCART 评分、T2*值有显著的负相关（r=-0.70，P < 0.01；r=-0.71，P < 0.01）；**结论** MACI 对 III-IV° 大面积软骨损伤有较好的近期疗效，可显著改善膝关节功能；软骨下骨的受损面积与移植物的 MOCART 评分及 T2*值呈显著负相关，对移植物的预后起着重要的作用。

动态技术在颈椎动力 MRI 的应用初探

孙琦
上海交通大学医学院附属第九人民医院

目的：本研究通过调节成像参数，以寻求高信噪比和高分辨率的动态成像，并在颈椎过屈过伸位时观察骨质运动、椎管变化，并探讨其临床指导意义。
材料与**方法** （1）志愿者扫描，在其他所有参数保持统一、单一因素改变的条件下，以需求最佳动态扫描成像的各项参数。（2）选择 2019 年 3 月来我院骨科门诊颈椎病患者 30 例，给予颈椎正中矢状位常规扫描及动态核磁共振成像，观察其各椎体骨质及有效椎管等变化，病观察其动态下脊髓受压变化情况。
结果 （1）动态颈椎磁共振最优参数确认。颈椎病患者自由缓慢做伸屈运动，各颈椎锥体骨质清晰显示，椎间隙水平有效椎管矢径屈曲位最大，后伸位最小。（2）C1-C3 锥体与 C4-C6 锥体动态成像之间差异都有统计学意义；C1-C3 锥体椎间隙显示欠清晰。水平后伸位分别与前屈位及中立位之间差异具有统计学意义；C5/6 椎间隙水平三种体位之间差异无统计学意义；C6/7 椎间隙水平后伸位与前屈位之间差异具有统计学意义。颈椎各椎间盘水平受体位及线圈限制，缓冲空间屈曲位最大，中立位次之，后伸位最小，差异都具有统计学意义。
结论 （1）0.5 秒动态颈椎成像显示清晰，信噪比高，可以用于辅助临床诊断。（2）颈椎病患者颈椎运动时，在 C1-C3 存在运动伪影，C4-C7 显示可，两组具有显著性差异。（3）颈椎病患者运动时其椎间隙水平有效椎管矢状径三种体位之间没有变化；其在 C3/4－C6/7 间隙水平后伸位变小；在 C5/6 椎间隙水平后伸位变小，前屈位变大：在 C6/7 椎间隙水平前屈位变大。所有椎间隙水平的缓冲空间前屈位时变大，后伸位时减小。而脊髓矢状径无变化。颈椎有效椎管矢状径在 C4/5.C5/6 节段后伸时变化幅度最大。

多层螺旋 CT 及其图像后处理技术在踝关节处隐匿性骨折中的诊断价值

何绪成,王贵生
解放军总医院第三医学中心

目的 分析踝关节处隐匿性骨折的多层螺旋 CT（MSCT）表现，研究 MSCT 及其图像后处理技术在诊断踝关节处隐匿性骨折的应用价值，为临床诊疗提供帮助。**方法** 收集我院 2016 年 12 月~2018 年 12 月经临床及手术证实的踝关节处隐匿性骨折病例 56 例，对所有患者的 MSCT 资料进行回顾性分析。**结果** MSCT 断层图像诊断出出踝关节处隐匿性骨折 31 例，多平面重组（MPR）诊断出 39 例，容积再现三维成像（VRT）诊断出 32 例，表面阴影显示法（SSD）诊断出 14 例，最大密度投影（MIP）诊断出 7 例，CT 仿真内镜（CT viryual endoscopy）诊断出 5 例；所有方法综合运用诊断出 47 例。MPR 的检出率最高，与其他方法对比均具有统计学意义（P＜0.05）。 **结论** MPR 是 MSCT 及其图像后处理技术中诊断踝关节处隐匿性骨折检出率最高的方法，多种方法联合运用效果最佳，能够为临床诊疗提供更加准确的影像学依据。

肩袖损伤磁共振综合观察（专题讲座）

徐雷鸣,魏建功,朱秀良,孙秀娟,王加伟
浙江大学医学院附属第二医院

目的 肩袖撕裂磁共振诊断已较完备，但时常发生误诊。分析我们失败的原因和近年的体会，提供一些拙见供大家批评指正。**方法** 回顾我院去年肩袖撕裂，手术证实病例 500 例，其中影像诊断与手术对照偏差较大的 37 例。回顾分析全部误诊病例，与手术结果对照，并回顾分析影像，以期改进诊断。肌肉萎缩定量分析，采用 Goutallier 分级。**结果** 附着点短小部分撕裂 13 例，影像表现冈上肌肿胀，裂隙观察较困难，这部分估计需要关节造影。肩袖全层撕裂误诊为部分撕裂 15 例。回顾分析这 15 例，9 例主要是老年人，累及冈上下肌腱，呈慢性陈旧性全层断裂，断端纤维化且纤细，肩峰下滑囊和盂肱关节缺乏积液。但这些患者，肱骨头-肩峰间隙明显狭窄，冈上肌腱难以辨识，更直接的征象是冈上下肌甚至肩胛下肌 Goutallier Ⅲ级以上萎缩。如果事先观察到肩袖肌Ⅲ级以上萎缩，则肩袖肌腱全层断裂诊断就迎刃而解。还有一个问题就是肌肉萎缩程度估计过高，有 10 例，主要是肌肉回缩与萎缩发生误判，这在肩胛下肌萎缩中常见，主要是萎缩程度判断过高。需要充分结合矢状面和 T1WI 横断面，后者对估计肌内脂肪浸润情况十分关键。**结论** 肩袖损伤磁共振评价需要综合观察，非但需要观察肩袖损伤程度和范围的观察，也需要肩袖肌萎缩程度的判断。同时注意区分萎缩和肌肉回缩的区别。

OR-459

T1ρ、T2-mapping 与膝骨关节炎临床评分的相关性分析

高丽香,袁慧书
北京大学第三医院

目的 探讨 T1ρ、T2-mapping 技术与膝骨关节炎（Osteoarthritis，OA）WOMAC 评分之间的相关性。

方法 纳入 53 名符合中华医学会骨科学分会 2007 年修订的膝 OA 的诊断标准的志愿者。对所有入组的志愿者通过病例报告表的方式收集临床资料及性别、年龄等一般资料，由专业的骨科大夫使用 WOAMC 评分量表（Likert 版）评估其临床症状；所有志愿者进行 MR 常规序列和 T1ρ、T2mapping 序列扫描，由专业的放射科大夫分别评估股骨内侧、股骨外侧、胫骨内侧、胫骨外侧、髌骨侧软骨，选取各区域软骨损伤最重部分，勾画感兴趣区测取 T1ρ值和 T2 值。其中男性 16 名，女性 37 名，平均 53.66±8.31 岁。采用 Mann-Whitney U 检验不用性别之间 WOMAC 评分的差异。采用 Spearman 秩相关分析年龄、T1ρ和 T2-mapping 两个序列上的各区域软骨的核磁数值及其总和与

WOMAC 疼痛评分、僵硬评分、功能评分和 WOMAC 总评分之间的相关性。|r|> 0.7，高度相关；0.4 <|r| <=0.7，中度相关，0.2 < |r| <= 0.4，低度相关。检验水准 α 值取双侧 0.05。
结果 1、不同性别之间的 WOMAC 评分没有显著差异（P＞0.05），年龄和 WOMAC 评分未见显著的相关（P＞0.05）。2、股骨内侧髁软骨 T1ρ 值和 WOMAC 疼痛评分、僵硬评分、功能评分及 WOMAC 总评分均具有相关性，除与僵硬评分呈中度相关外，其余均呈低度相关；胫骨内侧软骨 T1ρ 值仅与 WOMAC 功能评分存在着低度相关，其它均不具有相关性。3、股骨内侧髁软骨 T2 值仅与 WOMAC 功能评分和总评分之间存在着低度相关，而其它部位软骨的 T2 值和 WOMAC 评分均不具有相关性。
结论 股骨内侧髁软骨在一定程度上可以反应 WOMAC 评分的情况，T1ρ 技术与 WOMAC 评分之间的相关性较 T2-mapping 好。

业余马拉松运动员踝关节损伤的 MRI 特征及相关因素分析

方义杰,贾韬宇,叶颖,李葳,洪国斌,李绍林
中山大学附属第五医院

目的 探讨业余马拉松运动员踝关节损伤原因、特点和影像学表现。**方法** 2018 年 12 月至 2019 年 3 月按研究纳入和排除标准，收集业余马拉松运动员作为受试对象。通过问卷调查收集相关资料，并对受试者行踝关节 MRI 平扫检查，采用踝关节专用相控阵线圈，分别行快速自旋回波序列（TSE）冠状面 T1WI，质子密度加权抑脂序列（PDWI-FS)横断面、冠状面及矢状面扫描，三维-双回波稳态序列（3D-DESS）及三维-可变翻转角快速自旋回波序列(3D-SPACE)扫描。检查结果由 2 名医师对韧带、肌腱、骨髓等踝关节影像表现进行综合分析，两者意见不一致时由第 3 名医师进行判定作为最终诊断；分析不同跑姿、参加马拉松的次数及训练强度与踝关节损伤的关系 ，统计采用独立样本 x^2 检验，2 名医师的一致性采用 kappa 检验。结果 根据纳入及排除标准，最终纳入受试者 39 名，64 侧踝关节，右踝 35 侧、左踝 29 侧。2 名放射科医师有较好的一致性，Kappa 值为 0.91。跑姿中，后脚掌着地较前、中脚掌着地韧带损伤发生率明显增加，差异有统计学意义（P=0.013，x^2 值为 6.191）。前、中脚掌着地较后脚掌着地肌腱损伤发生率目明显增加，差异有统计学意义（P=0.029，x^2 值为 4.775）；训练量较大者（训练跑步量≥300 km/个月）踝关节损伤较显著（P=0.005，x^2 值为 7.844）。结论 业余马拉松志愿者踝关节运动损伤的 MRI 影像表现特征与不同的跑姿及训练强度有关。

髌骨脱位的影像诊断及术后评估的讨论

王慧
上海交通大学附属第六人民医院

目的 利用 CT 和 MRI 对髌骨脱位患者进行进行术前及术后检查，对比两种检查方法的优缺点。**方法** 对 19 名髌骨脱位患者，有外伤史 17 名，无明显外伤史 2 名，年龄 11-46 岁，平均 21.5 岁，分别进行术前及术后的 CT 及 MRI 检查，结果与关节镜术中观察情况进行对比，比较其诊断髌骨脱位的准确率及术后状态的评估。**结果** CT 及 MRI 对膝关节脱位髌骨内移度的诊断准确率相仿,对于其术后状态的髌骨的复位情况，关节内积液，韧带情况及周围水肿度的比较 MRI 较 CT 有较大优势。**结论** 髌骨脱位术前诊断 CT 和 MRI 相仿，但是术后 MRI 能更准确的显示其术后状态，更有利于其术后关节功能的评价，而 MRI 术后评价与其远期疗效的评定需要进一步观察。

Detection of Bone Marrow edema in stress injury of lower extremity by using DECT：Comparison study with MR imaging

Lei Xu,Yue fen Zou
The First Affiliated Hospital of Nanjing Medical University

Abstract
Objective: To evaluate the performance of dual-energy computed tomographic (DECT) virtual noncalcium images for the detection of bone marrow edema in patients with clinically suspected stress injury of lower extremity.
Matetial and methods: This prospective study includes 24 patients who had stress injury in the lower extremity from January 2018 to July 2018. DECT and 3.0T magnetic resonance image were performed within 1 week of each other. DECT was performed with a tube voltage of 90KV and 140 KV. Two radiologists evaluated the virtual noncalcium images for bone edema in the injury of lower extremity. Reference standard was the result of the MRI images. Performance characteristics (sensitivity, specificity, accuracy) were performed to evaluate the diagnostic value between DECT and MRI.
Results: The Sensitivity was 91% and 95% and Specificity was 100% and 100% and Overall accuracy was 92% and 96% for both observers, respectively. There was near-perfect agreement between the two readers (κ = 0.89).
Conclusion: DECT virtual noncalcium images were able to demonstrate bone marrow edema of stress injury in the lower extremity.

马拉松运动足踝关节损伤的影像学研究现状

陈萍,马湘乔
中国人民解放军北部战区空军医院

马拉松运动是一项在公路上举行的超长距离的（42.195 公里）比赛。近几年来，随着全民健身的普及和推广，马拉松运动越来越受到大众的欢迎。
跑步已被证明对身体的不同系统有明显的益处：可以降低患心血管疾病，糖尿病和精神疾病的风险。然而长距离跑步是否会产生不良影响仍存在争议，是否会导致急性或慢性损伤，或者是否会加速关节炎的发生，是否导致更多的运动损伤仍需进一步追踪和研究。

Quantitative T2 mapping-based tendon healing can predict the clinical outcomes during the first year after arthroscopic rotator cuff repair (ARCR)

yuxue xie,Hongyue Tao,Yiwen Hu,Yuyang Zhang,Rong Lu,Shuang Chen
huashan hospital fudan university

Purpose: Rotator cuff repair using arthroscopic double-row technique enables a better tendon healing at the footprint region. The objective of this study was to determine whether quantitative T2 mapping-based tendon healing and muscle fatty degeneration could predict the clinical outcomes during the first year after arthroscopic rotator cuff repair (ARCR) using double-row technique.

Methods: Twenty-two patients with rotator cuff tear were prospectively recruited. Serial clinical and MRI follow-up assessments were carried out at: 1 month, 6 months and 12 months. Twenty healthy volunteers were involved and performed with MRI examinations. A standard protocol including quantitative T2 mapping sequence was used to determine repaired tendon integrity, tendon healing and fatty degeneration. Pearson's correlation coefficient was used to analyze correlations between MRI measurements and clinical outcomes.
Results: All clinical scores including functional assessments and pain ranking scale indicated significant improvement compared with preoperative scores ($P<0.001$) and all the affected shoulders returned to daily activities at 12 months. The T2 values at the healing site significantly decreased over time ($P<0.001$), and the mean T2 value at 12 months was comparable to healthy controls ($P=0.49$). Additionally, the T2 values at the healing site significantly correlated with clinical results ($P<0.05$), but the T2 values of cuff muscles didn't significantly correlate with clinical outcomes ($P>0.05$).
Conclusions: Tendon healing was featured by decreased T2 values. T2 mapping-based tendon healing could predict clinical outcomes in the first follow-up year. Furthermore, the repaired tendons at 12 months were almost mature compared to healthy controls based on biochemical T2 values. However, quantitative T2 mapping-based fatty degeneration should not be used as an objective test to evaluate the clinical outcomes. The results from this study will allow clinicians to evaluate tendon-specific health to determine whether the tendon healing is mature enough to return to activities during the first postoperative year.

The MR appearance of spinoglenoid notch cyst

Shitong Liu
The Affiliated Hospital of Qingdao University

Objective To analyze the MRI appearance of spinoglenoid notch cyst(SNC). **Methods** MRI data of 28 cases of SNC confirmed by histopathology were analyzed retrospectively. **Results** All 28 SNC located in spinoglenoid notch, 22 cases were on the right side. All of the cysts were hypointense on T1 weighted imaging(T1WI) and hyperintense on both T2 weighted imaging(T2WI) and proton density weighted imaging(PDWI). Hypointense band-like separation could be seen in 25 cases. The size and shape of SNC vary dramatically. 9 cases combined with superior labrum anterior posterior lesion(SLAP). On oblique sagittal fat-suppressed PDWI, suprascapular nerve compressed by SNC could be discovered in 12 cases. Edema of infraspinatus could be observed in 4 cases.

Conclusion MRI could provide accurate location and characteristic diagnosis of SNC. SNC could cause symptoms regardless of size and shape. SLAP lesion was closely related to the occurrence of SNC. The occurrence of low signal separation was helpful in distinguishing cysts from effusion.

OR-466
踝关节外侧副韧带急、慢性损伤 MR 与高频超声的联合诊断价值

赵晖,张越,袁宇,曾宪铁,赵嘉国,曹毅,万业达
天津市天津医院

目的 探讨 MR 与高频超声联合诊断踝关节外侧副韧带急、慢性损伤的价值
材料与方法 回顾性分析天津医院足踝外科收治手术的 65 例急、慢性踝关节外侧副韧带损伤患者的 MR 检查与高频超声检查资料，并以踝关节镜手术结果作为“金标准”。本组病例中男性 47 例，女性 18 例，年龄 15-61 岁，平均 31.7 岁；病程从 4 小时-10 年，平均 6.3 个月；急性损伤 29 例，慢性损伤 36 例；病因：扭伤 36 例，运动损伤 15 例，交通事故 11 例，坠落伤 3 例；损伤部位：右踝 35 例，左踝 30 例。所有患者均使用美国 GE 公司 MR750 DISCOVERY 3.0T 核磁共振扫描仪行核磁检查，使用美国公司 GE LogicE9 进行彩色多普勒超声检查。
结果 MR 检查诊断单纯距腓前韧带完全断裂 8 例，大部分断裂 12 例；单纯跟腓韧带完全断裂 2 例，距腓前韧带+跟腓韧带联合损伤 31 例，陈旧性损伤 7 例，距骨软骨损伤 12 例，骨折 15 例，骨挫伤 29 例，滑膜炎伴积液 39 例。手术符合率达 93.8%。超声诊断单纯距腓前韧带完全断裂 8 例，大部分断裂 11 例；单纯跟腓韧带完全断裂 2 例，距腓前韧带+跟腓韧带联合损伤 30 例，陈旧性损伤 7 例，骨折 11 例，滑膜炎伴积液 39 例，手术符合率达 90.2%，软骨损伤及骨挫伤则未能诊断。
结论 踝关节镜手术对比，核磁与超声对距腓前韧带损伤、滑膜炎伴积液诊断符合率基本一致；诊断跟腓韧带损伤，超声较 MR 有优势，MR 检查需要精确的扫描角度，而超声可以沿着韧带走行方向检查；陈旧性韧带损伤，MR 主要表现为韧带增粗，信号异常，超声则表现为韧带厚薄不均、回声减低、张力减弱；骨折的诊断，由于超声检查视野所限，诊断不如 MR；软骨损伤和骨挫伤，核磁检查与术中所见基本一致，而超声则不能诊断；在诊断上，MR 可以多位医师会诊，超声则依靠检查医师的个人经验。综上所述，外侧副韧带损伤的诊断要依据 MR 与超声的联合检查，能对临床治疗方案提供最佳的帮助。

OR-467
应用 T2 mapping 成像评价马拉松前后膝关节软骨短中期改变

陈小帅,赵建
河北医科大学第三医院

目的 应用 T2 mapping 成像评价非专业长跑者马拉松前后膝关节软骨短中期改变。
方法 招募 12 名非专业马拉松运动员，年龄 21.0~37.0 岁，体质量指数（body mass index, BMI）17.6~27.2 kg/m2。入组受试者平均每周跑步 3 次以上，每次运动时间约 30 min，24 个膝关节在赛前 1 周、赛后 12 h 内及 2 个月时行 MR 扫描。应用 T2 mapping 成像测量膝关节股骨内髁（MFC）、股骨外髁（LFC）、胫骨内侧平台（MTP）、胫骨外侧平台（LTP）、髌骨（Patella）和滑车（Trochlea）各亚区软骨的浅层（SZ）、深层（DZ）T2 值。赛前与赛后软骨 T2 值比较选用配对 t 检验，软骨浅层与深层 T2 值比较选用独立样本 t 检验。

结果　T2 mapping 成像示关节软骨浅层 T2 值在赛前、赛后 12 h 内及 2 个月随访时均高于深层，差异有统计学意义（t=11.095、10.385、10.102，P 值均<0.01）。赛后 12 h 内关节软骨浅层 T2 值较赛前低，差异有统计学意义（t 值为 2.18,P<0.05）；关节软骨深层 T2 值与赛前相比，差异无统计学意义（t 值为 1.832,P>0.05）。赛后 12 h 内除 MTP-DZ 外，余软骨 T2 值均呈降低趋势，其中 MFC-DZ 与赛前比较差异有统计学意义（t=2.11,P 值<0.05）。赛后 2 个月随访时，2 名受试者失访，大部分亚区软骨 T2 值与赛前相比差异无统计学意义（P 值均>0.05），LFC-SZ 和 LFC-DZ 与赛前相比差异有统计学意义（t=2.378、3.147,P 值<0.05）。
结论　T2 mapping 成像 T2 值的变化可以反映马拉松长跑者关节软骨内组织结构的变化过程，在压力作用下，软骨浅层 T2 值的变化更为显著。膝关节软骨的 T2 值在跑后 2 个月可逐渐恢复到跑前水平。

OR-468

MR 对非职业马拉松运动员髋部骨髓转化的评价

冷群,常晓丹
大连大学附属中山医院

目的　通过 3.0 T MR 成像（MRI）T_1加权像（T_1WI），观察无症状非职业马拉松运动员髋臼及股骨近端骨髓信号，评价骨髓转化情况。
方法　随机选取近 2 年≥1 次/年参加并完成全程马拉松比赛，长跑训练里程不少于 1600 km，髋关节无症状、查体无异常，22~53 岁的 31 名（62 个髋）志愿者为研究组。对照组随机选取 23~53 岁的 29 名健康者（58 个髋），无髋关节痛，不常运动。受试者均进行髋关节 MR 扫描，且显示正常。MR 扫描前至少 12 h 未从事长跑及其他运动。对髋臼及股骨近端各部位骨髓 T_1WI 信号与周围肌肉及脂肪相比，将信号强度由低到高分为 0～4 级，进行分级评价；并将研究组按马拉松训练年限（跑龄）分为 2 组，跑龄大于等于 4 年为 A 组、小于 4 年为 B 组，并进行组间比较。对股骨近端骨髓信号分布采用较直观的 3 型 4 分法进行分型评价。本研究结果为等级资料，采用 Mann-Whitney U 检验进行统计分析。
结果　骨髓信号分级评价，研究组共 62 个髋 384 个部位中观察骨髓信号，对照组共 58 个髋 348 个部位中观察骨髓信号，两组间所观察髋臼、股骨头、股骨颈、粗隆间、大粗隆、股骨干上段骨髓信号等级分布差异均有统计学意义（P <0.05）。研究组组间比较，A 组 14 名、28 髋、168 个部位，B 组 17 名、34 个髋、204 个部位，骨髓信号等级分布，髋臼、股骨头、股骨颈、粗隆间、大粗隆、股骨干上段骨髓信号差异均有统计学意义（P<0.05）。对股骨近端骨髓信号分型评价，研究组与对照组分别为 62 个、58 个股骨近端骨髓信号分型结果，两组间比较差异有统计学意义（P <0.05）。
结论　无症状非职业马拉松运动员髋臼及股骨近端骨髓 T_1WI 信号强度较非马拉松运动员低；跑龄长者髋臼、股骨颈、股骨干上段骨髓 T_1WI 信号强度较低；即马拉松运动对髋臼及股骨近端骨髓信号具有一定影响，且骨髓信号改变与运动量具有一定相关性。

椎体成形术后并发症的影像学诊断

杨海涛
重庆医科大学附属第一医院

目的　探讨椎体成形术后的影像学表现，提高对其并发症的诊断能力。

方法 回顾性分析 2011.5-2016.5 在我院进行影像学检查的椎体成形术患者资料共 182 例，其中行 X 线平片检查者 119 例，CT 检查者 38 例，MR 检查者 25 例(同一患者前后 X 线平片检查记录为 1 例，同时做 X 线和 CT 或 MR 检查者分开记录)。分析术后椎体的形态、高度及骨水泥的位置，评价骨水泥渗漏、感染和邻近椎体继发压缩骨折等并发症的发生率及表现。
结果 发现骨水泥渗漏者共计 21 例，发生率约 11.6%，其中渗漏入椎管者 16 例、椎间孔者 8 例、椎间盘者 3 例、椎后静脉丛者 6 例、椎前静脉者 5 例、下腔静脉者 1 例，同时合并肺动脉栓塞引发肺炎者 2 例（若同时渗漏入多个部位则分开记录）。影像学表现为相应椎管内硬膜外、椎间孔区平片和 CT 可见高密度骨水泥渗漏聚集；进入血管者表现为椎体周缘高密度血管影显示，类似于血管造影；MRI 则各序列均呈低信号改变。合并感染者 2 例，发生率 1%。影像学表现平片无明显阳性发现，CT 表现为椎体骨质密度不均，散在局限性低密度区，但不易诊断；MRI 更有价值，可见椎体信号不均匀，明显增多的骨髓水肿样 T2W 高信号，1 例同时累及椎间盘，可见终板破坏，椎间盘 T2W 信号增高，周围软组织肿胀。12 例患者在随访过程中发现相邻椎体继发压缩性骨折，最短者 3 个月，最长者 1 年，发生率约 6%。
结论 椎体成形术是临床常见骨科手术之一，最常见并发症是骨水泥渗漏入椎管和血管内，若进入血管应注意并发肺动脉栓塞；椎体感染较少见，MRI 更有价值；随访过程中因注意相邻上下椎体继发压缩性骨折。

膝关节轻度屈曲位 MR 横断面测量值对复发性髌骨脱位的诊断价值

刘丽思
华中科技大学同济医学院附属同济医院

目的 利用 MRI 对复发性髌骨脱位患者进行横断面骨性结构定量测量分析，探讨此类患者在膝关节轻度屈曲位横断面测量指标的诊断价值。**方法** 对比分析 30 例临床诊断复发性髌骨脱位患者（病变组）及 30 例与之年龄、性别及体质量指数（Body mass index，BMI）相匹配健康志愿者（对照组）。利用八通道膝关节专用线圈，在轻度屈曲位（约 10°）MRI 横断面上测量股骨滑车面对称性、外侧滑车倾斜度、滑车深度、髌骨倾斜角、外移度、股骨滑车与胫骨结节的水平距离（Tibial tuberosity-trochlear groove distance，TTTG）。利用独立样本 t 检验比较这些测量值在病变组和对照组之间是否存在统计学差异。采用受试者工作特征（Receiver operating characterisitic，ROC）曲线观察各测量指标曲线下面积，以约登指数最大点作为诊断界值，计算各指标诊断复发性髌骨脱位的敏感度和特异度。**结果** 1、病变组股骨滑车面对称性、外侧滑车倾斜度、滑车深度较对照组显著减小，差异有统计学意义（P 值均＜0.05）。病变组髌骨倾斜角、外移度、TTTG 值较对照组显著增大，差异有统计学意义（P 值均＜0.05）。2、股骨滑车面对称性、外侧滑车倾斜度、滑车深度、髌骨倾斜角、外移度和 TTTG 值诊断复发性髌骨脱位 ROC 曲线下面积分别为 0.940、0.955、0.948、0.973、0.970、0.852，其诊断界值分别为＜56.5%、＜15.0°、＜4.5mm、＞10.7°、＞-2.4mm、＞9.7mm，诊断的敏感度分别为 90.0%、86.7%、96.7%、93.3%、93.3%、70.0%，特异度分别为 86.7%、93.3%、83.3%、93.3%、93.3%、86.7%。 **结论** 在膝关节轻度屈曲位，股骨滑车面对称性、外侧滑车倾斜度、滑车深度、髌骨倾斜角和外移度对复发性髌骨脱位具有较好的诊断价值。

OR-471
扩散张量成像在评估业余马拉松运动员跑步前后大腿骨骼肌变化的初步研究

张莉,周静,丁建平
杭州师范大学附属医院

目的 运用 MR 扩散张量成像（diffusion tensor imaging，DTI）技术，定量分析业余马拉松运动员大腿骨骼肌在半程马拉松跑步前后的微观分子水平变化。
方法 招募符合纳入标准的业余马拉松运动员 10 名（男性 6 名，女性 4 名）。所有被试者在跑前及半程马拉松后 3h 内均行双侧大腿轴面 T1WI、T2WI 及 DTI 扫描，应用 Siemens Neuro 3D 后处理软件对图像进行后处理分析，测量双侧大腿股四头肌、内侧群骨骼肌及腘绳肌的 FA 值及 ADC 值。采用单因素重复测量检验比较跑步前后大腿骨骼肌 DTI 参数的差异性。
结果 跑步后股四头肌的 FA 值较跑前显著降低，差异具有统计学意义（F=5.843，P<0.05），而大腿内侧群骨骼肌及腘绳肌在跑步前后的 FA 值变化无明显统计学差异（P>0.05）；股四头肌、大腿内侧群骨骼肌及腘绳肌 ADC 值在跑步前后的变化无统计学差异（P>0.05）。
结论 在常规 MR 成像无阳性发现的情况下，DTI 技术能在微观分子水平早期无创地评估业余马拉松运动员跑步前后双侧大腿骨骼肌的改变。

OR-472
55-65 岁中国老年女性在隔代抚养中腰椎疲劳风险的有限元分析

李娜
中南大学湘雅三医院

目的 在中国的 5 5 岁到 6 5 岁之间的老年妇女，约 66.47%充当带孙儿孙女的角色，而频繁的负重（抱孩子）的动作增加了腰椎慢性疲劳的风险。本文利用有限元方法 模拟中国女性抱小孩的行为，分析验证脊柱松质骨的应力集中效应，并对应力集中位置进行疲劳仿真和预测，对中国老年女性在隔代抚养时的腰椎保护具有很大的指导意义。
方法 根据无退行性临床症状的中国老年女性腰椎 CT，进行图像分割和三维重建，建立具有中国老年女性腰椎特点的腰椎三维几何模型，在三种载荷条件下计算分析脊柱松质骨局部应力和应变分布情况，选取关键位置进行疲劳仿真，预测不同疲劳载荷强度下脊柱松质骨的疲劳耐受极限。
结果 腰椎椎间盘内压受力最大部位在弯腰不抱小孩状态下，弯腰抱小孩和直立之后，都在 L5-S1 之间，分别为 3.56 Mpa，5.38 Mpa 和 1.47 Mpa ；腰椎椎体上下的终板软骨受力最大部位，在弯腰不抱小孩状态下，弯腰抱小孩和直立之后，都在 L5 的上下终板软骨的边缘，分别为 16.55 Mpa ，23.58 Mpa 和 26.55 Mpa；腰椎椎体在弯腰无负重，弯腰抱小孩和抱起孩子直立三种状态下，受力最大的位置均在 L5 的侧后方，对应的疲劳极限次数分别为 1 000 000 次以上，1 300 次，18 次。
结论 中国老年女性如果连续抱三岁孩子直立的动作次数超过 18 次，L4-L5 的椎体后部以及椎弓根松质骨将面临疲劳性损伤的风险，研究结果 对于保护老年女性的腰椎健康具有很大的意义。

OR-473
无症状业余马拉松运动员踝关节损伤的 MR 特征及相关因素分析

姚婉贞,张晏境,张莉,郑孝众,张懿,周静,丁建平
杭州师范大学附属医院

目的 分析无症状业余马拉松运动员踝关节损伤的 MR 特征及损伤的影响因素。**方法** 招募本地区 63 名业余马拉松运动员作为研究对象，其中男性 38 名，女性 25 名，均无任何踝关节不适症状。所有研究对象行 MRI 踝关节扫描，采用踝关节专用相控阵线圈，扫描序列包括快速自旋回波 T_1WI 序列、脂肪抑制质子密度加权像序列(PDWI-FS)、脂肪抑制快速自旋回波 T_2WI 序列(T_2WI-FS)和三维双回波稳态序列(3D-DESS)。两个或多个独立样本率的比较采用 Fisher 精确检验。采用 Logistic 回归性检验分析损伤的影响因素。**结果** 骨质损伤主要表现为骨髓水肿、囊变及应力性骨折。其中骨髓水肿共 14 例；囊变 5 例；应力性骨折 1 例。韧带损伤主要表现为部分损伤，未见完全损伤。其中距腓前韧带损伤 41 例；距腓后韧带损伤 40 例；跟腓韧带损伤 40 例；内侧三角韧带损伤 16 例；下胫腓前韧带损伤 16 例；下胫腓后韧带未见损伤。跟腱损伤主要表现为跟腱滑囊炎及跟腱炎。其中跟腱滑囊炎 19 例；跟腱炎 22 例。其余肌腱损伤主要表现为腱鞘积液。其中踇长屈肌腱腱鞘积液 52 例；趾长屈肌腱腱鞘积液 29 例；胫骨后肌腱腱鞘积液 51 例；腓骨长短肌腱腱鞘积液 12 例；趾长伸肌腱腱鞘积液 4 例；胫骨前肌腱腱鞘积液 5 例；未发现踇长伸肌腱腱鞘积液。软组织水肿 15 例。经 Logistic 回归分析发现性别、落地模式、跑龄、周跑量及配速与损伤具有相关性（P＜0.05）。**结论** 无症状业余马拉松运动员由于长期反复的训练及比赛容易造成踝关节损伤，主要 MR 特征为外侧副韧带部分损伤、跟腱损伤及腱鞘积液。而且，性别差异、落地模式不同、跑龄高低、周跑量多少及配速高低是造成踝关节损伤的影响因素。

基于 MR 扩散张量成像分析业余马拉松运动员大腿肌肉的性别及肌群间差异

周静,丁建平
杭州师范大学附属医院

目的 利用 MR DTI 技术分析业余马拉松运动员双侧大腿肌肉扩散参数的性别及肌群间差异。
方法 对所有符合纳入标准的 20 例男性业余马拉松运动员及 17 例女性业余马拉松运动员行双侧大腿轴位磁共振 T1WI，T2WI 及 DTI 扫描。采用两独立样本 T 检验分析比较两组双侧大腿前群（股直肌，股内侧肌，股外侧肌，股中间肌）、内侧群（大收肌，长收肌）及后群（股二头肌长头，半腱肌，半膜肌）肌肉扩散参数值（FA 值、ADC 值）。采用 Kruskal-Wallis 检验分别分析比较男性和女性大腿前群、内侧群和后群肌肉之间的差异性。
结果 男性组股直肌、股外侧肌、大收肌、股二头肌长头、半腱肌、半膜肌 FA 值以及前群肌肉 FA 值均值、后群肌肉 FA 值均值分别为 0.28±0.06、0.22±0.06、0.22±0.03、0.25±0.05、0.29±0.05、0.27±0.04、0.23±0.03、0.27±0.04 均低于女性组[FA 值分别为 0.35±0.07、0.26±0.06、0.24±0.02、0.24±0.02、0.36±0.06、0.31±0.06、0.26±0.03、0.31±0.06]（P 值均<0.01）。两组间仅股内侧肌 ADC 值[男性组为（1.82±0.13）×$10^{-3}$$mm^2$/s，女性组为（1.71±0.08）×$10^{-3}$$mm^2$/s，P<0.01]、半膜肌 ADC 值[男性组为（1.74±0.13）×$10^{-3}$$mm^2$/s，女性组为（1.82±0.12）×$10^{-3}$$mm^2$/s，P=0.007]有统计学差异。男性组大腿前群与后群肌肉、内侧群与后群肌肉间 FA 值有差异（P<0.01），前群与内侧群肌肉间 FA 值无统计学差异，三组肌肉间 ADC 值均无统计学差异。女性组得到相同结果。

结论 DTI 技术能够无创定量反映业余马拉松运动员大腿肌肉的性别差异和肌群间差异，这有助于指导不同性别马拉松运动员的训练和比赛。

MRI T2mapping 序列在肩袖损伤病变中的诊断价值

刘新新,马晓文
西安市红会医院

目的 常规 MRI 诊断肩袖病变有一定局限性，定量 MRI T2mapping 可以敏感的显示生化改变，本研究探讨利用 T2mapping 定量评价冈上肌腱在无症状健康志愿者组、肌腱炎组及部分撕裂组的 T2mapping 值，比较冈上肌腱差异性。
方法 选取 2017 年 3 月至 2018 年 3 月冈上肌腱撕裂 15 人，肌腱炎 10 人，对照组选取无症状健康志愿者 15 人。所有研究对象行肩关节 MRI 常规序列及 T2mapping 检查。冈上肌腱评价选取斜冠状位在肱骨头的足印侧至肱骨头最内侧的范围，均分为 3 等分，即外侧部、中间部及内侧部，每一区再均分为前后两部分，共 6 区。两位影像医生分别间隔两周测量冈上肌腱在各区的 T2 值，再计算平均 T2 值。利用单因素方差分析 Welch ANOVA 及 Games-Howell 检验，比较不同解剖分区下 3 组冈上肌腱差异性。同时将测量结果进行组内及组间一致性 ICC 检验。
结果 在冠状位前外侧区，冈上肌腱 T2 值在撕裂组为 44.59±8.19，明显高于肌腱炎组 34.92±2.55（P=0.000）、无症状组 33.48±3.51（P=0.001）。在冠状位后外侧区，冈上肌腱 T2 值在撕裂组为 46.55±8.83，高于肌腱炎组 38.85±5.51（P=0.034）、无症状组 33.36±3.79（P=0.001）。但在冠状位中间及内侧区，各组间 T2 值无明显差异。组内及组间有较好的一致性（ICC＞0.75）。
结论 T2mapping 作为非侵入性方法可以定量评价早期肩袖病变。在冠状位外侧区，通过测量冈上肌腱 T2 值有助于对正常肌腱的判断，同时提高对肌腱炎及肌腱撕裂的诊断准确性。利用 T2mapping 对退变肌腱及撕裂肌腱量化分析，临床医生可以对冈上肌腱病变精准诊断，并且可为临床治疗方案的选择及疗效评估提供指导。

业余马拉松运动员与健康志愿者膝关节软骨的 T2* 值定量研究

张晏境,丁建平
杭州师范大学附属医院

目的 运用定量 T2* mapping 技术研究业余马拉松运动员与健康志愿者的膝关节软骨生成分的差异。
方法 招募 25 名男性业余马拉松运动员及 14 名健康志愿者，分别进行右膝关节 T1WI、质子密度加权像(proton density weighted image, PDWI)、三维双回波稳态（Three-Dimensional Double-Echo Steady-State, 3D-DESS）、T2* mapping 序列扫描。将膝关节软骨分为股骨髁内侧软骨、股骨髁外侧软骨、胫骨平台内侧软骨、胫骨平台外侧软骨、髌软骨及滑车软骨六部分，所有软骨再根据厚度 1/2 分为深层、浅层，勾画感兴趣区得到相应区域的 T2*值。利用独立样本 t 检验膝关节软骨的 T2*值差异。
结果 与健康志愿者相比，业余马拉松运动员的股骨外侧浅层软骨 T2*值显著减低（t=2.373，P<0.05），其余各软骨区域 T2*值差异均无统计学意义（P均>0.05）。

结论 利用 T2* mapping 定量磁共振成像技术能够间接反映关节软骨生化成分改变。长期运动引起膝关节软骨的 T2*值变化是不均匀的。

OR-477
The value of dsct identification of MSU on the diagnosis of gout

Xuekun Zhang
Ruijin Hospital, Shanghai Jiaotong University School of Medicine

OBJECTIVE: To know more the clinical characteristics of local gout and improve the level of clinical recognition by analyzing the clinical data of patients in Guangxi Province; To explore the value of DSCT in the diagnosis of gout and the peculiarity of MSU on DSCT. METHODS: 1. 102 cases of patients visited the Department of Rheumatology and immunology, the First affiliated Hospital of Guangxi Medical University ,who suspected gout with clinical data. 2. Examine the sensitivity and specificity of DSCT diagnosis of gout. 3. Measure the volume of MSU by DSCT and analyze the correlation with the age, course of disease, the number of nodules and the biochemical indexes; Analyze the deposition site of MSU. 4.Discuss the authenticity of the toe nails green pseudo color. 5. 20 cases of patients before and after treatment, check the MSU site and volume change by DSCT. RESULTS: Among the 102 patients, 86 cases were confirmed gout,with the mean age (55.8 ±12.7) years old, average duration of (91.7±63.6) months, average suffering age of (47.8 ± 11.8) years old, and mean serum uric acid level of (497.3± 112.9)μmol/L, mean creatinine (122.2±67.8).Positive C reaction protein was 89.7%;Positive of ESR was 85.9%; Positive RF was 42.9%. 83.7% patients had complications, the most common were hypertension, hyperlipidemia, diabetes. The uric acid salt is easer deposited in the lower limb joint, which is the foot joint, the knee joint and the ankle joint. The sensitivity and the specificity of DSCT for diagnosis of gout were 96.5% and 87.5%.The volume of MSU was from1mm3 to 279.55cm3 .The median was 2.52cm3.There was no statistically significant between the volume of MSU and the age, course of disease, serum uric acid, serum creatinine,but the number of crystals. It has statistically significant about the volume of green color on the toe nail between the gout group and the non-gout group . CONCLUSION: 1. Gout occurs in young and middle-aged men, the course of the disease involving multiple joints, often accompanied by a variety of metabolic diseases. 2. DSCT has high sensitivity and specificity on diagnosis of gout; And plays an important role in many clinical departments. 3. There was no correlation between the volume of MSU and the age, course of disease, the level of serum uric acid and creatinine. But a positive correlation with the number of crystals. 4.When the toe nails show green color, some of them are meaningful. And it should be analyzed, which can improve the accuracy of DSCT. 5. DSCT can be used to monitor the condition of gout. KEYWORDS DSCT, gout, MSU, serum uric acid

OR-478
腕关节 MR 评估类风湿关节炎病情活动度的临床价值及意义

陈琪,龚沈初
南通市第一人民医院（南通大学第二附属医院）

目的 探讨联合运用腕关节 MR 影像学指标、临床参数及实验室指标对类风湿关节炎（RA）疾病活动度的评估价值。
方法 回顾性分析 2018 年 9 月至 2019 年 7 月在我院就诊的连续性 RA 患者 64 例，按照患者 28 关节病情活动度评分（DAS28）进行分组，其中 DAS28＞3.2 组 47 例，DAS28≤3.2 组 17 例；根据腕关节滑膜强化程度及累及范围将滑膜炎、骨髓水肿、骨侵蚀进行半定量评分，腱鞘炎进行定性评估。采用独立样本 t 检验比较两组间腕关节 MR 各影像指标评分和实验室指标；采用 Spearman 相关分析评价各参数与 DAS28 的相关性，采用 ROC 评价各参数鉴别两组的诊断效能，并采用 Z 检验比较各参数 ROC 下面积的差异。将独立样本 t 检验差异有统计学意义的参数作为自变量进行线性回归分析获得 RA 病情活动度的重要预测因素。
结果 DAS28＞3.2 组与 DAS28≤3.2 组腕关节 MR 的滑膜炎、骨侵蚀、RAMRIS 及 CRP、ESR 差异均有统计学意义(P＜0.05)，而骨髓水肿、腱鞘炎、性别、年龄、RF 及抗 CCP 抗体差异均无统计学意义(P＞0.05)。RA 病情活动度与腕关节 RAMRIS、滑膜炎、骨髓水肿评分呈正相关（r=0.463，0.420，0.345，P＜0.001），RA 病情活动度与病程、抗 CCP 抗体、腱鞘炎无明显相关(P＞0.05)。RAMIRS、滑膜炎总分、骨侵蚀、骨髓水肿鉴别 DAS28＞3.2 的 ROC 曲线下面积分别为 0.737、0.706、0.701、0.608；回归分析显示 RAMRIS 是病情活动度的重要预测因素。
结论 腕关节 MR 可以用于评估类风湿关节炎的病情活动度，RAMRIS 是重要预测因素。

中老年髋部脆性骨折患者骨性关节炎的发生率及体质指数相关分析

陈其春[1,2],袁贵斌[3,2],王玲[2],管松[1],程晓光[2]
1.安徽医科大学第二附属医院
2.北京积水潭医院放射科
3.云南省第三人民医院放射科

目的 探究中老年髋部脆性骨折患者骨性关节炎（Osteoarthritis，OA）发生率及其身高、体重及 BMI 的关系。 **方法** 将 455 例中老年人髋部脆性骨折患者按年龄分为 2 组，50～74 岁组 207 例，男 47 例，女 160 例，≥75 岁组 248 例，男 95 例，女 153 例。依据 Kellgren-Lawrence（K/L）分级法、图谱对照，评估患者健侧髋关节 X 线平片，K/L≥2 级为 OA 诊断标准。比较各年龄组患者身高、体重和 BMI 及骨折部位的差异；评价髋部 OA 发生率与患者年龄的相关性；比较男女 OA 组与非 OA 组患者身高、体重及 BMI 的差异；比较超重组与非超重组 OA 发生率的差别。**结果** 同年龄组男女患者身高、体重差异均有统计学意义（P＜0.001），≥75 岁组男女 BMI 差异有统计学意义（P＜0.05）；K/L 分级法对中老年髋部脆性骨折患者 OA 的总体检出率为 10.33%（47/455），50-74 岁组 8.21%（17/207），≥75 岁组 12.10%（30/248）；OA 组与非 OA 组身高、体重及 BMI 差异均无统计学意义（P＞0.05）；髋部脆性骨折患者超重组与非超重组 OA 发生率无差别（P＞0.05）。**结论** 髋部脆性骨折患者 OA 发病率高龄组比低龄组高；女性高龄组粗隆间骨折发病率明显较低龄组高；髋部脆性骨折患者超重组与非超重组 OA 发生率无差别。重度 OA 在髋部脆性骨折患者中少见。

25 例腰骶椎布氏杆菌脊柱炎的影像学表现分析

黄世廷,田军
山东省医学影像学研究所

目的　探讨 25 例腰骶椎布氏杆菌性脊柱炎（BS）的影像学特征，以提高对本病的诊断及鉴别诊断水平
方法　回顾性分析 2012 至 2017 年本院经临床和/或病理证实的 25 例腰骶椎布氏杆菌脊柱炎的 X 线、CT 及 MR 表现特点，其中 X 线平片 4 例，CT 9 例，MR 22 例。
结果　25 例患者中，病变累及单个椎体者 3 例，累及相邻 2 个椎体者 17 例，累及 3 个及 3 个以上相邻椎体者 4 例，跳跃式累及多个椎体者 1 例。X 线平片可显示椎体边缘不规整并明显骨质增生、骨桥形成，椎间隙变窄；CT 表现为受累椎体边缘性虫蚀状或小类圆形骨质破坏伴有骨质增生硬化，使椎体边缘呈“花边椎”改变，小破坏区无死骨，破坏范围较大时可见死骨，椎间盘破坏，椎间隙变窄，部分伴有小关节损伤；除上述表现外，MR 能更好的显示病变累及范围，病灶多表现为不均匀长 T1、长或混杂 T2 信号，STIR 和 FS 呈不均匀高信号，增强扫描为明显不均匀强化，部分低信号区内出现更低信号区。
结论　X 线平片对受累椎体骨质破坏的细节显示欠佳；CT 能很好地显示受累椎体骨质破坏、形成的硬化骨；MRI 对椎体及椎间盘破坏、周围组织受累、椎旁脓肿的形成有较高分辨率，能早期发现病灶。布氏杆菌脊柱炎的影像学表现具有特征性，CT 及 MRI 能为布氏杆菌脊柱炎的诊断提供影像学依据，具有较高临床价值。

应用于腰椎 x 线影像的深度学习机会性骨质疏松和骨质减少的筛查:一项回顾性、多队列、诊断性研究

余可妍[1],张斌[2],张晓东[1]
1.南方医科大学第三附属医院（广东省骨科医院）
2.广州华侨医院

背景:骨质疏松症和骨质减少是普遍存在的，但诊断不足。目的:通过分析腰椎 x 线图像对骨质疏松症的识别，评价深卷积神经网络(DCNN)模型辅助骨密度(BMD)评估与双能 x 线骨密度仪(DXA)相比较。设计:多中心、回顾性、诊断准确性研究。环境:在一个大都市环境中有三个三级中心。患者:982 名绝经后妇女(年龄 50 - 92 岁)在 3 个月内接受腰椎 x 线和 DXA 检查。测量:两种 DCNN 模型(模型 1 区分骨质疏松症与骨质疏松症或正常骨密度，模型 2 区分骨质疏松症与正常骨密度)的接收机工作特性曲线(AUC)下面积测量的图像诊断性能;dxa 衍生的 BMD 测量(参考标准)。结果:DCNN 模型对骨质疏松症和骨质疏松症均有较好的诊断效果。在训练队列中，模型 1 和模型 2 的 AUC 分别为 0.906(95%置信区间[CI]: 0.881, 0.927)和 0.828(95%置信区间:0.785,0.866)。在外部验证队列 1 中，模型 1 和模型 2 的 AUC 分别为 0.845 (95% CI: 0.784, 0.894)和 0.868 (95% CI: 0.810, 0.914)。在外部验证队列 2 中，模型 1 和模型 2 的 AUC 分别为 0.828 (95% CI: 0.723, 0.906)、0.806 (95% CI: 0.697, 0.888)。结论:利用腰椎 x 线片训练深度学习诊断网络，可准确筛查骨质疏松症和骨质疏松症，具有较高的临床应用价值。

定量 CT 胸椎骨密度测量诊断骨质疏松症的初步研究

蹇新梅[1,2],宋玲玲[1],张耀明[1],段庆红[2,1]
1.贵州医科大学附属医院影像科
2.贵州省肿瘤医院

目的 研究低剂量胸部 CT 筛查联合脊柱 QCT 测量胸椎骨密度诊断骨质疏松症的可行性并建立诊断阈值范围。**方法** :共纳入我院体检中心患者 1402 例，其中男 908 例，女 494 例，接受胸部定量 CT 扫描，并将图像传至 PACS 及 BMD 后处理工作站“QCT Pro”，分别测量 T11-L2 椎体平均骨密度，按 10 岁一年龄段统计出均数和标准差，并且行同性别、同年龄之间胸腰椎骨密度相关性及差异性分析并计算测量胸椎骨密度诊断的阈值范围。统计学应用 t 检验、Pearson 相关分析及线性回归等分析。**结果** ①T11-T12 及 L1-L2 骨密度均值峰值年龄段均是 20-30 岁，T11-T12 的峰值骨密度男性为 179mg/cm^3±26.06，女性为 184mg/cm^3±22.64；L1-L2 的峰值骨密度男性为 169mg/cm^3±26.06，女性为 180mg/cm^3±22.64，男性、女性的 T11-T12 的峰值骨密度均值比 L1-L2 的峰值骨密度均值高出约 8.08%、8.17%。②胸椎(T11-T12 骨密度均值)及腰椎（L1-L2 骨密度均值）对应 T 评分采用配对 t 检验结果显示差异性显著（男性:$p<0.01$、女性 $p<0.05$），采用线性回归方程 T’ = -6.040 + 0.971×T（男性），T’ = -10.622 + 1.003×T（女性）对 T 评分进行修正后，两者配对 t 检验结果差异性均不显著($p>0.05$)。③胸椎（T11-T12）与腰椎（L1-L2）骨密度均值显著相关（男性 r=0.958、女性 r=0.979）。**结论** ①低剂量胸部 CT 筛查联合脊柱 QCT 测量胸椎骨密度可预测骨质疏松症。②低剂量胸部 CT 筛查联合脊柱 QCT 测量胸椎 T11-T12 椎体骨密度诊断骨质疏松标准为：骨密度绝对值≥130mg / cm^3，骨密度正常 ；骨密度绝对值介于 87-130mg / cm^3 之间，低骨量；骨密度绝对值≤87mg / cm^{3}时，为骨质疏松症。

Histogram analysis of T2*value for lumbar intervertebral disc

Xiaoqing Liang,Xiaoming Li
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To explore the correlation between lumbar intervertebral disc degeneration and histogram-derived parameters of MR T2* mapping.
Materials and Methods: 100 lumbar intervertebral discs of 20 healthy volunteers were investigated in our study. All subjects underwent 3.0T MR with sagittal T2WI, T2* mapping. 100 lumbar intervertebral discs were graded according to Pfirrmann score. Histogram parameters including mean, standard deviation, inhomogenity , skewness, kurtosis, entropy , median, Min and Max were derived from the T2*map by FireVoxel software. Correlations between histogram parameters and Pfirrmann grade of lumbar intervertebral discs were assessed.
Results: 8 discs were graded as Pfirrmann Ⅰ, 29 in grade Ⅱ, 36 in grade Ⅲ, 26 in grade Ⅳ and only 1 in grade Ⅴ. There were correlations between Pfirrmann grade of lumbar Intervertebral discs and histogram parameters, including the mean, standard deviation, inhomogenity , kurtosis, entropy and median; the correlation coefficients were -0.875, -0.718,-0.428, 0.397, -0.525 and -0.849, respectively.

Conclusion: Histogram-derived parameters of T2* value were potentially helpful for predicting lumbar Intervertebral disc degeneration.

OR-484
磁共振增强扫描对血友病性关节病滑膜 IPSG 评分影响的初步研究

张玉霞[1,2],卫淑芳[1,2],潘玉坤[1,2],李佳佳[1,2],王静[1,2],葛英辉[1,2]
1.华中阜外医院
2.河南省人民医院

目的 探讨 MRI 增强扫描对血友病性关节病（HA）患者滑膜增生的诊断价值及对 IPSG 评分的影响。**材料与方法** 本研究为回顾性研究，选取 2016 年 8 月到 2017 年 9 月在河南省血友病诊疗管理中心确诊为 HA 的 46 例患者的 54 个关节作为研究对象。54 个关节同时进行 3.0T MRI 平扫和增强扫描。其中，膝关节 31 个，踝关节 17 个，肘关节 4 个，髋关节 2 个。按照 IPSG 评分标准，对每个关节增强前后的滑膜增生分别进行评分，同时进行关节总的 IPSG 评分。用后处理工作站分别测量增强前后增生滑膜和同层面肌肉的信号强度，并计算滑膜、同层面肌肉的强化率。用配对秩和检验分别比较 MRI 平扫和增强扫描对滑膜增生 IPSG 评分、关节总 IPSG 评分的差异。采用 Spearman 秩相关分析，分别对增强后关节总 IPSG 评分、增强后滑膜 IPSG 评分、滑膜强化率与关节总出血次数、病程、HJHS 评分间的相关性进行统计学分析。**结果** MRI 平扫和增强对滑膜增生的 IPSG 评分、关节总的 IPSG 评分间有统计学差异，增强扫描优于平扫（$p<0.05$）。MRI 增强扫描后，54 个关节滑膜的总体强化幅度均高于同层肌肉。滑膜强化率与总出血次数、病程及 HJHS 评分间无临床相关性（$p>0.05$），增强后滑膜 IPSG 评分与 HJHS 评分间无临床相关性（$p>0.05$）。增强后关节总 IPSG 评分与关节总出血次数、病程呈高度正相关（$r=0.957$、0.835，$p=0.000$），与 HJHS 评分呈中度正相关（$r=0.578$，$p=0.000$）；增强后滑膜 IPSG 评分与关节总出血次数、病程呈低度正相关（$r=0.369$、0.357，$p=0.006$、0.008）。**结论** MRI 增强扫描较 MRI 平扫能更清晰、全面地显示增生的滑膜，并使关节总的 IPSG 评分更准确；通过 MRI 增强扫描时滑膜的强化幅度，能预估滑膜增生的类型。MRI 增强扫描能为 HA 患者的滑膜增生提供精准显影。

OR-485
3TMRI 评估人膝骨关节炎亚区域软骨下骨小梁结构与软骨的相互关系

刘成磊
上海交通大学附属第六人民医院

目的 利用 3TMRI 评价膝骨关节炎亚区域的软骨下骨小梁特征及软骨与软骨下骨的相关性，旨在阐明骨关节炎启动和进展的病理机制

方法 纳入 92 个膝关节并根据 KL 评分分为对照组，轻度 OA 组，重度 OA 组，利用 3TMRI 高分辨率梯度回波序列成像软骨及软骨下骨，采用 3D 拓扑分析方法对软骨下 12 个区的骨小梁结构特征进行分析，包括骨容积分数（BVF），骨吸收指数（EI），板杆状比值（SCR）及骨小梁的厚度。采用 ITK-snap 软件对软骨进行分割并计算四个区域的软骨厚度。分析比较各个组间的软骨及软骨下骨小梁骨参数的差别，并分析软骨厚度与软骨下骨参数的相关性，最后计算相同关节部分不同亚区域的骨小梁参数的差别。

结果 在轻度 OA 组，内外侧股骨髁呈骨质疏松改变，表现为低的 BVF 和 SCR，高的 EI 指数；内外侧胫骨平台亦呈现骨小梁的损害，表现为低的 BVF 和高的 EI。软骨厚度的丢失主要发生在内测关节（内测股骨髁及内测胫骨平台），并且软骨下骨小梁的损害早于软骨厚度的丢失。软骨厚度的丢失与双侧股骨髁及胫骨平台骨小梁参数均有相关性，主要表现为与股骨髁的 BVF 呈正相关，与胫骨平台的 SCR 呈负相关。另外，轻度 OA 组关节中心区域的骨小梁厚度存在差别，提示骨关节炎的启动可能最早出现在关节的中心区域。

结论 3TMRI 结合计算机图像分析方法可以体内显示骨小梁的结构特征。在 OA 早期，内外侧股骨髁及胫骨平台均呈骨质疏松改变，软骨厚度和骨小梁骨参数密切相关。骨小梁在 OA 的启动和进展中起着重要的作用。

Analysis of the value of dual energy spectral CT in the diagnosis of msu deposition

Xiaohu Li,Yongqiang Yu,Liu Bin
The First Affiliated Hospital of Anhui Medical University

PURPOSE
Using DESCT to identify gout and the deposition of MSU in the joints of the knee, ankle and wrist of patients with gout. To understand the regularity of deposition of MSU in patients with gout on the knees, ankle joints, and wrist joints
METHOD AND MATERIALS
A total of 107 gout patients were selected according to the screening criteria. There were 90 male patients and 17 female patients. All the patients were from November 2015 to February 2018. All experiments were voluntary participants participated, detailed records of the patient's name, age, gender, duration, clinical features, and quantitative scores for clinical symptoms. All the subjects were tested on GSI scans and blood uric acid values to observe the regularity of sedimentation and distribution of MSU, such as the location of deposition, and to count the number of sites, etc., and to organize the data and perform statistical analysis on the data.
RESULTS
107 patients with gout, 57 cases of knee gout with 283 urate deposition areas, with the largest number of depositions of medial and lateral collateral ligaments, anterior and posterior cruciate ligaments, and tendons (more quadriceps tendon tendons), followed by The incidences of urate deposition in the tarsal ligament, supraorbital bursa, meniscus attachment, articular cartilage, and joint cavity were relatively low. A total of 213 urate crystal deposition sites were detected in 63 patients with foot and gout arthritis. The number of metatarsophalangeal joints, sacroiliac joints, soft tissues and tendons (with more Achilles tendons) was higher, followed by the lower rate of deposition of urate in the lower tibia, calcaneus, talus, and joint cavity; 24 cases of gout ,A total of 283 sites of urate crystal deposition were detected in patients, among which the proportion of metacarpophalangeal joints, interphalangeal joints, tendons, wrist joints, soft tissues, and ligaments was larger, followed by the distal ulnar radius, intra-articular cavity, and dorsal tendons. The incidence of MSU deposition is relatively low.

足踝双源 CT 伪影识别对痛风诊断的临床价值

张艳,袁慧书
北京大学第三医院

目的 研究足踝双源 CT 检查中伪影识别对痛风诊断的临床价值。 **方法** 收集 2018 年 12 月至 2019 年 5 月于北京大学第三医院临床诊断为痛风患者 58 例为病例组，男 57 例，女 1 例，年龄 18~69（39+13）岁。对照组收集临床明确排除痛风患者 37 例，男 36 例，女 1 例，年龄为 16~76（34+14）岁。两组病例性别及年龄均无统计学差异。两组均行单侧足踝部双源 CT 扫描，病例组选取患侧/症状重侧。并利用痛风软件对所得薄层数据进行尿酸盐分析。比较两组数据在趾甲、亚毫米点、皮肤、运动影及血管钙化影等影像中检出尿酸盐阳性的差异。 **结果** 病例组与对照组阳性趾甲检出率分别为 94.8%（55/58）与 59.5%（22/37），单个个体阳性趾甲检出个数分别为（2.02+1.13）与（1.19+1.35）个，阳性趾甲尿酸盐分布评分为（1.84+0.93）与（1.05+1.12）分，差异均有统计学意义（P<0.01）。病例组与对照组伪彩阳性亚毫米点总检出率分别为 81%（47/58）与 13.5%（5/37），在肌腱韧带的检出率分别为 75.9%（44/58）与 13.5%（5/37），差异均有统计学意义（P<0.01）。且两组数据亚毫米点除在足背与小腿前群肌分布上无统计学差异外，在其他肌群分布上均有统计学差异（P<0.05）。两组数据在皮肤、运动影及血管钙化影伪彩阳性的检出率方面没有统计学差异。**结论** 趾甲与亚毫米点尿酸盐伪彩阳性对痛风诊断具有较高的临床价值，不应被简单判定为伪影。

运用放射组学对膝关节骨性关节炎（OA）二分类的研究

李葳,李绍林,王远丹,文峥桢
中山大学附属第五医院

目的 运用放射组学云平台，经过机器学习的方法，对膝关节骨性关节炎进行二分类。**方法** 收集本院 2017 年 6 月-9 月共 422 例膝关节 X 线正侧位片（其中左膝 261 份，右膝 258 份，左膝平均年龄为 49±15.44，右膝平均年龄为 49±16.2），以 X 线诊断报告为金标准，分成有无骨性关节炎两类，运用汇医慧影放射组学平台，其机器学习模块使用所选数据的 80%的样本做训练集训练机器学习模型，20%的样本做测试集对模型的准确性进行评估。使用测试集的数据用准确度（score）矩阵简单对比和评估各个模型的训练结果，本研究使用 6 个监督学习分类器(KNN、SVM、XGBoost、RF、LR、DT)进行分类，ROC 曲线分析用于说明放射学特征的预测性能。**结果** 对于左膝关节，机器学习模块首先用方差阈值法从 2818 个特征中选取 717 个特征，然后使用选择 K 最佳方法选取 34 个特征，最后用 LASSO 算法选取 5 个最优特征。准确度矩阵显示 LR 学习分类器效果最佳，每个测试样本属于正样本的概率（Testing-score）为 0.74，AUC 值为 0.68。对于右膝关节，机器学习模块首先用方差阈值法从 2818 个特征中选取 694 个特征，然后使用选择 K 最佳方法选取 16 个特征，最后用 LASSO 算法选取 11 个最优特征。准确度矩阵显示 RF 学习分类器效果最佳，每个测试样本属于正样本的概率（Testing-score）为 0.72，AUC 值为 0.81。**结论** 运用放射组学（机器学习）的方法在一定程度上可以对膝关节是否患有骨性关节炎进行判断。

3D MR 间接关节腔造影对膝关节半月板修复术后愈合评价的作用

雷立昌[1],陈建宇[2],蔡兆熙[2],李卫平[2],李永[2],刘珍珍[2]
1.昆明医科大学第一附属医院
2.中山大学孙逸仙纪念医院

目的 探讨膝关节核磁共振三维间接关节腔造影成像对半月板修复术后愈合评价的作用。

方法 使用 FasT-Fix 系统进行关节镜下全内半月板修复的 26 例（29 侧）半月板进行磁共振三维间接关节腔造影成像及 MR 常规扫描，其中 10 例患者进一步行二次关节镜检查。按照 Barrett 的标准评价临床愈合情况，按照 Henning’s 标准评估 MR 间接关节腔造影图像上半月板修复后愈合情况。分别以临床预后、二次关节镜检结果为标准，比较 MR 间接关节腔造影及 MR 常规扫描评估半月板修复愈合情况的准确性。**结果** 3D MR 间接关节腔造影显示 29 侧半月板中全层愈合 20 侧(68.9%)，部分愈合 5 侧(17.2%)，全层撕裂 4 侧(13.8%)，其中有 2 侧符合临床诊断，诊断诊灵敏度为 100%，特异性为 74.1%；常规 MR 中有 21 侧仍表现为撕裂的 III 级高信号，诊断灵敏度均为 100%，特异性为 29.6%。与二次关节镜结果对比，MR 间接关节腔造影及常规 MR 平扫诊断半月板修复后愈合的灵敏度均为 100%，特异性分别为 88.9%，33.3%。**结论** 3D MR 间接关节腔造影可作为半月板修复后愈合评价的可靠手段，常规 MR 平扫不适合用于半月板修复术后的评估。

MRI 扩散张量成像对腕管综合征的诊断价值

宋希根,李勇,赵林伟,周庆,蒋永明,吴镭,严高武
遂宁市中心医院

目的 评价 MRI 扩散张量成像（DTI）对腕管综合征（CTS）的诊断价值，确定最佳诊断参数和测量平面。**方法** 分别纳入 CTS 患者（CTS 组）和健康志愿者（健康组）各 48 例，测量两组正中神经在三个层面（DRUJ：尺桡远端关节层面；P：豌豆骨层面；H：钩状骨层面）的部分各向异性值（FA）和表观扩散系数（ADC），并进行统计分析。**结果** CTS 组和健康组在三个层面的 FA 值差异均有统计学意义（P均＜0.05），并以豌豆骨层面 FA 值降低更明显；ADC 值在豌豆骨和钩状骨层面两组间差异有统计学意义（P＜0.05），并以豌豆骨层面 ADC 值升高更明显，但 ADC 值在 DRUJ 层面差异无统计学意义（ P＞0.05）。豌豆骨层面的 FA 值具有最高的诊断效能（AUC=0.85），FA 值和 ADC 值诊断 CTS 的阈值分别为 $0.46\times10^{-3}mm^2/s$ 和 $1.3\times10^{-3}mm^2/s$，其敏感性、特异性分别为 87.5%、66.7%和 75%、75%。**结论** CTS 患者正中神经 FA 值较健康人群降低，ADC 值明显升高。DTI 对 CTS 具有较高的诊断效能，豌豆骨层面正中神经 FA 值对 CTS 的诊断价值高于 ADC 值。

Fast KV switching dual-energy CT HAP-water decomposition technique for identifying bone marrow edema in vertebral compression fractures

Junhan Pan,Luyou Yan ,Kun Zhang
First Affiliated Hospital of Hunan University of Chinese Medicine

Purpose: To assess the diagnostic performance of fast KV switching dual-energy CT hydroxyapatite (HAP)-water decomposition technique for detection of bone marrow edema in patients with vertebral compression fractures (VCFs).
Materials and Methods: Thirty-one patients with 80 VCFs who had undergone both dual-energy CT and MR of the spine between October 2018 and January 2019 were retrospectively and consecutively included in our study. MR examination served as the standard of reference. Two blinded and independent readers assessed all vertebrae

visually for the presence of abnormal edema on color-coded overlay virtual nonhydroxyapatite (VNHAP) images; inter-reader agreement, specificity, sensitivity, accuracy, and predictive values were calculated. Other two readers performed a quantitative analysis on VNHAP images; receiver operating characteristic (ROC) curve analysis was conducted, threshold was calculated.
Results: MR imaging depicted 45 edematous and 35 nonedematous VCFs. For visual analysis, VNHAP technique showed a sensitivity of 93.3%, specificity of 97.1%, positive predictive value of 97.7%, negative predictive value of 91.9% and accuracy of 95.0%. The inter-reader agreement was almost perfect (k=0.90). Significant differences in CT numbers between vertebrae with and without bone marrow edema were found in quantitative analysis (P <0.001). The area under the curve (AUC) of VNHAP images was estimated to be 0.917. The threshold of 1003.2 mg /cm^3 yielded sensitivity of 88.9%, specificity of 82.9% for the differentiation of fresh and old VCFs.
Conclusions: Fast KV switching dual-energy CT HAP-water decomposition technique had excellent diagnostic performance for identifying acute and chronic VCFs at visual and quantitative analyses.

定量 3D 磁共振超短回波序列（3D-UTE-MRI）快速扫描骨皮质的研究

万丽娣[1,2],赵伟[2],马亚军[2],杜江[2],汤光宇[1]
1.上海第十人民医院
2.美国加州大学圣地亚哥分校

目的 本研究旨在探讨延长 K-空间采样窗缩短超短回波磁共振（UTE-MRI）的扫描时间，将对骨皮质的定量结果产生的影响。
方法 10 个牛骨皮质和 17 个人胫骨中段样本，采用临床 3T MRI 扫描仪进行 UTE 序列成像，使用 8 通道膝关节线圈进行信号激发与采集。使用径向或不同持续时间的螺旋锥形轨迹进行 K-空间的填充，并分别采集图像、获得定量 UTE 生物标志物，包括 T1，T 2*，磁化传递比（magnetic transfer ratio，MTR）和骨皮质大分子比例（macromolecular fraction，MMF）。以径向采样的定量结果为金标准，评估延长螺旋形采样时间的生物标记物定量结果的误差。
结果 与径向采样的定量结果相比，延长采样时间窗（螺旋轨迹采集的时间从 992μs 延长至 1600μs）后，在牛和人骨皮质的 UTE 标记物的定量结果，包括 T1，T 2*，MTR 及 MMF，均未发现显著差异（P<0.05）。
结论 通过延长采样时间窗，可以大大加速 UTE-MRI 的扫描，使总扫描时间减少 76%；而与金标准相比，延长采样时间所致的 UTE 定量结果的误差不到 5%。这一加速扫描的技术将有助于磁共振 UTE 序列在临床推广使用。

Integrated slice-specific shimming (iShim) intravoxel incoherent-motion and stretched-exponential diffusion-weighted MR imaging in the spine: the value of early

assessment in breast cancer patients with bone metastases treated with antiangiogenic drugs

Yanjie Shi,Haitao Zhu,Xiaoyan Zhang,Yiingshi Sun
Peking University Cancer Hospital & Institute

Methods: Thirty-six patients with 177 Osteolytic metastasis from breast cancer were enrolled and underwent MR imaging before and after 3-6 months' treatment on a MAGNETOM Aera 1.5T MR scanner (Siemens Healthcare, Erlangen, Germany). According to MDA criteria, laboratory examination index and clinical status of patients, 114 lesions were categorized as stable or improvement and 63 lesions were categorized as progressive group. The prototype iShim DWI sequence was obtained; b values (0, 20, 40, 60, 100, 150, 200, 400, 800) s/mm^2. The volume of interest (VOI) was segmentated and measured by a radiologists with more than 10 years of diagnostic experience with a software of ITK-SNAP. The IVIM parameter maps (D, Dstar, f) and SE parameter maps (DDC,alpha) were generated by a post-processing software called IBEX. The quantitative index about two groups before and after treatment were analyzed and the variation of DDC values was calculated as below formula: Delta DDC=DDC_{before}-DDC_{after}. Independent sample t test was used. A P-value< 0.05 was considered to indicate significant difference.

Results: The variation of DDC value between before and after treatment is lower in stable group than in progressive group, and significant difference were found for DDC sum value and DDC kurtosis between two groups(P=0.001, P=0.048). The variation of alpha value is higher in stable group than in progressive group, and significant difference were found for alpha max, min and sum between two groups(P=0.013, P=0.028, P=0.000).The variation of D value is lower in stable group than in progressive group, and significant difference were found for D sum, skewness and kurtosis between two groups(P=0.000, P=0.035, P=0.001).Significant difference were found in D* max, sum, skewness and kurtosis(P=0.002, 0.000, 0.001, 0.012).The f value was also showed significant difference, and also f min, max, sum, kewness and kurtosis showed significant difference(P=0.008, 0.020,0.000).

Conclusions: The iShim IVIM and SE-derived parameters showed a higher diagnostic performance in the early evaluation of therapy with spine metastases from breast cancer. Values of D* max, sum, skewness, kurtosis, f min, max, sum, skewness and kurtosis could be used as a valuable tool in the assessments of tumor early response to the chemotherapy.

MRI T1rho 对下腰痛者腰椎间盘退变的定量研究

李丹
华中科技大学同济医学院附属协和医院

【摘要】 目的 探讨 MRI T1rho 对下腰痛者腰椎间盘退变的定量研究价值，比较下腰痛者与正常志愿者各解剖节段腰椎间盘 T1rho 值的差异性，并分析 T1rho 值与椎间盘退变等级、年龄及 BMI 的相关性。**方法** 38 位下腰痛者（22-75 岁，平均年龄 44.1±15.4 岁）及 28 位无症状者（22-38 岁，平均年龄 25.6±3.1 岁）接受腰椎 MRI 检查，分别采集腰椎矢状位 T2WI 及矢状位 T1rho 图像，按 Pfirrmann 分级标准在 T2WI 图像上对所有腰椎间盘进行等级分级，通过后处理软件在矢状位 T1rho 伪彩图上测量髓核（NP）的 T1rho 值，比较下腰痛者与正常志愿者各解剖节段腰椎间盘 T1rho 值的差异性，并分析 T1rho 值与椎间盘退变等级、年龄及 BMI 的相关性。**结果** 下腰痛者与无症状志愿者相应各节段腰椎间盘 NP 区 T1rho 值存在显著差异性（P<0.01），且下腰痛者 L4/5、L5/S1 椎间盘 T1rho 值明显低于 L1/2、L2/3（P<0.05）；Pfirrmann I-IV 级的 NP 区 T1rho 值分别约（141.5±9.8）ms、（119.6±12.3）ms、（84.1±14.8）ms、（60.0±10.4）ms，且各腰椎间盘 T1rho 值与 Pfirrmann 分级呈负相关（r=-0.88，P<0.05），各 Pfirrmann 等级间 T1rho 值均存在显著差异（P<0.01）；各腰椎间盘 NP 区 T1rho 值与年龄、BMI 均呈负相关（r=-0.62,P<0.01 和 r=-0.39,P<0.01）。**结论** T1rho 值与椎间盘退变等级密切相关，对下腰痛者腰椎间盘退变程度的定量诊断存在潜在临床价值。

Quantitative evaluation of pubic symphysis in late pregnancy using T2* mapping

Yubo Liu[1],Tao Gong[2],Guangbin Wang[2]
1.SHANDONG PROVINCIAL HOSPITAL
2.Shandong Medical Imaging Research Institute

Background: T2* mapping is a reliable tool in articular cartilage imaging, has been widely used to evaluate the degeneration of knee joint and intervertebral discs. Degenerative joint disease of pubic symphysis is the primary cause of groin pain during late pregnancy.
Purpose: To evaluate the alterations of pubic symphyseal cartilage during late pregnancy using T2* mapping.
Materials and Methods: Sixty-one women during first pregnancy, 48 women during second pregnancy, and 64 nulliparous women underwent pubic symphysis MRI exam on a 1.5T MR scanner, including multi-echo T2* mapping sequence. ROIs were hand drawn on T2* maps along the left and right side of cartilage and anterior/middle/posterior sub-regions of each side. T2 * values were analyzed and compared among the three groups using analysis of covariance. The average pubic symphyseal width was measured, the correlation between pubic symphyseal width and T2* values of cartilage were analyzed using Pearson's correlation coefficient.
Results: Compared with nulliparous women, T2* values increased significantly in late pregnancy in left/right cartilage of pubic symphysis, the differences were mainly driven by the posterior sub-region, while no differences were found between women during first and second pregnancies. The positive linear correlation between symphyseal width and mean T2* values of cartilage was only seen in the group of women during first pregnancy (R^2=0.225, p=0.000), no correlation in the other two groups.
Conclusions: T2* mapping is a sensitive quantitative method capable of detecting the pubic symphyseal cartilage changes related to pregnancy, and the T2* values increased significantly during late pregnancy.

磁共振去金属伪影序列 MAVRIC-SL 对于骨科金属植入物术后感染患者的诊断价值

朱婧怡,张子田,李松柏
中国医科大学附属第一医院

目的 金属植入物会在磁共振成像常规序列中形成较大伪影，影响假体周围结构的观察，易造成误诊漏诊，特别是术后可疑感染的患者。本研究磁共振去金属伪影序列 MAVRIC-SL 对于骨科金属植入术后感染患者的诊断价值。

材料与**方法** 纳入 2018 年 7 月至 2019 年 3 月的 11 例体内含有骨科金属植入物的患者（男 7 例，女 4 例），年龄 23-74 岁（54.91±19.13 岁），临床诊断均为术后可疑感染，其中锁骨 1 例、肱骨 1 例、腰椎 1 例，髋关节 5 例、膝关节 2 例、胫骨 1 例。使用 3.0T SIGNA PIONEER 磁共振，对患者进行常规序列扫描，并加扫 MAVRIC-SL 序列 T1WI、PDWI、IR。所有图像上传至 PACS 系统，由两位有经验的放射科医师共同阅片并对常规序列及 MAVRIC-SL 序列进行评分，有争议的部分商议后取得共识。评分内容：1.是否有窦道；2.是否有关节旁积液；3.窦道或积液等病灶是否与假体相连；4.是否有周围软组织水肿。评分标准：0=无法判定；1=可能存在/不存在；2=存在/不存在。对四组评分行 Wilcoxon 秩和检验，$p<0.05$ 有统计学意义。以术中所见及细菌培养为金标准，计算 MAVRIC-SL 序列的阳性符合率。

结果 对于窦道以及关节积液等病变 MAVRIC-SL 的观察得分更高（p1=0.046，p2=0.038）；对于病变是否与假体相连以及周围软组织是否水肿，MAVRIC-SL 得分更高（p3＜0.01，p4＜0.01）。11 例患者中 10 例确诊为感染，1 例实验室检查为阴性，MAVRIC-SL 的阳性符合率为 95.2%。

结论 对于骨科金属植入物术后可疑感染的患者，虽然部分窦道以及关节积液等病变可在两部分序列中同时被发现，但 MAVRIC-SL 可以较常规序列给出更多信息，包括但不限于病变是否与假体相连、周围软组织是否水肿，对于可疑感染患者有很高的诊断价值。

多发性骨髓瘤的双能量 CT 成像：与 MRI 的相关性研究

王勤,李烁,薛华丹,孙照勇,金征宇
中国医学科学院北京协和医院

目的 双能量 CT 可经虚拟去钙（VNCa）对骨髓成像，本研究探讨多发性骨髓瘤（MM）的双能量 CT 成像特点与 MRI 的相关性。

方法 前瞻性收集 MM 患者 22 名，行全身双能量 CT 及全身 MRI 扫描，两种成像方法分别评估患者是否存在 MM 骨髓浸润及骨髓浸润严重程度（根据椎体 T1WI 信号强度与椎间盘信号强度关系，分为轻、中、重度骨髓浸润），并在 VNCa 及常规 CT 图像上测定椎体 CT 值，与椎体 MRI 信号强度做相关性分析。

结果 共测定 173 个椎体，椎体 VNCa CT 值与 T1WI 序列椎体与无退变椎间盘信号强度比值显著负相关（r=-0.592，P=0.000）。VNCa CT 值与 MRI 上骨髓浸润严重程度呈显著正相关（r=0.580，P=0.000）。VNCa 诊断 MM 骨髓浸润的敏感性 90.32%，特异性 87.18%。

结论 多发性骨髓瘤（MM）的双能量 CT 成像与 MRI 有较好的相关性，有望成为评估 MM 骨髓病变的新手段。

Changes in fat and muscle contents of lumbar paraspinal muscles with aging in healthy population by using Revolution CT material decomposition techniques

Hui Gao,Kun Zhang
First Affiliated Hospital of Hunan University of Chinese Medicine

[Abstract] **Objective** To evaluate changes in muscle and fat contents of lumbar paraspinal muscles with aging in healthy subjects by using Revolution CT material decomposition (MD) technique. **Methods** A retrospective analysis of 125 healthy subjects who underwent Revolution CT gemstone spectral imaging non-enhancing scan for lumbar. The muscle and fat contents were measured for erector spinae muscle (ES) at each disc level from L1/2 to L4/5, psoas muscle (PS) and multifidus muscle (MS) from L2/3 to L5/S1 on muscle-based MD images and fat-based MD images respectively, differences of muscle and fat contents at each disc level and in each age group were statistically analyzed .**Results** In the middle group, fat content of MS was significantly higher than that of the young group at L 4/5,L5/S1(P<0.05), while muscle content lower than that of the young group at L4/5,L5/S1 (P<0.05). In the old group, fat content of MS was significantly higher than that of the young and middle groups at all levels(P<0.05), while muscle content lower than that of the young and middle groups at all levels (P<0.05). In the middle group, fat content of ES was significantly higher than that of the young group at L 4/5 (P<0.05), while muscle content lower than that of the young group at L 4/5 (P<0.05). In the old group, fat content of ES was significantly higher than that of the young and middle groups at all levels(P<0.05), while muscle content lower than that of the young and middle groups at all levels (P<0.05) There was no significant age-dependent change in the fat and muscle contents of the PS muscle at each disc level. **Conclusion** The muscle degeneration with age in healthy population occur in lumbar paraspinal multifidus muscle and erector muscle, but not in psoas muscle.
[Abstract] **Objective** To evaluate changes in muscle and fat contents of lumbar paraspinal muscles with aging in healthy subjects by using Revolution CT material decomposition (MD) technique. **Methods** A retrospective analysis of 125 healthy subjects who underwent Revolution CT gemstone spectral imaging non-enhancing scan for lumbar. DWI 单指数模型、DKI 模型及 DCE-MRI 模型对脊柱肿瘤诊断价值的对比研究

张家慧[1],张恩龙[1,2],陈永晔[1],袁慧书[1],郎宁[1]
1.北京大学第三医院
2.北京大学国际医院

目的 探讨扩散加权成像(DWI)单指数模型、 扩散峰度成像(DKI)模型及动态增强磁共振成像(DCE-MRI)模型对于脊柱恶性肿瘤与非恶性肿瘤的鉴别诊断价值及三种模型参数值之间的相关性，并对比分析三种模型参数的诊断效能。

材料与方法 对 66 例脊柱肿瘤(39 例恶性肿瘤、27 例非恶性肿瘤)行 DWI 单指数、DKI 和 DCE-MRI 检查。图像后处理分析得到 DWI 和 DKI 模型的表观扩散系数（ADC）值、平均扩散系数(MD)值、平均扩散峰度(MK)值和 DCE-MRI 模型的容积转运常数（K^{trans}）、回流速率常数（k_{ep}）和血管外细胞外容积分数（v_e）。采用独立样本 t 检验比较脊柱恶性肿瘤和非恶性肿瘤参数值的统计学差异。采用受试者工作特性曲线(ROC)分析评价 DWI、DKI 和 DCE-MRI 鉴别诊断脊柱肿瘤的价值，并对比分析三种模型的诊断效能。采用 Pearson 相关分析评价参数值之间的相关性。

结果 MD、MK、ADC、v_e、k_{ep}值在脊柱恶性肿瘤与非恶性肿瘤中差异有统计学意义(P < 0.05)，脊柱恶性肿瘤的 ADC、MD、v_e值明显低于非恶性肿瘤，MK 和 k_{ep}值明显高于非恶性肿瘤。DKI 的 MK 具有最高的曲线下面积 0.940 和最高的敏感度 96.3%，曲线下面积显著高于 DCE-MRI 的 v_e和 k_{ep} (P=0.0012、0.0003)。v_e与 ADC、MD 呈弱正相关，Pearson 相关系数 r 分别为 0.468 、0.363，与 MK 呈弱负相关，r 为 0.469 ；k_{ep}与 MK 呈弱正相关，r 为 0.375，K^{trans}与 ADC 呈弱正相关，r 为 0.325。

结论 DWI 单指数模型、DKI 模型及 DCE-MRI 模型对于脊柱恶性肿瘤与非恶性肿瘤均具有鉴别诊断价值，三种模型参数之间存在一定的相关性。DKI 作为一种无创、新型的磁共振成像技术，在脊柱肿瘤的临床应用方面前景广阔。

Mr compressed sense technique: evaluation of the quality and diagnosis accuracy on lumbar vertebra imaging

Tianyang Gao[1],Zhao Lu[1],Fengzhe Wang[1],Jiazheng Wang[2],Shinong Pan[1]
1.Department of Radiology，Shengjing Hospital of China Medical University
2.Department of Clinical Science， Philips Healthcare，China

Purpose:

To compare the image quality, diagnostic accuracy of compressed SENSE turbo spin echo (CS-TSE) and traditional turbo spin echo (TSE) in lumbar vertebra MRI.

Methods:
A retrospective analysis of lumbar vertebra MRI from 300 patients (male: female = 135:165; median age: 52 years) with traditional-TSE and 300 patients (male: female = 126:174; median age: 51 years) with CS-TSE, was conducted. The SENSE acceleration factor was 1.4 for T1WI, 1.7 for T2WI and PDWI was 1.7. The CS acceleration factor was 2.4 for T1WI, 3.6 for T2WI and PDWI, and 4.0 for T2WI transverse. The image objective quality for both sequences was evaluated by SNR and CNR. The subjective image quality and nerve root were evaluated by the five-point scale. Two radiologists independently diagnosed 300 cases of CS-TSE and their consistency was evaluated. The Sen, Sep, and of two sequences were compared.
Results:
The scan time of using CS-TSE was reduced from 7min28s to 4min26s. There was no significant difference between SNR, CNR and subjective evaluation of two sequences ($p>0.050$). The subjective median score of nerve roots image quality was 4 points. The Sen, Sep, and of two sequences had no difference. Two radiologists were highly consistent in diagnosing lumbar diseases($\kappa > 0.750$) by using CS-TSE.
Conclusion:
Compressed SENSE and TSE as a potential tool in lumbar vertebra and disc disease diagnosis, could provide the similar image quality, diagnostic consistency, and dramatically reduced imaging time, when compared to the traditional-TSE,especially best performance of nerve root.

Quantitative T2 mapping accelerated by GRAPPATINI for evaluation of muscles in patients with myositis

Fengdan Wang[1],Haiping Zhang[2,1],Chanyuan Wu[1],Qian Wang[1],Bo Hou[1],Yi Sun[3],Tobias Kober[4],Tom Hilbert[4],Yan Zhang[1],Xiaofeng Zeng[1],Zhengyu Jin[1]
1.Peking Union Medical College Hospital
2.Beijing Friendship Hospital
3.MR Collaboration NE Asia, Siemens Healthcare
4.Advanced Clinical Imaging Technology, Siemens Healthcare AG

Objective: Dermatomyositis (DM) and polymyositis (PM) make up the largest group of potentially treatable myopathies and require early diagnosis. This study investigates whether the edema of thigh muscles in DM/PM can be quantitatively assessed by a novel accelerated T2 mapping technique—GRAPPATINI.
Methods: Three conventional MR sequences and GRAPPATINIaccelerated T2 mapping of bilateral thighs from 20 patients (7 DM and 13 PM) and 10 healthy volunteers were prospectively carried out on a 3T MR scanner. Afterwards, T2 values of 477 thigh muscles from the patients and the healthy controls were manually measured. In addition, the correlations between T2 values and serum muscle enzymes in patients were also analyzed.
Results: The new GRAPPATINI technique made quantitative T2 mapping of bilateral thighs feasible with a scanning time of only 2 min 18 s.Moreover, GRAPPATINI-generated T2 values of muscles from patients were markedly higher than those from healthy subjects ($P < 0.001$). GRAPPATINI accelerated T2 mapping appeared a more sensitive technique in

that some DM/PM muscles appearing normal per conventional MRI had increased T2 relaxation time. Furthermore, GRAPPATINI-generated T2 values of DM/PM thigh muscles positively correlated with serum enzyme levels ($P < 0.001$), which reflected the severity of myopathy.
Conclusion: GRAPPATINI can significantly shorten acquisition time of T2 mapping and may potentially be applied clinically in DM and PM.

第三代双源 CT 腰椎间盘低剂量扫描的运用研究

施辉友,王玉权,张小勇,唐滢
贵州省人民医院

目的 探讨第三代双源 CT 低管电压联合高级建模迭代重建技术（advanced modeled iterative reconstruction ,ADMIRE）在正常体质指数（Body Mass Index BMI）腰椎间盘病变检查中的可行性。**方法** 将拟行腰椎间盘多层螺旋 CT 扫描的 BMI 正常(BMI 18～24) 的患者 60 例随机分为 A 组（30 例）常规管电压（120kVp）扫描，滤波反投影法（filtered back-projection，FBP）重建；B 组（30 例）低管电压（100kVp）扫描， ADMIRE 重建，强度选择 3 级；两组参考管电流均为 300 mAs，开启自动管电流调节技术(CARE Dose 4D)扫描。比较不同扫描条件下两组图像的客观评价指标（包括噪声、CNR、SNR）、图像主观评分及辐射剂量。
结果 两组图像客观评价指标及主观评分差异无统计学意义（P>0.05）且均达到诊断要求；两组辐射剂量比较差异有统计学意义（P<0.05），B 组较 A 组辐射剂量下降约 60.58%。
结论 运用第三代双源 CT 低管电压(100kVp)扫描联合高级建模迭代重建技术在正常体质指数患者行腰椎间盘检查，有效降低辐射剂量的同时不影响图像质量。

羊膝关节骨性关节炎模型磁共振 T1-map 的成像研究

门广美[1],于静红[1],李明楷[1],石磊[1],石月[1],门广美[1],于静红[1],李明楷[1],石磊,石月[1]
1.内蒙古医科大学第二附属医院
2.内蒙古医科大学第二附属医院

目的 探讨应用 3.0T 磁共振 T1-map 成像技术（未注入造影剂）评估羊膝关节骨性关节炎（osteoarthritis，OA）早期损伤的可行性。
方法 选择健康的蒙古羊 25 只，月龄 6-8 月，雌雄不限，体重 20-30kg，标准饮食，圈养。随机分为 A、B、C、D、E 共 5 组，每组 3 只。利用膝关节内注射木瓜蛋白酶（13U）溶液制作蒙古羊左膝关节软骨退变模型。将蒙古羊麻醉后,左后腿膝关节周围剃毛,碘伏消毒后轻弯膝关节,在透视引导下从左髌骨外侧方穿刺进入关节腔，向内注入 1.6ml 木瓜蛋白酶溶液，作为处理组，右膝关节作为对照不做任何处理。A 组 1 次注药造模完成，B、C、D、E 组于第 1、4、7 天三次注药（每次 1.6ml）造模完成，每次造模麻醉清醒后正常饲养。检查采用 SIEMENS Skyra 3.0T 磁共振仪，行常规 MRI 序列及 T1-map 扫描。所有实验动物在注药前行常规 MRI 检查及 T1 map 检查，A 组造模完成后 24 小时，B、C、D、E 组于造模完成后 1 周、3 周、5 周、7 周对各组膝关节进行软骨常规 MRI、T1 map 扫描，每组动物模型检查完毕后，进行双侧膝关节软骨取材、制作标本，HE 染色观察软骨细胞形态数量及软骨层次变化，按 Mankin 分级标准评估软骨损伤情况。选取股骨内侧髁及胫骨内

侧平台两个感兴趣区，测量 T1 值，并进行图像后处理，观察 T1-map 彩图色阶变化。对两组数据进行统计学分析。

结果 正常对照组膝关节上软骨在 T1-map 上呈均匀的蓝色区域。造模组中膝关节软骨在 T1-map 出现斑片状黄色、红色区域。 膝关节正常对照组与各个造模组之间 T1 值差异均有统计学意义(P＜0.05)， T1 值随软骨退变病理分级程度的加重而升高。

结论 磁共振 T1-map 可以对 KOA 软骨损伤程度进行定量评估，随着软骨损伤程度加重，T1 值会发生不同程度的改变。T1 map 成像技术可以成为评估早期 KOA 的有效检查手段之一。

成年男性腰椎骨密度与内脏脂肪组织的关系研究

陈佳,宋玲玲*,蹇新梅,杜霞,朱霞,张耀明
贵州医科大学附属医院

目的 探讨成年男性腰椎骨密度与内脏脂肪组织的关系。**方法** 收集 2018 年 6 月-9 月我院体检男性共 1374 人，年龄 30~75 岁，平均年龄（50.9±0.30）岁。所有研究对象均测定身高、体重、腰围，并计算体质指数（body mass index，BMI）；利用 QCT 测量 L1、2 椎体的平均 BMD 值及 L2 层面的腹部皮下脂肪面积（subcutaneous fat area ，SFA）与内脏脂肪面积（visceral fat area，VFA）。根据研究对象的 BMD 分为骨量正常组、低骨量组及骨质疏松组，比较各组间年龄、BMI、VFA、SFA 的差异，并分析其与腰椎 BMD 的相关性。**结果** 正常骨量组共 807 人、低骨量组 451 人及骨质疏松组 116 人。其中低骨量组年龄、VFA 高于正常组，BMI 低于正常组；骨质疏松组年龄、VFA 高于正常组，BMI 低于正常组；骨质疏松组年龄高于低骨量组，BMI 低于低骨量组；上述差异均具有统计学意义（P<0.05）；男性腰椎 BMD 与 VFA 呈负相关，且控制年龄及 BMI 因素后，男性腰椎 BMD 与 VFA 仍呈负相关。**结论** 男性腰椎骨密度与内脏脂肪组织呈负相关关系。

OR-505
基于健康人群的腰椎椎旁肌年龄相关性脂肪浸润的研究

彭娴婧[1],李新彤[2],王玲[2],蔡韦[2],程晓光[2],廖伟华[1]
1.中南大学湘雅医院
2.北京积水潭医院，北京大学第四临床医学院

目的 研究我国健康女性随年龄增长腰椎椎旁肌发生脂肪性退变的变化情况，同时探讨体重指数对椎旁肌脂肪浸润的影响。

材料与**方法** 对 516 例健康女性进行腹部定量计算机断层扫描（quantitative computed tomography ，QCT）后，在 L3 椎体中间水平测量椎旁肌和肌间脂肪组织的横截面积（Cross-sectional area of paraspinal muscles （CSAmuscle） ，intermuscular adiopose tissue (CSA_{IMAT})），计算椎旁肌的脂肪浸润率 IMAT% (CSA_{IMAT}/ CSA_{IMAT}+ CSAmuscle)。使用 Spearman 相关分析评估志愿者基线信息和 QCT 测量值之间的关系。采用 Kruskal-Wallis H 检验和 LSD post-doc 校正比较不同年龄组不同体重指数亚组的 QCT 结果。校正身高和体重后计算 QCT 结果随年龄变化的趋势。

结果 20-29 岁组和 70-79 岁组的平均 IMAT 分别为 7.29%和 25.84%。CSA_{IMAT}, IMAT%随年龄增长呈强正非线性相关（r=0.648，P<0.01；r=0.660，P<0.01），而 CSAmuscle 随年龄增长呈弱负线性相关（r=-0.227，P<0.01）。体重指数与 CSA_{IMAT}, CSAmuscle 和 IMAT%呈正相关。在三个年龄组中，肥胖亚组与正常体重指数亚组的所有变量均存在显著差异。CSA_{IMAT} 随年龄变化的差异较 CSAmuscle 大。

结论 椎旁肌脂肪浸润随年龄和体重指数增加而增加，而肌萎缩可能与年龄有关。本研究为我国成年女性椎旁肌脂肪性退变提供了正常参考值，对今后的研究具有重要意义。

骨密度定量 CT（QCT）在椎体内固定术前评估的应用价值

陈晓君
中山大学附属第五医院

[摘要] **目的** 探索腰椎椎体各部分的骨密度及其变化规律，为临床骨质疏松患者骨折的预防及内固定手术术前评估内固定钉道位置提供一定的参考依据。**方法** 回顾性分析 450 例行腰椎骨密度定量 CT（QCT）检查患者，其中骨密度正常（>120g）、骨量减低（80-119g）及骨质疏松（<80g）者各 150 例，每例患者腰椎 L2-4 椎体，每个椎体分为前、后 2 部分，每侧椎弓根分为前、中、后 3 部分，分别测量其骨密度值，每例患者可得 8 组数据，总得 3600 组数据，所得数据进行统计学分析。**结果** 统计学分析结果显示，椎体前缘骨密度与椎体后缘骨密度变化有差异性（$P<0.05$），尤其在骨量减低组及骨质疏松组较为显著；椎体前缘、椎体后缘骨密度与椎弓根前、后部分的骨密度变化有一定的相关性（$P<0.05$），与椎弓根中间部分没有相关性（$P>0.05$）；双侧椎弓根前、中、后 3 部分的骨密度变化没有显著相关性（$P>0.05$）。**结论** 椎体前缘骨密度变化较椎体后缘明显，故椎体前缘较易骨折；椎体前、后缘骨密度变化较椎弓根前、后部分明显，而椎弓根中间部由于结构的特异性，骨质较为致密，骨密度减低较为缓慢；由此可为骨质疏松患者骨折预防宣教及骨折患者行椎体内固定术前手术方案及器材选择提供一定的参考依据。

不同性别体检者血生化指标、腹部脂肪分布与骨密度的关系

王硕
皖南医学院弋矶山医院

目的 探讨不同性别健康体检人群的血生化指标、腹部脂肪分布和骨密度的关系。
方法 纳入我院体检的 1738 名健康人群，用 QCT 测量腰 1、腰 2 椎体骨密度和腹部脂肪分布。按每 10 岁一个年龄段对受检者进行分组，比较不同性别骨密度随年龄变化的关系；同时比较不同性别骨密度正常和异常组之间血生化指标、腹部脂肪分布的差异性，及腹部脂肪组织和血脂之间的关系。利用多因素 Logistic 回归分析评估不同性别影响骨密度的风险因素。
结果 骨量异常者男性为 37%，女性为 41%；年轻的男性骨密度下降较年轻女性明显，但是 50 岁以后骨密度下降在女性中更明显。腹部脂肪和血脂之间存在不同程度的相关性。在多因素 Logistic 回归分析中，年龄、总胆固醇和高密度脂蛋白是男性人群骨量异常的危险因素，年龄、腹内脂肪面积是女性人群骨量异常的危险因素。
结论 多种因素对骨密度均有不同程度的影响。年龄、总胆固醇和高密度脂蛋白是男性骨量异常的危险因素，年龄、腹内脂肪面积是女性骨量异常的危险因素。腹部脂肪和血脂之间存在相关性。

The effect of changes in bone mineral density of temporal mandibular joint(TMJ) disorder under spectral CT on the activity of temporal jaw joint

Hua Huang[1,2], Tan Biwen[1,2], Xu Yajing[1,2], Zhou Bin[1,2]
1. Shenzhen University General Hospital
2. Shenzhen University Clinical Medical Academy

Objective: To investigate the effect of the changes in bone mineral density on the activity of the temporal jaw joint (TMJ) using spectral CT.
Methods: MRI were selected for diagnosis of temporomandibular joint disorders and normal patients in a total of 30 cases(BMI<30). After excluding postoperative, traumatic, tumor, hereditary diseases and other factors, patients were divided into 3 groups, 10 cases of both-sides health in group A, 10 cases of both-sides disorders in group B and 10 cases of one-side disorder in group C. All patients underwent spectral CT scan with routine mode for bone mineral density measurement and cine mode for activity evaluation. ROIs were selected on sacral joint nodules, mandibular condyle and mandibular branches. The CT values were measured under different keV level, and image series were reconstructed as described below: bone- and water-based material decomposition images and spectral curve images. All these imaging series were analyzed quantitatively and qualitatively.
Results: Spectral HU curve of ROI in Group A, B and C all showed a declining trend. The ROI measurement of bone was basically symmetrical and there was no significant difference (P>0.05). The CT values and mean values measured in each group were statistically different with the high correlation of the base matter(P<0.05). The bone marrow content of ROI on bone(water)density images was similar to the bone density of mandibular condyle and mandibular branch in group A, and the correlation coefficient r=0.93; The activity of the temporal jaw joint in group B was completely limited, and the bone marrow content of ROI on bone(water)density images was significantly lower than that of the mandibular condyle and mandibular branch, and the correlation coefficient r= 0.15; In group C, the bone marrow content of the disorder-side was significantly reduced, and the bone density was significantly reduced in the mandibular condyle and mandibular branch, and the correlation coefficient r=0.53.
Conclusion: The changes in bone mineral density in the temporal jaw joint(TMJ) disorder is an important clinical indicator for the effect of joint activity.
Clinical Value: The changes in bone mineral density can be measured with spectral CT imaging, which maybe an important indicator for depicting temporal mandibular joint disorder.

发育性髋关节脱位患儿软骨性股骨头覆盖率的 MRI 研究

张雯双,王光彬
山东省医学影像学研究所

目的 应用磁共振髋关节高分辨成像测量侧方及前方软骨性股骨头覆盖率，探讨其于儿童发育性髋关节脱位（DDH）临床复诊及进一步治疗中的应用价值。

方法 纳入 30 例手术治疗（髋关节闭合复位术或切开复位术）后 3-4 年的发育性髋关节脱位（DDH）患儿，对其双侧髋关节（包括闭合复位组、切开复位组及健侧髋关节组）行 3T 磁共振常规序列及高分辨脂肪抑制质子密度加权像（Fat Suppressed Proton Density Weighted Image, FS-PDWI）扫描，分别获得髋关节 FS-PDWI 斜冠、斜矢位图像。由 2 名高年资放射科主任医师于斜冠、斜矢位图像上分别测得各髋关节侧方（LC-）及前方软骨性股骨头覆盖率（AC-FHC），比较闭合复位组、切开复位组及健侧髋关节组各组间的 LC-FHC、AC-FHC 是否存在统计学差异；并结合临床，判断各患髋是否需要进一步行骨盆或股骨截骨术，分别计算闭合复位组及切开复位组中需再次手术的髋关节所占百分比，并对其需再次手术的原因行初步分析。

结果 侧方软骨性股骨头覆盖率（LC-FHC）：闭合复位组、切开复位组与健侧髋关节组各组间数值无显著统计学差异（P>0.05）；前方软骨性股骨头覆盖率（AC-FHC）：闭合复位组数值明显小于切开复位组及健侧髋关节组，其差异有统计学意义（P<0.05），切开复位组与健侧髋关节组之间数值无显著统计学差异（P>0.05）。且需再次手术治疗侧髋均为闭合复位组，再次手术的原因主要为前方软骨性股骨头覆盖率低下，需再次干预以提高髋关节稳定性。

结论 应用磁共振高分辨成像测得患髋的前方软骨性股骨头覆盖率（AC-FHC），可为闭合复位术后的 DDH 患儿是否需要再次手术治疗提供客观的参考依据。

乳腺 X 线摄影不对称征像的良恶性鉴别诊断

邬昊婷,王丽君,汪登斌
上海交通大学医学院附属新华医院

目的 探讨临床及影像表现对乳腺 X 线摄影不对称征像的鉴别诊断价值。
方法 收集 2014 年 1 月-2016 年 12 月经双侧乳腺 X 线摄影检出不对称征像且 BI-RADS 分类为 4-5 类共 124 例，所有患者均在行乳腺 X 摄影检查 2 周内行乳腺 MRI 检查。随访 2 年稳定或经病理证实为良性病变共 87 例，经病理证实为恶性病变共 37 例。收集临床资料包括年龄、月经状态；乳腺 X 线摄影表现分析包括乳腺腺体构成，不对称可见体位数目、不对称是否位于腺体与腺体后方脂肪交界处，是否伴有其他异常征像；乳腺 MRI 表现分析包括背景实质强化程度，不对称所在处有无异常强化以及强化方式。采用单因素及多因素分析的方法比较良恶性病变临床及影像表现的差异。
结果 经单因素及多因素 logistic 回归分析，患者已绝经，乳腺 X 线摄影上不对称位于腺体与腺体后方脂肪交界处，伴有钙化、乳头凹陷或周围皮肤增厚，乳腺 MRI 上可见异常强化为鉴别不对称良恶性的独立预测因素。联合上述 6 个特征对乳腺不对称良恶性鉴别的敏感性、特异性、准确性和曲线下面积分别为 89.2%，75.9%，79.8%，0.89。
结论 综合患者的临床及影像表现有助于鉴别乳腺 X 线摄影不对称征像的良恶性。

基于 CESM 的影像组学构建乳腺癌组织学分级预测模型的可行性研究

毛宁[1],洪楠[2]
1.山东省烟台毓璜顶医院
2.北京大学人民医院

目的 探讨基于乳腺对比增强 X 线摄影（Contrast-Enhanced Spectral Mammography，CESM）的影像组学方法，构建乳腺浸润性导管癌分级预测模型方面的可行性。
方法 回顾性分析山东省烟台毓璜顶医院自 2017 年 7 月至 2018 年 12 月，经病理证实为乳腺浸润性导管癌且有明确组织学分级，术前行 CESM 影像学检查的 205 例患者，其中 I 级患者 58 例，II 级患者 83 例，III 级 64 例。对训练集的 CESM 图上对病变的乳腺头尾位（craniocaudal view，CC）低能图及减影图上的肿瘤区域均进行手动分割并提取影像学特征，从提取的 396 个特征中去除冗余的特征，最终低能图和减影中选取 28 个影像组学标签建立模型。通过机器学习的方法对低级别（I 级、II 级）、高级别（III 级）进行分类。
结果 CC 位低能图训练集及验证集模型的 AUC 分别 0.78 (95%CI, 0.73-0.84)、0.78 (95%CI, 0.66-0.91)；减影图训练集及验证集模型的 ROC 下面积（AUC）分别是 0.83 (95%CI, 0.78-0.87)、0.76 (95%CI, 0.62 -0.90)；低能图联合减影图训练集及验证集模型的 ROC 下面积（AUC）分别是 0.88 (95%CI, 0.85 - 0.92)、0.80 (95%CI, 0.67 -0.92)。
结论 基于 CESM 的影像组学分类预测模型，能有效预测乳腺浸润性导管癌组织学分级，低能图联合减影图效模型预测效能较低能图或减影图模型更高。

OR-512
基于 DCE-MRI 的聚合深度学习模型在肿块型乳腺癌区域淋巴结转移预测中的应用价值研究

陈欣[1],赵凤军[2]
1.西安交通大学第二附属医院
2.西北大学

目的 探讨基于多期动态增强磁共振成像（DCE-MRI）的聚合深度学习模型在预测肿块型乳腺癌区域淋巴结转移方面的价值。
方法 收集我院 2016 年 1 月至 2018 年 8 月行乳腺 3.0T MRI 检查，MRI 表现为肿块，经手术或活检穿刺病理证实为乳腺癌，并有区域淋巴结转移信息的患者。共有 108 例符合纳入和排除标准的患者的基线 MRI 资料纳入本研究，将这 108 例患者随机分为训练集（76 例）和测试集（32 例）两组，对其五期 DCE-MRI 图像进行后处理。首先，以每个乳腺肿块的几何中心为中心，将原始图像裁剪成 80×80 像素的方形感兴趣区域（ROI）。然后，利用五期增强图像分别训练五个深度学习（DL）模型。我们的 DL 模型在 INCEPTION V3 网络基础上进行了改进，在其最后一层和输出预测结果之间添加一个具有 128 个节点的全连接层。在验证过程中，将五个 DL 模型所做的五个预测聚合后对患者的每一个切片进行预测。最后，根据少数服从多数投票法汇总所有切片预测结果，最终确定患者的转移特征。
结果 在训练集中，DCE-MRI 每一期的 DL 模型和聚合 DL 模型预测区域淋巴结转移的受试者工作曲线下面积（AUC）均接近 1。在测试集中，DCE-MRI 每一期的 DL 模型预测结果分别为 0.82, 0.92, 0.87, 0.91 和 0.91，而聚合 DL 模型的结果最高，为 0.94。

结论 DCE-MRI 每一期的 DL 模型对区域淋巴结转移都有较高的预测精度，但不同期相的 DL 模型的诊断效能不尽相同，尤其是第一期 DL 模型的 AUC 低于 0.85。通过使用聚合策略，可以获得超过任何单期 DL 模型预测精度的最高 AUC 值。

DKI and IVIM parameters measured with different methods for breast non-mass enhancement

Lifang Si,Xiaojuan Liu,Kaiyan Yang,Yichen Ma,Li Wang,Tao Jiang
Beijing chao-yang hospital, Capital Medical University

Objective To investigate the value of diffusion kurtosis imaging (DKI) and intravoxel incoherent motion (IVIM) parameters measured by different methods in differentiating malignant from benign breast non-mass enhancement. **Methods** In this retrospective study, Totally 63 patients (63 non-mass enhancement) with breast mass lesions which were verified by pathologic results or follow up were enrolled. All the patients underwent MR scanning, including dynamic contrast-enhanced MRI, IVIM-DWI and DKI. The ROI were placed at the most enhanced location, and the parameters of standard ADC (ADC_{stand}), slow ADC (ADC_{slow}), mean kurtosis (MK) and mean diffusion (MD) were measured. Whereafter, the whole lesions on the maximum slice were drawn as ROI, and the ADC_{stand}-max, ADC_{slow}-max, ADC_{fast}-max, MK-max, MD-max were obtained, Care was taken to avoid cyst, hematoma, or necrosis regions. The difference of these parameters between benign and malignant breast lesions was analyzed. And the diagnostic performance of these parameters was evaluated by ROC curve, the AUC was compared between the 2 methods. **Results** There were 30 malignant lesions and 33 benign lesions. All the parameters (ADC_{stand}, ADC_{stand}-max, ADC_{slow}, ADC_{slow}-max, MK, MK-max, MD, MD-max) had significant differences between malignant and benign lesions (all P<0.001). The AUC of ADC_{slow} was biggest (0.888), with the sensitivity of 93.3% and specificity of 78.8%. The AUC of ADC_{slow} is higher than ADC_{stand}-max and MK and there is statistical difference (P=0.03, P=0.009). The differences of the AUC between ADC_{stand} and ADC_{stand}-max (Z=1.578, P=0.115), ADC_{slow} and ADC_{slow}-max (Z=1.563, P=0.118), MK and MK-max (Z=0.384, P=0.701), MD and MD-max (Z=1.038, P=0.299) had no statistical significance. **Conclusion** For breast non-mass enhancement lesions, all the DKI and IVIM DWI parameters are helpful for differentiating malignancy from benign lesions, and these parameters measured with different methods show equal diagnostic efficiency.

Differentiation between mucinous carcinomas and fibroadenomas with high T2 signal intensity on DCE-MRI using volume-based kinetic analysis

Shuyi Peng,Fan Yang
Union Hospital Tongji Medical College Huazhong University of Science and Technology

PURPOSE
Mucinous breast carcinoma, a malignant tumor, that cannot typically be distinguished from fibroadenoma with high T2 signal intensity based on routine MRI imaging. The purpose of this study was to explore the diagnostic value of quantitative kinetic composition analysis on dynamic contrast-enhanced MRI (DCE-MRI) of the breast for the differential diagnosis of mucinous carcinomas of breast (MCBs) from fibroadenomas (FAs) with high T2 signal intensity.
METHOD AND MATERIALS
13 patients with pathologically confirmed MCBs and 28 patients with pathologically confirmed FAs from 2015 to 2018 were enrolled, all the patients underwent breast MR imaging. Two radiologists analyzed MR imaging retrospectively, included measurements of shape, size, margins, ADC value, T2 signal intensity and internal mass enhancement pattern. The maximum diameter, volume, and percentages of voxels within the lesion representing persistent, plateau, or washout kinetics were quantified using computer-assisted diagnosis software *(DynaCAD Breast, Invivo)*. Parameters above were compared between two groups of lesions using Manny-U test, univariate and multivariable analyses were performed to investigate the differentiation between MCBs and FAs.
RESULTS
The mean volume of MCBs was significantly greater than that of FAs (2.85±1.52cm vs. 1.57±1.61cm, respectively; P=0.025). The median rate of plateau enhancement in MCBs was (8.00±14.99) %, while in FAs with high T2 signal intensity was (1.65±3.03) %, statistical difference was found between two groups (P=0.007). Area under the ROC curve (AUC) for volume and plateau enhancement was 0.752 and 0.766 respectively. In multiple factors analysis, combined with two variables showed good discrimination in differential diagnosis (AUC, 0.821, 95% CI,0.668-0.973).
CONCLUSION
The percentages of plateau kinetic voxels, combine with the size of masses may aid in differentiating MCBs from FAs with high T2 signal intensity.

OR-515
乳腺 MRI 特征对乳腺小肿块（≤1cm）的鉴别诊断价值

王丽君,罗冉,邬昊婷,刘欢欢,吴晨青,张玉珍,崔雪娥,尹秋凤,汪登斌
上海交通大学医学院附属新华医院

目的 探讨乳腺 MRI 特征对于乳腺小肿块（≤1cm）病变的良恶性鉴别诊断价值。
材料和方法 回顾性分析术前行乳腺 MRI 检查且经病理证实的乳腺小肿块（≤1cm）病变 160 例（良性 111 例，恶性 49 例）。分析两组病灶位置，形态学特征， TIC 曲线，T2W 图像特征及 ADC 值差异。病灶位置分 2 类：完全位于纤维腺体内和位于纤维腺体及脂肪交界面（IFFA）。当肿块位于远离乳腺主要纤维腺体的区域，且周围环绕脂肪组织，则称周围脂肪征（surrounding fat sign）阳性。采用单因素及多因素分析的方法比较良恶性乳腺小肿块临床及常规 MRI 特征的差异。
结果 乳腺良性和恶性肿块均好发于 IFFA，分别占 86.5%（96/111）及 89.8%（44/49）。单因素分析显示，良性组和恶性组在周围脂肪征，肿块边缘，内部强化类型，TIC 类型，T2W 图像信号特征及 ADC 值差异均有统计学意义。多因素回归分析结果显示：年龄＞50 岁（比值比[odds ratio, OR] = 6.728），周围脂肪征阳性（OR = 5.545）、T2WI 上略低信号（OR = 31.110）及周边高信号（OR = 13.794）及 ADC 值≤1.22x10^{-3}mm^2/s（OR = 5.802）是提示小乳腺癌的 4 个独立危险特征。联合这 4 种特征对于乳腺小肿块鉴别诊断的敏感性、特异性、阳性预测值、阴性预测值及准确

率分别为 89.2%（33/37），69.4%（59/85），55.9%（33/59），93.7%（59/63）及 75.4%（92/122）。

结论 乳腺良恶性病灶均好发于 IFFA 区，结合患者年龄，周围脂肪征，T2WI 信号特征及 ADC 值有助于乳腺小肿块（≤1cm）的良恶性鉴别诊断。

磁共振多参数成像定量图和直方图分析在三阴性乳腺癌与其他分子亚型鉴别中的价值

谢天文,顾雅佳,彭卫军
复旦大学附属肿瘤医院

目的 通过 MR 多参数定量图和全肿瘤的直方图分析，发现三阴性乳腺癌区别于其他分子亚型的影像生物学标志物。

方法 ：该研究回归地分析了 134 例乳腺导管癌患者，从弥散加权成像的 ADC 定量图和动态对比增强成像的半定量图（流入 washin 和流出 washout）中分别提取全肿瘤直方图特征。通过 t 检验或 U 检验进行单因素分析，以筛选出区分三阴性乳腺癌与其他分子亚型乳腺癌的有意义的特征值。然后使用筛选出的特征，生成接受者操作特征曲线，本文报告了三阴性乳腺癌与不同分子亚型乳腺癌的曲线下面积、敏感度和特异度。

结果 ：基于单因素筛选出的特征，区分三阴性乳腺癌与管腔 A 型乳腺癌的 AUC 为 0.710（95%置信区间：0.562～0.858）、灵敏度为 63.6%，特异度为 73.1%。区分三阴性乳腺癌与 HER2 阳性乳腺癌的 AUC 为 0.763（95%置信区间：0.608～0.917）、灵敏度为 86.4%、特异度为 72.2%。区分三阴性乳腺癌与非三阴性乳腺癌的 AUC 为 0.683（95%置信区间：0.556，0.809），灵敏度为 54.5%，特异性为 83.9%。 单因素分析未发见区分三阴性乳腺癌与管腔 B 型乳腺癌的显著特征。

结论 ：从磁共振多参数成像中 ADC、washin 和 washout 提取的全肿瘤直方图特征，提供了一种区别三阴性乳腺癌与其他分子亚型的无创性生物学特征分析方法。

基于 MRI 动态增强图像的影像组学模型对三阴性乳腺癌基因亚型的评估价值

马明明,姜原,张晓东,秦乃姗,王霄英
北京大学第一医院

目的 基于 MRI 动态增强图像（DCE）的影像组学模型对三阴性乳腺癌基因亚型的评估价值。

材料与**方法** 回顾性分析我院 2016 年 1 月至 2016 年 12 月，经乳腺穿刺活检或手术病理证实为乳腺癌的病例 89 例，且病理结果包含乳腺免疫组化结果。均与我院接受了乳腺 MRI 检查，可获得完整 DCE 图像。3D 肿瘤区域由 2 名有经验的放射科医生在 DCE 早期强化图像上手动勾画得到，并对肿瘤区域进行影像组学特征提取。基于矩阵的纹理特征包括 GLCM（灰度共生矩阵），GLRLM（灰度行程宽度矩阵），GLSZM（灰度尺寸域矩阵）和 NGTDM（领域灰度色调差距阵）。以上所有的特征提取和多模态体数据融合算法于 MATLAB 实现。以雌激素受体、孕激素受体、人表皮生长因子受体

表达状态（TN 型及非 TN 型）将病例分为两组，利用逻辑回归模型分析软件 DRESS 将所提取特征整合进多变量模型中建筑，并绘制 ROC，计算 ROC 下面积（AUC），比较各模型的诊断效能。
结果 TN 型者 45 例，非 TN 型者 44 例。经过 logistics 回归分析，选取由 8 个特征构建的最佳鉴别诊断模型，敏感度 0.838 ，特异度 0.900 ，准确度 0.853，ROC 下面积 AUC 为 0.876。
结论 基于 MRI 动态增强图像（DCE）的影像组学模型对三阴性乳腺癌基因亚型的评估具体一定价值。

Quantitative MRI radiomics in the task of predicting of the molecular classification of invasive breast cancers in a large clinical dataset from China

yu ji,Wenjuan Ma,Hong Lu,Ying Zhu,Peifang Liu
Tianjin Medical University Cancer Institute and Hospital

PURPOSE
To evaluate the potential of quantitative MRI radiomics in the task of predicting of the molecular classification of invasive breast cancers in a large clinical dataset from China.

METHOD AND MATERIALS
Our research involved a clinical DCE-MRI database of 998 invasive breast cancers retrospectively acquired. Immunohistochemistry molecular classification was performed including estrogen receptor, progesterone receptor, human epidermal growth factor receptor 2, and Ki-67, the molecular subtype (luminal A, luminal B, HER2-enriched, and triple-negative). The average age of the patients were 48.4 years with a standard deviation 9.6 years. Once each lesion was indicated to our radiomics workstation, the machine learning algorithm automatically segmented and extracted radiomic features on the primary lesion, including those from six categories: size, shape, morphology, enhancement texture, kinetics, and enhancement-variance kinetics. The selected feature subset was input to a support-vector machine (SVM) classifier and underwent 5-fold cross validation. The performance of the classifier model for molecular subtyping was evaluated using receiver operating characteristic analysis.

RESULTS
The resulting radiomic lesion signature from the SVM classifier yielded an AUC value of 0.57 (se = 0.05), 0.76 (se = 0.08), 0.75 (se = 0.06), 0.63 (se = 0.08), 0.63 (se = 0.06), and 0.77 (se = 0.09) in the tasks of distinguishing between luminal A versus luminal B, luminal A versus HER2-enriched, luminal A versus triple negative, luminal B versus HER2-enriched, luminal B versus triple-negative, and HER2-enriched versus triple negative.

CONCLUSION
Quantitative MRI radiomics demonstrated promising classification performance in predicting of the molecular classification of invasive breast cancers in a large clinical dataset from China.

Radiomics analysis of dynamic contrastenhanced magnetic resonance imaging for the prediction of sentinel lymph node metastasis in breast cancer

Chuanming Li,Jia Liu,Dong Sun
The Second Affiliated Hospital of Chongqing Medical University

Purpose: To investigate whether a combination of radiomics and automatic machine learning applied to dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) of primary breast cancer can noninvasively predict axillary sentinel lymph node (SLN) metastasis.
Methods: 62 patients who received a DCE-MRI breast scan were enrolled. Tumor resection and sentinel lymph node (SLN) biopsy were performed within 1 weeks after the DCE-MRI examinations. According to the time signal intensity curve, the volumes of interest (VOIs) were delineated on the whole tumor in the images with the strongest enhanced phase. Datasets were randomly divived intointo two sets including a training set (~80%) and a validation set(~20%).. A total of 1409 quantitative imaging features were extracted from each VOI. The least absolute shrinkage and selection operator (Lasso) and select K best were used to obtain the optimal features. Three classification models based on the logistic regression (LR), XGboost and support vector machine (SVM) classifiers were constructed. Receiver operating curve (ROC) analysis was used to analyze the prediction performance of the models. Both feature selction and models construction were firtstly performed in the training set, then were further tested in the validation set by the same thresholds.
Results: There is no significant difference between all clinical and pathological variables in breast cancer patients with and without SLN metastasis ($P > 0.05$), except histological grade ($P = 0.03$). Six features were obtained as optimal features for models construction. In the validation set, with respect to the accuracy, the SVM demonstrated the highest performance, with an accuracy, sensitivity (for positive SLN) , secificity, (for positive SLN) and Mean squared error (MSE) of 0.85, 0.71,1, 0.26 respectively.
Conclusions: We demonstrated the feasibility of combining artificial intelligence and radiomics from DCE-MRI of primary tumors to predict axillary SLN metastasis in breast cancer. This noninvasive approach could be very promising in application.

MRI 引导下乳腺可疑病灶定位活检的临床应用价值研究

罗冉,王丽君,尹秋凤,张玉珍,汪登斌
上海交通大学医学院附属新华医院

目的 探究对于仅在 MRI 可见的乳腺可疑病灶、进行经 MRI 引导下病灶定位活检操作对病灶定位及定性诊断的临床价值。
方法 回顾性收集 2016.05.01-2019.06.30 期间于我院行乳腺 MRI 引导下病灶定位活检的患者 82 例，所有患者术前乳腺 MRI 诊断为 BI-RADS 4 类或 BI-RADS 5 类、且乳腺 X 线摄影及乳腺 B 超未见对应病灶，分析不同类型病灶的 MRI 定位活检诊断价值。
结果 共纳入患者 82 例、82 个病灶，包括 2 例旋切活检、80 例钩丝定位后切除活检，病灶大小范围 0.3-1.2cm，平均 0.7cm，定位后扫描图像确认定位针尖位于病灶位置、定位准确；其中良性 71 个（包括 10 个 ADH 或 LCIS），恶性 11 个，阳性率 13.4%；术前 MRI 评估为 4A、4B、4C 及 5 类分别 65、12、3、2 个，恶性病灶分别为：3、3、3、2 个，阳性率分别为：4.6%、25%、100%、100%，与术前 MRI 诊断基本符合。
结论 MRI 引导下乳腺可疑病灶定位活检定位准确、对仅于 MRI 可见的早期乳腺癌的准确诊断有重要价值。

Investigation of a CT-based radiomics nomogram to predict human epidermal growth factor receptor 2 status in patients with gastric cancer

Yexing Li[1,2],Zixuan Cheng[1,3],Zaiyi Liu[1]
1.Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences
2.Shantou University Medical College
3.School of Medicine, South China University of Technology

Purpose: To develop and validate a CT-based radiomics nomogram for predicting the human epidermal growth factor receptor 2 (HER2) status in patients with gastric cancer.
Method: This retrospective study enrolled 134 patients with gastric adenocarcinoma from April 2013 to March 2018. 87 HER2-negative patients combined with all 47 HER2-positive patients to constitute the study dataset (training cohort: n = 94, validation cohort: n = 40). A radiomics signature was developed with the least absolute shrinkage

and selection operator method in the training cohort and then combined with independent clinicopathologic risk predictor to build a radiomics nomogram. The univariate test was performed to reveal the association between radiomics nomogram and HER2 status. A validation cohort was applied to confirm the predictive performance.
Results: The radiomics signature, which comprised seven radiomics features, has significantly association with HER2 status. Prediction model was constituted by the radiomics signature and carcinoembryonic antigen level. The model demonstrated better discriminative performance than radiomics signature for HER2-positive and HER2-negative patients, with an AUC of 0.799 (95% confidence interval [CI]: 0.704－0.894) in the training cohort and 0.771 (95%CI: 0.607－0.934) in the validation cohort. This model was visualized as a nomogram for individualized prediction. There were no statistically significant differences in age, sex and CT-reported T stage between the training and validation cohorts. Decision curve analysis showed that the radiomics nomogram was useful in clinical practice.
Conclusions: A radiomics nomogram we developed and validated has the potential to predict HER2 status in patients with gastric cancer.

Deep learning for diffusion kurtosis MRI predicts response of rectal cancer after neoadjuvant chemoradiotherapy

Xiaoyan Zhang,Meng Ye,Haitao Zhu,Xiaoting Li,Yingshi Sun
Beijing Cancer Hospital

Background: Preoperative therapy response evaluation remains a big challenge in locally advanced rectal cancer with neoadjuvant chemoradiotherapy. Recently, deep learning has been widely used in tumor diagnosis and treatment produced exciting results.
Purpose: This study proposed to develop and validated a deep learning method to predict response based on diffusion kurtosis imaging.
Methods: 383 patients were enrolled in this prospective study, and chronologically divided into 290 in the discovery cohort and 93 in the independent validation cohort. Deep learning models were constructed for predicting pathological complete response (pCR), tumor regression grade (TRG) (0-1/2-3) and T-downstage according to pathological results. The performances of deep learning models were compared with DKI-derived parameters and subjective evaluation for response evaluation.
Results: The area under receiver operating characteristic curve was 0.989 for pCR, 0.695 for TRG and 0.789 for T-downstage. The deep learning model for predicting pCR was much better than the mean value or change value of DKI-derived parameters. Subjective evaluation produced significantly higher error rate for predicting pCR than deep learning model (0.022, 0.269 and 0.248 for model, rater 1 and rater 2, $P<0.01$); the raters achieved much lower error rate (0.129 and 0.14 for rater 1 and rater 2) under the assistance of deep learning model.

Conclusions: Deep learning model potentially provides effective assistance for clinical diagnosis of response evaluation in locally advanced rectal cancer with neoadjuvant chemoradiotherapy.

基于弱监督深度学习利用 DWI 对急性缺血性脑卒中及出血转化的自动化分析

曹宸[1],刘之洋[2],靳松[1]
1.天津市环湖医院
2.南开大学

目的 采用弱监督深度学习对 DWI 中的弥散像、ADC 及 EPI-b_0进行分析，自动检测急性缺血性脑卒中（Acute Ischemic Stroke, AIS）位置并对是否出现出血转化进行甄别，方法上解决人工智能医学应用中图像相对较少及专家标签获得困难的问题，影像上弥补了 EPI-b_0像肉眼很难观察而 GRE 序列需要额外扫描时间的矛盾，临床上辅助医师对 AIS 的早期准确诊断并及时发现出血转化以调整治疗策略，对提高患者预后有重要的临床意义。
方法 选取 751 例 AIS（432 例训练及 319 例测试）和 311 例出血转化（246 例训练及 65 例测试）的 DWI 图像，以 GRE 作为金标准评价出血转化位置。训练组进行弱监督标记，即仅标记每层是否出现病灶，测试组进行全监督标记，即准确标记病灶范围。首先，将 AIS 组测试数据按病灶大小和位置分为大病灶组和腔隙灶组（脑桥、基底节、半卵圆中心），计算 ResNet 和 VGG 两种方法的 ROC 曲线下面积和敏感度，并使用连通区域分析的方法，计算平均误诊数（mFP）及平均漏诊数（mFN）；接着，将上一步证实的较优方法用于甄别出血转化，分别标出 AIS 及出血转化位置，并计算敏感度、mFP 及 mFN。
结果 1.ResNet 和 VGG 对 AIS 检测的 ROC 曲线下面积为 0.97 和 0.94。2.ResNet 提高了脑桥腔隙灶组的敏感度并且降低了 mFN 及 mFP （$P<0.05$），降低了大病灶组、基底节和半卵圆中心腔隙灶组的 mFP （$P<0.05$）。3.针对出血转化组，ResNet 检测 AIS 的敏感度为 87.73%、mFN 为 0.78、mFP 为 0.37，检测出血转化的敏感度为 86.20%、mFN 为 0.68、mFP 为 0.43，两者间无统计学差异（$P>0.05$）。
结论 通过弱监督深度学习可以有效检测 AIS 与出血转化，且通过网络结构的优化可以减少病灶位置对检测效率的影响，此方法有潜力提高人工智能在医学影像中的应用范围。

基于 MRI 影像组学特征预测进展期高级别浆液性卵巢癌手术可切除性的研究

李海明[1],张睿[2],高欣[2],彭卫军[1]
1.复旦大学附属肿瘤医院
2.中国科学院苏州生物医学工程技术研究所

目的 探讨基于 MRI 的影像组学特征能否准确预测进展期高级别浆液性卵巢癌（High grade serous ovarian carcinoma, HGSOC）的手术可切除性。
方法 回顾性分析 214 例 HGSOC 卵巢癌患者的多参数磁共振影像数据，其中单侧病灶患者 92 例，双侧病灶患者 122 例，根据病理结果，将患者分为术后无残留组和术后有残留组，随后由临床经验

丰富的放射科医生对肿瘤感兴趣区域（region of interest，ROI）进行勾画。然后利用影像组学方法提取病灶高通量特征，包括形状特征、一阶统计特征和纹理特征等。随后对所提的高通量特征进行筛选，剔除常量与缺失值，并利用最小冗余最大相关性（minimum redundancy maximum relevance，mRMR）算法对特征进行相关性排序，得到最优特征子集。最后我们针对单侧病灶患者和双侧病灶患者分别采用 LASSO（Least absolute shrinkage and selection operator）回归算法对患者术后残留情况构建预测模型。

结果 本研究基于影像组学方法对 HGSOC 患者多参数磁共振影像数据中肿瘤区域提取出 1682 个影像特征，剔除特征中的常量、缺失值和绝对相关性高于 0.9 的冗余特征，保留 383 个特征，随后对保留的特征做 mRMR 算法分析，筛选出最优特征子集并作为 LASSO 的输入以构建预测模型。针对单侧病灶患者预测模型，其受试者操作特性曲线下面积（area under curve, AUC）为 0.727；针对双侧病灶患者预测模型，其 AUC 为 0.733。

结论 本研究提出了一种基于影像组学的 HGSOC 患者术后残留预测模型构建方法，所建模型能较好地预测术后有无残留情况，有望为临床进行术前无创预测手术残留情况提供新的解决方案，避免不必要的开腹手术，延长患者的生存期。

肥厚型心肌病患者左心室心肌深度纹理特征与心衰程度的相关性研究

方良瑞,赵骏
陆军军医大学西南医院

目的 应用心脏磁共振电影序列定量计算肥厚型心肌病患者左心室舒张末期心肌区域深度纹理特征与心衰程度的相关性。

材料与方法 回顾性分析我院 2013 年至 2016 年接受心脏磁共振检查的患者，纳入完成 Siemens Magnetom Trio 3.0T 超导 MR 扫描仪标准化扫描检查并确诊为肥厚型心肌病的患者，共 75 例，按照纽约心脏协会(New York Heart Association，NYHA) 心功能分级法分组，其中 NYHAⅠ-Ⅱ为第一组（男性 26 例，女性 23 例，平均年龄 44.44±12.12 岁），为轻度心衰组，NYHAⅢ-Ⅳ设为第二组（男性 13 例，女性 13 例，平均年龄 49.46±14.63 岁），为重度心衰组。将电影序列用 MATLAB（Matrix Laboratory）软件手动提取所有患者左室舒张末期所有心肌区域，并用经过训练测试的深度神经网络 VGG 进行纹理特征提取分析。用递归特征增加法对深度纹理特征进行选择，最终挑选出 12 个特征用机器学习的方法支持向量机（Support Vector Machine，SVM）分类学习，用留一法进行交叉验证完成心功能分级轻重度分类分析。用西门子 Argus 软件计算所有患者射血分数 EF。用 SPSS 18.0 进行 Mann-Whitney 检验两组患者之间年龄分布的差异性，利用卡方检验计算两组患者之间男女比例的分布差异性。使用受试者工作特征曲线 ROC 对深度纹理特征和 EF 的诊断效能进行分析,并进行 ROC 曲线下面积的计算。

结果 轻重度心衰两组患者平均年龄没有显著性差异(P=0.108)，男女分布比例没有显著性差异（P=0.083）。ROC 计算得出深度纹理特征曲线下面积（81.0%）明显大于 EF 的曲线下面积（51.9%）。

结论 深度纹理特征分析算法能够有效定量鉴别纽约心功能分级的Ⅰ-Ⅱ、Ⅲ-Ⅳ级差别，敏感性明显高于 EF。

深度学习在非门控胸部 CT 平扫冠脉钙化积分危险分层的预测价值研究

樊荣荣[1],刘凯[1],夏晨[2],吴双[2],张荣国[2],萧毅[1],刘士远[1]
1.海军军医大学第二附属医院（上海长征医院）
2.推想科技有限公司

【目的】探讨深度学习在非门控 CT 平扫冠脉钙化积分危险分层的预测价值。
【方法】由推想科技有限公司搭建平台并训练非门控胸部 CT 平扫冠脉钙化积分模型，模型由上海长征医院 102 例非门控胸部 CT 平扫纵隔窗有冠脉钙化者组成，其中高危者有 32 例、中危者有 41 例、低危者有 29 例。训练集中所有病例均行非门控胸部 CT 平扫和门控 CT 平扫，以门控 CT 平扫评估的冠脉钙化积分危险分层为金标准，对非门控胸部 CT 平扫纵隔窗冠脉钙化进行标记记，输入标记后采用交替训练方法进行深度学习训练。纳入武汉同济医院 50 例非门控胸部 CT 平扫作为测试集。将深度学习法中的非门控胸部 CT 扫描所评估的钙化积分与心电门控 CT 扫描所评估的钙化积分进行比较，评价分类的准确性。
【结果】测试集 50 例，其中高危 26 例，中危 10 例，低危 14 例。采用深度学习模型确定了 26 例高危组，10 例中危组和 10 例低危组。当将阈值设置为 0.9 时，平均正确率为 93.8％。
【结论】深度学习能够评估非门控胸部 CT 平扫的冠脉钙化积分，并进行危险分层，预测价值较高。

人工智能系统对于儿童骨龄评价的优化研究

白凤森
首都儿科研究所附属儿童医院

目的 比较在人工智能骨龄评价系统辅助下的骨龄评估与儿科放射医师人工评价骨龄的优劣，探讨人工智能在儿童骨龄中的作用。材料和**方法** 收集我院 1303 例左手腕 X 线摄片（男 675 例，女 628 例），以 3 名高年医师 G-P 图谱法骨龄评估结果的平均值作为参考标准。另选三名放射医师在无人工智能辅助下进行首次阅片，4 周后，在人工智能辅助下对摄片进行再次评估。采用骨龄准确性和根均方正误差（RMSE）作为比较指标。**结果** 在人工智能的辅助下，三位放射科医师的 RMSE 均有所下降（从 0.76 降至 0.32；从 0.57 降至 0.50；从 0.59 降至 0.45），骨龄评估准确度也高于无 AI 辅助组（准确度从 81%提高到 94.4%；从 86%提高到 91.6%；从 87%提高到 93%）。**结论** 与放射科医师单独评估骨龄比较，人工智能系统的应用可以提高医师的工作效率，减少不同观察者间主观因素的影响，提高骨龄测定准确度，降低 RMSE。人工智能系统可为儿科放射科医师测定骨龄提供有利的帮助。

基于深度卷积神经网络实现 CT 脑萎缩自动分类的初步研究

王锦程[1],陈思杰[2],徐梦迪[2],熊兵[1],刘伟[1],石磊[2],楼海燕[1]
1.浙江大学医学院附属第一医院
2.杭州依图医疗技术有限公司

目的 探索深度卷积神经网络结合线性测量法，构建 CT 脑萎缩分类模型的可行性。
方法 收集 2019 年 1 月至 3 月在我院行头颅 CT 平扫的患者，按照 3∶2 的比例，提取脑萎缩 300 例，无脑萎缩 200 例，共 500 例 CT 数据。在基底节层面，人工测量前角间最大径（A）、前角间最小径（B）、三脑室最宽径（C）、侧脑室脉络丛间径（D）4 个线性指标；在侧脑室顶层面，人工测量侧脑室顶间外径（E）、头颅最大外径（F）以及头颅最大内径（G）3 个线性指标；在侧脑室顶消失以上第三层面，人工判定脑沟是否增宽。所有数据随机分为训练集 347 例，验证集 52 例和测试集 101 例。采用卷积神经网络（Convolutional Neural Networks, CNN）构建关键层面识别、线性指标测量和脑沟增宽判定模型。CNN 输出结果通过 logistic 回归，构建脑萎缩分类模型 M1，结合相关临床信息进一步构建模型 M2（M1+性别）、M3（M1+年龄），并使用观察者操作特性曲线（ROC）进行性能评价。
结果 CNN 线性指标测量的一致性较高，7 个参数的 ICC 值：A=0.81，B=0.85，C=0.65，D=0.87，E=0.90，F=0.98，G=0.98，*P* 均＜0.001。脑沟增宽判定模型的 kappa 值为 0.70，*P*＜0.001。模型 M1-3 均取得较高的脑萎缩识别率，M1 敏感性 84.8%，特异性 80.0%，准确性 82.4%；M2 敏感性 87.9%，特异性 85.7%，准确性 86.8%；M3 敏感性 91.4%，特异性 93.9%，准确性 92.6%；三者曲线下面积（AUC）为 M1=0.90、M2=0.90、M3=0.99。
结论 利用深度卷积神经网络和关键层面选取技术，可以对 CT 脑图像进行可靠的线性指标测量。我们构建的脑萎缩分类模型具有准确的识别率，如果结合患者的年龄，可以显著提升模型的性能，为临床工作和科研提供一种 CT 脑萎缩快速筛选工具。

Assessment of Acute Pulmonary Embolism based on Computed Tomographic Pulmonary Angiography with Artificial Intelligence

Weifang Liu[1,2], Min Liu[1], Sheng Xie[1], Han Kang[3], Rongguo Zhang[3]
1. China-Japan Friendship Hospital, China
2. Peking University Health Science Centre
3. Infervision

Purpose: Assessment of clot burden of acute pulmonary embolism (APE) is useful to clinical severity and treatment evaluation(1,2). This study takes advantages of the deep learning algorithms to detect and calculate clot burden of APE on computed tomographic pulmonary angiography (CTPA).
Methods: The retrospective study included a CTPA dataset containing 590 cases from two medical imaging centers between Jan 2014 and Dec 2015. A deep learning convolutional neural network (DL-CNN), called U-Net, was trained on this dataset to segment clot, and then the trained model was tested on the other 288 patients with suspected APE. The performances of our model were evaluated in terms of sensitivity, specificity, and Area Under Curve (AUC). Using the segmentation result, the volumetric assessment of clot burden in APE was subsequently provided. Meanwhile, clot burden of APE assessed with Qanadli score, Mastora score(3,4) and other imaging parameters were calculated by the residents to correlate with clot volume calculated with our model.
Results: When the probability threshold for segmentation results is setting as 0.1, the sensitivity and specificity respectively are 94.6% and 76.5%. The AUC was 0.926 (95% CI: 0.884-0.968), which indicates good discriminative power. Clot burden measured

with U-Net model at setting value of 0.1 was significantly correlated with Qanadli score (r=0.819, p<0.001) and Mastora score (r=0.874, P<0.001). The time to test clot burden by the U-Net model is significantly shorter than that of manual measurement by the 5-year residents (AI 12.9 (9.1-16.7) seconds VS Mastora score10.2 (6.7-14.3) minutes, VS Qanadli score 9.8 (4.2-11.0) minutes, P < 0.001). Moreover, Clot burden measured with DL model is correlated with parameters related to right ventricular function.
Conclusions: In comparison with resident's evaluation, deep learning convolutional neural network algorithm could be a more efficient method to evaluate APE and calculate the clot burden.

OR-531

Radiologic-Radiomic Machine Learning for Differentiation of Benign and Malignant Solid Renal Masses: Comparison to Expert Level-based Decision Performance

Xueying Sun, Qiuxia Feng, Xun Xu, Jing Zhang, Feipeng Zhu, Yanhao Yang, Yudong Zhang
First Affiliated Hospital of Nanjing Medical University

OBJECTIVE. To compare radiologic-radiomic machine learning (R^2ML) and expert level-based performance (ELDP) for differentiation of benign and malignant solid renal masses during contrast-enhanced CT interpretation.
MATERIALS AND METHODS. This retrospective study included a cohort of 254 renal cell carcinomas (RCCs) (190 clear-cell RCCs, 38 chromophobe RCCs and 26 papillary RCCs), 26 fat-poor angioleiomyolipoma (fp-AML) and 10 oncocytomas with preoperative CT examination. Lesions identified by ELDP were manually segmented for radiologic-radiomic analysis. Disease-specific support vector machine R^2ML models for classification of renal masses were trained and validated using a 10-fold cross-validation. ELDPs and R^2ML were compared by using the McNemar test.
RESULTS. ELDP from four radiologists had a sensitivity 77.4-96.8% (median, 84.5%; variance, 122.7%) and specificity 48.4-71.9% (median, 61.8%; variance, 161.6%) for differentiating clear-cell RCCs from papillary/chromophobe-RCCs; a sensitivity 73.7-96.8% (median, 84.5%; variance, 122.7%) and specificity 52.8-88.9% for differentiating clear-cell RCCs from fp-AMLs/oncocytomas (median, 80.6%; variance, 269.1%); and a sensitivity 28.1-60.9% (median, 84.5%; variance, 122.7%) and specificity 75.0-88.9% for differentiating papillary/chromophobe-RCCs from fp-AMLs/oncocytomas (median, 50%; variance, 191.1%). After a 10-fold cross-validation, the R^2ML model resulted in a sensitivity 90.0%, 86.3% and 73.4%, a specificity 89.1%, 83.3% and 91.7%, respectively, for distinguishing renal masses abovementioned by ELDP.
CONCLUSION. ELDP had obviously large variances in differentiation of benign and malignant solid renal masses, while R^2ML can be potential way to improve inter-reader concordance and performance.

Noninvasively Predicting Epidermal Growth Factor Receptor Mutation Status and Subtypes in Lung Adenocarcinoma Based on Radiomics Nomogram

Wei Zhao[1],Ming Li[2],Jun Liu[1],Yuzhi Wu[1]
1.Department of Radiology, Second Xiangya Hospital, Central South University, Changsha, China
2.Department of Radiology, Huadong Hospital Fudan University, Shanghai, China

Purpose: To develop and validate radiomics-based nomograms, integrating radiomics, CT features and clinical characteristics, to noninvasively predict *EGFR* mutation status and subtypes.
Materials and Methods: We included 637 patients with lung adenocarcinomas, who performed the *EGFR* mutations analysis in the current study. The whole dataset was randomly split into a training dataset (n=322) and validation dataset (n=315). A sub-dataset of *EGFR*-mutant lesions (*EGFR* mutation in exon 19 and in exon 21) was used to explore the capability of radiomic features for predicting *EGFR* mutation subtypes. 475 radiomic features were extracted and a radiomics sore (R-score) was constructed by using the least absolute shrinkage and selection operator (LASSO) regression in the training dataset. A radiomics-based nomogram, incorporating clinical characteristics, CT features and R-score was developed in the training dataset and evaluated in the validation dataset.
Results: The constructed R-scores achieved promising performance on predicting *EGFR* mutation status and subtypes, with AUCs of 0.694 and 0.708 in two validation datasets respectively. Moreover, the constructed radiomics-based nomograms excelled the R-scores, clinical, CT features alone in terms of predicting *EGFR* mutation status and subtypes, with AUCs of 0.734 and 0.757 in two validation datasets respectively.
Conclusions: Radiomics-based nomogram, incorporating clinical characteristics, CT features and radiomic features, can noninvasively and efficiently predict the *EGFR* mutation status and thus potentially fulfill the ultimate purpose of precision medicine. The methodology is a very promising strategy to predict *EGFR* mutation subtypes, providing the support of clinical treatment scenario.

基于 mpMRI 的影像组学预测模型对前列腺癌包膜浸润的诊断价值

许梨梨[1],张古沐阳[1],赵仑[2],毛丽[2],李秀丽[2],金征宇[1],孙昊[1]
1.中国医学科学院北京协和医院
2.深睿医疗人工智能研究院

目的 本研究拟构建基于多参数磁共振（mpMRI）的影像组学预测模型用以诊断前列腺癌包膜浸润（EPE），并验证模型的诊断效能。**方法** 回顾性收集 2015.01 至 2019.03 期间本院接受前列腺根治性切除术的前列腺癌患者 95 例，所有患者都进行了术前 mpMRI 检查，且检查前未接受内分泌治疗、放化疗等。收集患者的年龄、t-PSA、f-PSA、F/T、PI-RADS 评分和穿刺病理的 Gleason 评分。由一名影像科医师分别在 T2 加权图像（T2WI）、弥散加权图像（DWI）、表观扩散系数图

（ADC）和动态增强 MRI（DCE-MRI）图像上对病灶进行逐层勾画，并由病理医师评估包膜浸润情况，最终纳入 115 例病灶进行分析。对 MRI 图像进行滤波处理后提取特征，用 10 折交叉验证方法，采用 Logistic 回归模型进行统计分析，筛选与 EPE 相关的影像组学特征并构建影像组学标签。最后选取诊断效能最高的影像组学标签与显著性临床指标结合以构建影像组学模型，通过计算曲线下面积（AUC）评估模型诊断效能。**结果** 在测试组中，T2WI、DWI、ADC 和 DCE 诊断 EPE 的 AUC 分别为 0.819、0.860、0.804、0.788。将不同序列的影像组学特征进行组合，结果表明 T2WI+DWI+DCE 的诊断效能优于 T2WI+ADC+DCE 和 T2WI+ADC+DWI+DCE，在测试组中该组合的 AUC 为 0.860，敏感性、特异性分别为 84.85%，83.67%。选取该模型与有显著性差异的临床指标（t-PSA、PI-RADS 和 Gleason 评分）进行结合构建诺莫图，该组合模型的 AUC 为 0.861。**结论** 基于 mpMRI 的影像组学标签可以很好地预测前列腺癌包膜浸润，可以为术前诊断 EPE 并指导治疗方案选择提供重要参考，有重要临床意义，而临床指标对该模型诊断效能的提高作用有限。

Study on the effect of AI-assisted software on the detection efficiency of pulmonary nodules in fatigued intern in Radiology Department.

Di Xu,Liang Wang,Fei Wu
Affiliated Zhongshan Hospital of Dalian University

PURPOSE: Previous studies have demonstrated that radiologists experience increased fatigue and decreased diagnostic accuracy for detecting pulmonary nodules after their usual workday. To explore the diagnostic efficiency improvement for fatigued intern after daily work with the help of AI-assisted pulmonary nodule detection software.
METHOD AND MATERIALS: A total of 182 patients were collected. One senior radiologist with more than 10 years' experience read CT images based on the initial diagnosis of another senior radiologist with similar experience and a final decision was subsequently conducted by deputy chief radiologist with more than 15 years' experience to determine the ground truth lung nodules. Three readings were conducted by an intern (with 4 months' chest CT experience) using different methods under different conditions: an intern in daily work (not fatigued) without AI (group A), the same fatigued intern (after routine 8 hours' working time) without AI (group B) and the fatigued intern with AI (group C). All three reading had an inter-washout period of more than 15 days. The performance of three readings regarding lung nodule detection was assessed by using sensitivity and false positive rate.
RESULTS: A total of 1281 nodules were confirmed to be gold standard nodules. Group A detected 890 nodules including 591 true positive nodules and 299 false positive nodules with a sensitivity of 46.14% and a false positive rate of 1.64 per CT scan (299/182). Group B detected 749 nodules including 517 true positive nodules and 232 false positive nodules with a sensitivity of 40.36% and a false positive rate of 1.27 per CT scan (232/182). Group C detected 1162 nodules including 995 true positive nodules and 167 false positive nodules with a sensitivity of 77.67% and a false positive rate of 0.92 per CT scan (167/182). Group A achieved a sensitivity (46.14%) 5.78% higher than group B (40.36%) and a lower false positive rate ($p<0.05$). Group C achieved the highest sensitivity (77.67%) as compared with group A (46.14%) and group B (40.36%) while the false positive rate is the lowest ($p<0.05$).

Conclusion: Fatigue can reduce the detection efficiency of pulmonary nodules for radiologists. However, fatigued intern with AI could achieve much higher diagnostic efficiency than radiologists in daily work (not fatigued).Fatigued intern aided with AI-assisted lung nodule detection system could achieve desirable detection rate for pulmonary nodules which is especially helpful for hospitals to cope with the increasing CT examination needs by involving radiologists with more working hours.

初步探究影像组学在胃癌腹膜转移化疗疗效预测的价值

陈智成,刘屹
中国医科大学附属第一医院

目的 初步探究基于网膜索条影的影像组学在发生腹膜转移的晚期胃癌一期化疗中的临床应用价值。
材料与**方法** 回顾性分析经手术及穿刺活检病理证实为胃癌腹膜转移病例 28 例。其中治疗有反应组 10 例，治疗无反应组 18 例。选取层厚为 2mm 门脉期的 CT 图像进行分析，由两名有经验的放射科医生进行感兴趣区（ROI）的勾画。运用 AK 软件进行特征提取、特征选择及构建预测模型。运用 R 软件，利用 4 种不同的机器学习方法（线性判别分析、K 邻近、 朴素贝叶斯、支持向量机（SVM））使用选择出的特征组合对肿瘤进行分类，同时计算曲线下面积（AUC）或者分类准确率 AUC， 评估能力分 5 个级别： 0.50-0.59 差； 0.60-0.69 中等； 0.70-0.79 较好； 0.80-0.89 非常好； 0.90-1.0 极好。
结果 通过灰度直方图、基于灰度共生矩阵（GLCM）、灰度游程长度矩阵特征（GLRL）、灰度区域大小矩阵特征（GLZSM）四种方法共提取出 396 个特征，使用 spearm 相关进行特征降维后得到熵、偏态、聚类突（ClusterProminence_AllDirection_offset1）等 44 个共同特征。最后运用这 44 个特征进行模型构建，得到最佳预测模型为 SVM 分类器。建立 ROC 曲线得到曲线下面积为 0.7733（ 95% CI 0.6621- 0.8621），具有较好的分类能力，灵敏度、特异度分别为 0.73 和 0.79。
结论 通过构建基于网膜索条影的影像组学预测模型对预估有腹膜转移的晚期胃癌一期化疗疗效具有较好的预测价值。

基于 MRI 影像组学特征的骨肉瘤患者的生存预测

张璐,李佳佳,王静,程天明,葛英辉
河南省人民医院

目的 本研究旨在开发一个基于 MRI 影像组学诺模图，用于在诊断骨肉瘤时对患者进行生存预测。
方法 收集 2011 年 1 月至 2019 年 1 月经手术病理证实的骨肉瘤患者 150 例，所有患者都曾于术前进行常规 MRI 检查。根据诊断的先后顺序，将患者分为两组：训练组和独立验证组。训练组 102 例用于构建预测模型。独立验证组 48 例用于测试模型的预测能力。治疗后存活≥5 年的患者归类于生存组，而手术后 5 年内死亡的患者归类于非生存组。最低随访时间为 5 年。同时收集临床数据，包括年龄，性别，肿瘤解剖部位，肿瘤外科分期（Enneking）和是否发生病理性骨折。使用 PACS 系统中存档的各序列图像并以 DICOM 格式导出原始图像。使用 ITK-SNAP 软件进行人工手动 ROI 分割。之后进行最佳的生存相关影像组学特征提取，包括肿瘤强度、形状和大小、纹理和小波特征。然后，利用 LASSO 逻辑回归来构造骨肉瘤患者生存预测的影像组学标签（Rad-score），并结

合临床数据进行多元分析，构造了诺模图个性化预测模型。**结果** 1.生存组患者的得分通常高于非生存组患者。在训练组和验证组中，在生存组和非生存组中的患者之间观察到放射组学评分的显着差异（p 值<.0001）。训练组的 AUC 为 0.79。验证组 AUC 为 0.76。2.影像组学列线图显示出比临床模型更好的校准和分类能力。 决策曲线分析证明了放射组学列线图对于临床的重要价值。3.在诺模图预测的生存组和非生存组的存活曲线之间观察到显着差异（p 值 b<.05;log-rank 检验）。**结论** 影像组学诺模图可以帮助临床医生定制更合适的治疗方案。

CT Radiomic And Semantic Features Predicting Epidermal Growth Factor Receptor Mutation in Peripheral Lung Adenocarcinoma

Xiaoqian Lu,Dianbo Cao
The First Hospital of Jilin University

Objective: To predict epidermal growth factor receptor (EGFR) mutation status in those patients with lung adenocarcinoma using clinical imaging and quantitative radiomic biomarkers.
Method: 104 patients with lung adenocarcinoma, who underwent surgical excision and EGFR mutation detection of tumor tissue, were enrolled from 2016 to 2018 in our center. Radiomic and CT semantic features that reflect the heterogeneity and phenotype of tumors were extracted from pre-operative non-enhanced computed tomography (CT) scans. Afterwards, the least absolute shrinkage and selection operator (LASSO) method was applied to select the most distinguishable features. Three logistic regression models were built to predict the mutation status of EGFR by combining CT semantic with clinicopathological characteristics, the radiomic biomarkers alone and the radiomic biomarkers with clinicopathological characteristics. Meanwhile, the receiver operating characteristic curve (ROC) was plotted by using five-fold cross-validation and the AUC (area under curve) mean value was calculated and compared respectively to obtain the optimal model for predicting the EGFR mutation. In addition, radiomic nomogram was constructed to demonstrate the performance of the model.
Results: 1025 radiomic features were extracted and reduced to 13 features as the most important predictors for building the radiomics signature. The radiomic biomarkers combined with clinicopathological features model was developed based on radiomics signature, gender, smoking, vascular infiltration and pathological type, whose AUC for the training cohort was 0.88±0.03 (mean±standard deviation), the AUC for the verification cohort was 0.88±0.12 and the AUC for the test cohort was 0.913. This model was superior to the other prediction models that used the CT semantic combination with clinicopathological characteristics (AUC for test cohort: 0.768) and radiomic variables alone (AUC for test cohort: 0.837).
Conclusion: Prediction model built by radiomic biomarkers and clinicopathological features including radiomics signature, gender, smoking, vascular infiltration and pathological type, subsequently constructing radiomics nomogram, could effectively predict the EGFR mutation status in those patients with peripheral lung adenocarcinoma. This model has better predictive performance than the simple radiomic features model and CT semantic combination with clinicopathological characteristics model.

Characterization of microvessels and parenchyma in in-line phase contrast imaging CT: healthy liver, cirrhosis and hepatocellular carcinoma

Jinghao Duan
Shandong Cancer Hospital and Institute, Shandong First Medical University and Shandong Academy of Medical Sciences

Background: Hepatocellular carcinoma (HCC) is a cancer with a poor prognosis, and approximately 80% of HCC cases develop from cirrhosis. Imaging techniques in the clinic seem to be insufficient for revealing the microstructures of liver disease. In recent years, phase contrast imaging CT (PCI-CT) has opened new avenues for biomedical applications owing to its unprecedented spatial and contrast resolution. The aim of this study was to present three-dimensional (3D) visualization of human healthy liver, cirrhosis and HCC using a PCI-CT technique called in-line phase contrast imaging CT (ILPCI-CT) and to quantitatively evaluate the variations of these tissues, focusing on the liver parenchyma and microvasculature.
Methods: Tissue samples from 9 surgical specimens of normal liver (n=3), cirrhotic liver (n=2), and HCC (n=4) were imaged using ILPCI-CT at the Shanghai Synchrotron Radiation Facility (SSRF) without contrast agents. 3D visualization of all ex-vivo liver samples are presented. To quantitatively evaluate the vessel features, the vessel branch angles of each sample were clearly depicted. Additionally, radiomic features of the liver parenchyma extracted from the 3D images were measured. To evaluate the stability of the features, the percent coefficient of variation (%COV) was calculated for each radiomic feature. A %COV<30 was considered to be low variation. Finally, one-way ANOVA, followed by Tukey's test, was used to determine significant changes among the different liver specimens.
Results: ILPCI-CT allows for a clearer view of the architecture of the vessels and reveals more structural details than does conventional radiography. Combined with the 3D visualization technique, ILPCI-CT enables the acquisition of an accurate description of the 3D vessel morphology in liver samples. Qualitative descriptions and quantitative assessment of microvessels demonstrated clear differences among human healthy liver, cirrhotic liver and HCC. In total, 38 (approximately 51%) radiomic features had low variation, including 11 first-order features, 16 GLCM features, 6 GLRLM features and 5 GLSZM features. The differences in the mean vessel branch angles and 3 radiomic features (first-order entropy, GLCM-inverse variance and GLCM-sum entropy) were statistically significant among the three groups of samples.
Conclusions: ILPCI-CT may allow for morphologic descriptions and quantitative evaluation of vessel microstructures and parenchyma in human healthy liver, cirrhotic liver and HCC. Vessel branch angles and radiomic features extracted from liver parenchyma images can be used to distinguish the three kinds of liver tissues.

Purpose

Incomplete multi-modality images (MRI, FDG-PET, and Amyloid-PET) and other clinical variables can significantly hinder accurate diagnosis and prognosis of mild cognitive impairment (MCI) patients for Alzheimer Disease (AD). We developed a novel longitudinal transfer learning (TL)-based artificial intelligence (AI) model, LTL-AI model, using incomplete multi-modality images collected at baseline and follow-up. This study investigates the efficacy of LTL AI for diagnosis and prognosis of MCI.

Material and methods

214 MCI patients consisting of 3 modalities at baseline and follow-ups from ADNI were included: 97 are MCI due to AD and 26 converting to AD within 2 years. We randomly deleted the same image modality, forming incomplete multimodality data, into four sub-cohorts with MRI, MRI&FDG-PET, MRI&Amyloid-PET, and all 3 modalities.

We extracted commonly used imaging features for AD from 3 modalities and non-imaging like age, APOE 4 status, MMSE and CDR.

Based on expectation-maximization, we developed and applied LTL AI Model to train the incomplete longitudinal multi-modality imaging and non-imaging data to avoid the negative transfer.

Area Under ROC Curve (AUC) was used for the evaluation of the LTL AI and a traditional separate model (SM) which was trained using solely MRI modality.

Results

LTL TL yielded higher performance than SM model for diagnosis and prognosis. By applying an operating threshold to divide all testing cases into positive and normal cases, following Table lists more evaluation indices to assess performance, including AUC, Sensitivity, Specificity, p-values for both models.

Conclusion

We successfully developed a novel LTL AI model to diagnose and prognose of MCI with varying availability of imaging modalities from MRI, FDG-PET, Amyloid-PET, and other clinical variables based on knowledges instead of image features transfer from multi-modalities into single modality. The LTL AI model achieved much better accuracy than traditional SM model.

Relationship Between Radiomics and Risk of Lymph Node Metastasis in Pancreatic Ductal Adenocarcinoma

Yun Bian, Jianping Lu, Li Wang
Department of Radiology, Changhai Hospital, The Second Military Medical University, Shanghai, China

Objective To explore the exact relationship between the arterial radiomics score (rad-score) and lymph node (LN) metastasis in pancreatic ductal adenocarcinoma (PDAC).
Methods A total of 225 patients with pathologically confirmed PDAC who underwent multislice computed tomography within one month of resection from December 2016 to August 2017 were retrospectively studied. For each patient, 1029 radiomics features of arterial phase were extracted, which were reduced using the least absolute shrinkage and selection operator (LASSO) logistic regression algorithm. Multivariate logistic regression models were utilized to analyze the association between the arterial rad-score and LN metastasis.
Results Lymph node-negative and -positive patients accounted for 107 (47.56%) and 118 (52.44%) of the cohort, respectively. The rad-score, which consisted of 12 selected features of the arterial phase, was significantly associated with LN status (P <0.05). Univariate analysis revealed that the arterial rad-score and T stage were independently and positively associated with risk of LN metastasis (P <0.05). Multivariate analyses revealed a significant association between the arterial rad-score and the LN metastasis (P < 0.0001). Higher arterial rad-score was associated with LN metastasis (P for trend <0.0001).
Conclusion The arterial rad-score is independently and positively associated with the risk of LN metastasis in PDAC.

Purpose

A shortage of physicians to interpret radiological and pathological images from digital radiography and sputum smear in TB high-burden (HB) rural areas of China hinders the early diagnosis of TB. We deployed Deep-learning based Multi-modality AI (DMAI) in a TB HB large rural province, Qinhai, to assist physicians in detecting TB in radiological and pathological images. Our study investigates the efficacy of DMAI to assist physicians in detecting TB at multiple hospitals located in Qinhai.

Material and methods

A DMAI system was installed in a central TB hospital to automatically screen for TB in radiological (DR) and pathological images received from more than 60 local hospitals via secured internet connection. DMAI classified each DR image into high-risk, low-risk, and no-TB and automatically generated heatmaps denoting abnormality in <10 sec. Junior physicians (~12.5 yr-experience) reviewed these cases with DMAI support. Senior physicians (>25 yr-experience) then reviewed results from junior physicians and DMAI to generate final diagnosis. A MRMC study compared diagnoses from DMAI, junior physicians, and senior physicians from multiple hospitals to determine the effectiveness of DMAI.

Results

Within 6 months, our DMAI system processed 105,558 radiographs and classified 77.7%, 6.4%, and 15.9% as no-TB, high-risk, and low-risk, respectively, with heatmaps in each abnormal image (Figures 1 and 2). For the high-prevalence group (age>50), DMAI classified 13% and 20% of the cases as high-risk and low-risk, respectively. DMAI and junior physicians agreed 96.3% on confirmed TB and 90.6% on non-TB cases. Compared to historical data, physicians using DMAI increased the sensitivity by 23% with similar specificity.

Conclusion

This is the first reported large-scale clinical application of DMAI for TB screening in China. DMAI's performance is similar to junior physicians'. DMAI assisted physicians in detecting more TB cases in rural areas in a shorter time period without needing more physicians.

融合深度特征与手工特征术前预测结直肠癌 KRAS 基因状态的研究

吴小媚,李亚军
广东省人民医院

目的： 抗表皮生长因子受体(Epidermal growth factor receptor, EGFR)靶向治疗在 KRAS 突变型患者中效果较差，治疗前评价患者基因状态有重要价值。本研究融合深度影像组学特征和手工影像组学特征构建模型术前预测结直肠癌患者 KRAS 基因的突变状态。
方法： 这是一个回顾性的研究，共纳入手术证实并实施了 KRAS 基因检测的结直肠癌患者共 398 名，其中训练组纳入从 2011 年 4 月到 2015 年 4 月的患者共 279 人，验证组中纳入了从 2015 年 5 月到 2016 年 4 月的患者 119 名。术前患者均采集了门静脉期 CT 图像，从采集到的图像中提取深度卷积神经网络和传统手工影像组学特征。采用 Lasso 回归模型和最大相关最小冗余(mRMR)算法进行数据降维、特征筛选和影像组学标签构建。采用多变量 logistic 回归分析，结合深度影像组学标签、传统手工影像组学标签建立融合模型。最后从鉴别、校准和临床应用等方面对模型的性能进行了评价。
结果： 手工影像组学标签训练组中一致性指数（C-index）为 0.719，（95%CI: 0.658-0.776），验证组为 0.720(95% CI: 0.625-0.813)；深度影像组学标签训练组中一致性指数为 0.754(95% CI: 0.696-0.813)，验证组为 0.786(95% CI: 0.702-0.863)；融合预测模型进一步提高了影像组学标签的预测能力，训练组一致性指数为 0.815(95% CI: 0.766-0.868)，验证组为 0.832(95% CI: 0.762-0.905)
结论： 本研究提出一种融合手工影像组学标签和深度影像标签的模型，可用于结直肠癌患者术前个体化预测 KRAS 状态。

Preoperative prediction of lymph node metastasis in rectal cancer by multiregional radiomics features from multiparametric MRI

Xiangchun Liu,Yu Fu,Huimao Zhang
The First Hospital of Jilin University

Objectives
To develop and validate a radiomics prediction model based on MRI for the preoperative individualized prediction of lymph node (LN) metastasis in patients with rectal cancer (RC).
Methods
A total of 186 rectal cancer patients who underwent high-spatial-resolution MRI and radical surgical resection with pathological results between January 2016 and December 2018 were included in this retrospective study. For radiomics, the volumes of interest (VOIs) were drawn on the tumor on high-spatial-resolution T2-weighted imaging (T2WI), diffusion-weighted imaging (DWI) images and the mesorectum on T2WI images. Spearman correlation analysis and the least absolute shrinkage and selection operator (LASSO) was used for feature dimensionality reduction. In the modeling stage, multivariate

models were trained on the training cohort through five-fold cross-validation and their performance was evaluated on the cross-validation cohort using the area under the ROC curve (AUC), accuracy, specificity, sensitivity, and F1 score.

Results

A total of 16 radiomics features were retained by Spearman correlation analysis and the LASSO algorithm to construct a predictive model. The Support Vector Classifier was found as the best predictive performance. An average AUC in training dataset, cross-validation dataset, and the testing dataset is 0.860, 0.755, and 0.746, respectively.

Conclusions

Multiregional radiomics features from multiparametric MRI of rectal cancer is a powerful tool for individualized, noninvasive prediction of lymph node metastasis and has marked discrimination accuracy.

OR-544

Individual classification of Parkinson disease with diffusion magnetic resonance imaging

Wenliang Fan,Xiangchuang Kong,Ziqiao Lei,Jianming Yu,Fan Yang
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose

To investigate the feasibility and performance of the PD classification using diffusion MRI of different machine learning methods.

Methods

A total of 285 PD patients and 135 healthy controls were included and underwent diffusion tensor imaging scans. DTI images were processed with the FSL toolbox to get the parameters such as fractional anisotropy (FA), mean diffusivity (MD), axial diffusivity (AD), radial diffusivity (RD). Values of each brain areas in stereotaxic white matter atlas were extracted by the ICBM template as the raw features for subsequent machine learning based classifiers. All of the PD patients and healthy controls were separated to training data sets and testing data sets. Feature optimization was performed by the LASSO and principal component analysis. And both the filter- and wrapper-based feature selection models were used to get the final features used in the last classifier. The k-nearest neighbor algorithm (KNN), naïve Bayes algorithm and support vector machine (SVM) models were trained on the training data sets and the performance of these models were evaluated by the testing data sets.

Results

Compared to healthy control subjects, PD patients showed significantly alteration of white matters in wide spread brain regions. The machine learning analyses showed that the SVM model performs best than KNN and naïve Bayes algorithm with an overall accuracy of 86.7%, sensitivity of 83.3% and specificity of 89.0% when discriminated PD patients from healthy controls.

Discussion and Conclusion

The combination of DTI and machine learning methods is a promising method to discriminate PD patients from healthy controls. These findings may be useful for

future incorporation of DTI and machine learning methods for disease classification, or as a useful tool for clinical diagnosis by diffusion MRI.

MRI 影像组学在脑胶质瘤术前分级中的研究价值

欧阳红,张静
兰州大学第二医院

目的 探讨基于 MRI 影像组学对脑胶质瘤进行术前分级的预测价值。
材料与**方法** 回顾分析例经病理证实的 140 例颅内胶质瘤患者的 MRI 资料，其中 WHO Ⅱ级 （低级别胶质瘤） 70 例，WHO Ⅲ~Ⅳ级 （高级别胶质瘤）85 例。从 T2 加权和三位等体素 T1WI 增强 MRI 中提取影像学特征，包括一级统计特征、形态和大小特征、纹理特征及滤波特征。基于套索方法回归方法筛选出与胶质瘤高、低级分级最相关的 23 个影像组学特征。对支持向量机、逻辑回归（ Logistic Regression,LR)、随机森林（Random Forest,RF）三种分类方法进行比较。
结果 基于套索方法进行特征选择后，利用支持向量机方法具有最高的准确率 91.93%，受试者工作特征曲线下面积(area under the receiver operating characteristic curve，AUC)值为 0.906。LR 支持向量机方法的准确率 90.01 %，受试者工作特征曲线下面积(area under the receiver operating characteristic curve，AUC)值为 0.909。RF 支持向量机方法的准确率 89.8 %，受试者工作特征曲线下面积(area under the receiver operating characteristic curve，AUC)值为 0.889。
结论 基于磁共振影像组学方法，应用合适的分类器，可以对脑胶质瘤进行术前分级预测。

Radiomics of pericoronary adipose tissue texture features based on coronary CTA in differential diagnosis between acute coronary syndrome and stable coronary heart disease

Qing Tao[1],Chunhong Hu[1],Weijie Zou[1],Yanfen Fan[1],Su Hu[1],Guangyu Hao[1],Shaofeng Duan[2]
1.The First Affilicated Hospital of Soochow University
2.GE Healthcare

Objective To establish a radiomics signature based on pericoronary adipose tissue and evaluate its value in determining the type of coronary event.
Methods The images and clinical data of 93 patients with coronary heart disease diagnosed and treated from 2013 to 2018 were retrospectively analyzed. Among them, 39 patients were acute coronary syndrome and 54 patients were stable coronary heart disease. The patients were divided into training cohort and validation cohort using stratified random sampling according the ration 6:4 (56 patients in training cohort, 37 patients in validation cohort). The pericoronary adipose tissue on each coronary CTA was segmented to extract radiomics features using AnalysisKit software, and then a radiomics signature was constructed after reduction of dimension in training cohort by the least absolute shrinkage and selection operator (LASSO). ROC analysis was conducted to assess the performance of the radiomics signature in the training group and to verify in the validation cohort. Decision curve analysis was conducted to determine the clinical usefulness of the radiomics signature.
Results A total of 396 radiomics features were extracted from the pericoronary adipose tissue. 8 most valuable features were selected after reducing the dimension by LASSO algorithm. The area under the ROC of the model to distinguish acute coronary syndrome from stable coronary heart disease was 0.86 and 0.81 in the training and validation cohorts, respectively. Using the proposed radiomics signature to predict N+ shows a greater advantage than either the scheme in which all patients were assumed to N+ or the scheme in which all patients are N-. Decision curve analysis demonstrated that the radiomics signature were clinically useful in identifying coronary heart disease types.
Conclusion The radiomics signature based on pericoronary adipose tissue can be used as a promising biomarker to identify coronary event types.

影像组学预测局部进展期直肠癌新辅助治疗后淋巴结转移

朱海涛,张晓燕,史燕杰,朱汇慈,孙应实
北京大学肿瘤医院

目的 结合原发灶与淋巴结的影像特征，建立影像组学模型预测局部进展期直肠癌新辅助治疗后的淋巴结转移状态。
方法与材料：本研究纳入 229 名进展期直肠癌患者，按照时间顺序分为训练集（n=183)和验证集（n=46）。所有患者在 3.0Tesla 的 MRI 系统上进行扫描，采用小视野 T2 加权序列，参数如下：

TR=5700ms，TE=110ms，回波数为 25，视野为 180mm。以术后病理作为金标准，区分每名患者为 N0 或 N+。由一名有经验的影像医生采用 itk-snap 软件对直肠癌原发灶和若干淋巴结进行勾画。对于每个勾画区域提取了 41 个影像特征，包括形状特征、灰度特征、纹理特征等。在训练集内采用 L1 正则化的逻辑回归算法训练模型，通过交叉验证确定超参数和最优淋巴结的选取规则，并在验证集内进行验证。

结果 联合原发灶与最优淋巴结模型的 AUC 值在训练集内为 0.840(95%CI:0.778-0.890)，在验证集内为 0.864(95%CI:0.731-0.947)。只纳入肿瘤原发灶模型的 AUC 值在训练集内为 0.580(95%CI:0.505-0.653)，在验证集内为 0.669(95%CI:0.515-0.801)。联合原发灶与最大淋巴结模型的 AUC 值在训练集内为 0.801(95%CI:0.736-0.856)，在验证集内为 0.839(95%CI:0.701-0.931)。联合原发灶与淋巴结平均特征模型的 AUC 值在训练集内为 0.741(95%CI:0.671-0.803)，在验证集内为 0.539(95%CI:0.386-0.687)。主观评价的 AUC 值在训练集内为 0.650(95%CI:0.576-0.719)，在验证集内为 0.756(95%CI:0.607-0.870)。

结论 联合原发灶与最优淋巴结特征的影像组学方法能够提高局部进展期直肠癌新辅助治疗后淋巴结转移状态预测的准确度。

基于深度学习的儿童骨龄评估模型构建及临床应用验证

宋娟,方向明
南京医科大学附属无锡人民医院，无锡市儿童医

目的 以“中华 05”骨龄评估系统下专家阅片为标准，构建基于深度学习的儿童骨龄智能评估模型（AI 模型），为儿科医师及儿影像科医师提供一个快速便捷的辅助工具。

方法 回顾性连续性纳入质量合格的儿童骨龄 DR 左手正位平片 5000 例，按照各年龄段等比例采样原则纳入 2351 例为训练组，验证组 101 例；4 位儿童放射学专家按双盲原则，采用“中华 05”RUS-CHN 法评估 13 块掌指骨骨骺发育等级，取专家骨龄评测的均值作为参考金标准；采用深度学习方法训练并建立骨龄评估模型，并在验证组比较儿影像科住院医师与 AI 模型评估之间的准确性及耗时差异。

结果 本研究构建的 AI 模型及两名儿影像科住院医师与参考金标准之间的 MAE 分别为 0.37 年、0.42 年、0.41 年，差异无统计学意义（$P>0.05$）；当误差范围在±1.0 岁、±0.7 岁及±0.5 岁以内时，AI 验证组评测准确性分别为：94.1%，89.1%，74.3%，医师验证组评测准确性分别为：（93.1%、94.1%）（78.2%、82.2%）（67.3%、68.3%），医师与 AI 模型之间差异无统计学意义（$P>0.05$）。两医师完成一份骨龄评价平均用时分别为（10.3±3.3）分钟、（8.2±3.1）分钟，显著长于 AI 模型（约 5 秒），差异均有统计学意义（均有 $P<0.05$）。

结论 本研究构建的基于深度学习的儿童骨龄评估智能模型具有准确性高以及耗时短的特点，具有快速辅助医师评估骨龄的实用价值。随着建模样本量的增加，本 AI 骨龄评估模型精度有可能进一步提高，发挥更大的临床价值。

基于磁共振图像的影像组学在前列腺病灶良恶性鉴别中的临床研究

徐敏[1],喻冬东[2],方梦捷[2],虞芯仪[1],周立娟[1],董迪[2],田捷[2],方向明[1]
1.无锡市人民医院
2.中国科学院自动化研究所

【目的】
研究基于双参数磁共振图像的影像组学在前列腺病灶良恶性鉴别中的效能及临床价值。
【方法】
本研究回顾性连续性纳入 2013 年 1 月至 2016 年 11 月于我院进行磁共振检查，包括 T2 加权磁共振成像、弥散加权成像、表观扩散系数及病理检查的患者，共计 331 名。利用 ITK SNAP 软件在磁共振图像上手动勾画感兴趣区，分别勾画与病理取材相对应且包含取材组织的病灶区域、外周带、移行带，使用在 Matlab 平台上独立开发的工具对感兴趣区域进行特征。通过对随机选择的 40 名患者进行的重复性试验，筛选出组内相关系数大于 0.8 的特征。随后，将 Pearson 相关系数＞0.75 的特征归为一类，实现进一步降维。最后使用 LASSO 选择出预测效能最强的影像组学特征，使用这些特征构建相应的影像组学模型。此外还收集了患者的临床信息和实验室指标构建了临床模型。
【结果】
所有序列（T2WI、DWI、ADC）所有区域（病灶区、外周带、移行带）共提取 2916 个特征，最终筛选出 6 个关键特征。基于三种成像模式组合的双参数磁共振模型训练集上 AUC 为 0.887（95%CI，0.844～0.930），验证集上 AUC 为 0.920（95%CI，0.863～0.978）。临床模型由年龄、PSA 构建，在训练集上 AUC 为 0.748（95%CI，0.686～0.809），验证集 0.732（95%CI，0.634～0.831）。综合了双参数磁共振影像组学参数和临床因子的联合模型在训练集上 AUC 为 0.909（95%CI，0.871～0.946）；在验证集上 AUC 达到 0.933（95%CI，0.879～0.987）。在验证集上联合模型与临床模型比较 $P<0.001$，$z=5.503$，联合模型与临床模型对前列腺癌鉴别的差异有统计学意义。
【结论】
结合了影像组学特征和临床因子的联合模型鉴别对前列腺病灶良恶性鉴别的效能最佳，有助于提高前列腺病灶良恶性诊断能力。

OR-552
基于磁共振 T2 加权成像的影像组学对直肠癌新辅助治疗疗效的评估价值

沈浮,陆建平
海军军医大学第一附属医院（上海长海医院）

目的 探讨基于磁共振高分辨 T2WI 的影像组学对直肠癌新辅助治疗疗效的预测价值。
方法 回顾性分析 2018 年 1 月至 2019 年 3 期间，在我院经病理证实，新辅助治疗前接受 3T MRI 的 79 例直肠癌患者。在高分辨 T2WI 图像上手动勾画直肠病灶 VOI 后提取影像组学特征，采用 LASSO（least absolute shrinkage and selection operator）算法进行降维，选择出对病理完全缓解（pathologic complete remission, pCR）有价值的特征。随机分为训练集（80%）与测试集（20%）进行机器学习，与 pCR 信息建立决策树（decision tree, DT）、逻辑回归（logistic regression, LR）、随机森林（random forests, RF）、极限梯度增强树（extreme gradient boosting decision tree, XGBoost）分类器模型,获得 ROC（receiver operating

characteristic）曲线，分别计算曲线下面积（area under the curve，AUC）、敏感度、特异度及 95%置信区间，采用 DeLong test 比较 ROC 曲线差异。

结果 79 例直肠癌患者根据术后病理检查，14 例达到 pCR（17.72%）。共提取得到 1409 个影像组学特征，LASSO 算法筛选出 8 个最有价值的特征。其中 XGBoost 分类器测试集的 AUC 为 0.945，敏感度 85.71%，特异度 98.46%，95%置信区间为 0.870-0.984，优于其他三种模型（P均<0.05），其余三种模型间无显著性差异（P均>0.05）。

结论 基于磁共振高分辨 T2WI 图像的影像组学 XGBoost 模型有预判肿瘤 pCR 情况的能力，可以用于对直肠癌新辅助治疗疗效的评估。

MR-Based Radiomics of Rectal Cancer: Predict Synchronous Liver Metastasis

Xiaolu Ma, Fu Shen, Jianping Lu
Radiology Department, Changhai Hospital, Shanghai, China

Purpose
The purpose of this study was to investigate the value of high resolution T2-weighted-based radiomics in prediction of synchronous liver metastasis (SLM) in patients with rectal cancer.
Methods
A total of 101 patients (79 men and 22 women; mean age, 57 years±9.91; range, 28-74 years) with rectal cancer who underwent rectal MR imaging in our hospital on a 3T scanner between January 2018 and May 2019 were included in this study. We used Radcloud (Huiying Medical Technology Co., Ltd, Beijing, China) to manage imaging data, clinical data, and subsequent radiomics statistics analysis. Lesions were delineated on the MR mages manually by radiologist who was blinded to the clinical information of the patients. 101 volumes of interest (VOIs) manually dropped from 101 patients' high resolution T2-weighted MR images. Assign 80% of the VOIs to the training data set and 20% of VOIs to the validation data set. Features were extracted on the Radcloud platform, then the optimal features were selected by least absolute shrinkage and selection operator (LASSO) method to best predict the SLM. The SVM (Support Vector Machine) classifier combined with clinical risk factors (CEA and CA19-9) was used for building model which could predict the SLM. The prediction performance of the models was evaluated by receiver operating characteristic (ROC) curves with area under the curve (AUC), sensitivity and specificity, and compared to the DeLong test.
Results
Of the 101 patients, 25 patients (24.75%) were accompanied by SLM. 1409 quantitative imaging features were extracted from MR images firstly, and 5 optimal features related to the SLM prediction were selected with LASSO algorithm finally. The AUC, specificity and specificity for validation set of combined model (T2WI+CEA+CA199) was 0.845 (95% CI: 0.760 - 0.910), 88.00% and 72.37%, respectively. Compared to these four models, the combined model showed significantly better prediction performance ($P_{\text{T2WI-Combined}}$ = 0.0036, $P_{\text{T2WI+CA199-Combined}}$ = 0.0069, and $P_{\text{T2WI+CEA-Combined}}$ = 0.0091). There were no significant differences among $\text{Model}_{\text{T2WI}}$, $\text{Model}_{\text{T2WI+CA199}}$, and $\text{Model}_{\text{T2WI+CEA}}$ (P > 0.05).
Conclusion

Our study demonstrated that the high resolution T2-weighted MR-based radiomics with CEA and CA19-9 can serve as a quantitative tool to predict SLM of rectal cancer.

基于文献计量学的七年放射组学研究热点分析

杨倩
中国医学科学院肿瘤医院深圳医院

目的 从文献计量学角度，探讨近 7 年放射组学的研究热点。
方法 下载 Pubmed 数据库中 2012 年 1 月 1 日至 2018 年 12 月 31 日发表的放射组学研究文献题录，使用 Bicomb 2.0 软件统计分析文献的发表年代、来源期刊及期刊所属国家、高频主要主题词分布情况。对发表文献不小于 3 篇的第一作者所属国家进行人工逐条统计分析。将出现频次不小于 15 次的主要主题词作为高频主要主题词，建立词篇矩阵，使用 SPSS 24.0 软件进行聚类分析，得到该领域研究热点。
结果 共检索到文献 670 篇，其中 2012、2013、2014、2015、2016、2017、2018 年分别为 2(0.3%),3(0.4%),4(0.6%),28(4.2%),62(9.3%),174(26%)和 397(59.2)。670 篇文献来源于 19 个国家的 216 种期刊，将载文量不小于 15 篇的期刊划分为核心区，入选期刊共 9 种，共 194 篇文献。发表文献不小于 3 篇的第一作者共 24 个，来自于 9 个国家，其中美国有 8 个作者，中国有 6 个作者，德国有 3 个作者，荷兰有 2 个作者，加拿大、瑞士、法国、韩国和意大利均有 1 个作者。高频主要主题词共 12 个。凝聚为四大类研究热点方向，其中第一个热点是使用 CT、PET 借助图像处理、计算机辅助方法诊断肺肿瘤、乳腺肿瘤和颅脑肿瘤；第二个热点是非小细胞肺癌诊断；第三个研究热点是 CT 成像方法；第四个热点是磁共振成像方法。
结论 近 7 年放射组学研究热点集中在使用 CT、PET 借助图像处理、计算机辅助方法诊断肺肿瘤、乳腺肿瘤和颅脑肿瘤；非小细胞肺癌诊断；CT 成像方法和磁共振成像方法。

基于深度学习的影像组学方法 鉴别肾脏良恶性肿瘤的应用研究

陈宇辰,殷信道
南京市第一医院

目的 肾脏良恶性肿瘤的鉴别对于指导临床治疗十分关键。传统影像组学方法需要人工提取特征，效率低且适应性差。因此，本研究运用一种能自动学习图像特征并分类的基于深度学习的影像组学方法对肾脏良恶性肿瘤进行鉴别分类。
材料与方法 本研究采用基于卷积神经网络（Convolutional Neural Network，CNN）的迁移学习方法对肾脏良恶性肿瘤的 CT 图像进行分类。我们收集 153 例经病理确诊的肾脏肿瘤的增强 CT 图像。采用 InceptionV3 模型通过 ImageNet 数据集进行预处理并分类。分别在 Slice、感兴趣区域（ROI）和矩形盒区域（RBR）数据集上建立五个图像水平模型。然后，基于最优图像水平模型建立两个患者水平模型。使用 ROC 分析和交叉验证来评估网络的性能。利用从大规模自然图像训练得到的多种卷积神经网络模型提取肾脏占位图像特征，通过对最后全连接层的精细调整，实现肾脏占位性病变的良恶性分类鉴别。
结果 我们研究发现，在图像水平模型中，Slice 数据集（准确度（ACC）＝0.84 和马休斯相关系数（MCC）＝0.66）的模型训练的交叉验证结果最差。ROI 数据集（ACC＝0.95 和 MCC＝0.89）的分

析结果略优于 RBR 数据集（ACC＝0.91 和 MCC＝0.82）。与图像水平模型相比，两种级别的模型均能提高对肾脏良恶性肿瘤的鉴别诊断（ACC 增加 2%-4%，MCC 增加 2%-7%）。
结论 研究实验结果表明使用基于 CNN 的迁移学习方法对肾脏占位病变的良恶性分类有很好的效果。基于深部学习的影像组学方法可用于从 CT 图像中鉴别肾脏良恶性肿瘤，从而有效指导临床治疗方向。

Co-trained Convolutional Neural Networks Analysis for Assessment of the Diagnostic Accuracy of Biparametric Magnetic Resonance Imaging of the Prostate

Xiangyu Wang[1],Zilong Liu[2],Chaoyang Liu[3],Guangyao Wu[4],Fan Lin[1],Yi Lei[1]
1.The First Affiliated Hospital of Shenzhen University
2.Wuhan University of Technology
3.Wuhan Institute of Physics and Mathematics, Chinese Academy of Sciences
4.Shenzhen University General Hospital

Purpose: The study aimed to apply convolutional neural networks (CNNs) to biparametric magnetic resonance imaging (MRI) and to evaluate the diagnostic values of the prediction model generated from training CNNs in prostate cancer.
Materials and Methods: This study evaluated 56 patients with prostate cancer (PCa) and 58 benign prostatic hyperplasia (BPH). A total of 116 PCa and 148 BPH lesions were devided into a training set and a test set. Prediction models of prostate MRI were developed through a novel called CNN40bottleneck based on four different improved methods --bottlenecks, batch normalization, global average and pooling, namely, CNN40bottleneck_gap, CNN40bottleneck_nobn, and CNN40bottleneck_nogap framework. T2 weighted images and ADC images are used as training data in the post-network part. Accuracy, sensitivity, specificity and areas under the receiver operating curve (AUC) were calculated to compare the diagnostic performance of CNNs models based on T2WI, ADC and the combination of T2WI and ADC (T2WI-ADC).
Results: The six models trained with T2WI had significantly higher AUCs (0.862, 0.844, 0.854, 0.813, 0.821, 0.854) than those with ADC (0.724, 0.695, 0.702, 0.715, 0.668, 0.765) in distinguishing between PCa and BPH. When A deep $CNN40_{bottleneck}$ model, the product resulting from jointly combining T2WI with ADC, was adopted, the differential diagnostic efficiency (0.934) was significantly improved. It was remarkably obvious that $CNN40_{bottleneck}$ possessed simliar diagnostic performance and accuracy with ReNet and Inception , but the $CNN40_{bottleneck}$ framework took less training time (T2WI:5391.54s, 3574.32s, 5450.79s; ADC: 4141.76s, 2842.54s, 4220.37s) and needed fewer parameters (16.80MB, 16.50MB, 17.40MB) than the latter two(T2WI:6416.36s, 61241.32s, 10675.32s; ADC: 5085.01s, 21646.21s, 51315.27s; Parameters: 40.70MB, 180.00MB, 315.00MB).
Conclusion: The Co-trained deep CNNs framework based on MRI can effectively differentiate PCa from BPH. In addition, combining both T2WI and ADC (biparametric MRI) in the $CNN40_{bottleneck}$ framework can provide increased diagnostic accuracy. Compared with ResNet and Inception, $CNN40_{bottleneck}$ is a better choice for its advantage of taking less training time and needing fewer parameters.

OR-557

The guidance of radiomic-based quantitative CT analysis for the identification of the invasiveness of pure ground-glass-nodule-like lung adenocarcinoma

Fangyi Xu[1],Wenchao Zhu[1],Rui Xu[2],Hongjie Hu[1]
1.Department of Radiology, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou, Zhejiang, China,
2.College of Software, Dalian University of Technology, Dalian, Liaoning, China

Objective: To investigate the potential supplementary role of radiomic-based analysis on CT images in identifying invasiveness of lung adenocarcinoma manifesting as pure ground-glass nodules (pGGNs).

Methods: 322 pGGNs resected via surgical interventions and confirmed pathologically were involved in this retrospective study. Two radiologists with 3 years' (radiologist A) and 10 years' (radiologist B) experience in thoracic diagnosis performed the nodule segmentation on 3D-Slicer (http://www.slicer.org) with CT images together and accessed each nodule respectively. Random forest and Support Vector Machine (SVM) were used for feature selection and radiomic-based predictive model building. The two radiologists evaluated and made a diagnosis for each nodule again with the assistance of radiomic predictive model. Accuracy, sensitivity, specificity, positive predictive value (PPV) and negative predictive value (NPV) were calculated to investigate the potential value of radiomic-based predictive model in diagnosing pGGN-like lung adenocarcinoma.

Results: Among 322 pGGNs, 48(15%) were adenocarcinoma in situ (AIS), 102(32%) were minimally invasive adenocarcinoma (MIA) and 172(53%) were invasive adenocarcinoma (IVA). All nodules were split into training and test cohort randomly with a ratio of 4:1 to establish a radiomic-based predictive model. The accuracies were 72.84%, 76.54% and 92.59% for radiologist A, radiologist B and predictive model. Assisted with the predictive model, the accuracies were increased to 88.89% and 91.36% for the two radiologists.

Conclusion: Radiomic-based predictive model showed a better performance in identifying invasiveness of lung adenocarcinoma manifesting as pGGNs. Combining with the predictive model could improve radiologist's diagnostic performance.

3.0T 磁共振无对比剂全心冠状动脉血管成像图像质量及影响因素分析

林路,代静文,李潇,王健,曹剑,王怡宁,金征宇
中国医学科学院北京协和医院

目的 探讨 3.0T 磁共振无对比剂全心冠状动脉血管成像（Magnetic resonance angiography，MRA）的临床可行性及其图像质量影响因素。
方法 采用心电门控技术及自由呼吸导航技术，于 3.0T 磁共振行无对比剂全心冠状动脉磁共振血管成像。以冠状动脉节段为单位进行主观图像质量评分，评分采用四分制。比较同一冠状动脉血管不同节段的图像质量差异。并根据图像质量评分并将研究对象分为图像质量合格组和图像质量不合格组，对比两组受试者的年龄、体质量指数（body mass index，BMI）、心率、呼吸末膈肌位移、自由呼吸膈肌运动幅度、呼吸采集效率及扫描时间的组间差异。P＜0.05 具有统计学意义。
结果 本研究共纳入 37 例健康志愿者及 44 例临床可疑冠心病患者，冠状动脉主观图像质量评分：131 个节段为优， 314 个节段为良，181 个节段为中， 103 个节段为差。同一冠状动脉血管不同节段图像质量两两对比显示，前降支近中段图像质量高于其远段（P＜0.01），回旋支及右冠状动脉近段图像质量均高于其远段（p＜0.01）。3.0T 磁共振无对比剂冠状动脉图像质量合格者为 58 例（71.6%），不合格者为 23 例（28.4%）。研究对象年龄及扫描时间在图像质量合格组与图像质量不合格组间的分布无明显统计学差异。图像质量合格组受试者心率、BMI、呼吸末膈肌位移、最大膈肌运动幅度均低于图像质量不合格组（P＜0.05），而图像质量合格组其呼吸采集效率高于图像质量不合格组（p＜0.05）。
结论 3.0T 磁共振无对比剂 MRA 在冠状动脉近中段成像方面具有较好的可行性，呼吸及心率是影响冠状动脉 MRA 图像质量的重要因素，未来可以通过控制心率及呼吸因素进一步优化图像质量。

数字乳腺三维断层成像与磁共振成像技术对乳腺癌诊断的临床应用评价

范文文,欧阳汗
中国医学科学院肿瘤医院

目的 比较数字乳腺三维成像与磁共振成像在乳腺癌诊断的临床应用价值。材料和**方法** 回顾性分析了 253 例临床怀疑乳腺病变的女性患者,患者分别在 Hologic 乳腺机的标准模式下进行数字化乳腺三维断层摄影和在 3.0T MR 系统上进行乳腺 DCE-MRI 及弥散加权成像(DWI)扫描，并将数字乳腺三维断层成像及磁共振成像影像的结果与手术病理诊断结果进行比较分析。**结果** 253 例乳腺检查中，数字乳腺三维断层技术诊断乳腺癌其敏感性为 90.9%，特异性为 89.7%，准确率为 89.3%；传统数字乳腺摄影诊断乳腺癌其敏感性 85.6%,特异性为 80.7%，准确率为 83.4%；MRI 检查技术诊断乳腺癌其敏感性为 94.1%，特异性为 83.3%，准确率为 89.7%；各种准确率差异有统计学意义（ P＜ 0 .05）.**结论** ；数字乳腺三维断层成像技术对乳腺癌检查的特异性优于单纯的乳腺磁共振成

像，敏感性不如 MRI 影像检查技术，但其 DBT 影像检查技术更为经济实用，对造影剂过敏患者降低其过敏风险。

低剂量全器官动态容积 CT 检查在胰腺炎中的应用价值

贾广生,姜慧杰
哈尔滨医科大学附属第二医院

目的 探究低剂量全器官动态容积 CT 在胰腺炎诊断中的应用价值。**方法** 收集胰腺炎患者及正常胰腺的健康志愿者各 50 例的低剂量全器官动态容积 CT 检查的影像学资料，将胰腺炎患者作为观察组，胰腺正常的健康志愿者作为对照组，分析比较两组受检者的血液容量(BF)、特定区域组织(100 g)的血液容积总量(BV)。**结果** 观察组 BF 为（70.56±14.10）ml/(100 g·min),BV 为(10.66±2.39)ml/100 g；对照组 BF 为（196.33±34.50）ml/(100 g·min),BV 为(35.60±3.20)ml/100 g。观察组 BF、BV 明显低于对照组，差异具有统计学意义(P<0.05)。**结论** 低剂量全器官动态容积 CT 对胰腺组织灌注成像以及胰腺炎的诊断具有较好的临床应用价值。

OR-562
头颈部 CTA 扫描及后处理质量控制规范及优化

吴韬
陆军军医大学大坪医院

头颈 CTA 检查技术是目前头颈部血管病变诊断及长期随访的首选无创影像检查方法，本科人员在对受检者进行头颈部 CTA 检查时，严格按照头颈部血管的操作规范及专家共识操作，通过对每月随机抽取 50 例头颈 CTA 受检者的检查图像进行监测并进行质控评分，结合临床医生的需求以及诊断医生的反馈，逐月进行优化改进，找到一套合适的检查方案。

将 2019 年 1-6 月的 300 例头颈 CTA 检查图像按月份分为 6 组，每组 50 人，每人图像按 100 分制评分，扫描、后处理各占 50 分，扫描由体位设计、扫描范围、异物、运动伪影、大动脉血管 CT 值（主动脉弓、颈动脉窦、颅内大动脉）以及静脉干扰、噪声干扰组成，后处理由重建范围、重建视野、显示角度、组织裁剪、血管分析、阈值调节、特殊后处理、图像排版组成，由本科的高年资技师对图像参照标准进行打分。

由于之前对头颈 CTA 检查缺乏质控，没有一套完整的方案，且后处理技师水平参差不齐，所以 1、2 月份受检者图像质量评分较低，针对此情况，通过对科室技师的规范化培训以及将质控评分纳入个人考评后，3-6 月图像质量较前明显改进，临床医生及诊断医生反馈较好。

OR-563
基于深度学习的胸部 CT 智能辅助诊断系统在胸部 CT 数据集上的应用研究

张天然
海军军医大学第二附属医院（上海长征医院）

目的 肺癌的发病率和死亡率在所有肿瘤中均居首位，肺内结节有发生肺癌的潜在风险，本研究目的应用卷积神经网络（CNN）算法模型与低剂量 CT（LDCT）图像数据集，探讨人工智能（AI）技术检测肺部结节的效能，这样可以减少诊断时间并降低患者的死亡率。
方法 连续纳入我院 2017 年 1 月至 2017 年 6 月间共 4380 例肺部 LDCT 影像数据进入人工智能辅助检测系统进行肺结节检测，系统自动标注图像数据库中每个图像序列上的结节数以及单个结节的位置、长径、体积、平均 CT 值等信息；同时 2 名资深影像专业医生独立对每个序列图像的智能检测结果逐一进行确认，包括删除和新增等处理。对所有病例依据系统和医生不同的处理方式归为真阳性、假阳性、假阴性和真阴性四类；对所有结节则分成真阳性、假阳性和假阴性三组；用卡方检验统计系统的灵敏度、阳性预测率及阴性预测率等，利用两样本 t 检验验证不同结节组别之间在长径、体积、平均 CT 值等方面是否存在显著统计学差异。
结果 智能辅助诊断系统在 LDCT 数据集上的病例数、灵敏度、正确率、阳性预测值、阴性预测值、错误率在 1 月至 6 月合计分别为 4380、92.63%、80.32%、70.64%、71.78%、29.48%。按 1 月至 6 月数据迭代时序计算，其灵敏度、正确率、阳性预测值，阴性预测值均有提升，而错误率则呈下降趋势。
结论 基于 AI 的胸部 CT 智能辅助诊断系统在检测肺结节上的主要效能指标具有可靠性和成长性，可以帮助放射科医师快速识别结节并对结节的性质做出判断。是在门诊和体检场景下针对 LDCT 肺结节检查和筛查的有效辅助工具。

双源 CT 大螺距联合智能调制技术及低对比剂用量扫描方案在肾脏血管成像中的应用

羊丹
四川大学华西医院

目的 评价双源 CTFlash 大螺距联合智能调制技术及低对比剂用量扫描方案在肾脏血管成像中的应用效果。**方法** 随机收集 50 例肾脏血管 CT 成像的患者，分为 FLASH 扫描组和常规扫描组。常规组采用单能常规扫描，参考管电压 120kv，管电流 210mAs；FLASH 组采用 flash 大螺距扫描，参考管电压 100KV，管电流为 150mAs。常规组及 FLASH 组均采用 CareDose4D 及 CareKV 技术。常规组对比剂速率及用量分别为 5.0ml/s，85ml。FLASH 组对比剂速率对比剂用量 5.0ml/s，40ml。评价两组扫描的辐射剂量、对比剂用量及图像质量。结果显示 FLASH 扫描组与常规扫描组图像质量上均能满足诊断及临床需求，在对比剂用量上及辐射剂量上存在显著差异。**结论** 在双源 CTflash 大螺距扫描低对比剂用量扫描技术在对比剂用量和辐射剂量上均明显低于常规扫描，图像质量满足诊断，可在 CT 肾脏血管成像扫描中应用。

李玲,肖书萍,张华珍,葛艳,饶亚丽
华中科技大学同济医学院附属协和医院放射科

目的：了解肝癌介入治疗患者围术期的体验与需求状况，为进一步提高患者就医体验和满意度提供依据。方法：采用质性研究中的现象学研究方法，对 16 例肝癌介入治疗患者进行半结构式深入访谈，利用 Colaizzi 分析程序进行分析、归纳、提炼和萃取主题。结果：肝癌介入治疗患者围术期的体验与需求主要归纳为七大主题：焦虑、恐惧无助；对介入治疗具体过程不了解；担忧疾病得不到预期治疗效果；对介入围手术期不良反应认识不足、无力应对；担忧医疗花费对家庭造成经济负担；担忧家属身心状况；诊疗流程有待提高。结论：肝癌介入治疗患者具有复杂的心理体验，临床工作中应注重患者的内心需求及变化，提供有针对性的心理干预、健康指导和社会支持，从而提高患者就医体验和满意度。

耐高压输液港在肿瘤患者增强 CT 检查中应用的护理体会

彭映华[1],宋晓敏[1],刘乔[1],田国亮[1],罗德红[2]
1.中国医学科学院肿瘤医院深圳医院
2.中国医学科学院肿瘤医院

目的 探讨耐高输液港在肿瘤患者 CT 增强检查中的应用效果及护理体会。
方法 选取 2019 年 03 月至 2019 年 06 月在我院已置入耐高压输液港需进行 CT 增强扫描检查的肿瘤患者 54 例，经输液港注入造影剂进行 CT 增强扫描检查，来我科检查前患者输液港均已置入耐高压蝶翼针，我科护士按要求进行用药前评估，按标准规范消毒抽回血确认导管无异常，注药时按扫描部位要求以 2-3ml/S 速度注入，监测注射压力，实时观察患者有无药物外渗及病情变化，注药后观察有无药物反应、感染等不良事件，并对比同期外周留置针一针穿刺成功率及造影剂外渗率，分析其应用效果。
结果 54 例患者使用耐高压输液港进行 CT 增强扫描时平均压力为 120-150pis，在产品说明书所示安全压力范围，增强图像符合诊断要求，无一例药物外渗、无一例导管断裂及相关并发症发生；统计科室同期使用外周留置针的 CT 增强检查患者 3063 例，穿刺失败 121 例，一针穿刺成功率为 96.1%，造影剂外渗率为 0.09%。
结论 对已置入耐高压输液港及蝶翼针的肿瘤患者行增强 CT 扫描检查可以直接使用此装置，无需再另外置入外周留置针，能有效减轻患者痛苦，保护肿瘤患者的外周静脉，提高患者满意度，减少护理工作量，并降低造影剂外渗的发生率，节约耗材。

Study on improving the quality of patients'life after PTBD by regular interventional nursing outpatient dressing change and drain tube maintenance

Xiuchun Yang,Wei Mo
Hunan Provincial Peoples' Hospital

Abstract. - **OBJECTIVE**: To study the effect of regular interventional nursing outpatient dressing change and drain tube maintenance on improving the quality of patients'life after PTBD.
MATERIALS AND METHODS: Patients with malignant obstructive jaundice treated in our hospital from March 2016 to February 2018 were divided into two groups according to the time of admission. 300 cases were treated as control group from March 2016 to February 2017, and 300 cases were treated as observation group from March 2017 to February 2018. The patients in the control group were given oral instruction to the local hospital to change the dressing simply. The patients in the observation group were all in time to the outpatient department of interventional nursing to change the wound dressing and replace the butterfly fixator and the maintenance of the drain tube.
RESULTS: Comfort, self-care ability (knowledge of related diseases), patients' satisfaction to nurse, wound infection and re-admission were compared between the two groups. Compared with the control group, the rate of wound infection and accidental removal of tube in the observation group was significantly lower than that in the control group, and the degree of comfort and the knowledge of related diseases (self-care ability) were significantly higher than those in the previous group, and the difference was statistically significant.
CONCLUSIONS: Patients after PTBD who regularly come to the interventional nursing outpatient department to change the wound dressing and maintain drain tube can obviously improve their comfort and knowledge of related diseases (self-care ability), reduce wound infection and accidental readmission rate, improve the quality of life.

影像科院内感染危险因素及防控措施的研究与探讨

付玲
北京大学人民医院

目的:探讨影像科院内感染发生的相关危险因素及其预防管理措施。
方法:选取 2018 年 1 月至 2018 年 12 月于我院影像科接受检查发生院内感染 45 例患者为观察组,采用系统随机抽样方法，随机抽取同期于我院影像科接受检查未发生院内感染的患者 45 例作为对照组,对两组临床资料及诊疗状况进行调查分析,探讨放射科院内感染相关危险因素及管理措施。
结果:单因素分析结果显示：两组患者年龄、就诊类型、空气中菌落数、操作者洗手消毒正确性、检查室检查时间比较差异具有统计学意义($p<0.05$)。多因素 Logistic 回归分析结果显示,检查室检查时间(＞10 分钟)、检查者未正确洗手消毒、住院患者、空气中菌落数(＞80%)，进入回归方程，方程拟合度较好，差异有统计学意义($p<0.05$)。

结论 检查时间长、操作者卫生消毒不到位、住院患者、空气中菌落数超标是影像科院内感染发生的独立危险因素。因此,应加强医护人员的专业培训,做好各项防感染医疗措施,以降低院内感染发生率。

两种肝动脉化疗栓塞术治疗肝癌的不良反应对比及护理

陈冬萍
华中科技大学同济医学院附属协和医院

目的: 对比两种化疗栓塞术治疗肝癌的不良反应，便于护士根据不同的化疗栓塞方案，理清关注的重点问题做好健康指导和症状的观察与处理，促进患者康复。方法: 选取 2018 年 4～10 月在我科行经导管动脉化疗栓塞术(Transcatheter arterial chemoembolization，TACE)的肝癌患者 160 例，其中传统的经导管动脉化疗栓塞术（Conventional transcatheter arterial chemoembolization，c-TACE）（均为表柔比星联合碘油）80 例；载药微球经导管动脉化疗栓塞术（drug eluting beads transcatheter arterial chemoembolization，DEB-TACE）（均为表柔比星联合载药微球）80 例，术后 24h 内每 4h 询问及记录过去 4h 内的不良反应， 24h 后每天询问及记录 1 次 1 天内的不良反应。**结果** DEB-TACE 组患者术后 24 小时尿量少于 c-TACE 组（$P<0.05$）、肝区疼痛发生率高于 c-TACE 组（$P<0.05$）；c-TACE 组恶心呕吐发生率高于 DEB-TACE 组（$P<0.05$）；肝功能损伤发生率、发热、便秘等不良反应发生率在两组无明显统计学差异。结论: 护士对待 TACE 术后的患者除关注的共性问题外，对于不同的肝动脉化疗栓塞方案存在差异的不良反应应做到预见性护理，积极采取有效措施和健康指导以及心理护理，降低并发症的发生、提高患者对介入治疗的依从性和生活质量。

一次性静脉留置针在冠状动脉 CT 血管造影检查中的对比性研究

樊红苓[1],李玉梅[1]
1.中国医学科学院北京协和医院
2.中国医学科学院北京协和医院

目的 探讨两种类型一次性静脉留置针在冠状动脉 CT 血管造影检查中的穿刺使用效果对比。
方法 2018 年 3 月至 2019 年 2 月对 3900 例行冠状动脉 CT 血管造影检查的患者进行回顾性分析。使用一次性带延长管直型静脉留置针穿刺者为实验组；使用一次性直型静脉留置针穿刺者为对照组，对照组与实验组均穿刺前臂外周血管，对照组与实验组分别入组 1950 例患者。观察使用两种不同穿刺材料后患者在行冠状动脉 CT 血管造影检查后发生接口处溢血、静脉留置针移位、对比剂外渗等现象的发生情况。
结果 两种不同穿刺材料之间的差异有统计学意义（P＜0.05）。带延长管直型静脉留置针接口处溢血、静脉留置针移位、对比剂外渗低于直型静脉留置针。
结论 在冠状动脉 CT 血管造影检查中使用一次性带延长管直型静脉留置针效果明显优于一次性直型静脉留置针。

首站电子信息采集在放射体检中的重要性

许红
合肥平安健康检测中心

【摘要】**目的** 探讨首站电子信息采集在放射体检中的重要性。健康信息采集是体检的开始环节，更是得出正确结论的前提条件[1]。放射体检在体检行业中，特别在预防及诊断疾病中起着非常重要的作用。我国接受放射体检的顾客不断增加[2]。人们对体检健康档案的信息化管理有着极高的认同[3]。 **方法** 随机选取 2019 年 5 月-2019 年 7 月我中心 300 名体检顾客，随机分为观察组和对照组，各 150 名。对照组不采集健康信息直接进入中心进行体检，观察组在对照组的基础上进行电子信息采集，然后再进行体检，在体检报告发出后予以一次电话随访。比较两组顾客的放射体检满意度、放射技师拍片所需时长及放射科医生诊断报告的时长。 **结果** 放射体检顾客满意度明显提高，。技师在拍片之前省去许多的提问环节，减少了拍摄时长，提高了工作效率。医生在诊断报告的过程中，可以结合病史，减少误诊或者漏诊的现象，可以给予顾客更全面的指导意见。体检顾客电子信息采集前后，顾客的满意度由对照组的平均 2 分到观察组的平均 4 分、技师的操作时长由 15min 减少到 10min、医生诊断报告的时长由 5min 减少到 3min，差异有统计学意义（$p<0.05$）。**讨论** 目前国内大部分体检中心缺少首站电子信息的采集，这样会增加放射检查的操作及诊断风险，产生不必要的医疗浪费及纠纷。如何建立一个完善的、有效的电子信息采集档案是值得大家去探讨的一个问题。

影像专科护士核心能力分层次培训模块的建立与实施

兰芳,赵丽,刘俊伶,陈廷静,李雪
陆军军医大学大坪医院

目的 建立影像专科护士核心能力分层次培训模块，并实施教学培训，以提高影像专科护士的专业综合能力，满足影像检查护理岗位的需求。
方法 根据影像科护理岗位的特点，构建临床核心能力和提升核心能力培训模块，其中临床核心能力模块含影像基础、专业知识、专科技能、风险管理 4 个子模块，提升核心能力模块含管理能力、教学能力、科研能力 3 个子模块。在此基础上引入重组教学模式，结合分层次培训方法，对 30 名护士进行培训，要求全部护士掌握临床核心能力模块内容，逐步进行提升核心能力模块内容的培训。采用网上理论考核、自录视频操作考核、读书交流与专题讲座等方式评价培训效果。
结果 ①评价指标：培训后护士理论与操作考核成绩、健康教育能力、教学能力评价指标、护理质量核心指标明显高于培训前（$P<0.01$）：②获得的成果：完成文档资料 1 套、多媒体资料 10 部、国内首部影像护理专著；护理组发表论文 70 篇，SCI 论文 3 篇；主持学校及省部级课题 4 项；获得省部级及学校等成果奖项 6 项。③推广应用：在全国、全军及重庆市影像诊断/技术/护理大会上发言 12 次、专题讲座 30 余次；举办国家级继续教育培训班 10 期。
结论 本研究成果紧密结合影像护理的特点和国内外发展方向，研究成果丰富，实用价值高，通过请进来：举办国家继教、学术交流会、培养进修生；走出去：参加学术讲座、大会交流、培训指导、帮带医院等形式带动和引领影像护理学术发展，积极推广和普及影像专科护理理论、护理特色技术、先进的管理理念及影像护理教学与科研方法。真正解决了当前影像科护理存在的实际问题，对提升影像护理专业水平具有重要的指导意义。

宫颈癌腔内后装治疗患者舒适状况及影响因素的研究

李彦华,王霞,麻富卯,韩映华,魏红
山西省肿瘤医院

目的 调查宫颈癌腔内后装治疗患者的舒适状况，并分析其影响因素。
方法 整群抽取山西省肿瘤医院 2015 年 12 月-2016 年 1 月 117 名行腔内后装治疗的宫颈癌患者，使用患者一般情况调查表及宫颈癌腔内后装治疗患者舒适状况量表进行问卷调查。并对数据进行分析整理。
结果 调查显示：整体舒适得分为（3.79±0.418）分。心理舒适维度均值为（3.29±1.023）分，社会舒适维度均值为（3.65±0.648）分，生理舒适维度均值为（3.94±0.644）分，环境舒适维度均值为（4.16±0.623）分。其中舒适状况最差的 10 项内容中心理舒适维度占 5 项，社会舒适维度占 4 项，生理舒适维度占 1 项，分别为：①我担心家庭的经济状况；②一想到腔内治疗我就觉得紧张、害怕；③我现在情绪低落；④我担心以后的夫妻生活受到影响；⑤在进行放疗准备时，我觉得难为情；⑥我睡眠紊乱、入睡困难、易醒或失眠；⑦我愿意和他人谈论我的病情；⑧在我需要帮助时有我可以依靠的人；⑨我想了解自己更多的病情；⑩对于家人、朋友和社会来说，我是有价值的、重要的。多重回归分析显示：患者年龄、职业、文化程度、收入水平、腔内治疗次数是影响舒适水平的因素，这些因素占舒适度总影响因素的 54.5%。
结论 调查显示患者的心理舒适维度得分最低，其次是社会舒适维度，环境舒适维度得分最高。因此，在临床护理工作中，护士在减轻患者生理不适的基础上，要加强患者的心理护理及对患者社会支持系统的干预。本文在先人研究基础上，使用了科学的舒适度测量工具，对患者各维度的舒适状况进行了调查及分析研究，研究结果可为临床采取针对性护理干预提供依据，并在舒适护理质量的持续改进方面起到一定的推进作用。

Comparative Analysis of Anaphylactoid Reaction between Four Types of Iodine Contrast Media in Enhanced CT Scanning

chuanming zhu,Xiaofeng Zheng ,Jie Hou,Xiaohui Wang,Hao Li
Beijing aerospace general hospital

Background: The anaphylactoid reaction is one of the most important side effects of iodine-based contrast media.

Purpose: To investigate the safety and applicability of four typesof iodine contrast media used in 6399 cases of enhanced CT scan in our hospital.

Material and Methods: The occurrence of anaphylactoid reactions to Iohexol, Ioversol, Iodixanol and Iopromide (as I1, I2, I3 and I4) were collected for 9 months since August, 2007. The incidence of anaphylactoid reactions was calculated in each group.

Results: Enhanced CT scans were performed in 6399 cases. Anaphylactoid reactions occurred in 9 cases, and the incidence of anaphylactoid reaction was 0.14%. Among them, 6 cases were mild anaphylactoid reaction (0.093%), 3 cases weremoderate (0.047%) and no cases were severe reactions. There was a significant difference in the incidence of anaphylactoid reaction among the 4 contrast media used (p=0.03). I3 had the highest incidence of anaphylactoid reaction at 0.46%. The incidence in I1 group was the lowest (0.04%). I2 group and I4 group had incidence rate of 0.1%, and 0.23%, respectively.

Conclusion: The overall incidence of anaphylactoid reaction was low while iodixnaol group had the highest rate and the Iohexolhad the lowest rate.

恒温碘伏对介入手术皮肤消毒性能及效果的观察

毛清雯
重庆医科大学附属第三医院（捷尔医院）

目的 观察将同一厂家碘伏消毒液加热至一定温度后，碘伏消毒液的有效碘含量的变化，对金黄色葡萄球菌、大肠杆菌和白色念珠球菌的杀菌率变化，以探讨不同温度碘伏用于介入手术皮肤消毒性能及效果。**方法** 1、将同一厂家碘伏消毒液加热至一定温度后，用滴定液滴定碘伏消毒液测其有效碘含量变化 2、采用介入手术室常用室温碘伏（24±0.5℃）及加温接近人体体温的碘伏（34~37℃）对介入手术病人进行手术区域皮肤消毒，然后使用无菌棉拭子分别采样培养，观察消毒效果。3、用悬液定量杀菌实验的方法观察加温后的碘伏消毒液对金黄色葡萄球菌、大肠杆菌和白色念珠球菌的杀菌率变化。**结果** 1、中和剂鉴定试验：按照中和剂鉴定标准，10g / L 的硫代硫酸钠磷酸盐缓冲液用于悬液定量杀菌实验是合适的。2、室温碘伏消毒及不同温度碘伏消毒的样本经过 48 小时培养后，均无细菌生长。3、悬液定量杀菌实验：碘伏消毒液作用 3 分钟，对金黄色葡萄球菌、大肠杆菌和白色念珠球菌的平均杀灭对数值均＞5.00，杀菌率为 100%。说明加热后的碘伏消毒液能达到杀菌效果。**结论** 1、加热后的碘伏有效碘含量较常温下有所增加。2、实验证明碘伏加温到接近人体体温时不会影响消毒效果，可以运用于临床介入手术皮肤消毒。3、碘伏加热后不影响碘伏杀菌率。

OR-577
以家庭为中心的协同护理对冠状动脉介入术后抑郁焦虑情绪和生活质量的影响

李娅
成都第三人民医院

[摘要] 目的 探讨以家庭为中心的协同护理对冠心病患者经皮冠状动脉介入治疗（PCI）术后抑郁焦虑情绪和生活质量的影响。**方法** 2017 年 10 月～2018 年 6 月行 PCI 治疗的冠心病患者 80 例为研究对象，分为观察组和对照组，每组 40 例。对照组采用常规护理干预，观察组在常规护理的基础上实施以家庭为中心的协同护理干预。护理干预前及干预 6 个月后，用 17 项-汉密尔顿抑郁量表（HAMD-17）和汉密尔顿焦虑量表（HAMA）分别评价抑郁和焦虑情绪；用健康调查简表（SF-36）评价生活质量；用社会支持评定量表（SSRS）评价患者的社会支持情况。**结果** 护理

干预后，观察组 HAMD-17 和 HAMA 评分均低于对照组（$P<0.05$）；观察组 SF-36 总体健康、社会功能、情感职能和精神健康评分均高于对照组（$P<0.05$）；观察组 SSRS 主观支持、客观支持、社会支持利用度和社会支持总分均高于对照组（$P<0.05$）。**结论** 以家庭为中心的协同护理可能通过提高社会支持而改善患者的不良情绪及生活质量。

Investigation on the status of first urination after transcatheter arterial chemoembolization

Min Li
First Hospital of Jilin University

Objective To analyze the first urination after transcatheter arterial chemoembolization. **Methods** 112 patients with hepatic artery chemoembolization from March 2018 to September 2018 were collected.The general information of patients, the first Autonomous Urination after operation, the first Autonomous Urination time more than 4 hours after operation and the causes of dysuria after catheterization were investigated. **Results** 109 patients (97.32%) could urinate spontaneously after operation, 3 patients (2.68%) with indwelling catheter, and 39.28% patients had the first time to urinate more than 4 hours after operation. he main causes of dysuria were not timely evaluation after operation, no urination training before operation and body position change, accounting for 39.71%, 22.06% and 19.12% respectively. The waiting time for the first urination was less than 30 minutes in 14.68% of the patients and more than 30 minutes in 4.59% of the patients. The color of the first urination was red in 7.34% of the patients. **Conclusion** The patients who need indwelling catheter and the first Autonomous Urination time more than 4 hours after transcatheter arterial chemoembolization occupy a certain proportion, this part of the population needs to focus on; Lack of timely post-operative evaluation, pre-operative urination training and postural changes are the main factors leading to prolonged urination time and difficulty in urination, which should be improved.

耳穴贴压对肝癌射频消融患者超前镇痛干预的应用效果研究

吴巧红
丽水市中心医院

目的 观察耳穴贴压对肝癌射频消融患者超前镇痛干预的应用效果。**方法** 使用试验病例随机编码表，对符合纳入标准的患者随机分成 A 组、B 组、C 组，每组 50 例。A 组 50 例 RFA 术前 30min 皮下注射吗啡注射液 10mg。B 组 50 例 RFA 术前 24 小时使用王不留行籽耳穴贴压，C 组 50 例采用上述吗啡注射联合联合耳穴贴压方法。记录术中疼痛程度及术后活动性疼痛及静息性疼痛强度及免疫指标：T 细胞亚群，包括 CD3+细胞、CD4+细胞、CD4+ / CD8+比值。 **结果** 三组患者 RFA 术中及术后比较，NRS 评分存在统计学差异（P<0.05），两两比较发现，A 组与 B 组相比，NRS 评分差异无统计学意义（p>0.05），C 组 RFA 术中及术后各时间点疼痛程度 NRS 评分比较 AB 两组均较低，且存在统计学差异（P<0.05）。C 组 RFA 术中及术后各时间点各时间点 FAS 评分比较 AB 两组均较

低，P<0.05。RFA 术中及术后 A 组与 B 组相比，免疫指标结果差异无统计学意义（p>0.05），C 组与 A 组治疗前后比较，结果存在统计学差异，P<0.05；与本组治疗前比较，结果存在统计学差异，P<0.05 ，C 组与 B 组治疗前后比较，结果存在统计学差异，P<0.01；与本组治疗前比较，结果存在统计学差异，P<0.05 。 **结论** 耳穴贴压超前镇痛能够有效缓解肝癌射频消融术后患者疼痛，而且安全、经济、无毒副作用，是一种能够在临床中广泛应用的中医特色治疗手段。

TIPS 手术后非计划再住院患者相关因素分析

肖书萍
华中科技大学同济医学院附属协和医院

目的 通过对 TIPS 术前、术后、再入院的生化指标的分析，找到患者再入院的原因，改进延续护理方案，以降低患者非计划再住院率。**方法** 选择 2017 年 1 月至 2019 年 6 月入住我院行 TIPS 手术的肝硬化门脉高压症出院后非计划性再住院患者 28 例，收集患者术前、术后 3 天及再入院生化指标作为研究参数。 **结果** 患者 TIPS 术后再入院与术后相比，APTT、血氨值升高（P<0.05），；患者 TIPS 手术术前、再入院查 APTT、血氨值升高（P<0.05）；单因素分析和多因素分析结果显示，患者早期再入院与支架血栓形成有关。**结论** 医务人员要针对患者个体情况，复查的各种指标，针对性进行用药、饮食指心理等康复指导，才能保证手术的长期疗效，减少术后并发症的发生。

护理干预对 64 排螺旋 CT 冠状动脉 CTA 图像质量的影响研究

陈娅
上海交通大学医学院附属第九人民医院

目的 探讨护理干预对 64 排螺旋 CT 冠状动脉 CTA 图像质量的影响。
方法 入组 50 例在 2016 年 2 月 21 日至 2018 年 2 月 21 日期间收治的实施 64 排螺旋 CT 冠状动脉 CTA 检查患者。采用计算机随机分组法，将 50 例患者分为干预组（25 人）和对照组（25 人）。干预组在常规化护理基础上进行呼吸训练、心理疏导、用药指导等护理干预，对照组仅进行常规化护理。2 名主治职称以上的放射科医师对图像质量进行评估。采用独立样本 T 检验对两组间患者年龄进行比较。采用卡方检验对两组间患者性别和图像质量进行比较。
结果 两组间患者年龄、性别无统计学差异（P>0.05）。干预组图像质量明显优于对照组，两组间图像质量存在统计学差异（P<0.05）。
结论 通过护理干预，可以明显提高 64 排螺旋 CT 冠状动脉 CTA 图像质量，值得临床应用推广。

The Application and the Effect of Treating Patients with Malignant Obstructive Jaundice who had been Treated with

Biliary Stent Implantation by Butt Joint of Self-Made Assisted I-125 particles Implantation Device Set and Abdominal I-125 particles Implanta

Lanqian Qiu,Ni Jiang,Yan Qiu,Zhuolin Yang,Yanping Zhang,Ailing Duan,Qiongbo Wang
Tumor Hospital of Yunnan Province/the Third Affiliated Hospital of Kunming Medical University

[Abstract]
Objective To investigate the application and the effect of treating patients with malignant obstructive jaundice who had been treated with biliary stent implantation by butt joint of self-made assisted I-125 particles implantation device set and abdominal I-125 particles implantation protective coat made from lead. **Methods** To select 80 patients with malignant obstructive jaundice who were eligible for I-125 particles biliary stent implantation and randomly divide them into the experimental group and the control group with 40 cases each. There were no statistically significant difference in baseline data between the groups (P>0.05). During the operation of patients in the experimental group, doctors used the independently invented auxiliary I-125 particles implantation device set (patent No.ZL201620839740.9) and those patients after the operation need to put on the independently invented abdominal I-125 particles implantation protective lead (patent No.ZL201620839740.9). During the operation of patients in the control group, doctors adopted traditional seed implantation surgical instruments and those patients after the operation should dress regularly protective coat made from lead. The aim of the experiment is to compare the time spent by doctors in accurately implanting particles to two groups of patients, the radiation shielding effect of the two kinds of lead suits after the operation and the duration and comfort of patient's active protection. All statistical analysis was performed using SPSS 23.0 software package.
Results There was a statistically significant difference between the two groups in the amount of time it took for doctors to accurately implant a particle (t=-6.974, P<0.001). Besides, there were no difference between two groups of patients to wear different clothes for radioactive protection with radiation carrying capacity after the interval distance of 0 M and 0.5 M(t_{0M}=1.449, $t_{0.5M}$=0.08633, P>0.05). In addition, there was a statistically significant difference between the amount of duration time it took for two groups of patients to actively wear the protective lead coat (t=7.866, P<0.05). In the meantime, there was a statistically significant difference in comfort between the two groups of patients(Z=-2.193 , P<0.05). **Conclusion** Applying self-made assisted I-125 particles implantation device set combined abdominal I-125 particles implantation protective coat made from lead to the patients with malignant obstructive jaundice with I-125 particles stent implantation can improve the efficiency of doctors' operation, reduce the amount of time they are exposed to particles and improve compliance and comfort of patients with active radiation protection. It proved that there were clinical application value and promotion significance.

移动健康教育在 PTBD 术后出院患者护理中的价值探索

邱永敬,王志学,陈月华
河南大学第一附属医院

目的 探讨移动健康教育在经皮经肝穿刺胆道引流术(Percutaneous transhepatic bile duct drainage,PTBD)术后带管出院患者中的运用价值。**方法** 本研究选取 2017 年 1 月至 2018 年 12 月我院进行 PTBD 术后带管出院的患者 84 例作为研究对象，采用随机数列法将患者分为观察组和对照组，每组各 42 例。其中对照组给予常规健康教育。观察组在对照组基础上，给予移动健康教育。对患者带管的目的、引流胆汁总量、胆汁颜色、引流管维护、切口皮肤护理、夹闭引流管时间、带管脱落预防、导管造影、导管拔出适应症的认知情况进行评分。调查两组患者的满意度。对比两组患者的脱管、切口感染、导管堵塞的发生率和导管留置时间。**结果** 观察组患者的带管的目的、引流胆汁总量、胆汁颜色、引流管维护、切口皮肤护理、夹闭引流管时间、带管脱落预防、导管造影、导管拔出适应症评分均高于对照组，差异有统计学意义（P<0.05）。观察组的满意度高于对照组，差异有统计学意义（P<0.05）。观察组的脱管、切口感染、导管堵塞的发生率和导管留置时间比对照组低，差异有统计学意义（P<0.05）。**结论** 移动健康教育可提高 PTBD 术后带管出院患者的认知度和满意度，降低并发症的发生，缩短导管留置时间。

前循环急性缺血性卒中血管内取栓的个体化镇静护理实践

陈健聪,杨文才,陈利芳
暨南大学医学院第一附属医院

目的 指南指出前循环急性缺血性卒中(AIS)患者取栓时行个体化镇静或麻醉更为合适。遵循“时间即大脑，争分又夺秒”的救治原则，前循环和部分后循环的 AIS 取栓常不通知及等待麻醉师参与，患者的镇静护理由介入手术护士在医嘱下参与承担，已是国内外普遍现状。本文目的分析个体化镇静护理在保证 AIS 患者安全和缩短治疗时间的作用。
方法 遵医嘱对 106 名患者实行个体化镇静护理：(1)动态评估与调整：采用 SAS 评分和 CPOT 评分动态评估镇静状态，目标 SAS 评分 3-4 分，CPOT 评分＜3 分，未达目标时报告医生并遵医嘱调整用药；(2)用药方案：采用咪达唑仑或右美托咪定联合芬太尼作为镇静用药选择，并与医生根据患者体重个体化设计负荷剂量和泵注速度；(3)约束与安全：优化介入手术床，制作更快捷有效的约束工具，患者入室常规约束保障安全；(4)气道护理：掌握吸痰护理、口咽通气管和简易呼吸气囊使用，对呼吸抑制和呕吐采取预见性护理；(5)血压管理：持续血压监测，血管再通后遵嘱用药控制血压，以防再灌注损伤。根据用药方案不同，患者分为咪达唑仑组(n=72)和右美托咪定组(n=34)，比较入室至再通时间、芬太尼用量与不良反应发生情况。
结果 咪达唑仑组与右美托咪定组患者入室至再通时间为 52.7±10.8min 和 53.4±11.9min，均低于文献参考水平。呕吐、血压和血氧饱和度下降等不良反应发生率低。图像伪影比较上有统计学差异(P＜0.05)。
结论 个体化镇静护理利于缩短前循环 AIS 患者取栓治疗时间，并控制不良反应发生，保障安全。咪达唑仑或右美托咪定联合芬太尼可作为合适的镇静方案，但右美托咪定易产生类似睡眠的效果，导致头部摆动而造成伪影。ARIN 等组织相继建议，介入手术室在 1 名足够经验的执业护士镇静管理下，可不需要麻醉师参与。目前镇静护理在 ICU 已有成熟的护理体系，同样作为急重症部门的介入手术室，应更积极地借鉴学习。

1H-MRS 对儿童 OSAHS 脑代谢变化的初步研究

王婷婷,张利
青岛市第五人民医院

目的 用氢质子磁共振波谱(¹H magnetic resonance spectroscopy, ¹H-MRS)探讨儿童阻塞性睡眠呼吸暂停低通气综合征（OSAHS）大脑代谢及功能的变化。**方法** 对 20 例 OSAHS 患者、20 例正常者行磁共振波谱（ *¹H-MRS*）检查和多导睡眠呼吸监测（PSG），记录两组双侧额叶代谢物的比值和检测指标，比较两组间的差异，并和主要监测指标进行相关性分析，观察有无乳酸（Lac）峰出现。**结果** OSAHS 组 NAA/Cr、NAA/Cho 较对照组明显降低，Cho/Cr 较对照组明显升高，差异具有统计学意义(P＜0.05)。各被测者均未见 Lac 峰。OSAHS 组的 AHI 与双侧额叶 NAA/Cho、NAA/Cr 呈负相关（P＜0.05），而与 Cho/Cr 无相关性（P＞0.05），$MSaO_2$与双侧额叶 NAA/Cho、NAA/Cr 呈正相关（P＜0.05），而与 Cho/Cr 无相关性（P＞0.05）。**结论** *¹H-MRS* 能较早监测儿童 OSAHS 脑代谢的变化，为临床治疗和效果评价提供客观的影像学依据。

回顾分析新生儿化脓性脑膜炎 MRI 表现

林志旭,王强
泉州市儿童医院

目的 分析新生儿化脓性脑膜炎颅脑 MRI 异常表现。
方法 随机选取医院收治的 50 例新生儿化脓性脑膜炎患儿对其影像资料进行回顾性研究。根据患儿脑脊液或血病原菌培养阳性、脑脊液糖含量降低、发生惊厥将其分为难治组(21 例)和普通组(29 例)，对新生儿化脓性脑膜炎的头颅 MRI 影像学特点进行分析.
结果 在 50 例患儿颅脑 MRI 检测中，难治组异常率明显升高,两组比较差异有统计学意义(x2=3.227,P＜0.05)。
结论 在化脓性脑膜炎患儿中若出现脑脊液或血病原菌培养阳性、脑脊液糖含量降低以及发生惊厥的情况的情况下，MRI 磁共振容易出现以下阳性征象：脑表面他像呈线条状高信号,脑膜增厚，硬膜下积液脑沟变浅消失，皮层及皮层下弥漫性长 T1/长 12 异常信号,双侧脑室前后角周围白质水肿信号，脑积水,脑梗死等表现

Atypical Tteratoid /Rhabdoid Tumors: Imaging Findings of Four Cases and Literature Review

Jingjing jiang,Wenzhen Zhu
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

PURPOSE: To characterize the computed tomography (CT) and magnetic resonance imaging (MRI) findings of four cases pathologically proved atypical teratoid/rhabdoid tumors (AT/RTs) in children.

MATERIALS AND METHODS: We retrospectively reviewed the CT and MRI findings of four patients with brain AT/RTs. and evaluated the size, location, CT density, MR signal intensity, enhancement level, pattern, peritumoral edema, mass effect, and the presence of dissemination of this tumor.
RESULTS: The patients were three boys and one girl, with a mean age of 6.25 years (median age, 4.5 years) at diagnosis. Radiographically, three tumors were located in the supratentorial region, and one was located in the posterior fossa. Bulk, heterogeneous tumors with solid and cystic component, perifocal edema, mass effect, and varying degrees of heterogeneous enhancement were present on CT and MRI of AT/RTs. Of the four tumors, two had CSF dissemination.
CONCLUSION: To the best of our knowledge, this is the fourth literature mentioning an AT/RT extending to the right temporal lobe. At the same time, there are few AT/RTs occupying the whole anterior skull base. AT/RT remains an uncommon CNS tumor. Imaging findings with bulky, heterogeneous masses with eccentric cysts, mass effect and a bandlike rim of strong enhancement completely or partly surrounding a central cystic or necrotic area should alert the radiologist to mention AT/RT in their differential diagnosis. Immunohistochemical exam is required for a certain diagnosis of this kind of tumor.

胎儿轻中度侧脑室扩张合并颅脑病变的产前 MR 表现及相关预后情况

陈芳芳,刘影
中国科学技术大学附属第一医院/安徽省立医院

目的 分析胎儿轻中度侧脑室扩张合并颅脑病变的产前 MR 表现及相关预后情况。**方法** 抽取从 2015 年 1 月 1 日-2018 年 3 月 1 日间在我院行胎儿颅脑磁共振检查后诊断为侧脑室扩张的 95 例孕妇作为研究对象，根据脑室扩张程度分为轻、中度，A 组为轻度 10.0mm-12.0mm，B 组为中度 12.1mm-15.0mm，并根据双侧脑室扩张差异是否大于 2mm，分为对称组及非对称组，对其磁共振影像进行回顾性分析，并电话或门诊随访妊娠结局及生长发育情况。**结果** A 组胎儿侧脑室扩张共 57 例，对称性扩张组 24 例，非对称性扩张组 33 例，B 组侧脑室扩张共 38 例，对称性扩张组 9 例，非对称性扩张组 29 例。A 组中侧脑室扩张合并中枢神经系统病变共有 14 例（25%），B 组共 9 例（24%），A 与 B 两组比较无明显统计学意义。A、B 两组中对称性脑室扩张合并中枢神经系统病变比例均高于非对称组。随访妊娠结局 A 组引产 7 例，生长发育正常 37 例，其中单纯侧脑室扩张者 34 例发育正常；生长发育迟缓 4 例（7%），其中对称组 3 例（13%），非对称组 1 例（3%）。B 组引产 4 例，生长发育正常 20 例，其中单纯侧脑室扩张者 19 例发育正常；生长发育迟缓 6 例（16%），其中对称组 2 例（22%），非对称组 4 例（14%），A 组与 B 组胎儿发育情况比较亦无明显统计学意义。**结论** MRI 在诊断胎儿轻中度侧脑室扩张合并中枢神经系统病变具有重要的临床意义，轻中度单纯性侧脑室扩张的妊娠结局及胎儿产后预后情况相对良好，侧脑室增宽合并中枢神经系统病变者其妊娠结局往往不良，患儿预后与病变严重程度密切相关。

儿童弥漫性中线胶质瘤伴 H3K27M 突变型的 MRI 表现（5 例报道并文献复习）

杨豪
武汉市妇女儿童医疗保健中心

探讨儿童弥漫性中线胶质瘤伴 H3K27M 突变型的脑部 MRI 表现，提高对本病的认识及诊断水平。**资料与方法** 回顾性分析 2018 年 6 月-2019 年 2 月武汉儿童医院收治并经临床、病理证实的弥漫性中线胶质瘤伴 H3K27M 突变型患儿 5 例的 MRI 特征。**结果** 临床表现病程较短（<2 个月），常表现为间断头痛、共济失调、运动减弱、步态失调等。4 例患儿病灶发生于脑干并沿着左侧桥小脑臂（n=1）、右侧桥小脑臂（n=3）浸润性生长，同侧小脑半球受累（n=4），背侧丘脑受累（n=1）。1 例患儿表现为双侧额颞岛叶及胼胝体弥漫性异常信号影，伴明显占位效应。常规序列中，病灶信号表现为长 T1 信号长 T2 信号影，FLAIR 序列呈高信号，增强扫描示 2 例病灶无明显强化，3 例病灶可见环形强化伴或不伴点片状强化。**结论** 儿童弥漫性中线胶质瘤伴 H3K27M 突变型常位于中线结构（脑干、丘脑），常可沿白质纤维束向周围脑组织浸润。该病 MRI 表现具有一定的特征性，并且可评测与周围脑组织浸润情况，有助于临床诊断及预后评估。

PU-0006
中枢神经系统非典型畸胎样/横纹肌样瘤 6 例及相关文献复习

欧洁琳,廖伟华
中南大学湘雅医院放射科

目的 探讨中枢神经系统非典型畸胎样/横纹肌样瘤的临床特点、磁共振表现及治疗进展。
方法 回顾性分析我院 2018 年 1 月-2019 年 4 月经病理及免疫组化确诊的 6 例中枢神经系统非典型畸胎样/横纹肌样瘤患者的磁共振表现及相关临床资料，并就国内外相关文献进行复习和归纳，结合上述病例特点进行讨论。
结果 6 名患者平均发病年龄约 2 岁 5 月，肿瘤位于幕上 4 例，幕下 2 例，其中 2 例为多发病变。病灶最大径为 2.7～10.9cm，所有病例中均可见短条状出血灶及脑积水并间质性脑水肿征象，囊变 4 例，4 例病例呈中重度不均匀强化，另 2 例呈轻中度均匀强化。 6 例患者均接受手术治疗，手术全切除 4 例，次全切除 2 例，术后都得到有效随访，手术全切 3 例患者术后 2-3 月内 MRI 随访提示病灶复发，次全切除 2 例 2-4 月内残留病灶较前增大。
结论 中枢神经系统 AT/RT 好发于儿童，年龄常小于 3 岁，肿瘤体积较大、占位效应明显，常合并幕上脑室扩张并间质性脑水肿，病灶内信号混杂，增强后可呈明显不均匀条带状强化。AT/RT 常预后不佳，肿瘤全切除术后 2-3 月内即可见复发，术后积极地进行放、化疗治疗，可以改善患者预后。

PU-0007
甲型流行性感冒引发急性坏死性脑病的磁共振影像

廖怡,赵福敏,曲海波,宁刚
四川大学华西第二医院

患儿，女性，1 岁 3 月，因“发热 2 天，抽搐 5 次，意识障碍 6 小时”到四川大学华西第二医院就诊并入院。患者主要表现为高热、抽搐，最高体温 40℃，伴畏寒、寒战，偶有咳嗽，伴纳差、腹泻、喷射性呕吐，病初有烦躁不安，后表现为精神萎靡、嗜睡。抽搐形式为大发作，持续时间 10+秒。
实验室检查主要阳性指标如下，甲型流感病毒（+），血常规：白细胞 8.5×109 /L，中性粒细胞 7.84×109 /L，中性粒细胞百分比 92.2%，C 反应蛋白 31.6mg/L，肝功能：ALT 589U/L，AST 945 U/L。Glasgow 评分 5 分，Babinski 征阳性，双侧戈登征阳性，腱反射不能引出。
影像学检查 MRI 影像表现：双侧大脑半球脑沟增宽、加深，双侧半卵圆中心、双侧侧脑室旁脑白质区、壳核、脑桥、双侧小脑半球脑白质区、双侧背侧丘脑见多发片状异常信号，T1WI 呈混杂稍低信号及低信号，T2WI 呈混杂稍高信号及高信号，T2-Flair 呈中央低信号、边缘片状稍高信号，部分弥散受限，其间可见多发坏死灶，呈坏死性脑病影像学改变。
临床上予管喂、有创呼吸机辅助通气、美平抗感染，奥司他韦抗病毒，甘露醇、甘油果糖降颅压，绿汀诺保肝，B 族维生素营养神经，奥美拉唑护胃治疗后临床症状有所缓解出院。
儿童急性坏死性脑病是快速进展性脑病。最初在 1995 年由日本的 Mizuguchi 等提出，多发生在东南亚等地。其临床特点：多发生在病毒感染之后，伴随癫痫发作及快速神经功能恶化及意识水平改变。发病机制为流感、单纯疱疹病毒和支原体感染可能为潜在的病因，疾病过程由细胞因子和免疫介导。影像学表现为丘脑、脑干，壳核，脑室周围白质和小脑多发对称性长 T2 病灶，弥散受限、多发出血灶及明显病灶强化。诊断基于实验室检查及脑脊液分析，排除其他诊断。

PU-0008

SWI 对早产儿脑损伤脑出血的诊断价值研究

宋吉清
山东省立医院

目的 探讨 SWI 对早产儿脑损伤脑出血的诊断价值，并与常规 MRI 成像进行对照。
方法 38 例早产儿脑损伤脑出血的患儿均进行常规 MRI（T1WI、T2WI）及 SWI 扫描，5/例随访复查，其中 2 例复查时做了 SWI 检查。根据文献将早产儿脑出血按照出血部位及程度进行量化评分。按出血部位分为五类，分别为点状脑白质病变伴出血（0～6 分）；室管膜下/脑室内出血（0～8 分）；小脑半球出血（0～4 分）；脑实质的出血（0～4 分）；硬膜下/硬膜外出血（0～4 分），按严重程度总分为 0～26 分。
结果 SWI 发现病变总评分为 140 分,高于常规 T1、T2 序列。SWI 显示点状脑白质病变伴出血 8 例，28 分；室管膜下/脑室内出血 20 例 40 分；小脑半球出血 10 例，22 分；脑实质的出血 4 例，8 分；硬膜下/硬膜外出血 18 例，42 分。常规 T1WI 分别为点状脑白质病变 8 例，26 分；室管膜下/脑室内出血 12 例 20 分；小脑半球出血 2 例，2 分；脑实质的出血 4 例，6 分；硬膜下/硬膜外出血 18 例，40 分；T2WI 分别为点状脑白质病变 8 例，16 分；室管膜下/脑室内出血 18 例 26 分；小脑半球出血 4 例，10 分；脑实质的出血 4 例，6 分；硬膜下/硬膜外出血 18 例，40 分。5 例随访复查的患儿，常规 MRI 显示病变减小，较少；其中 2 例行 SWI 随访复查的患儿，常规 MRI 病变显示明显好转，但在 SWI 序列上仍可见较多病灶。
结论 SWI 对小脑半球、室管膜下/脑室内出血显示的例数及评分明显优于常规 T1、T2。对点状脑白质病变伴出血的显示虽然例数与常规序列无明显差别，但显示的病变数目明显多于 T1、T2，可发现更多、更广泛的病变；对硬膜下/硬膜外出血的价值与常规 MRI 结果基本一致；但对治疗后复查患儿病变的显示明显优于常规 MRI 检查。

PU-0009

The role of contrast enhanced MR imaging in young infants with Sturge-Weber syndrome

Jin Shen
Children's Hospital of Fudan University

Object: The aim of this study was to discuss whether it is indispensable in the diagnosis of Sturge-Weber syndrome in young infants (younger than 1 year) with contrast enhanced MR imaging.
Material and methods: The clinical and imaging characteristics of one newborn and seven young infants with Sturge-Weber syndrome underwent magnetic resonance imaging including IV contrast between January 2009 and December 2014.
Results: The age of the patients at diagnosis ranged from nine days to eleven months. Clinical presentation was angiomatosis involving the face in seven patients, seizure in three cases and unilateral glaucoma in one case. All patients underwent the contrast-enhanced cranial MR. Of the patients, the lesions involved unilateral cerebraland six patients and involved bilateral in two patients. We found six cases with supratentorial involvement, one case with only infratentorial involvement and one case with simultaneous supra- and infratentorial involvement. Cranial MRI revealed serpentine leptomengingeal enhancement in all patients,T2WI transient hyperperfusion in five patients, ipsilateral brain atrophy in five patients, and enlarged ipsilateral choroid plexus in four cases.
Conclusion: Contrast enhanced MR plays an important role in the diagnosis of Sturge-Weber syndrome with cranial MR, especially in young infants lack of the symptoms of T2WI "accelerated" myelination and ipsilateral atrophy.

PU-0010

MR CHARACTERISTICS OF SUPRATENTORIAL ANAPLASTIC EPENDYMOMA IN CHILDREN

Jin Shen
Children's Hospital of Fudan University

Objective: Anaplastic ependymoma is a malignant glioma of ependymal differentiation with accelerated growth and unfavourable clinical outcome,and it is not common in children. In this article, we report the MRI, including DW MRI, findings in pediatric patients with pathologically proven supratentorial anaplastic enpendymoma. DWI and ADC maps are useful in evaluation a number of different brain lesions.**Material and methods:**We reviewed the MRI features in children with pathologically proven supratentorial anaplasitc ependymomas. The preoperative cranial MRI studies at initial presentation were reviewed about tumor location, size, signal intensity and enhancement characteristics were recorded. Isotropic DW MRI was reviewed and ADC values were automatically calculated by the built-in software of the scanner by a signal operator (HQL) placing regions of interest (ROI) in the areas of abnormal

signal intensity within the solid portion of the tumor. **Result:**There were eight patients in our study. Most tumors (6/8) located in the cerebral parenchyma, one in the ventricle, one both in the ventricle and parenchyma. On T2 tirm dark-fluid images, the signals of the cystic portions had variable hyperintense to cerebrospinal fluid. DW MRI performed in all 8 patients. The solid component of the tumors was isointense and hyperintense in two patients.In other patients the solid component of the tumors were hyperintense. Mean ADC value was 0.70 ± 0.09×$10^{-3}mm^2/s$ in the hyperintense area on DW MRI of the tumors.Mural nodular enhancement was seen in one patient and heterogeneous enhancement of the solid portions was found in other patients. Conclusion: The MR contrast enhancement pattern in supratentorial ependymoma can be heterogenous enhancement of a solid lesion, heterogenous enhancement of a cystic/solid lesion and although rare, an enhancing nodule in the wall of a cyst. The solid portion of the tumor was hyperintense to the surrounding parenchyma in our patient in DW imaging. Anaplstic ependymoma showed hyperintense on DW imaging and reduced ADC, The ADC value of the solid portion of the tumor was lower than 0.9×$10^{-3}mm^2/s$ in our patients. The cut-off values to differentiate low and high grade paediatric brain tumours were 1.0 × 10^{-3} mm^2/s for average ADC values respectively. Supratentorial anaplastic ependymoma involved multiple lobes in the cerebral parenchyma in children, and had imaging appearance of solid and cystic mass, decreased ADC of the solid and the hyperintense on DW imaging.

PU-0011

积水型无脑畸形

唐蕴荻
昆明市儿童医院

本病可在孕期 B 超检查发现，根据出生后患儿临床表现结合 CT 诊断。CT 扫描能客观反映出积水型无脑畸形的大体病理改变。其特征性表现为幕上双侧大脑半球、脑室不显示，整个颅腔大部分呈脑脊液密度影，仅于脑底部见残存部分脑组织，基底节、丘脑部分存在，大脑镰、蛛网膜、软脑膜完整存在，幕下结构正常，但脑干可略变细。本病需与前脑无裂畸形、脑裂畸形、脑穿通畸形、巨大蛛网膜囊肿及重度脑积水相鉴别。

PU-0012

磁共振动脉自旋标记技术在足月窒息新生儿中的应用

高敏,盛茂
苏州大学附属儿童医院

目的 利用磁共振动脉自旋标记技术来探讨足月新生儿在围产期窒息后脑部灌注的变化情况，从而指导临床治疗，改善患儿预后，减少新生儿脑损伤的发生。
方法 使用 GE 3.0T 超导型磁共振对本院 12 例有窒息史的足月新生儿进行头颅常规 MRI 检查和 3D-ASL 检查，另收集 15 例正常足月新生儿作为对照组。所有受试者均使用 10%水合氯醛 0.5ml/kg 灌肠镇静，待其进入睡眠状态后进行扫描。3D-ASL 各项参数：矩阵 64×64，FOV 20cm，TR/TE 4500/10ms，激励次数 3 次，层厚 4mm，扫描层数 32，标记后延迟时间 1025ms，扫描时间 4 分钟 13

秒。利用 ADW4.6 工作站 functool 软件对图像处理获得伪彩图，将伪彩图与 T2WI 图像融合，在融合图像上分别在双侧额叶、基底节及丘脑区测量脑血流量，分析足月窒息新生儿和正常足月儿之间的差异。

结果 窒息组和对照组新生儿检查时日龄、胎龄、体重均无统计学差异。在基底节和丘脑区，窒息组 rCBF 较足月儿高，差异有统计学意义，额叶白质区 rCBF 两组数据无明显统计学差异。在窒息组中，轻度窒息 7 例，重度窒息 5 例，重度窒息新生儿额叶白质区的 rCBF 小于轻度窒息新生儿，差异有统计学意义。

结论 足月窒息新生儿基底节区和丘脑区 CBF 较正常足月新生儿增加，而在额叶白质区 CBF 没有明显差异；重度窒息患儿额叶白质区 CBF 较轻度窒息患儿减低。3D-ASL 有助于早期发现足月窒息新生儿中脑部的高灌注，从而达到预防脑损伤发生的目的，在评价足月窒息新生儿脑部灌注情况是有研究价值的。

27 例儿童可逆性胼胝体压部病变综合征的临床和头颅 MRI 表现分析

裴江山,王强
泉州市儿童医院

目的 探讨儿童可逆性胼胝体压部病变综合征的临床和 MRI 表现特点。 **方法** 回顾性分析 2014.12 - 2018.12 收治的 27 例可逆性胼胝体压部病变综合征患儿的临床和 MRI 表现资料并进行总结分析。 **结果** 27 例患儿中男 14 例, 女 13 例，所有病例均有前驱感染史，感染部位以上呼吸道及消化道为主，临床表现主要为发热、惊厥、急性胃肠炎等，症状轻，预后较好；其中 25 例头颅 MRI 显示胼胝体压部孤立性椭圆形 DWI 高信号病灶，边界清楚，为 1 型 RESLES，2 例病灶除了胼胝体压部 DWI 高信号外，还累及半卵圆中心及脑室周围白质，为 2 型 RESLES。 **结论** 儿童可逆性胼胝体压部病变综合征多有前驱感染史，临床症状较轻，颅脑 MRI 具有特征性改变，预后较好。

PU-0014
苍白球与壳核磁共振信号比值在足月新生儿急性胆红素脑病早期诊断中的价值

卢平明,尹家瑜,申炜,黄龙全
南宁市第一人民医院

目的 探讨苍白球与壳核 T1WI、T2WI 及 ADC 比值在足月新生儿急性胆红素脑病早期诊断中的价值。**方法** 回顾性分析 95 例足月新生儿，根据血清总胆红素（TSB）及临床症状分组，测量苍白球与壳核 T1WI、T2WI 及 ADC 比值，通过采用 Sperman 等级相关及单因素方差分析（ANOVA-LSD）进行统计分析。**结果** 按 TSB 分组：T1WI-G/P 比值及 ADC-G/P 比值随胆红素水平增高而增加，相关性分析**结果** T1WI-G/P 比值为极强等级相关（r_s=0.824，P＜0.05）、ADC-G/P 比值为强等级相关（r_s=0.673，P＜0.05），且各组间均存在差异；T2WI-G/P 比值为弱等级相关（r_s=-0.054，P＞0.05），且组间无差异。按临床症状分组：T1WI-G/P 比值及 ADC-G/P 比值随临床症状加重而增加，相关性分析**结果** T1WI-G/P 比值为强等级相关（r_s=0.645，P＜0.05）、ADC-G/P 比值为中度等级相关（r_s=0.495，P＜0.05），且各组间均存在差异；T2WI-G/P 比值为弱等级相关（r_s=-

0.117，P＞0.05），且组间无差异。**结论** 苍白球与壳核 T1WI、ADC 比值与临床症状结合，能增加足月新生儿急性胆红素脑病的早期诊断准确客观性。

Abnormal Gray Matter Structural Covariance Networks in Children with Bilateral Cerebral Palsy

heng liu[1],Haoxiang Jiang[2],Tijiang Zhang[1],Wenchuan Bi[3],Bingsheng Huang[4],Jian Yang[2]
1.The Affiliated Hospital of Zunyi medical University
2.The First Affiliated Hospital of Xi'an Jiaotong University
3.School of Pharmaceutical Sciences, Shenzhen University Health Science Center,
4.School of Biomedical Engineering, Health Science Center, Shenzhen University

Bilateral cerebral palsy (BCP) is a common movement disorder in children, which often results in lifelong motor disability. One main symptom of BCP shows the limitations of hand function in everyday activities and participation restrictions. However, the neuroanatomical mechanisms for the manual ability are poorly understood. Recent advances in the understanding of cerebral palsy include the development of coordinated pairwise gray matter, which is important for sensorimotor integration, and cognitive development. Here, in our study, neuroimaging with network analysis was employed to evaluate the changes of structural covariance networks (SCNs) in BCP children. We aimed to elucidate the alteration of SCNs based on cortical thickness (CT), and to reveal the relationship of CT and hand function in the participants with BCP. SCNs were constructed using covariance between regional CT, which was acquired from T1-weighted images of 19 children with BCP and 19 demographically matched healthy controls (HCs). Compared with HCs, BCP children showed increased CT in several regions involving the bilateral areas (lateraloccipital, lingual, and fusiform) and right areas (cuneus, pericalcarine, inferiortemporal, middletemporal, superiortemporal, and insula). Decreased CT was found in the left superior temporal and right superior parietal cortices. Global network analyses revealed significantly decreased normalized clustering and small-worldness in the BCP network. The area under the curve (AUC) of global network measures varied slightly between the BCP and HCs networks. The resistance of the both SCNs to the target and random attack showed no significant difference. Also, the BCP foci (right superior temporal and subtemporal cortex) showed a significantly negative correlation between the CT and manual ability. In this work, we identified the CT-based SCNs changes in children with BCP. The abnormal topological organization of SCNs was revealed, indicating abnormal CT, incongruous development of structural wiring, destructive nodal profiles of betweenness, and moved hub distribution in BCP children. This may provide a neuroanatomical hallmark of BCP in the developing brain. Therefore, our results may not only reflect neurodevelopmental aberrations but also compensatory mechanisms.

极低出生体重儿脑损伤和神经行为预后的影像学早期诊断价值

王程程,赵鑫,张烁,张鹏华,张小安
郑州大学第三附属医院

【摘要】目的 研究多模态磁共振对极低出生体重儿（VLBW）神经发育障碍的早期诊断价值。**方法** 选取 2018 年 2 月至 2019 年 4 月在河南郑州大学第三附属医院新生儿重症监护室收治的极低出生体重儿（BW≤1500g）64 例，排除先天性神经系统畸形、染色体疾病、遗传代谢性疾病。在纠正胎龄 33-38 周时行磁共振检查，包括结构磁共振和扩散张量磁共振。通过磁共振检查将其分为脑损伤组（37 例）和无脑损伤组（27 例），分析两组围生期资料、颅脑损伤情况和脑白质微结构的改变。参照中国科学院心理研究所编制的婴幼儿智能发育量表（CDCC），随访 1 个月、3 个月、6 个月进行神经行为方面的测试，包括智能发育指数（MDI）和运动发育指数（PDI）。**结果** 极低出生体重儿脑损伤中，主要包括脑白质损伤和脑室周围白质软化，分别为 51.4%和 32.4%。两组围生期资料比较差异无统计学意义，在 CGA33-37 周时，磁共振的异常信号检出率高于头颅超声。完成随访后发现脑损伤组发生神经发育障碍的为 14 例，且脑白质损伤和脑室扩大程度越严重，智力发育障碍的比例越高；无脑损伤组发生神经障碍的为 4 例。**结论** 脑损伤在极低出生体重儿中较为常见，磁共振检查对其脑损伤的早期诊断有意义，且可为远期神经行为发育的评估提供依据。

PU-0017
儿童脑实质内室管膜瘤一例及文献复习

郭亚飞,赵鑫
郑州大学第三附属医院

目的 分析儿童脑实质内室管膜瘤的影像表现，提高鉴别诊断能力。 **方法** 对 1 例手术病理证实的儿童额叶室管膜瘤进行回顾性分析，观察肿瘤的发病部位、发病年龄、病灶形态、密度、信号及强化特点，复习国内外相关报道。**结果** 儿童脑实质内室管膜瘤的临床影像表现为：好发于男孩，多发生于脑凸面呈囊实性肿块，瘤内出血、瘤周水肿较成年少见，边界多较清；同时需要与毛细胞星形细胞瘤、胶质母细胞瘤、少突胶质细胞瘤等鉴别。 **结论** 幕上脑实质室管膜瘤患者术前行 CT 及 MRI 检查对评估其病理分级及具体病情具有一定意义，对临床手术治疗具有指导价值。

The Value of Diffusion Tensor Imaging in the Prognosis Evaluation of Preterm Infants with Hypoxic-Ischemic Brain Injury

Xueyuan Wang,Xin Zhao,Xiaoan Zhang
The Third Affiliated Hospital of Zhengzhou University

Objective To investigate the value of DTI in predicting the prognosis of premature infants with HIBD. **Methods** Preterm infant with HIBD in our hospital were enrolled in the study. MRI were performed on all the subjects. When the corrected age of children was 7~8 months, our hospital used the revised version of BSID to conduct

neurobehavioral development score.The subjects were divided into two groups of good prognosis and poor prognosis by results. The FA among different groups were statistically analyzed.The ROC are drawn to find the best truncation value for each ROI. **Results** The FA of most ROI in the better prognosis group were higher than those in the poor prognosis group, and the difference was statistically significant.The AUC of FA of the posterior limb of the inner capsule was the largest, and the diagnostic efficiency was the highest. **Conclusions** DTI can be used as an imaging reference index for predicting the prognosis of HIBD in preterm infants.

PU-0019

Diffusion tensor imaging of premature with hypoxic ischemic brain damage

Xueyuan Wang,Xin Zhao,Xiaoan Zhang
The Third Affiliated Hospital of Zhengzhou University

Objective To explore the application of DTI in premature with HIBD. **Methods** Premature diagnosed as HIBD and normal neonates were selected. All subjects underwent MRI. The FA in HIBD group and normal group were statistically analyzed by t test and one-way anova.The correlation of FA in posterior limb of internal capsule and Apgar score was examined. **Results** In case group, most ROI had statistical significance compared with control group (P<0.05); FA of parietal white matter, thalamus and cerebral peduncle in HIBD moderate group and severe group compared with the control group, the difference was statistically significant . In the group comparison, the FA of most ROI were significantly different in the three groups. There was no significant correlation between FA of the posterior limb of the internal capsule and Apgar score (1 minutes and 5 minutes) (r=-0.179, P>0.05; r=-0.201, P>0.05). **Conclusions** DTI can be used to evaluate early HIBD brain injury.

PU-0020

DTI 在早产儿 HIBD 预后预测中的应用价值

王雪源,赵鑫,张小安*
郑州大学第三附属医院

目的 探讨扩散张量成像（diffusion tensor imaging,DTI）在早产儿缺氧缺血性脑损伤（hypoxic-ischemic brain damage,HIBD）预后预测中的应用价值。 **方法** 选取 2016 年 9 月至 2017 年 6 月入住我院新生儿科的 HIBD 早产儿 74 例为研究对象,应用 3.0T 磁共振扫描仪对所有研究对象行常规 MRI 和 DTI 扫描。待到患儿纠正年龄 7～8 个月时，到我院儿童保健科使用贝利婴幼儿发展量表（bayley scales of Infant Development,BSID）进行神经行为发育评分（剔除未到我院随访及随访时其他干扰因素较大的患儿，最终有 46 例患儿纳入研究），并根据评分结果将研究对象分为预后较好组和预后较差组两组。利用独立样本 t 检验,比较两组患儿感兴趣区（region of interest,ROI）的各向异性分数（fractional anisotropy,FA）的差异是否有统计学意义，并对各 ROI 绘制受试者工作特征曲线（receiver operating characteristic curve,ROC），寻找最佳截断值。**结果** 预后较好组的内囊后肢、胼胝体压部、额叶白质、顶叶白质、枕叶白质、丘脑、小

脑、大脑脚的 FA 值比预后较差组的 FA 值高，且差异具有统计学意义；内囊后肢 FA 值的曲线下面积（area under curve，AUC）最大，诊断效能最高。**结论** DTI 可作为预测早产儿 HIBD 预后的影像学参考指标。

PU-0021

儿童神经皮肤综合征的临床表现及颅脑 CT、MRI 的影像诊断

周俊霖,丁山,吴主强,陶钧
江西省儿童医院

目的 收集本院近 7 年来经临床确诊的神经皮肤综合征 30 例，对其影像学资料进行回顾性的总结和分析，探讨其影像特征，提高此类疾病的诊疗水平。
资料与**方法** 收集本院 2012 年 1 月至 2018 年 12 月临床确诊神经皮肤综合征 30 例，男 18 例，女 12 例，年龄 1 d 至 11 岁，平均（5±0.17 岁）。30 例中，CT 平扫 20 例，增强扫描 6 例，25 例行磁共振成像 MRI 平扫，增强 6 例。
结果 神经皮肤综合征临床大部分有神经症状和体征，以癫痫、惊厥发作为最常见的症状。本组病例 NF 6 例(Ⅰ型 5 例、Ⅱ型 1 例)，结节性硬化 18 例， 以癫痫发作为最常见的症状。脑颜面血管瘤综合征 6 例，均可见到面部鲜红斑痣可累及部分或整个面部，其他临床症状包括癫痫发作、偏瘫、偏盲和智力发育障碍。本组病例尚无神经皮肤黑素沉着症患儿。
30 例中病例 NF 6 例(Ⅰ型 5 例、Ⅱ型 1 例)，CT 和 MRI 表现：脑实质内的病变（5 例）、视通路病变（1 例）、脑积水（2 例）、头部及面颊部肿块（2 例）和颅骨、眼眶骨病变（2 例）。结节性硬化 18 例，CT 双侧侧脑室室管膜下多发高密度钙化结节（10 例）， MRI 双侧侧脑室室管膜下、颅内各叶皮层及皮层下多发结节（12 例），室管膜下巨细胞星形细胞瘤（1 例），伴肾脏多发囊肿及错构瘤（4 例）。脑颜面血管瘤综合征 6 例，CT 顶枕部沿脑回分布的弯曲的条状高密度钙化（2 例），部分延伸至侧脑室内，增强后见病灶内有扭曲的条状和结节状明显强化的血管影。MRI 病变区脑皮质 T2WI 显示飘带样改变（3 例），同侧大脑半球萎缩，脑表面可见扩张的静脉，伴脉络丛增大（3 例），局部板障增厚（2 例）。
结论 近年来许多遗传性疾病也归于斑痣性错构瘤病，如神经皮肤黑素沉着症等。此类病变，常有多系统的先天异常，临床表现复杂，就诊原因各异，容易漏诊和误诊，不同的影像学方法对此类疾病有不同的诊断价值。

PU-0022

MRI 诊断急性坏死性脑病 1 例

张鹏,黎萍,杨宝霞,王聪,郑百红,许忠
吉林大学第二医院

目的：报道 1 例急性坏死性脑病(acute necrotizing encephalopathy, ANE)病例，探讨该病的影像特点、诊治及预后。方法：收集 1 例 ANE 患者的病历资料，回顾性分析 ANE 患者的影像资料及临床资料。**结果** 3 岁男孩，因发热、咳嗽 3 天入院，入院第 10 天出现癫痫样抽搐，随即昏迷，头部核磁共振（MRI）提示双侧丘脑、基底节区、脑干等部位出现多发对称性坏死，临床诊断为 ANE。给予重症监护、抗感染、甲泼尼龙冲击、免疫球蛋白静推、脱水、亚低温及对症支持治疗。3 月后，复查头部磁共振（MRI），可见双侧丘脑出现少量渗血，双侧基底节区病灶明显减小。患儿能听懂指令，对话欠流利，不能独走，仍在康复治疗中。**结论** ANE 是一种罕见的中枢神经系统疾病，临床表现多样，病情进展快，死亡率高，幸存者常留有神经系统后遗症。头部 MRI 具有急性对

称性坏死表现，以丘脑为中心，相对特异，对疾病的早期诊断及治疗是十分必要的。各种免疫调节治疗有效，但长期预后不理想，有待开发改善 ANE 预后的最佳治疗方案。

PU-0023
MR 特殊序列在评价新生儿缺氧缺血性脑病(HIE)脑组织损伤程度和预后情况的价值

王怀武,孔俊沣,钟雯
重庆三峡中心医院

目的：探讨磁共振(DWI)、(DTI)、(SWI)及 FLAIR 技术在评价新生儿缺氧缺血性脑病(HIE)脑组织损伤程度和预后情况的价值.方法：对我院 2016 年 1 月～2018 年 1 月临床确诊为 HIE 的 72 例新生儿进行 MR 检查，其中早产儿 38 例，足月儿 34 例。男 35 例，女 37 例，年龄 4h～90 天，平均 47 天。临床主要病因和症状有出生时窒息、脐带绕颈、新生儿吸人性肺炎、青紫、抽搐等。 MR 检查前 10～20min 给予水合氯醛灌肠，按体重 1ml / kg 计算。采用飞利浦 1. 5 T 超导 MRI 仪、头部 16 通道相控阵线圈行头部 MRI 扫描横断位。扫描参数： 层厚 5mm. 层距 1 mm，层数 18，FoV 180 mm× 180 mm；矩阵 320×256；采用常规序列加(DWI)、 (DTI)、(SWI)及 FLAIR 序列。图像分析，由 2 位高年资影像诊断医师负责图像分析，统一计数标准，意见不一致时协商后得出结果。观察内容包括病变在常规序列和(DWI)、 (DTI)、(SWI)及 FLAIR 序列特点，记录病灶部位及数量，同时记录侧脑室旁≤ 3 mm 与>3 mm 病灶，确认病灶以多序列比对结果为准，不能确定的不计入。采用 SPSS 17. 0 统计软件，对各序列的病灶检出率行 X 平方检验，以 P<0.05 有统计学价值。结果：MR 特殊序列,显著高于常规方法(P<0.05)；MR 特殊序列基底节区核团损伤、脑室周围白质缺血损伤、胼胝体以及脑干、小脑、海马损伤比较差异无统计学意义(P>0.05)；MR 特殊序列早产儿脑室旁出血性损伤、皮层及分水岭区损伤率与常规方法相比差异有统计学意义(P<0.05);,T1WI 对基底节核团区病灶显示最佳,并且早期及稍晚期基底节核区病灶检出情况相近.DWI 序列对于室周白质区病灶显示最佳,

PU-0024
磁共振 DWI 联合 SWI 序列对于新生儿早期缺血缺氧性脑病的诊断价值

任翔
上海市儿童医院、上海交通大学附属儿童医院

目的 进一步分析弥散加权成像(DWI)、磁敏感加权成像(SWI)联合扫描用于新生儿缺氧缺血性脑病中的作用，以提高对本疾病的早期诊断。**方法** 回顾性分析上海市儿童医院于 2016 年 1 月至 2018 年 6 月间收治且行 MRI 扫描的 38 例新生儿缺血缺氧性脑病（HIE）的患儿资料，对比 T1WI、T2WI、T2-FLATR、DWI、SWI 序列下在出生 1～5d 和出生 6-8dHIE 病灶检出率；对比以上序列 新生儿中病灶检出率。 **结果** 38 例患儿共检出 126 枚病灶，主要分布在大脑皮质及，室管膜下。SWI 病灶检 出率为最高，DWI 为其次。DWI 对大脑皮质损伤的检出例数最多，SWI 对室管膜、硬膜外及硬膜下损伤检出例数较多。DWI 在出生 1～5d 的患儿中检出率大于出生 8～14d 的患儿。**结论** MRI 联合 SWI、DWI 能提高 HIE 诊断准确性，尤其适合用于出生 1 一 5d 的新生儿 HIE 筛查中，可做为临床怀疑 HIE 患儿的常规序列。

Maple Syrup Urine Disease: A Rare Metabolic Disease with Typical Imaging Findings

Yang Li
Qingdao Women and Children's Hospital

PURPOSE:
We aimed to evaluate the neuroimaging features and clinical features of maple syrup urine disease (MSUD), discuss the mechanism of MSUD and enhance the knowledge of pediatricians about this disease.
METHODS:
This retrospective study consisted of 3 neonates and 1 infant with the classic subtype of MSUD. All patients underwent brain magnetic resonance imaging (MRI). We analyzed the MRI manifestations, reviewed the literature and summarized the neuroimaging characteristics.
RESULTS:
Four cases plasma BCAA (leucine, isoleucine and valine) levels were markedly elevated. MRI of the brain showed bilateral symmetrical lesions involving the cerebellar white matter, brainstem, globus pallidus, internal capsule, and thalamus, which are the typical areas that are myelinated in normal full-term neonates. We searched literature and found a total of 23 cases with the classical form of MSUD and MRI, all patients showed involvement of a wide range of brain parenchyma which are the same as the 4 cases we reported. The alterations in brain tissue were more evident on DWI images than on T2-FLAIR images.
CONCLUSION
MSUD has typical neuroimaging features, which is based on the MSUD edma in typical areas that are myelinated in neonates. MRI, especially diffusion-weighted imaging (DWI), is the preferred and best choice for diagnosing MSUD.

PU-0026
局灶性脑皮质发育不良 MRI 诊断标准的系统性评价

刘川,叶鹏飞,宁刚
四川大学华西第二医院

目的 系统性评价局灶性脑皮层发育不良(Type II focal cortical dysplasia，FCD) 的临床与 MRI 诊断特征，以期为临床实践提供精确影像模式。
方法: 检索在 PubMed、CNKI、万方数据库收录的所有关于 MRI 诊断 FCD 相关的中英文文献，分析 FCD 临床资料及 MRI 征象发生率及其组合。
结果 最终共纳入文献 24 篇，共计 693 名 FCD 患者。有 471（67%）名患者显示 MR 成像阳性结果，其中至少可以发现三种影像征象组合，约 64%的患者合并了局灶性皮层增厚、灰白质分界模糊和 Transmantle 征。FLAIR 对显示灰白质界限、白质内异常信号较 T1WI 敏感,T1WI 显示脑回、脑沟形态有一定的价值。3.0T 较 1.5TMRI 更容易发现病变（68% VS 60%）。
结论 3 种最主要 MR 征象组合可帮助早期诊断 2 型 FCD，MRI 高场强和薄层图像更容易发现病变。

系统性幼年性黄色肉芽肿一例报告并文献复习

尹一伟
湖南省儿童医院

目的 探讨系统性幼年性黄色肉芽肿的影像特征及组织病理改变。方法 回顾性分析 2018 年 8 月收治一例经病理证实为系统性幼年性黄色肉芽肿患儿的影像学资料，主要评价指标包括病灶形态、密度 / 信号特点以及鉴别诊断。结果 系统型 JXG 于 CT 表现在软组织内为大小不等实性高密度结节样密度影，增强后轻度强化，在肝脏及肾实质内表现为相对低密度肿块，强化程度低于正常肝实质，边界清晰。MRI 在颅内表现为稍短 T1 短 T2 信号，增强扫描呈明显强化，DWI 无弥散受限，在肝内 T1WI 呈低信号，于 T2WI 呈稍高信号，DWI 为高信号，无明显强化，在软组织内 T2WI 表现为高信号，抑脂序列亦呈高信号，增强后可见强化，边界清晰。结论 系统性幼年性黄色肉芽肿好发于婴幼儿，在不同系统上具有不同的影像学表现。

PU-0028
儿童脉络丛癌一例

江虹
昆明市儿童医院

目的 探讨脉络丛癌的 CT、MRI 改变及其病理学基础。**方法** 对 1 例脉络丛癌患者的影像学、病理资料进行分析及文献学习。**结果** CT、MRI 检查示左侧侧脑室来源分叶状占位，侵犯周围脑实质，占位密度/信号不均，见囊变及钙化，血供丰富。**结论** 脉络丛癌是少见儿童颅内恶性肿瘤，在检查过程中使用不同的影像学检查方法，有利于判断肿瘤的来源、性质及预后。

复发型伴胼胝体压部可逆性病变的轻度脑炎/脑病 II 型一例

段崇锋
青岛大学附属医院

伴胼胝体压部可逆性病变的轻度脑炎/脑病临床-影像表现特异。根据病变累及范围分为 I 型和 II 型，临床以 I 型多见，II 型少见。我们报道一例罕见的复发型伴胼胝体压部可逆性病变的轻度脑炎/脑病 II 型，结合相关文献对其临床及影像学表现进行分析，加深对该病的认识，提高诊治水平

PU-0030
T1WI 信号强度在苍白球 T1WI 高信号鉴别诊断中的应用

朱付立
胜利油田中心医院

目的 探讨新生儿苍白球肉眼可见 T1WI 高信号在新生儿常见颅脑疾病鉴别诊断中的临床意义。

方法 回顾性分析 2017 年 1 月至 2019 年 1 月胜利油田中心医院新生儿科收入院的异常患儿 172 例，其中高胆红素血症患儿 72 例，作为高胆红素血症组，非高胆红素血症患儿 100 例，作为非高胆红素血症组，另外选取 70 例正常新生儿作为对照组。所有研究对象均肉眼可见苍白球 T1WI 高信号。所有研究对象均行 1.5T 西门子磁共振扫描，均选用 T1WI、T2WI、DWI、T2-FLAIR 序列，分别测量双侧苍白球 T1WI 信号强度，并取其平均值，对三组的 T1WI 信号强度行单因素方差分析。另外统计高胆红素血症患儿的总胆红素值，并与其苍白球 T1WI 信号强度进行直线相关性分析。

结果 高胆红素血症组与非高胆红素血症组、正常组的 T1WI 信号强度比较，P 值分别为 0.389、0.379，差异均无统计学意义，非高胆红素血症组与正常组比较，P 值为 0.926，差异亦无统计学意义；高胆红素血症患儿的总胆红素值，与其苍白球 T1WI 信号强度之间的相关系数为 0.056，P=0.740，无统计学意义。

结论 新生儿苍白球肉眼可见 T1WI 高信号在高胆红素血症患儿、非高胆红素血症患儿及正常新生儿均可见，且其 T1WI 信号强度均无统计学差异，提示新生儿苍白球肉眼可见 T1WI 高信号这一影像征象在新生儿常见颅脑疾病鉴别诊断中并无显著临床意义。高胆红素血症患儿的总胆红素值，与其苍白球 T1WI 信号强度之间并无显著相关性，提示苍白球肉眼可见 T1WI 高信号对诊断高胆红素血症仅有一定参考价值，还需以临床生化检查为主要依据。

PU-0031

Cognitive Function Evaluation of Children with Infantile Spasms

Xiaoyu Wang
Shenzhen Children's Hospital

Purpose: To explore the alteration of neurological function of children with IS and its main impact factors by combining the results of cognitive function with clinical data.

Method: 20 children with IS including 12 males and 8 females were enrolled in IS group, ranging in age from 2.83 to 43 months old ($x \pm S$, , 15.86±9.77 months), with a median of 11.70. 18 children including 8 males and 10 females were enrolled in HC group, ranging in age from 4.33 to 12.83 months old ($x \pm S$, 7.65±2.34 months), with a median of 7.64. BSID-Ⅱ was used to evaluate cognitive function and motor development in both groups. Statistical analysis was conducted by SPSS 22.0 .

1. Comparison between groups: Rank sum test was used to test the difference between MDI and PDI, and the descriptive parameters were median, maximum, minimum and level difference. When $P<0.05$, the difference between groups was considered statistically significant.

2. Correlation analysis: (1) Spearman correlation analysis was used to detect the correlationship between MDI, PDI and metric indicators. Fisher's exact probability test was used to detect the correlationship between MDI, PDI and count indicators. (2) The correlation coefficient r was used to describe the parameters, ranging from -1 to 1. The greater of absolute value represented the stronger correlation degree. When $P<0.05$, the correlation was considered to be statistically significant.

Result: 1. Comparison between groups: (1) MDI: Compared with HC group (median 90.5, in the interval of 85-114), IS group focused on <50 interval, the difference between groups was statistically significant ($P=0.00$, < 0.05). (2) PDI: Compared with HC group

(median 94.5, in the interval of 85-114), IS group focused on <50 interval, the difference between groups was statistically significant (P=0.00, < 0.05).
2. Correlation analysis: (1) The score of PDI was negative moderately correlated with the age (r=-0.56, P=0.02), and negative strongly correlated with course (r=-0.60, P=0.009), respectively. (2) The score of MDI was negative strongly correlated with the course (r=-0.60, P=0.02).
Conclusion: 1. Patient with infantile spasms had motor impairment, which was worse as the disease course prolonged. 2. Patient with infantile spasms had intelligence impairment, which was worse as the disease course prolonged.

PU-0032

A preliminary study of decreased interhemispheric functional connectivity in ADHD

Tiao Chen
Hubei Cancer hospital

Objective: To characterize interhemispheric functional connectivity in different subtypes with attention deficit hyperactivity disorder (ADHD) patients.
Methods: Thirty-eight patients in the ADHD-combined (ADHD-C), 26 patients in the ADHD-inattention (ADHD-I), and 52 subjects in the typically developing (TD) were recruited in this study. Resting-state fMRI data were analyzed using the voxel-mirrored homotopic connectivity (VMHC). Then the correlations between VMHC values and clinical scores were calculated.
Results: Compared with the TD group and ADHD-C, the ADHD-I group showed decreased functional connectivity (FC) in the temporal lobe and the occipital lobe.. the ADHD-C group exhibited lower VMHC values in the temporal lobe and the frontal lobe compared with TD group.. The mean VMHC values of whole brain in ADHD-I group was significantly negatively correlated with age.
Conclusion: Using VMHC to study the subtypes of ADHD, we found that the VMHC values in frontal lobe and temporal lobe decreased in ADHD-C group compared with TD group, while those in temporal lobe and occipital lobe decreased in ADHD-I group compared with TD group. Compared with ADHD-C, the ADHD-I group shown differences in frontal lobe, temporal lobe and occipital lobe. The finding that VMHC values and the age were significant correlated suggests that VMHC measurements can be used as an effective method to analyze ADHD.

戊二酸血症II型新生儿颅脑影像探究

杨鸣姝,徐素华
复旦大学附属儿科医院

戊二酸血症(glutaric academia，GA)Ⅱ型是一种罕见的以低酮或非酮性低血糖症和代谢性酸中毒为临床特征的常染色体隐性遗传的遗传性代谢缺陷病。本文分析我院经基因证实的两例戊二酸血症Ⅱ型新生儿的颅脑核磁共振影像特点，探讨影像学检查在该疾病早期诊断中的价值。

目的 探讨新生儿期戊二酸血症Ⅱ型颅脑影像学检查在早期诊断中的价值。

方法 回顾性分析 2 例基因证实的戊二酸血症Ⅱ型新生儿颅脑核磁共振检查影像学资料。

结果 1 例为戊二酸血症Ⅱ型新生儿期发病伴轻度先天畸形（房间隔缺损），1 例为戊二酸血症Ⅱ型新生儿期发病不伴先天畸形。两例患儿常规序列图像均发现双侧颞部脑外间隙增宽及双侧大脑白质广泛 T1WI 信号异常减低及 T2WI 信号异常增高；前者还发现双侧枕叶皮层信号异常，DWI 示小脑、脑干、基底节、半卵圆区对称性高信号；后者 DWI 未见明显异常，行 MRS 发现双侧半卵圆区 NAA 峰降低伴乳酸峰出现。

结论 核磁共振能对戊二酸血症Ⅱ型新生儿期发病患儿的脑损伤程度进行评价，在该病诊断及监测中具有重要价值。对于不伴有先天畸形疑似该病的患儿进行 MRS 检查有利于该病的早期诊断。

MRI Diffusion Changes in Neonatal Hypoxic-ischemic Encephalopathy

Yuan Yang
Renmin Hospital of Wuhan University

OBJECTIVE: Hypoxic-ischemic encephalopathy (HIE) in newborns is the most common central nervous system disease caused by perinatal acute hypoxic ischemia, and is prone to poor neurodevelopmental outcome. Neonatal brain development is accompanied by changes in water and myelin formation, while diffusion-weighted imaging (DWI) can sensitively reflect the diffusion characteristics of water molecules, with great significance in the discovery of abnormal changes. This study is aimed to investigate the value of DWI in the early diagnosis of neonatal HIE White matter injury.

MATERIALS AND METHODS: Newborns 2-6 days after birth in the Neonatal pediatrics were selected out, with 10 HIE as experimental group and 12 normal infants as control group. The newborns were imaged with GE HDxt 1.5T scanners without sedation and T_2WI, T_1WI, T_2 FLAIR and DWI were performed. DWI was obtained using TR/TE of 6000/90msec, flip angle of 90 and b valves of 0 and 1000 s/mm^2. Mean diffusivity maps were computed and average apparent diffusion coefficient (ADC) was measured in regions of abnormal changes. Statistical analysis was performed using SPSS and Data are expressed as mean±SD. Student t test were used to compare the differences between outcomes among groups and Two-sided p values of <0.05 were used to define statistical significance.

RESULTS: T_1WI shows low or high signal and T_2WI showed high signal intensity, while DWI showed an increase signal change. The abnormal signals mainly appeared in the thalamus and basal ganglia, posterior limbs of internal capsules and deep white matter of frontal lobe, etc. The average ADC was decreased ($p<0.05$) in HIE newborns compared with control group.

CONCLUSION: DWI combined with ADC value shows early diffusion abnormalities in HIE lesions, improving the prognosis of HIE white matter injury in neonates.

PU-0035
儿童颅内原发黑色素瘤两例临床、影像学特征分析

黎耀文,干芸根,曹卫国
深圳市儿童医院

目的 探讨儿童颅内黑色素瘤的临床、影像学表现特征，进一步提高对本病的认识。方法 搜集本院经组织病理学诊断的颅内原发黑色素瘤患者 2 例，结合文献进行回顾性分析其临床表现、影像学特征。结果 2 例患者临床上均以颅内压增高、脑膜刺激征、脑神经损害为主要表现，1 例骶尾部皮肤有先天性色痣。2 例均为单发肿瘤，均出现囊变坏死，病灶周围有小片水肿；T1WI 、T2WI 2 例均呈等信号为主，内见点状 T1WI 稍高信号、T2WI 稍低信号； DWI 2 例呈等低信号；经静脉注射 GdDTPA 后，2 例均明显强化。免疫表型：2 例 Melan-A 、 S100 均表达阳性。结论 临床上表现为颅内压增高，合并存在皮肤黑色素痣，影像检查肿瘤 T1WI、T2WI 等信号，混杂点片状 T1WI 稍高信号、T2WI 稍低信号有助于非色素型黑色素瘤的诊断发现。 【关键词】 颅内肿瘤；黑色素瘤；磁共振成像

PU-0036
儿童松果体区肿瘤的临床及影像学特点

谢婵来
复旦大学附属儿科医院

目的 通过总结儿童松果体区肿瘤的临床资料和影像学表现，提高术前诊断的准确性。
方法 回顾性分析 20 例经病理证实的儿童松果体区肿瘤。
结果 20 例儿童松果体区肿瘤中，男孩 15 例、女孩 5 例；其中生殖细胞源性肿瘤 12 例（包括生殖细胞瘤 5 例，畸胎瘤 4 例，混合性生殖细胞肿瘤 3 例），松果体母细胞瘤 5 例，中间分化松果体实质瘤 1 例，间变性星形细胞瘤 1 例，神经节细胞瘤 1 例。12 例生殖细胞肿瘤中，男孩 11 例（占 92%例），平均年龄 9.1±3.6 岁；其中 8 例患儿血 AFP 升高（>5 ng/ml）。生殖细胞源性肿瘤影像学表现多样，平均 ADC 值为 1138+407×10^{-6} mm^2/s。其中生殖细胞瘤在 CT 和 MRI 上密度和信号相对均匀，强化亦均匀，平均 ADC 值为 841±115×10^{-6} mm^2/s。而畸胎瘤和混合性生殖细胞肿瘤密度和信号不均（伴瘤内钙化和囊性成分），平均 ADC 值分别为 1376±361×10^{-6} mm^2/s 和 1316±459×10^{-6} mm^2/s。5 例松果体母细胞瘤中，男孩 3 例、女孩 2 例，平均年龄 5.3±5.2 岁；常规 CT 和 MRI 表现与生殖细胞源性肿瘤相似，松果体母细胞瘤的平均 ADC 值（646±81×10^{-6} mm^2/s）低于生殖细胞源性肿瘤（P＜0.01）。
结论 生殖细胞源性肿瘤是儿童松果体区最常见的肿瘤，大多数患儿是男孩，影像学表现多种多样，放射科医师将影像与肿瘤标志物结合起来观察是很重要的。主要鉴别诊断是松果体母细胞瘤，ADC 值有助于儿童松果体母细胞瘤与生殖细胞源性肿瘤的鉴别。

儿童睡眠中癫痫性电持续状态患儿的认知功能评测研究

莫潼,黄钰纯,唐雨曼,干芸根,曾洪武
深圳市儿童医院

目的 采用韦氏儿童智力量表第四版，评估儿童睡眠中癫痫性电持续状态（Electrical status Epilepticus During sleep, ESES）的认知功能情况，探讨患儿的智力结构状况及影响因素。**方法** ESES 组患儿 25 例，8.57±1.99 岁；正常对照组 16 例，9.50±1.80 岁。采用韦氏儿童智力量表第四版进行认知功能评估。1、组间对比：（1）采用秩和检验对总量表及四大分量表智商进行组间对比；（2）采用独立样本 t 检验对项目得分进行组间对比，描述参数为平均值和标准差；当 P＜0.05 时，认为组间差异有统计学意义。2、相关性分析：（1）总量表、四大分量表智商与病程、发病年龄、检查年龄之间采用 Spearman 相关分析，描述参数均采用相关系数 r，取值范围-1 至 1，当 P＜0.05 时，认为相关性有统计学意义。**结果** 1、组间对比：（1）与正常对照组相比，ESES 组患儿总量表智商降低（P=0.01,＜0.05）；（2）言语理解量表智商及类同项目得分降低（P 值分别为 0.04 和 0.003， 均＜0.05）；（3）知觉推理量表智商及积木、图画概念、矩阵推理三个项目得分均降低（P 值分别为 0.01、0.01、0.03 和 0.03，均＜0.05）。2、相关性分析：（1）ESES 组中，言语理解量表中的词汇项目得分与检查年龄呈正相关（r=0.55, P=0.02）；（2）理解项目得分与病程（r=-0.52, P=0.04）、发病年龄（r=-0.62, P=0.008）、检查年龄（r=-0.73, P=0.001）均呈负相关。 **结论** 1、ESES 患儿存在认知功能损害，尤其在语言能力、理解能力、空间辨别与分析能力、非语言概念形成能力等方面发育落后。2、随着年龄的增长，患儿的词汇积累能力有所提高；病程越长、发病年龄和检查年龄越大，患儿的理解能力损害越明显。

PU-0038

儿童 MERRF 一例报道

谢婵来
复旦大学附属儿科医院

目的 分析本例 MERRF（肌阵挛癫痫伴破碎样红纤维综合征）的头颅 MRI 表现，加深对此类儿童罕见疾病的认识，探讨其诊断思路。
方法 西门子 1.5T MRI 行头颅 MRI 平扫+增强、MRS。
结果 患儿，女 2 岁，6 月龄时体检示身高、体重较同龄儿落后。现因“咳喘 4 月，加重 1 周”收治入院。入院时行走不稳，口齿不清、伴流涎，眼球运动障碍。查体：精神萎，面色苍白，两肺可及细湿罗音，心率 175 次/分，余无殊。辅助检查：乳酸波动在 1.1-8.7mmol/L（正常参考值 0.5-2.0mmol/L）。胸片示两肺渗出。心超示室间隔及左室后壁增厚，心功能尚正常，二尖瓣少量返流。脑电图：背景弥漫性慢波。入院 MRI 平扫示脑干背侧见对称性 T1WI 低、T2WI 高、T2 TIRM 低、DWI 高信号。MRS 示双侧中脑背侧、基底节区 NAA 峰减低伴少许倒置乳酸峰。入院诊断：重症肺炎，脑干脑炎？代谢性脑病？入院后对症治疗，患儿未见好转，病程中伴昏迷。1 月后复查 MRI 平扫示脑干背侧病灶内对称小囊变，双侧基底节区新发对称性 T1WI 低、T2WI 高、T2 TIRM 低、DWI 高信号，脑萎缩。2 月后复查 MRI 平扫+增强示脑干、双侧基底节区病变范围较前增大，脑萎缩加重，病灶内未见异常强化。线粒体 DNA（mtDNA）基因突变分析：mtDNA8344A→G 热点突变，突变比例 94%，疾病表型 MERRF。患儿入院 6 月后死亡，死亡诊断线粒体脑病、呼吸衰竭。
结论 MERRF 综合征是线粒体脑肌病中较为罕见的一种类型，多见于儿童。典型临床表现为：肌阵挛、癫痫、共济失调，部分患者还有身材矮小、智力低下、眼外肌麻痹等。MRI 表现为弥漫性脑萎缩，脑干、基底节区对称性异常信号，MRS 表现为 NAA 峰减低，并可检测到乳酸峰。怀疑本病时可检查血和脑脊液乳酸检查，必要时行肌肉活检，如发现破碎样红纤维，可行基因检查进一步明确属线粒体脑肌病的何种类型，预防漏诊或误诊。

3.0TMRI 及 256 排多层螺旋 CT 在诊断小儿病毒性脑炎的应用价值

徐守成[1],姜丹[2]
1.哈尔滨市儿童医院
2.哈尔滨医科大学附属肿瘤医院

目的 3.0TMRI 及 256 排多层螺旋 CT 在诊断小儿病毒性脑炎的应用价值分析的探讨。
方法 选取我院 2014.10-2018.03 收治的患有病毒性脑炎的 110 例患儿进行临床诊断，将其按照数字抽签法分为两组，对照组给予 256 排多层螺旋 CT 扫描诊断，观察组给予 3.0TMRI 诊断，对比其临床诊断价值。
结果 两种诊断方式对患者病情的诊断结果存在明显差异（P<0.05），有统计学意义。
结论 病毒性脑炎患儿采用 MRI 诊断的临床敏感性和特异性显著高于 CT 扫描诊断结果，准确判断患者的病情，可在临床诊断中使用。

PU-0040

儿童病毒性脑炎的 MRI 误诊经验分享

靳瑞娟,孙多成, 黄锦钊,汪建华,陈传明
广东省中山市博爱医院

目的 总结儿童病毒性脑炎的 MRI 误诊经验，提高影像鉴别诊断水平。**方法** 回顾性分析我院 2010-2019 年经临床确诊的 36 例儿童病毒性脑炎的 MR 资料，其中男 17 例，女 21 例，所有病例均行头颅 MRI 扫描，包括常规 T_1WI，T_2WI 、DWI、增强扫描，8 例行波谱检查，13 例有 MRA 检查的结果，所有病例均有治疗后随访复查的结果。**结果** 头颅 MRI 最容易发生误诊的征象是深部黑质核团对称性受累的病变，有双侧苍白球、壳核对称性受累伴发白质病变，也有双侧丘脑对称性受累，还有脑干双侧黑质红核区域对称性异常信号，还有双侧侧脑室后角白质对称性片状异常信号。因为对称性病变，较容易被误诊为遗传代谢性脑病。儿童线粒体脑肌病 MELAS 病变多不具有对称性，各序列均容易与病毒性脑炎混淆，只有临床提示高乳酸血症、患儿发育迟滞或瘦小等症状，才会想到线粒体脑肌病 MELAS。关于脑脊髓炎，主要受累范围在脑干及脊髓上段，临床表现危重，当合并脑内病变要注意 EB 病毒脑炎，并注意近期的疫苗预防接种情况。自身免疫性脑炎无影像特征性，脑脊液抗 NMDAR 抗体检测多滞后于临床诊断，单纯疱疹病毒脑炎后也可以出现抗 NMDAR 脑炎。如果反复发生脑炎症状和体征，应想到此疾病可能。还有一种病毒性脑炎为胼胝体压部孤立性病变，有时伴发双侧脑室后角脱髓鞘病变，一般在 2 个月内消失，预后良好，应注意与低钠血症脑病鉴别。手足口病导致的脑炎具有特征性，一般不造成误诊。**结论** 儿童病毒性脑炎致病病毒种类繁多，发病部位对病原学有部分指导价值，较难有不同病毒致病的 MRI 影像特征，要注意与遗传代谢性疾病慎重鉴别，采用 MRS、ASL、MRA、增强等功能成像是重要的鉴别手段，避免造成患儿诊疗经济负担和延误病情。

PU-0041

磁共振氢质子波谱在儿童颅脑中的临床应用进展

朱凯
哈尔滨市儿童医院

摘要：目前,国内外的医学专家对脑发育的研究越来越深入,各类医学文献也有较多介绍，从近年来越来越多的儿科临床病例看,儿童脑部疾病呈快速增长趋势,因此,深入研究磁共振氢质子波谱在儿童颅脑中的应用探索刻不容缓。对临床医生能更多的了解磁共振波谱在儿童颅脑的应用范围，对脑部疾病的预防、诊断及治疗,具有极其重要的现实意义。氢质子波谱作为目前唯一无创性进行活体组织内化学物质的检测方法,已逐渐成为一项应用于人体的诊断技术,尤其是在中枢神经系统疾病等方面更是倍受关注。

方法 笔者大量阅读中外文文献，摘取与儿童颅脑有关的氢质子波谱文献进行仔细阅读。

结果 笔者阅读了近期外文文献 30 篇，中文文献 9 篇，总结了近几年氢质子波谱在儿童颅脑中的应用范围，从而进一步帮助临床医生按需选择氢质子波谱检查儿童颅脑。

结论 ^{1}H-MRS 的化学特异性使它在中枢神经系统中的研究起十分重要的作用,不仅因为它是无创的,能从活体组织中获得神经化学信息,而且能在同一个体中重复检测,随着可测定化合物的增多,操作技术的成熟, ^{1}H-MRS 将越来越成为神经生物学领域研究细胞和分子的有力手段。当然, ^{1}H-MRS 正处于发展阶段,它的广泛应用仍然依赖于方法、技术及仪器的进一步改进和发展,随着 ^{1}H-MRS 及相关技术的不断发展和软、硬件的开发,^{1}H-MRS 必将为研究正常儿童及脑部疾患的诊断和鉴别诊断方面提供更加可靠的影像学依据。

PU-0042

DKI 评估儿童脑发育

石晶晶,王剑,朱文珍
华中科技大学同济医学院附属同济医院

目的 DKI 评估新生儿期至 14 岁青少年脑发育规律。

材料和方法 收集正常儿童 218 名(136 名男性，2 天至 14 岁)。这些受试者没有中枢神经系统疾病，均无头部 MRI 表现异常。按年龄分为 8 组:1 组 2 天~ 28 天为足月新生儿组(N=24);2 组 1 个月~ 1y 组(N=40);组 3 为 1y ~ 2y 组(N=35);4 组为 2y ~ 3y 组(N=20);组 5 为 3y ~ 4y 组(N=17);6 组为 4y ~ 5y 组(N=11);7 组 5y ~ 6y 组(N=13);8 组为 6y ~ 14y 组(N=58)。数据的后处理是在 ADW 4.6 离线工作站进行。在 FA 图像上定义感兴趣的区域，然后投射到平均扩散率(MD)、轴向扩散率(Da)、径向扩散率(Dr)、平均峰度(MK)、轴向峰度(Ka)和径向峰度(Kr)图像上。感兴趣区域包括:灰质区域[尾状核头部(CN);苍白球(GP);核(PUT);丘脑(TH)];中央白质区[内囊后肢(PLIC);内囊前肢(ALIC);胼胝体压部(SCC);胼胝体膝(GCC)];外周白质区[(额白质(FWM)、顶叶白质(PWM)、半圆中心水平中央白质(CWM)]。利用非线性对数拟合得到 dki 衍生参数与年龄的关系，公式为 Y = b0 + b1 * lnX。我们假设新生儿组 DKI 参数值为基线值，各年龄组间参数变化率采用 Prate = (Pgroup - Pbaseline) / Pbaseline 计算。

结果 DKI 可以同时获得扩散参数和峰度参数。在灰白质区域峰度参数及 FA 值与 PMA 呈正相关，弥散参数呈负相关。这些参数与年龄呈非线性相关，在 2 岁以内变化迅速，2 岁以后呈下降趋势。峰度参数在白质和灰质中均表现出较高的变化率，这可能更敏感地反映了发育现象。

结论 DKI 参数能较好反应儿童脑发育，可作为脑发育成像的可靠影像标记。

PU-0043

Gray Matter Differences between Pubertal Girls With and Without the Reactivation of the Hypothalamic -Pituitary -Gonadal Axis

Yuchuan Fu
The Second Affiliated Hospital of Wenzhou Medical University

The onset of puberty and related hormones exerts significant effects on brain morphometric and psychosocial development. However, the biological mechanisms underlying how puberty-related hormonal maturation sculpts human brain architecture remain elusive, especially during the early phase of hormonal maturation. To address this question, 105 young girls (age 8-11 years) without menstruation underwent brain structural scanning on a 3T MR system, and the gonadotropin-releasing hormone (GnRH) stimulation test was used to identify the reactivation of the hypothalamic -pituitary -gonadal axis (HPG). Among the 105 girls, 63 were positive for HPG axis reactivation (HPG+), while the others showed a negative reaction for HPG axis reactivation (HPG-). Cortical parameters were calculated and compared between the two groups after adjusting for age. The brain regions showing intergroup differences were then extracted and correlated with serum hormone levels. Compared to HPG- girls, HPG+ girls showed reduced cortical thickness mainly in the default mode network, including the right precuneus, right inferior temporal gyrus, right superior frontal gyrus and the left rostral middle frontal gyrus, while increased cortical thickness primarily in the executive control network, including the left superior parietal lobe and right inferior parietal lobe, and the right temporal pole, right rostral middle frontal gyrus, left lateral occipital gyrus, and left superior temporal gyrus. Subsequent linear regression analysis revealed negative correlations between the cortical thickness of several regions showing differences between the two groups and the levels of serum hormones, including plasma follicular stimulating hormones, secreting luteinizing hormone and estradiol only in HPG+ girls. These findings provide evidence to support the notion that the changes of hormones during the early phase of hormonal maturation (before menstruation) exert influences on the gray matter of widespread regions, mainly involving the default mode network and executive control network, which are vulnerable in psychiatric disorders.

PU-0044

Diffusion Kurtosis Imaging and Pathological Comparison of Early Hypoxic-Ischemic Brain Damage in Neonatal Piglets

juan xiao,Xiaoning He,Chao Yang
The Second Affiliated Hospital of Dalian Medical University

Objective

To investigate the application value of magnetic resonance diffusion kurtosis imaging (DKI) in the microstructural evaluation of hypoxic-ischemic brain damage (HIBD) in neonatal piglets and to compare it to pathological results.

Materials and Methods

Of 25 healthy York piglets aged 3–5 days studied, 20 were in the experimental group, and 5 were in the control group. The HIBD model was created in the experimental group; the control group (n = 5) underwent only a sham operation. Mean kurtosis (MK) and mean diffusion (MD) images were obtained by DKI scanning 3, 6, 9, 12, 16, and 24 h after the model was created, and the lesion areas and MK and MD parameters were measured. Under anesthesia, craniotomy was used to remove brain tissue, the center and edge of the lesion and the normal brain tissue were evaluated with light microscopy and electron microscopy.

Results

The MD value of the lesion area gradually decreased, and the MK value gradually increased, in the experimental group in comparison with those of the normal control group; the differences were statistically significant ($p < 0.05$). MK and MD images showed that the lesion area gradually expanded with time ($p < 0.05$), and the MK map was significantly smaller than the MD map ($p < 0.002$). Light microscopy revealed neuronal swelling, inflammatory cell infiltration, local necrosis, and other changes in the MK/MD matching area and mismatched area. Electron microscopy demonstrated different degrees of swelling of mitochondria, collapse and rupture of some mitochondrial membranes, blurred mitochondrial ridges, broken, and autophagosomes appear in the cells in the MK/MD matching area.

Conclusion

In the MK and MD map matching area, damage was greater and tended more to be irreversible than in the mismatch area. DKI can reflect the change of HIBD from the level of organelle, which is affected early in the course of HIBD.

PU-0045

Application of post labeling delay time in 3D-pseudo continuous arterial spin labeled perfusion imaging in normal children

Shilong Tang
Children's Hospital of Chongqing Medical University

Objective To explore the application value of post labeling delay (PLD) in 3D-pseudo continuous arterial spin-labeled (3D-pcASL) perfusion imaging in normal children and to find the optimal PLD values for children at each age group. **Methods** Five groups of children, with fifty patients in each group, who underwent routine MRIs with normal results were included. The patients were stratified according to the following ages: <1 month, >1 month to 6 months, >6 months to 12 months, >1 year to 3 years, >3 years to 6 years and >6 years to 18 years. All patients received 3D-pcASL perfusion MR scanning. The PLD values were set to 1025 ms, 1525 ms or 2025 ms. In subjective evaluations, the signal-to-noise ratio (SNR) and cerebral blood flow (CBF) of 3D-pcASL perfusion images under different PLD values were compared and analyzed. **Results**

For patients in the <1 month group and >1 month to 6 months group, the images were mainly grade A when the PLD value was 1025 ms, which equaled 43 cases and 46 cases, respectively. The brain CBF values and SNR values were higher than those of the images with PLD values of 1525 ms and 2025 ms. For patients in the >6 months to 12 months group, >1 year to 3 years group, >3 years to 6 years group, and >6 years to 18 years group, the images were mainly grade A when the PLD value was 1525 ms, which equaled 43, 45, 43 and 46 cases, respectively. The brain CBF values and SNR values were higher than those of the images with PLD values of 1025 ms and 2025 ms. **Conclusion** The optimal PLD values for 3D-pcASL perfusion imaging are different in children of different ages. The optimal PLD value for infants who are aged ≤6 months is 1025 ms. The optimal PLD value for children >6 months to 18 years old is 1525 ms.

Isolated intracranial myeloid sarcoma at the age of 6 months with metastatic spread: case report and review of literature

Jianbin Zhu, Sujan Thapa, Zhibo Wen
Southern Medical University Zhujiang Hospital

Isolated myeloid sarcoma (MS) is an extramedullary tumor of myeloid cells and it is quite rare in the central nervous system. Only very few cases have been reported in infant to date. We report a case of a 6-month-old infant with a primary isolated MS originated in the brain, which fails to progress with blood or bone marrow involvement but disseminates to form multiple intracranial metastases within half a month after surgery. Computed tomography (CT) of the head revealed a space-occupying lesion beside the left frontotemporal area, which involved the cerebral cortex, or gray matter mostly. Magnetic resonance imaging (MRI) examination revealed a giant irregular mass with cystic and solid appearance in the left frontotemporal region, with obscure boundary and absence of peritumoral edema, the solid portion of mass showed mildly hypointense on T1WI and isointense/mildly hyperintense on T2WI, with obvious inhomogeneous enhancement and the lesions was 8.4×3.5×7.5 cm. The diffusely thickened meninges occurred in the right temporal region and the left cerebral hemisphere with the left cerebral gyrus was enlarged at the same time. After 15 days of operation, MRI scans showed meningeal multiple enhanced nodules in the right temporal lobe, bilateral cerebral hemisphere, cerebellar hemisphere and vermis and interpeduncular cistern. We present this case to highlight the risk of metastatic spread in a short time of these tumors rather than development of leukemia which is poorly documented in the medical literature and may be significant in clinical treatment of the patient. We describe and conclude the imaging features of this rare tumor here.

小儿肝脏间叶性错构瘤的 CT 及 MRI 表现

于啸
徐州市儿童医院

目的 探讨小儿肝脏间叶性错构瘤（Mesenchymal hamartoma of liver，MHL）的 CT 及 MRI 表现特点，以期提高该病的术前诊断正确率。
方法 回顾性分析经手术、病理证实的肝脏间叶性错构瘤的 CT 及 MRI 表现，9 例患儿中，男 6 例，女 3 例，年龄 8d～3 岁，主要病史：生后体检 B 超发现腹部包块 7 例，腹痛 2 例，9 例患儿分别行 CT 或 MRI 平扫及增强扫描。
结果 9 例病例中，病灶位于肝右叶 5 例，肝左叶 2 例，累及两个肝叶 1 例，肝尾状叶 1 例、瘤体长径约 7.8～19.2cm，平均约 13.5cm，CT 表现取决于肿瘤囊实性成分比例和分布，表现为囊性型肿瘤 5 例，囊实混合型肿瘤 3 例，实性型肿瘤 1 例。增强后肿瘤实性部分及分隔强化，囊性部分无明显强化。MRI 检查，实性为主的肿块，T1WI 为稍低信号，T2WI 为不均匀高信号，囊性为主的肿块，表现为多房分隔的囊性肿块，T1WI 为低及稍低信号，T2WI 为高信号。增强后，实性部分及肿瘤内分隔强化，囊性部分无强化。

结论 肝脏间叶性错构瘤（MHL）的 CT 及 MRI 表现，有一定特征性，结合其临床病史，并注意与肝脏其他囊实性肿瘤相鉴别，有助于提高该病术前诊断符合率。

Abnormal cortical neurodevelopment in children with moyamoya disease after indirect surgery

Yuting Liu,Meijiao Zhu,Wang Ying,Ming Yang
Children’s hospital of Nanjing Medical University

Purpose: Children with postoperative moyamoya disease (pMMD) often accompanied with neurodevelopment impairments. Our study aimed to characterize the cortical neurodevelopment in pMMD using imaging analysis, and to explore the neurodevelopmental mechanism of this disease.

Methods: 13 pMMD children and 14 healthy controls were recruited in our hospital. We investigated cortical surface indicators including cortical fractal dimension and thickness in all subjects using high-resolution T1-weighted image and surface-based data analysis techniques. Cortical fractal dimension (FD) and cortical thickness were calculated by using the Computational Anatomy Toolbox (CAT12). Analyses were performed for the entire cortical surface followed by a complementary regions-of-interest approach.

Results: pMMD children showed significantly decreased cortical FD in right superior temporal cortex and superior parietal cortex, and increased cortical thickness in right medial orbitofrontal cortex compared with controls (FDR $p<0.05$). In addition, there was a positive correlation between cortical FD in right superior parietal cortex and performance intelligence quotient scores ($p=0.047$, $r=0.559$).

Conclusions: This study showed cortical surface abnormalities in pMMD and correlated with intelligence quotient scores, which suggested that abnormal cortical development may serve as a vulnerability marker of MMD and provide new insight into the neuropathological of pMMD.

垂体柄阻断综合征病因、临床表现及诊疗进展

朱斌
徐州市儿童医院

垂体柄阻断综合征(PSIS)的病因和发病机制目前尚不明确，围生期损伤和先天性下丘脑垂体发育不良可能是导致 PSIS 的病因，近来研究表明，有遗传因素参与 PSIS 的发生、发展。PSIS 的临床表现复杂多样，随不同年龄及不同垂体激素缺乏而表现各异，MRI 是唯一能明确此病诊断的影像学方法，及时检查有利于早期诊断和治疗，PSlS 患者确诊后的治疗是一个复杂且漫长的过程。现就 PSIS 的病因、临床表现及诊疗进展进行综述。

PU-0052

Sturge-Weber 综合征的影像诊断

刘玉奇,盛茂,高云剑
苏州大学附属儿童医院

目的 探讨 CT、MRI 对 Sturge-Weber 综合征的诊断价值。**方法** 回顾性分析在我院诊治的 15 例 Sturge-Weber 综合征患儿的 CT 及 MR 资料，其中 10 例行 CT 平扫、MR 平扫及增强检查，2 例行 CT 及 MR 平扫检查，2 例行 MR 平扫及增强检查，1 例行 CT 平扫检查。**结果** ①13 例患儿行 CT 平扫检查，11 例显示大脑皮层不同程度的钙化，2 例受累脑实质密度增高，4 例伴有局部灰白质分界不清。11 例伴有不同程度的脑萎缩。7 例伴有同侧脉络丛扩大，5 例伴有同侧颅骨板障增厚。②14 例患儿行 MR 平扫检查，12 例同时行 MR 增强检查。MR 平扫 5 例示受累脑表面、脑沟回、深部白质及同侧侧脑室旁迂曲流空血管信号，3 例显示皮层钙化灶，12 例伴有不同程度的脑萎缩改变。MR 增强检查 12 例见不同程度的脑回表面、相邻脑沟及脑实质的脑回样明显强化，8 例伴同侧脉络丛扩大、明显强化。5 例伴同侧板障增厚。③MR 显示病变部位同 CT 表现，其中 2 例 MR 检查病变累及范围较 CT 更广泛。**结论** MR 检查可作为诊断 Sturge-Weber 综合征得首选检查方法。

完全性生长激素缺乏患儿中央沟形态变化的 3.0T MRI 研究

张忠和[1,2,3],林祥涛[1,2,3],侯中煜[1,2,3],于乔文[1,2,3],王锡明[1,2],刘树伟[3,4]
1.山东省立医院
2.山东第一医科大学附属省立医院医学影像科
3.山东大学齐鲁医学院断层影像解剖学研究中心
4.山东大学数字人研究院

目的 应用 3.0T 磁共振图像（MRI）及后处理技术分析完全性生长激素缺乏（CGHD）患儿与特发性矮小（ISS）患儿大脑皮质中央沟（CS）的形态变化。
材料与方法 30 例 CGHD 患儿（平均年龄 8.650 岁，GH 刺激实验峰值浓度小于 5 μg/l）与 30 例 ISS 患儿（平均年龄 7.767 岁，GH 刺激实验峰值浓度大于 10.0 μg/l）被纳入本研究中。在首次就诊时采集患者高分辨率、高信噪比三维（3D）T1WI MRI。利用 BrainVISA 软件图像后处理方法获得两组患儿双侧大脑半球 CS 形态学测量值，包括平均宽度（AW）、最大深度（MD）、平均深度（AD）、顶长（TL）、底长（BL）和不同位点的脑沟深度（DPP），并统计分析其组间差异。
结果 CGHD 患儿与 ISS 患儿相比，双侧 CS 的 AW（右侧 P=0.018、左侧 P=0.040）显著增大。左侧 MD（左侧 P=0.008）、右侧 AD（右侧 P=0.030）显著减低。右侧 MD，左侧 AD，双侧 TL、BL 在两组患儿半球间未发现显著性差异。两组患儿双侧大脑半球 CS 的 DPP 均呈现为山峰样外观并部分起伏交错。在左侧 CS 中部（手部躯体运动功能区）及右侧 CS 近外侧沟部（口腔运动功能区），CGHD 患儿具有显著较小的 DPP。
结论 CGHD 患儿较 ISS 患儿存在显著的 CS 形态变化，这可能是其运动、认知与语言功能发育相对落后的结构基础。

Brain Gray Matter Abnormalities in Treatment-Naive Children with Obsessive-Compulsive Disorder

Bochao Cheng[1,2], Xijian Chen[1], Qiyong Gong[2], Gang Ning[1]
1.West China Second University Hospital of Sichuan University
2.Huaxi MR Research Center, West China Hospital of Sichuan University

Purpose: Although several magnetic resonance imaging (MRI) studies have been conducted in children with obsessive-compulsive disorder (OCD), the brain structural abnormalities in OCD, especially in children, are not yet well characterized. We aimed to identify gray matter (GM) abnormalities in the early stage of pediatric OCD and examine the relationship between these structural abnormalities with clinical characteristics.
Materials and Methods: Examinations of 30 first-episode, treatment-naive pediatric OCD patients without any comorbidities and 30 matched healthy controls (HCs) were performed with 3.0 T magnetic resonance imaging (MRI). Voxel-based morphometry (VBM) following Diffeomorphic Anatomical Registration using Exponentiated Lie algebra (DARTEL) was used to conduct voxel-wise tests for group differences in regional gray matter volume (GMV).
Results: Compared to HCs, the patient group exhibited more GMV in the bilateral putamen and left orbitofrontal cortex (OFC) and less GMV in the left inferior parietal lobule (IPL). The GMV alternation in the right putamen of OCD patients was positively correlated with Hamilton Anxiety Rating Scale (HAM-A) scores, while the GMV alternation in the left IPL exhibited a trend to negatively correlate with HAM-A scores.
Conclusion: Our current results suggest that the GM abnormalities were defined in the early stage of pediatric OCD. Moreover, these findings provided further evidence of brain GM abnormalities that are not only present in the classical fronto‐striatal‐thalamic circuit but also in the default mode network (DMN), which may represent the interaction of abnormally functional organization of both network in pediatric OCD.

PU-0055

TORCH 感染的脑部 CT 表现

陈超,张增俊,胡文,王冬,侯欣
西安市儿童医院

目的 探讨先天性 TORCH((toxplasma；rubellavirus ；cytomegalovirus； herpes Viras；简称 TORCH)感染的脑部 CT 表现。**材料与方法** 对 35 例血清学检查证实的先天性 TORCH 感染的脑部 CT 表现进行回顾行分析。**结果** 脑内钙化伴侧脑室周围密度减低 32 例，占 91.4%。钙化呈条状、斑点状、主要分布在脑室周围及室管膜下，其次是底节区和大脑半球脑白质内。脑发育不良和脑萎缩 29 例，占 88.6%，CT 表现为脑室扩大、脑沟增宽及额顶部蛛网膜下腔增宽，常与钙化并存。脑软化及脑穿通畸形囊中 5 例。脑裂畸形或厚脑回畸形 8 例,常伴有脑室周围密度减低及钙化。严重脑萎缩、广泛性脑实质钙化 2 例。**结论** TORCH 感染对儿童神经系统的损害严重,典型的 CT 表现结合临床可提示 TORCH 感染，血清学检查具有诊断意义。

PU-0056

结节性硬化的 CT 及 MRI 表现

陈超,侯欣,张增俊,胡文,白慧萍,王小飞
西安市儿童医院

目的:研究结节性硬化的 CT 及 MRI 特点及诊断价值。方法:回顾性研究 51 例结节性硬化的 CT 及 MRI 表现。**结果** 临床表现为面部皮脂腺瘤、癫痫和智力障碍三联征 23 例；室管膜下结节 39 例，双侧室管膜下多发结节状钙化 31 例，未钙化的结节 8 例，并向脑室内突入，主要分布在侧脑室前角及体部，其次是侧脑室颞角下角及四脑室；皮质及白质内结节 12 例，表现为脑皮质及白质内结节状低密度灶及长 T1、T2 信号，局部脑皮层不同程度受压变薄。增强扫描可使病变显示更清晰，常与室管膜下结节并存。结论:室管膜下钙化或未钙化结节是结节性硬化的典型征象，结合临床可以达到定性诊断。

PU-0057

婴幼儿颅脑 MRI 扫描技术及临床应用回顾性分析

罗青毅,肖廷智,雷寿军
遵义市红花岗区人民医院

摘 要： 目的 回顾性分析婴幼儿颅脑 MRI 检查技术和临床应用价值。**方法** 收集我院 48 例婴幼儿颅脑 MRI 患者回顾性分析，序列 T1WI、T2WI、FLAIR，轴位，T2WI 矢状位，DWI，SWI，分析图像显示灰白质等结构和病变检出率。**结果** 48 例，足月婴儿 23 例；早产儿 25 例，正常者 20 例，新生儿缺血缺氧性脑损伤 15 例，高胆红素脑损伤 5 例，产伤 5 例，脑发育畸形 3 例；脑变性灶表现 T1WI 低信号、T2WI 高信号；脑出血灶表现 T1WI 高信号、T2WI 低信号，脑软化灶表现 T1WI 低信号，T2WI 高信号，边缘清。**结论** 颅脑 MRI 检查技术能显示婴幼儿脑组织解剖结构、髓鞘形成情况和病变，临床应用价值高。

PU-0058

兄弟同患 Cockayne 综合征两例并文献复习

何雯,刘鸿圣,刘振清
广州市妇女儿童医疗中心

目的 提高临床及影像医生对 Cockayne 综合征的认识。
方法 通过对一对同胞兄弟共患经典型 Cockayne 综合征的影像学特征进行回顾性分析并进行文献复习。
结果 患儿为同胞两兄弟，分别为 4 岁和 7 岁，都因为生长和智力发育落后数年就诊。发现皮肤光敏感，小头，听力及视神经损害。
影像学检查： 兄弟俩的 CT 显示双侧大脑、小脑、脑干萎缩并双侧基底节钙化，大枕大池；MRI 显示双侧大脑、小脑、脑干萎缩，脑部成熟髓鞘形成水平明显落后，后颅窝脑脊液腔扩大，脑室周围及半卵圆中心异常信号影，T1WI 呈等信号，T2WI 及 T2WI-Flair 呈稍高信号。双侧基底节钙化；MRS 成像显示半卵圆中心的 NAA 峰下降，提示脑白质、脑灰质区有不同程度的神经元损伤或功能受损，Cho 峰下降，提示髓鞘形成不良和/或脑白质疏松。

基因检测：ERCC6 扩增产物直接测序表明存在 2 个基因位点的突变。一个是第 1357 位胞嘧啶所表达的精氨酸被终止密码子所代替，来自于患儿的母亲；另一个是第 1607 位胸腺嘧啶所表达的亮氨酸被色氨酸所代替，来自于患儿的父亲。患儿的父母均为正常临床表型携带者。
讨论：Cockayne 综合征是一种罕见的常染色体遗传性疾病，累及多个系统，主要表现为生长发育迟缓、小头畸形合并皮肤光敏感。易误诊为脑瘫、先天性小头畸形、过早衰老呈特殊鸟样外貌等，与 XPB、XPD、XPG、CSA (ERCC8)和 CSB (ERCC6)的主要致病基因有关，因此一般采用基因检测确诊。影像特征可表现为双侧基底节区钙化和颅内多发散在钙化，常伴脑萎缩和双侧弥漫性脑白质损伤，偶可见骨盆异常、骺板硬化或脊柱侧弯。本例符合典型的临床及影像学表现。
综上所述：Cockayne 综合征的临床和影像学表现典型，一般与其他早老综合征相鉴别，无特殊有效疗法，大多数预后不良。

PU-0059
小儿以中枢性尿崩症为首发症状的朗格汉斯细胞组织细胞增生症的影像学表现与临床特点分析

徐超
徐州市儿童医院

目的 分析小儿以中枢性尿崩症(CDI)为首发症状的朗格汉斯细胞组织细胞增生症(LCH)的影像学表现及临床特点，提高对该疾病的诊断水平。**方法** 回顾性分析 13 例经手术和病理证实以 CDI 为首发症状的 LCH 患者的 CT 和 MRI 影像学表现及临床资料。**结果** 13 例患者中男 9 例，女 4 例，男女比例是 2.25:1，年龄 4～12 岁，平均 7.3 岁，病程 6 月～9 年。13 例患者均有不同程度的多饮多尿症状，均行禁水-加压素试验，符合 CDI 诊断标准。所有患者的危险器官（肝脏、脾脏、肺脏及造血系统）未见受累。所有患者均行 MRI 平扫和增强检查，13 例患者垂体柄增粗、垂体后叶高信号消失，1 例患者下丘脑见小结节影，增强扫描呈明显均匀强化。5 例患者生长迟缓，生长激素激发试验峰值均<5μg/L。9 例患者行 CT 检查，其中颅骨单发破坏 3 例，多发破坏 4 例，肋骨局限性破坏 2 例，边界清晰，无硬化缘。8 例患者有皮疹，呈湿疹样、脂溢性、出血性斑丘疹，白色斑疹。6 例患者浅表淋巴结肿大。所有患者均有病理诊断及免疫组化，见朗格汉斯细胞增生，其中 13 患者 CD1a（+）、Langerin（+）、S-100（+），9 例患者 CD68（+）。13 例患者予手术及联合化疗后，随访 6～24 个月，其中 11 例患者症状消失，2 例患者症状好转。9 例患者复查 MRI，其中 8 例患者垂体柄＜3mm，1 例患者垂体柄病灶缩小，下丘脑病灶消失。**结论** 小儿以 CDI 为首发症状的 LCH 起病较为隐匿，容易延误诊断，MRI 能清晰地显示垂体的解剖结构，可以为本病的早期诊断提供依据。

Differentiation of Low- and High-grade Pediatric Brain Tumors by Using intravoxel incoherent motion imaging and diffusion kurtosis imaging

Dejun She,Dairong Cao
the First Affiliated Hospital of Fujian Medical University

Purpose To demonstrate the quantitative parameters derived from intravoxel incoherent motion imaging (IVIM) and diffusion kurtosis imaging (DKI) models can be used to

improve the accuracy of MR imaging for differentiating among low- and high-grade pediatric brain tumors.

Material and Methods This study was approved by the institutional review board. Forty-nine pediatric patients with histologically proved brain tumors who underwent IVIM and DKI were recruited in this study. All the MR exams were conducted on a 3T system (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany). 13 b values ranging from 0-2000 s/mm^2 were used the MR diffusion acquisition, The diffusion weighted images with b value of 0, 50, 100, 150, 200, 300, 400, 600, 800, 1000 s/mm^2 were used to calculate IVIM parameters, and the diffusion weighted images with b value of 0, 700, 1400, 2000 s/mm^2 were used to generate DKI parameters. The mean, minimum, and maximum value of IVIM [pure diffusion coefficient (D), pseudo-diffusion coefficient (D*) and perfusion fraction (f)] and DKI [diffusion kurtosis (K) and diffusion coefficient (Dk)] parameters were measured. The IVIM and DKI values were measured in solid tumor regions, as well as in normal-appearing gray matter as a control. These values were compared between the low-and high-grade pediatric brain tumors by using the Mann-Whitney U test. Receiver-operating characteristic (ROC) analysis and logistic regression analysis were performed to evaluate the diagnostic performance of single-parametric and multiparametric models.

Results None of the IVIM and DKI parameters exhibited significant differences in normal-appearing gray matter (P >.05). The Dk and D values were lower, whereas the K and f_{min} value was higher in high-grade pediatric brain tumors than those in low-grade pediatric brain tumors (all p <.05). The combination of DK_{min} and K_{max} provided the largest area under the ROC curve (0.955) in the ROC analysis compared with individual parameters (D_{min}, 0.891; DKmin,0.933; Kmax, 0.923 and fmin, 0.734), indicating an improved diagnostic performance for tumor grading.

Conclusions The parameters derived from IVIM and DKI can be used to distinguish low-grade pediatric brain tumors from high-grade pediatric brain tumors. The combination of DK_{min} and K_{max} value may serve as a noninvasive and quantitative imaging parameter for grading pediatric brain tumors in vivo.

PU-0061

T2WI FLAIR 增强序列及 DWI 序列对儿童感染性脑膜炎的诊断价值

肖汉方,杨秀军
上海市儿童医院 上海交通大学附属儿童医院

目的 分析儿童感染性脑膜炎的 MRI 特征，评价 T2WI FLAIR 增强、DWI 序列以及 T1WI 增强三种扫描序列的成像效能，探讨增强 T2WI FLAIR 序列和 DWI 联合应用对儿童感染性脑膜炎的诊断价值。**方法** 回顾性分析我院 2018 年 1 月～2019 年 5 月确诊感染性脑膜炎的儿童 42 例，所有患者均在常规磁共振成像（MRI）扫描后行增强 T2WI-FLAIR 序列及 T1WI 序列扫描，分析儿童感染性脑膜炎在不用扫描序列上的影像学特征，对比两种增强方法独立应用及联合应用诊断儿童感染性脑膜炎的敏感性及特异性。**结果** 42 例病变中，化脓性脑膜炎 25 例，病毒性脑膜炎 14 例，真菌性脑膜炎 3 例。增强 T2WI FLAIR 序列和 DWI 序列与增强 T1WI 的敏感性相似，而增强 T2WI FLAIR 序列和 DWI 联合应用的特异性高于增强 T1WI。**结论** :增强 T2WI FLAIR 序列和 DWI 序列可清晰显示儿童感染性脑膜炎脑膜强化，应作为儿童脑膜炎 MRI 检查的首选扫描序列。

多层螺旋 CT 与数字 X 线摄影 在儿童副鼻窦炎诊断中的价值比较

韩淑娟
青海省妇女儿童医院

【摘要】目的 对比分析儿童副鼻窦炎采取多层螺旋 CT 与数字 X 线摄影诊断价值。方法 选取本院 2017 年 8 月-2018 年 7 月接收的副鼻窦炎患儿 62 例为研究对象，所有患儿分别进行多层螺旋 CT 与数字 X 线摄影检查，对比两种检查方法检查结果。
结果 多层螺旋 CT 副鼻窦炎检出率及息肉、黏液囊肿、黏膜下囊肿检出率均较数字 X 线摄影更高，差异均存在统计学意义（P<0.05）。结论 儿童副鼻窦炎诊断期间，多层螺旋 CT 诊断价值更高，其可以提高疾病检出率，促进其他疾病检出率的提高。

PU-0063
低剂量多层螺旋 CT 在唇腭裂患儿术前检查及预后评估中的应用

张毅,王志伟
哈尔滨市儿童医院

目的 探讨低剂量多层螺旋 CT 在唇腭裂患儿术前诊断及预后评估中的价值
方法 唇腭裂系列患儿 70 例，男 57 例，女 43 例；设备采用 Philips Brilance 64 排螺旋 CT，迭代算法，扫描条件为 100 kV、80 mA s，准直 1. 5。扫描范围从眶下至咬合平面，重组层厚 0.625 mm。数据后处理采用 MIP 多平面重建、VR 三维立体图像技术及齿科专业重建软件等。
结果 左侧 25 例；右侧 8 例；双侧 5 例；牙槽突裂 12 例；软腭裂 6 例；无骨性改变 14 例；伴发其它畸形 9 例。
结论 迭代算法低剂量螺旋 CT 扫描可明显降低扫描剂量；图像后处理技术可以准确测量并计算唇腭裂骨缺损量及形态，同时可明确判断颌面部、颅底等伴随畸形，对唇腭裂患儿术前诊断及预后评估具有重要价值。

肺外结核的影像表现与临床

孙多成[1],孙多成[1]
1.中山市博爱医院
2.中山市博爱医院

目的 探讨不同部位肺外结核的影像特点，以提高对非常见部位结核的认识。
方法 收集 2010 年 1 月－2019 年 5 月经我院临床手术和综合治疗确诊的肺外结核患者 31 例，男 16 例，女 11 例，年龄 1y~65y。CT 采用西门子 SOMATOM Definition AS 128 层螺旋 CT 行腹部 CT 平扫及增强扫描，铅皮覆盖患儿甲状腺及生殖器作好防护，MRI 采用 GE Signa Ovation EXCITE 0.35T 及 MAGNETOM Avanto 1.5T 扫描仪，对比剂为碘海醇，Gd-DPTA.。乳腺采用美国 Hologic Selenia 数字化乳腺机。
.**结果** 31 例均经手术及临床病理证实 ，其中腮腺结核 1 例，颈部淋巴结核 10 例，腋下淋巴结核 1 例，乳腺结核 4 例，胸壁结核 3 例，睾丸结核 3 例，付睾结核 1 例，子宫内膜及输卵管结核各 2 例，输尿管下端结核 1 例，肩胛骨、髋关节各 1 例，髌下囊 1 例，脾结核 1 例。
影像表现：发生在腮腺、颈部淋巴结、腋下淋巴结、乳腺、胸壁、睾丸、付睾及脾脏部位结核，共同特点 CT 平扫低密度，增强环形强化，伴周围脂肪间隙模糊，坏死者 MRIT1WI 低信号，T2WI 高信号，DWI 与 ADC 增高信号，见环形强化，周围软组织呈水肿信号。子宫内膜结核 CT、MRI 检查均表现子宫内膜增厚，轻度强化。输卵管结核表现输卵管增粗、纡曲、积水。输尿管下端结核表现局部管腔狭窄、管壁增厚。肩胛骨、髋关节结核在 X 线摄影及 CT 扫描时表现骨质破坏，伴软组织肿块，强化不明显。髌下囊结核具有淋巴等软组织结核特点，增强扫描见环形强化。
结论 肺外结核是指发生于肺部以外全身其他脏器的结核，是结核病疫情的重要组成部分，淋巴结结核是最常见的肺外结核，以颈部多见，占 91%（11/12），可根据特征性环形强化定性，其他部位结核要结合临床症状及实给室检查及病理确诊。

儿童紫癜性肾炎合并可逆性后部脑病综合征 MRI 诊断分析

李小会,杨明,管红梅,高修成,高峰,张新荣,陈桂玲
南京医科大学附属儿童医院

目的 通过分析儿童可逆性后部脑病综合征（PRES）的临床特征、影像学特点、治疗及预后，提高儿科影像科医生对儿童 PRES 的认识和早期诊断及鉴别诊断。
方法 回顾性分析南京医科大学附属儿童医院 2011 年 2 月—2018 年 3 月收治的 2 例 PRES 患儿的临床特点、影像学特点、治疗及预后，主要总结 MRI 早期表现特点。
结果 2 例患儿均确诊为紫癜性肾炎并头痛，腹部 CT 显示部分肠管管壁增厚，周围渗出。2 例患儿两侧大脑半球额叶、枕叶、后顶叶的皮质和白质多发、1 例左侧丘脑斑片状异常信号，T1WI 呈等或略低信号，T2WI 呈高信号， FLAIR 呈高信号， DWI 呈低信号、等信号；ADC 图呈高信号、等信号，随访观察异常信号基本消失。
结论 PRES 的临床表现以神经系统症状为主，MRI 表现及 DWI 表现特异，是诊断该病的主要依据，早期诊断、及时治疗是防止不可逆脑损伤的关键。临床症状及影像学改变可短期内恢复正常，大多预后良好。

儿少精神障碍患者伴发脑白质病变的核磁检查

李萍,张晓静
西安市精神卫生中心

目的 认识儿少精神障碍患者伴发脑白质病变的核磁检查价值
方法 对我院 2017 年 5 月至 2019 年 3 月期间 118 例儿少精神障碍患者行颅脑 3.0TMRI 检查，所有病例均行轴位 T1WI、T2WI、冠状位 T2FLAIR、矢状位 TIWI、DWI 及 ADC 检查，重点观察并分析轴位 T2WI 及冠状位 T2FLAIR 图像上脑白质的改变，并查阅相关资料
结果 118 例儿少精神障碍患者其中 15 例儿少精神障碍患者 T2WI 及 T2FLAIR 图像均显示脑白质区异常信号
结论 MRI 检查对儿少精神障碍患者伴发脑白质病变有诊断价值

透明血管型巨大淋巴结增生症（Castleman 病）1 例

王玉琴,石浩
昆明市儿童医院

目的 探讨巨大淋巴结增生症（Castleman 病）的 CT 平扫及增强扫描的影像表现及诊断要点。**方法** 对 1 例术后病理结果为巨大淋巴结增生症（透明血管型）的 CT 扫描病灶表现特点、增强后病灶强化特征进行分析,并结合临床资料复习文献。**结果** CT 平扫左侧颈部见边界清晰、密度均匀的软组织肿块;，CT 增强扫描病灶明显强化，随时间推移强化持续，呈“快进慢出”表现。**结论** 巨大淋巴结增生症的影像检查总体来说无明显特征性，但其中 UCD（单中心型）影像表现具有一定特点，该病例影像表现符合其特点

PU-0072

新生儿头皮肌纤维母细胞瘤 1 例

林艳青
昆明市儿童医院

目的 报告 1 例新生儿肌纤维母细胞瘤的影像学表现，提高对本病的特异影像表现认识。
方法 男，13 天，发现头部包块 13 天。体检：枕后可见约 14cm×13cm 包块，质软，边界清楚，包块上可见皮损、结痂。CT 示：枕部头皮软组织区可见一较大混杂密度灶，软组织 CT 值约 33-53Hu,其内可见钙化及液性密度灶，邻近枕骨局部骨质增生、破坏。增强扫描后，实质部分明显强化，以周边强化为著，其内边缘可见多发迂曲血管，可见双侧颈外动脉分支供血，病灶内部可见坏死灶。MRI 示：枕部头皮软组织区较大混杂信号影，在 T1 及 T2 上呈高等低信号，FLAIR 上呈高等低信号，边界尚清，大小约 7.6cm×4.5cm×5.9cm。
结果 手术所见：枕部皮下实体样包块，病变基地与颅骨粘连紧密，颅骨在枕部有明显突起，分离时出血明显。病理：瘤细胞为梭形、短梭形、呈束状交错或旋涡状排列，局部排列疏松，可见核分裂，并可见粘液变，血管丰富，可见后壁血管，局部管壁黏液变性，炎细胞散在浸润，肿瘤局部出血、钙化。病理诊断：肌纤维母细胞瘤伴出血及钙化，局部瘤细胞增生活跃。
讨论：肌纤维母细胞瘤是一种少见而独特的间叶性肿瘤，表现为交界性或低度恶性肿瘤的特点。其病因不明确，部分病例发生在手术、创伤或炎症以后，提示本病起初可能是人体对损伤的一种异常

或过度的反应，最终激活肌纤维母细胞显著生长或失控生长，直至最终发展成肿瘤。本病常见于儿童或青少年，平均年龄为 10 岁，本病例年龄为新生儿较罕见。发病部位常见部位为肺部，其他如腹腔、腹膜后、盆腔、躯干等部位也可发生。肌纤维母细胞瘤的临床表现多样性、无特异性，所以术前诊断困难，影像学检查中发现单发实质不匀质肿块，可伴有坏死、钙化，增强后早中期表现为周边强化或环形强化者，尤其是边缘强化较显著的特征，与其他儿童常见实体瘤有所不同，应引起重视，尽可能减少漏诊及误诊，为临床医生的治疗方案的选择提供有效的参考价值。

CT 低剂量扫描在儿童副鼻窦检查中的应用

尤丽芹
昆明市儿童医院

【摘要】 目的 讨论 64 排螺旋 CT 低剂量扫描在儿童副鼻窦检查中的应用，获得不同参数的辐射剂量并对图像质量进行评估。**方法** 对 50 例临床怀疑鼻窦炎来放射科行 CT 检查的儿童随机分组，分别行低剂量扫描和常规计量扫描，并作冠状位重建。分析两组图像质量的差异及辐射剂量。**结果** 与常规剂量组相比低剂量组的 CT 图像质量良好，无明显差异，图像颗粒略粗，但不影响诊断，而辐射剂量明显下降。**结论** 儿童 64 排螺旋 CT 低剂量扫描可以获得符合临床诊断需求的图像信息，可应用于临床。

PU-0074

多排螺旋 CT 后重建技术在儿童气管支气管异物中的应用

张高峰
昆明市儿童医院

目的 ：气管及支气管是呼吸的通道，假如异物较大堵住，患者可在几分钟内窒息而死亡。因此，气管及支气管异物是器官进入异物中较危险的一种，也是耳鼻喉科常见的急症之一。急需明确诊断、尽早治疗。早期准确的检查方法对临床手术异物定位起到至关重要的作用。近来多排螺旋 CT 在气管支气管病变领域中的应用越来越广泛，本研究目的在于利用多排螺旋 CT 及多种重建技术分析小儿气管、支气管异物的位置、大小、形态，证实其多种重建技术在诊断气管支气管异物中的应用价值。

2. **方法** 2.1 病例 收集医院 2016 年 7 月至 2018 年 7 月经支纤镜 (21 例)及经手术证实的气管支气管异物患者。男 15 例，女 6 例。年龄 6 个月～6 岁，就诊时间：发病后 1h～1 月。18 例有明显的异物吸人史，其余不太明确。临床症状：呛咳、咳嗽、呼吸困难等症状；听诊可闻及湿罗音、哮鸣音。2.2 检查方法使用多排螺旋 CT，扫描层厚 3.75mm，重建厚度 0.625mm，扫描条件：转速 / 螺距 0.8：1，管电压 80-140kV，管电流 100-300mA。采用多平面重建，曲面重建技术，最小强度投影、CT 仿真内窥镜等对气管支气管异物的显示情况及诊断价值的评估。不配合患者扫描前可口服水合氯醛 (50～ 100mg / kg)使其进入睡眠状态，然后进行 CT 检查。

3. **结果** CT 图像均显示清楚，21 例临床术中结果与 CT 检查一致。

4. **结论** 多层螺旋 CT 扫描及多种后重建技术相融合能直接及间接显示气道异物的位置、大小、形态、数目、局部气管、支气管狭窄程度，能进一步提高异物检出及其并发症诊断的准确性，是一种

无创、快捷、安全的术前检查方法，是指导临床医生确定治疗预案及评估疗效的最重要、最直接、最直观第一手材料，为此多排螺旋 CT 扫描应为小儿气道异物诊断的首选检查。

PU-0075

CE-MRA 技术在小儿海绵状血管瘤中的应用

蔡静怡,张旭
哈尔滨市儿童医院

目的 ： 探讨磁共振成像(M RI)对肢体深部海绵状血管瘤的诊断价值。均经手术及病理证实， 年龄 1 ～ 9 岁,症状及体征:下肢疼痛或酸胀不适,跛行或行走不便，下肢局限性肿胀或触及柔软性肿块,肿块处皮肤轻度发蓝， 压之可褪色。**方法** ： 本组病例具有以下临床及影像学特点： 稍短 T1 长 T2WI， 信号不均匀,病灶侵及肌肉及肌肉间隙,周围肌肉组织萎缩，病灶可包绕长骨生长,骨骼无受侵表现，增强后病灶呈明显强化，CE-MRA 序列见异常强化血管团。**结论** :深部海绵状血管瘤有时向纵深广泛发展、蔓延,范围很大， 和深部血管可有广泛交通， 因此， 在选择手术治疗前应了解血管瘤与大血管的关系， 以避免术中出血过多， 手术损伤过大。MRI 及 CE-MRA 可较好地反映较大血管与病灶的关系,可了解血
管瘤病变区的血供及引流血管状况。总之， 磁共振成像可显示深部海绵状血管瘤的某些病理改变及信号特点， 可作为肢体深部海绵状血管瘤较理想的诊断手段。

PU-0076

医学影像技术未来的发展

刘宪文,吕佳南
佳木斯大学附属第一医院

{摘要}医学影像技术发展的日新月异,现代医学影像技术发展促进了医学影像诊断断的准确性发展,同时也使临床诊断越来越依赖于医学影像诊断,医学影像检查技术的出现对现代临床医学的发展起到了很大的推动作用,如何规范的使用医学影像技术检查方法成为现在医院需要解决的一个现实问题。

1.一切实际存在于我们意识之外的而且能为我们感觉直接地或者间接地可以认识到的东西都是物质。宇宙的一切都是由物质组成的,物质由分子组成,而分子又是由原子核和绕原子核旋转的电子组成的,因此原子是元素的基本单位,一个分子可由一种或几种不同元素所组成。对于物质实体原子结构的概念也是我们所学过的知识。

2 医学影像技术是一门将物理学和医学相结合的新的研究、应用分支。将医学影像技术应用于医疗实践之中，要求医生、研究人员必须具备医学和物理学的相关知识，并在实践中根据具体情况进行有针对性的改造以适用。该学科方向的研究、发展为我国医疗健康卫生事业培养了数以万计的高水平专业人才，极大缓解了我国居民对医疗健康卫生相关领域人才的需求.无论医院大小,医学影像检查技术的出现是对现代临床医学的发展起到了很大的推动作用,问题是是否所有疾病都要依赖于医学影像检查。传统的中医有望、闻、问、切,西医也有听诊、触诊、叩诊等方式。但是随着医学影像技术的发展,临床诊断的准确性有了明显的提高,从而可以挽救更多人的生命,为临床治疗提供了一个更加切实可行的治疗方案,这说明医学影像的发展给我们临床诊断和治疗带来了积极有效的方面。

3.医学影像技术专业的毕业生通常都会在全国各地医院的影像科从事影像技术工作。但是近年来，各大医疗卫生机构对医学影像技术专业人才提出了更多、更高的要求，导致一些专科学生在就业时受到了限制，很难进入满意的单位
4 通过以上论述可以发现，在新形势下，医学影像技术专业面临着巨大的挑战，要求高校不断完善学科的建设，使之适应时代的发展。

PU-0077
对小儿先天性感音神经性耳聋诊断中 3.0TMRI 及多层螺旋 CT 的联合应用价值

徐守成[1],姜丹[1]
1.哈尔滨市儿童医院
2.哈尔滨市医科大学附属肿瘤医院

目的 :对小儿先天性感音神经性耳聋诊断中 3.0TMRI 及多层螺旋 CT 的联合应用价值的探讨。
材料：选取 2014 年 12 月至 2018 年 4 月间我院临床诊断为感音神经性耳聋的患儿 83 例。
方法 所有患儿均行高分辨率 CT 及 MRI 检查。并进行多种重建方法观察病变，MRI 行斜矢状位重建观察面神经、前庭蜗神经发育情况。
结果 CT 检查对耳部骨性结构显示较好,MRI 检查对耳部软组织结构显示较好，尤其是内耳膜迷路及耳部神经病变的显示较有优势。
结论 CT 与 MRI 在诊断耳部病变中各有优势，如能将两者结合将对人工耳蜗植入术提供明确的诊断依据。

PU-0078
上颌窦骨内血管瘤合并含牙囊肿 CT 表现 1 例

王玉琴,石浩
昆明市儿童医院

目的 ： 通过该病例的 CT 表现学习骨内血管瘤合并含牙囊肿的诊断。
方法 ： 患者：男，2 岁，因头部外伤行 CT 检查发现右侧上颌窦占位病变，行右侧面部病损切除术，术后病理检查为含牙囊肿伴急慢性炎，骨血管瘤。出院后因反复出血两次入院，行右侧上颌窦骨内血管瘤介入栓塞止血术治疗。使用 GE 64 排螺旋 CT 机对该患儿行颌骨及口腔 CT 平扫+增强扫描，对比术后病理结果。
结果 ： CT 表现为右侧上颌窦壁、鼻腔、上颌骨内膨胀性骨质破坏，边界尚清，其内见放射状新生骨小梁，增强扫描呈明显强化，病灶内见牙齿影。
结论 ： 该病例因骨内血管瘤与含牙囊肿并发，较为罕见，CT 诊断具有一定困难。

PU-0079
儿童 18 例甲状舌管囊肿ＣＴ诊断分析

杨恒
昆明市儿童医院

目的 探讨甲状舌管囊肿的 CT 影像学分析、诊断。**方法** 回顾性分析 18 例经手术病理证实的甲状舌管囊肿的影像、临床资料。**结果** 18 例甲状舌管囊肿中，中线 10 例，中线偏左 6 例，中线偏右 2 例；舌骨上方 3 例，舌骨水平 3 例，舌骨下方 12 例；呈类圆形、类椭圆形及不规则形囊性病变。**结论** 根据甲状舌管囊肿特定部位及影像学表现可做出定性诊断。

PU-0080

Primary intra-arterial chemotherapy versus primary intra-arterial chemotherapy plus adjuvant intravenous chemotherapy for advanced retinoblastoma

Qiuying Chen,Bin Zhang,Shuixing Zhang
The First Affiliated Hospital Of Jinan University

Purpose: Intra-arterial chemotherapy (IAC), which is more commonly used nowadays, does not cover the patient systemically. We aimed to investigate whether the addition of intravenous chemotherapy (IVC) as adjuvant therapy before IAC has any beneficial (or the opposite) impact in terms of survival and metastasis.
Methods: This multi-center retrospective cohort study included 213 patients with advanced intraocular retinoblastoma who received IVC plus IAC (n = 103) or IAC alone (n = 110) between April 2009 and January 2017. Eyes were grouped as per the International Intraocular Retinoblastoma Classification. Kaplan–Meier and Cox regression analyses were performed to compare survival outcomes between the two groups. In addition, details about enucleation and histopathological findings were recorded.
Results: The 2-year ocular survival rate was 68% in the IVC plus IAC group and 72% in the IAC group [hazard ratio (HR), 0.88; 95% confidence interval (CI), 0.55–1.43; P=0.61], while the 2-year overall survival rates were 97% and 96%, respectively (HR, 1.56; 95%CI, 0.41–5.90; P=0.51). Moreover, the 2-year event-free survival rates were 76% and 79%, respectively (HR, 0.96; 95%CI, 0.56–1.65; P=0.89). High-risk histopathological features were identified in 10.5% eyes in the IVC plus IAC group and 16.7% eyes in the IAC group, with no significant difference between groups (P=0.46).
Conclusions: According to this study, with relatively short follow-up, the use of IVC as adjuvant therapy before IAC, had no beneficial impact in terms of survival and metastatic spread.

PU-0081

早产儿脑损伤磁共振检查临床分析

蒋凌燕
昆明市儿童医院

了解早产儿脑损伤的发生率及探讨磁共振检查对早产儿脑损伤的诊断价值。**方法** 对我院住院早产儿 100 例在生后 1 周内行头颅磁共振检查。**结果** 早产儿脑损伤的发生率为 63.8%，以出血性病灶较多见（29.2%），其次为出血合并缺血性病灶（24.6%）。弥散加权成像对脑白质损伤较敏感，磁敏感加权成像对出血较敏感。**结论** 磁共振检查对早产儿脑损伤的诊断提供了准确的影像学依据。

PU-0082

小儿轻度创伤性脑损伤的ＤＴＩ研究进展

蒋凌燕
昆明市儿童医院

儿轻度创伤性脑损伤是临床常见脑外伤，由于受损部位主要分布在灰白质交界处和大脑深部中线结构，且脑损伤呈弥漫性，常规影像学检查常无阳性发现，往往低估了患者病情。本文就扩散张量成像应用于轻度创伤性脑损伤的研究进展进行综述。

PU-0083

延误治疗引发儿童肘关节骨化性肌炎

李学江
河南省滑县骨科医院

目的 X 线平片、CT 在诊断儿童肘关节骨化性肌炎的诊断。
方法 初步选择 X 线平片（肘关节正侧位）、然后 CT 平扫（3D、MPR 重建）进行检查。
结果 患者主因“右肘外伤后肘关节功能缺失 14 月”查体右肘外观无异常，肘关节固定僵直于伸肘受限 30°位，屈伸功能无、旋后、旋前 60°，手部痛触觉及功能正常。患者因摔伤致右肘关节疼痛、活动受限，行 X 线检查示：右肱骨髁上骨折，患者家属拒绝手术治疗，当地行保守复位石膏固定 1 月，治疗期间患者手部肿胀较轻，1 月后拆除石膏行被动功能锻炼 2 次后右肘及右手肿胀，再次石膏固定 1 周拆除石膏，患者肘关节屈伸功能丢失，目前伤后 14 月，肘关节功能无改善，门诊参照 X 线平片及 CT 平扫加重建，诊断为“骨化性肌炎”。影像检查中肱骨远端与尺骨近端骨性融合，骨皮质增厚，肘关节屈曲，关节间隙未见异常的确实少见。
结论 麻醉满意后，行切开手术，以骨刀逐渐切除成熟的异位骨化，直至显露出肱骨滑车和部分冠状突，修整冠状窝和冠状突。伸肘可至 0 度，屈肘可至 140 度，肘关节稳定。

PU-0084

儿童颈胸椎疾病 MRI 检查新发现

李学江
河南省滑县骨科医院

目的 儿童颈胸椎结合部不适，MRI 检查颈椎疾病的新发现。
方法 利用低场开放式 MRI 平扫，T1WI、T2WI 及脂肪压制序列对儿童颈椎疾病的诊断。
结果 该组病人 30 例，年龄为 12-16 岁儿童，男女比例几乎相等，在季节变换明显的地区，夏天发现儿童颈胸部软组织凸起明显，部分出现头晕、颈部及肩部不适症状，患者家属发现后及时到医院就诊，临床触诊及外部观察为软组织内肿物，建议 MRI 检查。MRI 诊断为颈椎曲度变直，椎间盘及椎体信号正常，后缘颈胸部为脂肪信号堆积所致。仔细询问病史，30 例患者均为留守儿童，父母外地打工，孩子跟着爷爷奶奶或外公外婆在家上学，由于老人溺爱孩子对其管教不严，放学后、假期内玩手机游戏，低头看视频，不正确的学习姿势等。长期低头致使颈椎曲度变化，颈胸部脂肪堆积，引发后缘软组织凸起明显。
结论 成年人引发的颈椎病在治疗中方法几乎相同，儿童引发的颈椎病需要谨慎治疗，在防范中应加强颈部肌肉的锻炼，正确的学习姿势也非常重要，严防儿童长时间玩手机和电脑游戏。

PU-0085
儿童颈椎椎间盘钙化症伴寰枢关节伴脱位一例病例报道

李学江
河南省滑县骨科医院

摘要
目的 X 线平片、CT 在诊断儿童颈椎椎间盘钙化症伴寰枢关节半脱位的诊断。
方法 初步选定 X 线平片（颈椎正侧位、张口位）、CT 平扫（3D、MPR 重建）进行检查。
结果 颈椎生理曲度变直，寰枢关节不等宽，左侧间隙变窄右侧间隙变宽，颈第 3/4 椎间隙可见团块状密度增高影，椎间孔内团块、点状影高致密影，呈不规则改变、密度不均匀，并向后突出硬膜囊受压，CT 值约为 130HU。影像学资料报道；小儿椎间盘钙化大致可分为三型：1、消散型；急性起病，症状明显，吸收与消散快，2、潜伏期；钙化在体征出现前就消失散，而在症状出现后逐渐吸收。3、静止型；因有其他疾病做 X 线检查时发现，无症状，钙化多不消散。也可能有以下几种：1、外伤； 2、先天性因素； 3、混合型。【儿童颈椎间盘钙化是一种少见疾病，】伴寰枢关节半脱位更为少见。由于多发儿童，儿童有较强的修复愈合能力，椎间盘钙化可以自行吸收，一般正常治疗后恢复很快，数天即可消除症状，由于该患者为创伤性损伤，寰枢关节半脱位，即使有神经压迫症状非手术同样能取得满意疗效。
结论 我院给予制动颈部牵引、消炎对症治疗，1 周后症状明显消失、出院康复锻炼。

PU-0086
如何做好放射科设备的保养与维护

陈超,王冬,张增俊,胡文,魏思文,白慧萍
西安市儿童医院

随着放射科检查的数字化，使其图像分辨率、显示的层次及解剖结构有了明显提高。计算机技术与各种检查设备的融合，其性能更加稳定，操作也更加便捷，但日常工作中如何科学使用、维护保养显得尤为重要。我院 2008 年已经实现科室数字化，经过 7 年多工作实践，探索出一套使用与管理办法，现介绍如下。

1、做到日有清洁、周有维护、月有保养

每天开机前清洁设备,仔细检查是否完好；室内温度、湿度。定人定机严格交班。工程师在维修过程中做好陪查、陪修、陪维护，对设备的性能、操作、常见故障及重要部件的保养有了更深一步了解，做到大故障心有底、小故障靠自己。不仅节约了维修费用，更重要的是保证机器正常运行。

2、激光打印机是最终输出设备，其工作状态对图像质量有着至关重要的影响。机房内应保持通风干燥，室温应保持在 22℃左右。机器过滤网每季度清洁一次，每半年对其内部清洁保养一次。

3、各种设备分工到人并做好记录，一旦发现异常及时向技术组组长或科主任反映。

由于我们严格执行管理，定期维护保养，与同等使用设备的单位相比，明显减低了故障率，保证设备的正常运行。大大方便了患儿，也节约了支出费用。

PU-0087

儿童 ALL 缓解期软脑膜浸润一例

黄竹媛
西北妇女儿童医院

目的 提高对儿童急性淋巴细胞白血病（ALL）缓解期软脑膜浸润的认识及早期诊断准确性。
方法 分析 1 例经脑脊液细胞学检查证实的儿童 ALL 缓解期软脑膜浸润的临床表现及 MRI 影像学特征，并进行治疗后随访。
结果 患儿系急性淋巴细胞白血病临床缓解期，近 1 月前出现头痛、无诱因呕吐等症状，可自行缓解。遂就诊于我院，行头颅 MRI 平扫仅表现为脑沟、脑裂变窄，T2FLAIR 序列上脑沟内呈线状高信号；MRI 增强扫描后局部脑膜增厚，且呈明显强化；经外院脑脊液细胞学检查及脑脊液流式检测结果显示可见大量幼稚细胞存在，且 $LAIP^{+}$细胞占脑脊液有核细胞的 85%，确诊为中枢神经系统白血病（CNSL）；经鞘内注射化疗药物治疗后，复查头颅 MRI 平扫表现为脑沟、脑裂较前增宽，T2FLAIR 序列上脑沟内异常信号影较前消失。
结论 ①由于白血病化疗药物不能有效通过血脑屏障，中枢神经系统成为白血病细胞的潜在“庇护所”，当患儿处于临床治疗缓解期时，白血病细胞更容易侵犯中枢神经系统，从而造成白血病的复发。②当患儿临床表现为颅高压及脑膜刺激征时，应警惕 CNSL 的发生，MRI 中 T2FLAIR 序列及增强扫描对于发现早期白血病细胞软脑膜浸润具有一定的价值，再结合脑脊液细胞学检查，可以进一步明确诊断。

PU-0088

婴儿鼻腔鼻软骨间叶性错构瘤 1 例

郝仕娟
昆明市儿童医院

鼻软骨性间叶错构瘤（nasal chondromesenchymal hamartoma，NCMH）是一种罕见的具有破坏性的良性肿瘤，我院于 2018 年 8 月收治 1 例，病理诊断婴儿鼻软骨间叶样错构瘤。
NCMH 是一种罕见的错构瘤性病变，好发于婴儿的鼻腔鼻窦区域。影像学上该病变可显示破坏性生长方式，高度怀疑恶性。该疾病需与发生在儿童鼻窦鼻腔具有重叠形态学特征的多种病变进行鉴别。NCMH 的正确认识和准确诊断对于避免误诊和采取适当的外科治疗有十分重要的意义

PU-0089

儿童脑动静脉畸形影像诊断新技术进展

苏小丽
浙江大学医学院附属儿童医院

脑动静脉畸形（AVM）是儿童常见的血管性疾病，出血风险高，具有较高的致残率和病死率，目前该病的诊断主要依靠影像学检查。近年来发展的一些影像学新技术有助于提高儿童脑动静脉畸形的诊断符合率，包括 4D-DSA、4D-CTA、4D-MRA、动脉自旋标记（ASL）和磁敏感加权成像（SWI）。四维影像技术不仅可以清晰显示儿童脑 AVM 的供血动脉、瘤巢、引流静脉，还能显示血管从动脉早期到平衡期的完整的动态充盈过程；ASL 通过选择性标记血管，能够准确识别供血动

脉；SWI 对引流静脉高度敏感。各种新技术在儿童脑 AVM 的诊断中具有独特的价值。本文对各种新技术的研究进展进行综述。

PU-0090

新生儿衣原体肺炎影像学表现

徐峰,吴永彦
贵阳市妇幼保健院贵阳市儿童医院

目的 ： 近年来新生儿期衣原体肺炎逐渐被人们重视，其临床表现不典型，本文回顾性分析新生儿衣原体肺炎临床及影像学特征，为临床诊断提供可靠的影像学检查。
方法 ： 回顾性分析 2009 年至 2019 年收治的临床诊断为衣原体肺炎的 11 例患儿的临床及影像学资料。 其中男 7 例、女 4；足月儿 10 例，早产儿 1 例。 发病年龄 3～20d。
临床 表现：咳嗽 7 例次，吐沫、呛奶各 8 例次，鼻塞、眼分 泌物增多各 2 例，气促、呼吸困难各 2 例，流涕、 纳差各 1 例。11 例患儿均无发热。体检肺部呼吸音增粗 11 例，肺部有少到中量湿啰音 5 例。11 例中顺产 9 例，剖宫产 2 例。
二、影像学检查方法 11 例患儿均行 x 线胸片及 CT 检查。
结果 ： 一、实验室检查 11 例患儿衣原体抗体 IgM 均为阳性，明确为沙眼衣原体感染 4 例，肺炎衣原体感染 7 例。其中 3 例母亲孕期有明确的阴道炎病史。

影像学表现：
(1)11 例患儿均有两肺过度充气；
(2)两肺广泛大小不等的结节影分布不均匀，粟粒肺样弥漫分布， 也可呈多发或散存分布，粟粒肺样弥漫分布占多数，分布最主要为背侧；结节影另一个特点是胸膜下分布较显著，本小结节可以融合成大 结节，还可以融合成片。
(3)可合并不同程度的肺内实变，斑片影的特点为两肺背侧近胸膜处片影较大，及散在胸膜下小片影，而靠近内带及肺门区片影大多较小或无，但无支气管充气象。
(4)支气管血管束增厚
(5)磨玻璃影，新生儿衣原体肺炎磨玻璃样改变相对较少，本研究中仅有 2 例。
(6)无胸膜渗出，无纵隔淋巴结肿大，此 2 种征象有助于与其他疾病鉴别。

结论 ： 新生儿衣原体肺炎临床症状不典型，但影像学表现具有一定的特征性，可以早期为临床提供诊断及预后随访。

PU-0091

低浓度等渗造影剂在儿童先天性心病 CTA 检查中的应用

董丽娜
徐州市儿童医院

目的 阐述“双低”扫描技术在儿童先天性心病（congenital heart diseas,CHD）的应用价值；
材料和**方法** CHD 患儿 34 例，扫描条件：轴扫，管电压 70Kv，自动毫安，10-375mA，NI：22，探测器宽度 120-160mm，扫描时间 0.3s，Asir-V：50%，随机分为两组，A 组：17 例，碘海醇 350mgI/ml，用量 1ml/kg,B 组：17 例，碘克沙醇 270mgI/ml，用量 1ml/kg，选择升主动脉、降主动脉、肺动脉主干共同显示的层面及左心室层面，记录升主动脉、降主动脉、肺动脉主干、左心室

CT 值及同层面背部软组织标准差 SD，取 SD 值为背景噪声指数，记录每个病例的剂量长度乘积（DLP），并根据公式换算有效剂量（ED），由 20 年以上工作经验的两名副主任医师独立评片图像质量主观评分，标准：1 分，图像质量极差，无法用于诊断；2 分，图像质量较差，不能用于诊断；3 分，图像质量一般，可用于诊断；4 分，图像质量较好，可以满足诊断；5 分，图像质量非常好。图像评分≥3 分为符合临床诊断要求，2 分及以下不符合临床诊断要求，对两位阅片者阅片的一致性分析采用 Weighted Kappa 检验，**结果** A 组各兴趣区 CT 值均大于 B 组，差异有统计学意义（P<0.05），A 组各层面 SD 值与 B 组相当，差异无统计学意义（P>0.05），A 组 DLP：12.93±3.39，ED：0.48±0.15，B 组 DLP：14.13±2.34，ED：0.37±0.43，A 组与 B 组相当，差异无统计学意义（P>0.05），两位医师读片显示各病例图像质量良好，读片结果一致性良好；**结论** 低浓度等渗对比剂降低心脏大血管强化程度，但在同等用量的前提下减少碘摄入量，使用低浓度等渗对比剂可以保证图像质量并有效减少碘摄入量。

PU-0092

Bannayan-Riley-Ruvalcaba 综合征影像学观察及文献复习

付聪,王梅云
河南省人民医院

目的 探讨 Bannayan-Riley-Ruvalcaba 综合征的影像学特点。
方法 回顾性分析 1 例 BRRS 综合征患者的临床及影像学资料。
结果 患者男，6 月。查体见大面积青紫色肿块，触及多处结节样改变，局部稍压痛。阴茎及阴囊散在色斑。胸部 X 线见肋骨膨胀样密度减低。CT 平扫及 MR 平扫见双侧颈肩部、上肢、胸腹壁及背部、纵膈、双侧胸腔多发软组织弥漫增厚、结节、肿块影，MR 呈长 T1 混杂长 T2 信号，内见小流空血管影，其中部分增厚软组织中见小结节状脂肪信号影，背部、脊柱旁、双侧胸腔近背侧胸膜区软组织间脂肪成分明显增多， T2 压脂序列呈低信号，双肺膨胀不全，多发肋骨膨胀样骨质破坏，脾脏 MR 信号不均，双侧胸腔少量积液。头颈部 MR 平扫见头颅增大，小脑扁桃体下疝。基因检测示 PTEN 基因突变。BRRS 综合征是一种罕见的常染色体显性遗传性疾病，部分由 PTEN 基因突变或缺失所致。主要特征为巨头、生殖器着色斑病和肠息肉病。其他特点包括血管畸形、脂肪过多症、多发软垂疣等。本例患者出现典型的巨头、生殖器着色斑、软组织广泛多发脉管畸形，脂肪增多、脂肪瘤、多发软垂疣。此外该病例合并小脑扁桃体下疝畸形，目前尚无此合并症报道。X 线价值有限。CT 有辐射性，当可疑合并肺部、骨关节病变时，可选用。MR 作为观察软组织病变的最佳检查方法。本例患者全身多发脉管畸形，部分呈弥漫浸润型，表现为软组织增厚，部分呈团块型，T2 压脂序列观察为佳，表现为多发大小不一类圆形高信号伴混杂低信号，可见流空血管影。MR 对明确脂肪增多、脂肪瘤具有重要价值， T2 压脂序列呈信号减低，该例患者可见皮下软组织间隙、脊柱周围广泛脂肪增多。该患者双侧胸腔内背侧胸膜区见明显增多脂肪信号及软组织结节，导致双肺膨胀不全，合并肺炎，此表现在既往病例中尚未见报道。
结论 BRRS 综合征是一种罕见多系统受累疾病，影像学检查尤其 MR 对明确多系统受累情况具有重要价值。

PU-0093

Morgagni 疝四例报道并文献复习

郑桂芬
天津市儿童医院

[摘要] 目的 探讨先天性胸骨后膈疝影像学检查（胸片、CT、消化道造影）诊断价值。 材料与方法 收集我院 2016 年 9 月~2019 年 1 月接诊的 4 例先天性胸骨后膈疝患者的影像学资料进行回顾性分析，所有病例均经外科手术证实。 结果 其中男 2 例，女 2 例，年龄 6 月~6 岁。4 例患者中左侧膈疝 1 例，右侧膈疝 1 例，双侧膈疝 2 例。疝内容物均为结肠。 结论 先天性胸骨后膈疝行影像学检查，尤其是薄层螺旋 CT 扫描或消化道造影能够早期诊断，指导临床治疗，是提高诊断率、减少误诊的可靠手段。

特发性婴儿动脉钙化症 1 例

邵燕
浙江省台州医院

特发性婴儿动脉钙化症（Idiopathic infantile arterial calcification, IIAC）是一种罕见的常染色体隐性遗传疾病，迄今国内外报道的病例约 200 例。IIAC 病情进展迅速，约 85%的患儿在出生 6 个月内死亡。本文报道 1 例依靠 CT 确诊的特发性婴儿动脉钙化症的患儿，并就相关问题进行讨论。

PU-0095

罕见先天性支气管-胆管瘘合并气管-食管瘘 1 例并文献复习

严琳,洪卫,吴征平,吴永彦
贵阳市妇幼保健院贵阳市儿童医院

目的 主要探讨罕见先天性支气管-胆管瘘合并气管-食管瘘影像诊断方法及相关文献复习，提高对该病的进一步认识。**方法** 对罕见先天性支气管-胆管瘘合并气管-食管瘘 1 例的临床特征、影像诊断和治疗方法进行了论述，另外查阅国内外关于气管瘘疾病的相关研究，对这些研究进行了总结复习。**结果** 纤维支气管镜检查见较多黄色分泌物持续涌出，反复吸引不能完全清除。上腹部 MR 平扫+DWI+MRCP：肝门区见一长 T1、长 T2 液体信号条状影向上走行达食道水平偏右前方，长约 3.5cm；扫及食道末端偏右上方亦可见一条带状影，似与食道相通，向右上方走行至右下肺内，长约 4.5cm。自支气管异常开口处经纤维支气管镜分别注入气体及碘剂后行 CT 扫描，结果食道及胃腔内见高密度碘剂；肝内胆管内见低密度气体影。另外，患儿右肺实变和不张，右肺中叶支气管扩张。手术所见：术中支气管-胆道瘘瘘道造影，示支气管瘘道向膈肌下方与胆道相连，瘘管直径约 0.6cm。可见肝内外胆管显影，术中见食管下段与支气管-胆道瘘管粘连较紧密，分离困难，予处理，于支气管远端结扎、缝扎瘘管满意，切断瘘管，分离远端瘘管时可见瘘管与食道粘连紧密，分离时食道浆膜破损，见少许黄色液体渗出，予浆膜层修补缝合，考虑此处为气管食管瘘处，诊断：支气管-胆管瘘合并气管-食管瘘。**结论** 纤维支气管镜、MRCP 均能提供有效的诊断价值，但于支气管异常开口处经纤维支气管镜分别注入气体及碘剂后行 CT 扫描，若食道或胃腔内见高密度碘剂；肝内胆管内见低密度气体影，则更具有特征性。

PU-0096
多层螺旋 CT 在儿童叶外型肺隔离症诊断中的应用

hanzhonglong,于彤,彭芸
首都医科大学附属北京儿童医院

目的 探讨多层螺旋 CT 在肺隔离症诊断中的应用价值
方法 回顾性分析 61 例经手术病理证实为叶外型肺隔离症患儿的多层螺旋 CT 表现。所有患儿均行 CT 平扫及增强检查，并行图像后处理。
结果 多数位于下肺叶脊柱旁，少数位于上腔静脉后方，前纵膈、肺门下方及膈肌内，异位于腹腔 2 例，腹膜后 1 例，颈部 1 例，合并先天性肺气道畸形 47 例，支气管源性囊肿 3 例，膈疝 4 例，漏斗胸 6 例，后纵隔神经母细胞瘤 2 例，先心病脊柱侧弯伴椎体及附件畸形 2 例。叶内及叶外同时存在的隔离肺 1 例，该病例同时合并食管囊肿及胃重复畸形。颈部隔离肺合并交通性支气管肺前肠畸形。
结论 多层螺旋 CT 增强及后处理能能够清晰显示叶外型隔离肺的供血动脉、回流静脉及伴发畸形，为儿童叶外型隔离症的首选检查方法。

PU-0097
先天性肺静脉异位引流的 CTA 影像表现

段修华,杨秀军,李婷婷
上海市儿童医院、上海交通大学附属儿童医院

目的 分析 CTA 先天性肺静脉异位引流的诊断价值。
方法 对我院收治 60 例先天性肺静脉异位引流的心脏 CTA 检查进行分析，分别进行大血管重建。
结果 心脏大血管重建均可正确诊断肺静脉异位引流，完全性肺静脉异位引流 45 例，其中心上型 19 例，心内型 9 例，心下型 15 例，混合型 2 例；部分型肺静脉异位引流 15 例。
结论 心脏大血管 CTA 能准确诊断肺静脉异位引流及其分类，对临床手术方式提供帮助。

PU-0098
主动脉弓离断 1 例

赵思琪
昆明市儿童医院

主动脉弓离断(Interrupted Aortic Arch,IAA)是指升主动脉与降主动脉之间连续性中断，表现为完全中断或存在闭塞的纤维条索组织或闭塞管腔结构，由胚胎发育时期 6-7 周时，第 4 对动脉弓未发育或发育障碍所致[1]。IAA 为先天性心脏病中少见的一种，约占所有先心病的 1%，在活产婴儿中约占 0.003%-0.02%，常合并有其他心血管畸形，常见合并的畸形为动脉导管未闭、室间隔缺损、主-肺动脉窗，永存动脉干、右室双出口等畸形，当同时合并“主动脉弓中断-动脉导管未闭-室间隔缺损”时，被称为主动脉弓离断三联征[2]。

PU-0099
双向格林术后选择足背静脉注射对比剂完成心脏 CTA 检查的可行性探讨

冯晓刚,杨瑞
河南省胸科医院

[摘 要]**目的** ： 婴幼儿复杂先心双向格林术后选择足背静脉注射对比剂完成心脏 CTA 检查的可行性探讨 **方法** 回顾性分析 2010 年 1 月-2019 年 6 月在我院行双向格林术 30 例术后行双源 CT 心脏 CTA 检查的先天性心脏病患儿，年龄 3 个月-12 岁,其中小于 1 岁 8 例,1～3 岁 15 例,3～14 岁 17 例;体重 5～33kg;患者统一使用碘克沙醇对比剂，对比剂量 1.0-1.5ml/kg 流率 0.3-2.0ml/s 从足背静脉注入对比剂。**结果** :患儿全部完成心脏 CTA 检查，心脏结构显示清晰.**结论** 双向格林术后采用足背静脉注射对比剂能够很好的完成心脏 CTA 检查。

PU-0100
基于 lightspeedVCT 的儿童胸部 CT 扫描优化

徐盛威
重庆医科大学附属儿童医院

目的 探讨基于 GE 公司 lightspeedVCT 的儿童胸部 CT 扫描的优化方法，以期实现儿童 CT 扫描更高效率、更低剂量。
方法 以 GE 公司 lightspeedVCT 为检查设备，行儿童胸部 CT 平扫，检查技师在现行条件（该设备 2008 年投入使用，日均检查量约 200 人次，硬件和软件部分检查技师无法改变）下通过参数调节、体位设计等方法实现扫描更优化。
结果 通过以下调节可以实现儿童胸部 CT 扫描优化：
（1）标准体位。头向外，足先进，双手上举置于头部两侧，置于检查床中心；
（2）Z 轴短扫描范围。
（3）宽射线束准直。射线束准直用 40mm 代替 20mm，可以降低 CTDI。
（4）适当层厚。根据患儿情况选择 5mm 或 10mm。
（5）大螺距。有报道指出在螺距不大于 1.5 的情况下是不会影响病灶检出的。
（6）最短（机架）旋转时间。最短旋转时间可以最小化运动迷糊和伪影，尤其是纵膈处的重叠伪影。
（7）kVp。据患儿情况选择 80、100kVp，一般不超过 100kVp。
（8）mA。一般情况下选择自动管电流控制，通过设置 mA 范围以及噪声指数/剂量指数即可；若体位不正、没有居中或其他情况则用手动 mA 值。
（9）噪声指数/剂量指数调节。当前使用 10-12，根据具体情况适当加减。
（10）小 FOV。默认矩阵 512*512 情况下，小 FOV 空间分辨率更高，所需剂量更小；
（11）采用迭代重建算法。该算法相较于以往滤波反投影算法所需剂量更低。
（12）开启薄层和高分辨后重组，以弥补因层厚较大或剂量较低可能对诊断带来的不利影响。
结论 基于现有设备条件，通过摆位标准化和扫描范围、射线束准直、层厚、螺距、kVp、mA、旋转时间、FOV 等参数调节，可以实现儿童胸部 CT 扫描的更高效率和更低剂量。

PU-0101

肺母细胞瘤 1 例

赵思琪
昆明市儿童医院

肺母细胞瘤（pulmonary blastoma，PB）又称肺胚胎瘤或胚胎性癌肉瘤，是来源于肺或胸膜的恶性肿瘤，临床罕见，病情发展迅速。发病率占肺原发恶性肿瘤的 0.25~0.5%[1]，肺母细胞瘤病变在上下、左右、性别以及年龄上无特殊性，可发生于任何年龄，发病年龄集中于 35-78 岁，平均 52 岁[2]，男性居多，大多数有长期吸烟史。临床表现无特异性，早期可无任何症状，中晚期表现为咳嗽、咳痰、咯血、胸痛、胸闷、呼吸困难，当肿瘤进展至压迫气管、颈静脉、侵犯胸膜以及心包时才出现相应症状[3]。本例患者以发热、咳嗽及颈静脉受压迫致声音嘶哑、颈静脉怒张为主要表现。

PU-0102

不同权重下多模型迭代算法（ASIR-V）在“双低”儿童胸部 CT 图像质量的影响

关荣,李豆,王琦,胡智军,魏东红,姜露
长安医院

目的 探究不同权重迭代重建技术（ASIR-V）对“双低”（低剂量、低 kVp）儿童胸部 CT 图像质量的影响。**方法** 随机选取 19 例儿童胸部 CT 平扫;年龄（5.82±3.47）排除标准：患有心脏病、胸廓畸形、胸部肿瘤及肥胖患儿。采用 GE Revolution CT，扫描条件与**方法** 嘱患儿自由呼吸，从胸廓入口扫至肺底，80kVp，自动毫安技术（ATCM），噪声指数（NI）为 14，前置 Pre-ASIR-V 为 0%，对图像进行不同权重 Post-ASIR-V 重建（从 0%-100%，重建间隔为 10%），重建层厚为 0.625mm，共 11 组不同权（ASIR-V）图像；测量并计算每组图像胸廓入口、气管分叉及膈肌层面感兴趣区的皮下脂肪、竖脊肌及降主动脉的 CT 值及 SD 值，计算 SNR（CT 值/SD 值）并记录 CTDI、DLP，并计算有效辐射剂量 （ED）；统计学分析：由两位住院医师采用双盲法对各组图像进行 5 分法主观评分（≥3 分被认定为临床可诊断）采用单因素方差分析比较 11 组间各组织的 CT 值及 SNR 进行统计学分析，主观评分：采用 Kappa 检验两名医生一致性良好，秩和检验对各组图像进行主观评价。**结果** 随着 Post-ASIR-V 权重由 0%~100%，SD 值逐渐降低，SNR 逐渐增加，且各组间差异具有统计学意义（p<0.05）;Post-ASIR-V 权重在 60%时图像质量最佳；有效辐射剂量较常规小孩胸部辐射剂量减少了 60%；**结论** “双低”儿童胸部 CT 扫描中，Post-ASIR-V 重建可显著降低图像噪声，提高图像质量，采用 60% Pos- ASIR-V 重建算法图像质量最好。**临床相关性与应用：**不同权重多模型迭代算法（ASIR-V）对“双低”儿童胸部 CT,采用 60% Post-ASIR-V 重建算法图像质量最好，值得临床借鉴和推广应用。

PU-0103

儿童多发性大动脉炎治疗前后 CT/MR 表现

辛海燕,袁新宇
首都儿科研究所附属儿童医院

目的 讨论儿童多发性大动脉炎治疗前后 CT/MR 表现特点。
方法 回顾性分析临床诊断多发性大动脉炎 24 例患儿治疗前后 CT/MR 检查表现。治疗前行 CT 检查 19 例，MR 检查 5 例，经内科综合治疗后行 CT 检查 22 例，MR 检查 2 例。
结果 儿童多发性大动脉炎表现为受累主动脉及主要分支动脉管壁增厚，管腔狭窄（24 例）。最常受累主要分支动脉为左锁骨下动脉（CT 检查 18 例，MR 检查 4 例），左颈总动脉（CT 检查 8 例，MR 检查 4 例）。经内科综合治疗后受累动脉管腔狭窄均未进展加重。
结论 CT/MR 均是诊断儿童多发性大动脉炎的有效影像检查方法，对于治疗后随诊有其临床价值。

PU-0104

128 排螺旋 CT 在小儿胸部低剂量扫描的应用

陈务霜
重庆医科大学附属儿童医院

目的 运用 128 排螺旋 CT，探寻小儿胸部低剂量扫描的最优扫描参数，获得在满足诊断要求的图像前提下，尽可能减低受照着的辐射剂量。方法 (1)预实验：用体模做预实验 A 组：100kv,100mAs；B 组：100kv,80mAs；C 组：100kv,50mAs；D 组：100kv,30mAs；E 组：100Kv,15mAs，其他扫描参数：准直器宽度 64*0.625，螺距 0.6，矩阵 512*512，层厚 5mm,间隔 5mm。用 idose 技术处理，得到达诊断标准且辐射剂量最低参数：100kv，30mAs。
采集从 2019 年 3 月 1 日-2019 年 5 月 31 日来我科做胸部增强 CT 的婴幼儿（从 1m 至 3 岁）90 人，平扫为低剂量组：100kv，30mAs,按年龄分为 3 组：A 组 0<year≤1y;B 组 1y<year≤2y;C 组 2y<year≤3y，每组 30 人。增强以常规扫描条件扫描。排除标准为体重超过各年龄组平均数 30%的患儿；定位扫描发现有大量胸腔积液、肺实变、大块实质性肿瘤的患儿。标准组为回顾分析既往以常规条件 100kv,100mAs 扫描的病人资料，A 组 0<year≤1y;B 组 1y<year≤2y;C 组 2y<year≤3y，每组 30 人。采用 PHILIPS Brilliance 128 排 ICT 进行检查，患儿取仰卧位，平静呼吸，熟睡或镇静后进行扫描。扫描范围从肺尖到膈底 结果 本实验表明，随着管电流的降低，受照者接受的辐射剂量显著降低，图像质量随管电流的降低而降低。预实验得到以 100kv,30mAs 为扫描参数时，辐射剂量显著降低，而图像质量达诊断要求。
结论 PHILIPS 128 排螺旋 CT 在小儿胸部扫描时，运用 idose 技术，可以用低扫描参数 100kv，30mAs 时，使受检者既降低了辐射剂量，又能达到诊断要求。

PU-0105

支气管肺发育不良（BPD）的 X 线诊断价值

吕冬梅,张英杰,刘鑫春,蔡源,李京杰
哈尔滨市儿童医院

目的 探讨支气管肺发育不良（bronchopulmonary dysplasia，BPD）的 X 线表现，旨在提高对该病的认识、早期诊断及鉴别诊断能力，为临床 BPD 的早期防治提供诊断依据。
方法 回顾性分析我院新生儿重症监护病房 20 例支气管肺发育不良患儿的临床及 X 线表现，20 例患儿临床症状表现不一，无明显临床症状 4 例，呼吸急促、咳嗽 6 例，早产儿、新生儿肺透明膜病 10 例，所有患儿均拍摄床旁胸部正位片,其中 6 例进行了胸部 HRCT 检查.
结果 20 例 X 线床旁胸片患儿，显示两肺纹理增多、模糊、紊乱，片絮状模糊影 11 例，不规则实变影 6 例，两肺透光度局限性增高 12 例，两肺见斑片状条索状影及多囊状透亮影 6 例。6 例行

HRCT 检查患儿，表现有毛玻璃样病变 3 例，斑片状模糊影 2 例，不规则致密片状影 12 例，条索状致密影 3 例，多囊状改变 1 例，肺气肿 3 例。
结论 X 线胸片是诊断 BPD 的首选，HRCT 对 BPD 诊断有一定的特征性表现，结合病史及动态观察，X 线检查可以对 BPD 先期诊断做出提示,X 线诊断对 BPD 患儿的早期临床诊断治疗具有重要价值。

PU-0106
儿童呼吸机相关性肺炎 X 线诊断与临床的相关性分析

余海宁
青海省妇产儿童医院

目的 探讨呼吸机相关性肺炎(VAP)发病原因、病理基础、X 线诊断、临床的相关性并提高对本病的认识。方法 回顾分析 2015～2018 年青海省妇女儿童医院 PICU 呼吸机治疗的 135 例危重患儿的临床资料。方法 符合呼吸机相关性肺炎诊断标准的 VAP 患者 135 例，均在气管插管或气管切开前及 48h 后行影像学检查，对病变的分布、形态、密度等进行观察、分析。**结果** 135 例病例中，呼吸机相关性肺炎(VAP)发生。

PU-0107
新生儿气胸的床旁 X 线影像学特征分析

李勇芳
山西省儿童医院妇幼保健院

目的 分析新生儿气胸的床边 X 线检查影像学表现，结合患儿临床特征，以提高对新生儿气胸的认识与诊断，为临床治疗提供针对性的指导与帮助。**方法** 收集本院 2016.10-2019.04 收治的 26 例新生儿气胸患儿的床旁 X 线影像资料，所有患儿均行胸腹仰卧前后位检查，且对胸部 X 线表现随访复查。 **结果** 26 例新生儿气胸患儿中，医源性气胸 2 例（ 7.7% ），自发性气胸 5 例（ 19.2% ），病理性气胸 19 例（ 73.1% ）。26 例新生儿气胸患儿中，单侧气胸 18 例（69.2%），双侧气胸 8 例（30.8%），共 34 侧气胸，其中气体集中在前胸壁 8 例（23.5%），纵膈旁 10 例（29.4%），局限于膈上 3 例（8.8%），外侧气胸 5 例（14.7%），内侧气胸 2 例（5.9%），混合型 6 例（17.6%）。 **结论** 新生儿气胸床边 X 线表现多样化，气体可局限于胸腔多区域，常表现为“局部异常透亮征”、“深窦征”、“纵隔心缘清晰征”等。X 线检查过程中要提高优片率，准确识别气胸征象，分析气胸的具体分布及形态，减少误诊及漏诊。

PU-0108
新生儿肺透明膜病的 X 线诊断应用价值

韦红星,冯幸戈
天等县人民医院

目的 探讨胸部 X 线平片在新生儿肺透明膜病的应用价值。**方法** 回顾性分析本院 20 例经临床证实新生儿肺透明膜病患儿 X 线及临床资料，所有患儿经肺表面活性剂经气管导管治疗并治愈出院，其中早产极低出生体重 5 例，早产适于胎龄儿 15 例。分析 X 线影像学表现特性。**结果** 20 例中，表现为肺野透亮度普遍降低 75%，以两肺内中下野广泛细颗粒状或网状密度增高影 60%，2 例可见支气管充气征 5%；18 例纵膈、心影及双膈轮廓模糊 90%；3 例两肺野呈致密“白肺”改变 5%。**结**

论 早产极低出生体重以及早产适于胎龄儿，X 线表现为肺野透亮度普遍降低，纵膈、心影及双膈轮廓模糊征、白肺征为肺透明膜病特征性影像学改变，值得临床关注。

PU-0109
低剂量前门控 CT 检查在儿童先天性心脏病中的应用

辛涛
徐州市儿童医院

摘要：
目的 探讨利用低剂量、前门控及迭代算法的 CT 检查在儿童先天性心脏病诊断中的应用价值。**方法** 利用 GE Revolution 256 CT，分别采用 80KV、自动毫安和 100KV、自动毫安对两组先天性心脏病患儿进行心脏 CTA 检查，评估图像的质量，利用 SPSS 17.0 对检查辐射数据进行统计学分析，得出结论。**结果** 图像质量评分实验组为 4.50±0.67，对照组为 4.77±0.54，实验组评分略低于对照组，但图像质量可以满足临床医生的要求。辐射剂量统计显示实验组 CTDIvol 为 1.179±0.713，对照组 CTDIvol 为 1.721±0.668，实验组 DLP 为 18.083±11.433，对照组 DLP 为 33.358±8.020，实验组 ED 为 0.493±0.279，对照组 ER 为 0.863±0.342。实验组的各项辐射指标均明显低于对照组。**结论** 80KV、自动毫安秒的低剂量、前门控及迭代算法的 CTA 检查，可以有效的降低患儿所接受的辐射剂量，同时可以满足临床对检查图像的要求，具有较好的应用价值。

PU-0110
幼儿胸部 CT 扫描采用智能管电压技术的体会

余世勇
陆军军医大学附属新桥医院放射科

目的 智能最佳管电压（CARE kV）技术和自动管电流调控技术(ATCM) 已成为剂量优化的有效方法，笔者尝试探索针对幼儿胸部的 CT 低剂量优化扫描方案。**方法** 患儿共 60 例，随机平均分成两组：A 组 30 例，男 19 例，女 11 例；B 组 30 例，男 17 例，女 13 例。其中 30 例采用管电压 100 kV(A 组)，30 例采用管电压 80kV(B 组)；另搜集既往接受固定管电流(100 kV/60mAs) 低剂量扫描检查幼儿 30 例(C 组) 作为对照。扫描参数: C 组，采用传统降低管电压及管电流的低剂量扫描方式，100 kV，60 mAs; A 组，100 kV，管电流采用自动管电流调节技术; B 组，80 kV，管电流采用自动管电流调节技术; 余扫描参数一致，所有图像均进行多平面重组和容积再现等后处理成像。**结果** 所有病例的图像质量评价均为 2 分以上，均能够满足诊断要求。A 组 CTDIvol 平均（1.20±0.05）mGy、DLP 平均（25.23±1.34）mGy·cm，ED 平均（0.40±0.07）mSv；B 组 CTDIvol 平均（1.48±0.03）mGy、DLP 平 均（32.75±1.41）mGy·cm，ED 平均（0.52±0.06）mSv，A 组 ED 比 B 组下降了 23%，差异有统计学意义（P<0.05）。
结论 适当进行管电流的补充以降低辐射剂量，提高图像质量，同时自动计算 CTDIvol 和 DLP。CARE Dose 4D 扫描技术可降低剂量 66.6%，在幼儿胸部扫描中， 采用自动管电流调节技术和智能最佳管电压技术，不但能有效降低辐射剂量，而且不影响图像质量;低电压联合 ATCM 技术可以广泛应用于儿童胸部低剂量扫描。

PU-0111
高 IgE 综合征肺部影像学表现 1 例及基因分型

张翼,闫锐
西北妇女儿童医院

目的 报道一例基因确诊高 IgE 综合征肺部 CT 表现。 方法 分析一例确诊高 IgE 综合征患儿的临床及影像资料。 结果 胸部 CT 平扫示右肺中叶及下叶后内基底段团状高密影，右肺下叶外基底段片状高密度影，右门区团状高密度影。与院外片比较：右肺下叶外基底段囊状透亮影及片状高密魔影较前明显减少，右肺门区高密度影较前减少，右肺中叶及下叶后内基底段新增片状高密度影，考虑肺炎，金葡菌感染可能；结合患儿有反复皮肤冷脓肿的临床病史，考虑符合高 IgE 综合征肺部表现。 结论 高 IgE 综合征(hyper IgE syndrome，HIES)，又称 Job’s 综合征，是一种临床罕见的原发性免疫缺陷性疾病，以血浆 IgE 病理性增高(>2000IU / ml)为主要特点。湿疹、皮肤脓肿和肺部反复感染为主要临床特征，还可累及其他系统，包括骨骼系统、结缔组织系统、心血管系统等。基因突变是导致 HIES 发病的主要原因。目前已报道的 HIES 基因突变有三种，分别是 STAT3、DOCK8 和 Tyk2 基因突变。根据这三种基因突变的表型，可将 HIES 分为两种类型，即常染色体显性遗传类型(autosomal-dominance hyper-IgE syndrome，AD-HIES)和常染色体隐性遗传类型(autosomal-recessive hyper-IgEsyndrome，AR-HIES)，其中前者致病基因为 STAT3 基因，后者致病基因为 DOCK8、Tyk2 基因。由于基因表型的不同，两者在临床症状及发生机制方面存在显著差异。AD-HIES 感染症状主要为金葡菌所致的肺炎；AR-HIES 感染症状主要为皮肤病毒感染。本例患儿为 STAT3 杂合突变，为 AD-HIES，掌握其肺部影像表现及临床症状，对疾病的后期发展及临床治疗具有一定指导意义。

PU-0112
婴幼儿及儿童患者在 CT 增强扫描时镇静剂的选择

续鹏
山西省儿童医院/山西省妇幼保健院

目的 ：
婴幼儿及儿童患者在 CT 增强扫描时镇静剂的选择
方法 ：
回顾分析 2019 年 1 月至 8 月山西省儿童医院接受 CT 增强扫描的患儿 476 人次中，对于疾病种类对增强参数的要求所需镇静剂的选择。
结果 ：
增强扫描的 476 人次中需要镇静 385 人次，镇静患儿中水合氯醛镇静 385 人次，其中成功 309 人次，失败 76 人次。
成功的 309 人次中腹部增强 283 例，颈部增强 15 例，头部增强 8 例，心脏及冠脉 3 例。
失败的 76 人次中伴有孤独症、狂躁症等精神类疾病患儿 5 例，腹部增强 11 例，心脏、冠脉 60 人次。
失败的 76 人中隔天行鲁米那镇静成功 43 人，余 17 人请麻醉科依托咪脂或丙泊酚镇静皆成功。
分析成功和失败的患儿的增强部位的扫描参数及造影药剂的速率参数发现，增强部位对速率及单位浓度要求不高的患儿不容易失败，对速率单位浓度要求较高的部位容易失败，伴有精神类疾病患儿容易失败。
结论 ：

对速率及单位浓度较高的检查部位行更高等级的镇静剂有助于检查成功率的提高。但依托咪酯会偶有肌颤，患儿会偶有不自主的肢体颤动，所以注意对患儿的束缚以减少运动伪影。丙泊酚有可能有呼吸抑制和血压降低的风险，所以在使用丙泊酚和依托咪脂的时候必须有患儿的主管医师和麻醉医师在场并准备好抢救设备以降低患儿的检查风险。

PU-0113
新型 3 D 聚吡咯壳聚糖明胶导电复合材料研发及在心脏组织工程中的应用

何生,姜增誉,李健丁
山西医科大学第一医院

先天性心脏病（Congenital Heart Diease ,CHD）患儿的出生率已经有明显的下降；然而有研究表明，包括中国在内的亚洲地区，CHD 出生率高依然 0.9%，是严重威胁儿童健康成长的疾病之一，给个人、家庭、社会带来沉重负担;近年来心脏组织工程是一种修复心脏缺损强有力手段之一。现阶段很多非导电生物材料（如尼龙、海藻酸）可用于修复心脏的缺损或使心脏梗死区稳定和防止心脏扩张。然而，这些生物材料导不能满足心脏电传导需要，急需研发新材料来解决上述问题。本研究拟以化学氧化还原法和交联法合成 3D 复合导电材料聚吡咯壳聚糖明胶（polypyrrole-chitosan-gelfoam，Ppy-Chi-Gel）；在体内外充分研究其理化特性基础上；构建 3D 类心肌组织并应用与大鼠右心室缺损模型中，评估其体内生物安全性以及对心脏缺损修复的有效性，通过细胞存活、局部组织电阻和新生血管等研究评估其修复心脏缺损可能机制；本研究首次将具有生物活性导电补片材料应用于心脏缺损修复研究，可能成为心脏植入材料理想候选材料，拓展心脏组织工程的应用范围。

PU-0114
双源 Force CT 在婴幼儿及儿童先天性心病中的应用

张士朋[1],谢一婧[2]
1.甘肃省妇幼保健院
2.兰州大学第二医院

目的 探讨双源 Force CT 低剂量扫描在婴幼儿及儿童先天性心脏病中的临床应用价值。
方法 收集我院 2018 年 8 月至 2019 年 7 月经手术证实为先天性心病患儿 101 例。使用 Siemens Force CT 行心脏 CTA 检查，Turbo Flash -CARE dose 低剂量扫描。所有患儿均于 CT 检查后 1 周内经手术证实，计算检出畸形的准确率。根据辐射有效剂量转换系数 κ 值不同将患儿年龄分为四组，包括 0-1 岁组别 70 例，1-2 岁组别 14 例，2-5 岁组别 10 例，5-10 岁组别 7 例。记录患儿 CT 辐射剂量长度乘积（DLP）并计算出有效辐射剂量。所有图像均由两位高年资医师采用双盲法对图像治疗质量进行主观评分。本研究拟采用检出畸形准确率、有效辐射剂量及图像质量主观评分这 3 个指标来探究双源 Force CT 低剂量扫描对婴幼儿及儿童先心病的临床诊断价值。
结果 使用双源 Force CT 低剂量扫描所得图像诊断结果与手术后诊断的符合率为 95.4%，其中心内畸形检出率为 92.86%，心脏与大血管连接畸形及心外畸形检出率为 98.5%，有效辐射剂量分别为 0.40mSv、0.46mSv，0.34mSv，0.38mSv。图像质量良好的占 90.32%。
结论 双源 Force CT 低剂量扫描技术能清晰显示复杂性先天性心脏病的心内、外畸形，并能有效地降低辐射剂量，且图像质量良好，能够对病变进行全面、 清晰、准确的展示，为临床提供准确的术前诊断。

PU-0115

婴幼儿膈疝易误诊为膈膨升的影像学分析

刘超
山东大学齐鲁儿童医院/济南市儿童医院

目的:通过了解婴幼儿膈疝与膈膨升的影像学特点,并探究膈疝误诊为膈膨升的原因。方法:回顾性分析我院 2018 年 9 月至 2019 年 6 月收治的接受 X 线检查并发生膈疝误诊膈膨升的 28 例患儿的临床资料。结果:①膈疝对比膈膨升患儿有较明显临床症状; ②膈疝与膈膨升具有相似的 X 线表现,平片、钡餐透视及 CT 等多种检查可减少误诊;③手术证实婴幼儿膈疝易伴发隔离肺族的发生④膈疝与膈膨升发病年龄有显著差异。**结论** 临床上须结合多种影像技术对婴幼儿膈疝进行诊断,有助于减少误诊率,指导临床早期干预与针对性治疗。

PU-0116

儿童硬化性肺细胞瘤 1 例

林艳青
昆明市儿童医院

方法 患儿，男，10 岁。反复腹痛、发热 10 天，咳嗽、胸痛 4 天入院。查体：一般情况差，口周稍青紫，呼吸费力，三凹征（+），胸廓不对称，左侧高于右侧，左下肺呼吸音低，余肺呼吸音粗；辅助及实验室检查：胸部 CT 检查：两侧肺炎，左下肺大片实变，合并胸膜炎两肺病灶内多发空腔样改变。血细胞分析：白细胞计数 14.12×10^9/L，淋巴细胞百分率 21.30%，中性粒细胞百分率 68.90%，红细胞计数 3.77×10^12/L，血红蛋白 104.00g/L，血小板计数 443×10^9/L，超敏 C 反应蛋白 149.21mg/L。降钙素原：0.63ng/ml。电解质、肝肾功、心肌酶：谷丙转氨酶 140U/L，谷草转氨酶 133U/L，余未见明显异常。

手术及病理：左侧胸腔内粘连严重，左下肺可见多发肺囊肿存在。病理检查：肺泡间隔充血、增宽，慢性炎细胞浸润。肺内可见多发结节，结节内肿瘤细胞呈实性、乳头状、腺样排列，小血管丰富，瘤细胞圆形，部分胞浆嗜酸性，部分空泡状，局部间质化，可见砂砾体样钙化，局部乳头状增生，上皮核大深染。胸膜增厚、血管增生。病理诊断：左肺下叶硬化性肺细胞瘤。

讨论：硬化性肺细胞瘤临床上较少见，是一种发生于肺部的良性真性肿瘤。硬化性肺细胞瘤临床及影像学表现虽均无特异性，但边界清楚的胸膜下结节或肿块，无明显分叶及毛刺，周围无卫星灶，瘤内见低密度区和钙化，有明显强化是硬化性肺细胞瘤的典型 CT 表现。确诊仍有赖于病理和免疫组织化学。本例患儿胸部 CT 扫描未做增强检查，影像表现不具特征性，以及儿童硬化性肺细胞瘤比较罕见，影像科医师对本病认识不够，因此误诊为其他肺部疾病。通过加强硬化性肺细胞瘤的认识和学习，提高本病的术前诊断率。

PU-0117

CT 在先天性心脏病肺静脉畸形引流的诊断价值

欧舒斐,朱岳龙,高妙,秦志勇,张海琼,冯华坤,李子阳,郭文聪,徐龙,欧阳耀贤,倪翠玉,刘添添,曹桂香,李文婷,谢诗琴,蒋梓欣,唐琳
中国人民解放军第 458 医院（南部战区空军医院）

研究背景

研究双源 CT 血管成像在先天性心脏病肺静脉畸形引流的应用价值。

评价方法

选择广州军区总医院 256 例先天性心脏病患者，其中诊断为肺静脉畸形引流的患者 40 例（其中男 19 例，女 21 例，最大者 61 岁，最小者 3 个月），回顾性分析 40 例患者的 DSCTA 资料，常规行多平面重组、薄层最大密度投影和容积再现等后处理，并与超声及手术结果进行对照。

讨论

40 例肺静脉异位引流患者均能在 DSCTA 上显示，包括 28 例完全性肺静脉异位引流和 12 例部分型异位引流患者，其中一例伴有无脾综合征。其中 36 例 DSCTA 准确显示了肺静脉畸形部位及引流位置，诊断准确率 95.4%，并可显示合并心内畸形、心外大血管及其它内脏畸形。超声对心内型肺静脉异位引流诊断敏感性较好，但心外型及部分型肺静脉异位引流容易漏诊。DSCTA 诊断敏感性高于经胸超声检查。

结论

DSCTA 能准确诊断肺静脉畸形引流，并能对患者病情进行综合评估，诊断准确率高于超声，对指导临床治疗及手术具有重要价值。

PU-0118

64 排螺旋 CT 后处理对动脉导管未闭的应用

丁聪兴
昆明市儿童医院

动脉导管未闭（PDA）

动脉导管是胎儿时期肺动脉与主动脉间的正常血流通道，由于此时肺呼吸功能障碍，来自右心室的肺动脉血经导管进入降主动脉，而左心室的血液则进入升主动脉，故动脉导管为胚胎时期特殊循环方式所必需。出生后，肺膨胀并承担气体交换功能，肺循环和体循环各司其职，不久导管因废用闭合。如持续不闭合而形成动脉导管未闭

临床表现　主要取决于主动脉至肺动脉分流血量的多少以及是否产生继发肺动脉高压和其程度。轻者可无明显症状，重者可发生心力衰竭。常见的症状有劳累后心悸、气急、乏力，易患呼吸道感染和生长发育迟缓。晚期肺动脉高压严重，产生逆向分流时可出现下半身发

目的

CT 在心血管病变领域中的应用越来越广泛，利用 64 排螺旋 CT 三维技术分析动脉导管的与形态、大小，证实其三维技术在评估 PDA 中的价值。

方法

使用美国 GE 螺旋 CT ，描层厚 3.75mm，重组厚度 0.625mm，扫描条件：电压 100~120kV，电流 100~300mA，用高压注射器从肘正中静脉注射非离子型对比剂，剂量 2ml/kg，如要观察右心室及右心房，则在动脉晚期进行第 2 期扫描，可避免右心室及右心房内对比剂浓度不均的现象。采用多平面重（multipleplannar reformation，MPR）、容积再现（volume rendering，VR）及血管（vesel analysis,VA)软件从形态分类、大小等方面对 PDA 进行评估 .

PDA 是指主动脉和肺动脉之间的一种先天性的异常通道，多位于主动脉狭部和左肺动脉根部之间，是最常见的先天性心脏病之一，约占先天性心脏病的 9%~12%。如不及时治疗，则有可能转化为阻力性肺动脉高压而失去手术机会术前评估的重要性对动脉导管的形态、大小进行精确的评估是 PDA 术前评估的重要指标，可以指导临床选择最佳治疗方案。它不仅对 PDA 治疗方式的选择而且对器械种类以及具体型号的选择均有着重要的指导意义。

PU-0119
前瞻性心电门控技术在高心率儿童冠状动脉 CT 成像中的应用

唐世龙,程卓
重庆医科大学附属儿童医院

目的 探讨前瞻性心电门控技术在高心率儿童冠状动脉 CT 成像中的应用。**方法** 对照组，回顾性分析心率为 100-120 次/min ，2018 年 1 月-12 月在我院行回顾性心电门控冠状动脉 CT 成像，检查成功 2-4 岁患儿 60 名，找出该组患儿冠状动脉成像最佳相位期相。研究组，前瞻性选取 2019 年 1 月-6 月心率为 100-120 次/min 来我院行冠状动脉 CT 检查 2-4 岁患儿 60 名，采用前瞻性心电门控多相位扫描重建技术，重建 40％、45％、50％三个相位图像，选取其中最优相位期相进行冠状动脉血管重建。两组患儿扫描参数、对比剂使用剂量、对比剂注射方式均一致。对比两组患儿接受扫描辐射剂量、冠状动脉血管成像图像质量等。**结果** 患儿接受扫描辐射剂量研究组比对照组低 61％，两组患儿最优相位下冠状动脉血管成像图像质量差异无明显区别（P＞0.05）。**结论** 前瞻性心电门控技术应用于高心率儿童冠状动脉 CT 成像，在不影响冠状动脉成像质量的条件下，可大幅度降低患儿接受的扫描辐射剂量。

PU-0120
叶外型隔离肺蒂扭转:三例报告并文献复习

马慧静
华中科技大学同济医学院附属武汉儿童医院

目的 探讨肺隔离症蒂扭转致腹痛引起的误诊。 **方法** 回顾性分析 3 例经手术及病理证实的肺隔离症蒂扭转 的 MSCT 增强扫描及后处理资料，记录病变特征与发展过程。 **结果** 3 个病变中，均为叶外型 ，均位 于下叶后基底段；位于左肺下叶 2 个，右肺下叶 1 个；病灶均表现为实性病灶 ，增强检查病灶强化不明显，供血动脉均显示不清，均合并有胸腔积液，积液呈渐进性增长趋势，误诊为胸内肿块。 **结论** 隔离肺蒂扭转少见，结合影像表现：双肺下叶后基底段实性病灶合并胸腔积液及临床症状需考虑蒂扭转。

PU-0121
罕见儿童肺部占位—儿童气管腺样囊性癌一例报道

冯煜森,王丽娟
昆明医科大学附属延安医院

儿童肺癌非常罕见[1],国内显有报道。肺癌越来越趋于年轻化，国内 30 岁以下青年人肺癌的报道也日益增多[2]。中国医学科学院肿瘤医院报告 161 例肺癌患者中，肺癌患者最小年龄为 15 岁[3]，儿童肺癌的恶性程度高,发展快,预后较差[5],并且肺癌在年轻患者中多以非肺呼吸道症状为首发症状的约为 23.5%[6]。本例患儿除了发热外无其他症状,外院误诊为肺隔离症状。本病例经手术病例证实为气管腺样囊性癌。儿童肺癌少见而 TACC 更是罕见。文献报道提示此类肺癌十分罕见，发病率低，仅占肺部肿瘤的 0.04%-0.2%[7]。腺样囊性癌最早由 1856 年被 Billroth 命名,它常见于唾液腺,原发于肺及支气管的 ACC 罕见[8]。TACC 起源于气管黏液腺上皮细胞,好发于软骨和膜接合处附近外侧以及后外侧,并且主要于气管上 1/3 段[9]，病变好发于中老年人，约为 40- 60 岁,平均年龄 45 岁,男女发病率基本相当,与吸烟无明显相关性[10]。在影像检查方面，其在胸片上容易漏诊。CT

是发现病灶的首选影像学检查方法。多层螺旋 CT 及三维重建技术可清楚显示病灶的形态、大小、范围、生长方式、管腔侵犯情况。其特征为：好发于主支气管及隆突，常侵润性生长，表现为轻度分叶类圆形肿块，边界光整，与周围肺组织分界清楚，平扫密度较低并且均匀，常低于邻近胸壁肌肉，增强扫描后呈轻度强化，病灶内坏死不常见，少数病例可侵犯胸膜或纵隔形成巨大肿块，病理上由于肿块的间质内少有血管，易发生黏液样或透明变性，瘤组织坏死不常见，故 TACC 在 CT 上密度较低且均匀、增强后强化不明显[12]。本例患儿具有以上特征。MRI 有助于提示周围软组织的侵犯情况。 支气管镜检查是诊断气管肿瘤最直接有效的方法,其在可发现病变部位、形态、范围并进行病理活检及镜下治疗,为外科气管重建手术提供一定指导。本例患儿仅有发烧症状,在 CT 下误诊,支气管镜病理证实为 TACC.

PU-0122
儿童 CT 增强检查中留置针限速技术对降低渗漏率的应用探讨

唐贤超
昆明市儿童医院

探讨留置针限速技术在儿童 CT 增强检查降低渗漏率中的应用优势。 **方法** 利用留置针限速技术对我院 600 例患儿行 CT 增强检查，记录全部样本的年龄、体重（kg）、造影剂量（ml）、注射速率和所选用留置针型号，以及产生的造影剂外渗发生率，进行统计学分析。**结果** 600 例患儿中，20G 留置针较少使用；312 例使用 22G 留置针穿刺；276 例使用 24G 留置针穿刺；12 例使用 26G 留置针穿刺。平均造影剂注射速率 ml/s。仅 4 例患儿发生造影剂外渗现象，外渗率为 0.67 % 。**结论** 静脉留置针限速技术降低了我们造影剂外渗率，但它不是一个绝对值，患儿身体情况也存在一定差异，我们日常工作中应该根据自身经验再参考留置针限速技术选用最恰当的注射速率做检查。

PU-0123
基于经肘静脉注射对比剂的儿童胸部 CT 增强扫描方法 改进设想

徐盛威
重庆医科大学附属儿童医院

目的 提出基于经肘静脉注射对比剂的儿童胸部 CT 增强扫描方法改进设想，以期解决常规儿童经肘静脉推注对比剂行胸部 CT 增强扫描时因肘静脉、上腔静脉尚未进入右心房的残留对比剂导致伪影问题，并且有望降低碘对比剂注射量，减轻患儿代谢压力，降低医疗风险。
方法 本科室用 Philips 公司 Brilliance iCT 行各部位增强扫描，其中胸部 CT 增强扫描所占比例居首位。常规胸部 CT 增强，扫描范围由肺底到肺尖，都采用经患儿肘静脉注入对比剂，剂量 1.5~2.0mL/kg，最低不小于 10mL，最高不多于 80mL，注射流速 0.5~3.5mL/s；对比剂注射完毕生理盐水使用量占对比剂的 1/4~4/5，流速与注射对比剂同。对比剂推注结束时间为 20~25s，根据经验，常规胸部增强在对比剂注射结束延后 5s 扫描动脉期，动静脉可同时显影；也可以采用 bolus 阈值触发智能扫描，监测层放于扫描起始层面。改进**方法** ①积累经验，减少对比剂使用量，增加生理盐水用量，以此减少对比剂注射时间，相对滞后起始扫描时间；②减少对比剂用量，扫描范围由肺尖到肺底，用 bolus 监测，将监测层置于肺尖层面，主要观察对比剂从肘静脉回血至上腔静脉结束时手动触发快速扫描。

结果 理论上而言两种改进方法都具有可行性，但实践中得以验证的数量还很少，需要进一步在实践中验证其可操作性。
结论 常规胸部 CT 增强经肘静脉注射对比剂，总是会在肺尖那几个层面出现因碘对比剂未完全进入心脏导致的高亮放射状伪影，影响图像质量，也在一定程度上影响诊断，尤其是病变出现在肺尖或胸锁等部位时。通过改进对比剂用量及起始扫描时间等，为减轻或消除此种伪影带来了理论上的可能性，同时对受检患儿能减少代谢负担，进一步降低医患风险，但尚需进一步实践加以验证。

PU-0124

婴幼儿胸部 X 线摄片技巧体会

赵中顺
昆明市儿童医院

【摘要】一张优质的胸片，能为临床诊断及治疗提供强有力的依据。由于婴幼儿患者一般处于被动体位，不能同放射技师很好的配合，结合家长的因素，因此，拍摄出优质照片的难度加大。**目的** 探讨婴幼儿胸部 x 线投照技巧。**方法** 通过多年对婴幼儿胸部 X 线摄片工作经验的总结，从体位设计及曝光时机方面对摄片质量进行探讨。**结果** 根据不同情况设定不同的体位，结合最优的曝光时机，能提高胸部摄片质量。**结论** 对患儿高度责任心、正确的体位设定及合理的曝光时机的选择是摄出优质婴幼儿 X 线片的关键。

PU-0125

GE64 排多层螺旋 CT 对儿童气管\支气管异物的诊断价值

黎宁杰
昆明市儿童医院

摘要：目的 探讨多层螺旋 CT（MSCT）及 CT 重建对气管、支气管异物的诊断价值，提高对气管、支气管异物影像学认识及临床检出率。**方法** 对 10 例病例行 MSCT 检查及多模式重建如多平面重建（MPR）、表面遮盖显示法（SSD）、CT 仿真支气管镜（CTVB）图像分析诊断，病例均经纤维支气管镜或临床证实。**结果** 气管、支气管异物 10 例，诊断符合率 100%，与临床一致。**结论** 利用 MSCT 的多模式重建，结合轴位图像能提高诊断气管、支气管异物的准确性，可作为支气管镜检查前的筛查与定位手段。

PU-0126

儿童胸膜肺母细胞瘤 1 例

许金霞
浙江大学医学院附属儿童医院

目的 探讨儿童胸膜肺母细胞瘤的早期诊断、治疗及预后。**方法** 回顾性分析 1 例由 1 型胸膜肺母细胞瘤逐渐进展为 2 型胸膜肺母细胞瘤患儿的诊治过程。**结果** 患儿，男， 10 个月时无明显诱

因下出现发热、咳嗽，查胸片及胸部 CT 可见双侧多发大小不等的囊性占位，提示多发性肺囊肿可能。两年来患儿咳嗽、发热反复出现。2 岁 9 个月，胸部 CT 提示两肺囊性占位部分实变，手术后病理诊断(右肺)胸膜肺母细胞瘤（结合临床考虑为囊实型，Ⅱ型）。患儿手术后常规化疗，5 个月后出现左心房巨大癌栓、多器官功能衰竭而死亡。**结论** Ⅰ型胸膜肺母细胞瘤与先天性肺囊肿等囊性病变不宜鉴别,随着时间的进展，Ⅰ型胸膜肺母细胞瘤有可能演变为Ⅱ型、Ⅲ型胸膜肺母细胞瘤，胸膜肺母细胞瘤早期诊断及治疗对病人的预后非常重要。

PU-0127

新生儿先天性结核病 2 例并文献复习

张静,黄竹媛
西北妇女儿童医院（陕西省妇幼保健院）

目的 分析新生儿先天性结核病的临床及影像学特点，分析致死因素，提高早期诊断准确性。**方法** 回顾性分析我院确诊 2 例先天性结核病例的临床特点，并进行文献复习。**结果** 两例患儿的胸部 X 线及 CT 表现为双肺内弥漫分布的结节样高密度影，部分结节可见融合，周围伴少许渗出；腹部 X 线示：部分肠管积气扩张并多发宽大气液平面，提示肠梗阻伴腹水；复查腹部 X 线片诊断为肠穿孔，液气腹。两例患儿的肝脾内均可见多发低密度结节影形成。随后经胃液检查，确诊为先天性结核病，最终因十二指肠穿孔死亡。**结论** 先天性结核病临床表现不典型，影像学表现出现双肺广泛播散病灶，需要考虑到本病，结合结核生化指标检测可确诊；如并发脑膜炎，肠梗阻时提示预后不良。

PU-0128

儿童腺病毒肺炎合并肠穿孔一例

王敏
天津市儿童医院

患儿，男，11 岁，主因“发热、咳嗽”入院。入院前 3 天无明显诱因出现发热，持续高热，呈稽留热，最高达 40℃，无寒战、皮疹。后出现咳嗽，偶尔咳出黄白色粘痰。入院前一天出现腹泻，为黄色稀水样便。血 PCT、CRP 明显升高。住院期间患儿诉腹痛，脐周为著，查超声提示：左侧腹腔局限性肠壁增厚，腹水。查胸部 CT 示：双肺散在大片状密度增高影，双侧胸腔内少量积液。查腹部 CT 示：腹腔内可见气体密度影，双侧肾盂增宽，腹腔内部分常规扩张积液、积气，肠系膜模糊肿胀，腹盆腔积液。急症手术探查，术中提示十二指肠穿孔。该患儿痰和肺泡灌洗液腺病毒（+），诊断为腺病毒肺炎。

腺病毒肺炎在小儿肺炎中占 5%~9%，主要由腺病毒 III、VII 型引起。病理上表现为两肺广泛支气管炎，支气管周围炎和毛细支气管炎，粘膜充血水肿，管腔内充满渗出物及坏死脱落的细胞，使管腔严重狭窄，甚至阻塞。肺实质可呈灶性或大片实变，广泛凝固性坏死为本病的特点。腺病毒感染病情比较重，还容易合并其他并发症，文献报道的有肠套叠，中枢神经系统感染等，像我们这一例，患儿合并消化道穿孔。当临床和影像学表现均比较重，而且合并有其他并发症时，要警惕腺病毒肺炎。

PU-0129

256 排 CT 在小儿先天性心脏病的应用

郭迪
徐州市儿童医院

【摘要】目的 研究在小儿先天性心脏病患儿中使用 256 排螺旋 CT 进行诊断的效果。**方法** 选择我院收治的先天性心脏病患儿 40 例，对其使用 256 排螺旋 CT 以及多普勒超声进行诊断，对比手术确诊结果、CT 诊断结果以及超声诊断结果。**结果** 40 例患儿经手术全部确诊为小儿先天性心脏病，CT 检查结果显示为 38 例，超声检查结果显示为 37 例，三种检查方法相比并没有明显的差异（P>0.05）。除此之外，在患儿先天性心脏病类型的诊断中，手术结果与 CT 检查结果的差异也没有统计学意义（P>0.05）。**结论** 在小儿先天性心脏病的诊断中，使用 256 排螺旋 CT 具有较高的准确性，提高先心诊断准确率。

PU-0130

睾丸畸胎瘤一例

梁庆乐
玉林市第一人民医院/广西医科大学第六附属医院

患者 xxx，男，5 月，发现右侧睾丸肿大 2 月余。2 月前无意中发现右侧睾丸肿大，表面不平，无红肿触痛，睾丸肿物逐渐增大。门诊 B 超提示：右侧睾丸异常回声占位。初步诊断：右侧睾丸肿物。

CT 示：右侧睾丸明显增大，密度不均匀，边界较清楚，增强扫描无明显强化，边界清楚，大小约为 2.6cm×2.9cm×3.9cm；左侧睾丸未见明显异常；盆腔未见肿大淋巴结，未见积液。CT 诊断：右侧睾丸占位性病变，考虑畸胎瘤可能性大，未除精原细胞瘤，请结合临床。

病理：右侧睾丸成熟性畸胎瘤。

按组织病理学畸胎瘤分为成熟、不成熟和恶性畸胎瘤。

本病例为 5 个月大婴儿，右侧睾丸肿大，内有小斑片状钙化灶，增强扫描无明显强化，虽然无明显脂肪密度灶，但还是应先考虑良性肿瘤。

PU-0131

囊肿型肠重复畸形的 MSCT 诊断

吴德红
十堰市太和医院

目的 分析小儿囊肿型肠重复畸形的 CT 表现，以提高该病的诊断水平。**方法** 回顾性分析 11 例经手术病理证实的肠重复畸形患儿的临床资料及 CT 表现。**结果** 男 8 例，女 3 例，全部为囊肿型肠重复畸形，其中肠外型 9 例，肠内型 2 例。肠外型 CT 表现为单房低密度囊性肿块，囊壁较厚，增强扫描囊壁均匀强化；其中 5 例表现为双层状“晕轮征”。肠内型 C T 表现为肠腔内附壁囊性肿块，轴位扫描表现为“双弧征”。**结论** 囊肿型肠重复畸形临床表现缺乏特异性，CT 表现较具特征，对该病的术前诊断及鉴别诊断具有重要价值。

PU-0132

小儿卵巢蒂扭 转 64 层 MSCT 诊断

李庚武,费维敏,李旭,胡俊,王昶
安徽省儿童医院

目的：总结小儿原发性卵巢蒂扭转的64层MSCT表现，提高对本病的认识。方法：回顾性分析本院2013年1月－2019年6月经手术病理证实的21例小儿原发性卵巢蒂扭转患者的MSCT表现。年龄主要发生在两个年龄段3天～42天，8～12岁，其中主要临床表现为腹胀、腹痛、发热、呕吐等，临床疑阑尾炎或新生儿肠梗阻行腹部MSCT检查，其中21例均行平扫检查，增强检查14例。结果：21例患者中右侧卵巢蒂扭转9例，左侧13例，其中1例左右卵巢相隔两年后先后发生扭转；MSCT主要表现为子宫一侧软组织肿块影，呈椭圆形，前后径大于左右径，包膜完整，边界清楚，包膜下可见典型铺路石征13例。增强扫描示卵巢呈轻度－中度强化，包膜强化，包膜下多发圆形低密度影无强化，9例其周边强化血管增粗、增多、紊乱。结论：小儿原发性卵巢蒂扭转好发于新生儿期及8至12岁儿童；MSCT表现具有特征性，尤其是盆腔铺路石征具有特征；MSCT可用于儿童急腹症的诊断及鉴别诊断。

PU-0133

肾上腺区囊性神经母细胞瘤一例

王宁
天津市儿童医院

神经母细胞瘤（neuroblastoma，NB)是儿童罪常见的颅外实体恶性肿瘤，其年发病率在1/300万~10/100万。5岁以下为发病高峰，男多于女，恶性程度高，易转移。囊性神经母细胞瘤（cystic neuroblastoma，CNB）是NB的一种罕见类型。CNB非常罕见，影像学上诊断较困难，本文简述一例囊性神经母细胞瘤。

PU-0134

动态 DR 在小儿气道 X 线阴性异物检查中的独特价值

刘金丰
广东省中医院珠海医院

临床背景：

小儿气道异物为呼吸道阻塞的紧急情况，是小儿常见急症之一，严重威胁患儿生命健康，如果处理不及时可引起严重并发症，甚至死亡。小儿气道异物检查有X线检查、CT检查和支气管镜检查，其中X线检查是非创伤性检查的金标准，是小儿气道异物检查的首选方法。文献报导，小儿气管、支气管异物的X线检查误诊漏诊率可达44.4%，而不做胸透以及缺乏良好的深呼、吸气相胸片则是误诊漏诊的主要根源。

动态 DR 检查:

对于有异物吸入史的低龄患儿，检查设备选择动态 DR，患儿平卧于检查床上，先透视患儿的一个呼吸周期，动态观察呼吸运动、纵膈有无摆动等（可通过视频回放做细致观察）。然后选择 2 帧每秒的连续点片模式，连续点片 4-8 张，完整记录患儿一个呼吸周期的胸部动态影像。因为点片速度快，对于哭闹不配合的患儿，只需家长对其双肩及盆骨处稍加限制即可，并不影响摄片效果。通过回看呼吸周期的连续点片影像，即可根据患儿胸廓大小准确找到深吸气相和深呼气相对照观察。最后结合动静态影像，观察呼吸过程中是否存在局部肺野透亮度异常改变、纵膈和横隔运动及其位置的变化异常、心影吸气性增大等间接征象来进行诊断。

结果与**结论**

普通透视影像不能记录和重复，放射诊断医师往往在进行较长时间连续透视后仍不能观察到所有有价值的诊断征象，这种情况在低年资医师中更为普遍。患儿或因气促呼吸周期缩短，或因年幼哭闹不配合，医师常难以摄取理想的深呼、吸气相胸片，已摄取的胸片也常存在难以确定是吸气还是呼气相的问题。所以，普通 X 线透视和摄片在小儿气道异物的诊断中存在检查一次性成功率低、图像质量难以保证和细微影像不易观察的局限性，重复摄片和长时间透视不仅患儿接受 X 线照射量大，也延误救治时机。通过动态 DR 连续点片获得良好的深呼、吸气相胸片，再辅以透视，则气管、支气管异物基本可以明确诊断。

PU-0135

新生儿坏死性小肠结肠炎的 X 线表现及临床分析

张增俊,陈超,侯欣,王冬
西安市儿童医院

目的 分析新生儿坏死性小肠结肠炎(NEC)的 X 线征象及临床因素,提高对新生儿 NEC 的认识。方法 回顾性分析经临床及手术确诊的 21 例新生儿 NEC 患者的腹部 X 线平片、临床资料及危险因素。结果 NEC 的 X 线表现: Ⅰ 期,肠动力性改变,肠间隙增厚 ≤2mm 者 10 例; Ⅱ 期, ① 肠间隙增厚 >2mm (4 例); ② 肠壁积气(4 例); ③ 门静脉积气(3 例); Ⅲ 期, ① 明确腹腔渗液(3 例); ② 气腹(3 例)。早产儿 18 例(85%);低体重儿 16 例;新生儿呼吸窘迫综合征、感染、肺炎、败血症和机械通气是 NEC 重要的危险因素。
结论 新生儿 NEC 的 X 线征象早期缺乏特征性,中晚期具有特征性表现,明确诊断需结合临床表现及致病危险因素,必要时动态随观。

PU-0136

新生儿先天性十二指肠梗阻的 X 线诊断价值

张英杰,刘爱萍,吕冬梅,董哲,蔡源
哈尔滨市儿童医院

【摘要】目的 分析新生儿十二指肠梗阻 X 线表现，以便诊断原发疾病。**方法** 收集我院 2016 年 7 月-2018 年 10 月间手术病理证实的十二指肠梗阻患者 34 例，34 例均行腹部立位片检查,其中 32

例行胃肠道碘对比剂造影检查,16 例行结肠造影检查，就其 X 线表现进行回顾性分析。**结果** 腹部立位片见“单泡征”2 例,“双泡征”24 例,“三泡征”1 例, 腹部生理积气减少 7 例.胃肠道造影检查显示十二指肠完全梗阻 7 例,不完全梗阻 25 例,其中梗阻位于十二指肠降段中部以上 5 例，梗阻位于十二指肠降段中部以下 27 例，显示空肠位置异常 18 例.结肠造影检查显示回盲部位置异常 9 例,细小结肠 4 例。手术证实：环状胰腺 5 例，十二指肠闭锁 6 例，十二指肠狭窄 5 例，肠旋转不良 18 例伴中肠扭转 14 例。**结论** 结合临床病史及腹部立位片可对十二指肠梗阻做出诊断,胃肠道碘对比剂造影和/或结肠造影检查对新生儿先天性十二指肠梗阻及病因诊断有重要的价值。

PU-0137

儿童肝血管瘤的 CT 影像学分析

黎宁杰
昆明市儿童医院

50 例肝血管瘤儿童患者（共 60 个病灶）均行 CT 平扫及三期增强扫描。造影剂注射结束后 16~20s 后行动脉期扫描，60s 后行静脉期扫描，3~10 分钟后行行延迟期扫描。结果平扫 CT 图像上所有病例均表现为低密度或稍低密度灶，边缘清晰或较清晰。增强扫描动脉期大部分病灶呈周边强化，门脉期造影剂逐渐向中心扩展，延迟期病灶被部分或完全充填呈高密度表现。造影剂“快进慢出”或“慢进慢出”是肝血管瘤的典型 CT 表现，具有较高的诊断价值。

PU-0138

空肠浆膜下血肿影像学诊断

王更辉,徐守成
哈尔滨市儿童医院

方法 回顾性分析 2 例病理证实的空肠浆膜下血肿 CT 影像学表现；
结果 CT 平扫表现为肠壁内椭圆形高低混杂密度肿物，边界欠清，肠管局部狭窄，可见新月形气体裂隙征，CT 增强后肿物内未见明显强化，肿物后壁与空肠肠管关系密切，强化程度相当；
结论 CT 检查对空肠浆膜下血肿的诊断有重要价值，血肿影像表现具有一定特征性。

PU-0139

研究胰腺实性假乳头状瘤(SPTP)CT、MRI 影像学表现

王更辉,徐守成
哈尔滨市儿童医院

方法:回顾性分析 3 例经病理证实的胰腺实性假乳头状瘤的 临床及 CT 和 MRI 影像学表现
结果:SPTP 是好发于青少年女性的一种少见的胰腺肿瘤,胰头、体部位好发.CT 及 MRI 影 像学表现为境界清晰的类圆形肿块.CT 平扫表现为囊实性混杂密度,无钙化， MRI 表现为混杂信号，肿块周围呈实性，其内可见小片状短 T1 信号，提示肿块内部有出血灶，DWI 序列实性部分弥散明显受限呈高信号.动态增强肿块实性部分早期轻度强化,后期强化不明显.3 例肿瘤 肿块包膜完整清晰,肿块内多伴有出血及囊变

结论:CT 及 MRI 对胰腺实性假乳头状瘤诊断有重要价值,MRI 可提示病灶有无出血,囊变,包膜方面更具优势.

PU-0140
儿童 Xp11.2 易位 TFE3 基因融合相关性肾癌 CT 表现

马秋红,金科
湖南省儿童医院

[摘 要] **目的** 分析儿童 Xp11.2 易位 TFE3 基因融合相关性肾癌 CT 表现，以提高该病的诊断水平。**方法** 回顾性分析湖南省儿童医院 2011 年 1 月～2019 年 6 月经手术病理确诊的 3 例 Xp11.2 易位 TFE3 基因融合相关性肾癌患儿资料，并结合相关文献复习。3 例均行 CT 平扫及增强扫描。观察分析 Xp11.2 易位 TFE3 基因融合相关性肾癌瘤体的部位、大小、形态、密度（囊实性特征、钙化、出血）、强化方式及转移等。**结果** 3 例病灶均位于左肾，2 例病灶中心位于髓质内，1 例病灶为外生型。CT 平扫 2 例呈稍高密度，1 例呈囊实性密度影，2 例合并出血，1 例出现钙化灶。2 例出现淋巴结转移。3 例呈圆形、类圆形改变，其中 2 例出现结节状、分叶状改变。动态增强扫描示病灶呈轻中度不均匀强化改变，各期强化程度均低于正常肾皮质，皮质期高于髓质期，髓质期高于延迟期，强化程度逐渐减低改变。**结论** 儿童 Xp11.2 易位 TFE3 基因融合相关性肾癌 CT 表现具有一定的特征性，当儿童肾脏肿瘤 CT 平扫密度稍高，有出血、坏死、钙化，增强轻中度强化时，应考虑 Xp11.2 易位 TFE3 基因融合相关性肾癌的可能。

PU-0141
探讨 MR 同反相位对诊断肾上腺腺瘤的价值

李婷婷
上海市儿童医院、上海交通大学附属儿童医院

目的 探讨 MRI 同相位反相位成像在小儿腹部肾上腺腺瘤诊断中的应用价值。**方法** 收集我院 2018 年 6 月-2019 年 4 月间，经超声诊断位于肾上腺，怀疑为腺瘤占位且行肾脏 MR 检查的患儿 30 例，同时收集此期间收治的肾上腺其他肿瘤患儿 30 例作为对照，分析两组病变 MRI 同反相位序列上的占位图像信号，并统计术后所有病例病理分型报告。**结果** 两组均顺利完成检查，观察组在 MR 反相位上呈现出程度不同信号降低的患儿有 28 例，对照组所有病例 MR 同反相位序列上，未出现反相位信号下降特征（P〈0.05）。**结论** MR 反相位信号下降是肾上腺腺瘤重要特征，结合 MRI 同相位反相位序列能提高肾上腺腺瘤确诊机率。

PU-0142
儿童睾丸卵黄囊瘤的 MRI 表现与病理结果 对照

李旭
安徽省儿童医院

目的 分析儿童睾丸卵黄囊瘤的 MRI 表现，并与病理结果对照，提高对儿童睾丸 YST 的认识。**资料和方法** 回顾性分析我院自 2015 年 1 月至 2018 年 12 月共发现 62 例儿童睾丸占位的影像学表现，其中 8 例行 CT 检查, 54 例行 MRI 平扫及增强扫描，分析其中 15 例经 MRI 诊断为睾丸 YST 的 MRI

表现，并与手术病理结果进行对照分析。**结果** 该组 15 例患儿均为单侧睾丸发病，9 例位于左侧，6 例位于右侧，术前超声诊断 YST5 例，提示占位未给予明确占位 6 例，畸胎瘤 3 例，1 例超声结果未知；MRI 给予诊断睾丸 YST 诊断 15 例，同时侵犯附睾或精索 7 例。AFP 结果显示：>1000ng/ml 有 10 例，<1000ng/ml 有 2 例，3 例未行 AFP 检查。该组患儿均行手术并取得病理结果，MRI 诊断结果均与病理结果相符。**结论** MRI 在诊断睾丸 YST 及评估精索受侵情况具有非常高的敏感性及准确性，与病理结果具有较高的一致性，可为临床手术和评估提供准确的信息。

PU-0143

肝脏间叶性错构瘤 1 例并文献复习

韦建规
广西医科大学第一附属医院

目的 探讨肝脏间叶性错构瘤的 CT 表现，以提高其诊断正确率。
方法 回顾性分析 临床资料：搜集已经获得病理证实的 1 例肝脏间叶性错构瘤的 C T 图像及临床资料，对其 CT 表现进行分析，并复习相关性文献。
结果 患者 1 月 28 天，查体腹部膨隆，右上腹可触及一大小约 6cm×5cm 包块，实验室检查 AFP 阴性。CT 检查示肝右叶见一囊实性低密度肿块，肿块体积较大，中央见斑点状稍高密度影，增强多期扫描动脉期边缘实性部分不均匀斑片状强化，门脉期及平衡期呈渐进性持续强化。病理诊断肝脏间叶性错构瘤。
结论 肝脏间叶性错构瘤 CT 表现具有一定的特征性，CT 可作为一种辅助检查，能够提供一定的诊断依据。

PU-0144

儿童脾性腺融合综合征一例并文献复习

蔡雪梅
上海交通大学医学院附属儿童医院、上海市儿童医院

阴囊内脾性腺融合是一种罕见的泌尿生殖系统畸形,由 Bostroem 于 1883 年首次报道。该病多见于左侧阴囊,极少见于右侧尚无双侧同时发病的报道。据不完全统计超过 70%的病例发病年龄低于 20 岁,约 50%的病例发病年龄低于 10 岁。由于阴囊内脾性腺融合多为良性,所以儿童阴囊肿物的鉴别诊断对避免不必要的睾丸切除具有重要意义。本文以一例脾性腺融合症为背景介绍其 CT、MRI 影像表现及腹盆部联合扫描的临床诊断价值。

PU-0145

能谱 CT 在儿童疾病检查中的应用进展

刘思讪
上海市儿童医院

目前，能谱 CT 在成人疾病中的应用已越来越普遍，已广泛应用于全身各个器官和系统。儿童处于生长发育期，对辐射的损伤较成人更敏感，致癌风险也较成人明显增大。因此，儿童 CT 检查要尽可能使用低剂量扫描，如使用低管电压和迭代重建技术也可以减少儿童 CT 扫描的辐射剂量，能谱

纯化技术通过滤过低能级剂量，可以提高射线利用率而达到降低辐射剂量目的。学龄儿童能谱 CT 扫描未显著增加辐射剂量，能谱 CT 在降低 CT 辐射剂量方面的价值也得到了一定的认可。能谱 CT 在儿童疾病中的应用也可见报道，本文就能谱 CT 在儿童疾病中的技术及临床应用作一综述。与传统 100 kV 扫描技术相比,在儿童胸部 CT 平扫中采用第 3 代双源 CT 能谱纯化技术可以降低 92%的辐射剂量,并且同时可获得诊断能接受的肺窗图像质量。能谱分析技术还能发现病灶的组织成分，有学者利用能谱分析技术发现一例纵隔神经母细胞瘤内含脂肪成分，还对纵隔淋巴瘤和胸腺瘤的鉴别有很大的潜能。能谱 CT 的多点多参数研究有助于评价 BCS 患者的肝功能及预后，即通过能谱 CT 确定的标准碘化值（normalized iodine concentration，NIC)有助于评估布加综合征（Budd-Chiari syndrome ，BCS)患者的肝功能，不同肝功能的 BCS 患者的肝实质 NIC 值可提供一定的诊断价值，并可为 BCS 患者治疗后的复查，预后评估和随访提供影像学资料。CT 能谱成像多参数可用于分析评估血友病性滑膜炎 SHD 的严重程度，具有重要的临床意义。应用能谱成像技术和 AISR 技术联合扫描可以降低图像噪声，为脊柱融合患者术后 CT 评价提供更好的图像质量。能谱 CT 与常规 CT 相比，能够提供多种参数进行疾病的诊断及定量分析，为临床和科研更多的疾病信息。但是能谱 CT 在儿童疾病中的应用仍较成人相对少且落后，笔者相信随着技术的不断成熟，研究的逐渐深入，能谱 CT 在儿科领域的临床和科研中能发挥越来越大的作用。

PU-0146
胃肠道巨大毛发性胃石症致肠穿孔 CT 表现 1 例报道

葛文,宋修峰
青岛市妇女儿童医院

背景：胃石症是指因摄入异物或不能消化的食物并在胃内形成团块，进而引起的一系列临床症状。毛发性胃石症，尤其是胃肠道巨大毛发性胃石症致肠穿孔极其罕见。
病例简介：患儿，女，13 岁，因“持续性腹痛 2 小时”入院。CT 诊断:1. 腹腔积气积液，提示胃肠道穿孔可能；2. 胃、十二指肠及空肠上端肿块并扩张；3. 腹膜炎、腹腔积液。于全身麻醉下行胃穿孔修补术+腹腔引流术，术后确诊为毛发性胃石症。术后追问病史，患儿自 3 岁起捡食头发。
讨论：巨大毛发性胃石延伸至十二指肠或空肠近端并出现的临床症状，又称为“长发公主综合征”(Rapunzel Syndrome)。CT 是其首选诊断方法，可明确胃石的位置、大小、形态等，表现为胃内不强化的包块影，形成类似于“胃、肠”的形状，其内可见夹杂的斑点状气体密度影。周围可有液体及气体，且与胃石不能混合，在其周围形成独立的气-液平面，考虑本征象或许可以认为是诊断毛发性胃石及与正常胃内容物鉴别的重要指征。

PU-0147
A Huge Urinary Bladder Spindle Cell Hyperplasia : A Case Study

Siqi Chen,Chunchen Wei,Kai Li
The First Affiliated Hospital of Guangxi Medical University

Purpose: To investigate the Imaging features and pathological characteristics of urinary bladder spindle cell hyperplasia, a rare tumor.
Method and materials: Using a review in a patient who was admitted to the hospital because of hematuria for 5 days, we analyzed the Imaging features and the clinicopathological characteristics of the patient.

Results: A 1-year-old girl was admitted to the hospital because of hematuria for 5 days. The temperature was 37.5° C, the pulse was 120, and the respirations were 28. On examination: A 3cm × 2 cm mass can be touched in the lower abdomen. The results of hematologic laboratory tests : UA: 105 umol / L,HCO 3: 18.9mmol / L , mannosylated antigen CA199 / 125 / 513(-) ,carcinoembryonic antigen CEA (-), A. Fetal protein AFP (-); A Contrast-enhanced computed tomographic (CT) scan shows heterogeneous enhancing mass arising from the posterior urinary bladder wall. The size is about 4.4 cm × 5.1 cm × 6.5 cm with indistinct boundaries. And the bladder wall was thickened and irregular. The boundaries between left ureter and and the mass are unclear. The left ureter expanded, the renal pelvis and renal pelvis are dilated. All these suggestived of the mass invasion, but the ultrasound-guided biopsy: Two Gray tissues, 0.7-1.5 cm long and 0.1 cm in diameter, were fully produced. The spindle cells proliferated under the microscope, and the cells showed no atypical mitotic activity. Immunohistochemistry：Actin (-), Bcl-2(-), CD34(-), CD99(+), CD68(-/+), Desmin(-), Ki-67 (very low positive rate), GATA3 (-), Vimentin(+), S-100(-), SMA(-), CK(-), CK18(-), CK5 / 6(-). Striated muscle, smooth muscle tumor can be excluded.
Conclusion: Spindle cell lesions of the urinary bladder is a rare tumor, include inflammatory myofibroblastic tumor (IMT) and Postoperative spindle cell nodules . IMT is a rare myofibroblast overgrowth that can occur anywhere, occurring either spontaneously or after instrumentation. The CT or MRI findings of the most common inflammatory myofibroblasts were a soft tissue mass with a significant enhancement of contrast enhancement. 80% lesions is a solid mass, only 10% with calcification, and the location is multiple and uncertain. At the same time, it needs to be differentiated from malignant tumors (sarcomatoid urothelial carcinoma and leiomyosarcoma) because of its overlapping in their morphology and published immunohistochemical profil. When IMT is considered, surgical resection is first recommended. And patient need further follow-up treatment.

PU-0148

儿童胰母细胞瘤 CT 表现与病理对照分析

李小会,杨明,高峰,张新荣,管红梅,顾海斌,陈桂玲
南京医科大学附属儿童医院

目的 探讨儿童胰母细胞瘤的 CT 表现，提高对该病认识。
方法 回顾性分析 2009 年 9 月-2019 年 6 月我院 7 例儿童患者均行 CT 扫描并经手术病理证实的胰母细胞瘤的 CT 表现，并与病理结果对照分析，总结胰母细胞瘤的特点。
结果 胰母细胞瘤临床表现为消化道症状、腹部包块、不同程度的贫血及肿瘤标准物 NSE 的升高。 CT 表现为腹腔巨大占位，7 例患儿，男 5 例，女 3 例；1 例 5 月，6 例＞2 岁，平均年龄 3.2 岁。3 例位于胰腺头体部，1 例位于胰腺体尾部、3 例胰腺头体尾部，其中 6 例跨中线生长，病灶边界清晰； 6 例以实性为主，其内见坏死成分，5 例有沙粒样钙化，1 例囊实混合有分隔；增强后实性成分呈中度延迟性不均匀强化，由腹腔干分支供血，2 例包绕周围血管，5 例周围有肿大的淋巴结,1 例胰管扩张，2 例肝内胆管扩张。上皮细胞构成的巢状小体是胰母细胞瘤典型的病理改变，EMA、CK、Ki-67 和 Syn 是主要的阳性标志物。
结论 胰母细胞瘤 CT 表现较具特征性，结合临床表现及好发年龄可在术前作出诊断，但其确诊依靠病理。

PU-0149

磁共振 T2*诊断新生儿血色病一例

龚英
复旦大学附属儿科医院

目的 提高对新生儿血色病(neonatal hemochromatosis，NH)的认识，探讨磁共振 T2*在诊断新生儿血色病中的诊断价值。**方法** 患儿女，3 天，孕 38 周，G2P2，生后 Apgar 评分 9-10 分。因发现双下肢水肿 2 天，尿少 1 天入院，入院后有腹胀，胃肠减压引出血性液体表现；患儿同时有房间隔缺损，二尖瓣中量反流，三尖瓣少量反流，肺动脉高压，动脉导管未闭。**结果** 实验室检查提示患儿肝肾功能损坏，低蛋白血症，胆汁淤积，三系减少，凝血功能持续异常，动态监测铁蛋白均明显高于正常，腹部 MR 示肝脏及胰腺铁沉积，临床诊断新生儿血色病。最终患儿医治无效死亡。**结论** 新生儿血色病指早期新生儿严重肝病，以肝及肝外组织铁沉着为典型病理表现。新生儿血色病曾归为先天性铁代谢疾病，属于先天性家族性血色病。陆续散发病例报道，该病均以新生儿期严重肝损伤、甚至肝衰竭为显著临床特征的一组综合征，伴有肝外组织铁沉积，病死率极高。新生儿血色病临床表现多有肝功能衰竭、多脏器衰竭、低血糖、凝血机制明显异常、低蛋白血症、伴或无腹水水肿(非免疫性水肿)、少尿等。对产前或生后短期内即有肝病表现均应疑诊新生儿血色病。存在肝外组织铁沉着是诊断新生儿血色病必备条件，肝内铁沉着非诊断所必需。磁共振 T2*技术可以直观地展示肝脏和其他脏器的信号变化 ，无创地反映肝脏及其他脏器的铁含量，为临床诊断和进一步治疗提供必须的依据。

PU-0150

空气灌肠在治疗儿童肠套叠中的应用

高云剑[1],曹巧玲[2]
1.苏州大学附属儿童医院
2.苏州第五人民医院

摘 要 ：目的 研究空气灌肠在治疗儿童急性肠套叠中的应用价值 。 方法：收集本院 2 0 1 6 年 1 月至 2 0 1 6 年 12 月间 20 例肠套 叠患儿样本，研究空气灌肠整复术的疗效 。 结果：总整复率 90% 。 讨论：空气灌肠是儿童肠套叠首选治疗方法 ，具有小创伤 、便利 、低成本 、高成功率等优点 ，具有临床推广意义 。

PU-0151

婴幼儿泌尿系 CT 增强扫描与静脉肾盂造影联合检查的应用

吴锦华,王荣品,曾宪春
贵州省人民医院

目的 在婴幼儿泌尿系疾病检查中，采用泌尿系 CT 增强扫描与静脉肾盂造影联合检查，既可以得到 CT 与 DR 的互补影像，而且可以减少碘对比剂注入体内的次数与剂量，从而减轻患者的痛苦及经济负担。

方法 产前检查发现泌尿系异常的患儿，出生后根据病情需要作泌尿系 CT 增强扫描/静脉肾盂造影检查时，先行腹部平片 DR 摄影后，再行泌尿系 CT 增强扫描。根据患儿体重经静脉注入适量非离子型碘对比剂后进行泌尿系 CT 增强扫描，当 CT 动静脉期扫描完成后，再将患儿平躺带入 DR 室进

行，利用泌尿系 CT 增强注入的对比剂进行静脉肾盂造影，在 DR 室不再注入对比剂。当静脉肾盂造影结束后再将患儿带入 CT 室进行泌尿系 CT 增强扫描。

结果 泌尿系 CT 增强扫描与静脉肾盂造影联合检查更有利于影像的观察。在泌尿系 CT 增强扫描前行 DR 腹部平片，可观察泌尿系结石或钙化灶，在 CT 增强扫描中肾实质显影可见，但静脉肾盂造影不能显示该影像。对比剂在肾盂肾盏浓度达不到一定量时，静脉肾盂造影不能正确显示，但 CT 扫描可以根据 CT 值（密度值）进行分辨对比剂在肾盂肾盏的密度值。

结论 泌尿系 CT 增强扫描与静脉肾盂造影联合检查不仅可以提高影像诊断水平，还能减轻对比剂第二次注入对比剂肾脏的损害，也减轻患儿第二次注入对比剂的痛苦，再加减轻对比剂第二次注入的费用。

PU-0152

弥散加权成像对儿童良恶性肝脏肿瘤的鉴别诊断

丁雅玲,马小敏,张杰,黄新发
厦门市妇幼保健院

目的 探讨扩散加权成像（DWI）技术在儿童良恶性肝脏肿瘤鉴别诊断中的应用价值

资料与方法 回顾性分析 2009 年 1 月-2019 年 7 月经病理确诊的 35 例儿童肝脏肿瘤的影像学资料。由 2 名有经验的腹部影像专家分析肿瘤在 DWI 和 ADC 图上的信号特点（分为 T2 穿透效应、弥散受限、在 DWI 和 ADC 图上均呈低信号，均呈等信号），并测量肿瘤的平均 ADC 值。采用独立样本 t 检验、Fish 精确概率检验及 ROC 曲线进行统计学分析。

结果 观察者间在定量分析 DWI 信号特点和定性测量 ADC 值均具有良好一致性（Kappa=0.856；ICC=0.892）。88.9%（16/18）的肝脏恶性肿瘤呈弥散受限，而仅 5.8%（16/17）的肝脏良性肿瘤呈弥散受限，两者差异具有统计学意义（$P<0.001$）。恶性肝脏肿瘤的平均 ADC 值明显低于良性肿瘤（$1.82\pm0.40\times10^{-3}mm^2/s$ vs $1.30\pm0.53\times10^{-3}mm^2/s$，$P=0.002$）。当 ADC 值$\geqslant1.27\times10^{-3}mm^2/s$ 诊断肝脏良性肿瘤时，敏感性和特异性分别为 94.1%和 66.7%。

结论 DWI 和 ADC 值有助于儿童良恶性肝脏肿瘤的鉴别诊断。

PU-0153

过敏性紫癜肠管损伤的 CT 诊断及鉴别诊断

辛涛
徐州市儿童医院

摘要： **目的** 探讨过敏性紫癜腹型肠管损伤的 CT 典型影像学表现。 **方法** 回顾性分析我院自 2017 年 6 月至 2018 年 10 月间收治的腹型过敏性紫癜患儿 18 例，其中男性 11 例，女性 7 例，年龄范围在 2.1 ~ 15 岁之间，平均值（6.67 岁±3.31），其中单独进行 CT 平扫的 2 例，进行 CT 平扫和增强的 16 例。前来就诊的临床主述，多是腹痛，呕吐、腹泻等，其中出现腹痛的 18 例，出现消化道出血的 6 例，不全性肠梗阻的 9 例，肠套叠的 1 例，分析其典型的影像学表现。 **结果** 腹型过敏性紫癜的肠管损伤 CT 平扫示肠管粘膜呈稍高密度影，粘膜下肠壁增厚，呈稍低密度影，CT 增强肠管粘膜呈环状、曲线状、结节状明显持续强化，粘膜下肠壁由内向外呈渐进性中度强化。 **结论** 过敏性紫癜(Henoch-Schonlein purpura, HSP)是由于自身免疫性毛细血管变态性反应所引起的出血性疾病，好发于秋冬季，儿童及青少年过敏性紫癜侵及胃肠道时，主要表现为腹痛，通常位于脐周或上中腹，餐后加重。过敏性紫癜肠道病灶可以单发，也可以多发，下消化道以回肠为主，上消化道尤其以十二指肠降部受累最为严重。因典型的对称性紫癜样皮疹是诊断 HSP 的必要条

件，因此此类以消化道症状为首发表现的患者早期诊断困难，易发生误诊。如前来就诊的患儿腹部 CT 增强时，肠管粘膜出现这种典型的 CT 增强表现，对过敏性紫癜的早期临床诊断具有较高的提示作用，具有一定的临床应用价值。

PU-0154

儿童小肠良性淋巴样息肉病 1 例及文献复习

冷媛媛,黄燕涛
四川省自贡市第一人民医院

目的

探讨儿童小肠良性淋巴样息肉病影像学表现及临床特征。

方法

回顾性分析我院诊治的 1 例儿童小肠良性淋巴样息肉病的 CT 表现及临床特征，结合术中所见及病理特征，以及复习相关文献，使对该病具有全面的认识。

结果

4 岁男孩，半年前出现反复脐周及右下腹疼痛，不剧烈，可自行缓解，近期疼痛逐渐加重；腹部 CT 及增强扫描示：右下腹末段回肠区域局部肠管扩张，最宽处约 2.4cm，管壁不规则增厚，最厚处约 1.0cm，近端肠管较多积液，增强扫描增厚肠壁呈明显均匀强化，浆膜面光滑，肠周可见多个肿大淋巴结。术中见：回肠末段靠近回盲部区可见长约 10cm 肠壁明显增厚段，肠管表面呈灰白色，弹性差，肠管明显扩张，直径约 8cm，内有粘稠肠内容物，肠系膜淋巴结肿大明显，较大者约 2.0×1.5cm，阑尾充血、水肿。术后病理考虑为良性淋巴性息肉病；肠周查见淋巴结 14 枚，均系反应性增生。

结论

良性淋巴样息肉病（Benign lymphoid polyp）又称为良性淋巴组织增生，为肠道较少见的良性病变，多见于儿童，尤其是 6 岁以下，好发于回肠末端；该病并非真正的肿瘤，而是黏膜正常存在的淋巴滤泡的局限性过度增生所致；典型的病理学改变：主要由分化良好的淋巴组织构成，表面被覆薄层黏膜，黏膜与黏膜下层可见大量分界清楚的淋巴滤泡；临床上多以腹痛及肠梗阻为主要表现；CT 表现为病变区肠管广泛增粗、肠壁弥漫增厚、肠腔变窄，增强扫描呈明显均匀强化，肠周多可见反应性淋巴结增生。本病需与淋巴瘤、多发性淋巴瘤性息肉病相鉴别：淋巴瘤多见于老年人，多表现为“动脉瘤样”扩张，增强扫描呈轻度强化；多发性淋巴瘤样息肉病病变多发并广泛分布于胃肠道，为结节状（多为 1cm 以下）凸向肠腔。良性淋巴样息肉病虽为良性病变，部分文献报道该病为自限性疾病，但发现时病变累及范围已较广泛，常导致肠梗阻及肠套叠，局部手术切除仍为首选治疗方式。

PU-0155

肝脏间叶性错构瘤 1 例

郭万亮,赵廉
苏州大学附属儿童医院

患儿，男性，1 岁 11 月，因“B 超发现腹腔肿块两天”入院。一般情况良好，腹膨隆，未见腹壁静脉曲张及胃肠型蠕动波，上腹部可触及一巨大肿块，大小约 15cm*10cm*8cm，无触痛。CT 检查：上腹部可见一巨大囊状低密度影，其内密度均匀，其边界清晰，大小约 140mm*95mm*53mm，增强扫描囊壁可见明显强化，囊壁较厚，门静脉贴近其后缘受压，其左侧可见一小囊状影与其相连；肝内胆

管、肝总管及左、右肝管未见明显扩张。肝脏受压，其内密度均匀。胆囊受压，胆囊内未见异常密度影。胰腺头部及体部受压变细。其内密度均匀。脾脏及双肾未见明显异常。局部小肠受压推移至左下腹部。MR 平扫：中上腹前部可见一巨大囊状长 T_1 长 T_2 信号，其内信号尚均匀，其边界清晰，大小约 160mm*150mm*94mm，其左侧可见一类似信号小囊状影与其相连；肝内胆管、肝总管及左、右肝管未见明显扩张。肝脏左叶、门静脉受压。胰腺后缘受压，胰管未见扩张。胆囊受压，胆囊内未见异常信号。脾脏及双肾未见明显异常。肠管受压推移至两侧后下腹部。MRCP 示：上腹部一巨大囊性占位，胆囊受压位于占位下方，胆囊、胰管未见扩张。术后病理：肝脏间叶性错构瘤。
讨论：肝脏间叶性错构瘤（MHL）是一种罕见的肝脏良性肿瘤，多发生于 2 岁以内的婴幼儿，男性多于女性。患儿早期常无明显症状和体征，随着肿物增大可出现腹部膨隆、腹痛、黄疸甚至心衰等表现。实验室检查肝功能多数正常，约 1/4 患儿 AFP 可升高。CT 检查肝叶内类圆形肿块,密度不均,与周围组织界限清晰,囊性液体部分可为水样密度,实性部分、囊壁、囊内间隔呈软组织密度,可有或无钙化,增强可见分隔及包膜强化。MRI 表现为肝内类圆形信号,根据囊实性成分的不同,可有不同信号表现。实性部分常为等 T_1 或稍长 T_2 信号,囊性液体成分常为短 T_1 长 T_2 信号。本病例为囊性，须与单纯性囊肿、包虫病、肝脓肿、转移瘤囊变等相鉴别。

食管造影对新生儿先天性食管闭锁的诊断价值

覃慧
广西柳州市妇幼保健院

目的 探讨食管造影对新生儿先天性食管闭锁的诊断价值。**方法** 搜集 2013 年 2 月-2018 年 3 月在我院经手术及病理证实的 39 例先天性食管闭锁患儿的临床及影像资料进行回顾性分析，所有患儿均行胸腹联合摄片及食管造影检查。由 2 位有经验的影像诊断。**结果** 39 例先天性食管闭锁患儿，其中Ⅰ型 1 例，Ⅲ型 37 例（其中Ⅲa 型 10 例，Ⅲb 型 27 例），ⅣⅤ型 1 例，6 例合并其他畸形。**结论** 食管造影对新生儿先天性食管闭锁的诊断具有重要诊断价值。

PU-0157

婴儿型肝脏血管内皮细胞瘤的 CT 诊断

程广明
柳州市妇幼保健院

目的 分析婴儿型肝脏血管内皮细胞瘤（IHHE）的 CT 表现特征，评估其临床诊断价值。方法 回顾性分析我院 8 例 IHHE 患儿的 CT 表现，所有病例均有手术病理或临床诊断结果。结果 8 例患儿中，2 例为单发肿块型病灶，6 例为多发病灶，CT 增强表现为肝内富血供病灶，7 例为动脉期呈周边环形强化，边缘不规则，增强程度等同于同层主动脉强化程度，中央呈星芒状低密度区，静脉期及延迟期持续向心性强化，中心区域可见条索状血管样强化及未强化区域，边缘变光滑；1 例多发病灶动脉期表现为斑片状、结节状强化，所有病例均合并有不同程度动静脉瘘。结论 IHHE 的 CT 表现具有一定特征，而 CT 增强表现对本病的诊断更具诊断价值。

PU-0158
儿童少见类型肾母细胞瘤 5 例影像学特点分析

李勇,赵林伟,严高武,范小萍,胡纳,杨国庆
遂宁市中心医院

目的 探讨儿童特殊类型肾母细胞瘤的影像学诊断要点及鉴别诊断。**方法** 收集 5 例儿童特殊类型肾母细胞瘤病例进行临床资料、CT 影像学特征，并结合文献探讨其诊断与鉴别诊断。**结果** 5 例患儿中男童 2 例，女童 3 例，年龄 2-6 岁，中位年龄 4 岁，临床特点均因无痛性肉眼血尿、腹部包块、腹痛或发热就诊，左肾(2 例)多于右肾(3 例)。其中部分囊状分化型 2 例，肾母细胞瘤伴肾源性残余 3 例，囊性部分分化型肾母细胞瘤 CT 表现为多囊样肿块伴粗细不等间隔；肾母细胞瘤伴肾源性残余 CT 表现为肾内软织密度肿块，增强扫描 呈“快 进快出”肾透明细胞癌强化模式。**结论** 部分囊状分化的肾母细胞瘤(cystic partially differentiated nephroblastoma，CPDN)、肾母细胞瘤伴肾源性残余是少见特殊类型的肾母细胞瘤，尽管发病率很低，但是 CT 扫描具有一定的特征性；有利于为患儿治疗及预后判断提供较为可靠的依据。

PU-0159
探讨磁共振成像技术在胎儿肾囊肿上的应用价值

刘冀,戴克楠
陆军特色医学中心（大坪医院）

目的 探讨磁共振成像技术在胎儿肾囊肿上的应用价值；
方法 收集我院 2018 年 9 月至 2019 年 7 月，临床超声诊断提示胎儿肾脏囊性病变，扫描方法采用常规 T2 序列扫描，扫描基线：沿胎儿的腹部扫描冠状以及失状，最后再扫描胎儿的腹部横断位压脂。
结论 磁共振 T2 序列对于胎儿肾脏囊性病变有较好的应用价值，而 T2 压脂序列能更好的与脂肪性病变做鉴别。

PU-0160
磁共振胰胆管成像在先天性胆总管囊肿的诊断【摘要】

王芳,蔡静怡
哈尔滨市儿童医院

目的 探讨磁共振胰胆管成像诊断小儿先天性胆总管囊肿的价值分析。
方法 回顾性分析经临床手术及病理证实的 17 例小儿先天性胆总管囊肿，对所有病例的磁共振胰胆管成像的征象进行分析。
结果 17 例小儿先天性胆总管囊肿中，I 型 14 例，占 82.4%，II 型 1 例，占 5.8%，III 型 2 例，占 11.8%。胆总管囊肿多为囊状改变，境界清楚，边缘光整。
结论 先天性胆总管囊肿又称为先天性胆管扩张症，可以发生在肝内、外胆管的任何部位，是小儿常见的一种先天性胆道疾病，以腹痛、腹部包块、黄疸为主要临床表现。磁共振胰胆管成像为患儿提供无创无辐射的影像检查手段，为外科手术医师提供重要的术前影像资料。

PU-0161

磁共振水成像对小儿泌尿系梗阻临床诊断的意义

徐守成,张玉华
哈尔滨市儿童医院

目的 研究分析磁共振水成像对小儿泌尿系梗阻应用的临床诊断价值。
方法 59 例小儿泌尿系梗阻患儿， 分别采用腹部磁共振水成像、腹部超声（BUS）、静脉尿路造影（IVP）进行检查诊断， 对其诊断结果与手术病理进行比对。
结果 MRU 诊断小儿泌尿系梗阻准确率为 100.00%， BUS 诊断小儿泌尿系梗阻准确率为 71.19%，IVP 诊断小儿泌尿系梗阻准确率为 79.66%。MRU 准确率分别与 BUS、IVP 比较， 差异均有统计学意义（ $\chi 2=19.86$、13.36， $P<0.01$）。
结论 MRU 诊断小儿泌尿系梗阻准确率较高，安全无辐射， 为临床治疗方案的制订提供可靠的依据。

PU-0162

网膜轴型胃扭转 1 例

胡丽丽,袁理想,孙焱,王春祥
天津市儿童医院

患儿，女，4 岁，腹胀伴呕吐 2 天入院。查体：腹胀，中上腹为著，触诊质韧，未及明显压痛、反跳痛。胃泡振水音阳性。
影像学检查：立位腹部平片示胃影明显增大，考虑胃扭转可能。腹部 CT 平扫显示胃腔扩张，幽门显示不清；脾脏内下移位。上消化道造影显示胃呈球形卷曲，胃窦位于左上腹，食管胃交界处与胃窦幽门接近。诊断胃扭转（网膜轴型）。
治疗：予禁食、胃肠减压、静脉抗感染等保守治疗，并嘱增加下地活动量。患儿症状好转。7 天后复查上消化道造影检查，未见异常。
讨论：胃扭转分为器官轴型和网膜轴型。器官轴型胃扭转，即胃沿其长轴发生扭转，胃大弯的位置高于小弯且位于小弯右侧。网膜轴型胃扭转，即胃沿其短轴线折叠，结果导致胃大弯和胃小弯在其通常相对于彼此的位置，胃食管交界处与幽门之间的关系可发生倒置。
网膜轴型胃扭转，胃食管交界处与幽门位置接近，形成一个较窄的蒂，胃可沿此蒂发生闭环性梗阻、绞窄和胃缺血。上消化道造影是本病诊断的金标准。在 CT 上，异常高位的胃窦出现在食管下段层面上，形似“贲门”。MPR 冠状位显示“倒置幽门征”。
因此，急腹症急性胃扩张病例行 CT 检查时，应仔细观察确定胃扩张的原因，注意胃大小弯形态，贲门与胃窦幽门的位置。当发现胃窦位置异常，特别呈现“假贲门”征时，应考虑到胃扭转诊断。

PU-0163

Liver involvement of Langerhans Cell Histiocytosis masquerading as Caroli’s Disease. Case Report

Yingyan Shi
Children Hospital of Fudan University

Langerhans cell histiocytosis (LCH), formerly known as histiocytosis X, refers to a spectrum of diseases characterized by idiopathic proliferation of histiocytes that produce either focal (localized LCH) or systemic manifestations. Liver involvement of Langerhans Cell Histiocytosis is recognized as an indicator of poor prognosis of LCH. The diagnostic imaging findings of hepatic LCH are challenging. Multiple saccular dilatations of intrahepatic bile ducts are common and characteristic magnetic resonance imaging (MRI) feature of Caroli's disease, but is rarely seen in LCH. In this report, we describe a case of LCH masquerading as Caroli's disease in a 4-year-old child based on clinical symptoms, laboratory findings, and pre-diagnostic MRI findings (multiple saccular dilatations of intrahepatic bile ducts). Therefore, the multiple saccular dilatations of intrahepatic bile ducts is not sufficient to clearly establish the diagnosis of Caroli's disease, and the differential diagnosis of hepatic LCH should be considered when a child with Caroli's disease.

PU-0164

急性胰腺炎的 CT 诊断

李琳
昆明市儿童医院

通过 CT 检查诊断，及早给临床提供可靠诊治资料，减少患者痛苦，降低死亡率，提高治愈率，使患者免受不必要的痛苦。方法 收集分析我院近年来经临床证实的 21 例急性胰腺炎病例的 C T 资料，观察其 C T 表现特征、病变范围。采用东芝 16 层螺旋 CT。全部病例均行腹部 CT 平扫，层厚 5~10mm,层距 5~10mm。其中几例做了增强薄层扫描。

PU-0165

浅谈坏死性小肠结肠炎 X 线表现

浦玉敏
昆明市儿童医院

讨论新生儿坏死性小肠结肠炎的早期 X 线表现。 **方法** 回顾性分析昆明市儿童医院 40 例新生儿坏死性小肠结肠炎的早期 X 线表现。 **结果** 临床上出现新生儿坏死性小肠结肠炎的症状，首次或多次复查 X 线片发现胃泡影增大且内有网络状、条索状影：肠壁轻度扩张、紊乱、僵直、肠道充气分布不均匀，部分呈管状扩张、部分细小痉挛且肠壁有增厚、模糊，尤其在右下腹或肠腔内有液平等动力性肠梗阻改变，即应提示新生儿坏死性小肠结肠炎的早期诊断。

PU-0166

Analysis of imaging and clinical manifestations of children with Kasabach-Merritt syndrome

Junying Wang,Hao Shi
Shandong Qianfoshan Hospital

Rationale and Objectives: Kasabach-Merritt syndrome (later known as Kasabach-Merritt phenomenon) is a rare disease that occurs in infants or young children with extremely high mortality. The main purpose of this paper is to analyze the imaging findings of Ka-Mei syndrome occurring in different sites and to improve the understanding of the disease.**Materials** and **Methods:**Retrospective analysis of the imaging, ultrasonography, clinical manifestations and biochemical indicators of 3 children with Kasabach-Merritt syndrome diagnosed in our hospital to explore the basic imaging findings and clinical manifestations of Kasabach-Merritt syndrome **Result:** child 1 ,3 weeks old baby girl, multiple large hemangioma respectively located in the liver and hepatic and gastric space, the number of platelets was 15 $x10^9$ / L; child 2, 3 months old boy, giant hemangioma located in the pancreas, platelet count is $11x10^9$/L; child3, 2 months old boy, the giant hemangioma located in the left axilla, and there found multiple hematomas in left iliopsoas and erector spinaecan, the minimum number of platelets is $11x10^9$/L. Tests of coagulation function showed all three children had different degrees of fibrinogen reduction, D-dimer and fibrinogen degradation products (FDP) increased.**Conclusion:** Kasabach-Merritt syndrome is a group of syndromes that occur in infants .The main clinical manifestations include large hemangioma in different organs or tissues, a decrease in platelet count and coagulopathy.Imaging performances are as follows:1. Hemangiomas are mostly located in superficial or deep subcutaneous soft tissue, only a few can occur in deep abdominal organs. Lesions distribution can be localized or diffused, while the possibility of involved both skin and abdominal organs is small, besides hemangioma rapidly enlarge in the short term is a typical feature. 2. Giant hemangioma showed soft tissue density on CT withirregular, lobulated shape. There were characteristic calcification or venous stones in the superficial lesions, if the Lesion located in the abdominal organs then no venous stones were found. After enhancement it should be progressively enhanced,surrounding the lesion large drainage vessel can be seen .Some lesions formed arteriovenous fistulas can be markedly uniformly enhanced during the arterial phase.3. MRI signals of hemangiomas located at superficial tissues and deep abdominal organs are different. The giant hemangioma located on superficial or deep subcutaneous soft tissue shows an equal/low signal on T1WI , slightly higher signal indicated fat component. The T2WI sequence signal is rather complex, the strip-like low signal represents fiber fiber stove, Sedimented hemosiderin or fluid void vessels. Hemangioma in the deep organ showed a homogenous high signal on T2WI with clear boundaries.4. Doppler ultrasound also show the lesion well, which can distinguish hemangiomas from other soft tissue tumors and vascular malformations. The giant hemangioma appears as a strong echo with unclear boundaries, and the CDFI show rich blood .Finally, the clinical mortality rate of Kasabach-Merritt phenomenon is relatively high,If there are single or multiple hemangioma in infants , accompanied by thrombocytopenia and coagulopathy, the Kasabach-Merritt syndrome should be considered immediately.It's nesessary providing effective imaging information to clinical doctors helps them to develop appropriate treatment in the early stage,which can avoid misdiagnosis and mistreatment, improve the survival rate of children.

PU-0167

多排 CT 在美克尔憩室中的诊断应用

王志伟,张毅
哈尔滨市儿童医院

目的 多排 CT 在美克尔憩室中的应用价值
方法 回顾性分析 6 例经手术和病理证实的梅克尔憩室的患者的 CT 影像学特点。
结果 3 例以肠梗阻症状就诊，CT 可见小肠段出现气液平面，回肠区见靶征，盆腔可见积液，2 例以便血症状就诊，CT 可见肠管大部充气明显，见回肠区一囊性肿物，壁呈肠管样，1 例以转移性腹痛就诊，CT 可见中腹部回肠区一包块，其内密度欠均。
结论 正常人群发病率为 2%左右。卵黄管的肠端未闭所致， 回肠系膜对侧形成的袋状残留物。憩室一般位于距回盲瓣 30~100cm 的末端回肠上。有自身供血，多呈圆锥形，少数为圆柱形，口径 1~2cm，憩室较回肠腔为窄，长度 1~10cm，盲端游离于腹腔内。一般较肠重复畸形小。容易发生消化道出血、憩室炎、肠梗阻、穿孔等并发症，当小儿患者出现这些临床表现时，应考虑到美克尔憩室及其并发症的可能性，尤其是伴有脐茸、脐窦等卵黄管残留的脐部表现时，更应注意。美克尔憩室是在胚胎发育过程中卵黄管退化不全所形成的回肠远端憩室。临床上多无症状往往因憩室出现并发症表现才就诊而获诊断。多以肠梗阻、便血、憩室炎表现酷似急性阑尾炎为常见，CT 缺乏特异性表现，但有一些影像特点有助于诊断，如病变位于多回肠区，囊性病变囊壁呈肠管样结构、CT 后处理可见部分病变与肠管呈憩室样改变等。对疾病的定性诊断及鉴别诊断有一定价值。

PU-0168

新生儿肠旋转不良的消化道造影表现

张增俊,王冬,侯欣,胡文,陈超
西安市儿童医院

目的 探讨新生儿肠旋转不良消化道造影的 X 线表现，旨在提高对本病的认识及诊断。**方法** 对我院 2013 年 1 月一 2018 年 12 月，经消化道造影并手术证实的 38 例新生儿肠旋转不良的影像学表现及临床特点进行回顾性分析。**结果** 消化道造影诊断肠旋转不良 38 例患儿中，术中确诊为肠旋转不良并发中肠肠扭转 33 例，伴环状胰腺 2 例，十二指肠闭锁 3 例，伴有腹膜索带压迫十二指肠 2 例。婴幼儿儿肠旋转不良的典型 X 线表现为“螺旋征”、“漩涡征”、回盲部位置异常，肠旋转不良可合并中肠扭转、胃扭转、十二指肠隔膜、十二指肠闭锁、胃隔膜、食道裂孔疝等。**结论** 泛影葡胺上消化道造影、钡灌肠造影是诊断本病首选方法。
关键词：新生儿；肠旋转；X 线

PU-0169

先天胆总管囊肿的 MRI 表现

陈超,侯欣,张增俊,王冬,胡文
西安市儿童医院

目的 探讨胆总管囊肿的 CT 表现及鉴别要点。**方法** 36 例手术证实的胆总管囊肿患儿(9 名男孩和 27 名女孩，年龄 7 天至 7 岁，平均 3.5 岁)回顾性分析。**结果** 1)肝外胆管囊肿Ⅰ型 25 例。囊肿位于肝门至胰头之间，平扫呈水样密度囊性肿块，其大小不一。最小直径 1.5cm,最大者

直径达 15cm 以上。胆囊增大 8 例，所有病例伴有不同程度肝内胆管扩张及胰头弧形受压移位和十二指肠环扩大。2）胆总管单发性憩室Ⅱ型 1 例，MRI-T1WI 表现为胆总管外侧壁见囊性低信号影、信号均匀、边缘光滑，胆囊及肝内胆管无异常征象。3）多发性囊肿Ⅳ型 4 例，MRI 表现为肝内胆管及肝外胆管多个大小不等囊性扩张的长 T1WI,长 T2WI 信号，囊壁光滑，胆囊无异常征象。4）肝内胆管囊肿型(Caroli’S 病)5 例。胆管囊肿位于肝内近水样信号，囊肿直径大小不一，可有“中心点征”，为异常扩张的胆管包绕相伴的门静脉小分支的投影强化所致。囊状与柱状扩张的胆管相连接，呈“串珠状”或“分节状”。**结论**　小儿先天性胆总管囊肿的 MRI 表现有一定特征性，为本病治疗提供可靠信息。

64 排螺旋 CT 泌尿系成像对输尿管先天畸形的诊断价值

饶彬斌
江西省儿童医院

目的:探讨 64 排螺旋 CT 泌尿系成像对输尿管先天畸形的诊断价值。方法:收集我院五年来经手术及临床证实的先天性输尿管畸形患者 50 例,所有病例均行 64 排 CT 平扫、双期增强及延时扫描,并在 ADW4.4 工作站中利用 MPR、CPR、MIP、VR 技术进行后处理。结果:50 例患者中,肾盂输尿管重复畸形 20 例,先天性输尿管狭窄 16 例,下腔静脉后输尿管 3 例,输尿管囊肿 6 例,输尿管异位开口 2 例,先天性巨输尿管 3 例,所有病例经手术及临床证实。结论:64 排螺旋 CT 泌尿系成像及后处理能清楚显示异常输尿管的形态、走形及周围结构关系,是先天性输尿管疾病诊断的一种重要检查方法。

PU-0171

小婴儿副脾扭转伴坏死 1 例

李蕊
天津市儿童医院

目的　报道小婴儿副脾扭转伴坏死 1 例
方法　回顾性分析病例。患儿，女，2 月龄，入院前 2 天因发热伴腹泻就诊于当地医院，超声发现腹腔肿物。CT 增强示：左肾前下方不规则囊性占位性病变，包膜强化。MRI 示左腹部不规则形稍长 T_1长 T_2信号为主的包块影，边缘可见不规则短 T_1短 T_2信号影。诊断为腹部肿物，腹腔镜手术探查并切除。
结果　镜下见左上腹暗紫色实性肿物，以穿刺针抽出 200ml 淡黄色清凉液体，切除残留组织并送病理。病理回报：副脾扭转坏死。
讨论：副脾扭转坏死较为罕见，临床多表现为急腹症。当弥漫性梗死时，副脾内可见大面积坏死囊变，周围边缘可见强化，在 MRI 上呈长 T_1长 T_2液体信号影。主要需与左上腹部囊性肿块相鉴别。通过对该病例的复习，我们意识到当小婴儿左上腹部出现囊性占位性病变且没有明确急腹症病史时，还需考虑该病的可能性。

PU-0172

后肾腺瘤 1 例

陈跃
昆明市儿童医院

患者 女，2 岁 2 个月，B 超发现左肾下极包块 10 天余。为进一步治疗到我院就诊。超声：左肾下份探及一包块，大小约 2.5cm×2.1cm×2.0cm，椭圆形，边界清，内部呈中等回声，CDFI:其内可见短棒状血流信号。超声诊断：左肾下份实性包块声像 CT 检查：平扫左肾下极可见一类圆形稍低密度包块，边界清楚，大小约 1.9cm×1.7cm，密度欠均匀，CT 值约 19-38Hu，增强扫描成不均匀强化，动脉期病灶中心明显强化，后期逐渐减退，病灶外周强化不明显。CT 诊断：左肾下极肿瘤，性质待定。手术及病理：行左肾下极肿瘤切除术+肾周围粘连松解术+肾固定术，术中见左肾下极囊实性包块，质韧，显露部分光滑，包膜呈紫红色与灰白色相间，包膜内未见明显异常增生曲张静脉。病理切片：肿瘤细胞呈筛状、网状及乳头状分布,部分区似肾小球结构,细胞核圆形或椭圆形,大小一致,核仁不明显,未见核分裂,散在沙砾体,局部呈多囊性扩张,边缘见纤维包膜及残余肾脏组织。免疫组织化学染色:S100(-)、CK7(散+)、CK8/18(+)、CD56(散+)、CD57(散-)、WT1(+)、eMA(-)、CD10(+)、Glypican- Vimentin(-)、Ki-67(+,3-5%)、CK(+)。病理诊断：(左肾肿瘤)考虑后肾腺瘤。

PU-0173

儿童卵巢横纹肌肉瘤一例

陈跃
昆明市儿童医院

患者，女，6 岁。3 月前出现间断腹痛，加重 2 天就诊。B 超提示：左中腹混合回声占位，CT 提示：左侧卵巢来源恶性肿瘤并瘤内出血。临床诊断：腹部包块性质待查。2018 年 11 月 9 日行左卵巢肿瘤切除术。病理检查：肿瘤细胞疏松排列，部分区域密集，细胞短梭形或星形，胞浆淡染，细胞核梭形或圆形，核分裂易见，部分可见小核仁，局灶见软骨组织，边缘区见少量卵泡结构。免疫组织化学染色：Vim（+）、CD117（+）、Nestin（+）、S-100（部分+）、Bcl-2（+）、CyclinD1（+）、CD10（+）、CD99（+）、Myogenin（灶性+）、Dog1（灶+）、Ki-67（+，70%）、WT-1（±）、CK（-）、Syn（-）、EMA（-）、SMA（-）、CR（-）、a-inhibin（-）、CgA（-）、CD34（-）。病理诊断：胚胎型横纹肌肉瘤伴软骨分化。

PU-0174

胎儿卵巢囊肿 MRI 表现及临床治疗转归

刘乐[1],张翼[2]
1.西安交通大学第二附属医院
2.西北妇女儿童医院

目的 探讨胎儿卵巢囊肿 MRI 表现及临床治疗转归。方法 报道 3 例胎儿卵巢囊肿 MRI 表现，使用 SSFSE 及 FIRM 序获得胎儿 MRI 图像。结果 MRI 示：病例 1 胎儿腹腔可见一类圆形混杂信号肿块，呈长 T1 稍短 T2 信号，内可见斑片状、线条样长 T2 高信号影，肿块大小约 70mm×66mm×65mm，边界较清，边缘光整。病例 2 胎儿腹腔可见一类圆形长 T1 稍长 T2 信号肿块，大小约

59mm×51mm×51mm。病例 3 胎儿膀胱两侧分别可见一类圆形长 T1 长 T2 信号肿块，右侧大小约 26mm×26mm×26mm，左侧大小约 20mm×20mm×20mm。病例 1 患儿出生后，肿块明显缩小，术后病理为滤泡囊肿；病例 2 术后病理为卵巢囊肿伴扭转；病例 3 生后随访囊肿消失。结论 胎儿时期卵巢囊肿主要受激素作用形成，较小的囊肿可于产后自行消失；较大的囊肿或复杂囊肿多需手术切除。随着 MRI 在产前诊断的不断应用，胎儿卵巢囊肿信号可有不同表现，掌握胎儿卵巢囊肿的信号特点，对产前诊断、胎儿预后及手术评估具有重要意义。

胎儿磁共振检查技术探讨

刘小艳
南通大学附属医院

目前常用的胎儿影像学检查方有超声检查及磁共振检查，MRI 具有无电离辐射的特点，安全性高；软组织对比分辨率较高，不受骨骼影响，对胎儿各系统解剖结构及异常的显示明显优于超声；视野大，可以精确地进行各种不同切面扫描，从而显示胎儿全貌；能比较精确地进行胎儿发育及母体、胎盘等各种测量；对胎儿组织的定性较好，可做胎儿脑组织及肺功能等频谱，对于胎儿病变诊断提供更多的信息。

PU-0176

MRI 对超声发现的胎儿颅后窝池增宽的再评价

顾海磊
南京医科大学附属妇产医院（南京市妇幼保健院）

目的 探讨快速 MRI 对超声所发现的胎儿颅后窝池增宽的诊断价值。**方法** 选取超声在大排畸检查中（孕龄 20W-24W）发现的胎儿颅后窝池增宽（宽≥10mm），并在 1 周之内接受产前 MRI 检查的胎儿 60 例，得出 MRI 诊断结果，并与超声诊断结果进行比较评价。**结果** 60 例胎儿中，超声诊断均为数值性诊断，无明确意义的定性诊断，胎儿 MRI 诊断**结果** 颅后窝池单纯性增宽 45 例，大枕大池 6 例，蛛网膜囊肿 3 例，典型 *Dandy-Walk*er 畸形 2 例，非典型 *Dandy-Walk*er 畸形 1 例，Black 囊肿 1 例，右侧小脑半球发育不良及半球缺如各 1 例。**结论** 快速 MRI 较超声在胎儿颅后窝疾病的诊断中具有一定的优势，可作为超声检查的有力补充。

PU-0177

磁共振在胎儿侧脑室增宽中的应用及进展

祝小卫
南昌大学第二附属医院

一、磁共振在胎儿侧脑室扩张诊断上的优势及不足。
胎儿磁共振是任意层面成像，视野大、解剖细节好，对胎儿侧脑室扩张合并脑发育异常和畸形，比如灰质异位、结节性硬化、胼胝体发育异常等做到比较确切的诊断。通过功能序列检查对胎脑病灶组织成分进行大致区分，为胎儿先天性疾病诊断提供一些比较有效的信息。但是成像过程中难以克服胎动的影响。
二、常规胎儿磁共振检查所运用的序列。

胎儿磁共振所运用的主要是两个快速扫描序列：单次激发快速自旋回波序列（SSFSE）以及快速稳态激动采集序列（FIESTA）。不同的磁共振产家命名不同：单次激发快速自旋回波序列序列 GE 公司命名为 SSFSE 序列，西门子公司命名为 HASTE 序列，飞利浦公司命名为 SSTSE 序列。快速稳态激动采集序列 GE 公司命名为 2D-FIESTA 序列，西门子公司命名为 True FISP 序列，飞利浦公司命名为 Balance FEE 序列。在临床实践中，一般还会增加扫描 DWI 序列以及 T1 序列，得以进一步大致区分胎儿的组织成分。

三、胎儿磁共振检查技术进展。

1、三维磁共振成像技术。运用这种技术检查后期可以重建出胎儿侧脑室三维图像。

2、胎儿磁共振功能成像技术。

2.1 弥散加权成像（DWI）。胎儿脑组织以及肾脏在 DWI 上表现较高信号，DWI 对胎儿脑组织以及肾脏的观察上很有优势。

2.2 弥散张量成像（DTI）。DTI 技术可以显示皮质层状结构、脑白质纤维束以及髓鞘的发育成熟过程等。

2.3 磁共振波谱成像（MRS）。MRS 可以检测胎儿脑不同代谢物来反映胎脑发育成熟度及过程，通过检测这些代谢产物的峰值变化来评估胎脑的发育情况以及是否存在病理情况。

2.4 磁敏感成像（SWI）。SWI 可以显示微小静脉以及微小出血灶，因此对胎儿脑内微小出血灶的检出具有一定的价值。

2.5 血样水平依赖（BOLD）成像。BOLD 是基于血红蛋白氧饱和度变化而进行成像的 MR 技术。

PU-0178

胎儿颅脑磁共振成像在产前诊断中的应用价值

刘鑫春,吕冬梅
哈尔滨市儿童医院

目的 探讨胎儿颅脑 MR 功能成像联合优化常规检查的临床应用价值。**方法** 选择具有产前超声检查、产前和新生儿期 MR 胎脑检查平均孕龄为 31±3 周的 96 例为研究对象。MR 常规序列 2D T2W-TSE 及 3D T1WI-TFE 或 2D T1W Balance TFE 序列；功能序列包括 DWI、选择性 SWI 序列。将产前 UCG、MR 检查结果与新生儿期 MR 结果分别进行对比分析。**结果** 1、MRI：单胎 95 例、双胎 1 例；胎脑正常 32 例、胎脑异常 65 例。异常主要包括脑室不同程度扩张 23 例、后颅窝池增宽 10 例、胼胝体发育不良或缺如 13 例、透明隔增宽或缺如 8 例、室管膜下囊肿 5 例、脑实质出血 3 例、脑室血肿 3 例等。2、胎脑产前 US 与产前 MR 诊断结果对照：完全符合 62 例（64.5%）；胎脑产前 US 与新生儿期颅脑 MR 诊断结果对照：完全符合 60 例（62.5%）；产前 MR 与产后 MR 结果对照：诊断完全符合 86 例（89.6%）。**结论** 常规 MRI 对胎脑疾病诊断具有明显优势，显著弥补超声学对胎脑检查的不足，可为临床提供更详细、更精准的影像信息，减低畸形及缺陷儿出生。

PU-0179

Haste-Flair 序列对胎儿 MR 侧脑室增宽的诊断价值

俞飞丹
浙江大学医学院附属邵逸夫医院

目的

胎儿侧脑室增宽占胎儿神经系统疾病中的大部分，单纯的侧脑室增宽和侧脑室室管膜下囊肿用传统的快速扫描序列很难鉴别。而磁共振 Haste-FLAIR 序列有助于对一些孕妇产前 B 超提示胎儿侧脑室增宽的神经系统疾病鉴别诊断的价值。

方法

筛选 2017.9 年至 2019.8 年浙江大学医学院附属邵逸夫医院产科门诊的孕妇，并且产前 B 超提示具有单侧或双侧胎儿脑室增宽的 120 人，为鉴别诊断进行胎儿 MR 平扫，所有孕妇扫描前均签署孕妇磁共振安全告知书。所扫描的机器为西门子 Avanto，1.5Telsa，扫描序列为半傅里叶单发射快速 SE *序列*Haste 和真性快速稳态序列 Trufi 扫描胎儿的头颅、体部等三平面图像；用 T1WI、DWI 和 Haste-FLAIR 序列扫描胎儿头颅标准轴位图像；用磁敏感加权成像 SWI 序列扫描胎儿脊柱；用 3D-trufi 扫描头颅和四肢三维。扫描所获得的 MR 图像由两位经验丰富的儿科影像学医生进行诊断及结果评估。

结果

总共选择 120 例孕妇，平均年龄 29.9 岁， MR 平均成像妊娠 30 周。 Haste-FLAIR 序列总共检测到侧脑室内室管膜下囊肿 9 例,其中 2 例单侧侧脑室室管膜下囊肿，7 例双侧侧脑室室管膜下囊肿。在 Haste、3D-Trufi 序列上脑室内囊肿跟脑脊液一样呈高信号， Haste-Flair 上信号比脑脊液高。

结论

Haste-FLAIR 序列可用于胎儿侧脑室增宽的鉴别诊断，尤其适合鉴别室管膜下囊肿，特别是当大孕周、胎位或母体肥胖妨碍超声影像诊断时。

胎儿体蒂异常并中央性前置胎盘 MR 影像一例

李志娟,朱旻,刘海萍,董志华,何斌,王进华
江西省妇幼保健院

孕妇，47 岁，孕 2 产 1，因“中期妊娠，胎儿畸形，中央性前置胎盘”于 2019 年 6 月 27 日入院江西省妇幼保健院。患者既往月经规律，否认毒物、放射性物质接触史，否认家族遗传病史、近亲婚配。患者自述 2019 年 03 月余因月经未来自测验孕棒阳性，当地医院行彩超提示宫内妊娠，2019-06-23 本院彩超提示：胎儿腹壁连续性回声中断，腹腔内脏器（肝、肠道）漂浮羊水中，胎儿脊柱前突，胎儿仅见一侧下肢，胎儿脐带长约 40 mm，考虑体蒂异常。2019-06-27 日我院 MRI 提示：胎儿体蒂异常（腹裂畸形、脊柱侧弯、左侧下肢缺如、脐带过短），中央型前置胎盘。入院体格检查：一般情况可，血压 140 / 81 mmHg(1 mmHg=0.133 kPa)，宫体：前位，脐耻之间，质中，活动可。患者剖宫取胎，以足位牵引娩出一胚胎，内脏外翻，脐带短。死胎检查：（1）影像学检查：MRI 平扫显示胎儿脊柱侧弯，腹壁缺损（肝脏及大部肠管游离至胎儿腹腔外），胎儿左下肢缺如；CT 平扫提示脊柱侧弯，胎儿左下肢缺如，腹壁缺损，所示肝脏及大部肠管游离至胎儿腹腔外。所示胎儿左下肢缺如；DR 显示胎儿脊柱侧弯，左下肢缺如，腹腔脏器疝出。（2）死胎检查：胎儿左下肢缺如，腹壁缺损，肝脏、肠管及膀胱膨出，脐带短小（约 40 mm），脊柱侧弯。**最终诊断：**胎儿体蒂异常。

PU-0181

胎儿 MRI 诊断胎儿颅内出血的价值

王静
吉林大学第一医院

目的
产前诊断胎儿颅内出血具有重要的病因分析，治疗和预后意义。超声和磁共振成像（MRI）可被用于该病的诊断。本文总结了胎儿颅内出血的 US 和 MRI 表现，评价 MRI 对胎儿颅内出血的产前诊断价值
方法 5 例孕妇产前行常规 US 检查发现异常后 24~48h 内行 MRI 检查，采用半傅里叶采集单次继发 RARE 序列（T2-HASTE）、平衡式稳态自由进动序列（T2-Trufi）、扩散加权成像（DWI）序列、扰相回波 T1 序列，将产前 MRI、US 表现及 1 胎引产后尸检结果对照。
结果 5 例胎儿 MRI 诊断脑室内出血 3 胎，室管膜下出血 1 胎，硬膜外血肿 1 胎。其中 2 例脑室内出血及 1 例室管膜下出血超声已诊断，MRI 进一步证实。1 例脑室内出血超声漏诊，MRI 的 T1WI 及 DWI 序列对出血的发现发挥了重要作用。硬膜外血肿的 1 胎超声表现为颅内囊性回声，其内可见分隔及密集点状回声，未见血流信号。超声诊断为颅内占位。MRI 表现为颅内巨大类圆形异常信号，T1WI 呈高信号，T2-HASTE 及 T2-trufi 均呈高及稍高信号，其内并见与母体平行的液液平面，脑组织呈受压改变。T1WI 的高信号对这例患者的诊断具有重要提示意义。
结论　目前 MRI 是胎儿颅内出血的较理想检查手段,各种序列联合更直接清晰显示出血的不同时期及范围,减少胎儿颅内出血的漏诊及误诊率。胎儿硬膜外血肿罕见。目前，还没有已知的有效的宫内治疗手段。

PU-0182

Prenatal Diagnosis of Joubert Syndrome by ultrasound and MRI

Wei Xia[1],Jianbo Shao[1],Xinlin Chen[2],Wenzhong Yang[2]
1.Wuhan Children's Hospital (Wuhan Maternal and Child Healthcare Hospital), Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China
2.Hubei maternal and children's hospital

Objective: To describe the imaging characteristic of Joubert syndrome in fetuses by ultrasound and MRI.
Materials and methods: We report a series of three fetuses with Joubert syndrome in Hubei Maternal and children' s hospital from January, 2012 to March 2015. All the mothers undertook the prenatal ultrasound. Two of the babies undertook prenatal MRI and were aborted subsequently; one live delivering baby took MRI after birth.
Results: One baby was correctly diagnosed by both ultrasound and prenatal MRI. One baby was diagnosed only by MRI. And one living baby was misdiagnosed by ultrasound.
Conclusion: Prenatal ultrasound could discover the Joubert syndrome in the case of paying special attention to. But in most cases, Joubert syndrome could be missed. Sonographer should realize the typical sign of Joubert syndrome, and prenatal MRI is necessary when the imaging is atypical.

PU-0183

产前 1.5T 磁共振成像上睾丸的下降情况

孙艳
四川大学华西第二医院

estis was not observed in scrotum on prenatal 1.5T MRI prior to 23 weeks' gestation. Unilateral testicular descent was firstly observed at 24+1 weeks of pregnancy, and the earliest bilateral testicular descent showed at 25+3 weeks. The descent of testicles mainly occurred in the gestation of 25-28 weeks, 82.6% of 28-week fetuses showed bilateral descent and 93.0% showed the descent of at least one side. Bilateral descent was observed in 100% of cases at 33 weeks

PU-0184

西门子 Avanto 1．5T 超导磁共振在新生儿 HIE 中的应用

冯源源
南通瑞慈医院

新生儿缺氧缺血性脑病（HIE）是产科围产期常见病，主要见于各种原因导致宫内窘迫窒息患儿、大部分早产儿，是临床致死主因之一，存活患儿中部分遗留智力低下、偏瘫、癫痫等并发症，影响患儿发育。早期确诊 HIE，并予以积极的治疗干预是改善患儿预后的关键。对于 HIE 的诊断，除依据临床诊断标准，CT 及 MRI 等影像学辅助检查越来越成为重要依据。就检查方法而言，MRI 有其很高的软组织分辨率优势，相对 CT 消除了骨骼伪影又无辐射，同时能多序列、多方位成像，加之特殊序列如磁敏感加权成像（SWI）及弥散加权成像（DWI）技术更进一步提高了 HIE 早检率，从而为临床及时正确治疗提供了有效帮助。

PU-0185

MRI 定量分析胎儿脑干-小脑蚓部夹角与脑干-小脑幕夹角及其在胎儿单纯后颅窝池增宽中的应用价值

李冠[1],林祥涛[2],肖连祥[3]
1.山东省烟台毓璜顶医院
2.山东大学附属省立医院
3.山东大学附属山东省医学影像学研究所

目的 利用 MRI 测量正常胎儿脑干-小脑蚓部夹角（BVA）与脑干-小脑幕夹角（BTA），分析其随与孕周的变化规律，并探讨其在胎儿单纯后颅窝池增宽中的应用价值。
方法 本研究共纳入 139 例胎龄为 24～38 周的正常胎儿，行胎儿颅脑 1.5T MRI 检查，选取胎儿小脑蚓部正中矢状面在三维后处理工作站（OsiriX 软件）上测量胎儿脑干-小脑蚓部夹角（BVA）与脑干-小脑幕夹角（BTA），分析其随与孕周的变化规律；同期选取 75 例单纯后颅窝池增宽胎儿利用相同方法测量的结果进行对比分析。
结果 ①160 例正常胎儿 MRI 测得的 BVA 正常值范围为 1.6°～9.7°，平均值为（4.62±1.34）°，BTA 正常值范围为 16.0°～43.1°，平均值为（28.34±5.58）°，由散点图得出 BVA 及 BTA

与孕周均不存在相关关系；②75 例单纯后颅窝池增宽，BVA 平均值（4.70±1.18）°，BTA 平均值（29.40±6.23）°，与正常胎儿相比均不具有统计学差异（*P*均＞0.05）。
结论 MRI 测量正常胎儿 BVA、BTA 与孕周无明显相关性，且对于胎儿后颅窝发育异常的判定及分类提供可参考的量化指标。

儿童。骨朗格汉斯细胞组织细胞增生症的 CT 表现

钟雯
重庆三峡中心医院

目的 总结骨朗格汉斯细胞组织细胞增生症的 CT 表现及影像学特点，探讨其在 LCH 中的诊断价值，提高对其的诊断水平。**方法** 回顾性分析 2014 年 12 月至 2019 年 7 月重庆三峡中心医院妇女儿童分院经手术及病理证实的 10 例骨朗格汉斯细胞组织细胞增生症患者的 CT 表现。**结果** 9 例为单发病灶，其中颅骨 4，颌面部 1 例，髂骨 2 例，股骨 2 例。1 例为多发病变，其多发病灶位于颅骨、髂骨、耻骨上支。其 CT 表现为不同程度的骨质破坏及软组织肿胀或肿块，因部位不同而异。**结论** 对骨朗格汉斯细胞组织细胞增生症，CT 均能准确显示病变范围及邻近的组织病变，其较好的显示 LCH 的分布范围，且 CT 的检查结果集合临床有助于对该病的诊断

PU-0187
骨龄与骨密度关系的初步探讨

李森
天津市儿童医院

目的 探讨儿童骨龄与骨密度的关系，为骨龄的评估提供一种新方法。**方法** 收集我院 300 名 6—14 岁儿童左手腕部骨密度数据（采用双能 x 线吸收法测定)和左手腕骨骨龄数据（采用 TW2 平片计算法）。**结果** 儿童骨龄与骨密度、年龄均呈正相关关系。**结论** 对儿童进行骨密度的测量可以初步评估儿童骨龄。

PU-0188
儿童朗格汉斯细胞组织细胞增生症累及股骨头骨骺 1 例并文献复习

忻西子
天津市儿童医院

目的 分享及探讨朗格汉斯细胞组织细胞增生症（LCH）累及长骨、骨骺的影像学表现及影像学检查（X 线、CT、MRI）诊断价值。 材料与方法 回顾性分析我院 2018 年 8 月收治 1 例 3 岁女性患儿的影像学资料。结果 术后病理证实为朗格汉斯组织细胞增生症。结论 LCH 骨骼病变的 X 线诊断有时缺乏定位准确性，结合薄层螺旋 CT 扫描或 MRI 能够更准确地诊断病变是否累及骺板和骨骺，从而指导临床治疗。

PU-0189

骨软骨瘤继发假性 Madelung 畸形一例

李辛子, 胡少建,孙焱,王春祥
天津市儿童医院

患儿，男性，8 岁，两年前发现左前臂中远段内侧无痛性肿物，未予治疗。后随生长发育肿物逐渐增大，左腕关节活动稍受限，遂入我院。家族史无异常。体格检查：左侧前臂内侧触及质硬肿物，无压痛，无活动，左腕活动度差。同时于左小腿近端及右侧胸壁亦触及类似肿物。左前臂向桡背侧稍弯曲。行四肢 X 线检查示左侧尺骨距远端干骺端 3.5cm 处广基底骨性凸起向桡侧及掌侧突出，皮质与左侧尺骨皮质相延续。左侧尺骨远端短小，左侧桡骨干向外稍弯曲，远端骨骺及干骺端增宽，骨骺尺侧变薄，下尺桡关节关系紊乱，腕骨角约 109° 。符合骨软骨瘤继发假性 Madelung 畸形。患儿后接受手术切除骨软骨瘤，术后恢复可，嘱康复科定期复诊。
骨软骨瘤，也称外生性骨疣，是最常见的良性骨肿瘤，占全部骨肿瘤的 20%~50%。肿瘤骨外表面覆盖软骨帽骨性赘疣，内含髓腔与正常骨髓腔相同。最常见起自长骨干骺端，股骨远端、胫骨近端多见，其次为桡骨及腓骨等。骨骼未发育成熟时，与骨骺生长板一样，软骨帽下发生软骨内骨化使骨软骨瘤体积不断增大，或导致并发症，如骨折、滑囊炎、神经血管损伤，同时也出现骨骼与关节的变形。骨软骨瘤会出现骨骼重塑异常，干扰骨骺生长板骨化导致肢体短小。前臂的远端的骨软骨瘤将导致尺骨短缩、肿瘤突出推挤继发桡骨弯曲变形。
Madelung 畸形一种少见的先天性畸形，系因桡骨远端掌内侧 1/3 骨骺生长障碍而外 2/3 骨骺及尺骨生长正常，导致桡骨远端尺偏，尺骨小头半脱位。女性多见，70%以上为双侧发病。假性 Madelung 畸形系由于肿瘤、创伤、感染或内分泌异常等导致。与 Madelung 畸形相比，假性 Madelung 畸形相对更为常见。出生时病变不会显现，而是随着随着年龄增长逐渐表现出症状，发病年龄通常在 2-10 岁。骨软骨瘤通常行 X 线检查即可明确诊断。重要的是在发现骨软骨瘤的同时，也要注意有无继发骨骼畸形形成，提示临床综合评估患肢功能。

PU-0190
儿童骨骼朗格汉斯细胞组织细胞增生症 X 线片诊疗分析

吕冬梅,张英杰,刘鑫春,于宁,刘佳佳
哈尔滨市儿童医院

目的 分析儿童骨骼朗格汉斯细胞组织细胞增生症（Langerhans cell histiocytosis，LCH）X 线表现，提高 X 线片影像诊断 LCH 的认识，有助于临床早期诊断和治疗。
方法 收集总结我院 2010 年~2015 年确诊 18 例朗格汉斯细胞组织细胞增生症的临床资料及 X 线片影像特点。男性 10 例，女性 8 例，男女病例 1.25:1。年龄 8 个月~12 岁，平均年龄 4.5 岁。本组病例中，临床表现差异较大，轻者仅表现为孤立性无痛性骨骼病变，重者则累及全身多器官系统，同时伴发热、贫血和消瘦等表现。其中，单一系统（或器官）受累 11 例（61.11%），两个或两个以上的多系统受累 7 例(38.88%)。局部软组织肿块 12 例，皮疹贫血、伴发热 3 例，外伤后偶然发现局部病灶 1 例，反复发热伴局部疼痛 2 例，所有病例均予病变部位 X 线平片。
结果 单一系统（或器官）受累 11 例中，病变位于颅骨 4 例，位于肋骨 2 例，位于颈椎 1 例，位于胸椎 1 例，位于四肢骨 3 例，单发病灶伴软组织肿块 5 例，不伴软组织肿块 6 例，多发病例中，累及两处骨骼 4 例，累及 3 处及多处骨骼 3 例。
结论 儿童骨骼朗格汉斯细胞组织细胞增生症常累及全身骨骼，X 线平片作为一项基础影像检查，可较准确显示儿童骨骼 LCH 病变范围及邻近组织病变，是临床诊断 LCH 病变的重要方法之一。

PU-0191

浅谈儿童 X 线防护问题

焦承丽
中国人民解放军总医院第一医学中心

浅谈儿童 X 线防护问题

1.目的 通过了解 X 线对儿童的辐射危害，增强医患双方的防护意识。

2 材料与方法:(1) X 线对儿童的辐射影响
X 线照射生物体时，与机体细胞、组织、体液等物质互相作用，儿童是辐射损伤的高危人群之一。儿童处于生长发育高峰期，细胞分裂活跃，生命周期长，较成年人敏感得多,相关资料显示 CT 辐射导致终身癌症死亡率相关风险在 1 岁儿童腹部 CT 检查是 0.18%，头部 CT 检查是 0.07%。低辐射水平就可导致潜在致癌效应和基因变异，并遗传给受辐射者的下一代。因此，合理应用儿童 X 线检查，不断加强和完善患儿的防护，防止和减少照射损害等成了亟待解决研究的重要课题。
(2). 儿童 X 线防护存在的问题
1.儿科医生过分依赖客观的检查手段;
2. 放射科医生责任心不强;
3. 家长对 X 线检查的危害性认识不足.
(3)儿童 X 线防护问题的解决方法
1 儿科医生要加强专业知识,严格掌握儿童 X 线检查适应症,避免不必要的 X 线检查;
2 提高放射科医生的能力素质;
3 加大对公众放射防护知识的宣传,认识到 X 线检查在诊断疾病的同时所具有的危害性。
3.**结果** 尽管 X 线检查存在辐射危险，加强 X 线辐射危害方面的学习了解，一般 X 线检查的辐射剂量表，检查名称平均剂量（mSV）等同拍几张正面胸片：头部 0.15、颈椎 0.210、胸椎 150、腰椎 1.575、胸部正面与侧面 0.15、胸部正面 0.021、腹部 0.735、骨盆 0.630、髋关节 0.735、肩膀 0.010.5、膝关节 0.0050.25、四肢 0.0010.05。临床医生尤其儿科医生能够在 X 线检查前进行评估，权衡利弊，做出正确选择;

PU-0192

多发性内生软骨瘤病一例

马亮
复旦大学附属儿科医院

多发性内生软骨瘤(multiple enchondromatosis)，又称 Ollier 病，是一种罕见的非遗传性良性肿瘤。发病率约为 1/100 000，以多部位软骨发育异常为特征，易累及指 / 趾骨、长管状骨等部位，受累部位有膨胀、缩短、畸形及骨折等表现，并有单侧受累的倾向。该病可发生恶变，常合并其他系统肿瘤，需要长期密切随访。现报道我院诊治的 1 例 Ollier 病。
患儿 男，3 岁，因发现双下肢异常 2 年余来我院就诊。体格检查：步态不良，左侧下肢明显成角畸形，膝内翻，左下肢体稍细。足月产，产时无窒息，按时预防接种。否认家族性遗传性疾病及畸形，父母体健。影像检查：双肱骨近端、肩胛骨、双髋关节诸骨及双侧股骨、胫腓骨干骺端见多发大小不一囊样灶，局部骨皮质变薄、破坏，左股骨干骺端及右侧股骨远端干骺端膨大，见少量骨膜反应。双膝关节关节面与重力线欠垂直，左股骨形态弯曲（图 1-4）。病理检查**结论** 结合临床及影像学，考虑非典型多发性内生性软骨瘤（Ollier 病），软骨细胞增生活跃。

PU-0193

儿童左胫骨干非骨化性纤维瘤 1 例

盛茂,康梦菲
苏州大学附属儿童医院

病例：患者男性，8 岁 7 月，因“左小腿疼痛 5 日”入院。入院查体见一般情况良好，行走步态无明显跛行，左小腿表面无肿胀，未触及明显肿块，有明显压痛，余肢体关节未见异常。X 线片示：左胫骨中段见片状骨质破坏区，中央呈椭圆状稍高密度影，周圈环以环状透亮影，外围呈稍高密度影，破坏区大小 23mm*43mm*22mm，略呈膨胀性改变，边缘骨皮质变薄，硬化边不明显，软组织未见明显肿胀；CT 检查示：左胫骨中段见团块状高密度影，呈磨玻璃样改变，外缘见硬化边，内部见更高密度影，见低密度影环绕，后外侧骨皮质略菲薄，周围软组织未见明显肿胀,左侧腓骨及右胫腓骨骨质连续，未见明显骨质异常。MRI 检查示：左胫骨干局部稍膨胀，可见信号异常，总体呈长 T1 短 T2 信号，STIR 不均匀高信号影，境界欠清，病灶内可见各序列类环形高信号影，与胫骨长轴平行。邻近肌肉可见条状 STIR 高信号影。左腓骨形态及信号未见明显异常。病理分析发现:该肿瘤组织以梭形细胞为主，其中有较多散在分布的多核巨细胞，局部有较多淋巴细胞、粒细胞浸润。

讨论：非骨化性纤维瘤（NOF）多见于 8-20 岁的青少年，是一种罕见的良性骨肿瘤，多发于下肢长骨的干骺端，发生于骨干者少见。NOF 发病缓慢，症状轻，病灶较大可因未被发现的病理性骨折引起明显疼痛，一般为孤立病灶。NOF 的 X 线典型表现为病灶位于长骨干骺端,圆形或椭圆形缺损,略偏心性,侵犯骨的大部分横径,向长轴方向扩展，单囊病灶密度较均匀,多囊者其分隔较细,伴边缘锐利的反应性骨硬化边,且髓腔侧硬化边往往比皮质侧硬化边厚。可发生病理性骨折引起骨膜反应。CT 可更清楚的显示侵犯程度。本例患者为儿童，因左小腿疼痛入院发现左胫骨干占位。术中见髓腔内肉芽组织丰富，刮除后可见肿瘤中部有骨性分隔，病理检查可见镜下细胞呈梭形，符合 NOF 诊断。表现不典型者需要与骨纤维发育不良、骨样骨瘤、嗜酸性肉芽肿等鉴别。

PU-0194

低龄儿童肘关节侧位 X 线摄影的方法　探讨

米彦红,周海春
浙江大学医学院附属儿童医院

目的　通过比较两种体位的肘关节摄影成像效果，探讨适合低龄儿童肘关节侧位 X 线摄影方法。
方法　用两种不同的 X 线拍摄方法各拍摄 50 名患儿，比较肘关节侧位片解剖结构及病变显示效果，并评估两种方法在实际操作中的可行性。上举法：幼儿仰卧于摄影床上，被检侧上臂外展，前臂上举使肘关节屈曲 90 度，桡侧贴近床面，肱骨外上髁置于探测板中心，掌面垂直于床面，中心线垂直肘关节摄入，家长辅助固定患儿体位。外展法：幼儿仰卧于摄影床上，被检侧上臂外展，前臂下举使肘关节屈曲 90 度，尺侧贴近床面，肱骨内侧髁置于探测板中心，掌面垂直于床面，中心线垂直肘关节摄入，家长辅助固定患儿体位。
结果　上举法可清楚显示肱骨小头骨骺、桡骨头及尺骨冠突和鹰嘴，并可清楚展示肱桡关节及肱尺关节。外展法，肱骨小头骨骺多处于斜位，肱尺关节显示欠佳，但桡骨头，肱桡关节间隙情况可显示清楚。实际操作中患儿及家属比较容易执行上举法。
结论　上举法比外展法能提供更多的肘关节信息而且实际工作中更容易实施。

64 排螺旋 CT 气管三维重建在小儿 气管异物中的应用价值

张津华
昆明市儿童医院

探讨 64 排螺旋 CT 气管三维重建在小儿气管异物中的应用价值。方法 对 2018 年 6 月~2019 年 6 月行 64 排螺旋 CT 扫描诊断为支气管异物患儿 45 例的影像学资料进行回顾性**分析。结果** 64 排螺旋 CT 三维重 建及仿真内窥镜可准确、直观地显示气管支气管异物的位置、大小、形态、密度及阻塞程度。其直接 CT 征象为气 管、支气管内的结节状、条状软组织密度影或高密度影;间接 CT 征象为阻塞性肺气肿、肺不张及纵隔移位。45 例气 管异物患儿，右侧支气管异物 29 例，左侧支气管异物 16 例，合并肺炎 22 例,肺不张 7 例,肺气肿 32 例，纵隔、皮下 气肿 4 例。结论 64 排螺旋 CT 三维重组及仿真内窥镜可准确评价气管支气管异物，是一种准确无创性诊断方法，为临床诊治提供直观的影像学资料，具有较高的临床诊断及指导价值。

PU-0196
CT 三维重建在儿童肱骨远端骨折的应用价值

张津华
昆明市儿童医院

目的 分析儿童肱骨远端骨折的 CT 三维重建应用价值。方法 42 例儿童肱骨远端骨折 患者行 X 线,CT 扫描三维重建，并与 X 线正侧位对照。结果 42 例患者 X 线显示 30 例，而通过 CT 扫 描三维重建均能显示。CT 三维重建的检出率有显著意义(P<0.01)o 结论 CT 扫描三维重建为儿童肱骨远端骨折患者早期诊治的一种准确的放射检查手段。

PU-0197
Ullrich 型先天性肌营养不良 1 例 MRI 表现

张孟杰
天津市儿童医院

目的 探讨 1 例 Ullrich 型先天性肌营养不良（UCMD）患儿的临床及核磁共振成像（MRI）特点。**方法** 分析我院就诊的 1 例 Ullrich 型先天性肌营养不良患儿的临床资料及双侧臀部、盆底及双下肢 MRI 表现并复习相关文献。**结果** 患儿男性，6 岁，出生后肌张力低下，运动发育落后合并关节挛缩。MRI 显示双侧臀部及盆底、双侧大腿及小腿诸肌群均存在肌纤维发育不良合并脂肪化，弥漫性双侧对称。单块肌肉脂肪化可见“三明治”征，以大腿肌群更为显著，小腿肌群中以腓肠肌明显，T_1WI 序列显示最佳，与既往文献报道相符合。**结论** UCMD 具有典型的 MRI 特点，结合临床症状可对该病做出初步诊断。

PU-0198
0-1 岁儿童双下肢全长 X 片不同体位设计比较

徐盛威
重庆医科大学附属儿童医院

目的 比较在日常工作中 0-1 岁儿童双下肢全长 X 片不同体位设计，作简要分析。
方法 本科室拍片检查使用的 DR 设备主要有 GE 的 Discovery 650、Diffinium 6000、西门子 Ysio 和岛津 Rad speed PLUS 等，所采用的 FPD 平板探测器长边都为 17 英寸（约 43.18 厘米）。临床上对于 0-1 岁怀疑双下肢骨折、骨质异常\破坏、发育异常（X 型腿、O 型腿等） 、佝偻病等会要求行 X 双下肢正位片检查和(或)测量长度。患儿检查双下肢需要去除裤子鞋子等遮挡物，尤其是尿不湿必须去掉。通常在两个家属陪检情况下，检查技师设计体位并做检查。
结果 不同影像技师对 0-1 岁儿童双下肢全长摄片体位的设计有所不同：⑴将双下肢全长分为股骨段和胫腓骨段分两次投照。这种方法摆位简单，利于家属固定，但是会使患儿及家属受到更多辐射，测量长度更显复杂且误差增大；⑵一次投照，一家属将患儿上半身拉住，另一家属将患儿脚尖拉住，采用抓拍。此法成功率相对低，患儿下肢会不停挣扎反抗，抓拍困难、图像会出现几何失真（尤其是膝关节翘起状态下）、测量误差大；⑶一次曝光，一家属用一次性中单取部分材料将患儿股骨双膝压住，防止弹起，另一家属将患儿脚尖固定。此法成功率很高、使用频率最高；⑷有三个家属情况下，一人固定患儿肩部摆正，另两家属按⑶执行。此种体位最好，但一般陪检家属没有三个人在场或也无此必要性。
结论 0-1 岁儿童双下肢长度一般都不超过 43cm，因此采用上述方法⑷最好，⑶次之，⑴备选，⑵不推荐。标准的体位对于影像诊断至关重要，而体位固定技巧需要一线技师在实践中不断尝试和总结，尤其是当婴幼儿作为被检查对象时，运用更多的技巧可以极大提高检查效率还可让患者家属对技师工作水平刮目相看从而利于医患关系。

PU-0199
磁共振扩散加权成像对儿童颈部淋巴病变和颈部蜂窝织炎的诊断作用

朱凯
哈尔滨市儿童医院

目的 儿童因免疫系统尚不完善，颈部好发一些感染性疾病，颈部淋巴病变和颈部蜂窝织炎临床特征有所重叠，本研究目的是应用磁共振扩散加权成像(DWI)鉴别二者，探讨 DWI 的作用。

资料和方法 回顾性分析经病理证实临床诊断颈部淋巴病变（32 例）和颈部蜂窝织炎（27 例）患儿颈部 DWI 图像和 ADC 值，通过测量病例组 ADC 值和健康儿相应部位 ADC 值进行分析。使用 GE 1.5T 磁共振扫描仪，应用头颈部线圈，患者仰卧，行轴位、冠状、矢状位位扫描，层厚 5mm，总扫描时间约 6min。在后处理平台使用标准化的兴趣区域（ROI），测量 ADC 值进行统计分析。

结果 我们发现颈部淋巴病变和颈部蜂窝织炎之间 DWI 强度显著差异，颈部淋巴病变比颈部蜂窝织炎亮，颈部淋巴病变 ADC 值低于颈部蜂窝织（$P<0.05$）。

结论 磁共振扩散加权成像有助于鉴别颈部淋巴病变和颈部蜂窝织炎，因此成为有用的工具，为临床提供一个有力的影像学依据。

PU-0200
不同评测方法 对单纯性肥胖儿童骨龄的情况分析

刘爱萍,张英杰,于宁,吕冬梅,刘佳佳
哈尔滨市儿童医院

目的 观察单纯性肥胖儿童骨骼发育情况，探讨肥胖因素对儿童骨龄的影响。**材料与方法** 选取 50 为肥胖儿童作为实验组（其中男 25 例，女 25 例），50 例体重正常儿童作为对照组（其中男 25 例，女 25 例），所有病例均来自于我院青春期门诊及遗传保健科门诊肥胖患儿及健康体检儿童。对所有病例应用图谱法、计分法及 CHN 法进行骨龄测定。**结果** 运用不同方法对两组儿童骨龄进行测定，显示肥胖儿童的骨龄与实际年龄之间的差异有显著性，而正常组儿童的骨龄与实际年龄无显著性差异。**结论** 肥胖组儿童的骨龄显著高于对照组，并且肥胖组儿童的骨龄显著高于其实际年龄，而对照组的骨龄和实际年龄差异无显著性。随着肥胖度的增加骨龄提前的幅度也在增加，导致成年预期身高的降低，对于肥胖儿童有必要监测骨龄，在控制体重的同时对于骨龄提前的儿童如预计会造成成年终身高损失的患儿应该及时给予治疗及干预，以达到控制骨龄成熟的速度及追赶损失的身高。

PU-0201

胰腺导管内乳头状黏液性肿瘤 MR 影像诊断的研究

王雪,张善国
大庆龙南医院

目的 通过影像学的方法提高胰腺囊性肿瘤检出率，提高胰腺囊性肿瘤的诊断率
方法 利用 3.0T MRI 的多期动态增强表现及时间-病变强化曲线技术，将数据归纳总结，结合影像学直接征象，得出综合诊断依据，判断胰腺囊性肿瘤的分类、分型；并针对导管内乳头状黏液性肿瘤（IPMN）的影像表现和强化程度分析，能够对病变的良恶性进行早期评估。所有患者均采用平扫及 6 期动态增强检查技术（包括动脉早期、动脉期、动脉晚期、静脉期、平衡期及延迟期）。
结果 。①胆总管扩张提示恶性可能，研究发现胆总管扩张在恶性 IPMN 中较多，其病理基础可能是肿瘤分泌大量黏液栓在乳头部阻塞胆总管开口 也可能是肿瘤侵犯胰头部胆总管致使狭窄或梗阻，其近侧胆总管扩张相对明显。②分支胰管型相对于主胰管型和混合型恶性比例较低。③病灶或壁结节越大 胰管扩张越宽 提示恶性的可能性越大。肿瘤直径≥30㎜， 壁结节直径≥5㎜，主胰管扩张≥7㎜， 提示可能恶性。④发生于胰头或钩突部的 IPMN 通常提示恶性或侵袭性，而发生于胰腺体尾部的 IPMN 多为提示良性。⑤十二指肠扩张及软组织肿块均提示恶性或侵袭性 IPMN 此外淋巴结转移 血管侵犯及远处转移是恶性或侵袭性 IPMN 的间接征象。时间-病变强化曲线针对具有囊壁强化和壁结节强化的导管内乳头状黏液性肿瘤，反映了囊壁或壁结节血液灌注和廓清情况，是对比剂在病变组织内分布变化的直观描述，可间接揭示病变组织的血流动力学情况。Ⅰ型渐增型，曲线逐渐上升，说明病变内造影逐渐填充，可以判定为良性病变；Ⅱ型平台型，曲线速升平台，诊断恶性病变的敏感性和特异性为 87.5%和 75%；Ⅲ型流出型，曲线速升速降，表明病变内血运为迅速填充迅速排出，尤其显示壁结节的强化过程，诊断恶性病变的特异性为 90%。

结论 3.0T 磁共振的 6 期动脉增强技术能够对导管内乳头状黏液性肿瘤的良恶性进行定性分析和诊断，并做出正确的术前评估。

PU-0202

Quantitative Assessment of Liver Function before and after TIPS by Using T1 mapping on Gadoxetic Acid-enhanced MR imaging

Shan Yao,Bin Song
West China Hospital, Sichuan University

PURPOSE
To determine whether T1 mapping of the liver on gadoxetic acid-enhanced magnetic resonance imaging (MRI) can be used to quantitatively estimate the liver function and evaluate the prognosis before and after transjugular intrahepatic portosystemic shunt (TIPS) placement.
METHOD AND MATERIALS
Between September 2018 and March 2019, 21 patients with liver cirrhosis and portal hypertension underwent liver MRI at 3.0T including T1 mapping before and after TIPS placement. T1 maps were obtained by using the Look-Locker sequence before and 20 minutes after Gd-EOB-DTPA or before and 3 hours after Gd-BOPTA. Following MRI parameters was evaluated: pre-and post-contrast T1 values of the liver parenchyma, reduction rates of T1 relaxation times(ΔT1). ΔT1 between before and after TIPS were calculated as $[(T1_{pre}-T1_{post})/T1_{pre}\times100\%]$. Paired samples T test was used to compare ΔT1 before and after TIPS.
RESULTS
$T1_{pre}$、$T1_{post}$ and ΔT1 before TIPS were (813.70±152.19)ms、(403.49±229.97)ms、(50.61±25.58)%, $T1_{pre}$、$T1_{post}$ and ΔT1 three days later after TIPS were (876.46±179.10)ms、(484.47±227.11)ms and (44.52±24.93)%. ΔT1 were significantly different ($P<0.05$) before and after TIPS.
CONCLUSION
Evaluation of hepatic uptake using T1 mapping of the liver on gadoxetic acid-enhanced MRI is of potential in quantitatively accessing liver function and can provide clinically relevant information which may help to evaluate the treatment effect and prognosis after TIPS placement.

PU-0203
肝脏特异性对比剂普美显增强 MRI 在小结直肠癌肝转移瘤诊断中的作用

王立峰,陈学军,张孝先,孟帆,刘翠翠
河南省肿瘤医院

目的 探讨肝脏特异性对比剂普美显增强 MRI 在诊断小结直肠癌肝转移瘤的价值。
方法:收集 2015 年 1 月至 2018 年 12 月来我院就诊结直肠癌患者，同时行上腹部 MRI 平扫+动态增强扫描，对比剂选取肝脏特性对比剂普美显，选取目标病灶小于等于 2cm 纳入研究。共 80 例患者 126 个病灶纳入研究，其中 38 病灶经穿刺活检证实，88 个病灶在随后随访过程大小改变证实。对比 MRI 平扫联合常规动态增强扫描（动脉期、门脉期及延迟期）及 MRI 平扫联合动态增强及肝胆期图像对小转移瘤的检出率及诊断正确率。

结果：MRI 平扫联合常规动态增强扫描及 MRI 平扫联合动态增强及肝胆期图像对小于 2cm 肝脏转移瘤检出率 84.13%(106/126)，100%(126/126),差异有统计学意义(P＜0.05)。 126 个病灶中，105 个病灶经病理所访证实为结直肠癌肝转移瘤。MRI 平扫联合常规动态增强扫描及 MRI 平扫联合动态增强及肝胆期图像对小转移瘤的诊断正确率分别为 81.13%(86/106)，85.85%(91/106)，二者无统计学差异(P＞0.05)。
结论:普美显增强 MRI 在诊断结直肠癌小肝转移瘤中，可以提高对病灶检出率，及早发现小病灶，指导临床个性化治疗。但是，由于普美显单支剂量过小、代谢速度过快等原因，不能提高对肝转移瘤的诊断正确率。

PU-0204

腹膜后粘液囊腺瘤的影像学特点

张国平,樊玮,窦彤,张艳,黄明刚
陕西省人民医院

目的 分析腹膜后粘液囊腺瘤的 CT、MRI 特点，以提高认识及诊断水平。
方法 回顾性分析 3 例经手术证实为腹膜后囊腺瘤的影像资料。总结其分布、密度及信号特点。
结果 本组 3 例均位于右侧结肠旁沟，CT 为囊性密度，部分隐约见间隔影，MRI 上可见分隔信号。
结论 腹膜后粘液囊腺瘤在影像学上有一定特点，MRI 能很好显示病变信号特点。

PU-0205

胆道几何结构与胆囊结石相关性的 MRI 研究

成涛,黄小华,匡静,刘念
川北医学院附属医院

利用 MRI 探讨胆总管几何结构与胆囊结石的相关性。**方法** 回顾性连续搜集我院 2018 年 08 月至我院 2018 年 12 月间行上腹部 MRI 及 MRCP 检查的 817 例病例，按照纳入与排除标准入选胆囊结石 55 例(其中男 32 例，女 23 例)，同期共纳入 40 例正常对照组(其中男 26 例，女 14 例)。数据上传至 PACS 系统并行图像分析，在最投影角度及弯曲度最大的层面分别测量胆囊管与肝总管夹角、胆总管直线距离、胆总管长度、胆总管最大偏离距离、胆总管最大管径并计算胆总管最大偏离程度及胆总管弯曲度。**结果** 胆囊管与肝总管夹角、胆总管最大偏离程度、胆总管最大管径、胆总管弯曲度在胆囊结石组中与对照组间无统计学意义；胆总管直线距离、胆总管长度在胆囊结石组中与对照组间有统计学意义（45.51±12.23，41.32±8.57，*P*=0.04；49.01±12.29，44.51±8.46，*P*=0.03）。**结论** 胆囊结石的发生与肝总管夹角、胆总管最大偏离程度、胆总管最大管径无关，与胆总管长度、胆总管直线距离有关，AUC 分别为 0.619、0.612。

PU-0206

磁共振成像对自身免疫性胰腺炎的优势分析

王亦强,贾宏波,朱思远
抚顺矿务局总医院

目的 探讨磁共振各序列对自身免疫性胰腺炎（AIP）的诊断优势。**方法** 回顾性分析 2015 年 1 月~2018 年 12 月在我院确诊的 AIP 患者 14 例临床资料，所有患者均行常规平扫、弥散加权成像（DWI）、磁共振胰胆管成像（MRCP）及动态增强扫描。**结果** 常规平扫示胰腺局部受累 5 例，胰腺弥漫性受累者 9 例，胰周有少量积液，胰腺实质信号稍欠均匀，T_1WI 信号等或稍低，T_2WI 信号普遍稍增高；5 例患者胰腺呈“剑鞘状”，胰腺病变周围有假包膜样结构包绕。DWI 信号普遍增高。MRCP 示胆总管胰腺段呈“鸟嘴状”，变窄、变细，以上肝外胆管呈不规则扩张，胰管显示欠清，肝内胆管呈“残根状”；2 例胆总管扩张，5 例肝内、外胆管均呈不同程度扩张。动态增强扫描示肿大胰腺动脉期强化并不明显，门脉期开始逐渐强化，强化信号均匀一致，胰腺周围可见环状影，8 例患者呈渐进性延迟强化。**结论** MRI 在 AIP 的鉴别诊断方面有较好的应用价值，结合实验室检查有助于早期诊断 AIP，避免不必要的胰腺切除术，为后续治疗提供可靠保障。

PU-0207
MR IDEAL-IQ 评价急性胰腺炎状态下脾脏铁沉积、脂肪和水含量变化

雷力行
川北医学院附属医院

目的 探讨急性胰腺炎（AP）状态下脾脏组织内铁沉积、脂肪及水含量变化。**方法** 44 例 AP 患者和 21 例健康受检者分别作为实验组和对照组，进行 MR 上腹部常规扫描，并采用 IDEAL-IQ 序列扫描，在后处理工作站多点测量脾脏驰豫率图（R2*）、水像图（Water）、脂像图（Fat）及脂肪分量图（FF）值并行统计学分析。**结果** 实验组和对照组的脾脏 R2*值（P=0.011）、Water 值（P=0.003）、Fat 值（P=0.022）具有统计学意义差异，FF 值（P=0.861）无统计学意义差异。脾脏在轻、中、重度 AP 状态下 R2*、Water、Fat 值组间差异无统计学意义差异（P＞0.05）。青年组（14～44 岁）、中年组（45～59 岁）、老年组（≥60 岁）脾脏在 AP 状态下 R2*、Water、Fat 值组间差异无统计学意义差异（P＞0.05）。**结论** AP 状态可导致脾脏组织内铁沉积、脂肪及水含量变化，IDEAL-IQ 技术能定量测定其铁、脂肪及水含量变化。

PU-0208
探讨普美显 MRI 增强成像在肝脏疾病中的诊断价值

王艳
宝鸡市中心医院

目的 探讨普美显 MRI 增强成像在肝脏疾病中的诊断价值。**方法** 对我院行普美显 MRI 增强的 30 例肝脏疾病患者进行回顾性分析总结，所有病例均行 MRI 平扫、普美显动态增强及肝胆期扫描，排除临床及病史因素干扰，分析平扫、动态增强扫描及肝胆期病灶的信号特点并与术后病理进行对照。**结果** 在平扫中发现病变 21 例，未发现病变者 9 例；21 例中有 13 例患者常规动态增强可以鉴别出典型肝癌和血管瘤，肝癌呈“快进快出”型，血管瘤呈“渐进性强化”，影像诊断与病理结果一致；有 8 例患者对不典型肝癌及 FNH 难以鉴别，行普美显肝胆期扫描后，有 3 例患者在肝胆期呈低信号影，诊断为肝癌，有 5 例患者在肝胆期呈高信号影，诊断为 FNH；普美显是钆(Gd+)与 EOB-DTPA 螯合物的二钠盐，是新型的磁共振 T1 增强对比剂，不仅具有一般非特异性细胞外间隙对比剂的性能，还兼有肝细胞特异性对比剂的特性，与一般钆类对比剂具有同样的增强效果，并且于静脉注射 10～20 分钟后大约有 50%可被正常的肝细胞所摄取，因此在行 T1 增强肝胆期扫描时，正常肝实质信号强度呈渐进性增高，而对于仅有很少功能性肝细胞存在或者是完全没有的病灶，则极

少甚至无法摄取普美显，可有轻度强化或者是没有强化效果而表现为低信号；肝癌不含有正常肝细胞，不未摄取造影剂呈低信号影，而 FNH 含有正常肝细胞，摄取造影剂呈高信号影，术后随访与病理诊断一致；9 例未发现病变患者中 2 例有肝硬化病史，行常规动态扫描后看到多发结节，难以定性，而行普美显肝胆期扫描后呈低信号影，诊断为癌前病变；7 例患者均有原发肿瘤病史，行常规动态增强后，3 例发现微小转移病变，而行普美显肝胆期扫描后，均有多发的低信号影，诊断多发微小转移灶。**结论** 普美显 MRI 增强成像能较好的鉴别诊断肝脏病变—FNH、血管瘤、小肝癌、肝硬化结节、癌前病变及多发微小转移瘤等，特别是普美显 MRI 增强肝胆期信号特点对肝脏病变诊断具有重要价值。

PU-0209

不同位置及大小肝癌癌灶介入术后疗效对比研究

闫建华,何苹
天津市第三中心医院

目的 探讨 TACE 治疗不同大小原发性肝癌的近期疗效及安全性.
方法:对比分析我科行 TACE 治疗的不同大小及不同原发部位的原发性肝癌患者术前、术后的 AFP 定量、影像学改变及生存期、并发症.
结果:经 TACE 治疗,38 例患者瘤体都有不同程度缩小、肿瘤血供不同程度减少;肿瘤≤3 cm 组的碘油几乎完全沉积，沉积完全率为 88%，1 年生存率 91.7%,2 年生存率 83.5%;3～5 cm 组完全沉积病例占 68.1%,1 年生存率 85.7%,2 年生存率 57.1%;>5 cm 组完全沉积率仅为 33%,1 年生存率 20%,无 1 病例存活 2 年。位于左内叶及右前叶瘤体碘油沉积率较高，而位于肝门区及左外叶、右后叶、肝下缘及肝顶部等部位的原发性癌灶碘油沉积率较低。
结论:TACE 是一种疗效可靠、安全性较高的治疗原发性肝癌的方法,尤其对肿瘤≤3 cm 的原发性肝癌更为有效。同时，位于肝脏左内叶及右前叶癌灶的碘油沉积率较好，而位于边缘部位的癌灶碘油沉积完全率较低，要注重随访，必要时进行多次 TACE 治疗。

腹膜后节神经细胞瘤的 MSCT 特征分析

宋杨[1],斯光晏[1],杨彬[1],祝爽[1],舒健[2]
1.西南医科大学附属中医医院
2.西南医科大学附属医院

目的 探索腹膜后节神经细胞瘤的 MSCT 表现特点，以提高腹膜后节神经细胞瘤的诊断准确性。**方法** 回顾性分析 2010 年 2 月 1 日到 2019 年 2 月 1 日之间西南医科大学附属中医医院及西南医科大学附属医院经手术病理证实的 39 例腹膜后节神经细胞瘤患者的临床及影像资料，所有患者均行 CT 平扫+增强扫描，记录患者的性别、年龄、临床症状、发病部位、大小、形态、密度、强化程度等情况，分析其特征性。**结果** 29 例直径≥5cm，10 例＜5cm，其中 13 例位于肾上腺，形态不规则 12 例，类圆形 27 例；28 例沿长轴生长；4 例有伴随影像（血管受包绕）；钙化者 10 例；25 例均为轻度强化，14 例无强化。**结论** 腹膜后节神经细胞瘤虽少见，但具有一定的 CT 特征性，MSCT 增强扫描具有很好的诊断价值，便于临床制定治疗方案。

PU-0211

肝癌术后复发 CT 增强强化方式与 CK19 变化之间的关系

廖飞辉
广西医科大学第一附属医院

目的 探讨肝癌术后复发患者的计算机体层摄影（CT）增强强化特点与细胞角蛋白 19（CK19）免疫组化指标的表达变化之间的规律与联系。**方法** 回顾性分析 31 例肝癌术后复发并再次行手术治疗（包括多次）患者的影像学资料及病理结果，比较两次术后病理 CK19 表达情况，分析两次术前 CT 平扫+增强扫描的影像学表现，主要为病灶三期增强强化特点、边界、包膜情况，比较 CK19 表达变化与 CT 影像学变化之间的关系。**结果** 31 例肝癌术后复发患者 CK19 表达：15 例无变化（13 例均为-，1 例均为+，1 例均为+/-），12 例有变化（7 例从-到+或从+到+3,5 例从+3 到-或从+3 到+），无变化组中强化方式出现改变 4 例，11 例两次强化方式大致相同，有变化组中强化方式出现改变 8 例，4 例两次强化方式大致相同。**结论** CK19 表达在复发患者中变化较大，可出现多种变化，因此不能单凭首次手术病理而直接评判复发病理 CK19 表达情况，而增强强化特点的转变可以起到一定的提示作用。

3.0T MRI 肝胆特异性对比剂增强扫描与多排螺旋 CT 增强扫描对肝细胞癌的诊断价值研究

陆玉敏[1],柴梦琪[2]
1.广西壮族自治区人民医院
2.广西右江民族医学院

目的 探讨 3.0T MRI 肝胆特异性对比剂增强扫描与多排螺旋 CT 增强扫描对于肝细胞癌诊断中的应用价值研究。**方法** 选取我院 2016 年 1 月至 2018 年 12 月临床收治且临床资料、影像数据完整的肝细胞癌患者共 38 例为研究对象，所有患者均接受 MRI 肝胆特异性对比剂增强扫描和多排螺旋 CT 增强扫描检查，分析两种检查方法对于肝细胞癌的强化方式、包膜检出率及检验效能。**结果** 38 例患者中共检出 45 个病灶。MRI 肝胆特异性对比剂增强扫描肝细胞癌的包膜检出和多排螺旋 CT 增强扫描肝细胞癌的包膜检出组间比较差异无统计学意义(p>0.05)。两种检查方法的各期影像学的表现特点及相同期相中不同检查方法的检验效能差异性对比，MRI 肝胆特异性对比剂增强扫描在门脉期的检验效能与多排螺旋 CT 增强扫描在门脉期的检验效能比较，有差异性(p＜0.05)。两种检查方法的各期影像学的表现特点及同一种检查方法在不同期相中检验效能差异性对比，MRI 肝胆特异性对比剂增强扫描在 20 分钟时肝胆特异期对肝细胞癌的检验效能最显著。**结论** MRI 肝胆特异性对比剂增强扫描及多排螺旋 CT 增强扫描两种影像学检查方法均能较好显示肝细胞癌的强化特征及对肝细胞癌包膜的检出，但 MRI 肝胆特异性对比剂增强扫描对肝细胞癌病变的检出有更好的检验效能，尤其是肝胆特异期检验效能显著。

Intravoxel incoherent motion (IVIM) diffusion-weighted imaging DWI) in patients with liver dysfunction of chronic viral hepatitis - relationship with Child-Turcotte-Pugh class at 3 Tesla

Lianxiang Xiao
Shandong Medical Imaging Research Institute

Purpose: The aim of the study was to evaluate the differences of liver IVIM parameters among different group of CTP class in cirrhotic livers (chronic viral hepatitis).
Material and Methods: This was a retrospective study of 142 consecutive patients with chronic liver disease who underwent MRI examination at the XXX Hospital between January 2015 and December 2016. IVIM DWI (seven different b values) was performed on a Siemens 3.0-T MRI scanner. Pure molecular diffusion (D), pseudo-diffusion (D*), and perfusion fraction (f) in different liver segments were evaluated.
Results: f, D, and D* were different among the liver segments (all P<0.05), indicating heterogeneity in IVIM parameters among liver segments. f was consistently higher in Child-Turcotte-Pugh (CTP) class A compared with CTP Class B+C (all P<0.01). D was higher in CTP class A compared with CTP class B+C in EL (extra segment of the left lobe), PR (posterior segment of the right lobe), and whole liver (all P<0.05). D* was higher in CTP class A compared with CTP class B+C in EL, ML (medial segment of the left lobe), PR, and whole liver (all P<0.05). In patients with mean f-value of >0.29,

the AUC was 0.88 (95%CI: 0.81-0.96), with 86.8% sensitivity and 81.8% specificity for predicting CTP class A from CTP class B+C.
Conclusion: Liver IVIM could be a promising method for classifying the severity of segmental liver dysfunction of chronic viral hepatitis as evaluated by the CTP class.

PU-0216
磁共振弹性成像(MRE)对肝纤维化分级诊断优势及临床适用价值研究

刘洪
重庆市第二人民医院

目的 肝纤维化是各种慢性肝病向肝硬化过度的共同病理基础，肝纤维化的发现及准确判断肝纤维化分期对临床治疗意义重大[1]。磁共振弹性成像（MRE）作为一种新型的影像技术，可以通过探测弹性改变对肝纤维化进行分级，其诊断效能及临床适用性还处于探索阶段。国内外已有多个研究通过临床实验对其诊断效能进行了客观评价[2-15]，但评价结果不一，另外由于肝纤维化病理检查患者接受程度较低，常规临床实验纳入患者数相对较少，为了客观地评价 MRE 对肝纤维分级的诊断价值，并避免常规研究中样本量小的缺点，本文利用荟萃（Meta）分析循证医学方式对有关 MRE 和肝纤维化分级的文献进行质量评价及数据合并分析，旨在为临床诊断、治疗提供参考。
方法 1.收集磁共振弹性成像对肝纤维化诊断及分级价值的国内外文献； 2.提取数据，制成表格；3.进行异质性检验，选用效应模型，合并诊断指标；4.评价诊断效能及临床适用性，分析异质性来源；5.得出结论，为临床提供参考
结果与**结论** 磁共振弹性成像（MRE）被称作“影像触诊”，近年来已经大量应用到临床研究中[16-18]，并在肝脏等器官中广范应用，显示出其良好的应用前景。由于 MRE 能直接测量肝组织弹性的变化，其准确诊断可以避免行病理创伤性检查。同时由于 MRE 检查的重复好，能检测全肝弹性程度，MRE 在肝纤维化分级、了解疾病进展方面具有巨大的临床应用价值。
综上所述：肝纤维化诊断目前病理仍是肝纤维化检查的金标准，但仍存在很多不足和局限。无需造影剂、示踪剂引入的功能影像成像技术成为肝纤维化分级研究的方向。磁共振弹性成像肝纤维化分级的展现出了良好的应用前景。

PU-0217
肝硬化结节转变成肝癌过程中病理改变与 MRI 的关系

赵庆秋
河北省人民医院

目的 探讨肝硬化良性结节（RN）转变成肝癌的过程中，不同阶段的病理学改变和与之相对应的 MRI 表现特征，为早期肝癌的诊断提供有价值的诊断思路和参考依据。
材料与方法 肝硬化背景，影像检查与病理学资料齐全的肝硬化结节（RN）、非典型增生（DN）、早期肝癌（HCC）以及进展期 HCC 患者的影像学与病理学进行回顾性研究。MRI 序列包括 T 1WI 同反相位、T2WI、DWI、动态多期增强扫描，增强使用肝胆特异性造影剂。
结果 大多数 RN 在 MRI 上表现为与正常肝脏等信号而不易察觉，少部分 T1WI 表现为稍高信号，T2WI 表现为低信号；DWI 不表现高信号；增强程度与正常肝组织相似，少数有轻度、延迟的低信号，肝胆期呈等或稍高信号。DN 的 T1WI 的信号改变较复杂，与结节内铜或铁的沉积（T1WI 与 T2WI 低信号），以及脂肪（T1WI 高信号）的沉积量有关。有些 DN，特别是 HG-DN，由于脂肪聚

集，在 T1WI 表现为高信号，T2WI 呈等或略高信号；肝胆期呈略低信号；DWI 不表现为高信号；增强扫描多不表现出强化特征。早期肝癌在 T1WI 表现为低或高信号（含脂），T2WI 与 DWI 多呈高信号。早期肝癌通常表现为乏血供结节，“结中结”具有特征性（但不多见），肝胆期呈低信号。进展期肝癌的典型 MRI 表现为 T1WI 低信号、T2WI 与 DWI 高信号，增强扫描呈特征性的动脉期血供丰富，静脉期和/或平衡期洗脱；肝胆期呈低信号。
结论　病理学上 RN－DN－早期 HCC－进展期肝癌的转变过程中具有以下趋势：肝门静脉供血逐渐减少，肝动脉供血逐渐增加；细胞密度逐渐增加；细胞内脂肪由少到多，至早期肝癌达高峰，进展期肝癌由于脂肪消耗增加而又逐渐减少；铁的聚集自 LG-DN 由多逐渐减少；胞膜上有机离子转移多肽功能由正常逐渐丧失。这就为通过观察 MRI 不同序列的信号特征以及随访过程中的信号变化，区分结节的良、恶性成为可能。

PU-0218
对比与改良肝门部胆管癌肝动脉侵犯的术前 CT 诊断标准

周群
南京大学医学院附属鼓楼医院

目的　比较三种 CT 标准和两种征象对肝门部胆管癌肝动脉侵犯的诊断价值。
方法　回顾性分析 61 例肝门部胆管癌的 CT 表现。以术中诊断和/或术后病理诊断为标准，评估改良 Loyer、Lu 标准和 Li 标准、动脉迂曲和接触长度对肝门部胆管癌肝动脉侵犯的诊断效能。
结果　评估肝门部胆管癌肝动脉受侵的改良 Loyer、Lu 标准和 Li 标准的敏感度分别为 88.9%，87.0%，72.2%，特异度为 93.8%，93.8%，94.6%，准确度为 92.4%，91.8%和 88.0%。改良 Loyer、Lu 标准的诊断效能较 Li 标准好（P = 0.049）。与左、右肝动脉相比，CT 标准对肝固有动脉侵犯的诊断效能最佳。Loyer 标准结合 10.9 mm 的接触长度，可避免 3 例假阴性病例。
结论　Loyer、Lu 标准在术前 CT 评估肝门部胆管癌肝动脉侵犯的诊断效能最佳，尤其是肝固有动脉的评估。接触长度和 Loyer 标准相结合可提高诊断性能。

PU-0219
胰腺 SPNP 的性别差异：临床表现和 MSCT 特征对比

史曙光
连云港市第一人民医院

目的　回顾性分析男性胰腺实性假乳头状瘤(SPNP)的临床特征及多层螺旋 CT(MSCT)表现，并与女性 SPNP 病例进行对照研究。**方法**　收集 2010 年 8 月至 2018 年 12 月行 MSCT 检查并经手术病理证实的 29 例胰腺 SPNP 病例（男 7 例，女 22 例），分析男性与女性胰腺 SPNP 的临床特征和 MSCT 表现。**结果**　男性 SPNP 患者中位年龄为 56 岁，明显大于女性患者的 29 岁，差异有统计学意义(P=0.012)，男性与女性胰腺 SPNP 患者的临床表现和肿瘤部位之间差异均无统计学意义(P均＞0. 05)；男性胰腺 SPNP 患者中肿瘤最大径（3.9cm）明显小于女性患者(7.0cm)，差异有统计学意义（P<0.001）；钙化比例男性较女性多见，差异有统计学意义（P=0.013）；实性肿瘤男性较女性多见，差异有统计学意义(P=0.036)。**结论**　男性胰腺 SPNP 影像学特征较女性患者有差异，其 MSCT 表现为病灶较小，实性成分较多，钙化比例较多，具有典型 SPNP 典型的强化特征。

PU-0220

黄色肉芽肿性胆囊炎的 CT 影像讨论

郑魏,陆伦
海军军医大学第三附属医院(上海东方肝胆外科医院)

目的 探讨黄色肉芽肿性的胆囊炎(XGC)的 CT 影像表现。
方法 回顾性分析 33 例经手术病理证实的 XGC，总结其 CT 表现。
结果 CT 表现：33 例(100.0%)均有胆囊壁增厚，且 33 例(100.0%)均有腔面增强，其中弥漫性增厚 31 例(93.9%)，局限性增厚 2 例(6.1%)，18 例(54.5%)壁内有低密度结节，21 例(63.6%)表现为黏膜线完整，25 例(75.8%)伴胆石症，18 例(54.5%)表现为肝胆浸润，15 例(45.5%)在动脉期肝脏有一过性强化。
结论 弥漫性胆囊壁增厚、壁内低密度结节、连续的黏膜线、腔面增强，胆石症，肝周有一过性强化和肝内外胆管无扩张共同存在强烈提示 XGC。

PU-0221

胰腺囊性肿瘤的诊断及鉴别诊断指标

崔文静
哈尔滨医科大学附属第二医院

目的 ：回顾性分析常见胰腺囊性肿瘤 (pancreatic cystic neoplasms, PCNs) 的诊断及鉴别诊断指标。
方法 ：收集哈尔滨医科大学附属第二医院自 2013 年 1 月至 2019 年 1 月经手术病理证实为 PCNs 的 68 例患者的影像学及临床资料进行回顾性分析，其中影像学资料包括 64 排多层螺旋 CT 平扫及增强扫描图像与 MRI 常规 TIWI 及 T2WI 平扫及增强扫描图像。采用 t 检验、 $x2$ 检验、*Logistics* 回归模型从年龄、部位、囊腔、胰管等角度评价浆液性囊性肿瘤 (Serous cystadenoma, SCN)、黏液性囊性肿瘤 (Mucinous cystadenoma, MCN) 、导管内乳头状黏液性肿瘤 (Intraductal papillary mucinous neoplasm, IPMN)的诊断与鉴别诊断指标。
结果 ：本研究所选 68 名患者中， SCN22 例，MCN26 例，IPMN20 例。当肿瘤囊腔数目≥6 个、不与主胰管相通、可见中央星状纤维瘢痕、增强扫描囊壁无强化时诊断 SCN 更有利 (P<0.05)，后者是鉴别 SCN 的独立因素 ；当肿瘤囊腔数目＜6 个、平均直径 72.90 mm、肿瘤不与主胰管相通、常见于胰尾时诊断 MCN 更有利 (P<0.05)；当肿瘤发病平均年龄 66.70 岁、肿瘤与主胰管相通时诊断 IPMN 更有利 (P<0.05)。
结论 发现 SCN 囊腔数目多、可见中央星状纤维瘢痕、极少见囊壁强化；MCN 肿瘤好发于胰尾、直径较大且与主胰管不相通；IPMN 老年患者多发，肿瘤与主胰管相通。

PU-0222

1756 例肝棘球蚴感染的 CT 诊断分析

刘军[1],李世海[1,2]
1.重庆市急救医疗中心
2.昌都市人民医院

目的 探讨肝棘球蚴感染的 CT 表现特征及误诊原因，提高肝棘球蚴感染 CT 诊断的影像学特征的综合认识。

方法 回顾性分析 2000 年至 2018 我院放射科诊断的肝脏棘球蚴感染 1756 例，所有图像均经 2 名医生阅片，所有患者均经手术、并经病理证实。
结果 所有患者中， 1746 例为棘球蚴感染，9 例是肝囊肿，1 例是肝癌， 1742 病例中，肝细粒棘球蚴感染 1725 例，泡状棘球蚴感染 21 例。1756 例均行 CT 平扫及薄层重建后发现，肝细粒棘球蚴和泡状棘球蚴感染各有典型 CT 影像，CT 扫描对绝大部分棘球蚴感染病变能早发现、早诊断，但肝囊肿偶尔可能错误诊断为细粒棘球蚴，肝癌偶尔可能泡状棘球蚴不易鉴别。
结论 CT 扫描能清楚的显示肝棘球蚴感染病灶，具有较快的检查速度和极高的诊断准确率。

PU-0223
肝脏上皮样血管平滑肌脂肪瘤的影像学表现及误诊分析

叶茗珊
中国科学技术大学附属第一医院/安徽省立医院

目的 探讨肝脏上皮样血管平滑肌脂肪瘤 (epithelioid angiomyolipoma, EAML) 的影像学表现，以提高对其的认识及影像诊断准确率。
方法 回顾性分析 2017 年 6 月—2019 年 5 月经中国科学技术大学附属第一医院诊治的 7 例经病理学证实的肝脏 EAML 患者的 MRI、CT 影像学资料及临床资料，上述病例中有 3 例行 MRI 检查，3 例行 CT 检查,1 例行 MRI 和 CT 检查。
结果 7 例 EAML 中女 7 例,男 1 例，平均年龄 41.6 岁，均为单发病灶，边界清楚，均无肝硬化病史。4 例位于肝左叶，2 例位于肝右叶，1 例位于肝左右叶交界区，最短径均大于 3cm。术前仅 1 例诊断正确，其余均误诊,其中 1 例误诊为肝癌，,1 例误诊为海绵状血管瘤，2 例误诊为局灶性结节增生(FNH)，1 例误诊为腺瘤，1 例 CT 误诊为肝癌，MRI 误诊为 FNH。MRI 平扫 T1WI 呈稍低信号,T2WI 呈稍高信号，同反相位未见明显信号改变，均未见明显脂肪信号。增强扫描 4 例肿瘤动脉期呈不均匀或均匀明显强化，门静脉和延迟期 3 例持续强化, 呈“快进慢出”模式, 1 例强化减弱,呈“快进快出”模式。CT 平扫呈稍低密度,3 例密度均匀，1 例密度不均，边界欠清晰。增强模式为“快进慢出”型 3 例、“快进快出”型 1 例。上述病灶中有 5 例在动脉期可见“早期引流静脉”，1 例见假包膜明显强化。
结论 EAML 临床较为罕见，其影像学表现具有一定特征性,病灶内部或边缘出现粗大畸形的静脉有助于该病的诊断,可借此其他肝脏肿瘤相鉴别。

PU-0224
能谱技术在转移性肝癌中的应用

卜令贤,邵广瑞
山东大学第二医院

目的 肝脏是转移瘤的好发部位，全身各种器官的恶性肿瘤有 30%-50%可转移到肝脏，其发病率仅次于淋巴结转移。CT 检查对>2cm 的肝转移灶敏感性几乎为 100%，1-2cm 的病灶则为 74%，<1cm 的病灶敏感性很低。因此，提高辅助检查的敏感性，是早期发现转移性肝癌、提高治愈率、延长生存期的关键。CT 能谱图像可以实现物质的分离和鉴别，通过选择合适的基物质和调整不同的能量水平，能谱 CT 物质图像和单能量图像能特征性的显示一些病灶。本文诣在了解能谱技术在脊柱内固定术后影像随访中的应用。

方法 转移性肝癌能谱 CT 扫描通常采用上腹强化三期扫描。能谱扫描方式选择 Helical-musculoskeletal-large-40mm,根据患者体型大小选择机架转速为 0.5-0.8s/r,首先重建混合能量图像，采用标准算法；然后重建单能量图像，一般选择 68kev，将单能量图像载入 GSI viewer，选择病灶区得出能谱曲线和直方图。
结果 将能谱图像载入能谱分析浏览器（GSI），依次观察单能量及多平面重建图像，找到感兴趣区依次得出能谱曲线、CT 直方图可发现能够客观的显示不同病灶的能谱曲线是否具有一致性以及 CT 值分布是否具有同一性。
结论 能谱 CT 单能量成像在肝转移癌的鉴别中效果显著。

PU-0225
采用 IDEAL-IQ 定量评估糖尿病患者腹部脂肪分布和内脏脂肪沉积

黄小燕
温州医科大学附属第二医院、育英儿童医院

目的 采用磁共振 IDEAL-技术量化糖尿病患者的腹部脂肪组织分布及内脏脂肪含量，并评估它们之间的关系。
方法 43 例志愿者纳入本项研究（男性 22 例，女性 21 例；年龄范围，20-69 岁），包括 20 例糖尿病患者和 23 例年龄与 BMI 相匹配的健康志愿者。所有志愿者都进行了 3.0T 磁共振扫描，并且行 IDEAL-IQ 扫描得到脂肪分数（fat fraction）图像。在脂肪分数图像上测量肝脏、椎体、两肾实质和肾窦以及胰腺的质子密度脂肪分数（PDFF）。同时也测量腹腔内脂肪组织（VAT）面积和皮下脂肪组织（SAT）面积。
结果 糖尿病组的肝脏、胰腺和椎体的 PDFF 值显著高于对照组（*P* 值分别为 0.002， 0.003，0.049），然而两肾窦及肾实质的 PDFF 值在两组中无统计学差异（*P*>0.05）。糖尿病组的腹腔内脂肪组织（VAT）面积显著高于对照组（*P*=0.039），而皮下脂肪组织（SAT）面积在两组中无统计学差异（*P*=0.758）。同时，腹腔内脂肪组织面积分别与胰腺和椎体 PDFF 值呈显著正相关（*P* 值分别为 0.020，0.032）。
结论 IDEAL IQ 可以准确、简捷地量化糖尿病患者的腹部脂肪组织分布及内脏脂肪沉积。糖尿病会影响腹部脂肪分布及内脏脂肪沉积，腹腔内脂肪组织（VAT）会影响椎体和胰腺的脂肪含量。

PU-0226
脾脏窦岸细胞血管瘤的临床特点及影像表现（附 6 例病例）

李莹,查云飞
武汉大学人民医院

目的 结合文献总结脾脏窦岸细胞血管瘤（LCA）的临床特点及影像表现，从而提高对本疾病的认识。
方法 回顾性对 6 例脾脏窦岸细胞血管瘤的临床资料、CT 平扫加增强检查及超声、PET 检查影像表现进行分析、总结。
结果 本组病例中 3 例因腹部不适就诊，5 例伴有不同程度贫血；1 例单发病灶呈明显均匀强化，另 5 例均为多发病灶，其中部分强化方式呈由内向外，其余呈向心性强化。4 例 LCA 患者行超声检查，其中 3 名多发病灶呈高或稍高回声，内均未见明显血流信号；另 1 例脾门单发 LCA 病灶呈实性低回声，且可及较丰富的血流信号。1 例多发 LCA 患者行 PET-CT 检查放射性分布未见异常。

结论 对于贫血伴有或不伴腹部不适患者，影像学检查提示脾脏多发占位，LCA 应被考虑在内。

PU-0227

飞利浦极速 CT 检查肾上腺的研究探讨

姜海余
吉林大学第二医院

目的 探讨使用飞利浦极速 CT 扫描肾上腺占位检查的应用研究。
方法 回顾分析我医院 2019 年 1 月 ～ 2019 年 7 月收治的患者 20 例，并行肾上腺增强检查的志愿者作为研究对象，使用随机数字表法，将其分为动态组和常规组，每组 10 例。两组受检者的一般资料比较，差异无统计学意义(P ＞ 0. 05) ，组间具有可比性。
检查方法
使用 Philips Brilliance 256iCT 扫描。参数:管电压 120 kV.毫安秒 300mAs/slice。扫描前叮嘱患者检查时不要动，听机器口令配合好憋气。使用对比剂延迟扫描技术，扫描范围自膈向下，至肾门水平（L2 水平），屏气后扫描。造影剂使用优维显(碘普罗胺注射液)370(碘浓度 370mg/ml)。造影剂剂量 85 ml 从肘静脉注射，注射速度 3. 5 ml /s; 然后追加生理盐水 30 ml，注射速度 3. 5 ml /s。常规组扫描时间 30s 60s 150s 动态组加扫 5min、 7min 两组患者除扫描延迟时间不同，其它固定扫描参数不变。根据测得的各个时间点的 CT 绝对值逐一绘制时间-密度（T-D）曲线，分析曲线走势.
结果
通过绘制多期动态增强时间-密度曲线，观察曲线类型从而确定肿瘤性质。肾上腺动态增强 CT，对腺瘤的诊断率明显高于肾上腺常规增强 CT (P<0.05)具有统计学意义。
结论
通过资料研究与病理结合证实,肾上腺 CT 动态增强扫描检查能够对腺瘤和非腺瘤鉴别诊断具有较大价值。但因为扫描时间与剂量方面也有其不足,所以最好的方法就是在临床治疗过程中,将两种诊断方式进行结合诊断,可以提高诊断率.

PU-0228

256 层 CT 进行多期扫描对慢性胰腺癌的诊断准确性的价值分析

孙淑钦
平顶山煤业(集团)公司总医院

目的 256 层 CT 进行多期扫描对慢性胰腺癌的诊断准确性的价值分析。
方法 选取我院于 2017 年 3 月至 2019 年 3 月就诊的慢性胰腺癌患者 120 例，作为观察组进行 256 层 CT 多期扫描，另选取我院于 2018 年 3 月至 2019 年 3 月的慢性胰腺癌患者 110 例，作为对照组进行 MRCP（磁共振胰胆管成像技术）检查，对比两组患者的超声检查效果，分析诊断结果的准确性。
结果 256 层 CT 多期扫描对慢性胰腺癌的诊断准确性要优于 MRCP 检查方式，且两组之间的差异（P<0.05）具有统计学意义。结论 采用 256 层 CT 进行多期扫描对于慢性胰腺癌的诊断具有非常好的准确度，对胰腺癌范围以及手术切除方案设计、治疗、预后等具有重要意义，建议在临床推广使用。

PU-0229

the Imaging Feature—Vessel Floating Sign in Hepatic Lymphoma and Hepatic Inflammatory Pseudotumor

Lanhui Qin,YanSha Wei,Jinyuan Liao
The First Affiliated Hospital of Guangxi Medical University

Objective：Our retrospective study sought to compare the vessel floating sign and the other features between the hepatic lymphoma and hepatic inflammatory pseudotumor on the enhanced CT. **Method**：A retrospective analysis was conducted on 25 patients with pathologically proven HL and HIP who underwent enhanced CT between January 2009 and December 2018, there were 10 cases of hepatic lymphoma and 15 cases of hepatic inflammatory pseudotumor . Two radiologists evaluated the morphological features—number, size of lesion, the mode of enhancement, vessel floating sign and counted the numbers of vessels and ducts in the lesions of vessel floating sign. These parameters were analyzed in in these two diseases. **Result**：Among investigated parameters, only the bile ducts and the numbers of arteries penetrating through lesion shows a significant variation of values(c2=1.500，P=0.221; c2=1.632，P=0.201) between HL and HIP, and a significant statistically difference for the number of floating signs(c2=4.900，P=0.027).Also there are differences in total number of lesions in HL and HIP(c2=7.272，P=0.007) and homogeneous enhanced((c2=11.003，P=0.001) . **Conclusion**：The vessel floating signs are different in hepatic Lymphoma and hepatic pseudotumor, particularly, on the arteries and bile ducts.

原发肝外胆管神经内分泌癌 1 例报告附文献复习

周敏洁,何茜,向述天,邵举薇,浦俭
云南省第二人民医院

背景：神经内分泌肿瘤最常见于消化系统，而来自肝外胆管的神经内分泌癌极为罕见。本报告介绍了肝外胆管的神经内分泌癌的临床病理特征、影像特点。
病例报告：一名 45 岁的女性患者术前被诊断为肝外胆管神经内分泌癌。根据组织病理学结果，肿瘤诊断为胆管低分化神经内分泌癌，伴有淋巴结转移。我们对其影像特征进行总结并做文献复习。
结论 肝外胆管神经内分泌癌是一种非常罕见且高度恶性的疾病，预后较差，影像诊断缺乏特异性，最终诊断依赖病理诊断。

PU-0231

基于 MACC1-SPON2 诊断结直肠癌肝转移的放射性示踪剂的筛选

姜昊,姜慧杰,张茗昱
哈尔滨医科大学附属第二医院

目的 探究 ^{18}F-FDG、^{18}F-FLT 和 ^{18}F-FMISO Micro-PET 显像在监测不同转移潜能结直肠癌细胞系 LoVo 和 HCT8 肝转移模型及核素体外细胞摄取中的价值，从体内、体外两方面分析放射性示踪剂的摄取率与 MACC1 和 SPON2 蛋白表达的相关性。

方法 培养人 CRC 细胞系 LoVo 和 HCT8 两种细胞进行体外放射性核素摄取实验及迁移实验，比较不同转移潜能结直肠癌细胞之间的分子影像学特征。并将两种细胞注射到裸鼠脾脏中以建立肝转移模型。接种 8 周后进行 PET 成像，注射三种示踪剂后评估具有高低不同肝转移潜能结直肠癌模型的活体 PET 成像特征。使用免疫组织化学和 Western blot 技术检测组织中结肠癌转移相关基因-1（MACC1）和 Spondin2 蛋白（SPON2）的表达水平。通过线性回归分析评估肝转移灶中示踪剂摄取与 MACC1 和 SPON2 表达之间的相关性。

结果 体外 ^{18}F-FDG、^{18}F-FLT 和 ^{18}F-FMISO 摄取实验 4 小时摄取率为：LoVo>HCT8。Micro-PET 扫描显示两种细胞 ^{18}F-FDG SUV 值之间无统计学差异（P>0.05）；而 ^{18}F-FLT 和 ^{18}F-FMISO SUV 值之间均差异显著（P<0.05）。并且所有体内 FLT 和 FMISO SUV 值 LoVo 肿瘤均显著高于 HCT8 肿瘤。Western blot 实验结果显示：LoVo 肝转移病灶中 MACC1 和 SPON2 的蛋白表达水平均高于 HCT8，差异有统计学意义（P<0.05），这与免疫组化结果相一致。^{18}F-FLT SUVmax ratio 与肝转移瘤组织中 MACC1 和 SPON2 的表达均有显著相关性。^{18}F-FMISO SUVmax ratio 值仅与肝转移瘤组织中 MACC1 的表达有显著相关性。

结论 筛选出 ^{18}F-FLT 和 ^{18}F-FMISO 两种示踪剂对结直肠癌肝转移的早期、高效诊疗具有重要临床价值。

PU-0232

Assessment of liver fibrosis in early stage with perfusion CT in a mini-swines model

Ting Duan, Zheng Ye, Zhen Zhang, Shan Yao, Bin Song
West China Hospital of Sichuan University

PURPOSE

This work aims to assess the performance of perfusion CT in diagnosis of liver fibrosis in the early stage in a mini-swines model

METHOD AND MATERIALS

Diethylnitrosamine (DEN) were injected into the peritoneum of 7 mini-swines to establish mini-swines models of liver fibrosis. Perfusion CT were performed at before and 4-, 8-, 12-, 16- week after injection. The parametric perfusion indices of blood volume (BV), hepatic blood flow (BF), hepatic arterial perfusion (HAP), portal venous perfusion (PVP), and hepatic perfusion index (HPI), time to peak (TTP), mean transit time (MTT), area of curve (AUC) on perfusion maps were measured. Histological examination of the liver tissues with hematoxylin and eosin staining was performed after CT scan. Liver samples were scored as F0, F1, F2, F3, F4 for fibrosis. The perfusion parameters were compared between 2 groups of mini-swines (F0 vs F1) and analyzed with ROC curves.

RESULTS

35 samples were observed. 10 samples were histopathologically scored as F0, 12 were F1, 8 were F2, 3 were F3 and 4 were F4. A statistically significant difference was observed in PVP, BF, HAP and HPI between F0 vs. F1. In the early stage of liver fibrosis PVP decreased with the progression of liver fibrosis, whereas HPI, HAP and BF increased with the progression of liver fibrosis. The area under the ROC curve of PVP was 0.89, which was the highest, the corresponding optimal cut-offs was 35.968. PCT

parameters did not correlate with laboratory findings including AST-platelet ratio index.

CONCLUSION
CT perfusion combined with ROC curve analysis is a new diagnosis model for assess liver fibrosis in the early stage. PVP was the ideal reference index.

PU-0233

Prognostic significance of PD-L1 expression and 18F-FDG PET/CT metabolic parameters in colorectal cancer

Hao Jiang,Huijie Jiang,Mingyu Zhang
The Second Affiliated Hospital of Harbin Medical University

Objectives: ^{18}F-FDG PET is an effective method for assessing tumor glucose metabolism. It has been rarely reported whether ^{18}F-FDG uptake in colorectal cancer cells is associated with the expression of PD-L1. We performed a clinical pathology study to evaluate PD-L1 expression in patients undergoing surgical resection of colorectal cancer (CRC) with preoperative ^{18}F-FDG PET/CT imaging, with the aim of predicting immunological testing in patients with CRC The response of point inhibitors is critical for the successful advancement of PD-L1 immunotherapy in CRC patients. **Methods:** A retrospective analysis of 65 patients with CRC who underwent ^{18}F-FDG PET/CT imaging before surgery was performed to measure the parameters of ^{18}F-FDG PET/CT imaging: the maximum standardized uptake value (SUVmax), the metabolic tumor volume (MTV), and the total lesion glycolysis (TLG) were evaluated to determine whether each parameter was associated with clinical pathology. Tumor specimens were stained with PD-L1 by immunohistochemistry, and whether PD-L1 expression was correlated with the parameters of ^{18}F-FDG uptake in CRC was explored, investigate whether ^{18}F-FDG PET/CT imaging can be used to predict PD-L1 expression status and the impact of these indicators on prognosis prediction of CRC patients. **Results:** PD-L1 was highly expressed in 68% of CRC patients, and its expression level was significantly correlated with SUVmax, MTV3.0 and TLG3.0. Multivariate analysis showed that PD-L1 and TLG3.0 were independent predictors of poor DFS in patients with CRC, PD-L1 expression is closely related to the patient's lesion (TLG3.0), which may be an important indicator for poor prognosis in patients with CRC who have a high level of complete glycolytic level. An important indicator of poor prognosis in patients with CRC. **Conclusion:** The results of this study indicate that high PD-L1 expression levels and tumor vascular invasion are independent risk factors for OS differences in CRC patients. High PD-L1 expression levels and high TLG3.0 are independent risk factors for DFS differences in CRC patients. There was a significant correlation between PD-L1 expression and TLG3.0, which helped to explore the usefulness of TLG3.0 as a predictor of PD-L1 inhibitor activity to determine the optimal therapeutic strategy for CRC.

肝细胞腺瘤 1 例误诊分析并文献复习

李欢,管松,王龙胜
安徽医科大学第二附属医院

目的 提高对肝细胞腺瘤不典型影像学表现的认识，减少误诊。
方法 通过对我院 1 例肝细胞腺瘤的临床及影像、病理资料进行回顾性分析，并复习国内外相关文献。
结果 当肝细胞腺瘤发生于脂肪肝背景并且病变周围肝细胞炎性水肿的情况下，术前定性诊断有一定难度，MRI 增强肝胆期扫描有一定鉴别诊断价值。
结论 肝细胞腺瘤是起源于肝细胞的一种少见的良性肿瘤，通常发生在没有肝硬化的基础上，影像学表现通常较为典型，但也要认识到不典型的影像表现，早期明确定性诊断有助于患者治疗方法的个性化选择。
【主题词】 肝细胞腺瘤；MRI

PU-0235
多层螺旋 CT 增强检查及重建对肝脏泡状棘球蚴病累及脉管及胆道系统的临床应用

刘丽
阿坝藏族羌族自治州人民医院

目的 应用多层螺旋 CT 增强扫描及重建技术，对肝脏泡状棘球蚴病患者脉管系统损害情况进行评价。
方法 所有病例均行多层螺旋 CT 平扫加增强扫描，分析原始图像及重建图像，评价脉管系统受累情况，并将肝血管受累情况与手术所见行对照分析。
结果 MSCT 图像显示 117 例患者中 59 例病变累及肝动脉、肝静脉或门静脉，与手术所见对比研究，多层螺旋 CT 对肝血管评价的敏感度、特异度及阳性预测值分别为 96%、93%和 93%。另外 31 例患者存在肝内胆道系统不同程度扩张。
结论 MSCT 增强扫描可用于分析肝脏泡状棘球蚴病患者脉管系统受累情况，为正确诊断及合理治疗提供影像学依据。

PU-0236
Hepatobiliary phase hypointensity on MRI could improve the detection of hepatocellular carcinoma.

Jianwei Chen,Yueming Li
The First Affiliated Hospital of Fujian Medical University

Objective: To determine the clinical value of hepatobiliary phase (HBP) hypointensity for the detection of hepatocellular carcinoma (HCC) in high-risk patients.

Materials and methods: 235 consecutive patients who were at high-risk for HCC with 251 selected nodules (113 HCCs, 138 non-HCCs) undergoing GD-BOPTA enhanced MRI were included. Imaging-based diagnoses of HCCs were made using any of the following four criteria: 1. arterial phase hyper-enhancement (APHE) plus hypointensity on the portal venous phase (PVP); 2. APHE plus hypointensity on the PVP and/or transitional phase (TP); 3. APHE plus hypointensity on the PVP and/or TP and/or HBP; 4. criterion 3 plus non-LR-1/2/M. Sensitivity, specificity, positive-predictive values, negative-predictive values and accuracy of each criterion were calculated. Sensitivities and specificities of those criteria were compared.
Results: Among diagnostic criteria for HCCs, both criterion 3 and 4 showed significantly higher sensitivities (99.1% and 96.5%, respectively) than criterion 1 and 2 (69.9% and 87.6%, respectively) ($p < 0.001$ for all). In comparison to criterion 3 (54.3%), criterion 4 (89.9%) showed significantly higher specificity ($p < 0.001$). In addition, the specificity of criterion 4 was comparable to criterion 1 (94.9%, $p = 0.065$). Criterion 4 also showed the highest accuracy among these imaging criteria (92.8%).
Conclusion: In the non-invasive diagnosis of HCCs based on hepatobiliary contrast enhanced MRI, HBP hypointensity has definitive clinical value when combined with ancillary features.

PU-0237
定量分析多时相 MRI 图像预测小肝细胞癌的组织病理学分级

许旭茹[1,2],李跃明[2]
1.厦门大学附属中山医院
2.福建医科大学附属第一医院

目的 探讨多相磁共振图像的术前定量分析是否有助于预测小肝细胞癌的病理分级。
材料与方法 回顾性分析 49 例行多期相磁共振成像的患者，患者在术前进行常规平扫 MRI 和钆高酸二甲基葡胺（Gd-BOPTA）增强 MRI。 在指定的感兴趣区域（ROI）内测量信号强度（SI），包括病变和竖脊肌。 分别计算在 T2W，DWI 和动态 Gd-BOPTA 增强 T1W 成像上，病变 /竖脊肌的相对信号比，并进行统计分析以确定组织学分级的预测能力。
结果 49 例患者包括 3 例高分化 HCC，36 例中分化 HCC 和 10 例低分化 HCC。动脉期图像上相对信号比与小肝癌病理分级呈负相关（$\rho = -0.305$，$P < 0.05$）。 然而，其他期相的相对信号比与小肝细胞癌的病理分级无统计学意义（所有 $P > 0.05$）。 此外，肿瘤边缘、肿瘤部位、囊性/坏死性改变、瘤内脂肪、强化模式、肿瘤包膜、肿瘤边界或肿瘤大小在任何组织病理学分级之间也没有相关性（所有 $P > 0.05$）。
结论 Gd-BOPTA 增强的 T1W 显像显示，病灶/竖脊肌的相对信号比可作为预测小肝癌组织学特征的依据。

PU-0238
钆贝葡胺增强 MRI：肝胆期低信号可以提高肝细胞癌的诊断效能

陈建炜,李跃明
福建医科大学附属第一医院

目的 探讨在所有患者及有高危因素的患者中，肝胆期低信号对肝细胞癌的无创性诊断价值。
材料与方法 本研究纳入 369 例行上腹部 GD-BOPTA 增强 MRI 的患者，共 391 个病灶(133 例肝细胞癌，258 例非肝细胞癌)。以下影像标准被用于肝细胞癌的诊断：1. 动脉期高强化（APHE）+门静脉期低信号（PVP）；2. APHE+PVP 和/或平衡期（TP）低信号；3. APHE+PVP 和/或 TP 和/或 HBP 低信号；4. 标准 3+非血管瘤/肝内胆管细胞癌（ICC）；5. HBP 低信号+非血管瘤/ICC；6. 5. HBP 低信号+非血管瘤/ICC+T2WI 轻度-中度高信号+非 ADC 高信号。此外，对上述含有高危因素的患者另设 4 个标准行诊断分析。计算所有标准的诊断敏感性、特异性、阳性预测值、阴性预测值、准确性，并比较这些标准的敏感性和特异性。
结果 在肝细胞癌的诊断标准中，在所有患者中，标准 3、4、5、6 的敏感性分别为 85.0%、82.0%、90.2%、88.7%，明显高于标准 1 和 2。标准 5 和 6 的特异性（分别为 88.4%和 92.6%）与标准 1（97.3%）相近，尽管 p 值<0.05，并且标准 6 的准确度最高（91.%）。在高危患者组中，结果与上述相似。
结论 无论是高危患者还是所有患者，用 GD-BOPTA-MRI 诊断肝细胞癌时，肝胆期低信号结合辅助特征具有明确的临床价值。

PU-0239

34 例原发性肝癌患者 TACE 术后疗效分析

蒋春雨
上海交通大学附属第六人民医院

目的 TACE 在肿瘤的治疗中具有重要的作用，尤其是在复发肿瘤及转移瘤的治疗中发挥着不可替代作用,本文着重研究 TACE 对原发性肝癌的治疗效果及其影响因素。
方法 2011-2014 年共有 34 例原发性肝癌的患者在我院行 TACE 治疗，治疗完成后对 34 例病人进行临床随访，收集病人临床资料及影像学资料，利用 Kaplan－Meier 法进行生存率的计算机分析，利用 Cox 模型分析影响病人预后的因素。
结果 34 例病人中 1 年、2 年、3 年的生存率分别为 82%、71%、47%，AFP 值、肿瘤体积、肿瘤的 TNM 分级不同的病人，其生存率不同（p<0.001）。
结论 TACE 为一种安全有效的原发性肝癌的治疗方法，AFP 值、肿瘤体积、肿瘤的 TNM 分级均为影响预后的危险因素。

PU-0240

肝脏镰状韧带旁假性病灶的 MRI 分型及表现

李国,陈峰,陈旺生,邢增宝,袁利
海南省人民医院

目的 探讨两种类型肝脏镰状韧带旁假性病灶(简称肝假病灶)的 MRI 平扫及增强表现。
方法 回顾性分析 152 例肝假病灶的 MRI 表现特点，并依据影像表现分型。
结果 152 例患者中共检出肝假病灶 173 个，位于肝左叶内侧段 127 个，肝左叶外侧段前缘 46 个；单发肝假病灶 131 个，21 例肝假病灶为双发共 42 个，对称分布于肝左叶内侧段和肝左叶外侧段前

缘。MRI 动态增强扫描动脉期 113 个病灶呈等信号，60 个病灶呈低信号；静脉期 173 个病灶均呈低信号；延迟期 110 个病灶呈等信号，63 个病灶呈低信号。
结论 肝假病灶有特征的好发部位，两种类型 MRI 表现有一定差异，应避免误诊为真性病变。

PU-0241

Effect of low tube current combined with iterative algorithm on image quality and radiation dose of upper abdominal CT scan: a phantom and clinical study

Changjiu He
sichuan cancer hospital

Objective To explore the effect of low tube current combined with iterative algorithm on the image quality and radiation dose of upper abdominal CT scan, and optimize the parameter of upper abdominal CT scan.
Methods Phantom experiment:the abdominal phantom was scanned with 5 different tube currents (200, 180, 160, 140, 120mAs). All data were reconstructed using filtered back projection(FBP) and iterative algorithm [idose4 (Level 1～6)]. The image noise under different tube currents and reconstruction algorithms were compared. Clinical trial: 100 consecutive cases with upper abdominal CT scan were collected and divided into experimental group (48 cases) and control group (52 cases) according to random digital table method. The experimental group was scanned with 120 mAs, and the image (group A) was reconstructed with idose4 (Level 6). The control group was scanned with 200 mAs, and the image of group B and group C was reconstructed with FBP and idose4 (Level 6) respectively. Objective evaluation indexes [contrast noise value(CNR) and image noise], subjective score and effective dose (ED) were compared between experimental group and control group.
Results In phantom experiment, the image noise of FBP, idose 4 (Level 1), idose 4 (Level 2), idose 4 (Level 3), idose 4 (Level 4), idose 4 (Level 5), idose 4 (Level 6) were gradually decreased under the same tube current, and the differences were statistically significant(P<0.05). With the increase of tube current, image noise were gradually decreased under the same reconstruction algorithm, the differences were statistically significant(P<0.05). The image noise of 120 mAs with idose4 (Level 6) group was lower than 200 mAs with FBP group, and higher than 200 mAs with idose4 (Level 6) group, the differences were statistically significant(P<0.05). In clinical experiment, the image noise of group A was lower than group B, and higher than group C, the differences were statistically significant (P<0.05). The CNR of liver in group A was higher than group B, and lower than group C, the differences were statistically significant (P<0.05). Subjective scores of the three groups were >3 points, there was no significant difference in subjective score between group A and B(P>0.05). The subjective score of group C was higher than group A and B, and the differences were statistically significant (P<0.05). The ED of the experimental group was lower than control group, the difference was statistically significant (P<0.05). **Conclusions** In upper abdominal CT scan, the image quality which meets the diagnostic requirement can be obtained by using low tube current combined with iterative algorithm, and the radiation dose can be effectively reduced.

PU-0242

The experience of diagnosis and treatment in solitary giant hepatic lymphangioma

Cuiyun Chen
Henan Provincial People's Hospital

Hepatic lymphangioma was a kind of rare benign tumors, which was characterized by cystic dilation of lymphatic vessels in the hepatic parenchyma. Clinically, hepatic lymphangioma usually had non-specific clinical signs or symptoms and often was discovered during physical examination. Although, the imaging features of hepatic lymphangioma could appear as a cystic or multi-cystic mass with internal septa, it was difficult to differentiate it from other cystic diseases. So, the exact diagnosis was confirmed by pathological examination. In this study, we reported on a case of hepatic lymphangioma in a 29-year-old male. A giant lymphangioma in his right lobe was detected by Imageological examinations. The imaging results and histopathological examinations collectively supported the diagnosis of hepatic lymphangioma. The aim of this article was to report on the experience in diagnosis and treatment of hepatic lymphangioma, which was confirmed by pathology. We also reviewed the literatures of hepatic lymphangiomas in order to improve the understanding of this disease.

PU-0243

探究 T2*在输血性铁过载中的应用价值

徐佳佳
安徽医科大学第二附属医院

目的 探究磁共振 T2*技术对慢性输血患者肝脏中铁沉积的评估价值。
方法 搜集我院近两年因血液系统疾病长期输血患者，入组者排除肝脏肿瘤史，以及促红细胞生成药物服用史、铁剂服用史。抽出患者静脉血，测出血清铁蛋白，c 反应蛋白，并计算出校正血清铁蛋白；利用磁共振设备对肝脏进行最大横断面扫描，用软件测量肝脏 T2*值以及竖脊肌 T2*值，计算出 $SIR_{肝脏/竖脊肌}$，并进行相关性分析;同期收集正常志愿者作为对照组，将输血组根据铁过载程度分为轻中重组，并进行组间差异性分析。
结果 $SIR_{肝脏/竖脊肌}$与血清铁蛋白、校正铁蛋白、输血量均具有相关性,具有统计学意义（$P<0.05$）。组间均具有差异性。
结论 T2*技术在评估慢性输血的患者肝脏铁含量方面有一定价值。

PU-0244

基于 CT 图像的 3D 纹理分析鉴别肾细胞癌的初步价值

裴子璐
安徽医科大学第二附属医院

目的 探讨基于 CT 图像的 3D 纹理分析技术及其相关参数在鉴别不同病理类型肾癌中的应用价值。材料与方法 回顾性分析未经过手术、放化疗及其他抗肿瘤治疗的 73 例肾癌（其中 54 例肾透明细胞癌，19 例肾非透明细胞癌）患者的临床、影像资料。所有患者行 CT 平扫以及动态增强扫描，采用 3DQI 纹理分析软件，在不同扫描时期图像上逐层勾画出肿瘤的边界，获取整个瘤体的纹理参数特征。分析、比较两种不同病理类型肾癌相关纹理参数值（平均灰度值、标准差、偏度、峰度、熵）之间的差异，认为 *P<0.05* 的纹理参数差异具有统计学意义，并通过绘制 ROC 曲线评价各纹理参数的诊断效能。 结果 不同扫描时期，肾透明细胞癌的 CT 定量纹理参数平均灰度值、标准差、熵高于肾非透明细胞癌，峰度低于非透明细胞癌。平均灰度值与标准差在髓质期、实质期、排泄期的差异有统计学意义（*P<0.05*）；熵与峰度在平扫期、髓质期、实质期差异有统计学意义（*P<0.05*）；偏度参数在肾透明细胞癌与非透明细胞癌的不同扫描时期差异均无统计学意义（*P>0.05*）。髓质期，峰度参数 ROC 曲线下面积为 0.87，敏感度 95%，特异度 72%，其最佳阈值为 1.09，对鉴别肾透明细胞癌与肾非透明细胞癌具有较高的诊断价值。结论 基于 CT 图像的 3D 纹理分析技术在鉴别两种不同病理类型肾细胞癌中具有一定价值，可以成为初步诊断肾细胞癌病理分型的新方法。

PU-0245
乏血供胰腺神经内分泌肿瘤的 MR 影像表现及鉴别诊断

付岩宁
中国人民解放军总医院第一医学中心

目的 分析乏血供胰腺神经内分泌肿瘤在 MR 中的影像学特征以及鉴别诊断，以提高对其诊断水平 **方法** 对 20 例经手术病理证实的胰腺神经内分泌肿瘤 MR 表现进行回顾性分析 结果 20 例胰腺神经内分泌肿瘤患者行 MR 平扫及增强扫描，其中 7 例病理证实为胰岛细胞瘤患者 4 例边界清楚，3 例边界不清，T2WI 呈高信号，T1WI 呈低信号，增强后动脉期和静脉期均呈中度强化；13 例病理证实为神经内分泌癌患者均表现为边界不清，T2WI 呈不均匀高信号，T1WI 呈稍低或低信号，增强后病变均呈轻度强化，静脉期较动脉期增强幅度稍减低，所有患者各期增强幅度均未超过胰腺实质。20 例患者，病理证实为胰岛细胞瘤患者动脉期表现为中度强化，病理证实为神经内分泌癌患者动脉期均以轻度强化为主，差异有统计学意义（P＜0.05）。结论 边界清楚明显增强以及包膜强化被认为是胰腺神经内分泌肿瘤的典型影像学表现，但其影像学表现多样，乏血供胰腺神经内分泌肿瘤与胰腺癌在影像学表现上有很多相似之处，二者很难鉴别。

PU-0246
结肠癌肝转移 PD-1 治疗后影像疗效评估误诊一例

秦岫波,崔湧,孙应实
北京肿瘤医院

患者，女，71 岁，因间断腹泻就诊，便潜血阳性，结肠镜示升结肠低分化腺癌，免疫组化 HER2（-）、PD-1 / PD-L1（-）、MLH1 / PMS2（-）、MSH2 / MSH6（+）；PCR：MSI-H。腹部 MR 增强检查示肝脏 S7、S4/8 两个稍长 T1 稍长 T2 信号结节，DWI 高信号，动脉期明显高强化，门脉及延迟期强化稍减低，考虑转移。患者经两周期 PD-1 单抗治疗后复查腹部增强 CT，提示肝脏转移灶增大，并

且新见一转移结节，综合评效 PD。之后患者行肝 TACE 术及第三周期 PD-1 单抗治疗、第 1 周期 XELOX 方案化疗及第 4 周期 PD-1 单抗治疗，再次行腹部 MR 增强检查，示肝脏转移灶均缩小，DWI 信号减低，边缘呈延迟强化，考虑仍具有活性，综合评效 PR。患者行右半肝切除加右半结肠切除术后，病理示肝脏三处肿物均为坏死组织，ypCR。患者术后随访 1 年余，未见复发。

PU-0247

胆囊大细胞神经内分泌癌一例

纪婉莹,孙应实
北京肿瘤医院

本文汇报一名男性患者，53 岁，体检超声发现胆囊占位半月余，上腹部增强 MR 提示胆囊壁可见等 T1 短 T2 信号小结节，大小约 16x9mm，DWI 呈高信号，增强扫描可见强化，延迟期持续强化，考虑恶性。术后病理为胆囊大细胞神经内分泌癌（pT3N1）。查阅中外文献可知，原发于胆囊的大细胞神经内分泌癌十分罕见，目前尚无系统性报道，本文讨论部分通过综合分析中外个案报道，总结其影像学特点，辅助临床诊断及治疗。

PU-0248

特异性对比剂普美显磁共振成像在鉴别肝硬化结节与小肝癌中的诊断价值分析

秦响
徐州医科大学附属医院

目的 探讨特异性对比剂普美显磁共振成像在鉴别肝硬化结节与小肝癌中的诊断价值及普美显动态增强肝胆期扫描对小肝癌应用效果，为肝硬化结节与小肝癌的鉴别诊断提供理论依据。
方法 选取 2016 年 7 月-2017 年 12 月我院 30 例接受治疗的肝硬化患者作为研究对象，患者男 17 例，女 13 例，年龄 33-77 岁，平均（56.1±3.4）岁，所入选的病例术前均为均有乙肝病史，每一位患者肝内至少发现一个肝硬化病灶，所入选的患者均自愿参与本次研究，并签署知情同意书。对以上患者分别进行 MRI 平扫、普美显动脉增强扫描及普美显动态增强肝胆期扫描。在影像学检查结束之后的 4 周内对以上所有患者进行手术检查或是穿刺活检等病理学检查，将影像学检查结果与病理学结果进行对比，并对 MRI 平扫、普美显动脉增强扫描、普美显动态增强肝胆期扫描三种检查方法的灵敏度、特异度、阳性预测值、阴性预测值、诊断正确率。
结果 经过病理学检查与影像学检查后，结果发现 3 例患者中一共存在 90 个肝硬化结节。其中，58 个病灶并确诊为肝硬化再生结节或是肝硬化增生结节，32 个病灶被确诊为小肝癌。普美显增强扫描诊断原发性肝细胞癌的灵敏度、特异度、阳性预测值、阴性预测值、诊断正确率明显高于 MRI 平扫，差异具有统计学意义（P＜0.05）；普美显动态增强肝胆期扫描小肝癌诊断的敏感性、特异性明显高于普美显增强扫描，差异具有统计学意义（P＜0.05）。
结论 特异性对比剂普美显磁共振成像在鉴别肝硬化结节与小肝癌中的诊断价值显著，能够大大提高临床对于肝硬化再生结节、肝硬化增生结节及小细胞癌诊断的敏感性，其诊断正确率明显高于 MRI 平扫。同时，能够在早期将具有恶化倾向的肝硬化结节与小肝癌进行鉴别诊断。

PU-0249

高分化肿块型肝内胆管细胞癌的 MRI 特征

李杰
重庆三峡中心医院

分析高分化肿块型肝内胆管细胞癌的 MRI 表现，以提高影像认识。
方法 回顾性收集 33 例经手术病理证实的肝内胆管细胞癌，根据其病理分级不同将其分为高分化组（n=11）及非高分化组（n=22），对比分析 2 组 MRI 表现差异。
结果 高分化肿块型肝内胆管细胞癌多为类圆形肿块（10/11，90.9%），边界清晰（11/11，100.0%），非高分化组多为边缘不清晰（14/22，63.6%）、不规则软组织肿块（16/22，72.7%），两者比较有统计学意义（*P＜0.05*）；多期增强扫描，高分化组以Ⅰ型及Ⅱ型强化为主，非高分化组以Ⅱ型及Ⅲ型为主，与非高分化组相比有统计学意义（*P＜0.05*）；高分化组 DWI 靶征 6 例（6/11，54.5%），伴随征象 3 例（3/11，27.3%），与非高分化组相比有统计学意义（*P＜0.05*）。
结论 高分化肿块型肝内胆管细胞癌多表现为类圆形、边界清晰的软组织肿块，强化模式多为Ⅰ型及Ⅱ型，伴随征象少见，DWI 可见靶征。

PU-0250

能谱 CT 碘定量评估肝硬化肝、脾血流动力变化的研究

项改生,姜增誉
山西医科大学第一医院影像科

目的 利用飞利浦分层探测器 DECT 通过比较肝、脾实质碘浓度以探讨肝硬化患者的血流动力学变化。
方法 收集山西医科大学第一医院临床或影像确诊为肝硬化的患者 46 例（Child A 级 10 例、Child B 级 24 例及 Child C 级 12 例）及健康对照组 22 例，对所有研究对象行上腹或全腹平扫+增强三期扫描，利用能谱分析软件得到肝硬化组与对照组的肝实质、脾、腹主动脉及门脉的碘浓度并计算两组间的肝动脉碘分数。采用 SPSS 24.0 统计学软件进行分析，计量资料以均数 ± 标准差（X±s）表示，肝硬化组与对照组组间比较采用独立样本 t 检验，Child 评分与其它定量指标采用 Spearman 相关分析，以 P ＜0.05 为差异有统计学意义。
结果 肝硬化组动脉期肝实质碘浓度、静脉期脾脏浓度及肝动脉碘分数均高于对照组，而动脉期脾脏浓度低于对照组，肝动脉碘分数和动脉期肝实质碘浓度与 Child-Pugh 分级呈正相关，相关系数分别为 R=0.71、R=0.46
结论 采用碘浓度法测定肝硬化患者肝、脾实质的血流动力学变化是可行的。肝动脉碘分数和动脉期肝实质碘浓度的定量指标与 Child-Pugh 分级呈正相关，使能谱 CT 作为评估肝硬化血流动力变化的无创性工具成为可能。

罕见腹腔滤泡树突细胞肉瘤 1 例

王璐
陆军军医大学大坪医院

患者，男，45 岁，体检发现腹腔包块 1 月，查体无特殊，血常规检查及肿瘤标志物检查均为阴性。
多层螺旋 CT 检查：肝脏下方、胃窦胰腺间见一类圆形肿块，大小约 3.4×5.4×4.4cm，肿块边缘有小分叶，周围脂肪间隙清楚；CT 平扫显示肿块内部见不规则结节状钙化，肿瘤非钙化区域密度约高于肌肉密度，肿瘤内部无明显坏死、囊变，三期增强检查显示肿块明显强化，静脉期及延迟期强化程度降低，平扫 CT 值约 45HU，动脉期 CT 值约 120HU，静脉期 CT 值约 90HU，延迟期 CT 值约 80HU；肿块与周围组织分界清楚，肿瘤可见一较大供血或引流血管显示；首次 CT 检查误诊为 Castleman 病或肉瘤。
手术及病理：胃窦小弯侧、肝脏下缘及胃十二指肠韧带左侧，活动度好，肿块血供丰富，肿瘤完整切除，术中考虑良性肿瘤。光镜可见： 淋巴结结构破坏,大量淋巴细胞背景中肿瘤细胞呈束状、席纹状、漩涡状或弥漫性排列；瘤细胞呈梭形卵圆形，胞质丰富，可见核仁；免疫组化：瘤细胞 CD35(+)，CD21(+),CD23+),S-100(+),ALK 基因(-)。病理诊断：滤泡树突细胞肉瘤。

PU-0252

胰尾部巨大癌肉瘤 CT 表现一例

刘兴华
重庆三峡中心医院

目的 探讨临床少见病胰腺癌肉瘤的 CT 表现。【\
方法 患者，女，51 岁，因左上腹隐痛不适 7 月余，加重 20 天入院。体格检查：左上腹肋缘下可扪及质硬肿块，约 6cm×7cm 大小，活动度差，压痛明显，无肌紧张及反跳痛。为明确诊断，行上腹部 CT 平扫+增强检查确定病变性质。【结果】 上腹部 CT：左上腹见一巨大囊实性肿块影，大小约 15.3cm×9.4cm×12.3cm，以囊性为主，壁薄，其内可见分隔，平扫囊性部分呈低密度，实性部分呈等、稍高密度；增强囊壁及分隔可见强化，囊性部分未见强化，实性部分明显不均匀强化；肿块与胰腺关系密切，胰尾部呈杯口状改变，考虑来源于胰尾的肿瘤性病变。另横结肠系膜区见 3.5cm×4.0cm 的囊性肿块，考虑转移。术后病理诊断为胰腺癌肉瘤伴肠系膜转移。
结论 胰腺癌肉瘤是一种罕见的肿瘤，确诊需依靠病理及免疫组化；恶性程度高，对放疗和化疗均不敏感，所以手术为大部分病例的首选治疗方式，只有无法手术或无法切净的病例才采用放疗和化疗。

成人型环状胰腺的影像诊断

耿宽,普福顺
红河州第一人民医院

目的 探讨成人型环状胰腺的影像表现及各种影像检查的价值。
方法 分析 24 例成人型环状胰腺的临床、X 线、CT 及 MR 表现。
结果 1 例腹部立位片表现“双泡征”，19 例 CT 平扫均表现为十二指肠周围软组织密度影，其上段十二指肠均有不同程狭窄，17 例增强扫描示十二指肠周围周围软组织明显均匀强化，强化与正常胰腺组织强化程度一致。4 例 MR 平扫示胰头增大，呈完全或不完全包绕十二指肠，其上段十二

指肠狭窄，均增强示肿大胰头与正常胰腺组织强化一致；MRCP 清晰显示环状胰腺的胰管的情况。结论 成人型环状胰腺的影像表现有一定的特征性，通过对病例的总结及分析提高对该病影像表现的认识。

“三低”技术结合 ASIR-V 在肝脏 CT 增强检查中的应用研究

姜露,王琦,胡智军,李豆
长安医院

目的 探讨在低 kVp、低造影剂用量、低流速下结合 ASIR-V 技术在肝脏 CT 增强检查中的应用研究。
方法 前瞻性收集 40 例进行肝脏 CT 增强检查的患者，并随机分为 A、B 两组，造影剂种类使用碘帕醇 370mgI/ml,A 组造影剂用量=（Kg×450）/370ml，流速=造影剂用量/30ml/s；B 组造影剂用量=（Kg×350）/370ml，流速=造影剂用量/30ml/s。扫描条件：A 组管电压 120kVp，噪声指数 NI（Noise Index）为 10，自动管电流技术（Smart mA），采用 FBP 形式重建，图像后重建层厚为 1.25mm；B 组管电压 80kVp，NI 为 10，Smart mA，ASIR-V 重建分别为 0%、20%、40%、60%、80%、100%，间隔 20%，图像后重建层厚为 1.25mm。扫描**方法** 监测膈肌下 1-2cm 的腹主动脉，阈值达到 120HU 后延迟 10s 自动触发扫描动脉期，延迟 30s 扫描门静脉期，延迟 120s 扫描延迟期。
结果 两组间的年龄、体重指数均无统计学差异（p＞0.05）；客观测量值均具有统计学差异（p＜0.05）；两组间图像质量主观评分存在明显差异(P＜0.05)；造影剂用量及流速分别为 76.95±10.98 mL vs.62.55±9.77 mL、2.56±0.36 mL/s vs.2.08±0.31 mL/s（p 均为 0.000＜0.05），具有明显统计学差异，B 组的造影剂用量及流速较 A 组均减少约 22%；两组间的辐射剂量分别为 5.68±1.27 mSv vs.2.11±0.22 mSv，且 B 组辐射剂量较 A 组减少约 56%。
结论 在低 kVp、低造影剂用量、低流速条件下进行肝脏 CT 增强扫描时，随着迭代重建递增，不仅能得到优于 120kVpFBP 重建图像质量，且能大幅度降低辐射剂量。

PU-0255
Application of personalized iodine contrast agent scheme in liver enhancement scan

Lu Jiang,Zhijun Hu,Dou Li,Qi Wang
Chang'an hospital

Objective To study the value of personalized iodine contrast agent in liver enhancement scan. **Methods** Forty patients who underwent liver CT enhancement examination were prospectively collected. Forty patients were randomly divided into A and B groups. The contrast agent type was ibuprofen 370 mgI/ml, the dose of contrast agent A was (Kg×1.22) ml, and the flow rate was (radiography). Dosage / 30) ml / s; B dose of contrast agent = (Kg × 0.95) ml, flow rate = (contrast agent dosage / 30) ml / s. Two groups of scan conditions: tube voltage 120 kVp, noise index NI (Noise Index) 10, and automatic tube current technology (Smart mA). Group A was reconstructed with FBP and the reconstruction thickness was 1.25mm; ASIR-V reconstruction in group B was 0%, 20%, 40%, 60%, 80%, 100%, interval 20%, and post-image reconstruction Thickness is 1.25mm. Scanning method: monitoring the abdominal aorta below 1-2cm of the diaphragm.

After the threshold reaches 120HU, the arterial phase is automatically triggered after 10s delay, the portal vein phase is delayed by 30s, and the delayed phase is delayed by 120s. The ROI was placed in the liver parenchyma at the level of hepatic hilum and at the same level of back subcutaneous fat. Mean values were measured 3 times and CT and SD values were recorded. The signal-to-noise ratio of liver was calculated (SNR=CT). / SD) and contrast-to-noise ratio (CNR = (CT liver-CT fat) / SD fat. Statistical analysis of general patient data and objective measurement results, and subjective scoring of double-blind methods for image quality of each group using the 5-point method. (5 points, best image quality; 1 point, worst image quality.)
Results There was no statistical difference in age, body mass index, and CTDI between the two groups (p>0.05); there was a significant difference in subjective scores of image quality between the two groups. (P<0.05), as the weight of the iodine contrast medium increases, the image quality gradually increases. When the weight is 80%, good diagnostic requirements can be achieved, and the image quality is better than that of the high contrast agent. The image contrast agent dosage and flow rate were (76.95±10.98)/(62.30±10.20), (2.56±0.36)/(2.06±0.34) (p were all 0.000<0.05), with statistically significant difference, group B Contrast agent dosage and flow rate were reduced by about 18% compared with group A; The radiation dose between the two groups was (5.68±1.27) mSv/(4.80±1.36) mSv, respectively, and the radiation dose in Group B was reduced by about 11% compared with Group A. **Conclusions** The personalized iodine contrast agent plan for enhanced CT scanning of the liver Iterative reconstruction of incremental, can get better image quality.

PU-0256
普美显增强磁共振成像评价肝泡型包虫病的病变和肝功能

郭琴,鲍海华,王理祎
青海大学医学院附属医院

目的 我国的青海是肝泡型包虫病的高发地，此病在组织学上具有类似恶性肿瘤的的浸润性的生长特点，导致患者的生存质量差，在此探讨普美显的肝胆期对肝泡型包虫病的生长及侵润特性的的优势，加强对此病的明确诊断。
方法 收集我院自 2017 年到 2019 年经临床确诊为肝泡型包虫病的 44 例患者应用普美显的 MRI 影像资料及评价肝功能的临床资料。
结果 在 44 例患者中，12 名（27.3%）为男性，32 名（72.7%）为女性；平均年龄为 42 岁（范围为 21 岁-66 岁）；44 例患者共检出 53 个病灶，实质型共 27 个，液化坏死 9 个，混合型 9 个，多发结节型 8 例。肝胆期、DWI(b＝0 mm/s^2、b＝800 mm/s^2)序列显示边缘浸润带的宽度分别为 0.93±0.16cm、0.73±0.11cm，差异有统计学意义（P＜0.05）。在 77.4%(41/53)个病灶中，肝胆期对病灶的显示优于或等同于门脉期；在 8 例多发结节型病例中，6 例肝胆期对小病灶显示的更清楚。44 例患者，将这些病例按照 Child-Pugh 分级分为 3 组，A 组 25 例，B 组 12 例，C 组 7 例，对病灶的显示清楚程度，肝功能 childA 级 88%（22/25）＞B 级 58.3%(7/12)＞C 级 42.9%(3/7)。
结论 1、肝胆期对病灶显示的更清楚，特别是多发结节型内的小病灶,为临床提供完全切除所有病灶的可能；2、肝胆期对病灶边缘浸润带范围显示更具有优势，为临床提供更确定的切除范围；3、通过肝胆期可以间接评估肝功能。

Evaluation of Portal System Flow in Response to a Meal Challenge with 4D-Flow MRI

Lihua Chen[1], Ailian Liu[1], Jiazheng Wang[2], Yishi Wang[2], Yaxin Niu[1], Qingwei Song[1]
1. The First Affiliated Hospital of Dalian Medical University
2. Philips Healthcare, China

Purpose: This study monitors the flow changes in portal system through a meal challenge in healthy volunteers with 4D flow MRI to investigate the feasibility of non-invasively quantifying the hemodynamics changes if pathological conditions presented.
Materials and Methods: Ten healthy subjects were prospectively enrolled for MR exam at 3.0 T (Ingenia CX, Philips Healthcare, the Netherlands) with a 16-channel abdominal array coil. The MR protocol included a 2D quantitative flow measurement (axial, TR/TE = 4.4/2.7 ms, FOV = 200×200 mm^2, resolution = 1.5×1.5×8 mm^3, PC direction = RL, PC velocity = 200 cm/s, scan time = 13 s) to measure the flow velocity in portal vein as a reference for velocity encodings (VENC) and a 4Dflow sequence with compressed sensing (CS) acceleration (axial, TR/TE = 5.0/3.2 ms, FOV = 300×350 mm^2, resolution = 2.5×2.5×2.5 mm^3, PC direction = RL-AP-FH, CS =8, scan time = 370 s) for hemodynamics quantification. VENC was set to 30 cm/s for the 4D flow sequence to slightly surpass the measured velocity and avoid phase wrapping. The acquired images were processed in CVI42 (Canada Circle Cardiovascular Imaging) by a single radiologist to obtain a 3D angiogram. The places of those cut planes were put at the middle of the portal vein (PV), superior mesenteric vein (SMV), and splenic vein (SV) trunk. Flow velocity (cm/s) and volume (ml/ cardiac cycle) measurements were performed blinded to subject status (fasting/meal). The intra-class correlation coefficients (ICC) was used to check the consistency of the data measured by the two observers. Flow velocity and volume for each vessel were compared before and after the meal using paired.
Results: The consistency of the data obtained by the two observers were good (ICC value > 0. 75). After meal, significant increased blood flow velocity and volume were observed in PV and SMV and significantly decreased blood flow was observed in SV.

PU-0258

胰周血管改变在急性胰腺炎改良 CTSI 分级中的价值

宫希军,赵红,王龙胜,江安红
安徽医科大学第二附属医院

目的 观察急性胰腺炎胰周血管并发症的影像表现，并统计血管并发症出现率，探讨胰周血管 CT 成像在急性胰腺炎 MCTSI 评分分级中的价值。
方法 对 175 例 SAP 患者的增强影像资料进行回顾性分析，观察其影像学表现，统计分析胰头动静脉弓、脾动、静脉、门静脉、肠系膜上动、静脉出现的增粗、管壁毛糙、受压性改变、狭窄 / 闭塞、血栓形成以及侧枝循环形成等 CT 异常表现的频率。并将血管并发症作为 SAP MCTSI 分级评分标准之一。

结果 175 例急性胰腺炎中出现血管并发症 86 例（占 49.1%）145 次血管损伤。其中以脾静脉发生率较高，占 24.8%。血管并发症的有无在不同严重程度 AP 中具有统计学差异。所有出现血管并发症病例中，仅一例未合并其他胰周并发症。
结论 胰腺炎血管并发症常累及多支血管具有多种 CT 表现，不同严重程度 AP 中血管并发症发生频率不同，并与 CTSI 分级具有较高的一致性，详细评价血管变化有助于判断 SAP 严重程度。

PU-0259

Portal System Hemodynamics Using Highly Accelerated MRI - Compare to the Standard of Care Clinical Imaging Methods

Lihua Chen[1], Ailian Liu[1], Jiazheng Wang[2], Yishi Wang[2], Yaxin Niu[1], Qingwei Song[1]
1. The First Affiliated Hospital of Dalian Medical University
2. Philips Healthcare, China

Purpose: To objectively evaluate the highly accelerated 4D flow magnetic resonance imaging (MRI) in portal system hemodynamics studies with Compressed SENSE (CS-SENSE).
Materials and Methods: Ten healthy volunteers (mean age 27.9±2.66 [20 - 35] years; 5 males, 5 females) were scanned on a 3.0T scanner (Ingenia CX, Philips Healthcare, the Netherlands) with a 16-channel abdominal array coil. The MR protocol included a 2D quantitative flow measurement (axial, TR/TE = 4.4/2.7 ms, FOV = 200×200 mm^2, resolution = 1.5×1.5×8 mm^3, PC direction = RL, PC velocity = 200 cm/s, scan time = 13 s) to measure the flow velocity in portal vein as a reference for velocity encodings (VENC) and a 4Dflow sequence (axial, TR/TE = 5.0/3.2 ms, FOV = 300×350 mm^2, resolution = 2.5×2.5×2.5 mm^3, PC direction = RL-AP-FH) with no-CS (scan time = 7min 24 s) and different CS (CS6 6min 10 s, CS8 4min 37 s, CS10 3min 44 s) for hemodynamics quantification. VENC was set to 30 cm/s for the 4D flow sequence to slightly surpass the measured velocity and avoid phase wrapping. The acquired images were processed in CVI42 (Canada Circle Cardiovascular Imaging) by a single radiologist to obtain a 3D angiogram, where measuring planes were manually placed to the trunk of portal vein (PV), superior mesenteric vein (SMV), and splenic vein (SV) to measure the flow velocity (cm/s), volume rate (ml/cardiac cycle), axial-wall shear stress (axial-WSS, Pa). Flow velocity, volume rate and axial-WSS for each vessel were compared between different CS acceleration rates using Kruskal-Wallis H.
Results: There was no statistically significant difference in flow velocity, volume rate, axial-WSS of portal system when compared among different CS, and all the measured parameters remained relatively consistent among the healthy volunteers with a reasonable standard deviation (Table 1).
Conclusion: In this study, Compressed SENSE has dramatically reduced the imaging time by up to 10 fold when compared to the traditional acquisition method without altering the measured flow parameters, implying the technique a potential alternate in clinical practice. Higher acceleration factors may be explored in further studies.

基于平扫的个体化肝 CT 增强扫描方案的临床应用

刘欣,马嘉敏,徐彪,雷淑妃,张鹏程,杨淑敏
汕头大学医学院附属粤北人民医院（原:韶关市粤北人民医院）

目的 探讨基于平扫影像下，制定个体化的肝 CT 增强扫描方案，并评估其临床应用价值。
方法 根据肝脏平扫的情况，将肝硬化程度分为 5 个等级，给予每个等级相应的 CT 增强方案，采用对比研究方法，比较个体化肝 CT 增强与固定时间点肝 CT 增强的图像质量差别。
结果 实验组肝实质 CT 值 $\Delta_{门脉期-动脉期}$与对照组肝实质 CT 值 $\Delta_{门脉期-动脉期}$在轻度肝硬化中无差异（P＞0.05），在中重度肝硬化中差异有统计学意义（P＜0.05）；实验组门脉期 CT 值 $\Delta_{门静脉-肝实质}$与对照组门脉期 CT 值 $\Delta_{门静脉-肝实质}$在轻度肝硬化中无差异（P＞0.05），在中重度肝硬化中差异有统计学意义（P＜0.05）；实验组门脉期 CT 值 $\Delta_{肝静脉-肝实质}$与对照组门脉期 CT 值 $\Delta_{肝静脉-肝实质}$在轻度肝硬化中无差异（P＞0.05），在中重度肝硬化中差异有统计学意义（P＜0.05）
结论 基于平扫图像个体化扫描的扫描方式与固定时间点的扫描方式比较，正常肝与轻度肝硬化患者之间无明显差异，中重度肝硬化患者，个体化扫描的病例肝血管显像更清晰，血管/肝实质对比性更优。

肾上腺皮质嗜酸细胞腺瘤 1 例

徐海燕
安徽医科大学第二附属医院

患者男，57 岁，系“左侧腰痛 3 年，体检发现左侧肾上腺占位两天”入院，腰痛时无发热、血尿、尿急、尿频、尿痛等症状。既往否认高血压、低血钾等病史。实验室检查促肾上腺皮质激素、醛固酮、血儿茶酚胺、血皮质醇、立卧位肾素血管紧张素、尿 3 一甲基-4-羟基苦杏仁酸、尿 17-羟皮质类固醇,17-酮皮质类固醇均正常。
腹部 CT 平扫+增强示：左侧肾上腺区可见团块状占位，最大层面大小约 8.5cm×9.4cm，其内密度不均，其大部呈软组织密度影，内可见裂隙样低密度液性成分及斑片状钙化灶，平扫实性部分测 CT 值约 45HU，肿块血供丰富，增强后动脉期可见多发迂曲血管影，动脉期肿块强化不显著，CT 值约 49HU，门脉期继续强化，测 CT 值约 97HU，延迟期有所减退，测 CT 值约 74HU，肿块内裂隙样液性成分无明显强化，见图 A-E；右侧侧肾上腺形态、密度未见明显异常。
手术所见：进入腹膜后显露包块，呈类圆形，约 10cm×9cm×9cm 大小，位于肾上极与胰腺之间，表面血供丰富。病理示：肿块包膜完整，肿块呈实性，切面呈灰红、灰黄、灰褐，部分区域有胶冻物呈放射状分布，部分区域有坏死。肿瘤细胞为类圆形,胞浆充满嗜酸性颗粒。免疫组化**结果** CK（弱+），Vim（+），LCA（-），Syn(少数+)，CgA(-)，CD56(+)，S-100(-)，Ki-67(约 1%)，HMB45（-），Melan-A(-),考虑肾上腺皮质嗜酸细胞腺瘤，伴广泛坏死及灶性出血，肿瘤包膜完整，细胞核分裂象罕见，但核有轻-中度非典型性，未见明确血管及包膜侵犯，目前诊断恶性依据尚不足，建议密切随访，见图 F、G。

肝细胞肝癌细胞外体积分数与肝脏血清肿瘤标志物相关性的探索

崔凤娇,罗娅红
辽宁省肿瘤医院

目的 探索肝细胞肝癌患者肿瘤细胞外体积分数（fECV）与血清肿瘤标志物相关性及临床意义。
方法 选取我院经病理确认为肝细胞性肝癌患者 46 例，收集患者血清生化指标 AFP（甲胎蛋白）、AFU（α-L-岩藻糖苷酶）、CEA（癌胚抗原）、 CA199（肿瘤标志物）、TAP（异常糖链糖蛋白）值。 对患者进行常规肝脏多期动态增强 CT 扫描，通过平扫及平衡期（注射对比剂 3min 后）计算肝脏肿瘤（Etumor）、正常肝实质（Eliver）及主动脉（Eaorta）绝对强化值，并通过以下公式计算肿瘤和肝实质的 fECV 值：fECV1（%）=Etumor/Eaorta（100-Hct[%]）,fECV2（%）=Eliver/Eaorta（100-Hct[%]）。分析肝细胞肝癌患者细胞外体积分数与肝脏肿瘤标志物相关性。
结果 肝脏正常实质的细胞外体积分数 fECV2 与 CEA（癌胚抗原）呈正相关（r=0.299，p=0.041），肝脏肿瘤细胞外体积分数 fECV1 与 CA199（肿瘤标志物）呈正相关（r=0.333，p=0.025）。
结论 肝细胞肝癌患者肝实质的细胞外体积分数与血清 CEA（癌胚抗原）值呈正相关、肝脏肿瘤的细胞外体积分数与血清 CA199（肿瘤标志物）值呈正相关。

原发性肝癌 TACE 术后影像学疗效评估

周红俐,斯兴无,陈世孝
南充市中心医院

目的 探讨 MRI 和 CT 对原发性肝癌肝动脉化疗栓塞（Transcatheter arterial chemoembolization, TACE）术后疗效评估的价值。
方法 收集我院 2015 年 9 月-2016 年 12 月 128 例经 TACE 治疗的原发性肝癌患者资料予以探析，均行 MRI、CT 及数字减影血管造影（DSA）检查，以 DSA 结果为金标准，对 MRI、CT 的诊断结果进行对比。
结果 128 例患者中，DSA 显示病灶 166 个，其中 115 个病灶存在肿瘤复发或残余，51 个病灶无肿瘤复发或残余；MRI 检出 108 个复发或肿瘤残余病灶，准确率为 94.53%，敏感性为 93.04%，特异度为 100.00%。CT 检出 76 个复发或肿瘤残余病灶，准确率为 69.53%，敏感性为 66.08%，特异度为 100.00%； MRI 诊断的准确性高于 CT，比较具有统计学意义(P＜0.05)；MRI 对有包膜病灶的检出率较 CT 高，比较差异具有统计学意义(P＜0.05)。**结论** MRI 对复发及残余病灶诊断的准确性高于 CT，在原发性肝癌 TACE 术后疗效评估中具有较高价值。

PU-0264

钆塞酸二钠增强 MRI 肝胆期信号与肝细胞肝癌分化程度的相关性分析

谭海猷
陆军军医大学附属新桥医院放射科

目的 探索钆塞酸二钠（Gd-EOB-DTPA）增强 MRI 肝胆期信号与肝细胞肝癌（HCC）分化程度的相关性。
方法 回顾性分析 2018 年 01 月至 2019 年 5 月期间笔者所在医院收治的 30 例非肝硬化 HCC 患者的 Gd-EOB-DTPA 增强 MRI 肝胆期图像，分别计算信号噪声比（SNR）、强化率（ER）和相对强化率（RER）以及相对信号强度比（RIR），并统计患者年龄、血 AFP 值及病灶最大径。比较不同分化程度 HCC 患者平扫、肝胆期各信号指标及年龄、血 AFP 值及病灶最大径的差异。

结果 30 例患者（35 个病灶）中，分化程度为高分化 5 例，中分化 22 例，低分化 8 例；高、中及低分化 HCC 的 RER（P=0.007）、年龄（P=0.02）比较差异有统计学意义（P＜0.05），而 SNR、ER、RIR 及血 AFP 值及病灶最大径比较差异均无统计学意义（*P*＞0.05）。
结论 Gd-EOB-DTPA 增强 MRI 肝胆期信号指标预测 HCC 分化程度有一定的价值。

PU-0265
全肝 CT 灌注成像评估兔 VX2 肝肿瘤经肝动脉栓塞术联合阿帕替尼治疗效果

刘晓,梁琪,刘晟,胡鹏志
中南大学湘雅三医院

目的 探讨全肝 CT 灌注成像评估兔 VX2 肝肿瘤经肝动脉栓塞术联合阿帕替尼治疗效果的价值。
方法 建立 36 只兔 VX2 肝肿瘤模型,随机分为 4 组,每组 9 只。A 组行 TAE(0.4 mg 栓塞微粒球),B 组单纯强饲阿帕替尼 50 mg/(kg.d),C 组行 TAE(0.4 mg 栓塞微粒球)+强饲阿帕替尼 50 mg/(kg.d),D 组使用生理盐水行肝动脉灌注。4 组均于治疗前和治疗 7,14 d 后行 CT 灌注成像,获取灌注参数,包括血流量(blood flow,BF)、血容量(blood volume,BV)、肝动脉分数(hepatic arterial fracture,HAF)、平均通过时间(mean transit time,MTT)及毛细血管表面通透性(permeability surface,PS)。各组于第 1 次灌注扫描后分别处死 1 只兔,最后一次灌注扫描后处死剩余 8 只兔,取肿瘤边缘区组织行免疫组织化学染色。比较各组治疗前及治疗 7 d 后肿瘤边缘区 CT 灌注参数的变化,比较各组的肿瘤边缘区微血管密度(microvessel density,MVD)值,对各组灌注参数与 MVD 值行相关性分析。
结果 治疗前 4 组间肿瘤边缘区各灌注参数无明显差异(P>0.05)。与治疗前相比,治疗后 A,B,C 组 BF,HAF,PS 明显降低(P<0.05),D 组稍增高。治疗 14 d 后 MVD 值分别为 A 组 80.1±16.4,B 组 50.2±11.2,C 组 27.4±9.7,D 组 68.7±12.7,C 组 MVD 值较其他 3 组显著降低(P<0.01)。除 A 组外,其余各组兔 VX2 肝肿瘤边缘区 CTPI 参数 BF,HAF,PS 与 MVD 均呈正相关;BV,MTT 与 MVD 无明显相关性;A 组 MVD 与各 CTPI 参数无明显相关性。结论:全肝 CT 灌注可定量评估兔 VX2 肝肿瘤 TAE 治疗前后肝血流动力学变化,可替代 MVD 评价肿瘤血供生成,TAE 联合口服阿帕替尼能够有效抑制肿瘤血管生长。

PU-0266
A Initial Study of Liver Fat Quantification Using volume extraction on compressed sensing 3D mDIXON sequence

Nan Zhang[1],Qingwei Song[1],Ailian Liu[1],Renwang Pu[1],Haonan Zhang[1],Yu Song[1],Jiazheng Wang[2],Xiaofang Xu[2]
1.The First Affiliated Hospital of Dalian Medical University
2.Philips Healthcare

Objective: To investigate the effect of volume in liver fat quantification on compressed sensing 3D mDIXON.
Materials and methods: The ten healthy volunteers (28.5±2.38) with CS acceleration factor of 2 were collected to perform compressed sensing 3D mDIXON sequence liver scanning under 3.0T MR scanner（Ingenia CX, Philips Healthcare, the Netherlands）in

our hospital. At the ISP workstation, two observers quantitatively measured the liver fat of the same volunteer using volumetric extraction and axial placement ROI respectively. The whole liver volume was extracted by the threshold method layer by layer from the septum top to the lower edge of the liver, avoiding the bile duct and blood vessel. The ROI were placed at the maximum level of the liver, with an area of 200±8mm^2, respectively in the left outer lobe, left inner lobe, right upper lobe and right lower lobe of the liver, avoiding the bile duct and blood vessel, and 10mm away from the liver edge, and the mean value was taken. The intraclass correlation coefficient (ICC) method was used to confirm the reliability of the volumetric extraction technique for quantitative liver fat fraction(FF), and the mean value between groups and the ROI data were used for Spearman test.
Results:The measurement of FF by volume extraction method and ROI method was consistent between the two observation groups (Table 1). There was a high correlation between volumetric extraction and ROI for liver FF (r=0.781,P=0.008).
Conclusion: The volume extraction technology can be used to measure the liver FF in the compressed sensing 3D mDIXON, which can replace the ROI method and provide an important reference for the screening, diagnosis and treatment effect evaluation of diseases.

PU-0267
第三代双源 CT 在肝脏转移瘤与血管瘤中的鉴别诊断价值

王金凤
山西医科大学第一医院

目的 探讨第三代双源 CT 能谱衰减曲线对肝脏血管瘤及转移瘤肝脏的鉴别价值。**材料和方法** 分析我院行第三代双源 CT 检查的肝脏病变患者 29 例，共 43 个病灶，其中，转移瘤 13 例，共 25 个病灶，肝血管瘤 16 例，共 18 个病灶；获得两组病灶实质部分（即肿瘤强化明显的部分）、病灶周边肝实质（为病灶周围 2cm 范围内的部分）及正常肝脏平扫、增强扫描三期能谱曲线及 40～190keV 各单能量点的 CT 值及能谱衰减曲线形态，并计算能谱曲线斜率（K）。
结果 1.两组病灶平扫：两组病灶实质部分显示转移瘤能谱曲线呈下降型，血管瘤能谱曲线呈平直上升型，且病灶 40-80keV 间差异没有统计学意义，余差异有统计学意义；两组病灶周边肝实质部分及正常肝脏显示，能谱曲线均呈下降型，且病灶在 40～190keV 水平单能量下 CT 值差异均没有统计学意义。2.两组病灶增强扫描：增强扫描三期病灶实质部分及周边肝实质部分能谱曲线均呈下降型，40～190keV 单能量下病灶实质部分血管瘤 CT 值均高于转移瘤，差异有统计学意义，且以病灶诊断效果绘制受试者工作特征曲线（ROC）所得，静脉期 70keV 单能量曲线下面积（AUC）最大，ROC 曲线下面积为 0.990，且以能谱曲线 CT 值 123.6150 为阈值鉴别时，灵敏度及特异度分别为 100%、92.0%；增强扫描三期病灶周边肝实质部分两组病灶 40～190keV 单能量下差异均没有统计学意义；两组病灶正常肝脏增强扫描静脉期及延迟期 40～190keV 单能量下 CT 值差异没有统计学意义。3.两组病灶能谱曲线斜率：平扫病灶能谱曲线斜率差异没有统计学意义；增强扫描三期病灶实质部分能谱曲线斜裂差异均有统计学意义，且以斜率切点-1.1865 为阈值鉴别时，ROC 曲线下面积为 0.950，灵敏度及特异度分别为 96%、87.5%。
结论 第三代双源 CT 能谱衰减曲线有助于更好地鉴别肝脏良、恶性结节，为临床提供了有效的鉴别方法。

胃肠道异位胰腺的影像学表现并文献复习

印隆林,孙菊,曾桔,张传德,王益双
四川省医学科学院·四川省人民医院

目的 探讨胃肠道异位胰腺（Ectopic pancreas,EP）的 CT 及 MRI 影像表现，以提高对该病的认识。
方法 回顾性分析 12 例行腹腔镜切除术或内镜粘膜下剥离术，并经病理证实为胃肠道异位胰腺的患者的临床、影像资料及病理结果，并总结其影像表现特点。
结果 12 例异位胰腺均为单发，病灶多位于黏膜下层。其中 6 例位于胃体小弯侧，3 例位于胃角，1 例位于胃窦后壁，1 例位于空肠上段，1 例位于回肠末段。病灶长径均≤3cm，长轴多与胃肠道壁平行。CT 及 MRI 密度/信号大多与胰腺类似。
结论 CT 及 MRI 可以提供异位胰腺的发生位置、形态、大小及病灶内部密度、信号等信息，有助于该病的诊断。

PU-0269

屏气 3D-MRCP 成像技术的临床应用价值

宋维通
南京大学医学院附属鼓楼医院

目的 探讨屏气 3D-MRCP 成像技术的临床应用价值。
方法 对 150 例受检者同时进行两种 MRCP 成像方法的扫描:一是采用屏气 3D-MRCP 成像技术进行屏气扫描；二是单次激发快速自旋回波、厚层多角度成像（屏气 2D-MRCP），以胆总管为定位中心屏气完成扫描；最后一种成像技术为快速自旋回波三维薄层扫描，采用呼吸门控方式进行扫描。根据图像的肝内分支显示情况和图像的空间分辨率、对比度、呼吸运动伪影状况以及背景干扰因素等，对三种 MRCP 图像分别评级。x^2检验三种扫描方法图像间的差异性。
结果 屏气 3D-MRCP 维成像方法获得的图像中Ⅰ级、Ⅱ级合计 142 例,Ⅲ级 8 例；三维图像中,Ⅰ级、Ⅱ级合计 125 例,Ⅲ级 25 例。屏气 3D-MRCP 和屏气 2D-MRCP 图像运动伪影小于常规呼吸门控 3D-MRCP；两种 3D-MRCP 技术肝内胆管分支显示情况由于 2D-MRCP；x^2检验结果:x^2= 9.64, P= 0.003。结论:采用屏气 3D-MRCP 技术进行扫描既能减少扫描时间，又能很好的显示肝内胆管情况，建议临床扫描中尽量采用此技术。

螺旋 CT 测量肝脏及肝内肿瘤体积的临床意义

杨建君
大理市第一人民医院

研究对象 自 2017 年 10 至 2018 年 11 月间我院内肝脏病灶单发或病灶≤3 个的 25 例原发性肝癌、转移性肝癌或肝血管瘤（弥漫型肝癌不在此讨论）。
目的 探讨肝脏体积及肝脏肿瘤体积测量对于临床应用的价值。
方法 利用西门子 64 排 128 层螺旋 CT、层厚 2mm，螺距 8mm， 100KV，250-300MAS 进行平扫及增强三期容积扫描，取病灶边缘显示最清晰期相（一般取平衡期）利用计算机后处理及人工修正法对目标病灶测量。**意义** 肝脏体积测量不仅可以定量评价肝脏大小，还能间接反映肝功能情况，具有

广泛而重要的临床应用价值，在评估肝硬化肝功能储备、肝脏肿瘤手术方式选择和预后评价、肝移植中都有重要意义。

PU-0271
3D-FSE-Cube 在离体肝脏质量评估中的价值研究

陈根,汤浩,李震,胡道予
华中科技大学同济医学院附属同济医院

3D-FSE-Cube 在离体肝脏质量评估中的价值研究
背景：供肝质量评估非常重要，与肝移植术后并发症和死亡率密切相关。目前供肝评估方法主要包括穿刺活检和视检评估，穿刺活检是有创性操作，同时存在抽样误差，视检评估存在很大主观性并缺乏统一标准。磁共振成像是一种无创、客观评价离体肝脏质量的新方法。
目的 将 3D-FSE-Cube 序列应用于离体肝脏质量评估的 MR 常规扫描中，为离体肝脏质量评估提供依据。
方法 13 例离体肝脏在低温条件下行 3D-FSE-Cube 序列和常规序列扫描，分别获取 3D-FSE-Cube 序列扫描图像和常规 T1WI、T2WI 序列扫描图像。
结果 1. 肝脏在离体、低温条件下，磁共振 3D-FSE-Cube、T1WI、T2WI 序列均获得高质量图像。2. 3D-FSE-Cube 序列较常规 T2WI 序列扫描离体肝脏，对正常肝实质显示优良率的差异无统计学意义（$p>0.05$）；2. 3D-FSE-Cube 序列较 T2WI 序列扫描肝脏，对肝脏管道系统显示优良率的差异无统计学意义（$p>0.05$）。
结论 在 MRI 对离体肝脏质量评估中，应用 3D-FSE-Cube 序列代替 T2WI 序列，在不影响肝脏实质病变显示的情况下，能够显示管道系统情况，从而为离体肝脏评估提供更可靠信息。此外 3D-FSE-Cube 无间断扫描可以减少病灶的遗漏，同时可对肝脏进行三维重建，测量肝脏体积，为治疗计划制定提供可靠依据。

PU-0272
普美显 MR 增强扫描在肝硬化局灶结节增生样病变诊断中的应用

杨创勃,贾永军,于楠,马光明,张喜荣,段海峰,于勇
陕西中医药大学附属医院

目的 探讨肝硬化背景下局灶结节增生样病变（FNH-like）普美显 MR 增强的影像表现，以加深对此类病变影像表现的进一步认识。
方法 回顾性分析 32 例经过 5 年随访的肝硬化患者，多次行普美显 MR 增强扫描，最终经超声引导下穿刺活检病理证实，或临床长期随访观察，最终诊断为肝硬化局灶结节增生样病变的 MR 影像资料，分析 MR 平扫及普美显增强扫描各期相的影像特点，统计分析病灶在 T1WI、T2WI、DWI、ADC 图及普美显动态增强时各期相的影像特点。
结果 32 例患者共发现直径 3 毫米以上 FNH-like 病变共 155 个，结节直径大小在 3-27 毫米之间，其中 T1WI 呈等信号结节 73 个（73/155，47.0%）；呈稍低信号 47 个（47/155，30.4%）；呈稍高信号 35 个（35/155，22.6%）。T2WI 病灶或其中心呈稍高信号 46 个（46/155，29.7%）；呈等信号 109 个（109/155，70.3%）；DWI 及 ADC 图所有结节均呈等和稍高信号。普美显增强扫描结节呈四种强化及摄取方式：①动脉期、门静脉期及延时期轻度持续强化，肝胆期弥漫高摄取 23 个（23/155，14.8%）；②动脉期、门静脉期及延时期结节周围轻度持续强化，中心瘢痕区域不强化，肝胆期周围摄取，中心瘢痕区域不摄取 57 个(57/155，36.8%)； ③动脉期、门静脉期及延时

期与肝实质等强化，肝胆期稍低摄取或等摄取 25 个（25/155，16.1%）；④动脉期、门静脉期及延时期与肝实质等强化，肝胆期等或高摄取 50 个（50/155，32.3%））。
结论 肝硬化伴局灶结节增生样病变影像表现有一定的特点，应用普美显 MR 增强扫描影像表现并结合临床病史，对本病的诊断及与早期小肝癌鉴别有一定的价值。

PU-0273

3D-MRCP 与 2D-MRCP 对比的临床应用优势

唐斌,郑念华,王荣品
贵州省人民医院

目的 探讨 3D-MRCP 与 2D-MRCP 相互对比的临床应用优势及价值。
方法 对进行胰胆管磁共振成像患者分别进行 2D-MRCP 和 3D-MRCP 的薄层扫描及容积 MIP 重建，2D-MRCP 主要使用单次激发的快速自旋回波序列 HASTE，3D-MRCP 主要使用 SPACE 序列。扫描范围包括左右肝管，肝总管，胆囊入口，胆总管，胰管，然后对两组扫描时间，图像像素大小，图像分辨率，图像背景抑制，以及容积重建的诊断效能等进行比较。
结果 两组扫描对比：两组都是在患者屏气下扫描，时间都是 16~20s，没有差异。2D-MRCP 薄层层厚一般为 3.0~4.0mm，而 3D-MRCP 薄层层厚可达 1.2~1.6mm。体素大小：2D-MRCP:1.5x1.3x4.0mm，3D-MRCP:1.5x1.2x1.6mm。分辨率：2D-MRCP: 231x256， 3D-MRCP: 231x320。容积 MIP 重建 2D 扫描图像的容积效应明显，组织结构的细节显示能力较差。背景抑制：3D-MRCP 明显优于 2D-MRCP。
结论 3D-MRCP 相对于 2D-MRCP 分辨率更高能分辨更小的组织结构和病变，图像背景抑制良好，能更好地突出肝胰胆管成像，值得临床推广应用。

PU-0274

MSCT 与 MRI 对胆道梗阻性疾病诊断的对比研究

唐茁月
中国科学院大学重庆医院（重庆市人民医院）

目的 探讨 64 排 128 层螺旋 CT 增强扫描胰胆管曲面成像对胆道梗阻性疾病的临床诊断价值。
方法 前瞻性收集 81 例临床诊断为梗阻性黄疸的病人，行 64 排 128 层螺旋 CT 腹部增强扫描检查，同时行 MRI、MRCP 检查，所有病例均行手术或 ERCP 检查获得病理结果。利用曲面重建技术对所得 CT 增强图像进行胰胆管曲面重建，与 MRI、MRCP 检查结果对比，并与手术病理结果对照。
结果 对于胆道梗阻在定位诊断方面，64 排 128 层螺旋 CT 增强扫描胰胆管曲面成像与 MRI+MRCP 无明显差异；在定性诊断方面，对于良性病变尤其是对结石的诊断，前者高于后者。
结论 应用 64 排 128 层螺旋 CT 增强扫描胰胆管曲面成像对于胆道梗阻性疾病具有重要诊断价值。

Solitary necrotic nodule of the liver: clinical and imaging findings in twelve patients

Danyan Li

The Affiliated Drum Tower Hospital of Medical college of Nanjing University

Abstract

Purpose: Solitary necrotic nodule of the liver (SNNL) is an uncommon lesion. Since the clinical and imaging characteristics are unspecific and can mimic primary hepatic cancer or metastasis. The purpose of this study is to analyse the clinical and imaging features of SNNL in order to help the diagnosis.

Methods: We retrospectively evaluated the demographic and clinical characteristics of 12 SNNL cases. The imaging features including size, lobar location, shape, depth from the hepatic capsule, and enhancement type of lesions were assesed in 8 patients using CT and MRI.

Results: SNNL often occurred in mid-aged people without gender difference. Most patients presented with no specific symptom (82.3%) or abdominal pain (17.7%). All patients had a single nodule in the right liver lobe and most were subcapsular (62.5%). Lesions were hypo- or iso-density (87.5%), except for calcified or patchy soft tissue lesions that were hyperattenuating to the surrounding liver on unenhanced CT. On post-enhanced CT, half of them had capsule and 87.5% cases showed mild to moderate rim or patchy-like enhancement with internal hypo-density on arterial phase. The enhancement showed wash out on venous phase. Moreover, the enhancement area was slightly progress on the delay phase on both CT or MRI (62.5%). One of these patients was progressed during 4 years follow-up.

Conclusions: There are no specific clinical findings in SNNL. However, the imaging features such as location, attenuation and enhancement type of lesions on CT or MRI are considered to be helpful for SNNL diagnosis.

罕见脾脏硬化性血管瘤样结节性转化影像学表现一例

陈琛,李彩英
河北医科大学第二医院

脾脏硬化性血管瘤样结节性转化（sclerosing angiomatoid nodular transformation of spleen，SANT)是发生于脾脏的一种非常少见的非肿瘤血管增生性病变。2004 年 Martel[1]根据其组织特征、免疫表型首次描述 SANT，并认为病变由脾脏红髓成分组成，缺乏白髓成分，是一种错构瘤样病变，但特有的结节性血管瘤样改变和传统的错构瘤不同。

PU-0277

乏血供肝细胞癌的的 CT 及 MRI 影像学特点，1 例病例报道并文献复习

张建鹏[1],侍明海[2],任涛[3]
1.盐池县人民医院
2.宁夏医科大学总医院
3.宁夏医科大学

目的 通过回顾性结分析乏血供肝细胞癌的影像学特点和临床病理特点为乏血供肝细胞癌的诊断和治疗提供参考。
方法 1 例在宁夏盐池县医院进行诊断和治疗的乏血供肝细胞癌。结合其它对乏血供肝细胞癌的文献报道，对该病的病因学，病理生理，影像学特点，诊断，鉴别诊断和治疗进行总结和讨论。
结果 通过回顾文献我们发现乏血供肝细胞癌十分罕见。肝细胞癌通常为富血供肿瘤，肝动脉血供为主。常见的影像学表现为动脉期强化明显，门脉期及平衡期强化减弱，大部分肝细胞癌存在肿瘤被膜。CT 及 MRI 检查对肝细胞癌的敏感性和特异性均较高，对大部分肿瘤可以从影像上进行定性诊断。本例肝细胞癌在肝内呈弥漫性较大范围略低密度分布，界限不清晰，增强后动脉期、门脉期及平衡期均未见明显强化。依据患者的乙肝病史、AFP 明显升高、病变短期内范围增大，再辅助于 MRI 检查最后诊断为乏血供肝细胞癌。
结论 乏血供肝细胞癌是一种罕见的肝细胞癌，因为其缺乏特征性的影像学表现不容易从影像学上进行诊断，需要辅助于患者的病史、AFP 检查等进行诊断。熟悉乏血供肝细胞癌的影像学特点和其它临床特点可以帮助我们准确地对该病进行诊断，给予合适的治疗。

PU-0278

Gadoxetate acid disodium-enhanced MRI: Multiple arterial phases using differential sub-sampling with cartesian ordering (DISCO) may achieve more optimal late arterial phases than the single arterial phase imaging

Yi Wei,Song BIN
Department of Radiology, West China Hospital, Sichuan University, Chengdu, China

Background: To prospectively determine whether the use of a multiple arterial phase imaging (DISCO) improve the capturing rate of late arterial phase with less motion artifact than single arterial phase obtained with gadoxetate acid disodium.
Materials and methods: From 06/2017 to 10/2018, prospectively acquired data of 132 patients who underwent either single (n=67) or multiple arterial phase (n=65) gadoxetate acid-enhanced MR imaging were analyzed. Two readers independently assessed arterial phase timing and the degree of motion artifact on a five-point scale. The *kappa*test was used to determine the agreement between the two readers, c^2 or *fisher*exact test were used for the categorical variables and *Student t*test or *Mann-Whitney U*test were used for the comparison of the motion artifacts.
Results: Good to perfect inter-observer agreement was obtained for the arterial phase timing and degree of motion artifact (all *kappa*value > 0.70). Optimal timing of arterial phase was observed in 95.4% (62/65) of multiple arterial phase compared with 73.1% (49/67) of single arterial phase (c^2=12.209, p<0.001). Motion artifact score of the late arterial phase images measured using single arterial phase acquisition (3.22±0.68) was significant higher than the multiple arterial phase (2.42±0.74) group (t=5.921, p<0.001). For the multiple arterial phase, motion artifact score of the 2^{nd}, $3^{rd}$and 4^{th} phases were also significant reduced compared with 1^{st}, $5^{th}$and 6^{th} phases (all p<0.001).
Conclusion: The use of multiple arterial phase acquisition with gadoxetate acid disodium can improve the capturing rate of well-timed late arterial phase with less motion artifact.

PU-0279
肝脏上皮样血管平滑肌脂肪瘤与原发性肝细胞癌 CT/MRI 征象的比较研究

吴若岱
深圳大学总医院

目的 通过比较肝脏上皮样血管平滑肌脂肪瘤（HEAML）与原发性肝细胞癌（HCC）的 CT 及 MRI 征象，探讨可供两者鉴别的影像学特点。
方法 回顾性收集 2007 年至 2018 年于中山大学附属第一医院放射科行 CT 或 MRI 检查并经病理证实的 29 例 HEAML。在同一时期，随机选取 50 例经 CT 诊断并经病理证实的单发 HCC。分析其影像资料，分别记录平扫、动脉期、门脉期肿瘤/大血管的绝对 CT 值为 Tp/Ap, Ta/Aa, Tv/Av，以及分别计算三期标准化 CT 值为 Sp=Tp/Ap, Sa=Ta/Aa 和 Sv=Tv/Av，计算肿瘤动脉期及门脉期的 CT 值差异并记录为 Ta -Tv。由两名读者回顾图像评估病变的边界、均匀度、肿瘤包膜、早期引流静脉，瘤内迂曲血管、癌栓、周围淋巴结、肝内转移，两组间的这些征象和测量值进行比较，对两种肿瘤影像征象间差异有统计学意义的征象绘制 ROC 曲线，并计算曲线下面积（AUC）及鉴别诊断的特异性及敏感性。
结果 与 HCC 相比，HEAML 更常表现为边界清楚、均质的、具有早显静脉及瘤内迂曲血管（p<0.05），而肝内转移则更常见于 HCC（p<0.05）。两者在肿瘤包膜、癌栓、瘤周淋巴结差异无统计学意义（p>0.05）。ROC 曲线分析显示早显静脉，Sp, Sa 和 Ta -Tv 的鉴别诊断能力较好(AUC>0.7)，其中早显静脉的鉴别诊断能力最好(AUC=0.93)。
结论 通过定性及定量分析显示影像学某些特定征象有助于 HEAML 与 HCC 的鉴别。

PU-0280
多期动态增强 CT 扫描及三维重建对肝癌肝外动脉供血评估的价值

何苹,闫建华
天津市第三中心医院

目的 应用多期动态增强 CT 分析肝细胞癌患者 TACE 术前肝外动脉供血的发生率、发生原因及发生类型。
方法 收集我院 2016 年 2 月－2019 年 5 月计划行 TACE 治疗的肝癌患者 100 例，术前采用西门子动态 800 排完成上腹部多期动态增强 CT 扫描，使用西门子 Syngo.via 后处理 系统重建提取所有患者图像的最佳动脉期，结合重建原始图、后处理 VR 及 MIP 图像，分析肝外动 脉供血的发生率、发生原因及发生类型。
结果 研究中所有肝癌患者发生肝外动脉供血 45 例，发生率为 45%。总发现肝外动脉供血血管 62 支，其中 15 例为双支肝外动脉供血，6 例为 3 支肝外动脉供血，12 例为单支肝外动脉供血。膈下动 脉分支供血占 12 例（38.7%），肠系膜上动脉分支供血 5 例，胃左动脉分支供血 9 例，胃右动脉分 支供血 1 例，右肾上腺动脉分支供血 3 例，右肾动脉分支供血 8 例，胰腺十二指肠动脉分支供血 2 例，腹腔干小分支供血 1 例。肝癌患者肝外动脉供血发生的主要原因包括：肿瘤的直径 （≥30mm）、肿瘤发生的部位（右肝、肝顶及下段）、肿瘤分期，以及肝癌 TACE 治疗的次数等。

结论 多期动态增强 CT 可以准确评估肝癌患者 TACE 术前肝外供血动脉的发生率及类型。

PU-0281
单次屏气下肝脏多期动脉期扫描图像运动伪影发生情况

王萱,徐佳,王士阗,薛华丹,金征宇
中国医学科学院北京协和医院

目的 研究单次屏气下的肝脏多期动脉期扫描图像运动伪影发生情况。
方法 回顾性分析 2018 年 10 月至 2019 年 6 月在我院因神经内分泌肿瘤肝转移随访患者共 22 人（共计 42 次检查）。扫描均采用西门子 Skyra 3.0T 磁共振扫描仪，采用包含多期动脉期的肝区动态磁共振扫描方案，序列包括 T2WI、T1WI、多期动脉期（1 次屏气，连续扫描 6 期，总时长约 18s）、门脉期、肝胆期，于检查前嘱患者听到声音指示进行屏气。对多期动脉期（第 1-6 期）分别进行伪影评价，采用 4 级评分（0 级：结构清晰可辨；1 级：结构稍欠清晰，但不影响诊断；2 级：结构较模糊，阅片受影响；3 级：结构模糊不清，无法阅片）。统计多期动脉期扫描运动伪影发生的比例，以及不同动脉期伪影出现的概率。
结果 在 42 个扫描病例中，22 例（52.3%）多期动脉期 6 期图像均无伪影（0 级）；14 例（33.3%）多期动脉期图像有至少 1 期图像存在 1 级伪影，其中 2 例仅发生于第 6 期（2/14,14.3%），4 例发生于第 5-6 期(4/14,28.6%)，6 例发生于第 4-6 期（6/14,42.9%），2 例发生于第 3-6 期（2/14,14.3%）；6 例（19%）存在 2 级伪影，其中 2 例发生于第 6 期（2/6，33.3%），4 例发生于第 5-6 期（4/6,66.7%）。
结论 肝脏多期动脉期成像约 85.7%的病例各期图像均无运动伪影或部分期像存在 1 级伪影，伪影主要发生于多期动脉期扫描后半程（第 4-6 期）。

PU-0282
磁共振动态增强扫描评估肝纤维化分期的实验研究

廖锦元
广西医科大学第一附属医院

目的 探讨磁共振动态增强扫描定量参数评估肝纤维化分期的可行性。
方法 新西兰家兔随机分为实验组 50 只，对照组 10 只，实验组采用 CCl_4复合因素法建立肝纤维化模型。3.0T 磁共振动态增强扫描获取肝脏定量灌注参数：K^{trans}（容量转移常数）、K_{ep}（速率常数）、V_e（细胞外血管外间隙容积比 ）。统计学分析灌注参数诊断肝纤维化分期的能力。
结果 ROC 分析，Ktrans 值对判别肝纤维化 F0 vs F1-4、F0 vs F1-2、F0 vs F3-4、F0-2 vs F3-4 的 ROC 曲线下的面积为 0.887、0.776、0.913、0.887；Kep 均值对判别肝纤维化 F0 vs F1-4、F0 vs F1-2、F0 vs F3-4、F0-2 vs F3-4 的 ROC 曲线下的面积为 0.719、0.573、0.820、0.831。
结论 磁共振定量参数 K trans、K ep 可用于鉴别正常肝脏与肝纤维化，也可用于鉴别非晚期肝纤维化与晚期肝纤维化， K trans 较 K ep 诊断价值高， V e 无法用于诊断肝纤维化。

PU-0283
肝静脉流出道阻塞性疾病的 CT 表现

窦乐
吉林大学第一医院

目的 研究探讨肝小静脉闭塞症、布-加综合征及淤血性肝病的多层螺旋 CT（MSCT）表现特征，提高相关疾病影像诊断水平，为临床诊治相关疾病提供帮助。
方法 对 11 例肝小静脉闭塞症、13 例布-加综合征、34 例淤血性肝病病例进行回顾性研究，分析其 CT 征像。
结果 肝小静脉闭塞征 CT 表现：典型特征为门脉期“地图样”强化不均匀；布-加综合征：肝静脉或下腔静脉肝段及以上管腔狭窄、阻塞或闭塞征像，增强检查肝尾状叶及肝门区明显强化，肝外周实质强化不明显，并出现肝内外侧枝循环静脉；淤血性肝病：增强检查下腔静脉逆向性对比剂充盈征像。
结论 CT 检查表现对肝淤血性疾病的诊断、鉴别诊断及病因诊断具有重要价值。

PU-0284
对比剂注射方式对 CT 门静脉成像质量的影响

张雪
西南医科大学附属中医医院

目的 探讨对比剂注射方式对 CT 门静脉成像质量的影响。
方法 选取行双源 CT 静脉血管成像,且符合纳入标准的 30 例患者进行研究,通过抽签法分为研究组(n=17)与对照组(n=13)。研究组先以 4.0mL/s 的流率注射碘佛醇(350 mg I/mL)70 mL,后以 2.0 mL/s 的流率注射碘佛醇 30 mL,再用 30 mL 生理盐水以 3.0 mL/s 的流率冲管;对照组先以 4.5 mL/s 的流率注射碘佛醇(350 mg I/mL)100 mL,再用 30 mL 生理盐水以 3.0 mL/s 的流率冲管。由两位有经验的医师对两组图像质量进行评分,并测出门静脉主干、门静脉左右支主干、脾静脉和门静脉主干-肝实质 CT 值,对比两组所测 CT 值。对两位医师的 CTV 图像质量评分的一致性行 Kappa 检验;两组测量图像质量评分及 CT 值数据比较采用两独立样本 t 检验。
结果:两位医师对两组图像质量评分一致性好。两组门静脉主干、门静脉左右支主干、脾静脉、门静脉主干-肝实质的 CT 值和图像质量评分比较,差异均有统计学意义(均 $P<0.05$)。
结论 对比剂以不同流率相结合的注射方式能够提高门静脉成像质量,减少其他血管的干扰，降低对比剂渗漏的风险。

PU-0285
肝脏特异性对比剂对肝癌术后局部肝功能的评价

吴娇艳,刘影
中国科学技术大学附属第一医院（安徽省立医院）

目的 GD-EOB-DTPA 增强肝脏 MR 肝胆期评价肝癌经动脉导管化疗栓塞（TACE）术后及肝癌微波固化术后对局部肝功能影响。
方法 研究对象：回顾性分析 50 例肝癌术后患者，均行 Gd—EOB—DTPA 磁共振动态增强扫描，男 45 例，女 5 例，年龄 25-76 岁，平均年龄(54.2±12.8)岁。其中肝硬化患者 45 例，非肝硬化患者 5 例。纳入标准：肝癌 TACE 术后及肝癌微波固化术后行肝脏特异性对比剂扫描患者；排除标准：严重运动伪影；肝脏弥漫性占位；严重肾功能不全。分析肝癌经动脉导管化疗栓塞（TACE）术后及肝癌微波固化术后肝胆期病灶周边肝实质与平均肝实质信号增强程度（IS%）差异。

结果 5 例肝癌介入术后病灶及 3 例肝癌微波固化术后病灶周围肝实质 IS%较平均肝实质 IS%明显减低，42 例病灶灶周肝实质 IS%较平均肝实质 IS%无明显差异（P=0.37）。
结论 GD-EOB-DTPA 磁共振增强肝胆期可以显示肝癌经动脉导管化疗栓塞（TACE）术后及肝癌微波固化术后局部肝功能情况，GD-EOB-DTPA 磁共振增强肝胆期可以反映肝细胞功能及全肝功能，亦可反映局部肝功能。

PU-0286
全模型迭代重建在 CT-Ⅲ、Ⅳ级肝硬化患者低辐射剂量 CTPV 中的应用

夏振元,梁志梅,黄卫庆,莫欣鑫,李伟雄
广西医科大学第二附属医院

目的 探讨全模型迭代重建（IMR）技术在 CT-Ⅲ、Ⅳ级肝硬化患者低辐射剂量 CTPV 中的应用价值。
方法 实验设计分为对照组（A 组）和实验组（B 组），每组随机收集 40 例 CT-Ⅲ、Ⅳ级肝硬化患者的 256 层螺旋 CT 门静脉成像数据。A 组：管电压为 100kV，剂量指数（DRI）为 19 联合 iDose4 重建，B 组：管电压为 80kV，DRI 为 17 联合 IMR 重建。对比两组患者肝实质及门静脉图像的噪声（SD）、信噪比（SNR）、对比信噪比（CNR）、主观评分、容积 CT 剂量指数（$CTDI_{VOL}$）、辐射剂量长度乘积（DLP）和有效辐射剂量（ED）的差异性。
结果 B 组肝实质及门静脉的 SD 均低于 A 组（P＜0.01），而肝实质 SNR、门静脉 SNR 及 CNR 均高于 A 组（P＜0.01）；两组肝实质主观评分差异无统计学意义（P＞0.05），而 B 组门静脉主观评分高于 A 组（P＜0.01）；B 组 $CTDI_{VOL}$、DLP 及 ED 分别为 6.28±1.38mGy、134.48±34.79mGy*cm 和 2.29±0.59mSv，较 A 组分别减低 27.5%、27.8%及 27.8%（P＜0.01）。
结论 全模型迭代重建技术联合低管电压可进一步降低 CT-Ⅲ、Ⅳ级肝硬患者 CTPV 辐射剂量并提高图像质量，可用于晚期肝硬化患者低辐射剂量 CTPV 成像之中。

PU-0287
胰腺淋巴上皮囊肿的影像表现及病理特征

戴丽娟,时高峰
河北医科大学第四医院

目的 探讨胰腺淋巴上皮囊肿的(Lymphoepithelial cysts ，LECs)临床、影像表现及病理特征。资料与方法 回顾性分析经手术病理证实的 4 例胰腺 LECs 患者的临床、影像学及病理学资料，4 例均行 CT 增强扫描。结果 4 例肿物均为单发，可发生于胰腺各个部位；病灶为囊性，密度较液性密度高，2 例密度均匀，2 例密度不均匀，增强扫描可呈均匀或不均匀强化。结论 胰腺淋巴上皮囊肿在影像及病理表现方面具有一定的特征性。提高对该病变的认识，可以为临床选择治疗方式提供帮助。

MR IVIM-DWI 预测囊性肝包虫生物学活性的价值

李勇[1],石睿[1,2],乔飞[1,2],宋娟[1,2],罗容[2],杨国庆[1]
1.遂宁市中心医院
2.石河子大学医学院第一附属医院

目的 探讨 MR 体素内不相干运动扩散加权成像(Intravoxel incoherent motion diffusion-weighted imaging,IVIM-DWI)评价肝脏囊性包虫病生物学活性的价值。
方法 将 28 例手术后病理证实的 30 枚包虫囊，分别测量术前 CT 及 MR 检查的感兴趣区(ROI)内的 CT 值、D 值、D*、f 值，根据伊红染色判断肝脏包虫生物学活性并分为活性组和失活组，判断测量值在两组间的统计学差异及与包虫活性的相关性。
结果 D 值、f 值及 CT 值在不同包虫活性中存在统计学差异($P<0.05$)，而 D^*值不存在统计学差异($P>0.05$)。D 值和囊性肝包虫活性具有负相关($P<0.05$)，f 值、CT 值于囊性肝包虫呈正相关($P<0.05$)，但是三者相关系数不具有统计学差异。D*值与囊性肝包虫活性不具有相关性($P>0.05$)。
结论 IVIM-DWI 扫描序列及 CT 值能定量评价囊性肝包虫病生物学活性，但是 IVIM-DWI 对判断囊性肝包虫病生物学活性并不优于 CT 值。

PU-0289
肝胆胰脾增强（普美显）患者心理干预对检查结果的重要性

陈思
陆军军医大学第二附属医院（新桥医院）

目的 了解认真有效的心理干预对于肝胆胰脾 MRI 增强（普美显）患者检查效果的重要影响。
方法 总结了取得符合诊断要求图像的 50 例肝胆胰脾 MRI（普美显）增强扫描患者的护理心理干预,主要包括认真评估患者心理压力，认真直接的给予呼吸训练的指导，呼吸训练达到检查标准，可以有效的减少在检查过程中因患者的呼吸动度带来的呼吸运动伪影，从而更有利于微小病灶的诊断。有针对性的对患者对于用药不良反应进行心理疏导、密切关注对比剂注射过程和患者的反应,提前告知患者普美显药物推注后的一系列不良反应，并告知其常规性，减少患者心理压力，从而减少了患者在检查过程中因药物正常不良反应所引起的检查失败，以及患者不良反应的对症处理等。认为严格落实规章制度,认真有效的与患者沟通,密切观察整个检查流程中的患者状况,提前有效的对患者沟通检查用药后的各项不良反应，认真有效的让患者了解到有效配合的重要性，做到有效的心理干预。
结果 50 例肝胆胰脾 MRI（普美显）增强检查患者满意度高，配合度高，检查效果好，图片质量高，对于诊断效果很好，有利于一些微小病灶的早期诊断。
结论 认真有效的给予患者心理干预，严格的护理操作及有效的护患沟通是提高肝胆胰脾 MRI（普美显）检查效果的关键，提高了病灶的检出率与准确度。

PU-0290
囊性肝细胞癌的 CT 诊断及鉴别诊断（附 3 例报道及文献复习）

郭转转,黎金葵,冯雯,卢星如,雷军强
兰州大学第一医院

目的 探讨囊性肝细胞癌的 CT 表现，提高其诊断的准确性。
方法 收集我院经病理证实的囊性肝细胞癌 3 例，回顾其临床、CT 及病理数据，并复习国内外相关文献进行讨论。
结果 本组 3 例囊性肝细胞癌，男 2 例，女 1 例，年龄 44-64 岁，均有乙肝病史，有上腹部胀痛不适等症状，2 例 AFP 明显升高，1 例 AFP 正常。CT 表现：3 例均为肝左叶单发的囊实性肿块，以囊性成分为主，肿块中央囊变坏死区呈稍低密度，增强后始终未见明显强化；肿块边缘未完全囊变坏死的肿瘤组织呈等密度，局部向腔内突起形成多发不规则的边缘壁结节，增强扫描边缘壁结节内多发迂曲供血动脉并呈现“快进快出”的强化特征；2 例肿瘤压迫周围肝组织形成不完整的环形线样稍低密度边，增强后动脉期未见明显强化，门脉期及延迟期强化，即“假包膜”征；1 例静脉早显并静脉内癌栓形成。
结论 囊性肝细胞癌的 CT 表现具有一定的特征，可为囊性肝细胞癌的诊断及鉴别诊断提供佐证。

PU-0291

MRI 对 Vater 壶腹癌的 T、N 分期诊断价值研究

吴仙燕
莆田学院附属医院

目的 通过分析 Vater 壶腹癌患者的磁共振图像，探讨磁共振对壶腹癌术前 T、N 分期的诊断价值，并评估肿瘤的可切除性，为临床治疗提供影像学依据。
方法 回顾性分析 2016 年 9 月至 2018 年 12 月期间由抚顺矿务局总医院收治的 Vater 壶腹癌患者 62 例。分析确定病灶位置、大小、平扫以及强化特点，并据 MRI 平扫及增强图片的特点确定肿瘤的 T、N 分期。分期参考第 8 版美国抗癌联合会（AJCC）vater 壶腹癌 TNM 病理分期标准。采用 SPSS17.0 软件包进行统计学处理。采用 Kappa 检验 MRI 对壶腹癌的检查结果与术后病理分期的一致性。Kappa≥0.75 为一致性较好，0.4≤Kappa<0.75 为一致性一般，Kappa<0.4 为一致性较差。计数资料采用卡方检验，计量资料采用方差分析。P<0.05 表示差异有统计学意义。
结果 MRI 和病理对 Vater 壶腹癌 T 分期的一致性检验，Kappa 值=0.763，P=0.001，表明两种诊断方法具有较高一致性。MRI 和病理对 N 分期的一致性检验，Kappa 值=0.655，P=0.001，表明两种诊断方法对淋巴结分期一致性一般。不同 T 分期肿瘤最大径比较，其 F 值=13.241，P=0.001，P<0.05，不同 T 分期肿瘤长径差异具有显著统计学意义。不同 N 分期肿瘤最大径相比，其 F 值=5.740，P=0.005，P<0.05，表明不同 N 分期肿瘤长径差异具有显著统计学意义，病灶越大越容易发生淋巴结转移。不同 T 分期肿瘤病理分化程度比较，χ^2=8.847，P=0.014，P<0.05，差异具有显著统计学意义，表明不同 T 分期肿瘤与病理分化程度相关。不同 N 分期肿瘤病理分化程度比较，χ^2=0.454，P=0.978，P>0.05，差异没有统计学意义。
结论 MRI 能够对 Vater 壶腹癌进行较准确的 T、N 分期，尤其是 T 分期与病理分期有较高的一致性，N 分期与病理分期一致性一般。

PU-0292

Gd-EOB-DTPA 增强 MRI 肝胆期不同时相在肝脏病灶显示力与胆管成像能力的分析

崔美玲,顾馨田,金恩浩
延边大学医学院附属医院

目的 探讨钆塞酸二钠（Gd-EOB-DTPA）增强 MRI 合理的肝胆期延迟时间及其临床中的应用价值。
方法 因肝占位而行 Gd-EOB-DTPA 增强 MRI 检查的 68 例患者（肝炎组 52 例，非肝炎组即对照组 16 例），经静脉注射对比剂后行动态增强扫描，并在延迟 20min、1h、2h 行肝胆期扫描，在各时相的

肝胆期①测量肝胆期肝脏、竖脊肌和病灶的信号强度（SI），分别计算肝脏信号噪声比（SNR）、肝脏与竖脊肌信号比值（liver muscle ratio）、病灶对比噪声比（CNR），比较组内及组间差异。②分析肝局灶性病变的检出率。③分析胆囊全部充盈率及肝内胆管显影情况。

结果 1.延迟 20min、1h、2h，组内肝脏的 SNR、肝脏与竖脊肌 SI 比值均无差异（P＞0.05）；延迟 20min，两组间肝脏 SNR 无差异，延迟 1h、2h，两组间肝脏 SNR 有差异（P＜0.05）。延迟 20min、1h、2h，两组间肝脏与竖脊肌 SI 比值均有差异。2.HCC、硬化结节、血管瘤分别在延迟 20min、1h、2h 后 CNR 均无差异。3.延迟 20min、1h、2h，对照组胆囊全部充盈所占比分别为 18.8%、25.0%、75.0%，肝炎组分别为 1.9%、32.7%、75.0%；延迟 20min，两组胆囊的显示率有差异，延迟 1h、2h，两组胆囊的显示率均无差异。延迟 20min、1h、2h，对照组肝内胆管显影评分均为 2.12±0.81；肝炎组肝内胆管显影评分为 1.81±0.97、2.02±0.87、1.96±0.88，肝内胆管显影评分无差异。

结论 1.Gd-EOB-DTPA 增强 MRI 延迟 20min、1h、2h 的肝胆期均能提供良好的 SNR 及 CNR，为肝占位性病变的诊断提供有效诊断依据。

2.较短的 Gd-EOB-DTPA 肝胆期延迟时相对判断胆道功能的评估更有帮助。

PU-0293

自发性孤立性肠系膜上动脉夹层的 MSCT 表现及对临床治疗的指导价值

何其舟
西南医科大学附属中医医院

目的 探讨 MSCT 成像对自发性孤立性肠系膜上动脉夹层（SISMAD）的诊断及临床治疗的指导价值。

方法 搜集 19 例 SISMAD 患者的临床资料，其中 1 例经 DSA 证实并行内支架治疗，其余 18 例由临床随访证实，所有患者均行 MSCTA 检查，并采用 MPR、CPR、MIP 和 VR 技术进行图像后处理，并按 Yun 分型进行 MSCT 诊断，探讨各型 SISMAD 的影像特征，并分析其临床特点。

结果 本组 19 例 MSCT 及后处理图像均可以良好的显示夹层破口位置、内膜片、真假腔及假腔内血栓；夹层开口处距离肠系膜上动脉（SMA）起始部（25.2±6.5）mm；夹层范围（75.4±4.3）mm。sISMAD 按 Yun 分型 I 型 7 例（真假腔均通畅，可见假腔的入口和出口），Ⅱ型 12 例（真腔通畅，假腔无血流），其中Ⅱa 型 4 例（假腔无出口），Ⅱb 型 8 例（假腔内血栓形成，伴真腔狭窄）；Ⅲ型 0 例（夹层并肠系膜上动脉闭塞）；同时显示合并有急性胰腺炎 2 例，大动脉粥样硬化 11 例，内脏动脉瘤 2 例，髂总动脉瘤样扩张 3 例。其中 1 例经 DSA 内支架治疗，其余保守治疗，均取得良好疗效。

结论 MSCT 能准确诊断 SISMAD，并对临床治疗具有重要的指导价值。

PU-0294

Ectopic thyroid presenting as liver mass

Outesh Chooah
Master Student in Medical Imaging and Nuclear Medicine

Introduction:

This case report presents an ectopic thyroid situated in the liver. Very few reports have described detailed imaging findings at such an atypical location.

Presentation of case:

A 63 years old female patient revealed a mass at the Porta Hepatis at a local hospital during a routine general medical check-up. On 20/10/2018, the patient attended our hospital for a definitive diagnosis and its subsequent management. Physical examination and blood tests, including tumor markers were unremarkable except for an increase in Surface antibody [SAb] at a value of 34.91 IU/L and Nuclear antibody at a value of 4.28 S/CO. MRCP was performed which did not reveal any abnormality. On 23/10/218, CT scans of the upper abdomen and pelvis (enhanced) were done with the following report and images: Group of high-density nodules (at the Porta Hepatis) with calcification and expansive radius of 43 x 38mm; greatly enhanced in the arterial phase and prolonged enhancement with decreasing intensity in the venous phase. Low-density round-shaped mass was observed in the intra-hepatic region with no apparent enhancement with an area of 10mm.On 27/10/2018, an MRI of the upper abdomen was done with the following abnormality observed: enhancement in T1 and T2 at the hepatic entrance with mixed attenuation signal with an area of 49 x 35mm. The observed mass is well demarcated from the liver with diminished attenuation signal in both arterial and venous phase.

Diagnosis:

Ectopic Thyroid in Liver with nodules.

Discussion:

Ectopic Thyroid is defined as the presence of benign thyroid tissues at sites other than anterior or lateral to the second, third, and fourth tracheal rings. Most cases can be explained by an arrest of migration or excessive descent of the thyroid anlage at any point along its migratory path during development. Ectopic Thyroid remains a rare disease. Prevalence of this condition is reported to be between 1 per 100,000-300,000 persons. This is a reported case of ectopic Thyroid within the liver itself. This case report highlights the medical imaging features that were observed to improve diagnosis of ectopic Thyroid, even as an incidental finding.

PU-0295

Correlation between clinicopathological features and prognosis in patients with colorectal cancer with simultaneous liver metastasis

xue Lin,Huijie Jiang
The Second Affiliated Hospital of Harbin Medical University

Objective： To investigate the clinicopathological features of patients with colorectal cancer with simultaneous liver metastasis, and to analyze the related factors affecting their prognosis. **Methods：** A retrospective analysis of 60 patients with colorectal cancer simultaneous liver metastases from January 2017 to January 2019 in the Second Affiliated Hospital of Harbin Medical University was conducted to analyze the relationship between prognosis and clinicopathological factors. **Results：** The 1, 3,

and 5-year survival rates of patients with liver metastases at the time of diagnosis were 67.5%, 19.8%, and 9.4%, respectively. The median survival time was 16 months. Univariate analysis showed that serosal invasion, stage of liver metastasis, depth of invasion, and degree of tumor differentiation affect the prognosis of patients. Multivariate analysis of Cox regression model showed that only liver metastases were independent prognostic factors for patients with liver metastases from colorectal cancer. **Conclusion：** The stage of liver metastasis of colorectal cancer affects the prognosis and should be detected and diagnosed early.

PU-0296

The significance of thin-layer dynamic CT in preoperative evaluation of malignant biliary obstruction

xue Lin,Huijie Jiang
The Second Affiliated Hospital of Harbin Medical University

Objective： To investigate whether thin-layer dynamic CT can be used as a reliable method for resection of malignant biliary obstructive lesions. **Methods：** 53 cases of malignant biliary obstruction (32 cases of pancreatic cancer, 13 cases of high cholangiocarcinoma and 8 cases of ampullary carcinoma) were collected for thin-layer dynamic CT examination one week before operation. **Results：** Liver metastasis was adjacent to 46 cases of organ invasion, 17 cases of direct invasion of blood vessels, and 12 cases of ascites and retroperitoneal lymph node metastasis. **Conclusion：** Direct invasion of blood vessels, invasion of organs adjacent to liver metastasis, ascites and retroperitoneal lymph node metastasis are reliable evidence of unresectable tumors, and the combined use of lymph node enlargement and fat pad invasion is also reliable evidence of unresectable tumors.

PU-0297

Spiral CT and MRI findings of focal nodular hyperplasia of the liver

xue Lin,Huijie Jiang
The Second Affiliated Hospital of Harbin Medical University

Objective: To investigate the CT and MRI features and characteristics of focal nodular hyperplasia (FNH) in the liver. **Methods:** A total of 23 lesions were collected from 20 patients with pathologically confirmed FNH. Among them, 15 patients underwent CT plain scan and dynamic enhanced scan before operation, and 4 underwent preoperative MRI plain scan and dynamic enhanced scan. One of them underwent CT and MRI. **Results：** The mean age of the patients was 30.4 years, 17 patients had single lesions, and 3 patients had multiple lesions. The average diameter of the lesions was 2.6 cm. All FNH

lesions were significantly enhanced in the arterial phase. FNH showed a central scar of 52.2% (12/23), FNH showed a vascular shift of 60.9% (14/23), and FNH showed a vascular "ball" sign of 34.8% (8/23). **Conclusion:** FNH has characteristic and atypical signs on CT and MRI. Comprehensive recognition of CT and MRI signs is of great value in the diagnosis and identification of FNH.

PU-0298
胰腺神经内分泌肿瘤 CT 影像表现在预测其病理分级方面的研究

张莹
徐州市中心医院

目的 分析术前胰腺神经内分泌肿瘤 CT 增强影像表现，探讨其影像表现对胰腺神经内分泌肿瘤病理分级预测。
方法 收集经病理证实 43 例的胰腺神经内泌肿瘤术前影像学资料，采用回顾性分析方法，两名放射科医师观察 PNET 动静脉期 CT 影像表现，包括肿瘤最大直径，边界、囊变、钙化、同时测量动静脉期病变 CT 值和同层正常胰腺实质 CT 值。根据 2010 年 WHO 胰腺神经内分泌肿瘤的病理分级，比较不同级别的胰腺神经内分泌肿瘤影像表现和参数差异是否存在统计学意义(P<0.05)。
结果 43 例患者中 G1、G2、G3 级分别为 19 例、8 例、16 例。G3 级胰腺神经内分泌肿瘤最大直径(4.26±1.76cm)大于 G1 级最大直径(2.05±1.25cm)差异有统计学意义(P<0.05)，G3 级与 G1 级间动脉期 CT 值、静脉期 CT 值、动脉期相对强化 CT 值和静脉期相对强化 CT 值差异均有统计学意义(P<0.05)；G3 与 G1 级在钙化、囊变方面差异存在统计学意义(P<0.05)。G2 级最大直径(4.35±1.22cm)大于 G1 级最大直径(2.05±1.25cm)差异有统计学意义(P<0.05)，G2 级动脉期 CT 值低于 G1 级，差异有统计学意义（P<0.05），G2 与 G1 级在钙化、囊变方面差异存在统计学意义(P<0.05)。G3 级与 G2 级间动脉期 CT 值、静脉期 CT 值差异均有统计学意义(P<0.05)，G2 与 G3 级在钙化方面差异存在统计学意义(P<0.05)。
结论 胰腺神经内分泌肿瘤增强 CT 表现中的病灶最大直径，病灶动静脉期 CT 值和动静脉期相对强化 CT 值对病理分级有一定预测价值。

PU-0299
不典型肝细胞癌的临床及影像表现

王滔,叶永刚
乐山市人民医院

目的 探讨不典型肝细胞癌(HCC)的临床表现及影像特点。
方法 回顾性分析经手术病理以及随访复查证实的不典型 HCC 的临床及影像学表现，8 例均为肝硬化患者，均完善各项肿瘤标记物检查，并全部行 MSCT 及 MRI 平扫+增强扫描，5 例行普通 B 超检查，3 例行 B 超造影检查，3 例行 TACE 治疗，5 例行手术切除病理检查。
结果 3 例患者短期内多次检查甲胎蛋白（alpha fetoprotein，AFP）均大于 1000 ng/mL，在 MSCT 平扫+增强扫描上均未发现病灶；在 MRI 扫描上仅在 DWI 序列可见一枚点状弥散受限微小结节，在其余各序列及增强扫描上均未见显示；B 超造影均未见显示；行 TACE 手术时，未见动脉期早期显影，未见碘油沉积；TACE 术后短期多次复查 AFP 呈逐渐下降趋势，6 个月~1 年复查 AFP 正常，复查 MRI 原病灶无增大，未见新增病灶。5 例 B 超提示肝占位患者，AFP 正常或轻微升高；在

MSCT 平扫上肝占位密度不均匀；而在 MRI 各序列均不可见或仅在 DWI 序列呈轻微高信号、ADC 信号无降低，增强扫描呈典型快进快出征象；病理结果为高分化肝细胞癌。

结论 AFP 明显升高患者，在常规 MSCT、MRI 检查及 B 超造影均未发现明显病灶时，需警惕点状 HCC 的可能，此时在多 b 值上仔细观察可能有所发现，及时采用 TACE 治疗可有效防止 HCC 的进展。部分表现为典型快进快出强化模式的肝占位，在 MRI 平扫时可能不具备典型 HCC 表现，此时需考虑高分化 HCC 的可能；肝硬化患者仅仅采用 MRI 平扫筛检可能并不能发现不典型高分化 HCC。

PU-0300

A comparative study of respiratory motion artifacts caused by Gd-EOB-DTPA ,Gd-BOPTA and Gd-DTPA in dynamic enhanced

Hunying liu C
Affiliated Hospital of Beihua University

Objective: To investigate the distribution of respiratory motion-related artefacts and the incidence of moderate-severe artifacts at different phases of the patient's liver during dynamic contrast-enhanced scans of Gd-EOB-DTPA, Gd-BOPTA and Gd-DTPA.

Materials and methods: Select MRI images of outpatients or inpatients from the Philips 3.0T MRI Liver Enhanced scan at the Affiliated Hospital of Beihua University from June 2017 to January 2018 according to the standard. A total of 290 cases (90 cases of Gd-EOB-DTPA,Each of 100 cases of Gd-BOPTA and Gd-DTPA.).Using a double-blind method, two senior doctors evaluated the respiratory motion-related artifacts generated by T1-weighted images (nonenhanced, arterial , venous , and delay phases) using the 5-point method,≥3 point is divided into moderate and severe artifacts. The distribution of respiratory motion-related artifacts and the incidence of moderate-severe artifacts in each phase were compared. SPSS 24.0 software package was used for statistical analysis. The image arterial phase artifact scores of each group were tested by the rank sum test, and the comparisons between the two groups were compared.

Results:

Gd-EOB-DTPA, Gd-BOPTA and Gd-DTPA had different probability distributions of arterial phase respiratory motion-related artifacts, and the difference was statistically significant ($P<0.05$); Gd-EOB-DTPA had a different probability of arterial phase respiratory motion-related artifacts than Gd-BOPTA and Gd-DTPA ($P<0.017$).

2.The probability of moderate-to-severe respiratory motion-related artifacts (40%) in the arterial phase of Gd-EOB-DTPA was significantly higher Gd-BOPTA (21%) and Gd-DTPA (17%) were statistically significant ($P < 0.017$).

3.There was no significant difference in the probability of distribution of respiratory motion-related artefacts and the incidence of moderate-severe respiratory motion-related artifacts between Gd-EOB-DTPA, Gd-BOPTA and Gd-DTPA in the nonenhanced, venous, and delayed phases($P >0.05$).

Conclusion:

The arterial phase artifact distribution of Gd-EOB-DTPA is different from that of Gd-BOPTA and Gd-DTPA. The arterial phase of Gd-EOB-DTPA has a significantly higher

probability of occurrence of moderate-to-severe respiratory motion-related artifacts than Gd-BOPTA and Gd-DTPA, which has a certain influence on image quality.
2. The motion-related artifacts of Gd-EOB-DTPA, Gd-BOPTA, and Gd-DTPA in the nonenhanced, venous, and delayed phases did not affect the liver dynamic enhanced image quality.

PU-0301

Correlation between AFP Expression and MRI Diagnosis in Primary Hepatocellular Carcinoma

U ying L
Affiliated Hospital of Beihua University

Objective:To help clarify the diagnostic value of different expression of AFP in hepatocellular carcinoma, and to explore the correlation between MRI and MRI in the diagnosis of hepatocellular carcinoma. To provide a reference for clinical diagnosis of hepatocellular carcinoma. Methods:The high-risk population of hepatocellular carcinoma in our hospital from January 2013 to September 2017 and earlier diagnosis and treatment of 203 cases of patients with hepatocellular carcinoma were 346 cases, were confirmed by serological AFP examination within one week after the MRI scan, with pathology as the gold standard, review the patient Mr report, pathological findings, serological examination and medical records to track patients according to the final results. AFP was divided into different cut value is compared with the pathological evaluation of the gold standard, the diagnostic value of different cutting value, the optimal cut-off for AFP diagnosis of primary hepatocellular carcinoma. With the optimal cut-off value as the standard of 514 patients were divided into AFP positive and negative two group, and the pathological results as the gold standard, AFP analysis MRI, alone or in combination with the diagnosis of hepatocellular carcinoma and the sensitivity, specificity and accuracy of diagnostic efficiency
Results:
1. when the AFP value is 20 ng / ml, the sum of specificity and sensitivity corresponding to this value is up to 1.410). The area under the ROC curve was 0.745%, the Yorden index was 0.4306 ($p < 0.05$), the sensitivity was 51.11% and the specificity was 78.03%. The diagnostic coincidence rate was 71. 03%.
2. The sensitivity of MRI in the diagnosis of hepatocellular carcinoma was 83.01% and the specificity was 82.35%. The diagnostic coincidence rate was 82.86%.
3. The sensitivity of MRI combined with AFP examination (one side is positive and positive) was 78.30% and the specificity was 88.23%. Thediagnostic coincidence rate was 80.71%.
4. The sensitivity of MRI combined with AFP examination (both positive and positive) was 88.68%, the specificity was 79.41%, and the diagnostic coincidence rate was 86.42%.
5. The sensitivity and specificity of MRI combined with AFP examination (both positive and negative were negative) were 97.91% and 96.77% respectively,and the diagnostic coincidence rate was 97.63%.6. The sensitivity, specificity and diagnostic conformance of the five groups were compared with each other, $p<0.005$, and the difference was statistically significant.

Conclusions:
1. Serological examination of 20ng/ml can be used as a screening indicator for the diagnosis of hepatocellular carcinoma.
2. When AFP was inconsistent with MRI diagnosis, it was believed that MRI diagnosis was more reliable.
3. When MRI and AFP were both diagnosed as hepatocellular carcinoma (HCC) or non-hepatocellular carcinoma at the same time, the results were consistent with pathological results.

PU-0302

螺旋 CT 诊断腹部神经鞘瘤的临床价值

李毅勋
广西医科大学第一附属医院

目的 分析腹部神经鞘瘤的 CT 表现特点，探讨 CT 对本病的诊断价值。
方法 收选 2018 年 6 月～2019 年 6 月本院经手术病理证实的腹腔神经鞘瘤住院病人 5 例 ， 其中男性 3 例，女性 2 例，年龄 23～56 岁，平均年龄 41.2 岁。肿瘤位于盆腔 2 例，腹膜后 2 例 ，肾上腺 1 例。4 例良性，1 例恶性。5 例均以螺旋 CT 行平扫加增强扫描。测量肿块的最大径及增强前后 CT 值。图像分析诊断采取讨论方式进行，重点观察病变形态、密度及边缘，并与手术及病理结果对照。
结果 所有肿块 CT 值 14～67HU 不等，4 例形态规则，1 例形态欠规则。4 例密度较均匀者为良性；1 例混杂密度(实质呈略高密度伴有明显的液化)者为恶性。良、恶性肿块均可见实质呈不同程度强化。4 例良性有完整包膜，平均最大径(77.4±44 .3)mm；1 例恶性包膜不完整或粘连，最大径(61.2)mm。
结论 腹部神经鞘瘤的 CT 表现具有一定特征，依据其特定部位的肿块，有无包膜及其密度分布特征可提示诊断。定位以肿块边缘及其周围结构关系为主要依据。边缘不规则，包膜不完整、密度不均匀可提示恶性可能。良恶性需结合临床病理。鉴别诊断尚需考虑其他多种间叶源性(包括其他神经源性)、泌尿生殖源性肿瘤和淋巴瘤 。

肝细胞癌射频消融术后短期侵袭性复发与功能磁共振成像的相关性分析研究

徐民,叶卫川,陈春妙,吴徐璐,赵中伟,胡祥华,纪建松
丽水市中心医院

目的 探讨并明确肝细胞癌射频消融术后短期内侵袭性分段复发（Aggressive intrasegmental recurrence，AIR）与功能磁共振成像的相关性。
方法 回顾性分析 2012 年 1 月至 2018 年 6 月期间在我院行射频消融术（RFA）治疗的肝细胞癌患者 1262 例，所有患者均通过病理证实为肝细胞癌，其中 30 例患者在术后 3 个月内影像学随访发现 AIR 现象，同时，随机筛选 35 例疾病进程在短期内得到了控制的患者作为对照组。入组的所有患者均在术前行动态增强磁共振成像（DCE-MRI）以及弥散加权成像（DWI）扫描，比较两组患者的临床资料、病灶位置以及各功能磁共振参数之间的差异，并分析其与 RFA 术后 AIR 的相关性。

结果 研究发现肝细胞癌患者 RFA 术后短期 AIR 出现的频率为 2.4%（30/1262）。两组患者的一般临床资料均无统计学差异，具备可比性；AIR 组病灶在 I 段和 IV 段明显多于对照组（P<0.05），在其他肝段的病灶数量并无统计学差异；两组患者的病灶形态并无统计学差异，而病灶动脉早期强化方式存在明显区别（P<0.05），且 AIR 组的动脉早期强化率和 ADC 值均显著低于对照组（P<0.05）；进一步相关性分析发现病灶动脉早期强化方式、动脉早期强化率、ADC 值和病灶位置均与 AIR 具有相关性，且均呈正相关。

结论 肝癌射频消融后短期内的 AIR 与病灶功能成像参数（动脉早期强化方式、动脉早期强化率、ADC 值）及其所在肝段（I 段和 IV 段）高度相关。

PU-0304
CT 测量腹腔内脂肪面积/皮下脂肪面积比值与急性冠脉综合征相关性研究

马进
重庆市中医院

目的 探讨腹腔内脂肪面积（VAT）与皮下脂肪面积（SAT）的比值（VAT/SAT）与急性冠脉综合征(acute coronary syndromes,ACS)相关性。

方法 选取 2018 年 1 月~2019 年 1 月我院收治的急性冠脉综合征患者 258 例患者作观察组，其中包括 ST 段抬高型心肌梗死（ST elevation myocardial infarction,STEMI）102 例，非 ST 段抬高型心肌梗死(non ST elevation myocardial infarction,NSTEMI)45 例，非稳定性心绞痛(unstable angina,UA)111 例，同时选取健康体检者 250 名作为对照组。全部参加人群采用 GE 公司 64 排螺旋 CT 行腹部扫描，选定 CT 值范围为（-200HU）-(0HU)，测量肚脐水平腹腔内脂肪面积及皮下脂肪面积并计算其比值。同时进行体格检查、测定空腹血糖（FPG）、尿酸（UA）、血脂等生化检查。对两组比值、体格及生化检查结果进行统计,分析腹腔内脂肪面积与皮下脂肪面积的比值与急性冠脉综合征的相关性。

结果 观察组与对照组的 VAT、VAT/SAT、BMI 差异有显著统计学意义（P＜0．01），观察组的腰围、UA、FINS、TG、FFA、舒张压、收缩压明显高于对照组（P＜0．05），HDL 明显低于对照组（P＜0．05）,腰围、舒张压、收缩压、BMI、FINS、UA、TG、FFA 与 VAT/SAT 值呈正相关（P＜0．05），HDL 与 VAT/SAT 值呈负相关（P＜0．05）。

结论 随着 VAT/SAT 值增加，急性冠脉综合征风险明显增加，糖尿病风险亦增加，并出现血压、尿酸、脂肪酸、胰岛素等多项代谢指标的异常。

PU-0305
姜黄素脂质体抑制肝癌栓塞后血管生成的实验研究

高歌军,戴峰
江苏省中医院（南京中医药大学附属医院）

目的 探讨 VX2 兔肝癌模型栓塞后残存肿瘤组织中乏氧诱导因子 1-α（HIF-1α）和血管内皮生成因子（VEGF）的相关性；探讨姜黄素脂质体联合肝动脉栓塞在抑制栓塞后肿瘤血管生成中的作用。

方法 建立 VX2 兔肝癌模型，分为 3 组。第一组（对照组 n=18）：给予 0.9%生理盐水假栓塞；第二组（栓塞组 n=18）：给予碘化油和 90-180um 聚乙烯醇颗粒（PVA）栓塞； 第三组（姜黄素脂质体联合栓塞组 n=18）：给予姜黄素脂质体（20mg/kg body weight）与碘化油乳液和 90-180 nm 聚乙烯醇颗粒（PVA）栓塞。基于栓塞后 VX2 兔模型猝死时间再将每组分为 3 个亚组，第一亚组

（n=6）：栓塞后 6 小时处死；第二亚组（n=6）：栓塞后 24 小时处死；第三亚组（n=6）：栓塞后 3 天处死。免疫组化测定 HIF-1α， VEGF 和 MVD 的表达。

结果 ⑴ 对照组 VX2 兔在假栓塞治疗后，肿瘤体积呈上升趋势。坏死肿瘤边缘残存肿瘤组织 HIF-1α 呈现强染色表现， VEGF 呈强阳性染色表现， MVD 呈现明显的上升趋势(P＜0.05)；姜黄素脂质体联合栓塞组栓塞后肿瘤体积呈现减小趋势，HIF-1α 表达明显降低（P＜0.05)。VEGF 表达低于栓塞组（P＜0.05）， MVD 表达则呈现明显下降趋势。⑵ HIF-1α 蛋白与 VEGF mRNA 具有显著正相关性（r=0.705, P=0.001）；与 VEGF 蛋白的相关性为（r=0.655, P=0.003）；与 MVD 的相关性为（r=0.521, P=0.027），同时 VEGF 蛋白与 MVD 也具有良好的相关性（r=0.519, P=0.027）。

结论 VX2 肝癌模型栓塞后残存肿瘤组织中 HIF1-α 与血管生成因子具有较强相关性，姜黄素脂质体能够明显下调 HIF-1α 蛋白表达水平，从而有效抑制 VX2 兔肝癌栓塞后残存肿瘤组织由于乏氧诱导导致的肿瘤血管生长。

PU-0306

CT and MRI findings of large undifferentiated embryonal sarcoma of the liver in children

xin lu
Affiliated Hospital of Southwest Medical University

1 Case

The 6-year-old female patient was admitted to hospital with abdominal distension for 1 week. Physical examination: body temperature 36.7℃, pulse 86 times/min, respiration 24 times/min, blood pressure 90/54mmhg. Specialist examination: abdominal distention and touching mass. Lower boundary reach two horizontal fingers above umbilicus, medial reach anterior median line, hard texture.

Auxiliary examination: (1) Laboratory examination showed no significant increase in alpha-fetoprotein (1.76ng/ml), and CA199 was significantly increased (265.04IU/ml). (2) Total abdominal CT enhancement: large cystic solid mass shadows were seen in the liver, the size was about 13.3×11.5×13.0cm, multiple septa and a few nodular shadows were seen in the liver, the septa and capsule were significantly enhanced in the enhanced scan. (3) Total abdominal MRI enhancemen: a large round cystic mass with a size of 12.8×10.5×12.0cm was observed in the liver, with multiple septa and a few nodules, showing low signal on T1WI. The signals of liquid components in the lesion were uneven, and T2WI and SAPIR showed high signals. DWI showed slightly higher mixed signal. Enhanced scan septa and capsule markedly enhanced. (4) Surgical findings: the liver was enlarged and the tumor was located in the right half of the liver, about 13.0×12.0×12.0cm in size. The cystic component accounted for about 80%, showing multilocular septa. (5) Pathological examination: spindle cell tumor was found in the right liver. Combined with immunohistochemistry, the pathological diagnosis accorded with undifferentiated embryonal sarcoma (UES) of the liver.

2 Discussion

UES is a malignant tumor in the primitive mesenchymal tissue of the liver, which mainly occurs between 6 and 10 years old [1-2]. UES's clinical manifestations are not specific, mainly liver enlargement or epigastral mass [3].

UES is mainly presented as a huge cystic lesion with clear boundaries, and there are solid parts in it to varying degrees, which are mostly distributed on the edges, and

much space can be seen within the lesion. UES is a tumor with little blood supply, and the parenchyma is often slightly enhanced in CT and MRI enhanced scans, with obvious edges[4].The differential diagnosis includes hepatoblastoma, primary hepatocellular carcinoma, and hepatic mesenchymal hamartoma.

多层螺旋 CT 成像技术在胃肠道肿瘤诊断的应用价值

宋乐乐,陈殿森,王琳,徐志宾,郭强
河南科技大学第一附属医院

目的 探讨胃及小肠、结肠一次成像的多层螺旋 CT 造影检查技术对胃肠道肿瘤病变的应用价值。
方法 选取本院接受检查的疑似小肠肿瘤性疾病患者 96 例,所有患者均经腹部准备后，接受胃及小肠、结肠一次成像的多层螺旋 CT 造影检查的技术，口服 2.5%甘露醇 45 分钟扫描时胃、小肠、结肠，并进行相关病理检查。比较 CT 与病理检查结果。
结果 以病理检查为“金标准”,统计分析 CT 检查的特异度、灵敏度、准确度分别为 100.00%、96.71%、98.02%，两者差异无统计学意义(P>0.05)。
结论 胃及小肠、结肠一次成像的多层螺旋 CT 造影检查的技术是诊断小肠肿瘤性疾病有效方式,有着高度的准确性,此项检查提供内镜所不能提供的优势,包括观察全层肠壁的结构和肠外的并发症及腹腔情况,值得临床应用。

PU-0308
胰腺炎型左侧门静脉高压 23 例影像学分析

李强[1],孙玲麟[2],兰朋训[1],史燕巧[1]
1.宁波市鄞州人民医院
2.宁波市华慈医院

目的 评估胰腺炎型左侧门静脉高压(LSPH)的影像学特点，提高对该病的认识。
方法 回顾性分析 300 例胰腺炎患者的临床和影像学资料，统计 LSPH 的发生率，总结并分析其影像学特征。依据胰腺炎和左侧门静脉高压的影像学特征对患者进行分类评估，统计每组伴随情况下 LSPH 的发生率。
结果 （1）300 例胰腺癌患者中 21 例具有不同程度的 LSPH，发生率达 29.9%；（2）胰腺炎分类描述　　病变位于头颈部的患者（70 例）较体尾部的患者（47 例）多，两者 LSPH 的发生率分别约 22.0%、44.7%，差异具有统计学意义（P=0.007）；（3）病灶中 2-4cm 的患者（58 例）多于≤2cm（17 例）、＞4cm（42 例）的，三者 LSPH 的发生率分别约 11.8%、22.4%、47.6%，差异具有统计学意义（P=0.006）；（4）胰腺癌是否伴有胰腺体尾部萎缩与 LSPH 的发生无统计学差异（P=0.315），发生率分别约 25.0%、34.4%；（5）胰腺癌中伴有胰管扩张的患者（79 例）LSPH 的发生率（34.2%）高于未见明显扩张者（38 例，21.1%），两者差异无统计学意义（P=0.196）；（6）病变侵犯胰周血管，LSPH 的发生率明显增高（58.3% vs 0.000%），差异具有统计学意义（P=0.000）；（7）胰腺癌 LSPH 的发生与胰周淋巴结转移与否无关，差异无统计学意义（P=0.201），淋巴结转移的患者 LSPH 的发生率（33.8%）高于未转移者（21.6%）。
结论 LSPH 或可成为评估胰腺癌病变情况的参考依据之一。

影像组学在原发性肝癌领域的最新研究进展

韩青青
厦门大学附属翔安医院

目的 影像组学作为 2012 年提出的新概念，被认为是精准医疗的重要组成部分，也已经成为了医学影像学发展的必然趋势。近年来，影像组学在各种疾病领域的研究和应用得到了人们的广泛关注。原发性肝癌作为我国病发率、致死率最高的肿瘤之一，及时早发现、早诊断、早治疗能够有效提高患者的疗效，改善预后，降低复发及死亡率。但是由于各个研究所采用的影像组学方法不同、图像质量的差异、病灶分割重组的主观性以及各种参数缺乏标准化等因素，研究的可重复性较差，研究结果的临床作用也有待进一步验证。
因此，本文就影像组学在原发性肝癌领域的最新研究进展进行综述。
方法 通过综合分析近年影像组学领域的文献报道，阐述影像组学的几个基本步骤，分别是图像的采集和重建、图像分割及重组、图像特征的提取和量化、数据库的建立及共享、个体数据的解析病灶。并就最新的影像组学腹部疾病研究进展进行分析，阐述影像组学在病灶分割、诊断与鉴别诊断、治疗方案选择及预后评价等方面取得的成就及最新发展。
结果 影像组学通过获取影像学图像、分割和重组病变图像、提取和量化纹理特征、建立数据库及患者的个人数据解析等步骤，为疾病的诊断、病理分型、治疗方案选择及疗效预测提供了新的思路。目前影像组学在颅内肿瘤、肺癌及小结节、胃肠道肿瘤等方面的研究与应用正在快速发展。虽然目前影像组学处理流程已经比较完善，但是许多流程仍然存在许多缺陷。
结论 通过影像组学的五个基本步骤，原发性肝癌研究在病灶分割、诊断与鉴别诊断、治疗方案选择及预后评价等方面均得到推动和发展。

能谱 CT 最佳单能量成像结合门静脉流入期对提高门静脉图像质量的应用

王超,邱晓晖,章辉庆,高建磊
亳州市人民医院

目的 探讨能谱 CT 单能量成像技术结合门静脉流入期对提高门静脉图像质量的价值。
方法 收集临床诊断肝硬化并行腹部 CT 增强患者 31 例，对门静脉流入期及门静脉期采用 GSI 模式扫描，并重建出四组图像（A、B、C、D）。分别测量四组图像中门静脉、肝脏 CT 值、SD 值（$CT_{门}$、$SD_{门}$、$CT_{肝}$、$SD_{肝}$），计算出 $SNR_{门}$、$CNR_{门}$、$SNR_{肝}$，并对图像主观质量进行评价，进行统计学分析。
结果 B、D 组 $CT_{门}$、$SD_{门}$、$CT_{肝}$差异无统计学意义，余各组间差异均有统计学意义（$P<0.05$）；A、C 两组间及 B、D 两组间 $SD_{肝}$、$SNR_{门}$差异无统计学意义（$P=0.418$，$P=0.838$；$P=0.169$，$P=0.283$），A、C 组 $SD_{肝}$、$SNR_{门}$值高于 B、D 组（$P<0.05$）；B、C 组间 $CNR_{门}$及图像主观质量评分差异无统计学意义（$P=0.793$，$P=0.991$），余各组间 $CNR_{门}$差异均有统计学意义（P 均<0.05），其中 A＞B=C＞D。
结论 能谱 CT 最佳单能量成像技术结合门静脉流入期能有效提高门静脉图像质量。

PU-0311

脾脏海绵状淋巴管瘤的影像学表现及病理学特征

李则锋
广西中医药大学第一附属医院

目的 探讨脾脏海绵状淋巴管瘤的 CT、MRI 表现及病理学特征。
方法 收集我院经手术和病理证实的 6 例脾脏海绵状淋巴管瘤临床和影像学资料，其中行 CT 增强检查 5 例，MRI 增强检查 1 例。回顾性分析其 CT、MRI 表现及病理学特征。
结果 脾脏海绵状淋巴管瘤的影像学表现：可为单发、多发结节或肿块，亦可弥漫累及整个脾脏，边界清楚或不清楚，有分隔及分叶；CT 平扫为低密度灶，有时病灶中心可见斑点状或结节状钙化灶，MRI 平扫，T2WI 呈高信号、分隔呈等或稍低信号，T2WI 压脂序列信号更高、灶内分隔显示更加清楚，T1WI 以低信号为主、灶内分隔亦呈稍低或等信号且显示较为模糊；CT 和 MRI 增强扫描各期囊性成分均未见强化，动脉期囊壁及分隔轻度强化，门脉期和延迟期分隔呈“蜂窝状”或“网格状”持续强化。病理学特征：海绵状淋巴管瘤为多发迂曲扩张的较大淋巴管形成，聚集而呈蜂窝状结构。
结论 脾脏海绵状淋巴管瘤影像学表现具有一定的特征性，有利于定性诊断。

PU-0312
Evaluation of hepatic perfusion in pancreatitis patients by 3rd-generation dual-source computed tomography

Xilin Lan,Shiyong Zhang,Haibing Zhang,Bing Ming
deyang people’s hospital

PURPOSE
A number of studies have demonstrated that acute pancreatitis (AP)can result in liver damage, which is often without obvious clinical symptoms, but plays an important role in the progression of AP and other organ damage.Fewer studies published about the difference in hepatic perfusion parameters in patients with AP, Therefore, we quantitatively investigated hepatic perfusion in patients with mild AP(MAP) and severe AP (SAP)compared to control group using perfusion CT.
METHOD AND MATERIALS
The clinical and abdominal CT data on all patients were retrospectively analyzed, including 61 patients with AP and 15 cases as a control group,and the AP group further classified into mild AP(26 cases)and severe AP(35 cases) according to CT severity index (CTSI).Upper abdomen perfusion CT imaging was performed in all cases by 3rd-generation dual-source CT. Perfusion CT imaging was obtained for 82.5s beginning with a bolus injection of 60 ml of contrast agent (400 mgI/kg) at a flow rate of 5 ml/s. Perfusion data were analyzed by the deconvolution method to obtain blood flow(BF, mL/100mL/min),blood volume(BV, mL/100mL),arterial liver perfusion (ALP, mL/100mL/min) , portal venous liver perfusion (PVP, mL/100mL/min),mean transit time(MTT,s) and hepatic perfusion index(HPI,%). Finally, hepatic perfusion parameters were compared for any significant ($P < 0.05$) differences among mild AP patients, severe AP patients and control group.
RESULTS

Various perfusion parameters was significantly higher in the control group than severe AP patients (BF:p=0.002 BV:p=0.000, PVP:p=014,MTT:p=0.000,HPI:p=0.039, p < 0.05 ; ALP: p=964>0.05). There was no significant difference in various perfusion parameters between mild AP patients and the control group ,except in MTT(8.53±0.92s vs 7.59±1.30s,p=0.018).

CONCLUSION

Using quantitative analysis on hepatic perfusion CT, we demonstrated the decrease of various hepatic perfusion parameters ,namely hepatic blood perfusion in SAP, responding to the changes in hepatic hemodynamics in SAP,hepatic perfusion CT is useful for evaluation and prediction of liver damage in patients with SAP.

PU-0313

胆囊肉瘤样癌一例

梅磊磊,曾珍,李文富,张体江
遵义医科大学附属医院

胆囊肉瘤样癌（gallbladder sarcomatoid carcinoma,GBSC）是一种同时含有上皮和间叶（肉瘤样）成分的恶性侵袭性肿瘤，由 Landsteiner 于 1907 年首次报道[1]。GBSC 非常罕见，据 Liu 等[2]和宋等[3]统计，其分别占同期胆囊癌的 4．3%和 0.9%，且该病好发于老年女性，男女发病率约为 1:3.25[4]，患者常伴有腹痛、黄疸、发热、恶性、呕吐及腹部包块[5]等症状。文献表明，胆石症是本病最主要的危险因素，其次混合细菌或沙门菌感染、肥胖、瓷化胆囊等也与本病的发生有关[6]。

本例 CT 平扫表现为不规则低密度肿块沿腔内生长，密度不均、中央见片状更低密度，这可能与肿瘤细胞分化低、生长快，滋养动脉无法充分供血导致的坏死有关，增强扫描肿块实质呈持续明显强化，与文献[6, 7]报道一致。T_1WI 表现为低信号，T_2WI 呈高、稍高及低信号，增强后中央区无明显强化，提示病灶可能含出血、坏死及含铁血黄素等成分，肿瘤周围实质及不规则纤维样分隔表现为明显延迟强化，较具特征，与贺[8]等所报道的肝肉瘤样癌 MRI 强化方式相似，贺[8]等认为这可能与肿块周边增殖的癌组织内含有纤维间质有关。笔者推测肿瘤内部滋养动脉分化不良及血管上皮不完整，也可导致对比剂填充延迟。鉴别诊断：（1）肿块型胆囊癌，表现为腔内软组织肿块，可伴坏死，但肿块大小及坏死范围均不及 GBSC 大，增强扫描为不均匀明显强化，无特征性纤维样分隔延迟强化。（2）胆囊息肉，多为直径小于 1cm 的良性结节，常多发，无明显坏死。

综上，GBSC 缺乏特异性，确诊仍需依靠术后病理，免疫组化显示 CK、EMA 等上皮性标志物及 Vimentin 等间叶源性标志物都可为阳性，且电镜下可见张力微丝、桥粒样连接等超微结构[9]。该病恶性程度高、转移早、预后差，放化疗效果不确定，彻底的手术切除是当前首选的治疗方法

PU-0314

胰腺实性假乳头状瘤 CT 影像学特征分析

宁培钢,王梅云,朱绍成,窦设伟,谭红娜
河南省人民医院

目的 分析胰腺实性假乳头状瘤的多层螺旋 CT 影像学特征,探讨 CT 对其诊断价值。

方法 回顾性分析经手术及病理证实的 62 例胰腺实性假乳头状瘤的 MSCT 影像特征及临床特点。

结果 24 例可见钙化，其中 16 例成蛋壳样钙化，8 例斑片状及结节样钙化；2 例可见胰管扩张。62 例实性假乳头状瘤增强扫描后，实性部分动脉期呈轻度不均匀强化、门脉期及延迟期强化也呈渐进性增加，囊性及坏死部分不强化。62 例均未见腹膜后淋巴结转移。
结论 胰腺实性假乳头状瘤以 CT 特征性表现，诊断具有重要价值。

PU-0315
3.0T 磁共振钆塞酸二钠增强扫描在鉴别肝硬化结节与结节型肝癌的临床诊断价值

张涛,刘连锋,张媛,魏春燕,张利安,蒋小锋,蔡雷,张飞,吕琳
延安大学咸阳医院

目的 探讨钆塞酸二钠(Gd-EOB-DTPA) MRI 增强肝胆期对肝硬化结节与结节型肝癌进行评估和分析。
方法 52 例存在肝硬化结节患者进行 3.0TMRI 平扫、钆塞酸二钠动态增强扫描及肝胆期扫描，对磁共振图像进行分析，行穿刺活检或手术得出病理结果，影像诊断与病理结果对照。
结果 52 例经磁共振平扫加常规三期增强共发现肝内结节 102 个，初步诊断癌灶者 31 例，增强扫描肝特异期共发现癌灶 35 例，最终病理结果检查癌灶 35 例，磁共振平扫加三期增强与之符合 27 例（77%），钆塞酸二钠增强特异期扫描与之符合 31 例（88%），数据差异有统计学意义（P ＜ 0.05）。
结论 将钆塞酸二钠磁共振增强扫描应用于肝硬化结节与结节型肝癌的鉴别诊断当中，大幅度提高了对 肝内结节性质的敏感性，诊断准确率优于动态 MRI 增强扫描，值得推广应用。

PU-0316
Uncinate Process Cancer and Non-Uncinate Process Pancreatic Head Cancer: Relationship to Survival Outcomes

Yun Bian,Li Wang,Jianping Lu
Department of Radiology, Changhai Hospital, The Second Military Medical University, Shanghai, China

Background Few reports have compared the radiopathological characteristics of uncinate process pancreatic cancer (UP-PC) and non-uncinate process pancreatic head cancer (nonUP-PC), and their exact relationship with prognosis is unclear. This study investigated the exact relationship between the two locations of pancreatic head cancer and OS.
Methods We enrolled 150 patients with pathologically confirmed pancreatic ductal adenocarcinoma who underwent multislice computed tomography within 1 month of resection from October 2014 to December 2017. All patients were divided into the UP-PC group or the nonUP-PC group based on tumor location, and their all characteristics were retrospectively analyzed. Multivariable Cox proportional hazards models were used to analyze associations with overall survival (OS).

Results Patients with UP-PC and nonUP-PC accounted for 48% (72) and 52% (78) of the study cohort, respectively. The median OS in the UP-PC group and the nonUP-PC group was significantly different (19.3 months vs. 24.0 months). Lymphovascular space invasion (LVSI) played an interactive role in the association between the tumor location and OS. Multivariate analyses revealed a significant association between tumor location and OS. UP-PC had a higher mortality risk than nonUP-PC (hazard ratio [HR] 1.75). Similar results were found in the minimally adjusted model (HR 1.76) and the fully adjusted model (HR 2.03).
Conclusion UP-PC patients had significantly worse survival than those with nonUP-PC patients.

PU-0317
肾脏上皮样血管平滑肌脂肪瘤的病理特征及 CT 表现

杨维森
苏州大学附属第二医院

目的 探讨肾脏上皮样血管平滑肌脂肪瘤（renal epithelioid angiomyolipomas,EAML)的病理学特征及 MDCT 的影像学表现。
资料与方法 回顾性分析 10 例术后病理证实的 EAML 的临床、病理及 CT 图像资料。10 例均行 CT 平扫及三期增强扫描，观察及分析其影像学特征。
结果 10 例病灶最大径 2.8-13.5cm，平均 6.7cm；9 例平扫呈相对高密度（>45HU）；7 例瘤内含脂肪成分；3 例可见坏死灶，10 例均未见明显囊性及钙化灶；增强扫描 9 例皮-髓质交界期明显强化，实质期呈持续强化；1 例皮-髓质交界期及实质期均呈轻度强化；病灶主要表现为“快进慢出”模式；4 例瘤内可见畸形血管。
结论 EAML 并非为绝对的乏脂性肿瘤，其 CT 表现多样，与病理成分密切相关。病灶表现为体积较大、平扫高密度、瘤内出血，可见坏死灶而囊变及钙化罕见时有一定的特征性，确诊仍依赖病理。

PU-0318
2018 版 LI-RADS 在原发性肝脏恶性肿瘤中的鉴别诊断价值

邹显伦,沈亚琪,李震,胡道予
华中科技大学同济医学院附属同济医院

目的 探讨 2018 版 CT/MRI 肝脏影像报告及数据系统（LI-RADS v2018）在原发性肝脏恶性肿瘤中的鉴别诊断价值。
材料和方法 回顾性分析经病理证实的肝细胞癌（HCC）48 例，胆管细胞癌（iCCA）39 例以及混合性肝细胞胆管细胞癌（cHCC-CCA）9 例。将病例分为两组：HCC 组（48 例 HCC）、非 HCC 组（共 48 例，包括 39 例 iCCA 以及 9 例 cHCC-CCA）。两组病例在患者年龄、性别、病灶大小及肝病背景（乙型病毒性肝炎或肝硬化）等特征上匹配。所有患者均临床资料证实有 HCC 高危因素，且在手术或病理穿刺活检前已进行 MR 平扫,动态增强及弥散加权成像。在不知病理结果的情况下，由两名有

经验的腹部影像诊断医师采用 LI-RADS v2018 对所有病例的影像资料进行分析。记录各个病例影像征象的出现情况及 LI-RADS 分类结果。应用统计软件，分析两名医师评估结果的一致性及 LI-RADS v2018 对 HCC 准确分类的敏感性、特异性及准确性。

结果 两名医师 LI-RADS 分类的一致性高。若 LR-4、LR-5 及 LR-TIV(HCC)视为阳性（HCC 组），将 LR-M 及 LR-TIV(M)视为阴性（非 HCC 组）。则两名医师应用 LI-RADS v2018 将 HCC 正确归类为 LR-4、LR-5 或 LR-TIV(HCC)的敏感性、特异性、准确性分别为 91.6%、72.9%、82.3%（医师 1）及 89.6%、79.2%、84.4%（医师 2）。

结论 LI-RADS v2018 能将大多数 HCC 准确归类为 LR-4、LR-5 或 LR-TIV(HCC)。然而，应用 LI-RADS v2018 时仍需注意，cHCC-CCA、少数不典型 HCC 及 iCCA 可能会被错误分类。

PU-0319
MDCT 联合血管形态定量分析在胰腺导管腺癌累及门静脉-肠系膜上静脉术前评估中的应用

张雷
无锡市第二人民医院

目的 研究多排螺旋 CT 联合血管形态定量分析对胰腺导管腺癌（PDAC）累及门静脉-肠系膜上静脉（PV-SMV）进行术前评估的应用价值。

方法 对 103 例经手术和病理证实的 PDAC 患者的增强 CT 图像进行回顾性分析。2 位阅片者采用 CT 后处理工作站中的血管分析软件对 PDAC 累及 PV-SMV 状况进行血管管腔狭窄率（luminal narrowing rate, LNR）的定量分析，并行相关分析评价 2 位阅片者的评估结果。行 ROC 图像分析及 Kappa 检验，取敏感性和特异性均较高的 LNR 值作为判断手术中血管与肿瘤可直接分离的最佳临界阈值。将 PV-SMV 的 LNR 评价结果及 TVC 联合 LNR 评价结果与手术结果相对照，评价两者一致性。使用 LNR 方法进行 PV-SMV 侵犯相关的手术肿瘤-血管可分离性预测，对照手术结果，得出各预测方法的敏感性、特异性、阳性预测值（positive predictive value，PPV）、阴性预测值（negative predictive value , NPV）和准确性。

结果（1）LNR = 29%为最佳临界阈值。使用该阈值时，2 位阅片者的 LNR 分级评估结果一致性很高（r = 0.861，P = 0.000）。（2）在 PV-SMV 侵犯相关的手术肿瘤-血管可分离性预测中，使用 LNR 方法的诊断敏感性、特异性、PPV、NPV 和准确率分别为 93.9%、84.6%、92%、88%和 90.7%。

结论 MDCT 联合血管定量分析获得的 LNR 数据可对 PDAC 侵犯 PV-SMV 进行术前评估且不同诊断经验医师评估结果的一致性高。LNR 是预测 PDAC 累及 PV-SMV 独立因素，其最佳临界阈值为 29%。

PU-0320
肝脏上皮样血管平滑肌脂肪瘤的影像学表现

陈炜,张伟
湖南省第二人民医院

目的 分析肝脏上皮样血管平滑肌脂肪瘤 (Hepatic epithelioid angiomyolipoma, HEAML) 的 CT 和 MRI 表现，加深对 HEAML 的认识。

方法 对手术后病理证实的 10 例 HEAML 患者的资料进行回顾性分析。10 例患者中, 3 例同时行 CT 平扫及多期增强扫描与 MRI 平扫及动态增强扫描, 2 例行 CT 平扫及双期增强扫描，5 例行 MRI 平扫及动态增强扫描。对病灶的形态、大小、平扫密度或信号特点、血管情况、包膜及增强特征等进行记录并分析。

结果 12 枚病灶均为椭圆形或圆形；病灶大小 1.5-20.0 cm；6 枚病灶均为低密度，10 枚病灶 T1WI 呈低信号、T2WI 呈高信号；动态增强 6 枚表现为“快进快出”型，6 枚表现为“快进慢出”型；2 枚含脂肪成分；12 枚病灶中心可见条状强化血管影；9 枚见环形强化的假包膜。
结论 富血供肿块、瘤体中心血管影、动脉期出现强化假包膜是 HEAML 具有一定特征性的影像学表现。

PU-0321
CT 纹理分析在预测肝细胞性肝癌病理分级及无病生存期中的应用

胡慧娟,徐海波,张在鹏,胡金香
武汉大学中南医院

目的 探讨 CT 纹理分析(CTTA)在预测肝细胞癌(HCC)术后病理分级及无病生存期（DFS）中的应用价值。
方法 回顾性分析 2015 年 1 月至 2018 年 12 月间行肝脏多期 CT 检查且经病理结果证实为肝癌，且排除图像有伪影干扰和病灶直径小于 1.0 cm 的患者，共 246 例。两名评估者分析了肿瘤的 CT 表现，包括肿瘤大小、边缘、瘤周强化、包膜、强化形式、卫星结节等；术前 CT 图像上肿瘤的纹理分析使用 MaZda 软件进行，从灰度直方图、共生矩阵、绝对梯度、自回归模型及小波变换中提取纹理特征值，得到了像素分布直方图的均值、正像素的均值、熵、峰度、偏度和标准差。然后根据组织学分级比较各组间的纹理特征。多变量 Logistic 回归分析方法分析纹理特征及临床参数与病理分级的关系，采用 Kaplan-Meier 和 Cox 比例危害分析，确定纹理特征与 DFS 之间的关系。
结果 动脉期 CT 图像纹理的 SD 和 MPP 与 HCC 组织学分级呈显著正相关($p < 0.05$)。卫星结节、瘤周低密度是预测肿瘤分级的重要指标($P < 0.05$)，卫星结节的敏感性和特异性分别为 51.9%和 96.4%。Cox 比例危害分析确定肿瘤大小($p = 0.001$)，显微血管浸润($p = 0.026$)，边缘动脉增强($p = 0.001$)和瘤周实质强化($p = 0.010$)作为 DFS 的独立预测因子。
结论 CTTA 除了提供其他有价值的影像学和临床病理参数外，还能提供与肿瘤分级及 DFS 显著相关的纹理特征。

PU-0322
比较钆塞酸二钠增强磁共振成像与白蛋白-胆红素评分、前白蛋白胆红素评分肝功能评估结果的研究

李娟,刘四斌
湖北省荆州市中心医院

目的 本研究围绕钆塞酸二钠（Gd-EOB-DTPA）增强磁共振成像（MRI）评估肝功能的可行性，探讨其局段性肝功能评估结果与白蛋白-胆红素（ALBI）评分、前白蛋白-胆红素（mALBI）评分间的差异，并计算 Gd-EOB-DTPA 增强 MRI 诊断不同肝功能组患者的诊断效能。
方法 本研究为回顾性研究，经湖北省荆州市中心医院研究伦理委员会通过。筛选 2017.5 至 2019.1 于湖北省荆州市中心医院放射科接受 1.5T Gd-EOB-DTPA 增强 MRI 检查者 36 例纳入研究。入组者均收集临床病史、实验室检查资料及影像学检查资料，根据 ALBI 评分、mALBI 评分进行肝

功能分组。入组者 Gd-EOB-DTPA 增强 MRI 检查均测量增强前肝实质的信号强度（SIpre）和肝细胞特异期肝实质的信号强度（SI_{post}），计算相对强化程度 $RE_{肝}$=$SI_{肝}$post/ $SI_{肝}$pre。比较（1）入组者的实验室检查资料与三种肝功能分级间的差异；（2）不同肝功能组间肝脏各段 $RE_{肝}$差异；（3）$RE_{肝}$诊断不同肝功能组患者的诊断效能。数据采用 SPSS 22.0 软件、MedCalc 15.8 软件分析，测量资料用均数±标准差（`x±s）表示，$P<0.05$ 具有统计学差异。

结果 （1）不同肝功能组间实验室检查指标如血清总胆红素、白蛋白、前白蛋白以及凝血酶原时间差异具有统计学意义。（$P<0.05$）

（2）不同肝功能组间多数肝段 $RE_{肝}$差异具有统计学意义。（$P<0.05$）

（3）$RE_{肝}$能诊断肝功能正常组与肝功能受损组、轻度肝功能损伤组与中重度肝损伤组。（AUC 分别为 0.828、0.812、0.823 以及 0.923）

结论 Gd-EOB-DTPA 增强 MRI 可作为局段性肝功能评估的方法，可采用 $RE_{肝}$作为评价指标，$RE_{肝}$对不同肝功能组患者具有较高诊断价值。

PU-0323
LI-RADS(v2013)对肝脏病变的诊断价值初步研究

王影[1],余深平[1,2]
1.中国科学技术大学附属第一医院（安徽省立医院）
2.中山大学附属第一医院

目的 探讨 LI-RADS 对有 HCC 发病风险人群的肝脏病变的诊断价值。

方法 2 名医生独立双盲地阅读 813 名有 HCC 发病风险患者共 1115 处病变的 CT/MRI 征象，运用 LI-RADS(v2013)的分级诊断标准进行诊断。

①比较两名医生对肝脏良性病变、HCC 病变诊断的可重复性。

②比较 LI-RADS(v2013)分级诊断结果与金标准的一致性及敏感度、特异度等。

结果 ① 两名医生对 HCC、良性病变的 LI-RADS(v2013)分级诊断结果的一致性均介于显著和最佳之间，kappa 系数分别为 0.80、0.84。

② LI-RADS(v2013)与金标准的一致性为最佳，kappa 系数为 0.85；LI-RADS(v2013)的敏感度、特异度、阳性预测值和阴性预测值分别为 100%、80.2%、91.4%、100%，LI-RADS(v2013) LR 3 至 5 级的阳性预测值分别为 67.8%、84.2%、98.2%。

结论 ① 两名医生对 HCC、良性病变的分级诊断结果的一致性均介于显著和最佳之间。

② LI-RADS(v2013)与金标准一致性为最佳，LI-RADS(v2013)的敏感度、特异度均较高。

PU-0324
肝脏上皮样血管周细胞瘤的 CT 和 MRI 特征分析

李强
宁波市鄞州人民医院

目的 探讨肝脏上皮样血管周细胞瘤(PEComas)的 CT 和 MRI 影像学特征，提高诊断的准确性。

方法 回顾性分析 10 例经手术病理证实的肝脏上皮样血管周细胞瘤的 CT 和 MRI 影像资料，包括发病部位、直径、包膜、强化特点和病灶周围情况等，并复习相关文献。

结果 肿瘤位于肝左叶 6 例，右叶 3 例，尾状叶 1 例；瘤灶最大直径： 3cm 以下 3 例，3cm 以上 7 例；平扫表现：密度(信号)不均 7 例，含脂肪成分 6 例，有完整包膜 7 例，有钙化 2 例，病灶内出血 1 例；增强表现：动脉期明显强化 9 例（均质强化 3 例，边缘向中心性强化 6 例），强化不明显

1 例，肝动脉穿行于肿瘤内 1 例；门脉期及延迟期强化程度减低呈等或稍低密度（信号）10 例，门静脉左支受累 3 例。

结论 CT 和 MRI 对肝脏上皮样血管周细胞瘤有一定的诊断价值，但仍需与肝癌、肝血管瘤等鉴别。

PU-0325

Three-Year MR and CT Imaging Follow-Up of Primary Pancreatic Leiomyosarcoma: A Case Report and Literature Review

Qiang Li
Yinzhou People's Hospital, Ningbo

We are reporting a 73-year-old female patient with primary pancreatic leiomyosarcoma. In April 2013, MRI and CT revealed an indeterminate lesion in the pancreatic body. In November 2014, an ultrasound imaging follow up showed the significant enlargement of the tumor mass. The following computed tomography and MRI demonstrated an enlarged heterogeneous tumor mass mixed with solid and cyst components in the body-tail of pancreas. Contras-enhanced CT and MRI further characterized the tumor as an inhomogeneous tumor with slight enhancement of solid comments and non-enhanced cyst-like components and calcification. Pathology and immunohistochemical examination of surgically excised tumor showed the histologic characteristics of pancreatic leiomyosarcoma. The patient underwent pancreatectomy with splenectomy and lymph node dissections. Sixteen months after the tumor resection, CT and MRI remonstrated the tumor metastasis in the liver and lung. Primary pancreatic leiomyosarcoma is a rare malignant neoplasm. If a patient has a large mass with a cystic necrotic component, pancreatic leiomyosarcoma should be considered in the differential diagnosis list after excluding other common differential diagnoses.

256 排 CT 三期扫描及三维血管成像重建在原发性肝癌诊断中的价值

胡慧
上海交通大学附属第六人民医院

目的 探讨 256 排 CT 三期扫描及三维血管成像重建技术在原发性肝癌诊断中的应用价值。方法 从 2011 年 9 月至 2015 年 9 月收治的原发性肝癌患者中随机选择 205 例，给予 256 排 CT 三期扫描及三维血管成像重建 ，并与同期行肝动脉 DSA 的 158 例患者进行对比分析。 结果 肝动脉期 MSCTA 可以良好的显示出腹腔干及其主要分支、肝动脉解剖变异，VR 对血管的立体显示效 果优于 MIP，但在肝内动脉显示方面存在差异。MIP 和 VP 法检查在供血动脉显 示方面存在差异，但差异无统计学意义（P>0.05）；在肿瘤血管显示方面 ，差异有统计学意义 （P<0.05）。 在显示肝动脉 3 级 以下分支以及肿瘤供血动脉和肿瘤血管方面，MIP 与 DSA 间差异无统计学意义（均 P>0.05）。在显示 4 级 以上分支方 面，DSA 优于 MIP 且经比较差异有统计学意义（P<0.05）。在门静 脉 4 级以上分支显示方面，MIP 和 VR 经比较差异均无统计学意义（均 P>0.05）。 结 论 256 排 CT 三期扫描及三维血管成像重建在原发性肝癌诊断中具较高 的应用价值 。

PU-0327

MSCT 对壶腹周围癌的诊断价值

尹华
南宁市第二人民医院

目的 探讨 MSCT 对壶腹周围癌的诊断价值。
方法 回顾分析我院经手术病理证实的 17 例壶腹周围癌患者的 MSCT 资料，所有病例均行动态增强并对图像进行分析。
结果 17 例中胰头癌 9 例，十二指肠癌 4 例，胆总管下段癌 4 例。胰头癌、十二指肠癌、胆总管癌有较典型的 CT 征象，表现为连接区软组织肿块，同时伴有低位胆道及胰管梗阻。多种重建后处理可显示十二指肠壶腹周围的解剖结构、胰胆管扩张及病灶位置、形状、大小情况。16 例表现低位胆道梗阻，3 例表现胆总管截断征，1 例表现胆总管下段偏心性狭窄；16 例表现双管征；1 例仅胰管扩张；病灶全部不同程度强化，其中不均匀强化 12 例，实心圆强化 5 例。
结论 MSCT 增强检查并结合多种重建后处理对壶腹周围癌的诊断有较高准确性,多种后处理方法可直观显示壶腹周围癌的直接和间接征象。

PU-0328

The correlation of nutcracker syndrome and superior mesenteric artery syndrome

Yuting Gu,Chunyan Li
The First Affiliated Hospital of Guangxi Medical University

Objective: To investigate the correlation of nutcracker syndrome and superior mesenteric artery syndrome. **Methods:** Collected 29 cases of patients with superior mesenteric artery syndrome; calculated the transverse diameter ratio of the left renal vein between the extended segment and the narrow segment on CT. Collected 30 cases of patients without superior mesenteric artery syndrome; calculated the transverse diameter ratio of the left renal vein between the extended segment and the narrow segment on CT. Collected 28 cases of patients with nutcracker syndrome, the distance between SMA and aorta, at the location where the duodenum passes from, was measured on CT. **Results:** Among the 29 patients with superior mesenteric artery syndrome, 26 were complicated with nutcracker syndrome. Among the 30 patients without superior mesenteric artery syndrome, no patient was complicated with nutcracker syndrome. Among the 28 patients of nutcracker syndrome, all patients complicated with superior mesenteric artery syndrome. According to the spearman rank correlation analysis, r = 0.928, P = 0.000, it can be considered that the nutcracker syndrome and the superior mesenteric artery presented syndrome significant correlation. **Conclusions:** Nutcracker syndrome complicated with superior mesenteric artery syndrome. Individual anatomical reasons can lead to the superior mesenteric artery syndrome alone.

PU-0329

Diffusion kurtosis imaging in predicting the recurrence of early stage of hepatocellular carcinoma treated

Fei Jia,Dongming Han
First Affiliated Hospital of Xin Xiang Medical University

Objective: This study aimed to analyze the diffusion kurtosis imaging (DKI) in predicting the recurrence of early stage of hepatocellular carcinoma (HCC) treated. **Methods** : DKI and DWI date of 50 patients with untreated HCC was retrospectively analyzed, and MD,MK and ADC values were measured. Recurrence rate of HCC was recorded after a median follow-up of 12 months. The differences of the parameters between recurrence and non- recurrence HCC groups were analyzed. The predictive values of DKI were analyzed using ROC curves. **Results**: hepatocellular carcinoma tissue MK of untreated HCC group was higher than that Para-carcinoma tissue group, while MD, ADC was lower than those of Para-carcinoma tissue group (all $P<0.05$). MK of recurrence of treated HCC group was higher than that non- recurrence group, while MD, ADC was lower than those of non- recurrence group (all $P<0.05$). The MK value of Para-carcinoma tissue had the higher AUC in predictive the recurrence of early stage of HCC treated, The MK value of hepatocellular carcinoma tissue was the next (all $P<0.05$). **Conclusions**: Diffusion kurtosis imaging (DKI) can provide a new way to predict the prognosis of hepatocellular carcinoma.

PU-0330

胰腺非高强化神经内分泌肿瘤与导管腺癌的 MR 鉴别诊断

裴新龙,刘剑羽
北京大学第三医院

目的 分析动脉期非高强化的胰腺神经内分泌肿瘤 （pancreatic neuroendocrine tumors，PNET）的 MR 成像特点，探讨 MR 平扫及动态增强扫描在鉴别非高强化 PNET 和胰腺导管腺癌（ pancreatic ductal adenocarcinoma， PDAC）的鉴别诊断价值。方法 回顾性分析经过病理证实的 35 例 PNET（共 45 个病灶）和 52 例 PDAC（共 53 个病灶）的 MR 平扫及动态增强扫描。 记录 PNET 和 PDAC 组病变的位置、大小、数量及边缘、平扫及增强信号特点。观察胰管、胆管及胰腺形态、血管侵犯及周围浸润情况及其他脏器转移情况。结果 根据动脉期强化程度将 PNET 病灶分为两组：高强化组共 20 个病灶，非高强化病灶共 25 个病灶。（1）非高强化 PNET 组病灶动脉期、静脉期、延迟期强化程度均高于 PDAC 组（P＜0.01）；静脉期等高强化病灶数量（20/25）和延迟期等高强化病灶数量（23/25）多于 PDAC 组（P＜0.05）；（2）非高强化 PNET 组病灶边缘多数（17/25）较规则，而 PDAC 多数（47/53）病灶边缘不规则（P＜0.05）；（3）非高强化 PNET 组主胰管狭窄（8/25）明显少于 PDAC 组（43/53）；继发远端胰管扩张（6/25）亦较少，扩张程度较轻，远端胰腺萎缩（5/25）较少；仅 2 例累及胆总管；（4）非高强化 PNET 组胰周浸润（8/25）及血管侵犯（8/25）较 PDAC 组少（P＜0.05）。结论 边缘规则，门静脉期及延迟期高或等强化，胰管无扩张或轻度扩张、胰腺无萎缩更支持动脉期非高强化 PNET 的诊断，有助于和 PDAC 鉴别。

PU-0331

Revolution CT 虚拟平扫替代常规平扫的可行性研究

崔达华[1],刘爱连[1],刘静红[1],陈安良[1],张钦和[1],刘义军[1],李剑颖[2]
1.大连医科大学附属第一医院
2.通用集团（中国）CT 影像研究中心

目的 探讨 Revolution CT 虚拟平扫替代常规平扫的可行性。
方法 回顾性分析 2017 年 11 月至 2018 年 7 月于我院行 Revolution CT 全腹或上腹扫描的肝脏正常者 43 例，均行腹部常规真实平扫（TNC）及动脉期、静脉期、平衡期增强的双能量能谱成像扫描，对三期增强图像进行虚拟平扫（VUE）重建。在 TNC 及增强三期 VUE 图像上分别测量肝实质 CT 值，在肝脏的右后叶、右前叶及左外叶各取一圆形感兴趣区域（ROI），直径 10mm，避开肉眼可见血管区域，距离肝被膜≥10mm，距肝门≥10mm，记录三个 ROI 的 CT 值。间隔 2 周以上由同一名测量者按相同方法重复测量。计算平均值，以非参数秩和检验（Friedman Test）分析 TNC 及三期增强图像的 VUE 共四组的 CT 值是否有差异。
结果 动脉期 VUE（61.27（56.47，64.10） Hu）、静脉期 VUE（61.00（58.43，63.83） Hu）、平衡期 VUE（60.43（57.03，62.73） Hu）及 TNC（62.30（59.17，64.23） Hu）四组 CT 值差异无统计学意义（P = 0.571）。
结论 动脉期 VUE、静脉期 VUE、平衡期 VUE 及 TNC 对正常肝实质 CT 值的测量结果无区别,有望取代 TNC 用于正常肝实质的测量。

PU-0332

DWI 及 IVIM 在肝外胆管癌与胆管炎的鉴别诊断价值

牛雅欣,刘爱连,李烨
大连医科大学附属第一医院

目的 探讨 DWI 及 IVIM 在肝外胆管癌与胆管炎的鉴别诊断价值。
方法与资料 收集经病理证实或临床证实 28 例肝外胆管癌患者和 17 例胆管炎患者。所有病灶均行轴位 T1WI、T2WI、DWI、IVIM 序列。在 ADW4.6 工作站上，两名观察者采用双盲分别测量两组病灶弥散扩散系数（ADC）、真性扩散系数（D）、灌注相关扩散系数（D*）值及灌注系数（f）值。使用组内相关系数（ICC）分析两名观察者测量结果一致性，采用独立样本 T 检验或 Mann-Whitney U 检验分析两组病变各参数的差异，并使用诊断效能的受试者工作特征曲线（ROC 曲线）评估有统计学意义参数的诊断效能。
结果 两位医师测量数据一致性良好（ICC 均>0.9）。肝外胆管癌组病灶的 ADC、D、D*及 f 值低于胆管炎组，差异有统计学意义（P<0.05）。ADC、D、D*及 f 值相应的 AUC 分别为 0.748、0.778、0.769、0.712，灵敏度分别为 70.6%、76.5%、76.5%、64.7%，特异度分别为 67.%、67.9%、82.1%、67.9%。
结论 DWI 及 IVIM 成像为肝外胆管癌与胆管炎鉴别诊断提供了重要信息。

PU-0333

Differentiation of chronic mass-forming pancreatitis from pancreatic ductal adenocarcinoma using contrast-enhanced computed tomography

Shuai Ren,Kai Guo,Zhongqiu Wang
the Affiliated Hospital of Nanjing University of Chinese Medicine

Purpose: Both chronic mass-forming pancreatitis (CMFP) and pancreatic ductal adenocarcinoma (PDAC) are focal pancreatic lesions and share very similar clinical symptoms and imaging performance. There is great clinical value in preoperative differentiation of those two lesions. The purpose of this study was to investigate the value of computed tomography (CT) features in discriminating CMFP from PDAC.
Patients and methods: Forty-seven patients with pathologically confirmed PDAC and 21 patients with CMFP were included in this study. Demographic and CT features, including tumor location, size, margin, pancreatic or bile duct dilatation, vascular invasion, cystic necrosis, pancreatic atrophy, calcification, and tumor contrast enhancement, were retrospectively analyzed and compared. Multivariate logistic regression analyses were adopted to identify relevant CT imaging features to discriminate CMFP from PDAC.
Results: There were significant differences between CMFP and PDAC with respect to main pancreatic duct dilatation, vascular invasion, cystic necrosis, pancreatic atrophy, calcification, and tumor contrast enhancement. Delayed contrast enhancementda(＞70.5HU) showed high sensitivity and specificity of 84.2% and 84.7%. The areas under the curve (AUCs) of the predicting models based on qualitative and quantitative variables were 0.770 [95% confidence interval (CI): 0.660 - 0.880] and 0.943 (95%CI: 0.888 - 0.999), respectively. When all significant variables were used in combination to build a predicting model, the AUC was 0.969 (95%CI: 0.930 - 1.000) with 84.2% sensitivity and 94.7% specificity.
Conclusion: Main pancreatic duct dilatation, vascular invasion, cystic necrosis, pancreatic atrophy, calcification, tumor size, and tumor contrast enhancement were shown to be useful CT imaging features in discriminating CMFP from PDAC.

影像学检查在胃癌 TNM 分期中的研究进展

严映[1],杨斌[2],杨亚英[1]
1.昆明医科大学第一附属医院
2.南京医科大学医学院金陵医院

胃癌(Gastric Cancer)是位居全球第 5 的常见恶性肿瘤，流行病学研究表明其发病率与病死率均较高，在恶性肿瘤死亡中居第二位[1,2]。WHO 国际癌症机构显示，胃癌在中国癌症顺位排名为第 2 位，5 年生存率仅为 20%-30%[3]，而一旦发生转移，患者存活时间仅为 9-10 个月[4,5]。胃癌主要采用以手术治疗为主的综合治疗，而术前准确的影像学分期对患者诊治与预后至关重要，明确各项影像检查技术在胃癌术前分期中的优势与不足，有助于提高胃癌术前 TNM 分期的准确性，有利于胃癌患者术

前及时制定准确治疗方案，改善患者预后。笔者就近年来多种影像学检查技术在胃癌术前 TNM 分期中的研究进展展开综述。

PU-0335
体素内不相干运动扩散加权成像在胰腺癌分化程度中的价值

陈芙蓉
上海交通大学附属第六人民医院

目的 探讨磁共振体素内不相干运动扩散加权成像(IVIM-DWI)评价胰腺导管腺癌（PDAC）分化程度的价值。方法 收集 30 例经病理证实的胰腺导管腺癌患者，术前一周内均行 3.0TIVIM—DWI 检查及术后评价 PDAC 分化程度（中/高分化 21 例，低分化 9 例），由两名具有 5 年以上腹部影像诊断经验的放射科医师于胰腺癌灶处绘制感兴趣区(ROI)，测得真实扩散系数(D)，假性扩散系数(D*)及灌注分数(f)值，采用独立样本 t 检验比较 PDAC 中/高分化组与低分化组 D、D*、f 值差异，P<0.05 具有统计学意义；受试者工作特性曲线(ROC)分析 D、D*、f 值评估 PDAC 分化程度的效能。结果 中/高分化 PDAC 的平均 D 值显著低于低分化 PDAC（P〈0.001）。 中/高分化 PDAC 的平均 f 值明显高于低分化 PDAC（P〈0.001）。f 值在区分中/高分化的 PDAC 和低分化 PDAC 的曲线下面积略高于 D 值（0.894〉0.865）。结论 IVIM—DWI 成像可无创性预测胰腺导管腺癌组织学分级，并有助于鉴别中/高分化 PDAC 与低分化 PDAC，其中 D 值和 *f*值诊断效能最高。

PU-0336
多层螺旋 CT 及 MRI 对胰腺癌的影像学诊断分析

周小娇
广西医科大学第一附属医院

目的 比较分析多层螺旋 CT(MSCT)、MRI 对胰腺癌的诊断价值。
方法 收集本院 2018 年 4 月-2019 年 4 月 56 例临床怀疑胰腺癌患者的 MSCT、MRI 影像学资料进行回顾性分析，以手术病理结果为对照，比较 MSCT、MRI 对胰腺癌诊断敏感度、特异度、准确度，及对胰腺癌早期分期确诊率。
结果 手术病理证实胰腺癌 34 例，MSCT 诊断胰腺癌敏感度 85.1%，特异度 78.0%，准确率 82.3,较 MRI 的 93.2%、73.4%、86.1%差异无统计学意义(P＞0.05)。CT、MRI 对早期胰腺癌确诊率比较差异也无统计学意义(P＞0.05)。胰腺癌在 CT 图像上表现出胰腺肿大、形态不规则特点，增强扫描可见胰腺实质内低密度肿块；胰腺癌 MRI 呈 T1WI 低或略低信号、T2WI 混杂或略高信号特点。
结论 MSCT 与 MR 在胰腺癌诊断中均具有良好的准确性、敏感度和特异性以及较高的应用价值,但在不同时期的显示方面,MR 优于多排螺旋 CT。

PU-0337
肝脏血管周上皮样细胞肿瘤 1 例报告并文献复习

张国平,吕长磊,寇明清,许兵强,陈小龙,黄明刚
陕西省人民医院

目的 探讨肝血管周上皮样细胞肿瘤 的 CT 表现特点，以提高对该病的诊断水平。
方法 回顾性复习 1 例经手术证实为肝血管周上皮样细胞肿瘤的 CT 平扫及增强表现，并结合文献复习，分析其 CT 特点，尤其是脂肪成份在诊断及鉴别诊断的价值及意义。
结果 肝血管周上皮样细胞肿瘤在 CT 上动脉期多呈周边或局部明显强化、延迟期强化程度减低或呈低密度影，不同文献病例脂肪成份多少有差异。

结论 肝血管周上皮样细胞肿瘤 CT 有一定特点，脂肪成份较多时需要脂肪瘤等相鉴别。

Quantifying Non-alcoholic Fatty Liver: Liver-Spleen CT Ratio or Fat Concentration in Dual-Energy Spectral CT? Accuracy Comparison with Magnetic Resonance Q-dixon Technique

Min Zhang, Jianying Li, Nan Yu, Dong Han
Affiliated Hospital of Shaanxi Chinese Medicine University

Objective: *To compare the accuracy of using conventional liver-spleen (LS) CT ratio or fat concentration (FC) in spectral CT to quantify non-alcoholic fatty liver using the fat fraction (FF) determined using magnetic resonance Q-dixon (MRQd) technique as a reference standard.*
Methods: *Retrospectively analyzed 80 liver patients with both MRQd and spectral CT within one week. Using MRQd results, patients were divided into normal and fatty liver groups (normal: n=20, FF<5%; mild: n=26, FF=5%-10%; moderate: n=20, FF=11%-25%; and severe: n=14, FF>25%). The liver FC was measured on the lipid-based material decomposition images in spectral CT by 2 senior abdominal radiologists by placing regions of interest in two different hepatic lobes over 7 image slices centered at the hepatic portal level. Final FC values were obtained by averaging the measurements. The two doctors also measured the LS CT ratio on the 70keV images. Measurements were repeated three times weekly to evaluate the repeatability using intra-group or inter-group correlation coefficient (ICC). The correlation between MRQd and spectral CT results was analyzed. The diagnostic efficacy of using FC in spectral CT for differentiating normal and mild fatty livers was tested by ROC curve.*
Results: *The ICC values were high indicating consistent measurements. There were differences in FC between any groups* (P<0.05), while the LS ratio was not significantly different between the normal and mild fatty liver group (p>0.05). There was a positive correlation between FC in spectral CT and FF in MRQd (r=0.959, P<0.001), and a negative correlation between LS ratio and FF (r=-0.848, P<0.001). ROC curve analysis showed that with a FC cut-off value of 351.19mg/ml, the sensitivity, specificity and area under curve were 95%, 100% and 0.990, respectively in differentiating the normal and fatty liver group.
CONCLUSION: *The fat concentration in spectral CT has excellent correlation with the fat fraction by MR Q-dixon and is better than that determined by liver-spleen CT ratio. FC in spectral CT has high accuracy to differentiate normal and fatty livers for non-alcoholic fatty liver patients.*
Clinical Application/Relevance: *The fat concentration measurement in spectral CT can replace the Liver-Spleen CT Ratio as an imaging method for the diagnosis of fatty liver, and its accuracy is high.*

PU-0339

不典型增强 HCC 的 CT 与 MRI 诊断

许凡勇,夏进东
上海市松江区中心医院

目的 初步分析不典型增强原发性肝细胞肝癌（primary hepatocellular carcinoma，HCC）的 CT 及 MRI 表现，提高对不典型增强 HCC 影像表现认识。
方法 收集 3 例经临床及手术病理证实的不典型增强 HCC，2 例行 MSCT 及 MRI 检查，1 例行 MSCT 检查及随访，结合文献资料，分析不典型增强 HCC 的 CT 及 MRI 表现。
结果 3 例不典型增强 HCC 平均直径 24.5mm；MSCT 多期增强扫描无快进快出表现，无典型肝硬化表现；MRI 病灶示不均匀强化，DW 呈高信号，肝内多发再生结节可见；1 例不典型 HCC 包埋血管，1 例位于胆囊旁，1 例强化类似炎性假瘤。
结论 不典型增强 HCC 病灶较小、无典型快进快出型强化方式、无明确肝硬化病史等容易导致误诊；MRI 多期增强扫描及 DWI 成像有利于不典型增强 HCC 特征及肝硬化背景显示，较 MSCT 更具优势。

PU-0340

Gd-EOB-DTPA 增强 MRI 肝胆期不同延迟时间对肝细胞肝癌诊断价值的研究

李迅
桂林医学院附属医院

目的 保证肝细胞肝癌病灶检出和肝储备功能评估的前提下，为不同肝功能状态患者选择最佳的肝胆期延迟时间。
方法 回顾性分析 50 例肝癌患者(实验组)及 30 例对照组患者的 Gd-EOB-DTPA 增强影像资料及临床资料，根据临床资料对实验组进行 Child-Pugh 分组。通过选择 ROI 采集平扫、动脉期、门脉期、平衡期、延迟 5 分钟、10 分钟、15 分钟、20 分钟的肝脏、脾脏、竖脊肌及病灶的 SI，将肝脏与竖脊肌信号比定义为 LMR，肝脏与脾脏信号比定义为 LSR，肿瘤病灶与肝脏信号比定义为 LLR。采用重复测量方差分析处理数据。
结果 NLF 组、LCA 组及 LCB+LCC 组的 LMR 随时间呈上升趋势。10 分钟、20 分钟时 LCB+LCC 组的 LMR 与 LCA 组、NLF 组有明显差异，且高于后者。各组在延迟 20 分钟时达 LMR 峰值；延迟 20 分钟时，NLF 组、LCA 组 LMR 值与其余各延迟时相的 LMR 存在显著差异， LCB+LCC 组的 LMR 与其余各延迟时相 LMR 无明显差异。LCA 组及 LCB+LCC 组的 LLR 随时间呈上升趋势；LCB+LCC 组的 LLR 值与 LCA 组存在差异（p=0.015），且低于后者；LLR 值在 LCA 组延迟 15 分钟与 20 分钟无统计学差异，在 LCB+LCC 组动脉期、延迟 15 分钟与 20 分钟无统计学差异。
结论 Gd-EOB-DTPA 在延迟 20 分钟时达到肝实质强化的峰值，随着肝功能状况下降，强化程度也相应减低。Gd-EOB-DTPA 增强扫描动脉期时就有很强的检出肝癌病灶的能力，在肝功能状况较好的情况下，可将延迟扫描缩短至 15 分钟，肝功能状态不佳时，为获得更好的检出能力，需要延迟超过 20 分钟。

PU-0341

Is pleural effusion volume quantitative by CT correlated to the severity of acute pancreatitis?

Rong Peng[1],Xiao-Ming Zhang[2],Ling Zhang[1],Ze-Ming Zhang[1],Guang-yu Liu[1]
1.Panzhihua Central hospital
2.Affiliated Hospital of North Sichuan Medical College

Purpose: To study the volume quantitative by CT for pleural effusion in evaluating the severity of acute pancreatitis (AP).
Methods: 273 patients with AP performed thorax-abdominal CT examinations were recruited in this study. The volume quantitative of pleural effusion was derived from CT volume evaluation software tool. The severity of AP was graded using the CT severity index (CTSI), the Acute Physiology And Chronic Healthy Evaluation Ⅱ (APACHE Ⅱ) scoring system and modified Marshall system. The pleural effusion on CT was correlated to CTSI, APACHE Ⅱ and modified Marshall system.
Results: In 273 patients with AP, 36.7% had pleural effusion. Bilateral pleural effusion is much more often ($P < 0.05$). The prevalence of the right pleural effusion was 0.9%, 42.8%, 46.2% and the left was 0.9%, 56.6%, 76.9% in mild, moderate and severe AP according CTSI. According to APACHE Ⅱ scores, the prevalence of the right pleural effusion was 18.5%, 47.9% and the left was 28.0%, 56.0% in mild and severe AP. The prevalence of the right pleural effusion was 23.3%, 58.3% and the left was 32.5%, 66.7% in AP patients without and with organ failure (OF) according modified Marshall system. The volume of pleural effusion was correlated with CTSI, APACHE Ⅱ scores and the Marshall scores ($P < 0.05$).
Conclusion: Pleural effusion on CT in AP is common. The volume quantitative of pleural effusion is correlated to the severity of AP, which may be a supplementary indicator in determining the severity of AP.

肝脏上皮样血管平滑肌脂肪瘤 CT/MRI 表现

何华,金银华,郭修玉,闫昆
中国科学院大学宁波华美医院

目的 探讨肝脏上皮样血管平滑肌脂肪瘤（EAML）的 CT/MRI 表现，旨在提高本病的诊断水平。
方法 回顾性分析经手术病理证实 9 例 EAML 的影像学表现，其中 8 例行 CT 平扫+增强，3 例 MRI 平扫+增强。观察病灶的部位、形态、大小、密度/信号、内部成分、边界、假包膜、强化方式、畸形静脉、侵犯及转移特点。
结果 4 例位于肝右叶，4 例位于肝左叶，1 例位于肝尾状叶。6 例类圆形，3 例椭圆形。肿瘤最大径 1.5cm～7.7cm。3 例密度均匀，6 例密度不均，有 5 例脂肪成分，4 例无脂肪成分，9 例内均无坏死、囊变、出血及钙灶。3 例在 MRI 上均呈长 T1、长 T2 信号，DWI 呈高信号，ADC 呈低信号。增强分隔样强化 1 例，不均匀明显强化 8 例，其中 5 例呈“快进快出”的强化方式，另 3 例呈“快进慢出”的强化方式，典型瘤中央有扩张迂曲引流静脉者 3 例。9 例均未无侵犯转移征象。
结论 肝脏 EAML 的影像学表现具有一定的特征性，CT 和 MR 检查有助于提高肝 EAML 的术前诊断及鉴别诊断能力。

PU-0343

3D-VIBE 增强扫描不同时期诊断小肝癌的临床价值

马文婷,黄刚
甘肃省人民医院

目的 定量分析 3D-VIBE 增强扫描各时期对于肝硬化背景上原发性小肝癌的诊断准确性，分析甲胎蛋白（AFP）与小肝癌强化程度之间相关性。

方法 连续性纳入疑似 SHCC 的肝硬化患者 70 例，共 91 个病灶，患者均行 3.0T 容积式插入屏气（3D-VIBE）检查，注射 GD-EOB-DTPA 26s 后扫动脉期，73.0s 门脉期，180s 延迟期，600s,1200s 肝胆期。通过测量信号强度（SI）与背景噪声标准差(SD)，计算信噪比（SNR）、对比噪声比（CNR）。独立样本 t 检验比较图像质量，卡方检验比较病灶检出率。Spearman 秩相关分析 SHCC 患者 AFP 值与动脉期及肝胆期强化程度间相关性。

结果 1. 3D-VIBE 动脉期 SHCC 检出率 100%，10min、20min 肝胆期病灶检出率均为 96.08%，差异无明显统计学意义（P =0.113）。2. 3D-VIBE 动脉期与 10min、20min 肝胆期相比，SNR、CNR 无统计学差异（P=0.097，P=0.770；P=0.346，P=0.810），10min 肝胆期与 20min 肝胆期相比，SNR、CNR 无统计学差异（P=0.062，P =0.560）。3.AFP 与动脉期、肝胆期平均强化程度之间无相关性，Spearman 相关系数 r_s分别为 0.066，0.092。

结论

1.对于肝硬化背景上原发性小肝癌的检出，动脉期及肝胆期无明显统计学差异；2. 10min 及 20min 肝胆期其病灶检出率无差异，图像质量无统计学差异，所以临床工作中延长肝胆期时间无意义；3. 日本学者提出肝胆期 HCC 强化程度与血清 AFP 呈反比，但本研究显示血清 AFP 与 SHCC 动脉期、肝胆期强化程度间均无统计学相关性，原因可能为 SHCC 处于 HCC 早期，癌细胞还未大量增殖，AFP 分泌少且不稳定，故而 AFP 参考价值不高。

PU-0344

肝脏罕见肿瘤的 MRI 表现

刘玉
中国科学技术大学附属第一医院/安徽省立医院

目的 探讨肝脏罕见肿瘤的 MRI 表现。

方法 回顾性分析我院 2014 年 1 月到 2019 年 6 月收治的 24 例罕见肿瘤患者的 MRI 表现。

结果 24 例患者中肝脏局灶性结节增生 5 例，肝脏血管平滑肌脂肪瘤和肝母细胞瘤各 3 例，肝脏炎性假瘤、肝脏弥漫性大 B 细胞淋巴瘤、上皮样血管内皮瘤、肝脏错构瘤各 2 例，肝脏粘液性囊腺瘤、肝脏血管肉瘤、肝脏孤立性纤维瘤、肝胆管绒毛状腺瘤、肝原发间质瘤各 1 例。MRI 检查敏感性 100%，但特异性不高，诊断较困难。但部分肝脏罕见肿瘤仍有相对较特征性表现。肝细胞母细胞瘤内含裂隙状影，可伴瘤内出血、纤维瘢痕，MRI 表现为混杂信号，患者血清 AFP 及绒毛膜促性腺激素显著增高；肝脏局灶性结节性增生显示中央瘢痕，且延迟强化；肝脏炎性假瘤 MRI 显示病灶呈 T1WI 底信号，T2WI 高信号，部分呈 T2WI 低信号，增强扫描多呈边缘强化；肝脏孤立性纤维瘤 MRI 实性成分呈 T1WI 及 T2WI 低信号的纤维成分，增强扫描呈渐进性向心性强化；上皮样血管瘤表现为肝内多发病灶主要发布于肝包膜下，出现棒棒糖征及靶征或晕征；肝绒毛状腺瘤多位于胆管内；肝胆管囊腺瘤为多囊性液性信号，囊内见分隔；肝脏错构瘤 MRI 显示肝内多房囊泡影。

结论 肝脏罕见肿瘤种类繁多，术前诊断比较困难，熟悉它们的 MRI 特征性表现，可提高其诊断准确率。

Multifocal Nodular Fatty Infiltration of the Liver with Mass Effect Associated with Nonalcoholic Steatohepatitis: A case study and Literature Review

Fengyi He,Liao Jinyuan
Department of Radiology, The First Affiliated Hospital of Guangxi Medical University

Multifocal nodular fat infiltration of the liver is a special and rare manifestation of fatty liver. Although it is a non-tumor disease, misdiagnosed easily as multiple benign and malignant tumors in the liver. The specific mechanism of formation is not clear,but it can occur in many diseases. We report a case of multifocal nodular fat infiltration of the liverwith mass effect in a 26-year-old asymptomatic female diagnosed as nonalcoholic steatohepatitis. It poses a great challenge to diagnosis. We show it in a varieties of imaging methods and correlate with pathological stages. And a review of a literature was conducted. Detailed medical history and imaging examinations will help us to diagnose.

The predictive value of Gd-EOB-DTPA- enhanced MRI for the expression of Ki67 and CD34 in hepatocellular carcinoma

Yidi Chen,Liling Long,Ling Zhang,Xiali Qin
The First Affiliated Hospital of Guangxi Medical University

Objectives

To explore the predictive value of gadolinium-ethoxybenzyl-diethylenetriamine pentaacetic acid (Gd-EOB-DTPA)-enhanced MRI for Ki67 and CD34 expression in HCC.

Methods

We retrospectively collected the data of 180 patients (age, 23–79 years), between January 2017 and December 2018. All patients underwent Gd-EOB-DTPA-enhanced MRI; the T1 relaxation time (T1rt), reduction rate of T1rt (rrT1rt), and signal intensity (SI) of the lesion were measured, and the Ki67 and CD34 expressions were evaluated by immunohistochemistry. Spearman's coefficient was used to analyze the correlation between T1rt and SI and the Ki67 and CD34 expressions. ROC curves were used to analyze the diagnostic efficacy of T1rt for high Ki67 expression (≥50%) and hypervascular (microvessel density≥100).

Results

The T1rt of HCC at pre-enhancement (T1rt-Pre) was 717.43±157.85 ms and at 20 min after enhancement (T1rt-20min) was 581.06±173.23 ms; the expression of Ki67 was 27.5% (range, 2.0%–75.0%) and of CD34 was 41.07±19.43 vessels/field. The T1rt, rrT1rt, and SI were strongly correlated with Ki67 20 min post enhancement, the r values were 0.846, -0.765 and -0.760 ($P<0.05$), respectively. There were moderate correlations with CD34, with r values -0.444, 0.336, and -0.463 ($P<0.05$), respectively. The T1rt-Pre, T1rt-20min, SI-Pre, and SI-hepatobiliary phase were significantly different both between the high and low ki67 expression groups and between the hypervascular and hypovascular groups. There were longer T1rt and lower SI in HCC tissues with high ki67 expression. T1rt-20min was found to have high diagnostic efficiency for high ki67 expression; the AUC was 0.937, with 91.18% sensitivity and 90.41% specificity ($P<0.05$). T1rt-20min also had moderate diagnostic value for hypervascular (AUC, 0.716; $P<0.05$).

Conclusions

The T1rt and SI of Gd-EOB-DTPA-enhanced MRI were correlated with Ki67 and CD34 expression. T1rt-20min can predict high ki67 expression and hypervascular in HCC tissues.

PU-0348

Ruptured hepatoblastoma in an adult

Chunxiang Ling,Jizhen Feng,Jiamei Li
Shandong Provincial Hospital Affiliated to Shandong University

Aim: Hepatoblastoma (HB) is the most primary hepatic tumor in children, but very rare in adult and presented with spontaneous rupture in extremely rare occasions. Here, we reported a rare case of one adult HB with spontaneous rupture.

Methods: A51-year-old man suffered from sudden onset of presistent abdominal pain with no obvious reasons accompanied by nausea and emsesis. Hepatic tumor with rupture was diagnosed on the basis of imaging studies. Surgical resection was performed, an incomplete rupture was found in the diaphragmatic surface of the tumor which was limited by the surrounding omentum during the operation.

Results: The histopathology diagnosis was of a hepatoblastoma. It is difficult to distinguish adult HB from malignant primary liver neoplasm in radiology because they presented with similar image.

Conclusions: the diagnosis is always postoperative. Surgery is the only accepted treament, which can improve survival rate of patient.

PU-0349

以肝肾损害为主要表现的轻链淀粉样变性 1 例

尚阿利,杨全新,卢晓霞
西安交通大学医学院第二附属医院

目的 轻链淀粉样变性（light-chain amyloidosis，AL）即原发性淀粉样变性，是由于浆细胞克隆性增殖引起轻链型淀粉样蛋白前体在不同组织中形成不溶性蛋白纤维沉积，可累及全身多个器官功能衰竭，该病发病率低，临床表现复杂多样，误诊率高，常延误治疗时机，预后较差。
方法 现报道 1 例以肝肾损害为主要表现的原发性 AL 型淀粉样变性，回顾分析该病人的临床表现、实验室检查、影像学表现及诊疗方法。
结果 病人，52 岁，男性，因乏力伴双下肢浮肿 1 月余，加重伴纳差 20 天就诊。查体：可见肝掌及蜘蛛痣，肝脏肋下 8cm，质中，脾脏肋下 4cm；外院电子胃镜示：食管静脉曲张：胆汁性反流性胃炎；门脉高压性胃病。以肝硬化失代偿，原因待定入院。入院后患者肝功示白蛋白 21.8g/L,24h，ALP 444IU/L,尿蛋白定量：6003.51mg/24h，肾脏早期损伤标志物：尿轻链 kap（BN-II）30.00mg/L，尿轻链 lam（BN-II）21.10mg/L，N 乙酰 D 氨基葡萄糖苷酶 48.6U/L,尿常规 3+。
影像学表现为肝脏体积增大影，增强示肝内多发散在低密度，延迟期静脉显示不清。游离轻链：游离 kappa 轻链 20.30mg/L，游离 lamda 轻链 269mg/L。考虑为血液系统性疾病，后行骨髓检查示骨髓增生活跃，可见似骨髓瘤细胞占 7.5%。血免疫固定电泳示 IgG、Lamda 阳性。肾穿刺结果汇报：免疫荧光检查：3 个肾小球。IgG-,IgM++，IgA-，C3-，C1q-，FIB-,K-(团块样于系膜区沉积)。光镜检查刚果红染色阳性物质沉积。
根据诊疗规范，予以 PD 方案治疗，具体为硼替佐米及地塞米松治疗。患者病情稳定。治疗后无任何不适。
结论 当患者出现肝肿大、血清 ALP 升高且无法以常见的肝病明确诊断时，临床医生应该考虑肝脏淀粉样变性这以少见但致命的疾病，进而通过积极的相关检查，及早明确诊断，正确指导治疗。

PU-0350

基于 MRI mDixon-quant 技术量化胰腺脂肪沉积

gukangchen[1],姚文君[1],程晓光[2]
1.安徽医科大学第二附属医院
2.北京积水潭医院

目的 探讨于 MRI mDixon-quant 技术在胰腺脂肪含量测定中的应用价值。**方法** 共纳入 237 人，其中男性 107 名、女性 130 名。所有对象均进行上腹部 3.0T MRI mDixon-quant 扫描，并分别测量胰腺头、体、尾脂肪含量，取均值作为整个胰腺的最终脂肪含量。比较头、体、尾的脂肪含量有无统计差异，并按照性别、年龄分组，并记录不同年龄段及性别下胰腺脂肪含量。**结果** 测量结果两个观察者内的 ICC 分别为 0.997 和 0.996；观察者间的 ICC 为 0.989；胰腺头、体、尾部脂肪含量无统计学差异；237 位受试者胰腺总体脂肪含量为 3.33%（25 分位值 1.82%, 75 分位值 6.16%）。
结论 采用 MR mDixon-Quant 技术可简便、精确测量胰腺脂肪含量，重复性和再现性都很高，可为胰腺脂肪沉积相关疾病的研究提供方法学基础。

PU-0351
基于 MRI mDIXON 技术评估胰腺脂肪沉积与年龄、性别的关系

姚文君[1],顾康琛[1],程晓光[2]
1.安徽医科大学第二附属医院
2.北京积水潭医院

目的 探讨普通人群胰腺脂肪含量随年龄增长的变化规律，并分析同年龄段男女间胰腺脂肪含量的差异。
方法 纳入 237 名成年志愿者，其中男性 107 名、女性 130 名，年龄 21～79 岁。不同性别分别按年龄分为 5 组，组 1（21～30 岁）、组 2（31～40 岁）、组 3（41～50 岁）、组 4（51～60 岁）、组 5（61～70 岁）。以 MR 魔镜成像技术（MRI mDIXON-Quant）测量胰腺（头、体、尾）脂肪含量。比较不同性别之间每组胰腺脂肪含量的差异，以及同年龄组男女之间的差异。
结果 胰腺头、体、尾部脂肪含量无统计学差异。男性各组间胰腺脂肪含量差异具有统计学意义，胰腺脂肪含量与年龄呈正相关(r=0.336，P<0.05)；女性各组间胰腺脂肪含量差异具有统计学意义，胰腺脂肪含量与年龄呈正相关(r=0.433，P<0.05)。男性中组 2~组 5 相对于组 1，胰腺脂肪含量增长率分别为-20.87%、-1.34%、62.61%、94.41%；女性中组 2~组 5 相对于组 1，胰腺脂肪含量增长率分别为 30.46%、58.02%、205.90%、205.90%。同年龄段男女间比较，各年龄段男性胰腺脂肪含量均高于女性，但各组不同性别胰腺脂肪含量差异无统计学差异(P<0.05)。
结论 胰腺脂肪含量趋向均匀沉积，且随年龄增长整体呈上升趋势。50 岁以上胰腺脂肪沉积速度明显加快。

PU-0352
磁共振动态增强扫描结合弥散成像对肝细胞肝癌的诊断研究

梁欣
山西医科大学第一医院

目的 分析磁共振弥散成像（DWI）及动态增强扫描成像对肝细胞癌的诊断价值。
方法 回顾性分析就诊于我院并行肝脏磁共振检查（包括有 DWI 机 Gd-DTPA 动态增强扫描）的 40 例病理证实的肝细胞癌的影像资料，记录病灶的数量和部位并对其信号特点及检出率进行统计分析。
结果 40 例患者中，DWI 及 Gd-DTPA 动态增强扫描检查发现 57 个 HCC 和 10 个良性病变。其中 46 个 HCC 在 DWI 图像上表现为高信号，11 个表现为等信号。在 Gd-DTPA 动态增强扫描中有 42 个 HCC 动脉期明显强化，在 DWI 上均表现为高信号，其中 37 个门静脉和延迟期表现为低信号；其余动脉期表现为等信号，各期增强仍为等信号，9 个 DWI 上表现为高信号，6 个表现为等信号。
结论 多数肝细胞癌在磁共振动态增强扫描图像中表现为动脉期明显强化，部分小肝细胞癌可表现为等信号。Gd-DTPA 动态增强扫描结合 DWI 扫描可有助于提高肝细胞癌的诊断准确性。

PU-0353
应用 3D mDIXON Quant 成像探讨人体胰腺体积与 BMI、性别、年龄的关系

张钦和[1],刘爱连[1],王家正[2]
1.大连医科大学附属第一医院
2.飞利浦医疗公司

目的 应用 3D mDIXON Quant 成像分析健康志愿者胰腺体积与 BMI、性别、年龄的关系。
方法 前瞻性纳入 22 名志愿者（男 12 例，女 10 例，BMI 范围 17.71-34.29kg/m^2 ，平均 BMI 23.97±3.95kg/m^2，年龄范围 22-62 岁，平均年龄 38.00±16.01 岁）。所有患者行 3.0T 磁共振扫描仪（Ingenia CX, Best，the Netherlands）3D mDIXON Quant 序列扫描。扫描参数如下:FOV=375mm×300mm×168mm, TR=6ms，层厚及层间距=5.0mm/2.5mm,CS=2，Echo=6。图像导入在 ISP 工作站，在脂肪分数图像上由两名放射科医师进行胰腺体积测量。所有数据经 SPSS v19.0 (IBM, Chicago, III)进行统计分析。采用组内相关系数（ICC）检验两名观察者测量数据一致性。采用 Spearman 检验评价胰腺体积与 BMI、性别、年龄的相关性。
结果 两个观察者的测量结果 ICC 值均大于 0.75，一致性良好，测量的胰腺体积取平均值进行后续分析。胰腺体积与 BMI、性别、年龄之间无显著相关性(r = -0.142, -0.280,0.245, P>0.05)。
结论 在我们的研究中，胰腺体积不随年龄、BMI 和性别的改变而改变。

PU-0354

CT and MRI diagnosis of autoimmune pancreatitis

xiaorong li,Xiangdong Li
General Hospital of Southern Theatre Command

Abstract: **Objective** To investigate the CT and MRI findings of autoimmune pancreatitis (AIP). **Methods** In this investigation, the CT and MRI data of 12 AIP patients diagnosed by pathology and clinical findings were reviewed retrospectively. **Results** In the 12 patients with AIP, 9 lesions showed diffuse swelling of the pancreas and 3 lesions showed pancreatic focal lesions. All lesions showed homogenous isodense or slightly hypodense on CT plain scan, and T1-weighted hypointensity and T2-weighted hyperintensity. All the lesions showed homogeneous enhancement on portal venous and delayed phase images by using CT and MRI, pancreatic duct stricture was observed in 6 patients, bile duct wall thickening was found in 4 patients, distal common bile duct stricture was noted in 3 patients. In addition, 6 lesions showed "encapsulation-like" changes around the pancreatic parenchyma, including 4 lesions of mild enhancement in the delayed phase. Moreover, 6 cases of AIP showed hyperintensity in 4 patients and isointensity in 2 patients according to DWI (b=1000), and the ADC value is (0.756±0.542)×$10^{-3}$$mm^2$/s. **Conclusion** The definite diagnosis of AIP should be combined with imaging findings, serum IgG4 levels and pathological results. The enhanced delayed imaging of AIP in the three-phase scan is helpful for the differential diagnosis of AIP and pancreatic cancer.

PU-0355

普美显 MRI 在肝癌早期影像诊断中的应用

陕曼玉
山西医科大学第一医院

目的 探讨普美显核磁共振(MRI)在肝癌早期影像诊断中的应用价值。
方法 选取 2017 年 1 月至 2019 年 3 月期间在我院经组织病理学确诊的原发性肝癌患者和单纯性肝硬化患者作为研究对象,比较两组不同 Child-Pugh 分级的患者肝脏摄取分数(HEF)值的差异,并比较普美显 MRI 和 MRI 平扫诊断肝癌效能的差异,分析普美显 MRI 定量评估 HEF 值诊断肝癌的 ROC 曲线下面积。
结果 原发性肝癌组患者的 HEF 值为(84.12±7.16)%,明显高于单纯肝硬化组的(76.49±7.55)%,差异具有统计学意义(P<0.05);普美显 MRI 诊断肝癌的灵敏度、特异度、阳性预测值、阴性预测值、准确率分别为 81.82%、88.10%、85.71%、84.62%、85.11%,均高于 MRI 平扫的 50.45%、61.00%、52.00%、55.56%、53.19%,且差异均有统计学意义(P<0.05);普美显 MRI 定量评估 HEF 值诊断肝癌的 ROC 曲线下面积为 91.45%,诊断阈值为 81.0%,灵敏度为 81.81%,特异度为 92.00%,约登指数为 0.738。
结论 普美显 MRI 诊断肝癌的效能高于 MRI 平扫,且普美显 MRI 定量评估 HEF 值可作为诊断肝癌的指标。

PU-0356
能谱曲线对漏出性，渗出性和血性腹水的鉴别与诊断

魏照坤[1],康玉洁[2]
1.甘肃省人民医院
2.甘肃省肿瘤医院

能谱 CT 是通过计算物体对 X 线的衰减来成像的，其成像的基础是组织的特异性与能量水平的差异性，而 X 线的衰减是随着其本身的能量水平的不同而不同[1]。因此，每一种物质都有其特定的 X 线衰减吸收曲线，这即是能谱成像的基本原理，通过能谱成像能够显示不同化学成分构成的组织结构随着 X 线能量水平的变化而变化的曲线(能谱曲线)[2]，主要反映了所选取的感兴趣区随着 X 线能量的变化其 CT 值的变化规律，可用于化学成分的分析。由于不同的物质其化学分子结构不同，每一种物质都有其相对应的能谱曲线，因此能谱曲线能够用于鉴别两种不同化学构成的物质，而对于能谱曲线差异的分析主要是通过曲线的形态和斜率的表现。腹水作为临床疾病中常见的并发症，其病因比较繁多复杂，依据腹水的性质可将其分为漏出液，渗出液和血性腹水。由于产生的机制不同，所含成分不同，导致其化学成分的差异性，通过能谱曲线上可以直观了解三种腹水 X 线的衰减特性，因此通过能谱曲线的斜率与形态对腹水进行鉴别诊断。

小肝癌的磁共振诊断与微创治疗后效果评价

张保庆
阳煤集团总医院

目的 总结小肝癌的磁共振诊断经验，评价小肝癌微创治疗后效果；
方法 总结 2007-20195 我院进行磁共振检查诊断小肝癌 26 例；对微创治疗后效果进行评价；设备：采用西门子 Avanto1.5T 磁共振进行扫描，常规平扫+动态增强扫描。
结果 小肝癌的磁共振表现有多种表现；微创治疗后效果评价准确可靠。

结论 磁共振平扫+动态增强扫描是小肝癌诊断的最敏感影像学检查手段，对小肝癌微创治疗后评价效果肯定。

PU-0358

少见多怪真开眼，“脾脏”长到胰里面

张保庆
阳煤集团总医院

作者遇到一例少见病例 。术前怀疑是胰腺肿瘤，手术结果是胰腺内异位脾组织。一般来说，副脾80%位于脾门部或者脾脏周围，诊断比较容易；20%位于其它部位。比如，胰腺、肠系膜、空肠壁等。副脾的影像特点：CT 和 MRI 扫描，平扫+动态增强扫描，其强化方式和脾的强化方式一样。当诊断困难时，可以采用脾特异性对比剂进行扫描，可以准确诊断。

PU-0359

CT 影像学对急性胰腺炎肝损伤的诊断价值及影像特征分析

王继萍,张蓓
吉林大学白求恩第一医院

目的 为了明确急性胰腺炎与脂肪肝之间内在联系，分析和探讨 CT 评价急性胰腺炎后肝损伤的影像学征象。
方法 按照入组条件，搜集 2016 年 1 月 1 日-2018 年 12 月 31 日就诊于吉林大学第一医院的急性胰腺炎合并胰源性肝损伤患者 196 例，所有患者均接受上腹部（包括以下及肝脏）CT 扫描，收集和整理病人的临床及影像资料，并以此分析急性胰腺炎合并胰源性肝损伤的影像学特征表现。
结果 在此次研究中，胰腺炎的病人在 CT 影像学上表现出肝脏密度减低发生率为 100%，其中肝脏体积增大发生率为 82.5%，门静脉周围轨道样低密度发生率为 55.67%，且肝脏的 CT 值与血淀粉酶水平呈负相关（P<0.05），血清总胆红素、丙氨酸氨基转移酶(ALT)均与血淀粉酶水平呈现一定相关性（P<0.05）。
结论 CT 检查有效评估胰腺炎引起的胰源性肝损伤，各项影像学征象具有评价意义。

PU-0360

胆管损伤真的就不可避免吗？

张保庆
阳煤集团总医院

目的 研究腹腔镜胆管损伤的原因，提出预防胆管损伤的具体措施；
方法 采用西门子 1.5Tavanto 磁共振设备进行检查。收集本院 2016-2019 年 4 例腹腔镜胆管损伤病例资料，分析每一例患者胆管损伤的原因。
结果 4 例患者均没有在术前做过 MRCP 检查。4 例手术医生的职称在副高以上；

结论 腹腔镜胆管损伤高年资医师多见，胆管变异是导致胆管损伤的主要原因。术前进行 MRCP 检查是避免胆管损伤的有效措施。

PU-0361
DWI 背景抑制技术结合磁化转移技术在肝脏疾病的应用价值

谢欢,冉启胜
陆军特色医学中心（大坪医院）

目的 探讨 DWI 背景抑制技术（DWIBS）结合磁化转移技术(MTC)对提升肝脏疾病显示率和 DWI 图像信噪比的应用价值。
方法 搜集我院 2019 年 3 月-2019 年 6 月行上腹部核磁共振检查的 30 例患者作为研究资料，此 30 例患者均采用西门子 Aera 1.5T 超导磁共振扫描仪进行扫描，线圈采用 16 通道体部相控阵线圈。此 30 例患者行肝脏核磁共振检查 DWI 序列扫描时，均先采用常规 DWI 序列进行扫描，再采用 DWI 背景抑制技术（DWIBS）结合磁化转移技术(MTC)进行扫描。得出的图像分为常规组和改进组两组，主观上两组图像质量高低由我科高年资医师进行评估，两组计数资料行卡方检验。客观上分别测量两组图像的信噪比进行自身对比比较。
结果 肝脏 DWI 序列成像改进组图像质量从主观上观察明显优于常规肝脏 DWI 图像质量，改进组图像优秀率为 83.3%，常规组图像优秀率为 40%；并且改进组对肝脏细小病变的显示也明显优于常规组，两组计数资料行卡方检验，P＜0.05，差别具有统计学意义。从客观上分别测量改进组和常规组肝脏病变信噪比，分别进行自身对比比较，改进组信噪比（115.56±105.86）明显高于常规组信噪比（79.6±65.68）。
结论 肝脏 DWI 检查技术结合背景抑制技术和磁化转移技术可以明显提高肝脏 DWI 图像质量和信噪比，其不但提高了对肝脏细小病变显示率，还明显提高了肝脏病变的信噪比，进而也提高了医生的正确诊断率，从而更加有利于临床医生对患者进行诊治和评估，值得临床进行推广。

PU-0362
Pancreatic schwannoma: CT, MR manifestations and pathological correlation

Wei Tang,Wei-jun PENG
Fudan University Shanghai Cancer Center

Objective: This study aimed to describe the computed tomography (CT), magnetic resonance imaging (MRI) imaging features of pancreatic schwannoma and to correlate imaging findings with histopathologic findings.
Materials and Methods: The findings from multiphase CT or MRI examinations of seventeen patients with histopathologically confirmed pancreatic schwannoma were reviewed. The imaging criteria included shape, size, margin, attenuation, signal intensity, secondary degeneration, internal mass enhancement pattern and peripancreatic lymph node.
Results: All cases were unilateral, round or oval solitary tumors, with diameters ranging from approximately 2.5 to 10.8 cm (median=6.5 cm). Of the eleven cases assessed using CT, pancreatic schwannoma appeared as well-circumscribed round or oval low-density suprarenal masses with a mean attenuation values of 30.1 HU of

solid portions during unenhanced phase. Ten cases exhibited heterogeneous cyst formation, and one case showed calcification. Internal septa were noted in 8 cases. All solid areas displayed early mild heterogeneous enhancement and delayed progressive enhancement. Regarding MRI, solid portions of six masses were hypointense to the liver parenchyma on T1-weighted imaging (T1WI) and were heterogeneously hyperintense on T2-weighted imaging (T2WI). The enhanced pattern of solid areas of pancreatic schwannoma on MRI is similar to that of CT. Cystic or hemorrhagic changes were noted in 4 cases and internal septa were noted in 3 cases. Among all cases, peripancreatic lymph node is noted in 10 patients.
Conclusion: Although pancreatic schwannoma is really a rare event in the pancreas, we believe that the following signs may suggest the diagnosis of this entity: a non-lipid containing mass, a well-defined border, a unilateral mass with cystic degeneration, septa with delayed enhancement, a characteristic progressive contrast enhancement pattern of the solid portions and reactive hyperplasia of peripancreatic lymph node.

PU-0363
双源 CT 双能量虚拟平扫在肝癌 TACE 术后成像中的应用研究

程国涛,王升忠,孔曙兵,杨涛,郑义
咸宁市中心医院 湖北科技学院附属第一医院

目的 探讨双源 CT 双能量虚拟平扫在肝癌经导管化疗栓塞(TACE) 术后成像中的图像质量及辐射剂量。
方法 本文回顾性分析 51 例肝癌 TACE 治疗后复查的患者的影像资料，对本组病例进行第三代 Flash 双源 CT 行常规平扫及增强三期(动脉期、门脉期及延迟期)扫描，动脉期采用双能量扫描，记录扫描中患者所接受的辐射剂量。将获得的图像数据传送到 Siemens syngo via client 工作站上，采用肝脏虚拟平扫后处理软件(Liver VNC)生成虚拟平扫(VNC)的图像，对常规平扫与虚拟平扫从图像硬化伪影、肝实质噪声及碘油形态显示情况三个方面进行观察，测量计算 CT 值、噪声和信噪比，并对整体图像质量进行主观综合评分。
结果 肝脏在虚拟 CT 平扫图像上的 CT 值高于常规 CT 平扫，差异具有统计学意义($P<0.05$)，常规 CT 平扫噪声高于虚拟 CT 平扫，SNR 均低于虚拟 CT 平扫，差异有统计学意义（$P<0.05$），肝脏常规平扫与虚拟平扫辐射剂量分别为（14.9±4.2）、（8.6±1.1）mSv，具有统计学差异($P<0.05$)，图像整体综合主观评分无统计学差异($P>0.05$)。
结论 肝脏常规平扫与双能量虚拟平扫相比，图像噪声高、信噪比低，在肝脏检查中肝脏双能量虚拟平扫可替代常规平扫，可减低辐射剂量。

PU-0364
A comparative study of diagnostic value of DWI MRI bewteewn mono-exponential, bi-exponential and non-Gaussian kurtosis models in pancreatic ductal adenocarcinoma

Shengkun Peng

Department of Radiology， Sichuan Province of people’s Hospital

Objective: To investigate the diagnostic value of different DWI models(monoexponential,biexponentialmodels multiple b values diffusion weightedimaging and non-Gaussian diffusion-weighted MRI) in poorly differentiated pancreatic ductal adenocarcinoma. **Materials and Methods:** 52 patients with poorly differentiated pancreatic ductal adenocarcinoma which confirmed by surgery were collected. All patients underwent DWI (1.5T, Multi-b values：0, 50, 100, 150, 200, 500, 800, 1000, 1500, 2000 s/mm2). Mean values of DWI-derived metrics $ADC_{standard}$, ADC_{slow},ADC_{fast}, f,MK and DK were calculated from regions of interest in all tumours and non-tumorous parenchyma and compared. ROC was used to evaluate the diagnostic efficiency. **Results:** All lesions could be distinguished from non-lesions by three DWI sequences (ADC-DWI, DKI and IVIM). The $ADC_{standard}$, ADC_{fast} , f values and MK showed significant differences between tumours and non-tumorous parenchyma (both $P < 0.05$). Area under the curve for ADC, D, D*, f, K, and DK were (0.705, 0.665, 0.648, 0.614), respectively. The ROC curve integrated with $ADC_{standard}$ and MD has better diagnostic efficiency (the area under ROC curve is about 0.754).**Conclusion:** $ADC_{standard}$、ADC_{fast}、f and MK could differentiate tumours from non-tumorous parenchyma. The combination of Gaussion distribution model and non-Gaussion distribution model has the potential to increase the diagnostic accuracy of DWI in patients with pancreatic ductal adenocarcinoma.

PU-0365

一站式增强联合灌注在肝细胞肝癌中的应用价值

冯萌云,吕培杰,梁盼,王会霞,李伟然,高剑波
郑州大学第一附属医院

目的 优化肝细胞肝癌（HCC）一站式增强联合灌注 CT 扫描方案并进一步评估增强与灌注参数间的关系。
方法 回顾性分析 20 例 HCC 患者一站式增强联合灌注扫描数据中的时间密度曲线（TDC）获得 HCC 显示的最佳时间点和前瞻性一站式最佳扫描方案。前瞻性收集 33 例 HCC 患者行最佳方案扫描后分别获得灌注及动静脉期图像。选取肿瘤最大截面进行勾画，记录灌注动脉期不同时间点 HCC 与正常肝实质的 CT 值、HCC 灌注参数、增强双期 HCC CT 值(CT_{HCC}-AP, CT_{HCC}-VP)和正常肝实质 CT 值，并计算 HCC 与正常肝实质比值(λCT-AP, λCT-VP)和差值绝对值(△CT-AP, △CT-VP)，进一步分析灌注与增强参数间的相关性。
结果 打药后 29 秒开始动脉期扫描病灶显示最佳，33 例患者中 20 例最佳扫描时间与回顾性研究一致，有 6 例患者扫描最佳时间点为 24 秒，另 5 例为 35 秒，2 例为 38 秒。CT_{HCC}-AP, CT_{HCC}-VP 与平均上升斜率（MSI）、血容量（BV）、平均通过时间（MTT）正相关（r 值分别为 0.6065 和 0.6221、0.4723 和 0.4085、0.4329 和 0.5859），λCT-VP 与 MSI、MTT 正相关（r 值为 0.4288 和 0.3857），其他增强参数与灌注参数之间无相关性。
结论 通过回顾性分析 HCC 灌注数据可以优化一站式增强联合灌注扫描方案，且增强参数与灌注参数间有一定相关性。

PU-0366

Amiodarone-induced hepatotoxicity: quantitative measurement of iodine density in the liver using dual-energy CT (report of three cases)

Haijuan Lv,Hu Liu,Fengjie Shi,Hongwei Zhao
The second affiliated hospital of Jiaxing university

Background: Amiodarone is the drug most commonly used to manage arrhythmias. Long-term amiodarone administration causes hepatotoxicity due to iodine accumulation in the liver. Here, we present three cases of amiodarone-induced hepatotoxicity in patients on long-term oral amiodarone therapy who underwent dual-energy computed tomography (DECT).
Case presentation: We report the clinical and iodine density in the liver using dual-energy CT of three Chinese patients with amiodarone-induced hepatotoxicity. Liver enzymes were increased in these three patients, and abdominal DECT without contrast medium showed highly increased attenuation in the liver. Furthermore, the iodine concentration in the liver was increased. First patient with amiodarone-induced reversible hepatotoxicity, showed a reversible course of liver function and CT values after discontinuation of amiodarone; the second patient with long-term oral amiodarone induced an increased iodine concentration in the liver and liver damage, eventually, the patient suffered from rapidly progressive pneumonia and died of multiple organ failure; the third patient, an increased iodine concentration in the liver and elevated liver enzymes were observed, however, the patient refused radiofrequency ablation and continued administration of oral amiodarone to control atrial fibrillation, routine liver function testing was required every 3-6 months for monitoring in this patient.
Conclusion: DECT is a potentially noninvasive diagnostic tool for quantifying the iodine concentration in liver and monitoring adverse reactions to amiodarone.

PU-0367

The characteristics of acute pancreatitis based on age : an MRI and clinical study

Dandan Yang[1],Xiaoming Zhang[2],Huadan Xue[3],Zhengyu Jin[3]
1.the Third People's Hospital of Chengdu
2.Affiliated Hospital of North Sichuan Medical College
3.Peking Union Medical College Hospital

Objective: To study the MRI and clinical characteristics of acute pancreatitis (AP) in Chinese and to obtain a better understanding of its variations in different age stages.
Methods: MR imaging and clinical charts of 1059 adult patients with AP was retrospectively reviewed. On MRI, acute necrotic pancreatitis (ANP) and AP-associated gastrointestinal abnormalities

were intuitively evaluated. Clinical charts included age, gender, etiology of AP, pre-existing diabetes mellitus (DM) and new-onset prediabetes/DM after AP. Each admission was assigned a subgroup based on ten year age ranges, and these characteristics of AP were compared among the different age groups.

Results: Biliary-related was still the primary etiology of AP (62.0%); however, hyperlipidemia (18.9%) took the place of alcohol (6.7%) as the second most common cause of AP. Biliary AP occurred more frequently in older female patients, whereas hyperlipidemic and alcoholic AP were more common in young male patients. A total of 19.0% (179/940) of the patients developed new-onset prediabetes/DM during hospitalization, of which the prevalence was higher in the younger age group (54[28.4%] out of 190 patients aged 18-40 yrs and 125[16.7%] out of 748 patients aged >40 yrs; p<0.001). On MRI, 204 patients (19.3%) had ANP. The patients aged >70 yrs were at a higher risk of developing ANP than those patients aged ≤70 yrs (26.8% vs 17.9%; p=0.008). In addition, age was associated with the prevalence of AP-associated gastrointestinal abnormalities (Cramer's V=0.487), which occurred most frequently in the 18-30 yrs age group (84.5% vs 43.2%; p<0.001).

Conclusion: There is close correlation between characteristics of AP and age. Certain age brackets should be considered a group of special concern in clinical practice.

PU-0368
基于磁共振 T2WI 的刻度化信号强度应用于前列腺癌诊断和侵袭性评价研究

韦超,董江宁
中国科学技术大学第一附属医院西区， 安徽省肿瘤医院

目的 探讨基于磁共振 T2WI 的刻度化信号强度在前列腺癌诊断和侵袭性评价的价值。

方法 回归性分析手术或超声引导下穿刺病理证实的 46 例连续性前列腺癌 MRI 和病理资料，其中 12 例仅累及外周带，28 例同时外周带和移行带，6 例累及全叶；通过对照研究确定出前列腺癌癌区（N=46）和对应非癌区（N=40），同时根据病理学指南将 46 例患者分为中高级别组（Gleason 评分≧4+3,N=25）和低级别组（Gleason 评分≦3+4,N=21）。然后以闭孔内肌（设为 0）和臀部皮下脂肪（设为 100）的信号值为参考，将前列腺癌癌区和非癌区 T2WI 信号强度刻度化为 0-100；最后独立样本 t 检验和 ROC 曲线对癌区、非癌区及病理组别分别进行分析评价。

结果 (1)前列腺癌癌区刻度化信号强度（24.60±7.70）低于非癌区（44.35±16.81），差异有模型统计学差异（t=-6.830，P<0.001）,刻度化信号强度鉴别前列腺癌癌区和非癌区 ROC 曲线下面积为 0.917，最佳临界值为 31.77，敏感性为 82.5%，特异性 87%。（2）前列腺癌中高级别组刻度化信号强度（23.53±7.20）略低于低级别组（25.90±8.23），差异无明显统计学差异（t=-1.041，P=0.303）。

结论 基于磁共振 T2WI 的刻度化信号强度可以为诊断前列腺癌提供一种新的定量参考，并且在判断前列腺癌侵袭性方面也有一定价值。

PU-0369

Correlation of ADC and T2 measurements with Ki-67 labeling index in peripheral zone prostate cancer at 3.0 T

Liang Li,Changsheng Liu,Yunfei Zha
Renmin Hospital of Wuhan University

Objectives: Prostate cancer (PCa) incidence rates have risen dramatically over the last few years with a particularly marked increase evident in the under 65 age group[1]. A noninvasive method to predict aggressiveness of PCa would be desirable because it would help anticipate tumor recurrence and improve tumor management and the treatment outcomes. The Ki-67 protein is a marker of tumor proliferation, and apparent diffusion coefficient (ADC) and T2 relaxation time are related to tumor cellularity[2]. The purpose of this study was to assess the relationship between MRI derived parameters (ADC and T2 value) and Ki-67 labeling index (LI) as determined from whole mounted radical prostatectomy specimens in peripheral zone prostate cancer. *Materials and Methods:* The local Institutional Review Board (IRB) approved this retrospective study and waived the requirement of informed consent. Between April 2016 and October 2018, fifty-two patients (mean age: 61.4 years, range: 42-76 years) who underwent preoperative MRI and radical prostatectomy were included in our study. Diffusion and T2 imaging were performed on a 3.0 T MR scanner to enable subsequent ADC and T2 calculation. A radiologist and pathologist located the dominant tumor on the MR images based on histopathologic correlation. Ki-67 LI was then determined using an immunohistochemical staining technique. The relationship between MR and histopathologic parameter was assessed using scatter-plots and the *Pearson* correlation coefficient. *Results:* The mean tumor diameter was 15.2 mm(range, 5-28 mm). Of the 52 peripheral zone prostate tumors, four (7.7%) had a Gleason score of 6, 33 (63%) had a Gleason score of 7, and 15 (28.8%) had a Gleason score of greater than 7. ADC, T2 and Ki-67 LI in peripheral zone prostate cancer were $(1.43\pm0.19)\times10^{-3}mm^2/s$, (99 ± 20) milliseconds, and $33.8\%\pm5.3\%$, respectively. A significant negative correlation with Ki-67 LI was noted for both ADC($r= -0.696$, $P<0.0001$) and T2($r= -0.512$, $P<0.001$). Trends for increased Ki-67 LI, decreased ADC, and decreased T2 with increasing Gleason score were also noted. *Discussion & conclusion:* A correlation between proliferation activity, PCa T2 relaxation time, and ADC values has been investigated. Increases in cellular density and disruption of ductal architecture in PCa can result in decreased ADC values. The Ki-67 protein functions as a nuclear antigen that is only expressed in proliferating cells. Noninvasive determination of parameters reflecting cell density may be important as some clinical studies have noted increased metastatic activity in highly cellular tumors suggesting that cellularity may be indicative of tumor aggressiveness. ADC and to a lesser extent T2 are good indicators of Ki-67 labeling index. Because of the potential link with Gleason score, multiparametric MRI may have a prognostic role with regard to potential metastatic activity and tumor aggressiveness. These results warrant further investigation on the potential of multiparametric MRI to facilitate noninvasive assessment of prostate cancer aggressiveness and proliferative activity.

对鉴别诊断肾嫌色细胞癌与嗜酸细胞腺瘤最佳单能量 CT 值的价值初探

卜欣淼,刘爱连,李烨,牛雅欣,杨伟萍,徐明哲
大连医科大学附属第一医院

目的 初探单源双能 CT 对肾嫌色细胞癌与肾嗜酸细胞腺瘤的鉴别诊断价值。
方法 回顾性收集本院 2015 年 1 月-2019 年 2 月应用单源双能 CT 行双肾三期增强扫描、经手术病理证实为肾嫌色细胞癌（Chromophobe cell renal carcinoma, CCRC）与肾嗜酸细胞腺瘤（Renaloncocytoma, RO）的单发肿瘤患者共计 33 个病灶（CCRC 13 个，RO 20 个）。在 GE ADW4.6 工作站，两名影像诊断医师采用双盲法分别在 5mm 层厚图像上测量，在肿瘤的最大层面放置类圆形 ROI，避开动静脉血管、出血、钙化、坏死囊变区。分别测量两组病灶实质区各期 40keV-140keV 单能量下 CT 值（以 10 keV 为间隔，共计 11 个），计算能谱曲线斜率 K 值， K=（40keV-140keV）/100。两观察者测量数据行组内相关系数（ICC）检验，若一致性良好取高年资医师数据，采用独立样本 t 检验，分析两组病灶不同单能量（40-140keV）CT 值、能谱曲线斜率 K 值的差异。选择有差异指标进行受试者工作特征（receiver operating characteristic，ROC）曲线分析，获得曲线下面积（area under curve，AUC），同时得到相对应的阈值、敏感度和特异度。
结果 两位观察者所测数据的一致性良好（ICC>0.75）。CCRC 组和 RO 组皮质期 40-60 keV 单能量 CT 值、K 值的差异具有统计学意义（P<0.05）。其中，皮质期 60keV 单能量 CT 值诊断效能最高，当阈值为 151.37 时，AUC 最大为 0.804，此时敏感度和特异度分别为 70.0%，84.6%。除此之外，两者间其他参数间差异均无统计学意义（P>0.05）。
结论 单源双能 CT 能谱成像皮质期 60keV 单能量 CT 值能有效鉴别肾嗜酸细胞腺瘤与肾嫌色细胞癌。

PU-0371
女性盆腔囊性病变的 CT、MRI 表现及其病理基础

孙辉,任冉
广东医科大学附属医院

目的 分析女性盆腔囊性病变的 CT 和 MRI 表现，提高对其诊断及鉴别诊断水平。
方法 回顾性分析 69 例经手术病理证实的女性盆腔囊性病变的 CT 和 MRI 表现。其中 59 例行 CT 检查，其中 53 例行 CT 增强检查，13 例行 MRI 平扫检查，其中 7 例行 MRI 增强检查，其中 3 例同时例行 CT、MRI 检查。
结果 50 例良性病变，1 例交界性肿瘤，18 例恶性病变。61 例来源于卵巢，其中囊腺瘤 18 例，囊腺癌 14 例，畸胎瘤 8 例（1 例恶性），卵巢甲状腺肿 3 例，性索间质类肿瘤 2 例，囊肿 15 例，转移瘤 3 例；卵巢结核 1 例；3 例输卵管副中肾囊肿；5 例盆腔病变中，包括 1 例盆腔畸胎瘤、2 例盆腔积脓；2 例盆腔神经源性肿瘤。
结论 女性盆腔囊性病变大部分来源卵巢，CT、MRI 检查相结合在发现病变内部细微结构及其与周围器官关系方面有很大的诊断价值，术前可做出正确诊断，为临床治疗方案的选择及预后判断提供理论依据。

血氧水平依赖磁共振对糖尿病肾病的初步研究

周纪宇,周倩
川北医学院附属医院

目的 利用血氧水平依赖磁共振成像评估 2 型糖尿病所致慢性肾病者的 BOLD 图像特点及其与肾功能受损程度的相关性，拟探寻一种无创的评价肾功能的方法。
方法 选取川北医学院附属医院 2018 年 7 月至 2019 年 7 月间确诊为 2 型糖尿病的患者 20 例作为观察组，另选取年龄、性别相匹配的健康志愿者 20 例作为对照组，均行 BOLD-MRI 检查，对比两组间肾脏皮髓质 R2*值的差异。
结果 与糖尿病肾病患者相比，健康志愿者的平均肾髓质 R2*值(13.6±2.4)1/s 较观察组 R2*值(19.2±1.2)1/s 低。两组之间的皮质 R2*值没有显著差异 11.1±0.9sec^{-1} vs.11.6±0.7sec^{-1},p=0.6）。髓质 R2*值诊断 2 型糖尿病患者的的敏感性、特异性、准确性、漏诊率和误诊率分别为 86.43%、100.00%、93.28%、13.52%和 0，可见糖尿病患者肾功能受损程度与髓质 R2*值的具有相关性（p＜0.005）。
结论 糖尿病肾病患者骨髓 R2*值低于健康志愿者，BOLD-MRI 可以反映糖尿病肾病的肾脏功能损伤,具有潜在的临床应用价值。

Imaging features of renal myomatous angiomyolipomas

BINGNI ZHOU,XIAOHANG LIU,CAN LI,LIANGPING ZHOU
Fudan University Shanghai Cancer Center

Objectives: To review the imaging features of renal myomatous angiomyolipomas (mAML).
Methods: Fourteen patients were pathologically diagnosed as mAML. Two radiologists reviewed all images to evaluate CT attenuation, magnetic resonance imaging (MRI) signal intensity (SI), enhancement features (ie, homogeneity and degree of enhancement, enhancement pattern), homogeneity on unehancement scans, tumor size, margin, location, intratumoral fat, cystic degeneration, seudocapsule, hemorrhage and intratumoral vessels. Mean attenuation on unenhanced CT of mAML, normal renal parenchyma and skeletal muscle, were compared by the paired-sample t tests, respectively.
Results: The mean unenhancement CT values of every tumor lesions were similar to that of skeletal muscle (P>0.05). 71.43% lesions were hyperattenuating on unenhanced CT. All tumors were hypo-intensity on T2WI. 61.54% cases were homogeneous or slightly heterogeneous on unenhancement scans. Eleven cases were categorized as a slightly heterogeneous or heterogeneous enhancement type with a weak degree. Tumor enhancement pattern on MRI was various, an early washout enhancement pattern , a gradual and prolonged enhancement pattern was observed in 46.15%, 23.08%, 30.77% of the cases, respectively. Nine of tumors were intracapsular. Intratumoral fat was detected in the four cases.

Conclusions: The radiological appearance of mAML has a tendency to locate in intracapsular, without macroscopic fat, to be hyperattenuating on unenhanced CT images, with hypo-
intense on T2WI, could be homogeneous or slightly heterogeneous on unenhancement scans. After the injection of contrast agent, mAML tend to have a weakly lightly heterogeneous to heterogeneous enhancement, and could demonstrate various enhancement pattern.

PU-0374
Bosniak 分级系统在肾脏囊性病变 MSCT 诊断中的应用价值

姚瑶
广西医科大学第一附属医院

目的 探讨 Bosniak 分级系统在肾脏囊性病变 MSCT 诊断中的应用价值，并分析其 CT 表现特点。
方法 随机选取 2016 年 7 月—2018 年 11 月广西医科大学第一附属医院手术及病理确诊的肾脏囊性病变共 37 例，年龄 2 月至 72 岁，男性 21 例，女性 16 例。回顾性分析其 CT 表现(包括囊的大小、囊壁厚度、有无分隔、分隔多少及厚度、囊壁及分隔强化、钙化、实性成分形态及其强化)，分别由两名医师对其进行 Bosniak 分级，并与术后病理结果进行对照。
结果 Bosniak 分级越高，病理恶性病变所占比例越高。37 例患者均行 CT 平扫及增强扫描，其中: Bosniak Ⅰ级 11 例，病理结果均为良性，10 例单纯性肾囊肿，1 例为肾结核；Bosniak Ⅱ级 5 例，病理结果均为良性；Bosniak ⅡF 级 3 例，病理结果均为良性；Bosniak Ⅲ级 9 例，病理结果为 4 例恶性，恶性率为 44.44%；Bosniak Ⅳ 级 9 例，病理结果均为恶性，恶性率为 100%。
结论 Bosniak 分级系统对肾脏囊性病变的 CT 诊断有较高的应用价值，对临床的诊断及治疗具有较高的的参考作用。

基于 CT 三期增强扫描的输尿管梗阻患者肾灌注改变研究

吕海蓉,高燕军
西北大学附属医院/西安市第三医院

目的 应用 CT 三期增强扫描技术，评估输尿管梗阻时肾脏灌注功能。
方法 回顾性分析 50 例单侧输尿管梗阻患者 CT 三期增强扫描图像资料，分别测量患侧与健侧肾脏皮质、髓质在动脉期、静脉期、排泄期的 CT 值及动脉期相对强化程度值，应用配对计量资料 t 检验比较患侧与健侧 CT 值的差异。
结果 健侧肾脏皮质动脉期、静脉期、排泄期 CT 值分别为：169.6±30.7HU HU，149.5±32.2 HU，128.5±29.1 HU；健侧肾脏髓质动脉期、静脉期、排泄期 CT 值分别为：63.9±19.1 HU，117.7±36.0 HU， 200.2±31.8 HU；患侧肾脏皮质动脉期、静脉期、排泄期 CT 值分别为：150.2±35.9 HU， 145.2±25.8 HU， 118.8±26.0 HU；患侧肾脏髓质动脉期、静脉期、排泄期 CT 值分别为：49.2±17.5HU， 93.6±38.8 HU， 158.2±50.0 HU；健、患侧肾皮质动脉期相对强化程度值分别为 142.1±61.0HU， 161.6±69.7 HU。患侧肾皮、髓质动脉期、排泄期、髓质静脉期 CT 值均低于健侧，患侧肾皮质相对强化程度值高于健侧，且差异具有统计学意义（$p<0.05$）；患、健侧肾皮质静脉期 CT 值间无显著差异（ $P>0.05$）。

结论 通过 CT 三期增强扫描技术，测量肾脏皮髓质不同期相 CT 值、皮质动脉期相对强化程度值，可以判断肾脏血流灌注改变情况，初步评价输尿管梗阻后肾脏灌注功能。

Renal perfusion changes in ureteral obstruction patients :based on tri-phase enhancement CT scan

常规 CTU 延迟扫描与等待期间排尿后检查的对比与研究

曹晖
陆军特色医学中心（大坪医院）

目的 1 减少患者在 CTU 检查时等待排泄期的时间，增加患者的舒适度。
2 减少因患者因憋尿而导致的不适。减少膀胱不充盈现象，降低漏诊的可能。

方法 针对 70 例 CTU 检查者（未做膀胱全切手术），检查前 20 分钟，嘱咐患者多喝水（500ml 以上），自觉有尿感告知检查人员，然后进行泌尿系常规检查。检查分为平扫、皮质期、实质期、排泄期。在扫完肾盂期后，告知患者下床等待排泄期检查。这时把患者分为两组 A 组 38 人，下检查床后立即排尿后再饮水，等待 20-30 分钟，或自觉有尿感以后进行排泄期扫描。B 组 32 人，下床之后继续胀尿。20-30 分钟以后或自觉有尿感时进行排泄期扫描。

结果 A 组 38 人平均年龄 46 岁；平均延迟时间 25 分钟；平均膀胱充盈体积 144ml；平均 CT 值 680。且膀胱全部由造影剂充盈。B 组 32 人，平均年龄 51 岁；平均延迟时间 30 分钟；平均膀胱充盈体积 437ml；均 CT 值 158。其中膀胱全部充盈 12 例，充盈不足 20 例，尿液与造影剂在膀胱内出现分层现象。

结论 B 组优势：膀胱充盈程度优于 A 组，膀胱体积是 A 组的两倍多。B 组缺点：过于充盈的膀胱会导致检查者等待时感到不适。老龄患者和前列腺增生患者无法完全配合。

A 组优势：与 B 组相比，缩短了排泄期平均等待时间，提高了平均 CT 值，并保证膀胱全部充盈。不会出现因病人无法坚持配合，而出现的造影剂与尿液分层的情况，降低漏诊的可能性。

PU-0377
肾透明细胞癌 CT 强化特征与病灶体积的相关性

张飞,刘连锋,张媛,张涛,蔡雷,白江涛
延安大学咸阳医院

目的 探讨肾透明细胞癌 CT 强化特征与病灶体积的相关性。

方法 回顾性分析 2017 年 5 月至 2018 年 6 月 18 例有穿刺或病理结果肾癌患者,观察不同亚型肾癌 CT 表现和强化特点情况。

结果 1、血供丰富的肿瘤 11 例，11 例均为透明细胞癌（长径＞3cm），以坏死囊变最明显,和其他病理类型比较差异显著,2、乏血供肿瘤 7 例，4 例透明细胞癌（长径≤3cm），1 例嫌色细胞癌及 2 例乳头状细胞癌在坏死、囊变、钙化表现不明显，平扫时肿瘤呈圆形或卵圆形等密度影,边界欠清,增强时,病灶强化程度明显低于肾实质（CT 值升高＜40Hu）,增强后肿瘤边界较清，与其他病理类型比较差异不明显。

结论 1.肾癌体积较大（长径＞3cm），透明细胞癌与其他亚型肾癌在 CT 平扫及增强表现中有一定的差异；2.肾癌体积较小（长径≤3cm），强化程度往往较低，CT 平扫及增强与其它类型肾细胞癌鉴别困难。

PU-0378
多模态 MRI 检查在产后胎盘植入的诊断价值分析

韦洁勤,申炜,黄龙全,许梅海
南宁市第一人民医院

目的 探讨多模态 MRI 检查的表现在产后胎盘植入的诊断价值。
方法 回顾性分析 17 例高度怀疑产后胎盘植入患者的临床资料。所有患者均行 MRI 平扫、DWI 及增强扫描，综合其影像征象与临床或术后病理对照，并对诊断效能进行统计学分析。
结果 以临床或手术病理为金标准，17 例患者中， 3 例为胎盘残留，未发生胎盘植入，磁共振全部诊断正确（3/3）；5 例为粘连性胎盘，磁共振将 1 例诊断为胎盘植入，其余全部诊断正确（4/5）；9 例证实为植入性胎盘，磁共振均诊断正确（9/9）；0 例证实为穿透性胎盘。
结论 磁共振平扫、DWI 及增强多模态成像能很好的显示产后胎盘植入及肌层受累情况，对产后胎盘植入的诊断有重要价值。

PU-0379
不典型子宫阔韧带平滑肌瘤 CT 和 MRI 诊断与病理对照分析

江安红
安徽医科大学第二附属医院

目的 探讨不典型阔韧带平滑肌瘤(BLL)在高场 MRI 及 CT 中的影像学表现及其病理学基础，以提高 BLL 的诊断及鉴别诊断水
平。
方法 回顾性分析经手术病理证实的 18 例 BLL 患者的 MRI 或 CT 表现和病理资料。
结果 18 例不典型 BLL，6 例为 CT 检查，11 例为 MRI 检查，1 例同时做了 CT 和 MRI 检查。1 例以囊性成分为主，包绕不规则实性成分(实性成分 T2WI 呈高信号)，病理证实为平滑肌瘤伴脂肪花生；1 例周边 T2WI 明显环形高信号，病理为平滑肌瘤伴玻璃样变性；15 例呈混杂密度或信号，病理上肿瘤由较多平滑肌细胞构成，且细胞胞体大，合并水肿 2 例，玻璃样变 6 例，红色样变 1 例，粘液样变 2 例，5 例为平滑肌瘤。
结论 不典型 BLL 在 MRI 及 CT 上具有多种不典型的表现，熟悉其病理学基础有助于提高 BLL 的诊断与鉴别诊断水平。

PU-0380
纹理分析在 CT 增强扫描鉴别肾细胞癌亚型中的应用研究

吴文杰
安徽医科大学第二附属医院

目的 探讨 CT 增强纹理分析鉴别透明细胞肾细胞癌(clear cell renal cell carcinoma，ccRCC)、乳头状肾细胞癌(papillary renal cell carcinoma，pRCC)和嫌色肾细胞癌(chromophobe renal cell carcinoma，ChRCC)的价值。

方法 回顾性分析经病理证实的 95 例 ccRCC、22 例 pRCC 和 17 例 ChRCC 患者资料，分别提取肾皮髓质期、实质期及延迟期增强 CT 肿瘤纹理特征，筛选后应用原始数据分析、主成分分析、线性判别分析和非线性判别分析方法进行分类分析，计算诊断准确率、敏感度、特异度及受试者工作特征曲线下面积(area under the curve，AUC)。
结果 增强 CT 纹理分析鉴别 ccRCC 与 pRCC 的诊断准确率、敏感度、特异度达 87.54%、90.89%、76.27% (AUC=0.826)；鉴别 ccRCC 与 ChRCC 的诊断准确率、敏感度、特异度达 94.60%、98.30%、85.24% (AUC=0.923)；鉴别 pRCC 与 ChRCC 的诊断准确率、敏感度、特异度达 78.49%、71.73%、85.24% (AUC=0.815)。非线性判别分析方法均获得较高的诊断效能(AUC 0.717～0.938)。
结论 增强 CT 纹理分析有助于鉴别 ccRCC、pRCC 和 ChRCC。

PU-0381

3.0 T 磁共振 3D CUBE T2WI 序列在 MR 移植肾成像中的应用

宋黎,汪巧玲
华中科技大学同济医学院附属同济医院

目的 将 3D CUBE T2WI 序列应用于移植肾的 MR 常规扫描中，为移植肾评估提供依据。
方法 26 例肾移植术后患者，行冠位 3D CUBE T2WI 序列和常规轴位序列扫描移植肾，分别获取冠位 3D CUBE T2WI 序列扫描图像和常规 T2WI 序列扫描图像，分别获取移植肾常规轴位 T1WI 图像及 MRU 图像。
结果 1. 3D CUBE T2WI 序列较常规 T2WI 序列扫描移植肾，对肾实质显示优良率的差异无统计学意义（$p>0.05$）；2. 3D CUBE T2WI 序列较传统 MRU 序列扫描移植肾，对肾盂及输尿管显示优良率的差异无统计学意义（$p>0.05$）。
结论 在常规移植肾的扫描中，应用 3D CUBE T2WI 序列代替 T2WI 序列，在不影响肾实质病变显示的情况下，能够显示肾盂情况，从而为临床进行移植肾评估提供重要依据。此外 3D CUBE T2WI 无间断扫描可以减少病灶的遗漏，同时可对移植肾进行三维重建，测量体积，为移植肾评估提供可靠依据。

PU-0382

The value of the apparent diffusion coefficient in differentiating Type II From Type I Endometrial Carcinoma

Jingya Chen
Affiliated Hospital of Nanjing University of Chinese Medicine

Objectives:To investigate the value of apparent diffusion coefficient (ADC) values in predicting patients with Type II endometrial carcinoma (EC), and to evaluate the diagnostic accuracy of ADC in differentiating type II from type I EC.
Materials and Methods: Ninety-four patients with endometrial carcinoma who underwent diffusion-weighted imaging (DWI) were retrospectively included and divided into type I and type II groups based on postoperative pathologic results. Clinical features, conventional MRI manifestations, mean ADC values (ADCmean), minimum ADC values (ADCmin), max ADC values (ADCmax) and standard deviation(SD) of ADC values were

analyzed. To differentiate type II from type I tumors, optimal ADC measurements were established. Receiver operating characteristic curve analysis was used to determine optimal cutoff values.
Results: The tumor size, endometrial status, ADCmean and ADCmin differed significantly between type I and type II EC. The area under the curve (AUC) values for ADCmean and ADCmin were 0.787 (95% CI, 0.692－0.882; P = 0.001) and 0.835 (95% CI, 0.751－0.919; P = 0.001), respectively, for predicting type II endometrial carcinoma. The optimal cut-off value of ADCmean and ADCmin for prediction were 0.757×10^{-3} mm^2/s (sensitivity: 91 %, specificity: 58%, and accuracy: 74%) and 0.637×10^{-3} mm^2/s (sensitivity: 82 %, specificity: 73%, and accuracy: 75%), respectively.
Conclusion: Endometrial carcinoma with lower ADCmean and ADCmin is suggestive of type II endometrial carcinoma. The ADC value may have the potential to differentiate type II from type I tumors.

PU-0383

腹膜后纤维化临床诊断

白景奇
山西医科大学第一医院

腹膜后纤维化临床诊断
白景奇 山西医科大学第一医院 影像科
目的 探讨腹膜后纤维化的临床表现及影像学特征，提高对此病的认识，提高早期诊断率、减少误诊率。
方法 收集我院经病理证实的 RPF 患者 10 例，详细分析其临床特点及影像学特征。10 例患者均行 CT 增强扫描；5 例行 MRI 检查；3 例行静脉肾盂造影检查。
结果 （1）10 例患者早期均表现为腰骶部或下腹部钝性疼痛不适，8 例患者出现邻近脏器受压，少尿、无尿症状。5 例患者实验室检查结果 IgG4、C 反映蛋白升高，2 例患者血沉增快。（2）影像学表现：9 例患者病变位于腹膜后，其中 7 例为肿块型，2 例为弥漫型，1 例位于骶前及髂动脉走行区。CT 平扫肿块型显示腹膜后密度均匀的软组织密度肿块，肿块大多与腹主动脉紧密相连,并包绕输尿管和下腔静脉，并可见双侧肾盂肾盏及输尿管扩张积液。弥漫型肾周脂肪囊内见弥漫分布的索条状、斑片状软组织密度影。增强扫描 7 例呈明显强化，2 例呈轻度强化。MRI 检查显示，4 例呈稍长 T1、稍长 T2 信号，增强扫描后病灶强化较明显；1 例呈等 T1、短 T2 信号。IVP 检查中 6 例患者表现为双肾及双侧中上段输尿管扩张积液，下段输尿管变细。
结论 影像学检查在发现病变方面具有重要价值，通过 CT 密度及 MRI 信号的不同表现，并结合临床检查，可以对疾病的分期和疗效提供参考。

PU-0384

前列腺癌多参数 MRI 检查与经直肠超声穿刺活检相关性研究

王立峰,陈学军,张孝先,孟帆
河南省肿瘤医院

目的　本研究的目的是确定活检前多参数核磁共振成像（mpMRI）检测前列腺癌的准确性，以评估我院标准 MRI 检查方案与经直肠超声（TRUS）活检在诊断前列腺癌的临床意义和临床意义上的敏感性和特异性。
方法　筛选 2016 年 1 月 1 日至 2017 年 12 月 31 日期间临床怀疑前列腺癌并行 3.0TMR 检查患者。要求患者既往没有确诊前列腺癌并行前列腺穿刺活检等有创性检查。针对临床高度怀疑前列腺癌或前列腺特异性抗原(PSA)水平明显升高患者行 TRUS 系统性穿刺。统计分析 mpMRI 检查和活检对前列腺癌检出的特异性及敏感性。
结果：共 165 名患者符合纳入标准： 103 例（62.4%）患者在 MRI 上检测到病变，其中 84 例经 TRUS 证实为前列腺癌（TRUS 穿刺证实总例数为 124 例）。MRI 对前列腺癌检出准确率为 64.2%。MRI 显示前列腺癌对前列腺 TRUS 活检的敏感性为 67.7%，特异性为 53.7%，阳性预测值为 81.2%，阴性预测值为 35.5%。同时，MRI 检出的病变与临床诊断显著的前列腺癌以及 NCCN 高风险分类相关（P<0.001）。MRI 检出 54 例 NCCN 高危患者中的 53 例，其中 14 例 Gleason 评分为 8-10 分。
结论：MRI 的敏感性和特异性似乎不足以在临床上避免所有男性的 TRUS 活检。对临床怀疑患有前列腺癌，需要标准化的 MRI 检查和综合临床其他资料来进行综合分析。

PU-0385
子宫平滑肌肉瘤恶性潜能预测：CT 与临床病理特征相关性研究

蒙丽宇,康巍,金观桥,苏丹柯
广西医科大学附属肿瘤医院

目的　分析子宫平滑肌肉瘤（uLMS）CT 增强强化程度与 Ki-67 增值指数是否具有相关性。
方法　回顾性分析 14 例 uLMS 的临床表现、CT 特点、肿瘤标志物及病理特点，所有病例均经过病理证实。本文分析 uLMS CT 增强强化程度与 Ki-67 增值指数的相关性。
结果　uLMS 实性成分 CT 呈中度至明显强化，且与 Ki67 增殖指数具有明显的相关性 (p ＜ 0.05)。 另外，大部分病人 CA125 值明显升高，且 Desmin 及 SMA 表达阳性。
结论　对于 uLMS CT 强化程度及 Ki67 增值情况可能可以预测其恶性转化过程，CA125 升高也能预测 uLMS 的恶性程度。

PU-0386
T2-tirm 序列对卵巢子宫内膜异位囊肿的诊断价值

彭华荣,宋建勋,梁久平,胡钰,林国辉
深圳市宝安区人民医院

目的　探讨 T2-tirm 序列对卵巢子宫内膜异位囊肿的诊断价值。
方法　回顾性分析 66 例（83 个病灶）经手术病理证实为卵巢囊性病变，且行盆腔 MRI 扫描的患者，根据病理结果将患者分为卵巢子宫内膜异位囊肿组（A 组，29 例 43 个病灶）和其它卵巢囊性病变组（B 组，37 例 40 个病灶）。患者均行盆腔横轴面 T1WI、T2WI、T2-fs、冠状面 T2-tirm、横轴面、冠状面、矢状面脂肪抑制 T1WI 增强序列检查，采用 X^2 比较两组病灶 T2-tirm 低信号。
结果　A 组病灶 T2-tirm 低信号阳性率为 95.35%，B 组病灶 T2-tirm 低信号阳性率为 2.50%，两组病变的 T2-tirm 低信号差异具有统计学意义（P＜0.01）。
结论　T2-tirm 序列对于鉴别卵巢子宫内膜异位囊肿与其它附件囊性病灶具有很高的应用价值。

PU-0387

Assessment of embolization effect with temperature-sensitive nano-gel p(N-isopropyl-acrylamide-co-butyl methylacrylate) in rabbit renal artery by CT perfusion and pathology

chunyuan cen,Ping Han,Zhen Zhang
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To assess the effect of embolization with new temperature-sensitive nano-gel p(N-isopropyl-acrylamide-co-butyl methylacrylate) (PIB) in rabbit renal artery by CT perfusion and pathology, and evaluate the feasibility of the nano-gel as a blood vessel embolization agent.
Methods: Ten healthy adult Japanese rabbits received right renal arterial embolization with PIB hydrogel. CT perfusion scans were performed pre and post-treatment at different time points(1, 4, 8, and 12 weeks), two rabbits were euthanized and received histological examinations each time, and the remaining rabbits were sacrificed at 12 weeks after the embolization. The efficacy was further confirmed by a pathological examination after the CT perfusion.
Results: Significant differences were found in renal volume ($P < 0.05$) and renal blood flow ($P < 0.05$) between the right kidney pre- and post-treatment during the 12-week CT re-examination. No recanalization or collateral circulation was observed in the right kidney during this period for PIB dispersed blood all levels of vessels. The CT perfusion outcome showed the change of kidneys in different time, similar to the pathological result.
Conclusion: CT perfusion imaging and pathological examination show the changes of right kidney before and after embolization from renal morphology, the quantification of right renal blood flow, as well as histocyte. It indicated the effect of embolization with PIB was good not only dispersion but also permanency, which supported PIB is a good blood vessel embolic material.

PU-0388

多排螺旋 CT 上肢血管造影对血液透析自体动静脉内瘘评估的临床意义

黄增超
广西中医药大学第一附属医院

动静脉内瘘形态改变是影响透析的首要原因，及早发现能改善血液透析，同时延长内瘘使用寿命。我们采用多排螺旋 CT 血管成像评估动静脉内瘘形态，取得较好的效果

、对象和方法

I.病例资料：维持性血液透析（MHD）患者 40 例，男女各 20 例，年龄 23-80 岁，平均 63 岁；每周透析 2-3 次。内瘘使用时间平均 21.3 个月；34 例吻合口位于腕部；6 例吻合口位于鼻烟窝。40 例患者共进行 59 次 CT 血管重建检查，原因为内瘘功能不良 31 例次；可疑狭窄 18 例次；血管瘤形成 5 例次；使用前检查 5 例次。
2．CT 血管重建**方法** 采用 GE 64 层螺旋 CT （Discovery 750 HD），扫描条件为 100 kV，120-250 mA，层厚 1.25 mm，螺距 0.975。用高压注射器自非内瘘侧肘前静脉或颈外静脉以 3-3 • 5 ml/s 注入 300 mgI/ml 的碘海醇 60 ml，延时 25、30 s 扫描。扫描范围从吻合口到胸廓入口。数据通过 GE ADW4.4 工作站进行处理分析。
结果
所有病例内瘘动脉吻合口和引流静脉均显示清晰。3 例次无异常；26 例次吻合口狭窄；4 例次引流静脉狭窄；5 例次吻合口和引流静脉同时狭窄；21 例次动脉狭窄。动脉或引流静脉狭窄表现为串珠样或线状狭窄；狭窄远端的血管可局部扩张，扩张部位和狭窄段形成明显的分界，部分显著扩张的血管伴有明显的迂曲。临床根据 CTA 检查结果，对 33 例患者制订了相应的手术干预方案。术中，发现 CTA 定位准确，直视血管狭窄程度和范围与 CTA 检查结果相符。
讨论
本研究证实，多排螺旋 CT 血管成像应用于内瘘的形态检查可以从不同的角度、直观和完整地评价内瘘的形态，能发现隐蔽的问题，对异常内瘘的处理有积极的指导意义。内瘘形态异常不仅表现为狭窄还表现为瘤样扩张，这与目前采用的动静脉内瘘的穿刺法有关。为减少造影剂的损害，在 CT 血管重建后立即进行血液透析治疗排出造影剂。

PU-0389

探讨 MSCT 的 CTU 的临床应用价值

张善国
大庆龙南医院

目的 探讨 CTU 的临床应用价值，提高泌尿系统疾病诊断率
方法 用曲面成像可以显示泌尿系统影像，并针对重点部位进行手动操作，沿泌尿系统走行进行重建，即肾脏（起始端）向膀胱（终端）进行，重建曲线位置要求必须位于泌尿系统脏器的长轴中心位置，以保证肾脏、输尿管、膀胱的完全、无偏差的全程显示。
结果 1、泌尿系结石：显示结石的位置、大小、数目及形态，主要呈高密度影，周围管壁水肿增厚，梗阻端以上输尿管腔内对比剂充盈较差伴梗阻性积水；患侧肾功能较对侧差，肾周有渗出改变。2、输尿管狭窄：显示狭窄位置；输尿管节段性狭窄、扭曲变形，伴尿路扩张积水。3、肾脏、输尿管肿瘤：显示病变本身的范围，位置和近段扩张积水的输尿管；输尿管腔内软组织影，管壁不规则增厚，有异常强化，周围脂肪间隙不清，伴输尿管梗阻。4、外压性病变致输尿管扩张：输尿管、膀胱外的病变使输尿管受压移位伴同侧肾积水。5、感染性疾病：肾及输尿管结核等显示肾及输尿管全程形态，肾实质内有空洞形成与肾盏相通，肾盂输尿管壁广泛不规则增厚，异常强化，输尿管腔不规整，管腔节段性狭窄与扩张并存。6、先天性改变：肾盂、输尿管畸形，MSCTU 可以显示肾及输尿管全程形态。
结论能及时准确的显示梗阻性泌尿系统病变，明确显示积水扩张的肾盂、肾盏、输尿管等主要表现，并进一步明确梗阻端的病因（先天性、感染性病变、肿瘤性病变、结石性病变、外压性等），并且具有检查时间短、检查费用容易被病人接受确等优点。

PU-0390

CT 诊断腹壁子宫内膜异位症

黄晖
中山市人民医院

目的 研究腹壁子宫内膜异位症的 CT 表现，以提高对此病的诊断水平。
方法 回顾性分析 8 例经手术病理证实的腹壁子宫内膜异位症的 CT 平扫及增强影像资料。
结果 8 例腹壁子宫内膜异位症，年龄 30-39 岁，平均年龄 32.5 岁。8 例均有明确手术史，7 例行剖宫产手术，1 例行肝血管瘤手术。其中 2 例腹壁肿块会随经期有所变化并伴有疼痛。最大者大小 35mm×25mm，最小者大小约 8mm×7mm。病变均位于前腹壁，手术切口位置或附近。3 例位于皮下脂肪层，5 例位于腹壁肌肉内或与肌肉分界不清。平扫表现为等密度灶，增强扫描轻度均匀强化，强化幅度略高于周围肌肉组织。本病需与炎症包块、腹壁纤维组织肿瘤等鉴别。炎症包块局部及全身症状明显，无周期性表现，平扫呈略低密度包块，形成脓肿后，可见环状增强。纤维组织肿瘤以韧带样瘤多见，表现与本病类似，为单发或多发等密度肿块，但增强扫描时肿块只有轻度增强，可有囊变，临床症状轻或无。此外还应与纤维瘤、疤痕瘤等相鉴别。
结论 CT 检查能发现腹壁子宫内膜异位症，但缺乏特异性表现，诊断必须密切结合临床。

PU-0391

Ⅰ型和Ⅱ型乳头状肾细胞癌的影像表现特点

黄秀珠
福建医科大学附属第一医院

目的 探讨Ⅰ型和Ⅱ型乳头状肾细胞癌(papillary renal cell carcinoma,PRCC)的 CT 表现的差异性。
方法 回顾性分析 2010 年 1 月至 2019 年 1 月经手术病理证实的 31 例 PRCC 患者资料，其中Ⅰ型 19 个病灶，Ⅱ型 12 个病灶。所有患者术前均行肾脏 CT 平扫及动态增强检查。收集患者基本临床信息、病灶的最大径、生长方向、平扫及增强的密度（＜20HU，20-40HU，＞40HU）、是否有包膜、钙化、囊变坏死、出血以及病灶的外侵情况，如是否侵犯肾窦、淋巴结及静脉。统计学**方法** 采用独立样本 t 检验对患者年龄、病灶最大径进行比较；采用卡方检验对病灶的分类特征进行比较。
结果 Ⅰ型、Ⅱ型 PRCC 平均年龄，性别，病灶大小，是否钙化、出血，平扫密度，有无包膜均无统计学差异（P＞0.05）；Ⅱ型 PRCC 的强化程度较Ⅰ型高(χ2=23.4，P=0.000)。Ⅱ型 PRCC 的囊变较Ⅰ型常见(χ2=10.8，P=0.002）。在生长方向方面，Ⅱ型 PRCC 更易向肾盂方向生长，Ⅰ型更易向肾轮廓外生长，二者（(χ2=8.3，P=0.007）；在肿瘤外侵表现方面，Ⅱ型较Ⅰ型 PRCC 更易发生淋巴结转移、肾窦侵犯以及静脉癌栓形成(P<0.05)。
结论 Ⅰ型和Ⅱ型 PRCC 在病灶强化、囊变、生长方向及肿瘤外侵情况上有一定差异，Ⅱ型 PRCC 更易囊变、强化更明显、具有向肾盂方向生长的趋势，并且更具有侵袭性以及更易发生转移。

PU-0392

肾上腺外副神经节瘤的 CT 影像表现

李芳云
中山市人民医院

目的 探讨肾上腺外副神经节瘤的 CT 影像表现特点，提高其诊断准确率。

方法 回顾性分析经病理确诊的 15 例肾上腺外副神经节瘤的部位、大小、密度、增强特点、有无钙化及囊变坏死，探讨 CT 诊断肾上腺外副神经节瘤的的价值。
结果 男 11 例，女 4 例，年龄 13-61 岁，平均年龄 38 岁，3 例肿瘤位于腹膜后占(3/15)，2 例位于左侧腹膜后，1 例位于骶前正中腹膜后；6 例位于头颈部占（6/15），均位于颈动脉体部，其中 2 例为双侧颈动脉体均可见病变；3 例位于内脏占（3/15）(2 例位于膀胱，1 例位于膀胱右侧壁，1 例位于膀胱后壁；1 例位于右下肺)，1 例（1/15）位于右后纵隔；1 例位于肝门区；1 例（1/15）为左侧颈动脉体、纵隔及肝脏多处病变。肿瘤以囊实性为主，与周围组织分界清晰，平扫肿瘤密度不均匀，增强扫描实性部分明显强化。最大径小于 30mm 肿瘤密度较均匀，无液化、坏死，无钙化，最大径大于 30mm 肿瘤均出现不同程度囊变、坏死，肿瘤越大，囊变坏死越明显，部分肿瘤内出现斑点钙化。
结论 肾上腺神经节细胞瘤的 CT 表现具有一定特征性，在肿瘤的定位、定性诊断及血供特点、浸润程度及鉴别诊断方面可互相补充,对肾上腺外副神经节瘤患者临床术前诊断具有重要价值。

PU-0393

To Explore the Optimal Concentration of Contrast Agent for CT Peritoneography and Evaluate its Safety

Jing Dong,Jiao Bai
The Affiliated Hospital of Southwest Medical University

Objectives This study is aimed to find the contrast protocol with appropriate concentration, which could result in best peritonaography and in the mean time, have minimal side effects on the residual renal function.
Material Sprague-Dawley uremic rats were divided into five groups for peritoneography injected with 40ml different contrast concentration (group A: 0mL/2L; B: 25mL/2L; C: 50mL/2L; D:75mL/2L; E:100mL/2L, n=5 for each group). And the ratio of the concentration was calculated as: iohexol/peritoneal dialysate. After 30 minutes of the injection, CT peritoneography was performed. And the quality of peritoneography were blindly graded in a nine-point scale by two experienced radiologists in terms of the depiction of abdominal organs and cavity. The residual renal function was decided as rat serum creatinine value and the hematoxylin and eosin (HE) staining of the residual renal. And peritoneal morphology and thickness was also assessed by HE and Masson staining. And the values before and after the procedure were both recorded for all parameters mentioned above. ANOVA and wilcoxon sign rank test were used to do the comparison. Intra-class correlation was used to assess the agreement between readers.
Results Uremic rat model was successfully established. The rating of quality on CT peritoneography images was 6.90±0.82 for group C, which was the highest (Group A: 2.40±0.42/ B:4.10±0.42/ D:4.30±1/ E:2.50±0.35, all $p<0.0001$, respectively). As demonstrated, along with increase concentration of the contrast, cell and peritoneal thickness significantly increased. There was no statistically significant change in serum creatinine and HE staining of the residual renal before and after CT peritoneography procedure.
Conclusions At the concentration of 50ml/2L, the preference of CT peritoneography image for both reader is the highest. Furthermore as shown, the thickness of the peritoneum and the number of cells increase along with the increase of concentration.

Thus in order to obtain the best image with minimal effect on the peritoneum, 50ml/2L might be suggested to use as a standard contrast protocol in the study.

PU-0394

泌尿系统类癌的 CT 与 MRI 表现

陈优,何来昌,谭永明,占雅如
南昌大学第一附属医院

目的 探讨泌尿系统原发类癌的 CT 与 MRI 表现，加强对该病的认识。
方法 搜集 4 例经手术病理证实的泌尿系统类癌的临床、影像及病理资料，3 例行 CT 平扫及增强，另外 1 例行 MRI 平扫及增强检查。 结果 右肾类癌 3 例，膀胱类癌 1 例，其中 3 例边界清楚，1 例边界欠清，平扫肿块呈实性（1/4）或囊实性（3/4）密度/信号，增强扫描动脉期（皮质期）3 例明显强化，1 例轻度强化，静脉及延时期（实质期及排泄期）3 例出现延迟强化，1 例为持续性强化。
结论 泌尿系统类癌肾临床上很罕见，影像上多以实性肿块或囊实性肿块形式存在，密度/信号均匀或不均，内有钙化，增强扫描动脉期明显强化，静脉及延时期持续性或延迟性强化,并且出现心血管或胃肠道等临床症状时，可以考虑类癌可能，但确诊任靠病理诊断。

Leiomyomatosis peritonealis disseminata: A case report and review of the literature

章国伟,周作福
福建省妇幼保健院

Leiomyomatosis peritonealis disseminata(LPD) is a rare smooth muscle pathology, characterized by the presence of multiple tumors inperitoneal cavity mimicking a malignant process with metastases. The diagnosis may be difficult in some cases as the results of ultrasonography and MR imaging may suggest malignancy. The final diagnosis was made on biopsy and pathologic examination performed during surgery. Exposure to estrogens probably plays the main etiologic role. In this report we describe the diagnostic difficulties and the clinical course of LPD in 43 year old women. The surgical treatment consisted on hysterectomy and removal of multiple nodules located in intestinal serosa. This report documents the image findes of MRI and review of the literature, objective to further improve the recognition of image manifestation in LPD.

PU-0396

The Diagnostic Value of Intravoxel Incoherent Motion Diffusion-Weighted Imaging in Different Histological Types of Cervical Carcinoma

Jiangning Dong,Bin Shi,Mengshi Fang,Chao Wei,Tingting Lin,Yaoyuan Wu
Department of Radiology, West Branch of the First Affiliated Hospital of USTC, Division of Life Sciences and Medicine, University of Science and Technology of China, Anhui Provincial Cancer Hospital, Hefei, China230031

Objective. To explore the diagnostic value of intravoxel incoherent motion diffusion-weighted imaging (IVIM-DWI) for different histological types of cervical carcinoma.
Methods. 101 patients with pathologically proved (cervical squamous cell carcinoma, 87; cervical adenocarcinoma, 11; cervical small cell carcinoma, 3) underwent the IVIM-DWI examinations with 10 b values (b = 0, 10, 20, 50, 100, 200, 400, 800, 1200, 2000 s/mm^2), obtaining the ADC_{stand}, D, D* and f values. All variables were analyzed by the steps of normality test, homogeneity test for variance, analysis of variance or nonparametric test. Then the receiver operating characteristic curve was extracted.
Results. For different histological types of cervical carcinoma, the comparison of ADC_{stand} and D values reached statistically significant differences ($p<0.05$). The cut-off values of ADC_{stand} and D values between cervical squamous cell carcinoma and cervical adenocarcinoma were $0.75*10^{-3}$ mm^2/s and $0.66*10^{-3}$ mm^2/s , and the sensitivity, specificity and the area under the curve(AUC) were 59.8%, 100%, 0.812 and 88.5%, 90.9%, 0.929, respectively. The cut-off values of ADC_{stand} and D between cervical squamous cell carcinoma and cervical small cell carcinoma were $0.61*10^{-3}$ mm^2/s and $0.49*10^{-3}$ mm^2/s, and the sensitivity, specificity and the AUC were 90.8%, 100%, 0.962 and 65.5%, 100%, 0.807, respectively.
Conclusion. The ADC_{stand} and D values had better diagnostic value than D* and f values for differential diagnosis of histological types of cervical carcinoma. Furthermore, IVIM-DWI might provide non-invasive and quantitative molecular imaging basis to evaluate different histological types of cervical cancer, and it may be helpful to the individual treatment.

PU-0397
CT 值对肾上腺嗜铬细胞瘤和肾上腺乏脂肪腺瘤的鉴别诊断价值

方娴静
安徽医科大学第二附属医院

目的 探讨各期 CT 值对肾上腺嗜铬细胞瘤和肾上腺乏脂肪腺瘤的鉴别诊断价值。
方法 回顾 33 例肾上腺嗜铬细胞瘤和 32 例肾上腺乏脂肪腺瘤（平扫 CT 值>15HU）病例，测量其各期 CT 值，利用箱型图和 ROC 曲线进行比对分析，分别选取了平扫（29HU、34HU、39HU）、动脉期 67HU、门脉期（87HU、97HU）、延迟期（70HU、74HU、79HU），作为诊断参考阈值，≥阈值即可诊断为肾上腺嗜铬细胞瘤，得出相应 AUC 值及灵敏度、特异度。
结果 以平扫 CT 值≥34HU 诊断效果最优，AUC 值 0.922、灵敏度 100%、特异度 84.375%，其次也可参考延迟期 CT 值≥70HU 的诊断结果，其 AUC 值 0.859、灵敏度 100%、特异度 71.875%。
结论 肾上腺嗜铬细胞瘤与肾上腺乏脂肪腺瘤影像学表现有重叠，参考平扫 CT 值≥34HU 及延迟期 CT 值≥70HU 提示嗜铬细胞瘤的诊断有一定的价值，有助于提高肾上腺嗜铬细胞瘤的诊断符合率。

PU-0398
不同类型乳头状肾细胞癌的 CT 表现及其差异

管松
安徽医科大学第二附属医院

目的 探讨Ⅰ型和Ⅱ型乳头状肾细胞癌(papillary renal cell carcinoma，PRCC)的CT表现及其差异。 方法 回顾性分析经手术病理证实的27例PRCC患者资料，其中Ⅰ型10个病灶，Ⅱ型17个病灶。所有患者术前均行肾脏CT平扫及动态增强检查。对PRCC的形态学特征、肿瘤外侵征象、增强CT表现进行定性和定量分析。采用独立样本t检验对病灶最大径、三期CT值及皮髓交界期△CT、实质期△CT进行比较；采用Pearson x^2检验或Fisher确切概率法对分类变量进行比较。
结果 一般形态学上，Ⅱ型PRCC平均最大径大于Ⅰ型(t=一2.504，P=0.012)，密度更不均匀(x^2=15.318，P=0.000),更易出现囊变或坏死(x^2=5.628，P=0.016)，且程度更明显(x^2=4.296，P=0.027)；在CT图像上，两型之间出血和钙化征象的差异均无统计学意义。在肿瘤外侵表现方面，除边界征象外，Ⅱ型较Ⅰ型PRCC更易发生肾周脂肪侵犯、‘肾窦侵犯及转移(P<0.05)。在增强CT表现方面，两型在皮髓交界期CT值、皮髓交界期△CT 的差异均有统计学意义(t=一2.562，P=0.014；t=一3.203，P=0. 006)，而在平扫期CT值、实质期CT值、实质期△CT上的差异均无统计学意义。结论 Ⅰ型和Ⅱ型PRCC在形态学特征、肿瘤外侵征象及强化程度上有一定差异，部分Ⅱ型肿瘤具有侵袭性生物学行为，预后更差。

PU-0399
磁共振及弥散加权成像对卵巢颗粒细胞瘤的诊断价值

张彩霞
福建中医药大学附属人民医院

目的 分析卵巢颗粒细胞瘤的MRI及DWI(弥散加权成像)特点，以提高对其的断价值。
方法 回顾性分析经手术证实的14例卵巢颗粒细胞瘤患者的临床及MRI影像资料，对所有病例行常规MRI及DWI（b=0，800）检查，并行增强扫描。
结果 本组14例患者，仅3例合并子宫内膜增厚。其中幼年型卵巢颗粒细胞瘤(OAGCT)3例，成年型卵巢颗粒细胞瘤(OJGCT)11例。囊性2例，囊实性11例，实性1例。实性成份T1WI呈等或稍高信号，T2WI呈稍高或等信号，DWI上呈不同程度高信号；囊性成份因囊液性质不同T1WI呈低等或稍高信号，T2WI呈高信号，DWI上部分囊液呈等或稍高信号，部分呈低信号，以低信号为主；增强扫描实性部分中等-明显强化，囊性部分未见强化。其中13例肿瘤囊变区均可见数量不等的出血信号，1例实性肿瘤未见明确出血信号。
结论 卵巢颗粒细胞瘤的临床特点可不典型，但具有特征性MRI表现，以囊实性居多，且均有不同程度出血信号，有助对其做出较为准确的术前诊断。

Primary vaginal Ewing sarcoma with uterine fibroid:A case report

Maolin Xu
Hubei Cancer Hospital

Background: Extra osseous Ewing sarcoma (ES) , an uncommon malignant neoplasm ,account for about 25% of Ewing sarcoma, and mainly affects paravertebral region, lower extremity, chest wall, retroperitoneum, pelvis, and hip. Here is a rare case of primary vaginal Ewing sarcoma with uterine fibroid,the imaging findings of which have been fewly known or reported.
Case presentation: A 54-year-old woman was admitted to our hospital due to complaints of pain in the vagina.The uterus showed as parallel position and enlarged as about 3 months of pregnancy size,with no tenderness.Magnetic resonance imaging(MRI) and ultrasonography(US) demonstrated 2 large, heterogeneous masses in the vagina and uterus,respectively. Ultrasound-guided puncture biopsy revealed a malignant tumor in the right lateral vaginal wall. The patient was treated by hysterectomy,bila-teral salpingo-oophorectomy and tumors excision,with the subsequent treatment of chemotherapy. The patient has been closely followed-up after discharge.
Conclusions: Primary vaginal Ewing sarcoma is extremely rare.Few literatures have been found concerning the imaging appearance of the tumor. Vaginal ES and uterine fibroid have certain manifestations and imaging features in MRI and US, but not specific. Ultrasound-guided puncture biopsy is useful to confirm the pathologic diagnosis.The treatments of uterine fibroid include uterine artery embolization and surgical options ,While wide local excision followed by adjuvant chemotherapy and/or radiotherapy is recommended for the vaginal ES.

PU-0401

左肾上腺神经束膜瘤 1 例 CT 表现及文献复习

罗荣,刘芳
重庆医科大学附属永川医院

目的 报道 1 例罕见肾上腺神经束膜瘤，探讨其影像学表现及组织病理学特点，提高对该病的认识。方法 回顾分析左侧肾上腺神经束膜瘤的 CT 表现及病理学特点。仔细阅读其 CT 平扫及增强扫描影像学资料，同时通过矢状位、冠状位多平面成像多方位观察神经束膜瘤的影像学特点，分析、总结本病例的影像学表现。结果 男性患者，50 岁，左侧肾上腺结合部结节，边界清楚，密度均匀，平扫 CT 值约 14HU，动脉期 CT 值约 38HU，静脉期 CT 值约 80HU，延迟期 CT 值约 76HU；镜下见良性梭形细胞；免疫组化 VIM（+），EMA（+），Ki67（+）。结论 神经束膜瘤是一种罕见的良性肿瘤，常发生于外周神经。神经束膜瘤影像学表现报道较少，还有待更多病例进一步分析、总结。发生于肾上腺的神经束膜瘤应与肾上腺腺瘤、神经鞘瘤等鉴别。

PU-0402

128 层螺旋 CT 在透析患者上肢 CT 血管成像中的临床应用价值

张霞
上海交通大学附属第六人民医院

目的 研究 128 层螺旋 CT 在透析患者上肢 CT 血管成像中的临床应用价值。

方法 回顾性分析 30 例患者的 64 层 CT 图像（64 层组）与 39 例患者 128 层 CT 图像（128 层组），对扫描数据进行三维重建后比较两组患者的动脉分支级别、血管边缘、静脉干扰评分及瘘口显示情况的差异。
结果 128 层组前臂与手部动脉分支级别显示评分高于 64 层组，差异有统计学意义（P<0.05）；128 层组肩部、上臂及前臂的血管边缘光滑度显示评分高于 64 层组，差异有统计学意义（P<0.05）。
结论 128 层螺旋 CT 在透析患者上肢血管成像中血管、内瘘口以及流入流出道等细节方面显示效果更理想。

PU-0403
扩散张量成像和血氧水平依赖性磁共振成像在碘海醇诱导家兔双侧肾功能评估中的应用

王志强
北华大学附属医院

背景
扩散张量成像（DTI）和血氧水平依赖（BOLD）磁共振成像（MRI）序列用于评估兔子模型中碘海醇肾动脉注射的双侧肾扩散，各向异性和氧合作用。
方法
将 42 只新西兰白兔分成两组。通过右肾动脉给予盐水和碘海醇（1g 碘/ kg，1ml / 秒）。在基线和给药后 1,24,48 和 72 小时纵向获取 MR 图像，以分别评估表观扩散系数（ADC），分数各向异性（FA），相对横向弛豫率（R2 *）。在每个时间点进行 MR 扫描后，在每组中处死 3 只兔子并评估血清肌酸酐，组织学和缺氧诱导因子-1α（HIF-1α）免疫表达的变化。
结果
给予碘海醇 24 小时后，ADC 和 FA 值显着下降（P <0.05），而 R2 *值在皮质（CO），外髓质（OM）和内髓（IM）中显着增加（P <0.05），右肾的变化比左肾明显。在 CO，OM 和 IM 中，ADC，FA 和 R2 *之间观察到显着的负相关（所有 P <0.001，r = -0.654-0.828）。
结论
DTI 和 BOLD 可以同时和非侵入性地评估双侧肾脏中不同程度的造影剂引起的急性肾损伤（CI-AKI）。

PU-0404
双肾粘液性纤维瘤一例

林国成,曹劲松
宜昌市第二人民医院

临床病史 患者因“双下肢乏力 3 月”入院，患者于 3 个月前开始无明显诱因开始出现双下肢乏力，当时无明显下肢麻木，无行走不稳，无跛行，休息后未见明显好转，外院腹部彩超示：肝内多发实性团块，考虑为血管瘤可能，双肾包膜下异常回声，考虑为实性占位性病变，右肾结石，右肾小囊肿。肾功能：肌酐：133.9umol/L，UA：757umol/L,CO2:29.5mmol/L；肝功能：白蛋白

35.5g/L；血脂：甘油三酯：2.39mmol/L,总胆固醇：4.78mmol/L,低密度脂蛋白胆固醇：4.04mmol/L。外院泌尿系 MR 检查示：双肾淋巴瘤可能性大，不排除其他结构复杂黄色肉芽肿等其他病变可能。我院泌尿外科住院治疗。由于肾动、静脉与占位关系密切，患者接受了保守治疗并定期随诊复查。截止到目前，患者情况稳定。

PU-0405

肾占位性病变的 CT 诊断分析

韩波
四平市中心医院

目的 分析肾占位性病变的 CT 表现,探讨 CT 对肾占位行病变的鉴别诊断价值。
方法 回顾性分析经对手术证实的 50 例肾占位性病变的影像表现，所有病例均行 CT 平扫和增强扫描。
结果 肾透明细胞癌 24 例，乳头状肾癌 6 例，嫌色细胞癌 4 例，肾血管平滑肌脂肪瘤 12 例，嗜酸细胞腺瘤 2 例，纤维肉瘤 1 例，肾炎性假瘤合并化脓性炎症 1 例。不同肾占位病变 CT 表现不同。
结论 CT 平扫及增强扫描对典型的肾脏占位性病变具有重要诊断及鉴别诊断价值。

PU-0406

肾上腺罕见疾病的影像学诊断

马义,朱斌
南京大学医学院附属鼓楼医院

目的 分析 6 种肾上腺罕见疾病患者的临床资料及影像学表现，旨在增强对该类罕见疾病的认识，提高其术前诊断的准确性。
方法 回顾性分析 27 例经病理证实的 6 种肾上腺罕见疾病的临床及影像学资料，包括肾上腺结核、21-羟化酶缺陷症、肾上腺节细胞神经瘤、肾上腺皮质嗜酸细胞腺瘤、肾上腺淋巴瘤及肾上腺皮质腺癌。
结果 23 例患者病灶为单发,18 例为功能性，其中血压增高者 16 例。21 例患者病灶为良性，多呈椭圆形或类圆形，边界清楚，6 例恶性，其中 1 例侵犯邻近下腔静脉。
肾上腺结核：有 TB 病史，根据影像学病灶有无环形强化、钙化推测病程长短指导临床治疗；
21-羟化酶缺陷症是先天性肾上腺皮质增生的一种最常见类型，根据实验室检查确诊，患者临床可伴有两性畸形，影像学表现为肾上腺增生或肾上腺髓质脂肪瘤；
肾上腺节细胞神经瘤影像学特点为嵌入式生长，密度低，渐进性强化；
肾上腺皮质嗜酸细胞腺瘤表现为出血、坏死少见，星芒状强化；
肾上腺淋巴瘤表现为钻缝样生长，轻度强化，伴有肿大淋巴结，穿刺活检确诊；
肾上腺皮质腺癌表现为体积大，好发出血及坏死，钙化，邻近侵犯，远处转移。
结论 肾上腺罕见疾病具有一定的影像学特征,与临床特点相结合,能提高此类疾病术前诊断的准确性。

PU-0407

左侧肾上腺淋巴结 Castleman 病 1 例

罗勇
黔南布依族苗族自治州医院

Castleman 病又称巨大淋巴结增生症或血管滤泡性淋巴组织增生，由 Castteman 于 1954 年首先报告[1]，是一种介于良、恶性之间的不典型淋巴结增生症。

病史摘要

患者，男性，39 岁，慢性病程；2 年前患者无明显诱因出现左侧腰部胀痛不适，呈间歇性胀痛不适，休息可缓解，无发热、畏寒，无胸闷、气促，无血尿、脓尿等不适，因疼痛不严重，未予作检查治疗，近期患者感上述症状加重。既往有半年高血压病史，一直口服药物（降压灵）降压治疗，自诉血压控制尚可。否认冠心病、肾病等慢性病史，否认肝炎、伤寒、结核、疟疾等传染病史；预防接种史：不详；过敏史：否认；外伤史：否认；输血史：否认。

PU-0408
多层螺旋 CT 在女性盆腔非生殖源性肿块定位诊断中的价值

肖运平,颜俏燕
柳州市人民医院

目的 探讨多层螺旋 CT 在女性盆腔非生殖源性肿块定位诊断中的价值。

方法 回顾性分析我院 26 例经手术病理证实盆腔非生殖源性肿块患者的术前多层螺旋 CT（MSCT）资料，重点观察肿瘤供血动脉来源（看血供）、肿块中心位置以及与肿块与周围邻近器官的关系（看细节）及病侧正常卵巢显示情况（看病侧卵巢），评估上述征象在非生殖源性肿瘤定位诊断中的价值。

结果 26 例盆腔肿块中，其中胃肠道间质瘤 12 例，小肠黑色素瘤 1 例，小肠未分化圆形细胞肉瘤 1 例、乙状结肠癌肉瘤 1 例，直肠梭形细胞肿瘤 1 例 ，直肠高分化肉瘤 1 例，乙状结肠粘液纤维肉瘤 1 例，神经源性肿瘤 3 例，阑尾粘液囊腺瘤 2 例，盆腔小圆细胞型恶性肿瘤 2 例，盆腔腹膜恶性间皮瘤 1 例，根据供血动脉判断病灶起源准确性为 75%（20/26），肿块中心位置以及与周围器官的关系判断病灶起源的准确性为 80%（21/26），病变侧正常卵巢显示对非卵巢源性肿瘤判断的准确性为 54%（14/26）。

结论 MSCT 能清楚显示肿块供血动脉，判断肿块与周围毗邻结构的关系及病侧正常卵巢显示情况，综合运用三个指标（病变细节、血供、病侧卵巢）对肿瘤起源的判断具有重要意义。

PU-0409
能谱 CT 虚拟平扫技术在 CT 泌尿系造影检查中的 应用价值探讨

陈灿,郭睿,胡跃群,胡鹏志
中南大学湘雅三医院

目的 探讨宝石能谱 CT 虚拟平扫技术（Virtual Non-Contrast scan，VNC）在 CT 泌尿系造影检查中的应用价值。

方法 选取 2018 年 6 月至 2019 年 2 月我院门诊疑泌尿系梗阻病变到我科行 CTU 的病人 80 例，随机均分为 A、B 两组。A 组行常规 CTU 扫描：真实平扫（TNC）、动脉期、实质期、延时期。B 组动脉期使用 GSI 扫描模式，其他时相均扫描与 A 组相同。比较 A、B 两组的总有效辐射剂量、A 组与 B 组增强三期有效辐射剂量、B 组内 TNC 图像和 VNC 图像的图像质量。以同一部位的图像信噪比(Signal to Noise Ratio，SNR)和对比噪声比(Contrast to Noise Ratio，CNR)作为客观图像质量评价标准，主观图像质量评价由 3 名高、中、初级放射科医师对总体图像质量、锐利度、噪声、病灶显示情况 4 个方面进行双盲评估。利用 SPSS 软件对实验结果进行统计学分析。
结果 B 组总有效辐射剂量（31.39±1.74）mSv 高于 A 组总有效辐射剂量（24.66±0.97）mSv（P＜0.001），但 B 组应用 VNC 的增强三期总有效辐射剂量（20.18±1.56）mSv 显著低于 A 组总有效辐射剂量（P＜0.001）；图像质量的客观评价中，TNC 和 VNC 的 SNR 无统计学差异（4.82±0.55 和 4.69±0.44，P=0.08），CNR 亦无统计学差异（2.62±0.46 和 2.50±0.37，P=0.21）。图像质量的主观评价中，VNC 的整体图像质量、噪声水平、病灶显示情况与 TNC 图像比较均无统计学差异（P＞0.05）；但 VNC 图像的锐利度不如 TNC 图像的锐利度，差异有统计学意义（P=0.02）。
结论 在泌尿系梗阻性病变的 CTU 检查中，能谱 CT VNC 能替代 TNC，其不仅能满足临床诊断的需求，还能大大减少患者所受的辐射剂量，缩短检查时间，具有较大的临床应用价值。

PU-0410

动态数字化 DR 在泌尿系结石中的诊断价值

王贤军
吉林省梅河口市红梅镇中心卫生院

目的 探讨动态数字化 DR 在泌尿系结石中的诊断价值。
方法 于 2015 年 1 月到 2016 年 1 月间，在我院选取 90 例泌尿系结石患者作为研究对象，对所有患者进行动态数字化 DR 和常规腹部 X 线检查，对比两种检测方法的检测效果。
结果 90 例泌尿系结石患者实际结石状况为：肾结石 24 例，输尿管结石 38 例，尿路结石 28 例。动态数字化 DR 检测结果为：肾结石 23 例，输尿管结石 36 例（35 例符合），尿路结石 26 例。动态数字化 DR 检测检出率为 93.3%。常规腹部 X 线检测结果为：肾结石 24 例（22 例符合），输尿管结石 40 例（30 例符合），尿路结石 26 例（14 例符合）。动态数字化 DR 检测检出率为 73.3%。动态数字化 DR 检测泌尿系结石检出率与常规腹部 X 线检测相比明显较高，P＜0.05。
结论 动态数字化 DR 检测泌尿系结石效果显著，结石检出率高，可在泌尿系结石诊断中推广运用。

PU-0411

子宫瘢痕早期妊娠的比较影像学分析

涂蓉,于亚妮
海南医学院第一附属医院

目的 比较子宫瘢痕早期妊娠的磁共振成像、超声影像学表现及其诊断价值；分析 MRI 是否能够判断胚胎死活。

方法 选择临床拟诊为瘢痕妊娠的患者 55 例，MRI 结合人绒毛膜促性腺激素(HCG）阳性、有子宫手术史和病理综合诊断，作为诊断瘢痕妊娠的金标准，确诊子宫瘢痕妊娠 47 例，比较 MRI 图像及超声图像，分析影像学征象并测量相关数据。另对综合诊断为非瘢痕妊娠的 8 例，进行图像及其原因分析。以超声诊断作为判断胚胎死活的金标准，评价 MRI 诊断死胚的效能。
结果 MRI 可清晰显示子宫瘢痕、妊娠囊以及二者关系，显示率 100%；以综合诊断 47 例为金标准，MRI 诊断的敏感度和特异度均为 100%；超声诊断敏感度 87.2%，特异度 62.5%，阳性预测值 93.2%、阴性预测值 45.5%；临床拟诊 55 例病例中，超声误诊和漏诊共 9 例，将宫内妊娠误诊为瘢痕妊娠 3 例，将瘢痕妊娠误诊为宫内妊娠 5 例，漏诊 1 例；经超声判断的死胚 27 例中，MRI 显示妊娠囊形态不规则 23 例，妊娠囊径线小于正常孕周的 23 例，不能显示妊娠囊三层结构的 24 例，胚芽组织未显示（孕周 > 6 周）10 例，与活胚组差异有显著性意义（P<0.05）；综合诊断的 47 例中，妊娠囊形态不规则、大小较正常孕周小、胚芽组织未显示（孕周 > 6 周）和不能显示妊娠囊三层结构四种表现，MRI 图像中出现四种任一表现作为 MRI 诊断死胚的依据，共 37 例，与超声诊断比较符合率为 61.7%，MRI 与超声诊断死胚比较差异具有统计学意义（P<0.05）。
结论 MRI 结合 HCG 阳性、有子宫手术史和病理可诊断瘢痕妊娠，尤其适用于超声显示不清楚者。MRI 对显示子宫瘢痕位置、子宫瘢痕与妊娠囊的位置关系等信息，优于超声；对判断胚芽的死活虽然不及超声，有一定的诊断价值。

PU-0412

增强 CT 误诊罕见肾实质占位 1 例

陈斌
华中科技大学同济医学院附属同济医院

异位脾脏在临床上较为常见，但是肾实质的异位脾脏极为罕见，且 CT 检查无明显特征性表现，故很难与常见的肾实质良、恶性肿瘤相鉴别，极易误诊（本病例亦误诊）。超声检查具备一定的提示作用。在临床工作中，结合增强 CT 及超声检查，排除其他常见的肾脏肿瘤后，应考虑到异位脾脏的可能；必要时建议超声引导下肾脏穿刺以明确诊断，进而规避过多的外科干预，改善疾病预后。

PU-0413

宝石能谱 CT 分次团注对比剂在肾动静脉血管成像及辐射剂量中的研究

姜伦,胡必富,汪军,江广斌
湖北医药学院附属随州医院(随州市中心医院)

目的 探讨宝石能谱 CT 分次团注对比剂单期扫描在肾动静脉血管成像及辐射剂量中的应用。
方法 收集临床需行肾动静脉血管成像患者 80 例，将患者随机分为实验组和对照组。实验组采用分次团注对比剂单期扫描宝石 CT 能谱成像，对照组采用单次注射对比剂常规双期扫描。实验组扫描方案：先团注 60 ml 对比剂，注入对比剂后 25 s 再注射 40 ml 对比剂并以相同流率跟注 30 ml 生理盐水。 在第一次注射对比剂开始后 70 s 行能谱 CT 扫描。 在后处理工作站上获得肾动脉和肾静脉的最佳单能量 keV，并重组图像。对照组扫描方案：一次性注入对比剂 100 ml 并以相同流率跟注 30 ml 生理盐水，行多层螺旋 CT 双期扫描。分别测量并记录两组病例肾动静脉 CT 值、噪声、SNR、CNR 及图像质量主观评价得分。统计学分析采用 t 检验。
结果 两组患者在年龄、体重、性别和 BMI 指数均无统计学差异。 显示肾动脉的最佳单能量为 58 keV ，显示肾静脉最佳单能量为 67 keV 。实验组 58 keV 单能量图肾动脉 CT 值与常规组动

脉期肾动脉 CT 值无明显差异（ P＞0. 05）。 实验组 67 keV 单能量图肾静脉 CT 值高于常规组肾静脉 CT 值（ P＜0. 05 ）。实验组与常规组噪声、SNR、CNR 无统计学差异（P＞0.05）。实验组与常规组图像质量主观评分无统计学差异（P＞0.05）。实验组辐射剂量明显小于常规组（P＜0.01）。

结论 对比剂分次团注技术在相同对比剂用量的前提下，宝石能谱 CT 单期扫描在肾动静脉的显示等同于或优于常规双期增强扫描，同时辐射剂量明显减少。

PU-0414

卵巢透明细胞癌的 CT 影像表现

田玉龙,邓克学
安徽医科大学附属省立医院影像科

目的 分析卵巢透明细胞癌（OCCC）的 CT 影像特征。

方法 回顾性分析 10 例手术病理证实的 OCCC 患者平扫和三期增强影像资料，总结影像学特征（位置、形态、分隔、大小及囊实性成分、囊实性特征及强化方式）。

结果 10 例 OCCC 均为单侧，呈圆形或椭圆形，单房多见（3 例多房），以囊性成分为主多伴有实性成分（1 例为实性），肿瘤平均最大直径 14.7cm(9.7-24.4cm)，囊性部分密度均匀，平均 CT 为 24.7HU（10-43HU），未见明显强化。实性部分呈乳头状或结节肿块状，平均最大直径 4.0cm（2.1-12.7cm），平均 CT 为 41.0HU(26HU-56HU)，增强示动脉期强化，静脉期及延迟期呈明显持续强化。

结论 腹盆腔较大边界清晰的单房囊实性肿块，实性部分呈明显渐进性强化是 OCCC 特征性的影像学表现。

PU-0415

卵巢实性肿瘤的 MRI 鉴别诊断

李晓姣
中国科学院大学重庆医院（重庆市人民医院）

目的 通过分析不同病理类型卵巢实性肿瘤的 MRI 表现，评价 MRI 对卵巢实性肿瘤的定性诊断价值。

方法 收集 42 例经手术病理证实的卵巢实性肿瘤，回顾分析其 MRI 表现。

结果 原发卵巢癌 13 例，呈分叶状或不规则实性肿块，MRI 表现为长 T1、不均匀长 T2 信号，增强扫描明显不均匀强化；卵巢转移瘤 6 例，原发肿瘤病史明确，MRI 呈不均匀稍长 T1、T2 软组织信号结节，增强扫描为不均匀强化，其中 5 例为双侧发病；卵泡膜细胞瘤 7 例，MRI 表现为 T1WI 稍低信号，其中 4 例肿瘤内含脂质丰富的卵泡膜细胞较多，T2WI 为稍高信号，且反相位信号减低，其中 3 例瘤内含纤维细胞较多，呈 T2WI 稍低信号，增强扫描均呈渐进性轻-中度持续强化，肿瘤周围环绕不同程度腹腔积液，临床实验室检查均有雌激素升高；卵巢纤维瘤 6 例，呈圆形或卵圆形，MRI 表现为长 T1、稍短 T2 信号，增强后轻度延迟强化或不强化，其中 3 例肿块内散在不定形片状水肿信号，DWI 显示弥散受限；卵巢无性细胞瘤 2 例，为分叶状、有包膜，MRI 为稍长 T1、稍长 T2 信号，增强扫描肿瘤轻度强化，内部有较明显强化的纤维血管间隔，其中 1 例 LDH 升高；卵巢颗粒细胞瘤 7 例，均为实性肿块内多发蜂窝样囊变，MRI 表现为 T1WI 呈等、稍低信号，T2WI 呈稍高信号，增强后实性部分中等强化，囊性部分不强化；卵巢淋巴瘤 1 例，表现为双侧卵巢肿块，信号均匀，MRI 为等信号，增强轻-中度强化。

结论 大部分卵巢实性肿瘤 MRI 征象具有特异性，结合临床表现及实验室检查可作出较准确的定性诊断。

PU-0416
DCE-MRI 成像技术评价宫颈癌同步放化疗疗效的应用价值

雷鹰,李杰惠,赵恒飞,段庆红
贵州省肿瘤医院

目的 探究磁共振动态增强（Dynamic contrast-enhanced MRI，DCE-MRI）成像技术其定量参数评价宫颈癌同步放化疗的疗效。
方法 收集 2018 年 12 月-2019 年 6 月我院经病理证实为宫颈癌 30 例，患者在化疗前后分别行盆腔磁共振动态增强，测定肿瘤组织在同步放化疗前后的 Ktrans、Ve、Kep 值，采用独立样本 t 检验比较肿瘤组不同时期各定量参数的差异。
结果 宫颈癌组织在同步放化疗前后各定量参数值之间进行比较，肿瘤组织的 Ktrans、Ve、Kep 值的变化有统计学意义(P<0.05)。肿瘤组在治疗后的 Ktran 值、Ve 值、Kep 值明显低于治疗前。
结论 DCE-MRI 各定量参数对宫颈癌同步放化疗的疗效评估具有重要价值。

PU-0417
囊性肾癌影像学表现及病理分型间对照分析

唐言,陶晓峰
上海交通大学医学院附属第九人民医院

目的 分析囊性肾癌的临床特点、影像学表现并与手术病理结果对比，以提高对囊性肾癌诊断的准确率。
方法 回顾性分析 30 例经手术病理证实的囊性肾癌的临床表现、影像学征象及病理结果。
结果 30 例患者临床表现上有 17 例无明显症状、体检发现，13 伴有患侧腰背部不适，其中 7 例伴有肉眼血尿，3 例伴有排尿困难。影像表现上为单房囊性、多房囊性和囊实性病灶，CT、MRI 增强后囊壁、分隔及实性部分强化，彩色多普勒可见较丰富血流信号，部分囊液信号、密度复杂，可伴有囊壁结节、囊壁蛋壳样钙化、囊内钙化及同侧、对侧或双肾多发囊肿、肾结石，部分同侧肾周筋膜增厚、腹膜后肿大淋巴结。病理上 6 例肾透明细胞癌，8 例多房囊性肾癌，5 例单房囊性肾癌，1 例肾肉瘤样癌，4 例乳头状肾癌并出血、坏死、囊变， 3 例肾嫌色细胞癌，1 例浸润性尿路上皮癌，2 例肾透明细胞管状乳头状肾细胞癌。术前影像诊断复杂囊肿 2 例，分隔囊肿 5 例，肾囊肿可疑肾癌 6 例，感染病变 1 例，囊性肾瘤 2 例，囊性肾癌 8 例，肿瘤 6 例。影像诊断与病理诊断契合率达 73%。
结论 影像学 CT、MRI 及超声综合检查手段能够最大程度降低囊性肾癌的误诊率。

PU-0418
The correlation between diffusion-weighted imaging parameters and immunohistochemical factors and pathological classification of endometrial carcinoma

璟 xuan Jiang
Affiliated Hospital of Nantong University

Objective: To investigate the correlation between the apparent diffusion coefficient of MRI diffusion weighted imaging (DWI) and the Immunohistochemistry prognostic factors and pathological types of endometrial carcinoma.**Methods:** From the pathology database, among the patients who had been proved endometrial carcinoma through biopsies and surgeries from January 2013 to May 2017 were collected.All patients underwent pelvic enhanced MRI and DWI scan, and the apparent diffusion coefficient (ADC) and relative apparent diffusion coefficient (rADC) were measured. To observe the expression of estrogen receptor (ER), progesterone receptor (PR), human epidermal growth factor receptor type II (Cerb-2) and prognostic factor Ki-67, and to classify the pathological types of the patients. Of the 49 patients, ER was positive in 38 cases, negative in 11 cases, PR positive in 36 cases, negative in 13 cases, Cerb-2 positive in 18 cases, negative in 22 cases (some patients did not receive ER, PR and Cerb-2 receptor expression results at the same time). The pathological types of 49 cases of endometrial carcinoma were 11 cases of lowly differentiated, 22 cases of moderately differentiated and 16 cases of highly differentiated. The expression of receptor in different conditions and different pathological types of endometrial carcinoma in patients with ADC and rADC values are used Mann-Whitney U test, The correlation between ADC values, rADC values and Ki-67 positive expression rate was evaluated by Spearman method. Results: the ADC value of the lowly differentiated group endometrial carcinoma patients was lower than that of the highly differentiated group, the difference was statistically significant ($P<0.05$). The ADC and rADC values of PR positive patients was higher than that of ER, PR negative patients, the difference was statistically significant ($P<0.05$). There was no significant difference between ADC values of Cerb-2 positive and negative patients ($P>0.05$), the ADC and rADC values of endometrial carcinoma patients were negatively correlated with the expression of Ki-67 ($r=-0.76$ and -0.66, $P<0.05$). Conclusion: MR DWI examination may indicate the different pathological types of endometrial carcinoma to a certain extent, and has the potential to evaluate the malignancy from the molecular level.

PU-0419

Solitary Fibrous Tumor of the Urinary Bladder in an 85-year-old Woman: Case Report and Review of Literature

Wenwei Shi,Yan Tan
First Hospital of Shanxi Medical University

Solitary fibrous tumor of the urinary bladder is an extremely rare type of mesenchymal tumor. We present a case of an 85-year-old woman with a protruding intravesical mass detected by CT and MRI, which was proven to be a solitary fibrous tumor through histopathological examination. The clinicopathologic and radiological features are here discussed, and the published literature on this topic is reviewed. Solitary fibrous tumors of the urinary bladder are more common in men (75%), with a peak incidence in people 40–60 years old. Most such tumors show heterogeneous intensity

with a complete capsule. A decrease in the T2WI signal with an increase in collagen tissue content and gradual enhancement on CT/MRI images are their main features. Most such tumors are positive for CD34 under immunohistochemistry (approaching 100%). The majority of tumors (87.5%) studied have been benign and most patients (95.2%) showed favorable prognosis after a long-term follow-up.

PU-0420

螺旋 CT 诊断卵巢甲状腺肿的临床价值

周登镕
广西医科大学第一附属医院

目的 分析卵巢甲状腺肿的 CT 表现特点，探讨 CT 对本病的诊断价值。
方法 回顾性分析 6 例经手术后病理证实为卵巢甲状腺肿患者影像学资料，分析其发生部位、病变形态、密度、成分及强化方式，复习相关文献，总结其 CT 特点。
结果 6 例患者均为单侧附件区（3 例位于右侧附件，3 例位于左侧附件）囊实性占位，囊壁光整，边界清晰，呈类圆形，长径约 4.3cm-14.5cm 不等；实性部分密度较高，CT 值约 55-77Hu，囊性部分密度较低，CT 值约 2-39Hu。5 例囊性部分可见分隔，成多房样，1 例无分隔。4 例囊壁壳样、斑点状钙化，1 例点状钙化，1 例无钙化。增强扫描 5 例实性部分轻-中度强化，1 例不强化。1 例可见脂肪成分。2 例合并对侧附件区畸胎瘤（不含甲状腺组织），1 例合并腹水。
结论 卵巢甲状腺肿是卵巢囊性成熟畸胎瘤的一种少见的特殊类型，CT 表现为单侧附件区囊实性占位，实性部分密度较高，囊性部分分隔多见，囊壁壳样钙化多见，增强扫描实性部分可强化，含脂肪成分少见，具有一定特征性，对疾病诊断有一定帮助。

PU-0421

Measurement of pelvic characteristics of Han and Tibetan nationality young female based on CT

Hua Zhong[1],Qing-hua Tong[2],Jie Liu[2]
1.Tibet University
2.Tibet Military Region General Hospital (Tibet University Teaching Hospital)

Objective Female pelvis is an important part of the birth canal, its size, shape directly affect situated the smooth delivery. In addition to the development of the pelvis, which is affected by the influence of nutrition, it is also related to ethnicity, genetics, geographical environment, habits of life and labor methods. Through linear measurement, this paper explores the normal pelvic morphology characteristics of Han and Tibetan female.
Method The study subjects selected 89 young female (35 Hans, 42 Tibetans) from January 2017 to December 2018 at the Tibet Military Region General Hospital (Tibet University Teaching Hospital) for various indications of pelvic CT examination, aged 18-44 years, with an average age of 24.6±3.5 years, and normal limb development. Exclude pathological pelvis. The GE Discovery CT 750 was used to perform a pelvic routine dose scan on 83 patients. Apply Mimics 10.01 software (Belgian Materialise company products) to build a digital three-dimensional model of the pelvis, measuring

the three-dimensional model pelvic entrance diameter, diameter of pelvic inlet, posterior sagittal diameter of pelvicinlet, anteroposterior diameter of pelvic inlet, diagonal conjugate diameter, posterior sagittal diameter of midpelvis, anteroposterior diameter of midpelvis, angle of pubic arch, agittal outlet, sacrum length, sacrum curvature. Statistical analysis is performed using SPSS Statistics (V. 21.0, IBM Corp., USA, 2012) .

Results Tibetan female in the following measurements are greater than the Han , Tibetan female diameter of pelvic inlet (130.88±1.61) mm, Han female diameter of pelvic inlet (127.67±1.00) mm, the difference between the two is statistically significant (t=4.318, P＜0.01). Tibetan female posterior sagittal diameter of pelvicinlet (50.21±2.14) mm, Han female posterior sagittal diameter of pelvicinlet (47.37±2.62) mm, the difference between the two is statistically significant (t=2.490, P＜0.01). Tibetan female sacrum length (117.25±2.90) mm, Han female sacrum length (107.70±1.50) mm, the difference between the two is statistically significant (t=-2.811, P＜0.01).Tibetan female in the following measurements are smaller than the Han , Tibetan female posterior sagittal diameter of midpelvis (36.10±1.75) mm, Han female posterior sagittal diameter of midpelvis (44.10±0.71) mm, the difference between the two is statistically significant (t=-3.719, P＜0.01). Tibetan female sacrum curvature (129.80±2.31), Han female sacrum curvature (139.11±2.65), the difference between the two is statistically significant (t=1.743, P＜0.01). Anteroposterior diameter of pelvic inlet,diagonal conjugate diameter,anteroposterior diameter of midpelvis,angle of pubic arch,sagittal outlet,the comparative difference between the different ethnic groups is not statistically significant (P＞0.05)

Conclusion Tibetan female have their own unique living habits and labor methods, resulting in Tibetan female's pelvis than Han female's pelvis deeper, side wall cohesion and the lower pelvis narrow, resulting in adverse factors for childbirth. Understanding the morphological characteristics of the pelvis will be helpful in choosing the mode of delivery and can provide effective measures to reduce maternal mortality and neonatal mortality.

PU-0422

少见部位的海绵状血管瘤 3 例误诊分析

周淑丽
南昌大学第二附属医院

目的 海绵状血管瘤是一种常见的良性肿瘤。以往报告多位于肝脏、脾脏、眼眶及脑等典型部位，对少见部位影像学特征分析不足易导致误诊。本研究旨在分析经手术病理评估证实的 3 例非典型部位的海绵状血管瘤的影像学特征，以提高对这一常见肿瘤少见部位的认识。
方法 回顾性研究了 3 例不典型部位的血管瘤的影像学特点，并根据影像学表现探讨相应鉴别诊断。3 名患者包括男 1 例，女 2 例，年龄 40～71 岁。临床表现包括腰痛并镜下血尿 1 例，反复头晕 1 例，腹痛 1 例，患者均接受了 CT 及 MRI 平扫加增强扫描。
结果 3 例血管瘤，1 例位于左肾，误诊为肾癌，2 例位于左肾上腺，1 例误诊为腹膜后占位，1 例误诊为嗜铬细胞瘤，3 例病灶均边界光整，CT 平扫为等密度，2 例密度不均匀，MRI 平扫 T1WI 上 2 例呈低信号 ，1 例呈高低混杂信号，在 T2WI 上 2 例呈高信号 ，1 例呈高低混杂信号，3 例病灶

CT 及 MRI 增强早期均以边缘不均匀强化为主 ，后期强化逐渐向中心充填 ，1 例最后肿块达均匀明显强化，呈典型“快进慢出”强化形式 。

结论 由于海绵状血管瘤在肾及肾上腺发病率特别低，易误诊为该部位的其他常见肿瘤，仔细分析病灶影像学表现和临床特征可能有助于更准确的诊断特殊部位的海绵状血管瘤，减少误诊的发生。

PU-0423

Application of ASIR-V Technique in Reduction of Radiation Dose in Renal Artery CT Imaging

Lu Jiang
Chang'an hospital

Objective To study the clinical application of ASIR-V technology in reducing radiation dose in CT imaging of renal artery. **Methods** Forty consecutive patients who underwent continuous CT angiography of renal artery were randomly divided into A and B groups. The contrast agent was ibuprofen 370 mgI/ml and injected by bolus follow-up. Scan conditions: tube voltage 100 kVp, noise index NI (Noise Index) 10, automatic tube current technology (Smart mA). A group was reconstructed with FBP and the image reconstruction layer thickness was 1.25mm; group B tube pre-ASIR-V was 40%, and post-reconstruction was 0%, 20%, 40%, 60%, 80%, 100%, respectively. the thickness of the image after reconstruction is 1.25mm. Scanning method: Monitor the abdominal aorta below 1-2 cm of the diaphragm and trigger a delay of 10 s after the threshold reaches 120 HU. Objectively measure the subrenal artery and subcutaneous fat in the same plane, record the CT value and SD value, calculate the signal-to-noise ratio (SNR=CT/SD) and contrast noise ratio (CNR=(CT renal artery-CT fat)/SD fat), The 5-point method was used to subjectively score the image quality of each group by double-blind (5 points, the best image quality; 1 point, the worst image quality). Statistical analysis was performed on general patient data and objective measurement results, and subjective scores were scored on a 5-point scale for each group of image quality (5 points, best image quality; 1 point, worst image quality). **Results** The general data between the two groups were not statistically different ($p>0.05$). There was a significant difference in subjective scores of image quality between the two groups ($P<0.05$). Except for no statistical difference in CT values, there was a statistically significant difference in the objective measurements ($p<0.05$) . The radiation doses between the two groups were $(4.14\pm0.64)/(2.46\pm0.63)$, respectively, and the radiation dose in group B was reduced by about 36% compared with group A; with the pre-ASIR-V being 40%, the iteration weights were increasing. The image quality is also gradually improved. When the weight is 80%, good diagnostic requirements can be achieved, and the image quality is better than that of the pre-ASIR-V 0% reconstruction image. **Conclusion** With ASIR-V technique, CT imaging of renal artery can be performed with increasing iterative reconstruction, which can not only obtain better image quality than FBP reconstruction, but also can significantly reduce radiation dose.

PU-0424

妊娠合并附件扭转 MRI 表现及其临床特点

宋亭,魏慧慧
广州医科大学附属第三医院

目的 探讨妊娠期附件扭转（AT）MRI 表现及临床特点。
方法 回顾性分析 14 例经病理证实的妊娠期 AT 患者的 MRI 表现及临床资料。
结果 14 例 AT 中，原发性 2 例，继发性 12 例（卵巢囊肿 5 例、卵巢畸胎瘤 4 例、输卵管积水 2 例、输卵管间皮囊肿 1 例）。右侧 5 例,左侧 9 例。扭转角度 180～1720°。MRI 示，除 3 例孤立性输卵管扭转之外，其余 11 例均见卵巢增大，12 例于盆腔或腹腔内见异常信号肿块，包括 8 例囊性肿块、4 例囊实性肿块；肿块旁见扭转蒂 7 例，其中 6 例呈“鸟嘴征”，1 例呈漩涡征，DWI 均呈混杂高信号。附件区出血 6 例，盆腔积液 8 例。6 例孕妇分娩足月健康胎儿，8 例分娩早产儿。
结论 妊娠期 AT 的 MRI 表现有一定特征性，结合临床有助于诊断。

PU-0425
ASIR-V 联合低 kVp 在肾动脉 CT 成像中降低辐射剂量的临床应用

姜露,胡智军,王琦,魏东红,李豆
长安医院

目的 研究基于多模型的迭代重建算法（ASIR-V）联合低 kVp 在肾动脉 CT 成像中降低辐射剂量的应用。
方法 对 60 例怀疑肾动脉疾病并行肾动脉成像检查的患者，根据管电压不同分为 A、B、C 三组（120kVp、100kVp、80kVp），每组 20 例。A 组管电压 120kVp，采用 FBP 重建；B 组管电压 100kVp，后迭代重建权重为 80%；C 组管电压 80kVp，后迭代重建权重为 80%，重建层厚均为 1.25mm。客观测量双肾动脉及同层面皮下脂肪，记录其 CT 值及 SD 值，计算信噪比（SNR=CT/SD）及对比噪声比(CNR=（CT 肾动脉-CT 脂肪）/SD 脂肪)，采用 5 分法对各组图像质量进行双盲法主观评分（5 分，图像质量最好；1 分，图像质量最差）。对患者一般资料及客观测量结果进行统计学分析，并对各组图像质量进行 5 分法主观评分（5 分，图像质量最好；1 分，图像质量最差）。
结果 三组患者一般差异均无统计学意义（P＞0.05）；图像质量主观评分存在明显差异(P＜0.001)；客观测量的 CT 值无统计学差异（P＞0.05），而 SD 值、SNR 及 CNR 均存在明显差异(P＜0.001)；三组间的辐射剂量分别为（4.80±1.36）mSv、（4.14±0.64）mSv、（2.11±0.22）mSv，存在明显统计学差异（P＜0.001），80kVp 较 100kVp 与 120kVp 辐射剂量分别降低了 49%、56%。
结论 在肾动脉 CT 成像中，低 kVp 联合 ASIR-V 技术在保证优质的利于诊断的图像质量前提下，能大幅度降低辐射剂量。

PU-0426
肾透明细胞癌的 CT 表现与 Ki-67 表达程度的相关性研究

刘京京,董江宁
中国科学技术大学附属第一医院西区，安徽省肿瘤医院

目的 探讨肾透明细胞癌表达程度与 CT 表现的相关性，为术前治疗方案的选择及预后评估提供参考。

方法 回顾性分析 68 例经病理证实为肾透明细胞癌的患者，所有肿瘤组织病理标本均切片行 Ki-67 免疫组织化学染色。病例分为弱阳性组（Ki-67<10%）38 例，阳性组（ Ki-67>10%）30 例，统计囊变/坏死及周围组织侵犯情况，对 Ki-67 表达水平与其的关系进行相关性分析。
结果 Ki-67 弱阳性组及阳性组肿瘤的囊变/坏死分别为（24/38，25/30），周围组织侵犯分别为（2/38，13/30），P 均<0.05，差异具有统计学意义。
讨论：随着 Ki-67 在肾透明细胞癌中表达程度的增加，肿瘤的囊变/坏死及周围组织侵犯增加。

PU-0427

气肿性膀胱炎 CT 表现

曹霞[1],孟闫凯[1],于芳民[1],陈安记[1],徐凯[2]
1.陕西省商洛市商州区人民医院
2.徐州医科大学附属医院

目的 观察盆腔 CT 及多平面重建技术诊断气肿性膀胱炎的价值。
方法 检索中文数据库气肿性膀胱炎的相关文献报道。回顾性分析临床参数（糖尿病病史、高血压病史、长期卧床史、尿路感染）、实验室参数（血白细胞、中性粒细胞比率、尿潜血、尿白细胞、尿酸）、盆腔 CT 特征（膀胱壁增厚、膀胱壁溃疡、膀胱壁积气）在气肿性膀胱炎中的诊断价值。
结果 糖尿病病史、长期卧床史是气肿性膀胱炎的重要危险因素。膀胱壁积气在气肿性膀胱炎病例中具有典型特征，CT 多表现为膀胱壁增厚、壁内积气。多平面技术矢状位、冠状位重建可以满意显示膀胱壁积气的多少、分布。
结果 盆腔 CT 及多平面重建技术在气肿性膀胱炎的诊断中具有重要的价值。膀胱壁积气形成的抱球征是气肿性膀胱炎的特征性表现。

PU-0428

数字化隔室遥控双腔球囊导管子宫输卵管造影术的临床应用

韩宏生
延安市人民医院

目的 探讨数字化隔室遥控双腔球囊导管子宫输卵管造影术的临床应用价值。
方法 选取延安市人民医院 2017 年～2018 年 300 例不孕症患者，应用数字化双腔球囊导管子宫输卵管造影术进行检查的资料进行分析。具体方法如下：选在月经干净后 5～7 天进行检查，排除禁忌症，患者仰卧于数字胃肠机检查床上，取膀胱截石位，常规消毒、铺巾，操作医生将一次性使用子宫造影通水管（湛江事达实业有限公司）置入患者宫腔内，气囊内注入 1.5～2.5 mL 空气或生理盐水，轻拽造影管不能脱出，使球囊封堵宫颈管内口，一次性注射器吸入造影剂排净空气后与造影管相连，递入患者手中，卸掉阴道扩张器，让患者小骨盆腔对准数字胃肠 X 线机球管，操作医生迅速离开进入隔室控制室，利用对讲系统遥控指挥患者推注造影剂，在透视监视下观察并适时点片，造影过程中要注意球囊的大小及造影管头的位置,并适时调整，管头靠近一侧输卵管间质部时，会导致局部痉挛不显影；球囊太大，影响宫腔显影，球囊太小，造影管容易脱出宫颈口，造影满意后结束检查。
结果 本组 300 例,造影成功 297 例(99%),1 例宫颈管过度弯曲置管失败,造影未能成功(0.3%),2 例出现逆流(0.67%),双侧输卵管通畅 58 例,单侧输卵管通畅 62 例,双侧输卵管梗阻 19 例,单侧输卵管通而不畅 75 例,双侧输卵管通而不畅 86 例。
结论 该法操作简单、安全可靠,患者简单的操作配合能分散注意力可更好地配合完成检查,而且操作医师不用接受射线的辐射，建议临床推广应用。

PU-0429
多层螺旋 CT 对于诊断成年人 Xp11.2 易位 /TFE3 基因融合相关性肾癌的价值

王艳艳
山西省肿瘤医院

目的 探讨多层螺旋 CT 在成年人 Xp11.2 易位/TFE3 基因融合相关性肾癌的诊断和鉴别诊断中的价值。
方法 回顾性分析总结经手术病理证实为 Xp11.2 易位/TFE3 基因融合相关性肾癌 24 例成年患者的临床资料、多层螺旋 CT 资料并复习文献。
结果 24 例 Xp11.2 易位/TFE3 基因融合相关性肾癌患者中，女性 7 例（29.2%），男性 17 例（70.8%），年龄 19～77 岁，中位年龄 45.3 岁，位于左侧 20 例（83.3%），位于右侧（16.7%）；24 例患者中 19 例有螺旋 CT 扫描资料，形态呈圆形及类圆形，平扫病变显示为混杂密度，CT 值高于对侧正常肾实质，灶内合并出血 2 例，钙化 6 例，囊变 11 例，增强后皮质期呈不均匀强化，CT 强化程度低于对侧肾实质，4 例出现血管样强化，5 例出现囊变区边缘结节样强化，髓质期及肾盂期呈轻度造影剂退出，髓质期 CT 值高于肾盂期 CT 值；24 例中 3 例术前考虑腰大肌受侵，4 例考虑伴同侧肾门淋巴结转移，术后均经病理证实，余所有患者术前经影像学检查淋巴结及远处均无转移征象。
结论 成人 Xp11.2 易位/TFE3 基因融合相关性肾癌 CT 平扫及增强扫描有一定的特征性改变，结合临床资料可以考虑诊断本病。

PU-0430
Imaging Features of Deep Aggressive Angiomyxoma with Pathologic Correlations

Xueying Long,HUI LIU
Xiangya Hospital, Central South University

Objective: To analyze the computed tomography and magnetic resonance imaging findings of deep aggressive angiomyxoma with pathologic correlation.
Methods: Seven deep aggressive angiomyxoma confirmed by histopathologic examination were analyzed retrospectively. Image characteristics were analyzed and correlated with the pathologic features.
Results: Four CT and four MRI studies were available for 7 patients (2 males, 5 females), mean age 44.3 years, range 38 -65. Locations were including: 3 cases located at abdominal and pelvic cavity (including 2 males with one of them arises from the peritoneum and the small mesentery and another arises from the small mesentery, 1 female with tumor arises from posterior cervical and left broad ligament), 3 cases located at vulva, and 1 case at pelvic floor (ischiorectal fossa). All cases show heterogeneous mass (n=7), all cases show myxoid in mass and companied by varied Vascular components, hemorrhage was seen in 2 cases. The tumors were soft in 6 cases and mild hardness, cystic and solid (n = 4), predominantly cystic (n =1),

predominantly solid (n=2). The largest diameter of tumors was 7-28 cm, with round or oval regular morphology (n=4), irregular morphology (n=3). 4 cases were encapsulated, 3 cases were without capsule or with incomplete capsule. Growth patterns: invasive growth (n=3), expansive growth (n=4). On CT, 3 cases showed hypodensity or isodensity tumors at noncontrast CT, with water-like density lesion with strip soft tissue density in it, and 1 case showed soft tissue density with small focal cystic areas. On MRI,The tumors show inhomogeneous hypointense on T1WI and hyperintense on T2WI, and DWI and ADC maps show hyperintense (n=3). At contrast enhanced images, all cases show heterogeneous enhancement, with stripy, patchy or swirling internal enhancement pattern varying from mild to evident extent. In 3 cases, the tumors invade the adjacent organs, companied by ascites (n=2), distant metastasis (n=2). No lymphatic metastasis (n=0) is observed. Important complications including: intraductal mucosal papilloma of the pancreas (n=1), mesenteric low grade malignant myofibroblastoma (n=1).
Conclusion: There are some characteristic imaging manifestations of deep aggressive angiomyxomas. A mucinous stromal mass with varied striated or swirling blood vessels may suggest the diagnosis of aggressive angiomyxomas.

PU-0431
R2 * MFGRE 序列在盆腔子宫内膜异位诊断中的附加价值

许祎帆,王青
山东大学齐鲁医院

目的 探究 R2*MFGRE 序列在盆腔子宫内膜异位诊断中的附加价值
方法 本文回顾性分析 2017.5 月-2019.3 月期间 55 名患者经常规 MRI 序列及 R2*MFGRE 序列检查、经病理证实的子宫腺肌病或子宫内膜异位患者的 MRI 图像，比较常规 MRI 序列及联合常规 MRI 序列+R2*MFGRE 序列所显示的病灶数目。
测量所有病灶的 R2*值，去掉部分偏差较大及病灶较小不易测量的病灶，比较不同类型子宫内膜异位症的 R2*值。
结果 55 名子宫内膜异位症及/或子宫腺肌病患者，经 MRI 常规序列共发现病变 103 处，其中子宫内膜异位在子宫肌层 44 处、卵巢 39 处、深部子宫内膜异位症 9 处、腹壁 11 处。联合 R2 * MFGRE 序列后新显示病 30 变处，子宫腺肌病新增 0 处，卵巢新增 6 处，DIE 24 处，腹壁 0 处。应用 SPSS 20.0 配对 t 检验对常规序列和常规序列+R2*MFGRE 序列检出病灶数目进行比较，在检出病变方面，常规序列+R2*MFGRE 序列联合应用更有优势（$P<0.05$）。

子宫腺肌病 R2*值为 24.39±3.45，卵巢子宫内膜异位症 R2*值为 12.98±4.02，深部浸润型子宫内膜异位症 R2*值为 71.61±18.5，腹壁型子宫内膜异位症 R2*值为 13.55±3.33，应用 SPSS 20.0 方差分析显示 DIE 与子宫腺肌病组间存在统计学差异（$P<0.05$），而卵巢巧克力囊肿与腹壁子宫内膜异位症组间无统计学意义（$P>0.05$）。
结论 R2*MFGRE 序列作为子宫内膜异位症常规 MRI 序列的补充，可以提高卵巢子宫内膜异位症、深部浸润子宫内膜异位症的检出率，但是对子宫腺肌症、腹壁子宫内膜异位帮助不大。深部浸润型子宫内膜异位症与子宫腺肌病由于周围结构及病理成分不同造成了 R2*值的不同，而腹壁子宫内膜异位症与卵巢巧克力囊肿发病部位单一，病理成分类似，无明显差异。

PU-0432
嫌色细胞肾癌和乳头状肾细胞癌的 MSCT 诊断和鉴别诊断

周享媛
江西省肿瘤医院/江西省第二人民医院

目的 探讨嫌色细胞癌(ChRCC)和乳头状肾癌(pRCC)多排螺旋 CT 的特征及其鉴别诊断。
方法 收集 7 例 ChRCC 和 14 例 pRCC，经手术病理证实的患者临床资料，分析 MSCT 形态学和多期增强扫描的特征。
结果 7 例 ChRCC 肿瘤体积均较大，平均直径 8.2 cm，呈类圆形，膨胀性生长，大部分可见完整包膜，边界清晰。肿瘤内均可见囊变坏死，但以多发边界清晰小囊变为主，共 4 例伴有钙化，以病变边缘斑点状为主。13 例 pRCC 平均直径 5.8 cm，10 例呈膨胀性生长，包膜完整，3 例形态不规则，呈分叶状，边界不清，侵犯周边组织。13 例病灶中仅 2 例（直径小于 3cm）密度均匀，其余 11 例伴有囊变坏死、出血。共 5 例伴有钙化，以病变边缘斑点状、结节状钙化多见。增强后 ChRCC 动脉期强化明显，静脉期和排泄期下降不明显，pRCC 表现为轻中度持续强化，排泄期略有下降。
结论 ChRCC 及 PRCC 多以膨胀性生长为主，伴有完整包膜。部分 PRCC 形态不规则，呈侵袭性。ChRCC 多以边界清楚小囊变为主，钙化多见，增强后呈中等程度强化,少数强化明显。pRCC 囊变坏死多见，可见钙化，增强后呈轻中度持续强化。 ChRCC 及 PRCC 的 MSCT 表现具有一定特征，鉴别两者难度不大。

PU-0433
动态增强 MRI（DCE-MRI）在临床显著前列腺外周带癌中的应用价值

陈学军,王立峰,云游
河南省肿瘤医院

目的 动态增强 MR 成像（DCE-MRI）在 PI-RADS 2.0 版中被应用于进一步评估扩散加权成像（DWI）得分为 3（DWI3）的外周带病例，如果 DCE-MRI 为阳性结果，将要则 DWI3 将增加至 4，提示临床显著前列腺癌（clinically significant prostate cancer，csPCa）。然而，DCE 在 DWI3 的前列腺外周带病例中预测 csPCa 的准确性尚不清楚。本研究旨在评估 DCE 改变 PI-RADS 2.0 版本中 DWI3 评估类别的评率，并确定 DCE-MRI 在可疑外周带 DWI3 病变中的总体准确性。
方法 研究回顾性分析 2016 年 1 月 1 日至 2017 年 12 月 31 日之间，来我院就诊的行 3.0 T 前列腺 mpMRI、经直肠超声引导下穿刺证实的前列腺癌患者，所有患者均行根治性前列腺切除术。由经验丰富的放射科医师采用盲法并根据 PI-RADS 2.0 版进行评分。csPCa 被定义为 Gleason 评分≥7 分，或在病理学结果中有其他的恶性特征。统计分析 DCE 在 DWI3 病变中对 csPCa 诊断准确性。
结果 共有 71 名患者纳入分析，平均年龄为 65±5 岁，平均 PSA 为 7.3ng/mL。csPCa 在手术病理检查中发现 53 例（74.6%，53/71），其中 49 例位于外周带。其中 DWI3 患者共 19 例，对这些患者进一步用 DCE-MRI 分析，其中 13 例（13/19）为阳性，将最终的 PI-RADS 2.0 版本评分为 4；其中 6 例（6/19）DCE-MRI 结果为阴性。与最终病理学相比，在所有 DCE-MRI 阳性结果中，有 11 例（11/13）例临床诊断为 csPCa。
结论 DCE-MRI 提高了外周带病变中 csPCa 检测的准确性，应用 PI-RADS 2.0 版可更高的对前列腺癌进行诊断。

PU-0434

Associations between Uterine Peristalsis in Women with Adenomyosis and Findings from Quantitative and Cine MR Imaging in lesions

Chengyu Lin[1], Yonglan He[1], Yafei Qi[1], Xiaoqi Wang[2], Hailong Zhou[1], Zhengyu Jin[1], Huadan Xue[1]
1. Peking Union Medical College Hospital
2. Philips Healthcare

Purpose: To investigate the associations between uterine peristalsis in women with adenomyosis and the results quantitative and cine MR Imaging, including T1, T2 and T2* mapping.
Materials and Methods: This prospective study was approved by institutional review board. Between November 2017 and April 2018, 20 patients clinically suspected of adenomyosis underwent MR scanning in ovulatory phase (Ingenia CX, Philips Healthcare, Best, the Netherlands). T1, T2 and T2* relaxation times of lesions were obtained from quantitative MR and number of uterine peristalsis in 3 minutes was observed on cine sequence. Spearman correlation analysis were performed to compute r for each relaxation time vs. number of peristalsis.
Results: The T1, T2 and T2* relaxation times of lesions were 1418±26.19ms, 63.81±2.235ms, 46.67±2.844ms (mean±standard error of mean), respectively. Number of uterine peristalsis in 3 minutes and peristalsis frequency were 4.65±0.8623 and 1.55±0.2874/min, respectively. A positive moderate correlation was found between T1 values vs. peristalsis frequency (r=0.534, p≈0.0186). While correlations between T2 and T2* values vs. peristalsis frequency were not statistically significant (r=0.438, p≈0.0534, and r=0.3218, p≈0.1791, respectively).
Conclusion: Uterine peristalsis frequency in women with adenomysosis was positively correlated with T1 relaxation time of lesions. No statistical significance was found in correlations between T2 and T2* values vs. peristalsis frequency.
Clinical Relevance: Correlation between uterine peristalsis and T1 values of lesions could help clinicians assess lesion degree and evaluate therapeutic effect in patients with adenomyosis, and might become prediction of prognosis.

PU-0435

慢性精囊炎 MRI 诊断及鉴别诊断价值探讨

赵一蓉
重庆市中医院

目的 分析慢性精囊炎的 MRI 表现，提高对血精性精囊炎的认识，探讨 MRI 在血精性精囊炎的诊断及鉴别诊断价值。
方法 回顾性分析了科室 PACS 系统里血精性精囊炎 MRI 病例 36 例。 分别采用常规 T1WI 横轴位、T2WI 横轴位、T2WI 抑脂序列横轴位、冠状位及矢状位及增强扫描。

结果 精囊炎 MRI 主要表现为单侧或者双侧精囊扩张，扩张的精囊囊壁增厚、不规则，间隔模糊。T1WI 可呈等低信号，也可呈高信号，T2WI 可呈信号，也可呈高信号，可见液-液平面，T2WI 上还可见低信号沉积物影。增强后精囊囊壁轻度强化，部分病例囊内容物无强化，部分病例可出现强化（出血时期不同）。可以合并或者不合并精囊囊肿或者精囊扩张。 MRI 能有效鉴别精囊肿瘤、结核、前列腺占位。

结论 MRI 是慢性精囊炎的诊断及鉴别诊断可靠影像学检查方法。

PU-0436

Renal Cell Carcinoma: Preoperative Evaluate the Grade of Histological Malignancy Using Volumetric Histogram Analysis Derived from Magnetic Resonance Diffusion Kurtosis Imaging

Guangyao Wu
Shenzhen Universit General Hospital

To investigate the value of histogram analysis of magnetic resonance (MR) diffusion kurtosis imaging (DKI) in assessment of renal cell carcinoma (RCC) grading before surgery. **Methods:** A total of 73 RCC patients who underwent preoperative MR imaging and DKI were classified into low- grade group and high-grade group. Parametric DKI maps of each tumor were obtained using an in-house software, and histogram metrics between the two groups were analyzed. Receiver operating characteristic (ROC) curve analysis was used for obtaining the optimum diagnostic thresholds, area under the ROC curve (AUC), sensitivity, specificity and accuracy of the parameters. **Result:** Significant difference were observed in 3 metrics of ADC histogram parameters and 8 metrics of DKI histogram parameters ($p<0.05$). ROC curve analyses showed that K_{app} mean had the highest diagnostic efficacy in differentiating RCC grades. The AUC of the K_{app} mean, sensitivity, and specificity were 0.889, 87.9% and 80%, respectively. Conclusions: DKI histogram parameters can effectively distinguish high and low- grade RCC. Kapp mean is the best parameter of differentiating RCC grades. **Keywords:** renal cell carcinoma; Magnetic resonance imaging; Diffusion kurtosis imaging; Histogram analysis

PU-0437

表观扩散系数及影像组学对去势抵抗性前列腺癌诊断的初步研究

吴慧[1],牛广明[1],蔚纳[1],任嘉梁[2]
1.内蒙古医科大学附院
2.GE 药业

目的 探讨表观弥散系数(ADC)与影像组学对诊断去势抵抗性前列腺癌的临床意义。双参数 MRI（bpMRI）T2WI 和弥散加权成像（DWI）是一种精确定位前列腺癌的工具，但在附加雄激素剥夺治疗（ADT）中价值不太明确。本研究目的是探讨 ADC 值与影像组学对 ADT 前列腺癌复发诊断价值.

方法 回顾性分析 30 例去势抵抗性前列腺癌，行 T2WI 和 DWI 的 bpMRI 检查。病变、中央带(CG）、周围带(PZ)的感兴趣区由经验丰富的泌尿生殖放射科医生根据局部治疗前组织病理学描绘。计算 ADC 值及 T2WI 上肿瘤与 CG、肿瘤与 PZ 的差异，提取 T2WI 的 396 个组学特征。采用受试者操作特征（ROC）分析 ADC 值及影像组学特征在鉴别前列腺癌复发与良性组织的能力。
结果 在 ADC 图中，肿瘤与 CG、肿瘤与 PZ 的差异明显，ROC 曲线下面积均＞0.99，p＜0.05。在 T2WI 组学特征中肿瘤与 CG 差异明显，ROC 曲线下面积为 0.91，并且 VoxelValueSum、LongRunEmphasis 这两个特征表现出最佳鉴别能力。肿瘤与 PZ 差异明显，ROC 曲线下面积为 0.87，并且 GLCME-Entropy、LongRunEmphasis、LongRunHighGrey Emphasis 这两个特征表现出最佳鉴别能力.
结论 ADC 值及 T2WI 的组学特征在去势抵抗性前列腺癌的诊断中均表现出很好的鉴别能力，这些结果推动了进一步的研究，为患者下一步的精准放射治疗体积描绘提供条件。

PU-0438
凶险性前置胎盘术前 MRI 系统评分与手术风险及出血量相关性分析

陈永露
广州医科大学附属第三医院

目的 分析凶险性前置胎盘术前 MRI 系统评分与手术风险相关性的价值，探讨 MRI 系统评分对临床治疗的指导意义。
方法 回顾性分析 2018 年 6 月一 2019 年 6 月期间本院 125 例凶险型前置胎盘植患者临床资料、手术方式及盆腔 MRI 检查资料。10 个术前评分指标包括前置胎盘类型、既往剖宫产次数 2 个临床评分，胎盘主要附着部位、T2WI 胎盘内低信号面积、胎盘内增多增粗血管直径、是否有子宫下段膨隆征象、胎盘内信号不均匀、子宫下段肌层厚度、胎盘是否突入宫颈管和胎盘是否侵犯周围组织器官等 7 个 MRI 评分，临床评分和 MRI 评分相加得到术前系统量化评分。手术风险评分依据所行所有手术方式等级（1-4 级）累计相加得到，并统计术中及术后 24 小时内出血量。分析不同胎盘植入类型术前系统量化评分、手术风险评分及出血量的差异，术前系统量化评分与手术风险评分及出血量相关性。
结果 125 例患者中手术及病理诊断有胎盘穿透 13 例，胎盘植入 77 例，胎盘粘连 24 例，无胎盘植入 11 例，术前系统量化评分分别为 17.5±3.6，13.8±4.7，8.4±3.7 及 4.2±2.5，各组间差异均有统计学意义（P<0.05）。四组手术风险评分分别为 10.5±2.6，6.1±2.3，4.5±1.9 及 3.2±1.8，各组间差异均有统计学意义（P<0.05）。四组出血量分别为 1578±487ml，1054±364ml，691±402ml 及 397ml±105ml，各组间差异均有统计学意义（P<0.05）。术前系统量化评分与手术风险评分呈正相关（r=0.785，P<0.05），术前系统量化评分与出血量呈正相关（r=0.678，P<0.05）。
结论 凶险性前置胎盘术前 MRI 系统量化评分对制定手术方案，评估手术风险具有重要意义，尤其对于伴有胎盘植入或胎盘穿透的高危孕妇。

PU-0439
肾嗜酸细胞腺瘤的影像学特点，1 例病例报道并文献复习

侍明海[1],任涛[2],胡彬[1]
1.宁夏医科大学总医院
2.宁夏医科大学

目的 通过回顾性结分析肾嗜酸细胞腺瘤的影像学特点和临床病理特点为肾嗜酸细胞腺瘤的诊断和治疗提供参考。
方法 1 例在本院进行诊断和治疗的肾嗜酸细胞腺瘤。结合其它对肾嗜酸细胞腺瘤的文献报道，对该病的病因学，病理生理，影像学特点，诊断，鉴别诊断和治疗进行总结和讨论。
结果 通过回顾文献我们发现肾嗜酸细胞腺瘤比较少见。肾嗜酸细胞腺瘤通常为良性。嗜酸细胞腺瘤是由大嗜酸粒细胞组成的肿瘤，大嗜酸粒细胞是一种上皮细胞，内含有大量的线粒体，进而导致细胞浆内含有大量的嗜酸性的颗粒状物。肾嗜酸细胞腺瘤典型的影像表现为中央的瘢痕的存在，但这个特征难与肾嫌色细胞癌相鉴别。肾肿瘤活检是现有最准确的诊断方式。
结论 嗜酸细胞腺瘤是一种少见的肾脏肿瘤，因为其影像学上难与肾嫌色细胞癌相鉴别，需要进行肾肿瘤活检。影像学上怀疑肾嗜酸细胞腺瘤主要是确定其大致良性，再结合肾肿瘤活检来确定合适的治疗方式。

PU-0440
应用脑静息态功能磁共振成像研究儿童原发性单症状夜间遗尿的神经病理机制

吴玥,车英玉
郑州大学第一附属医院

目的 应用静息态功能磁共振成像（RS-fMRI）研究儿童原发性单症状夜间遗尿症（PMNE）的神经病理学机制。
方法 37 名右利手 PMNE 患儿（男 20 名，女 17 名，年龄 11.3±4.1 岁）和 17 名年龄匹配的右利手对照组（男 9 名，女 8 名，年龄 11.1±2.9 岁），在西门子 3.0T Skyra 磁共振机器上进行脑功能磁共振扫描，并在 Matlab 平台上使用 DPABI 软件进行图像预处理，然后利用 REST 软件分别对低频振幅（ALFF）、区域一致性（ReHo）和丘脑种子点功能连接（FC）进行了分析。将单个体素阈值 $p<0.001$ 与最小簇大小大于 30 个体素相结合，以 $p<0.05$ 的水平用 alphasim 对结果进行多次校正。
结果 与对照组相比，PMNE 组左眶内侧额上回（额中脑）ALFF 值降低，左枕上回（枕上）ReHo 值升高。以左侧丘脑为种子点，PMNE 组左侧内侧额上回（额上内侧回）的功能连接显著降低。
结论 左眶内侧额上回、左枕上回的功能障碍与左侧内侧额上回和左丘脑之间的低水平功能连接可能是儿童 PMNE 的重要神经病理机制。本研究有助于了解 PMNE 的潜在发病机制，为有效治疗提供了客观依据。

PU-0441
磁共振扩散加权成像及动态增强扫描在宫颈癌分期中的应用

贺帅
辽宁省肿瘤医院

目的 常规 MRI 联合扩散加权成像(DWI)和动态增强(DCE) MRI 在宫颈癌诊断及分期中的价值.
方法 例经手术病理或活检证实的宫颈癌患者按临床治疗方式分为手术组(20 例)和非手术组(15 例),以病理及临床分期为参照,评估常规 MRI 联合 DWI、DCE-MRI(多模态 MRI)对宫颈癌的分期诊断准确性.

结果 术组中常规 MRI 和多模态 MRI 对宫颈癌分期诊断符合率分别为 80%(16/20)和 95%(19/20).术后病理证实盆腔淋巴结转移 4 例,MRI 检出 3 例.非手术组中多模态 MRI 分期与临床分期符合率为 67%(10/15).

结论 MRI 联合 DWI 和 DCE MRI 可提高对宫颈癌分期的准确性,有助于宫颈癌治疗方案的制定.

PU-0442

宫颈小细胞神经内分泌癌的影像学特征

贺帅
辽宁省肿瘤医院

目的 分析总结宫颈小细胞神经内分泌癌(small cell neuroendocrine carcinoma of the uterine cervix,SCNECC)的影像学特征.

方法 经术后病理学检查证实为 SCNECC 的患者 22 例、宫颈鳞癌患者 30 例、宫颈腺癌患者 20 例,对 SCNECC、宫颈鳞癌和宫颈腺癌组的表观扩散系数(apparent diffusion coefficient,ADC)值及淋巴结转移率进行统计学分析,并复习国内外文献,归纳总结影像学特征.

结果 NECC 在磁共振成像(magnetic resonance imaging,MRI)上通常表现为 T2 高信号或稍高信号的肿块,扩散加权成像(diffusion-weighted imaging,DWI)上呈高信号,ADC 值显著低于其他类型宫颈癌,差异有统计学意义.SCNECC 组比宫颈鳞癌组和宫颈腺癌组转移率高,差异有统计学意义.

结论 CT、超声及 MRI 检查可以帮助临床诊断 SCNECC,ADC 值有助于辅助诊断 SCNECC,在宫颈癌筛查中也有一定价值.

PU-0443

动态增强 MRI 定量参数预测高强度聚焦超声消融子宫肌瘤疗效

刘柳恒
重庆市中医院

目的 态增强 MRI（DCE-MRI）定量参数能否预测高强度聚焦超声（HIFU）子宫肌瘤消融术疗效。

方法 术前对 60 例子宫肌瘤患者（共 76 个子宫肌瘤）行 DCE-MRI 检查，获得定量参数 K^{trans}、V_p、K_{ep}、V_p值。将子宫肌瘤按照消融率是否大于 40%分为消融效果良好组和消融效果不佳两组，比较两组间各定量参数的差异，再绘制相关定量参数与预测疗效的 ROC 曲线找到界值为临床选取子宫肌瘤进行 HIFU 治疗提供参考。

结果 效果良好组和消融效果不佳两组肌瘤间 K^{trans}值存在统计学差异（P＜0.05），以 Ktrans=1.925min^{-1}为阈值，判断子宫肌瘤 HIFU 消融效果良好的 ROC 曲线下面积为 0.88[95%CI(0.75,0.93)]。

结论 肌瘤 K^{trans}值可预测其 HIFU 消融效果，DCE-MRI 可为子宫肌瘤 HIFU 消融术选择患者提供依据。

PU-0444

MRI 纹理分析评价前列腺癌 Gleason 评分 7 分肿瘤异质性的初步研究

张宏江,吴昆华,毕国力
云南省第一人民医院

目的 探讨基于 T_2WI 和 ADC 图纹理参数鉴别诊断前列腺癌(PCa) Gleason 评分(3+4)与(4+3)的可行性。
方法 回顾性分析我院经病理证实 77 例 PCa Gleason 评分(GS) 7 分的患者，GS(3+4)组 45 例，GS(4+3)组 32 例。在轴位 T_2WI 和 ADC 图上选择肿瘤最大层面手动勾画 ROI，并提取角二阶矩(ASM)、对比、相关、逆差距及熵(entropy) 5 个纹理参数，再进行两组间纹理参数统计学分析，并对有统计学差异的纹理参数采用 ROC 曲线评价其诊断效能。
结果 GS(3+4)与(4+3)组患者年龄和 PSA 浓度差异均无统计学意义(P>0.05)；基于 T2WI 和 ADC 图提取的 5 个纹理参数中，ASM 及熵值差异均有统计学意义(P<0.05)；而对比、相关及逆差距的差异无统计学意义(P>0.05)。除 T_2WI_{ASM} 的 ROC 曲线下面积(AUC)无统计学差异外，$T_2WI_{entropy}$、ADC_{ASM} 及 $ADC_{entropy}$ 均存在统计学差异，且 ADC_{ASM} 和 $ADC_{entropy}$ 的 AUC 均大于 T_2WI_{ASM} 和 $T_2WI_{entropy}$。$ADC_{entropy}$ 的 AUC 最大，为 0.732，以 5.71 为诊断阈值，敏感度为 97.6%，特异度为 59.5%。
结论 MRI 纹理分析可用于鉴别 PCa GS(3+4)与 GS(4+3)，其中 $ADC_{entropy}$ 鉴别二者的诊断效能最佳。

PU-0445
肾嫌色细胞癌的影像学表现与临床病理分析 （附一例介绍及文献复习）

郭君君
随州市中心医院

目的 肾嫌色细胞癌的临床特征、影像学表现及病理特点，以期提高对本病的认识，从而提高诊断水平。
方法 顾性分析我院收治的 1 例肾嫌色细胞癌患者的临床、影像及病理资料，并复习相关文献。女，36 岁，因“体检发现左肾占位 5 天”入院，无尿频尿急、肉眼血尿、腹痛等临床症状，查体：腹部未触及肿块，双肾区无叩击痛。术前采用 revolution CT 及 3.0TMRI 进行平扫及增强多期扫描。
结果 泌尿系统增强 CTU 示：左肾见类圆形混合高密度影，内见多发囊状低密度影，边界清楚，大小约 4.2x3.4cm，增强后左肾占位性病变皮质期呈明显不均匀强化，髓质期及分泌期强化程度减低，病灶内囊性灶未见强化；MRI 平扫+增强示：左肾见团状等 T1 稍长 T2 信号，病灶内信号不均匀，见多发小囊状长 T1 长 T2 信号，病灶内及周边可见流空血管影，边界清晰，大小约 3.2x4.0x5.0cm，增强后病灶皮质期呈不均匀明显强化，髓质期及分泌期强化程度减低，可见血管穿行其中。患者遂于我院行腹腔镜下左侧肾根治性切除术，切除左肾、肿瘤、肾周脂肪组织及部分输尿管，手术标本：左肾一极见 4x3.5x3cm 灰白肿块。左侧输尿管断端阴性，免疫组**结果** CD117(-)CD10(-)Vimentin(+)PCK(+)CK7(+)S100(-)PAX8(+)ECA(+)。
结论 色细胞癌是一 种罕见的低度恶性肾脏肿瘤， 发病率占肾癌的 6%～8%。1997 年 WHO 对肾癌的病理类型进行了重新分类，自此肾嫌色细胞癌作为一种独立的肾癌类型得到公认。其生长缓慢，临床上多因为肿瘤增大产生局部的压迫症状而就诊，也有部分是在体检时发现，很少引起肾癌晚期所特有的三联征（疼痛、血尿、腹部肿块）以及远处转移的征象，鉴于此类肾癌与常见肾癌临床表现相似，因此了解其临床特点对指导临床诊断与治疗具有重要意义。

PU-0446
CT 对乳头状肾细胞癌的诊断价值

施梦烨
江苏省南京市第一医院

目的 分析乳头状肾细胞癌的 CT 表现，提高影像诊断准确性，为制定合适的手术方案做准备。
方法 选择 2013 年 6 月至 2018 年 9 月南京医科大学附属南京医院 9 例经手术病理确诊的乳头状肾细胞癌患者，其中男性 7 例，女性 2 例；年龄 35~91 岁，平均年龄 63 岁。行 CT 平扫及增强扫描，总结 CT 影像特点。
结果 CT 平扫 7 例病灶密度较均匀，呈低密度、稍高密度，2 例病灶密度不均匀，其中 1 例病灶内部可见钙化影，病灶边缘较清。动态增强扫描 9 例中有 7 例呈轻度渐进性强化，其中 2 例强化不均匀，9 例中有 2 例强化不明显。
结论 乳头状肾细胞癌的 CT 表现具有一定特点，根据强化方式可与肾透明细胞癌和复杂囊肿等鉴别，确诊依靠手术行病理学检查和免疫组织化学检查。

PU-0447

IVP 和 CTU 检查技术的比较及选择

谢赛
重庆黔江民族医院

目的 比较 IVP 和 CTU 检查技术在泌尿系统疾病的检出率，病人耐受情况，对临床的指导价值。
方法 1.资料与**方法**
1.1 一般资料
取我院同时进行 IVP 和 CTU 检查的患者 30 例，男 16 例，女 14 例，年龄 20~75 岁，平均年龄 35 岁，
临床症状均表现为不同程度的血尿，腰痛，膀胱刺激征等症状。
1.2 检查方法
IVP 检查**方法** 先拍摄腹平片，然后通过肘静脉注射非离子型对比剂 40~60ml，压紧压迫带，7、15、30 分钟腹部加压各摄片一张，减压后再拍摄一张，显影情况不佳可延长到 60 分钟再摄腹平片。CTU 检查**方法** 扫描参数为 120KV，350mAs，5mm 层厚螺旋扫描。扫描前空腹喝清水 800~1000ml，常规横断面扫面，扫描范围从肾上极至耻骨联合。用高压注射器经肘静脉以速率约 3mls 注入非离子型对比剂 85ml 左右，先行腹部三期扫描，观察输尿管充盈情况，充盈欠佳时，嘱咐患者不要排尿，20 分钟后行延迟扫描全尿路。
结果 2.**结果**
2.1 两组检查诊断泌尿系统疾病的准确率比较 IVP 检查诊断泌尿系疾病的准确率为 60%（20/30），CTU 检 查诊断泌尿系疾病的准确率为 97%（29/30），两种检查方法在诊泌尿系疾病的准确率方面比较 ，CTU 检查明显优于 IVP 检查。
2.2 两组检查病人耐受情况的比较 IVP 检查出现两例不能耐受，耐受率为 93%（28/30），CTU 检查患者情况良好，无不良反应，耐受率为 100%（30/30）。
结论 4.**结论**
CTU 较 IVP 有明显的优势，该检查深受临床方面的欢迎。随着低辐射计量 CT 及非离子型对比剂的发展，不久将来 CTU 将取代 IVP，从而更好应用于临床为患者服务。

PU-0448
多层螺旋 CT 三维重建技术在泌尿系梗阻性疾病中的临床应用

王卓骥
北华大学附属医院

目的 多层螺旋 CT 泌尿系三维重建技术对泌尿系梗阻性疾病定性、定位诊断的准确性，并与常规 CT 平扫相比较，评价多层螺旋 CT 三维重建技术在泌尿系梗阻性疾病中的临床应用价值。
方法 使用多层螺旋 CT 检查疑诊为泌尿系梗阻的患者共计 80 例，搜集完整的 CT 平扫及三维重建资料,并搜集整理所有患者的手术病理或病例追踪结果。以手术病理或病例追踪结果为金标准，将 CT 平扫结果与三维重建结果进行对比分析。
结果 1. 多层螺旋 CT 三维重建技术对 80 例泌尿系梗阻性疾病患者的定位诊断符合率为 96%，高于 CT 平扫的定位诊断符合率 83%；经过 X^2 检验，两种检查方法在诊断泌尿系梗阻性疾病之间的定位诊断符合率之间的差异有统计学意义（X^2= 7.964 P =0.005 p<0.01<0.05）。
2. 多层螺旋 CT 三维重建技术对 80 例泌尿系梗阻性疾病患者的定性诊断符合率为 93%，高于 CT 平扫的定性诊断符合率 75%；经过 X^2 检验，两种检查方法在诊断泌尿系梗阻性疾病之间的定性诊断符合率之间的差异有显著统计学意义（X^2= 9.001 P =0.003 p<0.01<0.05）。
结论 1.多层螺旋 CT 泌尿系三维重建技术方法安全、扫描快速、图像具有高分辨率，能对泌尿系统进行较全面的显示,对泌尿系梗阻性疾病的定位、定性诊断方面独具优势，提供了准确可靠的依据以满足临床上的诊治需求，是对泌尿系梗阻性疾病的检查较为理想的一种影像学检查方法。
2. 三维重建后获得的图像,能对病变进行不同方位、不同角度的观察，与常规横轴位 CT 平扫相比较，在诊断泌尿系梗阻性疾病方面具有较全面的优势。

PU-0449
Preliminary utilization of radiomics in differential diagnosis between uterine sarcoma from atypical leiomyoma

Yineng Zheng,Zhibo Xiao,Yang Liu,Fajin Lv
The First Affiliated Hospital of Chongqing Medical University

Purpose: This study aims to quantify the differences of MRI measurements between atypical uterine leiomyoma (AUL) and uterine sarcoma (US), so as to provide the basis for computer-aided diagnosis.

Method: Thirty-five patients that were histopathologically proven to have US and fifty patients that were diagnosed with AUL by surgical operation were selected. Then, the radiomics-based features consisting of shaped, statistical and texture features have been extracted using 3D regions of interest placed on T2-weighted images. Feature selection algorithms such as univariate analysis of variance, lasso and principal component analysis were employed to determine the optimal feature subset. Classification of these features is performed with four different machine-learning such as support vector machine (SVM), Random forest (RF), Artificial neural network (ANN) and K-nearest neighbor (KNN).

Result: The experimental results demonstrate that SVM performs better in the classification of different ROIs than the other models, which obtains an accuracy of

75.49% for identifying between AUL and US, and radiomics features achieve encouraging classification results on the optimal feature subset (AUC=0.842).

Conclusion: This study demonstrates that MRI radiomics analysis is valuable in supporting differential diagnosis between AUL and US.

弥散加权成像在 Gleason 评分 3+4 和 4+3 前列腺癌鉴别诊断中的应用研究

薛英楠,叶琼
温州医科大学附属第一医院

目的 研究体素内不相干运动弥散加权成像（IVIM）和体素内计算弥散加权成像（vcDWI）在鉴别 Gleason 评分 3+4 和 4+3 前列腺癌中的应用价值

方法 回顾性分析 2014 年 9 月至 2018 年 9 月期间在我院行术前多模磁共振检查，并行前列腺癌全切术 Gleason score（GS）=7 的患者，其中 GS3+4 前列腺癌 19 例，GS4+3 前列腺癌 24 例。在 ADC 图上基于阈值（ADC＜1.111 x $10^{-3}mm^2/s$）由计算机辅助选取肿瘤弥散区域（tDv）[1]，分别匹配到 IVIM 和 vcDWI 各参数图上[2-4]，计算 IVIM 乏氧相关参数分子弥散系数（Ds）、灌注分数（fp）和 vcDWI 相应 tDv 内的各参数值[5, 6]，包括均数， 标准差(STD)， 中位数， 峰度， 偏度和第 10 百分位数值。组间比较单因素分析 p＜0.1 的变量纳入逻辑回归模型，使用 ROC 曲线分析 IVIM 和 vcDWI 鉴别 GS3+4 和 GS4+3 前列腺癌的效能。

结果 GS3+4 组的 Ds 偏度值比 GS4+3 组低（p=0.015），而 fp 峰度值则比 GS4+3 组高（p=0.049）。vcDWI 图中 GS4+3 组 tDv 内的均数，中位数和 STD 值均比 GS3+4 组高。结合 IVIM 和 vcDWI，鉴别 GS3+4 和 GS4+3 前列腺癌的 ROC 曲线下面积为 0.844（准确率=81.4%，灵敏度=68.42%，特异度=95.83%）。

结论 1，IVIM 乏氧相关参数值在 GS3+4 和 GS4+3 组前列腺癌之间是存在差异的。2，联合 IVIM 和 vcDWI，有助于鉴别 GS3+4 和 GS4+3 组前列腺癌。

PU-0451

The exponential apparent diffusion coefficient derived from diffusion-weighted magnetic resonance imaging is associated with progression-free survival in patients with stage I/II cervical cancer treated surgically

Lei Deng,Xiaoxia Lu,Ali Shang,Quanxin Yang
the Second Affiliated Hospital of Xi'an Jiaotong University

Purpose: To explore the prognostic utility of exponential apparent diffusion coefficient (eADC) derived from diffusion-weighted MRI in patients with cervical cancer

Methods: This retrospective study included patients with stage I/II cervical cancer treated surgically in our hospital (August 2011 to June 2014). Patients underwent preoperative MRI (T1-weighted, T2-weighted and DWI). Baseline parameters recorded were:

age, menopause, stage, tumor dimensions, differentiation, pathology, lymph node involvement, mean ADC (ADC_{mean}), normalized ADC (nADC), eADC, DWI signal intensity (SI_{DWI}), T2-weighted imaging signal intensity (SI_{T2}), and postoperative adjuvant therapy. Baseline and MRI parameters associated with recurrence were identified by Cox regression analysis.

Results: Thirty-three patients were included (low eADC group, n=17; high eADC group, n=16). The high eADC group had higher ADC_{mean}, nADC and eADC and lower SI_{DWI} than the low eADC group (all P<0.001). PFS was longer in the low eADC group than in the high eADC group (P=0.010). In univariate analysis, ADC, nADC and eADC were associated with recurrence (all P<0.05). In multivariate analysis, only eADC (HR, 3.610; 95%CI, 1.467–8.886; P = 0.005) was associated with recurrence.

Conclusion: Preoperative eADC has comparable utility to ADC at predicting PFS in patients with stage I/II cervical cancer treated surgically, and eADC mapping may have an advantage over ADC mapping in terms of improved tissue contrast.

PU-0452
多层螺旋 CT 血管三维重建技术在女性生殖系统巨大肿瘤 定位诊断中的应用

许晨阳
河南省人民医院

目的 探讨多层螺旋 CT 血管三维重建技术在女性生殖系统巨大肿瘤定位诊断中的应用价值。
方法 回顾性分析我院 2018 年 1—6 月经病理证实的 18 例女性生殖系统巨大肿瘤来源，采用多层螺旋 CT 血管三维重建技术寻找肿瘤供血动脉，进行定位诊断，并与病理结果对照分析。
结果 18 例女性生殖系统巨大肿瘤，将卵巢动脉单独供血 3 例、子宫动脉卵巢支单独供血 2 例、子宫动脉卵巢支与卵巢动脉共同供血 5 例，定位为卵巢来源的肿瘤。将子宫动脉单独供血 5 例、由子宫动脉供血为主，卵巢侧支动脉供血为辅的 3 例，定位为子宫来源的肿瘤。其结果与病理结果完全吻合。
结论 多层螺旋 CT 血管三维重建技术可以显示女性生殖系统巨大肿瘤的供血动脉来源，为定位诊断提供了依据。

PU-0453
3.0TMRI 在卵巢上皮良恶性肿瘤诊断中的应用价值

闫瑶瑶,宋建勋
深圳市宝安区人民医院

目的 探讨 3.0TMRI 平扫、弥散加权成像（DWI）及多期动态增强成像（DCE-MRI）在卵巢上皮肿瘤良恶性诊断中的应用价值。
方法 回顾性分析 2018 年 1 月至 2019 年 6 月 48 例卵巢肿瘤患者均行手术切除治疗及病理对照，年龄为 14 岁-71 岁，主要症状为腹部或盆腔包块、腹水、腹痛，月经紊乱，阴道不规则流血，每位患者均行盆腔常规 MR 平扫包括 T2WI 矢状位、T1WI 及 T2WI 压脂序列轴位、DWI 及动态增强扫描。两名主治医师职称以上影像诊断医生观察并分析病灶的大小、形态、信号、边界、质地、囊实性比例以及强化方式、病变与周围组织的关系、有无腹水及肿大淋巴结。

结果 术前 48 例患者行 MRI 检查经术后病理证实，共 56 个肿瘤；囊性病变 22 例 26 个病灶，MRI 诊断与病理诊断均为良性；囊实性病变 22 例 30 个病灶，囊性为主伴有少部分实性成分变 12 例 16 个病灶（交界性肿瘤 8 例，透明细胞癌 4 例），MR 表现较大囊样长 T1 长 T2 信号，实性成份较少，呈稍长 T1 稍长 T2 信号，DWI 为较高信号，增强呈明显强化，部分伴少量腹水，MR 诊断交界性肿瘤，病理诊断 8 例交界性肿瘤 4 例低度恶性肿瘤，4 例双侧病变；实性成分为主并伴有大小不等囊性病变 12 例患者 14 个病灶，MRI 表现实性成分较多呈稍长 T1 稍长 T2 信号，DWI 呈高信号，增强呈明显强化，囊性部分较少呈长 T1 长 T2 信号，囊壁可见强化（子宫内膜样腺癌 4 例，高级别囊腺癌 6 例，转移性腺癌 2 例，2 例双侧病变）。对肿瘤良恶性判断中，卵巢单纯囊性病变组与囊实性病变组差异有统计学意义（P<0.05）；囊实性病变中，实性成分所占病变并比例越大恶性程度越高，具有统计学意义（P<0.05）；囊实性病变中，囊性成分的分布无统计学意义（P<0.05）。
结论 3.0TMRI 高场强磁共振对卵巢上皮肿瘤良恶性的诊断及恶性程度的术前评估在临床方面具有较大临床意义很高的应用的价值。

PU-0454
高分辨率 CT 靶扫测量输尿管壁厚度作为预测输尿管镜下治疗输尿管下段梗阻性结石的应用研究

潘奇
西安医学院第二附属医院

目的 测量输尿管壁厚度预测输尿管镜下治疗的输尿管下段结石是否为梗阻性结石。
方法 顾性分析自 2014 年 2 月至 2018 年 2 月共计 320 例接受输尿管镜手术的患者资料，通过高分辨 CT 平扫测量结石周围输尿管管壁厚度，通过 ROC 曲线分析输尿管管壁厚度，通过不同诊断分界点的灵敏度和特异度确定最佳诊断分界点。
结果 20 例患者中，梗阻性结石的患者为 119 例，患者所患结石是否合并肾周渗出、结石的数量、大小、输尿管管壁厚度均具有明显统计学意义（P＜0.001），通过 ROC 曲线分析得出分界点 3.15mm 对应的诊断指数最大。
结论 尿管管壁厚度可以预测输尿管下段梗阻性结石，从而预测输尿管镜碎石术的难易度。

PU-0455
不典型子宫脂肪平滑肌瘤 MR 误诊一例

张艳,王学建,陈佳,谢婕
贵航贵阳医院

目的 探讨子宫脂肪平滑肌瘤的影像学表现。
方法 患者行盆腔 MRI 平扫、DWI 序列、增强扫描。团注 Gd-DTPA 0.2mmol/kg 后行轴位、矢状位抑脂增强扫描。
结果 CT 或 MRI 上发现瘤体内的脂肪密度或信号，从局灶性到弥漫性分布，甚至完全由脂肪成分构成，MRI 抑脂序列其信号丢失，病灶包膜完整，增强后软组织部分呈轻-中度强化，而脂肪成分无强化，瘤体内多无钙化及脂-液平面，无液化及囊变。
结论 子宫脂肪平滑肌瘤临床较为罕见，瘤体内含有特征性的脂肪成分，提示我们在日常工作中正确诊断。

PU-0456

磁共振联合超声对异位妊娠的诊断价值

徐峰,吴永彦
贵阳市妇幼保健院贵阳市儿童医院

目的 探讨磁共振联合超声对异位妊娠的诊断价值。
方法 回顾性分析 33 例经手术病理证实的异位妊娠的 MRI 及超声表现，结合临床进行分析。
结果 3 例宫角妊娠，7 例输卵管间质部妊娠，11 例子宫瘢痕妊娠，2 例卵巢妊娠，5 例子宫颈妊娠，2 例子宫残角妊娠，1 例肌壁间妊娠、1 例阔韧带妊娠。MRI 诊断准确率为 95%，超声诊断正确率 92%。
结论 MRI 联合超声对异位妊娠临床早期明确诊及治疗具有重要价值。

PU-0457

肾血管性病变的双源 CT 诊断

周德兴
徐州医科大学附属医院

目的 双源 CT 对肾血管性病变的诊断与临床使用价值
方法 回顾性分析 2013-2016 年来双源 CT 肾血管成像 120 例，其中男 73 例，女 47 例，年龄 14-78 岁，临床有高血压、腰酸、腰痛、血尿、尿频、尿急等。将原始扫描数据传输至后处理工作站进行图像后处理，应用最大密度投影 MIP、多平面重建 MRP、曲面重建 CPR、容积再现 VR 对肾脏血管进行分析。
结果 **血管正常表现及解剖变异**：肾动脉变异：1 肾副动脉（44 例）2 肾动脉过早分支（8 例）肾静脉变异：1 肾副静脉 （3 例）2 主动脉后左肾静脉（1 例）3 环主动脉左肾静脉（2 例）4 左肾静脉汇合较晚（5 例）**肾动脉病变**：1.肾动脉狭窄（58 例）a 动脉粥样硬化（45 例）b 纤维肌性发育不全（1 例）c 大动脉炎（3 例）d 其他原因 2.肾动脉瘤(6 例)3.肾动静脉畸形（4 例）4.主动脉夹层累及肾动脉（7 例）5.肾栓塞及肾梗死（15）6 肾癌（13）**肾静脉病变**：1.“胡桃夹”现象（5 例）2.肾静脉栓子（血栓、癌栓 9 例）
结论 A 具有很高的空间分辨率，但需行动脉插管、注射造影剂剂量较大，接受 X 线辐射量较多、具有一定的危险性，不能完全提供满意的血管信息
双源 CTA1、经济、方便、无创，准确度等于 DSA2、获得的图像类似血管造影图像 3、三维重建可以从不同角度显示血管结构 4、成像速度快，不受呼吸、搏动、蠕动等影响 5、可以识别管壁的钙化斑块

PU-0458

囊性卵巢甲状腺肿的 CT 表现分析

李强
宁波市鄞州人民医院

目的 探讨囊性卵巢甲状腺肿的影像表现，提高诊断准确率。

方法 回顾性分析 7 例囊性卵巢甲状腺肿的临床、病理和影像资料。分析指标包括位置、肿块大小、外形、边界、内部成份、强化情况以及肿瘤标志物和甲状腺功能等生化指标。
结果 7 例囊性卵巢甲状腺肿左侧 4 例（57.14%），右侧 3 例。肿块大小 3.3-5.8 cm，平均 5.1 cm；囊壁均表现为光滑且边界清晰，多分叶囊（分叶≥3 个）4 例（占 57.14 %），囊壁弧形、线样钙化 7 例（100%）；囊内钙化 3 例（42.86%），肿块内含脂肪成份 3 例（42.86%）；内见结节高密度 4 例（57.14%）；7 例患者均未发现特异性临床症状。
结论 囊性卵巢甲状腺肿临床症状不典型。CT 图像上附件区多分叶囊性结构、点线样钙化的囊壁、贴壁生长的高密度实性成份是诊断该病的重要依据，增强扫描后实性结节明显强化有助于确定诊断。

PU-0459
单源双能 CT 碘定量鉴别膀胱良性肿瘤与膀胱尿路上皮癌的价值初探

杨伟萍,刘爱连,王学东,牛雅欣
大连医科大学附属第一医院

目的 单源双能 CT 碘定量对膀胱良性肿瘤（Benign Bladder Neoplas，BBN）与膀胱尿路上皮癌（Urothelial Carcinoma of the Bladder，UCB）的鉴别诊断价值。
方法 性分析经手术病例证实，且术前行盆腔单源双能 CT 能谱成像检查的膀胱良性肿瘤 8 例（内翻性乳头状瘤 7 例，平滑肌瘤 1 例），膀胱尿路上皮癌 15 例。采用能谱扫描模式进行三期动态增强扫描。应用 GSI 综合分析平台，生成动、静脉期碘（水）浓度图。由两位观察者分别测量两组病灶动、静脉期的碘（水）浓度值（Iodine Concentration，IC），记为 ROI_T，同时测量同层面髂动脉的碘（水）浓度值，记为 ROI_A，并计算两期标准化碘水浓度值（Normalized Iodine Concentration，NIC，$NIC = ROI_T/ROI_A$）。采用组内相关系数（ICC）检验两位观察者测量各期数据结果的一致性，采用单个样本 K-S 检验分析数据正态性，采用曼-惠特尼 U 检验分析分析两组病灶增强两期的 NIC 的差异，采用 ROC 曲线分析有统计学差异参数的诊断效能。
结果 观察者获得的各项数据一致性良好（ICC>0.8）。动脉期 UCB 的标准化碘（水）浓度值显著高于 BBN，差异具有统计学意义（$P<0.05$）；静脉期两组病灶的标准化碘（水）浓度值之间均无统计学差异（$P>0.05$）。动脉期标标准化碘（水）浓度值诊断 UCB 的 AUC 为 0.817，敏感度和特异度分别为 100%与 75%。
结论 双能 CT 动脉期标准化碘（水）浓度值可定量鉴别膀胱良恶性肿瘤，具有一定临床应用价值。

PU-0460
腹部和盆腔恶性孤立性纤维瘤/血管外皮细胞瘤的影像学表现

刘显旺[1,2,3],周俊林[1,2,3]
1.兰大二院
2.兰州大学第二临床医学院
3.甘肃省医学影像重点实验室

目的 探讨腹部和盆腔恶性孤立性纤维瘤/血管外皮细胞瘤(solitary fibrous tumor/Heman - giopericytoma,STF/HPC)的影像学表现，以提高其诊断准确率。

方法 回顾性分析 10 例经手术病理证实的腹部和盆腔 STF/HPC 患者的影像、临床及病理资料，其中 2 例行 CT 平扫，7 例行 CT 平扫及增强检查，1 例仅行 MR 平扫。分析 CT、MR 影像学特征，并与病理学结果进行对照研究。
结果 10 例中，男性 7 例，女性 3 例，平均年龄 49.7 岁，中位年龄为 50 岁，9 例单发，1 例多发，分别位于膀胱 4 例，阴囊 1 例，盆腔 1 例，腹膜后 2 例，膈肌 1 例，肝脏 1 例。肿瘤最大径范围约 3.5-13.2cm 中位数为 8.0cm，7 例边界清楚，3 例与周围组织分界不清，4 例呈分叶状，6 例呈圆形或类椭圆形；1 例行 MR 扫描，内部信号不均匀，TIWI 呈低信号，T2WI 呈稍高信号，并可见血管影；9 例行 CT 扫描，CT 平扫密度不均匀，内见不规则的片状低密度影，7 例增强扫描后呈中度-明显不均匀强化，4 例肿瘤内可见血管影。
结论 腹部和盆腔恶性 STF/HPC 的影像学表现具有一定特征性，当腹部及盆腔 STF/HPC，信号/密度不均匀，增强后中度-明显不均匀强化、肿瘤内部有血管影，并出现与周围组织分界不清等影像学特征时，高度提示恶性 STF/HPC 可能。

PU-0461

胃肠外间质瘤 1 例

郑慈娜
厦门大学附属中山医院（原:厦门中山医院）

患者，男，57 岁，以进行性排尿困难 4 年，小便不能自解 13 小时入院。膝胸位肛诊：前列腺双侧叶Ⅲ度大，中央沟消失，右侧叶质硬，与周围界限不清，左侧叶质中，表面光滑，无压痛，未及硬结。

病理诊断：双侧前列腺组织梭形细胞性肿瘤，结合形态学及免疫组化，考虑胃肠道外胃肠间质瘤。
讨论：胃肠间质瘤可以发生于消化道任何一个部位，但临床发现一些定位于胃肠道外间叶源性肿瘤其形态学、免疫表型及分子生物学特征也与 GIST 相同，为区别胃肠道来源间质瘤，医学上目前将这些非胃肠来源间质瘤称之为胃肠外间质瘤 。EGIST 较为罕见,仅占 GIST 的 5% 。EGIST 可发生于网膜、肠系膜及腹膜后，也可罕见于肝脏、胰腺及膀胱等部位。临床上多见于中老年男性，以 45~ 65 岁为其好发高峰。临床表现无特异性，常表现为腹痛、腹胀、便秘、食欲缺乏、恶心、呕吐、消瘦和腹水，而无明显消化道及肠梗阻症状。肿瘤多在腹腔内或腹膜后生长,当发展至较大时,因推挤、侵犯邻近器官而引起相应症状。EGIST 具有 GIST 类似的病理特征与免疫表型，GIST 最具有特征的免疫组织化学标记物是 CD117。
影像学上，EGIST 多呈类圆形或分叶状，较巨大，具有侵袭性，与周围组织及器官粘连紧密，周围组织多呈推压、移位改变。CT/MR 平扫肿瘤多呈囊实性软组织密度/信号，肿瘤易黏液样变性或出血、坏死、囊变等，钙化少见。增强扫描，动脉期肿块实性部分轻度不均匀强化，静脉期则呈中度到明显不均匀强化，静脉期强化程度高于动脉期，肿瘤内坏死，黏液变区未见明显强化。因本例 EGIST 位于前列腺区，需与前列腺癌相鉴别。但本例患者 PSA 在正常范围，而前列腺癌 PSA 均见不同程度升高。

PU-0462

Quantitative Assessment of Prostate Cancer Aggressiveness in Diffusion Kurtosis imaging: Comparison of Two Methods of Delineating ROI

Xiangyu Wang[1], Fan Lin[1], Yi Lei[1], Yuli Wang[1], Guangyao Wu[2]
1. The First Affiliated Hospital of Shenzhen University
2. Shenzhen University General Hospital

Purpose: To determine the impact of two different methods for delineating region of interest(ROI) from ADC map derived from conventional monoexponential DWI, Dapp and Kapp maps derived from diffusion kurtosis imaging (DKI) on the assessment of prostate cancer aggressiveness in a preliminary study.
Materials and Methods: A total of 60 patients with prostate cancer who underwent MRI Scan were enrolled in this study. The PCa patients were divided into low grade group (L-PCa) and intermediate-/high-grade group (I/H-PCa). ADC , D_{app} and K_{app} values were respectively measured by two radiologists blind to patients' clinicopathological data based on the following two different methods to delineating ROIs: three slices ROIs (three-ROIs) and whole-tumor volume ROIs (WTV) Interobserver variability was analyzed by calculating intraclass correlation coefficient (ICC). Paired-Samples T Test, ROC curve analysis, Delong test were used. Pearson correlation analysis was used to evaluate the correlation between the values of these parameters and the Gleason score (GS).
Results: 60 patients with prostate cancer were included, including 19 cases of GS≤3+4 (31.67%) and 41 cases of GS≥4+3 (68.33%). The ICCs of all the parameters between two radiologists were higher than 0.75. The ADC, D_{app} and K_{app} values based on three-ROIs and WTV were significantly different between L-PCa and I/H-PCa groups ($P<0.001$). The AUCs of ADC, D_{app} and K_{app} values using three-ROIs and WTV were 0.823, 0.839, 0.829, 0.854, 0.779 and 0.791, respectively (all $P\leq0.001$). There were no significant difference in AUCs using three-ROIs and WTV (all $P>0.05$). Nonetheless, the assessment results of prostate cancer aggressiveness demonstrated that the AUCs of ADC, D_{app} and K_{app} values of WTV exhibited an increasing tendency, compared to three-ROIs. There was a median to significantly negative correlation between the ADC, D_{app} values based on three-ROIs and WTV and Gleason score (-0.573, -0.619, -0.599, -0.616, all $P < 0.01$), and a median positive correlation between the K_{app} value and Gleason score (0.441, 0.476, $P < 0.01$).
Conclusion: The pilot study demonstrated that two methods of drawing ROI can both evaluate prostate cancer aggressiveness. There is a slightly higher trend in WTV in PCa grading, Therefore, WTV may be desirable to define an optimal delineating method for the assessment of tumor heterogeneity.

PU-0463

增强 T2*加权血管成像（ESWAN）序列多定量参数鉴别子宫肉瘤与变性子宫肌瘤的价值初探

田士峰, 刘爱连
大连医科大学附属第一医院

目的 探讨增强 T_2^*加权血管成像（ESWAN）序列多定量参数鉴别子宫肉瘤（US）与变性子宫肌瘤（DH）的价值。
方法 回顾性分析经手术病理证实的 17 例 US 和 33 例 DH 的患者资料，术前均行 1.5T MRI 检查（含 ESWAN 序列），由两位观察者分别测量两组病例 ESWAN 序列后处理参数，包括幅度值、相位值、R_2^*值、T_2^*值。采用组内相关系数（*ICC*）检验两位观察者对各参数值测量结果的一致性，采用独立样本 *t* 检验或 *Mann-Whitney* 秩和检验比较两组病例各参数值的差异，采用 *ROC* 曲线评估有统计学差异的参数对两组病例鉴别诊断的效能。

结果 两位观察者测量两组病灶各参数的一致性均很好（*ICC*>0.75）。US 组的幅度值、相位值、R_2^*值、T_2^*值分别为 921.54±278.30、[0.025（0.012,0.056）] 弧度、（14.04±3.99） Hz、[96.95（82.14,113.23）] ms，DH 组的上述参数分别为 959.32±325.98 、[0.007（-0.002,0.016）]弧度、（22.45±5.47）Hz、[48.15（40.19,56.80）] ms，US 组的相位值、T_2^*值大于 DH 组，R_2^*值小于 DH 组，差异均有统计学意义（*P*<0.05）；两组间幅度值差异无统计学意义（*P*>0.05）。相位值、R_2^*值、T_2^*值对 US 诊断的 *AUC* 分别为 0.854、0.900、0.961，阈值分别为 0.007 弧度、14.28 Hz、73.46 ms。

结论 ESWAN 序列的相位值、R_2^*值、T_2^*值能够有效鉴别 US 与 DH，具有一定临床应用价值。

PU-0464

MRI 对胎物残留的诊断及临床价值

李裕丹,高欣
德阳市人民医院

目的 探讨 MRI 对胎物残留的诊断和指导临床治疗的作用。

方法 对 14 例经病理证实的胎物残留患者进行回顾性研究。所有患者接受了核磁共振成像，分析病灶的大小、T1WI 及 T2WI 信号强度、动态强化方式、附着子宫肌层范围及浸润肌层深度，并将 MRI 结果与临床治疗经过进行对比分析。

结果 胎物残留的大小在 2.2×3.4×1.9cm ~ 18.2×21.4×10.0mm。T1WI 环形高信号者 3 例，高信号者为 3 例，混杂信号者 6 例，低信号者 1 例，等信号者 1 例；T2WI 呈高信号者 5 例，高、低混杂信号者为 5 例，低信号者为 4 例。 富血供者 7 例，乏血供者 3 例。4 例与子宫接触面积达半圆，所有胎物残留浸润肌层处不同程度变薄。3 例富血供患者经高强度聚焦超声（HIFU）治疗后，在动态增强 MRI 上表现为完全梗死的胎物残留，2 例经子宫动脉栓塞后行清宫术，2 例行子宫次全切除术，余患者中 1 例行宫腔镜下宫腔占位电切术，6 例行米非司酮及甲氨蝶呤杀胚治疗。

结论 MRI 对评价胎物残留附着肌层范围、深度及血供情况有助于临床评估及治疗。MRI 对胎物残留的诊断和指导临床治疗具有重要意义。

目的 能谱 CT 单能量成像提供了 101 组单能量图像用于不同的临床需求，本研究探讨能谱 CT 平扫鉴别肾盂旁囊肿与非结石性肾积水的最佳单能量水平。

方法 回顾性分析本机构经能谱 CT 动态增强扫描及 CT 尿路造影（CTU）确诊的肾盂旁囊肿患者 42 例，肾积水患者 46 例。在连续三个层面测量 40-140keV（间隔 10keV）单能量图像上肾盂旁囊肿或扩张的肾盂肾盏 CT 值。比较 11 组单能量水平的差别，绘制受试者特征曲线，并计算曲线下面积。

结果 两组病灶同侧肾实质 40-140keVCT 值差异均无统计学意义(all p>0.05)。肾盂旁囊肿及非结石性肾积水 40-140keVCT 值差异均有统计学意义(p<0.01)，其中以 60keV 的曲线下面积最大，为 0.810（95%CI：0.716-0.904），敏感性及特异性分别为：71.74%%和 88.10%。
结论 能谱 CT 平扫单能量图像的 CT 值对鉴别肾盂旁囊肿与非结石性肾积水具一定价值，对于无症状的肾盂旁囊肿患者可避免 CT 增强或 CTU 检查而降低电离辐射剂量及对比剂负荷，其中 60keV 的 CT 值对鉴别肾盂旁囊肿与非结石性肾积水表现出最高的诊断效能。

能谱 CT 影像组学构建肾透明细胞癌 WHO/ISUP 分级的预测模型

韩冬[1,2],于勇[1,2],贺太平[1,2],雷雨欣[1],任嘉梁[3],段海峰[1],于楠[1,2]
1.陕西中医药大学附属医院
2.陕西中医药大学
3.GE（中国）医疗

目的 能谱 CT 影像组学构建肾透明细胞癌(ccRCC)WHO/ISUP 分级的预测模型。
方法 回顾性收集本院行 CT 增强扫描并经病理确诊的 ccRCC 患者 104 例。采用分层抽样将患者分为训练组(73 例)和验证组(31 例)。根据肾癌 WHO/ISUP 分级将 I 级及 II 级定义为低级别组，III 级及 IV 级定义为高级别组。皮质期图像被导入 ITK-Snap 及 A.K.软件中用于肿瘤分割及影像组学特征提取。采用 Lasso 回归对训练组影像组学特征进行降维，并建立影像组学风险评分。以 WHO/ISUP 分级为金标准，采用逻辑回归选择预测肾 ccRCC 分化程度的独立危险因素，并构建预测模型。将该预测模型用于验证组数据中。采用 Bootstrap 法对模型进行内部验证，分别计算 C 统计量、敏感度及特异度。采用 Hosmer-Lemeshow 拟合优度检验(HL-test)评价模型的校准度。采用决策曲线分析不同概率阈值下的患者净获益情况。
结果 LASSO 回归后的 19 个特征及其系数的线性加权建立影像组学风险评分。二元逻辑回归结果表明仅影像组学风险评分是预测 ccRCC 分化程度的独立危险因素,OR 值为 3.576。影像组学风险评分在训练组经 Bootstrap 法内部验证 C 统计量为 0.940，灵敏度为 95.5%，特异度为 88.2%。HL-test 表明该预测模型的校准度较好(p=0.813)。影像组学风险评分在验证组 C 统计量为 0.859，灵敏度为 77.8%，特异度为 81.8%。HL-test 结果表明该预测模型的校准度较好(p=0.068）。验证组决策曲线分析显示，概率阈值在 2%～95%时，影像组学预测 ccRCC 病理分级优于将所有患者都认为高级别，也优于将所有患者认为低级别。
结论 基于 ccRCC 能谱 CT 动态增强皮质期虚拟单能量图像的影像组学构建的预测模型，对预测高、低级别具有一定的临床价值，可为患者术前治疗及预后提供参考依据。

PU-0467
增强后 T2WI 反转恢复压脂序列对膀胱癌 T 分期的应用价值

邓文明[1],罗德红[1,2],康文焱[1],文洁[1],何翠菊[1]
1.中国医学科学院肿瘤医院深圳医院
2.中国医学科学院肿瘤医院

目的 探讨 T2WI-Flair-FS 增强扫描序列在膀胱癌 T 分期中的应用价值，为制定治疗方案提供可靠依据。
资料和方法 收集 28 例行盆腔增强 MRI 检查的膀胱癌患者，扫描 T1WI、DWI、小野高清 T2WI、T2WI-Flair-FS 和增强后的 DCE-LAVA、T2WI-Flair-FS 序列。由 1 名放射科副主任医师分别以 DWI+T2WI+DCE 组合、增强后 T2WI-Flair-FS 序列两种方法进行 T 分期，并与病理进行比较。分期

方法为：非肌层浸润型膀胱癌（Non-Muscle Invasive Bladder Cancer，NMIBC），主要包括 Tx~T1 期；肌层浸润性膀胱癌(Muscle Invasive Bladder Cancer，MIBC)主要包括 T2~T4 期。两种方法的敏感性及特异性比较采用 x^2 检验，以 P＜0.05 为差异有统计学意义。

结果 28 例 45 个病灶中，单发 18 例，2 个病灶 5 例，3 个病灶 3 例,4 个病灶 2 例。经手术或病理证实，确诊为 NMIBC(T 分期＜T2a 期)14 个(31.1%)、MIBC（T 分期≥T2a)31 个(68.9%)。DWI+T2WI+DCE 组合诊断为 NMIBC、MIBC 分别为（11/45）、（34/45），增强后 T2WI-Flair-FS 诊断为 NMIBC、MIBC 分别为（13/45）、（32/45）。由于样本量不足，采用 Fisher 精准检验，结果显示 P＜0.001，提示增强后 T2WI-Flair-FS 序列诊断膀胱癌肌层侵犯与否的敏感性与特异性优于 DWI+T2WI+DCE 组合。

结论 增强后 T2WI-Flair-FS 对于诊断膀胱癌肌层侵犯有较高的诊断效能，是鉴别 NMIBC、MIBC 的有效方法。

PU-0468

肾肉瘤样癌的 CT 特征分析

张莹莹
辽宁省肿瘤医院

目的 肾肉瘤样癌(sarcomatoid renal cell carcinoma，sRCC)是肾细胞癌(renal cell carcinoma， RCC)亚型的一种变异，它可以发生在任何肾细胞癌亚型，具有恶性程度高、浸润性强、预后差的特点。本文回顾性分析 4 例肾肉瘤样癌患者的 CT 图像，并复习相关文献，探讨肾肉瘤样癌的 CT 特征。

方法 收集病理证实为肾肉瘤样癌患者 4 例术前 CT 检查资料，分析其 CT 表现。

结果 4 例病灶位于左肾 3 例，右肾 1 例。4 例均为囊实性病灶，密度不均，形状不规则，边界不清。4 例均未见到钙化及出血改变。病灶直径 32mm～117mm，平均 81.5±39.03mm。多期增强扫描病灶不均匀强化，强化程度低于肾皮质；2 例肾周筋膜增厚并见肾周积液；1 例肾周见多发结节；2 例腹膜后淋巴结转移；2 例肺转移。

结论 肾肉瘤样癌的 CT 表现有一定特征性，正确认识肾肉瘤样癌的 CT 特征性表现，将为临床制定治疗计划和判断预后提供更可靠的参考依据。

80%ASIR-V 在 CTU 成像中的应用价值

王楠[1],郭旭[1],刘义军[1],刘爱连[1],刘静红[1],赵莹[1],李剑颖[1]
1.大连医科大学附属第一医院
2.通用电气公司

目的 Revolution CT 机(80%ASIRV)与 HD750CT 机(30%ASIR)对比，探讨高权重 ASIRV 在 CT 尿路造影(CT urography, CTU)中的应用价值。

方法 回顾性分析 2017 年 5 月和 10 月 Revolution CT 机进行 CTU 检查的患者，为 A 组；以及同时期在 HD750 CT 机进行 CTU 检查的患者，为 B 组。所有入组病例均未发现器质性病变。两台 CT 机扫描层厚/层间隔 5mm，重建层厚/层间隔 1.25mm。由两位医师(分别工作 5 年，3 年)分别选择 1.25mm 图像进行数据测量，包括两组图像的膀胱 CT 值、SD 值，两侧臀大肌 CT 值、SD 值。计算对比噪声比(CNR)、信噪比(SNR)和有效辐射剂量(effective dose, ED)，记录容积 CT 剂量指数(volume CT dose index, $CTDI_{vol}$)及平脐层面图像的长径（a）、短径（b）。由两位医师(分别工作 5 年，3 年)

共同对两组图像进行主观评价。采用组内相关系数(ICC)比较两位观察者所测量数据的一致性，选择高年资医师所测数据进行后续统计学分析。膀胱 SD 值、有效辐射计量的比较采用独立样本 t 检验，臀大肌 SD 值、SNR、CNR 的比较采用 Mann-Whitney U 检验，P<0.05 具有统计学差异。
结果 两位医师测量数据一致性良好(ICC 均>0.8)。A 组的 CNR 及 SNR 均高于 B 组，差异具有统计学意义(P<0.05)；A、B 组的膀胱 SD 值及 $CTDI_{vol}$ 无统计学差异(P>0.05)。
结论 80%ASIRV 能够保证同等辐射剂量条件下，提高 CTU 图像质量。

PU-0470

Diffusion and perfusion MRI in the assessment of tumor grade in endometrial carcinoma

璟 xuan Jiang,Xianhua Wu
Affiliated Hospital of Nantong University

Objective: Our purpose was to evaluate the diagnostic performance of preoperativedynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) and diffusion-weighted imaging (DWI) in discriminating tumour grades of endometrial carcinoma (EC). **Methods**: Fifty-one patientswith EC who underwent DCE-MRI and standard DWI before confirmation by histopathology were enrolled in this study. Parameters derived from DCE-MRI and DWI were measured, the optimal cut-off values for differential tumour grades of EC were determined, and the combinations of the two methods were evaluated. MRI parameter differences between high-grade (grade 3) and low-grade (grade 1 and 2) tumours were tested using Wilcoxon signed-rank tests.The diagnosticperformance of the (combined) parameters for differentiation between different EC tumour grades was determined using ROC analysis. **Results**: Significantly higher K^{trans}, $K_{ep}$and ADC values were found in high-grade EC than in low-grade EC (all $p < 0.001$). There was no significant difference in theVe values between the two groups. The area under the curve (AUC) of thecombined DWI and DCE-MRI model was significantly larger than that of theDCE-MRI model andthat of thesingle parameters of DWI (ADC) and DCE-MRI ($K^{trans}$and K_{ep})(0.95 vs. 0.79, 0.88, 0.78 and 0.72; $p < 0.05$, respectively). **Conclusion**: DCE-MRI and DWI, particularly when used in combination, are promising methods for the assessment of EC tumour grade.

PU-0471

影像组学结合临床指标在肾脏嫌色细胞癌和嗜酸性细胞腺瘤中的鉴别诊断价值

于子洋,任克
中国医科大学附属第一医院

目的 探讨肾脏增强 CT 的纹理分析与临床指标相结合的影像组学在鉴别肾脏嫌色细胞癌（Chromophobe cell renal carcinoma; CCRC）和嗜酸性细胞腺瘤（Renal oncocytoma，RO）中的价值。

方法 回顾性分析 64 例 CCRC 和 31 例 RO 肾脏肿瘤病灶的 CT 图像，采用 ITK-SNAP version 4.11.0 软件进行感兴趣区勾画并使用 A.K.Version V3.0.0.R 软件提取纹理特征。通过随机森林算法纳入的纹理特征建立影像组学标签。采用 Logistic 回归评价影像组学标签结合临床指标在 CCRC 和 RO 中的鉴别效能。
结果 随机森林算法构建的影像标签对于鉴别 CCRC 和 RO 具有较好的预测效能，所构建的三个模型中皮质期模型的预测准确性为 0.876；实质期模型的预测准确性为 0.861；两期混合后模型的预测准确性为 0.945。结合肌酐、尿素氮后，三个模型的 AUC 值分别地提高到 0.930，0.932 和 0.968。
结论 基于 CT 图像的影像组学结合临床指标研究对 CCRC 和 RO 的鉴别诊断具有临床价值。

PU-0472

Multislice spiral computed tomography signs of invasion of the renal capsule by renal cell carcinoma

Yanman Zhang
Affiliated Hospital of Nantong University

Purpose:Capsular invasion is frequently detected in localized renal cell carcinoma (RCC) specimens and is associated with a poor prognosis, but the pretreatment imaging features are poorly known. This study aimed to explore the positions and margin types of RCC and various computed tomography (CT) signs, as well as the correlations with the presence/absence of RCC invasion of the renal capsule.
Medthod:This was a retrospective study of 158 consecutive patients treated for pathologically confirmed RCC between January 2013 and December 2016 at the Nantong University Affiliated Hospital. The patients were divided into the capsule invasion and noninvasion groups. The CT signs were analyzed (position type, margin type, and CT findings in the perirenal fat).
Result:There were 92 (58.2%) men and 66 (41.8%) women; mean age was 59.1±12.8. Renal capsule invasion was confirmed in 45 cases. There was no difference in the position types between the 2 groups (all P>.05). The smooth margin was more common in the noninvasion group (53.1% vs 15.6%, P<.01). The deep lobulated type and the saw tooth sign were more common in the invasion group (57.8% vs 7.1%; and 40.0% vs 6.2%; both P<.01). The deep lobulated (OR=2.03, 95%CI: 1.21–3.39, P=.007) and saw tooth (OR=1.036, 95%CI: 1.008–1.065, P=.011) signs were independently associated with renal capsule invasion.
Conclusion:Smooth tumor margin suggests the absence of renal capsule invasion, while the deep lobulated and the saw tooth signs strongly suggest the presence of renal capsule invasion in patients with RCC.

PU-0473
数字断层融合技术（DTS）结合静脉肾盂造影（IVP）在泌尿系结石诊断中的影响因素及诊断效能分析

何子龙,秦耿耿,黄国慈,杜钢,曾辉,文婵娟,徐维敏,陈卫国
南方医科大学南方医院

目的 探讨数字断层融合技术（DTS）结合静脉肾盂造影（IVP）在诊断泌尿系结石中的影响因素和分析各种影响因素的危险度及诊断相关性，进而分析 DTS +IVP 在泌尿系结石的诊断效能。
方法 回顾性分析并收集 2015 年 10 月至 2018 年 10 月同时行静脉肾盂造影（IVP）及数字断层融合技术+静脉肾盂造影（DTS+IVP）检查，并经临床随访或 CT 证实输尿管结石的病人，共 500 例。由三个高年资医师二次阅片对其影响因素进行提取，获取与影响检出泌尿系结石相关性高的因素，使用全变量 logistic 回归分析对其危险度进行分析。再基于两种诊断方式诊断效能获取 AUC 值，建立 ROC 曲线并进行方差分析。
结果 共提取 27 个影响因素，一般情况 5 个，临床症状 5 个，影像学特征 17 个，经分析得其中 4 个有统计学意义，分别为：结石形态、大小、位置及密度。其中为危险因素（有利检出）：IVP 为结石形态（OR=3.61）、大小（OR=1.12）、位置（OR=5.82）及密度（OR=16.56）；DTS 为结石形态（OR=12.71）及密度（OR=11.91）；DTS+IVP 为结石形态（OR=13.11）、位置（OR=4.27）、大小（OR=7.57）及密度（OR=16.94）。IVP、DTS 及 IVP+DTS 的 AUC 值分别为 0.87、0.90 及 0.93，方差分析 P<0.001，其 AUC 值之间对比有统计学意义。
结论 IVP 上输尿管全程显影时加摄 DTS，可降低结石形态、位置、密度及大小的影响，消除重叠、阴性结石及骨性结构的遮挡，提高输尿管结石检出率，对于双肾区结石，DTS 独特消除重叠的效果能更好的帮助诊断医师。DTS+IVP 的多模态融合检查方式能进一步提高泌尿系结石检出敏感性，IVP+DTS 的诊断效能与单纯 IVP 的相近，但结合临床经验，IVP+DTS 能较好的检出小结石及消除输尿管中段的遮挡因素。

PU-0474
Assessment of Delayed Graft Function Using Susceptibility-Weighted Imaging in the Early Period after Kidney Transplantation: A Feasibility Study

Jun Sun
The First People’s Hospital of Changzhou

Purpose: This study aimed to explore the feasibility of susceptibility-weighted imaging (SWI) for evaluating delayed graft function (DGF) during the early post-transplantation period.
Methods: Sixty-nine recipients who accepted allograft renal transplantation underwent SWI during the second post-transplantation week. Renal allograft function was estimated via the glomerular filtration rate. Recipients with and without DGF were identified. For each transplanted kidney, the presence of abnormal signal intensity lesions (ASILs), excluding benign lesions, on SWI was assessed. Renal allograft function was compared between the recipients with and without ASILs. The correlation

between ASILs and renal allograft function was tested by Spearman's rank correlation analysis.
Results: Thirty-four recipients were diagnosed with DGF, while 35 recipients showed no DGF. In the DGF group, 16 recipients had low-intensity ASILs, primarily at the corticomedullary junction of transplanted kidneys on SWI, and no ASILs were found in 18 recipients. In the non-DGF group, none of the recipients showed ASILs on SWI. In the DGF group, the renal allograft function among the 16 recipients with low-intensity ASILs was significantly lower than that among the other 18 recipients (8.5±4.2 vs. 19.7±9.7 mL/min, P<0.001). The presence of low-intensity ASILs on SWI showed a moderate negative correlation with renal allograft function in recipients with DGF (r=-0.553, P=0.001).
Conclusion: SWI can be used to evaluate DGF in the early post-kidney transplantation period.

PU-0475
CTU 三维重建技术在上尿路病变中的诊断价值分析

黄国权,张晓金,陶凌松,朱峰岭,谢钊,汪建文
芜湖市第二人民医院

目的 探讨 CTU 三维重建技术在上尿路疾病中的诊断价值。
方法 收集 2017 年 1 月～2019 年 1 月连续性临床疑似上尿路病变的住院病人，排除单纯肾结石、泌尿系和泌尿系外肿瘤未累及肾盂、肾盏和输尿管的 139 例 CTU 检查资料。扫描数据传至影像工作站，由两名放射学医师行 MIP、MPR 和 CPR 重建分析。CTU 三维重建技术在上尿路病变中的意义以诊断敏感度、特异度、准确度、阳性预测值、阴性预测值、阳性似然比、阴性似然比表示。上尿路各类疾病所占比及各种疾病诊断正确率以百分数表示。
结果 男 97 例，女 42 例，年龄 16～90 岁，平均 57.37 岁。CTU 上尿路异常表现共 123 例，其中 117 例 CTU 异常表现和临床随访结果一致，5 例 CTU 疑似上尿路病变（肾盏 2 例，输尿管 3 例），输尿管镜检查正常；肾盏、输尿管微小病灶各 1 例 CTU 诊断正常，输尿管镜检查为息肉样增生和局部炎症；CTU 和随访结果上尿路均正常 16 人。CTU 三维重建技术对上尿路病变诊断敏感度为 98.32%、特异度 76.19%、准确度 95.68%、阳性预测值为 95.90%、阴性预测值 88.89%、阳性似然比 4.13、阴性似然比 0.02。主要阳性病例中输尿管结石占 47.01%，其中单纯输尿管结石、输尿管结石伴局部炎症、输尿管结石伴局部息肉诊断正确率 100%（34/34）、84.62%（11/13）、37.50%（3/8）。上尿路尿路上皮癌占 23.93%，诊断正确率为 89.29%（25/28），输尿管壁炎性病变占 9.4%，诊断正确率为 90.90%（10/11），肿瘤侵犯上尿路占 9.4%，诊断正确率 100%（11/11）。其他病例，如输尿管单纯息肉、良性肿瘤和输尿管畸形等占 10.26%（12/117）。
结论 CTU 三维重建技术可以全面显示上尿路整体情况、准确显示病变形态、范围及其 CT 表现，对上尿路病变的诊断和鉴别诊断有很好的临床价值。

PU-0476
肾脏少见良性肿瘤 CT 及 MRI 诊断

郝金钢
昆明医科大学第二附属医院

目的 肾脏肿瘤的发现逐年增多，肾良性肿瘤往往被过度的干预和治疗，部分患者失去了保留肾脏的机会。因此；有必要提高肾良性肿瘤的术前 CT、MRI 诊断水平，避免过度诊疗。
方法 结合文献对我院手术病理证实的 14 例肾脏良性肿瘤的 CT 和 MRI 表现进行回顾性分析，并与病理结果进行对照。
结果 肾嗜酸细胞腺瘤 CT 平扫与正常肾实质相比呈等或稍高密度为主的肿块，密度均匀或稍不均匀，边界清楚，增强扫描 3 例皮质期、髓质期呈不均匀明显持续强化，2 例瘢痕样延迟强化，1 例反转强化。MRI 扫描与正常肾实质相比信号均匀或不均匀，边界清楚，增强扫描皮质期、髓质期不均匀强化高于肾皮质，2 例瘢痕样延时强化；1 例反转强化。
囊性肾瘤表现为肾脏囊性占位，边界清楚，无钙化，1 例病灶内部及周边肾实质可见密度增高影，1 例呈多囊样结构，壁明显稍增厚。增强扫描 2 例囊壁未见明显强化，囊内可见轻度分隔样强化影；1 例壁明显稍增厚者呈持续延迟明显强化。T2WI 呈高信号，T1WI 呈低信号，其内可见多发分隔信号，增强扫描包膜及分隔渐近性强化。
混合型上皮和间质肿瘤 CT 呈稍高密度影，边界清楚，较大病灶位于肾内，膨胀性生长，1 例为囊实性病变，多囊厚壁样病灶，呈膨胀性生长，实性及厚壁成分 CT 呈稍高密度，T2WI 呈低和极低信号影，T1WI 呈等信号，增强扫描实性及厚壁成分呈渐进性明显强化。
后肾腺瘤 1 例 CT 呈稍高密度影，未见钙化。增强扫描周边轻中度强化；MRI 呈囊实质占位，实质成分 T2WI 和 T1WI 均比肾实质信号稍低，囊性成分 T2WI 和 T1WI 均呈高信号，增强扫描呈中等度强化，强化程度始终低于皮质。
结论 肾脏良性肿瘤的 CT、MRI 表现具有一定的特异性，常见人群为以成年女性及未成年男性为主，无包膜多见，少数有包膜，增强扫描以持续的轻中度强化为主。

PU-0477

宫角妊娠的 MRI 诊断价值

孔俊沣,曾文兵,吴炅,刘嵩,钟雯
重庆三峡中心医院

目的 总结宫角妊娠 MRI 表现特征，探讨 MRI 在宫角妊娠诊断及鉴别诊断中的价值。
方法 手术或病理证实的 15 例宫角妊娠患者，全部行盆腔 MRI 检查，回顾分析其 MRI 表现。
结果 妊娠物呈孕囊型 10 例，包块型 5 例。妊娠物全部位于单侧宫角，其中位于左侧宫角 8 例，位于右侧宫角 7 例。妊娠物呈类圆形或椭圆形 11 例，呈梭形或其他形状 4 例。9 例孕囊全部位于宫角结合带内侧缘，其中孕囊周围蜕膜增厚 6 例，局部蜕膜增厚并胎盘植入 2 例。5 例包块型妊娠物全部与宫腔相通，伴有胎盘植入 4 例。孕囊型妊娠物呈较均匀 T_1WI 低信号，T_2WI-SPAIR 高信号 6 例；包块型妊娠物呈混杂信号 5 例。
结论 宫角妊娠 MRI 表现有一定特征性，宫角妊娠与输卵管间质部妊娠的鉴别主要为位置不同，MRI 能清楚显示病灶的位置、形态、信号特点及侵犯周围结构情况，对宫角妊娠诊断及鉴别诊断有重要价值。

ASIR-V 联合低 kVp 在肾动脉 CT 成像中降低辐射剂量的应用

李豆,胡智军,魏东红,姜露
西安长安医院

目的 研究基于多模型的迭代重建算法（ASIR-V）联合低 kVp 在肾动脉 CT 成像中降低辐射剂量的应用。
方法 对 60 例怀疑肾动脉疾病并行肾动脉成像检查的患者，根据管电压不同分为 A、B、C 三组（120kVp、100kVp、80kVp），每组 20 例。A 组管电压 120kVp，采用 FBP 重建；B 组管电压 100kVp，后迭代重建权重为 80%；C 组管电压 80kVp，后迭代重建权重为 80%，重建层厚均为 1.25mm。客观测量双肾动脉及同层面皮下脂肪，记录其 CT 值及 SD 值，计算信噪比（SNR=CT/SD）及对比噪声比(CNR=（CT 肾动脉-CT 脂肪）/SD 脂肪)，采用 5 分法对各组图像质量进行双盲法主观评分（5 分，图像质量最好；1 分，图像质量最差）。对患者一般资料及客观测量结果进行统计学分析，并对各组图像质量进行 5 分法主观评分（5 分，图像质量最好；1 分，图像质量最差）。
结果 三组患者一般差异均无统计学意义（P＞0.05）；图像质量主观评分存在明显差异(P＜0.001)；客观测量的 CT 值无统计学差异（P＞0.05），而 SD 值、SNR 及 CNR 均存在明显差异(P＜0.001)；三组间的辐射剂量分别为（4.80±1.36）mSv、（4.14±0.64）mSv、（2.11±0.22）mSv，存在明显统计学差异（P＜0.001），80kVp 较 100kVp 与 120kVp 辐射剂量分别降低了 49%、56%。
结论 在肾动脉 CT 成像中，低 kVp 联合 ASIR-V 技术在保证优质的利于诊断的图像质量前提下，能大幅度降低辐射剂量。

PU-0479

后肾腺瘤影像及病理对照分析

张晓辉,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 探讨后肾腺瘤(MA)的 CT/MRI 影像学特征。
方法 回顾性分析了经术后特殊病理证实的 11 例 MA 患者影像资料,归纳肿瘤的大小、形态、密度或信号强度及强化方式。
结果 11 例 MA,男 3 例,女 8 例,均为单侧单发,其中 6 例位于右肾,5 例位于左肾。11 例病灶均呈圆形或类圆形,其中 8 例病灶为实性,3 例为囊实性(1 例以囊性为主)。CT 平扫病灶实性成分呈等或稍高密度,增强扫描病灶边界清晰,实性成分呈延迟性轻中度强化,强化程度低于正常肾皮质。MRI 平扫 1 例信号强度与肾实质相似;另外 1 例病灶信号欠均匀,呈稍长 T1,稍长 T2,两例 DWI 均为高信号。
结论 MA 的影像学表现具有一定的特征性,CT 及 MRI 对其诊断及鉴别诊断有重要意义。

PU-0480

Low-dose CT with adaptive statistical iterative reconstruction for evaluation of urinary stone: a pilot study

Xiaohu Li,Yongqiang Yu,Bin Liu
The First Affiliated Hospital of Anhui Medical University

PURPOSE
To evaluate the feasiblity of low-dose CT combined with adaptive statistical iterative reconstruction (ASIR) in the diagnosis of urinary calculi

METHOD AND MATERIALS

70 patients with clinically suspected urolithiasis were included.Followed by both conventional-dose CT scans (CDCT) and low-dose CT scans (LDCT).Automatic tube current modulation scanning was used, with a noise index setting of 13 in CDCT and 25 in LDCT.Image were reconstructed with filtered back projection (FBP) and different settings of ASIR (40%、60%、80%).Calculi (size、location、number) 、image quality (scale, 1-5) 、image noise (scale, 1-3) and confidence levels for urolithiasis diagnose (scale, 1-3) were evaluated and measured by two radiologists independently.Radiation dose by dose length product (DLP) were recorded,and effective dose (ED) was calculated.Statistical analysis was performed with Mann-Whitney U test and paired t tests

RESULTS

Mean ED was 2.07 mSv in LDCT compared with 6.12 mSv in CDCT (P<0.05),.which decreased by 66.1%.LDCT-80%ASIR images showed great image quality (score, 4.09),which was similar to CDCT-FBP images (score,4.17) (P>0.05),but higher than LDCT-FBP images (score,2.77) (P<0.05)

CONCLUSION

Combined with automatic tube current modulation scanning and ASIR,radiation dose can be significantly reduced with image quality maintained.

PU-0481

CT 与 MRI 对合并出血肾占位性病变的诊断与鉴别诊断

段文峰
南昌大学第一附属医院

目的 探讨 CT 与 MRI 对合并出血的肾脏占位性病变的诊断及鉴别诊断价值，提高诊断的准确性。
方法 回顾性分析经病理或随访证实的我院 2015 年 1 月至 2019 年 1 月收治的 75 例合并出血的肾脏占位性病变患者的临床资料及影像表现，其中，血管平滑肌脂肪瘤合并出血 31 例，囊肿并出血 26 例，肾癌合并出血 18 例。所有病灶行 CT（平扫和增强）或 MRI（平扫和增强）扫描，分析比较病灶的影像学征象，包括病灶的发生部位及位置、大小（平均直径）、形态、肾瘤界面边界及形态、病灶内成分、增强形式及肿瘤内血管影等。
结果 三种病变在病变发生位置及性别差异无统计学意义。在病灶发生部位、大小、形态、肾瘤界面边界及形态差异有统计学意义，血管平滑肌脂肪瘤较后两者出血更易破向肾外且平均直径更大，血管平滑肌脂肪瘤与囊肿合并出血形态更规则、边界清楚、肾瘤界面以喇叭口或杯口状为主，肾癌形态不规则或分叶形，边界不清，肾瘤界面以不规则或分叶状为主。含脂肪成分是血管平滑肌脂肪瘤的诊断标准，对乏脂肪成分的血管平滑肌脂肪瘤合并出血在强化方式及程度、肿瘤内血管影与肾癌合并出血差异无统计学意义，囊肿合并出血病灶内无实性成分及无强化特点与其余两者差异有统计学意义。
结论 CT 和 MRI 可以准确地诊断合并出血的肾脏占位性病变，明确不同性质的占位性病变的影像学特点，有重要的临床应用价值。

PU-0482
原发性子宫内膜癌 MRI 非结构式报告与结构式报告对比研究

刘义
北京大学第一医院

目的 本文通过研究原发性子宫内膜癌 MRI 非结构式报告与结构式报告，比较两类报告的影像报告信息完整性、临床价值，进一步讨论书写报告及阅读报告的效率。
方法 对 41 例经组织病理学证实的子宫内膜癌患者的盆腔 MRI 增强非结构式报告和结构式报告进行比对研究。非结构式报告是在正常临床工作流程中书写生成的。非结构式报告书写完成 3 个月后，由同样的影像科医生使用结构式报告系统对同样的病例进行书写，相同的上级医生审核报告。由一位未参与病例书写的放射科医生分析非结构式报告和结构式报告中与肿瘤分期相关的关键特征描述的完整性和书写时间，并进行比较。招募两名妇科医生独立填写问卷，问卷内容包括报告满意度、临床价值、报告质量和阅读时间，并对问卷结果进行比较。
结果 两位临床医生关于非结构式报告和结构式报告内容、语言质量满意度、临床价值和报告质量评估的一致性均较好（k>0.5)。与非结构式报告相比，结构式报告中包含的与肿瘤分期相关的关键特性量明显增多(双样本配对 t 检验，11.44±1.34 和 14.76±0.73，p< 0.001)，两名临床医生对结构式报告的语言质量满意度优于非结构式报告 (Wilcoxon 符号秩和检验，第一位临床医生：4.02 vs.4.63, p= 0.002；第二位临床医生：3.86 vs.4.02，p= 0.035)。影像科医生完成结构式报告的时间明显少于非结构式报告（双样本配对 t 检验，727.22±38.42s vs.616.44±60.00s，p= 0.037)。
结论 原发性子宫内膜癌 MRI 结构式报告提升了子宫内膜癌分期报告的完整性，增加了临床医生对影像报告的满意度，并减少了诊断用时，结构式报告的应用明显提高了原发性子宫内膜癌 MRI 报告的价值。

肾上腺少见肿瘤 CT 表现及鉴别诊断

闫红卫
江苏省肿瘤医院

目的 分析肾上腺少见肿瘤的 CT 表现，提高对肾上腺病变的 CT 诊断与鉴别诊断水平。
方法 回顾性分析 51 例经手术病理确诊有完整资料的肾上腺肿瘤 CT 图像，其中神经母细胞瘤 10 例，转移瘤 8 例，皮质癌 6 例，髓质脂肪瘤 3 例，囊肿 5 例，神经鞘瘤 5 例，海绵状血管瘤 2 例，节神经细胞瘤 3 例，神经节细胞瘤 1 例，副神经节细胞瘤 1 例，囊性淋巴管瘤 2 例，畸胎瘤 3 例，纤维肉瘤 1 例，平滑肌肉瘤 1 例，从病变大小、形态、密度、内部结构、强化程度等方面分析 CT 图像。
结果 神经母细胞瘤为不均较大肿块，有钙化，呈明显不均匀强化；转移瘤表现各异，有原发灶病史；皮质癌为较大不均肿块，边界欠清，见大片坏死，1 例见少许点状钙化，呈明显不均匀强化；髓质脂肪瘤为边清含脂肿块，混杂软组织密度，脂肪密度不强化，软组织轻、中度强化，1 例以软组织成分为主，少许脂肪，有坏死、囊变和钙化；囊肿为边清均匀囊性肿块，不强化，囊壁可有钙化；神经鞘瘤为边清软组织肿块，囊变、钙化，呈轻、中度强化，1 例囊性为主；海绵状血管瘤为不均软组织肿块，易出血、钙化，中心延迟填充强化；节神经细胞瘤为边清均匀软组织肿块，点状

钙化，呈轻度强化；神经节细胞瘤为边清较大软组织肿块，见颗粒状钙化及小片状囊变区，明显不均匀强化；副神经节细胞瘤为巨大软组织肿块，边界欠清，中心大片不规则坏死区，边缘明显不均匀强化；囊性淋巴瘤为边清单囊或多囊肿块，囊壁斑点状钙化，囊内不强化，壁轻度强化；未成熟实性畸胎瘤为实性不均匀肿块，不均匀强化；良性囊性畸胎瘤为囊性成分为主，有分隔，见脂肪、钙化，囊内不强化，分隔明显强化；肉瘤为分叶状巨大软组织肿块，密度不均，见不规则大片坏死区，呈明显不均匀强化。

结论 肾上腺少见肿瘤的 CT 图像具有一定特征性，认真分析其 CT 表现，可提高诊断与鉴别诊断水平。

PU-0484

前列腺动脉磁共振增强血管成像的前瞻性研究

申艳光
北京中医药大学第三附属医院

目的 探索研究前列腺动脉增强 MR 成像的可行性,为前列腺介入术前评估提供指导。

方法

1、7 例经前列腺动脉介入栓塞术，术前均行 3.0 T 磁共振增强血管成像。

2、依扫描方法分两组：透视触发成像组（FT 组）和对比动力学时间分辨率成像组（TR 组）。检查后一周内前列腺动脉栓塞术。

3、两位放射科医师独立分析 MRA，确认前列腺动脉起源、走形、影像表现，并与 DSA 造影结果对比分析。

结果

1）7 例患者中 1 例病理证实前列腺癌并前列腺增生, 6 例经 MR 诊断为前列腺增生。

2）7 例中 FT 组 4 例，TR 组 3 例。经 DSA 证实共 17 条前列腺动脉（PA），左侧 8 支，右侧 9 支。FT 组 4 例显示率 60%（6/10），TR 组 57.14%（4/7）。

3）MRA 双侧正确显示率为 58.82%（10/17）。左侧 PA-MRA 正确显示率 87.5%（7/8），右侧 PA-MRA 显示率 33.33%（3/9）。10 支 PA 平均直径 1.39±0.46 mm。典型 MRA 表现为螺旋形迂曲血管影并延伸入前列腺内。

4）起源于闭孔动脉及阴部内动脉各 29.41%。1 例左侧有三支 PA 供血，右侧双支 PA 供血；1 例右侧两支 PA 供血，左侧单支 PA。双侧对称性 3 例，不对称性 4 例。

5）除右髂总动脉和右髂内动脉信号强度、左髂总动脉 SNR 和 CNR 差异有统计学意义，余两组图像质量均无显著性差异。

结论

前列腺动脉增强 MR 成像具有可行性，可为前列腺介入栓塞术提供导航作用。

PU-0485

前置胎盘诊断中的磁共振序列优化及与 SAR 值关系的初步研究

蒋春景[1],何建英[2],华建军[1],楼建义[1],舒锦尔[1],傅晓艳[1],丁明星[1],周邵斌[1]
1.金华市中心医院
2.金华市人民医院
3.金华职业技术学院

目的 探讨前置胎盘诊断中的磁共振序列优化及与 SAR 值关系的初步研究。

方法 对 50 例术前确诊为前置胎盘及前置胎盘伴植入患者进行 T2W 及 T1W 多序列扫描，对照手术及病理，分析 MRI 多序列诊断的诊断准确性、敏感度、特异度，并与 SAR 值一起分析，进行 MRI 序列的优化。

结果 对 50 例前置胎盘术前进行 MRI 扫描，快速成像 Haste 序列和常规 T2W 脂肪抑制序列，外加 T1-vibe 容积扫描序列，其诊断准确性、敏感度、特异度均无显著差异，但不同序列间的 SAR 值相差明显，有统计学差异。

结论 由于 SAR 值对患者的影响，建议进行 MRI 快速 Haste 序列加 T1-vibe 容积扫描序列三维重建，能最大程度上满足临床诊断需求，又保护了患者的利益，值得临床推广应用。

PU-0486

基于血氧水平依赖成像的功能 MR 评价肾部分切除术后残余肾功能

张莎莎[1,2],宋彬[2]
1.贵州省人民医院
2.四川大学华西医院放射科

目的 血氧水平依赖（BOLD）是目前可评价组织氧含量的唯一的非侵入性检查，研究 BOLD 对不同类型肾细胞癌定性及诊断的价值，对比肾细胞癌患者术前及术后的 R2*值,评价腹腔镜部分切除术前后肾肿瘤患者残余肾组织及健康肾脏氧合水平的变化。

材料与方法 肾细胞癌患者共 55 名，其中女性 22 名，男性 33 名，年龄 23-80 岁，平均(54.89±14.84)岁，患者术前 1 周内及术后 3 个月均在华西医院放射科 3.0TGE750W 磁共振仪上完成 T1WI、T2WI、BOLD 扫描。计量资料用“均值±标准差”表示，t’检验分析各项测量值之间的差异。

结果 55 个肾肿瘤中含透明细胞癌 29 个，嫌色细胞癌 26 个。1.透明细胞癌、嫌色细胞癌平均 R2*值分别为 83.95±15.46$seconds^{-1}$，69.78±11.31$seconds^{-1}$，差异有统计学意义（t=3.841，p<0.001），透明细胞癌平均 R2*值较高。2.55 例患者术前患侧、健侧肾皮质 R2*值与 GFR 呈显著正相关(r=0. 786，P<0. 001)，(r=0. 726，P<0. 001)，55 例患者术后患侧、健侧肾皮质 R2*值与 GFR 呈正相关(r=0. 725，P<0. 001)，(r=0. 715，P<0. 001)。3.55 例患者术后、术前患侧残余肾组织 R2*为(32.88±5.74)$seconds^{-1}$，(25.56±3.86)$seconds^{-1}$，差异有统计学意义(t=8.194，p<0.001)。55 例患者术后、术前健侧 R2*值为(28.22±7.02)$seconds^{-1}$，(31.21±6.56)$seconds^{-1}$，差异有统计学意义(t=2.413，p=0.017)。

结论 BOLD 可进行透明细胞癌与嫌色细胞癌的鉴别诊断，并定量评估肿瘤血氧水平。肾皮质 R2*值与 GFR 正相关，评价肾癌患者经腹腔镜肾部分切除术治疗前后肾功能的变化。

Bilateral giant ovarian luteinized follicular cysts: case report

Jiping Wang,Bei Zhang
First Hospital of Jilin University

Abstract
Background:

The bilateral ovarian luteinized follicular cysts are rarely described, not to mention full-term natural labour without cystectomy beforehand. One case will be reported in our report.
Case:
A 29-year-old woman had pelvic masses detected at 12 weeks of pregnancy. The main worry was the safety of pregnancy, conservative management and close review were adopted. She was admitted to our hospital again 30 days after childbirth. Ultrasound examination was performed as well as CT. CT imaging showed that there was multilocular cystic low density in abdomen without calcification. She accepted bilateral ovarian cystectomy and reconstruction. Postoperative pathological results led to the diagnosis of bilateral ovarian luteinized follicular cysts.
Conclusion:
The CT imaging feature combined with medical history, HCG level or other imaging modality can be used for diagnosing it initially. The case we report will provide useful experience for the diagnosis of ovarian luteinized follicular cyst.

PU-0488

Highly accelerated prostate water/fat 3D MRI with compressed sensing and SENSE, compared to the standard of care

Yanan Wu[1], Meiyu Sun[1], Ailian Liu[1], Jiazheng Wang[2], Xiaofang Xu[2], Chengyan Wang[1], Lihua Chen[1], Qingwei Song[1], Renwang Pu[1], Bingbing Gao[1]
1. The First Affiliated Hospital of Dalian Medical University
2. Philips Healthcare, China

Purpose: To explore the feasibility of prostate 3D MRI with two point spectral resolution, improved spatial resolution, and reduced imaging time, highly accelerated by a combination of compressed sensing and parallel imaging (CS-SENSE). ***Materials and Methods:*** Ten healthy volunteers (mean 27.3 years) were prospectively involved for 3.0T MRI (Ingenia CX, Philips) with 3D GRE sequences (6-point Dixon water/fat) on prostate. A clinical routine protocol was scanned with SENSE factor 2, followed by a SENSE 4 to stretch the acceleration capability. CS-SENSE with acceleration factors 2 and 5 were then prescribed to approximately match the scan times with SENSE 2 and 4. Other parameters were kept same: TR/TE 3.7/1.3 ms, resolution 1.5×1.7×3.00 mm^3. Scan times were 17.7s, 11.2s, 15.5s and 12.7s for SENSE 2, SENSE 4, CS-SENSE 2, and CS-SENSE 5. All image analysis was performed independently by two radiologists on ISP workstation (Philips), blind to the imaging sequence. ROIs with fixed area were placed as in Figure 1 for SNR and CNR calculations. These two radiologists also scored on the overall image impression, anatomical distortion and detail display according to Likert 5, which were analyzed for consistency using Kappa coefficient. The SNR and CNR were analyzed for consistency using intraclass correlation coefficient (ICC). The SNR and CNR of images among four imaging protocols were tested using Friedman-test. ***Results:*** The SNR, CNR, and subjective scoring agreed well between the two radiologists (Kappa>0.75, ICC>0.75, Tables 1&2), and the data from the senior observer was chosen for the final statistical analysis. The average

scores among these different acceleration factors were 3.8, 3.3, 3.5 and 3.5, without statistical difference (P=0.375). There was no statistical difference in SNR between CS-SENSE 2 and CS-SENSE 5, nor between CS5 and SENSE2. The SNRs of CS-SENSE 2 and 5 were both higher than that of SENSE 4 (Table 3). There was no significant difference in CNR among the four protocols. ***Conclusion:*** CS-SENSE 5 yielded similar SNR and CNR in prostate water/fat imaging to those of SENSE 2, the clinical routine, while the imaging time was cut by 28%. ***Clinical Relevance:*** CS-SENSE with acceleration factor 5 is demonstrated a potential replacement for the clinical routine protocol for prostate water/fat imaging, given the retained image quality and the reduced imaging time, and these benefits are expected to increase with further improved resolution.

PU-0489

子宫腺肉瘤 1 例及文献复习

黄运瑞,张灵
广西医科大学第一附属医院

目的 探讨子宫腺肉瘤的 MRI 表现及相关文献复习，以提高对该疾病的诊断及鉴别诊断能力。
方法 回顾性分析经手术病理证实的 1 例子宫腺肉瘤的 MRI 表现并复习相关文献。
结果 平扫 T1WI 呈等或稍低信号，T2WI 呈高于外肌层不均匀信号，肿块信号不均，可见囊变，DWI 提示病灶弥散受限呈明显高信号影。增强扫描早期病灶实质部分明显强化，后期持续强化。
结论 MRI 平扫及动态增强多参数扫描并结合临床资料可以提高子宫腺肉瘤的诊断，但确诊仍需依靠病理学检查。

PU-0490

不同对比剂用量在能谱 CT 肾脏增强扫描中的应用研究

陈晓侠
陕西中医药大学附属医院

目的 探讨能谱 CT 在肾脏增强中降低对比剂用量的可行性。
方法 收集需肾脏增强的患者 60 例，随机分为对照组 A、研究组 B 和 C 三组各 20 例，对比剂用量为 A 组：600mgI/kg 体重，B 组：450mgI/kg 体重，C 组:300mgI/kg 体重。对比剂为 350mgI/ml,流速(
ml/s)=对比剂总量÷30s,扫描延迟时间：注射对比剂后 40s 扫描皮质期，70s 扫描髓质期。A 组采用常规扫描：管电压 120kVp,智能毫安,噪声指数为 12,扫描层厚 5mm。B、C 组采用能谱扫描，扫描协议根据患者常规 120 kVp、NI10-5 mm 的平均毫安秒进行个性化选择。扫描后 A 组皮质期、髓质期均重建 1.25mm、40%ASIR 图像，B 组双期分别重建 65keV 单能量、C 组双期分别重建 50keV 单能量、层厚均为 1.25mm、40%ASIR 图像。分别测量皮质期双肾皮质、双肾动脉、腹主动脉及同层面竖脊肌的 CT 值及 SD 值，髓质期双肾髓质、双肾静脉、下腔静脉及同层面竖脊肌的 CT 值及 SD 值，其中 SD 值代表测量噪声，计算肾皮质、肾髓质、腹主动脉、肾动脉、肾静脉、下腔静脉信噪比（SNR）和对比噪声比（CNR）：SNR=CT 值$_{组织}$/SD 值$_{组织}$,CNR=CT 值$_{组织}$-CT 值$_{肌肉}$/SD 值$_{肌肉}$。采用单因素方差分析对三组图像的 CT 值、SD 值、SNR、CNR 进行统计分析，$P<0.05$ 具有统计学意义。

结果 三组的有效剂量相同（P＞0.05），B 组和 C 组的对比剂量分别比 A 组降低 31%和 52%（P<0.001）。所有图像均可接受诊断。A 组肾皮质 CT 值最高，C 组肾动脉 CT 值最高。除 B 组腹主动脉皮质期外，B 组各期均低于 A 组和 C 组。B 组皮质和髓质期的信噪比和 CNR 均高于 A 组和 C 组。
结论 在 CT 肾脏增强中，采用能谱模式和 ASIR 算法，在保持诊断图像质量的同时降低对比剂量用量是可行的，可在患者肾功能异常时选择性使用。

PU-0491

The application of Cinematic rendering of Force computed tomography in the diagnosis of Ovarian cancer

Yiren Jin,Chengde Liao,Yingying Ding
Yunnan Cancer Hospital

Ovarian cancer is the second most common gynecologic malignancy. When patients are treated, the ovarian cancer is often in the later-stage.CT is established as the primary imaging modality for characterization of ovarian tumors and ovarian cancer staging. Cinematic rendering (CR) is a new 3D post-processing tool that produces photorealistic images, and it has the potential to more accurately depict anatomic detail compared to traditional volume rendering.The purpose of this article is to describe the potential application of CR to imaging of Ovarian cancer. CR has the potential to improve visualization of Ovarian cancer, differentiation of solid and cystic Ovarian cancer, assessment of Peripheral tissue and vascular invasion, and visualization of Peripheral lymph node metastasis and peritoneal metastases.
The application of Cinematic rendering in the diagnosis of Ovarian cancer. which has good clinical value and more helpful on preoperational evaluation.

PU-0492

卵巢卵泡膜细胞瘤的 MRI 表现及病灶大小的特征分析

李志,罗志琴
湖州市妇幼保健院

目的 探讨卵巢卵泡膜细胞瘤的 MRI 表现，重点分析病灶大小的特点，提高该病的术前诊断率。
方法 回顾性分析我院 25 例经手术病理证实为卵巢卵泡膜细胞瘤的病例，分析病灶的 MRI 表现，根据病灶大小分为＜5cm 组和≥5cm 组，＜5cm 组 4 例，≥5cm 组 21 例，用统计学方法分析病灶大小与盆腔积液、囊变、绝经及 CA125 之间的关系。
结果 25 例均单侧发生，边缘清晰，左侧 15 例，右侧 11 例；病灶实性成分 T1WI 呈等信号 15 例，稍低信号 10 例，T2WI 呈稍高信号 8 例，等信号 7 例，稍低信号 10 例，DWI 呈高信号 18 例，混杂高信号 7 例，增强后均呈轻度不均匀强化；囊变 T1WI 呈低信号，T2WI 呈高信号，DWI 呈低信号，增强后未见强化；病灶合并盆腔积液共 20 例，其中＜5cm 组 1 例，≥5cm 组 19 例，两组间差异有统计学意义（P＜0.05）；病灶合并囊变共 19 例，其中＜5cm 组 1 例，≥5cm 组 18 例，两组间差异有统计学意义（P＜0.05），所有囊变范围较小，边界均不规则，絮状囊变最常见；已绝经患者 19 例，其中＜5cm 组 2 例，≥5cm 组 17 例，两组间差异无统计学意义（P＞0.05）；CA125 升高 10 例，其中＜5cm 组 1 例，≥5cm 组 9 例，两组间差异无统计学意义（P＞0.05）。

结论 病灶实性成分 DWI 呈高信号及增强呈轻度不均匀强化是该病 MRI 的特征性表现，囊变多见且范围较小，结合单侧附件单发较大病灶，边缘清晰，可提高术前诊断符合率。

PU-0493

卵巢肿瘤的影像特征及多 b 值 DWI 的应用

魏俊
江西省肿瘤医院

目的 探讨探讨卵巢良恶性病变与 MRI 影像表现及多 b 值 DWI 的应用价值，为卵巢肿瘤的良、恶性鉴别提供无创、可复性及一定的参考依据。
方法 分析所有 45 例患者术前磁共振扫描仪行常规扫描、多 b 值扫描，分析病变的影像学特征作出定性诊断，与术后组织病理结果进行对照得出敏感性(Se)、特异性(Sp)、阳性预测值(PPV)、阴性预测值(NPV)及准确度；其次分别测量卵巢肿瘤实性与囊性部分的 ADC 值，进行统计分析。最后，利用 ROC 曲线分析得出各个参数值对鉴别卵巢肿瘤良、恶性的最优参数值及最佳诊断阈值，及相对应的敏感性、特异性、阳性预测值及阴性预测值。
结果 45 例患者中良性 30 例，恶性 15 例，其中双侧者良性 8 例，恶性 5 例，占位病变共 55 个。(1)各组卵巢肿瘤良性组所测实性部分的 ADC 值(ADC1、ADC2、ADC3、ADC4)均明显高于恶性组，差异存在显著统计学意义(P<0.01)，两者之间基本无重叠部分。另外，卵巢肿瘤良性组的实性部分的 ADC 值跨越范围均较恶性组宽。(2)各 b 值扫描下卵巢肿瘤所测实性部分的各组间 ADC 值具有明显统计学意义，将这些参数值利用 ROC 曲线进行统计分析，ADC1、ADC2、ADC3、ADC4 的 ROC 的曲线下面积(area under the curve，AUC)分别为 0．922、0．922、0．937、0．932，可知，当 b=1200s／mm2 时曲线下面积最大，具有较其他三组更高的诊断效能。（3）利用 ROC 曲线分析，参考 Youden 指数的最大值得出诊断卵巢肿瘤良、恶性的临界值，当 b 值为 1200s／mm2 时具有最佳诊断效能，ADC 值的 AUC 为 0．937，阈值为 1.17
×103/s，敏感性为 90.5%，特异性为 89.5%，阳性预测值为 89.6%，阴性预测值为 90．4%。
结论 b 值为 1200s／mm2 是鉴别卵巢肿瘤良、恶性的最佳扫描参数，ADC 值对卵巢肿瘤的定性具有肯定的诊断价值。

PU-0494

腺性膀胱炎的 CT 和 MRI 诊断及鉴别诊断

陈炯
南宁市第二人民医院

目的 分析和探讨腺性膀胱炎（cystitis glandularis,CG）的 CT 和 MR 影像表现。
方法 搜集 8 例经病理证实的腺性膀胱炎的 CT 和 MR 资料，3 例行 MRI 平扫+增强+DWI，1 例行 MR 平扫，4 例行 CT 平扫+增强。
结果 发生部位：侧顶壁 3 例，膀胱三角区 4 例，三角区-侧壁 1 例；病灶形态：局部扁平状增厚型 2 例，局部扁平状增厚并局部结节样隆起混合型 6 例；强化情况：4 例明显强化（强化高于肌层），3 例轻度强化，1 例未行增强检查；DWI 高信号 2 例，稍高信号 2 例；ADC 值平均（1.63）$\times 10^{-3}mm^2/s$,范围（1.56～1.73）$\times 10^{-3}mm^2/s$。
结论 腺性膀胱炎主要表现为局部扁平和/或伴局部小结节样隆起状膀胱壁增厚,增强后轻度或明显均匀强化，ADC 值相对较高；病灶形态、ADC 值定量、强化均匀有助于和膀胱癌鉴别。

PU-0495
T2WI 结合 MRS、DWI 对前列腺癌与前列腺增生的鉴别诊断价值

陈瑶,刘兴华
重庆三峡中心医院

目的 探讨 T2WI 结合磁共振波谱成像（magnetic resonance spectroscopy, MRS）、弥散加权成像（diffusion weighted imaging，DWI）对前列腺癌与前列腺增生的鉴别诊断价值。
方法 回顾性分析 2014 年 8 月至 2017 年 11 月在我院经病理证实为前列腺病变患者的 54 例完整临床资料，所有患者均行 T2WI、MRS 及 DWI 检查。在工作站进行数据测量，单体素法测量病变区胆碱(Choline, Cho) 、枸橼酸盐(Citrate, Cit) 、肌酸(Creatine, Cre) 的峰值；ADC 值测量方法为测量病灶最大层面中心区 ADC 值，测量 3 次取平均值。应用 SPSS 19.0 软件进行统计学分析，前列腺癌和前列腺增生组(Cho + Cre) / Cit 比值及 ADC 值数据经 K-S 检验证实为正态分布后，采用独立样本 t 检验进行比较，以 $P < 0.05$ 为差异有统计学意义。
结果 前列腺癌病例 21 例（74.5±7.4 岁），前列腺增生病例 33 例（71.7±8.4 岁），年龄无统计学差异（t=1.257，P=0.214＞0.05）。前列腺癌病例共选取 97 个体素，MRS 主要表现为 Cho 峰显著升高, Cit 峰明显降低,两者波峰可呈现倒置。前列腺增生病例共选取 172 个体素，MRS 主要表现为 Cho 峰及 Cre 峰较低，Cit 峰高耸。前列腺癌及前列腺增生组(Cho + Cre) / Cit 平均值分别为 3.96±5.41、0.90±1.82，两组间差异有统计学意义（t=5.397，P=0.000＜0.05)。b=800 时，前列腺癌及前列腺增生组 ADC 值分别为（0.841±0.189）×$10^{-3}mm^2/s$、（1.436±0.196）×$10^{-3}mm^2/s$，两组间差异有统计学意义（t=-11.019，P=0.000＜0.05）。
结论 T2WI 结合 MRS、DWI 对前列腺癌与前列腺增生均具有较高的诊断和鉴别诊断价值。

PU-0496
双源 CT 泌尿系统 CTU 技术和临床应用

何小华,李向东
中国人民解放军南部战区总医院

【摘要】目的 探讨双源 CT 在泌尿系统造影中的技术与应用。 **方法** 收集在 2011-2012 年有临床症状并行泌尿系统螺旋 CT 扫描的病例 56 例，采用西门子双源螺旋 CT 机，连续容积增强扫描，造影剂用量为 1.5～2ml/Kg,注射速率 2.5～3ml/s,根据造影剂在图像中的显示来决定延时的时间，包括常规薄层平扫、动脉期、静脉期、延迟期扫描。所有数据传输到西门子后处理工作站进行处理，重建方法包括 MPR（多平面重建），MIP（最大密度投影），VR（容积再现技术）等。**结果** 对影像资料进行归纳总结：所有病例均成功重建出双肾、输尿管和膀胱三维图像，能旋转、切割、放大等清晰显示泌尿系统整体和局部细微结构、形状、走形及与周围组织关系。双侧输尿管正常的 20 例，左侧输尿管闭塞的 8 例，右侧输尿管闭塞的 5 例，左侧输尿管扩张的 11 例，右侧输尿管扩张的 5 例，输尿管占位的 7 例。**结论** 采用适当的扫描方法和重建方法，双源螺旋 CT 泌尿系统 CTU 具有快速、高分辨成像的优势，满足临床的需求，为临床治疗提供详细的影像学依据。

前列腺恶性间质瘤一例并文献复习

王斌
山西医科大学第一医院

目的
提高对前列腺恶性间质瘤的临床表现、影像诊断及治疗的认识。
方法
通过对 1 例前列腺恶性间质瘤临床病例资料及影像图像的分析，并结合文献讨论
结果
患者行前列腺穿刺术及肿瘤切除术，诊断为前列腺来源恶性间质瘤
结论
间质瘤常发生于胃肠道，前列腺间质瘤的罕见，是来源于间叶组织非定向分化的肿瘤，多见于中老年男性，发病高峰为 45-65 岁；恶性程度高，与前列腺癌相比，更易侵润和破坏性生长；MRI：瘤体大，球形或分叶状，坏死囊变明显，T1WI、T2WI 呈高、低混杂信号。

嗜酸细胞肾癌两例影像学表现并文献复习

邹建华
十堰市太和医院

摘要：**目的** 探讨嗜酸细胞肾癌的影像学表现。**方法** 回顾性分析两例嗜酸细胞肾癌的 CT 与 MRI 平扫与增强，结合手术病理。**结果** 嗜酸细胞肾癌平扫表现为边缘清楚的类圆形肿块，CT 等或略低密度，T1WI 等、略低信号，T2WI 略高信号。增强后轻度强化，质均均匀，周围间隙清楚。肾静脉与腹膜后淋巴结未见明显异常。讨论：嗜酸细胞肾癌的影像学表现有一定特点，可为临床保留肾单位切除肿瘤提供依据。

PU-0499

Split-Bolus dual energy computed tomography(DECT) Urography with Synchronous Nephrographic and Excretory Phase Enhancement：Comparison image quality of iterative reconstruction and filtered back projection.

Ali Shang,QuanXin Yang,XiaoQian Zhou,NanNan Jin,XiaoXia Lu
The Second Affliated Hospital of Xi'an Jiaotong University

Objective : To assess the effect of different levels of iterative reconstruction techniques and filtered back projection on Synchronous Nephrographic and Excretory Phase Enhancement images with split-bolus dual source dual-energy CT.
Methods: Institutional review board approval was obtained. 30 patients received split-bolus DECT; FBP and SAFIR images were reconstructed from Synchronous Nephrographic and

Excretory Phase Enhancement. Energy spectrum analysis software(MMWP) was used to find the optimum single energy value of renal pelvis and adjacent tissure. CT values of the ranal parenchyma, pelvis, upper ureters, middle ureters, lower ureters, bladder, psoas and standard deviation of subcutaneous fat were measured on the optimum level to calculate signal-to-noise ratio and contrast-to-noise for image quantitative analysis. Results: of these patients, 22 were women and 18 were men. The average age was 61.5±14.3years. The optimum kev of FBP and SAFIR is 66.57±0.93，66.76±0.89，there is no statistical difference(p=0.500). SNR、CNR of all measured sites, except the lower ureters（p=0.278，p=0.323） showed a statistically significant correlation (p < 0.001) between the FBP and SAFIR images. There was no statistical difference among three groups of ureters regarding CT density, SNR, CNR and all mean CT density. Conclusion: Synchronous Nephrographic and Excretory Phase Enhancement using split-bolus DECT urography, there was no difference in CT values of all groups. the image quality of SAFIR reconstruction was superior to that of FBP reconstruction.

PU-0500

IVP 与 CTU 在泌尿系统疾病的诊断价值对比分析

向正东
华中科技大学同济医学院附属协和医院

1.目的 对比分析静脉肾盂造影（IVP）与 CT 泌尿系成像(CTU)技术对泌尿系疾病的诊断价值。
2.资料与方法
2.1 一般资料 取本院均行 IVP 和 CTU 患者 32 例，男 17 例，女 15 例，年龄 13-65 岁，平均 45 岁。
2.2 仪器与方法 **IVP**：常规肠道准备后，使用 MRAD_50S RADREX 数字化摄片机器，先摄尿路平片，然后用两个压迫器放置于脐下两旁，用连有血压计的气袋覆盖，腹带束紧。静脉注射 350mgI/ml 碘海醇注射液，按 1.5ml/Kg 给药。注射完毕后 7、15 、30 分钟摄两肾区片，后放松腹带，摄全尿路片，膀胱充盈后摄全尿路片。
CTU ：采用 Toshiba Aquilion ONE 640 扫描，常规准备,采用足先进仰卧位，先行常规横断面平扫。扫描方式：螺旋扫描；扫描范围：肾上极至耻骨联合下缘；扫描参数：100-120KV 250-300mA,转速 05.-0.8s,层厚 8mm。增强：经肘静脉以 2.5ml/s 注入 350mgI/ml 碘海醇注射液，按 1.5ml/Kg 给药。分别在 30s 50s 180s 6min 扫描。结束后嘱患者不排尿，30min 后再扫描一次。然后用 1mm 软组织窗行 CPR VR 处理
3.结果 肾输尿管结石患者共 16 例，**IVP** 和 **CTU** 都能清楚的显示结石；肿瘤患者 10 例，**CTU** 对病灶的定位明确，可清楚显示肿瘤大小，边界。**IVP** 不能明确诊断。其他病变 6 例，包括双肾畸形，双肾盂双输尿管畸形等，**IVP** 检查显示双肾盂双输尿管畸形比较清楚， **CTU** 结合平扫均能清晰显示。
4. 结论:IVP 可以直接显示泌尿系统整体形态，其空间分辨率有很大的优势，但是易受准备条件影响，肾功能受损时往往显影不良。**CTU** 既能显示泌尿系正常解剖，病变，又能通过各种图像处理技术来观察病变，如 CPR VR 等，在泌尿系肿瘤诊断方面有很大的优势。

The study of high b value DWI using different mathematical models in the diagnosis of prostate cancer.

Yi Si,Lei Chu,Rongbo Liu
West China Hospital, Sichuan University

PURPOSE
To explore the diagnostic value of four mathematical models (monoexponential model: ADC; intravoxel incoherent motion model: D, D*, f; stretched-exponential model: α, DDC; diffusion kurtosis model: ADC_{kurt}, K) in diffusion weighted imaging (DWI) for prostate cancer (PCa) in peripheral and transitional zone.
METHOD AND MATERIALS
Thirty-six patients with histologically confirmed prostate cancer (PCa) and twenty patients with benign prostatic hyperplasia (BPH) in our hospital were included. All patients underwent the routine prostate MRI and high b value (0, 100, 200, 300, 400, 500, 700, 800, 1000, 1100, 1500, 1500, 1500, 1100, 1100, 1500, 1100, 1100, 1500, 1900, 2000, 2500, and 3000) DWI examination. The quantitative parameters were calculated using monoexponential, kurtosis, stretched exponential, and intravoxel incoherent motion models. The differences were analyzed between peripheral zone (PZ) PCa and PZ BPH, transitional zone (TZ) PCa and TZ BPH. The ROC curve analysis was used to evaluate the value of these parameters in identifying PZ PCa and PZ BPH, TZ PCa and TZ BPH. The linear discriminant analysis (LDA) was used to evaluate the performance of the comprehensive parameters of the models in diagnosing PCa.
RESULTS
There were significant differences in all parameters between PZ PCa and PZ BPH, TZ PCa and TZ BPH except parameter D*. Parameter ADC, D, DDC and ADCkurt demonstrated excellent diagnostic performances for PZ PCa, and the AUC of them were similar, range from 0.939-0.967. Parameter ADC, D, DDC, ADCkurt and K demonstrated good diagnostic performances for TZ PCa, and the AUC of them were similar, range from 0.887-0.941. The comprehensive parameters of kurtosis model have high specificity(100%) in diagnosing PZ PCa, and have great sensitivity(91.3%) and specificity(90.7%) in diagnosing of TZ PCa.
CONCLUSION
The water molecular diffusion coefficients in all models were of high value in diagnosing both PZ and TZ PCa, the monoexponential model for DWI was sufficient for PCa detection, but the kurtosis model can be used as an auxiliary method.

PU-0502

前列腺少见病变的 MRI 诊断

秦江波,王效春,谭艳,张辉
山西医科大学第一医院

目的 探讨前列腺少见病变的 MRI 表现，提高对此类疾病病的诊断水平，更好地指导临床治疗。

方法 收集我院 2012 年至 2015 年经手术病理或临床证实的前列腺肉瘤 3 例、前列腺上皮内瘤 5 例、前列腺囊腺瘤 2 例、不典型前列腺癌 4 例、前列腺小囊结石、前列腺结核各 1 例，年龄 50-73 岁。全部患者接受了前列腺 3.0T MR 常规及 DWI 序列检查，回顾性分析其 MRI 表现。

结果 前列腺肉瘤 3 例，表现为肿瘤体积较大，呈分叶状，易出血，DWI 肿瘤实质呈高信号，ADC 图弥散受限。前列腺上皮内瘤 5 例，表现为前列腺巨大增生并中央腺体多发小囊状病变；前列腺囊腺瘤 2 例，肿瘤多较大，呈大小不等多发囊状结构，境界清楚，囊液信号多样，长 T1 长 T2、短 T1 短 T2 信号、短 T1 长 T2（粘液蛋白、出血等成分），增强扫描囊壁中度强化；不典型前列腺癌主体位于前列腺外，类似于盆腔内前列腺与直肠间隙恶性占位，易与盆腔内肉瘤相混淆；前列腺小囊结石表现为前列腺小囊扩张，其内点状短 T1 短 T2 信号；前列腺结核结节型表现为结节样 T2WI 极低信号，弥漫型表现为多发斑片状或弥漫性 T2WI 低信号。

结论 高场强 MRI 对前列腺不常见病变的诊断具有很高的敏感性及特异性，同时 MRI 可清晰显示前列腺病变的部位、侵犯范围及周围结构等。有助于临床医生对前列腺少见病变的 MRI 表现及其侵犯范围有一个直观、全面的认识，对临床治疗方案的制定提供客观依据。

卵巢甲状腺肿 CT 和 MRI 的影像征象与病理相关性分析

翁淑萍[1],叶榕平[2]
1.福建省妇幼保健院暨妇儿医院
2.福建医科大学附属第一医院

目的 通过分析卵巢甲状腺肿的多层螺旋 CT 和 MRI 的表现特点，探讨其影像特征与病理的关系，提高对本病的认识，为临床制定手术方案提供影像支持。

方法 回顾性分析 28 例经手术病理证实的卵巢甲状腺肿的 CT 和 MRI 征象，包括（1）病灶的部位、最大径、形态、结构、边界；（2）病灶密度/信号（有无坏死、出血、囊变、钙化及脂肪成分等；（3）病灶的强化方式及程度；（4）病灶与周围结构的关系，有无盆腔积液，有无合并其他病变。全面分析患者临床病史资料，并结合术后病理结果，进一步探讨其影像表现与病理特征的关系。

结果 患者平均年龄 49.5 岁，临床症状均无甲状腺功能亢进的表现，实验室检查 3 例 CA125 升高，1 例 TPOAb、TGAb 升高。28 例中有 23 例 SO 为单侧多囊型肿块，5 例为单囊型，境界清楚，呈分叶状 21 例，类圆形 7 例；病灶平均直径约 8.3cm。8 例患者有盆腔积液，均无肿瘤包膜破裂、盆腔转移淋巴结或腹膜播散灶。病灶实性部分平扫呈稍高密度，CT 值约 50-100HU，增强明显强化；囊性部分呈边界清晰、大小不等的囊腔，均有完整的囊壁，囊壁较厚，一般大于 2mm，内壁光整，增强明显强化，同一患者多个囊内容物密度不一，CT 值约 13-63HU；病灶内可伴有钙化或脂肪组织。MRI 表现为大小不等的囊内 T1 信号高低不一；其中 11 例可见 T2 极低信号灶，对应区域的 T1 呈等稍高信号，增强无强化；9 例表现为囊壁明显强化，5 例表现为实性组织明显强化，明显强化区域弥散明显受限者 3 例；3 例见小结节状弥散高信号，增强无强化。术后病理提示明显强化的区域镜下见到大小不一的成熟甲状腺滤泡样的结构；密度/信号不一的囊内为淡黄色透明液体的胶样物，部分为清亮液体；病灶内 T2 极低信号及弥散受限但无强化的区域镜下见多少不等的嗜伊红胶质样的物质。

PU-0504
基于 PI-RADS V2 评分联合 DCE-MRI 定量分析对前列腺癌的 诊断价值

雷颖

山西医科大学第一医院

目的 探讨磁共振动态对比增强定量分析对 PI-RADS V2 评分在评估前列腺癌的诊断价值。**方法** 筛选前列腺 MRI 检查并经手术或穿刺活检病理证实的 129 例患者，采集前列腺癌病灶区及外周带非癌区和中央腺体非癌区的磁共振动态对比增强定量参数值，并采用 Pearson 相关分析检验 PI-RADS V2 评分组、PI-RADS V2 评分联合 LAVA 组。**结果** PI-RADS V2 评分联合 LAVA 序列对诊断前列腺癌具有较高的诊断价值。**结论** 磁共振动态对比增强定量分析诊断前列腺癌具有可行性，有助于 PI-RADS V2 评分精准评估前列腺癌病变，能更加精准、更加完善的指导临床决策。

PU-0505
磁共振扩散张量成像定量参数鉴别Ⅰ期子宫内膜癌与子宫内膜息肉

王学东,刘爱连,田士峰
大连医科大学附属第一医院

目的 探讨磁共振扩散张量成像（diffusion tensor imaging, DTI）定量参数对 I 期子宫内膜癌（endometrial carcinoma, EC）与子宫内膜息肉（endometrial polyp, EP）的鉴别价值。方法 回顾性分析经手术病理证实的 I 期 30 例 EC 患者和 27 例 EP 患者，术前均行 1.5TMRI 检查（含 DWI 和 DTI 序列）。由两位观察者分别测量两组病灶实质区 DWI 的表观弥散系数（ADC）值、DTI 的表观弥散系数（ADC^{T}）值和各向异性（FA）值，采用组内相关系数（ICC）检验两位观察者测量结果的一致性，根据是否符合正态分布，采用两独立样本 t 检验或者 Mann-Whitney 秩和检验比较两组病灶间各参数值的差异，有统计学差异的参数利用 ROC 曲线评估对两组病灶的鉴别效能，采用 DeLong 检验比较 ADC^{T}、FA 和 ADC 值之间 AUC 的差异。结果 两位观察者测量各组数据的一致性良好（ICC>0.75）；EC 组的 ADC^{T}、ADC 值均小于 EP，EC 组的 FA 值大于 EP 组，分别为 (1.062±0.232)$X10^{-9}$ vs （1.656±0.305）$X10^{-9}mm^{2}/s$、（0.987±0.199）$X10^{-3}$ vs （1.285±0.355）$X10^{-3}$ mm^{2}/s、0.153±0.054 vs. 0.118±0.050，差异有统计学意义（P<0.05）。以 ADC^{T}、ADC、FA 值分别为 1.368$X10^{-9}$mm2/s、1.03$X10^{-3}$ mm^{2}/s、0.135 作为鉴别诊断阈值，敏感度和特异度分别为 88.9%和 100%、100%和 66.7%、63.3%和 80.5%，AUC 值分别为 0.985、0.896 和 0.746。ADC^{T}和 ADC 值的 AUC 具有统计学意义，FA 和 ADC 值的 AUC 没有统计学意义。结论 DTI 定量参数有效鉴别 I 期 E C 和 EP，其中 DTI 的 ADC 值较 DWI 的 ADC 值具有更好的诊断效能。

PU-0506
DCE-MRI 联合多 b 值 DWI 对结直肠癌肝转移化疗后疗效早期评估价值

孙超
天津市人民医院

目的 探讨 DCE-MRI 结合多 b 值 DWI 对结直肠癌肝转移化疗后疗效早期评估的应用价值。**方法** 收集 2019 年 1 月-2020 年 1 月就诊于天津市人民医院的结直肠癌肝转移患者 30 名，共有肝内病灶约 100 个。对每一个病灶选取 ROI，ROI 分别选取在病变全部（最大范围覆盖肿瘤全部，不包括肿瘤周围肝实质）、病变中心位置（面积约肿瘤全部面积的 10%）及病变周围（面积约肿瘤全部面积的

10%），并分别在入院化疗前及两个周期及四个周期化疗后对病灶的 DCE-MRI 参数（病变形态、强化特点、峰值时间、最大增强斜率、容量转移 Ktrans、速率常数 Kep 及血管外细胞外间隙体积百分比 Ve）及多 b 值 DWI 参数 ADC 图进行分析。患者治疗效果根据四个周期实体肿瘤疗效评价分为应答组及非应答组。**结果** DCE-MRI 参数及多 b 值 DWI 参数 ADC 图参数值的变化可以早期评估肿瘤化疗后效果。**结论** DCE-MRI 结合多 b 值 DWI 可以早期预测结直肠癌肝转移化疗后效果，并可能成为一种高效的且临床切实可行的 MRI 疗效评估方案。

Adult intestinal malrotation: An easily overlooked but important fact

Ziman Xiong,Yaqi Shen,Daoyu Hu
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology (HUST), Wuhan, Hubei, P. R. China

Intestinal malrotation is generally considered as a pediatric pathology and is rare in adults, so the adult patients always fail to draw the attention of clinicians. **Objective:** Here we emphasize the importance of correct diagnosis of intestinal malrotation in adults and the value of CT in it. **Methods:** We reported two patients with malrotation of the intestine, both of whom suffered from diagnostic delays due to atypical clinical manifestations, and all of whom underwent abdominal CT examination. **Results:** CT shows that superior mesenteric vein was located to the left of superior mesenteric artery and the “Whirlpool sign” of the mesentery, which has the value of qualitative diagnose. **Conclusion:** CT has certain advantages in the diagnosis of malrotation in adults, and It can help to formulate reasonable treatment plan and evaluate the prognosis .

PU-0508

腹盆增强 CT 对右半结肠癌 TN 分期准确性的研究

刘婧娟,薛华丹,刘炜,陆君阳,肖毅,金征宇
中国医学科学院北京协和医院

目的 研究增强 CT 对右半结肠癌术前 TN 分期的准确性。
方法 前瞻性入组病理确诊的右半结肠癌患者，术前行增强 CT 检查，根据第八版 AJCC 指南进行 TN 分期，详细描述可疑转移淋巴结特征及个数（包括短径/长径≥0.8；≥3 个淋巴结聚集，淋巴结间脂肪间隙消失；短径≥1cm；淋巴结形态欠规则、边缘毛糙），测量病灶中心位置、长径、厚度、累及环周百分比、平扫及门静脉期 CT 值，参照手术病理为金标准，计算增强 CT 术前分期的准确性、特异性及敏感性，分析相关影响因素。
结果 本研究共纳入 82 名结肠癌患者，病理 pT1-2 期 5 例（6.1%），pT3 期 61 例（74.4%），pT4a 期 16 例（19.5%），N0 期 50 例（61.0%），N+期 32 例（39.0%）。T 分期诊断准确率为 80.49%（66/82），区分 T1-2 及 T3-4 期准确率为 97.56%（80/82）。N 分期诊断准确率为 63.4%（52/82），敏感性 75%（24/32），特异性 56%（28/50）。对于真阳性淋巴结（24 例）和假阳性

（22 例），满足一个标准的是 10 例（33.75%）和 19 例（86.36%），满足两个标准是 7 例（29.17%）和 2 例（9.09%），满足三个标准的是 7 例（29.17%）和 1 例（4.54%），两者分布具有统计学差异（*P=0.0067*），病变长度、厚度、累及环周百分比、平扫及门静脉期 CT 值及变化均与 T、N 分期无显著相关性（*P>0.05*）。

结论 增强 CT 对于右半结肠术前 T 分期准确性较高，特别是区分 T1-2 与 T3-4 期；针对 N 分期，满足 2 个及以上形态学标准，可提高诊断淋巴结转移的特异性。

PU-0509

MSCT 对腹内疝分型和分级的应用研究

姜传武
青岛市海慈医疗集团

目的 探讨多层螺旋 CT（MSCT）对腹内疝分型、分级的临床应用价值。材料与**方法** 30 例手术病理证实的腹内疝患者，其临床和影像资料被回顾性分析，然后，将 MSCT 对腹内疝分型和分级的结果与手术病理表现进行对照，并对腹内疝的共同病理基础和主要 MSCT 征象进行统计分析。**结果** ①先天性腹内疝中，十二指肠旁疝最常见，后天性腹内疝中，肠粘连束带疝最常见。②CT 对腹内疝的诊断准确率为 66.7%（20/30），分型准确率为 53.3%（16/30），其中，先天性腹内疝容易诊断，如网膜孔疝、十二指肠旁疝和盲肠周围疝 CT 诊断准确率为 100%，CT 分型准确率为 81.1%（9/11）。获得性腹内疝，特别是肠粘连束带疝，易误诊和漏诊，多以闭袢性肠梗阻收入住院。③肠粘连束带疝与传统腹内疝共同病理基础相比，CT 对肠管异位积聚征的诊断后者不及前者；后者多为闭袢征，前者多为囊袋征；CT 对绞窄征象的诊断两者相近。④肠管异位征对腹内疝定位，囊袋征和闭袢征对腹内疝定量，靶征、漩涡征、血性渗液征对腹内疝定性。以上 6 种征象的诊断也就构成了腹内疝 CT 诊断的一般流程。⑤肠管换位征和网膜脂肪异位征是肠管异位积聚征的特殊表现形式；簇状分布和蘑菇状肠管分别是囊袋征和闭袢的早期表现形式；囊袋征是闭袢征的特殊类型，也是腹内疝特有的典型征象，多见于先天性腹内疝。⑥与病理结果相比较，MSCT 分期总的准确性为 83.3%(25/30)。MSCT 对腹内疝分期结果与手术病理结果评定一致（Kappa=0.759，Z=5.000，P<0.05）。**结论** MSCT 对腹内疝共同病理基础和主要 CT 征象的探讨为建立腹内疝 MSCT 诊断程序提供依据。肠粘连束带疝是对传统腹内疝分型和流行病学的重要补充。MSCT 对腹内疝分期的探讨有助于准确评估病情，指导手术治疗。

PU-0510

MSCT 及后处理技术在消化道枣核诊断中的应用价值

杨想春,马鸣岳,刘润,董燕,宁文锋,高明
西安市中心医院

目的 探讨 MSCT 及后处理技术在消化道枣核诊断中的应用价值。

方法 回顾性分析 24 例经内镜、手术证实的消化道枣核患者的资料。19 例行胸部平扫，3 例行全腹部平扫，2 例行全腹部增强扫描。所有病例均在工作站行多平面重建(MPR)、最大密度投影(MIP)、容积再现(VR)。

结果 食道入口处枣核 16 例，其中 2 例合并食道穿孔，1 例食道周围感染；食道第二生理狭窄处枣核 2 例；胃窦处枣核 2 例；十二指肠水平段枣核 1 例，伴感染；回肠中段枣核 2 例，其中 1 例伴肠管周围感染；乙状结肠枣核 1 例。MSCT 容积扫描均清晰显示枣核；后处理技术对枣核位置、形态、大小及消化道损伤程度、周围感染均清晰显示。

结论 MSCT 对消化道枣核检出率高，后处理技术可清楚评价枣核形态、位置、消化道损伤程度及并发症，以及周围结构的关系；其检查安全、便捷、无痛苦，较钡餐造影有明显优势，可作为消化道枣核诊断最有效的检查手段。

PU-0511
十二指肠神经内分泌肿瘤的 CT 影像学特点，1 例病例报道并文献复习

侍明海,贾晶
宁夏医科大学总医院

目的 通过回顾性分析十二指肠神经内分泌肿瘤的影像学特点和临床病理特点，为十二指肠神经内分泌肿瘤的诊断和治疗提供参考。
方法 1 例在宁夏医科大学总医院进行诊断和治疗的十二指肠神经内分泌肿瘤。结合其它对十二指肠神经内分泌肿瘤的文献报道，对该病的病因学，病理生理，影像学特点，诊断，鉴别诊断和治疗进行总结和讨论。
结果 通过回顾文献我们发现十二指肠神经内分泌肿瘤比较少见。胃肠道神经内分泌肿瘤分为功能性和无功能性肿瘤，功能性肿瘤通常在发现时较小，无功能肿瘤和恶性神经内分泌肿瘤在发现时通常较大，容易发现。上消化道神经内分泌肿瘤通常位于胃和十二指肠。CT 检查胃肠道对无功能性胃肠道神经内分泌肿瘤敏感性非常高，可以在术前对病变进行很好的评估，包括病变的范围，对邻近器官的侵犯，淋巴结的肿大等。胃肠道神经内分泌肿瘤通常缺乏特定的影像学特征，诊断主要依靠特定的部位和医生的意见。本例胃肠道神经内分泌肿瘤位于十二指肠降部，体积较大引起了十二指肠降部腔的狭窄，同时伴有肝脏的多发转移，患者因肿瘤出血致上消化道出血到医院就诊。
结论 十二指肠神经内分泌肿瘤是一种少见的肿瘤，无功能及恶性肿瘤因其体积较大容易发现，但因为其缺乏特征性的影像学表现不容易从影像学上进行诊断，主要依靠病理诊断。熟悉胃肠道神经内分泌肿瘤的影像学特点和其它临床特点可以帮助我们准确地对该病进行诊断，给予合适的治疗。

PU-0512
MSCT 对肠梗阻病因诊断的价值

冯俊榜
重庆市急救医疗中心

【摘要】目的 探讨多排螺旋 CT 对肠梗阻病因诊断的价值。**方法** 回顾分析经临床诊断为肠梗阻的患者，再筛选出术前 CT 资料完善的患者，最后选取经手术确诊为肠梗阻的患者 238 例，对本组病例的 CT 图像（全腹平扫）进行分析并结合临床表现，对肠梗阻做出病因诊断并探讨其价值。**结果** 238 例均有不同程度的腹痛、呕吐、腹胀、停止肛门排气排便的临床表现，其中梗阻部位发生于小肠 203 例，结肠 18 例，直肠 5 例，未能精确定位 2 例。MSCT 全部显示肠梗阻征象，阳性率 100%。238 例手术治疗患者中，其 MSCT 肠梗阻表现均与手术结果相符，肠粘连 158 例，肿块 36 例，其中 17 例伴肠套叠，疝 13 例，回肠挫伤 4 例，腹膜炎 10 例，慢性炎伴灶性腺上皮增生 1 例。**结论** MSCT 不仅能较为准确的诊断肠梗阻，在其病因的诊断方面还具有一定的价值与意义。

PU-0513
右半结肠癌伴阑尾炎的 CT 影像特点及其相关性分析

谢欣,雷振
锦州医科大学附属第一医院

摘要：目的 分析右半结肠癌伴阑尾炎的 CT 表现及其临床特征，降低误诊率及漏诊率。**方法** 回顾性分析 2017 年 5 月至 2019 年 3 月在锦州医科大学第一附属医院接受全腹增强 CT 检查的右半结肠癌患者的临床资料，共计 114 例，将这些患者分为结肠癌伴阑尾炎组和结肠癌不伴阑尾炎组，分析两组 CT 及临床特点。（收集患者性别、年龄、肿瘤部位、肿瘤生长方式、肿瘤厚度、狭窄程度，有无排便习惯或性状改变、肠梗阻、慢性腹痛等临床因素）。**结果** 单因素分析显示肿瘤位置、肿瘤生长方式和管腔狭窄程度均有统计学意义（ P<0.05），多元回归分析显示肿瘤位置及管腔狭窄程度有统计学意义（ P<0.05）。**结论** 结肠癌 CT 检出的结肠癌位置、管腔狭窄程度与阑尾炎的发生有关，因此，当怀疑有阑尾炎时，应进行全腹增强 CT 检查，以减少误诊、漏诊。

PU-0514
3D MRI texture analysis based on T2WI in differential diagnosis of benign and malignant presacral lesion after resection of rectal carcinoma

Jian Jiang,Yuan Ji,Ailian Liu
The First Affiliated Hospital of Dalian Medical University

Objective: To evaluate the diagnostic value of 3D MRI texture analysis based on T2WI in differential diagnosis of benign and malignant presacral lesion after resection of rectal carcinoma
Materials and methods: Postoperative MRI and clinical data of 26 patients with histopathologically confirmed presacral lesion (12 postoperative granulation or fibrous tissue and 14 local recurrence tumors) were retrospectively analyzed. The regions of interest (ROIs) covering the entire lesion were manually delineated on axial slices using O.K. (Omni Kinetics, GE Healthcare, China) software; and the histogram and GLCM features based on T2WI sequence were automatically generated. Statistical package for social science (SPSS) 12.0 and R language (RStudio Version 1.0.143 2009-2016 RStudio, Inc.) were used for data analysis.
Results: In texture analysis of T2WI features, min-intensity, max-intensity, mean value, standard deviation, variance, RMS, range, skewness, quantile5, quantile10, quantile50, quantile90, quantile95 and correlation were significantly increased in benign group compared to malignant group; while volumecount, entropy and inertia of benign group were significantly decreased (P=0.003~0.044). According to ROC analysis, the entropy (cutoff value=0.69, area under the curve (AUC) = 0.833) was considered the best parameter for the diagnosis of two groups, with the sensitivity of 85.7% and specificity of 83.3%, respectively. Multivariate logistic regression was used for modeling. The modeling formula of T2WI was as follow: f_{T2WI}=-7.857+18.553×entropy-0.065×volumecount-168.287×skewness.

Conclusion: MRI texture analysis based on T2WI could be used as a new noninvasive method for identification of benign and malignant presacral lesion for the patients of rectal cancer after operation.

PU-0515

进展期胃癌术前多期增强 CT 预测脉管侵犯的价值

陈昊升,雷振
锦州医科大学附属第一医院

摘要 目的 探讨多期增强 CT 对进展期胃癌(AGC)术前淋巴、血管浸润（LVI）的术前预测作用。**方法** 回顾性分析 150 例术前 2 周内行多期增强 CT 扫描的 AGC 患者的临床资料。测量肿瘤平扫 CT 值（Value $_{NON}$）、动脉期 CT 值（Value $_{AP}$）、静脉期 CT 值（Value $_{PP}$）、延迟期 CT 值（Value $_{DP}$）,并计算各期 CT 值与平扫 CT 值的强化 CT 差值（ Δ_{AP}、 Δ_{PP}、 Δ_{DP}），以及肿瘤静脉期 CT 值（ Value $_{PP}$）与脊柱旁竖脊肌的 CT 值（ Value $_{Muscle}$）的差值 Δ_{T-M}。对比 LVI 阳性组及阴性组 CT 观察参数和临床基本信息、病理变量的差异，对存在统计学意义的参数进行多因素 logistic 回归分析和受试者工作特征曲线（ROC）分析。**结果** LVI 阳性组与阴性组在组织学分化、劳伦分型均具有统计学意义（分别为 P<0.030，P<0.035）。CT 观察参数中 Value $_{PP}$、 Value $_{DP}$、 Δ_{PP}、 Δ_{DP}及 Δ_{T-M}均具有统计学意义（均为 P<0.000）。多因素 Logistic 回归分析结果显示：Δ_{PP}（OR=1.062）、Δ_{T-M}（OR=1.053）是脉管侵犯的独立预测因素。Δ_{PP}，Δ_{T-M}预测 LVI 正确率分别为为 78.7%（ AUC，0.752；灵敏度，86.5%；特异度 57%），和 78.6%（AUC，0.786；敏感度，69.3%；特异度 79.2%）。**结论** 多期增强 CT 检查中通过观察值 Δ_{PP}、Δ_{T-M}可初步评估进展期胃癌 LVI 的状态，从而为临床治疗提供参考。

PU-0516

Value of CT morphologic features with pT1-2 gastric cancer in predicting lymph node metastasis

zhicong Wang
Department of Radiology, The First Affiliated Hospital of Xiamen University

Purpose
To investigate the value of CT tumor volume and enhancement features of pT1-2 gastric cancer in assessing lymph node metastasis (LNM) with pathologic results as the reference standard.
Materials and methods
This retrospective study included 86 patients with consecutive pathologically proven T1–2 stage gastric cancer. Tumor volume, CT values in plain and portal-venous phase (PVP) were measured and percent enhancement of PVP were calculated. The correlations between tumor volume, CT values in plain and PVP, percent enhancement of PVP and pathologic N stages were analyzed. Receiver operator characteristics (ROC) analyses were further performed to assess diagnostic performance for prediction of LNM in T1-2 stage gastric cancers.
Results

Tumor volume, CT value in PVP and percent enhancement of PVP were significantly correlated with the histopathologic N stage (rho: 0.307, 0.558, 0.586, respectively). Tumor volume were significantly smaller in LNM- group in comparision with LNM+ group (P=0.004). The differences between LNM+ and LNM- groups in CT value in PVP and percent enhancement of PVP were also statistically significant (P<0.001, P<0.001, respectively). The area under the ROC curves (AUCs) for identification of LNM+ group were 0.693 for tumor volume, 0.865 for CT value in PVP, 0.883 for percent enhancement of PVP, respectively. The percent enhancement of PVP of 129.27% predicted LNM+ with 82.14% sensitivity, 79.31% specificity, the CT value in PVP of 76HU predicted LNM+ with 89.29% sensitivity, 75.86% specificity, the tumor volume of 17.35ml predicted LNM+ with 82.14% sensitivity, 58.62% specificity.

Conclusion

CT tumor volume and enhancement features of pT1-2 gastric cancer had potentially value for predicting lymph node metastases.

PU-0517

小肠间质瘤术前 CT 征象与术后病理危险程度分级对照研究

蓝燕芬
福建省立医院

目的探讨小肠间质瘤术前 CT 征象以评估其病理危险程度。**方法**选取 2012 年 6 月至 2018 年 2 月本院收治的经手术及病理证实的 64 例小肠间质瘤患者，根据术后病理危险程度结果将患者分为危险程度较高组和危险程度较低组，其中危险程度较高组占 71.9%（46/64），危险程度较低组占 28.1%（18/64），回顾性分析患者术前影像学表现与肿瘤危险程度的关系。**结果**单因素分析结果显示两组间患者病灶边缘是否清楚、病灶与周围组织分界是否清楚、病灶有无分叶、平扫密度是否均匀、是否合并溃疡、是否合并囊变、病灶大小、病变增强动脉期增值及静脉期增值差异有统计学意义（P<0.05）；两组间患者性别、年龄、病灶是否合并钙化、病变部位、生长方式、强化方式及延迟期强化增值、是否合并消化道出血差异无统计学意义（P＞0.05）。多因素分析结果显示病灶越大（*P*=0.002，*OR*：4.718，95% *CI*：1.788～12.454）、病灶与周围组织分界不清（*P*=0.024，*OR*：24.336，95% *CI*：1.531～386.957）小肠间质瘤危险程度越高。病灶大小的 ROC 曲线结果为 AUC=0.938，P<0.001，说明病灶大小对于小肠间质瘤危险程度分级准确性高，且病灶≥4.80cm 肿瘤为高危险程度。病灶与周围组织分界 AUC 为 0.694，P=0.016，说明病灶与周围组织分界对于小肠间质瘤危险程度分级具有较低准确性。**结论**小肠间质瘤的 CT 征象具有一定特征性，根据其特征，可协助术前对小肠间质瘤危险程度分级。

PU-0518

Impact of a structured report template on the quality of MSCT reports for small bowel diseases

Bosheng He, Jushung Yang, Zhou Jie
First People's Hospital of Nantong (Affiliated Hospital 2 of Nantong University)

Objective: To develop a structured report of small bowel diseases (SBDs) based on multi-slice computed tomography (MSCT) enterography and evaluate its superiority over free text reporting in radiologists with different seniority.
Methods: Radiologists, gastroenterologists, gastrointestinal surgeons and oncologists were involved in developing a structured report template for small bowel imaging. Six radiologists were divided into inexperienced group (< 5 years, n = 3) and experienced group (≥ 5 years, n = 3), and 60 cases of small intestinal MSCT data were available for free text reports and another 60 cases for structured reports after training. The accuracy and satisfaction of reports as well as the completion time between two reporting methods was compared.
Results: The completion time of structured reports was significantly less than that of free text reports. Using free text reports, the positive accuracy of five kinds of diseases in the experienced group was higher than that in the inexperienced group, but the misdiagnosis rate except for bone diseases was lower in the experienced group. After using structured reports, the accuracy of the above diseases in inexperienced group and the positive diagnostic accuracy of bone lesions were significantly enhanced in experienced group. Besides, the total missed diagnosis rate of the two groups was significantly declined, and the satisfaction scores of structured reports in two groups was superior to those of free text reports, although no obvious difference of satisfaction scores was observed between two groups.
Conclusions: Structured reporting was superior to free text reporting in writing efficiency, accuracy and satisfaction, and thus could improve the report quality of SBDs for physicians, especially for the inexperienced radiologists.

PU-0519
多层螺旋 CT 血管造影与单纯 CT 平扫对小肠梗阻患者的临床诊断价值

徐爱民
平顶山煤业(集团)公司总医院

[摘要] 目的 分别探讨多层螺旋 CT 血管造影与单纯 CT 平扫对小肠梗阻患者的临床诊断价值。方法 回顾性分析 2016 年 8 月至 2018 年 6 月在我院治疗的 103 例小肠梗阻患者的临床资料，所有入选者均需接受多层螺旋 CT 血管造影检查以及 CT 平扫检查，分析不同检查方式的诊断结果。结果 两种检查方式对动力性肠梗阻、血运性肠梗阻的诊断符合率对比，差异无统计学意义（P＞0.05）；多层螺旋 CT 血管造影检查对机械性小肠梗阻的诊断符合率以及总诊断符合率均高于单纯 CT 平扫结果，差异有统计学意义（P＜0.05）；两种检查方式对机械性小肠梗阻中高位小肠梗阻、完全性梗阻的诊断符合率对比，差异无统计学意义（P＞0.05）；多层螺旋 CT 血管造影检查对机械性小肠梗阻中低位小肠梗阻以及不完全性梗阻的诊断符合率均高于单纯 CT 平扫检查结果，差异有统计学意义（P＜0.05）；多层螺旋 CT 血管造影对小肠梗阻病因总诊断符合率为 86.41%。结论 与单纯 CT 平扫相较而言，多层螺旋 CT 血管造影检查对小肠梗阻病因、梗阻程度、位置等均具有较高诊断准确性。

PU-0520

Histogram analysis of ADC from high-resolusion diffusion-weighted imaging with clinical characteristics in rectal cancer

Xin Wang,Jinyu Huang
First Affiliated Hospital of Soochow University

Purpose: To elucidate possible associations between ADC histogram parameters obtained using readout-segmented echo-planar imaging (rs-EPI) diffusion weighted magnetic resonance and several clinical features in rectal cancer.
Methods: Eighteen patients with pathologically confirmed rectal cancer were enrolled. ADC histogram analysis was performed on the rs-EPI based ADC maps. The patients were grouped according to the degree of differentiation, TN stage, and the plasmatic CEA level. The correlation between each clinical feature and the ADC histogram parameters were evaluated.
Results: Spearman's correlation analysis revealed a strong correlation between degree of differentiation and skewness. Tumors with lower differentiation grades corresponded to higher skewness values (r= -0.578, P=0.01). However, ADC parameters differences were not observed in different clinical T and N stage (P>0.05) and plasmatic CEA level (P> 0.05).
Conclusion: Skewness value was significantly different in different differentiation grade of rectal cancer. Skewness in the higher differentiation grade has lower skewness value. There was no significant difference in ADC parameters between different TN stages and plasmatic CEA level. The quantitative description of rs-EPI sequence-based ADC parameters has potential to be used to assess the biological behaviors of rectal cancer.

PU-0521

肠白塞 MRE 表现两例

冷小园[1],吴光耀[2],徐国斌[1]
1.武汉大学中南医院
2.深圳大学总医院

例 1：患者男，37 岁，因 “间断腹痛 1 年余，加重伴便血 5 天”就诊。既往口腔溃疡十余年，其舅有肺结核病史。体格检查：脐周及右下腹明显压痛，可触及包块。肠镜于回盲部见环周巨大溃疡，回盲部活检见呈中度活动性炎伴溃疡形成，未见明显肉芽肿。MRE 检查示（图像见附件）：回盲部不均匀管壁增厚伴管腔局限性变形扩张，系膜对侧增厚为著。增强及 DWI 见回盲部及肠周小淋巴结呈较均匀强化，弥散明显受限。患者要求转外科手术。术后病理：回盲部巨大溃疡伴广泛静脉血管炎及纤维化，符合肠白塞之诊断。
例 2：患者女，28 岁，因“间断右下腹隐痛不适 4 月余”就诊。 既往发现白塞病 9 月余，有激素治疗及生殖器溃疡史。体格检查：右下腹压痛。肠镜示回盲部环周溃疡，占据整个管腔，表面凹凸不平；回盲瓣明显变形，肿胀。取活检：送检组织未见明显炎症性肠病改变，未见淋巴瘤改变，但不能除外白塞病、肠结核、血管炎。 MRE（图像见附件）示：回盲部不均匀管壁增厚伴异常强化及弥散受限，脂肪间隙多发稍大淋巴结，结合病史考虑肠白塞病可能。家属要求行外科手术解除肠穿孔风险。术后病理：小肠溃疡边缘腺体轻度不规则，包括绒毛变短与幽门腺化生。未见明显血管

炎、透壁性炎。结合临床患者有生殖器溃疡病史，以及激素治疗史，虽未见活动静脉周围炎、诊断仍考虑为白塞氏病（Behcet 病）治疗后。
讨论：典型肠白塞肠镜表现为回盲部单发或少发、深大、圆形或椭圆形的溃疡。本研究中 2 例均有较典型的肠镜表现。2 例 MRE 检查均显示回盲部肠壁显著增厚，肠腔变形，部分可显示深大溃疡。相对于克罗恩病肠壁增厚逐渐进展为肠腔狭窄，肠白塞病变肠段增厚程度更重却表现为肠腔柔软，未见梗阻症状。克罗恩病分层强化多见，而肠白塞则以均匀强化多见。肠白塞的 MRE 表现具有一定特点，对该病的诊断及鉴别诊断有重要的价值。

PU-0522
食管鳞癌淋巴结转移病理及影像学危险因素分析

韩鹏
南京大学医学院附属鼓楼医院

目的 研究食管鳞状细胞癌淋巴结转移临床病理及 CT 影像学危险因素，为评估有无淋巴结转移提供依据。**方法** 回顾性分析 2010 年 1 月至 2016 年 4 月在南京鼓楼医院行术前 CT 平扫及增强检查的 176 例食管癌患者临床病理及影像资料，分析淋巴结转移的危险因素。**结果** 176 例患者，90 例（51.14%）发生淋巴结转移。肿瘤 T 分期及肿瘤上下径是影响淋巴结转移的独立危险因素（P < 0.05）。以“T 分期≥ 3”为评估标准时，敏感度及特异度分别为 71.9%、52.3%，以“肿瘤长径≥ 4.95cm”为评估标准时，敏感度及特异度分别为 48.3%、77.9%。**结论** 术前食管鳞癌除行常规 CT 轴位扫描测量轴位长径外，还应补充多平面重建，测量肿瘤上下径值，从而对易发生淋巴结转移患者进行有效评估。

PU-0523
低剂量 CTC 联合 iDose4 迭代重建技术在结直肠癌术前 TNM 分期中的应用

谢妹珍
柳州市人民医院

摘要：目的 探讨低剂量 CT 结肠成像（CTC）联合 iDose^{4}迭代重建技术在结直肠癌术前分期的临床应用价值。**方法** 回顾性分析本院 2017 年 102 例结直肠癌患者术前采用常规剂量 CTC 扫描联合滤波反投影（FBP）技术重建的影像资料，与 2018 年 102 例结直肠癌患者术前采用低剂量 CTC 扫描联合 iDose^{4}迭代重建技术重建的影像资料，由两名高年资放射科医生采用双盲法进行术前影像学分期，以手术病理结果为金标准，判断术前 TNM 分期的准确性；分别记录每次扫描的 CT 容积剂量指数、剂量长度乘积，估算出有效剂量进行对比。**结果** 常规剂量和低剂量 CTC 扫描对结直肠癌术前 TNM 分期判断的总体准确率分别为 78.43%（80/102）和 86.27%（88/102）、69.61%（71/102）和 63.72%（65/102）、M 分期均为 97.05%（99/102）；两种扫描方法对结直肠癌术前 TNM 分期诊断准确率的差异无统计学意义（均 P>0.05）。低剂量组的辐射剂量比常规剂量组降低了约 68.65%。**结论** 低剂量 CTC 联合 iDose^{4}迭代重建技术对结直肠癌术前 TNM 分期与术后病理具有良好的相关性，既能明显降低患者接受的辐射剂量，又能很好的满足临床医师对结直肠癌的术前评估要求和手术方案的制定，具有较好的临床应用价值。

PU-0524

绞窄性肠梗阻增强 CT 征象分析

向刚
西南医科大学附属中医医院

目的 分析绞窄性肠梗阻 CT 征象，提高绞窄性肠梗阻诊断准确性。
方法 统计分析诊断明确的 42 例绞窄性肠梗阻和 60 例单纯性肠梗阻患者的增强 CT 图像， 查阅文献，选取 9 种提示绞窄性肠梗阻的 CT 征象:
(1) 肠壁强化减弱；(2)肠壁无强化；(3)肠壁持续强化；(4) 肠壁、肠系膜静脉、门静脉积气；(5)漩涡征；(6)肠系膜血管充血；(7) 肠壁增厚呈双晕征；(8) 肠系膜水肿(9) 血性腹腔积液。
对比分析绞窄性肠梗阻与单纯性肠梗阻的 CT 增强特征。
结果 上述 9 种 CT 征象在绞窄性肠梗阻病例中出现概率明显高于单纯性肠梗阻病例(P 均 ＜ 0. 05) ; 前 5 种征象只出现在绞窄性肠梗阻病例中， 42 例绞窄性肠梗阻患者中同时具备 2 项以上征象者占 87. 6% ， 60 例单纯性肠梗阻患者中具备 2 项以上征象者仅 4 例， 两组差异有明显统计学意义(P＜ 0. 05) 。
结论 肠梗阻时，出现肠壁强化减弱、无强化、肠壁持续强化、肠壁、肠系膜静脉、门静脉积气、漩涡征等征象之一或至少其他 2 种以上 CT 征象，则强烈提示绞窄性肠梗阻。

PU-0525

不同位置结肠癌术前 T 分期策略的区别：MSCT 与病理对照研究

董龙春,钟进,刘学焕,李晶龙
天津市人民医院

目的 探讨不同位置结肠癌术前 T 分期的不同诊断策略。
材料与方法 回顾性搜集 2017 年 1 月-2019 年 7 月期间入住我院的结肠癌患者 550 例（男性 310 例，女性 240 例；平均年龄 62 岁）。所有患者均经肠镜穿刺活检病理证实为结肠癌，并于术前行全腹部平扫+增强 CT 检查。由 3 名工作 5 年以上的腹盆部专业影像诊断医师对所有图像进行评估，采集并记录以下影像征象：病变肠段位置、累及长度、肿物类型（肠壁增厚/隆起型肿物）、占据肠管周径、是否累及系膜侧、强化程度及方式、脂肪线征、结节状外突、是否与周围有腹膜覆盖的结构粘连，评估肿瘤影像 T 分期。以术后病理 T 分期作为参考标准，分别计算影像 T 分期的敏感性、特异性、阳性预测值（PPV）、阴性预测值（NPV）和诊断准确性，并行多因素分析。
结果 多因素分析显示，脂肪线征、结节状外突、是否累及系膜侧、是否与周围有腹膜覆盖的结构粘连是 T 分期的独立危险因素。对于腹膜内位的横结肠和乙状结肠，脂肪线征对 T3 期肿瘤的 PPV、NPV 分别为 0.89、0.95，结节状外突对 T4 期肿瘤的 PPV、NPV 分别为 0.84、0.92。而对于腹膜间位的升结肠和降结肠，脂肪线征对 T3 期肿瘤的 PPV、NPV 分别为 0.72、0.95，结节状外突对 T4 期肿瘤的 PPV、NPV 分别为 0.31、0.96。联合脂肪线征与结节状外突对 T4 期横结肠和乙状结肠癌的诊断准确性高达 94%，而对 T4 期升、降结肠仅为 26%。对升、降结肠癌累及系膜侧组，结节状外突对 T4 期的诊断准确性为 85%，联合脂肪线征与结节状外突对 T4 期的诊断准确性为 89%。与周围有腹膜覆盖的结构粘连对判断各位置结肠癌 T4 期的诊断准确性差异无统计学意义（P>0.05）。
结论 不同位置结肠癌应采用不同的术前分期策略，对于腹膜间位的升、降结肠癌，判断肿瘤是否累及系膜侧是准确诊断 T 分期的关键。

PU-0526

X 线射线技术对急性肠梗阻诊断的临床价值

朱婉莹
合肥平安健康检测中心

【摘要】目的　分析腹部 X 线片在急性肠梗阻诊断中的应用价值，采用超声检查技术和 X 线检查技术的对比。

方法　选择在我院就诊急性肠梗阻患者 80 例，随机分为研究 1 组和研究 2 组，平均每组 40 例。第一组用超声技术对患者的病情进行诊断，扫描过程中患者去平卧位，对患者的腹部进行全面检查。第二组采用 X 线射线技术进行诊断，扫描过程中患者取站立位，对腹部进行摄影。这两组进行对比。（2）观察指标：选择 2 组研究对象诊断结果与病理学检验结果的符合率等作为观察指标进行对比。

结果　X 线组诊断肠梗阻部位的准确率明显高于超生，两组比较有统计学意义。

结论　X 线片技术对急性肠梗阻疾病进行诊断准确率较高,是目前临床上首选诊断方法，但也有可能出现误诊和漏诊，因此术后进行病理学检验非常必要。

PU-0527

Inverted ileal diverticulum with mesentery comorbid with lipoma: A case report

Juan Zhang,Dechang Peng
the First Affiliated Hospital of Nanchang University

objective:Inversion of the diverticulum into the lumen is rare, we report a case of inverted ileal diverticulum comorbid with lipoma and describe the radiological features that enable the preoperative diagnosis of inverted diverticulum.
Methods: Clinical analysis of 1 cases of inverted ileal diverticulum comorbid with lipoma as a clinical manifestation and review of clinical literature in recent years.
Results:Enhanced MSCT (multi-slice CT) scanning revealed a fatty density nodule and thickened vessel in a section of underfilled ileum and a lipoma in the distal ileum. Iohexol CT enterography showed that the fatty density nodule was mesenteric fat. We diagnosed invaginated mesentery combined with lipoma and performed surgery. pathology revealed a diverticulum and a lipoma in the resected small intestine.
Conclusion: The invaginated mesentery fat may be mistaken for lipoma. Increased awareness of this disease and its imaging findings will help doctors make the correct diagnosis. Elongated filling defects and thickened vessels in the intestinal bowel on CT images suggest this possibility.

PU-0528

以下腹痛为主诉的急诊 CT 诊断思路

李良才
中山市人民医院

目的
探讨以下腹痛为主诉的急诊 CT 的影像诊断思路。
方法
研究对象为 128 例急性起病的下腹痛患者作了 CT 检查，年龄 20~80 岁，男性 78 例，女性 50 例，均为我院 2017 年 1 月—2018 年 6 月收治，其中 62 例单纯作了螺旋 CT 平扫检查，38 例作了螺旋 CT 平扫+增强扫描检查，28 例作了螺旋 CT 平扫+CTA 检查，CT 扫描过程中对非检查部位（尤其是甲状腺、性腺）作了防护处理。对平扫及增强/CTA 图像进行阅片观察，其中平扫图像常规采用肝窗、腹部窗、脂肪窗观察，增强/CTA 图像结合 MPR/cMPR、MIP 及 VR 重组图像观察，记录影像表现及予以分析和比较。
结果
平扫检查可以诊断以下疾病：①胆系/泌尿系结石，部分阑尾炎、憩室炎及肠脂垂炎等感染性疾病；②胃肠道穿孔所致气腹的诊断，但对穿孔病因诊断显示不确切；③提示肠梗阻，但对梗阻原因（比如是黏连、肿瘤、绞窄等）单靠平扫检查诊断有限，进一步明确梗阻原因需要结合增强检查；④CT 平扫+增强/CTA 检查，可明确实质/空腔脏器损伤、腹主动脉瘤或夹层、胃肠憩室出血，胃肠道动静脉畸形等出血性疾病及肠系膜动脉血栓、绞窄性肠梗阻等缺血性疾病。
结论
MSCT 平扫+增强/CT 可早期明确引起下腹痛的病因诊断，为无创、安全快捷的检查方法。

PU-0529
应用能谱 CT 成像对结直肠肿物分化程度及良恶性肿物的鉴别

王丹丹,罗娅红
辽宁省肿瘤医院

目的:评估动态能谱 CT 成像定量参数对结直肠癌分化程度及结直肠良恶性肿物鉴别的诊断价值。**方法** 收集 84 例结直肠肿物患者行术前一站式动态能谱扫描，同时获得能谱及灌注成像数据。根据手术病理结果分为 A 组（腺瘤，n=15）,B 组（腺癌，n=69），C 组（高分化腺癌,n=36）,D 组（中低分化腺癌,n=33）。将不同组间的一般资料、病灶碘值（IC）、标准化碘值（NIC）、动脉期血流量（AF）、血容量（BV）、表面渗透性（PS）进行统计学分析， ROC 曲线用于评估其诊断效能。**结果** 静脉期 IC 和 NIC 对鉴别腺瘤和腺癌存在显著差异（P <0.001）。 ROC 分析显示，静脉期 NIC 为 3.52 时鉴别腺癌与腺瘤的敏感性为 72.0%，特异性为 91.9%。腺瘤和腺癌组之间的 AF，BV 和 PS 均存在显着差异（P <0.001）。ROC 分析表明， AF 值为 175.13 ml·min·100 g 时鉴别腺癌和腺瘤的敏感性为 80.0%，特异性为 86.4%；高分化腺癌和中低分化腺癌之间的 AF、BV 和 PS 均存在显着差异（P< 0.001）。BV 值为 7.76 ml / 100 g 时鉴别低级别癌症和高级别癌症的灵敏度为 90.9%，特异性为 77.7%。**结论** 一站式动态能谱 CT 扫描能同时得到能谱参数及灌注参数对鉴别结直肠良恶性肿物及肿瘤的分化程度有重要诊断价值。

PU-0530
65 例小肠肿瘤就诊情景、术前影像检查方法选择及结果分析

唐秉航
中山市人民医院

目的
回顾性分析经手术病理证实的 65 例小肠肿瘤临床就诊情景、影像检查方法选择及结果。
方法
复习病案资料，搜集 2013 年 1 月至 2018 年 12 月本院经手术病理证实的 65 例小肠肿瘤，对就诊情景、术前影像检查方法选择及影像检查结果回顾性分析。
结果
男性 37 例，女性 28 例。年龄 29-91 岁，平均 60.4 岁。以消化道症状就诊 62 例， 其中一般性腹部症状（腹痛、腹胀等）40 例，占 61.5%；发热、消瘦、贫血，黑便，便血 19 例，占 29.3%。体检偶然发现 3 例。术前临床医师影像检查方法选择：65 例患者术前影像检查均选择了 CT，其中平扫 21 例，平扫+增强 28 例，直接增强扫描 9 例，CTE7 例。术后病理**结果** 小肠腺癌 10 例，淋巴瘤 7 例，转移瘤 12 例，间质瘤 32 例，脂肪瘤 3 例，腺瘤 1 例。对比手术所见及病理结果:平扫定位准确率 14.3%，定性小肠肿瘤准确率 23.8%；常规增强扫描定位小肠肿瘤准确率 71.1%，定性小肠肿瘤准确率 68.4%；小肠 CTE 定位小肠肿瘤准确率 85.7%，定性小肠肿瘤准确率 71.4%。
结论
CT 仍是目前临床首选的小肠疾病检查方法。患者就诊情景影响临床医生对影像检查方法的选择，而选择不同检查方法是影响小肠肿瘤术前影像诊断病灶定位、定性准确率的重要因素。

PU-0531

胃神经鞘瘤的 CT 表现

傅宁
徐州医科大学附属医院

目的 探讨胃神经鞘瘤（GS）的 CT 表现特点，以提高对该病的认识以及正确术前影像诊断。 **方法** 选择经手术病理及免疫组化证实的 12 例 GS，均行 全腹 CT 平扫及增强扫描，分析病灶的大小、密度、部位、强化方式及有无坏死、囊变、出血以及钙化，并总结其影像学表现。 **结果** 12 例均为单发、圆形或类圆形病灶；直径 2．5～6．5 cm；胃体部 10 例，胃窦部 2 例；向腔内生长者 4 例，向腔外生长者 3 例，腔内外生长者 5 例。 2 例肿块内部发现小片状低密度区，增强扫描强化不均匀；10 例均呈均匀密度，动脉期轻度强化，静脉期轻中度强化。 所有患者均未发现钙化灶及出血，1 例伴胃周淋巴结肿大。 **结论** GS 的 CT 表现具有一定特征，对部分病例可作出提示，有助于临床术前的诊断及治疗决策。

能谱 CT 多参数成像在胃腺癌分化程度中的应用价值

李长健,朱广辉
蚌埠医学院第一附属医院

目的 通过对不同分化程度胃腺癌在能谱 CT 成像上的参数及特征进行对比分析，研究 CT 能谱成像在不同分化程度胃腺癌诊断中的应用价值。方法 选择 60 例胃腺癌影像资料进行回顾性分析，将其依据分化程度进行分组，其中低分化组 28 例，中高分化组 32 例，全部的研究对象都进行 CT 能谱平扫及动静脉双期扫描。得到图像后确定出感兴趣区域，对所得结果进行处理，计算出不同扫描期相所有病灶在不同单能量水平下 CT 值、碘-水浓度等相关参数，并进行独立样本 t 检验。结

果　静脉期 40～90 kev 各单能量水平下低分化组的 CT 值均高于中高分化组，且低分化组的能谱曲线斜率（3.92±1.04）明显高于中高分化组（3.17±0.53），结果存在统计差异，静脉期低分化组标准化碘基值（0.50±0.14）高于中高分化组标准化碘基值（0.40±0.06），动脉期仅 60　kev 单能量水平下低分化组的 CT 值（80.47±13.80）高于中高分化组（68.35±13.20），差异具有统计学意义（P＜0.05）；余平扫及动静脉双期相关的参数差异较小，不存在统计学意义。结论　能谱 CT 多参数成像能够对不同分化程度胃腺癌进行定量分析，40-90kev 下单能量 CT 值、标准化碘浓度及能谱曲线斜率有助于术前胃癌分化程度评估。

PU-0533
早期胃癌 CT 影像特征与组织分化程度的对照研究

何玉鹏[1,2],陈勇[3],高知玲[3],陈文[1],徐霖[1]
1.十堰市太和医院
2.宁夏医科大学
3.宁夏医科大学总医院

目的　探讨早期胃癌（EGC）CT 影像特征与组织分化程度的相关性。**方法**　收集我院 87 例 EGC 患者的 CT 图像，按照术后病理分为分化组及未分化组，分析两组间基线资料（性别、年龄、病变部位、病变方位、淋巴结转移）、胃壁形态（黏膜厚度、胃壁厚度、黏膜下层完整性）、肿瘤密度（肿瘤平扫及增强 CT 值、ΔCT 值、肿瘤强化方式）、区域淋巴结（淋巴结数目及短径）之间的差异。**结果** 两组在性别（x^2=7.889，P=0.005）、病变部位（x^2=8.500，P=0.014）、黏膜下层完整性（x^2=5.631，P=0.018）、平扫 CT 值（t=-3.763，P=0.000）、动脉期 CT 值（t=-3.532，P=0.001）、动脉期ΔCT 值（t=-2.367，P=0.020）、门脉期ΔCT 值（t=2.698，P=0.008）、延迟期ΔCT 值（t=3.352，P=0.001）、峰ΔCT 值（t=3.437，P=0.001）、小淋巴结短径（t=-3.607，P=0.000）间有统计学差异；在年龄（t=1.615，P=0.110）、病变方位（x^2=1.695，P=0.638）、淋巴结转移（x^2=0.708，P=0.400）、黏膜厚度（t=-0.420，P=0.675）、胃壁厚度（t=-0.013，P=0.990）、门脉期 CT 值（t=1.273，P=0.206）、延迟期 CT 值（t=1.959，P=0.053）、峰 CT 值（t=1.737，P=0.086）、肿大淋巴结数量（x^2=2.582，P=0.108）、肿大淋巴结短径（z=-0.346，P=0.730）间无统计学差异；分化组强化方式以抛物线及上升型为主，未分化组以抛物线及下降型为主（x^2=2.325，P=0.000）；联合平扫 CT 值、动脉期ΔCT 值及门脉期ΔCT 值判断未分化型 EGC 的 AUC 可达 0.829。结论　EGC 的部分 CT 特征一定程度上可以反映其组织分化。

PU-0534
多层螺旋 CT 后重建技术在诊断小肠肠梗阻中的应用价值

骆孟
连云港市第一人民医院

摘要:目的:探讨多层螺旋 CT 后重建技术在诊断小肠不全性肠梗阻中的应用价值。**方法:**搜集 64 例经手术治疗及随访观察明确诊断为肠梗阻的患者。通过观察　肠系膜血管聚集、拉伸、牵拉、扭曲，小肠狭窄及扩张程度，并进行统计学处理。**结果:**（1）MPR 显示 肠道显示肠道肿块 18 例，肠道浸润性狭窄 6 例，肠道炎性狭窄 23 例，肠套叠 9 例，漩涡征 11 例。显示肠系膜上动脉钙化斑块 9 例，非钙化斑块 6 例。肠壁增厚 35 例，肠壁呈环形强化 20 例，肠壁内点状积气 5 例，肠系膜水肿 8 例，肠系膜静脉内积气 1 例，肠壁无强化 5 例。腹腔积液 13 例。（2）CTA 显示　肠系膜上动脉旋转 11 例，肠系膜上动脉移位 45 例，肠系膜血管聚集 15 例，肠系膜血管分散 18 例，肠系膜上动脉闭塞 14 例。 **结论:**利用 128 层螺旋 CT 扫描，联合血管容积再现（VR）及

多平面重建（MPR）后重建技术，可以早期确定梗阻的具体部位、梗阻的原因；客观地分析判断病变肠管缺血程度。

PU-0535

Can iodine concentration of Spectral CT non-invasively assess angiogenesis in colon cancer?

Weixing Li,Xingzhi Sun,Hongbao Li,Zhen Jia
Xinxiang Central Hospital

Aim To investigate the correlation of iodine concentration (IC) generated by spectral CT with micro-vessel density (MVD) and vascular endothelial growth factor (VEGF) expression in patients with colon cancer.

Methods Twenty-two patients who were diagnosed colon cancer in T3 and T4a by colonoscopy from October 20 to March 2019 underwent abdomen enhanced spectral CT scan, CT value, iodine concentration (IC), normalized iodine concentration ratio (nIC) during arterial phase (AP), venous phase (VP) were measured by two experienced radiologists at primary lesion and fat around the lesion. And Patients were confirmed as T4a group (with serosal infiltration) and T3 group (with no serosal infiltration) by pathology results after operation . The microvessel density (MVD) and Endothelial growth factor (VEGF) of the two groups were detected by immunohistochemistry.

Correlation of nIC with MVD, VEGF and clinicopathological features were analyzed. The total RNA of the two primary lesions was extracted from the tissue samples excised during the operation, and VEGFA and other related factors were detected by RT-PCR. The relative expression level of the ligand angiogenesis index.

Results

1. IC and nIC in tumors at stage T4a were significantly higher than those in T3,and there was statistical difference ($P<0.05$).
2. NICs in both groups were positively correlated with MVD, and were significantly during AP, but NICs had no significant correlation with VEGF.
3.The results of RT-PCR showed that the expression of VEGFA in the primary lesion was higher in tumors at stage T4a than in T3 group, and showed a positive correlation between nIC and VEGFA expression.

Conclusions

Iodine concentration can reflect the infiltration of the serosa around the colon and the angiogenesis of colon cancer to some extent, so that the colon cancer stage can be evaluated non-invasively before operation. The IC detected by spectral CT correlated with the MVD.

PU-0536

磁共振弥散加权成像在直肠癌术前分化程度中的应用价值

陈海霞,鲁宏
重庆市第七人民医院

目的 评价磁共振弥散加权成像在直肠癌术前分化程度中的预测价值。**方法** 回顾性分析 2018 年 1 月至 2019 年 4 月经我院病理组织学检查确诊为直肠癌患者 50 例，对比术后病理结果，将 50 例患者分为高分化 9 例、中分化 33 例、低分化 8 例。所有研究对象行盆腔磁共振检查，收集所有研究对象 MRI 图像，在后处理工作站独立进行图像分析和测量。参照薄层 T2WI 图像，在 ADC 图像上对肿块进行勾画，感兴趣区选择为肿瘤最大层面区域勾画三个小圆形测量相应的 ADC，避开坏死、囊变、出血等区域，取其平均值为测量值（图 1）；用于评估直肠癌术前分化程度。采用 SPSS17.0 软件进行分析，P＜0.05 为差异有统计学意义。**结果** 50 例直肠癌患者，男性 24 例（47.62%），女性 26 例（52.38%），平均年龄 65.48±10.79 岁。根据术后病理结果，将肿瘤分化程度分为高分化 9 例、中分化 33 例、低分化 8 例。ADC 值在高中低分化直肠癌中差异有统计学意义 P＜0.001，高分化直肠癌 ADC 为 1.030±0.045（$10^{-3}mm^2/s$），中分化直肠癌 ADC 为 0.941±0.059（$10^{-3}mm^2/s$）；低分化直肠癌 ADC 为 0.821±0.079（$10^{-3}mm^2/s$）。每两组之间比较差异有统计学意义 P＜0.001。**结论** ADC 值能准确的反映水分子在肿瘤细胞内外的运动情况。肿瘤分化程度越低，ADC 值越低，恶性程度越高；ADC 值在鉴别高分化与中分化、中分化与低分化的直肠癌中有一定价值。总之，
磁共振弥散加权成像能准确评估直肠癌患者术前分化程度，对患者的治疗、预后提供重要的影像依据。

PU-0537
磁共振成像评估局部进展期直肠癌新辅助治疗疗效

康文焱,文洁,邓文明,罗德红
中国医学科学院肿瘤医院深圳医院

目的 探究磁共振成像（MRI）在新辅助治疗进展期直肠癌疗效评估中的价值。**方法** 将 2017 年 1 月至 2019 年 6 月中国医学科学院肿瘤医院深圳医院收治的Ⅱ～Ⅲ期 58 例直肠癌患者纳入回顾性队列研究，所有患者术前均行新辅助治疗，治疗方法为局部放疗配合同步化疗，治疗后 6-8 周内手术，最长不超过 10 周。治疗后磁共振评估的时间为前 1 周以内。研究本组患者 MRI 影像资料，比较其治疗前后肿瘤大小，分析其治疗后的影像学 T 分期，并与术后病理分期进行比较。采用 Kappa 检验新辅助治疗后影像学分期和术后病理分期一致性。**结果** 58 例Ⅱ～Ⅲ期直肠癌患者中男性 32 例，女性 26 例，中位年龄 53.4（32～80）岁。新辅助治疗前影像分期 T3 期者 36 例（62%），T4 期者 22 例（38%）。新辅助治疗后，28 例（48%）患者发生 T 分期降期（包括完全缓解），30 例（52%）患者 T 分期未降期（其中 3 例患者发生 T 分期进展）。按照实体瘤疗效评价标准（RECIST）方法进行评估，缓解者（包括完全缓解和部分缓解）占 83%（48/58），未缓解者（包括疾病稳定和疾病进展）占 17%（10/58）。比较新辅助治疗后影像 T 分期与术后病理分期，T 分期再分期的准确率为 71%（41/58），对 T0～2 期、T3～4 期诊断的敏感度和特异度分别为 62%（20/32）和 77%（20/26），79%（27/34）和 59%（14/24），影像及病理一致性差（Kappa 值＝0.391，P＝0.002）。**结论** 新辅助治疗在肿瘤的降期与缓解、缩小病变的范围中具有重要的作用。MRI 作为一种重要的评估手段，通过比较治疗前后的肿瘤大小能够初步判断疗效，而单纯通过比较治疗前后肿瘤的影像 TNM 分期判断疗效，其准确性不高。从临床的角度看，新辅助治疗后 T 分期低估的情况应予以重视。

PU-0538
炎症性肠病的临床表现及影像学表现综述

孙凯容
无锡市第二人民医院（南京医科大学附属无锡第二医院）

炎症性肠病(inflammatory bowel disease。IBD)是一类可由不同病因所引起的非特异性慢性肠道炎症性疾病，主要分类为溃疡性结肠炎(ulcerative colitis，UC)和克罗恩病(Crohn’8 disease，CD)，另外还有少部分病人因无法明确诊断，则称之为“不确定性大肠炎”。该病病因目前尚不清楚，但是，近来来，越来越多的国人开始患上此病，为了能够明确诊断炎症性肠病， 减少临床工作的困难，同时提高该类疾病诊断的可靠性，降低漏诊率、误诊率，对于溃疡性结肠炎和克罗恩病的临床表现、病理表现、尤其是影像学表现的比较的掌握至关重要，非常有利于两种疾病的鉴别诊断，同时随着近代影像学技术的发展，CT、核磁共振、肠镜、超声等技术在对于两种炎症性肠病的诊断和治疗中都扮演着不可替代的角色。本文是基于本人阅读的多篇文献，从而对溃疡性结肠炎和克罗恩病两种炎症性肠病的诊断、比较、鉴别诊断有了一个系统的概念而写就，目的是为了深入了解两种疾病，寻找最为简便可靠的治疗方法，辅助临床诊断和治疗，提高诊断效率，减少痛苦。

原发性消化道黑色素瘤的影像表现

陈妙玲,邹玉坚,梁满球,肖利华,黄翔,郑晓林
东莞市人民医院

目的 分析原发性消化道黑色素瘤的 CT、MRI 及 PET/CT 表现，探讨其影像表现学特征及诊断价值。**方法** 回顾性分析 11 例经病理组织学和免疫组织化学证实的原发性消化道黑色素瘤的影像及临床资料，其中 MRI5 例，CT6 例，PET/CT5 例。**结果** 11 例原发性消化道黑色素瘤中，肿瘤位于食管 1 例、胃 1 例、同时发生于食管和胃 1 例、小肠 2 例、大肠 6 例，以直肠肛管最为多见。原发性消化道黑色素瘤多表现明显蕈伞型肿块充满管腔(n=7)，多大于 2.0cm，部分呈管壁明显增厚(n=4)，通常不伴肠梗阻，7 例伴周围脂肪浸润、淋巴结转移。典型性恶性黑色素瘤有 MRI 特征性表现，MRI 表现为 T1 和 T2 驰豫时间缩短，T1WI 呈稍高信号，T2WI 呈低信号。CT 检查病变多表现为中等软组织密度灶，大部分平扫密度较均匀，注射造影剂后大部分病变中度强化。PET/CT 均表现为葡萄糖代谢增高。本组病例均经组织病理学检查并免疫组化确诊，其中 HMB45、Vimentin 均为阳性，S-100(+)82%（9/11），Melan-A（+）91%（10/11）。**结论** 原发性消化道黑色素主要依靠病理组织学和免疫组织化学的综合诊断，但其影像表现有一定的特征性，MRI 检查对其鉴别诊断有提示价值。影像学检查能很好地显示原发性消化道黑色素瘤的部位、与邻近组织的关系，进一步指导临床治疗及评估预后。

PU-0540

CT 在胃肠道穿孔的诊断及定位穿孔位置的价值分析

胡元楠
武汉大学中南医院

目的 回顾性分析 CT 在胃肠道穿孔的诊断及穿孔部位定位的价值。
方法 选取 2018 年 1 月～2019 年 5 月我院收治的 98 例胃肠道穿孔患者,所有患者均经过手术病理诊断证实,按穿孔时间分为 0-24h、24-48h、＞48h 组，并分析游离气体体积等影像征象与穿孔位置、穿孔大小及时间的相关性。

结果 0-24h 为诊断穿孔的准确率达 98%，穿孔定位准确率达 66%；23-48h 诊断穿孔的准确率达 65%，穿孔定位准确率达 45%；＞48h 诊断穿孔的准确率达 10%，穿孔定位率达 0%；差异具有诊断学意义。局限性腹膜炎伴周围不规则形空气影对穿孔的定位有诊断意义。
结论 CT 对于穿孔时间小于 24h 的穿孔部分定位具有显著意义。

PU-0541
CT 门静脉成像预测肝硬化食管下段静脉曲张程度的价值评估

万上,宋彬
四川大学华西医院

目的
食管下段静脉曲张是肝硬化患者门静脉高压症的常见并发症，本研究目的是评估 CT 门静脉成像（CT Portography, CTP）在预测食管下段静脉曲张程度的诊断效能和临床价值。
方法
选取我院 2016 年 1 月-2018 年 8 月临床上诊断为肝硬化食管下段静脉曲张（esophageal varices，EV）患者 53 例，所有患者均在内镜检查 4 周内接受 CTP 检查。以内镜检查为金标准，53 例患者分为非显著性食管静脉曲张（EV）组（轻度+中度 EV）（n = 28），显著性 EV 组（重度 EV）（n = 25）。观测曲张静脉的直径，曲张静脉的截面总面积以及曲张静脉的体积，所有数据均采用 3D-slicer 软件测量，计算纳入指标的灵敏度和特异性，拟合 ROC 曲线，计算 AUC，选择截断点，评估纳入指标在预测食管下段静脉曲张的诊断效能。两组间数据采用成组设计的两样本均数的 t 检验，以 P＜0.05 为差异有统计学意义。
结果
CTP 能较好地显示食管下段的曲张静脉，非显著组 EV 平均直径为 4.65±1.38mm，显著组为 7.08±2.13mm，非显著组 EV 平均体积为 1059.84±795.97mm^3，显著组为 2440.84±1310.05mm^3，非显著组 EV 平均总面积为 30.04±20.32mm^2，显著组为 59.92±35.06mm^2，曲张静脉直径在预测重度 EV 时的 AUC 为 0.846，诊断敏感度为 92%，特异度为 73.1%，曲张静脉体积在预测重度 EV 时的 AUC 为 0.820，诊断敏感度为 88%，特异度为 65.4%，曲张静脉的截面总面积在预测重度 EV 时的 AUC 为 0.766，诊断敏感度为 72%，特异度为 76.9%。
结论
CT 门静脉成像可作为一种预测食管下段静脉曲张程度的方法，曲张静脉直径及体积对于诊断肝硬化合并食管下段静脉曲张有较高的诊断效能，其中，体积作为一种新指标，对曲张静脉的的检测具有较高价值。

PU-0542
多层螺旋增强 CT 结合血管重建技术对肠及肠系膜损伤的诊断价值

周玮[1],何剑[1],魏云海[1],胡红杰[2],韩玉鑫[2]
1.浙江大学湖州医院（浙江省湖州市中心医院）
2.浙江大学医学院附属邵逸夫医院放射科

目的 腹部创伤是目前较为常见的急诊外科常见疾病，其中肠及肠系膜损伤(bowel and/or mesenteric injuries，BMIs)在腹部创伤中的发生率为 1%～5%，早期发现、准确诊断和及时治疗是挽救患者生命的关键。笔者回顾性分析了 86 例闭合性 BMIs 患者的螺旋 CT 增强及血管重建

（multi-slice spiral computed tomography angiography，MSCTA）的影像表现，探讨其对 BMIs 疾病的诊断价值。

方法 选取浙江大学湖州医院及浙江大学医学院附属邵逸夫医院 2012 年 1 月至 2018 年 1 月间因腹部闭合性损伤来院诊治的 BMIs 患者 86 例，所有患者均行急诊腹部 CT 增强及肠系膜 CTA 检查。回顾性分析所有入选研究的肠及肠系膜损伤（BMIs）患者的 CT 增强扫描及 CTA 影像特征，来评价多层螺旋 CT 结合血管重建技术对肠及肠系膜损伤的诊断价值。

结果 在 86 例 BMIs 患者中，单纯小肠损伤共 35 例（40.7%）；小肠合并肠系膜损伤 21 例（24.4%）。单纯结肠损伤患者共 15 例(17.4%)；结肠合并小肠损伤 5 例(5.8%)；结肠合并肠系膜损伤 3 例(3.5%)。单纯肠系膜损伤 7 例（8.1%）。MSCT 及 CTA 主要表现为小肠或结肠肠壁增厚，肠管连续性中断；肠系膜损伤，肠系膜血肿形成，造影剂外渗出；腹腔、盆腔及腹膜后积液（血），腹腔内游离气体。

结论 本研究通过回顾性分析 86 例经过手术及临床保守治疗随访证实的闭合性 BMIs 患者的临床资料及影像学表现得出**结论** BMIs 的多层螺旋增强 CT 及 CTA 成像具有典型的影像学特征，利用该技术对临床精确制定治疗方案具有一定指导价值，值得临床推广。

PU-0543
青年人大肠癌 CT 和 MRI 影像学表现与病理学对照分析

张光明
云南省第二人民医院

【摘要】目的 探讨青年人大肠癌的 CT 和 MRI 影像学表现及发病特点。方法 回顾性分析 26 例经病理证实为大肠癌的青年患者的 CT（24 例）和 MRI（19 例）影像学表现，并与病理进行对照分析。结果 26 例患者中直肠癌 10 例，乙状结肠癌 7 例，升结肠癌 6 例，横结肠癌 2 例，盲肠癌 1 例，其中 2 例合并肠套叠，1 例合并阑尾类癌；病理上腺癌 14 例，粘液腺癌 9 例，印戒细胞癌 3 例，伴有淋巴结转移 10 例，腹腔转移 4 例，淋巴结癌栓形成 8 例。结论 早期大肠癌在青年人中的发病容易被忽视，因病就诊时多数已达中、晚期，发病率逐年上升，恶性程度也较高，CT 扫描中尤其增强 CT 能够较好的发现病变，MRI 扫描能够显示病变侵犯程度及范围，对淋巴结转移的判断明显优于 CT，可对病变作出 TNM 分期，从而协助临床作出正确干预，以提高患者生存率。

PU-0544
结直肠癌影像检查的技术进展与挑战

戴琦,陈斌
中国科学院大学宁波华美医院（宁波市第二医院）

目的 回顾结直肠癌成像的现状，概述指导结直肠癌管理的各种情形中关键成像模式的优势和局限性，特别是新兴影像学技术评估肿瘤对新型疗法时面临的挑战。

材料与**方法** 近二十年来，随着新型成像技术开发和分子示踪剂的出现，影像学检查在结直肠癌中应用可谓日新月异，在疾病监测、诊断、分期、治疗选择和随访中发挥着越来越重要的作用。通过动态对比增强 CT（DCE-CT）、动态对比增强 MRI（DCE -MRI）、弥散加权 MRI（DW-MRI）等新技术可用于评价结直肠癌早期生物和功能学的变化。正电子发射断层扫描（PET）和计算机断层扫描（CT）等技术的融合，氟代脱氧葡萄糖（FDG）-PET/CT 结合代谢和解剖成像，提高了肿瘤检测的敏感性、特异性，以及肝转移病灶的检出水平，促进了直肠癌治疗策略的发展，但也并非没有局限性。

结果 当前的挑战主要体现在结直肠癌全程管理中不同的影像检查技术没有明确的使用规范，检查结果缺乏统一的评估标准，成像技术的诊断效能-经济成本仍需要进一步优化。
结论 有效结合患者个性化治疗方案和医院固有的影像检查硬件设备，影像学检查技术可能会在降低结直肠癌的死亡率方面发挥更大、更重要的作用。

PU-0545
DCE-MRI 对直肠癌周围系膜内淋巴结转移的诊断价值

印隆林[1],杨李[1,2],曾桔[1],孙菊[1],张传德[1]
1.四川省医学科学院·四川省人民医院
2.绵阳市中心医院

目的 探讨 DCE-MRI 对诊断直肠癌周围系膜内淋巴结转移的价值。方法 前瞻性纳入经肠镜检查确诊为直肠癌的患者 56 例，所有患者术前均行常规 MRI 及 DCE-MRI 检查且随后 1 周内行全直肠系膜切除术及术后标本病检。分析直肠系膜内可视淋巴结的边界、平扫及 T1W 增强信号特点（均匀/不均匀强化或环状强化），测量感兴趣淋巴结短径及 ADC 值，根据上述结果综合判断其是否为转移性淋巴结且与手术病理结果比较；通过 DCE-MRI 图像后处理获得定量灌注参数 Krans、Ke 及 Ve，比较直肠癌周围淋巴结转移组与非转移组间的差异性，绘制差异有统计学意义参数的 ROC 曲线并计算 AUC，并进一步确定诊断阈值。结果 ①56 例患者的 79 枚淋巴结根据手术病理结果分为转移组 44 例、非转移组 35 例。②直肠癌周围系膜淋巴结的短径、边界、平扫及 T1W 增强信号特点、ADC 值在两组间的差异均有统计学意义（P＜0.05）；Ktrans 值在两组间的差异有统计学意义（P＜0.05），而 Kep、Ve 值的组间差异无统计学意义。③常规 MRI 与病理标准诊断淋巴结转移的一致性比较中，Kappa 值=0.455、P＜0.001，诊断直肠癌周围系膜淋巴结转移的敏感度 61.4%、特异度 85.7%，阳性预测值 84.4% 、阴性预测值约为 63.8%。④常规 MRI、常规 MRI 联合 DCE-MRI 诊断直肠癌周围系膜淋巴结转移的 ROC 曲线下面积分别为 0.858、0.919，且 DCE-MRI 的 AUC 大于常规 MRI（Z 值=3.116,P=0.0018）。当 Ktrans=0.124 min^{-1}时约登指数最大，敏感度、特异度分别为 93.2%、77.1%。结论 常规 MRI 检查诊断直肠癌周围系膜淋巴结转移效能一般，常规 MRI 联合 DCE-MRI 诊断直肠癌周围系膜淋巴结转移准确性较高，且可将 Ktrans=0.124 min^{-1}作为鉴别直肠癌周围系膜淋巴结转移与非转移的阈值。

PU-0546
小肠 CT 造影多时相显示效能研究

董春梅
昆明医科大学第一附属医院

目的 比较 CT 造影在不同扫描时相下对小肠肠壁及血管的显示效果，确定最佳扫描时相，评价该时相的临床诊断效能。方法 将 100 例行小肠 CT 造影的患者分别进行动脉期、门脉早期及门脉晚期、延迟期扫描，测量十二指肠、空肠及回肠肠壁 CT 值、血管显示数量及血管 CT 值，比较分析后选择最佳扫描时相，评价该时相 CT 图像小肠及血管病变的诊断效能。结果 （1）十二指肠、空肠及回肠肠壁 CT 值均为门脉早期高于动脉期、门脉晚期和延迟期（P＜0.05），而动脉期和门脉晚期、延迟期差异无统计学意义。（2）回肠动脉在各时相 CT 值比较：动脉期＞门脉早期、门脉晚期及延迟期，后三者无统计学差异。回肠静脉在各时相 CT 值比较：门脉晚期＞门脉早期＞延迟期＞动脉期（P＜0.05）。（3）小肠 CT 造影证实小肠淋巴瘤 8 例、间质瘤 5 例、腺瘤 1 例、克罗恩病 8 例、小肠结核 2 例。结论 小肠 CT 造影门脉早期对小

肠肠壁有较好的显示效能，动脉期及门脉晚期对血管显示较高，利用动脉期及门期双期扫描方式进行小肠 CT 造影检查，可对大多数小肠疾病做出准确诊断。

胃神经内分泌癌的预后分析

秦凤英,董越
辽宁省肿瘤医院

目的 本文主要通过 CT 增强及临床资料探讨胃 NEC（neuroendocrine carcinoma，神经内分泌癌）的预后相关因素。材料与方法 1、病例资料 对经病理确诊为胃 NEC 的患者进行回顾性分析，共 70 例，其中男性 57 例，女性 13 例。所有患者均行上腹部增强 CT 检查。2、CT 检查方法 采用 Siemens SomatomSensation64 层螺旋 CT 扫描仪，增强扫描采用双筒高压注射器 (German Ulrich)自肘前静脉注入非离子型对比剂碘海醇注（350mgI /L)80～100mL，注射流率 3～3.5mL/s。3、影像分析 对 79 例患者的影像资料进行观察分析，观察内容为有无淋巴结转移。4、生存分析 对确诊为胃 NEC 并实施手术的患者进行随访，随访截至 2019 年 1 月 9 日。统计的 DFS(disease-free survival，无病生存时间)为从手术结束到第一次复发或死亡的时间。复发标准：胃 NEC 复发或其他部位转移，经病理或者影像至少一项检查证实。把出现转移或死亡的患者纳入进展组，其余患者为非进展组。5、统计学方法 对患者的预后，采用 Kaplan-Meier（Log-rank 检验）进行单因素分析。检验有意义的指标采用 Cox 回归模型分析。p<0.05 为差异有统计学意义。结果 在 53 例术后的胃 NEC 患者中，发生转移的患者 12 例，死亡患者 22 例，进展组患者共 34 例，非进展组患者共 19 例。患者生存时间为 0.5~47.5 月，平均生存时间 29.6 月，中位生存时间 40.1 月 。对于手术治疗的胃 NEC 患者，年龄、淋巴结转移及 TNM 分期对患者的预后影响存在差异，差异有统计学意义（p <0.05）。其中淋巴结转移是影响预后的独立危险因素。结论 对于手术治疗的胃 NEC 患者，年龄、淋巴结转移、TNM 分期是影响预后的因素，其中淋巴结转移是影响预后的独立危险因素。

PU-0548

16 排螺旋 CT 对阑尾炎的诊断意义及附 1 例漏诊分析

谭一静,陈胜良,王大江,孙跃奎
遵义市余庆县人民医院

目的 探讨 16 排螺旋 CT 对急性阑尾炎的有效诊断，降低阑尾炎的误漏诊。**方法** 应用 Scope16 排螺旋 CT，对临床疑似急性阑尾炎 16 例进行薄层扫描，并冠状位矢状位重建。**结果** CT 显示急性单纯性阑尾炎者 6 例，急性化脓性阑尾炎 4 例；坏疽性并阑尾穿孔性阑尾炎 2 例；阑尾异常并阑尾炎 1 例，1 例粪石阑尾炎误诊为肠梗阻。**结论** 充分做好检查前、检查过程中的准备工作，薄层扫描的同时采用增强扫描，冠状位与矢状位重建，以及阅片医生丰富的工作经验是减少误诊漏诊的重要手段，为临床早期治疗方案制定提供有效的影像诊断依据，CT 对急性阑尾炎的正确诊断具有重要意义。

PU-0549

能谱 CT 在胃癌术前分期诊断中的应用研究进展

向世玲,刘芳,罗荣,李妹玲
重庆医科大学附属永川医院

胃癌是起源于胃黏膜上皮的恶性肿瘤，是常见的恶性肿瘤之一，占全球恶性肿瘤死因第 3 位。中国是胃癌的高发区域之一，每年约有 35 万人死于胃癌。胃癌患者预后和胃癌的术前分期密切相关，早期胃癌患者术后 5 年生存率已超过 90%，而进展期胃癌的 5 年生存率仍低于 30%。准确的胃癌术前分期对提高患者的生存率以及选择合理的治疗方案、评估预后等具有十分重要意义。随着各种影像技术越来越成熟，新兴技术如超声造影、能谱 CT、影像组学的运用，胃癌术前分期评估日趋完善。能谱 CT 作为一种双能量成像设备，提供了全新的多参数成像诊断模式，实现物质分离与鉴别，在胃癌诊断中具有更显著优势。能谱 CT 在胃癌 T 分期的应用研究中，赵致平等对 91 例患者进行能谱 CT 平扫及增强检查，进入最佳单能量图像，得到整个病变及其周围的能谱曲线，发现能谱 CT 对胃癌层次结构的显示与病理间存在相关性，通过最佳单能量图像 及能谱曲线的分析胃癌 T 分期的术前评估与病理结果的一致性较好，可提高早期胃癌的对比噪声比，改善图像质量，对胃癌的侵犯范围显示具有一定的应用价值。在胃癌淋巴结转移的应用研究中，王睿通过回顾性分析经病理确诊为胃腺癌并行能谱 CT 扫描的 210 例患者的临床及影像学资料，发现肿瘤原发灶的 Borrman 分型、最厚径及能谱 CT 参数静脉期 nIC 值可以评价并预测胃腺癌淋巴结转移，提高 CT 胃癌术前诊断 N 分期的准确度。能谱 CT 的定量参数 IC 值，特别是静脉期 nIC 值可以作为预测胃癌淋巴结转移的影像学指 标，为临床胃癌患者个体化治疗提供更多依据。由此可见，能谱 CT 对胃癌术前分期诊断有较高的应用价值，能谱 CT 联合多种平面重组技术在胃癌 T 分期诊断中具有较高价值,。然而，有关这方面研究方兴未艾， 能谱 CT 的多参数定量分析的结果并不一致，有关参数的诊断界值及效能尚缺乏统一的认识，因此能谱 CT 成像在胃癌分期诊疗中的应用价值尚待进一步挖掘。

PU-0550

Magnetic resonance enterography for the detection of inflammatory diseases of th e juvenile Crohn’s disease: quantifying the inflammatory activity.

Meina Li[1],Xianying Zhen[1,2],Yinchen Wu[1,2],Xuehua Lin[1,2]
1.The first affiliated hospital of fujian medical university
2.The first affiliated hospital of fujian medical university

Objective:
To evaluate the accuracy of Magnetic resonance Enterography (MRE) in the diagnosis of active lesions and ulcers in juvenile Crohn’s disease (CD) against endoscopic and histopathology reference standard.
Materials and methods:
70 children (under 18 years of age) with CD, who underwent ileocolonoscopy and MR enterography within 7 days were recruited and the terminal ileum biopsy was available. The Simplified Endoscopic Activity Score for Crohn’s Disease (SES-CD), histopathologic endoscopic acute inflammation score[eAIS]) and Magnetic resonance enterography global score (MEGS) were scored in the terminal ileum. The correlation between MEGS and the reference standard (SES-CD and eAIS) was assessed by Spearman rank estimation. The diagnostic accuracy of MER for active disease and ulceration defined by endoscopic or histopathologic were calculated. Receiver operating characteristic curves (ROC) were constructed.

Results: Fifty-two adolescent CD patients were included. MEGS showed strong correlation to SES-CD (r =0.698) and weak correlation to eAIS (r= 0.31). With endoscopic as the standard of reference, the MEGS had a high accuracy for the detection of disease activity (AUC of 0.87, sensitivity 0.88 and specificity 0.86) and for ulcerative lesions (AUC of 0.85, sensitivity 0.83, specificity 0.87) in the terminal ileum. When histopathology diagnosis was chosen as the reference standard, MRE had lower sensitivity and specificity than Endoscopic in the identification of active disease and ulcers; for the detection of disease activity (AUC of 0.60, sensitivity 0.69, specificity 0.50) and for ulcerative lesions (AUC of 0.60, sensitivity 0.64, specificity 0.56) in the terminal ileum.
Conclusion: The accuracy of MRE for detecting disease activity and ulceration brings about the possibility of using MRE as an alternative to endoscopy in the evaluation of juvenile CD.

PU-0551

MR 检查在坏死性筋膜炎中的应用

陈晨
天津市第三中心医院

目的 探讨 MRI 检查在坏死性筋膜炎早期诊断中的价值。
方法 采用回顾性研究，汇总 4 例由于肠道肿物导致大肠埃希细菌感染引起下腹部壁坏死性筋膜炎的 MRI 影像学表现。
结果 坏死性筋膜炎是一种急性细菌性感染型疾病。主要特点是病程进展迅速且扩散广泛。累及皮下组织和深筋膜，多为需氧菌与厌氧菌协同作用造成的混合感染。免疫力低下者及使用皮质醇类药物，糖尿病患者等为高发人群。常常为感染中毒症状，严重者危及生命，因此影像学结合临床症状对于该病早期发现，协助诊断及后续治疗及预后判断就显得十分必要。MRI 影像学上表现：在 T2WI 脂质抑制序列，肌间深筋膜增厚≥3 mm，成高信号，可有单侧或双侧多处受累，可有气体存在。但 T2 高信号并非坏死性筋膜炎的特征性影像学表现，仍需排除非感染型筋膜炎以及可能存在的肌肉撕裂；另外排除类似部位的非坏死性软组织感染。这些影像学表现可能十分类似，但临床表现却迥然不同。
结论 对于肠道肿物继发感染所致坏死性筋膜炎,该病的临床表现及相关的特点应作为早期排查的首要指标，影像学如见异常或考虑该病，应协助临床医师做好早期诊断工作,协助选择清创的范围，告知累及部位，并在后续为该病治疗提供相应的影像学依据，并据此协助做出远期预后的判断。

PU-0552

高分辨磁共振在直肠癌术前分期中的应用

李宗文,杨超
中国科学院大学重庆医院（重庆市人民医院）

目的 探讨高分辨直肠磁共振检查中序列的优化与应用

方法 使用西门子 VERIO 3.0T 磁共振对 60 例直肠癌患者进行直肠磁共振检查。其中男性 32 例，女性 28 例。随机分为两组，每组 30 例。两组检查前均为检查前禁食 4-6h，且行清洁灌肠。检查前 20min 肌注 20mg 山莨菪碱。嘱患者检查过程中平静呼吸，不能移动身体。头先进，仰卧位，腹部沙袋，相控阵线圈。A 组检查技术：行横断面 T2WI，T1WI，DWI，矢状位 T2WI，冠状位 T2WI。B 组检查技术：A 组序列基础上加扫 T2WI+FS。两组所选序列均为小 FOV（25-27cm）、薄层扫描（3mm），DWI（b=0,800）。对两组不同扫描技术所得图像进行病灶的 T 分期。

结果 两组不同检查序列对直肠癌 T 分期中 T1-2 期、T3 期、T4 期及淋巴结转移诊断的敏感性为 89.85％、94．51％、93．94％及 88．54％，与病理检查分期诊断结果具有良好的一致性。

结论 高分辨磁共振应用于直肠癌术前分期诊断具有较高的准确性，能准确评估直肠癌浸润程度和术前 T 分期.其中 T1WI+DWI 能够很好的显示周围淋巴结情况。T2WI+FS，DWI 能够很好的显示病灶本身的信号特点。T2WI 能够很好的显示病灶浸润周边情况。推荐使用 T2WI，T2WI+FS, T1WI，DWI，矢状位 T2WI，冠状位 T2WI。MRI 能够术前提供准确的分期信息以帮助临床医生制定最佳的治疗方案。

PU-0553
直肠癌磁共振与病理分期对照及其与 MVD 值的相关性分析

唐茁月
中国科学院大学重庆医院（重庆市人民医院）

目的 探讨直肠癌 MRI 与病理分期对照及其与 MVD 值的相关性。
方法 顾性分析 28 例直肠癌患者的磁共振成像(MRI)资料，结合高分辨率 MRI(HR-MRI)及弥散加权成像(DWI)的多序列 MRI 对患者进行 T、N 分期，并与术后病理对照。术后标本采用 CD34 单克隆抗体行免疫组化染色计数微血管密度(MVD)，统计 MRI 分期与 MVD 的关系及表观弥散系数(ADC)与 MVD 的相关性。
结果 显示多序列 MRI 对直肠癌 T 分期总的正确率为 85.7％(24/28)，Kappa=0.805；N 分期正确率为 82.14％(23/28)，Kappa=0.632。MRI T3-4 期的 MVD 值(27．00±4．34)较 T1-2 期(20.47±3.60)高，N1-2 期(26.35±4.06)较 N0 期(19.09±2.98)高，差异有统计学意义。ADC 与 MVD 呈负相关(r=-0.743，P<0.05)。
结论 本研究显示 MRI 分期及弥散成像的 ADC 值与 MVD 之间存在相关关系。因此，术前 MRl 分期及 ADC 值的定均可在一定程度上反映病灶微血管增生情况，从而为临床提供帮助。

PU-0554
多排螺旋 CT 在肠梗阻诊治中的价值

周志敏
苏州大学附属第二医院

目的 研究肠梗阻急诊病例的诊治过程，评估 MDCT 在肠梗阻诊治中的价值。**方法** 回顾性研究 80 例肠梗阻病例，以及 MDCT 三维重建影像学资料。**结果** 急诊病例因 CT 检查而改变治疗方案的比例为 18.7%，并且能够为肿瘤性肠梗阻提供制定治疗方案的依据，为肠梗阻手术指征提供判断依据，MDCT 判断肠绞窄的敏感性 100%，特异性 58.3%. **结论** MDCT 是诊断不明或存在并发症的肠梗阻必须的评估手段。

PU-0555
能谱 CT 在结肠癌术前鉴别 T3 和 T4a 分期中的研究

孙兴智,李卫星,栗鸿宝,贾祯,吕东元
新乡市中心医院

目的
探讨能谱 CT 在结肠癌术前 T3 期和 T4a 期鉴别中的应用价值。
方法
前瞻性收集 2018 年 3 月至 2019 年 5 月期间结肠镜怀疑结肠癌病人 160 例，并对这些病人进行能谱模式下双期全腹部扫描，有两位经验丰富的放射科医生测量 40—140 keV 不同单能量下 CT 值及动脉期（AP）、静脉期（VP）原发病灶及病变周围脂肪的碘浓度（IC）、水浓度（WC），并计算标准化碘浓度比(nIC)，能谱曲线斜率（$\lambda_{(HU)}$）。经手术病理证实， 121 名患者中浆膜浸润 T4a 组为 61 例，无浆膜浸润 T3 组为 60 例，采用非参数 Mann-Whitney U 检验，比较 T3 组及 T4a 组各参数间的差异。并对定量参数进行 ROC 分析，计算曲线下面积（area under curve,AUC）,评价定量参数值鉴别 T3 及 T4a 的能力。
结果
采用非参数 Mann-Whitney U 检验得出，T3 组及 T4a 组原发病变及周围脂肪的动脉期碘浓度（ICAP）、动脉期标准碘含量（nICAP）、动脉期 40-70keV 的能谱斜率（λ_{AP}）及静脉期碘浓度（ICPP）、静脉期标准碘含量（nICPP）及静脉期 40-70keV 的能谱斜率（λ_{PP}），T4a 组病人各参数均高于 T3 期患者，具有统计学意义（P 值<0.05）。
使用 MedCalc 进行两期各参数 ROC 曲线分析，得出两期两组原发病变及周围脂肪 IC 及 nIC 的 AUC 面积，动脉期标准碘含量碘浓度临界值为 0.29mg/ml 时，ROC 曲线下面积（AUC）为 0.668，灵敏度为 50.82%，特异度为 81.67%；静脉期标准碘含量临界值为 0.2mg/ml 时，AUC 值为 0.819，灵敏度为 93.44%，特异度为 73.33%，提示静脉期对 T3 及 T4a 鉴别诊断效率较高。
结论
能谱 CT 多参数成像在结肠癌术前无创鉴别 T3 及 T4a 分期中具有临床应用潜在价值。当静脉期标准碘含量临界值为 0.2mg/ml 时，可获得较高的诊断效能。

PU-0556
双源 CT 融合图像显示直肠癌病变的初步研究

杜煜,时高峰
河北医科大学第四医院

目的 探讨不同融合系数对直肠癌双源 CT（dual source computed tomography , DSCT）融合图像质量的影响。**方法** 选择 45 例直肠癌患者行 DSCT 腹部强化扫描扫描，其中男性 25 例，女性 20 例。扫描完成后取得 6 组数据，分别为 80kVp 数据，sn140kVp 数据，融合图像数据（融合系数为 0.3、0.4、0.6、0.8）；6 组数据的图像分别测量直肠癌病变的平均 CT 值及噪声，并计算信噪比（SNR）。两名医师同时对各组图像进行质量评分。采用统计学软件 SPSS 11.5 版本进行统计学分析。**结果** 0.6 组（动脉期和静脉期）的平均噪声显著低于其他组（$P<0.05$）；0.6 组（动脉期和静脉期）的平均 SNR 显著高于其他组（$P<0.05$）。0.6 组的图像质量优于其他各组（$P<0.01$）。**结论** 融合系数 0.6 组的图像中直肠癌病变具有较高的 SNR，有较好的图像质量。

PU-0557

胃原发黑色素瘤一例

公维义,杨新国,吕海莲,刘帅
胜利油田中心医院

患者，男 56 岁，因进食梗咽感 5 月，黑便 1 月入院。入院体格检查及实验室检查均未见明显异常。曾在外院行胃镜检查示贲门黏膜及坏死组织，坏死组织内见异性细胞，首先考虑低分化腺癌。既往史：房间隔缺损，于 2018 年在我院行房间隔缺损修补术。
影像表现：钡餐：食道吞钡后食管下端管腔狭窄，管壁僵硬，钡剂通过受阻，粘膜中断破坏，贲门口结构紊乱；钡剂充盈后胃呈鱼钩型，胃底、贲门口部见巨大软组织肿块，呈不规则充盈缺损改变，周围粘膜中断破坏。考虑：胃 Ca 可能。CT：胃贲门区胃壁明显增厚，平扫 CT 值约 36HU，增强后明显均匀强化，静脉期为著，三期强化 CT 值分别约 65HU、108HU、88HU；胃周见多组肿大淋巴结，较大短径约 2.3cm，明显强化；考虑胃癌并淋巴结转移可能性大（T3N3Mx）。
手术及病理所见：探查见肿物位于胃底贲门，未侵出浆膜，1-12 组淋巴结肿大，术中诊断胃癌。快速病理示胃底及胃食管交界处恶性肿瘤，考虑为淋巴瘤或恶性黑色素瘤，上切缘查见肿瘤钩，下切缘未见肿瘤。术后肿块大体检查：全胃切除标本，大弯长 23cm，小弯长 15cm，沿大弯侧剪开，紧邻食管切缘，距下切缘 13cm 于贲门处见一隆起型肿物，大小：9cm×7cm×2.5cm，肿物切面灰白灰黑色，质稍韧，鱼肉状，侵达浆膜下脂肪组织。网膜组织一堆，大小：12cm×10cm×4cm，未触及肿大结节及淋巴结。常规:病理：胃恶性黑色素瘤，侵达浆膜下脂肪组织，查见脉管内癌栓，未见明确神经侵犯，上切缘查见肿瘤，下切缘未查见肿瘤，网膜组织中未查见肿瘤；淋巴结查见肿瘤转移：4/23 。免疫组化结果示：HMB45（+），Vimentin（+），Melan-A（+）， Bcl-2（弱+），CK 高（-），CK 广谱（-），LCA（-），S-100（-）， TopoIIa（+，20%），CD31（显示脉管，查见脉管内癌栓），Ki-67（+，40%）。

PU-0558

MR 小肠造影对克罗恩病活动性及并发症的评估

张凯
浙江中医药大学附属第一医院

目的 探讨克罗恩病活动期在 3.0T MR 小肠造影的影像表现，以及对严重程度、肠周并发症的评价。**方法** 回顾性分析 2017 年 5 月至 2019 年 3 月期间在浙江中医药大学附属第一医院就诊，并经消化道内镜道检查证实的克罗恩病活动期患者共 56 人，所有患者检查前均行肠道准备，并行 MR 肠道造影检查。**结果** 56 例患者中，均表现为肠壁增厚，肠道 MR 造影增强均表现异常强化，T2WI 显示肠壁水肿 23 例；T2WI 及增强扫描表现肠壁溃疡 6 例，肠周水肿 13 例；梳齿征 36 例，瘘管/窦道 6 例，肛周脓肿 3 例。**结论** MR 具有高软组织分辨率，在显示克罗恩病活动性（不对称肠壁增厚、异常强化、肠壁水肿）具有明显优势，并对克罗恩病严重性（溃疡、肠周水肿、DWI 高信号）的发现具有一定价值。在肠周及系膜并发症中（梳齿征、瘘管/窦道、肛周脓肿）亦有较高的诊断价值。

PU-0559

小肠系膜神经鞘瘤 1 例

顾馨田,金恩浩
延边大学医学院附属医院

患者女，27 岁，偶然发现左下腹肿物 10 天。CT 检查：腹主动脉左前方可见直径约 3.0CM 的类圆形低密度肿块影，病灶边界清楚。增强扫描后动脉期 CT 值约为 76HU，门脉期及延迟期病灶逐渐强化，在延迟期达到强化高峰，CT 值约为 117HU，病灶内可见空回肠动脉穿过。MRI 检查：中腹腔腹主动脉左前方见直径 3.0CM 的类圆形异常信号灶，T2WI 压脂序列成高信号，其内可见血管留空效应，T1WI 呈低信号，DWI 呈高信号，ADC 值减低。影像诊断：考虑血管瘤，巨淋巴细胞增生等良性病变。
手术及病理：术中见小肠起始部对应的系膜远端见一直径 3CM 的肿物，包膜完整，将一根肠系膜上动脉的小肠支中末端完全包绕。肿瘤病理涂片示：肿瘤主要由具有栅栏结构的梭形细胞构成。肿瘤免疫组化检测显示：S-100 蛋白阳性， DOG-1、CD117、SMA 呈阴性。细胞增殖指数（Ki67 染色）小于 5%。结合免疫组化诊断为小肠系膜神经鞘瘤。
讨论：小肠系膜神经鞘瘤相对少见，且本例中肿块包饶空回肠动脉，病灶成渐进式中度强化，结合本病影像特点应与肠系膜海绵状血管瘤，巨淋巴细胞增生及小肠平滑肌瘤相鉴别。①肠系膜海绵状血管瘤表现为圆形或椭圆形肿块，T1WI 呈低信号，T2WI 呈相对于脂肪信号的更高信号。病变内可见蜂窝状、线样分隔。增强后动脉期病灶边缘明显强化，近似血管信号，门脉期及延迟期强化逐渐向病灶中心填充，且信号强度减低，最终呈均匀高信号肿块。②巨淋巴细胞增生一般表现为边界清楚的单发类圆形肿块，少部分病灶可伴有树枝状、砂砾状钙化。增强后病灶动脉期明显均匀强化，门脉期和平衡期持续强化，强化程度与邻近大动脉强化程度相仿。③小肠平滑肌瘤边界清楚，包膜完整。肿瘤较大时可发生液化、坏死。增强扫描病灶呈均匀强化，强化程度高于且早于神经鞘瘤。小肠系膜神经鞘瘤少见，且与其他疾病影像学表现相似，确诊需要结合病理及免疫组化。

PU-0560

meta-analysis

Yi Xiao[1],Yi Xiao[1]
1.ZHONGNAN HOSPITAL OF WUHAN UNIVERSITY
2.ZHONGNAN HOSPITAL OF WUHAN UNIVERSITY

ABSTRACT
Background Tyrosine kinase inhibitors (TKIs) targeting the epidermal growth factor receptor (EGFR) have been evaluated in patients with metastatic and advanced non-small cell lung cancer (NSCLC).The U.S.Food and Drug Administration initially granted accelerated approval to gefitinib but subsequently rescinded the authorization. Erlotinib and afatinib are similar compounds approved for the treatment of metastatic NSCLC. The objective of this study was to compare the gastrointestinal toxicities of erlotinib, gefitinib, and afatinib in NSCLC.
Methods We searched relevant clinical trials from PubMed, EMBASE, and Web of Knowledge databases, meeting proceedings of American Society of Clinical Oncology as

well as ClinicalTrials.gov. Data was extracted from phases II, III, and IV RCTs. Statistical analysis was performed to calculate the summary incidence, relative risk (RR), and 95 % confidence intervals (CIs) using fixed effects or random effects models based on the heterogeneity of included studies.
Results Initial database search revealed 784 relevant citations. After excluding non-eligible studies, 24 trials were considered eligible for the analysis.
The relative risk (RR) of all-grade nausea , vomitting and constipation was 1.82 (95% CI: 1.42 - 2.34; p < 0.00001) 2.09 (95% CI: 1.54 - 2.83; p < 0.00001)and 1.53(95% CI=1.24 - 2.15; p < 0.00001) respectively; while for high-grade nausea and vomitting, it was 9.23 (95% CI: 5.06 - 16.85; p < 0.00001) and 1.78 (95% CI: 0.5 - 6.26; p = 0.37), respectively.
Conclusion Our meta-analysis has shown that there is an overall elevated risk of gastronomicintestinal with the use of these agents

PU-0561
多排螺旋 CT 增强扫描在胃癌术前淋巴结检出中的应用

高爱军
忻州市人民医院

目的 探讨分析 MDCT 增强扫描在胃癌术前淋巴结检出中的应用价值。方法 回顾分析 2016 年 6 月至 2019 年 3 月在我院行胃癌切除术患者的多期增强 CT 检查的影像资料，共 65 例术前检出淋巴结肿大患者，其中腹腔镜手术 30 例，开腹手术 35 例，观察淋巴结肿大的大小，数目及位置，并观察强化特点和与周围结构关系，术后行病理学对照。采用 2mm 以上作为观察对象。结果 本组 65 例患者术前检出淋巴结 482 枚，其中位于幽门上区淋巴结 49 枚，幽门下区淋巴结 45 枚，胃网膜左淋巴结 38 枚，胃网膜右淋巴结 52 枚，胃左淋巴结 46 枚，胃右淋巴结 37 枚，腹腔及肝门部淋巴结 51 枚，脾门淋巴结 48 枚，腹膜后淋巴结 16 枚，2-5mm 淋巴结 280 枚，转移 80 枚，约 28.6%，5-8mm 淋巴结 180 枚，转移 92 枚，约 51%，8mm 以上淋巴结 22 枚，转移 20 枚，约 91%。结论 应用 MDCT 增强扫描和窗宽技术在胃癌术前淋巴结检出中有良好应用价值，淋巴结体积越大，转移可能性越大，并对腹膜后淋巴结有明显检出优势。

PU-0562
PET/CT-MRI 三模式对直肠癌新辅助放化疗疗效的评估价值

吴雪元[1],李绍东[2],刘洪[1]
1.徐州市第一人民医院
2.徐州医科大学附属医院

目的 探讨 PET/CT-MRI 三模式对直肠癌新辅助放化疗疗效的评估价值，比较 PET/CT、MRI-DWI 及 PET/MRI 融合图像三者评估肿瘤退缩分级及反应性的准确性。**方法** 回顾性分析 30 例直肠癌患者新辅助放化疗前后 PET/CT 与盆腔 MRI 图像，并进行 PET 与 MRI 图像的融合；患者新辅助放化疗后均行根治性直肠癌切除术，根据 Dworak 肿瘤消退分级(TRG)标准将术后标本进行分级，并分为有反应组(TRG3-4)和无反应组(TRG0-2)。利用 Spearman 相关分析比较直肠癌新辅助放化疗后 PET/CT、

MRI-DWI 及 PET/MRI 融合图像评估影像肿瘤退缩分级与术后病理 TRG 分级之间的相关性，并比较三者预测反应性的准确性。**结果** 30 例患者，术后 TRG1 级 12 例，TRG2 级 6 例，TRG3 级 7 例，TRG4 级 5 例；有反应组 12 例，无反应组 18 例。PET/CT、MRI-DWI 和 PET/MRI 融合评估影像肿瘤退缩分级与术后病理 TRG 分级间均具有一定的相关性（P<0.01），相关系数 r 分别为 0.478、0.668 和 0.759，其诊断反应性的准确率、灵敏度和特异度分别为 63.3%、83.3%和 50.0%；83.3%、66.7%和 94.4%；90.0%、91.7%和 94.4%。**结论** 直肠癌新辅助放化疗后 PET/CT、MRI-DWI 及 PET/MRI 融合均可以在一定程度上评估肿瘤退缩分级及反应性，以 PET/MRI 融合价值最高，因而 PET/CT- MRI 三模式可较好预测新辅助放化疗疗效。

PU-0563
胃癌 CT 表现、临床病理特征与 HER-2 表达的相关性研究

赵瑾
浙江医院

目的 探讨胃癌 CT 表现、临床病理特征与人表皮生长因子受体 2（HER-2）表达的关系。
方法 回顾性收集 157 例浙江大学医学院附属第二医院经手术病理证实的胃癌患者，术后均予免疫组织化学检测 HER-2 表达情况，分为 HER2 阴性组（0，1+）和 HER2 阳性组（2+，3+），分析术前 CT 表现（各期 CT 值及强化值、淋巴结特征）、临床资料（性别、年龄、BMI）、病理特征（肿瘤分化程度、Lauren 分型、Borrmann 大体分型、肿瘤大小、发生部位、TNM 分期、神经脉管侵犯）与 HER2 基因表达的相关性。
结果 中分化腺癌 HER-2 阳性表达率 64.6%，低分化腺癌 HER-2 阳性表达率 25.3%（ χ^2=23.926，P＜0.001）；肠型胃癌 HER-2 阳性表达率 63.0%，弥漫型胃癌 HER-2 阳性过表达率 17.8%（ χ^2=38.572，P＜0.001）。Borrmann 大体各分型 HER-2 阳性表达率：结节隆起型 8.0%，局限溃疡型 13.3%，浸润溃疡型 78.7%，弥漫浸润型 0.0%，组间比较差异显著，P＜0.05。HER-2 过表达与较高的静脉期 CT 值、相对较低的延迟期 CT 值、较小的动静脉期强化差值（CT_{PA}）呈正相关性，P 值均＜0.05。HER-2 过表达与患者性别、年龄、BMI、肿瘤大小、发生部位、TNM 分期、神经脉管侵犯及病灶平扫 CT 值、动脉期 CT 值、动脉期强化值 CT_A、静脉期强化值 CT_P、淋巴结影像特征（形态、边界、坏死）、腹水无关，P 均>0.05。
结论 中分化、肠型腺癌 HER-2 过表达率高，静脉期高强化、延迟期衰减较快、动静脉期强化差值较小的胃癌往往 HER-2 过表达率高。通过结合胃癌 Lauren 分型、分化程度、Borrmann 大体分型、MSCT 静脉期 CT 值及强化方式等可初步预测 HER-2 表达情况，为后续治疗提供帮助。

磁共振肠道造影对炎性肠病的诊断价值

叶心然[1],叶斌[2],张声旺[2]
1.中南大学公共卫生学院
2.中南大学湘雅三医院

目的本研究的目的是探讨磁共振肠道造影（magnetic resonance enteroclysis，MRE）在炎性肠病（inflammatory bowel disease IBD）中的诊断效能和图像质量的评估。**方法**回顾性分析在湘雅三医院拟诊为炎性肠病并行 MRE 检查的 132 名患者。将患者的 MRE 表现与手术及内窥镜获得的组织病理学结果进行比较，计算灵敏度，特异度和诊断符合率。并使用四分法评估 MRE 的图像质量。**结果** MRE 诊断炎性肠病的灵敏度，特异度和诊断符合率分别为 94.3%，92.6%和 93.9%,其中 2 名患者

假阳性，6 名患者假阴性。本研究一共分析了 530 个肠段，其中 323 个肠段（61%）的图像质量得分为 1，8 个肠段（1.5%）图像质量得分为 4。**结论** MRE 在诊断炎性肠病中具有高度的诊断符合率，并能提供优异的图像质量。

多层螺旋 CT 增强扫描及三维重建技术在肠及肠系膜损伤临床精准治疗的应用价值研究

张德生,何剑,刘东
湖州市中心医院

【摘要】 目的 探讨多层螺旋 CT（MSCT）增强扫描及三维重建技术在肠及肠系膜损伤临床精准治疗的应用价值。**方法** 回顾分析经手术或临床证实的 42 例肠及肠系膜损伤患者的 CT 增强、三维重建表现和临床资料。**结果** 42 例中，肠道破裂 16 例，肠系膜损伤者 7 例，均经手术证实，余 19 例经保守治疗痊愈。MSCT 主要表现为：肠道管壁连续性中断 6 例（15%），对比剂外溢 7 例（18%），肠道腔外气体 15 例（38%），肠管壁增厚 24 例（61%），肠壁强化异常 9 例（23%），强化减弱 4 例，肠壁强化增加 5 例；肠系膜渗出 17 例（43%）。肠道管壁连续性中断、对比剂外溢、肠道腔外气体病例均行手术治疗。**结论** MSCT 增强扫描及三维重建技术可以直观、多方位的显示肠及肠系膜损伤的部位及范围，为临床精准治疗提供丰富的诊断信息。

PU-0566
胃肠道间质瘤肝转移的 CT 表现和病灶分布规律

谢瑶,孟晓春,谢佩怡,熊斐,孔德灿
中山大学附属第六医院

目的 探讨胃肠道间质瘤肝转移的 CT 表现及原发灶静脉回流对肝转移灶在肝内分布的影响。**方法** 回顾性分析中山大学附属第六医院经病理证实的 32 例无其他恶性肿瘤史的胃肠道间质瘤肝转移患者的临床资料及 CT 动态增强图像，以 GIST 原发灶经肠系膜上静脉（SMV）汇入门静脉与否分为 SMV 组及非 SMV 组；以肝转移瘤的分布分为左叶组、右叶组及全肝组。采用 SPSS 24.0 软件进行统计学分析，计数资料用百分比（%）表示。不同组间构成比的比较采用 Fisher 精确检验，以 $P<0.05$ 为差异有统计学意义。 **结果** 在 32 例患者中，CT 动态增强检出肝内转移灶共 294 个，肝左、右叶分别为 55 个（18.7%）、239 个（81.3%）；单发 5 例（15.6%）、多发 27 例（84.8%）；均呈类圆形或圆形结节、肿块，表现为环状强化 251 个（85.4%）、结节状强化 6 个（2%）和其他不典型强化 37 个（12.6%）。环状及结节状强化灶动脉期以边缘轻中度环状及结节状强化为主，门脉及延迟期强化逐渐减退，典型“牛眼征”34 个（11.6%）；不典型强化灶中伴出血坏死灶占 45.9%（17/37），直径平均 82mm。病灶内伴供血动脉穿行 42 个，不典型强化灶多见（25/37，67.6%），环状强化灶偶见（16/252，6.3%）。SMV 组共 23 例（71.9%），非 SMV 组共 9 例（28.1%），两组转移灶在肝内分布差异无统计学意义（P＞0.05）。**结论** 胃肠道间质瘤肝转移病灶常多发， CT 动态增强动脉期边缘轻中度强化，以环形强化为主，少见结节状及不典型强化，呈“快进慢出”。环形强化灶可表现为典型“牛眼征”，偶见供血动脉穿行。不典型强化灶常伴有多条供血动脉穿行，较大时易发生出血坏死。原发灶的静脉回流与转移瘤在肝内分布无明显相关性。因此，上述胃肠道间质瘤肝转移灶的血供特点，有助于提高胃肠道间质瘤肝转移瘤的检出率和诊断符合率，减少误诊率。

PU-0567
能谱 CT 诊断肌少症对于晚期胃癌病人预后的预测研究

韩思圆,陈敏
北京医院 国家老年医学中心

目的 肌少症（sarcopenia），定义为骨骼肌质量及功能的减低。常继发与各种实体肿瘤，与肿瘤预后相关。这项研究的目的是确定的晚期胃癌(AGC)患者继发肌少症对预后的影响。
材料与**方法** 纳入 100 名胃癌晚期的患者，用能谱 CT 测量 L3 椎体水平的肌肉横截面积及肌肉内脂肪含量，采用握力试验评定肌肉强度和物理性能，体重指数综合诊断肌少症。我们比较了胃癌晚期病人继发肌少症和无继发肌少症两组病人之间的总体生存率(OS)和临床生存率。
结果 中位年龄为 67 岁，其中 95%患者有转移性疾病。47.9%的患者存在肌少症，且与男性(p < 0.05) 和低体重指数(p = 0.002)显著相关。在多变量分析中，肌少症是一个独立的预后不良因子(p = 0.029)。
结论 骨骼肌减少症可用于预测 AGC 的不良预后。

PU-0568
CT 小肠成像评分对克罗恩病临床活动度的评估价值

王侠
安徽医科大学第一附属医院

目的 探讨 CT 小肠成像影像学评分对克罗恩病（crohn's disease，CD）疾病活动性的判断价值。方法 收集做过 CTE 检查，经临床确诊为 CD 且具有经典克罗恩病活动指数（Crohn's disease activity index，CDAI）评分的 CD 患者 72 例，缓解组 14 例，活动组 58 例（轻度活动期 34 例，中度活动期 24 例）。记录两组患者 CTE 征象，找出对疾病活动性有统计学意义的 CTE 征象。对有意义的 CTE 征象赋值，计算综合 CTE 评分。用 Pearson 法检验此 CTE 影像学评分与经典 CDAI 评分的相关性。采用 ROC 曲线法分析 CTE 评分对于 CD 缓解组与活动组判断的诊断准确性及具体的诊断阈值。进一步用 ROC 分析分别计算轻度活动与中度活动组之间、缓解与轻度活动组之间、缓解与中度活动组之间的诊断准确性及诊断最佳阈值。结果 活动及缓解组患者中差异有意义的 CTE 征象为肠壁增厚、梳状征、肠壁分层活动性强化、肠系膜脂肪密度浑浊。CTE 评分与经典 CDAI 评分高度相关，r=0.813，p=0.000。活动及缓解组 ROC 曲线下面积为 0.926（P<0.001），诊断最佳阈值为 5.5 分，敏感度和特异度分别为 82.8%、85.7%；轻度-中度活动组 ROC 曲线下面积为 0.866，（P<0.001），最佳阈值为 6.5 分，敏感度和特异度分别为 95.8%、73.5%。缓解-轻度活动组、缓解-中度活动组其 ROC 曲线下面积（AUC）分别为 0.876（P<0.001）和 0.997（P<0.001），对应的灵敏度分别为 70.6%和 95.8%，特异度分别为 85.7%和 100%，最佳诊断阈值分别为 5.5 分和 6.5 分。结论 综合 CTE 评分判断 CD 处于活动度的灵敏度和特异度较高；对于活动期患者进一步区分轻度或者中度活动性亦有较高的灵敏度和特异度；对于 CD 缓解期和轻度活动期的判断也有很高的灵敏度和特异度。

PU-0569
MRI 在肛瘘分型及内口定位中的应用价值

孟宪运,陈波
中国科学院大学宁波华美医院（宁波市第二医院）

【目的】：探讨 MRI 检查在肛瘘分型与内口定位中的临床应用价值。
【材料与方法】：对 210 例经临床确诊的肛瘘患者采用 1.5 TMRI 检查，并由 2 名高年资放射科医生阅片，明确瘘管走向，内口位置，有无支管，有无脓肿、主要瘘管与肛门括约肌之间的关系，并与手术探查结果对照。结果根据 Parks 分型法分型，并采用截石位时钟法描述内口分布情况，MRI 内口显示位置与术中所见位于同一象限内认为显示正确。
【结果】：(1) 210 例肛瘘患者的肛瘘主支 Parks 分型与手术探查分型符合情况：单纯性肛瘘 161 例，复杂性肛瘘 49 例，经手术探查结果符合率均为 100%。MRI 诊断及术后诊断 Parks 分型结果分别为：括约肌间型 145 例/143 例；经肛管括约肌型 44 例/46 例；括约肌上型 13 例/14 例，括约肌外型 8 例/7 例；结果符合率分别为 98.62%、95.65%、92.86%和 87.50%。(2)内口定位与手术探查结果符合情况：MRI 诊断内口 265 个，术后诊断内口 288 个，诊断符合率 92.01%。(3) MRI 诊断肛瘘主、支管分别为 265 支、27 支，术后诊断肛瘘主、支管分别为 267 支、32 支，诊断符合率高于 84%。(4) MRI 诊断肛周脓肿 62 例，术后诊断肛周脓肿 62，诊断符合率为 100%。
【结论】：MRI 检查能准确地对肛瘘进行分型并明确内口位置，为临床治疗提供可靠影像学依据。

18F-FDG PET/CT 相关代谢参数与直肠癌血行转移的关系

李淑娟,陈龙,谢燃,赵雷,孙华
云南省肿瘤医院/昆明医学院第三附属医院

目的 探讨直肠癌原发灶 ^{18}F-FDG PET/CT 代谢参数与血行转移的关系。**方法** 回顾性分析 2016 年 1 月值 2019 年 6 月间云南省肿瘤医院的直肠癌患者 63 例（男 35 例、女 28 例，年龄 30～81 岁），所有患者均于术前行 ^{18}F-FDG PET/CT 检查，检查前未行任何治疗，且均有术后病理结果。应用 PET VCRA 软件以最大标准摄取值（SUVmax）的 40%为阈值自动勾画感兴趣区（ROI），软件自动测量直肠癌原发灶 SUVmax 和 MTV。采用独立样本 t 检验和受试者工作特征（ROC）曲线分析处理数据。**结果** 直肠癌发生血行转移组与无血行转移组原发灶 MTV 差异有统计学意义（$P<0.05$），两组原发灶 SUVmax 差异无统计学意义（$P>0.05$）。MTV 预测直肠癌血行转移的受试者工作特征曲线下面积为 0.631，敏感度为 45.2%，特异度为 90.6%。**结论** 直肠癌原发灶 MTV 对预测血行转移有一定的价值。

PU-0571
多层螺旋 CT 对胃癌 TN 分期的诊断应用

孟姮
北华大学附属医院

目的 评价 128 层螺旋 CT（128 slice spiral CT）结合多平面重建（MPR）平扫及动态增强扫描在胃癌 TN 分期中的应用价值。**方法** 将接受胃癌根治性手术的各期胃癌患者 81 例，术前进行 MSCT 平扫及多期增强扫描，利用 CT 轴位图像和 MPR 重建图像对胃癌患者进行 TN 分期，将 CT 判断胃癌浸润程度（T 分期）及淋巴结转移情况（N 分期）与术后病理结果对照，评估 128 层螺旋 CT 对肿瘤对胃壁的浸润程度（T 分期）及淋巴结转移情况（N 分期）的准确性及其临床价值。**结果** 1.128 层螺旋 CT 诊断结果与病理结果对照，CT 对胃癌胃壁浸润深度（T 分期）准确性为 80.2%，其中各期准确性分别为 T1 期 55.6%、T2 期 77.8%、T3 期 81.5%、T4 期 88.9%。T1 期、T2 期胃癌 CT

诊断结果与病理结果具有中度一致性；T2 期、T3 期胃癌 CT 诊断结果与病理结果具有高度一致性；T3 期、T4 期胃癌 CT 诊断结果与病理结果具有极高度一致性。**2.**将胃周淋巴结短径≥5㎜作为转移的阈值，对诊断的敏感性为 85.9%，特异性为 31.7%；准确性为 56.3%；CT 诊断结果与病理结果一致性较低；将胃周淋巴结短径≥10㎜作为转移的阈值，诊断的敏感性为 47.7%；特异性为 55.4%；准确性为 51.9%，CT 诊断结果与病理结果无一致性；将胃周淋巴结短径≥5㎜及增强扫描各期 CT 值改变作为淋巴结转移的阳性指标，评估的敏感性为 94.5%；特异性为 70.4%；准确性为 79.0%，CT 诊断结果与病理结果具有高度一致性。**结论** **1.**128 层螺旋 CT 轴位结合 MPR 重建能对胃癌术前 TN 分期做出较准确的评估。CT 显示的胃壁不同分层结构进行分类，制定个体的影像诊断标准,可以提高胃癌 T 分期的 CT 诊断准确率；**2.** CT 图像显示胃周淋巴结短径≥5㎜伴增强扫描各期相密度改变作为转移淋巴结诊断标准,可明显提高检出转移淋巴结的敏感性、特异性及准确性。

PU-0572
改良保留灌肠法在结直肠癌患者螺旋增强 CT 检查前的疗效观察

张高绯[1],张高绯[1]
1.济宁医学院附属医院
2.济宁医学院附属医院

探讨结直肠癌患者全腹部增强 CT 前保留灌肠的有效方法，改善灌肠效果，使 CT 检查时充分显示结直肠肠腔，提高结
直肠癌的 CT 诊断及临床分期的准确性。
方法:选取本科室 2019 年 4 月至 2019 年 5 月需保留灌肠的患者 20 例，随机分为观察组和对照组各 10 例，其中男 10 例，女 10 例，年龄 49-88 岁，平均年龄 68 岁，两组患者在性别、年龄、病程、病变部位等方面比较无统计学意义（*P*>0.05），具有可比性。

PU-0573
西门子 64 排炫速双源螺旋 CT 增强扫描在胃癌诊断中的应用

孙波,郭英瑜
松原吉林油田医院

胃癌是最常见的恶性肿瘤之一，以往胃癌的诊断主要依靠上消化道造影和胃镜检查，但这两种诊断手段都在判断肿瘤的分期、制定治疗方案方面存在缺陷。64 排双源螺旋 CT 三期增强扫描对于胃癌的分期具有很大的优越性，是胃癌术前分期首选的、可靠的方法。多层螺旋 CT 为容积扫描，它不仅能检查出胃癌，且能判断胃癌浸润的范围及深度，发现腔外肿瘤播散，淋巴结及远处转移。并能依靠扫描后的数据进行薄层重建及多平面显示或三维重建
胃壁软组织病变局部呈肿块样，可向腔内或腔外生长，多呈分叶状，导致胃腔狭窄或胃周侵犯，肿块内部常出现坏死，增强后门静脉期和平衡期肿瘤实质强化多不均匀。肿瘤向外侵及，胃周脂肪层模糊、消失或其内见到索条状软组织密度灶，提示肿瘤已突破胃壁，胃肿块与脏器间的脂肪间隙消失，提示肿瘤侵犯周围脏器。
淋巴结转移 淋巴结大小是判断淋巴结转移的主要依据。以淋巴结直径 10㎜为阈值，一般认为大于 15㎜可认为淋巴结转移。转移性淋巴结于增强后高于非转移性淋巴结。

多层螺旋 CT 三期增强扫描在胃癌诊断方面较其它影像检查具有一定的优越性，对发现胃癌、确定有无转移及术前准确分期起着非常重要作用，多层螺旋 CT 必将成为胃癌检查中不可缺少的手段之一。

PU-0574
弥散加权成像联合外周循环肿瘤细胞对食管鳞癌病理分级的预测价值

路双,曲金荣
河南省肿瘤医院

目的探讨弥散加权成像（diffusion-weighted imaging，DWI）及外周循环肿瘤细胞（circulating tumor cells，CTCs）总数及各亚型数目与食管鳞癌病理分级之间的的相关性。**方法**回顾性收集经活检证实为食管癌的患者，根据 2017 版美国国立综合癌症网络（NCCN）食管癌诊疗指南选择治疗方案及手术与否；入组术后病理诊断为鳞癌的 68 例患者，所有患者术前均行食管 MRI 扫描及 CTCs 检测，测量得到表观弥散系数（apparent diffusion coefficient，ADC）值及 CTCs 总数及各亚型数目。手术后病理标本分析得到肿瘤的病理分级（高、中、低分化）、局部浸润深度（T 分期）、淋巴结转移情况（N 分期）。统计分析得到组间差异有统计学意义的有效参数。采用受试者工作特征(receiver operating characteristics,ROC）曲线、二元 logistic 回归分析及 Z 检验比较有效参数对低分化食管鳞癌诊断效能。**结果**食管鳞癌高分化 5 例、中分化 43 例、低分化 20 例。ADC 值及 CTCs 各亚型数目与病理 T 分期、N 分期间差异无统计学意义。不同病理分级间 ADC 值、间质型 CTCs、CTCs 总数间差异具有统计学意义(P均＜0.05）。ADC 值、间质型 CTCs 诊断低分化食管鳞癌的 ROC 曲线下面积分别为（0.870,0.690，P均＜0.05），其中 ADC 值诊断效能优于间质型 CTCs（P＜0.05），ROC 曲线可知 CTCs 总数诊断低分化食管鳞癌效能差（P＞0.05）。ADC 值联合间质型 CTCs 诊断低分化食管鳞癌的 ROC 曲线下面积分别为(0.873，P＜0.001）。**结论** ADC 值及间质型 CTCs 与食管鳞癌病理分级有一定的相关性，两者均可以在一定程度反映食管鳞癌病理分化程度，两者结合预测低分化食管鳞癌价值更高

PU-0575
结直肠多原发癌的临床病理特征和 CT 征象分析

李华秀
云南省肿瘤医院/昆明医学院第三附属医院

目的 探讨结直肠多原发癌的临床病理特征及 CT 表现，以提高影像医生对本病的认识。方法和资料回顾性分析 62 例结直肠多原发癌患者的临床资料及结直肠癌病灶的 CT 征象。根据就诊或影像检查发现癌灶的时间先后顺序、发病部位及发病时间间隔分为先发癌和伴发癌、肠内多原发癌和肠内-外多原发癌、同时性癌和异时性癌。再随机抽取同期本院收治的 219 例单发结直肠腺癌作为对照组。然后，分别比较各组病灶 CT 征象的差异。结果 62 例符合研究标准的结直肠多原发癌中共有结直肠癌病灶 90 个。结直肠同时性双原发癌中，先发癌与伴发癌在 T 分期、肿瘤肠壁长度及厚度的差异有统计学意义（P<0.05），在发病部位、分化程度、肠壁增厚形式、强化程度的差异无统计学意义（P>0.05）。肠内多原发癌病灶和肠内-外多原发癌肠内病灶在肿瘤肠壁长度、强化程度及分化程度的差异有统计学意义（P<0.05），在发病部位、T 分期、肠壁增厚形式及肿瘤肠壁厚度的差异无统计学意义（P>0.05）。同时性癌与异时性癌中结直肠癌病灶的 CT 征象的差异均无统计学

意义。结直肠多原发癌与结直肠单发癌在是否合并息肉、肠壁增厚形式、肿瘤肠壁厚度及强化程度的差异有统计学意义（P<0.05），在性别、年龄、合并肠梗阻、发病部位、肠周浸润、淋巴结肿大、肿瘤肠壁长度的差异无统计学意义（P>0.05）。结论 结直肠同时性双原发癌中伴发癌病灶的长度、厚度及 T 分期均小于先发癌病灶。肠内-外多原发癌肠内病灶较肠内多原发病灶分化程度更低、强化更明显、肿瘤浸润肠壁长度更广。

PU-0576

成人中肠旋转不良的 CT 分型诊断与临床分析

傅晓彬[1],关键[2]
1.佛山市三水区人民医院
2.中山大学附属第一医院

目的 探讨成人中肠旋转不良的 CT 分型与临床意义，提高对该病的认识。 **方法** 对中山大学附属第一医院放射科 2018 年 3 月～8 月行全腹部 CT 平扫加增强检查的成人病例进行连续性筛检。按设定的纳入与排除标准，由两位高年资的放射科医师共同阅片，判定是否存在中肠旋转不良并分型。 **结果** 共筛查全腹部 CT 平扫加增强检查的成人病例共 8778 例，排除 902 例，最终以 7876 例为基数共检出符合诊断标准的中肠旋转不良 80 例（1.0%），男 46 例，女 34 例，年龄 22～86 岁。80 例中经典型 7 例（8.8%），CT 表现为十二指肠空肠结合部（DJJ）位于胃幽门水平线以下、正中线右侧，大多数合并回盲部异位（6/7，85.7%）；可有肠系膜上动脉（SMA）与肠系膜上静脉（SMV）换位（3/7，42.9%）；1 例为多脾综合征。非典型 73 例（91.2%）， CT 表现为 DJJ 位于胃幽门水平线以下、正中线左侧，且空肠位于右腹；少部分出现回盲部异位（15/73，20.5%）、SMA 与 SMV 换位（1/73，1.4%）；10 例出现相关消化道症状（10/22，45.5%），3 例右腹部小肠肿瘤因判断出中肠旋转不良而准确定位为空肠肿瘤。CT 冠状位重建图像可清晰显示空肠和回盲部的位置；横轴位增强图像有利于观察 SMA 与 SMV 位置关系。 **结论** CT 可准确诊断成人中肠旋转不良并分型，并应认识其临床意义。

PU-0577

Can CT Texture Analysis Predict the World Health Organization Grade of Rectal Neuroendocrine Tumors?

Ping Liang,Mingzhen Chen,JIali Li,Anqin Li,Daoyu Hu,Zhen Li
Tongji Hospital， Tongji Medical College， Huazhong University of Science and Technology

Objectives To investigate the diagnostic value of computed tomography texture analysis (CTTA) in predicting the world health organization (WHO) grade of rectal neuroendocrine tumors (R-NETs).

Methods and Materials A total of 50 (28 G1, 9 G2 and 13 G3) patients who underwent preoperative contrast-enhanced CT and treated with surgery to be confirmed as R-NETs were included in this study from January 2014 and May 2019. We accurately depicted the region of interest (ROI) and measured the CT texture parameters (mean, median, 5th, 10th, 25th, 75th, 90th percentiles, skewness, kurtosis and entropy) from arterial phase image by two radiologists. We calculated and compared these parameters between low grade (G1) and higher grades (G2/G3) by applying appropriate statistical method.

We obtained the optimal parameters to identify G1 and G2/G3 by using receiver operating characteristic (ROC) curves.
Results The CTTA showed a good predictive performance between G1 and G2/G3 with different texture parameters on arterial phase imaging. Mean, median, 5th, 10th, 25th, 75th and 90th percentiles demonstrated significant differences between G1 and G2/G3 (P=0.000, 0.000, 0.003, 0.001,0.001, 0.001, 0.004), however, there were no significant differences for skewness, kurtosis and entropy (P=0.805, 0.602, 0.290). Median generated the highest the area under the curve (AUC=0.819) in the ROC analysis and followed by mean (AUC=0.811).
Conclusions CT texture features, especially median and mean, can be used as an excellent method to predict the grade (G1 and G2/G3) of rectal neuroendocrine tumors.

肠系膜上动脉夹层病变区域相关参数的 CTA 定量分析

马玲,韩丹,蔡雅倩,盛林丽
昆明医科大学第一附属医院

目的 探讨正常人群与肠系膜上动脉夹层相关 CTA 数据的差异，为肠系膜上动脉夹层发生及治疗提供依据。**方法** 回顾性分析经 CTA 确诊为肠系膜上动脉夹层 64 例（病变组），包括自发性孤立性肠系膜上动脉夹层（SISMAD）组 42 例（男 38 例，女 4 例，年龄 40-86 岁）、主动脉合并肠系膜上动脉夹层（CASMAD)组 22 例（男 17 例，女 5 例，年龄 40-76 岁），与正常组（男性 54 例，女性 10 例，年龄 40-77 岁）进行对照。在 MPR 矢状位上测量腹主动脉-肠系膜上动脉（AA-SMA）夹角、病变处最大肠系膜上动脉（SMA）直径（D1）及肠系膜上动脉（SMA）到腹腔干（CA）距离（D2），SMA 壁 1cm 内周围脂肪密度（平均 CT 值）并观察 SMA 及 AA 管壁有无钙化。**结果** （1）病变组 AA-SMA 夹角及 D1、D2 分别为 68.48±19.66°、1.28±0.25cm、0.77±0.40m，正常组分别为 59.83±19.74°、0.77±0.12 cm、0.57±0.30cm，两组经 t 检验差异有统计学意义(P<0.05），说明病变组数值均大于正常组，但 SMA 周围脂肪密度差异无统计学意义（P>0.05）。AA-SMA 夹角及 D1、D2 ROC 曲线下面积（AUC）分别为 0.618、0.995、0.665，临界值分别为 53.5°、0.95cm、0.61cm，灵敏度分别为 78.1%、100%、68.8%，特异度分别为 45.3%、95.3%、60.9%。而 SISMAD 与 CASMAD 两组 AA-SMA 夹角、D1、D2 均无统计学差异（P>0.05）。（2）SMA 及 AA 管壁钙化病变组（14 例/43 例）与正常组（5 例/26 例），经卡方检验差异有统计学意义（P<0.05），病变组钙化多于正常组。SISMAD 组与 CASMAD 组管壁钙化无统计学差异。**结论** 正常肠系膜上动脉与肠系膜上动脉夹层的血管相关测量值及管壁钙化有差异。

PU-0579

A diagnostic nomogram for predicting lymph node metastasis in rectal cancer: what role does the chemical shift effect play?

Lijuan Wan,Hongmei Zhang
National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

PurposeTo establish an effective diagnosticnomogram for predicting lymph node metastasisin rectal cancer (RC) patients by using the chemical shift effect(CSE) before surgery.
Materials and Methods A total of 324 lymph nodes from 32 RC patients were enrolled in this retrospectively study between March 2015 and May 2016 (217 in the primary cohort and 107 in the validationcohort). All patients underwent baseline MRI and radical surgery, and all lymph nodes were harvested from transverse whole-mount specimens. Experienced radiologist evaluated baseline MRI for CSE status of lymph node in addition to nodal location,border, internal structure (IS),signal intensity (SI),size, and the minimum distance to rectal wall (MinDR). A diagnostic nomogram for predicting lymph node status were developed with significant variables selected by the stepwise logistic regression. The discrimination and calibration ability of the nomogram were determined by concordance index (C-index) and calibration curve, decision-curve analysis was applied to assess the clinical usefulness.
Results On multivariate analysis of the primary cohort, independent factors for lymph node metastasis were CSE, the maximum long-axis diameter of lymph node, and nodal location, which were all selected into the nomogram. The nomogram showed good discrimination performance in the primary cohort, with a C-index of 0.934 ((95% CI, 0.892 to 0.976)). In the validation cohort, the nomogram also showed good discrimination, with a C-index of 0.838 ((95% CI, 0.678 to 0.997)), and good calibration. Decision-curve analysis demonstrated the clinical utility of the diagnostic nomogram for lymph node metastasis.
ConclusionThe study proposed a nomogram, which including CSE, the maximum long-axis diameter, and nodal location, resulted in more accurate diagnostic performance for lymph node metastasis in RC patients. And CSE play an important role in the nomogram.

原发性小肠淋巴瘤多层螺旋 CT 表现

胡慧
上海交通大学附属第六人民医院

目的 探讨原发性小肠淋巴瘤的多层螺旋 CT(MSCT)的表现特征及其诊断价值。**方法** 回顾性分析 2010 年 1 月至 2017 年 12 月本院 47 例经手术、病理证实并符合 Dawson 标准的原发小肠淋巴瘤患者的 MSCT 资料。**结果** 47 例小肠原发淋巴瘤病例中，17 例位于回肠(包括回盲部)，10 例位于空肠，20 例同时发生于空、回肠。根据小肠原发淋巴瘤患者的 CT 表现，可分为 5 型：肠壁增厚型(14 例)、肠腔动脉瘤样扩张型(13 例)、息肉肿块型(9 例)、混合型(11 例)；伴腹腔或腹膜后淋巴结肿大 15 例。MSCT 表现为病变肠管肠壁环形不规则增厚，肠管仍保持一定的扩张度和柔软度，病灶轻一中度均匀强化。**结论** 小肠原发淋巴瘤的 MSCT 表现具有一定的特征性，MSCT 通过 MPR 图像重建等更能直观显示病变特征，有助于手术前治疗方案的制定。

PU-0581

Castleman 病 MSCT 及 MR 表现

胡慧
上海交通大学附属第六人民医院

目的 探讨 Castleman 病的多层螺旋 CT(MSCT)及 MRI 影像学表现及其诊断价值。方法 回顾性分析 2010 年 1 月至 2017 年 12 月本院 31 例经手术后病理证实 Castleman 病的 CT 及 MRI 征象及病理资料。结果 病变部位：颈部 13 例，腹膜后 11 例，颈部、胸部、两侧腋窝、腹膜后及盆腔同时发生 7 例。临床分型：局限型 14 例，弥漫型 13 例，病理分型透明血管型 17 例，浆细胞型 7 例，混合型 3 例。MSCT 或 MRI 表现：透明血管型 CT 平扫 7 例伴有点状钙化，增强扫描均呈明显持续性强化，强化方式与大血管相似；MRIT1WI 呈等信号，T2WI 呈高信号，信号均匀，边界清晰；增强扫描呈明显强化。浆细胞型 CT 平扫表现为密度均匀，增强扫描呈轻度～中度强化。术前 CT、MRI 明确诊断 14 例(45%)，误诊 3 例(10%)。结论 Castleman 病的 MSCT、MRI 表现与临床类型、病理分型密切相关，尤其是透明血管型 Castleman 病表现具有一定特征，术前影像学检查，尤其是 MRI 检查，对 Castleman 病诊治具有重要价值，而浆细胞型缺乏特征性，确诊需要结合病理学检查。

PU-0582

MRI 对 SIB-IMRT 技术在直肠癌新辅助放化疗的疗效评估及预测疗效的价值

黄晓琳
广西中医药大学第一附属医院

目 的：通过高分辨 MR 体积、磁共振弥散加权成像和动态增强磁共振成像对比同步加量调强放疗（SIB-IMRT）和常规调强放疗（R-IMRT）技术应用于局部进展期直肠癌术前同步放化疗中的疗效，评价 SIB-IMRT 在局部进展期直肠癌患者术前同步放化疗中的可行性，并预测病理完全缓解的价值。

材料和**方法** 本研究共纳入 67 名患者，随机分为 SIB-IMRT 实验组 39 人和 R-IMRT 对照组 28 人，所有患者在 CRT 前、后均行 MR 检查，后均进行全直肠系膜切除术（TME）。经后处理得到参数体积、ADC 值、K^{trans} 值，同时计算治疗前后的变化率 ΔVolume%、ΔADC%、ΔK^{trans}%。术后病理 TRG 评分，改评分采用 Mandard 标准，分别将实验组和对照组分为 pCR 组和 non-pCR 组，运用 ROC 比较其预测疗效价值。

结 果：1.新辅助治疗后实验组体积缩小、K^{trans} 值降低较对照组明显。2.实验组放疗后 pCR 组的体积缩小程度高于 non-pCR 组，具有统计学意义；同为 pCR 组，SIB-IMRT 组治疗后肿瘤 ADC 值升高、肿瘤的体积缩小程度优于 R-IMRT 组；同为 non-pCR 组，SIB-IMRT 组放疗后肿瘤体积缩小及 Ktrans 值的降低优于 R-IMRT 组。3.ROC 诊断实验分别评估实验组与对照组 CRT 前后 ΔVolume%、ΔADC%、ΔK^{trans}%的诊断效能。其中，实验组的体积变化率（ΔVolume%）诊断效能较高，AUC 为 0.734，ADC 变化率 AUC 为 0.698。

结 论：1.SIB-IMRT 技术应用于局部进展期的直肠癌的术前同步放化疗效果在肿瘤体积缩小、体积缩小率、ADC 值的升高、Ktrans 值降低方面优于 R-IMRT。2.肿瘤体积缩小率（ΔVolume%）、ADC 增高率（ΔADC%）有助于预测局部进展期直肠癌新辅助放化疗后的 pCR。

PU-0583

CT 浆膜高强化征鉴别诊断 T3 期与 T4a 期胃癌

张梦梅[1],杨泠[2],冯瑶杰[1],危春荣[1],杨亚英[1]
1.昆明医科大学第一附属医院
2.昆明医科大学第三附属医院

目的 分析浆膜高强化征鉴别胃癌 T3 期与 T4a 期的价值，探索腹部 CT 增强三期扫描观察浆膜高强化征的差异。**方法** 回顾性分析 104 例经手术病理证实的胃癌 T3 期或 T4a 期患者术前腹部三期增强扫描 CT 图像，由两位高年资腹部专业组医师双盲观察每位患者的三期增强 CT 图像是否出现

浆膜高强化征，计算浆膜高强化征诊断 T4a 期的准确率、敏感度、特异度、阳性预测值、阴性预测值。对三期 CT 图像出现浆膜高强化征进行卡方检验，判断各期出现浆膜高强化征是否存在差异。**结果** 共纳入 104 例经手术病理证实的胃癌病例，其中 T3 期 34 例，T4a 期 70 例。浆膜高强化征判断 T4a 期（即浆膜浸润）的准确率、敏感度、特异度、阳性预测值、阴性预测值分别为 77.88%、81.43%、70.59%、85.07%、64.86%。T4a 期胃癌病例动脉期、静脉期及实质期浆膜高强化征出现率分别为 32.86%、75.71%、62.86%，三组数据进行两两比较，动脉期与静脉期、动脉期与实质期之间差异有统计学意义，静脉期与实质期之间差异无统计学意义（P<0.01）。**结论** 浆膜高强化征诊断胃癌 T4a 期有较高的准确率、敏感度及特异度，可用于判断胃癌浆膜受侵。浆膜高强化征在静脉期及实质期较容易观察，推荐在静脉期或实质期观察该征象。

PU-0584
继发于 Meckel 憩室异位胰腺的急性肠扭转性肠梗阻一例罕见病例报道及扭转性肠梗阻原因分析

王志忠,芦春花,李岩
南昌大学第二附属医院

摘要：
Abstract:
异位胰腺是胃肠道（GI）中罕见的粘膜下肿瘤，Meckel 憩室与异位胰腺常无任何临床症状，但当它出现炎症、出血、梗阻或恶变继发性病变时可出现异常的临床症状，常尸检或偶然发现。小肠 Meckel 憩室异位胰腺引起的肠扭转性肠梗阻罕见且是偶然发现。我们在此报告一例继发于 Meckel 憩室异位胰腺的急性肠扭转性肠梗阻一例并分析其引起肠扭转性肠梗阻的原因，患者行“小肠扭转复位术+小肠憩室切除术”成功治愈。
结论
Conclusion:
综上所述，Meckel 憩室异位胰腺是罕见病症，异位胰腺跨越黏膜下层及固有肌层更是罕见，再加上引起的小肠扭转性肠梗阻是非常罕见。术前诊断几乎是不可能的，并且在一些文献报道的病例中，手术是最佳的选择[10]，尤其是怀疑恶性肿瘤时。因此为缓解症状进行剖腹手术并进行病理检查。

PU-0585
结直肠神经鞘瘤和间质瘤的 MSCT 影像学特征分析

陶超,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 探讨有助于结直肠神经鞘瘤和间质瘤鉴别诊断的 MSCT 影像学特征。
方法 收集 2007 年 1 月~2017 年 4 月笔者所在医院经病理确诊的 16 例结直肠神经鞘瘤和 25 例结直肠间质瘤患者 MSCT 影像资料,采用卡方检验或 t 检验分析二者影像学特征,ROC 曲线分析阳性指标用于鉴别的效能。
结果 相对结直肠间质瘤而言,结直肠神经鞘瘤 MSCT 影像学特征表现为:直径小(2.5±1.3,t=3.850,P<0.001),结肠来源(75%vs 16%,Χ2=14.272,P<0.001),圆形(68.8%vs 36%,Χ~2=4.188,P=0.041),边缘光滑(68.8%vs 32%,Χ~2=5.299,P=0.021),均质(93.8%vs 48%,Χ~2=9.081,P=0.003),较少发生囊变(12.5%vs 60%,Χ~2=9.069,P=0.003)、坏死(6.25%vs

44%,Χ~2=6.716,P=0.010),轻中度强化(87.5%vs 52%,Χ~2=5.468,P=0.019),区域淋巴结肿大(31.3%vs 0,Χ~2=8.898,P=0.003)。两者在性别、年龄、肿瘤生长方式、有无钙化、表面溃疡、远处转移方面,差异无统计学意义(P>0.05)。ROC 曲线分析发现 CT 测量的肿瘤最大径 4.4cm 为最佳界值,鉴别结直肠神经鞘瘤和间质瘤的敏感性和特异性分别为 88.0%(22/25)和 87.5%(14/16),曲线下面积(AUC)=0.915。

结论 结直肠神经鞘瘤 MSCT 特征表现为结肠来源体积较小的肿瘤,边缘光滑,均质,较少发生囊变和坏死,可伴区域淋巴结肿大。

Assessment of lymphovascular space invasion in endometrial cancer with preoperative histogram analysis of quantitative pharmacokinetic parameters on DCE-MRI

璟 xuan Jiang,Xianhua Wu
Affiliated Hospital of Nantong University

Objective: To evaluate whether the dynamic contrast-enhanced MRI (DCE-MRI) quantitative pharmacokinetic parameters derived from histogram analysis could assess the lymphovascular space invasion (LVSI). **Methods:** Fifty-six patients with pathological confirmed endometrial cancer were prospectively evaluated using DCE-MRI. Histogram parameters including mean; skewness; kurtosis; uniformity; energy; entropy; and percentiles (5th, 10th, 25th, 50th, 75th, 90th) were derived from the pharmacokinetic parameters (K^{trans}, K_{ep}, and Ve). Histogram parameters were compared between endometrial cancer with and without LVSI. For significant parameters, receiver operating characteristic (ROC) curves were further plotted to compare the diagnosis performance for identifying LVSI. **Results**: The mean and percentiles (5th, 10th, 25th, 50th, 75th, 90th) of K^{trans}, the mean and percentiles (10th, 50th, 75th, 90th) of K_{ep}, the mean, percentiles (5th, 10th, 25th, 50th, 75th, 90th) and kurtosis of Ve between endometrial cancer with and without LVSI were statistically significant (all $P<0.05$). The areas under the ROC curves (AUCs) were 0.69-0.87 for pharmacokinetic parameters. The largest AUC of pharmacokinetic parameter (10th percentile of Ve) showed significantly higher accuracy than others. With a cut-off of 0.76, the 10th percentile of Ve provided a sensitivity of 81.2% and a specificity of 87.4% in the prediction of LVSI. **Conclusion**: Histogram analysis of DCE-MRI can be useful for predicting tumor cell proliferation and LVSI.

PU-0587

结直肠同时性双原发癌的 MSCT 诊断价值

杨彬,斯光晏,何其舟
西南医科大学附属中医医院

【摘要】

目的 探究 MSCT 检查在结直肠同时性双原发癌中的诊断价值，以提高认识。
方法 回顾性分析 2012 年 10 月 1 日到 2019 年 6 月 1 日因结直肠癌就诊的所有连续性病例 620 例，收集经病理证实的具有完整临床及影像资料的结直肠同时性双原发癌患者，记录患者的一般资料、肿瘤标志物、病理、部位及影像表现。
结果 结直肠同时性双原发癌患者 15 例，男性 14 例，女性 1 例，9 例患者长期饮酒史，12 例患者长期吸烟史，7 例患者肿瘤标志物升高，以癌胚抗原升高为主。术后证实均表现为双原发癌，右半结肠-左半结肠组 4 例，右半结肠-直乙状结肠组 4 例，左半结肠-直乙状结肠组 2 例，直-乙状结肠组 5 例，病理均表现为腺癌，其中 3 例粘液腺癌（2 例溃疡型，1 例隆起型），11 例溃疡型腺癌，8 例隆起型腺癌，3 例绒毛状腺瘤恶变，4 例多发性管状-绒毛状腺瘤癌变，1 例粘膜管状腺瘤恶变；术前 MSCT 检查发现双原发癌灶 9 例，漏诊 6 例（40%），分别为升结肠 1 处，横结肠 2 处，结肠脾曲 1 处，降结肠 1 处，直肠 1 处，分析其原因为 MSCT 检查前结直肠未做充分灌肠和扩张肠管准备，不利于癌灶的显示，以及影像诊断时仅满足于一处明显病灶的检出而未进一步查找结直肠其他部位是否同时存在隐匿病灶；结直肠同时性双原发癌的 MSCT 表现为结直肠壁均匀/非均匀性增厚或肿块，癌肿周围脂肪间隙可表现模糊或肠系膜血管增多增粗，增强后癌肿表现为均匀/非均匀性延迟性明显强化。
结论 结直肠同时性双原发癌比较罕见，对于临床怀疑结直肠癌患者，行 MSCT 检查前，需充分肠道准备以及详细观察，以防多原发癌灶的遗漏。

PU-0588
定量 CT 测定上海地区人群体质成分与血压的相关性

潘亚玲[1],陈彤彤[1],王晗琦[1],常蕊[1],程晓光[2],陆勇[1]
1.上海交通大学医学院附属瑞金医院
2.北京积水潭医院

目的 采用定量 CT（QCT）测定腹部体质成分含量，探讨体质成分与血压的相关性，确定预测高血压的切点值。 方法 选取 2018 年 5-12 月行低剂量 CT 肺癌筛查联合 QCT 体质成分测定的体检人群共 1307 例。QCT 测定腰 2 椎体中心层面体质成分包括腹部软组织面积(ASTA)、腹内脂肪面积（VAA）及皮下脂肪面积（SAA）。分别采用 Pearson 相关、多因素线性回归及多因素 Logistic 回归分析体质成分与收缩压、舒张压及高血压的相关性。绘制 ROC 曲线，确定预测高血压的切点值。
结果 ASTA 与收缩压、舒张压呈显著负相关（$P<0.05$），VAA、SAA 与收缩压、舒张压呈显著正相关（$P<0.05$）。多因素回归分析显示在调整年龄、性别、体重指数、腰围因素后，VAA 与收缩压、舒张压及高血压显著关联（$P\leq0.01$），而 ASTA、SAA 与收缩压、舒张压及高血压不关联（$P>0.05$）。ROC 曲线分析显示男性和女性的 VAA 预测高血压的切点值分别为 201.89cm^2、136.01cm^2。 结论 腹内脂肪与高血压关系密切。在高血压健康管理中，应早期筛查腹内脂肪异常增多的人群并加强预防和管理。

PU-0589
双能 CT 多模态参数对胃癌 Lauren 分型的诊断价值

张梦梅[1],杨泠[2],严映[1],吕艳娥[1],杨亚英[1]
1.昆明医科大学第一附属医院
2.昆明医科大学第三附属医院

目的 探索双能 CT（Dual-Enery CT）多模态参数诊断胃癌 Lauren 分型的价值。**方法** 收集有完整双能扫描资料并经手术病理证实的 67 例胃癌患者，通过双能量后处理软件得到碘图并测得病灶

的动静脉期碘浓度、Overlay 值、病灶动脉期及静脉期 CT 值，计算动静脉期 CT 值之差。采用单因素方差分析多重比较进行统计学分析，将有统计学意义的参数绘制受试者工作特征曲线（ROC 曲线），分别评价各指标的诊断效能。**结果** 弥漫型、肠型、混合型胃癌动静脉期碘浓度、动静脉期 Overlay 值及动静脉期 CT 值之差分别为 1.61±0.68（mg/ml）、2.77±0.72（mg/ml）、38.94±18.66（HU）、66.17±18.23（HU）、41.21±13.17（HU），1.06±0.58（mg/ml）、1.53±0.44（mg/ml）、26.16±12.70（HU）、38.91±10.67（HU）、22.74±10.73（HU），1.08±0.41（mg/ml）、1.77±0.45（mg/ml）、26.38±10.31（HU）、43.37±8.03（HU）、28.40±9.58（HU）。其中弥漫型胃癌的各组数据均明显高于肠型及混合型胃癌，两两比较，弥漫型-肠型、弥漫型-混合型各组指标差异均有统计学意义，肠型-混合型各组指标差异均无统计学意义。动脉期碘浓度、动脉期 Overlay 值、静脉期碘浓度、静脉期 Overlay 值及动静脉期 CT 值之差诊断弥漫型胃癌的 AUC 分别为 0.736、0.709、0.944、0.927、0.858，诊断阈值分别为 1.05（mg/ml）、28.75HU、1.95（mg/ml）、36.70HU、30.50HU。**结论** 双能 CT 动静脉期碘浓度、Overlay 值及动静脉期 CT 值之差有助于术前评估胃癌 Lauren 分型，其中静脉期碘浓度及静脉期 Overlay 值诊断效能最佳。

PU-0590
探讨不同病理类型及分化程度胃癌宝石 CT 谱曲线及 CT 值差异

马建科
甘肃省中医院

目的:探讨不同病理类型、不同分化程度胃癌宝石谱曲线及 CT 值的差异。**方法:**收集 91 例胃癌患者术前宝石 CT 影像资料,其中粘液癌 24 例,非黏液癌 67 例,印戒细胞癌 16 例,粘液腺癌 8 例,中度分化腺癌 32 例,35 例低分化腺癌。术前行宝石 CT 光谱成像，利用 GSI Viewer 软件获得静脉期病变的光谱曲线，计算曲线斜率，测量 11 个单能 CT 值，40~140 (10 keV 区间)。比较不同病理类型和分化程度胃癌的宝石谱曲线和 CT 值。**结果:**非黏液性癌、印戒细胞癌和低分化腺癌的曲线斜率分别为-1.92±0.53、-1.73±0.37 和-2.14±0.54。其绝对值分别大于粘液癌(-1.45±0.54)、粘液腺癌(-0.90±0.34)、中分化腺癌(-1.67±0.41)，差异均有统计学意义(P<0.05)。黏液性癌与非黏液性癌在 40~140 keV 时的单能 CT 值有显著差异(P<0.05)。前者不同程度低于后者，能量越低 CT 值差异越大。在 40~100 keV 时，印戒细胞癌与粘液腺癌的单能 CT 值有显著差异(P 均<0.05);低分化腺癌与中分化腺癌在 40~90 keV 时的单能 CT 值差异有统计学意义(P<0.05)。**结论:**不同病理类型和分化程度的胃癌有其特征性静脉期频谱曲线，低能量时 CT 值存在明显显著。利用宝石 CT 的频谱曲线可能有助于术前评估胃癌的病理类型和分化程度。

PU-0591
256 层 CT 三期动态增强扫描及图像三维重建技术对胃癌术前 TN 分期的价值

陈丽君
邵武市立医院

目的 分析胃癌 256 层螺旋 CT 平扫及三期动态增强扫描的影像表现，并与术前胃镜检查及术后病理 TN 分期对照，探讨 MSCT 检查在胃癌术前评估中的临床应用价值。**方法** 收集本院普外科 2017 年 1 月至 2019 年 5 月间，均行病理及胃镜检查确诊为胃癌患者 57 例。过动态增强及图像三维重建技术显示病变的位置、形态、大小、浸润深度、胃周侵犯情况及邻近淋巴结,进行术前 TN 分期,并

与术后病理进行对照。**结果** 结合胃镜检查结果可以显著提高早期胃癌的检出率。胃癌增强后病灶明显强化。以术后病理结果为标准，256 层 CT 三期动态增强图像对于胃癌 T1～T4 分期的诊断准确率分别为 51.15%、66.67%、84.62%、66.67%，对于 N0-N2 分期的诊断准确率为 75.0%、70.0%、52.94%。MSCT 对区分 T1 期与 T2 期、T2 期与 T3 期的能力相对较弱。MSCT 对区分 T1 期与 T2 期、T2 期与 T3 期的能力相对较弱。**结论** 256 层 CT 三期动态增强图像结合三维重建技术有助于提高胃癌病灶的发现及肿瘤分期评估，对于胃癌术前 TN 分期具有较高的准确性，有助于外科术前手术方案的制定。

恶性腹膜间皮瘤 MRI 信号特点及病理分析

方军杰,闫昆,郑建军
中国科学院大学宁波华美医院

目的探讨恶性腹膜间皮瘤(MPM)的 MRI 信号的特征性表现。**方法**回顾性分析本院 6 例经病理证实的 MPM 患者的临床资料，所有病例都进行 MRI 扫描,序列包括 MR 平扫+钆剂对比增强、扩散加权成像(DWI)。分析 MRI 影像征象及信号改变，并与临床病理进行对照分析。**结果** 局限性腹膜间皮瘤(LMPM)2 例，均表现为孤立性包块，病变都位于盆腔，MRI 示 1 例呈囊实性，1 例实性，实性部分 T1WI 呈等或略低信号，T2WI 呈等或略高信号，增强扫描实性成分多呈中度以上强化。弥漫性腹膜间皮瘤(DMPM)4 例，MRI 表现为腹膜不规则增厚、腹膜多发大小不等结节及团块，增厚的腹膜及结节在 T1WI 呈稍低信号或等信号,T2 脂肪抑制序列呈稍高信号为主，增强后多呈明显强化。6 例 MM 病灶在 DWI 上均呈高信号，ADC 信号减低，表现为明显弥散受限。4 例弥漫性 MPM 都伴有淋巴结肿大。 **结论** MPM 在 MRI 信号上有一定的特点，MRI 能在肿瘤诊断、鉴别诊断中有一定的价值。

PU-0593

胃肠间质瘤危险度分级与 CT 影像学表现的关系研究

郑穗生
合肥平安健康检测中心

目的 通过分析不同危险度胃肠间质瘤（GIST）的 CT 征象，探索 CT 对 GIST 术前危险度分级的临床意义。**方法** 收集 2014 年 1 月 1 日至 2017 年 12 月 31 日间，我院行手术切除的胃肠间质瘤病例 62 例及切除后复发转移的 6 例。根据病理结果将其分为极低危险、低度危险、 中度危险、高度危险四个等级,分析不同危险度与 CT 影像学表现之间的关系。**结果** 极低危险、低度危险、中度危险及高度危险分别为 5 例、20 例、11 例及 26 例。不同危险度的 GIST 在肿瘤最大径、有无液化、发病部位、强化方式方面差异均有统计学意义(P＜0.05)，而在不同危险度中钙化、生长方式、强化程度及各期 CT 值方面无统计学差异(P＞0.05)。**结论** 不同危险度的 GIST CT 征象存在一定差异，肿瘤最大径、液化和强化方式有助于 GIST 术前无创危险度分级，而钙化、生长方式及强化程度对术前 GIST 的危险度分级无明显价值。

PU-0594

Comparison of the values between high resolution MRI and Revolution CT enhanced scan imaging in diagnosing T stages of rectal cancer before surgery

Xi Li
Beijing Shijitan Hospital, Capitial Medical University

Objective: To compare the values between high resolution MRI and Revolution CT enhanced scan imaging in diagnosing T stages of rectal cancer before surgery.
Methods: 74 patients of rectal cancer who received therapy in our hospital from January 2017 to December 2017, by pathology confirmed, were collected as observational objects. All patients received examinations of high resolution MRI and Revolution CT enhanced scan imaging. Consistency between pathologic results and high resolution MRI diagnosis and between pathologic results and Revolution CT enhanced scan imaging diagnosis were analyzed respectively and diagnostic accordance rates of T stages of cancer by high resolution MRI and Revolution CT enhanced scan imaging were compared.
Results: Kappa consistency test showed that consistence between pathologic results and high resolution MRI and between pathologic results and Revolution CT enhanced scan imaging were both confirmed excellent (kappa value = 0.888, 0.820). The diagnostic accordance rate of high resolution MRI in diagnosing total T stages of rectal cancer before surgery was 93.2%, which was statistically same with that of Revolution CT enhanced scan imaging (89.2%, P>0.05).
Conclusion: The consistency of high resolution MRI and Revolution CT enhanced scan imaging with pathologic results in diagnosing T stages of rectal cancer are both excellent and both have high diagnostic accordance rates. And suitable examination can be chosen according to patients' specific situations clinically.

Clinical Value of Energy Spectrum Curves of Dual-energy CT in Evaluating Pathological Grading of Gastric Adenocarcinoma

Yueming Li[1], Zhihua Lu[2]
1.The First Affiliated Hospital of Fujian Medical University
2.Putian First Hospital of Fujian Province

Abstract
Purpose: To explore the clinical value of energy spectrum curves of dual-source dual-energy CT in the quantitative evaluation of different pathological grades of gastric adenocarcinoma.

Methods: A total of 62 patients with 1 well, 25 moderately and 36 poorly differentiated gastric adenocarcinomas pathologically confirmed by surgery were collected, and they underwent dual-source dual-energy CT plain scanning and enhanced scanning before operation. Dual-Energy software was used to measure the slope of the energy spectrum curves (λ) in arterial and venous phases after image reconstruction. Patients were divided into two groups according to the pathological results, including well and moderately differentiated gastric adenocarcinoma group and poorly differentiated gastric adenocarcinoma group. Data of each group were analyzed by independent sample t-test. The receiver operating characteristic curve was plotted to evaluate the diagnostic efficiency of the corresponding parameters.
Results: There were significant differences in λ values of 40-50keV, 40-60keV, 40-80keV, 40-90keV, 40-100keV, 40-120keV, 40-130keV, 40-140keV and 40-150keV energy ranges in venous phase between the well and moderately differentiated group and poorly differentiated group ($P<0.05$), but no significant differences in λ values of different energy ranges in arterial phase between the two groups ($P>0.05$). And the area under curve in 40-120keV energy range was the largest in venous phase. $K_{40-120keV}=2.69$ was selected as the diagnostic threshold with the maximum Youden index, the sensitivity and specificity were 61.1% and 76%, respectively.
Conclusion: The energy spectrum curve of dual-energy CT had certain diagnostic value in the quantitative evaluation of pathological grading of gastric adenocarcinoma.

胃肠道柿石及其并发症的 CT 表现

吕长磊
陕西省人民医院

目的 探讨胃肠道柿石及其并发症的 CT 表现，以提高对该病的认识。**方法** 回顾性分析 36 例经胃镜及手术证实的胃肠道柿石患者的 CT 平扫图像。**结果** CT 所示柿石的数量和部位与胃镜和手术结果一致。胃柿石 11 例，小肠柿石 19 例，胃和小肠并发柿石 6 例。32 例单发，4 例多发。共取出 41 枚柿石，其中大部分为卵圆形，边界清楚。31 枚呈高密度包壳伴内部多发小气泡。6 枚呈多发小气泡，无包壳样结构。4 枚呈不均匀高密度。随时间推移 1 枚柿石在消化道内移动并且边界和密度均发生变化。并发症：胃和十二指肠柿石伴发胃潴留，表现为胃腔明显扩张积液积气。小肠柿石均伴有小肠梗阻，表现为柿石近端肠管明显扩张，远端肠管突然塌陷，两者之间是过渡区。**结论** 胃肠道柿石有多种 CT 表现，其中椭圆形、边界清楚、由气体和软组织组成的不均匀包块为常见表现。根据这些 CT 表现可以作出胃肠道柿石及其并发症的明确诊断。

腹膜后 Castleman 病 CT 表现 1 例

唐苏丹
重庆医科大学附属永川医院

目的 血管滤泡性淋巴结增生又称 Castleman 病，是一种罕见的瘤样病变。该病 70%发生于纵隔，20%发生于颈部、腋部、腹股沟、肩部及外阴部等处浅组淋巴结，极少数病例发生于肠系膜或腹膜

后。本研究报告一例罕见的腹膜后 Castleman 病并复习相关文献，分析其病理及影像学特点，探讨其病因学及鉴别诊断。**方法** 回顾分析了 1 例腹膜后 Castleman 病的 CT 检查和手术病理。一位 36 岁女性患者，门诊体检，检查包括全腹部及盆腔 CT 平扫加增强扫描。应用 CT 扫描显示腹膜后一明显强化病灶，结合病理特殊表现，对其 CT 表现进行评估。**结果** CT 示腹主动脉旁一类圆形肿块，大小约 4.7X5.9cm，边界清楚，平扫 CT 值约 34HU，增强扫描病灶呈明显均匀强化，动脉期 CT 值约 131HU，静脉期 CT 值约 88HU，病灶邻近血管迂曲扩张，周围另见多发结节状软组织密度影。术后病理（后腹膜）结合形态学及免疫组化结果，符合 Castleman 病。免疫组化：CD3 滤泡间区（+）、CD5 滤泡间区（+）、CD20 滤泡（+）、CD21 显示 FDC 网、CD23 显示 FDC 网，CD68 组织细胞（+）、CD123 组织细胞（+）、Ki67 生发中心（70%+）。
结论 Castleman 病属原因未明的反应性淋巴结病之一，其病理特征为明显的淋巴滤泡、血管及浆细胞呈不同程度的增生，临床上以深部或浅表淋巴结显著肿大为特点部分病例可伴全身症状和(或)多系统损害，多数病例手术切除肿大的淋巴结后，效果良好。Castleman 病病理上分为透明血管型和浆细胞型两种类型，透明血管型占 80%～90%。显微镜见淋巴结内许多增大的淋巴滤泡样结构，有数根小血管穿入滤泡，血管内皮明显肿胀，管壁增厚，后期呈玻璃样改变。滤泡周围由多层环心排列的淋巴细胞，形成特殊的洋葱皮样结构。浆细胞型占 10%～20%。患者常伴有全身症状，如发热、体重减轻、贫血、红细胞沉降率升高。

PU-0598

腹部 Castleman 病 MSCT 表现

肖钦,刘春华,王树楠
陆军军医大学大坪医院

【摘要】**目的** 探讨腹部 Castleman 病影像表现及病理特点。**方法** 回顾性分析 7 例经手术病理证实 Castleman 病的增强 CT 影像学表现及临床病理特点。**结果** 男性 4 例，女性 3 例。7 例病灶均边界清楚， 28.6%的病灶存在钙化，72.4% 病灶存在不同程度囊变，28.6%的病灶密度均匀，CT 增强均表现为持续性强化，周围多发淋巴结；72.4%病例对血管呈包埋征，无明显侵犯。**结论** Castleman 病通常表现为边界清楚、密度不均匀的实性肿块，周围多发淋巴结，对血管呈包埋征，无明显侵犯，增强 CT 动脉期明显强化及静脉期、延迟期持续性强化对 Castleman 病的诊断有一定的指导意义。

X 线钡灌肠在慢性阑尾炎的检查应用性诊断

杜钢,何龙龙，曾辉，潘德润，陈卫国
南方医科大学南方医院

目的 慢性阑尾炎是临床常见疾病，目前对于有效确诊慢性阑尾炎的方法并不多，尤其对于临床症状不典型的病人，在诊断上更加困难。本研究通过回顾性分析我院 75 例通过阑尾 X 线钡灌肠造影诊断慢性阑尾炎的病例，证明阑尾 X 线钡灌肠造影是否具有充分的慢性阑尾炎诊断价值，同时根据结果进行分析，提高慢性阑尾炎诊断水平。
方法与资料
1.一般资料：本组 75 例，男 27 例，女 48 例，年龄 14-57 岁。体征:转移性右下腹疼痛 45 例，脐周疼痛 30 例。白细胞正常 59 例，白细胞升高 16 例。75 例慢性阑尾炎均经临床手术及病理证实。

2 阑尾 X 线钡灌肠造影检查
1.2 检查前准备：所入选患者按常规钡灌肠检查准备，检查前 12h 禁食，4h 禁水，2h 清洁灌肠。
1.2
方法 本研究 75 例均常规进行常规钡灌肠检查。以低压稀钡，将钡剂灌至横结肠肝曲停止，改变体位，使钡剂沿解剖方向逐步充盈升结肠至回盲部，随即将检查床调整呈头高脚低 15°。盲肠钡剂充盈良好，回盲部区寻找阑尾，每次阑尾复查，无论阑尾是否显影，都进行 X 线摄片，作为诊断重要依据。
结果 75 例中阑尾显影 56 例，不显影 13 例，阑尾显影率为 75%，术前 X 线诊断慢性阑尾炎 67 例(显影组 52 例，不显影组 15 例)，诊断符合率为 89%。
本研究中慢性阑尾炎患者的 X 线表现有以下几种：（1）阑尾腔内壁边缘不规整，管壁僵硬:本组 55 例符合。其中阑尾蠕动减弱或消失，钡剂排空缓慢 48 例，余 4 例排空正常；（2）阑尾腔钡剂不完全充盈:表现阑尾短小呈残桩征或尖角征 10 例；（3）阑尾扭曲、分节改变:表现阑尾扭曲、僵硬，钡剂呈节段状改变，透视下观察阑尾移动性差 11 例。而阑尾未见显影患者 16 例，在透视下于回盲部下方盲肠内侧阑尾区进行指压试验，12 例病人感到阑尾区指压性疼痛，后诊断为慢性阑尾炎。
结论 阑尾 X 线钡灌肠造影具有充分的慢性阑尾炎临床诊断价值，同时根据结合患者体征，可有效提高慢性阑尾炎诊断水平。

Solitary fibrous tumor of the mesentery: a case report and review of literature

JINGNI LIU,SHUNLIN GUO,ZHAO LIU
the First Hospital of Lanzhou University

Solitary fibrous tumors (SFTs) are rare mesenchymal tumors which mostly arise from pleura. Such tumors arising from the mesentery are rare. A 66-year-old man was referred to the department with a painless mass in the left abdomen, which was detected incidentally ten years ago. The patient sometimes had abdominal pain, and the physical examination revealed an irregular mass. The mass was resected, and excisional biopsy results revealed an SFT originating from the mesentery of the small intestine. He was discharged a week after surgery and remained normal in the following four-month. Through this case report and literature review, the author hopes to accumulate materials and make a more accurate diagnosis later.

Four-point CT scores for evaluation of occult peritoneal metastasis in patients with gastric cancer: a region-to-region comparison with staging laparoscopy

Lei Tang,Zi-Yu Li,Jia Fu,Yan Zhang,Xiao-Ting Li,Jia-Fu Ji,Ying-Shi Sun
Peking University Cancer Hospital

Purpose To explore the abnormal CT signs of occult peritoneal metastasis (OPM) in patients with advanced gastric cancer, and investigate the efficacy of the "four-point CT scores" in the evaluation of OPM prospectively, through the region-to-region comparisons with staging laparoscopy.

Methods

The CT and endoscopic ultrasound diagnosed $cT_{3-4}N_{0-3}M_0$ patients were included into this study. All enrolled patients were performed staging laparoscopy before surgery or neoadjuvant chemotherapy. OPM detected during staging laparoscopy will be compared with preoperative abdominal CT to investigate whether there were abnormal signs through region-to-region comparison. The radiologist observed the OPM areas which include large omentum, transverse mesocolon, perihepatic peritonum, left sub-diaphragm area, parietal peritoneum, mesentery, falciform ligament and hepatogastric ligament areas, on standard three reconstruction planes (axial, coronal and sagittal). The abnormal signs were recorded. A four-point CT-score system was proposed to define the radiological characteristics of the OPM areas according to the severity degrees of the CT signs. The defined CT score system was then verified the diagnostic efficacy on a cohort of consecutive gastric cancer patients prospectively.

Results 33 out of 385 enrolled patients were diagnosed as OPM by staging laparoscopy, which were all missed by preoperative CT. Fifty-seven PM positive regions were confirmed in these 33 cases. The large omentum was the mostly involved areas in OPM patients (38.60%, 22/57), which usually demonstrated as smudge-like ground glass opacity (S-GGO) signs (90.91%, 20/22), with a mean CT score of 2.14. Parietal peritoneum was the second mostly involved region (22.81%, 13/57), which usually displayed as the thickening peritoneal line, with a mean CT score of 1.69. The perihepatic peritoneum was also the second mostly involved region (22.81%, 13/57), with the lowest CT score of 0.85. In the prospective study of 143 gastric cancers, it was more prone to be positive of OPM following the increase of CT scores ($p<0.001$). Taken $\geq$ score 2 as cutoff value to predict OPM positive, the area under the curve (AUC) was 0.848, with a sensitivity of 0.875 and specificity of 0.764; the false negative rate was 2% (2/99), and the true positive rate was 31.8% (14/44).

Conclusions

The four-point CT-score system has the potential to improve the pre-treatment evaluation of occult peritoneal metastasis.

MDCT 肿瘤优势供血动脉征鉴别胰胃间隙区肿物的价值

李佳铮,唐磊,付佳,李英,李晓婷,李健,李子禹,孙应实
北京大学肿瘤医院

目的: 评价 MDCT "肿瘤优势供血动脉征"对胰胃间隙外生型肿瘤的定位诊断价值。**方法:**回顾性研究经病理证实的 34 例位于胰胃间隙的外生型肿瘤，包括 20 例胃胃肠间质瘤（GIST），14 例胰腺肿瘤（7 例胰腺神经内分泌肿瘤 NEN，7 例胰腺实性假乳头状瘤 SPN）的 MDCT 图像,由两名放射科医生追踪肿瘤的供血动脉并作出定位诊断，用卡方检验或 Fisher 精确检验比较两组间供血动脉的差别。**结果:**19/20 例胃 GIST、13/14 例胰腺肿瘤可识别肿瘤供血动脉来源,两组在肿瘤起源血管上有显著性差异（$c^2=23.86$，$P<0.001$）。17/20 例（85%）胃 GIST、11/14 例胰腺肿瘤（78.6%）可显示"肿瘤优势供血动脉征"，两组间征象的阳性率没有统计学显著性差异（Fisher 精确检验,P =

1.000）。对于所有入组的肿瘤，该征象诊断胃 GIST 和胰腺肿瘤的敏感度、特异度、诊断准确度、阳性预测值和阴性预测值分别为 85.0%、92.9%、88.2%、94.4%、81.3%和 71.4%、100%、88.2%、100%、83.3%。**结论：** MDCT“肿瘤优势供血动脉征”可辅助胰胃间隙胃及胰腺外生性肿瘤的定位诊断。

CT characteristics and risk factors of isolated recurrence of peritoneal reflection following radial resection for colon cancer

Ziwan Liu,Yun Mao,Yin Zhou,Dong Yang,Fengming Tao
The First Affiliated Hospital of Chongqing Medical University

Objective: To evaluate the CT imaging characteristics and analyze risk factors of isolated peritoneal reflection recurrence (IPRR) after radial resection for colon cancer, so as to make early diagnosis and proper treatment, prolonging the survival.
Methods: BetweenJanuary 2012 and April 2019,83 patients with colon carcinomaand IPRR confirmed by surgery or/and pathology in our center were retrospectively gathered. 17 cases without preoperative CT images and 56 cases with non-IPRR peritoneal metastases were excluded and eventually 10 cases were included in this study. Clinical and pathological information were recorded as follows: preoperative complications such as intestinal obstruction and perforation, ways of operation, primary site, T stage, N stage, pathological types, the time period from radial resection to the diagnosis of IPRR and non-IPRR metastases at the time of diagnosis of IPRR. The CT information was descriptively analyzed as follows: ascites status at the time of pre-operation and diagnosis of IPRR, size of IPRR, morphological features of IPRR (three types: I,band or flake; II,nodule, maximum diameter equal or less than 2cm; III,mass, maximum diameter beyond 2cm), enhancement pattern,border and the involvement of adjacent organs.
Results:A total of 10 cases (6 men and 4 women; mean age, 60ys;age range31-78ys) were enrolled in this study.The clinical, pathological and CT imagingcharacteristics of patients with IPRR were given in **Table 1**and **Table 2**. Preoperative complications: intestinal obstruction, 3 cases, perforation, 1 case. The ways of operation: laparoscope, 7 cases, open surgery, 1 case, and 2 cases with unknown operative way. Majority of the primary tumors (7 cases, 70%) located in the right colon.All the primary tumors were of T3/T4 stage and 5 cases with lymph node metastases (N1, 3 cases and N2, 2 cases). Of 10 patients, only one mucous adenocarcinoma and one signet ring cell carcinoma.The mean period time fromradial resection to the diagnosis of IPRRwas 18.70 ms (5-76 ms). Only 2 cases withnon-IPRR metastaseswere occurred, one with liver metastasis (Fig.1) and one with liver & lung metastasis. Ascites was found in 3 cases (30%) at the time ofpre-operation and only one at the time of diagnosis of IPRR.The sizes of IPRR were as follows: <2cm, 3 cases; 2.1-4cm, 4 cases; 4.1-6cm, 2 cases; >6.1cm, 1 case. All the 7 cases of size beyond 2cm were involved with adjacent organs, including 4 seminal vesicles (Fig.2), 3 bladders, 2 rectums, and 1 uteruses. The shape of IPRR was type I in 2 cases,type II

in 3 cases and typeIII in 5 cases (Fig.3).All the cases showed slightly slow enhancementand majority of cases (90%) were of irregular border.
Conclusion: The patients with locally advanced (T3/T4) right colon cancer may be more prone to IPRRpost radial resection, as well as obstructing colon cancer may be also a risk factor for IPRR.Early diagnosis of IPRR when lesion is less than 2cm may reduce the damage of adjacent organs and distant metastases.

多层螺旋 CT 对胃癌侵犯浆膜诊断中的价值分析

宋芹霞,陈志萍
安徽省安庆市立医院

【摘要】 目的 探讨多层螺旋 CT 在诊断胃癌浆膜侵犯的临床价值。 **方法** 收集 2014 年～2018 年经病理证实的 160 例胃癌患者，所有患者术前均行 CT 增强动静脉期扫描，分析病灶多层螺 CT 检查的特点，判断浆膜是否侵犯，并与病理结果比较。**结果** 160 例胃癌患者的病灶术前均明确诊断，有 70 例位于胃体小弯部，胃窦部 59 例、贲门区 31 例。溃疡型胃癌 75 例，隆起型胃癌 55 例，浸润型胃癌 30 例。CT 检查图片显示 130 例浆膜侵犯，且胃周见结节影，30 例浆膜面光滑、胃周脂肪间隙清晰，均与术后病理一致。 **结论** 多层螺旋 CT 检查操作方便，术前对胃癌的检出率较高，并且可以初步分型、判断浆膜面侵犯情况，有助临床术前准备和评估疗效，值得在临床推广。

十二指肠球部 Brunner 腺瘤 2 例及文献复习

邵亚军
宝鸡市中心医院

【摘要】目的 探讨十二指肠 Brunner’s 腺瘤的影像学特征。材料和方法 回顾性分析 2 例 Brunner’s 腺瘤的影像表现，并与病理表现相结合，通过对文献的复习，分析总结十二指肠 Brunner’s 腺瘤的影像诊断特征。**结果** 2 例 Brunner’s 腺瘤均发生于十二指肠球部，与 brunner’s 腺的生理分布相符合。均为腔内息肉样肿块，肿块大部分边缘光整，轻度到明显强化，强化程度及均匀度与肿块的病理构成有关。胃肠造影多表现为边缘光整的息肉样充盈缺损。**结论** 十二指肠腺瘤主要发生在十二指肠球部，多呈带蒂的息肉样肿块，可引起消化道出血、肠梗阻、肠套叠等。肿块边缘清楚，强化程度不等，肿块中可分布小片状低密度囊性区。CT 扫描及薄层重建 结合内镜超声，可帮助诊断及鉴别诊断。

Absence of the celiac trunk: definition, classification, MDCT angiographic findings and their probable embryological mechanisms

Yi Mao,Wei Tang,Bo Jin,Lian Qin Kuang,Shuang Yue Tang,Yi Wang
Daping Hospital, Army Medical University, Chongqing, China

Purpose : To identify the types and prevalence of absence of the celiac trunk by using multidetector computed tomography (MDCT) angiography, and analyze their probable embryological mechanisms.
Materials and Methods: A retrospective study was carried out on 2,500 abdominal MDCT angiography images. The absence of the celiac trunk was defined as that the celiac trunk is not exist, more specifically, there is not such an arterial trunk containing at least two major branches of the celiac trunk. Various types of the absence of the celiac trunk were investigated.
Results: Of the 2,500 patients, 19 (0.76%) patients were identified as an absence of the celiac trunk. According to its definition and classification, the absence of the celiac trunk could be divided into five types: type I (LGA + CHA + SA + SMA), type II (HM trunk + LGA + SA), type III (SM trunk + LGA + CHA), type IV (GM trunk + CHA + SA), and type V (other type); and these types were observed in 5 patients (0.20%), 9 patients (0.36%), 3 patients (0.12%), 0 patients (0.00%) and 2 (0.08%) patients, respectively. There were more examples of the types I and II than of the types III–V (P = 0.004).
Conclusions: We systematically classified the absence of the celiac trunk based on its MDCT angiography findings. Abnormal interruptions and persistence of the longitudinal anastomosis, and regression of vascular root and emergence of replaced artery could all be the embryological mechanisms of various types of the absence of the celiac trunk.

MSCT 在胃肠道双原发癌诊断中的临床价值

杨彬[1],关键[2]
1.西南医科大学附属中医医院
2.中山大学附属第一医院

目的 探究 MSCT 检查对胃肠道双原发癌的诊断价值，以提高认识，减少误诊及漏诊。
方法 回顾性筛查 2012 年 1 月 1 日到 2019 年 7 月 1 日因胃肠道癌就诊的所有连续性病例 660 例，收集经手术病理证实的具有完整临床及影像资料的胃肠道双原发癌患者，记录患者的一般资料、病理、部位、影像及漏诊情况，并分析其漏诊原因。
结果 660 例患者中仅有 18 例符合胃肠道双原发癌（2.73%），男 15 例，女 3 例，年龄 33-82 岁，平均 64.28±7.72，9 例饮酒史，12 例吸烟史，3 例有家族史，临床主要因腹痛和大便性状改变就诊，其中 1 例并发肠套叠，6 例并发肠梗阻，10 例经肠镜证实为合并结直肠息肉或腺瘤；18 例患者均为双原发癌，包括胃-结肠组 2 例，小肠-结肠组 1 例，结肠-结肠组 6 例，结肠-直肠组 7 例，直-直肠组 1 例，直-肛管组 1 例，术前漏诊 8 例（44.4%），均漏诊为结肠（升结肠 1 例，横结肠 4 例，结肠脾曲 1 例，乙状结肠 1 例，直肠 1 例），分析漏诊原因包括 MSCT 检查前胃肠道未做充分准备，1 例因肠套叠漏诊横结肠癌，7 例因诊断时满足于一处病变的检出而未进一步查找胃肠道其他部位是否同时存在病变。对胃肠道多原发癌中的结直肠癌的 MSCT 进行分析，其 MSCT 表现为肿块、肠壁均匀/非均匀性增厚，癌肿周围脂肪间隙可表现为模糊及肠系膜血管增多增粗，增强后癌肿表现为均匀/非均匀性延迟性明显强化。
结论 MSCT 是胃肠道肿瘤诊疗过程中必不可少的检查方法，对于长期吸烟饮酒的中老年男性患者，特别是结直肠多发息肉或腺瘤者，胃肠道充分准备下行腹盆腔大范围 MSCT 扫描，仔细观察结直肠段，可有效减少术前漏诊，提高诊断准确性。

T2 mDixon MV 在颈部的应用研究

徐焕文,郑君惠
广东省人民医院

目的 探讨 T2 mDixon MV 序列在颈部的应用
方法 第一阶段志愿者扫描：志愿者 6 个，分别扫描 T2mDIXON\ T2mDIXON MV 序列，设置好参数，使两个序列的扫描时间和空间分辨率相同。每人每个序列扫描 3 次，第一次不做任何运动，第二次每隔 30s 做一次吞咽运动，第三次每隔 10s 做一次吞咽运动，第四次每隔 30s 做一次摇头运动，第五次每隔 10s 做一次摇头运动，第六次不间断的进行摇头运动。分别由一位有 10 年以上工作经验的头颈部放射诊断副主任医师和 10 年以上工作经验的主管技师各自在工作站上分析图像，测量图像信噪比、运动伪影，并用统计法分析比较。
结果 不做运动时，T2mDIXON 序列的图像信噪比和图像整体质量评分（范围 3～4，平均值 3.85）均高于 T2mDIXON MV 序列（范围 3～4，平均值 3.42）；志愿者做吞咽运动时，T2mDIXON MV 序列图像没有运动伪影，T2mDIXON 序列口腔和喉部层面的图像运动伪影明显，且随运动频率增快增加；志愿者做摇头运动时，T2mDIXON MV 序列图像没有运动伪影，T2mDIXON 序列图像运动伪影明显，且随运动频率增快增加，图像信噪比也随运动频率增加而降低。
结论 不做运动时，T2mDIXON 序列的图像信噪比和图像整体质量评分均高于 T2mDIXON MV 序列；T2mDIXON MV 序列可以有效抑制颈部的运动伪影，明显改善图像质量。

IVIM-DWI 成像在脑泡型包虫病及其边缘带中的应用

田慧,杨洁,杨静,高欣,王俭
新疆医科大学第一附属医院

目的 探讨体素内不相干运动弥散加权成像技术(introvoxel incoherent motion diffusion-weighted imaging，IVIM-DWI)定量评价脑泡型包虫病（CAE）边缘带的研究价值。**方法** 收集 2010 年 7 月－2019 年 01 月我院就诊的共 18 例 CAE 患者(共 31 个有效病灶)；行常规 MR 及 IVIM-DWI 扫描检查，分测量 CAE 病灶实质区、边缘带、水肿区（5mm、10mm、15mm）及相对应的对侧正常区（对照区）脑实质的纯扩散系数 (ADC $_{slow}$)、假扩散系数(ADC $_{fast}$)和灌注分数(f)，并进行统计学分析。结果 病灶实质区与边缘带 ADC $_{standard}$ 值、ADC $_{fast}$ 值、ADC $_{slow}$ 值、f 值均无统计学意义；病灶实质区与水肿区 10mm 及相对应的对侧正常区（对照区）的 ADC $_{standard}$ 值差异具有统计学意义（$P<0.05$）；病灶实质区水肿区 5mm 及相对应的对侧正常区（对照区）的 ADC $_{fast}$ 值差异具有统计学意义（$P<0.05$）；病灶实质区与相对应的对侧正常区（对照区）、边缘带与相对应的对侧正常区（对照区）、水肿区（5mm、10mm、15mm）与相对应的对侧正常区（对照区）ADC $_{slow}$ 值差异均具有统计学意义（$P<0.05$）；病灶实质区与水肿区（5mm、10mm、15mm）、相对应的对侧正常区（对照区）与水肿区（5mm、10mm、15mm）的 f 值差异具有统计学意义（$P<0.05$），余组间比较差异无统计学意义（$P>0.05$）。**结论** IVIM- DWI 的部分参数(ADC $_{fast}$ 和 ADC $_{slow}$)有助于界定 CAE 浸润带的范围，为 CAE 手术方案的拟定及预后分析给予可靠的影像学依据。

基于氢质子磁共振波谱技术的 L 波段微波辐射对 大鼠学习和记忆影响的研究

李春舫
中国人民解放军总医院第一医学中心

目的 基于氢质子磁共振波谱（^{1}H-MRS）技术，研究 L 波段微波辐射对大鼠学习和记忆功能的影响。

方法 二级雄性 Wistar 大鼠 26 只，按照体重随机分为假辐射组（Sham 组）、L 波段 30mW/cm^{2}微波辐射组（L30 组）。将 L30 组大鼠放置于有机玻璃照射盒中，使用 L 波段微波辐射源从背侧照射 10min；Sham 组大鼠除未行微波辐射外其他处理与照射组相同。采用 Morris 水迷宫方法于辐射后 1d 和 7d 对各组大鼠的学习和记忆功能进行检测。使用 ^{1}H-MRS 于辐射后 1d 和 7d 检测鼠脑中的 N-乙酰天门冬氨酸（N-acetylaspartate，NAA）、胆碱（choline，Cho）、肌酸（creatine，Cr）浓度水平。

结果 微波辐射后 1d 和 7d，与 Sham 组相比，L30 组平均逃避潜伏期（average escape latency，AEL）有延长趋势，但无统计学意义（P>0.05）。^{1}H-MRS 检测结果显示，辐射后 1d 与 Sham 组比较， L30 组 ^{1}H-MRS 波谱 NAA/Cr 值显著降低（P<0.05），Cho/Cr 值无显著差异；辐射后 7d 与 Sham 组比较，L30 组大鼠脑部 NAA/Cr 和 Cho/Cr 值均无显著差异。

结论 30mW/cm^{2} L 波段微波辐射后 1d 大鼠脑内 NAA/Cr 显著降低，而学习和记忆行为学指标无显著改变。提示利用 ^{1}H-MRS 技术能够在被试未出现显著行为学改变时检测出微波辐射对学习和记忆相关神经元的影响。

PU-0611
颈动脉斑块高分辨率磁共振扫描序列的初步探讨

李娟,邵广瑞
山东大学第二医院

目的 随着生活水平的不断提高，高血脂高血糖高血压患者不断增加，间接导致颈动脉斑块发生率稳步升高，动脉斑块使血管狭窄甚至闭塞，从而导致脑缺血，脑梗死。本文旨在研究运用合理的 MRI 扫描方案，对斑块成份进行分析，进而有利于临床诊断与治疗。

方法 颈动脉斑块多位于颈总动脉分叉处，以分叉处为中心进行磁共振扫描，扫描序列分强化前与强化后，强化前扫描序列包括三平面定位像、Ax 3D TOF MRA、Cor 3D CUBE T1、OBL Sag 3D T1、Ax PD fs FSE、Ax T2 fs FSE,强化后扫描序列为颈部动态血管增强 Cor Tricks MRA、Cor 3D CUBE T1+C、OBL Sag 3D T1+C、Ax PD fs FSE+C. OBL Sag 3D T1 为病变侧的颈总动脉分叉处的斜矢状位，目的是不用重建更直观的观察血管分叉处斑块的影像。需要注意的是强化前后相同序列的定位保持一致，更方便对比强化前后病变信号的变化。

结果 颈动脉斑块高分辨率 MRI 扫描不仅可以直观的观察到狭窄的血管，还可以通过强化前后对比，对斑块的位置、范围、成份等进行分析。CUBE 为三维无间隔容积扫描，能重建大血管的整体走形。

结论　　颈动脉斑块高分辨率 MRI 可更好的评估管腔内斑块情况，定性判断斑块成份，定量测量管壁结构，官腔最大狭窄程度，为临床诊断与治疗提供帮助。

PU-0612
三维动脉自旋标记技术(3D-ASL）在急性缺血性脑卒中的应用

杨小田
哈尔滨医科大学附属第二医院

目的　探讨三维动脉自旋标记技术（three-dimension arterial spinlabeling,3D-ASL）在急性缺血性脑卒中的应用。

方法　入院时 DWI 表现为急性缺血性脑卒中疾病的患者 40 例，男性 27 例，女性 13 例，年龄 25-85 岁，平均年龄 55.5 岁。根据 Adamas 分型，将缺血性脑卒中患者根据 DWI 图像上病灶面积大小分成两组：小面积脑梗死组(≤3 ㎡），大面积脑梗死组（＞3 ㎡，且累计两个或两个及以上脑解剖部位）。对每位患者在标记后延迟（PLD）时间分别为 1.5s 和 2.5s 时行 3D-ASL 检查，常规 T2WI、T1WI、MRI、DWI 检查。将后处理 3D-ASL 图像与 DWI 及 MRA 图像进行分析处理，并进行梗死核心 PLD=1.5s 及 PLD=2.5s 脑血流量 CBF 值的测量。

结果　小面积脑梗死组 23 例，大面积脑梗死组 17 例。小面积脑梗死组 DWI 面积 141.65±67.78㎜²，PLD=1.5s 病灶面积为 1334.48±1200.48㎜²，CBF 值 12.03±5.165ml/100g/min，PLD=2.5s 病灶面积为 731.82±810.18㎜²，CBF 值为 20.43±4.145ml/100g/min，大面积脑梗死组 DWI 面积 833.89±453.17㎜²，PLD=1.5s 病灶面积为 3177.67±1350.84㎜²，CBF 值 7.69±2.655ml/100g/min，PLD=2.5s 病灶面积为 1721.44±559.27㎜²，CBF 值 16.99±3.05ml/100g/min。

结论　3D-ASL 技术结合 DWI,能够评价缺血半暗带，对于提示临床采取合理方案挽救缺血脑组织有重要价值。3D-ASL 技术提示大面积梗死灶 CBF 更低，更加敏感。

PU-0613
应用功能性磁共振技术研究嗅觉通路的改变以及嗅觉适应机制

陈晓惠,肖伟
武汉大学中南医院

目的　嗅觉是人类重要的化学感觉，而上呼吸道感染是发生嗅觉障碍的常见病因之一。研究表明，与正常人相比，有嗅觉障碍的患者的嗅球体积减小、嗅束沟深度降低。应用功能性磁共振成像技术 BOLD（血氧水平依赖）对嗅觉适应前以及恢复后早期大脑功能激活区进行研究，探讨上呼吸道感染患者中枢嗅觉通路的改变及嗅觉适应机制。**方法**　选取嗅觉障碍组 19 例（男 5 例，女 14 例），年龄与性别与之匹配的健康对照组 19 例（男 5 例，女 14 例），所有被试均为右利手，对所有被试进行了内窥镜检查以及嗅觉测试。给予无嗅觉障碍组 2 次间隔 20 分钟相同的嗅觉刺激任务(分别称为任务 1 和任务 2)，刺激剂为异戊酸，采用德国西门子 Trio Tim 3.0T 核磁扫描仪进行功能性磁共振成像，获取图像数据，包括 3D T1W 图像、BOLD（血氧水平依赖）图像等，采用 SPM8 软件进行数据处理。利用视觉模拟量表对 2 次任务进行气味强度和愉悦度评分，并将结果进行统计学分析。　**结果**　嗅觉障碍组在很多区域都有灰质体积的减少，这些区域主要包括前扣带回、梭状回、

额上回、颞上回及小脑。病程 1 年以上的患者的灰质体积减少更多。任务 1 中大脑激活区域位于双侧小脑、额叶(包括眶额回)、岛叶、丘脑、扣带回、杏仁体、梨状皮层、左侧顶下小叶、中央前回、右侧海马、苍白球、颞中回、缘上回。任务 2 中，仅见右侧额中回激活，且激活区域显著减少。对 BOLD 图像信号进行分频处理，不同 ALFF（低频振幅）下的大脑激活区域不同。 **结论** 右眶额皮层和嗅球形态学上的改变可能与上呼吸道感染患者发生嗅觉障碍的发病机制有关。大脑的嗅觉适应较主观感觉有明显的“延时现象”，主观嗅觉适应已经恢复时，而大脑敏感性仍处于较低水平。低频振幅下的激活脑区与嗅觉损伤机制有关，高频振幅下的激活脑区与嗅觉的适应机制相关。

Cortical Thickness Parameters for the Discrimination of Girls Showing and Not Showing Early Hormonal Maturation: A Machine-Learning Approach.

Di Yang[1],Wenjing Zhang[2],Zhihan Yan[3],Jianjun Zhang[1]
1.Department of Radiology， Zhejiang Hospital， Hangzhou 310013， P.R. China
2.Department of Radiology， the Center for Medical Imaging， West China Hospital of Sichuan University， Chengdu 610041， P.R. China
3.Department of Radiology， the Second Affiliated Hospital and Yuying Children’s Hospital of Wenzhou Medical University， Wenzhou 325027， P.R. China

Objective: Previous studies have shown the significant changes on cortical morphometry in girls during early hormonal maturation defined by the gonadotropin-releasing hormone (GnRH) stimulation test[1]. These morphometry changes may be neurological markers to recognize early hormonal maturation, which can be a noninvasive method to replace the invasive laboratory tests. But the accuracy of these predictions remains unclear. The current investigation is to specify the ability of whole brain cortical thickness parameters in identifying precocious puberty girls who are undergoing early hormonal maturation from those who are not.

Methods: Seventy-eight precocious puberty girls underwent structural imaging on a 3T MR system and finished GnRH stimulation test to identify hormonal manifestations of hypothalamus-pituitary-gonadal axis (HPG-axis) activation. Support vector machine (SVM) implemented in PROBID software (http://www.brainmap.co.uk/probid.htm) was adopted to investigate the discriminating accuracy of whole brain structure parameters for identifying early hormonal maturation. Based on clinical outcome, we selected two groups of undergoing hormonal maturation (n=25) and not undergoing hormonal maturation (n=25) girls matched for age, BMI and IQ to optimally train the classifier[2]. The cortical mantle thickness of each subject, derived from the preprocessing step, was selected as the feature for multivariate pattern analysis.
Results: SVM analysis showed that classification accuracy separating those with and without early signs of pubertal hormonal changes using cortical thickness maps was 84.0% (sensitivity=80.0%, specificity=88.0%). Permutation tests indicated that the accuracy of classification was statistically significant ($p \leqslant 0.001$).
Conclusion: These results indicate that cortical thickness parameters have high potential in identifying precocious puberty girls showing and not showing early

hormonal maturation. Structural neuroimaging may provide image markers to apply in the context of clinical diagnosis and treatment.

PU-0615
定量 DTI 在血管性认知障碍和阿尔茨海默病鉴别中的价值

伏晓,余晖
贵州医科大学附属医院

目的 采用全脑 DTI 定量研究方法检测脑小血管病 VCI 患者脑白质损害的特点，并对比及其与 AD 患者的不同，从而探讨 DTI 在 VCI 早期诊断和鉴别诊断中的作用。**方法：**收集经神经内科诊断脑小血管病且伴有认知功能障碍的 VCI 患者 9 例、AD 患者 11 例和健康志愿者 20 例。对所有研究对象进行全脑 DTI 扫描，采用基于纤维束示踪的空间统计分析（TBSS）方法分析全脑各向异性分数(FA)异常变化的区域。将 VCI 组和 AD 组的定量 FA 图分别与健康志愿者进行比较，寻找脑白质和深部灰质 FA 值下降区域。随后再对 VCI 组和 AD 组的定量 FA 图进行比较，寻找 VCI 患者 FA 值下降更为显著的区域。**结果** VCI 组与正常对照组比较，VCI 患者的脑白质骨架图显示广泛的 FA 值下降，包括双侧辐射冠、双侧外囊、右侧内囊、穹窿、胼胝体膝部和压部、双侧丘脑、双侧矢状层、双侧下纵行束、右侧上纵行束、双侧扣带和双侧钩束；AD 组与正常对照组比较，脑白质骨架图显示双侧辐射冠、双侧外囊、穹窿、胼胝体膝部和压部、双侧丘脑、双侧矢状层、双侧下纵行束、右侧上纵行束、双侧扣带束 FA 值的下降；与 AD 组比较，VCI 患者的脑白质骨架图显示左侧前辐射冠和上辐射冠、双侧扣带束和胼胝体体部的 FA 下降程度更明显。**结论** DTI 可以检测 VCI 患者与认知障碍相关脑区的白质损害，有助于 VCI 的诊断；VCI 患者的脑白质骨架图显示左侧前辐射冠和上辐射冠、双侧扣带束和胼胝体体部的 FA 下降程度更明显，可能有助于与 AD 患者的鉴别。

PU-0616
高分辨率 MR 血管壁成像技术在头颈部动脉瘤中的应用

舒红格
华中科技大学同济医学院附属同济医院

目的 探讨高分辨率 MR 血管壁成像技术在头颈部动脉瘤诊断中的应用。
方法 回顾性分析经高分辨率 MR 血管壁成像技术诊断的 6 例头颈部动脉瘤的影像资料，高分辨率血管壁成像技术主要包括 3D-T1WI，3D-T2WI，3D 增强扫描，所采集的数据经后处理和分析。同时采集了 3D-TOF MRA，部分患者也行 CTA 检查。
结果 4 例颈内动脉动脉瘤，1 例椎动脉动脉瘤，1 例发生在基底动脉；1 例为假性动脉瘤，另外 5 例为真性动脉瘤；2 例有附壁血栓，1 例内膜不完整局部形成壁间血肿。
结论 高分辨率 MR 血管壁检查技术可以对头颈部动脉瘤进行定位和定性诊断，同时提供更多的临床价值，通过对管壁完整性的分析可以鉴别真性和假性动脉瘤；真性动脉瘤壁的完整性欠缺及薄弱处预示动脉瘤破裂危险性增加；动脉瘤内血栓与缺血性脑卒中等临床事件的发生相关。

小脑内淋巴囊肿瘤一例及文献回顾

温丽婷
福建医科大学附属第一医院

摘要：目的 探讨内淋巴囊肿瘤的临床及影像学表现。方法 总结经病理证实的内淋巴囊肿瘤 1 例的诊断资料,复习文献并讨论内淋巴囊肿瘤的临床特征及影像学表现诊断进展。例，男,47 岁,因"左耳听力下降七年，反复枕额痛半年"入院。CT 表现以岩骨后缘中部为中心的虫蚀状或穿凿样骨质破坏。MR T1W I 上可见片状高信号区，T2WI 上见高低混杂信号影，其内见多发杂乱血管流空信号及含铁血黄素沉着。CTA 显示肿瘤血供丰富,主要由左颈外动脉及左锁骨下动脉分支参与供血。

PU-0618
T2*-PWI 在脑胶质瘤复发与放射性坏死鉴别诊断中的应用价值

余正贤
南京大学医学院附属鼓楼医院

目的 探讨 T2*-PWI 在脑胶质瘤复发与放射性坏死鉴别诊断中的应用价值。**资料与方法** 本研究共收集 24 例经外科手术切除或活检病理并临床随访证实的脑胶质瘤复发及放射性坏死病例，其中 15 例为放射性坏死，9 例为脑胶质瘤复发，所有病例均在 3T 磁共振传统平扫及增强的基础上行 T2*-PWI,所有数据的后处理均在 Philips EWS 工作站完成。分别以病灶强化区、水肿区及正常对照区为感兴趣区，得到各感兴趣区的 nrCBV 值。以独立样本 t 检验比较脑胶质瘤复发及放射性坏死病灶的强化区、水肿区的 nrCBV 值，以 $p<0.05$ 为差异有显著统计学意义。**结果**: 脑胶质瘤复发病灶的强化区与水肿区 nrCBV 值均高于放射性坏死区。脑胶质瘤复发病灶的强化区与水肿区 nrCBV 值分别为 3.27±2.32 和 1.17±0.56；放射性坏死病灶的强化区与水肿区 nrCBV 值分别为 0.97±0.57 和 0.58±0.22。其强化区 nrCBV 值的诊断敏感性及特异性分别为 88.2%和 97.4%，而水肿区为 92.3%和 100%。**结论**: 脑胶质瘤复发病灶的强化区与水肿区 nrCBV 值均高于放射性坏死, 利用 T2*-灌注加权成像可以明显提高脑胶质瘤复发与放射性坏死的鉴别诊断的正确率。

MR 增强高分辨 3D-T1WI 抑脂序列联合曲面重建在非外伤性面瘫中应用价值

宁文锋[1],刘红生[1],杨想春[1],邬小平[1],杨军乐[1],马鸣岳[1],高明[1],李璐言[1],杜伟[1],张子照[2]
1.西安市中心医院
2.西安市工会医院

目的 探讨 MR 增强高分辨 3D-T1WI 抑脂序列联合曲面重建在非外伤性面瘫中应用价值。
方法 收集非外伤性面瘫患者 58 例，男 36 例，女 22 例，中位年龄 48 岁。均在飞利浦 3.0TMR 行常规轴位 T2-mDIXON 和 T1-TSE 序列后注射钆喷酸葡胺再行高分辨 3D-T1WI 抑脂扫描，扫描范围由颅底至鼻尖部；58 例患者原始数据均行行曲面重建（CPR）。详细分析面神经及相关结构受累情况。
结果 58 例非外伤性面瘫患者中，面神经炎引起面瘫 42 例，面神经肿瘤引起面瘫 26 例。其中单侧面神经炎伴同侧面部表情肌萎缩 12 例，单纯单侧面神经炎 30 例，面神经鞘瘤 16 例。

结论 高分辨 3D-T1WI 抑脂序列可显示各段面神受累情况，CPR 可在一幅图像上清晰显示面神经全貌，推测各段结构受损情况。结合轴位图像充分利用 CPR 后处理技术，可准确诊断在非外伤性面瘫，对临床治疗选择及预后评价有重要的指导意义。
结论 高分辨 3D-T1WI 抑脂序列可显示各段面神受累情况，CPR 可在一幅图像上清晰显示面神经全貌，推测各段结构受损情况。结合轴位图像充分利用 CPR 后处理技术，可准确诊断在非外伤性面瘫，对临床治疗选择及预后评价有重要的指导意义。

PU-0620
脑小血管病认知障碍大鼠脑 FA 值的纵向研究

伏晓,余晖
贵州医科大学附属医院

目的 观察自发性高血压认知障碍大鼠全脑 FA 值的纵向变化，探讨脑小血管病认知障碍发生的可能机制及早期诊断价值。方法：50 只 SHR 随机分为非手术组和手术组，于手术组大鼠 16 周龄时采用单侧结扎颈总动脉的方法进行手术。于大鼠 16 周龄、20 周龄、28 周龄时进行 Morris 水迷宫试验，并对大鼠进行 DTI 扫描，利用基于体素分析方法分析各组大鼠 FA 值下降的脑区；利 ROI 的方法手动画出代表海马面积的 ROI，分析海马 FA 值的变化；组织病理学观察纹状体、海马、胼胝体神经细胞受损情况。
结果 VBA 方法发现 28 周龄时的 SHR 非手术组大鼠同其 16 周龄时相比：双侧纹状体、双侧海马、双侧额叶皮质区 FA 值降低（$p<0.05$）；同其 20 周龄对比双侧下丘外皮质、双侧海马、双侧纹状体、左侧皮层 FA 值下降（$p<0.05$）；同对照组相比，SHR 非手术组大鼠 20 周龄时桥脑、胼胝体、内囊、左侧纹状体 FA 值降低（$p<0.05$）；28 周龄时桥脑、右侧下丘脑中央核、双侧海马、胼胝体、左侧纹状体 FA 值下降（$p<0.05$）。对于 SHR 手术组，28 周龄 SHR 手术组大鼠同其 20 周龄时对比：皮层、双侧纹状体（尾壳核）、前联合、双侧伏隔核、胼胝体（小钳）FA 值下降（$p<0.05$）；同对照组相比，SHR 手术组大鼠 20 周龄时桥脑、胼胝体、内囊 FA 值下降（$p<0.05$）；28 周龄时桥脑、右侧下丘脑中央核、双侧海马、胼胝体、左侧纹状体 FA 值下降（$p<0.05$）。病理学发现 SHR 手术组、非手术组大鼠海马区锥体细胞排列紊乱、数量减少，尼氏小体溶解、消失，海马轴突染色变浅、数量减少，胼胝体区神经纤维束排列稀疏、数量减少。**结论** 通过纵向研究观察发现自发性高血压认知障碍大鼠胼胝体、纹状体、海马、桥脑的 FA 值存在不同程度下降，提示该区域微观白质变化有助于脑小血管病认知障碍的早期诊断。

PU-0621
功能磁共振 VBM 技术在肝硬化轻微型肝性脑病中的应用价值

汪涛,王建萍,戚乐
杭州师范大学附属医院

资助基金项目：
1、杭州市卫生科技计划一般（A）类项目 2017A14；
2、浙江省医药卫生一般研究计划项目 2018KY587；
3、杭州市农业与社会发展科研自主申报项目 20191203B101。

摘要：目的 利用基于体素的形态学测量分析（VBM）技术探讨肝硬化背景下轻微型肝性脑病（MHE）患者脑微观结构的变化，为 MHE 早期诊断提供参考价值。 **方法** 纳入被试 40 例 ，包括 20 例 MHE 患者及 20 例正常人，用 3.0T 磁共振获得高分辨率三维 T1WI 序列，利用 MATLAB 下 SPM8 内置工具包 VBM8 软件对扫描获得的图像进行处理，而后对 MHE 组和对照组的全脑灰质体积进行统计，比较其灰质体积的差异。 **结果** 与对照组比较 ，MHE 组双侧壳核、杏仁核、海马及海马旁回等脑区灰质体积明显减少；双侧丘脑灰质体积明显增加（FWE 校正，$P<0.05$）。而对照组、MHE 组的灰质体积变化与 NCT-A 时间、DST 评分之间无显著相关性（FWE 校正，$P<0.05$）。 **结论** VBM 技术能检测肝硬化患者脑微观结构的改变，可能有助于早期诊断 MHE。

PU-0622

MRI 对帕金森病患者丘脑底核可视化扫描的初步研究

刘凌翀,李伟
山东第一医科大学第一附属医院（山东省千佛山医院）

目的 探讨并对比研究丘脑底核（STN）的 MRI 最佳直视化扫描序列。 **方法** 对 20 例正常人及 20 例帕金森病（PD）患者深部脑电刺激术（DBS）前进行扫描，与以往常规序列对比，半定量分析各种扫描序列对于 STN 显示的情况，术后复查并确认患者微电极记录（MER）电极探针位置。 **结果** T2*flash2D 和 T2-SPACE、QSM、SWI 序列半定量评分高于常用的 T1-mprage、T2-TSE 序列及 FLAIR 序列， 并与患者术中 MER 确定的电极探针位置有较高的一致性。 **结论** 使用 T2*flash2D 和 T2-SPACE、QSM、SWI 序列可以准确预定靶点位置，能够提高定位精确度，避免并发症，提高手术效率。

PU-0623

无症状性基底动脉粥样硬化斑块的分布特征

王旭超
哈尔滨医科大学附属第一医院

目的 无症状性基底动脉粥样硬化斑块的分布尚不明确，本研究旨在通过三维高分辨磁共振成像探索无症状性基底动脉粥样硬化斑块的分布特点。
方法 回顾性分析哈尔滨医科大学附属第一医院 HR-MRI 数据库的无症状性基底动脉粥样硬化斑块患者，采用四分法将斑块分为腹侧壁，左侧壁、右侧壁和背侧壁，统计患者各个壁的分布情况。
结果 研究共纳入无症状性基底动脉粥样硬化患者 30 名，斑块横向分布以多象限受累为主，分布最多的是腹侧壁。
结论 无症状性基底动脉粥样硬化斑块患者较多分布在腹侧壁，以多象限受累为主。采用三维高分辨磁共振成像分析基底动脉斑块分布有助于揭示颅内动脉粥样硬化的发展过程和评估缺血性卒中的风险。

PU-0624

急性脑梗死与颈动脉粥样硬化斑块的相关性

陈薇,叶天和,张炜
华中科技大学同济医学院附属协和医院

目的 运用我院 3.0T 磁共振进行高分辨 MRI 成像技术，分析颈动脉粥样硬化斑块的组成成分，探讨脑梗死与颈动脉粥样硬化斑块的相关性。
方法 选取自 2017 年 9 月到 2019 年 3 月期间因脑血管病于我院就诊的患者 37 名。患者躁动、患有幽闭恐惧症、体内安装起搏器、有脑动脉瘤夹及心脏瓣膜置换术后的患者由于是 MRI 禁忌，均不在本研究之列。使用西门子 3.0T MRI 扫描机，应用 16 通道头颈部相控阵表面线圈和心电门控，对患者双侧颈动脉进行扫描，结合 3D TOF 亮血、T1 space、T2 space、 T1WI、T2WI 、PDWI 及增强序列对扫描结果进行分析，判定颈动脉斑块的组成成分。采集患者发病后血压、血糖、血脂等实验室检查资料，记录患者既往高血压史、糖尿病史、吸烟史等危险因素。应用 P 检验分析比较患者的年龄、性别、血压、血脂、糖尿病、吸烟、体重指数等危险因素与斑块组成成分的相关性。P<0.05 具有统计学意义。
结果 急性与非急性脑梗死，基线对比，两组性别、生化指标没有统计学差异，年龄、LDL、HDL、甘油三酯、总胆固醇与急性脑梗死相关，p 值分别为 0.121、0.469、0.070、0.452、0.213。年龄、狭窄程度与急性脑梗死相关，其中急性脑梗死的平均年龄 54 岁，狭窄程度约 25%；非急性脑梗死的平均年龄 64 岁，狭窄程度约 27.5%，年龄、狭窄程度的 P 值分别为 0.013、0.788。糖尿病、高血压与急性脑梗死相关，P 值分别为 0.478、1.000。斑块溃疡、斑块强化、斑块出血、纤维帽、脂质核心与急性脑梗死相关，P 值分别为 1.000、0.447、1.000、0.721、0.027。急性脑梗死患者中脂质核心发病率更高。
结论 高分辨 MRI 可清晰显示颈动脉粥样斑块的内部成分，为急性脑血管病的预防和治疗提供一种新的科学依据，且年龄、斑块内脂质坏死核心与急性脑梗死有密切相关性。

PU-0625
弥漫中线胶质瘤伴 H3 K27M 突变，6 例影像报道及文献复习

李建瑞, 张志强,刘宵雪,骆仲强,卢光明
中国人民解放军东部战区总医院

目的 探索弥漫中线胶质瘤伴 H3 K27M 突变的 MR 影像学特征。
方法 回顾性分析经免疫组化及分子基因测序证实为 H3 K27M 突变的弥漫中线胶质瘤 6 例患者的临床、影像及病理学表现。
结果 本组研究共 6 例患者。男性 4 例，女性 2 例，年龄 10-60 岁；均位于脑中线区附近：下丘脑 1 例，延髓 2 例，丘脑 3 例；4 例（67%）T1WI 呈稍低信号、T2WI 呈等信号，6 例（100%）DWI 呈等-稍高信号、伴裂隙样囊变；33%（2 例）瘤内出血，4 例（67%）显著强化，所有肿瘤均呈不均质强化，且边界不清、瘤周无水肿，4 例（67%）在 ASL 上呈高灌注；术中提示 5 例（83%）血供丰富。术中肿瘤均未实现全切，术后辅助同步放疗和化疗。术后组织学病理诊断为低级别胶质瘤 3 例，高级别胶质瘤 3 例，免疫组化 H3 K27M 强阳性表达、H3F3A 基因 K27M 突变 6 例（100%），IDH1 野生型 6 例（100%），MGMT 启动子甲基化阴性 5 例（83%）。
结论 本组弥漫中线胶质瘤伴 H3 K27M 突变在 MRI 的典型表现为：①脑中线部位、弥漫性生长，②T2WI 及 DWI 等信号多见，增强后不均质强化，③瘤内裂隙样囊变、瘤周无或轻度水肿，④不均匀高灌注、Cho/NAA＞2。如遇到影像符合以上表现的肿瘤时，则强烈建议加做 H3 K27M 的免疫组化或分子病理检测。

各向同性三维磁共振扫描技术在视神经脊髓炎中的应用

韩玉娟,杨剑,温鹏
天津市第三中心医院

目的 视神经脊髓炎（NOM）是视神经与脊髓同时或相继受累的急性或亚急性脱髓鞘病变，又称 Devic 病或 Devic 综合症，其临床特征为急性或亚急性起病，单眼或双眼失明，前后数周伴发横贯性或上升性脊髓炎。该病是神经内科疾病，属于中枢神经系统脱髓鞘疾病的一种，临床表现多样，主要累及视神经及脊髓。本研究主要观察患者视神经受累后，其视神经厚度变化与正常人的对比分析。
材料与**方法** 自 2017 年 10 月至 2018 年 10 月扫描 20 例临床诊断为视神经脊髓炎的患者及 20 例志愿者，采用各向同性的三维磁共振扫描技术，轴位采集图像，范围应将双侧眼眶扫描完整，在后处理工作站对图像进行后处理，沿双侧视神经长、短径方向分别行斜矢状位及斜冠状位重建，在重建的图像上分别测量同一位置处的截面面积，两次测量数值取平均值。志愿者对照组采用完全一致的方法，测得视神经截面积数值，并进行组间对比分析。
结果 视神经脊髓炎患者的视神经截面积明显小于志愿者的视神经截面积，具有统计学差异。
结论 MRI 具有软组织分辨率高、无辐射、任意断面成像等特点,特别是近年来扫描技术的发展,能清楚显示视神经解剖细节和微小病变,是视神经病变的最佳影像检查方法。视神经的走形方向与各轴线间均存在夹角,，用常规 MRI 扫描方式,需要对两侧视神经进行多次、多角度的序列才可以完成，增加了操作步骤，延长了扫描时间，患者长时间扫描难免因头部移动而造成运动伪影，从而影响测量数据的准确性。三维磁共振扫描通过一次扫描完成双侧轴位视神经的图像采集，再经过后处理技术，可以多角度观察视神经，具有分辨率高、采集时间短，患者易于配合的优点。

PU-0628
胎儿小耳畸形的 MRI 表现

王团团[1],王光彬[1]
1.山东省医学影像学研究所
2.山东大学

目的 探讨胎儿小耳畸形的 MRI 表现。
方法 对山东省医学影像学研究所超声疑诊胎儿小耳畸形的 13 例孕妇行胎儿外耳 MRI 检查，包括真实稳态进动快速成像（True FISP）及半傅里叶采集单次激发快速自旋回波（Haste），分析胎儿小耳畸形的 MRI 表现，包括耳廓大小、形态、位置及颅耳角。
结果 13 例孕妇，共检出胎儿 13 例：双侧小耳畸形 3 例，单侧小耳畸形 10 例（左侧 3 例，右侧 7 例）。畸形耳廓在 MRI 上表现为体积减小、形态失常呈团块状、颅耳角增大，但耳廓位置相对正常。
结论 胎儿小耳畸形具有相对特征性的 MRI 表现，能对其作出正确诊断，为产前咨询提供指导意见。

PU-0629

基于 3. 0T 高分辨磁共振颅内血管壁成像技术对基底动脉粥样硬化斑块与后循环脑梗死关系的研究

王艳
宝鸡市中心医院

〔摘 要〕 目的 运用 3. 0T 高分辨磁共振颅内血管壁成像技术(HRMRI-VWI)，分析无症状性基底动脉粥样硬化斑块的形态学特征，研究其与后循环脑梗死的关系，进一步为临床工作提供有价值的信息。方法 在我院行磁共振血管成像(MRA) 发现基底动脉轻中度粥样硬化狭窄患者 60 例，均做高分辨磁共振颅内血管壁成像（HRMRI-VWI），有斑块者 45 例，然后对这些有斑块患者做磁共振头颅平扫及 DWI 检查，将患者分为两组，30 例急性联合亚急性梗死患者(A 组) 、15 例慢性及无梗死患者(B 组)，分析斑块的形态特点，研究其与后循环梗死的相关性。结果 通过分析斑块成分特征，30 例 A 组中 23 例患者斑块为不稳定斑块，7 例为稳定斑块，15 例 B 组中 10 例患者斑块为稳定斑块，5 例为不稳定斑块，得出差异有统计学意义(P ＜ 0. 005) 。结论 基于 3. 0T 高分辨磁共振颅内血管壁成像技术（HRMRI-VWI）通过对无症状性基底动脉粥样硬化斑块分析，可以预测后循环脑梗死患者，为临床工作提供有价值信息。

PU-0630

Resting-State Functional Magnetic Resonance Imaging Study of Characteristics of Brain Function and Structure in Early

Heyi Gu,Xuejin SUN ,Wei ZHAO,Yi LU,Yin MO
the First Hospital of Kunming Medical University

[Abstract] **Objective** Using resting-state functional magnetic resonance imaging(Rs-fMRI), we explored characteristics and significance of spontaneous brain activity in early Parkinson's disease (PD. **Methods** 29 patients with early PD (PD group) and 30 matched healthy controls(HC) underwent resting-state fMRI scanning.Methods of ALFF, ReHo and rsFC were used to analyze the state of brain functional activity in resting state of early PD. For Rs-fMRI data between groups we adopted the method by which was based on voxel two sample *t*-test with REST software.Using the partial correlation analysis to observe the UPDRS score and different brain regions of early Parkinson's disease patients.Both the differences of data were expressed by the international generic statistical parametric mapping. **Results** Compared with the HC group, mALFF in PD group decreased in the bilateral postcentral gyrus, posterior cingulate gyrus, middle occipital gyrus and cerebellum posterior lobe;left primary motor cortex, fusiform gyrus, inferior occipital gyrus, cuneus, lingual gyrus,;right superior parietal lobule; increased in the bilateral insula, right putamen and the right cerebellum anterior lobe .The left cuneus was negatively correlated with UPDRS score;the average activation strength of these regional in PD group decreased in the bilateral primary motor cortex, supplementary motor cortex, postcentral gyrus and anterior cingulate gyrus;left middle frontal gyrus, middle occipital gyrus and

precuneus;increased in the left insula and right middle temporal gyrus.These different brain regions were no correlated with UPDRS score. When the bilateral putamen as the regions of interest,compared with the HC group,PD group exhibited decreased rsFCs in left and right putamen; the bilateral anterior cingulate gyrus, inferior frontal gyrus;left middle frontal gyrus and superior temporal gyrus;increased rsFCs in the bilateral primary motor cortex, postcentral gyrus and left medial frontal gyrus. **Conclusion** The early PD patients had a wide range of the loss of brain neurons function, It may be a complex neuropathological basis for PD multi system involvement.

MRS 对儿童 OSAHS 脑代谢变化的初步研究

王婷婷
滨州市中心医院

目的 用磁共振波谱(magnetic resonance spectroscopy, MRS)探讨儿童阻塞性睡眠呼吸暂停低通气综合征（OSAHS）大脑代谢及功能的变化。**方法** 对 20 例 OSAHS 患者和 20 例正常者（NC）行磁共振波谱扫描和多导睡眠呼吸监测（PSG），记录两组双侧额叶脑白质的 NAA/Cr、NAA/Cho、Cho/Cr 比值和有无乳酸（Lac）的出现；并记录两组 PSG 监测指标。采用两独立样本 t 检验分析两组代谢物及 PSG 监测指标的变化, OSAHS 组双侧额叶脑代谢物与 PSG 监测指标进行线性相关性分析。**结果** OSAHS 组 NAA/Cr、NAA/Cho（2.1925±0.1437、1.5861±0.1713）较对照组（2.7901±0.1437、1.9745±0.1632）明显降低（P 值分别为 P＜0.0001、P=0.0001），Cho/Cr（1.2937±0.1352）较对照组（1.1823±0.1925）明显升高（P=0.0031），差异具有统计学意义(P 值均＜0.05)。各被测者均未见 Lac 峰。OSAHS 组的 AHI 与双侧额叶 NAA/Cr、NAA/Cho 呈负相关（r 值分别为-0.635、-0.617，P 值分别为 0.003、0.004），而与 Cho/Cr 无相关性（r=0.029，P=0.904），$MSaO_2$与双侧额叶 NAA/Cr、NAA/Cho 呈正相关（r 值分别为 0.630、0.640，P 值分别为 0.001、0.002），而与 Cho/Cr 无相关性（r=0.008，P=0.974）。**结论** *^1H-MRS* 能较早监测儿童 OSAHS 脑代谢的变化，为临床治疗和效果评价提供客观的影像学依据。

PU-0632

全脊柱磁共振成像诊断脊柱脊髓病变的价值

田传帅,胡安宁,刘广月,张冰,施健,杨尚文,王坤,张庆雷
南京大学医学院附属鼓楼医院

目的 探讨全脊柱磁共振成像诊断脊柱脊髓病变的价值。
方法 使用 Philips Achieva 1.5T 双梯度超导磁共振成像系统和全神经系统组合线圈，对 78 例脊柱脊髓病变的患者进行全脊柱磁共振扫描，分析研究得到的磁共振图像。
结果 图像质量：75 例图像显示较好，2 例显示欠佳，1 例运动伪影，图像显示良好率占 96.2%。磁共振表现：本组 78 例病例中，其中正常 8 例，转移瘤 12 例, 外伤 16 例, 脊柱侧弯伴脊髓空洞 19 例，脊柱结核 3 例,脊髓肿瘤 5 例,炎症 4 例, 椎间盘病变 11 例。
结论 全脊柱磁共振成像能够清楚显示脊柱脊髓本身及周围的病变情况，对脊柱脊髓病变的诊断及后续治疗等具有重要的价值。

PU-0633

MSDE 准备后的 T1-FEE 增强序列对脑转移瘤的诊断效能的评估

陈珏屹,汪晶,孔祥闯,迟彬,柳佳
华中科技大学同济医学院附属协和医院

目的 通过与常规 T1-FEE 序列增强扫描对比，评价运用了磁共振黑血运动致敏驱动平衡改良技术（improved motion sensitized driven equilibrium, iMSDE）的增强扫描序列对于脑转移瘤的诊断效能。
方法 对 15 名怀疑或诊断为有脑转移瘤的病人，运用场强为 3.0T 的飞利浦 CX 磁共振机器，进行 T1-FFE-无 iMSED 准备序列增强扫描、T1-FFE-iMSDE 准备序列增强扫描。3 位放射诊断医生快速、独立对上述三项序列进行阅片，独立判定患者脑转移瘤的数量。通过灵敏度、特异度、读片时间评价三个序列的诊断效能。
结果 15 名患者均存在脑转移瘤，共发现 125 个转移瘤。T1-FFE-non iMSDE 增强、T1-FFE-iMSDE 增强对于脑转移瘤的的敏感度分别为 83%、100%，特异度分别为 100%、93%，平均每个病人快速读片时间为 81 秒、72 秒，三项评价指标有统计学差异。
结论 应用了 iMSDE 准备的增强扫描序列，相对没有应用的，有更高的灵敏度，能帮助阅片医生发现更多的脑转移瘤，并节约阅片时间。但是其假阳性率较高，需要进一步优化序列设置。

PU-0634

Histogram analysis of apparent diffusion coefficient maps for WHO grade II/III glioma molecular subtyping

Hong Guo
Daping Hospital, Army Medical University

Purpose: To explore the role of histogram analysis of apparent diffusion coefficient (ADC) maps based on entire tumor volume data in differentiating molecular subtyping of WHO grade II/III glioma. **Materials and Methods:** Twenty-one patients underwent diffusion weighted magnetic resonance imaging with b values of 1000, and the corresponding ADC maps were calculated. Regions of interest containing the lesion were drawn on every section of the ADC map containing the tumor and were summated to derive volume-based data of the entire tumor. Histogram parameters were compared among subtypes. Receiver operating characteristic (ROC) curves were constructed to research the value of histogram parameter in differentiating subtypes. **Results:** The 25th, 50th and 75th percentiles of ADC values showed significant differences between IDH mutant & 1p19q intact type and IDH mutant & 1p19q co-deleted type, IDH wild type ($p<0.05$). The 25th, 50th and 75th percentiles of ADC values were highest in IDH mutant & 1p19q intact gliomas ($1312\times10^{-6}mm^2/sec$, $1629\times10^{-6}mm^2/sec$, $1889\times10^{-6}mm^2/sec$), while the first two values before showed lowest in IDH-wild type ($874\times10^{-6}mm^2/sec$, $1156\times10^{-6}mm^2/sec$). ADC histograms of IDH wild type showed a higher relative frequency at low ADCs compared with IDH mutant 1p19q co-deleted and 1p19q intact gliomas. The left shift of the cumulative histograms of it was more obvious. The 50th and 75th percentile of the ADC values histogram were accurate in differentiating IDH mutant & 1p19q intact and IDH wild type ($p<0.05$). **Conclusions:** Histogram analysis of ADC maps based on entire tumor can be a useful tool for WHO grade II/III glioma molecular subtyping. The 50th

and 75th percentile of the ADC value were valuable parameters for differentiating subtyping in grade II/III gliomas.

PU-0635
室管膜下巨细胞星形细胞瘤的影像学及病理学特征：附 1 例报告并文献复习

林姗,曹代荣
福建医科大学附属第一医院

目的 报告一例室管膜下巨细胞星形细胞瘤的影像表现及病理特征，以提高对脑内少见肿瘤的诊断与鉴别诊断。
方法 回顾性分析我院诊治的 1 例室管膜下巨细胞星形细胞肿瘤患者的临床、影像学及病理资料，并复习相关文献。
结果 该例患者入院前 10 天无明显诱因出现双颞叶针刺样疼痛，MR 示病灶位于双侧侧脑室前角，呈不规则团块状稍长 T1 稍长 T2 信号影，Flair 呈高信号，DWI 呈高信号，ADC 呈低信号，其内信号不均匀，内见结节状低信号影及斑片状更长 T2 信号影，病灶呈分叶状，增强后呈明显不均匀强化。本例患者行开颅病灶切除术，术后病理诊断为室管膜下巨细胞星形细胞瘤，肿瘤为边界清楚的结节生长模式，内见大量薄壁血管，瘤细胞围绕血管生长，部分胞浆丰富，部分细胞为梭形细胞，局部呈节细胞形态。术后随访 5 月余，未见肿瘤复发、进展或转移，患者自觉良好。
结论 室管膜下巨细胞星形细胞瘤是一种中枢神经系统的罕见良性肿瘤，典型的发生在侧脑室壁，WHO 分级为Ⅰ级。细胞形态学多样，诊断时需要与肥胖型星形细胞瘤、节细胞胶质瘤、胶质母细胞瘤、室管膜瘤、横纹肌样脑膜瘤等鉴别。

PU-0636
脑缺血病变中反应性星形胶质细胞增生的常规及功能磁共振成像研究

郑冲霄
天津市第三中心医院

摘要: 目的 研究脑缺血性病变中星形胶质细胞增生的磁共振成像(MRI)及功能磁共振成像 表现，并分析其特征以提高对该病的诊断价值。方法 回顾性分析 2018 年 1 月至 2019 年 1月经手术及病理检查证实、且有完整病程记录的缺血性脑血管病伴星形胶质细胞增生患者 20 例的 MRI 表现。症状为头痛、头晕 15 例，面部肌肉抽搐 1 例，反复发作性意识丧失 4 例。扫描设备用 GE Sigma 3.0 T MR 扫描仪，均行常规 MRI 、增强 MRI 扫描、功能成像弥散加权成像（DWI）、检查灌注加权成像（PWI）检查。结果 20 例患者中，病变位于右侧额叶和左侧颞叶各 5 例，左侧额叶 6 例，脑桥 1 例和右侧小脑半球 3 例。临床表现为轻度缺氧缺血细胞凋亡主要局限于皮质下白质，星形胶质细胞增生持续较久；重度缺氧缺血可致缺血侧大脑半球广泛的细胞凋亡，星形胶质细胞增生短暂且强烈。组织学表现为神经节细胞变性、神经细胞嗜节现象及胶质细胞增生。MRI 显示，病灶表现为皮质或皮质下脑组织肿胀，呈片状或条状略长 T1、长 T2 信号; 在 FLAIR 序列上病灶呈略高信号，增强扫描轻度强化，DWI 显示为稍高信号，PWI 大部分区域无血流灌注或显著低灌注。结论 MRI 及其功能序列对脑胶质细胞增生的诊断正确率较高且能综合多序列影像，对脑胶质细胞增生的基础和临床研究具有一定的指导作用。

PU-0637

Altered interhemispheric resting-state functional connectivity in type 2 diabetes patients

lin lin,Jianlin Wu
Affiliated Zhongshan Hospital of Dalian University

Purpose: Abnormalities in structural and functional brain connectivity have been increasingly reported in Type 2 diabetes mellitus (T2DM) patients by recent neuroimaging studies. However, few studies used voxel mirrored homotopic connectivity method to investigate the changes of homotopic connectivity in T2DM. The present study aims to examine the interhemisphere functional connectivity of the whole brain in T2DM during resting-state.
Method: Resting-state functional MRI data was acquired from 29 T2DM and 33 gender-and age-matched control subjects. Indices of interhemispheric homotopic functional connectivity were derived with voxel-base whole-brain voxel-mirrored homotopic connectivity (VMHC) analysis. Pearson correlation analyses were used to explore the correlations between interhemispheric homotopic functional connectivity changes and clinical and cognitive variables of T2DM.
Results: The patients with T2DM showed lower VMHC than normal controls in the medial frontal gyrus, superior occipital gyrus, posterior cingulated cortex, lingual gyurs. There were significant correlations between the VMHC values in medical frontal gyrus, lingual gyurs and verbal fluency test.
Conclusion: These findings suggest substantial impairment of interhemispheric coordination in T2DM, which was positively correlated with cognitive function. Our results might provide powerful new insight into the neural mechanisms that underlie the diabetes-related cognitive decline.

PU-0638

应用 APT 成像鉴别高级别胶质瘤和颅内转移瘤

魏平
山东省医学影像学研究所

目的 研究酰胺质子转移成像对颅内转移瘤和高级别胶质瘤的鉴别诊断
方法 对 2017 年 7 月-2019-5 月在山东省医学影像研究所行 MRI 检查并对病变最大横截面行 APT 成像的 50 里颅内转移瘤和高级别胶质瘤患者，对肿瘤区域勾画瘤体区、瘤周水肿区及对侧正常脑白质区域的非对称磁化转移率（MTR 值）。应用受试者特征曲线比较两者之间的区别。
结果 高级别胶质瘤的瘤体区的 MTR 值高于转移瘤的瘤体区，瘤周水肿区的 MTR 值没有明显差异。
结论 应用 APT 成像能够一定程度上鉴别高级别胶质瘤和转移瘤。

PU-0639

ASL 对脑星形细胞瘤分级辅助应用

秦江彦,冯天保
延安大学附属医院

目的 探讨动脉自旋标记成像（ASL）灌注成像技术在星形细胞瘤分级中的应用价值。
方法 前瞻性选取医院收治颅内星形细胞瘤患者 20 例，其中 10 例高级别星形细胞瘤、10 例低级别星形细胞瘤患者。选取星形细胞瘤实质部分、对侧脑实质部分测定 r CBF，分析星形细胞瘤与正常脑组织差灌注情况及不同脑肿瘤的 ASL 灌注情况。
结果 ASL 灌注成像技术所得 r CBF 定量参数在星形细胞瘤较正常脑组织 r CBF 均有所增高，高级别星形细胞瘤较低级别星形细胞瘤 r CBF 增高更为明显。
结论 ASL 能定量反应肿瘤微循环的灌注情况，与 MRI 常规序列联合应用，多模态影像观察，对脑肿瘤定性诊断以及星形细胞瘤分级有重要参考价值。

PU-0640
产后妇女自发性神经元活动受损和认知功能障碍的关系

郑金霞
南京市妇幼保健院

目的 先前的研究已经证明产后期与认知功能障碍的风险增加有关。本研究旨在使用静息态功能磁共振成像（rs-fMRI）探讨无抑郁症的产后妇女是否存在自发性神经元活动受损以及确定这些异常和认知功能障碍之间的关系。**材料与方法** 使用 rs-fMRI 对产后妇女（n = 22）和未生育女性（n = 23）年龄和教育匹配方面进行了比较。我们计算低频震荡振幅（ALFF）和局部一致性（ReHo）值来评估自发性神经元活动以及确定 rs-fMRI 信息和认知能力之间的关系。**结果** 和未生育女性相比，产后妇女有显著异常的神经活动，主要是在后扣带回（PCC）、前额叶和小脑后叶。后扣带回 ALFF 和 ReHo 值降低与产后延迟复杂图形测试（CFT）得分呈正相关（分别 r = 0.693，P = 0.001；r = 0.569，P = 0.011）。此外，右侧额上回 ALFF 和 ReHo 值降低与画钟实验（CDT）得分呈正相关（分别 r = 0.492，P = 0.033；r = 0.517，P = 0.023）。**结论** ALFF 及 ReHo 测量反映的产后妇女自发性脑活动异常可能阐明产后认知障碍的神经生理机制。

PU-0641
颅内孤立性纤维瘤 MRI 特征及良恶性鉴别诊断

李沁梅
广州医科大学附属第二医院

孤立性纤维瘤是一种极少见的来源于软组织的间叶源性肿瘤，占软组织肿瘤的比例低于 2%，原发于颅内的孤立性纤维瘤(I-SFT）尤为罕见。笔者分析了 6 例颅内孤立性纤维瘤的 MR 影像学资料及病理资料，以提高该病诊断水平。
资料与**方法** I-SFT 病例 6 例，男 2 例，女 4 例。初次发病年龄 23-71 岁，平均约 47 岁。临床症状有反应迟钝、头痛、肢体乏力、视力进行性下降、呕吐、记忆力下降等，病程为 5 天至半年。6 例 I-SFT 均行外科开颅手术，手术证实病灶均起源于硬脑膜。MR 扫描**方法** 6 例 I-SFT 患者均采用 GE signal1.5T TWEEN SPEED 超导磁共振仪行 MRI 平扫及增强扫描。平扫采用横轴面、矢状位，扫描参数 T1WI(TR1700ms、TE8ms)、T2WI(TR4500ms、TE100ms)，扫描层厚 5.0mm，层间距 1.5mm。增

强扫描采用 T1WI 序列（TR300ms、TE1.9ms）行磁共振轴位、冠位及矢位增强扫描。影像分析**方法** 由两位有经验的副主任及以上医生进行磁共振征象诊断，判断肿瘤位置、大小（平均径线=（轴位最长径+最长径垂直径）/2）、信号、边界、增强程度、增强是否均匀、瘤周水肿程度、瘤内囊变、瘤内血管、脑膜尾征、颅骨或邻近结构改变。
结果 6 例 I-SFT 中，良恶性肿瘤各 3 例。肿瘤发生在幕上 5 例，跨越幕上及幕下 1 例。I-SFT 的 MRI 表现具有一定的特征性，当脑膜肿瘤呈分叶状，T2WI 信号欠均匀、增强后显著不均匀强化、特别是出现典型的“阴阳征”，脑膜尾征无或者不典型，肿瘤内见多发迂曲血管流空征象应考虑到 I-SFT 可能。根据肿瘤的部位、大小、信号、增强程度、脑膜尾征、瘤周水肿、瘤内囊变、瘤内血管等影像学征象难以判定肿瘤良恶性，如肿瘤边界不清、合并颅骨或邻近结构破坏提示恶性可能。
结论 颅内孤立性纤维瘤具有一定的 MRI 特征，但其确诊及良恶性鉴别仍需依靠组织病理学和免疫组织化学。

PU-0642

卒中后癫痫的 DKI 成像研究

苗燕平,赵盛
内蒙古医科大学附属医院

摘要：目的 探讨扩散峰度成像（DKI）对于卒中后癫痫患者的脑白质微观结构受损情况的评估。**方法** 选取符合纳入标准的 PSE 患者（病例组， n ＝39）及与之相匹配的梗塞后无癫痫者（对照组， n ＝39）作为对照组。DKI 数据分析采用 DKE 后处理后的图像划取感兴趣区测值的方法，应用 IBM SPSS25.0 将相关组内及组间参数值进行比较及相关性分析。**结果** 病例组：右侧壳核、右侧内囊前肢、后肢的 MD 值大于左侧；右侧壳核、右侧内囊前肢的 MK 值右侧大于左侧，右侧丘脑的 MK 值小于左侧；FA 值各区域间无明显统计学差异；对照组：右侧丘脑 FA 值小于左侧；右侧内囊前肢、后肢、右侧海马、右侧丘脑、右侧壳核 MD 值大于左侧；右侧壳核 MK 值大于左侧。**结论** 扩散峰度成像（DKI）可通过参数值的明显变化，进而更加敏感地检测出微细结构损伤及其偏侧性损伤。

PU-0643

卒中后癫痫的静息态脑功能磁共振成像研究

苗燕平,赵盛
内蒙古医科大学附属医院

摘要：**目的** 探讨静息态脑功能成像（rsfMRI）对于卒中后癫痫患者的脑白质微观结构受损情况的评估。**方法** 选取符合纳入标准 rsfMRI 的 PSE 患者（病例组， n ＝39）及与之相匹配的梗塞后无癫痫者（对照组， n ＝39），进行 rfMRI 成像采集数据，rsfMRI 分析采用静息态脑功能数据辅助处理（REST）及 SPM 方法。**结果** 双侧额叶、右侧海马、双侧内囊前肢 ALFF 值较对照组高。双侧枕叶、顶叶 ALFF 值病例组较对照组低；双侧额叶、颞叶、内囊前肢 ReHo 值病例组较对照组高，双侧枕叶、双侧小脑半球 ReHo 值病例组较对照组低。**结论** 静息态功能磁共振成像 rsfMRI 采用 ReHo、ALFF 算法可检出卒中后癫痫造成的局部脑组织血氧水平依赖信号同步性的改变，进而可以确定 PSE 潜在的致痫灶。

PU-0644

MR 血氧水平依赖成像评估兔 VX2 瘤转移性淋巴结放射性治疗反应的可行性研究

杜亚楠, 俞胜男,丁玖乐
常州市第一人民医院

目的探讨 MR 血氧水平依赖成像评估兔 VX2 瘤转移性淋巴结放疗后反应的可行性。**方法** 28 只健康新西兰大白兔建立 VX2 瘤腘窝转移性淋巴结模型，分为放疗组（n = 16）和对照组（n = 12）。放疗组接受 20Gy 放疗，对照组接受假放疗。所有实验兔于放疗前（0 天）及放疗后 3、7、14 天（4 个时间点）行 MRI 扫描，测量参数：淋巴结的大小和 R_2^*值（s^{-1}）。在各时间点，每组随机处死两只实验兔，取腘窝淋巴结行病理学检查，分析参数：微血管密度（MVD，单位：条/高倍视野）和凋亡指数（AI（%））。比较两组间，以及组内各时间点间参数的差异，分析淋巴结大小和 R_2^*值分别与 MVD 及 AI 的相关性。**结果** 淋巴结的大小在两组间、组内 4 个时间点间均无显著差异（P均 > 0.05）。放疗组淋巴结在 0、3、7 和 14 天的 R_2^* 值呈逐渐升高趋势；MVD 呈逐渐减少趋势；AI 呈逐渐增加趋势。对照组淋巴结 R_2^* 值和 AI 在 4 个时间点间均无明显变化，但 MVD 呈逐渐增加趋势。两组间淋巴结的 R_2^* 值和 MVD 在 3、7、14 天有显著差异，而 AI 在 7、14 天有显著差异（P均< 0.05）。淋巴结 R_2^*值，而不是淋巴结的大小，分别与 MVD 及 AI 有显著相关性（r 分别为-0.87 和 0.94）。**结论** MR 血氧水平依赖成像间接反映放射性治疗后转移性淋巴结内部乏氧状态，具有潜在的评价放射性治疗反应的价值。

PU-0645

失神癫痫发放状态切换下的脑功能梯度改变

许强,郝竞汝,谢心瑀,张志强,卢光明
中国人民解放军东部战区总医院

目的 失神癫痫是儿童常见的癫痫类型，其特征为发作状态下失去意识。脑功能梯度方法是当前有效刻画脑内信息通路等级信息的技术。前人研究发现长期的疾病状态下患者的脑功能等级梯度被显著破坏。脑功能梯度的改变能否在状态切换中依然体现尚未可知。本研究采用同步 EEG-fMRI 扫描技术，结合脑功能梯度处理手段，尝试验证失神癫痫患者的状态切换下的脑功能梯度改变趋势，为失神癫痫的病理生理机制提供有效信息。
材料与**方法** 研究纳入 15 例失神癫痫患者。被试采集同步 EEG-fMRI 和高清结构 T1 图像。由有经验的神经科脑电图医生进行判读，每个被试均截取失神发作和无失神发作各一段。数据预处理采用 fmriprep 平台进行，主要完成了时间校正，头动校正，ICA 噪声去除。随后滤除白质和脑脊液平均信号，并行带通滤波（0.01-0.1Hz）。最终配准到 freesurfer 空间。采用皮尔逊相关构建全脑 vertex 水平的功能连接，采用 MICAOPEN 软件包计算被试的脑功能梯度。采用两样本 T 检验对发作状态和未发作状态的脑梯度进行统计分析。
结果 在发作状态和未发作状态中均发现了前人研究的脑主梯度分布图。在发作状态下，主梯度的低级网络脑区梯度增加（枕叶区域），高级网络梯度降低（默认网络/后扣带回、前额叶）。从总体梯度的分布来看，发作状态下，梯度分布整体向高梯度偏移。
结论 本研究初步研究了失神癫痫患者在癫痫发放状态切换中脑功能梯度的改变情况，发现发作状态脑整体向高级网络偏移，高级网络的信息集中优势受到抑制，这可能与意识丧失有关。本研究为失神癫痫的脑活动机制提供了一些客观指针。

MRI 扩散加权成像鉴别兔良恶性淋巴结实验研究

杜亚楠, 俞胜男 ,陈蕾
常州市第一人民医院

目的 探讨扩散加权成像（diffusion weighted imaging，DWI）鉴别良恶性淋巴结的价值。**方法** 32 只健康新西兰大白兔，随机分为两组（每组 16 只），分别建立良性（16 个淋巴结）和恶性淋巴结（16 个淋巴结）模型。对所有实验兔均行 MRI 检查。在淋巴结最大层面上选取感兴趣区，获得淋巴结表观扩散系数（$ADC_{lymph\ node}$）；同时测量同层肌肉的 ADC 值（ADC_{muscle}），计算相对 ADC(rADC = $ADC_{lymph\ node}/ADC_{muscle}$)。采用两独立样本 t 检验分别比较良、恶性淋巴结 ADC 值与 rADC 值的差异；采用受试者工作特征曲线（ROC 曲线）分析 ADC 及 rADC 定性诊断淋巴结的效能。**结果** 良、恶性淋巴结在 DWI 上均表现为相对高信号。良、恶性淋巴结 ADC 值分别为（0.92 ± 0.13）× 10^{-3} mm^2/s^{-1}和（0.76 ± 0.08）× 10^{-3} mm^2/s^{-1}；良、恶性淋巴结 rADC 值分别为 0.71 ± 0.05 和 0.63 ± 0.05，良、恶性组淋巴结的 ADC 值及 rADC 值差异均有统计学意义(P 均<0.05)。利用 ADC 值鉴别良、恶性淋巴结的 ROC 曲线下面积为 0.83（最佳阈值为 0.84 × 10^{-3} mm^2/s^{-1}），利用 rADC 值进行鉴别的 ROC 曲线下面积为 0.88（最佳阈值为 0.66），二者比较无统计学意义（P ＞0.05）。**结论** DWI 对定性淋巴结病变有一定的价值，且 rADC 未能改善淋巴结的定性诊断。

3D-TOF-MRA 判断脑梗死脑内血管狭窄与高同型半胱氨酸血症相关性分析

伏平友,秦风,刘媛,李艳,孙永梅,邢璐,邢霞
山东黄河河务局山东黄河医院

目的 本项目旨在研究 3D-TOF-MRA 判断脑梗死脑内血管狭窄与循环酶法检测 Hhcy 的相关性，科学指导临床从提前干预病因方面，减少脑梗死及其并发症、后遗症的出现。。方法 搜集 2015 年 11 月至 2019 年 5 月在我们医院住院病例 146 例，搜集其 MRI、MRA 图像及同型半胱氨酸检测数据，通过回顾性分析所搜集病例图像及数据，总结归纳分析 MRA 诊断脑血管动脉粥样硬化性狭窄及高同型半胱氨酸血症与脑梗死的相关性。结果 本组 146 例患者磁共振显示患有脑梗死 100 例，其中急性亚急性脑梗死 8 例，脑血管狭窄 83 例，脑血管无狭窄 63 例，高 hcy 84 例，Hcy 正常 62 例。磁共振 MRA 检出脑血管狭窄组脑梗死发病高于脑血管无狭窄组，有统计学意义，(P<0.05)；循环酶法检测出高 Hcy 组脑血管狭窄发病率高于正常组有统计学意义，(P<0.05)；循环酶法检测出高 Hcy 组脑梗死发病率高于正常组有统计学意义，(P<0.05)；平均血清 Hcy 水平脑梗死组高于对照组，有显著性差异(P<0. 05)。据以上分析脑血管狭窄为脑梗死的重要致病原因，高同型半胱氨酸是导致脑血管狭窄的重要原因，高同型半胱氨酸通过导致脑动脉硬化性狭窄引起脑梗死发病率增高。血清高 Hcy 是脑血管病的独立危险因素。结论 3D-TOF-MRA 为无创性检查，具有安全、快速的特点，可以较清晰的评价颅内血管狭窄和闭塞程度，且无 X 线辐射及对比剂过敏之虞。通过循环酶法检测出同型半胱氨酸血症，为提前干预治疗 HHcy 及预防脑动脉粥样硬化性脑梗死提供科学指导依据。通过本研究发现 3D-TOF-MRA 判断脑梗死的血管狭窄程度且与 Hcy 具有良好的相关性。临床应积极将 3D-TOF-MRA 与血清 Hcy 的测定作为常规检查，应用于脑血管疾病的早期筛查及病例复查，以预防脑梗死发病及其并发症、后遗症的发生。

CUBE T2 FLAIR 伴和不伴压脂序列在鼓室钆注射内耳成像中的比较

肖如辉,李涛
川北医学院附属医院

目的 鼓室内注射钆对比剂后，行内耳三维各向同性快速自旋回波快速液体衰减反转恢复磁共振成像(three-dimensional isotropic resolution fast spin-echo fluid-attenuated inversion recovery magnetic resonance imaging，3D CUBE-FLAIR MRI)扫描，对比 3D CUBE T2 FLAIR 加压脂和不加压脂序列的内耳结构显像效果。**方法** 通过收集确诊梅尼埃病（患者组）和疑似梅尼埃病诊断标准（疑似患者组）的各 25 例患者，均进行双侧鼓室内注射钆对比剂，24 小时后进行内耳 3D 水成像（fast imaging employing steady state acquisition，FIESTA）、伴和不伴压脂 3D CUBE T2 FLAIR 磁共振检查，对比两组中各序列内耳结构显像（评分标准：完整清晰显示记为 2 分；局部部分缺失记为 1 分；大部分缺失或未显示记为 0 分），并分析总结。**结果** 两组中 3D CUBE T2 FLAIR 伴和不伴压脂序列之间均有统计学意义；伴压脂的 3D CUBE T2 FLAIR 内耳结构显像优于不伴压脂的序列；且在 3D CUBE T2 FLAIR 压脂和不压脂序列上，内耳外淋巴间隙高信号、内淋巴间隙低信号。**结论** 鼓室钆注射内耳成像中，3D CUBE T2 FLAIR 压脂序列能提供更多内耳细节结构，且背景组织干扰显示更优，较 3D CUBE T2 FLAIR 不压脂序列而言。

PU-0649
静息态功能磁共振在高血压偏头痛肝阳上亢证候分型中的研究价值

彭飞
江苏省中西医结合医院

目的:评估静息态功能磁共振成像(RS-fMRI)在高血压偏头痛肝阳上亢分型中的价值。方法:选取 24 例高血压偏头痛患者(肝阳上亢证型 11 例、非肝阳上亢型 13 例)与 24 名健康对照者,行 RS-fMRI 检查,对静息态功能磁共振图像应用 DPARSF2.2 进行后处理。并用 REST 软件进行局部一致性分析(ReHo),观察默认网络并比较三组间 ReHo 值差异。结果:(1)偏头痛组和对照组 ReHo 值在左侧海马、左侧额叶直回、左侧中脑、右侧上外额叶、右侧额中回等脑区不完全相等(P <0.05,Alphasim 校正)。(2)相比肝阳上亢组,非肝阳上亢组 Re Ho 值在海马旁回、梭状回、顶下小叶、左侧脑干、右侧小脑中脑脑区明显增高;在左侧大脑半球的壳核、颞中回、顶下小叶、额叶直回、扣带回等脑区 ReHo 值则有显著减低(P <0.05,Alphasim 校正)。结论:肝阳上亢证与非肝阳上亢证高血压偏头痛患者在边缘系统、基底节区、壳核等脑区存在显著差异有助于我们更好的了解偏头痛的中医辨证分型。

内耳 3D 水成像

靳新娟
山东大学齐鲁医院

摘要：**目的** 测量人体内耳膜迷路的大小及位置等形态学参数，探讨双侧内耳膜迷路有无偏侧化、性别差异、年龄相关的改变。**方法** 对 60 位年龄范围 1-70 岁的正常人（其中男性 30 人，女性 30 人）的内耳膜迷路的形态学参数进行测量评价，之后对其形态学参数行性别、左右侧、和位置大小的关系等进行统计学分析。**结果** ①除膜迷路大小有性别差异外，余值无显著的性别差异②主要骨性结构的形态学参数均有显著的偏侧性。余内耳膜迷路形态学参数与年龄无显著的相关性。**结论** 全面了解内耳膜迷路的形态学特征，对感音神经性耳聋的诊断及耳蜗项目的应用有极其重要。

PU-0651

Study of functional connectivity alterations of default mode network and sensorimotor network in cervical spondylotic myelopathy patients

Yaru Zhan[1], Guoshu Zhao[1], Yuan Cao[2]
1. The First Affiliated Hospital of Nanchang University
2. West China Hospital of Sichuan University

Objective: To evaluate the difference of brain default mode network (DMN) and sensorimotor network (SMN) functional connectivity (FC) of cervical spondylotic myelopathy (CSM) by using independent component analysis (ICA), and the correlation with clincal scores and disease duration.
Materials and Methods: A total of 36 CSM patients and 30 sex-, age- and education-matched healthy controls underwent resting-state functional MRI (rs-fMRI) examinations. The fMRI data was analyzed by using independent component analysis (ICA), and default mode network and sensorimotor network component were extracted between two groups. The differences of functional connectivity between the patient group and the control group were compared by two sample *t* test ($P<0.05$, AlphSim corrected). Correlation analysis was performed for FC value of brain areas which had statistical differences in CSM and modified Japanese orthopaedic association scores(mJOA), disease duration.
Results: Compared with the control group, the FC value of DMN in CSM group significantly increased in left inferior occipital cortex and supramarginal gyrus, while decreased in right middle cigulum gyrus, left superior parietal lobule, praecuneus and medial frontal gyrus; the FC value of SMN increased in left anterior lobe of cerebellum, bilateral postcentral gyrus, while decreased in right praecuneus and left anterior paracentral lobule. There were no correlation between FC value and mJOA scores, disease duration (both $P>0.05$).

3.0T MRI 联合低浓度对比剂 CE-MRA 和灌注成像 在急性缺血性脑卒中的应用价值

姜海龙
南京市第一医院

目的 探讨在 3T MRI 联合低浓度对比剂增强磁共振血管成像(CE-MRA)和动态磁敏感灌注成像（DSC-PWI）在急性缺血性脑卒中的应用价值。 **方法** 收集南京市第一医院 2017 年 10 月-2018 年 3 月急性脑卒中患者 30 例，所有患者均接受低浓度对比剂 CE-MRA 和 DSC-PWI 成像，并于 24 小时内接受数字减影血管造影（DSA）检查。CE-MRA 和 DSC-PWI 均使用半剂量对比剂浓度（0.05mmol/kg）。通过与 DSA 对照，评估 CE-MRA 对血管狭窄诊断的准确性。CE-MRA 诊断血管狭窄及 DSC-PWI 诊断不匹配区的观察者间一致性检验使用 Kappa 分析。 **结果** CE-MRA 对头颈动脉低级别（<50%）及高级别（>50%）狭窄诊断的敏感性、特异性、阳性预测值、阴性预测值分别为 82.4%、100%、100%、93.8%及 100%、82.4%、93.8%、100%。CE-MRA 诊断动脉狭窄及 DSC-PWI 诊断不匹配区观察者之间一致性均好（分别为 κ=0.87、 κ=0.86）。**结论** 3T MRI 联合低浓度对比剂 CE-MRA 和 DSC-PWI 是一种可行的急性缺血性脑卒中 MRI 扫描方案。

PU-0654

Early postoperative delineation of infarction, residual tumor and edema after glioma resection using DWI and DSC-PWI combined with conventional MR imaging: comparison with independent factors analysis of infarct volume

Xiaofang Zhou,Zhen Xing,Dairong Cao
First Affiliated Hospital of Fujian Medical University

Abstract
Objective Postoperative infarction leads to a more aggressive recurrent pattern, and the infarct volume is also an independent factor of overall survival after glioblastoma surgery. Therefore, the aims of this study were to investigate the value of diffusion weighted imaging (DWI), dynamic susceptibility contrast perfusion weighted imaging (DSC-PWI) combined with conventional MRI (cMRI) in delineating

postoperative infarction, residual tumor and edema in glioma, and also to analysis the independent factors of postoperative infarct volume.
Methods 192 patients underwent surgeries with a newly diagnosed glioma (WHO II-IV) were retrospectively assessed. Values of the relative minimum ADC (rADCmin), relative mean T2 (rT2mean) and relative maximum CBV (rCBVmax) in early postoperative MRI (epMRI) were compared with respect to different lesion types (infarction, residual tumor and edema) by using Kruskal-Wallis H test. Receiver operating characteristic (ROC) curve was applied to evaluate diagnostic performances. Multiple linear regression analysis was used to assess the independent factors of infarct volume.
Results Among different lesion types, the rADCmin value of infarction region was the lowest with a value of 0.56±0.19 and the rCBVmax value of residual tumor was the highest with a value of 3.15±1.39. The rADCmin with the cutoff value of 1.15 could distinguish infarction region from edema with an AUC of 0.99, which is higher than that of rT2mean and rCBVmax (0.79 and 0.70, respectively). The rCBVmax with the cutoff value of 1.69 could identify residual tumor from edema with a highest AUC of 0.97 comparing with rADCmin and rT2mean (0.86 and 0.73, respectively). And the accuracy of rCBVmax and rADCmin in the differentiation between residual tumor and infarction were similar with an AUC of 0.99 and 0.98, respectively. Multivariate analysis identified that tumor grade (p=0.027) and the postoperative cavity volume (p=0.003) were independent factors of infarct volume.
Conclusions The combination of DWI, DSC-PWI and cMRI can accurately identify postoperative infarction, residual tumor and edema. Such imaging techniques are valuable and easy to perform in clinical practice with an immediate clinical effect. Tumor grade and postoperative cavity volume in patients with glioma have an important impact on postoperative infarct volume, which may provide novel and valuable information for surgery planning.

PU-0655
高分辨率磁共振在匹伐他汀对富脂核心不稳定颈动脉斑块疗效中的应用研究

黄晓星
中山市人民医院

目的
利用 3.0T 高分辨率磁共振评估不同剂量的匹伐他汀对富脂核心不稳定颈动脉斑块的疗效，并探讨斑块变化与血脂及炎症指标的关系。
方法
经 3.0T 高分辨率磁共振发现有富脂核心的颈动脉斑块的患者（N=60），随机分配到高剂量（N=30，4mg/天）和低剂量（N=30，2mg/天）组中接受匹伐他汀治疗。高分辨率磁共振成像及实验室检查均在治疗前和随访结束时进行，随访时间 48 周。根据患者的血脂和炎症指标变化水平，结合磁共振特征的改变进行相关分析，为了便于比较数据变化幅度的大小，对数据并进行变化百分率的转换。
结果

①高分辨率磁共振 PT、WA、NWI、LCA 均有降低，LA 有升高（P＜0.05）；TVA 在治疗前后则无明显变化（P＞0.05）； %PT、%LA、%WA、%NWI、 %LCA 在高剂量组中较低剂量组高（P＜0.05）。②血脂及炎症指标：TC、LDL-C、TG、hsCRP、IL-6 均有降低，HDL-C 均有升高（P＜0.05）。%TC、%LDL-C、%HDL-C、%TG 在高剂量组中较低剂量组高（P＜0.05）；%hsCRP、%IL-6 在两个组别中无明显差别（P＞0.05）。③多重线性回归分析发现，%LCA 与%LDL-C、%HDL-C，%PT 、%NWI 与%LDL-C 呈多重线性回归关系。

结论

高分辨率磁共振是一种评价他汀类药物治疗富脂性颈动脉斑块疗效的有效工具。匹伐他汀能够使患者的血脂及炎症反应减低，逆转富脂核心不稳定颈动脉斑块，以脂质成分改善明显，在有效剂量范围内，相比低剂量匹伐他汀，高剂量作用更大。

PU-0656

The study of T2-weighted trace map of diffusion tensor imaging in healthy optic nerve

Yanqiu Zhang[1],Dapeng Shi[1],Meiyun Wang[1],Xiaona Xu[1],Zhonglin Li[1],Xirang Guo[2]
1.Henan Provincial People's Hospital (Henan Key Laboratory for Medical Imaging of Neurological Diseases & Zhengzhou University People's Hospital & People's Hospital of Henan University)
2.Henan Provincial People's Hospital (Zhengzhou University People's Hospital & People's Hospital of Henan University)

Objective To quantitatively study the manifestation of T2-weighted trace (T2-WT) parameter map of Diffusion tensor imaging (DTI) in healthy optic nerve. **Methods** Sixty-eight healthy right-handed volunteers (36 men, 32 women; mean age, 38 years; range, 9-78 years) were recruited in this study. DTI and conventional MRI were performed on all subjects. The mean T2-WT, fractional anisotropy (FA), mean deviation (MD), λ//, and λ⊥were obtained for quantitative analysis. Differences between right and left eyes, and differences between males and females were both evaluated by using paired t-test and independent-samples t-test respectively. Further analyses were performed to determine the correlation of T2-WT in 68 eyes (136 optic nerves) of subjects with FA, MD, λ//, λ⊥, and age, respectively. **Results** In healthy right-handed volunteers, the value of T2-WT from left nerves was higher at 390.7±88, compared with 371.4±87 from right nerves (P<0.01), while FA, MD, λ//, λ⊥ between left and right nerves showed no significant differences (P>0.05). No significant differences between males and females were seen in T2-WT, FA, MD, λ//, and λ⊥ calculated from DTI (P>0.05). In addition, there were negative correlation of T2-WT with MD, λ//, λ⊥respectively (r=-0.374, -0.361, -0.348, respectively, P=0.000), , but no correlation with FA and age (P>0.05). **Conclusion** T2-WT of optic nerve shows left dominance in normal right-handed group. As an isotropic parameter of DTI, T2-WT has significant relationship with MD, λ//, λ⊥. In addition, values of T2-WT do not decrease with the increasing age.

PU-0657

Abnormal dynamic functional connectivity of hippocampus subregions in obstructive sleep apnea

Ye Yuan
First Affiliated Hospital of Anhui Medical University

Objective: To determine whether aberrant dy-FC exists between the hippocampus subregions and other brain areas and whether such abnormalities are related to emotional disorders and cognitive impairment in OSA.
Methods: The resting-state functional magnetic resonance imaging (dy-fMRI) data of 20 severe OSA patients and 24 matched healthy controls (HCs) were collected. The dyFC between the hippocampus subregions and other brain areas was compared between the two groups. The correlations between aberrant dy-FC and clinical variables and neuropsychological assessments were evaluated.
Results: Intergroup differences in the dy-FC of the hippocampus subregions The rsFC patterns of the precuneus subregions The rsFC map of each hippocampus subregion for each group is depicted in Fig. 2 ($P < 0.05$, FDR corrected). Howerer, we did not find any significant difference between OSA and healthy controls in the rsFC maps. The dyFC patterns of the precuneus subregions .Compared to the healthy controls, patients with OSA had increased dyFC between the right RH and the left frontal mid ,left CH and Precentral, right CH and right Lingual left Fusiform .

Conclusion: In this study, severe OSA patients showed complex dy-FC patterns in the hippocampus subregions, which may be the result of OSA-related selective damage to the hippocampus, and abnormal dy-FC between the hippocampus subregions and brain regions associated with emotional, cognitive and executive functions may partly explain the affective defificits and cognitive impairment observed in male severe OSA patients.

PU-0658
利用 MEGA-PRESS 探索正常人上份脑干 GABA+含量的可行性研究

宋玉璐,巩涛,王光彬
山东省医学影像学研究所

背景与目的 γ-氨基丁酸(GABA)是脑内主要的抑制性神经递质，其在脑组织内的含量极低，常规磁共振波谱（MRS）技术无法测量其含量。MEGA-PRESS 采用新的编辑技术可以分离出 GABA 在 3.0ppm 处的波峰，进而测量其含量。虽然用质子磁共振波谱法(^{1}H-MRS)测定颅脑内 GABA 水平已经有一段时间，但对于上份脑干水平 GABA 是否可以测量还存在争议。本研究的目的是用质子磁共振波谱(MRS)测定健康志愿者中脑γ-氨基丁酸(GABA)水平，并探讨中脑γ-氨基丁酸(GABA)与年龄的是否具有相关性。**材料与方法** 对 22 名年龄在 20 至 76 岁之间的健康志愿者进行了 GABA+水平检测。采用 3.0T 扫描仪（型号： Philips Achieva TX, Best, Netherlands)，颅脑 8 通道线圈，MEGA-PRESS 序列检测上份脑干 GABA+水平，用 Gannet 软件进行光谱处理。检测到的 GABA+信号，是 GABA、大分子(MMS)和高碳酸钙的复合信号。在测定上份脑干 GABA+时选取了较小的 ROI(10×25×30 cm)。**结果** 用质子磁共振波谱法(^{1}H-MRS)可以测定健康志愿者上份脑干区域 GABA

水平，并且 ROI 降至 10×25×30 mm；其含量约为 2.47±0.66(ｘ±SD)，本研究发现上份脑干 GABA 含量与年龄无显着相关性。**结论** 本研究对健康志愿者上份脑干 GABA 水平的测定表明，GABA 上份脑干含量可以用较小的 ROI 来测量，并且研究发现健康志愿者的 GABA 水平与年龄无关，这可能是由样本量较小引起的。

PU-0659

Examining alterations in GABA levels in the upper brainstem of patients with Parkinson’s disease by MEGA-PRESS MRS

Yulu Song,Tao Gong,Guangbin Wang
Shandong Medical Imaging Research Institute

Abstract Purpose: To explore the changes of gamma-aminobutyric acid (GABA) in the upper brainstem in healthy volunteers and Parkinson’s Disease (PD) patients using MEGA-PRESS magnetic resonance spectroscopy. **Methods:** 18 healthy volunteers, 30 patients with PD were included in this study. GABA+ levels in the upper brainstem were measured by using MEGA-PRESS. The GABA+ levels of healthy volunteers and PD were analyzed using analysis of covariance. The relationship between GABA+ levels and NMSQ were also analyzed. **Results:** GABA+ levels were lower in the upper brainstem regions of PD patients(2.53±0.69) compared with healthy controls(2.94±0.64) ($P < 0.05$). A significant positive correlation was found in PD between GABA levels and NMSQ (r^2=0.177, P=0.021). **Conclusion:** The GABA+ level in PD was lower than in healthy volunteers in the upper brainstem, which suggests a potential link between abnormalities of the GABAergic system and the pathogenesis of PD. This study also demonstrates a positive relationship between regional GABA levels and NMSQ in PD.

PU-0660

Magnetic resonance Propeller technique in reducing signal loss artifacts in sinus

Yu Zhang
Renmin Hospital of Wuhan University

Purpose
iterative decomposition of water and fat with echo asymmetric and least-squares estimation(IDEAL) are often used to achieve uniform water-fat separation that is insensitive to Bo inhomogeneities. but in boundaries of different magnetic substances such as bone, gas and soft tissue surface will lead to signal loss or fat-water “swapping”. Which serious impacts on MR image quality. Periodically rotated overlapping parallel lines with enhanced reconstruction(Propeller) scanning technique, acquire images using a specific filling pattern to collect data spirally by radial

blades till all data in K space are acquired. Propeller technique reduces signal loss artifacts caused by magnetic-susceptibility at a great extent.

Methods

A total of 30 patients were performed routine sinus MR examination (17 males and 13 females, age:51.9 ± 16.5) were enrolled in this study with ethic committee approved. underwent Propeller T2WI and the images were compared with IDEAL T2WI sequence. An eight-channel head coil was used for axial Propeller T2WI sequence of the sinus: TR 4058ms, TE 115 ms, slice thickness 5 mm, slice gap 1.5 mm, bandwidth 50KHz, Field of view 24 cm×24 cm, No.of excitation 3, and scanning time 97 s; axial IDEAL T2WI sequence: TR 2225 ms, TE 69.3 ms, scanning matrix 384×224, bandwidth 62.5KHz, Field of view 24 cm×18 cm, slice thickness 5 mm, slice gap 1.5 mm, No.of excitation 3, scanning time 135 s.

Images were evaluated using a 4-point Likert scale (1, nondiagnostic; 4, outstanding).Bland-Altman analysis was used to analyze the consistency of image quality score of two observers (95% LOA) .The data were analyzed by SPSS 17.0 statistical software, and the samples were compared by non-parametric statistics. The results were compared with the Wilcoxon paired sign rank test, and the results were compared by the Friedman test. $P < 0.05$ was considered as statistically significant.

Results

The signal loss artifacts of 30 cases were significantly reduced by Propeller T2WI scanning, and the SNR and CNR, image quality were significantly improved, and pathological changes were well presented on the images (Figures 1,2).It is seen that the difference of the quality grading of sinus images obtained was within the 95% consistency interval, and the two observers showed good consistency(Figures 3). ($P < 0.001$).The total scores for Propeller T2WI and IDEAL T2WI images, respectively, were as follows: 115 and 81. Statistically significant difference was observed between Propeller T2WI and IDEAL T2WI ($Z=-4.540$, $P=0.000$).

Discussion

MRI has become an important medical imaging approach in sinus. How to reduce signal loss artifacts caused by magnetic susceptibility, and how to acquire MR images meeting the demands for diagnosis are important.

Magnetic susceptibility artifacts appear in boundaries of different magnetic substances such as the sinus,which including bone, gas and soft tissue surface. Because magnetic susceptibility is different, these substances will produce varied magnet effects after entering magnetic field, and the regional uneven magnetic fields will lead to signal loss in the tissue surfaces. and magnetic susceptibility artifacts are increased with magnetic intensity.

Propeller technique employs spiral data collection, which fills the data in k-space using a leaf blade with certain thickness. During k-space filling, the center of the blade was fixed, rotated along one direction, and connected with other blades to form an integral circle. Therefore, the data collection of every time can correct signal loss artifacts, During once data collection, although the blade only rotates a period, the data in central region of k-space is sampled for every strip. Therefore, during once data collection, the SNR and CNR of Propeller T2WI are significantly higher than IDEAL T2WI. Propeller technique producing high-resolution images with no signal loss artifacts, which are significant for clinical diagnosis.

RESOLVE DWI 序列在小儿垂体 MRI 中的应用

张静
上海交通大学医学院附属新华医院

目的 评估 RESOLVE DWI 序列在小儿垂体 MRI 检查中的图像质量及应用价值。**方法** 分析采用 RESOLVE DWI 序列进行小儿垂体扫描的 40 例病例，与采用常规 DWI 序列扫描的 40 例病例做对比，评估两者的图像质量并进行统计。**结果** 采用 RESOLVE DWI 序列扫描的小儿垂体比常规 DWI 的图像更清晰、伪影大为降低，差别有统计学差异。**结果** RESOLVE DWI 序列有效提高了小儿垂体 MRI 的图像质量，尤其在垂体占位病史的磁共振检查中，有较高的应用价值。

PU-0662

Effects of BMPER, CXCL10 and HOXA9 on neovascularization during early-growth stage of primary high-grade glioma and their corresponding MRI biomarkers

Wei Xue,Weiguo Zhang
Daping Hospital, Army Medical University

Neovascularization is required in high-grade glioma (HGG). The objective of this study was to explore neovascularization-related genes and their corresponding MRI biomarkers during the early-growth stage of HGG. Tumor tissues from 30 HGG patients underwent perfusion MRI scanning prior to surgery were used to establish orthotopic xenograft models, pathologically analyze the tumor vasculature and perform transcriptome sequencing. The cases were divided into two groups based on whether the xenograft was successfully established. Microvascular density and BMPER, CXCL10 and HOXA9 expression of surgical specimens in the xenograft-forming group was significantly elevated and the microvascular diameter was significantly reduced, In vitro inhibition of BMPER, CXCL10 or HOXA9 in the glioma stem cell significantly suppressed its tube formation abilities. The in vivo experiment showed that BMPER was highly expressed in the early tumor growth phase (20 days), CXCL10 and HOXA9 expression was elevated with tumor progress, and spatially associated with tumor vasculature. Perfusion MRI derived parameters, rCBV, K_{trans} and V_p, were also increased in the xenograft-forming group. In conclusion BMPER, CXCL10 and HOXA9 promote early tumor growth and progression by stimulating neovascularization of primary HGG. The rCBV, K_{trans} and V_p can be used as imaging biomarkers to predict the expression of these genes.

3.0T MRI 3D 序列与 CS 3D 序列（Compressed SENSE）图像质量的对比讨论

程婉怡
合肥平安健康检测中心

目的 探究 3.0T MRI 上使用 3D T1W 梯度回波序列与 CS 3D T1W 梯度回波序列图像质量对诊断的价值。
方法 选取了 25 例患者于 3.0T 磁共振进行头颅 MRA 检查。扫描采用 TOF 法，采用 T1W FFE TRA 序列。对同一患者分别采用 3D TOF T1 梯度回波 TRA 序列和 CS 3D TOF T1 梯度回波 TRA 序列各检查一次。随机采集多个扫描点，通过采集到的多个扫描点，选取采集到的比较重要的扫描点通过非线性重建。对比这两种序列对头颅 MRA 显示清晰程度及扫描时间。
结果:使用 3D TOF T1W 梯度 TRA 序列扫描时间 4.28min。SENSE:P reduction（RL）：2.5 S reduction （FH）:1:使用 CS 3D TOF T1W 梯度回波 TRA 序列扫描时间约为 2.42min。CS-SENSE:reduction：2：采用压缩感知技术 CS 3D TOF T1W 梯度回波 TRA 序列。
结论 CS SENSE 压缩感知成像可大幅度提高 MR 的扫描速度，增加图像空间分辨率，满足诊断要求。普通 3D TOF T1W 梯度回波 TRA 序列使用了并行采集，提高体素，来缩短扫描时间。提高了信噪比，降低了空间分辨率。CS 3D TOF T1W 梯度回波 TRA 序列通过压缩感知技术缩短扫描时间。原理：稀疏采样。

Population receptive field (pRF) measurements of attentional scope responses in human early visual cortex using fMRI

Bo Liu
The First Hospital of Shanxi Medical University

Object: Visual attention is the mechanism by which attentional inputs are preferentially processed at the expense of distracters. However, how attentional scope influences spatial representations in human early visual cortex is unknown. Our study assessed the modulatory role of attentional scope on the spatial information content by using population receptive field (pRF) mothed.
Methods: In our experiment, thirteen right-handed neurologically healthy participants performed one-back tasks on identical streams of stimuli presented at either central fixation (focused attention condition) or all-around vision (distributed attention condition) while task-irrelevant mapping stimuli traversed the visual field. FMRI data were recorded at the same time. We analyze the difference of pRF size (σ), eccentricity and amplitude between conditions.
Results: We were able to reconstruct robust spatial representations across a range of eccentricities and for both attention conditions. Our result demonstrated a remarkable attentional modulation of early visual cortex on pRF size, location and amplitude. The pRF sizes increased more strongly with eccentricity under focused attention condition. Furthermore, the focused attention condition showed a smaller pRF size at foveal eccentricity in early visual area and a larger pRF size at peripheral eccentricity in V3 than distributed attention condition. In addition, attention scope also affected pRF locations in V3 area, with more eccentric at perifoveal visual degree under distributed vs. focused attention condition. While compared with distributed attention

condition, the amplitudes in early visual areas were significantly higher in the focused attention condition. Our data support that attention modulation occurs in the early visual cortex.
Conclusions: These results provide important insights into how human early visual field representations are affected by scope of attention.

PU-0665
Diagnostic Value of DWI Combined with Conventional MRI in Palatal Lesions

Weiqing Tang
Shanghai 9th People ‘s Hospital

Objective: To analyze the characteristics of conventional MRI and DWI sequences of palatal lesions and to explore the diagnostic value of combination in palatal lesions. **Methods and Materials:** A retrospective analysis was performed on MRI images of patients with palatal lesions which proven by pathology from January 2015 to December 2018. Each lesion was evaluated with conventional MRI characteristics, including size, location, morphology, inner texture, enhancement, capsule, bone destruction, nerve invasion and cervical lymph node. Diffusion weighted MRI were performed on a 3 tesla unit with b factors of 0 and 1000s/mm^2, and apparent diffusion coefficient (ADC) values were calculated. Statistical analyses were performed to assess the differential performance of each parameter separately and together. **Result:** A total of 86 patients (30 females and 56 males) with solitary palatal lesions were included in this study. In conditional MRI, capsule structure, nerve invasion and lymph node abnormalities were proven useful in the differential diagnoses of palatal lesions. Sensitivity and specificity of conditional MRI were 82.5% and 51.3%, respectively. The average ADC value of malignant lesions was $1\pm0.18\times10^{-3}mm^2/s$, which was lower than that of benign lesions of $1.53\pm0.34\times10^{-3}mm^2/s$, with statistical difference (P=0.001). The optimal diagnostic threshold of ADC value was $1.21\times10^{-3}mm^2/s$. Combination of conventional MRI and ADC values can increase sensitivity to 94.7% and specificity to 82.8%. **Conclusion:** DWI sequences combined with conventional MRI can contribute to accurate differentiation of benign and malignant palatal lesions. Besides, ADC value is an important diagnostic criterion.

PU-0666
双标记延迟时间 3D ASL 对急性脑梗塞取栓前后脑血流动力学的评估价值

王莉蓉,高志国
荆门市第二人民医院

目的 探讨磁共振三维动脉自旋标记(three-dimensional arterial spin labeling, 3D ASL)采用双标记延迟时间(postlabeling delays,PLD)评估急性脑梗塞取栓前后脑血流动力学的应用价值。

方法 以行血管内机械取栓的急性脑梗塞患者为研究对象，所有患者均于发病 6h 内行 DWI、MRA 及 3D ASL，ASL 采用两个标记延迟时间进行扫描。取栓后 1-3 天复查 DWI 及 ASL，观察取栓前后脑血流灌注情况，计算取栓前梗塞侧晚到达逆行血流比例，评估取栓前梗塞侧晚到达逆行血流比例与取栓后 NIHSS 评分的相关性。**结果** 纳入 2017 年 7 月至 2018 年 9 月期间在我院血管介入科行急性脑梗塞机械取栓的患者 20 例，ASL 显示：PLD1.5s 均可见面积大于 DWI 高信号区的低灌注区，PLD2.5s17 例低灌注区缩小，仍可见缺血半暗带，3 例低灌注区范围无明显变化。取栓后复查造影显示责任血管灌注达 mTICI2b/3 级，ASL 显示 17 例低灌注区较取栓前明显缩小，1 例范围扩大，2 例梗塞区域出现片状高灌注区。取栓后大部分患者脑灌注明显改善，取栓前后梗塞侧脑血流量（cerebral blood flow,CBF）差异有统计学意义（$p<0.05$），取栓前梗塞侧晚到达逆行血流比例与取栓后 NIHSS 评分呈负相关。**结论** 双标记延迟时间的 3D ASL 能更客观的评价取栓前后的脑血流动力学改变，随着标记时间延长，CBF 图可以一定程度上评估侧枝循环血流储备，为急性脑梗塞的预后提供理论依据。

颅内孤立性纤维瘤/血管外皮瘤的影像学诊断

李子园
河南省人民医院

摘要 **目的** 探讨颅内孤立性纤维瘤/血管外皮瘤(intracranial solitary fibrous tumor， SFT/hemangiopericytoma， HPC)的影像学特征。**方法** 分析 10 例经手术及病理确诊的颅内孤立性纤维瘤/血管外皮瘤的影像学结果。**结果** 10 例患者 9 例病变位于幕上，1 例跨越幕上及幕下，为类圆形或不规则形，有分叶，边缘清楚; CT 平扫病变表现为稍高密度影，增强扫描后病变均匀或不均匀明显强化;MRI 平扫，与脑实质相比，T1WI 上，5 例表现为等信号，2 例表现为低信号，3 例表现为混杂信号; T2WI 上 6 例表现为等信号，4 例表现为混杂信号; DWI 表现为低信号，增强扫描后病变均匀或不均匀明显强化。病变与硬脑膜呈窄基底相连 7 例(70.0%)、呈宽基底相连 3 例(30.0%); 5 例伴有脑膜尾征(50.0%); 瘤周见轻-中度水肿 7 例(70.0%); 最大径 2.5-5.6cm，平均(4.5±1.0)cm。结论 认识颅内孤立性纤维瘤/血管外皮瘤的的影像学特点，有助于患者的后续治疗和预后。

幕上室管膜瘤的影像学分析

李子园
河南省人民医院

【摘要】 目的:总结分析幕上脑实质内室管膜瘤的影像学表现。方法:对经手术病理证实的 13 例幕上脑实质内室管膜瘤的影像表现及病理学结果行回顾性分析,13 例均行颅脑 CT 或 MRI 检查。结果 10 例病理分级为 II 级，病灶较小,位置表浅;3 例病理分级 III 级,病灶则多贴近脑室表面;11 例病变表现为囊实性,其中 10 例囊变位于病灶边缘,当病灶较大时,较大囊变部分多位于脑深部;所有病例均呈混杂长 T1、长 T2 信号影,实质部分内见多发点状低信号灶,实性部分 DWI 呈稍高信号;其中 5 例行 CT 检查者病变呈稍高密度。13 例扫描呈不均匀、分房分隔样强化;病灶周围的水肿程度与病理分级没有明确相关性。结论:幕上脑实质内室管膜瘤的 CT 及 MRI 表现有一定的特征性,术前诊断影应考虑到本病的可能。

磁共振新技术在颈神经根成像中的应用进展

张莉
川北医学院附属医院

随着计算机的广泛应用，颈椎病的发病率越来越高，并且有年轻化趋势。颈椎病变可导致神经根受压迫和炎症刺激，引发一系列临床症状，严重影响患者的生活质量。因此，如何直观而清晰地显示其神经根形态和走行、并进一步明确受累神经根损伤程度等具有重大的临床意义。传统常规磁共振成像检查只能显示粗大周围神经干的大体解剖形态 ， 难以显示神经的细微结构，故在周围神经领域很少应用。随着高场强 MRI 及各种检查序列和后处理技术的开展应用，尤其是对功能成像技术的探索，使周围神经成像成为目前影像学检查中的研究热点。本文将围绕颈神经根的磁共振神经成像（MR Neurography，MRN）、DTI 成像等进行综述。

The relationship between patterns of remodeling and degree of enhancement in patients with atherosclerotic middle cerebral artery stenosis: a high-resolution MRI study

Danfeng Zhang
Department of Radiology, Nanjing First Hospital, Nanjing Medical University

Purpose: Recently, high-resolution magnetic resonance imaging (HR-MRI) has been more widely used to display characteristics of intracranial arterial vessel walls and has become a focus of research. The aim of this research was to investigate the relationship between remodeling patterns and degree of enhancement in patients with atherosclerotic middle cerebral artery (MCA) stenosis using HR-MRI.
Materials and Methods: From August 2015 to May 2016, 38 consecutive patients with unilateral MCA stenosis on time-of-flight (TOF) MR angiography were prospectively enrolled. The routine MR scan and the cross-sectional images of the stenotic MCA vessel wall on HR-MRI were performed in all patients. Among them, 17 patients displayed positive remodeling (PR) and the other 21 patients displayed negative remodeling or non-remodeling (non-PR). The patients displaying hyperintensities on diffusion-weighted imaging (DWI) in the territory of ipsilateral stenotic MCAs were considered to have had acute stroke. Subsequently, the differences in the degree of enhancement and the number of acute stroke patients between the PR group and the non-PR group were compared. The Spearman rank correlation analysis of the enhancement degree and the remodeling index was calculated.
Result: The PR group had more obvious enhancement plaques than the non-PR group (10 versus 3, P=0.006). The PR group also had a larger number of acute stroke patients than the non-PR group (15 versus 4, P=0.000). The spearman rank correlation analysis showed that the degree of enhancement had a weak positive correlation with the remodeling index (r=0.379, P=0.019).
Conclusion: The current study suggested that HR-MRI has emerged as a valuable method to reveal the characteristics of intracranial arterial walls and its association

with atherosclerotic plaques. The PR, obvious enhancement predicted vulnerable plaques that were more prone to causing acute stroke.

3.0TMRI 弥散权重神经成像在臂丛神经疾病与肿瘤性疾病中的应用

周臻阳
华中科技大学同济医学院附属协和医院放射科

目的 评价 DW—MRN 技术在臂丛神经可视化研究与臂丛神经丛性疾病的可行性以及临床应用中的的评价作用。
方法 40 例有臂丛神经性疾病的患者同时在 3.0TMRI 场强下行传统的磁共振序列与单向性 DW—MRN，对图像进行后处理，图像由两位专业的放射诊断医师独立的依从 5 分法对臂丛神经的解剖结构进行独立评价，主要需要显示臂丛神经结构的构成，走行，连续性，形态及信号，清楚显示外伤或者肿瘤性及臂丛神经疾病所致的各种征象，评价者首先使用 5 分法对常用磁共振序列进行评分，然后联合 DW—MRN 方法进行评判，同时对臂丛神经结构异常者也采用 5 分法进行评价，并使用 Kappa 分析进行资分析，最终将从单纯的依靠常用 MRI 序列与联合使用 DW—MRN 序列两种方法的比较，并且结合 ROC 分析相关性的方法来比较两种方法的诊断准确性。
结果 40 例臂丛神经的图像中，征象显示明确，主要征象包括，正常神经根消失或离断，连续性中断，创伤性脊膜囊肿，神经根形态消失或失常，神经根增殖等等。DW—MRN 联合普通臂丛神经显像法相比单纯的常规 MRI 显示方法显著的提升了臂丛神经的成像效果，（$P<0.001$），当评价臂丛神经疾病时，评价者组内对常规 MRI 序列的评分为（Kappa=0.48），但相对联合诊断的得分更高为（Kappa=0.62），DW—MRN 联合常规 MRI 扫描可以明显有效的提升单个评价者对臂丛神经疾病的诊断效能（$P<0.05$），但是与另一个评价者在同种方法下的诊断效能是相似的。
结论 DW—MRN 可以清晰的显示臂丛神经的解剖结构以及病变部位的改变，并显著提升臂丛神经性疾病的成像质量和诊断效能。

主观认知下降的主观性担忧与 APOE ε4 基因对皮层形态学影响

孙宇[1],左西年[2],韩璎[1]
1.首都医科大学宣武医院
2.脑与心智毕生发展研究中心（CLIMB），中国科学院心理研究所

目的:对自身感到认知下降，但是客观神经心理学测试在正常范围内的人群被定义为主观认知下降（subjective cognitive decline，SCD）。本研究通过结构 MRI 评价老年 SCD 的担忧以及客观性 APOE ε4 风险基因对其大脑皮层形态结构的影响，以期更深入理解老年 SCD 脑结构特征及其风险性评价。
材料与方法:依据中国认知障碍纵向队列（SILCODE），收集 88 名有担忧主诉的 SCD 和 48 名与之年龄、性别、教育程度匹配的无担忧 SCD。采集并分析结构 MRI，按照左右半球、全脑 7 个网络、网络内 47 个感兴趣脑区，分别得到不同尺度上的灰质体积（gray matter volume, GMV）、皮层表面积（surface area, SA）和皮层厚度（cortical thickness, Cth），通过协方差分析比较担忧主诉与 APOE ε4 基因在皮层形态指标上的作用。

结果:在半球尺度上，担忧和 APOE ε4 在全脑 GMV（p=0.001）与双侧 SA（左脑 p=0.001，右脑 p=0.003）上具有交互作用，未见 Cth 受到影响。在网络尺度上，担忧以及 APOE ε4 在左脑默认网络 GMV（p<0.001）和右脑腹侧注意网络 GMV（p=0.001）存在交互作用，同时具有两个风险因素的 SCD，比起具有单风险因素只担忧或者只携带 APOE ε4，其左脑默认网络 GMV 更小。同时发现 AVLT 再认分数与默认网络 GMV 有正相关性；抑郁分数与腹侧注意网络 GMV 有负相关性。在感兴趣脑区尺度上，右脑默认网络的颞顶联合区（p=0.027）存在担忧和 APOE ε4 的交互作用。
结论:对于老年 SCD 群体，担忧主诉和 APOE ε4 基因对 SCD 皮层形态学结构减少具有协同作用，网络尺度上的灰质体积改变与行为学表现具有显著相关性，为 SCD 中相关临床表型和基因型多种风险因素对脑结构作用的生物学机制提供了新的见解。

ADC 定量参数在高级别胶质瘤（HGG）与原发性中枢神经系统淋巴瘤（PCNSL）鉴别诊断中的临床应用

吴玲,王冬女,朱华勇,郑珂,胡安夏,李欣
浙江省台州医院

摘要

目的 探讨 ADC 值在高级别胶质瘤（HGG）与原发性中枢神经系统淋巴瘤（PCNSL）鉴别诊断中的价值。

方法 回顾性分析经临床病理证实的 10 例 HGG 患者共 12 个病灶和 10 例 PCNSL 患者共 20 个病灶，分别进行常规 MRI 平扫及增强，扩散加权成像（DWI）扫描，总结两组常规 MRI 平扫、强化特点，并测量肿瘤实质区的 ADC 值，分析 PCNSL 和 HGG 两组之间囊变数量、出血、强化特点及 ADC 值有无差异。

结果 HGG 组 12 个病灶均发生囊变，6 个病灶有点状或片状出血，强化方式以花环样强化为主，部分呈片状不均匀强化。PCNSL 组 20 个病灶，3 例囊变坏死，未见出血，强化方式均明显均匀强化，部分呈握拳征。GBM 组肿瘤实质平均 ADC 值为（1.02±0.30）×$10^{-3}mm^2/s$，PCNSL 组肿瘤实质平均 ADC 值为（0.69±0.08）$10^{-3}mm^2/s$，两组肿瘤实质平均 ADC 值差异有统计学意义（t 值=3.71 ，p<0.05）。

结论 ADC 值结合 MRI 形态特点、强化方式可为 HGG 与 PCNSL 的鉴别诊断提供影像学依据。

PU-0674

The relationship between high density lipoprotein cholesterol and depressive symptoms is mediated by white matter integrity in major depressive disorder

Cun Zhang,Zhu Jiajia,Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Aims: Major depressive disorder (MDD) has been linked to serum lipid level alterations. However, the neural substrates underlying this association remain poorly understood.
Methods: 49 patients with MDD underwent diffusion tensor imaging (DTI). Multiple diffusion parameters were calculated to measure brain white matter integrity. Peripheral venous blood samples were collected to measure serum levels of lipid

profiles including total cholesterol (TC), triglyceride (TG) and high density lipoprotein cholesterol (HDL-C). Hamilton Rating Scale for Depression was used to assess severity of depression symptoms. Correlations between serum lipid levels and white matter integrity were investigated using tract-based spatial statistics (TBSS). Further mediation analysis was performed to determine whether micro-structural integrity in those affected white matter regions mediates the relationship between serum lipid levels and depressive symptoms.
Results: A majority of patients with MDD had lower serum level of HDL-C but normal serum levels of TC and TG. There were positive correlations between serum level of HDL-C and fractional anisotropy (FA) in the genu, body and splenium of corpus callosum (CC), bilateral anterior and superior corona radiata (ACR and SCR), and left external capsule (EC), and negative correlations between serum level of HDL-C and radial diffusivity (RD) in the genu and body of CC, and left ACR and SCR. Moreover, white matter integrity in the genu of CC was a significant mediator of the association between serum level of HDL-C and severity of depressive symptoms.
Conclusions: These findings may provide new insight into intervention, treatment and prevention of MDD from the perspective of regulating serum lipids.

磁共振头颅 BPAS 血管扫描法的应用研究

邢宇
十堰市太和医院

目的 评价磁共振头颅 BPAS 的血管扫描法（椎基底动脉系统扫描解剖成像）作为常规 TOF MRA 序列的补充序列在血管扫描中的临床意义。**方法** 收集我院头颅磁共振检查患者 36 例，采用优化参数后的 3D-TOF MRA 与优化参数后的 BPAS 血管扫描法结合对头颅进行扫描。比较分析 BPAS 血管扫描法对于椎基底动脉系统成像效果作为常规 TOF MRA 序列的补充序列在血管扫描中的临床意义，由一名主任医师评价血管图像质量整体显示情况。**结果** 在 3D-TOF MRA 序列扫描结束后，补充扫描 BPAS 成像序列可以清晰地显示椎-基底动脉，对于椎-基底动脉夹层的诊断很有意义。**结论** 在头颅 3D-TOF MRA 检查时，使用 TOF MRA 序列显示椎-基底动脉夹层效果不佳。补充扫描 BAPS 血管成像，可以提高的椎-基底动脉夹层病变的检出率，对于提高颅内血管图像质量，有很好的临床应用价值，可以作为磁共振常用序列使用。
关键词： 磁共振；并行采集技术；3D-TOF MRA；头颅血管成像;BPAS 血管成像

Selective micro-structural integrity impairments of the anterior corpus callosum are associated with cognitive deficits in obstructive sleep apnea

Biao Zhang,JiaJia Zhu,YongQiang Yu
The First Affiliated Hospital of Anhui Medical University

Background: There is evidence that obstructive sleep apnea (OSA) patients have white matter integrity abnormality in the corpus callosum (CC). However, whether the CC subregions are differentially affected in OSA is largely unknown.
Methods: Twenty patients with OSA and 24 well-matched healthy controls underwent diffusion tensor imaging (DTI) and clinical and cognitive assessments. DTI tractography was used to reconstruct the CC which was divided into five subregions. Inter-group differences in multiple diffusion metrics of each CC subregion and their associations with clinical and cognitive variables were tested.
Results: In comparison to healthy controls, OSA patients exhibited white matter integrity alterations in the anterior CC, characterized by increased RD in the subregion 1 and reduced FA along with increased MD and RD in the subregion 2. Moreover, we found that the lower micro-structural integrity in the anterior CC was associated with worse performances in prospective memory and sustained attention in OSA patients.
Conclusions: These findings suggest that the selective impairments of the anterior CC may help clarify the neural correlates of cognitive deficits in OSA.

原发性早泄患者静息态精细脑区亚区功能连接的异常改变及其与抑郁状态的相关性

章婷婷,朱佳佳,余永强
安徽医科大学第一附属医院

目的 近年来，已经有一些研究表明脑结构和脑功能的异常可能在原发性早泄的病因学中起着重要的作用，包括原发性早泄患者特定脑区的皮层厚度增加（如：枕叶皮层、边缘系统等）、广泛的功能连接异常（如：颞中回、额下回、岛叶等）。然而传统的功能连接分析方法具有一定局限性，如：没有精准定位。因此，我们设计了基于中科院自动化所团队绘制 246 精细脑区亚区的脑网络组图谱以评估原发性早泄患者的精细脑区亚区静息态功能连接，并同时探讨其与抑郁状态的相关性。从 2018 年 12 月到 2019 年 6 月我们共招募了 27 例基于循证医学定义的原发性早泄患者以及 22 例年龄匹配且主诉无早泄的正常健康对照组男性。在获得医院伦理批准以后受试者签署知情同意书后，所有人都填写了一份详细的问卷，问卷内容主要包括：人口特征学数据（如年龄、身高、体重、学历、月收入、抽烟、饮酒情况等），既往疾病、手术史和性生活情况，以及 PEDT 和 Beck 抑郁量表。同时，所有人进行了全脑 MRI 的静息态 BOLD-fMRI 扫描。
结果 早泄组患者的年龄、月收入、BMI 等与对照组无显著差异，而 PEDT 评分及 Beck 抑郁量表评分显著高于对照组（PEDT：14.70±3.95 vs.2.91±2.51，P <0.001； Beck：11.78±7.55 vs.3.05±4.12，P <0.001）。而在不同亚区的静息态功能连接中，我们发现早泄组患者右侧腹侧颞中回与左侧颞中回，右侧前部颞中回与右侧海马旁回、左侧后部颞中回与双侧楔前叶的功能连接比正常组增强，同时，以上脑改变与原发性早泄患者抑郁评分无显著相关。
结论 精细脑区亚区静息态功能连接分析可以为原发性早泄患者的脑网络异常提供更精确定位。

探讨磁共振增强减影技术在颅脑出血性病变中的应用价值

翁强

福建医科大学附属第一医院

目的:探讨磁共振增强减影技术对颅脑出血性病变的应用价值。方法:收集 2015 年 6 月-2017 年 8 月期间 46 例行颅脑磁共振增强扫描并发现 T1WI 上有高信号出血病灶的患者，利用 3.0T MRI 扫描仪后处理工作站对增强前后的 GRE T1WI 序列进行减影。由 1 名高年资磁共振医师对常规组及减影组的图像进行分析。 结果:46 例中肿瘤出血 19 例，高血压出血 6 例，血管畸形出血 21 例。常规组 SI 相对信号强度均值为 0.27±0.241，减影组 SI 相对信号强度均值为 4.63±8.04，两者具有统计学差异（P=0.023）。常规组正确率为 50.0%（23/46），肉眼难以识别率 32.6%（15/46），错误率达 17.4%（8/46），而减影组正确率达 95.7%（44/46），错误率仅为 4.3%（2/46），两者具有统计学差异（P=0.007）。结论:磁共振增强减影技术在颅脑出血性病变具有重要的临床应用价值。

多次静脉注射钆对比剂后小鼠脑内钆沉积的初步研究

孔莹,徐凯
徐州医科大学附属医院

目的 使用小鼠模型在病理层面上验证钆对比剂脑内沉积现象。定量比较多次静脉注射线性钆对比剂钆喷酸葡胺（Gd-DTPA）、大环类对比剂钆特酸葡胺（Gd-DOTA）后小脑组织中钆沉积是否存在差异。

方法 将 45 只昆明白鼠随机分为 2 个暴露组（Gd-DTPA 组、Gd-DOTA 组）、1 个对照组（生理盐水组），每组 n=15。暴露组每次以 2.0 mmol Gd/kg（4.0 ml/kg）剂量共进行 20 次钆对比剂尾静脉注射（每周注射 4 次，持续 5 周）。在 2 周恢复期后，处死动物、获取组织，通过电感耦合等离子体质谱（ICP-MS）技术进行钆含量测定，采用单因素方差分析比较各组间小脑组织中钆含量差别是否具有统计学意义。

结果 恢复 2 周后，使用 ICP-MS 技术检测得到 Gd-DTPA 组小脑组织内钆含量最高，约是 Gd-DOTA 组小脑组织的钆含量 9 倍以上，分别为 8.767±0.059nmol/g、0.882±0.043nmol/g；但是在 Gd-DTPA 组小鼠小脑组织中检测到的总钆量仍然很低，大约为小脑组织总注射量的 0.0029%。生理盐水组未检测到明显的钆沉积（0.201±0.040nmol/g）。经单因素方差分析显示 3 组的钆含量比较差异有统计学意义（F=1.4×105，P<0.05），两两比较结果显示 Gd-DTPA 组、Gd-DOTA 组及生理盐水组 3 组之间钆含量均有统计学意义（P<0.05）。

结论 连续多次静脉注射线性、大环类钆造影剂后，小鼠脑内均出现钆沉积现象；线性钆对比剂脑内沉积量明显高于大环类钆对比剂。

Primary prostate solitary neurofibroma without neurofibromatosis-I: a case report and narrative review of the literature

屈巧俊
山西医科大学第一医院

Neurofibroma of the prostate is an extremely rare benign tumor, particularly when it is not associated with neurofibromatosis-I (NF-1). This study aimed to report the case

of a 44-year-old man who presented with dysuria for about 4 years. Magnetic resonance imaging (MRI) showed a mass in the prostate with “target sign” on T2-weighted imaging. The mass was surgically excised, and histopathological findings revealed a neurofibroma. No clinical or laboratorial manifestations of NF-1 were identified. Also, no local recurrence occurred after the 3-month follow-up. This was the first case of prostate solitary neurofibroma without NF-1, and the “target sign” on MRI could supply some significant implications in the diagnosis.

PU-0681

头颅磁共振灌注成像最佳注药时机的研究

周婕,冉启胜
陆军军医大学大坪医院

目的 头颅磁共振灌注成像（perfusion- weighted imaging，PWI）采用对比剂首过灌注成像反映脑组织微循环分布及其血流灌注情况、评估局部组织活力和功能。研究不同注药期相来获得脑组织血流灌注的信号强度-时间曲线以探究其最佳注药时机，为 MR PWI 在临床应用研究迈出重要的一步。

方法 ：收集我院进行头颅磁共振灌注成像的无明确脑血管疾病的 160 名配合患者，随机分为 8 组，每组 20 名。使用西门子 3.0T Verio 高频 MRI 扫描仪，头部线圈，头颅灌注序列，双倍剂量 MRI 对比剂（钆喷酸葡胺，0.2mmol/kg），扫描范围自枕骨大孔至颅顶，常规 T1-sag、T2-tra、T1-tra、T2-flair 扫描后行 PWI，使用高压注射器进行静脉团注，注射速率统一为 4ml/s，注射对比剂结束后立即以相同速率注入 20ml 生理盐水，8 组病例分别于第 3、4、5、6、7、8、9、10 期注射对比剂。扫描结束后，图像资料传送到西门子后处理工作站，用 perf MR 软件后处理选择感兴趣区（ROI），以单侧大脑中动脉作为研究区域，选择可靠曲线经过计算机计算得到信号强度-时间曲线。由 2 名经验丰富的磁共振成像(MRI)诊断医师评价所有患者的图像，得到 160 例中第 3-10 期所有图像符合例数分别为 3、4、17、18、18、19、12、6 例，各期符合率分别为 15%、20%、85%、90%、90%、95%、60%、30%。

结果 根据各实验组划定的 ROI 后处理所得信号强度-时间曲线得到，不同注药期相所获得图像各有差异：第 3 期、4 期大部分二次灌注效应明显；第 5-8 期各例数灌注首过效应明显，符合实验要求；第 9-10 期对比剂通过时间延长，引起低灌注现象。

结论 本实验研究结果表明，头颅 PWI 第 5-8 期既能有效地改善二次灌注效应，也能避免低灌注现象，即可参考为头颅磁共振灌注成像最佳注药期相。

Abnormal resting-state functional connectivity of amygdala in primary angle-closure glaucoma: A seed-based functional connectivity study.

Fei Jiang
1.The second Affiliated Hospital of Nanchang University
2.Department of Radiology， The second Affiliated Hospital of Nanchang University

Background: Glaucoma is the second leading cause of blindness and affected patients are at a high risk of anxiety and depression. However, the neural mechanisms underlying glaucoma-induced anxiety and depression remain unknown.
Purpose: The purpose of this study was to investigate alterations in amygdala-based emotional processing circuits in primary angle-closure glaucoma (PACG) patients by using resting-state functional connectivity (FC) analysis.
Materials and methods: Thirty-seven patients with PACG (20 men and 17 women) and 36 healthy controls (20 men and 16 women) closely matched for age, sex, and education, underwent resting-state magnetic resonance imaging scans. A seed-based correlation analysis was performed to investigate altered FC of the amygdala. A voxel-wise FC method was used to explore differences in amygdala FC patterns between the two groups.
Results: Compared with healthy controls, PACG patients showed reduced FC from the left amygdala to the bilateral brainstem, right thalamus, and left superior frontal gyrus; they also showed enhanced FC from the left amygdala to the left middle temporal gyrus, right inferior temporal gyrus, and left cuneus. In addition, PACG patients showed reduced FC from the right amygdala to the right cerebellum_4_5 and enhanced FC from the right amygdala to the right inferior temporal gyrus and right calcarine (two tailed, voxel-level: $P<0.01$, GRF correction, cluster-level: $P<0.05$).
Conclusion: Our results highlighted that PACG patients had abnormal FC between the amygdala and each of the following: superior frontal gyrus, thalamus, temporal gyrus, and visual cortices. This offers novel insights into the understanding of neural mechanisms underlying depression in PACG patients.

Selective micro-structural integrity impairment of the isthmus subregion of the corpus callosum in alcohol-dependent males

Yajun Wang, JiaJia Zhu, YongQiang Yu
The First Affiliated Hospital of Anhui Medical University

Background: Previous studies have provided evidence that alcohol-dependent patients have abnormality in corpus callosum (CC); however, it is unclear whether micro structural integrity of the CC subregions is differentially affected in this disorder.
Methods: In this study, a total of 39 male individuals, including 19 alcohol-dependent patients and 20 age-matched healthy controls, underwent diffusion tensor imaging (DTI). CC was reconstructed by DTI tractography and was divided into seven subregions. Multiple diffusion metrics of each subregion were compared between two groups.
Results: Compared to healthy controls, patients exhibited increased axial diffusivity ($P = 0.007$), radial diffusivity ($P = 0.009$) and mean diffusivity ($P = 0.005$) in the isthmus. In addition, we observed that daily alcohol intake was correlated positively with radial diffusivity and mean diffusivity and negatively with fractional

anisotropy, while abstinence time of hospitalization was negatively correlated with mean diffusivity in the patients.
Conclusion: These findings suggest a selective micro-structural integrity impairment of the corpus callosum subregions in alcohol dependence, characterized by axon and myelin alterations in the isthmus.

上皮样胶质母细胞瘤 5 例 MRI 表现分析并文献复习

陈随,陈子健,刘春雨,黄伟,卢光明
中国人民解放军东部战区总医院

目的 分析、总结上皮样胶质母细胞瘤（epithelioid glioblastoma，eGBM）的 MRI 表现，提高术前诊断正确率。**方法** 回顾性分析 5 例经病理证实的 eGBM 的 MRI 图像，观察内容主要包括：病灶部位、边缘、信号、瘤周水肿及强化特点。**结果** 1 例病变多发，4 例单发，病灶主体位于颞叶 3 例，顶叶 1 例，额叶 1 例；病变边界均清楚；1 例瘤周重度水肿，4 例瘤周轻中度水肿；1 例病变呈花环样明显强化，壁厚且毛糙，3 例病变实性部分及囊壁明显强化，壁薄且光滑，未见壁结节。**结论** 上皮样胶质母细胞瘤的 MRI 表现具有一定的特征性，结合发病部位表浅、肿瘤边界清楚及年轻人多见等特点，有助于提高术前诊断正确率。

年龄对大脑皮质语言分区不对称性影响的 MRI 研究

侯中煜[1],夏新建[1,2],汤煜春[3],林祥涛[1],张忠和[1],于乔文[1],刘树伟[3],王锡明[1]
1.山东省立医院
2.寿光市人民医院
3.山东大学

目的 应用 MRI 图像和计算机图像分析技术探讨不同年龄段大脑语言分区皮质体积、厚度及表面积的侧化差异。
方法 招募右利手汉族 20 岁以上 80 岁以下的健康志愿者 286 例，获取脑 3.0 T MRI 原始数据，选择额中回、额下回岛盖部、额下回三角部、中央前回、角回、颞上回作为感兴趣区，使用 FreeSurfer 脑成像软件分析得到语言区相关脑回皮质体积、厚度、表面积具体数值，探究青年组（21-40 岁）、中年组（41-60 岁）、老年组（61-80 岁）三个年龄段大脑皮质语言区的偏侧性。
结果 语言区的脑皮质体积、厚度、表面积与年龄皆呈负相关关系，三个形态学指标的年龄相关性相互关联；不同年龄段语言相关脑区皮质体积、厚度及表面积的不对称区域数量不同、偏侧程度不同，三个形态学指标不对称性随年龄变化而改变的模式各不相同（皮质厚度呈“抛物线”模式）；语言区皮质厚度多数呈明显右侧化。
结论 语言区皮质结构是不对称的，其不对称性随着年龄的变化而呈动态改变，不同形态学指标改变模式不同。

Abnormal synchronization of functional and structural networks in schizophrenia

Jiajia Zhu
The First Affiliated Hospital of Anhui Medical University

Synchronization is believed to play an important role in information processing of the brain. Mounting evidence supports the hypothesis that schizophrenia is related to impaired neural synchrony. However, most previous studies characterize brain synchronization from the perspective of temporal coordination of distributed neural activity, rather than network properties. Our aim was to investigate the network synchronization alterations in schizophrenia using publically available data. Resting-state functional magnetic resonance imaging (fMRI) and diffusion tensor imaging (DTI) were performed in 96 schizophrenia patients and 120 healthy controls. The whole-brain functional and structural networks were constructed and analyzed using graph theoretical approaches. Inter-group differences in network synchronization were investigated. Both the binary and weighted functional networks of schizophrenia patients exhibited decreased synchronizability (increased eigenratio) than those of healthy controls. With respect to the structural binary networks, schizophrenia patients showed a trend towards excessive synchronizability (decreased eigenratio). In addition, the excessive synchronizability of the structural binary networks was associated with more severe negative symptoms in schizophrenia patients. Our findings provide novel biological evidence that schizophrenia involves a disruption of neural synchrony from the perspective of network properties.

PU-0687

Quantitative prediction of individual cognitive flexibility using structural MRI

Jiajia Zhu
The First Affiliated Hospital of Anhui Medical University

Cognitive flexibility, a core dimension of executive functions, refers to one's ability to switch between multiple tasks and sets in a quick and flexible manner. However, whether objective neuroimaging can be used to quantitatively predict cognitive flexibility at the individual level remains largely unexplored. High-resolution magnetic resonance imaging data of 100 healthy young participants from the Human Connectome Project (HCP) dataset were used to calculate gray matter volume (GMV). Cognitive flexibility was assessed by the Dimensional Change Card Sort Test (DCCS). Using a multivariate machine learning technique known as relevance vector regression (RVR), we examined the relationship between GMV and cognitive flexibility performance. We found that the application of RVR to GMV allowed quantitative prediction of the DCCS scores with statistically significant accuracy (correlation = 0.41, P = 0.0001; mean squared error = 73.35, P = 0.0001). Accurate prediction was mainly based on GMV in the temporal regions. In addition, a univariate approach also revealed an inverse association between DCCS scores and GMV in the temporal areas. Our findings provide

preliminary support to the development of neuroimaging techniques as a useful means to inform the cognitive assessment of individuals. Furthermore, the significant contribution of temporal regions suggests the prominent role of temporal cortex morphology in individual differences in cognitive flexibility.

PU-0688

Altered spatial and temporal concordance among intrinsic brain activity measures in schizophrenia

Jiajia Zhu
The First Affiliated Hospital of Anhui Medical University

Various data-driven voxel-wise measures derived from resting-state functional magnetic resonance imaging (rs-fMRI) have been developed to characterize spontaneous brain activity. These measures have been widely applied to explore brain functional changes in schizophrenia and have enjoyed significant success in unraveling the neural mechanisms of this disorder. However, their spatial and temporal coupling alterations in schizophrenia remain largely unknown. To address this issue, 88 schizophrenia patients and 116 gender- and age-matched healthy controls underwent rs-fMRI examinations. Kendall's W was used to calculate volume-wise (across voxels) and voxel-wise (across time windows) concordance among multiple commonly used measures, including fractional amplitude of low frequency fluctuations, regional homogeneity, voxel-mirrored homotopic connectivity, degree centrality and global signal connectivity. Inter-group differences in the concordance were investigated. Results revealed that whole gray matter volume-wise concordance was reduced in schizophrenia patients relative to healthy controls. Although two groups showed similar spatial distributions of the voxel-wise concordance, quantitative comparison analysis revealed that schizophrenia patients exhibited decreased voxel-wise concordance in gray matter areas spanning the bilateral frontal, parietal, occipital, temporal and insular cortices. In addition, these concordance changes were negatively correlated with onset age in schizophrenia patients. Our findings suggest that the concordance approaches may provide new insights into the neural mechanisms of schizophrenia and have the potential to be extended to neuropsychiatric disorders.

PU-0689

Disrupted topological organization of the motor execution network in alcohol dependence

Jiajia Zhu
The First Affiliated Hospital of Anhui Medical University

Motor function damage is one of the most common symptoms in patients with alcohol dependence (AD). However, relatively little is known about the neuropathology of the motor impairments in AD. The aim of this study was to identify changes in the

topological organization of the motor execution network in AD. Here, a total of 39 male individuals, including 19 AD patients and 20 age-matched healthy controls, underwent resting-state functional magnetic resonance imaging (fMRI). The motor execution network was constructed and analyzed using graph theoretical approaches. Topological properties (including global, nodal and edge measures) were compared between the two groups. At the global level, AD patients exhibited increased local specialization (indexed by increased clustering coefficient and local efficiency) relative to healthy controls, indicating that the motor execution network of AD patients shifts toward regularization. At the node level, nodal degree was higher in AD patients in the cerebellum. At the edge level, we observed a cerebello-thalamo-striato-cortical circuit with altered functional connectivity strength in AD patients. These findings suggest that topological architecture of the motor execution network is disrupted in AD patients, which may provide important insights into the neurobiology of the AD-related motor impairments.

PU-0690

Abnormal coupling among spontaneous brain activity metrics and cognitive deficits in major depressive disorder

Jiajia Zhu
The First Affiliated Hospital of Anhui Medical University

BACKGROUND: A variety of functional metrics derived from resting-state functional magnetic resonance imaging (rs-fMRI) have been employed to explore spontaneous brain activity changes in major depressive disorder (MDD) and have enjoyed significant success in unraveling the neurobiological mechanisms underlying this disorder. However, it is unclear whether spatial and temporal coupling relationships among these rs-fMRI metrics are altered in MDD. METHODS: 50 patients with MDD and 36 well-matched healthy controls underwent rs-fMRI scans. A dynamic analysis was applied to compute multiple frequently used metrics including fractional amplitude of low frequency fluctuations, regional homogeneity, voxel-mirrored homotopic connectivity, degree centrality and global signal connectivity. Kendall's W was used to calculate volume-wise (across voxels) and voxel-wise (across time windows) concordance among these metrics. Inter-group differences in the concordance and their associations with clinical and cognitive variables were tested. RESULTS: Compared to healthy controls, patients with MDD showed decreased whole gray matter volume-wise concordance. Despite similar spatial distributions, quantitative comparison analysis revealed that MDD patients exhibited reduced voxel-wise concordance in multiple cortical and subcortical regions. Moreover, the lower concordance was associated with worse performances in prospective memory and sustained attention in the MDD group. LIMITATIONS: The study design of fairly modest sample size did not allow us to perform a full analysis of the potential effects of medication and illness duration. CONCLUSIONS: Our findings suggest that spatial and temporal decoupling of multiple resting-state brain activity metrics may help elucidate the neural mechanisms of cognitive deficits in depression.

PU-0691

Variance of the global signal as a pretreatment predictor of antidepressant treatment response in drug-naïve major depressive disorder

Cai Huanhuan,Zhu Jiajia ,Yu Yongqiang
The First Affiliated Hospital of Anhui Medical University

Several behavioral and neuroimaging markers could be used to predict eventual antidepressant medication (ADM) outcomes in patients with major depressive disorder (MDD). However, these predictors are either subjective or complex, which has limited their clinical use. Thus, we aimed to identify an objective and easy-to-get marker to predict early therapeutic efcacy. Forty-seven drug-naïve patients with MDD and 47 age-, gender- and education-matched healthy controls underwent resting-state functional magnetic resonance imaging (fMRI) scans. We calculated the variable coefcient (VC) of the global signal for each subject. Baseline Hamilton Rating Scale for Depression (HRSD) score and that after 2 weeks of ADM were assessed for patients. Although there was no difference in VC between patients with MDD and healthy controls, we found a significant positive correlation between the VC and the decline rate of HRSD scores in the patients. Compared with the nonresponding depression (NRD) group, the treatment-responsive depression (TRD) group had a higher VC. Receiver operator characteristic curve analysis revealed that the VC exhibited a good ability to differentiate TRD from NRD. In addition, the linear and logistic regression analyses showed that the VC was a significant predictor of the decline rate of HRSD scores and the antidepressant treatment response. These findings suggest that variance of the global signal may serve as a useful marker to help clinicians find an appropriate drug for individuals with MDD at the earliest opportunity and then further to facilitate personalized therapy.

DKI 序列在帕金森患者中的研究应用

姚佳琪
新疆医科大学第二附属医院

帕金森病患者的病理可与神经元内和细胞外的变化相联系，从而导致神经元变性，中枢神经系统是由许多生物屏障组成的复杂结构。某部分微观结构阻碍或许受到一些病理因素的影响，具体来说，脑内显微微观结构的变化改变了水的扩散，而水的扩散可以通过扩散加权成像(DWI)技术进行非侵入性评定，弥散张量成像(DTI)是一种扩散高斯过程的 MRI 序列，没有扩散障碍。然而，脑组织的环境具有非高斯扩散的特征，因此，为了量化水扩散的非高斯分布，发展了扩散峰度成像(diffusion kurtosis imaging, DKI)作为 DTI 方法的扩展，该技术为早期诊断提供了一种很有前途的方法，本文的目的是总结目前正在进行的帕金森病临床和临床前研究，使用 DKI 并讨论该技术作为神经退行性疾病的早期生物标志物的作用，为临床及影像正确认识帕金森病提供科学依据.

基于 MRI 平扫 T1WI 序列多次使用对比剂后脑内核团信号改变的研究

沈连芳,钟山,蒋常琴,冯强
潍坊市益都中心医院

目的 分析多次使用钆对比剂后，MRI 平扫 T1WI 序列上齿状核、豆状核、尾状核及丘脑的信号强度变化及信号强度变化与使用对比剂次数、使用对比剂间隔时间的相关性。
方法 回顾性分析 2010 年 3 月 19 日至 2019 年 5 月 4 日 26 例曾在我院接受过 4 次以上 MR 增强检查的患者的临床及 MRI 资料。所有患者 MRI 检查在 Siemens Avanto 1.5T 及 Siemens Skyra 3T 磁共振仪上进行，将所有图像传输至 Skyra 3T 副台。由两位高年资医师分别在第一次增强扫描前及最后一次增强扫描后的平扫 T1WI 上测量齿状核、豆状核、尾状核、丘脑及脑桥的信号强度，分别计算齿状核、豆状核、尾状核、丘脑与脑桥的信号强度比值。采用配对样本 t 检验分析两名医生测得所有数据间的一致性及同一患者多次增强前后平扫 T1WI 上齿状核、豆状核、尾状核、丘脑与脑桥的信号强度比之间是否存在差异。采用线性回归分析方法分析多次增强前后齿状核／脑桥、豆状核／脑桥、尾状核／脑桥、丘脑／脑桥信号强度比变化与使用对比剂次数、使用对比剂间隔时间是否相关。
结果 多次增强后齿状核与脑桥的信号强度比（1.04±0.04）大于增强前的信号强度比（1.01±0.05），差异具有统计学意义（t=-3.475，p=0.002）；增强前后豆状核、尾状核、丘脑与脑桥的信号强度比变化不大（0.91±0.06，0.94±0.06，0.93±0.05；0.91±0.05，0.94±0.05，0.93±0.05），差异均无明显统计学意义（p>0.05）。线性回归分析结果显示齿状核/脑桥信号强度比与钆对比剂注射次数之间存在正相关(回归系数=0．144，p=0．009)；与使用对比剂间隔时间之间无明显相关性(P 值>0．05)。
结论 多次使用钆对比剂注射患者，MRI 平扫 T1WI 序列齿状核信号增高，且与增强扫描次数存在相关性。

PU-0694
女性 HPRL 患者垂体 MRI 影像表现的相关研究

李妮
宁夏医科大学心脑血管医院

目的　探讨女性高泌乳素血症患者垂体 MRI 影像学表现与 PRL 水平的关系，以期垂体 MRI 在高泌乳素血症的病因诊断及治疗方案的选择提供影像学参考依据。方法　严格按照纳入排除标准回顾性收集女性高泌乳素患者 140 例，垂体表现正常 44 例，空泡蝶鞍 10 例，Rathke 氏囊肿 16 例，微腺瘤 44 例，大腺瘤 26 例，依据微腺瘤瘤体位置、垂体柄位置将微腺瘤分组，瘤体位于中间 10 例，位于两侧 34 例，垂体柄偏倚 19 例，居中 25 例，根据大腺瘤术后病理免疫结果将其分为泌乳素型大腺瘤（11 例）及非泌乳素型大腺瘤（15 例）。于 GEADW4.2 工作站观察垂体瘤的 MRI 表现并测量垂体瘤的长宽高各径线三次取平均值，使用多田公式法（V=xyz×π/6)计算肿瘤体积 V，并回顾性收集临近时期 PRL 水平。采用非参数秩和检验统计分析五组垂体 MRI 表现 PRL 水平差异性，微腺瘤瘤体不同位置、垂体柄不同位置 PRL 水平差异性，泌乳素型大腺瘤与非泌乳型大腺瘤瘤体体积、PRL 水平的差异性，利用非参数统计 Spearman 相关检验分析微腺瘤瘤体体积与 PRL 水平的相

关性。 结果 五组垂体 MRI 表现的 PRL 水平差异具有统计学意义，泌乳素大腺瘤与非泌乳素大腺瘤瘤体体积、PRL 水平差异具有统计学意义，P<0.05;微腺瘤瘤体体积与 PRL 水平具有相关关系，r=0.425,p<0.05;微腺瘤瘤体不同位置、垂体柄偏倚或否 PRL 水平差异无统计学意义，P>0.05；本组 44 例伴高泌乳素血症微腺瘤，有 34 例位于两侧，占 77%。结论 PRL 水平对患者是否合并垂体病变及病变亚型有预测意义；将 PRL 水平与垂体 MRI 表现结合可提高泌乳素型大腺瘤与非泌乳素型大腺瘤鉴别诊断价值，对合理选择治疗方案，改善预后有重要意义。

PU-0695

Abnormal white matter integrity in MDD patients with poor sleep quality: A Tract-Based Spatial Statistics Study

Ying Yang,Jiajia Zhu,Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Background: Major depressive disorder (MDD) patients with sleep disturbances represent a large proportion of depressed population. However, neural mechanisms underlying sleep disturbances in MDD remain largely unknown.
Methods: 96 patients with MDD underwent polysomnography (PSG) monitoring and magnetic resonance imaging (MRI) scans. According to the value of sleep efficiency (SE), participants were divided into two groups, 42 MDD patients with SE ≥ 90% and 54 well-matched MDD patients with SE < 90%. Inter-group differences in the analyses of tract-based spatial statistics (TBSS) on diffusion tensor imaging (DTI) were tested.
Results: Compared with MDD patients with SE ≥ 90% group, MDD patients with SE < 90% group had significant increased AD in the left superior corona radiata (L-SCR), left posterior corona radiata (L-PCR), left posterior limb of internal capsule (L-PLIC) and left retrolenticular part of internal capsule (L-RLIC).
Conclusions:
The present study suggests that MDD patients with poor sleep quality had reductions of AD in two major white matter pathways. These findings may explain the neural mechanisms underlying poor sleep quality in MDD and could lead to a potential neuroimaging biomarker for this clinical subtype of MDD.

PU-0696

DCE-MRI 对局部晚期鼻咽癌 TP 诱导化疗疗效的价值研究

马丽雅,马贺骥
锦州医学院附属第一医院

「**摘要**」**目的**：探讨动态增强磁共振（Dynamic contrast-enhanced MRI,DCE-MRI）多参数评估局部晚期鼻咽癌（III/IV 期）诱导化疗（Induced chemotherapy, IC）疗效的价值。**方法**：收集 2017 年 9 月至 2019 年 9 月于我院治疗的局部晚期鼻咽癌患者 40 人随机分为实验组和对照组。实验组分别测量诱导化疗前后及同步放化疗（CCRT）总体结束后；对照组分别测 CCRT 前后的时间-信号强度曲线（TIC）形态、最大强化率（MER）、早期强化率(SER)，肿瘤最大径（V_d）、肿瘤最大

径退缩率（Δ V_d%）达峰时间（TTP）、ΔMER %、 Δ SER %、比较各参数在组内不同治疗阶段及组间同一阶段的变化幅度及各参数之间相关性。**结果**：实验组 TP（多西他赛联合顺铂）IC 疗末 V_d、 MER、SER 较 IC 治疗前降低； Δ MER %、 Δ SER %、Δ V_d%变化幅度较同组其他阶段以及对照组同一阶段变化幅度最大，差异均有统计学意义（p 值<0.01）。肿瘤最大径退缩率与实体肿瘤治疗疗效差异有统计学意义（p<0.05），两组 TIC 曲线的形态变化与Δ V_d%差异之间（p=0.040,）有统计学意义，即诱导化疗前 TIC 曲线流入及流出速度、达峰时间（TTP）与肿瘤退缩率呈显著负相关。**结论**；鼻咽癌 TP 方案有效的减轻肿瘤负荷，DCE-MRI 各参数与实体肿瘤疗效高度相关，具有较好预测 TP 诱导化疗方案疗效及评估疗效的效能，对 TP 诱导化疗方案有效评估可使其作为局部晚期鼻咽癌综合治疗中重要阶段发挥积极作用、为临床早期完善进一步治疗提供更客观的影像学证据。

脊柱线圈与体部线圈联合使用在 3.0T MRI 上用 3D-SPACE 序列对肥胖患者的腰骶丛神经显示的讨论

张清俊
合肥平安健康检测中心

【摘要】目的探究脊柱线圈与体部线圈联合使用在 3D-SPACE 序列对肥胖者腰骶丛神经显示的价值。**方法**选取 20 例肥胖志愿者（BMI＞28）于 3.0T 磁共振行腰骶椎 MRI 检查。扫描包括横断位和矢状位快速自旋回波 T_2WI 序列及冠状位 3D-SPACE 序列，对同一志愿者分别仅使用脊柱线圈和使用脊柱线圈联合体部相控阵列线圈各检查一次。观察各序列中腰骶丛神经显示的情况，对比两种检查方法腰骶丛神经清晰的显示率及神经的信号强度。**结果**仅使用脊柱线圈 3D-SPACE 序列上腰骶丛神经优良率为 65%，信噪比（35.6±3.5）；T_2WI 序列优良率为 70%，信噪比（30.3±2.1）；使用脊柱线圈联合体部相控阵列线圈 3D-SPACE 序列上腰骶丛神经优良率为 95%，信噪比（55.4±5.5）；T_2WI 序列优良率为 85%，信噪比（48.9±4.5）。两者差异具有统计学意义（P<0.05）。**结论**脊柱线圈与体部相控阵列线圈联合使用较脊柱线圈单独使用对肥胖患者腰骶丛神经显示更全面、更清晰。多线圈的联合使用对肥胖患者腰骶丛神经显示中具有重要价值。

PU-0698

Directed functional connectivity of the hippocampus in patients with presbycusis

Yuchen Chen, Xindao Yin, Jianping Gu
Nanjing First Hospital, Nanjing Medical University

Purpose: Presbycusis, associated with a diminished quality of life characterized by bilateral sensorineural hearing loss at high frequencies, has become an increasingly critical public health problem. This study aimed to identify directed functional connectivity (FC) of the hippocampus in patients with presbycusis and to explore the causes if the directed functional connections of the hippocampus were disrupted.
Methods: Presbycusis patients (n = 32) and age-, sex-, and education-matched healthy controls (n = 40) were included in this study. The seed regions of bilateral hippocampus were selected to identify directed FC in patients with presbycusis using Granger causality analysis (GCA) approach. Correlation analyses were conducted to

detect the associations of disrupted directed FC of hippocampus with clinical measures of presbycusis.
Results: Compared to healthy controls, decreased directed FC between inferior parietal lobule, insula, right supplementary motor area, middle temporal gyrus and hippocampus were detected in presbycusis patients. Furthermore, a negative correlation between TMB score and the decline of directed FC from left inferior parietal lobule to left hippocampus ($r = -0.423$, $p = 0.025$) and from right inferior parietal lobule to right hippocampus ($r = -0.516$, $p = 0.005$) were also observed.
Conclusion: The decreased directed functional connections of the hippocampus were detected in patients with presbycusis, which was associated with specific cognitive performance. This study mainly emphasizes the crucial role of hippocampus in presbycusis and will enhance our understanding of the neuropathological mechanisms of presbycusis.

PU-0699
不同标记后延迟时间对急性缺血性脑梗死患者侧支循环 的建立及愈后的评估

邓得峰,郭瑞,吴英,安甲佳
新疆生产建设兵团医院

目的探讨 3D-ASL（three-dimensional pulsed continuous arterial spin labeling,3D pCASL）中不同标记后延迟时间（post labeling delay,PLD）对急性缺血性脑梗死患者有无缺血半暗带、侧支循环的建立及愈后的初步评估。材料**方法** 选取 46 例经临床神经医生诊断为急性缺血性脑梗死患者（CT 除外脑出血及其它非缺血性脑病）行扩散加权成像（diffusion weighted imaging,DWI）以及三维准连续动脉自旋标记技术（three-dimensional pulsed continuous arterial spin labeling,3D pCASL）（PLD=1.5 s,2.5 s）序列扫描。测量脑梗死区不同 PLD 时间的血流量(CBF)值。并对 46 例患者 DWI，GE ADW4.6 Functool 自动后处理软件对不同 PLD 时间的 3D-ASL 图梗死区（ROI）统计学分析。**结果** 脑梗死区 CBF 值在 PLD=1 .5s 与 PLD=2 .5s 无变化，比较差异无统计学意义(P>0.05),脑梗死区 PLD=2 .5s 的 CBF 值明显高于 PLD=1 .5s 的 CBF 值，比较差异有统计学意义(P<0.05)。**结论** 作为一项无创性磁共振灌注成像新技术， 3DASL 中不同标记后延迟时间(1 .5s 和 2 .5s)对急性脑梗死患者有无缺血半暗带侧支循环的建立提供重要依据，对脑梗死患者的预后具有重要意义。

3D-ASL 联合 SWAN、DWI 序列在急性脑梗塞中的诊断价值

王显峰,张蓓蕾
重庆市第七人民医院

【摘要】 **目的** 分析、探讨 3 D 动脉自旋标记灌注成像(3D-ASL)联合应用磁敏感加权技术(SWAN)、弥散加权成像（DWI）在急性脑梗塞诊断的应用价值。**方法** 使用美国通用 GE Optima 360 1.5T 磁共振成像系统，选取 2018 年 1 月至 2019 年 1 月接受检查扫描患者 30 例，临床诊断急性脑梗死患者均行常规 MRI 序列（T1WI、T2WI、T2FLAIR、SAG-T2WI）、DWI、SWAN、3D-ASL 检查，根据病情需要，6 例患者行增强扫描。将获得的图像数据输入 ADW4.6 工

作站进行后处理，再经 PACS 发送至医生诊断工作站，由经验丰富的诊断医师对图像进行评价分析。 **结果** 常规 MRI 序列和 DWI 扫描，结合典型的临床症状和体征，30 例病人均为急性脑梗死，其中 6 例为大面积脑梗塞，并能找到责任病灶，常规序列扫描 T1WI 表现为低信号灶，T2WI 和 T2FLAIR 表现为高信号，DWI 表现为不同范围的明显高信号区，大面积脑梗塞呈连续的大片状，单发或多发的腔隙性脑梗塞为单发或多发斑点状、团片装的高信号区，病灶可以分布在不同的脑叶；SWAN 序列成像检查 20 例急性脑梗死患者脑内有微出血灶，呈点状、圆形、椭圆形低信号，分布在病灶内及病灶以外区域，显示病灶区静脉血管形态改变，大动脉阻塞的血栓也可以显示，明显优于常规序列。 3 D-ASL 显示病灶的脑血管灌注特点和侧支循环供血情况、评价半暗带范围。**结论** SWAN 显示急性脑梗塞周围引流静脉形态学改变，反映病变区血氧饱和度水平改变的情况，以及并发的微出血及梗死区是否有侧支循坏形成和责任血管情况，对于患者治疗方案的确定起着重要的作用；3D-ASL 与 SWAN 序列联合应用应作为急性脑梗死检查的常规序列，既评价急性脑梗塞患者的脑血流灌注特点、动脉血栓，还能够评价患者是否伴发出血及潜在出血风险，对急性脑梗塞患者溶栓治疗具有重要的指导价值。

PU-0701

3D-ASL 联合 DWI、MRA 成像在脑梗塞的诊断价值

王显峰,彭亚飞
重庆市第七人民医院

【摘要】目的 分析磁共振 3 D 动脉自旋标记灌注成像（ 3 D-ASL）联合 DWI、MRA 成像技术对脑梗塞的临床诊断结果，评价其对急性脑梗塞诊断、治疗的指导价值。 **方法** 选择 2018 年 1 月至 2019 年 1 月在我院检查诊断患者 30 例，采用美国 GE Optima 360 1.5T 磁共振成像系统，均行常规 MRI 序列（T1WI、T2WI、T2FLAIR、SAG-T2WI），DWI、MRA、 3 D-ASL 检查，DWI 采取多 b 值扫描，ASL 检查时选取 PLD 1.5 秒和 2.5 秒进行扫描采集相关数据，将采集的数据输入工作站 ADW 4.6 后处理形成脑血流量图（CBF），对影像表现对比评价。**结果** 30 例患者中，6 例为大面积脑梗塞，常规序列表现为大范围脑实质内异常信号改变，T1WI 表现为低信号，T2WI 表现为高信号，T2FLAIR 呈高信号，常累及大脑中动脉供血区，脑回肿胀，脑沟变浅，T2WI 显示供血动脉主干远端的分支流空信号明显减少或消失，DWI 图像表现为大片的明显高信号区，同时 MRA 表现一侧大脑中动脉主干及分支闭塞，远端分支消失或减少；24 例为新发的腔隙性脑梗塞，单病灶者 18 例，多发病灶者 6 例，表现为单发或多发的长 T1 长 T2 信号灶，T2FLAIR 呈高信号，可分布在不同脑叶；DWI 表现为不同范围的斑点状、斑片状明亮高信号；ASL-CBF 表现为不同范围的血流灌注减低区，大部分病人低灌注范围大于 DWI 高信号区，部分与 DWI 高信号范围基本一致，PLD 1.5 秒 ASL-CBF 表现为明显的低灌注区，PLD 2.5 秒 ASL-CBF 上低灌注区有一定的减少或恢复，提示侧枝循环的代偿作用。**结论** 3 D-ASL 联合 DWI 、MRA 成像既能明确诊断急性脑梗塞，同时评价急性脑梗塞患者的范围大小、脑血流灌注的改变，以及半暗带和侧支循环的情况，对急性脑梗塞患者下一步的治疗方法选择具有重要的指导价值，可以作为急性脑梗塞扫描的常规扫描方法。

孤立椎动脉的颈部 MRA、头部平扫 CT、MRI 诊断及临床意义

于宏,李云,杨强,邵艳萍,王明强
辽宁中置盛京老年病医院（沈阳第十二人民医院）

目的 研究孤立椎动脉的颈部 MRA 诊断与头部平扫 CT、MRI 的对应关系及临床意义。**方法** 对 58 例孤立椎动脉颈部 MRA 与头部平扫 CT、MRI 及临床症状对照分析。男 37 例，女 21 例；年龄 28-77 岁，平均年龄 59.5 岁。磁共振成像采用西门子 1.5T 成像系统，运用 3D-TOF 法颈部血管成像。当一侧椎动脉纤细，上端未与基底动脉汇合时，确定为孤立椎动脉。**结果** 58 例患者均有反复头迷眩晕等后循环供血不足症状。病史最长者约 20 余年，其中左侧孤立椎动脉 28 例，右侧 30 例，头部平扫 CT 或 MRI 均可发现患侧椎动脉明显变细或消失。**结论** 一侧椎动脉纤细，上端未与基底动脉汇合，我们称之为孤立椎动脉，目前尚未得到临床的广泛重视。孤立椎动脉时，椎基底动脉系统的血供全部来自于健侧椎动脉，因此，当健侧椎动脉受压或血压下降时，会产生相应临床症状，小脑后下动脉缺血可产生眩晕、呕吐、眼球震颤及头面部感觉异常。内听动脉又称迷路动脉，为一细长分支，几乎 80%以上发自小脑前下动脉，内听动脉血液供应障碍，有时可作为椎-基底动脉疾病早期信号，这是因为内听动脉供应区侧枝循环较差的缘故，半规管、椭圆囊、球囊及耳蜗对血液供应的变化反应特别敏感，只要通过的流量稍减少，就可产生平衡障碍、眩晕、恶心、呕吐及耳鸣等症状，由于早期症状很像美尼尔综合征，故临床应仔细加以鉴别。本文中有 5 例曾被诊断为耳源性眩晕；10 例因高血压服用降压药后导致血压过低，其中最严重一例导致突发椎动脉闭塞引起脑干梗塞而死亡。

综上，①孤立椎动脉是眩晕的主要原因之一，也是椎基底动脉系统闭塞的危险因素，与先天发育不良密切相关，应当得到广泛重视。②颈部 MRA 是诊断孤立椎动脉的安全、简便、准确的方法。③当眩晕患者头部平扫 CT 及 MRI 未发现确切责任病灶时，要仔细观察双侧椎动脉，如有异常应立即做颈部 MRA 检查。④对于孤立椎动脉伴高血压患者，血压不宜降至过低，应保证后循环灌注。

2 型糖尿病伴脑小血管病患者脑损伤与认知功能障碍关系的研究

黄明明,杨丽铭,韦莎莎,李小宝,余晖
贵州医科大学附属医院

目的 探讨 2 型糖尿病（Type 2 Diabetes Mellitus, T2DM）伴脑小血管病(Cerebral Small Vessel Disease,CSVD)患者脑损伤与认知功能障碍的关系。

材料与方法 选取 T2DM 伴 CSVD 患者 18 例（T2DM 组）和健康体检者 18 例（对照组）行 3 维 T1 加权成像（3D T1 weighted image,3D T1WI ）和扩散张量成像（Diffusion Tensor Imaging,DTI），并利用简易智能精神状态检查量表（Mini Mental State exam,MMSE）和蒙特利尔认知评估量表（Montreal Cognitive Assessment,MoCA）对认知能力评估

结果 研究发现 T2DM 组患者存在颞叶、枕叶区域萎缩及皮层厚度减小，额中回、额极、右侧岛叶皮层厚度减小；此外，T2DM 组患者大脑各项异性值（Fractional Anisotropy, FA）的下降出现在前额叶、颞叶、枕叶、胼胝体、扣带、岛叶、丘脑、海马等，且伴随着广泛的白质纤维损伤，表现在平行扩散参数（$\lambda_{/\!/}$）、垂直扩散参数（$\lambda_{\perp}$）和 表观扩散参数（Apparent diffusion coefficient, ADC）值显著上升。FA 值结合认知能力评分的相关性分析发现，MoCA 评分与双侧上纵束（颞叶部分）的 FA 均显著正相关（左侧：r=0.485，P=0.041；右侧：r=0.523，P=0.026）；视空间执行能力与丘脑前辐射的 FA 正相关（r=0.480，P=0.044）；记忆力与左侧扣带（海马）（r=0.480，P=0.044）及左侧上纵束（颞叶部分）（r=0.592，P=0.010）的 FA 值均正相关。

结论 DTI 参数所反映的大脑微观结构的变化比 3DT1 结构像所反映的形态学改变更敏感，其提供的影像学指标有助于 T2DM 伴 CSVD 患者认知障碍的早期诊断。

PU-0704
MRI T2-IDEAL 序列对视神经病变的应用价值研究

ZHAO WEI
中国人民解放军总医院第一医学中心

目的 探讨核磁共振成像(magnetic resonance imaging,MRI) T2-IDEAL 序列对视神经病变的诊断价值.
方法 回顾性分析 33 例视神经病变的患者行视神经 T2-IDEAL 序列 MRI 检查,结合临床表现、眼科学检查及手术病理结果分析各类视神经病变 T2-IDEAL 序列 MRI 表现.
结果 33 例患者中 T2-IDEAL 核磁检查均显示阳性，其中视神经脊髓炎 14 例，视神经管占位 5 例，视神经萎缩 7 例，视神经损伤 5 例，特发性脱髓鞘性视神经炎 2 例
结论 T2-IDEAL 序列可以清晰显示视神经解剖细节及相关病变,对各种类型视神经病变病因诊断具有较高的临床价值.

PU-0705

Quantitative MRI Volumetry in Detection of Hippocampal Atrophy

Hui Xiao,Hui Li,Xiaoyang Wang,Ziqian Chen
The 900th Hospital of Joint Logistic Support Force， PLA

Purpose: To determine the effectiveness of the magnetic resonance imaging (MRI) for detection of hippocampal atrophy (HA) and lateralization of the seizure focus in TLE patients based on volumetry and asymmetric index (AI).
Methods: Volumetric MRI data were analyzed for 17 patients with refractory TLE and 17 healthy control subjects. Structural volumes of hippocampus were measured using a 3-dimensional image reconstruction software. Outcomes of quantitative MRI analyses were compared with postoperative hippocampal histological specimens to determine its correlation with hippocampal neuronal loss and gliosis. Binary logistic regression (BLR) and receiver operating characteristic (ROC) analyses were performed to determine the optimal sensitivity and specificity of volumetry and AI for detecting HA.
Results: When hippocampal volume of 2328 mm3 was set as cut-off for 50% epilepsy probability, a sensitivity of 70.6% and a specificity of 82.4% were achieved for detecting TLE from healthy control subjects.Using a hippocampal AI of 7.82 as a cut-off, a sensitivity of 88.2% and a specificity of 89.2% were achieved for detecting TLE. There were correlations between hippocampal volume and neuronal loss, and hippocampal AI and astrocyte gliosis.
Conclusions: MRI volumetry and AI can be used as a clinical tool to assist the detection of HA in patients with TLE. Volumetry and AI also provide histopathological information associated with epilepsy.

简述脑网络的分析方法

邹智,赵翠花,李中林,王梅云,窦社伟
河南省人民医院

目的 总结大脑网络的分析方法，为揭示脑神经网络提供有效手段。**方法** 脑信号的处理技术主要有时域分析、频域分析、神经网络和混沌理论等，其中神经网络的研究可从结构网络和功能网络两方面进行。脑功能网络连接技术是基于脑功能整合理论，从多个脑区或全脑出发以功能连接或结构连接的角度探究脑活动。其中，大脑网络的提取方法可以采用广义线性模型、低频振幅以及局域一致性等方法；脑功能网络的连接方法有相关分析、独立成分分析、图论分析及小世界网络分析法；脑功能网络的效应连接主要有动态因果分析法和格兰杰因果分析法。**结果** 广义线性模型是一种最常用的假设驱动方法，主要研究变量之间的相关性，多用于揭示人脑功能的分离。低频振幅可以提示静息状态时神经元的自发活动。局域一致性将局部空间信息和时间序列信息同时考虑在算法之内，突破了线性时不变的理论。相关分析是通过计算相关系数来表示感兴趣区与其它脑区之间的功能连接强度，相关系数越大则脑区之间的功能连接越强。独立成分分析是一种新的盲源分析方法，目的在于从随机线性混合的观测信号中恢复出各源信号。根据网络拓扑性质的不同，图论分析将网络分为规则网络、小世界网络和随机网络，其中小世界网络模型是目前图论分析中最流行的一类。动态因果模型是一种双模型分析方法，它是将神经动力学模型和血液动力学模型结合起来建立的模型。格兰杰因果分析模型建立在多元自回归模型的基础上，它依赖于信号的时间优先性，可用来衡量信号之间相互影响的程度。**结论** 从脑功能网络的提取方法、连接方法到效应连接方法，各方法均有自身的特点及优劣势，可以从不同的角度为脑功能网络应用于疾病的研究提供理论依据。

痉挛型脑瘫患儿脑灰质结构与运动功能的相关性研究

贾文霄[1],王云玲[1],邵华[1],贾琳[2]
1.新疆医科大学第一附属医院
2.新疆医科大学第二附属医院

目的 利用磁共振基于体素的形态学分析方法（voxel based morphometry ，VBM）定量分析运动功能不同的痉挛型脑瘫患儿脑灰质结构评估脑瘫患儿脑灰质体积和临床表现之间的关系。**方法** 收集 36 例年龄在 2 至 15 岁的痉挛型脑瘫患儿并运用粗大运动功能分级系统(GMFCS)将所有患儿分为轻度运动功能障碍组(A 组)和重度运动功能障碍组(B 组)。对两组受试者进行常规磁共振和全脑高分辨 3D-T1WI 扫描，采用基于体素的形态学分析方法获得两组受试者的全脑灰质及局部脑灰质体积，采用双样本 t 检验比较两组脑灰质体积，运用 Spearman 相关性分析方法分别分析差异脑区灰质体积与 GMFCS 分级间的相关性。**结果** 在重度运动功能障碍组中，脑瘫患者总脑灰质体积明显低于轻度运动功能涵盖组（$P<0.001$）。与轻度运动功能障碍组相比，重度运动功能障碍组多处区域局部脑灰质减少（$P < 0.001$，未经校正），包括双侧额上回，双侧颞极，右侧梭状回，右侧颞中回，右侧颞上回，右侧扣带回，左侧顶下小叶，左侧缘上回，左侧中央前回，右侧楔前叶，右侧枕叶。其中右侧额上回（$r=-0.605$, $P=0.000$），左侧额上回（$r=-0.508$, $P=0.004$）,右侧扣带回（$r=-0.367$, $P=0.035$），右侧颞中回（$r=-0.388$, $P=0.031$），左侧中央前回（$r=-0.418$,$P=0.019$），右侧楔前叶（$r=-0.430$, $P=-0.015$）与粗大运动功能分级呈负相关。**结论** 痉挛型脑瘫患儿运动功能障碍与弥漫性的皮质损伤有关，VBM 可对脑瘫患儿的脑部结构及功能异常提供无创的影像学检查方法。

磁共振扩散峰度成像在脑损伤后植物状态的研究初探

唐嘉莹,张磊,尤永笑,陈糜,陈宏,王少彧,王宝兰,王俭

新疆医科大学第一附属医院

目的 探讨磁共振弥散峰度成像(DKI）技术在脑损伤后植物状态患者大脑微观结构改变的应用以及对临床的诊断价值。 **方法** 收集 13 例植物状态患者（病例组）和 20 例健康志愿者(对照组)，行常规脑磁共振检查、脑弥散峰度序列检查，分别测定非直接损伤区丘脑、胼胝体膝部、胼胝体压部、内囊、双侧颞叶皮层、脑干平均峰度（MK）和平均弥散系数（MD）。 **结果** 与对照组相比病例组的丘脑、胼胝体膝部、胼胝体压部、双侧颞叶皮层、脑干非直接损伤部位的平均峰度（MK）值较正常对照组比较显著降低，二者差异具有统计学意义（P＜0.05）。与对照组相比病例组的丘脑、胼胝体膝部、胼胝体压部、内囊、双侧颞叶皮层、脑干非直接损伤部位的平均峰度（MD）值与正常对照组比较显著升高，二者具有统计学意义（P＜0.05）。**结论** DKI 的指标可初步反映持续植物状态患者脑部神经纤维束的完整性，对于影像学判断植物状态患者的 微观结构具有一定的应用价值。

磁共振高分辨血管壁成像对脑卒中患者大脑中动脉粥样硬化与豆纹动脉特征分析

丁爽,王云玲,林威龙
新疆医科大学第一附属医院

目的 探讨高分辨磁共振血管壁成像技术对大脑中动脉粥样硬化狭窄（Intracranial atherosclerotic arterial stenosis ICAS）的斑块强化程度及血管重塑方面与豆纹动脉数量及深度之间的联**系。方法** 收集我院 22 名有症状 ICAS 患者与 23 名无症状 ICAS 患者参加该研究，对所有受试者行高分辨磁共振血管壁成像（High Resolution Magnetic Resonance Imaging）3D-T1WI-VISTA 序列成像，受试者高分辨血管成像数据传至后处理工作站，应用 Philips Intellispace portal 软件对的大脑中动脉斑块强化指数及管腔重构指数与豆纹动脉血管数量及深度进行统计，采用 SPSS 22.0 软件对两组受试者大脑中动脉斑块强化指数及管腔重构指数与豆纹动脉的深度及数目进行统计学分析。**结果** 有症状 ICAS 患者组与无症状 ICAS 患者组相比，有症状 ICAS 患者组大脑中动脉粥样斑块有更高的增强指数（P<0.05），有症状 ICAS 患者组豆纹动脉长度明显短于无症状 ICAS（P<0.05），有症状 ICAS 患者组与无症状 ICAS 患者组大脑中动脉管腔重塑指数与豆纹动脉数量均无统计学差异（P〉0.05）。**结论** 有症状 ICAS 患者与无症状 ICAS 患者大脑中动脉粥样斑块的强化程度与豆纹动脉长度存在一定差异，高分辨磁共振血管壁成像对大脑中动脉粥样斑块评估具有临床价值。

PU-0710
磁共振 VBM 方法评价手术对 PVL 合并脑瘫患儿脑灰质的影响

王云玲[1],陈宏[1],贾琳[2],张泉[1]
1.新疆医科大学第一附属医院
2.新疆医科大学第二附属医院

目的 应用基于体素的形态学分析(VBM)方法研究颈总动脉交感神经网剥脱术(cervical perivascular symphathectomy）对脑室周围白质软化症(PVL)合并脑瘫患儿脑灰质的影响。 **方法** 收集在我院神经外科接受过颈总动脉交感神经剥脱术的 PVL 合并脑瘫患儿 15 例作为观察组，另外收集未经治疗的 PVL 合并脑瘫患儿 17 例作为对照组。对所有儿童均进行常规规磁共振及 3D-

T1WI 检查，采用 VBM 方法对两组患儿的全脑结构进行分割，并对分割后的脑灰质体积用双样本 t 检验比较两组灰质体积差异，并进一步分析观察组患者差异有统计学意义的脑区体积与手术后病程进行相关性分析。**结果** 观察组患儿局部脑灰质增加的区域包括双侧额上回,双侧颞极，右侧颞中回，左侧缘上回，右侧扣带回及左侧小脑前部（P＜0.001，未经校正）。双侧额上回体积与手术后病程成正相关（r=0.732，P＜0.003）。 **结论** 颈总动脉交感神经网剥脱术能引起 PVL 合并脑瘫患儿语言，运动，思维以及认知功能相相关的脑区的灰质的重塑。

PU-0711

HRMR-VWI 在椎-基底动脉病变诊断中的应用价值

贾琳[1],黄海燕[2],王云玲[2]
1.新疆医科大学第二附属医院
2.新疆医科大学第一附属医院

目的: 探讨高分辨磁共振血管壁成像（high-resolution magnetic resonance imaging，HRMR-VWI）在椎-基底动脉病变诊断中的应用价值。 **方法** 对 52 例经 CTA/MRA/DSA 确诊椎-基底动脉血管腔病变的患者，分别行 HRMR-VWI T1-VISTA 序列平扫加增强检查，由两位高年资医师对图像进行评估，对病变段血管壁改变及病因进行分析。**结果:** 52 例椎-基底动脉管腔病变患者中，发现 27 例动脉粥样硬化改变，占 52.9%，均表现为偏心性管壁增厚，增强扫描管壁轻度或明显强化； 6 例原发性中枢神经系统血管炎，占 11.5%，表现为管壁向心性增厚，明显强化；12 例椎基底动脉夹层，占 23.1%，可见内膜瓣，双腔征，夹层开口位置；7 例动脉瘤，占 13.4%，5 例发生于椎动脉，2 例发生于基底动脉，HRMR-VWI 清晰可见瘤壁厚度及强化特点 。**结论:** HRMR-VWI 能够为椎-基底动脉病变病因探究、治疗方案制定提供重要信息，是椎-基底动脉病变的重要检查方法。

Abnormality of spontaneous brain activities inpatients with chronic neck and shoulder pain: A resting-state f-MRI study

Chengxin Yu,Tingting Ji
The First College of Clinical Medical Science of China Three Gorges University and Yichang Central People’s Hospital

Objectives: Chronic gneck and shoulder pain (CNSP) is a common clinical symptom of cervical spondylotic radiculopathy. Several studies using resting-state functional magnetic resonance imaging (rs-fMRI) have reported that most chronic pain diseases are accompanied by structural and functional changes in the brain. However, few rs-fMRI studies have examined CNSP. The current study investigated cerebral structural and functional changes in CNSP patients.
Methods: In total, 25 CNSP patients and 20 healthy volunteers participated in the study. 3D-T1W and rs-fMRI images were acquired. Voxel-based morphometry analysis was

applied to structural images, and regional homogeneity (ReHo) was extracted from rs-fMRI. Statistical analysis was performed on post-processing images and ReHo parameter maps.

Results: The results revealed no significant differences in brain structure between the two groups. In the patient group, ReHo values were significantly increased in the bilateral middle frontal gyrus and decreased in the left insula, superior frontal gyrus, middle cingulate gyrus, supplementary motor area, right postcentral gyrus, and superior parietal lobule.

Conclusions: This initial structural and rs-fMRI study of CNSP revealed characteristic features of spontaneous brain activity of CNSP patients. These findings may be helpful for increasing our understanding of the neuropathology of CNSP.

PU-0713

青年抑郁症患者胼胝体 MR 扩散张量成像研究

丁辉
贵州省第二人民医院(原:贵州省安宁医院)

目的 应用 DTI 技术，研究青年抑郁症患者胼胝体可能存在的细微结构异常，探讨其可能的发病机制。

方法 选取 2016 年 9 月至 2018 年 8 月心身科门诊的首次发病抑郁症患者 52 例，采用 GE Signa 1.5T 磁共振扫描仪。所有被检查者均行常规头颅 MRI 检查及 DTI 检测。

结果 胼胝体膝部和体部的 ADC 值高于正常对照组，FA 值低于对照组；差异有统计学意义（P 值均＜0.05）。但胼胝体压部的 ADC 值和 FA 值在两组间差异无统计学意义。

结论 DTI 显示青年抑郁症患者胼胝体膝部和体部的神经纤维束可能存在微细结构的改变，明显早于常规 MRI 所能观察到的形态学改变，其在揭示抑郁症的发病机理、探测病变过程、早期明确诊断和建立诊断指标以及疗效评价等方面具有巨大潜力。

PU-0714

Alteration of Functional Connectivity in Patients Suffering From Chronic Neck and Shoulder Pain Caused by Cervical Spondylotic Radiculopathy: A Resting-state fMRI Study

Chengxin Yu,Bo Li
The First College of Clinical Medical Science of China Three Gorges University and Yichang Central People’s Hospital

Objective: This study investigates the alterations of spontaneous neural activities of patients with chronic neck and shoulder pain caused by cervical spondylotic radiculopathy (CNSP-CSR) using the method of rs-fMRI. The parameter of the functional connectivity (FC) is counted in this study.

Methods: CNSP-CSR patients (n = 25) and age-, sex-, and education- matched normal controls (n = 20) were included in this study. Both conventional MRI, the structural

(high resolution 3D T1-weight) and rs-fMRI images were acquired. Seed-based whole-brain FC analyses were performed between groups with seed regions placed in the aACC and pACC.
Results: We found that the aACC had reduced functional connectivity with left amygdala, angular gyrus and IPL. We also found that the pACC had reduced FC with bilateral caudate and left mPFC whereas increased FC with left IOG, SOG, SPL, PoCG and right MTG, ITG. $P < 0.01$ (corrected by the AlphaSim program, cluster size ≥ 18) were considered to show significant difference between groups.
Conclusion: The abnormalities of spontaneous brain activity reflected by FC measurement in patients with CNSP-CSR confirm the neuronal disturbances in CNSP. The abnormal FC is mainly associated with pain perception, cognitive execution, emotion and memory effects. The pACC, an important component of ACC, is more involved in pain processing.

PU-0715
多模态磁共振技术在胶质瘤复发与放射性脑损伤鉴别诊断中的应用价值

周旭嘉
十堰市太和医院

目的探讨联合应用弥散加权成像(DWI)、灌注加权成像(PWI)、磁共振波谱成像(MRS)等磁共振成像技术对胶质瘤复发与放射性脑损伤的鉴别诊断价值。方法回顾性分析 2011 年 1 月-2013 年 12 月 32 例在北京军区总医院就诊的胶质瘤术后放疗患者的临床及影像学资料,其中胶质瘤复发 15 例,放射性脑损伤 17 例。分析 32 例患者的 DWI、PWI、MRS 等磁共振影像学资料,比较异常强化区与对侧正常区的磁共振表观扩散系数(ADC)、自动生成脑血容量(CBV)、脑血流量(CBF)、平均通过时间(MTT)、胆碱(Cho)/磷酸肌酸(Cr)比值及 Cho/N-乙酰天门冬氨酸(NAA)比值。结果胶质瘤复发组 ADC 值与放射性脑损伤组比较差异无统计学意义(P0.05)。胶质瘤复发组相对脑血流量(r CBF)、相对脑血容量(r CBV)的最大值和平均值明显高于放射性脑损伤组(P0.05),相对平均通过时间(r MTT)的最大值和平均值与放射性脑损伤组比较差异无统计学意义(P0.05)。胶质瘤复发组的 Cho/Cr 和 Cho/NAA 比值均明显高于放射性脑损伤组(P0.05)。对胶质瘤复发的诊断灵敏度,单用 PWI 为 80%,单用 MRS 为 73.3%,PWI 联合 MRS 为 93.3%。对放射性脑损伤的诊断灵敏度,单用 PWI 为 82.4%,单用 MRS 为 70.6%,PWI 联合 MRS 为 88.2%。结论联合应用多模态磁共振成像技术可提高胶质瘤复发及放射性脑损伤的诊断准确性,为临床治疗提供良好的指导。

神经根型颈椎病颈肩痛脑静息态局部一致性研究

徐亚卡,潘君龙
三峡大学第一临床医学院&宜昌市中心人民医院

目的 运用静息态功能磁共振成像(resting-state functional magenetic resonance imaging, rs-fMRI)局部一致性(regional homogeneity, ReHo)方法研究神经根型颈椎病慢性颈肩痛状态下静息态脑功能改变。

方法 采用 PHILIPS 公司 Intera Achieva 3.0 T 双射频源超导扫描仪对 25 例神经根型颈椎病慢性颈肩痛患者及 20 例健康志愿者进行常规磁共振、高分辨率 3D-T1 结构像及静息态功能磁共振扫描，扫描结束对每位患者进行视觉模拟评分(visual analgesia score, VAS)。组间对比分析 ReHo 的改变，并对 ReHo 均值与 VAS 得分进行 Pearson 相关性分析。
结果 1）与正常对照组相比，神经根型颈椎病慢性颈肩痛组 ReHo 值减低的脑区位于左侧岛叶(insular cortex, IC)、海马、辅助运动区(supplementary motor area, SMA)、额上回(superior frontal gyrus, SFG)，右侧中央后回(postcentral gyrus,PoCG)、顶上小叶(superior parietal lobe, SPL)；ReHo 值增高的脑区位于双侧额中回(middle frontal gyrus, MFG)($P < 0.01$，AlphaSim 矫正，Cluster Size $\geq$ 18)。2）神经根型颈椎病慢性颈肩痛组左侧 IC 的 ReHo 均值与 VAS 得分存在显著负相关性($r = -0.552$, $P = 0.004$)。
结论 1)神经根型颈椎病慢性颈肩痛导致以额、顶叶为主的部分脑区出现 ReHo 的异常改变。2) 左侧 IC 能够感知疼痛强度。3)神经根型颈椎病慢性颈肩痛脑自发性活动异常主要与认知执行和情感、疼痛感知和及记忆等脑功能受到影响相关。

平山病 MR 屈曲位诊断价值

蔡文杰
福建医科大学附属第一医院

目的 为了探讨平山病的 MR 屈曲位诊断价值。
方法 回顾性的分析了 10 例已经确诊为平山病的患者影像学资料。10 例患者均行颈椎自然位和屈曲位 MR 平扫检查。
结果 屈曲位下，有 7 例患者椎管内硬膜囊后方见条状长 T1 长 T2 信号影，有 7 例患者可见血管流空影，有 9 例患者局部脊髓及硬膜囊受压前移，有 9 例患者脊髓变细。自然位下，有 0 例患者椎管背侧硬膜囊后方见长 T1 长 T2 信号影，有 2 例患者脊髓变细，其内见斑片状长 T2 信号影。
结论 详细的影像学检查尤其是颈椎屈曲位的 MR 检查对于本病的确诊有重要的意义。

PU-0718

Quantitative Analysis of DCE-MRI and DWI at 3.0T in the differentiation of solid benign lesions from malignant lesions with jawbone

xue zhao,Jiangmin Zhao
Shanghai Ninth People’s Hospital, Shanghai JiaoTong University School of Medicine

Objective To explore the value of dynamic contrast enhanced MRI (DCE-MRI) and diffusion weighted imaging (DWI) and a combination of both techniques to differentiate solid benign lesions from malignant neoplasm with jawbone.
Methods Preoperative DCE-MRI and DWI examination was enrolled in 49 patients with pathologically confirmed mandible and maxilla lesions between January 1, 2017 and May 1, 2019. The apparent diffusion coefficients (ADC) were obtained form DWI sequences. The ADC value together with the DCE-MRI parameters (time to peak (T_{peak}), wash in rate (WIR), wash out rate (WOR), relative enhancement and, maximum enhancement) was

determined. Statistical analyses were performed to assess the differential performance of each parameter separately and together.
Results Benign group (n = 22) and malignant group (n = 25) differed in ADC value, T_{peak}, WIR and WOR (P<0.05). The ADC value displayed the most significant difference (P=0.009) with a mean value in benign and malignant group of 1.55×10^{-3} $mm^2/s\pm0.83$, 0.95×10^{-3} $mm^2/s\pm0.37$, respectively. The cut-off value of ADC was 1.05×10^{-3} mm^2/s. The WOR displayed another significant difference among the parameters of DCE-MRI (P=0.011). Malignant tumors with jawbone showed higher WOR, WIR, and lower T_{peak}, ADC value compared with the benign group (P<0.05). The AUC of the WOR combined ADC value was 0.858, and identification of combination had a high sensitivity 82.6% (95%CI 0.59, 0.91) and specificity 87.2% (95%CI 0.60, 0.96) in differentiate solid malignant lesions from benign neoplasm, which manifested better than that by using ADC value or WOR alone.

Conclusion DCE-MRI parameters combined ADC value can differentiate solid benign lesions from malignant neoplasm with jawbone better than a single parameter, and may serve as a valuable tool with regard to the preoperative delineation of jawbone lesions.

PU-0719
高热惊厥对内侧颞叶癫痫灰质结构影响的形态学研究

郝竞汝,许强,张其锐,谢心瑀,张志强
中国人民解放军东部战区总医院

目的 内侧颞叶癫痫(mTLE)是临床最常见的难治性癫痫之一，其病理基础是海马硬化。有研究表明，在伴有海马硬化的 mTLE 患者常伴有高热惊厥（FC)。本研究采用基于体素的形态学分析，观察高热惊厥对 mTLE 脑灰质体积（GMV)的影响及其与病程的相关性，探究高热惊厥对内侧颞叶癫痫脑灰质结构的损伤机制。
方法 收集 50 例有高热惊厥病史（mTLE-FC）、52 例无明显致病因素（mTLE-NO）的内侧颞叶癫痫患者，以及年龄、性别相匹配的正常对照组 50 例。对所有受试者进行全脑高分辨率 T1WI 结构 MRI 扫描。采用基于体素的形态学测量方法进行灰质结构分割，比较三组受试者各脑区灰质体积；选取杏仁核和扣带回作为兴趣区，采用 Spearmen 秩相关分析探讨内侧颞叶癫痫灰质体积变化与病程的相关性。
结果 相比于正常对照组，各 mTLE 组表现出广泛 GMV 降低；与正常对照组相比，mTLE-FC 组同侧海马、海马旁回、丘脑、小脑体积减少（p<0.01，small volume 校正）；与正常对照组相比，mTLE-NO 组双侧丘脑、同侧海马、对侧颞上回体积减小（p<0.01，small volume 校正）；与 mTLE-NO 组相比，mTLE-FC 组同侧杏仁核、额上回及对侧扣带回体积减小（p<0.01，small volume 校正）。mTLE-NO 组局部 GMV 与病程无相关性；mTLE-FC 组杏仁核 GMV 与病程呈负相关（r=-0.336，P=0.017）。
结论 mTLE 患者存在双侧大脑半球广泛灰质结构损伤；既往有高热惊厥病史的内侧颞叶癫痫(mTLE)患者脑损害更加严重，提示高热惊厥导致的 mTLE 病理生理机制不同，存在的癫痫网络也不同。

PU-0720
基于三叉神经痛体征 MRI 成像序列价值探讨

陈华平,母其文,郭志伟,张福洲,曹金明,杨浩,蒋琳,张入月
南充市中心医院

目的 探讨基于三叉神经痛体征 MRI 成像序列的应用价值，以期为基于三叉神经痛体征 MRI 成像规范提供参考。**方法** 对临床诊断为三叉神经痛的 104 例患者行 MRI 检查，采用 T1 加权（TIWI）、T2 加权（T2WI）、T2 水抑制成像（T2Flair）、三维快速平衡稳态采集序列（3D-COMSIC）、3D-TOF 成像、弥散加权序列（DWI）、三维容积内插快速扰相梯度回波序列增强扫描行头颅的横断面、冠状面扫描，分析总结不同 MRI 成像技术应用于三叉神经痛诊断中的应用效果。**结果** 所扫描序列均能发现 8 例肿瘤引起的三叉神经痛；T1 加权（TIWI）、T2 加权（T2WI）、T2 水抑制成像（T2Flair）仅可疑发现异常血管压迫三叉神经痛 2 例，三维快速平衡稳态采集序列（3D-COMSIC）、3D-TOF 成像 95 例患者中发现 83 例存在动脉血管压迫三叉神经，漏诊异常静脉压迫三叉神经 12 例，三维容积内插快速扰相梯度回波序列增强扫描序列能发现 95 患者均存在血管压迫三叉神经；DWI 序列发现海绵窦综炎症引起的三叉神经痛 1 例，其它序列未发现。**结论** 三维快速平衡稳态采集序列（3D-COMSIC）、3D-TOF、三维容积内插快速扰相梯度回波序列增强扫描完能发现动静脉压迫三叉神经痛的原因，DWI 序列能较敏感的发现炎症引起的三叉神经痛，各序列对发现肿瘤引起的三叉神经痛无明显差异。

PU-0721
DWI 在肺癌脑转移和脑胶质瘤诊断和鉴别诊断中的应用

唐洁
十堰市太和医院

目的 通过比较肺癌脑转移瘤和高级别胶质瘤实质区、坏死区、瘤周水肿区 ADC 值，探讨 DWI 在肺癌脑转移瘤与高级别胶质瘤诊断和鉴别中的价值。
方法 对 29 例肺癌脑转移瘤和 12 例Ⅲ -Ⅳ级高级别胶质瘤的 MRI 常规平扫、增强扫描和 DWI 成像进行回顾性分析。在肿瘤实质区、坏死区、瘤周水肿区及对侧相应或邻近部位正常白质分别选取 3-5 个兴趣区，测其 ADC 值并进行统计分析。
结果 肺癌脑转移瘤多发 20 例，单发 9 例， 其中 10 例病灶 DWI 图上为高信号，而 ADC 图上均呈低信号；另 19 例病灶中心 DWI 图上可见低信号，ADC 图为高信号。高级别胶质瘤均为单发， 5 例 DWI 图上病灶为高信号，ADC 图上为低信号；另 7 例未见明显高信号，而 ADC 图上可见高信号。肺癌脑转移瘤和高级别胶质瘤实质区 ADC 值分别为 0.86±0.23、1.07±0.14，差异无统计学意义；坏死区 ADC 值分别为 2.41±0.47、2.83±0.08，差异有统计学意义；近瘤水肿区 ADC 值分别为 1.58±0.18、1.41±0.16，差异有统计学意义；远瘤水肿区 ADC 值分别为 1.59±0.08、1.51±0.15，差异无统计学意义。转移瘤近瘤水肿区、远瘤水肿区 ADC 值分别为 1.58±0.18、1.59±0.08，差异无统计学意义；高级别胶质瘤近瘤水肿区、远瘤水肿区 ADC 值分别为 1.41±0.16、1.51±0.15，差异有统计学意义。
结论 DWI 在肺癌脑转移瘤与高级别胶质瘤肿瘤瘤体以及瘤周的 ADC 值不同，是诊断和鉴别诊断有效的 MRI 技术。

PU-0722
SWI 在 MRI 诊断脑微出血等的应用体会

池科承,陈胜良,王大江
遵义市余庆县人民医院

目的 探讨 SWI 在 MRI 诊断脑微出血（CMB）脑血管疾病中的临床意义。**方法** 选取 2014 年 12 月至 2019 年 2 月我院接诊的脑血管疾病病人 60 例，全部病例均接受 MRI 检查，MRI 序列包括常规 T1WI、T2WI、FLAIR、DWI 序列，以及磁敏感加权成像 SWI 序列，对检查结果的差别进行比较。**结果** SWI 序列发现大动脉硬化性脑梗死患者 24 例（占 40%）合并 CMB，腔隙性脑梗死 18 例（占 30%）合并 CMB，心源性脑栓塞 13 例（占 21.7%）合并 CMB，短暂性脑缺血发作 5 例（占 8.3%）合并 CMB。**结论** 磁共振 SWI 序列较常规序列在脑血管疾病微出血方面具有独特的优势，可清晰、较好发现病灶，提高检查准确率，可及时为临床治疗方案制定提供有效的影像学依据，是脑血管疾病检查的有效方法之一，值得临床推广应用

PU-0723
多参数动脉自旋标记对急性脑梗死后交叉性小脑机能联系不能评价

廖海波,顾浩玉,唐海涛,许硕果,张雪峰,杜龙庭
深圳市宝安区中心医院（深圳大学附属第五医院）

目的 利用多个延时标记时间（PLD）动脉自旋标记技术（3D ASL），通过测量急性脑梗死后全脑血流灌注，评价不同 PLD 3D ASL 在诊断脑梗死后交叉性小脑机能联系不能（CCD）价值，及其与 NIHSS 评分相关性，了解梗死灶与 CCD 关系。
方法 前瞻性收集幕上急性脑梗死患者供 93 例，利用多个延时标记时间 3D ASL 分别测量梗死区、对侧镜像区、双侧小脑半球脑组织 CBF 值，计算小脑不对称指数(AI)，依据 AI 大于 10%时诊断为 CCD，分析多个 PLD 3D ALS 对 CCD 诊断价值，及其与 NIHSS 评分相关性分析。
结果 93 例幕上急性脑梗死患者中，PLD1.5S、2.0S 及 2.5S 时 CCD 的检出分别为 41 例（44.1%）、19 例（20.4%）及 12 例（12.9%），联合 1.5S 及 2.0S 时 CCD 检出为 45 例（48.3%），联合 1.5S+2.0S 及 2.5S 时 CCD 检出为 51 例（54.8%）。配对样本 t 检验显示，CCD 组 NIHSS 评分（7.44±2.57）较非 CCD 组（2.50±1.33）增高（F=10.07，t=－8.10，P＜0.001），且当 1.5S、2.0S 及 2.5S 均显示为 CCD 时（NIHSS 评分：8.79±2.58），NIHSS 评分明显较单组 PLD（NIHSS 评分：3.58±2.00）检出为 CCD 明显增高（F=1.41，t=－7.48P＜0.001），梗死区面积越大，NIHSS 评分越高，梗死区 CBF 值越低，NIHSS 评分越高。
结论 3D ASL 技术能够无创评价脑梗死后 CCD 现象发生，参数为 1.5S 时 CCD 检出率最高，联合多个 PLD 可以提高 CCD 检测率，CCD 的发生与梗死区最大面积、梗死区 CBF 及 NIHSS 评分相关。

PU-0724
MRI 在慢性酒精中毒性脑病的临床应用体会

陈航,陈胜良,王大江,田黎明,池科承,吕昌禄,谭一静,宋纯建,李洪兵,游绍昆,陈宇
遵义市余庆县人民医院

目的 进一步提高对慢性酒精中毒性脑病的 MR 特征及临床表现认识。**方法** 运用 MR 对临床疑及慢性酒精性脑病患者进行 MRI 检查，回顾性分析其 MR 表现。**结论** 慢性酒精性脑病有其特征性影像学表现，能早期发现慢性酒精中毒性脑病，具有重要的临床应用意义。

PU-0725

1.0T 开放式磁共振实时透视技术在颅脑病变穿刺活检中的应用

李成利,何祥萌
山东省医学影像学研究所

研究 1.0-T 开放式磁共振实时透视技术引导颅脑病变穿刺活检的安全性、可行性及诊断价值。**方法** 回顾性分析 106 例 1.0-T 开放式磁共振实时透视技术引导的颅脑病变穿刺活检病例，评价穿刺活检病理的诊断率、诊断准确率、并发症发生率及手术操作时间；根据病变大小，将 106 例病例分为＞1.5cm 及≤1.5cm 两组，Fisher’s 精确检验比较两组的诊断率。**结果** 诊断率、诊断准确率分别为 95.3%、94.3%，＞1.5cm 及≤1.5cm 的两组诊断率比较无统计学差异(p>0.05)；手术操作时间为 39±4.6min （ 29-49 min)；并发症发生率为 3.8%，并发症包括 4 例少量脑出血，无严重并发症发生。**结论** 1.0-T 开放式磁共振实时透视技术引导颅脑病变穿刺活检安全、可行，具有良好的诊断价值，可缩短手术时间及简化手术流程，可作为一种新的技术选择应用于颅脑病变穿刺活检中。

Differential diagnosis of parkinsonian degenerative disorders using both brain manual measurements and automated volumetry

Yiwei Zhang[1],Han Wang[1],Hui You[1],Dan Xu[1],Lin Shi[2],Feng Feng[1]
1.Peking Union Medical College Graduate School
2.Department of Imaging and Interventional Radiology， The Chinese University of Hong

Introduction: To examine the manual brainstem measurements and automated brain volumetry in PD, MSA, PSP and controls and evaluate thediagnostic performance of these measures.
Methods:Eighty-seven PSP patients (51 males, mean age 70.6 years), 31 MSA patients (20 females, mean age 61.2 years), 115 PD patients (57 males, mean age 64.9 years) and 50 controls (30 males, mean age 66.1 years) were included respectively. Manual brainstem measurements included the MR parkinsonism index (MRPI), midbrain short axis and midbrain-pons short axis ratio (M/P). Relative brain structural volumes adjusted for intracranial volume (ICV) of the midbrain, pons, cerebellum, putamen, pallidum, caudate, brain parenchyma, lateral ventricle, and third ventricle were quantified. Differences among and between groups were evaluated. Receiver operating characteristic curve analysis was used to assess diagnostic performance and define cutoff values of these measures.
*Results:*The manual midbrain short axis measure showed the highest diagnostic performance (AUC: 0.828) for distinguishing PSP from MSA or PD and controls with an optimal cutoff value of 9.75 mm (sensitivity 79.3%, specificity 73%). The relative volume of pons gave the highest diagnostic performance (AUC: 0.769) for differentiating MSA from PD and controls with an optimal cutoff value of 0.822% (sensitivity 90.9%, specificity 64.5%). At the optimal cutoff value of 9.08%, the relative volume of cerebellum was useful in differentiating PD from controls (AUC: 0.647, sensitivity 64.3%, specificity 62%).
*Conclusion:*Manual and automated cerebral measurements can reveal different brain atrophy features and be helpful in differential diagnosis of Parkinsonian syndromes.

PU-0727
早发性帕金森病患者脑结构体积变化及其与发病年龄的相关性分析

赵瑞琛,高雪梅,张春艳
郑州大学第一附属医院

目的 我们评估早发性帕金森病(EOPD)[1]和晚发性帕金森病(LOPD)患者的脑结构体积变化，以帮助早期 EOPD 诊断。材料和**方法** 我们招募了 20 名 EOPD(组 1)和 25 名 LOPD(组 2)患者，15 名年轻(YC，组 3)和 24 名老年对照组(OC，组 4)。受试者使用磁化强度预备快速梯度回波序列(MPRAGE)和标准脑形态计量学软件包在具有 64 通道头/颈部线圈的 MAGNETOM Prisma 3T 扫描仪上进行扫描。扫描后将直接自动计算脑内各个结构的体积，并使用相对体积(定义为一个脑区与总颅内总体积的体积比)进行统计分析。YC 组和 EOPD 组以及 OC 组和 LOPD 组之间的相对脑体积差异用双样本 t 检验进行分析。用 Spearman 对异常相对脑体积和发病年龄进行相关性分析。当 P＜0.05 时，认为差异有统计学意义。**结果** EOPD 组的左侧顶叶灰质(GM)、右侧颞叶 GM 和左侧岛叶体积明显小于 YC 组。LOPD 组的全脑体积、左侧尾状核、左侧苍白球、双侧丘脑和双侧额叶体积明显小于 OC 组。LOPD 组的脑脊液(CSF)体积明显大于 OC 组。EOPD 组和 LOPD 组的全脑 GM 和左侧壳核体积显著小于对照组。CSF 相对体积与发病年龄呈中度正相关(R＝0.422)，左侧苍白球、左侧顶叶 GM 和右侧颞叶 GM 相对体积与发病年龄呈中度负相关(R＝-0.313；R＝-0.374；R＝-0.403)。**结论** 在 EOPD 患者认知功能中起关键作用的几个脑区[2]有显著的体积变化。这些结果有助于早期 EOPD 诊断。

PU-0728
探索失眠伴焦虑患者与正常对照组的静息态脑功能成像差异性

黄忠江
山西医科大学第一医院

摘要 目的 探索失眠伴焦虑患者在静息态功能磁共振 （resting-stage fMRI，rs-Fmri）是研究脑功能改变，**方法** 选取取符合人选标准的失眠伴焦虑患者 34 人以及人口学各数据匹配的对照组人员 28 人，分别采集被试的结构像（3D-T1）、 静息态功能像（resting-stage fMRI，rs-Fmri），对受试者全脑的 BOLD 信号进行采集分析， 以区域一致性（regional-homogeneity，ReHo）和低频振荡振幅（amplitude of law frequency fluctua-tion ALFF）作为评价指标，比较失眠伴焦虑患者和健康对照者的大脑功能磁共振成像的差异 与认知及情绪功能相关脑区（海马旁回、扣带回、丘脑）等作为兴趣区， 综合考察脑结构 、脑功能改变。结果性失眠伴焦虑组较健康对照组 ALFF 值增高脑 区包括：左侧额内侧回、右侧额下回、右侧颞中回、左 侧小脑前叶、左侧海马旁回、右侧壳核、左侧外侧核、 左侧丘脑、左侧梭状回、左侧脑干；失眠伴焦虑组较健康对照组 ALFF 值降低的脑区包括：左侧 额中回、左侧颞上回、左侧颞中回、左侧顶上小叶、右 侧梭状回、左侧楔叶、双侧楔前叶。原发 性失眠组较健康对照组 ReHo 值升高的脑区包括： 双侧小脑后叶、左侧脑干、右侧海马旁回、右侧前扣 带回、左侧颞中回、左侧枕上回、左侧枕中回；失眠伴焦虑组较健康对照组 ReHo 值降低的脑区包 括：右侧额中回、左侧额下回、右侧枕叶、左侧后扣带回、左侧中央前回。结论，失眠伴焦虑患者颞中回、脑干、 海马旁回的局部自发活动增强，其 ReHo 和 ALFF

值均大于健康受试者，额中回局部自发活动降低，其其 ReHo 和 ALFF 值均低于健康受试者。本研究中发现发失眠伴焦虑患者与认知及情绪 功能相关脑区(海马旁回，扣带回，丘脑等)的神经活动水平发生上调，情绪的兴奋性增加最终可能会妨碍睡眠启动或维持的能力及焦虑症状的产生。

PU-0729

3DHR MRI 序列在大脑中动脉血管壁成像中的应用

袁保锋
扬州大学附属医院

目的 探讨 3D HR MRI 序列在评估大脑中动脉血管壁成像及斑块评估中的应用价值。
方法 选择 2017 年 1- 6 月份我院行 3D HR MRI 血管壁成像的大脑中动脉狭窄患者 120 例，其中男性 69 例，女性 51 例；平均年龄 61.2±12.7 岁，平均身高 169.6±15.1 cm。对血管壁的显示情况，斑块的判断情况进行分析。
结果 大脑中动脉斑块 3D HR MRI 成像技术的成功率 97.5%。大脑中 M1 段的管壁结构能够清晰显示。对大脑中动脉斑块的判断，同一评价者间具有较高的一致性[k=0.95（95%CI=0.85-1.02）]。不同评价者间也具有较高的一致性[k=0.91（91% CI=0.81-1.02）]。
结论 3D HR MRI 序列能清晰显示大脑中动脉的狭窄程度，官腔结构，斑块的成分及易损性，为脑卒中的早期预防、早期治疗提供影像依据。

磁共振波谱技术在帕金森病研究中的运用

杨钒,王红
新疆医科大学第二附属医院

帕金森病（Parkinson’s Diseases,PD）是较为常见的中老年神经系统退行性疾病。随着磁共振技术的发展，磁共振波谱技术（Magnetic resonance spectroscopy,MRS）以其无创性、客观性反映脑内神经生物代谢情况的优势被广泛运用于帕金森病的研究中。尽管目前多数研究结果显示出较大差异，且 MRS 技术上同样存在改进空间，但不可否认 MRS 具有良好的运用前景。本文就磁共振波谱在帕金森病中的应用作一综述。

PU-0731

亚临床肝性脑病患者 fMRI 改变的研究

郎丽敏
山西医科大学第一医院

目的 采用静息态功能磁共振成像(fMRI)研究亚临床肝性脑病(SHE)患者各脑功能区及全脑功能连接的改变。
方法 收集 35 例亚临床肝性脑病患者(SHE 组)及 45 例健康志愿者(正常对照组)行静息状态下的 fMRI 扫描，利用独立成分分析方法，分离得到各自的脑功能区，采用单样本 t 检验组内分析和两样本 t 检验组间分析，观察 SHE 患者静息状态下脑功能区的改变；采用 Post-hoc 检验观察两组间脑功能连接的差异。

结果 与正常对照组相比，SHE 患者大部分脑功能区功能降低，其中包括：左侧后扣带回、双侧前扣带回、双侧额中回、左侧海马旁回，而楔前叶功能增加；且 SHE 组与正常对照组全脑脑区间的功能连接也存在巨大差异，研究发现共有 21 对脑区间的连接差异具有统计学意义（P 值<0.05），其中 18 对脑区间功能连接显著下降（P<0.01）,3 对显著升高（P<0.01），其中左侧海马与右侧杏仁核间的功能连接变化最明显，其变化与神经心理学测试存在一定相关性。
结论 静息态功能 MRI 可用于观察亚临床肝性脑病各脑功能区及脑区间连接的改变，且有助于早期诊断。

PU-0732

Magnetic resonance imaging study of cranial nerve diseases in children

Qinglong Wu
Ninth People's Hospital Affiliated to Medical College of Shanghai Jiaotong University [Baoshan District, Shanghai]

Cranial nerve disease is a rare disease in pediatric patients. It can be divided into congenital, inflammatory, traumatic or neoplastic diseases, including the disease of cranial nerve itself or the abnormality of adjacent organs. However, due to the small caliber of the cranial nerve and the small caliber of the intracranial structure, it is challenging to determine whether the cranial nerve of pediatric patients is normal, whether there are malformations and abnormalities. With the help of the newly developed magnetic resonance imaging technology, it can provide higher spatial resolution and fast imaging technology including three-dimensional images. With or without gadolinium contrast, radiologists can more easily diagnose small cranial nerves, such as oculomotor nerve, abducent nerve, facial nerve and hypoglossal nerve, as well as normal radiological anatomy, even in very small children. If cranial nerve involvement is suspected, the evaluation of cranial nerve should include specific MR imaging schemes. Location is an important consideration in cranial nerve imaging, which should cover the whole path and target organs as far as possible. Therefore, radiologists should not only be familiar with the various diseases leading to cranial nerve dysfunction, as well as the whole process of each cranial nerve, including the axonal nucleus and fibers, but also be familiar with the technical considerations of optimum imaging of pediatric cranial nerve. This paper briefly reviews the normal cranial nerve anatomy in children and the imaging manifestations of various cranial nerve dysfunction, as well as the technical considerations of cranial nerve imaging in children.

多模 MRI 在脑卒中评估的价值研究

陈江
南宁市第二人民医院

本研究探讨了快速多模态 MR 检查对急性缺血性脑卒中(AIS)患者的应用价值。
方法 患者纳入标准：（1）急性脑卒中疑似患者，美国国立卫生研究院卒中量表≥3 分；（2）神经功能障碍症状开始＜24h；（3）无 MR 检查的禁忌症。共纳入 80 人为研究对象，患者同时进行了 CT 与 DSA 检查。采用 Siemens 3.0T MR 扫描仪。应用序列：头颅平扫（T1WI,T2WI,T2 WIFLAIR）,三维时间飞跃法磁共振血管成像(3D TOF MRA),弥散加权成像(DWI),磁敏感成像（SWI）,灌注成像（PWI）。由两名资深医师单独诊断，并将检查结果与 CT ，DSA 检查结果进行对比。
结果 多模 MRI 对脑卒中确诊率明显高于 CT,特别是对急性缺血性脑卒中确诊率达 100%。DWI 是在急性缺血性脑卒中(急性脑梗死)发生后数分钟内发现梗死灶的最敏感和特异性的技术，可以和 T2 WIFLAIR(液体衰减反转恢复成像)结合使用，以识别不可逆和可逆损伤的脑组织。三维时间飞跃法磁共振血管成像(3D TOF MRA)在不使用造影剂的情况下，可以判断脑血管是否存在血栓、出血、狭窄，并能确定血管狭窄与闭塞的准确部位。磁敏感成像（SWI）可以作为检测脑梗死受累血管分布区、梗死区以及梗死后出血的辅助手段，通过与 MR 灌注成像结合可判断梗死组织的预后。另外 SWI 还可以发现慢性高血压患者受损的小血管周围发生的陈旧性出血灶，即脑内微出血。发现少量微出血灶（数量 1～10 个）或大量微出血灶（数量＞10 个），从而达到指导阿替普酶静脉溶栓，减小脑出血风险。在常规 MRI 扫描中，这种微小出血点较难发现。灌注成像（PWI）用于确定早期脑梗塞，和 DWI 比较缺血范围，找出缺血半暗带等 。通过静脉注射顺磁性对比剂，计算局部脑血容量，局部脑血流量和平均通过时间。提供常规磁共振不能获得的血流和脑血管功能状态的信息，有助于缺血性脑卒中的早期诊治。

短 TR 对 3D-TOF-MRA 信噪比、成像时间及伪影的影响

雷盛,王爽,谷涛
陆军军医大学附属新桥医院放射科

目的 减少 MRA 图像上的慈敏感伪影提升图像信噪比，缩短成像时间；使劲动脉虹吸部血管及头颅远端血管显示清楚；减轻固定假牙患者金属伪影提高图像质量。**方法** 1、使用 GE HD speed3.0T 选取 200 例 MRA 检查患者，其中 100 例使用常规参数作为对照组，100 例使用短 TR 参数作实验组。**结果** 实验组图像较对照组成像时间短，金属伪影及慈敏感伪影更小，组织信噪比、对比度更高，虹吸部及远端细小血管显示更清楚。**结论** 在 3D-TOF-MRA 中应用短 TR 可缩短成像时间，增加图像信噪比及对比度，减少伪影。

缺血脑白质病变在胼胝体 DTI 神经纤维束受损分析

姜洪新
故城县医院

【摘要】 **目的** 采用弥散张量成像（DTI）技术，观察脑白质疏松症患者胼胝体神经纤维束的改变。**方法** 回顾性分析 60 例健康志愿者、60 脑白质疏松症患者，应用独立成分分析法分别筛选出胼胝体纤维束，并分析差异。结合临床确诊用 Extended MR WorkSpsce 工作站上的 DTI Studio 软件对所有受试者的 DTI 原始数据进行预处理，应用独立成分分析法，分别提取胼胝体神经纤维束的功能连接强度值，并对纤维束的根数、像素、FA 值、ADC 值、长度改变、网络连接进行研究。**结果** 脑白质疏松症与正常对照组显示，胼胝体纤维束有着明显改变，尤其在脑网络连接、根数、长度方面更明显。**结论** 磁共振 D T I 纤维追踪技术可以三维直观地显示胼胝体纤维束的异常改变，并能定量分析，对其诊断及判断预后具有重要价值。

PU-0737
首发抑郁症患者静息态脑功能荟萃分析

马潇越[1,2],刘太元[1,2],王梅云[1,2]
1.河南省人民医院
2.河南省神经疾病影像诊断与研究重点实验室

目的 抑郁症(major depression disorder, MDD)患者静息态功能磁共振成像(resting-state functional magnetic resonance imaging, RS-fMRI)的研究结果存在异质性，迫切需要进行荟萃分析以描述其脑功能并提供可靠的生物标志物。**方法** 在 PubMed、Ovid 等数据库检索 1984 年 1 月至 2016 年 7 月未经治疗的首发单相 MDD 患者基于体素分析的 RS-fMRI 研究并进行筛选、评价质量、提取资料，采用荟萃分析软件(anisotropic effect size-signed differential mapping, AES-SDM) 分析 MDD 患者与健康对照者（healthy controls, HCs）的全脑脑功能差异，依据不同的 MRI 分析方法进行分组荟萃分析，并对患者平均年龄、受教育时间、发病持续时间、严重程度行元回归分析。**结果** 共纳入 12 项研究，总计 313 例 MDD 患者和 283 例 HCs。总汇结果和亚组分析显示左海马旁回、左杏仁核、左海马、左额中回（眶部)和辅助运动区功能亢进,左舌回、左枕中回、右楔叶皮层、右额中回（眶部)和左小脑前叶功能减退。元回归分析显示发病持续时间与左海马旁回功能亢进和左小脑半球 IV/V 叶功能减退正相关。**结论** 荟萃分析表明未经治疗的首发单相 MDD 患者的杏仁核、左海马等脑区静息态脑功能显著异常，反应了 MDD 患者认知、情绪障碍病理生理学机制，为 MDD 的诊断、评估提供了可靠的生物标志物。

PU-0738
ADC 值可以用来评价 MRI 平扫表现正常的急性一氧化碳中毒病例

徐文杰
河南科技大学第一附属医院

目的 探讨表观弥散系数(ADC 值)在 MRI 平扫表现急性一氧化碳中毒病例中的诊断价值。**材料与方法** 回顾分析 46 例急性一氧化碳中毒脑部 MRI 表现正常的病例。50 例 MRI 影像表现正常的健康成人志愿者的脑部 MRI 资料为正常对照组。对每一例病例均进行 DWI 检查及 ADC 值测量。在后处理工

作站上利用图像后处理软件按照半卵圆中心区、侧脑室周围白质区、苍白球区、大脑皮层区四个部位对所有（p＜0.有统计学意义）。采用独立样本双侧 t 检验对 MRI 表现正常组与正常对照组间相同部位的平均 ADC 值进行分析（p＜0.05 有统计学意义）。**结果** MRI 表现正常组与正常对照组比较：皮质区、半卵圆中心区、侧脑室周围白质区的平均 ADC 值较正常对照组减低（具有统计学差异），苍白球区的平均 ADC 值无统计学差异。**结论** 对有临床症状而常规 MRI 平扫表现正常的病例，ADC 值是评价急性 CO 中毒的一个较为敏感指标。用 ADC 值对 MRI 表现正常的病例进行量化评价，可以为临床诊断的提供依据，减少漏诊的发生。

PU-0739
儿童胚胎发育不良性神经上皮肿瘤 2 例报道并文献复习

李明奕
广西医科大学第一附属医院

目的 报告 2 例儿童颅内胚胎发育不良性神经上皮肿瘤 (dysembryoplastic neuroepithelial tumor, DNET) 病例, 分析其临床病理特征、神经影像学特点、手术治疗及预后情况，以期进一步提高对本病的认识。材料与**方法** 回顾性分析 2 例经手术及病理证实的儿童 DNET 病例的临床资料、患儿术前及术后的头颅磁共振影像表现，并结合文献复习，探讨该病 MR 表现特征，提高影像诊断水平。**结果** 2 例均为 8-10 岁儿童，其中男、女各 1 例，均有反复癫痫发作病史；病灶均为单发，1 例发生于顶叶、1 例发生于颞叶，MR 平扫显示病灶均呈 T1 低、T2 高信号，T2-FLAIR 图像上 1 例呈中央低、周围高信号的“环形征”及“倒三角征”，1 例内见细小分隔，增强扫描均未见明显强化，病灶边缘清楚，无占位效应及瘤周水肿；术后随访 1 年内 1 例无癫痫发作，1 例癫痫发作频率明显减少。**结论** DNET 是中枢神经系统较少见的良性肿瘤，好发于儿童及青少年，临床表现以反复发作的癫痫为主，外科手术切除治疗效果好，术后无需放、化疗，影像学上易与低级别胶质瘤相混淆，但其 MR 表现仍具有一定特征,有助于明确对该疾病的诊断和鉴别诊断，为临床医生制定适宜的手术及诊疗方案提供可靠的影像依据。

PU-0740
Parcellation-dependent topological patterns of white matter connectivity networks in adolesecents

Zhifeng Zhou,Xia Liu
Shenzhen Kangning Hospital/Shenzhen Mental Health Center

Purpose: To investigate the influences of different brain parcellation atlases on the topological patterns of brain white matter connectivity networks (WMCN) in adolescents using diffusion tensor imaging (DTI).
Methods: DTI and T1 structural data of 26 health adolescent participants (age range 11-19 years; 15 males) were acquired on a 3.0 T MR scanner (Discovery MR 750; GE; USA). DTI data preprocessing and network construction were using the PANDA toolbox[1]. Then, graph theory approach was used to investigate the topological organizations of WMCN based on Automated Anatomical Labeling atlas (AAL, 90 regions) and Brainnetome atlas (BNA, 246 regions) [2], respectively. Then, both the global and nodal topological properties of weighted WMCN were analyzed using GRETNA toolbox[3]. The global properties included: clustering coefficient (Cp), shortest path length (Lp), global efficiency

(Eglob), normalized clustering coefficient (Gamma, γ), normalized shortest path length (Lambda, λ), and small world parameters (Sigmma, σ). Each nodal efficiency (Enod) was estimated as the nodal profiles. In addition, hub nodes were defined as those nodes if Enod was at least one standard deviation (SD) greater than the average Enod of the group network. To investigate the robustness of the main results corresponding to the edge weight, the network properties with edge threshold fiber number (FN)= 1, 2, 3, 4 and 5 were analyzed, respectively. Paired *t*-test was used to determine the differences of global topological properties between the two brain parcellation schemes.
Results:The global and local efficiency of AAL parcellation approach were significantly higher than those of BNA approach ($P < 0.0001$), while the Lp, σ, γ and λ of AAL approach were significantly lower than those of BNA approach ($P < 0.0001$). For Cp, only when FN threshold was greater than 3, there was a significant difference between those two parcallation approaches (FN = 4, $P = 0.028$; FN = 5, $P = 0.001$). When FN= 3, 12 hub regions were found in AAL-based network, 43 hub regions in BNA-based network, including bilateral precentral gyrus and precuneus gyrus in both networks.
Conclusion: Global properties and hub nodes of adolescent WMCN largely depended on the brain parcellation template. The stuctural network properties were relatively robust when the FN threshold was set to 3.

PU-0741

产后抑郁症患者脑白质纤维连接的弥散张量研究

黄俊浩,胡良波
重庆医科大学附属永川医院

目的： 运用基于纤维束示踪的空间统计学方法(tract—based spatial statistics，TBSS)探索产后抑郁症患者脑白质微观结构的改变。

方法 纳入 20 例符合 DSM-V 产褥期抑郁症诊断标准的患者（PPD 组）和 24 例年龄、性别及受教育程度相匹配的健康产妇（HPW 组）,进行爱丁堡产后抑郁量表（Edinburgh Postnatal Depression Scale，EPDS）评分，要求 PPD 组评分≥9 分，HPW 组评分≤3 分，两组进行全脑弥散张量成像（diffusion tensor imaging，DTI）扫描，运用基于纤维束示踪的空间统计学方法（TBSS）对 PPD 组及 HPW 组的各向异性分数（fractional anisotropy,FA）值进行组间对比。

结果 产后抑郁组的大脑右侧额上回及额中回、右侧中央前回及顶上小叶、右侧中央后回、右侧扣带回、左侧内囊后支 FA 值低于健康产妇组(P<0.05)，与之相对应右上纵束、右皮质脊髓束及丘脑前辐射、左皮质顶枕颞桥束 FA 值低于健康产妇组。

结论 产后抑郁组右上纵束、右皮质脊髓束及右侧丘脑前辐射、左皮质枕颞桥束纤维连接存在损害；脑白质微结构和纤维连接异常参与产后抑郁症的发生过程，这些改变在产后抑郁早期已经出现；边缘系统-纹状体-苍白球-丘脑(limbic-cortico-striato-pallido-thalamic)神经环路异常可能是导致产后抑郁症发病的原因之一。

PU-0742

基于体素的形态测量学分析常规 MRI 阴性智力障碍儿童脑灰质容积的变化

谢荣倩
遵义医学院附属医院

【摘要】 **目的** 应用基于体素的形态测量学(voxel based morphometry，VBM)技术测量常规 MRI 阴性的智力障碍儿童脑灰质容积的改变，从脑结构水平探讨智力障碍相关机制。**方法** 回顾性分析 2017 年 8 月至 2018 年 11 月在本院儿科中心确诊为智力障碍患儿 22 例，常规磁共振检查阴性，按照年龄、性别、受教育程度及利手匹配原则选择 26 名正常健康儿童作为对照组；采用高分辨率 3DT1 脑 MR 扫描，利用基于 SPM8 的 DARTEL 工具箱进行 VBM 分析，运用独立样本 t 检验比较两组儿童各脑区灰质容积差异(P＜0.01，FDR 校正，cluster size＞50)，年龄、性别、受教育程度和全脑容积为协变量。同时，对病例组的智商评分（IQ）与异常脑区灰质容积进行 Pearson 相关分析。**结果** 病例组与对照组间的年龄、性别、受教育程度及全脑容积均无统计学差异（P＞0.05）。与对照组比较，病例组灰质容积下降的脑区包括双侧海马、额上回、扣带回、右侧颞中回、左侧颞上回、海马旁回、中央前回、颞上回；Pearson 相关分析显示病例组异常脑区（左侧海马）灰质容积与 IQ 呈负相关（r=0.638，p=0.011）。**结论** 常规 MRI 表现正常的智力障碍儿童额叶、颞叶、海马部分功能区皮质灰质体积缩小；双侧海马灰质容积改变反映儿童智力障碍程度，海马损伤是导致儿童智力障碍的原因之一。

PU-0743

DWI 在新生儿缺氧缺血性脑病的应用体会

王大江,陈胜良
遵义市余庆县人民医院

目的 探讨 DWI 序列在诊断新生儿缺氧缺血性脑病的应用价值。**方法** 通过 86 例新生儿 MRI 常规 T1WI、T2WI 序列和加扫 DWI 序列影像分析。**结果** DWI 序列在脑皮质、脑白质、基底节区及丘脑区较早于 T1WI/T2WI 显示高信号。**结论** DWI 序列诊断新生儿缺氧缺血性脑病优于常规 T1WI 和 T2WI 序列.

PU-0744

急性和缓解期多发性硬化患者脑局部连通性改变：基于多体素水平 KCC-Reho 和 Cohe-ReHo 的 MRI 研究

朱艳艳
南昌大学第一附属医院

目的 采用多体素水平（7、19、27）的肯德尔系数-局部一致性（KCC-ReHo）和相干-局部一致性(Cohe-ReHo）探讨急性期和缓解期-复发缓解型发性硬化（RRMS）患者的功能改变及其与临床参数之间的关系。
方法 采集急性期 RRMS18 例、缓解期 RRMS26 例及年龄、性别相匹配的健康志愿者 20 例静息态功能磁共振（fMRI）数据，基于 matla 平台行数据预处理，计算并提取三组受试者在不同体素水平的

KCC-ReHo 和 Cohe-ReHo 值，比较三组间 Reho 值的改变，并分析患者 Reho 值的改变与扩展残疾状态量表（EDSS 评分）、连续听觉加法测试（PASAT 评分）、病程等临床参数之间的关系。

结果 不同体素下的 KCC-ReHo 和 Cohe-ReHo 分析显示三组间在额上回、额内侧回、枕中回 Reho 值升高：其中急性期与缓解期间的 Reho 值仅在枕中回存在差异但与临床参数无相关性；急性期相对于健康组额上回 Reho 值升高且与病程评分呈负相关（r＜-0.5,P＜0.05）。不同的是：KCC-ReHo 分析发现三组间楔叶 Reho 值也升高（P＜0.05，FDR 校正），急性期相对于健康组额内侧回 Reho 升高且与病程呈负相关（r＜-0.5,P＜0.05），缓解期与健康组的差异和临床参数无相关性；而 Cohe-ReHo 分析显示缓解期相对于健康组额上回 Reho 值升高且与病程呈负相关(r=-0.571, P=0.041)。此外 KCC-ReHo（7 和 9 体素）分析另显示急性期相对于健康组额上回 ReHo 值升高且与 EDSS 评分呈负相关（r＜-0.5,P＜0.05）。

结论 相对于缓解期，处于急性状态下的 RRMS 患者存在更广泛的局部功能连通性改变，这种和疾病状态有关的应对性改变反应了患者的临床功能情况。KCC-ReHo 和 Cohe-ReHo 分析可提供更多有用信息，采用不同的 Reho 计算方法可提供更多信息，有利于进一步探讨患者病理生理的改变机制。

PU-0745

颈动脉斑块内出血信号强度与急性脑梗塞风险分层的相关性

柳洋[1],王苇[1],赵锡海[2]
1.扬州大学附属医院
2.清华大学生物医学影像研究中心

目的

有研究表明颈动脉斑块内出血（IPH）与脑血管缺血性事件有关。目前，磁共振（MR）血管壁成像已被证明能够评估颈动脉动脉粥样硬化斑块的形态和成分特征，具有很高的敏感性和特异性。本研究的目的是通过多对比 MR 血管壁成像研究出血性颈动脉斑块患者颈动脉 IPH 的 SIR 与 ACI 之间的关系。

方法

本研究纳入颈动脉 IPH 症状患者，均使用 3.0T MR 进行颈动脉和脑组织成像。对颈动脉进行了标准化多序列协议,包括 TOF、T1W、T2W 和 MPRAGE 序列。通过扫描 T1W 和 DWI 序列获得脑的结构图像。通过 MPRAGE 图像识别 IPH，即信号强度是肌肉信号的 1.5 倍。分别测量了颈动脉 IPH 在 T1W、T2W、TOF 和 MPRAGE 图像上的 SIR。在与颈动脉 IPH 同侧大脑半球上确定是否存在 ACI。采用独立样本 t 检验或 Mann-Whitney U 检验比较有 ACI 和无 ACI 患者颈动脉 IPH 的 SIRs。采用 logistic 回归方法计算不同成像序列在校正混杂因素前后预测 ACI 时 IPH SIRs 的比值比（OR）和相应的 95%置信区间（CI）。

结果

118 例患者（平均年龄 66.9±10.2 岁；88.1%男性）中，35.6%的患者在颈动脉 IPH 的同侧半球有 ACI。与无 ACI 的患者相比，有 ACI 的患者在 T1W 时颈动脉 IPH 的 SIRs 显著升高（1.5±0.6 vs.1.3±0.3；p=0.022），而在 T2W、TOF 和 MPRAGE 图像上则没有。logistic 回归分析显示，经临床混杂因素校正后，T1W 图像上颈动脉 IPH 的 SIR 与 ACI 的存在显著相关（OR=3.535；95%CI 1.120-11.155；P=0.031）。在 TOF、T2W 和 MPRAGE 图像上，ACI 和 SIRs 之间未发现显著相关。

结论

我们的结果显示 T1WI 颈动脉 IPH 的 SIR 与 ACI 明显正相关，提示斑块内出血时间可能是急性缺血性脑血管事件风险的独立指标。

PU-0746

肝豆状核变性治疗前后的临床与 ADC 值对照

陈琦
安徽医科大学第二附属医院

摘要 目的:分析铜螯合剂治疗肝豆状核变性(HLD)患者的临床特征、功能障碍和包括 DWI 指标在内的 MRI 脑功能的影响。
方法与结果: 对 20 例经临床和血清学证实的，有神经损害的肝豆状核变性(HLD)患者，经铜螯合剂治疗后，持续随访，并对其临床特征、进行系列评估，治疗前后完善实验室指标（铜蓝蛋白、24H 尿铜）,MRI 及功能检查，并应用扩散加权成像(DWI)评估肝豆状核变性患者病变区域治疗前后的功能改善；在他们接受治疗后，随着随访时临床症状及实验室指标的总体改善，比较治疗前后病变区域平均扩散系数(ADC)，差异有统计学意义(p ＞ 0.05)。
结论 HLD 患者经铜螯合剂治疗治疗后，ADC 值可作为药物治疗开始后临床神经系统状态及脑功能改善的替代指标

PU-0747
腹腔注射钆对比剂评估多形性胶质母细胞瘤侵袭性与 hMSH6 基因的相关性研究

石莹
哈尔滨医科大学附属第一医院

目的 探索 hMSH6 表达对多形性胶质母细胞瘤在脑组织中形成和进展的影响，利用磁共振评估肿瘤侵袭，并探究 balb/c 裸鼠腹腔注射替代尾静脉注射对比剂的可行性，及两种方案最佳剂量和扫描时间窗。
方法 研究使用 U251 细胞系，实验组 MSH6 基因过表达，对照组正常表达。体外试验，western blot、RT-PCR、细胞划痕实验、Transwell 实验检测两组细胞蛋白、基因表达水平、迁移侵袭能力。体内实验，将两组细胞种于裸鼠皮下，待肿瘤直径大于 1.5cm 取材，Western Blot、RT-PCR 分别检测 MSH6 蛋白、基因表达水平。将两组细胞种于 24 只裸鼠颅内（12 只/组），使用 Philips 3.0T Achieva，配备小鼠专用 8 通道正交线圈，采集 T_1DIXON、T_1Mapping、T_2DIXON、T_2FLAIR 序列，种瘤后 15 日、28 日进行 MRI 扫描，获得平扫图像后分别对实验组、对照组裸鼠进行尾静脉、腹腔注射，并在注射后 15、30、60、90、120、150、180min 采集增强图像，取材、病理验证肿瘤范围，并检测各组织钆沉积情况。
结果 Western Blot、RT-PCR 结果表明实验组 MSH6、MMP2、MMP9 蛋白水平，MSH6 表达水平高于对照组，细胞划痕实验、Transwell 实验结果表明实验组细胞的迁移、侵袭能力强于对照组，小鼠肿瘤组织中实验组的 MSH6 蛋白、基因表达水平高于对照组。磁共振结果显示实验组肿瘤大小大于对照组（3.1±0.4mm×2.6±0.5mm vs 2.2±0.2mm×1.7±0.3mm, $p<0.05$），与病理结果相符。腹腔注射对比剂组和静脉注射对比剂组在注射后 60min、15min 达到最佳增强效果，静脉注射对比剂组强化程度略高于腹腔注射对比剂组。
结论 hMSH6 表达水平与多形性胶质母细胞瘤侵袭性呈正相关，腹腔注射钆对比剂可有效评价多形性胶质母细胞瘤侵袭性。

PU-0748

准连续动脉自旋标记技术在脑瘫患儿脑血流量改变中的临床应用

王禄伟,韩秉艳
新疆医科大学第二附属医院

脑性瘫痪（cerebral palsy，CP，简称脑瘫）是由于各种围生期因素所引起非进行性脑损伤和发育缺陷综合征。研究结果报道如下：

1 目的

探讨准连续动脉自旋标记（pseudo-continuous arterial spin labeling，pCASL）磁共振灌注成像技术在评价脑瘫患儿颈总动脉交感神经网剥脱术后脑血流量改变的应用。

2 方法

选择 2015.10-2017.3 在我院进行颈总动脉交感神经网剥脱术的 50 例 CP 患儿以及 20 例正常儿童纳入本项研究，对正常对照组受试儿童以及 CP 患儿手术前、手术后 7d 和手术后 6 个月分别进行 PCASL 磁共振灌注检查，采用 pride 软件对双侧基底节区、双侧顶叶灰质、双侧放射冠白质区的脑血流量值进行统计分析。并观察 CP 患儿术后临床症状改善情况。

3 结果

CP 患儿术前经 pCASL 评价各兴趣区 CBF 明显低于正常对照组受试儿童，有统计学差异，$p<0.05$。术后 7d，CP 患儿的 CBF 值仍然明显低于正常对照组，有统计学差异，$p<0.05$；术后 6 个月，虽然 CP 患儿的 CBF 值较术前和术后 7d 改善更加显著，有统计学差异，$p<0.05$；但是仍然低于正常受试儿童的 CBF 值，有统计学差异，$p<0.05$。另外，CP 患儿语言障碍、肌张力异常、共济失调、斜视、流涎等临床症状得到明显改善。

4 结论

pCASL 磁共振灌注成像是一种采用磁标记的动脉血水分子作为内源性示踪剂，用于测量脑组织血流灌注的非电离、非侵入式的 MR 技术，由于其无创性，安全性较高，可重复性强，在儿科具有较大的应用优势。

pCASL 磁共振灌注成像技术可以用于脑瘫患儿脑血流量的评估以及颈总动脉交感神经网剥脱术疗效的动态观察，值得临床推广。

PU-0749

基于磁共振成像的棕色脂肪检测研究进展

祝翠玲,张晓东
南方医科大学第三附属医院

【摘要】 **目的** 棕色脂肪作为治疗肥胖症糖尿病等代谢性疾病的潜在治疗靶点，准确检测其体积和代谢活性对评估其治疗潜力具有重要意义。以往临床检测棕色脂肪的诸多方法都各有弊端，目前，一种较新的检测手段-磁共振成像越发广泛地应用于棕色脂肪检测。本文就目前常用于棕色脂肪检测磁共振成像方法作一综述。**方法** 进入 PubMed、百度学术、知网、万方等数据库检索系统，采用“棕色脂肪”、“磁共振成像”、“检测”、“活性”为主要检索关键词，检索文献经筛选后纳入分析 21 篇，文献时间范围到从 2009 年至 2018 年。**结果** 棕色脂肪的检测手段日新月异，相对于其他的检测棕色脂肪的方法，磁共振成像技术具有明显的优势，有助于提高棕色脂肪的准确性。目前，磁共振检查以其无创、无辐射、软组织分辨力高、成像参数多等优势，越发广泛地应用于棕色脂肪检测。**结论** 磁共振成像在无创性检测棕色脂肪方面具有良好的应用前景。

自恋型人格障碍患者静息态脑功能网络拓扑属性重组改变

刘婉晴
大连大学附属中山医院

目的 研究自恋型人格障碍对人脑功能网络的影响从而探索自恋型人格障碍的神经生理机制。
方法 在大连医科大学收集 20 名男性自恋型人格障碍患者及 20 名年龄、性别匹配的健康对照组，进行 3.0T 西门子磁共振头颅进行静息态序列扫描，然后经过 GRETNA 进行图像后处理计算和比较两组的大脑静息态功能网络的拓扑属性。
结果 与健康对照组相比，自恋型人格障碍患者的脑功能网络的小世界属性升高，最短路径长度和聚类系数增加，局部效率升高但全局效率减低。
结论 自恋型人格障碍患者的大脑静息态功能网络发生了异常改变，更趋向规则网络属性，这为自恋型人格障碍的神经影像学机制探索提供了重要依据。

PU-0751

MRI 动态增强扫描技术在垂体微腺瘤中的临床应用

韦红星,黄新洪,戴太亮
天等县人民医院

摘要：目的 探讨 MRI 动态增强扫描技术对垂体微腺瘤诊断价值。**方法** 选择我院放射科 2017 年 1 月至 2018 年 12 月期间确诊为垂体微腺瘤的患者 22 例，均行常规 MRI 平扫、MRI 动态增强扫描以及延迟增强扫描影像学表现。MRI 检查使用 GE BRIVO MR355 1.5T 磁共振扫描仪，使用的是头颈联合线圈。①平扫：行 CUBE T1 矢状位、冠状位扫描，ET 为 12ms；TR 为 400 ms，TE 为 35 ms；层厚层距为 3thk/osp；视野为 18 cm×18 cm；FSE-T2WI 矢状位、冠状位、横断位序列扫描，ET 为 17ms；TR 为 3108ms，TE 为 130ms；层厚层距为 3thk/osp，视野为 18 cm×18 cm；②MRI 动态增强扫描：用高压注射器取 0.1 mmol/kg 钆特酸葡胺于右前臂行静脉注射，速度为 2.5 mL/s，用 FSE-T1WI 序列进行鞍区动态增强扫描，注意保持扫描平面和垂体柄的平行；③延迟增强扫描；结束了动态增强扫描约 20 min 后，则可进行延迟增强扫描，包括进行矢状位与冠状位的 CUBE T1 序列扫描。**结果** 垂体微腺瘤好发于女性，平扫共检出 12 例阳性，检出率为 53%；延迟增强扫描共检出 15 例阳性，检出率为 65%；动态增强扫描共检出 20 例阳性，检出率为 90%。动态增强扫描的检出率均分别高出平扫及延迟增强扫描（P＜0.05）。**结论** MRI 动态增强扫描技术在垂体微腺瘤诊断中检出率较高，临床可疑垂体微腺瘤推荐动态增强 MRI 扫描。

PU-0752

探讨 T2*与 SWAN 在脑出血的对比应用

戴太亮,韦红星,黄新洪
天等县人民医院

目的 探讨 T2*与 SWAN 在脑出血的对比运用。**材料与方法:**收集本院 30 例不同时期脑出血的患者（超急性期、急性期、亚急性早期、亚急性晚期、慢性期每期各 3 例）,患者签署知情同意书。采用美国 GE 公司超导型 1.5T BRIVO MR355 扫描仪，扫描方法包括 SWAN 和 T2*序列。SWAN 扫描参数：TR Minimun ms，TE 49.7 ms,FA 20ms，序列视野 24cm×24cm，层厚层间距 1thk/2sp，Matrix=384×288,Banwidth=41.67，扫描时间 4.12 分钟。T2*扫描参数：TR 360ms，TE 15 ms,FA 20ms，序列视野 24cm×24cm，层厚层间距 6thk/2sp，

Matrix=256×192,Banwidth=15.63，扫描时间 1.47 分钟。效果评价：由 3 位放射科医师对 SWAN 序列和 T2*序列处理后的图像进行对比评分，采用 3 分制双盲法评分。对两者扫描出来的同一出血期的图像质量、信噪比、微小出血灶的显示程度进行对比。应用 SPSS22.0 统计学软件对所得资料进行分析处理。图像的信噪比、清晰度、以及显示微小病灶的成像效果进行比较，评分、信噪比的比较采用配对 t 检验，以 P＜ 0.05 为差异有显著性意义。**结果** 经三位放射科医师对比 T2*与 SWAN 两序列的信噪比、病灶检出效果，发现 SWAN 序列在显示脑卒中急性出血期的效果和在其它脑出血期检出微出血灶的能力均优于 T2*序列。两者对比的差异有统计学意义(P＜0.05)。**结论** SWAN 序列较 T2*序列在显示血肿内顺磁性物质较 T2*更突出，在早期微出血灶、静脉成像、基底节铁沉积优于 T2*，应当多推广提倡应用于脑出血筛查。

PU-0753

MRS 对 HIE 预后早期评估的临床应用价值

唐楷
中国科学技术大学附属第一医院/安徽省立医院

目的 研究磁共振波谱分析（MRS）对新生儿缺血缺氧性脑病预后早期评估的临床应用价值。**方法** 整理 2017 年 12 月至 2019 年 6 月中国科学技术大学附属第一医院收治的 71 例足月缺血缺氧性脑病患儿纳入观察组，对照组则是无缺血缺氧性脑病的 71 例足月儿，对两组分别行 MRS 检查，分析两组 Cho 值、Cr 值、NAA 值并观察乳酸（Lac）峰
结果 观察组基底节兴趣区 Cho/Cr 及 Cho/NAA 升高，其中 30 例可见增高的乳酸（Lac）峰，观察组与对照组比较，中-重度与轻度 HIE 比较差异均有统计学意义（均 P<0.05）。**结论** 磁共振波谱成像可对 HIE 预后做出准确客观的诊断

PU-0754

3D pCASL 成像技术在亚急性期轻度创伤性脑损伤中的应用

汪飞,朱娟
安庆市立医院

目的 应用三维准连续式动脉自旋标记(3D pseudo-continuous arterial spin labeling,3D pCASL)技术探讨亚急性期轻度创伤性脑损伤（mild Traumatic brain injury, mTBI）患者的脑血流量(cerebral blood flow,CBF)特点及其与神经心理学改变的关系。 **方法** 收集 2017 年 6 月至 2018 年 12 月亚急性期 mTBI 患者 40 例，所有患者均于 mTBI 后 1 个月内(11.37±5.21 天)行 MRI 及神经心理学检查，招募性别、年龄与病例组相匹配的健康志愿者 40 例作为对照组。分别测量双侧额叶、双侧颞叶、双侧枕叶及双侧顶叶灰质 CBF 值，应用独立样本 t 检验对病例组及对照组的 CBF 值进行分析；亚急性期 mTBI 的 CBF 值与各神经心理学指标之间的相关性采用 *pearson* 或 *spearman* 相关分析。 **结果** 与正常对照组相比，亚急性期 mTBI 患者的各脑叶 CBF 值均有降低，mTBI 患者左侧额叶、右侧额叶及左侧枕叶 CBF 值减低差异具有统计学意义（t=23.1,p=0.008；t=18.4,p=0.02；t=7.72,p=0.009）。左侧额叶 CBF 值与 DHI 得分呈负相关（r_s=－0.619，p=0.001），与 PCS 评分呈负相关（r=－0.638,p=0.002）；右侧额叶 CBF 值、左侧枕叶 CBF 值与 PCS 均呈负相关（r=－0.559,p=0.01；r=－0.413,p=0.021） **结论** 3D pCASL 技术作为一种无创性磁共振脑灌注成像方法，能发现亚急性期 mTBI 患者的低灌注脑区，且脑血流量的改变与脑震荡后综合征症状具有一定相关性。

PU-0755

Altered functional connectivity of anterior cingulate cortex in primary insomnia: A resting-state fMRI study

Tianyue Wang
Guangdong No. 2 Provincial People's Hospital

Abstract

Objective: To explore the connectivity pattern change betweentheanterior cingulate cortex(ACC) and the voxels from the whole brain in primary insomnia (PI). **Methods:** With region of interest (ROI)-based functional connectivity , a two-sample *t*test was performed on individual FC correlation maps from two groups based on the resting-state fMRI data acquired from 57 PI patients and 46 healthy controls ($p<0.001$, AlphaSim-corrected). **Results:** Compared to the healthy controls, the PI patients show increased connectivity between the right ACC and the right middle frontal gyrus, with decreased connectivity between the right ACC and the bilateral precuneus gyrus. **Conclusion:** Our study shows the alterations of PI patients in the level of functional integration, especially the decreased connectivity between the regions of thedefault mode network(DMN). These changes may provide additional evidence to understand the possible neural mechanisms of PI.

2.Sichuan Cancer Hospital & Institute, Sichuan Cancer Center
3.University of Electronic Science and Technology of China

This study compared the topological organization of brain function in never-treated and treated long-term schizophrenia patients, and whether age-related effects differed between these groups.

In a cross-sectional study, 21 never-treated schizophrenia patients with illness duration over five years, 26 illness duration-matched antipsychotic-treated patients and 24 demographically-matched healthy controls underwent a resting-state functional magnetic resonance imaging (MRI) scan. The topological properties of brain functional networks were compared across groups, and then we tested for differential age-related effects in regions with significant group differences.

Both never-treated and antipsychotic-treated schizophrenia patient groups showed reduced global functional efficacy, and altered nodal centralities in right amygdala, right olfactory cortex and bilateral putamen relative to controls. Never-treated patients demonstrated reduced global clustering coefficient and efficiency, increased shortest path length, and decreased nodal centralities in right amygdala and right

putamen relative to antipsychotic-treated patients. No significant relationships of age and altered functional metrics were seen in either patient group, and no greater alterations in the treated group were identified. These findings provide insight into brain function deficits over the longer-term course of schizophrenia independent from potential effects of antipsychotic medication. Greater functional alterations in never-treated than treated patients suggests that long-term antipsychotic treatment may partially protect or enhance brain global and nodal topological function over the course of schizophrenia, notably involving in amygdala and striatum that have long been associated with the disorder.

3D-TOF 结合图像融合后处理技术对颌面部肿瘤术前引导的价值研究

冉启胜,张乐天
陆军军医大学大坪医院

摘要：目的 比较 3D-TOF、CE-MRA 技术、CT 增强分别结合图像融合后处理技术对于颌面部包块患者的手术前评估优劣，以提供更好的临床支持。**方法** 回顾性分析 2019 年 3 月～2019 年 6 月期间在我科行颌面部 MRI 检查的 11 例患者，均选择 3D-TOF（A 组）及 CE-MRA（B 组）病灶区图像采集，其中 9 例患者行颌面部 CT 增强检查（C 组）；分别比较病灶周围图像的信噪比（SNR）、对比噪声比（CNR）、血管与病灶的关系显示优良情况由两名有独立诊断经验的放射诊断医师对影像进行评价。**结果** ①SNR：A 组＞C 组＞B 组，差异有统计学意义（P＜0.05）；②CNR：A 组＞C 组＞B 组，差异有统计学意义（P＜0.05）；③影像质量评价：A 组＞C 组＞B 组，差异有统计学意义（P＜0.05）。**结论** CE-MRA 能动态的显示病灶及血管的供血过程但由于采集时间较短图像信噪比较低，对于病灶及周围血管间关系显示较差；CT 增强检查由于病灶的强化时机与周围动脉的强化时机差异较大不能在同一期相显示，导致病灶与周围血管关系显示不佳；3D-TOF 结合图像融合后处理技术对于病灶显示及病灶与周围血管间的关系显示最优，且无辐射危害、无需注射对比剂，降低了患者风险，能为临床手术引导提供更好的支持。

PU-0758
MR 磁敏感加权成像与 CT 诊断颅脑外伤微出血的价值分析

唐洁
十堰市太和医院

目的 探讨 MR 磁敏感加权成像技术（SWI）与 CT 在颅脑外伤诊断中的应用价值。
方法 收集本院 2017 年 1 月-2019 年 5 月颅脑外伤患者临床资料 38 例，均接受 MR 磁敏感加权成像与 CT 检查，对图像进行回顾性分析。
结果 CT 平扫微出血灶检出率 72.20%，SWI 序列微出血灶检出率为 95.36%(P<0.05)。
结论 MR 磁敏感加权成像诊断颅脑外伤微出血的敏感性较 CT 高，有助于提高诊断阳性率，评估颅脑外伤的严重程度，为临床医师制定诊疗方案提供更多可靠信息，值得推广。

PU-0759
基于高场磁共振的肠易激综合征患者海马代谢产物变化的研究

刘光耀,张德奎,张静
兰州大学第二医院

目的 探索高场磁共振下不伴有精神症状的肠易激综合征（IBS）患者海马代谢物水平的变化。
方法 选取 2019 年 5 月—2019 年 8 月就诊于兰州大学第二医院的不伴有精神症状的腹泻型 IBS 患者 34 例（IBS 组），同期纳入与之性别、年龄、教育程度匹配的健康志愿者作为对照组（HC 组）。利用 Siemens 3.0T 磁共振采集两组被试双侧海马单体素氢质子磁共振波谱（H^1-MRS）数据。计算各组间海马谷氨酸-谷氨酰胺（Glx）、胆碱类（Cho）、肌酸（Cre）、N-乙酰天门冬氨酸（NAA）、（肌醇）mI 的相对值，并比较两组间的差异，对得到的差异代谢物与疼痛量表进行相关分析。
结果 与 HC 相比，IBS 患者海马区 Glx 相对值降低，mI 相对值明显升高，mI/NAA 值升高，Glx 相对值与疼痛评分呈负相关。
结论 IBS 患者海马代谢存在异常，尤其是神经递质 Glx，而且 mI/NAA 情况一定程度上与临床严重程度呈负相关。

PU-0760
基于功能成像机器学在诊断首发未用药抑郁患者中的临床研究

胡万均,张静
兰州大学第二医院

目的 利用功能磁共振静息态数据指标（ALFF、FC、DC 等）结合机器学习对首发未用药抑郁患者进行诊断分类研究。
方法 对我院 21 名抑郁高风险医生患者及 25 名确定抑郁症状的医生患者，以及 18 名性别年龄相匹配的正常对照分别计算其 ALFF 值、基于 AAL116 模板的 ROI-wise 全脑功能连接，动态功能连接，以及度中心度（DC）指标；利用 PRONTO 工具包对三组被试功能成像数据进行三分类机器学习，最后根据 ROC 曲线得出各个功能指标诊断效能。
结果 ALFF 值在机器学习三分类诊断效能中准确性为 65%，特异性为 68%，灵敏度为 67%; 而全脑 FC 值在机器学习三分类诊断效能中准确性为 75%，特异性为 70%，灵敏度为 71；基于动态功能连接机器学习三分类诊断效能中准确性为 75%，特异性为 78%，灵敏度为 73%; 基于度中心度的指标在机器学习三分类诊断效能中准确性为 68%，特异性为 70%，灵敏度为 71%;由此可以得出动态功能连接以及静态 FC 功能连接的诊断效能特异性最高，而功能连接也许从另一方面反应了抑郁患者的真实大脑活动情况以及异常脑活动变化。

PU-0761
不同年龄组豆纹动脉 3T 磁共振成像对比

吴啸
浙江大学医学院附属第二医院

目的 研究各年龄层豆纹动脉的差异性

方法　　招募二组（20-40 岁 ,50-70 岁各二十位）共四十名健康志愿者,使用联影 790 磁共振分别对两组健康志愿者使用黑血序列进行豆纹动脉成像,经 mip 后处理重建出豆纹动脉，然后在 photoshop 上画出豆纹动脉的各个分支,并统计出豆纹动脉的数量,长度和形状.
结果　使用 3T 优化的黑血序列可以清楚的描绘豆纹动脉,在老年组检测到的豆纹动脉数量,长度明显减少.
结论　高分辨黑血序列为豆纹动脉可视化和量化提供了一种新的方法,其可应用于豆纹动脉损伤相关的检查中.

PU-0762
CT、MRI 在小儿病毒性脑炎诊断中的效果比较研究

张高峰
昆明市儿童医院

目的 ：比较研究 CT、MRI 在小儿病毒型脑炎诊断中的效果。**方法**　在我院 2017 年 12 月～2018 年 12 月间收治的经病理确诊的小儿病毒性脑炎患儿中选取 120 例进行本次研究，对所有患儿进行 CT 与 MRI 检查，就两种检查的结果进行对比分析。**结果**　120 例患儿中，MRI 扫描阳性发现 115 例，未发现 5 例，阳性率为 95.83%，其中多发病灶 93 例，占比 80.87%；CT 扫描阳性发现 99 例，未发现 21 例，阳性率为 82.5%，其中多发病灶 74 例，占比 61.67%，MRI 检查的阳性率明显高于 CT 检查，其诊断率也显著高于 CT 检查(P＜0.05)。**结论**　MRI 在小儿病毒型脑炎诊断中的阳性率较高，诊断准确性较高，较 CT 检查具有更高的诊断价值，值得临床推广与应用。

PU-0763
甲基苯丙胺成瘾者执行控制网络功能连接改变与精神症状的相关性研究

陈静[2,1],李玮[2],刘艳[2],刘为[2],时宏[2],王玮[2]
1.陕西中医药大学附属医院
2.空军军医大学唐都医院

目的　采用静息态功能磁共振（*rest-state functional magnetic resonance imaging，rs-fMRI*）技术联合运用独立成分分析（Independent component analysis，ICA）方法，研究伴有精神症状的甲基苯丙胺成瘾（methamphetamine addiction，MA）者执行控制网络 （executive control network，ECN）完整性改变，并分析其与精神症状的相关关系。
方法　对 19 例 MA 者（MA 组）和 20 例健康志愿者（HC 组）进行临床资料采集、精神症状测试及静息态 fMRI 扫描，提取执行控制网络（executive control network，ECN）并进行 2 组间功能连接差异比较，运用 Spearman 相关分析组间感兴趣差异脑区的平均 Z 值与症状自评量表（Self-reporting Inventory-90，SCL-90）评分间的相关关系。
结果　MA 组 SCL-90 各因子评分均高于 HC 组。与 HC 组相比，MA 组左执行控制网络（left executive control network，LECN）的左额叶、左枕中回功能连接增强，右执行控制网络（right executive control network，RECN）的左尾状核功能连接减弱（单体素 P<0.001，经 GRF 校正后

P<0.05，体素阈值>30；表 1，图 1—图 3）。同时，LECN 左额叶平均 Z 值与 SCL-90 的精神病性评分呈负相关（r＝－0.494，P＝0.032，图 4）。

结论 甲基苯丙胺成瘾者 ECN 内部多个脑区 FC 发生异常，提示甲基苯丙胺成瘾可导致吸食者认知功能损害，同时 ECN 大脑内部 FC 的改变与相应精神症状存在相关关系，推测甲基苯丙胺成瘾者临床精神症状的出现，可能与 ECN 内部 FC 的异常改变有关。

PU-0764

PACG 患者静息态功能磁共振成像分数低频振幅研究

余晨,曾献军
南昌大学第一附属医院

目的 应用静息态功能磁共振成像(rs-fMRI) 分数低频振幅(fALFF) 方法分析原发性闭角型青光眼（PACG）患者全脑活动改变。 方法 采用 3.0 T MRI 分别 对 PACG 组(37 例)和正常对照（HC）组(36 例)进行 rs-fMRI 扫描。运用静息态 fMRI 数据处理助手(DPARSF) 对数据进行预处理并分析 fALFF 值，采用两样本 t 检验比较 PACG、HC 组 fALFF 改变。 结果 相对 HC，PACG 患者 fALFF 值减低区左侧枕下回、距状裂、顶上小叶、右侧舌回、双侧枕中回、中央后回；PACG 患者 fALFF 值增高区位于左侧嗅裂、右侧小脑（体素＜0.05，GRF 校正，P＜0.05）结论 PACG 存在视觉、情感、认知皮质区神经元活动异常，fALFF 为理解 PACG 患者视功能丢失及情感、认知功能障碍神经机制提供了帮助。

PU-0765

引起视束水肿样变的鞍区肿瘤的 MR 诊断

江冰清,郑颖彦,曹代荣
福建医科大学附属第一医院

目的 探讨 MRI 在引起视束水肿样变的鞍区肿瘤中的诊断价值。**方法** 回顾性分析 31 例引起视束水肿样变的鞍区肿瘤的 MR 表现。**结果** 31 例视束水肿样变中，17 例为双侧对称性，8 例以左侧为主，6 例以右侧为主；包括垂体瘤 2 例，颅咽管瘤 11 例，脑膜瘤 3 例，生殖细胞瘤 12 例，胶质瘤 3 例，其 MR 表现各具有一定的特征性。**结论** 引起视束水肿样变的鞍区肿瘤表现各异，MRI 可提供准确的术前定位和定性诊断。

PU-0766

多模态磁共振技术对慢性颈内动脉狭窄侧支循环 定量评估研究

佟丹,闫昱竹,刘晓超,徐宝锋,王晓蕾
吉林大学第一医院

目的 利用多模态磁共振联合扫描技术,定量评估 EICASS 或 EICAO 患者侧支循环代偿能力与临床表现的关系，探讨侧支循环开放情况及解剖结构对代偿能力的影响。**方法** 收集 2018-01 至 2019-01 就诊于吉大一院证实有 EICASS（>70%）或 EICAO 患者 40 例及 30 例正常志愿者。均使用 3.0T MRI 扫描设备进行检查，分析患者的一般临床资料和脑血管危险因素，按临床表现分为 TIA 组及脑梗死组。**结果** 1 性别、吸烟既、往脑梗死病史等均存在统计学差异。2TIA 组和脑梗死组 Willis 环开放情况无统计学差异。两组间二级侧支开放情况无统计学差异。3TIA 患者组内患侧与健侧 A1 段及 PcomA 统计学有差异。脑梗死组仅 A1 段直径存在统计学差异。4TIA、脑梗死两组间 Willis 环血管直径比较差异无统计学意义。5TIA 及脑梗死两组间健侧 ICA 及 VBA 代偿容积比未见明显统计学差异。两组间剪影容积比存在统计学差异。6 患者组健侧 ICA 代偿容积比无统计学差异，与对照组 A1 段缺如者比较有统计学意义。**结论** 多模态联合扫描能为定量评估 ICAS 患者侧支循环代偿能力提供可靠的诊断依据。

PU-0767

Altered amplitude and connectivity of brain function in first-degree relatives of children with autistic spectrum disorders: a resting-state fMRI study

Xiangwen Zhu,Min Xu,Zongming Zhu,Aihua Wang,Lili Zhang,Xiangming Fang
Wuxi People's Hospital

BACKGROUND: According to the genetic and epidemiological data, the first-degree relatives of autistic-spectrum -disorders (ASD) children may present similar but milder personality traits as compared to the defined ASD features. Herein, amplitude of low-frequency-fluctuation (ALFF) and functional-connectivity (FC) were employed to investigate the alterations in typical brain regions of unaffected parents.
METHODS: 42 unaffected parents of ASD children (pASD) and 39 matched controls underwent resting-state fMRI scanning. Spontaneous brain activity was examined using ALFF between groups. The increased/decreased regions were selected for FC analysis. Correlation analysis was calculated between FC-degree and children's Autism-Behavior-Checklist (ABC) score.
RESULTS: The ALFF increased in bilateral superior frontal gyrus (SFG), while decreased in left hippocampal- gyrus (HG) in pASD. Over-connectivity was shown between bilateral SFG and superior-temporal-gyrus (STG), along with left-HG and right posterior-cingulate-cortex, whereas under-connectivity appeared (i) between right-SFG and left superior-occipital-lobe, (ii) between right-SFG and right cerebellum-posterior-lobe, and (iii) between left-HG and bilateral TG/right para-hippocampus gyrus (PHG). For over-connectivity between right-SFG and left-STG, a positive correlation was found between fathers' Z-score and ABC-score, while to mothers, a negative correlation appeared. For under-connectivity between left-HG and right-PHG, and between right-SFG and right-CPL, positive correlations were shown between mothers' Z-score and ABC-score.
CONCLUSIONS: These findings indicated that the underlying alterations in central brain regions in unaffected parents may present similar patterns as the reported ASD adults. Meanwhile, some compensation patterns might have been generated to prevent the deterioration towards the defined ASD. Besides, FC-degree of unaffected mother might be considered as a predictor of the severity of children's disease.

PU-0768
DWI 图像分析在不同时期脑梗死诊断中的价值

张雅滨
中国人民解放军联勤保障部队第 940 医院（原兰州军区兰州总医院）

目的 探讨弥散加权成像（diffusion weighted imaging, DWI）对不同时期脑梗死的临床诊断价值。**方法** 回顾性分析我院的 80 例不同时期脑梗死患者的临床资料，均采用 MR 常规序列（T1WI、T2WI、T2-FLAIR）及 DWI 进行扫描,比较分析两种不同成像方式对病灶的检出率，以及对病灶的边界、范围的显示情况，分别测量病灶的表观弥散系数（Apparent dispersion coefficient, ADC）值。**结果** DWI 图像分析检出 76 例脑梗死患者，超急性期、急性期、亚急性期及慢性期脑梗死患者检出率分别为 87.0%、96.1%、95.7%、100%，而常规序列则分别为 19.3%、30.7%、73.9%、87.5%。76 例脑梗死患者中，68 例患者脑梗死病灶在 DWI 图像表现为高信号，其病灶中心位置的 ADC 值均明显低于对侧相应位置；8 例患者病灶在 DWI 图像显示为等信号或低信号，ADC 值明显高于对侧相同位置。DWI 对显示病灶的边界、范围均优于 MR 常规序列，差异具有统计学意义($p < 0.05$) 。

PU-0769
基于常规 MRI 图像的影像组学对高级别脑胶质瘤总生存期预测的临床价值

虞芯仪,方向明
南京医科大学附属无锡人民医院

【目的】
研究基于常规 MRI 图像的影像组学对高级别脑胶质瘤总生存期预测的效能及临床价值。
【方法】
回顾性收集具有完整 MRI 图像、病理和总生存期资料的高级别胶质瘤 25 例。在 MRI 图像上勾画肿瘤最大径层面的瘤体实性部分为感兴趣区，采用 Image J 软件，提取直方图和灰度共生矩阵特征，测量各序列图像标准差（standard deviation,SD）、峰度（kurtosis）、偏度（skewness）、对比度（contrast）、逆差矩（inverse different moment,IDM）、熵（entropy）等特征值。采用 pearson 相关性分析计算各特征与总生存期之间依存关系。对与总生存期存在线性相关关系的组学特征绘制受试者工作特征曲线，计算其曲线下面积和最佳临界值，其次采用 Kaplan-Meier 曲线计算平均生存期，采用 Log-rank 检验比较生存期。
【结果】
标准差、偏度、熵等参数与 OS 成负相关，最大值、峰度、逆差矩与 OS 成正相关；SD_{T2WI}低于 36.7 的患者平均生存期为 599.059 天，高于 36.7 的患者平均生存期为 109.5 天（$p<0.05$），AUC 为 0.74；$Cont_{Flair}$低于 6.514 的患者平均生存期为 854.286 天，高于 6.514 的患者平均生存期为 260.647 天（$p<0.05$），AUC 为 0.621；$Skew_{Flair}$低于-0.174 的患者平均生存期为 604.429 天，高于-0.174 的患者平均生存期为 188.6 天（$p<0.05$），AUC 为 0.743。联合患者年龄、常规影像学特征和组学特征可提高预测诊断价值，AUC 达 0.81。
【结论】
影像组学可提供更多量化信息，可为预测高级别脑胶质瘤总生存期提供重要信息。联合影像组学、患者年龄及常规 MRI 征象学，可进一步提高对高级别胶质瘤总生存期预测的效能。

PU-0770

Decreased topology properties in depressive disorder patient`s brain network

An-Ping Shi,Ke Xu,Ying Yu,Wen Wang,Guang-Bin Cui
Department of Radiology , Tangdu Hospital, Fourth Military Medical University

Objective
Resting-state functional magnetic resonance imaging (rs-fMRI) is used to construct brain functional network and assess the small-world properties of brain network in depressive patients.
Background
Depression has a serious impact on human health and society.It is believed that the ability of brain information processing in patients with depression is significantly reduced. Resting-state functional magnetic resonance imaging (rs-fMRI) can assess the disturbed small-world networks, and further explore the neuroimaging mechanism of brain dysfunction in patients.
Methods
In this study, 47 depressive patients (Hamilton Depression Scale score 17-24) and 43 healthy controls were matched at age, sex, body mass index and education level. Rs-fMRI data were collected, and the brain were segmented into 90 regions by ALL template to calculate the global efficiency and local efficiency of depression related network. Pearson correlation coefficient was implemented to study the relation among global efficiency of global efficiency, age, gender, disease history.
Results
Properties of small world network nature were confirmed in Functional network in both groups. Depressive patients had a rise on node efficacy in the marginal regions, reduction on node efficacy in the executive regions and the optimal parameters of the small world network of patients decrease significantly. There was a significant relationship between neuroimaging indicators and depression level reflected by the degree of small-world decline.
Conclusions
Small-world properties in the brain regions of patients significantly reduced suggesting that disturbed small-world networks in the brain regions may be related to the mechanism of depressive mood regulation disorder.

PU-0771

3D-nerve 序列对新生儿臂丛神经的成像优势

赵磊磊,宋玉霞
济南儿童医院

目的 对 3D-nerve 序列在新生儿臂丛神经损伤中的成像效果进行研究，并与 DWIBS、3D-STIR 序列显示臂丛神经损伤中的效果进行对比，同时与超声、肌电图检查做对比，为其临床诊断与治疗进行指导。**方法** 征集 15 例臂丛神经损伤的新生儿，进行臂丛神经 MRI 扫描，扫描序列包

括 3D-nerve、DWBIS、3D-STIR 序列，评估每个序列图像的血管搏动伪影、脂肪抑制均匀性及臂丛神经分支的显示效果，并测量神经-脂肪比，神经-肌肉比，同时与超声、肌电图结果进行对比。**结果** 臂丛神经在 DWIBS 序列图像上显示效果差，无法观察；血管搏动伪影、脂肪抑制不均匀在 3D-nerve、3D-STIR 分别有 1/15、5/15，3/15、7/15，两组间无明显统计学差异（P＞0.05）；3D-nerve 序列神经显示效果优于 3D-STIR 序列：神经-脂肪比、肌肉-脂肪比明显高于 3D-STIR 序列（P<0.05）；3D-nerve 序列显示臂丛神经分支能力明显优于 3D-STIR 序列；与超声及肌电图对比，虽然三者均能判断臂丛神经损伤，但是 3D-nerve 序列较心电图能直观清楚显示损伤的位置、性质，同时对于锁骨上区神经损的显示明显优于超声。**结论** 3D-nerve 序列对新生儿臂丛神经损伤中的成像效果明显优于 DWBIS 及 3D-STIR 序列，可准确诊断新生儿臂丛神经损伤。

PU-0772
三维磁共振静脉成像对窦汇区变异的研究

李伟宁,鲍道亮
福建省肿瘤医院

目的 运用三维磁共振静脉成像对窦汇区静脉窦的解剖变异进行研究。**方法** 收集 39 例颅内静脉窦的三维磁共振静脉成像（MRV） 图像进行回顾性分析，其中三维 TOF MRV 法 29 例，CE－MRV 法 10 例，对其静脉窦的解剖变异进行观察。**结果** 显示上矢状窦、 直窦、 横窦在窦汇区相互连接的方式：上矢状窦与左右横窦的连接、直窦与左右横窦的连接各 5 种方式，左右横窦于窦汇区存在有直接连接和间接连接二种，优势侧横窦以右侧居多。**结论** 三维 TOF MRV 和 CE－MRV 法均能显示窦汇区静脉窦的连接方式并对其解剖变异形式做出有效判断，为临床的诊断和治疗提供解剖依
据。

PU-0773
颅内孤立性纤维性肿瘤/血管周细胞瘤影像表现及病理改变

曾禹莉,刘建滨,王贵良,赵洁,李文稳
湖南省人民医院/湖南师范大学附属第一医院

目的 探讨颅内不同分级孤立性纤维性肿瘤/血管周细胞瘤(solitary fibrous tumor /hemangiopericytoma，SFT /HPC)影像表现及病理改变。
方法 回顾性分析 8 例经病理证实的 SFT/HPC 临床、影像及病理学资料，结合文献进行探讨、分析。
结果 ①8 例均为单发肿块，7 例边界较清。幕上 3 例（1 例骑跨中线），幕下 3 例，2 例跨小脑幕生长。1 例类圆形，7 例分叶状，瘤体平均直径 7.5cm。8 例无钙化，7 例囊变、坏死，1 例出血，2 例瘤周水肿明显。4 例 CT 平扫：实性部分 3 例稍高密度（脑实质比），1 例呈等、低混杂密度。6 例 MR 平扫：4 例等 T1WI（白质比），等 T2WI（灰质比）信号，2 例呈稍长 T1WI、短 T2WI 信号，T2WI 上低信号（纤维）与高信号（囊变、坏死）混杂形成“阴阳征”。增强:血供丰富，由颈内外动脉分支双重供血，实性部分明显强化，1 例见“脑膜尾征”。4 例 MRS: NAA 峰、Cr 峰降低，Cho 增高。②镜检: 2 例 WHOI 级，5 例 WHOⅡ级，1 例 WHOⅢ级。③免疫组化及特殊染色: 8 例 STAT6（+），7 例波形蛋白（+），5 例 CD34、CD99（+），1 例 Bcl-2（+），2 例 Ki-67 标记＞5%，8 例 S-100、SMA、EMA（-）。

结论 SFT/HPC 影像表现有一定特征性：属颅内脑外肿瘤，常单发，体积较大，窄基底与脑膜相连，钙化少见，具相对较高 ADC 值和较低 DWI 信号（瘤细胞密度较低、血管丰富）。I 级大多分化良好，富含胶原纤维、薄壁血管，肿瘤生长缓慢，形态多较规则，包膜较多见，T2WI“阴阳征”及 T2WI 低信号区延迟期显著强化较具特征性。II、III级由于胶原纤维减少，细胞异型性明显，核分裂象、坏死增加，形态多不规则，囊变、坏死、出血及瘤周水肿、流空血管、骨质破坏等较多见。确诊需病理学及免疫组化检查，STAT6 为本病特异性的诊断标记。

PU-0774

常规 3D-T1 序列与 3D-DIR 序列在脑胶质瘤诊断中的应用价值比较

余菡
重庆医科大学附属第二医院

目的 比较常规 3D-T1 序列与 3D-DIR（three-dimensional double inversion recovery ，三维双反转恢复）序列在评价脑胶质瘤诊断中的应用价值

方法 收集本院肿瘤科 2018 年 8 月至 2019 年 7 月收治的脑胶质瘤患者 20 例，所有患者均经病理证实。对 20 例患者行 3D-T1 序列与 3D-DIR 序列磁共振颅脑成像，得到 A（3D-T1）、B（3D-DIR）两组图像，对两组图像进行主客观评价。主观评价由两名经验丰富的诊断医师对图像质量进行评分，图像质量由高至低分别为 4 分、3 分、2 分、1 分。图像质量客观评价参数为信噪比（SNR）。使用 SPSS 20.0 对所有计量资料进行独立样本 t 检验，对两名医师进行一致性检验，P＞0.05，为无显著统计学差异，P＜0.05，则有显著统计学差异。

结果 A 组图像质量评分结果为 3.22±0.15，B 组图像质量评分结果为 3.46±0.18，p＜0.05，差异有统计学意义；A 组图像信噪比为 2.71±0.24，B 组图像信噪比为 2.82±0.17，p＞0.05，差异无统计学意义； 两名医师一致性高。

结论 与常规 3D-T1 序列相比，3D-DIR 序列以其独特的成像原理，对灰质病变及皮层下病变显像更加清晰，能有效显示胶质瘤的形态，对胞体能突出显示，可帮助诊断脑胶质瘤，对临床诊疗工作具有指导作用，为临床诊疗工作提供有效的参考 .

The fMRI observation on alterations of iron level and functional connectivity in the hippocampus of pateients with type 2 diabetes

Qian Sun,Ying Yu,Linfeng Yan,Yuxuan Shang,Wen Wang,Guangbin Cui
Tangdu Hospital, The Fourth Military Medical University

Background: To observe occurrence of the hippocampal iron deposition and functional connectivity (FC) states in patients with type 2 diabetes mellitus (T2DM) by using quantitative susceptibility mapping (QSM) and resting-state functional magnetic resonance imaging (rs-fMRI).

Methods: Twenty T2DM patients and twenty matched healthy controls (HC) were recruited. QSM and rs-fMRI data were subsequently acquired on a 3.0T MR scanner. Decrease of QSM values were used as an index of tissue iron deposition and FC measurement was

performed to calculate hippocampal FC with other brain regions, respectively. Cognitive function was evaluated by using Mini-Mental State Examination (MMSE), Montreal Cognitive Assessment (MoCA) and auditory verbal learning test(AVLT). Brain volumes were also evaluated among these participants.
Results: The QSM values significantly decreased in hippocampus of T2DM groups. Significant decreases of FC of hippocampus with other brain regions, e.g. the bilateral frontal gyri were observed . The decreased QSM values in bilateral hippocampus were closely related with the decreased hippocampal FC to caudate and frontal gyri. Significant correlation was found between the QSM values and FC of the left hippocampus and the short and long delayed free recall scores of the T2DM patients.
Conclusions: The iron deposition and abnormal FC in hippocampus of T2DM patients and QSM values and FC of left hippocampus were closely associated cognitive impairment. It suggests that abnormal iron concentration of the hippocampus may be a potential biomarker of T2DM-related cognitive impairment.

PU-0776

Altered intrinsic brain activity in patients with colorectal cancer after chemotherapy comorbid depression

Wenwen Zhang,Lianping Zhao,Gang Huang,Yaoxing Duan
Gansu Provincial Hospital

Abstract **Objectives** To characterize the pattern of altered intrinsic brain activity in patients with colorectal cancer after chemotherapy comorbid depression. **Methods** The patients with colorectal cancer who received adjuvant chemotherapy comorbid depression (CTD)(n=20) and control subjects (n=43) underwent resting-state functional MRI (rsfMRI). Amplitude of low-frequency fluctuation(ALFF) and regional homo-geneity (ReHo) were calculated and compared between the groups using the two-sample *t* test. Correlation analysis was also performed between rsfMRI values (i.e., ReHo, ALFF) and 9-item Patient Health Questionnaire (PHQ-9) and generalized anxiety disorder (GAD-7) scores. **Results** In comparison with the control subjects, patients with CTD showed decreased ALFF in the left occipital areas, left cuneus, right precuneus/cuneus and decreased ReHo in the bilateral lingual, and cuneus. There were no significant correlations between the scores of PHQ-9 and GAD-7 and altered intrinsic activity values. **Conclusions** We observed neurological abnormalities in patients with CTD and the ALFF and ReHo abnormal in these areas could be neuroimaging biomarkers for CTD.

Abnormal Network Connections of Autism Spectrum Disorder in Preschool Children: A resting-state Functional study

Xiaomeng Li[1,2,3],Longlun Wang[1,2,3],Yun Zhang[1,2,3],Bin Qin[1,2,3],Jinhua Cai[1,2,3]
1.Children’s Hospital of Chongqing Medical University ‘

2.Ministry of education key laboratory of child development and disorders
3.Chongqing key laboratory of pediatrics

Objectives: This study is used network-based statistics to analyze the functional brain network characteristics of preschool children in order to find Imaging biomarkers for early diagnosis of autism.
Materials and Methods: In this study, fMRI imaging technology based on brain blood oxygen level dependence (BLOD) was used to scan preschool children (aged 2－6 years, 53 children with ASD, 63 children as controls), and graph theory was used for analysis.
Results: Compared with the control group, the autism group has a wide range of abnormal connective edges, involving the frontal, parietal, temporal, occipital and subcortical structures, especially concentrated in amygdala, right hippocampus, parahippocampal gyrus, occipital lobe, lingual gyrus and cuneiform lobe, mostly located in hindbrain region. In ASD group, the node degree of right Frontal_Mid_Orb and the efficiency of right Lingual node were higher than those in control group.
Conclusion: Our study shows that autism has certain effect on the functional brain network, and the brain regions involved are related to autism symptoms, that results have strengthened our understanding of the dysfunction of autistic patients.

舌腺泡状软组织肉瘤 1 例

许奇俊
福建医科大学附属第一医院

目的 分析舌腺泡状软组织肉瘤的 MRI 表现特征，提高对该病的认识及术前影像诊断水平。
方法 回顾性分析经病理证实的我院 1 例舌体腺泡状软组织肉瘤的临床及 MRI 表现。**结果** 病灶位于右侧舌体，呈椭圆形，T1WI 等或高信号，T2WI 不均匀高信号，瘤内和瘤周有很多流空信号，增强强化明显，边界清楚，病灶跨越舌中线，右侧下颌舌骨肌及舌骨舌肌显示不清，邻近骨质结构完整，颈部未见肿大淋巴结。
结论 肿瘤内和瘤周有流空信号，对舌腺泡状软组织肉瘤具有重要的诊断价值。

PU-0779

颈动脉斑块 MRI 诊断个案分析

李帆,卓丽华
绵阳市第三人民医院/四川省精神卫生中心

目的 探讨 MRI 对颈动脉斑块成份分析、判断斑块的稳定性及病理分期。
方法 MR 成像扫描序列：2D：横断 T1、T2WIFS（黑血）、SNAP、T1WI+C（横断），3D:TOFMRA 横断（亮血）、（黑血）T1WI 冠状位（曲面重建、测量范围）；斑块成分及信号特征（与同层肌肉信号进行比较），回顾性分析经综合诊断为不稳定斑块患者的 MRI 表现。
结果 该病例右侧颈内动脉分叉处可见粥样斑块形成，内可见脂质核、钙化及出血，斑块表面纤维帽变薄，伴小溃疡形成。

结论 颈动脉粥样硬化斑块 MR 成像无电离辐射，能定量、定性分析颈动脉斑块的成份特征，较为准确测量颈动脉斑块负荷及狭窄程度。

磁共振 MRS 联合 ADC 值对胶质瘤分级的诊断价值

樊晓宇,张露
湖北医药学院附属随州医院（随州市中心医院）

目的 探讨磁共振波谱分析技术(MRS)联合弥散加权成像(DWI)中 ADC 值对脑胶质瘤分级的临床价值。

方法 选取 2015 年 12 月-2019 年 1 月在我院就诊的 43 例脑肿瘤患者作为研究对象,行 MRI 平扫+增强扫描,对病灶实性成份行 MRS 及 ADC 值分析,收集患者临床资料,计算患者患侧肿瘤实性成份、瘤周水肿以及健侧的 ADC 值,对 NAA、Cho、Cr 等代谢物值进行计算。

结果 低级别胶质瘤肿瘤实性成分 ADC 值及 rADC 明显高于高级别胶质瘤，肿瘤实性成份 ADC 值明显低于瘤周水肿区(P<0.05)，ADC 值与病理分级呈负相关（r=-0.72），最大曲线下面积（AUC）约为 85%，当临界值取 $1.3\times10^{-3}mm^2/s$ 时诊断效能最佳（敏感度为 87.3%，特异度为 92.5%）。低级别胶质瘤 rNAA、NAA/Cr 明显高于高级别胶质瘤,rCho、Cho/Cr、Cho/NAA 则明显低于高级别胶质瘤(P<0.05)，差异均有统计学意义(P<0.05),其中较稳定的比值是 Cho/NAA，其与病理分级呈正相关（r=0.81），最大曲线下面积（AUC）约为 88%，当临界值取 3 时诊断效能最佳（敏感度为 59.3%，特异度为 83.2%）。

结论 磁共振 DWI 联合 MRS 扫描应用于脑肿瘤患者的检查中,能对胶质瘤的分级提供帮助，并在划分肿瘤边界方面有重要的价值,在临床治疗方案的选择及确定手术切除的范围等方面有一定的指导意义，值得临床推广。

Severe asymptomatic carotid stenosis: Can resting fMRI signals identify patients at higher risk?

Lei Gao,Haibo Xu
Department of Radiology， Zhongnan Hospital of Wuhan University， Wuchang District， Wuhan City， 430071， Hubei Province， China;

Purpose: This study aimed to explore hemodynamic delay measured by resting-state BOLD signals in patients with severe asymptomatic carotid stenosis (SACS).

Methods: Twenty-four patients with SACS (19 males/ 5 females; 64.25 ±7.18 years) and 24 comorbidities-matched controls (19 males/ 5 females; 67.16 ±6.10 years) were included. Hemodynamic delay was assessed using resting-state fMRI. Arterial spin labeling based cerebral perfusion, susceptibility weighted imaging based micro-hemorrhagic lesions, and T2-weighted white matter hyperintensities were also quantified.

Results: Temporal-shift analysis revealed both significant hemodynamic delay in the affected side and lead in the unaffected side in patients with about 2 seconds, predominately appeared in the lateral temporal and frontal regions, and paralleling with delayed recall.

Conclusions: Temporal-shifting alterations, specifically in the somatomotor, salience, dorsal attention, and executive systems, are characteristic changes in patients with SACS. These changes suggest that lag structure of resting BOLD signals in SACS patients is significantly impaired, may echo the impairments in organizational activity and neurovascular couplings. Our results suggest that temporal-shift analysis can be used as a possible clinical utility for functional reserve assessment in brain stenosis patients.

PU-0782

Cerebral Altered Neurovascular Coupling in Patients with Sudden Deafness

Chenxi Liu,ZheSheng Shi,Wen Wang,Guang-Bin Cui
the fourth military medical university

BACKGROUND:
According to statistics, the incidence of sudden deafness (SD) is 5-20/100,000, and about 150,000 people are sick every year in the world [1,2]. Previous basic studies have shown that there may be cerebral neurovascular coupling (NVC) disorder in SD patients. However, the certain NVC pattern for SD patients is still unknown. Therefore, this study intends to use multimodal magnetic resonance technology to explore the NVC function of SD patients and the relationship between it and the disease severity.
SUBJECTS AND METHODS:
In this study, 41 patients with SD and 41 matched healthy controls were recruited. Pearson correlation coefficients between cerebral perfusion map and four kinds of brain neuron activity maps were calculated at the whole brain level and brain region level respectively. Then four kinds of "NVC indicators" were obtained. The independent sample t test was used for statistical comparison to explore the intergroup alteration.
RESULTS:
NVC coefficients were significantly increased in bilateral superior temporal gyrus, straight back, left parahippocampal gyrus, bilateral precuneus, and decreased in left pillow parietal lobe, bilateral superior temporal gyrus, left cingulate gyrus, right angular gyrus, bilateral occipital, right parahippocampal gyrus, bilateral temporal side in the back. Meanwhile, most NVC indexes were significantly positively correlated with disease duration and the decreased decibel level.
CONCLUSIONS:
Cerebral altered NVCs were found in patients with SD. There was a significant correlation between the imaging changes of NVC and the disease severity. This technique may contribute to the etiology of SD.

病例报告：颅脑间叶性软骨肉瘤 1 例

苏妍
福建医科大学附属第一医院

目的 分析颅脑间叶性软骨肉瘤的影像特点，探讨颅脑间叶性软骨肉瘤的影像学表现。**方法** 回顾性分析 1 例我院经病理证实的颅脑间叶性软骨肉瘤的临床影像资料，分析病变发生的年龄、性别和临床症状等临床特征，以及观察病灶的大小、边界、CT 和 MR 图像特征及其强化方式，总结该病变的特征性影像学表现。**结果** 患者为 59 岁女性，发现右下肢无力 1 月余，病灶位于左侧额顶部-大脑镰旁，宽基底附着于脑膜上，境界清楚，大小约为 3.1cm×2.8cm，CT 图像上病灶呈等密度，密度不均匀，内可见点状、条状粗大钙化，周围可见水肿带。MR 图像上病灶 T1WI 和 T2WI 均呈等信号，DWI 呈高信号，ADC 呈低信号，MR 增强扫描显示病灶呈明显强化，病灶侵犯上矢状窦，可见硬膜尾征。未出现远处转移。**结论** 颅脑间叶性软骨肉瘤多起源于脑膜，发生在颅脑的间叶性软骨肉瘤少见，影像上极容易被误诊为脑膜瘤，其特征性影像学特点包括 CT 图像上可见粗大钙化，MR 图像上 T1WI 和 T2WI 均呈等信号，DWI 呈高信号，ADC 呈低信号，呈明显不均匀强化。利用 CT 和 MR 技术进行联合诊断能够提高颅脑间叶性软骨肉瘤的影像诊断效能。

PU-0784

可逆性后部白质脑病综合征的影像表现分析

彭琨,郭向东,景辉
山西医科大学附属太钢总医院

目的 分析探讨可逆性后部白质脑病综合征的临床和影像表现特点，以提高诊治水平。**方法** 回顾分析我院收治的 11 例可逆性后部白质脑病综合征（RPLS）患者的临床及影像学资料。患者年龄 24 ～ 65 岁，其中女性 8 例，男性 3 例。相关发病因素包括：高血压脑病、子痫、系统性红斑狼疮、多发性动脉炎、环孢霉素治疗后、血栓性血小板减少性紫癜；临床表现有头痛、言语不清、意识障碍、抽搐、癫痫发作、视物模糊等。**结果** CT 平扫显示脑内分布于双侧顶枕叶的斑片状低密度影，边界模糊，主要位于脑白质 ；头颅 MRI 显示所有患者以大脑半球后部白质受累为主，多位于双侧顶枕叶，双侧大致对称，也可累及额叶、颞叶、基底节、小脑、脑干等部位。T1WI 病灶等或稍低信号、T2WI 及 T2FLAIR 上呈高信号， DWI 表现为等信号,病灶边缘模糊，增强扫描不强化。经治疗后患者临床症状得到有效缓解，复查 MRI 或 CT 病灶减轻或消失。 **结论** 可逆性后部白质脑病综合征具有较为特征的影像表现，头颅 MRI 是最佳检查方法。早期诊断、适当治疗可使大部分患者临床症状改善，影像学异常逆转。及时进行 CT 和 MRI 检查及治疗后复查对其诊断和疗效评价具有重要价值。

胶质瘤术后早期 MR 形态成像及人工智能评估生存的研究进展

全冠民
河北医科大学第二医院

讲座摘要：胶质瘤是颅内最常见的原发肿瘤，术后早期（48h 内）MRI 影像学基线检查对于评估肿瘤残留、复发、预测无进展生存及总生存期具有重要价值。作者从常规 FLAIR、DWI、增强 T1WI 形态学及人工智能方面，并与功能影像学对照，包括 MRS、DTI、DKI 及 PWI、多模态功能成像比较，并结合胶质瘤基因表型，阐述形态学成像对于生存评估的研究进展。

PU-0786
MR 征象预测较低级别胶质瘤 1p/19q 杂合性缺失状态的初步研究

全冠民
河北医科大学第二医院

背景和**目的**　较低级别胶质瘤（lower grade glioma, LGG）染色体 1p/19q 杂合性缺失（loss of heterozygosity, LOH）状态与化疗敏感性及预后明显相关，本研究将通过术前及术后 MR 征象预测 LGG 1p/19q LOH 状态。

方法　回顾性分析 69 例 LGG 患者的术前与术后 MR 及临床资料，术前 MR 征象包括肿瘤部位、均质性、T2-FLAIR 不匹配、室管膜下区（subventricular zone, SVZ）受累及中线移位征，术后 MR 征象包括新增强化形态、残腔周围 FLAIR 高信号范围变化趋势、残腔 FLAIR 信号强度变化、假性进展，临床资料包括性别、年龄与 WHO 肿瘤分级。通过单因素及多因素 logistic 回归分析评估各参数与 1p/19q LOH 状态的相关性并计算多因素 logistic 回归模型预测 1p/19q LOH 的灵敏度、特异度、PPV、NPV 及准确度。

结果　单因素分析显示术前征象：肿瘤部位（P＜0.001）、均质性（P=0.049）、T2-FLAIR 不匹配（P＜0.001）及 SVZ 受累（P=0.031），术后征象：新增强化形态（P＜0.001）、假性进展（P=0.026）与 1p/19q LOH 相关性有统计学意义；中线移位、术后残腔 FLAIR 信号强度变化、残腔周围 FLAIR 范围变化及临床因素无统计学差异。多因素 logistic 回归分析显示部位、T2-FLAIR 不匹配及术后新增强化形态与 1p/19q LOH 有关，多因素 logistic 回归模型预测 1p/19q LOH 的灵敏度、特异度及准确度分别为 0.88、0.85、0.86。

结论　本研究评估了常规 MR 征象与 1p/19q 基因状态的相关性，提供了一种无创预测 1p/19q LOH 的方法。

PU-0787
基于 DWI 的影像组学特征评估急性脑梗死预后的模型研究

全冠民
河北医科大学第二医院

背景和**目的**　急性脑梗死病变具有异质性，并可能影响病人预后，常规影像学方法对此种评估不足。本研究拟建立影像组学模型，从大数据分析角度观察脑梗死病变异质性，并确定该模型评估脑梗死预后的可能性及最佳算法。

方法　回顾性分析 208 例急性大脑中动脉（MCA）区梗死病人临床和 DWI 资料，采用 ITK 软件及支持向量机、Logistic 回归分析、RF 随机森林分类器模型分别进行分析，建立影像组学模型并分析其评估预后的价值。

结果 预后良好（mRS£2）与不良（mRS>2）组的临床及人口学因素中仅年龄有统计学差异，共提取 396 个影像组学特征，套索回归降维后筛选出 8 个最强相关特征，补充可行性结果，即试验组和验证组，说明本方法的可行性， RF 随机森林模型分类器获得的影像组学模型效果最佳，ROC 曲线下面积（AUC）分别为训练组 AUC 为 0.824，敏感度 95.3%、特异度 59.2%、准确度 69.9%数字列出方法一致，两组不一样，验证组 AUC 为 0.725，敏感度、特异度及准确度分别为 77.8%、63.6%及 67.7%。

结论 影像组学方法提取的特征可用于建立基于 DWI 序列的 MCA 区急性脑梗死评估模型，其中 RF 算法模型效果最佳。

关键词：急性缺血性卒中；磁共振成像；扩散加权成像；影像组学；预后

PU-0788
探讨 3D-pCASL 技术在导水管梗阻性脑积水中的应用价值

黄江龙,肖新兰,龚良庚,唐小平
南昌大学第二附属医院

目的 探讨 3D-pCASL 技术在导水管梗阻性脑积水中的应用价值，并初步研究导水管梗阻性脑积水梗阻程度与脑组织灌注的相关性。

方法 搜集导水管梗阻性脑积水患者 26 例（轻型 12 例、中型 9 例、重型 5 例、极重型 0 例），将术前脑积水组分为低度和高度梗阻脑积水组（轻型归为低度组，中型与重型归为高度组），正常志愿者 30 例，均行颅脑 MR 常规序列及血管成像扫描；然后采用同一标记延迟时间（T=1525ms）行全脑 3D-pCASL 扫描，获得脑积水术前组、术后组及对照组各脑区（前外分水岭、后外分水岭、基底节区、半卵圆中心）的脑血流量 CBF。**结果** 对照组与脑积水术前组、脑积水术前与术后组前外分水岭与基底节区 CBF 相比，差异有统计学意义；后外分水岭与半卵圆中心 CBF 相比，差异无统计学意义；对照组与脑积水术后组前外分水岭、后外分水岭、基底节区及半卵圆中心 CBF 相比，差异无统计学意义。术前低度与高度梗阻脑积水组前外分水岭和基底节区 CBF 相比，差异有统计学意义；后外分水岭与半卵圆中心 CBF 相比，差异无统计学意义。前外分水岭与基底节区、后外分水岭与半卵圆中心 CBF 诊断术前低度、高度梗阻脑积水的 ROC 曲线下面积分别为 0.815、0.78、0.679、0.696，前者诊断的准确性相对较好，后者较低。前外分水岭和基底节区 CBF 术前诊断低度、高度梗阻脑积水的最佳阈值分别是 21.769、41.878ml/(100g×min)。**结论** 3D-pCASL 技术能对导水管梗阻性脑积水术后疗效进行评估，为今后前瞻性研究梗阻性脑积水提供进一步的评价指标。导水管梗阻性脑积水患者存在脑组织灌注的异常，前外分水岭及基底节区较正常人对应脑区的 CBF 低；脑积水梗阻程度与前外分水岭及基底节区的脑组织灌注呈负相关，且能通过术前脑积水组前外分水岭和基底节区 CBF 的最佳阈值来评估脑积水梗阻程度的进展情况，为临床决策及时简便地提供更为有效的信息。

PU-0789
磁共振扩散加权成像在常见腮腺肿瘤中的诊断价值

李丹
江苏省肿瘤医院

目的 ：探讨磁共振弥散加权成像(DWI)在常见腮腺肿瘤中的诊断中的临床应用价值。

方法 ：研究对象选取接受诊疗腮腺肿瘤疑似病例 80 例。所有患者均采有和 MRI 诊断,以病检为金标准,计算患者的阳性/阴性检测度、特异度、敏感度。最后确诊病例 90 例,根据不同肿瘤类别将其

分为 A 组为多形性腺瘤(n=45)、B 组为腺淋巴瘤(n=25)、C 组为恶性肿瘤(n=20)。在受检者 MRI 图像基础上结合其 DWI 图像进一步重建 ADC 图,并对三组肿瘤患者 ADC 值进行对比分析。结果 研究结果显示,80 例疑似病例患者阳性检测度为 97. 75%,阴性检测度 50%;诊断敏感度为 96. 67%,诊断特异度为 60%。

结论 在常规 MRI 检查基础上联用磁共振弥散加权成像(DWI)对腮腺常见肿瘤诊断及鉴别诊断具有重要意义，通过测量 ADC 值，我们可以明确辨别出肿瘤的恶性程度，这对临床应用价值起到关键性作用。

PU-0790

DWI 图像分析在不同时期脑梗死诊断中的应用价值

方燕燕,黄刚
甘肃省人民医院

目的 探讨弥散加权成像（diffusion weighted imaging, DWI）对不同时期脑梗死的临床诊断价值。方法 回顾性分析我院 2016.04～2019.04 收治的 80 例不同时期脑梗死患者的临床资料，均采用 MR 常规序列（T1WI、T2WI、T2-FLAIR）及 DWI 进行扫描,比较分析两种不同成像方式对病灶的检出率，以及对病灶的边界、范围的显示情况，分别测量病灶的表观弥散系数（Apparent dispersion coefficient, ADC）值。结果 DWI 图像分析检出 76 例脑梗死患者，超急性期、急性期、亚急性期及慢性期脑梗死患者检出率分别为 87.0%、96.1%、95.7%、100%，而常规序列则分别为 19.3%、30.7%、73.9%、87.5%。76 例脑梗死患者中，68 例患者脑梗死病灶在 DWI 图像表现为高信号，其病灶中心位置的 ADC 值均明显低于对侧相应位置；8 例患者病灶在 DWI 图像显示为等信号或低信号，ADC 值明显高于对侧相同位置。DWI 对显示病灶的边界、范围均优于 MR 常规序列，差异具有统计学意义(p ＜ 0.05) 。

PU-0791

磁共振 3D T1-SPACE 高分辨率黑血管壁成像技术对颅内动脉粥样硬化斑块的应用价值

付娟,李华
陕西省榆林市第二医院

目的

应用 3D T1-SPACE 高分辨率黑血序列对急慢性缺血性卒中患者行颅内动脉血管壁成像，评价颅内动脉粥样硬化斑块的影像特征及其与新发梗死的关系。

方法

回顾性研究 2017 年 9 月到 2019 年 5 月在我院就诊的缺血性脑卒中患者，并且在这些患者中筛选经证实有颅内动脉狭窄并行高分辨率颅内动脉磁共振血管壁成像，排除明确心源性栓塞及颈动脉显著狭窄，按照临床发病时间分为急性期（A 组），亚急性期（B 组）和慢性期（C 组）3 组。颅内动脉血管壁成像采用 3.0TMRI 扫描仪（Siemens，spectra），32 通道头线圈，3D 可变翻转角度快速自旋回波 T1 加权序列（3D T1-SPACE）。根据斑块与急性梗死的对应关系，将斑块分为症状性斑块与非症状性斑块，对不同组别的症状性与非症状性斑块的影像学特点进行比较分析。

结果

经筛选，有 32 名患者纳入实验标准，其中急性期脑卒中患者 12 人，亚急性期 10 人，慢性期 10 人，行 3D T1-SPACE 共发现 73 个斑块，在急性患者中，所有症状性斑块均发生强化，症状性斑块

与非症状性斑块相比，出现明显强化差异具有统计学意义（p<0.01）。不同时期的症状性斑块相比，三组强化程度差异具有统计学意义（p<0.01）。亚组随访研究发现，斑块强化程度随时间降低。

结论

①3D T1-SPACE 序列使用非常长的回波链，并使用可变翻转角来维持相对稳定的信号，因此其不仅可以清晰显示管壁结构，还能够显示斑块内各种成分的形态并测量其体积；

②颅内动脉斑块强化与缺血性脑卒中发生存在一定相关性，急性期斑块出现明显强化，慢性期强化程度减低；③3D T1-SPACE 技术可对颅内动脉粥样硬化进行评价分析，进一步明确动脉管壁及斑块特性，为脑卒中的一级预防和风险性评价提供参考。

基于 TBSS 方法的经前期烦躁障碍患者脑网络纤维束成像研究

巩涛
山东省医学影像学研究所

目的 经前期烦躁障碍（PMDD）是经前期综合征（PMS）的严重形式，约占比 5%，患者周期性出现易怒、易激惹和内心紧张等症状，对女性的生活造成严重的干扰。本研究试图通过磁共振扩散张量成像（DTI）探讨 PMDD 患者大脑白质纤维网络细微结构的变化及其与临床症状的相关性。

方法 根据美国精神病学会的《精神障碍诊断及统计手册》第 5 版（DSM-5）的诊断标准，纳入 43 例 PMDD 患者，并纳入性别、年龄、教育程度相匹配的 40 名健康志愿者作为对照。所有受试者均在月经周期的黄体期进行 3.0T 磁共振高分辨全脑 DTI 成像扫描，并对 PMDD 患者进行状态-特质愤怒表达量表（STAXI-2）进行评分。所采集的影像学数据通过 FSL6.0 进行预处理，利用基于纤维束示踪的空间统计（TBSS）方法构建纤维束网络骨架，计算脑白质的部分各向异性（FA）值及平均扩散系数（MD）值，通过独立样本 t 检验获得 PMDD 患者相对于正常人在脑纤维束网络骨架中 FA 值和 MD 值的差异，相关差异区的参数值与临床 STAXI-2 评分进行相关性分析。

结果 与正常对照组相比，PMDD 患者全脑白质纤维骨架的 MD 值未见明显统计学差异，FA 值在多个区域明显减低，主要包括左侧前辐射、左侧上纵束、左侧丘脑后辐射、左侧矢状层、胼胝体膝部及右侧内囊前肢（p＜0.05）；PMDD 患者的左侧前辐射及上纵束 FA 值与临床 STAXI-2 总分呈负相关关系（r=-0.449, p＜0.05；r=-0.4180, P<0.05）。

结论 扩散张量成像的 TBSS 方法可以发现 PMDD 患者大脑白质纤维束的细微结构变化，为其发病机制的探索及临床症状的解析提供了重要的影像学依据。

PU-0793

The Value of Diagnosing Intracranial Atherosclerotic Plaque Using 3D T1-SPACE High -Resolution MR Vessel Wall Imaging

Juan Fu
Yulin City Second Hospital of Shaanxi Province

Objective:

Our aim was to determine the characteristic of pattern of intracranial atherosclerotic plaque and the relationship with newly onset of stroke by using 3D T1-SPACE high - resolution MR vessel wall imaging.
Methods:
Retrospective study of patients with ischemic stroke who were treated in our hospital from September 2017 to May 2019,and in these patients, screening for intracranial artery stenosis and high-resolution intracranial magnetic resonance vascular wall imaging, then Excluding of clear cardiogenic embolization and significant carotid stenosis were divided into acute phase (group A), subacute phase (group B) and chronic phase (group C) according to clinical onset time.Intracranial arterial wall imaging were used a 3.0TMRI scanner (Siemens, spectra), 32-channel head coil,and the 3D variable flip angle fast spin echo T1 weighted sequence (3D T1-SPACE).According to the corresponding relationship between plaque and acute infarction, plaques were divided into symptomatic plaques and non-symptomatic plaques, and the imaging features of symptomatic and non-symptomatic plaques in different groups were compared.
Results:
After screening, 32 patients were included in the experimental criteria, including 12 patients with acute stroke, 10 with subacute phase, and 10 with chronic phase.In acute patients, all symptomatic plaques were intensified, and there was a statistically significant difference between symptomatic plaques and non-symptomatic plaques ($p<0.01$).Compared with symptomatic plaques in different periods, the difference in the degree of enhancement between the three groups was statistically significant ($p<0.01$). A subgroup follow-up study found that the degree of plaque enhancement decreased over time.
Conclusions:
1 The 3D T1-SPACE sequence uses a very long echo chain and uses a variable flip angle to maintain a relatively stable signal, so it not only clearly shows the wall structure, but also shows the shape of various components in the plaque and measures it. volume;2 There is a certain correlation between intracranial atherosclerotic plaque enhancement and ischemic stroke, and acute plaques are obvious Strengthen,at the same time the degree of strengthening were reduced in the chronic phase.3 3D T1-SPACE technology can evaluate and analyze intracranial atherosclerosis, further define the characteristics of arterial wall and plaque, and provide reference for primary prevention and risk assessment of stroke.

小脑半球卵黄囊瘤一例报道

朱莉平,焦晓,孟莉,廖伟华
中南大学湘雅医院

目的 通过报道一例病理确诊的小脑半球卵黄囊瘤，提高影像医生对该病的认识。
方法 收治一例男，1 岁，以“行走不稳 1 周”为主诉入院的患儿。
结果 患儿主要表现为行走不稳。个人史、家族史无特殊。入院查体：行走不稳，共济运动检查不配合。辅助检查：血清甲胎蛋白＞1210ng/ml。头部磁共振示：左侧小脑半球可见一团块状长 T1 等-长 T2 信号灶，FLAIR 序列呈高信号，增强后明显强化。 术中见肿瘤位于四脑室旁小脑半球内，大小约 4x4x5cm，起自小脑，突向并挤压四脑室，对四脑室壁有侵犯。肿瘤质地软，血运丰

富。术后病检回报：卵黄囊瘤，免疫组化**结果** Ki67（约 85%+），CD17（+），PLAP（灶性+），β-HCG（-），AFP（+），CK-Pan（+），LIN28A（+），CD30（-），Oct-4（-），D2-40（-）。**结论** 卵黄囊瘤又名内胚窦瘤,是一种起源于生殖细胞的具有胚体外卵黄囊分化特点的生殖细胞肿瘤，占儿童及青少年恶性肿瘤的 3%。多发生于性腺，10%-20% 发生于性腺外，颅内者极为罕见，颅内好发于松果体、第三脑室及鞍区。本病多有血清、脑脊液的甲胎蛋白升高，当血清 AFP＞500ng,结合影像学表现可对其做出可能性诊断，确诊须依靠病理诊断。病理上肿瘤质地稍韧，组织结构较复杂，S-D 小体是其特征性结构。影像学上病灶呈实性或囊实性肿块，呈长 T1 稍长 T2 信号，FLAIR 序列呈稍高信号，DWI 可见轻度弥散受限；可见出血、囊变，钙化及脂肪少见；肿瘤血供丰富、增强扫描实性部分明显强化；肿瘤易直接侵犯周围组织，常随脑脊液播散。发生于小脑半球的卵黄囊瘤需与毛细胞星形细胞瘤、髓母细胞瘤、室管膜瘤等鉴别。手术、放疗或联合治疗对颅内原发卵黄囊瘤治疗欠佳，且预后极差。

PU-0795

PWI 和 DWI 在鉴别间变性多形性黄色瘤型星形细胞瘤与胶质母细胞瘤瘤周非强化区的价值

赵益晶,刘建宜,佘德君,曹代荣
福建医科大学附属第一医院

目的 分析 MR 灌注加权成像(PWI)和扩散加权成像(DWI)在鉴别间变性多形性黄色瘤型星形细胞瘤与胶质母细胞瘤瘤周非强化区中的价值。**方法** 回顾性分析我院 2010 年 7 月至 2018 年 7 月经病理证实的 4 例间变性多形性黄色瘤型星形细胞瘤（APXA）以及 33 例胶质母细胞瘤（GBM）的常规 MR 平扫+增强、DWI 和 PWI 资料。比较肿瘤周边 1cm 以内水肿区与对侧正常脑实质区的参数比值，包括相对脑血容量(rCBV)及 ADC 比值。采用独立样本 t 检验进行统计学分析。**结果** APXA 瘤周非强化区 ADC 比值高于 GBM（分别为 2.29±0.05、2.08±0.28），差异具有统计学意义（P=0.001）。APXA 瘤周非强化区 rCBV 比值低于 GBM（分别为 0.34±0.15、0.53±0.14），差异具有统计学意义（P=0.015）。**结论** PWI 和 DWI 技术可以较好的反应瘤周非强化区的信息，对 APXA 和 GBM 的鉴别具有一定的价值。

TOF-MRA 与 3D CE-MRA 对脑血管显示的价值分析

杨民
南京医科大学第二附属医院

目的:探讨 TOF-MRA 与 3D CE-MRA 成像技术对脑血管的显示价值。方法:选取本院 50 例同时行 TOF-MRA 及 CE-MRA 检查的患者，采用血管原始图像、最大密度投影(MIP)、容积再现(VR)等后处理方法进行图像分析。结果:50 例患者 TOF-MRA、CE-MRA 在正常血管显示方面 2 种成像方法无显著性差异(P>0.05);2 种方法综合评价优于单一成像方法的应用(P<0.05),与 TOF-MRA 相比,CE-MRA 与综合评价方法具有更好的一致性,但差异无统计学意义(P>0.05)。结论:TOF-MRA 与 3D CE-MRA 2 种成像方法各有优势,在脑卒中患者的血管显示方面有着重要的临床价值,2 种方法的综合应用更有利于血管病变的显示。

不同翻转角对 3DTOF MRA 图像质量的影响

杨民
南京医科大学第二附属医院

摘要 目的:分析不同的翻转角对 3DTOF MRA 成像图像质量的影响。材料与方法: 选用本院 80 例行 3D TOF-MRA 检查的患者，分成四组选用不同的翻转角（10°，20°，30°，40°）取得图形，对 3DTOF MRA 图像上血管信号强度比值(SIR)。结果:随着翻转角角度的增大,SIR 值增大，血管饱和效应增加。结论: 翻转角直接影响血管与静止组织信号对比度,影响图像质量。20° 翻转角是最佳翻转角

PU-0798

肺癌脑转移瘤的 MRI 诊断及价值

王重阳
208 医院

目的:探讨肺癌脑转移瘤的 MRI 影像特征及诊断价值。
方法:回顾性分析 72 例肺癌脑转移瘤的脑 MRI 表现，所有病例经临床及病理证实,分析转移瘤部位、大小、形态、瘤周水肿及强化特点。
结果:72 例肺癌脑转移患者中,小细胞肺癌 12 例,鳞癌 28 例,腺癌 32 例。脑部瘤体共 98 个,额叶 24 个,顶叶 35 个,颞叶 20 个,枕叶 10 个,小脑 6 个,蝶鞍 3 个。直径为 0.5-5cm ，平均直径为 1.5cm。转移瘤灶中 75 个瘤周不同程度水肿，23 个无瘤周水肿。病灶增强后呈结节状强化的 26 例、环形强化的 25 例,混合型强化的 15 例,片状强化 6 例。
结论:MRI 平扫+增强扫描联合特殊序列扫描有助于提高肺癌脑转移瘤的检出率,其影像学特征为多发结节状强化和(或)环形强化病灶、瘤周水肿为主。

磁共振增强 3D-FSPGR 成像技术 对静脉窦病变诊断价值的研究

谭淑睿,吕兴隆
赤峰市医院

目的比较 2D-TOF-MRV 成像技术与增强 3D-FSPGR（三维扰相 GRE）成像技术对颅内静脉窦病变的诊断价值。**方法** 纳入 2014 年 3 月-2018 年 3 月间 102 例怀疑脑静脉系统疾病的患者，先行常规序列平扫和 2D-TOF-MRV 扫描，注入对比剂后行 3D-FSPGR 增强扫描进行静脉窦造影，诊断结果与经临床内科治疗、复诊或外科手术后的结果进行比较。**结果** 2D-TOF-MRV 成像技术对静脉窦病变诊断的准确率、特异性及敏感性分别为 81.4%、54.5%、94.2%；增强 3D-FSPGR 成像技术对静脉窦病变诊断的准确率、特异性及敏感性分别为 98.0%、93.9%、100%。两者在准确性和特异性的差别有统计学意义，*P<0.05*。增强 3D-FSPGR 成像技术与临床诊断一致性检验，*KAPPA* 值为 0.9；2D-TOF-MRV 成像技术与临床诊断一致性检验，*KAPPA* 值为 0.5。**结论** 3D-FSPGR 增强成像技术与 2D-TOF-MRV 成像技术比较，前者能提供更全面病变的信息，可以作为静脉窦病变的常规检查序列。

PU-0800
多次使用钆对比剂后未增强的 T1 加权 MR 图像中齿状核和苍白球高信号强度的研究价值

何畅,陈萍贞
香港大学深圳医院

目的 探讨多次使用钆对比剂后与未增强的 T1 加权像的齿状核和苍白球高信号强度之间的变化。

方法 回顾性分析 2013 至 2019 年，59 例患者，至少 6 次以上钆对比剂增强检查，分别测量首次和末次检查时未增强的 T1 加权像图像上齿状核、脑桥、丘脑和苍白球感兴趣区 ROI 平均信号强度及计算两次齿状核/脑桥、苍白球/丘脑信号强度比。采用配对样本 t 检验评估两组信号差异，采用 Pearson 相关性检验增强次数与两组信号强度之间相关性。

结果 经过多次钆对比剂增强检查的患者末次齿状核、苍白球信号强度明显高于首次未增强的信号强度（左齿状核首/末:360.8±57.8/414.7±55.3;右齿状核首/末:361.0±57.7/410.0±58.5;左苍白球首/末:366.1±65.1/411.0±63.7;右苍白球首/末:365.0±66.1/421.3±67.1）两组信号强度差异,具有统计学意义（P<0.05）。多次增强后齿状核/脑桥、苍白球/丘脑信号强度比高于增强前的信号强度比，具有统计学差异（P<0.05）。钆对比剂使用次数与齿状核、苍白球信号强度存在正相关性（齿状核 r=0.222;苍白球 r=0.127）。

结论 多次使用钆对比剂增强后齿状核和苍白球信号强度明显增高，且与钆对比剂使用次数呈正相关性。

PU-0801
A preliminary study on the value of CT and MRI in the diagnosis of sinonasal paragangliomas

Linying Guo,Zuohua Tang
Eye & ENT hospital of fudan university

PURPOSE:
To study CT and conventional MRI findings, and further to explore the value of multi-parametric functional MRI in the diagnosis of sinonasal paragangliomas (SNPGLs).
METHODS:
Three patients with pathologically confirmed SNPGLs were included. CT and conventional MRI findings (n=3), including the location, signal intensity, enhancement presentation, necrotic/cystic changes, bony invasion, extension to the adjacent structure, were reviewed. We also explored multi-parametric functional MR imaging features obtained from diffusion-weighted imaging (DWI, n = 3), proton magnetic resonance spectroscopy (^{1}H-MRS, n=1), dynamic contrast-enhanced imaging (DCE, n=2).
RESULTS:
All SNPGLs showed heterogeneously/homogeneously isointense signal on T1WI MRI, heterogeneously/homogeneously on T2WI MRI and intense enhancement on contrast enhanced T1WI MRI. “salt and pepper” appearance on T1/T2 WI was characteristic for SNPGLs. Bony invasion on CT, and extension to the adjacent structure on MRI such as the anterior cranial fossa in patient 1, the middle cranial fossa in patient 2 and patient

3, and the pterygopalatine fossa in patient 3, were necessary for deciding the malignancy in the diagnosis of SNPGLs. Functional MRI revealed high signal on DWI with correspondingly ADC value higher than 1.0×10^{-3} mm^2/s, type III or type I pattern on DCE of two patients, and characteristic succinate peak and high ratio of choline to creatine on ^1H-MRS of one patient.
CONCLUSION:
CT, conventional MRI, and multi-parametric functional MRI could demonstrate imaging features of SNPGLs from different aspects thus helping differentiate SNPGLs from other sinonasal neoplasms.

PU-0802
探讨 T2- FLAIR 序列在脊髓肿瘤诊断方面的应用价值

张斌,吴雨萌
上海交通大学附属儿童医院

目的 探讨磁共振 T2- FLAIR 序列在婴幼儿椎管内脊髓疾病诊断中的价值。方法 收集 2018 年 6 月至今，使用 Philips Ingenia 3.0 T 超导磁共振仪对我院 32 例疑有椎管内病变的患儿进行颈椎磁共振扫描，序列分别为 T1WI、T2WI、T2-FLAIR 及 DWI。结果 1.脊髓肿瘤 12 例（髓内肿瘤 3 例，髓外硬膜下肿瘤 9 例），椎管内囊肿 15 例，脊髓炎症 3 例，脊髓空洞 2 例。2.T2- FLAIR 序列能清晰显示椎管内病变形态范围，尤其可以鉴别 T2WI 统一为高信号的病变性质。3.12 例脊髓肿瘤在 T2-Flair 上呈异常高信号同时在 DWI 上弥均散受限，其中 3 例脊髓肿瘤患儿 T1WI 信号正常。**结论** T2-FLAIR 诊断脊髓病变的敏感性高于普通 T1、T2 加权，对椎管内肿瘤定性具有显著诊断价值。

PU-0803
1.5T 磁共振 3D-pCASL 对溶栓治疗后大脑半球大面积脑梗死出血转化的相关性研究

杨朝慧,吴江,牛衡,朱丽娜,李璇,郝晓勇
山西省心血管病医院

【摘要】
目的 探讨 1.5T 磁共振应用三维伪连续动脉自旋标记(3D-pCASL)技术在溶栓治疗后大脑半球大面积脑梗死出血转化(hemorrhagic transformation，HT)的相关性研究。
材料与方法 回顾性分析 2018 年 2 月-2018 年 12 月山西省心血管病医院 51 例经溶栓治疗后大脑半球大面积脑梗死患者，均行常规 MR 序列、SWI、3D-ASL（标记后延迟时间为 1525ms）检查，依据 3D-pCASL 伪彩图提示的梗死区灌注状态不同，分为高灌注组和非高灌注组，结合 SWI 提示 HT 的发生情况，统计分析梗死区不同灌注状态与 HT 发生之间的相关性。
结果 入组患者 51 例，梗死区高灌注组 HT 发生 27 例，未发生 HT6 例，非高灌注组 HT 发生 2 例，未发生 HT16 例，两组采用 c2 检验，两组差异有显著统计学意(P=0.000)。
结论 3D-pCASL 与 MR 常规序列、SWI 序列检查，能够更好评估溶栓治疗后大脑半球脑梗死区高灌注与 HT 的相关性，对于脑梗死患者的出血转化提供预估价值和诊断依据。

PU-0804
无症状型单侧颈内动脉重度狭窄或闭塞老年患者脑血流动力学改变及 Willis 环侧枝代偿作用的 ASL 灌注评价

郝晓勇,吴江,杨朝慧,朱丽娜,牛衡,李璇
山西省心血管病医院

目的 通过对无症状型单侧颈内动脉重度狭窄或闭塞老年患者的全脑 ASL 灌注进行分析，对其脑血流动力学改变及 Willis 环侧枝循环代偿作用进行评价，为无症状型单侧颈内动脉重度狭窄或闭塞的老年患者早期血管再通治疗提供血流动力学的影像学依据。
材料与方法 收集山西省心血管病医院 2018 年 7 月到 2019 年 3 月份无症状型单侧颈内动脉重度狭窄或闭塞老年患者共 30 例（年龄≥60 岁），其中男 18 例，女 12 例，年龄 60～81 岁；全部患者均无症状型神经系统定位体征，其中 7 例 MRI 平扫未见明显异常．23 例 MRI 平扫发现少量腔隙性脑梗死。根据患者的 TOF-MRA，将患者分为 Willis 环完整和 Willis 环不完整两组，分别对其行全脑 ASL 检查，比较健侧与患侧大脑半球 CBF 值并予以对比分析。
结果 30 例老年患者中 17 例左侧颈内动脉重度狭窄或闭塞，13 例右侧颈内动脉重度狭窄或闭塞；30 例老年患者中有 8 例 Willis 环完整，该 8 例患者全脑 ASL 灌注示患侧、健侧大脑半球 CBF 值相近，另 22 例患者 Willis 环不完整，其中，12 例患者患侧大脑半球 ASL 灌注示 CBF 值较健侧大脑半球 CBF 值下降，另 10 例患者 Willis 环虽不完整，但患侧 Willis 环至少有前后一条侧枝血管开放，该 10 例患者患侧大脑半球 ASL 示 CBF 值下降较健侧不明显。
结论 对于无症状型单侧颈内动脉重度狭窄或闭塞老年患者，若 willis 环不完整，特别是患侧 willis 环前后侧枝血管均不完整患者，应及早积极行血管支架植入等预防性内外科治疗，以期早期预防脑梗死。全脑 ASL 灌注扫描可以早期了解脑动脉重度狭窄或闭塞后侧枝循环代偿途径和其代偿能力，对脑血管病的早期溶栓治疗、介入治疗、药物治疗、判断预后提供可靠的帮助。

PU-0805
Willis 环对颈内动脉狭窄侧支循环代偿能力的定量研究

闫昱竹,佟丹,刘晓超,王晓蕾,徐保锋
吉林大学白求恩第一医院

目的 定量研究 ICA 严重狭窄或闭塞患者 Willis 环各组成动脉解剖结构对代偿能力的影响。**方法** 收集 2018-01 至 2019-01，就诊于吉大一院神经内外科，并经 TOF-MRA、CTA、TCD 检查证实有单侧 ICA 颅外段严重狭窄或闭塞患者 40 例及 30 例正常志愿者。所有入组者均行 TOF-MRA、tASL 检查，结果由 2 名影像科医师独立处理评估。**结果** TIA 组共有 23 例，脑梗死组有 17 例。TIA 组患侧与健侧 A1 段及 PcomA 相比统计学有差异（P＜0.05），健侧 A1 段直径（2.12±0.682）大于患侧（1.49（0.00，1.79）），而患侧 PcomA 直径（1.27±0.652）大于健侧（0.00（0.00，1.35））。脑梗死组仅 A1 段存在统计学差异（P＜0.05），健侧 A1 段直径更大（2.06±0.725/1.36±0.615）。两组与正常对照组比较，TIA 组发现健侧 A1 段、双侧 PcomA 及双侧 P1 段均较正常对照组大（P＜0.05）。脑梗死组健侧 A1、患侧 PcomA 及双侧 P1 段直径较正常组相应血管直径大（P＜0.05）。AcomA 开放时健侧 ICA 代偿范围大（0..294±0.144/0.177±0.189）； PcomA 开放时，健侧 ICA 代偿容积较 PcomA 未开放者小（0.208±0.171/0.338±0.130），而 PcomA 开放时，VBA 代偿范围大（0.223（0.142，0.421）/0.056±0.042）。健侧 A1 段、患侧 PcomA 直径分别与健侧 ICA 代偿能力、VBA 代偿能力存在正相关，相关系数分别为 0.581、0.727。

结论 ICA 严重狭窄或闭塞时会造成 Willis 环各组成动脉直径发生改变，而 Willis 开放情况及解剖结构的差异对健侧 ICA 及后循环代偿能力具有不同影响。

PU-0806
磁化准备快速梯度回波序列在颅脑增强的临床应用价值

翟茂雄,徐超,郑念华,王頔,王荣品
贵州省人民医院

目的 探讨磁化准备快速梯度回波（Magnetization Prepared Rapid Gradient Echo imaging，MPRAGE）序列在颅脑增强的临床应用价值。
方法 收集 MRI 平扫发现颅脑病变加作增强扫描患者 56 例，增强扫描时先使用快速自旋回波（TSE）序列行常规横轴位、矢状位、冠状位 T1WI 扫描，再用 MPRAGE 序列作 3D-T1WI 的横轴位扫描并采用多平面重组（MPR）重建出矢状位及冠状位图像，比较两种序列所得图像在观察病变内结构、病变与周围组织分界、脑血管及小病灶检出率等方面的差异。
结果 MPRAGE 序列在图像质量和对病变的显示方面均显著优于 TSE 序列，主要表现在以下方面：1 MPRAGE 横轴位薄层图像具有极高的空间分辨率；2 MPRAGE 采用薄层连续扫描，减少了部分容积效应，病变内结构显示清楚，不同组织之间对比度良好，对颅底等易出现伪影的部位也能获得清晰无干扰的图像；3 MPRAGE 薄层图像通过多平面重组（MPR）、最大密度投影（MIP）等多种方式、方向的重建；4 MPRAGE 高分辨率薄层图像对小病灶的显示比较清晰，特别对颅底处及接近脑膜边缘的小病灶显示较为确切可靠。
结论 MPRAGE 序列在颅脑增强中对病变内结构、病变与周围组织分界、脑血管及小病灶检出率等方面明显优于常规 TSE 序列，具有更高的临床应用价值。

PU-0807
MRI 3D 薄层高分辨序列在神经成像中的应用

蔡莉,赵卫
昆明医科大学第一附属医院

目的 探讨磁共振三维稳态进动快速成像(three-dimensional fast imaging employing steady state acquisition，3D-FIESTA) 及三维时间飞跃-扰相位梯度回波（3D-TOF）序列以及增强三维 T1BRAVO3D 序列在神经 MRI 成像中的应用。 方法 回顾分析临床诊断为三叉神经痛患者的磁共振成像 60 例。两名影像医师盲法分析其平扫、基础图及多平面重建图，判断三叉神经出脑干段和邻近血管的关系，比较三组序列对血管与神经显示效果。**结果** 60 例患者中，影像学阴性 8 例（13.3%），三叉神经与血管关系密切 22 例（36.7%），与血管靠近 10 例（16.7），三叉神经受压推移 20 例（33.3%），其中 7 例与肿瘤包绕、推移有关（脑膜瘤 1 例，表皮样囊肿 3 例，囊肿 1 例，听神经瘤 2 例）,三叉神经与小脑上动脉有关 16 例（26.7%），与基底动脉有关 2 例（3.3%）。（2）3D-FIESTA 序列显示三叉神经全程效果好；3D-TOF 序列显示小动脉与神经关系好；增强三维 T1BRAVO 序列显示血管与神经的关系最佳。结论 3D-FIESTA 序列信噪比高,显示三叉神经全程效果好；3D-TOF 序列显示血管为高信号,可以清楚地显示血管的走行和分支与神经的关系。增强三维 T1BRAVO 序列可以进一步发现血管分支特别是小静脉与神经的关系。可同时提供全脑组织的增强后影像。三组磁共振序列联合应用有利于对面神经、三叉神经痛的病因诊断、治疗方案制定及预后评估提供有价值的影像学参考

PU-0808
磁共振弥散序列联合 3D-ASL 技术对急性脑卒中的诊断价值

蔡莉,赵卫
昆明医科大学第一附属医院

摘　　要：　　目的　分析磁共振弥散序列联合 3D-ASL 技术对急性脑卒中的诊断价值 。**方法**　回顾分析临床 66 例急性脑卒中患者临床及影像学资料。脑卒中患者行 MRI 平扫、弥散、MRA 及 ASL 多序列常规检查。观察弥散信号联合 ASL 分析。**结果** 66 例患者弥散加权序列确诊断脑梗死 55 例（83.3%），脑梗并低灌 41 例（62.3%），左侧大面积或左侧多发脑梗 27 例（40.9%），ASL 大面积低灌 21 例（31.8%），ASL 高灌注并梗死出血 4 例（6.6%）大面积梗死并 ASL 缺血半暗带 2 例（3.3%）延迟灌注 19 例（28.8%）**结论** 弥散加权成像敏感度高。患者多为缺血性梗死并 ASL 低灌。梗死部位左侧多发及左侧大面积梗死多于右侧。弥散信号的提示联合 ASL 技术分析可以对急性脑卒中患者作出缺血或出血性梗死定性的诊断，为临床提供可视病灶面积及灌注信息。以及是否有可恢复半暗带存在，对临床诊治方向有重要价值。

Prediction of the grade and histological subtype in meningiomas: A comparative study on susceptibility-weighted imaging and pathological correlation

Bingqing Jiang,Zhen Xing,Dairong Cao
First Affiliated Hospital of Fujian Medical University

BACKGROUND AND PURPOSE: Preoperative prediction of the meningioma grade is of importance because it influences the treatment strategy. The purpose of this study was to evaluate the role of susceptibility-weighted imaging (SWI) in the differentiation of grades and histological subtypes of meningiomas.
MATERIALS AND METHEDS: We retrospectively reviewed SWI and conventional MR imaging features of 201 patients with meningioma (122 low-grade [benign], 79 high-grade [atypical and anaplastic]). The degree of intratumoral susceptibility signal intensity (ITSS) was correlated with meningioma grades and histological subtypes using the independent t test. Receiver operating characteristic curve analysis was performed to access the capability of SWI in predicting tumor histological grade. The correlation between ITSS and the Ki-67 labeling index was evaluated by Pearson correlation coefficient analysis and linear analysis.
RESULTS: Low-grade meningiomas had a significantly lower ITSS grades than high-grade meningiomas (mean 0.89 vs 1.90, p< 0.001). The sensitivity, specificity and area under the curve were 63.3%, 77.9%, 7.1%, respectively. Meningiomas of meningothelial type had a significantly higher ITSS grades than other low-grade meningiomas (median 1.26 vs 0.74, p= 0.005). The ITSS grades exhibited close relationship with Ki-67

labeling index, showing a higher ITSS grade for increasing Ki-67 labeling index ($r=0.542$, $p<0.001$).
CONCLUSIONS: SWI is useful for differentiating meningioma grades and meningothelial meningiomas showed higher ITSS grades than the other benign meningioma subtypes.

Abnormal Intrinsic Brain Activity Patterns in Patients with Presbycusis: A resting-state functional MRI study

Fuxin Ren,Fei Gao,Bin Zhao
Shandong Medical Imaging Research Institute

Purpose:
Presbycusis (PC) is characterized by bilateral sensorineural hearing loss at high frequencies and speech-perception difficulties in noisy environments and has a strikingly detrimental impact on cognitive function[1]. The purpose of this study was to use amplitude of low-frequency fluctuation (ALFF) analysis[2] to elucidate whole-brain functional differences between patients with PC and age-matched normal hearing controls.

Materials and Methods:
Resting-state fMRI images of twenty-six patients with PC and twenty-six age-, sex- and education-matched healthy controls (HCs) were acquired. All participants underwent a battery of neuropsychological and auditory tests.

Results:
Compared with healthy controls, presbycusis patients manifested decreased spontaneous activity mainly in the right superior temporal gyrus, nodes of the default mode network (DMN), including the bilateral precuneus, posterior cingulate cortex, angular gyrus and right middle temporal gyrus, and the right supramarginal gyrus and middle frontal gyrus. Moreover, ALFF alterations in the nodes of the DMN were associated with cognitive impairments in PC patients. Additionally, this study provides evidence that a higher ALFF of right posterior cingulate cortex is associated with better speech perception in patients with PC.

Conclusions: Patients with presbycusis have disrupted spontaneous neural activity in several brain regions. Decreased ALFF of key nodes in the DMN may be imaging markers for PC-related cognitive decline. Moreover, this study provides evidence that a higher ALFF of right posterior cingulate cortex is associated with better speech perception in patients with PC. Our findings is likely to yield more precise information about underlying neurochemical mechanism of cognitive impairment in patients with presbycusis.

PU-0811
ＥＳＷＡＮ 序列和常规 ＦＳＥＴ２ＷＩ序列对儿童脑微出血灶检出效能的比较

周瑜
武汉市妇女儿童医疗保健中心

一、**目的** ＥＳＷＡＮ 是近年来发展的磁共振成像新技术，是一种全新的 Ｔ２＊权重的 ＧＲＥ 序列，对去氧血红蛋白、含铁血黄素、脑内静脉结构、铁蛋白的沉积等高度敏感。在脑 出 血 性疾病，尤其是对脑内微出血（Ｉｎｔｒａｃｅｒｅｂｒａｌ ｍｉｃｒｏｂｌｅｅｄｓ，ＩＭＢ）的诊断方面 具 有 较 高 的 临 床 应 用 价 值。本 文 通 过 ＥＳＷＡＮ序列检测患者脑内多发ＩＭＢ 并与 常 规 ＦＳＥＴ２ＷＩ序 列 进 行比较，从而为 ＥＳＷＡＮ 序列的临床应用提供客观精确的量化数，有助于临床早期发现脑内ＩＭＢ，为及早治疗提供参考探讨 ，ＥＳＷＡＮ 序列对脑多发微出血灶的检出效能
二、材料**方法** ３５例怀疑血管畸形及小静脉出血儿童。采用 ＧＥ３．０Ｔ 磁共振 ＦＳＥＴ２ＷＩ及 ＥＳＷＡＮ 序列横断位扫描，扫描方法本研究采用ＧＥ３．０Ｔ 超导型磁共振，８通道头部相控阵线圈。常规行自旋回波 Ｔ１、Ｔ２加权和 ＦＬＡＩＲ轴位扫描（１序列：ＴＲ／ＴＥ＝５００ｍｓ／１５ｍｓ，翻转角７０°。并与ＥＳＷＡＮ 序列对照。
三、**结果** ３５例患者均存在多发微出血灶，以基底节／丘脑区多发，皮质及皮质下区次之，脑干和小脑区最少，差异有统计学意义（Ｐ＜０．０１）。ＥＳＷＡＮ 序列对脑微出血灶的显示明显优于 ＦＳＥＴ２ＷＩ序列，差异有统计学意义（Ｐ＜０．０１）。
四、**结论** 在中枢神经出血性疾病，ＥＳＷＡＮ是对脑内ＩＭＢ的诊断方面具有较高应用价值。ＩＭＢ脑内微小血管病变导致的、以微出血为主要特点的脑实质亚临床损害。在其出现临床症状之前只 能 通 过 ＤＳＡ、ＣＴ、常规磁共振等相关检查获得脑部信息，而这些辅助检查只能发现较大血管 病 变，对ＩＭＢ 的 检 出 极 为 有 限。ＥＳＷＡＮ 序列对微出血敏感，有助于临床更早期发现病变，为及早治疗提供信息。

Pineal gland abnormality in sudden hearing loss patients

Zhesheng Shi,Ke Xu,Wen Wang,Guang-Bin Cui
the fourth military medical university

BACKGROUND:
Sudden hearing loss (SHL) is a hearing loss of >30 dB in at least three consecutive frequencies that occurs in 3 days, which is accompanied with emotion and sleep disorders. Melatonin, which is secreted by the human pineal gland, plays an important role in sleep and circadian rhythm. The aim of the present study was to evaluate and compare pineal gland volumes in SHL with healthy control.
SUBJECTS AND METHODS:
We retrospectively evaluated the pineal gland volumes of 90 cases, including 45 cases of SHL and 45 cases of health control. The total pineal gland volume of all cases was measured via magnetic resonance images using 3D slicer software, and the total mean pineal volume of each group was compared. The correlation between pineal volume and psychological measurements was also investigated.
RESULTS:
Smaller pineal gland volumes were found in SHL patients. Meanwhile, The mean pineal volumes of SHL patients and the health controls were negatively correlated with most psychological measurements.
CONCLUSIONS:
Our data show that patients with SHL have smaller pineal gland volumes and pineal gland volume is negatively related to emotional disorders. We hypothesize that volumetric changes in the pineal gland of SHL may be involved in the reduced melatonin secretion in these patients.

PU-0814

Increased Cerebellar Subregions Related Functional Connectivity in Type 2 Diabetes Mellitus

An-Ding Zhang,Jia-Cheng Han,Ying Yu,Bo Hu,Wen Wang,Guang-Bin Cui
Department of Radiology, Tangdu Hospital, Fourth Military Medical University

Background
Type 2 diabetes mellitus (T2DM) is a critical risk factor for mild cognitive impairment and the acceleration of MCI to dementia. Our previous study showed significantly decreased absolute neurovascular coupling (NVC) in subregions of cerebellum cortex in T2DM patients [1,2]. Besides, NVC coefficients were significantly positively correlated with the total score of Mini-Mental State Examination (MMSE). However, the role of cerebellum subregions in overall brain function remains unknown.
Methods
To assess the cerebellar functional connectivity (FC) pattern in diabetic status, 30 T2DM patients and 30 matched healthy control subjects were prospectively enrolled.

All participants completed the MMSE, the Stroop Color-Word Test (SCWT), and the California Verbal Learning Test (CVLT) to assess general cognition, executive and memory function, respectively. Then, they underwent resting state functional MRI to calculate the FC between cerebellum subregions and the other cerebral voxels. To evaluate the certain direction of altered FCs, Granger causality analysis were also performed. Correlation analysis were used to calculate the relationship between FCs and cognitive performance.

Results

Poorer performance was found in patients in 6 subitems of SCWT or CVLT. T2DM group displayed significantly increased functional connectivity between certain cerebral areas and cerebellum subregions, including left cerebellar lobule VI to left cingulate gyrus, right cerebellar lobule VIIb to right precentral gyrus, cerebellar lobule VIIIa vermis to right ventomedial parietooccipital sulcus, left and right cerebellar lobule X to left inferior occipital gyrus.

Furthermore, all those increased FCs were positively correlated with MMSE total scores ($P < 0.05$).

Conclusion

Increased cerebellum subregions related FCs were significantly correlated with general cognitive performance in T2DM patients leading FCs in cerebellum subregions to be promising indicator for cognitive impairment in T2DM patients.

脑内节细胞胶质瘤的 MRI 表现多样性分析--10 年确诊病例完整展现。

戴平丰
浙江大学医学院附属第二医院

目的 通过完整展现节细胞胶质瘤的整组确诊病例，全面阐述脑内节细胞胶质瘤的各种磁共振表现形式，以纠正教科书留给大家的关于此病的非常局限的认识。

材料与方法 收集最近 10 年内凡在本院经手术病例证实的节细胞胶质瘤的全部病例，共 14 例，根据其磁共振表现形式进行分组描述和讨论。

结果 全部 14 例，磁共振表现可分为 6 种类型，包括：1、弥漫型，4 例，基本特征是：T2WI 稍高信号，膨胀性，无边界，无强化或局部少量强化。2、团块型，3 例，基本特征是：T1 低、T2 高，DWI 稍高，边界清，轻强化，额叶 2 例，小脑 1 例。3、坏死囊变型，4 例

基本特征是：T1 很低、T2 很高，flair 很低，边界清，边缘强化，颞叶 3 例，小脑 1 例。4、囊壁结节型，1 例，基本特征是：囊性为主，可见一壁结节，强化较轻。5、钙化团样，1 例，基本特征是：T1 低、T2 低，信号不均匀，边界清，有强化。6、间变型（胶母样），1 例

基本特征是：占位明显，周围水肿，内部坏死，不规则花边状强化，形同高级别胶质瘤。

结论 节细胞胶质瘤表现形式多样，需要加强认识。大多数教科书上描写的囊性结节影，只是本组所见 6 种表现形式之一，且只占所有病例数的 1/14，因此认为教课书上描述的表现只是比较有特色，而非特征性，此点必须引起重视，否则受教科书影响，很难提高此病的诊断水平。

PU-0816

Mismatch between Behavioral and Resting-State Cerebral Blood Flow and Functional Connectivity in Mindfulness Intervention of Smartphone Addiction

Peng Qin,Zhe Zheng,Wen Wang,Guang-Bin Cui,Ying Yu,Bo Hu
Department of Radiology , Tangdu Hospital, Fourth Military Medical University

Objective
Smartphone addiction has become an increasingly common public mental health problem [1]. Mindfulness intervention can effectively alleviate the symptoms of smartphone addiction [2]. However, there is limited study on cerebral mechanism of the mindfulness intervention in smartphone addiction population. Previous study showed that neurovascular coupling (NVC) is the functional unit for organization of high-level information through magnetic resonance imaging . Therefore, this study attempts to explore the potential NVC dysfunction in smart-phone addiction by exploring the relationship between neuronal activity and cerebral perfusion maps.

Methods
11 smart-phone addicts were recruited. Oxygen level dependent signals, and arterial spin labeling imaging was performed. All subjects were examined with the Mobile Phone Addiction Index (MPAI). They underwent resting-state functional MRI to calculate indicators for neuroactivity and cerebral perfusion. We investigated the potential NVC dysfunction in smart-phone addiction by exploring the relationship between neuronal activity and cerebral perfusion maps. The Pearson correlation coefficients between these 2 maps were defined as the NVC biomarkers. Besides, the correlations between NVC coefficients and addiction index were also estimated.

Results
The MPAI scores of the experimental group generally decreased after the intervention. However, there were no significant different NVC between addicts at the whole brain level before and after intervention, no significant change in NVC coefficient after mindfulness intervention and no significant correlation between NVCs and addiction index. Besides, there was no significant difference in imaging manifestations among different brain regions.

Conclusion
There was no significant correlation between NVC coefficient and addiction index. Behavioral and imaging manifestations of mobile phone addiction may be asynchronous after mindfulness intervention.

SWI、DWI 联合 3D-ASL 在缺血性脑卒中溶栓治疗中的应用价值

彭彬,袁玉山,马培旗,乔阿龙
安徽阜阳市人民医院

摘要:目的 探讨磁敏感加权成像（SWI）、MR 扩散加权成像（DWI）联合 3D-动脉自旋标记（ASL）在缺血性脑卒中溶栓治疗中的应用价值。**方法** 选取自我院 2018 年 7 月--2019 年 5 月急诊科收治的急性缺血性脑卒中 30 例患者为研究对象，进行 SWI、DWI 加权成像和 3D-ADL 灌注扫描。观察分析其影像学表现与溶栓治疗效果，溶栓出血和复发的关系。**结果** 所有患者在 SWI、DWI 加权成像和 3D-ADL 灌注指导下进行溶栓治疗，出血率为 10%，再复发率为 10%，均为 3D-ASL 低灌注，且低灌注面积大于 DWI 梗死面积，半暗带组织面积较大者。**结论** SWI、DWI 联合 3D-ASL 灌注成像评估能对缺血梗死部位及面积、责任血管进行准确判断，指导临床医生进行溶栓治疗，并降低治疗后出血和复发的风险。

The specific absorption rate in different brain regions of rats exposed to electromagnetic plane waves

Chunfang li
First Medical Center of PLA General Hospital, Beijing, China

Accurate dosimetry of a specific brain region in rats exposed to an electromagnetic field (EMF) is essential for studies focusing on dose-effect relationship of the region. However, only dosimetry of whole brain or whole body were evaluated in most of previous studies. In this study, a numerical voxel rat model with 10 segmented brain regions was constructed. Then, the effects of frequency, incidence direction, and E-polarization direction of plane wave EMF on brain region averaged specific absorption rate (BRSAR) of rats were investigated. At last, the reliability of using whole-body averaged SAR (WBDSAR) and whole-brain averaged SAR (WBRSAR) as estimations of BRSAR were also evaluated. Our results demonstrated that the BRSAR depended on the frequency, incidence direction, and E-polarization direction of the EMF. Besides, the largest deviation could be up to 13.1dB between BRSAR and WBDSAR and 9.59dB between BRSAR and WBRSAR. The results suggested that to establish an accurate dose-effect relationship, the variance of the BRSAR induced by alteration of frequency, incidence direction, and E-polarization direction of EMF should be avoided or carefully evaluated. Furthermore, the use of WBDSAR and WBRSAR as estimations of BRSAR should be restricted to certain conditions such that the deviations are not too large.

PU-0819

脊髓小脑性共济失调 3 型 SCA3/MJD 患者大脑皮层微结构改变研究

唐静怡,张友明,廖伟华
中南大学湘雅医院

目的:首次应用局部回指数（LGI）探讨 SCA3/MJD 患者大脑皮层微结构的变化。
方法:收集基因诊断确诊为脊髓小脑共济失调 3 型（SCA3/MJD）患者 61 例（男/女=31/29，平均年龄 41.23±9.49 岁）及相匹配的健康对照组（HCs）70 例行 3.0T 高分辨 3D T1WI 扫描。使用局部回指数（LGI）分析探讨 SCA3/MJD 患者大脑皮层折叠程度及脑沟复杂程度，并采用一般线性模型，以年龄及性别作回归分析，获得 SCA3/MJD 患者与 HCs 有差异的脑区。
结果:与正常对照相比，SCA3/MJD 患者主要在左侧中央前回、中央后回、双侧楔叶、楔前叶、左侧颞上回、右侧扣带回呈现 LGI 减低，差异具有统计学意义（P＜0.05，校正）。
结论:本研究关于大脑皮层 LGI 的分析，可能有助于揭示 SCA3/MJD 的潜在神经生物学机制。

Correlation between characteristics of posterior artery intracranial atherosclerotic plaque and ischemic stroke

Xu Huang,Ziyun Xiang
Longgang people's hospital

[Objective]
To differentiate symptomatic posterior artery intracranial atherosclerotic plaque from asymptomatic plaque based on vessel wall magnetic resonance imaging and investigate its relation to ischemic events.
[Methods]
We retrospectively analyzed the imaging and clinical data of 69 patients who performed VW-MRI in XX hospital.Patients were classified as asymptomatic group and symptomatic group.Plaque characteristics, including plaque distribution,lumen area,outer wall area,vessel wall area,lumen volume,outer wall volume,vessel wall volume,plaque length,plaque thickness.Then the plaque volume,stenosis degree,remodeling partern and enhancement index were calculated.The relationship between posterior artery intracranial atherosclerotic plaque characteristics plaque region and clinical presentation was analyzed.
[Conclusion]
Compared to asymptomatic patients,the symptomatic group of posterior artery intracranial atherosclerotic had larger plaque volume,irregular plaque surface,higher stenosis degree and more lateral wall involvement,These characteristics are promising factors for stratifying stroke risk.

椎间盘突出所致下腰腿痛患者初级躯体感觉皮层功能连接的 fMRI 研究

裴衣秀
南昌大学第一附属医院

目的 探讨慢性下腰腿痛（LBLP）患者静息态初级躯体感觉皮层的功能连接情况。
方法 采用 3.0 T MRI 对 26 例椎间盘突出所致下腰腿痛（low back related-leg pain，LBLP）患者（LBLP 组）和 34 名健康志愿者（对照组）进行静息态 fMRI 扫描，使用 DPABI V3.0 对静息态 fMRI 数据进行预处理。以双侧初级躯体感觉皮层（$S1_{leg}$：初级躯体感觉皮层足代表区）作为种子点，进行功能连接分析并采用两样本 t 检验与健康对照组进行组间比较。将功能连接系数有显著性差异的脑区分别选为感兴趣区，以峰值坐标为中心提取球形区域内功能连接系数的平均值，与临床评估（视觉模拟量表评分、日本骨科协会评分、两点触觉辨别（2PD）测试等）参数进行偏相关分析。
结果 1）与对照组相比，左侧 $S1_{leg}$和左侧前扣带回（ACC）功能连接减弱（体素水平 P<0.01，簇水平<0.05，GRF 校正），而右侧 $S1_{leg}$和双侧小脑后叶（CPL）功能连接增强（体素水平 P<0.01,簇水平<0.05，GRF 校正）；2）在 LBLP 患者组，右侧 $S1_{leg}$和双侧小脑后叶的功能连接系数与 Barthel 指数呈正相关（r=0.422，P=0.040）、与左手两点触觉辨别测试评分呈负相关（r=-0.447，P=0.028）、与右足两点触觉辨别测试评分呈负相关（r=-0.510，P=0.011）。
结论 静息状态下慢性 LBLP 患者存在和临床症状相关的初级躯体感觉皮层（S1）功能连接异常。

PU-0822
椎间盘突出所致下腰腿痛患者初级躯体感觉皮层的动态功能连接研究

裴衣秀
南昌大学第一附属医院

目的 结合静态(static functional connectivity, sFC)与动态功能连接(dynamic functional connectivity, dFC)方法，分析慢性下腰腿痛患者初级躯体感觉皮层功能连接的改变及其与临床评估参数之间的关系。
方法 30 例椎间盘突出所致下腰腿痛（low back related-leg pain，LBLP）患者和 37 名健康志愿者（对照组）进行静息态 fMRI 扫描。以双侧初级躯体感觉皮层感觉亚区(primary somatosensory cortex, S1)（下肢，背部，胸部，上肢，手指，头面部）（$S1_{leg_L}$：初级躯体感觉皮层左侧下肢感觉亚区）为种子点，进行功能连接分析并进行组间比较。提取 LBLP 患者组差异脑区的功能连接系数，并与临床评估（视觉模拟量表评分、日本骨科协会评分、两点触觉辨别（2PD）测试等）参数进行偏相关分析。使用滑动时间窗方法，捕获两组 S1 的 dFC 变异性模式，以 dFC 的变异系数量化 S1 与全脑之间的 dFC 变异性，并确定与临床评估参数的相关性。
结果 与对照组相比，LBLP 组双侧 $S1_{chest}$、$S1_{back_R}$与右侧额上回、额中回 sFC 增强，$S1_{face_R}$与右侧额中回 sFC 增强，$S1_{face_L}$与右侧顶下小叶 sFC 增强且与 Barthel 指数呈负相关（r=-0.408，P=0.048）（体素水平 P<0.001,簇水平<0.005，GRF 校正）；$S1_{hand_L}$与左侧中央前回、中央后回 dFC 变异性增加，而 dFC 结果显示 $S1_{hand_L}$、$S1_{finger_L}$与双侧中央前回、中央后回（S1）变异性增加（体素水平 P<0.01,簇水平<0.05，GRF 校正）。
结论 慢性下腰腿痛患者存在和临床症状相关的初级躯体感觉皮层 sFC 异常，而 dFC 变异性增强可能有助于进一步了解持续性疼痛状态的病理机制。

PU-0823
应用磁共振波谱评价美多巴对原发型帕金森患者中脑 GABA 表达的影响

宋玉璐,巩涛,王光彬
山东省医学影像学研究所

目的 帕金森病是临床上一种常见的中枢神经系统退行性疾病。中脑多巴胺能神经元选择性变性死亡是帕金森病特征性的病理改变，目前对于帕金森疾病的治疗以药物治疗为主，药物治疗主要有美多巴等。随着磁共振波谱成像(MRS)技术的不断发展,越来越多的研究表明 MRS 可以清晰显示中脑的代谢物及其动态变化,因此 MRS 技术有望实现对帕金森病的精准诊断、病情评估及疾病监测。本研究应用磁共振波谱（MRS）技术，研究帕金森患者用药治疗期间短期（24h）停药前后中脑 GABA 含量变化，探讨帕金森患者的中脑 GABA 含量变化及抗帕药物临床疗效的关系。**方法** 收集 2018 年 4 月至 2019 年 4 月临床诊断为原发型帕金森病的患者 15 例，对符合标准的 15 例患者和 15 例性别、年龄、利手、受教育程度相匹配的正常对照分别进行 MRS 检查，全部被试均采用 Phillip 3.0T 超导型磁共振扫描仪采集数据，序列包括 3D-T1WI、MEGA-PRESS 序列。PD 组规律用药行 MRS 检查(PD 组用药后)，于检查前停药 24h 再次行 MRS 检查（PD 组用药前）。对 PD 组用药前后的数据及健康对照组的数据进行分析处理，采用 Gannet 软件测量中脑 GABA 含量，然后用药前后分别与健康对照进行双样本 T 检验，结果阈值取 p=0.05 进行分析。**结果** PD 组间中脑 GABA 值比较，PD 组用药前（3.084±0.34）较用药后（2.086±0.40）中脑 GABA 含量增高，差异有统计学意义(P <0.005)；PD 组用药前与对照组（2.47±0.69）比较，差异没有有统计学意义(P >0.5)；PD 组用药后与对照组（2.47±0.69）比较，差异有统计学意义(P <0.005)。**结论** MEGA-PRESS 技术可以预测帕金森患者用药治疗期间短期（24h）停药前后的中脑代谢物 GABA 改变情况，为临床客观评价治疗情况及抗帕药物的疗效提供新的见解，也对其病理生理机制的进一步研究开辟新的思路。

PU-0824
The fMRI study of Functional Connectivity of Primary Somatosensory Cortex in patients with Low Back-related Leg Pain due to Herniated Disc

Yixiu Pei
The First Affiliated Hospital of Nanchang University, Nanchang, Jiangxi

Objective To evaluated the resting-state functional connectivity of primary somatosensory cortex (S1) in patients with low back-related leg pain (LBLP).
Methods Twenty-six patients with LBLP and thirty-four healthy control subjects were recruited in our study. Siemens 3.0 T MR scanner was used to obtain resting state fMRI data. The data was processed with DPABI in MATLAB 8.4.0. Choosing the bilateral primary somatosensory cortical ([$S1_{leg}$]: representation of the leg in the primary somatosensory cortex) as a seed point. After fisher-z-transform for improve Gaussian distribution, a two-sample t-test was used to compare the differences of functional connectivity between the LBLP and healthy controls. Selecting all regions of the brain with significant differences in functional connectivity coefficients as ROI and extracting the average value of the functional connection coefficients in the ROI

centered on the peak coordinates of the signal. Finally, using partial correlation statistical analyses with clinic evaluation of visual analogue scale (VAS), Japanese Orthopaedic Association (JOA) scores, two-point discrimination (2PD) test etc. **Results** 1) Compared with control group, functional connectivity of the left $S1_{leg}$ and the left anterior cingulate was decreased in patients with LBLP, and functional connectivity of the right $S1_{leg}$ and the bilateral cerebellar posterior lobe was increased(voxel-level < 0.01,cluster level P < 0.05, Gaussian random field theory correction); 2) In the LBLP patient group, the functional connectivity coefficient between the right $S1_{leg}$ and the bilateral cerebellar posterior lobe was significantly positively correlated with the Barthel index (r = 0.422, P = 0.040), and was significantly negative correlated with the Two-point discrimination test of left hand (r = -0.447, P = 0.028) and right feet (r = -0.510, P = 0.011). **Conclusion** Functional connectivity of primary somatosensory cortex is abnormal in chronic low back pain patients.

PU-0825

磁共振头部增强序列黑血序列和增强 MRV 序列一站式检查在头颈部静脉血栓中的应用

李京凯
首都医科大学宣武医院

磁共振成像是静脉窦血栓形成的主要诊断标准之一，由于对其他颅内疾病的鉴别，需要多种类型的磁共振图像从多个方面相互验证。因此，怀疑脑静脉血栓形成的患者往往需要多次增强磁共振造影，检查周期长，诊断图像数据相互对照性差，多次注射造影剂，很容易产生不良结果。磁共振一站式多模式图像检查，注射单剂量造影剂进行多序列扫描，同时多组不同图像数据相互对照比较，提高诊断准确性。

15 例脑窦血栓疑似患者进行一站式多模式检查，注射造影剂 1 次获得磁共振黑血图像和常规头颅图像及对比增强图像，15 例脑窦血栓疑似患者分为 3 次磁共振序列扫描。磁共振黑血序列、常规头颅序列及 MRV 增强序列。统计分析两组黑血图像和常规头颅图像及对照增强 MRV 图像对血栓敏感率。

两组患者磁共振成像对窦性血栓形成的敏感性 P>0.05，两组患者磁共振成像信噪比 P>0.05。

一站式多模式检查图像与三次磁共振黑血序列、常规头颅序列和对比增强序列图像在血栓敏感性和信噪比方面无差异。脑窦血栓形成的一站式多模式检查，减少造影剂注射的数量和剂量，减少不良反应的发生率，提高检查诊断效率，提高患者护理水平。

磁共振黑血图像、常规头颅图像和增强磁共振（mrv）图像的一站式多模式检查有助于识别脑窦血栓形成信号和慢血流信号，减少误诊。同时还对区分鉴别其他颅内病变提供了有效诊断依据。

PU-0826

DKI 技术在脑胶质瘤分级中的研究

白岩,魏巍,王梅云
河南省人民医院

目的：探索磁共振扩散峰度成像在脑胶质瘤分级中的价值。
方法：纳入 128 例经手术病理证实的脑胶质瘤患者。在 3.0 T 磁共振成像仪上对所有患者行磁共振扩散峰度成像序列扫描。采用 Mann-Whitney 检验分别比较对磁共振扩散峰度成像数据进行后处理获得的平均扩散系数(mean diffusivity, MD)、各向异性分数(fractional anisotropy, FA)和平均峰度值(mean kurtosis，MK) 值在高、低级别脑胶质瘤之间的差异。采用受试者工作特性曲线比较每个参数的曲线下面积。
结果 MD 值在高级别脑胶质瘤中显著低于在低级别脑胶质瘤中 ($P < 0.05$)。M 值在高级别脑胶质瘤中显著高于在低级别脑胶质瘤中 ($P < 0.05$)。FA 值在高、低级别脑胶质瘤间没有统计学差异($P > 0.05$)。MK 的曲线下面积显著大于 MD 和 FA 的曲线下面积 ($P < 0.05$)。
结论：磁共振扩散峰度成像可为脑胶质瘤分级提供更多的信息并提高分级准确性。

PU-0827
罕见成人脑室内原发原始神经外胚层肿瘤影像表现 1 例

马越
吉林大学白求恩第一医院

PNET（Primitive neuroectodermal tumors, PNET）起源于原始神经上皮细胞，是一组发生于中枢神经系统及周围肌肉、骨骼组织，由原始未分化小圆细胞构成的恶性肿瘤，1973 年由 Hart and Earle 首次报道。颅内 PNET 多见于儿童，极少见于成人，仅占成人颅内肿瘤的 0.46%。颅内 PNET 好发于大脑半球，以额、颞叶多见，极少发生于脑室内，文献仅见 4 例报道，本例位于脑室内，且呈多发结节，散在分布于脑室壁，这种影像表现未见报道。临床表现与肿瘤部位有关，常表现为高颅压症状，也可为癫痫、精神异常、轻偏瘫等。
颅内 PNET 大小多为 6cm 以上，TIWI 呈低信号，T2WI 呈高信号，增强扫描肿瘤强化明显，瘤周水肿轻。肿瘤信号不均，其内可见坏死、囊变，瘤内可伴有出血或钙化。尽管发病部位特殊，但脑室内 PNET 的 MRI 信号特点与发生在大脑半球者相同，此外，肿瘤无瘤周水肿、边界清晰的特点。增强扫描肿瘤的强化程度与肿瘤内部血管成分的多少有关。DWI 有利于识别肿瘤中的固体成分，本病例肿瘤 DWI 呈高信号，增强扫描中等程度强化。本病还需要与一些脑室内原发的肿瘤如室管膜瘤、室管膜下瘤、室管膜下巨细胞瘤等病相鉴别。
脑内 PNET 的治疗方案是手术最大限度切除肿瘤、辅以放疗及化疗。预后极差，成人 5 年存活率不超过 35%。我们主张 PNET 的治疗需要结合患者的发病部位、病理及免疫分型进行多角度评估，实施个体化的治疗方案。

PU-0828
戒断时间对海洛因成瘾者大脑大型脑网络的影响

陈佳杰
空军军医大学唐都医院

目的:探讨戒断时间对海洛因成瘾大脑网络核心脑区功能连接的影响.材料与方法:招募海洛因成瘾者（Heroin 组）、强制戒断 6 月者（PA6 组）、强制戒断 12 者（PA12 组）及健康对照者（HC

组）。收集所有受试者的人口学资料，并采集静息态功能磁共振数据（rs-fmri）。对 rs-fmri 进行独立成分分析，提取前默认网络（aDMN）、后默认网络（pDMN）、左侧执行控制网络（LFPN）、右侧执行网络（RFPN）及突显网络（SN），即而提取每个脑网络的核心脑区，包括内侧前额叶、楔前叶、左侧外侧前额叶、左侧顶下小叶、右侧外侧额中回、右侧角回、内侧前额叶、双侧岛叶等 9 个脑区。以核心脑区为种子点做网络的功能连接，方差分析戒断时间对脑网络功能连接的差异。**结果** 方差分析显示存在显著性差异的功能连接包括：（1）内侧前额叶与右侧楔前叶功能连接存在显著性差异，并随着戒断时间延长功能连接增强；（2）左侧后扣带与内侧前额叶、左侧背外侧前叶、右侧楔叶功能连接存在显著性差异，并随着戒断时间延长功能连接增强，且存在正相关；（3）左侧顶叶与内侧前额叶、右侧楔叶功能连接存在显著性差异，并随着戒断时间延长功能连接减弱，且存在负相关；（4）背侧前扣带与双侧侧外侧前额叶、岛叶、内侧前额叶、双侧顶叶功能连接存在显著性差异，并随着戒断时间延长功能连接增强，且存在正相关；（5）左侧岛叶与左侧内侧前扣带、左侧背外侧前叶功能连接存在显著性差异，并随着戒断时间延长功能连接增强，且存在正相关；（6）右侧岛叶与左侧内侧前扣带功能连接存在显著性差异，并随着戒断时间延长功能连接增强，且存在正相关。**结论** 默认网络内部功能连接随戒断时间延长而增强，与左侧执行控制网络连接减弱；突显网络内部功能连接增强，与双侧执行控制网络连接增强。延长强制戒断时间有利于海洛因成瘾脑功能的恢复。

颅内成熟型畸胎瘤的 MRI 诊断（附 4 例报告）

侯若莹,曾珍,李文富,张体江
遵义医学院附属医院

【摘要】目的 分析颅内成熟型畸胎瘤的 MRI 表现，提高对本病的认识。方法 回顾性分析 4 例经手术病理证实为颅内成熟型畸胎瘤的 MRI 表现，观察病灶的数目、大小、形态、信号、强化程度和方式。4 例均可行 MRI 平扫及增强，其中 3 例行 CT 平扫。结果 4 例成熟型畸胎瘤均为单发，其中 2 例病变破裂，广泛累及蛛网膜下腔。另 2 例病变为圆形及类圆形，边界清楚。MRI 平扫 2 例病变呈等/稍长 T1、稍长 T2 信号为主混杂信号，压脂序列信号均未减低；另 2 例呈短 T1、长 T2 为主信号，压脂序列信号减低，均可见脑沟脑池多发条状、不规则短 T1 信号长 T2 信号。增强扫描仅 1 例为不均匀明显强化，其余 3 例无强化。结论 MRI 能清楚显示成熟型畸胎瘤的病变及其累及范围，对其诊断及鉴别诊断具有重要价值。

CVSD 患者脑白质高信号的自动及手动分割比较及其与临床数据的相关性分析

沈业隆[1],王锡明[1],Danny JJ Wang[2]
1.山东省立医院
2.南加州大学 Keck 医学院

目的

此研究的目的是通过液体反转恢复序列（DIR）及双反转恢复序列（FLAIR）检测并分析脑小血管疾病（CSVD）的脑白质高信号（WMHs）。并探究 WMHs 与 CSVD 患者临床特征的关系。

材料与方法

本研究使用 MAGNETOM Skyra 3T 扫描仪采集了 36 位二型糖尿病患者和 36 位年龄性别相仿的正常志愿者的 DIR、FLAIR 以及 T1-MPRAGE 数据。使用 MAGNETOM Prisma 3T 扫描仪采集了 24 位脑小血管疾病患者（包括糖尿病患者、高血压、高血脂等疾病）的 FLAIR 以及 T1-MPRAGE 数据。通过临床检查采集患者及志愿者的年龄、性别、血糖、血脂、血压、认知评分等数据。分别计数糖尿病患者与对照组的 WMHs 数量并比较两者之间的不同。使用 ITK-SNAP 自带的测量方法以及 Matlab 分别计算手动分割及自动分割得出的 WMHs 的体积/相对体积。计算 WMHs 体积/相对体积与各种临床数据之间的相关性。

结果

与对照组相比，二型糖尿病患者有着更多的 WMHs（p=0.0039）。与 ANTS 和 SPM 提供的配准方式相比，改良的 Elastix 配准方式有着所需时间更少，所得结果更加精确等优势。手动与自动分割两者之间的相关性相对较好（p<0.001,r=0.85）。所得相关性中呈明显正相关的有：年龄与脉压差（r=0.77）；性别与灰质体积（r=0.58）；性别与脑总体积（r=0.67）；舒张压与胆固醇（r=0.63）和低密度脂蛋白（r=0.68）等。呈明显负相关的有：年龄与灰质（r=-0.63）、白质（r=-0.73）及脑总体积（r=-0.59）；性别与脉压差（r=-0.55）；性别与 Flanker 评分（r=-0.55）等。

结论

糖尿病患者有着更多的 WMHs，提示其可能与糖尿病增加了 CSVD 的风险有关。手动 WMHs 分割与自动 WMHs 分割有着良好的一致性。部分临床数据以及影像数据之间存在一定的相关性。

PU-0831

MR 对脑梗死半暗带发生机制的探讨

赵斌
1.山东省医学影像学研究所
2.山东大学

脑卒中是非外力下脑血管的栓塞和出血，导致局部脑细胞缺血、缺氧引起相近偏瘫、失语等功能障碍。从第三次全国人口健康报告调查情况来看，脑卒中的死亡率占到所有疾病死亡率第一位，而且我国是脑卒中大国，平均发病年龄是 66 岁，还出现年轻化的趋势，比西方发达国家提前 10 年。缺血脑组织的 MTT 增加，CBV 可以是正常或轻微降低，类似缺血性半暗带；而脑梗死组织则表现型为典型的峰值时间延长或 MTT 增加并明显的 CBV 降低。对于急性脑梗死中，缺血半暗带的确定有利于临床的溶栓治疗，平扫加增强的扫描方法以确定哪条血管的供血区需要溶栓治疗。并除外脑出血和大面积的脑梗死。但脑梗死治疗的时间窗定在 2 小时或 4.5 小时内或外没有影像依据，半暗带的作用及发生机制是什么？据临床观察及文献研究，用增强的 MRI、DWI、SWI、ASL 及灌注等成像方法推断半暗带应该是毛细血管网及静脉的起始端，所以，对脑梗死的病人早期采用脱水、抗缺氧等治疗保持毛细血管的通畅可有效地延长半暗带的存在时间，提高治疗成功率。而且发现大脑皮层区与基底节区和小脑的半暗带的表现明显不同。

复发缓解型多发性硬化患者灰质灌注与体积改变间的相关分析

顾瑶[2,1],李咏梅[1],马晓文[2],郑桥[1],谢敏[1],陈晓娅[1]
1.重庆医科大学附属第一医院
2.西安市红会医院

目的 应用 3D 伪连续动脉自旋标记(3D pCASL)分析复发-缓解型多发性硬化（RRMS）患者灰质脑血流量（CBF）改变及其与灰质体积、临床扩展残疾状态量表（EDSS）及病程间的相关性。**方法** 对 31 例 RRMS 患者和 37 名健康对照组（HC）行常规 MRI、3D pCASL 及 3D T_1WI 扫描，并应用 Matlab 平台的 SPM 8 和 VBM 8 软件分别对 3D pCASL 和 3D T_1WI 图像进行预处理。将灰质体积作为协变量和未将灰质体积作为协变量分别分析 RRMS 组与 HC 组间灰质 CBF 改变情况，进一步提取灰质灌注改变脑区的 CBF 值并与 EDSS 评分和病程做相关性分析。**结果** 校正灰质体积前，与 HC 组比较，RRMS 组表现出多个脑区 CBF 下降（P<0.01，Alphasim 多重比较校正，体素>93）。,校正灰质体积后，与 HC 组比较，RRMS 组上述 CBF 下降脑区仅右侧额上回、左侧三角部额下回、左侧枕中回仍存在差异（P<0.01，Alphasim 多重比较校正，体素>73）。fRRMS 组灌注下降脑区的 CBF 值与病程均呈负相关（P均<0.05），与 EDSS 均无相关性（P均>0.05）。**结论** RRMS 患者存在广泛灰质灌注下降，其中存在与灰质体积萎缩无关的灌注改变，可为 RRMS 灰质灌注的病理改变提供更多影像学依据。

放射学孤立综合征的研究现状

薄丹丹
厦门大学附属翔安医院

放射学孤立综合征（RIS）是一种核磁共振成像（MRI）表现与多发性硬化（MS）高度相似，但无多发性硬化典型症状及定位体征，并有可能进展为多发性硬化的一种综合征。RIS 患者中有一半主诉头痛而接受 MRI 检查，有些患者的亚临床认知障碍与多发性硬化症相似。影像学检查显示了 RIS 与多发性硬化症之间的相似性。 约三分之二的 RIS 的患者中出现影像学进展，在平均 5 年的随访时间内，约三分之一的患者出现神经系统症状。颈髓病变是疾病进展的重要预测因子。RIS 患者的管理需个体化，但是否启动疾病修饰治疗（DMT）现在仍有很大的争议的。

3.0TMRI 多模态成像在阿尔兹海默症认知功能评价中的应用价值

郑玉洁,马静,宋法亮
新疆生产建设兵团总医院

摘要：目的 阿尔茨海默病(AD)是一种以神经退行性变和脑功能丧失为特征的老年痴呆症，其早期表现为记忆力减退。回归分析已广泛应用于 AD 研究，以关联临床和生物标志物数据，如预测磁共振成像(MRI)措施的认知结果。**方法** 在一定程度上，容量和功能磁共振成像(fMRI)研究可以检测结构、脑血流和血氧的变化，从而将 AD 和轻度认知障碍(MCI)受试者与健康对照组(HC)区分开来。对 25 例 AD 患者、25 例 MCI 患者及 25 例 HC 患者进行 3T 高分辨率 MRI 检查。一种基于独立分量分析(ICA)的方法来研究潜在的与痴呆相关的 MR 图像特征，并结合使用支持向量机(SVM)/2 名副主任医师将扫描结果分类为 AD、MCI 和 HC 三类。定量磁化率映射（QSM）重建后，将使用 FSL 进行全脑分析，比较各组间的易感性图谱。将性别、年龄和教育程度设置为妨害变量，当 p (FEW) < 0.05 时，认为聚类显著。**结果:**ICA 方法结合 SVM 分类器可以将 AD、MCI 与 HC 区分开来，进行回归分析，以调查 QSM 分布模式与认知测量(MMSE)之间的相关性。**结论** 应用 3.0TMRI 功能成像预测阿尔兹海默症认知功能有一定的研究价值。

Brain GABA levels distinguish multiple sclerosis and neuromyelitis optica using edited magnetic resonance spectroscopy

Fei Gao,Guangbin Wang
Shandong Medical Imaging Research Institute

Purpose: Although immunological, clinical, and imaging measures have exhibited the potential to distinguish relapsing-remitting multiple sclerosis (RRMS) and neuromyelitis optica (NMO), no method has been able to completely differentiate MS from NMO. Thus, there is an urgent need to identify imaging markers that could be used to distinguish these two disorders. Gamma-aminobutyric acid (GABA) is the main inhibitory neurotransmitter in the central nervous system. Previous studies have demonstrated that there is a dysfunctional GABAergic neurotransmission in animal models of multiple sclerosis. Edited magnetic resonance spectroscopy (MRS), using the MEGA-PRESS sequence, is the most widely used technique for detecting GABA in the human brain. However, none of the existing studies are performed to compare the brain GABA levels between patients with MS and NMO.

Material and Methods: 39 patients with RRMS (27 males/12 females, mean age 43.7±4.9 years) and 35 patients with NMO (25 males/10 females, mean age 43.1±3.9 years) and 40 healthy controls (28 males/12 females, mean age 43.8±4.1 years) were examined on a 3T scanner and T1-weighted three-dimensional TFE images were used as a localizer. The MEGA-PRESS sequence (TR 2000 ms; TE 68 ms; 256 averages) was used to measure GABA concentrations in the posterior cingulate cortex (PCC), medial prefrontal cortex (mPFC) and left hippocampus (LHC). For quantification, a shorter measurement (8 averages) of the unsuppressed water signal was obtained. The MRS data were analyzed using 'Gannet' (GABA-MRS Analysis Tool) in Matlab with Gaussian curve fitting to the GABA peaks. 3 Hz exponential line broadening was applied. The ratios of the integrals of the GABA and water signals, making corrections for T1 and T2 relaxation times and partial volume effects, were used to calculate water-scaled GABA concentration in mmol/L (mM) using a formula.

Results: The RRMS group showed reduced GABA levels in the PCC and LHC compared to the control group (LHC: 1.20 ± 0.23 mM vs. 1.36 ± 0.23 mM, p = 0.026; PCC: 1.13 ± 0.13 mM vs. 1.22 ± 0.14 mM, p = 0.02). Importantly, The RRMS group showed reduced GABA levels in the PCC and LHC compared to the NMO group (LHC: 1.20 ± 0.23 mM vs. 1.40 ± 0.36 mM, p = 0.035; PCC: 1.13 ± 0.13 mM vs. 1.28 ± 0.16 mM, p = 0.003). No statistical difference in GABA concentrations in the MPFC region was seen among three groups.

Conclusion: In this study, we found the differences of GABA levels in the LHC and PCC between the RRMS and NMO patients, which may be helpful in distinguishing RRMS from NMO after further validation.

PU-0836

MRI findings of primary central nervous system vasculitis

孙屹
中国人民解放军总医院第一医学中心

Abstract: Objective to explore the MRI characteristics of primary central nervous system vasculitis. **Methods** MRI findings of 9 patients with primary central nervous system vasculitis confirmed by pathology were retrospectively analyzed. **Results** 9 cases shows lesions on MRI, Which were slightly hypointensity on T1 and hyperintensity on T2 , high signal on FLAIR, iso or slightly hyperintensity on DWI and high signal on ADC.Enhanced scan were patchy, gyrus reinforcement, SWI were dotted low signal, ASL shows low perfusion, most of the lesions, fuzzy boundaries involvement, gray and white matter part with edema. **Conclusion** the imaging manifestations of primary vasculitis of the central nervous system have certain characteristics, SWI can be chronic bleeding products have important clinical differentiation significance, and ASL showed hypoperfusion ,which has important significance for diagnosis.

PU-0837

应用高分辨 MRI 评估颈动斑块与体质指数的相关性

孙培育,刘影
中国科学技术大学附属第一医院/安徽省立医院

摘要 目的 通过高分辨率磁共振成像，探讨患者颈动脉粥样硬化斑块与体质指数的相关性。 **材料与方法** 选择行颈动脉磁共振检查的患者 64 例，将体质指数 BMI＜24.0kg/m² 患者分为非肥胖组（31 例），BMI≥24.0 kg/m² 分为肥胖组（33 例），比较两组患者一般资料、颈动脉斑块成分（薄或破裂纤维帽发生率、斑块内出血发生率、脂质核发生率及体积、钙化发生率及体积、IV-VI 型斑块）及负荷（管腔面积、最大管壁厚度、管壁标准化指数）的差异。结果 肥胖组缺血性脑卒中［21（63.60）vs 11（35.50），P=0.024］及高血脂［16（48.50）vs 7（22.60），P=0.031］患者较非肥胖组多。肥胖组斑块内钙化体积［（13.32±21.08）mm³ vs（3.00±11.10）mm³，P=0.017 ］及脂质核体积［（75.45±123.62）mm³ vs（18.80±62.75）mm³，P=0.026］明显大于非肥胖组。肥胖组与非肥胖组的易损斑块［9（29.00）vs 19（57.60），P=0.021］、斑块最大管壁厚度［（2.02±0.90）mm vs（2.38±0.90）mm，P=0.025 ］、管壁标准化指数［（44.69±8.81）mm³ vs（48.81±8.94）mm³，P=0.010 ］比较，差异有统计学意义。 **结论** 高分辨 MR 可评估不同体质指数患者颈动脉斑块的稳定性，为肥胖患者病情预测及临床干预提供可靠参考依据。

磁共振 SWI 在脑血管淀粉样变诊断中的应用价值

彭及
贵州省第二人民医院(原:贵州省安宁医院)

目的 探讨磁共振磁敏感加权成像（SWI）在诊断脑血管淀粉样变脑出血中的应用价值。

方法 选取常规自旋回波 T1 加权像、快速自旋回波 T2 加权像、液体衰减翻转回复序列(FLAIR)及 SWI 诊断并经手术病理证实的脑血管淀粉样变脑出血患者 8 例，对常规 MRI 序列及 SWI 进行分析。

结果 SWI 显示的出血灶数目明显多于常规 MRI 序列，所有病例的出血均主要位于大脑皮质和皮质下区，合并基底节出血 1 例、丘脑出血 1 例。

结论 SWI 在检出脑微小出血灶方面有明显的优势，能显示脑血管淀粉样变多发性脑出血的特点，诊断价值大于常规 MRI 检查。

PU-0839

探讨磁共振在老年血管性痴呆诊断中的应用价值

俞慧
贵州省第二人民医院(原:贵州省安宁医院)

目的 本文探讨头颅磁共振在血管性痴呆患者中的临床诊断价值。

方法 选取 2016 年 7 月-2018 年 6 月间于我院进行磁共振的脑血管性痴呆患者 48 例作为观察组，将同期于我院进行磁共振的阿兹海默老年痴呆患者 48 例作为对照组。观察组患者均是在脑血管疾病发病后 90d 内表现异常，并经由测试确诊为痴呆。所有患者均接受头颅血管磁共振，采用 GE Signa 1.5T 磁共振成像仪，首先对 T1WI、T2W2 以及 Flair 等三个序列进行扫描，然后进行 3D-FSPGR 扫描。收集整理获得的图片，观察比较两组患者的两侧海马大小、颞叶沟回间距、大脑左右径、颞叶沟回间距与大脑左右径比值。

结果 观察组患者的左右侧海马体积均明显大于对照组，差异有统计学意义（P＜0.05）。观察组患者的颞叶沟回间距小于对照组患者的颞叶沟回间距，观察组患者颞叶沟回间距和大脑左右径比值小于对照组，以上数据差异均存在明显的统计学意义（P＜0.05）

结论 通过对患者各项数据的分析，阿兹海默症患者的双侧海马大小明显小于脑血管性痴呆患者的双侧海马大小，这也是阿兹海默症患者的最明显表现；同时能够发现两种疾病的病理表现有所不同，利用头颅磁共振能快速对痴呆患者的病情进行分型，操作简单，能为临床诊断提高依据，值得进一步推广使用。

肾透明细胞癌垂体转移瘤 1 例

高峰,张军
内蒙古包钢医院

患者，男，57 岁，近 3 个月无明显诱因感头痛，夜尿次数增多，4-7 次/晚。既往 2015 年 10 月份明确左肾癌、右侧肾上腺转移于北京某医院行左肾及右侧肾上腺手术切除。2017 年 5 月份因左侧肾上腺转移于我院泌尿外科行手术切除。就诊我院查头颅 CT 示鞍区增大，密度较高；后完善垂体 MRI 平扫及增强检查示鞍区实性占位，大小约 19.8*22.6*24.8mm（前后径*左右径*上下径），T1WI 及 T2WI 示高低混杂信号影，增强不均匀明显强化，垂体柄略增粗向左侧偏移，与双侧海绵窦分界欠清，视交叉受压上抬，考虑垂体大腺瘤。本次以垂体瘤入院，完善泌乳素及生长激素正常，考虑无功能腺瘤。化验提示垂体性甲减，睾酮明显下降，垂体前叶功能减退症诊断明确,予优甲乐 25ug/日替代治疗。转神经外科手术治疗，行鼻碟垂体腺瘤切除术，术中见瘤体动脉性出血较严重，并非典型垂体腺瘤表现，终止手术待病理回报后进行下一步治疗。病理结果为肾透明细胞癌垂体转移，后行经额垂体病损切除术。

PU-0841

Identifying Severity of Bell's Palsy Using Whole Brain Rest State Functional Connectivity Network

Xiaowei Han,Wenwen Gao,Guolin Ma,Lei Du,Yue Chen
Department of Radiology, China-Japan Friendship Hospital

Introduction: Bell’s palsy is characterized by the unilateral facial expression muscles palsy. Until now, the evaluation of severity in patients with Bell’s palsy depends on clinical experience and is difficult to standardize. The aim of this study is to determine severity of facial palsy by using a whole brain rest state functional connectivity network (rs-FCN) model. **Methods:** The study included 67 patients with early Bell’s palsy (1-3 d after onset). Their symptoms were quantitatively assessed using the Sunnybrook facial grading system by two senior neurologist. A 3.0-T MRI system obtained sagittal 3D T1-weighted and fMRI images. Preprocessed data were used to construct a rs-FCN captured by a 116×116 matrix and a 6,670-dimensional vector space was extracted as classification features with the upper triangle of FCN matrix. The absolute value of Kendall’s tau rank correlation coefficient determined the discriminative power of a feature, and features with coefficients above a threshold were selected as the final feature set. A leave-one-out cross-validation (LOOCV) was used to estimate the generalization ability of the classifier. Region weight, defined as the occurrence number in the consensus connections, represented the relative contribution to severity identification. The data sets of features with high discriminative power was solved using support vector machine (SVM). The classifier performance was quantified using the generalization rate, sensitivity, and specificity. The statistical significance of classification accuracy was assessed using permutation tests. **Results:** The cross-validation identified 305 consensus functional connections and the final correct classification rate was 100%. Using the LOOCV, the SVM classifier achieved an accuracy of 98%. With the generalization rate as statistic, the classifier had a probability of being wrong of < 0.0001. The altered brain regions located within the different network and the 100 highest-ranking connections were obtained. **Discussion:** Most of the discriminative functional connections are located within or across the default mode network, affective network, sensorimotor cortex, and cerebellum. The psychological stress and negative emotions are heightened in patients with Bell’s palsy, accompanying their abnormal facial movements.

PU-0842

Reliability for quantifying brain morphometry using three-dimensional multi-echo magnetization-prepared rapid gradient echo at 3 tesla

Luguang Chen[1],Fan Chunxiu[1],Bi Xioaying[1],Fu Caixia[2],Lu Jianping[1]
1.Changhai Hospital of Shanghai
2.Siemens Shenzhen Magnetic Resonance Ltd

Purpose

To explore the reliability for quantifying brain morphometry using three-dimensional multi-echo magnetization-prepared rapid gradient echo (MEMPRAGE) at 3 tesla.

Materials and Methods

Thirty healthy volunteers were recruited and examined on a 3 tesla magnetic resonance imaging system using three-dimensional MEMPRAGE technique. The main imaging parameters of MEMPRAGE were as follows: TR/TE1 = 2300ms/1.69ms, FOV = 240×256 mm^2, Matrix = 240×256, Thickness = 1.2 mm, Gap = 0, Slices = 160, flip angle = 9°, inversion time = 900ms, Contrasts =4, Bandwidth = 890, number of averages =1, acquisition time=5’12”. Three scan sessions were performed, with 30 subjects in scan 1, 30 subjects in scan 2 and 8 subjects in scan 3, respectively. Brain morphometry was automatically reconstructed and output a six-page report after imaging. In all, 63 brain tissues were quantitative measured, such as grey matter (GM), white matter (WM) and cerebral spin fluid. Absolute and normalized brain volumes in different areas were documented. To evaluate short-term (Scan 1 vs. 2) and long-term (Scan 1 vs. 3) variability, intra-class coefficient (ICC), coefficient of variability (CV), Bland-Altman plots and paired student t-test were used to perform the statistical analyses.

Results

For the short-term variability, the total intracranial volume (TIV) was 1486.78±98.67 vs. 1486.99±99.50 ml for scan 1 vs. 2, with ICC = 0.999, CV = 0.25% and p-value = 0.83, respectively. There was an excellent reproducibility for assessing the absolute and normalized brain volumes except for abnormal WM and pallidum, ICC ranged from 0.794 to 0.999, CV ranged from 0.25% to 13.8% and narrow interval was observed using Bland-Altman plots. For the long-term variability, the total intracranial volume (TIV) was 1509.50±91.37 vs. 1508.13±90.26 ml for scan 1 vs. 3, with ICC = 0.999, CV = 0.16% and p-value = 1.00, respectively. There was an excellent reproducibility for assessing the absolute and normalized brain volumes except for abnormal WM, ICC ranged from 0.789 to 0.999, CV ranged from 0.16% to 7.25% and narrow interval was observed using Bland-Altman plots.

Conclusion

Brain morphometry can be measured with excellent scan and rescan reliability using MEMPRAGE technique at 3 tesla, which may serve as an alternative tool for longitudinal evaluation of brain volume.

PU-0843

PWI 对超时间窗急性脑梗塞血管内治疗的应用价值研究

孙琰
复旦大学附属中山医院青浦分院

目的 运用 PWI 技术为超时间窗（6~24 小时）急性脑梗塞血管内的治疗(本研究主要为血管内取栓)提供影像学信息，观察急性脑梗塞区血液动力学改变，判断缺血半暗带病变范围。进一步根据预后分析 PWI 技术的各参数的敏感度与相关度，预测血管内治疗的预后及可能出现的风险。
方法 （1）对临床怀疑急性脑梗塞（6~24h）的患者先行头颅 CT 平扫及 CTA 检查，排除脑出血并明确为大血管闭塞引起临床症状

（2）建立绿色通道进行 PWI 检查，根据中国急性缺血性脑卒中诊治指南 2018 的推荐：测量核心梗死区和低灌注区符合（DWI<70ml,PWI>15ml）,并结合相关临床筛选指标，筛选出符合血管内取栓的患者 30 例（研究组），进行手术治疗，在研究组中通过术后随访，将其分为预后良好组（90 天 mRS 评分低于 2 分）和非预后良好组(90 天 mRS 评分大于 2 分)两个亚组。
（3）通过对研究组所采集的 PWI 图像用联影公司的 u WS-MR 脑灌注成像软件进行后处理，对脑灌注参数图分别进行定性和定量分析。
（4）定性分析由两位有经验的神经影像诊断医师对图像进行分析，观察比较脑内两侧灌注区别，然后再共同阅片，对灌注异常区达成统一意见。
（5）对所有资料进行汇总，应用受试者工作特性曲线（Receiver operator characteristic curve, ROC），对两组 PWI 各影像参数（核心梗死灶、梗死灶增大区及存活低血供区间 rADC、rrCBV、rMTT 等）之间的敏感度和相关度进行比较，判断上述各指标是否具有统计学意义。
结果 两组 PWI 各影像参数（核心梗死灶、梗死灶增大区及存活低血供区间 rADC、rrCBV、rMTT 等）之间的敏感度和相关度具有统计学意义。
结论 超时间窗（6~24h）急性脑梗塞患者进行 PWI 检查后通过统计学分析 PWI 各影像学参数的敏感度及相关度，建立一个多因素的预测模型，为临床治疗提供决定性参考。

PU-0844
抑郁症患者经计算机认知功能训练后识别面部表情的 fMRI 研究

范嘉晨[2,3],邢炯[5],冯苏洋[2,3],柳荣荣[6],刘加成[1,4]
1.东南大学附属中大医院
2.东南大学医学院
3.江苏省分子影像与功能影像重点实验室
4.东南大学附属中大医院核医学科
5.江苏省无锡市第三人民医院放射科
6.复旦大学附属中山医院青浦分院

目的 计算机认知功能训练（CCT）可能通过激活背外侧前额叶、眶额回、背侧前扣带回等脑区来减轻抑郁症患者的情绪症状。本研究利用 fMRI 探讨 CCT 治疗对抑郁症患者识别面部表情神经基础的影响。
方法 从东南大学附属中大医院精神科纳入抑郁症患者共 29 人，对照组 14 人，治疗组 15 人。两组患者均在入组前及入组 4 周后接受飞利浦 3.0T 磁共振 BOLD 和 T1WI 轴位扫描、HAMD-17 和 MADRS 量表评估。BOLD 扫描时，患者需完成内隐性面部表情刺激范式（判断性别，所有表情来源于韩国 KOFEE 数据库）。本研究采用一套名为“捉球”的 CCT 程序对治疗组患者进行为期 4 周共计 30 小时的认知治疗。使用双样本 T 检验比较两组患者基线及 4 周后量表得分差异，利用 SPM8 比较两种表情下（喜悦-中性、悲伤-中性）治疗的交互作用（p=0.001,不校正，像素阈值>10）。
结果 两组患者年龄、性别、受教育程度间无统计学差异。治疗组与对照组患者基线期量表得分无统计学差异（HAMD:t=-0.118,p=0.907;MADRS:t=-0.310,p=0.759）;4 周后，HAMD 得分存在统计学差异（6.67±3.50 VS 11.07±7.22，t=2.115,p=0.044），MADRS 得分虽未存在统计学差异（9.07±6.63 VS 13.36±8.57，t=1.514,p=0.142）但治疗组均分<12。fMRI 表明：喜悦表情 4 周治疗交互作用体现在左侧额叶、额中回，右侧边缘叶、扣带回前部、中部（BA24、BA32），右侧顶叶、额叶、中央后回负性激活。悲伤表情 4 周治疗交互作用暂无脑区激活改变。
结论 CCT 治疗可以改善抑郁症患者临床症状。在识别喜悦表情时，CCT 治疗导致患者额叶、边缘叶、顶叶发生激活改变；而识别悲伤表情时，治疗前后未发现明显变化，提示短期 CCT 治疗虽可以改善临床症状，但患者对负性刺激的激活模式未发生明显改变。

PU-0845

鞍区原发性多形性横纹肌肉瘤 1 例

危春容,张梦梅,冯瑶杰,何波,杨亚英
昆明医科大学第一附属医院

横纹肌肉瘤(rhabdomyosarcoma,RMS)是较常见的软组织恶性肿瘤，以儿童多见，胚胎型为主，可发生于全身各个部位，原发于颅内少见，而原发于鞍区者极罕见，现将我院收治的 1 例成人鞍区原发性多形性横纹肌肉瘤报道如下。患者　　女性，77 岁，因“左眼睑下垂伴左眼视力下降 9 月余，加重伴双眼视力下降 1 月”入院。MRI 平扫矢状位示蝶鞍扩大、鞍底下陷，鞍内及鞍上见一不规则稍长 T1、稍长/长 T2 信号肿块，DWI 呈混杂等/稍低信号，肿块破坏鞍底进入蝶窦，并向前突入后组筛窦，大小约 3.4cm×2.8cm×2.9cm，增强扫描呈明显不均匀强化，邻近硬脑膜增厚强化，病灶侵犯双侧海绵窦，垂体及视交叉显示不清。病理诊断：(鞍区肿物)多形性横纹肌肉瘤。RMS 在影像上多表现为单发实性软组织肿块，易囊变坏死但钙化、出血少见，增强扫描呈均匀或不均匀明显强化，不同病理亚型的 RMS 影像学表现差异不明显，“围血管现象”是 RMS 的特征性表现。

MRI 诊断真性红细胞增多症所致左侧大脑后动脉栓塞一例

于喜红,杨瑞,刘继伟
河南省胸科医院河南康复中心医院

关键词 真性红细胞增多症；脑梗死；脑血管病；MRI；MRA

病例 患者男性，75 岁，一周前无明显诱因出现头部不适，4 天前出血头痛、恶心、呕吐，双下肢麻木，测量血压 160/90mmhg，自行口服降压药。后头痛、双下肢麻木未缓解，出现视力模糊，记忆力减退。为求进一步治疗，就诊于我院。查体：双下肢行走不利，伸舌右偏，右侧视野偏盲。急诊查颅脑 MRI 及磁共振血管成像（MRA）（如下图）：左枕叶见斑片状 T1WI 低（图 C）、T2WI 高信号影（图 A），T2 FLAIR（图 B）及 DWI（图 D）呈高信号;MRA 示左侧大脑后动脉 P2 段见节段性未显影（图 E、图 F 黑箭头），其两端整齐，呈“截断征”，余未见明显异常。考虑左侧大脑后动脉血栓形成伴左枕叶亚急性梗死。高度怀疑心脏、静脉血栓或血液系统所致血栓形成。遂查血常规及肝、肾功能示白细胞 14.14×10^9/L,血红蛋白 217g/L,血小板 557×10^9/L，红细胞 8.36×10^{12}/L，红细胞压积 72.2%，谷丙转氨酶 55.3U/L，尿酸 470umol/L；基因检测是 JAK2 V617F 基因突变阳性；骨髓穿刺骨髓象示增生活跃，血三系均显著增生，以红系为著，综上诊断为真性红细胞增多症所致左侧大脑后动脉节段性栓塞伴左枕叶脑梗死。

扩散峰度成像显示肌萎缩侧索硬化异常脑微结构

黄铙欣,邹漳钰,薛蕴菁,陈华俊
福建医科大学附属协和医院

目的 肌萎缩侧索硬化（Amyotrophic lateral sclerosis, ALS）是一种以脑结构损伤为一致性特征的神经变性疾病。本研究中,我们利用扩散峰度成像（Diffusion kurtosis imaging, DKI）探索 ALS 脑微结构改变。

方法 本研究纳入 14 名 ALS 患者与 15 名健康对照，均接受 DKI 扫描。使用修订的 ALS 功能评分量表（ALSFRS-R）评估疾病严重程度，同时记录症状持续时间与疾病进展率。应用基于体素分析检测 DKI 指标的变化情况，包括灰质和白质的平均峰度（MK），轴向峰度（AK）和径向峰度（RK）。
结果 ALS 患者在双侧中央前回、双侧中央旁小叶和左前扣带回的灰质区域中 MK 降低;同时 ALS 患者还在双侧中央前回、双侧辐射冠、双侧胼胝体中部、左枕叶和右顶上小叶的白质中 MK 值降低。RK 降低区域的空间分布与 MK 降低的区域相似。ALS 组与对照组间 AK 无显著差异。相关性分析表明 DKI 指标与临床评估指标（ALSFRS-R 评分、疾病持续时间）间存在显著关联。
结论 DKI 指标降低表明 ALS 患者颅脑运动相关区域及运动外区域微结构复杂性降低。这些发现进一步支持 ALS 涉及多个系统变性的观点。MK 与 RK 指标可作为评估 ALS 疾病严重程度的潜在生物标志物。

Shared and Distinct Dysfunction of Dynamic Functional Connectivity Networks across Schizophrenia, Bipolar Disorder and Major Depression Disorder

Chao Li,Ke Xu
The First Affiliated Hospital of China Medical University

[Objective] Converging evidence indicates that nominally distinct psychiatric disorders have both broadly shared and distinct risk genes, clinical symptoms, and brain structural and functional disruptions. Some studies used the time-averaged (static) functional connectivity (FC) to examine the shared and distinct FC networks in psychiatric disorders. However, little is known about the shared and distinct dynamic FC networks across multiple major psychiatric disorders. Our aim is to study the shared and distinct dysfunction of dynamic connectivity across schizophrenia (SZ), bipolar disorder (BD) and major depression disorder (MDD).

[Methods] A total of 655 participants (125 with SZ, 121 with BD, 192 with MDD, and 217 demographically matched healthy controls (HC) completed resting-state functional magnetic resonance imaging at a single site. We used sliding-window approach to construct dynamic FC networks which were further grouped into four network states using k-means clustering. In each state, we identified shared and distinct dysconnectivity across these psychiatric disorders compared with HC.

[Results] We found dysconnectivity in psychosis were state-specific, rather than a time-invariant global abnormality. SZ, BD and MDD shared decreased intra-network FC (especially within frontoparietal control network (FPN)), whereas increased inter-network FC (especially between visual network (VN) and both default mode network (DMN) and FPN). Almost all dysconnectivity in BD and MDD were included in those in SZ, with SZ had distinct inter-network dysconnectivity that preferentially involving high-level cognitive networks. Most dysconnectivity were not detected by static FC.

[Conclusion] These findings shed new light on the current transdiagnostic knowledge, and advocate future studies use dynamic methods to study psychiatric disorders, besides use static methods.

Diffusion Kurtosis Imaging in the Differential Diagnosis of Parotid Gland Disease and Parotid Adenolymphoma: Preliminary Results

Shun Yu
Fujian Provincial Hospital

Purpose
This study aimed to study the value of diffusion kurtosis imaging (DKI) in diagnosis of parotid gland disease (PGD) with different pathological patterns and parotid adenolymphoma (PAL).
Method and Materials
Fifty-seven patients with different kinds of PGD who underwent DKI and conventional diffusion-weighted imaging (DWI) were enrolled in this study. All patients were categorized into different groups according to their pathological patterns. The result of calculating the value of DKI-derived parameters (Kmean, Krad, Kax, Dmean, Drad, Dax, and FA) and apparent diffusion coefficient (ADC) of DWI were used to study their diagnostic accuracy in PGD with different pathological patterns. The binary logistic regression method was used to confirm clinical valuable diffusion parameters (obtained with DKI and DWI models) for diagnosing PAL. Using MedCalc 13.0, receiver operating characteristic (ROC) analysis was conducted to evaluate the diagnostic value of confirmed parameters based on the logistic regression equation.
Results
Both DKI parameters and conventional ADC showed statistical significance in diagnosing PGD with different pathological patterns ($P < .01$). By using the DKI model, kurtosis coefficients showed higher diagnostic capability than diffusion coefficients ([Kmean + Krad + Kax] vs [Dmean + Drad + Dax]: 22 vs 15, $P < .01$) did in the differential diagnosis among different PGD groups. In the diagnosis of PAL among all PGD patterns, the ROC analysis demonstrated that the area under curve (AUC) FA + Kax [0.881 ± 0.057 (0.824 to 0.938)] is higher than that when using FA [0.629 ± 0.095 (0.534 to 0.724)] and Kax [0.800 ± 0.070 (0.730 to 0.870)] alone ($P < .05$), with sensitivity, specificity, accuracy, and both positive and negative predictive values of 71.43%, 95.78%, 91.77%, 76.92%, and 94.44%, respectively.
Conclusion
DKI showed higher diagnostic capacity in the differential diagnosis of PGD with different pathological patterns. Combined parameters of DKI can differentiate PAL from other PGD pathological patterns with a high degree of accuracy. This technique shows great potential for DKI in the differential diagnosis of PGD within a certain pathological category.
Clinical Relevance/Application
DKI showed higher diagnostic capacity in the differential diagnosis of PGD with different pathological patterns. Combined parameters of DKI can differentiate PAL from other PGD pathological patterns with a high degree of accuracy. This technique shows

great potential for DKI in the differential diagnosis of PGD within a certain pathological category.

表观扩散系数直方图在胶质瘤分级中的价值

王翅鹏[1,2],贾思[1],高思[1],熊飞[2]
1.武汉平安好医医学影像诊断中心
2.中国人民解放军中部战区总医院

目的 探讨基于肿瘤全域的表观扩散系数（apparent diffusion coefficient,ADC）直方图对于胶质瘤分级的价值。
方法 回顾性分析经病理证实为胶质瘤，术前接受过常规 MRI、扩散加权成像（diffusion weighted imaging,DWI）的 16 例患者，其中低级别胶质瘤 7 例（Ⅰ级 0 例、Ⅱ级 7 例），高级别胶质瘤 9 例（Ⅲ级 3 例、Ⅳ级 6 例），记录胶质瘤的 ADC 直方图参数，并采用独立样本 t 检验（正态分布）或 Mann-Whitney U 检验（偏态分布），利用受试者工作特征曲线(receiver operator characteristic curve, ROC)评价 ADC 直方图参数鉴别诊断高、低级别胶质瘤的效能。
结果 低级别胶质瘤以负偏态分布为主，高级别胶质瘤以正偏态分布为主。高、低级别胶质瘤 ADC_25th（第 25 百分位数 ADC 值）、ADC_50th（第 50 百分位数 ADC 值）、ADCmean（平均 ADC 值）值差异有统计学意义（P 均＜0.05）。低级别胶质瘤偏度值低于高级别胶质瘤，偏度值差异有统计学意义（P＜0.05）。ADC_25th、偏度值鉴别高、低级别胶质瘤的效能最高，ROC 下面积（Area under ROC，AUC）为均为 0.905。
结论 基于肿瘤全域的 ADC 直方图分析有助于胶质瘤的分级，ADC_25th、偏度值具有良好的诊断效能。

2 型糖尿病患者视觉网络功能的独立成分分析

王晓阳,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 探讨 2 型糖尿病患者的视觉网络在不同病程阶段的改变特点。
方法 收集 14 例 2 型糖尿病不伴视网膜病变患者（T2NDR）、13 例 2 型糖尿病伴视网膜病变患者（T2DR）及 18 例健康对照组（NC），并收集其年龄等一般资料、糖化血红蛋白等临床资料及 MoCA 评分。采用西门子 Trio 3.0T 磁共振采集大脑静息态 fMRI 及 3D T1WI 结构像扫描。利用独立成分分析法（ICA）分离提取视觉网络的 z-map，采用单因素方差分析对三组的视觉网络进行比较，并选择性进行两组间双样本 t 检验比较。
结果 三组患者的视觉网络差异具有统计学意义，主要为双侧距状回皮质、左侧舌回及布罗德曼 18 分区，T2DR 组相较于 T2NDR 组显著减低主要在左侧距状回皮质，T2NDR 组相较于 NC 组显著减低主要在双侧距状回皮质及左侧舌回。
结论 T2DR 及 T2NDR 均出现了视觉网络功能异常，而 T2DR 在初级视觉皮质的损害更加严重。

颞叶癫痫患者发作间期内侧颞叶磁共振动态磁敏感对比增强灌注成像研究

付丽媛,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的　采用动态磁敏感对比增强（dynamic susceptibility contrast-enhanced，DSC）灌注成像探讨颞叶癫痫（temporal lobe epilepsy，TLE）患者发作间期内侧颞叶灌注改变。 方法　对经过手术病理证实的 15 例发作间期右利手 TLE 患者及相匹配 15 例正常对照者行 DSC 检查。在工作站上重建出 DSC 的相对脑血容量（relative cerebral blood volume，rCBV）图及相对脑血流量（relative cerebral blood flow，rCBF）图，结合高分辨率解剖像，选取两侧内侧颞叶作为感兴趣区（region of interest，ROI），计算病例组及正常对照组两侧内侧颞叶的 rCBV 值 、rCBF 值，比较病例组及正常对照组两侧内侧颞叶 rCBV 、rCBF 的不对称指数（asymmetry index，AI）的差异。结果　1、正常对照组双侧内侧颞叶 rCBV 值、rCBF 值差异无统计学意义（P>0.05）。2、TLE 组患侧 rCBV 值、rCBF 值均低于对侧，差异有统计学意义（P<0.05）。3、TLE 组 AIrCBV、AIrCBF 均高于正常对照组，差异有统计学意义（P<0.05）。　4、TLE 患者内侧颞叶 AIrCBF 值、AIrCBV 值均与病程呈正相关。结论　TLE 发作间期患侧内侧颞叶 rCBV 值、rCBF 值降低，TLE 患者的血流灌注改变与患者发病病程具有一定的相关性，表现为随着 TLE 患者发病病程的延长，其灌注不对称性越高。

PU-0853
基于度中心度方法评价尼古丁依赖者静息态功能网络中心性的改变

黄荟玉,张勇
郑州大学第一附属医院

目的 采用度中心度方法评价尼古丁依赖者静息态功能网络中心性的变化。**材料与方法** 对招募入组的 89 名尼古丁依赖者和 62 名不吸烟对照者进行常规 MRI 序列及 fMRI 序列扫描。运用 DPARSFA 软件对静息态 fMRI 数据进行预处理并作基于体素的全脑相关性分析，然后采用 Matlab 对尼古丁依赖组和对照组行双样本 t 检验，定义 p<0.05 具有统计学意义。**结果** 与对照组相比，尼古丁依赖组边缘叶（t=4.78，P=0.000）、后扣带回（t=4.86，P=0.000）及楔叶（t=4.75，P=0.000）的度中心度值升高（P<0.05，FWE 校正）；桥脑（t=-3.19，P=0.001）、岛叶（t=-3.20，P=0.001）及右侧颞叶（t=-3.18，P=0.001）的度中心度值降低（P<0.05，FWE 校正）。**结论** 尼古丁依赖者的全脑功能连接异常，尤以默认网络、边缘叶及岛叶为主；功能相关性的改变与尼古丁依赖者脑网络中心性的变化有关，可作为生物学标志物运用于临床。

PU-0854
ADC 直方图分析对鉴别胶质母细胞瘤和胶质肉瘤的价值

黄荟玉,张勇
郑州大学第一附属医院

目的:探讨基于 ADC 的直方图在鉴别胶质母细胞瘤和胶质肉瘤方面的价值。**材料与方法** 回顾近 6 年在我院做脑部 MRI 检查且经术后病理及免疫组织化学证实的 25 例胶质母细胞瘤和 22 例胶质肉瘤。分别在两组肿瘤轴位 ADC 图的每一肿瘤层面上采用软件 MaZda 手动勾画感兴趣区（region of interest,ROI），并行全域及针对最大层面感兴趣区的灰度直方图分析，进而对获得的直方图参数特征进行统计学分析，比较分析各参数的统计学意义。**结果** 从 ADC 全域灰度直方图中提取的 9 个特征参数均无统计学意义（P>0.05）;, 最大层面 ADC 直方图的 9 个特征参数中仅第 1 百分位数（Perc.01%）具有统计学意义（P<0.05），绘制其 ROC 曲线，曲线下最大面积（AUC）为 0.688，即鉴别胶质母细胞瘤和胶质肉瘤的最佳临界值为 77.50，特异度和敏感度分别为 70.0%和 61.0%；其余 8 个参数：均值（Mean）、偏度（Skewness）、变异度（Variance）、峰度（Kurtosis）、第 10 百分位数（Perc.10%）、第 50 百分位数（Perc.50%）、第 90 百分位数（Perc.90%）及第 99 百分位数（Perc.99%）均无显著统计学差异（P 均>0.05）。**结论** 基于轴位 ADC 图的最大层面灰度直方图分析可为鉴别胶质母细胞瘤和胶质肉瘤提供量化信息，可作为一种新的辅助诊断方法应用于临床。

PU-0855

基于 T2WI 全域直方图评价腮腺多形性腺瘤及恶性肿瘤

黄荟玉,张勇
郑州大学第一附属医院

目的:探讨基于轴位 T_2WI 全域灰度直方图在鉴别腮腺常见多形性腺瘤及恶性肿瘤中的价值。**方法** 回顾性分析我院 64 例经病理证实为腮腺肿瘤者的磁共振图像，其中多形性腺瘤 41 例（男 27 例、女 14 例）；恶性肿瘤 23 例（男 13 例、女 10 例）。采用 MaZda 软件在轴位 T_2WI 图像的每一肿瘤层面勾画感兴趣区并运行出各组肿瘤的全域灰度直方图，进而对两组直方图的 9 个特征参数进行统计分析。其中，样本均值、偏度、第 1 百分位数、第 90 百分位数、第 99 百分位数符合正态分布，采用两独立样本 t 检验（P＜0.05）；方差、峰度、第 10 百分位数、第 50 百分位数不符合正态分布，采用非参数检验（P＜0.05）。**结果** T_2WI 全域灰度直方图分析得到参数中，均值、偏度、第 10 百分位数、第 50 百分位数的差异有统计学意义（P 均<0.05），且具有较高的灵敏度和特异度。**结论** T_2WI 灰度直方图分析作为一种新的诊断方法，在腮腺多形性腺瘤与恶性肿瘤的鉴别中非常有用，其中均值、偏度、第 10 百分位数、第 50 百分位数具有较高诊断效能，有望实现临床诊断的智能化。

PU-0856

MRI 在胎儿颅内静脉窦血栓中的影像特征

徐生芳
甘肃省妇幼保健院

目的 探讨胎儿颅内静脉窦血栓中的产前 MRI 影像特征。方法 收集 2013 年 1 月至 2019 年 5 月在我院行产前诊断的 3 例胎儿 CVST 的临床资料，3 例胎儿均在产前超声发现胎儿后颅窝异常后 12-24h 内完成 MRI 检查。结果 3 例胎儿 CVST 产前超声颅脑横切面显示窦汇扩张，呈扇形，扩张的窦汇与上矢状窦相延续，窦汇内充满较密集点状回声，且缓慢流动，另与窦汇区可见点片状的高回声，超声结果提示胎儿窦汇处高回声（血栓可能）。MRI 显示发病部位均位于窦汇处，均累及上矢状窦，MRI 表现均为枕顶部中线窦汇区的信号异常，轴位呈三角形或扇形扩大，边界清晰，前缘呈尖角样朝向脑中线，T1WI 呈等、稍高信号，T2WI 呈等、稍低信号，DWI 序列弥散不受限，信号走

形与矢状窦走形一致。结论 产前 MRI 可准确诊断胎儿颅内静脉窦血栓，同时可评估大脑发育状况，有助于产前临床决策和评估胎儿预后。

PU-0857
增强全域直方图鉴别胶质母细胞瘤和胶质肉瘤的价值

黄荟玉,张勇
郑州大学第一附属医院

目的 探讨增强 MRI 全域直方图分析鉴别胶质母细胞瘤和胶质肉瘤的价值。**材料和方法** 回顾性分析我院经手术病理证实的胶质母细胞瘤 25 例和胶质肉瘤 22 例。在两组肿瘤轴位增强 MR 图像的每一层肿瘤层面上，用 Mazda 软件勾画感兴趣区并进行直方图分析，对两组肿瘤直方图参数特征进行统计学分析，找出两组肿瘤之间有显著性差异的参数特征。**结果** 利用直方图提取出的 9 个特征参数中,仅偏度（Skewness）具有统计学意义（P＜0.05），并绘制 kurtosis ROC 曲线，ROC 曲线下的最大面积为 0.671，即鉴别胶质肉瘤和胶质母细胞瘤的最佳 kurtosis 值是 0.52，特异性为 68.2%和敏感性为 60.0%。**结论** 增强 MRI 全域直方图分析可用于鉴别胶质母细胞瘤和胶质肉瘤，为鉴别两者提供可靠的客观依据。

PU-0858
Alterations of cortical thickness in patients with panic disorder

Mingfei Ni
First Affiliated Hospital of Dalian Medical University

Purpose: The pathophysiology of panic disorder(PD) is not well understood. In recent decades, neuroimaging studies have revealed structural abnormalities in the gray matter regions of patients with PD, but no unambiguous conclusions can be drawn regarding specifically increased or decreased volume in gray matter regions. Up to now, nearly all structural MRI studies comparing the brains of PD patients and healthy controls(HCs) have been volume-based. To further delineate the alterations of cortical thickness in PD, this study used surface-based morphometry (SBM) to investigate regional cortical thickness and its association with the severity of PD symptoms(including PDSS and HAMA). **Materal and methods:** A high-resolution T1-weighted scan (3DBRAVO) was used in 3.0 T GE MRI (GE HDXT, USA). For SBM and region of interest (ROI) morphometric analysis, we used the surface-preprocessing pipeline of the CAT 12 toolbox implemented in SPM12. The relation between the cortical thickness and the severity of PD symptoms were then further analyzed via the Pearson correlation. **Results:** Compared with HCs, PD patients exhibited decreased cortical thickness in the right fusiform (q=0.02977, FDR correction). The cortical thickness in the right fusiform were negatively correlated with the symptom severity(P<0.05,FEW correction). **Conclusion:** Less cortical thickness in the right fusiform might reflect difficulties in recognizing and distinguishing emotions in a given face. Our results indicate that PD patients may have difficulties to analyse emotional facial features.

PU-0859
ASL 鉴别诊断环形强化的高级别胶质瘤与脑单发转移瘤临床价值

李文菲[1],张明[2],刘兰祥[1],王占秋[1]
1.秦皇岛市第一医院
2.西安交通大学大学第一附属医院

背景：由于 HGG 与转移瘤的临床过程、治疗及预后完全不同，术前对高级别胶质瘤与转移瘤的鉴别诊断具有重要意义。在传统的磁共振序列上，HGG 和转移瘤之间的可能表现表现为孤立不均匀强化的影像表现。但是病理学上不同的病理特征有助于区分 HGG 与孤立性转移瘤。两者的血流动力学存在显著差异。灌注磁共振成像（PWI），提供了肿瘤血流动力学信息，目前已在临床上得到广泛应用。但是国内外研究结果存在一定的分歧与争议，本研究旨在通过 meta 分析方法来评估 PWI 区分 HGG 与脑孤立性转移瘤的临床价值。

方法 检索 PubMed、Web of Knowledge, and Cochrane Libraries 和 CNKI（中国知网）数据库，检索截止时间为 2019 年 5 月 31 日。采用 Stata 软件对数据进行综合分析磁共振灌注成像技术鉴别 HGG 和转移瘤的敏感性和特异性、曲线下面积和阈值效应分析。采用 Deek’s 检验方法评估发表偏倚。

结果 共纳入 22 篇文献，共包括患者 1185 例，683 例为 HGG，502 例为单发转移瘤。本研究森林图显示 PWI 敏感性为 0.88（95%CI:0.65，0.96），特异性为 0.89（95%CI:0.74，0.92）。汇总受试者操作特征曲线下的面积（AUC）为 0.95。亚组分析动态磁敏感加权成像敏感性为 0.88，特异性为 0.86，AUC 为 0.94。ASL 的敏感性为 0.78，特异性为 0.88。AUC 为 0.92。基于敏感性分析表明，该研究结果是可靠的。未发现明显发表偏倚（p=0.38）。

结论 迄今为止，这是第一篇研究采用 meta 分析方法来评估磁共振灌注成像技术鉴别 HGG 和脑转移瘤。我们研究发现磁共振灌注成像在两者的鉴别上显示出较高的诊断效能，同时我们亚组分析证明动态磁敏感加权成像技术诊断的敏感性高于 ASL。

PU-0860
头颅柔性 12 通道线圈的性能评价

康英杰
上海中医药大学附属曙光医院

目的：探讨头颅柔性 12 通道线圈（AHC12）与硬质 16 通道（HNC16）、24 通道（HC24）射频线圈在磁共振成像中的性能特点。

方法：（1）物理测试：三个线圈均采用直径为 150mm 的球形水模、联影 1.5T uMR560 磁共振进行成像，首先进行二维单自旋回波、单层序列成像，分别选取感兴趣区测量每个线圈图像的信噪比、均匀性。之后进行 SE T1WI、SE T2WI 序列并根据信噪比绘制前后方向、左右方向的体素-信噪比曲线。（2）临床测试：在健康志愿者中比较三个线圈 T1WI、T2WI 及 DWI 图像的信噪比，并进行图像主观评分。

结果 物理测试中，AHC12 线圈图像信噪比高于 HNC16 线圈 11.9%-49.7%，均匀性方面，HNC16 线圈图像的均匀性高于 HC24 和 AHC12 线圈，HC24 线圈与 AHC12 线圈图像的均匀性相仿。体素-信噪比曲线显示在 T1WI、T2WI 序列中，在图像的 L-R 方向上 AHC12 线圈图像信噪比均高于 HC24 线圈、HNC16 线圈，在 A-P 方向上，AHC12 线圈图像信噪比与 HC24 线圈存在交叉，但均高于 HNC16 线圈。在临床测试中，AHC12 线圈图像的信噪比高于 HNC16 线圈，三个线圈图像质量的主观评价无明显差异。

结论 头颅柔性 12 通道线圈（AHC12）可获得比硬质 16 通道（HNC16）、24 通道（HC24）射频线圈更好的信噪比，但均匀性略有下降。

PU-0861

HR-MRI 成像测量大脑中动脉狭窄率的准确性评价

王勇胜,姜兴岳,沈善昌
滨州医学院附属医院

目的 评价 3.0T 高分辨率磁共振成像（HR-MRI）技术测量动脉粥样硬化所致大脑中动脉（MCA）狭窄的准确性。 **方法** 对滨州医学院附属医院 2017 年 9 月至 2018 年 5 月 40 例经数字减影血管造影（DSA）证实的症状性 MCA M1 段动脉粥样硬化性狭窄患者行 HR-MRI 序列（T1 加权像、T2 加权像、质子密度加权像）扫描，分别用华法林-阿司匹林症状性颅内动脉疾病实验法（WASID 法）、面积测算法在 HR-MR 图像上测量 MCA 狭窄率（定量测量），并依据狭窄率判定狭窄程度（半定量测量），以 DSA 为金标准评价两种测量方法的准确性。 **结果** 符合测量要求的 30 例患者的 HR-MRI 图像均可清晰显示血管壁结构，血管内缘清晰可辨、光滑，表现为偏心性狭窄。DSA、WASID 法、面积测算法测得的 MCA 狭窄率分别为(82±17)%、(70±12)%、(81±16)%，面积测算法测得的 MCA 狭窄率与 DSA 比较，差异无统计学意义（P>0.005），与 DSA 的相关性较好（r=0.893）；面积测算法测得的狭窄程度符合率较高（符合率为 90%）。 **结论** 高分辨 MR 成像技术能够显示管壁情况，面积测算法在测量 MCA 狭窄方面准确性高。

MELAS 综合征的 MRI 影像表现及鉴别诊断

许凯,张坤
宝鸡市中心医院

目的 回顾性分析 MELAS 综合征的 MRI 征象并复习文献，探讨 MRI 新技术在 MELAS 综合征诊断中的价值。
方法 收集近 8 年进行 MRI 扫描并通过基因检测确诊的 MELAS 综合征患者共 16 例，全部患者均行头颅 MRI 平扫，其中 DWI 扫描 12 例，MRA 扫描 9 例，MRS 扫描 4 例， 3DASL 扫描 3 例，增强扫描 2 例，分析其 MRI 影像表现特点。

结果 16 例中均出现大脑皮质或皮质下长 T1、长 T2 信号异常信号影，12 例 DWI 均呈高或稍高信号，9 例 MRA 中均无明显血管狭窄，其中 3 例病灶区可见增多的分支血管，4 例 MRS 可见乳酸峰，3 例 3DASL 示病灶区呈高灌注，2 例增强扫描均未见明显强化，4 例复查时病灶出现游走性。
结论 在 MELAS 综合症的 MRI 扫描中，DWI、MRA、MRS、3DASL 及增强扫描均具有特征性，对其诊断具有重要意义。

PU-0864
基于循证方法评价酰胺质子转移加权磁共振成像对胶质瘤分级的诊断价值

李文菲[1,2],张明[2],牛晨[2],令潇[2],温鑫[2]
1.秦皇岛市第一医院
2.西安交通大学第一附属医院

目的 早期区分高低级别胶质瘤一直是神经外科医师研究的热点问题，近年来，通过测量信号强度，酰胺质子转移加权磁共振成像（APT-MRI）可以准确区分胶质瘤的级别。不同文章诊断差异的变化可能是由于不同类型的 MRI 扫描仪、成像参数和后处理技术造成的。然而，目前还没有对 APT-MRI 鉴别高级别胶质瘤和低级别胶质瘤的准确性进行相关评价。因此，本研究的目的是评价 APT-MRI 在胶质瘤分级中的诊断价值。
方法 我们搜索了 4 个电子数据库，包括 PubMed、Web of Science、EMBASE 和 EBSCO，以获得相关研究，评估 APT 和胶质瘤分级之间的关系，截止时间为 2019 年 5 月。检索词如下：（“酰胺质子转移”或“APT”）和（“胶质瘤”或“或“脑肿瘤”）以及（ “分级”），语言不受任何限制。研究的质量由两位作者使用 QUADAS-2 版本进行评估。使用 I^2通过卡方值检验来评估合格研究之间的异质性。如果观察到异质性，则使用随机效应系数模型；否则使用固定效应系数模型。采用 Stata12.0 评估该研究的发表偏倚是否存在。
结果 总共 16 篇文章纳入该研究。研究中使用的核磁共振扫描仪来自飞利浦， GE，其余来自西门子。所包括研究中，MRI 扫描仪的磁场强度为 3.0T。森林图显示高级别胶质瘤 APT 相关参数信号强度（SI）显著高于低级别胶质瘤组（WMD=0.86（0.61-1.1），P<0.0001）；II 级和 III 级之间（WMD=0.6（0.4-0.8），P<0.0001）以及 II 级和 IV 级之间（WMD=1.07（0.65-1.49），P<0.0001）也存在显著差异。通过敏感性分析，结果变化不显著，说明该研究信息可靠。Egger’s 检验证明该研究不存在发表偏倚。
结论 APT 成像是一种潜在的鉴别低级别胶质瘤和高级别胶质瘤有效的影像新技术。

PU-0865
三维高分辨率磁共振血管壁成像（HR-VWI）联合 3D-MRA-TOF 成像评价可疑颅内血管病变

杜子伟,李澄
东南大学附属中大医院

目的:大多数血管病变病理学改变始于管壁内。如，颅内动脉粥样硬化(ICAD)始于内膜脂质沉积，导致炎症和内膜增厚然后狭窄。出现管径变化时可能已是 ICAD 末期表现。目前，颅内血管病变研究主要采用测量管径的方法，如 CTA、MRA 和 DSA。然而，这些检查可能降低了狭窄前或早期血管

变化的敏感性。MR 血管壁成像(VWI)越来越多地用于评价颅内血管病变，而且提高了颅内血管病变诊断准确性，对于指导治疗尤为重要。本研究将 VWI 联合 TOF 来观察血管病变，提供更准确评估疾病的能力。
方法:收集缺血性脑病临床症状患者 80 例，并进行 MRI 及 VWI 成像。排除 39 例，其中图像质量较差者 6 例、颈内颅外动脉中度及以上狭窄者 8 例、无斑块 25 例。最终，纳入 41 例患者行进一步数据分析。诊断类别包括:非闭塞性(ICAD、可逆性脑血管病、血管炎、夹层)和闭塞性血管病变(近端血管闭塞/原位血栓形成、栓塞)和隐源性卒中。**结果** 包括 41 例 VWI 和 TOF 检查。男性 29 例，女性 12 例(平均年龄 65 岁；41－78 岁)。分析了 164 根血管,评判者一致性良好，TOF(κ =0.64，P<0.0001)，VWI(κ=0.67，P<0.0001)以及 TOF 联合 VWI(κ=0.57，P<0.0001)。TOF 检出异常血管段仅占 12.3%，而两种方法检出的异常血管段占 20.8%(P<0.0001)，具有统计学意义。
讨论:本研究结果表明，仅使用常规模式可能低估疾病程度。一些病变血管可能存在狭窄但没有明显的管径变化。这些情况有解释为 ICAD 早期无狭窄改变。有报道在尸检中大约有 20%的管腔狭窄率小于 30%的动脉表现出组织学上的 ICAD，这种程度管腔狭窄很难通过管腔成像识别，但 VWI 可以表现为管壁强化。另一种解释是动脉壁扩张重塑，即保持正常管径的 ICAD。与 TOF 相比，VWI 可以识别出更多异常的颅内血管段，并提供更准确的疾病负担评估。

PU-0866
对轻微型肝性脑病患者大脑皮层复杂性下降的研究

邹添秀,黄铙欣,陈华俊
福建医科大学附属协和医院

目的 已有研究报道轻微型肝性脑病（minimal hepatic encephalopathy, MHE）患者出现灰质体积减少、局部皮层变薄和局部回指数（local gyrification index, LGI）改变等脑结构性改变。分型维数（Fractal Dimensionality, FD）是另一个被广泛用于描述各种神经和精神性疾病患者的脑结构复杂性改变的形态学指标。我们首次利用 FD 这个指标来探讨 MHE 患者大脑皮层结构复杂性改变。
方法与材料：本次试验包括 20 个伴 MHE 的肝硬化患者和 21 个健康对照者。所有受试者均进行高分辨结构磁共振扫描和基于 PHES（psychometric hepatic encephalopathy score）系列量表的认知评估。采用 CATA12（Computational Anatomy Toolbox）计算局部脑区的 FD 值，并进行组间比较。我们进一步评估局部 FD 值与患者的认知表现（PHES 得分）的相关性。
结果 对比健康对照者，MHE 患者在左侧楔前叶、左侧缘上回、右侧前扣带回尾部、右侧扣带回峡部、右侧岛叶、双侧距状旁沟、双侧中央旁小叶出现局部 FD 值降低。此外，右侧扣带回峡部和右侧岛叶的 FD 值与患者的认知表现呈显著正相关关系。
结论 MHE 患者多个脑区的皮层复杂性发生改变，这可能是其出现各种神经认知障碍的另一个神经生物学机制。

PU-0867
慢性主观性耳鸣患者大脑的低频波动振幅研究

冯源,殷信道
南京医科大学附属南京医院（南京市第一医院）

目的 主观性耳鸣是临床上一种常见的疾病，以在无外源性声音时出现的异常听觉体验为主要症状。近些年的研究显示，耳鸣患者的大脑局部血流量以及灰质体积较正常人均有所改变。这提示中

枢神经系统在耳鸣的神经病理生理学过程中可能扮演重要角色。而耳鸣患者大脑皮层之间的功能改变与耳鸣严重程度之间的关系尚未明确。本研究即主要应用静息态功能磁共振（fMRI）探讨耳鸣患者的大脑皮层的异常功能情况。

方法 本研究选取 30 名慢性主观性耳鸣患者为耳鸣组，28 名健康受试者为对照组，两组间性别、年龄及教育程度均进行良好匹配。耳鸣组患者均进行 IOWA 耳鸣障碍量表评估（THQ）。所有受试者均进行磁共振数据采集，包括结构相 3D-T1WI 以及静息态 fMRI 数据。结构相数据经灰白质分割后的结果进行两组间比较。静息态 fMRI 数据经预处理后获得低频波动振幅(amplitude of low-frequency fluctuation，ALFF)数据，继而比较得到耳鸣组全脑内 ALFF 较对照组明显变化的脑区。将以上显著差异结果与临床特征参数如 THQ 等进行相关性分析。

结果 耳鸣组与对照组间的灰白质结构无显著差异。耳鸣患者多个大脑皮层脑区的功能均显著增强，包括感觉、运动以及认知功能脑区等，如右侧颞上回、右侧颞中回、左侧海马旁回、双侧枕下回、左侧梭状回以及右侧中央前回。右侧颞上回（r=0.567, p=0.002）以及左侧颞上回（r=0.466, p=0.004）的 ALFF 信号分别和耳鸣 THQ 评分呈正相关。

结论 慢性主观性耳鸣患者可能因中枢神经对噪声性神经活动的屏蔽作用减低或在损害出现后发生神经功能重塑，使部分脑区功能增强，直接或间接地影响感觉、运动以及认知功能，进而促进耳鸣的发生发展过程。同时部分听觉中枢的活动改变可能是决定耳鸣严重程度的关键因素之一。

PU-0868

3.0T 磁共振磁敏感成像的探讨

张善国
大庆龙南医院

目的 磁敏感加权成像 SWI 利用不同组织问磁敏感性的差异产生图像对比，通过运用高分辨率扫描、相位图像蒙片和最小密度投影等技术，清晰地显示啮内静脉系统，对含铁血黄素沉着、矿物质沉积等顺磁性物质非常敏感。在血管畸形、外伤、肿瘤、血管性疾病、神经变性疾病以及与铁沉积等有关的疾病中的应用潜力。

方法 磁敏感加权成像是一种利用组织的磁性的成像技术，实际上是一种三维采集技术，通过长 TE、高分辨率、完全流动补偿、薄层重建的梯度回波伴滤过的相位信息以增加磁矩图的对比和增加组织问的磁敏感差异，使对磁敏感效应的敏感性最大化。在临床实践中，经常用最小密度投影来帮助显示扭曲的结构和显示静脉血管系统的连续性，它还帮助区别主要静脉相邻的出血。

结果 SWI 具有以下诸多特点：高分辨率的三维梯度回波成像，在 3 个方向上的完全流动补偿，薄层厚避免信号丢失，相位图通过滤波减少不必要的场效应，产生相位蒙片，利用相位蒙片对磁矩冈进行增强处理，相对邻近层面进行最小强度投影，这种独特的数据采集和图像处理过程提高了磁矩图像的对比，对静脉血、出血和铁沉积高度敏感。**结论** 所有研究的初步临床应用，已显示在血管畸形、外伤、肿瘤、血管性疾病、神经变性疾病以及与铁沉积等有关的疾病中的应用潜力。

PU-0869

高清磁共振扩散加权成像在鉴别小脑囊性血管母细胞瘤 与转移瘤中的价值

王庆国,王悍
上海市第一人民医院

目的 探讨高清磁共振扩散加权成像（DWI）在鉴别小脑囊性血管母细胞瘤与转移瘤中的价值。

材料与方法 收集 2016 年 1 月至 2018 年 4 月本院经手术病理证实的小脑囊性血管母细胞瘤 12 例和转移瘤 18 例。所有患者术前两周内均行常规 MRI 增强及高清 DWI 检查。测量所有病变强化区、无强化区及正常小脑的表观扩散系数（ADC）,并分别计算病变强化区、无强化区 ADC 值与正常小脑 ADC 值的比值（rADC）。统计学分析采用 SPSS 19.0 软件，小脑囊性血管母细胞瘤和转移瘤的强化区域、非强化区域 ADC 值之间的比较采用 Mann-Whitney U test。受试者工作特征(ROC)曲线确定 ADC 和 rADC 鉴别两种病变的最佳诊断阈值。

结果 小脑血管母细胞瘤与转移瘤的强化区域平均 ADC 值分别为 $1.59\times10^{-3}mm^2.s^{-1}$ 和 $0.89\times10^{-3}mm^2.s^{-1}$，两者之间具有统计学差异，$Z$=-3.81，$P$<0.001。小脑血管母细胞瘤与转移瘤的强化区域平均 rADC 值分别为 2.41 和 1.23，两者之间具有统计学差异，Z=-4.11，P<0.001。受试者工作特征(ROC)曲线确定 ADC 和 rADC 鉴别小脑血管母细胞瘤与转移瘤的最佳诊断阈值分别为 $1.09\times10^{-3}mm^2.s^{-1}$（诊断敏感性为 100%，特异性为 83.3%）和 1.68（诊断敏感性为 100%，特异性为 83.3%）。ADC 和 rADC 值 ROC 曲线下面积(AUC)分别为：0.92 和 0.95。

结论 采用高清磁共振 DWI 成像对鉴别小脑血管母细胞瘤和转移瘤具有重要的参考价值。

PU-0870

基于静息态功能磁共振的儿童期急性淋巴细胞 白血病患者化疗后脑功能连接密度改变的研究

陈玲珑[1],曾献军[2],龚洪翰[2],徐海波[1]
1.武汉大学中南医院
2.南昌大学第一附属医院

目的 采用基于体素的功能连接密度(functional connectivity density，FCD)图方法观察急性淋巴细胞白血病(Acute Lymphoblastic Leukemia, ALL)经治儿童静息状态下脑网络水平各脑区的异常改变，并评价与神经认知功能检查结果的相关性，探究儿童期 ALL 患者化疗相关认知损害的可能的神经病理基础。

方法

本研究收集收集 ALL 经治儿童 20 例(ALL 组)及性别、年龄相匹配的健康儿童 18 例(health controls, HCs)采集 rs-fMRI 数据，其中 ALL 组为确诊时符合急性淋巴细胞白血病标准、完成同质化化疗方案并停疗 1 年以上的患儿。所有 ALL 经治儿童及对照组均接受神经认知功能量表检查，包括韦氏儿童智力测验第四版中文修订版、连线测试 A、数字广度测试。在本研究中，我们运用功能连接密度图的方法并结合基于感兴趣区的静息态功能连接分析方法探索 ALL 经治儿童的脑功能连接改变。

结果

ALL 组及 HC 组长程及短程 FCD 的组内空间分布基本相同。选取长程 FCD 减低的脑区为感兴趣区，相对于 HC 组，ALL 组的右侧额中回、楔叶、舌回表现为与感兴趣区连接减低，右侧小脑后叶表现为与感兴趣区连接增强。ALL 组智力商数与减低的长程 FCD 值呈正相关。数字广度测试结果与减低的短程 FCD 值呈正相关，连线测试 A 结果与增高的 FC 值呈负相关。

结论

本研究运用了基于体素的 FCD 方法，我们发现了 ALL 经治儿童的大脑网络节点重要性和异常脑区与全脑功能连接的改变，体现局部脑区对化疗相关的各种病理因素的易感性。静息态脑网络的改变与神经认知功能量表结果相关，提示静息态磁共振可以作为一种客观的无创的检查方法为 ALL 经治儿童的脑功能变化提供更多的信息。

PU-0871

采用静息态与 DTI 研究 AD 患者大脑的早期改变

林亚妹,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目　的　通过探究阿尔茨海默病（AD）的 ALFF 值差异相关脑区的 FA 值，为 AD 的早期诊断提供功能与分子影像学依据。
方　法　采用西门子 Trio 3.0T 磁共振对 17 例 AD 病人及 17 例对照组被试进行静息态 fmri、DTI 检查。对静息态、DTI 原始数据进行预处理，得到 ALFF 图和 FA 图，并进行组间独立双样本 t 检验，得到具有统计学意义的差异脑区，做成 mask 用于 FA 图的统计，然后进行组间独立样本 t 检验。
结　果　AD 组和健康对照组相比，AD 组患者 ALFF 值在右侧后扣带回、双侧中央前回及左侧额中回等脑区降低，在左侧丘脑、右侧海马旁回及右侧颞上回等脑区增高，同时这些脑区的 FA 值均增高。
结　论　阿尔茨海默病患者与健康对照组相比，ALFF 值异常的脑区，如右侧后扣带回、左侧额中回、右侧颞下回等默认网络脑区，FA 值也同时存在异常，说明 AD 患者功能存在异常的脑区的微观结构也同时存在异常，这为早期客观有效地诊断阿尔茨海默病提供了可能。

PU-0872

新兵适应障碍的亚频段低频振幅功能 MRI 研究

潘洁娜,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的:应用亚频段低频振幅(ALFF)分析方法,研究适应障碍新兵脑静息状态下自发性神经活动改变的特点。
方法:17 例适应障碍新兵及 20 例健康军人(对照组)行静息态下脑功能 MRI 扫描,成像数据经后处理,获得各频段的 ALFF 图,采用双样本 t 检验比较两组间各频段 ALFF 值的差异,并分析 ALFF 值改变与患者临床量表评分之间的相关性。
结果:与正常对照组比较,患者组在 Slow-5 亚频段 ALFF 值减低的脑区包括右侧小脑脚、左侧眶部额下回、左内侧前额叶、右侧额中回及双侧额上回(P<0.01,AlphaSim 校正),在 Slow-4 亚频段 ALFF 值减低的脑区有左内侧前额叶和左侧眶部额下回(P<0.01,AlphaSim 校正)。患者组中各 ALFF 值异常脑区的 ALFF 值与临床量表评分间的相关性均无统计学意义(P>0.05)。
结论:适应障碍新兵有多个脑区存在自发性神经活动异常,这些脑区与认知、情绪调节及执行功能有关,且不同亚频段异常活动脑区的空间分布不同。

PU-0873

Effects of region of interest sizes on apparent diffusion coefficient measurements of pleomorphic adenoma, Warthin tumor, and normal parotid parenchyma

Qi Sun[1],Chao Ma[2]
1.Department of Radiology, Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University

2.Department of Radiology, Changhai Hospital of Shanghai

Background: To determine the effects of ROI size on ADC measurements for the differentiation of pleomorphic adenoma (PA), Warthin tumor (WT), and normal parotid parenchyma.
Methods: Sixty-five patients including 37 with PA (lesions, n=37) and 28 with WT (lesions, n=36) were examined with diffusion-weighted imaging(DWI). The mean ADC values and standard deviations (SDs) of the ADC (ADCSD) of 12 concentric round ROIs for tumors and normal tissue were measured by using custom-made software. One-way repeated analyses of variance (ANOVAs) were performed on the mean ADCs, ADCSDs and homogeneity indices of the 12 ROIs in each group.
Results: Among the three groups, the mean ADC of normal parotid parenchyma was significantly lower than that of both PA and WT in the 12 ROIs, whereas the PA group had the highest mean ADC values. No significant differences were found in the mean ADCSDs with each ROI between PA and WT (all $p > 0.017$). PAs had lower homogeneity indices compared with WTs and normal parotid parenchyma (all $P < 0.01$).
Conclusions: Homogeneity index was a useful parameter in discriminating the three groups.

PU-0874
3.0T MRI 神经根成像扫描序列对颈神经根病变的诊断价值

王祺
冀中能源邢矿集团总医院

目的 颈椎病变常累及颈神经根引发相应临床症状，近年来手术治疗偏向于微创手术，术野小、要求精准度高，术前直观而清晰地显示其神经根形态和走行具有重大的临床意义。本研究比较 3.0T MRI 3 种扫描序列对颈神经根成像的应用价值，选择最优神经根成像序列，并对影像诊断与手术诊断对比分析，探讨最优序列对颈神经根病变的诊断价值。**方法** 2017 年 7 月-2018 年 3 月我院 45 例临床需要颈椎 MRI 检查患者，均行常规序列、三维双回波稳态(3D-DESS)序列、多回波数据图像重合(MEDIC)序列、可变反转角三维快速自旋回波(3D-SPACE)序列扫描，图像均进行后处理重建，对图像质量和正常颈神经根显示、受压颈神经显示清晰度、颈神经根与邻近组织的对比噪声比(CNR)3 个方面评价；选择最优序列扫描 31 例神经根型颈椎病患者，影像诊断结果与颈神经根手术诊断结果对比分析。**结果** 3D-DESS 序列神经根-椎体 CNR 和神经根-脑脊液 CNR 均高于 MEDIC 序列；3D-DESS 序列神经根-椎体 CNR 高于 3D-SPACE 序列，而 3D-DESS 序列神经根-脑脊液 CNR 低于 3D-SPACE 序列；3D-SPACE 序列神经根-脑脊液 CNR 高于 MEDIC 序列。图像质量评分 3 种序列两两对比差异均有统计学意义($P<0.05$)，3D-DESS 序列优于 MEDIC 序列和 3D-SPACE 序列。对受压神经根清晰度的显示，3 种序列对比，差异均有统计学意义($P<0.05$)，3D-DESS 序列优于其他两种序列。应用 3D-DESS 序列扫描 31 例颈椎病患者与手术诊断结果对比分析，诊断符合率为 93.5%。**结论** 对于显示神经根结构和诊断神经根病变等方面，3D-DESS 序列明显优于 MEDIC 序列和 3D-SPACE 序列，且手术诊断符合率高，对颈神经根病变的诊断具有很高的临床应用价值。

PU-0875
慢性颈肩痛患者静息态脑功能及脑血流灌注的 MRI 研究

岳茜,杜勇
川北医学院附属医院

目的 利用基于静息态脑功能磁共振成像（rs-MRI）的低频振幅（ALFF）分析方法和动脉自旋标记（ASL）技术观察神经根型颈椎病慢性颈肩痛患者静息态脑功能和脑血流灌注的改变，并分析异常脑区的 ALFF 值、区域脑血流量（CBF）值与临床指标的相关性，进一步探究神经根型颈椎病慢性颈肩痛的中枢神经机制。
方法 对 30 例神经根型颈椎病慢性颈肩痛患者（慢性颈肩痛组）及 25 例健康志愿者（正常对照组）进行 rs-fMRI 和 ASL 扫描，扫描后的图像采用基于 MATLAB2017b 平台的 DPABI_V4.0 及 SPM12 软件进行后处理。然后，计算 ALFF 值和 CBF 值并比较患者组与正常对照组脑区变化的差异。最后，将有差异脑区的 ALFF 平均值和 CBF 平均值与病程和 VAS 得分进行相关分析。
结果 慢性颈肩痛组与正常对照组相比，ALFF 值减低的脑区位于右侧颞中回、枕中回、扣带回、额中回、中央后回；ALFF 值增高的脑区位于左眶部额中回（P<0.01，AlphaSim 矫正，Cluster Size≥24）。慢性颈肩痛组与正常对照组相比，CBF 值增高的脑区位于左侧梭状回、顶上回，右侧梭状回、顶上回、中央后回、颞中回、扣带回；CBF 值减低的脑区位于左侧中央前回、中央后回（P<0.05，AlphaSim 矫正，Cluster Size≥284）。慢性颈肩痛组右侧额中回 ALFF 平均值与 VAS 评分呈负相关（r=-0.52，P=0.019）。
结论 神经根型颈椎病所致疼痛引起广泛的脑功能区 ALFF 和 CBF 的异常，涉及疼痛感觉、运动、情绪及记忆、认知等多个维度。rs-fMRI 和 ASL 技术相结合可以为更好地理解神经根型颈椎病慢性颈肩痛的中枢神经机制。

PU-0876
磁共振三维动脉自旋标记技术在颈动脉狭窄性脑缺血疾病中的应用价值

陈细香
武汉大学人民医院

目 的 应用全脑三维动脉自旋标记磁共振成像技术（3D ASL）了解颈动脉狭窄患者脑部灌注情况，探讨 ASL 的临床应用价值。**材料和方法** 使用 GE 3.0T MRI DISCOVERY 750 及 16 通道头部专用线圈对颈动脉彩超发现单侧颈动脉重度狭窄（狭窄程度＞95%）患者 30 例,，行头部常规磁共振及 ASL 检查。 将扫描扫结果在 AW4.6 工作站进行后处理，测量患侧大脑中动脉供血区及健侧大脑中动脉供血区相对脑血流量（rCBF）值并进行统计学分析。**结果** 21 例患者患侧大脑中动脉供血区出现低灌注,rCBF 值为 0.802±0.108，明显低于健侧大脑中动脉供血区 rCBF 值 1.06±0.03，有统计学差异（ P＜0.05）；9 例患者患侧大脑中动脉供血区未见异常灌注区域，考虑与其侧枝循环代偿有关。**结论** 3D ASL 是一种安全无创、能快速了解脑灌注的影像学方法，可用颈动脉狭窄性脑缺血疾病脑灌注情况的评估，为临床治疗提供依据。

PU-0877
基于多尺度的纹理分析方法在脑胶质瘤分级上的应用研究

曹之乐
陆军军医大学大坪医院

目的 胶质瘤的分级在临床上有指导后续治疗的作用，近年来纹理分析方法常被应用于疾病的识别分类。本文提出一种基于多尺度的纹理分析方法在脑胶质瘤分级上的应用。
材料与**方法** 首先，采集临床 60 例脑胶质瘤病例，其中Ⅱ级胶质瘤弥漫型星形细胞瘤和少突胶质细胞瘤 22 例，Ⅲ级胶质瘤间变型少突星形细胞瘤和间变星形细胞瘤 18 例，Ⅳ级胶质瘤胶质母细胞瘤例 20 例。病例图像信息包含平扫 T2 序列和 T2_flair 序列以及增强后的 T1 序列。而后，对三种序列图像做多尺度化处理，并对多尺度化后的图像做纹理分析。并以肿瘤的核心实质区域为感兴趣区，计算纹理参数，探究纹理参数与脑胶质瘤的内在关联含义，做Ⅱ级与Ⅲ级间纹理参数的 ROC 分析，以及Ⅲ级与Ⅳ级间纹理参数的 ROC 分析。最终，以支持向量机作为机器学习核心，通过留一法进行交叉验证，得出纹理分析方法在胶质瘤分级上的准确度。
结论 从整体来说随着滤波尺度变大，纹理细节被模糊后，纹理参数与胶质瘤级别之间的相关性值变小。这反过来说明不同级别胶质瘤之间存在着纹理细节的差异性。基于支持向量机的机器学习内核，通过交叉验证留一法计算出Ⅱ级和Ⅲ级间总体参数的正确率为 91.5%。在Ⅲ级和Ⅳ级间的总体参数正确率为 97.9%。这也就意味着可以通过对最常扫描序列的数据挖掘，来提供对脑胶质瘤分级的重要参考信息。

PU-0878
基于信息流和支持向量机的产后抑郁预测研究

毛宁[1],洪楠[2]
1.山东省烟台毓璜顶医院
2.北京大学人民医院

目的 构建的优势信息流方向分析产后抑郁患者大脑信息流特征。最后，基于支持向量机分类和回归对产后抑郁患者进行临床鉴别诊断和预测评估。
方法 基于产后抑郁患者的静息态 *fMRI* 数据。首先，采用皮尔森相关构建的功能连接和图论分析了产后抑郁患者的大脑全局和局部的信息流模式改变。同时，采用 *NPMR GCA* 构建的优势信息流方向分析产后抑郁患者大脑信息流特征。最后，基于支持向量机分类和回归对产后抑郁患者进行临床鉴别诊断和预测评估。
结果 产后抑郁患者在杏仁核、扣带回、脑岛、海马、额叶、顶叶和枕叶部分区域的信息流模式发生明显改变，尤其杏仁核区域以及与颞叶和额叶之间的信息流方向与临床评估（*HAMD* 和 *EPDS*）存在显著相关。同时基于优势信息流方向的预测分析表明，信息流模式的改变对抑郁状态具有很好的评估能力。
结论 产后抑郁患者杏仁核相关信息流模式的改变是造成抑郁症状的主要神经病理机制，同时也为临床抑郁状态的评估提供稳定可靠的影像学指标。

PU-0879
应用基于体素的形态测量学方法研究颞叶癫痫患者脑白质体积变化

赵丽梅,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 运用基于体素的形态测量学(VBM)技术对颞叶癫痫(TLE)患者全脑白质体积进行分析,并探讨颞叶癫痫患者大脑内部的结构改变及其规律。

方法 收集 22 例颞叶癫痫患者(其中左侧颞叶癫痫组 11 例,右侧颞叶癫痫组 11 例)和 15 例性别、年龄匹配的正常健康志愿者,使用磁化准备快速梯度回波序列(MPRAGE)进行全脑结构像扫描,采用基于体素的形态学测量学(VBM)方法对 T1WI 3D 图像进行统计分析,计算每一组全脑白质的体积(以体素表示),提取部分脑区体积以比较组间差异,另外分别将左 TLE 组、右 TLE 组与对照组进行组间检验,以得出左 TLE 组与右 TLE 组白质体积有差异的脑区。
结果 1、左 TLE 组较对照组脑白质体积降低的脑区有:左侧海马旁回、右侧颞中回、左侧额上回、左侧丘脑、右侧岛叶、左侧顶下小叶、左侧顶上小叶;2、右 TLE 组较对照组脑白质体积降低的脑区有:右侧颞下回、左侧舌回、左侧枕中回、右侧额上回、左侧中央前回、左侧颞上回、右侧楔前叶、右侧中央后回、左侧顶下小叶。
结论 颞叶癫痫患者存在多个脑区白质结构异常,通过采用基于体素的形态测量学技术可以反映脑白质体积的变化。

静息态功能磁共振对产后抑郁症患者情绪网络功能连接的研究

郭定波,黄俊浩,陈暇女,易小琦,余娇艳,胡良波
重庆医科大学附属永川医院

目的 分析静息态下产后抑郁症（PPD）患者情绪网络（AN）的功能连接（FC）特点及其意义。方法 选取符合 DSM-V 产褥期抑郁诊断的患者 23 例（PPD 组）和与之匹配的健康产妇 28 名（HPW 组）进行 rs-fMRI 扫描，以 AN 中杏仁核（AMYG）和膝下前扣带回(sgACC)为感兴趣区，采用双样本 t 检验比较 PPD 组与 HPW 组 AMYG 和 sgACC 与全脑脑区 FC 强度差异，并对 PPD 组中异常 AN-FC 与爱丁堡产后抑郁量表评分进行 Pearson 相关分析。结果 与 HPW 组相比，PPD 组左侧 AMYG 与右侧眶部额上回、左侧眶内额上回、右侧中央前回 FC 减弱，与右侧楔前叶、左侧顶上回 FC 增强；右侧 AMYG 与右侧眶部额上回、右侧背外侧额上回、左侧海马、双侧颞下回、Cerebelum_8_R、Cerebelum_6_L 间 FC 减弱，与右侧颞极颞上回、右侧岛盖部额下回 FC 增强；左侧 sgACC 与左侧距状裂周围皮层、左侧丘脑、左侧颞上回、胼胝体压部、双侧内侧和旁扣带脑回、右侧补充运动区 FC 增强；右侧 sgACC 与左侧缘上回、双侧内侧和旁扣带脑回、左侧楔前叶、右侧补充运动区、左侧舌回和左侧距状裂周围皮层 FC 增强，与 Cerebelum_6_R、Cerebelum_4_5_L 间 FC 减弱。PPD 组左侧 AMYG 与左侧眶内额上回 FC 减弱和 EPDS 评分呈负相关（r=-0.617，P=0.019）。结论 PPD 患者 AN 存在广泛 FC 异常，左侧 AMYG 与左侧眶内额上回 FC 减弱与 PDD 症状严重程度相关，这可能揭示了 PPD 神经机制的基础并提供一个潜在的特异性生物学标记。

Structural network topology correlates to cognitive impairment and iPTH level in End-stage renal disease patients with peritoneal dialysis

liwei zou,Longsheng Wang,Wu Hanqiu,Shan Yanqi,Zhao Ru,Liu Guiling,Gong Xijun
the second hospital of anhui medical university

Objective: The burden of cognitive impairment in end-stage renal disease (ESRD) undergoing peritoneal dialysis received more attention, which associated with hospitalization, mortality and quality of life. We aimed to assess the topological

alterations of brain white matter structural network in ESRD and the correlation between network metrics with Montreal Cognitive Assessment scores and clinical data. **Methods:** The study included 25 ESRD patients with secondary hyperparathyroidism (SHPT group), 25 patients without SHPT (Non-SHPT group) and 25 healthy controls (HC group) of comparable age and sex. Cognitive function was assessed using Montreal Cognitive Assessment. WM structural network constructed by diffusion tensor imaging and deterministic tractography method, and then used graph theoretical approaches to investigate alterations in the global and regional properties of the WM network in these participants.
Results: ESRD patients showed cognitive impairment compared to HC and SHPT patients was lower cognitive scores than Non-SHPT patients. The global topological organization and local efficiency of WM network was significantly disrupted in SHPT but not in Non-SHPT patients, as compared with HC group. Moreover, lower regional efficiency was found in ESRD patients mainly distributed in the frontal and parietal cortices. In addition, association was found between iPTH, shortest path length and cognitive impairment, and iPTH level was negatively correlated with small-worldness by two indexes normalized clustering coefficient and normalized shortest path length.
Conclusion: The present study indicated that brain structural connectome in ESRD patients with high iPTH level was disrupted as cognitive impairment and it has the potential connectome-based biomarkers for early detection.

Resting-state f-MRI study of the changes of spontaneous neural activity in postpartum depression.

Kaili Che[1,2],Haizhu Xie[1]
1.Shandong province Yantai Yuhuangding Hospital
2.Qingdao University School

Purpose: In postpartum depression (PPD), some brain regions related to depression have displayed abnormalities by tasking-state functional magnetic resonance imaging (fMRI) in past years. In this study, we used two markers of resting-state fMRI (R- fMRI), to investigate the changes of spontaneous neural activity and the correlation with the severity level of depression. **Materials and Methods:** Sixteen PPD individuals (31.06±2.79 years) and age-matched sixteen healthy controls (HCS) were scaned by 3.0T R- fMRI. 24-item Hamilton Rating Scale (HAMD) and Edinburgh Postnatal Depression Scale(EPDS)was administered to assess subjects clinical symptoms. Two-sample t-test was used to compare the amplitude of low-frequency enablement (ALFF) and regional homogeneity (ReHo) values between groups. The correlation between the ALFF and the ReHo value of the abnormal brain region and the HAMD and EPDS scores were analyzed. **Results:** Compared with the HCS, the right cerebellum anterior lobe (culmen) and the left frontal lobule increased ALFF in PPD and decreased ALFF in the right parietal lobe. We found PPD had increased ReHo values in the left cerebrum (ORBsup, ORBinf, MFG, precuneus, IPL, and SFG) than HCS. Decreased ReHo values in the right cerebrum (OL, IFG, FL), and the left cerebellum inferior semi-lunar lobule. We found that the ALFF value of the left frontal lobe was positively correlated with the HAMD

score in PPD. (r = 0.583, p＜0.05). **Conclusion:** This R-fMRI study suggests that the changed spontaneous neural activity of these regions related to emotional response. PPD with higher ALFF values in the left frontal lobe have more severe depression.

基于独立成分分析的 2 型糖尿病脑网络功能连接研究

黄钟馨,彭娟
重庆医科大学附属第一医院

目的　采用独立成分分析（ICA）方法探究 2 型糖尿病（T2DM）患者各脑网络功能连接（FC）变化。　方法　选取 47 例 T2DM 患者（T2DM 组）及 29 例健康对照组（HCs 组），进行静息态功能磁共振扫描、数据预处理、ICA 分析，选出默认网络（DMN）、视觉网络（VIS）、背侧注意网络（DAN）及躯体运动网络（SMN），比较组间脑网络的功能连接变化情况，分析差异脑区 FC 值与临床参数及认知评分的相关性。　结果　（1）与对照组相比，T2DM 组 DMN 功能连接减弱脑区为左侧辅助运动区及左侧额上回，功能连接增强脑区为双侧内扣带回；VIS 功能连接减弱脑区包括右侧距状回、右侧楔叶及双侧舌回，无功能连接增强脑区；DAN 及 SMN 未见明显差异脑区。（2）右侧舌回的 FC 值与体质量指数（BMI）呈负相关（r=-0.434, P=0.003）。　结论　T2DM 患者的 DMN 及 VIS 功能连接异常，提示部分脑网络受损，为临床早期诊断 T2DM 认知功能障碍提供了可能的影像学途径。

多模态磁共振成像监测 AQP1 在胶质瘤瘤周水肿及浸润组织中的表达的实验研究

鲁宏
重庆市第七人民医院

目的　探究多模态磁共振成像(MM-MRI)监测 AQP1 表达上调/干扰后瘤周水肿及浸润组织的影像学变化，为临床应用 AQP1 基因治疗胶质瘤并用 MM-MRI 评估疗效提供理论依据。

材料方法　选取 60 只健康成年 Wistar 大鼠，计算机随机法分为对照组、AQP1 上调组、上调空载体组、AQP1 干扰组、干扰空载体组，采用立体定位法成功建立大鼠胶质瘤模型 40 例。于造模后 15 天行 T1WI、T2WI、DTI 检查、T1WI 增强，经后处理得到肿瘤体积、瘤周水肿参数（EI 值）、瘤周 rFA 值及瘤周 rADC 值。随后观察瘤周水肿及浸润组织病理变化、Western-blot 的 AQP1 表达水平。所得实验结果均以 x(__)±s 表示，各组间进行独立样本 t 检验。

结果　C6-AQP1 组肿瘤生长迅速，肿瘤体积大于 C6 对照组，AQP1 上调组肿瘤生长缓慢，肿瘤体积小于 C6 对照组；　EI 值大于 C6 对照组，上调空载体组 EI 值小于 C6 对照组。C6-AQP1 组瘤周 rFA 值小于 C6 对照组，C6-AQP1-sh3 组瘤周 rFA 值大于 C6 对照组；而各实验组 rADC 值比较无统计学意义。HE 染色提示实验各组胶质瘤均为高级别胶质瘤；C6-AQP1 组瘤周细胞间隙增宽、间质疏松程

度较 C6 对照组明显，C6-AQP1-sh3 组瘤周细胞间隙增宽、间质疏松程度较 C6 对照组轻；C6-AQP1 组瘤周细胞浸润数目较 C6 对照组增多，C6-AQP1-sh3 组瘤周细胞浸润数目较 C6 对照组减少，而 C6-PCDH 组、C6-shRNA 组与 C6 对照组比较差异无统计学意义。C6-AQP1 组瘤周 AQP1 表达水平高于 C6 对照组，C6-AQP1-sh3 组瘤周 AQP1 表达水平低于 C6 对照组，而 C6-PCDH 组、C6-shRNA 组与 C6 对照组比较差异无统计学意义。

结论 AQP1 干扰可减轻瘤周水肿和减少瘤周肿瘤细胞浸润；多模态磁共振成像可用于评估 AQP1 基因治疗胶质瘤的疗效的影像学方法。

PU-0885

多模态 MRI 显示脑创伤半暗带的实验研究

鲁宏
重庆市第七人民医院

目的:探究多模态磁共振成像是否可以显示大鼠脑创伤半暗带（traumatic penumbra，TP）的动态变化。

方法:56 只健康成年雄性 Wistar 大鼠，分为对照组（7 只）和创伤组，按创伤后不同时间分为 7 个时相：1h、6h、12h、24h、48h、72h、7d 组（每个时间点各 7 只）。采用改良的 Feeney 氏法建立中度脑创伤模型，行头部 SE 序列及 DWI 扫描，测量 TP 区的 rADC 值，对相应区域进行病理观察，对结果进行分析。

结果:对照组组织未见异常。创伤组伤后 1h，TP 表现为血管源性水肿；6h 出现细胞内水肿；12h 两种水肿共存并明显加重，24h 水肿减轻；48h 血管源性水肿再次加重；72h 细胞内水肿占优势；7d 两种水肿均明显减轻。DWI 显示：创伤后 1h TP 区 rADC 值明显升高，6h 时下降，12h 减低为（64.37±1.07）%，之后 ADC 值逐渐上升，48h 时再次升高，72h 又降低，除 6h 与 12h、6h 与 24h 和 12h 与 24h 外，其余各时相点之间对比差异有统计学意义（$p<0.05$）。

结论: ADC 值可显示 TP 区水肿类型和程度的动态变化，从而提示 TP 区。

PU-0886

Changes of resting MRI in patients with sudden deafness based on ALFF, fALFF and ReHo

Xiaoqi Pang
The first affiliated hospital of Guangxi medical university

Objective Amplitude of low frequency fluctuation (ALFF), fractional amplitude of low frequency fluctuation (fALFF) and Regional homogeneity (ReHo) were used to study the difference of resting functional magnetic resonance imaging (fMRI) between patients with severe sudden deafness and normal people and functional remodeling of other relevant brain regions. **Methods** 19 patients with moderate to severe sudden deafness who met the inclusion criteria and 22 matched healthy controls were selected. Based on the rs-fmri data, the resting fMRI data of the two groups of subjects were collected. The changes of resting functional magnetic resonance (fmri) in patients with sudden deafness were analyzed by amplitude of low frequency fluctuation (ALFF), fractional amplitude of low frequency fluctuation (fALFF) and Regional homogeneity

(ReHo).Subjects in both groups were tested by two-sample T test and corrected by Alphasim. **Results** the ALFF values of bilateral Medial cingulate gyrus and left medial superior frontal gyrus were different between the two groups($p < 0.01$).There were differences in the ReHo values of the right fusiform gyrus and the right inferior temporal gyrus ($p < 0.01$). FALFF found no functional changes in the brain area. **Conclusion** compared with the normal group, the patients with sudden deafness had abnormal activity in the brain functional area under resting state.Compared with fALFF, ALFF and ReHo could better reflect BOLD signal changes caused by abnormal data activity in the brain of patients with sudden deafness.

磁共振颈部血管壁多模态高分辨率成像技术及斑块分析 对临床诊疗的指导意义

胡源浩
中国科学院大学重庆医院（重庆市人民医院）

目的 血管高危斑块所引发的心脑血管疾病已成为威胁人类健康的重要疾病之一，并且有越来越年轻化的趋势。磁共振成像具有高软组织对比度、多种成像方式、任意截面成像等诸多优势，在血管壁成像方面，磁共振成像可以满足临床需求，斑块分析软件能更好的提供斑块成分的分析报告，具有广阔的发展和应用空间。

方法 应用 SIEMENS MAGNETOM Verio 3.0T 高分辨磁共振，选取颈部血管疾病患者 64 例，成像序列为对比剂引入前 T1WI-TSE、黑血（black blood）T1WI、T2WI-TSE、质子密度加权像（PDWI），3D-T1WI、3D-T2WI 及 SWI（磁敏感成像技术）成像，注入对比剂后行 T1WI-TSE 和 3D-T1WI 成像，部分序列行脂肪抑制。所得序列图像导入 MRI-PlaqueView 斑块分析软件，获得斑块成分分析报告。

结果 颈部血管 64 例患者中，钙化斑块 32 例，混合型斑块 13 例，其余为正常，偏心性斑块 41 例，对 13 例混合型斑块行斑块分析，3 例有炎性反应，斑块内出现强化。1 例斑块内出血。T1WI 最大的优势是可以反应斑块内出血。T2WI 对血管内外壁及斑块的边界显示较为清晰。PDWI 信噪比较高，相对于 T1WI 和 T2WI，PDWI 更能清晰的显示斑块的边界和血管腔。T1WI+C 对比剂强化说明斑块内新生血管或内皮细胞通透性增加，能鉴别出斑块内炎症活动，并能清晰显示斑块纤维帽的边缘。理论上纤维成分在 T1WI、T2WI、PDWI、均为高信号，纤维帽破裂在 T1WI+C 和 T2WI 易于观察，是斑块活动的标志之一。

结论 3.0 高分辨率 MRI 技术在对颈动脉的狭窄程度进行准确评估的同时，还能清楚地显示斑块的范围、形态、大小及部位，斑块分析软件能更好的对斑块内部的结构及病理成分进行更为详细的分析，从而对斑块的稳定性进行较为准确地判断。为临床的诊治提供了价值极高的影像学资料。

磁共振臂丛神经成像扫描技术的应用

包艳森[1,2],谢兴佳[1,2],陈顺新[1,2],白艳[1,2],周友丽[1,2]
1.随州市中心医院
2.湖北医药学院附属随州医院

【摘要】**目的** 日常工作中颈椎病多伴随椎间盘突出压迫神经引起的上臂麻木疼痛，常规 MR 扫描的序列可以检测出颈椎的生理曲度、脊髓信号有无异常、而对神经根的压迫程度显示欠缺。因外伤、神经原发病变引起的臂丛神经病变显示不明显。给临床医师确立治疗方案带来了困扰。磁共振臂丛神经成像可以明确显示臂丛神经及其周边组织结构。作为一种理想的无创影像检查手段，磁共振成像对臂丛神经病变的诊断和治疗具有重要意义。

方法 选取 2018 年 1 月至 2019 年 4 月在本院行颈椎 MR 扫描患者 120 例，在常规平扫结束后，使用 IDEAL 序列联合 2DMERGE 序列扫描臂丛神经。将图像传至 Aw4.6 工作站，对图像进行 MPR、MIP、CUR 处理。扫描图像及后处理图像交由两位高年资医师独立分析,分别以常规 MR 平扫序列获取的图像和常规 MR 平扫获取的图像结合臂丛神经成像技术获取的图像分别对疾病进行诊断。然后对诊断结果进行统计学分析。

结果 仅以常规 MR 平扫获取的图像为依据，诊断结果为 120 例患者中颈椎间盘突出压迫脊髓者 40 例，颈椎间盘轻微突出未压迫脊髓者 66 例，未见明显异常者 14 例；以常规 MR 平扫获取的图像结合臂丛神经成像技术获取的图像为依据，诊断结果为 120 例患者中，颈椎间盘突出压迫脊髓的 40 例患者中有 9 例伴随臂丛神经损伤，颈椎间盘轻微突出未压迫脊髓的 66 例患者中有 17 例伴随臂丛神经损伤，未见明显异常的 14 例患者中 5 例有臂丛神经损伤。

结论 IDEAL 序列联合 MERGE 序列扫描臂丛神经，在臂丛神经成像中的应用。可以立体显示臂丛神经的走行，形态，以及其周边结构。在影像诊断上具有独特的优势，有助于临床确定治疗方案，而且 MR 检查无需借助任何造影剂，也没有 X 线辐射损伤及椎管穿刺技术的影响，操作简单方便，为目前臂丛神经疾病理想的影像检查手段。

PU-0889

ASL 灌注成像技术在急性缺血性脑卒中的应用

周友丽[1,2],邵天喜[1,2],谢兴佳[1,2],马秋洁[1,2],包艳森[1,2]
1.湖北省随州市中心医院
2.湖北医药学院附属随州医院

【摘要】 **目的** 探讨磁共振动脉自旋标记（ASL）灌注成像技术对急性缺血性脑卒中的临床应用价值。

方法 选取自 2018 年 4 月至 2019 年 5 月在本院收治经临床拟诊为缺血性脑卒中且发病时间在一周内的 40 例患者，在医学影像科行常规颅脑 MRI 平扫及 DWI 检查后，请两位有丰富经验的影像科诊断医师进行诊断，诊断报告确诊为急性脑梗死的患者，对其均行 3DASL 扫描，观察急性脑梗死病灶在 3DASL 和常规 DWI 影像中的表现，并在 AW4.6 工作站上对数据进行后处理，测量缺血区域与对侧镜像层面的脑血流值（CBF），并计算相对脑血流值（rCBF)=缺血区域 CBF/对侧镜像层面 CBF，rCBF 在 0.9～1.1 之间定义为灌注正常，rCBF＞1.1 定义为高灌注，rCBF＜0.9 定义为低灌注。

结果:40 例脑缺血患者经随访证实脑梗死 35 例，短暂性脑缺血发作（TIA）患者 5 例，35 例脑梗死患者其 DWI 均表现为高信号，3DASL 表现为低灌注，测量患者 ASL 图像上表现为低信号的缺血区平均 CBF 值为（22.28±0.95）ml/100g*min、对侧镜像区 CBF 为（44.97±2.85）ml/100g*min、rCBF 为 0.52±0.03；5 例 TIA 患者 DWI 图像未见异常信号改变，在 ASL 上有 4 例表现为低灌注，测量患者缺血区平均 CBF 值为（37.6±4.2）ml/100g*min.对侧镜像区 CBF(50.6±9.0)ml/100g*min

结论 ASL 灌注成像技术在急性缺血性脑卒中的诊断具有非常重要的临床意义，并能部分检出在 DWI 上表现为阴性的 TIA 患者，有利于 TIA 患者的早期诊断。

PU-0890

扩散峰度成像（DKI）在胶质瘤的分级和细胞增殖评估中的价值

江浩茹
山西医科大学第一医院

目的 对胶质瘤进行分级和细胞增殖评估对于胶质瘤的治疗具有至关重要的作用，然而常规的扩散成像技术对其评估不够准确。扩散峰度成像(DKI)是一种先进的非高斯扩散成像技术，可利用其对胶质瘤进行分级和细胞增殖评估。
方法 利用扩散峰度成像（DKI）和扩散加权成像（DWI）对 68 例经病理证实为胶质瘤患者进行检查，并获得肿瘤的扩散峰度和常规扩散指标和量值，评价这些指标与胶质瘤分级及 Ki-67 表达的关系，并进一步比较这些指标在分级中的诊断效能。
结果 与常规的扩散成像技术相比，扩散峰度成像在对胶质瘤分级方面具有很大的潜能。在Ⅱ、Ⅲ、Ⅳ级胶质瘤中，峰度指标在预测 Ki-67 表达方面也显示出很大的潜力。
结论 扩散峰度成像（DKI）可以比常规扩散成像技术如 DWI 更准确的对胶质瘤进行分级和细胞增殖评估，对手术治疗具有重要意义。

PU-0891

Gadolinium Retention in the Diabetic Brain after Administrations of Gadolinium Contrast in a Rat Model

Xiang Yao,Ke Ren
The Xiang’an Hospital of Xia Men Uneversity

Objectives: To evaluate gadolinium (Gd) retention and clearance in the brain of diabetic rats after administrations of gadodiamide, gadopentetate dimeglumine, and gadoterate meglumine.
Materials and Methods: Both diabetic rats (n = 52) and normal rats (n = 52) intravenously received 20 injections of 0.6 mmol Gd/kg gadodiamide, gadopentetate dimeglumine, gadoterate meglumine, or saline. Both diabetic rats and normal rats were divided into 2 subgroups of 24 and 28 rats for the 7-day and 42-day evaluations (i.e., they were sacrificed at 7 days (n = 6 per group) and 42 days (n = 7 per group)), respectively, after the last injection. For the 7-day subgroup, 6 rats were euthanized for inductively coupled plasma mass spectrometry (ICP-MS) analysis. For the 42-day subgroup, 6 rats underwent T1-weighted magnetic resonance imaging (MRI) and ICP-MS, and 1 rat was analyzed by transmission electron microscopy (TEM).
Results: The T1 enhancements in the deep cerebellar nuclei (DCNs) of diabetic rats were lower than those of normal rats in both linear Gd-based contrast agent (GBCA) groups. The average Gd concentrations in the brains of diabetic rats were significantly lower than those of healthy rats in both the short-term groups and long-term groups. The highest Gd retentions were in the olfactory bulb, DCN, and striatum with gadodiamide. Compared with the results obtained 7 days after the last injection, the residual Gd concentrations of the 42-day subgroups in the brains of diabetic rats showed no significant difference in both linear GBCA groups.
Conclusions: Compared with normal rats, the diabetic status decreased the residual Gd concentrations in the brain after multiple administrations of gadodiamide,

gadopentetate dimeglumine, and gadoteratemeglumine. The clearable fraction of Gd in the brain was eliminated faster in diabetic rats than in normal rats.

PU-0892

垂体 MRI 扫描技术规范探讨

陈修燕
中国科学院大学重庆医院（重庆市人民医院）

目的 回顾性分析垂体 MRI 扫描技术优化序列对影像诊断的价值。**方法** 回顾性收集垂体 MRI 扫描病例 90 例，将文献 1 中的检查序列归为 A 组，文献 2 中的检查序列归为 B 组，优化序列归为 C 组。**结果** A 组序列中缺乏矢状位 T2WI，对观察垂体前后位置的病变有所缺乏；B 组序列中由于垂体特殊的解剖位置及极小的形态致轴位 T1WI 对观察垂体的解剖情况不佳、可以省略，缺乏矢状位 T1WI，对垂体前后叶解剖结构显示不佳；C 组优化序列能够较全面的了解垂体微小的解剖情况以及信号改变，检查总时间较 A 组短，清醒患儿较易接受。**结论** 由于 MRI 扫描仪对软组织有较高的分辨率，那么合理的组合及优化序列对正常垂体的解剖结构、信号表现及垂体变异或微小病变显示最全面。

PU-0893

探讨 GE3.0T 磁共振多体波谱扫描兴趣区域选择方法与价值

何小华,李向东
中国人民解放军南部战区总医院

目的探讨 GE3.0T 磁共振多体波谱（MRS）扫描兴趣区域选择的方法与价值。**材料与方法**从我院收集 30 例（均是脑肿瘤患者，肿瘤部位均有坏死、囊变、水肿）行 GE3.0T 磁共振多体波谱扫描的患者（均可配合检查），分成 A 和 B 两组，每组患者均一样。A 组多体 MRS 扫描时所选的兴趣区域包括：肿瘤实质部分、小部分水肿区及小部分正常的脑实质；B 组多体 MRS 扫描所选兴趣区域为：肿瘤所在区域以及对侧脑组织，两组匀场方法一致。30 例患者均进行 A 组和 B 组多体 MRS 扫描，扫描完毕行谱线后处理。**结果**两组均取同样的肿瘤实质部位、水肿区以及正常脑组织处的谱线，两组进行对比。A 组谱线处理的信噪比均比 B 组谱线处理的信噪比高，同样肿瘤部位谱线信噪比 A 组比 B 组高出 0.75～1.35；同样水肿区谱线信噪比 A 组比 B 组高 0.30～0.97；同样正常脑实质部位谱信噪比 A 组比 B 组高 2.47～3.04。**结论** 行 GE3.0T 磁共振多体波谱扫描时兴趣区域的选择对谱线的信噪比有一定的影响。而多体（MRS）的优点是包括评价病灶的范围，并且可以获得未被病变累及区域的波谱，从而提供一已知代谢物的图形；缺点是容积效应，各小体素的值都会受周边体素的影响。定位时尽量不要大范围的选取兴趣区域，减少周边体素的容积效应，提高感兴趣代谢物的信噪比，其最终的结果是尽量准确的进行各代谢物的定量分析，以进行临床定性分析。因此行 GE3.0T 磁共振多体波谱扫描时兴趣区域的选择在包含肿瘤实质部分以及正常脑组织的前提下应尽可能小，以提高谱线的信噪比从而更准确提供临床定性分析。

PU-0894

磁共振 T1W FSBB 增强技术在脑部肿瘤的应用价值研究

罗承龙,于杰
云南省临沧市人民医院

[摘要] **目的** 探讨磁共振 T_1加权(T_1W)流动敏感黑血(Flow Sensitive Black Blood ,FSBB)增强技术与常规 T_1W 快速自旋回波(Fast Spin Echo ,FSE)增强及 T_1W 梯度回波（Fast Field Echo ,FFE）增强技术相比对脑部肿瘤诊断的应用价值.方法:选取我院 2018 年 4 月至 2019 年 6 月，40 例经临床确诊脑部肿瘤患者,应用 1.5T 磁共振扫描仪及 13 通道头颈联合线圈，对患者注射钆喷酸葡胺(Gd-DTPA)(0.2mmol/kg)后,行 T1W FSBB, T1W FSE, T1W FFE 三种检查技术扫描全颅,获取影像数据。评价图像质量，记录病灶大小，病灶数目。对比三种检查方法对脑部肿瘤尤其是微小转移瘤的诊断检出率。**结果** 40 例患者图像质量均较好，达到诊断标准。40 例脑部肿瘤患者，T1W FSBB 增强技术检出病灶 182 个，小于 1mmX1mm 肿瘤 52 个；T1W FSE 增强技术检出病灶 130 个，小于 1mmX1mm 肿瘤 0 个；T1W FFE 增强技术检出 169 个，小于 1mmX1mm 肿瘤 39 个。常规 T1W FSE 与 T1W FSBB 相比病灶检出率 71.4%，差异有统计学意义（P<0.05）；T1W FFE 与 T1W FSBB 相比病灶检出率 92.8%，差异无统计学意义（P>0.05）。**结论** T1W FSBB 技术对于脑部肿瘤尤其是微小肿瘤诊断具有重要意义，与常规 T1W FSE 技术相比能发现无法发现的微小病灶；T1W FFE 增强技术扫描层厚可以 1mm，能够发现微小病灶，但是微小病灶强化后呈高信号，与血管高信号不容易区分，造成漏诊，T1W FSBB 通过施加流动相位损毁脉冲抑制血流信号，血管在图像上呈低信号，突出病灶显示，不会漏诊。

非酮症高血糖性偏侧舞蹈症的 CT 及 MRI 对比分析

陈育文,王方明,甘良志,黄辉,张航
武汉市黄陂区人民医院

目的 分析探讨非酮症高血糖性偏侧舞蹈症的头部 CT 及 MRI 影像特征。**方法** 对 11 例符合临床及实验室诊断标准的非酮症高血糖性偏侧舞蹈症的头部 CT 及 MRI 影像表现进行分析。**结果** 所有病例头部 CT 平扫主要表现为患肢对侧基底节区斑片状稍高密度，MRI 患肢对侧基底节区 T1WI 表现为斑片状稍高信号，T2WI 为低、等或稍高信号，DWI 则为稍低信号。**结论** 非酮症高血糖性偏侧舞蹈症的头部 CT 及 MRI 具有特征影像学表现，结合临床及相关实验室检查即可诊断本病。

PU-0896
颞肌 MRI 厚度对胶质母细胞瘤患者预后的预测价值研究

刘芳,查云飞
武汉大学人民医院

目的 探讨三维颅脑 MRI 上颞肌厚度（TMT）对胶质母细胞瘤(GBM) 患者预后的预测价值。
方法 纳入 TCGA-GBM 数据库中 95 例原发性 GBM 患者进行回顾性分析。在三维颅脑 MRI 上测量患者颞肌厚度，并随机选择 30 例病人由第二位放射医师进行重复性测量，计算组间相关系数（inter-class correlation，ICC）。然后采用 Kaplan-Meier 曲线计算患者生存期，不同因素中位生存期比较采用 Log-Rank 分析，并采用 Cox 比例风险模型进行多因素分析。
结果 三维颅脑 MRI 颞肌测量重复性较好，观察者间左右侧 TMT 的 ICC 分别为:0.878、0.895（p <0.001）。按 TMT 中位数分组，TMT>中位数组患者中位存活时间（467 天）较 TMT ≤中位数组患者存活时间（268 天）明显增加（p <0.001; Log-Rank 分析）。使用 Cox 回归模型进行多变量生存

分析显示，TMT（HR 0.511，95%CI ：0.329-0.792，p=0.003）及肿瘤诊断年龄（HR 1.032，95% CI：1.015-1.050，p＜0.001）与存活时间显著相关。
结论 颅脑 MR 测量 TMT 可重复性好，TMT 可作为胶质母细胞瘤患者生存预后的独立预测因子，有助于早期发现危险患者。

MRI 新技术在脑肿瘤诊断中的合理应用

李建蓉
重庆三峡中心医院

目的 探讨 MRI 新技术在脑肿瘤临床诊断中的合理应用。
方法 选取我院 2018 年 10 月至 2019 年 5 月收治的 42 例脑肿瘤患者作为研究对象，其中男性患者 23 例，女性患者 19 例，年龄 28~73 岁，平均年龄（48.96±4.25）岁。均对 42 例患者实施 MRI 检查，检查仪器均为西门子 3.0T 超导型磁共振成像机，检查操作由我院放射科两名经验丰富的医师共同进行，应用头颅相孔阵正交线圈，检查过程中应用弥散加权成像、磁敏感加权成像两种 MRI 新技术，统计 42 例患者应用两种 MRI 新技术的肿瘤、出血、血管、钙化、脑组织坏死、周围组织水肿的检出率，并将手术病理结果最为金标准，统计两种 MRI 新技术诊断结果与手术病理结果的符合率。应用统计学软件 SPSS 24.0 对研究数据进行统计学处理。
结果 42 例患者经手术病理证实均为脑肿瘤，其中额叶肿瘤 11 例，顶叶肿瘤 9 例，颞叶肿瘤 13 例，枕叶肿瘤 5 例，基底节、丘脑、胼胝体、蝶鞍部肿瘤各 1 例，39 例患者合并出血，10 例患者肿瘤内部有新生血管，19 例患者有钙化灶，9 例患者脑组织坏死，35 例患者肿瘤病灶周围组织水肿。
结论 MRI 新技术弥散加权成像和磁敏感加权成像诊断脑肿瘤均具有较高的准确率，但与弥散加权成像比较，磁敏感加权成像对肿瘤实质及脑组织的敏感性更高，肿瘤内部血管、出血、钙化的检出率更高，能够为疾病临床诊断提供的信息更多。建议医师根据患者病情选择合适的 MRI 诊断技术，必要时在联合应用两种新技术，以减少医疗资源浪费。

静息态局部一致性在轻度创伤性脑损伤中的研究

王朝朝,马军
首都医科大学附属北京天坛医院

目的 应用静息态局部一致性的分析方法，分析轻度创伤性脑损伤患者静息状态下神经元自发活动的程度及相邻神经元活动的一致性，以期寻找有效的影像学标记物。
方法 收集 2017 年 11 月至 2019 年 1 月就诊于我院的轻度创伤性脑损伤发生后 3-6 个月的患者 16 例（男 10 例，女 6 例），年龄 22-62 岁；并同期招募年龄、性别组成和受教育程度相匹配的正常对照者 16 例（男 10 例，女 6 例），年龄 24-60 岁，分别进行静息态功能磁共振成像数据采集及临床资料采集，临床资料包括患者主诉、MoCa 量表评分、RPSQ 量表评分。磁共振数据经 SPM8 软件进行预处理，而后通过静息态数据处理软件进行 ReHo 运算，并进行组间双样本 t 检验（$P<0.01$），得出 mTBI 患者与正常对照组之间的差异脑区，将其设为感兴趣区并进行感兴趣区信号的提取，以便进一步与临床资料进行相关性分析（$P<0.05$）。
结果 （1）mTBI 组与 NC 组间性别、年龄、受教育年限均无统计学差异（$P>0.05$）。所有 mTBI 患者及正常对照组常规 T1WI、T2WI、T2 FLAIR 脑内表现均为阴性，仅一例 mTBI 患者左额颞部可见薄层硬膜下积液。

（2）与正常对照组相比，mTBI 组 ReHo 值显著减低的脑区有：右侧颞下回、梭状回、海马旁回、枕中回、左侧前扣带和旁扣带脑回、右侧小脑。mTBI 组 ReHo 值显著升高的脑区有：右侧内侧和旁扣带回、楔前叶、中央前回。
（3）mTBI 组 ReHo 较正常对照组差异脑区信号强度未发现与 MoCa 量表评分及 RPSQ 量表评分有显著相关性（$P>0.05$）。
结论 轻度创伤性脑损伤患者静息状态下相邻神经元活动的一致性存在显著差异，但较正常对照组差异脑区信号强度未发现与 MoCa 量表评分及 RPSQ 量表评分有显著相关性（$P>0.05$）。

PU-0899
磁共振黑血三维成像序列在颈部动脉血管病变的应用价值

谢欢,冉启胜
陆军军医大学大坪医院

目的 探讨核磁共振成像（MRI）黑血三维成像序列在颈部血管病变应用价值。
方法 收集我院 2018 年 1 月-2019 年 6 月行核磁共振（MRI） 黑血三维成像序列检查，并通过临床诊治证实颈部动脉血管斑块性狭窄阻塞塞的患者 10 例、颈部动脉血管夹层 4 例、颈部动脉血管瘤 2 例、颈部动脉血管炎 1 例，作为研究对象。年龄 32-81 岁，平均（50.8±12.1）岁。患者多因头痛、头昏、四肢无力入院。采用 SIEMENS 公司 VERIO 3.0T 超导型磁共振扫描仪，使用头颈部相控阵线圈，患者取仰卧位，平静呼吸。17 例患者均先行常规头颈部检查，然后行磁共振黑血三维序列对颈部进行扫描，层厚 0.8 mm，TR 700ms，TE 11ms，矩阵 512×512，FOV 215×215。扫描完毕后，先在薄层图像上定位病变动脉血管部位，然后将薄层图像调入西门子 3D 后处理选项卡中进行曲面重组后处理。通过曲面重组后处理技术将靶血管壁病变处全程显示在同一平面内，然后通过 3D 多平面重组技术对靶血管病变处进行横状、冠状、矢状位显示，分析血管病变。
结果 磁共振黑血三维成像序列可以清晰的显示颈部动脉血管病变，其中颈部动脉血管斑块性狭窄或阻塞 10 例、颈部动脉血管夹层 4 例、颈部动脉血管瘤 2 例、颈部动脉血管炎 1 例。此 17 例患者图像数据再通过 3D 后处理技术进行血管重组，可以进一步对血管病变进行准确分析。
结论 磁共振黑血三维成像序列通过其流空效应可清晰的显示颈部动脉靶血管壁病变及管腔狭窄情况，其也是血管壁成像的一个主要方法，再结合 3D 曲面重组后处理技术可进一步对颈部动脉靶血管病变处进行分析，也更加有利于将病变准确的呈现出来，值得临床进行推广。

White Matter Impairment in Type 2 Diabetes Mellitus With and Without Microvascular Disease

Yaoyao Zhuo[1],Kangan Li[2]
1.Shanghai Public Health Clinical Center, Fudan University
2.Shanghai General Hospital, Shanghai Jiaotong University School of Medicine

Background and objective: Type 2 diabetes mellitus (T2DM) is a serious public health problem, and the phenomenon of T2DM occurring in younger people has directed more attention to functional changes in the brain[1]. In this study, the microstructural integrity of white matter (WM) was evaluated in three groups of middle-aged subjects: healthy controls (HCs) and T2DM patients with and without peripheral microvascular complications (T2DM-C and T2DM-NC patients, respectively).

Methods: Diffusion tensor imaging (DTI) and related clinical examinations were performed in 66 subjects, including 20 T2DM-C patients, 20 T2DM-NC patients, 26 age- and sex-matched HCs. Magnetic resonance imaging (MRI) at 3.0 T was used to perform DTI; then, FSL (www.fmrib.ox.ac.uk/fsl) and tract-based spatial statistics (TBSS) software were used to assess differences in the fractional anisotropy (FA) and mean diffusivity (MD) among the groups [2,3].
Results: There were no significant differences in sex or age among the groups, and the clinical data of the groups met the experimental requirements. There was no significant difference in the FA values between the HCs and T2DM-NC groups. Compared with the HCs, the T2DM-C patients showed decreased FA values and increased MD values in the corpus callosum, bilateral anterior limb of the internal capsule, right retrolenticular part of the internal capsule, bilateral posterior thalamic radiation, right superior longitudinal fasciculus, bilateral superior corona radiata and left middle frontal gyrus ($P < 0.01$) (Figure 1). Compared with the T2DM-NC patients, the T2DM-C patients showed decreased FA values and increased MD values in the corpus callosum, bilateral fornix, right retrolenticular part of the internal capsule, middle cerebral peduncle, right superior longitudinal fasciculus, right posterior thalamic radiation, and left middle frontal gyrus ($P < 0.01$) (Figure 2).
Conclusions: This study indicates that WM impairment is present in working-aged T2DM patients and that the integrity of the WM in T2DM patients with microvascular complications is compromised compared to that in patients without microvascular complications. More importantly, this study also shows that such impairment may be diagnosed using the DTI mode of functional MRI before it can be diagnosed clinically[4,5]. However, this study also has some shortcomings, including that patients with T2DM-C have hypertension which may be one of the causes of the results. We believe that after further experimental studies, WM injury in T2DM patients may be clinically diagnosed by functional MRI mode, providing new basis for early diagnosis and treatment.

PU-0901
磁共振成像在鉴别可逆性胼胝体压部病变综合征与胼胝体压部梗死中的应用价值

王嫣,王梅云
河南省人民医院

目的 对可逆性胼胝体压部病变综合征与胼胝体压部梗死患者病灶的表观扩散系数进行分析，探讨磁共振成像在两者中的鉴别价值。
方法 回顾性分析 2016 年 10 月至 2018 年 11 月在河南省人民医院就诊并经临床和影像确诊的可逆性胼胝体压部病变综合征患者 11 例和胼胝体压部梗死患者 14 例，测量病灶表观扩散系数，分析两组患者表观扩散系数的差异。
结果 11 例可逆性胼胝体压部病变综合征患者病灶位于胼胝体压部中央，DWI 呈高信号，ADC 呈低信号，表观扩散系数平均为 291.59±48.30 mm^2/s；14 例胼胝体压部梗死患者病灶分布不均匀，DWI 呈高信号，ADC 呈低信号，表观扩散系数平均为 328.43±53.70 mm^2/s。两组 ADC 值差异无统计学意义（P=0.089）。
结论 可逆性胼胝体压部病变综合征和胼胝体压部梗死的表观扩散系数之间无显著差异，但稍低的表观扩散系数可辅助诊断，两者鉴别还需结合病灶位置及形态。

PU-0902
基于 LDH 值探讨终末期肾病继发性甲旁亢患者脑白质改变及认知相关性

吴旱秋,王龙胜
安徽医科大学第二附属医院

目的　采用一种新参数—局部弥散一致性（LDH）探讨终末期肾病继发性甲旁亢患者的脑白质改变。 方法　选取被确诊为终末期肾病并进行血液透析患者，根据是否伴有继发性甲旁亢分为两组：SHPT 组（25 例）与 Non-SHPT 组（25 例），利用 MoCA 功能量表评估认知功能；两组受检者均进行 MR 平扫及 DTI 扫描采集数据；对两组受检者全脑白质纤维的 LDH 值进行基于体素间的比较。　结果　两组间脑白质 LDH 值存在显著差异。SHPT 组较 Non-SHPT 组出现双侧大脑半球弥漫性、对称分布的 LDH 减低区，右侧小脑半球发现局灶性 LDH 减低区（P<0.01），LDH 值升高的区域集中在脑干及小脑。SHPT 组 MoCA 总评分与 iPTH 水平呈负相关，与受教育水平呈正相关（P 均<0.05）；MoCA 总评分与左侧皮质脊髓束的 LDH 值呈正相关（P<0.05）；iPTH 水平与差异脑区的 LDH 值无相关性（P>0.05）。　结论　LDH 值可以提供终末期肾病继发性甲旁亢患者脑白质局部弥散一致性信息，且这种改变和认知及临床指标具有相关性。

PU-0903
MRI 系统的设备性能比较探究

王灌忠
苏州大学附属第二医院

目的 评价郎润科技有限公司研制的 SuperVan 1.5T 磁共振成像系统的安全性和有效性。 **方法** 对 41 例合格的受试者（男 14，女 27），年龄 23.9~81.6 岁，平均 55.2 岁，分别使用 SuperVan 1.5T，Philips Achieva 1.5Nova Dual 给予同部位两次磁共振检查，比较两组所获得图像的影像学指标和两种设备安全性指标。 **结果** 两组检查图像在对比度和伪影上诊断结果是一致的，在解剖结构分辨率上尽管差别有统计学意义，但并不影响诊断结果。两种设备再开机事件和故障率上基本相同。 **结论** SuperVan 1.5T 磁共振和 Philips Achieva 1.5Nova Dual 在图像质量，临床有效性和安全性方面是相当的。

PU-0904
视网膜母细胞瘤的 MRI 预测筛板后视神经侵犯与广泛脉络膜侵犯研究

夏杰军,张靖
广州市妇女儿童医疗中心

【摘要】 **目的**　探讨视网膜母细胞瘤的 MRI 预测筛板后视神经侵犯与广泛脉络膜侵犯可行性和价值。 **方法**　回顾性分析自 2010 年 1 月至 2016 年 12 月间共 60 例患儿 64 只眼，患儿均临床诊断为 RB，术前均行增强磁共振检查，且在眼球摘除后病理明确诊断为 RB，且眼球摘除与磁共振检

查之间未曾化疗（包括经眼动脉灌注化疗）的患儿。记录患儿病史、IIRC 分期，磁共振和组织病理发现等。 **结果** 23 例 RB 患儿 23 只眼纳入研究，筛板视神经侵犯 6 眼（26%），筛板后视神经侵犯 6 眼（26%），广泛脉络膜侵犯 6 眼（26%），眼前节侵犯 0 眼，巩膜侵犯 0 例，巩膜外侵犯 0 例。磁共振预测筛板后视神经侵犯 的敏感度和特异度分别为 50%和 82%。磁共振预测广泛脉络膜侵犯的敏感度和特异度分别为 85%和 870%。

结论 MRI 是一个可靠的预测筛板后视神经侵犯与广泛脉络膜侵犯的方法。

磁共振弥散加权成像对良恶性腮腺肿瘤的鉴别价值

解婷
徐州医科大学附属医院

摘要 **目的** 分析磁共振(MR)弥散加权成像(DWI)对腮腺良恶性肿瘤鉴别诊断的价值。**方法** 回顾性分析 2015 年 1 月至 2019 年 5 月徐州医科大学附属医院诊治经病理证实的 46 例腮腺上皮性肿瘤患者资料，术前均行常规 MR 及 DWI 检查。测量病变的表观扩散系数(ADC)均值，采用 t 检验分分析腮腺上皮性肿瘤 ADC 值的差异，运用受试者工作特征(ROC)曲线评价 ADC 值的诊断价值。**结果** 良性肿块边界多清晰，以腺瘤和腺淋巴瘤最常见，T2WI 呈等信号或低信号，增强扫描显著强化；恶性肿瘤形态不规则，边界模糊，信号不均匀，增强扫描均匀或不规则强化，伴周围结构侵犯和颈部淋巴结肿大。良性腮腺肿瘤中腺淋巴瘤和良性淋巴上皮病变的 ADC 值均较低，其他良性肿瘤的 ADC 值较高，恶性肿瘤的 ADC 值多数介于两者之间，三组两两比较，差异均有统计学意义(均 P<0. 05)。以病理结果为对照，其敏感度为 81%，特异度为 89%，与病理结果行一致性检验。讨论：磁共振(MR)弥散加权成像(DWI)鉴别诊断腮腺良恶性上皮性肿瘤具有一定参考价值，值得临床推广应用。

西门子 1.5T MRI 在头颈部血管病变方面的应用

冯源源
南通瑞慈医院

[摘要]目的 探讨西门子 1.5T MRI 在头颈部血管病变方面的应用。**方法** 回顾我院 2012 年 9 月至 2018 年 6 月 238 例怀疑头颈部血管病变患者，进行 MRI 与 MRA 检查，分析其影像特点。**结果** 238 例中检出血管病变 57 例，其中动脉瘤 12 例，发育变异 16 例，动静脉畸形 2 例，狭窄或闭塞（斑块或血栓引起）25 例，海绵状血管瘤 2 例。**结论** MRA 对头颈部血管病变起到无创且有效的筛查价值。

PU-0907

磁共振在臂丛神经损伤诊断中的应用

任幕之
南通瑞慈医院扬州大学第四临床医学院

目的 探讨磁共振常规扫描序列与神经成像技术在臂丛神经损伤诊断中的应用。
方法 选取 2018 年 3 月至 2019 年 3 月期间对 18 例怀疑臂丛神经损伤患者作为观察组，进行磁共振扫描，其中男 10 例，女 8 例，年龄最小 22 岁，最大 54 岁。选取 20 例同期在本院行头颅磁共振检查患者，通过交流作为志愿者加入对照组，其中男 11 例，女 9 例，年龄最小 24 岁，最大 49 岁。
使用西门子 1.5T Avanto 磁共振设备进行检查，使用头颈联合线圈，指导患者取仰卧位，头部置入线圈内，使颈部正中矢状面中线与床面长轴保持一致。检查前告知患者使用腹式呼吸，尽量避免吞咽动作，也可使用饱和带以避免不自主吞咽带来的伪影影响。嘱患者肩部后伸并进行固定后，定位颈 6 椎体，对自颈 4 椎体上缘至胸 2 椎体下元、椎体前缘至椎管后缘进行扫描。使用常规 T1WI 轴位、T2WI 轴位、STIR/Long TE 冠状位，以及 DWIBS 序列轴位扫描。扫描结束后，将 STIR/Long TE 序列及 DWIBS 序列原始图像进行处理，通过多平面重建，最大密度投影等方式重建图像，交由经验丰富的诊断医生进行诊断分析。
结果 观察组受检者锁骨下神经、锁骨上神经、神经根、神经节在 STIR/Long TE 序列及 DWIBS 序列的显示率均低于对照组受检者。其中观察组 18 例在 STIR/Long TE 序列下显示锁骨下神经 8 例，锁骨上神经 7 例，神经根 6 例，神经节 8 例。在 DWIBS 序列序列下显示锁骨下神经 10 例，锁骨上神经 9 例，神经根 9 例，神经节 10 例。对照组 20 例在 STIR/Long TE 序列及 DWIBS 序列下对各神经显示率都为 100%。
结论 观察组 STIR/Long TE 序列及 DWIBS 序列对臂丛神经的显示率均低于对照组，STIR/Long TE 序列对臂丛神经的显示率低于 DWIBS 序列，可见神经成像诊断臂丛神经损伤的准确率较高，能为临床提供可靠依据。

PU-0908
RS-EPI 在正常人群三叉神经成像中的初步应用

徐俊峰,崔磊,尹剑兵,朱建峰,刘佳,姜洪标
南通市第一人民医院

【摘要】 **目的** 比较分段读出平面回波成像（RS-EPI）与单次激发平面回波成像（SS-EPI）对三叉神经（TGN）的成像质量，旨在满足诊断的前提下获得三叉神经的高分辨率 DTI 图像。**方法** 使用 3 组不同 b 值的 RS-EPI 及 SS-EPI 对 34 例健康志愿者进行三叉神经成像。对所得 DTI 图像进行主观评分，并计算信噪比（SNR）及对比噪声比（CNR），统计分析三组 b 值下两组 DTI 的主观及客观评价差异。**结果** RS-EPI 各组图像的优良率明显优于 SS-EPI 图像；两组图像质量评分差异有统计学意义（$P<0.0001$）。相同 b 值 SS-EPI 图像 SNR 均优于 RS-EPI（P 均<0.05）；而相同 b 值的两组序列 CNR 无明显差异（P 均>0.05）。**结论** 虽然 RS-EPI 各组 b 值 SNR 均低于 SS-EPI 图像，但 RS-EPI 的整体图像质量均优于对应组 SS-EPI，且图像伪影及扭曲变形等较 SS-EPI 少。使用 b 值 600 s/mm^{2}的 RS-EPI DTI 可获得三叉神经高分辨率图像。

PU-0909
RS-EPI DTI 对三叉神经定量参数测量的可重复性研究

徐俊峰,尹剑兵,朱建峰,何一舟,刘佳,崔磊
南通市第一人民医院

【摘要】 **目的** 使用 RS-EPI DTI 对正常人群三叉神经进行成像，分析 RS-EPI DTI 定量参数的稳定性及可重复性，旨在探讨不同 b 值 RS-EPI DTI 在三叉神经定量参数测量中的稳定性。
方法 对入组志愿者 33 人（共 66 侧）进行 RS-EPI DTI 及 T2WI 序列检查，其中 RS-EPI 中 b 值分别采取（0，300s/mm2）、（0，600s/mm2）、（0，900s/mm2）三组。A、B 两名观察者，结合 T2WI 图像，挑选三叉神经最大层面，在三组 b 值图像上分别勾勒感兴趣区域（region of interest，ROI），将所得 ROI 复制至表观扩散系数（apparent diffusion coefficient，ADC）图上，由软件自动计算得平均扩散率（mean diffusivities，MD），分别测量三次，取平均值作为研究对象的 MD 值；将 T2WI 及 RS-EPI DTI 图像融合，在所得融合图像上测量三叉神经的各向异性分数（fraction anisotropy，FA），取三次结果的平均值。 其中 B 观察者间隔两周后进行再次测量（记录为 B*）。
结果 本研究中，2 名测量者之间及同一测量者 2 次测量之间的 MD 值及 FA 值可重复性好（ICC 均＞0.4）；随着 b 值的增大，2 名观察者 3 次测量得到的 MD 值、FA 值均逐渐减小；A 与 B 两名观察者三次测量中，FA 值在三组 b 值间均无统计学差异（P 均＞0.05），而 MD 值在三组 b 值间均有统计学差异（P 均＜0.001）；各组的 MD 值、FA 值组内相关系数（ICC）也随 b 值的增大而逐渐降低。
结论 正常人群三叉神经不同 b 值的 RS-EPI DTI 的 MD 值及 FA 值组间及组内的一致性好；三叉神经 MD 值受 b 值大小的影响，b 值越小，MD 值及 FA 值越大；在不同 b 值扫描条件下，FA 值的稳定性较高。

PU-0910

血液病患者脑梗死的 MRI 分析

孙俊杰
天津市第三中心医院

目的 分析血液病患者伴发脑梗死的原因及 MRI 影像学表现，提高对血液病患者脑梗死的认识及诊断水平。
方法 回顾性分析我院 2010 年 04 月至 2015 年 11 月期间 36 例血液病脑梗死患者资料，分析受累血管、病变分布及磁共振信号的特点。
结果 血液病脑梗死患者中，12 例患者为单一动脉受累，24 例为多支动脉受累；31 例为脑内多发梗死灶，单发梗死灶仅 5 例。T2WI 病灶呈长或稍长 T2 信号，DWI 病灶呈高信号，增强扫描无强化或梗死灶边缘出现脑回样强化。
结论 MRI 诊断血液病脑梗死具有明显优势，MRI 对病变的发现、诊断具有重要价值，需要与血液病脑内早期感染及脑实质浸润等鉴别。血液病患者出现中枢神经系统症状，尤其脑梗死临床症状，首选 MRI 检查。

PU-0911

原发性干燥综合征患者发病早期海马功能连接改变的静息态功能 MRI 研究

李景利,赵琳茹,程悦,张晓东,沈文
天津市第一中心医院

目的 探讨原发性干燥综合征（pSS）患者早期海马功能连接（FC）的变化，并分析其与神经精神症状的相关性。

方法 于 2017 年至 2019 年间共招募 pSS 患者 38 名和健康被试 38 名，采用 3.0T MR 采集 T2 FLAIR 序列及全脑静息态功能成像数据。以双侧海马为感兴趣区，应用基于种子点的方法分别计算其与全脑其他体素的功能连接强度，将年龄、性别及受教育年限作为协变量，应用独立样本 t 检验做组间比较 FC 差异，结果应用蒙特卡洛模拟方式进行多重比较校正。根据 T2 FLAIR 图像对患者进行白质高信号分级（WMHIs）评分。所有被试完成脑认知（NCT-A/DST/视觉再生）及精神状态（HAMA/HAMD/FS-14）相关量表。采用 Spearman 相关分析评估海马功能连接强度与临床指标及神经精神量表的相关关系。

结果 与对照组相比，pSS 患者中左侧海马与右侧枕下回及右侧颞下回间 FC 减低，右侧海马与右侧枕下回、双侧枕中回及左侧颞中回间 FC 减低。在左侧海马与左侧壳核，右侧海马与右侧小脑后叶之间 FC 增强。右侧海马与右侧枕中回及枕下回间 FC 改变与视觉再生量表评分呈正相关，左侧海马与右侧右侧枕中回及枕下回间功能连接改变与 WMHIs 评分呈负相关。

结论 pSS 患者早期阶段的功能连接减低主要位于右侧海马和枕叶及颞叶皮层之间，提示海马功能连接的改变可能作为 pSS 患者早期发现脑功能改变和指导神经保护的潜在神经影像标记物。

PU-0912
应用磁共振血管成像研究脑后循环缺血者的功能性后交通动脉血流动力学

周围,陆敏茹,张嘉莉
南方医科大学顺德医院（佛山市顺德区第一人民医院）

【摘要】目的 应用相位对比磁共振血管成像（Phase contrast magnetic resonance angiography, PC MRA）定量研究脑后循环缺血（Posterior Circulation ischemia, PCI）患者的功能性后交通动脉（Functional Posterior Communicating Artery, F-PCoA）的血流动力学特征，探讨 F-PCoA 对脑前后循环间血流代偿的临床意义。**方法** 回顾性收集 51 例 PC MRA 资料，研究组为 26 例确诊 PCI 且存在 F-PCoA 者，对照组为 25 例临床排除 PCI（10 例存在 F-PCoA、15 例不存在 F-PCoA）。分析 F-PCoA 的亚型，记录 F-PCoA 的管径、截面积、平均流量、平均流速、血流方向、前向后绝对流量，以及基底动脉的血流动力学参数，进行统计分析。**结果** 共 36 例存在 F-PCoA，可分为 3 型：⑴F-PCoA 与解剖性后交通动脉（Anatomical Posterior Communicating Artery, A-PCoA）一致，占 83.3%（30/36），⑵F-PCoA 与 A-PCoA 不一致，占 13.9%（5/36），⑶混合型，一侧 F-PCoA 与 A-PCoA 一致但另一侧不一致，占 2.8%（1/36）。F-PCoA 亚型的构成比在 PCI 者与非 PCI 者间无显著差别。F-PCoA 的流速、流量曲线形态相似，在一个心动周期内可以表现为单向或双向血流。PCI 者 F-PCoA 的前向后绝对流量增加，血流曲线在收缩期有更明显的主波峰。**结论** PC MRA 可定量分析 F-PCoA 的血流动力学特征，F-PCoA 前向后绝对分流量可为临床 PCI 的诊疗提供重要的参考信息。

PU-0913
应用相位对比磁共振血管成像研究青中年血管性头痛患者的脑血流动力学特征

周围,陆敏茹,张嘉莉

南方医科大学顺德医院（佛山市顺德区第一人民医院）

【摘要】 目的 阐述应用相位对比磁共振血管成像研究青中年血管性头痛患者的脑血流动力学特征。**材料和方法** 回顾性分析年龄 30 至 50 岁，临床确诊血管性头痛者 16 例为研究组，年龄匹配的无诉头痛者 20 例为对照组，常规头颅磁共振成像检查、脑电图、心电图检查均未见异常。分别记录基底动脉、左颈内动脉、右颈内动脉的血管截面积、平均流量、最小流量、最大流量、平均流速、最小流速、最大流速、每搏流量、每搏流距，并计算流量峰高（最大流量－最小流量）、流速峰高（最大流速－最小流速）。 **结果** 研究组女性占比较高；研究组基底动脉的平均流量、最大流量、流量峰高、最小流速、最大流速、每搏流量等 6 个参数均大于对照组，差异有统计学意义；研究组左颈内动脉的平均流量、平均流速、最小流速、最大流速等 4 个参数均大于对照组，差异有统计学意义；右颈内动脉仅平均流速的差异有统计学意义。研究组部分病例（11/16 例）可见脑血管痉挛改变，但研究组和对照组的流量曲线与流速曲线的形态特征基本一致，无特异性诊断特征。**结论** 应用相位对比磁共振血管成像研究青中年头痛者的脑血流动力学特征，可能有助于为血管性头痛的诊断提供可靠的客观指标。基底动脉可能是检测血管性头痛较为敏感的理想靶血管。

Dissociative changes in gray matter volume following electroconvulsive therapy in major depressive disorder: a longitudinal structural magnetic resonance imaging study

Hui Xu[1,3], Feifei Luo[1], Yunsong Zheng[2], Ming Zhang[1]
1.the first affiliated hospital of Xi'an Jiaotong University
2.Affiliated Hospital of Shaanxi University of Traditional Chinese Medicine
3.University of Toronto

PurposeElectroconvulsive therapy (ECT), has become a widely applied potent treatment in clinical practice for major depressive disorder (MDD) over decades. However, due to its nonspecific and spatially unfocused nature,the underlying mechanisms of ECT remain unclear.

MethodsIn this longitudinal study, eleven patients with MDD underwent magnetic resonance imaging (MRI) before and after ECT at three different time points. A longitudinal voxel-based morphology approach was performed to characterize dynamic changes in brain gray matter volume (GMV). Twelve age- and sex-matched healthy controls were recruited to identify structural brain changes of patients with MDD before and after ECT.

ResultsThe brain GMV was globally found to increase shortly after a series of ECT, and then decrease one month after ECT treatment exposure. This fluctuating tendency was localized to the bilateral inferior parietal lobes, bilateral insula and right superior temporal cortex. Afterthe global GMVwas corrected, there were only significant global effect increases in GMV in the left anterior hippocampus and right caudate, which were both significantly correlated with the improvement of depression symptoms. However, one month after ECT treatments, there was still significantly reduced GMV following patients with MDD compared to healthy controls in the left

putamen, right anterior cingulate and leftinferior temporal cortex, which was observed before ECT.

ConclusionsThese findings indicate that ECT in patients with MDD is closely associated with dissociative structural changes. The locally enhanced GMV in limbic areas may reflect the ECT-related brain compensatory mechanisms contribute to brain structure recovery in MDD.

静息态功能磁共振成像在脑小血管病研究中的优化应用

王辉,张苗
首都医科大学宣武医院

目的 比较不同扫描参数和数据计算方法在脑小血管病的静息态 fMRI 研究中的应用价值。**方法** 对 11 例脑小血管病患者，一次性扫描两组不同时长的静息态 fMRI 数据 G1（近 7 分钟）和 G2(4 分钟)；对 11 例年龄、性别与患者匹配的健康正常志愿者，用另一台仪器和序列扫描一组静息 fMRI 数据 G3(6 分钟)。分别采用节点度的两种计算**方法** 度中心度（DC degree centrality）和加权度中心度（DCW degree centrality Weighted）得到三个被试组的六组 z 值化分布图（G1-DC、G1-DCW、G2-DC、G2-DCW、G3-DC、G3-DCW），使用配对 t 检验，比较患者组 G1-DC 与 G2-DC、G1-DCW 与 G2-DCW 的定量差别，使用两样本 t 检验比较 G1-DC 与 G3-DC、G2-DC 与 G3-DC、G1-DCW 与 G3-DCW、G2-DCW 与 G3-DCW，定性观察患者相对正常对照在不同扫描时长和计算方法下得到结果的差异。**结果** 患者不同扫描时长的两组图像 G1 和 G2，无论 DC 还是 DCW 计算得到的图像均无统计学差别；与正常对照组 G3 相比使用不同扫描时长（G1、G2）和不同计算方法（DC、DCW），都得到基本一致结果，患者节点度下降的脑区位于左顶内沟附近。**结论** 即便使用不同扫描仪器，4 分钟的优化扫描足以提取小血管病潜在的 fMRI 标志物，静息态 fMRI 节点度分析为小血管病的多中心研究提供了有力的支持。

PU-0916
颌面部肿瘤对颅神经外周段的影响的磁共振神经成像研究

吴绯红,吴文骏,王莉霞,孔祥泉,郑传胜
华中科技大学同济医学院附属协和医院

目的 探讨磁共振神经成像（MRN）显示颌面部肿瘤对颅神经外周段的影响的价值。
方法 收集 35 例志愿者及经病理证实为颌面部肿瘤的患者 44 例，在 3.0T 磁共振上以 3D SPACE STIR 序列进行颅神经外周段神经成像。获取志愿者常规平扫神经成像（conventional MRN, cMRN）及增强神经成像（contrast-enhanced MRN, ceMRN）图像的下牙槽神经、下颌骨骨髓、翼内肌、皮下脂肪、颌下腺腺体的信噪比（SNR）及背景噪声的标准差（σ_0），计算下牙槽神经相对其他组织的对比噪声比（CNR）及对比度（CR），由 3 名放射科医师对颅神经 10 对分支的显示程度进行 5 分法主观评分。对所有患者 ceMRN 图像的肿瘤与邻近外周神经的毗邻关系进行分类，包括分离、压迫、包绕、浸润和沿神经生长，并记录各类关系分别累及的颅神经外周段分支的数量。
结果 共 16 名志愿者进行了 cMRN 检查，cMRN 图像中的 SNR（下牙槽神经、下颌骨骨髓、翼内肌、皮下脂肪、颌下腺腺体）均高于 ceMRN 图像中所得，$P<0.05$。cMRN 图像中的 CNR（神经-下颌骨骨髓、神经-翼内肌、神经-皮下脂肪）均高于 ceMRN 图像中所得，$P<0.05$。cMRN 图像中的 CR（神经-下颌骨骨髓、神经-翼内肌、神经-颌下腺腺体）均低于 ceMRN 图像中所得，$P<0.05$。

3 名放射科医师间对 ceMRN 图像中颅神经的 10 对分支主观评分的一致性好，κ 值均＞0.8。在患者 ceMRN 图像中，肿瘤与神经分离关系 17 例，余共识别异常神经 63 支，其中 25 支神经被压迫，25 支神经被包绕，5 支神经被浸润，肿瘤沿神经生长 8 支。恶性肿瘤对外周神经常表现为压迫、包绕、浸润及沿神经生长，良性肿瘤常与外周神经表现为分离或压迫。

结论 以 3D SPACE STIR 序列作为颅神经外周段神经成像方式，可展示颌面部肿瘤与外周神经位置关系及肿瘤对神经的影响。

PU-0917
磁共振扩散峰度成像评估急性缺血性卒中大鼠的实验研究

程晓青
中国人民解放军东部战区总医院

扩散峰度成像（diffusional kurtosis imaging，DKI）是一个非高斯的水扩散测量方法。本研究主要是利用 DKI 技术评估缺血性卒中大鼠，评价 DKI 技术测量缺血半暗带的可行性和可靠性。

研究**方法** 将 25 只 SD 大鼠利用线栓法建立大脑中动脉缺血再灌注模型后，于造模后 90min 及再灌注后 2h 进行 DKI、DWI 等序列扫描，以 24h 后 T2WI 显示的高信号作为最终梗死范围。主要通过两种方法评估缺血半暗带：①一种方法是利用 DWI 评估通过测量闭塞后 ADC 图显示异常信号范围与再灌注 24 小时后 T2WI 显示的最终梗死范围不重叠的区域作为缺血半暗带；②利用 DKI 技术测量大鼠缺血再灌注后 MD 与 MK 的不匹配区作为缺血半暗带。

结果 21 只大鼠纳入本研究中。①造模后 90min，大鼠的 MD 与 MK 之间存在不匹配区（MD/MK 不匹配区的 MD 值为 0.58±0.1 um2/ms：MD/MK 不匹配区的 MK 值为 0.85±0.19）② 再灌注后 2h，大鼠 MD 异常面积缩小（27.81±15.68 mm2），MK 范围无明显变化（27.43±15.81 mm2），MD 损伤的范围缩小直至与 MK 范围基本一致。③ ADC（半暗带区）、ADC（核心区）、MD（MD/MK 不匹配区）、MD（MD/MK 一致区域）、MK（MD/MK 一致区域）的曲线下面积 AUC 分别为 0.902（0.766-0.973）、0.915（0.783-0.980）、1.000（0.912-1.000）、1.000（0.912-1.000）、1.000（0.912-1.000），指标均有显著的诊断效果（P＜0.001）。④指标 ADC 对半暗带区的诊断曲线下面积和指标 MK（MD/MK 不匹配区）的诊断曲线下面积差异有统计学意义（P＜0.05）。

研究**结论** DKI 技术能够有效的评估大鼠超急性脑梗死。ADC 对半暗带区的诊断效果优于指标 MK（MD/MK 不匹配区）的诊断效果。

PU-0918
2 型糖尿病患者大脑 ReHo 值及脑灰质体积改变相关性的功能磁共振研究

沈善昌,姜兴岳,王茹茹
滨州医学院附属医院

摘要：目的 应用基于体素的形态学测量(VBM)技术及 ReHo 值分析 2 型糖尿病（T2DM）患者和正常人大脑结构及功能异常的相关性。**方法** 采用西门子 Skyra 3.0T 磁共振对滨州医学院附属医院收治的 25 例 T2DM 患者和年龄、性别相当的 33 例正常人进行常规 MRI、脑部静息态 MRI 及 3D 全脑高分辨率解剖像扫描。通过处理静息态图像数据获得两组受试者的 ReHo 值并在 Matlab 上采用 SPM 软件包对全脑高分辨率解剖图像进行处理得到所有受试者的大脑灰质体积，然后对得到的实验组及对照组的所有受试者的 Reho 值及大脑灰质体积 **结果** 与正常对照组相比，糖尿病患者左侧海马区、左侧梭状回、左侧颞上回、左侧尾状核、右侧额上回、右侧额中回、右侧楔前叶及右顶叶区

Re Ho 值减低；左侧颞横回、左侧岛叶、左侧颞中回、右侧梭状回、右侧舌回、右侧枕叶及右侧扣带回 VBM 减低。 **结论** T2DM 患者大脑灰质体积变化的脑区域功能异常的脑区没有重叠，这说明糖尿病患者大脑灰质体积的变化与大脑功能的改变可能是相互独立的。

Differential impairment patterns of the corticospinal tract segments in alcohol dependence

Cun Zhang,Jiajia Zhu,Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Aims: Previous studies have reported inconsistent findings regarding corticospinal tract (CST) changes in alcohol dependence. Here, we aimed to clarify this issue by examining the micro-structural integrity differences of distinct CST segments between alcohol-dependent patients and healthy controls.
Methods: Diffusion tensor imaging was performed in a total of 39 male individuals, including 19 alcohol-dependent patients and 20 age-matched healthy controls. CST was reconstructed using tractography and was divided into inferior and superior segments at the level of the lateral sulcus. Multiple diffusion measures of each segment were compared between two groups.
Results: For the bilateral whole CSTs, no diffusion measures showed significant between-group differences. However, compared to healthy controls, alcohol-dependent patients exhibited decreased FA and increased RD in the left-superior segment, increased FA and decreased RD/MD in the left-inferior segment, increased AD/MD in the right-superior segment, decreased RD/MD in the right-inferior segment.
Conclusion: These findings suggest that CST impairments may vary with the fiber arrangement patterns of its segments in alcohol dependence.

PU-0920

区域动脉自旋标记技术 TASL 评估单侧大脑中动脉闭塞再通术后脑灌注情况

王心雨[1,2],王新怡[2],韩帅[1,2]
1.山东省第一医科大学
2.山东省千佛山医院

目的 探究区域性动脉自旋标记技术 TASL 在单侧大脑中动脉闭塞再通术后脑血流灌注显示情况，评估再通术后效果。
方法 纳入 16 例由 DSA 确诊单侧大脑中动脉闭塞患者，排除同侧颈内动脉及大脑前动脉病变，术后行 DSA 检查评估血管开通效果，并行区域性动脉自旋标记 TASL 成像检查，选择 3 根血管进行标记，分别为基底动脉及双侧颈内动脉；先在 MIP 图像上确定标记的血管，选择上下走行的一段，在横轴位图像上确定血管位置，扫描图像起始层在标记位置向上 25mm，延迟 1525ms。将 TASL 原始数据传输至 GE 工作站，采用 Functool 软件进行后处理：对平面回波成像 EPI 技术引起的图像变形进行校正，得到 CBF 参数图，由红色至蓝色表示，红色代表高灌注，提示再通术后效果良好；蓝色代

表低灌注，提示术后效果差。以 DSA 为金标准，术后管腔成形良好、远端血流通畅者为再通术后效果好；术后闭塞段仍未显影，远端血流不畅者为术后效果差。分别将 TASL 序列对开通效果的诊断结果与 DSA 检查结果对照，应用 MedCalc18.2.1 统计学软件分析，使用 Kappa 检验衡量 TASL 序列与 DSA 在诊断结果上的一致性。（＜0.40 一致性差，0.40-0.60 为具有一定的一致性、0.60-0.80 为高度一致性、0.81-1 为近乎完全一致性。）

结果　13 例单侧大脑中动脉闭塞患者中，DSA 诊断为开通术后效果良好患者 11 例，诊断为开通效果差患者 2 例。TASL 成像中 10 例患者术后同侧大脑中动脉分布区呈红色高灌注状态，诊断为开通术后效果好，3 例患者同侧大脑中动脉分布区呈蓝色低灌注状态，诊断为开通术后效果差者。与 DSA 的一致性对比中，TASL 的 Kappa 值为 0.755，提示两者具有高度一致性。

结论　TASL 是新发展的一种无需对比剂的 MR 灌注成像技术，可直观的显示单支血管血流分布及灌注情况，在诊断患者预后、指导临床治疗方案等具有重要意义，可在临床进行广泛推广。

PU-0921
DSC 灌注成像联合 DWI 在鉴别高级别脑胶质瘤假性进展和复发中的价值

景辉,张辉,谭艳,王效春
山西医科大学第一医院

【摘要】**目的**　探讨动态磁化率对比增强 MR 灌注成像（DSC-MRI）联合磁共振扩散加权成像（DWI）在鉴别高级别脑胶质瘤假性进展和复发中的价值。**方法**　回顾性分析本院 2014 年 1 月-2019 年 1 月高级别脑胶质瘤患者术后行放疗或联合替莫唑胺化疗后 1 月内 MRI 上出现新的强化病灶或强化范围扩大者 38 例，应用 DSC-MRI 分析病灶局部血流情况，应用 DWI 分析病灶局部组织弥散受限情况，评价两种方法联合在鉴别高级别脑胶质瘤假性进展和复发中的价值。**结果**　38 例患者中，经二次手术病理或随访 6 个月以上证实 20 例为假性进展，18 例为肿瘤复发，rCBF 值在两组病变区分别为 3.60±0.63 和 0.89±0.20，t = 51.32，组间差异均有统计学意义(P＜0. 05)。单纯应用 DSC-MRI、DWI 及二者联合正确诊断假性进展者分别为 9 例、12 例及 16 例。复发的表现：DSC-MRI 病变区呈高灌注,DWI 病变区弥散明显受限，假性进展的表现：DSC-MRI 病变区呈低灌注，DWI 病变区弥散未见明显受限。**结论** DSC-MRI 和 DWI 联合应用可更好地鉴别高级别脑胶质瘤假性进展和复发，具有重要的临床应用价值。

腰椎 MR 检查时脊柱外异常的发现率及临床意义

邓先波,马辉
华中科技大学同济医学院附属协和医院

目的　回顾性分析病人腰椎 MR 检查时脊柱外异常的出现率及临床意义。

材料及**方法**　因腰疼和（或）神经根症状行腰椎 MR 检查的 2500 例病人，由 1-2 名高年资放射医生复习每例病人脊柱 MR 检查时的图像，记录脊柱外异常，结合临床资料，确定其诊治与结果。

结果　2500 例腰椎 MR 检查中，198 例影像发现有脊柱外异常。178 例病人脊柱外的异常不能确定或有重要临床意义，需结合临床或进一步检查。发现腹主动脉瘤 4 例；腹主动脉周围淋巴结转移 2 例；直肠癌 3 例；肾自截 1 例；肾癌 1 例；前列腺癌 6 例；宫颈癌 3 例。有重要临床意义的出现率为 0.8%。

结论　腰椎 MR 检查时，除可以发现脊柱本身的病变外，还可以发现少量重要的脊柱外病变。

PU-0923

Brain functional substrates underlying decreased sleep efficiency in major depressive disorder

Cun Zhang,Jiajia Zhu,Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Aims: Poor sleep quality is one of the main symptoms in major depressive disorder (MDD). However, the neural substrates underlying poor sleep quality in MDD remain poorly understood.
Methods: Ninety-six patients with MDD underwent overnight polysomnography, resting-state functional magnetic resonance imaging (MRI) scans and then were classified into two groups: patients with poor sleep quality (sleep efficiency (SE) < 90%, n = 54), and patients without poor sleep quality (SE ≥ 90%, n = 42). Fractional amplitude of low-frequency fluctuation (fALFF) and functional connectivity (FC) were voxel-wisely compared between the two groups. Pearson correlation analyses and mediation analyses were used to investigate the associations of poor sleep quality with brain function and clinical symptoms severity in MDD patients. In addition, we compared the gray matter volume of regions with functional abnormalities between the two groups.
Results: Compared with patients without poor sleep quality, patients with poor sleep quality exhibited decreased fALFF in the right cuneus, right thalamus, and right middle temporal gyrus. There was also a decreased FC of right cuneus with right lateral temporal cortex (R-LTC). In MDD patients, the FC of right cuneus with R-LTC was positively correlated with the SE, negatively correlated with depressive and anxious severity, respectively. Moreover, mediation analysis revealed that the FC of right cuneus with R-LTC significantly mediated that the relationship between SE and clinical symptoms severity. There was no difference in the gray matter volume of regions with functional abnormalities between the two groups.
Conclusion: These findings suggest that the functional abnormalities of brain regions in MDD patients with poor sleep quality is independent of structural changes and, more important, that the decreased FC of right cuneus with R-LTC provides a neural basis for the association between depression and poor sleep quality.

PU-0924

多种磁共振成像参数与胶质母细胞瘤 P53，Ki67 表达量的相关性

周波,张伟国
陆军军医大学 大坪医院

目的 探究多种磁共振参数与胶质母细胞瘤（GBM）患者肿瘤内部 P53，Ki-76 基因表达量相关性。
方法 收集 2014.08-2017.09 在我院诊断为原发胶质母细胞瘤(GBM)患者 34 例，其中男性 21 例，女性 13 例；术前采用 Siemens Verio（1.5T/3.0T）磁共振成像仪进行图像采集，收集常规 T1 增强磁共振、动态对比增强磁共振成像（DCE-MRI）、动态磁敏感增强磁共振成像(DSC-MRI)，运用 3Dslicer 对图像中肿瘤坏死、强化、水肿区域进行分割，3D 重建后统计各区域体积、表面积参

数；对灌注磁共振图像后处理后选取容积转换常数（K^{trans}）、相对脑血容量（rCBV）、相对脑血流量（rCBF）；肿瘤组织切片后进行免疫组化染色，P53 阳性细胞数量低于或等于 10%为低表达，Ki67 阳性细胞数量低于或等于 20%为低表达。

结果 P53 高表达组表面规律性高于低表达组（P=0.002），ROC 分析肿瘤表面规律性能够反映 P53 表达（AUC=0.847，P=0.005），高表达组肿瘤体积小于低表达组（P=0.016），ROC 分析显示肿瘤体积能很好反映 P53 表达量（AUC=0.783，P=0.023），两组间 K^{trans}、rCBV、rCBF 没有显著差异。Ki67 高表达组水肿体积小于低表达组（P=0.012），ROC 分析显示水肿体积可以较好的反映肿瘤内 ki67 表达（AUC=0.746，P=0.016），两组间 K^{trans}、rCBV、rCBF 同样没有显著差异。

结论 表面规律性和肿瘤体积可以反映胶质母细胞瘤患者体内 P53 表达，水肿组织体积大小可以反映 Ki67 表达情况，为患者个性化治疗方案选择、疗效评价和预后评估提供重要依据，灌注磁共振成像（DCE，DSC）参数与 P53、Ki67 表达量间没有较好的相关性。

PU-0925
原发性中枢神经系统淋巴瘤(PCNSL) 与高级别胶质瘤(WHO III～IV 级)的 MRI 鉴别诊断

许若梅
山西医科大学第一医院

目的 探讨原发性中枢神经系统淋巴瘤(PCNSL)与高级别胶质瘤(WHO III～IV 级)的 MRI 影像特点。

方法 回顾性分析经手术病理证实为 PCNSL 和高级别胶质瘤各 10 例患者的 MRI 影像表现，患者均进行 MRI 平扫和增强扫描。

结果 大多数 PCNSL 病变均匀增强，强化形态可见多种多样；高级别胶质瘤病灶强化均欠均匀，存在明显的坏死，呈花环状、虫蚀状或斑片状强化；高级别胶质瘤部分病灶内可见囊变、坏死、出血征象；而 PCNSL 患者出血少见；两者病灶周缘均可见血管源性水肿存在，高级别胶质瘤的水肿程度较 PNSCL 的水肿程度高；PCNSL 组患者肿瘤实质 ADC 值明显低于 HGG 组。

结论 MRI 平扫及增强可以通过观察病灶部位、病灶内囊变坏死及出血情况，增强后表现等能够帮助鉴别原发性中枢神经系统淋巴瘤和高级别胶质瘤。

PU-0926
大鼠 MCAO 脑梗死后交叉性小脑神经机能联系不能的 DKI 评价

马桢,赵鑫,张小安
郑州大学第三附属医院河南省妇幼保健院

目的 观察大鼠大脑中动脉闭塞（MCAO）模型中 NMDA 的表达、细胞凋亡及对神经功能恢复的影响。应用扩散峰度成像（DKI）评价交叉性小脑神经机能联系不能（CCD），为临床治疗提供实验依据和理论依据。

材料与方法 建立大鼠 MCAO 模型，每 12 只大鼠随机分为对照组、6h 组、12h 组、24h 组、48h 组、7d 组、14d 组。在以上时间点对大鼠进行脑扫描，MRI 扫描后处死大鼠进行 HE 染色、免疫组化染色和 TUNEL 法，分别检测核心梗死区和小脑的 NMDA 表达，并分析 MRI 参数与 NMDA 关系。

结果 MCAO 大鼠的 MD、ADC 和 FA 值皆低于对照组，且对侧小脑的参数低于同侧小脑（$P<0.05$），于 12h 达最低值，MK 值则相反。NMDA 的表达呈上升趋势，高于对照组，24h 达到最大值（$P<0.05$），且对侧小脑高于同侧小脑。

结论 NMDA 可成为治疗 CCD 的新靶点，且 MRI 参数能预测 CCD 的发生发展。

PU-0927

Neuroanatomical substrates underlying contrast sensitivity

Ying Yang, Jiajia Zhu, Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Background: Contrast sensitivity (CS), a measurement of the ability to discriminate an object from its background, is an essential domain of visual function. CS decline or impairment indicates one's disability to discern an object in low contrast, which has been related to poor performance in driving, face recognition, real-world mobility tasks, postural stability, reading processes, and other functions of everyday life. Aging or lesions in the eye (including the retina) as well as in thalamic or cortical locations are usually responsible for this decline or impairment. There is evidence that CS deficits are associated with several neurological and psychiatric disorders, such as Alzheimer's disease, Parkinson's disease and depression. Previous studies in animals have suggested that lesions in medial posterior thalamus and striate cortex significantly depress CS. However, whether neuroanatomical substrates are underlying CS in humans is largely unknown.

Methods: High-resolution magnetic resonance imaging data of 100 healthy young subjects (46 males) from the Human Connectome Project (HCP) dataset were used to calculate gray matter volume (GMV). These participants are healthy young adults without documented history of major psychiatric, neurological or physical disorders and within a restricted age range of 22-36 years, which corresponds to a period after the completion of significant neurodevelopment and before the onset of neurodegenerative changes. CS was assessed using the Mars Contrast Sensitivity Test. CS was assessed using the Mars Contrast Sensitivity Test. This test is a brief, valid and reliable measure that improves upon the traditional Pelli-Robson measure. The Mars test presents 48 letters of the same size, but each letter decreases in contrast by 0.04 log unit across and down the chart. The test stops when the participant makes two consecutive errors. The final score (Mars_Final) is the log contrast sensitivity of the last correct letter, minus 0.04 for any mistakes that precede the two consecutive errors. The current norms recommend by Mars Letter Contrast Sensitivity Test USER MANUAL (http://www.marsperceptrix.com) are as follows: 0.04-0.48 represents a profound loss; 0.52-1.00 a severe loss; 1.04-1.48 a moderate loss; 1.52-1.76 normal (age > 60 years); 1.72-1.92 normal middle/young adult (age between 18 and 60 years). A multiple regression analysis was used to investigate the relationship between CS and GMV in a voxel-wise manner within the whole gray matter.

Results: The range of Mars_Final scores for the 100 participants was from 1.08-1.88. Among them, one score was 1.08 (a moderate loss), 10 scores were within 1.52-1.72 (normal > age 60 years), and the remaining 89 scores were within 1.72-1.92 (normal middle/young adult). In the voxel-wise whole gray matter analysis, we found significant positive correlations (cluster-level $P < 0.05$, FWE corrected; a minimum cluster size of 1013 voxels) between the Mars_Final scores and the GMV in the

bilateral visual cortex (left: cluster size = 1109, peak MNI coordinates x/y/z = -20.5/-88.5/38.5, peak T = 4.3, partial correlation coefficient [pr] = 0.429, P < 0.001; right: cluster size = 1699, peak MNI coordinates x/y/z = 24.5/-88.5/32.5, peak T = 5.0, pr = 0.467, P < 0.001). To rule out the potential confounds due to covariates such as age, gender and visual acuity, we repeated the partial correlation analyses controlling for these additional covariates and found that the positive correlations between the Mars_Final scores and the GMV in the bilateral visual cortex remained significant (left: pr = 0.434, P < 0.001; right: pr = 0.450, P < 0.001). Precisely, the significant bilateral clusters were mainly located in bilateral V3A, with the superior parts extending to the bilateral posterior parietal cortex according to the Human PALS-12 atlas.

Conclusions: In conclusion, we found an association between contrast sensitivity and morphology in the V3A and adjacent posterior parietal cortex, suggesting the critical role of the dorsal visual stream in contrast sensitivity processing. These findings may provide insights into the neuroanatomical mechanism of contrast sensitivity and its relation to some brain disorders.

PU-0928

NODDI 在帕金森病早期诊断中的研究进展

刘伟星
新疆医科大学第二附属医院

帕金森病（PD）是最常见的神经系统变形性疾病，典型的 PD 病理表现为黑质致密部（SNpc）中多巴胺能神经元变性的纹状体多巴胺能耗竭，但这些不能完全解释 PD 产生的临床的临床症状，目前 PD 的发病原因及机制尚不明确，尚未建立系统的早期诊断及保护治疗方式。磁共振成像(MRI)是一种很好的非侵入性活体脑评估工具。然而，常规 MRI 的空间分辨率最多只有几毫米，而大脑中微观神经组织的评估需要亚微米级的分辨率。因此，扩散磁共振成像(DMRI)被用来解决水分子在组织中扩散的微米级位移和评价神经组织的微观结构。在 dMRI 定位的组织中，水分子位移受组织中屏障(细胞膜和髓鞘)的方向、通透性和数量，以及神经元、树突、轴突、神经丝和微管中细胞内蛋白质和细胞器的差异的强烈影响。因此，dMRI 可以间接推断这些屏障和细胞器的微观结构。而今年来逐步发展起来的神经突方向分散度和密度成像（Neurite orienttation dispersion and density imaging，NODDI）对脑白质微观结构的研究更具有敏感性，它还为帕金森病早期诊断提供了一种新方法。本文对 NODDI 新技术的一些基本成像原理及在帕金森病的研究进展做以综述。

PU-0929

基于体素分析的动脉自旋标记技术在血液透析伴不宁腿综合征脑血流量的研究

王昊,王振常
首都医科大学附属北京友谊医院

目的 血液透析导致的不宁腿综合征(HD-RLS)与神经功能、血脑屏障和铁沉积改变有关，从而影响大脑代谢和灌注。本研究采用三维动脉旋转标记技术（ASL）来识别血液透析伴不宁腿综合征相关的灌注模式和与疾病严重程度的潜在关系。

方法 纳入 26 名 HD-RLS 患者、30 名无不宁腿综合征（HD-nRLS）的血液透析患者和 30 名年龄、性别和教育相匹配的健康对照组。应用单因素协方差分析和 post-hoc 分析用于评估三组受试者的 CBF 值、人口统计学和临床数据的差异。应用 Pearson 相关分析评估在 HD-RLS 组中 CBF 值和临床数据之间的相关性。
结果 与 HD-rRLS 患者相比，HD-RLS 患者的右侧初级运动皮层（中央前回）CBF 值增加（[FDR 校正，P<0.05）。与正常对照组相比，两个 HD 亚组（即伴或不伴 RLS 的亚组）的 CBF 变化一致，包括左内侧额上回和双侧丘脑 CBF 增加，左岛叶皮质 CBF 降低（FDR 校正，P<0.05）。
结论 感觉运动皮质和基底神经节的过度灌注可能与 HD 患者的 RLS 发病机制有关，可能为进一步阐述不安腿综合征的发病机制提供研究基础。

PU-0930

高分辨率磁共振成像评估皮肤癌浸润深度

郎思远
广西医科大学第一附属医院

目的 高分辨率磁共振成像评估皮肤癌浸润深度
方法 患者术前应用 3.0T 磁共振高分辨率成像技术对病灶行常规扫描，层厚为 1.5mm，层间距为 0，FOV128mm×128mm，对病灶部位进行常规 T1WI、T2WI 及增强扫描。扫描后，由具备资深经验的医师，找到病灶显示最大肿瘤浸润深度层面，从肿瘤浸润最深点到肿瘤最突出点的垂线距离为测量深度值。扩大切除术后，将原发灶标本制片后镜下找到病灶阳性边缘，测量肿瘤病理浸润深度。
结果 患者女，77 岁，左下颌肿块，表面溃疡，活检病理示高分化鳞状细胞癌，影像表现示：左下颌骨下角见类圆形肿物，信号均匀，边界清，大小约 2.26cm×1.63cm，浸润深度约为 1.84cm，突破浅筋膜层累及颈阔肌，未见肿大淋巴结及转移征象。根据影像学检查结果，拟行 0.5cm 安全切缘扩大切除术，术后病理明确阳性切缘后，测量病灶大小约 2.17cm×1.49cm，浸润深度约 1.75cm。磁共振术前测量浸润深度与术后实际差值约 0.11cm，小于安全切缘，术后半年随访，未见复发。可以认为磁共振术前测量肿瘤浸润深度与临床大体标本检测无明显性差异。据报道，特别是那些仅接受手术治疗的病人经常发生局部复发，这被认为是由于在进行 SCC 手术时，外科医生仅凭触诊就确定了手术切除的深缘。因此，为提高 SCC 治疗效果，有必要对肿瘤进行术前初步评估其浸润深度的检查；磁共振成像在软组织分辨率方面有很大优势，可通过多轴位、多序列及增强扫描来更好地显示肿瘤侵及情况。该例患者磁共振检查可清楚显示病灶浸润深度及累及情况，增强扫描更好的显示病灶血供及与邻近血管关系。
结论 磁共振并非皮肤癌术前常规检查，其软组织分辨率高，对皮肤癌肿瘤检出率高，能够更精准的确定原发灶切除范围，具有更高的可靠性及术前判断性。磁共振术前评估皮肤鳞状细胞癌浸入深度有一定的价值，可为正确的手术方案的制定提供参考。

颅内动脉 MR 高分辨率管壁成像新进展和应用体会

张建军,陈尧,曹海安,王瑞琳,谢梅,翟利浩
浙江医院

脑血管病在我国的发病率逐年上升，已成为严重威胁国民健康的危险因素。CTA、MRA、DSA 在脑血管病的诊断中发挥着重要作用，但无法显示分支小血管结构、缺乏对血管壁结构的分析。脑血管病的转归与血管壁重构及斑块性质密切相关，因此，获得脑血管及其小分支的管壁结构或斑块特征性影像信息，对明确病变部位和发病原因具有直观及可靠的证据。高分辨率 MRI 是目前唯一无创性对动脉管壁结构进行成像及分析的影像学技术。**目的** 结合本院临床应用情况，探讨 MR 高分辨率管壁成像诊断颅内动脉病变的敏感性和特异性。**方法** 收集我院 2018.12—2019.06 进行 MR 高分辨率管壁成像患者共 32 例，成像技术包括 2D T1WI、2D T2WI、2D 质子加权成像、T1 SPACE、3D TOF。以 DSA 作为金标准。**结果** MRI 提示大脑中动脉 M1 段病变 15 例（46.8%），M2 段病变 5 例（15.6%）；基底动脉病变 15 例（46.8%），左侧椎动脉颅内段病变 8 例（25.0%），右侧椎动脉颅内段病变 7 例（21.9%）。其中轻度狭窄 10 例（31.3%），中度狭窄 18 例（56.3%），重度狭窄和闭塞 17 例（53.2%），动脉瘤 5 例（15.6%），基底动脉夹层 1 例（3.1%）。与 DSA 结果对比，MR 敏感性 100%，特异性 93.8%。**结论** MR 高分辨率动脉管壁成像能够准确显示颅内动脉各级分支管壁结构，并能显示斑块特征，为脑血管病变明确病因和定位诊断提供精准影像依据。

PU-0932

全身黑色素瘤的 CT 及 MRI 诊断

彭娟,吕发金,李咏梅
重庆医科大学附属第一医院

目的 探讨全身黑色素瘤的 C T 及 MRI 表现，提高影像学诊断及鉴别诊断水平。**方法** 回顾性分析我院经病理学证实的 131 例黑色素瘤患者的临床资料，女性 65 人，男性 66 人，年龄 14~88 岁，平均年龄 59.3 岁。原发性黑色素瘤 123 例，转移性黑色素瘤 5 例，原发部位不明确的黑色素瘤 3 例。其中 70 例患者有 CT 或 MRI 检查资料，涉及全身多个部位，总结上述黑色素瘤的 C T 及 MRI 表现，并与文献对比。**结果**（1）皮肤恶性黑色素瘤共 21 例：头皮（2 例）、面部皮肤（3 例）、胸壁（2 例）、腹壁（2 例）、臀部（1 例）、上肢（5 例）、下肢（6 例），其中 CT 检查 15 例，MRI 检查 6 例。（2）非皮肤恶性黑色素瘤共 49 例，主要累及眼球及不同部位的粘膜：包括鼻腔 16 例，眼 7 例，口腔 2 例，颅内 3 例，胃肠道 9 例，泌尿生殖道 5 例，胸腔 2 例，腹腔 5 例；其中 CT 检查 29 例，MRI 检查 20 例。（3）形态、部位：皮肤恶性黑色素瘤形态不规则，与皮肤粘连，表面可见黑色素痣；13 例鼻腔病灶发生在单侧，3 例累及双侧鼻腔，主要表现为沿着鼻腔生长的不规则形软组织肿块，3 例邻近骨质吸收伴部分破坏；眼部病灶发生于脉络膜 5 例，结膜 2 例，呈蘑菇状或不规则形；颅内 2 例为多发，1 例为单发病灶，病灶位于皮髓质交界区或软脑膜下结节、肿块影；（4）CT、MRI 特点：CT 平扫稍高密度结节或肿块 41 例，稍低密度 3 例；黑色素型（T1WI 高信号，T2WI 低信号）11 例，非黑色素型（T1WI 低/等信号，T2WI 高/等信号）9 例，出血型（T1WI 高信号，T2WI 高信号）2 例，混合型 4 例；病灶多为轻中度强化，胃肠道粘膜来源恶性黑色素瘤明显强化；均匀强化 29 例，不均匀强化 41 例。**结论** 黑色素瘤的 CT 及 M R I 表现具有一定特征性，综合分析能提高影像诊断准确率；部分病灶表现不典型，诊断需依靠病理检查。早期诊断及鉴别诊断对临床治疗及判断预后有重要价值。

MTC 技术在胎儿头部磁共振检查中的应用

艾光勇
重庆医科大学附属第二医院

目的 探讨 MTC（磁化传递对比）技术在胎儿头部磁共振检查中的应用价值 **方法** 前瞻性收集 20 例临床怀疑头部有病变的胎儿，在常规 MRI 检查的基础上行 T2WI+MTC 序列检查。最后，分别比较常规序列与 T2WI+MTC 序列脑脊液-脑实质的对比噪声比（CNR=SI1-SI2/SD），并对得出的结果进行两两配对 t 检验。同时，由 2 名高年资 MRI 诊断医生采用双盲法对图像进行对比分析，得出结论。**结果** 20 例胎儿中，11 例为侧脑室增宽；1 例为胼胝体发育不良者；1 例为脉络膜囊肿；4 例为正常。两类序列均可显示病变。常规 T2WI 的 CNR 值为 16.85±4.33，T2WI+MTC 序列的 CNR 值为 29.65±5.05，后者的 CNR 值均高于常规序列。且（t=6.9，p<0.01）,差异具有显著统计学意义。**结论** MTC 技术在胎儿头部磁共振检查中具有肯定的价值，能够在常规序列基础上提供新对比的图像，便于脑室的显示，提供更清晰的灰白质对比，突出病灶的显示，从而能够提升诊断的准确性和可靠性。

PU-0934
三点 DIXON 技术在颈部增强磁共振检查中的应用

艾光勇
重庆医科大学附属第二医院

目的 探讨 DIXON 技术在颈部增强磁共振检查中的应用价值.
方法 收集 20 例， 行 MRI 颈部增强磁共振检查的患者，在增强序列中， SOG 方位上分别用三点法 DIXON 与 FS 两种方式进行成像 . 选颈部脂肪最后的层面，测量脂肪信号强度，用于评价两者脂肪抑制效果 . 对两组测量值行两两配对 t 检验
结果 20 例病例中,以 FS 压脂的信号测值为 19.24±6.44; 以三点法 DIXON 压脂的信号测值为 9.94±3.21
结论 三点法 DIXON 对脂肪的抑制效果相比于 FS 压脂效果要好许多，在颈部 MRI 增强检查中可以有效的发挥脂肪抑制作用，可以突出显示病灶，由于其自身原理的不同其抑脂效果对磁场均匀性的要求比 FS 低，故可用于颈部增强 MRI 替代 FS.

PU-0935
探讨磁共振全脊柱拼接和常规脊柱序列对诊断脊柱及椎管内病变的敏感性

张斌[1]，吴雨萌[1]
1.上海交通大学附属儿童医院
2.上海交通大学附属儿童医院

目的 探讨磁共振全脊柱拼接序列在儿童脊柱及椎管内脊髓疾病诊断中的价值，并与常规分段脊柱序列进行比较，探讨其是否可代替或作为补充扫描序列。**方法** 收集 2018 年 6 月至今，使用 Philips Ingenia 3.0 T 超导磁共振仪对我院 30 例疑有椎体/椎管内病变的患儿进行全脊柱磁共振扫描，序列分别为 T1WI、T2WI、T2-stir 及 DWI。**结果** 1、脊髓肿瘤 10 例（髓内肿瘤 3 例，髓外硬膜下肿 7 例），脊髓侧弯 8 例，椎管内囊肿 5 例，脊髓炎症 5 例，脊髓空洞 2 例。2、常规序列能清晰显示椎管内病变形态范围，尤其可以鉴别 T2WI 统一为高信号的病变性质。3、5 例脊髓炎在常规序列 T2 上呈异常高号，而全脊椎拼接序列上显示不清。4、全脊柱拼接序列更能直观的显示 8 例侧弯的位置、方向及程度，对骨科早期干预治疗意义重大。**结论** 全脊柱序列诊断脊柱侧弯优于常规序列；而常规序列对诊断椎体上或椎管内病变的敏感性高于全脊椎序列，对椎管内肿瘤定性具有显著价值。

PU-0936
腮腺嗜酸细胞瘤的 MRI 表现（附 1 例报告及文献复习）

赵益晶,杨丽彬,刘建宜,曹代荣
福建医科大学附属第一医院

目的 分析腮腺嗜酸细胞瘤的 MRI 表现，以提高诊断能力。
方法 回顾性分析 1 例经手术病理证实的腮腺嗜酸细胞瘤的临床资料及 MRI 表现，并做文献复习，总结其影像特点。
结果 本例患者为 72 岁男性，无吸烟史，发现左腮腺区肿物 4 年余，查体质地稍硬，活动性良好，触及稍疼痛。MRI 上表现为左侧腮腺下极椭圆形实性肿块，大小约 2.1cm×1.2cm，边界清楚，T1WI 呈等信号，T2WI 呈等信号，弥散加权成（DWI）呈高信号，rADC=0.9(rADC=肿瘤 ADC/正常腮腺 ADC)，动态增强曲线为速升速降型。
结论 腮腺嗜酸细胞瘤的 MRI 表现具有一定特征性，T2WI 呈等信号、rADC<1 及动态增强曲线为速升速降型，支持腮腺嗜酸细胞瘤的诊断。

PU-0937
乳腺癌脑转移的 MRI 特征及 MRI 序列优化的价值分析

邵华,贾文霄,姜磊
新疆医科大学第一附属医院

目的 探讨乳腺癌脑转移的磁共振成像（Magnetic resonance imaging，MRI）特征及 MRI 序列优化的价值。**方法** 选择 2015 年 4 月至 2017 年 10 月我院接诊的 40 例乳腺癌脑转移患者为研究对象，均行 MRI 常规扫描和 MRI 序列优化扫描，记录乳腺癌脑转移 MRI 特征以及各序列病灶检出情况，对比优化扫描方案与常规扫描方案的扫描时间。**结果** 40 例乳腺癌患者中多发转移 31 例，单发转移 9 例；伴坏死、囊变 33 例，出血 7 例；MRI 各序列共检出 355 个病灶，病灶周围无水肿 87 个（24.51%），有水肿 268 例（75.49%）；幕下病灶占 16.90%（60/355），幕上病灶占 83.10%（295/355）；脑膜转移 6 例，颅骨转移 3 例；增强 T_1加权成像（T_1-Weighted imaging，T_1WI）检出率高于、T_2液体衰减反转恢复（T_2Fluidattenuated inversion recovery，T_2FLAIR）、扩散加权成像(Diffusion Weighted Imaging，DWI)、T_1WI、T_2加权成像（T_1-Weighted imaging，T_2WI），差异具有统计学意义（$P<0.05$）；肿瘤实质信号为不均匀性，T1WI 平扫多为等或低信号，T_2FLAIR、DWI、T_2WI 病灶多为等或高信号；强化方式：环形强化占 11.55%（41/355），结节型强化 62.25%（221/355），混合型强化为 26.20%（93/355）；常规方案平均扫描时间为（638.21±10.46）s，优化方案扫描时间为（575.32±7.52）s，差异具有统计学意义（$P<0.05$）。**结论** 乳腺癌脑转移以多发转移较为常见，多伴坏死、囊变，多发生于幕上转移，强化方式以结节型强化为主，肿瘤实质信号为不均匀性；MRI 序列优化能缩短扫描时间，提高脑转移瘤检出率。

PU-0938

Prevalence, CMR Characteristics and Outcomes of Hypertrophic Cardiomyopathy with Restrictive Phenotype

Shuang Li[1], Bailing Wu[1,2], Gang Yin[1], Lei Song[1], Yong Jiang[1], Jinghan Huang[1], Shihua Zhao[1], Minjie Lu[1]
1. Fuwai Hospital, Chinese Academy of Medical Sciences
2. The Second Hospital of Hebei Medical University

Purpose Previous reports indicated that there was a subgroup of HCM defined by restrictive filling and reduced diastolic volumes. The aim was to investigate the prevalence, clinical significance, CMR characteristics and outcomes of hypertrophic cardiomyopathy (HCM) with restrictive phenotype. **Materials and Methods** A total of 2592 consecutive patients with HCM were evaluated to identify individuals who fulfilled the diagnostic criteria of restrictive phenotype. 34 patients of HCM with restrictive phenotype were retrospectively enrolled. 34 age and gender matched patients with non-obstructive HCM were randomly selected from the rest of the other HCM patients as the control group. The left and right atria diameter were 55.4±4.8 mm and 61.4±8.7 mm, which were significantly larger than those of the controls ($p < 0.001$); The cardiac index, and the left heart ejection fraction of patients with restrictive phenotype were all significantly lower than those of the controls ($p < 0.001$). The late gadolinium enhancement(LGE) volume fraction was 23.3±11.4 in restrictive phenotype group, which were significantly higher than controls (15.2±10.2, $p=0.023$). The 72-month event-free survival from any cause of death, cardiac transplantation was 60.5% in HCM with restrictive phenotype, compared with 94.4% in control group for a 91-month follow-up. **Conclusions** Restrictive phenotype is a special subtype of HCM. The CMR features of this phenotype includemild-to-moderateleft ventricular hypertrophy, severely enlarged atria, normal or small ventricles,moderate myocardial fibrosis and pericardial effusion. These patients have severe clinical symptoms and poor prognosis.

PU-0939
心脏磁共振对肥厚型心肌病患者是否合并房颤的左室形态及功能差异的研究

徐敏
哈医大一院

目的 探究应用心脏磁共振评估肥厚型心肌病合并房颤患者的左室结构及功能参数改变。
方法 收集在我院接受 1.5T 心脏磁共振检查并确诊为的肥厚型心肌病的 78 位患者，根据有无房颤发生，分为房颤组（n=14）及非房颤组（n=64），比较两组患者代表左室结构及功能的多个磁共振参数。
结果 房颤患者的左房前后径、年龄、钆对比延迟强化百分比显著高于无房颤的肥厚型心肌病患者（p(0.05），房颤患者的左室射血分数、左室峰值充盈率显著低于无房颤患者（p(0.05），两组之间的 LVESV/BSA、LVEDV/BSA、SV、CO、LVM、LVEDD、LASID 没有显著差异（p(0.05）。
结论 肥厚型心肌病合并房颤患者的左室峰值充盈率、左室射血分数减低，合并房颤患者的年龄及左房前后径、钆对比延迟强化百分比升高。

PU-0940

CE-MRA 3D_Tricks 序列在诊断脊髓血管畸形中的应用

刘远成
贵州省人民医院

目的 脊髓血管畸形是一种先天性脊髓血管病变，系先天性脊髓血管在发育上的异常或畸形，占脊髓占位性病变 3%-11%。发病年龄以青年和中年人多见，脊髓血管畸虽然少见，但致残率高，临床表现不典型，常发生漏诊、误诊，如能得到早期诊断和根治手术，许多病人可以获得较好的效果。DSA 对血管性病变分辨率较高，可以选择性插管进入各节段脊髓供血动脉显示畸形血管，是脊髓血管检查的金标准，但 DSA 为有创检查、辐射大、造影剂用量多、检查复杂、禁忌症及并发症多。我院利用 GE 3.0T MRI 3D_Tricks 序列（three-dimensiona time-resolved imaging of contrast kinetics）进行参数优化，该序列采用椭圆中心 K 空间采集 4 倍于外周 K 空间采集的方法成倍提高 CE-MRA 的时间分辨率(2～6 s)而不影响图像的质量，时间分辨率快可把动静脉各期图像分开，避免重叠，在短时间（90s）内动态连续采集 20 期血管图像，同时图像质量能够得到保证，能观察到细小的血管，多期观察，清晰显示正常血管及畸形血管。且为无创、无辐射，安全可靠的一种血管检查技术。

方法 选取临床或常规 MRI 检查怀疑血管畸形患者 11 例，行 3D_Tricks 序列脊髓 MRA 检查，然后行 MPR 及 MIP 血管重建。同时均在 1-3 天内行 DSA 检查，对比分析 MRA 与 DSA 结果。

结果 DSA 诊断 9 例血管畸形，2 例正常；MRA 诊断 9 例血管畸形，2 例无血管畸形；与 DSA 比较，9 例血管畸形中 MRA 可以准确判断血管畸形供血动脉及漏口，与 DSA 具有较好一致性。

结论 CE-MRA 3D_Tricks 序列与 DSA 对脊髓血管畸形诊断均具有较高的一致检出率，且 CE-MRA 可准确、无创、无辐射、快速清晰的显示脊髓血管畸形的供血动脉及漏口，在诊断脊髓血管畸形、术后随访等方面有重要价值。

PU-0941

The role of multiparametric cardiac MR in monitoring myocardium lymphoma infiltration evolution

Shenglei Shu, Jing Wang, Xiangquan Kong, Chuansheng Zheng
Department of radiology, Union hospital of Tongji Medical Collge, Huazhong University of Science and Technolgy

Objective: To investigate the value of Native T1 and T2 value derived from cardiac MR imaging in monitoring therapeutic evolution to chemotherapy in a patient with lymphoma infiltration of left ventricular wall.

Methods: One patient with lymphoma infiltration of mid segment of ventricular wall proven by intrathoracic biopsy was consecutively followed and monitored by multiparametric cardiac MR imaging from October 2016 to April 2017. During this period, the patient had taken five times of clinical symptom assessment and MR imaging. (21th October 2016, 7th December 2016, 28th December 2016, 8th February 2017 and 7th March 2017). Cardiac MR was performed using a 1.5T system (MAGNETON Aera, Siemens, Erlangen, Germany) with a multiparametric scan including conventional T1, T2 weighted morphology imaging, cine sequences and T1 T2mapping scan. Native T1 and T2 values of infiltration region and unaffected septum were acquired, the strain parameters were also obtained based on cine images. Clinical condition of this patient was consecutively evaluated

simultaneously at the time of imaging. The change of parameters derived from multi sequences of each time were evaluated and the relation to disease condition was analyzed.

Results: The patient showed evident relive in second follow-up but great rebound at the time of third examination due to severe side effects to new antitumor drugs, the condition returned to stability by reduced dose which remained until last follow-up. Native T1 and T2 values of infiltrated region showed irregular fluctuation during following, but the ratios to the value of septum showed same trend with illness condition change (ratio of T1 value between tumor region and septum: 1.229, 1.164, 1.223, 1.133, 1.156; ratio of T2 value between tumor region and septum: 1.568, 1.462, 1.550, 1.352, 1.192). Strain parameters in all three directions showed no evident change pattern no matter in global or segmental level.

Conclusion: Multiparametric cardiac MR imaging can play a useful role in evaluating and monitoring lymphoma affect ventricular wall evolution, especially by tissue characteristic parameters including native T1 and T2 values.

PU-0942

Diagnostic Value of T1 Mappiing and ECV for tissue characterization of cardiac masses

Jing Wang,Shenglei Shu,Xiangquan Kong,Chuansheng Zheng
Department of Radiology, Union hospital, Tongji Medical College of Huazhong University of Science and Technology

Objective: This study aimed to evaluate the diagnostic value of CMR for evaluating cardiac masses using multiple techniques including CINE, T1W-TSE, T2-STIR, T1 and T2 mapping, and late gadolinium enhancement (LGE) sequences.

Method: A total of 10 patients were recruited between June and Oct 2016 and were diagnosed with a cardiac mass using routine trans-thoracic echocardiography; their diagnoses were confirmed by post-operative histopathology or extra-cardiac biopsy. CMR was performed using a 1.5T system including protocols CINE, T1W-TSE, T2-STIR, T1 mapping (pre and post contrast to calculate ECV), T2 mapping, and LGE.

Result: The 10 patients in this study had the following diagnoses: 2 thrombi, 6 benign tumors (4 myxoma,1 lipoma, and 1 leiomyoma) and 2 malignant tumors (1 metastasis and 1 lymphoma). Morphologically, thrombi were smaller, more homogeneous, and more immobile than tumors. Malignant tumors, especially metastases, demonstrated a larger size than benign tumors. Chronic thrombi exhibited isointense or hypointense signal on T1W-TSE and T2-STIR images, but lipoma and myxoma tended to be hyperintense on T2-STIR images. LGE was more common in tumors than in thrombi. LGE phenomenon was also more common in malignant than benign tumors. Compared to the myocardium, we observed significantly higher native T1 and T2 values in cardiac myxomas. T1 values of the cardiac lipoma were significantly lower than that of the myocardium. Chronic thrombi showed intermediate short T1 values. Using histology as the gold standard, CMR demonstrated an accuracy of 98% in distinguishing benign from malignant tumors.

Conclusion: Although transthoracic echocardiography is useful in initial evaluation for screening, CMR provides additional information about the morphology, location, and

extent of a cardiac neoplasm.CMR features demonstrated a high accuracy in differentiating benign from malignant tumors and can also be helpful in distinguishing thrombi from tumors. T1 and T2 mapping of masses may assist in tissue characterization, particularly in myxomas, lipoma, and thrombi. CMR plays an important role in characterizing the three-dimensional extent and tissue attachment of cardiac masses, which can help plan the surgical approach aimed at either complete removal or palliative debulking of a tumor mass.

MRI 评估原发性扩张型心肌病患者心室功能

顾敏,李康
中国科学院大学重庆医院（重庆市人民医院）

目的　研究核磁共振检查(MRI)评估原发性扩张型心肌病(IDCM)患者心室功能中的效果。
方法　回顾性分析 85 例 IDCM 患者资料，根据心功能分级标准分为Ⅰ-Ⅱ级(n=20)、Ⅲ级(n=35)和Ⅳ级(n=30)，分析 MRI 与二维超声(2DE）评价心室功能价值。
结果　85 例 IDCM 患者均存在左右心室不同程度扩张，以左侧心室扩张为主，MRI 检查中，36 例左心扩大，左室多呈球形，室壁厚度变薄，49 例双侧心室扩大，心肌运动弥漫性减弱；2DE 检查所有患者均显示全心扩大，56 例以左心室扩大为主，室间隔及左室后壁厚度变薄，室壁运动弥漫性减弱；随着 IDCM 患者心功能分级增高，MRI 检查的 LVEDV、LVESV 逐渐升高，LVSV、LVEF、LVPER、LVPFP 逐渐降低，不同等级差异显著(P<0.05)；2DE 检查的 LVESV 逐渐升高，LVEF 逐渐降低，不同等级患者间差异显著(P<0.05)；2DE 与 MRI 检查在室间隔、前壁、后壁厚度的测量上无显著性差异(P>0.05)，在侧壁与心尖部厚度检查中差异显著(P<0.05)。
结论　2DE 与 MRI 均可有效评估 IDCM 患者心室功能，但 2DE 易低估左心室容积、重复性差，而 MRI 则可提供更多左心室功能、容积等参数，可重复性高，评估心脏功能和心室壁厚度更加准确，临床应用价值更高。

中国人心室功能正常参数的 MRI 研究

徐晶,庄白燕,李爽,尹刚,杨新令,赵世华,陆敏杰
中国医学科学院阜外医院

目的 使用 MRI 测量中国正常成人左右心室功能参数。**方法**　纳入 200 名年龄在 20-70 岁的正常志愿者，按照性别分为两组，每组 100 名，每组中再按年龄每十岁分为一个亚组，每组共 5 个亚组，每亚组内 20 名。无线矢量心电门控下，采用单次激发半傅立叶快速自旋回拨与真实稳态自由进动序列，分别获得标准心脏各长轴及短轴切面二维体层及电影图像。由两名医师独立进行心功能后处理分析，获得包括左室射血分数（EF）及心肌质量（Mass）,左右心室舒张末容积（EDV）、收缩末容积（ESV）等心功能参数。使用 SPSS 软件进行统计学分析。**结果**　男性和女性正常志愿者左室 Mass、右室 EF、EDV、ESV 有显著差异（P<0.05），而左室 EF、EDV、ESV 无明显差异；经 BSA 标准化后，两组左室 EDV、ESV、Mass，右室 ESV、SV 有明显差异，而右室 EDV 差异不大。**结论**　心功能参数随年龄、性别和 BSA 的差异而规律性发生改变，对三个变量统一化评估，可以早起识别心功能异常。

PU-0945
探讨心脏磁共振成像在致心律失常心肌病诊断中的应用价值

许玲
安徽医科大学第二附属医院

【摘要】 **目的** 回顾性分析致心律失常心肌病的心脏磁共振成像(CMR)表现，探讨 CMR 在其诊断中的应用价值。**方法** 搜集 2016 年 7 月-2018 年 6 月在我院行 CMR 检查并诊断为致心律失常心肌病患者 20 例。从心脏形态结构(心肌脂肪浸润、房室大小)、功能(室壁运动功能)、心肌组织学特性等方面对心室受累程度进行分析。**结果** 20 例患者，双室受累 9 例，单纯右室受累 6 例，单纯左室受累 5 例。双室受累组 9 例中，均表现为右室流出道增宽、左右室壁变薄、左右室壁收缩运动减低，7 例左室腔扩大，出现右室壁心肌脂肪浸润、延迟强化均为 5 例，左室壁心肌脂肪浸润、延迟强化均为 7 例；单纯右室受累组 6 例均表现为右室流出道扩张，右室腔扩大及室壁收缩运动减低，2 例右室壁心肌脂肪浸润，4 例表现为右室壁与心外膜脂肪分界不清；单纯左室受累组均表现为左室壁变薄或偏薄、不同程度左室壁或室间隔脂肪浸润及延迟强化，4 例左室腔扩大。**结论** CMR 检查在致心律失常性心肌病诊断中具有重要应用价值，能较好评估心室受累情况。左心室是否受累不能用于 ARVC 病程判断，右心室受累 ARVC 患者主要表现为右心室腔扩大、室壁变薄及不同程度右室流出道扩张，而左心室受累 ARVC 主要表现为特征性左心室心肌脂肪浸润及延迟强化。

PU-0946
Early detection of myocardial fibrosis by CMR extracellular volume fraction quantitation in a hypertensive swine model

Baiyan Zhuang,Chen Cui,Minjie Lu,Shihua Zhao
fuwai hospital

Background: The mechanism of left ventricular hypertrophy (LVH) in the setting of hypertension is currently thought to be an adaptive hypertrophy of cardiomyocytes in response to hypertension. However, recent studies have shown that extracellular interstitial fibrosis, which can be detected by extracellular volume (ECV) fraction on CMR, also plays an important role in LVH.
Aim: To quantitatively evaluate the dynamic changes of ECV in normal and hypertensive pigs over time and determine whether ECV quantification by cardiac magnetic resonance (CMR) can demonstrate left ventricle (LV) extracellular interstitial fibrosis in a hypertensive (HTN) swine model. To determine the significance of extracellular interstitial fibrosis in left ventricular remodeling and hypertrophy secondary to hypertension.
Methods: Ten adult male Chinese miniature pigs aged 6-12 months were divided into two groups: 7 pigs were in the hypertensive (HTN) group and 3 pigs were in the normal control group. Both groups of pigs underwent cardiac MR imaging before and 1week, 1 month, 3 months, 6 months after induction of hypertension in the HTN group. The systolic and diastolic pressure of HTN group was gradually increased from 111.20/68.00 mmHg to 167.67/109.33mmHg. ECV quantification was prospectively performed in both

groups at all imaging time points. Systolic function of the left ventricle (LV) was calculated from the cine images. Individual and segmental ECV were compared to the late gadolinium enhancement (LGE) images. Histopathologic examination of the heart was performed after sacrifice.

Results: The control group ECV was 24.21±4.0%. The mean ECV fraction was higher in the HTN model group than the control group ECV fraction at 3 months (25.79±5.81; p=0.009) and 6 months (26.88±4.87;p=0.019). The LGE of both HTN and NC groups were all negative. There were no differences between the HTN group and control group in terms of LV ejection fraction (mean, 61.38±6.64 vs 63.67±4.51; P =0 .99).
Conclusion: ECV fraction calculation from CMR imaging can identify LV abnormalities secondary to myocardial fibrosis at an early stage in a HTN model before LGE abnormalities are evident. As the hypertensive disease progresses, the ECV fraction increases.

Multi-parametric cardiac magnetic resonance for detecting extensive skeletal muscle and subclinical myocardial involvement in immune-mediated necrotising myopathy

Lu Huang,Peijun Zhao,Liming Xia
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Aims Immune-mediated necrotising myopathy (IMNM) is distinct from the other forms of idiopathic inflammatory myopathy (IIM), and may be associated with high risk of cardiac involvement hence poor prognosis. The aim of the study is to investigate the extent of skeletal muscle and subclinical myocardial involvement in IMNM patients using multi-parametric cardiac magnetic resonance (CMR), in comparison with other IIM subgroups.
Methods Fifteen IMNM patients (age 46±14 year, 17 female), twenty-seven polymyositis (PM) patients (age 41±16 years, 13 female), five dermatomyositis (DM) patients (age 35±22 year, 4 female), and ten age and gender matched healthy volunteer were enrolled in this study. All the patients underwent clinical, serological, and CMR assessment. The ventricular function and strain was evaluated by the short-axis and 4-chamber cine MRI. Native T1/T2 mapping were performed, and post-contrast T1 mapping and LGE were acquired after injection of contrast agent. Extracellular volume (ECV) was calculated in both myocardium and four thoracic skeletal muscle groups present in the CMR field of view.

Results Myocardial native T1/T2 and ECV, in IMNM patients compared to PM, DM patients and controls (P<0.05 for all). The percentage of LGE-positive segment in IMNM patients was markedly higher than that of the PM group (P=0.008). Compared to PM and DM patients, skeletal muscle ECV was also significantly elevated in patients with IMNM (P ＜0.05 for all), but native T1/T2 of skeletal muscle showed no significant difference. Patients with anti-SRP IMNM had significantly increased myocardial and skeletal muscle T2 value and ECV (P<0.05 for all) compared to seronegative subgroup. Skeletal muscle ECV showed significant correlation with myocardial ECV (rho=0.521, P< 0.001) and blood hs cTnI (rho=0.517, P< 0.001), respectively.
Conclusion Compared to other IIM, patients with IMNM have more extensive skeletal muscle and subclinical myocardial involvement. Within the IMNM group, patients with anti-SRP positive have more severe skeletal muscle and myocardial involvement. IMNM patients need more attention and intensive treatment than other IIM.

4D Flow MRI 在血管疾病的应用

周晶晶,龚良庚
南昌大学第二附属医院

4D Flow MRI 是一种沿时间编码的三维三方向的非侵入性成像技术，可以通过流线图、矢量图及粒子图等可视化及量化血管血流动力学特征，同时也能准确测量血流速度、血流方向、血管壁面剪切应力（WSS）、脉搏波传导速度（PWV）及能量损耗等重要参数。4D Flow MRI 可用于评估不同组织区域血管正常及异常的血流动力学特征，并可能成为早期预测血管类疾病的诊断方法。本文旨在对 4D Flow MRI 在血管疾病的应用进行综述，评估 4D Flow MRI 在血管疾病的诊断及预后价值。

CMR 在暴发性心肌炎短期随访研究

朱慧,李浩杰,夏黎明
华中科技大学同济医学院附属同济医院

目的 探讨 CMR 在识别及监测暴发性心肌炎患者心肌炎性损伤价值。
材料与方法 19 例临床诊断暴发性心肌炎患者在急性期及随访三个月在 3.0 MR 进行 CMR 扫描，纳入 19 例正常志愿者作为对照组。扫描序列包括心脏电影，T2WI，延迟强化。
结果 急性期患者左室心肌质量指数及室间隔厚度明显增加，慢性期恢复正常。与急性期相比，暴发性心肌炎愈合期心肌水肿率及 LGE 质量明显减低。疾病组心肌应变值均低于对照组。在鉴别急性与慢性心肌炎，心肌水肿率及 LGE 质量诊断效能较高，AUC 分别为 0.884 与 0.809。
结论 CMR 较准确识别及监测暴发性心肌炎患者心肌炎性损伤，心肌水肿率及 LGE 质量鉴别急性期与愈合期心肌炎效能较高。

一项评估心脏 MR 多参数在评估重度 AS 患者左心室重构过程中心肌整体及局部功能的初步研究

谭泽焜
广东省人民医院

目的 利用心脏 MR 多参数评估重度 AS 患者左心室重构过程中心肌形态、组织特征及功能的改变，并进一步探讨各参数在左室心室底部、中部及心尖部水平是否有差异性及相关性，以期评估心脏 MR 多参数在定性及定量化评价重度 AS 患者心肌重构过程中的应用价值。
方法 选取符合入组标准的 31 例重度 AS 患者和 20 例无症状对照组作为对照组，分别行心脏磁共振常规序列、电影序列及改良 MOLLI T1 mapping 序列扫描，并对电影图像进行心肌 Strain 后处理分析。比较重度 AS 组及无症状对照组常规心功能指标、T1 mapping 全心肌参数（ECV）及 Strain 全心肌长轴应力参数（GLS）的差异性，并进一步对 T1 mapping（$ECV_{1、2、3}$）及 Strain（$LS_{1、2、3}$）参数进行局部分析，分别比较其在心室底部、中部及心尖部水平表达的差异性。最后分析 ECV 及 GLS 间、以及 ECV、GLS 与心室重构指标 LVEDMi 间的相关性。
结果 重度 AS 组 LVEDMi、GLS 和与无症状对照组间差异有统计学意义（t=-11.26，-5.639，$p<0.05$）;而 ECV 值并未表现出显著差异性。在心室底部、中部及心尖部水平上，各 LS 值均表现出显著差异，并显示出从心室底部至心尖部数值依次递增的规律，其值如下，$LS_{1、2、3}$（-18.20±4.31，-16.93±4.42，-14.34±5.25，$p<0.001$）。然而 ECV 值只在中部和底部表现出统计学差异（$p<0.05$）。ECV 值、GLS 值与左心室心肌质量指数之间均有良好相关性。
结论 心脏 MR 多参数可无创性评估重度 AS 引起的左心室重构过程中心肌形态、组织特征及功能的改变。重度 AS 左心室重构过程中不仅整体心肌形态及功能发生改变，而且其在不同心室水平间也有着显著差异。对于重度 AS 患者，心尖部心肌长轴应变参数也许会有助于对其进行功能评估和风险分层，进而可对临床进行早期决策治疗提供指导意见。

心脏磁共振 Mapping 技术定量评估免疫介导型肌病亚临床心脏损伤的研究

赵培君,黄璐,冉玲平,唐大中,夏黎明
华中科技大学同济医学院附属同济医院

研究目的 在免疫介导型肌病中，心脏损伤往往提示预后不良。传统心脏磁共振 T2 加权和延迟增强成像可以检出心脏局灶性水肿、坏死和纤维化，但其在弥漫性心脏损伤中的诊断价值有限。本研究旨在应用心脏磁共振 Mapping 定量技术检测出免疫介导型肌病的亚临床心脏损伤。
研究对象和方法 收集 2016.1-2018.12 在我院行心脏磁共振成像的免疫介导型肌病患者 40 例。排除 10 例出现心肌局灶性延迟强化的患者。另外，收集 25 例健康对照组。测量所有入试者左心室整体心肌 T1、T2 值和细胞外体积分数（ECV）。
结果 一共 30 例免疫介导型肌病患者和 25 例健康对照组纳入本研究中。健康对照组和 IMM 患者组之间的左心室容积及功能参数无显著统计学差异（$p> 0.05$）。与健康对照组相比，左心室整体心肌 T1、T2 值和细胞外体积分数均显著升高（$p <0.05$）。
结论 心脏磁共振 Mapping 心肌定量技术可以早期检出免疫介导型肌病亚临床心肌损伤。

PU-0952

临床检查技术评估免疫介导型肌病亚临床心脏损伤的初步对比研究

赵培君,黄璐,冉玲平,唐大中,夏黎明
华中科技大学同济医学院附属同济医院

研究目的 免疫介导型肌病合并心脏损伤会增加肌病患者死亡率，因此心脏损伤的早期筛查至关重要。十二导联心电图及超声心动图是临床筛查免疫介导型肌病患者心脏损伤的常规检查方法，但均存在一定的局限性。心脏磁共振成像不仅可以准确评估心脏形态及功能，而且能表征心肌组织学改变，如心肌坏死或纤维化等。我们旨在评估 与传统检测方法相比，心脏磁共振成像诊断免疫介导型肌病心脏损伤的准确性。
研究对象和方法 收集 2016.1-2018.12 在我院行心脏磁共振成像的免疫介导型肌病患者，并整理分析所有患者临床病史、十二导联心电图、超声心动图及心脏磁共振影像 资料。
结果 40 例免疫介导型肌病患者入组。免疫介导型肌病患者心电图异常率为 47.5%； 超声心动图异常率为 20%；心脏磁共振成像异常率为 52.5%。其中，10 例（25%）患者出现了局灶性坏死或纤维化。
结论 免疫介导型肌病心脏损伤的异常率较高。较超声心动图，心脏磁共振成像除能准确评估心脏形态学功能学之外，还能够提供额外的组织学信息，即心肌局灶性坏死或纤维化，对心脏损伤的早期诊断及预后评估具有一定的意义，可作为临床免疫介导型肌病心脏损伤的常规筛查方法。

PU-0953
压缩感知技术在儿童心脏磁共振中的应用研究

许华燕,郭应坤
四川大学华西第二医院

目的 儿童心脏病患者具有无法闭气，心率高等特点，常规电影序列可能存在伪影重、心动周期检测不全等局限性。压缩感知电影技术具有成像速度快、无需闭气等优势。因此本研究将评价压缩感知技术在无法闭气儿科患者心脏磁共振电影序列中的应用。
方法 前瞻性纳入 2019 年 4 月到 2019 年 8 月在我院就诊的心脏疾病患者共 30 例，所有患者均行常规的心脏磁共振电影序列及基于压缩感知的心脏电影序列。对两组序列进行心功能测定及图像质量评分，评价基于压缩感知技术的心脏电影序列在儿科患者中的应用价值。
结果 患者年龄范围为 2-15 岁，其中 17 例年龄大于 7 岁；10 例患者在屏气时进行常规电影扫描，20 例患者自由呼吸状态下进行常规电影序列扫描；所有患者的压缩感知电影序列均在自由呼吸状态下采集。后处理软件处理常规电影序列及压缩感知电影序列得到心脏功能参数，进行相关性分析发现，两种技术方法所获的心功能参数具有极好的相关性（EDV：r=0.989，p=0.000；ESV：r=0.988,p=0.000; SV=0.986,p=0.000; EF=0.842,p=0.004; CO=0.805，p=0.09）；Bland-Altman 分析发现，两种技术方式具有较好的一致性。图像质量评分发现，自由呼吸状态下扫描的常规电影序列图像质量差于压缩感知序列，存在呼吸及心脏搏动伪影；但屏气状态下扫描的常规电影图像质量优于压缩感知电影图像。压缩感知电影扫描完全心的平均扫描时间为 10-20s，而常规电影扫描时间为 60-120s.
结论 基于压缩感知的电影序列可以明显缩短扫描时间，同时能在自由呼吸状态下获得较好的图像质量，其与常规电影序列所测量的心功能参数一致性较好。但对于能够屏气扫描的患儿，仍然推荐使用屏气扫描。

T1Mapping 序列对肥厚型心肌病(HCM)心肌纤维化的应用初探

林青
1.华中阜外医院
2.河南省人民医院

目的 探讨 T1Mapping 序列对肥厚型心肌病(HCM)心肌纤维化的应用。
方法 按诊断标准入选 40 例 HCM 患者和 25 名健康志愿者，分别行 T1mapping 成像和常规延迟强化(LGE) 检查，按 HCM LGE 有无及程度，分为 LGE 远处正常区、LGE 边缘区、LGE 区(分为晕状 LGE 与斑片状 LGE)，并按照（AHA）分段法分析左心室心肌 16 个心肌节段（心尖部除外），统计分析各个节段 LGE 程度。测量各节段 T1mapping 值。
结果 40 例患者 LGE 节段共有 384 个，LGE 边缘区节段共有 130 个，LGE 远处正常区节段 126 个。LGE 斑片状强化节段的 T1Mapping 值为 1333.5±109.2ms，LGE 晕状强化节段的 T1Mapping 值为 1280.5±109.2ms，LGE 边缘区 T1Mapping 值为 1202.4±69.8ms，LGE 远处正常区 T1Mapping 值为 1180.5±57.6ms。25 例志愿者无一 LGE 节段，其 T1Mapping 值为 1176.3±59.8ms。远处正常区(1180.5±57.6ms)与 LGE 周边区、晕状区及斑片区比较差异均有统计学意义（t 值分别为 17.52、18.35 和 52.14，P 值均<0. 01)；LGE 晕状区与斑片区比较差异有统计学意义（p<0.01)；LGE 周边区与 LGE 晕状区和斑片区比较差异均有统计学意义(t 值分别为 3.71 和 36.80，P 值均<0. 01)。LGE 远处正常区与对照组无统计学意义（p＞0.05）。
结论 T1Mapping 序列可以定量对肥厚型心肌病(HCM)心肌纤维化的程度分析，尤其是对早期纤维化的评估。

Fabry 病 MRI 个案报道

李帆,卓丽华
绵阳市第三人民医院/四川省精神卫生中心

目的 探讨 Fabry 病 MRI 表现。
方法 回顾性分析经临床综合诊断为 Fabry 病的 1 例个案心脏 MRI 表现，MRI 采用平扫+增强+延迟扫描+血清检测。
结果 患者男、60 岁，体检发现心电图：房性早搏、电轴左偏、I、avL 见病理性 Q 波，考虑急性非 ST 段抬高型心肌梗死，血清α-半乳糖苷酶减低，嘱冠脉造影患者拒绝，为进一步诊治收入我院行心脏 MR 增强扫描示：左房面积 27.14，右房面积 17.52，室间隔、左室下壁、前壁及前侧壁基底段和心尖段室壁增厚，较厚处约 25.4mm 位于室间隔，左室下侧壁变薄，上述室壁运动幅度减低，主动脉瓣、二尖瓣可见反流信号，延迟扫描：左室下侧壁、下壁基底段-中段、各壁心尖可见肌壁间及心外膜下延迟强化，左室功能 LVEF34%（减低），合并肾功能不全、心脏病家族史及血清α-半乳糖苷酶减低，综上考虑 Fabry 病诊断明确。
结论 小结：Fabry 病是罕见单基因遗传病，心脏受累为主要致死原因，影像表现为：左室下侧壁基底段-中段心外膜下/肌壁间延迟强化阳性、NativeT1 值减低，确诊需要α-半乳糖苷酶检测和基因检测，早期诊断和早期使用酶替代疗法可明显改善预后。

CMR 在铁沉积所致心肌病的应用

彭鹏
广西医科大学第一附属医院

铁过载在遗传性血色素病、地中海贫血、镰状细胞贫血、再生障碍性贫血、骨髓增生异常综合征等患者中常有发生，其中铁沉积所致的心肌纤维化及心内膜炎最终形成心力衰竭是患者最主要的死亡原因之一。及时诊断，加强去铁治疗，不仅可以预防心肌铁沉积的发生还可以逆转早期铁沉积导致的纤维化。
利用 CMR-T2*的方法定量铁沉积是一种准确、无创且可重复的检查方法。这种方法可以明确心肌铁沉积的程度，使临床早期诊断心肌铁过载成为了可能，进而制定个性化的祛铁治疗方案，同时还可以动态评价祛铁治疗疗效，及时修改治疗方案。
CMR 还可以对心肌铁沉积患者进行心功能分析，评估是否出现心功能异常。患者出现 临床症状或心血管体征时，此时心铁过载已经十分严重，容易急速发展成心力衰竭。此时即使再加强去铁治疗，预后仍然不良。如果在临床前期诊断心肌铁沉积，加强去铁治疗，往往可以逆转病情。
CMR-T2*和心功能分析的缺陷是不能了解心肌组织病变情况。特别是当患者经过去铁治疗心肌 T2*值恢复正常后，是否存在心肌纤维化？是否还需继续治疗？使用 T1-mapping 技术测量铁过载患者心肌 ECV，可能可以了解其纤维化程度。进而指导临床祛铁治疗方案的制定。

Left Atrial Phasic Function Assessed by Feature Tracking CMR in Type 2 Diabetes Mellitus Patients with Preserved LVEF

Mengting Shen[1],Zhigang Yang[1],Yingkun Guo[2]
1.West China Hospital，Sichuan University， China
2.West China Second Hospital， Sichuan University

Background T2DM patients are associated with LA function abnormalities. The value of FT-CMR derived strain parameters in T2DM patients is unclear. Thus, we aim to assess left atrial (LA) phasic function in T2DM patients with preserved LVEF by using feature tracking-cardiovascular magnetic resonance (FT-CMR) imaging.
Methods One hundred consecutive patients diagnosed with T2DM and 20 age- and sex-matched controls underwent CMR imaging were prospectively enrolled. LA phasic functions were quantified by emptying fractional and CMR FT-derived strain and strain rate. εsand SRs, εeand SRe, εa and SRa were measured reflecting LA reservoir, conduit, and pump function, respectively.
ResultsLA reservoir, conduit function reflected by strains and strain rates were decreased in T2DM than controls. However, LA pump strain and strain rate were numerically higher than controls. The ROC analysis showed superiority of strain parameters (AUC of εs: 0.852, εe: 0.802, $p < 0.001$ for both) than traditional LAEF parameters (AUC of total LAEF: 0.671, $p = 0.014$; passive LAEF: 0.642, $p = 0.042$) to differentiate T2DM from controls. Multivariate linear regression analysis showed age was independent determinant of εs (β = - 0.248, $p = 0.018$) and εe (β = - 0.247, $p = 0.021$), DM duration and LV global longitudinal strain (GLS) were independent determinants of εe (DM duration: β = - 0.229 $p = 0.035$; LV GLS: β = - 0.298, $p = 0.002$) and εa (DM duration: β = 0.238 $p = 0.034$; LV GLS: β = 0.231, $p = 0.013$).
ConclusionsAside from LA pump function, LA reservoir and conduit function determined on FT-CMR are impaired in T2DM patients compared with controls regardless of LA size. FT-CMR derived strain parameters are superior in differentiating T2DM from controls. Phasic measurement of LA function using FT-CMR may add important information in clinical decisions.

血流储备分数为参考评价磁共振心肌灌注成像准确性的 Meta 分析

林铭霞,莫绪凯,梁建业,刘伊勇,黄家喜,史长征*
暨南大学附属第一医院

目的 应用 Meta 分析的方法评价以血流储备分数（FFR）为参考，磁共振心肌灌注成像（MR-MPI）在诊断冠心病准确性中的价值。
方法 检索以 FFR 诊断为金标准，MR-MPI 诊断冠心病的文献，提取符合纳入标准的诊断试验数据。运用 Meta-disc1.4 和 STATA12.0 软件进行统计分析：包括异质性检验、发表偏倚检测等，合

并汇总敏感度(SEN)、特异度(SPE)、95%可信区间(95%CI)，绘制出受试者工作特性曲线(SROC)同时计算其曲线下面积(AUC)。

结果 本研究最终纳入文献 24 篇，评价了 1529 例患者和 4535 支血管。在患者水平汇总的敏感度和特异度分别为 0.88(0.85，0.90)、0.87(0.84，0.89)，在血管水平汇总的敏感度和特异度分别为 0.81(0.78，0.83)、0.89(0.88，0.90)，患者水平、血管水平对应的 AUC 分别为 0.93、0.92。

结论 以 FFR 为参考，MR-MPI 在诊断冠心病时敏感度及特异度较高，诊断能力强。

PU-0960

Evaluation of Cardiac Structure and Function in Patients with Chronic Mountain Sickness by 3.0TMRI

Chunlong Yan[1],Xianlong Qi[1],Guibo Tang[2],Guocai Yang[2],Hui Xu[2],Ning Zheng[1]
1.Jining No.1 People's Hospital
2.Qinghai Provincial People's Hospital

Abstract:Objective:To evaluate the cardiac structure and function parameters of patients with chronic high altitude sickness (CMS) and healthy normal by cardiac magnetic resonance imaging (CMRI), and to evaluate the changes in cardiac structure and function of patients with CMS. Methods: The CMRI imaging data of 20 patients with chronic high altitude disease were retrospectively analyzed. Another 20 healthy people were selected as the control group. The 3.0T MRI instrument was used to measure and analyze the two groups of cardiac structure and functional parameters.cardiac structure parameters:AWOIVS,LVEDD,LAD,AOD,MPAD,RVOTD,RATD, RALD, RVTD and RVLD; left ventricular function parameters: LVEDV,LVESV, LVSVand LVEF; right heart Functional parameters: RVEDV,RVESV,RVSV,RVEF andRVMM. An independent sample t test was used to measure whether the difference between the two groups was statistically significant.Results: 1.The left and right ventricular structural parameters of the CMS group were larger than the control group, The difference between AWOIVS, MPAD, RVOTD,RALD and RVLD was statistically significant ($p<0.05$).2.In the left ventricular cardiac function parameters, the values of LVEDV and LVESV in the CMS group were larger than those in the control group, and the LVSV and LVEF values were smaller than those in the control group. There was no statistically significant difference in parameters between the two groups ($p>0.05$). 3. In the right ventricular cardiac function parameters, the RVEDV, RVESV and RVMM values in the CMS group were larger than those in the control group, and RVMM values were statistically significant between the two groups ($p<0.05$); RVSV and RVEF values in CMS group were lower than those in the control group, and RVSV and RVEF values were statistically significant between the two groups ($p<0.05$). Conclusion: CMRI can accurately evaluate the cardiac structure and function of patients with CMS. The heart structure and function of CMS patients have changed. The right heart structure and function change are the main factors, which will cause pulmonary hypertension,right heart enlargement, right ventricular outflow tract widened, right ventricular hypertrophy, AWOIVS thickening, right heart function decreased, and no significant effect on left heart structure and function.

PU-0961
压缩感知与传统电影序列在心功能评估方面的比较

詹晨奥
华中科技大学同济医学院附属同济医院

目的 在心血管疾病的诊断及预后判断中，心功能的评估发挥着重要的作用，而磁共振心脏电影是评估心脏功能的金标准。但是因其耗时较长且对患者呼吸配合的要求较高等原因，限制了其在临床上的使用。为了解决这一难题，科研工作者将压缩感知的技术应用于心脏磁共振领域。本次研究基于中国人群，探究压缩感知技术是否能代替传统的心脏电影序列。
方法 在 2018 年 2 月至同年 7 月间，我们选取了 28 名正常人群及 104 名有心脏基础疾病的患者，共 132 名作为研究对象，并分别对其进行传统心脏电影序列及压缩感知电影序列的扫描，扫描间隔时间不超过 10 分钟。并对其图像进行心功能定量分析。
结果 在 132 名研究对象中，有 88 名男性（平均年龄为 58±2 岁），44 名女性（平均年龄为 56±2 岁）。图像质量均较好，可做统计学分析。$LVEF_{CS}$ 与 $LVEF_{传统}$ 相比，存在统计学差异（$p<0.0001$），其平均差异为 7.0%，95%的置信区间为（6.1,7.9）。$LVEDV_{CS}$ 与 $LVEDV_{传统}$ 相比，未见统计学差异（$p=0.33$），其平均差异为 3.6ml，95%的置信区间为（-3.7,11.0）。$LVESV_{CS}$ 与 $LVESV_{传统}$ 相比，存在统计学差异（$p<0.05$），其平均差异为 4.9ml，95%的置信区间为（-9.8,0.1）。
结论 压缩感知技术会高估左室收缩末容积，致使射血分数存在明显偏差，因此压缩感知技术仍无法替代传统心脏电影。

PU-0962
心脏磁共振在心脏肿瘤与血栓中的鉴别诊断价值

杨朝霞,唐大宗,夏黎明
华中科技大学同济医学院附属同济医院

目的 心脏肿瘤与血栓的治疗方法及预后大有不同，因此在临床实践中正确鉴别诊断二者十分重要。本研究的目的是评价心脏磁共振（Cardiac Magnetic Resonance, CMR）在心脏肿块中的鉴别诊断价值。
方法 回顾性纳入 2014-2019 年期间临床怀疑心脏占位并行 CMR 检查共 50 例患者，心脏肿瘤及血栓的诊断参考标准是组织病理学结果及抗凝治疗后影像学手段随访肿块是否缩小。采集心脏肿块在 CMR 上的电影序列、IR 序列（Double /Tripple IR）、延迟增强序列（LGE）图像，对心脏肿块的位置、大小、运动性、CMR 信号、同质性及强化特征进行分析。采用 SPSS 25.0 统计学软件进行数据统计学分析。
结果 CMR 检查的 50 例患者中，未发现异常 5 例，不能明确诊断 6 例，有诊断参考标准 39 例，其中血栓 12 例，肿瘤 19 例，良性病变 8 例。心脏肿瘤组与血栓组患者性别、年龄、信号均质性及 TIWI 高信号比较，差异无统计学意义（$p>0.05$）。形态学特征上，血栓更小（5.7±2.7 vs 18.1±4.1cm^2, $p=0.017$），运动较弱或无运动（16.7% vs 68.4%, $p=0.09$）。以正常心肌信号作为参考，T2WI、DWI 及 LGE 序列上高信号在肿瘤组较血栓组更多见（分别为 89.5% vs 50%, $p=0.032$; 57.9% vs 8.3%, $p=0.08$; 89.5% vs 8.3%, $p<0.0001$）。肿瘤组各影像特征 ROC 曲线结果显示，LGE、肿块大小、肿块运动性及 DWI 高信号的 AUC 分别为 0.906、0.827、0.759、0.748。血栓多位于左室 58%（37/12），而肿瘤位置分布多变。

结论 CMR 可从形态、运动性、信号及延迟强化等特征鉴别心脏肿瘤与血栓。血栓通常更小、无运动、DWI 呈低信号且多不强化，LGE 及肿块大小在诊断心脏肿瘤方面具有很高的诊断价值，对临床诊断及治疗具有一定的指导意义。

Diagnostic accuracy of monoenergetic reconstruction and nonlinear blending on chronic myocardial infarction using dual-energy CT: comparison with 3T cardiac MR

yanfei he[1],Rui Wang[2],Rui Yang[1]
1.Henan Chest Hospital
2.Beijing Anzhen Hospital

Background: Both monoenergetic reconstruction at 80Kev and non-linear blending images improves subjective image quality. However, comparative study of monoenergetic reconstruction and nonlinear blending late enhancement DECT (LE-DECT) is rare in detecting myocardial infarction.
Objective: To evaluate the image quality and diagnostic accuracy of both monoenergetic reconstruction and nonlinear blending LE-DECT in detecting myocardial infarction, as 3T cardiac MR a reference.
Methods: Twenty patients with coronary artery disease were prospectively enrolled and underwent LE-DECT and late gadolinium enhancement CMR (LGE-CMR). LE-DECT images were reconstructed as monoenergetic spectral images 40-190 Kev with 30 Kev interval and non-linear blending setting. Images were assessed for image quality, LE extent (percentile % of whole ventricle segments).
Results: Fifty-two myocardial segments (15%) showed LGE on CMR. LE-DECT detected 70 myocardial segments. The signal-noise ratio, contrast-to-noise ratio of images at 70Kev and non-linear reconstruction were better than that of other series. The sensitivity, specificity, positive predictive value, negative predictive value and diagnostic accuracy of non-linear reconstruction in detecting myocardial infarction in per-segment level was 58%,92%,78%,90%,88%, respectively. However, LE extent detected at 70 Kev and non-linear reconstruction were overestimated 12% in comparison with CMR in per-segment level.
Conclusion: LE-DECT using monoenergetic reconstruction at 70Kev and non-linear reconstruction significantly improve image quality and diagnostic accuracy. However, LE extent of myocardial infarction detected with LE-DECT is overestimated compared with CMR.

CMRI 与超声心动图对高海拔地区正常人心脏结构及功能的评价研究

颜春龙[1],齐先龙[1],唐桂波[2],杨国财[2],郑宁[1],徐辉[2],马金凤[1]
1.济宁市第一人民医院

2.青海省人民医院

目的 探讨心脏磁共振成像（CMRI）和超声心动图（UCG）对高海拔地区正常人在评价心脏结构及功能方面的应用价值。**方法** 选择世居高海拔地区 25 名健康正常人行 CMRI 检查，并将图像导入专用后处理工作站，测定前室间隔厚度、左房内径、左室舒张末内径、右房内径、右室流出道宽径、主肺动脉内径、主动脉窦部内径等心脏结构指标，并用 Argus 软件测定左室射血分数，并与超声心动图（UCG）测量结果进行比较。**结果** CMRI 与 UCG 测定右房内径、主肺动脉内径、左室射血分数分别为（40.11±4.18）mm、（33.41±2.34）mm；（22.82±1.12）mm、（22.41±1.33）mm；（52.06±9.69）%、（63.95±7.82）%，差异有显著性（p＜0.05），主肺动脉内径及左室射血分数相关性好；测定前室间隔厚度、左房内径、左室舒张末期内径、右室流出道宽径、主动脉窦部内径分别为：（9.79±1.05）mm、（9.68±0.95）mm；（34.10±3.19）mm、（33.68±3.37）mm；（49.73±4.18）mm、（48.64±3.65）mm；（30.19±2.71）mm、（29.77±2.96）mm；（29.86±2.22）mm、（29.95±2.42）mm，差异无显著性（p＞0.05），相关性好。CMRI 测定的左室射血分数低于 UCG 检测值。**结论** 对于高海拔地区人群，在测定左心结构方面 CMRI 和 UCG 均为较准确方法，在测定右心结构及心功能方面 CMRI 优于 UCG，CMRI 测量值更准确、可靠，临床应用当中 UCG 测量值会高估左室功能。

Value of cardiac MR strain in discriminating hypertrophic left ventricular noncompaction cardiomyopathy, isolated left ventricular noncompaction and hypertrophic cardiomyopathy

Shenglei Shu,Jing Wang,Xiangquan Kong,Chuansheng Zheng
Department of radiology， Union hospital of Tongji Medical Collge， Huazhong University of Science and Technolgy

Objective: To analyze the value of cardiovascular magnetic resonance (CMR) cine derived myocardial parameters to differentiate left ventricular non-compaction cardiomyopathy (LVNC) from hypertrophic cardiomyopathy (HCM) and controls.
Methods: We retrospectively analyzed 10 patients with isolated LVNC, 10 with hypertrophic cardiomyopathy and 10 hypertrophic LVNC, 20 sex and age matched controls were also collected. Cardiac MRI including cine steady-state free precession imaging was performed. Strain parameters were derived from longitudinal and short axial cine images using post-processing software. Global and segmental strain parameters were compared between groups.
Results: Strain parameters of hypertrophic LVNC group showed more remarkable difference with control group no matter in global (global longitudinal strain:(-7.57±3.59)% vs (-16.58±1.68) %; global circumferential strain:(-12.13±4.10)% vs (-19±2.24)%; global radial strain:(-7.57±13.55)% vs (-16.58±9.15)%, p<0.001) or segmental level which were prominent in mid and apical segmental longitudinal strain(mid longitudinal strain: (-7.27±3.77)% vs (-21.39±2.72)%; apical longitudinal strain: (-10.08±4.12)% vs (-18.34±2.85)%, p<0.001) compared with isolated LVNC or HCM group. Significant differences between isolated LVNC, HCM and hypertrophic LVNC were only shown in global circumferential strain((-16.95±2.49)% vs (-17.65±3.91)% vs (-12.13±4.10)%,p<0.01) and apical circumferential strain((-19.12±3.44)% vs (-

20.3±3.88)% vs (-13.16±5.13)%, p<0.01). Whereas no evident difference were found in other strain parameters between isolated LVNC, HCM and hypertrophic LVNC patients, so as to normal controls.
Conclusion: Hypertrophic LVNC has a remarkable different strain property derived from cardiac MR cine compared with isolated LVNC, HCM and normal controls which can be used an useful marker to differentiate between these groups.

PU-0966

Layer specific strain assessment of cardiac function in acute and chronic stages of myocarditis in a rat model

Jing Zhu,Ziqian Xu,Lei Wang,Xiaoxin Liu,Fabao Gao
Sichuan University West China Hospital

Purpose The aim of present study was to investigate whether layer specific strain could reliably detect the characteristic of myocardial damage distribution in the course of myocarditis using cardiac magnetic resonance tissue-tracking(CMR-TT).
Methods Twenty Lewis rats were induced experimental autoimmune myocarditis (EAM) model by subcutaneously injecting with 1mg Porcine Cardiac Myosin into the footpad on days 0 and 7, respectively. Before administration, all rats underwent baseline CMR scanning(cine-FLASH sequence) on a 7.0T preclinical system, which obtained in a short-axis stack and two horizontal long-axis (2,4-chamber, 2C, 4C) views. Then, ten rats were rescanned cine-FLASH sequence on day 21 and another ten rats on day 35. Global endocardial and epicardial circumferential strain (CSendo, CSepi) were acquired on short-axis levels and longitudinal strain on two horizontal long-axis levels (2C-LSendo, 2C-LSepi, 4C-LSendo, 4C-LSepi). Next, rats were euthanized and histological evaluation was performed.
Results All rats that developed myocarditis verified by both histology and CMR. Compared with baseline, EAM subjects presented significant decreased CSendo, 2C-LSendo and 4C-LSendo on days 21 and 35(P<0.05), and significant decreased CSepi, 2C-LSepi and 4C-LSepi on day 21(P<0.05), but no difference in CSepi, 2C-LSepi and 4C-LSepi on day 35 vs baseline. CSendo, CSepi, 2C-LSendo, 2C-LSepi, 4C-LSendo and 4C-LSepi all were found statistical significance on day 21 vs day 35(P<0.05). Among them, all endocardial and epicardial strain values were lowest on day 21.
Conclusion Myocardial epicardium damage persists but endocardium gradually recovered over time in myocarditis. Myocardial layer specific strain could reliably detect the characteristic of cardiac impairment changes throughout the course of myocarditis.

PU-0967

Comparation of right ventricular myocardial deformation between cardiac amyloidosis and hypertrophic

cardiomyopathy with cardiac magnetic resonance tissue tracking

Hui Liu[1],Ying-kun Guo[1],Hua-yan Xu[1],Rong Xu[1],Zhi-gang Yang [2],Hang Fu[1],Lin-jun Xie[1]
1.The West China Second UniversityHospital of Sichuan University, China
2.West china hospital of Sichuang University

Objectives: Left ventricular (LV) hypertrophy is an important differential diagnostic index in both patients with cardiac amyloidosis (CA) and hypertrophic cardiomyopathy (HCM). However, the diagnostic performance of right ventricular thickness (RVT) and RV deformation between CA and HCM is still lacking. This study aimed to assess RVT and RV deformation of CA and HCM patients by cardiac magnetic resonance (CMR) tissue tracking (TT) technique and determine the diagnostic accuracy of various RV parameters in differentiating CA form HCM.
Methods: Sixty CA (mean age 58±10 years; 33 males (55%)) and sixty HCM patients (mean age 55±14 years; 27 males (45%)) were retrospectively enrolled. We included 30 age- and sex-matched healthy volunteers (mean age 54±12 years, 17 males (57%) as controls. RVT and RV myocardial strain parameters including global radical peak strain (GRPS), global longitudinal peak strain (GLPS) and global circumferential peak stain (GCPS), were analyzed, respectively. To determine cutoff values of RVT and RV strain parameters for the diagnosis of CA from HCM, area under the curve (AUC) receiver operating characteristic curves were constructed.
Results: Compared with HCM patients, CA patients had significantly higher myoglobin, NT-pro BNP and Troponin-T (all $p<0.05$). Similarly, RVT of CA patients were significantly thicker than HCM patients (7.7±2.1 vs 5.9±1.3, $p=0.001$). Moreover, significantly decreased RV-GRPS (12.1±6.9 vs 23.5±12.1, $p<0.001$), RV-GCPS (-3.4±2.2 vs -5.6±3.5, $p<0.001$) and RV-GLPS (-4.6±2.3 vs -11.1±4.9, $p<0.001$) were observed in CA patients than those of patients with HCM. RVT and RV strain demonstrated comparable diagnostic accuracy to differentiate CA from HCM. Especially, RV GLPS combined RVT showed the best performance to discriminate CA (area under the curve = 0.92, 95% confidence interval: 0.85 to 0.96, $p=0.0001$).
Conclusions:
CMR-TT is a feasible technique for the analysis of RV deformation in CA and HCM patients. RV GLPS combined RVT presents the excellent diagnostic performance to differential CA form HCM.

PU-0968

Combined MR imaging for pulmonary embolism and deep venous thrombosis by contrast-enhanced MR volume interpolated body examination

Qing Fu
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan 430022, China

Objective: MR pulmonary artery imaging combined with MR venography was performed by using contrast-enhanced MR volume interpolated body examination (VIBE) sequence, aim of this study was to investigate the clinical value of this scanning protocol in the diagnosis of venous thromoembolism (VTE).
Materials and Methods: Thirty-four patients identified with deep venous thrombosis (DVT) by ultrasound were enrolled. Contrast-enhanced VIBE sequence was applied for visualizing pulmonary artery, abdominal veins, pelvic veins and bilateral lower extremity veins, ranging from inferior vena cava to ankle level. Two radiologists observed the MR pulmonary artery images in consensus, recorded the location and number of emboli, then observed MRV images of the abdominal, pelvis and lower extremities veins which based on per-vein segment. Cohen's kappa coefficient statistic was used to assess diagnostic agreement of DVT between MRV and ultrasound for venous segment-to-segment comparison.
Results: All patients were suffered with DVT by MRV images. MRV detected more venous segments with DVT than ultrasound based on per-vein segment analysis. The agreement rate for DVT detection between the two examinations were poor in deep femoral veins and anterior tibial veins (Kappa value <0.4), the agreement for the residual veins were good (Kappa value > 0.7). Twenty-three patients with pulmonary embolism (PE) were detected by MR pulmonary artery imaging. Twenty-one patients underwent both pulmonary CT angiography and MR imaging, consistency for PE detection between the two examinations was 100%. Total examination time of the combined MR protocol was 7 minutes for each patient.
Conclusion: The contrast-enhanced VIBE sequence can visualize the pulmonary artery, abdominal-pelvic vein and bilateral lower extremity veins simultaneously, which make it possible for detecting PE and DVT. This proved to be a promising method for VTE diagnosis in one-stop MR scanning procedure.

PU-0969

Diagnostic accuracy of true FISP, MR pulmonary angiography and volume-interpolated body examination for pulmonary embolism compared with CT pulmonary angiography

Qing Fu
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan 430022, China

Objective: This study evaluated the diagnostic accuracy of MR sequences for pulmonary embolism (PE) by true fast imaging with steady state precession (true FISP), contrast MR pulmonary angiography (MRPA) and volume-interpolated body examination (VIBE).
Materials and Methods: Twenty-one patients with confirmed deep venous thrombosis suspected of PE were enrolled. Emboli were analyzed on a per-patient and per-vessel basis with CT pulmonary angiography (CTPA) as reference standard. Sensitivity, specificity, PPV and NPV were calculated. ROCs were applied to compare differences in sequences by calculating the area under the curve (AUC). **Results:** Based on a per-patient and per-vessel analyses, sensitivity was 81.3% and 36.7% for true FISP, 82.4%

and 56.3% for MRPA, 94.4% and 68.1% for VIBE; specificity was 80% and 99.8% for true FISP, 100% and 99.2% for MRPA, 100.0% and 99.2% for VIBE; PPV was 92.9% and 98.3% for true FISP, 100.0% and 95.5% for MRPA, 100.0% and 96.9% for VIBE; NPV was 57.1% and 80.3% for true FISP, 50.0% and 88.2% for MRPA, 75.0% and 89.8% for VIBE. Compared with true FISP and MRPA, VIBE had the highest AUC. **Conclusion:** Enhanced VIBE was the most accurate sequence (95.2% per-patient basis; 91.1% per-vessel basis), especially for emboli in segmental pulmonary vasculature.

增强磁共振血管造影(CE-MRA)用于头颈部动脉狭窄

刘振华
福建省南平市第一医院

目的 分析增强磁共振血管造影(CE-MRA)用于头颈部动脉狭窄诊断中的价值。**方法** 选择 2018 年 1 月-2019 年 3 月在本院就诊的头颈部动脉狭窄疑似患者 85 例，其中有同时行 CE-MRA、DSA 两种检查或 CE-MRA、CTA 及 DSA 三种检查的病例 29 例，以 DSA 检查为金标准，若存在动脉狭窄，以狭窄最严重段参与检查结果评估与分析。**结果** （1）29 例头颈部动脉狭窄疑似患者经 DSA 检出无狭窄或轻度狭窄者 11 例、中度狭窄 7 例、重度狭窄 7 例、完全闭塞者 4 例；（2）CE-MRA 检出无狭窄或轻度狭窄者 10 例、中度狭窄 6 例、重度狭窄 8 例、完全闭塞者 5 例，检查灵敏度分别为 90.91%、71.43%、85.14%、75.00%，检查准确率 82.76%；（3）经 CTA 检出无狭窄或轻度狭窄者 13 例、中度狭窄 6 例、重度狭窄 7 例、完全闭塞者 3 例，灵敏度分别为 72.73%、57.14%、85.14%、100.00%，检查准确率 75.86%；（4）CE-MRA、CTA 检查准确率数据差异无统计学意义（$P>0.05$）。**结论** 将 CE-MRA 用于头颈部动脉狭窄诊断中的价值良好。

PU-0971
采用磁共振心肌组织追踪技术定量评估心肌炎患者左室心肌应变力的变化

黄荟玉,张勇
郑州大学第一附属医院

目的:通过磁共振心肌组织追踪技术定量评估心肌炎患者左室心肌应变力的变化规律。**方法** 连续性收集我院近两年确诊为心肌炎的患者 20 例，同时招募入组健康成年志愿者 37 例，采用 CVI42 后处理软件在磁共振图像（MRI）上测量左心室 3D 全局径向峰值应变（GPRS）、全局纵向峰值应变（GPLS）、全局周向峰值应变（GPCS）及心功能，进而探讨心肌炎患者与健康成年志愿者左室全局峰值应变和心功能的变化及相关性。**结果** 与志愿者相比，心肌炎患者舒张末期容积与左室射血分数显着降低（$P<0.001$），每搏输出量、心排出量及心指数降低（$P<0.05$）；全局应变力均下降，其中 GPRS、GPLS 远低于对照组，差异具有统计学意义（$P<0.001$），且 GPLS 最具鉴别效能，曲线下面积为 0.818，最佳阈值为-12.995，敏感度和特异度分别为 75%和 75.7%；此外，GPRS 与 GPCS 呈中度负相关（$P<0.001$），与 GPLS、ESV 呈轻度负相关（P 均<0.05），与 EF 呈中度正相关（$P<0.05$）；GPCS 与 EF 呈轻度负相关（$P<0.05$），与 ESV 呈中度正相关（$P<0.001$），与 EDV 呈轻度正相关（$P<0.05$）。**结论** 全局周向、径向及纵向应变力对于区分心肌炎与正常人左心室心肌功能变化具有重要意义，可用于心肌炎的早期诊断，以提高 CMR 对心肌炎诊断的准确率。

二尖瓣赘生物：感染性心内膜或心脏瓣膜肿瘤？

杨朝霞,唐大宗,夏黎明
华中科技大学同济医学院附属同济医院

目的 瓣膜赘生物是诊断感染性心内膜炎（infective endocarditis IE）的主要标准，当 IE 患者临床表现及赘生物形态不典型时，通常需要与其他瓣膜受累疾病鉴别。影像学检查手段有助于瓣膜病变的定位、定性及鉴别诊断。本文报道 1 例与心脏乳头状弹力纤维瘤（Cardiac papillary fibroelastomas CPF)影像表现相似的 IE 二尖瓣赘生物，提高临床医生的诊治经验。
方法 回顾分析我院收治的 1 例感染性心内膜炎二尖瓣赘生物患者的临床表现、实验室检查、影像学资料及病理结果。
结果 男性，53 岁，因“发热 20 余天”入院，伴咳嗽、咳痰，阵发性胸痛。入院后实验室检查示白细胞 11.46*10^9/L↑，高敏心肌肌钙蛋白 I 88.8 pg/mL↑，氨基末端脑钠肽前体 493pg/mL↑，血沉 53 mm/H↑，超敏 C 反应蛋白 86.7 mg/L↑，降钙素原 0.58 ng/mL↑，神经元特异性烯醇化酶 24.89 ug/L↑，糖链抗原 72-4 62.11 U/mL↑。体格检查各瓣膜区未闻及病理性杂音。血培养/痰培养/大便培养/尿培养+药敏及寄生虫检查均未见阳性结果。经食道超声心动图示二尖瓣前叶左房侧中等回声影附着，二尖瓣开放受限，考虑为 CPF 或 IE 可能。心脏磁共振示二尖瓣前叶增厚并见大小约 14*10mm 异常信号赘生物，运动良好，收缩期脱入左室，DWI 未见明显弥散受限，mapping 序列上初始 T1 值约 1460ms，T2 值约 44ms。首过灌注呈轻度充盈缺损，延迟增强未见明显强化，晚期黑血 TIWI 序列上明显强化。初步考虑为 IE 所致可能性大，不除外 CPF。术后病理**结果**（二尖瓣赘生物）符合感染性心内膜炎病理改变。
结论 瓣膜赘生物的鉴别诊断包括 IE、钙化、血栓、心脏肿瘤（尤其是 CPF）。不同病因所致的瓣膜病变治疗手段大相径庭，临床医生应充分利用多模态影像学手段进行瓣膜赘生物的鉴别诊断并及时治疗。

PU-0973

Dynamic Deuterium MRS Imaging for Studying Rat Heart Energy Metabolism in vivo - Initial Experience

Huan Li[1],Xiao-Hong Zhu[2],Wei Zhu[2],Byeong-Yeul Lee[2],Hannes Michel Wiesner[2],Yi Zhang[2],Tao Wang[2],Wei Chen[2]
1.Department of Radiology，Zhongnan Hospital of Wuhan University， Wuhan University，Wuhan，430071，P.R.China
2.Center for Magnetic Resonance Research， Department of Radiology， University of Minnesota，Minneapolis， MN， United States

Introduction
Assessment of energy metabolism is crucial for understanding myocardial activity and function under physiopathological conditions. Myocardium mainly obtained energy *via* aerobic oxidation of various energy substrates including fatty acids (>60%) and glucose. MR perfusion imaging and SPECT perfusion imaging are commonly used to assess blood supply of the myocardium, myocardial ischemia and viability of the myocardium (1). However, these methods are unable to evaluate the myocardial cellular activity and metabolism directly. Recently, we developed a novel Deuterium (^{2}H) MR (DMR) spectroscopic (DMRS) approach for assessing energy metabolisms in preclinical rat brain at ultrahigh field (2). This new method is advantageous since it eliminates the

radioactive tracer commonly employed in SPECT imaging of myocardial metabolism; and it allows more signal averaging to gain sensitivity per unit time owing to shorter T_1 of deuterated metabolites with quadrupolar relaxation mechanism. In this study, we aimed to develop and utilize the dynamic DMRS method for assessing myocardial energy metabolisms in the rat heart at 16.4 T.

Method

Three Sprague Dawley rats (BW=432±34 g) were anesthetized by 2% isoflurane, and their femoral arteries and veins were catheterized for blood sampling, physiological monitoring and deuterated glucose and/or acetate infusion. Rectal temperature was maintained at 37±1℃ using heated circulating water. The arterial blood pressure and heart rate were monitored during the entire experiment. The animal study protocol was approved by the Institutional Animal Care and Use Committee of University of Minnesota, and were compliance with the ARRIVE guidelines. All MR experiments were conducted at 16.4 T/26 cm bore scanner (Varian/VNMRJ) using a small (~1.2cm diameter) ^{2}H surface coil for deuterium data acquisition and a large (~3.5cm diameter) ^{1}H surface coil for anatomical imaging. The ^{2}H coil was inserted into the rat chest via thoracotomy and placed between the chest wall and the heart with the animal in prone position. The ^{1}H surface coil was placed at the left side of the chest at the same level of the heart (see Figure 1). A single-pulse-acquire sequence was applied to obtain dynamic DMR spectra with 30 s temporal resolution for 60 min. For each rat, 2 min baseline spectra were acquired followed by 5 min i.v. infusion of deuterated D-Glucose-6,6-d (d66, Cambridge Isotope Laboratories, Inc., 1.0 g/kg BW) or/and deuterated sodium acetate-d_3 (Sigma Aldrich, 1.0 g/kg BW) dissolved in 2.5 mL saline. The ^{2}H 3D-CSI data of rat hearts were also acquired before and after injection of glucose and/or acetate with 124 mL nominal spatial resolution in approximately 5 min (spectral width=3 kHz; TR = 45 ms; FOV=4′4′4 cm^3, 9′9′5 phase encodes, 15 averages). All resonance signals (deuterated water, glucose (Glc), glutamate/glutamine (Glx), acetate) were fitted using a MATLAB based program (2).

Result

We were able to successfully place the ^{2}H surface coil underneath the heart and reduce the heart motion caused by breathing during the experiment; the position of the heart and coils were illustrated in Figure 1; it also displays DMRS imaging of natural abundance Deuterium-labeled water with excellent sensitivity and spectral quality in rat heart *in vivo*. Figure 2 shows representative DMR spectra of rat hearts (black and red traces represent original and fitted spectra) under 4 min post-infusion of deuteriated-acetate (a) and 10 min post-infusion of deuteriated-glucose (b). Model-decomposed individual components of deuterated water, acetate, glucose and Glx could be characterized clearly. Figure 3a displays the time courses of deuterated glucose, Glx and water signals before, during and after infusion of d66 based on the model fitting of the *in vivo* ^{2}H spectra as shown in Figure 2a. Figure 3b showed the time courses of deuterated water with glucose and acetate infusion, respectively. Significantly higher production of the deuterated water was observed with acetate infusion as compared to the glucose infusion.

Discussion & Conclusion

Myocardium mainly produces ATP energy *via* aerobic oxidation of various substrates including fatty acids and glucose with preference on fatty acids. The observed higher deuteriated-water production under acetate infusion in the heart could be due to the

higher concentration of ^{2}H in acetate infusion than that of glucose; 1g /kg BW of acetate and glucose was used for this study, the concentration of ^{2}H in acetate is about 3.2 times higher than that of glucose. This work demonstrates the feasibility and sensitivity of the in vivo DMR imaging technique for assessing myocardial energy metabolisms, which makes it possible to image the energy metabolism and assess cardiomyocyte activity in hearts under normal and diseased states (such as myocardial ischemia&myocardial infarction) at high/ultrahigh field. Further studies and quantification modeling are needed to find more characteristics of cardiac energy metabolism.

PU-0974

Qualitative and quantitative evaluation of the cardiac magnetic resonance T1 mapping motion correction

Sixian Hu[1],Wanlin Peng[1],Huayan Xu[2],Chunchao Xia[1],Zhenlin Li[1]
1.West China Hospital，Sichuan University
2.Department of Radiology， Key Laboratory of Obstetric & Gynecologic and Pediatric Diseases and Birth Defects of Ministry of Education， West China Second University Hospital， China

Purpose
To explore the clinical feasibility of motion correction based on phase sensitive inversion recovery (PSIR) in cardiac magnetic resonance (CMR) T1 mapping by evaluating quantitative parameters and image quality.
Methods and materials
Fifty-four patients with diverse cardiovascular diseases and 14 normal participants were prospectively enrolled. CMR T1 mapping using modified look-locker inversion recovery (MOLLI) sequences with (MOCO) and without (NOMOCO) motion correction technique were performed. Region of interest (ROI) were manually delineating of endocardial and epicardial borders and blood pool. The pre-/post- T1, ECV, signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) values of two groups were measured and compared. The subjective image quality was assessed using a 4-point score scale.
Results
The Bland-Altman plots showed a good agreement between MOCO and NOMOCO images in pre-contrast T1 values and ECV values. SNR values of native T1 images in MOCO group were significantly higher than NOMOCO group (1.97±0.27 vs 1.92±0.28, P<0.01), while there were no significant differences in SNR of post T1 images (P=0.54). Both in pre-/post-contrast T1 maps, CNR values of MOCO images were significantly greater than that of NOMOCO images (pre: -1.01, -1.15 to -0.89 vs -0.98, -1.10 to -0.83; and post: 0.31, 0.26 to 0.42 vs 0.29, 0.25 to 0.38, respectively; all P<0.01). The subjective image quality was significantly improved when MOCO technique was applied.
Conclusion
T1 mapping images with MOCO technique showed a good agreement in quantitative analysis and improved image quality compared to conventional MOLLI T1. T1 mapping with a robust motion correction based on phase sensitive inversion recovery has a potential in clinical quantitative diagnosis, especially for patients with poor breath-holding.

动脉粥样硬化早期易损斑块 MRI 诊疗一体化纳米探针的构建及分子成像研究

王嘉慧,吴梦琳,彭期臻,郝剑文,张雪宁
天津医科大学第二医院

目的 制备一种靶向多功能诊疗一体化纳米探针，实现对动脉粥样硬化易损斑块的早期无创高分辨成像与精准靶向治疗。**方法** 利用易损斑块泡沫细胞高表达的清道夫受体（SR-AI）作为靶点，以介孔二氧化硅包被的超小超顺磁性氧化铁纳米颗粒（FMSNs）为载体，整合与 SR-AI 具有高亲和力的多肽 PP1 及高效治疗药物 Atorvastatin，制备可精准靶向易损斑块的高分辨磁共振诊疗一体化纳米探针（Atorvastatin@FMSNs-PP1），对其进行表征及生物相容性分析。体外培养泡沫巨噬细胞(RAW 264.7)，建立 $ApoE^{-/-}$ 鼠动脉粥样硬化模型，并进行体内外 MR 连续动态成像，根据 T2WI 信号动态变化半定量分析探针在斑块的分布聚集情况，最终进行组织学定量分析，验证其检出斑块的负荷、性质及纳米探针的靶向治疗效果。**结果** 本研究制备的 Atorvastatin@FMSNs-PP1 具有良好的生物相容性和超顺磁性，适合作为易损斑块 MR 分子成像造影剂。细胞吞噬实验显示 Atorvastatin@FMSNs-PP1 对泡沫巨噬细胞具有高度结合特异性和亲和力。体内 MR 成像结果表明，$ApoE^{-/-}$鼠尾静脉注射靶向探针 24 小时后，动脉粥样硬化易损斑块处 T2WI 信号显著降低。斑块组织切片普鲁士蓝染色证实，纳米探针 Atorvastatin@FMSNs-PP1 在高表达 SR-AI 的易损斑块高度聚集。同时，活体 MRI 连续动态监测结果证明易损斑块可被靶向递送的 Atorvastatin 药物有效抑制。**结论** 本研究制备的 MRI 诊疗一体化纳米探针 Atorvastatin@FMSNs-PP1 可准确靶向具有易损倾向的斑块，多角度精确分析早期易损斑块的性质、成分等病理信息，并同步精准投递治疗药物，从而提高早期易损斑块 MRI 检出率、减少用药频率、提高药物利用率，为实现真正意义的易损斑块早期一体诊疗及无创动态监测提供了可靠依据和实验数据支持。

PU-0976
兔颈总动脉粥样硬化斑块建模新方法及超小锰铁氧体新型对比剂 MRI 成像可行性研究

叶鹏飞
四川大学华西第二医院

目的探索经兔耳中央动脉穿刺入路，行球囊导管损伤颈总动脉内膜联合高脂饲料喂养，构建兔颈总动脉粥样硬化斑块的动物模型新方法。利用 3.0T 磁共振仪验证超小锰铁氧体新型对比剂对动脉粥样硬化斑块 T1 增强成像能力的可行性。
材料与方法经兔耳中央动脉穿刺入路，行球囊导管损伤右侧颈总动脉内膜，再经高脂饲料喂养 8 周，建立兔颈总动脉粥样硬化斑块的动物模型。将经球囊导管损伤的右侧颈总动脉作为斑块侧，将未经球囊导管损伤的左侧颈总动脉作为对照侧。在 3.0T 磁共振仪上，采用快速自旋回波 T1 加权序列，获得兔颈总动脉横轴位普通扫描和各个时间节点超小锰铁氧体纳米颗粒横轴位增强扫描图像。分别对 T1WI 横轴位普通扫描图像、各个时间节点超小锰铁氧体纳米颗粒 T1WI 横轴位增强扫描图像进行动脉壁信号强度和背景噪声的标准差测量，计算获得信噪比。
结果超小锰铁氧体纳米颗粒注入后斑块侧颈总动脉血管壁立即强化，在 7min 时信号强度（897.5±131.2）和信噪比（399.1±54.2）达到峰值，其维持强化超过 100min。超小锰铁氧体纳米颗粒注入后，斑块侧在不同时间节点颈总动脉血管壁信号强度（R=-0.68，P<0.01）、信噪比

（R=-0.69，*P*<0.01）的变化有显著相关性，对照侧在不同时间节点的血管壁信号强度（R=-0.59，*P*<0.01）、信噪比（R=-0.64，*P*<0.01）的变化有相关性。
结论球囊导管损伤颈总动脉内膜采用了独创的兔耳中央动脉穿刺入路，为构建兔颈总动脉粥样硬化斑块动物模型开辟了新思路。超小锰铁氧体纳米颗粒可作为 MRI 对比剂，并且可应用于颈总动脉粥样硬化斑块 T1 增强成像，为动脉粥样硬化斑块的检测提供了新选择，尤其是钆对比剂受限的患者。

非增强磁共振胸导管成像联合腹盆部磁共振扫描在女性生殖系统乳糜漏中的应用

霍萌[1,2],岳云龙[1,3],王仁贵[1,2],孙莹[1,2],张春燕[1,2]
1.首都医科大学附属北京世纪坛医院
2.放射科
3.磁共振室

目的 探讨非增强磁共振胸导管成像（non-contrast magnetic resonance thoracic ductography MRTD）及磁共振（magnetic resonance MR）腹盆腔扫描在女性生殖系统乳糜漏中的应用价值。
方法 回顾性分析 18 例女性生殖系统乳糜漏患者 MRTD、直接淋巴管造影（direct lymphangiography DLG）、核素淋巴显像（lymphoscintigraphy LSG）中胸导管主干及出口区域的可视化，把胸导管主干分为上中下三段，对其可视化程度进行评分及统计学分析；比较 MRTD、DLG、LSG 对胸导管出口区域的显示率。回顾性分析 MR 腹盆部的异常表现。
结果 MRTD 胸导管主干全程显影（visualization of the main thoracic duct ）17 例（94.4%），DLG 胸导管主干全程显影 12 例（66.7%），LSG 不能显示胸导管。MRTD 上、中、下各段胸导管可视化程度均高于 DLG（*P*=0.00）。MRTD 成功显示胸导管出口区域 18 例（100%）;其中左侧引流 10 例，右侧 1 例，双侧 6 例。DLG 出口区显影 12 例（66.7%），均提示胸导管出口梗阻，左侧引流 9 例，右侧 1 例，双侧 2 例。LSG 静脉角区域显影 7 例（38.9%），均呈放射性持续浓聚，提示胸导管出口梗阻，左侧显影 3 例，右侧 1 例，双侧 3 例。MRI 腹盆腔平扫发现 18 例（100%）盆腔及腹膜后淋巴管均有不同程度扩张、紊乱，发现脾脏多发淋巴管瘤 6 例（33.3%），皮下多发淋巴管瘤 7 例（38.9%），多发骨质异常 6 例（33.3%）（Gorham/骨淋巴管瘤）。
结论 非增强 MRTD 作为一种无创的、便捷的影像学手段在胸导管及其出口的显示中具有优势，联合 MR 腹盆部扫描可为女性生殖系统乳糜漏患者做出更全面的评估，并为后续治疗提供指导，应把其纳入到此类患者的诊疗常规中。

PU-0978
磁共振检查对纵隔病变诊断的价值

张爱莲,庞小平,李梦露,张晶
中国人民解放军总医院第一医学中心

目的 通过对纵隔 MR 检查技术的研究，探讨 MR 不同序列在纵隔病变检出中的作用。**材料和方法** 回顾性分析纵隔磁共振检查患者 88 例，男 58 例，女 40 例。设备 1.5T 核磁共振检查仪，腹部相控阵线圈，所有患者采取平扫和增强扫描。扫描序列：SSFSE T2WI，采用屏气法扫描横轴面、冠状面和矢状面；FSE T2WI-FS 采用呼吸触发扫描横轴位；in-out phase T1WI 采用屏气扫描横轴位；三维快速梯度回波 T1WI 序列动态增强扫描。分析不同序列对不同大小病灶、不同信号特征的

病灶以及不同分布病灶的检出价值。**结果** 88 例患者，病灶<1.5cm 38 例，病灶>1.5cm 50 例；囊性病灶 26 例，实性病灶 62 例；富血供 18 例，血供不丰富或乏血供的 70 例。1 不同序列病灶的检出：in-out phaseT1WI 显示最佳；SSFSE T2WI 不抑脂横轴面、矢状面次之；再次是 T2WI-FS 序列；T1WI+C 对富血供的大病灶易检出；2 不同病灶特征病灶的检出：>1.5cm、远离大血管病、富血供、囊性灶易检出。<1.5cm、距离纵隔内大血管较近病灶不易检出。
结论 不抑脂的同反相位 T1WI 序列和不抑脂的横轴面单次激发序列由于纵隔内脂肪高信号的衬托容易检出病灶，是纵隔检出的首选序列；抑脂的横轴面 T2WI 序列对于囊性病灶、大病灶和远离血管的病灶容易检出，为诊断定性提供有帮助的信息；增强扫描对富血供的病灶有特征性的表现，也为诊断定性提供有帮助的信息。对于小于病灶、距离纵隔内大血管较近的病灶不易检出，有待于序列和参数的优化，更好的发现病灶诊断病变。

纵膈磁共振成像技术的临床应用研究

陆晓军
中国人民解放军总医院第一医学中心

目的 探讨纵膈磁共振扫描成像技术。**方法** 采用 GE 公司 3.0T 磁共振仪，对 40 例患者做纵膈磁共振成像，扫描方法及脉冲序列：横轴位 FSE T2WI、FSET1WI ，冠状位及矢状位 FSET2WI，所有 T2WI 采用脂肪抑制技术。**结果** 横轴位能清晰显示病变与周围解剖结构关系。冠状位，矢状斜位能清晰显示病变的大体轮廓及与相邻组织关系。**结论** 正确的扫描方法，合理的参数和脉冲序列有助于显示正常纵膈剖结构及病变，帮助定位和诊断。

PU-0980

A comparative study of contrast-enhanced and unenhanced MR Pulmonary Angiography in the diagnosis of pulmonary embolism

Sishu Yuan,Limin Xia
Tongji Hosipital，Tongji Medical College， Huazhong University of Science and Technology.

Purpose： To evaluate detection of pulmonary embolism (PE) using conventional contrast-enhanced MR angiography and unenhanced MR angiography applying spatial labeling with multiple inversion pulses sequence (SLEEK) imaging.
Method and Material: 26 patients (15 males and 11 females) diagnosed with PE using computed tomographic(CT) a underwent contrast-enhanced MR pulmonary angiography and SLEEK MR angiography within 48 hours after CT scans. Written consent forms were obtained prior to MR scans. Images from each sequence was analyzed separately by two independent reviewers who recorded presence of emboli in categorized pulmonary artery anatomic territories. CT angiography results were analyzed by a third independent reviewer, who retrospectively recorded presence of emboli using the same format; these review results were used as reference. Sensitivity, specificity, and positive and

negative predictive values for PE detection were calculated and compared for each MR acquisition based on a per-embolus basis, and 95% confidence intervals were calculated according to the efficient-score method. A two-sample t test was used to compare values between different MR acquisitions .Weighted K values were calculated to evaluate the consistency between results from the readers.
Results: Calculated sensitivities for PE detection were 78.8% for CE-MR pulmonary angiography and 83.8% for SLEEK MR angiography respectively. However if the results from two MR sequences were simultaneously used, the overall sensitivity was improved up to 85.4%. Specificities for PE detection was 97.7% for CE-MR Pulmonary angiography and 100% for SLEEK MR angiography., if two MR sequences were simuteanously used the overall specificity was improved up to 100%. Consistency between readers was considerably high (k=0.87).
Discussion and conclusion: Contrast-enhanced MR pulmonary angiography and SLEEK MR angiography possessed relatively similar sensitivity and specificity. There were complementary benefits to combine these two MR sequences for the evaluation of PE. However, considering the non-invasive property of SLEEK MR angiography, where no contrast agent was required, it might become a potential diagnostic strategy for pulmonary embolism.

PU-0981

3.0T MRI 在食管癌 T 分期及可切除性评估的重要价值研究

林生发,马明平
福建省立医院

目的 运用新一代高场强磁共振最新序列（主要是 T2WI-BLADE、T1-STAR-VIBE）及动态增强扫描、延迟扫描，对食管癌进行多方位、多序列成像，评估病灶的 T 分期和可切除性。为临床诊断、治疗方案、手术方式及预后评估提供重要证据。
方法 对本院 30 例活检病理已确诊为食管癌的患者进行前瞻性评估，包括①T2WI-BLADE 对食管癌 T 分期及可切除性评估，②T1-STAR-VIBE 对食管癌 T 分期及可切除性评估，③T2WI-BLADE 联合 T1-STAR-VIBE 对食管癌 T 分期及可切除性评估；而后参照术中及最后病理结果，分别对以上三种评估方法的敏感性、特异性、准确性等进行分析统计。
结果 以上三种针对食管癌 T 分期及可切除性评估方法，均具有较高的敏感性、特异性、准确性，以 T2WI-BLADE 联合 T1-STAR-VIBE 对食管癌 T 分期及可切除性评估效果最佳。
结论 新一代高场强磁共振最新序列能够清楚的显示食管粘膜层、粘膜下层、固有肌层、纤维膜和向外侵犯情况，其 T 分期结果、可切除性评估与病理检查结果具有较高一致性，可为临床医师选择食管癌的治疗方案、预后评估提供重要依据和价值。

Clinical application value of diffusion weighted whole body imaging with background body signal suppression in malignant tumors

Wenling Ma,Sheng Zhou
Gansu Provincial Hospital of Traditional Chinese Medicine

Clinical application value of diffusion weighted whole body imaging with background body signal suppression in malignant tumors
Objective: to understand the principle of diffusion weighted whole body imaging with background body signal suppression and to explore its clinical application value in the display of malignant tumors and distant metastases. Methods: two patients who have been pathologically confirmed lung squamous cell carcinoma and systemic metastasis underwent diffusion weighted whole body imaging with background body signal suppression examination,then compared its findings with CT. Results: diffusion weighted whole body imaging with background body signal suppression can well show metastases in the rest of the body in addition to the primary tumors and distant metastases found by CT examination. Conclusion: diffusion weighted whole body imaging with background body signal has the advantages of wide coverage and no ionizing radiation. It has potencial clinical application value in the screening of malignant tumors and distant metastases.

MRI 对前纵隔偶发肿瘤样结节的初步评价

谢青
南京市胸科医院

目的探讨 MRI 对前纵隔偶发肿瘤样结节(最大径≤3 cm)的评价价值。方法 回顾性分析 52 例行 CT 检查时偶然发现的前纵隔肿瘤样结节的 MRI 征象，分析结节的形态、信号特征，周围脂肪间隙及结节与纵隔结构、肺组织的界面情况，化学位移成像及增强后信号变化情况及强化程度。所有病例均经手术证实。 结果 52 例偶发肿瘤样结节中，胸腺囊肿 30 例，支气管源性囊肿 9 例，心包囊肿及脉管囊肿各 1 例；胸腺增生 3 例，胸腺退化不全 2 例；淋巴结 2 例；淋巴组织增生 4 例。前纵隔偶发肿瘤样结节中囊肿占 78%，多表现为长 T1 长 T2 信号，呈圆形或椭圆形，随呼吸幅度变化具备一定塑形性，边界光整，T1WI 增强无强化或囊壁轻度强化；胸腺增生呈四边形、三角形，双锥形，化学位移成像反向位信号衰减。前纵隔淋巴组织增生呈软组织信号结节，结节内部信号不均，坏死区呈稍长 T1 较长 T2 信号，DWI 呈稍高信号。 结论 前纵隔偶发肿瘤样结节具有一定 MRI 特征，根据其 MRI 表现，多数可与肿瘤性病变区分,指导临床选择合适的诊疗路径。

Intratumor septum: an important imaging signfor differentiating thymic solid tumors

Weiqiang Yan,Yuchuan Hu,Linfeng Yan,Yong Jing,Gangfeng Li,Shijun Duan,Wen Wang,Guangbin Cui
Department of Radiology, Tangdu Hospital, Fourth Military Medical University

Purpose: To study the types and incidences of intratumor septal signs among thymomas, thymic carcinomas and thymic lyhmphomas using MR diffusion weighted imaging (DWI) and T2 weighted imaging (T2WI).

Materials and Methods: Fifty-six patients with pathologically diagnosed thymic tumors who underwent DWI and T2WI were retrospectively enrolled. Intratumor septal signs were classified into four categories based on MR images: no septum, single line, reticulate and central patchy. Comparison was made on the types and incidences of intratumor septal signs among different thymic tumors.
Results: Among56 thymic solid tumor patients,30 were men, with the mean age of, 46 years (5 to 69 years). 23 (41.1%) patients had thymomas, 16 (28.6%) patients had thymic carcinomas, and the rest 17 (30.4%) had thymic lymphoma. Intratumor septal signs were found in all thymoma patients, and reticulate septum in 17(73.9%) cases of thymoma. Central patchy signs were identified in 13 (81.3%) thymic squamous carcinoma, and no obvious septum was found in 3 (18.8 %) cases of thymic neuroendocrine carcinoma. In thymic lymphoma, single line septal signs existed in 4 (23.5 %) patients, and central patchy signs in 3 (17.6 %) patients, and no intratumor septum was seen in 10 (58.8 %) patients.
Conclusion: The types and incidence of intratumor septumare different in different thymic solid tumors, which is of value in the differential diagnosis of thymic tumors based on MR DWI and T2WI.

PU-0985

DW-MRI for esophageal squamous cell carcinoma, correlations between ADC values with histologic differentiation and VEGF expression: A retrospective study

Shanguo Zhang,Congqingxue 丛庆学
daqinglongnanyiyuan

Abstract. The aim of the present study was to assess the correlations between diffusion-weighted magnetic resonance imaging (DW-MRI) features with the histologic differentia-tion and the expression of vascular endothelial growth factor (VEGF) in esophageal squamous cell carcinoma (ESCC). A total of 52 patients with ESCC included in the present study received radiotherapy, and all patients underwent contrast enhanced MRI and DW-MRI prior to and following radio-therapy. The diffusion sensitivity coefficient (*b* value) was set as 800 s/mm². Apparent diffusion coefficient (ADC) values were automatically computed. VEGF expression was evaluated by immunohistochemical staining. The results demonstrated that the pathological grading of ESCC was positively correlated with ADC values (r=0.635, P=0.0007), and the VEGF expression was inversely correlated with ADC values (r=-0.321, P=0.008). However, no correlation was identified between the pathological grading and the VEGF expression (r=0.178, P=0.284). All patients were categorized as complete response (CR) or partial response (PR) and the ADC values were increased significantly following radiotherapy. The mean ADC values in the CR group were higher than the PR group prior to radiotherapy (t=5.156, P=0.0004). Therefore, we concluded that the DWI with ADC value measurement may represent the grade of tumor histologic differentiation and the degree

of VEGF expression, and may also serve as a useful marker to predict radiotherapy and anti-VEGF response in ESCC. ADC value may be a substitution for assessing tumor angiogenesis and novel prognostic factor and contribute to the treatment of ESCC.

PU-0986
肺孤立性实性病变的磁共振弥散成像技术优选

俞家熙,李新春
广州医科大学附属第一医院

目的
对肺孤立性实性病变的患者进行磁共振弥散加权成像（Diffusion-weighted MR Imaging，DWI），通过对比快速自旋回波弥散成像(Turbo Spin Echo Diffusion-weighted MR Imaging，TSE-DWI)与平面回波弥散成像(Echo Planar diffusion weighted imaging，EPI-DWI)对病灶的图像质量、变形率、成像效率及主观评分，寻找对肺孤立性实性病变成像较好的弥散成像技术。
材料与方法
采用 3.0T MRI 对 40 例肺孤立性病变进行 TSE-DWI 序列及 EPI-DWI 序列扫描(b 值=600 s/mm2)。分别测量常规 TSE-DWI 序列及 EPI-DWI 序列图像的信噪比，孤立性病变区及脊髓的 ADC 值，比较其变形率及成像效率，并进行统计学处理。由 2 名 5 年以上工作经验的放射科诊断医师，采用双盲 3 分法分别对 TSE-DWI 序列及 EPI-DWI 序列图像质量进行评分，并结果行一致性评价。
结果
TSE-DWI 序列的信噪比为 17.40±7.7，EPI-DWI 序列的信噪比为 13.92±7.73，两者之间有统计学意义（P=0.032＜0.05）。40 例 TSE-DWI 序列的 ADC 值为 1.88±0.99×10-3 ㎜²/s，36 例 EPI-DWI 序列病灶的 ADC 值为 1.71±0.96×10-3 ㎜²/s，两者之间有统计学意义（P=0.006＜0.05）。40 例 TSE-DWI 的变形率为 0.02±0.06×100%，36 例 EPI-DWI 的变形率为 0.41±0.38×100%，两者之间有统计学意义（P=0.00）。
结论
TSE-DWI 序列信噪比、变形率、成像效率及主观评分较 EPI-DWI 序列高，能准确反映肺孤立性病变的位置及形态，更有利于对病灶的准确测量，可以应用于胸部孤立性病变的常规扫描。

PU-0987
DCE-MRI 扫描定量参数在肺结节鉴别诊断中的应用价值

王玉锦,周舒畅,祝婷婷,夏黎明,吴维,唐大宗
华中科技大学同济医学院附属同济医院

目的：探究 DCE-MRI 扫描定量参数在肺结节鉴别诊断中的应用价值.方法对 31 例肺结节患者共 39 个结节行 3T DCE-MRI 检查，动态增强采用 TWIST-VIBE 序列行 200 期扫描(空间分辨率为 1.6 mm×1.6mm×5 mm，时间分辨率为 2s)。测得所有病灶的血流动力学参数(Ktrans、Ve、Kep、iAUC)。 对良恶性病变的定量参数进行独立样本 T 检验分析，并用 ROC 曲线对其进行诊断效能分析。**结果** 采用 TIST-VIBE 序列的 DCE-MRI 可成功应用于病人的灌注扫描。良性病变的定量参数 Ktrans、Kep、Ve、iAUC 分别为 0.287±0.182/ml、0.957±0.739/ml、0.416±0.239/ml;恶性病变的定量参数 Ktrans、Kep、Ve、iAUC 分别为 0.737±0.387/ml、2.426±3.238/ml、0.482±0.185/ml、30.467/13.698/ml。 所有定量参数在良恶性病变之间 Ktrans、Kep、iAUC 具有显著的统计学差异。Ktrans 诊断的敏感度、特异度、准确性、曲线下面积分别为 80.8%、76.9%、

79.5%、0.893；Kep 诊断的敏感度、特异度、准确性、曲线下面积分别为 84.6%、76.9%、82.1%、0.784；iAUC 诊断的敏感度、特异度、准确性、曲线下面积分别为 76.9%、61.5%、71.8%、0.772。结论：DCE-MRI 扫描定量参数能提供肺结节血流动力学方面的信息，由 VIBE 序列获取的定量参数 Ktrans、Kep、iAUC 在病变诊断方面具有较高的敏感性及准确性,其中 Ktrans 诊断效能最佳。对肺部良恶性肿瘤的鉴别诊断具有较高价值。

Motion-suppressed GRASP MRI for multiphase assessment of the lung: initial experiences

Lihua Chen[1,2],Jian Wang[2],Li Feng[3]
1.Department of Radiology， PLA 904 Hospital
2.Department of Radiology， Southwest Hospital， Army Medical University
3.Memorial Sloan Kettering Cancer Center

Objective: This work aimed to test the performance of free-breathing dynamic contrast-enhanced MRI (DCE-MRI) of the lung using golden-angle radial sparse parallel MRI with motion suppression (Motion-Suppressed GRASP). **Methods:** Thirty-nine patients with known pulmonary lesions were recruited to participate in this prospective study. A prototype fat-statured T1-weighted stack-of-stars golden-angle radial sequence was employed for data acquisitions. Based on the data classification criteria, 20 datasets were selected into group one for testing the Motion-Suppressed GRASP reconstruction. Each radial dataset was reconstructed using both Motion-Suppressed GRASP employing a soft-weighted iterative reconstruction algorithm and standard GRASP without motion compensation. Post-contrast conventional Volumetric Interpolated Breath-Hold Examination (BH-VIBE) images were acquired for additional comparison. Corresponding breath-held post-contrast CT images was also available in three patients for comparison. Two experienced readers blinded to reconstruction and acquisition schemes independently scored the overall image quality, the conspicuity of lesion, the overall artifact level and the diagnostic confidence of four contrast phases selected from each reconstructed image-set. **Results:** Compared to standard GRASP, Motion-Suppressed GRASP achieved significant visual improvement (All $P<0.05$) in overall image quality (3.37 ± 0.28 v.s. 3.10 ± 0.32), lesion conspicuity (3.33 ± 0.35 v.s. 2.98 ± 0.51), overall artifact level (3.29 ± 0.33 v.s. 2.96 ± 0.49) and diagnostic confidence (2.54 ± 0.24 v.s. 2.31 ± 0.31). There was no significant difference (All $P>0.05$) between the post-contrast BH-VIBE and Motion-Suppressed GRASP images. The Cohen’s Kappa value was 0.80, 0.87, 0.90 and 0.83 for the overall image quality, the conspicuity of pulmonary lesions, the overall artifact level and the diagnostic confidence, respectively, suggesting good inter-reader agreement. **Conclusion:** Motion-Suppressed GRASP MRI achieves improved imaging performance for free-breathing DCE-MRI of the lung and can be used for better assessment of pulmonary lesions.

PU-0989

MR imaging of thymomas: a combined radiomics nomogram to predict histologic subtypes

Gang Xiao[1],Yu-Chuan Hu[1],Jia-Liang Ren[2],Wen Wang[1],Guang-Bin Cui[1]
1.Tangdu Hospital, the Military Medical University of PLA Airforce (Fourth Military Medical University), China
2.GE Healthcare, Beijing, 100176, China

Introduction: The accurate prediction of WHO classification of thymomas is urgently needed to guide the optimal individualized therapeutic strategies. We aimed to develop and validate a combined radiomics nomogram for personalized prediction of histologic subtypes in patients with thymomas.
Methods: A total of 182 thymoma patients were divided into the training cohort (n=128) and the test cohort (n=54). Radiomics features were extracted from T2-weighted, T2-weighted with fat suppression, and diffusion-weighted images to build a radiomics signature in the training cohort. Multivariate logistic regression analysis was used to develop a combined radiomics nomogram that incorporated clinical, conventional magnetic resonance (MR) imaging variables, apparent diffusion coefficient (ADC) value, and radiomics signature. The clinical, conventional MR imaging and ADC models were also evaluated respectively. The performances of different models were compared by receiver operating characteristic (ROC) analysis and Delong test. Discrimination, calibration and clinical usefulness of the combined radiomics nomogram were assessed.
Results: The radiomics signature, consisting of 14 features, achieved favorable predictive efficacy in differentiating low-risk from high-risk thymomas, outperforming clinical, conventional MR imaging, and ADC models. The combined radiomics nomogram incorporating tumor shape, ADC value, and the radiomics signature showed the best performance (training cohort: area under the curve [AUC] = 0.946; test cohort: AUC = 0.878). The calibration curve and decision curve analysis indicated the clinical utility of the combined radiomics nomogram.
Conclusion: The radiomics signature is a useful tool to predict histologic subtypes of thymomas. The combined radiomics nomogram improved individualized subtype prediction in patients with thymomas.

囊性胸腺瘤的临床及 MRI 特征分析

肖刚,胡玉川,崔光彬
空军军医大学唐都医院

目的 探讨囊性胸腺瘤的 MRI 影像特征，评估 MRI 对其诊断价值。
方法 回顾性分析 17 例囊性胸腺瘤患者的临床及 MRI 影像资料，其中男 9 例，女 8 例，年龄 19~72 岁，平均 46 岁。所有病例均经组织病理学及免疫组化检查，且行常规 MRI 及 DWI 序列扫描，分析其常规 MRI 特征（主要包括大小、形态、囊腔分隔、实性成分、囊实比、包膜完整度、瘤周水肿等）及 ADC 值。
结果 组织病理学亚型：A 型胸腺瘤 2 例（11.8%），AB 型胸腺瘤 2 例（11.8%），B1 型胸腺瘤 2 例（11.8%），B2 型胸腺瘤 8 例（47.1%），B3 型胸腺瘤 3 例（17.6%）。肿瘤大小 2.3~13.6cm，

平均 7.1cm；囊液呈 T1 低/T2 高信号 12 例（70.6%），T1 高/T2 高信号 5 例（29.4%）；囊壁或分隔含有不同程度实性成分，其中单发附壁结节/肿块 9 例（52.9%），多发附壁结节/肿块 5 例（29.4%），囊壁弥漫性增厚伴结节/肿块 3 例（17.6%）；肿瘤囊实比平均为 2.6±1.6；实性成分 ADC 平均值（1.32±0.21）×$10^{-3}mm^2/s$。

结论 囊性胸腺瘤多为 B2 型胸腺瘤，其 MRI 表现具有一定特征性，肿瘤多伴有不同程度实性成分。MRI 对囊性胸腺瘤的诊断具有重要价值。

3D-动态增强 MRI 在肺部实性孤立结节的血管构筑评估的应用研究

付靓,李凯
广西医科大学第一附属医院

摘要 **目的**:探讨动态增强 MRI 定量参数在肺部实性孤立结节的血管构筑评估的应用价值。**方法** 前瞻性分析 32 例经病理学证实肺部占位性病变，所有患者术前均使用德国西门子 3.0TMR 行常规胸部 MRI 平扫和 DCE-MRI 扫描，术前行西门子 3.0TMRDCE-MRI 检查，将原始数据手动导入图像灌注处理软件 Tissu4D 行多参数测值，获取肺部实性孤立结节的 Ktrans、Kep 和 Ve 值最终平均数据，所有患者标本均采用 CD31、VEGF、SMA 免疫组化标记，运用图像分析软件 ImageJ 获取血管构筑各参数值。**结果** 不同良、恶性肺结节组间 Ktrans 及 Ve 值存在统计学意义（P＜0.05）；不同分化程度组别间进行分析，Ktrans 值随着分化程度降低而逐渐升高，且具有统计学意义（P＜0.05）；在不同病理 T 分期组别间进行比较，Ktrans、Kep、Ve 值随着分期增高逐渐升高，且均有统计学意义（P＜0.05）；Ktrans、Kep 与微血管参数（CD31-MVD、VEGF、MPI）均有相关性（P＜0.05）；Ve 与微血管参数（CD31-MVD、VEGF）有相关性（P＜0.05），但与表示血管成熟度参数 MPI 无相关性；经绘制 ROC 曲线分析显示，Ktrans、Kep 及 Ve 值诊断肺部恶性结节的 ROC 下面积分别为 0.922、0.521 和 0.911，其阈值可作为鉴别诊断的临界值。**结论** 磁共振动态增强扫描对于评估肺结节病理分级及分化程度具有一定的诊断价值；DCE-MRI 定量渗透性参数可以间接量化肿瘤微血管生成量、血流灌注特性，反映肿瘤微血管成熟度，进而动态、重复的观察评价肺实性孤立结节血管的构筑情况。

背景抑制全身弥散成像（DWIBS）在儿童肿瘤全身转移随访中的应用

秦奋洁
浙江大学医学院附属儿童医院

目的:探讨背景抑制全身弥散成像（DWIBS）在儿童肿瘤全身转移随访中的应用价值
方法 使用 Philips Prodiva 1.5T MR 扫描仪,信号采集使用两块 Torso 线圈，对 3 名肿瘤患者进行 DWIBS 检查，经三维最大密度投影重建及黑白反转后形成全身“类 PET”MRI 图像，对其所得影像进行分析。
结果:两名患儿均获得高质量的 DWIBS 图像，病变周围组织信号被有效抑制，Case1:神经母细胞术后，左肾缺如，双侧股骨、部分骨盆组成骨、腰骶椎骨质信号不均匀，见多发斑点状、结节状长 T2 信号，以右侧股骨颈病变明显，部分病变可见环状短 T 2 信号影，其在类 PET 序列上呈低信号；

CASE2:左后腹膜肾上腺区见软组织肿块影，信号欠均匀，在类 PET 序列上呈低信号，所见诸骨信号尚均匀，周围软组织无明显肿胀，类 PET 上未见明显异常信号.
结论 背景抑制全身弥散成像（DWIBS）在儿童肿瘤全身转移复查上有一定应用价值，减少家庭经济负担，且安全无辐射。

PU-0993
Native T1 Mapping 定量技术在乳腺癌中的初步应用研究

王亚弟
深圳市宝安区人民医院

目的 采用磁共振 T1 Mapping 定量技术，检测正常乳腺及乳腺癌的腺体 T1 定量值，探索 T1 Mapping 技术分析判断乳腺癌的可行性。**方法** 选取 2019 年 1 月-6 月来我院还未进行治疗前的 50 例乳腺癌女性患者与 50 例正常女性志愿者，均采用德国 Siemens 3.0T Skyra MRI 进行乳腺检查，对 MRI 扫描得到的图像进行有效地处理，利用后处理工作站测量腺体 TI 值，并重建成乳腺的 T1 值空间上的分布图，结合这些情形，对数据进行有效的分析。**结果** 乳腺癌患者的 T1 值都要远高于其正常乳腺 T1 值，这两者之间数据差异都具有显著性（P＜0.05）。**结论** 磁共振 T1 Mapping 定量技术在乳腺癌病变中的应用取得比较高的价值。

PU-0994
基于动态增强 MRI 图像的纹理分析对乳腺良恶性肿瘤的诊断价值

吴瑶媛,董江宁
中国科学技术大学附属第一医院西区， 安徽省肿瘤医院

目的 研究基于动态增强 MRI 图像纹理分析对乳腺良恶性肿瘤的诊断价值及临床价值。
方法 回顾性研究 2013 年 8 月至 2019 年 5 月术前行 3.0T MRI 检查（T1WI, T2WI fs, Vibrant+C, DWI）乳腺肿瘤患者共 82 例，平均年龄(49.55±12.18) 岁，良性者共 36 例（其中术后病理为乳腺纤维腺瘤 26 例，导管内乳头状瘤 11 例），恶性者 46 例（其中术后病理为浸润性导管癌 30 例，导管内癌 14 例，浸润性小叶癌 2 例）。在 Vibrant+C 图像上，勾画乳腺肿瘤最大径层面的瘤体实性部分为 ROI，利用 AK 软件，进行纹理分析，提取特征参数，并数绘制 ROC 曲线，得出乳腺良恶性肿瘤的诊断效能。
结果 1.共勾画 36 例乳腺良性肿瘤和 46 例乳腺癌，通过 AK 软件分析，共得到 175 个纹理特征，通过 LASSO 降维筛选出 5 个特征参数： Haralick 相关偏移量、灰度共生矩阵 45° 能量角偏移 、Cluster Prominence 偏倚、3Correlation_angle15 偏倚量、最小强度，这 5 个特征参数良恶性肿瘤的组间差异有统计学意义（P 值均<0.05）。
2.分别绘制 ROC 曲线，Haralick 相关偏移量、灰度共生矩阵 45° 能量角偏移量 、Cluster Prominence 偏倚量、3Correlation_angle15 偏倚量、最小强度的曲线下面积（AUC）分别为 0.696、0.252、0.683、0.325 和 0.294，其中 Haralick 相关偏移量曲线下面积最大。
结论 纹理分析可提供更多量化信息，术前诊断乳腺良恶性肿瘤有一定的价值。

PU-0995
全数字 3.0T 磁共振对乳腺良恶性肿瘤的临床研究

张善国

大庆龙南医院

目的 探讨 3.0T 磁共振对乳腺良恶性肿瘤的鉴别诊断中的作用。
方法 乳腺动态时间-信号强化曲线反映了病灶血液灌注和廓清情况，间接揭示病变组织的血流动力学情况，同时显示病变的肿瘤血管情况。Ⅰ型渐增型，曲线逐渐上身，诊断良性病变的敏感性和特异性为 52%和 71%；Ⅱ型平台型，曲线速升平台，诊断恶性病变的敏感性和特异性为 43%和 75%；Ⅲ型流出型，曲线速升速降，诊断恶性病变的特异性为 90%，敏感性不高为 20%。因此，乳腺良性病变表现为缓慢、延迟的渐进性强化；恶性病变趋向快进明显增高并快速下降。
结果 应用常规 T1、T2、DWI 和动态增强检查技术，对乳腺病变进行常规诊断和定性分析，可以对早期乳腺癌进行比较准确的诊断。动态增强磁共振是目前公认的诊断乳腺疾病最准确的影像技术，其不仅能显示病灶外部形态特征，还可以反映肿瘤的内部信号及血流动力学特点；本课题目的是应用 DCE-MRI 定量分析通过动态监测对比剂在肿瘤组织内的吸收和代谢等药代动力学过程,经过后处理分析得到相应位置的定量血流动力学参数,从而达到量化评价肿瘤组织的血管内皮通透性和血流量,实现在细胞分子水平观测肿瘤组织内血管分布和血流灌注,进一步为病变的诊断和治疗方案的选择提供有价值的信息。
结论 MRI 具有多角度、多层面扫描、多成像参数等特点，其检查技术以无创、无辐射、清晰、准确的特性在疾病的诊断和鉴别诊断中显示其突出的优势，动态增强磁共振是诊断乳腺疾病的重要手段，可通过增强后病变的强化特征不仅提供病灶的形态学特征，而且动态增强 MRI 还能提供病灶的血流动力学情况，可以提供多项参数，时间-信号强度曲线、MIP 血管成像技术，不同程地反映乳腺病变的肿瘤血管、微血管密度，通过影像检查客观地揭示肿瘤内部的情况，对乳腺癌的术前正确评估，使得外科医师对肿瘤的全面了解成为现实，为临床制定手术治疗方案及预测乳腺癌转移、复发和预后可提供重要依据。

PU-0996
3.0T 磁共振多 b 值 DWI 及其 ADC 值定量分析在乳腺良恶性病变鉴别诊断中的价值

蔡玉琳
陆军军医大学附属新桥医院放射科

目的 探讨 3.0T 磁共振多 b 值弥散加权成像(diffusion weighted imaging,DWI)及表观扩散系数(apparent diffusion coeffi-cient,ADC)定量分析在乳腺良恶性病变鉴别诊断中的价值。**方法** 采用单次激发回波平面成像(echo planar imaging,EPI)技术行双侧乳腺 DWI,扩散敏感系数(b 值)分别为 0、300、800s/mm2。观察乳腺病变在 DWI 上的大小、形态及信号特征，计算 20 个正常乳腺（对照组）、手术病理证实 16 个恶性病灶（恶性病变组）、20 个良性病灶（良性病变组）分别在 b=0、300、800s/mm2 时的 ADC 值,比较三组研究对象间 ADC 值差异的统计学意义以及 b=0、300、800 s/mm2 时 ADC 值差异的统计学意义。根据恶性病变组平均 ADC 值的 95%可信区间的上界,计算 3 组不同 b 值下诊断乳腺癌的敏感性、特异性、准确性。**结果** 乳腺良、恶性病变、正常腺体间 ADC 值差异均有统计学意义（$P<0.0001$),恶性病变 ADC 值明显低于良性病变和正常腺体组织($P<0.0001$),良性病变 ADC 值明显低于正常腺体组织($P<0.0001$)；3 组 b 值间 ADC 值差异均有统计学意义($P<0.0001$),b 值越低,ADC 值越大($P<0.05$)。b=0、300、800s/mm2 时，以恶性病变组平均 ADC 值的 95%可信区间的上限诊断乳腺癌的敏感性 87.5%、85.71%、81.25%,特异性分别为 77.5%、78.57%、81.25%,准确性分别为 82.5%、82.14%、81.25%。**结论** 磁共振多 b 值 DWI 及其 ADC 值定

量分析在乳腺良恶性病变鉴别诊断中具有较高的临床诊断价值,可提高临床诊断的敏感性和准确性,对乳腺疾病的病变性质进行诊断。

PU-0997

Feasibility Study of applying Simultaneous Multi-slice technique in Diffusion Weighted Imaging of Breast Lesions

Fei Wang,Juan Zhu
Anqing Municipal Hospital

Objective: To evaluate the feasibility of applying simultaneous multi-slice (SMS) single-shot echo planar imaging (EPI) to accelerate MR diffusion imaging for breast lesions.
Materials and Methods:60 patients (30 breast carcinoma,17 fibroadenoma of breast and 13 normal breast) who underwent breast MRI(3T,Skyra,Siemens Healthcare) were collected.The following three different diffusion weighted imaging (DWI) scan protocols were applied.The first sequence(A) is the conventional single-shot echo planar DWI (EPI-DWI):TR/TE 5200ms/72ms,FOV 360mm×227.4mm,Slices 30,Voxel size 0.9×0.9×5mm^3,b-values50s/$mm^2$and 800s/mm^2,Scan time 2:31min.For the second(B) and the third(C) DWI protocols,a SMS factor of two and three were applied,respectively.In order to compare the image quality with those acquired by sequence A,all the sequence parameters were kept the as described above,except for changing the TR of sequence B to 2600ms(scan time 75s) and the TR of sequence C to 1800ms(scan time 55s).For all sequences,image quality is evaluated on a five-point scale.The quantitative analysis for the three sequences included image signal-to-noise ratio (SNR),ADC values.Paired *t*-test was used to compare the differences of SNR and ADC values between A and B,A and C.Inter-reader reliability was analyzed by calculating the intra-class correlation coefficient (ICC).
Results: Compared with protocol A, the image quality of protocol C was significant reduced (ICC=0.4),while that of protocol B was stable (ICC= 0.9).There was no significant difference between protocol B and A (p=0.162) of the image SNR.The SNR of protocol C were significant lower than those of protocol A(p<0.001).There was no significant difference in ADC values between protocol B and A、C and A in normal breast parenchyma and lesions (all $p > 0.05$).
Conclusion: By applying SMS technique with a factor of 2, the acquisition time of breast DWI can be significantly reduced without sacrificing the image quality. However, if the SMS factor increases to 3, the image SNR decreases which affects clinical diagnosis.

PU-0998

DCE-MRI 联合 DWI 对乳腺癌新辅化疗疗效的评价作用

陈惠枚

深圳市宝安区人民医院

目的 探讨磁共振动态增强（DCE-MRI）联合扩散加权成像（DWI）评价乳腺癌新辅化疗（NAC）疗效的临床价值。**方法** 收集我院 2017 年 2 月至 2019 年 3 月病理证实为浸润型乳腺癌患者 36 例，并行新辅化疗 4-6 疗程，以化疗前后穿刺活检病理变化为标准分为缓解组 21 例，无效组 15 例，对比分析新辅化疗前后 DCE-MRI、DWI 检查各参数的差异。**结果** 患者化疗后峰值、达峰时间、最大线性斜率变化率、最大排泄速率、流出斜率、ADC 值较化疗前有变化（P<0.05），缓解组的变化程度较无效组更显著（P<0.05），DCE-MRI 联合 DWI 检查判断乳腺癌新辅化疗的疗效的准确性 86.1%（31/36），特异性 80.00%（12/15），灵敏度 80.95%（17/21），Kappa 值 0.80。**结论** DCE-MRI 联合 DWI 检查能准确评价乳腺癌新辅化疗的疗效，为临床提供可靠信息。

PU-0999

A Meta-analysis of the Diagnostic Dynamic Contrast-enhanced MRI for Breast Lesion Characterization

Qi Yang
The First Hospital of Jilin University

Background: Various techniques are available to assess diffusion properties of breast lesions as a marker of malignancy at MRI. The diagnostic performance of these Dynamic Contrast-enhanced (DCE) MRI markers has not been comprehensively assessed.
Purpose: To investigate the diagnostic performance of DCE-MRI to differentiate malignant and benign breast lesions.
Materials and Methods: PubMed, Embase, and Cochrane Library databases (from building to July 31, 2018) were searched to collect articles about diagnostic performance of Dynamic Contrast-enhanced MRI in the breast. Studies were reviewed according to exclusion criteria and eligibility. Publication heterogeneity and bias between studies were assessed. Pooled summary estimates for sensitivity, and specificity obtained for each parameter by using a variate model. A subanalysis investigated the effect of DCE-MRI parameters on diagnostic performance by using a Student t test or a one-way analysis of variance.
Results: From 153 eligible articles, including 3325 lesions in total, in which 2168 malignant lesions and 1157 benign lesions, considering the pathological results as the gold standard. The sensitivity and specificity in the included 20 articles of quantitative DCE-MRI (Ktrans, Kep, and ve) in comprehensively evaluating Breast Lesion Characterization were 88 percent (95% confidence interval (CI): 77-98%) and 83 per cent (95% CI: 78-87%), respectively. The sensitivity and specificity in the five articles of Ktrans evaluating lesions for breast cancer were 75.1 per cent (95% CI: 71.8-92.6%) and 79.6 per cent (95% CI: 72.9%-88.2%), respectively.
Conclusion: Our study confirmed that the quantitative DCE-MRI is able to monitor lesion Characterization for breast cancer because of its high sensitivity and specificity.

PU-1000

磁共振动态增强与钼靶 X 线对非肿块型乳腺疾病的对比研究

戴丽娟,时高峰
河北医科大学第四医院

目的 比较磁共振动态增强与钼靶 X 线对非肿块型乳腺癌的诊断价值。资料与**方法** 回顾性分析经临床触诊和钼靶 X 诊断为乳腺非肿块型疾病（包括不对称致密影 16 例，微钙化 35 例、结构扭曲 19 例、混合征象 12 例）患者 82 例，均为单发病灶，共 82 个病灶。其中乳腺癌 53 例（包括乳腺浸润性导管癌 41 例， 浸润性小叶癌 9 例，乳腺黏液腺癌 1 例，浸润性导管-小叶混合癌 2 例）；乳腺良性疾病共 29 例（包括乳腺纤维腺瘤 7 例，乳腺腺病 17 例， 导管内乳头状瘤 2 例，慢性炎症 3 例）。**方法** 均采用钼靶 X 线及 MRI 多参数成像扫描。对比 MRI 动态增强及钼靶 X 线诊断非肿块型乳腺癌准确率、特异性、敏感性、阳性预测值和阴性预测值，阴性预测值。 **结果** MRI 动态增强对非肿块型乳腺癌诊断的的准确性为 80.49%，敏感性 83.02%，特异性 75.86%，阳性预测值 86.27%，阴性预测值 75.86%；钼靶 X 线诊断非肿块型乳腺癌诊断的的准确性为 70.73%，敏感性为 72.22%，特异性 67.86%，阳性预测值 81.25%，阴性预测值 67.86%。**结论** MRI 动态增强诊断非肿块型乳腺疾病的准确性、敏感性和特异性均高于钼靶 X 线；尤其对于不对称致密影的乳腺疾病的诊断准确性明显高于钼靶 X 线。钼靶 X 线对于乳腺微钙化疾病诊断敏感性高于钼靶 X 线。总之，对非肿块型乳腺疾病的诊断，MRI 多参数成像可提高病变的检出率和诊断准确率，可以给临床提供更加直观清晰的图像，为临床确定治疗方案提供帮助。

PU-1001
比较 RS－EPI（分段读出回波成像）和传统 SS－EPI 在乳腺癌筛查中的诊断价值

戴敏慧
浙江中医药大学附属第一医院

目的 定性和定量比较 RS－EPI（分段读出回波成像）和传统 SS－EPI 在乳腺癌筛查中的诊断价值
材料和**方法**

对 31 例女性乳腺磁共振检查患者进行回顾性研究（年龄范围： 23-69 岁 ，平均 43 岁），其中 15 例 MR－BI－RADS 为 2 级，14 例 MR－BI－RADS 为 3 级，2 例 MR－BI－RADS 为 5 级。均用西门子 VERIO 3T 磁共振扫描仪行常规 MRI 、SS－EPI 及 RESOLVE 序列扫描 (b=50、800s/mm2)。选取感兴趣区通过测量肿瘤表面的扩散系数（ADC）、信噪比（SNR）、对比度来比较两个序列之间的定量差异。由 2 名 5 年以上工作经验的放射科诊断医师，采用双盲 5 分法分别对 EPI－DWI 和 resolve 图像质量进行评分，并采用 kappa 分析对 2 名医师的结果行一致性评价。采用 Mann－Whitney U 检验比较 SS－EPI 和 RS－EPI 之间的 ADC 差异。用配对 t 检验比较两个序列的定量参数（SNR、对比度、CNR）的差异。

结果

2 名医师对 SS－EPI 和 RS－EPI 图像质量进行主观评价，SS－EPI 序列 kappa 值为 0.921，RS－EPI 序列 kappa 值为 0.813，P 值均<0.01，结果一致性良好。RS－EPI 组评分 4 分及 4 分以上约占 97.8%，而 SS－EPI 组评分均在 4 分及 4 分以下，评分 4 分仅占约 16.67%。RS－EPI 组的 SNR 明显高于常规 SS－EPI 组（53.65 对 18.078.75，P）。RS－EPI 组的 CNR 和对比度均高于常规 SS－EPI 组（P<0.001）。标准化的 ADC 在两个序列之间没有显著差异，无统计学意义（P>0.05）。

结论

RS－EPI 对比常规 SS－EPI 明显提升了图像的质量、SNR 与 CNR，对 ADC 的值的测量没有影响。在乳腺癌筛查中相较于传统的 SS－EPI 序列，RS－EPI 序列具有更高的诊断准确性和诊断价值。

PU-1002
动态增强曲线与弥散成像对乳腺良恶性占位的诊断价值

陈杰
上海市浦东新区公利医院

目的 探讨动态增强曲线与弥散成像对乳腺良恶性占位的诊断价值。**方法** 测定 60 例临床怀疑乳腺占位的女性患者，年龄 36--75 岁，平均 58 岁，进行常规核磁共振检查的基础上增加横断面弥散与动态增强成像，利用后处理软件绘制动态增强曲线，分析其在乳腺占位区分良恶性的价值。**结果** 利用动态增强曲线结合弥散成像对乳腺占位区分良恶性的敏感性。18 个恶性病灶，42 个良性病灶，灵敏度 89.1%，特异度 42.8%，准确度 69%。**结论** 动态增强曲线与弥散成像对乳腺良恶性占位的诊断具有很大的参考价值。

PU-1003
磁共振在乳腺癌新辅助化疗疗效评价中的应用价值

李晶
吉林市人民医院

目的 探讨磁共振（MRI）在乳腺癌新辅助化疗（NAC）疗效评价中的应用价值。**方法** 选取本院于 2018 年 4 月-2019 年 4 月收治的 58 例乳腺癌患者，开展为期 2~4 周期的 NAC，分别于 NAC 前、后，开展 2 次 MRI 检查，并于 NAC 第 3~4 周期时，进行手术治疗。依据实体瘤反应评价标准、MRI 检查指标及术后病理检查结果，评价 NAC 疗效。**结果** NAC 后，MRI 检查评估总有效率为 72.41%（42/58），术后病理对 NAC 进行评估的有效率为 77.59%（45/58），通过检验得知，两方法相关性明显（P＜0.05）。NAC 治疗前后病灶大小、体积等 MRI 相关指标对比，差异显著（P＜0.05）。**结论** 乳腺癌 NAC 治疗后，开展 MRI 检查，能够准确的将肿瘤病灶变化情况给反映出来，在对乳腺癌 NAC 疗效评价方面，价值突出。

PU-1004
浅谈乳腺 MRI 检查技术

侯伯男
解放军第八十二集团军医院

磁共振检查作为目前最先进的检查技术被广泛应用于乳腺疾病的诊断和临床评估，MRI 检查作为一种无辐射、无创性的检查得到飞速发展。本文简要介绍乳腺 MRI 检查的基本技术、序列设计、主要参数、图像采集及图像后处理技术等问题进行讨论和研究。

PU-1005
MRI 动态增强联合 MRS 对乳腺癌 NAC 早期疗效的评估价值

周雪春

江西省肿瘤医院

目的 探讨 MRI 动态增强扫描联合波谱分析（MRS）在评价新辅助化疗（NAC）治疗乳腺癌方面的价值。
资料与方法 回顾性分析我院经活检或手术病理证实的 36 例乳腺癌患者 MRI 检查资料，所有患者术前行新辅助化疗，并且化疗前、后均行 MRI 动态增强扫描及波谱分析检查。比较治疗前后病灶的时间-信号强度曲线及 ^{1}H-MRS 结果变化情况，观察分析 ^{1}H-MRS 中胆碱复合峰的峰高、峰下面积及胆碱信噪比，以评估新辅助化疗早期疗效。
结果 磁共振动态增强扫描能准确观察判断新辅助化疗后乳腺癌病灶缩小情况，同时对于化疗有效患者，病灶的时间-信号强度曲线（TIC）类型及 ^{1}H-MRS 中胆碱峰改变有统计学意义（P＜0.01）。
结论 乳腺癌新辅助化疗又称术前化疗或诱导化疗，广泛运用于肿瘤较大而有保乳愿望的患者,其目的是使肿瘤缩小、降低疾病分期以提高手术及保乳手术的成功率，通过提高病理完全缓解率改善乳腺癌病人的远期生存率，已成为乳腺癌综合治疗的手段之一。国外多中心前瞻性随机对照临床实验研究结果表明，NAC 与术后辅助化疗的无病生存率和总体生存率无统计学差异，但达到病理完全缓解者无病生存率和总体生存率得到明显改善。MRI 通过静脉注入对比剂在乳腺产生对比增强来发现病灶和对病灶的特征进行描述，动态增强乳腺 MRI 模式在推测微血管密度及对比剂渗透速度方面具有潜在作用，能较客观地反映乳腺癌的血供，有助于判断肿瘤的生物学行为及预后。MRS 是利用 MRI 的化学位移作用检测活体内代谢和生化信息的一种无创性功能成像技术，是一种能够活体定量检测病变内化学物质的无创检查方法，能从分子水平上反映组织的病理生理变化，可以鉴别肿瘤良、恶性，提高 MRI 诊断的特异性。MRI 动态增强扫描联合波谱分析在乳腺癌新辅助化疗早期疗效的无创性评价方面具有较大价值。

PU-1006
功能磁共振成像评估乳腺癌新辅助化疗疗效的应用效果

刘永光,马捷
深圳市人民医院

目的:探讨功能磁共振成像在乳腺癌新辅助化疗疗效的应用效果。**方法** 选择 2014 年 1 月-2019 年 4 月通过穿刺活检或手术确诊为乳腺癌并采用新辅助化疗的患者 80 例作为对象，采用前瞻性队列研究方法，根据行新辅助化疗后肿瘤体积变化情况，分为效应组（n=64）和无效应组（n=16）；两组化疗前和化疗 2 个周期（4-6 周后）后均采用功能磁共振成像评估病灶体积的变化、最大信号衰减率及病灶退缩率，以及他们之间相关性。**结果** 效应组经新辅助化疗后肿瘤退缩率、ADC 变化值，均高于无效应组（P<0.05）；新辅助化疗前后所有患者均完成功能磁共振成像检查，并以病理结果作为“金标准”。ROC 曲线结果表明：功能磁共振成像在乳腺癌新辅助化疗中的 ROC 曲线分别为 0.801、0.933，诊断敏感性为 84.2%，特异性为 90.3%；乳腺癌新辅助化疗前、后均完成功能磁共振成像检查，患者新辅助化疗前后 32 例时间-信号曲线变化不明显，34 例患者分型得到下降。**结论** 将功能磁共振成像应用于乳腺癌新辅助化疗疗效显著，可有助于乳腺癌早期疗效评估，整体疗效得到提升，在临床中具有应用价值。

影像组学预测雌激素受体阳性、淋巴结阴性乳腺癌复发风险

毛宁[1],洪楠[2]
1.山东省烟台毓璜顶医院
2.北京大学人民医院

目的 评估雌激素受体阳性、淋巴结阴性乳腺癌患者的磁共振影像组学与复发风险之间的关系。
材料与方法 本回顾性研究经过机构审查委员会批准。该数据包括 298 例具有完整磁共振检查，以及临床、组织病理和基因组数据的乳腺癌病人。从每个病人的磁共振图像中提取影像组学特征。该组患者分为训练集和验证集。通过回归分析和受试者操作特征（Receiver operating characteristic, ROC）曲线分析，评价磁共振影像组学特征对 Oncotype DX 多基因检测结果的预测能力，用独立验证集数据评估模型的效能。
结果 多重线性回归分析显示影像组学与多基因检测复发评分之间存在显著相关性（R2=0.26-0.36，r=0.5-0.55，p<0.0001）。在训练集（AUC 0.89；95%CI，0.80-0.98）和验证集（AUC 0.87；95%CI，0.80-0.95）中，影像组学模型显示出良好的判别能力。
结论 基于磁共振成像的影像组学在评估乳腺癌复发风险中显示出良好的前景。

PU-1008

乳腺腺肌上皮瘤一例

李云霞,彭琨,郭向东
山西医科大学附属太钢总医院

患者，女，41 岁，体检乳腺彩超示左乳外下象限 4-5 点近乳头、距皮肤表面约 0.7cm 见实性结节，形态欠规则，大小约 4.7mm*4.9mm*4.9mm，内部呈弱回声，分布欠均，其内可见点状强回声，CDFI 结节内及周边未见明显血流信号，双侧腋下未见肿大淋巴结。诊断左乳实性结节 BI-RADS 4b。查体：双乳可及散在片状增厚，未触及明确肿块结节。乳腺钼靶示左乳中央区见大小约 7.8mm*5.4mm 的等密度结节影，边缘较清楚，双乳中央区见小点状钙化，考虑 BI-RADS 3；乳腺 MR 平扫+动态增强扫描示左乳头后下方略偏外侧见一强化结节，距乳头约 2.9mm，形态欠规则，平扫呈等长 T1 长 T2 信号，DWI 呈高信号，直径约 6.3mm，其后方见一供血血管，动态增强扫描示病灶强化曲线呈流出型。双侧腋窝淋巴结未见明显增大。诊断左乳中央区结节 BI-RADS 5。病理检查示(左乳肿块)灰白灰黄色不规整组织，肿块直径约 0.6cm，包膜完整。免疫组化结果示：ER 部分+，PR 部分+，CK5/6（肌上皮+），HCK+，CD10 部分+，HER-2(++),Calponin(肌上皮+)，P63（肌上皮+）。符合乳腺腺肌上皮瘤（小管型），腺上皮不典型增生。

讨论

乳腺腺肌上皮瘤（AME）是由腺上皮和肌上皮细胞同时增生形成，大多为良性，恶性十分罕见。其诊断主要依据病理和免疫组织化学检查。影像学缺乏特异性表现。综合文献学习，AME 超声多表现为低回声包块，形态可规则或不规则，内部回声多不均匀。乳腺 X 线多为等密度或稍高密度影，钙化少见。乳腺 AME MRI 可表现为形态规则或不规则，边缘清楚或不清楚，平扫呈等、长 T1 等、长 T2 信号，动态增强扫描呈均匀强化，良性 AME 时间-信号强度曲线（TIC)多表现为流入型及平台型，也可为流出型，DWI 呈高信号；恶性 AME 多表现为流出型，恶性 ADC 值更低，DWI 弥散受限更严重。本例 AME 与恶性病变鉴别困难。

磁共振功能成像在乳腺癌新辅助化疗疗效评估应用的研究进展

曾乔
江西省肿瘤医院/江西省第二人民医院

近几年来，乳腺癌已经成为我国女性发病率及死亡率第一的癌症[1]。新辅助化疗（neoadjuvant chemotherapy NAC）已广泛作为局部进展期乳腺癌患者重要的综合治疗方法[2]。NAC 能够减小乳腺癌肿块大小，降低肿瘤分期，提高根治性或保乳手术几率及改善预后[3]。常规影像学检查基于肿瘤形态学变化评估疗效，但是肿瘤治疗过程中功能学变化往往先于形态学变化[4],早期预测、评估乳腺癌 NAC 疗效将有助于及时调整化疗方案，影响治疗效果及其预后。随着 MRI 硬件、软件的改进和发展以及乳腺专用线圈的应用，磁共振检查已经广泛用于乳腺癌的诊断及疗效评估上[5]。乳腺 MRI 也从结构成像发展到功能成像，如磁共振动态增强成像(MRI dynamic contrast enhanced imaging，DCE-MRI)、灌注成像(perfusion weighted imaging，PWI)、扩散加权成像(diffusion weighted imaging，DWI)及磁共振波谱(MR spectroscopy，MRS)等，这些功能成像技术能提供乳腺肿块的血管生成、水分子扩散、药代动力学、组织微循环、病理生理学等生物学信息。现就 MR 功能成像在乳腺癌 NAC 疗效预测及评估应用的研究近况进行综述。

PU-1010
18F-FDG PET/CT 与 MRI 动态增强对乳腺癌术后复发及转移的对比研究

郑潜新[1],周丽娟[2],任德标[2],李金胜[1],许斯鼎[1],时昭胤[1]
1.漳州市正兴医院
2.联勤保障部队第 909 医院

目的 对比 ^{18}F-FDG PET/CT 与 MRI 动态增强在乳腺癌术后复发及转移诊断中的价值。**方法** 对 2012 年 10 月至 2017 年 10 月 55 例乳腺癌术后 5 年内临床怀疑复发或转移并接受 ^{18}F-FDG PET/CT、 MRI 动态增强和病理学检查随访的患者资料进行回顾性 分析。结果 55 例乳腺癌术后患者中，联合 PET/CT 与磁共振共在术区局部、腋窝淋巴结、远处器官发现 91 个可疑病灶，经病理学证实其中局部复发 17 个，瘢痕 12 个，淋巴结转移 35 个，远处转移 27 个。PET/CT 诊断的乳腺癌复发及转移的灵敏度、特异度、准确率为 85%、72%、87%， MRI 动态增强诊断的乳腺癌复发及转移的灵敏度、特异度、准确率为 78%、91%、83%。结论 ^{18}F-FDG PET/CT 与 MRI 动态增强在乳腺癌术后复发及转移诊断中有重要价值，其中 ^{18}F-FDG PET/CT 对诊断乳腺癌术后转移的诊断明显优于 MRI 动态增强， MRI 动态增强对诊断乳腺癌术后复发准确率高于 ^{18}F-FDG PET/CT

PU-1011
磁共振同时多层（SMS）技术在乳腺扩散加权成像中的可行性研究

汪飞,朱娟
安庆市立医院

目的 探讨应用磁共振同时多层（Simultaneous Multi-slice, SMS）加速技术对乳腺扩散加权成像（DWI）的图像质量进行系统分析。
材料和方法 搜集应用 Siemens Skyra 3.0T MRI 进行乳腺磁共振扫描的 60 例患者。三套 DWI 扫描协议分别为：A 协议-单次激发平面回波 DWI（EPI-DWI）：FOV 360mm×227.4mm、TR/TE

5200ms/72ms、层数 30、分辨率 0.9×0.9×5、b 值为 50 及 800 s/mm ^{2}，扫描时间为 2min31s；B、C（SMS-DWI）协议：除 TR 时间以外其他参数均与 A 扫描协议完全一致，B 协议的为 TR2600ms、层面加速因子为 2（AF2），扫描时间为 1min15s，C 协议的 TR 为 1800ms、层面加速因子为 3（AF3），扫描时间为 55s。图像质量评估：以 A 协议为参考标准，（1）主观评价：对 B（AF2）和 C（AF3）协议图像质量进行分级评估；（2）客观评价包括图像信噪比（SNR）、乳腺正常腺体实质及病灶的 ADC 值。

结果 与 A 扫描协议相比，C（AF3）协议图像质量明显降低（ICC=0.4），B（AF2）协议表现出稳定的图像质量（ICC=0.9）。B（AF2）协议与 A 协议差异无统计学意义（p=0.162），C（AF3）协议 SNR 明显低于 A 标准协议，差异具有统计学意义（p＜0.001）。B（AF2）、C（AF3）协议分别与 A 协议乳腺正常腺体实质及病灶 ADC 值比较，差异均无统计学意义（p＞0.05）。

结论 在显著减少扫描时间且不会对图像 SNR、ADC 值产生影响的情况下，使用 SMS-DWI（AF2）扫描协议能取得很好的临床应用效果；SMS-DWI（AF3）图像 SNR 明显下降。因此，SMS 作为一种新的磁共振技术，在乳腺 DWI 中具有良好的应用前景。

骨盆漏斗韧带子宫平滑肌肉瘤 1 例报告与文献复习

邹春霞
重庆市第七人民医院

子宫肉瘤是女性罕见的肿瘤，占所有子宫恶性肿瘤的 3%，子宫平滑肌肉瘤占子宫肉瘤的 63%。多见于更年期及绝经后的妇女，恶性程度高，常见远处转移，且易复发，预后差。子宫平滑肌肉瘤多发于子宫体，宫颈少见，位于韧带处罕见，常见于子宫圆韧带及阔韧带，骨盆漏斗韧带更罕见。位于骨盆漏斗韧带的子宫平滑肌肉瘤常常被误诊为其他盆腔肿瘤。而对于子宫肉瘤或疑似子宫肉瘤的患者主要行子宫切除术加或不加双侧输卵管卵巢切除术。本文就骨盆漏斗韧带子宫平滑肌肉瘤患者 1 例的病例资料及 MR 表现进行分析、总结。

PU-1013

MRI 对肝癌 TACE 介入治疗术后病灶残留及疗效评估中的应用

陆洪江
中国人民解放军联勤保障部队第九〇三医院

摘要：目的 探究 MRI 对肝癌 TACE 介入治疗术后病灶残留及疗效评估。**方法** 将 2016 年 6 月至 2017 年 6 月我院收治 86 例肝癌 TACE 介入治疗患者作为研究对象，术前、术后均实施 MRI 增强扫描，分析 TACE 介入治疗疗效。**结果** 共检查出 106 个病灶，术前平均直径 7.32 cm，术后 3 个月、6 个月，CER 动脉期、SIR 动脉期教术前显著降低（P<0.05）。经 RECIST 标准评估 67 例（77.91%）有效，19 例（22.09%）无效。术后 3 个月.6 个月 ADC 教术前显著升高（P<0.05）。TACE 术后 3 个月、6 个月有效组患者 CER 动脉期、SIR 动脉期、肿瘤直径指标均显著低于术前（P<0.05），无效组患者术后 3 个月、6 个月 CER 动脉期、SIR 动脉期指标均显著低于术前（P<0.05）；有效组患者术后 3 个月、6 个月 CER 动脉期、SIR 动脉期、肿瘤直径指标均显著低于无效组（P<0.05）。TACE 术后 3 个月、6 个月两组患者 ADC 值均显著高于术前（P<0.05），且有效组术后 3 个月、6 个月 ADC 值显著高于无效组（P<0.05）。**结论** MRI 增强扫描可有效评估肝癌 TACE 术后病灶情况及疗效，对临床持续治疗方案具有指导意义

基于 T2*mapping 的无创性肝脏铁浓度检测在长期输血患者肝脏铁含量评估中的价值研究

吴梦琳,张雪宁
天津医科大学第二附属医院

目的 探讨基于 T_2^*的肝脏铁浓度（LIC）检测在长期输血患者肝脏铁过载评估中的价值。**方法** 收集长期输血患者 28 例，正常志愿者 10 例，均行肝脏 MRI-T_2^*map 成像及取血检测血清铁蛋白（SF）及转铁蛋白饱和度（TSAT）。测量患者及志愿者肝脏 T_2^*值，并依据公式 LIC=0.0254×R_2^*+0.202，换算成 LIC（单位 mg/g），分析输血组与正常志愿者间 SF、TSAT 及 LIC 的差异，并分析 LIC 与 SF 及 TSAT 之间的相关性。计算 LIC 对诊断肝脏铁过载的敏感度及特异度。**结果** 输血组 SF、TSAT 及 LIC 均较正常志愿者显著升高（P 均＜0.001）。LIC 与 SF 及 TSAT 均呈显著正相关，其中 LIC 与 SF 之间的相关性比与 TSAT 的相关性略高（r=0.815，P＜0.001；r=0.708，P＜0.001）。若分别以 SF、TSAT 为诊断标准，则 LIC 诊断肝脏铁过载的灵敏度分别为 77.8%、76%，特异度分别为 100%、84.6%。**结论** 基于 T_2^*的 LIC 检测是一种无创性评估长期输血患者肝脏铁负荷的有效方法。

肝细胞癌 VEGF 和 MMPs 的表达及其与 MRI 特征的相关性

杨翠,杨林
川北医学院附属医院

血管内皮生长因子（vascular endothelial growth factor，VEGF）及基质金属蛋白酶（Matrix metalloproteinases，MMPs）是重要的肿瘤血管生成相关因子，参与肿瘤血管生成的多个过程，通过多种方式影响肿瘤的生长及转移。MRI 检查在肝癌的诊断、鉴别诊断、治疗反应评价等方面均具有重要价值。这篇文章主要综述 VEGF 和 MMPS 的结构、作用机理、调控以及肝癌 VEGF 和 MMPs 的表达及其与 MRI 特征的相关性。

PU-1016
磁共振三维快速自旋回波成像技术（SPACE）对肛瘘诊断价值的研究

方键
武汉大学中南医院

目的 肛瘘属于多发病，一般由内、外口及瘘管组成。肛瘘易复发，内口及支瘘管在常规检查中显示不佳。三维快速自旋回波成像技术（SPACE），通过在回聚脉冲中使用可变翻转角的设计，可以克服 T2 衰减效应；回波间隔短，可提供快速高分辨率的三维 TSE 对比度成像。临床应用广泛。现将其用于盆腔，对比研究磁共振 SPACE 技术对肛瘘的诊断价值。
方法 收集分析 2019 年 1 月到 7 月，25 例肛瘘患者的磁共振图像资料和手术资料，由 2 名高年资放射科医生阅片,明确瘘管走向,内口位置,有无支管,有无脓肿、主要瘘管与肛门括约肌之间的关系，分析不同磁共振序列对肛瘘内口、瘘管的显示情况，内口位置采用膀胱截石位时钟判断法。比较三维 SPACE 序列、二维 T2WI 序列、二维 T1WI 序列对肛瘘诊断及瘘口定位的准确性。

结果 SPACE 能提供各向同性的高分辨图像，具有高信噪比，减轻了部分容积效应 ，支持任意平面重建，可较完整的显示内外口及瘘管，相比二维 T2WI、二维 T1WI 序列，SPACE 可提高肛瘘的诊断准确率。
结论 SPACE 技术对肛瘘显示的准确率更高，优于二维 T2WI、二维 T1WI 序列，具有重要价值。

Correlation study between ADC value and T stage of esophageal cancer

Jing Sun,Zhu Wang
Cancer Hospital Chinese Academy of Medical Sciences

Objective: To analyze and discuss the correlation between the ADC (apparent diffusion coefficient) value and T-stage of esophageal carcinoma.
Methods:
Twenty patients with esophageal cancer admitted to our hospital were selected. Inclusion criteria: 1. Patients with esophageal cancer confirmed by surgery and pathology.(2) preoperative radiotherapy or chemotherapy were not given.(3) preoperative MRI examination was performed .Thirty-two patients with esophageal cancer underwent preoperative MR imaging with single-shot echo plannar imaging (EPI) diffusion-weighted sequences (b=0, 800 s/mm2). The tumor mean value of ADC staging were measured on the GE AW4.6 postprocessing workstation, Matching and grouping analysis of the tumor T-stage and ADC. Three-dimensional localization method was used to locate the tumor plane. 3 solid tumor areas were selected as ADC values to measure ROI, avoiding obvious necrosis areas. The average value of 3 ROI areas was then taken as the final ADC value of the lesion .
Results: The esophageal carcinomas were slightly high signal or high signal on DWI. According to TNM stage, the patients were divided into 4 groups: T1, T2, T3 and T4.The average ADC value of T1 (1.824±0. 443) ×10-3 mm2/s, the average ADC value of T2 (1.979±0. 199) ×10-3 mm2/s, average ADC value of T3 (1.571±0. 309) ×10-3 mm2/s, the average ADC value of T4 (1.416±0. 228) ×10-3 mm2/s, the average ADC value of esophageal cancer had significant difference in the degree of tumor differentiation and T stage group (P<0. 05) . The results of Spearson correlation analysis showed that ADC value was negatively correlated with T stage .There were statistically significant differences between the average ADC values of T2 phase and those of T3 or

T4 . The average ADC value in T3 phase was significantly higher than that in T4 phase. There was no statistically significant difference in ADC values between the T1 phase and T2/T3 phase. The difference between the average ADC values in T1 phase and T4 phase was statistically significant. Correlation analysis showed that ADC value decreased as T staging increased. We divided the patients into two groups, T1/T3 and T3/T4, and statistically compared them. The ADC values in the pT1/T2 groups were significantly higher than in the T3/T4 groups.

Conclusions： The ADC value of esophageal cancer is significantly correlated with the tumor T-stage, and it can reflect the clinical stage of esophageal cancer. Future studies with more patients are needed to confirm the clinical evidence. This non-invasive technique could be a valuable clinical tool for providing optimal treatment for patients with esophageal cancer. *The average ADC value can predict the common clinicopathological and prognostic factors of esophageal cancer, and can be used as a quantitative indicator to distinguish the malignant degree of esophageal cancer.*

磁共振弥散加权成像在胃癌诊治中的应用

郑婧,杨林
川北医学院附属医院

胃癌是全球最常见的恶性肿瘤之一，治疗仍以外科手术为主，放化疗为辅。磁共振（MRI）弥散加权成像（DWI）能够检测活体组织内水分子扩散运动，通过测量表观扩散系数（ADC）值提供定量信息。体素内不相干运动（IVIM）能将水的真性扩散与微循环灌注区分开来，获得更多的组织内部结构的信息。这些技术在胃癌的诊断与治疗反应评价中均具有重要价值。本文对 DWI 在胃癌的诊断、分期、病理、治疗反应评估中的应用现状进行综述。

PU-1020

CDI、CT 及 MRI 应用于腹腔镜切除卵巢肿物术前评估的价值

王楠,张欣伟,黄沁松,运鸿飞,曹艳岑,陈威,崔跃强
天津市职业病防治院

目的 探讨 CDI、CT 及 MRI 在腹腔镜切除卵巢肿物术前评估中的应用价值。

方法 回顾性分析 2015 年 7 月至 2018 年 12 月本院收治的 121 例腹腔镜手术治疗卵巢肿物患者的 CDI、CT 及 MRI 检查资料，并与术后病理结果对照。采用 c^2检验比较术前 CDI、CT、MRI 检查及 CDI 联合 CT、CDI 联合 MRI 检查病灶检出率、肿瘤定位准确度、良恶性判定准确率及恶性肿瘤分期准确率的差异。

结果 术前 MRI 的病灶检出率、肿瘤定位准确率、良恶性判定准确率均高于 CDI 检查（$P<0.01$）。CT 及 MRI 的恶性肿瘤分期准确率均高于 CDI 检查（$P<0.01$）。CDI 联合 MRI 的病灶检出率高于 CDI 检查（$P<0.01$）。MRI 的肿瘤定位准确率高于 CDI 联合 CT 检查（$P<0.01$），CDI 联合 MRI 的肿瘤定位准确率高于 CDI、CT 及 CDI 联合 CT 检查（$P<0.01$）。CDI 联合 MRI 的良恶性判定准确率高于 CDI、CT、MRI 及 CDI 联合 CT 检查（$P<0.01$）。CDI 联合 CT 的恶性肿瘤分期准确率高于 CDI 检查（$P<0.01$），CDI 联合 MRI 的恶性肿瘤分期准确率高于 CDI、CT 及 CDI 联合 CT 检查（$P<0.01$）。

结论 MRI 在卵巢肿瘤病灶检出、定位、良恶性判定及恶性肿瘤分期评估方法均具有较高的准确性，CDI 联合 MRI 在腹腔镜切除卵巢肿物术前评估中具有较好的应用前景。

对比剂对腹部扩散加权成像影响的研究进展

蒋宇,黄小华,匡静,成涛,刘梦苓,徐红霞
川北医学院附属医院

扩散加权磁共振成像(DWI)是诊断疾病的重要影像学检查方法之一，在腹部检查中应用广泛。DWI 和磁共振增强扫描相结合，突显病变的特征，补充病变的性质。DWI 通常在增强扫描前完成，但若注射对比剂后发现存在伪影、图像失真等影响 DWI 图像质量，则需在存有对比剂的情况下重复扫描 DWI。近来，不少学者研究注射对比剂后 DWI 参数的变化，但其影响机理未得到充分解释。本文就对比剂是否对腹部 DWI 产生影响以及研究现状予以综述。

PU-1022
流入反转恢复序列在门静脉非对比增强成像中的应用

苏文婷,潘自来
上海交通大学医学院附属瑞金医院北院

目的 探讨国产 1.5T MR 流入反转恢复（FIRM）序列对门静脉系统进行对比增强成像的可行性。 方法 收集我院 30 例疑似有门静脉病变的患者，在联影 1.5T MRI 上行门静脉冠状位 FIRM 序列扫描及门静脉 CTA 增强扫描，将扫描图像在工作站行 3D 和 MIP 重建，由两名影像诊断医生分析两种方法对门静脉及其分支的显示，并进行评分，比较两者对门静脉显示的差异。 结果 两种方法门静脉图像质量评分的差异无统计学意义（P<0.05），两位诊断医师对 NCE-MRA 门静脉成像质量评分的一致性较高，Kappa 值为 0.95 。 结论 国产 1.5T MRI FIRM 成像序列是一种无需使用对比剂的非侵入性血管成像方法，能在不用对比剂情况下获得与门静脉 CTA 相似成像效果的门静脉系统图像，并能有效地对肝脏门静脉进行评估。

PU-1023
对比增强扫描肾动脉 MRA 中多种钆对比剂应用对比研究

潘珂
川北医学院附属医院

目的 探讨三种目前临床常用的钆对比剂是否对肾动脉磁共振血管成像中血管分支显示造成差异。**方法** 对 45 名无肾脏相关病史且血肌酐正常的病例分成三组，分别为钆喷酸葡胺组（n=15）、钆双胺组（n=15）与钆贝葡胺组（n=15）。对三组病例均进行常规磁共振肾脏扫描；平扫结束后进行对比剂增强肾动脉成像。注射药品说明书规定剂量，以相同速率（2.5 毫升/秒）注射，扫描采用同一扫描方案（延迟 20 秒后进行动态三期扫描，采用肝脏容积加速采集序列）。对血管成像序列进行最大密度投影、多平面重建。对图像中血管显示情况进行评分，包括血管与背景组织对比度，肾动脉主干显示，肾动脉一级分支、二级分支显示。**结果** 三组对比剂增强肾动脉血管成像中肾动

脉主干及一、二级分支显示图像质量评分均不存在统计学差异（P＜0.05）。**结论** 三种目前临床常用的钆对比剂对肾动脉 MRA 中血管分支显示未造成差异。

PU-1024
CT 纹理特征在鉴别肾脏嗜酸细胞腺瘤与肾脏嫌色细胞癌的意义

朱月珉
福建医科大学附属第一医院

目的 探讨纹理分析在多层螺旋 CT（MSCT）增强扫描图像上对肾嗜酸细胞腺瘤（renal oncocytoma,RO）与嫌色细胞癌（chro-mophobe cell renal carcinoma,CCRC）的鉴别诊断价值。资料与**方法** 搜集经手术病理证实的 8 例 RO 和 11 例 CCRC 患者的资料,术前全部行 CT 平扫和三期增强扫描,勾画 ROI，获得纹理特征，采用 SPSS 16.0 软件对两种肿瘤的影像学纹理特征进行统计学处理。**结果** 纹理分析的 MDF 值差异有统计学意义（P＜0.05）。**结论** MSCT 的纹理特征对术前 RO 和 CCRC 的鉴别诊断具有一定价值。

PU-1025
磁共振对布加综合征的诊断意义

杨然然
徐州医科大学附属医院

目的 研究磁共振对布加综合征的诊断意义
方法 研究 2017 年 10 月至 2018 年 6 月期间在徐州医科大学附属医院做 MRI 平扫及增强扫描的 60 例布加综合征患者的 MRI 图像资料。
结果 56 例布加综合征患者的 MRI 直接征象为肝静脉和(或)下腔静脉狭窄或阻塞,并据此分为Ⅰa 型 8 例,Ⅰb 型 4 例,Ⅱb 型 16 例,Ⅲa 型 4 例,Ⅳa 型 4 例,Ⅳb 型 20 例。32 例急性布加综合征患者中,12 例肝内静脉形成陈旧性血栓,4 例下腔静脉内有血栓形成;32 例肝脏呈弥漫性肿大,24 例伴有腹水和脾肿大,4 例伴有胆囊水肿;20 例行 MRI 平扫示肝实质信号不均匀,增强后肝实质呈中心强化,周边强化减弱;8 例出现肝外侧支循环,1 例出现肝内侧支循环。24 例慢性布加综合征患者中,12 例肝脏体积缩小,4 例尾状叶代偿性肥大,8 例肝内出现多发再生结节;4 例伴有腹水和脾肿大,4 例伴有胆囊水肿;6 例行 MRI 平扫示肝实质信号不均匀,增强后 4 例呈“地图样”强化,2 例肝脏中央部分出现斑片状强化,而周边部分强化程度相对较低,延迟扫描时肝脏呈较均匀强化;6 例出现肝外侧支循环,其中 1 例伴有肝内侧支循环。
结论 MRI 图像能够显示布加综合征的直接或间接征像,是诊断急、慢性布加综合征重要的无创性检查方法。

PU-1026
胎儿肝上型膈疝引产前后磁共振表现及尸检结果对照 1 例

汤虹[1],孙聪[1],陈昱帆[1],沈丽梅[2],王光彬[1]
1.山东省医学影像学研究所
2.东营市人民医院

目的 探讨胎儿肝上型膈疝磁共振检查与尸检结果的一致性。
方法 孕妇 26 岁，孕 1 产 0，唐氏筛查低危，孕 25 周超声扫查：胎儿四腔心切面：于右侧胸腔内右心房右旁探及肝右叶回声，大小约 2.9×2.0cm，心脏受压略向左移位，双肺回声强度显示正常，肺头比约 2.91。诊断：胎儿右侧膈疝（肝右叶疝入胸腔）。次日行胎儿磁共振检查，T1WI、T2WI 均示肝右叶明显抬高，右肺受压体积减小。于孕 26 周在当地医院引产，产后 2 小时内复查胎儿标本磁共振，T2WI 示右侧膈肌连续性中断，肝右叶于中断处突入右侧胸腔。随后行标本解剖，沿锁骨、双侧腋中线剪断肋骨，充分暴露胸腔。
结果 标本见右肺体积小，移除双肺及心脏，示右侧膈肌于前外侧附着于肋骨处缺如，见一破裂孔，肝叶从破裂孔突入，邻近膈肌菲薄，肌纤维交叉错落可见，后部膈肌厚度未见异常，左侧膈肌连续性好，食管裂孔、主动脉裂孔及腔静脉孔未见明显异常。诊断：胎儿右侧膈疝（肝上型、前外侧疝）。
结论 MRI 作为产科胎儿超声检查的一种重要补充方法，对胎儿膈疝病变的显示，与尸检结果具有较高吻合性，对产前诊断有一定帮助。

PU-1027
体素内不相干运动(IVIM)对健康孕妇中晚期胎盘灌注测量的可重复性

徐苏琴
重庆市肿瘤医院

目的 研究体素内不相干运动(intravoxel incoherent motion，IVIM)模型测量健康中晚期孕妇胎盘灌注的可重复性。
方法 收集 48 例超声检查确诊胎盘无异常的单胎正常妊娠孕妇。依不同孕龄(GA)分为 3 组包括:Ⅰ组 GA15～27 周（n=27）;Ⅱ组 GA28～33 周（n=11）;Ⅲ组 GA34～39 周（n=10）。所有孕妇均使用 3.0T 磁共振仪进行胎盘普通磁共振成像及 IVIM 成像。2 名医师分别对胎盘基蜕膜侧、胎盘中间、胎盘胎儿侧等 3 个区域的 IVIM 图灌注系数 f 值进行测量。利用组内相关系数(Interclass Correlation Coefficient，ICC)分析评价两名观察者间测量结果的一致性。
结果 48 例孕妇平均孕龄 27±3 周。在胎盘不同区域使用 IVIM 测量灌注分数观察者间具有良好的一致性（胎盘胎儿侧 ICC=0.935，胎盘中间带 ICC=0.941，胎盘基蜕膜侧 ICC=0.973，P＜0.05）。
结论 体素内不相干运动(IVIM)模型评价正常胎盘灌注系数(f)具有良好的可重复性，可为不能使用造影剂的孕妇胎盘灌注情况观察提供新选择。

PU-1028
宫颈妊娠的 MRI 诊断价值

孔俊洋,王怀武,万鹏
重庆三峡中心医院

目的 总结宫颈妊娠的 MRI 表现特点，探讨 MRI 在宫颈妊娠中的诊断价值。**方法** 回顾分析经手术病理或临床证实的 17 例宫颈妊娠的 MRI 表现。**结果** 妊娠囊呈单纯囊状 13 例，呈混合包块 4 例。宫颈管内有妊娠囊 17 例，其中妊娠囊完全位于宫颈管 14 例，3 例位于宫颈管并局部凸向宫腔下段。宫颈管扩大 16 例，宫腔空虚 16 例，宫颈内口闭合 14 例，宫内膜增厚 7 例，宫颈胎盘植入 4 例。妊娠囊 T_1WI 呈低信号或低信号伴少许点条等信号 13 例，T_2WI 呈高及稍高信号 14 例。妊娠囊边缘 T_2WI 呈低信号 17 例，T_1WI 呈高或稍高信号 15 例。增强囊内乳头状或索条状强化 5 例，边缘

呈不均匀强化 5 例。**结论** 宫颈妊娠主要呈囊状，宫颈管内发现妊娠囊是最重要的 MR 表现。T_2WI 上妊娠囊边缘低信号影、宫颈管扩大、宫腔空虚、宫颈内口闭合是诊断宫颈妊娠的重要征象。MRI 能很好显示宫颈妊娠的位置、大小、范围、信号特点及侵犯肌层状况，结合临床资料可提示诊断。

卵巢子宫内膜异位囊肿的影像研究进展

陆丽娟
复旦大学附属金山医院

子宫内膜异位症，简称内异症，指具有活性的子宫内膜组织异位到子宫体以外的部位而引起的疾病。子宫内膜可异位至全身任何部位，最常见于卵巢及宫骶韧带。当内膜侵犯卵巢并在其内生长形成的囊肿称为卵巢子宫内膜异位囊肿，其囊液似巧克力，故又称为巧克力囊肿。主要表现为痛经、性交痛、慢性盆腔痛及不孕，是一种严重影响育龄期女性身心健康的疾病。一次性手术切除病灶是消除症状、恢复生育能力的最佳方法，但因术前病灶范围未能明确，常发生术后病灶残留，易发生不典型增生甚至恶变。因此，及时、准确的诊断及术前病灶范围评估对内异症的治疗及预后具有重要意义。磁共振成像能够准确的显示病灶部位、大小、形态、范围及与周围组织的关系，是筛选或诊断本病的最佳无创性检查方法。本文就卵巢子宫内膜异位囊肿的影像诊断做一综述。

磁共振 IDEAL-IQ 技术与生物电阻抗分析法对内脏脂肪定量的相关性研究

李晓凤
重庆医科大学附属第三医院

目的 评价磁共振 IDEAL-IQ 技术与生物电阻抗分析法对腹腔内脏脂肪定量的一致性
方法 选取 32 例志愿者分别经 InBody 测量和磁共振扫描，对比分析两种方法测量脂肪含量的差异及相关性。
结果 32 例志愿者中，24 例诊断为超重（BMI≥24），超重者（24/32,75%）有统计学意义（P＜0.05）。经 InBody 人体成分测量，得到 BMI、体脂肪和内脏脂肪面积；经磁共振扫描，测量每个志愿者的肝脏脂肪分数（FF）、腹壁脂肪面积和内脏脂肪面积。Pearson 相关性分析显示经 InBody 人体成分测量的内脏脂肪面积与经磁共振测量的内脏脂肪面积呈正相关（r=0.506,P=0.012）.
结论 磁共振 IDEAL-IQ 技术与生物电阻抗分析法对腹腔内脂肪面积定量有一致性。

PU-1031

磁共振 IDEAL-IQ 技术与生物电阻抗分析法对内脏脂肪测定的相关性研究

庄羽翔
重庆医科大学附属第三医院

目的 评价核磁共振 IDEAL-IQ 技术与生物电阻抗分析法对腹腔内脏脂肪测定的一致性。**方法** 选取 32 例志愿者分别经生物电阻人体成分分析法（InBody770）测量和核磁共振扫描，对比分析两种方法测定脂肪含量的差异及相关性。**结果** 32 例志愿者中，24 例 BMI≥24 kg/m^2，超重及肥胖者占 75%。经 InBody 人体成分测量，志愿者 BMI 为 26.55±2.33 kg/m^2（22.62~30.11 kg/m^2）、体脂肪为 26.43±9.64 kg（17.4~62.9 kg）、内脏脂肪面积则为 112.78±30.63 cm^2（69.2~178.9 cm^2）。进一步经核磁共振扫描，测量每个志愿者的肝脏脂肪分数（FF）为 4.47±3.87（1.25~17.52）、腹壁脂肪面积为 259.56±74.11 cm^2（144.7~455.8 cm^2）和内脏脂肪面积则为 75.60±27.98 cm^2（34.98~127.09 cm^2）。Pearson 相关性分析显示生物电阻抗人体成分分析测量的内脏脂肪面积与经核磁共振方法测量的内脏脂肪面积呈正相关（r=0.506, P=0.012）。**结论** 核磁共振 IDEAL-IQ 技术与生物电阻抗分析法对腹腔内脂肪面积定量具有一致性。

剖宫产术后切口妊娠的磁共振表征与术前诊断价值

胡金香
武汉大学中南医院

目的 探讨子宫切口瘢痕妊娠（CSP）的 MRI 表征及术前诊断价值；**方法** 收集 45 例剖宫产瘢痕妊娠 45 例患者，年龄范围 21 岁至 47 岁，平均年龄 34.60±5.61 岁，中位年龄 35 岁。回顾性分析 45 例切口瘢痕妊娠患者的临床及 MRI 资料，包括孕育史、血 HCG、子宫瘢痕信号特征、测量瘢痕厚度、判断孕囊类型、孕囊体积、孕囊或胎盘与瘢痕之间关系。采用 2 名不同年资医师共同观察评价子宫瘢痕位置、孕囊体积大小及子宫的 MRI 特征，包括胎盘植入程度、增强强化方式及病理表现。**结果** 45 例患者资料中，5 例为胎盘低置状态或前置胎盘，孕周为 15 周至 34 周；40 例 CSP，经清宫手术获取病理标本，术前 MRI 肯定性诊断 38 例，正确率 95%。其中①囊状孕囊 25 例，孕囊呈椭圆形囊状信号，形态主要呈类圆形、哑铃形及泪滴形，MRI 表现为 T1WI 低信号，T2WI 高信号，增强呈环形薄壁强化；②包块型孕囊 15 例，表现为子宫下段宫腔内不规则包块影，形态主要呈圆形、椭圆形，MRI 表现为 T1WI 等、低信号，其 T2WI 呈高信号为主的混杂信号，增强扫描呈环形厚壁、斑片状强化。MRI 显示 40 例 CSP 妊娠囊，内生型 28 例、外生型 12 例；子宫前壁瘢痕主要表现为子宫前壁连续性中断，局部凹陷性变薄，瘢痕条状或不规则形 T1WI、T2WI 低信号，增强时瘢痕无明显强化。矢状位测量瘢痕厚度，最薄厚度 1.2mm，最大厚度 11mm，平均厚度 3.08mm;，孕囊大小，最小 9mm*13mm，最大孕囊大小 50mm×86mm，平均为 23.55mm×32.82mm。 **结论** 术前诊断孕囊类型、大小、瘢痕位置、厚度及胎盘附着于子宫瘢痕并增强明显强化是诊断 CSP 的可靠标准并具有明显术前诊断价值。

腹膜后 Castleman 病的 CT 和 MRI 表现

黄婉蓉,曹代荣
福建医科大学附属第一医院（福建省福州市）

目的 分析腹膜后 Castleman 病的 CT 和 MRI 表现，探讨其诊断要点。
方法 回顾性分析 2012 年 7 月~2019 年 1 月福建医科大学附属第一医院经病理证实的 9 例腹膜后 Castleman 病的 CT 和 MRI 影像表现。6 例只行 CT 检查，3 例均行 CT 和 MRI 检查。分析病变的数量、形态、大小、密度/信号、强化特点、边界及周围情况等。

结果 9 例患者中，男 5 例，女 4 例，年龄范围 35~65 岁，中位年龄 48.3 岁。肿瘤为透明血管型 5 例，浆细胞型 2 例。单发 7 例，多发 2 例。肿瘤呈类圆形 6 例，呈分叶状 3 例。肿瘤境界清楚 6 例，境界欠清 3 例。CT 检查肿瘤均呈软组织密度,其中伴有脂肪密度 1 例，囊变 1 例。MRI 检查信号均匀 2 例，余 1 例不均匀，与周围肌肉组织比，T1WI 均呈低信号；T2WI 呈均匀高信号 2 例，以低信号为主的高低混杂信号 1 例；弥散受限 3 例。增强扫描均呈明显较均匀强化，2 例周围可见迂曲扩张血管影。
结论:腹膜后 Castleman 病具有较特征的影像表现：CT 平扫呈软组织密度，多呈类圆形，境界清楚，增强强化明显，部分病灶周围可见扩张迂曲血管影。MRI 弥散受限，CT 与 MRI 结合能较好地显示肿瘤部位、与周围组织的关系。

T3 期直肠腺癌淋巴结转移 MRI 影像及临床病理相关因素分析

汪静,雷振
锦州医科大学附属第一医院

摘要 目的 通过研究 T3 期直肠腺癌原发肿瘤 MRI 影像征象及临床病理因素与淋巴结转移的相关性，从而提高对淋巴结转移的诊断，指导临床选择最佳的治疗方案。**方法** 收集本院经病理证实的 T3 期原发性直肠腺癌患者 51 例，分析患者的年龄、性别、肿瘤的位置、病变长度、病变厚度、病灶中心与腹膜反折关系、绕肠周径、ADC 值、T3 分期、大体类型、分化程度、脉管侵犯、神经侵犯与淋巴结转移的相关性。**结果** 共计 T3 期直肠腺癌 51 例，其中淋巴结转移组 22 例，无淋巴结转移组 29 例，淋巴结转移率 43.1%。单因素分析显示肿瘤的厚度、病灶中心与腹膜反折关系、分化程度、神经侵犯、脉管侵犯与淋巴结转移相关，差异具有统计学意义（$p<0.05$）。多因素 Logistic 回归分析显示肿瘤的厚度和脉管侵犯是淋巴结转移的独立危险因素。**结论** 肿瘤的厚度、脉管侵犯是淋巴结转移的独立危险因素，可以提高对淋巴结转移诊断的准确率，从而指导临床选择最佳的治疗方案。

采用机器学习预测子宫内膜癌组织学级别高低

罗燕,龚静山,梅东东
深圳市人民医院

目的 组织学分级是影响子宫内膜癌的一个重要预后因素，影像检查只能大致获得其影像分期，因此本研究目的是采用多参数 MRI（multiparameter Magnetic Resonance Imaging，mpMRI）的放射组学特征在术前预测其组织学分级，为临床术前个性化治疗方案的制定提供决策支持，促进临床精准医疗的发展。
材料与**方法** 本研究回顾性搜集了从 2015 年 10 月到 2019 年 1 月术前进行 MRI 检查的 140 名子宫内膜癌患者 MR 影像资料，然后采用放射组学软件 the 3D Slicer (www.slicer.org)对肿块的 T2WI、增强 T1WI (contrast-enhanced T1WI, CE-T1WI)、DWI 和 ADC 四个序列进行勾画，提取放射组学特征，最后提取出 428 个组学特征。采用 Mann-Whitney U 检验分析放射组学特征与组织学分级的相关性，对差异有统计学意义的变量进行随机森林建模，用 5 折叠法将样本分为训练集和测试集进行交叉验证，最后采用 ROC 曲线计算 AUC 值得到模型对子宫内膜癌组织学分级的诊断效能。

结果 140 例子宫内膜癌患者中，组织学分级低级别组共 108（77.1%）例，高级别组共 32 例（22.9%）。随机森林模型对于组织学分级的诊断效能 AUC 值分别为 0.871（95%CI：0.804-0.923）。
结论 基于多参数 MRI 放射组学特征和机器学习表明放射组学特征可以用于术前预测子宫内膜癌组织学分级，能达到较好的诊断效能，促进精准医疗的发展。

MRCP 结合 Gd-EOB-DTPA 肝脏增强 MRI 胆管造影在胆管成像中的应用

胡玉芳
桂林医学院附属医院

目的 研究 MRCP 结合磁共振 Gd-EOB-DTPA 增强磁共振胆管成像(EOB-MRC)对胆管系统结构的显示。
方法 回顾性分析 46 例患者 MRI 胆管系统图像，所有患者均同时行 MRCP 扫描和 Gd-EOB-DTPA 肝脏动态增强扫描、延迟期及肝胆特异期扫描。分析 MRCP 及 EOB-MRC 胆管系统结构显示情况。
结果 MRCP 对胆囊管的显示受胃肠高信号背景干扰较大，MRC 胆道显示受肝功能影响。胆道内造影剂正常排泄者,MRCP 及 MRC 对肝总管、胆总管及肝内一级、二级胆管显示无明显差异；胆道系统扩张者,MRCP 能够显示更细的肝内胆管分支。
结论 MRCP 与 EOB-MRC 均可以清晰显示胆管系统结构，联合应用可进一步了解肝功能。

To investigate the value of combining MRI texture features with logistic regression analysis in differentiating borderline from malignant epithelial ovarian tumors based on the whole tumor

Rongping Ye[1],Shuping Weng[2],Yaoming Li[1],Jianwei Chen[1],Chuang Yan[1],Yueming Zhu[1],Liting Wen[1]
1.the First Affiliated Hospital of Fujian Medical University
2.Fujian Provincial Maternity and Child Health Hospital

Purpose: To explore the value of texture features combined with logistic regression analysis in differential diagnosis of borderline epithelial ovarian tumors (BEOTs) and malignant epithelial ovarian tumors (MEOTs) based on the whole tumor.

Materials and Methods: The clinical data and MRI characteristics of 88 patients with BEOTs or MEOTs proven by surgery and histopathology were retrospectively reviewed, the characteristics of clinical and MRI considered statistically significant were analyzed by binary logistic regression. Texture features of all tumors were extracted with MaZda software by manually delineating the entity layer by layer on T2WI, DWI and contrast-enhanced T1WI, respectively. The most optimized 30 texture parameters were chosen by Fisher's coefficient, classification error probability

combined with average correlation coefficient (POE+ACC) and interaction information (MI) method (MI+PA+F, MPF). The importance of each texture feature was automatically calculated by Random Forest using feature selection algorithm. The five texture features with the highest weights derived from T2WI, DWI and contrast-enhanced T1WI were also analyzed by binary logistic regression, respectively. Hosmer-Lemeshow test and Receiver Operating Characteristic (ROC) curve were used to assess the diagnostic performance.

Results: Compared with BEOTs, the CA-125 and maximum diameter of solid component of MEOTs were significantly higher than those of BEOTs($p< 0.001$). Furthermore, MEOTs more frequently had thickened irregular septa and ill-defined margin than in BEOTs ($P< 0.001$), whereas purely cystic and round or oval appearance were more prevalent in BEOTs than MEOTs ($p<0.001$, $p=0.001$, respectively). Most of the selected 30 optimal texture features were derived from the Gray Level Co-occurrence Matrix on T2WI ,DWI and contrast-enhanced T1WI (all of 25/30, 83.3%).The five texture features with the highest weights were S(0,1,0)DifEntrp, GrKurtosis, S(0,5,0)Correlat, S(0,0,5)DifVarnc and GrVariance on T2WI; S(0,0,4)SumAverg, S(0,0,4)Correlat, S(3,0,0)DifEntrp, S(3,0,0)Entropy and 135dr_RLNonUni on DWI; S(0,0,5)SumAverg, GrNonZeros, S(0,0,5)Correlat, S(4,0,0)DifEntrp and S(1,0,0)DifEntrp on contrast-enhanced T1WI. All Hosmer-Lemeshow statistics were greater than 0.05 showing a good fit goodness of those logistic regression models(P=0.674, 0.877, 0.997 and 0.959 of T2WI, DWI, Contrast-Enhanced T1WI and the clinical data and MRI characteristics, respectively). The AUC, sensitivity, and specificity of those logistic regression models were 0.794, 91.2% and 62.1% of T2WI; 0.915, 89.7% and 71.4% of DWI ; 0.934, 91.4% and 72.4% of Contrast-Enhanced T1WI ; 0.793, 84.5% and 50.0% of the clinical data and MRI characteristics. In the differential diagnosis of BEOTs and MEOTs, texture features extracted from the whole tumor were more preferable than the combination of clinical data and MRI characteristics. Furthermore, texture features extracted from Contrast-Enhanced T1WI of the whole tumor had the optimal differential diagnostic performance compared to T2WI and DWI.

Conclusion: MRI texture features combined with logistic regression analysis are capable of quantificationally differentiating BEOTs from MEOTs.

PU-1038

原发性肾上腺血管瘤 4 例报告并文献复习

杨婷
南昌大学第二附属医院

[摘要]**目的** 探讨肾上腺血管瘤 CT/MRI 表现特点及其病理学特征。**方法** 回顾性分析 2018 年 3 月至 2019 年 3 月南昌大学第二附属医院 4 例经病理证实的肾上腺血管瘤患者的 CT/MRI 影像资料及病理学特征。**结果** 该组病例中女性 3 例，男性 1 例，平均年龄 68 岁（65-71 岁），左侧 1 例，右侧 3 例，肿瘤最大径为 15mm-167mm，CT 扫描 4 例，MRI 扫描 2 例，囊实性 3 例，实性 1 例，4 例均可见边缘结节状及条片状明显强化，其中 1 例最大者信号混杂，T1WI 边缘为稍低信号实性成分，中央呈稍高信号，T2WI 呈花斑状高低信号。**结论** 动态增强后病灶边缘见结节状及条片状明显强化及 T2WI 信号混杂、高低信号对比明显是血管瘤特征性影像表现。

PU-1039

MRCP 在胆道系统病中的误诊原因

苟辉亮
贵州省第二人民医院(原:贵州省安宁医院)

目的 探讨磁共振 MRCP 在胆道系统病中的误诊原因分析。
方法 采用磁共振 MRCP 对胆道系统进行扫描。
结果 1、常见胆结石误诊原因分析；2、胆总管癌常见误诊的原因分析
结论 在利用 3DMRCP 对胰胆道系统疾病进行诊断时，必需充分了解患者病史、设备性能的同时，结合 MRI 平扫各参数扫描和增强扫描、弥散成像认真分析影像特征才能做出最好的诊断，提高诊断率，减少漏诊、误诊。

PU-1040

磁共振动脉自旋标记技术不同扫描方式正常肾脏的对比应用

刘小艳
南通大学附属医院

摘要:目的 分析单次激发快速自旋回波-流动敏感反转恢复序列(SSFSE-FAIR)与平面回波-流动敏感反转恢复序列(EPI-FAIR) 所测量的健康臂的相对血流量值(rBFV)，评价两种动脉自旋标记(ASL)序列在正常肾脏检查中的应用价值。方法 分析 40 例符合纳入标准的受试者的 rBFV。采用 3.0T 磁共振扫描仪扫描。按 3 种方式采集图像:EPI-FAIR 屏气法、 SSFSE-FAIR 屏气法及 SSFSE-FAIR 自由呼吸法。结果 SFSE-FAIR 自由呼吸法可定量区分肾脏皮髓质。皮质 rBFV:1148± 9.23；髓质 rBFV:94.98±3.38；SSFSE-FAIR 屏气法及 EPI-FAIR 不能定量区分肾脏皮髓质。EPI-FAIR 皮质平均 rBFV 为 178.50± 171795%置信区间:167.59～189.41。结论 SFSE-FAIR 屏气法及 EPI-FAIR 空间分辨率低，无法区分肾脏皮糖质，可粗略评价肾脏灌注情况。 SSFSE-FAIR 图像空间分辨率较高，可区分肾脏皮髓质结构，可初步评判肾脏皮髓质的灌注状态 。

PU-1041

肺炎克雷伯菌肝脓肿 MRI 表现

邓大勇,陈曦
吉林省肿瘤医院

目的 探讨肺炎克雷伯菌肝脓肿的 MRI 表现。**方法** 回顾性分析 30 例肺炎克雷伯菌肝脓肿患者的临床及 MRI 影像学资料，入选患者均行腹部 MRI 平扫、增强和 DWI 检查，分析其 MRI 特征。**结果** 30 例患者中共发现病灶 65 个，高毒力型 16 例，脓腔积气 17 例，分隔强化 18 例，单叶 26 例，双叶 4 例，实性 18 例，囊性 12 例，薄壁 24 例，厚壁 6 例，单房 5 例，多房 25 例，一过性灌注异常 18 例，脓肿周围无强化 22 例。全部脓肿呈明显 T1WI 低信号，T2WI 高信号，24 例 DWI 呈高信号、ADCmap 呈低信号，6 例 DWI 呈低信号、ADCmap 呈高信号。**结论** 肺炎克雷伯菌肝脓肿的 MRI 特征表现包括单发、单叶、实性、多房、薄壁、脓肿周围无强化、脓腔积气及分隔强化，且以上特征具备越多，本病的可能性越大。MRI 可准确显示早期肺炎克雷伯杆菌的影像特征，对临床决策有重要意义。

月经状态对不同病理类型早期宫颈癌表观弥散系数的影响初探

董越,董瑞彤,于岩岩,罗娅红,于韬,刘凡
辽宁省肿瘤医院

目的 探讨月经状态对不同病理类型早期宫颈癌表观弥散系数的影响。材料与**方法** 回顾性分析我院 2015 年 1 月至 2016 年 12 月收治的经术后病理证实的ⅠB$_1$~ⅡA$_1$期宫颈癌 352 例，其中鳞癌 317 例和腺癌 35 例，177 例患者未绝经，175 例患者绝经。行 MR 弥散加权成像（b 值取 0、1000 s/mm^2），测量病灶最大层面的 ADC 值，记录 ADC 最大值、最小值和平均值。采用独立样本 t 检验，比较宫颈鳞癌和腺癌各 ADC 值的差异，在绝经患者和未绝经患者中，分别比较宫颈鳞癌和腺癌各 ADC 值的差异；在鳞癌和腺癌亚组中，比较绝经和未绝经患者的 ADC 值的差异。**结果** 在所有患者中，宫颈鳞癌的 ADC 平均值和最小值均低于腺癌，两者差异有统计学意义（p<0.05），两者的 ADC 最大值没有差异；对于未绝经患者，宫颈鳞癌的 ADC 平均值和最小值均低于腺癌，两者差异有统计学意义（p<0.05），ADC 最大值没有差异；而对于绝经患者，宫颈鳞癌的 ADC 平均值、最小值和最大值均与腺癌相仿，两者差异没有统计学意义（p>0.05）。未绝经患者整体宫颈癌病灶、鳞癌亚组病灶的 ADC 平均值、最大值和最小值之间均高于绝经患者，且差异具有统计学意义（p＜0.05）；腺癌亚组中，未绝经患者的 ADC 平均值和最小值也高于绝经患者，差异有统计学意义（p<0.05），而 ADC 最大值无统计学差异。**结论** 宫颈癌的病理类型和患者的月经状态对于宫颈癌病灶的 ADC 值有影响。

PU-1043
基于多参数 MRI 影像组学模型预测直肠腺瘤癌变的应用研究

李盼盼[1],李爱银[1],宋歌声[1],李厚颖[1],崔景景[2],左盼莉[2]
1.山东省千佛山医院
2.慧影医疗科技（北京）公司

目的 探讨基于多参数 MRI 影像组学模型预测直肠腺瘤癌变的价值。
方法 回顾性分析山东省千佛山医院 2016 年 8 月至 2019 年 3 月术后病理证实为直肠腺瘤（n=25）及直肠腺瘤癌变(n=21)的患者共 46 例,所有患者均在术前两周内行盆腔 MRI 平扫检查, 利用影像组学分析工具（Radcloud,Huiying Medicial Technology Co.,Ltd）和 ITK-SNAP 分别在平扫轴面小 FOV T2WI 及 DWI 序列上分割出感兴趣区域（VOI）。分别从 T2WI、DWI 及 T2+DWI 中提取影像组学特征，利用 SVM 算法构建 3 个预测模型用于预测直肠腺瘤癌变，分别为 Model $_{T2}$、Model$_{DWI}$、Model$_{T2+DWI}$。利用受试者工作曲线（ROC）评价模型的预测效能，并通过 ROC 曲线下面积（AUC）、敏感性、特异性进行量化，利用 DE-LONG 检验比较各模型的预测效能。
结果 分别从 T2WI、DWI、T2WI+DWI 中提取 10、11、15 个影像组学特征构建模型。Model $_{T2}$、Model$_{DWI}$、Model$_{T2+DWI}$预测模型在验证组中的 AUC 分别为 0.88（95% CI0.58-1.00）、0.84（95% CI0.51-1.00）、0.96（95% CI0.66-1.00），敏感度分别为 0.80、0.80、0.80，特异度分别为 0.80、0.60、0.80。3 个预测模型对直肠腺瘤癌变的预测效能无统计学差异（p>0.05）。
结论 基于 MRI 影像组学特征构建的 SVM 回归模型在直肠腺瘤癌变预测中表现良好，Model $_{T2}$、Model$_{DWI}$、Model$_{T2+DWI}$对直肠腺瘤癌变的预测效能无统计学差异。基于单一序列的放射组学模型即可作为影像学生物标志具有诊断腺瘤癌变的潜力，辅助临床医师更好的制定治疗方案。

PU-1044
Meta 分析：普美显增强 MRI 肝胆期能否提高肝细胞癌诊断准确性

潘洁琳,李文娟,洪国斌
中山大学附属第五医院

目的 探讨增加肝胆期图像(HBP)对于诊断慢性肝病患者小肝癌(直径≤3 cm)的应用价值。**方法** 在 PubMed, Web of Science, Embase 以及 Scopus 数据库中收集 2000 年 1 月至 2017 年 12 月中，所有使用普美显增强的磁共振（MRI）诊断小肝癌（≤3cm)的相关研究。在新的诊断标准中，增加肝胆期图像增强 MRI 的诊断标准定义为在动脉期表现为高信号，在门静脉期、延迟期或肝胆期表现为低信号的结节，诊断为肝细胞癌。而对未增加肝胆期图像增强 MRI，诊断标准参照美国肝病研究学会（AASLD）肝癌诊断指南，即在增强 MRI 中表现为动脉期强化且静脉期洗脱的肝脏结节诊断为肝细胞癌。在纳入文献中提取数据，采用双变量随机效应模型，计算敏感度、特异度、诊断比值比、似然比及受试工作者特征曲线(sROC)的汇总计算。使用软件为 Stata 14.0 及 R 语言 3.5.1。**结果** 共纳入 16 篇文献，1668 例小肝癌病灶。增加 HBP 的增强 MRI 敏感度为 90% (95% CI: 78%, 96%)，特异度为 95% (95% CI: 85%, 98%)，阳性似然比为 17.7 (95% CI: 5.7, 55.5)，阴性似然比为 0.11 (95% CI: 0.05, 0.24)，诊断比值比为 168.8 (95% CI: 46.2, 615.6)，sROC 曲线下面积为 97%(95% CI: 96%, 98%)。增加 HBP 的普美显增强 MRI 的敏感度明显高于未增加 HBP 的 MRI (84% vs 62%，P = 0.04)。**结论** 在慢性肝病患者中，增加肝胆期图像的普美显增强 MRI 相对未增加肝胆期图像的增强 MRI，在诊断小肝癌上具有更高的敏感度。因此，在临床实践中应考虑在普美显增强 MRI 中增加肝胆期图像，并将肝胆期低信号纳入诊断标准中，作为诊断慢性肝病患者小肝癌的重要影像学依据。

PU-1045
MRI 双参数与多参数对前列腺癌诊断效能比较

吴文娟,张雷,陈昉铭,张追阳
无锡市第二人民医院

目的 探讨包括动态对比增强成像(dynamic enhanced imaging, DCE)的多参数相对于 T2 加权成像(T2WI)和弥散加权成像(diffusion weighted imaging, DWI)双参数对前列腺癌的诊断价值。**方法** 85 例患者因前列腺特异性抗原（PSA）水平升高及/或怀疑前列腺癌行前列腺 3.0 T MR 扫描，在 PACS 上导出图像，分为两组，第一组双参数扫描图像（T2WI+DWI），第二组采用多参数扫描图像（T2WI+DWI+ DCE），分别由具有 9 年、2 年前列腺 MR 成像经验的 2 名影像科医师根据 PI-RADS V2 评分原则进行回顾和独立评分。比较 2 名医师的评分，且一致性结果与穿刺结果对照后，采用二分法计算其敏感性、特异性、阳性预测值和阴性预测值，进行 ROC 曲线分析，计算曲线下面积(AUCs)。**结果** 2 位医师的评分一致性较高(第一组 k=0.839、第二组 k=0.901)。两组图像对前列腺癌的检测均有显著意义（P=0.000）。双参数和多参数 MR 的 AUC 分别为 0.784、0.812。**结论** 由 T2WI 和 DWI 组成的双参数 MR 扫描方案诊断前列腺癌的效能与标准多参数成像方案相当。对 PSA 升高患者 MRI 检查应优化扫描方案，即 T2WI、T1WI 及 DWI，对于需要判断盆腔有无淋巴结转移或有无盆壁转移，可进行 DCE 辅助诊断。

PU-1046

Diagnostic performance of MR imaging for evaluating prognostic factors in patients with cervical cancer: A meta-analysis

Meiling Xiao
Jinshan Hospital of Fudan University

Objectives: The study aimed to determine the diagnostic performance of conventional magnetic resonance imaging (MRI) in assessing the distance between the tumour and the internal os, stromal infiltration, lymph node metastasis and parametrial invasion in patients with cervical cancer.
Methods: A systematic English-language literature search of conventional MRI in the evaluation of human cervical cancer was performed in PubMed, Cochrane Library, Embase and Web of Science from 1995 to 2018. The pooled sensitivity, specificity, diagnostic odds ratio (DOR), and positive and negative likelihood ratios (PLR and NLR) of all studies were calculated. The results were plotted in hierarchical summary receiver operating characteristic (HSROC) plot. Meta-regression and subgroup analyses of parametrial invasion were performed.
Results: The pooled sensitivity, specificity, DOR, PLR and NLR were 86%, 97%, 167.91, 24.74, and 0.15, respectively, for evaluating the internal os involvement (6 studies, 454 patients); 87%, 91%, 73.41, 10.22, and 0.14, respectively, for evaluating the stromal infiltration (11 studies, 672 patients); 51%, 89%, 8.63, 4.72 and 0.55, respectively, for evaluating the lymph node metastasis (15 studies, 997 patients); and 75%, 92%, 34.01, 9.38 and 0.28, respectively, for evaluating the parametrial invasion (19 studies, 1748 patients). The meta-regression of parametrial invasion showed that the application of contrast enhancement was a significant factor affected the heterogeneity ($p = 0.039$).
Conclusions: Conventional MRI can accurately evaluate the distance between the tumour and the internal os, and stromal infiltration, and performs good in diagnosing parametrial invasion. However, this method exhibited a limited ability to diagnose lymph node metastasis.

PU-1047

Multiparametric MRI-based radiomics nomogram in prediction of lymph node metastasis of early-stage cervical cancer preoperatively

Meiling Xiao
Jinshan Hospital of Fudan University

Objective
To develop and validate a multiparametric MRI-based radiomics nomogram for prediction of LNM in patients with cervical cancer.

Patients and Methods
Three hundred consecutive patients with stage IB－IIB cervical cancer with or without lymph node metastases were included in this study. And 200 patients were allocated to the primary cohort and 100 patients to the validation cohort according to the ratio of 2:1. All data was gathered from January 2016 to December 2018. Radiomic features were extracted in Pyson-software from MRI examination[T1WI, fs-T2WI, dynamic contrast-enhanced (DCE), diffusion-weighted imaging (DWI) and apparent diffusion coefficient (ADC)] of patients with cervical cancer. In the process of data dimension reduction, feature selection, and radiomics signature building, LASSO method was used. Multivariable logistic regression analysis was used to develop the predicting radiomics model. The radiomics nomogram were incorporated the radiomics signature, MRI-reported LN status and clinicopathologic. The performance of the nomogram was assessed with respect to its calibration, discrimination, and clinical usefulness.
Results
In the process of feature of selection, 3940 features were reduced to 26 potential predictors on the basis of 200 patients in the primary cohort. Predictors contained in the individualized prediction nomogram included the rad-score, MRI-reported LN status, FIGO stage, and histologic subtype. The radiomic signatures allowed good discrimination between LNM and non-LNM groups. The C-index was 0.840 (95% confidence interval [CI], 0.782－0.898 in the primary cohort and 0.823 (95% CI, 0.729－0.917) in the validation cohort. Application of the nomogram still gave good discrimination(C-index, 0.865 [95% CI, 0.813 to 0.917]) (C-index, 0.832 [95% CI, 0.737 to 0.927]) in the primary and validation cohort, it yields good calibration in both two cohorts. Decision curve analysis demonstrated that the radiomics nomogram was clinically useful.
Conclusion
A radiomics nomogram is developed in this study that incorporates the MRI-reported LN status, FIGO stage, histologic subtype and radiomic signature. And the radiomics nomogram can be conveniently used to facilitate the individualized prediction of LNM in patients with early-stage cervical cancer.

PU-1048

Evaluating the clinical efficacy of magnetic resonance elastography in patients with Budd-Chiari syndrome

Peng Xu,Kai Xu
Department of Radiology, Affiliated Hospital of Xuzhou Medical University, Xuzhou, Jiangsu Province 221002, China

Aimes : To measure liver stiffness (LS) of Budd-Chiari syndrome (BCS) patients and then to investigate the relationship between LS levels and liver function properties. Materials and Methods: Forty-six BCS patients, confirmed with ultrasonography exams, were enrolled in this study. The liver function of these patients was classified according to the Child-Pugh grading standard before treatment. As a result, 20 cases were graded as Child-Pugh A, 16 as Child-Pugh B and 7 as Child-Pugh C. Furthermore, clinical liver function parameters were also recorded, including albumin (ALB), alanine aminotransferase (ALT), aspartate aminotransferase (AST), prothrombin time

(PT), and total bilirubin (TBIL). All patients were measured with MRE before and after BCS treatment. The corresponding time interval between scans was 2-7 days. Pearson correlation analysis was performed to measure the correlation between LS and clinical liver function-related parameters (i.e., ALB, ALT, AST, PT and TBIL). Univariate analysis of variance test with a post hoc least significant difference test was used to compare LS of patients in three different Child-Pugh categories. Additionally, a paried t-test with a significant threshold of p=0.05 was used to compare LS of these patients before and after treatment.
Results: Significant correlations were, respectively, found between PT and LS (p=0.001), and between TBIL and LS (p=0.014). Liver stiffness also showed significant difference for patients with three different Child-Pugh grades (F=9.536, p<0.001). Relative to Child-Pugh C group, significantly decreased liver stiffness was found in Child-Pugh groups A (p < 0.001) and B (p=0.003), respectively. Comparable liver stiffness was observed between Child-Pugh groups A and B (p=0.166). In addition, comparing the liver stiffness before and after treatment, a significantly decreased liver stiffness was found in all three Child-Pugh grades, including for Child-Pugh A: 5.67 ± 1.15kPa vs. 4.83 ± 1.06kPa, p<0.001; for Child-Pugh B: 6.31 ± 1.13kPa vs. 5.12 ± 0.93kPa, p<0.001; for Child-Pugh C: 8.27 ± 2.22kPa vs. 7.37 ± 1.96kPa, p=0.009.
Conclusion: MRE for LS measurement has been demonstrated to act as an effective tool to evaluate liver function, and to monitor the BCS patients in follow-up treatments.

PU-1049
多模态 MRI 定量参数与前列腺癌 Gleason 评分及血清 PSA 相关性

李淑华
蚌埠医学院第一附属医院

目的 探讨 MRI 扩散加权定量参数 ADC 值、动态增强定量参数 Ktrans、Ve、Kep 值与前列腺癌 Gleason 评分及血清 PSA 相关性。**方法** 回顾性分析我院 58 例前列腺癌患者的临床资料，所有患者穿刺前均具有血清 PSA 及前列腺多模态 MRI 检查，病理证实为前列腺癌并进行 Gleason 评分。测量其 MRI 定量参数 ADC、Ktrans、Kep、Ve 值。根据 Gleason 评分，得分为 2 至 4 的患者被归类为高分化组，5 至 7 被归类为中分化组，8 至 10 被归类为低分化组，分析多模态 MRI 定量参数与 Gleason 评分、tPSA、fPSA 值的相关性，比较多模态 MRI 定量参数及 PSA 在各组间差异。**结果** ADC 值与 Gleason 评分、tPSA、fPSA 均呈负相关（P<0.05）；Ktrans、Kep 值与 Gleason 评分、fPSA、tPSA 均呈正相关（P<0.05）；Ve 值与 Gleason 评分、血清 tPSA、fPSA 均无相关性（P>0.05）；随着分化程度的降低，ADC 值降低；Ktrans、Kep、tPSA、fPSA 随分化程度减低呈升高趋势，差异有统计学意义（P<0.05）；Ve 值在各组间无明显统计学差异（P>0.05）。**结论** 前列腺多模态 MRI 定量参数能在术前非侵入性评价前列腺癌的病理评分，对临床具有一定指导意义。

PU-1050

不同表观扩散系数对子宫肉瘤与非典型子宫肌瘤鉴别诊断价值

邹春霞
重庆市第七人民医院

目的
探讨不同 ADC 值对确子宫肉瘤与非典型子宫肌瘤鉴别诊断价值，联合不同 ADC 值提高鉴别诊断准性。
材料与方法
回顾性分析我院在 2011 年 6 月至 2016 年 12 月期间经病理证实为子宫肉瘤与非典型子宫肌瘤的患者，术前均行 3T MRI 检查。测量并记录 mADC 值、minADC 值以及 rADC 值。分析并比较两组患者不同 ADC 值的差异性以及诊断效能。通过纳入 3 种 ADC 值建立多因素 logistic 回归诊断模型，采用 ROC 曲线评估诊断模型鉴别诊断子宫肉瘤及非典型子宫肌瘤的诊断效能。
结果
mADC 值、minADC 值以及 rADC 值均可鉴别诊断子宫肉瘤及非典型子宫肌瘤，差异均具有统计学意义（P 值<0.00）。当 mADC 值取阈值为 1.21×10^{-3} mm^2/s 时，敏感度为 88.6%，特异度为 84.1%，准确度为 86.6%，阳性预测值为 43%，阴性预测值为 47%。当 minADC 值取阈值为 0.95×10^{-3} mm^2/s 时，敏感度为 87.3%，特异度为 87.3%，准确度为 86.6%，阳性预测值为 44%，阴性预测值为 53%。当 rADC 值取 0.59 为阈值时，敏感度为 69.8%，特异度为 81.0%，准确度为 37.0%，阳性预测值为 37%，阴性预测值为 22%。根据多因素 Logistic 回归模型可选取 mADC 值与 minADC 值作为诊断模型的独立因素，根据 ROC 曲线评估诊断模型诊断效能的 AUC 为 0.907（95%可信区间为 0.850～0.965），敏感度为 97.5%，特异度为 82.5%，准确度为 91.5%，阳性预测值为 40%，阴性预测值为 17%。
结论
3 种 ADC 值都可鉴别诊断子宫肉瘤及非典型子宫肌瘤，mADC 值与 minADC 值诊断准确性相差不大，当 mADC 值与 minADC 值联合诊断时准确性最高。

PU-1051

3.0T MRI 对剖宫产后子宫切口瘢痕妊娠的诊断价值

周小玲
成都市妇女儿童中心医院

目的 探讨剖宫产后子宫切口瘢痕妊娠(cesarean scar pregnancy，CSP)的 MRI 影像特征，分析其对 CSP 的诊断价值。
方法 ：回顾性分析 2017 年 8 月至 2018 年 6 月期间，50 例经手术及病理证实的 CSP 患者资料，将 MRI 影像表现与手术及病理结果对照，总结其 MR 影像特征。
结果 50 例 CSP 均清楚显示孕囊，并位于子宫前壁下段切口瘢痕周围。手术瘢痕表现为子宫肌层连续性中断、局部向内凹陷或变薄，以 MRI 增强时显示清晰，呈条状无强化影；50 例其中 35 例为圆形或卵圆形单纯囊性灶，紧贴子宫切口瘢痕区、部分突入切口内，T1WI 呈底信号，T2WI 呈高信号，增强呈环状强化，距峡部子宫浆膜层约 1-4mm；50 例中 13 例为不规则包块影呈混杂信号，向子宫前壁切口浸润生长同时向宫腔内、宫颈管生长，增强包块内见条片状强化影，局部子宫峡部前壁呈线状、部分欠连续；50 例中一例表现为多囊伴分隔表现，向子宫前壁下段切口内生长并向外膨突、局部子宫峡部肌层欠连续，经手术病理证实为良性葡萄胎；50 例中有一例为双胎合并切口瘢痕妊娠。上述病例中有 23 例合并孕囊周围宫腔内或宫颈管内积血。
结论 准确掌握 CSP 的 MRI 影像特征，可以为 CSP 的诊断及治疗方式的选择提供可靠的依据。

PU-1052
磁共振各序列对宫颈癌 IB1 期病灶大小精准性评估

刘国源,董越
辽宁省肿瘤医院

目的 评价磁共振 T1W 增强、T2W、表观弥散系数(ADC)、弥散加权成像（DWI）各序列对宫颈癌 IB1 期病灶大小测量的精准度 **方法** 回顾性分析 43 名经过术后病理确诊为宫颈癌 IB1 期的 MRI 常规平扫、增强及 DWI 检查资料， b 值取 0 、800、1000s/mm² 。由精通妇科影像诊断的医生分别测量 MR 图像（T1W 增强、T2W、ADC、DWI）中病灶的左右径、前后径及上下径，再将测量的各值和组织病理中对应的病灶径线进行一致性检验。**结果** T1W 增强、T2W、ADC、DWI 序列上，测得病灶左右径同组织病理左右径相比无差异（p>0.05）； T1W 增强、T2W 序列上，测得病灶前后径同组织病理前后径相比无差异（p>0.05）。在 ADC、DWI 序列上，测得病灶前后径同组织病理前后径相比有差异（p<0.05）；T1W 增强及 T2W 上，测得病灶上下径同组织病理上下径相比有差异（p<0.05），两两间差异有统计学意义。 **结论** 磁共振各序列能够对宫颈癌 IB1 期病灶大小进行相对精确的评估。

PU-1053
Prenatal MR imaging diagnosis of placental invasion

jinchao du
Department of Radiology, Chongqing Traditional Chinese Medicine Hospital

[Abstract] **Objective** To evaluate the characteristic imaging features and performance of prenatal magnetic resonance(MR) imaging in the diagnosis of placental invasion. **Methods** 156 patients with suspected placental invasion underwent prenatal MR imaging, including 96 patients with placental invasion and 60 without. Two radiologists assessed, independently and then in consensus, the presence of MR imaging finding associated with placental invasion. The results were compared with the operation and pathological finding. Sensitivity, specificity, positive, and negative values, and accuracy were calculated. The diagnostic performance was determined by a receiver-operating-characteristic curve analysis. **Results** Uterine bulging, abnormal vessel in the placental, hypointense intraplacental bands, uterine penetration and parametria implantation, uterine recess, placental tissue into the cervical canal were significantly more common in patients with placental invasion than in those without(P£0.05). The presence of abnormal vessel in the placental, hypointense intraplacental bands, uterine penetration and parametria implantation, uterine recess, placental tissue into the cervical canal yielded a specificity, positive of 100%,respectively. **Conclusions** Prenatal placental MR can be used for accurate diagnosis of placental invasion, especially in the presence of abnormal vessel in the placental, hypointense intraplacental bands, uterine penetration and parametria implantation, uterine recess, placental tissue into the cervical canal.

PU-1054

3.0TMR 平扫对复杂性肛瘘的诊断价值及分型尝试

文铁,王霞,闫苗苗
延安大学附属医院

目的 评价磁共振平扫对复杂性肛瘘的诊断价值，并尝试进行分型。
方法 回顾分析 26 例经手术病例证实为肛瘘患者的 MR 平扫资料，包括肛瘘内口、主管、支管、伴发脓肿的数目、位置，以及分型，与手术结果进行对照分析。
结果 MR 平扫对肛瘘内口、主管、支管、脓肿诊断的灵敏度分别为 86.2%、90.3%、86-9%、100%，与手术分型对照准确率为 85.3%。
讨论 3.0TMR 平扫能准确诊断肛瘘内口、主管、支管和伴发脓肿，并可以准确分型，对肛瘘手术有指导意义。

PU-1055

Noninvasive assessment of portal hypertension in patients with liver cirrhosis using MR elastography

Xiaopei Wang,Erhu Jin,Zhenghan Yang
Beijing Friendship Hospital, Capital Medical University

PURPOSE:
To assess the value of MR elastography (MRE) in estimating portal pressure based on liver and spleen stiffness.
Method and materials:
33 patients with cirrhosis were consecutively enrolled. All patients underwent hepatic venous pressure gradient (HVPG) measurement and MRE scan in 1 week. Liver and spleen stiffness obtained by software post-processing were compared to the HVPG with Pearson coefficients and multiple regressions. Patients with and without clinically significant portal hypertension (CSPH) or compensated cirrhosis were compared with Mann–Whitney tests, logistic regression and ROC analysis.
RESULTS:
The mean(± SD) of HVPG was15.88±5.71mmHg. Spleen stiffness correlated with the HVPG(r=0.56,p=0.001),liver stiffness in compensated cirrhosis patients correlated with HVPG(r=0.60,p=0.003), at multivariate linear regression, only spleen stiffness associated with HVPG(r^2=0.35,p＜0.001). The AUCs of liver and spleen stiffness to predict CSPH were 0.88, 0.81respectively(p＜0.05).Liver and spleen stiffness also demonstrated high diagnostic performance for indicating the decompensated cirrhosis (AUC=0.74,0.80 respectively, p＜0.05), the AUCs of combined diagnosis to predict decompensated cirrhosis were 0.84(p＜0.05), no statistical difference was found among above three AUCs.
Conclusion:
Spleen and liver stiffness correlated with HVPG and they can be used alone or unitedly to assess the degree of portal hypertension in liver cirrhosis, especially the spleen stiffness.

PU-1056

PSMA-1 靶向的多功能纳米探针在早期前列腺癌的 MRI 分子成像研究

李亮,张雪宁,张洪团
天津医科大学第二医院

目的 通过构建集靶向特异性、成像敏感性与体内长循环特性于一体的多功能磁共振成像纳米探针，实现对前列腺癌的早期精确诊断与无创动态监测。
方法 以前列腺特异性膜抗原 (Prostate-specific membrane antigen, PSMA-1) 作靶点，以超小金纳米粒子 (Gold nanoclusters, AuNCs) 为载体，将 MR 成像组件 Gd 及长循环物质 PEG 进行多功能组装，构建 PSMA-1 靶向的高分辨精准磁共振分子成像纳米探针(PSMA-1-Au@Gd NCs)，并明确探针的生物相容性及生物学分布。建立荷人前列腺癌裸鼠移植瘤模型，鼠尾静脉注射纳米探针 PSMA-1-Au@Gd NCs，利用 MRI 分别从细胞、在体水平监测探针在前列腺癌的分布聚集情况，通过活体动态成像测量肿瘤区 T1WI 信号强度 (Signal intensity, SI) 及对比噪声比 (Contrast to noise ratio, CNR)，评估前列腺癌的负荷和性质，并进行组织学定量分析，验证其实际功效。
结果 本研究合成的 PSMA-1-Au@Gd NCs 探针具有良好的生物相容性，适合作早期前列腺癌 MRI 靶向分子成像造影剂。细胞实验表明，PSMA-1-Au@Gd NCs 对前列腺癌细胞 (PC3) 有高亲和力；体内动态 MR 成像结果显示，荷瘤裸鼠静脉注射 PSMA-1-Au@Gd NCs 后肿瘤组织 T1 信号强度 SI 及对比噪声比 CNR 随时间延长而显著增强，并可持续至 36 小时；组织切片免疫组化及镀银染色证实 PSMA-1-Au@Gd NCs 在 PSMA-1 受体高表达的肿瘤明显聚集。
结论 本研究构建的 MR 分子成像探针 PSMA-1-Au@Gd NCs 同时具有前列腺癌靶向特异性、成像敏感性及体内长循环特性，可从多角度精准、动态分析早期前列腺癌肿瘤区域病理信息，为实现真正意义的前列腺癌分子水平早期诊断提供了科学依据和实验证据支持，在前列腺癌临床诊疗中有非常广阔的应用前景。

PU-1057

MRI 常规序列联合 DWI 对直肠癌术前分期的价值

王霞,文铁
延安大学附属医院

目的 探讨 MR 常规序列及 DWI 对直肠癌术前分期的诊断价值。
方法 对临床首诊直肠癌的 35 例患者进行常规 MR 序列及 DWI 扫描后手术治疗并进行病理分期。
结果 MRI 常规序列能很好地显示肠壁的各层解剖结构及肿瘤对肠壁及邻近结构的侵犯范围和程度，常规 MRI、联合 DWI 行 TN 分期的准确性分别为 52%和 71%，差异有统计学意义。
讨论 MR 常规序列联合 DWI 对直肠癌术后 TN 分期较单独常规 MRI 序列更具优势。

PU-1058

MRI 征象预测肝内胆管细胞癌的微血管侵犯

马喜娟[1],师毅冰[1],杨春[2]
1.徐州市中心医院
2.复旦大学附属中山医院

目的 微血管侵犯（MVI）与肝内胆管细胞癌（ICC）患者的术后存活率相关。本研究试图研究 ICC 患者的影像参数与 MVI 之间的相关性。
方法 回顾性分析 108 例经手术切除的单个 ICC 病灶的患者（34 个 MVI 阳性和 74 个 MVI 阴性）的术前肝脏 MRI 检查资料，包括 T1WI，T2WI，弥散加权成像（DWI）和动态增强成像。定性评估以下影像学特征：形态学特征，包括肿瘤形态，T1WI 和 T2WI 的信号特征，肝内胆管扩张，肝包膜回缩，DWI“靶征”，动态增强模式，动脉期增强模式，肿瘤内部的点/带状增强，肿瘤内部可见穿透血管（肝动脉，门静脉或肝静脉），动脉期增强边缘的完整性和外周肝脏异常灌注。定量分析评估肿瘤大小，最大增强边缘厚度，动脉期边缘增强比和延迟期增强范围。卡方检验，Fisher 精确检验和独立 t 检验用于单变量分析，以确定 MVI 的存在与这些 MR 参数之间的关系。Logistic 回归分析用于识别这些 MR 参数中 MVI 的独立预测因子。
结果 在 MRI 特征中，四个定性特征（肿瘤形态，肝内胆管扩张，动脉期增强模式和可见肝动脉穿透征）和两个定量肿瘤参数（肿瘤最大直径和动脉期边缘增强比）与 MVI 相关（P 值分别为 0.007、0.003、0.008、0.000、0.003 和 0.002）。此外，肿瘤标志物 CA19-9 和肿瘤病理分级也与 MVI 相关（P 值分别为 0.014 和 0.004）。多变量逻辑回归分析显示上述参数均不是 ICC 中 MVI 诊断的独立预测因子。
结论 对于术前预测 ICC 病灶的 MVI，术前 MRI 获得的一些定性和定量数据以及术前 CA19-9 水平均有一定的意义，此外，术后病理学肿瘤分级与 MVI 也有相关性。需要更多的研究来确定可用作独立风险因素的 MR 特征。

PU-1059
犬肝脏射频消融坏死模型的制作及磁共振弥散加权成像的参数选择

戚晓军,任克
厦门大学附属翔安医院

目的 DWI 成像评价射频消融治疗反应及预测其疗效已经成为影像学研究的热点。本研究拟通过正常肝脏组织进行射频消融治疗术后 DWI 随访中图像质量进行定性和定量评价，筛选 DWI 检查时合适的扩散权重(b 值)。**方法** 正常家犬 15 只在犬肝右叶进行射频消融，制作肝脏凝固性坏死模型。给予磁共振扫描，计算 T2WI 和不同 b 值(300 s/mm^2、500 s/mm^{2}和 800s/mm^2)的 DWI (分别记为 DWI300、DWI500 和 DWI800)图像上坏死灶不同部位及坏死灶与整个正常肝脏的信号强度比值（Single Intensity Ratio, SIR ）和坏死-肝脏对比信噪比(contrast signal-noise ratio，CNR)。观察犬肝脏射频消融坏死模型 MRI 成像各参数图像的信号特点；比较坏死灶在不同 b 值的 DWI 图像中的 SIR、CNR 及 ADC 比值，选择合适的 b 值。**结果** 坏死/肝脏、坏死周边环形反应带/凝固性坏死中心的 SIR 和 ADC 比值随着 b 值的增加，均呈不同程度的逐渐上升趋势。**结论** 从坏死灶的 SIR 和坏死-肝脏 CNR 角度分析，最佳 b 值应选择 300s/mm^2，500 s/mm^{2}次之。从 ADC 值准确性角度来考虑，应该尽量选择大 b 值，但当 b 值为 800s/mm^{2}时，坏死灶和肝脏的信号值衰减均较明显，背景噪声明显，坏死-肝脏 CNR 较低，对多数坏死灶轮廓显示不清。综合考虑，应当选择 b=500 s/mm^2

PU-1060
钆布醇与钆喷酸葡胺在腹部 MRA 中的对比研究

陈国勇

四川大学华西医院

目的 对比钆布醇与钆喷酸葡胺在腹部动态增强 3D MRA 中的图像质量和血管显示情况。
方法 对 20 名志愿者行分两次分别用钆布醇和钆喷酸普安行上腹动态增强 3D MRA 检查，获取动脉期、门脉期血管图像以及静脉期 VIBE 图像。测量动脉期腹主动脉、腹腔干、肠系膜上动脉和肾动脉主干；门脉期门静脉汇合处、门静脉左支、门静脉右支和肠系膜上静脉；静脉期肝静脉汇合处和肾静脉的信号强度（signal intensity，SI）， 计算其信噪比（signal to noise ratio，SNR）。评价腹主动脉、肝总动脉、肝固有动脉、胃十二指肠动脉、胃左动脉、肾动脉及分支、脾动脉及分支的可视性及图像质量。
结果 所有纳入观察的目标血管图像质量均能很好地满足诊断要求，但钆布醇血管远端及分支的显示效果优于钆喷酸葡胺。钆布醇所获腹主动脉、腹腔干动脉、肾动脉主干、门静脉及左右分支、肠系膜上静脉的 SNR 明显高于钆喷酸普安所获血管图像（$p<0.05$）。肠系膜上动脉和肝静脉汇合处，两种对比剂所得血管的 SNR 无明显差异（$p=0.171$ 和 $p=0.078$）。
结论 腹部血管成像中，等摩尔量的钆布醇对小血管的显示明显优于钆喷酸葡胺，获得的血管对比更好。

PU-1061
超清弥散 RESOLVE-DWI 在直肠癌 MRI 检查中的临床应用研究

蔡晓明,雷子桥
华中科技大学同济医学院附属协和医院

目的 对比分析分段读出平面回波扩散加权成像与常规扩散加权成像在 1.5T 场强下直肠癌 MRI 检查中的图像质量、信噪比、对比噪声比、对比度及表观扩散系数以及在 T 分期的准确性上的差异性，以探讨 RESOLVE-DWI 在直肠癌 MRI 检查中的临床价值。
材料与方法 连续收集 2016 年 1 月至 2017 年 2 月间临床怀疑直肠癌并顺利完成 MRI 检查的 135 例患者资料,将术后病理结果证实为直肠癌的 42 位患者纳入本组研究，进行常规直肠 MRI 扫描的同时，扫描 RESOVLE-DWI 序列与常规 DWI 序列。由两位放射科诊断医师对两组 DWI 图像的解剖变形、空间分辨率、病灶细节显示、图像的总体质量 4 个指标进行主观评价,并进行 T 分期。定量测量并计算两组 DWI 图像的 SNR、CNR、C 及 ADC 值以进行客观评价。
结果 RESOLVE-DWI 与常规 DWI 在图像质量 4 项指标及 SNR、CNR 对比上差异均具有统计学意义（P 值均满足 $P<0.05$），且 RESOLVE-DWI 组 4 项指标评分和 SNR、CNR 值均高于常规 DWI 组，两组 DWI 图像的 ADC 值差异无统计学意义（P 值满足 $P>0.05$）。RESOLVE-DWI 组 T 分期的准确率 88.1%高于常规 DWI 组 T 分期的准确率 71.4%，且两组间对比病理结果进行卡方检验，$P>0.05$，具有显著性差异。
结论 RESOLVE-DWI 对比常规 DWI 提升了图像质量，明显提升了图像 SNR 与 CNR，对 ADC 值的测量没有影响，明显提升了直肠癌 T 分期的准确率，可以替代常规 DWI 用于直肠癌 MRI 扫描中。

PU-1062
婴幼儿腹部磁共振检查技术探讨

徐军
华中科技大学同济医学院附属协和医院

目的 把握婴幼儿的生理特征和检查技术要点，可以安全有效的帮助患儿完成检查。

方法 一.检查前准备 1.所有需要进入磁体间的各类人员应去除一切金属，磁性及电子产品，如手机，手表，钱包，信用卡，银行卡，硬币，钥匙，打火机，假发，助听器，首饰，小刀，别针，氧气瓶所有监护设备等等。2.不同厂家，不同型号的设备噪声不一样，对于婴幼儿磁共振检查，应当选择噪声较小的机器。 3.婴幼儿的体温调节能力较差，要注意保暖，因此检查室的温度不宜过低。最好不要低于 22℃，以免小儿感冒咳嗽，惊醒，影响检查。4.婴幼儿需要熟睡方能检查。但在实践过程中，在医师的指导下适量使用安眠药效果更佳。5.摆位时，动作要轻，动作不宜过大，给患儿耳朵塞好棉球，然后轻轻的盖上腹部线圈。定位时，嘱咐家属不要东张西望，看好患儿，患儿不适时，可以及时处理。6.对于重症患儿，需要医生和家属陪同，密切关注患儿状况。二.检查过程中 1.全部检查，最好 30min 钟内完成，序列扫描次序：诊断关键序列—常规序列—科研序列。2.开始检查时，机器响起，婴幼儿往往多有不适，耐心等待，等婴幼儿适应环境，继续完成未做好的检查。3.婴幼儿与成人不同，无法憋气，但是腹部运动相对较小，可以选用单次激发快速自旋回波序以及平面运动矫正和膈肌导航技术，可以减小运动伪影。4.婴幼儿的脏器较小，层厚 4-6mm 即可，图像分辨率可以适当提高，以达到诊断要求。5.婴幼儿的腹部脂肪不多，常规脂肪抑制可以商榷。6.婴幼儿一般不做腹部增强，如果要做，可以先用快速序列扫两期，能看多少看多少，之后可以运用导航技术加扫一期。7.结束检查，安全退出检查床。

结果 在婴幼儿腹部磁共振检查中，了解婴幼儿的生理特征和检查原则，在很大的程度上可以安全有效的提高婴幼患儿检查成功率。

结论 分析学习婴幼儿腹部磁共振检查技术，不仅可以帮助患儿更好的解决问题，还对自身技术的提高也有一定的帮助。

PU-1063

3.0T 磁共振动态增强成像定量参数在前列腺癌鉴别诊断中的价值

李强
华中科技大学同济医学院附属协和医院

目的 探讨磁共振动态增强定量参数在前列腺癌鉴别诊断中的可行性及临床应用价值。

材料与方法:收集疑诊前列腺癌患者 45 例，行前列腺磁共振扫描及动态增强灌注成像，其中良性病变 23 例，前列腺癌 22 例，其中 16 例患者采用前列腺根治切除进一步证实。两名医师参照 T2WI 低信号区域，协商一致后共同在 DCE 病灶区放置 ROI，测量病灶区定量参数转运常数（K^{trans}）、血管外细胞间隙体积百分数（V e）及速率常数（Kep）。根据临床数据结果将病灶分为前列腺癌灶组和良性前列腺病灶组。采用独立样本 t 检验比较 Ktrans 、Kep、Ve 在前列腺癌与良性病灶中的差异，采用 ROC 曲线分析 DCE 定量参数鉴别前列腺癌和良性病变中的价值。

结果 前列腺癌和良性病灶组的 Ktrans、Kep、Ve 分别为(0.160±0.056)
VS(0.096±0.047)、(0.588±0.197)VS (0.395±0.182)、(0.302±0.187)
VS(0.316±0.191)，两组间 Ktrans 和 Kep 独立样本 t 检验结果差异有统计学意义
(P<0.01)，Ve 之间差异无统计学意义。Ktrans、Kep、Ve 诊断前列腺癌和
前列腺良性病变的曲线下面积分别为 0.825、0.853、0.514。Ktrans、Kep 鉴别前列腺癌和良性前列腺病灶的敏感性及特异性分别为 85.11%、81.6%和 75.32%、71.9%。

结论 动态对比增强定量参数 Ktrans、Kep 在前列腺癌与前列腺良性病变鉴别诊断中具有重要价值。

Discussion on the display of cortical medulla of healthy adult kidney by different flip angle of LAVA sequence

Liping Deng[1],Hehan Tang[1],Jiayu Sun[1],Weijie Yan[1]
1.West China Hospital, Sichuan University
2.West China Hospital, Sichuan University

Objective To investigate the application value of changing the magnetic reversal three-dimensional volume interpolation fast GRE sequence (LAVA sequence) with different flip angles in showing the cortical medulla of healthy adult kidney. Methods A total of 95 healthy adult volunteers were enrolled in a magnetic resonance examination using a 3.0T MR system (Discovery MR 750, GE Healthcare, Milwaukee, USA). In the breath holding mode, the LAVA-flex sequence was scanned in the transverse section of the kidney, and the inversion angle was set to 5° 10° 15° 20° 30° . The images were transferred to a workstation for processing, and the contrast of the renal cortex of each sequence was observed and scored. Select the left and right kidney kidney upper pole, the renal hilum and the inferior pole three levels, manually delineate the left and right kidney cortex, medullary region of interest (ROI), measure the signal value; measure the standard deviation of the corresponding level of the psoas muscle. The renal cortex and medullary signal values measured at three levels were averaged to calculate the contrast-to-noise ratio. The difference in cortical medullary contrast-to-noise ratio obtained from different flip angles was analyzed. Results The flip angle was 5° 10° 15° 20° 30° . The diagnostic physician showed a difference score on the cortex and medulla. The contrast ratio of renal cortex and medulla on both sides of the renal medulla was 4.21±0.42, 6.24±0.83, 4.69±0.92, respectively. 3.30±0.81, 2.89±0.31, the differences were statistically significant. Conclusion The LAVA flex sequence has a flip angle of 10° , and the cortex and medulla has a higher contrast-to-noise ratio, which can better distinguish the renal cortex.

PU-1065

IVIM-DWI and DCE-MRI in Diagnosis of StageⅡCervical Cancer With Parametrium Invasion

Xinxiang Li,Jiangning Dong
West district of The First Affiliated Hospital of USTC, Division of life Sciences and Medicine, University of Science and Technology of China, Anhui Provincial Cancer Hospital

Purpose: To investigate the value of intravoxel incoherent motion diffusion weighted imaging (IVIM-DWI) and dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) in the diagnosis of stageⅡcervical cancer with parametrium invasion.
Meterials and Methods Forty-one patients with stageⅡcervical cancer confirmed by surgerical pathology were enrolled in our hospital, containing parametrium invasion (n=17) and parametrium non-invasion (n=24). Plain MRI, IVIM-DWI and DCE-MRI were

preoperatively scaned. The tumor volum of the two groups were measured. The optimal maps were reconstructed of IVIM-DWI parameters (ADC, D, D*, f) and DCE-MRI parameters (K^{trans}, K_{ep}, V_e). All parameters of the two groups were analyzed by one-way anaylsis variance. The optimal cut-off values of parameters with statistical significance were acquired by receiver operator characteristic curve.

Rusltes The difference of volum of stage Ⅱ cervical cancer with parametrium invasion and without parametrium invasion had statistical significance. There were a significant difference of D, D^* and f values of the two groups (F=30.487, 6.752, and 8.983, P＜0.05). Meanwhile, there was no defference of ADC values (P＞0.05). Areas of D, $D^*$and f values under ROC curves were 0.140, 0.680, and 0.745, respectively. The diagnostic threshold of $D^*$and f values was 33.65 mm^2/s (specificity=77.4%, sensivity=60.9%) and 0.226 (specificity=83.9%, sensivity=65.2%), respectively. There were a significant difference of K^{trans}, K_{ep} and V_e values of the two groups (F=45.20, 125.42 and 85.32, P＜0.05). Areas of K^{trans}, K_{ep} and V_e values under ROC curves in the diagnosis of cervical cancer with vaginal fornix invasion were 0.896, 0.864 and 0.885, respectively. The diagnostic threshold of them were 0.272 mm^2/s (specificity=74.2%, sensivity=95.7%), 0.554 (specificity=67.7%, sensivity=100%), and 0.558 (specificity=90.3%, sensivity=78.3%), respectively.

Conclusions IVIM-DWI and DCE-MRI parameters are helpful for the diagnosis of cervical cancer with parametrium invasion, and auxiliary conventional MRI.

子宫内膜间质肉瘤与子宫肌瘤变性的影像鉴别

伍雪,蔡春仙
内江市第二人民医院

目的 探讨 MRI 在子宫内膜间质肉瘤（ESS）与子宫肌瘤变性中的鉴别诊断价值。方法 搜集我院经病理证实为 ESS 的病例 4 例，结合（近 5 年）国内外相关文献报道的 34 例，及我院经病理证实为子宫肌瘤变性的病例 17 例（30 个），分析两者的 MRI 影像学特征，总结 MRI 对二者的鉴别诊断要点。结果 1、ESS 的病灶大部分位于肌层，其次位于宫腔，少数位于宫外，与子宫肌瘤变性的病灶发生部位相似，其差别不具有统计学意义（*c2=1.952，P=0.400*）；2、ESS 的病灶相对较大，边界部分不清者相对较多，且常伴有出血及坏死，但二者的差别均不具有统计学意义（*t=-0.971，P=0.335，c2=2.506*、*0.167，P=0.113*、*0.092*）；我院 3 例 ESS 伴坏死的病灶，坏死面积均大于 50%以上，而 8 例子宫肌瘤变性伴坏死的病灶，坏死面积均小于 50%；3、ESS 的强化程度多高于正常子宫肌层，而子宫肌瘤变性的强化程度多低于正常子宫肌层，二者的差别具有统计学意义（*c2=34.343，P=0.000*）。结论 ESS 与变性的子宫肌瘤在发生部位、大小及信号特征上近似，在 MRI 上特征性的影像表现相对有限，但病灶坏死面积大于 50%及强化程度高于正常子宫肌层有一定的鉴别价值。

PU-1067
体素内不相干运动成像对前列腺癌盆腔淋巴结转移情况的价值研究

石林,马贺骥

锦州医科大学附属第一医院

目的 评估体素不相干运动成像（IVIM-DWI）定量参数对于前列腺癌盆腔淋巴结良恶性的诊断价值。
方法 对符合纳入标准的 27 例行前列腺癌根治术(RP)联合盆腔淋巴结切除术(PLND)患者行术前 IVIM-DWI 扫描，根据术后病理结果将切除淋巴结分为转移与非转移组，测量淋巴结的表关扩散系数（ADC）、单纯扩散系数（D）、伪扩散系数(D*)、灌注分数（f），分析组间各参数的差异，并采用受试者工作特征曲线（ROC）评估各参数对于前列腺癌盆腔淋巴结转移情况的诊断效能。
结果 共选取 98 枚有效淋巴结，其中 69 枚为非转移淋巴结，29 枚为转移淋巴结。转移组与非转移组在平均 ADC 值[（1.01±0.12）×$10^{-3}mm^2/s$ vs （1.46±0.24）×$10^{-3}mm^2/s$]、D 值[（0.74±0.13）×$10^{-3}mm^2/s$ vs （1.16±0.28）×$10^{-3}mm^2/s$]、f 值[（22.53±7.81）% vs （30.03±11.73）%]上差异有统计学意义（P<0.05），而在 D*值上无统计学意义（P>0.05）。各参数鉴别前列腺癌淋巴结转移的诊断效能如下：ADC 值的 AUC 值为 0.957，阈值为 1.10×$10^{-3}mm^2/s$，敏感性为 75.86%，特异性为 98.55%， D 值的 AUC 值为 0.931，阈值为 0.93×$10^{-3}mm^2/s$，敏感性为 93.10%，特异性为 78.26%，f 值的 AUC 值为 0.682，阈值为 34.5%，敏感性为 96.55%，特异性为 43.48%。
结论 表关扩散系数（ADC）、单纯扩散系数（D）对于前列腺癌转移及非转移盆腔淋巴结的诊断效果好，灌注分数（f）稍差，三者可作为行 RP 联合 PLND 的术前参考。

PU-1068

MRI 与 CT 对小肝癌诊断价值比较研究

陈刚
郑州市第六人民医院

目的 对 MRI 与 CT 在诊断小肝癌中的应用价值进行分析。**方法** 将 2016 年 1 月至 2017 年 12 月我院收治 40 例小肝癌患者作为本次研究对象，均采取 MRI 与 CT 对其进行诊断，对诊断结果进行比较。**结果** MRI 诊断准确率 95.0%高于 CT 诊断准确率 75.0%，数据差异显著（P＜0.05）；CT 诊断漏诊率 7.5%与 MRI 诊断漏诊率 2.5%没有差异（P＞0.05）。**结论** MRI 在诊断小肝癌中有着重要的应用价值，其诊断准确率比较高，有效的显示出了小肝癌患者血供特点，值得推广。

PU-1069

磁敏感加权成像对肝纤维化的无创性临床诊断价值的应用

闫苗苗,文 铁
延安大学医学院附属医院

摘要：目的 探讨磁敏感加权成像（susceptibility weighted imaging,SWI）幅值图（magnitude image）的信号强度值（signal intensity,SI）对肝纤维化的诊断价值，及对乙型病毒性肝炎肝纤维化患者无创诊断中的临床价值。
方法 120 例慢性乙型肝炎肝纤维化的患者为观察组,男 75 例，女 45 例,年龄（45±15）。80 例体检健康者为对照组。且肝炎标志物均阴性者为对照组，男 48 例，女 27 例，年龄(46±10)岁。分别行联影 3.0T 光梭磁共振磁敏感加权成像扫描，以肝组织活检为金标准，分析幅值图的信号强度值与肝纤维化分期的相关性。

结果 SWI 幅值图的信号强度值与肝纤维化分期呈正相关（r=-0.663、P<0.001），对肝纤维化的敏感性为 78%，特异性为 83%，阳性检出率 79%。
结论 随着肝纤维化程度的加重，SWI 信号强度呈现不同的变化，但诊断轻度肝纤维化的价值较低。

PU-1070
女性盆腔囊性占位病变应用常规序列磁共振成像扫描的实用性探究

叶晓
湖北医药学院附属随州医院（随州市中心医院）

目的 研究探讨应用核磁共振常规序列扫描在女性盆腔囊性占位病变诊断中的实用性。
方法 对从 2015 年 1 月至 2017 年 1 月在随州市中心医院经手术病理确诊的 70 例盆腔囊性占位病变的女性患者，进行 MRI 和超声检查进而比较二者的准确率，并进一步分析通过 MRI 检查不同种类的盆腔囊性占位病变的相应特点。
结果 在 70 例病例中，共有 69 例通过 MRI 检查诊断为盆腔囊性占位病变，病灶部位与病理诊断符合，准确率达 98.55%，且这 70 例病例中经手术病理确诊出 25 例恶性肿瘤有 24 例经 MRI 检查被诊断出，准确率达 96.00%；超声检查诊断出盆腔囊性占位病变共计 63 例，准确率 90.00%，其中手术病理确诊的 25 例恶性肿瘤，经超声检查诊断出 19 例，准确率 76.00%，两种方法之间的两组数据均具有统计学意义(P<0.05)。盆腔囊性占位病变在 MRI 检查下各有特点:子宫肌瘤一般会出伴随积增大、宫旁肿块，另外会有 T1WI 低信号；子宫腺肌症除了表现为体积增大之外，低信号的 T1WI 以及混杂信号的 T2WI 亦是其重要表现；宫颈癌则伴随有宫颈增大、低信号 T1WI、中等信号 T2WI。
结论 相对目前应用更多的超声检查而言，MRI 能够更准确地诊断出盆腔囊性占位病变、更准确的定位盆腔病灶，而且能更准确的定性判断肿瘤的良恶性。

PU-1071
磁共振对卵巢良性、交界性及恶性肿瘤的鉴别诊断

任振东,任克,徐海龙
厦门大学附属翔安医院

【摘要】**目的** 探讨 MRI 对卵巢原发性良性、交界性及恶性肿瘤的鉴别诊断价值。方法 分析经手术病理证实卵巢肿瘤患者（良性 64 例，交界性肿瘤 62 例，恶行肿瘤 62 例）术前的 MRI 影像表现，包括肿瘤形态、大小、单多囊、实性成份、囊壁厚度、是否有壁结节等，与病理结果对照，并在 DWI 序列测量肿瘤实性成份的 ADC 值，比较卵巢良性、交界性及恶性肿瘤单多囊、囊壁厚度、壁结节的以及 ADC 值之间的差异。结果 单多囊、囊壁或分隔增厚（≥5mm）、壁结节（≥5mm）三个征象良性与交界性及恶性肿瘤之间有统计学意义，交界性与恶性之间无统计学意义；ADC 均值：良性（2.01±0.59）×$10^{-3}$$mm^2$/s、交界性（1.57±0.46）×$10^{-3}$$mm^2$/s、恶性（0.94±0.22）×$10^{-3}$$mm^2$/s，三者之间有统计学意义（P＜0.05）。结论 MRI 可以良好的显示卵巢肿瘤的各种征象，部分征象可以用于鉴别肿瘤的病理特征，ADC 值的测定有助于良性、交界性及恶性肿瘤的鉴别，指导手术方案的术前制定。

PU-1072
犬肝脏射频消融后凝固性坏死的动态磁共振弥散加权成像研究

戚晓军,任克
厦门大学附属翔安医院

目的 本实验利用 MR 弥散加权成像（DWI）技术动态观察评价犬正常肝脏射频消融后亚急性期（2 周内）的影像变化，同时与相应的病理切片进行对照研究。以探讨 RFA 后坏死组织和正常治疗反应带的功能成像表现是否存在差异及其相应的病理基础。**方法** 选择健康成年家犬 9 只制作肝脏射频消融坏死模型，分别于射频后即刻及 1 周、2 周进行 MR 平扫和 DWI 检查，测定坏死灶消融坏死中心、周边环形反应带及正常肝脏组织的 ADC 值，观察肝脏坏死灶内部不同病理组织在不同时期的 MR 影像学变化及 ADC 值的变化。并于检查后在每个时间节点各处死 3 只家犬，最后处死全部动物。剖腹取肝脏坏死灶进行大体病理学观察，测量坏死灶直径后常规甲醛固定、包埋、切片及 HE 染色后进行显微病理学检查。分别与 MR 平扫图像和弥散成像图像进行对照研究。**结果** 以 DWI 图像上正常肝组织信号作为对比，对应于病理观察到的消融组织周边环形反应带区域在 DWI 图像上表现为更高信号，而消融坏死灶中心区域表现为低信号。射频消融后即刻，1 周及 2 周时消融坏死组织周边环形反应带、消融坏死组织中心及正常肝脏组织的 ADC 值(单位：$10^{-3}mm^2/s$)分别为 2.26±0.22、0.59±0.01、1.73±0.18；1.95±0.19、0.63±0.09、1.76±0.12；1.82±0.17、0.74±0.05、1.78±0.17。各组之间的消融坏死组织周边环形反应带与消融坏死组织中心的 ADC 值存在显著性差异（P<0.05）；各组的 ADC 值呈现逐渐减小的表现，尤以环形反应带显著，各时间组间差异具有显著性(P<0.05)。而坏死中心区域与正常肝脏的 ADC 值各组间差异不具有显著性(P>0.05)。**结论** 肝脏的 MRI 成像能够很好的反映肝脏组织射频消融坏死后的病理变化过程。弥散加权成像能够有效地鉴别周边炎性反应带与中心完全坏死组织。

PU-1073
产前 MRI 预测胎盘植入患者行预防性腹主动脉球囊阻断术加剖宫产预后

杜金超
重庆市中医院

目的 评价产前 MRI 征象在预测胎盘植入患者行预防性腹主动脉球囊阻断术加剖宫产术（AABC-CS）中大出血和子宫切除预后中的价值。**方法** 回顾性分析 86 例因产科高度怀疑严重胎盘植入接受可能导致大出血行 AABC-CS 腹主动脉球囊阻断术加剖宫产术患者的产前 MR 图像，根据患者预后分为成两组，预后良好组（n=50：，术中出血量＜1 000 ml 及且未切除子宫保留），和预后不良组（n=36，：术中出血量≥1 000 ml 及或切除子宫切除），比较 2 组间 MRI 征象差异，采用 t 检验来比较两组患者临床指标，c^2检验来比较两组患者胎盘 MR 征象出现的频率，并采用多因素 Logistic 回归分析获得得出预测预后不良最有价值的危险因子素，并计算危险因子的其预测值效能。**结果** 胎盘内异常血管影、T2 低信号带、胎盘局部凹陷征、胎盘穿透在预后不良组中更常见，（P值均＜0.001），在多因素 Logistic 回归分析显示中胎盘内异常血管影（OR=15.78，P=0.015）、胎盘穿透（OR=12.25，P=0.020）是患者预后不良的危险因子，(OR 15.78，P=0.015；

OR 12.25，*P*=0.020)，其预测预后不良的敏感性度和及特异性分别为 77.78%（28/36，）、62.00%（31/50）和；44.44%（16/36）、，100%（50/50）。**结论** 产前 MRI 征象胎盘内异常血管影、胎盘穿透是胎盘植入患者行预防性 AABC-CS 术腹主动脉球囊阻断术加剖宫产术中大出血和子宫切除的危险因子。

PU-1074

MR 成像在膀胱癌 T 分期中诊断价值

张磊
山西医科大学第一医院

评价 MRI 在鉴别 T1 期或更低级别膀胱癌与 T2 期或更晚期膀胱癌的诊断准确性，并分析不同成像序列对其的影响。在经尿道膀胱肿瘤切除术前，膀胱壁结构完整，膀胱 MRI 对判断有无肿瘤肌肉受侵最理想。当前膀胱癌诊断和分期的标准是经尿道膀胱肿瘤切除术。膀胱镜检查由于光动力学等技术的运用对改善膀胱癌诊治有重要价值。然而，经尿道膀胱肿瘤切除术低估癌分期，因此成像作为经尿道膀胱肿瘤切除术的补充改进肿瘤分期备受关注。运用图像引导的方法识别 b 值并且同时行膀胱癌分期，从而跳过膀胱镜检查，直接行经尿道膀胱肿瘤切除术。虽然组织学确认仍然是膀胱癌诊断的金标准，但这种路径使得经尿道膀胱肿瘤切除术更快。MRI 是临床诊治中的重要手段，具有可重复性和可行性。对于非肌肉受侵性肿瘤，准确分期对于帮助选择治疗方案非常重要。对于原位癌（carcinoma in situ，CIS）检出，当前的 MRI 仍不太可靠。在非肌肉受侵性癌中，准确的分期对于 T1 肿瘤是最重要的。MRI 可以帮助了解肿瘤大小和分期，从而帮助制定治疗计划。例如对于具有明显带蒂并且没有膀胱固有肌层受累的小 T1 肿瘤，应该以经尿道膀胱肿瘤切除术为根治手段，在不需要二次经尿道膀胱肿瘤电切术的情况下，启动膀胱癌卡介苗免疫治疗。对于较深受侵的 T1（T1b/c），没有明显的带蒂或生长接近固有肌层的肿瘤，二次经尿道膀胱肿瘤电切术是必需的，可考虑进行膀胱切除术。也许在不久的未来，更多的多参数 MRI 研究提供的充足的解剖学和功能信息，可以预测对保守治疗不太可能有反应的肿瘤，对于这种肿瘤，应该使用更加激进的治疗方法。约 25%的 T1 肿瘤在二次经尿道膀胱肿瘤电切术后具有肌肉受侵的特征，这显然完全改变了治疗方法，因此，T1 肿瘤的准确分期是 MRI 在膀胱癌诊疗中非常重要的领域之一。

PU-1075

不同 b 值组合的 IVIM 成像在前列腺癌诊断中应用价值研究

印隆林,曾桔,孙菊,张传德
四川省医学科学院·四川省人民医院

目的 探讨不同 b 值组合 IVIM 成像在前列腺癌（PCa）诊断中的应用价值。**方法** 前瞻性纳入行前列腺 IVIM-DWI 检查且随后病理确诊的 24 例 PCa 患者和 20 例前列腺增生（BPH）患者作为研究对象。所有患者的 IVIM 序列根据 b 值组合分为 A 组（b=0、50、100、150、200、400、600s/mm^2）和 B 组（b=0、50、100、150、200、400、600、800、1000、1500、2000s/mm^2）分别进行后处理，测得 D 值、D*值及 f 值，比较各个参数在 PCa 与 BPH 组间的差异并绘制 ROC 曲线。根据 Gleason 评分系统将 PCa 组分为低分组 6 例（评分≤6）、高分组 18 例（评分≥7），比较各参数的组间差异并绘制 ROC 曲线，分析各参数与 Gleason 评分的相关性。**结果** ① A 组 D 值在 PCa 组明显低于 BPH 组（P<0.05）、A 组 f 值在 PCa 组明显高于 BPH 组（P<0.05），B 组 D 值在 PCa 组明显低于 BPH 组（P<0.05）。进一步绘制差异有统计学意义参数的 ROC 曲线，AUC 分别为 0.917、0.809、0.993，敏感度和特异度分别为 83.3%和 95%、75%和 75%、91.7%和 100%，A 组 D 值和 f 值的 AUC 差异没有统计学意义（P>0.05），但二者均低于 B 组 D 值的 AUC（P<0.05）② A、B 两组 D 值在 PCa 低分组

明显高于高分组（P<0.05）。A、B 两组 D 值区分低分组 PCa 与高分组 PCa 的 AUC 分别为 0.917、0.926，且二者差异没有统计学意义（P>0.05），敏感度和特异度分别为 83%和 83%、72%和 100%。③ A、B 两组 D 值与 Gleason 评分均有相关性，r 值分别为-0.510、-0.596（P<0.05）。**结论** 低 b 值（b<200s/mm^2）为主的 IVIM 成像与高 b 值为主的 IVIM 成像在 PCa 诊断中均具有一定价值，且二者价值有所不同。

PU-1076
快速 MRI 成像技术在前置胎盘诊断中的应用价值

姜涛
天津市第三中心医院

目的 探讨快速 MRI 成像技术在前置胎盘以及前置胎盘并发胎盘植入诊断中的应用价值。
方法 采用单激发快速自旋回波（single shot fast spin echo, SSFSE）序列和快速稳态进动采集（fast imaging employing steady state acquisition, FIESTA）序列对 25 例前置胎盘孕妇行 MRI 扫描，观察和分析该 25 例病例前置胎盘的 MRI 表现特征。
结果 25 例病例均顺利完成检查，其中边缘型前置胎盘 1 例，表现为胎盘下缘离子宫颈内口 1.3cm，但并没有覆盖宫颈内口；部分型前置胎盘 6 例，表现为胎盘边缘覆盖了一部分宫颈内口；完全型前置胎盘 18 例，表现为宫颈内口完全由胎盘覆盖。另外，前置胎盘合并胎盘植入 9 例，其中胎盘粘连 3 例，表现为胎盘基底部局部组织增厚，内部信号混杂，胎盘与子宫肌层分界模糊，子宫肌层局部受压变薄；胎盘植入 5 例，表现为胎盘与子宫肌层分界模糊，中等信号胎盘组织部分侵入低信号的子宫肌层；胎盘穿透 1 例，表现为子宫肌层局部中断，胎盘组织由中断处完全侵入子宫肌层，子宫浆膜层与膀胱分界模糊。
结论 MRI 可以直接显示前置胎盘与子宫颈内口之间的关系，合并有胎盘植入的病例，可直观评估胎盘组织侵入到子宫肌层的程度。MRI 快速成像技术在前置胎盘以及胎盘植入的诊断中有较高的临床应用价值。

PU-1077
多参数 MRI 联合超声引导下穿刺活检术在前列腺癌诊断中的价值

霍敏华,张坤,王小强,索凌云,李静,田宏哲
宝鸡市中心医院

摘要：目的 通过前列腺 MRI 多参数成像联合超声引导下穿刺活检术,提高前列腺癌诊断的阳性率。**方法** 回顾性分析 100 例 PSA 升高的前列腺疾病患者，其中 50 例患者首先行前列腺 MRI 多参数成像，后在 MRI 的提示下行超声引导下穿刺活检术，其余 50 例患者直接行超声引导下穿刺活检术（12 针）。随访两组病理检查结果，将两组检查流程的诊断阳性率进行统计分析。**结果** 先经过前列腺 MRI 多参数成像提出可疑区后行重点穿刺活检组的前列腺癌诊断阳性率为，直接接受超声引导下穿刺活检术组的诊断阳性率为。我们发现在超声引导下前列腺穿刺前行前列腺 MRI 多参数成像能明显提高诊断阳性率。**结论** 前列腺 MRI 多参数成像结合超声引导下前列腺穿刺活检术能明显提高前列腺癌诊断阳性率。

The diagnostic value of the histogram analysis derived from T1WI enhancement MR imaging in differentiating Endometrial cancer from Uterine stromal sarcoma

man bai
The first affiliated hospital of Zhengzhou University

Objective To investigate the diagnostic value of the histogram analysis derived from T1WI enhancement MR imaging based on whole tumors volumme in differentiating endometrial cancer from uterine stromal sarcoma and examined by MRI. **Methods and Materials** Retrospective analysis of 53 patients which were pathologically confirmed malignant glioma, including 36cases of endometrial cancer , 17 cases of uterine stromal sarcoma . Drawing the region of interest(ROI) on each layer of enhancement MR transaxial images and going on histogram analysis, these two steps are all performed on the software named Mazda. Performed a statistical analysis on the histogram parameters to find out the characteristics of the significant differences between the two groups. **Result** In the 9 parameters which are extracted from histogram, skewness has the statistical significance ($P<0.05$) .The maximum area under the ROC curve was 0.650. The optimum skewness to distinguish endometrial cancer from uterine stromal sarcoma was 0.14 (58.33% specificity and 82.35% sensitivity). **Conclusion** Histogram analysis of enhancement MR imaging can provide reliably objective basis for differentiating endometrial cancer from uterine stromal sarcoma .

PU-1079

Value of MRI and DWI in diagnosing normal-sized pelvic lymph nodes metastases in patients with cervical cancer

Qingling Song,Yue Dong
Cancer Hospital of Liaoning Province

Objactive To investigate the value of MRI and diffusion weighted imaging(DWI)in differentiating metastatic from non—metastatic normal-sized lymph nodes in patients with cervical cancer.
Methods The retrospective study included 90 patients with cervical cancer who underwent both conventional MRI and DWI scan before surgical treatment. Of the total 2129 removed lymph nodes, 114 lymph nodes were included. The size-based and ADC-based criteria of lymph nodes were measured and calculated including short-axis diameter(D_S), long-axis diameter(D_L), short to long-axis diameter(D_R), ADC_{max}, ADC_{mean} and ADC_{min}. The independent sample t test was employed to compare differences in statistically significant criteria between metastatic lymph nodes (MLNs) and non-metastatic lymph

nodes (non-MLNs). Logistic regression was used to analyze combined size-based with ADC-based criteria of lymph nodes. The receiver operating characteristic (ROC) analysis was performed to compare the diagnostic performance of statistically significant criteria in the detection of lymph node metastasis.

Results The D_S, D_R, ADC_{max}, ADC_{mean} and ADC_{min} of MLNs were significantly higher than those of non-MLNs ($P<0.001$), and there was no significant difference between metastatic and non-metastatic lymph nodes in D_L of lymph nodes ($P>0.05$). A prediction model was built as Logti(P1) = 2.01 +(-0.10 × ADC_{min})+ (0.49 × D_S) + (3.73 × D_R).The AUC of D_S, D_R, ADC_{max}, ADC_{mean} and ADC_{min} of lymph nodes were 0.801, 0.722, 0.769, 0.837 and 0.870 respectively, and the AUC of P1 was 0.913. the sensitivity of statistically significant indexes and P1 were 79.3%, 55.2%, 87.1%, 70.6%, 65.9% and 89.7% respectively; specificity were 68.2%, 83.5%, 55.2%, 79.3%, 93.1% and 80% respectively.

Conclusions MRI with DWI is a valuable tool in diagnosing normal-sized pelvic lymph nodes metastases in patients with cervical cancer. The ADC_{min} of lymph nodes had the optimal reference significance as a sole index and combined the D_S, D_R with ADC_{min} of lymph node showed the best diagnostic performance among all criteria.

PU-1080

MRI 及 DWI 对于宫颈癌 Ki67 表达分数的评估-初步分析

宋庆玲,董越
辽宁省肿瘤医院

目的 初步分析探讨探讨 MRI 及弥散加权成像（diffusion weighted imaging，DWI）对于宫颈癌 Ki67 表达分数的评估的

方法 回顾性收集本院 2018 年 1 月至 2018 年 12 月于治疗前同时行常规 MRI 和 DWI 的患者 29 例。我们通过治疗前病理免疫组化检查了患者 Ki67 在宫颈癌原发肿瘤中的表达分数。将 Ki67 表达分数分为三组，5%-25%为第一组，26%-75%为第二组，76%-100%（全层）为第三组。通过方差分析比较宫颈癌原发肿瘤 ADC_{max}，ADC_{mean}，ADC_{min}，在 Ki67 不同表达分数组间的差异性。通过 Spearman 研究宫颈癌原发肿瘤中 Ki67 表达分数与 ADC_{max}，ADC_{mean}，ADC_{min} 的相关性。

结果 原发肿瘤 ADC_{mean}，ADC_{min} 在 Ki67 的不同表达分数组间有显著性差异。ADC_{min} 在 Ki67 表达分数 26%-75%组与 76%-100%组之间的差异存在统计学意义（P=0.046，P＜0.05）。ADC_{mean} 在 Ki67 表达分数 5%-25%与 76%-100%之间的差异存在统计学意义（P=0.019，P＜0.05）。宫颈癌原发肿瘤中 Ki67 表达分数与 ADC_{mean} 之间存在相关性（P=0.22，P＜0.05），二者呈负相关，相关系数为-0.425。

结论 初步分析 MRI 及弥散加权成像（diffusion weighted imaging，DWI）对于宫颈癌 Ki67 表达分数的评估具有一定价值。

PU-1081

全容积 ADC 预测中晚期宫颈癌放化疗疗效

孟婕
南京鼓楼医院

目的 探究全容积表观扩散系数（apparent diffusion coefficient, ADC）对预测中晚期宫颈癌同步放化疗后疗效的价值。

方法 36 名病理证实的中晚期宫颈鳞癌患者被纳入本前瞻性研究。分别在治疗前（2 周内）和治疗开始后 2 周进行包含扩散加权成像序列（b 值取 0、800 s/mm^2）的 3.0T 盆腔磁共振检查。通过软件获取肿瘤全容积 ADC 平均值参数。对患者进行疗效随访。
结果 治疗前和治疗早期的 ADC 平均值在不同预后组之间有统计学差异。
结论 治疗早期的全容积 ADC 平均值有潜力用于预测宫颈癌同步放化疗后疗效。

PU-1082
扩散张量成像在子宫内膜良恶性病变中的应用价值

杜吉,陈渝晖,吴昆华
云南省第一人民医院

目的 探索扩散张量成像（diffusion tensor imaging, DTI）及其相关参数在子宫内膜良恶性病变中的应用价值。
方法 收集本院 2018 年 1 月至 2019 年 7 月临床怀疑为子宫内膜良恶性病变的患者 80 例，所有患者术前均行 MRI 扫描（包括 DTI 系列），术后均有手术病理作为金标准。测量并比较子宫内膜良恶性病灶的平均 ADC 值、平均 FA 值及相对 FA 值（以正常子宫肌层作为参比部位）。用 DTI 纤维束示踪技术判断子宫内膜良恶性病变的纤维束走形及疏密程度。
结果 子宫内膜良恶性病变中共有 55 例子宫内膜癌（其中 I_A期 25 例，I_B期 30 例）、18 例子宫内膜增生、7 例子宫内膜息肉。子宫内膜良恶性病变的平均 ADC 值分别为（0.97±0.25）×10^{-3}mm^2/s 和（1.31±0.26）×10^{-3}mm^2/s，二者差异具有统计学意义（P=0.02）。I_A期子宫内膜癌的平均 ADC 值明显高于 I_B期子宫内膜癌的平均 ADC 值（P=0.04）。子宫内膜良恶性病变的平均 FA 值和相对 FA 值分别为 0.23±0.21、0.22±0.26 和 0.78±0.71、0.97±0.71，相应 FA 值比较差异均无统计学意义（P>0.05）。 I_A期和 I_B期子宫内膜癌的平均 FA 值和相对 FA 值差异亦无统计学意义（P>0.05）。子宫内膜癌病灶中可见残存子宫纤维束，且纤维束走形欠连续；良性子宫内膜病灶内未见子宫纤维束显影。
结论 平均 ADC 值及 DTI 纤维束示踪技术在子宫内膜良恶性病变的鉴别诊断中具有重要价值，且平均 ADC 值能鉴别子宫内膜癌肌层浸润程度。

PU-1083
MRI 对女性盆腔占位性疾病的诊断价值分析

杨李军,谢磊,贾顺华,马亮
西宁市第一人民医院

目的 探讨 MRI 对女性盆腔占位性疾病的诊断价值。方法 150 例女性盆腔占位性疾病均进行 MRI 检查，与手术病理活检进行比较。结果 MRI 扫描诊断准确者 140 例，诊断准确率为 93.33%。结论 MRI 对于女性盆 腔占位，性疾病的诊断准确率较高。

PU-1084
肝脏局灶性结节增生的 MRI 诊断进展探讨

孙阳
四平市中心人民医院

采用钆塞酸二钠行肝脏局灶性结节性增生（FNH）动态增强扫描及延迟 20min 肝细胞期特异期检查，分析总结钆塞酸二钠对 FNH 诊断的意义。方法 收集我院经临床、病理证实的 7 例 FNH 病例， 1 例腹胀不适，1 例因肺炎做肺 CT 检查发现，5 例行常规体检时发现，除腹胀不适患者外，其他患者无腹部不适症状。7 例患者采用肝细胞特异对比剂钆塞酸二钠进行 MR 动态增强扫描。 **结果** 动脉增强后，动脉期明显高于肝实质信号 7 例，门静脉期 5 例仍明显高于肝实质信号，2 例等信号，平衡期 4 例呈略高信号，3 例呈等信号，平衡期呈等及稍高信号。肝细胞特异期 4 例呈高信号，3 例边缘与正常肝实质相仿，且瘢痕均未见钆塞酸二钠摄取。仅仅利用动态增强扫描分析 7 例病灶，其中两例不除外 HCC,增加延迟 20min 肝细胞特异期后分析均给出 FNH 结论，病理证实均为 FNG. **结论** 采用钆塞酸二钠行 MRI 动态增强及肝细胞特异期扫描对 FNH 的诊断有较好的诊断价值，可以提供病变形态、血供、细胞来源及功能等更多相关信息，能够提高诊断符合率。

PU-1085
MR 扩散加权成像联合肿瘤指标对宫颈癌放化疗疗效评估的预测

王欢欢
南京大学医学院附属鼓楼医院

目的 探讨扩散加权成像（Diffusion weighted imaging，DWI）、表观扩散系数（Apparent diffusion coefficient，ADC）以及肿瘤指标癌胚抗原（Casino embryonic antigen, CEA），糖类抗原（CA-125，CA-153）及细胞角蛋白 19 片段（Cytokeratin19 fragment antigen-2，CYFRA-2）等对中晚期宫颈癌放化疗后疗效评估的应用价值。方法 对 42 例经病理证实为 IIb 期以上的中晚期宫颈癌患者分别于放化疗前、中及后期随访复查行盆腔磁共振扫描，包括 T1WI、T2WI、DWI 及增强扫描，分别测量治疗前、后肿瘤体积，并分别测量横断位及矢状位肿瘤最大径平面的平均 ADC 值，并获得每位病人放化疗前及后期复查的肿瘤指标检查结果。 结果 放化疗前平均 ADC 值约为（0.882±0.087）×$10^{-3}$$mm^2$/s，之后约为（1.312±0.152）× $10^{-3}$$mm^2$/s，治疗后比治疗前平均 ADC 值升高（P<0.05）；放化疗前肿瘤体积约 4.5±1.3cm，之后体积约 1.7±1.2cm，治疗前后肿瘤变小（P<0.05）；治疗前各项肿瘤指标升高组 ADC 值较正常组 ADC 值高，且有统计学意义，放化疗前肿瘤升高者，治疗之后肿瘤指标降低（P<0.05），治疗前后肿瘤体积变小、ADC 值升高以及部分肿瘤指标变化三者有相关趋势。 结论 弥散加权成像中的 ADC 值联合肿瘤指标可以监测宫颈癌放化疗疗效。

PU-1086
磁共振成像在胎盘植入诊断中的应用价值

唐洁
十堰市太和医院

目的 胎盘植入为妇产科严重的妊娠并发症，极大威胁母婴生命安全。超声检查因其简单操作、高普及度成为了首选的影响学检查方法，但目前就其各项指标的诊断效能仍有较大争议。本文分析在妊娠期胎盘植入的磁共振成像(MRI)表现及特征，探讨其诊断中的应用价值。
方法 回顾性分析 21 例经临床及病理证实的产后胎盘植入患者，在征求患者同意后行 MRT 检查，结合现有同行的研究结果，总结 MRI 的相关影像特征，并将之与术后病理结果进行对比。
结果 21 例胎盘植入中 18 例合并前置胎盘，粘连型 9 例，植入型 10 例，穿透型 2 例。MRI 表现为子宫体积增大，胎盘形态及植入部位子宫壁改变多表现为局部突出，植入区子宫壁变薄或中断，膀胱顶壁不光滑或不规则。植入区胎盘内见丰富的血管影，胎盘边缘或宫颈内伴有出血症状。

结论 MRI 软组织分辨率高，具有一定的特征性，对胎盘植入诊断，具有较高的应用价值。

PU-1087
3.0T 磁共振多模态成像在前列腺癌与前列腺增生鉴别诊断中的应用价值

徐亚卡,余成新
三峡大学第一临床医学院&宜昌市中心人民医院

目的 评价 3.0T 磁共振多模态成像在前列腺癌与前列腺增生鉴别诊断中的价值。
方法 对 60 例前列腺癌及 64 例前列腺增生患者行 MR 常规扫描及 DCE、DWI 扫描,采集 DCE 相关指数(达峰时间，峰值，强化率，最大灌注率 SSmax)、表观扩散系数(ADC)值,运用双样本 t 检验，组间对比采用 x 2 检验，比较前列腺癌组与前列腺增生组之间的差异，并计算 DCE、DWI 及多种检查方法联合应用（多模态成像）的敏感度、特异度和准确性。
结果 前列腺癌与前列腺增生的 SSmax 差异有显著统计学意义(T=38.471,P=0.000)；ADC 值差异有显著统计学意义(T =22.588, P =0.000)。本研究结果显示 DCE、DWI 成像对前列腺癌诊断的准确性分别为 87.50%、86.45%,通过（多模态）多种检查方法的联合应用,其敏感度、特异度和准确性分别可以达到 96.67%、96.87%、96.77%。
结论 由于 3.0T 磁共振高软组织分辨率、时间分辨率及多功能成像，使多模态成像得以实现，其在前列腺癌诊断中具有特异性表现，为临床诊断及治疗方案的选择提供了可靠的影像学图像及数据。

PU-1088
磁共振弥散加权成像及 ADC 值鉴别胆囊良、恶性病变的价值

张灿,余成新
宜昌市中心人民医院

目的 评估 DWI 技术并 ADC 值的测量在胆囊良、恶性病变的诊断与鉴别诊断方面的价值。
方法 (1)收因胆囊病变拟行胆囊手术切除的住院病人 22 例。(2) 使用 PHILIPS 公司 Intera Achieva 3.0 T 超导 MR，对病例进行常规序列及 DWI 扫描。(3) 对 DWI 图像首先直接观察，根据病变信号强度分组，并测量其 ADC 值。(4) 将检测结果与相应的病理学诊断结合分析：分为良性与恶性两组，并结合 DWI 信号强度再分组。(5)进行组内及组间统计学分析，首先总结胆囊良、恶性病变的 DWI 肉眼信号特征，然后根据测量的 ADC 值，进一步探讨鉴别胆囊良、恶性病变的最适 ADC 值。
结果 (1)手术后经组织病理学证实的胆囊病变共计 22 例，其中良性病变 12 例（胆囊息肉 8 例，胆囊腺瘤 4 例）；恶性病变 10 例（胆囊腺癌 8 例，胆囊鳞状细胞癌 2 例）。(2) 12 例良性病变中，10 例为低信号病变，2 例为稍高信号病变。10 例恶性病变中，3 例为稍高信号病变，7 例为高信号病变。(3)采用 two-sides Fisher's 确切概率法分析结果显示，胆囊良、恶性病变的信号强度差异有显著统计学意义(P=0.004)。(5)恶性病变组的平均 ADC 值约为$(1.12\pm0.29)\times10^{-3}$ ㎜²/s，良性病变组的平均 ADC 值约为$(1.85\pm0.36)\times10^{-3}$ ㎜²/s，采用 Mann-Whitney 检验对两组间数据进行比较，结果恶性病变的 ADC 值低于良性病变，差异有显著统计学意义(P=0.001)。
结论 不同病理类型的胆囊病变，其 DWI 信号强度有差异，其 ADC 值水平亦不相同。其中良性病变多呈现低或等信号，ADC 值多高于 1.59×10^{-3} ㎜²/s。而恶性病变多呈稍高信号或高信号，ADC 值多

低于 1.59 ×10^{-3} ㎜^{2}/s。DWI 结合 ADC 值测量，有望成为鉴别胆囊良、恶性病变的有效方法，对胆囊癌的早期检测及鉴别诊断具有一定价值。

PU-1089

妊娠早期胎盘植入的 MRI 诊断

范帆
福建省立医院

目的 探讨 MRI 在妊娠早期胎盘植入诊断中的临床应用价值。**方法** 回顾性分析 19 例经手术病理证实的妊娠早期胎盘植入的 MRI 表现。所有病例均行 MRI 平扫，15 例行动态增强扫描。**结果** 19 例平扫显示胎盘与子宫肌层分界不清，局部胎盘边缘不规则，相邻子宫结合带模糊或中断，T1WI 呈等低信号，T2WI 呈稍高或稍低信号，15 例增强扫描胎盘组织呈渐进性明显强化。**结论** MRI 对妊娠早期胎盘植入的诊断有重要价值，增强扫描有助于评估胎盘植入深度及范围，为临床诊疗提供重要信息。

PSA 及其衍生指标在第二版前列腺影像报告与数据系统 3 分病灶临床决策中的价值

杨硕,张跃跃,赵文露,李梦娟,檀双秀,沈钧康
苏州大学附属第二医院

目的 探讨临床相关指标在第二版前列腺影像报告与数据系统（PI-RADS V2）3 分病灶临床穿刺活检决策中的价值，比较上述观察指标对 PCa 和 csPCa 的诊断效能。材料与**方法** 回顾性分析 2016 年 3 月至 2018 年 10 月于苏州大学附属第二医院经穿刺病理证实的 121 例主病灶 PI-RADS V2 评分为 3 分患者的 MRI、病理资料和相关临床指标［年龄、前列腺特异性抗原（PSA）、游离前列腺特异性抗原（fPSA）、f/tPSA、前列腺特异性抗原密度（PSAD）以及前列腺体积（PV）］，比较各观察指标在 PCa 组和非 PCa 组间以及 csPCa 组和非 csPCa 组间的差异，运用受试者工作特性（ROC）曲线比较有统计学意义指标对 PI-RADS 评分为 3 分的 PCa 及 csPCa 病灶的诊断价值。**结果** 主病灶 PI-RADS V2 评分为 3 分者共 121 例，其中 PCa 31 例（25.6%），csPCa 14 例（11.2%）。上述 PI-RADS 3 分病灶中 PCa 组和非 PCa 组间以及 csPCa 组和非 csPCa 组间的 PSA、f/tPSA、PSAD 值的差异均有统计学意义（P 均＜0.05），且均以 PSAD 的 ROC 线下面积最大；另一方面，中位 PSAD 值 csPCa 组（0.39 ng/ml2 ）明显高于 PCa 组（ 0.24 ng/ml2 ）和非 PCa 组（0.17ng/ml2）。若以 PSAD＞0.20ng/ml2 作为穿刺参考阈值，诊断 csPCa 的敏感度、特异度、阳性预测值、阴性预测值分别为 78.6%、58.9%、20.0%、95.4%， 54.5%（66/121）的病例可避免穿刺活检，3 例 csPCa 漏诊。**结论** PSA、f/tPSA、PSAD，尤其是 PSAD 可提高 PI-RADS 3 分病灶中 PCa，尤其是 csPCa 的检出效能，对临床决策制定具有重要参考价值。

PU-1091

直肠癌 MRI 表现与 HER2 表达的相关性研究

胡友强

自贡市第四人民医院

目的 探讨直肠癌 MRI 征象与人类表皮生长因子受体（Her-2）基因表达之间的相关性。**方法** 回顾性分析 2017 年 1 月—2019 年 6 月于自贡市第四人民医院行 MRI 检查，并经手术病理证实的 160 例直肠癌患者。其中 Her-2 阳性组（n=54），Her-2 阴性组（n=106）。测量和记录 MRI 征象（肿瘤部位、最大厚度、最大径线、肿瘤体积、强化方式、浆膜面受侵、淋巴结转移）。使用单因素分析比较两组 MRI 征象，将存在统计学意义（P<0.05）的相关因素纳入 Logistic 回归方程分析。**结果** Her-2 阳性组最大厚度、肿瘤体积、浆膜面受侵、淋巴结转移与 Her-2 阴性组比较，差异有统计学意义（P<0.05）。Logistic 回归分析显示，肿瘤体积（OR=2.048）、浆膜面受（OR=2.032）、淋巴结转移（OR=2.064）可作为 Her-2 表达的独立预测因素（P<0.05）。**结论** MRI 检查中肿瘤体积、浆膜面受侵、淋巴结转移等征象可初步估计直肠癌 Her-2 的表达情况，为临床治疗和预后评估提供参考。

PU-1092

子宫平滑肌瘤病的临床分析及影像学特点

黄社磊
深圳市人民医院

目的 深入分析子宫平滑肌瘤病的临床及 MRI 特点。**方法** 收集近两年内在我院治疗的 6 例子宫静脉内平滑肌瘤病患者的临床影像学资料，分析肿瘤形态、位置、大小、信号及强化方式、DWI 信号及 ADC 值，将研究结果与病理诊断结果进行对比。**结果** 大体观察，所有患者均有子宫形态的改变，多数表现为子宫增大，多数病灶仅局限在子宫内。免疫组化实验显示平滑肌分化标志物全部呈现阳性，多数激素受体、血管源性标记物阳性。6 例均有病灶蠕虫样改变，均发现病灶内流空信号，仅病例 3 的影像学诊断与病理诊断相符。T1WI 呈等信号 3 例，等高信号 3 例；T2WI 呈高低混杂信号 2 例，稍高信号 2 例，混杂高信号 1 例，等高信号 1 例。6 例肿瘤内部或肿瘤旁可见多发迂曲血管。肿块强化方式均为快进慢出，强化程度除病例 2 为管状强化，其余均为明显强化。DWI 呈高信号 2 例、稍高信号 4 例，磁共振 ADC 值处于正常水平。**结论** 子宫静脉内平滑肌瘤病的临床特异性较差，术前检查的诊断正确率较低。T1WI 信号为等或等高，T2WI 信号为高或稍高，肿瘤内部或肿瘤旁可见多发迂曲血管。

PU-1093

浸润性宫颈癌术前 CT 及 MRI 诊断的临床价值研究

曾康婵
陆军军医大学附属新桥医院放射科

目的 比较分析浸润性宫颈癌术前 CT、MRI 对其的诊断临床价值。**方法** 回顾性收集我院 2016 年 1 月--2016 年 12 月经影像学检查、病理学诊断证实的 61 例浸润性宫颈癌患者的影像资料，所有患者术前均先后进行 CT、MRI 检查，检查后 4 周内行手术治疗。以手术病理分期结果为依据，比较 CT、MRI 对宫颈癌术前分期诊断符合率。另外以手术病理学结果为对照，比较 CT、MRI 对阴道浸润、子宫体侵犯等相关征象，统计 CT、MRI 对上述征象诊断准确度。应用 SPSS19.0 统计软件分析数据，计数资料(%)表示， χ2 检验，P ＜0.05 为差异有统计学意义。 **结果** 以术后病理分期为对照，对于Ⅱ、 Ⅲ、Ⅳ期宫颈癌患者，术前 MRI 检查的诊断符合率明显高于 CT 检查，差异有统计学意义（P＜0.05）。MRI 对Ⅱ、 Ⅲ、Ⅳ期宫颈癌的误诊率均为 0%，CT 对Ⅱ期及Ⅲ期宫颈癌的

误诊率显著高于 MRI。且 CT 对 I B1 期及以下诊断符合率为 65%， 较 MRI 的 85.7%差异有统计学意义(P＜0.05)。对照术后病理各征象结果，术前 CT 对阴道浸润诊断准确度明显低于术前 MRI，差异有统计学意义（P＜0.05）；CT 对子宫体侵犯诊断准确度为 94.6%，显著高于 MRI 的 79.2%(P ＜0.05)。**结论** 术前 MRI 相对 CT 在浸润性宫颈癌整体术前分期诊断上有优势，即最优选择 MRI，必要时可与 CT 联合应用，提高准确率。 MRI 对阴道浸润诊断准确率明显高于 CT，而 CT 对于子宫体侵犯的诊断准确度更有价值。

PU-1094
磁敏感加权成像在鉴别诊断前列腺癌和良性前列腺增生的潜在价值

徐嚣
天津医科大学第二医院

目的 磁敏感加权成像（SWI）是一种新的功能成像序列，已被成熟应用于颅内疾病的诊断，却很少应用在前列腺疾病中。本文旨在探讨 SWI 在前列腺癌（PCa）和良性前列腺增生（BPH）中的鉴别诊断价值。材料与**方法** 回顾性分析经磁共振超声融合靶向穿刺证实的 24 例前列腺癌患者和 56 例良性前列腺增生患者的影像学资料，所有患者均行 3.0T 常规磁共振（MRI）检查序列和高分辨 SWI 检查序列，根据病理结果将靶向穿刺区和 MRI 图像进行匹配。由两位七年以上经验的诊断医师分别对常规 MRI 图像和高分辨 SWI 图像进行分析和比较，并标注前列腺组织出血点。**结果** 分析结果显示，24 例前列腺癌患者中有 20 例在 SWI 图像上表现有出血病灶，而常规 MRI 图像上只有 4 例患者有出血病灶；56 例良性前列腺增生患者中有 4 例在 SWI 图像上表现有出血病灶，而常规 MRI 图像只有 1 例出血表现。**结论** 前列腺癌相比良性前列腺增生更易引起组织出血，而相比常规 MRI，SWI 在发现出血病灶方面有着更高的敏感性、特异性和准确性，因此 SWI 在鉴别前列腺癌和良性前列腺增生中具有重要价值。

PU-1095
产后胎盘植入的 MR 诊断与评估

张水花
广州全景医学影像诊断中心

目的 探讨产后胎盘植入的 MR 诊断价值。
资料与方法 回顾性分析 15 例病理证实为胎盘残留（PRT）患者的资料。全部病例经超声初筛后行 MR 平扫及动态增强检查。MR 评价指标：PRT 的大小、肌层受累程度、T1WI/T2WI 序列信号特点、PRT 小叶间隔结构及胎盘的强化方式。
结果 经病理证实 PRT 并粘连 3 例，PRT 并植入 11 例，PRT 并穿透 1 例。RPT 最大径面约 2.1×1.0cm—11.5×10.2cm，且 PRT 大小与类型无明显相关性（P＞0.05）。MRI 表现：宫体增大，受累面肌层变薄，局部结合带模糊或中断，受侵肌层厚度（d1）/未受侵肌层厚度（d2）与 PRT 分类存在相关性（P＜0.05）；T1WI 呈等低信号为主，T2WI 以高信号为主，11 例未行子宫动脉栓塞患者受累肌层内可见流空信号；1 例产后胎盘穿透动态增强曲线表现为逐渐增强，而 14 例胎盘粘连和植入动态增强曲线显示早期增强。其中 4 例行子宫动脉栓塞患者 PRT 内见节段性无强化梗死区。
结论 MR 对 PRT 诊断及预后评价有重要意义，而肌层受累程度、胎盘小叶间隔结构及胎盘强化方式的评估能够为临床决策提供帮助。

PU-1096

MRI 影像组学对直肠良恶性病变鉴别诊断的价值

李厚颖[1],李爱银[1],宋歌声[1],李盼盼[1],崔景景[2],马龙飞[2],左盼莉[2]
1.山东省千佛山医院
2.慧影医疗科技（北京）有限公司

目的 探讨基于直肠 MRI 图像的影像组学模型在直肠良恶性疾病鉴别诊断中的价值。**方法** 回顾性分析山东省千佛山医院 2016 年 8 月至今有手术病理支持并具有完整的术前 MRI 影像资料的直肠病例 78 例（直肠腺瘤 n=32，直肠癌 n=46），年龄范围 38-83 岁（女性 n=34，男性 n=44），采用影像组学分析工具（Radcloud,Huiying Medicial Technology Co,Ltd）依次从 T2WI、DWI 及 T2+DWI 图像中提取组学特征，进行特征筛选并建立组学标签；利用机器学习算法支持向量机（SVM）构建 3 个模型用于预测直肠良恶性病变，分别为 $Model_{T2}$、$Model_{DWI}$、$Model_{T2+DWI}$。利用受试者工作特性曲线（ROC）评价模型的预测效能，并通过 ROC 曲线下面积（AUC）、敏感性、特异性进行量化，利用 DE-LONG 检验比较各模型的预测效能。用 IBM SPSS23.0 软件对病例临床资料（性别、年龄）进行统计学分析。

结果 ①分别从 T2WI、DWI、T2WI+DWI 序列图像筛选出 24、13、30 个影像组学特征构建模型，3 个预测模型在验证组的敏感性、特异性及 AUC 分别为 $Model_{T2}$：0.86、0.70、0.89（95% CI0.71-1）、$Model_{DWI}$：0.86、0.90、0.88（95% CI0.75-1）、$Model_{T2+DWI}$：0.86、0.60、0.85（95% CI0.66-1）。②$Model_{T2}$、$Model_{DWI}$、$Model_{T2+DWI}$对直肠良恶性病变的预测效能无统计学差异（p>0.05）。③性别、年龄组间差异无统计学意义（p>0.05）。

结论 ① 基于 MRI 影像组学特征构建的模型，在直肠良恶性疾病鉴别诊断中有应用价值。②放射组学可以利用计算机技术充分挖掘图像中隐藏的信息，尤其 DWI 序列图像的隐藏信息，能更全面地分析病灶信息，辅助临床医师选择合适的治疗方案。

PU-1097

原发性输卵管癌 2 例及 MR 诊断复习

续晋铭
上海市杨浦区中心医院

原发性输卵管癌是少见的女性生殖系统恶性肿瘤，占所有妇科恶性肿瘤的 0.14%~1.8%[1]。以 40~65 岁居多，平均年龄 52 岁，超过 60%的原发性输卵管癌发生于绝经后妇女[2]。因少见且早期多无症状，体征多不典型，临床较易漏诊和误诊。本文收集我院在 2018 年 8 月至 2018 年 12 月收治的 2 例经手术和病理证实的原发性输卵管癌的临床及 MRI 资料，分析总结其 MRI 图像特征，以提高对原发性输卵管癌的术前诊断的准确性。

高分辨 3T 磁共振评估直肠癌术前环周切缘有无累及的前瞻性研究

李维

南充市中心医院/南充市肿瘤医院

目的 探讨高分辨 3.0T 磁共振对直肠癌术前环周切缘有无累及的前瞻性评估，以指导直肠癌的多学科诊断和个体化治疗方式。**材料与方法** 在 2012 年 2 月至 2017 年 7 月期间利用 GE 3.0T 磁共振对 46 例经结肠镜证实的直肠癌患者进行盆腔磁共振平扫、DWI 检查，常规序列包括失状位 FRFSE T2WI、冠位 FRFSE T2WI、轴位 FRFSE T2WI 和 DWI，并且所有 T2WI 序列都采用小视野、薄层扫描，DWI 的 b 值取 1000 s/mm²。然后综合所有序列对直肠癌病灶进行术前 MR-T、N 分期，评估直肠系膜筋膜、环周切缘有无累及，然后与手术病理结果进行对照分析。**结果** 在 46 例直肠癌中，MR-T 分期中正确诊断 40 例，错误诊断 6 例，正确率为 86.9%。N 分期中正确诊断 34 例，错误诊断 12 例，正确率为 73.9%。MRI 判断直肠系膜环周切缘（circumferential resection margin，CRM）有无累及的准确率、敏感性、特异性、阳性预测值及阴性预测值分别为 93.4%、100.0%、91.1%、80.0%及 100.0%。**结论** 高分辨率 3.0T 磁共振成像可以对直肠癌手术环周切缘有无累及进行准确的预测，还可以清楚的显示病灶及邻近组织侵犯情况，对直肠癌的个体化治疗提供有力证据。

扩散加权成像单指数与扩散峰度成像模型术前预测肾透明细胞癌病理分级的对比研究

曹金凤,何兵,罗昕,孙新儒
淄博市中心医院

目的: 探讨扩散加权成像单指数模型和扩散峰度成像（DKI）模型在术前预测肾透明细胞癌病理分级中的价值。

资料与方法: 前瞻性收集经病理结果证实的肾透明细胞癌（ccRCC）患者 80 例，根据 Fuhrman 分级将上述患者分为四组：I 级（G1）15 例，II 级（G2）22 例，III 级（G3）24 例，IV 级（G4）19 例。患者均行肾脏常规单指数 DWI 序列和 DKI 序列扫描，测量参数包括 ADC 值、各向异性分数（FA）、平均扩散系数（MD）、平均扩散峰度（MK）、轴向扩散峰度（Ka）以及径向扩散峰度（Kr）值。利用独立样本 t 检验分别进行两组间均数的比较，使用受试者工作特征（ROC）曲线评价各参数的诊断效能。

结果: ①与正常肾实质比较，各级别 ccRCC 患者的 ADC、MD 值均减低，MK、Ka 及 Kr 值均升高，差异具有统计学意义（$p<0.05$），FA 值差异没有统计学意义（$p>0.05$）；②ADC 值在 G1/G3、G1/G4、G2/ G3、G2/G4、G3/G4 各组间差异有统计学意义($p<0.05$)，G1/G2 两组间 ADC 值差异无统计学意义（$p>0.05$)。③MD、MK、Kr 值在 G1/G2、G1/G3、G1/ G4、G2/ G3、G2/G4、G3/G4 各组间差异均有统计学意义($p<0.05$)；Ka 值在 G1/G2、G1/G3、G1/ G4、G2/G4、G3/G4 各组间差异均有统计学意义($p<0.05$)，G2/ G3 两组间 Ka 值差异无统计学意义（$p>0.05$)；FA 值在各组间差异均无统计学意义($p>0.05$)。④绘制 ROC 曲线，得出 MK 值在鉴别 G1/G2、G1/G3、G1/ G4、G2/ G3、G2/G4、G3/G4 的曲线下面积（AUC）分别为 0.96、1.00、1.00、0.87、1.00、0.94，均高于 ADC、MD、Ka 和 Kr 值。

结论: DKI 模型比单指数扩散模型更适合作为肾透明细胞癌术前病理分级预测的成像技术。

PU-1100

magnetic resonance image-based machine learning for differentiating borderline from malignant epithelial ovarian tumors: A multicenter study

Yongai Li
Jinshan Hospital, Fudan University

Introduction
Preoperative differentiation of borderline from malignant epithelial ovarian tumors (BEOT from MEOT) can impact surgical management. MRI has improved this assessment but subjective interpretation by radiologists may lead to inconsistent results.

Material and methods
In this multicenter retrospective study of eight clinical centers, totally 501 women with histopathologically-confirmed BEOT (n=165) or MEOT (n=336) derived over an 8-year period (January 2010 to June 2018) were enrolled. Patients underwent preoperative MRI within two weeks of surgery. Single- and multi-parameter (MP) machine learning assessment models were built for differentiating BEOT from MEOT utilizing the following four MR sequences: T2WI FS, DWI, ADC, and CE-T1WI. Diagnostic performance of models was assessed for both whole tumor (WT) and solid tumor (ST) components. Six radiologists of varying experience also interpreted the MR images. We further validate the model performance in discriminating BEOT versus early stage MEOT (n=36).

Results and Discussion
The MP-ST model performed better than the MP-WT model for both the internal validation cohort (AUC=0·932 vs. 0·917) and the external validation cohort (AUC=0·902 vs. 0·767). Among the single-parameter models in the external validation cohort, the ADC-ST model was best (AUC=0.898). The model can also discriminate BEOT versus early stage MEOT (AUC=0.909 and 0.920 in internal and external validation cohort). Radiologist performance was considerably lower for both the internal (mean AUC=0.785; range, 0·635-0·832) and external (mean AUC=0·788; range, 0·661-0·867) validation cohorts. If these models successfully implemented into clinical practice, improved preoperative prediction could potentially lead to preserved ovarian function and fertility for some women.

PU-1101

MR image-based radiomics to differentiate type Ⅰ and type Ⅰ Ⅰ epithelial ovarian cancers and identify the most critical region for sampling

Yongai Li
Jinshan Hospital, Fudan University

Objective
In this study, we aimed to construct an MR image-based radiomics assessment model to differentiate between type I and type II EOC, and to identify the most critical region for EOC differentiation at IFS.
Methods and materials

In this multicenter retrospective study, a total of 294 eligible patients derived over a 9-year period (January 2010 to February 2019) were enrolled. Quantitative MR imaging features were extracted from the following axial sequences: T2WI FS, DWI, ADC, and CE-T1WI. Ten models were constructed based on various combinatiuons of these four MR sequences, with or without age at the time of surgery). The diagnostic performance was evaluated by ROC-AUC. In addition, an occlusion test was carried out to identify the most crucial region for intraoperative frozen section (IFS) sampling.

Results

Combined models exhibited superior diagnostic capability over all four single-parametric models, both in internal and external validation cohorts (AUC of 0.834 and 0.847, respectively). The additional value of patient age to our model was confirmed. The occlusion test revealed that the most crucial region for IFS sampling was the border zone between the solid and cystic components, or the loose areas of solid component on direct visual inspection.

Conclusion

MR image-based radiomics modeling can objectively and accurately differentiate between type I and type II EOC, as well as identify the most appropriate area forIFS sampling.

PU-1102

Image quality analysis of rectal cancer mr patients with anal-injected coupling agent

Jian Zhang
The People's Hospital OF Leshan

Objective: to explore the best method of MR scanning for rectal cancer patients, and compare the image quality between conventional method and injection coupling method. Methods: a total of 78 patients (endoscopic diagnosis of rectal cancer) from March 2018 to May 2019 in our hospital were collected and divided into 39 patients in the conventional group and 39 patients in the experimental group. After enema emptying the intestine in the experimental group, 280ml ultrasonic coupling agent was injected for scanning. Results: there was a large interference between air and free water in the intestinal cavity of patients with conventional method, especially some air interference and water interference artifacts when DWI sequence had a high B value. After the injection of the coupling agent, the tumor location was clear, and the DWI sequence reduced the excellent rate of artifact interference images by 94.8%, and the excellent rate of peripheral cutting edge and T staging images by 94.3% ($P<0.001$). Conclusion: the injected ultrasonic coupling agent can reduce artifacts in high-b-value DWI sequences, but the image excellence rate is slightly lower than that of the image without injected coupling agent due to the enlarged intestinal cavity observation peripheral cutting edge and T stage.

对照 CTA 评价 3D Balance FFE 序列显示肾动脉的能力

邓大勇
吉林省肿瘤医院

目的 评估三维平衡全稳态快速场梯度回波序列(3D Balance FFE)对肾动脉的显示能力,探讨 3D Balance FFE 序列对肾癌局切术前评估肾脏血管分布的价值。材料与方法 收集我院 2016 年 1 月至 2019 年 1 月因肾癌术前行肾动脉 CTA 检查并行 3D Balance FFE 序列检查的患者，3D Balance FFE 序列显示肾血管及肾血管变异的能力由两名副主任医师进行评估。所有患者以 CTA 显示肾动脉的结果为对照来评估 3D Balance FFE 序列显示肾血管的准确性。结果 42 例患者接受了 CTA 和 3D Balance FFE 两项检查。3D Balance FFE 显示了 87 根肾动脉(CTA：88 根)，其中正常肾动脉 82 根(CTA：82 根)，副肾动脉 5 根(CTA：6 根)；在显示肾动脉分支方面，3D Balance FFE 显示四级分支数与 CTA 无明显差异 ($P<0.05$)。结论 3D Balance FFE 序列能较好地显示肾动脉及评价肾动脉的变异，与 CTA 显示肾动脉分支能力一致，它可以替代 CTA 成为肾癌局切术前评估肾血管的一种有效检查方法。

肝脏普美显强化核磁共振肝胆期胆管成像的临床应用价值

温鹏,于长路,张翔,韩玉娟,杨剑
天津市第三中心医院

目的 探讨肝脏普美显强化核磁共振肝胆期胆管成像的临床应用价值。 **方法** 选取 2018 年 12 月-2019 年 3 月来我院就诊或复查的小肝癌患者 62 名行肝脏普美显强化核磁检查。在患者知情同意的情况下，注射普美显对比剂前行常规胆管水成像（MRCP）检查（行屏气薄层半傅里叶采集单次激发快速自旋回波序列重 T2（HASTE）成像），注射普美显对比剂后 30min 后肝胆期（部分对比剂被肝细胞吸收摄取经胆道排泄，胆道树系统显示完整）行胆管成像检查（行屏气薄层重 T1 成像）。有两位高年资诊断医生（副主任医师）分别对注射对比剂前后图像质量进行评分（Ⅰ级为胆管树显示清晰 4 分；Ⅱ级为胆管树显示良好 3 分；Ⅲ级为存在部分背景高信号干扰，影响诊断 2 分；Ⅳ级为背景高信号使胆管树结构显示不清，严重影响诊断 1 分）。 **结果** 注射对比剂 30min 后肝胆期 MRCP 图像质量明显好于注射对比剂前（P<0.05）。但 30min 后肝胆期 MRCP 并不能显示胰管结构和走形（注射对比剂 30min 后采用 T1WI 序列扫描，对比剂能延长 T1 弛豫时间，但不经胰管排泄）。 **结果** 肝脏普美显强化核磁共振肝胆期成像能更好地显示胆管树结构，对胆道系统疾病具有重要的临床应用价值。

PU-1105
孤立性胃底静脉曲张的 CT 和 MRI 征象研究

刘玉婷,靳二虎,杨正汉,王振常
首都医科大学附属北京友谊医院

目的 提高对孤立性胃底静脉曲张影像表现的认识，探讨其与非孤立性胃底静脉曲张的异同点。 **方法** 在 PACS 系统中检索并调取符合入组条件的 60 例孤立性胃底静脉曲张患者的影像资料，包括 CT 平扫、CT 增强、MRI 平扫、MRI 增强，由两位高年资放射科医生阅片，分析孤立性胃底静脉曲张患者的病因、CT 及 MRI 影像特点。另外选择 60 例非孤立性胃底静脉曲张患者的 CT 和 MRI 影像资料作为对照组，比较两组的异同点。

结果 孤立性胃底静脉曲张患者的主要病因包括慢性胰腺炎、胰腺肿瘤及胰腺炎合并假性囊肿；CT 和 MRI 表现为：①下腔静脉和/或门静脉系统的大部分属支血管显示良好，但在连续数个层面上脾静脉均见局部的明显狭窄、突然中断或完全不显示；②侧枝循环血管多见于脾门-胃底之间及胃大弯侧胃结肠韧带内。其中，慢性胰腺炎多引起胃网膜右静脉曲张，胰腺肿瘤多引起胃网膜左静脉曲张。非孤立性胃底静脉曲张患者的主要病因为肝硬化；CT 和 MRI 表现为：①门静脉不同程度增宽；②侧枝循环血管多表现为食管下段-胃底静脉曲张。
结论 孤立性与非孤立性胃底静脉曲张的病因及影像表现有所不同，腹部增强 CT 及 MRI 检查可以清晰显示这些影像特征。

单、双指数模型 DWI 在直肠癌 T 分期中的应用价值

傅爱燕,冯峰,邢金丽,段书峰,邱钱赛
南通市肿瘤医院

摘要：目的 比较单、双指数模型 DWI 参数在术前直肠癌壁外浸润中的应用价值。方法 收集 60 例手术病理证实的直肠癌患者，其中壁外浸润 41 例，非壁外浸润 19 例。均行单指数模型（b=0,1000/mm^2）及双指数模型（b=0、50、100、150、200、400、600、800、1000、1200、1500s/mm^2）扩散加权成像（DWI）检查。利用 matlab 软件测量表观扩散系数（ADC）值、纯扩散系数（D）值、灌注相关扩散系数（D*）值及灌注分数（f）值，比较两组之间的参数是否有统计学差异，并绘制相对应的 ROC 曲线，分析其诊断效能。结果 直肠癌壁外浸润组的 D 值低于非浸润组具体值，差异有统计学意义（P＜0.05）。直肠癌壁外浸润组的 D*值高于非浸润组，差异有统计学意义（P＜0.05）。两组间 F 值及 ADC 值均无统计学差异（P>0.05）。D 值对于诊断直肠癌壁外浸润的曲线下面积（AUC）为 0.847 高于 D*值诊断直肠癌壁外浸润 AUC（0.689），差异有统计学意义（P＜0.05）。D 值诊断直肠癌壁外浸润的敏感度、特异度、阳性预测值、阴性预测值及准确度分别为（80.49%）、（89.47%）、（94.29%）、（68.00.%）、（83.33%）；D*值诊断直肠癌壁外浸润的敏感度、特异度、阳性预测值、阴性预测值及准确度分别为（70.73%）、（63.16%）、（80.56%）、（50.00%）、（68.33%）。结论 相比于单指数模型 ADC 值，双指数模型 DWI 的参数 D 值及 D*值对直肠癌壁外浸润具有较佳的诊断效能。

PU-1107
利用磁共振电影序列观察非妊娠子宫动力学特点的研究

富彦
天津医科大学第二医院

目的 使用磁共振电影序列轴位和矢状图像详细观察月经周期每个阶段的子宫动力学特点。
方法 从 2019 年 1 月至 2019 年 5 月，招募 7 名有自然妊娠和分娩史的志愿者。利用磁共振电影序列评估子宫肌肉收缩的动力学参数（深度，频率和方向）。
结果 在月经期间可观察到从子宫角到子宫颈平滑肌的强烈收缩。在卵泡后期，子宫颈和子宫角的反相收缩频率增加。在排卵期之前，由子宫颈的收缩传达至子宫底。排卵后，反相收缩恢复。这些收缩的频率在黄体中期逐渐降低，在排卵后 7 天可以观察到从子宫颈到子宫体中部的微小收缩。
结论 子宫动力学特点在月经周期的每个阶段根据子宫不同的生理功能而改变。此外，需要利用 MRI 电影序列针对月经周期内的每个阶段进行研究来评估子宫动力学特点和不育症之间的关系。

PU-1108

磁共振高分辨成像序列与 T1 增强扫描序列在肛瘘术前诊断中的应用对比

陈维娟,韦鑫,陈金华,罗银灯,郭大静
重庆医科大学附属第二医院

目的 探讨磁共振高分辨成像序列 （3D-CUBE T2WI FS） 与 T1 增强扫描序列（LAVA+C）对肛瘘分型诊断的准确性。
方法 回顾性分析 2018 年 1 月至 2019 年 7 月我院收治的 37 例经手术病理证实为肛瘘的患者，术前均采用 GE 1.5T Signa HDXT2012 磁共振行 MRI 检查，以术中所见及病理结果为准，对比分析 3D-CUBE T2WI 抑脂序列与 LAVA 增强序列对肛瘘瘘管形态及走行诊断的准确性；采用 4 分法对二者图像进行评分。
结果 37 例患者经手术病理证实:单纯性肛瘘 20 例，复杂性肛瘘 17 例；高位肛瘘 11 例，低位肛瘘 26 例；Parks 分型**结果** 括约肌间型 24 例，经括约肌型 12 例，括约肌上型 1 例，括约肌外型 0 例；主瘘管 39 个、支管 8 支、内口 47 个、外口 38 个、脓肿 9 个。两种扫描序列对主瘘管的显示符合率分别为：3D-CUBE T2WI FS 95.1%、LAVA 增强 95.1%；对内口的显示符合率分别为：3D-CUBE T2WI FS 93.6%、 LAVA 增强 95.7%；差异均无统计学意义 （均 P ＞ 0.05）。将两种序列所得图像按照对肛瘘主瘘管、内口、分支及其多发细小瘘管、瘘管与肛门周围肌肉关系显示的清晰度进行 4 分法评分，评分结果有统计学差异（P<0.05）,以 LAVA 增强序列所得图像为佳。
结论 3D-CUBE T2WI 抑脂序列与 LAVA 增强序列均能够在术前有效定位肛瘘主瘘管、分支瘘管、内口；对肛瘘分型诊断具有高度的准确性；且 LAVA 增强序列可提供更丰富的细节，尤其是对瘘管侵犯周围组织结构的显示及对病变的累及范围、累及程度的评价；两种序列联合应用可为临床治疗方案的选择提供较高参考价值。

PU-1109

Monitoring tumor response to the vascular disrupting agent CA4P in a rabbit VX2 liver tumor model using dynamic contrast-enhanced MRI: Simultaneous evaluation of vascular and quantitative parameters

Tianzhuang Han[1],Ting Qian[2]
1.Shanghai Universal Medical Imaging
2.Shanghai Fifth People's Hospital

Objectives:
To determine whether the CA4P produces a significant change in vascular and quantitative parameters in dynamic contrast-enhanced MRI (DCE-MRI), and to evaluate the correlation between quantitative parameters of DCE-MRI and microvessel density (MVD).
Materials and methods: With institutional Animal Care and Use Committee approval, Forty VX2 liver tumors were implanted in the left lobe of liver by percutaneous puncture under CT guidance. Twenty nine rabbits were successfully evaluated 2-2.5 weeks later. Serial MRI (T1WI, T2WI and DCE-MRI) were performed before, 4 hours, 24 hours,72 hours and 1-week after vascular disrupting agent, CA4P at a dose of 10 mg/kg (treated group, n = 23) or saline (control group, n = 6) administration. The

parameters of DCE-MRI (Ktrans, Kep, Ve and iAUC60) of viable tumor portions were measured. Then all the liver samples were processed for hematoxylin and eosin (*H&E*) staining to determine MVD. At last, DCE-MRI derived perfusion parameters and their interval changes were compared between the treated and control group by using the linear mixed model. Each parameter within each group was also compared by using the linear mixed model. Correlation between the DCE-MRI-derived perfusion parameters and MVD was analyzed by using the Spearman rank test or Pearson correlation analysis.
Results: Three VX2 tumor-bearing rabbits were dead during experimental period. The four parameters (Ktrans, Kep, Ve and iAUC) in the treated group at 4-hour follow-up were lower than the value of the baseline, and with significant difference (P<0.001,P=0.029,P=0.005,P=0.001) ,then the four parameters all increased gradually. while the same parameters in the control group were increased from baseline to 1 week. The metabolic tumor volume (MTV) of the two groups both increased at a 4-hour follow-up and further increased at a 1-week follow-up,and the change of MTV in the treated group was significantly smaller compared with that in the control group at 1-week follow-up (mean, +92.24% vs. +138.94%, P =0.009). For the experimental group, the parameters Ktrans (r = 0.621, P <0.01) and iAUC60 (r = 0.564, P =0.01) of 7 days in viable tumor portions were positively moderately correlated with MVD, whereas the parameters Kep(r = 0.027, P = 0.908) and Ve (r = 0.022, P = 0.927) were not correlated with MVD. For the control group, the parameters Ktrans (r = 0.852, P = 0.031) and iAUC60 (r = 0.823, P = 0.044) of 7 days in viable tumor portions were also positively moderately correlated with MVD, while the parameters Kep (r = -0.232, P = 0.658) and Ve (r = 0.306, P = 0.555) were not correlated with MVD. Ktrans, Kep, Ve, iAUC60 and MVD of residual viable tumors in the treat group 1 week later were lower than the viable tumors of the control group but no statistical difference (P > 0.05).

Conclusions: DCE-MRI could be used to evaluate the therapeutic effect induced by CA4P, The quantitative parameters Ktrans and semi- quantitative iAUC60 of DCE-MRI is correlated with MVD, which can assess tumor angiogenesis noninvasively of VX2 liver tumor model.

PU-1110

磁敏感加权成像评估慢性肝病铁沉积

李静,闫 苗,冯旭霞,王 霞,文 铁
延安大学附属医院

目的 SWI 幅度图值评估慢性肝病铁沉积和肝纤维化的可行性及其在诊断慢性肝病中的应用价值。

方法 磁敏感加权成像 SWI 是利用磁场中局部磁敏感差异而产生影像对比的一种梯度回波序列，目前为评估慢性肝病的首选检查手段 。

结果 慢性肝炎患者肝内常有轻至中度铁沉积，引起四型胶原细胞增生，导致肝脏纤维化包绕含铁的增生结节，故随着肝炎、肝硬化进展，SWI 信号值 随着铁沉积和肝纤维化程度加重而减低 。

结论 慢性肝炎患者肝脏常有轻至中度过量的铁沉积，肝炎性铁沉积是慢性肝病重要的危险因素。了解慢性肝病患者肝脏是否存在铁过载以及铁过载程度，对于评估病情、指导治疗以及判断预后具有重要意义 。

PU-1111

子宫静脉内平滑肌瘤一例磁共振报告

郭斌,刘香玉,杨林峰,王晓文
济南市妇幼保健院

子宫血管内平滑肌瘤是一种少见的组织学形态良好，但生物学行为呈侵袭性生长易复发等恶性表现[1]。现将我院 2019 年收治的一例报告如下。

患者女，42 岁，有子宫肌瘤病史，近来感觉下腹隆起。查体：下腹部隆起如孕三月大小，质硬。超声检查：子宫肌层不均质回声伴低阻血流。磁共振检查：子宫体积明显增大，子宫壁见大片状等长 T1 等长 T2 信号，以子宫右后上壁为主，增强扫描见明显强化。病变上达宫底，下缘达宫颈水平，双侧卵巢受累，病变与右侧髂总动脉关系密切。磁共振提示：子宫壁异常信号，考虑恶性肿瘤。

快速病理示：子宫平滑肌瘤，结合大体表现，符合静脉内平滑肌瘤。

常规病理结果示：子宫平滑肌瘤，结合大体所见，符合静脉内平滑肌瘤。

磁共振讨论：回顾本例磁共振表现，发现子宫结合带尚连续，病变沿子宫壁生长，累及范围较大，但没有突破浆膜层。

静脉内平滑肌瘤临床罕见，临床上一般无特异性症。与子宫平滑肌瘤关系密切，特点是可以在子宫内及子宫外静脉系统内生长的良性平滑肌瘤[2]。病变早期临床症状不明显，超声检查不典型，易漏诊，病变晚期肿瘤沿静脉系统生长时，临床症状明显，就诊率较高，但此时治疗复杂，对机体伤害大。因此提高对本病的认识，早期识别并全面切除，可以有效保护患者并减少复发率。

IDEAL-IQ 技术诊断 OSAS 患者非酒精性脂肪性肝病

林铭霞,莫绪凯,林志超,刘伊勇,黄俏庭,史长征*
暨南大学附属第一医院

目的 探讨在磁共振扫描中采用定量非对称回波的最小二乘估算法迭代水脂分离序列（IDEAL-IQ）成像技术评价阻塞性睡眠呼吸暂停低通气综合征（OSAS）患者肝脏脂肪含量及病变程度的可行性。**方法** 选取 106 例进行多导睡眠监测的患者为研究对象，根据监测结果分为非 OSAS 组和 OSAS 组，均进行 IDEAL-IQ 成像技术检查。将两组患者间一般临床资料、肝脏脂肪含量、实验室检查结果及非酒精性脂肪性肝病（NAFLD）程度分级进行比较，同时行肝脏脂肪含量与血清丙氨酸氨基转移酶（ALT）、门冬氨酸氨基转移酶（AST）相关性分析。**结果** 106 例患者中非 OSAS 患者 47 例，OSAS 组患者 59 例。非 OSAS 组患者的肝脏脂肪含量为（13.51±10.47）%、OSAS 组患者的肝脏脂肪含量为（18.49±7.90）%，差异有统计学意义（P<0.05）；两组患者年龄、性别、血清 AST、甘油三酯（TG）、总胆固醇（TC）、高密度脂蛋白胆固醇（HDL-C）差异无统计学意义（P>0.05）；OSAS 组体质指数（BMI）、血清 ALT、低密度脂蛋白胆固醇（LDL-C）显著高于非 OSAS 组，差异均有统计学意义（P<0.05）。非 OSAS 组中 36 例患者（76.60%）诊断为 NAFLD，OSAS 组中 57 例患者（96.61%）诊断为 NAFLD，NAFLD 严重程度两者差异有统计学意义（P<0.05）。ALT 与肝脏脂肪含量呈正相关（r=0.316，P=0.000），AST 与肝脏脂肪含量呈正相关（r=0.314，P=0.000）。**结论**

OSAS 患者相对于非 OSAS 患者，NAFLD 的发病率及严重程度显著增高，肝脏损伤程度加重。IDEA-IQ 技术对诊断 OSAS 患者肝脏脂肪变性及病变程度具有较高价值。

PU-1113
多模态 MR 对早期宫颈癌病灶大小及其临床病理特征的评估价值

庞慧婷, 董越
辽宁省肿瘤医院

目的 比较 MR 各序列及临床对宫颈癌病灶大小测量的准确度，并探讨 MRI 参数与宫颈癌患者临床病理特征的相关性。
方法 选取我院 2014—2017 年间收治的经手术证实的早期宫颈癌（IB-IIA 期）患者 175 例，所有患者术前均行 MRI 扫描（包括常规平扫，增强 T1WI 和 DWI 序列）。回顾性分析患者的临床、病理、影像资料。肿瘤大小测量：在各序列横轴位图像上测量病灶左右径与前后径，在 T2WI 及增强 T1WI 矢状位上测量病灶上下径，在经病灶最大层面的 ADC 图测量肿瘤 ADC 值。采用配对 t 检验比较 MR 及临床与病理上肿瘤大小测量值的差异；采用独立样本 t 检验或秩和检验比较病理类型不同的患者各参数值的差异；采用多组独立样本的秩和检验比较分化程度不同者各参数值的差异，并采用 Spearman 检验评价两者的相关性。
结果 T2WI、增强 T1WI 及 ADC 图病灶左右径及前后径与病理测量值差异无统计学意义（$p>0.05$）；T2WI、增强 T1WI 序列上下径与病理测量值间差异显著（$p<0.001$）。DWI 序列左右径与前后径测量值小于病理测量值（$p<0.05$）。T2WI、增强 T1WI 序列病灶最大径与病理最大径存在差异（$p<0.05$）；而横轴位上各序列所得病灶最大径与病理最大径差异均无统计学意义（$p>0.05$）。临床查体所测肿瘤大小与病理测量值差异不明显（$p>0.05$），但其相关性低于 MR 上各径线与病理测量值的相关性。宫颈鳞癌 155 例，腺癌 12 例，其他类型癌 8 例。宫颈鳞癌 ADC 平均值及最小值低于腺癌（$p<0.001$）；鳞癌与腺癌各 MR 序列病灶最大径差异无统计学意义（$p>0.05$）。病理分化程度不同的肿瘤间 ADC 值差异显著（$p<0.05$）；宫颈癌分化程度与 ADC 值存在弱正相关关系。
结论 相较临床，MR 可以较准确评估宫颈癌病灶大小，但矢状位上所测上下径与肿瘤实际大小差异较大；MRI 可通过 ADC 值可以定量反映宫颈癌的病理学特征。

PU-1114
肝脏 castleman 病误诊为肝腺瘤的一例分析

郑婉静
福建医科大学附属第一医院

caseleman 病是一种以淋巴滤泡增生为特征的良性淋巴组织增生性疾病，病因不明，临床少见。Castleman 病好发于 40 岁左右青年，男女发病率相当，常发生于纵隔（70%），也可见于颈部（10% -14%）、腹部（2%-10%），腋窝、腹盆腔、腹膜后和腹股沟区等。本文介绍的病例是一例体

检发现肝脏占位 3 月余，MRI 显示肝尾状叶可见一类圆形肿块，增强扫描动脉期可见明显均匀强化，实质期肿块信号与肝实质信号相当，周围似可见“假包膜”显影。在未获得病理之前酷似肝腺瘤。行肝尾状叶肿瘤切除术后，病理考虑 castleman 病（透明血管型），因此，应当加强对该病的认识，提高诊断水平，减少误诊。

PU-1115

应用体素内不相干运动评价早期慢性移植肾肾病

张声旺,王维,颜智敏,容鹏飞
中南大学湘雅三医院

目的 探讨应用体素内不相干运动扩散加权成像（intravoxel incoherent motion diffusion weighted imaging，IVIM-DWI）技术无创性评价早期慢性移植肾肾病（chronic allograft nephropathy，CAN）的可行性及临床应用价值。**方法** 收集符合本研究纳入标准的住院患者 23 例，其中经病理诊断为早期慢性移植肾肾病（CAN 组）的患者 12 例，移植肾肾功能长期稳定的志愿者（对照组）11 例。采用多 b 值 DWI 序列对移植肾进行磁共振扫描，利用 IVIM2b_new 软件获取移植肾的 IVIM-DWI 各定量参数伪彩图及测量肾实质的 IVIM-DWI 各定量参数值，包括真实扩散系数（D）、灌注相关扩散系数（D^*）和灌注分数（f）。采用独立样本 t 检验对 CAN 组和对照组的 IVIM 各定量参数值进行比较，对差异具有统计学意义的指标进行 ROC 分析，并计算曲线下面积。**结果** CAN 组的定量参数 D 值低于对照组，差异具有统计学意义（$P<0.05$），两组间 D*及 f 值的差异无统计学意义（$P>0.05$）。真实扩散系数 D 鉴别早期 CAN 的敏感度和特异度分别为 58.3%、90.9%，曲线下面积为 0.784。 **结论** IVIM-DWI 的定量参数 D 能在一定程度上无创性评价早期 CAN。IVIM-DWI 技术有望成为一种筛查早期 CAN 的新型有效、简单无创手段，以协助早期诊断与动态监测 CAN。

PU-1116

磁共振化学位移伪影的分析和解决方法

吴丹
成都上锦南府医院

目的 简述化学伪影的特点和解决方法。化学位移伪影：是指由于化学位移现象所导致的图像伪影。我们知道在磁共振中水和脂肪的进动频率是不一样的！脂肪中的质子的进动频率要比水中的质子慢 3.5PPM，约 150HZ/T 左右。在某同一时刻二者方向相同或者相反（如同反相位）称为化学位移现象。 化学位移伪影的特点：

1.脂肪组织的信号向频率编码梯度场强较低一侧移位；

2. 出现在频率编码方向上；

3.理论上场强越高，化学位移伪影越明显。

化学位移伪影的解决**方法**

1.使用脂肪抑制技术。脂肪信号被抑制后，其化学位移影将用时被抑制；

2.增加频率编码的带宽；

3.交换频率编码和相位编码方向。这样做并不能完全消除化学位移伪影，而是将其更改在其他解刨位置。

PU-1117

前列腺区带和毗邻结构 MRI 表现分析

赵书怀,赵川,张志杰
忻州市人民医院

目的 观察前列腺区带及毗邻结构 MRI 表现，比较各序列价值，提高 MRI 前列腺癌灶发现率和前列腺癌分期准确率。**方法** 对 20 例前列腺 MRI 检查，正常 5 例，前列腺增生 11 例，前列腺癌 4 例。轴位 T2/TSE，压脂和不压脂，FOV200×220mm，层厚/层距 3.5/0mm，矩阵 256/192；轴位 T1/DIXON，FOV370×300mm，层厚/层距 3/0.6mm，矩阵 320×240×160；冠位 T2/FS/TSE，FOV350×298mm,层厚/层距 3.5/0mm，矩阵 256×192；DWI 序列 FOV200×200mm，层厚/层距 3.5/0mm，矩阵 112×103，b 值 50/800/mm^2；DCE 序列及参数同上 T1WI。**结果** 前列腺区带、包膜、精囊、神经血管束不压脂 T2/TSE 基本能辨认，中央腺体低信号， 移行带后上方；移行带高低混杂信号，中央带下方，外周带前方；精囊膀胱后方，前列腺上方，信号稍高或比较高，前列腺外周带前列腺后下方，对称弧形带状，信号较高或明显高，前列腺增生外周带变薄新月形或薄带形，中央叶向上后受压变扁，甚至不显示，前列腺体积增大或不明显，包膜中断与否判断可靠，肿大淋巴结门脂肪消失与否辅助判断是否为转移淋巴结；压脂 T2WI/TSE 序列外周带和精囊信号更高，癌灶显示更突出，骨质破坏显示亦较不压脂明显，盆腔转移淋巴结显示明显，不能显示淋巴结门脂肪，不能显示包膜，影响前列腺分期；T1/DIXON 序列前列腺显示分区不明显，显示前列腺出血、粘液变性区信号，FOV 大、骨转移信号低易观察，反相位勾边线判断包膜完整及与直肠分界；冠状位 T2/FS/TSE 序列 FOV 大可显示较高转移淋巴结，辅助轴位判断区带和癌灶。DWI 序列敏感发现外周带癌灶，移行带区癌灶起辅助作用；DCE 外周带癌灶定性起辅助作用。**结论** 熟悉前列腺 MRI 各区带位置及各序列信号特点是发现前列腺病变和定性诊断的基础。

PU-1118

DWI 感兴趣区的选择在宫颈癌术前分化程度鉴别的应用价值

王鸣宇,邓文明,黄波,康文焱,韦素岚,杨倩
深圳市肿瘤医院

目的 评价磁共振弥散加权成像感兴趣区（ROI）的选择在宫颈癌术前分化程度鉴别的应用价值。**方法** 选取医院诊治的 60 例宫颈癌患者作为研究对象,以手术组织病理结果作为金标准。使用 3.0T 磁共振（GE 医疗 750w）行常规序列及 DWI（b=800）序列检查，根据术后病理分析，将宫颈癌分高、中、低分化三组。分析不同 ROI DWI 对宫颈癌分化程度的鉴别，两名不同年资医师在 DWI 图像上采用三种 ROI 法（圆形 ROI、面积 ROI、容积 ROI）独立的进行测量病灶的 ADC 值。不同组间定量资料采用 ANOVA 检验；运用受试者操作特性（ROC）曲线将存在显著差异的参数进行分析，获得相应的最佳临界值、曲线下面积（area under the curve，AUC）和诊断性能。**结果** 三种 ROI 法获得的 ADC 值差异有统计学意义（$P<0.05$），其中容积 ROI 法测得的 ADC 值更高、重复性最好。三种 ROI 法测得的 ADC 值在鉴别宫颈癌高中低分化有统计学意义（$P<0.05$）。绘制 ROC 曲线，高、中分化组容积 ROI：AUC=0.897，最佳临界值为 $1.131\times10^{-3}mm^2/s$；中、低分化组容积 ROI：AUC=0.856，最佳临界值为 $0.978\times10^{-3}mm^2/s$。 **结论** 三种 ROI 法中容积 ROI 法测得宫颈癌的 ADC 值可重复性最好；ADC 值可用于区分高中分化、中低分化，而容积 ROI 法测得的 ADC 值预测价值最好。

PU-1119
磁共振 IVIM 及 DKI 预测直肠癌 TN 分期、 分化、脉管侵犯的初步研究

段书峰
南通市肿瘤医院/南通市第五人民医院

目的 探讨磁共振 IVIM 及 DKI 预测直肠癌 TN 分期、分化、脉管侵犯的应用价值。
材料与方法 对在我院就诊 52 例直肠癌患者行 IVIM 及 DKI 扫描，扫描后，患者均在一周内行手术治疗并送病理检查。IVIM 扫描采用 11 个 b 值，DKI 采用 6 个 b 值。图像通过软件处理后获得病灶的 IVIM 及 DKI 参数。分析比较两位医师测量值之间的一致性。使用 t 检验或 Mann-Whiteny U 进行直肠癌 T(1+2)期和 T（3+4）期两组之间、有无转移性淋巴结的直肠癌病变之间以及有无脉管侵犯的直肠癌病变之间差异性分析。并对上述各个有差异的参数之间的诊断效能进行评价，评价指标包括敏感性、特异性和 ROC 曲线及曲线下面积(AUC)。使用单因素方差分析各参数在病理分级之间的差异，分析各参数与病理分级之间的相关性。P<0.05 为统计学差异判定标准。
结果 1.随着 T 分期增加，D 值减低、D*值及 MK 值升高，各参数在各组患者差异均有统计学意义，f 及 MD 值无明显统计学差异，联合时诊断效能最高。2.直肠腺癌病理分化程度越低，D 值及 MD 值越低，D*及 MK 值越高，各组患者总体差异均有统计学意义，f 差异无统计学意义。3.有脉管侵犯的病例 MK 值较无脉管侵犯更大，两者间差异有统计学意义，D、D*、f、MD 值差异无统计学意义。4.MK、MD 及 D 值在是否有淋巴结转移的直肠癌两组之间差异有统计学意义，联合时诊断效能最高。
结论
1.IVIM 及 DKI 参数 D、D*及 MK 可以辅助诊断直肠癌 T 分期情况，联合时诊断效能最高。
2.D、MD 与病理分级呈负相关，D*、MK 与病理分级呈正相关，可以预测直肠癌病理分化程度。
3.DKI 参数 MK 值可以用来预测直肠癌周围脉管是否有侵犯。
4.IVIM 及 DKI 参数 MK、MD 及 D 值可以辅助诊断直肠癌是否发生淋

磁共振肝特异性对比剂临床使用概述

梁秀梅
重庆市第五人民医院

肝特异性对比剂已应用于临床，国内应用的医院逐渐增多，对于肝脏病变有重要的鉴别诊断价值，但是部分非教学三甲医院及基层医院在临床使用中仍然欠规范，部分医务人员对肝特异性对比剂缺乏足够认识。本文主要从对比剂特点、适应症、检查技术、疾病诊断、注意事项等方面进行阐述，旨在提高对肝特异性对比剂的认识并充分发挥肝特异性对比剂在肝脏疾病诊断中的作用。

PU-1121
3.0T 薄层高分辨磁共振 T2 加权成像及 RESOLVE 弥散加权成像在直肠癌术前 TN 分期评估中的应用

曾瑞腾
四川大学华西医院

【摘要】目的　探讨 3.0T 薄层高分辨磁共振 T2 加权成像及 RESOLVE 弥散加权成像在直肠癌术前 TN 分期评估中的应用价值。方法　我院 20 例直肠癌患者，均于术前进行 3.0T 薄层高分辨 T2WI 和 RESOLVE 弥散加权扫描，分析薄层高分辨 T2WI 和 VRESOLVE 序列图像中肿瘤浸润深度（T），并测量肿瘤及周围淋巴结（N）的表观弥散系数（ADC）值。以术后送检病理结果为金标准，分析 MRI 评估 T 分期的准确性，ADC 值与肿瘤 T，N 分期及分化程度的相关性。结果　MRI 从 T1 到 T4 分期的准确性分别为 95.62%，90.21%，92.56%，99.43%，N 分期的准确性分别为 87.64%，82.51%，94.74%。结论　3.0T 薄层高分辨磁共振 T2 加权成像及 RESOLVE 弥散加权成像是术前 T，N 分期的重要方法。

PU-1122
顽固性血精症远端生殖道区域 MRI 影像学分析

张琴,杨华
重庆市中医院

目的:探讨 MRI 在顽固性血精症病因诊断中的应用价值。方法: 回顾性分析 36 例既往诊断的顽固性血精患者和 30 例正常对照患者临床资料，重点分析双侧精囊及射精管区域的 MRI 影像学特征。**结果**　病例组患者 MRI 结果显示，36 例患者均显示精囊腺信号异常，其中精囊结石 2 例，前列腺小囊囊肿 13 例，射精管囊肿 2 例，苗勒氏囊肿 3 例，精囊囊肿 3 例，射精管扩张 11 例，2 例仅表现精囊腺出血信号。与对照组比较，病例组精囊腺宽度明显增大，而精囊长度无明显差异。结论: MRI 检查可有效显示远端生殖道区域的病变，对于顽固性血精症患者的病因诊断和临床治疗具有重要指导价值。

PU-1123
MRI 定量参数预测子宫内膜癌病理等级的临床价值

武雅琳,叶兆祥
天津医科大学肿瘤医院

目的　探究 MRI 定量参数对子宫内膜癌病理等级的预测价值。**方法**　对 188 例（G1：64 例；G2：68 例；G3：56 例）经手术病理证实为子宫内膜癌（endometrial cancer，EC）患者的 MR 图像（平扫、动态增强扫描及 DWI 成像）进行回顾性分析。根据椭球公式估算肿瘤及子宫的体积，并计算肿瘤/子宫体积比(neoplasm/uterus volume ratio, N/U)，分别对病灶及正常子宫肌层、闭孔内肌、臀大肌进行 ADC 值的测定（b=800s/mm^2），并计算 ADC 均值、ADC 均值的离散系数（coefficient variance，CV）及相应的 rADC 值（$ADC_{病灶}/ADC_{正常子宫肌层/闭孔内肌\ /臀大肌}$）。利用非参数检验评估 EC 三种病理等级的 MR 定量参数的差异；利用受试者工作曲线（ROC）及 Logistic 回归分析法评估不同 MR 定量参数对高级别 EC（G2、G3）的预测效能。**结果**　高级别 EC 的 N/U 明显高于低级别（$P<0.001$）；高级别 EC 的 ADC 均值及三种 rADC 均低于低级别 EC（P 均<0.001）；不同病理等级的 CV 差异无统计学意义（$P>0.05$）； Logistic 回归分析显示 N/U 及 rADC1($ADC_{病灶}/ADC_{正常子宫肌层}$)为 EC 病理等级的独立预测因子($P=0.018$；$P<0.001$)，两者联合应用所对应的曲线下面积为 0.777，灵敏度为 71.0%，特异度为 76.6%（截断点 N/U：0.11；rADC1：0.65）。**结论**　MRI 定量参数对于 EC 病理等级的预测具有一定的价值。

PU-1124
容积 ADC 直方图分析鉴别 Ia 期子宫内膜癌与子宫内膜息肉的价值

周欣
天津市第一中心医院

目的 探讨基于肿瘤容积的表观扩散系数（ADC）直方图分析在鉴别 Ia 期子宫内膜癌与子宫内膜息肉中的价值。
方法 回顾性分析经病理证实为 Ia 期子宫内膜癌（20 例）与子宫内膜息肉（20 例）患者的影像资料，所有病人均在 3.0 T MRI 上进行 DWI 检查（b = 50,800 s / mm 2）。取 DWI 原始图像，分别由两位医师在病灶每一层 ADC 图像上勾画 ROI 进行测量，得到整个病灶的直方图参数，包括 ADC 平均值(ADC_{mean})、ADC 第 1 百分位数($ADC_{1\%}$)、ADC 第 10 百分位数($ADC_{10\%}$)、ADC 第 50 百分位数($ADC_{50\%}$)、ADC 第 90 百分位数($ADC_{90\%}$)、ADC 第 99 百分位数($ADC99_{\%}$)、变异度（Variance）、偏度（Skewness）、峰度（Kurtosis）。对获得的两组直方图参数特征分别进行统计学分析，应用受试者工作特征（ROC）曲线评价 ADC 直方图各个参数的鉴别诊断效能。
结果 Ia 期子宫内膜癌组的 ADC_{mean}、$ADC_{1\%}$、$ADC_{10\%}$、$ADC_{50\%}$、$ADC_{90\%}$、$ADC99_{\%}$明显低于子宫内膜息肉组，子宫内膜息肉组的偏度明显低于内膜癌组，差异有统计学意义（P <0.05）；二者的变异度、峰度值差异无统计学意义（P> 0.05）。其中 ADC_{mean} 鉴别 Ia 期子宫内膜癌与子宫内膜息肉的效能最高，ROC 曲线下面积为 0.9，以 $1.06\times10^{-3}mm^2/s$ 为截断值，敏感度、特异度分别为 80%和 95%。
结论 ADC 直方图分析对 Ia 期子宫内膜癌与子宫内膜息肉有鉴别诊断价值，其中 ADC_{mean} 诊断价值最高。

PU-1125
胰腺异位副脾 1 例

韩雪
河北医科大学第四医院

副脾属于先天发育变异，是由于胚胎发育第 5 周时位于背侧胃系膜内胚胎脾芽的某部分融合失败所致，脾门是副脾最好发的部位，但也可发生于脾韧带、胰尾、大网膜、肠系膜、女性附件等部位。胰腺异位副脾(intrapancreatic accessory spleen,IPAS)临床罕见，IPAS 患者一般无临床症状，各项肿瘤指标均无异常，主要影像学表现为发生于胰尾，病灶较小，MRI 各序列图像信号与正常脾脏相似，增强呈花斑样或明显均匀强化。另外可结合 IPAS 与正常脾脏的 ADC 比值即可明确诊断，避免不必要的手术。

PU-1126
不同病原菌肛周脓肿 MRI 诊断的初步研究

陆炜平
上海市浦东新区公利医院

目的 探讨 MRI 常规序列及 DWI 在不同病原菌的肛周脓肿术前诊断中的价值。**方法** 采用回顾性方法分析，选取 79 例肛周脓肿患者，分析其脓液病原菌培养鉴定结果，对其中 24 例术前行 MRI 检查的病例进行图像分析及 ADC 值测定，并统计分析。**结果** 1.79 例肛周脓肿病例中，大肠埃希菌(47 株，55.29%)和肺炎克雷伯菌(23 株，27.06%)为主要致病菌。2.24 例行 MRI 检查的病例中，大部分为低位肌间脓肿（54.84%，17/31）和肛周皮下脓肿（25.81%，8/31）；其中，12 例大肠埃希菌主要引起低位肌间脓肿（53.33%，8/15）及肛周皮下脓肿（40.00%，6/15），7 例肺炎克雷伯菌主要引起低位肌间脓肿（55.56%，5/9）。但是，目前还不能认为本研究中 7 种病原菌所形成的 4 个肛周脓肿位置有区别。3.大肠埃希菌所致脓肿的 ADC 值为 $0.79\pm0.38\times10^{-3}mm^2/s$，肺炎克雷伯菌所致脓肿的 ADC 值为 $0.81\pm0.45\times10^{-3}mm^2/s$，这两种细菌引起脓肿的 ADC 值之间差异无统计学意义。**结论** MRI 有利于不同病原菌肛周脓肿术前定位诊断，目前尚不能认为大肠埃希菌和肺炎克雷伯菌引起脓肿的 ADC 值之间有差别。

PU-1127

胎盘植入 MRI 个案

李帆,卓丽华
绵阳市第三人民医院/四川省精神卫生中心

目的 探讨 MRI 对胎盘植入的部位、肌层及邻近器官的受累情况的影像诊断。
方法 回顾分析一例经临床综合诊断胎盘植入的 1 例个案 MRI 表现，3.0TMRI 平扫：T2- HASTE、True-FISP、FS-T1WI、DWI。
结果 患者女 24 岁，妊娠 29W+，入院诊断为瘢痕子宫，凶险性前置状态，胎盘 MR 表现：胎盘内 T2 暗带：有，部位：子宫下段右前壁约 11 点钟方向，范围≤2cm；肌层变薄：有，部位：子宫下段前壁；胎盘信号不均质：有，程度：轻微；胎盘突出宫颈内口征：无；子宫鼓胀：无；胎盘血管异常：有，部位：子宫前壁下段 11 点钟、12-1 点钟、上段 12 点钟方向可见跨界血管，其中最粗血管直径约 5.7mm；胎盘凹陷：无；穿透征：无；膀胱壁完整，周围脂肪间隙清楚；宫颈管内见出血信号；诊断：1.宫内单活胎。瘢痕子宫。子宫中下段与前腹壁粘连 2.低置胎盘。胎盘植入性病变（胎盘粘连+植入，mrFIGO 分类：2，PAS 分级：1，轻度）3.宫颈管内少量积血 4.胎儿脐带绕颈 1.5 周。剖宫产术后：瘢痕子宫，胎盘植入。
结论 超声诊断胎盘植入的敏感性为 77-93%，特异性为 71-95%，MRI 诊断胎盘植入的敏感性为 75-100%，特异性为 65-100%，2011 年英国皇家妇产科学院（RCOG）和国家临床研究所（NICE）版的指导方针，建议在超声诊断不确定的情况下利用 MRI，与超声相比,MR 的优点主要有成像范围大,受骨骼、脂肪、肠气的影响小等，其不受胎盘位置的影响,尤其对子宫后壁的胎盘植入显示优于超声。将其列为胎盘植入高风险病人的常规检查手段可以减低产妇的发病率和死亡率。MRI 表现能基本反映胎盘植入的病理特征、部分表现具有特征性，并能较准确的判断胎盘植入的部位、肌层及邻近器官的受累情况，对临床明确诊断、治疗方案的制定、疗效评估及预后随访等有一定的参考价值，熟悉以上 MR 征象,对于胎盘植入的诊断有很大帮助。

Longitudinal Assessment of Rabbit Renal Fibrosis Induced by Unilateral Ureteral Obstruction Using Two-Dimensional Susceptibility Weighted Imaging

Jinggang Zhang
First People Hospital of Changzhou

Background: Previous studies indicated that two-dimensional-susceptibility weighted imaging(2D-SWI) could serve as a useful biomarker for differentiating the grade of liver fibrosis. Purpose: To evaluate the feasibility of 2D-SWI in the dynamic quantification of renal fibrosis in a rabbit model. Study type: Longitudinal study. Animal model: Twenty-Four New Zealand White Rabbits including control group (n = 4); and renal fibrosis group (n = 20), via a unilateral ureteral obstruction (UUO) model Field strength/Sequence: 3.0 T SWI using a 2Dgradient-echo sequence. Assessment: The relative SWI signal ratio(r) of cortical and medulla (r=SIrenal/SImuscle) was longitudinally assessed before ligation and on weeks 2, 4, 6, and 8 following ligation. Sirius Red staining was used to assess the degree of fibrosis in five high-power fields. Statistical tests: The repeated measures of analysis of variance and linear regression analysis. Results: Both the cortical and medullary r values were significantly higher in the UUO kidneys at week 2 compared with the kidneys before ligation. Over the course of UUO progression, significant changes occurred in the cortical and medullary r values in vivo and fibrosis scores in vitro (all P values <0.05). The r values gradually decreased, while the fibrosis scores gradually increased over 8 weeks following ligation. The linear regression analysis showed a strong and significant correlation between cortical and medullary r values and the pathologic fibrosis scores (R2=0.91, 0.81, respectively). Conclusion: The SWI sequence could provide a quantitative evaluation of renal fibrosis during UUO progression.

Pre-treatment ADC image-based random forest classifier for identifying resistant rectal adenocarcinoma to neoadjuvant chemoradiotherapy

Liheng Liu,Shengxiang Rao,Mengsu Zeng

Zhongshan Hospital Fudan University

Objective
To develop a predicting model for tumor resistance to neoadjuvant chemoradiotherapy (NCRT) in locally advanced rectal cancer (LARC) by using pre-treatment apparent diffusion coefficient (ADC) images-derived radiomics features.
Method
A set of 89 patients with LARC were randomly assigned into training (N = 66) and testing cohorts (N = 23) at the ratio of 3:1. Radiomics features were derived from manually determined tumor region of pre-treatment ADC images. Random forest algorithm was used to determine the most relevant features and then to construct a predicting model for identifying resistant tumor. Stability and diagnostic performance of the random forest model was evaluated with the testing cohort.
Results
The top ten most relevant features ($entropy_{mean}$, inverse variance, $energy_{mean}$, small area emphasis, ADC_{min}, ADC_{mean}, sdGa02, small Gradient emphasis, age and size) were determined from clinical characteristics and 133 radiomics features. In the prediction of resistant tumor of the testing cohort, the random forest model constructed based on these most relevant features achieved an area under the receiver operating characteristic curve of 0.83 ± 0.20, with the highest accuracy of 91.3%, a sensitivity of 88.9% and a specificity of 92.8%.
Conclusion
The random forest classifier based on radiomics features derived from pre-treatment ADC images have the potential to predict tumor resistance to NCRT in patients with LARC, and the use of predicting model may facilitate individualized management of rectal cancer.

PU-1131
全身弥散加权成像在初诊直肠癌患者诊断和监测中的价值

高艳艳,黄刚
甘肃省人民医院

目的 探讨全身弥散加权成像（WB-DWI）在直肠癌患者诊断和监测中的价值。
方法 回顾性分析 2013 年 9 月至 2019 年 5 月在我院就诊的 46 名初诊为直肠癌患者的临床资料。分析在治疗前进行 WB-DWI 的所有患者的结果。并讨论了 WB-DWI 在诊断和监测直肠癌患者中的作用。
结果 46 例患者中，WB-DWI 发现 44 例异常占位灶，阳性率为 96.0％。直肠癌相关的转移病变主要发生在肝脏、肺、骨、颅内、腹膜及临近区域淋巴结。通过计算机断层扫描（CT）检查未发现颅内转移及腹膜转移的 8 名患者通过 WB-DWI 检测到。同时其在直肠癌患者 TNM 分期中的价值与 PET-CT 相当。10 名患者接受了一次以上的 WB-DWI 随访。放化疗前后 10 例患者最大病灶的平均表观弥散系数（ADC）值分别为 $1.01\times10^{-3}mm^2/s$ 和 $1.26\times10^{-3}mm^2/s$。
结论 WB-DWI 对初诊为直肠癌患者的诊断和监测具有重要价值。它的灵敏度高于 CT，价值与 PET-CT 相当。放化疗后 WB-DWI 的结果与治疗效果有很好的相关性，可作为随访的首选检查。

PU-1132
枸橼酸铁铵糖浆用作 MRI 胃肠道对比剂的应用研究

黄利昆,罗艳,张尔琚,蔡东明,黎思
云南省中医医院（云南中医药大学第一附属医院）

[摘要] 目的 探讨枸橼酸铁铵糖浆用作 MRI 胃肠道对比剂的应用价值。 方法 先用市售有国药准字的枸橼酸铁铵 B1 糖浆 II 加纯净温水配制成不同浓度的口服对比剂，采用超导 Philips Achieva 1.5T MRI 成像仪检查做体外试验，确定合适的对比剂浓度供人服用；然后选取自愿者，做服药前后的上腹部 MR 检查或 MR 胆胰管水成像（MRCp）。结果 口服枸橼酸铁铵糖浆后，发现自愿者胃肠腔在超导 Philips Achieva 1.5T MRI 成像仪 T1WI 像上呈现为高信号，在 T2WI 像上呈现为低信号，其有助于解决胃肠道与周围组织信号对比不足，有时难以将腹腔内病灶与胃肠道明确区分开而导致诊断困难，最大限度地避免误诊和漏诊的发生，并对口服 MRI 胃肠道对比剂安全性进行评估。结论 通过该研究，发现我们所选用的口服枸橼酸铁铵糖浆胃肠道对比剂安全性最高（如有国药准字号，副作用最小等），经济实惠，口感好多数患者易于接受。其次确定每次检查需服用的胃肠道对比剂的计量比例（对比剂＋水），达到胃肠道与腹部实质性脏器、后腹膜结构等形成鲜明对比的最小计量比例值。

PU-1133
单次屏气快速采集 3D SPACE 序列在 MRCP 成像中的应用

钱一帆,李馨,田娟,秦越
西安大兴医院

目的 探讨单次屏气快速三维可变翻转角快速自旋回波序列（3D-SPACE）在磁共振胰胆管成像（MRCP）中的应用价值，对比分析呼吸触发 3D-SPACE 序列采集图像质量的差异。
方法 使用西门子 MAGNETOM Aera 1.5T 超导型磁共振扫描仪对 55 例行 MRCP 检查的患者（男性 31 名，女性 24 名，年龄范围 14-89 岁）均行呼吸触发和单次屏气 3D-SPACE-MRCP 序列扫描；对两种序列的采集时间和图像质量进行统计学分析，比较两种序列的优缺点。
结果 单次屏气 3D-SPACE 序列采集时间为 16s，常规呼吸触发 3D-SPACE 序列采集时间（232.27±46.50）s，两种序列间差异有统计学意义（t=-18.014，P=0.000）；单次屏气 3D-SPACE 序列原始图像受肠道蠕动干扰小，最大密度投影（MIP）重建图像质量差异有统计学差异（胆总管显示评分差异：P=0.000）。
结论 相比呼吸触发 3D-SPACE 序列，单次屏气 3D-SPACE 序列采集时间减少约 90%，图像质量更好，扫描成功率较高，具有一定的临床应用价值。

直肠癌 MRI 术前研究

孙秋德
解放军 970 医院

[摘 要]目的: 术前准确预测直肠癌手术切缘的状态，对于全直肠系膜切除 (TME)的开展及治疗方案的制定具有重要的价值。 探讨 MRI 对直肠癌环周切缘的价值。 **材料与方法:** 36 例术前行薄层 MRI 检查的直肠癌患者，采用超导型磁共振成像仪，体部线圈，自旋回波(SE) T1WI、T2WI。

层厚 4mm，层间距 0.1mm，先行矢状位 T1WI，然后根据矢状位肿瘤与肠壁的关系，行倾斜轴位 T1WI 及 T2WI，使扫描线垂直于肿瘤所在的肠段中轴线。整个检查时间约为 15-20 分钟,。其中 20 例肠腔内充气检查,16 例肠腔内充水检查,6 例行增强扫描。观测癌肿与直肠筋膜的关系，并与组织病理学结果相对照。**结果** 36 例组织病理学证实阳性环周切缘 13 例，术前 MRI 确诊 11 例，敏感性为 84.6 %，特异性为 87.0%，准确性为 86.1%，阳性预测值 78.6%，阴性预测值 90.9%。**结论** 直肠癌局部浸润扩散关系到术前分期和患者的预后，MR 对直肠肿瘤 CRM 的准确评价，为临床术前的总体规划及全面、合理的治疗提供了影像学依据，具有一定的价值和临床意义。

腹部巨淋巴结增生症与脾脏 MR 成像对照研究

邓丽珠
厦门大学附属中山医院

【摘要】目的: 分析腹部巨淋巴结增生症（Castleman’s Disease，CD）的常规 MRI 和弥散成像特点，并与脾脏对照。**方法** 回顾性分析经手术病理证实的 14 例 CD 患者的 MR 影像资料，MR 图像分析包括病灶位置、大小、形状、边缘、平扫信号强度、增强特点、同步分析脾脏成像的相应特征。在 ADC 图上测量 CD 和脾脏的 ADC 值，采用配对样本 t 检验分析 CD 与脾脏的 ADC 值有无差异。**结果** 14 例 CD 患者中 9 例为透明血管型，病灶平均最大径为（5.1±2.4）cm，5 例为浆细胞型，病灶平均最大径为（4.5±1.9）cm，所有 14 例病灶均为圆形或类圆形，4 例透明血管型（4/9）及 1 例浆细胞型（1/5）外观似肾形，并见类似脐凹样的结构，透明血管型及浆细胞型各有 3 例病灶周围见条絮状模糊影；所有病例平扫均呈 T1WI 等或稍低信号，T2WI 呈高或稍高信号为主，DWI 高信号，2 例透明血管型（2/9）及 1 例浆细胞型（1/5）病灶内见钙化灶，其余 9 例病灶平扫信号均匀并与脾脏相近；14 例 CD 增强动脉期均明显强化，透明细胞型 CD 强化程度接近脾脏明显强化部分，而浆细胞型 CD 强化程度稍弱于透明细胞型 CD 以及脾脏明显强化部分，门脉及延迟期所有病例均持续强化，与脾脏接近。11 例无肝硬化背景的 CD 患者病灶与脾脏 ADC 平均值分别是（1.12±0.18）×10-3mm2/s 及（1.13±0.15）×10-3mm2/s，二者间的差异无统计学意义（p=0.836）。**结论** 腹部巨淋巴结增生症的 MR 表现具有一定特征性，病灶信号特点及强化方式类似脾脏，特别是病灶的弥散加权成像的信号特点及 ADC 值同脾脏一致，有助于诊断和鉴别。

PU-1137

Preoperative risk-stratification for stage I endometrioid adenocarcinoma: A simple method of measurement on DWI

Bin Yan,Xiufen Liang
Shaanxi Provincial Tumor Hospital

Objectives To explore the utility of the tumor area ratio (TAR) for predicting deep myometrial invasion (DMI) and tumor grade in stage I endometrioid adenocarcinoma (EEA).
Methods We retrospectively evaluated 86 patients with FIGO stage I EEA. All patients underwent cMRI and DWI procedures. The volume and maximum area of the tumor and uterus were obtained, and the tumor volume ratio (TVR) and TAR were calculated. The Kruskal–Wallis test and Mann–Whitney *U* test were used to compare the differences in indexes (TVR and TAR) between the different tumor grades and between superficial myometrial invasion (SMI) and DMI.
Results TVR and TAR values for DMI and high-grade (HG) EEA were significantly higher than the values for SMI and low-grade (LG) tumors. According to the ROC curve, AUC was significantly higher for TAR than for TVR for tumors with DMI. However, no significant differences in the AUCs for TVR and TAR were observed between HG and LG tumors. A TAR ≥34.6% predicted DMI with a sensitivity (SEN) and specificity (SPE) of 85.0% and 84.8%. A TAR ≥38.9% predicted HG tumors with a SEN and SPE of 83.3% and 81.1%.
Conclusion TAR is useful for predicting DMI and high-grade stage I EEA.

PU-1138

直肠癌侧方淋巴结的 MRI 分析

林晨岚
莆田学院附属医院

目的
评估直肠癌患者侧方淋巴结(lateral pelvic lymph node, LLN)的大小、形态预测淋巴结病理转移的意义。
方法
回顾性分析在我院诊治的 60 例术前 CRT 后行根治性手术的直肠癌患者，术前一周均接受过盆腔 MRI 检查。25 例仅行全直肠系膜切除术(TME)，另 35 例临床 LLN 转移者行 TME 联合 LLN 清扫。
结果
42 位直肠癌患者清扫出 303 颗 LLN，其中有 8 人(19%)、21 枚(6.9%)淋巴结报告病理转移。CRT 前后淋巴结短轴直径 cut-off 值分别为 7.0mm 和 6.2mm，LLN 小于 7.0mm 的患者术后 5 年无复发生存率明显高于 LLN 大于 7.0mm 的患者。淋巴结形态偏圆形的转移率高于椭圆形的。
结论

CRT 前 LLN 的短径当以 7 mm 为阈值判断淋巴结是否转移，淋巴结形态偏圆形的转移率高于椭圆形的。

Prediction of Prostate Cancer Aggressiveness with a Combination of Radiomics and Machine Learning-Based Analysis of Dynamic Contrast-Enhanced MRI

Chuanming Li,Bo Liu,Jia Liu,Guo Dajing
The Second Affiliated Hospital of Chongqing Medical University

Objectives To investigate whether the combination of radiomics and automatic machine learning-based classification of original images from multiphase DCE-MRI can predict prostate cancer (PCa) invasiveness before biopsy.
Methods Forty consecutive biopsy-confirmed PCa patients were included from our hospital. Biopsy was performed within 4 weeks after the DCE-MRI examinations. According to the time signal intensity curve, lesion segmentation was performed on the first and on the strongest phase of the enhancement on the original DCE-MR images, and 1029 quantitative radiomics features were automatically calculated from each lesion, wherein there were three datasets available (Dataset-F, Dataset-S and Dataset-FS). The variance threshold method, select k-best method and least absolute shrinkage and selection operator (LASSO) algorithm were used to reduce the feature dimensions. Five machine learning approaches leveraging cross-validation were employed, and the clinical value of each model was evaluated by AUC. Correlation analysis was performed between the features of the machine learning model that achieved the best classification performance and the Gleason score (GS) of the PCa lesion.
Results 8, 4 and 16 features were selected as optimal subsets in Dataset-F, -S and -FS, respectively. Among all three datasets, logistic regression (LR)-based analysis with Dataset-FS had the highest predication efficacy (AUC=0.93). 10 features in Dataset-FS showed significantly positively correlation with GS. The model performance of Dataset-F was generally better than that in Dataset-S.
Conclusions Combination of radiomics and machine learning-analysis based analysis of the union of the first and strongest phases of original DCE-MR images can predict PCa aggressiveness noninvasively, accurately and automatically.

3D 打印技术改良动物线圈优化 KM 小鼠磁共振成像研究

王秋霞
华中科技大学同济医学院附属同济医院

目的 探讨基于 3D 表面扫描技术改良 5cm 动物线圈，优化 KM 小鼠成像的实验研究。**方法** 采用 3D 表面扫描仪对 5cm 动物线圈扫描，并个性化设计完成线圈专用小鼠扫描支架，用于在 3T 上对 KM

小鼠进行多时间点优化成像研究。6 只荷瘤 KM 小鼠腹腔麻醉后，在 3.0T 磁共振仪上，采用 5cm 动物线圈进行扫描，对比采用支架前后 MR 图像，并记录预扫描次数，整个扫描过程和开始及结束时间。图像质量评估采用客观指标及主观指标，客观指标使用 SNR 和 CNR；主观指标由两名读片医师对前后图像出现的自主运动伪影、呼吸伪影进行 3 等级评分。**结果** 使用 3D 打印技术成功制备 2 个磁共振线圈平台支架（简称 3D 支架）。两位读片医师间对自主运动及呼吸运动伪影的判断进行一致性分析，其 κ 值均在 0.7 以上提示一致性良好。未采用 3D 打印支架时，总共预扫描需进行 21 次，成功率为 28.57%（6/21），平均每只 KM 小鼠完成扫描时间为 17.6 分钟；采用 3D 支架后，总共预扫描 6 次（每个小鼠预扫描 1 次成功），成功率 100%（6/6），平均每只 KM 小鼠完成扫描时间为 10.8 分钟，时间缩短了 38.64%。使用 3D 支架前后 SNR 分别为：2.16±0.18，2.41±0.14 ，CNR 分别为 1.48±0.11 ，1.86±0.14，进行配对 Wilcoxon’s 秩和检验，p 值均 <0.05。与未使用 3D 打印支架相比，使用 3D 打印支架后降低了对检查部位的自主运动及呼吸运动伪影，两位读片医师分别对使用 3D 打印前、后的自主运动伪影、呼吸运动伪影评分，进行配对 Wilcoxon’s 秩和检验，p 值<0.05。**结论** 利用 3D 打印技术制作的磁共振动物线圈支架，增加了扫描定位成功率和图像的信号强度，缩短了成像时间**并减少**伪影，在磁共振动物模型扫描实验中具有重要的应用价值。

复杂性肛瘘 MRI 影像与外科手术结果对照分析

虞辛强
杭州市第三人民医院

目的 了解复杂性肛瘘的 MRI 影像。
方法 回顾性分析外科手术证实的复杂性肛瘘的 MRI 影像。
结果 回顾性分析外科手术证实的 46 例复杂性肛瘘病例的 MRI 影像，其中 1 内口 2 出口的 18 例，2 内口 1 出口的 9 例，多内口 1 出口的 8 例，1 内口多出口的 5 例，多内口多出口的 6 例，肛瘘瘘管 T1 加权像显示低信号，T2 加权像显示高信号，弥散显示高信号，增强扫描管壁强化。
结论 MRI 可清楚显示复杂性肛瘘瘘管走向，对外科手术具有重要意义。

PU-1142

不同 b 值组合对正常志愿者胰腺 IVIM 定量参数的影响

丁勋,徐海波,徐佳,周军,龙清云
武汉大学中南医院

目的 研究不同 b 值组合下胰腺不同解剖部位的 IVIM 定量参数值的差异。
方法 前瞻性招募 32 名正常志愿者进行 IVIM-DWI 检查，采用自由呼吸的单次激发平面回波序列采集 IVIM 图像，测量 3 组不同 b 值组合(b_{10}，b_{20}和b_{50}组)的胰腺 IVIM 定量参数值(D_{slow}，D_{fast}和 f 值)，先利用 Bland-Altman 方法分析 IVIM 定量参数组内及组间重复测量的一致性，然后对 3 组间的胰腺不同解剖部位的 IVIM 定量参数进行 Kruskal-Wallis 检验，对于有统计学意义(P< 0.05)的参数采用 Bonferroni 校正法进行两两比较。
结果 胰腺 IVIM 定量参数重复测量差值的 95%LOA 与两次重复测量均值的中位数的比值分别为：组内 D_{slow} (5.42-10.12)%，D_{fast} (17.60-22.68)%，f (10.23-12.64)%，组间 D_{slow} (7.32-8.80)%，D_{fast} (13.01-24.51)%，f (9.05-11.69)%，胰腺的 IVIM 定量参数 D_{slow}和 f 值有较好的重复测量的一致性，其中胰腺头部和尾部的一致性较胰体部好。3 组间的比较，f 值在胰头、体部的 b_{20}和 b_{50}组间比较无统计学差异(P= 0.025, 0.044 > 0.017)，其余组间的两两比较均有统计学差异(P< 0.01)，b_{10}组有最低的 f 值；D_{fast}值的组间两两比较均有统计学差异(P< 0.01)，b_{10}组有最高

的 D_{fast} 值；D_{slow} 值在 b_{10} 组和 b_{50} 组间比较有统计学差异($P<0.01$)，b_{10} 组有较高的 D_{slow} 值，在其余两组间的比较无统计学差异($P>0.017$)。胰腺不同解剖部位的 D_{slow}，D_{fast} 和 f 值比较无统计学差异($P>0.05$)。

结论 不同的 b 值组合会影响 IVIM 定量参数值，胰腺 IVIM 定量参数值与胰腺的解剖部位无关。

PU-1143

MRI 诊断子宫内膜间质肉瘤 1 例及文献复习

叶丽丽
东莞康华医院

目的 通过探讨 1 例子宫内膜间质肉瘤的 MRI 表现，并复习文献，以提高对子宫内膜间质肉瘤的认识和诊断水平。**方法** 回顾分析经手术证实的 1 例子宫内膜间质肉瘤的 MRI 表现，复习近期国内外关于子宫内膜间质肉瘤相关文献。**结果** MRI 可见子宫内膜弥漫不均匀性增厚，增强后明显强化，MRI 诊断为恶性肿瘤性病变并侵犯宫颈及子宫肌层，术后病理证实为子宫内膜间质肉瘤。**结论** 子宫内膜间质肉瘤的诊断关键在于提高对本病征象的认识，而 MRI 在显示病变内部信号特点方面优于其他影像学方法，对本病的诊断有重要的价值。

PU-1144

宫颈癌体素不相干运动的直方图和纹理特征的可重复性研究

陈浩
湖北省肿瘤医院

目的 探讨宫颈癌 IVIM 的直方图和纹理特征的可重复性；

方法 回顾性收集 20 例我院经病理证实为宫颈癌患者的 MRI 体素内不相干运动图像，将这些图像 GE AW4.6 后处理工作站 MADC 软件中，分别生成标准扩散系数图（ADC-stand）、快速扩散系数图（ADC-fast）、慢速扩散系数图（ADC-slow）、扩散分数图（f）；将这些生成的图像及 b=1000 的 DWI 图导入然后由 3D slicer 软件，两名不同年资影像医生利用 3D slicer 软件在 b=1000 的 DWI 图分别间隔一个月两次勾画病灶最大层面的 ROI，并将该 ROI 移植到各 IVIM 衍生的参数图上，再利用该软件计算肿瘤最大层面的直方图和纹理特征，并使用 T 检验及组内相关系数（ICC）评价观察者内部、观察者之间测量的可重复性。

结果 一些直方图及纹理特征是可以从宫颈癌 IVIM 衍生图上重复测量的。另一方面，组内比较中，ADC-stand 图 A1A2 可重复数据 1 个，B1B2 可重复特征 5 个；f 图 A1A2 可重复数据 8 个，B1B2 可重复特征 6 个；ADC-fast 图 A1A2 可重复数据 10 个，B1B2 可重复特征 11 个；ADC-slow 图 A1A2 可重复数据 5 个，B1B2 可重复特征 8 个。组间比较中，ADC-stand 图 A1B1 可重复数据 3 个，A2B2 可重复数据 4 个；f 图 A1B1 可重复数据 10 个；ADC-slow 图 A1B1 可重复数据 7 个，A2B2 可重复数据 7 个。

结论 宫颈癌 IVIM 衍生图 ADC-fast、ADC-slow、f 图中提取的直方图和纹理特征可重复性优于 ADC-stand 图；随着观察者内部认知水平的提升和完善，组学特征提取的可重复性会小幅度上升。

PU-1145

MRI 弥散加权成像在腹部和盆腔肿瘤影像诊断中的应用价值探讨

李康
江苏省肿瘤医院

目的 综合分析 MRI(磁共振)弥散加权成像在腹部盆腔肿瘤影像诊断中的应用价值。
方法 选取本院 2018-6-2019-6 收治的 80 例腹部和盆腔肿瘤患者作为研究对象,所有患者均接受 MRI(磁共振)弥散加权成像诊断方法。采用统计学分析 80 例腹部和盆腔肿瘤患者的磁共振病灶部位评价结果(阴性、阳性)以及诊断价值(敏感度、特异性)。结果 80 例腹部和盆腔肿瘤患者中一共检测出 300 个部位,101 个瘤灶部位(占 33.67%),2 个假阳性(占 6.67%);197 个未检出瘤灶部位(占 65.67%),3 个假阴性(占 10.00%),194 个真阴性(占 64.67%),数据比较差异有统计学意义(P<0.05);80 例腹部和盆腔肿瘤患者的病灶边界较为清晰(以类圆形或者小规则分叶状肿块影为主要表现形式,其中 T1W1 主要为低信号,T2W1 呈现不均匀的高信号,肿块呈现较高信号);灵敏度为 97.06%(99/102)、特异度为 98.98%(194/196),数据比较差异无统计学意义(P>0.05)。
结论 ：MRI(磁共振)弥散加权成像在腹部和盆腔肿瘤影像诊断中的应用价值比较高。

PU-1146
剖宫产术后娠瘢痕妊娠不同类型的 MRI 表现及临床术前价值

徐生芳
甘肃省妇幼保健院

摘要 **目的** 探讨剖宫产术后瘢痕妊娠(CSP) MRI 表现并比较不同类型的 CSP 的影像特征、治疗手段及临床结局。**方法** 经临床确诊 CSP 60 例，回顾性分析 MRI 影像及临床资料，比较 CSP 三种类型的影像特征、治疗手段及临床结局。**结果** 60 例病变病理结果显示均含有绒毛和（或） 蜕膜组织，CSP 的病变均位于子宫前壁下段及峡部前壁，妊娠物种植在瘢痕处，MRI 对患者的病灶及周围组织结构显示清晰。MRI 表现为 41 例囊性病灶和 19 例混杂信号病灶（肿块型）。I 型 21 例，II 型 31 例,III 型 8 例，其中合并动静脉瘘有 4 例，合并绒毛植入 1 例。21 例行宫腔镜下妊娠物清除术，其中 34 例术前行子宫动脉介入栓塞术，3 例腹腔镜下盆腔粘连松解术，2 例行经腹疤痕妊娠物切除术加子宫修补术。**结论** MRI 可以清晰显示瘢痕妊娠囊、滋养细胞植入肌层情况、CSP 的不同类型、瘢痕及周围组织结构关系等，根据其分型可更好地选择 CSP 的手术方式，对临床治疗方案具有一定的指导作用。

PU-1147
剖宫产后切口妊娠的 MRI 表现及其临床价值

魏常辉
内江市第二人民医院

目的 探讨剖宫产后切口妊娠的 MRI 表现，评价其在切口妊娠治疗中的应用价值。
方法 回顾分析经手术或病理证实的剖宫产后切口妊娠 21 例的 MRI 表现，归纳孕囊与切口憩室关系并对其进行分型，总结孕囊与切口憩室关系分型在临床的应用价值。
结果 根据孕囊与切口憩室关系可分为三种类型：1、充满型：切口憩室可见，孕囊呈”C”形嵌入其中、憩室腔消失；2、残余型：切口憩室可见，孕囊呈“鸟嘴”形部分充填其中、憩室腔部分可见；3、掩埋型：切口憩室消失，相应区域为孕囊占据。21 例中，充满型 11 例（占 11/21，52.38%），孕囊附着处子宫肌壁侵润平均深度约 0.3 士 0.23cm，行经宫腔镜下瘢痕妊娠清除术，

术中平均出血量 27 士 19ml；残余型 4 例（4/21，19.05%），孕囊附着处子宫肌壁侵润平均深度约 0.46 士 0.18cm，行可视监测下经宫腔镜子宫瘢痕妊娠清除术，术中平均出血量 225 士 175.59ml；掩埋型 6 例（6/21，28.57%），孕囊所在处子宫肌壁被掩埋，其中 5 例采用经腹腔镜行子宫剖宫产瘢痕部位妊娠病灶切除术、1 例行经腹子宫次全切除术，术中平均出血量 633.33 士 680.2ml。
结论 孕囊与切口憩室的关系在孕囊所在处子宫肌壁侵润深度、病灶清除术中出血量差异有统计学意义；术前 MRI 检查可为临床个体化治疗提供依据。

PU-1148

磁共振成像在胎儿疾病诊断中的应用

罗玉婷
济宁市第一人民医院

目的 通过回顾性分析我院近两年接受 MRI 检查患儿的影像及临床资料，探讨胎儿 MRI 表现与临床病理之间的联系。
方法 收集 2016 年至 2018 年期间，于我院接受胎儿 MRI 检查的 42 例孕妇的影像及临床资料。所有的孕妇均行 1.5T 飞利浦仪器扫描检查， 并且所有病例均由怀疑患有胎儿病变的妇科医生转诊。分析先天性异常胎儿的各项生理情况，使用单因素方差分析和 Student t 检验，得到 95%置信区间。
结果 在接受 MRI 检查的 42 例胎儿中，2 例胎儿（4.8%）健康，20 例胎儿（47.6%）患有中枢神经系统病变，2 例胎儿胸腔病变（4.8%） ，12 例胎儿腹腔病变（28.6%），1 例胎儿四肢病变（2.3%），1 例胎儿脊髓病变（2.3%），2 例胎儿其它相关异常（4.8%）。 两名孕妇（4.8%）发现子宫和胎盘的病变。
结论 在由于胎儿的大小和位置特殊，超声检查不充分的情况下，产前 MRI 提供了非常有用的信息。 MRI 是决定是否继续或停止胎儿进一步发育的关键工具。

PU-1149

MRI 对卵巢颗粒细胞瘤的诊断价值

罗玉婷
济宁市第一人民医院

目的 描述卵巢颗粒细胞瘤（OGCT）的磁共振（MRI）特征，并与卵巢其他性索 - 间质肿瘤（OSCs）鉴别。
方法 回顾性分析 18 例经手术证实的卵巢颗粒细胞瘤患者的 MR 表现。 所有 MR 检查均在一个月内进行。 评估 OGCT 的临床和影像学特征，并与 OSC（对照组）进行比较。
结果 在 18 名患者中，MRI 检测到 20 个卵巢颗粒细胞瘤。 16 个肿瘤表现为实性或大部分为实性（16/20），4 个肿瘤为囊性肿块。 在 1 个 OGCT（1/18）和 11 个 OSC（11/34）中检测到病理性盆腔积液（p = 0.031）。在 T2 加权成像（T2WI）中，大多数 OGCT 显示高信号和混合信号（19/20）; 在 T1 加权成像（T1WI）上，11 个 OGCT（11/20）显示与 T2WI 成像相似的信号。 OGCT 和 OSC 之间的病变信号在 T1WI（p = 0.017）和 T2WI（p = 0.002）上均显著不同。 MRI 在 6 个 OGCT 中检测到肿瘤出血。 在扩散加权成像（DWI）图像上，OGCT 主要表现为高信号（16/20）。

从 OGCT 组 DWI 图像得到的平均表观扩散系数（ADC）值（0.84±0.26×10 -3 mm2 / s）小于对照组（1.22±0.47×10 -3 mm2 / s），差异有统计学意义（p= 0.002）。
结论 MRI 可以在 OGCT 诊断中提供重要信息。 ADC 值可能有助于区分 OGCT 和 OSC。

PU-1150

MRI 对早期宫颈癌深间质浸润的术前评估价值

庞慧婷,董越
辽宁省肿瘤医院

目的 探讨 MR 成像技术对早期宫颈癌深间质浸润情况的术前评估价值。
方法 回顾性分析 206 例经手术证实的早期宫颈癌患者（IB-IIA 期）的临床、病理及影像资料。在横轴位 T2WI、增强 T1WI、DWI 序列和 ADC 图上分别测量肿瘤最大径。在 T2W 序列上评估宫颈癌的深间质浸润（间质浸润深度超过 1/3）状态并与病理结果对比，采用卡方检验评价 MR 判断深间质浸润的准确度。将患者按肿瘤最大径（增强 T1WI 序列）2cm 及 4cm 为界进行分组，采用行×列卡方检验比较各组间深间质浸润状态的差异。再将患者按肿瘤最大径 2cm 及 4cm 进行分层，采用独立样本 t 检验比较各层深间质浸润状态不同组间肿瘤最大径的差异。
结果 共 132 例患者存在深间质浸润，MR 判断深间质浸润的准确度为 80.1%，敏感度为 98.5%，特异度为 47.3%，阳性预测值为 77.0%，阴性预测值为 94.6%；MR 判断深间质浸润与病理结果差异无统计学意义（p>0.05）。肿瘤最大径≤2cm 组中 5 例存在深间质浸润（共 21 例，23.9%）；2-4cm 组中 133 例存在深间质浸润（共 155 例，66.5%）；肿瘤最大径≥4cm 中 24 例存在深间质浸润（共 30 例，80%）。肿瘤最大径≤2cm 组与最大径 2-4cm 组及≥4cm 组深间质浸润状态差异显著（p<0.001），而最大径 2-4cm 组与≥4cm 组间差异不明显（p>0.05）。不同深间质浸润状态组间各序列肿瘤最大径差异不明显（p>0.05）。≤2cm 者，深间质浸润状态不同组间各序列肿瘤最大径差异不明显；2-4cm 者，组间 T2WI 序列及 DWI 序列肿瘤最大径存在差异（p<0.05）；≥4cm 者增强 T1WI 序列肿瘤最大径存在差异（p<0.05）。
结论 MRI 可直接对早期宫颈癌深间质浸润情况进行较准确的评估，肿瘤最大径≤2cm 者发生深间质浸润的概率显著低于＞2cm 者。

PU-1151

MR 对早期宫颈癌淋巴血管间隙受侵的术前评估价值

庞慧婷,董越
辽宁省肿瘤医院

目的 探讨 MR 成像对早期宫颈癌淋巴血管间隙受侵（LVSI）的术前评估价值。
方法 回顾性分析 206 例经手术证实的早期宫颈癌患者（IB-IIA 期）的临床、病理及影像资料。在横轴位 T2WI、增强 T1WI、DWI 序列和 ADC 图上测量肿瘤最大径，在经肿瘤最大层面的 ADC 图上测量最大 ADC 值（ADCmax）、最小 ADC 值(ADCmin)、平均 ADC 值（ADCmean）和最小 ADC 率(ADCmin/ ADCmean)。以手术病理结果为金标准，比较临床及 MR 各参数对 LVSI 的预测价值。首先采用卡方检验评价手术方式对病理 LVSI 状态的影响；按肿瘤最大径（增强 T1WI 序列）2cm 及 4cm 为界分组，采用行×列卡方检验比较各组间 LVSI 状态的差异；采用独立样本 t 检验或秩和检验比较不同 LVSI 状态组间临床（年龄及绝经状态）及 MR（各序列上肿瘤最大径及 ADC 值）各参数间的差异。
结果 共 83 例患者存在 LVSI，手术方式对 LVSI 状态无显著影响（p>0.05）。不同肿瘤大小组间 LVSI 状态差异不明显（p>0.05），肿瘤最大径≤2cm 组中 7 例存在 LVSI（共 21 例，33.3%）；最

大径 2-4cm 组中 68 例存在 LVSI（共 155 例，43.9%）；最大径≥4cm 中 8 例存在 LVSI（共 30 例，26.7%）。在各 MR 序列上，LVSI 阳性组病灶最大径测量值显著高于 LVSI 阴性组（$p<0.001$）。病灶 ADC 值及各临床参数与 LVSI 状态无显著相关性（$p<0.05$）。
结论 MR 上的宫颈癌的病灶越大，存在 LVSI 的机率越大。

PU-1152
小肠 MR 灌注成像对克罗恩病临床疗效评价的初步研究

吴吟晨,曹代荣
福建医科大学附属第一医院

目的 应用小肠 MR 灌注成像技术对克罗恩病（Crohn’s disease, CD）临床疗效进行研究，探讨定量参数对比剂容积转运速率（K^{trans}）及单位体积组织血管外细胞外间隙容积（V_e）与病变局部微血管灌注量及渗透性改变的关系，评价其对 CD 临床疗效评价的应用价值。**方法** 收集 35 例确诊 CD 患者，于临床治疗前及临床治疗 1 期后各行 MRE 检查及 DCE-MRI 扫描，分别计算两次扫描 CD 病灶区 K^{trans} 及 V_e 值，并比较两次扫描定量参数的差异。根据简化内镜评分（Simplified Endoscopic Score for Crohn’s Disease, SES-CD）及 CD 活动指数（Crohn’s Disease Activity Index, CDAI）进行临床疗效评价，对比两次扫描定量参数 K^{trans} 及 V_e 值的统计学差异及其与 SES-CD 评分及 CDAI 评分的相关性。**结果** 35 例 CD 患者中，13 例治疗后病情好转，10 例治疗后无明显改善或进展，12 例治疗后病情进展。CD 病灶区的 K^{trans} 及 V_e 值均随病情进展而增大，随病情好转而缩小，其中以 K^{trans} 值更为显著。定量参数值于病情好转时差异最为显著（P 均＜0.05）。各参数值均与 SES-CD 评分及 CDAI 评分呈高度正相关性（P 均＜0.05）。**结论** 小肠 MR 灌注成像定量参数可反映 CD 病变局部血管灌注量及渗透性改变，对 CD 临床疗效评价有一定价值。

PU-1153
MR 成像对早期宫颈癌深间质浸润的术前评估价值

庞慧婷,董越
辽宁省肿瘤医院

方法 回顾性分析 206 例经手术证实的早期宫颈癌患者（IB-IIA 期）的临床、病理及影像资料。在横轴位 T2WI、增强 T1WI、DWI 序列和 ADC 图上测量肿瘤最大径，在 ADC 图上测量最大 ADC 值（ADCmax）、最小 ADC 值(ADCmin)、平均 ADC 值（ADCmean）和最小 ADC 率(ADCmin/ ADCmean)。在 T2W 序列上评估宫颈癌的深间质浸润（间质浸润深度超过 1/3）状态并与病理结果对比，采用卡方检验评价 MR 判断深间质浸润的准确度。将患者按肿瘤最大径（增强 T1WI 序列）2cm 及 4cm 为界进行分组，采用行×列卡方检验比较各组间深间质浸润状态的差异。采用独立样本 t 检验或秩和检验比较两组间临床（年龄及绝经状态）及 MR（各序列上肿瘤最大径及 ADC 值）各参数的差异。
结果 共 132 例患者存在深间质浸润，MR 判断深间质浸润的准确度为 80.1%，敏感度为 98.5%，特异度为 47.3%，阳性预测值为 77.0%，阴性预测值为 94.6%；MR 判断深间质浸润与病理结果差异无统计学意义（$p>0.05$）。肿瘤最大径≤2cm 组中 5 例存在深间质浸润（共 21 例，23.9%）；2-4cm

组中 133 例存在深间质浸润（共 155 例，66.5%）；肿瘤最大径≥4cm 中 24 例存在深间质浸润（共 30 例，80%）。肿瘤最大径≤2cm 组与最大径 2-4cm 组及≥4cm 组深间质浸润状态差异显著（p<0.001），而最大径 2-4cm 组与≥4cm 组间差异不明显（p>0.05）。不同深间质浸润状态组间各 MR 参数（各序列肿瘤最大径，ADC 值）及临床指标（年龄和绝经状态）差异不明显（p>0.05）。

结论 MRI 可直接对早期宫颈癌深间质浸润情况进行较准确的评估，肿瘤最大径≤2cm 者发生深间质浸润的概率显著低于＞2cm 者。

PU-1154
HR-MRI 在直肠癌术前分期、评估环周切缘的应用价值

郭辉,马贺骥
锦州医学院附属第一医院

摘要：目的 评估高分辨率核磁共振（HR-MRI）在对直肠癌术前分期、直肠系膜筋膜和环周切缘是否受累的应用价值。**方法** 选择 40 例患者，年龄 30-68 岁（平均年龄 52.32±8.21 岁）。所有患者均经病理证实为直肠癌，距肛门外边缘约 15 厘米以内。所有患者均行 HR-MRI 检查，术后分析 MRI 表现与病理及手术结果的相关性。**结果** 肿瘤位于直肠上段 25 例（62.5%），位于直肠中段 7 例（17.5%）和直肠下段 8 例（20%）。MRI 显示 T 分期的敏感性、特异性、PPV 和 NPV 分别为 95.8%、87.5%、92%和 93.3%，（Kappa=0.84，P<0.05）。MRI 评价环周切缘（CRM）的敏感性、特异性、PPV 和 NPV 分别为 90%，96.7%，90%和 96.7%，（Kappa=0.86，P<0.05）。**结论** 应用 HR-MRI 能够对直肠癌术前做出准确地分期。肿瘤是否累及环周切缘是影响手术预后的主要因素，术前行 HR-MRI 检查有助于对患者准确地选择治疗方案。

磁共振 IVIM-DWI 技术在肾脏肿瘤中的应用及进展

刘雪丹
厦门大学附属翔安医院

磁共振的体素内不相干运动(intravoxel incoherent motion imaging，IVIM）技术理论在 1986 年由 LeBihan 等人提出之后，经过三十余年的发展，如今逐渐走进研究者及临床医疗工作者的视野，成为研究的热门技术之一，在肾脏中也不例外，其中，IVIM 技术在肾脏肿瘤中的应用逐渐增多。作为功能性磁共振（Functional magnetic resonance imaging，fMRI）中的一种，通过使用多 b 值进行扫描以及利用双指数模型来分析数据，可以得到三种不同的数据来尽量分别单独反映测量体素内单纯水分子弥散程度及由于毛细血管灌注导致的水分子弥散活动，从而达到更准确的反应感兴趣区的弥散特点及灌注特点的目的。作者对 IVIM 在肾脏肿瘤中的应用及其进展进行综述。

PU-1156
体素内不相干运动扩散加权成像在肝脏疾病中的研究进展

陶云云,杨林
川北医学院附属医院

扩散加权成像（diffusion weighted imaging, DWI）应用单指数模型获得表观扩散系数(apparent diffusion coefficient, ADC)值来反映活性组织的水分子扩散运动。体素内不相干运动扩散加权成像(intravoxel incoherent motion diffusion-weighted imaging, IVIM-DWI)应用双指数模型，能同时定量获得单纯水分子扩散和微循环灌注相关扩散的信息，弥补了传统 DWI 的不足。近年来，关于 IVIM-DWI 在肝脏疾病的应用研究逐渐增多。本文主要综述 IVIM-DWI 在肝纤维化评价、肿瘤性病变的诊断与鉴别诊断、肿瘤病理分级以及肿瘤治疗评价等方面的研究进展。

PU-1157

孕晚期正常胎儿肾脏发育磁共振研究

李芊,吕富荣
重庆医科大学附属第一医院

目的 利用磁共振成像技术观察孕晚期正常胎儿的肾脏大小指标，及其与孕周的相关性。**方法** 选取 28-39 周孕正常单胎胎儿 209 例，通过 MRI 图像测量胎儿肾脏的长径、前后径和宽径,统计计算各参数的均值并分析其与孕周的相关性。**结果** 共收集 209 例，得到正常的胎儿肾脏 418 个：（1）双侧肾脏各径线长度随孕周增大而增长，呈直线相关；（2）双侧肾脏的各径线值对比无显著差异。（3）可近似的通过孕周计算出肾脏各径线长度。**结论** 胎儿肾脏正常发育对于胎儿正常生长过程有着重要意义，磁共振成像能准确测量胎儿肾脏大小，并依据大小初步判断晚期孕龄，为临床发现肾脏异常提供可靠数据。

PU-1158

磁共振扩散加权成像 ADC 值对女性盆腔良恶性肿瘤 鉴别诊断中的应用体会

陆宝刚,谢娓洁
黔南州人民医院

【摘 要】 **目的** 测量肿瘤 ADC 值的大小，对女性盆腔内良恶性肿瘤诊断及鉴别诊断，术前的评估应用价值。**方法** GE1.5T 磁共振扫描仪，8 通道体部线圈，对 215 例女性盆腔肿瘤进行横断位弥散加权成像（DWI b 值=800s/mm^2）,测量 ADC 值的大小，单位：×10^{-3}mm^2/s。**结果** 良性肿瘤的 ADC 值均显示增高，大于或等于 1.4×10^{-3}mm^2/s，恶性肿瘤的 ADC 值均显示增高，小于或等于 1.18×10^{-3}mm^2/s〈p＜0．01〉，ADC 值介于 1.18-1.4×10^{-3}mm^2/s 区间鉴别诊断有困难。**结论** ADC 值能提供数字化较清确判断女盆腔良恶性肿瘤，明显提高对恶性肿瘤的筛查能力。

PU-1159

脾脏错构瘤 1 例

陈锦华
泰州市人民医院

患者，男性，60 岁，体检 B 超发现脾脏占位。

影像学检查：MRI 检查发现脾脏中上极 30*25mm 大小类圆形异常信号灶，T1 加权同相位表现为低信号(图 1)，反相位病灶信号高于周围脾组织(图 2)，T2 抑脂相表现为明显低信号(相对于周围正常脾组织)，内部可见偏心性点状高信号灶(图 3)，增强扫描动脉期瘤灶强化程度低于周围脾组织(图 4)，门静脉期以及延迟期扫描病灶强化程度同周围脾组织相似，内部偏心性点状坏死区不强化(图 5)。

手术结果显示：紧靠膈面包膜下之脾实质内可见灰红色结节状肿瘤性病变，病灶大小约 3.5*4*3cm。手术病理诊断脾脏错构瘤(图 6)，免疫组织化学显示 LCA+、MPO+、CD68+、Mac387+、Ki-67—。

讨论　脾脏错构瘤(Splenic hamartoma)起源于血管周上皮细胞，是少见的间叶源性良性肿瘤，成人多见，女性略多于男性。病理上脾脏错构瘤是由多种组织成分构成的肿块，内部成分多样化，包括扩大的血管腔、淋巴网织样细胞、纤维组织和钙化组织，偶尔可见含铁血黄素沉着，可以分为红髓型和白髓型。病灶通常呈圆形或不规则形，无包膜。

脾脏错构瘤 CT 表现为脾轮廓改变，脾内单发或多发低密度、等密度灶，少数伴有钙化及脂肪组织 。伴有钙化及脂肪组织的肿块为脾脏错构瘤特征性 CT 表现[1] 。但是也有研究认为瘤灶内大多无脂肪组织[2,3]。本例病灶中未见明显脂肪组织。

文献报道脾脏错构瘤在 MRI 上 T1WI 表现为等信号，T2WI 以不均匀高信号多见，但是也可呈现低信号[4]。增强扫描早期病灶弥漫不均匀强化，随着时间推移呈现渐进性强化，并有延迟增强现象。本例 MRI 表现与文献报道[4]大致相似，与文献不同的是该例病灶 T1WI 反相位信号高于周围脾组织，增强扫描动脉期瘤灶强化程度远低于周围脾组织，门静脉期及延迟期扫描病灶渐进性强化，表现为等信号，内部点状偏心性坏死区不强化。

PU-1160
细胞外对比剂和细胞外-肝胆特异性对比剂的对比研究

牟鹏,苏蕾,杨洁,王旭东,段庆红
贵州省肿瘤医院

【摘要】目的　探讨细胞外对比剂（钆喷酸葡胺，GD-DTPA，钆喷酸葡胺，马根维显）和细胞外-肝胆特异性对比剂（钆塞酸二钠，GD-EOB-DTPA,普美显）在上腹部磁共振成像（MRI）上的优缺、异同。**方法**　选取 2018.12-2019.5 期间于我院 3.0T 磁共振(Magnetic resonance lmaging，MR）增强患者 26 名，共计 46 例病灶，入组患者符合下列标准：①患者既往做过磁共振检查且对 GD-DTPA 无不良反应。②既往病史均有慢性肝炎或肝硬化③肝内至少存在一个异常强化灶④临床方面能提供明确的验证结果。各患者先后用 GD-DTPA 和 GD-EOB-DTPA 行动态期增强扫描，间隔时间不超过 3 周。由两名影像医师共同商议，对比分析两种对比剂情况下各病灶的强化方式、形态特征、信号强弱及小病灶的检出。应用两种对比剂下诊断的灵敏度、特异度。计算 ROC 曲线下面积（$p<0.05$），从而比较两种对比剂下诊断的效能。所得数据使用 Medcalc 软件进行处理。**结果**　本次研究下的 46 例病灶，同时行超声造影。经过临床确诊其中 RN4 例，DN6 例，FNH2 例，肝细胞癌 20 例，胆管细胞癌 4 例，转移瘤 9 例，肝海绵状血管瘤 1 例。应用 GD-DTPA 检出 38 例（86.9%，40/46）,应用 GD-EOB-DTPA 检出 44 例（95.6%，44/46）。而对于＜1mm 结节检出，GD-DTPA 为 6 例（50%，6/12），GD-EOB-DTPA 为 10 例（83.3%，10/12）。**结论**　①GD-EOB-DTPA 可以起到动态增强和肝胆特异性增强的双重作用。②GD-EOB-DTPA 具有更高的小病灶（＜1.0cm）检出率。③GD-EOB-DTPA 能提供胆道造影成像。④GD-EOB-DTPA 有助于病灶的鉴别，其诊断能力较 GD-DTPA 更佳。

PU-1161
磁共振 IDEAL-IQ 序列评价辟谷对肝脏脂肪含量的影响

周莹,涂宁,卜丽红,王志华
武汉大学人民医院

目的:探讨磁共振 IDEAL-IQ 序列评价“辟谷”对健康人群肝脏脂肪含量影响的价值，并评估它们之间的关系。
方法:44 例志愿者（经过健康体检筛查）纳入本项研究（年龄范围：22-28 岁）我们分别在辟谷第一天、辟谷 5 天后、恢复正常饮食 1 个月后等三个时间点在武汉大学人民医院 PET 中心为志愿者进行腹部 3.0T 磁共振扫描，并且行 IDEAL-IQ 扫描得到脂肪分数(fat fraction)图像。在脂肪分数图像上测量肝脏的质子密度脂肪分数(PDFF)，记录辟谷前后 44 例受试者的身高、体重并计算身体质量指数（BMI）。
结果 辟谷 5 天后测量部分肝段（V、VI、VII、VIII）的 PDFF 值较辟谷前有所下降，恢复饮食 1 个月后测量部分肝段（V、VI、VII、VIII）的 PDFF 值较辟谷 5 天后有所上升。辟谷 5 天后 PDFF 值与辟谷前相比差异有统计学意义（P 值为 0.039，P 值< 0.05）。恢复饮食一个月后 PDFF 值与辟谷前相比，PDFF 差异无统计学意义(P 值为 0.489，P 值>0.05)。
结 论:磁共振 IDEAL IQ 序列可以量化健康人群的肝脏含量。辟谷可以降低健康人群的肝脏脂肪含量，有重要的临床应用价值。

病例报告：膀胱横纹肌肉瘤 2 例

苏妍
福建医科大学附属第一医院

目的 分析膀胱横纹肌肉瘤的 MR 征象，并探讨 MR 对膀胱横纹肌肉瘤的诊断价值。**方法** 回顾性分析我院经病理证实的膀胱横纹肌肉瘤 2 例，2 例患者术前均行 MR 平扫及增强序列检查，根据患者的临床资料及 MR 表现，并与膀胱镜手术所见对照，回顾性分析膀胱横纹肌肉瘤的特征性 MR 表现及探讨 MR 对该病的诊断价值。**结果** 2 例膀胱横纹肌肉瘤患者均为男性儿童，分别以排尿困难和间断血尿为主要临床症状；1 例位于膀胱各壁，1 例位于膀胱三角区；2 例肿瘤体积均较大、边界清楚；2 例均呈分叶团块状；2 例中 T1WI 分别呈低信号和等-稍高信号，T2WI 均呈高信号，增强扫描均呈明显不均匀强化；2 例膀胱壁均明显增厚，均可见盆腔积液；其中 1 例肿瘤包绕尿道，侵犯前列腺，膀胱及直肠均受压推移；1 例可见双侧腹股沟区及盆腔多发淋巴结，1 例未见淋巴结转移。**结论** 膀胱横纹肌肉瘤的发病年龄及 MR 影像表现较具特征性，MR 检查可用于确定肿瘤的位置、大小、形态，也有助于观察肿瘤与周围邻近结构的关系以及转移。对于肿瘤的分期、治疗方案的制定以及预测预后疗效具有很大的价值。

自由呼吸触发扫描法对于肝脏 T2 加权脂肪抑制横断位图像成像质量的影响

干放
中国科学院大学宁波华美医院

[摘 要] **目的** 探讨提高肝脏 T_2加权脂肪抑制序列横断位图像质量的方法。**方法** 选择 2019 年 2 月-2019 年 3 月共 30 名患者，先后按 3 种不同方案行同参数 T_2加权脂肪抑制序列扫描。方案 A：选用

T_2加权脂肪抑制序列自由呼吸触发扫描；方案 B：选用 T_2加权脂肪抑制序列屏气法扫描；方案 C：选用 T_2加权脂肪抑制 haste 序列屏气法扫描。由 2 名主治医师对肝脏 T_2加权脂肪抑制序列横断位图像进行评价，采用 5 分法对图像信号均匀度、解剖清晰度进行评分。由其中 1 名主治医师计算肝脏 T_2加权脂肪抑制图像的 SNR、CNR。评价 2 名主治医师评分结果的一致性，比较 3 种方案所得图像信号均匀度、解剖清晰度评分及 SNR、CNR 的差异。**结果** 2 名主治医师间图像信号均匀度及解剖清晰度评分的一致性均较好(Kappa=0.737、0.713)。3 种方案间肝脏 T_2加权脂肪抑制图像的信号均匀度、解剖清晰度评分及图像 SNR、CNR 的总体及两两比较差异均有统计学意义(P 均<0.05),方案 A 优于方案 B，方案 B 优于方案 C。**结论** 采用自由呼吸触发扫描法能明显提高肝脏 T_2加权脂肪抑制横断位图像成像质量。

PU-1164
小视野高分辨率 T2WI、T2 压脂序列在肛瘘 诊断及分级中的应用价值

方强[1],刘珊珊[2],赵建设[1]
1.山东大学齐鲁儿童医院/济南市儿童医院
2.山东第一医科大学附属第一医院（山东省千佛山医院）

目的 研究小视野、高分辨 T2WI 及 T2 压脂序列在肛瘘诊断中的应用价值，并初步探讨肛瘘的 HR-MRI 新分型、分级标准的可行性。**方法** 收集自 2016 年 6 月～2018 年 6 月期间于本院拟诊为肛瘘的患者 76 例（男 58 例，女 18 例）进行前瞻性研究，年龄 15～67 岁，平均 36.28 岁。采用 Siemens Magnetom Skyra 3.0T HR-MRI 成像仪对患者进行术前扫描。对比手术结果，运用 SPSS 20.0 统计学软件进行 KAPPA 一致性检验，分析高分辨率磁共振对肛瘘内口、瘘道的显示结果与手术结果的符合率，计算吻合系数。以现代盆底、肛周解剖学为基础，结合中华中医药学会肛肠分会肛瘘分类办法、Parks 肛瘘分型原则，初步探讨新的 FIA 高分辨率 MRI 分级标准的可行性。**结果** 70 例（已去除 6 例不符合要求患者）患者中 MRI 检查共检出 102 条瘘管，102 个内口，56 处肛周脓肿，其中 1 条瘘管者 44 例，2 条瘘管者 20 例，3 条瘘管者 6 例；手术结果为，1 条瘘管者 42 例，2 条瘘管者 20 例，3 条瘘管者 8 例；MRI 对肛瘘瘘管的诊断结果与手术结果的吻合系数为 0.823＞0.75，P＜0.001。MRI 共诊断出 1 个内口者 43 例，2 个内口者 22 例，3 个内口者 5 例；手术结果为，1 个内口者 42 例，2 个内口者 21 例，3 个内口者 7 例；MRI 对肛瘘内口的诊断结果与手术结果的吻合系数为 0.845＞0.75，P＜0.001。术后随访患者复发情况，初步判断其复发率与患者病情复杂程度呈正相关，从而一定程度上肯定了本研究提出的 FIA 新分级标准的可行性。**结论** 小视野、高分辨 T2WI 及 T2 压脂序列在肛瘘诊断中更具优势，尤其是内口与瘘管的数目确定，准确率更高。另一方面，本研究提出的新的肛瘘分型、分级标准，可初步判断肛瘘患者病情的复杂程度及预后情况，亦可为临床医生提供更好的手术参考和指导。

The diagnostic value of conventional MRI sequence in primary sclerosing cholangitis liver lesions

Xinmeng Hou,Erhu Jin
Beijing Friendship Hospital , Capital Medical University

Objective To analyze the routine MRI manifestations of liver lesions in patients with primary sclerosing cholangitis (PSC), so as to provide valuable information for clinical diagnosis and improve the level of disease diagnosis.
Methods Clinical and imaging data of 51 patients diagnosed with PSC in our hospital were retrospectively analyzed, including 29 females and 22 males. Two physicians read the images together, reached a consensus and then analyzed the signs and recorded the data. Morphological changes in the liver, signal changes in the liver parenchyma, portal hypertension (portal vein trunk inner diameter ≥1.4cm), intrahepatic portal venous branch edema, and signs of periportal lymph node enlargement (lymph node short diameter ≥1.0cm) were observed on cross-sectional MR images. The control group selected 40 cases of non-psc cirrhosis, observed the above signs, and compared with the PSC group.
Results Among 51 patients with PSC, 30 patients (58.82%) had abnormal hepatic lobe proportion.Right lobe atrophy was found in 14 cases (27.45%).Left lobe atrophy occurred in 6 cases (11.76%).There were 11 cases (21.57%) with left lobe compensatory increase and 15 cases (29.41%) with cauda lobe compensatory increase. Signal increase in liver parenchyma in T2WI was observed in 15 cases (29.41%).Portal hypertension was found in 21 cases (41.18%).28 cases (54.90) with hilar and periportal lymphadenopathy.Edema around the branches of intrahepatic portal vein was observed in 22 cases (43.13%).The incidence of cauda lobe enlargement and increased hepatic parenchymal signal on T2WI was higher than that of the control group, but the difference was not statistically significant.The incidence of periportal lymph node enlargement was higher than that of the control group, and the difference was statistically significant ($P < 0.05$).The incidence of portal hypertension was lower than that of the control group, and the difference was statistically significant ($P < 0.05$).
Conclusion Routine cross-sectional MRI can be used to observe liver lesions in PSC as a supplement to MRCP to observe bile ducts.Among many signs of liver lesions in PSC, compensatory enlargement in cauda lobe, increased signal in hepatic parenchyma on T2WI and enlarged lymph nodes around portal vein are considered to be characteristic.

磁化传递成像技术在评价健康人肾脏生理特征的初步应用

陈静,张喜荣,韩冬,杨祺,于楠,于勇
陕西中医药大学附属医院

目的 探讨磁共振磁化传递成像技术（Magnetization transfer，MT）常用指标磁化传递率（Magnetization transfer ratio，MTR）与正常健康人肾脏生理特征的相关关系。
方法 纳入健康志愿者 35 例，记录所有被试的性别、年龄、身体质量指数（Body Mass Index，BMI）、腰臀比（Waist-to-Hip Ratio,WHR）、糖尿病家族史和高血压家族史。采用西门子 Skyra 3.0T 磁共振扫描仪，体部 18 通道相控阵表面线圈对所有被试进行双肾磁共振 MT 扫描。MT 扫描采用 3D 扰相梯度回波序列，该序列扫描 2 次，第一次为不添加 MT 射频脉冲信号（MTOFF），第二次为添加 MT 射频脉冲信号（MTON）。根据公式 MTR＝（MTOFF－MTON）×100／MTOFF 计算出 MTR，以百分数表示。在双肾上极、肾门、下极肾皮髓质绘制多个感兴趣区，测量相应磁化传递率并取平均值记录。运用皮尔逊相关分析评价年龄、BMI、WHR、血压与 MTR 值的相关关系；两样本 t 检验比较不同性别、是否存在高血压、糖尿病家族史组间 MTR 值的差异。

结果 随着收缩压的升高，正常健康人肾皮质 MTR 值明显升高（P<0.05）。尽管没有统计学差异，但正常健康人肾皮髓质 MTR 值均随年龄、BMI、WHR 和舒张压的增加而升高（P>0.05）；肾髓质的 MTR 值随收缩压的升高而降低（P>0.05）；有糖尿病家族史的被试 MTR 值高于无糖尿病家族史的被试（P>0.05）。

结论 肾皮髓质 MTR 值与正常人的某些生理特征显著相关，MT 能够反映肾脏微观结构的变化，为肾脏的临床变化提供更科学的依据。

恶性蝾螈瘤的影像学表现

李芳婷,方向军
南华大学附属第二医院(原:衡阳医学院第二附属医院)

目的 总结恶性蝾螈瘤 (malignant triton tumor，MTT)的临床及影像表现，提高临床放射科医师对该病的认识。**方法** 回顾性分析 2000-2018 年我院经病理证实的 5 例患者的临床及影像学资料。所有患者均行 CT 和（或）MRI 检查，分析病变的位置，形态，大小，密度/信号，边界，伴随征象，强化方式。**结果** 男性 4 例，女性 1 例，中位年龄 25（1-71）岁；病变分别位于腹腔、盆腔、骶椎、腹股沟区及上颌窦。位置表浅表现为形态规则，密度和信号均匀，边界清晰；位置较深时呈分叶状，密度和信号不均，坏死常见，实质部分不均匀强化，供血血管多见，肿块边界不清，周围脏器、组织受侵，邻近骨质破坏，尤其是 T2WI 表现为高信号，信号不均匀，肿块内见环形或线性低信号分割影。**结论** MTT 影像学表现具有一定特征性，结合 CT 与 MRI 表现可提高正确诊断率，但最终仍需要靠组织病理和免疫组化确诊。

PU-1168

MRI 定量评估非酒精性脂肪肝与冠状动脉钙化相关性初步研究

赵红星[1]，彭秀华[1],胡锦良[1],钱宇峰[1]
1.湖州市第一人民医院
2.吴兴区人民医院

目的 探讨应用 MRI 定量非对称回波最小二乘估算法迭代水脂分离（IDEAL-IQ）技术定量评估非酒精性脂肪肝（NAFLD）与冠状动脉钙化（CAC）相关性。 **方法** 收集我院 2016 年 12 月-2018 年 12 月非酒精性脂肪肝患者 47 例及 40 例健康志愿者作为对照组，两组均行常规肝脏超声、CT 检查、上腹部 MR 常规及 IDEAL-IQ 序列扫描、冠状动脉多层螺旋 CT 扫描及血生化检查，NAFLD 组中 22 例患者行细针穿刺活检术明确诊断。IDEAL-IQ 计算脂肪含量（FF），冠状动脉 CTA 计算冠状动脉钙化积分（CACS），比较 FF 与 CACS 是否存在相关性。

结果 NAFLD 组 FF 显著高于对照组，（P＜0.001）；NAFLD 组 CACS 显著高于对照组，（P＜0.001）；NAFLD 组 FF 与 CACS 具有相关性，且呈正相关（R^2=0.5743，P<0.05）。 **结论** 临床工作中除对非酒精性脂肪肝患者进行针对性诊治，还应考虑到其发生冠脉钙化的风险，及时筛查患者的冠状动脉情况，这对 CHD 的早期预防至关重要。

PU-1169

MRI 联合超声在异常双胎妊娠中的应用价值

徐生芳
甘肃省妇幼保健院

目的 探讨 MRI 联合超声在异常双胎妊娠中的应用价值。**方法** 回顾性分析经我院产前超声和 MRI 联合检出的 40 例异常双胎妊娠，并于分娩、引产或手术后证实，回顾性分析产前 MRI 影像图象和检查结果。**结果** 40 例双胎中，其中双绒双羊 12 例，单绒双羊有 18 例，单绒单羊 10 例。胎儿检出异常有 1 胎胎死宫内、另一胎正常有 10 例；1 胎胎死宫内、另一胎儿生发基质出血有 4 例；1 胎正常，其余胎儿合并畸形共有 26 例，其中合并一胎儿侧脑室增宽有 22 例、后颅窝池扩张 1 例、胼胝体缺如有 2 例、透明隔缺如合并胼胝体缺如有 1 例。MRI 检出母体胎盘异常有完全性前置胎盘 6 例、部分性前置胎盘 1 例、胎盘植入 2 例；母体并发症有 1 例合并母体子宫平滑肌瘤；1 例母体内脏转位。母体并发症有一侧附件区囊肿 3 例，均为黄体囊肿；1 例并发有右侧卵巢粘液性囊腺瘤和左侧卵巢成熟性畸胎瘤。**结论** 产前 MRI 联合超声能准确的检出异常双胎妊娠以及其他合并症，对尽早的指导临床干预并采取有效措施、减少不良妊娠结局具有重要的意义。

胎盘植入的磁共振检查技术的应用

布璟[1,2],谢兴佳[1,2],陈顺新[1,2],白艳[1,2]
1.湖北医药学院附属随州医院
2.湖北省随州市中心医院

目的 随着剖宫产数量的增加，胎盘植入发病率明显升高，严重威胁胎儿和母体的生命健康。磁共振对软组织分辨率高，能多平面、多参数、多方位成像，视野大，能清楚显示整个胎盘而不受其位置影响，对发生于宫底、宫角及子宫后壁的胎盘植入有高度敏感性，本研究主要探讨胎盘植入的磁共振检查技术，为临床提供更加明确的诊断。

方法 选择本院 2018 年 5 月-2019 年 3 月超声检查怀疑胎盘植入的孕妇，运用 GE1.5T 磁共振的快速成像稳态进动平衡序列(FIESTA)和单次激发快速自旋回波序列(SSFSE)进行扫描，对其诊断结果进行分类总结。

结果 磁共振的快速成像稳态进动平衡序列(FIESTA)和单次激发快速自旋回波序列(SSFSE)磁共振成像的检查效果图像质量满意，相对优于超声检查，不仅时间短，而且可以多平面，多方位观察其胎盘与子宫的关系，观察胎盘是否侵入或穿透子宫肌层所致的一种异常胎盘种植状态。

结论 磁共振的快速成像稳态进动平衡序列(FIESTA)和单次激发快速自旋回波序列(SSFSE)能很好的显示胎盘植入情况，能清楚的显示整个胎盘而不受其位置影响，软组织分辨率高，对发生于宫底、宫角及子宫后壁的胎盘植入有高度敏感性，为临床提供了更加丰富的信息，是超声检查的有利补充，同时也减少了因超声检查医生水平高低不一原因造成的各种误诊、漏诊，随着磁共振检查技术的广泛应用，磁共振成像将会在临床医学中发挥更为重要的作用。

磁共振定量测量腹部脂肪评估子宫内膜癌生物特性的应用价值

赵佳鑫[1,2],蒋璟璇[2],吴献华[2]
1.如东县人民医院
2.南通大学附属医院

目的 探讨通过磁共振测量腹部脂肪量及脂肪分布评估子宫内膜癌生物特征的应用价值。**方法** 回顾性收集经手术及病理确诊子宫内膜癌患者 104 例和正常患者 53 例，获取生物特征信息包括病理分级、分期、脉管浸润和 Ki-67 表达，通过 MRI 测量入组患者腹部脂肪参数包括皮下脂肪厚度，外脂肪面积、内脂肪面积和总脂肪面积。采用 Mann-Whitney U 检验比较各组腹部脂肪参数，各腹部脂肪参数与 Ki-67 阳性表达率的相关性采用 Spearman 方法评价。**结果** 子宫内膜癌患者各腹部脂肪参数均明显高于正常患者（P<0.001）；高分化子宫内膜癌患者腹部外脂肪和总脂肪面积明显高于低分化组（P<0.05）；I 期子宫内膜癌患者各腹部脂肪参数均明显高于 II 和 III 期患者（P<0.05），IIA 和 IIB 期患者外脂肪和总脂肪面积明显高于 III 期患者（P<0.05）；无脉管浸润患者腹部外脂肪面积明显高于有脉管浸润患者（P<0.05）。Ki-67 的表达与腹部皮下脂肪厚度、外脂肪面积和总脂肪面积呈负相关性（P<0.05）。**结论** 利用磁共振定量测量腹部脂肪可用于评估子宫内膜癌生物特征，其中外脂肪面积参数意义最大，腹部脂肪含量较高者更易罹患子宫内膜癌，但其分化程度和侵犯性较低。

Effect of Bandwidth on Abdominal Imaging Quality with 3.0T MR

Yanfang Dai[1,2],Miao Zhang[1,2],Mo Zhang[1,2],Kuncheng Li[1,2],Jie Lu[1,2,3]
1.Department of Radiology, Xuanwu Hospital, Capital Medical University，Beijing, China
2.Beijing Key Laboratory of Magnetic Resonance Imaging and Brain Informatics，Beijing, China
3.Department of Nuclear Medicine, Xuanwu Hospital, Capital Medical University，Beijing, China

Objective: To study the effect of imaging quality in abdomenbybandwidthadjustmentin 3.0T.Methods: A total of 38 patientswereenrolled from December 2018 to March 2019in this study. For each subject, the protocol of T_2 fast spin echo sequence with fat suppression in axial scan was repeated,acquiring two groups of images with conventional bandwidthandhigh-bandwidth.Two experienced doctors blinded to the parameter of bandwidth assigned a respiratory motion-related artifactscore[1 (nondiagnostic images) to 5 (no motion)] fortwo groups of images. Signal intensity-to-noise ratio (SNR) were evaluated inliver.Results: The SNR of the conventional bandwidth group were higher than that of high-bandwidth group (P<0.001) whereas doctors scored overall image quality the former was inferior to the latter (P<0.001).The Median, Mean Absolute Deviation,Coefficient of Dispersion,Coefficient of Variation of the SNR and the image overall quality score of twogroups were 87.40% and 115.50%, 0.12 and 0.16, 0.13 and 0.14, 19.50%and 17.80%, respectively.Conclusion: The imaging quality of T_2 fast spin echo sequence imaging of abdomen in 3.0T could be improved by increased the bandwidth of acquisition. Although this methodcan reduction of SNR of images.

妊娠期合并乙状结肠癌病例分析

陈小芳,许崇永
温州医科大学附属第二医院

妊娠期合并结肠癌罕见，大约 1/13000 万孕妇（约 0.008%），因其早期症状与孕期胃肠道表现类似，故早期诊断困难，误诊率和病死率较高，严重威胁胎儿及产妇的生命健康。本文报告 1 例 23 岁孕妇合并乙状结肠癌，结合文献分析其临床及影像学特点，提高对本病的认识。

PU-1174

ADC 值在早期宫颈癌的诊断价值及病理研究

张晓苗,董越
辽宁省肿瘤医院

目的 分析不同病理类型早期宫颈癌 ADC 值的差异，探讨 ADC 在早期宫颈癌病理分类上的临床应用。 **方法** 选取 131 例经病理及临床证实为早期宫颈癌的患者，其中鳞癌 100 例，腺癌 17 例，腺鳞癌 14 例；其中鳞癌组低分化 4 例，中分化 87 例，高分化 7 例；所有患者治疗前行 3.0T MRI 常规扫描检查及 DWI 检查。分别测量患者病灶的 ADC 值，分析不同病理分型及不同分化程度下的早期宫颈癌 ADC 的特征。**结果** 早期宫颈鳞癌与腺癌 ADC 均值、最小值之间差异有统计学意义（p=0.000，p=0.002），早期宫颈腺癌与腺鳞癌 ADC 均值、最小值之间差异有统计学意义（p=0.003，p=0.003）。早期宫颈鳞癌与腺鳞癌 ADC 均值及最小值之间差异无统计学意义；早期宫颈癌三种病理类型 ADC 最大值之间两两比较均无统计学差异；分化程度不同早期宫颈癌之间 ADC 平均值之间两两比较差异无统计学意义。**结论** ADC 值在早期宫颈癌的不同病理类型上具有一定的区分作用，但在不同的分化程度上诊断价值有限。

PU-1175

Diffusion-weighted imaging (DWI) versus dynamic contrast-enhanced MRI (DCE-MRI) for detecting cervical invasion in endometrial cancer: a systematic review and meta-analysis

Qiu Bi,Kunhua Wu
the First People`s Hospital of Yunnan Province

Objective: To compare the diagnostic accuracy of diffusion-weighted imaging (DWI) and dynamic contrast-enhanced MRI (DCE-MRI) for detecting cervical invasion in endometrial carcinoma.
Methods: An extensive search of articles about DWI or DCE-MRI in assessing cervical invasion in endometrial cancer was performed in PubMed, Embase, Cochrane Library (CENTRAL), Web of Science, and Clinical trails from January 2000 to June 2019. Quality was assessed using Quality Assessment of Diagnostic Accuracy Studies-2 (QUADAS-2). Pooled estimation data were obtained by statistical analysis.
Results: Nine studies using DWI and eight studies using DCE-MRI to assess cervical invasion were considered. Significant heterogeneity was found only for sensitivity, both in DCE-MRI and DWI (I^2=67.8 % and 66.4 %). For evaluating any cervical invasion, the pooled sensitivity and specifcity were 0.58 (95% CI: 0.49-0.68) and 0.96 (95% CI: 0.94-0.97) for DWI, and the pooled sensitivity and specifcity were 0.47 (95% CI: 0.37-0.57) and 0.95 (95% CI: 0.92-

0.97) for DCE-MRI. For assessing cervical stromal invasion, the pooled sensitivity and specifcity were 0.52 (95% CI: 0.41-0.60) and 0.95 (95% CI: 0.93-0.97) for DWI, and the pooled sensitivity and specifcity were 0.46 (95% CI: 0.45-0.67) and 0.95 (95% CI: 0.93-0.97) for DCE-MRI. The pooled sensitivity of DWI was significantly higher than DCE-MRI for evaluating any cervical invasion (P<0.05). There was no significant difference between DWI and DCE -MRI for assessing cervical stromal invasion (P>0.05). **Conclusion:** DWI showed a better sensitivity than DCE-MRI for detecting any cervical invasion in patients with endometrial cancer.

PU-1176

高分辨率 MRI、DWI 序列对直肠癌环周切缘及系膜血管受侵评估的价值

张茜,张禹,朱友志
中国人民解放军联勤保障部队第 901 医院

目的 评价高分辨率 MRI（HR-MRI）及弥散加权成像（DWI）序列预测直肠癌是否浸润环周切缘及系膜血管的评估价值。**方法** 回顾性分析 45 例直肠癌患者的磁共振成像（MRI）资料，应用 MRI 常规序列及 HR-MRI、DWI 序列观察直肠系膜及系膜内血管的信号特点，并预测环周切缘及系膜血管是否受累，判断结果分为：肯定无侵犯、可疑无侵犯、难以确定、可疑侵犯、肯定侵犯 5 个等级，与病理结果进行比较，算出两种方法的 ROC 曲线下面积。**结果** 经 ROC 曲线分析，MRI 常规序列判断 CRM 是否受侵（曲线下面积为 0.696，P<0.05），常规序列结合 HR-MRI 及 DWI 序列判断 CRM 是否受侵（曲线下面积为 0.946，P<0.05），MRI 常规序列判断 EMVI（曲线下面积为 0.730，P<0.05），常规序列结合 HR-MRI 及 DWI 序列判断 EMVI（曲线下面积为 0.815，P<0.05），虽然常规 MRI 也可作为判断直肠系膜是否受侵的有效指标，但 HR-MRI 结合 DWI 序列曲线下面积更大，诊断效能更高。**结论** HR-MRI 联合 DWI 序列比单纯使用常规序列能够更准确地判断环周切缘及系膜血管是否受累。

PU-1177

The ability of apparent diffusion coefficient (ADC) values in differentiating the grade of endometrial cancer: a systematic review and meta-analysis

Qiu Bi,Kunhua Wu
the First People`s Hospital of Yunnan Province

Objective: To explore the value of apparent diffusion coefficient (ADC) values for differentiating the histological grade of endometrial cancer.
Methods: The PubMed, Embase, Cochrane Library (CENTRAL), Web of Science, and Clinical trails were searched for studies that used ADC values (b=1000 s/mm^2) to differentiate the grade of endometrial cancer. We assessed pooled data by using a random-effects model.
Results: Eleven studies were included in this meta-analysis. The pooled mean ADC values were 0.87×10^{-3} mm^2/s, 0.78×10^{-3} mm^2/s, and 0.71×10^{-3} mm^2/s for grades 1,

2 and 3, respectively. Significant statistical differences of mean ADC values were observed for the three grades (P<0.05). But there was no significant difference between low-risk grade (G1+G2) and high-risk grade (G3) (P>0.005). The pooled minimum ADC values were 0.67×10^{-3} mm^2/s, 0.61×10^{-3} mm^2/s, and 0.51×10^{-3} mm^2/s for grades 1, 2 and 3, respectively. There were significant differences of minimum ADC values among these three grades (P<0.05). The minimum ADC values were significantly lower for patients with high-risk grade than for those with low-risk grade (P<0.05). **Conclusions:** The mean ADC values and the minimum ADC values were helpful for detecting the grade of endometrial cancer. The minimum ADC values can distinguish low-risk grade from high-risk grade.

PU-1178

MRI 常规序列结合 DWI 对于卵巢良恶性囊腺类肿瘤鉴别诊断的价值

龚梅林
中国科学院大学重庆医院（重庆市你人民医院）

目的 探讨 MRI 常规序列结合 DWI 对于卵巢良恶性囊腺类肿瘤鉴别诊断的价值
方法 回顾性分析 2016 年 5 月至 2017-12 月经手术病理证实的卵巢囊腺类肿瘤患者的盆腔 MRI 图像，共 30 人。纳入标准为：年龄>20 周岁、且<60 周岁；含囊性成分病灶囊壁厚度＞３ｍｍ。其中双侧卵巢患病 13 人，单侧卵巢患病 17 人，共发现病灶 43 例。分析肿瘤ＭＲＩ表现，检测 ROI 实质部分的 ADC 值，并行统计学分析。
结果 囊腺瘤囊壁厚度≤１０ｍｍ，实性成分较少；交界性囊腺瘤囊壁厚薄不均，囊 壁 布 满 细 小 乳头状结节；囊腺癌壁较厚，实性成分较多且不规则。卵巢囊腺瘤ＡＤＣ值显著高于卵巢囊腺癌（Ｐ＜0.01），而浆液性囊腺瘤与黏液性囊腺瘤、浆液性囊腺癌与黏液性囊腺癌间 ＡＤＣ值差异无统计学意义（Ｐ＞0.05）。
结论 常规 MRI 结合 DWI 对于卵巢良恶性囊腺类肿瘤的鉴别具有较高价值。

PU-1179

评估基于 3.0 T 多参数磁共振成像的 PI-RADS v2 评分联合前列腺特异性抗原密度对早期有临床意义前列腺癌的诊断价值

周理乾
陕西省人民医院

[目的]：评估第 2 版前列腺影像报告与数据系统（PI-RADS v2）联合前列腺特异性抗原密度（PSAD），对早期有临床意义前列腺癌（CSPCa）的诊断价值。
[方法]：采取回顾性分析方法，以穿刺病理为金标准，先通二元 logistics 回归分析确立 CSPCa 的独立预测指标，后建立联合预测模型 Logit（P），应用 ROC 曲线分析其诊断效能。
[结果]：纳入病例共 102 例，病理证实 71 例非 CSPCa 和 31 例 CSPCa。Logistic 回归分析显示 PI-RADS v2 评分和 PSAD 为独立预测指标；建立联合预测模型为：Logit（P）=－5.27+1.34×PI-RADS v2 评分+2.1×PSAD。预测模型 Logit（P）ROC 曲线下面积为 0.84（95%CI 0.78～0.89），高于

PI-RADS v2 评分 0.78（95% 0.73～0.85）、PSAD 的 0.75（95% 0.69～0.81），差异有统计学意义（P＜0.05）。
[结论]：PI-RADS v2 评分联合 PSAD 对可提高对早期 CSPCa 的预测效能，

比较平衡式自由稳态进动序列与单激发快速自旋回波序列在 3.0T 磁共振胎盘检查的应用效果

高凯
山西省儿童医院/山西省妇幼保健院

【摘要】目的 探讨 B-TFE 序列与 SSFSE 序列在 3.0T 磁共振胎盘扫描的应用效果。**方法** 对 30 例结合病史、临床表现及彩超诊断为胎盘植入或前置胎盘等胎盘相关疾病的孕妇行 B-TFE 序列与 SSFSE 序列扫描，由高年资医师对序列进行对比评分，结合 ROC 曲线对两种序列进行评价。**结果**：在 3.0T 磁共振中，B-TFE 序列由于组织的 T1 延迟，T2 缩短，导致该序列的权重 T2/T1 降低，导致信号及对比度不如在 1.5T 磁共振的效果。同时 B-TFE 序列为梯度回波序列，对磁化率伪影敏感，3.0T 比 1.5T 更敏感，在胎盘检查方面产生较大的磁化率伪影，而 SSFSE 序列没有相关问题，在 3.0T 磁共振胎盘检查时有更好效果。**结论** 经过我们对 30 例患者扫描图像的对比研究，SSFSE 序列在病变显示（部位、形态、对比度、组织分辨率、信号均匀度及去伪影等方面）优于 B-TFE 序列。

PU-1181
Research on Multi-mode Magnetic Resonance for Liver Parenchyma Around Tumors of Primary Hepatocellular Carcinoma

Fei Jia,Dongming Han
First Affiliated Hospital of Xin Xiang Medical University

Objective: To compare and analyze MR diffusion-weighted imaging (DWI) and amide proton transfer imaging (APT) in estimating the microenvironmental change of liver parenchyma around tumors of primary hepatocellular carcinoma. **Methods**: A retrospective analysis was made on 35 patients diagnosed with hepatocellular carcinoma via clinical and imaging examinations and 28 healthy volunteers as control group. Apparent diffusion coefficient (ADC), asymmetric magnetization transfer ratio (MTRasym) of hepatocellular carcinoma tissues, cancer proximal hepatocellular parenchyma (0~2 cm), cancer distal hepatocellular parenchyma (2~5 cm) and normal hepatic parenchyma were measured and analyzed. **Results**: MTRasym value was decreased with the increased distance to hepatocellular carcinoma tissues while ADC were increased with the increased distance. MTRasym was in a weak negative correlation with ADC (r=-0.368, p<0.01). APT combining with ADC had the highest estimated value in differential diagnosis of hepatocellular carcinoma tissues and normal hepatic tissues (AUC =0.914, p<0.01). **Conclusion**: APT quantitative parameter can estimate the malignant degree of liver parenchyma around

tumors of primary hepatocellular carcinoma more accurately compared with conventional DWI.

PU-1182

Can T2 mapping at magnetic resonance imaging differentiate endometrial cancer?

Han Xu,Jie Zhang
shangdong provincial hospital

Objectives
To investigate whether the T2 value obtained from magnetic resonance imaging (MRI) can differentiate endometrial cancer (ECA) from benign endometrial lesions (BEL) and is associated with the aggressiveness of ECA.
Materials and Methods
The institutional review board approved this study. Six-three patients (ECA, 51; BEL, 12) and 23 normal volunteers were included in this study. A multiecho spin-echo sequence was performed with echo time (ms) of 20, 40, 60, 80 and 100. The mean T2 value of ECA, BEL and normal endometrium (NE) was compared. The mean T2 value of type I and type II ECA was compared. The receiver operating characteristic (ROC) curve analyses and Youden index were used to determine an optimal T2 value threshold to distinguish between type I and type II ECA. The relationship between mean T2 value of ECA and pathological characteristics of tumors, including tumor grade and stage, was analyzed.
Results
The mean T2 value of ECA, BEL and NE was 109.6±30.2, 162.7±54.5 and 213.1±62.3 ($P<0.001$), respectively. The mean T2 value of type II ECA (148.0±47.0) was higher than that of type I ECA (100.2±13.6) ($P=0.011$). The area under the curve (AUC) was 0.959. When the threshold was 119.3, the sensitivity and specificity to differentiate between type I and type II ECA were 1 and 0.902, respectively. There were no significant differences among different stages ($P=0.091$) and among different grades ($P=0.686$).
Conclusion
The mean T2 value could differentiate ECA, BEL and NE. It could distinguish between type I and type II ECA. But it could not differentiate different stages of ECA or different grades of ECA.

MR 三维容积多期增强对乏脂型肝 EAML 的诊断价值

俞顺,蔡佳玲,王才虹,林敏贵,马明平,包强
福建省立医院

【摘要】目的 探讨 MR 三维容积多期增强显示病灶供血动脉和早期引流静脉及中心血管对乏脂型肝 EAML 的诊断价值。**方法** 回顾性分析 22 例经病理及免疫组织化学证实的肝 EAML 患者资料及

MRI 影像特点，重点观察 MR 三维容积多期增强检查显示的病灶供血动脉、引流静脉及中心血管。**结果** 22 例肝 EAML 中 17 例病灶同时可见供血动脉及引流静脉（17/22），2 例仅见供血动脉（2/22），1 例仅见引流静脉（1/22），供血动脉发自肝动脉分支（9/19）、门脉分支（7/19）、肝动脉及门脉分支（3/19），引流静脉多于动脉早期或晚期提早显影，汇入下腔静脉（9/18）或肝静脉（9/18)。10 例病例于动脉期见病灶内部及周边的扭曲血管（10/22）。22 例中 15 例病灶内不含脂肪（15/22），7 例仅含少量脂肪（7/22），6 例病灶内合并出血、坏死（6/22），8 例见假包膜征（8/22）。4 例行肝细胞特异性造影剂增强检查的病灶在肝胆期均呈低信号（4/4）。**结论** MR 三维容积多期增强检查有助于显示肝 EAML 病灶的供血动脉、早期引流静脉及中心血管，对乏脂型肝 EAML 有较高的诊断价值。

PU-1184
磁共振弥散加权成像联合动态增强扫描诊断富细胞、富血供子宫肌瘤的应用价值

俞顺,黄铙欣,刘凯丽,林敏贵,马明平,包强
福建省立医院

【摘要】目的 探讨磁共振弥散加权成像联合动态增强扫描诊断富细胞、富血供子宫肌瘤的应用价值。**方法** 回顾性分析 102 例经病理及影像表现证实为富细胞、富血供子宫肌瘤患者的影像指标，归纳总结该类型肌瘤特征。**结果** 102 例患者共发现富细胞、富血供子宫肌瘤 138 个。其中黏膜下 3 例、肌层 70 例、浆膜下 14 例、阔韧带 4 例，多发 11 例。位于宫底 17 例，宫体 63 例，宫颈 1 例，阴道 1 例，多发 20 例。肌瘤大小在 1cm-4cm 的 50 个，4cm-8cm 的 69 个，大于 8cm 的 19 个。病灶在 T2WI 上呈等或高信号，DWI 上呈高信号，平均 ADC 值低于周围正常子宫肌层，增强扫描明显强化，多数可见粗大供血动脉。**结论** DWI、ADC 值联合动态对比增强扫描对诊断富细胞、富血供子宫肌瘤具有重要价值。

PU-1185
产前 MRI 在胎儿卵巢囊肿中的诊断价值

徐生芳
甘肃省妇幼保健院

目的 探讨产前 MRI 在胎儿卵巢囊肿中的诊断价值。方法 回顾性分析我院产前诊断及手术确诊的 40 例胎儿卵巢囊肿的产前、产后 MRI 影像特征。结果 胎儿卵巢囊肿发生于单侧有 35 例（其中左侧 24 例，右侧 11 例），病灶均位于膀胱与一侧肾脏之间。2 例为双侧，病灶位于膀胱两侧。病灶形态均为类圆形或椭圆形，边界光滑，囊壁较薄。肿块自行消退的有 20 例。8 例患儿因囊肿最大经线超过 4cm，且信号混杂，行腹腔镜探查手术，术后病理结果显示 7 例为卵巢单纯性囊肿伴出血，1 例卵巢囊肿合并蒂扭转。MRI 显示为病灶内部信号均匀者 32 例，内部信号混杂者 8 例。结论 胎儿卵巢囊肿 MRI 表现具有一定的影像学特征，可为产后治疗及评估预后提供重要依据。

PU-1186
剖宫产后瘢痕妊娠的磁共振表征与术前诊断价值

邓明,徐海波,胡金香
武汉大学中南医院

目的 探讨子宫切口瘢痕妊娠的 MRI 表征及术前诊断价值；方法 回顾性分析 45 例切口瘢痕妊娠患者的临床及 MRI 资料，包括 HCG、子宫瘢痕信号特征、测量瘢痕厚度、判断孕囊类型、孕囊大小、孕囊与瘢痕之间关系。采用 2 名不同年资医师共同观察评价瘢痕、孕囊及子宫的 MRI 特征，包括胎盘植入程度、增强强化方式及病理表现。结果 45 例患者资料，包括前置胎盘 5 例，40 例 CSP，术前 MRI 肯定性诊断 38 例，正确率 95%。40 例 CSP 显示妊娠囊，内生型 28 例、外生型 12 例；囊状孕囊共 25 例，孕囊 MRI 呈椭圆形囊状信号，包块型孕囊 15 例，表现为子宫下段宫腔内不规则包块影。外生型孕囊附着子宫前壁。测量瘢痕厚度最薄厚度 1.2mm，最大厚度 11mm，平均厚度 3.08mm；孕囊大小，最小 9mm×13mm，最大 50mm×86mm，平均为 23.55mm×32.82mm。结论 术前诊断孕囊类型、大小、瘢痕位置、厚度及胎盘附着于子宫瘢痕并增强 MRI 明显强化是诊断 CSP 的可靠标准并具有明显术前诊断价值。

PU-1187
MRI 结合腔内充盈耦合剂对直肠癌术前评估的应用价值

宋军伟
淄博矿业集团有限责任公司中心医院

目的 探讨直肠 MRI 结合腔内充盈耦合剂对直肠癌术前评估的价值。**方法** 整理 2017 年 3 月至 2018 年 12 月在我院诊治的直肠癌 76 例，所有患者均经肠镜取组织病理确诊后，未行放疗及化疗并拟行外科手术治疗，于术前行直肠 MRI 检查和腔内充盈耦合剂后直肠 MRI 检查，分别评估肿瘤的 T 分期、N 分期、系膜血管受侵、环周切缘情况，并与术后病理结果进行对比分析。**结果** 直肠 MRI 对于直肠癌 T 分期、N 分期诊断的总准确率为 76.3%、72.3%，与病理结果的一致性为中等（kappa 值=0.593,0.572），系膜血管受侵、环周切缘分析的总准确率为 72.3%、89.5%，与病理结果分别为中等、较高一致（kappa 值=0.564,0.754）。腔内充盈耦合剂后直肠 MRI 后对于直肠癌 T 分期、N 分期诊断的总准确率为 86.8%、72.3%，与病理结果分别为较高、中度一致（kappa 值=0.736,0.569），系膜血管受侵、环周切缘诊断的总准确率为 77.4%、85.1%，与病理结果为较高一致（kappa 值=0.612,0.713）。**结论** 结肠 MRI 结合腔内耦合剂可提高直肠癌术前 T 分期、系膜血管受侵的病理结果符合率，对于 N 分期、环周切缘情况的总体病理结果符合率无明显影响。

转移性皮革状直肠的磁共振影像特征

李又成,黎金林
温州医科大学附属第一医院

研究背景及目的 皮革状是指空腔器官管壁内低分化或未分化癌弥漫性环形浸润，肿瘤细胞或其产物诱导肠壁产生丰富的促结蒂组织增生反应，从而出现管壁增厚、收缩、僵硬、无弹性，常见于胃，结直肠少见。皮革状直肠以来源于胃、乳腺、前列腺、膀胱、卵巢的转移性癌常见，原发性癌罕见。内镜对皮革状直肠的诊断价值有限，常因管腔狭窄内镜无法进入而放弃，或因直肠粘膜未受肿瘤累及而活检阴性。本研究总结两例转移性皮革状直肠的磁共振影像表现，旨在提高对该病的磁共振影像认识。
材料与方法 两例患者，例 1 男性，67 岁，胃癌术后 3 年半，大便性状改变 4 月余；例 2 男性，61 岁，前列腺癌内分泌去势治疗 2 年，大便次数增多、性状改变 2 月。MR 检查设备飞利浦 3.0T

MR 机，扫描序列包括 TWI、T2WI、DWI、高分辨率 T2WI、增强 3D T1WI。分析直肠病变的长度、范围、信号、强化。例 1 经直肠活检证实，例 2 经手术病理证实。
结果 两例转移性皮革状直肠的 MR 影像表现特点相似，表现为直肠长节段性管壁环形增厚、管腔狭窄，在横轴位上，平扫 T1WI 仅表现为管壁环形增厚，无分层靶环样征，在 T2WI、DWI、增强 T1WI 上均可见三层靶环样征，病灶在 T2WI 与 DWI 上三层靶环样征部位相对应一致，而与增强 T1WI 上三层靶环样征的部位不一致。例 2 手术病理提示前列腺癌浸润直肠壁全层。
结论 虽然直肠节段性肠壁增厚的疾病包括直肠炎症性、缺血性、放射性病变等，但增厚直肠壁的三层靶环样征，及每层在 MR 不同序列上的特征性信号，有助于提示皮革状直肠的诊断，并可建议内镜深入直肠粘膜下活检，以确保活检准确性。

胃肠道间质瘤 MRI 表现对临床治疗方式的参考价值

宋军伟
淄博矿业集团有限责任公司中心医院

目的 分析胃肠道间质瘤（GIST）的 MRI 影像表现，制定后续的临床治疗方案。
方法 回顾性分析 2014 年 1 月~2018 年 10 月期间 136 例原发 GIST 患者的 MRI 图像及相关临床病理资料。
结果 136 例 GIST 中,发生于胃部 89 例（65.4%），十二指肠 15 例（11.1%），空回肠 25 例（18.4%），结直肠 7 例（5.1%）。瘤体最大直径 1~15cm，平均 4.36±1.35cm，其中 1~5cm 者 69 例，5~10cm 者 36 例，＞10cm 者 31 例。患者进行内镜下切除 23 例（16.9%），行外科手术切除 113 例（83.1%），术后危险度分级：极低危险度 8 例（5.8%），低危险度 45 例（33.1%），中危险度 37 例（27.2%），高危险度 46 例（33.8%）。进行甲硫酸伊马替尼辅助治疗 75 例（55.1%）。病变 MRI 表现为类圆形或不规则分叶状软组织信号影，病变内出现囊变、坏死 71 例（52.2%），其中 61 例发生于直径＞5cm 的瘤体。病变内出血 16 例（11.8%），瘤体内钙化 4 例（2.9%）。影像分型瘤体位于粘膜下 51 例（37.5%），壁间 39 例（28.7%），浆膜下 46 例（33.8%）。边缘清晰者 59 例（43.4%），边缘模糊者 77 例（56.6%），相邻脏器受侵 9 例，12 例与周围组织发生黏连（图 4）。136 例 GIST 在 DWI 序列上均表现为高信号，其中高危险度组 ADC 均值为 1.236±0.259 x10-3mm2/s，中危险度组 ADC 均值为 1.416±0.312 x10-3mm2/s，低危险度组 ADC 均值为 1.521±0.236 x10-3mm2/s。行胃肠镜下切除 23 例（16.9%），外科手术治疗 113 例（83.1%），伊马替尼辅助治疗 75 例（55.1%）。
结论 通过 GIST 的 MRI 形态学及功能性检查，可以对其后续治疗方法及疗效评估提供重要参考。

孤立性肠系膜上动脉夹层的影像诊断和治疗

吴磊
十堰市太和医院

目的 近些年来随着影像学诊断技术和水平的增长，孤立性肠系膜上动脉夹层的检出率越来越高。本文旨在探讨孤立性肠系膜上动脉夹层的 CT、MRI 和 DSA 影像特点，以提高对本病的影像学表现认识。**方法** 回顾性 2014-2018 年供 23 例孤立性肠系膜上动脉夹层的临床表现、影像学特点以及治疗结果和随访。**结果** 其中男性 20 例，女性 3 例。年龄 43-76 岁，平均年龄 56 岁。所有患者中 15 例有高血压病史，7 例有长期吸烟史，动脉粥样硬化史 11 例。同时，有腹部外伤史 1 例，糖尿

病 3 例、结缔组织病 1 例。主要临床表现为突发性中上腹疼痛，少部分为渐进性腹痛，部分向腰背部放射，可伴有恶心、呕吐、腹泻等症状，部分重度患者可出现局部的压痛和反跳痛。本文采用 2009 年 Yun 的分型方法，根据破裂口的位置和管腔内是否伴有血栓共分为 I、IIa、IIb、III 型。其中 I 型 4 例、IIa 型 3 例、IIb 型 15 例、III 型 1 例。腹腔动脉 CTA 可以准确的显示特征性的内膜片、真假腔和血栓。腹部增强 MRI 图像因为呼吸和肠蠕动的影像，对于孤立性肠系膜上动脉夹层显示欠佳，有血栓的患者可表现为管腔的充裕缺损。DSA 是诊断腹腔动脉病变的金标准，本文的中的 DSA 病例均为 CTA 发现病变后行 DSA 明确诊断，其中 2 例患者行支架置入术，术后随访情况良好，管腔通畅。所有患者经治疗后症状均得到缓解或消失。经抗凝治疗 21 例中，夹层完全消失 1 例，血栓及假腔缩小 3 例，没有变化 17 例。**结论** 主动脉 CTA 仍是孤立性肠系膜上动脉夹层诊断的主要方法，增强 MRI 可以发现典型的病例，而 DSA 则主要是明确诊断和行血管内治疗。

PU-1191
多模态 MRI 对 T3 期直肠癌亚分期的诊断价值

许蕾
胜利油田中心医院

【摘要】**目的** 探讨多模态 MRI 对 T3 期直肠癌亚分期的诊断价值。**方法** 回顾性分析经手术病理证实 T3 期直肠癌患者 52 例且术前均行 MRI 直肠高分辨扫描、动态增强扫描（DCE）及扩散加权成像（DWI）检查。根据明确病理评价结果将 52 例患者按肿瘤浸润直肠系膜最大深度分为 T3I、T3II 两组，采用 χ^2 检验比较 2 组病变整体形态学指标、壁外索条形态学指标、时间信号强度曲线（TIC）类型、DWI 扩散受限分布位置指标的差异。采用独立样本 t 检验比较 2 组病变 DCE 半定量参数指标的差异。以病理结果为应变量，自变量采用上述具有统计学差异的指标，建立 Logisitc 回归模型构建联合参数并评价其诊断效能。**结果** 2 组病变整体形态学周径及壁外索条形态学指标（χ^2=6.994，p <0.01；χ^2=7.917，p <0.01）、DWI 扩散受限分布位置指标（χ^2=7.834，p <0.01）差异具有统计学意义。2 组病变在 DCE 半定量参数 EER（t 值=7.585，p<0.01）差异具有统计学意义。新构建病变$_{周径}$+壁外索条+DWI 扩散受限分布位置+EER 参数联合诊断的约登指数最高为 0.73，ROC 曲线下面积（Az）为 0.887（95% CI：0.847～0.912），诊断敏感性及特异性分别为 85.24%和 87.34%。**结论** 充分利用多参数信息，联合壁外索条形态学指标、周径、EER、DWI 扩散受限分布位置作为评价指标对 T3 期直肠癌亚分期具有较高的诊断效能。

对比分析扩散峰度成像与扩散加权成像诊断宫颈鳞癌分级的价值

侯孟岩,孟楠,宋凯,翟战胜,刘文玲,韩东明*（通讯作者）
新乡医学院第一附属医院

【摘要】 目的 对比分析扩散峰度成像（DKI)与扩散加权成像（DWI）诊断宫颈鳞癌分级的价值。资料与方法 回顾性分析 42 例宫颈鳞癌患者的 DKI 和 DWI 影像资料，以病理结果为金标准，分为高中分化组（n=27）、低分化组（n=15），分别测量两组肿瘤实质区平均扩散峰度（MK）值、平均扩散系数（MD）值及平均 ADC 值、最小 ADC 值。采用独立样本 t 检验比较低分化与高、中分化宫颈鳞癌组间 MK、MD、平均 ADC、最小 ADC 值差异；绘制 ROC 曲线评价上述各参数值的诊断效能及最佳诊断阈值，并根据约登指数确定各参数相应敏感度、特异度。以 $P<0.05$ 表示差异有统计学意义。 结果 低分化宫颈鳞癌组 MK 值高于高中分化宫颈鳞癌组（$P<0.01$），MD、平均 ADC、最小 ADC 值低于高中分化宫颈鳞癌组，差异具有统计学意义（$P<0.01$）。其中 MK 值在鉴别低分化与

高中分化宫颈鳞癌的 ROC 曲线下面积（area under curve,AUC）最大（0.877），敏感度最高（92.6%）,MD 值特异性最高（86.7%）。MK 联合 MD 值的 AUC（0.909），高于平均 ADC 联合最小 ADC 值的 AUC（0.854）。结论　DKI 与 DWI 参数值均有助于鉴别低与高中分化宫颈鳞癌，与传统 DWI 相比，DKI 可更有效地鉴别低分化与高中分化宫颈鳞癌。

磁共振扩散加权成像鉴别胆囊良恶性病变的 Meta 分析

张旭霞,张皓
兰州大学第一医院

摘要　目的 对磁共振扩散加权成像鉴别诊断良恶性胆囊病变的价值进行 Meta 分析。**材料与方法** 检索自建库起至 2018 年 12 月 1 日 PubMed、 EMbase、Web of Science、The Cochrane Library、CNKI 、万方数据库、中国生物医学文献数据库、中国科技期刊数据库中有关磁共振扩散加权成像鉴别诊断良恶性胆囊病变的相关文献。2 名研究者分别按照所制定的纳入标准以及排除标准独立筛选文献、提取数据并运用 QUADAS-2 文献质量评价工具及 Review Manager 5.3 软件评价纳入文献的偏倚风险，采用运用 Meta-disc 1.4 及 Stata12.0 软件进行 Meta 分析。**结果** 最终纳入 13 篇文献，其中英文 8 篇，中文 5 篇， Meta 分析结果显示，扩散加权成像（DWI）鉴别良恶性胆囊病变的合并敏感度(Sen)为 0.88(95%CI， 0.78-0.94)、特异度(Spe)为 0.85(95%CI， 0.79-0.89)、阳性似然比(+LR)为 5.84(95%CI, 3.97-8.59)、阴性似然比(-LR)为 0.14(95%CI， 0.07-0.28)、诊断比值比(DOR)为 41.88(95%CI, 15.42-113.69)；SROC 曲线下面积为 0.93，Q*为 0.86。表观扩散系数(ADC)鉴别良恶性胆囊病变的合并 Sen 为 0.79(95%CI， 0.71-0.86)、Spe 为 0.93(95%CI， 0.83-0.97)、+LR 为 10.8(95%CI, 4.7-25.1)、 -LR 为 0.22(95%CI， 0.16-0.32)、DOR 为 48(95%CI, 18-127)；SROC 曲线下面积为 0.89，Q*为 0.82。**结论** 磁共振扩散加权成像对良恶性胆囊病变的鉴别诊断具有较高诊断准确性。

非对比剂增强 MR 门静脉血管成像研究

黄炎文,徐慧慧,康英杰,龚志刚,杨烁慧
上海中医药大学附属曙光医院

目的　探讨非对比剂增强磁共振血管成像（NCE-MRA）在评估肝脏门静脉解剖中的临床价值，并与磁共振增强门静脉期成像（MRPV）进行对照。
方法　选择 50 例健康受试者在西门子 3.0T 磁共振扫描仪上进行 NATIVE-TrueFISP 序列和增强冠状位 T1-Vibe 门静脉期 MRPV 成像检查。两组图像均进行最大密度投影 MIP 及多平面重组 MPR，获得血管重建图像。由两位医师分别对所有患者的 NCE-MRA 和 MRPV 成像的图像质量及门脉显示情况进行评分，并进行统计学分析。
结果　在 NCE-MRA 组和 MRPV 组中，门静脉成像质量评分分别为 3.30 和 3.37。评分在 2 分及以上者分别占 92%（46/50）和 96%（48/50），两者无明显统计学差异（P>0.05）。两位诊断医师对 NCE-MRA 和 MRPV 成像质量评分的一致性较高，Kappa 值为 0.95。门静脉显示能力方面，两种方法均能显示所有受试者的 3 级及 3 级以下的肝内门静脉，符合率为 100%。3 例（6%）受试者的门静脉第 5 级分支在 NCE-MRA 上未显示，而在 MRPV 上可以显示；2 例（4%）受试者门静脉第 5 级分支在

MRPV 上未显示，而在 NCE-MRA 上可以显示。两者在门静脉显示能力方面无明显统计学差异（P>0.05）。

结论 NCE-MRA 是一种无需使用对比剂的血管成像方法，能有效地对肝脏门静脉进行显示及评估。

PU-1195
对比不同排泄类型钆造影剂在肝脏肿瘤手术前的检查意义

吴训华,孔令煜,赵皆,周高峰
中南大学湘雅医院

目的:探究肝脏增强磁共振检查中不同排泄类型钆造影剂（经肝脏排泄为主，经肾脏排泄为主）在肝脏肿瘤手术前的检查意义明确肿瘤性质数目及肿瘤与周围血管的关系。

材料与方法 收集我院 2017 年 2 月至 2019 年 4 月诊断为肝脏肿瘤的 MRI 资料（包括使用经肝脏排泄为主钆塞酸二钠,经肾脏排泄为主的钆喷酸注射剂），依据纳入标准和排除标准（患者呼吸配合），最终获得 218 名患者资料。2 名放射科医生 1 名普外科肝脏专科医生通过 DCE-MRI 和 GE 后处理工作站软件分别获得 Ktrans,Kep,Ve 和 ADC,FastADCF 的图像及数据。对比分析一般临床资料，常规影像特征，动态增强参数在肝脏肿瘤病灶数目及血管显影强化分组中的特点。定量资料满足正态和方差齐性组间比较采用独立样本 t 检验，不满足组间比较采用非参数秩和检验，定性资料组间比较采用卡方检验。影响因素的分析采用 Logistic 回归分析，采用 ROC 曲线表示各指标的预测效能。

结果 在 218 名患者中，单独使用经肝脏排泄为主的 51 名，单独使用经肾脏排泄为主的 77 名，使用两种造影剂确诊的 90 名。均在 3.0T GE HDX 机器上使用腹部线圈做双动脉期,静脉期，延时期（横轴位冠状位 LAVA 序列成像)。在肿瘤定性分组中没有统计学差异（P=0.00）而肿瘤病灶数目在增强延时期两组之间有统计学差异（P 值分别为 0.04,0.01,0.02）。；肝脏肿瘤术前增强 MRI 检查诊断和术后病理结果比较，两组之间没有统计学差异，在增强后延时排泄期肿瘤病灶数目上存在统计学差异，经肝脏排泄为主比经肾脏排泄为主的造影剂病灶数目准确性高 17.06%。经肾脏排泄为主的造影剂在肝脏肿块与血管关系显示更清晰。

结论 增强 MRI 肝脏肿瘤术前检查对比分析两种造影剂的使用，经肝脏排泄为主钆塞酸二钠注射剂对肝脏肿瘤性质及数目检测中有明显优势；经肾脏排泄为主的钆喷酸注射剂在显示肝脏肿块与血管分段关系中更清晰。

PU-1196
流入反转恢复序列在肝移植术前肝动脉成像中的应用

柳计强[1,2],杨春华[1],刘跃娜[1],王芳芳[1],穆学涛[2]
1.新乡医学院第三附属医院
2.中国人民解放军总医院第三医学中心

目的 探讨基于流入反转恢复序列（inflow inversion recovery，IFIR）在肝移植术前肝动脉成像中的应用价值。**方法** 肝移植术前需行血管成像的 31 例患者纳入研究，所有患者均依次行冠状位 IFIR 和增强磁共振成像（contrast enhanced magnetic resonance angiography，CE-MRA）。由 2 名影像科医师采用盲法分别对两组肝动脉图像质量进行评分并比较 IFIR 组与 CE-MRA 组在肝动脉各级血管图像质量评分的一致性及最大显示分支级别上的差异；评价医师间图像质量评分和显示肝动脉最大分支级别的一致性。**结果** 2 名医师对 IFIR 组及 CE-MRA 组中各级血管图像质量评分的一致性均为良好及以上（*Kappa* 值：IFIR 为 0.628～0.870 ； CE-MRA 为 0.620～1）。IFIR 与

CE-MRA 两种方法在腹腔干、肝总动脉、肝固有动脉、肝右动脉及肝左动脉血管成像图像质量评分上差异均无统计学意义（*P*值均≥0.05）。 CE-MRA 显示最大分支级别的能力优于 IFIR。 31 例患者中，CE-MRA 和 IFIR 均发现 3 例肝动脉变异。**结论** IFIR 序列作为一种无创伤、无电离辐射、无需对比剂的磁共振血管成像方法，在肝移植术前肝动脉血管成像中具有一定的临床应用价值。

PU-1197
磁共振弥散加权成像联合影像组学 Nomogram 图预测进展期胃癌淋巴结转移的临床研究

陈武杰[1,2],高旭宁[1,2],许茂盛[1,2]
1.浙江中医药大学附属第一医院
2.浙江中医药大学第一临床医学院

摘要
目的 建立和验证基于磁共振弥散加权成像（DWI）的 Nomogram 图，用于预测进展期胃癌（AGC）患者的淋巴结转移（LNM）情况。

研究设计：对来自浙江中医药大学第一附属医院的 101 例临床病理证实为 AGC 的患者进行回顾性研究。所有患者均接受术前 3.0T MRI 检查。数据集分为训练组（n = 71）和验证组（n = 30）。从每位患者中各提取总共 1305 个影像学特征，使用最小绝对收缩和选择算子（LASSO）逻辑回归模型以及学习矢量量化方法来选择影像图像中重要的纹理特征。通过结合影像组学特征和独立临床因素建立预测性 Nomogram 图。使用接收器操作特性分析，校准曲线和决策曲线分析评估 Nomogram 图的预测性能。

结果 我们发现两个影像组学特征与 LNM 发生概率的增加有显着相关（训练组的 P <0.002，验证组的 P = 0.004）。通过结合临床最小表观扩散系数（ADC）值和 MRI 报告的 N 分期建立影像组学 Nomogram 图。该图显示了良好的分类能力，在训练队列中曲线下面积（AUC）为 0.822（95％置信区间[CI]，0.768-0.923），然后在验证队列中证实，AUC 为 0.817（95％CI，0.714-1.000）。训练组中的特异性和敏感性分别为 0.758、0.782 和验证组中的 0.816、0.805。决策曲线在 Nomogram 图中也表现出良好的效能。

结论 本研究建立了基于磁共振的 DWI 序列及影像组学 Nomogram 图，分析了病灶影像学纹理特征，最小 ADC 值和 MRI 报告 N 分期与淋巴结转移的关系，可以在 AGC 患者中有效地进行术前 LNM 的预测，为其后的治疗提供重大的指导意义。

PU-1198
基于磁共振 T2WI 影像组学在诊断低 Gleason 评分前列腺癌中的价值

张虎,汪健文,杨兰英,高俊,过永,徐芳
芜湖市第二人民医院

目的 探讨前列腺 T2WI 影像组学预测模型在诊断低 Gleason 评分前列腺癌中的价值。

材料与方法 收集经手术或穿刺病理证实的前列腺癌患者 60 例，其中 Gleason 评分≤6 分者 20 例，运用美国 GE Analysis Kit（AK）软件将 T2WI 图像进行标准化处理，影像科 2 名经 PI-RADS V2 培训的医师运用 ITK-SNAP 3.6 软件根据多参数磁共振（包括 T1WI、T2WI、DWI、DCE-MRI）及病理结果在标准化后的 T2WI 上进行 ROI 勾画，ROI 放置于癌灶面积最大层面，其中一名医师 1 周后再重新勾画 ROI。运用 AK 软件进行影像特征提取，随后进行观测者间与观测者内一致性检验。保留一致性较高（ICC＞0.75）的影像特征,采用 spearman 相关分析和 LASSO 方法进行特征降维。在训练集中构建低 Gleason 评分前列腺癌的诊断模型，在验证集中评估模型效能。
结果 共提取 396 个定量影像特征参数，经降维和去冗余后，剩余影像特征 6 个，构建基于 T2WI 的低 Gleason 评分前列腺癌的诊断模型。训练集的准确度为 0.9048（95% CI,0.7738-0.9734），敏感度为 0.9286，特异度为 0.8929，阳性预测值为 0.8125，阴性预测值为 0.9615。验证集的准确度为 0.8889（95% CI,0.6529-0.9862），敏感度为 0.8333，特异度为 0.9167，阳性预测值为 0.8333，阴性预测值为 0.9167。训练集诊断低 Gleason 评分前列腺癌的 ROC 曲线下面积为 0.93(0.82-*1.00)*；验证集为 0.94 (0.88-*1.00)*。
结论 运用磁共振 T2WI 影像组学模型在诊断低 Gleason 评分前列腺癌中的准确性较高。

胰腺导管腺癌罕见变异型——肝样腺癌的 MRI 表现

方旭,边云,王莉,陆建平
海军军医大学第一附属医院（上海长海医院）

胰腺肝样腺癌是胰腺导管腺癌一种极其罕见的变异型，预后更差，具有腺癌和肝细胞癌样分化特征的原发性胰腺上皮源性癌，大部分患者血清 AFP 增高。目前国内文献报道仅 2 例，Pubmed 报道 20 余例。目前对其认识较少，影像诊断困难。海军军医大学附属长海医院于 2019 年收治 1 例胰腺肝样腺癌，男 56 岁，入院一周前体检发现胰尾部占位，血清 AFP、CA19-9 阴性，余无明显阳性症状及体征。影像学提示胰尾部类圆形肿块，边界光整，T1WI 低信号，内见斑片状高信号（出血），T2WI 等高信号，增强后持续强化，主胰管未见扩张，术前影像误诊为胰腺实性假乳头状肿瘤。后行胰体尾+脾脏切除术，病理证实：胰腺肝样腺癌，免疫组化 AFP（部分+）。本文报道一例胰腺肝样腺癌，对其影像学诊断进行讨论，具有较好的教学意义。

基于磁共振 T2WI 纹理分析对低 Gleason 评分与中高 Gleason 评分前列腺癌的鉴别

张虎,张帆,张位龙,杜涛,张涛,吴波
芜湖市第二人民医院

目的 探讨前列腺 T2WI 纹理分析在低 Gleason 评分与中高 Gleason 评分前列腺癌诊断中的价值。
材料与方法 收集经前列腺癌根治术或穿刺病理证实的前列腺癌患者 60 例，其中低 Gleason 评分组 20 例。术前均行多模态磁共振检查，将 T2WI 图像进行标准化处理，影像科 2 名经 PI-RADS V2 培训的医师运用 ITK-SNAP 3.6 软件根据磁共振及病理结果在标准化后的 T2WI 上进行 ROI 勾画，ROI 放置于癌灶面积最大层面，其中一名医师 1 周后再重新勾画 ROI，共得到 60 个目标区域。运用美国 GE Analysis Kit（AK）软件进行纹理特征提取，随后进行观测者间与观测者内一致性检验。保留一致性较高（ICC＞0.75）的影像特征,采用 spearman 相关分析和 LASSO 方法进行特征降维。并评判纹理分析在低 Gleason 评分与中高 Gleason 评分前列腺癌诊断中的价值。
结果 共提取 396 个定量影像特征参数，观测者间与观测者内一致性较高的纹理特征数为 176 个，经降维和去冗余后，剩余 68 个。前 4 个纹理参数单独诊断的 AUC 曲线下面积分别为：0.87（0.78-

0.96）、0.85（0.75-0.94）、0.82（0.72-0.93）、0.81（0.71-0.92）。而 68 个纹理特征共同诊断的 AUC 曲线下面积为 0.96（0.92-1.00）。纹理分析诊断低 Gleason 评分前列腺癌的准确性为 0.88（95% CI，0.77-0.95），敏感性为 0.95，特异性为 0.85，阳性预测值为 0.76，阴性预测值为 0.97。

结论 磁共振 T2WI 纹理分析在低 Gleason 评分与中高 Gleason 评分前列腺癌诊断中的价值较高。

PU-1201
增强前 T1 mapping 对肝囊肿与小肝血管瘤的鉴别诊断

陈地友
陆军军医大学大坪医院

目的 探讨增强前 MR T1 mapping 技术在肝囊肿与小肝血管瘤的鉴别诊断中的应用价值。

方法 筛选临床怀疑肝囊肿和/或肝血管瘤的病例 80 例，遵医嘱行常规上腹部 MR 检查的同时，增强前行 T1 mapping 扫描，两名高年资的扫描技师选择相同层面使用一致 ROI 测量病灶及其周围正常肝组织 T1 值，每个病灶及正常肝组织均测量三次，取平均值作为该病例测量处的最终 T1 值，并对两名技师的测量结果做一致性检验；同时两名高年资诊断医师对所有入组的 80 例患者的 MR 影像进行独立诊断，无法单独诊断的讨论后出最终结果。统计学软件选择 spss19.0，根据影像及临床诊断对两组病例所测数据做统计学分析并做 ROC 曲线分析，以 p＜0.05 作为差异有统计学意义。

结果 （1）本研究 80 例病例中，诊断为肝囊肿共 43 例，50 个病灶；肝血管瘤 37 例，42 个病灶；（2）两名高年资技师测量结果一致性检验 p＞0.05，无显著性差异；（3）肝囊肿组 T1 值大于肝血管瘤组，p＜0.05，有统计学意义；（4）两组数据 ROC 曲线分析具有良好的敏感性和特异性，有诊断截点。

结论 MR T1 mapping 技术无需增强即能够对肝囊肿与小肝血管瘤进行鉴别诊断，简单易行，耗时短，具有很高的灵敏性和特异性，值得广泛推广。

PU-1202
临床结合多参数 MRI 对不同子宫肉瘤亚型的鉴别诊断价值

毕秋,吴昆华
云南省第一人民医院

背景及目的 不同子宫肉瘤亚型的手术切除方式及预后不尽相同。探讨临床参数及磁共振成像（magnetic resonance imaging，MRI）表现对子宫平滑肌肉瘤、子宫内膜间质肉瘤及子宫癌肉瘤的术前鉴别诊断价值。

方法 在 2011 年 6 月至 2018 年 12 月间，收集了 71 例经手术病理证实为子宫肉瘤的患者资料。比较不同子宫肉瘤亚型的临床特点、常规 MRI 表现、平均 ADC 值 （mean apparent diffusion coefficient，mADC）、最小 ADC 值（minimum apparent diffusion coefficient，minADC）及相对 ADC 值（relative apparent diffusion coefficient，rADC）值。

结果 子宫癌肉瘤患者的年龄及临床表现、病灶的位置、形态及 T1 信号强度与子宫平滑肌肉瘤和子宫内膜间质肉瘤相比差异均有统计学意义（*P* 均<0.01）。子宫内膜间质肉瘤可见“束带征”（*P* 均<0.001）。病灶中囊变或坏死的形状以及强化方式有助于区别子宫平滑肌肉瘤与其余肉瘤（*P* 均<0.02）。子宫平滑肌肉瘤的实质 T2 信号强度与癌肉瘤相比差异具有统计学意义（*P*<0.001）。子宫内膜间质肉瘤的 rADC 值明显较子宫癌肉瘤的 rADC 值高（*P*=0.004）。

结论 临床结合多参数 MRI 有助于术前区别不同子宫肉瘤亚型。

PU-1203

The diagnostic value of MRI for preoperative staging in patients with endometrial cancer: a meta-analysis

Qiu Bi,Kunhua Wu
the First People's Hospital of Yunnan Province

Purpose: To assess the diagnostic accuracy of magnetic resonance imaging (MRI) for detecting myometrial invasion, cervical invasion, and lymph node metastases in endometrial cancer.
Materials and Methods: A systematic literature search was performed in PubMed, Embase, Cochrane Library (CENTRAL), Web of Science, and Clinical trails. The methodologic quality of each study was assessed by using the standard Quality Assessment of Diagnostic Accuracy Studies-2 (QUADAS-2). Statistical analysis included evaluating publication bias, assessing threshold effect, exploring heterogeneity, pooling data, meta-regression, forest plot, and summary receiver-operating characteristics (sROC) curves construction.
Results: Fourteen studies could be analyzed. For detecting deep myometrial invasion, the pooled sensitivity and specifcity were 0.79 and 0.81 respectively, and patients younger than 60 years old demonstrated higher sensitivity (0.84) and specifcity (0.90). There was low sensitivity and high specifcity in the diagnosis of cervical invasion (0.53, 0.95) and lymph node metastases (0.59, 0.95). The sensitivity for detecting cervical stromal invasion (0.50) was lower than the sensitivity for detecting cervical invasion (0.53). The sensitivity for detecting pelvic lymph node metastases (0.65) was higher than the sensitivity for detecting lymph node metastases (0.59).
Conclusion: MRI has good diagnostic performance for detecting deep myometrial invasion, and has high specificity for detecting cervical invasion and lymph node metastases in patients with endometrial cancer.

PU-1204

磁共振氨基质子转移成像与扩散加权成像模型对宫颈鳞癌分级诊断价值的对比研究

侯孟岩,王竞,张梦,段金晖,韩东明(通讯作者)
新乡医学院第一附属医院

目的 对比分析磁共振氨基质子转移成像（APT）与扩散加权成像模型[扩散加权成像(DWI)模型、扩散峰度成像（DKI）模型]在诊断宫颈鳞癌分级中的价值。**资料与方法** 回顾性分析 46 例宫颈鳞癌[高分化组（G1，n=13）、中分化组（G2，n=21）、低分化组（G3，n=12)]患者的 APT、DKI、DWI 影像资料，测量宫颈鳞癌组织的 ADC、平均扩散峰度（MK）、平均扩散系数（MD）、不对称性磁化转移率（MTR_{asym}）值。采用单因素方差分析比较各组宫颈鳞癌 ADC、MK、MD、MTR_{asym}值的差异；

采用 ROC 曲线评价各参数的诊断效能；采用 Spearman 相关分析检验各参数与组织学分级之间的相关性。**结果** ADC、MK、MD、MTR_{asym}值在 G1、G2、G3 组间差异均具有统计学意义（*P<0.01*）；两两组间比较，各参数值间差异均具有统计学差异（*P<0.01*）。在鉴别 G1/G2 及 G2/G3 组宫颈鳞癌中，MTRasym 值均具有最佳诊断效能，ROC 曲线下分别为 0.883、0.871，其次依次为 MK、MD、ADC 值，各参数间差异无统计学意义(P 均 > 0.05)。ADC 联合 MK 值、ADC 联合 MTRasym 值鉴别 G1/G2 及 G2/G3 组宫颈鳞癌的 ROC 曲线下面积分别为(0.934、0.949)、(0.883、0.964)，其中，ADC、ADC 联合 MTRasym 值诊断 G2/G3 组宫颈鳞癌 AUC 间差异有统计学意义(Z=2.004,P < 0.05)。 MK 值、MTRasym 值与病理分级呈正相关（r=0.743,0.789，P<0.01），ADC、MD 值与病理分级呈负相关（r=-0.644，0.732，P<0.01）。**结论** DWI、DKI 及 APT 的参数均有助于宫颈鳞癌分化程度的诊断，与扩散加权成像模型（DWI、DKI）对比，APT 可更有效评估宫颈鳞癌分级，联合应用 DWI 和 APT 参数的诊断效能更佳。

PU-1205

MRI 对肛瘘的诊断准确性及临床价值

李继亮
铜仁市人民医院

目的 探究 MRI 对肛瘘的诊断准确性及临床价值。
方法 收集铜仁市人民医院 2018 年 6 月至 2019 年 6 月进行诊断肛瘘患者 72 例，设观察组及对照组，两组各 36 例。选择 MRI 诊断的是观察组，选择肛管内超声检测诊断的是对照组。对比两组手术结果和检测结果。**结果** 在诊断肛瘘位置准确性中，观察组占 36 例（100.00%），在诊断肛瘘内口准确性中，观察组占 36 例（100.00%）；对照组患者诊断肛瘘内口准确率为 27 例（75.00%），肛瘘位置准确率为 23 例（63.89%），相较于对照组，观察组经 MRI 和超声检测结果的准确性对比差异有统计学意义（P＜0.05）。**结论** 针对肛瘘患者，采用 MRI 诊断，可显著改善患者的生活质量，明显优于腔内超声，快速、无损伤，有很高的准确性，具有临床应用价值。

PU-1206

Effect of Repeated Injection of Iodixanol on Renal Function in Healthy Wistar Rats Using Functional MRI

Yongfang Wang
First Hospital of Shanxi Medical University

Purpose. To determine the optimal time interval of repeated intravenous injections of iodixanol in rat model and to identify the injury location and causes of renal damage in vivo. Materials and Methods. Rats were randomly divided into Control group, Group 1 with one iodixanol injection, and Group 2 with two iodixanol injections. Group 2 was subdivided into 3 cohorts according to the interval between the first and second iodixanol injections as 1, 3, and 5 days, respectively. Blood oxygen level-dependent (BOLD) imaging and diffusion weighted imaging (DWI) were performed at 1 hour, 1 day, 3 days, 5 days, and 10 days after the application of solutions. Results. Compared with Group 1 (7.2%), Group 2 produced a remarkable R2* increment at the inner stripe of the renal outer medulla by 15.37% (= 0.012), 14.83% (= 0.046), and 13.53% (>

0.05), respectively, at 1 hour after repeated injection of iodixanol. The severity of BOLD MRI to detect renal hypoxia was consistent with the expression of HIF-1 and R2* was well correlated with HIF-1 expression (= 0.704).The acute tubular injurywas associated with urinaryNGAL and increased significantly at 1 day. Conclusions. Repetitive injection of iodixanol within a short time window can induce acute kidney injury, the impact of which on renal damage in rats disappears gradually 3 - 5 days after the injections.

PU-1207

子宫切口疤痕妊娠的 MRI 表现及诊断价值分析

余哲歆,王小宜,胡康新
湘雅常德医院

目的 探讨子宫切口疤痕妊娠的 MRI 表现及其应用价值分析，提高 MRI 诊断水平。**方法** 回顾性分析 10 例经手术和病理证实的子宫切口妊娠患者临床及影像资料并复习文献，患者均做 MRI 平扫及增强扫描。**结果** 年龄 25-38 岁，平均年龄 31 岁，10 例患者妊娠囊均位于子宫下段前壁宫颈内口上方，孕囊呈长 T1 长 T2 信号，增强后不均匀强化，切口疤痕厚度约 0-12mm，平均厚度 3.5mm，10 例患者切口肌层厚度均小于 2mm，1 例子宫浆膜层不完整。**结论** 子宫切口疤痕 MRI 检查具有特征性表现，在观察孕囊血供、子宫浆膜完整性及是否存在胎盘植入时具有一定的诊断价值，对患者治疗方式具有重要作用。

PU-1208

MRI 与超声在胎儿肺部疾病产前诊断中的对比研究

艾光勇
重庆医科大学附属第二医院

目的 对比分析 MRI 与超声在胎儿肺部疾病产前诊断中的价值；

方法 收集 20 例超声怀疑肺部有问题的胎儿，利用 MRI 采集肺部图像，将超声结果与 MRI 结果分别于产后诊断结果进行对比。分析超声于 MRI 在胎儿肺部疾病中的价值；

结果 20 例病例中，超声诊断肺囊腺瘤（CCAM）10 例，肺隔离症 7 例（BPS）。先天性膈疝 3 例，MRI 示肺 CCAM 9 例，肺隔离症 7 例。先天性膈疝 3 例。支气管源性囊肿 1 例；

结论 MRI 可作为超声产前诊断的有效补充手段，在胎肺解剖结构的显示上优于超声。能为临床诊疗提供形象直观的影像参考。

ADC 值对前列腺增生与腺癌的鉴别及其与腺癌 Gleason 评分相关性研究

孙冰冰
上海市第九人民医院

摘要

目的 探讨磁共振 ADC 值对前列腺外周带增生与腺癌的鉴别及其与腺癌 Gleason 评分的相关性。

方法 收集 2017 年 10 月～2019 年 2 月我院（北部）临床怀疑前列腺癌的患者，以经直肠超声引导下穿刺结果为标准，确诊为腺癌 41 例，增生 43 例。所有患者于穿刺术前行磁共振检查。比较腺癌与增生 2 组间 ADC 值的差异，绘制 ROC 曲线，探求 ADC 值对于腺癌的诊断阈值，评价该 ADC 值对腺癌的诊断校能（特异性和敏感性）。根据前列腺癌的 Gleason 评分又将腺癌分为低级别（高分化）组（Gleason 评分＜7 分）、中级别（中分化）组（Gleason 评分＝7）及高级别（低分化）组（Gleason 评分＞7），比较不同分化程度腺癌 3 组间 ADC 值的差异，用 Spearman 相关性分析评价 ADC 值与 Gleason 评分的相关性。

结果:1、 比较腺癌与增生两组间 ADC 值差异具有统计学意义（t=9.228，P=0.000），绘制 ROC 曲线，测得 ROC 曲线下面积为 0.869， ADC 值阈值为 $1.39\times10^{-3}mm^2/s$，诊断腺癌的敏感性与特异性分别为 71.43%及 89.33%。2、比较腺癌低级别（高分化）组、中级别（中分化）组及高级别（低分化）组 3 组间 ADC 值差异具有统计学意义（F=35.990，P=0.000），且两两比较，组间差异均具有统计学意义（P_1=0.000，P_2=0.000，P_3=0.002）。3、腺癌 ADC 值与 Gleason 评分呈负相关关系（r=-0.701，P=0.000）。

结论 1、ADC 值对腺癌及增生的诊断阈值为 $1.39\times10^{-3}mm^2/s$，其特异性与敏感性分别为 89.33%与 71.43%。2、ADC 值对腺癌恶性程度评估具有一定的价值。3、ADC 值与腺癌 Gleason 评分呈负相关。

3D-SPACE 序列结合三维重建在阴道斜隔综合征诊断中的应用价值

包磊,储彩婷,赵书会,崔雪娥,李芳珍
上海交通大学医学院附属新华医院

目的 探讨三维各向同性脂肪抑脂快速自旋回波（3D-SPACE）序列结合三维重建技术对阴道斜隔综合征术前诊断及临床分型的应用价值。

方法 回顾性分析 24 例经手术证实阴道斜隔综合征患者的的临床资料及术前 MRI 图像。由 2 名泌尿生殖系统专业放射科医生利用 3D-SPACE 序列及后处理重组图像进行双盲评价，并将诊断及分型结果与手术结果进行比较。

结果 24 例阴道斜隔综合征患者，年龄 10 ～ 23 岁，平均年龄 13.5 岁。阴道内斜隔：右侧 20 例，左侧 4 例。伴随子宫发育畸形：双子宫畸形 16 例，双角子宫 5 例，完全纵隔子宫 3 例。伴随泌尿系异常：同侧肾脏缺如 19 例，盆腔异位肾 3 例，盲端输尿管异位开口 2 例。盆腔其它病变：盆腔积液 22 例，斜隔侧隔后腔 18 例，隔后腔内混杂性血性肿块 4 例，斜隔侧隔后腔积脓 2 例，输卵管积血或积液 7 例，对侧阴道少许积血 9 例。24 例阴道斜隔综合征患中，23 例 3D-SPACE 序列结合三维重建的术前分型结果与手术结果一致，包括 I 型 12 例， II型 9 例，III型 2 例。仅 1 例术前分型结果与手术结果不一致，I 型误诊 II 型。

结论 阴道斜隔综合征是一种泌尿生殖系统发育畸形，3D-SPACE 序列结合三维重建能够准确地术前诊断及临床分型，同时提供客观的测量数据，对手术方案的选择及患者预后的评估有重要价值。

PU-1211
利用多参数定量 MRI 鉴别移行区前列腺癌及前列腺增生的研究

富彦
天津医科大学第二医院

目的 本研究调查了不同类型的良性前列腺增生（BPH）的多参数 MRI（mpMRI）表现以及定量 mpMRI 是否有效区分前列腺癌（PCa）和 BPH。
材料和**方法** 确诊 PCa 的患者（n = 60）接受术前 3T MRI 检查。在进行前列腺切除术之前获得 T2WI，多回波 T2WI，DWI 和动态对比增强图像（DCE）。 PCa 和 BPH（囊性，腺体或基质）在过渡区被鉴定并与 MRI 匹配。定量 mpMRI 指标：使用经验数学模型测量 T2，ADC 和 DCE-MRI 参数。
结果 与所有 BPH 类型相比，PCa 中 ADC 值显着降低（p <0.001），并且可以高精度地区分 PCa 和 BPH（AUC = 0.87，p <0.001）。与仅囊性 BPH 相比，PCa 中 T2 值显着降低（p <0.001），而腺体（p = 0.27）和基质 BPH（p = 0.99）与 PCa 无显着差异。 BPH 在 DCE-MRI 的过渡区中模拟 PCa，证明它们之间没有显着差异。腺体的 mpMRI 值（ADC = 1.31±0.22μm2/ ms，T2 = 115.7±37.3ms）和囊性 BPH（ADC = 1.92±0.43μm2/ ms，T2 = 242.8±117.9ms）有显着差异。腺体和间质 BPH 之间 ADC（p = 0.72）和 T2（p = 0.46）无显着差异。
结论 多参数 MRI 和特定定量 ADC 值可用于区分 PCa 和 BPH，改善过渡区的 PCa 诊断。然而，DCE-MRI 指标在区分 PCa 和 BPH 方面无效。如先前所认为的，腺体 BPH 在 ADC 和 T2 上不是高信号，并且对基质 BPH 具有相似的定量 mpMRI 测量值。腺体和囊性 BPH 在 mpMRI 上表现不同，组织学上不同。

PU-1212
磁共振扩散加权成像与宫颈癌细胞增殖活 Ki-67 表达的相关性研究

马桢,赵鑫,张小安
郑州大学第三附属医院河南省妇幼保健院

目的 探讨子宫颈癌患者不同分化程度磁共振扩散加权成像(DWI)ADC 值及 rADC 值的变化及其与宫颈癌细胞增殖活性 Ki-67 的相关性。方法 经病理确诊为宫颈癌的患者 40 例，所有患者术前均行磁共振检查并进行扩散加权成像; 术中病理均进行 Ki-67 免疫组化染色。应用方差分析分析不同分化程度宫颈癌患者 Ki-67 表达情况，Pearson 相关分析法分析 Ki-67、ADC 与 rADC 值的相关性。运用 SPSS 20.0 统计学软件对数据进行统计学分析，P＜0.05 为差异有统计学意义。结果 低分化组 ADC 值以及 rADC 值低于高分化组，差异有统计学意义(t = 2.118，P＜0.05) 。低分化组与中分化组之间差异无统计学意义(P ＞0.05) 。随着分化程度降低，Ki-67 表达程度逐渐升高。随着 Ki-67 表达程度的升高，ADC 值与 rADC 低，差异均有统计学意义(P<0.05) 。Pearson 相关性检验后发现，ADC 值与 Ki-67 表达程度呈负相关(P<0.05)。结论 宫颈癌 DWI 成像 ADC、rADC 值的测量有助于评价并鉴别宫颈癌不同病理级别并有潜力作为评价肿瘤增殖程度的无创性方法。

PU-1213
卵巢碰撞瘤 MRI 表现两例

沈善昌,姜兴岳,王茹茹

滨州医学院附属医院

由于字数限制仅输入部分内容。
碰撞瘤即发生在同一解部位的两种或两种以上不同组织来源的肿瘤，不同肿瘤相互邻近但绝无肿瘤组织混合。目前国内外文献报道的发生于卵巢碰撞瘤较为罕见，大多表现为囊实性肿块，其内成分混杂，可见多种密度或信号成分；且有文献报道的卵巢碰撞瘤几乎都起源于表面上皮、生殖细胞或性索间质细胞中的 2-3 种，组合形式多样；起源于生殖细胞或性索间质细胞的卵巢碰撞瘤较少见。本文报道两列卵巢碰撞瘤的临床及 MRI 表现，旨在加强人们对卵巢碰撞瘤的认识，以期更好的服务于临床。
碰撞瘤（collision tumor）即发生在同一解部位的两种或两种以上不同组织来源的肿瘤，他们分隔明确、相互邻近但不同肿瘤组织无混合[1]。碰撞瘤可以发生在肺部、中枢神经系统、消化系统、淋巴系统、子宫、卵巢、肾上腺等部位[2]，发生于卵巢的碰撞瘤较为少见，且几乎均为上皮细胞、生殖细胞、或性索间质细胞来源[3]，大多由其中的 2-3 中组织成分构成，表现形式多样。**卵巢碰撞瘤的影像学表现**：碰撞瘤中上皮源性的肿瘤体积常较大，而生殖细胞或者性索间质来源的肿瘤体积则相对较小；生殖或性索间质细胞来源的卵巢肿瘤常贴附于上皮来源肿瘤的囊壁上或位于囊变区内，但不同肿瘤成分之间相互邻近、分割明确但无混合；卵巢碰撞瘤典型的表现是囊中瘤或囊壁瘤。卵巢碰撞瘤的影像学表现与病变内部所含成分相关，它包含组成碰撞瘤的各种肿瘤的典型影像学表现：如囊腺瘤主要表现为多房囊性肿物，其内可见分隔及壁结节；畸胎瘤内可以看到脂肪或钙化；性索间质细胞来源的肿瘤多表现为较均匀强化的实性结节成分。目前国内外报道的卵巢碰撞瘤多为两种肿瘤组织的混合，由上皮细胞、性索间质细胞及生殖细胞三种成分组成的碰撞瘤极为罕见，国内外文献报道亦相对少见。本病例同时包含三种成分，且影像学表现典型。

Time-slip 技术在肾动脉无对比剂成像的应用价值

姜茗,谭威
锦州医科大学附属一院

目的 探讨采用时空标记动态磁共振技术(Time-Spatial Labeling Inversion Pulse ,Time-Slip)在无对比剂肾动脉的应用价值。**方法** 使用 Toshiba Elan1.5T 磁共振对 40 例患者行 Time-Slip 及对比增强（CE-MRA）肾动脉磁共振血管成像，分别测量肾动脉信噪比（SNR），肾周脂肪对比噪声比（CNR），对原始图像再进行最大密度投影（MIP）重建。由两位资深诊断医生对两组图像评价图像质量，并做统计。**结果** Time-slip 及 CE-MRA 肾动脉血管成像分别显示了 40 例患者总共 84 支肾动脉（80 支主肾动脉和 4 支副肾动脉），Time-slip 组及 CE-MRA 组的 SNR 分别为 113.4±12.7 和 92.5±11.4（t=-3.226,P<0.001），CNR 分别为 92.8±11.6 和 81.4±9.8（t=-3.557,P<0.001）Time-slip 的 MIP 图像比 CE-MRA 图像质量好，并且对于肾动脉远端分支 Time-slip 图像显示较 CE-MRA 清楚。**结论** Time-slip 技术进行肾动脉成像，无需用对比剂即能得到较高 SNR 的肾动脉图像,且图像质量较 CE-MRA 好，为临床提供一种新的可靠的影像学检查方法。

Combining clinical characteristics and specific MRI features to predict placenta accreta

Caiting Chu,Ming Liu,Yuzeng Zhang,Shuhui Zhao,Wenhua Li,Dengbin Wang
Xinhua Hospital affiliated to Shanghai Jiao Tong University School of Medicine

Objective: To explore the independent clinical and magnetic resonance imaging (MRI) performance risk factors for predicting placenta accreta.
Methods: From January 2012 to December 2015, We retrospectively reviewed the clinical characteristics and MRI features of 97 patients. Of these, 42 were confirmed to placenta accreta by pathological results or cesarean delivery findings. We tried to identify the independent risk factors by multivariate logistic regression model for significant differences in variables determined by univariate analysis.
Results: The multivariate logistic regression model indicated that two or more instances of previous cesarean deliveries and/or abortions, placenta previa, and placenta- myometrial interface interruption were independent risk factors for placenta accreta. The odd ratios were 3.79 for patients who had two or more instances of previous cesarean deliveries and /or abortions, 0.04 for marginal/partial placenta previa, 0.024 for complete placenta previa , and 6.56 for placenta-myometrial interface interruption. The values of accuracy and positive prediction by combination of a single clinical risk factor and placenta- myometrial interface interruption and of positive prediction by combination of all three risk factors for predicting placenta accreta were raised to 83.5%, 75% and 92.9%, respectively. We obtained three different risk groups by different combination of all three risk factors.
Conclusions: The study suggested that two or more instances of previous cesarean deliveries and/or abortion, placenta previa and placenta-myometrial interface interruption were independent risk factors for placenta accreta. Combination of a single clinical risk factor and MRI risk factor can improve the diagnosis of placenta accreta and combination of all three risk factors could help to recognize patients with placenta accreta.

沟槽状胰腺炎的影像诊断

曹琳
天津医科大学第二医院

目的

沟槽状胰腺炎(groove pancreatitis,GP)是一种特殊的慢性节段性胰腺炎,由于其发病部位特殊且临床 表现与胰头部肿瘤相似,术前诊断十分困难。GP 发病率较低,目前尚无确切发病率统计,国内对此报道甚少,许多临床医师对此病仍较为陌生。现就我院一例疑似 GP 患者的临床及影像特征并结合近年相关文献报道，总结分析沟槽状胰腺炎的影像诊断思路，以提高和加强对该病的认识。

方法

回顾性分析我院疑似沟槽性胰腺炎患者，收集血清学和影像学资料并结合文献报道，研究沟槽胰腺炎的临床和磁共振成像特征。

结果

GP 主要表现为餐后腹痛,同时可伴有恶心、呕吐、体重进行性下降,通常不合并黄疸、脂肪泻、糖尿病 等症状。 查体可有上腹部压痛。GP 高危人群是既往有慢性饮酒病史的 40 ~ 50 岁男性。血清学检查方面,GP 患者可有脂肪酶、淀粉酶、转氨酶的轻度升高,CEA、 CA19-9、CA125 等肿瘤标记物在正常范围。

影像表现可见如下表现：①CT 扫描中可见“片状样”低密度、低强化肿块,胆总管可有轻度 扩张,在动态强化扫描中,呈强化延迟; ②MRI 扫描中 T1WI 为低信号,T2WI 为低信号至稍高信号; 在增强扫描中表现为一种延迟、渐进性、不均匀强化; 十二指肠降段增厚，常伴有十二指肠降段增厚壁内囊性病变。

结论

我们的研究结果表明，MR 成像具有可识别的成像特征，有助于沟槽胰腺炎诊断。 这些特征包括以下内容：①十二指肠降段的局部增厚; ②十二指肠降段的局部异常增强; ③胰腺小乳头区域（十二指肠降段）的囊性改变。

CT and MRI appearance of the ovarian dysgerminoma: emphasis on the laterality, calcification and ovarian vascular pedicle

Shuhui Zhao,Fan Sun,Caiting Chu,Dengbin Wang
Xinhua Hospital Shanghai Jiao Tong University School of Medicine

Purpose: To investigate CT and MRI appearance of the ovarian dysgerminoma,emphasis on laterality, calcification and ovarian vascular pedicle.

Method: This retrospective study included 24 primary ovarian dysgerminomas in 20 patients. The followed imaging features of the tumors were assessed: (i) location, shape, and size; (ii) fibrovascular septa; (iii) necrosis, hemor-rhage, calcification; (iv) ovarian vascular pedicle; (v) lymphadenopathy; and (vi) ascites; (vii) hydronephrosis.

Result: Fourteen of 20 (70%) patients has a dysgerminoma in the right ovary. Even in the 4 bilateral cases, the size of the right tumos was lager than that of the left tumors .Typical fibrovascular septa was observed in 12 of the 24 (50%) tumors. Calcification was present in 6 of the 10 (60%) tumors in CT. Ovarian vascular pedicle sign was showed in 20 of the 24 (83.3%) tumors. Lymphadenopathy was found in 6 of 10 (60%) patients. Hydronephrosis was present in 6 of 16 (37.5%) cases.

Conclusion: Dysgerminoma was dominantly located in the right ovary. Calcification and ovarian vascular pedicle sign is helpful in diagnosis of the ovarian dysgerminoma.

Quantitative analysis of multiphase magnetic resonance images may assist prediction of histopathological grade of small hepatocellular carcinoma

Yueming Li[1], Xuru Xu[1,2]
1. The First Affiliated Hospital of Fujian Medical University
2. Zhongshan Hospital affiliated to Xiamen University

ABSTRACT
OBJECTIVE: This study aimed to investigate whether preoperative quantitative analysis of multiphase magnetic resonance images may assist to predict the pathological grade of small hepatocellular carcinoma.
METHODS: Forty nine patients underwent multiphase magnetic resonance imaging and were retrospectively reviewed. Routine unenhanced MRI and post gadobenate dimeglumine (Gd-BOPTA) enhanced MRI were preoperatively performed. Signal intensities (SI) were measured within the designated regions of interest (ROI) including the lesion and paraspinous muscles. The lesion-to-paraspinous muscle relative contrast ratio on T2W, DWI, and dynamic phase Gd-BOPTA enhanced T1W imaging were calculated and statistical analysis was performed to determine predictive power for histological grade.
RESULTS: The forty nine cases included three well differentiated (WD) HCCs, 36 moderately differentiated (MD) HCCs, and 10 poorly differentiated (PD) HCCs. There was a negative correlation between the relative contrast ratio and small hepatocellular carcinoma pathological grade in the arterial phase ($\rho = -0.305$, $P < 0.05$). However, there was no correlation between relative contrast ratio in other phases and pathological grade of small hepatocellular carcinoma(all $P > 0.05$). In addition, there was also no correlation between tumor margin, tumor location, cystic/necrotic change, intratumoral fat, enhancement pattern, tumor capsule, tumor boundary or tumor size among any of the differentiation categories (all $P > 0.05$).
CONCLUSION: The lesion-to-paraspinous muscle relative contrast ratio on arterial phase Gd-BOPTA enhanced T1W imaging may be useful for the prediction of the histological characteristics of small hepatocellular carcinoma.

MRI 流入反转恢复序列在肾动脉成像中的应用

谢兴佳[1,2], 邵天喜[1,2], 白艳[1,2], 布璟[1,2], 张傲[1,2]
1. 湖北省随州市中心医院
2. 湖北医药学院附属随州医院

【摘要】**目的** 肾动脉增强磁共振血管成像 （contrast enhancement MRA，CE -MRA）虽然是非侵入、无辐射的，曾经被认为是比较安全的血管成像方法，但随着含钆对比剂的使用与肾纤维化的相关报道增多，人们对使用磁共振对比剂的顾虑也加重，因此非对比剂增强 MRA 备受关注，本研究

运用 MRI 平衡式稳态自由进动流入反转恢复（IFIR）序列对肾动脉进行非对比剂增强成像，探讨 IFIR 技术在肾动脉成像中应用。

方法 收集我院 2018 年 4 月至 2019 年 6 月心血管内科病房有肾动脉病变临床特征的高血压患者 25 例，均运用无对比剂肾动脉血管成像 IFIR 序列和对比剂增强 LAVA-Flex 序列进行肾动脉 MRA 成像，对扫描图像在 AW4.6 工作站进行后处理，由 2 名诊断医生分析血管显示及其分支，将 IFIR 序列肾动脉 MRA 检查结果与同期对比剂增强 MRA 检查结果做对比分析，统计肾动脉成像情况及狭窄率。

结果 25 例患者均成功扫描，共获得肾动脉 58 支，其中 55 支可测量肾动脉狭窄率。IFIR 序列 MRA 与对比增强 MRA 对肾动脉显示图像质量评价结果差异无统计学意义（$p>0.05$）；IFIR 序列 MRA 与对比增强 MRA 显示肾动脉狭窄率分级评价结果差异无统计学意义（$p>0.05$）。

结论 ：IFIR 序列在评价肾动脉狭窄上与对比增强 MRA 一致性好，且简便、安全、经济及可靠，拥有广泛的应用前景。

磁共振注水中、低位直肠癌的检查应用

张傲[1,2],吴扬[1,2],陈顺新[1,2],谢兴佳[1,2],包艳森[1,2]
1.湖北省随州市中心医院
2.湖北医药学院附属随州医院

【摘要】 目的 随着近年来，中、低位直肠癌的患病率逐年升高，以及各种多元化检查方法的普及，MRI 检查目前已成为直肠癌术前评估的重要检查方法。根据 MRI 对软组织分辨率高，能多平面、多参数、多方位成像这些优点，本研究主要探讨 MRI 注水直肠检查，加上 LAVA-FLEX 序列增强检查观察直肠壁内和盆腔的改变。尤其 MRI 注水直肠成像对直肠肿瘤的分期以及鉴别术后肿瘤的复发与盆腔淋巴结转移有一定的意义。

方法 患者在检查床上取侧卧位，向直肠内注入 300ml 生理盐水，采用 GE1.5T 或 3.0T 磁共振的 LAVA-FLEX、T2WI 序列以及两组 B 值（500-1000）DWI 序列进行扫描，之后对患者注射对比剂采用 LAVA-FLEX 序列进行增强扫描，对其诊断结果进行总结。

结果 磁共振的 LAVA-FLEX、T2WI 序列以及两组 B 值（500-1000）DWI 序列检查图像效果满意，LAVA-FLEX 序列增强能较好的显示病变的大小、部位及对邻近解剖结构的侵犯。相对优于肠镜，不仅时间短、对患者无创伤，而且还可以多平面，多方位的观察腔内及腔外的情况，并观察盆腔是否有淋巴结转移。

结论 磁共振注水直肠并且采用磁共振的 LAVA-FLEX、T2WI 序列以及两组 B 值（500-1000）DWI 序列能很好的显示直肠内壁及外壁的情况，能清楚的显示肿瘤的位置，软组织分辨率高，是评估直肠癌以及直肠癌分期的重要检查方法。

探讨对比口服对比剂与不口服对比剂 MRCP 检查

赵如贞
中山大学附属第三医院

目的 探讨对比口服对比剂与不口服对比剂在磁共振胰胆道成像(MRCP)检查中的图像质量。**方法** 我院 2019.3.1 至 2019.3.31 需做 MRCP 检查的患者 5 名口服对比剂和 5 名不口服对比剂分别进行 MRCP 扫描,观察并比较胃、十二指肠信号丢失情况及胆道系统图像质量。**结果** 口服对比剂扫描

胆总管、胆胰壶腹、胰管及胆囊的图像质量均优于不口服对比剂，但不口服对比剂的图像亦可清楚显示胆总管、胆胰壶腹、胰管及胆囊，达到明确诊断的要求。**结论** 口服对比剂扫描 MRCP 优于不口服对比剂，但是对于部分病重患者因不能口服对比剂和水亦可检查 MRCP 达到诊断的要求。

子宫腺瘤样瘤与子宫肌瘤磁共振征象的对比分析

张芳
天津市第三中心医院

目的 探讨子宫腺瘤样瘤和子宫肌瘤的 MRI 征象，以提高对两病的认识和鉴别。
方法 回顾性分析、对比经手术病理证实的 25 例子宫腺瘤样瘤和 79 例子宫肌瘤的 MRI 表现。
结果 子宫腺瘤样瘤和子宫肌瘤好发年龄均为中年妇女，部位以肌壁多见，平均直径约 3.7～3.9cm，前者呈囊性病变伴实性结节或实性肿块，实性肿块 T1WI 呈等信号，T2WI 多呈均匀低信号，大部分均匀强化且强化程度多低于宫肌，较少出现假包膜；后者呈实性肿块，T1WI 呈等信号，T2WI 呈均匀或不均匀低信号，内常见斑片高信号、高信号分隔征，呈均匀或不均匀强化且强化程度多等于或高于宫肌，时常可见假包膜。
结论 子宫腺瘤样瘤 MRI 与子宫肌瘤 MRI 表现相似，T2WI 高信号分隔征、强化程度等高于宫肌及出现假包膜是肌瘤区分 AT 的特征表现，单发囊实性结节或实性结节 T2WI 呈均匀低信号、均匀强化且强化程度低于宫肌时需考虑到腺瘤样瘤可能，最后确诊依靠病理。

PU-1224
磁共振多模态扫描对 T2DM 患者治疗后肝脏、胰腺脂肪的变化的研究

以济兴
广西医科大学第一附属医院

目的 评价西门子 3.0T 磁共振系统成像技术测量 2 型糖尿病患者治疗前后肝脏、胰腺脂肪含量的对比，探讨治疗 6 个月后 T2DM 患者肝脏、胰腺、腹腔内脂肪含量的变化。
材料与方法 本研究纳入 18 例临床诊断为 T2DM 的患者，依据中国 2 型糖尿病防治指南(2013 版)推荐的生活方式干预法配合药物来控制血糖和体脂，治疗周期为 6 个月。所有患者于治疗前、后分别在西门子 3.0 T 磁共振成像系统上进行水脂分离技术和 MRS 脂肪定量扫描。图像采集完成后，通过快速脂肪定量和手工勾画感兴趣区(region of interest，ROI)两种不同的方式分别对肝脏、胰腺的平均脂肪含量进行定量分析。最后采用 SPSS 20. 0 软件进行数据分析。分类资料采用百分比(%)表示。应用 Spearman 方法进行各类 FF 百分比的相关性分析。检验水准(α)为 0.05。
结果 通过比对每一位受试者在各序列测得的 FF 值，得出 Screening Dixon 与 ME Dixon 测得的 FF 值高度正相关(r=0.827、0.953、0.950，P< 0.001)；Screening Dixon 及 ME Dixon 与 Histo 测得的 FF 值高度正相关(r=0.963、0.843、0.956、0.945，P<0.001；)。
结论 运用经过改良的 ME Dixon 技术，可一次采集获得 ME 图像，并可在 FF 图中自由测得任何所需的 FF 值，此技术对于 T2MD 患者肝脏、胰腺脂肪含量的测定结果较为真实、可信。该检查快速、可靠、无创，对于 T2MD 预后的评估、随访和干预监测均具有一定的临床价值。

PU-1225
多模态 MRI 对位于子宫肌层的富于细胞型肌瘤及子宫肉瘤的鉴别诊断

熊域霖
重庆医科大学附属第一医院

目的 探索磁共振成像(magnetic resonance imaging，MRI)定性及定量参数对位于子宫肌层的子宫肉瘤(uterine sarcomas, US)及富于细胞型肌瘤(cellular leiomyomas, CL)的鉴别价值。**方法** 回顾分析 2013 年 1 月至 2019 年 4 月间由我院病例证实的 44 例 CL 患者和 44 例 US 患者，术前均行 MRI、扩散加权成像(diffusion weighted imaging，DWI)及动态增强 MRI (dynamic contrast-enhanced MRI，DCE-MRI)检查。由 2 名有经验的放射科医生评估肿瘤的部位。将以上数据随机分为训练集及测试集。收集患者的年龄、临床表现、生育史、有无 CA125 及乳酸脱氢酶（LDH）升高，并分析并比较两组患者肿瘤在 MRI 定性图像特点、DWI 及 DCE-MRI 半定量参数方面的差异性。**结果** 训练集共纳入 22 例 CL 及 14 例 US，测试集共纳入 13 例 CL 及 10 例 US。阴道异常流血、T2WI 边界不清、实质 T2WI 混杂信号、mADC<1.029×10^{-3} mm^2/s、肿瘤内部出血、中央坏死为 US 的重要预测因子，另外 US 的时间信号强度曲线更多的表现为 III 型(P<0.001)。患者的年龄、生育史、CA125 及 LDH 水平、T2WI 相对信号强度、实质 DWI 信号、肿瘤的大小、早期强化率 (early enhancement ratio，EER)、最大对比增强率(maximum contrast enhancement ratio，MCER)无统计学差异。利用逻辑回归计算变量的参数估计值，5 个指标的总分大于等于 4 分时，诊断子宫肉瘤的敏感性、特异性、正确率、阳性预测值、阴性预测值分别为 90.91%、92.31%、95.65%、100%、92.31%。**结论** 多参数 MRI 在 US 与 CL 的鉴别诊断中具有重要价值。

PU-1226
重复使用碘对比剂对正常 wistar 大鼠肾脏功能的影响及功能磁共振评价的实验研究

王永芳
山西医科大学第一医院

目的 研究重复注射碘克沙醇对正常大鼠肾脏影响及最短的时间间隔。材料和**方法** wistar 大鼠 42 只，随机分为 2 次注射组（15 只），1 次注射组（5 只），对照组（5 只）与注入碘克沙醇 1h 后扫描 BOLD。2 次组按重复注射间隔分为 1 天组，3 天组，5 天组。余 17 只大鼠间隔 1 天重复注射碘克沙醇后 1h、1d、3d、5d、10d 扫描 BOLD。**结果** 各组间 1h 带 R2*值比较得出，间隔 1 天组，间隔 3 天组较 1 次组 R2*差异有统计学意义（p<0.05），5 天组 R2*与 1 次组比较差异无统计学意义（p>0.05）。间隔 1 天组内不同时间点与基线相比在第 5 天 ISOM 带 R2*值差异有统计学意义（p<0.05），病理显示在第 5 天肾脏损伤仍存在。**结论** 短期内重复注射碘克沙醇会加重大鼠肾脏损伤，引起对比剂诱导的急性肾损伤的发生。

PU-1227

Resveratrol Protects against Post-contrast Acute Kidney Injury in Rabbits with Diabetic Nephropathy

Yongfang Wang
First Hospital of Shanxi Medical University

Objective: Resveratrol (Res) is known as a multi-functional polyphenol compound that has protective functions in acute kidney diseases. Here, we aimed to examine whether the resveratrol could ameliorate post-contrast acute kidney injury (PC-AKI) following diabetic nephropathy (DN), and to explore its underlying mechanism(s) *in vivo* and *in vitro*. **Materials and Methods:** Twenty-four rabbits with DN were randomly divided into four groups: control (Cont), resveratrol (Res), iohexol (PC-AKI), and resveratrol plus iohexol (Res+PC-AKI) groups. Functional magnetic resonance imaging, renal histology, blood and urinary biomarkers, silent information regulator 1 (SIRT1), peroxisome proliferator-activated receptor gamma coactivator-1 alpha (PGC-1α), hypoxia-inducible transcription factor-1α (HIF-1α), and apoptosis-associated protein expression were assessed in *ex vivo*. For *in vitro* experiments, renal tubular epithelial (HK-2) cells subjected to high glucose conditions were treated with resveratrol, Ex527, or 2-methoxyestradiol (2-MeOE2) before treatment with iohexol. **Results:** Compared to the PC-AKI group, levels of cystatin C and urinary neutrophil gelatinase-associated lipocalin were all decreased; pure molecular diffusion (*D*), and the fraction of water flowing in capillaries (*f*) increased, while the apparent relaxation rate (*R2**), renal injury score and apoptosis rate decreased; moreover, protein expression levels of SIRT1and PGC-1α increased, and those of HIF-1α and apoptosis-associated protein decreased in the Res+PC-AKI group. In addition, iohexol decreased HK-2 cell survival and increased the cell apoptosis rate; results were reversed after treating cells with resveratrol. **Conclusion:** Resveratrol reduced renal hypoxia, mitochondrial dysfunction and renal tubular cell apoptosis by activating SIRT1-PGC-1α-HIF-1α signaling pathways in PC-AKI with DN.

肝脏含脂质肿瘤患者的磁共振 ＤＷＩ影像应用

范建锋
镇平县人民医院

目的 探讨磁共振 ＤＷＩ影像在肝脏含脂质肿瘤患者鉴别诊断中的应用价值。方法 对２０１７年１月至２０１８ 年１月在医院确诊的１２０例肝脏含脂质肿瘤患者进行回顾性分析，经病理诊断恶性肿瘤５０例，良性肿瘤７０例。采用磁共 振 ＤＷＩ影像技术对患者的表观扩散系数（ＡＤＣ）值和 ＡＤＣ 肿瘤／ＡＤＣ 肝脏（ｒＡＤＣ）值进行检测，对常规 ＭＲＩ检测患者良 恶性的比例进行记录，比较 ＭＲＩ、ＡＤＣ和ｒＡＤＣ鉴别肝脏含脂质肿瘤患者良恶性的准确度。结果 含脂质肝细胞癌患者、 肝腺瘤患者和肝脏血管平滑肌脂肪瘤患者的 ＡＤＣ值分别为（１．２１５±０．２２３）×１０－３ ｍｍ／ｓ、（１．３１９±０．２１３）×１０－３ ｍｍ／ｓ和（１．３１８±０．２９８）×１０－３ ｍｍ／ｓ，含脂质肝细胞癌患者、肝腺瘤患者和肝 脏血管平滑肌脂肪瘤患者的ｒＡＤＣ值分别为（１．００５±０．１５１）、（０．９８５±０．１４５）和（１．０２８±０．２２４），三者的 ＡＤＣ值和ｒＡＤＣ值差

异无统计学意义（摩＞０．０５）。ＭＲＩ检测 恶性肿瘤恶性４４例（８８．００％）、良性６例（１２．００％），检测良性肿瘤良性５１例（７２．８６％）、恶性１９例（２７．１４％），其数据比较 差异有统计学意义（摩＜０．０５）。ＭＲＩ鉴别肝脏含脂质良恶性肿瘤的灵敏度、特异度和准确度分别为８８．００％、７４．５０％和 ８１．００％，ＡＤＣ值鉴别肝脏含脂质良恶性肿瘤的灵敏度、特异度和准确度分别为２１．００％、８０．００％和６４．２１％， ｒＡＤＣ值鉴 别肝脏含脂质良恶性肿瘤的敏感度、特异度和准确度分别为８２．１０％、３２．１４％和６１．５０％，三者数据比较差异有统计学意 义（摩＜０．０５）。结论 ＡＤＣ值和ｒＡＤＣ值在肝脏含脂质肿瘤患者鉴别诊断中不具备诊断价值，ＭＲＩ检测能够成为鉴别诊 断肝脏含脂质良恶性肿瘤的重要依据。

PU-1229

压缩感知快速成像在肝脏动态成像中的应用

刘锴,陈财忠
复旦大学附属中山医院

目的 应用 3.0T 磁共振采用 Compressed Sensing（CS）技术对肝脏占位病例进行快速动态增强扫描，对所显示多组动脉期图像质量进行评估，评价其应用价值。

方法 随机选取临床诊断为肝局灶性病变患者 25 例行磁共振动态增强检查，扫描采用 United Imaging 3.0T MRI 使用压缩感知结合并采集快速成像序列完成肝脏动脉期成像。患者检查前禁食 7-8h，并在扫描前训练患者屏气，增强扫描体位选取仰卧位，扫描范围自膈顶至肝脏下极。采用 8 通道体部矩阵线圈，经肘静脉团注 Gd-DTPA, 剂量 0.1ml/kg，注射流速 1ml/s，追加生理盐水 20ml，注射流速 2ml/s 行动态增强扫描。注入造影剂后 20s 开始扫描动脉第一期，设置动脉期每期扫描平均时间 2s，整个动脉期扫描耗时 16s，时间分辨率为 2s，共获取 8 期动脉期成像。对各期相图像质量进行评分，绘制病灶及肝脏动脉强化曲线评价其临床可行性。

结果 一次屏气扫描所得 8 个动脉时相：第 1-5 期为动脉早期（只有动脉显影，门静脉不显影），后 6-8 期为动脉晚期（动脉和门静脉同时显示），所示动脉 8 期均为连续独立期相显示，动态强化曲线可描述病灶动脉早期至动脉晚期强化状态，可全程显示动脉强化过程。两名腹部磁共振医师对图像诊断一致性较好 kappa 评分为 0.915;图像质量评分为 3.67±0.48 和 3.72±0.56.

结论 CS 快速成像技术在肝脏增强的应用可以获得更多病灶血供信息，有广泛的应用前景。

PU-1230

多模态磁共振对早期宫颈癌盆腔淋巴结转移的评估

张晓苗,董越
辽宁省肿瘤医院

目的:探讨多模态磁共振在评估早期宫颈癌盆腔淋巴结转移中的应用价值。材料与方法:回顾性分析经病理证实的 57 例 IB1～IIA1 期宫颈癌患者，其中 19 人存在盆腔淋巴结转移，所有患者均行常规 MR 平扫、DWI 及 DCE-MRI 增强扫描。纳入术前磁共振检查与术后病理相对应淋巴结 94 枚（转移性淋巴结 30 枚，非转移性淋巴结 64 枚）。测量各淋巴结短径、DWI 相关参数（ADC）及 DCE-MRI 定量灌注参数（Ktrans、Kep、Ve），以及原发肿瘤的 DWI 及 DCE-MRI 相关参数。通过秩和检验对各

参数进行比较分析；通过 Logistic 回归模型拟合联合预测因子；绘制淋巴结短径、DCE-MRI 定量灌注参数及联合预测因子的 ROC 曲线，获取诊断界值。结果:转移性与非转移性原发肿瘤之间 ADC 值、Ktrans、Kep、Ve 均无统计学差异。转移淋巴结短径、ADC 值、Ktrans、Kep、Ve 均大于非转移淋巴结，且差异有统计学意义（P＜0.05）；淋巴结短径、ADC 值、Ktrans、Kep、Ve 的 ROC 曲线下面积分别为 0.834、0.849、0.784、0.648、0.703；Logistic 回归表明淋巴结短径、ADC 值以及 Ktrans 值为淋巴结转移的独立影响因子，三者的联合预测因子 prel 的曲线下面积为 0.930。结论:DWI 及 DCE-MRI 无法表明早期宫颈癌患者原发肿瘤的转移潜能。淋巴结短径、DWI 及 DCE-MRI 均可用于评估早期宫颈癌患者盆腔转移淋巴结，以三者联合评估结果最佳。

PU-1231

Gd-EOB-DTPA 增强 MRI T1 mapping 及 DWI 在肝细胞癌 TACE 术后摄取碘油预测研究

覃夏丽,黄仲奎
广西医科大学第一附属医院

目的 探讨 Gd-EOB-DTPA-MRI T1 mapping 及 DWI 在肝癌 TACE 术后碘油沉积预测价值。
材料与**方法** 收集 TACE 术前行 Gd-EOB-DTPA-MRI T1 mapping 检查的 HCC 患者 34 例（共 46 个病灶），其中男 30 例，女 4 例，年龄 34~71 岁(平均 54.53±9.81 岁)。根据 TACE 术后上腹部 CT 评估碘油沉积的情况，将碘油沉积率≥50%的 HCC 病灶分为碘油沉积好的组（LGU），碘油沉积率<50%的为碘油沉积差的组（LPU）。测量病灶的 ADC 值（DWI b=800s/mm^2）、20min 肝胆期病灶和非瘤肝实质的 T1 值，并计算肝胆期病灶相对非瘤肝实质 T1 值增加率[$T1_{(L-H)/H}$ (%)]。用 Pearson 相关和 T 检验分析 ADC 值、$T1_{(L-H)/H}$ (%)与碘油沉积率的相关系，绘制 ROC 曲线评估以上参数对于鉴别两组不同碘油沉积率 HCC 的诊断效能。
结果 46 个 HCC 病灶中 21 个（45.65%）为 LGU 组，25 个（54.35%）为 LPU 组。LGU 和 LPU 的 ADC 值（mm^2/s）、$T1_{(L-H)/H}$ (%)分别为 940.25±156.05、935.72±138.72，265.77±91.72、173.31±94.16。LGU 和 LPU 的 $T1_{(L-H)/H}$ (%)差异有统计学意义（p<0.01），与 HCC 的碘油沉积率呈中等正相关（r=0.452，p<0.01），对于区分 LGU 和 LPU HCC 的敏感度和特异度分别为 76.0%和 85.7%，AUC 为 0.787，最佳阈值分别为 205.85%。ADC 值与碘油沉积率无统计学差异（p>0.05）。
结论 Gd-EOB-DTPA-MRI T1 mapping 的相关参数 $T1_{(L-H)/H}$ (%)对于预测 HCC TACE 术后碘油沉积有一定的价值。TACE 术前 HCC 的 ADC 值与碘油的沉积率无相关性。

PU-1232

产前 MRI 检查在胎盘植入中的诊断价值

金晶,赵红
安徽医科大学第二附属医院

[摘要] 目的:分析 MRI 在胎盘植入产前诊断中的影像特征及应用价值。资料和方法:回顾性分析 44 例产前怀疑胎盘植入患者的 MRI 影像表现和临床术后资料，以分娩术后有无胎盘植入为金标准，分为 20 例无胎盘植入对照组和 24 例胎盘植入组，分别对胎盘异质性、胎盘-子宫肌层交界面分界不清、子宫下段向外膨隆伴局部胎盘明显增厚、胎盘血管增粗增多、膀胱局部“帐篷”状改变或结节状突起五种间接征象，采用二元 Logistic 回归进行单因素和多因素的分析，比较 MRI 征象在两组间的差异性。结果:胎盘的异质性诊断胎盘植入的 OR 值为 17.017（*P*=0.005）； 子宫下段膨隆伴局部胎盘明显增厚,诊断胎盘植入的 OR 值为 6.712（*P*=0.049）。多因素分析时胎盘的异质

性和子宫下段膨隆伴局部胎盘明显增厚诊断胎盘植入的 OR 值分别为 13.542（P=0.004）和 7.145（P=0.038）。**结论** 胎盘的异质性以及子宫下段膨隆伴局部胎盘明显增厚两个征象对胎盘植入的诊断具有很高的应用价值。

PU-1233
环状分子钆螯合物钆特酸葡胺 在前列腺增生的效果评价及与线状分子钆螯合物的比较

范宪淼,郑晓林*,邹玉坚,袁灼彬,沈海平
东莞市人民医院

目的 旨在评价环状分子结构钆螯合物 MRI 对比剂（钆特酸葡胺）对前列腺增生的增强效果和诊断价值，并与线状分子结构钆螯合物对比剂进行比较。**方法** 回顾性分析 75 例前列腺增生患者的多期动态增强和延迟期增强 MRI 表现，测量和观察钆特酸葡胺（观察组）和 3 个对照组：钆喷酸葡胺（Magnevist）、钆喷酸葡胺（Consun）和钆双胺（OMNISCAN）对增生结节的强化程度、对比噪声比、动态增强曲线形态及包膜显示的清晰程度，应用方差分析和 X^2 检验进行比较。**结果** 观察组和 3 个对照组的年龄、血清 PSA 水平和前列腺增生结节的大小均无显著性差异。在动态增强，观察组和 3 个对照组的前列腺增生结节基础信号强度、最大信号强度、增强幅度和上升斜率均无显著性差异。在延迟期扫描序列，观察组增生结节包膜的强化信号强度、包膜与闭孔内肌之间的 CNR 明显高于对照组（p 均<0.05）；各组结节实质的信号强度无显著性的差异，而观察组结节实质与闭孔内肌的 CNR 高于对照组 4（欧乃影）(F=6.79,p=0.00)，但与其他对照组无显著性差异。增生结节包膜显示例数在观察组明显高于 3 个对照组（X^2=127.9，p=0.00）。**结论** 环状分子结构钆特酸葡胺在 MRI 动态增强中，增强效果与线状分子结构对比剂相同，而其曲线类型更接近良性病变表现；延迟期强化所显示增生结节包膜强化更明显，表明其增强效果优于线状分子结构的对比剂。

磁共振 mapping 定量技术检测肩关节软骨退变的对比分析

王曦
武汉市中心医院

摘要：目的 采用 T1mapping、T2mapping 定量技术评价肩关节软骨退变程度，探讨两种技术对肩关节软骨退变的诊断价值。方法 肩关节退变的患者 50 例，正常对照组志愿者 20 例行肩关节平扫和 T1、T2 mapping 成像，后处理得伪彩图，将肩关节软骨三等分，测量每等分中心部位的 T1 值、T2 值，比较病例组与对照组间的 T1 值、T2 值差异。结果 病例组内中外带 T1 值均明显高于正常对照组，病例组内中外带 T2 值均明显低于正常对照组，两组之间 T1 值、T2 值均存在明显差异。结论 T1、T2mapping 技术可用于评价肩关节软骨成分与退变程度。

T1 mapping 评估足底筋膜炎体外冲击波治疗疗效的价值

马孟杰,梁建业,肖泽宇,罗良平
暨南大学医学院第一附属医院/广州华侨医院

目的 探究磁共振 T1 mapping 用于定量评估足底筋膜炎患者体外冲击波治疗疗效及疗效预测的应用价值。 **方法** 对符合条件的 23 例足底筋膜炎患者进行一个疗程（三次）体外冲击波治疗，一个星期一次，分别于首次冲击波治疗前、治疗后 4 小时以及复查时进行磁共振矢状位及冠状位的 T1WI、T2WI 及 T1 mapping 序列扫描，在治疗前及复查时行视觉模拟评分法（visual analogue scale，VAS）进行疼痛评价。采用配对样本 t 检验比较治疗前与复查时筋膜、肌肉、脂肪垫 T1 值及 VAS 评分的差异，同时采用 Pearson 相关分析上述感兴趣区首次治疗前后 T1 值变化量与 VAS 变化量的相关性。 **结果** 经一个疗程体外冲击波治疗后，筋膜炎患者筋膜、肌肉、脂肪垫 T1 值及 VAS 评分均有不同程度降低。筋膜（*r=0.837，P＜0.001*）、肌肉（*r=0.560，P=0.005*）、脂肪垫（*r=0.667，P=0.001*）的 T1 值变化量与 VAS 评分变化量具有良好的相关性。 **结论** T1 mapping 技术可以有效评估体外冲击波治疗疗效，且短期治疗后的 T1 值变化能有效预测远期治疗疗效。

腹腔干作为胸椎 MRI 定位标志的可行性

杜亭亭
绵阳市中心医院

[摘 要] **目的** 探讨腹腔干作为胸椎 MRI 定位标志的可行性。**方法** 观察 100 例胸椎 MR 扫描定位像上腹腔干的形态特点。参考 MR 定位像腹腔干形态表现，回顾性分析 531 例行胸部及全腹部增强 CT 检查的患者。在图像后处理工作站，采用多平面重建(MPR)、容积再重建(VR)成像，观察腹腔干起始部在脊柱中的水平位置。由三组技师分别按照 L1 椎体或脊髓圆锥定位法、大视野定位法、腹腔干定位法完成定位任务，比较其准确性和耗时时间。**结果** MR 定位像腹腔干形态大多具有特定表现，多位于胸 12 椎体。531 例患者中，腹腔干起始部位置：8 例（2%）位于 T11/T12 椎间隙及以上水平，217 例（41%）位于 T12 椎体水平，170 例（32%）位于 T12/L1 椎间隙水平,136 例（25%）位于 L1 椎体及以下。三种定位测试结果与 MR 定位像观察结果大致相似。**结论** 依据 MR 定位像上腹腔干典型形态，结合三种定位测试结果位置，确定腹腔干作为胸椎 MRI 定位标志为胸 12 椎体，可以有效判断胸椎位置。尤其对于急诊胸椎外伤，腹腔干可对椎体骨折部位作出初步定位。

膝关节腔囊性病变的磁共振影像诊断

张磊
山西医科大学第一医院

膝关节解剖结构复杂，韧带、肌腱及固有滑囊较多，由于膝关节活动度大，容易受到伤害，该区域囊性病变发生率高，且种类较多。滑膜囊肿常见的有腘窝囊肿、鹅足囊肿、浅髌下滑囊囊肿、髌前滑囊囊肿等；交叉韧带囊肿属于关节内腱鞘囊肿；半月板囊肿常伴有半月板损伤。

腘窝囊肿为膝关节最常见的滑膜囊肿，由腘窝处腓肠肌内侧头与半膜肌滑囊积液形成，又称 Baker′s 囊肿。腓肠肌与半膜肌滑囊是正常解剖结构，位于腓肠肌内侧头与半膜肌肌腱之间，当发生关节炎、交叉韧带损伤、半月板损伤等关节疾病时关节积液增多，积液可从裂隙流入腘窝内滑囊引起滑囊积液，偶有滑囊破裂引起炎性病变。

浅髌下滑囊位于髌骨下方皮下，故又称髌下皮下滑囊，常因炎症、慢性劳损、外伤引起滑囊积液，MRI 多表现为椭圆形囊性病灶，当囊内出血时可见液-液平面。

交叉韧带囊肿又名交叉韧带腱鞘囊肿，是一种较为少见发生在关节内的疾病，多为单侧发病，前交叉韧带囊肿发病率多于后交叉韧带囊肿，常见于交叉韧带胫骨止点。
半月板囊肿发生于半月板内或者半月板周边，以半月板旁囊肿较为多见，其发生常与外伤、退变、半月板手术等有关。半月板旁囊肿常伴有半月板的水平撕裂，囊肿与半月板撕裂处相接，表现为半月板周围囊腔或者单纯液体聚集。

腰椎椎间小关节积液与腰椎稳定性的 MRI 相关性分析

顾敏,李康
中国科学院大学重庆医院（重庆市人民医院）

目的 通过回顾患者影像学资料，分析退变性腰椎滑脱患者腰椎椎间小关节积液是否与腰椎稳定性存在相关性。
方法 本研究回顾性分析我院脊柱外科 2016 年 9 月到 2019 年 3 月间来院就诊的 L4-5 节段腰椎退变性滑脱共 108 人。根据其滑脱节段的腰椎 MRI 中是否出现椎间小关节腔内积液将患者分为“无积液组”和“有积液组”后进行对比分析。对“有积液组”中的双侧椎间小关节积液宽度和与矢状位椎体动态滑移指数、椎体旋转度、双侧椎间小关节退变指数和及椎间盘退变指数之间进行相关性分析。
结果 “无积液组”和“有积液组”相比， “无积液组”的失稳率低于“有积液组”，“无积液组”动态滑移量及动态滑移指数小于“有积液组”，“无积液组”矢状位旋转度小于“有积液组”，“无积液组”椎间小关节及椎间盘退变程度均高于“有积液组”。对“有积液组”的相关性分析，双侧椎间小关节积液宽度和分别与矢状位椎体动态滑移指数、矢状位椎体旋转度成线性正相关；双侧椎间小关节积液宽度和分别与双侧椎间小关节退变指数和椎间盘退变指数成负相关。
结论 退变性腰椎滑脱症患者腰椎 MRI 上存在椎间小关节积液表现可提示滑脱不稳定，滑脱节段椎间小关节总积液量与腰椎的滑移不稳定性、旋转不稳定性成正相关，与双侧椎间小关节的退变程度、椎间盘的退变程度成负相关。本研究认为腰椎小关节积液量可有效预判腰椎在矢状位滑移和角度旋转上的失稳状态，能够较为全面的评估滑脱节段的稳定性，腰椎 MRI 中小关节积液量可帮助决策腰椎手术的治疗方案。

PU-1239
1.5T 场强下 3D 高分辨对比增强率磁共振臂丛神经成像的应用价值研究

孔祥闯,周臻阳
华中科技大学同济医学院附属协和医院

摘要：目的 探讨 1.5T 场强下，重 T2 加权 3D T2-SPACE-STIR 序列在臂丛神经走行、分布、与周围组织的对比以及相关疾病诊断的临床应用价值。
方法 连续随机搜集来我院行臂丛神经磁共振检查的患者共 85 例，随机分为两组 A 组和 B 组，分别在 3.0T 和 1.5T MRI 臂丛神经成像，采用对比增强重 T2 加权 3D T2-SPACE-STIR 序列扫描。由两位从事 10 年以上神经 MRI 诊断医生对两种场强下所得臂丛神经图像的显示及伪影进行评价
[h1] 并打分，测量特征点信噪比（SNR）,对比噪声比（CNR），计算其神经和背景组织的对比值（CR，contrast ratio），观察臂丛神经相关性疾病在该序列中的 MR 表现。**结果** （1） 3.0T 场强下所得臂丛神经图像得分较高（3.0T,18.3±1.2）；(1.5T,14.5±1.1)，两种场强下臂丛神经显

示情况均可以满足临床需求（大于 12 分）；（2）图像伪影评分，（4.1±0.7，1.5T）高于（2.9±1.4,3.0T）（P＜0.001），两者差异具有统计学意义；（3） 3.0T 场强下的 SNR 与 CNR 相较于 1.5T 为高，1.5T 场强下各对比组 CR 值均高于 3.0T，且神经相对肌肉的 CR 值有统计学差异。**结论** 1.5T 场强下对比增强重 T2 加权 3D T2-SPACE-STIR 序列臂丛神经成像可以满足临床上对臂丛神经疾病的诊断需求，且在抑制因压脂不均导致的图像伪影情况上要优于 3.0T，其各部位 CR 值相对 3.0T 均较高，说明 1.5T 图像在显示臂丛神经及分支与背景各组织间的差异性要更好，1.5T 下臂丛神经成像有其独到的优势。

PU-1240

磁共振 TWIST 技术在下肢血管中的应用

黄硕
华中科技大学同济医学院附属协和医院

目的 探讨磁共振 TWIST（Time-resolved angiography with stochastic trajectories）技术在下肢血管中的临床应用效果及价值。
方法 选取 2012 年 7 月到 2013 年 7 月于我院就诊的 56 例下肢血管病变患者为研究对象，其中下肢血管存在肿瘤病变者 24，血管性病变者 32 例。对参与本次研究的 56 例患者采取较为常规的核磁共振（MRI）平扫检测，静注造影剂（contrast media）后利用 TWIST 技术获取下肢动态血管造影，此后行常规磁共振增强扫描，对下肢血管疾病患者的临床资料、造影图像质量及下肢血管病变程度进行深入分析，并与数字减影血管造影（Digital subtraction angiography，简称 DSA）或术前术后病理结果进行反复比对研究。
结果 参与本次研究的 56 例患者均于我院成功接受磁共振 TWIST 检查，通过清晰的造影图像可以很直观地了解患者下肢动脉与静脉的结构状况与充盈程度，患有肿瘤性病变的患者肿瘤病变处的供血血管清晰分明，患有血管性病变的患者下肢曲折迂回的供血血管也可直观辨明。通过磁共振 TWIST 技术获得的诊断结果与相关手术病理诊断或数字减影血管造影诊断结果大致相同，仅个例存在差异。
结论 磁共振 TWIST 技术能有效提升动态血管造影图像的时间及空间分辨率，为医护人员的诊断决策提供必要的图像数据资料，使医生清晰直观地了解患者下肢血管病变情况，具有较高的临床使用价值。

Dante SPACE 序列在 3D 非对比增强高分辨率臂丛神经成像的临床研究

孔祥闯,孟洁
华中科技大学同济医学院附属协和医院

目的 比较 Dante SPACE 序列和重 T2 加权 SPACE STIR 臂丛神经成像技术的临床应用价值
材料和**方法** 随机选取在试验时间内来我院行臂丛神经检查的患者共 60 例，随机分为两组，在同一磁共振扫描仪上行臂丛神经检查，一组采用常规重 T2 加权臂丛神经扫描方法，另一组采用全新 Dante SPCAE 序列进行非增强臂丛神经扫描，主要对比增强后 SPCAE 序列与 Dante SPCAE 序列的 SNR 、CNR 和背景小静脉的信号值，判断二者的成像效果。所有实验对象扫描完成后，由两位经验丰富的放射学专家分别对两序列的四个特征部分进行五分法评分，得到主观评分，另外测量两序列中神经和各背景组织的信号值，计算其 SNR 和 CNR。

结果 两组所得图像均可满足临床上关于臂丛神经的诊断要求。 Dante SPACE 序列所得图像中，背景小静脉抑制良好，信号降低，神经对比突出，显示效果好，神经相对各背景组织的 CNR 高，Dante SPACE 组除在背景抑制方面优于常规 SPACE 组之外，在发现早期的神经肿瘤病变方面上亦优于常规 SPACE 组， Dante SPACE 序列组避免使用造影剂，无 NSF 发生。
结论 Dante SPCAE 序列基本满足临床诊断要求，可以不用注射对比剂来三维高分辨大范围显示臂丛神经走形。

PU-1242
MR 零回波时间成像与 CT 对显示骨肿瘤性病变的骨质破坏对比研究

许艳红
上海市第一人民医院

目的 采用零回波时间（zero echo time，ZTE）成像对骨肿瘤或肿瘤样病变的患者进行扫描，比较 ZTE 与 CT 两种扫描方法在评价骨质破坏方面图像质量方面的差别。**方法** 选取 36 例患者，其中男 1 **目的** 采用零回波时间（zero echo time，ZTE）成像对骨肿瘤或肿瘤样病变的患者进行扫描，比较 ZTE 与 CT 两种扫描方法在评价骨质破坏方面图像质量方面的差别。**方法** 选取 36 例患者，其中男 18 人（平均年龄 35±20 岁），女 18 人（平均年龄 42±20 岁）。采用 MR 仪器（GE 公司，750 W MR）进行扫描，该机器可以进行 ZTE 成像，所有患者均行 ZTE-MR 及 CT 检查，并比较两种成像对于骨肿瘤或肿瘤样病变的骨质破坏的评价，图像质量评分采用 5 分制方法。**结果** 共发现 13 种不同类型的骨肿瘤或肿瘤样病变，ZTE-MR 及 CT 检查在图像质量评分分别为（4.47±0.76）和（4.97±0.16），两者间无统计学差异（Z=-1.83，*P*=0.067）。ZTE-MR 及 CT 评价者之间一致性较好（K=0.84， K=1）。**结论** 本研究提示 ZTE-MR 可以产生与 CT 相似的骨质影像，评价骨质破坏具有很好的一致性。

PU-1243
心电门控非对比增强静息间隔单次激发 MR 血管成像在下肢动脉狭窄中的应用价值

杨明,迟彬,范文亮
华中科技大学同济医学院附属协和医院

目的 探讨心电门控非对比增强静息间隔单次激发 MR 血管成像（QISS MRA）在下肢动脉狭窄中的应用价值。**方法** 回顾性分析 2017 年 4 月至 12 月华中科技大学同济医学院附属协和医院，有下肢缺血表现且同时进行了下肢动脉 CTA 及 QISS MRA 检查的 30 例患者。患者均成功进行了下肢动脉 CTA 及心电门控非对比增强 QISS MRA 检查。将整个下肢动脉分成 19 段（腹主动脉下段、髂总动脉、髂内动脉、髂外动脉、股浅动脉、股深动脉、腘动脉、胫前动脉、胫后动脉、腓动脉）进行评价，2 名医师采用 4 分法对 QISS MRA 和 CTA 图像质量进行评分，并对动脉狭窄严重程度进行评估。同一患者不同检查方法狭窄程度及同一患者不同医师狭窄程度评分一致性的评价采用 Kappa 分析。**结果** 30 例患者共采集到 570 个血管段。医师 1 的 560/570（98.2%）段和 548/570（96.1%）段的图像质量被 CTA 和 QISS-MRA 评为优秀或良好（3、4 级），医师 2 的 561/570（98.4%）段和 544/570（95.4%）段的图像质量分别被 CTA 和 QISS-MRA 评为优秀或良好。医师 1 对 CTA 与 QISS MRA 的图像质量评分分别为（3.87±0.38）、（3.70±0.53）分，医师 2 分别为（3.86±0.40）、（3.68±0.54）分。QISS-MRA 上，570 个节段中仅 7 个（1.2%，7/570）节段得

到不能满足诊断图像质量的图像。2 名医师分别采用 CTA 与 QISS MRA 对不同节段血管狭窄程度评价的一致性良好，医师 1 对不同节段血管狭窄程度评价 CTA 与 QISS MRA 间的 Kappa 值为 0.714～0.939，医师 2 的 Kappa 值为 0.603～0.939；2 名医师间采用 QISS MRA 对不同节段血管狭窄程度评价的一致性良好，Kappa 值为 0.813～0.933。**结论** 在下肢动脉栓塞诊断中，QISS-MRA 具有较大价值。

磁共振弥散张量成像定量分析正常成人腰骶段神经根

李丽艳,郭云志,吴桂春
吉林省吉林市人民医院

目的 探讨正常成人 L4、L5、S1 神经根磁共振弥散张量成像(DTI)和神经纤维束示踪成像(DTT)的可行性及量化特征。

方法 20 名正常成人志愿者接受 3.0T 多源磁共振检查，采用选择性激励技术(PROSET)及 DTI 融合图像，分别在 L4、L5、S1 神经根的节前神经根鞘硬膜囊出行处、神经节和节后脊神经前支出椎间孔外口处三个不同水平设定兴趣区(ROI)测量左、右两侧神经根的各向异性分数(FA)值和表观弥散系数(ADC)值，同时进行神经根 DTT。

结果 20 名正常成人志愿者 PROSET、DTI 及 DTT 均成功，可以清晰显示 L4、L5、S1 神经根，测量其 FA 及 ADC 的均值分别为 0.56±0.10 和(0.94±0.53)mm^2/s，0.52±0.11 和(1.07±0.50)mm^2/s，0.48±0.11 和(1.18±0.45)mm^2/s；各神经根相同水平左、右两侧的 FA 值及 ADC 值差异均无统计学意义(P＞0.05)；各神经根 ADC 值除节前神经根鞘硬膜囊出行处水平差异无统计学意义外，其它水平各神经根之间的 FA 值、ADC 值差异均有统计学意义(P＜0.05)，且 FA 值变化呈 L4＞L5＞S1 趋势，ADC 值变化趋势反之；同一神经根在三个不同水平的 FA 值、ADC 值差异均有统计学意义(P＜0.05)，且 FA 值变化呈节前＜神经节＜节后趋势，ADC 值变化趋势反之。

结论 正常成人 L4、L5、S1 神经根 DTI 及 DTT 是可行的，与 PROSET 融合图像能够显示神经根走行并进行量化分析，为研究神经根病变提供了较全面的影像学信息。

PU-1245

正常 SD 大鼠小腿 7T 磁共振扩散峰度成像序列优化研究

梁晓莹[1],陈杰[1],肖叶玉[2,1],夏学文[2]
1.汕头大学医学院第二附属医院
2.广州市中西医结合医院

摘要：目的 采用 7T 磁共振单通道表面线圈和单通道体线圈对正常 SD 大鼠小腿行常用扩散峰度成像（DKI）序列及优化 DKI 序列扫描，探究正常 SD 大

鼠小腿 7T 磁共振 DKI 序列较佳扫描方案。**材料与方法** 应用 7T 磁共振，分别以表面线圈+常用 DKI 序列、表面线圈+优化 DKI 序列、体线圈+常

用 DKI 序列、体线圈+优化 DKI 序列四种方案扫描 20 只正常 SD 大鼠（均为雄性，8 周龄，体重约 300g）右小腿，记录四种扫描方案的扫描时

间，计算图像信噪比（SNR），并由 3 名经过专业培训的影像科医师对图像几何变形及伪影严重程度进行评价，分为 0-3 级（0 级-无，1 级-轻

度，2 级-中度，3 级-重度）。应用 Matlab 软件作数据后处理， Image J 软件测量大鼠右小腿腓肠肌感兴趣区（ROI）的平均峰度（MK）、径

向峰度（RK）、平均扩散率(MD)和各向异性分数(FA)值评估四种扫描方案的稳定性。采用 SNK-q 检验分析各组间图像信噪比的差异性，

P<0.05 认为差异具有统计学意义。**结果** （1）用表面线圈+常用 DKI 序列/优化 DKI 序列扫描的图像均出现明显的几何变形和伪影，而用体线圈
+优化 DKI 序列扫描的图像几何变形和伪影程度较体线圈+常用 DKI 序列轻；（2）表面线圈扫描图像 SNR 较体线圈+常用 DKI 序列高，较体线圈+
优化 DKI 序列低，且差异具有统计学意义（P<0.05）；（3）无论表面线圈或体线圈，优化 DKI 序列扫描时间均比常用 DKI 序列缩短约 47%；
（4）四种扫描方案中，体线圈+优化 DKI 序列扫描图像的 MK、RK、MD、FA 值的标准差最小，稳定性最高。**结论** 体线圈+优化 DKI 序列扫描方
案在 7T 磁共振上对 SD 大鼠小腿进行扫描的图像质量最高，为临床上开展腿部 DKI 序列扫描提供了参考依据。

PU-1246

四肢软组织黏液样脂肪肉瘤的磁共振诊断

范帆
福建省立医院

目的 探讨 MRI 在四肢软组织黏液样脂肪肉瘤诊断中的临床应用价值。**方法** 回顾性分析 5 例经手术病理证实的黏液样脂肪肉瘤的 MRI 表现。所有病例均行 MRI 平扫及动态增强扫描。**结果** 5 例均位于四肢深部软组织内，平扫呈不均匀长 T1 长 T2 信号，内可见分隔，2 例可见少许条片状短 T1 长 T2 脂肪信号，DWI 呈高信号为主，ADC 呈稍高信号，增强扫描呈条索状、斑片状渐进性强化，3 例周边轻微水肿。**结论** 黏液样脂肪肉瘤的 MR 表现有一定特征性，脂肪信号对肿瘤的诊断有重要意义。

PU-1247

布氏杆菌脊柱炎的 MR 表现

戴纪男,吕兴隆
赤峰市医院

目的 通过对布氏杆菌感染引起脊柱炎的 MR 表现进行回顾性分析，提高对该病的诊断水平。
方法 对近 10 年 52 例血清凝聚试验阳性的布病患者的 MR 图像进行回顾性分析，总结布氏杆菌脊柱炎的 MR 表现特点。
结果:病变多发生在腰椎,以 L4 椎体发病率最高,受累椎体多伴有明显骨质增生。其中 50 例病变累及椎体，多呈轻度楔形变或虫噬样改变，信号以 T1WI 低信号为主，T2WI 可见混杂高信号，脂肪抑制 T2 序列病变呈高信号，增强扫描呈不均匀强化。48 例病变累及椎间盘，其中 45 例椎间隙变窄，椎间盘病变以 T1WI 低信号为主，T2WI 可见混杂高信号，脂肪抑制 T2 序列病变呈高信号，增强扫描呈不均匀强化。46 例椎旁可见条状或梭形异常信号影，位于椎前、两侧或椎体后方，T1 加权像呈低信号或中等信号，T2 加权像呈高低混杂信号，增强扫描 34 例呈条状强化，12 例呈不均匀强化，可见不规则强化的脓肿壁，中心不强化，椎体后方的脓肿压迫硬脊膜囊。
结论:布氏杆菌感染引起的脊柱炎具有特征性 MR 表现，应和脊柱结核、强直性脊柱炎和化脓性脊柱炎进行鉴别诊断。

PU-1248

基于 DCE-MRI 的四氧嘧啶诱导兔糖尿病合并外周动脉疾病（peripheral artery disease，PAD）骨骼肌微血管渗透性和纹理分析研究

杨琪
武汉大学人民医院

目的 探索动态对比增强磁共振成像（dynamic contrast-enhanced magnetic resonance imaging，DCE-MRI）定量评估兔糖尿病合并外周动脉疾病（peripheral artery disease，PAD）模型骨骼肌血流灌注和微血管通透性的可行性，为阐明糖尿病合并 PAD 骨骼肌病变的病理生理机制提供可视化影像依据。方法 制备兔糖尿病模型 12 只新西兰雄性大白兔随机分为实验组 6 只、假手术组 6 只将四氧嘧啶实验组、假手术组造模，在造模成功后 2 周对实验组兔行下肢单侧股动脉结扎术，假手术组取下肢腹股沟韧带中点皮肤切口，随即缝合。各组兔造模成功后分别于 1、5、10、15、20、25 天对各组行下肢大腿轴位 DCE 检查，将 DCE-MRI 数据导入 Omni Kinetics(GE Healthcare)软件分析，进行图像后处理及参数分析，定量参数包括：Ktrans、Kep、Ve、Vp、TTP、纹理分析参数。处死实验组和假手术组兔，取大腿后外侧肌群行微血管密度（microvessel density ，MVD）计数，对实验组和假手术组兔采用单因素方差分析比较同一时间点实验组和假手术组大腿后外侧肌群渗透参数差异。对不同时间点渗透参数差异比较采用重复测量的方差分析。肌肉 MVD 计数与 DCE-MRI 渗透性参数，大腿肌肉 MRI 纹理分析参数与肌肉 MVD 计数行 Pearson 相关分析。
结果 实验组 TTP 不同时间点（5d 和 10d、15d、20d、25d）在差异具有统计学意义（$P<0.05$），而在假手术组差异均无统计学意义（P 均＞0.05）。实验组与假手术组在相同时间点的差异在 10d 和 20d 具有统计学意义（$P<0.05$）。结论 DCE-MRI 定量参数 TTP、纹理分析参数可用于评估四氧嘧啶诱导兔早期糖尿病合并 PAD 骨骼肌微血管渗透性及血流灌注改变。

PU-1249

SAPHO 综合征一例影像表现及文献复习

梁爽
华中科技大学同济医学院附属同济医院

SAPHO 综合征（synoviltis acne pustulosis hyprotosis osteomyelitis symdrome）是一种以皮肤和骨关节受累为特征性的慢性无菌性炎症。1987 年由 Chamot 等首次提出并将以五种病变首字母的缩写作为疾病名称。包括滑膜炎(Synovitis)、痤疮(acne)、脓疱病(pustulosis)、骨肥厚(hyperostosis)和骨炎(osteitis)。SAPHO 另有脓疱病性关节炎骨炎、获得性骨肥厚综合征、前胸壁炎症综合征、胸肋锁骨骨肥厚、慢性复发性多灶性骨髓炎、慢性下颌骨骨炎、硬化性骨髓炎、痤疮相关脊柱关节炎等多个别称。临床上有一定的复发缓解倾向，多呈现慢性病程。皮肤损害主要以掌跖脓疱病和痤疮。骨关节损害主要由两部分构成，滑膜炎、骨肥厚、无菌性骨炎，附着点炎。*SAPHO 综合征诊断标准主要以*满足 4 个条件之一即可确诊：①骨关节表现 +聚合性痤疮和爆发性痤疮或化脓性汗腺炎；②骨关节表现 + 掌跖脓疱病；③骨肥厚(上胸壁、肢端骨、脊柱) 伴或不伴皮肤损害；④慢性多灶性复发性骨髓炎包含中轴或外周骨，伴或不伴皮肤损害。目前该病仍属少见病范畴，尽管近年来对于该病的认识和探究不断加深，但仍旧缺乏比较系统的大样本研究，对于疾病的发生、发展机制、临床以及病理过程仍然未有明确的认知，对于疾病的治疗规范缺乏统一的标

准，导致不少患者得不到有效的治疗或者治疗欠规范，预后较差。现将华中科技大学同济医学院附属同济医院诊治的 1 例 SAPHO 综合征患者报道如下，并复习相关文献加以分析。

磁共振 MRS 定量分析骨质疏松症的脂肪含量:Meta 分析

常荣[1],马晓文[1],张明[2]
1.西安市红会医院
2.西安交通大学附属第一医院

目的 由于全球人口老龄化、骨质疏松症的流行及其与高患病率、高致残率、高死亡率的关系，整体生活质量的不断恶化，对这种骨病的诊断进行了大量的研究。磁共振波谱(MRS)作为一种测定组织中各种化学成分浓度的非侵入性检查方法，在临床中被越来越广泛的应用。本文对这一种新兴诊断技术的研究成果进行了 Meta 分析。

方法 通过以前研究骨质疏松症的病理机制发现，骨髓脂肪含量的增加(FF%)具有统计学意义。通过磁共振 MRS 测量，骨密度（MBD）降低，骨强度的主要预测因子。查阅相关文献，从过去对骨质疏松组、骨质含量减少组和健康对照组的受试者的研究中收集了 1000 多个数据点。数据点根据 MRS 位置(腰椎、股骨颈、跟骨、股骨)进行分组。进行 ANOVA 分析，然后进行 Tukey’s post-hoc tests，我们评估 MRS FF%评分对骨质疏松、骨质含量减少和健康受试者的区分能力。Welch’s t-tests 进一步验证了这些发现，解释了受试者组间差异的不一致性。

结果 表明骨质疏松组、骨质含量减少组和健康组在腰椎测量方面存在显著的统计学差异(P<0.0001)，在股骨颈骨质疏松组和健康组之间统计学差异。在股骨和跟骨的测量中没有发现这样的差异，这可能是由于后两种类型的研究和研究对象较少。

结论 MRS FF%评分在临床上作为一种无创、早期诊断骨质疏松症的工具具有很大的潜力;然而，在这些发现被广泛应用于骨骼之外之前，还需要进一步的研究。

PU-1251
动态增强 MRI 对 Ilizarov 外固架骨搬移术治 疗糖尿病足疗效评价研究

杨随军
广西医科大学第一附属医院

摘要：目的:探讨 MRI 灌注对胫骨横向搬移术治疗糖尿病足疗效评估的价值。方法:1、搜集本院自 2018 年 3 月广西医科大学第一附属医院骨关节外科就诊的糖尿病足患者,且经 Ilizarov 外固定架胫骨横向搬移术治疗者,共 7 例受检者纳入研究(男性 4 例,女性 3 例),7 例糖尿病足患者均为单侧溃烂,其中 3 只位于左侧,4 只位于右侧,7 例胫骨横向搬移术均在溃烂侧进行。术前及术后 12 周均行 SE-MRI 3.0T 超导磁共振扫描仪扫描。按足部溃烂分为非溃烂组、溃烂组及糖尿病双足组三小组,三组进行术前、术后对照研究。2、扫描完成后将数据传送到工作站，使用相应灌注软件于足底选取合适感兴趣区(ROI)，要求部位尽量一致, 面积约 1.0～1.2 平方厘米, 同时避开坏死区、血管及骨骼，得到时间-信号强度曲线及相应的灌注参数，保存数据。3.统计学分析：应用 SPSS16.0 软件对糖尿病足患者术前病足与正常足、糖尿病患者术前与术后病足之间相应灌注参数进行 t 检验分析。**结果** 共 7 例 Ilizarov 外固定架胫骨横向搬移术治疗糖尿病足病例，术后 12 周后复查,7 例

受检者中溃烂足均愈合良好 2、糖尿病足 Ilizarov 外固定架胫骨横向搬移术前溃烂足 Ktrans 值较正常足低；术后溃烂足 Ktrans、值较术前增加,有统计学意义(P=0.040、0.036)，Ve 值较术前减小，有统计学意义。结论:1MR 灌注中的 Ktrans、Ve 各参数应用于评估 Ilizarov 外固定架胫骨横向搬移术治疗糖尿病足疗效具有一定的价值。

PU-1252

A Review: Magnetic Resonance Imaging Help Diagnosis of Piriformis syndrome

Xiangyu Chen
Shandong Province Medicine Imaging Institution

Piriformis syndrome (PS), is a disorder encompassing a onstellation of symptoms including buttock or hip pain. PS accounts for approximately 6–8 % of sciatica [1], caused by compression of the sciatic nerve by the piriformis muscle. It is a relatively uncommon, but not insignificant, cause of sciatica. PS is more frequently encountered in middle-aged patients and is rarely seen in patients younger than 20 years old [2, 3]The diagnosis of piriformis syndrome is complicated by the large differential diagnosis of low back and buttock pain with many diagnoses having overlapping symptoms. It has been described for over 500 years, yet remains controversial. Proposed mechanisms for PS include anatomical variations of the course of the SN or the anatomy of the PM, damage to PM from trauma, PM hypertrophy , and PM spasm.

There are several methods for the diagnosis of PS, tenderness with palpation over the piriformis muscle , the Pace test, the Freiberg test. Ultrasound (US), computed tomography (CT), electromyography (EMG) and magnetic resonance imaging (MRI), have been used to diagnose PS. [4]This review aims to highlight the relevant anatomy, and Imagings that are used to diagnose piriformis syndrome.

PU-1253

增强 SPACE 序列在腰骶神经根中的应用价值探讨

朱海昆
云南昆钢医院

目的 探讨增强 SPACE 序列在显示腰骶神经根中的应用价值。方法 对 60 例腰骶部 MRI 受检者进行常规检查序列， SPACE 序列平扫和增强扫描。分别计算 SPACE 序列平扫和增强的神经根信噪比值（SNR 神经根），肌肉信噪比值(SNR 肌肉），神经根和肌肉的对比度噪声比值（CNR 神经根 / 肌肉）；将 SPACE 序列平扫和增强的原始图像分别进行 MIP 重建，最大限度显示腰骶丛神经及其分支，采用 4 等级评分比较这两个序列对腰骶丛神经解剖的显示情况。 结果 增强的 SPACE 序列 SNR 神经根值（116.092 ±69.946）高于平扫 SNR 值（ 64.721 ±22.437），增强的 SPACE 序列 SNR 肌肉值（24.181 ±17.871）高于平扫 SNR 肌肉值（17.453 ±8.084）,增强序列的 CNR 神经根 / 肌肉值（101.610 ±72.924） 高于平扫的 CNR 神经根 / 肌肉值（52.841 ±27.649）， 两者均存在统计学差异（ P＜ 0 .05）。 结论 SPACE 增强序列能清晰地观察腰骶神经丛的解剖形态，增强的 SPACE 序列受周围组织干扰较小,对周围脂肪组织及小血管等

干扰抑制得更好，能更充分清楚地显示神经的形态，走行,能为临床诊治腰骶丛神经病变提供诊断依据。

PU-1254

腰椎 MR 检查病人舒适性的体位探讨

朱海昆
云南昆钢医院

目的 探讨病人在 MRI 检查中的感受，最终完成符合临床诊断需求的高质量图像和提高病人的就医感受。**方法** 让病人平躺检查床上，双腿屈膝，脚轮(圆柱形海绵垫)垫在膝部下方，让腰部及下肢疼痛病人尽量放松，病人自行调整膝部屈曲角度，达到最佳舒适状态，以便检查过程中保持身体稳定不动，顺利完成检查。**结论** 腰椎 MRI 检查中脚轮应用的临床实用性很强，经实践证明，减少病人检查中的疼痛，能够顺利完成临床所需诊断要求。

PU-1255

脊柱朗格汉斯细胞组织细胞增生症 1 例

赵琪,刘勇
西南医科大学附属中医医院

患者男，20 岁，苗族。因“腰部疼痛 1 月余”入院。既往史及个人史无明显特殊。查体：左下肢直腿抬高试验 50 度（+），加强实验（+）。实验室检查：血沉 15mm/H，CEA10.64ng/ml，余肝肾功、血常规、感染标志物等未见明显异常。影像学检查：CT 示：L5 椎体溶骨性骨折破坏，并见软组织密度影，其内见残存骨骨嵴（图 1A），CT 值约 55HU。MRI 检查示：L5 椎体骨质结构紊乱并肿块影（图 B-D），呈稍长 T1（图 C）、稍长 T2 信号（图 B），STIR 序列为稍高信号（图 D），凸向左侧椎间孔生长，边界较清楚，范围约 3.3cm×2.6cm；增强后病灶及邻近骨质明显均匀强化（图 E）。行 L5 椎体占位清除术，术中所见：L5 椎体左侧骨质破坏较明显，有较多鱼肉样组织填充。免疫组织化学：CD68(+)、S-100(+)、CD1a(-)、Ki-67(+＜1%)、Vimentin(+)、CD3(少+)、CD20(少+)、EMA(+)。术后病理诊断：朗格汉斯细胞增生症伴 L5 椎体骨质破坏。

PU-1256

髋臼唇撕裂 MR 平扫+关节造影个案报道

李帆
绵阳市第三人民医院/四川省精神卫生中心

目的 探讨 MRI 关节造影对髋臼唇撕裂的诊断价值。
方法 回顾分析经综合诊断为髋臼唇撕裂的 MRI 平扫及关节造影表现，MR 关节平扫（单髋关节小 FOV 高空间分辨率扫描）+MR 关节造影（MRA）。
结果 本例病人 CT 示：股骨头颈交界区骨质隆起、增生硬化，MR 关节镜示：前上臼唇基底部见线状造影剂进入；关节镜术后诊断：髋臼撞击综合征，髋臼唇撕裂。MR 关节造影（MRA）采用 Czerny 分期：IA：盂唇内有高信号，未达关节面，盂唇旁沟存在，IB：同 IA，但是盂唇增厚，盂唇旁沟消失，IIA 盂唇内高信号累及关节面，盂唇旁沟存在，IIB：同 IIA，但是盂唇增厚，盂唇旁沟消

失，IIIA：盂唇与髋臼分离，仍保持三角形外观，IIIB：盂唇与髋臼分离，盂唇增厚，信号异常，盂唇旁沟消失。
结论 髋臼唇撕裂：MRI 平扫 vs 造影，目前多认为 MRI 平扫价值有限，MRA 通过向关节腔内注入对比剂、扩张关节囊，增加关节腔内对比，能够更好的显示撕裂口，提高臼唇撕裂的诊断敏感度和准确度，弥补常规检查的不足。

PU-1257
肩关节撞击综合症的平扫 MRI 表现

赵书怀,张志杰
忻州市人民医院

目的 分析肩关节撞击综合征的平扫方法和 MRI 征象，提高诊断正确率。**方法** 选取图像满意的肩关节 MRI 平扫病例 33 例，使用西门子 AERA 1.5T MRI 扫描仪，肩关节专用表面硬线圈，根据患者胖瘦选择大或小线圈，FOV160×160mm，层厚/层距 3/0.6mm，矩阵 256×205。所用序列：斜冠状位 T2WI/FS/TSE、T1WI/SE 序列，轴位和斜矢状位 PD/FS/TSE 序列；定位：轴位上方包括肩锁关节，下方包括腋窝，平行向下扫描即可，斜冠状位平行岗上肌腱，斜矢状位平行关节盂。**结果** 病因表现有，勾形肩峰 8 例，肩峰前倾 3 例，肩峰骨刺 5 例，肩锁关节骨赘 3 例，无明显病因表现 14 例；撞击后表现有，肩峰下-三角肌下滑囊炎 28 例，岗上肌腱变性 21 例、撕裂 5 例，肱二头长头肌腱鞘积液 27，肱骨头糜烂 7 例。**结论** 肩关节平扫对肩关节撞击有一定的作用，必要时应行肩关节直接造影检查。

PU-1258
MRI 对股骨颈骨折术后并发股骨头坏死早期诊断的临床研究

李晶
吉林市人民医院

目的 探讨磁共振成像（MRI）对股骨颈骨折术后并发股骨头坏死早期诊断的临床效果。**方法** 回顾性分析 2017 年 3 月-2018 年 3 月本院 64 例（64 髋）股骨颈骨折术后并发股骨头坏死患者的临床资料。所有患者均分别在术后 3 个月内、4-6 个月、7-9 个月、10-12 个月时行 X 线片、MRI 检测。比较 X 线片、MRI 在术后 12 个月内及期间不同时段对股骨头坏死检出情况，分析诊断效能。**结果** 术后 12 个月内，MRI 对股骨头坏死总体检出率高于高于 X 线片（$P<0.05$）；术后 3 个月内、4-6 个月时，MRI 对股骨头坏死检出率均高于 X 线片（$P<0.05$）；术后 12 个月内，随着股骨头坏死分期的增加，MRI 检查发现时间逐渐延长。**结论** 股骨颈骨折术后并发股骨头坏死早期诊断中 MRI 检查应用价值较高，可提升早期检出率，值得推广应用。

PU-1259
磁共振 IDEAL-IQ 技术对糖尿病患者骨质疏松风险的评估价值

宋宇,宋清伟,张楠,张浩南,刘爱连,苗延巍
大连医科大学附属第一医院

目的 探讨磁共振 IDEAL-IQ 技术在糖尿病患者骨质疏松风险评估的价值。**材料和方法** 在提供知情同意后，对 16 名糖尿病患者分别进行磁共振腰椎 IDEAL-IQ 序列检查和双能 X 线吸收测量法(DXA)检测，体质量指数 BMI20.21～28.08kg/m^2。行双能 X 线吸收测量法（DXA）后将所有糖尿病患者分三组，A 组为骨量正常组，B 组为骨量减少组，C 组为骨质疏松组。IDEAL-IQ 序列通过一次扫描，系统可自动生成 6 幅图像，包括脂肪分数图、R_2*弛豫率像、水像、脂像、同相位及反相位图像，在 GE AW4.6 后处理工作站上分别测量腰 1～腰 5 腰椎椎体脂肪分数（Fat Fraction，FF）。分析比较 A、B、C 三组腰椎椎体 FF 值，采用 SPSS 19.0 进行统计分析。**结果** A、B、C 各组间年龄差异无统计学意义(P>0.05)。A、B、C 各组间腰椎椎体平均 FF 值测量结果分别为：43.65±3.91、49.78±6.67、57.85±3.84，单因素方差分析结果显示不同组间 FF 值有显著性差异(ANOVA ，F=5.515 ，P=0.036)。其中 A 组与 C 组间 FF 值差异有统计学意义(Post-Hoc LSD,P=0.013)；而 A 组与 B 组、B 组与 C 组间 FF 值差异均无统计学意义 (Post-Hoc LSD,P=0.084;Post-Hoc,P=0.171)。**结论** 磁共振 IDEAL-IQ 可定量评估腰椎椎体脂肪含量，从而对糖尿病患者中骨质疏松风险进行无创性评估，对临床诊疗有指导价值。

PU-1260
MR 弥散技术对脊柱单纯性和病理性压缩性骨折的诊断价值.

康晋杰
德州市人民医院

：目的:初步评价 MR 弥散技术对脊柱单纯性和病理性压缩性骨折的诊断价值.方法:70 例脊柱椎体压缩性骨折行 X 线、MRI 平扫和弥散序列检查(35 例加作增强扫描),其中 50 例另作 CT 检查.病理性骨折 40 例(包括转移性肿瘤 30 例,骨髓瘤 6 例,嗜酸性肉芽肿 2 例,);单纯性骨折 35 例(包括单纯外伤所致 17 例,骨质疏松所致 14 例).病理性骨折者行 CT 引导下经皮骨穿刺检查或手术病理证实;外伤或骨质疏松所致椎体压缩性骨折均符合临床、实验室检查及 MRI 表现,部分经随访证实.结果:急性单纯性压缩性骨折和病理性骨折在常规 MRI 上有各自的特点.9%(3/33)单纯性压缩性骨折在 DWI 表现为等低信号混有条状高信号;24%(8/33)表现为等低信号;67%(21/32)表现为高信号.93%(36/38)病理性椎体压缩性骨折 DWI 上表现为高信号;7%(2/38)表现为等低信号.DWI 上均呈高信号的单纯性压缩和病理性压缩经统计分析无显著性意义(P>0.05).结论:单凭 MRI 弥散序列的信号改变不能非常准确地鉴别脊柱单纯性压缩性骨折和病理性骨折,需进一步深入定量研究.

PU-1261
FLAIR T2 序列与 PDWI 在显示膝关节前交叉韧带的对比研究

刘增胜[1],赵鸿飞[1],张萍[2],方明[1],乔炳龙[3]
1.青岛市市立医院（本部院区）
2.青岛市中心医院
3.青岛大学附属医院

目的 比较磁共振 FLAIR T2 与 PDWI 在显示膝关节前交叉韧带的优劣，尤其是在关节积液的干扰下两者间的差异。**方法** 由两位 MRI 诊断经验丰富的放射医生采取双盲法对 49 例膝关节的 FLAIR T2/PDWI 图像进行对比，以前交叉韧带轮廓显示的清晰度做为参考，结果分为：FLAIR T2 优于 PDWI（记为”>”）；FLAIR T2 与 PDWI 相当(记为”=”)；FLAIR T2 差于 PDWI(记为”<”)。膝关节积液定量依据雍刘军等[1] 及 Tai AW[2]分为无-少量-中量-大量。**结果** 49 例病例中， FLAIR T2 优于 PDWI 的有 29 例，FLAIR T2 与 PDWI 相当的有 13 例，FLAIR T2 差于 PDWI 的有 3 例.。49 例中，有 4 例在两种序列中均未显示，予以剔除，有效病例 45 例。FLAIR T2 优于 PDWI 的 29 例中，有 26 例

膝关节存在中量或大量积液，3 例少量或无明显积液。FLAIR T2 与 PDWI 显示相当的 13 例中，有 4 例是少量或无积液，8 例中量积液。FLAIR T2 差于 PDWI 的 4 例中，3 例无或少量积液，1 例中量积液。统计学分析：采取趋势卡方检验，将关节积液分为两组，无-少量做为第 1 组，中-大量为第 2 组。统计结果显示，关节积液的多少能够影响两种序列的评价结果，在关节积液较多的前提下（第 2 组），FLAIR T2 优于 PDWI，两者间的差异性统计学分析有显著性意义（P<0.05）。两位评定医师的图像判定结果符合率采用 Kappa 检验，结果显示有较高的一致性。**结论** 1、膝关节积液能够影响 FLAIR T2 序列与 PDWI 序列显示膝关节前交叉韧带的结果。2、在膝关节积液较多的前提下（中-大量），FLAIR T2 序列显示膝关节前交叉韧带优于 PDWI 序列。

PU-1262

1H MRS 评估青年男性足球运动员骨髓脂肪组成的初步研究

王见,张晓东,余琴琴
南方医科大学第三附属医院

目的 探讨 1H 磁共振波谱成像（MRS）评估青年男性足球运动员骨髓脂肪成分的可行性及临床应用价值。

方法 纳入 24 名青年男性足球运动员（平均年龄 19.2±1.2 岁，范围 17-22 岁、）及 21 名青年男性志愿者（平均年龄 21.2±0.7 岁，范围 20-22 岁）为研究对象。所有研究对象行常规腰椎及双下肢 MRI 序列检查及 1H MRS 检查，应用 jMRUI 软件对 1H MRS 图像进行处理并测量，观察水峰及脂质峰位置，采用峰高度及峰下面积来计算各部位骨髓脂肪分数（Fat Fraction，FC）及不饱和脂肪分数（Unsaturated lipid fraction，ULF）。比较青年足球运动员与志愿者腰椎，右侧股骨及胫骨 FC 及 ULF 值是否有统计学差异。

结果 足球运动员组腰椎、右侧股骨颈及胫骨 FF 值分别为（0.39±0.12）、（0.86±0.09）、（0.92±0.01）；志愿者腰椎、右侧股骨及胫骨 FF 值分别为（0.51±0.12）、（0.89±0.05）、（0.94±0.02）；足球运动员组右侧股骨及胫骨 ULF 值分别为（0.20±0.02）、（0.22±0.02）；志愿者右侧股骨颈及胫骨 ULF 值分别为（0.17±0.03）、（0.20±0.03）。足球运动员组腰椎及右侧胫骨 FF 值低于志愿者；足球运动员组右侧股骨及胫骨 ULF 均高于志愿者；两组间比较腰椎及右侧胫骨 FF 和右侧股骨及胫骨 ULF 值差异均有统计学意义*（P<0.05）*，足球运动员组右侧股骨 FF 值与志愿者差异无统计学意义*（P>0.05）*。

结论 青年男性足球运动员右侧股骨及胫骨骨髓不饱和脂肪分数均高于健康志愿者，提示骨髓不饱和脂肪含量与运动密切相关，加强运动可能是提高骨质量的有效途径之一。

PU-1263

肩胛骨炎性肌纤维母细胞瘤 1 例

陈锦华
泰州市人民医院

患者男性，75 岁,因发现右侧背部肿块 3 年入院。患者于 3 年前发现右上背部一肿块，鸡蛋大小，表面无红肿，无明显肿胀疼痛，无畏寒发热，无消瘦、乏力、盗汗等，三年来肿块逐渐增大，并感同侧上肢不适。查体：右上背部 8*9cm 大小区域皮肤稍红，皮下可见 8*7cm 大小椭圆形性肿块，质地硬，轻压痛，活动度不佳，与基底部致密粘连。CT 显示

炎性肌纤维母细胞瘤由 Symmer 于 1921 年首先报道，是一种非常少见的间叶性肿瘤，命名非常混乱[],曾被称为炎性假瘤、浆细胞肉芽肿、良性肌纤维母细胞瘤、纤维黄色瘤、炎症性纤维肉瘤、假肉瘤样肌纤维母细胞增生、炎症性肌纤维母细胞增生、粘液样错构瘤、淋巴样错构瘤等。2002 年 WHO 软组织肿瘤国际组织学分类专家组将其定义为“由分化的肌纤维母细胞性梭形细胞组成的，常伴有浆细胞和（或）淋巴细胞浸润的一种肿瘤”，并将其归为纤维母细胞/肌纤维母细胞肿瘤、中间性、少数可转移类[]。

IMT 好发于儿童和青少年，多数以无痛性包块为首发症状，平均年龄 10 岁，中位年龄 9 岁，也可发生于成人，最常发生于肺部，也可发生于肺外，据 1998 年 Coffin 等文献报道，肺外的部位包括中枢神经系统、上呼吸道、鼻窦、口腔、甲状腺、心脏、腹部及大网膜、胃肠道、肝、脾、肾、子宫、阴道、膀胱、皮肤、周围神经[3]。国内文献报道多发于肺、肝、脾、肾、腹部，年龄跨度较大，男女发病比例无明显差异，病史较长，临床症状不明显，常体检发现。骨的 IMT 非常罕见，国外文献较少[4,5],国内仅见两篇 5 例报道[6,7]。文献报道发生的部位为股干骺端、髂骨、胫骨骨髓腔、颌骨等，可侵犯骨皮质及周围邻近软组织。

Research on the feasibility of MR imaging of patients receiving anterior cervical surgery using MAVRIC SL-STIR sequence at 3.0T

Renjie Yang,Yunfei Zha,Changsheng Liu
Renmin Hospital of Wuhan University

Objective: To investigate the feasibility of MR imaging of patients receiving anterior cervical surgery using MAVRIC SL-STIR sequence at 3.0T by comparing with bandwidth optimized STIR sequence. **Methods:** Sagittal MR images of MAVRIC SL-STIR and bandwidth optimized STIR sequences acquired in 20 patients receiving anterior cervical surgery were analyzed retrospectively. The areas of metal artifacts region, overall image quality, visibility of spinal cord and effect of fat suppression between the two sequences were compared. **Results:** The mean areas of metal artifacts regions for MAVRIC SL-STIR and bandwidth optimized STIR sequences were 422±189mm^2 and 774±394mm^2, respectively. The areas of metal artifacts from MAVRIC SL-STIR decreased significantly (P=0.000). In the aspect of overall image quality, difference between the two sequences had no statistics significance (P=0.617). But in the aspects of visibility of spinal cord and effect of fat suppression, bandwidth optimized STIR sequence was superior to MAVRIC SL-STIR (P=0.001). **Conclusion:** Despite the impaired visibility of spinal cord, the substantially reduced metal artefacts make it feasible for MAVRIC SL-STIR sequence to be applied in MR imaging of patients receiving anterior cervical surgery at 3.0T.

PU-1265

MAVRIC SL-STIR 序列在颈椎前路术后患者 3.0T MRI 中应用的可行性研究

杨仁杰,查云飞,刘昌盛,张宇

武汉大学人民医院

目的 通过与带宽优化的 STIR 序列进行比较，探讨 MAVRIC SL-STIR 序列在颈椎前路术后患者 3.0T MRI 中应用的可行性。**方法** 回顾性分析 20 例颈椎前路术后患者的矢状面 MAVRIC SL-STIR 序列和带宽优化的 STIR 序列的图像，比较两组间金属伪影面积的大小、总体图像质量、脊髓的可见性以及脂肪抑制效果。**结果** MAVRIC SL-STIR 和 STIR 序列图像的平均金属伪影面积分别为 422±189mm^2 和 774±394mm^2， MAVRIC SL-STIR 序列的金属伪影面积显著减小（*P*=0.000）。在总体图像质量方面，两个序列的差异并无统计学意义（*P*=0.617）；而在脊髓的可见性和脂肪抑制效果方面，带宽优化的 STIR 序列对脊髓的显示效果优于 MAVRIC SL-STIR 序列（*P*=0.001）。**结论** 尽管脊髓显示受限，金属伪影的显著降低为 MAVRIC SL-STIR 序列在颈椎前路术后患者 3.0T MRI 中的临床应用提供了可行性。

PU-1266
探讨动态增强扫描联合扩散加权成像在鉴别良恶性骨肿瘤中的应用价值

窦银聪,王梅云
河南省人民医院

目的 探讨动态增强扫描联合扩散加权成像在鉴别良恶性骨肿瘤中的应用价值
材料与**方法** 收集 2016 年 1 月至 2019 年 5 月间在我院明确诊断为骨肿瘤的患者 102 例，收集各组患者的影像学检查图像及病理结果，针对病变性质、边界、范围、侵袭性以及病变内部是否均匀等指标进行分析。**结果** (1) 57 例恶性病变中，20 例 TIC 为 I 型，17 例为Ⅱ型，20 例为Ⅲ型；55 例良性病变中，I 型 0 例，Ⅱ型 13 例，Ⅲ型 17 例，IV 型 25 例。I 型曲线仅见于恶性骨肿瘤，Ⅳ型曲线只见于良性骨肿瘤；良、恶性骨肿瘤病变的 TIC 类型分布差异有统计学意义(x=15.826，P=0.001)。TIC 取 I、Ⅱ型曲线为恶性诊断标准，诊断恶性肿瘤的敏感性为 73.68%，特异性为 69.57%，准确性为 72.13%，阳性预测值为 80%，阴性预测值为 61.54%。(2) 联合检查组对骨良、恶性肿瘤的检出率（分别为 60.0%、58.33%）要明显高于 MRI 动态检查组（分别为 17.65%、36.84%）和 DWI 扫描检查组（分别为 28.57%、14.29%），组间差异有统计学意义（P<0.05）。(3) 随着病变恶性程度的增加， ADC 值呈逐渐下降的趋势；良恶性组 ADC 值分别为 1.363±0.412；0.833±0.108。 (t = 3.119; P = 0.002)。病变的 Ktrans 值呈逐渐上升的趋势；其中良、恶性病变的 Ktrans 值分别为 0.0428±0.0031/min；0.1361±0.0047/min。两者间差异有统计学意义(t=2.831, P=0.014)。
结论 MRI 动态增强扫描联合 DWI 检查可显著提高良恶骨肿瘤的早期诊断效能，为临床提供更全面、可靠的影像资料，有利于改善患者的预后，值得临床推广。

PU-1267
磁共振脂肪抑制技术在骨关节病变检查中的应用价值

卢晓军,徐瑜
中国科学院大学重庆医院（重庆市人民医院）

目的:评价磁共振脂肪抑制技术在膝关节、肩关节等骨关节病变检查中的应用价值。设备材料和方法:我院的 MRI 机（SEMENS 1.5T AVANTO），MR 专用高压注射器，增强用对比剂钆喷酸葡胺注射液（GD-DTPA）。从我院骨关节科 2018 年 12 月--2019 年 6 月收治的骨关节病变患者中随机抽取

155 例,回顾性地进行 MRI 脂肪抑制、T1WI、T2WI 序列比较。结果:MRI 脂肪抑制技术序列发现骨及骨髓损伤的阳性率明显高于、T1WI、T2WI 序列,差异有统计学意义(P<0.05);对于韧带损伤的阳性发现脂肪抑制技术也明显高于 T1WI、T2WI 序列,差异有统计学意义(P<0.05);脂肪抑制技术结合 GD-DTPA 延迟强化对于发现关节软骨损伤或病变也明显高于 T1WI,T2WI。结论:磁共振脂肪抑制技术对于骨关节中骨、骨髓及软骨等病变的检查有较高的应用价值。

PU-1268
绝经后妇女腰椎脂肪含量与骨密度的相关性研究

陆丰
无锡市第二人民医院

摘 要 **目的** 应用磁共振脂肪定量扫描技术评估绝经后妇女腰椎骨质疏松程度与 DXA 的相关性。**方法** 采用 Siemens MAGNETOM Skyra 3T 超导型成像系统对所有研究对象行腰椎 MR Vibe-DIXON 检查。Vibe-DIXON 序列一次成像能产生正相位、反相位、水相、脂肪相 4 组图像。采集完图像后,再工作站分别测量 L1~L4 各椎体中间层面水相、脂肪相的信号强度,感兴趣避开血管及韧带。最后利用公式计算脂肪分数(FF)=$I_{脂肪}$/($I_{脂肪}$+$I_{水}$)。采用 GE Healthcare Lunar Prodigy Advance 骨密度测量仪进行双能 X 线骨密度测量。检查时,研究对象仰卧位,双下肢抬高,范围从 T12 下 1/2 至 L5 椎体上 1/2。收集绝经后妇女 153 例行腰椎磁共振脂肪定量扫描检查,测量 L1-L4 椎体脂肪含量。按照腰椎 DXA 检查结果分为骨量正常组、骨量减少组和骨质疏松组。比较不同组间脂肪含量差异及骨密度值与脂肪含量的相关性。**结果** 骨量正常组、骨量减少组和骨质疏松组分别对应的椎体脂肪分数(FF) 为,组间比较差异有统计学意义(P＜0.05) ; DXA 所测量的骨密度和 mDIXON 测得的腰椎脂肪含量呈中度负相关。**结论** 综上所述,MR mDIXON 技术是一种无创、高效、精准测量腰椎椎体内脂肪含量的影像学检查手段,与 DXA 的结果具有相关性,可间接评估骨质疏松程度,丰富了骨质疏松检查手段。如果进一步实验研究,积累大样本数据,将在评估骨质疏松程度、骨折风险等方面为临床骨质疏松预警及治疗评估提供重要参考。

PU-1269
砂砾性痛风石引起的腕管综合症:20 例病人 CT 和 MR 的影像学特点

李灿,葛建文,宋帅
鄄城县人民医院

目的 本研究的目的是通过对腕关节处痛风石 CT 和 MR 表现的研究,揭示腕关节处的痛风石为腕管综合症的一种病因。**材料和方法** 对确诊为痛风且表现出痛风相关性腕管综合症的病人腕关节 CT(n=18)和 MR(n=20)影像资料进行回顾性分析;24 份腕关节的影像资料来自 5 年时间的收集。病人总体包括 20 名男性,年龄跨度为 35～76 岁。所有的影像学资料均被两名高年资肌骨放射医师阅读审查并得到一致的诊断结论,其中 12 例诊断得到外科手术的验证。**结果** 于腕管底面发现痛风石者 18 例,腕骨处发现痛风石者 17 例,桡腕关节处发现痛风石者 17 例,腕关节伸肌肌腱或腱鞘处发现痛风石者 16 例。除腕管底面的痛风石(T2 加权像表现为低信号)外,其余所有痛风石均表现为相似的信号特点(T1 加权像表现为低到中等强度信号;T2 加权像表现为混杂强度信号)。CT 和 MR 图像上发现了不同程度的钙化影。钆强化 MR 图像表现为不均等强化。**结论** 在特定的病人总体中,痛风石应该是腕管综合症的一种致病因素,对此的认识和对其影像学特点的熟悉将给腕管综合症的诊断和外科手术治疗计划的制定带来帮助。

PU-1270

膝关节痛风石：对 30 名患者 MRI 图像特点的回顾

李灿,葛建文,宋帅
鄄城县人民医院

目的 对膝关节内痛风石的位置和侵蚀性进行研究，重新评估膝关节内痛风石的特征性磁共振图像特点。材料和**方法** 对 30 名经组织病理学检查确诊有痛风石的患者膝关节 MRI 图像进行回顾性研究。评价每处痛风石造成的损害位置、关节变形、信号强度和相关的骨破坏或骨内损害。**结果** 痛风石沉淀主要位于髌下脂肪垫的中部和前隐窝（n=28.87%），股骨外侧踝外缘间隙（n=25.78%），髁间窝（n=22.69%）。所有痛风性损害表现为相似信号特点（T1 加权像上为低到中等信号强度，T2 加权像上为不均匀信号强度），可见三种病损形式：无定型的团块（n=27），线型晶体状沉淀（n=6），膝关节囊损害（n=3）。相关的骨破坏发生在股骨外侧踝的外缘者有 8 例，发生在髁间窝顶部者有 7 例，发生在胫骨粗隆者有 5 例，发生在胫骨粗隆中部和外侧的有 3 例，发生在髌骨的有 1 例。**结论** 对痛风石形成的位置和相关损害的认识以及对其 MR 图像表现特点的了解可以提高我们结合 MR 图像做出诊断的正确率，特别是能提高我们对于没有临床症状仅在 MR 图像上有损害表现患者的诊断正确率。

磁共振高清扩散加权成像对脊柱关节炎的诊断价值

黄宏杰,张宇阳,曹代荣
福建医科大学附属第一医院

目的 探讨磁共振(MR)高清扩散加权成像(RESOLVE DWI)对脊柱关节炎的诊断价值。
方法 收集并分析临床怀疑 SpA 并行 3.0T 骶髂关节 MRI 检查患者 76 例，所有患者均行常规 MR 及 RESOLVE DWI 检查，采用 5 分法评估整体图像质量、伪影、结构扭曲，并比较急性骶髂关节炎的信噪比（SNR）及对比噪声比（CNR）。使用 Wilcoxon 符号秩检验比较整体图像质量、伪影、结构扭曲，使用配对 t 检验比较 SNR 和 CNR。
结果 RESOLVE DWI 的整体图像质量、伪影、结构扭曲评分高于常规 DWI（4.03±0.69 vs. 3.47±0.66、3.89±0.87 vs. 3.67±0.84、4.08±0.54 vs. 3.37±0.65，P 均＜0.05），RESOLVE DWI 急性骶髂关节炎的 SNR 和 CNR 高于常规 DWI（P＜0.05）。
结论 RESOLVE DWI 的图像质量及病灶显示均优于常规 DWI，有助于对脊柱关节炎的诊断。

腰肌劳损磁共振影像学研究现状及进展

马守成
吉林省吉林中西医结合医院

腰肌劳损（chronic lumbar muscle strain 或 a-cute）是指因为腰背部肌肉、筋膜、韧带等软组织的慢性损伤，导致的局部无菌性炎症，从而引起腰背部一侧或两侧的弥漫性疼痛的临床综合征，包括腰背肌筋膜炎、肌纤维织炎、肌筋膜疼痛综合征、第三腰椎横突综合征等[1]，该病好发于

30 ～ 40 岁的青壮年男性，外伤及长期劳损为该病的主要发病诱因，此外还与气候空气湿度有很大的关系[2]。随着社会的发展以及职业环境改变，越来越多的不良工作姿势以及违反人体生理规律的体育活动，促使腰肌劳损的发病率显著升高，影响患者的生活质量。

PU-1273

磁共振 T2 mapping 序列定量分析腰椎间盘疾病的价值

杨民
南京医科大学第二附属医院

摘要： 目的探讨磁共振 T2mapping 成像定量评价腰椎间盘疾病的价值。方法选择 50 例行腰椎间盘 MRI 常规扫描的患者,在扫描过程中运用 T2map 脉冲序列进行扫描。通过后处理工作站,在 T2mapping 像上测量腰 2，3,3，4，4，5 椎间盘髓核的 T2 值,分析不同性别，年龄的相关性。比较、不同分级腰椎间盘突出或膨出的 T2 值。结果最终腰椎间盘髓核 T2 值与患者年龄呈负相关。男女腰椎间盘髓核的 T2 值差异无统计学意义(P>0.05);Pfirrmann 分级Ⅱ、Ⅲ、Ⅳ、Ⅴ级椎间盘髓核 T2 值低于Ⅰ级,Ⅲ、Ⅳ、Ⅴ级椎间盘髓核 T2 值低于Ⅱ级,Ⅳ、Ⅴ级椎间盘髓核 T2 值低于Ⅲ级,Ⅴ级椎间盘髓核 T2 值低于Ⅳ级,差异均有统计学意义(P<0.05)。结论磁共振 T2mapping 定量方法可以更精确评价腰椎间盘退变的特点,腰椎间盘退变与年龄相关。

PU-1274

非小细胞肺癌骨转移瘤的 MRI 影像及免疫组化特征

史大宝
辽宁省肿瘤医院

目的 探讨非小细胞肺癌骨转移的 MRI 影像及免疫组化特征。方法:回顾性分析经病理证实的 24 例非小细胞肺癌（腺癌 22 例，鳞癌 2 例）骨转移患者 MR 和病理资料。24 例均行常规 MR 平扫，其中 21 例行 MR 增强检查。24 例行免疫组化检查。**结果** 股骨、髂骨和肩胛骨多见，多为类圆形（87.5%），呈偏心性生长（66.7%）。多数病灶（83.3%）骨皮质不连续，伴软组织肿块。所有病灶在 T1WI 上均呈稍低或等信号，T2WI 及 T2WI 脂肪抑制上均呈以高信号为主混杂信号。T2WI 上病灶（91.7%）周围可见水肿或积液样弥漫高信号，增强（95.2%）呈明显不均匀强化。肺腺癌骨转移甲状腺转录因子 1（TTF-1）、胃酶样天冬氨酸蛋白酶（NapsinA）、细胞角蛋白 7（CK7）、细胞角蛋白 5/6（CK5/6）、P63 阳性率分别为 72.7%(16/22)、68.2%(15/22)、100%(22/22)、18.2%(4/22)、22.7% (5/22)。结论:非小细胞肺癌骨转移瘤为类圆形，呈偏心性生长，磁共振 T2W 信号不均，增强为明显不均匀强化，肺腺癌骨转移瘤 TTF-1、NapsinA、CK7 多高表达，CK5/6、P63 低表达。

PU-1275

肾癌长骨骨转移的 MR 影像特征及文献复习

史大宝
辽宁省肿瘤医院

目的 探讨肾癌长骨骨转移的 MR 影像特点。**方法** 收集本院经手术病理证实的肾癌长骨骨转移患者，10 例患者纳入研究，6 例行 MR 平扫检查，4 例行 MR 增强检查。分析 MR 影像特征，包括病灶形态学及信号特征。**结果** 5 例在肾癌复查中发现，5 例以肢体不适为首发症状入院。8 例肾透明细胞癌（ccRCC），2 例嫌色细胞癌（chRCC）。7 例位于骨端，股骨近端 5 例，股骨远端 1 例，肱骨近端 1 例；3 例位于骨干，股骨 2 例，肱骨 1 例。病灶的纵横比范围 1.15-3.74，平均值 2.02。9 例呈膨胀性骨质破坏，1 例骨质未见明显膨胀性改变。8 例病灶 T1WI 呈稍低或等信号，T2WI 呈等高混杂信号，7 例 T2WI 另见皂泡状高信号及低信号分隔，其中 1 例低信号分隔呈轮辐样；2 例 T1WI、T2WI 呈均匀的等信号和稍高信号。4 例病灶内见流空血管影。2 例边缘明显强化，2 例轻中度强化。**结论** 肾癌长骨骨转移好发于长骨近端，多以膨胀性破坏为主，T2WI 上易出现皂泡状改变及低信号分隔，有时可见血管影。

PU-1276
晚期肺腺癌 EGFR 突变与骨转移相关性的 MR 影像组学分析

史大宝
辽宁省肿瘤医院

目的 探讨采用影像组学的方法分析晚期肺腺癌骨转移 MR 影像特征预测表皮生长因子受体（EGFR）基因突变状态的可行性。**方法** 回顾性分析 2016-2018 年经病理证实的 164 例肺腺癌患者的影像和临床资料，所有患者均行 EGFR 基因检测及 MR 常规脊柱检查,经综合影像学（CT、MRI 或 ECT/PET-CT）或病理证实为脊柱骨转移。应用 ITK-SNAP 软件对 MR 发现的肺腺癌骨转移病灶进行勾画，通过 AK 分析软件提取纹理特征，然后通过训练组使用 ANOVA+MW 和 Correlation Analysis 方法进行筛选，最后根据筛选后的特征集使用随机森林法（RTree）构建影像组学模型。用受试者工作特性曲线下面积（AUC）和准确度来评价模型预测 EGFR 突变状态的性能。**结果** 164 例患者，突变组 103 例（62.8%），野生组 61 例（37.2%）。EGFR 突变组以女性、非吸烟患者多见（$p<0.05$），突变类型以 19del 和 L858R 为主，两者合计共占总突变例数的 66.0%（68/103）。T1WI 上，模型诊断准确度和 AUC 在验证组中分别为 0.638 和 0.568；T2WI 上，模型诊断准确度和 AUC 在验证组中分别为 0.681 和 0.530；T2FS 上，模型诊断准确度和 AUC 在验证组中分别为 0.618 和 0.538。**结论** 对于肺癌骨转移的患者，应用 MR 影像组学的方法，可为临床了解 EGFR 突变状态提供重要的参考价值。

PU-1277
四通道相控阵表面线圈与十二通道头颅正交线圈在踝关节 MRI 中的应用比较

陈地友
陆军军医大学大坪医院

目的 比较四通道相控阵表面线圈与十二通道头颅正交线圈在踝关节 MRI 成像时，影像质量的差异。
方法 回顾性分析 2018 年 1 月～2018 年 5 月期间在我科行踝关节 MRI 检查的 89 例患者，其中 46 例选择四通道相控阵表面线圈（实验组）；43 例选择十二通道头颅正交线圈（常规组），两名高年资扫描技师选择相同 ROI 测量并计算同一扫描参数序列（PD FSE T2 fs）影像上相同位置的距骨、滑液、跟腱、肌肉的 SNR 及相邻组织的 CNR，对测量结果做一致性检验；同时两名具有独立诊

断经验的放射诊断医师根据统一标准对影像质量进行优、良、差评价，采用 spss19.0 对所有数据做统计学分析，以 p＜0.05 作为差异有统计学意义。

结果 ①SNR：实验组距骨、滑液、跟腱、肌肉的 SNR 均高于常规组，差异有统计学意义（P=0.000、0.001、0.004、0.000＜0.05）；②CNR：实验组滑液/距骨、滑液/肌肉 CNR 均高于常规组，差异有统计学意义（P=0.000、0.002＜0.05），实验组跟腱/肌肉 CNR 高于常规组，二者差异无统计学意义（P=0.11＞0.05）；③两名技师对影像的测量结果一致性检验，p＞0.05，无显著性差异；④影像的质量评价：实验组影像优良率高于常规组，二者差异有统计学意义（P=0.02＜0.05）。

结论 四通道相控阵表面线圈相较于十二通道头颅正交线圈具有更高的组织 SNR 及相邻组织的 CNR，是踝关节 MR 成像的优势线圈，可作为踝关节 MR 成像时的首选线圈。

PU-1278

DKI 应用于大鼠椎间盘微细结构的可行性分析

李丽,朱文珍,方纪成,李洋,焦占营
华中科技大学同济医学院附属同济医院

目的 分析 DKI 技术应用于正常成熟大鼠及椎间盘退变模型，判断椎间盘微细结构变化的可行性。

方法 12 雌 12 雄正常成熟的 SD 大鼠，21 例雌性椎间盘退变模型大鼠使用 3T 核磁共振扫描仪进行 DWI、DKI 和 T2 序列扫描。椎间盘退变模型采用经皮穿刺椎间盘方法。21 例模型大鼠根据穿刺后扫描时间分为 7 组：0（正常对照），3 小时，48 小时，3 天，7 天，10 天和 14 天。在 T2 图像上，测量尾椎 C6/7, C7/8 椎间盘高度，利用 5 级分级法进行椎间盘分级。利用画取 ROI 的方式，测量尾椎 C6/7, C7/8 的 ADC 值、FA、MD、Da、Dr、MK、Ka 和 Kr 值。利用纤维素追踪法获取各个椎间盘的纤维追踪图像。在 24 例正常成熟大鼠中，比较不同性别和不同等级，上述参数之间的差异。在 21 例雌性椎间盘退变模型大鼠，比较在 7 个不同时间点，上述参数的差异。同时，将上述椎间盘进行病理切片分析。

结果 与 1 级椎间盘相比， 2 级椎间盘的 ADC 值减低、FA 和 MK 值增高(P<0.05)，并发现 FA 值和 MK 值的诊断准确性较高。通过 DKI 的多参数分析，病理组织图像和纤维追踪的图像比较，证明了雄性和雌性大鼠的椎间盘微观结构存在差异。在 21 例雌性椎间盘退变模型大鼠的椎间盘中，T2 分级在穿刺后 7 到 10 天呈现明显的增长趋势(R^2=0.9424, P＜0.001),而 ADC 值及 DKI 多参数的变化在不同时间点与病理改变一致，具有明显的显著性差异 (P＜0.05)。

结论 DKI 是一种非侵入性和可持续性的检测椎间盘微细结构改变的影像方法。因正常大鼠尾椎的 1 级和 2 级椎间盘之间、雌雄性椎间盘髓核存在微细结构差异。故应选择同一性别大鼠，并对大鼠椎间盘进行 T2 等级筛选后用于实验研究。同时，DKI 的多参数分析用于评估椎间盘的微细结构改变具有较好的效用，与病理组织学相一致。

PU-1279

Diffusion and Perfusion parameters Is Associated with Early Lumbar Intervertebral Disc Degeneration: A Quantitative MRI Study

Xiaofei Chen
Gansu provincial hospital of Traditional Chinese Medicine

Abstract

Objective

To evaluate early intervertebral disc degeneration (IVDD) quantified by Intravoxel incoherent motion diffusion-weighted (IVIM-DWI) and T2mapping Magnetic Resonance Imaging in asymptomatic young adults.

Methods

Cross-sectional study using IVIM-DWI and T2 mapping MRI of lumbar spine in healthy adults was approve by the local ethics committee. 70 asymptomatic Adults (38 males and 32females; mean age, 25.07± 3.524years; range,20-48years) were performed lumbar MRI examinations at 3.0Tesla (Signa HDxt, GE Healthcare, Milwaukee, WI) with a spine-array coil. We analyzed the anterior annulus fbrosus (AF), nucleus pulposus (NP), and posterior AF of apparent diffusion coefficient (ADCstandard), pseudodiffusion coefficient (ADCfast), diffusion coefficient (ADCslow) and perfusion fraction(f) using IVIM-DWI MRI. The T2 values of the anterior AF, NP and posterior AF were evaluated using T2 mapping MRI. We compared the possible correlations of median ADCstandard, ADCfast, ADCslow and f values with the T2 values.
The sagittal IVIM-DWI was the following parameters: TR=2425ms, TE=88.5, Matrix=256×128, FOV=28×14cm^2, slices=4.5mm, gap=1.0mm. Ten b-values were used in IVIM acquisition (0,10,20,40,60,80,100,200,400,600s/mm^2), averages (b_0NEX=1,b_{10-100} NEX=4, $b_{200-600}$ NEX=6). acquisition time=223s. T2mapping parameters: TR=1000ms, 8 TE were used in T2mapping acquisition (9.4--75.6ms) Matrix=320×256, FOV=28×28cm2, Slicethickness=4.5mm, gap=1.0mm, NEX=1, acquisition time=548s.

Results

There was a signifcant negative correlation between ADCfast and T2 values of the anterior AF (r=-0.205, p<0.01),ADCslow and T2 values of the anterior AF (r=-0.116, p<0.05),ADCstandard and T2 values of the anterior AF (r=-0.140, p<0.05),and positive correlation between f values with the T2 values of the anterior AF (r=0.174, p<0.01). There were no signifcant correlations between IVIM-DWI parameters and T2 values of NP . ADCstandard with the T2 values of the posterior AF (r=0.154, p<0.05).
There were no signifcant correlations between ADCfast, ADCslow and f values with the T2 values of the posterior AF.

Conclusions

The results indicated that IVIM-DWI parameters might be accompanied with anterior AF degeneration. IVIM-DWI evaluation index might have the potential to identify novel technique for Diffusion and Perfusion parameters Is Associated with Early Lumbar IVDD.

基于压缩感知技术的 3D-MRI 在半月板损伤中的应用价值

马培旗,袁玉山
阜阳市人民医院

目的 探讨压缩感知技术在膝关节 3D 磁共振成像中应用的可行性及对半月板损伤的临床应用价值。

方法 对 30 名健康志愿者在 3.0T-MRI 仪上行右膝关节 MRI 扫描，完成常规 fs PDWI 扫描和 CS-3D 扫描常规膝关节 MRI 行矢状位、冠状位及横轴位 fsPDWI 扫描。CS 组图像按不同降噪（denosing，

DS）水平进行重建：CS-DS_{weak}（5%）、CS-DS_{medium}（10%）、CS-DS_{strong}（20%）。每位志愿者共获得 4 组图像，通过主、客观对矢状位图像质量进行评价。客观评价：选取外侧半月板后角正中矢状位层面，测量该层面外侧半月板后角 SNR 和 CNR。客观评价采用单因素方差分析，组间两两比较采用 LSD 法检验。采用 Kappa 系数对阅片者间进行一致性分析（k≥0.75 代表一致性较好），以 P<0.05 为差异有统计学意义。回顾性分析经关节镜证实的 26 个膝关节半月板撕裂的 CS-3D 图像，扫描参数如上，之后按 CS-DS_{medium}（10%）降噪水平进行重建。对每例图像进行半月板分型，采用 Kappa 系数对 CS-MRI 半月板分型结果和关节镜进行一致性分析（k≥0.75 代表一致性较好），以 P<0.05 为差异有统计学意义。

结果 1、两位高年资影像诊断医师的对图像质量的主观评价结果的评分一致性高（k=0.91），阅片者倾向将 CS-DS_{medium}组图像作为最佳诊断图像。2、客观评价中，CS-DS_{strong}在 4 组图像中 SNR 最高（p<0.05），且 CS-DS_{medium}组与常规 fsPDWI 组的 CNR 差异无统计学意义。3、26 例半月板撕裂患者 CS-3D 结果与术中关节镜结果一致性较高（k=0.94）。

结论 CS 技术可用于 3.0T MRI 仪半月板损伤进行成像，可以大大缩短扫描时间，同时能较准确的判断半月板损伤的类型，为临床提供更多指导性信息，值得推广进行常规应用。

PU-1281

非人工植入金属伪影 MRI 与 X 线诊断的价值

李学江
河南省滑县骨科医院

摘要 目的 X 线平片、MRI 检查非人工植入金属伪影诊断。

方法 在 MRI 常规序列进行检查中发现，头颅、膝关节无手术内置入物，无外伤史，外表未见异物。2 例头颅 MRI 常规检查，3 例膝关节 MRI 常规检查，图像完全影响诊断 3 例，伪影 2 例。

结果 2 例头部不适，年龄 59 岁，临床诊断脑血管病，建议 MRI 检查，在额部、鼻窦处可见条索状高信号伪影，技师多次询问患者、无手术史、无外伤史，检查患者体表未见异物，更换患者检查后，证实线圈、机器没问题。3 例膝关节检查，平均年龄 45 岁，临床以半月板损伤为诊断检查 MRI，膝关节 2 例伪影过大不能检查，1 例不影响半月板诊断。以上 5 名患者均进行了 X 线平片检查，2 例头颅内额部、鼻窦炎皮下点状高密度金属影。3 例膝关节检查，2 例关节囊内高密度金属影，1 例皮下高密度金属影。不能 MRI 检查的为多发和异物较深。以上 5 名患者均为工地电焊工，诱因为电焊喷发的铁粉贱至体表毛孔，铁粉随血液流动等原因从浅表到深部，引发患者疾病。

结论 询问患者自述无手术史和外伤史，但 MRI 检查出现伪影时，一定要进行普通 X 线检查，严重的要 CT 扫描确定金属异物的实际方位，影响患者健康的呈度进行评估，检查前患者病史、职业进行询问，确保患者健康为第一。

PU-1282

半肢骨骺发育异常的影像学表现（附 9 例报道）

王筱璇,马晓文
西安市红会医院

目的 分析半肢骨骺发育异常(Dysplasia epiphysealis hemimelica, DEH) 的影像表现，以提高此疾病的认知及诊断水平。 **方法** 回顾 2013 年 1 月至 2018 年 12 月本院收治的资料完整的 9 例 DEH 病变，其中男 8 例，女 1 例，年龄 2～11 岁，临床表现为关节附近硬性肿块。 **结果** 局限性 5 例，经典型 4 例。位于踝关节 6 例，膝关节 3 例；左侧肢体受累 1 例，右侧 7 例，双侧均受累

1 例；5 例单个骨骺受累，4 例多个骨骺受累；6 例肢体内侧受累，2 例肢体外侧受累，1 例肢体内外侧均受累。1 例合并踝内翻畸形，1 例合并膝外翻畸形，1 例合并双下肢不等长。8 例 X 线和/或 CT 表现为骨骺偏心性增大，骨骺旁斑点状、结节状高密度影，3 例与固有骨骺部分/完全融合，5 例无融合；6 例骨骺偏心性增大，1 例全侧增大，1 例未见明显增大。8 例 MR 均可见关节周围数量不一的骨软骨肿物，6 例与固有骨骺间有软骨间隙，2 例无软骨间隙，8 例 DEH 病变 MRI 检查均可清晰显示骨骺受累范围及病灶表面软骨帽的异常。 **结论** DEH 特征性的影像表现为骨骺偏心性增大，骨骺旁骨软骨性肿物，可与固有骨骺融合/不融合，常伴关节面倾斜，重者造成关节畸形。

Imaging of Dysplasia Epiphysealis Hemimelica (9 cases report)

Xiaoxuan Wang,Xiaowen Ma
Honghui Hospital Affiliated to Xi 'an Jiaotong University

Objective To deepen the understanding and improve the diagnosis level of dysplasia epiphysealis hemimelica (DEH) by analyzing the imaging performances.
Methods 9 cases of DEH with complete data admitted to our hospital from January 2013 to December 2018 were reviewed, including 8 boys and 1 girl, with ages from 2~11 years old. The clinical manifestation was a swelling hard mass around the joint.
Results 5 cases of localized and 4 cases of classical. Ankles are involved in 6 cases, and knees are involved in 3 cases.1 case involved left limb, 7 cases involved right limb, and 1 case involved both sides. Single epiphysis is involved in 5 cases, while multiple epiphyses are involved in 4 cases. 6 cases involved the medial limbs, 2 cases involved the lateral limbs, and 1 case involved both. 1 case combined with varus deformity of ankle, 1 case combined with valgum deformity of knee, and 1 case with leglength discrepancy. X ray and/or CT of 8 cases showed eccentricity enlargement of epiphysis, Spotted and nodular high density lesions around epiphysis. 3 of them fused with the epiphysis partially or completely, while 5 cases were separated from the epiphysis. 6 cases showed eccentricity enlargement of epiphysis, 1 case showed full side, and 1 case had no enlargement. There are variegated osteochondral masses around the joint in MR images. Cartilage space can be seen in 6 cases between osteochondral masses and inherent epiphysis, while 2 cases can not found. Extent of involved epiphyseal and abnormalities of surface cartilage cap can be displayed clearly in MR.
Conclusion DEH has characteristic image manifestation. It shows eccentricity enlargement of epiphysis, osteochondral masses around the epiphysis which were continuous or separated from the epiphysis. Articular surface tilt always accompanies and joint deformity will happened in severe cases.

PU-1284

肱二头肌长头肌腱损伤非增强 MRI 诊断价值

李海燕,马晓文,宋晓彬
西安交通大学附属红会医院

目的
肱二头肌长头腱损伤类型临床难以精确诊断。本研究旨在探讨非增强磁共振对肱二头肌长头腱损伤类型的诊断价值，分析并找出磁共振上最有用的诊断征象。
材料与**方法**
对 2017 年 10 月至 2019 年 4 月本院因肩袖撕裂行关节镜手术 312 例患者的磁共振图像及病案记录进行了回顾性分析。纳入标准为：本院术前 6 个月内行 MRI 扫描，有完整的肱二头肌长头腱损伤手术记录及关节镜采集图像。排除标准：超过 6 个月 MRI 检查、既往手术、肱骨近端骨折或伴随炎性关节炎的患者。MRI 采用 3.0T MRI（Verio；Siemens；Germany）进行扫描，常规扫描序列：斜冠状 TSE T1WI，斜冠状 PDW，斜矢状 TSE T2WI 和横轴位 T2 压脂（STIR）。根据关节镜检查结果进行损伤类型分类，分为以下几类：I 型：肱二头肌长头腱腱鞘炎；II 型：肱二头肌长头腱变性；III 型：部分撕裂，宽度小于 50%；IV 型：部分撕裂超过肌腱宽度的 50%；V 型：肌腱完全撕裂；VI 型：肱二头肌长头腱脱位。对 MRI 图像与关节镜结果的进行了比较。MRI 扫描显示异常征象包括信号强度改变、径线改变、形态是否规则，边缘是否整齐，周边有无液体聚集、软组织肿胀等。
结果
关节镜检查显示，92 例（29.5%）患者存在肱二头肌长头腱损伤。以“至少 2 个异常征像”为诊断标准可获得较高的诊断效果。其中以信号强度及边缘是否整齐两项异常征像诊断效果最好，（敏感性 80.9%，特异性 95.6%）II 型、III 型和 IV 型损伤在横轴位信号强度异常变化的敏感性最高（分别为 50.8%,70.9%和 81.7%），VI 型损伤在横轴位位置改变观察最佳，I 型、V 型三个扫描方位均可很好显示。
结论
非增强 3.0T MRI 对术前诊断肱二头肌长头腱损伤类型具有较高的诊断价值。最敏感的单一诊断征象是横轴位信号强度的改变。

PU-1285
肺腺癌与小细胞癌骨转移的鉴别：MR 影像组学

史大宝
辽宁省肿瘤医院

摘要　目的　探讨采用影像组学的方法分析肺癌骨转移 MR 影像特征预测肺癌病理类型的可行性性。**方法**　回顾性分析 2016-2018 年经病理证实的 113 例肺癌患者（腺癌 71 例。小细胞癌 42 例），所有患者经综合影像学（CT、骨扫描或 MR）或病理证实为脊柱骨转移。117 例患者均行 MR 常规脊柱扫描。利用 ITK-SNAP 软件对 MR 发现的骨转移病灶进行手动分割，利用 Python 获得肺腺癌骨转移的影像组学特征，MatLab2018a 分析其特征，用受试者工作特性曲线下面积（AUC），灵敏度，特异性和准确度来评价其性能。**结果**　影像组学预测肺癌病理类型具有较好表现，在验证数据集中，AUC 为 0.770（范围 0.741-0.820），灵敏度为 89.8%，特异度为 53.2%，准确度为 70.6%。**结论**　采用影像组学研究方法分析肺癌骨转移 MR 影像特征对预测肺癌病理类型具有一定的参考价值

PU-1286
探讨腰椎间盘退行性病变诊断中 CT 与 MRI 的应用价值

黄兴旺
南宁市第二人民医院

摘要 目的 探讨腰椎间盘退行性病变诊断中 CT 与 MRI 的应用价值。方法 选取我院 2016 年 5 月至 2019 年 5 月确诊为椎间盘退行性变患者 70 例，男 51 例，女 19 例，所有病例均进行 CT 和 MRI 诊断，回顾性分析比较两种方法诊断结果。结果 CT 诊断椎间盘突出、神经根受推移的正确率稍高于 MRI，MRI 在诊断椎管狭窄，突出椎间盘与硬膜囊的分界清晰率显著高于 CT，MRI 在诊断纤维环病变有明显优势。

磁共振扩散峰度成像诊断 SD 大鼠早期糖尿病足周围神经病变的初步研究

梁晓莹[1],陈杰[1],肖叶玉[2,1],夏学文[2]
1.汕头大学医学院第二附属医院
2.广州市中西医结合医院

摘要：目的 探讨磁共振扩散峰度成像（DKI）对 SD 大鼠早期糖尿病足周围神经病变（DPN）的诊断价值。**材料与方法** 将 30 只 5 周龄，体重约 150g
雄性 SD 大鼠随机分为对照组与实验组（每组 15 只），其中对照组以普通饲料喂养，实验组以高脂饲料喂养，一个月后于实验组腹腔注射 STZ 溶
液（45mg/kg），对照组腹腔注射等体积的柠檬酸一柠檬酸钠缓冲液，测量注射药物前及注射药物后 1d、3d、7d 实验组大鼠随机血糖，如随
机血糖稳定且均大于 16.7mmol/L 代表糖尿病大鼠模型造模成功。30 只 SD 大鼠均于成模后 3d、1w、2w、3w、4w、5w、6w 行右小腿常规
MRI 及 DKI 扫描，并于第 6w 行离体坐骨神经电生理及病理检查。应用 Matlab 软件作数据后处理，并用 Image J 软件测量大鼠右小腿腓肠肌感兴
趣区（ROI）的平均峰度（MK）、径向峰度（RK）、平均扩散率(MD)和各向异性分数(FA)值。应用 SPSS22.0 软件进行统计学分析，采用 t 检

验比较组间 DKI 各参数值差异。**结果** 成模后 3w-6w 实验组 SD 大鼠 MK、RK、MD、FA 值均稳定高于对照组（P<0.05），成模后 6w 实验组坐
骨神经传导速度显著低于对照组（P<0.05），病理示实验组坐骨神经出现早期脱髓鞘改变。**结论** DKI 对 SD 大鼠早期糖尿病足周围神经病变的
诊断，具有较高的参考价值，为进一步研究 DKI 对糖尿病患者早期周围神经病变的诊断提供了可能性。

PU-1289
非小细胞肺癌与小细胞肺癌骨转移的鉴别：MR 影像组学

赖庆园,董越
辽宁省肿瘤医院

目的 探讨采用影像组学的方法分析骨转移 MR 影像特征鉴别非小细胞肺癌与小细胞肺癌的可行性。**方法** 回顾性分析 2016-2018 年经病理证实的 80 例肺癌患者（非小细胞肺癌 40 例，小细胞肺癌 40 例）的影像及临床资料，所有患者经综合影像学（CT、骨扫描或 MR）或病理证实为脊柱骨转移。应用 ITK-SNAP 软件对 MR 发现的骨转移病灶进行手动分割，通过 AK 软件提取纹理特征，然后通过训练组使用 ANOVA+MW 和 Correlation Analysis 方法进行筛选，最后根据筛选后的特征集使用随机森林（RTree）构建影像组学模型。用受试者工作特性曲线下面积（AUC）和准确度来评价该模型在鉴别非小细胞肺癌与小细胞肺癌中的表现。**结果** T1WI 上，模型诊断准确度和 AUC 在验证组中分别为 0.722 和 0.570；T2WI 上，模型诊断准确度和 AUC 在验证组中分别为 0.631 和 0.598；T2WI 脂肪抑制上，模型诊断准确度和 AUC 在验证组中分别为 0.552 和 0.513。**结论** 采用影像组学研究方法分析骨转移 MR 影像特征对鉴别非小细胞肺癌与小细胞肺癌具有一定的参考价值。

PU-1290
在缺血性脑卒中模型鼠中活体示踪间充质干细胞来源外泌体的实验研究

徐蓉
东南大学附属中大医院

目的 外泌体是由多种细胞分泌的纳米囊泡，能够介导局部或远端的细胞间通讯。间充质干细胞来源的外泌体能调节免疫系统，促进突触再生和血管生成，修复受损组织。大量研究已经证实外泌体可以跨越血脑屏障，但它们在大脑中的迁移和归巢能力仍未得到研究。**方法** 提取并鉴定间充质干细胞来源外泌体，通过磁共振成像分子和近红外荧光成像分子修饰并对其表征，完成体外磁共振/光学成像；建立小鼠缺血性脑卒中动物疾病模型，尾静脉应用建立好的可视化间充质干细胞来源外泌体，多时间段采集磁共振图像和近红外荧光图像，定量分析，并对离体脑组织进行免疫荧光染色。**结果** 我们成功提取间充质干细胞分泌的外泌体，构建了可视化的外泌体分子，荧光基团为 Dir，在荧光显微镜下观察到红色荧光；磁性基团为 Fe_3O_4，在 MR T2 成像上观察到低信号。建立缺血性脑卒中小鼠模型后，全身应用可视化的外泌体分子，并在 1、2、3、4、5 天分别进行 T2 加权磁共振成像和近红外荧光成像，动态观察病灶处强度变化。在磁共振成像上，第 3 天可以观察到病灶周边低信号。在近红外荧光成像上，从第 1 天起右侧脑缺血部位即可出现光信号增强，表明外泌体已经开始在病灶处聚集，也由此证明近红外成像较磁共振成像灵敏度更高。随后信号逐渐增强，在第 3 天达到峰值，之后开始减弱并消失。本实验采集了对照组和实验组离体脑组织的光学信号，

在第 3 天具有显著差异（P＜0.05）。离体脑组织的免疫荧光染色可以观察到外泌体与神经元共定位。**结论** 通过磁共振/光学成像对外泌体进行活体示踪，充分证实间充质干细胞来源外泌体确实归巢至缺血部位；间充质干细胞来源外泌体能被病灶区的神经元选择性摄取，促进神经功能恢复。

重度抑郁症静息态 fMRI 的独立成分分析

刘凌翀[1],张琪[2],王滨[3]
1.山东第一医科大学第一附属医院（山东省千佛山医院）
2.滨州医学院烟台附属医院
3.滨州医学院

目的 采用功能磁共振成像（fMRI）和独立成分分析（ICA）方法，研究首发未服药重度抑郁症病人的脑功能状态。**方法** 共纳入 15 例首发未服药重度抑郁症病人和 15 例健康对照志愿者，2 组年龄[（27.80±15.44）岁和（26.07±12.19）岁]、性别（男/女：7/8 和 7/8）、受教育水平[（11.73±4.23）年和（12.73±2.58）年]均匹配。2 组均在静息状态下采用 3.0 T MR 设备进行 BOLD-fMRI 扫描。利用 ICA 方法，采用汉密尔顿抑郁量表（HAMD）24 项版本，分别对相同脑成分的两组数据进行双样本 *t* 检验，统计分析 2 组之间有差异的脑区。**结果** 静息状态下病人组的双侧额上回、双侧额中回、双侧颞中回、左侧楔前叶、左侧小脑前叶、双侧中央后回、双侧扣带回、双侧顶上小叶、双侧顶下小叶等脑区显著激活并且高于对照组[体素大小为 10 以上且差异有统计学意义的脑区（*P*<0.05，体素大小>10）]。**结论** 首发未服药重度抑郁症病人广泛的脑区激活，这些异常的脑区可能与抑郁症情绪调控机制障碍有关。

PU-1292

清甲治疗前 99mTc04-甲状腺静态显像对分化型甲状腺癌术后患者有无残甲的预测价值

彭杨灵
重庆市肿瘤研究所

目的 手术和术后放射性 ^{131}I 清除残余甲状腺组织（简称清甲）治疗是治疗分化型甲状腺癌（differentiated thyroid carcinoma，DTC）的主要手段，因此，清甲治疗前预测 DTC 术后患者的有无残余甲状腺组织（简称残甲）是尤为重要的，而清甲前 $^{99m}TcO_4^-$ 甲状腺静态显像（简称甲扫）简单易操作，且不会影响清甲治疗疗效。本文的研究目的在于探讨清甲治疗前甲状腺静态显像在评估 DTC 术后患者有无残甲上的价值。

方法 回顾性收集分析 2016 年 3 月-2016 年 10 月满足入组条件且于本院行 ^{131}I 清甲治疗的 DTC 术后患者。清甲前 2 周内完成甲状腺静态显像，口服 131I 治疗后的 3-4d 完成全身碘扫描（简称碘扫）。图像分析均有两名核医学诊断医师分别进行定性评价，分别为阳性（即存在残余甲状腺组织显影）与阴性（即无残余甲状腺组织显影），当出现分歧时通过达成共识得出结论。以治疗后全身碘扫描结果作为金标准，采用卡方检验以及 McNemar 检验分析计算两者的符合率、敏感性、特异性、阳性预测值（positive predictivevalue,PPV）、阴性预测值（negative predictivevalue,NPV）和准确性等指标。*P*＜0.05 表示有统计学意义。

结果 共计收集满足条件患者 171 例，其中男性患者 42 例（24.56%），女性患者 129 例（75.44%），年龄范围为 11-75 岁，中位年龄 43 岁。碘扫阳性 164 例（95.9%），其中 78 例

（47.56%）同时表现为甲扫阳性。碘扫阴性 7 例，且其甲扫均为阴性。甲扫阴性，而碘扫呈阳性的患者 86 例，碘扫阴性,且甲扫阳性的患者 0 例。甲扫与碘扫结果不一致的患者总计 86 例。以碘扫结果作为金标准时，卡方检验结果显示，清甲治疗前甲状腺静态显像结果与治疗后全身碘显像结果存在统计学差异。

PU-1293
磁共振酰氨基质子转移成像及体素内不相干运动成像在术前预测胶质瘤 IDH1、MGMT 及 Ki-67 表达的应用初探

邹天宇[1,3],于昊[2,3],王显龙[3],芮琦虹[3],蒋春秀[3],温志波[3],周进元[4]
1.威海市立医院
2.济宁医学院附属医院
3.南方医科大学珠江医院
4.约翰霍普金斯大学

目的 探索磁共振酰氨基质子转移成像（APT）及体素内不相干运动成像（IVIM）术前预测胶质瘤 IDH1、MGMT 及 Ki-67 表达的价值。
方法 收集我院 51 例术前行 APT 及 IVIM 序列扫描的患者，所有的病例均经病理学证实为胶质瘤。两序列的参数有：APTW，rAPTW、D 值，f 值，D*值。回顾性分析各肿瘤 IDH1、MGMT 及 Ki-67 的表达状态，利用卡方检验分析 IDH1、MGMT 不同表达状态下患者性别、肿瘤级别的差异；采用独立样本 t 检验分析 IDH1、MGMT 不同表达状态下各参数的差异及不同性别、年龄的 Ki-67 LI 的差异。运用双变量 Pearson 相关分析 Ki-67 LI 与各参数的相关性。各参数预测 IDH1、MGMT、p53 表达状态的准确性运用受试者特性曲线、曲线下面积和 cut-off 值。
结果:（1）IDH1 表达状态与年龄、性别无相关性，与胶质瘤的级别呈负相关性。APTW、rAPTW、f 值与 IDH1 表达状态呈负相关，D 值与其呈正相关。APTW、rAPTW、f 值、D 值均具有中等程度预测效能，rAPTW、f 值、D 值三者联合时预测效能最高（AUC=0.913）。（2）MGMT 表达状态与年龄、性别及胶质瘤的级别无相关性。两组间 APT 序列参数无差异，而 IVIM 参数均有差异，D 值、D*与 MGMT 表达水平呈负相关，f 值与其呈正相关。APT 序列参数预测 MGMT 蛋白表达状态时效能低，而 IVIM 各参数效能较高，D 值、f 值及 D*值联合时预测效能最高（AUC=0.907）。（3）年龄、性别、D*值与 Ki-67 LI 无相关性；肿瘤级别、APT、rAPTW、f 值与 Ki-67 LI 呈正相关，D 值与 Ki-67 LI 呈负相关。
结论 APT、IVIM 在术前能较好地预测 IDH1 的表达；APT 预测 MGMT 表达时效能差，IVIM 预测时效能较好； APT 参数、f 值与 Ki-67 LI 呈正相关，D 值与 Ki-67 LI 呈负相关。

PU-1294
偏头痛患者脑内 GABA 含量的磁共振波普研究

吴晓娟
苏州大学附属第一医院

目的 本实验具体检测无先兆性偏头痛病人前扣带回部位 GABA 含量与健康人群之间是否具有统计学差异。
方法 选取苏大附一院神经内科头痛门诊 17 名无先兆性偏头痛患者及 17 名年龄、性别及受教育程度相匹配的健康志愿者，临床评估包括病程、家族遗传性、焦虑自评量表（GAD-7）及抑郁自评量表（PHQ-9）及 0-10 分视觉模拟量表（VAS）。应用 3T 飞利浦 MRI 对所有无先兆偏头痛患者及志愿

者行颅脑 T1 加权 TFE 序列(T1W-TFE)扫描，得到三维高分辨率图像，并在所得的三维图像上将感兴趣区手动调整放置于前扣带回皮层。其后应用 MEGA—PRESS 序列采集 GABA 波普数据。利用 Gannet 软件对波谱数据进行自动后处理，定量分析前扣带回皮层的 GABA 含量。对无先兆性偏头痛患者和健康志愿者组的 GABA 含量用独立样本 t 检验进行统计分析，并对 GABA 水平与临床评估之间的相关性进行 Spearman 相关分析。

结果 统计分析结果显示，在脑前扣带回区域，无先兆性偏头痛患者组 GABA 含量低于对照组(0.116±0.009 VS 0.123±0.010)，有统计学差异(P=0. 048)。相关性分析结果显示，无先兆性偏头痛患者组前扣带回 GABA 含量与 VAS 分数无明显相关性（r = 0.454，p = 0.067）。

结论 无先兆性偏头痛患者组前扣带回区域 GABA 含量较健康对照组降低。这一结果提示抑制性神经递质 GABA 或可能参与无先兆性偏头痛发病的神经生物学。

PU-1295
水通道蛋白磁共振分子成像对脑缺血半暗带的评价

彭晓澜,余波,陈秋雁,陈婷婷,吴富淋,魏鼎泰
宁德市医院

目的 探讨多 b 值 DWI-MR 水通道蛋白分子成像（Aquaporin MR imaging，AQP-MRI）技术对脑缺血半暗带的诊断价值。方法 将 30 只 SD 大鼠随机分为缺血组（25 只）和对照组（5 只），缺血组经历 1 h 短暂性大脑中动脉栓塞（MCAO）建立脑缺血模型,两组分别行多模态 MR 扫描，采集 T2-FLAIR、DWI、ASL 及 AQP-MRI（18b 值 DWI）图像。将 AQP-MRI 与 T2-FLAIR 不匹配的区域与传统 T2-FLAIR 不匹配作比较，验证 AQP-MRI 对缺血半暗带的诊断价值，并结合组织病理学进行评价。结果 对照组在每个时间点各序列均未见异常信号。缺血组 24 h 内，AQP-MRI/T2-FLAIR 不匹配面积和 DWI/T2-FLAIR 不匹配面积有显著差异（P＜0.01）。6 h 内，AQP-MRI/T2-FLAIR 不匹配面积和 ASL/DWI 不匹配面积无明显统计学差异（P＞0.05）。24 h 内半暗带区相对比值 rIP 与梗死区 rIC 及正常脑组织 rNC 具有统计学差异（P=0.001 及 P＜0.05），MR 结果与组织病理学相对应。。结论 与传统的不匹配相比，AQP-MRI/T2-FLAIR 不匹配可多层次、更精准地实时动态显示缺血半暗带。AQP-MRI 与 T2-FLAIR 相结合可对缺血半暗带的评价提供有价值的影像学信息。

PU-1296
意识障碍的全脑功能神经连接网络表型及蛋白分布的三维可视化研究

刚亚栋,徐海波,梅豪,王良,吕金凤
武汉大学中南医院

目的 意识障碍是一种严重的脑功能紊乱，对社会经济及家庭造成沉重的负担。目前针对意识障碍尚缺乏有效的治疗手段，根本原因在于人们对于意识障碍产生的神经环路机制仍然知之甚少。现有的磁共振和光学成像技术是意识障碍机理研究的重要手段，但是单纯采用磁共振成像技术或传统的光学成像技术所建立的意识障碍模型和理论只能对脑区之间的神经元功能及其连接关系进行注解，无法精确地对特定类型神经元的投射路径和功能蛋白分布模式进行分析，仍然不能从根本上解析意识障碍发生的机制。**方法** 本研究围绕意识障碍全脑功能环路与蛋白分布关系问题展开，以创伤性意识障碍动物为疾病模型，综合运用全脑三维光片荧光成像技术和磁共振成像技术的优势，对光片成像系统进行改进，首先采用侧面高斯光片激发并在垂直的方向上对激发光信号进行探测，引入振动切片技术对全脑样本进行遍历式切片成像，克服了传统光片三维成像时样品深层组织的荧光信号

经散射造成的图像质量降低。其次筛选并建立适用于微米级振动切片的高分子光透明试剂和方法，在满足切片需要的同时保持组织细胞形态结构和荧光标记信号，建立了全脑光透明新方法。最后利用脑区轮廓定位及图像提取技术对磁共振成像数据中的功能脑区进行识别和定位，并在定位脑区的基础上进行标记和三维光学成像。**结果** 结合光片成像与振动切片技术研制三维荧光成像系统，实现了鼠脑全脑甚至更大体积样品的高分辨率快速成像。筛选并设计适用于微米级振动切片的高分子光透明试剂和方法，满足了三维荧光成像系统的成像需要。利用图像提取技术对磁共振成像数据中的功能脑区进行识别和定位，可满足对相应功能区域的特定神经元及蛋白进行注解。**结论** 采用搭建的三维光片成像系统结合 fMRI 成像技术，能够获取意识障碍动物模型全脑功能环路与蛋白分布数据，为意识障碍的机理研究提供科学支撑与技术保证。

PU-1297

Amide Proton Transfer-weighted (APTw) Imaging of Intracranial Infection in Children: Initial Experience and Comparison with Gadolinium-enhanced T1-weighted Imaging and Magnetization Transfer (MT) Imaging

Hong Zhang, Xiaolu Tang, Yun Peng
Beijing Children's Hospital, Capital Medical University, National Center for Children's Health

Objectives To demonstrate the feasibility of using amide proton transfer-weighted (APTw) imaging to detect intracranial infection in children at 3 Tesla.
Methods Twenty-eight patients (15 males and 13 females; age range 1-163 months) with intracranial infection were recruited in this study. The patients underwent MRI scans including APTw and conventional MR sequences. Magnetization-transfer (MT) spectra over an offset range of ± 6 ppm and the conventional MT ratio (MTR) at 15.6 ppm were acquired. The APTw imaging signal was quantified using the MTR asymmetry (MTR_{asym}) at the offset of 3.5 ppm.
Results In twelve patients with brain abscesses, the enhancing rim of the abscesses on the Gd-T1w images were consistently hyperintense on the APTw images. The average APTw signals were significantly higher in the gadolinium-enhancing rim of the lesions than in the perifocal edema and contralateral normal-appearing brain tissue (CNABT) ($P<0.001$). MTR values between gadolinium-enhancing rim and perifocal edema showed no significant differences. APTw values in the gadolinium-enhancing rim and perifocal edema decreased after treatment. MTR values in all tissue types stayed stable. In eight patients with viral encephalitis, three encephalitic lesions showed slight spotted gadolinium enhancement, while the APTw image also showed slight spotted high signal. Five encephalitic lesions showed no enhancement on Gd-T1w and iso-intensity on the APTw image. The average APTw and MTR values were not significantly different between viral encephalitis and normal control groups ($P>0.05$). In eleven patients with meningitis, increased APTw signal intensities were clearly visible in gadolinium enhancing leptomeninges.
Conclusions These initial data show that APTw MRI is a noninvasive technique for the detection and characterization of intracranial infectious lesion. APTw values show potential as early response biomarker after treatment for brain abscess.

PU-1298

脊髓型颈椎病生物力学分析初步研究

谭蓓,李娜,冯智超,颜海雄,容鹏飞,王维
中南大学湘雅三医院

目的 构建颈部三维有限元模型（finite element model，FEM），初步分析脊髓型颈椎病（cervical spondylotic myelopathy，CSM）患者及健康受试者颈部生物力学的差异，为 CSM 发病机制提供生物力学依据。
方法 从我院临床确诊的 CSM 随机抽取 1 名患者作为力学模拟实验对象、依照患者的年龄、性别、身高、体重等参数招募类似体型的人作为对照，进行三维 CT 扫描，并构建颈部三维 FEM，比较患者和健康受试者在颈椎正常受力情况下椎体、椎间盘、韧带及脊髓的应力差异，以及后仰伸运动后最大应力的差异。
结果 CSM 患者颈椎椎体受力差异最明显为 C5-C6 节段，健康受试者和患者的最大应力部位均在椎体前缘，CSM 患者椎体前缘的最大应力小于健康受试者；CSM 患者椎间盘应力分布不均匀，最大应力部位集中在椎间盘底部后缘的两侧；CSM 患者各韧带的应力分布不均匀，其中后纵韧带应力最大。CSM 患者颈椎在后仰伸运动范围受限。
结论 CSM 患者相对于健康受试者椎体、椎间盘、韧带受力平衡发生改变，运动范围受限，这可能是引起脊髓型颈椎病的生物力学基础

PU-1299

3.0T 磁共振化学交换饱和转移成像在肺癌脑转移的应用初探

杨永贵
厦门医学院附属第二医院

目的 探讨 3.0T 磁共振肺癌脑转移瘤的 CEST 成像技术与评价其应用价值。
方法 收集 2018 年 1-7 月肺癌脑转移瘤 26 例、胶质瘤 15 例及正常对照组 20 例，观察采用 ASSET 技术的 GRE EPI CEST 序列成像并通过 APT 软件处理获得 3.5ppm 磁化转移率（MTR）图，测定病灶实质区、水肿区、非病灶区的 MTR 值。测量值进行方差分析和独立样本 t 检验统计学分析，检验标准为 P＜0.05。同时进行 MTR 图像与传统 MRI 图像比较。
结果 MTR 图上转移瘤组的病灶实质区、水肿区、非病灶区分别呈红黄色、黄绿色、绿蓝色；其 MTR 值分别为 3.29±1.14%、1.28±0.36%、1.26±0.31%。胶质瘤组病灶实质区、水肿区、非病灶区分别呈红色、红黄色、绿蓝色，MTR 值分别为 6.29±1.58%、2.87±0.65%、1.03±0.30%。正常组对应区均呈绿蓝色，MTR 值分别为 1.07±0.22%、1.04±0.23%、1.06±0.24%。传统 MR 图像均呈黑白对比，无代谢信息显示。统计学比较显示转移瘤组与正常组、胶质瘤组 3 个区域 MTR 值有统计学差异（P＜0.05）；转移瘤组病灶实质区与水肿区、非病灶区的 MTR 值比较均有统计学差异（P＜0.05），水肿区与非病灶区的 MTR 值无统计学差异（P＞0.05）。胶质瘤组病灶实质区与水肿区、非病灶区的 MTR 值比较有统计学差异（P＜0.05），水肿区与非病灶区的 MTR 值有统计学差异（P＜0.05）。
结论 采用 CEST 成像技术可以获得伪彩图像并能够反映蛋白代谢。转移瘤病灶实质区、水肿区呈红黄色、绿蓝色，MTR 值比胶质瘤组低，比正常组高；而非病灶区呈绿蓝色，MTR 值比胶质瘤组、正常组高。通过 MTR 图像颜色分辨及 MTR 值测定，实现脑转移瘤早期诊断与病灶的分子影像水平的转归评估。

PU-1300
ASL 联合 SWAN 对单侧大脑中动脉闭塞后侧支循环建立状态显示的应用价值

周建国,符大勇
连云港市中医院

摘要：目的 探讨磁共振动脉自旋标记成像（ASL）联合 T2*血管加权成像（SWAN）在单侧大脑中动脉（MCA）闭塞后软脑膜侧支循环建立状态显示的临床应用价值。**方法** 收集研究 2016 年 1 月至 2019 年 6 月经临床及影像学诊断为急性缺血性脑卒中（AIS）且单侧 MCA 闭塞患者 50 例，均行磁共振常规序列、三维伪连续式动脉自旋标记成像（3D pCASL），SWAN 及三维时间飞跃法磁共振血管成像（3D-TOF MRA）序列检查，通过观察分析（CBF）伪彩图，依据缺血核心区周围是否出现动脉内高信号，将患者分为观察组和对照组，分别对两组患者于入院当日及 15 日依据美国国立卫生研究院脑卒中评分量表（NIHSS）进行评分，利用 DWI 序列评估两组梗死核心区面积差异。通过 SWAN 序列显示缺血核心区周围引流静脉形态学改变。**结果** 观察组患者入院当日与 15 日 NIHSS 评分均低于对照组，同时 DWI 序列提示观察组梗死区面积小于对照组，差异有统计学意义（P<0.05）。观察组缺血梗死区周围 PVS 显示率为 27.27%（6/22），明显低于对照组 78.57%（22/28）。**结论** 软脑膜动脉侧支循环是单侧 MCA 闭塞后的主要代偿途径，通过 ASL 联合 SWAN 序列反映侧支循环建立状态有助于评估缺血梗死现状、预后以及治疗方案的选择。

PU-1301
大脑中动脉 M1 段闭塞后动脉偏侧优势和动脉内高信号对比研究

周建国,卢明聪
连云港市中医院

摘要：目的 探讨大脑中动脉（MCA）M1 段闭塞后，同侧大脑前动脉（ACA）及大脑后动脉（PCA）偏侧优势与动脉内高信号之间的相关性。**方法** 收集 2016 年 1 月至 2019 年 3 月经磁共振血管成像（MRA）提示单侧 MCA M1 段闭塞患者 60 例，依据有无 ACA、PCA 偏侧优势分为偏侧优势组和对照组，通过观察三维动脉自旋标记成像（3D-ASL），对比两组动脉内高信号显示差异。同时选取急性脑梗死患者 38 例，依据 DWI 序列，测量并比较偏侧优势组及对照组梗死核心面积差异。**结果** 60 例患者中，偏侧优势组出现动脉内高信号为 87.9%（29/33），对照组患者出现动脉内高信号为 48.1%（13/27）。急性脑梗死患者 38 例，偏侧优势组脑梗死面积（226.38±56.51㎜^{2}）亦明显小于对照组（827.26±124.27 ㎜^{2}），两组差异有统计学意义（P<0.05）。**结论** 大脑动脉偏侧优势及动脉内高信号均可提示单侧 MCA M1 段闭塞后软脑膜侧支循环建立状态，但动脉内高信号更为敏感和准确，侧支循环的建立对于患者治疗方案的选择及临床预后均具有积极意义。

基于磁共振化学交换饱和转移成像技术对 类淋巴系统可视化的探究

陈源锋,沈智威,王润润,赖丽华,唐燕燕,李雁,贾岩龙,吴仁华
汕头大学医学院第二附属医院

目的 类淋巴系统是人体内重要的防御系统，其与心血管系统相互沟通，密切相关。该系统以脑脊液和间质液为基础,在脑实质内由蛛网膜下腔进入血管周围间隙的循环机制将颅内代谢废物(如β-淀粉样蛋白、tau、载脂蛋白)排出颅内，,本项研究旨在运用磁共振化学交换饱和转移成像技术(CEST)验证其存在性，并且为脑类淋巴系统损伤的监测提供一种新兴的无创成像方法技术，为相关的脑部疾病（如阿尔茨海默症、认知功能障碍等）提供更加全面的诊断方法。**方法** 采集猪血液、淋巴液和脑脊液样本，以及蒸馏水作为基础对照，将四种液体分别置于四支 2ml 核磁管内，加入抗凝剂枸橼酸钠(比例 10:1)并将 pH 滴定至 7.0。随后在 7.0T 磁共振扫描仪上行 CEST 扫描。**结果** 血液、脑脊液、淋巴液和蒸馏水在 CEST 成像中，淋巴液表现出最明显的 CEST 效应，在 1.0ppm 处，经过 B0 校正后最大磁化转移率(MTR)达 32%。**结论** 运用磁共振 CEST 技术对实现淋巴系统的可视化是可行的，并对探讨脑类淋巴系统可视化的可能性甚至类淋巴系统障碍的机制具有潜在的意义。

PU-1303
首发抑郁症患者纹状体多巴胺 D2 受体改变及其与行为学的相关分析

孙萌萌,徐俊玲
河南省人民医院

目的 应用 ^{11}C-Raclopride 正电子发射断层显像(PET)/计算机体层摄影(CT)扫描，结合汉密尔顿抑郁量表(HAMD)，探讨首发抑郁症患者纹状体多巴胺 D_2 受体结合状态改变及其与行为学改变之间的关系。

方法 分别对 20 例首次发病抑郁症患者与 20 例健康志愿者行脑部 PET-CT 及 MRI。应用 MIAKAT 软件计算每一例受试者双侧纹状体多巴胺 D_2 受体结合力，运用 SPSS 软件分析患者双侧纹状体多巴胺 D_2 受体结合力改变，并对患者双侧纹状体多巴胺 D_2 受体结合力及其汉密尔顿抑郁量表评分进行相关分析。

结果 1.抑郁组左右侧尾状核、左右侧壳核 D_2 受体结合力均分别低于对照组（t=4.41、3.78，p=0.00008、0.001；t=3.20、3.13，p=0.003、0.003）。2.抑郁量表总分与双侧尾状核、壳核结合力分别呈中度负相关（r=-0.688、-0.679，p=0.001、0.001；r=-0.654、-0.585，p=0.002、0.007）；焦虑/躯体化因子分与双侧尾状核、壳核结合力分别呈中度负相关（r=-0.570、-0.563，p=0.009、0.010；r=-0.605、-0.533，p=0.005、0.016）；认知障碍因子分与双侧尾状核结合力分别呈中度负相关（r=-0.588、-0.598，p=0.006、0.005），与左侧壳核结合力呈低度负相关（r=-0.489，p=0.029）；迟滞因子分与左右侧尾状核结合力分别呈中度、低度负相关（r=-0.521、-0.496，p=0.019、0.026）；睡眠障碍因子分与左侧尾状核结合力呈低度负相关（r=-0.453，p=0.045）。

结论 纹状体多巴胺受体异常可能是抑郁症患者中脑-纹状体多巴胺奖赏环路异常的重要分子机制之一。

多期相 CTA 联合 CTP 在脑梗塞病因学评估中的应用研究

张道强

1.苏大附一院
2.东海县人民医院

[摘要] 目的 多期相 CTA 联合 CTP 在评估急性脑梗塞两种病因中的应用研究。方法 回顾性分析本院 2018 年 10 月-2019 年 6 月,临床根据 TOAST 分型诊断为心源性栓塞（CE）患者 13 例，大动脉粥样硬化型（LAA）脑梗塞患者 30 例，分为 CE 组和 LAA 组，分析两组间一般资料、入院/出院时 NIHSS 评分及出院时神经功能好转率、CTA 参数、CTP 参数的相关性。结果 两组患者性别、年龄（P=0.307，P=0.162）差异无统计学意义；入院/出院时 NIHSS 评分及出院时神经功能好转率（P=0.526，P=0.850，P=0.288），梗塞累及双侧大脑半球 7.7%和 30%（P=0.112），梗塞累及 ACA、MCA、ICA 末端者分别是 8%、92%、15%和 6.7%、90%、20%（P=0.903，P=0.811，P=0.721），以上差异均无统计学意义；两组中梗塞是多节段者为 7.7%和 40%，P=0.034，差异有统计学意义；两组区域软脑膜评分为（12.46±3.20）分和（15.70±3.34）分，P=0.005，差异有统计学意义；CE 组低灌注脑组织体积、梗塞核心和缺血半暗带的体积（150.30±126.80、65.23±63.65、85.08±74.87）都大于 LAA 组（105.07±114.53、33.03±53.40、72.03±74.06），（P=0.256；P=0.094；P=0.600）；CE 组错配比（4.75±6.19）小于 LAA 组（7.82±14.77），P=0.477；但差异均无统计学意义。结论 多期相 CTA 上存在多节段血栓征患者病因更可能是动脉硬化；区域软脑膜评分（rLMC 评分）对急性前循环缺血性卒中病因有较好的预测价值。

Selective micro-structural integrity impairment of the sub-region of the corpus callosum associated with illness duration in major depressive disorder

Wenming Zhao
The First Affiliated Hospital of Anhui Medical University

Background: Aberrant structural and functional connectivity are considered to be involved in the underlying neural mechanism of major depressive disorder (MDD). However, the relationship between illness duration and alterations in structural and functional in the bilateral hemispheres are rarely examined.
Methods: 96 patients with MDD and 73 healthy controls were enrolled in this study. Diffusion tensor images (DTI) and Resting-state Blood oxygen level-dependent were acquired for all subjects. The corpus callosum (CC) was reconstructed by DTI tractography and was divided into five sub-regions. The white matter integrity of the CC sub-regions and voxel-mirrored homotopic connectivity (VMHC) of whole brain were compared between the two groups. Their correlations with clinical measures (e.g. illness duration) were further performed.
Results: There were no significant differences in the CC sub-regions and VMHC of the whole brain between two groups. In patients with MDD, significantly negative correlations between illness duration and FA values of CC sub-region 2 and CC sub-region 5, significantly positive correlations between CPT-IP-3 and FA values of CC, CC sub-region 2 and CC sub-region 3, and significantly positive correlation between illness duration and VMHC of the supplementary motor areas, lingual gyrus, and

precuneus. Further mediation analyses demonstrated that disrupted microstructural integrity of CC partly mediated the association between illness duration and on sustained attention.
Conclusion: Our findings suggest that longer illness duration was predictive of greater white matter microstructural abnormalities of CC sub-regions and altered inter-hemispheric functional connectivity in patients with MDD. These findings provide new insights into neural mechanisms and reinforce an integrative view of the microstructural integrity of CC and inter-hemispheric brain functional of MDD.

多功能 Cu2(OH)PO4@PAA 纳米颗粒通过抑制 MSH6-CXCR4-TGF-β1 环治疗脑胶质母细胞瘤

陈耀东
山西医科大学第一医院

目的
脑胶质母细胞瘤（Glioblastoma multiforme，GBM）是侵袭能力最强的神经系统肿瘤。MSH6 是 DNA 错配修复系统的重要组成因子，其在 GBM 中的功能仍然不清楚。因此，本课题探究了 MSH6 在 GBM 中的功能及分子机制，并针对该靶点寻找相应的治疗方式。
方法
采用 MTT 实验、流式细胞仪、Transwell 小室分别检测 GBM 细胞的细胞活力、细胞周期、迁移和侵袭能力。在分子水平上，采用 western blot，qRT-PCR 和免疫荧光实验来检测代表性的肿瘤标志物和调节因子的表达水平。采用水热法合成 $Cu_2(OH)PO_4$@PAA 纳米颗粒；采用 JEM-2010 透射电镜观察样品的大小及形貌；采用 U-4100 型光吸收检测仪检测样品的光吸收特性；采用红外热成像仪分析 $Cu_2(OH)PO_4$@PAA 的光热转换能力。采用 T1WI 在体外和裸鼠体内检测 $Cu_2(OH)PO_4$@PAA 的 T1 加权磁共振成像效果。在 GBM 细胞中和 U251 荷瘤裸鼠体内检测 $Cu_2(OH)PO_4$@PAA 介导的 PTT 的治疗效果及分子机制。
结果
MSH6 是一个在 GBM 中异常高表达的癌基因，MSH6、CXCR4 和 TGF-β1 可以组成一个反馈环路，即 MSH6-CXCR4-TGF-β1 反馈环，通过激活 p-STAT3/Slug 和 p-Smad2/3/ZEB2 信号传导通路，来促进 GBM 细胞的增殖、迁移和侵袭，并抑制其凋亡。此外，我们成功合成了平均粒径为 4 nm 的 $Cu_2(OH)PO_4$@PAA 纳米颗粒，其具有良好的光热转换能力和 T1 加权磁共振成像能力。$Cu_2(OH)PO_4$@PAA 介导的 PTT 在体外和体内均显示出良好的治疗效果，并且与 MSH6-CXCR4-TGF-β1 反馈环的抑制有关。
结论
促进 GBM 肿瘤形成和进展的 MSH6-CXCR4-TGF-β1 反馈环是 PTT 治疗 GBM 的一个新靶点。

T1-weighted contrast-enhanced image combined with radiomics in predicting IDH1 mutation status of WHO grade II and III gliomas

Shasha Zhao,Linfeng Yan,Guangbin Cui,Wen Wang

Tangdu Hospital, Air Force Military Medical University

Purpose
Isocitrate dehydrogenase 1 (IDH1) mutation has been shown to be closely associated with the occurrence of WHO grade II and III gliomas, and also an independent predictor of prognostic evaluation for WHO grade II and III gliomas. However, the confirmation of the IDH1 mutation status requires surgical excision or biopsy. Therefore, the purpose of this study was to assess the radiomic strategies in predicting the diagnostic performance of IDH1 mutation status of WHO grade II and III gliomas.
Materials and Methods
This study retrospectively analyzed 135 patients with histologically confirmed WHO grade II and III gliomas who underwent the T1CE MR examination before any intervention between January 2015 and July 2017 were recruited in the current study, including IDH1 wild type group (WHO grade II n = 21, WHO grade III n=30), IDH1 mutation group (WHO grade II n=48, WHO grade III n=36). The VOI of whole tumor-enhanced part was manually drawn on the T1CE using ITK-SNAP, and 1044 features were extracted by using the software of A.K. software (Analysis-Kinetics, A.K., GE Healthcare). Random forest (RF) algorithm and 5 fold cross validation were used to predict the IDH1 mutation status of WHO grade II and III gliomas.
Results
The anatomical locations of tumors for IDH1 mutant and IDH1 wild-type patients were different, with significant difference ($P < 0.001$). In addition, IDH1 mutant of WHO grade II and III gliomas were strongly associated with nodular/annular enhancement ($P = 0.001$). Moreover, there were no statistically significant differences in other imaging features and clinical characteristics between the IDH1 mutant and the IDH1 wild-type patients group. Radiomic strategy produced the stable diagnostic efficiency, with an area under the curve (AUC), ACC, sensitivity, and specificity of 0.794, 70.9%, 0.614 and 76.7%, respectively. The IDH1 mutation status of WHO grade II and III glioma was evaluated by radiomic strategy, and the difference between the two groups was statistically significant ($P < 0.05$).
Conclusion
Radiomic strategy can evaluate IDH1 mutation status of WHO grade II and III gliomas, and RF classifier model is a promising machine learning method to predict IDH1 gene mutations. The development of accurate and reliable model can help patients with gliomas to diagnose early and make treatment plan.

PDZ 蛋白抑制胶质瘤细胞恶性表型

赵春娟
山西医科大学第一医院

胶质瘤是最常见的原发性脑恶性肿瘤，恶心胶质瘤预后不良。我们的研究发现在脑胶质瘤病人中，PDZ 蛋白 MAGI3 在 mRNA 和蛋白水平均下调。通过过国表达和敲除 MAGI3 的细胞模型研究中，我们发现 MAGI3 能够抑制胶质瘤细胞的增殖、迁移和细胞周期进程。通过 GST pull-down 和 CO-IP 实验，我们发现 MAGI3 通过其 PDZ 域和β-catenin 的 PDZ 结合基序与β-catenin 结合。MAGI3 的过度表达通过与β-catenin 的相互作用抑制β-catenin 的转录活性。胶质瘤细胞 C6 中 MAGI3 的过度

表达抑制了包括 Cyclin D1 和 Axin2 在内的β-catenin 靶基因的表达，而胶质瘤细胞 U373 和 LN229 中 MAIG3 的敲除增强了上述基因的表达。MAGI3 的过度表达降低了小鼠皮下成瘤能力，抑制了异种移植瘤中β-catenin 靶基因的表达。此外，基于 GEO 胶质瘤数据库的分析显示 MAGI3 表达与总生存率和肿瘤分级负相关。最后，我们通过三个公开的胶质瘤数据集的 GSEA 和临床胶质瘤样本的免疫组化染色证实了 MAGI3 表达与 Wnt/β-catenin 信号传导活性之间的负相关。综上所述，这些结果证实 MAGI3 是一种新的肿瘤抑制因子，并提供了对胶质瘤发病机制的深入了解。

47 天小婴儿脑内节细胞胶质瘤误诊一例的磁共振及 CT 影像表现

孙惠苗,连欣,武艳君,温家祥
山西省儿童医院/山西省妇幼保健院

目的 分析一例 47 天小婴儿脑内节细胞胶质瘤病例的 MRI 及 CT 影像表现，对脑内节细胞胶质瘤疾病影像学表现有进一步的认识。**方法** 回顾性分析本院 2018 年 6 月脑内节细胞胶质瘤误为脑内血管畸形伴出血患儿 1 例，并经手术及病理证实的节细胞胶质瘤的 MRI 及 CT 表现，MRI 行颅脑平扫检查，CT 行颅脑平扫加增强检查，探讨该病发病部位，肿瘤形态、边界、信号及强化特点，并文献复习。**结果** 此例病例为 47 天患儿，临床症状以一侧肢体频繁抽搐症状为主，病灶于右侧额叶近中线处，呈分叶状，边界较清晰，MRI 表现为肿瘤主体 T1WI 呈高信号，T2WI 呈低信号，FLAIR 像呈低信号，DWI 呈稍低信号，ADC 图呈低信号。SWI 病灶周边可见迂曲、受压的小静脉显示，病灶周围无明显水肿，有轻度的占位效应。CT 表现为病灶呈不均匀性稍高密度影，病灶周边密度略偏低，CT 值约 39-51Hu，病灶中央可见片条状高密度钙化影，CT 值约 73-80Hu，增强扫描病灶周围明显强化，病灶周围无明显水肿，病灶周边可见多发迂曲动静脉血管影显示。故误诊为脑内血管畸形合并出血。患儿手术病理及免疫组化结果符合节细胞胶质瘤，可见散在节细胞及钙化。**结论** 此病例临床症状符合节细胞胶质瘤典型表现，患儿年龄不符合节细胞胶质瘤的好发年龄，好发部位不符合该病的好发部位（颞叶），MRI 表现及 CT 表现、病灶内钙化符合该病特点，加强对该病影像表现的认识，对该病影像诊断及鉴别诊断提供帮助。

Gene expression meta-analysis in diffuse low-grade glioma and the corresponding histological subtypes

Siqi Wang,Ping Han
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Diffuse low-grade glioma (DLGG) is a well-differentiated, slow-growing tumour with an inherent tendency to progress to high-grade glioma. The potential roles of genetic alterations in DLGG development have not yet been fully delineated. Therefore, the current study performed an integrated gene expression meta-analysis of eight independent, publicly available microarray datasets including 291 DLGGs and 83 non-glioma (NG) samples to identify gene expression signatures associated with DLGG. Using INMEX, 708 differentially expressed genes (DEGs) (385 upregulated and 323 downregulated genes) were identified in DLGG compared to NG. Furthermore, 497 DEGs (222 upregulated and 275 downregulated genes) corresponding to two histological types

were identified. Of these, high expression of HIP1R significantly correlated with increased overall survival, whereas high expression of TBXAS1 signi cantly correlated with decreased overall survival. Additionally, network-based meta-analysis identified FN1 and APP as the key hub genes in DLGG compared with NG. PTPN6 and CUL3 were the key hub genes identified in the astrocytoma relative to the oligodendroglioma. Further immunohistochemical validation revealed that MTHFD2 and SPARC were positively expressed in DLGG, whereas RBP4 was positively expressed in NG. These findings reveal potential molecular biomarkers for diagnosis and therapy in patients with DLGG and provide a rich and novel candidate reservoir for future studies.

Pineal gland abnormality in patients with type 2 diabetes mellitus

Jie Zhang[1], Ke Xu[2], Zhe-Sheng Shi[2], Dan Feng[1], Guang-Bin Cui[1], Wen Wang[1]
1. Tangdu Hospital, Air Force Medical University
2. Student Brigade, Air Force Medical University

BACKGROUND:
Patients with type 2 diabetes mellitus (T2DM) are often suffered from emotion and sleep disorders. Melatonin, which is secreted by the human pineal gland, plays an important role in sleep and circadian rhythm. Because the volume of the pineal gland is directly correlated with the gland's secretory capacity for melatonin, the aim of the present study was to evaluate and compare pineal gland volumes in T2DM patients with healthy control.
SUBJECTS AND METHODS:
We retrospectively evaluated the pineal gland volumes of 58 cases, including 35 cases of T2DM patients and 23 age, sex and body mass index (BMI) matched healthy controls (HC), in which 20 were women. The total pineal gland volume of all cases was measured via magnetic resonance images (T1-weighted magnetization-prepared rapid gradientecho sequence, sagittal view), the pineal gland and pineal cysts were outlined manually by using 3D slicer software, then the total mean pineal volume of each group was compared. The total intracranial volume (gray matter + white matter + cerebrospinal fluid) was assessed by using Statistical Parametric Mapping 8 (SPM8; Ashburner, 2009) and the voxel-based morphometry toolbox (VBM8; University of Jena, Jena, Germany) in Matlab R2012b. Additional analyses were performed to examine potential associations between total intracranial volumes and pineal volumes by using SPM8 and VBM8. The correlation between pineal volume and psychological measurements was also investigated.
RESULTS:
There were no significant differences in age, gender and BMI between T2DM patients and HC groups (all $P > 0.05$). The mean pineal volumes of T2DM patients and the health controls were 83.55 ± 10.11 mm³, and 99.73 ± 12.03 mm³, respectively, the pineal gland volume in patients with T2DM was smaller than that in healthy control subjects ($P = 0.019$), even when total intracranial volume and age were used as covariates. The pineal volume was negatively correlated with most psychological measurements, especially scores in the CVLT.
