结论 多排螺旋 CT 是一种评价肿块型胰腺炎及胰腺癌的有效手段，对鉴别这 2 种疾病有重要的应用价值。3T 磁共振胰腺 DWI 有助于正常与病变胰腺的诊断，胰腺癌与肿块型胰腺炎的 ADC 值尚存在重叠，利用 ADC 值鉴别两者尚存在争议。

PU-3533
多参数成像在肾脏恶性肿瘤诊断及鉴别诊断中的价值

吕琦
同济大学附属同济医院

目的 探讨 3.0TMR 磁敏感成像结合弥散加权成像序列与肾癌病理分级分期的关系及 320 CT 动态增强扫描在不同类型肾癌鉴别诊断中的作用。
方法 回顾性分析 65 例不同类型肾脏恶性肿瘤，采用 3.0TMR 行 b 值=800s/mm^2 DWI 及 SWI 检查，所有肿瘤均经手术病理或穿刺活检证实，其中肾透明细胞癌 38 例，乳头状肾细胞癌 15 例，肾嫌色细胞癌 12 例。对病灶的 DWI 及 SWI 信号特点进行记录和分析，将其中的 T 分期与术后病理 T 分期进行对比，计算并比较临床各期 ADC 值间的关系。比较肿瘤动态增强各期增强特点和强化程度，并测量动态增强扫描各期肾癌的 CT 值，对各组数据进行统计学处理，计算均值与标准差，并计算强化幅度。
结果 肾癌中，各期两两比较发现，在未用 SWI 检测出血时，I 期与其余各期相比，差异有统计学意义，III 与 IV 期相比差异有统计学意义，而 II 期与 III、IV 期相比，差异无统计学意义，参照 SWI 除外出血区域后测量 ADC 值发现，I 期与其余各期、II 期与 III、IV 期两两比较相比，差异均有统计学意义，而 I、II 期之间及 III 期与 IV 期之间相比，差异无统计学意义（$P<0.01$）。不同亚型肾癌 CT 动态增强扫描发现，肾透明细胞癌与非透明细胞癌强化幅度差异有统计学意义

（P<0.01），而乳头状肾癌与嫌色细胞癌两者差异无统计学意义（P>0.05）,肾透明细胞癌强化幅度最高。

结论 利用磁共振多参数序列成像能准确、良好的判断肾癌的临床分期，而 CT 动态增强扫描在鉴别不同亚型肾癌有方面较高的临床应用价值。

PU-3534

磁敏感加权成像与灌注加权成像在肾透明细胞癌分级诊断中的应用

马亮
同济大学附属同济医院

摘　要：目的明确磁敏感加权成像（SWI）肿瘤内磁敏感信号（ITSS）与灌注加权成像（PWI）转运常数（Ktrans）之间是否存在相关性,以及两者在肾透明细胞癌（ccRCC）分级诊断中的应用价值。方法选取 36 例经手术病理证实为 ccRCC 并进行病理 Fuhrman 核分级（Ⅰ~Ⅳ）评估的患者,行 2D 多次屏气 SWI 和肾脏 PWI 扫描。评估测量 ITSS 等级与 Ktrans 的平均值,对 FuhrmanⅠ、Ⅱ、Ⅲ3 组间分别进行 Kruskal-Wallis 检验和方差分析,并分析 ITSS 等级和 Ktrans 平均值之间的相关性;同时应用受试者工作特征（ROC）曲线分析其分级诊断效能。结果 Fuhrman 分级Ⅰ级 8 例、Ⅱ级 16 例、Ⅲ级 12 例,对应的 ITSS 等级分别为 1.25±0.43、1.75±0.83 和 2.20±0.75,Ktrans 值分别为（0.24±0.07）、（0.31±0.08）和（0.34±0.07）min-1,不同 Fuhrman 分级间 ITSS 等级和 Ktrans 值差异均有统计学意义（χ2=6.089,P〈0.05;F=4.116,P〈0.05）。ITSS 与 Ktrans 总体呈中度正相关（r=0.536,P〈0.01）。以 ITSS 和 Ktrans 的 ROC 曲线鉴别高、低级别（FuhrmanⅢvsⅠ~Ⅱ）ccRCC 的曲线下面积（AUC）、敏感性和特异性相对较高,分别为 0.737、80.0%、37.5%和 0.737、90.0%、68.8%。结论 ITSS 和 Ktrans 可以为 ccRCC 术前分级诊断提供更加丰富的信息,从而有助于手术方案的制定及预后的判断。

PU-3535

先天性肾动静脉瘘的影像学诊断

毛新清
同济大学附属同济医院

目的　探讨肾动静脉瘘的影像诊断价值。

方法　回顾性分析 2 例肾动静脉瘘患者的资料。2 例患者 CT 检查，其中 1 例同时行静脉肾盂造影、MRI 检查，发现病变后， 均经 DSA 检查证实。

结果　肾脏发现团块状占位，CT 上呈等密度，周围见钙化影；MRI 上 T1 为等高、T2 为高低混杂信号；增强后明显强化，强化程度与腹主动脉一致，下腔静脉早显；DSA 检查示血管畸形、动静脉短路、多分支供血等，下腔静脉早显。

结论　CT、MRI 等能够发现肾动静脉瘘，CT 检查尤其三维重建能够明确诊断，但 DSA 仍然是诊断肾动静脉瘘最佳的检查方法。

PU-3536
SPIOs 在体标记大鼠室管膜下区神经前体细胞及 MR 示踪成像研究

邵志红
同济大学附属同济医院

目的 研究超顺磁氧化铁纳米颗粒(SPIOs)对成体大鼠室管膜下区(SVZ)神经前体细胞(NPCs) 的在体标记及 MR 示踪成像的可行性。
方法 采用线栓法建立 SD 大鼠脑梗塞模型。在建模成功后第 2d 通过小动物脑立体定位仪分别向梗塞模型组(n=5)和正常成体组(n=5)大鼠脑内注射 1μl SPIOs (浓度 3.5mg Fe/ml)，梗塞对照组(n=4)和空白对照组(n=4)注射同等量 PBS 液，注射位点选择为右侧侧脑室前角前缘区域，于注射当天开始腹腔注射 5-溴脱氧尿嘧啶核苷(BrdU)，连续注射 1 周。所有实验动物均于术后第 1、3、7、14d 进行常规 T2*WI (7.0 T)扫描，于第 14d MR 扫描后行灌注固定取脑，标本分别行 HE、普鲁士兰染色以及普鲁士兰与 BrdU 免疫组织化学双重染色。通过比较 MR 图像与病理结果，观察 SPIOs 在脑内的分布与迁移过程。
结果 在正常成体组大鼠中，注射后 SPIOs 均大部分位于右侧侧脑室前角前缘区，仅部分进入脑室系统。矢状位 T2*WI 能较好地显示 SPIOs 经颅顶部注入脑内的路径以及沿吻侧迁移流(RMS)向嗅球(OB)区分布的过程，磁共振伪影适中，示踪成功率达 100%。染色结果显示 SPIOs 能较好地标记 NPCs，SVZ、RMS 以及 OB 区平均标记率分别约为 75.5%、42.3%、23.6%。在梗塞模型组大鼠中，除了 RMS 内可见少量 SPIOs 分布、迁移以外，梗塞区也可见部分 SPIOs 分布。梗塞对照组及空白对照组各时间点、各部位未见明显低信号改变。
结论 SPIOs 能有效地在体标记成体大鼠 SVZ 的 NPCs，且标记率优于文献报道的 MPIOs；MRI 能动态地监测标记后的 NPCs 迁移、分布的过程。在正常成体大鼠脑内，SPIOs 在体标记的 NPCs 主要沿 RMS 向 OB 方向迁移、分布，而在脑梗塞模型大鼠中，部分标记的 NPCs 可迁移至梗塞区。

PU-3537
SPIOs 在体标记大鼠室管膜下区神经前体细胞及磁敏感加权成像研究

邵志红
同济大学附属同济医院

目的 探讨磁敏感加权成像(SWI)在 SPIOs 在体标记及 MR 示踪成像中的应用价值。
方法 通过小动物脑立体定位仪分别向成体实验组(n=5)、空白对照组(n=5)大鼠脑内注射 1μl SPIOs (浓度 0.7mg Fe/ml)和同等量 PBS 液，注射位点选择为右侧侧脑室前角前缘区域，于注射当天开始腹腔注射 5-溴脱氧尿嘧啶核苷(BrdU)，连续注射 1 周。所有实验动物均于术后第 1、3、7、14d 进行 MR(3.0 T)扫描扫描，MR 扫描序列包括 T2WI、T2*WI、SWI。于第 14d MR 扫描后行灌注固定取脑，标本分别行 HE、普鲁士兰染色以及普鲁士兰与 BrdU 免疫组织化学双重染色。分析比较 T2*WI、SWI 对 SPIOs 在体标记脑内 NPCs 的示踪效果。
结果 3.0 T 磁共振 T2*WI、SWI 及其相位图、MIP 图能显示 SPIOs 注射的路径、分布以及沿 RMS 迁移的状态，其中 T2*WI、SWI 显示的最长迁移距离分别为 2.51±0.22mm 和 5.32±0.31mm，迁移区与皮层信号比分别为 0.75±0.12 和 0.53±0.11，两者比较均具有统计学差异(P＜0.01)，SWI 显示 SPIOs 迁移状态的敏感性和对比度明显优于 T2*WI。除了矢状位 MIP 图磁敏感伪影较重以外，其它矢状位、冠状位 SWI 及其相位图、MIP 图伪影较小，5 例实验大鼠 SWI 示踪成功达 100%。染色结果

显示 SPIOs 能较好地标记 NPCs。空白对照组各时间点、各部位及各成像序列均未见明显低信号改变。
结论 3.0 T 磁共振 SWI 及其相位图、MIP 图能显示由 SPIOs 在体标记的 NPCs 沿 RMS 迁移的状态，且敏感性、对比度明显优于 T2*WI，SWI 序列可作为在体监测 SPIOs 标记细胞迁移的优先序列。

PU-3538

实型胰腺浆液性囊腺瘤：影像与病理

马小龙
同济大学附属同济医院

【摘要】**目的：**探讨实型胰腺浆液性囊腺瘤（Solid Serous Cystadenoma of the Pancreas, SCP）影像学表现及其病理基础。**方法：**对 11 例经病理证实的实型胰腺浆液性囊腺瘤患者的影像学资料和病理资料进行回顾性分析。所有患者均经过 CT 和 MRI 平扫加增强检查。将 CT 扫描中肿瘤强化超过胰腺组织的病例列为 A 组；肿瘤强化未超过胰腺组织的肿瘤列为 B 组。分别测试 CT 动脉期、门脉期和延迟期两组病例肿瘤与周围胰腺组织的 CT 值。将两组肿瘤与周围胰腺在不同时强化时期的平均 CT 值图表比较。**结果：**患者全部为女性，41 岁-77 岁，中位年龄 60 岁。肿瘤 CT 和 MR 图像上边界清晰。A 组 7 例，肿瘤相对胰腺等高密度，增强后在退化胰腺背景下显著强化，肿瘤强化程度在动态增强的各期均超过周围胰腺组织。B 组 4 例，胰腺组织未发生退化，肿瘤相对周围胰腺低密度，增强后肿块各期强化均未超过周围胰腺。MRI T_2WI 图像上所有肿瘤显示 “高亮”信号，与水相近，并可以观察到相对低信号的分隔结构。增强后强化方式与 CT 相同。病理大体标本显示肿瘤为实性肿块，内部可见较为粗大的白色纤维分隔。镜下显示为大量微型囊腔和囊腔之间丰富的肿瘤间质。囊腔友单层立方上皮细胞覆盖内壁。肿瘤间质内富含血管及纤维胶原。**结论：**实型胰腺浆液性囊腺瘤的影像特征与其病理特征密切相关，其相对胰腺的强化方式与周围胰腺是否退化有关，MRI T_2WI 有助于揭示其囊性肿瘤本质。

PU-3539

胃壁增厚的 CT 研究及应用价值

唐俊军
同济大学附属同济医院

目的 提高 CT 对于引起胃壁增厚的胃部病变的诊断及应用价值重要性的认识。
方法 回顾性分析经手术病理及胃镜病理证实的 82 例胃壁增厚的 CT 表现，并与正常胃壁厚度相比较，从胃壁增厚的程度、形态等来诊断及鉴别胃壁增厚的病变。
结果 82 例胃部疾病，其中胃癌 45 例，胃淋巴瘤 17 例，间质瘤 12 例，胃炎 8 例，累及范围共 122 处；其中胃窦部 56 处，平均厚度 19.3+11.8mm；胃体部 45 处，平均厚度 32.6+12.3mm；胃底贲门部 21 处，平均厚度 39.1+7.5mm；与正常各区胃壁厚度有显著性差异。本组 82 例病例胃壁增厚的 CT 类型：条形或梭形增厚（30）、肿块形增厚（14）、结节形增厚（5）、溃疡型增厚（10）、不规则形增厚（8）、混合型增厚（15）等。

结论 CT 对于胃壁增厚的厚度、形态等的观察有很大的价值，能够较好地准确诊断胃壁增厚的相关疾病及鉴别诊断。

PU-3540
多模态磁共振成像对前列腺外周带弥漫病变的鉴别诊断

王伟
同济大学附属同济医院

【目的】探讨多模态磁共振成像对外周带弥漫前列腺癌和前列腺炎的鉴别诊断价值。
【方法】回顾性分析经直肠超声（TRUS）引导下饱和穿刺活检或前列腺根治术后病理证实前列腺病例 33 例，其中前列腺炎 18 例，前列腺癌 15 例。所有患者均采用 Siemens Verio 3.0 T 磁共振扫描，成像序列包括横断位、矢状位高分辨 T2WI，横断位弥散加权成像（DWI）及动态对比增强（DCE）扫描。
【结果】
前列腺炎 T2WI 呈均匀或不均匀低、稍低信号，14 例与中央带分界清，包膜完整；DWI 呈稍高或高信号，平均 ADC 值为（1.12±0.15）×10-3 mm2/s；DCE 9 例呈速升平台型，6 例呈流入型，3 例表现为不均匀强化，可伴有小脓肿或囊肿形成。前列腺癌呈均匀低信号，9 例病灶与中央带分界不清，累及包膜；DWI 呈高或稍高信号，平均 ADC 值（0.85±0.19）×10-3 mm2/s，与前列腺炎之间存在统计学差异（t=4.563，P＜0.01）；DCE 10 例呈流出型，5 例呈速升平台型。
【结论】
多模态磁共振成像有利于外周带弥漫前列腺癌和前列腺炎的鉴别诊断。
关键词：前列腺炎； 前列腺肿瘤； 磁共振成像； 磁共振成像，弥散； 动态对比增强磁共振

PU-3541
利用图论方法研究轻度认知功能障碍患者大脑功能网络的点介性

王湘彬
同济大学附属同济医院

目的：利用图论方法探索轻度认知功能障碍（MCI）患者大脑各脑区点介性的异常改变。
方法：首先采集 16 名 MCI 患者和 20 名正常老年人（NC）的大脑静息态 BOLD-fMRI 数据。采用 SPM5 和 DPARSF 软件包进行数据预处理；采用 Matlab 编程语言构建大脑功能网络，并计算 Sparsity=0.18（网络收益最大）时 90 个脑区的点介性。采用双样本 t 检验分别比较 MCI 患者与 NC 组 90 个脑区点介性的差异，并用 REST 软件呈现结果。
结果：两组人额上回、岛叶、楔前叶、前扣带和旁扣带回等区域的点介数较大；而中央扣带回、右海马区、杏仁核、枕下回、左梭状回、豆状核和右颞中回等区域的点介数较小。MCI 患者右额上回、右岛叶、右梭状回、左缘上回、右角回和左中央旁小叶 6 个区域点介性显著高于正常老年（P<0.05）；而右额下回鳃盖部、右辅助运动区和右舌回 3 个区域点介性显著低于正常老年（P<0.05）。
结论：MCI 患者大脑多个区域信息传递能力发生了异常改变，提示在 MCI 的诊断与鉴别诊断中应重点关注这些区域。

PU-3542

轻度认知功能障碍对大脑功能网络效率的影响

王湘彬
同济大学附属同济医院

目的 从网络效率的角度来检验轻度认知功能障碍（MCI）患者大脑功能网络的小世界特性，并探讨 MCI 对大脑功能网络效率的影响。
方法 共采集 16 名 MCI 患者和 20 名正常老年人（NC）的大脑静息态 BOLD-fMRI 数据。采用 SPM5 软件包对数据进行预处理，采用 Matlab 编程构建大脑功能网络。针对每个网络生成 100 个与之具有相同节点和边数的规则网络和随机网络。计算各网络的全局效率 E_{global}、局部效率 E_{local} 和网络收益 Earn。通过双样本 t 检验比较 MCI 患者与正常老年人大脑功能网络效率的差异。
结果 两组受试者大脑网络均符合 $E_{global}(G_{reg}) < E_{global}(G) < E_{global}(G_{rand})$ 和 $E_{local}(G_{rand}) < E_{local}(G) < E_{local}(G_{reg})$，且 MCI 组全局效率和网络收益均高于 NC 组（0.16≤Sparsity≤0.28 范围内 $P<0.05$），局部效率低于 NC 组。两组网络收益均为正值。
结论 MCI 患者和正常老年人的大脑功能网络都具有经济有效的小世界特性，但 MCI 患者大脑网络效率发生了异常，提示 MCI 患者大脑信息传递能力受损。

PU-3543

轻度认知功能障碍患者大脑 fMRI 网络的小世界特性

王湘彬
同济大学附属同济医院

目的 利用静息态 fMRI 数据检验轻度认知功能障碍（MCI）患者大脑功能网络是否具有小世界特性。
方法 采集 16 例 MCI 患者和 20 例正常老年人（NC）的大脑静息态 BOLD-fMRI 数据。采用 SPM5 软件对图像进行预处理，将大脑分割为 90 个区域并计算 90 个区域间的相关系数。以矩阵稀疏度 Sparsity 为阈值，将相关矩阵转换为网络。计算网络的聚类系数 C 和平均路径长度 L，若满足 $\gamma = C/Crand > 1$ 且 $\lambda = L/Lrand \approx 1$（rand 代表相应随机网络），则说明该大脑功能网络具有小世界特性。采用双样本 t 检验比较 MCI 患者与正常老年人大脑功能网络小世界参数的差异。
结果 在 0.1~0.4 阈值范围内，MCI 组和 NC 组均符合 $\gamma > 1$ 且 $\lambda \approx 1$。MCI 组 γ 和 δ 均大于 NC 组，且在 0.10≤Sparsity≤0.18 时差异达到显著水平（P<0.05）；MCI 组 λ 在各阈值处均小于 NC 组，在 Sparsity=0.18、0.28 和 0.32 处差异达到显著水平（P<0.05）。
结论 MCI 患者大脑 fMRI 网络具有小世界特性，但与正常老年人相比其小世界特性增强。

PU-3544

MDCT 对甲状腺肿瘤的鉴别诊断价值

倪炯,王培军
同济大学附属同济医院

目的 分析各种甲状腺肿瘤的 MDCT 征象，探讨 MDCT 对甲状腺肿瘤鉴别诊断的价值。
方法 回顾性分析 2011 年 1 月至 2013 年 12 月间本院收治的 50 例甲状腺肿瘤患者影像学资料及手术病理结果。所有患者术前行 MDCT 检查，MDCT 图像由 2 位中级职称以上影像科医师共同阅片，

分析甲状腺肿瘤边界、密度、强化方式、肿瘤与邻近器官关系；肿瘤以外甲状腺组织的密度、强化情况、边界；颈部淋巴结情况。

结果 50 例患者中男性 12 例，女性 38 例；年龄 17－80 岁，平均年龄 52 岁。50 例甲状腺肿瘤中，良性肿瘤 35 例；恶性肿瘤 15 例。35 例甲状腺良性肿瘤均为甲状腺腺瘤，MDCT 平扫表现为甲状腺内低密度肿块，边界清晰，增强后可更清楚显示病灶边界。肿瘤以外甲状腺组织包膜完整，强化后密度均匀。其中 19 例腺瘤发生囊变，17 例囊变区形态规则， 另 2 例囊变区形态不规则；增强后囊变区内无强化，囊变区周围见完整强化环。其余 16 例腺瘤呈实质性肿块，8 例增强早期强化均匀，2 例早期出现岛状强化，另 6 例早期呈不规则强化；延迟后 16 例实质性肿块均呈均匀强化。4 例腺瘤出现钙化，1 例钙化为块状，3 例钙化为弧形。35 例腺瘤患者均未发现颈部淋巴结肿大。15 例甲状腺恶性肿瘤中 14 例为甲状腺癌，1 例为淋巴瘤。MDCT 平扫多表现为甲状腺内低密度肿块，病灶内密度不均匀。恶性肿瘤边缘不规则，7 例边缘呈蟹足状改变，3 例出现包膜节段征。增强后 11 例恶性肿瘤呈不规则强化，延迟后密度不均匀。14 例甲状腺癌中 8 例肿块内出现钙化，其中细颗粒状钙化 3 例，点状钙化 4 例，不规则钙化 1 例。3 例甲状腺癌病灶突破甲状腺包膜。1 例甲状腺恶性肿瘤出现颈动脉受侵，2 例出现食管受侵，另有 2 例肿块突入气管内、导致气管壁连续性中断。本组甲状腺恶性肿瘤中 8 例发现颈部淋巴结肿大，1 例有纵隔淋巴结肿大。

结论 MDCT 对甲状腺肿瘤的鉴别诊断具有重大价值，可为临床确诊甲状腺肿瘤提供有价值的依据。

PU-3545

直肠癌 MR 灌注成像参数与病理特征的相关性研究

王培军
同济大学附属同济医院

目的：分析 MR 灌注成像参数包括对比剂容积转换常数（Ktrans）、速率常数（Kep）、血管外细胞外间隙容积分数（Ve）及初始强化曲线下面积(iAUC)与肿瘤病理分化程度、T N 分期、脉管侵犯、神经周围侵犯情况的相关性。方法：经肠镜病理证实的 35 例患者术前行 MR 灌注图像，经后处理获得直肠癌 TIC 曲线及各 MR 灌注参数值，分析直肠癌 MR 灌注参数与病理特征的相关性。结果：直肠癌 Ktrans 及 iAUC 值均高于癌周正常直肠壁；直肠癌 Ve 值低于癌周正常直肠壁；T3-4 期组直肠癌 Ktrans 及 Kep 较 T1-2 期组升高，N+组的 Kep 值高于 N0 组。其余病理特征与 MR 灌注参数均无统计学关系。结论：直肠癌的 MR 灌注成像参数值能反映肿瘤的不同病理特点，可以反映肿瘤微血管状态及血液动力学变化。

PU-3546

匹茨堡复合物 B 修饰的磁性纳米颗粒对阿尔茨海默病淀粉斑块的体外早期检测

曾嘉齐
同济大学附属同济医院

目的 构建特异性结合阿尔茨海默病（AD）病理标记物β淀粉（Aβ）斑块的靶向磁性纳米颗粒，并探究其与 Aβ斑块体外结合的能力。

方法 采用纳米级锰锌铁氧体 $Mn_{0.6}Zn_{0.4}Fe_2O_4$，以两亲性星型嵌段共聚物进行包覆，负载 Aβ特异性探针匹茨堡复合物 B（PiB），构建新型靶向 Aβ斑块的磁性纳米颗粒 MZF-PiB，透射电镜检测其形态，3.0T MRI 扫描测量 MZF-PiB 悬液的 T_2值，通过计算 r_2弛豫率评估其超顺磁性，应用人神经母

细胞瘤细胞株 SH-SY5Y、狗肾上皮细胞株 MDCK 行细胞毒性实验以评估该纳米颗粒的生物安全性，6 月龄 AD 小鼠脑片免疫组化染色检测其体外结合 Aβ 的能力。采用单因素方差分析进行组间比较。

结果 MZF-PiB 纳米颗粒成功构建，透射电镜显示其粒径约 100 nm，r_2弛豫率为 163.11 mMS^{-1}；孵育 MZF-PiB 悬液 24 h、48 h 后的 SH-SY5Y 和 MDCK 细胞与对照组细胞活性相比差异均无统计学意义（F=2.336、2.539、0.293、1.493，均 P>0.05）。体外结合实验显示纳米颗粒可与 Aβ 斑块特异性结合，被检出斑块最小尺寸为 27 μm。

结论 PiB 修饰的靶向磁性纳米颗粒具有良好的生物安全性和优良的顺磁性，具有体外检测 Aβ 斑块的能力和早期诊断 AD 的潜力。

320 排 CT 灌注成像联合踝臂指数在急性脑缺血中的应用

晁慧美
同济大学附属同济医院

目的 研究脑灌注成像与踝臂指数(ankle-brachial index，ABI)在急性缺血性脑血管病中的临床应用价值。

方法 选择我院疑似急性缺血性脑血管病患者 105 例，其中 ABI 异常组 33 例，ABI 正常组 72 例。均行 320 排动态容积 CT 全脑灌注扫描，一站式完成颅脑 CT 血管造影(CT angiography，CTA）和 CT 灌注成像（CT perfusion，CTP），获得脑血流量（CBF）、脑血容量（CBV）、平均通过时间（MTT）、达峰时间（TTP）及延迟时间（Delay）等灌注参数图，由 2 位有经验的医师共同评价脑灌注图像，计算 ABI 预测颅脑 CT 灌注异常的阳性预测值、阴性预测值、灵敏度、特异度。

结果 所有受试者中有 68 例出现脑灌注异常，表现为 MTT、TTP 延长，CBV 升高、正常或减低，CBF 正常或减低。其中 ABI 异常组有 25 例，ABI 正常组有 43 例，ABI 异常组脑灌注阳性率（25/33，75.8%）高于 ABI 正常组（43/72，59.7%），差异有统计学意义(P <0.05)，且 ABI 异常组的相对平均通过时间（relative MTT ,rMTT）、相对达峰时间（relative TTP , rTTP）大于 ABI 正常组，差异有统计学意义（P <0.05）。ABI 预测颅脑 CT 灌注异常的阳性预测值、阴性预测值、灵敏度、特异度分别为 75.8%、40.3%、36.8%、78.4%。

结论 应用 320 排动态容积 CT 全脑灌注扫描可以早期、全面、准确评价脑血管及血流动力学改变，简便的 ABI 检查对脑灌注异常有一定的预测价值,二者联合应用，利于早期预防及治疗脑血管病。

PU-3548
CT 全脑灌注成像对交叉性小脑神经机能联系不能的诊断价值

晁慧美
同济大学附属同济医院

目的 探讨 320 排 CT 全脑灌注扫描成像对交叉性小脑神经机能联系不能(crossed cerebellar diaschisis,CCD)的诊断价值及临床意义。

方法 收集 115 例急性及亚急性期单侧幕上新发脑梗死病例为实验组，同时期内正常志愿者 10 例为对照组。所有病例均在症状稳定期行 320 排 CT 全脑灌注扫描，运用 MTT、TTP、rCBF、rCBV 四个参数评估脑灌注改变。随访 CCD 阳性病例 2 月后日常生活活动能力量表（Barthel Index,BI），分析神经联系不能程度（the degre e of diaschisis，DoD）与 BI 的关系。

结果 急性脑梗塞组 CTP 参数发现 CCD 的比率为 MTT（36.4%）>TTP（21.8%）>CBF（18.2%）>CBV(9.1%)。亚急性期脑梗塞组 CTP 参数发现 CCD 的比率为 MTT（40%）>TTP（21.7%）>CBF（20%）>CBV（8.3%）。急性期 CCD 阳性组 DoD 与 2 个月 BI 无明显线性相关(P>0.05)。亚急性期 CCD 阳性组小脑ΔMTT、ΔTTP、CBF 减低率与 2 个月 BI 呈线性负相关(P<0.05)。
结论 320 排 CT 全脑灌注扫描成像可以有效诊断脑梗死后 CCD，且 MTT 对于发现 CCD 最敏感。对于亚急性期脑梗塞患者，CCD 现象提示临床预后较差。

PU-3549

CT 全脑灌注成像评估 CCD 严重程度的影响因素

晁慧美
同济大学附属同济医院

目的 运用 320 排 CT 全脑灌注成像分析交叉性小脑神经机能联系不能(crossed cerebellar diaschisis,CCD)严重程度的影响因素。
方法 收集 115 例急性及亚急性期单侧幕上新发脑梗死病例。所有病例均在症状稳定期行 320 排 CT 全脑灌注扫描，运用 MTT、TTP、rCBF、rCBV 评估脑梗塞患者大脑灌注异常程度，并计算灌注异常体积。计算 CCD 阳性病例的小脑不对称指数(asymmetry index，AI)，分析幕上大脑灌注异常程度和体积与小脑 AI 值的关系。并比较急性期 CCD 阳性组与亚急性期 CCD 阳性组间小脑 AI 值。
结果 急性期 CCD 阳性组大脑ΔMTT 与小脑ΔMTT、ΔTTP 呈线性正相关(P<0.05)，大脑ΔTTP 与小脑ΔTTP 呈线性正相关(P<0.05)。大脑 CBF 减低体积与小脑ΔTTP 呈线性正相关(P<0.05)，大脑 CBV 减低体积与小脑ΔMTT 呈线性正相关(P<0.05)。 亚急性期 CCD 阳性组大脑ΔMTT、ΔTTP 和小脑ΔMTT 呈线性正相关(P<0.05)。大脑 MTT 延长体积与小脑ΔTTP 呈线性正相关(P<0.05)。急性期 CCD 阳性组与亚急性期 CCD 阳性组间小脑 AI 值比较，差异无统计学意义(P >0.05) 。
结论 脑梗塞患者幕上低灌注体积与低灌注程度均与 CCD 的严重程度正相关。CCD 发生后，梗死持续时间与 CCD 严重程度的演变无关。

PU-3550

临床放射诊断中的精准医学模式

陈惟
同济大学医学院附属附属同济医院

目的 探讨临床放射诊断中的精准医学模式，摸索出提高放射科学生及未来放射科医师证据推理和数据整合能力的有效可行的教学方法，以适应信息共享及知识网路化的大数据时代生物医学研究和现代医学实践发展的需求。
方法 循证分析大数据时代新的疾病分类方法向着将个人分子检测与健康记录动态相连的、在结合患者内在生物学机理和传统的“ 身体信号和症状”基础上描述和定义疾病、直接对疾病机制和治疗进行更深入理解的趋势发展现状，特别分析现代医学影像学的特征和传统医学影像诊断模式存在的问题。
结果 医院信息系统(Hospital Information System, HIS)，医学影像存档与传递系统(Picture Archiving and Communication Systems，PACS)的与时俱进为放射科精准医学成功实施提供了调控、搜集及解释大量生物信息的框架，通过修订医学影像学专业教材和加强医学影像学学科师资队伍建设，更新教学手段,加强分析技能与影像信息处理能力的培训，提高未来放射科医师证据推理和复杂数据整合能力，从而逐步实现现有临床放射诊断模式向精准医学模式的转变。

结论 基于 PACS 的以放射诊断为核心、辅以影像资讯工具的应用训练及大数据整合基本能力训练的医学影像学课程体系，将有利于培养大数据时代放射科医学影像学专业学生及医师的从业能力和解决问题能力，使临床放射诊断中的精准医学模式成为可能。

PU-3551
联影 128 层 CT 低剂量冠状动脉 CTA 成像的应用价值

成水华
同济大学附属同济医院

目的：评估应用上海联影医疗科技有限公司生产的 128 层 CT（uCT 760）进行低管电压（80KV，70KV）冠状动脉 CTA 检查的临床应用价值。**方法**：选取 2016 年 3 月至 2016 年 6 月体重指数（BMI）在 22-25Kg/m^2，临床怀疑或已知冠心病拟行冠状动脉 CTA 检查的 120 例患者。采取随机数字表法选取 40 例为常规剂量组(A 组)，其余 80 例为低剂量组（B 组）。两组均行回顾性心电门控扫描技术，A 组采用管电压 120Kv，管电流 150mAs。B 组根据管电压分成两个亚组，B1 组管电压 80KV（40 例），B2 组管电压 70KV（40 例），均采用管电流 150mAs。各组 CT 图像的辐射剂量[CT 剂量长度乘积(DLP)和有效剂量(ED)]以及图像噪声（SD）、图像信噪比(SNR)、冠状动脉近段的对比噪声比(CNR)进行系统测量。由 2 名放射科医师采用双盲法对每例患者冠状动脉的图像质量进行 4 分法评估。应用 ANOVA 单因素方差分析比较三组辐射剂量(DLP 和 ED)、SD、SNR 和冠状动脉近段 CNR。用 Kappa 分析评价不同观察者冠状动脉图像质量评分的一致性。**结果**：A 组、B1 组、B2 组的 DLP 分别为（490.08±78.83）、（182.29±69.79）和（67.10±27.04）mGy*cm,ED 分别为（11.33±1.27）、（2.56±0.97）及（0.94±0.40）mSV，三组间两两比较均有显著性差异（P＜0.05）。主观图像质量评估：A 组(3.61±0.77)分，B1 组(3.53±0.80)分，B2 组(3.74±0.69)分，差异无统计学意义(P=0.20)。客观图像质量评估：三组之间 SD、SNR、冠状动脉近段 CNR **差异无统计学意义（P 值分别为 0.81、0.08、0.15、0.37、0.33）。结论**：联影 128 层排 CT 采用低管电压行冠状动脉 CTA，在保证图像质量的同时，可以有效降低辐射剂量。

PU-3552
RNAi 抑制宫颈癌细胞人端粒酶逆转录酶（hTERT）基因的体外实验研究

高晓龙
同济大学附属同济医院

目的 通过 RNAi 技术对宫颈癌细胞人端粒酶逆转录酶 hTERT 基因的特异性抑制,旨在探讨 RNAi 技术在宫颈癌中应用的可行性，并筛选出对宫颈癌治疗可能有效的 siRNA 片段，为宫颈癌的基因治疗提供实验依据。方法 1. 宫颈癌细胞株 Hela 的培养传代。2. 化学合成靶向于 hTERT 基因的 siRNA，用阳离子脂质体转染法将其导入宫颈癌细胞内。3. 实验分组如下：转染组 siRNA-1、siRNA-2、siRNA-3、siRNA-4、阳性对照组(siRNA-G)、阴性对照组(siRNA-NC)、阳离子脂质体组（LIP），空白对照组(Blank)。4. 通过 TRAP，RT-PCR、实时定量 PCR 和 Western Blot 方法分别检测宫颈癌细胞转染后细胞的端粒酶活性，hTERT mRNA 和蛋白水平，MTS 法检测细胞生长增殖，流式细胞仪检测细胞凋亡情况。结果 1. 流式细胞仪显示宫颈癌细胞的转染效率为 80%。2. siRNA-1、siRNA-2、siRNA-3、siRNA-4、siRNA-NC、Blank 的端粒酶活性分别为 0.540 士 0.21、0.624 士 0.19、0.292 士 0.12、0.778 士 0.14、0.81 士 0.14、0.91 士 0.05，siRNA-3 组的端粒酶活性明显下降，与其他 5 组相比有显著统计学意义（p＜0.01）。3. siRNA-3 组 hTERT mRNA 表达水平显著下降，与其他 5

组相比有显著统计学意义（p＜0.01）。4. siRNA-3 组，hTERT 蛋白表达明显下降，与其他各组相比有显著统计学意义（p＜0.01）。5. siRNA-3 组细胞凋亡率明显升高，与其他 5 组相比有明显统计学意义（p＜0.01）。结论 RNAi 技术能特异性抑制宫颈癌 Hela 细胞 hTERT 基因，下调 hTERT mRNA 及蛋白表达水平，降低端粒酶活性，抑制癌细胞生长、增殖，促进宫颈癌细胞凋亡，为宫颈癌的基因治疗研究提供实验依据。

PU-3553

简述医疗设备的管理

赵翠花
河南省人民医院

目的：做好医疗设备的管理工作，使之满足现代管理的需要，提高高资产使用率和经济效益。
方法：回顾性分析医疗设备管理的现状及存在的缺陷，阐述管理医疗设备的意义。
结果：随着新技术、精密化的现代医疗设备被医院广泛的使用，传统的管理模式已经无法高效、及时的管理和维护医疗设备。此外国家医疗卫生管理部门出台过一系列医疗设备管理相关的法律法规，从政策层面看，医疗设备的生产、经营和使用等都进行了规范的管理，但当前设备的质量检测工作相关的技术、操作、标准等层面的规范还不够完善。同时，由于医疗设备管理软件技术的落后，使得软件的移植性和易用性降低，从而导致整个医疗体系无法规范化、标准化的管理医疗设备。
结论：现代新型医疗设备的广泛引进，迫切需要相关部门进一步制定详细、标准、统一的准则来规范医疗设备的管理，从源头上解决医疗设备管理的混乱，真正做到管理过程中有法可依、违法必究。另一个方面，随着科学技术和信息技术的快速发展，设备管理系统的信息化、系统化是行业发展的趋势，这需要相关的医学工程专家、医院管理专家及信息工程专家共同研制和开发适合现代医疗设备管理的统一的信息管理系统，以有效的提高医疗设备管理效率、医院的工作效率和经济效益。

PU-3554

放射科医学影像设备防护的重要性

陈志远
合肥平安健康检测中心

【摘要】
目的：总结分析放射科影像设备防护的重要性。
方法：对于妊娠妇女和即将要妊娠的妇女尽量避免采用 X 射线检查腹部和盆腔，还有对受检者的非投照部位必须进行相关的屏蔽保护，患者的陪同人员应在检查室外等候，随着离放射源的距离越大，人体接受到的射线剂量会减少。摄影时，采用铅屏风，避开射线进行隔离射片。医务工作者在对危重症患者进行床旁射片时，应当穿上铅衣防护你，坚持个人剂量监测。
结果：1、X 射线对人体的损害机体受到 X 线照射后引起生物分子结构和性质的变化，从而引起细胞组织和器官的损伤产生一系列的生物学效应。2、放射医学 X 线查辐射剂量可增加患癌症的风险，除此之外，损害表现还有其他几个方面：神经系统的脑脊髓细胞损伤，较大剂量的 X 线会引起

脑型放射病；性腺功能降低，精子和卵子数量质量降低，大剂量效应会出现再生障碍性贫血和白血病等；其中消化系统的症状出现最早，会出现恶心呕吐，腹泻及电解质紊乱等临床症状。
结论：在放射医学检查中，X 线检查应用越来越多，但是 X 线技术的应用在给人类带来方便的同时，大剂量的 X 射线给人体健康带来一定的危害。因此，为了保证医护人员与患者的切身利益，我们要重视这个问题，加强对放射科医学设备的防护以及安全保障。

PU-3555
CDT-VIBE 技术在乳腺病变动态增强 MRI 成像中图像质量及病灶形态学特点描述能力

朱文颖
华中科技大学同济医学院附属协和医院

目的：探究超快速并行采集（CAIPIRINHA）、水脂分离压脂（Dixon）及时间分辨交叉随机轨迹成像（TWIST）三种技术的容积插入法扫描（VIBE）序列在高空间分辨率动态增强磁共振成像中的可行性，评价 CDT-VIBE 序列在应用于乳腺病变动态增强 MRI 图像质量及病灶形态学特点描述能力。
方法：1.体模成像：使用 1.5TMR 扫描仪(MAGNETOM Aera,Siemens），4 通道乳腺专用线圈，对两个球形体模进行 16 期 CDT-VIBE 序列和 16 期 GRE 序列（无脂肪抑制）扫描，CDT-VIBE 序列并行采集加速因子为 CAIPIRINHA 4 ,TWIST A、B 值均为 20%，时间分辨率为 12s；GRE 序列基本扫描参数与 CDT-VIBE 序列一致。
2.对 50 名乳腺疾病患者采用 CDT－VIBE 序列行动态增强 MRI,采用 4 通道乳腺专用线圈，行 30 期动态增强扫描（选择与体模成像参数相同的 CDT-VIBE 序列），扫描范围均完整覆盖双侧乳腺。
3.数据处理：在体模近中心 10 层图像上分别测量 20 期 CDT-VIBE 脂像（从第 2 期开始）与常规 GRE 图像双侧体模信号强度及标准差，计算图像信噪比。在患者图像上测量病灶信号强度与正常组织的信号强度，计算病灶/正常组织信号强度比值，对同期像的 CDT-VIBE 水像和常规 GRE 图像并行采集技术的伪影、边缘锐利度、病灶显著程度、内部结构清晰度、总体图像质量进行评估。测得病灶血流动力学参数，对良恶性病变的定量参数进行 T 检验分析，用 ROC 曲线进行诊断效能分析。
结果：CDT－VIBE 序列能在显著缩短采集时间的同时保留足够的形态学信息，使观察者在 CDT-VIBE 图像和常规 GRE 图像上进行的病灶形态学描述取得了较高一致性，CDR-VIBE 序列可成功应用于病人的灌注扫描，其对于病灶边缘锐利度和内部结构特征显示较清晰。

PU-3556
冠状动脉 CTA 对冠状动脉异常起源的诊断价值

倪炯,王培军
同济大学附属同济医院

目的 总结大样本病例冠状动脉 CT 血管造影成像中发现冠状动脉异常起源的类型及数量，提高对冠状动脉变异的认识，为临床诊治提供依据。
方法 回顾性分析 2010 年 6 月至 2013 年 12 月间在本院行冠状动脉 CTA 检查的 2679 例患者的影像学检查及病史资料。冠状动脉 CTA 采用回顾性心电门控，将 CT 原始图像在 R—R 间期 45%、50%、75%、80% 四个时相重建，选择图像最佳者在工作站进行图像后处理。采用容积成像（VR）、曲面重建（CPR）、最大密度投影（MIP）等后处理软件。CT 图像由 2 位中级职称以上的影像科医师各自独立完成图像后处理及诊断，重点分析冠状动脉的分布优势类型、是否为冠状动脉异常起源并判断开口位置、观察冠状动脉走行及管壁、管腔情况。造影术毕由包括术者在内的 2 名中级职称以上

的介入医师讨论，判定冠状动脉分布优势类型、是否为冠状动脉异常起源及其开口位置、观察冠状动脉的走行及管腔狭窄程度。
结果 4679 例患者年龄 69.5±10.6 岁；男性/女性 2798/1881。右优势型 3346 例，左优势型 356 例，均衡型 977 例。男性均衡型及左优势型所占比例均高于女性(P<0.05)，右优势型所占比例在男女性别之间无显著性差异(P>0.05)。4679 例患者中共发现冠状动脉异常起源者 33 例，其中男性 23 例，女性 10 例。右冠状动脉起源异常 19 例,其中最多见的类型是右冠状动脉开口于左冠状动脉窦（n=13,），其次为右冠状动脉高位开口（n=6）。左冠状动脉起源异常共 12 例，其中左主干短小或缺如较多（n=6）；另有左旋支缺如 4 例、左冠状动脉高位开口 2 例、左冠状动脉与右冠状动脉共同开口于右冠状动脉窦 1 例。单一冠状动脉 1 例。
结论 冠状动脉 CTA 能准确直观地显示冠状动脉异常起源，可作为冠状动脉变异的筛查手段。

PU-3557
RNA 干扰沉默 P2X7 受体治疗 APP/PS1 转基因小鼠的实验研究

倪炯,王培军,梁挺
同济大学附属同济医院

目的 检测 RNA 干扰沉默 $P2X_7R$ 对 APP/PS1 转基因小鼠治疗效果，探讨 $P2X_7R$ 作为 RNA 干扰治疗 AD 治疗靶点可行性。
方法 以 9 月龄 APP/PS1 转基因小鼠和同月龄的阴性纯合子小鼠为研究对象，通过颅内注射 Lenti-si$P2X_7R$ 将 siRNA 引入小鼠脑内。用 Real-Time PCR 和 Western blotting 检测小鼠脑内 $P2X_7R$ 的 mRNA 和蛋白表达水平。通过氢质子磁共振波谱检测小鼠海马区 NAA、mI 及 Cr 水平并计算 NAA/Cr、mI/Cr 比值。通过 HE 染色、Aβ 免疫组化染色、Iba1 免疫荧光染色、电镜检查观察各组小鼠脑组织病理改变。
结果 Real-Time PCR 检测结果显示注射 si$P2X_7R$ 的小鼠 $P2X_7R$ 基因 mRNA 表达下降，与注射 siNC 的小鼠比较差异有统计学意义(P＜0.05)，Western blotting 检测 $P2X_7R$ 蛋白表达下降与 Real-Time PCR 结果一致。氢质子磁共振波谱显示注射 si$P2X_7R$ 的转基因小鼠 RNA 干扰治疗后，海马区 NAA/Cr 较治疗前增高，与注射 siNC 的转基因小鼠相比差异有统计学意义(P＜0.05)。结合 HE 染色及电镜检查发现注射 si$P2X_7R$ 转基因小鼠海马区大部分神经元细胞形态良好；而注射 siNC 转基因小鼠海马区见大量神经元凋亡，核溶解，线粒体肿胀。注射 si$P2X_7R$ 转基因小鼠治疗后海马区的 mI 水平下降，与注射 siNC 转基因小鼠相比差异有统计学意义(P＜0.05)，结合 Iba1 染色发现该组小鼠海马及皮层的 Iba1 阳性细胞数少于注射 siNC 的转基因小鼠。
结论 颅内注射 Lenti-si$P2X_7R$ 可有效沉默 APP/PS1 转基因小鼠脑内的 $P2X_7R$，改善小鼠的学习记忆能力及脑内病理改变。氢质子磁共振波谱能有效评价 RNA 干扰沉默 $P2X_7R$ 治疗 APP/PS1 转基因小鼠的疗效。$P2X_7R$ 可成为 RNA 干扰治疗 AD 的一个新的、有效的治疗靶点。

PU-3558
情景模拟加快速读片培训模式在放射科颈椎 DR 检查技术规范化建立中的应用研究

刘美金
陆军军医大学大坪医院

目的　探讨情景模拟加快速读片培训模式在放射科颈椎 DR 检查技术规范化建立中的应用。方法　通过每日晨间随意抽取颈椎 DR 片进行快速阅片，让低年资技师对抽取 DR 片的对比度、曝光条

件、体位摆放等进行评价，并由高年资主管技师进行指导；随后采用检查室情景模拟拍摄颈椎 DR 片的方法，由 3 位以上高年资技师从患者核对、曝光条件、体位摆放、胶片打印、检查安全及辐射防护等方面，对低年资技师的不足进行评价指导，最后通过每位技师的不足及发现的问题整理成颈椎 DR 检查技术规范手册。随机筛选规范化建立前后年龄 18-45 岁、行动无异常、无内固定颈椎常规投照患者各 200 例，规范前为 A 组、规范后为 B 组，分别比较 A、B 两组图像质量、重复投照率；结果 B 组图像质量评分（9.14 分）＞A 组（8.26 分），B 组重复投照率（2%）＜A 组（9%）；结论 通过快速读片与情景模拟培训模式，建立适合科室情况的颈椎 DR 检查技术的规范；各年资技师通过参与规范化建立及培训过程较快掌握科室工作流程及相应检查技术，更有利于保障检查安全、规范、高效

PU-3559

Feasibility of using Optimal Monochromatic Image Technique in Dual-Energy Gastrointestinal Cancer Feeding Artery CT Angiography with Low- concentration Contrast Medium for Over-weighted Patients

Weiping Yang[1], Ailian Liu[1], Shifeng Tian[1], Jianying Li[1,2]
1. The first Affiliated Hospital of Dalian Medical University
2. GE Healthcare

Purpose To investigate the use of the optimal monochromatic image technique in single-source dual-energy spectral CT angiography (CTA) with low concentration contrast media (LCCM) for imaging feeding arteries in over-weightedgastrointestinal cancer patients. **Material and methods** 86 over-weighted gastrointestinal cancer patients who underwent spectral CT examination were randomly divided into two groups: Group A(n=41) used 120 kVp with high-concentration contrast medium (HCCM) of 350mgI/ml;Group B(n=41) used spectral CT with LCCM of 270mgI/ml. CT values and standard deviations of arteries and muscle were measured using the monochromatic image sets by two observers to calculate contrast-to-noise ratio (CNR) for arteries with data consistencies tested by ICC. The optimal monochromatic images for the highest CNR were determined. Image quality of the ideal image was evaluated by two radiologists using 5-point scale. The CT dose index (CTDI) at the arterial phase of two groups were recorded. Measurements of the two groups were statistically compared. **Results**Group B reduced 23% contrast dose compared to group A (27gI in Group B vs. 35gI in Group A). With the optimal monochromatic images (at energy levels 54±6keV), Group B had improved contrast enhancement (395.81±56.42HU vs. 234.46±43.66HU) and CNR (16.20±3.25 vs. 8.76±2.52) in arterials, and higher overall image quality score (3.47±0.69 vs. 2.71±0.84) (all P<0.05). There was no difference in image noise (20.79±2.01 HU vs. 20.57±2.77HU) and CTDI (16.87 ±0.00mGy vs.18.05±4.58mGy) between Groups B and A (P>0.05). **Conclusion** Using the optimal monochromatic imaging technique dual-energy spectral CTA improves the image quality of gastrointestinal cancer feeding arteries with reduced contrast does. **Advanced in knowledge** The optimal monochromatic imaging technique in dual-energy spectral CT compensates for the use of low-concentration contrast medium and provides more clear visualization for the gastrointestinal cancer feeding arteries than the conventional CT with high-

concentration contrast medium, effectively reduces the contrast media concentration while improving CTA image quality without increasing the dose of radiation, which has a good clinical application prospect.

PU-3560
不同重建算法下 AI 辅助肺结节检测效能的评价

孙丹丹
辽宁省大连市中山区大连大学附属中山医院

目的：探讨不同重建算法条件下（高分辨算法、标准算法），AI 辅助肺结节检测效能是否有差异。
方法：前瞻性收集 177 例患者的胸部 CT 资料，用高分辨率算法（B70f）、标准算法（B30f）重建原始数据以获得 DICOM 图像，并将数据传送到 AI 服务器进行结节检测。记录患者年龄、结节数、长轴直径及位置并进行统计，首先由两名具有 10 年以上工作经验的放射科医师结合 AI 辅助软件进行肺结节标记，最终由一名具有 15 年以上工作经验的放射科副主任医师进行最终判定，最终确定金标准肺结节，并比较不同重建算法条件下 AI 辅助肺结节检测效能是否有差异。
结果：高分辨率算法（B70f）、标准算法（B30f）对所有结节检出的敏感度分别为 **0.889±0.25、0.75±0.429**；假阳性率分别为 **1.58/CT、 2.46/CT**，差异具有统计学意义（$p<0.01$）。 高分辨率算法（B70f）、标准算法（B30f）对＜4mm 结节检出的敏感度分别为 **0.875±0.286、0.714±0.5**；假阳性率分别为 **0.58/ CT、1.06/CT**，差异具有统计学意义（$p<0.01$）。高分辨率算法（B70f）、标准算法（B30f）对 *≥4mm* 结节检出的敏感度分别为 **0.83～1、0.83～1**；假阳性率分别为 **0.99/CT、 1.38/CT**，差异具有统计学意义（$p<0.05$）。**结论：**在使用 AI 辅助软件检测肺结节时，高分辨重建算法的检测效能优于标准算法。
临床相关性/应用：建议使用高分辨重建算法用于 AI 辅助肺结节的检测，以提高检测效能。

PU-3561
数字乳腺断层摄影与全数字乳腺 X 线摄影技术对 ACR-156 体模内模拟病灶显示能力的对比研究

郭秋,任克
厦门大学附属翔安医院

目的：评价全数字乳腺 X 线摄影（FFDM）、数字乳腺断层摄影（DBT）对模拟病灶的显示能力。
方法：采用有机玻璃板及 ACR-156 体模组合模拟四种压迫体模厚度，同一压迫下，先自动曝光控制（AEC）获得 FFDM、DBT 的摄影管电压（kVp）及管电流（mAs），然后保持与自动曝光相同 kVp，手动曝光 mAs 值分别设置为 AEC 曝光的 90%、80%、70%、60%。计算模拟病灶检出率。
结果：同一体模厚度随管电流减小，FFDM 及 DBT 辐射剂量分别呈递减趋势；同一体模厚度、同一管电流条件下，DBT 较 FFDM 辐射剂量略高。随体模厚度增加 FFDM、DBT 及 V-Preview（合成 2D 图像）对纤维样、微钙化簇样及肿块样模拟病灶的检出率呈逐渐降低趋势。
结论：体模厚度及曝光条件是影响 DBT 及 FFDM 辐射剂量的直接因素，同一压迫体模厚度、同一曝光条件下，DBT 较 FFDM 辐射剂量略高，DBT 与 FFDM 图像对三种模拟病灶的显示能力相仿，且都高于 V-Preview 图像。

PU-3562
肺部 CT 成像中正位定位像与侧位定位像的对比研究

吴晟
华中科技大学同济医学院附属协和医院

目的：比较在肺部 CT 成像中正位定位像与侧位定位像的准确性
方法：随机选取 80 位行肺部 CT 平扫的患者，分为两组，一组在 CT 扫描中采用正位定位像，一组在 CT 扫描中采用侧位定位像，所有患者均采用西门子双源 CT 进行扫描，所有操作均有同一名技师完成操作。扫描完成后，测量肺组织下界与扫描末端距离。比较两组测量值是否有差别,行 T 检验。
结果：采用正位定位像组肺组织下界与扫描末端距离平均为 8.5cm，采用侧位定位像组肺组织下界与扫描末端距离平均为 3.4cm，行 T 检验，P＜0.05。
结论：在肺部 CT 扫描中采用侧位定位像定位准确

PU-3563
心脏 MR 的常见伪影及解决方案

刘振
华中科技大学同济医学院附属协和医院

目的：探讨心脏 MR 的常见伪影的成因及其应对策略。方法：回顾性分析了心脏 MR 成像的伪影类型及产生原因。结果：心脏磁共振常见见的几种伪影中射频伪影、梯度伪影,磁场不均匀引起的伪影在去除外界因素干扰仍无法改善时,则要请专业的技术人员进行判断和维护;运动伪影、化学位移伪影及卷摺伪影则要根据诊断的需要采用不同的方法加以克服.结纶:了解心脏磁共振图像伪影的产生原因和预防方法,对改善图像质量,提高诊断率具有重要意义。

PU-3564
影响 CT 图像质量的因素及控制措施

伍希,李征,吴蓉,马绍文
湘雅常德医院

目的：探讨影响 CT 图像质量的各类因素及控制措施，从而改善 CT 图像质量。
方法：随机抽取 100 例在同一个月内的被检者 CT 扫描图像进行评估，根据质控百分制统计，满分有 42 例，90-95 分 45 例，85-89 分 8 例，85 分以下即不合格未达到阅片要求为 5 例，其影响因素与控制措施可分为五类，分析如下：一、窗口技术。各部位都有其特定的窗宽和窗位，操作者应根据被检部位选择合适的窗宽窗位，达到良好的对比度，提高图像质量。二、分辨率。操作者可通过薄层、大矩阵及合适的重建算法来提高空间分辨率，采用高 KV、mAs，大像素、厚层提高密度分辨率，并应根据患者具体情况调整好空间分辨率与密度分辨率的关系，从而获得高质量图像。三、噪声。操作者可通过减小层厚，增大像素，增加 KV、mAs，采用恰当的重建算法降低噪声。四、伪影。常见的是金属异物伪影及运动伪影，检查前应做好患者的准备工作，消除患者人为伪影，去除金属异物，训练呼吸，扫描时采用屏气和缩短时间减少生理性运动伪影。对于躁动、不合作的患者争取临床医生意见给予适量镇静。五、扫描时的摆位及定位的不准确导致被检部位显示欠佳，CT 增强及血管成像患者碘对比剂的剂量、流速以及扫描时间的把控不准，操作者应熟知各解剖部位及增强时严格制定不同部位不同目的相应的注射剂量、流速以及扫描时间。

结果：将以上 5 例未达到阅片要求的检查者再次进行同部位扫描，在改变以上所述参数后，图像质量明显提高，按照以上标准扫描，再随机抽取 100 例 CT 扫描图像进行质控评估百分制统计，得到满分图像 70 例，90-99 分图像 25 例，85-89 分图像 4 例，85 分以下仅 1 例，整体图像质量明显提高。
结论：窗口技术、分辨率、噪声、伪影、定位及碘对比剂剂量、流速、扫描时间为影响 CT 图像质量的重要因素，操作者应选择合适的参数，提高 CT 图像质量，为临床提供优质的影像学资料。

PU-3565
探讨全胰腺脂肪定量测量：ROI 画取法和阈值拟合法比较研究

尤亚茹[1],刘爱连[1],张钦和[1],王家正[2]
1.大连医科大学附属第一医院
2.中国飞利浦医疗公司

目的：应用 3D mDIXON Quant 序列，探讨 ROI 画取法和阈值拟合法定量测量胰腺脂肪含量的可行性。
材料与方法：纳入 11 名健康志愿者在 3.0T 磁共振(Ingenia CX，Philips)上应用 3D mDIXON Quant 序列进行扫描。扫描参数为：FOV=375mm×300mm×168mm，TR=6ms，层厚= 5.0mm，层间距=2.5mm，CS=2，Echo=6。图像导入飞利浦 ISP(IntelliSpace Portal, Philips)工作站，在脂肪分数图像上进行胰腺脂肪测量。分别于胰腺钩突、头颈部、体部和尾部各放置三个 ROI。所有 ROI 尽可能避开血管、胰管和腹部脂肪组织。将 ROI 的平均值定为该区域的脂肪分数值，然后将每个区域的平均脂肪分数值计算为整个胰腺脂肪分数值。每个 ROI 大约为 25-64 mm^2。采用阈值拟合法在脂肪分数图像上得到胰腺脂肪分数。两名观察者（临床经验分别为 3 年和 5 年）采用双盲法进行胰腺脂肪分数测定。采用 SPSS19.0 进行统计学分析。采用组内相关系数(ICC)检验数据的一致性。
结果：胰腺脂肪分数值的 ICC 值分别为 0.957 和 0.947。ROI 画取法和阈值拟合法所测得胰腺脂肪分数值分别为：2.37(2.16,2.57)和 3.03(2.46,3.37)；两种方法间胰腺脂肪分数值的 ICC 值为 0.983。ICC 值大于 0.80，结果一致性良好。
结论：无论是 ROI 画取法还是阈值拟合法都可以评价胰腺脂肪含量。但由于阈值拟合法能全面地评价胰腺，因此可能是一种更为合适的方法。

PU-3566
第三代双源 CT 低管电压联合低浓度等渗对比剂在头颈心 CTA 一站式成像中的应用

张小勇,崔学龙,曾宪春,王荣品
贵州省人民医院

目的 探讨 80 kV 低管电压联合等渗对比剂（碘克沙醇 320 mgI/100ml）扫描方案行 Force CT 头颈血管及冠状动脉一站式检查的可行性。**方法** 对拟行头颈血管及冠状动脉成像的患者，采用 Force CT 进行前瞻性心电门控大螺距模式一次性扫描，按照随机数字法分为两组。对照组（30 例）：管电压 100 kV，对比剂浓度 370 mgI/100ml；试验组（30 例），管电压 80 kV，对比剂

浓度 320 mgI/100ml。记录并比较两组患者一般资料、图像质量、辐射剂量以及用碘量。**结果** 两组患者性别、BMI、胸围、平均心率等一般资料差异无统计学意义(P>0.05)。试验组主动脉根部、颈总动脉、大脑中动脉的平均 CT 值、SD 值均大于对照组，除颈总动脉 SD 值外，差异均有统计学意义（P<0.05）；相应层面图像的 SNR、CNR 与对照组比较，差异无统计学意义（P>0.05）。两组头颈部和冠状动脉图像的主观评分分别为（2.47±0.12）&（2.49±0.99）、（3.50±0.12）&（3.47±0.11），差异均无统计学差异差异均无统计学意义(P>0.05)；对照组与试验组患者 CTDIvol、DLP、ED 及用碘量分别为（3.07±0.28 mGy、158.1±19.93 mmGy·cm、1.32±0.18 mSv、15.6±0.66 g）&（1.17±0.16 mGy、63.5±6.52 mGy·cm、0.55±0.05 mSv、13.1±0.85 g），差异均有统计学差异(P<0.05)。与对照组比较，试验组的有效辐射剂量（ED）降低约 58.3 %，碘总量降低约 16.0 %。**结论** 低管电压（80 kV）结合等渗对比剂（320 mgI/100ml）行 Force CT 头颈心血管大螺距一站式扫描可获得满意的图像质量，并有效降低辐射剂量和减少对比剂用量，值得临床推广。

PU-3567

飞利浦 DR 平板探测器故障分析与解决

吴继军
华中科技大学同济医学院附属协和医院

目的 通过对平板探测器故障的分析和解决，保证平板正常的工作，从而保证整个 DR 系统的工作正常
方法：故障现象：飞利浦 DR Digital Diagnost 开机后发现右下角平板状态指示灯一直显示黄色，正常应该是蓝色，同时显示 detector is busy！无法曝光。
故障分析：这个时候我们使用的是胸片架平板模式，由于我院采用的是诊断床和胸片架双平板，我们切换到诊断床模式，这时屏幕右下角的指示灯变成正常的蓝色，可以正常曝光出图像，再切换回胸片架模式，屏幕上的平板状态指示灯依然显示异常的黄色，观察胸片架里面的平板状态指示灯是正常，说明平板功能是正常，怀疑是工作站和胸片架端平板的连接有问题。
故障解决：对换插在 blade2500 工作站的光纤通讯板上胸片架和诊断床端的光纤线，使用胸片架模式，这个时候屏幕右下角的平板状态指示灯显示正常的蓝色，切换回诊断床模式，平板状态指示灯显示异常状态的黄色，这个时候我们就确定了是胸片架到 blade2500 工作站通讯的光纤线断了。
结果 更换损坏的光纤线，曝光正常，图像正常，问题解决！
结论 日常工作中，要理解系统工作原理，冷静分析故障状态，再结合设备资料和维修经验，可以解决很多问题，保证设备正常运行。

PU-3568

前列腺磁共振扫描技术的质量评价

赵媛媛,冉启胜
陆军军医大学大坪医院

目的：探讨前列腺磁共振扫描定位的应用标准，获取前列腺磁共振精准图像，帮助临床对于前列腺相关疾病的诊断。方法：选取就诊于本院的前列腺疾病患者（包括前列腺体检筛查患者）作为本次研究对象，所有患者均采用西门子 3.0 T vero 磁共振进行扫描，同一病人同时采用两种磁共振前列腺定位方法，一组采用小视野前列腺扫描，横断面图像在矢状位定位像上使横断面层面平行于膀胱底部，垂直于尿道前列腺部得到 T2WI，T1WI 横断面图像；在矢状面定位像上扫描层面与横断面

垂直，平行于尿道前列腺部，垂直于膀胱底部得到 T2WI 冠状面图像，使其前列腺左右侧叶在冠状面上左右对称。另一组采用大范围全盆腔轴位 T2WI 和 T1WI 扫描，T2WI 冠状位扫描。将所得到的两组图像，让同一位影像诊断医生进行观察对比判断。结果： 40 组前列腺疾病患者，其中前列腺癌患者 24 例，前列腺增生患者 13 例，正常前列腺患者 3 例。将所得到的前列腺图像进行对比分析，小视野扫描方法所得图像，前列腺左右叶、内腺及外腺显示对称，病变组织均能观察清晰，可明确诊断前列腺相关疾病，而大范围全盆腔扫描方法 6 例患者前列腺与邻近组织显示不佳，不能明确判断前列腺癌患者肿瘤是否受累精囊或膀胱。结论：前列腺磁共振扫描定位根据前列腺组织解剖结构进行精准定位，能够更为准确的得到前列腺病变图像，帮助临床更为直观的观察与诊断前列腺相关疾病。

PU-3569
双源 CT 双能量扫描对结石成分分析准确性初步探究

刘晓静
华中科技大学同济医学院附属协和医院

目的：初步探讨并验证双源 CT（DSCT）双能量扫描对泌尿系结石成分分析的准确性。
方法：将不同成分、大小相同的类结石物质（含碳酸钙、尿酸盐、非尿酸盐）各 20 例分别随机置入体积相同形态相当的鲜猪肉内以模拟正常人体环境，全部经西门子双源 CT 双能量扫描并于 syngo 工作站上对每例行 DSCT 双能量扫描对其结石成分进行分析，将结果与对应分组物质红外线光谱分析成分作对比，计算 DSCT 在体内分析结石成分的准确性和特异性。
结果：以上 60 例标本均顺利完成体内结石成分分析，以红外线光谱分析为参照标准，双源 CT 双能量分析显示尿酸、草酸钙和磷灰石成分分别得到准确性 95.2%、91.3%、32.1%，灵敏度 86.3%、100%、9.1%，特异度 99. 0%、65.1%、91.0%，阳性预测值 94.8%、93.7%、66.2%，以及阴性预测值 95.2%、100%、30.6%。
结论：双源 CT（DSCT）双能量扫描分析体内泌尿系结石成分是可行的，对尿酸和草酸钙的定性有很高的准确性，具有较高的临床实用价值。

PU-3570
3T 磁共振动态增强在肝脏疾病诊断中的技术应用

朱海燕
同济大学附属同济医院

目的 探讨 3T 磁共振动态增强扫描技术对肝脏不同疾病诊断的应用价值，及对肝脏病变的鉴别诊断价值及不同病变的强化特征。
方法 对 40 例临床怀疑肝脏占位病变的病人进行肝脏动态增强三期扫描。女性 20 例，男性 20 例，年龄 32-78 岁，平均 47.6 岁。检查使用 SIEMENS MAGNETOM Verio 3T 磁共振扫描仪，专用 3T Body MATRIX 线圈。所有患者均行 MRI 平扫和动态增强扫描，患者取仰卧位，腹部以专用腹部相控表面线圈固定，常规行冠状位，横断位定位扫描后，采用（1）冠状位 haste T2WI（TR1200ms TE94ms 层厚 5mm 间隔 1mm 矩阵 202x320 FOV370mm；（2）横断位 haste T2WI，横断位 T1WI，T2WI 加脂肪抑制；（3）动态增强扫描三期（动脉期，门脉期，平衡期）横断位。检查前用 20G 静脉留置针建立静脉通道，对比剂采用 GD-DTPA30ml，生理盐水 20ml 高压注射器静脉快速团注 3ml/s。

结果 12 例原发性肝癌病人发现病灶 16 个，动脉期呈均匀或不均匀明显强化，门脉期病灶强化明显消退，平衡期病灶信号强度低于周围均匀强化的肝组织。5 例肝转移瘤病人发现病灶 13 个动脉期，门脉期，平衡期均呈呈环型强化。17 例海绵状血管瘤病人发现病灶 22 个，动脉期病灶周边呈结节状强化，门脉期明显或轻度强化，延迟期(2～8 分钟后)病灶呈均匀明显强化。6 例局灶性结节增生病人发现病灶 6 个，动脉期明显强化，门脉期明显或轻度强化，延迟期病灶强化明显消退而瘢痕轻度或中度强化。

结论 3.0T 磁共振动态增强扫描具有极高的时间分辨率，结合常规序列，动态增强技术能在极短的时间内获得肝脏增强多个时相,在 MR 腹部增强扫描中具有显著价值。选择正确合理的扫描序列，把握正确的扫描时间，诊断结果具有很高的参考价值，对原发性肝癌、肝血管瘤、肝转移癌等病变的鉴别诊断可起到非常大的帮助，更为临床的下一步治疗提供了好的依据。

PU-3571

膝关节前交叉韧带部分断裂的 MRI 诊断与关节镜对照研究

朱敏
同济大学附属同济医院

[目的] 目前 MRI 诊断前交叉韧带（Anterior Cruciate Ligament，ACL）部分断裂的准确率较低，为了进一步提高 ACL 部分断裂诊断的准确率，探讨 ACL 部分断裂的 MRI 表现特点及诊断价值，并对误诊原因分析。

[方法] 回顾性分析 48 例膝关节外伤患者的 MRI 资料,患者均来自同济大学附属同济医院。其中女性 19 名，平均年龄 39 岁，男性 29 名，平均年龄 42 岁。在不告知关节镜结果的条件下，由两位放射科专家分别分析 48 名患者的 MRI 图像，对韧带的连续性、信号、轮廓及走行进行观察并诊断，诊断结果包括 ACL 正常、部分断裂及完全断裂，并与关节镜诊断结果进行对比，分析 ACL 部分断裂 MRI 的表现特点，分别计算 ACL 部分断裂 MRI 诊断的灵敏度、准确度及特异度，并对误诊原因进行分析总结。

[结果] 关节镜检查证实 ACL 正常 16 例，部分断裂 14 例，完全断裂 18 例。MRI 诊断 ACL 正常 15 例，部分断裂 14 例，完全断裂 19 例。MRI 诊断 ACL 部分断裂的灵敏度、特异度及准确度分别为 71%、88%、83%。ACL 部分断裂 MRI 主要表现为韧带局部不连续、增粗或变细并伴有局限高信号。

[结论] MRI 对 ACL 部分断裂具有重要的诊断价值，MRI 横断位对 ACL 部分断裂的诊断价值应该得到充分重视。

PU-3572

Targeted Biodegradable Nanoparticles MRI Contrast Agent for Enhanced Tumor Imaging and Non-viral Gene Delivery

Xiaolong Gao[1],Peijun Wang [1],Zhihong Shao [1],Chao Lin [2],Bo Lou[2]
1.Tongji Hospital， Tongji University
2.The Institute for Biomedical Engineering and Nanoscience， School of Medicine， Tongji University

PURPOSE

To prepare targeted biodegradable nanoparticles to connect folic acid MRI contrast agent with appropriate size. To explore the feasibility of the macromolecular contrast agent for tumor targeting and the characteristics of imaging in vivo and in vitro with folic receptor-positive tumor cells in nude mice models.

METHOD AND MATERIALS

1. Synthesis of SSPUA-DTPA-FA-PEG-Gd. 1) Synthesis of SSPUA. a) synthesis of a new disulfide-containing monomer, 2, 2’-dithiodiethanol bis(p-nitrophenyl carbonate) (DTDE-PNC) for the generation of bioreducible cationic polyurethanes (SSPUAs); b) Polycondensation reaction of DTDE-PNC and tertiary-amine containing primary amines. (Notes: these SSPUAs are coded with the name of primary diamines and shown as disulfide bond in blue, urethane linkage in magenta and protonable amino group in red; 2) Synthesis of PEG AND FA modified SSPUA .3) preparation of SSPUA-DTPA-FA-PEG-Gd. 2. Characterization and measure cell toxicity of the poly nanoparticles. 3. Detection of transfection efficiency. 4. Tumor model. About 1×107 SKOV3 cells were suspended in 200μL of PBS and subcutaneously injected into the right lower back of the nude mice. The MRI study was performed when the tumor size reached 5 mm in diameter at day 10. 5. MR phantom images were obtained using a 3.0 Tesla Siemens MR in nude mice model.

RESULTS

The SSPUA-DTPA-FA-PEG-Gd had a high longitudinal relaxivity up to 18.1 $mM^{-1}s^{-1}$, 4 times higher than the clinically used contrast agents such as Magnevist. The MRI contrasted by SSPUA-DTPA-FA-PEG-Gd outlined the inoculated tumor more clearly, and had much higher contrast enhancement for a much longer time than Magnevist. Furthermore the SSPUA-DTPA-FA-PEG-Gd/siVEGF complexes can inhibitor the tumor growth. More importantly, the biodegradable SSPUA-DTPA-FA-PEG-Gd gave much less Gd retentions in all the organs or tissues than non-degradable contrast agents.

CONCLUSION

In summary, SSPUA-DTPA-FA-PEG-Gd was successfully developed as a target specific, biodegradable and non-toxic delivery system of siRNA therapeutics. Treatment with SSPUA-DTPA-FA-PEG-Gd/siVEGF complex reduced VEGF mRNA and protein expression in vitro and in vivo, and it also retarded tumor growth in vivo. The SSPUA-DTPA-FA-PEG-Gd helps to intensify the effect in MR enhancement in nude mice models. Therefore, SSPUA-DTPA-FA-PEG-Gd might be effective non-viral gene vector for gene therapy.

PU-3573

简述磁共振成像中的伪影

赵翠花,窦社伟
河南省人民医院

目的 探究磁共振成像图像伪影产生的原因，寻求磁共振图像伪影的克服方法。

方法 收集 2017 年 1 月至 2019 年 6 月间本院磁共振设备上采集出的具有代表性的伪影图像，分析伪影产生的原因，提出克服方法。

结果 磁共振图像常见的伪影主要有运动伪影、卷褶伪影、磁敏感伪影、拉链伪影、金属伪影、化学位移伪影等，这些伪影有的可以消除，有些则仅能尽量减少而不可能完全消除。

运动伪影通常分为自主性运动伪影和生理性周期运动伪影，前者主要包括检查中患者配合不佳的随意运动、吞咽动作、眼球运动等；后者主要包括心跳、大血管波动、呼吸等。运动伪影的主要出现在相位编码方向上，是因为相位编码方向的采集时间比频率编码方向的采集时间要长很多，因此，运动对相位编码方向的影响要比较重。预防和补偿措施通常为：在行使检查前充分的告知被检者检查过程中的注意事项；检查过程中可以根据检查部位改变相位编码方向；采用门控和触发技术；预饱和技术；梯度补偿；BLAD 技术等。

卷褶伪影是当检查部位大小超出所设置的视场（FOV）范围时会产生假频，从而出现图像混叠的现象。卷褶伪影可出现在频率编码或相位编码方向上，由于目前几乎所有的设备均设置了频率编码方向上的过采样，所以一般只出现在相位编码方向上。可采取如下对策来减弱或消除卷褶伪影：增大FOV；采用预饱和技术；切换频率和相位编码方向，采用举行像素技术；相位编码方向上采用过采样技术。
拉链伪影是由于额外的某一频率射频脉冲进入扫描室，并与病人体内的弱信号相互干扰从而产生的在图像频率编码方向上的致密线状伪影。出现此伪影通常需要重新扫描，若反复出现应立即通知维修工程师。
结论 了解磁共振图像伪影的产生原因及机理，并掌握伪影的克服方法，对于提高磁共振图像质量具有重要的意义。

PU-3574

FMRI study of mild Alzheimer's disease using amplitude of low frequency fluctuation analysis

Qian Xi,Xiaohu ZHAO ,Peijun WANG
Tongji Hospital, Tongji University

Background Previous studies have shown that the functional brain activity in the resting state is impaired in Alzheimer's disease (AD) patients. However, most studies focused on the relationship between different brain areas, rather than the amplitude or strength of the regional brain activity. The purpose of this study was to explore the functional brain changes in AD patients by measuring the amplitude of the blood oxygenation level dependent (BOLD) functional MRI (fMRI) signals.
Methods Twenty mild AD patients and twenty healthy elderly subjects participated in the fMRI scan. The amplitude of low frequency fluctuation (ALFF) was calculated using REST software.
Results Compared with the healthy elderly subjects, the mild AD patients showed decreased ALFF in the right posterior cingulate cortex, right ventral medial prefrontal cortex, and in the bilateral dorsal medial prefrontal cortex. No brain region with increased ALFF was found in the AD group compared with the control group.
Conclusion The reduced activity in the posterior cingulate cortex and medial prefrontal cortex observed in the present study suggest that the functional abnormalities of those areas are at an early stage of AD. The ALFF analysis

PU-3575

Spontaneous brain activity in mild cognitive impairment revealed by amplitude of low-frequency fluctuation analysis: A resting-state fMRI study

Qian Xi,Xiaohu ZHAO ,Peijun WANG
Tongji Hospital, Tongji University

Background Spontaneous low-frequency fluctuations (LFF) in the blood oxygenation level dependent (BOLD) functional magnetic resonance imaging (fMRI) signal have been shown to reflect cerebral spontaneous neural activity. The objective of this study was to explore the brain functional changes in MCI patients with measuring the amplitude of the BOLD signals.
Methods Eighteen amnestic MCI patients and twenty healthy elderly participated in the fMRI scan. The amplitude of LFF (ALFF) was calculated using REST software.
Results MCI patients showed decreased ALFF in the right hippocampus and parahippocampal cortex, and left lateral temporal cortex, right ventral medial prefrontal cortex and increased ALFF in the left temporal-parietal joint and inferior parietal lobule. The ALFF value in the right hippocampus and parahippocampal cortex was positively correlated with the scores of Mini-Mental State Exam.
Conclusion Reduced medial temporal lobe activity may implicate the underlying memory impairment mechanisms in MCI. Increased temporal-parietal joint and inferior parietal lobule activity may indicate the compensatory mechanism in MCI patients. These findings suggest that the ALFF analysis could provide a useful tool in fMRI study of MCI.

PU-3576

3.0T MR DWI 序列在肾脏肿块型病变的诊断价值

吕琦,王培军,王国良
同济大学附属同济医院

目的 评价 3.0T MR 弥散加权成像（Diffusion weighted imaging,DWI)序列在肾脏肿块型病变的诊断及鉴别诊断价值。

方法 回顾性分析 139 例肾脏肿块型病变，采用 3.0TMR 行 b 值=800s/mm^2 DWI 检查，除良性囊肿性病变外，所有肿瘤均经手术病理或穿刺活检证实，对病灶的 DWI 信号特点进行记录和分析：1、计算 ADC 值鉴别肾脏良恶性肿瘤的敏感性、特异性，阳性预测值、阴性预测值。2、测量比较所有病灶、病灶周围及健侧肾组织的 ADC 值。

结果 肾癌与癌周组织及正常肾实质 ADC 值相比，差异有统计学意义(P<0.05)，癌周组织与正常肾组织 ADC 值相比，差异无统计学意义(P>0.05)。肾癌、肾盂癌、肾脓肿、肾血管平滑肌脂肪瘤、肾良性囊肿性病变及肾癌囊变区各组 ADC 值差异有统计学意义(F= 129.71，P=0.000),其中肾癌、肾血管平滑肌脂肪瘤及肾盂癌组的 ADC 值两两之间差异有统计学意义（P<0.01)，肾癌及肾盂癌的 ADC 值统计学上均低于良性病变（肾脓肿及肾血管平滑肌脂肪瘤），肾盂癌的 ADC 值最低，肾血管平滑肌脂肪瘤的 ADC 值最高。良性囊肿性病变及肾癌囊变区的 ADC 值差异有统计学意义

（t=3.756，P=0.000 ）。其中透明细胞癌病理各分期两两比较发现，I 期与 III、IV 期及 II 期与 III、IV 期相比，差异有统计学意义（P<0.01），III 期及 IV 期的 ADC 值较低。

结论 高 b 值 DWI 鉴别肾脏良恶性肿瘤有较高的准确率，结合量化分析 ADC 值能够更好的显示肾脏肿块的病变特征，有助于肾脏肿块的鉴别、恶性程度评估以及预后预测等方面有着重要的意义。

PU-3577

PET 显像膀胱不常见低浓聚的原因分析

陆皓
四川省肿瘤医院

[**摘要**] **目的**：分析非泌尿系疾病患者氟代脱氧葡萄糖（18F-fluorodeoxyglucose,18F-FDG）PET/CT 显像膀胱低放射性浓聚的影像表现及产生原因，指导今后的临床采集工作。**方法**：对日常采集中偶发的 1 例非泌尿系病变患者膀胱代谢浓聚过低的影像进行量化分析，测量该患者肝脏组织、脑组织、膀胱的平均标准率摄取值（the average of standardized uptake value,SUVavg），与 50 例正常患者上述组织的 SUVavg 相比较，制作折线走势图。进行诊断、技术、放药综合读片分析会，从病史询问、放射性药物制备与检测、患者检查前准备、图像采集参数、图像重建参数等角度回顾性分析，找出浓聚异常的原因。**结果**：1，影像特点 不常见浓聚分布：肝脏 SUVavg＜膀胱 SUVavg＜脑 SUVavg；正常浓聚分布：肝脏 SUVavg＜脑 SUVavg＜膀胱 SUVavg。2，原因分析 患者单侧肾失代偿后肾小球率过滤（Glomerular Filtration Rate，GFR）过低，FDG 在泌尿系排泄速率降低，膀胱大量尿液对放射性的稀释，导致图像呈现膀胱放射性略高于肝脏远低于脑的不常见分布。**结论**：有针对性的病史询问、与患者充分的交流沟通、检查前核实患者检查前准备完成情况、及时在 PET Cine Display 窗口对成像进行预览、技师对 PET 诊断知识的普及都是 PET 检查图像质量的有效保证。

直接法联合间接法 CT 静脉成像在髂静脉受压综合征诊断中的应用

张金玲,肖喜刚,王俊程
哈尔滨医科大学附属第一医院

目的：探讨直接法联合间接法 CT 静脉成像(CTV)在髂静脉受压综合征(IVCS) 诊断中的应用价值。**方法**：选择临床怀疑髂静脉受压综合征并经数字减影血管造影(DSA) 证实的患者 40 例，分为 A、B 两组，A 组采用间接法扫描，肘静脉注射造影剂后 180s 启动扫描，造影剂为优维显（370mgI/mL），注射速率 5.0mL/s，注射剂量 100~120mL，追加盐水 40 mL，从头至足侧扫描，扫描范围为 L3 下缘平面至耻骨联合平面；B 组采用肘静脉注射造影剂 80 mL，注射速率 4.0mL/s，延迟 40s 后分别自双足背静脉注射造影剂（优维显 370mgI/mL）与盐水混合液（1:7 浓度）各 100 mL，踝关节处扎止血带，监测肾门水平下腔静脉，当阈值达到 150HU 后启动扫描，从足至头侧扫描。两组扫描结束后测量右侧髂总动脉及左侧髂总静脉的 CT 值，记录左侧髂总静脉的前后径及左右径，数据进行 VR 及 MPR 重建，并进行主观评分，采用 4 分法进行评价（1 分差；4 分优）两组数据比较采用 t 检验。**结果**：所有患者均完成检查，所有患者左侧髂总静脉左右径及前后径对比均大于 2，15 例受压呈细线状，13 例左侧髂总静脉受腰骶椎及右侧髂总动脉联合压迫， 6 例左侧髂总静脉可见血栓；B 组右侧髂总动脉及左侧髂总静脉的 CT 值明显大于 A 组，差异有统计学意义（p＜

0. 05），主观评分 B 组评分高于 A 组，差异有统计学意义（p＜0. 05）。**结论**：直接法联合间接法 CT 静脉成像能对髂静脉受压综合征作出准确诊断，相比传统间接法能获得更高的图像质量指导临床治疗。

PU-3579
呼吸门控技术对于 SPN 患者 PET 采集后 MTV 测量值的无效影响及增加技师所受辐射剂量分析

陆皓,程祝忠
四川省肿瘤医院

【摘要】 目的：比较常规 PET 采集与呼吸门控采集后孤立性肺结节（solitary pulmonary nodule,SPN）患者病灶代谢肿瘤体积（metabolic tumor volume，MTV）的测量差异，分析呼吸门控技术对测量值的影响。同时检测技师使用该技术时所受辐射剂量大小，从上述两方面论证该技术的临床应用可行性。**方法**：从 2017.10.1-2017.12.30 来我中心做 PET/CT 检查的病人中选择 50 例符合条件的患者，入组条件为肺部孤立性病灶患者。在常规 PET 采集之后加做呼吸门控采集，使用 TrueD 后处理软件分别测量两次采集后同一病灶层面下 MTV 值（50%SUV_{max}）以及病灶 SUV_{max}，使用折线图辅助统计软件法分别分析两组数据之间的组间差异；利用个人辐射检测仪监测技师在常规采集与使用呼吸门控技术床边操作时技师所受辐射剂量率的差异，从辐射安全的角度去分析这一方法的临床可操作性。
结果：使用呼吸门控技术后，患者病灶 MTV、SUV_{max} 无明显变化；技师安装和拆卸呼吸压敏原件所受的瞬时辐射剂量率较常规采集时所处的操作间本底明显增加。**结论**：呼吸门控技术在 PET 采集过程中并不能良好的控制患者的呼吸运动伪影，患者 SPN 在有无呼吸门控技术干预下，测量值无统计学变化，对临床诊断意义不大，且技师使用该技术时需床边操作，所受辐射剂量率成几十倍增加，从临床意义及可操作性均不提倡临床推行。

PU-3580
技师参与 PET/CT 检查前病史询问的必要性分析

陆皓,程祝忠
四川省肿瘤医院

【摘要】 **目的** 通过对比技师参与病史询问前后 PET/CT 检查影响图像质量的不良事件发生率的变化，说明技师参与病史询问的必要性。**方法** 对照组：作者所在 PET/CT 中心 2018.8.1-2018.9.31 期间共完成检查患者 647 例，技师未参与病史询问。观察组：2018.11.1-2018.12.31PET/CT 中心共完成检查患者 644 例，由技师参与病史询问并进行相应的检查前预处理。分别统计影响图像质量的不良事件占总患者比例数以及涉及到成像操作的不良事件所占总不良事件比例数。将所得数据做图表分析及统计学分析。**结果** 观察组患者不良事件发生率为 6.21%低于对照组 10.97%，差异具有统计学意义（P＜0.05）；由于成像技术原因所导致的不良事件占总不良事件比例，观察组 25.00%亦低于对照组 69.01%；差异具有统计学意义（P＜0.05）。**结论** 技师参与病史询问，可以从成像技术出发更加有针对性的得到患者的第一手资料，做出更加周全的采集预案，保证每一位患者的 PET 图像质量。具体临床推广价值。

碘对比剂特性及注射路径对肾脏的影响

王志强
北华大学附属医院

碘对比剂诱导急性肾损伤（Contrast-induced acute kidney injury，CIAKI）发生在多达 30%接受碘对比剂的患者，被认为是医院获得性急性肾损伤的第三个最常见的原因，仅次于肾灌注不足和肾毒性药物[1]。CIAKI 定义为在注射对比剂后 24 小时到 5 天内血清肌酐（Serum creatinine，SCr）水平升高（＞25%或绝对值升高＞0.5mg /mL）。大多数 CIAKI 患者肾脏呈暂时的功能障碍，但 CIAKI 也有严重的后果，如住院并发症发生率增加、死亡率升高以及转化为慢性肾脏疾病或长期肾功能丧失[2]。本文旨在总结目前临床上常用碘对比剂种类和特性，为临床选择更恰当的使用方法提供依据。

PU-3582

DR 及移动 DR 检查患者不同部位受照剂量水平监测与分析

杨启顺
广西壮族自治区南溪山医院/广西壮族自治区第二人民医院

目的　对比分析 DR 及移动 DR 检查患者不同部位 X 射线受照剂量水平,为医疗辐射防护提供科学依据。方法分别选择 100 例进行 DR 及移动 DR 检查患者。采用氟化锂热释光探测仪测量患者甲状腺、左胸、会阴、左手臂肘内的 X 射线受照剂量。结果 移动 DR 组患者甲状腺、左胸部、会阴表面受照剂量比较,差异均有统计学意义(P<0.05),移动 DR 组会阴受照剂量均高于 DR 组,DR 组甲状腺、左胸部受照剂量均高于移动 DR 组(P<0.05)，医院使用的 X 射线管电流比较,差异无统计学意义(P>0.05)。结论 不同的检查方式患者的不同部位的表面受照射剂量不同,应加强对床边患者的放射防护工作,以降低患者受照剂量水平。

PU-3583

青少年全脊柱全长摄影中两种 X 线曝光模式图像质量和辐射剂量的比较

曹瑞
陆军军医大学大坪医院

目的:探讨比较青少年全脊柱全长摄影中 2 种不同曝光模式下的图像质量评价以及辐射剂量,以指导针对青少年采用合理使用全脊柱全长摄影曝光模式。方法:选择 80 名全脊柱全长摄影患者并随机平分成 2 组,其中有 20 名脊柱侧弯患者随机均分入 2 组，每组男性 20 例（平均年龄 24 岁），女性 20 例(平均年龄 23 岁）。全脊柱全长摄影时 1 组运用自动曝光控制(AEC)模式曝光,另 1 组运用手动曝光控制(FIXED)模式曝光,曝光后任由软件采用自动拼接，并记录每位患者辐射剂量,由 3 名高年资医师对 2 组曝光的图像质量进行分析评分，。结果:2 组患者中非脊柱侧弯患者均能明确诊断,

但在手动曝光控制模式下普通患者图像质量评价得分与自动曝光控制图像质量评价得分差距微小。而脊柱侧弯患者在手动曝光控制模式摄片下脊柱侧弯图像质量评分高于自动曝光模式，但在辐射剂量上 FIXED 模式明显高于 AEC 模式。结论:不同曝光模式对图像质量有一定的影响,为了提高图像质量,脊柱侧弯患者可用手动曝光模式（FIXED）检查；但对于一般未有明显临床症状患者,考虑青少年低辐射剂量保护，仍然考虑推荐使用 AEC 模式摄片。

多扩散敏感系数的弥散加权成像对基于生成对抗网络的前列腺癌病灶检测影响的研究

王伟,王培军
同济大学附属同济医院

目的 探讨多扩散敏感系数（b 值）的弥散加权成像（DWI）对基于生成对抗网络（GAN）的前列腺癌病灶检测影响的价值。
方法 回顾性收集 2012 年 1 月至 2018 年 6 月在本院就诊的前列腺疾病病例 446 例，其中前列腺癌 174 例，前列腺增生 272 例，所有病例均经直肠超声引导下前列腺穿刺活检或前列腺根治术后病理证实。所有患者均采用 Siemens Verio 3.0T MRI 扫描，成像序列包括横断位、矢状位高分辨 T_2WI，b 值=0、500、1000 s/mm^{2}横断位 DWI 及 DCE 扫描，通过 Matlab 后处理化合成 b=1500、2000 s/mm^{2}的 DWI 图像。我们提出一个新的神经网络模型 SegDenseAN，并结合多 b 值 DWI 图像进行检测。该网络基于 GAN，由生成网络和判别网络两部分组成，生成网络是一个基于 Dense 模块的分割模型，而判别网络是一个多尺寸的特征提取网络。将多 b 值 DWI 与 ADC 影像的不同组合作为 SegDenseAN 网络的输入：组合 1：ADC 图；组合 2：ADC+DWI0+DWI500；组合 3：ADC+DWI0+DWI1000；组合 4：ADC+DWI0+DWI1500；组合 5：ADC+DWI1000+DWI1500;组合 6：ADC+DWI1000+DWI2000，分析比较不同组合对检测精度的影响。
结果 组合 1-6 的准确性分别为：0.871、0.887、0.903、0.903、0.903、0.903；敏感性分别为：0.935、0.935、0.968、0.968、0.968、0.968；特异性分别为 0.806、0.839、0.839、0.839、0.839、0.839；组合 6 的前列腺癌病灶区域识别最接近于原始金标准。
结论 SegDenseAN 可以实现病灶区域的自动分割，有助于前列癌的自动检测；多 b 值尤其多个高 b 值 DWI 与 ADC 影像的不同结合对算法的检测效果有影响，有助于提高前列腺癌的自动检测结果。

PU-3585
外周带前列腺癌 PI-RADS V2 评分与 Gleason 评分的比较研究

王伟,王培军
同济大学附属同济医院

目的 比较外周带前列腺癌 PI-RADS V2 与 Gleason 评分的关系；探讨外周带前列腺癌第二版前列腺影像和数据报告系统（PI-RADS V2）中总分 3+1 分与总分 4 分是否有差异并评估其对 PI-RADS V2 的影响。
方法 前瞻性连续收集 2012 年 1 月至 2016 年 1 月 354 例临床疑诊前列腺疾病病例，其中前列腺移行带病变 150 例，前列腺外周带病变 204 例（142 例前列腺癌，62 例非前列腺癌），病例均经过病理证实。所有患者均采用 Siemens Verio 3.0T 多参数 MRI 序列扫描。所获图像根据 PI-RADS V2 标准进行评分。204 例前列腺外周带病变用于统计分析。评分者之间一致性通过 Kappa 系数统计。PI-RADS 总分 3 分、3+1 分、4 分病例通过非参数 2 检验分析。

结果 204 例前列腺外周带病变中前列腺癌有 169 例，非前列腺癌 35 例。PI-RADS 总分 4 分的 kappa 系数高于 PI-RADS 总分 3 分或 3+1 分的 kappa 系数（k = 0.802 vs 0.737 vs 0.591; p < 0.01），PI-RADS 总分 2、5 分的 kappa 系数高于 PI-RADS 总分 3 分、3+1 和 4 分的 kappa 系数。PI-RADS 总分 3 分、3+1 分、4 分之间的构成比有统计学差异（ x 2 = 29.839, p < 0.05）。PI-RADS 总分 4 分中前列腺临床显著癌高于 PI-RADS 总分 3+1 和 3 分（78.2% vs 43.2% vs 16.7%）。PI-RADS 总分 3+1 分和 4 分之间的构成比有统计学差异（ x 2 = 15.286, p < 0.01）。71%病例 (44/62) 由于 DCE 阳性从 PI-RADS 总分 3 分升高到 3+1 分。

结论 PI-RADS V2 外周带评分系统中有必要将 PI-RADS 总分 3+1 分与 PI-RADS 总分 4 分加以区分，我们认为可将 PI-RADS 总分 3+1 分定义为 PI-RADS 3b 而非直接升级到 PI-RADS 总分 4 分。

PU-3586

不同计算化高 b 值对外周带前列腺癌第二版前列腺影像和数据报告系统中弥散加权成像评分的影响

王伟,王培军
同济大学附属同济医院

目的 探讨不同计算化高 b 值对外周带前列腺癌第二版前列腺影像和数据报告系统(PI-RADS v2)中弥散加权成像(DWI)评分的影响。

方法 回顾性分析 2012 年 1 月至 2013 年 12 月在本院经直肠超声引导下前列腺饱和穿刺活检或前列腺根治术后病理证实外周带前列腺癌 104 例患者的临床资料。所有患者均采用 Siemens Verio 3.0T MRI 扫描，成像序列包括横断位、矢状位高分辨 T_2WI，b 值=0、50、1000 s/mm^{2}横断位 DWI 及 DCE 扫描，通过 Matlab 后处理化合成 b=1000、1400、2000 s/mm^{2}的 DWI 图像（cDWI）。依据 PI-RADS v2 评分标准对 b=1000、1400、2000 s/mm^{2}的三组 cDWI 资料进行评分，并对各组病例的病灶信号强度比（SIR）进行独立样本 t 检验及单因素方差分析。

结果 三组 cDWI 中 DWI 评分 2、5 分的病例数无差别，27 例 b=1000 s/mm^2 DWI 评分 3 分的病例中有 9 例在 b=1400 s/mm^{2}及 2000 s/mm^{2}时 DWI 评分均升高到 4 分。升高至 DWI 评分 4 分的病例与仍为 DWI 评分 3 分的病例间的病灶 SIR 在 b=1400 s/mm^{2}及 2000 s/mm^{2}时的比值分别为 1.86±0.21 比 1.61±0.27、2.18±0.26 比 1.75±0.30，两组间 SIR 差异均有统计学意义（t=2.486、3.671，P<0.05）。升高至 DWI 评分 4 分的 9 例病例的病灶 SIR 在 b=1000、1400、2000 s/mm^{2}时两两之间差异均有统计学意义（F=10.907、33.768、8.043，P<0.05），且病灶 SIR 随 b 值的升高而增大。

结论 b≥1400 s/mm^{2}的高 b 值主要影响 DWI 评分 3 分的病例，但 b=2000 s/mm^{2}不改变 b=1400 s/mm^{2}时的 DWI 评分，b=1400 s/mm^{2}可能更适用于外周带前列腺癌的 PI-RADS v2 中 DWI 评分。

PU-3587

普放 DR 放大失真临床意义

马益
云南省肿瘤医院

在 X 线摄影过程中，照片影像较被照体的大小和形态的改变称之为影像失真，其变化的程度称之为失真度，根据失真的情况可分为放大失真、变形失真和重叠失真等。

我们这次主要探讨的是照片的放大失真，那照片放大有几个相关的因素:

（1）肢-片距

由半影公式 H=F·(b/a)知道，半影与肢-片距成正比。

（2）焦-片距 一定大小的照射野，焦-片距↑，照射到平板探测器上 X 线越接近平行，肢体放大率越小，半影也随之越小。由半影公式可知，半影的大小与焦-肢距成反比，即当 b 肢一定时，焦-片距增大，则半影缩小。
(3)模糊阈值及允许放大率
模糊阈值是指人眼观察照片影像认为有模糊时的半影值。国际放射学界公认的模糊阈值为 0.2mm。
照片影像变形失真的控制 X 线摄影控制、减小影像变形失真应注意和采取的方法有：
①被照体应尽量靠近和平行于平板探测器。
②将 X 线球管焦点置于被照体正上方。
③在 X 线及负荷允许的范围内尽量增加焦-片距离。

随着医学影像设备和信息化技术的迅猛发展，医学影像数字化在许多医院得以实现，但是不同的设备、不同的拍摄方式、不同的打印模式其影像放大率不同，给日常工作造成了一定的影响，如一个肺癌患者治疗前后复查胸片，如果两次的放大率不同，则难以判断病灶大小，也难以判断治疗效果。
有文献做过相关测试，用同一被照体在不同的设备上胶片距相同的情况下进行投照，分别测量所拍摄物体在照片中的大小和实际大小进行对比，分别计算出每台设备的影像放大率，立位摄影结果岛津 X 光机为 2.5%、飞利浦 DR 为 5%、西门子 DR 为 5%，卧位投照放大率分别为 7.5%、5%、15%。

DR 检查是影像都存在放大问题，所以我们一定要熟悉所使用的设备的放大率以及在摄影方法上严格按照操作规程操作，最大限度减小影像放大，为患者和临床做出指导。

PU-3588
基于磁共振成像调制的相关实验和理论研究

冯国胜
山西医科大学第一医院

磁共振成像广泛用于医疗方面的研究，利用磁共振成像的高分辨率，无限的穿透深度和极佳的软组织对比度优势可以有效探测器官的生化变化信息。磁共振成像的发展得益于磁共振仪的不断更新。多年来人们对磁共振仪的研究取得了显著的进步。在进行磁共振检测时，需要将检测对象置于几 T 到十几 T 的强磁场下，此时原子的能级发生塞曼分裂，但是由于高能级的核自旋与低能级的核自旋数量之差较小，引起微弱的探测信号常常被噪声所湮没，本文旨在发展一套集成化电路系统，包括数字控制，电路反馈系统，大磁场快速开断模块，从而实现对微弱信号的调制，消除噪声对探测结果的影响，进而提高磁共振成像的分辨率。同时，通过在理论上对探测结果的分析和拟合，来验证这一套集成化电路系统的合理性和有效性。本文提出的磁共振成像调制系统可以推广到常规的医疗检测中，用于提高成像的分辨率。

迭代重建算法对腰椎间盘 CT 图像质量和辐射剂量的影响

王峰,张锦,李军,张丽琴,刘涛,李海东,张俊杰,范跃星
武警山西省总队医院

[**摘要**] **目的** 比较低剂量扫描、IRIS 重建与常规剂量扫描、FBP 重建所得腰椎间盘 CT 的图像质量、辐射剂量及诊断可靠性。**方法** 回顾性分析 2018 年 7 月到 2019 年 2 月期间 232 例采用常规剂量（190mAs，130kVp）扫描、FBP 重建（n=115）或低剂量（130mAs，130kVp）扫描、IRIS 重建（n=117）的、临床怀疑腰椎间盘突出或膨出的患者，评价两组图像客观图像噪声、主观图像噪

声、图像锐利度、诊断可接受性、诊断准确性以及观察者间的一致性。**结果** 与常规剂量组相比，低剂量组辐射剂量显著减低（*P*<0.001），客观图像噪声及主观图像噪声显著减小（*P*<0.05），图像锐利度及诊断可接受性无显著差别（*P*>0.05），诊断可靠性（灵敏度、特异度、阳性预测值、阴性预测值及准确度）无显著差别（*P*>0.05），观察者间的一致性较好或很好（kappa 值 0.778-0.903）。**结论** 在辐射剂量减少约 30%的情况下，IRIS 重建低剂量 CT 对腰椎间盘突出的诊断效果与 FBP 重建常规剂量 CT 无显著差别，可以用于检查疑为腰椎间盘突出的患者。

PU-3590
CT 下肢血管造影不同触发阈值对图像质量的影响探讨

陈鹏程
安徽省宣城市人民医院

【摘要】 目的 探讨不同的触发阈值对图像质量的影响 **方法** 采用团注法示踪触发技术，当监测层面第三腰椎水平腹主动脉 CT 阈值分别达 100 HU 和 120HU 后延迟 10s 即启动扫描，一次性连续螺旋扫描。 扫描结束后将 2 组数据于工作站行 MPR、MIP、VR 等后处理。**结果** 30 例中，同层面实验组横断面动脉 CT 值除了髂总动脉分叉水平略低外，其他层面都比对比组的高，图像质量明显好些。**结论** 用阈值 100HU 的扫描条件时图像质量优于 120HU

PU-3591
自适应性统计迭代重建技术结合低管电压在肝脏三期增强低剂量扫描中的应用价值

贾广生,姜慧杰
哈尔滨医科大学附属第二医院

目的 探讨自适应性统计迭代重建（ASIR）技术结合低管电压在肝脏三期增强低剂量扫描中的应用价值，以达到在保证图像质量、满足临床诊断的同时，有效降低 CT 辐射剂量，并进一步实现临床推广。**方法** 收集哈尔滨医科大学附属第二医院 CT 诊断科肝脏占位拟行三期增强扫描的患者 100 例，随机分成 A、B 两组，每组各 50 例患者行 GE Discovery CT 750 HD 肝脏 CT 三期增强扫描，男 56 例、女 44 例，年龄 27～73 岁，42 例患者有肝细胞癌，44 例患者有肝血管瘤、肝囊肿，14 例患者为其他疾病。采用 GE Discovery CT 750HD 宝石能谱 CT，A 组患者动脉期和延迟期采用低剂量扫描即 100 kV+ASIR，门静脉期采用常规剂量扫描即 120 kV+滤波反投影（FBP）；B 组患者动脉期和延迟期采用常规剂量扫描即 120 kV+FBP，门静脉期采用低剂量扫描即 100 kV+ASIR；同时对所有低剂量扫描期相采用 FBP 重建，得到常规重建模式下低剂量图像。统计方法：图像质量主客观评价方法、辐射剂量评价方法。**结果** ASIR 技术结合低管电压在肝脏三期增强低剂量扫描，低剂量组较常规剂量组辐射剂量降低 37%；图像质量主观评价低剂量组（100 kV+ASIR）与常规剂量组（120 kV+FBP）差异无统计学意义（P>0.05）；图像质量客观评价除低剂量组门静脉期噪声略差于常规剂量组外（低剂量 10.86±1.98，常规剂量 9.40±2.12，P<0.05），其余各期各评价指标均优于或无差别于常规剂量组。**结论** 1. 肝脏三期增强 CT 检查，使用管电压为 100kV，可使患者辐射剂量降低大约 37%；2. 自适应性统计迭代重建结合低管电压技术可用于肝脏三期增强低剂量扫描，但在门静脉期时，低剂量图像的噪声会略高于常规剂量图像的噪声；3. 肝脏三期增强检查，当使用管电压 100kV 且重建算法为 FBP 算法时，图像质量会降低，不利于诊断。

256 排螺旋 CT 在自由呼吸下冠状动脉成像的研究

贾广生,姜慧杰
哈尔滨医科大学附属第二医院

目的：探讨应用 GE 256 排螺旋 CT 在患者自由呼吸下冠状动脉成像效果。**方法：**选取 30 例行冠状动脉 CTA 检查的患者，心率小于 90 次/分，使用美国 GE Revolution 256 排螺旋 CT 机，设置扫描参数为管电压 80KV，自动管电流 400～650 mAs，噪声指数 NI 为 12，扫描层厚 0.45mm，层间距 0.45mm，螺距为 0.16，旋转时间为 0.28s/转，探测器为 256×0.625mm，重建矩阵 512×512。患者保持双手举过头顶，仰卧位足部先进，先进行正侧位定位像及冠状动脉钙化积分扫描，再记录最近心电图变化情况，最后采用阈值触发法行冠状动脉 CTA 扫描，动态监测感兴趣区为患者主肺动脉窗层面降主动脉区域内，设置触发阈值为 150HU，达到阈值之后，患者无需吸气后屏气（自主均匀呼吸），延时 5 秒自动启动一个轴位扫描，曝光时间在 0.3～0.7s。使用双筒高压注射器，通过右侧肘前静脉留置针将碘对比剂碘海醇（350 mgL/ml）注入 70ml（1.0ml/kg）左右，注射速度 5.0～6.0ml/s，后以相同流率注射 40ml 的生理盐水。将图像数据传送到 AW4.7 工作站，利用 SSF 自动冻结后处理软件，重建一期最优图像，用于冠状动脉血管图像重组。如对其核心分支血管利用容积再现（VR）、最大密度投影（MIP）、多平面重建（MPR）、曲面重建（CPR)等技术分析处理图像。**结果：**升主动脉 CT 值均在 350HU 以上，冠状动脉主干及各分支清晰显示，无明显呼吸运动伪影。**结论：**患者在自由呼吸情况下，应用 GE 256 排螺旋 CT 行冠状动脉 CTA 成像可以得到满足诊断要求的优质图像。

PU-3593

医学影像诊断与医疗责任险小议

闫晓虹,牛玉军
锦州医科大学附属第一医院

目的:寻求一种解决临床医生包括影像医生与患者发生医疗纠纷产生经济损害赔偿方面的合理有效途径，尽可能减少双方的伤害及经济损失。
方法:本文在保险项目中检索到一种医疗责任险，可以单位集体参保，也有个人参保，横向的不同保险公司的具体保险额度及保费不太确切，同一保险公司不同职业间保费也有待详细咨询。
结果:由于时间较仓促，中国知网目前没有检索与题目相关内容，也没有通过保险公司方面看到一些个例及处理过程流程的详细资料；国外文献没有进一步检索。中文文献比较多，涉及医疗责任险制度建立、发展现状及对策、发展模式、运行机制及有效缓和医患矛盾，包括医疗责任险在医院开展 10 年的效果评析与思考一篇。
结论:
1、临床现状：临床医疗工作复杂繁琐，老龄化患者数量增多，就诊期望值较高；医生护士工作人员数量有限，各项工作交替，身心大脑思维连轴转，难免有一些疏漏闪失，甚至较大的纰漏。
2、临床高精尖、高强度的诊断治疗操作工作，就像再精确的仪器也会有系统误差一样，医疗差错、事故在所难免，给患者带来身体伤害会产生纠纷及经济损害索赔，这期间医护人员与患方交涉会费很多时间精力，情感可能受到一些干扰冲击……
3 基于这样的前提，医疗责任险在一定程度上可缓解这方面的问题。平时小投入，用时大回报，减轻患者及医护人员个人经济负担，解决燃眉之急和后顾之忧。特别是一些单位个人承担最高限额不低，就很有必要参保个人医疗责任险，避免时间经济更大损失。

4、同时在保证患者与医务人员双方权益的前提下，减少或免于相关责任人处理纠纷牵涉的时间与精力，保证临床工作的正常进行就尤显得重要。
5、如能像医疗保险一样全社会全员参与医疗责任险，每人每月有一部分投入，用时方便，整个社会形成良性循环，积极妥善解决实际问题。

PU-3594
CT 增强检查中等渗性造影剂对正常人及有高血压基础疾病患者的肾功能损害的临床分析

孙羽
锦州医科大学附属第一医院

摘要：目的 探讨 CT 增强检查中非离子型等渗性造影剂对肾功能的损害，在不影响造影对比图像质量的前提下减少造影剂肾病的发生率。 **方法** 收集本院 400 例行 CT 增强检查患者的临床资料，随机分为两组，分别为注射等渗性造影剂组及注射低渗性造影剂组，又分别分为有高血压组及无高血压组。回顾性分析患者的血肌酐升高水平及造影剂肾病的发生率。 **结果** 在所有受试者中，接受注射等渗性造影剂组 3 天后肌酐升高率较注射低渗性造影剂组肌酐升高率有差别（P<0.05），且等渗性造影剂组的 3 天后肌酐升高均数较低渗性造影剂组的肌酐升高均数低，但两组发生造影剂肾病的概率无显著差别；在有高血压组中注射等渗性造影剂组的患者肌酐升高率与低渗性造影剂组的患者肌酐升高率有明显差别（P<0.05），且注射等渗性造影剂组肌酐升高率均数更低；注射等渗性造影剂组的患者造影剂肾病（CIN）的发生率与注射高渗性造影剂组的患者 CIN 的发生率不构成统计学意义。 **结论** 等渗性造影剂对正常人及有高血压患者的肾功能影响较小，临床使用等渗性造影剂来降低 CT 增强检查造成的肾功能损伤,但未显示等渗性造影剂可降低造影剂肾病的发生率。

PU-3595
放射科影像质量控制方案及持续改进措施

向高居
重庆三峡中心医院

随着科技不断进步，影像诊断智能化，优质的影像是精确的诊断的基石，“影像精准，技术先行”，一直是我们影像技术工作的方向。严把技术质量关，切实做好质量控制。精准医疗依从于精准诊断，而精准诊断依从于精准技术，从细节入手，从差错入手，全面实现信息采集及图形后处理规范化，标准化。做好影像技术的持续改进的常态化，真正实现图像精准，技术先行。
一、实现影像技术的规范化、标准化，统一考核
1、制定并不断完善包括分院在内的 DR、CT、MR 检查标准，
2、实现总院、分院技术质量同质化。统一标准考核、抽查，归档、总结及分析。
3、定期学习，提高技师工作责任心，态度决定影像质量。
二、定期抽查与动态管理相结合
1、质控常态管理：继续开展图像质量缺陷登记和每月质量考核抽查，每月每人抽查不低于 40 份，对差错率较高的前三位，进行重点整改。
2、动态观察质控效果。每月差错率最高的 前 1 名，必须提出改进意见，并在下月的抽查中增加抽查 40 份，直到差错率进入后三名为止。
3、缺陷登记是在审签过程中，发现明显有质量缺陷的图像进行登记，月末收集，与抽查缺陷一起纳入考核，根据考核标准，扣分计入量化考核。由当事技师现场说明差错原因，并提出改进意见。

4、积极收集临床科室反馈意见，每月进行整理，持续改进。
5、学术交流，外出学术会期间，学习新知识，新理念，把新的知识融入到质量管理工作中。提高本科质控管理工作。
6、质控扣分与绩效挂钩，每月底对质控总结，部分绩效纳入质控管理，每一分对应相应比例的绩效扣除，提高技师的责任心。
三、做好质量持续改进
从细节入手，从差错入手，做到差错率真实降低；一是加强业务学习，积极参加我市及全国影像技术学术活动；二是加大与临床沟通，满足临床的需求，对临床的技术要求尽量满足，并且成为一个标准。改善图像质量，达到图像控制目的。影像质量控制工作任重而道远，一直在路上，需要全科同志共同参与，共同提高。

PU-3596
增大螺距在降低下肢 CTV 辐射剂量的应用研究

沈莉
南京市第一医院

摘要 目的 通过增大螺距联合使用低管电压、迭代重建算法及较低剂量的对比剂，研究下肢 CTV(computed tomography venography,CTV)图像质量及辐射剂量的相关研究。方法 选择临床怀疑下肢静脉血栓患者 40 例，随机分为 A、B 两组，每组各 20 例。 A 组扫描方案是标准螺距 1.0，B 组扫描方案是大螺距 1.55，两组扫描方案均采用低管电压 80kv 联合迭代重建算法，并注入较少的非离子型对比剂，记录并分析各组 CT 剂量指数(computed tomography dose index,C T D I)、CT 剂量长度乘积(dose length produce,D L P)、图像噪声(background noise,BN)、图像对比噪声比(contrast to noise ratio,C N R)，测量并分析增强后下腔静脉、髂静脉、股静脉、腘静脉管腔内 CT 值，由两位影像诊断医生采用双盲法分别评价各组 CT 图像主观质量。综合评价增大螺距联合低管电压及迭代重建算法在降低下肢 CTV 辐射剂量的可行性。结果 结论 对首次就诊患者，标准 1.0 螺距可以更全面评估病情，在病情随访复查时推荐使用较大螺距扫描，可以兼顾扫描剂量和图像质量。

PU-3597
Philip 256 排 CT 肺动脉低剂量扫描及低造影剂使用的新型成像方案的研究

肖前焜
四川省第二人民医院

摘要
目的：评价 CT 低剂量扫描及低造影剂使用的新型肺动脉成像方案，以明确能否获得可以满足影像诊断需求的图像。
方法：随机选择 80 例拟行胸部增强 CT 的患者，在获得患者及其家属同意、签署知情同意书后对其加做肺动脉成像。将患者随机分为 4 组，分别为低剂量 A 组、低造影剂 B 组、低剂量低造影剂 C 组及正常扫描对照 D 组。使用的 Philip 256 排 CT 扫描条件为 A 组（120kv，30mAs，80ml 造影剂）、B 组（120kv，100mAs，30ml 造影剂）、C 组（120kv，30mAs，30ml 造影剂）及 D 组（120kv，100mAs，80ml 造影剂），均使用 CAREDose 6，由两名具有丰富诊断经验的影像学诊断医

生进行肺动脉图像质量盲测。两名诊断医生对肺动脉影像学图像质量合格意见一致的即为合格图像。两组之间比较采用卡方检验，P<0.05 时差异具有统计学意义。
结果：A 组合格图像 19 例，B 组合格图像 19 例，C 组合格图像 18 例， D 组合格图像 20 例。A 组与 D 组合格图像比例比较 P>0.05，差异无统计学意义，说明 CT 低剂量扫描不影响肺动脉成像图像质量。B 组与 D 组合格图像比例比较 P>0.05，差异无统计学意义，说明 CT 低造影剂扫描不影响肺动脉成像图像质量。C 组与 D 组合格图像比例比较 P>0.05，差异无统计学意义，CT 低剂量联合低造影剂使用的新型成像方案不影响肺动脉成像图像质量。
结论：临床中可采用 CT 低剂量扫描及低造影剂使用的新型肺动脉成像方案，可满足影像诊断需求的图像。

PU-3598
探讨 CT 血管造影剂复方泛影葡胺对血液透析患者肾功能的损害

郭大志
陆军军医大学附属新桥医院放射科

目的 探讨 CT 血管造影剂复方泛影葡胺对血液透析患者肾功能的损害（To investigate the damage of CT angiographic agent compound meglumine diatrizoate on renal function in patients with hemodialysi）。**方法** 选取 20 例行电子计算机断层扫描血管造影（造影剂为复方泛影葡胺）的血液透析（血透）患者，在检查后一小时内行血常规肾功能检查。**结果** 20 例患者的肌酐值与未行电子计算机断层扫描血管造影前的肌酐值相比明显增高。**结论** 血管造影剂复方泛影葡胺对血液透析患者肾功能的损害明显。

PU-3599
高龄、肾功较差患者采用低浓度、低流率、低总量造影剂扫描

陈丽丽
厦门大学附属翔安医院

个案分析出，对于一些高龄患者，常伴有肾功能差、血管质量差、血压高等症状，这对于一些疾病的增强扫描带来了很大的局限性。为提高临床诊断要求，我们做了 3 例全泌尿系 CTU，采用低浓度、低流率、低造影剂总量同时低辐射剂量扫描，得到清晰完整达到临床进一步检查要求得图像，患者无不良反应，检查后一周肾功、血压等较检查前无改变。

下肢动脉支架置入后支架变形断裂的原因分析及应对策略

高继东,任克
厦门大学附属翔安医院

目的：探讨下肢动脉支架置入术后支架变形断裂的原因及处理方法。**方法：**回顾性分析我科自 2013 年 1 月～2017 年 12 月 209 例通过血 管支架置入术治疗下肢动脉硬化性闭塞症患者的临床资料。依据患者影像学资料及手术记录 ， 归纳整理患者的病变特点，分析支架变形断裂的原因及处理方法等。**结果：**80 例患者置入髂动脉支架共计 118 枚，其中有 1 例患者出现支架塌陷变型，支

架急性血栓形成。下肢股腘动脉 129 例患者共置入血管支架 200 例，6 例患者出现支架变形断**结论：**下肢动脉支架变形断裂的原因主要和动脉病变性质、支架置入位置、数量、支架和周围组织关系、病变血管的血流速度等因素有关，亦和支架本身缺陷相关，处理办法主要包括置管溶栓、球囊扩张、再次支架置入等治疗。

PU-3601
双低剂量结合迭代重建技术在急性脑梗死患者全脑灌注成像中的应用

姚晶晶
西南医科大学附属中医医院

目的：应用低浓度造影剂和低管电压结合迭代重建在急性脑梗死患者全脑灌注（CTP）成像中的对比研究。
方法：选取了 2018 年 2 月至 2019 年 7 月接受全脑 CTP 检查的 100 名患者。患者随机分为 A 组和 B 组.A 组 50 例[管电压，100 kV;造影剂，碘海醇（350 mg I / ml），通过滤波反投影重建]和 B 组 50 例[管电压，80 kV;造影剂，碘克沙醇（270 mg I / ml），通过迭代重建技术重建测量并统计分析两组的动脉 CT 值，信噪比（SNR），对比噪声比（CNR），剂量长度乘积，辐射有效剂量（ED）和脑碘摄入量。两位医生对图像质量评估的一致性进行了 kappa（κ）分析。通过 x 2 测试两组间主观图像质量评价的差异。
结果：两组 CT 值，SNR，CNR，CTP 和 CT 血管造影主观图像质量评价差异无统计学意义（P> 0.05）;两组急性梗死的诊断率无显着差异;而 B 组（双低剂量组）的 ED 和碘摄入量均低于 A 组。
结论：低管电压和迭代重建技术的结合，以及低浓度造影剂的应用（270 mg I / ml）在全脑 CTP 检查中，在不影响图像质量的情况下减少了 ED 和碘的摄入，从而降低了造影剂引起的肾病的风险。

PU-3602
X 线立位胸片架同步开合式屏蔽防护装置的价值研究

郭建雄,温晓琴
宜宾市第三人民医院

目的： 胸片中使用 X 线立位胸片架同步开合式屏蔽防护的价值研究，解决放射检查工作中辐射防护规范要求落实难的问题。
方法：研究制作胸片架同步开合式防护装置，基本结构含同步防护屏框架、头颈部防护屏（包括甲状腺屏蔽凸）、腹部及盆腔防护屏，铅板厚为 1.0mmpb。检测点位分别选择在胸部探测器板投照区中心和探测器周围及防护屏蔽区上、下、左、右，并各设置 1 个兴趣区，其中 1 点区及 1a 区为头颈部屏蔽防护区，2 点区为腹部防护区；先用模具进行未做任何防护前各点位常规标准曝光时的基础辐射剂量的检测，进而再检测使用防护后各点位常规标准曝光时的辐射剂量的检测 600 例，其中穿戴式防护组（对照组）300 例，同步开合式屏蔽防护组（观察组）300 例。在相同投照技术条件下，比较两组患者平均检查时间和兴趣区受到辐射剂量。
结果：1.平均检查时间：观察组明显短于对照组，有显著差异（p＜0.05）。2、兴趣区受到辐射剂量：观察组明显低于对照组，有显著差异（*P*＜0.05）。
结论：自动同步开合式辅助防护装置，操作简便，在有效防辐射同时，缩短患者检查时间，没有对患者、技师检查造成干扰或不便；结构简单，成本低廉，便于制造，利于推广应用；无需穿戴、搬运，不接触患者，消毒处理方便且不易老化，更符合院感控制要求；通过更换不同大小屏蔽板，可

以应用于立位胸片架其它部位投照检查。综上所述，使用立位胸片架同步开合式屏蔽防护装置能有效降低所受到辐射剂量，操作简便，只需一个简单动作就能完成防护，能节省检查时间，解决了日常放射检查工作中辐射防护规范要求落实难的问题，减少辐射对人体危害和减少医疗纠纷，值得在临床推广应用。

PU-3603

高分辨 3D-CE-MRV 在大脑浅静脉成像中的应用价值

黄龙全,许梅海,申炜,黄丽轩,韦洁勤,卢平明,潘洋洋,尹家瑜
南宁市第一人民医院

目的探讨高分辨三维对比增强磁共振静脉造影(3D-CE-MRV)在大脑浅静脉成像中的应用价值。**方法** 34 例行大脑浅静脉检查的患者采用高分辨 3D-CE-MRV 成像，分别对大脑中浅静脉、Trolard 静脉、Labbe 静脉的显示效能进行统计学分析。**结果** 34 例患者检查均获得成功，高分辨 3D-CE-MRV 对大脑中浅静脉、Trolard 静脉、Labbe 静脉显示率分别为 95.59%，95.59%，94.12%。**结论**高分辨 3D-CE-MRV 能提供高质量的大脑浅静脉图像，可为神经外科手术路径的选择提供重要的影像学信息。

PU-3604

3.0T 磁共振 TRICKS 技术在颈动脉成像中的应用研究

黄龙全,许梅海,申炜,卢平明,韦洁勤,潘洋洋,梁慧明
南宁市第一人民医院

目的 探讨时间分辨对比剂动态显像技术（TRICKS）在颈动脉成像中的应用价值，对比分析 TRICKS 和三维时间飞跃法磁共振血管造影（3D-TOF-MRA）在磁共振颈动脉成像图像质量的差异。**方法** 32 例行颈部 MRA 检查患者，采用 TRICKS 和 3D-TOF-MRA 成像。对 TRICKS 及 3D-TOF-MRA 图像颈动脉显示情况进行评分并测算图像的对比噪声比（CNR）。比较 TRICKS 及 3D-TOF-MRA 在扫描时间的差异。2 名医师对 TRICKS 和 3D-TOF-MRA 图像评分情况进行 Kappa 一致性检验，对 TRICKS 及 3D-TOF-MRA 图像评分进行 Mann-Whitney 秩和检验；对 TRICKS 和 3D-TOF-MRA 的 CNR、扫描时间采用 t 检验进行统计学分析。**结果** 2 名医师对颈动脉的评分在 TRICKS 分别为（3.03±0.180）、（3.06±0.181）分，Kappa 值 0.871；在 3D-TOF-MRA 上分别为（2.97±0.180）、（3.00±0.359）分，Kappa 值 0.747。2 名医师的评分结果一致性良好，TRICKS 图像质量评分高于 3D-TOF-MRA，两种方法的结果差异有统计学意义（Z=3.854，P 值均＜0.05）。TRICKS 及 3D-TOF-MRA 的 CNR、扫描时间分别为 13.45±7.75、62.00s 和 10.12±0.87、325.00s，TRICKS 与 3D-TOF-MRA 的 CNR、扫描时间差异有统计学意义（P 均＜0.05）。**结论** TRICKS 较 3D-TOF-MRA 具有更高的时间分辨率，图像质量更好，能更清楚显示颈动脉的解剖结构及病变，可作为颈动脉病变筛查的首选检查方法，但 TRICKS 需要使用钆对比剂，患者危险性及检查费用同时增加。

PU-3605

影像诊断警示录

余日胜
浙江大学医学院附属第二医院

目的：通过分析影像影像诊断医师在临床工作中的常见错误，提高住培医师的防范意识。
材料与方法：分析人体各系统影像学诊断报告投诉情况主要包括胸、腹、骨骼及神经系统诊断中的漏诊即严重错误，从而给患者带来不同程度的精神及机体组织、脏器的伤害，总结如何避免类似错误发生。
结果：
胸部：主要是胸片肺癌漏诊、肋骨骨折，还有纵膈病变的漏诊；
骨肌系统：主要是骨折、脱位漏诊；
腹部：空腔脏器穿孔、血管病变（尤其是肠系膜血管）、肠道肿瘤漏诊；
神经系统：脑膜瘤等疾病漏诊；
报告书写：用词不当，同名不同片（张冠李戴）等。
结论：重视培养住培医师对影像诊断报告中常见错误的发生，有助于住培医师将来在临床工作中的防范能力并提升自信心。

PU-3606

鞍区 CT 扫描及增强规范要点

ZHAO WEI
中国人民解放军总医院第一医学中心

目的：研究鞍区 CT 扫描，使检查更清晰更有针对性，方便临床检查
方法：从本院收治的鞍区 CT 检查患者中，抽取 50 例患者作为研究对象，观察其所拍 CT 图像并询问患者检查过程中相关信息，相互进行对比研究。
结果：少数患者图像对比度不清晰，范围太大或不全面，有些病变不足够突出，而图像特别鲜明的，分析后发现螺距≦1.0，层厚≦2mm ，重建间隔为 50%，基线向上包括鞍区及相应病变位置，增强扫描均是经上肢静脉高压注射含碘对比剂，注射流率 2.5ml /s ~3ml /s ，同时患者能很好的配合医生的指挥。
结论：鞍区 CT 扫描及增强检查必须规范要求，也需按照患者自身情况进行参考值调整，对比剂用量，成人 60～100ml 离子型或非离子型含碘对比剂，儿童按体重计算 2ml/kg

PU-3607

探究儿科 DR 摄影技术及对辐射的防护措施

刘斌
昆明市儿童医院

目的： 探讨儿科 DR 摄影技术及对辐射的防护措施。 **方法：** 抽取本院 2018 年 1 月至 2018 年 12 月间收治的 128 例需要进行 DR 摄影的患儿为研究对象，按照患儿年龄分为两组。对照组 64 例就诊时年龄 1 个月到 1 岁之间，观察组 64 例患儿 1 岁到 10 岁之间，比较 DR 摄影技术对两组患儿的影响，并探讨相关防护措施。 **结果：** 对照组照射中心以及性腺的 ESD 值均大于观察组，差异具有统计学意义（P>0.05），观察组患儿甲状腺部位的 ESD 值大于对照组，差异具有统计学意义

（P>0.05）。**结论：** DR 摄影对各个年龄阶段的儿童具有一定的辐射危害，因此需要针对特定年龄患儿在进行摄影过程中，选择合适的方式进行防护，避免辐射对患者造成伤害。

PU-3608

基于 CIP 管理方法提高住院患者 MR 预约到检准时率

邓婕
南京明基医院

目的：运用 CIP 管理方法来提高住院患者 MR 预约到检准时率。**方法：**CIP 是精益生产思想的精髓和推进精益生产的最有效管理手段，意为不断（Continuous）改进（Improvement）流程（Process）。准时的界定：因 MR 检查需要提前准备，所以在预约排检单上会有提示需提前 10 分钟至放射科登记台报到，以利检查顺利进行。提前预约排程时间前 10min 的为准时。 合理运用 CIP 管理方法可以达到以下效果：1 对患者而言：及时完成各项检查，尽快明确病因；2 对同仁而言：优化工作流程，提高工作效率 3 对院方而言：提升患者满意度，提高设备使用率。所以此次改善重点是患者 MR 检查的准时率。回顾性选取 2018 年 10 月 8 日-2018 年 10 月 22 日 MR 预约情况，将医院病房按楼层进行统计，当前 MR 到检准时率为 68%。按照柏拉图 80/20 原则，选取前 9 名科室作为分析重点。经统计，2018 年 10 月 8 日-2018 年 10 月 22 日做 MR 检查患者男性准时 58 人，迟到 150 人，女性准时 75 人，迟到 145 人，P=0.166>0.05,男女性别上没有显著的相关性。根据科室迟到分布，迟到大于 40 分钟科室主要分布在神经内科，占 61%。按时间段的人次准时率统计准时性在 51%-65%的在 9:45-10：30；13：45-14:30；18:45-20：30，按时间段迟到人数中平均迟到时间统计迟到时间的平均值>30 分钟的主要均集中在上午 8:45-12:30。本次的目标值是运用 CIP 方法将准时率从 68%提升至 84%，增幅为 24%。通过分析迟到真因有主护负责多床病患，事情太多忘记了 ；同一病区的排程时间按常规 15min 间隔；等电梯时间长。**结果：**针对迟到出的 3 种真因制定对策，实施良好，护理人员及 TC 配合度较高，对提高 MR 预约到检准时率效果明显。**结论：**运用 CIP 管理方法将住院患者 MR 预约到检准时率从 68%提升至 82%.

PU-3609

上腹部 CT 增强的个性化研究

胡冬敏
复旦大学附属中山医院青浦分院

目的 根据患者的体质量指数（body mass index，BMI）来制定上腹部 CT 增强时个性化碘对比剂使用剂量的可行性研究。**材料与方法** 实验组（n=40）根据患者 BMI 指数使用个性化的对比剂剂量、流速，并增加 30ml 生理盐水的助推。对照组（n=40）以速率 2.5ml/s 注射 80ml 碘对比剂。测量标准体重、轻度肥胖体重患者在动脉期、门脉期中第一肝门水平腹主动脉、下腔静脉、门静脉的 CT 值，并对对数据进行统计学检验。**结果** 实验组动脉期标准体重、轻度肥胖体重的 CT 值分别为：腹主动脉（236.41±46.62）HU、（227.08±28.94）HU；下腔静脉（101.98±26.47）HU、（121.09±18.10）HU；门静脉（120.13±23.46）HU、（140.82±18.95）HU。实验组门脉期标准体重、轻度肥胖体重的 CT 值分别为：腹主动脉（142.44±21.92）HU、（120.65±18.06）HU；下腔静脉（121.09±18.10）HU、（106.42±16.61）HU；门静脉（140.82±18.95）HU、（124.83±20.49）HU。与对照组对比，标准体重实验组对比剂用量（62.75±6.38 ml），（t=12.090，p=0.000），注射速率（2.08±0.21 ml/s），（t=9.050，p=0.000）；轻度肥胖体重对比剂用量（79.99±7.95 ml），（t=0.007，p=0.994），注射速率（2.65±0.25 ml/s），

（t=2.690，p=0.011）。实验组标准体重者对比剂的剂量明显降低但 CT 值无差异；实验组轻度肥胖者对比剂的剂量基本相同但 CT 值无差异。**结论** 根据个性化的对比剂注射方案，在图像质量一致的情况下，标准体重者对比剂剂量、速率均明显减少，而轻度肥胖者对比剂剂量相同，注射速率提高。

PU-3610
双能量 CT 非线性融合技术对头颈部 CTA 图像质量的影响

宋志双
莆田学院附属医院

目的：头颈部血管病变是脑缺血性或出血性疾病的主要发病原因。头颈部多层螺旋 CTA 无创、快速、便捷，可以较全面地评价脑血管的解剖与变异，且与 DSA 诊断符合率较高，已被广泛用于动脉瘤、动脉畸形、动脉粥样硬化等头颈部血管病变的诊断中。双源双能量 CT 优化对比显示技术近年受到关注，其中非线性融合（NLB）技术作为其独有的图像处理方法，有别于传统的图像线性融合（LB）方式。因此对于接受双能头颈部 CTA 检查的患者，可采用 NLB 技术以改善和提高头颈部 CTA 图像质量。旨在评估 NLB 改善和提高头颈部 CTA 图像质量的临床应用价值。
方法：
1、资料收集：选取院内近一年来对单能量图像不佳或不能满足诊断要求（主观评分≤3 分）的 15 例双能头颈部 CTA 图像。
2、检查方法：采用西门子双源电脑断层扫描仪，患者采用仰卧位，将扫描定位基准线定于听眦线，在摄取正侧位定位图像后，先进行一次正常头颈部 CT 平扫，增强前采用 SmartPrep 法，将监测的感兴趣区置于升主动脉处，同时按下打药与扫描键。层厚 1.0mm，层间距 0.7mm。采用高浓度对比剂碘佛醇注射液（350mg I/ml），流率 4.5ml/s，流量 55ml（数值依人而意），盐水流量 50ml。最终得到 100kV、140kV 两组图像。
3、对比方法：将收集到的影像行 LB 与 NLB 处理，每位患者则有 100kV、140kV、LB 以及 NLB 四组图像，测量并计算 4 组图像颈内动脉床突段、大脑中动脉、基底动脉及脑干的 CT 值、SNR 和 CNR，并由两名有经验的影像科医技师分别对四组图像进行独立盲法评分，采用 5 分标准评价图像质量。
4、统计学方法：对收集的数据进行统计学分析，计量资料以均值±标准差表示，计数资料以百分比表示。对四组图像的 CT 值、SNR 及 CNR 的比较采用重复测量方差分析，P＜0.05 认为差异具有统计学意义。
预期结果：NLB 技术明显改善头颈部 CTA 的图像质量。

PU-3611
基于常规 DWI 和 ZOOMit DWI 技术对甲状腺图像质量的对比评估

何珍珍[1],周清清[1],余玉盛[1],东强[1],段绍峰[2],张宏[1]
1.南京医科大学附属江宁医院
2.通用电气医疗集团

目的:采用常规和 ZOOMit DWI 技术对甲状腺图像质量进行定量评估及主观评价。**方法:**前瞻性分析 61 例甲状腺患者的常规 DWI 和 ZOOMit DWI 图像。定量分析两者在形变(def)、信噪比(SNR)的差异及主观评分。**结果:**甲状腺 ZOOMit DWI 图像较传统 DWI 图像更清晰。ZOOMit DWI 图像的信噪比（signal-to-noise ratio，SNR）显著高于传统 DWI 图像（9.05 vs. 4.81, P<0.001），图像形变（deformation，def）值显著低于传统 DWI 的 def 值（2.53mm vs. 3.14mm, P< 0.001）。两名医

师间主观评分一致性好（Kappa 值分别为 0.702，0.613）。ZOOMit DWI 图像的总评分（平均 231）高于 DWI 图像（平均 127）且每个患者的 ZOOMit DWI 图像评分（平均 3.79 分）均高于 DWI 图像（平均 2.08 分）差异具有统计学意义（$P<0.001$）。**结论:**与传统 DWI 相比，ZOOMit DWI 技术的甲状腺图像 SNR 更高，形变更小，图像与解剖一致，且医师主观评分较高。

PU-3612
心电编辑技术在屏气不佳患者 320 排 CT 冠脉成像中的应用分析

向勇生,史鹰勤,于吉利,吕礼,李臣臣
上海市同济医院(同济大学附属同济医院)

目的：探讨心电编辑技术在 320 排 CT 冠状动脉成像中弥补患者屏气不佳的应用价值。
方法：选取我院行 320 排 CT 冠状动脉血管成像中屏气不佳的患者 30 例，对屏气不佳患者的冠脉图像使用心电编辑技术进行后处理，并进行前后图像质量对比。
结果：统计 30 例患者心电编辑前后可显示右冠状动脉、左主干、左前降支以及左回旋支总数分别为 20/30、27/30、21/30、22/30 支。图像质量采用 4 级评价法。心电编辑前图像质量Ⅰ~Ⅳ级主支分别为 2、44、44、30 支，图像质量符合诊断要求的共 90 支。心电编辑后图像质量Ⅰ~Ⅳ级各主支分别为 59、54、7、0 支，图像质量符合诊断要求的共 120 支。心电编辑前后的影像质量差异均有统计学意义（$p<0.05$）。
结论：心电编辑技术能明显提高屏气不佳患者 320 排 CT 冠状动脉血管成像的后处理图像质量，提高一次性检查成功率。

PU-3613
不同成像参数与肺部结节 CT 图像质量及辐射剂量的相关性研究

彭盛坤,蒲红
四川省医学科学院·四川省人民医院

目的 探讨不同管电压及不同管电流对模拟植入肺部结节的胸部 CT 图像质量及相应辐射剂量的影响。方法 利用仿真人体模型植入模拟四种不同直径大小及每种直径设置三种不同密度共 12 枚结节，在不同管电压及管电流条件下进行分次成像，对结节检出率、结节变形度及图像质量（主观评价及客观评价）进行评价，并记录分次成像辐射剂量，分析成像参数与结节检出率、结节变形度、辐射剂量及图像质量的相关性。结果 在图像质量评价方面，管电压或管电流不变时，图像质量随管电压或管电流的增加而提升（P<0.05）；胸部器官 CT 值评价：管电流不变时，随着管电压增加，椎体 CT 值逐渐降低（P<0.05）；肺野 CT 值差异无统计学意义（P>0.05）。相同管电流 100mAs，不同管电压条件下，高密度（+100HU）肺结节 CT 值差异有统计学意义（P<0.05）；磨玻璃结节（-630HU）肺结节 CT 值差异有统计学意义（P<0.05）；更低密度结节（-800HU）肺结节 CT 值差异无统计学意义（P=0.57）。对于肺结节检出率，在 100kV 及 120kV 条件下，所有管电流结节检出率为 100%；80kV/15mAs 条件下，3mm 结节检出率为 33%，80kV/20mAs 条件下，3mm 结节检出率为 66%。对于肺结节变形度的影响，-630HU 密度结节及直径小于 5mm 结节变异度最大，其差异有统计学意义（P<0.05）。分析不同管电压下图像质量(Y)与辐射剂量(X)的关系，并确立相关性方程：80kV：Y=2.625x+0.038；100kV：Y=14.66x+0.158；120kV：Y=18.59x+0.093。结论 图像质量随管电流及管电压的增加逐渐上升，辐射剂量随管电压及管电流的上升相应增加。适当降低管电压，增加管电流可降低辐射剂量。肺部磨玻璃结节随访 CT 检查，应遵循相同管电压成像参数，从而有效减低结节密度测量的误差，更真实的评估结节的变化。

PU-3614

DTS 单侧和双侧摄影模式下茎突侧位影像的对比

王诗鸣,陆云峰,金瑞,何谐
重庆医科大学附属第一医院

目的：应用头颈部仿真体模评价 DTS（Digital Tomosynthesis，数字断层融合）技术单侧和双侧摄影模式对茎突侧位影像质量的影响。材料与方法：使用 DTS 技术对同一仿真体模茎突的左右两侧标准侧位分别进行扫描，在后处理工作站上根据各单侧原始图像分别重建出左右两侧茎突影像并测出茎突的长度，以 CT 扫描及三维重建测得的茎突长度作为标准值，分析 DTS 各测得值相对标准值的的准确度。结果：经各侧 DTS 摄影原始数据重建出的近侧茎突的长度测量值与 CT 标准值相比分别为左侧偏差 1.8mm，偏差度 8.6%，右侧偏差 1.2mm，偏差度 5.6%，偏差范围均在 2mm 以内，而经各侧 DTS 原始数据重建出的对侧（远侧）茎突的长度测量值与 CT 标准值相比分别为左侧偏差 2.5mm，偏差度 11.9%，右侧偏差 3.4mm，偏差度 15.9%，偏差度均已大于 10%，偏差相对较大。结论：DTS 茎突侧位摄影时应采用双侧摄影模式对两侧分别进行检查，不宜使用单侧侧位原始数据重建出双侧影像。

PU-3615

DR 比赛-有效提高 DR 照片质量的新方法

宋烈军,田碧童,陈金华
重庆医科大学附属第二医院

目的：探讨在日常医疗工作中怎样更好提高普放 DR 照片质量。
方法：从 2018.11 起，我院放射科进行每月一次的 DR 照片比赛，首先制定出优质胸部 DR 片的标准，然后规定当月在普放上班的职工必须参加，当月没在普放上班的职工（当月在 CT 及 MRI 上班的）可以自愿参加。每月月底前报出当月自己照的 5 个胸部 DR 号，评比的时候从 5 个号中随机抽取 1 个参加评比。每月评出前三名。对获奖者给予不错的奖励。对报名情况及获奖情况定期进行公示。
结果： 经过几个月的胸部 DR 比赛，我院放射科胸部 DR 照片质量得到了明显提高，取得了满意的效果。
结论：我院每月进行的 DR 比赛规定在普放上班的职工每人都必须参加，获奖者有不错的奖励，提高了大家注重工作质量的积极性；对报名情况定期公布，从另一方面又促使大家积极参加这项比赛，并尽可能地按照赛前制定的优质 DR 标准来认真进行每一个病人的检查。所以照片质量自然就提高了。

LIPO 技术在肾脏 DWI 的应用价值

武敬君[1],刘爱连[1],王家正[2],崔达华[1],陈丽华[1]
1.大连医科大学附属第一医院
2.飞利浦

目的：研究 LIPO 技术在肾脏 DWI 成像中的应用价值。
方法：前瞻性收集 10 名健康受试者（平均年龄 28.7±2.15 岁），所有受试者采用 3.0T MR 扫描（Ingenia CX，Philips）对肾脏进行扫描。首先关闭 LIPO 技术，仅仅行 DWI 常规扫描（b 值= 0,1000,2000），随后在 DWI 扫描（b 值= 0,1000,2000）的同时采用 LIPO 技术。所有图像分析均在 IntelliSpace Portal（Philips）上进行。两名放射科医师将 ROI 分别置于右肾的上，中，下极的肾皮质和髓质以及相同水平的腰大肌，计算 ADC 值，信噪比(SNR)和对比噪声比(CNR)。使用 Friedman 检验分析来自不同序列的图像之间的 ADC 值，SNR 和 CNR 值。

结果：在肾髓质及肾皮质的中极，DWI（b 值= 0,1000,2000）联合 LIPO 技术能够显著提升图像质量（SNR 和 CNR 均显著升高）。其肾上，中，下极的平均 SNR 和 CNR 也显着升高（P <0.05）（表 1 和 2）。 LIPO 技术对 DWI 成像的 ADC 值无统计学意义（表 3）。
结论：LIPO 技术能够显著提升肾脏 DWI 成像的图像质量，而对于测量的 ADC 值无显著影响。

PU-3619
轻度阿尔茨海默病患者静息态脑默认活动网络的 fMRI 研究

席芊,赵小虎,王培军
同济大学附属同济医院

目的 采用静息态功能磁共振（fMRI）技术，探讨轻度阿尔茨海默病（AD）患者的脑默认活动网络（DMN）是否存在异常及其可能的神经机制。
方法 对 24 名轻度 AD 患者和 25 名正常老年人（NC）进行简易智能状态检查（MMSE）、Mattis 痴呆评定量表（DRS）和静息态脑功能成像。利用低频振幅算法（ALFF），采用双样本 t 检验，以 P<0.01 水平对全脑静息态数据进行对比分析，观察 AD 患者相对于正常老年人 ALFF 有显著差异的区域。
结果 行为学结果：本组轻度 AD 患者与 NC 组比较，记忆功能存在明显损害。静息态 fMRI 结果：与 NC 组比较，AD 患者与记忆密切相关的后扣带回、前额叶中内侧腹侧、前额叶中内侧背侧等脑区 ALFF 明显减弱。
结论 AD 患者静息态 DMN 与记忆密切相关的脑区结点活动强度减弱，DMN 异常在其早期记忆损害的病理机制中起着非常重要的作用。

PU-3620
能谱 CT 对提高肝门静脉与肝静脉关系成像质量的研究

柳维娜
首都医科大学附属北京世纪坛医院

【摘要】目的：应用 8-cm 宽体探测器能谱 CT，探讨能谱增强扫描技术对提高肝门静脉与肝静脉成像质量的应用价值。材料和方法：随机选取行腹部能谱增强扫描患者 30 例，采用 8cm 宽体探测器 CT(Revolution,GE Healthcare,美国)扫描仪，能谱肝脏扫描模式，动脉期扫描时间采用对比剂追踪技术监测,动脉期结束 40S 后进行门脉期扫描。利用 GSI Viwer(GE AW4.7)软件处理肝门静脉期图像，分别得到 120 kvp-like 的图像和最佳单能量图像，多平面重组（MPR）,最大密度影（MIP）和容积再现（VR）后处理。选取感兴趣区（ROI）,分别测量两组数据中肝门静脉和肝实质 ct 值，竖脊肌的 ct 值和 std，用于计算门脉主干和肝实质的对比噪声比（CNR=肝门静脉 CT 值-肝实质 CT 值/竖脊肌的 std），同样的方法测量肝静脉和肝实质的 CNR,并由两名 10 年以上腹部影像诊断经验的医师在盲法条件下对重建图像进行主观图像评分。比较采用独立样本 t 检验，两名医师对重建图像质量一致性评估采用 Kappa 检验。结果：肝门静脉期门静脉与肝静脉最佳 CNR 单能图像能量水平集中在 55kev。最佳 CNR 图像上门静脉 CT 值.肝静脉 CT 值.肝实质 CT 值.竖脊肌的 std 值.门静脉-肝实质最佳 CNR，肝静脉-肝实质最佳 CNR，图像噪声均高于 120kvp-like 图像，两者间的差异有统计学意义（P<0.01）两名医师对最佳 CNR 单能重建图像评价一致性（Kappa 值为 0.683）高于 120 kVp -like 图像(Kappa 值为 0.452)；两组图像质量评分分别是（4.36±0.79）分和（3.24±0.57），差异有统计学意义（P<0.01）结论：应用 8-cm 宽体探测器能谱 CT 肝门静脉增强扫描，最佳单能量图像能比 120kVp-like 图像，明显提高了肝门静脉和肝静脉关系成像质量。

3.0T MR 多期动态增强扫描在肾脏肿瘤诊断中的价值

许晓雯,王培军
同济大学附属同济医院

目的 评价 3.0T MR 多期动态增强扫描（DCE-MRI）在肾脏肿瘤良恶性及不同病理组织学类型之间鉴别诊断的价值。
方法 15 例正常志愿者及 46 例经病理证实的肾脏肿瘤患者（其中肾透明细胞癌 18 例，乳头状肾细胞癌 8 例，肾嫌色细胞癌 7 例，肾血管平滑肌脂肪瘤 13 例）均行 3.0T DCE-MRI。采用单因素方差分析方法比较 DCE-MRI 所得 K^{trans}、K_{ep}、V_e在不同病理类型肾脏肿瘤之间的差异，应用 ROC 曲线评价 DCE-MRI 对于鉴别肾脏肿瘤良恶性的诊断价值。
结果 应用 DCE-MRI 得到正常肾实质的时间-信号强度曲线（SI-T 曲线）呈速升平台型，肾脏良性肿瘤的 SI-T 曲线呈上升平台型，而恶性肿瘤的 SI-T 曲线呈速升流出型。正常肾实质与各病理类型肾脏肿瘤之间 K^{trans}、K_{ep}及 V_e值差异均有统计学意义。肾脏各组恶性肿瘤的 K^{trans}值及 V_e值均高于良性肿瘤（P＜0.05），恶性肿瘤中，仅肾透明细胞癌的 K_{ep}值高于良性肿瘤（P＜0.05）。肾恶性肿瘤中，肾透明细胞癌、肾乳头状细胞癌及肾嫌色细胞癌的 K_{trans}值差异均具有统计学意义（P＜0.05）。肾透明细胞癌的 V_e值（0.42±0.08）高于肾乳头状细胞癌 Ve 值（0.29±0.14）（P＜0.05）。运用 ROC 曲线评估 DCE-MRI 鉴别肾脏肿瘤良恶性的诊断价值， K^{trans} AUC=0.937，灵敏度和特异度分别为 87.9%和 85.7%，临界值为 0.38/min； V_e AUC=0.803，灵敏度和特异度分别为 78.8%和 71.4%，临界值为 0.29/min；K_{ep}则表现出较低的鉴别诊断价值(0.564)。
结论 3.0T MR 多期动态增强扫描（DCE-MRI）能有效鉴别肾脏肿瘤良恶性及不同病理组织学类型，其中 K^{trans}值的诊断价值最高。

基于脑 CT 灌注评估头颈部动脉狭窄

许云,王培军
同济大学附属同济医院

目的:应用 320 排 CT 一站式 CTA-CTP 动态容积灌注成像技术，探讨头颈部动脉狭窄的脑血流动力学改变，分析头颈部动脉狭窄程度与脑灌注成像表现的关系。
方法:163 例经颈动脉 CTA 或 CE-MRA 及头颅 CTA 诊断为单侧颈动脉系统狭窄的患者纳入本研究中。所有患者均行脑 CTP 检查。经灌注后处理软件，分别得到相对脑血流量（rCBV）图、达峰时间（TTP）图、相对脑血流量（rCBF）图、平均通过时间（MTT）图及灌注参数值。根据头颈部动脉狭窄程度将头颈部动脉分为轻、中及重度狭窄组，对各组灌注表现进行定性和定量研究，分析各灌注参数中的敏感性指标；分析单侧头颈部动脉狭窄程度与灌注参数的相关性。
结果:80 例颈内动脉狭窄患者纳入本研究，年龄 44-90 岁。其中轻度组 25 例，男 15 例，女 10 例。中度组 41 例，男 28 例，女 13 例。重度组 14 例，男 8 例，女 6 例。83 例大脑中动脉狭窄患者纳入本研究，年龄 44-90 岁。轻度组 46 例，男 30 例，女 16 例。中度组 12 例，男 5 例，女 7 例。重度组 25 例，男 10 例，女 15 例。组间年龄、性别及患有高血压、糖尿病患者比例差异均无统计学意义（P>0.05）。各组间灌注参数图的定性、定量诊断显示，共 21 例颈内动脉狭窄和 33 例大脑中动脉出现灌注异常，颈内动脉狭窄患者患、健侧 TTP 差异有统计学意义（P<0.05），大

脑中动脉狭窄患者患、健侧 rCBV、MTT、TTP 差异有统计学意义（$P<0.05$），颈内动脉狭窄程度与患、健侧 rCBV 增加率、rCBF 增加率、MTT 增加率无相关性($P>0.05$)，与患、健侧 TTP 增加率有相关性（$P<0.05$）。而大脑中动脉狭窄程度还与患、健侧 rCBV 增加率、MTT 增加率有相关性（$P<0.05$）。

结论:CTP 是评价颈动脉系统狭窄后脑组织血流动力学改变的敏感方法，其中 TTP 是评价脑灌注异常的最敏感指标，与动脉狭窄程度呈正相关。

PU-3623

Myocardial Blood Flow Analysis of Stress Dynamic Myocardial CT Perfusion for Hemodynamically Significant Coronary Artery Disease Diagnosis: The Clinical Value of Relative Parameter Optimization

Yan Yi,Cheng Xu,Yining Wang,Zhengyu Jin
Peking Union Medical College Hospital

Objectives To investigate the optimal relative parameter of quantitative myocardial blood flow (MBF) on dynamic myocardial CT perfusion (CTP) for the detection of hemodynamically significant coronary artery disease (CAD).

Methods: A total of 86 patients who were prospectively recruited underwent adenosine triphosphate-stress dynamic myocardial CTP. The MBF value was measured by a manually drawn volume of interest (VOIs) on the MBF color-coded polar maps with perfusion defects of vessel-based territory. The relative MBF perfusion parameters were then calculated as Ratio1, Ratio2 and Ratio3 according to the three types of reference MBF values, respectively: 1) average segmental MBF value, 2) 75th percentile of the average segmental MBF value, and 3) highest segmental MBF value. All the data were derived from both the endocardial and transmural layers of the myocardium. Invasive coronary angiography and fractional flow reserve (ICA/FFR) were used as the reference standards for myocardial ischemia evaluation.

Results: 151 vessels of 60 patients (43 men and 17 women; 61.38±8.01 years) were enrolled in the analysis. The performance of endocardial layer was superior to that of the transmural layer (all P <0.05). The Ratio3 of endocardial myocardium (AUC=0.906, 95% CI: 0.857-0.954), for which the highest segmental value was selected as the reference MBF, was superior to both Ratio1 and Ratio2 for ischemia detection (AUC, 0.906 vs. 0.879, P <0.05; 0.906 vs. 0.891, P =0.18), and the sensitivity, specificity, PPV, NPV and diagnostic accuracy were 74.1%, 93.6%, 87.8%, 85.3% and 86.1%, respectively. The cutoff value of Ratio3 was 0.675.

Conclusions: The relative MBF parameter of the endocardial myocardium using the highest segmental MBF value as a reference provided optimal diagnostic accuracy for the detection of hemodynamically significant CAD.

PU-3624

基于脑 CT 灌注评估头颈部动脉狭窄后侧支循环情况

许云,王培军
同济大学附属同济医院

目的:应用 320 排 CT 一站式 CTA-CTP 动态容积灌注成像技术，探讨头颈部动脉狭窄后脑血流动力学改变与侧支循环关系。
方法:92 例经颈动脉 CTA 或 CE-MRA 及头颅 CTA 诊断为单侧颈动脉系统中重度狭窄的患者纳入本研究中，收集患者的临床基本信息资料及影像学检查资料。所有患者均行脑 CTP 检查。经灌注后处理软件，分别得到相对脑血流量（relative cerebral blood volume，rCBV）图、达峰时间（time to peak，TTP）图、相对脑血流量（relative cerebral blood flow，rCBF）图、平均通过时间（mean transit time，MTT）图及灌注参数值。将颈内动脉组和大脑中动脉狭窄组按侧支循环分级分为良好组和不良组，分析两组间 CTP 增加率的变化。
结果:将颈内动脉（55 例）和大脑中动脉（37 例）中重度组患者根据侧支循环分级分为良好组和不良组。颈内动脉侧支循环良好组 41 例，不良组 14 例；大脑中动脉良好组 15 例，不良组 22 例。组间年龄、性别及患有高血压、糖尿病患者比例差异均无统计学意义（$P>0.05$）。
当 ICA、MCA 中重度以上狭窄时，侧支循环不良者发生 CTP 阳性概率增加。比较各组组间 CTP 参数增加率，rCBV 增加率、rCBF 增加率及 MTT 增加率差异无统计学意义（$P>0.05$），TTP 增加率差异有统计学意义（$P<0.05$），说明侧支循环不良者，TTP 增加率较高
结论:CTA 或 CE-MRA 联合 CTP，可直观显示血管狭窄部位、程度及责任血管供血区的血流动力学情况，评价侧支循环情况，可综合评价颈动脉系统狭窄对个体的影响，对临床个体化治疗具有重要意义。

PU-3625
头颈部动脉粥样硬化斑块周围血流动力学改变的研究

许云,王培军
同济大学附属同济医院

目的：血流动力学因素在动脉粥样硬化斑块的形成和发展中起到重要作用。计算流体力学(CFD)可以显示和分析动脉狭窄处血液动力学状态，近年来常被应用于血管疾病中。本研究拟应用计算机数值模拟技术，对特定的头颈部动脉粥样硬化斑块进行血流动力学研究，观察头颈部动脉粥样硬化斑块周围血流动力学分布，探讨颅内动脉粥样硬化患者斑块周围血流动力学改变与脑组织灌注的关系。
方法：17 例经头颈动脉 CTA 诊断为颈内动脉中重狭窄及 10 例经颈动脉 MRA 及头 CTA+CTP 诊断为大脑中动脉中度狭窄的患者纳入本研究中，所有血管均行 CFD 后处理，得出壁面切应力（WSS）、血流速度、管壁压力（pressure）、血流储备分数（FFR_{CFD}）等参数值，其中大脑中动脉狭窄患者均行 CTP 检查。经灌注后处理软件，分别得到 CTP 的 rCBV 图、TTP 图、rCBF 图、MTT 图及灌注参数值。
（1）分析 CFD 结果，比较颈内动脉中重度狭窄组与 WSS、血流速度、pressure、FFR_{CFD} 等值之间的关系；
（2）分析大脑中动脉狭窄处与正常血管的血流动力学变化情况，分析大脑中动脉中度狭窄患者脑灌注异常与 CFD 各参数的相关性。
结果：（1）对于 17 例颈内动脉狭窄患者进行 CFD 模拟血流动力学，发现颈内动脉狭窄程度与 WSS、、血流速度、FFR_{CFD} 差异有统计学意义（$P<0.05$）。

（2）10 例大脑中动脉狭窄患者较对侧正常血管，WSS、血流速度、pressure 差异均有统计学意义（$P<0.05$）。10 例患者中 CTP 阳性组（6 例）较阴性组（4 例），WSS、血流速度、pressure、FFR_{CFD}均较大，其中 WSS 差异具有统计学意义（$P<0.05$）。

结论：头颈部动脉粥样硬化狭窄伴有明显的血流动力学改变，血流壁面切应力的增加可能是引起颅内动脉粥样硬化斑块破裂的危险因素。

The application of 3D-STIR-SPACE sequence in the display of the anatomical structure of the seminal tracts in adults.

Jiayi Chen,Chuntao Ye,Shihong Li,Chenhui Hong,Xiaodong Zheng,Guangwu Lin
Huadong Hospital Affiliated to Fudan University

【Abstract】**Objective** To explore the value of 3D-STIR-SPACE sequence in displaying the anatomical structure of the seminal tracts. **Methods** Retrospectively collected data of adult male patients who underwent pelvic magnetic resonance imaging in the MRI Room of Huadong Hospital affiliated to Fudan University from November 2016 to March 2019. The complete 3D-STIR-SPACE sequence image data was scanned and the scope of the scan covered the vas deferens and seminal vesicles. There were 58 cases of gland, ranging from 29-87 years old, divided into two groups according to age: younger group (≤60 years old) and older group (>60 years old), including 22 cases in the younger age group and 36 cases in the old age group. The image quality was evaluated by the thin-layer MPR and curved surface reconstruction technique after MIP reconstruction, and the display of the pelvic pelvic segment, the posterior peritoneal segment and the seminal vesicle. The maximal slice diameter of the prostate capsule can be measured by thin section MIP reconstruction of the coronal, transverse and sagittal. **Results** For the posterior peritoneal and ampullary segments of both sides of the vas deferens, curved surface reconstruction was superior to cross-sectional reconstruction, and the difference was statistically significant ($P < 0.05$). The image quality scores of the ampulla and seminal vesicle of the lower age group were slightly lower than those of the older age group ($P < 0.05$). The range of diameter in three orientations of prostate follicle size were 6.31±3.53mm、8.30±3.25mm、8.94±3.61mm, respectively . **Conclusion** 3D-STIR-SPACE sequence can clearly display the fine structure anatomy of the seminal vesicle, the ampullary segment of the vas deferens, the posterior peritoneum, and the prostate vesicle. This technique is good for fine anatomical display of seminal duct and can provide information for surgery in clinical practice.

Donabedian 三维质量结构理论在肺动脉 CT 血管造影检查中的应用效果探讨

喻瑶瑶
陆军军医大学第二附属医院（新桥医院）

目的 探讨 Donabedian 的结构-过程-结果三维评价模式在肺动脉血管 CT 造影中的应用。**方法** 以 2017 年 6 月~2017 年 12 月临床疑似肺栓塞且需要进行 CTPA 的患者 218 例为观察对象，随机分为两组，对照组通过常规的检查模式进行检查。观察组根据 Donabedian 的三维质量评价理论为指导，为肺动脉 CT 血管造影患者提供安全和系统的检查模式。比较两组病人图像质量，对比剂肾病和造影剂外渗发生率。**结果** 应用结构-过程-结果质量评价模式进行质量控制的患者图像质量高于对照组，对比剂肾病发生率和造影剂渗漏发生率均低于对照组。**结论** Donabedian 的三维质量评价模式的应用通过完善环节质量标准，可有效的提高患者图像质量和护理满意度并降低不良事件发生率。

T1-vibe-cor 序列大动脉搏动伪影去除探究

艾光勇
重庆医科大学附属第二医院

目的：探究 T1-vibe-cor 序列大动脉搏动伪影去除技巧
方法：以厂家推荐参数为基础（TR5.66，TE2.12），在保证其他参数不变的情况下，设置 3 套扫描参数方案。方案一，TR 保持不变，TE 以 0.2 位梯度上下各设置 5 个值；方案二，TE 保持不变，TR 以 0.5 为梯度上下各设置 5 个值；每种方案分别收集 10 例 100 组数据；得到的图像进行 A、B、C、D 四级评分；方案三，取方案一和二中，A 级图像扫描参数，收集 40 例病例。同时计算 A、B 组图像大动脉处对比噪声比，数据结果进行配对 t 检验。
结果：方案一中 A 级 55 例，B 级 20 例， C 级 20 例，D 级 5 例，方案二中 A 级 45 例，B 级 25 例，C 级 24 例，D 级 6 例。方案三中 A 级 39 例，B 级 1 例。图像大动脉处对比噪声比检验结果，t=0.053，差异无统计学意义。
结论：T1-vibe-cor 在 TR 为 4.16ms,TE1.12ms 时图像 A 级比例最大。推荐使用该参数进行图像采集，以确保图像质量。

不同 C-FLIPL 表达水平下 TIL 密度对结肠癌患者预后影响的研究

郭轶群
广州市妇女儿童医疗中心

目的：分析在不同 c-FLIP$_L$表达水平下 TILs 和患者总生存时间之间的关系。
材料与方法：收集在中山大学肿瘤医院就诊的 180 例经病理学证实为 IIIB 期(T3N1M0, AJCC, 第 7 版)的结肠癌患者标本。用免疫组化方法检测肿瘤组织中 c-FLIP$_L$ 的表达以及 TILs 的密度。分析 TILs 以及患者预后的关系。然后进一步分析在不同 c-FLIP$_L$ 表达水平下 TILs 和 患者预后之间的关系。**结果：**1.不考虑 C-FLIP$_L$的影响，CD8+和 CD45RO+ T 细胞的高表达与较好的 OS 相关，而 Foxp3+与较差的 OS 相关。2. 在 c-FLIP$_L$ 高表达组，CD8+ 和 CD45RO+T 细胞高表达或 Foxp3+T 细胞低表达与较短的 OS 相关；而在 c-FLIP$_L$ 低表达组，CD8+和 CD45RO+T 细胞 高表达或 Foxp3+T 低表达与较长的 OS 相关。**结论：**在某些特定的肿瘤遗传背景下，“免疫抑制”可能也发挥抗肿瘤效应。本课题的结果将为结肠癌的精准免疫治疗提供参考。

比较 CAIPIRINHA-based CISS 和 CISS-3d 序列在三叉神经脑池段的图像质量

孙晓清[1],续凯[2],张孟超[1],柳林[1]
1.吉林大学第三医院(中日联谊医院）
2.青岛市立医院

目的：
在相同扫描参数下，比较基于可控混叠的快速并行成像（Controlled Aliasing in Parallel Imaging Results in Higher Acceleration CAIPIRINHA）加速的稳态进动快速成像序列与传统三维稳态进动快速成像序列（CISS-3D）对三叉神经脑池段成像的图像质量。
材料与方法：

对 14 例正常志愿者、40 位患有三叉神经痛患者分别采用应用基于可控混叠的快速并行成像加速的稳态进动快速成像序列（CAIPIRINHA-accelerated CISS）与传统三维稳态进动快速成像序列（CISS-3D）对三叉神经脑池段进行扫描并对两种序列的成像质量进行统计比较。比较的方法包括定性分析和定量分析，定性分析由两位大夫采用三分法对所有实验对象的核磁图像包括三叉神经节显示、周围解剖结构、伪影等方面进行独立主观评分；定量分析包括测量图像的信噪比（SNR）、对比信噪比（CNR）及三叉神经脑池段长度、宽度、角度（三叉神经脑桥角）、桥小脑角池截面积等形态学变化指标。
结果：
利用 SPSS 软件对两种序列图像的定性及定量数据进行分析，两种序列的成像质量无明显统计学差异（P<0.05）。
结论：
与传统三维稳态进动快速成像序列（CISS-3D）相比，基于可控混叠的快速并行成像加速的稳态进动快速成像序列（CAIPIRINHA-accelerated CISS）在不降低图像质量的前提下，可以显著缩短扫描时间。

PU-3633
“云胶片”时代自助打印机解决方案应用前景分析

张炜
华中科技大学同济医学院附属协和医院

【摘 要】 目的 讨论自助打印机解决方案在放射科的临床应用价值及前景分析。**资料与方法** 收集我院本部和西院区自助打印机终端 21 台设备信息，其中锐科 9 台（*型号：KIOSK II 6 台*、*MyVue Center III 3 台*）、爱克发 7 台（*型号：*DRYSTAR Kiosk5503+)、科多尼克 4 台(*型号：*Codonics Kiosk-F）。分析自助打印机终端故障成本、人力成本及应用时效性与传统的人工模式、未来互联网+数字影像—云胶片解决方案对比，分析数字胶片各阶段从局部实现到全面解决的一整套的构造方案，实现与 PACS 系统并集成 HIS/RIS 系统的无缝相连以及完整的工作信息流。 **结果** 自助打印机在放射科发挥着重要的作用。自助打印解决方案实现和解决了医院放射科胶片的电子化存档及按需打印：电子胶片的统一存储和管理；规范的、数字化的工作流程提高工作效率；按需打印降低了由于弃片导致的浪费及节省大量的人力成本。**结论** 医疗机构应用互联网等信息技术拓展医疗服务空间和内容，构建覆盖诊前、诊中、诊后的线上线下一体化医疗服务模式，数字影像—云胶片是诊疗介质未来的发展方向。但现阶段从事云胶片服务的企业和单位来说，资质审核、存储时限保证的要求、数据安全和患者隐私保护等等都是待解的问题。自助打印解决方案秉承着检查技师现有工作流程和临床医生观片的习惯等一系列的优势，在一段时间内自助打印机仍发挥着不可替代的重要作用。

应用 3D mDIXON Quant 测量胰腺体积:单层 ROI 画取叠加容积测量技术与 3D 提取技术的比较研究

张钦和[1],刘爱连[1],王家正[2]
1.大连医科大学附属第一医院

2.飞利浦医疗公司

目的：应用单层 ROI 画取叠加容积测量技术和 3D 提取技术，评价胰腺体积测量的一致性和操作时间。
材料与方法：前瞻性纳入 11 名志愿者（男 4 例，女 7 例，平均年龄 24.91±1.64 岁，年龄范围 22—27 岁，BMI 为 17.71—28.73kg/m^2，平均 BMI 为 21.75±3.35 kg/m^2）。所有患者行 3.0T 磁共振扫描仪（Ingenia CX, Best，the Netherlands）3D mDIXON Quant 序列扫描。扫描参数如下:FOV=375mm×300mm×168mm, TR=6ms，层厚及层间距=5.0mm/2.5mm,CS=2，Echo=6。应用单层 ROI 画取叠加容积测量技术和 3D 提取技术在 ISP 工作站进行胰腺体积测量。记录测量时间。数据经 SPSS 19.0 处理。用组内相关系数(ICC)检验两种技术测得数据的一致性。采用 Mann-Whitney U 检验分析两种技术测量时间的差异。
结果：两名观察者数据一致性良好，ICC 值分别为 0.880、0.908。两种技术所测得胰腺体积（cm^3）分别为 58.50±6.42、55.98 ±9.19 ，一致性良好（ICC=0.701）。两种技术测得胰腺体积所需时间分别为 8.14±0.84、5.14±0.60，差异具有统计学意义(P<0.001).
结论：两种技术所测得胰腺体积一致性良好，但 3D 提取技术的操作时间明显小于单层 ROI 画取叠加容积测量技术。因此，3D 提取技术可能更适用于胰腺体积的测量。

Assessment of AI-assisted lung nodule detection for long-axis diameter <4mm nodules using different reconstruction kernels

Dandan Sun
Affiliated Zhongshan Hospital of Dalian University

OBJECTIVE: To evaluate the performance of AI-assisted detection of long-axis diameter <4mm lung nodules using different reconstruction kernels.
METHOD AND MATERIALS: A total of 183 patients who underwent routine chest CT examinations at Zhongshan Hospital affiliated to Dalian University from January 1, 2019 to January 31, 2019 were collected. The raw data were reconstructed with high resolution kernel (B70f) and standard kernel (B30f) to obtain DICOM images and they were transferred to the AI server (InferRead CT Lung Research, Infervision, Beijing, China) for automated nodule detection. The number of nodules, long-axis diameter and locations were recorded. One senior radiologist with more than 10 years' experience read CT images based on the initial diagnosis of another senior radiologist with similar experience and a final decision was subsequently conducted by deputy chief radiologist with more than 15 years' experience to determine the ground truth lung nodules. All readings for ground truth were performed on 1 mm slice thickness CT images with the assistance of AI software. The number of true positive nodules, false positive nodules under different reconstruction kernels were compared with the gold standard to calculate sensitivity and false positive rate. Finally, statistical analysis was conducted to compare the difference of sensitivity and false positive rate between the two reconstruction kernels.
RESULTS: A total of 984 long-axis diameter <4mm nodules were confirmed to be gold standard nodules. The number of true positive nodules in B70f group and B30f group were 792 and 662, respectively. The numbers of false positive nodules were 103, and

189, respectively. The sensitivity for lung nodule detection were 0.875±0.286 and 0.714±0.5 for B70f and B30f groups, respectively with statistically significant difference. The false positive rates were 0.56/CT and 1.03/CT, respectively for B70f and B30f groups, respectively with statistically significant difference.
Conclusion: The sensitivity for AI-assisted long-axis diameter <4mm nodules detection was higher for B70f reconstruction than B30f. And the false positive rates for AI-assisted long-axis diameter <4mm nodules detection was lower for B70f reconstruction than B30f.

肾脏 3D 酰胺质子转移成像：可重复性研究

崔达华[1],刘爱连[1],王家正[2],武敬君[1],陈丽华[1]
1.大连医科大学附属第一医院
2.飞利浦（中国）

目的：评价 3D 酰胺质子转移（APT）成像技术应用于健康肾脏的可重复性
材料与方法：前瞻性招募 10 名健康志愿者（年龄 22-35 岁，平均年龄 28.7±2.15 岁；男性 5 名，女性 5 名），采用 3.0T MR 仪（Ingenia CX, Philips），使用 3D TSE 序列（TR/TE = 7300/8 ms, FOV = 180×220×42 mm^3，分辨率= 2×2.3×6 mm^3，扫描时间= 4:30）对所有志愿者的双侧肾脏进行扫描。两名放射科医师分别将圆形 ROI 置于双肾的上、中、下极的肾皮质和髓质（图 1），计算平均 APTw 值。使用组内相关系数（ICC）对两名放射科医师测量结果的一致性进行检验。
结果：两名放射科医师对受试者双肾（右肾皮质、右肾髓质、左肾皮质、左肾髓质）的非对称磁化转移率（MTRasym）（中位数(P25, P 75)）进行测量，分别为放射科医师 1：1.12 (0.18,1.54)；1.56 (0.67,2.33)；1.23 (0.63,2.39)；2.09 (1.74,3.36)；放射科医师 2：1.34 (0.17,1.97)；1.59 (0.66,2.27)； 1.39 (0.75,2.28)；1.82 (1.58,3.54)。两名放射科医师测量 MTRasym 的组内相关系数分别为 0.982、0.989、0.933、0.977（表 1）。
结论：APT 成像技术可应用于健康肾脏的不同部位的定量测量，实验具有可重复性，不同观察者之间的组内一致性良好。

PU-3637

追踪定位技术：一种保证多次波谱扫描可重复性的方法

张敏,王培军
同济大学附属同济医院

目的 基于图像的配准信息，提出一种自动重定位感兴趣体素（VOI）的方法，提高重定位的准确性和效率，并降低对操作者的依赖性。
方法 将医学图像的配准方法应用于磁共振波谱的研究过程中。每次采集磁共振波谱数据前，均采集一高分辨结构像。将后续扫描时的结构像与第一次扫描的结构像进行配准，获取被试的位置变动信息，计算得到波谱扫描 VOI 的定位信息，以此完成定位，得到理想位置的波谱数据。为了对定位方法进行评估，选取 20 名被试在 3T 磁共振仪上进行多次扫描，其中后续扫描分别通过手动定位和追踪定位两种方法进行重定位。我们通常用体素的重合率和波谱含量的差异系数(CV)来评价重定位方法提高波谱测量结果可重复性的效果。按照组织类型的不同对 VOI 内的脑区进行分割并记录灰白质的含量，以此计算体素重合率。分别计算 NAA、Cr、Cho、NAA/Cr 和 Cho/Cr 的 CV 值，CV 通过公

式 CV=100*SD/mean 计算出来，其中 SD 代表每组数据的标准差，mean 代表每组数据的平均值，平均 CV 作为衡量化合物含量以及含量比值的可重复性的指标。将两种定位方法所得结果进行比较。**结果** 利用追踪定位技术得到的 VOI 与初始定位的 VOI，体素内白质和灰质的重合率分别为 98%和 94%，体素内化合物含量及含量比值的差异性系数分别为 NAA 1.84±2.11, Cho 2.73±2.45, NAA/Cr 1.99±1.54, Cho/Cr 1.55±1.38，与连续两次扫描所得差异性系数接近，符合文献报道连续扫描的合理范围。

结论 本文提出的方法能够有效地提高重定位的准确率和定位效率，对于身体不灵活，不能严格配合摆位要求的病人同样适用，保证了纵向研究的可行性，同时降低了对操作者的依赖性，减少了主观性的误差。

PU-3638
侧脑室内注入脑源性神经营养因子（BDNF）对 AD 小鼠 酪氨酸激酶（TrkB）及内源性 BDNF 表达的影响

张炜,王培军
同济大学附属同济医院

目的 探讨侧脑室内注入脑源性神经营养因子(BDNF)对 APP/PS1 双转基因阿尔茨海默病小鼠酪氨酸激酶 B(TrkB) 及内源性 BDNF 表达的影响。

方法 10 月龄 10 只 APP/PS1 小鼠随机分为两组，一组双侧侧脑室内注入 BDNF，另一组注入 PBS，为阴性对照组，时间均为 6 周，5 只 10 月龄野生型小鼠，不予任何处理，为阳性对照组；采用荧光免疫组化法观察小鼠皮层区 Aβ 斑块形态学改变，硫磺素 S 法(Thioflavin staining)检测致密斑的数量，同时检测小鼠皮层区 TrkB、BDNF 蛋白表达的强弱。

结果 (1) 治疗前、后 BDNF 组 Aβ 斑块总数与 PBS 组相比较未见明显变化，差异均无统计学意义(t = 0.695、-0.171，P= 0.509、0.869)；治疗 6 周后 BDNF 组 Aβ 斑块体积缩小、TS+斑块数量减少，与 PBS 组相比较，差异均具有统计学意义(t = -2.401、-2.536，P= 0.047、0.039)；(2) 治疗后 BDNF 组 TrkB、BDNF 蛋白表达增强。

结论 侧脑室内注入 BDNF 减少了 Aβ 致密斑的形成，使 Aβ 蛋白沉积导致的神经毒性作用减弱，从而促进皮层区 TrkB 表达增强，导致内源性 BDNF 表达增强，在一定程度上延缓 AD 小鼠的病程。

PU-3639
CT 值与管电流、管电压的关系以及图像噪声与辐射剂量的相关性研究

吕蓉
天津市第三中心医院

目的 探讨管电流、 管电压对图像 CT 值的影响，不同扫描条件下图像信噪比的变化、图像 CT 值的关系以及图像噪声与辐射剂量的相关性。**方法** 配制碘浓度为 0.5mg/ml~50.0mg/ml（以 0.5 mg/ml 递增）的 100 份样本。将样本按顺序装入量均为 4ml 的 100 个注射器，每 25 个为一组，将其用胶带等间隔固定在 CT 校准专用水模上。采用不同管电流（50、100、200、280 mA）及管电压（70、80、 100、 120、 140 kV），两两结合共 20 种扫描方式行轴面扫描。测量不同浓度样本在不同扫描条件下的 CT 值以及各种扫描条件下的图像噪声、信噪比和辐射剂量。采用方差分析比较不同管电流、 管电压条件下 CT 值和信噪比的差异，采用 *Pearson* 线性相关分析评价不同扫描条件下 CT

值以及图像噪声和辐射剂量的相关性，并用线性回归得到回归方程及相关系数，根据图像噪声与辐射剂量的关系曲线计算不同管电压时曲线的交汇点。 **结果** 管电流固定时，不同管电压间样本 CT 值的差异均有统计学意义（*P* 均<0.05）；管电压固定时，不同管电流间样本 CT 值的差异均无统计学意义（*P* 均>0.05）。不同扫描条件下图像 CT 值呈线性相关（R^2=0.973~0.999），并以 120KV 扫描的 CT 值为基准，得到其他管电压扫描下图像 CT 值的转化公式。不同管电压扫描下图像噪声与辐射剂量呈反比，并根据相关方程得到不同管电压下图像噪声和辐射剂量的关键点。 **结论** 管电压对图像 CT 值、信噪比有影响，可以根据图像噪声和辐射剂量的相关关键点调整管电压，以获得保证图像质量并降低辐射剂量的优化扫描方案。

PU-3640

探讨两次磁共振波谱扫描所得结果的稳定性

张敏,王培军
同济大学附属同济医院

目的 探讨磁共振波谱研究中两次扫描所得结果的稳定性。
方法 选取 30 名健康志愿者（9 男，21 女，年龄 21±3）分为 A、B 两组，每组 15 人，以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪（Siemens MAGNETOM Trio Tim），采用点分辨波谱（PRESS）序列对每位志愿者进行两次扫描，其中 A 组在定位后进行两次连续扫描，B 组在定位后先进行一次扫描，然后将扫描床移出磁场中心，隔三分钟再进床至原来的位置，间隔期间确保被试不动，严格按照第一次的定位并扫描得到第二次的数据，利用 LCmodel 软件对采集到的脑代谢物波谱数据（NAA、Cho、NAA/Cr、Cho/Cr）进行后处理及定量分析，将两次扫描所得结果的差异性系数（CV=100*SD/mean）作为衡量两组波谱定量分析结果一致性的指标。利用各个代谢物的含量及含量比值，分别对 A、B 组内数据进行统计分析，检验干扰因素是否造成各组内两次扫描数据间的显著性差异。
结果 A 组所得大脑右侧前额叶中各个代谢物含量及含量比值的平均差异性系数（Mean CV）分别为 NAA 1.84%, Cho 2.73%, NAA/Cr 1.99%, Cho/Cr 1.55%，B 组所得各个代谢物含量及含量比值的平均差异性系数分别为 NAA 4.44%, Cho 3.06%, NAA/Cr 4.57%, Cho/Cr 2.49%。利用各个代谢物的含量及含量比值，分别对 A、B 组内数据进行配对样本 t 检验，发现对于不同代谢物及代谢物比值，除了 B 组 Cho/Cr（0.001<P<0.05）外，利用两种方法所得结果的差异性不具有统计学意义（P>0.05）。
结论 干扰因素不会影响两次扫描结果定性分析的可靠性，但会影响结果的定量计算的精确度，且间隔扫描受到更多的干扰因素的影响，精确度低于连续扫描。

PU-3641

探讨纵向研究中多次扫描所得 MRS 结果的差异性

张敏,王培军
同济大学附属同济医院

目的 通过两种方式分别对相同患者同一脑区进行两次扫描，探讨多次扫描所得波谱结果的差异性。
方法 选取 30 名健康志愿者（9 男，21 女，年龄 21±3）分为 A、B 两组，每组 15 人，以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪（Siemens MAGNETOM Trio Tim），采用点分辨波谱（PRESS）序列对每位志愿者进行两次扫描，其中 A 组在定位后进行两次连续扫描，B 组在定

位后先进行一次扫描，然后将扫描床移出磁场中心，隔三分钟再进床至原来的位置，间隔期间确保被试不动，严格按照第一次的定位并扫描得到第二次的数据，利用 LCmodel 软件对采集到的脑代谢物波谱数据（tNAA、tCho、tNAA/tCr、tCho/tCr）进行后处理及定量分析。将两次扫描所得结果的差异性系数（CV）作为衡量两组波谱结果一致性的指标，并将 A、B 两组数据进行比较。
结果 A 组所得大脑右侧前额叶中各个代谢物含量及含量比值的平均差异性系数（Mean CV）分别为 NAA 1.84±2.11, Cho 2.73±2.45, NAA/Cr 1.99±1.54, Cho/Cr 1.55±1.38，B 组所得各个代谢物含量及含量比值的平均差异性系数分别为 NAA 4.44±2.98, Cho 3.06±2.45, NAA/Cr 4.57±2.63, Cho/Cr 2.49±1.58。配对样本 t 检验发现，对于不同代谢物及代谢物比值，除了 B 组 Cho/Cr（$P<0.05$）外，两种方法所得结果的差异性不具有统计学意义（$P>0.05$）。
结论 当扫描有一定的时间间隔时，所得同一患者的波谱数据之间一致性不如连续性扫描，代谢物的含量值浮动范围更大，说明间隔一段时间的扫描引入了更多的干扰因素，如磁场稳定性的改变、定位不精确等。在进行纵向临床研究时应考虑这些干扰因素造成的结果的差异。

PU-3642
慢性血吸虫肠病的 CT 影像表现与病理对照分析研究

张炜,王培军,沈星
同济大学附属同济医院

目的 回顾性分析慢性血吸虫肠病患者的 CT 表现与病理特征。
方法 共 56 例患者，男 37 例，女 19 例，平均 69.2 岁，均行腹部 CT 平扫+增强扫描,对病灶部位、形态、大小，钙化特点及强化方式进行评估；所有病例均经病理学检查证实为慢性血吸虫肠病，对其 CT 表现与病理学特点进行对照分析。
结果 CT 扫描中 56 例慢性血吸虫肠病均发生在大肠，呈广泛管壁增厚，0.3～1.2cm；43 例为较均匀增厚，占 76.8%。肠壁钙化可分为：线状钙化 42 例，轨道状钙化 19 例，斑点状钙化 8 例。钙化边界清晰。其中全结肠钙化 5 例，升结肠钙化 9 例，横结肠钙化 12 例，降结肠钙化 24 例，乙状结肠直肠钙化 34 例，直肠钙化 30 例。17 例患者管壁明显钙化。病理学证实线状、轨道状钙化为虫卵广泛沉积于黏膜下层、浆膜下层所致，8 例斑点状钙化及 17 例管壁明显钙化者，肠壁各层均可见钙化虫卵沉积，同时有结肠壁有不同程度炎性细胞浸润、肉芽肿、纤维组织增生及息肉伴钙化虫卵沉积，并发腺癌 5 例。
结论 CT 是显示慢性血吸虫肠病的重要影像学诊断方法，特征性表现为管壁较均匀增厚为主伴肠壁钙化，在此基础上出现管壁不规则增厚或伴软组织团块影，高度提示并发结直肠癌。

PU-3643
MCI 患者选择性记忆损害机制的 fMRI 研究

赵小虎,王湘彬,席芊,江虹,王培军
同济大学附属同济医院

目 的 人脑默认网络（DMN）与记忆密切相关，该网络可能存在负责记忆和注意功能的两个子系统。本研究利用静息态 fMRI 技术，旨在探讨 MCI 患者是否选择性损害 DMN 的记忆子系统。
方 法 33 例 AD 病人和 20 名健康老年志愿者参加实验。简易智能状态检查和 Mattis 痴呆评定量表（DRS）测试，评估受试者认知水平。采集静息态 BOLD-fMRI 数据。首先利用 rest 软件，分析两组受试者的 BOLD 信号低频振幅差异脑区，检验 MCI 患者低频振幅异常是否选择性出现在 DMN 的记忆

子系统。随后提取每个低频振幅异常区域内所有体素的 BOLD 信号平均值，计算每两个区域之间的相关系数，构建功能网络，检验 MCI 患者脑功能连接异常是否选择性出现在 DMN 的记忆子系统。
结 果 行为学结果：MMSE 平均分值，AD 组和正常对照组分别为 20.60±2.30、28.20±1.80。DRS 平均分值 AD 组和正常对照组分别为 96.00±10.82、123.22±13.74。MMSE 和 DRS 平均分值两组差别均具有统计意义。与正常对照组比较，MCI 患者低频振幅异常区域主要出现在前额叶中内侧、海马及颞叶等与记忆密切相关的 DMN 子网络：进一步的功能连接分析发现，MCI 患者功能连接降低也主要出现在 DMN 记忆子网络，而不是整个 DMN 网络。
结 论 本研究表明 MCI 患者选择性损害了人脑默认网络（DMN）的记忆子系统，而不是整个网络。这对深刻认识 DMN 的功能，阐明 MCI 记忆障碍脑机制，探讨早期诊断和治疗 MCI 的可能效方法具有重要意义。

PU-3644

阿尔茨海默病人大脑功能网络效率变化

赵小虎,王湘彬,席芊,王培军
同济大学附属同济医院

目 的 人脑网络具有小世界属性，网络效率反应网络内部的信息传递效应。本研究采用图论方法，探讨阿尔茨海默病对大脑功能网络的效率的影响。
方 法 33 例 AD 病人和 20 名健康老年志愿者参加实验。简易智能状态检查和 Mattis 痴呆评定量表（DRS）测试、评估受试者认知水平。采集静息态 BOLD-fMRI 数据，利用解剖学自动标记模板将大脑分成 90 个区域，提取每个区域内所有体素的 BOLD 信号平均值，计算每两个区域之间的相关系数，构建功能网络。利用图论方法，检验两组人群脑功能网络的小世界属性，并计算网络的效率。通过双样本 t 检验，对比研究 AD 病人脑网络效率的特征性变化。
结 果 行为学结果：AD 组 MMSE 和 DRS 平均分值均显著低于正常对照组($p<0.01$)。两组受试者的小世界性检验：以连接矩阵的稀疏度（Sparsity）为阈值，在 0.1~0.4 范围内，发现两组受试者的全局效率低于相应的随机网络，高于规则网络；局部效率高于随机网络，低于规则网络，都具有小世界属性。与对照组比较，AD 病人全局效率显著降低，局部效率显著增高，两者差别均具有统计意义($p<0.05$)。
结 论 AD 病人的大脑功能网络仍具有小世界属性，但网络的全局效率显著降低，局部效率显著增高，提示 AD 病人脑功能网络的信息传递能力和效率受损。该发现对从网络角度研究 AD 病理机制具有重要意义。

PU-3645

正常老年人大脑功能网络的小世界性

赵小虎[1],王湘彬[1],王培军[1],何俊民[2],席芊[1],江虹[1]
1.同济大学附属同济医院
2.同济大学

目的 利用静息态 BOLD-fMRI 探讨正常老年人脑功能网络是否具有小世界性。
方法 20 名健康老年志愿者纳入研究。采集静息态 BOLD-fMRI 数据。应用 SPM 5 软件进行数据预处理，利用解剖学自动标记模板将大脑分成 90 个区域，提取每个区域内所有体素的时间序列平均值，计算每 2 个区域之间的 Pearson 相关系数，构建 N×N(N=90)的相关性矩阵 R，并对矩阵进行 Fisher r to z 变换。采用直接定义阈值 T 和设定矩阵稀疏度两种方法确定阈值，根据小世界性的

定义：当γ＝Cp/Crand＞1，且λ＝Lp/Lrand≈1 时（γ和λ分别表示是由 c 和 p 确定的两个小世界参数，不需要特别说明，C 为平均聚类系数，L 为平均路径长度，下标 p 表示规则网络，下标 rand 表示随机网络），认为该网络具有小世界性。

结果 在直接定义阈值 T 条件下，γ值为 1.3157±0.3572（1.0005～2.1882），λ值为 1.0149±0.0226（1.0000～1.0796）；在设定矩阵稀疏度条件下，γ值为 1.3299±0.2330（1.0759～1.9574），λ值为 1.0152±0.0190（1.0001～1.0679）。两种方法均表明该网络具有小世界性。

结论 正常老年人脑功能网络具有小世界性。

PU-3646

X 线球管投照角度在 HSG 检查中的应用价值

杜丽洁,郭玲彤,张贺越
山西医科大学第一医院

近年来临床上不孕症的发病率不断增加，不孕症的诸多病因中子宫输卵管性不孕约占 45%。近几年子宫输卵管造影检查技术被广泛应用于不孕症的检查中。

目的：本研究通过改变 X 线球管投照角度，纠正因子宫前倾前屈或后屈引起的宫颈和宫体相互重叠引起的短缩问题，更好的观察子宫及输卵管真实全貌，以便给临床提供更准确的子宫及输卵管信息，为临床诊断和治疗提供可靠依据。

方法：收集山西医科大学第一医院放射科 2018.7.10~2019.2.10 因不孕症行 HSG 检查患者的影像学图像 1678 例，剔除其中各种畸形子宫 42 例，选择子宫呈倒三角形的 1636 例入组。

选择月经干净 3~7 d 内的不孕症患者，在 X 线检查床上取截石位常规消毒外阴、阴道、宫颈，插入子宫输卵管造影管至宫腔内，囊内注入 3~5 mL 空气，轻拉导管确定气囊在子宫腔内并堵住宫颈口，向导管内缓慢注入 76%复方泛影葡胺，观察子宫及输卵管通畅情况，仰卧位，球管垂直于检查床拍摄第一张 X 线片;根据子宫及输卵管的显影情况，向头或足侧倾斜球管,拍摄第二张 X 线片。

以观察到对称的倒三角形为摄片满意，采用配对 χ2 检验，分别计数两次摄片满意的数量。

结果：收集的 1636 例患者中，第一张 X 线片即摄片满意者有 778 例，子宫形态显示率为 47.56%，第二张 X 线片摄片满意者增加至 1588 例，子宫形态显示率为 97.07%，余 48 例因子宫过度屈曲以及球管变换角度有限，并且球管只能沿着一条轴线摆动，未能显示真正子宫形态。对两组子宫形态显示率进行 χ2 检验，差异具有统计学意义，P＜0.05。

结论：子宫输卵管造影检查中子宫形态显示率在适当改变球管角度后得到显著提高，适当调整球管角度可避免因子宫正常解剖结构引起的重叠短缩问题，在进行 HCG 检查中具有重要的应用价值。

浅谈儿童辐射的防护管理

薛龙
昆明市儿童医院

重申儿童 X 线检查中防护的重要性，并倡导对儿童进行高效及规范性放射防护措施，达到放射检查目的，同时实现低剂量高水平的摄片要求，降低放射检查过程中的辐射危害。常规的 X 线检查，对儿科疾病诊治起着越来越重要的作用，对于儿童辐射的防护管理就显得尤为重要。对患儿进行有

效地防护，对提高其后的生活质量有着非常重要的作用。分析放射损伤对儿童的危害，做到有效防护，医院放射科应提高重视程度，努力完善防护管理。

PU-3648

LCmodel 软件与 Spectroscopy 软件在 MRS 数据分析中的结果对比

张敏,王培军
同济大学附属同济医院

目的 利用 LCmodel 软件与 Spectroscopy 软件对同一组数据进行分析处理，比较两个软件的处理结果。

方法 选用健康志愿者 15 名（4 男，11 女，年龄 22±2 岁），以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪（Siemens MAGNETOM Trio Tim），在每次定位后，采用点分辨波谱（PRESS）序列对志愿者连续扫描两次。利用 Spectroscopy 软件计算 NAA、Cho、NAA/Cr、Cho/Cr 的值，并利用 LCmodel 软件处理后获得 tNAA、tCho 相对含量值及以 tCr 为参照物的相对含量的比值 tNAA/tCr、tCho/tCr，并将两种软件的分析结果进行比较。研究假设在完全相同的条件下，连续的两次扫描所得代谢物含量及代谢物含量比值应该是恒定不变的，因此本研究将两次扫描所得结果的差异性系数（CV）作为衡量两种软件数据分析的准确性的指标。

结果 对于连续两次扫描的大脑右侧前额叶中，Spectroscopy 软件计算所得各代谢物含量的平均差异性系数（Mean CV）分别为 NAA 1.68±1.21, Cho 2.21±2.11, NAA/Cr 2.36±1.60, Cho/Cr 3.36±2.52，LCmodel 软件所得各代谢物含量的平均差异性系数分别为 NAA 1.84±2.11, Cho 2.73±2.45, NAA/Cr 1.99±1.54, Cho/Cr 1.55±1.38。将两种软件的分析结果进行配对样本 t 检验，发现对于不同代谢物及代谢物比值，利用两种方法所得结果的差异性不具有统计学意义（P>0.05）。

结论 两种分析软件都能对波谱数据进行准确的分析，分析结果没有显著差异，表明在没有 LCmodel 的情况下，系统自带 Spectroscopy 软件仍能满足需求。系统自带软件对单个化合物含量的分析较 LCmodel 软件精确度略高，而对化合物含量比值的分析则 LCmodel 软件更具优势。

PU-3649

软件 LCModel 与 Spectroscopy 对 MRS 数据的后处理技术比较

张敏,王培军
同济大学附属同济医院

目的 比较软件 LCModel 与 Spectroscopy 对 MRS 代谢物含量估计的稳定性和准确性。

方法 选用健康志愿者 15 名（4 男，11 女，年龄 22±2 岁），以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪（Siemens MAGNETOM Trio Tim），在每次定位后，采用点分辨波谱（PRESS）序列对志愿者连续扫描两次。利用 Spectroscopy 软件计算 NAA、Cho 波峰下面积的积分值，求出 NAA/Cr、Cho/Cr 的值，并利用 LCModel 软件处理后获得 NAA、Cho 相对含量值及以 Cr 为参照物的相对含量的比值 NAA/Cr、Cho/Cr。分别将两种软件计算的代谢物含量比值与文献参考值进行比较，然后分别对每种软件计算的两次扫描数据进行比较，以差异性系数（CV=100*SD/mean）作为衡量两种软件数据分析稳定性的指标。

结果 对于连续两次扫描的大脑右侧前额叶中，LCModel 软件所得波谱数据基线较 Spectroscopy 软件所得波谱数据的基线更平稳，各代谢物峰清晰。LCModel 与 Spectroscopy 测得的代谢物含量比值 NAA/Cr 分别为 1.8±0.2, 1.9±0.7，文献参考值为 1.6±0.2，LCModel 结果更为接近；比值 Cho/Cr 分别为 0.3±0.03, 1.1±0.41，文献参考值为 0.9±0.2，Spectroscopy 结果更为接近。配

对样本 t 检验发现，对于不同代谢物及其比值，两种软件两次扫描所得结果的差异均不具有统计学意义（P>0.05）。
结论 两种软件对 MRS 代谢物含量的估计均有较高的稳定性。但 LCModel 有相对较好的处理基线不稳的能力，在实际临床应用中更具前景。

PU-3650

探讨多次重复扫描中 MRS 的可重复性

张敏,王培军
同济大学附属同济医院

目的 通过两种方式对被试同一脑区进行两次重复扫描，探讨重复扫描所得波谱结果的可重复性。
方法 选取 30 名健康志愿者（9 男，21 女，年龄 21±3）分为 A、B 两组，每组 15 人，以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪（Siemens MAGNETOM Trio Tim），采用点分辨波谱（PRESS）序列对每位志愿者进行两次扫描，其中 A 组在定位后进行两次连续扫描，B 组在定位后先进行一次扫描，然后将扫描床移出磁场中心，隔三分钟再进床至原来的位置，间隔期间确保被试不动，严格按照第一次的定位并扫描得到第二次的数据，利用 LCmodel 软件对采集到的脑代谢物波谱数据（tNAA、tCho、tNAA/tCr、tCho/tCr）进行后处理及定量分析。将两次扫描所得结果的差异性系数（CV）作为衡量两组波谱结果可重复性的指标，并将 A、B 两组数据进行比较。
结果 A 组所得大脑右侧前额叶中各个代谢物含量及含量比值的平均差异性系数（Mean CV）分别为 NAA 1.84±2.11, Cho 2.73±2.45, NAA/Cr 1.99±1.54, Cho/Cr 1.55±1.38，B 组所得各个代谢物含量及含量比值的平均差异性系数分别为 NAA 4.44±2.98, Cho 3.06±2.45, NAA/Cr 4.57±2.63, Cho/Cr 2.49±1.58。配对样本 t 检验发现，对于不同代谢物及代谢物比值，除了 B 组 Cho/Cr（P<0.05）外，两种方法所得结果的差异性不具有统计学意义（P>0.05）。
结论 结果提示多次重复扫描所得代谢物分析结果的变化不完全代表被试真实生理状态的改变，并且具有时间间隔的重复扫描会受到更多因素的干扰，在进行长期的跟踪研究时应将这种结果的差异性考虑进去。

CT 增强扫描知情同意告知主体的研究

俞菊红
江西省人民医院

[**摘要**] **目的** 探讨在临床医生与 CT 室护士中，谁更适合给患者进行 CT 增强扫描知情同意告知。**方法** 选择临床医生与 CT 室护士进行知情告知的两个月份作为研究对象，对比两个时间段知情告知内涵与患者检查时感受等指标，探讨不同知情告知主体在告知过程中的差异。**结果** 由临床医生进行知情告知后，临床医生对知情同意书的知晓度更高、知情同意退费率下降、患者检查折返率下降、患者恐惧心理减少，CT 室工作效率提高。**结论** 临床医生比 CT 室护士可能更适合进行 CT 增强扫描知情同意。

PU-3652

CT 检查在儿童急性颅脑外伤中的应用

郑红仙
昆明市儿童医院

目的 探讨 CT 检查对儿童急性颅脑外伤的诊断价值及应用中的相关问题。 方法 回顾性分析 80 例患童急性颅脑外伤的 CT 检查结果。结果 按 CT 检查结果损伤部位分三大类。单纯头皮血肿：共 19 例，占 23.75%。颅骨损伤：共 32 例，占 40.00%。颅内损伤：共 29 例，占 36.25%。 结论 儿童急性颅脑损伤首选 CI 检查；颅脑损伤的抢救和诊治，应选择 CT 检查配合；由于 CT 有一定的辐射副作用，对于仅有皮外伤、无任何临床症状、体征无任何变化的可暂不作 CT 检查；CT 检查是儿童急性颅脑损伤的首选检查方法，但不应作为常规检查方法；可以在儿童颅脑检查中采用低剂量扫描模式，减轻对儿童造成的损伤。

放射科含碘非离子对比剂静脉外渗管理的证据应用

毛燕君
上海同济大学附属肺科医院

目的 探讨基于最佳证据的放射科碘对比剂静脉外渗管理的干预方法并评价其效果。**方法** 应用循证护理的方法得出证据并将证据本土化后应用于临床，制定放射科碘对比剂静脉外渗管理的审查标准，规范护理人员的临床行为；采用线上线下的培训方式，对护理人员进行最佳证据的培训，比较应用最佳证据前后放射科碘对比剂静脉外渗的发生率，培训前后护理人员对最佳证据的知晓情况及执行情况。**结果** 最佳证据应用后，放射科碘对比剂静脉外渗的发生率由 1.01%下降至 0.41%；应用前后高危患者取消检查率从 0.0.8%提高至 1.75%；临床护士对碘对比剂静脉外渗的识别与评估、碘对比剂静脉外渗的相关因素分析、碘对比剂静脉外渗的处理等方面有所提高，差异有统计学意义（$P<0.05$）；临床护士对碘对比剂静脉外渗最佳证据的执行率大于 85%。**结论** 护理人员通过应用最佳证据，以科学的护理方法解决碘对比剂静脉外渗的问题，可提升护理质量。

PU-3654

含碘对比剂静脉外渗风险因素 logistics 回归分析

毛燕君
上海同济大学附属肺科医院

目的 分析含碘对比剂静脉外渗的风险因素，为临床预防和管理提供可靠的参考依据。**方法** 回顾性收集 2017 年 5—7 月在我院放射科接受 CT 增强检查的门诊和住院患者 5837 例，发生了明显的对比剂静脉外渗的患者为外渗组，未发生对比剂静脉外渗的为非外渗组，通过医院信息中心数据库提取相关信息，比较两组患者一般情况、患者疾病情况、注射信息和注射护士情况，并对收集的因素进行非条件 logistic 回归分析。**结果** 两组患者年龄、性别、体质指数、手术史、化疗治疗史、放疗治疗史等因素差异均无统计学意义（P 均>0.05）。两组患者的年龄划分的比较，差异有统计学意义（P<0.05）。两组患者对比剂注射情况的比较，对比剂的品牌、患者穿刺部位、注射速率、造影剂剂量、盐水量等差异均无统计学意义（P 均>0.05）。留置针规格、患者血管评估之间差异有统计学意义（P<0.05）。logistic 回归分析显示，年龄划分（中年，OR=0.152，

95%*CI*：0.040～0.576）为发生外渗的保护因素；有手术史（OR=3.514，95%*CI*：1.026～12.034），血管评估（差，OR=13.039，95%*CI*：1.399～121.483），留置针规格（24G，OR=9.170，95%*CI*：1.474～57.047），为发生外渗的危险因素。**结论** 患者年龄、自身静脉条件、留置针的粗细、手术史均可成为对比剂静脉外渗发生的风险因素。

PU-3655

MRI 增强扫描后致钆沉积病个案报道及文献复习

曹艳梅
苏州市第五人民医院

摘要：目的 报道 1 例 MRI 增强扫描静注钆对比剂（GBCA）后所致疾病的临床资料。方法 对 1 例 MRI 增强扫描静注钆对比剂后出现全身不适症状的患者的接触史、临床表现、辅助检查、诊断、鉴别诊断及治疗进行总结。结果 患者接触 GBCA 后约 6 小时后开始出现手、面部发麻，后逐渐表现为全身不适，临床症状主要表现为头痛，后出现内脏器官灼痛；手、面部发麻，颈部皮肤紧缩感等；接触 GBCA 5 个月后查 24h 尿钆为 0.097ug/g 肌酐，高于美国标准（≤0.019ug/g 肌酐）5 倍。参考相关文献，临床诊断为钆沉积病。治疗上予依地酸钠钙 1g qd 静滴驱钆治疗，驱 3d 停 4d 为一疗程，共驱三个疗程。结论 应加强对钆沉积病的认识，争取做到早期诊断及早期治疗。

儿童核磁共振检查的护理对策

黄莉
江西省肿瘤医院

目的: 探讨儿童核磁共振检查中的护理配合，以提高儿童检查核磁共振的检查质量，提高正确诊断率。方法:收集我院 2017 年 7 月至 2019 年 3 月 156 例做 MRI 各部位检查的患者，所有患儿均进行心理护理、药物护理、特殊护理。结果: 经过心理护理、药物护理、特殊护理，145 例患儿均成功做完检查，图像清晰、无伪影、病灶显示清晰、图像优良。11 例患儿因特殊原因未完成检查。结论:加强心理护理、药物护理、特殊护理可以有效减少患儿的不良心理反应，能够使患儿积极配合完成检查,提高了图像的质量，为临床医生快速做出诊断提供依据。

PU-3657

多层螺旋 CT 图像常见伪影的影响因素与解决方案

钱根年,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的:探讨多层螺旋 CT 成像过程中常见伪影的影响因素与解决方案,提高图像质量,获取优质的 CT 影像。
方法:选取 139 例患者 64 层螺旋 CT 扫描后的影像资料,其中头部伪影 38 例、胸部伪影 53 例、腹部伪影 29 例以及盆腔伪影 19 例,对 CT 图像伪影的形态和成因逐一进行分析。
结果:头部伪影包括:射线束硬化伪影 24 例、探测器故障伪影 1 例、斑马样伪影 2 例、运动伪影 1 例、金属伪影 10 例;胸部伪影包括:射线束硬化伪影 8 例、部分容积效应伪影 9 例、光子不足伪影

9 例、欠采样伪影 1 例、散射伪影 3 例、运动伪影 21 例、金属伪影 1 例、投影数据不完全伪影 1 例;腹部伪影包括:部分容积效应伪影 10 例、散射伪影 5 例、运动伪影 4 例、金属伪影 10 例;盆腔伪影包括:光子不足伪影 5 例、金属伪影 14 例。分析产生伪影的原因,主要为设备固有因素与检查技术因素两类;提出相应解决方案。
结论:多层螺旋 CT 图像的伪影与设备固有及成像检查技术的诸多因素有关,优化扫描技术参数,可有效消除、抑制或避免图像伪影,获得优质图像。

PU-3658
新一代基于模型不同迭代重建技术对腹部 CT 图像质量的影响

杨创勃,贾永军,段海峰,马光明,张喜荣,于楠
陕西中医药大学附属医院

目的：探讨基于模型的迭代重建（MBIR）的 STND 和 NR40 重建方法对常规薄层腹部 CT 图像质量的影响。
方法：采用 GE Discovery CT 750HD 对 20 例患者进行腹部常规剂量 CT 扫描。分别采用常规迭代 40%ASiR 重建和 MBIR 的 STND 和 NR40 重建技术对原始数据进行 0.625mm 薄层重建，并应用后处理台对图像进行质量评价分析。测量比较肝脏、脾脏、髂腰肌、皮下脂肪等实质脏器的噪声值（SD）、信噪比(SNR)、和对比噪声比(CNR)。重建薄层图像的主观评价由 2 名有经验的影像医师采用盲法评价，从图像的清晰度、锐利度、病灶细节显示和病灶或脏器内部的异质性四个方面按 5 分法（1－5 分）进行主观独立评分。
结果：以肝脏为主要研究对象，常规迭代 40%ASiR 和 MBIR 的 STND 和 NR40 重建三组图像的肝脏噪声分别为 17.08±2.58、9.77±1.06 和 5.78±1.13（P＜0.001）。STND 和 NR40 重建组图像噪声分别较 40%ASiR 组降低 41.9%和 65.3%，40%ASiR、STND 和 NR40 三组图像的肝脏组织的 CNR 分别为 12.60±2.66、18.32±3.42 和 32.90±4.74，STND 和 NR40 重建组图像 CNR 分别较 40%ASiR 组提 49.9%和 170%（P＜0.001）。40%ASiR、STND 和 NR40 三组重建图像肝脏组织的 SNR 分别为 5.19±1.03，7.59±1.53 和 13.58±2.43。STND 和 NR40 组图像 SNR 分别较 40%ASiR 组提高 49.9%和 169%（P＜0.001）。三组重建图像的主观评分分别为：3.73±0.45、4.63±0.49 和 4.80±0.41。
结论：与常规 40%ASiR 重建算法比较，在相同剂量条件下，MBIR 的 STND 和 NR40 重建能显著降低图像噪声,提高图像质量；其中 NR40 重建算法降噪及提高图像质量效果更为显著。

PU-3659
钆对比剂不良反应的预防及处置体会

钟佳媚
郑州大学第一附属医院

目的：回顾性分析我院磁共振检查中钆对比剂不良反应的发生情况，探讨有效的预防及处置方法。
方法：回顾分析我院 2017-2019 年钆对比剂的使用情况，共 115937 例，其中过敏反应共 156 例，汇总分析其病例资料和处置措施。
结果：钆对比剂不良反应发生率极低，不足 0.13%，其中轻度反应 128（82%）例，中度 27（17%）例，重度 1（1%）例。经过吸氧、静卧、注射地塞米松、肾上腺素等处置措施，患者情况均痊愈。
结论：钆对比剂检查前患者宣教、签署知情同意、告知不良反应可能性，检查中密切关注患者情况，检查后保留静脉通道、继续观察 30 分钟，及时发现患者出现的可疑过敏反应，高效的抢救处置流程，能够减轻对比剂过敏反应造成的后果。

PU-3660
64 排 CT 下肢血管成像在糖尿病引起的下肢血管病变中的应用

杨莎,李征
湘雅常德医院

摘要 目的 探讨 64 排 CT 下肢血管成像在糖尿病引起的下肢血管病变中的应用价值。
方法 29 例糖尿病临床疑诊下肢血管病变的患者，采用 Philips64 排 CT 机行螺旋 CT 下肢动静脉增强扫描，患者仰卧，右肘静脉穿刺埋置放置 18G 的套针管，连接高压注射器，扫描范围 L3 至足，对比剂用量 120ml，注射速率 4ml，固定双下肢，监测腹主动脉自动触发扫描，完成动脉增强扫描后延迟约 70s 开始静脉扫描，从 L3 至足扫一期，随后从足至膝扫一期，既保证大腿静脉显影同时也提高了小腿静脉的显影，根据原始图像利用工作站进行多模式成像分析。
结果 29 例双下肢动静显影良好，下肢血管正常 4 例，下肢血管硬化狭窄 20 例，血管微血栓形成后闭塞 5 例。
结论 64 排 CT 下肢血管成像结合工作站多模式成像分析可以全貌显示下肢血管，狭窄的位置、程度，血栓的位置、范围，为临床选择正确的治疗方法提供可靠的客观依据，具有一定的临床应用价值。

PU-3661
讨论 multivane 技术对肩关节 MR 扫描中的应用

施寅枫
苏州大学附属第二医院

目的：探讨 multivane 技术（简称 MV 技术）在减少及消除肩关节运动伪影及提升图像质量的作用 。
方法：对 53 例在肩关节 MR 扫描中无法配合的患者行 3.0T MRI 常规 TSE T2WI 扫描后加扫 MV TSE T2WI 序列 。 扫描后的图像由两位诊断医师对运动伪影、肌肉组织边缘、血管搏动伪影和图像的总体质量进行 5 个等级的评分。常规扫描图像与相同方位的 multivane 序列图像之间的对比使用 Wilcoxon 秩和检验 。
结果：常规 TSE T2WI 扫描序列中 5 例因严重运动伪影无法用于诊断 ，而 MV TSE T2WI 序列图像运动伪影明显降低 ，评分范围 3 ~4，平均值 3.74 ；肩关节 MR multivane 扫描能显著降低运动伪影及血管搏动伪影（均 P< 0.05） ，等级评分均在 3 级及以上 ；图像质量有显著提高 ，总体评分在 3 级及以上（P<0.05） ；肩关节肌肉边缘更加清晰 、锐利 。
结论：与肩关节常规 TSE T2WI 相比 ，multivane 技术能显著降低肩关节的运动及血管搏动伪影 ，提高图像总体质量，为临床提供更优质的诊断图像 。

PU-3662
自适应滤波联合迭代重建技术改善双上肢不能上举的急重症患者胸腹部 CT 伪影的可行性研究

金文凤,韩丹,江杰,刘顼,李浚利,蔡雅倩,崔晓
昆明医科大学第一附属医院

目的：分析自适应滤波(Adaptive Filter, AF)联合迭代重建减轻双上肢不能上举的急重症患者胸腹部 CT 成像伪影的可行性。**方法：**采用联影 128 层 UIH uCT760 螺旋 CT，对双上肢不能上举急重症成人患者行胸腹部 CT 扫描，其中胸腹连扫 11 例，胸部 49 例，腹部 49 例，BMI18-24。扫描参数胸部：100kV，80mAs，腹部：100kV，200mAs，管电流自动调制，球管转速 0.5s/r，螺距 0.938。将同一患者原始数据行四种方法重建：（1）A 组 AF 联合迭代（KARL 3D）重建；（2）B 组 AF 重建；（3）C 组迭代重建；（4）D 组无 AF 及迭代重建。四组图像质量行主观评分、客观指标、病灶形态特征（边缘、密度）显示效果对比：主观评分 5 分法（1 分伪影最大，5 分最小）；测量肺组织、降主动脉、肝脏、脾脏、胰腺、腹主动脉 CT 值、噪声（SD），计算 SNR、CNR。**结果：**（1）图像质量主观评分，胸腹部差异均有统计学意义（P<0.05），A>B>C>D，A 组伪影最小，B、C 次之，D 组最差。（2）图像质量客观指标，胸部四组图像 CT 值差异无统计学意义（P>0.05）；SD 值肺实质差异有统计学意义（P<0.05），A<B=C=D，降主动脉差异有统计学意义（P<0.05），A<B<C<D，A 组噪声最小；腹部 SNR 值差异有统计学意义（P<0.05），肝脏、胰腺、腹主动脉均为 A 组>B 组=C 组>D 组，脾脏 A 组>B 组>C 组>D 组，A 组 SNR 最高。肝脏、脾脏、胰腺、腹主动脉 CNR 值，差异均无统计学意义（P>0.05）。（3）胸部发现病灶 55 个，27 个位于 D 组伪影区，在 ABC 三组中分别有 26、24、6 个得到改善；腹部部发现病灶 53 个，38 个位于 D 组伪影区，在 ABC 三组中有 34、24、1 个得到改善。**结论：**急诊无法配合体位双上肢上举的患者行胸腹部 CT 检查时，采用 AF 联合迭代重建能有效减少伪影，提高图像质量。

PU-3663
基于体重优化 CT 扫描条件对 PET/CT 成像的 CT 辐射剂量与图像质量的影响研究

陈振,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 探讨 PET/CT 成像中优化 CT 扫描条件对检查辐射剂量和图像质量的影响。
方法 收集 60 例接受 18 F-FDGPET/CT 检查的肿瘤患者,其中体重≤60 kg 和>60 kg 患者各 30 例,并分为两组:CT 常规条件组 30 例及 CT 优化条件组 30 例。两组检查前准备方法相同。测量两组患者 PET 有效剂量(ED18 F-FDG)与 CT 辐射剂量。CT 辐射剂量为剂量长度乘积（Dose LengthProduct,DLP）和 CT 容积剂量指数（CT Volume Dose Index,CTDIvol）,计算图像对比度噪声比（Contrast Noise Ratio,CNR）,采用视觉特征分级评分法对两组图像质量进行 5 级评分。
结果 与常规组比较,优化组有效剂量指标 DLP 和 CTDIvol 显著降低（P<0.05）,ED18 F-FDG 和 CNR 差异未见统计学意义（P>0.05）。两组图像质量均满足诊断要求,图像质量平均得分差异未见统计学意义（P>0.05）,图像质量评分等级分布差异未见统计学意义（P>0.05）。
结论 基于体重优化 CT 扫描条件能够降低 PET/CT 中 CT 辐射剂量,且并不降低图像质量。

PU-3664
基于新模型迭代算法 Asir-V 在 70kVp 超低剂量成人副鼻窦 CT 扫描中的探究

胡智军
西安长安医院

目的：探讨超低剂量 70Kvp 在成人副鼻窦 CT 检查联合新模型迭代算法 Asir-V 获取最佳图像质量 Asir-V 权重。**材料与方法：**前瞻性收集 Revolution CT 副鼻窦检查成人患者 20 例，采用超低计量 70Kvp 进行螺旋扫描。每例均对原始数据进行后置 Pos-Asir-V 算法不同权重重建（0%，20%，40%，60%，80%，100%）、共 120 组图像、对每例 6 组图像进行客观评价；同时由 2 名高年资医师采用双盲法以 Likert 5 分法进行主观评分。**结果：**客观评价：Revolution CT 超低剂量 70Kvp 扫描有效辐射剂量 ED、较常规扫描有效辐射剂量明显减少；不同权重 Pos-Asir-V 图像 SD 值评分随着 Asir-V 权重的提升而降低，CNR 值随着 Asir-V 权重的提升而升高；主观评价： Asir-V80％图像质量最佳。**结论：**超低剂量 70Kvp 在成人副鼻窦 CT 检查联合多模型迭代算法既可满足临床诊断，也可明显降低有效降低辐射剂量。

PU-3665

PET/CT 显像常见伪影及质量控制

陈蕾蕾,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 分析 PET/CT 检查常见伪影,探讨相应的质控措施,以减少误诊,提高诊断率。
方法 选取 2015 年 1 月至 2018 年 1 月期间有伪影影响的 97 例全身 PET/CT 图像,统计分析 PET/CT 显像的常见伪影,并探讨相应的质控措施。
结果 97 例有伪影的图像中设备伪影 1 例,运动伪影 24 例,金属异物伪影 16 例,截断伪影 12 例,示踪剂因素伪影 11 例,生理性摄取及 18F-FDG 的非特异性伪影 33 例。
结论 掌握 PET/CT 显像的常见伪影,及时采取有效的质控措施,减少或避免干扰因素,是获得高质量 PET/CT 图像的重要保证。

PU-3666

基于压缩感知技术的盆腔三维 T2W 图像曲线重建测量子宫内膜厚度的初步研究

赵莹[1],刘爱连[1],王家正[2],张忠平[1],王楠[1],宋清伟[1],陈丽华[1],浦仁旺[1],高冰冰[1]
1.大连医科大学附属第一医院
2.飞利浦医疗集团

目的：探讨三维 T2W 图像曲线重建测量子宫内膜厚度的可行性。**材料与方法：**招募了 17 名年轻健康女性志愿者（年龄 23-29 岁，平均年龄 25.24±1.68 岁），所有志愿者在 3.0 T 磁共振扫描仪（Ingenia CX，Philips Healthcare，Best，The Netherlands）进行上腹部 MRI 检查。采用压缩感知（compressed SENSE, CS）技术进行三维 TSE 盆腔图像序列以获取子宫的 T2 加权图像。扫描参数：CS 加速因子 5，采集时间 155 秒，FOV 350mm×404mm×120mm，分辨率 1.1mm×1.1mm×2 mm。在 Intellispace Portal 7.0（ISP, Philips Healthcare, The Netherlands）工作站，在矢状面 T2W 图像上使用曲线重建功能沿着子宫内膜绘制曲线。子宫内膜厚度由两名放射科医生单独测量。记录身高、体重、从检查时间到末次月经开始的时间（$time_b$）和从检查时间到末次月经结束

的时间（$time_e$），并计算体质量指数（BMI）。使用类内相关系数（ICC）检验两位放射科医生测量值之间的一致性。使用 Spearman 相关分析检验子宫内膜厚度与身高、体重、体质量指数、$time_b$ 和 $time_e$ 之间的相关性。采用多元线性回归建立回归模型。**结果：**两名观察者测量子宫内膜厚度的一致性良好（ICC ＞ 0.995）。子宫内膜厚度与 $time_b$ 和 $time_e$ 呈强相关（p=0.001），相关系数分别为 0.750 和 0.748。与身高、体重、体重指数无关（P>0.05）。多元线性回归发现子宫内膜厚度与 $time_b$ 和 $time_e$ 呈良好的线性相关，厚度=2.655+0.596×$time_b$-0.379×$time_e$，r=0.797。**结论：**三维 T2W 图像曲线重建测量子宫内膜厚度是可行的。

PU-3667
前瞻性、多中心、个体内比较加乐显和马根维显在腹部增强 MRA 扫描的应用价值

刘曦娇[1],李峥艳[1],张薇薇[1],付宇[2],任静[3],宋彬[1]
1.四川大学华西医院
2.吉林大学第一医院放射科
3.四川省肿瘤医院放射科

目的：前瞻性、多中心、个体内比较加乐显和马根维显在腹部增强 MRA 的应用价值。
方法：本研究为前瞻性、多中心、个体内比较的试验。本研究获得伦理委员会同意。纳入 2014 年 12 月至 2015 年 12 月间同时行加乐显和马根维显增强 MRA 的健康志愿者。每位志愿者两次 MRA 检查间隔 3-5 天。三个中心 MRA 成像均在 Siemens Avanto 1.5T 完成。两名影像诊断医师盲法分析图像。采用三分类方法对 MRA 大血管、小血管和微小血管图像进行定性分析。采用信噪比和对比信噪比对大血管图像进行定量分析。采用秩和检验进行定性和定量数据的比较。两位观察者主观评分一致性分析采用 Kappa 检验。
结果：本研究最终纳入 40 例健康志愿者。40 例志愿者加乐显增强 MRA 大、中、小血管图像的定性分析结果分别是 20.98+2.11, 6.03+1.03, 3.41+1.18。40 例志愿者加乐显增强 MRA 大、中、小血管图像的定性分析结果分别是 20.01+2.18, 5.28+1.67, 2.61+1.40。秩和检验显示在小血管和细小血管定性分析方面，加乐显优于马根维显且差异具有统计学意义。对于大血管定性分析和定量分析，两组数据差异无统计学意义。两位阅片者之间定性分析一致性检验 Kappa 值 0.832，提示一致性高。
结论：本研究发现在腹部增强 MRA 成像中加乐显和马根维显均可良好显示腹部血管情况，其中加乐显在小血管和细小血管定性显示优于马根维显。

PU-3668
通过能谱 CT 提高低剂量胸部 CT 成像质量的胸部体模研究

张喜荣,陈静,于勇,贺太平,任占丽,韩冬
陕西中医药大学；陕西中医药大学附属医院

目的：探讨能谱成像在低剂量胸部 CT 中的可行性及临床应用。**方法：**使用 GE Discovery CT750HU 对胸部体模进行能谱 CT 扫描。常规剂量组扫描参数为管电压 100kVp，自动管电流调制，噪声指数

为 10HU，采用反滤波投影法（FBP）进行图像重建。低剂量组扫描参数为管电压 120 kVp，自动管电流调制，噪声指数为 12HU，GSI-49 扫描协议。能谱扫描后可以得到重建从 40keV 到 140keV（具有 10keV 间隔）11 组图像。测量肺实质、主动脉、背部肌肉和骨骼的 CT 值和标准差（SD）。计算脏器的信噪比（SNR = $CT_{主动脉}$ / $SD_{肌肉}$）和对比噪声比（CNR =（$CT_{主动脉}$-$SD_{肌肉}$）/ $SD_{肌肉}$）。记录两组的 CT 剂量容积指数（CTDIvol）、剂量长度乘积（DLP），并计算有效剂量（ED = k×DLP，k = 0.017）。单因素方差分析用于分析两组之间 SD、SNR 和 CNR 的差异，P <0.05 具有统计学意义。两组间图像主观评分由两名经验丰富的医生使用 5 盲法进行评分，并通过 Kappa 检验比较评分的一致性。**结果：**与常规剂量组相比，使用 GSI 后，平均 ED 降低约 50%。在 40keV 单能量图像上，两位医生观察肺窗的主观评分分别为 5.00±0.00 和 5.00±0.00，均高于常规剂量组的 4.66±0.57，差异有统计学意义（P <0.05）。在 100keV 单能量图像上，两位医生观察纵隔窗的主观评分分别为（4.66±0.57）和（4.66±0.57），均与常规剂量组的评分（4.66±0.57）相似。100keV 单能量图像的主动脉、背部肌肉和骨骼的 SD 值均较低，SNR 和 CNR 值均高于 FBP（P <0.05）。**结论：**当辐射剂量减少 50%时，使用 GSI40keV 单能量图像肺窗和 GSI100keV 单能量图像纵隔窗，可以获得与常规剂量组相似并且满足诊断要求的图像质量。

3.0 T 磁共振成像系统的质量控制检测

付丽媛,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的：本研究通过对 Siemens Skyra 3.0 T 磁共振成像系统的质量控制检测，探讨日常工作中 3.0 T 磁共振成像系统的质量控制方法。
方法：使用 Magphan SMR170 磁共振性能模体对 Siemens Skyra 3.0 T 磁共振成像系统的信噪比、图像均匀性、空间分辨率、低对比度分辨率、线性度和层厚进行检测。
结果：Siemens Skyra 3.0 T 磁共振成像系统的信噪比为 104，图像均匀性为 98.7%，空间分辨率为 5LP/cm，线性度变化为 0.92%，低对比度分辨率为 4mm/0.5mm，层厚偏差 0.7mm，所有指标均满足标准要求。
结论：通过对信噪比、图像均匀性、空间分辨率、线性度、低对比度分辨率和层厚的检测，可及时掌握设备的性能参数，有效保证磁共振设备始终处于良好的运行状态。

PU-3670

基于 ACR 标准的 MRI 图像均匀度及层厚的检测

付丽媛,陈自谦,陈坚,林迪奎
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的：采用 ACR 模体对 Siemens Skyra 3.0 T 与 GE Excite HD 1.5T 磁共振成像系统的图像均匀度及层厚进行测量，阐述 MRI 图像均匀度及层厚的测量方法。
方法：使用 ACR 磁共振性能模体对 2 台磁共振成像系统的图像均匀及层厚进行检测，并根据相应的测量计算方法得出检测结果。
结果：3.0T MR 和 1.5T MR 图像的均匀度分别为 96.0%和 92.7%，所侧层厚分别为 4.64mm 和 5.58mm，层厚偏差分别为 0.36mm 和 0.58mm，所测指标均满足检测标准的要求。
结论：通过对 MRI 图像均匀度和层厚的检测，可保证图像质量与层厚的准确性。

PU-3671

手运动相关脑功能皮层 BOLD-fMRI 质量控制和管理前后结果评价及相关影响因素探讨

付丽媛,陈自谦,许尚文
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 对手运动相关脑功能皮层 BOLD-fMRI 质量控制和管理前后成功率进行评价，同时探讨影响手运动相关脑功能皮层 BOLD-fMRI 结果的相关因素。
方法 回顾性分析接受手运动相关脑功能皮层 BOLD-fMRI 的 77 例受检者资料，其中质量控制与质量管理前后手运动相关脑功能皮层 BOLD-fMRI 影像资料分别为 31 例和 46 例，以试验结果是否出现合理的激活图为标准得出质控前后两组试验的成功率，并进行统计学分析。同时分析不成功的试验原因，包括：设备因素、受试者因素及其他因素。
结果 实施质量控制与质量管理后，手运动相关脑功能皮层 BOLD-fMRI 试验的成功率由质控前 67.74%上升到 86.96%，差异具有统计学意义。实施质量控制与质量管理后，受试者因素、设备因素两个方面较质控前对试验的影响明显降低，差异具有统计学意义。
结论 质量控制与质量管理对于提高手运动相关脑功能皮层 BOLD-fMRI 的成功率、降低受试者因素、设备因素对试验结果的影响具有重要的作用和意义。

PU-3672

磁共振成像的伪影及应对策略

付丽媛,陈坚,陈建新,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 研究磁共振成像图像伪影产生的原因，探讨日常工作中磁共振伪影的克服方法。
方法 收集 2009 年 10 月至 2015 年 8 月间 GE HD Excite 1.5T、Siemens Trio 3.0 T 和 Siemens Skyra 3.0 T 磁共振设备的具有代表性的伪影图像，分析伪影产生的原因，提出克服方法。
结果 磁共振图像常见的伪影主要有运动伪影、金属伪影、化学位移伪影、勾边伪影、卷褶伪影、截断伪影、交叉伪影、iPAT 伪影、拉链伪影、部分容积效应和近线圈效应。
结论 了解磁共振图像伪影的产生原因及机理，并掌握伪影的克服方法，对于提高磁共振图像质量具有重要的意义。

PU-3673

256 排 CT 在自由呼吸下对胸腹部联合扫描 图像质量和辐射剂量的影响

郭江,胡智军,魏东红
陕西省 西安长安医院

目的：探讨 Revolution CT 宽体探测器在自由呼吸下对胸腹部联合扫描图像质量和辐射剂量的影响。**方法：**收集 60 例胸腹部联合 CT 扫描的患者，并分为两组，对照组（A 组 30 例）采用憋气扫描；实验组（B 组 30 例）采用自由呼吸。两组相同参数 管电压均设置为 120Kv、噪声指数固定为

（NI）为 8、前置的 Asir-V 为 0%、后置 Asir-V 固定为 70%、自动管电流范围（80-350mA）。所有患者均记录体重指数（BMI）、CT 容积剂量指数（CTDIvol）、剂量长度乘积（DLP）、曝光时间（S）。客观评价：AW4.6 工作站测量软组织窗（1.25mm）、肺窗（0.625m），测量主肺动脉窗层面和肝门层面的各组织 CT 值和 SD 值，并记录相关数值，感兴趣区（ROI）的大小约 10mm²。主观评价：两名高年资主治医生协商一致取最终结果，采用 spss24.0 软件进行统计学分析。**结果：**两组患者基本信息均无统计学差异（p＞0.05）（表 1），两组 CTDI、DLP、ED、曝光时间比较均具有明显的统计学差异（P 均<0.05）(表 2)，客观评价均有统计学差异（P＜0.05）(表 3)，两组图像主观评价均无统计学差异（P＞0.05）(表 3)。**结论：**Revolution CT 宽体探测器、大螺距、高转速在自由呼吸下胸腹部联合扫描既保证图像质量达到诊断要求，又降低辐射剂量，缩短曝光时间，宜使用于胸腹外伤、COPD、急诊患者。

PU-3674
256 排 CT HD 扫描模式在冠状动脉支架术后 CCTA 成像应用价值

郭江,胡智军,魏东红
陕西省 西安长安医院

目的 探讨 GE Revolution CT 高清（HD）扫描模式在冠状动脉支架术后 CCTA 成像应用价值。**方法：**收集我院行冠状动脉 CTA 检查的患者共 40 例，随机分为两组各 20 例：常规对照组（A 组）和高清（HD）实验组（B）。所有患者心功能均正常，签订造影剂知情同意书。管电压（A 组 100kV,B 组 120KV），自动 mA，NI 为 28，PreASiR-V：70%。对比剂采用团注跟踪，ROI 10mm²监测层面放置于支气管隆凸下 1-2cm 的将主动脉，CT 阈值 220HU，触发扫描方式，延迟扫描时间 1.4s。对比剂碘帕醇 370mg/ml，两组碘含量按照公式 25mgI/kg/s 为标准，流速按照公式：流速=总量/注射时间 ml/s，总量=流速×注药时间（A 组为 10s，B 组为 12s）。客观评价　分别测量主动脉根部、RCA 近段、LAD 近段、LCX 近段、临近肌肉和脂肪的 CT 值和 SD 值，以肌肉为噪声背景，算出 SNR 值和 CNR 值。主观评价　冠状动脉节段的分段，AHA 修订的方法。由两名有经验的主治医师用盲法分别评价不同成像模式下冠状动脉支架、钙化斑块的图像质量，对冠状动脉支架、钙化斑块的曲面重组图像的图像质量采用 5 分制等级评分方法，评价支架、钙化斑块边缘及邻近管腔的清晰程度。采用 SPSS 24.0 软件进行统计学分析。**结果**　两组患者基本信息均无统计学差异（p＞0.05），两组患者的 CTDL、DLP、ED 均无统计学差异（p＞0.05），两组患者的主动脉根部、RCA、LAD、LCX、临近脂肪的 SNR 值和 CNR 值客观评分均无统计学意义（p＞0.05），主观评分均有统计学差异（p＜0.05）。 **结论**　Revolution CT 高清（HD）扫描对冠状动脉钙化、支架术后的图像质量优于常规扫描，且提高冠状动脉钙化斑块、支架及支架管腔情况的显示，可作为冠状动脉钙化和支架术后患者筛查和随访有效手段。

PU-3675
GE Revolution 256 排 CT 对血管内支架或骨关节金属植入物的能谱成像分析

苟瀚恒
重庆医科大学附属第三医院

利用能谱 CT 成像的基本原理：能谱 CT 成像的物理基础为：（1）X 线通过物质的衰减能客观反映 X 线的能量；（2）X 线经过物质后产生的光电效应与康普顿效应共同决定了物质的衰减曲线；（3）物质的衰减曲线呈线性关系（不包括 K 峰区域），可以选择 2 种物质作为基物质进行物质分离。能

谱成像的实现方式技术层面的临床类型（即双 KVp 成像）包括瞬时双 KVp 技术、双 X 线管技术和双扫描技术。采用双扫描或双 X 线管模式的能量成像中一个主要问题是由于能量时间分辨率不足引起的运动伪影。这种伪影出现于心脏等快速运动的器官、胃肠的蠕动及呼吸运动中。减影使这种运动伪影更加明显。双扫描或双 X 线管模式实现图像空间双能减影的另一个问题是硬化效应。由于减影图像是低电压和高电压的图像组合而成，而低电压的图像往往带有较严重的硬化效应，这样使得组合的减影图像也存在硬化效应。由于运动伪影和硬化效应的干扰，图像空间的双能减影图像中存在诸多不准确性和不确定性，使得临床应用受到很多限制。而以瞬时双 KVp 为核心技术的能谱 CT 双能量解析过程是在投影数据空间完成的，因为不受自主和不自主的运动干扰，在准确的硬化效果校正的基础上得到准确的能谱成像。
进而消除金属支架或骨关节金属植入物对周围组织的产生的伪影，使植入物周围组织显示清晰，提供准确的 CT 值，为影像诊断提供清晰准确的图像。能谱 CT 成像还可清晰还原支架或金属植入物本身形态，对临床了解血管内支架或骨关节金属植入物的结构及与周围软组织关系提供帮助。

PU-3676

幽闭恐惧症患者行 MR 检查的可行性研究

王小博
甘肃省人民医院

目的：分析研究磁共振检查中幽闭恐惧症患者心理辅导的具体方式及其应用效果。
方法：选取 2018 年 5 月～2019 年 6 月在本院接受磁共振检查的幽闭恐惧症患者共计 40 例,患者随机平均分为观察组(20 例)和对照组(20 例),对照组患者采用常规心理辅导,观察组患者在此基础上增加放松训练及心理安抚措施。对比两组患者在检查时的恐惧心理状况,检查完成情况,检查图像质量。
结果：在经过心理辅导和干预后,观察组患者与对照组患者在检查期间的负面情绪均有所下降,观察组患者检查前与检查期间的负面情绪变化明显,检查期间的负面情绪得分明显低于检查前,负面情绪得到了显著改善(P <0.05);观察组的心理辅导总有效率明显高于对照组,组间差异显著(P <0.05);检查图像质量方面,观察组得分明显高于对照组,组间差异显著(P <0.05)。
结论：磁共振检查中采用心理辅导能够有效改善幽闭恐惧症患者的心理状态,有助于磁共振检查顺利完成和保证图像质量。

PU-3677

重视高负荷急诊 CT 工作中防漏潜在的 AAS

胡晓云
无锡市人民医院

目的：探讨急性主动脉综合征（AAS）的形成机理、征象特点、影像诊断要点及实例教训，以减少漏误诊率，提高急诊影像工作质量。**方法：**分析 AAS 的概念、征象识别进展以及征象交集、转归的临床意义，归纳 AAS 的诊断要点及实例实战分析；对急诊工作技师及医师均进行上述 AAS 基础理论与实践的反复训练、以往 AAS 漏误诊经验的实战病例分享等急诊专项病种管理。**结果：**主动脉瘤、主动脉夹层及穿透性溃疡是主要 AAS 的病因，三者之间征象不仅有较多重叠、交集，也可有相互转化、转归，正确识别关键征象不仅利于准确诊断与鉴别诊断，同时也利于认识 AAS 演变的动态过程。多层 CT 增强血管成像（CTA）由于快速、便捷性，成为首选的急诊检查工具，尤其是心电门控的大视野、大螺距 CTA 技术能够提供精确的一站式诊断信息；强调急诊 CT 平扫可“意外发现”AAS

的诊断线索，经过专业反复训练后，能够极在地减少 AAS 在急诊平扫 CT 中的漏诊率。**结论：**正确认识 AAS 的关键征象有助于高负荷急诊工作状态下及时准确诊断 AAS；CTA 能够提供快速的一站式诊断信息，是首选的筛查工具。急诊 CT 平扫时更要重视中-大血管的 AAS 的潜在征象。

PU-3678
探讨 NSCLC 疗效的影像学定量评估要点及阅片人 QC 时评估结果差异的来源

胡晓云[1],Sanjeev Kumar PS[2],Peter Steiger[2],Manish Sharma[3]
1.无锡市人民医院
2.Department of Medical Imaging， Parexel International Corporation， Billerica， Massachusetts，USA
3.Department of Medical Imaging， Parexel International Pvt Ltd， Hyderabad， Telangana， India

目的：探讨非小细胞型肺癌（NSCLC）影像学评估标准的应用要点及影像评阅结果差异的常见缘由。
方法：浅析、比较肿瘤影像评估标准的发展演变过程，从 WHO 标准发展到 RECIST 和 RECIST 1.1 标准及其之间的区别。解读 RECIST 1.1 标准中的主要诊断术语解析及应用要点；NSCLC 多中心临床试验影像评估实际案例分析：28 家全球分布的多中心 890 例病例 4900 个访视点，独立影像中心采用 A、B 两组双盲独立阅片所有病例，每组由 2 名 5 年以上 RECIST 阅片经验的放射医师采用双盲一致性独立评估所有病例，评估结果不一致时由另一名同样资质的阅片人进行裁判阅片。最后，比较 2 组阅片人的结果差异，并归纳导致此差异的来源。
结果： A 组、B 组 2 组的组内阅片一致率分别为 95.7%、97.2%（P<0.05）;经裁判阅片后，两组间的评估结果一致性为 92.3%，符合 FDA 的评估要求。组内与组间的不一性的主要原因有（占 80%）：靶病灶的选择，肺内靶病灶的测量时的窗宽位，新病灶的确认；其次原因有（20%）：非靶病灶明确进展的确认；新增淋巴结病灶的判断；腹膜转移的忽略。
结论：掌握 RECIST1.1 的要点，并能科学合理的运用是 NSCLC 评估时的基础，也是评估结果差异的主要来源。

PU-3679
低剂量及低浓度对比剂注射方案在 CCTA 中的可行性研究

莫绪凯,史长征
暨南大学附属第一医院

目的 探讨 320 排 CT 冠状动脉成像使用低剂量及低浓度对比剂注射方案的可行性。**方法** 连续收集行 320 排 CT 冠状动脉成像检查的患者 150 例（男性 83 例，女 67 例），将患者随机分为三组，每组 50 例患者。A 组使用两时相 50ml 碘帕醇对比剂（370 mgI/mL）的注射方案、B 组使用三时相 39ml 碘帕醇对比剂（370 mgI/mL）的注射方案、C 组使用三时相 39ml 碘克沙醇对比剂（320 mgI/mL）的注射方案。由两位诊断经验丰富的医生对冠状动脉进行评价和分析，测量并比较主要血管 CT 值及信噪比、对比噪声比。**结果** 三组患者年龄、体重、BMI、曝光时心率、主动脉根部噪声、SNR、上腔静脉、CNR^{RCA1} 和 CNR^{LM} 比较，差异均无统计学意义（P>0.05），三组患者主动脉根部、右心房、肺动脉、右心室、RCA1、LM、心室壁 CT 值比较，差异有统计学意义（P<0.05）。三

组患者总共评价了 1822 个冠状动脉节段，冠状动脉节段图像质量评分分别为 1.22±0.53、1.21±0.51、1.27±0.64，组间比较差异无统计学意义（c2 = 0.782，*P* = 0.676）。**结论** 320 排 CT 在采用低管电压、低剂量、低浓度碘对比剂(320 mgI/ml)的情况下行 CCTA 检查，具有可行性，能以较低的碘负荷获得诊断所需图像质量。

PU-3680
胸部 CT 扫描联合专用手臂托架降低辐射剂量的对比研究

施辉友,崔学龙,陆泓宇,张小勇,王荣品
贵州省人民医院

摘要 目的 探讨胸部 CT 检查时，正确、规范双手摆放位置降低辐射剂量的对比研究。**方法** 连续收集本院行胸部 CT 检查患者 50 例，使用西门子第三代双源 CT 扫描仪进行扫描，参考管电压 100kVp，管电流 110mSv，开启自动管电压（CARE kV）及自动管电流（CARE DOSE-4D）调节技术。患者取仰卧位，头先进，头足方向扫描，进床至胸廓入口处，调整检查床高度对准腋中线；A 组常规双手置于头顶，扫描定位像，确定扫描范围，设备自动预测出扫描范围所需辐射剂量并记录其 DLP 值；B 组使用专用手臂托架（专利号 ZL 2018 2 0614969.1），将患者双手平放于托架平板上并完全伸直，扫描定位像，扫描范围同 A 组完全一致并记录 DLP 值；比较两组预测辐射剂量 DLP 值差异。**结果** A、B 两组预测辐射剂量比较差异有统计学意义（P<0.05），B 组较 A 组 DLP 下降约 20.61% 。**结论** 胸部 CT 扫描联合专用手臂托架正确摆放双手位置能有效降低辐射剂量，值得临床推广运用。

PU-3681
冠状动脉 CTA 检查中使用硝酸甘油的不良反应分析

王彬,杜凡,夏磊
东莞康华医院

【摘要】**目的** 在冠状动脉 CTA 成像中，通过舌下含服硝酸甘油扩张冠状动脉从而获得充盈良好的血管图像已经成为共识，但硝酸甘油的使用经常会产生一系列不良反应，通过回顾分析检查中使用硝酸甘油出现的不良反应，找出不良反应的发生的原因并提出相应的对策，为影像科医师使用该药物提供参考。

方法 回顾分析一年内成功完成冠状动脉 CTA 检查患者 2060 例，所有患者检前采取卧位舌下含服硝酸甘油 0.25mg,检查结束后 5 例患者不能维持自主体位，出现晕厥和意识丧失等严重不良反应，确认排除碘过敏反应和低血糖。所有患者在检查前均详细核查，确认无药物使用禁忌症。

结果 发生不良反应患者中男性 4 例，女性 1 例，年龄 51-72 岁。即往无硝酸甘油药物使用史 2 例。硝酸甘油所致低血压、低血压休克、晕厥等不良反应，是由于其是一种血管扩张剂，使回心血量减少，有效循环血量减少，产生低血压、脑供血不足，进而产生昏厥，其预防措施是采用正确的体位，宜采用平卧位，有利于增加回心血量；检查结束后离开检查床由平卧到站立位速度不易过快。发生休克的患者，要采取抗休克治疗。

结论 虽然硝酸甘油的不良反应大多见于静脉用药，但舌下含服仍有发生严重不良反应的风险。检查前要排除药物使用禁忌症，既往未使用过硝酸甘油的患者应减量使用。禁止在直立体位状态时用药，使用药物过程中监测患者脉搏血压改变情况。发生不良反应时应将患者迅速置于平卧状态，给予吸氧等治疗措施，发生休克的患者，应采取抗休克治疗。

影像科医生掌握硝酸甘油不良反应的表现、预防措施和抢救方法，可将该药物使用的风险将至最低。

【关键词】硝酸甘油；冠状动脉 CTA

PU-3682
超声造影及三维重建技术对腹壁下动脉穿支（DIEP）皮瓣血管评估的探索性研究

刘雪静
天津医科大学肿瘤医院

目的：探讨超声造影及三维重建对腹壁下动脉穿支皮瓣血管检查有效性，为运用 DIEP 皮瓣进行乳房再造术的术前穿支血管评估提供依据；探索腹壁下动脉深穿支（DIEP）血管的影响因素以及超声对于优势穿支的选择标准。研究内容：纳入本院乳腺再造科室从 2013 年 2 月至 2017 年 10 月乳腺癌患者应用 DIEP 皮瓣对胸壁组织缺损进行修复再造患者。详细记录患者的基本信息，乳腺癌病史及治疗史，术前高频彩色多普勒超声检查结果（超声测量下腹壁下动脉深穿支数、穿支部位、腹直肌前鞘处穿支点口径、血流参数），之后选用医用超声造影剂（SonoVue）肘静脉推注，采用 CDFI 模式观察穿支血管血流信号，同时标注穿支血管穿出肌肉进入腹壁脂肪层（出肌点）的体表投影位置；应用超声三维容积探头的重建技术将感兴趣区域内的穿支与主干的关系以及穿支在皮瓣的走行发布情况进行图像重建，使临床医生直观了解穿支血管情况。结果：超声造影检查是术前 DIEP 穿支血管探查可靠手段；DIEP 穿支管径与患者年龄、腹壁脂肪厚度呈正相关；血管收缩期峰值血流速度与患者穿支内径呈负相关，与患者年龄无显著相关。结论：超声造影因其无辐射、操作简捷、可重复等众多有点，在 DIEP 术前对穿支血管评估有重要的应用价值。

PU-3683
危急值记录报告流程在放射科安全管理中的价值探讨

方巧
陆军军医大学大坪医院

【摘要】 目的 探讨危急值记录报告流程在放射科安全管理中的应用价值。
资料和方法：收集我院放射科 2014 年 6 月-2016 年 7 月实施危急值记录报告流程前 180 例危急值患者为对照组，再收集我院放射科 2016 年 8 月-2019 年 2 月实施危急值记录报告流程 200 例危急值患者为观察组，对两组医疗事件发生情况及预防措施、急救流程、诊断报告及时性、临床满意度进行比较分析。
结果：观察组医疗不良事件发生率为 2.5%，对照组医疗不良事件发生率为 12.5%，两组差异具有统计学意义（P＜0.05）。对照组的诊断报告及时性明细低于观察组。对照组临床满意度为 76.25%，观察组 97.5%临床满意度为 97.5%，两组差异具有统计学意义（P＜0.05）。因我科急救流程完善，两组急救流程差异无统计学意义（P＞0.05）。
结论：在放射科安全管理中建立起完善的放射科危急值记录报告流程，能够减少医疗不良事件的发生率，提高临床满意度，该方法简单易行，值得推广。

PU-3684

单次屏气快速采集与呼吸门控触发采集 3D SPACE MRCP 图像质量的比较

杨龙
遵义市第一人民医院

目的：比较单次屏气快速采集方式与呼吸门控触发采集方式在不同屏气状况下、不同呼吸状况下成像质量的比较。**方法：**126 名患者在西门子 Skyra3.0T 磁共振上进行单次屏气快速采集与呼吸门控触发采集的 3D SPACE MRCP 检查。由检查技师通过对呼吸伪影与导航显示框的评价进而对屏气状况与呼吸状况进行定性分类，再由 2 名医师分别盲法记录、评价主观图像质量分数。**结果：**对于屏气好的患者，单次屏气快速采集 3D SPACE MRCP 的图像质量优于呼吸门控触发采集（P＜0.05）；对于呼吸规律的患者，呼吸门控触发采集 3D SPACE MRCP 的图像质量优于单次屏气快速采集（P＜0.05）；对于屏气好且呼吸规律的患者，两种采集方式比较无统计学意义（P=0.45）。**结论：**对于屏气好的患者，采用单次屏气快速采集能得到较好的图像质量；对于呼吸规律的患者，采用呼吸门控触发采集能得到较好的图像质量；对于屏气好且呼吸规律的患者，虽然两种采集方式得到的图像质量无差异，但是采用单次屏气快速采集能极大的缩短扫描时间。

320 排 CT 冠状动脉成像扫描技术及相关因素浅析

宋法亮,马静,杜向东
新疆生产建设兵团总医院

目的：分析 320 排 CT 冠状动脉成像能力及影响因素。 方法：对新疆生产建设兵团医院医学影像科 54 例(其中包括 1 例冠状动脉搭桥术后，4 例支架置入术后)受检者按心率≤55 次/min，55 次/min＜心率≤75 次/min，心率＞75/min 分为 3 组，运用 320 排 CT 在前置心电门控条件下对冠状动脉进行成像，并选择心动周期的相位窗 10%～90%，每间隔 15%进行相位窗和重建算法重建。 结果：54 例检查中显示冠状动脉血管总数为 634 节段，第一组（心率≤55 次/分）的 20 例中 240 节段血管全部显示，显示率达 100%，所有显示血管节段均可用于评价；第二组（55 次/min＜心率≤75 次/min）的 27 例中共显示 324 段血管，显示率达 96.1%，其中 6 段血管节段不满足评价标准，占所有血管节段的 1.9%；第三组(心率＞75 次/min) 的 7 例中共显示了 84 段血管，显示率达 95.2%，其中有 7 段血管节段不满足评价标准，占所有血管节段的 8.8%。 结论：在控制心率(75 次/min)下，16 层螺旋 CT 能有效显示冠脉及大部分支，是无创、简便、优良、准确的冠状动脉成像方法。

CEST 心脏磁共振技术用于评估系统性轻链型淀粉样变病人心肌受累的可行性研究

黄思思[1],李潇[1],Zhengwei Zhou[2],Linda Azab[2],Zixin Deng[2],Debiao Li[2],安靖[3],李剑[1],王怡宁[1],金征宇[1]
1.中国医学科学院北京协和医院
2.Biomedical Imaging Research Institute， Cedars-Sinai Medical Center， Los Angeles， USA
3.西门子（深圳）磁共振有限公司

目的：化学交换饱和转移（CEST）影像技术用于心脏磁共振中可通过检测肌酸的信号反应心肌代谢，本项研究目的在于探究 CEST 心脏磁共振技术用于诊断系统性轻链型淀粉样变病人心脏受累的可行性。
方法：研究共纳入了 40 位病理诊断的系统性轻链型淀粉样变性病人以及 21 位正常对照。对其进行 CEST 心脏磁共振扫描，测定心肌平均 CEST 信号强度；同时病人组接受了增强心脏磁共振扫描。
结果：和正常对照相比，伴有心肌延迟强化的病人中心肌 CEST 值明显减低(0.116 ± 0.022 vs 0.090 ± 0.002, P <0.001)，并且 CEST 显著减低的部位与延迟强化区域具有较好的一致性。而不伴延迟强化的病人其 CEST 值与对照组无明显差异(0.116 ± 0.022 vs 0.115 ± 0.030, P =0.969)。
结论：对于系统性轻链型淀粉样变性，有延迟强化的病人其心肌 CEST 值较正常对照明显减低。CEST 心脏磁共振有望成为评估轻链型淀粉样变性病人心脏受累的平扫参数。

放射检查分层管理的实践经验分享

詹松华
上海中医药大学附属曙光医院

目的：探索放射科众多检查的分层管理，将特殊检查归类于放射科医生与临床医生合作的检查项目，促进特殊检查成为放射科技术水平提升的桥梁。

材料与方法：将放射科各项检查氛围普通检查和特殊检查两大类，各亚专业的放射医师提出特殊检查的种类，制定特殊检查的目的、技术方法、适应症、负责人联系方式等一系列关键信息，与相关科室临床医生沟通，将特殊检查推广使用，参与临床各种疑难疾病解决的过程，是临床医生参与到检查结果分析中来，融入到临床各科室的诊疗过程中，提高特殊检查在解决临床特殊、疑难疾病中的作用。

结果：通过与临床广泛沟通，放射科推出了 70 多项特殊检查项目，受到临床的广泛欢迎，放射科技术水平和临床解决特殊、疑难疾病的能力空前提高，放射科医生走向临床第一线诊疗过程成为自

然的现象，放射科检查质量不断提升，在全院的学术影响力不断提升，也为放射科亚专业科研开展提供了坚强的基础。

结论：放射科检查分层管理是切实可行的，对放射科、临床各科的技术水平提高都十分有利。

PU-3689
急性肠系膜血管血栓致小肠透壁性梗死的相关危险因素分析

祝菲,陈卫霞
四川大学华西医院

目的：探讨急性肠系膜血管血栓患者的临床资料及 CT 平扫影像特征在预测小肠透壁梗死中的价值。
方法：回顾性分析 2011 年 4 月至 2018 年 12 月期间我院诊断为急性肠系膜动脉血栓或肠系膜静脉血栓的病例 75 例，对可能预测患者发生透壁性梗死的临床资料及 CT 平扫影像特征进行单因素及多因素分析。
结果： 单因素分析结果显示，与无透壁性梗死组比较，有透壁性梗死组出现呕吐（P=0.009）、肠壁变薄（P=0.011）、肠腔扩张（P=0.001）、小肠粪便征（P=0.040）、肠壁内积气（P=0.026）及肠系膜血管管腔密度增高（P=0.003）的比例较高。性别、年龄、腹痛、腹胀、腹泻、恶心、是否伴结肠缺血、发病到检查时间、发病到手术时间、糖尿病、房颤、低蛋白血症、腹膜炎、多器官功能衰竭、红细胞计数、红细胞分布宽度、血小板计数、白细胞计数、中性分叶核粒细胞绝对值、国际标准化比值、甘油三酯、胆固醇、高密度脂蛋白、低密度脂蛋白、碱性磷酸酶、肌酸激酶、乳酸脱氢酶、羟丁酸脱氢酶、肠壁密度增高、肠壁增厚、靶征、肠系膜模糊、腹水、气液平、其它器官受累这些临床资料及 CT 平扫影像特征在有透壁性梗死组和无透壁性梗死组的差异均无统计学意义（P>0.05）。多因素 logistic 逐步回归分析结果显示，呕吐（P=0.015）、肠腔扩张（P=0.002）及肠系膜血管管腔密度增高（P=0.003）是预测透壁性梗死的独立危险因素。
结论：呕吐、肠腔扩张及肠系膜血管管腔密度增高是预测急性肠系膜血管血栓所致小肠透壁性梗死的独立危险因素，对小肠不可逆的透壁性梗死的预测有助于治疗方案的选择和预后的有效评估。

设立不良事件登记本，降低不良事件发生率

贾丽峰,韩美蓉,张宏
山西省儿童医院/山西省妇幼保健院

目的：通过登记不良事件，总结事件类型、分析事件原因、提出改进方法来降低不良事件的发生率。
方法：建立一个不良事件登记本，登记发生不良事件的基本信息、事件类别、发生原因、不良后果、导致事件的可能原因、事件的处理情况（提供补救措施或改善建议），并记录当事人职称、姓名、工作年限（方便了解哪类人员容易发生不良事件，并帮助改进）。每半年统计一次不良事件登记本，将不良事件按类别，发生次数排列。分析不良事件发生次数最多的原因（是人为因素，还是客观因素），讨论改进方法，制定方案实施。
总结：3 个月或半年后检验方案是否有效，发生次数最多的不良事件是否有所减少。如果方案有效，则继续统计、分析这半年新登记的不良事件次数最多类别发生原因，讨论改进方法，制定方案

实施，以此循环。最后统计发生不良事件最多的人员名单，了解当事人是因为什么原因导致的发生不良事件，并帮助他（她）减少和避免类似的不良事件发生。
结论：通过设立不良事件登记本，能有效的统计不良事件发生原因及易发人员，并通过分析讨论，制定方案来减少不良事件的发生率。

动态 500 排在肺动脉强化中的应用

李行超,邵广瑞
山东大学第二医院

目的：普通肺动脉强化中通常使用监测肺动脉螺旋扫描的方法。由于病人血液循环快慢不同，一期肺动脉扫描经常会出现肺动脉与静脉同时显影，甚至肺静脉 ct 值会超过肺动脉 ct 值，给诊断带来影响。有没有另一种方法可以更好的扫描肺动脉呢？本文就利用宝石能谱 ct 上的动态 500 排技术对肺动脉增强扫描方法做下简介。
方法：胸部普通螺旋扫描过后找到上腔静脉，将其所在位置作为监测面，准备追踪扫描，其中准备时间设为 0，间隔时间设为 1，感兴趣区放在上腔静脉，阈值设为 50，打开动态 500 排功能，扫描次数设为三期。关掉自带语音，采用技师语音控制病人呼吸。进行增强扫描。
结果：三期扫描通常可得到肺动脉显影不充分的，肺动脉显影良好的，肺动脉与肺静脉皆显影的图像，此时可根据临床需要选择性的后处理。且由于动态 500 排的特性，患者接受这种扫描所受剂量并不大。
结论：监测上腔静脉使用动态 500 排增强扫描肺动脉具有很好的效果。

PU-3692

应用 ARMS 技术改良肩关节的图像质量

马一鸣
南京大学医学院附属鼓楼医院

目的　　评估和使用联影磁共振 ARMS（Acquision and Reconstruction with Motion Suppresion）技术在提高和改良肩关节 MRI 总体图像质量 、减少及限制运动伪影方面的作用和临床价值。方法 使用联影 uMR770 磁共振机器采集肩关节图像，收集我院 2016 年 1 月至 2017 年 1 月共 300 例肩关节数据，分析常规 FSE PDW 图像与 ARMS PDW 图像 。图像由 2 位医学影像科诊断医师和 2 位临床骨关节医生分别对图像伪影（血管搏动 、运动、呼吸 ） 、图像总体质量和肱二头肌边缘颗粒度和软化度进行 Rensis A Likert 5 分量表法评分 。常规 PDW 扫描和相同方位的 ARMS 图像对比后采用 Wilcoxon 符号秩检验 。 结果:运用 ARMS PDW 序列图像，评分范围 3.01 ～ 4.00 ，平均值 3.68 ，其中呼吸、运动、血管搏动伪影等平均分均在 3 分以上（P＜ 0.05），图像质量得到明显提高，伪影得到改善或消失。而常规 FSE PDW 扫描序列评分范围 2.54～3.00，平均值 2.76 分 。结论 通过与对比组的参照 ，ARMS 实验组评分优于对比组。运用 ARMS 技术在核磁共振肩关节扫描中，可以减少图像伪影，提高图像整体质量。

同源双功率成像技术降低对比剂剂量及流速的实验研究

玉权

贵州省人民医院

[摘要]
目的 对比贵州小型猪腹部的不同增强扫描模式，探讨同源双功率成像技术降低对比剂总量及流速的可行性。
材料与方法 对 8 只贵州小型猪腹部重复行 A、B、C 三组 CT 增强扫描，每次间隔时间一周，A 组：常规扫描组，开启 Care Dose 4D、Care kV ，参考电压 100 kV、参考电流 160 mAs，对比剂总量按 1.0 ml/kg，流速 1.5 ml/s；B 组：Dual source dual power 技术扫描，A/B 球管电压均固定为 70kV、开启 Care Dose 4D、参考管电流 160mAs，对比剂注射方案同 A 组。C 组：对比剂总量及流速均按 A 组减半为 0.5ml/kg、0.7ml/s，其余条件同 B 组。比较 A、B、C 三组对比剂总量、流速、辐射剂量及图像质量等。
结果 对比剂总量、流速的比较，A、B、C 三组间存在统计学差异（P<0.05），C 组较 A 组对比剂总量、流速降低 47.6 % 、66.7 %；辐射剂量（ED)的比较，A、B、C 三组间存在统计学差异（P<0.05），与常规扫描 A 组比较，C 组辐射剂量（ED)降低 31 %，而 B、C 两组无统计学差异（P>0.05）；图像质量的比较，A、B、C 三组无统计学差异（P>0.05）。
结论 腹部增强扫描中应用同源双功率成像技术能减少对比剂总量及降低注射流速，同时还能降低辐射剂量并保证图像质量，值得临床推广。

PU-3694
不完整包膜预测肝细胞癌微血管侵犯的 META 分析

祝菲[1],杨帆[2],李静[1],陈卫霞[1],杨薇霖[1]
1.四川大学华西医院
2.成都市第一人民医院

目的：探究肿瘤不完整包膜、完整包膜和无包膜与微血管侵犯的关系，为微血管侵犯的预测提供重要价值。
方法：在 Medline (by PubMed) 和 Embase (by OvidSP)数据库进行文献检索，运用 Stata V.13、Meta-Disc 1.4 和 Revman5.3 这三个软件进行统计分析。
结果：总共检索到 451 篇文献，最终纳入 15 篇文献，8 篇来自数据库检索的文章，7 篇来自文献的参考文献。META 分析结果显示，不完整包膜是微血管侵犯的危险因素[DOR=1.85 (1.13, 3.04)]，完整包膜是微血管侵犯的保护性因素[DOR=1.97 (1.01, 3.86)]，无包膜与微血管侵犯的关系没有统计学意义[DOR=0.90 (0.64, 1.26)]。CT 和 MRI 的亚组分析结果显示，在 MRI 组中，不完整包膜是微血管侵犯的危险因素[DOR=1.98 (1.00, 3.93)]，完整包膜是微血管侵犯的保护性因素[DOR=2.05 (1.19, 3.55)]，无包膜和微血管侵犯的关系没有统计学意义；在 CT 组中，不完整包膜、完整包膜和无包膜与微血管侵犯的关系都没有统计学意义。
结论：对于肝细胞癌微血管侵犯的预测，不完整包膜可能是个危险因素，完整包膜可能是个保护性因素，无包膜与微血管侵犯没有关系。这个结果的原因可能是不完整包膜的保护性因素与完整包膜的危险性因素相抵消，导致无包膜与微血管侵犯没有关系。

PU-3695
下腔静脉及从属性静脉对比剂淤积征

曹晖,张乐天
陆军军医大学大坪医院

目的：危重患者接受 CT 增强检查可以得到更明确的诊断，在这个过程中患者可能伴有心源性休克或突发心脏骤停、急性心功能不全。该类患者的增强ＣＴ影像有其显著特点，即“下腔静脉及从属性静脉对比剂淤积征”。及时识别该征象可以争取抢救时机。
方法：密切观察患者动脉期血管强化情况。如患者右房或右室无造影机充盈应立刻停止检查。排除连接管脱落或造影机渗漏等情况。若患者呼之不应，意识突然丧失或伴有短阵抽搐；大动脉（颈动脉、股动脉）搏动消失，应马上就地抢救。
结果
病例 1：患者做胸腹部增强时采用追踪法。追踪层面里上腔静脉逐渐出现高亮的造影剂液平面，胸部少数静脉也出现高亮情况。

病例 2：患者做全腹部增强时采用延迟法。CT 增强显示患者心脏除右房内均无造影剂；肝静脉、门静脉、右肝均有对比剂淤积；右肾静脉、下腔静脉造影剂淤积。

病例 3：患者做胸腹部增强时采用延时法。动脉期出现与病例 2 相同影像，立即停止检查观察病人情况。发现患者意识良好。随后采用追踪法再次扫描，发现右房强化后，右室缓慢充盈并逐渐强化。最终该患者诊断为心包内血肿导致心功能不佳，并在增强时出现从属性静脉对比剂淤积征。

结论：CT 增强扫描过程中密切观察患者图像。如仅发现右心房有造影剂，右心室没有造影剂：并伴随下腔静脉及从属性静脉有高密度造影剂淤积时，应立即观察患者身命体征，如有需要立即抢救。

PU-3696

320 排螺旋 CT 在儿童和危重症病人扫描的优势

梁鹏鹏,高向东
山西省太原市中心医院

1.极快的扫描速度可在 1 秒内完成单器官检查，10 秒内高速完成全身检查，无创完成心脏检查，为急、危重病人的抢救赢取时间。
2.图像清晰度高，对小病灶显示清晰精准。图像分辨率高。
3.多脏器功能的分析，脑缺血性疾病，急性脑梗塞的灌注，腹部实质脏器灌注等方面的应用检查，时间快，显示效果好。使得 ct 检查从单纯形态学诊断发展进入到功能诊断。
4.低辐射。部分器官如颞骨可在 0.35 秒内完成，时间短，辐射剂量低。
5.安全性高，对患者损伤小。如冠状动脉的筛查及搭桥，支架术后的复查。
6.常规体检。如低剂量胸部扫描，可以及时发现肺部小结节。
7.二三维后重建更可以多方位多角度对病灶进行全面分析。

PU-3697

探讨脊柱全长摄影技术的应用

张晨晔,邵广瑞
山东大学第二医院

目的 探讨脊柱全长摄影技术的应用

方法 对 100 例脊柱侧弯患者进行 dr 脊柱全长摄影，大多数患者胸椎侧凸，部分患者腰椎侧凸。首先在图像上确定侧弯脊柱的端椎，上端椎上缘划横线，下端椎下缘划横线，对比两线做垂直，上述横线或垂线的交角即为 COBB 角。
结果 测量 COBB 角进行分析。COBB 角小于 10 度为阴性，10 度到 20 度为阳性，大于 20 度为显阳性，一般临床会根据 COBB 角进行临床上的矫正治疗。
结论 脊柱全长摄影对脊柱侧弯检查有很大帮助。

PU-3698
低 KV 低流率联合 ASIR-V 重建算法应用不同浓度对比剂对肺动脉 CTA 图像质量影响的初步研究

刘凌翀,李伟
山东第一医科大学第一附属医院（山东省千佛山医院）

目的 低 KV（80KV）低流率（3.5ml/s）联合 50%ASIR-V 重建算法的技术前提下，比较低浓度对比剂威视派克 270、一般浓度对比剂碘帕醇 300 和高浓度对比剂碘帕醇 370 在肺动脉 CTA 图像质量的影响。**方法** 共纳入我院 2019 年 1 月 1 日至 7 月 1 日共 60 例患者行低 KV 低流率联合 ASIR-V 重建算法的肺动脉 CTA 检查；随机分为 3 组：A 组 20 例采用威视派克 270，B 组 20 例采用碘帕醇 300，C 组 20 例采用碘帕醇 370，三组扫描范围包括全肺动脉，扫描方向采用足头方向。肺动脉期扫描采用对比剂跟踪阈值触发技术。经右前臂静脉采用 18G 静脉留置针预注射生理盐水 16ml。感兴趣区设置于上腔静脉，阈值 130HU，团注速率 3.5ml/s，延迟时间 4s，共使用对比剂 30ml。扫描完成后采用 RevolutionCT 基于多模型的迭代重建算法（ASIR-V）50%进行图像重建。扫描比较三组的质量评分，肺动脉各段 CT 比值、图像信噪比（SNR）、图像载噪比（CNR）、碘用量及注射后的不良反应。**结果** C 组的主观质量评分高于 B 组和 A 组（P<0.05）；C 组的 CNR 和肺动脉的 CT 值高于 B 组和 A 组，B 组高于 A 组（P<0.05）；三组的 SNR 的比较差异无统计学意义（P>0.05）；A 组有效碘用量高于 B 组和 C 组，B 组有效碘用量高于 C 组（P<0.05）。**结论** 低 KV（80KV）低流率（3.5ml/s）联合 50%ASIR-V 重建算法的技术前提下，肺动脉 CTA 采用追踪扫描法联合低浓度对比剂可以提高有效碘用量降低对比剂的不良反应，并且保证图像质量，具有可行性。

PU-3699
MRI 定量评价直肠扩张对前列腺 T2WI 及 DWI 成像质量的影响

李亮,曾菲菲,龚 威,黄冬杰,刘昌盛,查云飞
武汉大学人民医院

目的 MRI 定量评价直肠扩张对前列腺 T2WI 及 DWI 成像质量的影响。**资料与方法** 2017 年 8 月至 2018 年 5 月期间，回顾性分析 236 例来我院就诊行前列腺 MRI 检查患者图像资料。由两名阅片者采用双盲法对 MRI 图像进行客观及主观评价，评价参数包括直肠体积、直肠负荷、T2WI 成像锐利度、T2WI 成像伪影、DWI 成像伪影和 DWI 成像变形。T2WI、DWI 及 ADC 图总体成像质量评价采用 Likert 5 分法。直肠扩张程度与前列腺 MRI 图像质量参数的相关性比较采用 Spearman 相关性分析。两位阅片者评分间的一致性评价采用 κ 检验。**结果** 两位阅片者在评价前列腺 MRI 直肠负荷、T2WI 质量、DWI 质量、DWI 伪影、DWI 变形及 ADC 质量评分的 κ 值分别是 0.87、0.84、0.77、0.71、0.73、0.73。直肠负荷与直肠前后径、体积呈正相关，r 值分别为 0.883、0.819（P 值均<0.05），与直肠左右径、上下径并无相关性（P 值均>0.05）。DWI 成像质量与直肠负荷显著相关（r= -0.628，P< 0.01），与直肠体积亦相关（r= -0.552，P<0.01）。DWI 成像变形与直肠负荷

相关（r= 0.814，P<0.01），与直肠体积亦相关（r= 0.887，P<0.01）。DWI 成像伪影与直肠负荷相关（r= 0.425，P<0.05），与直肠体积显著相关（r= 0.614，P<0.01）。直肠扩张导致 T2 运动伪影增加（P<0.05），但并没有显著影响 T2WI 成像的锐利度（P>0.05）。**结论** 直肠扩张影响前列腺 T2WI 及 DWI 的成像质量，在临床上行前列腺 MRI 检查前，必要的的肠道准备，可能将有助于提高图像质量。

PU-3700

不同呼吸指令对肺动脉 CTA 强化效果的影响

孙占国,陈月芹,亓志莹,周贤贤,程寒寒,姜鑫
济宁医学院附属医院

目的 探讨肺动脉 CTA（CTPA）扫描时不同呼吸指令对肺动脉强化效果的影响。方法 本研究经医院伦理委员会批准。根据纳入标准和排除标准，连续纳入我院疑诊肺栓塞行 CTPA 检查的患者，记录性别、年龄、身高、体重，计算体重指数（BMI）。根据肺动脉期 CTA 扫描采用的呼吸指令不同随机分为三组：A 组，深吸气后屏气；B 组，平静呼吸下轻屏气；C 组，自由呼吸下扫描。所有患者均采用西门子双源 CT 完成检查，扫描参数一致，自动触发阈值 100Hu，感兴趣区为主肺动脉。采用双通高压注射器经右肘静脉注射碘克沙醇注射液（320mg I/ml）70ml，追加生理盐水 30ml，注射速率 4.5 ml/s。工作站测量主肺动脉 CT 值，测量面积 200 ㎜²，3 次测量取均值。评估有无肺动脉栓塞、有无严重肺气肿。结果 共 192 例患者纳入本研究，其中 A 组 84 例、B 组 52 例、C 组 56 例，各组间一般资料、肺栓塞检出率、严重肺气肿检出率比较均无统计学差异。三组肺动脉干 CT 值分别为 311.42±77.49 Hu、341.94±82.10 Hu、345.77±66.16 Hu，差异具有统计学意义（F=4.392，P=0.014）。两两比较，A 组肺动脉 CT 值小于 B 组和 C 组，差异均有统计学（P 值分别为 0.023、0.009），B 组与 C 组差异无统计学意义（P=0.793）。A 组主肺动 CT 值（Y）与性别（X_1）、年龄（X_2）、BMI（X_3）、肺气肿（X_4）的多元线性回归分析显示：深吸气后屏气扫描时，BMI、肺气肿对肺动脉 CT 值有影响（P＜0.05）。回归方程为 $Y=408.41-4.96\ X_3+47.47\ X_4$，标准化方程为 $Y'=-0.238X_3+0.305X_4$。结论 传统的深吸气后憋气扫描可导致肺动脉强化程度减低，肥胖患者易受影响，肺气肿则为保护因素之一，平静呼吸下轻屏气或自由呼吸下扫描能够改善肺动脉强化效果。

PU-3701

血压对 CT 检查头颈血管成像的影响

胡强
武汉大学中南医院

摘要：目的:探讨在 CT 检查中血压对头颈血管成像的图像质量影响情况 **方法**：以我院近一月内门诊 113 例急诊 CT 头颈血管成像检查为例，检查前先询问受检者的基本病情，签署 CT 增强知情同意书，均在 GE64 排 CT 上扫描，使用头颈 CTA 扫描协议，采用造影剂实时监控触发技术进行检查，监测升主动脉起始段，阈值设定为 120HU，在受检者右侧肘静脉打 18G 留置针，造影剂为碘海醇，药量总量为 50ml，流速为 4.5ml/s,后续生理盐水总量为 25ml，流速为 4.5ml/s,注射药的同时按下扫描键监测阈值，到达阈值自动触发扫描头颈血管，然后以其第一期扫描图像质量作对比 **结果**：113 例 CT 头颈血管成像检查中，其中有 55 例患者平时血压情况良好，在正常血压范围值内，触发扫描时造影剂已经注射完毕，生理盐水已注射一半，其图像的头颈动脉显影清晰，伴有头颈静脉未显影或轻微显影，可以对头颈动脉血管清晰诊断；有 49 例患者有不同程度的高血压，触发扫

描时造影剂已经注射完毕，生理盐水也即将注射完毕，其头颈动脉成像近心端显影清晰，远心端小分支血管显影欠清晰或者不显影，可以对头颈大血管进行诊断；有 9 例患者血压偏低或有心功能偏差，触发扫描时造影剂已经注射完毕，生理盐水注射完毕，其头颈动脉成像只有近心端显影模糊或并未显影，头颈静脉并未显影，无法对头颈大血管诊断 **结论**：CT 检查中，血压对头颈血管成像的图像质量有着一定的影响。血压影响着体内血流的速度。同等情况下，对于多数血压增高患者，其血流速度相对减慢，提高阈值延迟触发扫描或者减慢造影剂注射速度，同样可以获得清晰地头颈动脉影像

PU-3702
急诊与复查多层螺旋 CT 对肋骨骨折诊断价值的对比分析

章淑兰
三明市第一医院

目的：探讨急诊多层螺旋 CT(MSCT)对肋骨骨折的诊断价值及限度.
方法：回顾性分析我院 2018、2019 年肋骨骨折影像资料,采用 Wilcoxon 配对符号秩和检验比较两次检查诊断结果的差异.
结果：急诊 MSCT 诊断肋骨骨折数 291 处,其中完全性骨折 187 处,不完全性骨折 104 处;复查 MSCT 诊断肋骨骨折数 334 处,其中完全性骨折 203 处,不完全性肋骨骨折 131 处.以复查 MSCT 为标准,急诊 MSCT 对肋骨骨折的检出率为 87. 12% (291/334).两次诊断在肋骨骨折总数、完全性骨折及不完全性骨折数方面均差异有统计学意义(Z= -4. 35、-2. 94、-3. 63,P=0. 000、0. 003、0. 000).
结论：MSCT 是肋骨骨折诊断的重要手段,但急诊 MSCT 对肋骨骨折诊断存在着一定的限度,肋骨骨折病人复查 MSCT 是有必要的.

PU-3703
研究者及感兴趣区对 IDEAL-IQ 评价肝脏脂肪定量的影响研究

洪居陆,陈婉雯,曾成龙,卢瑞梁,高明勇,贺小红
佛山市第一人民医院（中山大学附属佛山医院）

目的：探讨不同工作年限研究者及感兴趣区对 IDEAL-IQ 评价肝脏脂肪定量的影响。**方法**：应用 GE Discovery MR750W 3.0T 超导 MR 扫描仪的 3D IDEAL-IQ 序列获得脂肪分量图，由 3 名不同工作年限（1 年、4 年和 11 年）的研究者，以 3 种不同面积（10 mm^2、25 mm^2和 50 mm^2）的感兴趣区（ROI），分别测定符合研究标准的脂肪分量图的 PDFF，使用单因素方差分析和信度分析进行统计学分析。**结果**：3 名研究者测定的 PDFF 和按 3 种面积 ROI 测定的 PDFF，经单因素方差分析，差别均无统计学意义。同一名研究者分别以 ROI 面积 10 mm^2、25 mm^2、50 mm^2测定同一组资料，经信度分析，alpha 系数均＞0.8 和 ICC 均＞0.75，说明在不同面积 ROI 条件下测定的 PDFF 有很高的可信度和可重复性；同一面积 ROI，由 3 名研究者分别测定同一组资料，alpha 系数均＞0.8(分别为 0.998，0.994，0.997，0.982，0.985，0.984)和 ICC 均＞0.75(分别为 0.994，0.981，0.992，0.951，0.957，0.953)，说明不同研究者在同一面积 ROI 下测定的 PDFF 亦有很高的可信度和可重复性。**结论**：**研究者**工作年限和 ROI，对 IDEAL-IQ 序列评价肝脏 PDFF 无影响，具有极高的可信度和可重复性。

PU-3704
定量磁敏感成像 TE 与图像质量、磁化率的相关性研究

洪居陆,陈婉雯,高明勇
佛山市第一人民医院（中山大学附属佛山医院）

目的 探讨定量磁敏感成像中 TE 与图像质量、磁化率的相关性。**方法** GE ADW4.6 工作站 QSM 模块中，阈值为“0.06”，对 21 例研究对象按回波数量（1～4 个）分为 A～D 组，分别重建出对应的磁敏感图，评价的左侧苍白球（GP）的图像质量、磁化率，分析回波组合数量、TE 与图像质量及磁化率变化关系。**结果** 4 组图像质量评分、磁化率与 TE 的变化曲线基本重叠。当 TE 为 16.4 ms～39.7 ms 时，A、B、C、D 组图像质量评分平均值均≥2.5 分。磁化率随 TE 的变化呈类似抛物线样曲线变化。当 TE 为 29.7 ms～48.0 ms 时，磁化率曲线趋于水平走行，磁化率值趋于稳定。当 TE≥21.4 ms 时，4 组磁化率与模块默认回波序号组合（“14/15/16”）的磁化率差异无统计学意义。**结论** 图像质量、磁化率与回波组合数量无关；当 TE 为 29.7～39.7 ms 时，图像质量优秀，磁化率一致性好，且不随 TE 变化而改变。

PU-3705
影响 DR 摄影图像质量的因素及控制措施的探讨

伍希,李征,马绍文,吴蓉
湘雅常德医院

目的：探讨影响 DR 摄影图像质量的因素及控制措施。
方法：随机抽取本院 2019 年 6 月 DR 摄影图像 200 例，根据 X 线质量控制评分统计，甲级片 130 例（65.0%），乙级片 48 例（24.0%），丙级片 20 例（10%），废片 2 例（1%）,其影响因素大致可分为四类，分析如下：一、摄影前患者准备未做好。检查前应嘱咐患者去掉身上异物，在胸腹部摄影时训练呼吸，应用吸气、呼气、屏气曝光获得良好图像。二、摄影时摆位不标准、中心线、照射野及摄影距离不对导致被检部位显示欠佳。操作者应加强理论学习及操作训练，熟知各部位摄影体位及方法，选择合适照射野、摄影距离及中心线。三、曝光条件过高或过低。操作者应根据不同患者组织密度及厚度的不同适当调整 KV、mAs 等曝光条件，学会灵活运用。四、图像后处理不佳。操作者应确认左右标识正确，合理使用平滑锐化，选择合适的对比度及亮度，并运用裁剪功能。
结果：将以上 2 例废片的检查者再次进行同部位拍摄，在改变以上所述参数后，图像质量明显提高，按照以上标准拍摄，再随机抽取 200 例 DR 摄影图像进行质量控制分析，得到甲级片 160 例（80.0%），乙级片 32 例（16.0%），丙级片 8 例（4%）废片为 0。整体图像质量明显提高。
结论：摄影前准备、摄影体位、中心线、照射野、摄影距离、曝光条件及图像后处理为影响 DR 摄影图像质量的重要因素，操作者应选择正确的体位及参数，获取优质的 X 线图像。

PU-3706
基于情景模拟的静脉肾盂造影的影像质控

汪可馨
陆军军医大学大坪医院

目的：探讨技师情景模拟对提高静脉肾盂造影影像质量的影响
方法：连续 3 个月对普放组技师进行静脉肾盂造影情景模拟，由一名技师扮演被检者，另一名技师对其做静脉肾盂造影模拟检查。包括：①检查前准备：肠道准备情况询问、患者基本信息询问、异物去除；②体位设计：仰卧位，双下肢伸直，正中矢状面与暗盒长轴中线重合，双臂置于身体两

侧，中心线对准脐下 1cm；③曝光条件、呼吸模式设计、压迫点选择；④造影剂剂量的设计、注射造影剂后摄片时间的选择；⑤图像质量判断、过敏反应的判断和处理。其余技师对整个模拟过程进行评价并提出意见讨论，所有技师轮转进行情景模拟。同时高年资诊断医师根据统一标准对当月所有静脉肾盂造影图像进行评分，根据影像范围、图像对比度、解剖结构显示、图像中心显示、造影剂注入后摄片时间、标识放置、伪影等进行评分。
结果：①连续三个月技师出错率、患者过敏发生率逐月下降；②技师图像质量平均评分逐月提高；③同一技师图像质量评分逐月提高。
结论：全科技师情景模拟及每月质控能够提高静脉肾盂造影的影像质量，值得广泛推广。

PU-3707
HIFU 治疗单发性子宫肌瘤的影响因素与安全性及有效性分析

赵卫,范宏杰
昆明医科大学第一附属医院

【目的】探讨子宫肌瘤 HIFU 消融的影响因素。
【方法】回顾分析 234 例症状性单发子宫肌瘤 HIFU 治疗资料。治疗前 MRI 观察子宫位置，肌瘤部位、体积、T2WI 信号、强化类型、靶皮距、后场距。HIFU 消融并记录消融参数和不良反应（AEs）、能效因子（EEF）、肌瘤非灌注区体积（NPV）及非灌注区体积比率（NPVR）。可能影响消融的因素为自变量，EEF 和 NPVR 为因变量，建立多重线性回归模型。随访消融前后症状严重程度（SSS）、相关生活质量（UFS-QOL）、肌瘤体积变化，方差分析评价疗效。
【结果】患者年龄 37.73±6.29 岁。肌瘤体积 93.66±76.46cm3。治疗成功率 100％，EEF 7.13±5.13j/mm3。治疗后 NPV 69.67±61.99cm3、NPVR 74.74±15.15%。结果：EEF 与 T2WI 低 SI、肌瘤最大径、前位子宫呈负相关，与贯穿型肌瘤、强化程度、靶皮距呈正相关； NPVR 与贯穿型肌瘤、T2WI 高 SI、强化程度、靶皮距呈负相关，与前壁肌瘤、T2WI 低 SI 呈正相关。
AEs44.44%，SIR A 85.90%、B 11.11%、C 1.71%、D 1.28%、无 E 及 F，其中皮肤灼伤 24 例（10.26%），2 例需治疗，其余自行康复。随访完整的 49 例治疗前及后 1、3、6 个月，SSS、QOL、平均肌瘤体积，均随时间明显下降（$P<0.05$）。
【结论】HIFU 消融症状性单发子宫肌瘤可显著减轻症状，提高生活质量，缩小或消除肌瘤。EEF 和 NPVR 受声通道、肌瘤及子宫位置、肌瘤成分等多因素的影响。前位子宫，T2WI 低 SI、大直径、小靶皮距的消融效率高。前壁、T2WI 低 SI、CET1WI 轻度强化、靶皮距小的易达高 NPVR。AEs 一般轻微，严重 AEs 罕见。

PU-3708
基于不同水平自适应迭代重建技术的肋间后动脉成像图像质量比较

姜永宏,左秀娟
西安市红会医院

目的 探讨宝石 CT 能谱成像（GSI）不同水平自适应迭代重建技术对提高肋间后动脉图像质量的可行性，为 CT 引导经皮穿刺活检术提供指导。**方法** 回顾性收集我院 30 例患者使用 GE 公司的宝石能谱 CT(Discovery CT750HD)行 CT 增强扫描图像，其中男 15 例，女 10 例，年龄 28-60 周岁，平均 55.91±12.95 岁。分别采用自适应统计迭代算法（ASIR）将数据重建为 0-80%（间隔 20%）不同 ASIR 权重的 5 组图像，重建层厚为 0.625mm，并传至 ADW 4.6 后处理工作站用于分析。分别在不同

ASIR 权重的 5 组图像测量中肋间后动脉 CT 值、噪声、对比噪声比（CNR）、信噪比（SNR）。由两名副高级及以上职称放射科医生使用双盲法进行主观评价，在相同的窗宽、窗位下对 0% ASIR、20% ASIR、40% ASIR、60% ASIR、80% ASIR 重建图像进行主观评价。所获图像采用 SPSS 22.0 软件进行统计学分析。**结果** 随着 ASIR 权重的增高，SNR 与 CNR 值也在逐步增高。与 0%ASIR 组相比，20% ASIR、40% ASIR、60% ASIR、80% ASIR4 组图像的肋间后动脉 SNR 分别提高了 31.24%、38.19%、44.49%、50.47%。20% ASIR、40% ASIR、60% ASIR、80% ASIR 4 组图像肋间后动脉 CNR 分别提高了 33.86%、40.58%、46.63%、52.25%。其中 80% ASIR 的图像噪声最低，SNR 值、CNR 值最高。两位放射科医师对 5 组图像中 60% ASIR 的评分最高。**结论** 能谱扫描模式在不同权重肋间后动脉血管成像中，肋间后动脉血管成像的最佳 ASIR 权重水平为 60%。60%权重水平图像明显优于其他权重图像的图像质量，可以提高肋间后动脉的显示，便于 CT 引导下经皮穿刺活检术及胸腔穿刺在安全范围内进行，有助于介入操作的顺利进行。

PU-3709

肺动脉 CTA 短暂性对比剂中断的解决方案

孙占国,陈月芹,亓志莹,程寒寒,周贤贤,姜鑫
济宁医学院附属医院

背景及目的 短暂性对比剂中断（transient interruption of contrast, TIC）指常规肺动脉 CTA（CTPA）扫描时，肺动脉主干及其分支强化不良并影响肺栓塞诊断的一种少见现象，通常在深吸气后屏气扫描时发生，主要由无对比剂的下腔静脉血一过性大量回流所致。本研究旨在探讨深吸气后屏气下 CTPA 扫描出现 TIC 现象时，平静呼吸下轻屏气扫描能否改善肺动脉强化效果。方法 回顾性分析 2016 年-2018 年间行 CTPA 扫描的患者 1260 例，共 16 例出现 TIC 现象而影响诊断。TIC 的判断标准：常规扫描方案下，主肺动脉 CT 值≤200Hu 且低于升主动脉 CT 值。16 患者均在深吸气后屏气下完成首次 CTPA 检查，其中 13 例患者接受了二次扫描被纳入本研究，两次扫描参数及对比剂注射方案相同，仅呼吸指令改为平静呼吸下轻屏气。比较两次扫描所获上腔静脉、主肺动脉和升主动脉 CT 值。结果 13 例患者平均年龄 46.45±10.32 岁，更改呼吸指令后肺动脉强化效果均有不同程度改善，首次、二次扫描所获主肺动脉 CT 值分别为 140.38±39.93 Hu、263.23±38.18 Hu，差异具有统计学意义（Z=3.181，P＜0.001）。上腔静脉、升主动脉 CT 值两次扫描比较差异无统计学意义（P＞0.05）。结论 传统的深吸气后憋气 CTPA 扫描出现 TIC 现象时，平静呼吸下轻屏气能够明显改善肺动脉强化效果。

PU-3710

256 排 CT 呼气相低剂量胸部增强扫描方案

潘敦
成都市第三人民医院

目的：改善低管电流呼气相胸部增强扫描方案，大幅减少患者受辐射剂量，同时减少患者碘对比剂摄入，降低造影剂风险及辐射危害。

方法：选取 2017 年 11 月-2019 年 4 月我院 50 例行胸部增强扫描患者，所有患者均接受 256 层 CT 容积扫描。将患者分为实验组、对比组两组（实验组 29 例，采用呼气相扫描，对比组 21 例，吸气相扫描）。扫描后分别评价实验组对比组胸部增强图像质量、总碘浓度及辐射剂量。
结果：实验组及对比组胸部增强图像质量均可达到诊断要求。两组涵盖范围对比组差异有统计学意义（$p<0.05$），对比组高于实验组。两组造影剂用量及摄入总碘含量，实验组明显少于对比组，约为对比组三分之二。
结论：本方法可适用于胸部小气道疾病患者的常规增强检查，大幅降低辐射剂量，明显减少造影剂用量从而降低造影剂肾病风险。

PU-3711
东软医疗 NeuViz 64 CT 与 Philips Brilliance iCT 在儿童胸部低剂量扫描中图像质量对比与辐射剂量的评估

谢安,张建良,刘鹏,孙文杰,何维凌,陈浩,钟倩男,刘建滨
湖南省人民医院

目的：对比东软 NeuViz 64 CT（实验组）与 Philips Brilliance iCT（对照组）在儿童胸部低剂量扫描模式下图像质量与辐射剂量的差异。方法：回顾性分析 2016 年 6 月-2017 年 12 月在湖南省人民医院行胸部低剂量扫描的 80 例儿童患者资料，年龄 3-6 岁。按照随机数字法将其分为两组。两台 CT 设备均采用低剂量扫描模式，扫描条件相近。实验组及对照组分别采用 30% ClearView 迭代算法及 iDose Level3 自适应统计迭代重组算法进行图像重建。分别测量管分叉处层面肺组织及邻近前胸壁表面空气的感兴趣区（ROI）CT 值及噪声值（SD），信噪比（SNR）及对比噪声比（CNR）为图像质量客观评价指标。图像主观评分由 4 名放射科主任医师对肺部主要血管、气管及肺内病变边缘的锐利程度进行 5 分制评价。记录两组病例的容积 CT 剂量指数(CTDI vol)、剂量-长度乘积(DLP)、有效辐射剂量(ED)并进行辐射剂量。结果：实验组与对照组图像的客观评价指标 SD 及 SNR 上存在显著差异($t=2.13$，$t=4.09$；$P<0.05$)，CNR 无统计学差异($t=-1.71$，$P>0.05$)，两组图像的主观评分无显著性差异。实验组与对照组剂量评价指标 CTDI vol、DLP 和 ED 比较均有统计学意义($z=8.88$，$t=2.82$，$t=3.50$；$p<0.01$)，实验组低于对照组。结论：在相似扫描条件下，东软医疗 NeuViz 64 CT 与 Philips Brilliance iCT 两款设备对于儿童胸部较低剂量扫描可以获得相当水平的图像质量且辐射剂量相对较小。

PU-3712
子宫内膜癌 MRI 术前评价的成本-效果分析

邓蕾,尚阿利,卢晓霞,杨全新
西安交通大学第二附属医院

目的：不同的 MRI 检查方案在各地区的价格执行标准不同，对比子宫内膜癌术前评价的三种临床常用 MRI 检查方案的成本-效果，为更加合理应用 MRI 对子宫内膜进行术前评估提供参考。**材料与方法**：利用 TreeAge Pro 2011 软件，以我国东、中、西部地区共 10 省（市）医疗卫生服务价格标准为依据，构建决策树模型进行成本-效果分析。（1）评价对象：①评价要素：肿瘤是否侵犯深肌层、侵犯宫颈及盆腔淋巴结状态。②评价方案：本研究分别从以上这三要素对以下三种 MRI 检查方案进行经济学评价：a. 常规 MRI 检查方案：简称 MRI 方案，包括抑脂和/或非抑脂 T1WI + 抑脂和/或非抑脂 T2WI；扫描方位不限定。b.增强（contrast enhanced, CE）+常规 MRI 检查方案：简称 CE-MRI 方案。序列包括抑脂和/或非抑脂 T1WI + 抑脂和/或非抑脂 T2WI + T1WI 增强扫描（包括动

态增强和非动态增强扫描）；扫描方位不限定。c.弥散加权成像（diffusion weighted imaging, DWI）+常规 MRI 检查方案：简称 DW-MRI 方案。序列包括抑脂和/或非抑脂 T1WI + 抑脂和/或非抑脂 T2WI + DWI；扫描方位不限定。**结果：**（1）对深肌层浸润的诊断，东部地区首选 DW-MRI 方案，其次为 MRI 方案；而中、西部地区首选 MRI 方案，其次为 DW-MRI 方案。（2）对宫颈侵犯的诊断，东、中、西部地区均首选 MRI 方案，其次为 DW-MRI 方案。（3）对盆腔淋巴结转移的诊断，东、中、西部地区均首选 MRI 方案，其次为 CE-MRI 方案。**结论：**DW-MRI 方案应做为子宫内膜癌术前评价的首选一体化 MRI 检查方案，以最大限度的满足临床需求；为降低 MRI 检查成本，建议现行 MRI“分项”收费标准应该调整为“基于单病种的 MRI 检查打包收费”。这一结论为更加合理的应用 MRI 进行子宫内膜癌术前评价及制定单病种收费价格标准提供了参考依据。

PU-3713

数字化 X 线摄影双能量成像技术的临床应用价值探究

于晓君,陈威,王楠,崔跃强
天津市职业病防治院

目的：解读数字化 X 线（DR）摄影双能量成像技术用于临床疾病诊断中的价值。**方法：**抽取 2016.4~2017.8 收治的 70 例患者，遵照随机原则分为常规组、试验组，每组各 35 例，分别给予传统 X 线片与 DR 摄影双能量成像技术检查，观察两组的拍片质量，比较与分析临床诊断率。**结果：**试验组甲级片占有率为 94.29%，高于常规组的 71.43%；试验组、常规组的临床诊断率依次为 86.21%、97.06%，经比较分析，差异有统计学意义（$P<0.05$）。**结论：**DR 摄影双能量成像技术具有操作过程简单，拍片质量优良，能为疾病临床诊断与治疗提供质量较高的影像资料，具有推广价值。

PU-3714

下腔静脉平滑肌肉瘤 1 例

李少臻
榆林市第二医院

下腔静脉平滑肌肉瘤少见，发病者以女性多见，平均发病年龄 60 岁。肿瘤起源于血管平滑肌，下腔静脉起源最常见（50%）。血管来源平滑肌肉瘤占腹膜后平滑肌肉瘤 38%，其中完全位于血管内者约 5%，同时累计血管内外者 33%。CT 检查能够对病变的诊断与鉴别诊断提供较大帮助。

PU-3715

基于体模的腹部器官辐射剂量算法研究

郭钰,张惠茅
吉林大学白求恩第一医院

目的 探讨腹部 CT 扫描时 Radimetrics 软件与热释光剂量法测得器官剂量之间的关系。**材料与方法** 分别采用 GE64、Philips64、Siemens64 排螺旋 CT 按如下扫描方案（10 mAs，120kv；25 mAs，120k；50 mAs，120kv；150 mAs，120kv；150 mAs，100kv；150 mAs，80kv）对仿真体模进行三次

腹部扫描。扫描参数如下：螺距 0.984 ； 旋转时间 0.6 s；层厚 5 mm ； 层间距 5 mm；矩阵 512×512，分别通过基于 Monte-Carlo 算法的软件平台与热释光剂量法两种方法分别得到不同器官的有效剂量。**结果** Radimetrics 软件与热释光剂量法测得的器官剂量有很强的相关性，Pearson 相关系数为肺脏 0.995、肝脏 0.990、结肠 0.978、脾脏 0.967、肾脏 0.992、胰腺 0.967，且二者之间存在线性相关，可用对应线性方程表示，对于线性方程的拟合系数分别为肺脏 0.989、肝脏 0.979、结肠 0.954、脾脏 0.931、肾脏 0.982、胰腺 0.930。但二者间器官剂量之间的相对差异不可忽略。**结论** 不同器官的辐射剂量值通过 Radimetrics 软件与热释光剂量计之间可进行线性转化。

《军队医院影像基地规范化培训模式的探索——以实践转化能力和效果评估为导向》

胡莹莹,张云,李文平,陆伟,王庆军,郭勇
中国人民解放军总医院第六医学中心（原海军总医院）

2013 年国家初步建立住院医师规范化培训制度。在政策推行的五年间，由于军队医院管理上的特殊性，仍存在与地方不相统一的若干部分。本文试就军地住院医师规范化培训的差异分析入手，建立健全军队影像学科住培体系，并实现闭环评估，着重体现实体转化成果。

PU-3718
应用 Revolution CT 进行肺动脉血管造影检查个性化扫描方案研究

刘文蕴
吉林大学第一医院

目的 比较 256 排常规单源 CT、Revolution 单能 CT 及 Revolution 双能量 CT 进行肺动脉 CT 血管造影（CTPA）检查时的辐射剂量，对比剂用量、对比剂流速、主观及客观图像质量。

材料和方法 前瞻性的纳入 180 例临床怀疑肺动脉栓塞拟行肺动脉 CTA 检查的患者，将他们平均分为 3 组，每组 60 例。组 1：常规单源 CT（SSCT）120kV；组 2：Revolution 单能 CT 100kV（DSCT）；组 3：Revolution 双能量 CT（80/140kV）（DECT）。记录 CTDIvol、DLP，计算出有效辐射剂量（ED）；扫描前根据患者 BMI 指数及对比剂用量表选择个性的对比剂用量及流速，扫描后在肺动脉主干、右肺下叶肺动脉分支、左肺上叶肺动脉分支层面上选择三个感兴趣区，记录感兴趣区的 CT 值，计算出信号噪声比（SNR）、对比噪声比（CNR）。根据图像质量 5 级评分表，由 3 位不同层级的放射科医生（住院医师、主治医师、教授）在单盲条件下分别对图像质量进行评分。
结果 组 3 的平均 CTDIvol、DLP 比组 1 及组 2 明显减低（$p<0.001$ [CTDIvol]，$p<0.001$ [DLP]，组 1:($p=0.002$ [CTDIvol]; $p=0.002$ [DLP]，组 2）；组 3 的 ED 亦较组 1、组 2 明显减低。组 3 的 SNR 及 CNR 较组 1、组 2 高。组 1 的对比剂用量及流速明显大于组 2、组 3；组 2 的对比剂用量稍大于组 3，两者对比剂流速没有统计学差异。观察者间及组间的主观图像评分没有统计学差异。
结论 应用 Revolution 双能量 CT 进行肺动脉 CTA 检查不仅能够在保证图像质量的前提下有效的降低辐射剂量，而且可以减少对比剂的用量及对比剂流速，同时获得物质能谱曲线、碘基图等多模态 CT 成像特征。

影像医学检查中患者隐私的保护

程相晨
重庆平安健康（检测）中心

近年来，医学技术的飞速发展，极大地提高了医学临床诊治水平，也大大提高了人类的健康水平，然而同时也带来了许多复杂而棘手的医学伦理难题，其中患者隐私问题已经成为国内外关注的重点。随着公民自我保护意识的提高，患者隐私权的问题被不断提出，因此引发的诉讼和案件也层出不穷。目前，我国在影像医学检查中对患者隐私权没有设置相关的法律保护，患者本身无法确定哪些属于隐私权保护的内容，往往容易受到侵犯，也无法找到保护自己隐私权的依据。我国立法机关应当对患者的隐私权从法律的高度予以规定，确定医患关系中隐私权的内容以及侵权行为。由于隐私权概念具有高度模糊、抽象和不确定等特点，使得影像医技人员无法准确了解患者隐私范围，患者在影像医学检查中也难以区别医技人员的哪些行为属于合法诊疗行为。加之我国的相关立法中也没有规定患者隐私权的内容，往往使得患者隐私权的法律保护无法达到预期效果。在影像医学检查过程中，由于患者的法律意识弱，患者对自己权利的认识只是处于了解阶段，对于自己的隐私权问题，没有全面的法律认识，无法保持理性的态度来解决问题。部分医技人员缺乏医学伦理学知识，导致缺乏保护患者隐私权的意识，涉及患者隐私也未获得患者许可，时常忽略了对患者人格尊严的保护。笔者根据实际工作经验，阅读文章文献，分析相关问题，提出在影像医学检查中患者隐私权保护的观点

PU-3720

CT 重复扫描的记录及分析运用于质量控制的优化探讨

雷伟
陆军军医大学大坪医院

目的：对于 CT 重复扫描的记录及分析结果对于提高质量控制、优化扫描方案的探讨。

资料和方法：选取并记录 2014 年 1 到 6 月之间的所有出现重复扫描的 CT 图像，期间的扫描未做过任何质控优化分析，作为对照组；选取 2019 年 1 到 6 月所有重复扫描的 CT 图像，期间扫描进行系统质控优化分析，作为观察组。本科室对于每月的重复扫描数据进行不断完善，逐月进行优化分析、数据统计，找到一套比较合适的记录方案，分别从定位失误（定位反向；定位错误；体外金属伪影）、扫描范围不足、闭气不佳、心脏扫描中的心率异常、图像充盈不佳、图像运动伪影、设备故障、其他突发状况等，这几个方面记录平时工作中出现的重复扫描例数及出现重复扫描的原因。然后对不同年份的两组数据进行统计学比较以及对图像质量改善满意度进行统计学分析。
结果：对照组的各项数据指标明显高于观察组，于当年受检者总数占比率明显高于观察组，存在统计学差异；观察组 CT 图像质量明显改善，满意度高于对照组，存在统计学差异。
结论：CT 扫描过程中，由于各种因素造成的重复扫描是无法避免的。在放射科质量控制中建立完善的重复扫描记录规范是十分有必要的，不仅能够知晓每月重复扫描的情况，有效的减少重复扫描发生率，还可以提高 CT 扫描图像的质量。重复扫描的记录分析，有效的减少患者因人为因素造就的多余受照剂量，减少我们工作中出现的不必要的失误。该方法简单可行，值得推广。

PU-3721
质量控制对乳腺 X 线摄影图像质量影响的研究

李美地,孙诗昀,李卓琳
昆明医科大学第三附属医院

[摘要] **目的** 探讨质量控制对乳腺 X 线摄影图像质量的影响。**方法** 随机抽取我院 2019 年 3 月进行乳腺 X 线摄影的 1000 例受检者作为对照组，2019 年 5 月进行乳腺 X 线摄影的 1000 例受检者作为实验组。实验组在实施质量控制后进行摄片，对照组未实施质量控制，仅行常规乳腺 X 线摄影检查。对比两组受检者的 X 线图像质量、CC 位标准片主观评估与客观评估、分析影响图像质量的主要原因并提出相应整改措施。**结果** (1)实验组图像质量 I 级率为 93.5%，高于对照组，II 级率和 III 级率分别为 6.9%、0.2%，均低于对照组；(2)影响图像质量的主要因素有：①乳房皮肤皱褶、乳腺组织遗漏、乳头轮廓未显示切线位及伪影，在实施质量控制后上述因素所占比例均明显降低，且差异有统计学意义；(3) 统计两组 CC 位标准片的评估结果发现，主观评估和客观评估种实验组图像组织遗漏率均低于对照组组（1.3% vs 6%；4% vs 9.3%）。**结论** 经过对乳腺 X 线质量控制，可以明显提高图像质量，减少 II 级片或 III 级片概率，为诊断医生提供准确、科学的图像根据，从而使患者得到更好的医疗保障。

PU-3722
能谱 CT 不同单能量模式与非能谱模式下扫描成像的硬化伪影的对比研究

徐秋贞,陈文达
东南大学附属中大医院

目的：探讨能谱 CT 不同单能量模式下扫描成像与 120kvp 混合能量模式下扫描成像的硬化伪影的差异。方法：将 9 支含不同浓度碘溶液（浓度分别为 0、0、10.0、20.0、5.0、3.0、10.0、20.0、1.0 mg/ml）的硬塑料试管，置于圆柱形塑料体模（QC phantom）内，浓度为 0 的置于体模中心（记为 0 号试管），其余 8 支按 20.0、10.0、3.0、5.0、20.0、10.0、0、1.0 mg/ml 的顺序依次等距环形排列于体模的周边（分别记为 1-8 号试管）。应用能谱 CT（Revolution CT），分别用 GSI（40-140keV, 间隔 10keV)模式和 120kVp 混合能量模式采用相同剂量扫描，共获得 12 组图

像。在 AW 4.6 工作站选取 4 个层面分别测量 GSI（40-140keV, 间隔 10keV)和 120kVp 时的试管 0-1,1-2,5-6 之间的椭圆形感兴趣的 SD，以及背景处圆形感兴趣区的 SD，采用单因素方差分析比较 GSI（40-140keV, 间隔 10keV)模式和 120kVp 模式下所获扫描图像测得 的 BAI(Beamharding Artifact Index)之间的差异。结果：40-80Kev 的 5 组单能量图像的 BAI 之间的差异均有统计学意义，120kvp 混合能量图像与除 70kev 单能量图像外与其他 10 组单能量图像的 BAI 之间的差异均有统计学意义。各感兴趣区的 BAI 值均与 kev 值呈负相关关系，且与 120kVp 混合能量图像相比，70-140kev 的 8 组单能量图像所测得 BAI 值均有显著降低（但 120kvp 混合能量图像与 70kev 单能量图像的 BAI 之间的差异无统计学意义）。结论：能谱 CT 在 40-140kev 每隔 10kev 重建的 11 组扫描成像的硬化伪影随光子能量的升高而降低，且与 120kvp 混合能量模式扫描成像的硬化伪影相较，80-140kev 的单能量模式的硬化伪影均有显著降低。

PU-3723
双能量 CT 增强三种扫描方案对显示肠系膜上动脉血栓的对比研究

程维高
雅安市人民医院

目的 双能量 CT 增强三种扫描方案对显示肠系膜上动脉血栓的对比研究。**方法** 回顾性分析 36 例经临床证实的肠系膜上动脉血栓的双能量 CT 表现，采取随机分组，分别行基于 DS 模式双源双能量 CT 增强检查、双源双能量常规 CT 增强、双源双能量 CTA（分别为 A 组、B 组、C 组），包括动脉期、门脉期、平衡期及虚拟平扫、后处理血管重建，分别计算辐射剂量、肠系膜上动脉分支血管显示、血栓显示率。**结果** 辐射剂量：C 组>B 组>A 组；肠系膜上动脉分支血管显示：C 组=A 组>B 组；血栓显示率：C 组=A 组>B 组。**结论** 基于 DS 模式的双能量 CT 增强对显示肠系膜上动脉血栓效果优于双能量 CT 常规增强模式，辐射剂量最低，对显示肠系膜上动脉分支血管及腔内情况接近 CTA 图像质量，并有助于判断肠壁缺血的程度，减少临床误诊误治。

PU-3724
miRNAs 在 X 线辐射损伤后修复机制中的作用

刘栋,朱文珍
华中科技大学同济医学院附属同济医院

目的：探究细胞接受 X 射线辐照后通过 miRNAs 转录后调控对损伤及损伤后修复的分子生物学机制，以建立并完善辐射后损伤-修复模型，在分子层面及细胞层面上对放射防护提供理论支持。
方法：选用放射高敏感性的淋巴母细胞 T2、TK6 两个细胞系经不同剂量 X 线辐照后，利用 MTT 及 FCM 技术于不同时间点对两个细胞系进行细胞生物学检测，构建在梯度辐射剂量下细胞周期、增殖凋亡随时间变化的模型，并通过 miRNAs 表达芯片及 qPCR 技术筛选辐照相关 miRNAs，利用靶基因研究及 Western Blot 技术构建 miRNAs 与其靶基因对放射损伤的反馈调节模式图，建立完善的细胞放射损伤后修复模型。
结果：let-7 家族 miRNAs，miR-103b，miR-142，miR-143，miR-146ap，miR-155，miR-15a，miR-16，miR-181a，miR-191，miR-21，miR-22，miR-26a，miR-378，miR-423，miR-92a，miR-93 等多种 miRNAs 随辐照处理后存在显著性低表达趋势（P 值≤0.05），后在不同时间点（8h，24h，48h，72h）存在显著性过表达趋势（P 值≤0.05）。其中 let-7 家族，miR-92a，miR-143，miR-19b 等 miRNAs 的表达量随时间变化的趋势与细胞周期、凋亡变化趋势无统计学差异（P 值

≥0.05）。其中，靶基因研究表明 let-7 家族 miRNAs 通过调控 HIFs 通路；mir-92a 通过调控 VEGF/CD31/Tie2 通路；mir-143 通过调控 CD44v3/HGF 通路；miR-19b 通过调控 PGC-1α 通路等参与损伤后修复过程。
结论：多种 miRNAs 通过对不同蛋白通路调控，参与体内 X 线辐射损伤后修复的分子生物学机制。

PU-3725

DBT 与 FFDM 平均腺体辐射剂量差异

刘希童
武汉大学中南医院

目的：分析乳腺三维断层成像（DBT）与全数字化乳腺钼靶 X 线摄影（FFDM）Average Glandular Dose(AGD)平均腺体辐射剂量差异
方法：回顾性分析湖北省武汉市中南医院 2019 年 1 月至 7 月 100 例乳腺检查患者的钼靶图像与检查数据。不同乳腺类型其致密度 ，厚度，曝光条件不同对 AGD 都有相应影响。发现双侧 cc 位的 DBT 是 FFDM 的 Average Glandular Dose(AGD)平均腺体辐射剂量高一倍不到，最大 AGD 值不超过 3mGy。而 DBT 比 FFMD 图像数多 25 倍及以上。
结果：由本院 2 位从事放射诊断工作 5 年以上及 1 位 1 年工作经验以内诊断医师一起依据美国放射学会推荐的乳腺影像报告和数据系统（BI-RADS）得出结果。其中 100 例患者中有 41 例 BI-RADS 2 类。25 例在 DBT 和 FFDM 都能发现肿块，但是 DBT 上其边界大小显示更清楚。22 例只在 DBT 上发现肿块，多为致密性腺体结构。3 例结构扭曲，DBT 上显示的与周围结构关系更加清晰。9 例发现恶性钙化，在 FFDM 上显示清晰，DBT 上易出现放射状伪影。DBT 对病灶检出率提高，显示明显率提高，在致密型乳腺结构扭曲病变的总体检出率有显著提高。
结论：DBT 增加了 AGD 值的同时大幅度的提高诊断准确率。在日常工作中要进行有效的预评估，有效率的使用 DBT 增加诊断率控制对患者的辐射剂量。注意提醒患者佩戴辐射防护设备。

PU-3726

超低剂量条件下应用全迭代 IMR 重组技术对肝脏增强 CT 的应用价值

张天然
海军军医大学第二附属医院（上海长征医院）

目的:讨论超低剂量条件下（80kv，50mA）应用全迭代 IMR 重组
技术对于肝脏增强 CT 的应用价值.
方法：将 42 例患者的肝脏增强 CT 延迟期分别采用常规剂量下（120kv，150mA~200mA）滤过反投射法 FBP 进行图像重组并标记为 A 组；超低剂量下（80kv，50mA）全迭代 imr 重组技术并标记为 B 组。将两组图像的容积 CT 剂量指数、有效剂量作为单独指标。对两组图像进行客观评价（包括噪声、信噪比、对比噪声比）以及主观评价（低对比分辨率、图像失真度、诊断信心）测量记录用于图像评价。记录两组方案的 CT 剂量指数。对两组图像间客观指标的比较采用配对样本 t 检验；两组主观评价指标的比较采用 wilcoxon 符号秩和检验。
结果：B 组对于 A 组容积 CT 剂量指数、有效剂量均降低 90%以上;A 组噪声、信噪比、对比噪声比分别为（26.16±4.28HU）、（8.22 ±1.41）、（3.70±1.20）：B 组噪声、信噪比、对比噪声比分别为（14.96±5.42HU）、（15.61±3.56）、（6.97±2.63），差异均有统计学意义（t 值分别为-15.87、-10.01、11.50，P 值均<0.001），B 组对于 A 组主观评分中低对比分辨率无统计学差异

（Z=-1.000 P=0.317）、图像失真度有统计学差异（Z=-6.481 p〈0.001）、诊断信心有统计学差异（Z=-2.449 p=0.014）。
结论：超低剂量条件下应用全迭代 IMR 重组技术对比常规扫描应用滤过反投射法可以在明显降低剂量的基础上，使图像客观质量提升，并且主观诊断中可以帮助提高诊断信心。

科学规范小儿肠套叠空气灌肠诊断流程

柴永锋
甘肃省妇幼保健院

目的：探讨如何科学规范小儿肠套叠空气灌肠诊断流程，降低假性肠套叠发生率。**方法**：采用回顾性分析的方法，分析在我科室进行过空气灌肠复位诊断的所有患儿影像表现。**结果**：在 X 线透视下确诊为肠套叠的仅占 10.5%，其余均为假性肠套叠，其影像表现主要为：肠管内气粪混合影，乙状结肠冗长，肠管扩张，回盲部水肿。**结论**：科学规范小儿肠套叠空气灌肠诊断流程，能够很大程度上降低假性肠套叠发生率，同时避免患儿接受不必要的 X 线辐射。

胸部低剂量 CT 成像的应用与挑战

张佳佳
厦门大学附属翔安医院

摘要：通过对比其他检查方法，进一步探讨出低剂量 CT 的疾病诊断价值及其对健康人体检对于疾病筛查的益处。在了解胸部各种疾病（例如，胸壁肿瘤、纵膈肿瘤、肺肿瘤、食管肿瘤、乳腺肿瘤等）的基础上研究出哪一项疾病最为适合采用低剂量 CT 进行检查，并讨论它的优势之处和不合理使用导致的后果。Abstract:By comparing with other examination methods, we further explored the diagnostic value of low-dose CT and its benefits for healthy people of disease screening. In order to understand various diseases of the chest (for example, chest wall tumors, mediastinal tumors, lung tumors, esophageal tumors, breast tumors, etc.), it has been studied which disease is most suitable for examination with low-dose CT. It also discusses its advantages and the consequences of improper use.

SPIO 新型高分子材料在吞噬细胞标记和示踪领域的研究进展

陈旺生
海南省人民医院

Superparamagnetic iron oxide (SPIO) plays an important role in magnetic resonance and molecule imaging. SPIO can
track the vivo distribution and transformation of macrophage or other cells cell as they are marked by SPIO, which has becoming an im
portant part of biomedical research. In addition,S PIO cell mark and tracking can be used in the diagnosis, assessment and differentiation

of tumor and inflammation.Therefore, this article summarize the research progress of SPIO in phagocyte cell marker and tracking field in
recent years and now report as follows.

PU-3730

水合氯醛用于婴幼儿磁共核振检查的效果观察

刘建双[1],刘建双[1]
1.昆明市儿童医院
2.昆明市儿童医院

目的：探讨水合氯醛灌肠用于婴幼儿核磁共振检查的效果。方法：将 3 月 ～3 岁需要做核磁共振的 500 例患儿，按检查的先后顺序随机分平均为两组，对照组患儿于检查前半小时用 10%水合氯醛 30mg/kg/次口服，观察组患儿在检查前半小时给予水合氯醛 50mg/kg/次灌肠，比较两组检查用药入睡后药物制动效果。结论：观察组患儿灌肠入睡后制动效果好。婴幼儿核磁共振检查时，水合氯醛液灌肠效果好。

GE Revolution CT 能谱（GSI）扫描去伪影技术在脊柱内固定术后的临床应用

陈力
江苏省人民医院（南京医科大学第一附属医院）

摘要：**目的** 评价 Revolution CT 能谱扫描去伪影技术在减少脊柱内固定伪影方面的临床应用效果，同时研究应用能谱曲线寻找最佳 keV 值的可能性。
方法 对 4 例江苏省人民医院脊柱骨折内固定术后患者进行 GSI 扫描，获得 110kVp-like 图像，并用能谱分析软件获得 100KeV 单能量图像及 Mono+MAR 图像，以 10keV 为间隔重建 11 组 Mono 图像。每例病人选取 2 个带有金属伪影最大的层面对椎弓根螺钉伪影及椎管内结构伪影进行主观评分，同时选择椎管内感兴趣区进行测量并计算 AI 和 CNR，比较三组间椎弓根螺钉伪影、椎管内结构伪影主观评分及椎管内 AI 值的差异，寻找 GSI 去金属伪影最佳成像条件。以最佳图像为对照，比较利用能谱曲线寻得最佳 Mono 图像的质量和诊断效能。
结果 AI 在 90-140keV 时减低，在 100-130keV 达最低；CNR 在 100～120keV 时减低且最低。能谱成像技术在 90-140keV 对软组织、骨质及金属植入物诊断效能提高，在 110-130keV 对软组织观察最优，在 110-140keV 对骨质及植入金属观察最优。利用能谱曲线寻得最佳单能量成像条件为 100-120keV，范围落在普通方法确定的电压值区间内，其图像均能满足诊断。
结论 Revolution CT 能谱扫描在高电压区（100-120keV）可有效减除脊柱金属植入物伪影。对于椎管内结构的评价，单能量去伪影技术较常规混合能量图像及单能量+MAR 图像更有优势和临床指导意义。

PU-3732

缩短放射科急诊报告时限 PDCA

张有智,郝显华,闫秀秀
宝鸡高新人民医院

随着自助打印机管理系统的广泛应用，放射科信息化程度正在变得越来越高。信息化管理将现代信息技术与先进管理理念相结合，转变或改造了放射科操作方式和业务流程，使得管理目标更加数字化。ISO15189《医学实验室质量和能力认可准则》中明确指出，实验室质量管理不仅包括对检验结果数据真实可靠性的管理，对影响检验结果的各种因素的管理也必不可少。而检验结果回报时间(turn-around time，TAT) 它的及时性是影响检验质量的重要因素。TAT 又称为结果回报时间，是指从临床医生开出申请单到接收报告的时间。目前，国内外许多医院的临床实验室都将 TAT 作为其质量持续改进的观察指标。放射科于 2019 年 12 月由德国 AGFA 公司投放 4 台自助打印机，借用检验科 TAT 管理，对影响 TAT 的因素进行分析和定位，完善分析流程和技师操作等环节的信息化监控。通过 PDCA 循环应用确定延误放射科报告的原因，优化放射报告时限的各环节流程，有效的缩短 TAT，缩短放射科门急诊报告时限，放射科在提高临床和患者满意度方面取得了一定成效。具体措施：

放射科开展 X 线数字化透视、CR、DR、CT 检查 24 小时急诊服务。

临床科室根据患者病情需要申请医学影像急诊检查，放射科接到申请通知后，了解患者病情，申请检查项目部位，随时登记患者信息，按照设备操作规程完成检查。

发生紧急意外抢救事件时，按照放射科紧急意外抢救预案，放射科与临床科室紧急呼救与支援的机制与流程执行。

在放射科候诊大厅增添 4 台自助胶片打印机，检查完成后通知患者或陪人自助打印胶片和纸质报告，或后台处理，由值班人员发给患者，及时出具医学影像报告，并按照放射科影像报告审核制度与流程进行。

发现危急值时按危急值登记制度与报告流程执行。

循环运用到缩短放射科急诊报告时间，通过每一次的循环，增强了放射科全体人员对急诊报告及时性的重视程度，促进了临床医师合理使用急诊资源。

PU-3733

儿童 X 线检查成像的影响因素与质量控制

马绍文,李征
湘雅常德医院

摘要

目的：讨论儿童 X 线检查成像的影响因素与质量控制的方法

方法:随机抽出我院 2019 年 4 月至 6 月儿童 X 线摄影图像 100 例，根据 X 线质量控制评分统计可得：100 分 60 例（60%），90-99 分 15 例（15%），80-89 分 11 例（11%），不及格 4 例（4%）。分析得出其影响因素可分为以下几类：一、儿童自身因素。检查前应安抚儿童情绪，取得儿童配合，也可让家属适当控制儿童或等儿童睡眠时拍摄，必要时遵循医嘱使用适量镇静剂。二:体位设计、中心点，摄影距离及照射野问题。摄影技师应熟知各部位摄影体位，根据被检部位选择合适照射野、摄影距离及中心点。三：摄影条件的选择。摄影技师应根据儿童年龄大小、摄影部位的不同来调整摄影条件，实现摄影条件的最优化。四：图像后处理问题。在摄片完成后应正确标识左右、站立或仰卧、适当调整图像对比度。

结果：应用以上方法进行摄影，在随机抽取 100 例图像进行质量评分统计，100 分片为 87 例（87%），90-99 分片为 6 例（%），80-89 分片为 6 例（6%），80 分以下片为 1 例（1%），图像质量整体明显上升。

结论：摄影前准备及儿童配合度、摄影体位、照射野、摄影距离、中心点、摄影条件及图像后处理是影响儿童 X 线成像的重要因素，操作者应从以上方面获得优质的 X 线图像。

Noise reduction and image quality in ultra-high resolution computed tomography of the nasal bone and paranasal sinus using advanced modeled iterative reconstruction

Lihui Zu,Lin Liu
China-Japan Union Hospital of Jilin University

Abstract
Background:The novel advanced modeled iterative reconstruction (ADMIRE) algorithm in ultra-high-resolution computed tomography (CT) of the nasal bone and paranasal sinus has not yet been systematically evaluated.

Purpose:To assess the potential of ADMIRE in nasal bone and paranasal sinus.
Material and Methods: Twentycases of nasal bone fracture patients who underwent UHR CT of the nasal bone and paranasal sinus were retrospectively selected for analysis. Images were reconstructed using filtered back projection (FBP) and ADMIRE with multiple strength levels. Regions of interest were drawn in the nasal bone and

paranasal sinus. The average density (in Hounsfield units [HU]) and the image noise (standard deviation of density values) were extracted.The signal- to-noise ratio (SNR) and contrast-to-noise ratio (CNR) were then calculated. Additionally, a subjective qualitative analysis was performed using a five-point Likert scale.
Results:The image noise was significantly lower, and the SNR and CNR were significantly higher in ADMIRE reconstructions levels A2-A5 than in FBP (P < 0.001, respectively). Subjective image quality was significantly higher in ADMIRE levels A2-A5 than in FBP (P < 0.001) and it was rated best in ADMIRE level A3, which showed the fracture line clearly.
Conclusions: The ADMIRE reconstruction algorithm significantly improves image quality and reduces noise on nasal bone UHR CT scans. Thus, it is beneficial to observe the fracture of nasal bone.

艾力彼星级认证下的放射技术工作质量持续改进

翟方兵
大连医科大学附属第二医院

目的 总结艾力彼星级医院认证下的放射技术工作质量持续改进。方法 自启动星级认证之日起，至评审结束，在此期间按照评审标准的要求，放射技术组在质量与安全管理、设备管理、感控管理等方面所做的质量持续改进。结果 通过一年多的准备，技术组全体按照认证标准，逐条梳理，不断地对发现的问题进行及时整改，使放射技术工作质量持续改进，提高了工作效率，也使患者的就医感受大大提升。结论 作为中国版的 JCI 标准，在推进医院内涵建设的同时，极大地促进放射技术组在医疗质量、应急能力和患者安全管理方面水平的提升，使放射技术组的服务质量与水平达到新的高度。

PU-3741
基于 Magphan SMR170 体模的 3.0T 磁共振成像设备的质量控制检测

欧阳丽蓉,廖伟华
中南大学湘雅医院

目的：通过对我院 3 台 3.0T 磁共振成像成像设备（MRI）的质量控制检测，探讨日常工作中 3.0T MRI 的质量控制检测方法及评价指标。**方法：**使用 Magphan SMR170 体模对我院 3 台（两台不同型号的 GE 和一台 Siemens）3.0T MRI 进行周期性检测，计算信噪比、图像均匀性、空间分辨率、低对比度分辨力、层厚、纵横比等指标，并进行分析。**结果：**3 台 MRI 的信噪比分别为 852.364±73.591、674.468±106.607、962.369±205.847，图像均匀性为 0.942±0.009、0.949±0.056、0.900±0.023，空间分辨率均为 5Lp/cm 及以上，低对比度分辨率均为可见孔径为 4mm，孔深为 0.5mm 的孔，层厚分别为 5.250±0.178mm、5.098±0.130、5.219±0.150，纵横比分别为 0.996±0.003、0.997±0.002、0.996±0.002，所有指标均满足现行检测标准的要求；其中信噪比均远远高于国家标准(≥100)，且不同厂家、不同型号的差别较大；图像均匀性均高于国家标准（≥85%），相同厂家的比较接近，不同厂家的有所差别。**结论：**通过对 3.0T MRI 进行信噪

比、图像均匀性等主要成像参数的评价指标进行检测分析，可及时掌握设备的性能参数，以有效保证磁共振设备的稳定运行。此外，3.0T MRI 的信噪比远远高于国家标准，因此，现行的质量检测方法及标准需要进一步完善，以更好地规范与指导 3.0T 及更高场强的 MRI 的质量控制与质量保证。

PU-3742
双源 CT 在 CTP 结合 CTA 在短暂性脑缺血发作(TIA)患者早期诊断中的应用价值

徐左旭
上海市浦东新区公利医院

摘要： **目的** 研究 CT 灌注成像(CTP)结合 CT 血管成像(CTA)在短暂性脑缺血发作(TIA)患者早期诊断中的应用价值。**方法** 选取 2018 年 2 月～2019 年 5 月我院收治的 TIA 患者 50 例。均进行 CTP、CTA 检查.对比病变侧与健侧(镜像区)局部脑血流(CBF)、局部脑血容量(CBV)及平均通过时间(MTT),分析 CTP、CTA 单独诊断与联合诊断结果，比较 CTP、CTA 单独与联合诊断 TIA 阳性检出率和漏诊率。**结果** 根据 CTP 检查所测的 CBF 值、CBV 值、半影以及梗死核心体积，CTP、CTA 联合诊断 TIA 阳性检出率 93.00%，高于 CTP、CTA 单独诊断,漏诊率 7.00%，能有效提高 TIA 阳性检出率,降低漏诊率。 **结论** CTP 能反应 TIA 患者脑组织血流动力学异常灌注情况, CTP 结合 CTA 诊断 TIA,能有效提高阳性检出率,降低漏诊率.为临床提供更准确的依据。

基于重复扫描原因分析的上腹部 MR 质量控制

陈地友
陆军军医大学大坪医院

目的：探讨重复扫描记录及原因分析在提高上腹部 MR 图像质量中的应用。
方法：全科 MR 技师对 2019 年 4 月至 2019 年 7 月上腹部 MR 成像时的重复扫描进行记录，指定人员对前一周的记录进行汇总并作原因分类，当周一全科 MR 技师对汇总记录进行原因分析，情景模拟后讨论解决方法；高年资 MR 技师对当月全组技师的上腹部 MR 图像根据统一标准进行评分，评分标准包括：体位设计、抑脂效果、呼吸伪影、其他伪影、增强时机、延迟时间等，根据不同基础病种、年龄、性别做评分分类，质控评分将进行公示，同时对一次性检查成功率和检查耗时进行统计。
结果：①重复扫描记录总数逐月降低；②一次性检查成功率逐月提高；③检查耗时下降明显、单一病种检查成功率有提高；④当月质控平均评分较上月均有提高；⑤同一技师当月质控评分均高于上月。
结论：重复扫描记录能够发现原因，基于重复扫描原因分析的情景模拟及解决方法探讨提高了个人及全科整体的上腹部 MR 图像质量；检查时间的节约，提高了上腹部 MR 成像的一次性检查成功率。

64 排螺旋 CT 在儿童口腔齿科成像中的应用

郭勇
昆明市儿童医院

探讨 64 排螺旋 CT 全景齿科成像在口腔颌面部疾病中的诊断价值及相对于 X 线口腔全景片的优势，阐述 64 排螺旋 CT 的应用方法。在工作站上利用相关软件对所获数据进行重建，对病灶进行分析，并与 X 线口腔全景片相比较。结果：通过对比，我们发现 64 排螺旋 CT 全景齿科成像展示病变的阳性率、分辨率明显优于 X 线口腔全景片。

PU-3745

CT 四肢关节质量控制规范与优化

雷伟
陆军军医大学大坪医院

本院每月四肢关节检查占比较少，大概在 4%-6%，但是因为之前未形成统一的质量控制标准，以及大部分四肢关节病因为骨折所致，导致体位设计的出入，造成扫描及后处理差异性较大。目前按照四肢关节操作规范以及专家共识，通过对每月随机抽取的 50 例受检者图像进行质控评分，结合临床医生的要求以及诊断医生的反馈，逐月进行完善优化，找到一套较为合适的质控方案。

将 2018 年 7-12 月以及 2019 年 1-6 月随机抽取的 600 例四肢图像按月分配，每组 50 人。图像采取 100 制，扫描占 40 分，后处理占 60 分。扫描由体位设计、扫描定位像范围、运动伪影、金属异物、噪声以及扫描范围组成，后处理包括重建图像范围、VR、MIP、层厚、重建角度、重建图像的完整性、特殊重建等。图像由本科室高年资技师对图像进行评分。

由于之前四肢关节缺乏统一的扫描及重建要求，2018 年的图像质量评分较低，所以 2019 年的图像进行规范化培训并且纳入个人考评后，2019 年图像较之前得到明显的改观，临床及诊断医生反馈较好。

PU-3746

急诊 CT 中体外异物对诊断影响预估和应用

张世龙
首都医科大学附属北京朝阳医院

摘要：目的： 探讨急诊 CT 中体外异物形成的伪影对 CT 图像的影响，预估其是否影响诊断结果，在图像质量控制和诊断上达到平衡，避免重复 CT 扫描，减少患者痛苦，为病人救治争取时间。方法：1 在我院 2019 年 1 月-2019 年 6 月期间急诊 CT 中，选取 100 例有体外异物的 CT 图像，进行回顾性分析。分别测量 CT 图像中，体外异物的长度或直径、线性伪影的半径、有效干扰半径，CT 值。根据测量异物长度或直径，把异物分为小于 3mm，3-5mm，5mm-10mm, 大于 10mm。根据 CT 值测量，分为金属材料 、混合材料。2 调取相应 CT 扫描序列和诊断报告，评估体外异物产生的伪影，对诊断的影响。结果：在胸腹 CT 图像中金属材料异物小于 3mm，线性伪影半径 0-15mm，有效干扰半径 0-9mm。金属材料异物 3-5mm，线性伪影半径 15-25mm，有效干扰半径 9-15mm。金属材料异物大于 10mm，线性伪影半径大于 50mm，有效干扰半径大于 30mm。结论：1 大于 10mm 的金属异物，如粗项链、吊坠和腰带扣等，其有效干扰半径大于 30mm，其有效干扰范围已可达脏器中部，影响诊

断，应当去除。3-5mm 的金属异物，如电极、钮扣等，其有效干扰 9-15mm，其有效干扰范围可达脏器边缘，对诊断影响较小，尤其对于肥胖患者，影响只到皮下脂肪层，可是适当保留。小于 3mm 的金属异物，如导线、胸钩等，其有效干扰范围只达皮下，基本不影响诊断，适当调整顺直即可。2 头颅由于本身有颅骨干扰，加上金属异物，易行成贯穿性条形伪影，影响诊断，已予以去除。3 混合材料（如导线护套、体外引流管等）虽然 X 线下可见，但其有效干扰半径很小，可以保留，适当顺直即可。

噪音心理建设在 MRI 头颅检查中图像质量控制

刘亚运,李国峰
同煤集团总医院

随着医学检查技术的广泛普及，磁共振检查也逐渐成为临床及患者愿意接受的首选影像检查项目，虽说磁共振检查没有辐射，对软组织、神经方面有独有的优势，但是，磁共振检查过程的中的噪音也是不得不引起重视，尤其在进行头颅 MRI 检查中图像质量的主动控制尤为明显，噪音是头颅 MRI 检查图像质量控制中不能忽视的问题。通过对头颅 MRI 检查前患者进行噪音心理建设，消除患者初次行头颅 MRI 检查的恐惧心理，促进检查顺利进行，达到较好的图像效果。结论 MRI 头颅检查前对患者进行噪音心理建设减少头颅 MRI 图像运动伪影，提高头颅 MRI 检查图像质量具有良好的临床意义。

PU-3748

基于微信公众号的科室信息发布平台

赵亮,戴丽娟
河北医科大学第四医院

目的：科室内发布实时信息一直采用微信群内信息发送，包括工作安排、工作通知、设备故障反馈与记录，在微信群内查看不便，图片保存时效短，未查看的图片 7 天后将无法再次打开，而且微信聊天信息保存于本地，更换手机后数据迁移繁琐，给日常工作带来了不便。由于在工作中微信的使用场景较多，并且难以要求所有人安装或更换特定软件，所以唯有基于微信这个软件平台的二次开发才能适当解决上述问题。实现方法：注册微信公众号，按照腾讯公司公开的开发者手册实现公众号二次开发。最终结果：在微信公众号里可以通过链接打开程序网页，各种工作通知可以随时发布并查看，在公众号后台程序内可以修改各类信息。结论：通过此次二次开发后，可以方便的解决之前在工作中的各种不便，提高工作效率。

低体质量指数在小肠 CT 增强中的强化值及优化

朱冬云
中山大学附属第六医院

探讨低体质量指数在小肠 CT 增强中的强化值以及应用价值。**方法:**回顾性选取 2007 年 9 月-2017 年 11 月期间 186 例在我院行小肠 CT 增强的低体质量指数患者作为本次的研究对象，随机将他们平

均分为对照组和研究组，每组各 93 例。给予所有患者 370 mg/kg 的碘普罗胺，研究组实施 CT 增强扫描，对比剂量为 300 mg/kg，选取 40-65KeV 单能量图像联合 50% ASIR 重建，对照组采用 80Kvp 扫描，对比剂量为 420 mg/kg，联合 50% ASIR 重建，对全部的图像进行主观评价和客观评价、对比两组的辐射剂量，采用独立样本 t 检验比较客观评价，采用 Mann-Whitney U 检验对比两组间总体图像质量的主观评分。**结果:**辐射剂量对比方面，研究组的 DLP、CTD（Ivol）、ED 以及 SSDE 均高于对照组（P＜0.05）；在 40、50 keV 下,研究组噪声值均高于对照组（P＜0.05）；图像质量比较方面，两组主观图像质量对比无明显区别（P＞0.05）。**结论:**对于低体质量患者联合 CT 增强扫描和 ASIR 重建技术进行小肠 CT 增强扫描安全有效，获得图像质量较高，值得在临床上进一步推广。

640 层 CT 低剂量对比剂在肺动脉 CTA 检查中应用价值的研究

高广栋
锦州医科大学附属第一医院

目的:研究 640 层螺旋 CT 低剂量对比剂（碘帕醇）在肺动脉 CTA 检查中的应用价值。方法:选取 2017 年 3 月到 2019 年 2 月在我院行肺动脉 CTA 检查的 112 名患者作为研究对象,年龄及性别不限。应用随机数字表法分为实验组和对照组,各 56 例。其中实验组患者使用 30mL 对比剂,对照组患者使用 65mL 对比剂。比较分析两组患者 CT 图像噪声、对比噪声比、信噪比和主观图像质量及不良（过敏）反应发生情况。结果:两组患者 CT 图像噪声、信噪比、对比噪声比和主观图像质量比较差异无统计学意义(P>0.05)。实验组患者 CT 检查后的不良反应发生率为 6.84%,对照组患者 CT 检查后的不良反应发生率为 41.54%。实验组的不良反应发生率远远低于对照组,差异具有统计学意义(P<0.05)。结论:在肺动脉 CTA 检查中应用低剂量对比剂不影响 CT 图像噪声、信噪比、对比噪声比和主观图像质量,且能降低不良反应发生率,其临床应用价值极佳。

PU-3751
探讨规范化呼吸训练在多层螺旋 CT（MSCT）胸部高分辨（HRCT）检查中的临床应用价值

李海红
中山大学附属第六医院

探讨规范化呼吸训练在多层螺旋 CT（MSCT）胸部高分辨（HRCT）检查中的临床应用价值。方法 2 名技师分别在 128 层 CT 和 640 层 CT 采集规范化呼吸训练前后的胸部高分辨图像,共 100 例。2 名医师对图像的伪影进行等级评分。使用 t 检验比较规范化呼吸训练前后所采集图像的伪影程度和扫描前的准备时间有无差异。结果在 128 层 CT 上,比较规范化呼吸训练前后伪影等级评分,对于中、下肺区,P 值分别为 0.017 和 0.003,具有统计学意义；而上肺区没有统计学差异。在 640 层 CT 上,规范化呼吸训练前后在上、中、下肺区图像伪影等级评分均没有统计学差异。在 128 层 CT 和 640 层 CT 上,比较规范化呼吸训练前后扫描前准备时间,P 值均〈0.05,无统计学意义。结论在 640 层 CT 的胸部 HRCT 检查中,对于中、下肺区,规范化呼吸训练能明显减少呼吸运动伪影,改善图像质量；同时规范化呼吸训练并未增加扫描之前的准备时间。

Research status of methods to improve the quality of CTA image reconstructed from CTP raw data

Xiaolei Wang,Jianing Tian,Yang Yu,Dan Tong
the First Hospital of Jilin University

Many patients with cerebrovascular diseases must undergo CTP and CTA to evaluate their intracranial perfusion and vascular status. Repeated examinations are a burden to patients and consume medical resources. CTA images can be reconstructed from CTP raw data. However, due to the CTP scanning layer thickness and reconstruction technology, the quality of CTA images which reconstructed from CTP raw data is not good enough to provide appropriate images for clinical diagnosis and treatment. This paper reviews the methods used to obtain higher quality intracranial CTA images from CTP post-processing, which is of great significance for reducing the number of examinations and optimizing clinical diagnosis.

前列腺癌 MR 定性诊断规范化流程探索

胡娟,李刚,凌冰冰,高超,何波,李宗芳,孙学进,赵卫
昆明医科大学第一附属医院

目的：探索对临床疑诊前列腺癌患者进行 MR 定性诊断的规范化流程。
材料和方法：回顾性收集 2013 年 10 月～2016 年 10 月因临床疑诊前列腺癌，申请前列腺 MR 检查的病例共 320 例。整理、统计其临床资料、扫描序列及参数、图像质量、报告结果、超声引导下穿刺活检病理、手术、出院诊断及随访结果。通过全面分析、比较，总结前列腺 MR 定性诊断规范化流程。
结果：前列腺癌 MR 定性诊断规范化流程包括检查适应征、检查前准备、检查方案、规范化报告、影像病理对照及随访五个步骤。检查适应症为：因临床症状、PSA 升高、超声发现异常回声、直肠指诊异常等疑诊前列腺癌；检查前准备：肠道准备及 MR 通用准备；检查方案：前列腺癌专用方案核心为轴位 T2WI、高 B 值 DWI、动态增强（DCE）均行小 FOV 高分辨扫描；规范化报告要求对前列腺进行 PI-RADS 评分；MR 检查与检查后超声引导下穿刺活检、手术、随访进行影像病理对照。
结论：前列腺 MR 定性诊断规范化流程相较普通盆腔 MR 可显著提高前列腺 MR 定性诊断效能，应作为前列腺癌 MR 基本规范推广于临床。

宽体探测器在颅脑 CTA 的临床应用及辐射剂量的探讨

孔德灿,李彪,李雯莉,朱冬云,周智洋
中山大学附属第六医院

目的：比较宽体探测器采用容积(Volume)扫描模式和螺旋(Helical)扫描模式在颅脑 CTA 检查中的图像质量和辐射剂量，探讨两种扫描模式的临床应用价值。**方法：**对比性分析本院 2019 年 1 月至

2019 年 6 月 40 例行头颅 CT 血管成像的病例，采用东芝 Aquilion ONE 640 层 CT 机进行扫描，扫描条件：120kV，Auto mA，rot.0.5s，FOV160mm，层厚、层间距 1mm，保持其他扫描条件不变，改变扫描模式，其中 A 组采用容积扫描模式 20 例，B 组螺旋扫描模式 20 例。采用造影剂追踪技术，感兴趣区置于颈内动脉，阈值 100-120HU。测量两组图像颅内动脉主要分支的 CT 值，记录两组图像的 CT 剂量指数（CTDI）和 CT 剂量长度乘积（DLP），并计算有效剂量（ED），采用两独立样本的 t 检验对 A、B 两组图像进行比较分析。通过 Vitra 后处理软件对图像进行重建，方法包括：多平面重组（MPR）、最大密度投影（MIP）、容积再现（VR）和表面遮盖技术（SSD）等。**结果：**A、B 两组扫描模式的图像均能清晰显示颅内动脉主要分支，各分支平均 CT 值均达 450HU 或以上，符合临床诊断要求，诊断信息评分无差异（P>0.05）。A 组有效剂量（ED）为（0.93±0.24）mSv，B 组为（1.67±0.82）mSv，A 组较 B 组辐射剂量降低约 45%，差异有统计学意义（P<0.05）。其他条件不变，相同扫描范围（FOV=160mm），A 组曝光时间为 0.5s，B 组曝光时间为 5s，A 组患者检查受照时间更短，辐射有效剂量（ED）更少。**结论：**应用容积扫描模式可在剂量减少约 45%的扫描条件下获得满足临床诊断要求的颅内动脉图像，且扫描时间短，减少了扫描时间，降低了患者的受照辐射，能够符合防护的最优化原则。

DR 影像的特点及临床应用

施涛
苏州大学附属第二医院

摘要:目的:对直接数字化 x 线摄影(DR)应用与临床的相关优势进行分析。方法:选取我院于 2013 年 7 月至 2015 年 7 月 期间经 X 射线检查的 1200 例患者为研究对象，根据相关标准，对三片率进行统计。结果:统计三片率为甲级占 95.00%、乙 级占 3.25%、废片占 1.25%。结论:DR 数字化影像技术具有曝光时间短、操作简单、诊断准确度高的优势特征，在临床上的 应用前景非常广阔。

PU-3756

门脉 CT 成像的图像质量控制

余菡
重庆医科大学附属第二医院

目的：探讨使用小剂量测试法及经验法对门脉 CT 成像图像质量的影响
材料与方法：将于 64 排 GE CT 行门脉 CT 成像检查的且体质量指数 19≤BMI≤25.0kg/m2 的患者 80 例，随机分为 A,B 组，每组各 35 例。A 组采用经验法，B 组采用小剂量团注测试法，测量门静脉 CT 值达峰时间，并设置达峰时间触发扫描；两组其余扫描参数一致:管电压 120kV，管电流 250mAs，对比剂浓度 370mol/ml，对比剂剂量 1.5ml/kg。由两名高年资诊断医师使用双盲法以统一标准对图像质量进行主观评分，图像质量客观评价指标包括门静脉 CT 值、信噪比(SNR)。使用 SPSS 20.0 软件对计量资料进行统计分析，对 CT 值、信噪比及主观评分使用独立样本 t 检验，对两名诊断医师进行一致性检验，确认各参数有无统计学差异，P＞0.05，差异无统计学意义，P＜0.05，差异有统计学意义。
结果：A 组图像质量评分（3.87±0.56），B 组图像质量评分（3.96±0.47），两者（P＞0.05）差异无统计学意义；A 组 CT 值为 189±22.3，B 组 CT 值为 232±17.6，两者（P＜0.05）差异有统计

学意义；A 组信噪比 35.7±11.7 ,B 组信噪比 36.2±11.5，两者（P＞0.05）差异无统计学意义；两名诊断医师一致性高。
结论：小剂量测试法在门脉的 CT 检查中对门脉的显示能力优于经验法，在对门脉显示要求较高的检查中，应作为首选的方案。

医院必须重视 CT 检查的辐射安全和防护工作

郭晓洁,于子晓
河南省洛阳正骨医院（河南省骨科医院）

在科学技术日新月异的今天，CT 已经成为现代化医院的标配；在医院里接受 CT 检查的患者越来越多，作为有辐射伤害的一种检查手段，CT 检查期间的辐射安全和防护问题迫切需要关注和规范；医院至少应该从正确的选型与安装、科学的使用和合理防护三个方面做好辐射安全和防护工作。

PU-3758
XCY2002—1/200 型野战 X 线诊断车展开及伪装训练实践与思考

张振华
联勤保障部队第 989 医院

目的：比较不同训练方法展开及伪装野战 X 线车的时间，探讨改良法在野战 X 线诊断车快速展开及伪装的应用价值。
方法：记录双人协作传统操作流程展开及伪装时间，另记录双人协作改良法野战 X 线车展开计伪装时间，比较分析两者间差异。
结果：改良法较传统法明显减少 X 线车展开及伪装花费时间，极大提高了效率。
结论：改良法能够快速展开并伪装野战 X 线车，大幅减少 X 线车展开时间，对于提升野战 X 线车生存能力具有重要意义。

PU-3759
腰椎数字 X 线摄影中曝光指数的回顾性分析

陈伟,李树,谢斯敏,曹冬,李琛伟,廖伟华
中南大学湘雅医院

目的：在数字 X 线摄影中，曝光指数（Exposure index，EXI）作为一种反映平板探测器对相关图像区域所受辐射剂量的响应测量方法，理论上与 DR 图像的信噪比成正比关系，与图像质量密切相关。本研究调查了一组连续的站立位腰椎数字 X 线摄影 EXI 值，对数据进行分析，以探讨 EXI 的实际意义。**方法：**回顾性收集 2019 年 5 月-7 月在我院西门子 DR 系统（型号 YSIO FLUOROSPOT Compact）上拍摄的腰椎正、侧、斜位及过伸过屈位片连续病例图像，记录图像信息中的物理 EXI 和临床 EXI 等数值，对性别、有无内固定、不同体厚和曝光野等情况下的差异进行比较，并作 mAs 与 EXI 的相关性分析。**结果：**本研究共纳入腰椎 X 线摄片 405 例，计算腰椎六个方位的临床 EXI 均值，男女性 EXI 分别为 391±121 ，381±110，差异存在统计学意义（t=2.05，P＜0.05）；有内固定与无内固定者 EXI 分别为 427±147，385±115，差异存在统计学意义（t=2.67，P=0.01）；

体厚较大与较小者 EXI 分别为 332±74，302±67，差异存在统计学意义（t=3.01，P=0.00）；大曝光野与小曝光野 EXI 分别为 441±124，359±99，差异存在统计学意义（t=11.66，P=0.00）；mAs 与临床 EXI 无相关（ρ=0.065，P=0.355），mAs 与物理 EXI 亦无相关（ρ=0.148，P=0.034）。**结论：**尽管曝光指数与管电流量成正比的理论与实际并不相符，但不同临床情况下 EXI 的差异变化符合数字 X 线摄影原理，有助于 DR 图像质量的客观评价。

PU-3760
颈椎数字 X 线摄影中自动曝光控制的适用性评价

陈伟,刘文广,谢斯敏,曹冬,李树,廖伟华
中南大学湘雅医院

目的：颈椎 X 线摄影检查是颈椎病常用的影像手段，尤其是功能位摄片在评价椎体失稳方面有着重要作用。在曝光参数选择时为减少对操作者个人经验的依赖，通常会应用自动曝光控制（Automatic exposure control，AEC）技术来消除受检者个体差异对图像质量的影响，可实际上颈椎各方位的数字 X 线摄影图像质量却参差不齐。本研究回顾了颈椎各方位数字 X 线摄影应用 AEC 后获得的相关曝光参数，旨在对 AEC 的适用性进行评价。**方法：**回顾性收集 2019 年 5 月-7 月在我院西门子 DR 系统（型号 YSIO FLUOROSPOT Compact）上拍摄的颈椎正、侧、斜位及过伸过屈位片，由 2 名 3 年工作经验的放射诊断医师对图像质量进行评分，并记录图像信息中的管电流量。**结果：**本研究共纳入站立位颈椎 X 线摄片 69 例。颈椎正位、左侧位、过屈位、过伸位、左斜位及右斜位的 mAs 变异系数分别为 28%、32%、33%、38%、38%；颈椎左侧位与过屈位、左侧位与过伸位、过伸位与过屈位、左斜位与右斜位质量评分的 ICCs 分别为 0.047、0.014、-0.147 及 0.293。**结论：**在颈椎数字 X 线摄影中应用 AEC 时，侧位与功能位 mAs 值的变异系数均大于前后位，导致图像质量差异较大。提示临床上必须规范使用 AEC，必要时对传统 AEC 技术进行改进或寻求更可靠的 AEC 替代技术。

PU-3761
陈旧性 CR 在新生儿 PICC 床旁摄片辐射剂量及图像质量权衡

李俊鹏
成都市第三人民医院

摘要: 目的：探讨陈旧性 CR 在新生儿 PICC 床旁摄片应用中，辐射剂量与图像质量的权重。

方法：随机抽取 2018 年新生儿 PICC 床旁摄片 50 例为 A 组，条件为 1.8~2.0mA s，40~42 kV；2019 年改变剂量拍摄新生儿 PICC 床旁胸片 50 例为 B 组，条件为 2.4~3.0mA s，42~44 kV 进行比对。新生儿均为出生 5±4 天，体重 1.38±0.5，设备为东芝 CR 已使用 15 年+，IP 板 8 年+。

结果：B 组图像质量优于 A 组，PICC 位置清晰可见层次清晰度比较高，具有统计学意义。辐射剂量增加 5%，无统计学意义。

结论：随着科学的不断发展，床旁设备也在日益更迭，但由于客观条件的限制，很多陈旧性设备依旧在使用且占有重要的地位。对图像质量及诊断带来了严峻的考验。本次研究在满足临床诊断的前提下，较好的权衡了图像质量与辐射剂量，为临床在新生儿 PICC 插管提供信息量多、图像质量高的影像。

PU-3762

冈上肌出口位的摄影方法改良

康晋杰
德州市人民医院

目的:探讨冈上肌出口位的摄影方法及技巧,及其在临床的应用价值。方法:对常规冈上肌出口位摄影方法进行改良、简化,采取后前位水平投照的方法,对 100 例因肩关节疼痛或外伤的患者拍摄冈上肌出口位片,并加以分析。结果:肩胛骨侧位投影成一明显"Y"字,肩峰形态、骨质结构显示清晰;肩峰分为三型:扁平型(Ⅰ型),弯曲型(Ⅱ型)和钩型(Ⅲ型)。90 例非外伤患者中,Ⅰ型 23 例(26%),Ⅱ型 32 例(35%),Ⅲ型 35 例(39%);20 例外伤患者中 10 例可见骨折或脱位征象。结论:对冈上肌出口位摄影方法的改良、简化是适用的,能达到临床诊断的目的;冈上肌出口位摄片对肩峰下撞击综合征的诊断具有重要参考价值,对外伤所致的肩关节骨折或脱位的诊断也有临床应用价值。

PU-3763

碘对比剂对 CT 检查辐射生物学效应影响的初步研究

李强[1],汪玲[1,2],胡春洪[1,2]
1.宁波市鄞州人民医院
2.苏州大学附属第一医院

目的 评估碘对比剂对 CT 检查辐射效应的影响。**方法** 60 例怀疑泌尿道系统疾病而准备行 CT 泌尿道造影（computed tomography urography，CTU）的患者随机分为对照组和实验组。对照组使用常规法 CTU 检查（平扫、皮质期、髓质期和排泄期），第 1 次仅腹部 CT 平扫，3 天后补充其他三期增强扫描；实验组使用分次注射法 CTU 检查（平扫、实质-排泄期），第 1 次行分次注射增强扫描（实质-排泄期），3 天后补充平扫。两组患者第 1 次 CT 扫描前后 10 分钟内各抽取一次外周静脉血 2ml，分离淋巴细胞，使用免疫荧光法计数外周静脉血内淋巴细胞核的γH2AX 焦点数目。对照分析两组患者第一次扫描的辐射剂量和扫描前后外周静脉血内淋巴细胞核内γH2AX 焦点数目的差异。**结果** 共 50 例患者顺利完成 CT 扫描和免疫荧光法γH2AX 焦点数测定（对照组 24 例，实验组 26 例），对照组和实验组患者第一次 CT 扫描所接受的辐射剂量分别为(4.83±1.88)和(4.55±1.66) mSv，差异无统计学意义（t=0.56 P=0.58）。扫描前后外周静脉血内淋巴细胞内平均γH2AX 焦点数分别为（0.06±0.02，1.06±0.27）和（0.06±0.03，1.42±0.50）个，差值为（0.97±0.23）和（1.34±0.41）个，差异有统计学意义（t=-3.25，P=0.00），实验组焦点增多量较对照组高 38.14%。两组患者扫描前后的γH2AX 焦点变化受性别影响差异无统计学意义，但受年龄影响差异有统计学意义。**结论** 碘对比剂的存在可在一定程度上增加 CT 辐射引起的外周血淋巴细胞 DNA 损伤，建议临床工作中应尽可能降低碘对比剂使用的浓度和总碘量，以降低机体的损伤。

PU-3764

低浓度碘对比剂用于降低 CT 泌尿道造影的辐射生物学效应的可行性研究

李强

宁波市鄞州人民医院

目的 评估低浓度碘对比剂用于降低 CT 泌尿道系造影（Computed Tomography Urography，CTU）辐射生物学效应的可行性。**方法** 58 例临床怀疑泌尿道系统疾病而准备行 CTU 检查的患者随机分为对照组和实验组。两组均使用分次注射法 CTU 检查，对照组使用常规对比剂 CTU 检查（350 mg I／ml，100ml）；实验组使用低浓度碘对比剂 CTU 检查（270 mgI/ ml，100ml)。CT 检查前后 10 分钟内各抽取一次外周静脉血 2ml，分离淋巴细胞，记录两组的平均辐射剂量，用免疫荧光法测定外周静脉血内淋巴细胞核内γH2AX 焦点数目。对照分析两组患者扫描前后外周静脉血内淋巴细胞 DNA 损伤的差异。**结果** 共 51 例患者顺利完成检查（对照组 25 例，实验组 26 例），对照组和实验组 CT 扫描前后外周静脉血内每个淋巴细胞γH2AX 焦点数分别为（0.058±0.028，2.549±0.904）和（0.064±0.020，1.878±0.469）个，差值为（2.490±0.887）和（1.814±0.452）个，差异有统计学意义（t=-3.617，P=0.001），实验组焦点较对照组降低了 37.26%。**结论** 低浓度碘对比剂可降低 CTU 检查时辐射导致的 DNA 损伤，临床工作中推荐尽可能使用低浓度碘对比剂 CTU 检查。

PU-3765

联影 uCT 低剂量 CT 技术的临床应用研究

詹致君,杨述根
西南医科大学附属医院

目的：探讨低剂量 CT 在胸部体检中如何降低患者所受辐射剂量的临床应用研究。**方法：**从本单位职工体检中随机选取年龄在 24-35 岁体检患者 50 例。随机分为 AB 两组，研究 A 组使用联影 uCT 的 uDose®智能 mA 技术，自动 mA 设置范围 14-110mA,研究 B 组使用固定毫安 50mA,其余扫描参数与 A 组相同。记录每一位患者的 CT 容积剂量指数（CTDIvol）和剂量长度乘积（DLP）值，计算 ED。由两名诊断组副主任医师对两组患者的 CT 结果进行随机取样分析，图像质量分为优良差三级。同时，对两组图像的肺尖层面、主动脉弓层面、肺动脉开口层面、肺底层面进行噪声测量，所有数据记录 Excel，分析采用 SPSS3.0。**结果：**2 组图像质量评级分别为 A 组：优 0 例、良 25 例、差 0 例；B 组：优 0 例、良 21 例、差 4 例。测量 A 组图像噪声为：肺尖层面（16.77±1.37）、主动脉弓层面（15.56±1.22）、肺动脉开口层面（15.05±1.03）、肺底层面（21.32±1.53）；测量 B 组图像噪声为：肺尖层面（18.78±1.41）、主动脉弓层面（16.96±1.12）、肺动脉开口层面（17.88±1.24）、肺底层面（25.57±1.81）。研究 A 组 CTDIvol 为（2.51）mGy，ED 为（1.30±0.14）mSv；研究 B 组 CTDIvol 为（1.81）mGy，ED 为（0.85±0.57）mSv。两组 t 值比较 age t=1.345，P=0.171，CTDI t=5.713（P＜0.001），DLP t=6.371（P＜0.001），ED t=6.371（P＜0.001）。**结论：**使用联影 uCT 的 uDose®智能 mA 技术进行检查的患者，ED 低于使用固定毫安组的患者，图像质量也优于固定毫安组。联影 uCT 的 uDose®智能 mA 技术更适合用于低剂量胸部 CT 体检。

PU-3766

飞利浦 256 层螺旋 CT 头颈胸腹联合血管成像方案的探讨

詹致君,杨述根
西南医科大学附属医院

目的：临床上经常有部分患者需要同时进行头颈部 CTA、胸部 CTPA、腹部 CTA、主动脉 CTA 以及各部位的常规增强。为了保证图像质量，一般这种患者都是进行逐项检查，检查费用较高，检查时间长，辐射剂量大，对比剂使用多且副反应发生率高。基于此，笔者设置了头颈胸腹联合血管成像方案，目的是一次性完成检查，降低检查费用，减少辐射剂量。**方法：**方案分置为定位、平扫、监测、头颈胸腹联合 CTA、静脉期扫描五个序列，扫描范围自颅定到耻骨下缘，扫描参数：120KV、150-450mAs 自动毫安秒技术、0.984:1 螺距、0.625mm 薄层重建；右肘静脉注射 370mgI/ml 非离子造影剂 75~95ml，速率 5ml/s，40~60ml0.9%生理盐水冲管。监测层面设为主动脉弓层面，监测前延迟 5s 后开始监测，阈值 150HU 自动触发，触发后扫描前延时 6~8s，静脉期延迟 25~35s。扫描头颈胸腹联合 CTA 时期相当于注射造影剂后 15~25s，静脉期相当于造影剂注射后 65~80s。**结果：**共记录 8 例患者扫描结果，所有患者均一次性完成检查。检查图像横断面层次分明，基底动脉、肺动脉、肺静脉、主动脉弓、髂总动脉的动脉期 CT 值分别为 350±50HU、300±90HU、330±60HU、400±50HU、350±50HU；血管与周围组织界限清晰可辨，与常规 CTA 检查结果无明显差异；不足之处是双上肢及腔静脉毗邻处存在部分伪影干扰，且有少数患者肺动脉显影较淡。**结论：**大部分行行头颈部 CTA 加主动脉 CTA 的患者主要是观察夹层或者动脉瘤的情况，对于这部分患者行此扫描方案能完全达到诊断目的，但对于主要想观察肺部血管的患者部分患者图像质量上存在一定的不足；但此方案所需的检查时间及检查费用相对于逐项检查有明显的优势，且辐射剂量总 DLP 也从逐项检查的总 6000mGy_cm 降至 3000±500mGy_cm，仍可以认为是一种理想的检查方法。

PU-3767

颈椎和腰椎数字 X 线摄影的目标曝光指数

李树,陈伟,谢斯敏,曹冬,李琛伟,廖伟华
中南大学湘雅医院

目的：数字 X 线摄影中的曝光指数（Exposure index，EXI），如同屏-片成像系统中胶片密度信息，反馈给放射技师用来判断到达平板探测器的曝光量是否合适。AAPM TG116 建议将偏差指数用于 DR 图像的质量管理，而根据偏差指数公式要求，应先行获得厂家或用户制定的目标 EXI 表。目前各厂家给出的目标 EXI 并未得到临床认可，用户应根据不同诊断任务自行制定目标 EXI 表。本文通过规范化操作得到一组较为标准的站立位颈椎和腰椎数字 X 线摄影图像，求出各方位摄影的目标 EXI，旨在为其他用户制定目标 EXI 表提供一些经验和借鉴。**方法：**回顾性收集 2019 年 7 月 1 日至 30 月在我院西门子 DR 系统（型号 YSIO FLUOROSPOT Compact）上拍摄的颈椎和腰椎正、侧、斜位及过伸过屈位片，由 2 名 3 年工作经验的放射诊断医师对图像质量进行评分，并记录图像信息中的临床 EXI 值，将求得的均值作为目标 EXI。**结果：**图像质量符合诊断要求的腰椎 X 线摄影 200 例，颈椎 77 例纳入统计。腰椎前后位、左侧位、前屈位、后伸位、左斜位和右斜位的 EXI 分别为 525±97、316±72、350±72、340±76、475±111、461±104。颈椎前后位、左侧位、前屈位、后伸位、左斜位和右斜位的 EXI 分别为 169±26、97±19、80±19、102±27、105±27、103±29。**结论：**由于受数字 X 线摄影过程中多种因素的影响，求均值得到的目标 EXI 不能直接用于偏差指数的计算，建议根据经典理论和用户经验适当修正数据后，制定各型号 DR 设备曝光条件协议的目标 EXI 表。

PU-3768

自动曝光控制在腰椎内固定术后数字 X 线摄影中的应用评价

章茜,陈伟,谢斯敏,曹冬,李树,廖伟华
中南大学湘雅医院

目的：自动曝光控制（Automatic exposure control，AEC）技术，可以个性化地精确控制透过被照体达到成像介质的 X 线曝光量而获得稳定的图像质量，在各部位的数字化 X 线摄影（Digital radiography，DR）中得到广泛应用。但由于 AEC 技术原理上的局限，在一些特殊临床情况中使用 AEC 仍需要进一步规范。本文回顾调查了站立位腰椎 DR 中有无内固定植入物两种情况的管电流量、剂量面积乘积（Dose area product，DAP），旨在对 AEC 的合理使用进行探讨。
材料与方法：收集 2019 年 5 月-6 月在我院西门子 DR 系统（型号 YSIO FLUOROSPOT Compact）上拍摄的站立位腰椎正位和侧位片，查看是否存在金属内固定植入物，并记录图像信息中的 mAs 和 DAP，比较其差异。
结果：本研究共纳入站立位腰椎 DR 中金属内固定植入者 108 例，无内固定者 401 例。有内固定与无内固定植入者的 mAs 分别为 71±34，64±29，差异有统计学意义（t=2.18，P＜0.005）。有内固定与无内固定植入者的 DAP 分别为 225±103，198±102，差异有统计学意义（t=2.49，P＜0.005）。
结论：腰椎内固定植入术后进行 DR 随访时，采用 AEC 技术可能导致不必要的高 mAs，并存在增加患者辐射剂量的风险，违背了 ARALA 原则。在 AEC 技术局限未突破前，推荐优先使用经过临床验证和认可的手动摄影曝光参数。

前瞻性护理与改良扫描法在 COPD 患者胸部 CT 检查中的应用

刘平,邓小琴
陆军军医大学第二附属医院（新桥医院）

慢性阻塞性肺疾病（chronic obstructive pulmonarysease，COPD） 是一种严重威胁身体健康和生命安全的肺部最常见疾病，其发生率较高，仅次于心脑血管病与恶性肿瘤[1]，临床症状较严重，肺、心脏及肾脏等多个脏器的影响较大，发病率伴随环境污染的加重，社会人口结构的变化，肺部慢性病变发病率逐渐增加，是临床常见的危重症，常并发Ⅱ型呼吸衰竭，主要是肺通气和换气功能发生障碍，促使重症Ⅱ型呼吸衰竭的死亡率明显升高[2]，COPD 患者多系老年人，由于肺功能较差，在进行 CT 扫描时无法较长时间的屏气，往往在扫描后 1/3 或 1/2 时段就出现屏气不良、腹部

出现抖动，致使所扫描区域图像出现运动性伪影，影响病变的分析判断。我们采取有效的护理干预和改良这类患者的胸部扫描技术，较好的避免了扫描过程中屏气不良的影响，增加了图像的清晰度，确保了诊断质量。

人工智能技术在影像护理管理中的应用与展望

张峥
同济大学附属肺科医院/上海市肺科医院

目的 人工智能技术在影像医学领域的研究越来越深入，应用前景广阔，这必将给影像医学及护理的发展带来新的推动力。本文将结合国内外人工智能研究和应用现况，将人工智能技术与影像医疗护理专业相结合，论述人工智能在影像医疗护理中应用的优势，在碘对比剂外渗护理管理中的应用现状，并对其研发和应用前景进行展望。**方法** 从人工智能技术的发展及现状出发，综述人工智能技术与影像医疗护理相结合的概况，探讨影像医疗碘对比剂外渗护理管理中的相关因素，具体分析国内外人工智能技术在影像医疗碘对比剂外渗患者护理管理中的应用研究进展，并综合分析目前人工智能技术在影像医疗护理领域应用过程中所面临的挑战和不足。**结果** 基于人工智能技术在影像医疗护理领域各方面的研究进展和运用现状，从人工智能技术的特点及优势、增强 CT 检查前初步评估、缓解护理人力资源紧张、护理模式重构等方面分别阐述了目前人工智能技术的研究及应用情况。**结论** 通过人工智能的辅助，可以提高判断碘对比剂外渗的及时性，提高 CT 检查的效果，降低医护人员劳动强度，减少影像医护人员的辐射。尽管目前人工智能技术尚未在临床上广泛应用，但随着技术的不断完善和发展，相信人工智能将给影像科护理带来新一轮的技术革新，促进影像护理飞速发展，助力影像医疗碘对比剂外渗护理管理的建设和发展。

PU-3772
开展职业生涯规划教育对护理专业学员挫折教育情境现状及影响因素的调查分析

汤素琼[1],李彬[2]
1.湖北省孝感市中心医院肛肠科
2.湖北省孝感市中心医院 CT 室

摘要：临床护理技术性实践工作，是贯穿整个临床护理专业教学中重要的组成部分，也是临床护理专业学生在巩固与加强理论知识的同时，培养其具有独立工作能力的一个重要性阶段。这是继学校理论知识教育的深化和延续，但在现实培养教育工作中，医学临床护理专业教学质量受到来自多方面因素的影响。通过本调查研究分析发现，临床护理专业学生自身的理论知识储备量，以及临床带教老师专业性技能的熟练程度和患者所具有的个人素质等多方面因素，这些都有可能会影响到临床护理专业教学中的整体质量，所以要针对这些特定性因素，如何在日常的临床实践工作中去加强人文关怀？如何正确引导临床护理专业学生的学习态度？又如何去给临床护理专业实习学生们创造更多的临床实践机会？这些都是当前在临床教学工作中所要面对的新问题，在深化理论知识学习的同时应加强临床一线师资队伍的建设，完善优化临床教学方法，将有效提高临床护理带教工作的质量。

PU-3773
肿瘤患者颈外静脉高压注射碘对比剂的精细化管理

田小红,程琳
陆军军医大学第一附属医院（西南医院）

目的：肿瘤患者由于长期放疗、化疗使外周静脉破坏严重，血管壁硬化，对外周静脉穿刺特困难的患者行颈外静脉穿刺，为肿瘤患者高压注射碘对比剂提供安全有效的增强检查途径。**方法：**选择常规上肢静脉穿刺注射碘对比剂者为对照组(n=100)；颈外静脉穿刺注射碘对比剂为实验组（n=98），实验组为上肢和下肢血管特差、穿刺特别困难者。颈外静脉穿刺的精细化管理方法有：严密评估患者心肺功能、仔细静脉评估、掌握正确穿刺方法、缩短等待检查时间、严格试注水、精确把握碘对比剂剂量、注射速率等。**结果：**对照组 3 例穿刺失败，一次穿刺成功率为 97%；实验组全部一次性穿刺成功无渗漏发生；实验组穿刺时间比对照组穿刺时间缩短、对比剂使用总量比对照组少、患者使用对比剂后不适感比对照组少。 **结论：**对血管条件特别差的肿瘤患者选择颈外静脉穿刺并实施精细化管理提高了穿刺成功率，缩短穿刺时间，减轻患者的痛苦，颈外静脉穿刺高压注射增强检查具有重要的临床意义。

PU-3774
肺栓塞患者行肺动脉 CT 血管成像的护理干预效果

王永竹
四川省肿瘤医院

目的 分析肺栓塞患者行肺动脉 CT 血管成像检查过程中的护理特点干预措施。方法 回顾性分析 2017 年 2 月--2019 年 2 月在我院临床确诊或疑似肺动脉栓塞患者 93 例（分别为 43 例和 50 例）的临床资料。结果 造影术前和术中的护理使本组患者肺动脉 CT 血管成像获得满意造影效果，而术后护理有效地预防和控制了源自上述检查的并发症。结论 肺栓塞患者行肺动脉 CT 血管成像的护理要求高于普通 CT 增强检查，需强化对患者的观察，采取预见性、针对性的护理干预措施，确保患者高质量地完成检查。

PU-3775
碘克沙醇 CT 增强扫描致迟发型不良反应分析

胡梅
四川省肿瘤医院·研究所，四川省癌症防治中心，电子科技大学医学院

目的：探讨 CT 增强扫描检查中使用碘克沙醇对比剂迟发型不良反应的危险因素。**方法：**统计分析 2019 年 4 月使用碘克沙醇对比剂发生迟发型不良反应患者的资料、碘克沙醇使用方法、不良反应表现、不良反应发生时间。**结果：**使用碘克沙醇对比剂行 CT 增强扫描 5 例患者发生中度迟发型不良反应，发生不良反应时间均在注射碘克沙醇后 6-8h。**结论：**碘克沙醇迟发型不良反应发生率低，但是对于首次使用碘对比剂的患者应高度重视迟发型不良反应的发生，适当延长不良反应观察时间。

PU-3776

1 例高龄肝癌合并房颤患者行全麻 CT 引导下射频消融术的围手术期护理

陈珂
河南省肿瘤医院

【摘要】总结 1 例高龄肝癌合并房颤患者行全麻 CT 引导下射频消融术的围手术期护理经验。护理要点包括：重视术前检查及合并症处理，进行有效的心理干预；密切术中护理配合和患者观察；做好术后一般护理、临时起搏器护理，加强并发症预防和处理。经过精心的治疗与护理，患者恢复良好，术后第 5 天出院。

PU-3777

18F-PSMA PET/CT 检查前列腺癌的护理配合

陈世容
四川省肿瘤医院

目的：探讨 ^{18}F-PSMA PET/CT 检查前列腺癌的具体护理措施，规范检查护理程序 ,保证检查图像质量。方法：回顾性分析 68 例 ^{18}F-PSMA PET/CT 检查前列腺癌患者的护理经验和体会，提出了具体的护理措施，规范 ^{18}F-PSMA PET/CT 检查护理程序。结果：通过预约时的接诊护理、患者及家属的心理护理，检查前护理配合、注射药物前后的护理及健康教育，67 例顺利完成检查，其中 66 例图像显示清楚，符合诊断要求，1 例因饮水不足图像质量不合格；1 例因酒精过敏无法完成检查。结论：本检查需要工作人员严格掌握检查的适应症及禁忌症，对患者做好有关检查前、中、后注意事项的解释工作和心理护理，共同积极配合，是顺利完成检查和获得高质量图像的重要保证。

PU-3778

碘对比剂致过敏性休克 3 例病例分析

许琴,何月影,杨妹
海南省人民医院

目的:探讨碘对比剂致过敏性休克的特点、防范措施以及抢救流程。**方法**：对 3 例 CT 增强检查患者静脉注射碘对比剂注射液后发生过敏性休克的抢救过程进行回顾性分析。**结果**：我们按常规严密观察患者使用对比剂后的不良反应，及时发现，医、技、护立即启用应急议案，按急救流程争分夺秒抢救，患者转危为安。**结论**：在使用碘对比剂的过程中应严密观察使用者的药物不良反应，备齐急救药品和急救器材，处于备用状态，掌握急救技能，出现过敏性休克，当班的医、技、护应各负其责、齐心协力抢救病人，才能取得成功。

PU-3779

护理风险预警管理在介入手术中的应用效果

毕研玲
山东省泰安市中心医院

【摘要】目的：探讨护理风险预警管理在介入手术中的应用效果。方法：通过分析 2016 年 8 月至 2017 年 8 月介入手术中护理管理存在的风险因素，没有进行护理风险预警管理，实施护理风险预警管理前患者 246 例；2017 年 9 月至 2018 年 9 月采取护理风险预警管理，实施护理风险预警管理后的患者 246 例。观察实施护理风险预警管理前后介入手术室护理管理改善情况。结果：护理风险预警管理使用后，介入手术风险因素、介入术中意外事故发生率及手术医生对房间护士测评结果比较均优于实施前（P＜ 0.05）。结论：护理风险预警管理在介入手术配合中的应用效果显著，可以很好地改善发生护理管理风险的比例，减少介入手术护理风险的存在，具有重要临床意义。

PU-3780

对比剂不良反应的预防护理及应急抢救措施

庄丽娜
大连医科大学附属第一医院

【摘要】目的：分析放射科对比剂不良反应的预防护理及应急抢救措施。**方法：**选取大连医科大学附属第一医院 2018 年 2 月-12 月期间采用增强扫描检查且使用对比剂的急诊患者 88 例，平分为对照组与试验组。对照组为常规告知注意事项组别，试验组为常规告知基础上给予预防护理的组别，比较分析两组患者不良反应的发生率以及在不良反应发生后采取相应应急抢救措施的恢复效果。**结果：**试验组不良反应发生率明显低于对照组，两组中发生不良反应的患者，在采取及时准确的应急抢救措施后，均显示快速、良好、稳定的恢复效果。**结论：**对采用增强扫描的患者进行合理的预防护理和及时的应急抢救措施，不仅能大大降低患者对比剂不良反应的发生率，也能有效改善对比剂不良反应患者的恢复效果。

1 例耐高压留置针夹闭拇指夹回血的护理汇报

吕慧民
南昌市第一医院（南昌大学第三附属医院）

随着医学技术的不断发展，在增强 CT 检查中已广泛使用耐高压静脉留置针外周静脉穿刺。对护理的要求也越来越高，只有注重细节管理才能给病友好的就医体验。现将我科 2019 年 2 月 20 日出现的 1 例耐高压留置针夹闭拇指夹后仍回血的事件进行鱼骨图分析查找原因，采取的对策汇报如下。

PU-3782

泌尿系 MSCT 一站式检查前的护理干预

曾庆连
陆军军医大学大坪医院

目的：泌尿系 MSCT 一站式检查技术也逐渐成熟，通过泌尿系 MSCT 检查的多期扫描，可显示整个尿路系统的全貌、血管、各种病变及肾脏的排泄功能，为临床提供重要的影像学依据。通过检查前的护理干预可使患者更好的配合检查，从而达到提高图像质量，避免重复扫描。
方法：1.泌尿系 MSCT 检查前护理干预要点
（1）心理护理：在进入检查室前，向受检者说明此项检查的意义以及需要配合的事项，告知患者扫描时噪声以及增强后会有发热可能，消除患者紧张焦虑的情绪，取得患者的配合。告知延时扫描会在第一次扫描完成，下床活动 20-30 分钟后进行，消除患者疑虑，避免产生纠纷。
（2）询问受检者一周内是否服用过含重金属的药物及胃肠道钡剂检查，去除检查部位的金属异物。
（3）检查前半小时将膀胱排空，并饮 200-300ML 水,保证检查时膀胱处于中度充盈状态。
训练患者在屏气，讲解屏气的重要性以及对图像质量和诊断的影响；告知扫描时会多次屏气，每次屏气 10S 左右，且每次屏气幅度保持一致。
1.2 收集我院 2019 年 1 月到 6 月，进行泌尿系 MSCT 检查患者 300 名。其中 150 名给予 CT 检查常规准备；另 150 给予常规准备外，还进行泌尿系 MSCT 检查前的护理干预。分析比较两组检查的图像质量和重复扫描情况。
结果：150 名常规准备患者图像质量优 89 例、良 41 例、差 20 例，优片率 59.3%；护理干预后图像质量优 127 例、良 23 例、差 0 例，优片率 84.6%。相比具有显著统计学差异（P＜0.01）。常规准备患重复扫描为 19 例，原因为：患者屏气配合不佳 9 例；膀胱充盈欠佳 7 例，肠道内有钡剂 3 例；护理干预后患者重复扫描为 0 例，相比具有显著统计学意义（P＜0.01）。
结论：在进行泌尿系 MSCT 一站式检查前护理干预，可保证患者有效配合，并顺利完成扫描，得到了更高的图像质量和更准确诊断，提高了患者及家属的满意度，有效的避免重复扫描，使患者接受更低的辐射剂量。

PU-3783

子宫肌瘤介入治疗与护理

郭莉梅,王洋
河南省郑州大学第一附属医院郑东院区

【摘要】：目的：针对临床上子宫肌瘤病症介入治疗的观察以及护理进行了分析总结。方法：依据导管子宫动脉栓塞术进行子宫肌瘤病患治疗的相关临床资料进行分析总结。结果：在术后一个月患者的子宫肌瘤缩小非常明显，术后一年病患者子宫肌瘤基本消失。 结论：通过对子宫肌瘤介入治疗临床观察以及护理能够进一步提升手术的成功率。

PU-3784

标准预防在放射科感染控制的重要性

侯萌
北京清华长庚医院

目的 ：了解放射科医院感染相关因素，为加强放射科医院感染工作的管理提供可靠依据。
方法

1.资料：放射科是面向全院的重要窗口，是医院感染监控的薄弱环节，人员流量大。所以实施“标准预防”，切断可能引发传染的各个环节，采取切实可行的措施，即可保证就诊者检查服务的安全性，杜绝医源性交叉感染，又能保障医务人员免遭感染。
2.方法：
2.1.1 手卫生 涵义：依据标准预防的规定和诊疗活动的需要，合理配置手卫生设施、持续推动和优化手卫生实践。
2.1.2 流动水洗手设施、洗手池、洗手液、干手设施、速干手消毒液，以及手卫生流程图等。
2.1.3 手卫生宣传、教育和培训
2.1.4 临床科室是手卫生执行的主体部门，日常实施自查与监督管理。
2.1.5 手卫生监测、评估、干预和反馈机制，不断提升医务人员手卫生知识知晓率、手卫生依从性和正确率。
2.2.1 隔离 涵义：针对诊疗过程中出现或者可能出现的感染传播风险，依法、规范地设立有效屏障。
2.2.2 隔离对象分为两类：一类是具有明确或可能的感染传播能力的人员，对其按照感染源进行隔离；另一类是具有获得感染可能的高风险目标人员，对其进行保护性隔离。
2.2.3 在严格标准预防的基础上，按照疾病传播途径和防控级别实施针对性隔离措施。
2.2.4 对隔离措施执行情况进行督查、反馈，并加以持续质量改进。
2.3.1 环境清洁消毒 涵义：对诊疗区域的空气、环境和物体（包括诊疗器械、医疗设备、床单元等）表面，以及地面等实施清洁消毒或新风管理，以防控与环境相关感染的发生和传播。
2.3.2 确定实施环境物表清洁消毒的主体部门及监管部门，明确各部门及相关岗位人员的职责。
2.3.3 规范开展针对诊疗环境物表清洁消毒过程及效果的监测。
结果 放射科医院感染与相关制度缺乏，标准预防不到位相关。
结论 了解放射科医院感染相干因素，重视医务人员院感知识管理培训，提高医务人员感控意识，使院感工作落到实处。

PU-3785

CT 引导下经皮肺穿刺活检术的护理配合及体会

宁春芳,姚学会,韩嵩搏
北京大学第三医院

【摘要】**目的**:总结 CT 引导下经皮肺穿刺活检术的护理体会。**方法**:运用 GE 宝石螺旋 CT 机对 258 例患者进行 CT 引导下经皮肺穿朝活检术的护理配合，进行回顾性分析。**结果**:258 例患者肺穿刺活检均获得成功。做好患者的心理护理，熟练掌握术前、术中、术后的护理是保证成功的关键。**结论**:良好的护理在肺穿刺活检中发辉着重要的作用。

PU-3786

CT 增强检查中对比剂不良反应的预防和护理

柳晓璐,姚学会
北京大学第三医院

【摘要】
目的：探讨 CT 增强检查中患者对比剂反应的预防和护理。
方法：对我院 10502 例 CT 增强检查患者给予检查全过程、全方位的护理干预。
结果： 10502 例 CT 增强检查患者，均顺利完成检查，其中出现荨麻疹 30 例，轻度呕吐

10 例，均为轻度反应，无中度、重度反应的发生。
结论：对比剂不良反应的预防与护理是影像科室护理工作的重点，通过有序的、全面的、专业的护理，做到检查前充分预防、检查中密切观察，及时发现，及时处理，及时抢救，把专业的护理干预贯穿于 CT 增强检查的全过程，从而使对比剂不良反应的发生率、严重程度降到最低，以保障患者的检查安全。

PU-3787
1 例股青肿型下肢深静脉血栓患者行机械性血栓清除联合导管溶栓的护理

陈媛媛,付丽丽,纪光云,郑雯
徐州医科大学附属医院

目的：总结 1 例股青肿型下肢深静脉血栓患者行机械性血栓清除联合导管接触性溶栓的护理经验。方法：对 1 例股青肿患者行 AngioJet 机械性血栓清除联合导管接触性溶栓术，护理要点包括预防肺栓塞的发生、患肢护理、术后并发症的观察与护理、抗凝治疗的护理、溶栓治疗的护理和出院指导等。结果：此例患者手术效果良好，术后 12 天患肢青紫完全消退。患者术后发生了急性肾功能损伤和血红蛋白减少等并发症，经积极治疗和护理，于入院后第 20 天康复出院，随访 1 个月未发生血栓复发和血栓后综合征。结论：机械性血栓清除联合导管接触性溶栓术是治疗股青肿的重要方法，护士应做好围术期护理和病情观察，及时发现并发症。

PU-3788
下肢动脉硬化闭塞症行血管腔内治疗的护理要点

马海静
兰州大学第一医院

目的 探讨接受下肢动脉硬化闭塞症血管腔内治疗患者的护理要点。 **方法** 对 89 例下肢动脉硬化闭塞症患者术前、术后的护理进行回顾性分析。**结果** 89 例患者血管腔内治疗后患肢皮肤温度明显改善，麻木症状消失，疼痛症状缓解， 间歇性跛行消失，运动障碍明显改善，坏疽肢体血液再灌注明显，8 例出现术后并发症，其中 6 例再灌注损伤，2 例穿刺部位血肿，占手术的 9.0%。**结论** 血管腔内治疗下肢动脉硬化闭塞症具有微创、操作简单、疗效确切，合理有效的护理可提高手术成功率、有效改善下肢缺血、降低致残率，提高患者的生活质量。

PU-3789
影像科检查流程信息化管理

陈英梅
中山大学肿瘤防治中心/中山大学附属肿瘤医院

目的：建立影像科检查流程信息化管理系统，增强影像检查工作的标准化和规范化，完成并运行自助到检系统，实施无纸化办公流程，提高患者检查速度，减少等候时间。方法：利用先进的信息技术，通过 4G 网、ＷＩＦＩ、无线互联网，集成构建影像检查流程管理框架，绘制各个检查模块

的流程图，在每一个流程的关联活动添加标准化文档，集成流程管理的标准化系统。结果：通过建立智能化检查流程管理系统优化预约系统，实行分时段预约，缩短了病人等候时间，实现标准化成果的可应用、可共享、可优化、可持续。结论：通过信息化的流程管理， 可提高医疗质量和患者的满意度，并大力推动影像学科的快速发展。

PU-3790

探讨放射科护理安全隐患及其防范措施

宁春芳,姚学会
北京大学第三医院

［摘要］目的：分析放射科护理安全隐患并探索其防范措施。**方法**：将 2017 年 1 月来我院放射科进行影像检查的 41523 例患者设定为对照组，将 2018 年 1 月 44702 例患者设定为研究组。总结对照组出现的各种护理安全事件并进行回顾性分析，探讨其发生的原因及安全隐患，针对性地制定出有效的防范措施，实施于研究组患者，统计研究组发生的护理安全事件，并加以对比研究。**结果**：研究组差错发生率、意外事件发生率均低于对照组。**结论**：依据放射科发生护理安全隐患的因素进行分析，制定出针对性的防范措施，可以有效地规避安全风险，减少或杜绝医疗差错，提升影像护理安全，提升患者安全。

PU-3791

1 例经导管主动脉瓣置入术患者的护理

徐彤
郑州大学第一附属医院

摘　要：目的 探讨 1 例经导管主动脉瓣置入术（TAVI）患者的护理方法。**方法** 分析 1 例患者在围手术期的护理措施，包括：术前评估、麻醉护理、心理护理；术中护理；术后生命体征的监测、穿刺部位的护理及并发症的护理等。**结果** 患者成功置入主动脉瓣，术后恢复良好，症状明显改善，无并发症，顺利出院。**结论** 经股动脉途径的经导管主动脉瓣置入术的患者，创伤小，恢复快，症状改善效果明显，但 TAVI 操作难度大，需要护理团队对患者整个围手术期制定详细护理计划来保障患者安全。

PU-3792

碘造影剂外渗的风险评估及护理对策

秦秀凤
华中科技大学同济医学院附属同济医院

［摘要］ 目的：对患者行碘造影剂外渗的风险评估，探讨恰当的护理措施在 CT 增强检查过程中的应用效果。方法：2019 年 5 月~7 月，对 100 例在我科行 C T 增强检查的住院患者行高压注射外渗的风险评估，并给予恰当的护理措施。结果：为 100 例住院患者行 CT 检查，对其行外渗的风险评估，并给予恰当的护理措施，均无碘造影剂外渗的发生。结论：对 CT 增强检查的患者行外渗的风险评估，并给予恰当的护理措施，能有效的防止外渗的发生，减轻患者的痛苦，提高检查的成功率。

PU-3793

颅内动脉瘤介入治疗的护理

陈诗傲
郑州大学第一附属医院

目的：探讨颅内动脉瘤患者介入治疗的护理措施及效果
方法：回顾性分析 20 例颅内动脉瘤患者介入治疗的临床病例资料
结论：颅内动脉瘤是临床上常见的脑血管疾病之一，颅内动脉瘤是因为局部脑血管由于先天发育不良或后天损伤导致血管动脉壁产生损害逐步形成囊性的膨出，是几何形态、血流动力学和病理生理学三者相互动态作用的结果。绝大多少动脉瘤破裂出血后才得以诊断，而动脉瘤性的蛛网膜下腔出血致死致残率高达 33%—40%。在动脉瘤破裂出血前，约 99%的患者无特殊症状，而随着检查手段如磁共振、CT 等仪器设备及检测手段越来越先进，越来越多的未破裂的动脉瘤被检测出，若患者早期采取积极的治疗及预防措施可预防动脉瘤的破裂，显著的提高生存率和治愈率。而介入治疗具有创伤小、疗效显著、手术并发症少等特点，随着介入治疗技术的成熟，现如今介入治疗已成为颅内动脉瘤治疗的首选方法。
而对于患者来说，病情变化会让他们感到极度的恐慌及焦虑，在期待介入治疗的同时又对治疗效果及手术方式产生疑虑，护士在术前对患者进行心理护理，加强健康宣教，避免一切诱导动脉瘤破裂的危险因素；利用沟通技巧准确的发现患者的心理问题，进行心理疏导，帮助患者克服心理压力，维持情绪稳定，并向患者讲清介入治疗的意义、作用及效果，清除他们紧张、恐惧的心理，增强治疗的勇气和信心，积极配合手术，以良好的心态接受治疗。在术后严密的观察患者的生命体征、意识、瞳孔及四肢活动情况等，进行综合的护理干预，可以进一步降低术后并发症的发生；通过一系列准确、有效的护理措施及护理指导，提高了患者的舒适度，加强了护患之间的交流和理解，很大程度上提高了患者的治疗依从性，提高治疗效果、促进术后康复。实施整体综合护理能够减轻患者紧张、焦虑情绪，为介入手术的顺利进行、术后并发症的积极预防奠定了良好基础，有效的减短了患者的住院日期，有效的避免了并发症的出现，所以综合的护理干预实施具有重要的临床价值。

PU-3794

全程护理干预在提高螺旋 CT 增强扫描护理质量中的应用效果

何跃
陆军军医大学第二附属医院（新桥医院）

目的：分析全程护理干预在提高螺旋 CT 增强扫描护理质量中的应用效果。**方法：**随机挑选螺旋 CT 增强扫描的 100 例患者，时间为 2017 年 8 月至 2018 年 8 月。研究中依照双盲原理将患者分为对照组与观察组，两组患者均 50 例。对照组接受常规护理，观察组患者实行全程护理干预。对照两组患者护理满意度与检查情况。**结果：**统计分析两组患者护理满意度，对照组为 74.0%，低于观察组的 96.0%，检验数据 P<0.05，具有统计学意义；观察两组患者检查时焦虑、不良反应、检查中断发生率，观察组患者各项指标均优于对照组，检验两组患者的各项指标 P<0.05，符合统计学意义。**结论：**患者实行螺旋 CT 检查时，接受全程护理干预可明显提高扫描时护理质量，有助于患者顺利完成检查，应用效果较好。

1 例下腹部 CT 增强检查并发对比剂脑病的相关因素分析及预防

丁体英
河南省人民医院

目的：对比剂脑病是一种较少见的对比剂不良反应，据报道其导致神经系统结构或功能短暂、可逆性异常，出现一系列神经系统表现，多为短暂性，部分患者症状加重甚至死亡。探讨分析对比剂脑病的相关危险因素，为采取积极有效的护理预防措施，降低其发生率。**方法：**回顾性分析 2018 年 10 月 15 日 1 例患者，女，51 岁，因“间断腹疼”行下腹部 CT 碘海醇增强检查，常规准备，检查顺利完成，5 分钟后患者自诉心慌、胸闷，遵医嘱静推地塞米松 10mg 好转，2 小时后患者心悸加重，头痛、呕吐，反应迟钝，急查电解质，提示低钾低氯血症，继之患者全身抽搐，口吐血沫，立即给咪达唑仑针 10mg 缓慢静推，急查头颅 CT、MRI 未见异常，临床诊断造影剂脑病，给予吸氧、补充电解质、利尿降颅压、抗癫痫镇静及支持治疗，患者 3 天后神志转清，31 日好转出院。**结果：**本例患者对比剂脑病的相关因素 1.个体基础疾病如高血压所致大脑调节能力受损，对比剂外渗于大脑致脑损伤；2.患者年龄大肾脏代谢能力相对较差，对比剂排泄缓慢；3.检查前禁食水和导泄药应用使血容量相对不足，短时间内应用大量对比剂造成血液内渗透压偏高，造成一过性脑脱水；4.检查前评估不到位和没有充分水化；5.对比剂的神经毒性作用，对比剂渗透压高于脑组织的渗透压，可透过血脑屏障降低神经细胞的防御功能，引起脑组织变态炎性反应，表现出精神症状。护理预防：检查前 1.充分评估患者的基本情况，关注基础疾病，严格掌握适应症；2.高龄及肾功能异常患者调整好一般情况，多倾听患者的感受；3.详细交代检查前注意事项如导泄药应用，禁食水时间等，避免脱水血容量相对不足；4.检查前充分水化有助于造影剂排泄；5.尽量减少对比剂剂量，且使用非离子型、等渗或次高渗造影剂；**结论：**对比剂脑病是一种较为罕见的并发症，及时并及早发现是进行治疗的前提，积极采取预防措施，临床密切观察，及时有效地治疗，对降低其发生率，改善预后具有重要意义。

根因分析在减少放射科不良事件中的应用

刘凌云
中山大学附属第三医院

摘要：目的：探讨根因分析法在减少放射科不良事件中的应用效果；方法：针对 2017-10～2018-8 月共 19 例不同的不良事件中，运用根因分析方法进行近端原因、根本原因分析，从而改善制度和方式；**结果：**在同类事件中得到很大改善，杜绝了相关不良事件的再次发生。**结论：**应用根因分析法确定根本原因，完善影像科的相关措施和指引、制度，大大提高了影像科室的服务质量。

根因分析（Root Cause Analysis ,RCA） 作为一种质量管理模式，其核心是一种基于团体的、系统的、回顾性的不良事件分析方法，找出系统和流程中的风险和缺点并加以改善，通过与同行从错误中反思、学习及分享经验，可以做到改善流程、事前防范、从多角度、多层次提出针对性预防措施［1］。不良事件凡是在医院内发生的或在患者转运过程中发生的非疾病本身造成的异常医疗事件均属不良事件；此处不良事件属于因医疗器械或医疗设备的原因给患者或医务人员带来的损害，因工务人员或陪护人员的原因给患者带来的损害。

1 例碘帕醇重度外渗患者的护理

慕长萍,李康
中国科学院大学重庆医院（重庆市人民医院）

总结 1 例门诊碘帕醇重度外渗患者的护理经验。护理方法包括：早期正确、及时的处理、患者的心理护理、以及患者回家后实施基于微信小程序的延续护理，患者肿胀肢体快速消退，无并发症发生，患者的满意度提高，微信小程序的延续护理模式，值得在影像科推广使用。

PU-3801
主动脉夹层合并阻塞性睡眠暂停综合征患者的护理体会

陈晨
郑州大学第一附属医院郑东院区

主动脉夹层是因主动脉内膜破损，高压血流冲入血管壁，造成内膜与中膜分离，并延主动脉长轴方向扩展，形成真假两个通道。急性期病死率约 50%的在 48 小时内死亡，70%死于一周内[1],传统的经胸腹手术创伤大，费用高，严重并发症发生率和死亡率分别高达 17%和 26%[2]。随着介入治疗的发展，对主动脉夹层患者实施腔内隔绝术，具有创伤小，并发症少，恢复快，病死率低等优点。我科收住一例主动脉夹层合并阻塞性睡眠暂停综合征患者，并成功施行主动脉夹层腔内隔绝术，取得满意疗效，现报告如下。

PU-3802
化疗药物介入治疗对医护人员的损伤及防治

王伟光
郑州大学第一附属医院

我国近几年的癌症发病率一直呈上升趋势，化疗药物的出现使得癌症患者的治愈率得到了明显的提高。但与此同时，化疗药物的致癌、致畸、致突变也被证实，临床医护人员的自身防护问题也是国内外同行关注的焦点，特别是各种新药的临床应用，抗肿瘤药物应用越来越广泛。化疗药物对长期直接接触的医务人员的身体健康状况存在着巨大的危害，因此只有提高医护人员的自身防护意识，保护医护人员自身的健康才能更好地为患者服务。本研究旨在调查使用化疗药物相关科室的医护人员接触化疗药物所致的不良反应现状，并分析其影响因素，以期通过建立健全职业防护制度，提高管理部门对职业防护的重视，从而降低职业暴露及其所致的伤害。

PU-3803
颜色标识管理在放射科 CT/MRI 增强检查中的应用

何直蔚
海南省肿瘤医院

目的：颜色标识在放射科 CT/MRI 增强检查中的应用价值。统一规范醒目的颜色标识能引起患者和护士的注意，使患者明确自己的检查项目，有效防止护理安全隐患的发生；

利用色彩实现多元化的护理服务，一定程度上减少患者的检查等待时间，提高了医护人员对患者进行识别的正确性，提高科室患者满意；
让患者知晓并且参与到检查流程中，能够更好的配合技师及护士完成检查。
方法：通过利用不同颜色区分不同区域以实现目标管理进行评价。
结果：两组相对比，使用颜色标识管理后目标实现。
结论：颜色标识管理在放射科 CT/MRI 增强检查中可以使患者在明确自己检查项目的同时消除紧张情绪。同时减少患者的等待时间。也提高了医护人员对患者进行识别的正确性，预防护理不良事件的发生提高科室患者满意度。

PU-3804
润肤软膏对晚期肝癌患者使用索拉非尼致手足综合症的疗效观察与护理

李娇,邱新梅
中山大学孙逸仙纪念医院

目的：手足综合症（HFSR）是晚期肝癌患者服用索拉非尼过程中最常见的不良反应，探讨我院自制的润肤软膏对手足综合症的疗效。**方法**：选取我科 2018 年 1 月-2019 年 1 月服用索拉非尼的肝癌患者为研究对象 200 例，使用后出现皮肤反应，并对其分级后使用润肤软膏涂抹 3 次/d，连续两周，为一个疗效，观察使用前后的皮肤变化，评估患者的治疗对比前后的手足综合症的反应转归率情况。**结果**：患者出现不同程度的皮肤反应，使用润肤软膏后，症状减轻，患者无明显不良反应，治疗后手足综合症反应情况明显低于治疗前（$p<0.5$）,均未因手足综合症反应而停用索拉非尼。**结论**：润肤软膏对手足综合症有明显的疗效，减轻患者因手足综合症导致的痛苦，提高患者的生活质量。

PU-3805
延续服务在 PTBD 术后带管出院患者中的应用效果评价

邱永敬,孙小静,张丹丹,王志学
河南大学第一附属医院

目的 研究对 PTBD 术后带管出院患者应用延伸服务的效果。 **方法** 随机选取 2018 年 1 月到 2019 年 2 月期间在本院接受 PTBD 手术治疗的 86 例术后带管出院患者，将其作为研究对象并随机平分为对照组和观察组，每组各 43 例。对照组患者接受常规出院护理，观察组患者接受延续服务护理。 **结果** 观察组并发症发生率低于对照组且护理总满意率高于对照组，$P<0.05$。 **结论** 对 PTBD 术后带管出院患者采取延续服务的效果显著，可有效提高护理满意度，降低并发症的发生率，值得推广。

PU-3806
探讨介入专科护士信息素养培养

邱永敬[1],王晓华[2],王志学[1]
1.河南大学第一附属医院
2.遵义医科大学医学信息工程学院

摘要：探讨介入专科护士信息素养培养的重要性。对介入专科护士从个人信息素养的：信息意识、信息知识、信息能力、信息道德及捕捉信息的敏锐性、筛选信息的针对性、评估信息的准确性、交流信息的自如性、应用信息的独创性等方面的培养。介入专科护士的信息素养培养有益于提高个人专业素质、综合能力、服务能力。逐步实现护理资源共享、服务领域拓展，地区间护理工作水平共同提高。
介入专科护士的信息素养培养利于提高临床护理质量和介入护理专业的发展，优化介入护理服务流程，提高介入护理服务效率，改善介入护理服务体验，实现科学的、创新的、人性化的护理管理；同时促进患者健康恢复，减少患者住院天数及费用。

256 排 Revolution CT 冠脉 CTA 检查患者的心理护理及总结

陈娜
南昌大学第一附属医院

[**摘要]：目的** 探讨 256 排 Revolution CT 行冠脉 CTA 检查的更佳心理护理方法。**方法** 对我院冠脉 CTA 检查患者实施全程心理护理干预并进行分析总结。**结果** 患者均配合良好，顺利一次性完成检查且图像质量清晰。**结论** 全程有效连续的心理护理有利于缩短冠脉 CTA 检查用时，提高图像质量。
[Abstract]: **Objective** To explore a better psychological nursing methods for coronary CTA examination of 256-row Revolution CT. **Methods** Patients with coronary CTA examination in our hospital were given whole-course nursing intervention,and then the process was analyzed. **Results** Patients were cooperated well, completed the examination item at one time smoothly, and the CT image quality was clear. **Conclusion** The whole process of effective and continuous psychological nursing is beneficial to shorten the time of coronary CTA examination and improve the image quality.

PU-3808
下腔静脉滤器置入合并药物溶栓治疗下肢深静脉血栓形成的围手术期护理

蔡书杰
郑州大学第一附属医院

目的：总结和探讨下腔静脉滤器置入术合并药物溶栓治疗下肢深静脉血栓形成的围手术期护理方法及效果。
方法 ：回顾性总结和分析 8 例不同原因导致下肢深静脉血栓形成患者，采用下腔静脉滤器置入术治疗下肢深静脉血栓形成的护理经验。
结果：本组患者均顺利手术，取得满意疗效。
结论 ：下腔静脉滤器置入术下肢治疗深静脉血栓形成具有疗效好、 损伤小、恢复快优点，通过术前评估、患肢观察、心理护理以及术后穿刺处、溶栓导管及鞘管的观察及溶栓用药的护理，有效减少并发症的发生，促进患者的康复。

PU-3809
经造瘘插入型肠梗阻导管治疗肠梗阻患者的护理体会

沈安琪,王洋
郑州大学第一附属医院

目的:探讨经造瘘插入型肠梗阻导管治疗肠梗阻患者的有效护理措施。方法:对 3 例肠梗阻患者应用经造瘘插入型肠梗阻导管治疗后的效果进行观察和分析。结果:2 例治愈,1 例拔管后肠梗阻复发再次应用后痊愈。结论:应用经造瘘插入型肠梗阻导管治疗肠梗阻患者胃肠引流量明显增多,腹胀腹痛明显减轻,肠道功能恢复更快。

PU-3810
抗反流装置在经皮经肝胆道引流术患者中的临床价值

姜凤萍,李阳红,张丽琴,顾颖
云南省肿瘤医院/昆明医学院第三附属医院

【摘要】目的 探讨抗反流装置在经皮经肝胆道引流术患者中减少胆道感染的临床运用及效果。方法 选取例 PTCD 术的患者，随机分成两组，各 113 例。试验组应用抗反流装置连接 PTCD 引流管；对照组应用普通一次性使用引流袋与 PTCD 引流管连接。观察比较两组患者的意外拔管率（引流管与 PTCD 橡皮管连接处发生脱管）、两组发生感染的概率。结果 试验组的感染率低于对照组，差异有统计学意义（P＜0.05）。结论 抗反流装置运用于 PTCD 术后带引流管的患者具有较高的临床价值，值得推广运用。

PU-3811
骨关节肿瘤患者复合手术的护理配合路径建立

陈廷静
陆军军医大学（大坪医院）

摘要：目的 分析探讨骨关节肿瘤患者进行复合手术的护理配合路径的建立。**材料方法** 选取本院收治的 36 例较大骨关节肿瘤患者，患者入院后均完善相关检查及术前准备，签署手术知情同意书，接受手术方案并进行复合手术，先介入造影了解肿瘤血管供血情况，将肿瘤供血丰富的血管栓塞或者用球囊临时阻断，再进行外科肿瘤切除。**结果** 对较大骨关节肿瘤患者进行复合手术并组建复合手术团队，制定外科手术流程及抢救流程，完善护理干预建立配合路径；介入栓塞后能充分暴露手术视野、利于外科医生手术操作、提高了肿瘤的清除率；缩短手术耗时；较大骨关节肿瘤患者肿瘤血供丰富手术难度相对较大、手术创面大、出血量多，进行复合手术介入栓塞后减少出血量；并发症发生情况改善明显。**结论** 在骨关节肿瘤患者复合手术的过程中组建专业的手术团队，制定临床护理路径和完善手术流程有较好的应用效果，改善了患者生活质量，降低了并发症发生率，保证手术的顺利进行具有重要的临床意义值得应用推广。

主动脉夹层急诊 CT 检查的相关护理

叶秀娟[1],李新云[1],叶秀娟[1],李新云
1.广东省人民医院
2.广东省人民医院

[摘要]目的 使行主动脉夹层急诊 CT 增强检查的患者安全地完成检查，防范潜在的医疗纠纷。 方法 选择 2018 年 1 月至 2018 年 6 月主动脉夹层急诊 CT 增强 180 例患者为研究对象，在检查前与急诊科紧密合作，部分准备工作前移至急诊科完成，减少病人在 CT 室的滞留时间，降低风险保障安全。急诊科需控制及稳定收缩压至 100-120 /mmhg、与家属、病人积极沟通做好解释工作及签署知情同意书等准备工作；CT 室准备好急救物品及人力、机房环境等准备工作。检查过程中护士认真做好患者心理护理及交代配合事项，减轻患者紧张、恐惧心理，嘱咐患者勿用力并给与持续吸氧，密切观察病情等有效护理干预措施。结果 180 例急诊患者在我院行主动脉 CT 检查,179 例患者顺利完成 CT 检查，1 例患者因过床后病情变化未能完成检查。结论 对于疑似主动脉夹层的病人，急诊 CT 增强检查具有重要的意义，获取优质的图像，及早的做出诊断为患者的救治进一步赢得宝贵的治疗时间，提高预后效果。但由于患者病情危更易出现不同程度的不良反应或医疗纠纷。CT 室护士应正确识别风险因素，认真审视护理工作中存在的不安全因素，给与相应有效的护理干预措施，保证患者顺利、安全完成检查。

PU-3814

快速反应团队工作模式在肿瘤并发肺栓塞患者行 CT 检诊过程中的建立与应用

李娟,叶兆祥
天津医科大学肿瘤医院

目的：对肿瘤并发肺栓塞患者行 CT 检诊过程进行优化管理，充分发挥快速反应团队工作模式的作用。**方法：**根据入院的先后顺序将符合条件的患者进行分组，实验组在进行增强 CT 的检诊过程中采用快速反应团队工作模式，对照组实施常规的检查流程。在检查结束后调查患者不良事件的发生情况、患者家属的满意程度及 CT 室检诊周期时间，比较两组的差异情况。**结果：**肿瘤并发肺栓塞患者 CT 检诊时间从(25±2.53) min 缩短到(19±1.31) min。快速反应团队工作模式在肿瘤并发肺栓塞患者 CT 检诊中的应用，能有效缩短患者检诊时间，提高了患者家属满意度，降低了不良事件发生率。**结论：**通过采用快速反应团队工作模式对肿瘤并发肺栓塞患者 CT 检诊中的优化管理，能有效缩短了检诊时间，改善影像质量，提高紧急救护的有效性和患者家属满意度，降低检诊过程中不良事件的发生率，保障了患者安全。

脑血管介入术后改善患者舒适度的护理人文关怀实践研究

朱青,张延藏
郑州大学第一附属医院

摘要：介入治疗具有损伤小、恢复快、效果好的优势，可用于肝癌、动脉瘤等多种临床疾病[1]。社会的进步，人民生活水平的提高，病人不仅需要高超的医疗护理技术，而且更需要人文关怀。脑血管介入术后患者的舒适度在人文护理实施中得到改善，提高患者舒适度体验，把高超的介入护理技术与人文关怀完美结合，推进脑血管介入护理的深入发展，达到真正满足病人整体需求，让脑血管介入术后患者受益的最终目的。

PU-3816
颅内动脉瘤介入治疗术后进行持续有创血压监测的护理体会

刘文婕,张延藏,周纪妹
郑州大学第一附属医院

目的:探讨颅内动脉瘤患者介入治疗术后经桡动脉行有创血压监测的临床应用监测期间的护理方法。方法：2018 年 11 月至 2019 年 03 月行颅内动脉瘤栓塞术后并进行桡动脉有创血压监测的患者共 30 例，给予导管相关护理干预，并观察其效果。结果：30 例行颅内动脉瘤介入术患者置管监测的平均时间为（30.8±7.2）min，监测期间并发症发生率为 1%，穿刺点少量渗血 2 例、皮下淤血 1 例，经相关对症处理后均好转。结论：颅内动脉瘤介入术后持续有创血压监测，值得临床上大力推广结论，护理过程中应给予个性化护理，并密切观察患者病情变化，以保证患者的安全。

PU-3817
介入手术室流动人员培训效果评价

付军桦,史亚星
青岛大学附属医院

多年来从事这项工作的医生、技师、护士风雨同舟，使得介入医学在全国各地得到延伸和发展。胸痛、卒中中心的成立，为更多的病人带来福祉，这也使得医生、技师、护士的培训工作迫在

眉睫。然而，由于各家培训基地的流动人员的培训只关注介入技能的操作，在对流动人员进行针对性、全方位教学与培训方面产生空缺。介入手术室是医院的重要科室之一，流动人员管理的质量直接影响着医疗工作的顺利开展，笔者从事介入手术室管理工作十余年，在工作中不断总结创新，大胆摸索，最终将人性化管理的理念和方法[1]，应用于介入手术室流动人员管理中，对培训效果进行比较，干预后效果具有显著性差别。

PU-3818
分析护理干预对介入导管室中肝癌患者治疗的临床效果

曹宏霞
唐山市工人医院

目的：讨论护理干预对介入导管室中肝癌患者临床治疗效果的影响。**方法：**研究时间为：2018 年 1 月-2019 年 5 月。研究观察对象为：本院收治的 44 例肝癌患者，将其以随机法分为对照组（常规护理）与研究组（对照组基础上实施舒适护理）各 22 例。评判标准：总有效率及护理满意度。**结果：**研究组患者的治疗总有效率及护理满意度指标均明显高于对照组，P＜0.05。**结论：**舒适护理的实施可明显提高介入治疗效果，提高患者对护理工作的满意度，值得推广。

PU-3819
影像导检宣教系统的开发与应用

冷富萍
陆军军医大学第二附属医院（新桥医院）

目的：开发与应用影像导检宣教系统，实现患者检查的全流程管理，提高医患关系和医疗安全质量及服务水平。**方法：**放射诊断科患者宣教引导系统采用 C/S 结构，以医院信息系统 HIS 为基础，通过患者移动终端应用程序 APP，短信、候诊区视频广播播报，实现与患者提供有效的信息及数据反馈交换。**结果：**通过系统流程，完成引导宣教，以结合视频引导宣教提示，可以满足绝大多数受检者的管理，由试用前的 92%受检者坚持候诊区等待降低至试用后的 15%临近和老年受检者候诊等待，有效随访率由之前的 78%提升到 97%。**结论：**放射诊断科患者影像导检宣教系统可以将受检者给以合理的流程化管理，时间管理、宣教完成情况管理，风险知情告知，随访完成情况等，从检查的每个环节及后期进行跟踪并有效管理，实现了导检宣教随访的信息化流程管理。

PU-3820
多模式教学法在静脉穿刺基地教学中的应用

邵慧,任晓静
中国人民解放军总医院第一医学中心

目的：探究放射诊断科静脉穿刺基地新护士教学中采用多模式教学法的效果及意义。方法：选择 2018 年 1 月-12 月在我科静脉穿刺基地轮转的 96 名新护士为研究对象，随机分为对照组和观察组，每组 48 名新护士，对照组采用传统手把手授课教学法，观察组实施了量化培训标准，采用多模式教学法（即手把手教学法结合情景剧教学法及静脉穿刺手臂模型教学法），对两组新护士对教学方式满意度及一次性静脉穿刺成功率（一针见血，无后退）进行比较。结果：观察组新护士对教

学方式满意度及一次性静脉穿刺成功率均显著高于对照组，差异有统计学意义（P<0.05）。结论：静脉穿刺基地新护士带教中采用多模式教学法可有效提高新护士静脉穿刺水平，减轻了患者的疼痛，同时增加了放射诊断科增强检查患者高压团注的成功率，赢得了患者对护理工作的信任，提高了医院在群众中的威信。因此，该种教学模式在静脉穿刺基地新护士教学中值得推广。

PU-3821
马铃薯与 50%硫酸镁湿敷治疗对碘对比剂静脉外渗疗效与安全性的比较

张乔升
甘肃省人民医院

目的 比较土豆片外敷与 50%硫酸镁湿敷治疗碘对比剂静脉外渗的疗效与安全性。
一般资料：选择我院 2011. 03-2019. 06 月期间在我院放射科行静脉注射碘造影剂增强扫描发生造影剂外渗的的患者共 358 例，随机分为两组，观察组为土豆片外敷治疗共 178 例，对照组为 50%硫酸镁湿敷治疗组，共 180 例。观察组男 105 例，女 73 例，平均年龄 57.4±15.2 岁；对照组男 109 例，女 71 例，平均年龄 56.8±17.3 岁，两组差别没有统计学意义（P>0.05）。两组患者碘对比剂注射前均无局部感染。
两组患者静脉留置穿刺前，均进行健康宣教及心理护理，选择桡静脉或肘正中静脉，留置针型号为我科室通用，造影剂选择和流速根据科室常规。患者增强扫描造影剂注射时，选择有经验的护士观察造影剂外渗情况，一旦发生，立马停止注射。扫描完毕，选择有经验的护士评估评估造影剂外渗情况。处理：观察组：将土豆片切成厚 0.2-0.5cm 的土豆片，外敷于静脉外渗处并覆盖周围 1cm；2h 更换一次，4-6 次/天。对照组：硫酸镁敷料敷于患处外渗处，2h 更换一次，4-6 次/天。评估临床疗效，用 VAS 对评估疼痛及变化。
两组患者造影剂外渗程度，观察组轻度 137 例，中度 39 例，重度 2 例，而对照组轻度 133 例，重度 44 例，重度 3 例，两组差别没有统计学意义。
所有两组患者疗效比较，两组患者均得到临床痊愈，治愈率达 100%。观察组的治愈时间为 4.2±1.3 天，对照组治愈时间为 6.3 加减 0.9 天。两组 WAS 评分比较，统计外渗即刻、2 小时、24 小时、3 天及一周，两组数据对比提示外渗即刻及一周两组差别没有统计学意义，外渗 2 小时、24 小时及三天观察组疼痛较对照组轻，差别有统计学意义。
结论：使用土豆片外敷与硫酸镁治疗相比，疗效相当，但更加安全，稳定，价格更低廉，更容易为患者接受。

PU-3822
利多卡因封闭治疗增强 CT 检查造影剂渗漏的疗效分析

王文燕,苏蕾,段庆红
贵州省肿瘤医院

目的:探索碘对比剂渗漏利多卡因局部封闭治疗的疗效
方法:回顾性调查我院影像科 2010 年至 2019 年 6 月份例增强 CT 静脉注射碘对比剂渗漏患者 30 例，随机分为观察组和对照组，观察组采用利多卡因局部封闭治疗，对照组采取冰敷或 50%硫酸镁外敷。
结果: 采用碘对比剂渗漏利多卡因局部封闭治疗显效率 98%，有效率 100%。冰敷或 50%硫酸镁外敷组治疗显效率 70%，有效率 92%，利多卡因局部封闭治疗时效提高 24 小时。

结论：利多卡因封闭治疗碘比剂渗漏是一种有效的治疗方法。

刺激征的肠套叠患者。肠套叠一般多发生于小孩和老年人，对疑有肠套叠而腹部透视、平片不能明确诊断时,应尽早进行空气灌肠检查并酌情加压整复。动态 DR 可视化条件下空气灌肠法对本病的诊断和治疗具有重要意义。

二、检查方法：

患者描述：

陶某某、男、62 岁，高血压 10 年，突发腹痛 5 小时，伴恶心、呕吐。CT 提示右下腹结结型肠套叠，行肠套叠空气灌肠整复术。

检查过程：

1、先肌肉注射 5-10mg 654-2。

2、使用动态 DR 透视功能，行胸腹透视；采用高清点片，摄取腹部平片,仔细观察有无心肺病变、气腹、肠梗阻、肠管积气的程度和部位等。

3、接自动控制压力的结肠注气机和带有压力计的注气囊，由肛门插入带有气囊的双腔导管,向气囊内注入 20～30ml 气体,堵塞肛门。

4、在动态 DR 大幅面透视下向肠腔内注气,注气观察气柱的前端,辅以手法按摩腹壁。

5、复位时注气的压力一般保持在 7-10Kp,，即可达到整复目的。套管较紧者, 可增加至 15Kp,个别早期病人还可酌情增加,但不超过 20Kp。可用间断注气法,间断时间 15～20min。整复时间一般为数分钟到 1 小时左右。

6、复位标准：气体大量进入小肠；回盲部块影消失；患者症状消失，腹部柔软， 血便消失。

检查结果与结论：

肠套叠空气灌肠整复术是目前比较简单、实用的肠套叠复位方法，复位深度肠套叠时需要注入大量气体，操作不当极有可能造成肠穿孔。动态 DR 矩形采集，成像视野大，一次曝光即可显示腹部全部肠道，操作医生非常便捷——缓慢注气、揉按腹部、变换体位，整复术一气呵成。动态透视下图像清晰，利于观察气柱的前端及套鞘内肠管回复的情况，可以清晰看到套叠盲端渐进回复，并随时监控肠穿孔的发生。

电子壁报

EPO-0001

The Diagnostic Value of MRS and DTI in Epilepsy

Iuhong jiao Q
Affiliated Hospital of Beihua University

Objective: To investigate the performance of epilepsy of hydrogen proton magnetic resonance imaging and diffusion tensor imaging and its combined application in the diagnosis of epilepsy, in order to improve the understanding of the disease and to provide more accurately valuable information for initial diagnosis of the disease.
Methods: The subjects were 20 cases of epilepsy clinically diagnosed and the control group is the healthy volunteers without obvious symptoms and brain diseases.The two groups performed MRS and DTI simultaneously . We selected bilateral frontal lobe, parietal lobe, temporal lobe , hippocampus and anterior branch of internal capsule as interest area.We measured NAA / Cho + Cr, NAA / Cr , Cho / Cr, Cho / NAA , ADC and FA of the area of interest. Statistical analyzes were performed between groups and within groups, and the correlation between MRS metabolites and DTI parameters was also studied. Simultaneously,We observed the changes of NAA, Cho and Cr in the area of interest of the subjects .
Results:
1.MRS NAA decreased, Cho and Cr increased in ipsilateral epilepsy group.Compared with the opposite side of the epilepsy and normal control group, the NAA / Cho + Cr and NAA / Cr of hippocampus declined and the Cho / NAA of hippocampus of the ipsilateral epilepsy group rised,the difference is significant in statistics (P <0.05).Compared with the opposite side of the epilepsy and normal control group, the Cho/Cr of hippocampus of the ipsilateral epilepsy group rised,the difference is not significant in statistics (P <0.05).
2.DTI Compared with the normal control group, the ADC of hippocampus of the ipsilateral epilepsy group rised,the difference is significant in statistics (P <0.05); Compared with the normal control group, the ADC of the occipital lobe of the ipsilateral epilepsy group decreased, the difference is significant in statistics (P <0.05);There was no statistically significant difference in ADC among various brain regions (P>0.05). Compared with the normal control group, the FA of hippocampus of the ipsilateral epilepsy group rised,the difference is significant in statistics (P <0.05). Compared with the normal control group, the FA of the occipital lobe of the ipsilateral epilepsy group decreased, the difference is significant in statistics (P <0.05). There was no statistically significant difference in FA among various brain regions(P>0.05).
3.Correlation between MRS and DTI parameters there is a negative correlation between Cho / Cr and FA hippocampus of the opposite side of the epilepsy (P <0.05). There is no correlation between the relevant parameters of each group.

Conclusions:
1.^{1}H-MRS can noninvasively reflect the brain metabolism of epilepsy patients;
2.^{1}H-MRS contribute to epilepsy epileptogenic focus and positioning in clinical;

3.Combined application of MRS and DTI technology can show the microstructure of white matter and micro-metabolism changes, providing a possibility for the prospective study of epilepsy.

Altered brain functional network in patients with Amyotrophic Lateral Sclerosis

Yuanyuan Qin,Wenzhen Zhu
Tongji Hospital

Purpose: *To investigate the brain functional network changes in patients with amyotrophic lateral sclerosis (ALS).*
Materials and Methods: *This study was approved by the relevant research ethics committee, and all participants provided informed consent. Resting-state fMRI data at 3.0T MR scanner from 18 right-handed ALS patients and 13 age and gender-matched healthy controls were enrolled. Time series of Power 264 regions were extracted for each subject and correlation matrices were analyzed based on graph theory using GRETNA software. The functional brain properties such as clustering coefficient (Cp), characteristic path length (Lp), and degree centrality (DC) were compared between two groups using two-sample t-test. The Pearson Correlation Coefficient was calculated between Cp/Lp and disease progression rate (PR).*
Results: *In the defined sparsity (S) range (0.35≤S≤0.6), both ALS patients and healthy control exhibited small-world topology. Compared with healthy control, ALS patients showed significantly decreased clustering coefficient (t=-2.465, P =0.020) and increase characteristic path length (t=2.246, P =0.033) when S=0.6. Decreased average degree centrality were observed in ALS patients relative to controls, especially significant in the left middle temporal gyrus, the left inferior temporal gyrus, the left middle frontal gyrus, the right middle frontal gyrus, the right inferior frontal gyrus, and the right middle temporal gyrus, which all located in the default-mode network and frontal-parietal network (p <0 .05, not corrected). Moreover, the clustering coefficient of ALS patients was negatively correlated with PR (r=-0.648, P=0.004) while the characteristic path length was positively correlated with PR (r=0.656, P=0.003).*
Conclusions: *This study demonstrated that the brain network integration and segregation were disrupted in ALS patients. The brain network abnormal could help to monitor the disease progression and understand the brain dysfunction of ALS.*

Quantitative Evaluation of the Compressed L5 and S1 Nerve Roots in Unilateral Lumbar Disc Herniation by Using Diffusion Tensor Imaging

Jiulong Zhang[1,2],Feng Zhang[2],Fuxia Xiao[2],Zuogang Xiong[2],Dong Liu[2],Ting Hua[2], Indima Nekitsing[2],Guangyu Tang[2]
1.Department of Radiology, Shanghai Tenth People's Hospital, Tongji University School of Medicine
2.Department of Radiology, Shanghai Tenth People's Hospital, Tongji University School of Medicine, 200072 Shanghai, China

Background and Purpose Nerve root compression by lumbar disc herniation (LDH) induces a series of clinical symptoms, seriously affecting the patient's life and work. The purpose of this study is to investigate microstructural changes and fiber bundle abnormalities of the compressed L5 and S1 nerve roots in young patients with unilateral LDH by using diffusion tensor imaging (DTI). Methods Forty young patients with unilateral LDH and 17 healthy volunteers participated in the study, and 33 patients received follow-up DTI examination after one month of conservative treatment. Fractional anisotropy (FA), apparent diffusion coefficient (ADC) and trace weight (TraceW) values of the L5 and S1 nerve roots were measured on FA maps.Results The mean FA, ADC and TraceW values of the affected nerve roots were 0.259± 0.047, 1.79±0.252 and 0.076 ±0.025, respectively. Compared to the contralateral side and volunteers, the affected nerve roots showed a decreased FA ($P < 0.01$), an increased ADC ($P < 0.01$) and TraceW ($P < 0.05$). The compression severity had a moderately negative correlation with FA ($r = -0.646$, $P < 0.01$) and positive correlation with ADC ($r = 0.408$, $P < 0.01$) but not with TraceW ($r = 0.298$, $P = 0.06$). For 33 patients with follow-up study after conservative treatment, FA (0.286±0.06) and ADC (1.630±0.046) in the affected nerve roots showed an increasing and a decreasing trend, respectively.Moreover, FA values (14 cases; 0.246±0.015, $P = 0.213$) in the severe compression group had no significant changes between initial and follow-up data.Conclusions DTI is able to assess microstructural abnormalities of the compressed nerve roots and has potentially practical value for prognostic evaluation after treatment in patients with LDH.

基于 fMRI-DTI 多模态评估阿尔茨海默病进展

杜文莹[1],董立[2],杨昆[1],罗程[2],尧德中[2],韩璎[1,3,4]
1.首都医科大学宣武医院
2.电子科技大学生命科学与技术学院
3.北京脑重大疾病研究院阿尔茨海默病研究所
4.北京市老年病医疗研究中心
5.国家老年疾病临床医学研究中心

目的：探索阿尔茨海默病疾病进程中大脑内在功能活动及结构改变的同步变化。
方法：本研究纳入从 2009 年 9 月至 2016 年 6 月于宣武医院记忆门诊就诊受试，所有受试者完成系统性客观认知评估，包括健康受试 68 名、主观认知下降 35 例、遗忘型轻度认知障碍 47 例和阿尔茨海默病痴呆受试 31 例。首先计算得到静息态功能磁共振数据的低频振荡波幅（ALFF）图以及扩散张量成像数据的部分各向异性（FA）图，然后采用联合独立成分分析（Joint ICA）进行融合分析，最后利用单因素方差分析方法统计分析联合成分权值的组间差异，偏相关分析计算独立成分权值与认知测试结果的相关性。
结果：本研究结果显示 HC 组较 SCD 组权值无组间差异，相较于 HC、SCD 及 AD 组，aMCI 组 ALFF 成分在小脑、双侧楔前叶、双侧角回以及双侧额叶、颞叶、丘脑及左侧岛叶增高，AD 组比 HC 组降

低。FA 成分在胼胝体及边缘系统亦表现出相同的趋势。经偏相关分析显示，独立成分的权值与简易智力状态量表(MMSE)得分呈正相关（r=0.29, P＜0.01）。
结论：本研究通过联合独立成分分析实现对阿尔茨海默病的功能-结构改变同步评估，提示阿尔茨海默病作为神经退行性变疾病，病程进展过程中包含灰质功能及白质结构的广泛受累，尤以默认网络脑区及胼胝体为著，揭示了其潜在的代偿与退行性改变机制，从功能与结构的角度阐释了早期干预获益增多的可能性，为早期干预提供了潜在的理论基础，为未来疾病适配治疗提供靶点。

Differential patterns of dynamic functional connectivity variability of default model network in relapsing-remitting multiple sclerosis

Muhua Huang,Fuqing Zhou,Lixin Huang,Xianjun Zeng,Honghan Gong
The First Affiliated Hospital of Nanchang University

Objective To investigate the dynamic functional connectivity (dFC) variability of the default mode network(DMN) of relapsing-remitting multiple sclerosis (RRMS) patients seed-based correlation analysis using resting-state functional magnetic resonance imaging (rs-fMRI).**Methods** 3.0 T magnetic resonance imaging was used to collect rs-fMRI data from the acute phase RRMS (18), the remission phase RRMS (26), and 23 age- and sex- matched healthy controls(HC group). The fMRI data was preprocessed use Data Processing Assistant for Resting-State fMRI Advanced Edition(DPARSFA) based on Matlab 2012a,and the posterior cingulate cortex(PCC) (0, -53, 26) was selected as the seed, the dFC analysis based on the sliding time window technique was used to compare the dFC variability difference between the three groups,and analyzed correlations between dFC variability coefficient of the differences regions and MRI—derived metrics(brain parenchymal fraction,T2 lesion load), as well as the expanded disability status scale,the paced auditory serial addition test,the modified fatigue effect scale (MFIS-5) score and disease duration of the disease.**Results** The seed-based correlation analysis via functional connectivity of PCC showed that the temporal correlation between the blood oxygen level dependent signals of the DMN was reliable spatial patterns of activation.Compared with HC and acute phase RRMS patients,the remission phase RRMS group showed excessive variability (increased dFC variability) in the left superior temporal gyrus,the left medial superior frontal gyrus and the right middle temporal gyrus.By contrast,excessive stability (decreased dFC variability) was found in the right middle cingulum gyrus,the left superior temporal gyrus(SFG),the left medial superior frontal gyrus and the right middle temporal gyrus(MTG) in the acute phase RRMS patients when compared with the remission phase RRMS .In addition, correlation analysis revealed that the excessive variability in the left SFG(0.14±0.02) of remission phase RRMS was related to the course of disease (r=0.582, P=0.003),while excessive stability in the right MTG(0.12±0.02) of the acute phase RRMS patients was positively correlation with the course of the disease (r = 0.509,P = 0.044).**Conclusion** Abnormal changes dFC variability of the DMN in patients with acute and remission RRMS. The excessive increase of dFC variability in DMN in RRMS patients during remission is likely to be a limited compensatory mechanism to maintain stable DMN function.

Global Functional Network Connectivity Disturbances and Resting-State Functional Connectivity Alterations in early Parkinson’s disease by Resting-State functional MRI

yuhui wang,Xinxin Shuai,Ping Lei
Union Hospital of Tongji Medical College， Huazhong University of Science and Technology

PURPOSE: Examining the spontaneous BOLD activity to understand the neural mechanism of Parkinson’s disease (PD) is a focus in recent resting-state functional MRI (fMRI). The aim was to investigate the alteration of brain functional connectivity in PD in a systematical way at two levels: functional connectivity analysis within resting state networks (RSNs) and functional network connectivity (FNC) analysis.
MATERIALS AND METHODS: Using group independent component analysis (ICA) on resting-state fMRI data acquired from 30 participants (14 healthy controls and 16 patients with PD), 16 RSNs were identified; and functional connectivity analysis within the RSNs and FNC analysis were carried out between groups.
RESULTS: (1) Compared to controls, patients with PD showed decreased functional connectivity within putamen network, thalamus network, cerebellar network, attention network, and self-referential network and increased functional connectivity within execution network. (2) Globally disturbed, mostly increased functional connectivity of FNC were observed in patients group. Insular network and execution network was the dominant network with extensively increased functional connectivity with other RSNs. Cerebellar network showed decreased functional connectivity with caudate network, insular network, and self-referential network.
CONCLUSION: In general, decreased functional connectivity within RSNs except execution network and globally disturbed functional connectivity of FNC may be characteristics of PD. Increased functional connectivity within execution network may be an early marker of PD. Insular, execution and cerebellar network were the dominant RSNs with functional connectivity changes of FNC in PD group. The multi-perspective study based on RSNs may be a valuable means to assess functional changes corresponding to specific RSN, contributing to the understanding of the neural mechanism of Parkinson’s disease.

帕金森病合并认知障碍患者静息态功能磁共振成像初步研究

印雅俊,李小宝
贵州医科大学附属医院

目的：通过应用脑血氧水平依赖（BOLD)信号的低频振幅（ALFF）及局部一致性（ReHo）分析帕金森认知障碍患者静息态脑功能改变，探讨帕金森认知障碍患者神经活动特点及其相关机制。**方法：**收集贵州医科大学附属医院神经内科确诊的 PD 患者 32 例，以及 16 例健康对照者（HC）。所有 PD 患者均行蒙特利尔认知评估量表（MoCA）评估，进而将分为帕金森病合并认识障碍组（PD-CI）以

及帕金森病认知功能正常组（PD-CN）。采集研究对象静息态功能磁共振数据，运用 ALFF、ReHo 算法分析，得到具有统计学差异的脑区。**结果：**1、与 HC 组相比，PD-CI 组在双侧枕叶中回、右侧距状裂周围皮层、左侧小脑、左侧梭状回、双侧楔叶 ALFF 值减低；双侧额叶（包括右侧额中回、左侧额上回、左侧额中回）、左侧小脑前叶、左侧小脑后叶及左侧小脑扁桃体 ALFF 值增高；双侧额叶、双侧颞叶、双侧顶叶、扣带回、右距状裂周围皮层、右侧小脑 ReHo 值减低；双侧小脑、双侧楔前叶、胼胝体、右侧额叶 ReHo 值增高。2、与 PD-CN 组相比，PD-CI 组在右侧颞上回、右侧顶叶（包括顶下小叶、顶上小叶）ALFF 值减低，双侧额叶（包括双侧额叶回直肌、右侧额上回眶部）、双侧辅助运动区 ALFF 值增强；双侧额叶、扣带回、右侧丘脑、右侧尾状核、右侧距状裂周围皮层、左侧小脑、左侧梭状回 ReHo 值减低，左侧额叶、双侧小脑 ReHo 值升高。3、与 HC 组相比，PD-CN 组在左侧额叶（包括左侧额叶回直肌、左侧额上回眶部）、左侧外囊区、双侧辅助运动区 ALFF 值减低；左侧额叶（包括左内侧额上回、左额上回眶部）、双侧楔前叶 ALFF 值增高；左侧额叶、左侧壳核 ReHo 值减低；双侧小脑、双侧丘脑、左尾状核、左额叶、扣带回 ReHo 值增高。**结论：**PD-CI 患者存在多个脑区的静息态功能磁共振成像的改变，部分脑区活动减低可能与 PD 患者的认知损害相关。

Changed emotional memory related brain network in Alzheimer’s disease: a resting-state functional MRI research

Xiaoshu Li,Yongqiang Yu
Department of Radiology, the First Affiliated Hospital of Anhui Medical University

Objective

Alzheimer’s disease (AD) is the most common type of dementia in senile individuals, characterized by progressive and irreversible cognitive decline. Amnestic mild cognitive impairment (aMCI) is thought to be an earlier stage of AD. Emotional stimuli are more easily remembered than neutral stimuli, a phenomenon known as the emotional enhancement of memory (EEM). Previous studies of emotional memory of AD mainly focused on behaviors; however, the influence factors and the underlying neural mechanisms are inadequately understood. Since the high morbidity and limited treatment of AD, it will be very helpful if the neural pathway of emotional memory could be found, so that we may use the EEM effect of emotion on memory to improve the memory performance of AD patients. The purposes of current study were: (1) to investigate the probable influence factors of emotional memory, (2) to investigate the relationships between emotional memory and the related brain functional network changes during disease progression of AD.

Methods

Thirty-one AD patients, 24 aMCI patients and 23 normal controls were included in this study. Positive-high-arousal (PH), positive-low-arousal (PL), neutral (N), negative-high-arousal (NH) and negative-low-arousal (NL) pictures were used during the incidental encoding phase and the Recognition-Remember/Know paradigm according to the “Dual-process theory of memory recognition” was used during the retrieval phase of behavior test. Resting state functional magnetic resonance imaging (rs-fMRI) data were acquired on the 750w 3-T MRI scanner of GE. The resting state emotional memory

network was then built using graph-theoretical method. Both global and regional network measures were calculated to reflect brain network changes of AD and aMCI patients. The correlation analyses were conducted between the global and regional network properties and the behavioral scores of emotional memory.

Results
The EEM effect was only detected during the “recollection” process. Compared with neutral pictures, the NC group benefited from PH, NH and NL pictures. For aMCI patients, the EEM effects were preserved for high arousal emotional pictures. For AD patients, the EEM effects were completely lost. Notably, compared with NC, there was significantly decrease of the recognition sensitivity of recollection process rather than familiarity in aMCI patients. For AD patients, both the recognition sensitivity of recollection and familiarity were impaired. At a global level, AD patients showed significantly higher normalized clustering coefficient, small-worldness, and normalized local efficiency. At a regional level, there were disrupted neural circuits, consisting of abnormal nodes (increased or decreased nodal properties) and edges (decreased functional connectivity strength). The node degree and node efficiency of left dorsal caudate and left lateroventral fusiform were increased in aMCI patients. The amygdala, hippocampus and entorhinal cortex showed significant correlations with the recollection and familiarity processes of emotional memory in AD and aMCI patients.

Conclusions
Emotional memory is influenced by the arousal, valence and means of retrieval methods. The EEM effects of high-arousal-positive and high-arousal-negative pictures are remained in aMCI patients. And there exist some degrees of compensatory mechanisms of the emotional memory functional network in aMCI patients. The EEM effect is lost in AD patients, and may be associated with the regularization shift of emotional memory related network, function changes of vital nodes and decreased connections of neural circuits of both intra- and inter-hemispheres.

EPO-0009

Aberrant Brain Spontaneous Activity and Synchronization in Type 2 Diabetes Mellitus Patients with APOE-ε3 Homozygotes: A Resting-State Functional MRI Study

daihong liu,Jiuquan Zhang
Chongqing Cancer Hospital

Objective: To investigate the pattern of brain spontaneous activity and synchronization in type 2 diabetes mellitus (T2DM) patients carrying APOE-ε3 homozygotes.
Methods: In the population carrying APOE-ε3 homozygotes, 37 T2DM patients and 37 healthy controls (HC) were included with group-matched in terms of age, sex, education years and BMI. All participants were involved in blood sample measurement, neuropsychological test, and brain functional data acquisition. Amplitude of low-frequency fluctuations (ALFF) analysis was conducted to determine the peak coordinates

of brain regions with abnormal spontaneous activity. Then, the identified brain regions were considered as seeds to compute their functional connectivity (FC) with the rest brain regions. The two-sample *t* test and *Mann-Whitney U* test were applied to reveal significant differences of imaging indices, neuropsychological data and blood sample measurements between the T2DM group and HC group. Finally, the potential correlations among the three types of measurements were explored using partial correlation analysis in T2DM group.

Results: Comparing to HC group, T2DM group have elevated levels of HbA1c and fasting plasma glucose and scored lower in the MoCA but higher in HAMA and HAMD tests ($p < 0.05$). T2DM group exhibited higher ALFF in left middle occipital gyrus ($p < 0.05$) and the left middle occipital gyrus had lower FC with left caudate and left inferior parietal gyrus. No significant correlations were observed among three types of measurements in T2DM group.

Conclusion: T2DM patients carrying APOE-ε3 homozygotes exhibited aberrant brain spontaneous activity and synchronization associating with vision-related information processing, cognition and negative affect. The findings may advance our understanding of the mechanisms of T2DM-related brain dysfunction avoiding the potential influence of APOE-ε2 and -ε4 allele.

EPO-0010

Neurite orientation dispersion and density imaging in the substantia nigra and striatum in early-stage idiopathic Parkinson disease

Xiangzhu Zeng[1],Huishu Yuan[1],Yingying Xu[3],Yu Qin[2],Chuyang Ye[2]
1.PEKING UNIVERSITY THIRD HOSPITAL
2.Beijing Institute of Technology
3.Peking University sixth hospital

Purpose:

Neurite orientation dispersion and density imaging (NODDI) was used to quantify microstructural changes in substantia nigra (SN), red nucleus (RN) and striatum in the early stage of idiopathic Parkinson disease (PD).

METHOD AND MATERIALS:

19 PD (12 men and 7 women, mean age 58.48±6.36 years) cases and 20 healthy control (HC, 13 men and 7 women, mean age 60.20±7.02 years) cases were investigated. All PD patients were at stage≤2.5 (5 patients were stage 1, 2 were stage 1.5, 5 were stage 2 and 7 were stage 2.5) on the Hoehn and Yahr (H-Y) Scale without Parkinson's medication before. Movement Disorder Society-Sponsored Revision of the Unified Parkinson's Disease Rating Scale part III (MDS-UPDRS III) was obtained for all patients.

For all cases, the NODDI sequence was conducted on a GE 750 3T scanner. The protocol consists of one shell with 30 gradient directions and b= 711 s/mm^2 and the other with 60 directions and b= 2855 s/mm^2. The protocol also includes 3 b=0 images. The sequence parameters were as follows: repetition time=10000 ms; echo time=minimum; field of view=256×256mm; matrix size=128×128; slice thickness=2mm, and acquisition time=15 min 40 seconds. High-resolution 3D T1 SPGR and T2 FLAIR images were acquired as well. The T2 FLAIR parameters were: TR=8400ms, TE=140ms, slice thickness=3mm, slice spacing=0.3mm, slice number=41. The 3D T1WI parameters were: TR=8.2ms, TE=3.2ms, flip angle=9°, slice thickness=1mm, slices per slab=192, resolution=1mm×1mm×1mm.

All DWI data were fitted to the NODDI model using the Accelerated Microstructure Imaging via Convex Optimization (AMICO) algorithm (https://github.com/daducci/AMICO), where intracellular volume fraction (Vic), orientation dispersion index (OD), and isotropic volume fraction (Viso) maps were generated. An experienced neuroradiologist drew both sides of the head of caudate nucleus (CN), putamen (Pu), globus pallidus (GP), substantia nigra pars compacta (SNpc), substantia nigra pars reticulate (SNpr), red nucleus (RN) and thalamus on T2 FLAIR images including all areas of each nucleus in continuous slices. T2 FLAIR images were registered to the b_0 images using FSL (https://fsl.fmrib.ox.ac.uk/fsl/fslwiki/). Then we extracted values of each parameters of NODDI in every drawing slice and calculated the average values of nuclei mentioned above. We performed a two sample t-test using SPSS 21 to compare parameters of NODDI of the two groups.

RESULTS

1. Compared with HC, the OD of PD group was different significantly in bilateral GP and right thalamus ($p_{right\ GP}$=0.02, t=-2.39; $p_{left\ GP}$=0.01, t=-2.65; $p_{right\ Thalamus}$=0.005, t=-3.30); there is no significant difference in Vic and Viso between the two groups among the nuclei.

2. Compare with PD patients whose H-Y Scale was equal or greater than 2, those less than 2 have a significant difference of OD in the right CN (p=0.048, t=-2.13).

3. There is no correlation between the parameters of NODDI and MDS-UPDRS III scores in all involved nuclei.

CONCLUSION

Our results revealed microstructural change patterns of the substantia nigra and striatum in early stage patients, suggesting underlying neurite orientation abnormality. As a potential biomarker, OD of NODDI is effective to measure regional neurite changes in early PD patients.

CLINICAL RELEVANCE/APPLICATION

NODDI is a useful noninvasive MRI sequence to identify the cerebral microstructural changes in early-stage PD patients.

基于磁敏感加权成像的新纹状体影像组学模型对帕金森病的诊断价值

刘磐石,张祥林
锦州医科大学附属第一医院

目的 探讨基于磁敏感加权成像（SWI）的新纹状体影像组学模型对帕金森病（PD）的诊断价值。
方法 收集 135 例原发性 PD 患者及年龄、性别相匹配的 135 例健康志愿者；按 7:3 比例分别将两组受试者随机分为训练集（n=94）和验证集（n=41）。采用同一台磁共振设备对所有受试者进行颅脑 SWI 扫描。在 SWI 图上手动分割新纹状体（壳核和尾状核区域）并提取影像组学特征，分别采用 LASSO 算法对训练集的特征进行降维并构建诊断模型，运用受试者工作曲线（ROC）对两模型在训练集和验证集中的诊断效能进行评价；采用 Hosmer-Lemeshow 检验对模型在训练集的拟合优度进行检验。
结果 在壳核和尾状核区域分别提取了 542 个影像组学特征，经 LASSO 算法降维后，分别筛选出 13 和 9 个最佳特征用于构建壳核和尾状核诊断模型。壳核模型的曲线下面积（AUC）、特异度、敏感度在训练集中分别为 0.91（95%CI：0.88-0.98）、81.25%、95.83%，Hosmer-Lemeshow 检验模型无过拟合（P=0.812），在验证集中分别为 0.74（95%CI：0.65-0.91）、95.38%、67.40%；尾状核模型的曲线下面积（AUC）、特异度、敏感度在训练集分别为 0.88（95%CI：0.81-0.94）、65.23%、87.56%，Hosmer-Lemeshow 检验模型无过拟合（P=0.370），在验证集分别为 0.71（95%CI：0.54-0.87）、77.45%、65.62%。“S(1,0)Contrast_R”同时出现在壳核和尾状核模型的最佳特征中，在两个脑区处的特征值 PD 组均高于对照组（t=-4.63,P<0.001;t=-2.75,P=0.016）。
结论 本研究建立了基于磁敏感加权成像的新纹状体影像组学模型，该模型具有良好的诊断效能及泛化能力，为 PD 的诊断提供可靠的客观依据。

轻度认知功能障碍脑细微结构评估的 DKI 研究

梁欣
山西医科大学第一医院

研究目的：通过运用磁共振弥散峰度成像技术（DKI）研究轻度认知障碍（MCI）、阿尔茨海默病（AD）以及认知功能正常老年人（NC）多部位感兴趣脑区的各向异性（FA）值、平均弥散率（MD）值以及平均峰度（MK）值的差异，探讨 AD 患者脑组织细微结构的演变过程，评估 DKI 相关参数对 MCI 及 AD 的诊断及鉴别诊断价值。

材料与方法：采用美国 GE 3.0 T 磁共振仪，对选取的临床诊断为轻度认知障碍患者（aMCI 组）20 例、阿尔茨海默病患者（AD 组）14 例、认知功能正常的老年对照组（NC 组）20 例行常规 MR、DKI 扫描，分别测量比较三组内四个所选感兴趣区（海马区、前额叶白质、顶叶白质、颞叶白质）左右对称部位及三组间感兴趣区的相关参数值（FA 值、MD 值及 MK 值），了解其变化情况。

结果：（1）三组所选四个感兴趣区左右对称部位的 MD 值、MK 值及 FA 值均无明显统计学差异(P>0.05)。

（3）三组间 MD 值两两比较结果：NC 组-AD 组间，在四个所选感兴趣区中均具有统计学差异，P 值分别为 0.021，<0.010，0.042；MCI 组-AD 组间，仅海马区存在统计学差异，P 值为 0.027；而 NC 组-MCI 组间未检测到有统计学差异的脑区。

（4）三组间 MK 值两两比较结果：NC 组-AD 组间，在四个所选感兴趣区中均具有统计学差异，P 值分别为<0.010，0.043，0.039，<0.010。MCI 组-AD 组间，仅海马区存在统计学差异，P 值为 0.025；NC 组-MCI 组间，海马区同样存在统计学差异，P 值分别为 0.013。

结论：运用 DKI 技术可以检测到 AD 患者脑组织细微结构的受累改变，表现为 MK 值及 FA 值减低，MD 值升高，较具有特征性，提示 DKI 检查可以作为早期诊断 AD 的一种影像学辅助检查手段，且海马区的 MK 值有助于轻度认知障碍患者在老年人群中的筛查。

EPO-0014

Investigation of SWI of Brain Iron Deposition in Patients with Alzheimer’s Disease and Mild Cognitive Impairment

Xiaochun Wang,YANGYAO DU
First Clinical Medical College， Shanxi Medical University,

Objective: To compare the difference of brain iron deposition between Alzheimer’s disease(AD) patients and mild cognitive impairment(MCI) patients and control subjects through measuring the brain iron content by applying SWI and evaluate the application value of SWI. To provide a noninvasive and valuable biological indicator for the early diagnosis of AD and MCI.

Methods: 24 AD patients and 22 MCI patients were collected from hospital. There are 14 men and 10 women in the AD patients and 12 men and 10 women in the MCI patients. The age range of AD patients is 64 to 83 years and average is 72.2. The age range of MCI patients is 61 to 86 years and average is 71.1. 70 healthy volunteers were collected whose age is from 30 to 79.The average age is 58.There are 35 men and 35

women in the volunteers. 24 volunteers whose age are from 61 to 79 were selected from them to match the group of patients. Conventional brain MR examination was performed in all people to exclude the possibility of cerebral infarction, hemorrhage, tumor, operation or trauma.SWI examination was performed and measure the phase values of red nucleus, substantia nigra, caudate nucleus head, globus pallidus, putamen, thalamus, hippocampus, temporal cortex on corrected phase SWI pictures. The control group was divided into 5 groups, each group gender was balance. To evaluate the cerebral significance of phase values difference between different ages with one-factor ANOVA. To analyse the correlation of SWI phase value of each part and age with Pearson method. To evaluate the significance of phase values difference among AD patients, MCI patients and control group with one-factor ANOVA and compare the difference between every two groups with LSD method.

Results: ①Measured between different age groups of healthy volunteers, there were statistically differences in red nucleus, substantia nigra, caudate nucleus head, globus pallidus, putamen, hippocampus, temporal cortex SWI phase values($P<0.01$).There were no differences between different ages SWI phase values of the thalamus ($P=0.612>0.05$).Negative correlations were measured between SWI phase values and age in red nucleus($r=-0.384$, $P<0.01$), substantia nigra($r=-0.859$, $P<0.01$), caudate nucleus head($r=-0.829$, $P<0.01$), globus pallidus($r=-0.680$, $P<0.01$), putamen($r=-0.582$, $P<0.01$), hippocampus ($r=-0.441$, $P<0.01$), temporal cortex ($r=-0.548$, $P<0.01$).There was no correlation between the SWI phase value of thalamus and age ($r=0.006$, $P=0.960>0.05$).②There were statistically differences in red nucleus, substantia nigra, caudate nucleus head, globus pallidus, putamen, hippocampus, temporal cortex SWI phase values among AD patients, MCI patients and control group ($P<0.05$), but no differences in thalamus ($P=0.084>0.05$). ③There were statistically differences in red nucleus, substantia nigra, putamen SWI phase values between AD patients and MCI patients ($P<0.05$). There were statistically differences in red nucleus, substantia nigra, caudate nucleus head, globus pallidus, putamen, hippocampus, temporal cortex SWI phase values between AD patients and control group($P<0.05$). There were statistically differences in putamen, hippocampus, temporal cortex SWI phase values between MCI patients and control group($P<0.05$).

Conclusion: SWI was a simple, safe and non-invasive method and had good repeatability and can quantitatively analyse the changes of brain iron deposition. The brain iron deposition of AD patients, MCI patients and healthy volunteers could be distinguished by SWI. SWI may provide a new noninvasive dynamic monitoring method and valuable biological indicator for the early diagnosis of AD and MCI and the prevention of developing from MCI to AD.

EPO-0015

Self-reported traumatic brain injury and in vivo measure of AD-vulnerable cortical thickness and AD-related biomarkers in the ADNI cohort

Mingliang Wang,Wenbin Li
shanghaijiaotongdaxuefushudiliurenminyiyuan

Purpose: To investigate whether self-reported TBI was associated with decreased AD-vulnerable cortical thickness, and to assess the relationship between AD-vulnerable cortical thickness and AD-related biomarker in the Alzheimer’s disease Neuroimaging Initiative subjects.
Materials and methods: We identified 46 self-reported TBI subjects, who had structural MRI, 18F-AV45 PET, and cerebrospinal fluid (CSF) data. Of them, eight subjects were normal; ten were preclinical AD; eighteen were MCI due to AD; ten were AD. Additional demographics-controlled 46 subjects were included. Cortical thickness of eight AD-vulnerable regions, mean AD-vulnerable cortical thickness, 18F-AV45 PET mean amyloid SUVR, CSF Aβ42, CSF total tau (T-tau), and CSF phosphorylated tau (P-tau) were compared between TBI and non-TBI groups. Correlational analysis was done to investigate the relationship between mean AD-vulnerable cortical thickness and mean amyloid SUVR, CSF Aβ42, CSF T-Tau, CSF P-Tau.
Results: Preclinical AD subjects with self-reported TBI had smaller cortical thickness in mean and three AD-vulnerable cortical regions than control subjects ($P<0.05$). The mean AD-vulnerable cortical thickness was correlated with CSF T-tau ($r= -0.72$, $P=0.001$) and CSF P-tau ($r= -0.53$, $P=0.019$). There was no statistical difference in the comparison of normal, MCI due to AD, and AD groups.
Conclusions: Among individuals with preclinical AD subjects, but not normal, MCI due to AD and AD subjects, self-reported TBI was associated with more decreased AD-vulnerable cortical thickness which was related to CSF tau pathology.

EPO-0016

The mechanism of olfactory visual associative learning evidenced by comparing activation in the primary olfactory networks under semantic and non-sematic visual cue task-fMRI

Xin Zhang,Weiping Li,Bing Zhang
Affiliated Drum Tower Hospital of Nanjing University Medical School

Sensory perception is shaped by past experience, multi-sensory context as well as internal states and appears to be highly relevant in olfaction. Specifically, in humans, odor detection and perceived intensity can be modulated by congruent visual cues[1]. Human odor perception strongly depends on visual cue, because human are visual dominant species[2]. However, the odor and visual association learning mechanism are largely unknown. Previous study showed that rapid visual odor association using lexical sematic visual cue[3]. Our goal is to investigate if the non-sematic visual cue could activate the olfactory regions like the sematic visual cue and the differences.
Twenty-one healthy, nonsmoking, right-handed young adults (mean age = 28.5 ± 6.8 years old, 7 male) participated in the study. All participants were screened for any otorhinolaryngeal, neurological, psychiatric, central nervous system, and olfactory system disorders. Each subject’s smell function was scored within the normal range (mean = 35.7, SD = 2.8).The fMRI study was performed at Philips 3T MR Scanner (Achieva

TX, Best, the Netherlands). The olfactory paradigm was executed using a programmable olfactometer (Emerging Tech Trans, LLC, Hershey, PA, USA) to deliver odorants to subject's nostrils accurately and synchronized with the MRI scanner. The fMRI imaging paradigms were designed as the. The stimulus was lavender oil. Statistical Parametric Mapping (SPM8, Welcome Trust Centre for Neuroimaging, University College London, UK) was used to analyze all imaging data. Activation maps for the odor + visual and visual-only conditions, and for each subject, were computed using event-related generalized linear models (GLMs) and used in a one-sample t-tests to generate group activation maps. The odor + visual and visual-only conditions were compared using a paired t-test.

The two activation patterns of odor presentation with visual "(smell)" and visual "(smell)" only are very similar (P>0.05), both include bilateral olfactory cortex, piriform cortex, amygdala, entorhinal cortex, orbital frontal cortex, dorsolateral prefrontal cortex and hippocampus. In the odor presentation with visual "○" and visual "○" only, the two activation patterns both included bilateral olfactory cortex, piriform cortex, amygdala, entorhinal cortex, orbital frontal cortex, dorsolateral prefrontal cortex and hippocampus, but are significantly different in intensity and range.

In the paired t-test, there was no significant difference between odor presentation with visual "(smell)" and visual only, but there was a trend in bilateral olfactory cortex, piriform cortex, amygdala, entorhinal cortex that the BOLD signal intensity was higher in condition odor presentation with visual "(smell)" than in condition visual only. There were significant differences at bilateral amygdala, entorhinal cortex between odor presentation with visual "○" and visual only, and there was a trend in bilateral olfactory cortex, piriform cortex that the BOLD signal intensity was higher in condition odor presentation with visual "○" than in condition visual only.

Symbol can also be codes by odor, its role is similar with Chinese characters, but the coding effect is slightly lower. In the bilateral olfactory cortex, piriform cortex, amygdala, entorhinal cortex, the semantics encoding effect was the strongest. In non-olfactory-related semantic cue, the degree of activation was significantly lower than that of odor activation in bilateral amygdala, entorhinal cortex.This shows that the Olfaction and other sensory systems both have a perfect associative learning[4], Whether physical, Chinese characters or symbols. Olfactory sensory memory reflects activity, in part, within the primary olfactory cortex (POC), which like most sensory cortices (Ghazanfar and Schroeder 2006) receives direct and/or indirect convergent multisensory inputs [5]. There was also a shortcoming of this study that we didn't consider the difference between the non-semantic Chinese characters and the semantic, our next experiment will be verified.

Structural magnetic resonance imaging study of cortical thickness in early-stage Parkinson's Disease

Yingying Xu[1],Xiangzhu Zeng[2],Chuyang Ye[3],Yu Qin[3],Yingshuang Zhang[2]
1.Peking University Sixth Hospital

2.Peking University Third Hospital
3.Beijing Institute of Technology

PURPOSE
Parkinson’s disease (PD) is a progressive age-related neurodegenerative disease. The purpose of the study was to use surface-based analysis techniques to assess cortical thickness and identify characteristic morphological patterns of cortical changes in early-stage PD.

METHOD AND MATERIALS
24 patients diagnosed with early PD (Hoehn-Yahr stage ≤2.5) and 25 healthy control participants who were matched in age and gender were recruited. For all cases, High resolution 3D T1 SPGR was acquired for the whole brain on a GE Discovery750 3.0T scanner. The 3D T1WI parameters were as follow: TR=8.2ms, TE=3.2ms, flip angle=9°, slice thickness=1mm, slices per slab=192, resolution=1mm×1mm×1mm. Cortical thickness was automatically calculated using FreeSurfer (version 6.0.0) and the Desikan-Killiany Atlas for segmentation. We performed a two sample t-test using SPSS 21 to compare the cortical thickness of the two groups. The statistical threshold was set at p＜0.05.

RESULTS
Compared with the HC group, cortical thickness in the early PD group was widely reduced in the bilateral caudalmiddlefrontal, fusiform, inferiorparietal, inferiortemporal, lateraloccipital, lateralorbitofrontal, middletemporal, parsorbitalis, rostralmiddlefrontal, superiorparietal, supramarginal, frontalpole, temporalpole, and insula cortices, left bankssts and parahippocampal cortices, and right parsopercularis, parstriangularis, and precentral cortices; and increased in the bilateral paracentral and posteriorcingulate cortices, and right caudalanteriorcingulate and rostralanteriorcingulate cortices.

CONCLUSION
Our results demonstrate that the early PD patients designated by Hoehn-Yahr stage had a wide range of cortical thinning. The widespread cortical thinning was conformed to the complex neural pathological mechanism of PD patients with multiple system involvement. This provides important information about the pattern of cerebral atrophy in the early PD.

早、晚发性帕金森病脑皮层厚度及皮层折叠的研究

向意娟[1],谭长连[3],沈琴[3],张洪春[2]
1.湖南省妇幼保健院
2.安徽省立医院
3.中南大学湘雅二医院

摘要：
研究目的：

通过比较早发性帕金森病组与晚发性帕金森病组大脑皮层厚度及折叠度的改变，探讨早、晚发性帕金森病的不同发病机制。

材料与方法：

本研究募集了原发性帕金森病患者 60 例。根据年龄 50 岁为界将帕金森病患者分为早发性帕金森病（EOPD）27 例和晚发性帕金森病（LOPD）33 例。另外从社区募集 48 例年龄、性别等分别与 EOPD 和 LOPD 相匹配的正常人作为健康对照组，分为年轻正常对照组 23 例和老年正常对照组 25 例。利用同一台西门子 3.0T MRI 成像系统采集所有被试高分辨头部三维 T1 加权图像，然后利用 FreeSurfer 软件对被试脑结构图像进行数据后处理分析，比较早、晚发性帕金森病患者与相应正常对照组间的脑皮层厚度及皮层折叠变化。

研究结果：

早发性帕金森病组与相应正常对照组比较，结果发现早发性帕金森病组右侧顶上小叶、顶下小叶、楔前叶、中央旁小叶及双侧额上回、扣带回后部的皮层厚度增加（$p<0.05$），右侧梭状回、舌回皮层厚度变薄（$p<0.05$）；右侧额中回、额下回、中央前回、中央后回、岛叶、缘上回、颞叶、枕叶、顶下小叶的脑皮层折叠减低；右侧距状旁回、舌回、楔叶的脑皮层折叠增加（$p<0.05$）。晚发性帕金森病组与相应对照组比较，结果发现晚发性帕金森病组的双侧中央前回、中央后回、额下回、颞上回、岛叶、眶额叶皮层厚度变薄（$p<0.05$）；两组间脑皮层折叠无显著差异（$p<0.05$）。

结论：

本研究发现早发性帕金森病与晚发性帕金森病存在不同的脑皮层厚度及折叠度改变，磁共振成像研究将为进一步研究早、晚发性帕金森病的发病机制提供影像学依据。

EPO-0019
基于机器学习方法的 BOLD 诊断 HIV 相关神经认知障碍的研究初探

丁茜琳,苏丹柯
广西医科大学附属肿瘤医院

目的：运用基于机器学习方法的静息态功能磁共振成像技术，探究局部一致性和低频振幅两种指标在评估 HIV 相关神经认知功能障碍中的应用价值。

方法：按照纳入排除标准，收集 2017 年 09 月至 2018 年 12 月期间首诊于南宁市第四人民医院感染科的艾滋病患者，共纳入未进行抗病毒治疗的艾滋病患者 29 例（HIV 阳性组），16 位男性，13 位女性。以 NP 测验为参考标准，将 HIV 阳性组分为 HAND 组和非 HAND 组。要求受试者签署磁共振检查知情同意书并进行静息态功能磁共振扫描。采用 GE Discovery MR 750w 3.0T 磁共振行常规轴位 T1WI、轴位 T2WI、矢状位 T1WI 薄层扫描和梯度回波-回波平面成像序列(EPI)。图像的预处理使用 SPM12 和 DPARSF3.1，正式处理采用低频振幅（ALFF）指标，使用 PRoNTo2.1.1 机器学习工具包进行图像数据的分析。使用 SPSS25.0 统计软件分析 ALFF 指标在 HAND 组和非 HAND 组的差异。

结果：（1）ALFF 指标在 HIV 阳性组和 HIV 阴性组间差异贡献最大的十个大脑区域依次为：左侧中央旁小叶、右侧中央旁小叶、右侧楔叶、左侧颞极颞中回、左侧楔前叶、小脑蚓部 1、2 区、右侧补充运动区、左侧角回、左侧顶上回、小脑蚓部 10 区；（2）ALFF 的 AUC 为 0.65，准确率为 63.27%，灵敏度为 75.86%，特异度为 45%，阳性预测值为 66,67%，阴性预测值为 56.25%。HAND 组和非 HAND 组的 ALFF 值在右侧中央旁小叶、小脑蚓部 1、2、10 脑区有统计学差异，$p<0.05$。

结论：基于机器学习法的 ALFF 指标在 HIV 阳性组和阴性组的认知功能评估方面均有意义，其中 ALFF 指标可用于诊断 HAND。HIV 阳性组和 HIV 阴性组对比功能差异较大的脑区包括双侧旁中央小叶，运动辅助区，小脑半球、小脑蚓部和部分额、颞、顶、枕叶。

Dynamic Alterations of Spontaneous Neural Activity in Parkinson's Disease: A Potential Diagnostic Feature

Chao Zhang,Kai Xu,Yutao Rong,Xiuling Wang
Department of Radiology, Affiliated Hospital of Xuzhou Medical University

Objective: To investigate dynamic amplitude of low-frequency fluctuations (dALFF) in patients with Parkinson's disease (PD) and healthy controls (HCs), and to further explore whether dALFF can be used to test the feasibility of identifying PD from HCs.
Methods: Twenty-eight patients with PD and 28 demographically matched HCs received resting-state functional MRI (rs-fMRI) scans and neuropsychological tests. A dynamic method was used to calculate the dALFF of rs-fMRI data obtained from all subjects. The alterations in dALFF were compared between group of PD and HCs, and the correlations between dALFF variability and disease duration/ neuropsychological tests were further calculated. Then, the statistical differences of dALFF between groups were selected as classification features to discriminate patients with PD from HCs through a linear support vector machine (SVM) classifier. Classifier performance was assessed using permutation test (repeated 5000 times).
Results: Significantly increased dALFF in the left precuneus was detected in patients with PD when compared to HCs, and dALFF variability in this region was positively correlated with duration of disease. The present results show that 80.36% (p<0.001) of subjects were correctly classified through SVM classifier by leave-one-out cross-validation.
Conclusion: Patients with PD exhibited abnormal dynamic brain activity in left precuneus, and the dALFF variability can distinguish PD from HCs with high accuracy. Our results not only showed novel insights into the pathophysiological mechanisms about this disorder but also might provide a potential effective feature for its clinical diagnosis.

EPO-0021

Disrupted network topology contributed to spatial navigation impairments in mild cognitive impairments

Weiping Li,Hui Zhao,Bing Zhang
The Affiliated Drum Tower Hospital of Nanjing University Medical School

Bacground
Impairment in spatial navigation is not limited to patients with AD dementia, but can be detected earlier in patients with mild cognitive impairment (MCI). At the same time, the network topology is disrupted in early MCI. However, little is known about disrupted network topology on spatial navigation skill.
Methods

A total of 60 individuals were recruited, including 32 MCI (65.91±11.33 years old) and 28 NC (69.68±10.79 years old). All participants underwent spatial navigation tests and a 3.0-tesla DTI and T1 weighted imaging. We focused on global efficiency, local efficiency, clustering coefficient, shortest path length computed from weighted connectivity matrices based on DTI. The spatial navigation skill, evaluated as egocentric and allocentric, was assessed by a computerized human analogue of the Morris Water Maze tests Amunet. We further analyzed that the correlation between spatial navigation skill and network parameters.

Results

Compared with normal controls, MCI subjects showed significant decreased clustering coefficient parameters in left middle frontal gyrus, right rectus, right superior parietal gyrus and right inferior parietal, decreased shortest path length in left paracentral lobule and increased global efficiency in right middle frontal gyrus. MCI subjects performed worse egocentric navigation compared to normal controls, which indicated by larger average total error . Decreased clustering coefficient of the right inferior parietal gyrus was associated with poor performance in allocentric+egocentric, egocentric and allocentric navigation. white matter hyperintensity volume?

Conclusion

In conclusion, this study demonstrated the abnormalities of network, including global efficiency, clustering coefficient and shortest path length mainly in frontal and parietal gyrus are correlated to worse spatial navigation skill.

EPO-0022

Spatial Navigation Impairment Is Associated with Alterations in Subcortical Intrinsic Activity in Mild Cognitive Impairment: A Resting-State fMRI Study

Zhao Qing,Weiping Li,Bing Zhang
Affiliated Drum Tower Hospital of Nanjing University Medical School， Nanjing， China.

Impairment of spatial navigation (SN) skills is one of the features of the Alzheimer’s disease (AD) already at the stage of mild cognitive impairment (MCI). We used a computer-based battery of spatial navigation tests to measure the SN performance in 22 MCI patients as well as 21 normal controls (NC). In order to evaluate intrinsic activity in the subcortical regions that may play a role in SN, we measured ALFF, fALFF, and ReHo derived within 14 subcortical regions. We observed reductions of intrinsic activity in MCI patients. We also demonstrated that the MCI versus NC group difference can modulate activity-behavior relationship, that is, the correlation slopes between ReHo and allocentric SN task total errors were significantly different between NC and MCI groups in the right hippocampus (interaction F = 4 44, p = 0 05), pallidum (F = 8 97, p = 0 005), and thalamus (F = 5 95, p = 0 02), which were negative in NC (right hippocampus, r = -0 49; right pallidum, r = -0 50; right thalamus, r = -0 45; all p < 0 05) but absent in MCI (right hippocampus, r = 0 21; right pallidum, r = 0 32; right thalamus r = 0 28; all p > 0 2). These findings may provide a novel insight of the brain mechanism associated with SN

impairment in MCI and indicated a stage specificity of brain-behavior correlation in dementia. This trial is registered with ChiCTR-BRC-17011316.

EPO-0023
联合 FCD 和 VBM 研究 AD 和 MCI 患者的脑结构和功能改变

张冰,何中,陆加明
南京大学医学院附属鼓楼医院

目的：本研究将利用基于体素形态测量学（VBM）和基于静息态血氧水平依赖功能磁共振（fMRI）的功能连接密度(FCD)，比较阿尔兹海默病（AD）、轻度认知障碍（mild cognitive MCI）和健康老年人对照组（NC）间脑灰质体积和全脑功能连接密度的改变。
方法：对 19 名 AD 患者，22 名 MCI 患者，以及 32 名性别、年龄匹配的 NC 进行三维脑结构磁共振和 fMRI 检查。采用 VBM 的方法分析 AD、MCI、NC 全脑的形态学改变。采用全脑功能连接密度（gFCD）、短程功能连接密度（sFCD）和长程功能连接密度（lFCD）的方法分析 AD、MCI、NC 脑功能活动状态，gFCD 用于分析每个体素与全脑体素的连接数量，sFCD 用于分析每个体素与周围体素的连接数量，lFCD 用于分析每个体素与远端体素的连接数量。利用 SPM8、DPARSF、REST 软件进行统计分析，采用方差分析、两样本 t 检验，$p<0.01$ 差异有统计学意义。
结果： AD 与 MCI 和 NC 比较，双侧海马及海马旁回和左侧中央前回灰质显著萎缩($p<0.01$)，楔前叶的 sFCD 显著减小($p<0.01$)。MCI 与 NC 比较，左侧中央前回灰质显著萎缩($p<0.01$)，楔前叶 sFCD 有减小趋势($p=0.06$)，部分区域 sFCD 增加。AD、MCI、NC 的 gFCD 和 lFCD 各组之间无显著变化。
结论：本研究证实了 AD 和 MCI 患者双侧海马及海马旁回和左侧中央前回脑萎缩之外，还发现楔前叶的短程功能连接密度在患者中减低，为 AD 和 MCI 患者脑结构和功能退化的机制研究奠定了理论和方法学基础，有助于临床的早期诊断和治疗。

APOE ε 4 基因型子非痴呆老年人中对深部灰质体积与认知表现的相关性的调控作用研究

张冰,李卫萍,尹震宇
南京大学医学院附属鼓楼医院

目的： apoe ε 4 等位基因是阿尔茨海默病（AD）风险的最强预测因子，但其在深灰质体积与认知障碍之间的关系中的作用尚不清楚。
方法： 本研究调查了 apoe ε 4 等位基因对非痴呆老年人这种关联的影响。我们招募了 24 名轻度认知障碍（MCI）患者和 28 名年龄、性别和教育程度与正常对照组（NC）相匹配的患者，他们接受了全脑 3DTIW MRI、APOE 基因型测试和神经心理学测试。
结果： MCI 组右侧丘脑、左侧苍白质和双侧杏仁核体积均小于 NC 组。MCI 组右侧丘脑体积（$P=0.006$）、壳核体积（$P=0.006$）、左侧苍白质体积（$P=0.012$）、双侧杏仁核体积（右 $P=0.005$，左 $P=0.006$）与 MOCA 评分呈正相关。MCI 组右侧丘脑体积（$P=0.043$）与位数跨度（依次）评分呈正相关。此外，双侧丘脑体积（右 $p=0.001$，左 $p=0.003$）和尾状体积（右 $p=0.015$，左 $p=0.023$）与 MCI 组的位数跨度（向后）评分呈正相关。此外，一般线性回归模型表明，在非 apoe ε 4 等位基因携带者中，右丘脑和右壳核体积与 MOCA 评分呈正相关，而这些相关在 apoe ε 4 等位基因携带者中不显著。但 APOE ε 4 等位基因携带者右侧丘脑与 MOCA 评分相关的非标准系数大于非携带者，说明右侧丘脑体积萎缩与 APOE ε 4 等位基因携带者的认知水平有关。

结论： 总之，apoe ε 4 等位基因改变了右侧丘脑和 MOCA 评分以及右侧壳核之间的相关性。apoe ε 4 等位基因在一定程度上对认知与大脑结构的关系有着特殊的影响。

EPO-0025

嗅觉神经环路在 AD 超早期 SCD 中改变特征的研究

陆加明,张冰
南京大学医学院附属鼓楼医院

目的： 采用嗅觉刺激任务态功能磁共振（task-fMRI）探讨主观认知能力下降（SCD）患者与正常老年人的嗅觉脑区激活差异，探寻早期识别和评估 SCD 向阿尔茨海默病（AD）转化的客观影像标志物。
方法： 2017 年 3 月至 2018 年 12 月从社区招募 20 例 SCD 患者（SCD 组）及 20 名匹配的正常老年人（NC 组）。所有受试者均进行全套认知心理学量表测试、嗅觉行为学测试及嗅觉 task-fMRI。分析两组被试之间的嗅觉行为学、认知心理学量表及 task-fMRI 脑激活之间的差异，进一步采用两组在任务态有差异的脑区为种子点做静息态功能连接分析，计算脑区激活与行为学的相关性。
结果： 与正常被试比较，SCD 患者的嗅觉行为学（嗅觉识别能力）显著下降（t=-3.042, P<0.01），嗅觉阈值差异没有统计学意义。在 SCD 自评量表（t=6.973, P < 0.01）、费城词语学习的即刻（t=-4.623, P < 0.01）和延迟（t=-2.746, P<0.01）测试中也出现显著下降，其余常规认知心理学量表均表现为正常。嗅觉任务态 fMRI 中，SCD 患者双侧初级嗅觉皮层（POC）的激活显著下降，包括双侧内嗅皮层、梨状皮层、杏仁核、嗅前核以及海马头部。以 POC 为种子点，静息态功能连接显示 SCD 患者嗅觉系统与默认网络的功能连接显著减弱（AlphaSim 校正，体素水平，P<0.01，簇水平，P<0.05）。
结论： 嗅觉功能在 SCD 患者中已出现损伤，内嗅皮层等初级嗅觉皮层的活动改变可能是早期客观评价 SCD 神经环路损伤的生物标志物。

Age-related iron deposition in the basal ganglia of controls and Alzheimer disease patients quantified using susceptibility weighted imaging

dan wang
Shanghai Jiao Tong University Affiliated Sixth People's Hospital

This study aimed to investigate age-related iron deposition changes in healthy subjects and Alzheimer disease patients using susceptibility weighted imaging. The study recruited 182 people, including 143 healthy volunteers and 39 Alzheimer disease patients. All underwent conventional magnetic resonance imaging and susceptibility weighted imaging sequences. The groups were divided according to age. Phase images were used to investigate iron deposition in the bilateral head of the caudate nucleus, globus pallidus and putamen, and the angle radian value was calculated. We hypothesized that age-related iron deposition changes may be different between Alzheimer disease patients and controls of the same age, and that susceptibility

weighted imaging would be a more sensitive method of iron deposition quantification. The results revealed that iron deposition in the globus pallidus increased with age, up to 40 years. In the head of the caudate nucleus, iron deposition peaked at 60 years. There was a general increasing trend with age in the putamen, up to 50-70 years old. There was significant difference between the control and Alzheimer disease groups in the bilateral globus pallidus in both the 60-70 and 70-80 year old group comparisons. In conclusion, iron deposition increased with age in the globus pallidus, the head of the caudate nucleus and putamen, reaching a plateau at different ages. Furthermore, comparisons between the control and Alzheimer disease group revealed that iron deposition changes were more easily detected in the globus pallidus.

MR 定量磁敏感图评估阿尔茨海默病患者静脉血氧水平及其与认知功能水平的关系

刘杨颖秋,董俊伊,苗延巍
大连医科大学附属第一医院

目的

采用 MR 定量磁敏感图（QSM），定量测量 AD 患者大脑静脉血氧水平，并分析磁敏感值与临床实验室指标、认知评分之间的相关性。

材料与方法

研究对象分为 AD 组及对照（CON）组。AD 组共 59 例，均为自 2015 年 9 月-2019 年 12 月期间在本院住院，并符合 NINCDS/ADRDA 诊断标准的患者；CON 组 22 例，为自愿或因其他原因来我院检查的患者。记录所有 AD 组患者的临床资料及实验室检查指标，包括年龄、性别、病程、受教育程度、血压情况、总胆固醇、甘油三酯、高密度脂蛋白（HDL）、低密度脂蛋白（LDL）及同型半胱氨酸含量，并由神经内科医生进行简易智力状态检查量表(MMSE)、蒙特利尔认知评估量表(MoCA)、画钟试验(CDT)以及日常生活能力量表(ADL)评估。采用 GE 3.0TMR 机，行常规 MRI 及 ESWAN 检查。采用美国韦恩州立大学 SPIN 软件进行图像后处理，获得 QSM 图，在 QSM 图像上分别测量大脑内静脉（ICV）、丘纹上静脉（TV）、透明隔静脉(SV)、基底静脉(BV)及齿状核静脉(DNV)的磁敏感值（MSV）。应用 SPSS 17.0 进行数据分析。

结果

1.AD 组所有大脑静脉 MSV 值均高于 CON 组，并在双侧 TV、双侧 DNV、左侧 BV、左侧 ICV 具有显著差异（P＜0.05）。

2.双侧 TV、双侧 ICV、双侧 DNV 与 MMSE 评分间具有显著负相关性；双侧 TV、双侧 DNV 与 MoCA 评分间具有显著负相关性；双侧 TV、双侧 DNV、右侧 SV 与 CDT 评分间具有显著负相关性；双侧 TV、双侧 SV、左侧 BV 与 ADL 评分间具有显著负相关性。

3.左侧 DNV 的 MSV 值与病程正相关；右侧 SV 的 MSV 值与总胆固醇含量正相关；右侧 DNV 的 MSV 值与甘油三酯含量呈正相关；左侧 ICV 的 MSV 值与 HDL 含量呈负相关。

结论

AD 患者脑静脉 MSV 值增高，血氧饱和度降低，也影响认知评分；大脑静脉 MSV 值可以用于 AD 的鉴别诊断。

多模态磁共振成像在帕金森病中的应用价值

杨蕾,王龙胜,单艳棋,邹立巍
安徽医科大学第二附属医院

摘要：目的 探讨多模态磁共振成像技术在帕金森病(Parkinson’s disease，PD)患者脑结构变化中的应用价值。**方法** 对符合入选标准的 20 例 PD 患者及性别、年龄、利手相匹配的 20 例老年健康对照者，进行临床评估及磁共振图像采集，获取各项异性分数(FA)降低、灰质体积(grey matter volume，GMV)减小的脑区，比较两组间 T2 加权成像(T2WI)横断面黑质致密部(SNc)宽度及其与中脑直径的比值差异，并与 Hoehn-Yahr 分级量表、PD 统一评分量表第 3 部分(parkinson disease unified rating scale-Ⅲ，UPDRS-Ⅲ)评分进行相关性分析。**结果** 1.与对照组比较，PD 组神经纤维束呈现弥漫性异常，存在多个 FA 值降低区域：胼胝体、双侧前放射冠、内囊、外囊、皮质脊髓束、上纵束、钩状束、扣带束、穹隆、矢状层（下纵束及额枕下束）及小脑下脚。2.与对照组比较，PD 组距状沟、左侧角回、右侧额下回 GMV 减小；未发现 PD 组 GMV 增加的脑区。3.与对照组比较，PD 组 SNc、SNc/中脑直径减小，差异有统计学意义(P<0.05)；PD 组 SNc、SNc/中脑直径与 H-Y 分级、UPDRS-III 评分无相关性(P>0.05)。**结论** 多模态磁共振成像技术能精准定位 PD 患者脑内微结构损伤区域，对探究 PD 患者脑结构变化具有重要价值。

EPO-0029
静息态 BOLD-fMRI 在轻度认知障碍和阿尔茨海默病中的应用

文玉
山西医科大学第一医院

目的：应用静息态 BOLD-fMRI 成像技术，比较认知功能正常的老年人、aMCI 患者和 AD 患者与后扣带回（PCC）相关的默认网络结构的差异，探讨静息态 BOLD-fMRI 在 MCI 患者和 AD 患者中的应用，为 aMCI 及 AD 的早期诊断提供影像依据。**方法**：收集就诊于山西医科大学第一医院神经内科临床疑诊为 aMCI 患者 10 例，男 3 例，女 7 例，年龄 63～78 岁，平均年龄 69.3 岁；疑诊为 AD 患者 15 例，男 6 例，女 9 例，年龄 65～80 岁，平均年龄 71.9 岁；选取与 AD 组及 aMCI 组性别、年龄及受教育程度相匹配的健康志愿者 10 例，男 7 例，女 3 例，年龄 60～75 岁，平均年龄 67.8 岁。行头颅常规 MRI 检查除外脑外伤、脑出血、脑梗塞、脑肿瘤及颅脑手术等神经系统疾病。所有受试者行静息态 BOLD-fMRI 检查，以 PCC 为种子区，进行与全脑其他区域基于体素的时间序列相关分析。经获得激活脑区阈值设为经校正的 P<0.05，激活脑区体素范围>10。**结果**：①正常对照组与 PCC 有功能连接的脑区包括：前额叶内侧区、双侧海马、丘脑背侧、楔叶及楔前叶、顶下小叶、部分颞叶，网络结构的对称性良好，连通性完整。②aMCI 组所显示的与 PCC 有功能连接的脑区和正常对照组相似，但是激活脑区的体素减少，网络结构连通性减弱。③AD 组与 PCC 有功能连接性的脑区包括：双侧前额叶内侧区、楔叶及楔前叶、顶下小叶、部分颞叶等，激活脑区的部位及范围较正常对照组明显减少，双侧海马未见激活，网络结构存在减弱和断裂。**结论**：BOLD-fMRI 技术作为一种新的 MRI 成像方法，使磁共振检查不再局限于人脑形态学的研究，已经延伸到脑功能成像的领域，为我们更好的研究脑功能提供了方法。静息态默认网络的提出为我们诊断 AD 开拓了新思路，AD 认为

是一种“失连接状态”，MCI 患者和 AD 患者脑内默认网络功能的连通性出现减弱和断裂，为 aMCI 及 AD 的早期诊断提供了依据

EPO-0030

Altered resting-state voxel-level whole-brain functional connectivity in multiple system atrophy patients with cognitive impairment

Huaguang Yang[1],Xiaoguang Luo[2],Hongmei Yu[1],Miaoran Guo[1],Chenghao Cao[1],Yingmei Li[1],Guoguang Fan[1]
1.The First Affiliated Hospital of China Medical University
2.Shenzhen People's Hospital, Second Clinical Medical College of Jinan University

Objective: *Increasing evidence suggests that cognitive impairment (CI) is frequent in patients with multiple system atrophy (MSA), however, the neurobiological mechanisms underlying CI in patients with MSA are still debated.*
Methods: *Degree centrality(DC), voxel-wise image and clinical symptoms correlation and secondary seed-based FC analyses were performed in 61 patients with probable MSA and 33 healthy controls to reveal voxel-level whole-brain FC changes in MSA-CI.*
Results: *Patients with MSA-CI and patients with MSA with normal cognition (MSA-NCI) both exhibited similar low DC values in the left calcarine and right postcentral regions, while high DC values were noted in the bilateral caudate and left precuneus compared to controls. Direct comparison of MSA-CI and MSA-NCI showed differences only in the right middle frontal gyrus. The average DC values of right middle prefrontal cortex correlated with clinical cognitive severity, and using it as a seed, a secondary seed-based FC analysis further revealed FC changes in the right precuneus, inferior parietal lobe, and right insula.*
Conclusions: *Decreased right middle frontal cortex activity and its functional connectivity network alterations with the precuneus, inferior parietal lobe, and insula may serve as biomarkers of brain dysfunction in patients with MSA-CI.*

EPO-0031

Local connectivity of the resting brain connectome in patients with low back-related leg pain: A multiscale frequency-related Kendall's coefficient of concordance and coherence-regional homogeneity study

Fuqing Zhou
The First Affiliated Hospital, Nanchang University

Increasing evidence has suggested that central plasticity plays a crucial role in the development and maintenance of (chronic) nonspecific low back pain. However, it is unclear how local or short-distance functional interactions contribute to persisting low back-related leg pain (LBLP) due to a specific condition (i.e., lumbar disc

herniation). In particular, the multiscale nature of local connectivity properties in various brain regions is still unclear. Here, we used voxelwise Kendall's coefficient of concordance (KCC) and coherence (Cohe) regional homogeneity (ReHo) in the typical (0.01–0.1 Hz) and five specific frequency (slow-6 to slow-2) bands to analyze individual whole-brain resting-state functional magnetic resonance imaging scans in 25 persistent LBLP patients (*duration: 36.7±9.6 months*) and 26 healthy control subjects. Between-group differences demonstrated significant alterations in the KCC- and Cohe-ReHo of the right cerebellum posterior lobe, brainstem, left medial prefrontal cortex and bilateral precuneus in LBLP patients in the typical and five specific frequency bands, respectively, along with interactions between disease status and the five specific frequency bands in several regions of the pain matrix and the default-mode network (*P<0.01, Gaussian random field theory correction*). The altered ReHo in the five specific frequency bands was correlated with the duration of pain and two-point discrimination, which were assessed using partial correlational analysis. These results linked the course of disease to the local connectivity properties in specific frequency bands in persisting LBLP. In future studies exploring local connectome association in pain conditions, integrated frequency bands and analytical methods should be considered.

Extensive Microstructural Alterations of White Matter have been exited in End-stage Renal Disease Patients before Dialysis Initiation

Xueying Ma[1,2], Dun Ding[3], Peng Li[2], Ming Zhang[2]
1. The Affiliated Hospital of Inner Mongolia Medical University
2. The First Affiliated Hospital of Xi'an Jiaotong University
3. The Second Affiliated Hospital of Xi'an Jiaotong University

Purpose This study aimed to perform the microstructure of white matter in end-stage renal disease (ESRD) patients before dialysis initiation.
Methods We recruited 49 ESRD patients before dialysis initiation (mean age 35.41±10.04 years) and 42 healthy volunteers (mean age 38.25±8.93 years). Three-dimensional T1-weighted imaging and diffusion tensor imaging (DTI) were acquired using a GE 3.0T scanner. The tract-based spatial statistics (TBSS) of FSL tools was used to detect the micro characteristics of white matter, and correlation analysis among neuropsychological tests and laboratory tests was made for exploring the brain structural and functional impairment from microscopic level of white matter.
Results ESRD patients before dialysis initiation showed extensive white matter microstructural changes, almost involved all of the fiber tracts, characterized by decreased diffuse anisotropy (FA), and increased mean diffusion (MD), axial diffusivity (AD) and the radial diffusivity (RD) coefficient (P<0.05, FWE correction). The changes of white matter microstructure had a relationship with the accumulation of blood urea nitrogen. It may be associated with osmotic gradient change of blood-brain barrier, and then induced the diffuse interstitial brain edema. The changed

microstructural characteristics of bilateral superior longitudinal fasciculus (SLF) had a close relationship with memory function decline.
Conclusion Our findings revealed that ESRD patients before dialysis initiation have exited widespread white matter microstructural abnormality. And the microstructural damage of white matter, especially the injury of SLF which is the main internuncial fibers between the prefrontal cortex and posterior parietal cortex, is related to the decline of memory function in ESRD patients before dialysis initiation. The accumulation of urea nitrogen was one of most important risk factors for the impairment of whiter matter in ESRD before dialysis initiation.

EPO-0033
应用 SMS-Bold fMRI 评估高海拔地区慢性失眠障碍患者脑结构和功能变化

郑芸[1],鲍海华[1],李瑞阳[1],康东杰[1],王少彧[2]
1.青海大学医学院附属医院
2.西门子医疗保健公司 MR Scientific Marketing

目的 慢性失眠影响人的记忆、免疫及认知等功能，而高海拔地区由于低氧、低压、低温特殊的地理环境，慢性失眠障碍的发生率较高。故本研究目的在于应用 SMS-Bold fMRI 探讨高海拔地区慢性失眠障碍患者脑结构及功能的改变，为研究高海拔地区慢性失眠障碍发生的病理生理机制提供影像学支持。**方法** 招募高海拔地区（海拔高度约 2300m）、年龄、教育年限相匹配的 13 例慢性失眠障碍患者及 13 例健康志愿者，采集所有受检者脑结构像（MP2RAGE）及静息态功能磁共振(SMS-BOLD)序列，应用基于体素的形态测量学（VBM）、低频振幅（ALFF）方法处理并组间对比，提取差异脑区灰质体积（GMV）及 ALFF 值。**结果** 与正常对照组相比，慢性失眠障碍组在双侧梭状回、双侧小脑 6、1、9 区、左侧舌回、左侧距状裂周围皮层、左侧枕叶、双侧海马、左侧楔叶、左侧海马旁回、左侧杏仁核、右侧小脑 4/5 区灰质体积萎缩；与正常人对照组相比，慢性失眠障碍患者组在双侧小脑 2、8、1、7b 区、双侧舌回、左侧梭状回 ALFF 值减低。**结论** 高海拔地区慢性失眠障患者有多个脑区灰质体积的萎缩及功能异常，部分脑区功能的变化与结构相关。

Analysis of Resting-state Cerebral Blood Flow Characteristics in Treatment-naive Patients with First-episode Obsessive-compulsive Disorder Based on 3D-ASL Cerebral Perfusion Imaging

Xiao-ming Li,Jun-hong Liu,Yan Zhang,Jing-liang Cheng
First Affiliated Hospital of Zhengzhou University

【Abstract】**Purpose**:The cerebral blood perfusion characteristics of treatment-naive patients with first-episode obsessive-compulsive disorder patients were studied by 3D arterial spin labeling imaging (ASL) whole brain perfusion imaging technique.
Materials and Methods:Analysis of resting-state cerebral perfusion map (ASL) and

cerebral blood flow (CBF) images in 34 treatment-naive patients with first-episode obsessive-compulsive disorder, The results were compared with that of 34 healthy controls.The psychiatric symptoms of all patients were assessed with Y-BOCS. **Results**:The resting-state cerebral blood flow of treatment-naive patients with first-episode obsessive-compulsive disorder is mainly characterized by low perfusion of bilateral cingulate gyrus and high perfusion of left middle temporal gyrus and infratemporal gyrus. **Concolusion**:Resting-state cerebral blood flow of treatment-naive patients with first-episode obsessive-compulsive disorder is abnormal , suggesting a possible neurological pathogenesis of obsessive-compulsive disorder.

失去独生子女所致创伤后应激障碍的脑灰质体积改变

吴慧[1],吴光耀[1,2],王艳[1]
1.武汉大学中南医院
2.深圳大学总医院

目的 采用基于体素的形态测量学（Voxel-based Morphometry，VBM）的方法探讨失独所致创伤后应激障碍（Post-traumatic Stress Disorder，PTSD）患者的脑灰质体积（Gray Matter Volume，GMV）的变化。

方法 共收集 19 例伴 PTSD 的失独患者（PTSD 组）、28 例不伴 PTSD 的失独患者（TC 组）及 27 例健康对照组（HC 组），应用当前和终生的临床用创伤后应激障碍诊断量表（Clinician Administered PTSD Scale, CAPS）评估每位失独者的症状严重程度。所有受试者接受 3.0T MRI 扫描，并采用基于 Matlab_R2013b 平台的 SPM8、VBM8 分析软件，将年龄、性别及颅内容积（Intracranial Volume, ICV）作为协变量，得到两组间 GMV 有显著差异的脑区。

结果 结果显示，PTSD 组、TC 组及 HC 三组之间，默认网络相关脑区的 GMV 存在差异，差异有统计学意义（$P<0.01$）。与 HC 组相比，PTSD 组的右侧额上回、海马旁回及颞下回的 GMV 减小；与 HC 相比，TC 组的右侧海马、中央前回及楔前叶的 GMV 减小；与 TC 组相比，PTSD 组的左侧额上回、右侧楔前叶 GMV 减小，而左侧梭状回的 GMV 增加（P 均<0.001）。相关分析结果显示，左侧梭状回的 GMV 与 CAPS 评分呈中度负相关（$r=0.490$，$p=0.033$），且与 PTSD 的回避症状呈显著负相关（$r=0.555$，$p=0.014$）。

结论 失独者的默认网络相关脑区的脑结构存在异常改变，其中左侧额上回及右侧楔前叶的灰质体积减低可能导致了失独患者 PTSD 的发生，而左侧梭状回的体积增加可能是 PTSD 症状严重程度的潜在预测因子。

Cerebral Neurovascular Coupling Altered in Patients with Narcolepsy

Yu-Ting Li,An-Ding Zhang,Ying Yu,Bo Hu,Wen Wang,Guang-Bin Cui
Department of Radiology, Tangdu Hospital, Fourth Military Medical University

Background

Nowadays, narcolepsy is aggravating the adverse effect on human life. Recent studies have shown that there is a certain relationship between narcolepsy and neurovascular coupling (NVC) dysfunction. However, there is still a lack of clinical evidence for the association between narcolepsy and NVC dysfunction. Multifunctional MRI can explore the relationship between cerebral vascular perfusion and neural activity, thus reflecting NVC condition in people with narcolepsy [1]. Therefore, exploring the relationship between narcolepsy and NVC dysfunction may play an important role in the treatment of narcolepsy.

Methods

This study included 27 patients (including 2 type: rapid eye movement sleep behavior disorder, RBD; nonRBD) with narcolepsy and 27 healthy controls with no difference in age, gender, BMI and education level. All participants completed Pittsburgh Sleep Quality Index (PSQI) to assess sleep quality, which shown that narcolepsy patients have lower sleep quality. We used blood oxygen level dependent signal (BOLD) sequence to reflect the activity intensity of brain neurons and cerebral blood flow map (CBF) based on arterial spin labeling (ASL) signal to reflect cerebral blood perfusion. All these indicators were estimated between narcolepsy and the controls groups.

Results

The PSQI score increased significantly in narcolepsy patients compared with the control group indicating the sleep quality of narcolepsy patients decreased significantly. Decreased NVC were found in left occipital gyrus, right and left precentral gyrus, left postcentral gyrus, right amygdala and left fusiform gyrus. Besides, the total PSQI score was negatively correlated with NVC coefficients in the regions with deceased NVC.

Conclusion

Imaging results showed that there is neurovascular disfunction in narcolepsy patients. Significant correlations were found between the imaging changes of neurovascular uncoupling and the brain function indicators.

EPO-0037

Prognostic correlation between stent and thrombolytic therapy in patients with acute cerebral infarction with aspects score

Yuxuan Shang,Xiulong Feng,Wen Wang,Guangbin Cui
Department of Radiology , Tangdu Hospital, Fourth Military Medical University

Background:

Early ischemic changes(EICs) on CT before the administration of acute stroke therapies may predict functional outcome and the risk of cerebral hemorrhage. The Alberta Stroke Program Early CT score (ASPECTS) system is developed to assess the EICs on noncontrast-enhanced computed tomography (NCCT) in patients with acute ischemic stroke involving the middle cerebral artery (MCA) territory. However, its merit in predicting prognosis remains controversial. We aimed to use ASPECTS to predict patient prognosis in the our patient cohort of our hospital.

Methods:
A total of 358 patients from 2009 to 2019 with Acute cerebral infarction(ACI) who received intravenous thrombolysis or stent therapy were retrospectively included, the complete pre-treatment NECT images were obtained from the PACS(Picture Archiving and Communication Systems). According to the treatment, ACI patients were divided into two thrombolytic therapy group (n = 22) and stent therapy group (n = 336). The APPECTS of NECT as well as the patient prognosis were retrieved from NECT and the medical follow-up, respectively. The predicting merit of ASNPECTS for prognosis was analyzed.
Results:
This study included 336 patients. 123 cases were treated with intracranial stent implantation and 213 cases were treated with percutaneous intracranial stent implantation. 90% patients were successful recanalization (40% cerebral infarction thrombolysis [TICI] 2B (Almost completely re-pass) and 51% TICI 3 (Complete recanalization)), and aspects score decreased during hospitalization in all patients, with an average Aspects score decrease of 2-3 points. Compared with TICI 2B recanalization, the Aspects score of TICI 3 patients showed a significant decrease. There was Almost no symptomatic intracranial hemorrhage in our cohort.
Conclusions:
careful selection of patients using ASPECTS may allow for safe interventions, with low risk of clinical deterioration, and no-periprocedural mortality. All our patients demonstrated a reduction in their Aspects score after the thrombectomy and clinical improvement.

EPO-0038

The predictive value of anatomic abnormalities of habenula in the diagnosis of schizophrenia

Lei Zhang,Zhuo Wang,Yuejiao Sun
The First Hospital, Jilin University

Purpose
The diagnostic value of the anatomic abnormalities (AA) of habenula (Hb) became noticeable with the development of high resolution (HR) MRI in neuropsychiatric disorders. In this study, we primarily investigated the correlation of the AA effect of Hb with the pathophysiological mechanism of schizophrenia.

Methods
Institutional approval and consent form were obtained for this study. Fifteen patients with chronic schizophrenia (SC) and sixteen matched healthy controls (HC) were recruited. Psychopathological symptoms were assessed with the Positive and Negative Syndrome Scale (PANSS). All subjects were scanned at a 3.0T MR scanner. Left and right Hbs of each subject were manually delineated on the obtained 3D HR T1 MR images by two radiologists. Except for the Hb volume of each subject, the volume of grey matter (GM) and white matter (WM) contained in Hb were automatically generated using the “New Segment” toolbox in SPM8. The statistical comparisons were performed using paired t

tests for hemisphere, independent samples t tests between groups, and Spearman's rank correlation for correlation between volume and clinical variables.

Results and Discussion

Lateralization was found in both groups, with left Hb larger ($p<0.01$). It was observed the relative Hb volumes were far less a sensitive index as the absolute Hb volumes. Comparing with HC, SC patients exhibited significantly volumetric decreasing in left Hb GM and whole left Hb ($p<0.05$). The volumes of left Hb WM were significantly related with PANSS negative scores ($p<0.05$), so as the right Hb GM with the general scores and the total scores of PANSS ($p<0.05$).

Conclusion

Although the lateralization of Hb remained in SC, it was observed the volume of Hb for SC patients were smaller than HC. Especially, at certain regions, the absolute volumetric index of Hb had significant relationship with clinical syndrome, which indicated the AA of Hb might be involved in the neuropathological course of schizophrenia.

EPO-0039

The study of resting-state functional MRI based on amplitude of low-frequency fluctuation (ALFF) in chronic alcoholics

Liang Zhang, Jun Chen, Yilin Zhao, Jinhuan Liu, Hui Tan
Renmin Hospital of Wuhan University

Objective This study was to assess the value of amplitudes of low-frequency fluctuation (ALFF) in detecting the changes of brain spontaneous activity based on resting state functional MRI (fMRI) in chronic alcoholics, and to discuss the underling neurophysiological mechanism.
Methods Eighteen chronic alcohol dependent individuals and 22 relevant basic information (including gender, age, education and handedness) matched healthy controls were recruited as the alcohol dependent group and the control group respectively. All subjects were asked to perform MAST, ADS and record clinical symptom, then conventional sequences and resting-state functional MRI were applied. SPM8 and DPARSF software was used to process and analyze the resting-state functional MRI data, and then the whole brain regional homogeneity (ReHo) data were acquired. Two-sample t-test was used to examine the differences of ALFF values between two groups.
Results In comparison with control group, the alcohol-dependent group had decreased ALFF values in extensive brain regions including bilateral precuneus, left middle frontal gyrus, right cuneate lobe (voxels range 15～90. $t=-5.394$～-3.949, $P<0.01$), as well as increased ALFF values in bilateral frontal gyrus (voxels range 6～15. $t=3.585$～3.600, $P<0.01$).
Conclusion In resting state, the chronic alcohol-dependence individuals showed abnormal spontaneous activity of the brain compared to that of the normal's. The

significant abnormal brain regions in ALFF is also located in bilateral frontal lobes, and there existed overlap between the abnormal regions of ALFF and Reho values. The abnormal brain regions are the part of brain's default mode network, it may imply that these abnormal activities might be related to the brain's default network changes.

DCE-MRI 定量半定量分析对鼻咽癌放射性脑病影像诊断相关性研究

阿布都克尤木江阿布力孜[1],陈美微[2],买合米提江·达莫拉[1],戴国朝[1]
1.喀什地区第一人民医院
2.中山大学孙逸仙纪念医院

目的 研究对鼻咽癌放射性脑病（RE）的影像诊断中 DCE 定量及半定量参数相关性。**方法** 46 例经病理证实鼻咽癌并放疗后 2 年以上影像诊断及临床诊断符合放射性脑病的病人行普通 MRI 增强检查三次以上的患者扫描加 DCE 扫描，采用 FFE 序列行多层采集，采用渗透分析软件，按放射性脑病病理生理学变化特点在对比剂强化区域、水肿区域及同侧正常脑组织回顾性画出感兴趣区，获得 T1 加权信号强度-时间曲线，基于双室血流动力学模型，产生三个脑血流动力学参数 Ktrans、Ve 和 Kep。测量时参考增强图像，手动勾画感兴趣区，为了减少误差反复测量 8～10 次，取其平均值定量及半定量分析结构对比。比较强化区、水肿区及正常脑组织的各参数的变化，分别探讨 DCE-MR 参数与强化特点之间的各参数的相关性比较后期治疗效果评价的相关性研究。**结果** 放射性脑病病理学改变特点与放射性脑病影像表现特点、DCE-MRI 的各参数的变化特点参数意义基本一致。**结论** 鼻咽癌放射性脑病患者普通 MRI 强化以外 DCE-MRI 各定量血流动力学参数变化有一定相关性。RE 的强化区的 DCE-MRI 参数中（Ktrans、ve、kep 等）表现出明显意义，在 RE 水肿区的 DCE-MRI 参数（Ktrans、ve、kep）表现有一定的鉴别特点，可以用（Ktrans、ve 值）参考判断病变区域并疗效评估及治疗计划改变上有一定的价值指标，为鼻咽癌个体化治疗和治疗方案修正提供依据。DCE-MRI 定量参数对结合普通 MRI 增强结合评估病灶的各期变化特点及治疗效果评价中有一定量意义。

EPO-0041
The velocity of cerebral blood flow declines during prolonged altitude exposure in elderly men.

Jie Feng,Shiyu Zhang,Xiao Yu,Wenjia Liu,Lin Ma
radiology of PLAGH

Objective
The alteration of the cerebral arterial flow velocity (CBFv) is the integrated consequence of the hemodynamic and it can reflect the cerebral perfusion in certain extent. The aim of the present study was to explore the effects of acute and prolonged altitude exposure on extracranial cerebral arterial flow velocity (CBFv) in old male subjects, using phase contrast MR sequence.
• Materials and Methods

Eleven healthy old male subjects (56.7± 2.6 years, body mass index 22.7± 2.7) were recruited for this study with written informed consent obtained. All of the participants were apparently healthy and living at <100 m above sea level without previous exposure to high altitude (>1500 m). No alcohol, caffeine, or medication that could affect CBF was consumed during this study. None of the subjects received medication to prevent AMS. The study was approved by the Ethics Committee of Chinese PLA General Hospital and conformed to standards set by the Declaration of Helsinki. All subjects received MR scan at sea level (Beijing, 50 m) (SL1), the day ascent to the altitude (D0), the and the following 4 consecutive days (D1-D4) and the day descent to the sea level (SL2). PC sequence was acquired to measure the CBFv of 4 extracranial cerebral arteries (bilateral vertebral arteries (VA_R, VA_L) and internal carotid arteries (ICA_R, ICA_L)). Due to the technical problems, there were 68 data acquired that were: SL1=10, D0=10, D1=9, D2=9, D3=10, D4=9, SL2=11, only 4 subjects had accomplished all the 7 scan. So ANOVA and paired t test was used to maximize the usage of the data. A $p<0.05$ was considered as statistically significant.

Results

The CBFv of SL1,D0,D1,D3 was analyzed using one-way ANOVA, trend analysis of VA_R, VA_L, ICA_R and ICA_L shows the CBFv of these arteries during acute and prolonged altitude exposure show a quadratic trend (p=0.015, 0.000, 0.020, 0.013 respectively). After acute altitude exposure, the CBFv declines progressively, and after 2days accommodation, the CBFv restores to the basal level. Paired t test shows the CBFv of VA_L and ICA_L on D0 decreased compared with that on SL1(31.43 ± 8.72 VS 25.11 ± 5.25, p=0.019; 40.66±9.66 VS 30.24 ± 6.86, P=0.022), and the CBFv of VA_L and VA_R on SL2 decreased than that on SL1(32.09±8.47 VS 26.46±6.92, p=0.015; 30.53 ± 4.85 VS 27.46±5.46,p=0.030). During the prolonged exposure to the altitude, no increased CBFv was captured in present study.

Conclusions

Contrary to previous studies reported increased CBFv during altitude or simulated altitude exposure, the present study shows that CBFv of the extracranial cerebral arteries declines during acute altitude exposure, and restores after accommodation. In addition, there might be differences between the altitude accommodation of right and left, and ICA and VA, it needs to be investigated in the future.

EPO-0042

Altered spontaneous brain neural activity in dysthyroid optic neuropathy: A resting-state fMRI study

Ping Liu[1],Jing Zhang[2],GuiHua Jiang[1]
1.Guangdong Second Provincial General Hospital
2.Tong Ji Hospital, Hua Zhong University of y Science and Technolog

Purpose: Some researchers suggest that visual function impairment related disease maybe not only a disease limited to the visual system, but also a neurodegenerative disease involving multiple brain regions. We aim to investigate the altered global spontaneous brain neural activity in patients with dysthyroid optic neuropathy (DON)

by combined employing regional homogeneity (ReHo) and the amplitude of low-frequency fluctuation(ALFF).
Material and Methods:18 DON patients, 24 TAO patients without neuropathy and 30 age-,sex-matched healthy controls(HC) were included. ReHo and ALFF values were calculated to represent spontaneous brain activity. ANOVA were performed among them for comparison, then, two-sample t test were performed to observe the difference between any two groups.
Results:
(1) Compared to HC, TAO patients showed increased ReHo and ALFF in anterior cingulate, right hippocampus and left parietal lobe; ReHo and ALFF values significantly decreased in superior temporal gyrus, occipital lobe, anterior central gyrus, left middle frontal gyrus and right parietal lobe.
(2) Compared to HC, DON patients showed increased ReHo and ALFF in left middle temporal gyrus, left fusiform gyrus, right hippocampus, superior posterior cingulate gyrus and right superior marginal gyrus; ReHo and ALFF values significantly decreased in Brodmann area 18/19 and right superior temporal gyrus.
(3) DON patients showed increased ReHo and ALFF values in right middle temporal gyrus, posterior cingulate gyrus and central anterior gyrus in comparison with TAO, whereas, the ReHo and ALFF values of DON were decreased in Brodmann area 19 and the anterior cingulate. ($p<0.01$, AlphaSim corrected).
Conclusions: Combined ALFF and ReHo analyses demonstrated a significant decrease in spontaneous brain neural activity in various brain regions, which mainly located in the visual cortex areas. This study may enhance our understanding of the visual function impairment in DON, and the altered brain neural activity. Which may have potential guidelines for future therapeutic implications.

EPO-0043
抑郁症性别差异的磁共振脑结构成像研究

邱丽华,梅兰,牟静平,刁显明
宜宾市第二人民医院

目的：采用基于体素的形态学测量法（VBM）探讨男女性抑郁症患者脑灰质体积改变的性别差异，以及这些差异脑区灰质体积值与抑郁症临床指标的相关性。
方法：纳入 25 例男性未用药抑郁症患者、36 例女性未用药抑郁症患者及年龄匹配的 25 例男性和 36 例女性健康对照者为研究对象。对 4 组受试者均采用美国 GE 3.0T MR 扫描仪行磁共振常规及 3DT1 结构像数据采集。应用 VBM-DARTEL 对数据进行后处理，使用 SPM8 软件进行统计分析，对 4 组受试者行双因素方差分析，性别和诊断作为组间因素，在差异脑区的基础上进行 post-hoc 两两间双样本 t 检验。提取主结果中性别差异脑区的灰质体积值与抑郁症患者临床指标（病程、发病年龄及 HAMD 评分）进行相关分析。
结果：4 组受试组之间年龄、受教育年限差异均无统计学意义； 男女性抑郁症组 HAMD 评分差异无统计学意义；男女性抑郁症组病程差异有统计学意义（$P<0.05$）。 4 组间主分析结果发现男性右侧舌回、双侧颞中回、左侧中央后回、右侧额叶内侧回、双侧丘脑、双侧额上回、左侧中央后回、左侧额中回及双侧中央前回灰质体积均小于女性；进一步组间两两比较发现男性抑郁症组与女性抑郁症组相比，左侧额中回、双侧额上回、左侧中央前回、右侧额叶内侧回、双侧中央前回及双侧丘脑灰质体积减小（ $P<0.05$，Alphasim 校正），提取主分析结果中性别差异脑区的灰质体积值与抑郁症患者临床指标进行相关分析发现，男性抑郁症患者左侧颞中回的灰质体积与 HAMD 评分呈负相关

（r=-0.418, p=0.042），左侧额中回的灰质体积与 HAMD 评分呈负相关（r=-0.498, p=0.013），而女性患者无相关性。
结论：男女性 MDD 患者灰质体积出现性别差异的脑区可能与男女性患者临床表现和发病率的差异有关。男性 MDD 患者左侧颞中回及左侧额中回的灰质体积值与 HAMD 评分呈负相关提示灰质体积可以预测男性抑郁状态的严重程度。

EPO-0044

Resting-state functional MRI study: component analysis of brain networks in patients with diabetic retinopathy

Hui Dai
First Affiliated Hospital of Soochow University

PURPOSE: To explore the brain networks changes in diabetic retinopathy (DR) patients and uncover the underlying mechanism.
Methods and Materials: 21 patients with DR and 21 age and sex matched healthy controls were enrolled from August 2012 to September 2014. Subjects were scanned using 3T MR with blood-oxygen-level dependent (BOLD) and 3 dimension fast spoiled gradient echo (3D-FSPGR) sequences. MR data was analyzed via preprocessing and functional network construction. After a group comparison, components of brain networks with significant group differences were extracted and brain network-connection strengths among components were evaluated. The brain areas were compared between patients and controls group. P-values less than 0.05 were considered statistically significant. Connection strength was evaluated with alphasim $p<0.01$.
RESULTS: The components map of altered brain networks with quantified connection strengths were obtained in DR patients, demonstrating disconnections mainly in bilateral heschl’s gyrus, left cuneus, left occipital lobe, bilateral amygdala, left parahippocampal, bilateral fusiform and left superior parietal, in patients group than those in healthy controls ($p<0.01$, 12 network notes with mean count in random data 0.1190), while the compensations may occur in frontal-cingulumregion, as well as among the right caudate, left thalamus, left inferior temporal lobe and middle orbital frontal lobe.
CONCLUSION: Brain network connections, decreased in the brain areas of which in charging with cognition and visual function, suggests that DR patients might have cognitive decline and visual function loss. However, there might be a frontal compensatory circle in patients with DR.

硫化氢中毒脑损伤影像学征象

唐代迪
解放军总医院第五医学中心南院区

【摘要】 目的：探讨硫化氢气体引起中毒脑损伤在 CT 及 MRI 检查的影像学特征及机制。

方法：回顾分析 2016 年 1.1 -2018.11.1 三年间我院 9 例硫化氢气体中毒患者的影像学资料：在 9 例硫化氢中毒患者中，其中男性 8 例，女性 1 例；年龄 25-54 岁，中位年龄 33 岁。
结果：9 例患者均成功行头颅 CT 或 MRI 检查:其中 2 例重度中毒患者仅行 CT 检查，一例表现为脑水肿,并出现蛛网膜下腔出血，患者预后差，未行影像学检查复查;另一列脑白质对称性密度减低、双侧放射冠对称性密度减低；4 例中度中毒患者头颅 CT 检查表现为脑水肿、双侧基底节核团对称性密度减低，MRI 检查表现为双侧额叶、半卵圆中心、侧脑室周围、基底节核团对称性长 T1 长 T2 信号，DWI 及 T2-Flair 像呈对称性高信号，其中 2 例经治疗后行 MRI 复查脑内病变变化较前不著,2 例患者治疗过程中出现脑水肿加重、迟发脑改变等情况；3 例轻度中毒患者头颅 MRI 检查为阴性，经对症治疗后一般情况良好，各项生化指标正常。
结论： CT 及 MRI 检查对硫化氢中毒脑损伤患者的诊断和预后有重要价值。在 CT 检查中，硫化氢中毒脑内病变表现为脑水肿、脑白质对称性密度减低，部分病例可有出血。在 MRI 检查表现为双侧额顶叶、放射冠、半卵圆中心、基底核团、侧脑室周围对称性长 T1 长 T2 信号，DWI 呈等至高信号，T2-flair 像为高信号。MRI 检查能够早期发现脑部的异常表现，敏感性较高，观察 MRI 动态变化，对确定治疗方案、用药、高压氧疗程及判断预后有重要价值。但是不足之处在于其特异性较差，我们阅读其他文献提示脑血流灌注成像（rCBF 灌注减低）及波谱可能对硫化氢中毒脑损伤有特异性，在今后的工作中我们会进一步研究探索。此外，我们发现硫化氢中毒脑损害还有反复、迟发加重的表现，部分重度中毒病人可以发生不可逆性脑损害，应引起足够重视。

EPO-0046

Functional connectivity strength in patients with Type 2 Diabetes Mellitus: A resting-state functional MRI study

Lianping Zhao,Gang Huang,Yashan Lu
Gansu Provincial Hospital

Objective To provide a new approach to further elucidate the underlying pathogenesis of diabetes-related cognitive impairment in T2DM patients by using resting-state functional connectivity strength(FCS). **Methods** T2DM patients (n = 56) and age-, sex-, and education-matched healthy control subjects (n = 48) underwent the rs-fMRI .The whole brain FCS values were constructed and two-sample t-test was used to compare the FCS values of both groups to locate the regions with significant change. Functional Connectivity (FC) analysis was carried out between the seed points(the brain regions with significantly different FCS) and the voxels of whole brain. Additionly, correlation analysis was performed between the time series signal of significantly different FCS, FC and neuropsychological test , clinical variables . **Results** Patients performed worse on several neuropsychological test ,including Beck Depression Inventory,MOCA,HRSD,HAMA,YMRS,CDT. Compared with the control group, T2DM patients exhibited significantly increased FCS values in right middle temporal gyrus (t=4.718, P(voxel-level)<0.001,P (cluster-level<0.05) , additionly,decreased functional connectivity between right middle temporal gyrus and cingulate gyrus was found inT2DM.Pearson correlation analysis shows FC was significantly negatively correlated with the C- reactive protein (CRP) (t=-0.292, P=0.037). **Conclusion** The abnormal functional connectivity strength of the right middle temporal gyrus may be involved in the pathophysiological mechanisms of cognitive dysfunction of T2DM.

EPO-0047

Altered gray matter volume in patients with type 1 diabetes mellitus

Jia Liu
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background and Purpose: Previous studies of voxel-based morphometry (VBM) have found that patients with type 1 diabetes mellitus (T1DM) exhibit gray matter alterations, but these findings are inconsistent and have not been quantitatively reviewed. Therefore,
the aim of this study was to conduct a quantitative meta-analysis of VBM studies of patients with T1DM.
Materials and methods: The seed-based d mapping method was applied to quantitatively estimate the regional gray matter abnormalities in T1DM patients. We also used meta-regression to explore the effects of some demographics and clinical characteristics.
Results: Seven studies, with 6 datasets comprising 414 participants with T1DM and 216 non-T1DM controls, were included. The pooled meta-analyses found that T1DM patients showed robustly increased gray matter volume in the left dorsolateral superior frontal gyrus and middle frontal gyrus. And decreased gray matter volume in the right lingual gyrus, cerebellum, precuneus, the left inferior temporal gyrus and middle temporal gyrus. The meta-regression found that the patients' mean age, the percentage of female patients with T1DM, illness duration and HbA1c% were not linearly associated with gray matter volume changes.
Conclusion: This meta-analysis indicates that T1DM patients have significantly androbustly reduced gray matter mainly in the cortical regions and cerebellum.

EPO-0048

Deep radiomics biomarkers for differential diagnosis between neuromyelitis optica spectrum disorders and multiple sclerosis

Yineng Zheng,Yuling Peng,Tianyou Luo,Yongmei Li
The First Affiliated Hospital of Chongqing Medical University

Purpose: Deuromyelitis optica spectrum disorders (NMOSD) could present similar symptoms to relapsing remitting multiple sclerosis (MS). This study aims to quantify the differences of brain MRI measurements between NMOSD and MS, so as to provide the basis for computer-aided diagnosis.

Method: Clinical brain MRI sequences for 31 patients with NMOSD, 20 patients with MS and 20 healthy controls were examined. Different from the typical radiomics approach which extract features from lesions, the convolutional neural network VGG-18 was used to extracte deep radiomics features. The random forest algorithm was used to select features with importance values over 0.001 and support vector machine was used to built a linear discriminant analysis classifier.
Result: The classification performance (area under the curve (AUC): 0.872; 95% confidence interval (CI): 0.801-0.913) consistently outperforms those of independent radiomics (AUC: 0.817; 95% CI: 0.707-0.886) and SVM (AUC: 0.856; 95% CI: 0.835-0.886) approaches.
Conclusion: This study demonstrates that MRI radiomics analysis is valuable in supporting differential diagnosis between MS and NMOSD.

EPO-0049

Dynamic properties of functional connectivity in the first-episode, treatment-naive patients with obsessive-compulsive disorder

Junhong Liu,Jingliang Cheng
the First Affiliated Hospital of Zhengzhou University

Background and purpose: Traditional investigations of intrinsic brain organization of obsessive-compulsive disorder (OCD) patients based on resting-state functional magnetic resonance imaging have largely not taken into account the presence and potential of temporal variability. In this work, we describe an approach to assess whole-brain functional connectivity dynamics of first-episode, treatment-naive OCD patients based on spatial independent component analysis, sliding time window correlation, and k-means clustering of windowed correlation matrices.
Material and Methods: Using resting state eyes-closed functional imaging and independent component analysis on the data that included 29 first-episode, treatment-naive OCD patients and 29 age- and gender matched healthy controls, we decomposed the functional brain data into 28 components. We subsequently evaluated group differences in functional network connectivity in a dynamic sense, computed using sliding windows (20s in length) and k-means clustering to characterize four discrete functional connectivity states. To assess the severity of OCD symptoms, the Yale-brown obsessive－compulsive scale (Y-BOCS) was used to assess the severity of both obsessions and compulsions separately and provide an overall score.
RESULTS: A total of 14 components were selected from 28 independent components, which were highly similar to the standard functional network template and located on the gray matter, overlapping less with the ventricles and blood vessels. Relevant functional networks were default mode network, salience network, auditory network, executive control network, visual network, language network, sensorimotor network, basal ganglia and precuneus. In the comparison of dynamic functional connectivity indicators, we found that there were significant differences in number of transitions among the four functional connectivity states, but no significant differences in

fraction time and mean dwell time. The number of transitions among the four states was positively correlated with the total score of Y-BOCS.
Conclusion: The dynamic evolution of functional connection in patients with first-onset OCD has the characteristics of switching state frequently, and the more the number of transitions, the more severe the obsessive-compulsive symptoms.

EPO-0050

Local connectivity of the resting brain connectome in breast cancer patients with chemotherapy: A multiscale frequency related regional homogeneity study

Yanlin Zhao,Fuqing Zhou
the First Affiliated Hospital of Nanchang University

Objective To explore the alteration of regional homogeneity (ReHo) and the relationship between the altered ReHo and the memory function impairment in breast cancer patients with chemotherapy.
Methods Recruited a cohort of female breast cancer (BC) patients. Using Rey auditory verbal learning test (RAVLT) to evaluate the memory function of the subjects, and voxel wise Kendall's coefficient of concordance ReHo in the typical (0.01－0.1 Hz) and five specific frequency (slow-6 to slow-2) bands to examine the difference of local functional properties between the BC patients after chemotherapy with subjective cognitive impairment (BC-CSCI group, in this study) and the prechemotherapy BC patients (BC group). The relationship was assessed between the ReHo values of altered regions and the measured value of RAVLT in the BC-CSCI group using a partial correlational analysis.
Result There is no significant difference between the BC-CSCI group and the BC group in age (P=0.207), education (P=0.455), the immediate recall (IR) of RAVLT (p=0.512), the delayed recall (DR, P=0.896), the study score (SS, P=0.134), and significant difference in the forgotten score (FS, P=0.035). Compared with the BC group, the BC-CSCI group exhibited significantly difference of the ReHo values in right precuneus/cuneus at the typical frequency band, and right precuneus/posterior cingulate gyrus (PCG), left precuneus/PCG at slow-4 (P=0.01, GRF, voxelwise P=0.01, clusterwise P=0.05). In the BC-CSCI group, the KCC-ReHo values of right precuneus/cuneus at the typical frequency band significantly correlated with IR (P=0.011, R=-0.586), DR (P=0.027, R=-0.521) and FS (P=0.024, R=0.53), while right precuneus/PCG at slow-4 significantly correlated with IR (P=0.004, R=-0.648), DR (P=0.006, R=-0.62), and left precuneus/PCG significantly correlation with IR (P＜0.001, R=-0.747), DR (P=0.001, R=-0.693) and FS (P=0.004, R=0.646), which assessed using partial correlational analysis (age and education as covariate).
Conclusion These findings linked altered ReHo to the memory function impairment in BC-CSCI group, which may provide new evidence into the understanding of the pathophysiology mechanism of chemotherapy related cognitive impairment.

CACNA1C rs58619945 在双相障碍患者注意网络皮层厚度的作用

成小芳
广州市惠爱医院

背景及目的：持续性的注意力损害被认为是双相障碍（BD）特异性的，且独立于药物因素之外，可作为 BD 的客观标志物。影像遗传研究表明 CACNA1C 通过调节注意网络，在精神疾病注意力缺陷发育过程中起重要作用。至今，CACNA1C rs58619945 在注意网络的效应尚未明了，本研究应用结构核磁共振成像技术，以期探索 CACNA1C rs58619945 在 BD 患者注意网络皮层厚度的作用及相关机制。

材料和方法：159 例 BD 患者及 82 例正常对照接受 3.0 T 高分辨结构核磁共振扫描，利用 Freesurfer 软件后处理获取注意网络皮层厚度指标进行统计分析。

结果：BD 组右侧前额叶皮层、右侧顶叶后部、右侧颞上回、左侧外侧眶额叶皮层厚度较正常对照组减低($p<0.001$)， CACNA1C 基因型及诊断在右侧前额叶、右侧顶叶后部、右侧颞上回、左侧外侧前额叶皮层厚度存在交互效应($F=7.798$, $P=0.001$;$F=5.151$, $P=0.006$;$F=5.194$, $P=0.006$;$F=6.029$, $F=0.003$,respectively)。BD 患者 GA 及 GG 基因携带者右侧前额叶、右侧颞上回、左侧外侧眶额叶皮层厚度以及 GG 基因携带者右侧顶叶后部皮层厚度较健康对照减低。在 BD 病例组中，上述脑区皮层厚度在三种不同基因型存在较一致的变化趋势（AA>GA>GG），部分脑区不同基因型之间的皮层厚度具有统计学差异($P<0.05$, Bonferroni 校正)
。
结论：本研究首次应用结构核磁共振成像技术，探讨 CACNA1C rs58619945 在 BD 患者注意网络皮层厚度的作用及相关机制，结果显示通过神经可塑性变化等途径，CACNA1C rs58619945 在警觉、定位子网络形态学变化起一定的作用，有助于阐明 CACNA1C rs58619945 与 BD 之间的神经病理机制。

EPO-0052
Frequency-Specific Abnormalities of Functional Homotopy in alcohol dependence: A Resting-State fMRI Study

Linghong Guo,Fuqing Zhou,Ning Zhang,Hongmei Kuang,Zhen Feng
The First Affiliated Hospital of Nanchang University

Purpose: Alcohol dependence (AD) is a relapsing mental disorder and always concurrent misuse of tobacco. Increasing studies indicated disruption of structural connectivity between hemispheres in ADs brain. However, the alterations in interhemispheric interactions and its specificity of frequency bands in ADs is still unknown. Voxel-mirrored homotopic connectivity (VMHC) offer a means to examine the functional interactions between mirrored interhemispheric voxels. Here, we use VMHC to investigate the homotopic connectivity of ADs and alcohol and nicotine co-dependence (AND) subjects.
Patients and methods: VMHC and seed-based functional connectivity (FC) between 24 ADs, 30 ANDs, and 35 sex-, age-, education-matched healthy controls (HCs) were calculated in different frequency bands (slow-5, slow-4, and typical band).

Results: ADs demonstrated significantly reduced VMHC in bilateral cerebellum posterior lobe (CPL) and increased VMHC in bilateral middle frontal gyrus (MFG) compared to HCs in typical band and slow-4 band, and this higher VMHC value in MFG was positively correlated to dependence-severity score. In all bands of VMHC analysis, no significant differences were found in ANDs versus other groups. Subsequent seed-based FC analysis demonstrated all the abnormal VMHC regions exhibited altered FC with its counterpart on the opposite hemisphere in typical and slow-4 band, still consisting of CPL and MFG. Furthermore, FC value between bilateral CPL within ADs was negatively correlated with alcohol intake.
Conclusions: Our findings of abnormalities in CPL and MFG provide further evidence of the role of disruptions within brain circuitry supporting cognitive control in development of AD. Alterations neural activities in those regions might be a biomarker of dependence severity in AD patients. Meanwhile, because of the frequency-specific in VMHC, we have to consider frequency effects in future fMRI study of AD. Finally, No finding observed in AND group need further study.

EPO-0053

Default Mode Network Changes in Individuals with Subjective Cognitive Decline and Mild Cognitive Impairment

Lingyan Liang
First Affiliated Hospital of Guangxi University of Chinese Medicine

Abstract
Objectives: To investigate the change of the DMN in subjects with SCD and MCI,and provide evidence that SCD may occur before MCI in the course of AD disease.
Methods: Thirty-five subjects with SCD,88 with MCI and 32 healthy controls were recruited in present study. Resting-state functional MR imaging were used to detect the changes of the DMN with posterior cingulate cortex (PCC) ,anterior medial prefrontal cortex (a mPFC)and ventral medial prefrontal cortex(mPFC) as seed.
Results: with the bilateral PCC as seed,reduced activity can be detected in bilateral anterior cingulate cortex (ACC) and in individuals with SCD compared to HC,and in the bilateral HIP and PHIP,right medial frontal guri/left ACC,angular gyrus/partial right medial temporal gyrus in individuals with MCI compared to HC; and increased activity can be detected in the right inferior frontal gyri in individuals with SCD compared to HC,and in the right precentral gyrus, left insular/left inferior temporal gyrus, right middle cingulate gyrus/right ventral ACC, right insular/right inferior temporal gyrus, right supplementary motor area(SMA),partial right cerebellum in individuals with MCI compared to HC;no significant DMN changes in individuals with SCD compared to MCI.With the bilateral a-mPFC as seed, reduced activity can be detected in the right PCC in individuals with SCD compared to HC, no significant DMN changes in individuals with MCI compared to HC and SCD. With the bilateral v-mPFC as seed, reduced activity

can be detected in bilateral HIP/PHIP, bilateral PCC/ partial middle cingulate gyrus, left middle frontal gyrus/left ACC ,and increased activity in the right middle temporal gyrus in individuals with MCI compared to HC;and reduced activity can be detected in the right ACC in individuals with MCI compared to SCD; no significant DMN changes in individuals with SCD compared to HC.

Conclusion: Subjective cognitive decline may occur before mild cognitive impairment in the course of AD disease.

EPO-0054

An independent component analysis of dorsal attention network in alcohol dependence patients

Hongyan Nie[1], Jun Chen[2], Junwu Hu[1]

1.Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

2.Renmin Hospital of Wuhan University, Wuhan, China.

Objective To study the changes of dorsal attention network(DAN) in alcohol dependent patients by using functional magnetic resonance imaging(fMRI) based on independent component analysis(ICA), and to explore its role in the mechanism of attentional dysfunction.

Methods Thirty three alcohol dependent individuals and twenty one healthy control volunteers, matched in gender, age, handedness and education, were enrolled as the alcohol dependent group and control group from September 2016 to June 2017. Michigan alcoholism screening test(MAST) was performed for all subjects. All the subjects underwent fMRI data acquisition by MR scanning. The dorsal attention network was extracted by independent component analysis. Independent sample *t*-test was performed to evaluate the significant difference of two groups, meanwhile, the correlation analysis was conducted in the different brain regions and MAST scores.

Results In the resting state, compared with healthy control group, the alcohol dependence group showed no functional connectivity increased in brain, the functional connectivity of the right inferior parietal lobule (42 voxels, $t=-5.1477$), right supramarginal gyrus (35 voxels, $t=-4.4603$), right middle frontal gyrus (17 voxels, $t=-4.0956$), left superior parietal gyrus (11 voxels, $t=-3.8545$) and left precentral gyrus (18 voxels, $t=-4.2176$) were significantly decreased in alcohol dependent patients. The significantly decreased regions showing no correlation with the MAST scores($P>0.05$).

Conclusions In the resting state, The functional connectivity of the dorsal attention network was decreased in alcohol dependent patients. Resting-state brain functional magnetic resonance imaging(fMRI) can reflect the changes of brain function, and also provides a imaging basis for the mechanism of addiction and behavioral cognitive abnormality in alcohol dependent patients.

Abnormal intrinsic functional hubs in chemotherapy breast cancer patients: evidence from a voxelwise degree centrality analysis

Yanlin Zhao,Fuqing Zhou
the First Affiliated Hospital of Nanchang University

Objective To explore the altered intrinsic functional hubs using voxelwise degree centrality analysis approach, and the relationship with subjective executive function impairment in breast cancer patients with chemotherapy.
Methods A cohort of female breast cancer (BC) patients were recruited, and the Trail Making Test (TMT) were evaluated the executive function. Using a binary and weighted voxelwise degree centrality (DC) to examine the difference of intrinsic functional hubs between the BC patients after chemotherapy with subjective cognitive impairment (BC-CSCI group, in this study) and the prechemotherapy BC patients (BC group). The relationship was assessed between the DC values of altered regions and the measured value of TMT in the BC-SCI group using a partial correlational analysis.
Result There is no significant difference between the BC-CSCI group and the BC group in age (P=0.207), education (P=0.455), part A1 of TMT (P=0.977), part A2 (P=0.601) and part B (P=0.356). Compared with the BC group, the BC-CSCI group exhibited significantly difference of the binary voxelwise DC values in right parahippocampa gyrus and right cerebellum anterior lobe, and the weighted voxelwise DC values in bilateral pons and right cerebellum anterior lobe/parahippocampa gyrus (P=0.01, GRF, voxelwise P=0.01, clusterwise P=0.05). In the BC-CSCI group, the TMT values in part A2

was significantly correlated with the altered DC values of right prahippocampa gyrus (P=0.008, R=0.607), right cerebellum anterior lobe (P=0.027, R=0.502), right cerebellum anterior lobe/parahippocampa gyrus (P=0.014, R=0.566), and bilateral pons (P=0.005, R=0.635), using partial correlational analysis (age and education as covariate).
Conclusion These findings linked the altered intrinsic functional hubs to the subjective executive function impairment in the chemotherapy BC-CSCI group, which may provide new evidence into the understanding of the pathophysiology mechanism of chemotherapy related cognitive impairment.

EPO-0057

Large-scale network abnormality in bipolar disorder: A meta-analysis of resting-state functional connectivity and voxel-based morphometry

Jiaying Gong[1], Junjing Wang[3], Ying Wang[2]
1. The Six Affiliated Hospital of Sun Yat-sen University
2. Medical Imaging Center, First Affiliated Hospital of Jinan University
3. Department of Applied Psychology, Guangdong University of Foreign Studies

Background: Bipolar disorder (BD) has been linked to abnormalities in the communication and gray matter volume (GMV) of large-scale brain networks, as reflected by impaired resting-state functional connectivity (rs-FC) and aberrant voxel-based morphometry (VBM). However, given variable methods and results across studies, identifying patterns of network abnormality in BD has been elusive. The aim of this study was to investigate characteristic large-scale brain changes in BD through a multimodal meta-analysis of resting-state functional and structural magnetic resonance imaging (rs-fMRI, sMRI) studies.
Methods: Whole-brain seed-based rs-FC and VBM studies comparing individuals with BD and healthy controls (HCs) (published before May 3, 2019) were retrieved from multiple electronic databases (PubMed, Embase, Web of Science, SinoMed, Chinese National Knowledge Infrastructure (CNKI), and WanFang). Then, coordinates of seed regions of interest (ROI) and between-group effects were extracted and coded. Seed ROIs were categorized into seed networks by their location within an a priori template. Multilevel kernel density analysis (MKDA) was used to identify brain networks in which BD was linked to hyper-connectivity or hypo-connectivity with each a priori network and the overlap between dysconnectivity and GMV changes.
Results: Twenty-two seed-based rs-FC publications (929 individuals with BD and 976 HCs) and 57 VBM publications (2277 individuals with BD and 2590 HCs) were included in the meta-analysis. Our results showed that BD was characterized by hypo-connectivity within the default network (DN, self-related thought), hyper-connectivity within the affective network (AN, emotion processing), ventral attention network (VAN, processing of salience), and thalamus network (TN, gating information), and hypo- and hyper-connectivity within the frontoparietal network (FN, external goal-directed regulation). Additionally, hyper-connectivity between the AN and DN, AN and FN, AN and VAN, AN and

TN, FN and VAN, VAN and TN, VAN and DN, and TN and sensorimotor network (SS, involved in sensory and auditory perception). The only instance of hypo-connectivity between-network in BD was observed between the FN and DN. Decreased GMV in BD was found for DN, AN, VAN, FN, TN, and SS. Finally, dysconnectivity and GMV reductions converged in the insula, ACC, mPFC, caudate, thalamus, and SFG.
Conclusions: These results suggest that BD is characterized by both structural and functional abnormalities of large-scale neurocognitive networks. Data suggests that the ACC, mPFC, insula, caudate, SFG, and thalamus for DN, VAN, AN, and TN are characteristic targets of BD.

Abnormalities of intrinsic regional brain activity in first episode and chronic schizophrenia: a meta-analysis of resting-state functional MRI

Jiaying Gong[1], Junjing Wang[3], Ying Wang[2]
1. The Six Affiliated Hospital of Sun Yat-sen University
2. First Affiliated Hospital of Jinan University
3. Department of Applied Psychology, Guangdong University of Foreign Studies

Background: While resting-state functional magnetic resonance imaging (rs-fMRI) studies have provided numerous evidences of abnormal intrinsic brain activity in schizophrenia (SZ), results have not been consistent. **Methods:** A meta-analysis of whole-brain rs-fMRI studies that explored differences in the amplitude of low-frequency fluctuation (ALFF) between SZ patients (including first episode [FE] and chronic patients) and healthy controls (HCs) were conducted. **Results:** Systematic literature search identified 24 studies comparing 1249 SZ patients and 1179 HCs. Total SZ patients displayed decreased ALFF in the bilateral postcentral gyrus, bilateral precuneus, left inferior parietal gyri (IPG), and right occipital lobe and increased ALFF in the right putamen, right inferior frontal gyrus (IFG), left inferior temporal gyrus (ITG), and right anterior cingulate cortex (ACC). In the subgroup analysis, FE patients with SZ demonstrated decreased ALFF in the bilateral IPG, right precuneus, and left medial prefrontal cortex (mPFC) and increased ALFF in the bilateral putamen and bilateral occipital gyrus. Chronic patients with SZ showed decreased ALFF in the bilateral postcentral gyrus, left precuneus, and right occipital gyrus and increased ALFF in the bilateral IFG, bilateral superior frontal gyrus, left amygdala, left ITG, right ACC and left insula. **Limitations:** Small sample size of our subgroup analysis and Asian samples dominated, processing steps and publication bias can limit the accuracy of the results. **Conclusion:** Our comprehensive meta-analysis suggests that aberrant regional intrinsic brain activity during the initial stage and much more widespread damage with the progression of disease may contribute to understand the progressive pathophysiology feature of SZ.

EPO-0059

Analysis on Mean Apparent Propagator (MAP)-MRI and memory impairment in temporal lobe epilepsy patients with hippocampal sclerosis

Keran Ma
The first Affiliated hospital of Zhengzhou University

Purpose To explore the value of MAP-MRI in the diagnosis of hippocampal sclerosis (HS) and in the evaluation of cognitive function, and to extract comprehensive parameter indicators for preoperative evaluation to facilitate clinical diagnosis and treatment.

Methods and Materials

Eighteen patients with unilateral HS and seventeen controls underwent MRI acquisition on a 3T scanner with T2 FLAIR sequence and diffusion-weight sequence (DWI). The Auditory Verbal Learning Tests (AVLT) were performed to assess immediate memory, delayed recall and delayed recognition for patients. The DWI parameters: FOV = 220×220 mm^2, voxel size = 2.0 × 2.0 × 2.2 mm^3, TR/TE =3800/72 ms, b-value=0 and 3000 sec/mm^2 with 64 gradient directions. The MAP-MRI parameters were estimated from diffusion data using an open-resource tool DIPY (Diffusion Imaging in Python). The MAP-MRI parameters included the mean square displacement (MSD), non-Gaussian parallel (NG∥), non-Gaussian perpendicular (NG⊥), q-space inverse variance (QIV), the return to the origin probability (RTOP), the return to the axis probability (RTAP), and the return to the plane probability (RTPP). Hippocampus outline was delineated on the T2 FLAIR image of the axis oblique coronal position using MRICro. The ROI was then automatically transferred into the space of parameter maps Then the receiver operating characteristic (ROC) and correlation analysis were performed.

Results:

For the group of hippocampal sclerosis side, the mean values of MSD, and QIV in ROI were higher and NG, NG∥, NG⊥, RTAP, RTOP, and RTPP were lower than those of the group of contralateral non-hippocampal sclerosis side ($P < 0.05$). ROC analysis indicated that RTPP had the highest diagnostic accuracy for differentiating the two groups (AUC: 0.903, sensitivity: 93.33%, specificity: 81.82%). Correlation analysis showed that the mean values of MSD, QIV were negatively correlated while NG, NG∥, NG⊥, RTAP, RTOP, RTPP were positively correlated with delayed memory. However, these MAP-MRI parameters were not significantly correlated with delayed recognition and immediate memory.

Conclusion The MAP-MRI parameters can reflect the microstructure change of the early HS. Especially, RTPP had the highest diagnostic accuracy. The correlations between MAP-MRI parameters and delayed memory can also reflect the memory impairment caused by HS. MAP-MRI can help diagnose early hippocampal sclerosis and assess memory impairment.

Clinical relevance/application

MAP-MRI can help diagnose early hippocampal sclerosis and be used as a relatively objective and repetitive method for clinical assessment of patients with memory impairment.Correlation analysis showed that the mean values of MSD, QIV were negatively correlated while NG, NG∥, NG⊥, RTAP, RTOP, RTPP were positively correlated with delayed memory. However, these MAP-MRI parameters were not significantly correlated with delayed recognition and immediate memory.

EPO-0060
集合 MRI 作为日常神经成像检查方案的初始临床经验

王克军
十堰市太和医院

目的:在日常实践中将使用 32 通道头线圈进行 5 分 4 秒的单次扫描作为常规神经成像方案，通过评估集合 MRI 的诊断图像质量来分析其临床可行性。
方法:回顾性分析 2018 年 8 月至 2018 年 10 月间使用合成 MRI 进行常规颅脑 MRI 检查的 80 例患者的影像学资料。两个独立的评阅者对利用多动态多回波获得的 MAGiC T1 (FLAIR)、MAGiC T2、T2 FLAIR 和相敏感反转恢复序列（PSIR）进行了图像质量评估成像。使用 kappa 统计数据对两个评阅者之间的观察者可靠性进行了评估。
结果:颅脑合成 MRI 成像呈现的整体图像质量和解剖定位均较好，除 T2 FLAIR 序列外，所有序列的得分均在 3 分以上。合成的 T2 FLAIR 序列提供了足够的图像质量，但显示出更明显的伪影，尤其是脑脊液搏动伪影和沿脑表面的线性高信号。评估所有合成序列图像质量的组间一致性较好 (k 值为 0.67-0.90；P <0.001)。
结论:扫描时间较短的合成 MRI 可以成为常规临床神经影像成像方案，并且可根据需要设定灵活的神经成像方案。

EPO-0061
γ-aminobutyric Acid Level Changes in Prefrontal Lobe and Bilateral Hippocampus of Temporal Lobe Epilepsy

Che He
1.Tianjin First Center Hospital
2.Tianjin Medical University

Purpose: To explore the changes of inhibitory metabolite GABA(γ-aminobutyric acid) in the brain of TLE (temporal lobe epilepsy) patients and normal controls by magnetic resonance spectroscopy.
Materials and Method: This research included 27 controls(male/female:11/15, age: 31.22±8.52) and 40 TLE patients (male/female:24/16, age: 33.2±10.28). The clinical information of TLE patients has been collected, it including their seizure frequency, clinical history duration, type of seizure, and EEG(electroencephalogram). All participants did the MMSE(mini-mental state examination) and BDI(Beck Depression Inventory) scale test. The BDI was to excluded depressive patients, and MMSE was used to assess cognitive function of patients. Then TLE patients were divided into CI(cognitive impairment) group (MMSE score＜26) and NOCI(no cognitive impairment) group (MMSE score≥26). The hippocampal sclerosis was assessed by two radiologists based on the patient's cerebral MRI. NAA, Cr, CHO, GLX and GABA level in the prefrontal lobe cortex, right hippocampus and left hippocampus were measured by using a MEGA-PRESS sequence. NAA/(Cho+Cr) and GABA/Cr ratios were compared between controls

and TLE. These two ratios also analyze according to the patient's medical history information, cognitive score and hippocampus sclerosis.
Result：The NAA/(Cho+Cr) ratio in bilateral hippocampus of TLE was lower than that of controls group, and significantly decreased in right hippocampus (p=0.009). The GABA/Cr ratio of TLE was significantly decreased in left hippocampus(p=0.027) and right hippocampus(p=0.032) in comparison to controls group. Neither NAA/(Cho+Cr) or GABA/Cr ratio has significant decrease in the prefrontal lobe cortex. Further analysis according to hippocampal sclerosis, seizure frequency, history time and cognitive impairment of TLE patients, the following results were obtained: (1) The two ratios of left hippocampus sclerosis group were the lowest in left hippocampus, while those of right hippocampus sclerosis group were the lowest in right hippocampus. (2) Compared with CHD(clinical history duration)≥10 years group, NAA/(Cho+Cr) ratio significantly decreased and GABA/Cr increased remarkably in CHD＜10 years group. (3) From NOSeizure≥1 year(No seizures occurred for more than one year) group to SeizureF＜1/M(attacks occur within a year and the seizure frequency is less than once a month) group and then to SeizureF≥1/M(attacks occur within a year and the seizure frequency is more than once a month) group, NAA/(Cho+Cr) ratio decreased, and GABA/Cr ratio increased in turn. (4) In both NOCI and CI groups, NAA/(Cho+Cr) ratio decreased in the right hippocampus, but there was no significant change in the left hippocampus and prefrontal lobe cortex. In bilateral hippocampus, GABA/Cr ratio of NOCI was significantly lower in bilateral hippocampus than in NC group and CI group, and in prefrontal lobe cortex, GABA/Cr ratio of CI group was significantly lower than that of NC group and NOCI group.
Conclusion：(1) The results of GABA/Cr ratio are more stable and regular than those of NAA/(Cho+Cr), GABA/Cr ratio is more sensitive than NAA/(Cho+Cr) in the brain of TLE. (2) Changes of TLE neuronal metabolites in bilateral hippocampus and prefrontal lobe are different, And only GABA/Cr ratio has a downward trend in the prefrontal cortex. With the progression of seizure frequency, duration of disease history and cognitive impairment, the ratio of NAA/(Cho+Cr) is decreased in bilateral hippocampus. The change of GABA/Cr ratio in the bilateral hippocampus showed that it first decreased in the early stage and then increased to the normal level in the late stage. The changes of NAA/(Cho+Cr) and GABA/Cr ratios had no obvious regularity in the prefrontal lobe, they will show a decreasing trend when TLE patients with cognitive impairment, and GABA/Cr ratio in CI group is significantly decreased.

基于 VBM 的首发强迫症患者脑结构研究

刘俊宏,程敬亮
郑州大学第一附属医院

基于 VBM 的首发强迫症患者脑结构研究
目的：强迫症是世界范围内功能性残疾的主要原因之一，但其神经生物学和病因学起源尚不清楚。本研究的目的是使用基于体素的形态测定法（voxel-based morphometry ，VBM）探索强迫症患者脑灰质结构的改变。
方法：采用 3.0T 磁共振成像对 36 例首发、未经治疗且未合并任何并发症的强迫症患者和 37 例健康对照组进行检查。利用指数李代数（exponentiated Lie algebra，DARTEL）对不同形态解剖配

准后的基于体素的形态测量法进行了区域灰质体积组间差异的体素分析。耶鲁-布朗强迫症量表（yale brown obsessive compulsive scale，Y-BOCS）用于评估强迫症状严重程度。
结果：与健康对照相比，强迫症患者组双侧扣带回前皮质的灰质体积减小（T=-4.181，P=0.0005），左侧梭状回（T=4.841，P=0.0005）和左中央后回（T=4.299，P=0.0005）的灰质体积增加。灰质体积的改变与 Y-BOCS 评分无相关性。
结论：首发强迫症患者存在大脑灰质体积的异常，且这些异常不仅仅存在于经典的强迫症皮质-纹状体-丘脑-皮质环路中。

IVIM 成像对慢性高原病脑灌注的定量分析

高雅[1],鲍海华[1],王少彧[2]
1.青海大学医学院附属医院
2.西门子科研部门，上海

目的　利用 IVIM 成像探究高原低氧环境下慢性高原病（CMS）灌注的脑灌注情况。方法　选择 14 例临床诊断为 CMS 的患者及高原正常健康志愿者为研究对象,所有病例均在 3.0T Prisma 磁共振扫描仪上行扩散加权成像(DWI)和 IVIM (b=0，50，100，150，200，400，600，800，1000 s/mm2)扫描。DWI 序列扫描后，表观扩散系数自动生成，通过独立的扩散工具箱软件(西门子健康工程公司)对 IVIM 原始数据进行后处理,以获得灌注分数(F)、伪扩散系数(D*)、扩散系数(D)；分别对比 CMS 患者与高原正常人双侧额、顶、颞、枕叶灰质及白质、尾状核头、豆状核、背侧丘脑、小脑半球的 IVIM 各参数值。采用两独立样本 t 检验进行统计学分析。**结果**　所有参与者的脑实质的衰减曲线符合双指数模型。CMS 组双侧额叶灰质 D*值高于高原正常组，f、D、ADC 值均低于高原正常组（D*: P＜0.05）;双侧额叶白质 D 和 ADC 值高于高原正常组，f 和 D*值低于高原正常组（P>0.05）；CMS 组双侧顶叶灰质 f、D*、D 值高于高原正常组而 ADC 值低于高原正常组（P>0.05）；双侧顶叶白质 f、D、ADC 值均高于高原正常组，D*值低于高原正常组（P＜0.05）；双侧颞、枕叶灰质、尾状核头、双侧背侧丘脑及右侧小脑半球的 IVIM 各指标均高于高原正常组（P＜0.05）；双侧颞叶白质 f 高于高原正常组，D*、D、ADC 值均为低于高原正常组（f: P＜0.05）；双侧枕叶白质 f、D、ADC 值均为低于高原正常组，D*低于高原正常组（D*:P>0.05）；双侧豆状核 D*、D、ADC 值均为高于高原正常组，f 低于高原正常组（P>0.05）；左侧小脑半球则髂与双侧豆状核的各值想法（P>0.05）。结论 与高原正常人比，CMS 患者的部分脑区灌注发生改变，IVIM 能够通过反映弥散信息及脑组织微循环灌注为 CMS 的 研究提供新方法。

EPO-0064

Distinguishing bipolar disorder and major depressive disorder by dynamic amplitude of low-frequency fluctuations: a resting state fMRI study

Zhenye Luo
The First Affiliated Hospital of Jinan University

Objective

When bipolar disorder (BD) presents as the depressive state, it is often misdiagnosed as major depressive disorder (MDD), which are lead to inappropriate treatment, even poor clinical outcomes. However, few studies have focused on dynamic alterations of local brain activity directly compared between MDD and BD II depression. The present study in order to explore the whether there were neuroimaging marker between BD II and MDD by using dynamic amplitude of low-frequency fluctuations (dALFF) of resting-state functional magnetic resonance imaging (rs-fMRI).

Method

All patients met Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (known as DSM-V) criteria for BD II or MDD according to the diagnostic assessment by the Structured Clinical Interview for DSM-V Patient Edition (SCID-P). And they were diagnosed with YMRS score<7, HDRS-24 score>21 for patients with BD II depression and HDRS-24 score>21 for MDD patients. Patients with BD II depression (n = 107) and MDD patients (n =116) as well as 120 healthy controls underwent resting‐state functional magnetic resonance imaging. We first used sliding window analysis to evaluate the dynamic amplitude of low-frequency fluctuations (dALFF), which is a synonym for intrinsic brain activity. The one-way ANOVA analysis was performed to assess the significant differences among three groups. The brain regions showing significantly statistical differences were defined as mask respectively for further post-hoc analysis. Age, gender, education years and the mean framewise displacement were included as nuisance covariates. Multiple comparisons were corrected using Gaussian random field (GRF) theory (minimum z>2.3, cluster significant p<0.05, corrected).

Results

Compared with HCs, the BD II and MDD groups both showed significantly increased dALFF in left superior frontal gyrus (SFG) while the bilateral posterior cingulate cortex (PCC)/Precuneus were showed decreased dALFF variability in both BD II and MDD. BD II patients showed increased dALFF variability in the bilateral PCC/Precuneus compared with MDD patients.

Conclusions

Our findings showed that the alterations of temporal variability in the left SFG and the bilateral PCC/Precuneus may suggest this regions were associated with pathophysiology of BD II and MDD.

EPO-0065

The study of VBM in minimal hepatic encephalopathy

Lu Zhou
The Third Affiliated Hospital of CQMU

Objective: To study the characteristics of gray and white matter volume changes in the precuneus subregions of patients with minimal hepatic encephalopathy (MHE) and to explore the related neurological mechanisms via voxel-based morphometry (VBM).
Methods: The neuropsychological test was performed on 15 normal subjects and 15 MHE first , and then the 3D T_1WI images were obtained and analyzed by using 3.0 T MRI

scanner and dparsf softwar, respectively. Finally, the changes of gray and white matter volumes in the precuneus subregions were statistically analyzed between MHE and normal group.

Results: Compared with the normal group, generally the volumes of gray matter in the left precuneus decreased in MHE (slightly in the anterior and central but significantly in the posterior and the ventral), at the same time, a little increase was also noted in some parts. For the white matter volumes, 4 subregions increased in the left (slightly in the anterior and central subregions, but significantly in the posterior and ventral), along with some increase.The changes of gray matter and white matter in the right precuneus subregions were also more obvious than that in the left [$P<0.05$].

Conlusion: The changes of gray and white matter volumes in the precuneus subregions of MHE can be revealed by using voxel-based morphometry, which had a certain value in the early diagnosis of MHE and understanding of the mechanisms of nerve injury.

EPO-0066

Functional connectivity strength in patients with Type 2 Diabetes Mellitus

Lianping Zhao,Gang Huang,Yashan Lu
Gansu Provincial Hospital

Objective To provide a new approach to further elucidate the underlying pathogenesis of diabetes-related cognitive impairment in T2DM patients by using resting-state functional connectivity strength(FCS). **Methods** T2DM patients (n = 56) and age-, sex-, and education-matched healthy control subjects (n = 48) underwent the rs-fMRI .The whole brain FCS values were constructed and two-sample t-test was used to compare the FCS values of both groups to locate the regions with significant change. Functional Connectivity (FC) analysis was carried out between the seed points(the brain regions with significantly different FCS) and the voxels of whole brain. Additionly, correlation analysis was performed between the time series signal of significantly different FCS, FC and neuropsychological test , clinical variables .

Results Patients performed worse on several neuropsychological test ,including Beck Depression Inventory,MOCA,HRSD,HAMA,YMRS,CDT. Compared with the control group, T2DM patients exhibited significantly increased FCS values in right middle temporal gyrus （t=4.718, P(voxel-level)<0.001,P（cluster-level<0.05）,pearson correlation analysis shows FC was significantly negatively correlated with the C- reactive protein (CRP) (t=-0.292, P=0.037). **Conclusion** The abnormal functional connectivity strength of the right middle temporal gyrus may be involved in the pathophysiological mechanisms of cognitive dysfunction of T2DM.

基于动态功能连接分析的酒精使用障碍者脑默认网络和执行控制网络的 fMRI 研究

喻婷婷
武汉大学人民医院

目的：长期饮酒或酗酒将会导致酒精依赖或中毒，会不同程度损害大脑的结构及功能，本文旨在探讨酒精依赖者静息态脑默认网络和执行控制网络功能网络连接的动态改变。
材料和方法：收集酒精使用障碍者 23 例及与酒精使用障碍组年龄、受教育程度、利手等相匹配的健康对照组 24 例，采用基于组水平的空间独立成分分析方法提取网络成分，利用软件进行最优估计分为 35 个独立成分，提取默认网络和执行控制网络，然后基于 GIFT 软件采用滑动窗口方法研究默认网络和执行控制网络功能连接的时变变化，对网络连接所有时间窗口的脑功能连接活动状态进行 K-means 聚类分析，利用最优估计将大脑活动归类为 4 类不同的状态。
结果：相对于健康对照组，酒精依赖者的脑活动状态发生改变，其中 state1 停留时间增加约 6.81%，相应 state2 停留时间缩短约 6.84%，而 state3 和 state4 相对稳定；在 state1 状态下默认网络内部连接增强，state2 状态下执行控制网络内部连接增强。
结论：酒精使用障碍者脑功能动态活动是发生变化的，默认网络内部功能连接增强的脑活动状态增加，执行控制网络内部功能连接减弱的脑活动状态减少，这种脑默认网络和执行控制网络功能分离和异常整合的动态改变可能与酒精成瘾机制及其造成的脑损害相关。

EPO-0068

Aplication of Monochromatic Imaging and Metal Artifact Reduction Software in Computed Tomography Angiography after Treatment of Cerebral Aneurysms

Xuan Zhang
Jiangsu Province Hospital (The First Affiliated Hospital of Nanjing Medical University)

Purpose: To evaluate the image quality and degree of metal artifact reduction using the new-generation gemstone spectral imaging (GSI) and artifact reduction software (MARs) and to demonstrate the optimal monochromatic energy level for dual-energy cerebral CT angiography (CTA) in patients with intracranial aneurysm after endovascular treatment.
Material and Methods: A total of 20 patients with cerebral aneurysms treated with coils or clips underwent CTA using gemstone spectral CT. Artifact index (AI) was calculated at each energy level with and without MARs. Signal-to-noise (SNR) and contrast-to-noise (CNR) ratios were calculated on all axial images with MARs; subjective evaluation was done by using a 4-point scale and a 3-point scale for assessing noise and vessel contrast respectively and compared between the monochromatic energy levels.
Results: The AI value of group GSI-MARs was significantly lower than that of group GSI at each monochromatic energy level (all $P < 0.01$). CNR and SNR of the parent arteries decreased as the energy increased from 40 to 140 keV in group GSI- MARs (all $P < 0.01$). SNR and CNR between each two adjacent monochromatic energy level showed significantly difference (P). Subjective evaluation showed that a monochromatic energy level between 40-70 keV provided the optimal image quality.
Conclusion: GSI with MARs could reduce metal artefacts and improve the image quality of cerebral CTA after coils or clips treatment. The new generation of GSI could

provide better CNR and SNR at lower energy level, and the best image quality was obtained at energy 40-70 keV for GSI-MARs.

EPO-0069

Preliminary research on depression treatment: Combination of Transcranial Magnetic Stimulation and MRI-guided Low-intensity Focused Ultrasound Pulsation

Xu Li
Zhongnan Hospital of Wuhan University

Depression (major depressive disorder) is a common but serious mood disorder. When traditional medication treatment does not reduce symptoms, transcranial magnetic stimulation (TMS) has been approved by the Food and Drug Administration (FDA), neuromodulation has become increasingly relevant to clinical research. However, TMS has significant drawback in the lack of depth and special specificity. In the last few years low-intensity focused ultrasound pulsation (LIFUP) has been used to be focused noninvasively through the skull anywhere within the brain, together with functional magnetic resonance imaging (fMRI) guided techniques, LIFUP can be applied to deep structures with greater spatial precision. In this manuscript, combination of TMS and fMRI-guided LIFUP on the treatment of depression was proposed to achieve the benefits of both. The data of the combined methods demonstrate significantly better clinical results in comparison to the control group, as measured by the Hamilton Rating Scale for Depression (HAM-D) scale, Geriatric Depression scale (GDS) and the Pittsburgh Sleep Quality Index (PSQI) with low adverse reaction.

Altered dynamic parahippocampus functional connectivity in patients with posttraumatic stress disorder

Huijuan Chen[1], Rongfeng Qi[2], Jun Ke[2,3], Jie Qiu[3], Qiang Xu[2], Zhiqiang Zhang[2], Yuan Zhong[2], Guang Ming Lu[2], Feng Chen[1]
1. Department of Radiology, Hainan General Hospital
2. Department of Medical Imaging, Jinling Hospital, Medical School of Nanjing University
3. Department of Radiology, The First Affiliated Hospital of Soochow University
4. Department of Ultrasound, Affiliated Hainan Hospital of Hainan Medical College (Hainan General Hospital), NO. 19, XIUHUA ST, XIUYING DIC

Posttraumatic stress disorder (PTSD) might result from deficits in static and dynamic functional connectivity (FC).

Aims

This study investigated dynamic brain functional alterations in PTSD patients with resting state functional magnetic resonance imaging (rs-fMRI)

and evaluated the relationship between brain function and clinical indices in PTSD.

Methods

Degree centrality (DC) and seed-based functional connectivity (FC) analyses were conducted among typhoon survivors with (n = 27) and without PTSD (n = 33) and healthy controls (HC) (n = 30) to assess the intrinsic dysconnectivity pattern and network-level brain function. Pearson correlation analyses were performed to examine the association of brain function with clinical symptoms.

Results

Both the PTSD group and the trauma-exposed control (TEC) group had increased DC in the left parahippocampus relative to the HC group. More increased DC in the left parahippocampus gyrus was found in the PTSD group. Both traumatized groups exhibited decreased left parahippocampus dynamic FC with the bilateral middle frontal gyrus and superior frontal gyrus relative to the HC group. The Checklist-Civilian Version score was positively correlated with dynamic FC between the parahippocampus and left superior frontal gyrus but was negatively correlated with dynamic FC between the parahippocampus and right middle frontal gyrus.

Conclusions

Trauma exposure may lead to an altered dynamic FC in individuals with or without PTSD. An altered DC in the parahippocampus may be an important risk factor for PTSD development following trauma exposure. A more prominently increased DC in the parahippocampus might be a common trait in the PTSD group.

2 型糖尿病患者的静息态脑功能分数低频振幅研究

陆亚姗,黄刚,赵莲萍
甘肃省人民医院放射科

目的 采用静息态功能磁共振技术计算分数低频振幅（fALFF）值探讨 2 型糖尿病患者全脑自发性神经活动改变特点。方法 收集性别、年龄、受教育程度匹配的 2 型糖尿病患者（T2DM 组）56 例，正常志愿者（对照组）48 例，进行静息态功能磁共振扫描、神经心理认知量表测定、临床相关变量采集。计算静息态 fALFF 值，进行两独立样本 t 检验，以 fALFF 差异显著脑区为种子点与全脑各体素间进行功能连接（functional connectivity, FC）分析，并提取组间 fALFF 及 FC 差异显著脑区的时间序列信号值与临床变量、量表评分进行 pearson 相关分析。结果 两组 BECK 抑郁自评、MoCA、HRSD24 项、HAMA、CDT 差异有统计学意义；与对照组比较， T2DM 组右侧楔前叶 fALFF 值显著减低（t=-3.9508，P(voxel-level)<0.005，P(cluster-level)<0.05）；以右侧楔前叶为种子点与全脑的 FC 分析结果显示 T2DM 组右侧楔前叶与右侧颞中回间 FC 显著增加（t=4.011 ，P(voxel-level)<0.001，P（cluster-level）<0.05）；pearson 相关分析显示差异显著脑区 fALFF 值与血

浆皮质醇水平呈边缘显著性负相关（r=-0.322, p=0.089）。结论 T2DM 患者存在认知功能的损害和抑郁风险的增加。其右侧楔前叶局部自发性脑活动减低，且该脑区与右侧颞中回间功能连接异常，提示该脑区的静息态脑功能改变可能是 T2DM 患者认知功能损害和 T2DM 共病抑郁的潜在神经生物学标记。

EPO-0072

The abnormal brain regional homogeneity in end-stage renal disease patients at 24 hours after hemodialysis: a resting-state functional MRI study

Peng Li[2,1],Xueying Ma[2],Dun Ding[2],Huawen Zhang[1],Ming Zhang[2]
1.No.215 Hospital Of Shaanxi Nuclear Geology
2.Department of Medical Imaging, The First Affiliated Hospital Of Xi'an JiaoTong University

Objective Resting-state functional magnetic resonance imaging (rs-fMRI) and Regional homogeneity (ReHo) analysis were used to investigate spontaneous neural activity abnormalities associated at 24 hours after hemodialysis in patients with end-stage renal disease (ESRD) with cognitive improvement. **Methods** 24 ESRD patients (the ESRD group) and 26 healthy volunteers (the control group) who were matched by gender and age were performed on rs-fMRIscans and ReHoanalysis. All the patients in the ESRD group were evaluated by the Montreal cognitive scale (MoCA) at 24 hours after hemodialysis. The laboratory indicators of the ESRD group were collected at the same time point: serum creatinine and urea. The control group was evaluated at the same time point. The ReHochanges in both groups were calculated and statistically analyzed. **Results** There was no significant difference in MoCA scores between the ESRD group and the control group (P=0.033). Compared with the control group, the ReHovalues in the left middle frontal gyrus, bilateral anterior cingulate and bilateral middle cingulatein the ESRD group were decreased (P<0.005), the ReHovalues in the right hippocampusand right inferior temporal gyruswere increased (P<0.005), the correlation between the ReHovalues of difference brain regions and serum creatinine and urea in the ESRD group was not statistically significant (all P>0.05). **Conclusion** The overall cognition level of ESRD patients recovered to be normal at 24 hours after hemodialysis, but there was consistency abnormality of spontaneous neural activity in multiple brain regions, which provided objective imaging basis for revealing the dialysis treatment to assess the cognitive recovery of ESRD patients.

EPO-0073

Impaired interictal functional connectivity between the thalamus and visual cortex is related to anxiety in migraine without aura

Hengle Wei,Yu-Sheng Yu,Hong Zhang

Department of Radiology, The Affiliated Jiangning Hospital of Nanjing Medical University

Purpose: The visual network has been confirmed to be involved in patients with migraine without aura (MwoA). Migraine suffers may be associated with abnormal functional connectivity within the thalamo-visual pathways and psychiatric symptoms. The goal of this study was to determine whether migraine disrupted the functional connectivity patterns within the thalamo-visual pathway as measured by using resting-state functional magnetic resonance imaging (fMRI) approach.

Methods: Resting-state fMRI scans were acquired from 33 patients with MwoA and 22 well-matched healthy controls. The thalamus, a major site of information transmission, was chosen as seed region to detect the functional connectivity patterns with the visual network and then determine whether these changes were linked to clinical characteristics of migraine such as disease duration, headache severity, anxiety and depression.

Results: The visual network, described by independent component analysis, exhibited statistically significant regions (bilateral cunei, right lingual and left calcarine sulcus) by inter-group comparison. Patients with MwoA showed significantly increased functional connectivity between the bilateral thalami and bilateral cunei. Moreover, the right thalamus also showed similar connectivity with the contralateral calcarine sulcus. Furthermore, enhanced functional connectivity between the left thalamus and right cuneus in migraine patients was negatively correlated with Generalized Anxiety Disorder (r = -0.381, p = 0.038), and the neural activation of the left calcarine sulcus was positively correlated with Visual Analogue Score (r = 0.412, p = 0.024).

Conclusion: Patients with MwoA showed abnormal synchronization in visual network, and these abnormalities were correlated with headache severity and psychiatric symptoms. The results suggest that migraine distress is exacerbated by aberrant feedback projections to visual network, playing a crucial role in migraine physiological mechanism. The current study provides further insights into the complex scenario of migraine mechanism.

失独所致 PTSD 患者基于静息态功能磁共振的 ALFF 研究

王艳[1],吴慧[1],徐国斌[1],吴光耀[1]
1.武汉大学中南医院
2.深圳大学总医院

摘要

目的：采用基于静息态功能磁共振的低频振幅探讨失独所致 PTSD 患者自发脑活动特点，并分析失独者脑 ALFF 改变与临床症状间的关系。

方法：收集 28 例失独伴 PTSD 患者（$PTSD^{+}$组）、19 例不伴 PTSD 的失独者（$PTSD^{-}$组）及 28 例健康对照组。采集所有被试的 rs-fMRI 图像并对临床症状进行评估，比较三组间的 ALFF 值差异并分析ＡＬＦＦ值与临床量表评分的相关性。

结果：$PTSD^{+}$组、$PTSD^{-}$组及健康对照组间，左侧颞中回、左侧颞下回、右侧颞中回、左侧后扣带回、右侧角回、右侧枕上回、右侧楔前叶、左侧楔前叶的 ALFF 存在异常（P＜0.05）。

与健康对照组比较，$PTSD^{+}$左侧颞中回、左侧颞下回的 ALFF 增高（P＜0.05），左侧后扣带回、右侧角回、右侧楔前叶、左侧楔前叶 ALFF 减低；

与对照组比较，$PTSD^-$组左侧颞中回、左侧颞下回增高；右侧颞中回、左侧后扣带回、右侧角回、右侧枕上回、右侧楔前叶、左侧楔前叶减低。（P＜0.05）
$PTSD^+$组与 $PTSD^-$组之间比较，右侧颞中回增高；未见 ALFF 减低脑区。（P＜0.05）
相关分析结果显示 $PTSD^+$组右侧角回与 CAPS 评分呈正相关；右侧楔前叶与回避症状呈负相关。
结论：失独者存在双侧颞叶（颞中回和颞下回）、左侧后扣带回、右侧角回、右侧枕上回和双侧楔前叶局部脑区自发活动异常，失独这个巨大创伤可以在不引起 PTSD 的情况下引起一系列脑区的自发活动变化，且可能对人脑产生持续性的影响。

EPO-0075
基于 ALFF 及 ReHo 法的非酒精性肝硬化的 MHE 患者静息态功能磁共振研究

王飘
安徽医科大学第二附属医院

目的 通过 ALFF 及 ReHo 法显示基于非酒精性肝硬化的 MHE 患者神经元功能活动的改变情况。
方法 收集 22 例 MHE 患者（MHE 组）、23 例无 MHE 的非酒精性肝硬化患者（NHE 组）和 31 例正常人（HC 组）行静息态下 BOLD-fMRI 扫描，然后利用后处理软件获得组间 ALFF 和 ReHo 值有统计学差异的脑区，并进行相应差异脑区临床意义的分析。
结果 与 HC 组相比，MHE 组表现为右侧岛叶、右侧豆状核、右侧楔前叶、双侧楔叶、双侧枕叶及顶叶等多个脑区 ALFF 值有差异，NHE 组表现为双侧海马及海马旁回、左侧楔前叶及左侧颞叶多个脑区 ALFF 值有差异（P 均<0.05）；与 NHE 组相比，MHE 组 ALFF 值无明显差异性脑区（P>0.05）；与 HC 组相比，MHE 组表现为右侧额中回、右侧楔前叶、双侧侧楔叶等多个脑区 ReHo 值有差异（P 均<0.05），NHE 组表现为双侧尾状核、右侧前扣带回、右侧楔前叶及双侧楔叶多个脑区 ReHo 值有差异；与 NHE 组相比，MHE 组 ReHo 值无明显差异性脑区（P>0.05）。
结论 利用功能磁共振可以对基于非酒精性肝硬化的 MHE 患者脑功能的改变情况进行早期评估，为研究 MHE 的功能恢复机制提供依据，并有潜力应用于 MHE 的早期诊断。

White matter abnormalities based on TBSS and its correlation with impulsivity behavior of abstinent methamphetamine addicts

Sihong Huang,Wenhan Yang,Jing Luo,Cui Yan,Jun Liu
the Second Xiangya Hospital of Central South University

ABSTRACT
Purpose: Methamphetamine (MA) abuse is one of the most rapidly growing illicit drug problems worldwide. Impulsivity has been considered as a core impairment underpinning addictive behaviors. Studies have demonstrated that MA addicts have white matter abnormalities based on ROIs almost reflected by FA, no study has correlated diffusion parameters and impulsivity behavior of MA addicts. we used tract-based spatial statistics to detect FA, AD, RD and MD, and correlate these with the Barratt Impulsivity Scale (BIS), in order to verify and expand the previous results.

Methods: *A total of 28 MA addicts and 22 healthy controls were recruited. MRI was performed to evaluate the brain structural changes, the BIS was used to evaluate impulsivity behavior, white matter differences were compared between MA addicts and healthy controls, and the partial correlation between diffusion parameters and BIS scores was determined by using the FTND and AUDIT scores as covariates.*
Results: *MA addicts had significantly lower FA, and higher AD, RD and MD in a wide range of white matter, which mainly included: superior longitudinal fasciculus, sagittal stratum, corona radiata, internal capsule, external capsule, superior fronto-occipital fascicule, corpus callosum, and corticospinal tract compared with controls. The MA group had significantly higher total score, attention and motor scores compared to healthy controls. The major tracts that were significantly associated with the BIS scores were the corticospinal tracts.*
Conclusion: *MA addicts had significantly lower FA and higher AD, RD and MD in a wide range of white matter. The MA group has significantly higher impulsivity scores compared to healthy controls, and the correlation among AD, RD, MD and the BIS scores were almost reflected by the corticospinal tracts. Future studies on larger sample sizes, gender effects and longitudinal studies are needed.*

Decreased relative cerebral blood flow in unmedicated heroin-dependent individuals

Wenhan Yang, RU Yang, Jing Luo, Fei Tang, Lidan Fan, Jun Liu
Second Xiangya Hospital, Central South University

Background: Understanding the brain mechanisms of heroin dependence is invaluable for developing effective treatment. Measurement of regional cerebral blood flow (CBF) provides a method to visualize brain circuits with functional impairments due to heroin dependence. This study examined regional CBF alterations and their clinical associations in unmedicated heroin-dependent individuals (HDIs) using a relatively large sample. We trained a classifier on CBF data from significantly different brain areas.
Methods: Sixty-eight (42 males, 26 females; age: 40.9 ± 7.3 years) HDIs and forty-seven (34 males, 13 females; age: 39.3 ± 9.2 years) matched healthy controls (HCs) underwent a high-resolution T1 and whole-brain arterial spin-labelling (ASL) perfusion magnetic resonance imaging (MRI) scan. We measured rCBF in significant differences brain regions, and trained a support vector machine (SVM) to differentiate HDIs from HCs with 10-fold cross-validation. Additionally, clinical characteristics were collected for neurocognitive assessment.
Results: HDIs showed worse neuropsychological performance than HCs and had decreased relative CBF (rCBF) in the bilateral middle frontal gyrus (MFG), inferior temporal gyrus, precuneus, posterior cerebellar lobe, cerebellar vermis, and the midbrain adjacent to the ventral tegmental area; right posterior cingulate gyrus, thalamus,

calcarine. rCBF in the bilateral MFG were negatively correlated with the Trail Making Test times in HDIs. SVM showed that the left MFG contributed most, with 76% classification accuracy.
Conclusion: HDIs had limbic, frontal, and parietal hypoperfusion areas. Low CBF in the MFG predicted cognitive impairment in HDIs. Together, these findings suggest the MFG as a critical region in HDIs and suggest ASL CBF as a potential marker for use in heroin addiction studies.

EPO-0078
注射对比剂后不同延迟时间对于臂丛神经磁共振成像的影响

张晓晶,张爱莲,娄昕,马林
中国人民解放军总医院第一医学中心

目的：探讨注射对比剂后不同延迟时间对于臂丛神经磁共振成像的影响。
材料与方法：收集本院需行臂丛神经（BP）MR 成像的患者 34 例，设备为 GE Discovery MR 750 3.0T 扫描仪，8 通道头颈部联合线圈。34 例患者随机分为两组，第一组对比剂用量按照 0.2ml/kg，注射速率为 1.5ml/s，后以相同速率注射 20ml 盐水，注射对比剂的同时开始计时并扫描 3D CUBE STIR 序列，延迟时间分别为 10，20，30 分钟时重复扫描 3D CUBE STIR 序列；第二组对比剂的剂量和注射速率同上，注射对比剂的同时开始计时，延迟时间分别为 5，15，25，35 分钟时重复扫描 3D CUBE STIR 序列。所得图像传输至 GE Adw 4.6 工作站，用 MIP 对臂丛神经进行三维图像重组，测量左右两侧臂丛神经及其周围软组织的平均信号值 SI 和均方差 SD，根据公式计算臂丛神经的 SNR 和 CNR。利用 SPSS20.0 软件进行单因素方差分析（$p<0.05$）。
结果：第一组注射对比剂前 SNR 为 20.08±4.70CNR 为 6.66±2.69；延迟时间为 0 时 SNR 为 6.66±2.69CNR 为 11.81±3.57；10min 时 SNR 为 27.66±6.04CNR 为 10.39±3.76；20min 时 SNR 为 22.61±4.64，CNR 为 9.05±3.33；30min 时 SNR 为 20.24±5.87，CNR 为 9.09±3.79。第二组注射对比剂前 SNR 为 19.9±7.61CNR 为 6.25±3.43；延迟时间为 5min 时 SNR 为 30.16±7.58CNR 为 11.42±3.92；15min 时 SNR 为 25.46±6.34CNR 为 9.83±3.81；25min 时 SNR 为 22.58±6.44CNR 为 7.78±3.11；35min 时 SNR 为 17.92±6.89CNR 为 6.43±3.92。
结论：注射对比剂后建议 10min 以内扫描，臂丛神经图像质量最佳。

EPO-0079
The effect of early life stress on memory is mediated by anterior hippocampal network

Jingjing Xu,Xiaojun Guan,Xiaojun Xu,Hong Li,Minming Zhang
The Second Affiliated Hospital of Zhejiang University, School of Medicine

Purpose: The experience of early life stress (ELS) is a risk factor for memory dysfunction, but the impact at the neural level is less clear. One possibility is that ELS alters hippocampus, which, in turn, affects memory. The aim of this study is to investigate whether healthy people with a higher ELS display more structural and functional changes of hippocampus than people with a lower ELS. We aimed to investigate the association between ELS and memory and to test whether hippocampus change mediates this relationship statistically.

Method: The Childhood Trauma Questionnaire (CTQ) was used to assess early life stress in 100 young health participants. Resting state fMRI data were acquired and voxel-wise correlation analysis was performed to functionally divide the hippocampus. Group differences in gray matter volumes and memory circuits of the anterior and posterior hippocampus were analyzed. We also tested whether group difference in hippocampus mediated the relationship between ELS and memory.
Results: There was no overall group difference in hippocampal volume. Compared with participants with a lower ELS, participants with a higher ELS had reduced functional connectivity in anterior hippocampal network (p=0.001, Bonferroni corrected), which positively correlated with visual memory (p=0.046, r=0.309). In contrast, within participants with a lower ELS group, no significantly correlation was found (p=0.250, r=0.166). Among all participants, functional connectivity in anterior hippocampal network mediated the relationship of ELS on visual memory.
Conclusions: These findings suggest that ELS decreased anterior hippocampal-cortical functional connectivity, which, in turn, drives memory decline and highlight a potential pathway in which ELS affects memory by degrading anterior hippocampal functional network changes directly.

EPO-0080

Volume of subcortical nucleus in amyotrophic lateral sclerosis: magnetic resonance imaging study

Qianqian Duan,Qiuli Zhang ,Haining Li,Ming Zhang
The first affiliated of Xi’an Jiaotong University

Objective To assess the extent of basal ganglia injury and provide neuroimaging evidence for cognitive and behavioral damage in patients with amyotrophic lateral sclerosis(ALS), in this study, Freesufer MR volumetric analysis is applied to evaluate volumetric alterations of subcortical structures，while the relationship between the motor symptoms and the alterations of subcortical structures’ volume in ALS. **Methods** Clinical and imaging data of all patients with definite or probable diagnosis of sporadic ALS according to the El Escorial criteria was recruited through the neurology department at First Affiliated Hospital of Xi’an Jiaotong University included in-patient and out-patient, as well as healthy subjects matched for age, handedness and gender recruited in the same period . Based on 3D T1WI structural image, the volume of bilateral subcortical gray matter nucleis including cauda nucleus, pupilli nucleus, thalamus, globus pallidus, hippocampus, nucleus accuminatus, amygdala were calculated by Freesufer software.The relationship between ALS-FRSR score and the volume changes of gray matter nucleus between groups was analyzed by pearson’s correlation analysis. **Results** According to the revised E1 Escorial diagnosis, 66 patients with ALS (36 males) was included in this study, with an average age of (53 + 9) years. The healthy control group consisted of 47 (27 males) with an average age of (52±8) years. Compared with the healthy control group, the volume of bilateral hippocampus, thalamus, left cauda nucleus and left amygdala were significantly reduced in the ALS group, with statistically significant differences (P<0.05).Person’s correlation analysis results showed that there was a positive correlation between bilateral thalamic volume change

and ALS-FRSR score (right: R =0.29, p=0.032;Left r=0.319, p=0.018).
Conclusion Volume of subcortical gray matter nuclei in ALS patients were evaluated by using MRI analysis in vivo, which finds that gray matter nuclei are extensively involved, especially thalamus, hippocampus, caudate nucleus and nucleus accumbens. This study can explain the characteristics of motor and cognitive behavior in ALS patients, and has implications for the pathophysiological mechanism of the disease.

EPO-0081

Quantification of radiation doses at different scan power in children and adolescents head CT by a Monte-Carlo paltform

Bingyang Bian,Dan Li
First Hospital of Jilin University

Objective: In clinic practice, a unified head CT scan protocol was employed for both children and adolescents and this could be overdose for the children/adolescents since they usually have smaller head circumferences. Since the size of the head varies among children and adolescents, a more specific guideline for younger patients may reduce the radiation doses but keep imaging quality for diagnosis. In this study, we investigate if lowering the radiation doses based on the head circumference (HC) could keep the image quality. We then calculate the benefits of low-dose head CT scans to the patient's organ-specific-dose levels.
Methods: 83 patients including children and adolescents with suspected nervous system disease symptoms were prospectively selected. The conventional group received standard CT scan protocol (tube current: 250mAs). Low-dose groups were divided into 3 subgroup based on the HC: 54.1-57.0cm for group A, 51.1-54.0 cm for group B, and 48.1-51.0cm for group C. The tube current was set to 200mAs, 150mAs and 100mAs, respectively. The Image quality was assessed by subjective and objective image score. A Monte-Carlo-Simulation analysis platform (Radimetrics, Bayer) was used to calculate radiation doses of organ-specific including brain, eye lens and salivary glands. ANOVA test was employed to analyse the differences between groups in organ-specific-radiation doses and image quality score.
Results: In the conventional group, patients with smaller HC will receive higher radiation doses. The radiation dose levels of specific-organ of low-dose groups were significantly lower than that of conventional group. The brain in three low-dose groups (A:25.91±0.99mSv; B:23.18 ±6.11mSv; C:17.38±3.27mSv) were significantly lower than conventional group (34.37±3.62 mSv; P_{A-con}＜0.01, P_{B-con}＜0.01, P_{C-con}＜0.01). The radiation doses in group C were significantly lower than the other 3 groups (P＜0.01 for all three compares). The radiation doses in group A and B were not significantly different (P = 0.110).The salivary glands is 25.92±0.99 mSv, 22.93±6.54 mSv, 14.96±2.67 mSv, respectively in group A, B and C, there were significantly lower than conventional group(35.04±4.94 mSv; P_{A-con}＜0.001, P_{B-con}＜0.001, P_{C-con}＜0.001). The radiation doses in group C were significantly lower than the other 3 groups (P＜0.001 for all three compares). The radiation doses in group A and B were not significantly different (P=0.099). The

eye lens in three low-dose groups (A:33.03±0.35 mSv; B:26.12±2.72 mSv; C:20.88±4.45 mSv) were significantly lower than that of conventional group (41.54±1.04 mSv; P_{A-con}<0.01, P_{B-con}<0.001, P_{C-con}<0.01). Eye lens radiation dose of four group were different to each other (P<0.001 in all compares). In three low-dose groups, the images quality met the clinical requirement. The image quality scores in group A and B(A：4.51±0.22, B：4.54±0.32) was no statistical different than conventional group (4.39±0.58) (P_{A-Con}=0.64, P_{B-Con}=0.47).

Conclusion: Our research indicates that low-dose CT scan can significantly reduce the organ-specific-radiation dose levels but keep the same image quality. Head circumference can serve as an effective index to guide personalized head CT scan.

EPO-0082

Investigation on Altered Amplitude of Low-Frequency Fluctuation Induced by Acupuncture at Baihui: a Functional MRI Study

Shasha Li,Demao Deng
First Affiliated Hospital, Guangxi University of Chinese Medicine

Abstract

Background: Baihui (GV20), an important acupoint of the Governor Vessel according to the traditional Chinese medicine (TCM) theory of acupuncture, is usually used for treatments of psychiatric disorders. However, studies about relationships between the brain activities and GV20 are limited.

Methods: In the present study, we thereby tried to investigate specific pattern of brain activities induced by electroacupuncture stimulation (EAS) at GV20. Twenty nine healthy subjects were enrolled in this study for MRI scanning. Each subject underwent EAS at GV20 and at sham acupoint, separately. Based on sustained effects of acupuncture, amplitude of low-frequency fluctuation and fractional amplitude of low-frequency fluctuation (ALFF/fALFF) methods were used to examine different ALFF and fALFF patterns of the whole brain induced by GV20 with comparison to the ones induced by sham acupoint.

Results: Results showed that GV20 induced altered ALFF/fALFF in the brain regions, including the medial prefrontal cortex (mPFC), orbital frontal cortex (OFC), dorsolateral prefrontal cortex (dlPFC) and middle cingulate cortex (MCC), temporal cortex (TC), supplementarymotorarea (SMA), precuneus, thalamus, hippocampus (HIPP), insula, putamen and cerebellum compared to sham acupoint.

Conclusions: Our findings might present the specific neural responses to EAS at GV20 using ALFF and fALFF approaches, and may further provide preliminary evidence for understanding the mechanisms of GV20.

EPO-0083

Altered Amygdala Resting-State Functional Connectivity Following Acupuncture Stimulation at BaiHui (GV20) in First-Episode Drug-Naïve Major Depressive Disorder

Gaoxiong Duan,Demao Deng
The First Affiliated Hospital of Guangxi University of Chinese Medicine

Abstract
Background: Amygdala is an important locus of dysfunction implicated in major depressive disorder(MDD). Aberrant amygdala networks(AN) had been reported in resting-state functional magnetic resonance imaging (rs-fMRI) study. The safety and efficacy of acupuncture treatment on patients with MDD has been verified in previous clinical studies. We aimed to investigate whether acupuncture at GV20 could modulate the abnormal AN of patients with the first-episode, drug-naïve MDD by using rs-fMRI combined with functional connectivity (FC) method.
Materials and Methods: Thirty MDD patient underwent 6-minute rs-fMRI scans respectively before and after 20-minute electro-acupuncture stimulate(EAS) at GV20. Twenty-nine healthy subjects underwent only a 6-minute rs-fMRI scan. Based on the amygdala as the seed region, FC method was adopted to examine abnormal AN in patients by comparing with healthy subjects and to evaluate the influence of EAS on intrinsic connectivity within the AN in patients with MDD.
Results: Compared to healthy subjects, MDD patients had aberrant intrinsic AN which mainly showed increased FC between amygdala and hippocampus, precuneus, precentral gyrus and angular gyrus, meanwhile decreased FC between amygdala and orbital frontal cortex(OFC). Moreover, our results indicated that EAS at GV20 induced increased FC between amygdala and OFC, and decreased FC between amygdala and precuneus and precentral gyrus in MDD patients, which were the main brain areas showing significant differences between MDD patients and healthy subjects. In addition, the intrinsic amygdala FC within other certain brain regions in MDD patients were regulated by EAS at GV20 showing increased FC between amygdala and dorsolateral prefrontal cortex, and decreased FC between amygdala and anterior cingulate cortex, periaqueductal gray and insula.
Conclusion: The abnormal AN of MDD patients could be modulated by EAS at GV20. Our findings may further provide the potential imaging evidence to support the therapeutic mechanisms of acupuncture in MDD.

EPO-0084

Alterations of default mode functional connectivity in individuals with end-stage renal disease and mild cognitive impairment

Haitao Lu
Third Affiliated Hospital of Soochow University

Background: Mild cognitive impairment (MCI) occurs frequently in many end stage renal disease (ESRD) patients, may significantly worsen survival odds and prognosis. However, the exact neuropathological mechanisms of MCI combined with ESRD are not fully clear. This study examined functional connectivity (FC) alterations of the default-mode network (DMN) in individuals with ESRD and MCI.
Methods: Twenty-four individuals with ESRD identified as MCI patients were included in this study; of these, 19 and 5 underwent hemodialysis (HD) and peritoneal dialysis (PD), respectively. Another group of 25 age-, sex- and education level-matched subjects were recruited as the control group. All participants underwent resting-state functional MRI and neuropsychological tests; the ESRD group underwent additional laboratory testing. Independent component analysis (ICA) was used for DMN characterization. With functional connectivity maps of the DMN derived individually, group comparison was performed with voxel-wise independent samples t-test, and connectivity changes were correlated with neuropsychological and clinical variables.
Results: Compared with the control group, significantly decreased functional connectivity of the DMN was observed in the posterior cingulate cortex (PCC) and precuneus (Pcu), as well as in the medial prefrontal cortex (MPFC) in the ESRD group. Functional connectivity reductions in the MPFC and PCC/Pcu were positively correlated with hemoglobin levels. In addition, functional connectivity reduction in the MPFC showed positive correlation with Montreal Cognitive Assessment (MoCA) score.
Conclusion: Decreased functional connectivity in the DMN may be associated with neuropathological mechanisms involved in ESRD and MCI.

EPO-0085

Feasibility of free breathing, non-gated heart to brain CTA using wide detector CT in acute ischemic stroke

Yimeng Zhang
Xuanwu hospital

Purpose: To evaluate the feasibility of non-gated heart to brain CTA using a 16 cm detector CT in patients of acute ischemic stroke.
Materials and methods: Study protocol was approved by the institutional review board. Patients of acute ischemic stroke who were referred to multi-model CT were recruited consecutively. CT scans were performed with a 16cm detector CT scanner (GE revolution). Carotid and cerebral CTA conventionally included in the multi-model CT protocol was replaced by non-gated heart-brain CTA under free breathing. The CTA protocol includes a single heartbeat cardiac CTA and a spiral scan from the heart to the brain. Cardiac CTA was performed under simulated ECG triggering without wire connection. Axial images at 0.625 mm slice were reconstructed for further processing. As for the heart, the best phase was selected by the computer automatically. Another group of patients who received ECG-gated coronary CTA served as control for image quality evaluation of coronary arteries. Objective image quality of coronary artery segments was evaluated and compared. The CT values and contrast to noise ratio (CNR) were evaluated at thoracic aorta, carotid and vertebral arteries.

Results: The study group included 24 cases and the control group included 20 cases. There was no difference in age and body mass index between the two groups. The image quality scores of coronary artery segments of the study group and control group were 3.10±0.82 and 3.28±0.71, respectively (P>0.05). The radiation dose of coronary CTA was 13.41±4.91（CTDIvol）and 187.71±68.71（DLP）. The mean CT value and CNR of thoracic aorta, carotid arteries and vertebral arteries were 429.01±107.30（thoracic aorta）, 556.35±137.52(LICA), 559.80±136.80(RICA), 545.29±124.06(LVA), 542.42±135.40(RVA), 21.68±6.14(CNR), respectively.
Conclusion: It is feasible to perform free breathing, non-gated heart-brain CTA for patients of acute ischemic stroke, with good illustration of coronary arteries in addition to carotid and cerebral arteries.

EPO-0086
三叉神经痛患者脑灰质体积的变化：一项基于 VBM 的研究

李盟
广东省第二人民医院

研究目的：三叉神经痛(Trigeminal neuralgia，TN）属于慢性神经性疼痛，临床上以反复发作的面部三叉神经区域的剧烈电触样疼痛为特点，严重影响人们正常的生活。近年来，关于慢性疼痛的研究让人们认识到，长期疼痛刺激可促使中枢神经系统疼痛相关脑区皮层发生病理性重构。但是关于 TN 患者脑形态学改变的研究较少。因此，本研究采用基于体素的形态测量学（VBM）的分析方法，对 TN 患者进行全脑分析，从而定量 TN 患者脑部灰质结构的改变，为三叉神经痛发病机制提供新的影像学证据。
材料和方法：对 28 名三叉神经痛患者和 28 名健康控制组进行常规 MRI 扫描，获得高分辨率的 3D 结构像，使用 VBM 对每个被试的图像进行分割、空间标准化、调制以及平滑，然后对两组被试预处理后的图像进行统计学分析，得到灰质体积存在显著差异的脑区；随后提取差异脑区的平均灰质体积，并与疼痛年限进行相关性的分析。
结果：与健康控制组相比，TN 患者在双侧颞上/颞中皮层，双侧旁海马，左侧前扣带回，右侧梭状回及右侧小脑表现出显著的灰质体积的减少；相关分析发现双侧颞上/颞中皮层的平均皮层厚度与疼痛年限存在显著的负相关。
结论：TN 患者灰质体积的异常影响到其疼痛的处理与感知。而且疼痛年限是影响大脑结构的关键因素，疼痛时间越长，对灰质体积的影响越大。这些结果的发现为三叉神经痛神经机制的研究提供了重要的信息，而且在临床中为 TN 患者的治疗提供了重要的依据。

EPO-0087
Abnormal intrinsic functional activity in patients with cervical spondylotic myelopathy: A resting-state fMRI study

Cuili Kuang,Yunfei Zha
Renmin Hospital of Wuhan University

Purpose: We employed resting state-fMRI analyses to reveal central functional reorganization in the brains of patients with cervical spondylotic myelopathy (CSM)[1] and to provide complementary evidence of cortex reorganization[2] in these patients.
Patients and methods: We obtained zALFF[3] and zReHo[4] measurements from 33 patients with CSM and 33 healthy controls (HC) and used the brain regions with significant alterations in the zALFF or zReHo values as seed regions. Then, we calculated Pearson's correlation coefficients between the resting-state time courses of each seed and the time series of the rest of the brain. Lastly, we computed correlations between the altered zALFF, zReHo, and functional connectivity with Japanese Orthopaedic Association (JOA) scores[5], Neck Disability Index (NDI) score, and the duration of symptoms in patients with CSM (See Fig1, Table 1).
Results: zALFF and zReHo values were increased in the left medial superior frontal gyrus (lSFGmed) and left supramarginal gyrus (lSMG) in patients with CSM compared with those in the HC group (See Fig2, Table2). Selecting lSFGmed as the seed, we observed increased functional connectivity between it and the left postcentral gyrus (lPoCG) and left rolandic operculum (lROL), and decreased functional connectivity with the right medial superior frontal gyrus (rSFGmed) in patients with CSM (See Fig3, Table3) . In addition, there was a significant increase in the functional connectivity between the lSMG (seed) and the left calcarine (lCAL) and lPoCG in patients with CSM (See Fig4, Table3). However, we did not find any significant correlation between the resting-state findings and the clinical performance of patients with CSM (See Table4).
Conclusion: These observed intrinsic functional changes in the patients with CSM may be related to functional reorganization and reflect the innate cortical plasticity in patients with CSM. Notably, the increased connectivity between the lPoCG and the two seed ROIs indicate the adaptive changes in patients with CSM. These findings provide complementary evidence of cortex reorganization in CSM.

EPO-0088

Visible "Butterfly" in the Cervical Spinal Cord: A Pilot study using Phase-Sensitive Inversion Recovery and multiple Fast Field Echo

Bingbing Gao[1],Yanwei Miao[1],Ailian Liu[1],Jiazheng Wang[2],Yishi Wang[2],Qingwei Song[1],Liang Han[1]
1.the first affiliated hospital of Dalian medical university
2.Philips Healthcare, China

Purpose: The aim of this prospective study was to determine the feasibility of phase-sensitive inversion recovery (PSIR) and multiple Fast Field Echo (mFFE) imaging for the imaging of gray matter (GM) and white matter (WM) in cervical spinal cord (C-SC).
Methods: Ten healthy subjects (mean age 28.9±2.36 years; 5 males, 5 females] were recruited for MRI can. PSIR and mFFE sequences were performed at the superior cervical spinal cord (C1 to C4). The signal intensities of GM, WM and cerebral-spinal-fluid (SI_{GM}, SI_{WM}, SI_{CSF}) were measured on C1, C2 and C3 segments by two radiologist. The GM-to-WM contrast ratio, GM-to-CSF and WM-to-CSF contrast to noise ratio ($CR_{G/W,}$ $CNR_{G/C}$, $CNR_{W/C}$) and SNR ($SNR_{G/C}$, $SNR_{W/C}$) were calculated for each sequence. The differences of all

parameters were assessed using Mann-Whitney U test between the two sequences, and inter-reader agreement were evaluated using intraclass correlation coefficients (ICC). **Results**: ICC showed good to excellent consistency between the two radiologists (0.682 to 0.869). No significant difference was found for $CNR_{G/C}$ (P=0.600) and $CNR_{W/C}$ (P=0.401) between the two sequences. On PSIR imaging, GM showed a hyper-intensity signal relative to those of WM (P=0.005), the mean $CR_{G/W}$ was significantly greater than those on mFFE Imaging. mFFE imaging showed significantly greater SNR for GM (P=0.003) and WM (P=0.016). There was no significant difference of $CR_{G/W}$ on the mFFE images (P=0.115). **Conclusion**: PSIR imaging is superior to mFFE imaging in depicting GM and WM of cervical spinal cord with an acceptable SNR loss compared to mFFE.
Clinical application: PSIR for the superior cervical spinal cord can provide a visible differentiation of white matter and gray matter, a macroscopic distinguishable butterfly structure. We can further apply it to monitor diseases that usually involve the cervical spinal cord.

伴冻结步态原发性帕金森病患者脑网络连接属性

黎玉婷,阮秀杭
广州市第一人民医院

目的：探究伴冻结步态（FOG）原发性帕金森病（PD）患者静息态功能磁共振（Rs-fMRI）脑网络连接属性的改变及其内在机制。
方法：本研究对 25 名伴冻结步态（FOG+）的 PD 患者、30 名无冻结步态（FOG-）的 PD 患者和 26 名健康对照者（ HC）进行 Rs-fMRI 检查。根据自动解剖标记（ AAL）图谱，将大脑分成 90 个解剖脑区。利用 GRETNA 软件构建 90 个脑区的功能连接皮尔逊相关矩阵并进行阈值化处理，采用图论方法分析全脑网络拓扑属性，包括全局属性和局部属性，评估有统计学差异的脑网络拓扑属性与临床神经量表的关系。使用基于网络的统计（ NBS）方法筛选出超阈值的脑网络连边，采用非参数置换检验评估其统计学意义。
结果：PD FOG+组、PD FOG-组和 HC 组脑功能网络均显示出小世界属性（sigma >1）。与 FOG-和 HC 比较，FOG+患者右侧颞上回局部节点效率减低（P < 0.001、P = 0.014）。NBS 分析结果发现 FOG+和 FOG-存在异常的功能连接网络：与 HC 比较，FOG-患者感觉运动皮层、默认模式网络和视觉网络显示功能连接减低（P < 0.05）；与 HC 比较，FOG+患者的感觉运动皮层、默认模式网络、视觉网络、听觉网络和背侧注意网络功能连接减低（P < 0.05）。FOG+组右侧颞上回局部节点效率与统一帕金森病评分量表（UPDRS） Ⅰ评分成负相关（r = - 0.410，P = 0.042）。
结论：PD FOG+ 组、PD FOG- 组和 HC 组的脑功能网络均表现出小世界属性。FOG+组右侧颞上回局部节点效率减低, 并与注意情绪功能下降相关；FOG 患者感觉运动皮层、默认模式网络、视觉网络连接减弱；另 FOG+组听觉网络和背侧注意网络连接减弱；本研究为寻找伴冻结步态帕金森病患者的影像学标志提供新思路。

Topological Properties of Gray Matter Structural Networks in Children with Bipolar Disorder

Guiwen Lv,Yi Lei,Fan Lin,Hanwei Zhang,Zhaoguang Zhou,Yongqian Mo
Shenzhen Second People's Hospital

Objective: Bipolar disorder (BD) is a chronic, severe, and fluctuating mental disorder, the diagnosis of BD is always substantially delayed until the episode and bivalent nature of the illness has clearly expressed itself. Thus, it is necessary to investigate the neuropathological mechanism of BD.In the present study, we investigated structural brain network alterations in unmedicated depressed bipolar II disorder patients.So far, alterations of grey matter structure networks in BD remains to be characterized.
Methods: Sixty-eight currently depressed children diagnosed with BD II were recruited from our Hospital.Cortical reconstruction and parcellation were performed with the FreeSurfer software.The Graph Analysis Toolbox for the quantification of network measures, was used in graph theoretical analysis.The Graph Analysis Toolbox was used to conduct a comparison of network measurements between two groups.
Results: HC group demonstrated small-world network properties. BD patients showed lower Cp, Lp, γ, λand σ. Statistically, FDA analysis indicated that BD patients had significantly lower γ(P = 0.026), λ(P = 0.015) and σ(P = 0.042).The number of hubs in the BD group was less than that in the HC group, mainly from the bilateral frontal lobe, parietal lobe and temporal lobe.
Conclusions: This study serves as the first investigation of the complex topological organization of brain structural networks in patients with BD.The loss of small-world topological features indicated a less efficient network organization. The randomization alteration is an important characteristic occurring in the whole-brain network of bd patients, which may contribute to cognitive and affective processing problems.

失去独生子女所致创伤后应激障碍的脑灰质体积的变化

吴慧[1],吴光耀[1,2],徐国斌[1],王艳[1]
1.武汉大学中南医院
2.深圳大学总医院

[摘要] 目的 采用基于体素的形态测量学（Voxel-based Morphometry，VBM）的方法探讨失独所致创伤后应激障碍（Post-traumatic Stress Disorder，PTSD）患者的脑灰质体积（Gray Matter Volume，GMV）的变化。
方法 共收集 19 例伴 PTSD 的失独患者（PTSD 组）、28 例不伴 PTSD 的失独患者（TC 组）及 27 例健康对照组（HC 组），应用当前和终生的临床用创伤后应激障碍诊断量表（Clinician Administered PTSD Scale, CAPS）评估每位失独者的症状严重程度。所有受试者接受 3.0T MRI 扫描，并采用基于 Matlab_R2013b 平台的 SPM8 及 VBM8 分析软件，将年龄、性别及颅内容积（Intracranial Volume, ICV）作为协变量，得到两组间 GMV 有显著差异的脑区。
结果 结果显示，PTSD 组、TC 组及 HC 三组之间，多个脑区的 GMV 存在差异，差异有统计学意义（P<0.01）。与 HC 组相比，PTSD 组的右侧额上回、海马旁回及颞下回的 GMV 减小；与 HC 相比，TC 组的右侧海马、中央前回及楔前叶的 GMV 减小；与 TC 组相比，PTSD 组的左侧额上回、右侧楔前叶 GMV 减小，而左侧梭状回的 GMV 增加（P 均<0.001）。相关分析结果显示，左侧梭状回的 GMV 与

CAPS 评分呈中度负相关（r=0.490，p=0.033），且与 PTSD 的回避症状呈显著负相关（r=0.555，p=0.014）。

结论 失独者存在异常变化的脑区大部分属于默认网络，这些脑区的改变与创伤应激（失独）有关；而 PTSD 组的左侧额上回及右侧楔前叶 GMV 减低可能与疾病相关。左侧梭状回 GMV 与 CAPS 评分之间的负相关关系表明左侧梭状回的结构受损导致了 PTSD 症状的加重，其灰质体积增加可能是 PTSD 的一个潜在保护因素。

DCE-MRI 和 IVIM-DWI 对下腰痛患者退变椎间盘新生血管的研究

李瑞梅
上海交通大学附属第六人民医院

目的 探讨动态增强磁共振成像（dynamic contrast enhanced magnetic resonance imaging,DCE-MRI）和体素内不相干运动扩散加权成像（intravoxel incoherent motion diffusion-weighted imaging ,IVIM-DWI）对下腰痛患者退变椎间盘新生血管的评估价值。材料与方法 选取 51 例经腰椎后路手术治疗的腰椎间盘突出患者设为实验组，选取 8 例腰椎骨折经手术治疗的患者为对照组。所有患者术前行 DCE-MRI 和 IVIM-DWI 扫描，并分别测量 DCE 参数 Ktrans、Kep、Ve 和 IVIM 参数 D*，D 和 f。椎间盘通过免疫组织化学方法，并计算微血管密度（microvessel density,MVD）。应用 Pearson 相关分析 IVIM-DWI、DCE-MRI 参数和 MVD 的相关性，采用单因素方差分析 IVIM-DWI、DCE-MRI 各项参数值在不同退变程度患者中的差异。结果 Ktrans 值随着退变分级增加而增大（P<0.05），D 值随退变分级增加而减低（P<0.05）。Ktrans 值、f 值分别与 MVD 具有良好相关性(r 分别为 0.794，0.589；P 值均小于 0.05)。结论 DCE-MRI 和 IVIM-DWI 磁共振技术可无创重复地观察椎间盘退变的血管形成情况，并对病人椎间盘退变程度进行评估。

EPO-0093

Changes of brain function in male with hyperuricemia: A resting-state functional Magnetic Resonance Imagine study

Junhao Hu,Dong Zhang
Xinqiao Hosptial， Third Military Medical University

Background: *Physiological concentration of uric acid is an endogenous antioxidant that protects nervous system and cognitive function. However, abnormal high concentration of uric acid may cause damages to brain structure, cognitive function and emotions, such as widening of cerebral vascular space, atrophy of white matter, decrease of working memory and executive function, sleep disorder, depressive state and so on. Thus, the potential neurobiological mechanisms of these symptoms need to be explored.* ***Method:*** *Fasting serum uric acid, cognitive function and neuropsychology scale and resting-state magnetic resonance image(rs-fMRI) scanning were performed in 41 male patients with hyperuricemia and 41 healthy controls matched with age and education. Analysis of amplitude of low-frequency fluctuation (ALFF) was used to calculate the abnormal brain region. Then, the functional connectivity (FC) between these abnormal seed points and other voxels in the whole brain was calculated by using the peak value of the abnormal brain regions as the seed points. Finally, the correlation between clinical indexes, neuropsychological evaluation and neuroimaging data was analyzed.* ***Result:*** *Compared with the healthy controls, male patients with hyperuricemia showed lower ALFF values in the left inferior temporal gyrus (ITG.L) and higher ALFF values*

in the bilateral inferior frontal gyrus (IFG.B). With the ITG.L as the seed point, the strength of FC in left thalamus and right caudate increased; with the IFG.L as the seed point, the strength of FC in bilateral cuneus increased; By analyzing the correlation between these brain regions, uric acid value, neuropsychological evaluation and cognitive test results, we observed that the negative activation of ITG.L in ALFF was closely related to the damaged working memory. The activated IFG.L, strength of FC with THA.L and CAU.R are associated with weakened executive function, poor sleep quality, and depressive state.

Conclusion: *These results elucidate the brain abnormalities of regional and network levels in male patients with hyperuricemia, which may provide useful information for the potential mechanisms of cognitive impairment and emotional changes in this group.*

EPO-0094

Altered brain structural and cognitive impairment in End-stage renal disease patients with secondary hyperparathyroidism

Suisheng Zheng
Hefei Ping An Health Testing Center

Objective: To assess the pattern of brain volume changes in end-stage renal disease (ESRD) with secondary hyperparathyroidism (SHPT) by using voxel-based morphometry (VBM) and correlation with clinical and Montreal Cognitive Assessment (MoCA).
Methods: Fifty ESRD patients with no anatomical abnormalities in conventional magnetic resonance imaging (25 patients with SHPT, 14 males, mean age 42.20±7.53 year; 25 patients without SHPT, 15 males, mean age 41.96±6.17 year) were selected in this study. All patients underwent laboratory tests, neuropsychological tests and resting-state function magnetic resonance imaging (rs-fMRI). VBM analysis were performed to detect regional grey matter volume (GMV) changes among two groups. The relationship between abnormal GMV and clinical markers and MoCA scores were investigated.
Results: VBM revealed increased GM volume in ESRD patients with SHPT in bilateral caudate and bilateral thalamus compared with non-SHPT patients (p<0.05, FWE corrected). For laboratory tests and neuropsychological tests, we found a significant correlation between these brain regions and iPTH levels, and negative correlations with MoCA scores in SHPT groups. There was no significant association between brain volume changes and other clinical data (disease duration, urea, creatinine and uric acid).
Conclusion: Our results showed significantly increased GMV in ESRD patients with SHPT, which was associated with iPTH and cognitive impairment. Serum iPTH level may be a risk factor for cognitive impairment in ESRD patients with SHPT.

基于 ALFF 及 ReHo 法的非酒精性肝硬化的 MHE 患者静息态功能磁共振研究

郑穗生
合肥平安健康检测中心

目的 采用低频振幅（ALFF）及局部一致性(ReHo)方法观察基于非酒精性肝硬化的轻微型肝性脑病（MHE）患者神经元功能活动的改变情况。**方法** 收集 22 例 MHE 患者（MHE 组）、23 例无 MHE 的非酒精性肝硬化患者（NHE 组）和 31 例健康对照者（HC 组）行静息态下 BOLD-fMRI 扫描，利用 DPARSF 软件预处理图像数据并获取 ALFF 和 ReHo 值进行统计分析。**结果** 与 HC 组相比，MHE 组表现为右侧岛叶、右侧豆状核、右侧楔前叶、双侧楔叶、双侧枕叶及顶叶等多个脑区 ALFF 值有差异，NHE 组表现为双侧海马及海马旁回、左侧楔前叶及左侧颞叶多个脑区 ALFF 值有差异（P 均<0.05）；与 NHE 组相比，MHE 组 ALFF 值无明显差异性脑区（P>0.05）；与 HC 组相比，MHE 组表现为右侧额中回、右侧楔前叶、双侧侧楔叶等多个脑区 ReHo 值有差异（P 均<0.05），NHE 组表现为双侧尾状核、右侧前扣带回、右侧楔前叶及双侧楔叶多个脑区 ReHo 值有差异；与 NHE 组相比，MHE 组 ReHo 值无明显差异性脑区（P>0.05）。**结论** 利用功能磁共振可以对基于非酒精性肝硬化的 MHE 患者脑功能的改变情况进行早期评估，为研究 MHE 的功能恢复机制提供依据，并更好的指导 MHE 的治疗。

Degree Centrality of the Functional Network in Adolescent Patients of First-episode Major Depressive Disorder with Suicidal Ideation

Chen Chen,Cui-ping Ren
The First Affiliated Hospital of Zhengzhou University

Objective: The aim of the present study was to investigate the alternations of degree centrality (DC) in the brain of adolescent patients of first-episode major depressive disorder(MDD) with suicidal ideation at resting-state.
Methods: We analyzed resting-state functional magnetic resonance imaging data obtained from 53 first-episode, treatment-naive adolescent patients of MDD with suicidal ideation using the Beck Scale for Suicide Ideation (BSS) and from 33 healthy control subjects. Analysis of DC map between the patient group and the control group were performed by two sample t test.
Results: Compared with the control group, patients showed significantly decreased DC value in caudate,thalamus and hippocampus. Brain regions with increased DC included lingual,calcarine,temporal_inf,temporal_sup,occipital_mid,occipital_inf,precuneus,cingulum_mid and postcentral (T=5.08,P<0.05,FWE correction).However,the DC is not correlated with BSS.
Conclusion: DC,as a novel resting-state function MRI parameter in the voxel-wise whole-brain functional networks,might be an appealing alternative index for further studying on pathologic and neuropsychological states of first-episode MDD with suicidal ideation.

The Precuneu Sub-regions Features changes in Cirrhotic patients : A Radiomics Analysis

Sha Luo,Zhi-ming Zhou
The Second Affiliated Hospital of Chongqing Medical University

Purpose: Patients with the low grade of hepatic encephalopathy (HE) — covert HE (CHE), have poor health related quality of life (HRQoL). But CHE screening and diagnosis are often difficult to perform in clinical practice. CHE patients exhibit functional abnormalities, which are closely related to the function of the precuneu (PC). And studies found that there are significant changes in the PC of HE patients. We aimed to identify significantly different radiomic features in PC sub-regions among CHE and No-HE patients, by using radiomics analysis.
Materials and Methods: Radiomics analysis was applied to the high resolution image of T1-weighted three dimensional magnetization of 106 cirrhotic patients, included 54 had current CHE (CHE group) and 52 had no HE (No-HE group). The PC and its sub-regions (bilateral PEp, PEm, PEr and Lc1), in each subject, was segmented and extracted the radiomic features, a total of 423 features for each region. Then three major selection processes were carried out, included the variance and Mann-Whitney U-test, correlation analysis (Spearman' s correlation), and the least absolute shrinkage selection operator (Lasso), to obtained the significant features. Then the logistic regression models were constructed and evaluated according to identified features and clinical data. Finally the nomogram is used individualized prediction of CHE.
Results: Finally, 4 features (right PEp _ Var HLH, right Lc1 _ Median HLL, right Lc1 _ GrayLevelNonuniformity LLL, right Lc1 _ IMC1 LLL) were selected using the three major selection processes, following which, the logistic regression model was constructed. For the model of the selected 4 radiomic features, the area under the receiver operating characteristic curve values (AUC), sensitivity, specificity, and accuracy values of the test set were 0.846, 0.812, 0.706, and 0.758, respectively. The model integrating radiomic featuresd and clinical data has higher AUC values (0.949).
Conclusion: The results demonstrated the potential of PC sub-regions texture features, special the right PC, as a biomarker for the diagnosis of CHE, the radiomics models of PC based on machine learning was a valuable method for the diagnosis of CHE. And the results of this study also provide preliminary evidence that it is meaningful to further explore the sub-regions of the PC.

Functional magnetic resonance imaging (fmri) based correlation study of cerebral cortex activity and clinical correlation scale score in patients with postoperative depression of breast cancer

Jinwen Huang[1,2],Zhijian Cao[1,2],Maosheng Xu[1,2]

1.The First Affiliated Hospital of Zhejiang Chinese Medical University
2.The First Clinical Medical College of Zhejiang Chinese Medical University

Objective to investigate the changes of cerebral cortex activity in depressed patients with breast cancer after operation and its relationship with clinical correlation scale score by using resting state functional magnetic resonance imaging (rs-fmri) based on low-frequency amplitude (ALFF) and local consistency (ReHo). **Methods** functional magnetic resonance imaging (fmri) was used to analyze the changes of cerebral cortex activity in 23 patients with postoperative depression. Based on SPSS 25.0, Pearson and spearman correlation analysis was used to evaluate the correlation between ALFF value and ReHo value and clinical correlation scale score. **Results** the low-frequency amplitude of right precuneus was negatively correlated with HAMA score in patients with postoperative depression of breast cancer. The low-frequency amplitude of the left angular gyrus and the upper right marginal gyrus is positively correlated with the comprehensive attention quotient. The low frequency amplitude of the right posterior cingulate gyrus is positively correlated with the general control quotient. The ReHo values in the right angular gyrus were positively correlated with SAS and HAMA scores. **Conclusion** the changes of cortical activity in multiple functional brain areas of depressed patients with breast cancer in resting state are correlated with the scores of the clinical correlation scale, which may be related to the pathophysiological changes of depression, suggesting that the changes of brain activity in depressed patients can be used to evaluate clinical symptoms.

扩散峰度成像对儿童特发性全面性癫痫脑白质改变的研究

代云蒙,张体江
遵义医科大学附属医院

目的：应用扩散峰度成像技术（及基于纤维束示踪的空间统计分析方法）研究儿童特发性全面性癫痫患者脑白质微观结构改变，分析其与临床变量（病程、语言智商、操作智商、总智商）的相关性。
方法：收集就诊于我院的 24 例特发性全面性癫痫患者作为病例组，另招募一般资料与病例组相匹配的 28 例健康志愿者作为对照组。两组性别使用卡方检验，年龄以及受教育程度使用双样本 t 检验。病例组接受中国-韦氏儿童智力量表进行智力测试。所有受试者采用 GE 3.0T 磁共振行颅脑 MRI 检查（T_1WI、T_2-FLAIR 和 DKI 序列）。首先用 DKE 软件进行批处理，获得各向异性分数 FA、平均扩散率 MD、平均峰度 MK。然后构建平均 FA 骨架图，将 FA 图、MD 和 MK 图投射至平均 FA 骨架图，最后采用置换检验，p <0.05 作为有统计学差异，使用 JHUICBM- DTI-81 模板显示有差异的脑区。在有差异的区域提取相关参数值，采用相关分析观察其与临床变量是否存在相关性（p <0.05）。
结果：病例组与对照组性别、年龄、受教育程度无统计学差异（p >0.05）。相对于对照组，病例组胼胝体（膝、体、压部）、双侧外囊、双侧内囊前、后肢、双侧前辐射冠、双侧丘脑后辐射 MK 值减低；胼胝体（膝、体、压部）、左侧外囊、内囊前肢、前辐射冠、丘脑后辐射及右侧外囊、内囊后肢、前辐射冠 FA 值减低；胼胝体（膝、体、压部）、右侧内囊后肢、左侧外囊 MD 值增高。相

关分析发现病例组平均 MK 值与 PIQ 呈正相关（r_s=0.392，p<0.05），病例组病程与 VIQ、PIQ、FIQ 无明显相关性，平均 FA、MD 值与病程、VIQ、PIQ、FIQ 无明显相关性，平均 MK 值与病程、VIQ、FIQ 无明显相关性。

结论：儿童特发性全面性癫痫患者存在广泛的脑白质结构异常，DKI 特征参数 MK 能发现更广泛的异常脑区；并且平均 MK 与操作智商具有相关性，为揭示儿童特发性全面性癫痫的病理生理机制提供新的依据。

Whether brain structural and functional changes occur in Patients with medullary cone injury: A pilot fMRI study

Qian Chen[1], Nan Chen[2], Zhenchang Wang[1]
1. Beijing Friendship Hospital, Capital Medical University, Beijing, China
2. Xuanwu Hospital, Capital Medical University, Beijing, China

Neuropathic pain after medullary cone injury (MCI) affects the quality of patients' life seriously. Previous studies have shown that brain reorganization occurs in patients with neuropathic pain. The purpose was to explore possible brain changes after MCI, and to further study their associations with clinical variables.

10 MCI patients (all patients were labeled as grade A) and 10 age- and sex-matched healthy controls (HCs) were recruited. The 3D high-resolution structural images and resting-state functional magnetic resonance imaging of all subjects were obtained using a 3.0 Tesla MRI system. Voxel-based morphometry (VBM) and tract-based spatial statistics (TBSS) analysis were conducted to investigate the differences in gray matter volume (GMV), white matter volume (WMV) and white matter integrity between MCI patients and HCs, separately. The amplitude of low-frequency fluctuations (ALFF) and fractional ALFF (fALFF) was used to characterize changes in regional neural activity. Seed-based functional connectivity (FC) analysis was performed to study the whole brain changes using the results of VBM and ALFF/fALFF as seed regions. American Spinal Injury Association (ASIA) Scale scores and visual analog scale (VAS) were also obtained from each patient. Associations between brain changes and clinical variables were also analyzed.

MCI patients showed decreased ALFF in the right frontal lobe (FL). Additionally, when choosing the right FL as seed, MCI patients showed increased FC between the seed region and left orbital frontal cortex (OFC) and between the seed region and right cerebellum posterior lobe (CPL), separately . No significant difference was found in GMV, WMV, white matter integrity or fALFF between MCI patients and HCs. Subsequent correlation analyses revealed that increased FC between the right FL and right CPL was negatively correlated with the VAS score .

MCI may result in alterations in brain function rather than brain structure, and all these changes were within the cognitive-related areas or between these areas and sensorimotor related region. The association between the FC and VAS score may indicate that the neuropathic pain after MCI is closely related to cognitive-related brain functional changes.

Cognitive-related functional training may play an important role in rehabilitation for SCI patients with neuropathic pain.

COMT-rs4680 和 KIBRA-rs17070145 多态性对健康青年海马体积和情景记忆的影响

张冰,王军霞
南京大学医学院附属鼓楼医院

目的:
comt 和 kibra 的基因变异与记忆功能有关，记忆功能都在海马体中表达。本研究旨在探讨 comt rs4680 和 kibra rs17070145 对健康青年人海马亚区容量和记忆能力的影响。

方法:
共有 187 名健康青年志愿者参与了这项研究。采用 Freesurfer 6.0.0 软件计算海马区亚区体积。应用双向 ANCOVA 分析了 COMT 和 KIBRA 基因型间海马体积的变化。

结果: 我们发现，KIBRA 和 COMT 两个基因在右 CA1 和 CA3 亚区有显著的相互作用。在 Kibra C 等位基因携带者中，Comt-Val/Val 纯合子在这些区域的体积大于 Comt-Met 等位基因携带者。此外，这种相互作用效应可以调节海马体记忆关系。在 Kibra C 等位基因亚群中，在 Comt-Val/Val 纯合子和 Met 等位基因携带者之间，右 Ca1 体积和 CVLT 立即回忆（交互作用 f=4.36，p=0.041）以及延迟回忆（f=6.44，p=0.014）之间的相关性有显著差异，尽管 Correla 和 Met 等位基因携带者之间的相关性有显著差异。组内海马体记忆水平无明显升高。
结论: 这些发现提供了对 comt 和 kibra 对海马体积和记忆性能的相互作用影响的见解，这可能突出了遗传因素在海马记忆关系中的作用。

EPO-0103

A Preliminary Study of Diffusion Weighted Imaging and Resting-state Functional MRI in the Link between Brain Structural and Functional Network Disruptions in Cirrhosis with Minimal Hepatic Encephalopathy

QING SUN,HAN PING
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

PURPOSES
While minimal hepatic encephalopathy (MHE) is increasingly recognized as a system-level disorder affecting brain structure and function, little is known about alterations of topological organization of brain functional and structural connectivity networks.
METHOD AND MATERIALS
We constructed functional connectivity networks from functional MRI signal correlations and structural connectivity networks from diffusion tensor imaging tractography in 30 MHE patients, 31 cirrhotic patients without MHE (NMHE) and 59 well-matched healthy controls. Graph theoretical analysis was employed to compute network properties. We investigated the relationships between functional and structural connectivity networks.
RESULTS
We found that MHE/NMHE patients exhibited altered small-worldness property in both functional and structural networks. Many regional characteristics were altered in both networks, involving attention, subcortical and visual networks, and some topological parameters in those regions were correlated with neurocognitive performances and/or disease duration, which reflect disease-specific pathophysiology in MHE. Compared with NMHE patients, MHE patients had decreased nodal local efficiency in functional network. The coupling strength of functional-structural connectivity was decreased and exhibited high sensitivity and specificity to differentiate MHE patients from controls.
CONCLUSION
This study indicates that MHE patients exhibit dysregulation of the 'small-world' topological organization in both brain structural and functional networks, and there is decoupling between the two networks. Our results suggest this so far neglected relationship (i.e, decoupling) serves a key point, which is related to neurocognitive dysfunction.
CLINICAL RELEVANCE/APPLICATION
Graph theoretical analysis of diffusion weighted imaging and resting-state functional MRI images can evaluate the structural and functional networks of MHE, and be a useful diagnostic tool to distinguish MHE from NMHE.

维持性血液透析患者局部脑血流变化的纵向研究

王慧颖[1,2],柴超[2],夏爽[2]
1.青海大学医学院附属医院
2.天津市第一中心医院

目的 为探究血液透析(Hemodialysis, HD)患者局部脑血流量(Cerebral blood flow, CBF)的改变，观察组间有差异的脑区 CBF 与 MMSE(Mini-mental state examination，简明精神状态量表)评分的相关性，筛选影响 HD 患者 CBF 变化的危险因素。
材料与方法 本研究纳入 24 例 HD 患者为病例组和 23 例正常志愿者为正常对照组(Health controls，HCs)。病例组首次检查记为基线组，随访检查记为随访组。采用脉冲式动脉自旋标记技术测量 CBF，病例组于血液透析前一天行 MR 检查，并于 MR 检查一周内行临床实验室检查。分别比较基线组和 HCs、随访组和 HCs、基线组和随访组组间不同脑区 CBF 值的差异。各组间差异脑区 CBF 值与临床实验室指标采用逐步多元线性回归分析观察其相关性。
结果 病例组较 HCs 多发脑区 CBF 增加 (年龄、性别作为协变量，P=0.001)。随访组与基线组相比右侧中央后回 CBF 增加(年龄作为协变量，P=0.001)。病例组的 MMSE 评分低于 HCs(P<0.05)，随访组的 MMSE 评分低于基线组(P=0.017)。血红蛋白是影响基线组右侧颞上回颞极、左侧海马、左侧壳核 CBF 的独立危险因素；尿素是影响基线组右侧颞上回 CBF 的独立危险因素；肌酐是影响基线组右侧壳核、右侧苍白球、右侧岛叶、左侧岛叶 CBF 的独立危险因素。甲状旁腺激素是影响随访组右侧颞上回颞极 CBF 的独立危险因素；血红蛋白是影响随访组右侧颞中回、右侧中央后回、右侧背外侧额上回、右侧颞上回、右侧壳核、左侧中央前回 CBF 的独立危险因素。
结论 HD 患者局部脑区 CBF 增加，同时伴有认知功能下降。基线组与随访组相比，随访组右侧中央后回 CBF 增加。肌酐、尿素、血红蛋白可能是影响基线组 CBF 的独立危险因素。甲状旁腺激素、血红蛋白可能是影响随访组 CBF 的独立危险因素。

Chronic tinnitus exhibits bidirectional functional dysconnectivity in frontostriatal circuit

Yuchen Chen,XIndao Yin
Nanjing First Hospital, Nanjing Medical University

Purpose: The phantom sound of tinnitus is deemed to result from abnormal functional coupling between nucleus accumbens (NAc) and prefrontal cortex, which may form a frontostriatal top-down gating system to valuate and modulate the sensory signals. Resting-state functional magnetic resonance imaging (fMRI) was used to recognize aberrant directional connectivity of the NAc in chronic tinnitus patients and ascertain the relationship with tinnitus characteristics.
Methods: Participants included chronic tinnitus patients (n=50) and healthy controls (n=55), matched for age, sex, education, and hearing thresholds. The hearing status of both groups was comparable. On basis of the NAc as seed regions, a Granger causality analysis study was conducted to investigate the directional connectivity and the relationship with tinnitus duration or distress.
Results: Compared to healthy controls, abnormal directional connectivity between the NAc and prefrontal cortex has been discovered within tinnitus patients, principally the middle frontal gyrus (MFG), orbitofrontal cortex (OFC), and inferior frontal gyrus (IFG). Additionally, positive correlations between the Tinnitus Handicap Questionnaire (THQ) scores and increased directional connectivity from the right NAc to the left MFG (r=0.357, p=0.015), and from the right MFG to the left NAc (r=0.626, p<0.001) have

been observed. Furthermore, the enhanced directional connectivity from the right NAc to the right OFC was positively associated with the duration of tinnitus ($r=0.599$, $p<0.001$).

Conclusions: Concurring with expectations, tinnitus distress was strongly correlated with enhanced directional connectivity between the NAc and prefrontal cortex. To sum up, the current study not only helps illuminate the neural basis of frontostriatal gating control of tinnitus sensation, but also makes a great difference in deciphering the neuropathological features of tinnitus.

EPO-0106

Does Freezing of Gait in Parkinson Disease have relationship with Cortical Thickness reduction in Middle Temporal Gyrus?

E Li
Guangzhou First People's hospital

Abstract: Freezing of gait (FOG) is a crucial characteristic in late-stage Parkinson disease. However, the mechanism behind it still remains as a mystery. Cortical thickness (CTh) showed as a promising, reliable biomarker reflecting neuron degeneration. The aim of this study is to find out whether CTh reduction exists between PD patients with FOG onset and those without. 24 PD patients with FOG, 37 PD patients without FOG assessed by neurologist and 24 HC went through MRI scan. With Freesurfer toolkits, the Cortical Thickness, along with Brain Segmentation Volume Without Ventricles(BSVWV) and estimated Total Intracranial Volume(eTIV) of each participant were extracted. Between-group t test of each parameter were performed and CTh is correlated with clinical assessments of FOG and nFOG groups. As result, CTh difference were found between HC vs FOG, HC vs nFOG PD groups in middle temporal gyrus (MTG), but there is no significant difference between FOG and nFOG groups while no correlation established between CTh and FOG Questionnaire score. We unexpectedly found that weak correlation exists in CTh and BI score between two groups of PD patients. Regarded as a part of semantic system referring to visual perception, sound recognition and language information processing, MTG stays out of motor system to which mainstream opinions attribute the onset of FOG. While on the contrary, our finding may explain cognitive impairment, learning performance happen generally in PD patients as well as their worsening of abilities to perform daily tasks.

轻度脑外伤认知障碍静息态脑功能研究

杨艳芳
安徽医科大学第二附属医院

研究目的：利用静息态功能磁共振成像(rs-fMRI)技术)和 MoCA 量表对 mTBI 后认知障碍患者静息态脑网络和认知功能受损情况进行研究，探讨 mTBI 后认知障碍患者静息态脑网络连接改变与认知功能异常之间的关系。
材料和方法：mTBI 后认知障碍患者组 18 人，健康对照组 16 人，所有受试者在进行 fMRI 检查前签知情同意书，采用西门子 3.0T 磁共振成像仪，采用 T1 Flair 序列采集受试者结构像，采用 GRE-EPI 序列采集受试者的 rs-fMRI 数据。使用 SPM8 软件对数据进行分析预处理，fMRI 后处理工具盒对预处理后的数据进行独立成分分析(ICA)，组间差异进行双样本 t 检验。
结果： mTBI 后认知障碍患者组较健康对照组静息脑网络连接增强差异有统计学意义的脑区位于：右侧颞上回(58，-30，8)、右侧楔叶(14，-98，12)、右侧回直肌(2，18，-28)及左侧中央后回(-46,-14,56)，即默认网络和左侧执行网络所在的区域；mTBI 患者组较健康对照组静息脑网络连接减弱差异有统计学意义的脑区位于：左侧前扣带回(-6，22，28)、右侧枕上回(26，-90，28)，即视觉网络和右侧执行网络所在的区域
结论： TBI 导致了静息态网络尤其是默认网络和执行网络的改变，这些改变可能是 mTBI 患者伤后视空间与执行、语言能力、延迟记忆方面认知功能异常的神经功能基础。

EPO-0108

Changes in Brain Activation Patterns during Motor Imagery in Patients with Complete Spinal Cord Injury

Ling Wang[1],Qian Chen[2],Xuejing Li[1],Nan Chen[1]
1.Xuanwu Hospital Capital Medical University
2.Friendship Hospital Affiliated to Capital Medical University

Objective: The aim of our study was to investigate changes in the brain activation patterns in complete spinal cord injury (CSCI) patients during motor execution (ME) and motor imagery (MI) tasks, and to thereby explore the mechanism of MI for motor function rehabilitation in CSCI.
Methods: Fourteen CSCI patients and twenty age- and gender- matched healthy control subjects (HCs) were recruited for this study. Brain activity was assessed with task-related functional MRI during the mental movement of the right foot (the MI task) and the actual movement (ME: autonomic movement for HCs and passive movement for CSCI patients) that were performed with block design (MI & rest and ME & rest). The brain activation patterns between MI and ME within group and the activation patterns between groups during MI and ME tasks were compared.
Results: For the HCs, there were many overlapping activated brain regions during MI and ME, but the activation of these brain areas during MI was lower than that during ME. However, the activated regions during both tasks in CSCI patients were partially different from those in HCs. Compared with autonomic motor execution data of HCs, passive motor execution in CSCI patients revealed reduced primary motor cortex activation at the group level. Further comparisons with HCs revealed that during motor imagery, CSCI patients showed enhanced activation regions in superior parietal lobule, paracentral lobule and precuneus.

Conclusion：Our findings suggested that patients with CSCI may need more cognitive and emotional involvement during MI, which may reflect central plasticity changes due to altered input and output after CSCI. A better comprehension of the functional reorganization of the MI network in CSCI patients may help to improve the brain-computer interfaces (BCI) tools devices based on MI.

Sensorimotor and pain-related alterations of the gray matter and white matter in type 2 diabetic patients with peripheral neuropathy

Youming Zhang
Department of Radiology, Xiangya Hospital, Central South University

Diabetic peripheral neuropathy (DPN) has long been deemed a disease of the peripheral nervous system, although recent neuroimaging studies have shown that alterations in the central nervous system may play a crucial role in the pathogenesis of this disease. In this study, surface-based morphometry (SBM) and tract-based spatial statistics (TBSS) were used to investigate gray matter (GM) and white matter (WM) alterations in patients with DPN (44 painless and 23 painful) compared with 88 healthy controls (HCs). Compared with HCs, we observed GM alterations in pre- and post-central gyrus, deep gray matter nuclei (such as the caudate, putamen, medial pallidum, thalamus, and ventral nuclear), and altered WM tracts (including corticospinal tract, spinothalamic tract, and thalamocortical projecting fibers) in DPN patients, suggesting impaired motor and somatosensory pathways in DPN. Compared with HCs, we also observed morphological alterations in the cingulate cortex, insular cortex, prefrontal lobe and thalamus, as well as the impaired WM integrity in periaqueductal WM, internal and external capsule mainly in the patients with painful DPN, suggesting altered pain-perception/modulation pathways in painful DPN. Additional intermodal correlation analyses found that the morphological indices of the significant brain regions of the SBM analysis were significantly correlated with the FA of the significant brain regions of the TBSS analysis, suggesting that the GM and WM alterations were tightly coupled. Overall, our study showed sensorimotor and pain-related GM and WM alterations in patients with DPN, which might be involved in the development of DPN.

EPO-0110

Immediate abnormal intrinsic brain activity patterns in patients with end-stage renal disease during a single

dialysis session: A resting-state functional MR imaging study

cong peng[1],Tianyou Luo[2],Hua Yang[1]
1.chongqing traditional chinese medicine hospital
2.The first affiliated hospital of chongqing medical university

Purpose: *To prospectively investigate and detect cerebral amplitude of low-frequency fluctuations (ALFF) algorithm changes in patients with end stage renal disease (ESRD) undergoing maintain hemodialysis(HD) during a single HD in vivo resting-state functional MR imaging (rs-fMRI).*

Materials and Methods: *Twenty-four patients with ESRD undergoing maintain HD(HD group; fourteen men and ten women; mean age ± standard deviation, 56.21 years ± 11.85) and twenty-seven healthy contrast subjects (HC group: ten men and seventeen women; mean age, 50.7±11.2*) were recruit. HD group underwent neuropsychologic tests and MR imaging at least one hour before HD session (HDb), and within 30min after the session (HDa). zALFF values were compared among the three groups. The partial correlation between zALFF values and duration of dialysis, duration of disease, ultrafiltration volume, neuropsychological test scores were performed.

Results: Compared to the HC group, patients in HDb group performed poorer in digit symbol test and serial dotting test, the difference was significantly, and HDa group performed better in digit symbol test than HDb group, the difference was significantly, but there was no significant difference between HDa group and HC group. Patients in HDa showed higher zALFF values in left putamen region than that of HDb ($p<0.05$, false discovery rate corrected at cluster level, initial voxel-wise threshold $p=0.001$). Compared HDb and HDa to HC group respectively, multiple regions showed lower zALFF value ($p<0.05$, false discovery rate corrected at cluster level, initial voxel-wise threshold $p=0.001$). In patients in the HDa group, using left putamen region as mask consisting of regions of interest, the mean zALFF of each patient were correlated with the ultrafiltration volume($R=-0.679$, $p=0.005$). The demographic, clinical data, neuropsychological test scores correlated or positively correlated with zALFF value of multiple regions based on Automated Anatomical Labeling atlas(AAL) 90 templates, and the correlations changed after a single HD duration.

Conclusion: *Spontaneous brain activity abnormalities mainly occurred in left putamen during a single HD, which may related with improved performance of neuropsychological test indirectly. Ultrafiltration volume might be associated with activity of the left putamen in patients with ESRD underwent HD.*

Increased amplitude of low-frequency fluctuation in right angular gyrus and left superior occipital gyrus negatively correlated with heroin use

Jing Luo,Jun Liu
The second Xiangya Hospital, Central South University

Purposes: Abnormal amplitude of low-frequency fluctuation has been implicated in heroin addiction. However, previous studies lacked consistency and didn't consider the impact of confounding factors such as methadone and alcohol. The purpose of this study is to explore abnormal regional neural activity in heroin-dependent individual and the relationship between the heroin-use-induced disrupted local neural activity and the clinical characters of heroin-dependent individual.
Materials and Methods: Fifty-one heroin-dependent (HD) individuals and 40 healthy controls underwent resting-state functional magnetic resonance imaging. The 'amplitude of low-frequency fluctuation' (ALFF) value was calculated and support vector machine (SVM) classification analysis was applied to analyze the data.
Results: Compared with healthy controls, heroin addicts exhibited increased ALFF in the right angular gyrus (AG) and left superior occipital gyrus (SOG). A negative correlation was observed between increased ALFF in the right angular gyrus and left superior occipital gyrus and the duration of heroin use (p_1=0.004, r_1=-0.426; p_2=0.009, r_2=-0.361). Moreover, the ALFF in the right AG and left SOG could discriminate the HD subjects from the controls with acceptable accuracy (Acc_1=64.85%, p_1=0.004; Acc_2=63.80%, p_2=0.005).
Conclusion: HD patients showed abnormal ALFF in the brain areas of semantic memory and visual network. The longer HD individuals abused heroin, the less the ALFF of associated brain regions increased. These observed pattern suggested that accumulative effect heroin' neurotoxicity overpowered self-recovery of the brain and may be applied as a potential biomarker to identify HD individuals from the controls.

Study of resting-state fMRI in limb persistent numbness induced by electrical stimulation

Jie fangjie,Xueting LU,Fei LIU,Jiating FEI,Haibao WANG
The first affiliated hospital of anhui medical university

[Abstract] **Objective** To investigate brain function changes in limb persistent numbness induced by electrical stimulation by fractional amplitude of low frequency fluctuation of resting-state fMRI , and to discuss the brain mechanism of persistent numbness. **Methods** totally 21 healthy adult volunteers with and without numbness stimulation underwent resting-state fMRI scans, and the volunteers were asked to rate the nubmness intensity of the same electrical stimulation. Using fLAFF algorithm to analyze the fALFF date of the brain with and without stimulation , and acquire the significantly different brain regions , and correlation analysis was performed between the stimulation brain fALFF date with the individual numbness intensity score. **Results** Compared with none nubmbness stimulation, the brain regions with fALFF increased in nubmbness stimulation are medial frontal cortex, anterior cingulate cortex, bilateral medial temporal gyrus, bilateral inferior temporal gyrus and right temporal pole; brain regions with fALFF decreased are precuneus / posterior cingulate cortex and right cerebellum. The brain regions positively correlated with individual numbness scores have anterior precuneus / posterior cingulate cortex and left medial

temporal gyrus, and the negatively associated brain regions have right frontal pole and left inferior temporal gyrus. **Conclusion** The limb persistent numbness involves brain regions of sensorimotor, emotional and cognitive functions.,and is related to default mode network . The precuneus / posterior cingulate cortex, temporal lobe and frontal lobe are closely related to individual numbness. This study provides a new paradigm to explore the brain mechanisms of numbness.

论利手的脑结构和功能偏侧化及对称性关联

王哈哈
武汉大学中南医院

目的：应用静息态磁共振基于体素水平的体素-镜像同伦连接（VMHC）和灰质不对称性（AI）分析，探索不同利手程度的半球间结构和功能整合的神经关联。
方法：通过招募被试，得到左利手（LH）13 名，混合利手（MH）13 名，及 24 名右利手（RH）对照组。使用磁共振（3.0T）收集所有被试的结构像（T1）和静息态（BOLD）数据。在 Matlab 平台上利用 DPARSF 对 T1 和 BOLD 数据进行预处理并得到 VMHC 和 AI 值图，使用 SPM 软件对其进行单因素协方差分析，将年龄和性别作为协变量回归,对 AI 数据的分析额外加入协变量颅内体积 TIV 结果。对 zVMHC 值事后检验中有显著差异脑区作为感兴趣区（ROIs）,提取每个 ROI 的 VMHC 值与利手得分的绝对值使用 SPSS25.0 做偏相关分析。其中回归年龄和性别，$p<0.05$ 认为有显著统计学差异。
结果：对三组被试的 zVMHC 值图进行单因素协方差分析，结果在枕下回/颞下回（IOG/ITG）、额中回（MFG）和额叶眶部皮质（OFG）上有显著差异。对这三个差异脑区进行事后检验（$p<0.05$），非右利手在 IOG/ITG 上均与右利手有显著差异，左利手与非左利手在 MFG 上均有显著差异，右利手与非右利手在 OFG 上均有显著差异。三组被试的 AI 结果在内侧前额叶（MPFC）、额上回（SFG）和颞上回（STG）上显示有显著差异。事后检验得到左利手和右利手在 MPFC 上均与混合利手有显著差异，左利手与非左利手在 SFG 和 STG 上均有显著差异。偏相关结果发现在 MFG 上有显著正相关，在脑区 OFG 上有显著负相关（$p<0.01$）。
结论：非右利手的大脑半球连接较右利手表现出更多的互动性，左利手相对非左利手表现更多的脑区偏侧化，整体脑结构差异与功能连接差异结果一致。利手偏侧化程度与差异脑区左右半球间的信息交流有一定相关。

The Influence of Childhood Trauma in Patients with Untreated MDD: Severity, Duration and the Functional Connectivity of FPC-DMN

Yongliang Han,Qi Luo,Jingjie Wang,Chun Zeng,Jialiang Fu,Yongmei Li
The first affiliated hospital of Chongqing Medical University

Background: DSM-5 declares that childhood trauma (CT) is a risk factor for MDD, but how does CT change brain function and induce MDD is still unclear. This study is to investigate therelationship between childhood trauma, MDD and large-scale network connectivity through observing the resting-

state functional connectivity (FC) between fronto-parietal control (FPC)and default mode networks (DMN) in MDD and healthy controls (HC).
Methods: Independent component analysis was used to exam the functional connectivity between FPC-DMN. Fifteen untreated MDD and twenty HC were included. Symptom severity was rated using
Hamilton Depression and Anxiety Scale (HAMD and HAMA), while fivesubsets of early traumatic experiences was measured by Childhood Trauma Questionnaire.
Results: The OR of exposure - nonexposure to develop
MDD was 12.071, and OR of single-multiple exposure was 2.5. Physical abuse (PA) showed difference on first onset andrecurrence (t = -1.830, p = 0.043). Significant differences FC were seen (t = -2.309, p = 0.027) between FPC-DMN in two groups, and the FC was positively correlated with HAMD scores (r= 0.338, p = 0.047), PA(r = 0.336, p = 0.049), and emotional neglect (EN, r = 0.411, p =0.014).
Conclusion: Our findings suggests that CT increases the risk of MDD and amplifies its severity. PA and EN increase the FC, and Positive FC in FPC-DMN separates MDD from HC group.

无共患病儿童注意缺陷多动障碍的全脑体积研究

傅楚琪,王美豪
温州医学院附属第一医院

目的：本研究的目的是探究排除 ADHD 共患病的干扰后，ADHD 患儿是否仍存在脑结构的改变以及这种改变是否主要由 ADHD 的某种亚型造成的。
方法：在我们的研究中，我们采用了来自 ADHD-200 公共数据库中 3T MRI 的 T1 结构像。 采取严格的排除标准后（例如：排除了 181 名共患精神类疾病的 ADHD 样本），我们共纳入了 121 名年龄匹配的排除共患病的 ADHD 样本（11.3 ± 2.4 岁，包括 54 名注意力缺陷型和 67 名混合型）和 265 名正常对照（11.1 ± 2.3 岁）。我们使用基于体素的形态学分析软件（VBM8）来评估全脑体积和局部灰质体积，并显示组间有显著差异的脑区域。ADHD 组与正常组，以及 ADHD 注意力缺陷型、混合型分别与正常组显示显著差异的脑局部区域根据 AAL 图谱用 REST 软件进行提取。其次，提取出来的每个脑区体积与临床量表中的 ADHD 症状评分在 SPSS 22.0 软件中进行 Pearson 双变量相关的统计分析。
结果：ADHD 组相比正常组双侧丘脑体积显著增加（p< .0001, 未校正）。事后基于 ADHD 注意力缺陷型、混合型和对照组之间的分析显示只有 ADHD 注意力缺陷型与对照组相比显示右侧丘脑和右侧中央前回体积增大。ADHD 混合型与注意力缺陷型以及对照组均无组间差异。相关分析显示注意力缺陷型的右侧丘脑体积与 ADHD 注意力缺陷评分呈正相关(p= .033, r= .44)。另外，各组间全脑体积无显著差异。
结论：排除共患病的 ADHD 体积改变主要存在于丘脑且这种改变主要由 ADHD 注意力缺陷型造成。其次，注意力缺陷型的右侧丘脑体积增大可能是导致其注意力缺陷症状的病理基础。本研究为 ADHD 患者临床上分亚型进行治疗以及 ADHD 注意力缺陷型的右侧丘脑靶向治疗提供了初步的参考。
本研究由浙江省医药卫生科技计划项目（NO. 2019326177）及温州市科技局基础性科研计划项目（NO.Y20180185）资助。

Evaluation of cerebral hemodynamics in migraine patients with 320-slice CT perfusion

xueqing yin[1],Qiuli Huang[1]
1.Ningbo No.1 Hospital
2.Ningbo Medical Center Li huili Hospital

Objective To analyze cerebral hemodynamics distribution and perfusion characteristics of migraine patients with 320-slice CT perfusion imaging, and to study the correlation between migraine patients and aura symptoms and cerebral blood perfusion. **Methods** Patients diagnosed with migraine in our hospital during January 2015 to June 2019 were enrolled as the migraine group. Divided them into the group with aura (58 patients) and without aura (72 patients) according to the presence or absence of aura before onset, and 50 healthy patients were taken as the control group during the same period. All enrolled patients proceed craniocerebral CT nonenhanced scan and dynamic enhanced scan, removal the pattients of intracranial intracranial mass lesion and artery stenosis. Performed perfusion imagingCalculated and recorded cerebral blood flow (rCBF) and Mean transit time (MTT) on both sides of the frontal lobe, temporal lobe and occipital lobe subcortical white matter of brain regions, the center of a semicircle and the thalamus in the interested in same area cerebral perfusion , adopt chi-square test and LSD - t test to figure out the interclass correlation coefficient respectively, The correlation between aura and migraine was analyzed. **Results** 1. There was no significant difference in cerebral perfusion between the healthy group and the migraine group without aura, and there was an decrease in rCBF and a increase in MTT in basal ganglia area and subfrontal cortex area on one side of the group with aura. 2. Compared with the healthy group, the group with migraine without aura had increaseed MTT in the subcortical white matter area and thalamic area of one side of the frontal cortex, and the difference was statistically significant, while the perfusion in the other areas was not statistically significant. 3. There were statistically significant differences in rCBF and MTT between one side of the frontal lobe and the subcortical white matter area of the temporal lobe, the central area of the semicircle and the thalamic area of the migraine group and the healthy group. **Conclusion** 320-slice CT perfusion imaging can reflect the changes of intracranial hemodynamics in migraine patients, and may affect the occurrence and prognosis of migraine aura, providing an important support for clinical diagnosis and treatment of migraine.

基于 VBM 评价 COPD 患者脑灰质体积

彭兆辉,范丽,王玮,王祥,蔡佳丽,刘士远
海军军医大学第二附属医院（上海长征医院）

研究目的： 基于体素水平形态学的分析方法评价 COPD 患者灰质体积的变化。

材料与方法： 纳入 COPD 患者 60 例，HC 组 48 例。采集两组动脉血气、肺功能和认知功能评分。采集两组被试高分辨率 3D-T1WI 结构像 MR 数据，采用 VBM 软件分析两组脑灰质体积的差异。
结果：共 40 例 COPD 患者及 40 例健康志愿者纳入最终分析。与 HC 组相比，COPD 组灰质体积降低的脑区为：双侧颞中回、右侧枕中回、右侧额下回、双侧缘上回、左侧额中回、左侧中央前回、左侧楔前叶；灰质体积增加的脑区为：双侧纹状体。 COPD 组 MoCA 评分明显低于 HC 组，视空间与执行功能、注意、抽象、延迟记忆评分差异有统计学意义（P＜0.05）。COPD 组患者左侧额中回体积与 FVC 呈正相关、与 FEV_1/FVC 呈负相关；右侧颞中回体积与视空间与执行功能评分呈负相关；右侧额下回体积与 SaO_2、PaO_2 呈负相关，右侧额下回体积与语言评分呈负相关；右侧纹状体体积与 FEV_1%预计值、 FVC%预计值呈正相关；右侧缘上回体积与 FEV_1呈正相关；左侧额中回体积与 FVC、FEV_1/FVC 呈正相关；左侧缘上回体积与 SaO_2、PaO_2 、延迟记忆评分呈负相关；中央前回体积与 SaO_2、PaO_2 呈负相关、与 $PaCO_2$、FVC 呈正相关、与语言评分呈负相关。
结论： 稳定期 COPD 患者多个脑区灰质体积的异常，而且这些异常的灰质体积与肺功能、动脉血气分析及神经认知评分相关。这些发现可能为 COPD 的发病机制提供新的见解。

EPO-0118
脑梗死患者局部脑活动指标动态特征初步研究

高亚男
天津医科大学总医院

目的：

研究皮层下脑梗死患者在恢复过程中局部脑活动指标的纵向差异脑区及其动态演变模式，并探讨差异脑区局部脑活动指标的变化是否与临床行为学有关。

方法：

22 名皮层下脑梗死患者分别于发病后半年内进行 4 次数据采集，采用 3.0T MR 进行 fMRI 和 3D-T1 像采集。23 名健康志愿者作为对照组。将 fMRI 处理获得全脑 ReHo 图及 ALFF 图，统计分析皮层下脑梗死患者发病后 ReHo 及 ALFF 纵向变化差异脑区，提取其 ReHo 和 ALFF 值，分析平均值随时间的变化趋势。最后，将差异脑区 mReHo 值和 mALFF 值与临床行为学量表进行偏相关分析。

结果：

1.皮层下脑梗死患者 ReHo 纵向变化差异脑区为双侧楔前叶和健侧 MOG，双侧楔前叶 mReHo 值于急性期轻度增高，差异无统计学意义，随之逐渐减低并维持数周后又缓慢增高，最终低于对照组，差异无统计学意义；健侧 MOG mReHo 于急性期低于对照组，差异有统计学意义，之后升高并大致维持在某个稳定水平，最终低于对照组，与对照组无统计学差异。

2.皮层下脑梗死患者 ALFF 纵向变化差异脑区为双侧楔前叶和患侧 IFG，其中双侧楔前叶 mALFF 值于急性期低于正常对照组，差异无统计学意义，之后继续减低而后缓慢增高并于最终低于对照组，且与对照组有统计学差异；患侧 IFG 其变化趋势为急性期高于对照组，之后先减低而后略增高，最终低于对照组，但与对照组无统计学差异。

3.患侧 IFG 多个时间点的 mALFF 值与患者短时记忆评分存在相关性，且急性期 mALFF 值与慢性期短时记忆量表呈正相关。

结论：

本实验对皮层下脑梗死患者发病后不同时间点局部脑活动指标纵向分析得到 ReHo、ALFF 差异脑区为双侧楔前叶、健侧 MOG 和患侧 IFG，且这些差异脑区随时间的变化趋势各不相同。其中患侧 IFG mALFF 值与脑梗死患者记忆及认知功能恢复有一定相关性，可能作为急性期预测记忆功能预后的指标。

EPO-0119

Hypodensity sign predicts hematoma expansion in spontaneous intracerebral hemorrhage

Lina Zhang
the third affiliated hospital of sun yat-sen university

Objective To explore the application of "hypodensity sign" on plain CT scan in predicting the hematoma expansion in patients with acute spontaneous intracerebral hemorrhage (ICH).
Methods Clinical data of 82 patients with acute spontaneous ICH within 24 h were retrospectively analyzed. All patients were required to receive the baseline plain CT scan of the head, CT angiography (CTA) and repeated CT scan within 24 h after the onset of ICH. Clinical and imaging data of all patients were observed and analyzed by two independent radiologists. The hematoma volume was measured to determine whether the hematoma volume was enlarged. Univariate logistic regression analysis and ROC curve were performed to evaluate the values of "spot sign" in CTA and "hypodensity sign" on plain CT scan in predicting the hematoma expansion were statistically compared.
Results Among 82 patients with acute ICH, 39 cases had hematoma expansion. Univariate analysis demonstrated that the time of the first head CT scan, spot and hypodensity signs significantly differed between ICH patients with and without hematoma expansion (X^2=0.465, 9.854 and 23.146, all P<0.05). Binary logistic regression analysis showed that both the spot and hypodensity signs significantly differed between ICH patients with and without hematoma expansion (both P<0.05). The area under ROC curve (AUC) of the "spot sign" was 0.631, and 0.752 for the "hypodensity sign". The sensitivity and specificity of "spot sign" were 30.77% and 95.35%, and 92.31% and 58.14% for the "hypodensity sign".
Conclusion Both "spot sign" and "hypodensity sign" are independent factors for predicting the hematoma expansion in acute ICH patients. The specificity of "spot sign" is higher, whereas the sensitivity of "hypodensity sign" is higher. It can not only reduce the irradiation dose and medical cost, but also avoid the incidence of adverse reactions caused by contrast agents.

EPO-0120

Prediction of early hematoma expansion in cerebral hemorrhage based on non-contrast CT

Lei Song[1], Jiangtao Wang[1], Wanbi Wang[1], Hao Ren[1], Yazhen Yang[1], Tingting Guo[2], Bo Gao[3], Guiquan Shen[3]
1. Xiangyang Central Hospital, Affiliated Hospital of Hubei University of Arts and Science
2. Department of Radiology, Xiangyang No.1 People's Hospital, Hubei University of Medicine
3. Department of Radiology, Affiliated Hospital of Guizhou Medical University

Objective: Patients with intracerebral hemorrhage (ICH) were divided into hematoma expansion group and non-hematoma expansion group. The clinical features of the two

groups of patients and the imaging features of non-contrast CT were analyzed to explore the relationship between the two groups and the early hematoma expansion.

Methods: Consecutive adult patients (>18 years) with spontaneous ICH who had undergone baseline CT within 6 hours after ICH symptom onset in Xiangyang Central Hospital between June 2017 and June 2019 were screened for inclusion into this study. A follow-up CT scan was performed within 24 hours after the initial CT scan. The time to baseline and follow-up CT scan and baseline clinical and radiological variables were recorded for each participant. Baseline clinical data, including age, sex, diabetes mellitus, coronary heart disease, past stroke history, onset to CT scan time, and CT features (hematoma volume, hematoma morphology, hematoma site, delayed intraventricular hemorrhage and island sign), were prospectively collected and recorded in our ICH research database. We also prospectively recorded admission blood pressure, admission Glasgow Coma Scale (GCS) score. We defined hematoma growth as a 33% increase in hematoma volume or >6 mL at the time of the follow-up CT scan, and the hematoma expansion group and non-hematoma expansion group were respectively evaluated. Detailed records of clinical and radiographic baseline characteristics and comparing the differences of data in two groups, univariate logistic regression was used to analyze the relationship between baseline variables and early hematoma expansion. Multivariate logistic regression was used to analyze the independent predictive effect of early hematoma expansion, and to calculate the sensitivity and specificity of predicting hematoma expansion.

Results: A total of 370 patients with cerebral hemorrhage were enrolled, including 140 patients with hematoma expansion group (37.8%) and 230 patients with non-hematoma expansion group (62.2%). There was no significant difference between the two groups in sex, age, blood pressure at admission, diabetes mellitus and coronary heart disease ($P > 0.05$). Compared with the non-hematoma expansion group, the initial GCS score was relatively low in the hematoma expansion group ($P = 0.033$), and the time from onset to the first CT scan was shorter ($P = 0.043$). In terms of CT features, there was no significant difference between the two groups in the hematoma site and the delayed intraventricular hemorrhage ($P>0.05$). The initial hematoma volume, irregular hematoma shape, island sign and delayed intraventricular hemorrhage in both groups ($P<0.05$). Multivariate logistic regression analysis showed irregular hematoma shape (OR=2.289, 95% CI=1.131-4.631, P=0.021), island sign (OR=2.327, 95% CI=1.139-4.751, P=0.020) and delayed intraventricular hemorrhage (OR=4.979, 95% CI=1.423-17.429, P=0.012) are the independent predictor of early hematoma expansion. The predicted sensitivity and specificity were 71.45% and 54.78%, 51.4% and 81.7%, 23.07% and 71.3%, respectively.

Conclusion: Irregular hematoma shape, island sign and delayed intraventricular hemorrhage expansion based on non-contrast CT are the independent predictors of early hematoma expansion. Irregular hematoma shape has the higher sensitivity and island sign has the highest specificity.

EPO-0121
颅内有明显强化斑块病人的特征分析：一项高分辨 MR 研究

黄娟,焦晟,郭锬,张金涛,张晨,陈敏,宋焱
北京医院

目的：斑块内的炎症反应是脑卒中发生中重要的危险因素。利用 3.0T 高分辨率磁共振成像（High resolution magnetic resonance imaging, HRMRI）技术探讨颅内动脉明显强化的斑块及临床相关危险因素及斑块负荷之间的相关性。
方法：2015 年 10 月至 2017 年 10 月一共 141 例（102 例男性，平均年龄为 61.1±11.4 岁）病人进行了颅内动脉高分辨 MR 检查证实颅内有动脉粥样硬化斑块，根据颅内斑块的强化程度将所有患者分为两组，存在明显强化斑块的患者为明显强化组，存在轻度强化及无强化斑块的患者为非明显强化组，并统计所有患者的临床相关资料及实验室检查结果，用二元 logistic 回归评估斑块强化程度与临床特征及斑块负荷之间的关系。
结果：在 141 例病人中，共 98 例（69.5%）病人存在颅内明显强化斑块，和颅内没有明显强化斑块的病人比较，颅内有明显强化斑块的病人中更多的人患有糖尿病、有脑卒中家族史，有更低的高密度脂蛋白，更大的斑块最大长径及更严重的管腔狭窄程度（以上所有 $p<0.05$）；颅内动脉管腔狭窄与颅内明显强化斑块独立相关(OR 值：1.037; 95% 可信区间: 1.022, 1.052)。颅内动脉斑块明显强化组与非明显强化组之间的年龄、性别、高血压、吸烟史及家族史均无显著性差异（以上所有 $p>0.05$）。
结论：颅内动脉管腔狭窄与颅内明显强化斑块独立相关，提示明显强化的斑块有更大的负荷。

EPO-0122

The research of difference between CT and MRI in the evaluation of cerebral hemorrhage volume

Kun Zhang,Kai Xu
Baoji central hospital

Abstract: Objective To investigate the difference between CT and MRI T1WI in cerebral hemorrhage volume assessment and its relationship. **Methods** Fifty-five patients with intracerebral hemorrhage were collected, and conventional CT and MRI examinations were performed within 7 days of hemorrhage. Manual and automatic hematoma volume measurements were performed on CT and MRI T1WI images, and paired sample t tests were performed on manual and automatic measurements, and CT and MRI images were performed on cerebral hematoma volume measurements. **Results** The mean hematoma volume measured by CT and MRI images was 16.20 10.68ml and 29.28 21.34ml, respectively.There was no significant difference between manual and automatic measurement of cerebral hematoma volume ($P>0.05$), and the difference between CT and MRI images was statistically significant ($P<0.05$).Pearson correlation test showed that there was a significant positive correlation between the volume of cerebral hematoma measured by CT and MRI images ($r=0.783$, $P=0.000$), and the relationship between the two was: $V_{CT}=0.613*V_{MRI}$. **Conclusion** MRI is beneficial to the analysis of the internal components of cerebral hematoma, but MRI images may overestimate the hematoma volume. The results of this study can accurately evaluate the hematoma volume on MRI images, providing reliable imaging basis for clinical treatment.

The performance of time-of-flight MR angiography with sparse under-sampling and computed tomographic angiography in detection of unruptured cerebral artery aneurysms: digital subtraction angiography as a reference standard

Xu Xu,Wanlin Peng,Jinge Zhang,Chunchao Xia,Zhenlin Li
West China Hospital

Purpose
To investigate the performance of time-of-flight with sparse undersampling MRA (TOFu-MRA) and CTA in the visualizationand evaluation of morphological parameters of intracranial aneurysms, DSA as the gold standard.

Method and materials
Twenty-five consecutive adult patients who suspected intracranial aneurysms were perspectively enrolled and underwent CTA and TOFu-MRA within one week before DSA. Visualization of aneurysms was quantitatively assessed using: graded 2, visible (definitely present); grade 1, scarcely visible (inconclusive) and grade 0, invisible which indicating aneurysms were not detected by two neuroradiologists. The neck, height and width of aneurysms on volume rendered (VR) images of TOFu-MRA and CTA were measured and compared . With DSA as the reference, the absolute differences between CTA and DSA (d1neck, d1height, d1width), as well as TOFu-MRA and DSA (d2neck, d2height, d2width) were calculated and compared. Radiation dose in CTA was calculated.

Results
There were a total of 27 aneurysms in DSA. All aneurysms on these three imaging protocols were considered as graded 2. For aneurysms' morphologic parameters, the measurement data were as followed: the neck (DSA, 3.34±2.05, CTA, 3.79±2.35and TOFu-MRA, 3.62±2.21), height (DSA, 5.51±4.68, CTA, 4.49±3.84and TOFu-MRA,4.84±3.72) and width (DSA,4.63±3.54mm, CTA, 5.84±3.65mm and TOFu-MRA, 5.96±3.80mm. There were no significant differences between d1 and d2 (all $p > 0.05$). The radiation dose in CTA were as followed: $CTDI_{vol}$=6.10±0.15mGy, DLP=122.5±6.75mGycm.

Conclusion
Compared with conventional CTA, time‐of‐flight MR angiography with sparse TOF could visualizeintracranial aneurysms more clearly, as well as measure morphological parameters of intracranial aneurysms more accurately without ionizing radiation.

EPO-0124
针刺治疗脑卒中患者运动通路的脑功能连接变化特点的 fMRI 研究

易小琦,黄俊浩,陈暇女,郭定波,余娇艳,胡良波
重庆医科大学附属永川医院

目的：利用静息态 fMRI 观察针刺治疗脑卒中患者运动相关脑区功能连接的纵向变化特点，为优化卒中后偏瘫的治疗方案提供研究基础。**方法**：纳入脑卒中伴右侧肢体运动功能障碍患者 23 例，招募年龄、性别、文化程度相匹配的健康人 20 例。收集脑卒中患者治疗前后 Fugl-Meyer 量表评分及所有受试者的静息态 fMRI 数据，选取双侧初级运动皮层（Primary motor cortex，M1）为种子点，比较患者与健康受试者双侧 M1 区与全脑的功能连接差异。**结果**：脑卒中组治疗前与健康对照组比较，左侧 M1 区与右侧中央前回、右侧额上回、右侧额中回、左侧中央后回、左侧顶下缘角回、右侧岛叶、右侧岛盖部额下回、Cerebelum_7b_R 功能连接减弱，但与 Cerebelum_6_L 功能连接增强。右侧 M1 区与左侧中央前回、右侧眶部额中回、右侧中央后回、右侧中央前回、左侧中央后回、右侧顶下缘角回、右侧颞下回功能连接减弱，但与 Cerebelum_Crus2_R 功能连接增强。脑卒中组针刺治疗后与健康对照组比较，左侧 M1 区与右侧中央前回、右侧额中回功能连接增强，但与左侧颞中回、左侧前扣带和旁扣带脑回功能连接减弱。右侧 M1 区与右侧中央前回、右侧中央后回、右侧眶部额上回、右侧颞中回功能连接增强，但与右侧杏仁核、右侧海马功能连接减弱。脑卒中患者在针刺治疗后 Fugl-Meyer 量表评分有明显的提高。卒中组治疗前右侧额上回的功能连接与治疗前 Fugl-Meyer 量表评分呈明显负相关；卒中组治疗后右侧中央前回的功能连接与治疗前 Fugl-Meyer 量表评分呈明显正相关。**结论**：脑卒中伴右侧肢体运动障碍的患者针刺治疗前后双侧大脑皮质功能减弱与增强并存，这些改变可能与针刺治疗脑卒中运动功能网络改善和重建相关。脑卒中患者治疗后右侧中央前回的功能连接可以预测卒中患者针刺治疗的疗效。

高分辨率 MR 血管壁成像对缺血性卒中病因诊断的临床应用价值

杨帅,王小宜,唐海云,郭久晴,胡平,欧洁琳,廖伟华
中南大学湘雅医院

目的：研究高分辨率 MR 头颈动脉管壁成像对缺血性卒中病因诊断的临床应用价值。
方法：选择 2017 年 5 月-2019 年 6 月于我院就诊的缺血性卒中的患者经过临床评估及血管腔评估不能确定病因，而行高分辨率头颈动脉管壁 MR 成像明确病因的患者共 22 名进行分析，观察对高分辨率 MR 血管壁成像对血管壁病变的诊断能力。
结果：HR-MRI 头颈动脉管壁成像发现 2 例颈动脉蹼，表现为颈动脉起始部后壁突出并延伸至动脉腔内的薄膜样片状物；4 例头颈动脉夹层(cerebral artery dissection, CAD)，表现为双腔改变及短 T1 壁间血肿形成伴或不伴有管腔扩张，4 例 CAD 均为正性重构，其中 3 例 CAD 合并卵圆孔未闭及房间隔膨胀瘤；5 例烟雾病(Moyamoya disease, MMD)，4 例动脉粥样硬化性烟雾综合征(atherosclerotic Moyamoya syndrome, AS-MMS)，MMD 和 AS-MMS 均出现颅底动脉管腔缩小、闭塞及烟雾状侧枝形成，均为负性重构，但 AS-MMS 年龄更大、血管危险因素更多、颅外动脉粥样硬化证据更多、后循环受累更多、MR 血管成像分期系统评分更高、HR-MRI 动脉管壁成像出现易损斑块的表现更多、强化更明显；3 例原发性中枢神经系统血管炎，表现为颅内动脉多发节段性管壁增厚、强化，均为环形强化，累及颅内大中型动脉；4 例继发性中枢神经系统血管炎，其中 2 例为巨细胞动脉炎，表现为双侧颞浅动脉环形增厚、强化，管腔狭窄，1 例为神经精神性狼疮，责任动脉管壁环形增厚、强化，管腔中-重度狭窄，1 例为桥本脑病，责任动脉管壁轻度环形增厚，管腔轻度狭窄。

结论：高分辨率 MR 血管壁成像在缺血性卒中病因诊断中具有重要价值，尤其是血管腔评估（CTA、MRA、DSA）为阴性的不明原因卒中及血管腔狭窄病变的鉴别诊断，是血管腔诊断技术的重要补充。

EPO-0126

Imaging Features of High-resolution MRI Vascular Wall Imaging of Carotid Artery Dissection Caused by Massaging

Lisong Liang,Wuchao Li,Yuancheng Liu,Maoxiong Zhai
Guizhou Provincal People's Hospital

Objective: To discuss the imaging features of high-resolution MRI vascular wall imaging (HR-VWI) of carotid artery dissection caused by massaging.
Methods: A retrospective analysis was carried out by collecting information of patients with carotid artery trauma caused by massaging in Guizhou Provincial People's Hospital from January 2017 to January 2019. All included patients were interpreted by the staff in this study to inquiry the interval between the end of massaging and the onset of central nervous system symptoms. All patients underwent HR-VWI, and imaging features of the lesions were observed subsequently.
Results: Of the 9 patients, 4 were female, 5 were male, age ranged 31-57 years old, with an average age of 42.4±9.6 years. The median time from the end of the massage to the onset of symptoms was 11.5 hours. There were 10 lesions, with 7 located in internal carotid arteries and 3 in vertebral arteries. In addition, the average length of internal carotid artery lesions and vertebral artery lesions was 46±13 mm and 9±6 mm, respectively. The lesions were located laterally and posteriorly, with 1 occlusive lesion, and 10 moderate-severe stenosis in the lesion segment.
Conclusion: High-resolution MR vascular wall imaging can accurately analyze the extent of lesions and intraluminal hemorrhage in patients with massage-induced dissecting, providing clinicians with detailed and accurate imaging data as early as possible, thereby guiding clinicians in the decision-making of therapeutic programs.

DWI 在不同类型的脑梗中的对比研究

周佳
上海交通大学附属第六人民医院

目的：探究腔隙性脑梗死与其他类型脑梗的不同 DWI 表现与临床症状的关系，从而对病人的临床治疗方案的选择起一定的指导作用。 材料与方法：搜集从 2013 年 1 月到 2013 年 7 月经临床确诊脑梗死的 30 例病人影像资料，将 30 名脑梗病人根据 DWI 及 CT 表现分为腔梗组及非腔梗组，腔梗组的判断标准为病灶小于 1.5cm，非腔梗组的判断标准为病灶大于 1.5cm。根据 OCSP 标准将脑梗死患者临床症状分为 LACS（腔梗综合征）、PACS（部分前循环梗死综合征）、TACS（完全性前循环梗死综合征）、POCS（部分后循环梗死综合征）。 结果：30 名脑梗患者中经 DWI 诊断为腔梗的患者为 9 例，非腔梗患者 21 例，腔梗组表现为 LACS 的患者高于非腔梗组（$p<0.001$），而非腔梗组患者表现为 PACS、TACS、POCS 的患者明显高于腔梗组($p<0.001$)。

Random vessel-encoded arterial spin labeling in the assessment of altered flow territories after carotid stenting: a comparative study with digital subtraction angiography

shanshan lu[1],Lirong Yan[2],Yuezhou Cao[1],Chunqiu Su[1],Feiyun Wu[1],Sheng Liu[1],Danny JJ Wang[2],Haibin Shi[1]
1.The first affiliated hospital of Nanjing Medical University
2.University of southern california

Purpose: Random vessel-encoded pseudocontinuous arterial spin labeling (rVE-pCASL) is a noninvasive and planning-free method for mapping cerebral blood flow territories. In this study, we aimed to compare the rVE-pCASL with gold-standard digital subtraction angiography (DSA) for 1) the assessment of flow territories in patients with internal carotid artery (ICA) stenosis; and 2) the alterations in flow territories after carotid angioplasty with stent placement (CAS).
Materials and methods: Thirty-two patients presenting with internal carotid arterial stenosis were recruited. CAS were performed in 15 (46.9%) all these patients. Flow territory mapping was performed with rVE-pCASL before intervention and 3 months after. Cohen's k-statistics were computed to quantify agreement in perfusion patterns between rVE-pCASL and DSA.
Results: The cross-territorial filling patterns were consistent with circle of Willis anatomy. Good agreement was found between rVE-pCASL and DSA in the assessment of flow territories. The Cohen's k-statistics was 0.721 (95% CI, 0.582-857) and 0.763 (95% CI, 0.632-896) for reader one and two, respectively. The alterations of cerebral blood flow territories after CAS assessed on rVE-pCASL was comparable to that on DSA.
Conclusion: rVE-pCASL provided radiological information comparable to DSA on mapping flow territories and their alternations after CAS in patients with internal carotid artery stenosis.

症状性大脑中动脉粥样硬化斑块分布及形态学特征的高分辨磁共振成像研究

赵义,金灿,王礼同,何玲,王苇
扬州大学附属医院

目的　采用 HR-MRI 血管壁成像技术观察症状性大脑中动脉(MCA)粥样硬化斑块的分布和形态学特征，探讨急性脑梗死相关的高危斑块的 HR-MRI 特征。方法　对 57 例症状性 MCA 粥样硬化患者进行 DWI、3D TOF-MRA 及 HR-MRI 检查。统计 TIA 组和急性脑梗死组 MCA 管腔最狭窄层面斑块的分布情况，定量测量血管最狭窄处(MLN)的管腔面积(LA_{MLN})、血管面积(VA_{MLN})和参考血管的管腔面积($LA_{reference}$)、血管面积($VA_{reference}$)，再以此计算出血管最狭窄处管壁面积(WA_{MLN})、斑块面积、斑块负荷百分比、狭窄率、重构指数。结果 TIA 组和急性脑梗死组位于腹侧壁、上侧壁、背侧壁、下侧壁

分别为 6 例、5 例、7 例、9 例和 13 例、10 例、3 例、4 例，其差异无统计学意义（均 $P>0.05$）。TIA 组和急性脑梗死组的 $VA_{reference}$、$LA_{reference}$、VA_{MLN}、重构指数之间的差异无统计学意义($P>0.05$)。两组均以正性重构为主。TIA 组和急性脑梗死组的 WA_{MLN}、斑块面积、狭窄率、斑块负荷百分比分别为(8.85±1.92) mm^2、(4.00±3.00) mm^2、20.92%±9.18%、19.05%±14.93%和(11.10±1.88) mm^2、(6.00±2.25) mm^2、28.56%±8.67%、27.3%±7.69%，其差异有统计学意义($P<0.01$)。TIA 组和急性脑梗死组斑块表面不光整有统计学差异($P<0.05$)。TIA 组和急性脑梗死组的 LA_{MLN} 分别为(11.93±1.59) mm^2和(10.43±2.08) mm^2，其差异有统计学意义($P<0.01$)。 结论　急性脑梗死组的 MCA 粥样硬化斑块负荷更大，最大狭窄处管壁更厚，表面不光整更多，提示其具有高危斑块的特征性。

EPO-0130
颈动脉分叉处斑块表面形态特征与前循环脑血流灌注的关系

杨莉[1],苗延巍[2],王均昕[2],江林[1],李仕广[1]
1.遵义市第一人民医院
2.大连医科大学附属第一医院

目的：应用 CTA 评估颈动脉粥样分叉处斑块表面形态，分析其与狭窄程度、脑缺血性事件的关系；应用 ASL 测量前循环脑血流量，进一步探讨颈动脉斑块特征与前循环脑血流灌注的关系。
材料及方法：回顾性收集我院 2017 年 07 月至 2018 年 12 月以颈动脉狭窄收入院患者共 64 例，男 50 例，女 14 例，平均年龄为 71.00±9.37 岁，所有患者均行头颈动脉 CTA、颅脑 MRI 检查（含 ASL 序列，PLD=1.5s）。收集所有患者得临床资料及实验室检查。应用 CTA 评估颈动脉分叉处斑块表面形态，测量并记录斑块狭窄程度。将所有患者分为光滑、不规则及溃疡斑块组。通过 ASL 获得 CBF 图，测量责任血管侧前循环供血区（额叶、颞叶、顶叶皮层下白质和半卵圆中心、基底节区）CBF 值。采用行×列表卡方检验分析不同斑块形态与脑血管事件和狭窄程度的关系；应用 Kruskal-Wallis H 非参数检验比较不同斑块形态组间、狭窄程度组间前循环 CBF 值的差异。
结果：
1. 128 支颈动脉共 115 支血管颈动脉存在异常颈动脉斑块：光滑斑块 73 个（62.6%），不规则斑块 29 个（26.1%），溃疡斑块 13 个（11.3%）。
2.不同斑块形态组间脑缺血症状发生存在显著差异（P<0.001），不规则与溃疡斑块发生缺血症状的比例更高。不同狭窄程度组间脑缺血症状的发生存在明显差异（P<0.05），随着狭窄程度的增大脑缺血症状的发生率升高。斑块形态在不同狭窄程度组间有显著差异（P<0.001），随着狭窄程度增加，不规则和溃疡斑块的发生比例升高。
3.不同斑块形态组间的前循环 CBF 值无明显差异（P 值均>0.05）。额叶皮层下白质、半卵圆中心、顶叶皮层下白质的 CBF 值在狭窄程度组间有明显差异（P 值均<0.05），随着狭窄程度增加，CBF 值降低。
结论：不规则或溃疡斑块的缺血性脑血管事件的发生几率增大；前循环脑血流灌注与狭窄程度相关，而与斑块表面形态无关。

EPO-0131
CT 灌注成像对症状性烟雾病血流动力学的评价研究

高凌云,郭翔,陈月芹

济宁医学院附属医院

目的：探讨 CT 灌注成像(CTP)在评价症状性烟雾病血流动力学中的应用价值。**材料与方法：**回顾性分析行颅脑 CTP 检查的烟雾病患者 40 例，选择症状性烟雾病人为研究对象。勾画基底节层面的额叶、颞叶、基底节区脑组织及脑干为测量感兴趣区(ROI），以中线为镜面，同时获得额叶、颞叶、基底节区对侧镜面 ROI，分别测量并记录各 ROI 的灌注值。 (1)采用配对 t 检验或配对秩符号检验比较症状侧与非症状侧各感兴趣区各 CTP 参数相对值的差异。(2)根据 DSA 或/和 CTA 检查结果，将病人分为单侧烟雾病组和双侧烟雾病组，分别进行亚组分析，比较症状侧与非症状侧各感兴趣区各 CTP 参数相对值的差异。以上比较均以 P<0.05 认为差异有统计学意义。**结果：**40 例患者中，33 例患者纳入统计学分析。其中单侧烟雾病 7 例，双侧烟雾病 26 例。烟雾病患者症状侧与非症状侧灌注比较显示：症状侧额叶、颞叶及基底节区 rCBF 值较非症状侧明显降低，rTTP 及 rMTT 值较非症状侧明显延迟。亚组分析显示：对于单侧烟雾病患者，双侧额叶的各 CTP 参数比较无明显统计学意义。症状侧颞叶与基底节区 rCBF 值较非症状侧无明显统计学差异，rTTP 值较非症状侧明显延迟。TTP 能够敏感的反映症状侧与非症状侧的灌注差异。症状侧颞叶 rMTT 值较非症状侧明显延迟，基底节区 rMTT 值较非症状侧比较未见明显统计学差异。对于双侧烟雾病患者，症状侧额叶、颞叶及基底节区 rCBF 值较非症状侧明显降低，rMTT 较非症状侧明显延迟。症状侧 rTTP 值较非症状侧比较未见明显统计学差异。TTP 不能反映症状侧与非症状侧的灌注差异。以上各组症状侧与非症状侧各感兴趣区 rCBV 值比较，差异无明显统计学意义。**结论：**CTP 能够直观、定量地评价症状性烟雾病患者脑血流动力学的变化情况，了解其各参数的意义可以为临床提供重要的脑组织灌注信息，为临床治疗提供客观依据。

Brain Grey Matter Potential Abnormalities in Type 2 Diabetes Mellitus: A study use VBM and SBCT Analysis Abstract

Yumin Li,Heshui Shi
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: Previous research has shown abnormalities in gray matter structure in type 2 diabetes (T2DM) and which are increased risk factors for cognitive impairment, dementia, and depression. It’s unclear whethergrey matter abnormalitiesalready occur in the patients with normal cognition. Thus, this study aims to investigate both potential grey matter density and cerebral cortical thicknessalterationsin T2DM patients without cognitive impairments and microvascular complications and to examine the relationship of these changes with cognitive functions.
Methods and materials: T2DM patients with normal cognition (n=28) and age-, sex- and education-matched health controls (HC, n=31) underwent clinical,neuropsychological assessments and 3D structural T1 on a 3.0T scanner. We used both voxel-based morphometry (VBM) and surface-based cortical thickness (SBCT) analysis to investigate whole brain grey matter density (GMD) and cerebral cortical thickness (CCT) alterations, respectively.
Results:T2DM patients showed no significant differences in total grey matter volumes, but presented significantly lower regional GMD and CCT mainly in temporal, frontal, insular lobe and inferior parietal lobule. Both significant decreased brain GMD and

CCT were found in left fusiform gyrus and right orbital frontal gyrus. Even T2DM patients in normal cognition, it exhibited significant poor attention and delayed recall. Furthermore, GMD (the right orbital frontal gyrus) was analyzed by VBM demonstrated greater relationship with cognitive functions (the visual space and executive ability) and performed worse as disease duration progress; while strong correlation was observed between clinical parameters (the fasting plasma glucose and HbA1c%) and CCT (the right inferior parietal lobule, pars triangularis and fusiform gyrus) was analyzed by SBCT.

Conclusion: VBM combine with SBCT can better detect the potential alterations and their relationship with cognitive functions then one method. Our findings indicated that grey matter abnormalities already occur even the patients without cognitive impairments and microvascular complications and suggested that early blood glucose control contributes to the prevention of early T2DM-related cognitive decline.

EPO-0133

Quantifying Hemodynamic Changes in Moyamoya Disease Based on Two-Dimensional Cine Phase-Contrast Magnetic Resonance Imaging and Computational Fluid Dynamics

Zhao Ruan,Wenbo Sun

Department of Radiology, Zhongnan Hospital of Wuhan University, Wuhan University, Wuhan , 430071, P. R. China

OBJECTIVE: To investigate hemodynamic changes in moyamoya disease (MMD) via two-dimensional cine phase-contrast magnetic resonance imaging and computational fluid dynamics.

- METHODS: In 18 patients with MMD and 10 healthy control subjects, phase-contrast magnetic resonance imaging was performed to quantify flow rate of main supplying arteries, including internal carotid arteries (ICAs) and vertebral arteries. Mean flow rate in these vessels was adopted as the patient-specific boundary condition for computational fluid dynamics simulation of the circle of Willis in MMD and control groups. Pressure drop in both ICAs and their difference, wall shear stress and secondary flow in the carotid siphon of ICAs, and flow rate and size of posterior communicating arteries (PComAs) were
compared between MMD and control groups. Four patients with MMD underwent follow-up scans for longitudinal comparison.

- RESULTS: Phase-contrast magnetic resonance imaging data revealed significantly different flow rate in the left ICA and right vertebral arteries between MMD and control groups. Computational fluid dynamics simulation demonstrated similar wall shear stress and similar secondary flow of both ICAs but significantly higher pressure drop in left ICA, higher pressure drop difference between left ICA and right ICA, and higher flow rate in PComAs in patients with MMD compared with control subjects. Significantly increased size of left PComA in patients with MMD was also found. Follow-up results confirmed that the combination of pressure drop difference, flow rate, and size of PComAs can potentially assist long-term prognosis after surgery.

- CONCLUSIONS: Pressure drop difference, flow rate, and size of PComAs can be used to evaluate impairments in cerebrovascular reserve and indicate long-term prognosis in MMD.

轻中度血管狭窄易损斑块进展与临床生化指标相关因素分析的 HR-MRI 研究

杨倩
陆军军医大学大坪医院

目的 应用高分辨磁共振成像（high-resolution magnetic resonance imaging，HR-MRI）评估轻中度狭窄的颈动脉易损斑块进展，并探讨生化指标与易损斑块（vulnerable plague，VP）进展的关联性。**方法** 回顾性纳入轻中度狭窄的颈动脉 VP33 个，分为责任斑块（culprit plague，CP）组和非责任斑块(non-culprit plague，non-CP)组。HR-MRI 图像上测量定量参数包括斑块最厚层面、远端及近端参考点的总管腔、管壁面积；管壁标准化指数、重构指数、斑块负荷及斑块大小，临床生化指标比较采用独立样本 t 检验。用 SPSS19.0 软件绘制受试者反应曲线（receiver-operating characteristic，ROC）分析 C-反应蛋白(C-reactive protein，*CRP)*对于 VP 进展成为 CP 的预测价值，确定其阈值、敏感性及特异性。**结果** *CP* 组与 non-CP 组在总管腔、管壁面积、管壁标准化指数、斑块负荷及斑块大小差异无统计学意义(P>0.05)，生化实验室检查糖化血红蛋白、同型半胱氨酸、载脂蛋白、脂蛋白、总胆固醇、甘油三酯及高、低密度脂蛋白等均无统计学差异（*P>0.05*），CRP 在责任斑块组及非责任斑块组统计学分析有差异 *(P=0.032<0.05)*，且 CRP 的 ROC 下的面积（area under the curve，AUC）为 0.789（P=0.009，95%的置信区间为：*0.618~0.961*），表明通过 CRP 预测 VP 进展为责任斑块的可靠性很高，其 cut-off 值为 18.61，敏感性和特异性分别为 81.8%，78.9%。**结论** 通过回顾性研究发现轻中度血管狭窄颈动脉粥样硬化 VP 进展为 CP 可能与 CRP 有关联，斑块的进展与 CRP 测量值大小成正相关，通过 CRP 预测 VP 进展为 CP 的可靠性很高。

EPO-0135
Cerebrovascular Events of DAWS in Extracranial Internal Carotid Arteries in Moyamoya Disease

Bing Zhang,Xueping Li,Jian Wang
Affiliated Drum Tower Hospital of Nanjing University Medical School， Nanjing， China

Objective:
The aim of this study was to investigate association between severity of cerebrovascular events and disruption of arterial wall structure (DAWS) in extracranial internal carotid arteries (EICA) in patients with moyamoya disease (MMD) confirmed by ultrasound imaging and angiography.
Methods:
48 patients with MMD were consecutively recruited in this study. The diagnosis of DAWS in EICA was observed by ultrasound imaging. To clarify the severity of cerebrovascular

events in patients with and without DAWS in EICA, we defined unstable hemorrhage as either hemorrhage with infarctions or repeated hemorrhage. we compared the infarctions, hemorrhage and unstable hemorrhage . Univariate and multivariate logistic regression analysis was performed to identify independent risk factors for the presence of cerebrovascular events in patients with DAWS in EICA.
Results:
No significant differences in clinical characteristics were found between patients with and without DAWS in EICA. 15 (31.3%) patients (mean age: 41.5 ±12.5 years; 6 males) and 24 arteries were found to have DAWS in EICA, those with DAWS had higher prevalence of unstable hemorrhage (53.3%vs. 18.2%, P=0.019), prevalence of hemorrhage (6.7%vs. 36.4% p=0.04), prevalence of infracts (40%vs. 36.4% p=1.0). Compared these results of cerebral disease in normal sides, univariate and multivariate logistic regression analysis identified unstable hemorrhage (OR, 4.47; 95% CI:1.22-16.32; p=0.02) as independent risk factors for the presence of cerebrovascular events in patients with DAWS in EICA.
Conclusion:
We found MMD patients with DAWS in EICA had more serious cerebrovascular

EPO-0136

椎动脉发育不全与后循环中风的关系

刘明科
重庆医科大学附属永川医院

背景
椎动脉（VA）发育不全的临床意义正在讨论中。这项回顾性研究的目的是评估 VA 发育不全（VAH）与后循环中风（PCS）或 TIA 发生率之间可能的因果关系的假设，这取决于 VAH 和血管危险因素的程度。
方法
共有 367 名症状性（PCS 或 TIA）和 742 名无症状受试者被选中参与该研究。通过超声检查颅外动脉。尽管检查了不同程度的 VAH，但 VAH 被定义为整个过程中的 VA 直径<3mm。所有有症状的患者均接受 MRI 或 CT 和 MRA 或 CTA 检查。该研究评估了所有受试者的年龄，性别，共同危险因素（高血压，高脂血症，糖尿病，外周动脉疾病，心房颤动，心肌梗死），以及 180 名健康志愿者的身高。
结果
无论严重程度如何，VAH 在非心源性栓塞性 PCS 或 TIA 患者中更常见，而非无症状患者。65 岁以下患者发育不全的程度增加是 PCS / TIA 的预测指标，OR = 1.8,95%CI：1.3-2.5； p <0.001。在年龄超过 65 岁的受试者中，这种关联失败了。仅在 50 岁以下的患者中，TIA 组 VAH 发生率明显高于 PCS 组（分别为 68.2%和 50%； p= 0.047）。分离 PCS / TIA 和无症状组的最佳 VA 直径截止点为 2.7 mm。该值可能在不同的群体中有所不同，因为 VA 直径显示出对性别以及人体测量参数（身高）的显着依赖性。随着 VAH 程度的增加，远端 VA 部分狭窄/闭塞发生的可能性增加（OR = 1.6,95%CI：1.2-2.1； p = 0.002）。VA 直径<2.2 mm 时，可能发生远端 VA 狭窄/闭塞。
结论
VAH 对 PCS / TIA 的影响及其发病机制受年龄的显着影响。影响不同人群中 PCS 发生的 VA 直径的截止点可能会有所不同，因为 VA 直径取决于性别和人体测量参数（尤其是身高）。

EPO-0137

Combination of Plaque Characteristics and Hemodynamics Predicts Neurological Impairment in Patients with Infarction or Transient Ischemic Attack: A Multi-modal MRI Study

Song Liu[1], Ruowei Tang[2], Weiwei Xie[3], Shengting Chai[3], Song Jin[1], Shuang Xia[3]
1. Tianjin Huanhu Hospital
2. Beijing Friendship Hospital, Capital Medical University
3. Tianjin First Central Hospital

Background and propose: Intracranial atherosclerotic disease (ICAD) is the major reason for stroke events including infarction and transient ischemic attack (TIA) all over the world, especially in Chinese populations (1). Some patients merely suffer from transient symptoms of cerebral alchemist, but irreversible cerebral infarction happens to someone else. So how to discriminate infarction from acute stroke needs further study. The aims of current study were to explore relationship between the atherosclerotic plaque, hemodynamic parameters and irreversible infarction area, and to establish a multi-paramenter model for predicting the extent of neurological impairment of acute ischemic patients.

Methods and Materials: Sixty-seven patients (41 males; age, 58.01 ± 12.40 years) with acute ischemic events in MCA territory were reviewed retrospectively. MRI scans of patients were obtained on 3.0 T MRI Siemens Prisma System (Siemens Medical Systems, Allegra, Germany) with 64-channel head-neck coil, including DWI, TOF-MRA, pre-enhanced and post-enhanced Inversion-Recovery prepared Sampling Perfection with Application-optimized Contrast using different flip angle Evolutions (IR-SPACE) and DSC-PWI examination. All patients were subdivided to infarction group and TIA group according to DWI and neurological examination. The plaque characteristics, including outer wall area, lumen area, wall area, stenosis percentage, normalized wall index, plaque length, arterial remodeling ratio, plaque morphology, and enhanced behavior were evaluated in IR-SPACE. Pial collaterals (PCs) was graded as 4 grades, which were assessed on the raw axial images of TOF-MRA according to the method proposed by Yuan et al (2). DWI-ASPECTS was assessed in DWI images(3). RAPID software (4) was used to compute Tmax maps. Chi-square test, Mann-Whitney U test, univariate and multivariate logistic analysis, ROC curve, and multiple linear regression analysis was used.

Results: Forty-five patients were subdivided into infarction group, and 22 into TIA group. Longer laque length (8.63 mm vs. 6.40 mm, $P = 0.022$), more intraplaque hemorrhage (IPH) (25/45 vs. 1/22, $P < 0.01$), higher grade enhancement ($P = 0.021$), PCs ($P = 0.003$), and larger Tmax > 6.0 s volume (12.81 ± 21.72 ml versus 4.41 ± 18.27 ml, $P = 0.020$) were common seen in infarction group. IPH (OR 13.577, 95% CI 1.542-119.535, $P = 0.019$) and PCs (OR 0.453, 95%CI 0.210-0.975, $P = 0.043$) were independent predictors for patients with acute infarction. The AUC of combination of two variables was 0.860, and specificity was 95.45%. Plaque length, enhanced grade, IPH, Tmax > 6.0 s volume, and PCs were correlated with DWI - ASPECTS score ($P < 0.05$), respectively. Best setting

was achieved with Tmax > 6.0 s volume (β = 0.342, 95%CI 0.021-0.078, *P* = 0.001), IPH (β = 0.283, 95%CI 0.537-2.918, *P* = 0.005), hypertension (β = 0.260, 95%CI 0.431-2.845, *P* = 0.009), and PCs (β = -0.227, 95%CI -1.211- -0.060, *P* = 0.031) for NIHSS (F [4, 58] = 16.108, *P* < 0.001) in linear regression model.

Discussion and Conclusion: Our results indicated that plaque characteristics and hemodynamics had incremental values on predicting infarction occurrence and size. We established a multi-parameter model to prediction of patients' neurological deficit, and it may be useful in predicting clinical severity of acute ischemic patients.

EPO-0138

Clinical and MRI features of posterior reversible encephalopathy syndrome with atypical regions involvement: a large sample of descriptive study

Kunhua Li[1],Yang Yang[2],Dajing Guo[1],Dong Sun[1],Chuanming Li[1]
1.the second affiliated hospital of chongqing medical university
2.Chongqing Occupational Disease Prevention Hospital

Background: With the deepening of research on posterior reversible encephalopathy syndrome (PRES) in recent years, the lesions can also occur in atypical regions. However, until now little is known about the clinical manifestations and damage mechanisms of the PRES with atypical regions involvement. And its accurate diagnosis and timely treatment are very important in clinical practice. So the aim of this study is to investigate the clinical and MRI features to promote the clinical diagnosis and deepen our understanding of this disease.

Materials and methods: Six cases of PRES with atypical regions involvement were collected from our hospital. Another 437 cases were obtained by searching from the PubMed database with the keywords "posterior reversible encephalopathy syndrome", "reversible posterior leukoencephalopathy" or "hypertensive encephalopathy" contained in Title/Abstract. The clinical and MRI features of these 443 cases were analyzed together.

Results: 247 patients were females, and 193 were males, with a median age of 36 years. The gender or age information of 3 patients were not available. The most common symptom was headache (231/443, 52.1%), followed by altered mental status (193/443, 43.6%), seizure (172/443, 38.8%), visual disturbance (161/443, 36.3%), nausea/vomiting (112/443, 25.3%), and focal neurological deficit (82/443, 18.5%). Hypertention (337/443, 76.1%), renal diseases (130/443, 29.3%), immunosuppressant drugs (51/443, 11.5%), autoimmune disorders (46/443, 10.4%), chemotherapy (37/443, 8.4%), infection/sepsis/shock (33/443, 7.4%) and pre-eclampsia/eclamptic (32/443, 7.2%) were the major predisposing factors. The most common location of lesion was cerebellum (256/443, 57.8%), followed by occipital (204/443, 46.0%), parietal (171/443, 38.6%), basal ganglia (115/443, 26.0%), pons (112/443, 25.3%), frontal (105/443, 23.7%), periventricular/deep white matter (103/443, 23.3%), temporal (98/443, 22.1%), brain stem (86/443, 19.4%), thalamus (84/443, 19.0%), midbrain (45/443, 10.2%), medulla (33/443, 7.4%), and spinal cord (29/443, 6.5%). The major treatments were

antihypertensive (200/268, 74.6%), antiepileptics (59/268, 22.0%), discontinuation/switching agents (38/268, 14.2%), steroids treatment (29/268, 10.8%), and dehydrating/diuretics (17/268, 6.3%). The neurological symptoms of most patients completely resolved after appropriate treatment.

Conclusion: The PRES with atypical regions involvement is characterized with relatively specific clinical symptoms and MRI features. They can be reversible in a relatively short time, when promptly recognized and properly treated.

EPO-0139

Single-phase CTA could predict hemorrhage transformation in acute ischemic stroke patients after mechanical thrombectomy

Xin Gao,Qingtao Hui,Chun Ma
The People's Hospital of Deyang City

Background: Hemorrhage transformation is a severity complication after mechanical recanalization. Radiological evaluation plays an important role in selection patients for further endovascular treatment and monitoring iodine extravasation and hemorrhage after recanalization. The aim of this study is to identify useful predictive information from single-phase CTA.
Method: We retrospect the imaging factors of sixty-seven patients with acute middle cerebral artery obstruction or internal carotid obstruction from our hospital from June 1, 2018, to June 1, 2019. We divided these patients into three groups according to the follow up CT and MRI scan. The computed tomography angiography (CTA) was obtained in 24 hours after stroke onset before mechanical thrombectomy. Alberta Stroke Program Early CT Score (ASPECTS) and regional leptomeningeal score (rLMC) were evaluated by two experienced radiologists. Good clinical outcome was defined as mRS ≤2 at 90 days. Multiple linear correlation was conducted.
Results: Fourteen patients had no iodine extravasation and hemorrhage. 24 patients had iodine extravasation and hemorrhage. 29 patients only had iodine extravasation. There was significant difference in ASPECT ($p=0.001$), rLMC ($p=0.007$), mRS (0.023) within the three groups. Post hoc analysis showed that patients having hemorrhage had lower score of ASPECT, rLMC and mRS than other two groups ($p<0.05$).
Conclusions: Single-phase CTA showed that patients having poor collateral circulation were prone to hemorrhage after mechanical thrombectomy. Single-phase CTA can provide important diagnostic information in selecting patients for endovascular treatment.

EPO-0140

Interaction between cerebral small vessel diseases and iron deposition in grey nucleus: Quantitative susceptibility mapping study

Yanzhen Liu[1],Shuang Xia[2]

1.Tianjin Chest Hospital
2.Tianjin First Central Hospital

Objective To analyze the relationship between cerebral small vessel diseases (CSVDs) and iron deposition in gray matter nucleus in the elderly and further explore the interactive effect of the two entities.
Methods Patients was collected who accepted the MRI examination with no obvious structural lesion. SWI images were post-processed and was used to measure susceptibility of 14 gray matter nucleus. The location, number and volume of cerebral microbleeds(CMBs) were evaluated on SWI and recorded, the white matter hyperintensity(WMH), brain atrophy and lacunar infarction(LI) was scored on T2WI images. The Spearman test, multivariate linear stepwise regression analysis and one-way ANOVA was used for statistical analysis.
Results (1) The Spearman test showed that the iron deposition of several deep brain nucleus (caudal nucleus, putamen, thalamus, substantia nigra and dentate nucleus) is positively correlated with several CSVDs (P all<0.05).(2) Multivariate linear stepwise regression analysis was used to investigate the effect of CSVDs on nuclear iron content and the result showed that the number and volume of CMBs, WMH, LI, brain atrophy are the risk factors of caudate nucleus, putamen, dorsal thalamus and substantia nigra (P <0.05). (3) The iron deposition of nucleus was used as an independent variable to analyze the effect of nuclear iron content on CSVDs, the result showed that the right thalamus, right substantia nigra, right putamen, left globus pallidus are risk factors of some cerebral small vessel diseases. (P<0.05). (4) Patients were divided into 4 groups according to the number of CMBs, there is statistical significance between four groups in the left caudate nucleus (p = 0.016), right thalamus (p = 0.002), left substantia nigra (p = 0.026), right substantia nigra (p = 0.043). In the left caudate nucleus and bilateral substantia nigra, there is significantly increase of susceptibility once the CMB appeared. In the right thalamus, when the number of CMBs is greater than 10, the iron deposit of the nuclei is significantly increased.
Conclusion: Compared with other CSVDs, CMBs is more closely related with some gray matter nuclei. The iron overload of some gray nucleus may contribute to the occurrence or development of CSVDs.

MRI findings of cerebral small vessel disease in patients with systemic lupus erythematosus

Yiwei Che,Yanwei MIAO ,Yuhan JIANG ,Peipei CHANG
First Affiliated Hospital of Dalian Medical University

Objective: To evaluate MRI findings of enlarged perivascular space (EPVS), white matter hyperintense (WMH) and lacunes of CSVD in patients with systemic lupus erythematosus (SLE). **Materials and Methods:** Twenty-nine SLE patients (2 males and 27 females, mean age 43.82±12.99 yrs) and twenty-nine age- and sex-matched healthy subjects (2 males and 27 females, mean age 45.14±9.73 yrs) were participated in this retrospective study. All subjects underwent routine MRI scans. EPVS, WMH, and lacunes were rated by two radiologists. Kappa test was to verify the consistency of the evaluation results of two radiologists. With SPSS 24, Kolmogorov-Smirnov Z test was used to analyze group difference. Relations between CSVD and clinical & laboratory finding were analyzed using spearman correlation. **Results:** In the centrum semiovale (CS), the EPVS score in the SLE patients was higher than that in the healthy ones (2.52±0.91, 1.34±0.55, P<0.01). The periventricular hyperintense (PVH) and deep white matter hyperintense (DWMH) in the SLE group were more serious than that in the healthy subjects (P<0.01). Lacunes occurred more in the SLE's than in the controls (P<0.05).In SLE group, EPVS in the CS and PVH was associated with complement C3 (r=0.505, 0. 400, P<0.05) ; DWMH was negatively correlated with triglyceride levels (r=-0.482, P<0.05); and EPVS and WMH were positively correlated with disease duration(r=0. 460、0. 428、0. 416、0.404, P<0.05). **Conclusion:** Cerebral small vessel disease is a common manifestation of central nervous system lesions in SLE patients and is associated with complement C3 and disease duration.

EPO-0143

A simple scoring model for prediction of rupture risk of anterior communicating artery aneurysms

guang-xian wang,Dong Zhang
Department of radiology, Xinqiao Hospital, Third Military Medical University

Background: The rupture risk of anterior communicating artery aneurysms (ACoAAs) has been known to be higher than those of the other locations. Thus, the aim of this

study was to investigate the clinical and morphological characteristics associated with risk factors for the rupture of ACoAAs.
Methods: A total of 361 consecutive patients with 361 ACoAAs between August 2011 and December 2017 were retrospectively reviewed. Patients and ACoAAs were divided into rupture and unrupture groups. In addition to clinical characteristics, ACoAAs characteristics were evaluated by CT angiography (CTA). Multiple logistic regression analysis was used to identify the independent risk factors associated with ACoAAs rupture. The assigning score of these variables depends on the β coefficient. Receiver operating characteristic (ROC) curve analysis was used to calculate the optimal thresholds.
Results: Multiple logistic regression model revealed that A1 dominant (odds ratio (OR) 3.034), irregular shape (OR 3.358) and aspect ratio (AR, OR 3.163) positively increased the risk of rupture, while cerebral atherosclerosis (OR 0.080) and mean diameters (OR 0.474) were negatively correlated with rupture. Incorporating these 5 factors, ROC analysis revealed that the threshold value of the multi-factors was 1, the sensitivity was 88.3%, and the specificity was 66.0%.
Conclusions: The scoring model is a sample method which based on A1 dominant, irregular shape, aspect ratio, cerebral atherosclerosis and mean diameters on CTA is of great value in the prediction of rupture risk of ACoAAs.

EPO-0144

SWI 与常规 MRI、DWI 序列及 CT 在急性期脑梗死伴微出血病变诊断的对比研究

冯利波
应城市人民医院

目的 探讨磁敏感加权成像(susceptibility weighted imaging， SWI)在急性期脑梗死伴微出血病变中的诊断价值，以及在急性脑梗死溶栓治疗患者复查中的监测意义。**方法**收集整理 2014 年 12 月-2018 年 12 月在我院就诊的 131 例急性脑梗死患者，应用常规 MR 序列、DWI 序列、SWI 序列及 CT 对所有急性脑梗死病例脑微出血的检出率及脑微出血灶在 SWI 上的分布特点。根据 SWI 序列上脑微出血灶的检出数量，对其进行分级。对搜集病例中行溶栓治疗的病人进行 48h 后复查，行 SWI、MR 常规序列、DWI、CT 扫描。**结果** 与常规 MR 序列、DWI 序列及 CT 相比，SWI 可以更敏感地发现急性脑梗死患者的微出血灶(P<0.05)。在出现的 51 例 238 处脑微出血灶分布中，有 125（52.5%）个微出血灶位于基底节/丘脑区；有 98（41.2%）个微出血灶位于皮层及皮层下白质区；有 15（6.3%）个微出血灶位于幕下区。根据急性脑梗死患者 CMBs 数量进行分级，轻中重度比例分别为 19.6%、62.7%、17.7%。因此，CMBs 中度患者最常见。行溶栓治疗的急性脑梗死患者 48h 后复查，SWI 检测出新出血灶，并且部分微出血灶体积增大、数量增多。SWI 比常规 MRI 更敏感地检测出了脑出血病灶，提示其可以作为急性脑梗死患者溶栓治疗后的监测手段。**结论** SWI 序列在诊断急性脑梗死患者的微出血灶以及溶栓后继发出血均具有良好的检测效果。在急性脑梗死患者的诊断治疗过程中，采用 SWI 序列可以准确的观察和判断患者脑部微血管出血的详细情况以及溶栓后的治疗效果。因此，SWI 序列在急性脑梗死治疗过程中的运用效果更好，具有重要的预后监测作用。

Whole-brain computed tomography perfusion on admission and delayed cerebral ischemia time-window to detect the delayed cerebral ischemia in patient with aneurysmal subarachnoid hemorrhage

Yunfeng Zhou,Feng You,Shuo Wang ,Fengfeng Zhou,Quan Yuan
Yijishan Hospital of Wannan Medical College

objective To evaluate the value of whole-brain computed tomography perfusion (CTP) parameters on both admission and delayed cerebral ischemia time-window(DCITW) for detcting delayed cerebral ischemia(DIC) in patients with aneurysmal subarachnoid hemorrhage(aSAH).
Methods 80 aSAH patients underwent the one-stop whole-brain CTP scan on admission and DCITW.A total of 12 parameters ,including the mean cerebral blood flow(CBF),cerebral blood volume(CBV),mean transit time(MTT),time to delay(TTD),time to start(TTS),transit time to the center of the impulse response function(Tmax) were measured. Quantitative CTP parameters on admission and DCITW were compared between DCI and non-DCI groups by using Student's t-tests.Quantitative CTP parameters in patients with DCI on admission and DCITW were assessed by using paired Student's t-tests.The relation between CTP parameters and DCI was assessed using logistic regression models.The receiver operating characteristic(ROC) curve of all parameters were generated and the optimal threshold values were derived to calculate the sensitivities and specificities of quantitative CTP parameters.
Results 66.2% patients developed to DCI.There were statistical differences in CBF, MTT, TTS, TTD and Tmax between DCI and non-DCI groups on admission and DCITW. The CTP parameters of DCI were further deterioration compared with non-DCI on admission and DCITW.The mean TMax had the largest AUC of 0.698 (95%CI: 0.581-0.813),and a cutoff value of 2.220 seconds provided sensitivity of 62.26% and specificity of 77.77% for prediction DCI on admission.The mean TTS had the largest AUC of 0.789(95%CI:0.688-0.889),and a cutoff value of 0.605 seconds provided sensitivity of 60.37% and specificity of 92.59% for diagnosing DCI in DCITW. The combined model had a higher predicting value which provided a sensitivity of 60.56% and a specificity of 70.73% (AUC of the combined model 0.817:(95%CI,0.720-0.914).
Conclusion The quantitative CTP on admission can predict DCI early and quantitative CTP in DCITW can dignose DCI after aSAH. However the quantitative CTP paremeters in DCITW have obvious higher sensitivity and specificity than on admission. Furthermore, the combined model is more accurate and effective to detect DCI in patient with aSAH.

缺血性脑卒中预后评估系统

王效春,李晓茹
山西医科大学第一医院

目的 建立一个简便有效的临床/影像评分系统，用以指导急性缺血性脑卒中患者的临床治疗和评估 90 天临床功能恢复情况。**方法** 49 例急性缺血性脑卒中（＜9 小时）的患者行“多模式 CT” 扫描，评价基线多模式 CT、随访影像 ASPECTS 及基线 NIHSS，并应用 ROC 曲线分析，判断 90 天临床功能恢复良好（MRS<2）的各参数的阈值；按照获得的阈值分级并获得各参数的阈值评分，多模式 CT 各参数的阈值评分整合在一起获得多模式 CT 评分系统，将基线 NIHSS 阈值评分加入多模式 CT 评分系统中获得临床/多模式 CT 评分。然后应用 ROC 曲线分析比较各评分模式预测临床功能恢复的效能。**结果** 临床/多模式 CT 评分、多模式 CT 评分、基线 NCCT ASPECTS、动脉期 CTP-SI ASPECTS、静脉期 CTP-SI ASPECTS、CTA TICI 及基线 NIHSS 判断 90 天临床功能恢复良好（MRS<2）的各参数的阈值分别是：>1，>1，>9，>6.5，>8.5，>1 和≧7。临床/多模式 CT 评分 ROC 曲线下面积最大，其预测急性缺血性脑卒中患者 90 天临床功能恢复的效能最高，除临床/多模式 CT 评分与 ACTP-SI 及 NIHSS 阈值评分的差异无显著性意义外，其余各参数阈值评分与临床/多模式 CT 评分的差异均存在显著的统计学意义。**结论** 应用临床/多模式 CT 评分系统比多模式 CT 系统及 NIHSS 各参数单独预测 90 天急性缺血性脑卒中患者的临床功能恢复良好的效能高。

EPO-0147
CT 灌注在判断脑卒中患者缺血半暗带中的价值

乔国庆,李向东
中国人民解放军南部战区总医院

目的：探讨 CT 灌注在判断急性脑卒中患者缺血半暗带中的价值。
方法：回顾性研究 2018 年 10 月至 2019 年 1 月，怀疑脑卒中行 CT 灌注扫描的患者 28 例，男性 25 例，女性 3 例，所有病例均行 CT 灌注扫描。使用飞利浦 256 层 iCT，患者仰卧于检查床头部托架内，头部用绑带固定，先行 CT 平扫，然后，经患者肘静脉注射对比剂（碘帕醇 370mgI），流速=4-5ml/s，剂量=50ml，利用灌注扫描程序，覆盖扫描范围 16cm，间隔 4S，持续扫描 60s，灌注后，立即行延时扫描。所得原始数据传输至飞利浦后处理工作站，对各期图像、及 CTA、CTP 进行分析，设置延迟时间>3s 和 rCBF<30%分别为预测半暗带和核心梗死区体积参数阈值。
结果：28 例 CT 灌注患者中，脑梗塞 17 例，动脉瘤并出血 1 例，蛛网膜下腔出血 2 例，脑膜瘤 1 例，灌注正常 3 例，其它 4 例。CT 平扫、CT 灌注、延时扫描相结合能够对急性脑卒中进行确诊，能够区分梗死区及半暗带。
讨论：缺血半暗带仅是脑血流低灌注后神经功能受损，恢复灌注后神经功能仍可恢复的区域，长时间、严重的低灌注可致半暗带进展为不可逆梗死区。CT 平扫对于急性脑梗塞难以发现，即使增强扫描也不一定可发现急性期脑梗塞，而 CT 灌注可确诊急性脑卒中。本研究有 2 个病例 CT 平扫、延时扫描均不能观察到脑梗赛，而 CT 灌注显示存在低灌注区域，经重建血管，发现对应责任血管堵塞。CT 灌注可预测急性脑卒中，可区分梗死区和半暗带，灌注延迟时间>3s，可较好的显示半暗带的范围，与临床手术证实范围较一致。rCBF<30%确定的梗死区体积与临床实际一致性较好。特别是灌注扫描的同时还可得到 CTA 图像，能够准确的诊断急性脑卒中，确定责任血管，为临床溶栓提供全面的指导信息。

EPO-0148
磁敏感征和不对称静脉征对急性大脑中动脉闭塞患者诊断价值

许开喜
南京中医药大学连云港附属医院，江苏省连云港市中医院

目的探讨磁共振磁敏感加权成像(SWI)动脉磁敏感征(SVS）和不对称脉静脉血管征（,AVS)对急性大脑中动脉闭塞(AMCAO)引起急性缺血性卒中（AIS）体积程度的预测研究和临床价值。**材料与方法** 45 例 AMCAO 患者，根据 ASPECTS 评分的为基础的改良为 SWI-ASPECTS 评分。SWI-ASPECTS 显著组和稀疏组以及无 SVS 组、SVS≤20mmm 组、＞21mm 组进行 SWI-ASPECTS 评分量化，比较患者脑梗死体积程度是否差异。**结果** 45 例 AMCAO 的患者中，无 SVS 为 11 例、占 24.4%，有 34 例 SVS 征（SVS≤20mm 为 19 例、SVS>20mm 为 15 例）、占 75.6%。无 SVS 组、SVS≤20mm 组、SVS>20mm 组，其脑梗死体积分别（5.11±5.913）、（22.71± 33.568）和（111.51± 87.352）mm3，三组梗死体积差异有显著统计学意义（P＜0.001），三组梗死 SWI-ASPECTS 评分差异有显著统计学意义（P＜0.01）。随着 SVS 长度增加，SWI-ASPECTS 评分呈减小趋势(经 Spearman 检验，r=-0.538，P<0.001)； AVS 稀疏组 19 例、占 42.2%，AVS 显著组 26 例、占 57.8%，其体积分别（103.555±80.684）和（7.413±8.224）mm3，经 Mann-Whitney U 检验，稀疏组的梗死体积大于显著组，差异有显著统计学意义。(Z=-5.102，P<0.001)。**结论** SVS 颅内动脉严重狭窄或闭塞的标志，代表了血栓形成、预测栓子成分。AVS 代表 AMCAO 的缺血区域软脑膜侧支循环的形成，AVS 越广泛，SVS 长度越小，梗死面积越小，SWI-ASPECTS 评分越高患者的侧支循环分级越高。这对于患者最终梗死体积及临床预后的评估都具有重要意义。

EPO-0149

Vessel Encoded Arterial Spin Labeling Evaluation of Collateral Circulation in Symptomatic and Asymptomatic Patients with Internal Carotid Artery or Middle Cerebral Artery Occlusion

Jinhao Lyu
Chinese PLA General Hospital

Introduction

Symptomatic and asymptomatic patients with internal carotid artery (ICA) or middle cerebral artery (MCA) occlusion have the different prognosis. The symptomatic patients had a higher recurrent stroke than that of asymptomatic patients. The important factors determining the disease evolution include collateral circulation, cerebral vasoreactivity, and etiology of occlusion. Asymptomatic occlusion was considered as the benign condition, differences between symptomatic and asymptomatic occlusion regarding the disease evolution determinants remain unclear, but which is helpful to understanding the mechanism of stroke resulting from artery occlusion and improve patients management. The aim of the study was to evaluate collateral circulation and cerebral vasoreactivity in symptomatic and asymptomatic patients with unilateral ICA and/or middle MCA occlusion.

Methods

In the retrospective study, we enrolled consecutive patients with unilateral ICA or MCA occlusion confirmed by MRA, computed tomography angiography or Digital subtraction angiography (DSA) from June 2015 to June 2017. Patients with MCA and/or ICA stenosis were excluded. Patients with ipsilateral ICA ≥ 50% stenosis were excluded. Patients with evident cardioembolism and other pathologies such as vasculitis, dissection, and Moyamoya disease were excluded. Symptomatic patients were defined as having an

ischemic stroke/TIA within 90 days and asymptomatic patients were defined as having no history of ischemic event. All patients had underwent routine head MRI, Vessel Encoded Arterial Spin Labeling (VE-ASL) (technique: pseudo-continuous labeling scheme, labeling duration=1500ms, post labeling delay=2000ms) and Dynamic susceptibility contrast (DSC) perfusion imaging. VE-ASL was used to evaluate collateral circulation and DSC was used to assess cerebral vasoreactivity by mean transit time (MTT) map according to a previous study.[1] The VE-ASL perfusion information was combined with 3-colored cerebral blood flow maps of the left carotid, right carotid, and posterior circulation territories. The presence of collateral flow was identified by the color compared with the standard anterior cerebral artery/MCA flow territory obtained from volunteers. Variants of Circle of Willis including missing A1 segment and fetal type posterior cerebral artery were carefully and thoroughly considered. The intensity of collateral flow was categorized as: Grade 1, collateral flow distributed less than 1/3 target downstream territory; Grade 2, collateral flow distributed within 1/3-2/3 target downstream territory; Grade 3, collateral flow distributed more than 2/3 target downstream territory. The pattern of collateral flow was categorized as: A. Anterior dominant pattern: collateral flow mainly originated from anterior cerebral artery(ACA) by anterior communicating artery or leptomeningeal collateral; B. Posterior dominant pattern: collateral flow mainly originated from posterior cerebral artery(PCA) by posterior communicating artery or leptomeningeal collateral; C. Anterior and posterior pattern: collateral flow equally originated from ACA and PCA. Relative MTT value, as well as other parameters, were calculated by volumetric measurements of affected territory divided normal territory. If patients also had underwent DSA, the DSA data were collected. Collateral pattern and intensity were graded by a scaling system named Collateral index score which represented the origination and robustness of collateral.[2] Comparison between asymptomatic group and symptomatic group was conducted using student’s t-test/Mann-Whitney test and Chi-squared test.

Results

Totally, 35 patients (51.80±12.99 years, 28 men) including 25 symptomatic and 10 asymptomatic patients were recruited. Twelve patients had also underwent DSA. Kappa was 0.815 for the intensity of collateral and was 0.855 for the pattern of collateral between collateral evaluation by VE-ASL and DSA. In VE-ASL, The intensity of collateral in asymptomatic patients was significantly better than symptomatic patients (median 3, interquartile range(2.75-3) versus median 2, interquartile range(1-2), P=0.0001), whereas the pattern of collateral showed no significant differences. Collateral intensity and pattern showed no significantly different between different lesion location, In DSC, relative cerebral blood flow value was significantly greater in the asymptomatic group than the symptomatic group. Relative MTT value showed no significant differences. Risk factors were not significantly different between the symptomatic and asymptomatic group.

Conclusion

The present study indicates that hemodynamic impairments in symptomatic patients with ICA/MCA occlusion may be mainly induced by the insufficiency of collateral circulation. As a feasible and useful approach to evaluate the intensity and pattern of collateral flow, VE-ASL may be helpful in stratifying high-risk patients with ICA/MCA steno-occlusion.

Analysis of cerebral small vessel disease and clinical factors in young patients with symptomatic cerebral infarction

Yuhan Jiang,Yanwei Miao,Peipei Chang,Yiwei Che
The First Affiliated Hospital of Dalian Medical University

Purpose To evaluate and compare MRI manifestations of cerebral small vessel diseases (CSVD) in young patients with symptomatic cerebral infarction and then to exploit the correlation between CSVD and clinical factors.
Materials and Methods Retrospectively collect clinical and imaging data of 54 young acute ischemic stroke patients (43 males, 11 females, mean age=38.4±4.7 yrs). 57 elderly patients with acute ischemic stroke (37 males, 20 females, mean age=68.9±10.3 yrs)and 21 patients (17 males, 4 females, mean age=39.7±4.2 yrs) whose age and gender matched with the young group were recruited as control. Demographic features and clinical risk factors were recorded. All patients underwent conventional sequences (including T1WI, T2WI and T2 Flair) and DWI on 1.5T MRI scanner. Basal ganglia (BG) and centrum semiovale (CS) EPVSs, white matter hyperintensity (WMH), lacunar infraction (LI), cerebral microbleeds (CMBs) were rated. Calculate and classify total burden scores of CSVD (TBS). The Kruskal-Wallis H test was used to compare the ranked data between groups. Correlation between CSVD and clinical factors were assessed by spearman correlation analysis. The possible influencing factors (univariate analysis P ＜0.05) were further analyzed by multivariate logistic ordered regression analysis.
Results Compared with the young control and the elderly group, young patients with cerebral infarction showed a significant difference in TBS between the three groups (P ＜0.001 after adjustment). The EPVS, LI, CMBs and TBS in the young patient group were significantly higher than those in the young control group, but EPVS, WMH and TBS were significantly lower than those in the elderly group (P＜0.001 after adjustment).In multivariate logistic ordered regression, hypertension was independently associated with TBS and EPVS in the BG and CS in young patients (P＜0.05).Besides, age and smoking are closely related to LI and CMBs respectively in young patients with cerebral infarction (P＜0.05).
Conclusion Young patients with acute symptomatic cerebral infarction often combined with CSVD. Hypertension, smoking and age are the influencing factors.

SWI 诊断脑微出血对急性缺血性脑卒中预后及随访的价值研究

高科,罗禹,何文辉,周永明
同济大学附属上海市第四人民医院

目的 分析 SWI 诊断脑微出血与急性缺血性脑卒中治疗前后脑灌注的改变、NIHSS 评分的变化和 mRS 评分的相关性，来评估通过 SWI 诊断颅内微出血灶对急性缺血性卒中做早期预后判断的临床价值。
方法 收集 2016 年 1 月至 2018 年 12 月我院收治的发病在 24 小时内急性缺血性脑卒中患者共 100 例，所有患者到院 1 小时内完成首次磁共振检查，按照中国缺血性卒中治疗规范标准化治疗一周后复查磁共振，成像序列包括 DWI、PWI、SWI，并取得患者完整临床资料。根据首次磁敏感加权成像诊断有无脑微出血，将患者分为微出脑血阳性组和阴性组，比较两组患者治疗后脑灌注 Tmax 延迟的脑容积及治疗前后变化的程度、治疗后 NIHSS 评分以及出院后随访 mRS 评分有无显著性差异；数据以“中位数 （四分位差）”表示，P<0.05 为有显著性差异。
结果 两组患者在年龄、性别、急性缺血性卒中的主要危险因素（包括高血压、糖尿病、房颤、吸烟、饮酒）以及收缩压、舒张压、主要实验室检查项目（包括血糖、胆固醇、甘油三酯、高密度脂蛋白、低密度脂蛋白和纤维蛋白原）的均无显著性差异。两组患者入院 NIHSS 评分、Tmax>4s 脑容积和 Tmax>6s 脑容积、发病至入院时间、梗塞的部位分布和治疗方式也没有显著性差异。治疗后脑微出血阳性患者 Tmax>4s 脑容积为 61（165.75）ml、Tmax>6s 脑容积 6（48）ml、NIHSS 评分 2（5）、mRS 评分 3（3），脑微出血阴性组四项值为 12（36）ml、0（3）ml、1（3）、1（2），两组间均有显著性差异，治疗后 Tmax>4s 脑容积及 Tmax>6s 脑容积恢复的容积、NIHSS 评分降低的值也有显著性差异。
结论 脑微出血阴性的急性缺血性卒中患者治疗后脑灌注的恢复、NIHSS 评分和 mRS 评分均好于脑微出血阳性患者，通过 SWI 诊断脑微出血可以对急性缺血性脑卒中做早期预后判断。

Cortical microstructural changes in chronic lacunar infarcts

Hui Hong,Minming Zhang,Xinfeng Yu,Yeerfan Jiaerken,Ruiting Zhang,Shuyue Wang
the second affiliated hospital of Zhejiang University, School of Medicine

Background and Purpose
Lacunar infarcts may cause disturbances of cortical microstructural remote from the primary lesion. Here, we used Neurite orientation dispersion and density imaging (NODDI) to spatially characterize cortical microstructural abnormalities identified by probabilistic diffusion tensor tractography starting from the chronic lacunar infarcts.
Methods
In 25 patients with single lacunar infarct, we reconstructed the affected white matter tract using probabilistic fiber tractography. And then identified the corresponding affected cortex. The corresponding nonaffected lesion in the contralateral hemisphere served as a control cortex. orientation dispersion, neurite density, isotropic volume fraction indices (ODI/NDI/ISO) were projected to the corresponding cortex.
Results
Affected cortex neurite density indices(NDI) remote from chronic lacunar stroke significantly decreased compared with the control cortex (P=0.001). There were no significant differences in isotropic volume fraction (ISO) and cortex. orientation dispersion (ODI) between affected cortex and control cortex.
Conclusions
Chronic lacunar infarcts are associated with abnormalities in the affected cortex that extend beyond the lesion visible on conventional MRI. Our initial results suggest cortex changes after lacunar infarcts deriving from the loss of neurite density rather than the changes of orientation dispersion which is more sensitive to be affected in white matter.

EPO-0153

Brain Volume changes in children with moyamoya disease after indirect surgery

Yuting Liu,Meijiao Zhu,Wang Ying,Yang Ming
Children’s hospital of Nanjing Medical University

Purpose: Neurocognitive impairment is often reported in postoperative moyamoya disease (pMMD). We aimed to evaluate brain volume changes and correlated with neurocognitive impairments in children with MMD after indirect surgery.
Materials and Methods: In this study, 13 MMD children who underwent indirect surgery and 14 healthy controls were recruited. Total Brain Volume (TBV), Grey Matter Volume (GMV), White Matter Volume (WMV), ration of GMV/TBV, ratio of WMV/TBV and ratio of WMV/GMV were calculated based on high-resolution T1-weighted image by using SPM12 software. Wechsler Intelligence Scale was applied to evaluating cognitive function. We compared brain volume between two groups and also explore the correlations between brain volume alterations and clinical variables and Wechsler Intelligence Scale scores in pMMD.
Results: There were no difference in TBV and GMV between two groups. However, compared with controls, pMMD showed decreased WMV, WMV/TBV and WMV/GMV, and pMMD also showed significantly decreased performance intelligence quotient (PIQ) scores. In addition, there was positive correlation between PIQ and GMV/TBV (p=0.042, r=0.569), negative correlations between age and GMV/TBV (p=0.002, r=0.766), postoperative time and GMV (p=0.011, r=-0.679) in pMMD.
Conclusion: Our study found aberrant brain volume and worse PIQ in pMMD and demonstrated cognitive decline, providing insight into the neuropathological nature of this disease.

通过 CT 灌注定量侧枝预测急性脑卒中大血管闭塞的亚型

夏沪伟,张子锐,陈伟建
温州医科大学附属第一医院

目的
目前尚无快速、准确的方法来识别不同脑卒中亚型，且侧枝在不同脑卒中亚型中是否起着不同的作用尚不清楚。本研究目的是检验一种评价侧支血管功能的新方法能否成为急性脑卒中亚型的独立预测指标，并评价其与不同脑卒中亚型临床预后之间的关系。
方法
回顾性收集诊断为 AIS 且大脑中动脉 M1 段完全闭塞的病人。通过 CT 灌注得到脑侧枝最大血流灌注量($cCBF_{max}$)；脑卒中亚型按 TOAST 标准确定；症状出现后 3 个月采用改良 Rankin 量表评定临床预后；最终梗死体积用随访 NCCT 或 DWI-ASPECTS 评分确定，采用多变量 Logistic 回归检验 $cCBF_{max}$ 与脑卒中亚型的关系。
结果

86 名脑卒中患者符合纳入标准，其中 LAA 卒中患者 26 名，CE 卒中患者 42 名，UE 卒中患者 18 名。$cCBF_{max}$是 (A)LAA 卒中(OR, 0.941;95%CI,0.901-0.983; P=0.006)的独立预测因素，经过调整性别，基线 NIHSS 评分、基线 NCCT-ASPECTS、高血压、TG 和(B)CE 卒中(OR, 1.043;95%CI,1.009-1.078; P=0.012)的独立预测因素，经过调整年龄、男性、吸烟和低密度脂蛋白(LDL)。临床预测模型经加 $cCBF_{max}$后在 LAA 脑卒中(AUROC 0.807vs0.717，p=0.03)和 CE 脑卒中(AUROC 0.801vs0.726，p=0.049)中预测能力明显升高。较高的 $cCBF_{max}$与 CE 患者较好预后(r=-0.567，p<0.001)、较低 NCCT 或 DWI-ASPECTS(r=0.473，p=0.002)和较低死亡率(r=-0.434，p=0.004)有关，而与 LAA 患者无关。

结论

$cCBF_{max}$作为一个简便的方法是可行的，可作为 LAA 卒中和 CE 卒中的独立预测指标，侧枝血管功能与 CE 病人临床功能转归密切相关，而对 LAA 卒中则可能无明显影响。

EPO-0155

Improving the accuracy of quantifying carotid atherosclerotic plaques with high definition acquisition and reconstruction

Xiaoling Yao
West China Hosipital of Sichuan University

PURPOSE

To investigate the accuracy of quantifying carotid atherosclerotic plaques with high-definition (HD) acquisition and reconstruction model on a high-definition computed tomography (HDCT) system.

METHOD AND MATERIALS

20 Patients with carotid stenosis and plaques (9 males, 11 females, mean age 66±0.46y) underwent HDCT carotid arteries angiography with a high-definition acquisition mode. Images were reconstructed with the high-definition algorithm with the new adaptive statistical iterative reconstruction (ASIR-V) at 50% strength (50% ASIR-V) and standard algorithm with 40% ASIR-V. The axial images of the two reconstructions were further processed to generate the maximum intensity projection (MIP) and multi-planar reconstruction (MPR) three-dimensional images. CT values, standard deviation (SD) in arteries and muscle and the areas of plaques, calcifications and the degree of stenosis in vessels were measured. Contrast-to-noise ratio (CNR) for the carotid arteries was calculated (CNR= (CT carotid arteries -CT muscle) / SD muscle. All measured data were compared using paired sample t test for statistical analysis using SPSS software, α=0.05 indicating significant difference.

RESULTS

73 plaques, including 28 calcified plaques, 23 mixed plaques and 22 soft plaques were identified in both standard and HD reconstructions. CNR values of two reconstruction methods were statistically the same (P>0.05). However, the area measurement for the calcified plaques with the HD reconstruction (3.60±3.00mm2) was statistically smaller than that with the standard reconstruction (4.27±3.45mm2) (p=0.02). There was no difference between the two reconstructions in the vascular stenosis degree (P = 0.129) and plaque area measurement (P = 0.598) .

CONCLUSION

High-definition acquisition and reconstruction on a HDCT system improves the accuracy of quantifying calcified carotid atherosclerotic plaques.

EPO-0156
高分辨率磁共振粥样硬化性大脑中动脉管壁特征与脑梗死类型相关性研究

张越,卢洁
首都医科大学宣武医院

目的：利用 3.0 T 高分辨率磁共振成像（HRMRI）研究粥样硬化性大脑中动脉（MCA）管壁特征，探究其与脑梗死类型的相关性，从而对梗死机制进行预测。
方法：回顾性分析 32 例行颅内动脉 HRMRI 检查的急性脑梗死患者，HRMRI 采用 3D 可变翻转角度快速自旋回波 T1 加权（3D T1 SPACE）序列。分析其 MCA 的斑块形态、分布、强化程度，管腔狭窄程度以及重构指数（正性重构）。根据扩散加权成像（DWI）图像上 MCA 供血区急性梗死灶的数量(分为单发与多发梗死)及位置分布（分为穿支动脉梗死、分水岭梗死与皮质梗死)对梗死进行分型，探讨 MCA 管壁特征与梗死类型之间的关系。
结果：32 例急性梗死患者中，多发梗死 21 例，单发梗死 11 例。多发梗死组中分水岭梗死居多(16 例，76.2%)；单发梗死组均为皮质下深穿支动脉梗死（11 例，100%）。30 例(93.8%)偏心性斑块；斑块在穿支动脉梗死中多位于上壁（7 例，63.6%），分水岭梗死中多位于腹侧壁(12 例，75.0%)。单发与多发梗死组病人的临床资料及实验室检查指标比较，差异无统计学意义（P 均＞0.05）。多发梗死组中斑块位于腹侧壁、斑块明显强化、PR 重构方式的发生率以及管腔狭窄程度均大于单发梗死组，差异具有统计学意义（P 均＜0.05）。
结论：颅内粥样硬化性 MCA 斑块的位置分布与脑梗死类型密切相关，斑块位于上壁，多发生穿支动脉梗死，且多为单发梗死。斑块强化程度能够反映其稳定性。利用 HRMRI 能够直观显示粥样硬化性 MCA 的管壁特征，在一定程度上预测其梗死类型

EPO-0157
体素内不一致运动磁共振成像在缺血性脑卒中的应用价值研究

王巧丽
1.锦州医科大学附属第一医院
2.锦州医科大学附属第一医院

目的：研究体素内不一致运动磁共振成像(IVIM-MRI)的相关参数灌注分数 f、扩散系数 D 和伪扩散系数 D*评估梗死灶及周边区域的应用价值。材料与方法：材料：本次研究采用前瞻性的研究方法。按照中国急性缺血性脑卒中诊断指南（2014 版）中急性缺血性脑卒中的诊断及分期标准，收集 20 例急性及亚急性缺血性脑卒中患者，并排除脑肿瘤、出血及外伤等影响脑血流的疾病。仪器及后处理软件：设备：Siemens verio 3.0 T MRI；采用 MITK-Diffusion。数据测量：选择只存在单侧病灶且病灶的最大范围层面，手动画取病灶区域范围，作为感兴趣区，获得 D、D^*、f 值，以脑中线作为对称轴，于健侧镜像对照区选取相同大小及形状的感兴趣区，计算 D、D^*、f 值。手动在病灶周边宽约 5mm 区域范围内画取合适范围，作为感兴趣区，获得 D、D*、f 值，以脑中线作为对称轴，于健侧镜像对照区选取相同大小及形状的感兴趣区，计算 D、D*、f 值，每个区域测量间隔一周测量三次，计算平均值。 4、统计学分析：采用 SPSS 21.0 统计学软件进行统计学分析，病变区域与健侧镜像对照区、病灶周边宽约 5mm 区域与健侧镜面对照区 IVIM-MRI 相关参数进行统计

学分析。结果： IVIM-MRI 对缺血性脑梗死灶大小、形态及部位的评估与常规 MRI 序列相一致；梗死区 D 值、f 值较镜面健侧减低，且差异存在统计学意义，梗死区 D* 值较镜面侧比较差异不存在统计学意义；梗死周边 5mm 宽范围内感兴趣区的 D 值较镜面健减低，且差异存在统计学意义，梗死周边 5mm 宽范围内感兴趣区 D*及 f 值较镜面健侧减低，但差异不存在统计学意义。结论:IVIM-MRI 参数中的 D 值、f 值可用于评价缺血性脑梗死灶；参数 D 值提示梗死灶扩散受限，f 值提示毛细血管灌注血容量减少；参数 D 值提示梗死灶周边 5mm 范围内存在水分子扩散受限改变。

动态对比增强磁共振成像（DCE-MRI）在急性大面积脑梗死患者病情及预后评估中的价值

张莉,樊蓉,林齐欢,郑文斌
汕头大学医学院第二附属医院

目的 探讨动态对比增强磁共振成像（DCE-MRI）在急性大面积脑梗死患者病情及预后评估中的价值。

方法 收集我院急性期大面积脑梗死患者 16 例，在急性期内对患者进行 3T 磁共振平扫、DWI、DCE 检查，获取相关数据及图像，并进行对比分析，分别测得脑梗死患者病灶处及镜像对侧脑组织的血流动力学参数：容积转移参数（Ktrans）、速率常数（Kep）及血管外细胞外间隙体积比（Ve）；半定量参数：曲线最大上升斜率（MaxSlope）和强化率（CER）；初始轧曲线下面积（IAUGC）]；对 16 例患者进行急性期及发病 3 个月后 NIHSS 评分，依据 NIHSS 评分进行分组（高分组：大于 15 分， 低分组：小于 15 分），统计学分析比较各 DCE-MRI 参数组间差异是否存在统计学意义。

结果

1、急性大面积脑梗死患者病灶处与对侧正常脑组织的血流动力学参数除 IAUGC 外，余参数差异均有统计学意义（P＜0.05）。

2、急性期 NIHSS 评分分组（高分组 n=7，低分组 n=9），两组间比较参数 IAUGC 与 Ktrans 差异具有统计学意义（P＜0.05）；3 个月后 NIHSS 评分分组：随访 13 例，其中高分组 3 例，死亡 2 例，低分组 8 例，将死亡者合并入高分组并进行统计学分析，两组间比较参数 IAUGC 与 Ktrans 差异具有统计学意义（P＜0.05）。

结论 DCE-MRI 参数（IAUGC 与 Ktrans）在急性大面积脑梗死患者的病情及预后评估中有一定的价值。

Comparation on the Vessel Wall Characteristics of Branch Atheromatous Disease Acute Infarction in Different Artery Territory

Ran Fan,Wei yi Bu,Jun Yang,Cui ping Bao
Tianjin Union Medicine Center

Background: Acute infarction has various mechanisms, branch atheromatous disease (BAD) is one of the common mechanisms. To compare the different vascular pathophysiologies of BAD occurred in the basal ganglia regions and pons, we compared the high-resolution magnetic resonance imaging characteristics between the BAD in the two regions.

Material/Methods: We retrospectively studied 64 patients with acute infarction located in the basal ganglia regions and pons bleeding by proximal middle cerebral artery or basilar artery without carotid/cardiac embolic sources (34 located in the basal ganglia region and 30 located in pons). We divided each group into 2 groups according to whether the vessel has plaques or not. We compared the MR characteristics between the cases in the different regions as well as the vessel wall characteristics.
Results: BAD in the basal ganglia regions and pons had similar clinical features and radiological features such as infarct size and vessel wall characteristics ($P>0.05$). But in the basal ganglia regions, the infarct size of the cases with atherosclerotic plaques is larger than that without plaques($P<0.05$). Vessel wall characteristics including plaque size, remodeling mode, wall area index as well as the location feature between the two regions' lesions had no obvious difference($P>0.05$).
Conclusions: The acute ischemic stroke of BAD in different regions have similar vascular pathophysiology, but in the basal ganglia regions, the atherosclerotic plaques may lead to larger infarct size.

应用功能连接预测脑卒中患者的视野缺损的恢复情况

曹岂溱
十堰市太和医院

目的：运用功能磁共振成像（fMRI）测量的静息状态功能连接（RSFC）变化预测急性卒中患者视野缺损（VFD）的恢复情况。
方法：搜集来我院就诊并治疗的脑卒中患者 29 例。选择与实验组年龄、性别相匹配的正常志愿者 15 例作为对照组。实验组及对照组均进行 RS-fMRI 扫描和高分辨率 T1 加权图像序列扫描，并在初始时、1 周、1 月及 3 月时进行视野检测，以枕叶为功能连接的感兴趣区，通过图像后处理得到相关数据图，并进行相关测算，得到 RSFC 与不同时期 VFS 情况的相关分析。
结果：受影响的半球的平均总偏差发生了显著变化，但未受影响的半球没有显著变化。与对照组相比，卒中发病后 1 周内 VFD 患者枕叶的半球间 RSFCs 水平较低。在卒中后 1 周内，RSFC 与 VFS 之间没有显著相关性。 然而，枕叶半球间 RSFC 与卒中后 1 个月和 3 个月时的 VFS 呈正相关。
结论：卒中发病后 1 周内视皮层中的半球间的 RSFC，可能是预测长期 VFD 恢复的有用生物标志物。

Quantitative association between carotid stenosis and cerebral perfusion on whole brain CT perfusion imaging

Liu MiaoMiao, Xie XueQian.
Radiology Department, Shanghai General Hospital, Shanghai Jiaotong University School of Medicine

Purpose: Carotid stenosis may lead to abnormal cerebral perfusion. The aim is to quantify the association between carotid stenosis and cerebral perfusion using whole brain CT perfusion (CTP) imaging.

Materials and methods: 43 patients were randomly selected. All patients underwent whole brain CTP and carotid CT angiography by a multi-slice CT scanner (GE HD750) in the same day. Two radiologists read all the images and did post-processing using AW4.6 software package. We evaluated both frontal, parietal, occipital, temporal and insular lobes, and basal ganglia regions.Blood flow (BV), blood volume (BF), mean transit time (MTT) and maximal time (Tmax) were derived from CTP. Vessel stenosis percentage were derived from carotid CT angiography. Pearson's correlation coefficient was used to assess the association between CTP and vessel stenosis. ROC analysis was used to determine the optimal stenosis level leading to cerebral perfusion abnormality.

Results: Stenosis level of both carotid arteriessignificantly associated with BV in parietal, occipital and temporal lobe, and basal ganglia region ($P<0.05$), but not BF, MTT and TMax ($P>0.05$). Stenosis level of both vertebral arteries showed no association with cerebral perfusion ($P>0.05$). Abnormal perfusion was observed in

21 patients. ROC analysis indicated that carotid stenosis of 39% was optimal to determine abnormal perfusion, with a sensitivity of 82% and specificity of 79%。

Conclusions: Carotid stenosis associated with cerebral blood volume. A carotid stenosis of 39% has the potential to predict abnormal cerebral perfusion.

Clinical application: Abnormal cerebral perfusion is a risk factor leading to stroke. An investigation on the association between carotid stenosis and brain perfusion would benefit early diagnosis and treatment for abnormal cerebral perfusion.

EPO-0163

Default Mode Network Connectivity in the Asymptomatic Carotid Stenosis is Preferentially Influenced by the Dorsal Pairs

Lei Gao,Haibo Xu
Department of Radiology, Zhongnan Hospital of Wuhan University, Wuchang District, Wuhan City, 430071, Hubei Province, China;

Objective: Severe asymptomatic carotid stenosis (SACS) is an independent risk of cognitive impairment and future strokes. One suggested brain biomarker for cognitive impairment is the decreases in connectivity of default mode network (DMN).
Methods: Twenty-four patients with SACS (19 males/ 5 females; 64.25 ± 7.18 years), 24 comorbidities-matched controls (19 males/ 5 females; 67.16 ±6.10 years), and an independent sample of elderly healthy controls (39 females/45 males; 57.92 ± 4.94 years) were included. Eight-minute resting-state fMRI was acquired for each subject. Pair-wise functional connectivity within the DMN were analyzed using nineteen 6-mm spherical seeds from metanalytical activation of previous publications. Voxel-wise functional connectivity density (FCD) of the DMN was also computed with two types of long-range (> 75mm) and short-range (< 75mm) FCD.
Results: Behaviorally, the SACS patients were severely impaired on recall tasks (Bonferroni correction, $p < 0.05$. Pathologically, patients with SACS had significantly higher WMH loads (ratio between WMH size and total brain size, WMH volumes, and WMH number, $p < 0.005$). For the pair-wise FC within the DMN, patients with SACS exhibited remarkably decreased FC in several pairs of seeds within the default network, especially the dorsal DMN ($p < 0.05$, FDR corrected). Among these significant connectivity pairs, we sorted them according to their statistical weights, and found that FC of LLP_dorsal-RLP_dorsal, LPHP_ventral-RLP_ventral, LPCNG_ventral-RPCNG_ventral, LPHP_dorsal-RSFG_ventral, LMFG_ventral-LPHP_dorsal, LPHP_dorsal-RLP_ventral, LPCC_ventral-RLP_ventral, LPCNG_ventral-RLP_ventral, and LPCNG_ventral-RLP_ventral pairs are among the top 5 %. For the full-range and long-range FCD, significant reductions of FCD in bilateral posterior cingulate/ precunes cortices (voxel-wise $p < 0.05$, FDR corrected) were found in patients with SACS. For the short-range FCD, we only found significant increase in FCD in the left temporal-parietal conjunction in the patients with SACS (voxel-wise $p < 0.05$, FDR corrected).

Conclusions: The SACS patients present significantly distinguishable differences in connectivity within the DMN, especially the dorsal pairs of the DMN, and the connectivity can potentially reflect the extent of cognitive impairment.

EPO-0164

Optimization of scanning parameters to reduce diffusion kurtosis imaging scanning time in hypoxic-ischemic brain injury in newborn piglets model

Peng Wu,Yuxuan Han,Chao Yang
The Second Affiliated Hospital of Dalian Medical University

Purpose: Rapid qualitative and quantitative diagnosis of neonatal hypoxic-ischemic brain damage is essential for neonatal neuroprotective therapy and neurodevelopmental prediction.To reduce the time of diffusion kurtosis imaging (DKI) in newborn hypoxic-ischemic encephalopathy piglets model.

Materials and methods: Twenty-three newborn healthy piglets (20 and 3 in the experimental and control groups, respectively) with a full-day age of 3 days were selected and MR scan performed 6 h after ischemia and hypoxia. DKI scanning parameters, conventional DKI, 30 diffusion directions, TR=4500ms, NEX=2.Fast DKI A, 20 diffusion directions, TR = 3250ms, NEX = 1.Fast DKI B, 15 diffusion directions, TR = 3250ms, NEX=1. The contrast to noise ratio (CNR) of the MK map , percentage change of the lesion MK value, area of the lesion, and total number of lesions. Two piglets from each group were examined for pathology.

Results: There was no significant difference in hypoxic-ischemic lesion areas between the fast DKI A and conventional DKI MK maps (Wilcoxon test; P>0.05). Compared with fast DKI A, fast DKI B MK maps showed a significant difference in hypoxic-ischemic lesion areas. The CNR 0.848 (0.688, 1.01) and the MK percentage change [71.3 (62.5, 93)]of the conventional DKI MK map was significantly higher than that 0.521 (0.444, 0.639)and [39.3 (26.1, 50.7)] of the fast DKI B. In 16 scans, the number of lesions in the conventional DKI, fast DKI A, and fast DKI B MK maps were 155, 155, and 130, respectively. Pathological results showed that the fast DKI A and fast DKI B lesion mismatch only the neuron edema was observed under light microscopy.

Conclusion: Fast DKI A MK maps can quickly test hypoxic-ischemic encephalopathy in newborn piglets model for qualitative and quantitative diagnosis.

EPO-0165

缺血性卒中病人颅内动脉硬化斑块的 HRMRI 特征 及相关临床危险因素研究

焦晟,宋焱,黄娟,陈玉辉,陆军,王宏,陈敏
北京医院

目的：利用 3.0T 高分辨率磁共振成像（HRMRI）技术分析缺血性卒中病人颅内责任动脉斑块特征，并探讨颅内动脉不稳定斑块的临床相关危险因素。
方法：共纳入 49 例缺血性脑卒中病人行颅内动脉 HRMRI 检查，男 35 例，女 14 例，年龄 31~81 岁，平均年龄（60.73±12.4）岁。根据病人斑块与缺血区责任动脉的关系分为责任动脉斑块组和非责任动脉斑块组，分析 2 组病人的 HRMRI 特征。根据斑块的强化程度分为明显强化组和非明显强化组，分析斑块强化程度与临床相关危险因素的关系。计数资料采用 x 2 检验，计量资料采用 t 检验进行统计学分析。
结果：49 例病人共 196 处斑块，其中责任动脉斑块 70 处（35.7%），非责任动脉斑块 126 处（64.3%）；2 组间的管腔狭窄程度、斑块明显强化的比例等差异有统计学意义（P<0.001），责任动脉斑块所致的管腔狭窄程度更为严重、明显强化的比例更高（P<0.001）。明显强化组与非明显强化组之间的年龄、性别、高血压、糖尿病、吸烟史、既往卒中史及家族史差异均无统计学意义。非明显强化组的低密度脂蛋白/高密度脂蛋白（LDL/HDL）比值低于明显强化组（分别为 1.95±0.62 和 2.53±0.94，P=0.048）。
结论：颅内动脉粥样硬化斑块的强化与缺血性卒中事件的发生密切相关。斑块的强化程度能够反映斑块的稳定性。颅内动脉粥样硬化常见的危险因素并不能完全反映斑块的稳定性，LDL/HDL 比值升高有可能作为不稳定斑块的预测因子。

形态学成像结合临床指标评估急性缺血性卒中预后：与功能成像对照研究的进展

全冠民
河北医科大学第二医院影像科

讲座摘要：急性缺血性卒中（AIS）早期预后评估对于积极采取血管内治疗和手术治疗具有重要作用，目前多采用复杂、甚至有创的功能成像进行预后评估研究，虽然效果良好，且能较好地反映脑梗死局部病理生理学状态，但这些功能成像需要一定的技术支持、操作较复杂，解读标准不统一；而简便易行的形态学成像的评估价值尚未完全认识。作者就 CT 和 MR 病变与颅腔相对容积、相对密度及信号特征、高密度血管征、脑沟裂形态改变、病变范围基本评分（如 ASPECT）、非对比增强侧支循环评分，结合临床指标，如年龄、AIS 高危因素、入院时神经功能评分等对 AIS 预后早期评估的进展进行解读，比较形态学指标联合预测模型对于 AIS 预后评估的作用。

Predicting the outcome of STA-MCA Bypass Surgery depends on hemodynamics differences between Intracranial and Extracranial Circulation in MOYAMOYA Disease

Wenbo Sun[1], Xuan Dai[2], Zhao Ruan[1], Sirui Li[1], Haibo Xu[1]
1. Department of Radiology, Zhongnan Hospital of Wuhan University, Wuhan, China,
2. Department of Neurosurgery, Zhongnan Hospital of Wuhan University, Wuhan University, Wuhan, 430071, P. R. China

Abstract: This study aimed to investigate hemodynamic changes in Moyamoya disease (MMD) via two-dimensional cine phase-contrast magnetic resonance imaging and computational fluid dynamics, and determine whether the STA-MCA bypass surgery is feasible.
Method: 18 patients with MMD prepared for surgery were recruited. Phase-contrast magnetic resonance imaging was performed to quantify flow rate of main supplying arteries, including internal carotid arteries (ICAs) and vertebral arteries. Mean flow rate in these vessels was adopted as the patient-specific boundary condition for computational fluid dynamics simulation of the circle of Willis in MMD【1】. The pressure drop in both STAs and both ICAs in each subject was calculated. A pressure drop ratio (PDR) between the STA pressure drop and the ICA pressure drop was proposed to access the hemodynamic differences between the intracranial and extracranial circulation in MMD, and CTP was also performed for each subject before and after surgery. A correlation analysis was performed between PDR and cerebral blood flow (CBF). Clinic scales were also acquired to evaluate the prognosis.
Result: PDR result has a correlation ship with (CBF). Those patients with bigger PDR >7 and <2 in the the operation side showed a poor prognosis after surgery. Those patients with PDR between 2<PDR<7 showed a good outcome.
Conclusion: Hemodynamics differences between the intracranial and extracranial circulation in MMD, such as PDR, could be used to evaluate impairments in cerebrovascular reserve, and as an indicator to determine whether the STA-MCA bypass surgery is feasible.

EPO-0168

Beyond the carotid arteries: asymptomatic stenosis is associated with consistent changes to cortical morphology

Lei Gao,Haibo Xu
Department of Radiology, Zhongnan Hospital of Wuhan University, Wuchang District, Wuhan City, 430071, Hubei Province, China;

Objective: This study aimed to explore cortical morphologies (thickness, sulcal depth, gyrification, and cortical complexity) and brain lesions measured by multiparameter structural magnetic resonance imaging (MRI) parameters in patients with unilateral severe (stenosis > 70%) asymptomatic carotid stenosis (SACS).
Methods: Twenty-four patients with SACS (19 males/ 5 females; 64.25 ± 7.18 years), 24 comorbidities-matched controls (19 males/ 5 females; 67.16 ±6.10 years), and an independent sample of elderly healthy controls (39 females/45 males; 57.92 ± 4.94 years) were included. Surface-based cortical measures of the cortical thickness, sulcal depth, gyrification, and cortical complexity were computed based T1-3D high-

resolution anatomical images. Susceptibility weighted imaging based microhemorrhagic lesions, and T2-weighted white matter hyperintensities were also quantified.
Results: Significantly and robust cortical reductions across the multiparameter-based measures of the thickness, sulcal depth, gyrification, and complexity (validated by the independent dataset) were identified around the Perisylvian fissure and somatomotor areas in patients with SACS (false discovery rate corrected, $p < 0.05$). These involved areas span across the large-scale brain systems of somatomotor, salience, dorsal attention, and orbitofrontal-limbic. Further association analyses suggest that the decreased thickness and gyrification in left insula and superior temporal gyrus best reflect the delayed recall memory and other simple cognitive as well as sensorimotor functions measured by the metanalytical Z scores.
Conclusions: These results suggest that the SACS preferentially affects the lower hierarchy of the cortical anatomy, while the higher hierarchy, especially the topographies of default mode network are least impacted, which may be a hallmark of a precursor to vascular dementia. The multiparameter morphological measures may help to noninvasively track the progression of downstream cerebral damages under asymptomatic carotid stenosis.

EPO-0169

BRAIN STRUCTURAL AND FUNCTIONAL PLASTIC STUDY OF BASAL GANGLIA STROKE DURING MOTOR RECOVERY

Lijun Pan[1], Juan Wang[1], Jing Wang [2], Zengai Chen[1]
1. Ren Ji Hospital, School of Medicine, Shanghai Jiao Tong University
2. School of Medicine, shanghai jiao tong university

Objective: Studies shows that structural and functional cerebral reorganization exist during motor recovery of stroke patients. Corticospinal tract (CST) has shown structural change and the change is correlated with motor dysfunction. Damage on basal ganglia (BG) affects CST integrity and impacts on cerebellum (CB) and thalamus, both of which involve motor control and learning. We combined DTI and fMRI methodologies to investigate dynamic changes of CST pathway, BG-thalamus-cortical loop, CB-thalamus-cortical loop and the correlation of these loops along with motor recovery.
Methods: We recruited 14 basal ganglia stroke patients and performed DTI and fMRI scan for 3 sessions (S1:2w, S2:1-3m, S3:>3m). Fugl-Meyer (FM) motor assessment was acquired and finger-tapping task was performed during fMRI scanning. We calculated diffusion parameters of CST pathway and activation level of motor-related regions, analysed the correlation with FM score.
Results: The lateralization of bilateral CST fractional anisotropy (FA) value was positively correlated with FM score during S2, implying the importance of CST integrity in maintaining good motor function. The FAs in contralesional CP and PLIC during S1 were associated with changes of FM score, motor recovery was dependent on the damage degree of ipsilesional CST. The fMRI results showed CB functional lateralization correlated with motor recovery. The more contralesional dominance of CB activation at S1, the better motor recovery is at S2; but S2 showed the opposite trend to predict S3 stage motor function. Significant activation of cingulate gyrus during

S2 predicted functional motor recovery of S3, implying the role of attentional modulation.
Conclusions: The longitudinal study on motor recovery after stroke consolidates the hypothesis that basal ganglia stroke patients dysfunction in the three mentioned loops. The neuroimaging biomarkers showing significant correlation with motor recovery provide informative target for treatment.

EPO-0170

Application of the tecnique of contrast agents based on compound body weight factor in head and neck CTA

Yang Li,Chu Pan,Weijia Wan,Junwu Hu,Liming Xia,Wenhua Huang
Tongji Hospital of Tongji Medical College, Huazhong University of Science and Technology

Objective: To explore the feasibility of the contrast agent dose estimation method based on Tongji index in CTA examination of head and neck. **Methods:** Forty patients served as the experimental group underwent head and neck CTA with the use of contrast agent based on the weight and height named as compound body weight factor and tube voltage of 100kV. Twenty-six patients served as controls underwent head and neck CTA at the same spiral CT scanner with the use of contrast agent based on weight and conventional tube voltage of 120kV. An independent sample *t*-test was used to compare the contrast agent dose, radiation dose, and the CT value and relative enhancement CT values of aortic arch, right common carotid artery, right internal carotid artery, right vertebral artery, basilar artery, posterior cerebral artery, middle cerebral artery, and anterior cerebral artery between the experimental group and the control group, and the signal-to-noise ratios (SNR) and contrast noise ratios (CNR) of the CTA images in the two groups were also compared by the *t*-test. Subjective evaluation of the CTA image quality in the two groups was performed using a double-blind method and compared using Mann-Whitney *U* test. **Results:** The contrast agent dose in the experimental group was (55.4±5.9) mL, and (62.8±7.9)mL in the control group. There was a statistical difference in the contrast agent dose between the two groups (t=4.348, P<0.05). The dose length product (DLP) in the experimental group and control group was (489.1±55.0) and (555.6±78.7) mGy•cm, respectively. There was a statistical difference in radiation dose between the two groups (t=4.045, P<0.05). The CT values and enhancement CT values of the eight arteries observed in the experimental group were higher than those in the control group, and the differences were statistically significant (P<0.05). There were no statistical differences in the SNR and CNR between the two groups (P>0.05). The score of image quality in the experimental group was better than that in the control group with statistical significance (P<0.05). **Conclusion:** The method of contrast agent estimation based on compound body weight factor combined with low tube voltage may reduce contrast agent dose and radiation dose on the premise of ensuring image quality and satisfying clinical diagnosis needs.

EPO-0171

无症状颈内动脉狭窄的脑灰质不对称性研究

高磊,徐海波
武汉大学中南医院

目的：重度（＞70%）无症状颈内动脉狭窄是缺血性卒中的独立高危因素，也是血管性认知损害的主要原因。狭窄侧半球的血流动力学改变和沉默性病灶可能导致半球间脑实质不对称性的丢失、及相应神经认知功能的损害。本研究旨在使用 T1-3D 高分辨解剖图像建立这类无症状人群的脑损害偏侧化指标，进而辅助识别高风险人群。
方法： 24 例单侧无症状颈动脉重度狭窄患者（无先前 TIA 和卒中的发生，12L/12R，单侧狭窄 70~99%，64.25 ±7.18 岁）24 例人口统计学及合并症相匹配的健康老年人（67.16 ±6.10 岁）作为对照，同时纳入 84 例健康老龄数据作为独立对照样本。采集 T1-3D、T2-FLAIR-3D 及 SWI-3D 全脑高分辨形态解剖成像。T1 高分辨图像经非线性配准到镜像对称解剖模板、左右翻转、DARTEL 空间标准化及调制后，计算右侧半球体素水平的灰质不对称性指数（Asymmetry Index, AI）并使用 8mm 空间平滑用于随后的组间统计。FLAIR 及 SWI 图像经过信号校正、空间标准化、病灶识别后用于计算脑白质高信号的体积、空间位置和微出血灶的体积及空间位置。
结果：我们的初始（24 vs 24）及重复分析（24 vs 84）均发现单侧无症状颈内动脉狭窄患者呈现显著的灰质右侧偏侧化，特别是围绕外侧裂的中央前后回、颞上回、颞中回、岛叶、角回，以及海马、丘脑和壳核（体素水平 FDR 校正，$p < 0.05$）。同时患者呈现显著较高的脑白质高信号体积比及 SWI 低信号，特别是岛叶及角回的灰质不对称性能部分由脑白质高信号体积比解释。
结论：无症状重度颈动脉狭窄患者呈现显著的右侧灰质偏侧化，且与狭窄侧别无关，提示稳定的半球间灰质不对称性丢失及解剖重塑，反映了潜在的慢性适应不良性脑改变。个体水平灰质不对称性指标，特别是岛叶及角回区域的灰质右侧偏侧化可能是一种反应患者脑损害程度的潜在生物学标志物，但需要进一步的大样本验证。

Comparative study of SWI and 3D-TOF-MRA in detection thrombus in acute cardioembolic stroke

Yan Liu,Ruwu Yang
Xidian Group Hospitals, Xi'an

Objective: To explore the clinical application of SWI and 3D-TOF-MRA in detection of intravascular thrombus in the primary of acute cardioembolic stroke. **Methods:** In 50 patients with acute cardiogenic stroke, SWI and 3D-TOF-MRA were analyzed to determine the matching degree of position in displaying thrombus, vascular occlusion or stenosis. **Results : (1)**In 50 patients, the detection rate of SVS was 78%, 3D- TOF-MRA was 60%. There was significant difference in the total detection rate of thrombus between SWI and 3D-TOF-MRA(P<0.05); The SVS was observed in 9 patients without occlusion on 3D-MRA. (2) The results of SWI and 3D-TOF-MRA were consistent in 30 patients, the detection rates of thrombus in M1segment were 36% in both examinations, they were no significant difference; while detection rates of thrombus within the distal of M1 segment have significantly difference (32% for SWI versus 14% for 3D-TOF-MRA,P<0.05). **Conclusion:** In this study, we concluded that SWI is superior to 3d-tof -MRA in the accurate positioning of embolus in ACS patients, which was expected to be the first choice to

determine the location of ACS emboli, a new diagnostic model for ACS patients to select treatment plan and evaluate the prognosis will be established.

EPO-0173

Cerebral Amyloid-β -Related Angiitis: Case Report and Literature Review

Jinhao Lyu
Chinese PLA General Hospital

Purpose

To report a case of amyloid beta-related angiitis (ABRA), discuss diagnosis and differential diagnosis, review the literature, and emphasize early diagnosis of the disease by neuroimaging.

Method

One patient was described with histopathologically confirmed ABRA. We also summarized the imaging finding of ABRA from the published literature.

Results

A 61-year-old female patient with sub-acute onset of headache, vomiting for 2 months and mental disorder for 1 month. The patient had previously psoriasis. MRI was performed when admission which showed that multiple lesion with hyperintensity on T2 weighted imaging, hypointensity on T1 weighted imaging (T1WI), the lesions demonstrated hyperintensity on diffusion-weighted imaging (DWI), which indicated multiple infarctions. Heterogeneous contrast enhancement of part of the lesions as well as leptomeningeal enhancement was observed on post-contrast T1WI. Susceptibility weighted imaging showed linear hypointensity located in the superficial cortex which suggested hemorrhage. Arterial spin labeling perfusion showed cerebral blood flow of bilateral hemisphere decreased. MRA showed normal. The patient had also performed examinations of cerebral spinal fluid (CSF) and found no cancer cell. CSF studies including autoimmune encephalopathy panel were unremarkable. PET-CT also suggested lowered metabolism of the brain. The patient had follow-up MRI scans after corticosteroid pulse therapy and showed dynamic changes of the lesions with some turning invisible and newly found lesions within one month. The diagnosis included meningeal metastases, primary central nervous system vasculitis/ secondary vasculitis, infectious disease and cerebral amyloid angiopathy. The patient received MRI-guided biopsy which revealed granulomatous perivascular inflammation and extensive Aβ staining in the vessel walls consistent with amyloid-β -related angiitis. ABRA. She was then received long-term immunosuppression and clinical symptom had improved. The available literature revealed that partial overlap exists between the clinical features and investigation results of inflammatory cerebral amyloid angiopathy, ABRA, and primary angiitis of the central nervous system (PACNS). Most inflammatory cerebral amyloid angiopathy and ABRA patients are beyond 50 years, whereas one-half of PACNS patients present before this age. Brain MRI commonly shows white matter T2-hyperintensities and leptomeningeal gadolinium enhancement.[1]

Conclusion

ABRA is a rare cause of central nervous system vasculitis, with clinical and radiologic features that overlap with those of cerebral amyloid angiopathy and PCNSV. Definite diagnosis requires brain and leptomeningeal biopsy. Early diagnosis is critical for early treatment to improve clinical outcome. Age ≥50 years, the presence of multiple confluent lesions which can be hyperintensity on DWI with focal or diffuse cortical hemorrhages and leptomeningeal enhancement should alert radiologists to consider the possibility of ABRA.

EPO-0174
SWI 成像对多发性硬化和视神经脊髓炎的鉴别诊断价值

叶海琪,陈骞蓝,陈唯唯
华中科技大学同济医学院附属同济医院

背景与目的：多发性硬化（MS）和视神经脊髓炎（NMO）虽同为中枢神经系统炎性脱髓鞘疾病，但两者的治疗方法不同，早期的鉴别诊断一直是临床工作中的难题。近年来影像及病理均证实铁质异常沉积极有可能是 MS 发生发展的机制之一，而 NMO 病灶内是否也存在铁质沉积尚不清楚。本研究拟采用 SWI 研究 MS 及 NMO 病灶内铁质沉积及中心静脉征的差异，用以鉴别诊断。
材料与方法：回顾性收集我院 2017 年 9 月至 2019 年 7 月临床证实的连续的 30 例 MS 患者及 18 例 NMO 患者。所有患者均行常规及 SWI 序列成像。T2w 高信号灶被定义为 MS 或 NMO 病灶，由两名有经验的放射科医师对图像进行单独随机盲法阅片，记录所有病灶在 SWI 的 Phase 图上的信号改变，病灶周围低信号环征及 CVS 征，结果有差异时共同协商达成一致意见。两组病灶在信号特征，CVS 征的差异及两观测者之间的差异均采用卡方检验进行比较。
结果：两组病人共检出 362 个 MS 病灶及 135 个 NMO 病灶。SWI-Phase 图上 82.6%的 MS 病灶（299/362）呈低信号，17.4%的 MS 病灶（63/362）呈等信号，1.5%的 NMO 病灶（2/135）呈低信号，98.5%的 NMO 病灶（133/135）呈等信号。MS 病灶在 Phase 图上呈低信号的比例显著高于 NMO（p<0.001）。SWI-Phase 图上 43.9%MS 病灶（159/362）具有周围低信号环征，显著多于 NMO 病灶（0.7%，1/135，p<0.001）。CVS 征只出现在 MS 病灶中（32.3%，117/362）。两个观察者的结果具有很好的一致性（Kappa=0.92）。
结论：SWI-phase 图像上低信号病灶，病灶周围低信号环征及 CVS 征是 MS 特有的影像学征象，有助于 MS 和 NMOSD 的早期鉴别诊断。提示虽同为脱髓鞘疾病，铁质沉积参与 MS 发病机制，却并不参与 NMO 发病机制，但需要病理研究进一步证实。

基于纤维束自动细分量化技术评估抗 N-甲基-D-天冬氨酸受体脑炎白质纤维束完整性

曾春,向雅芸,李咏梅,罗天友
重庆医科大学附属第一医院

目的：应用纤维束自动细分量化（AFQ）技术探讨抗（NMDA）受体脑炎患者脑白质纤维束各节段的扩散特性，以评估其完整性。

材料与方法：（1）收集在本院住院诊断并随访的 48 例抗 NMDA 受体脑炎患者，同时招募性别、年龄、教育程度与病例组匹配的 40 例健康志愿者。（2）两组被试均行头颅常规 MRI 和 DTI 扫描，并接受 mRS 评分及 MMSE 评分。（3）两组 20 条纤维束的逐点部分各向异性（FA）、平均扩散率（MD）值比较，采用 5000 次置换检验；病例组白质纤维束各扩散参数与 mRS、MMSE 之间的相关性采用 *Pearson* 相关分析。$P < 0.05$ 差异有统计学意义。
结果：（1）常规 MRI 示 1 例患者双侧皮质脊髓束走行区和双侧海马、1 例患者左侧额叶皮层存在异常信号。（2）病例组左、右侧皮质脊髓束、扣带束、扣带束海马及弓形束弥漫性 FA 值降低和 MD 值升高，与对照组存在显著统计学差异（$P < 0.01$）；其余白质纤维束扩散指标呈节段性改变，与对照组比较无统计学差异（$P > 0.05$）。（3）患者双侧皮质脊髓束、扣带束和扣带束海马、弓形束 FA 值与 mRS 评分均呈负相关（r 分别为-0.81、-0.77、-0.86、-0.85，$P < 0.01$），与 MMSE 评分均呈正相关（r 分别为 0.90、0.83、0.92、0.89，$P < 0.01$）；双侧皮质脊髓束、扣带束、扣带束海马、弓形束 MD 值与 mRS 均呈正相关（r 分别为 0.84、0.77、0.88、0.77，$P < 0.01$），与 MMSE 评分均呈负相关（r 分别为-0.92、-0.86、-0.92、-0.89，$P < 0.01$）。
结论：抗 NMDA 受体脑炎患者以皮质脊髓束、扣带束和扣带束海马、弓形束为主的白质纤维束存在广泛微结构损害，与患者 mRS 评分和 MMSE 评分密切相关，有助于患者白质纤维束隐匿性损伤的判断，更好地解释临床症状。

复发缓解型多发性硬化患者扣带束白质完整性和扣带皮质灌注研究

郑桥,李咏梅,谢敏,陈晓娅,曾春,罗琦
重庆医科大学附属第一医院

目的 采用扩散张量成像(DTI)及三维伪连续动脉自旋标记(3D-pCASL)技术探讨复发缓解型多发性硬化患者扣带束微结构改变和扣带皮层亚区灌注及其与临床评分的相关性。
方法 对 24 名 RRMS 患者（RRMS 组）和 26 名健康对照组（对照组）行临床扩展残疾状态量表(EDSS)和神经心理学量表评分。行 DTI 及 3D-pCASL 扫描，测量左右扣带束的 FA、MD 值和扣带皮层 8 个亚区 CBF 值及均值，分析评估 MR 参数值与 EDSS 及神经心理学评分之间的相关性。
结果 (1) 与对照组相比，RRMS 组左侧前扣带皮层尾部、右侧后扣带皮层及扣带皮层峡部 CBF 值明显减低，右侧扣带皮层的平均 CBF 值显著低于对照组(p 均＜0.05)。MS 组双侧扣带束 CGC 部分 FA 值明显降低，MD 值明显升高；左侧 CGH 部分 FA 值明显降低，双侧 CGH 部分 MD 值明显升高(p 均＜0.01)。(2) RRMS 患者 SDMT 评分与左侧前扣带皮层尾部、右侧后扣带皮层及扣带皮层峡部 CBF 值呈正相关(r=0.391、0.346、0.307， p 均＜0.05)；与双侧扣带束 CGC 部分 FA 值呈正相关(左侧：r=0.389, p=0.005；右侧：r=0.374, p=0.007)，且与右侧扣带束 CGH 部分 MD 值呈负相关(r=-0.371, p=0.008)。HAMD 评分与双侧扣带束 CGC 部分 FA 值呈负相关(左侧：r=-0.296, p=0.037；右侧：r=-0.338, p=0.016)，与 MD 值呈正相关(左侧：r=0.324, p=0.022；右侧：r=0.343, p=0.015)。
结论 RRMS 患者扣带束及扣带皮层均出现改变，与患者认知功能障碍和抑郁相关，可能体现出扣带回的功能异质性。

EPO-0177
Significance of 3D Cube Flair with Compressive Sensing in the Diagnosis of Subcortial Microlessions

Xiao zang[1],Jinfeng Li[1],Guangnan Quan[2],Tao Wu[2],Jianxing Hu[1]
1.The General Hospital of the People's Liberation Army
2.GE

PURPOSE

Optimize 3D Cube Flair with compress sensing sequence to improve detection rate of subcortical microlesions,optimize scanning sequence package and speed up scanning process.

METHOD AND MATERIALS

Twenty patients with cerebrovascular diseases,who came to hour hospital for treatment were collected as subjects.Scanning sequence include T2WI\T1WI\DWI\T2 Flair and 3D Cube Flair with compress sensing on 3.0T MR(Discovery 750W,GE Healthcare,Milwaukee,USA).After scanning,coronal 2D T2 Flair and 3D Cube Flair with compress sensing were compared subjectively and objectively.Subjective scoring is based on the five-point method,two deputy chief physicians with more than ten years of diagnostic experience scored subjectively with double blindness from images with or without artifact,image homogeneity and contrast between lesions and normal brain tissue.Subjective indicators were analyzed by non-normal distribution test,and the consistency between the two raters was analyzed by Kappa analysis.The objective evaluation mainly starts from three aspects:image signal-to-noise ratio,contrast between lesions and brain parenchyma,and the number of lesions detected.The results were analyzed by t-test with two independent samples.

RESULTS

Coronal 3D Cube Flair with compressed sensing image sequences and 2D T2 Flair subjective scores were as follows:Statistical result of subjective score about artifact X^2=40.83,P<0.05,subjective scores of image homogeneity were X^2=46.97,P<0.05,subjective scores of contrast between lesion and normal brain tissues were X^2=49.12,P<0.05.Coronal 3D Cube Flair with compressed sensing image sequence and 2D T2 Flair objective evaluation results were as follows:The SNR of images was t=6.97,P<0.05,the contrast between lesions and white matter was t=11.07,P<0.05,the number of lesions detected was t=13.01,P<0.05.

CONCLUSION

3D Cube Flair with compressed sensing technology can improve the detection rate of subcortical micro lesions,and can improve scanning speed on the premise of ensuring images,and can effectively avoid various artifacts caused by cerebrospinal fluid fiuctuations and phase error in 2D scanning,thus replacing the conventional coronal 2D T2 Flair and optimizing the scanning process.

EPO-0178

Can electrotherapy and rehabilitation training be conducive to the functional recovery for spinal cord injury rats? Study of rat's cortex via magnetic resonance diffusion tensor imaging and motor behavior scoring

Lei Wang,Fabao Gao
West China Hospital of Sichuan University

PURPOSE
Previous studies focused on spine to investigate the functional recovery after spinal cord injury (SCI), but precious few studies discussed the subsequent alterations of cortex induced by SCI. This study aim to evaluate the functional recovery after SCI via magnetic resonance (MR) diffusion tensor imaging (DTI) and motor behavior Basso-Beattie-Bresnahan(BBB) scoring, we conducted a comparison between electrotherapy and rehabilitation training that may improve the functional recovery for SCI rats.
METHOD AND MATERIALS
Eighteen rats were randomly divided into 3 groups receiving a midline contusion(n=6, each): control(C), rehabilitation training(R) and electrotherapy combined with rehabilitation training(ER). Contusions were induced at T-10 using a MASCIS impactor. The therapies were implemented one week after contusions with frequency of six days a week for six weeks. Besides, the electrodes were placed between the lesion of contusion with electrical stimulation for electrotherapy and treadmill exercises were used for rehabilitation training. Motor behavior scoring was applied six weeks later after contusions, three trained observer recorded scores for hind-limbs. Besides, DTI and T2 imaging of rat's cortex for all groups were underwent two weeks later after BBB score. The DTI images were post-proceeded and calculated fractional anisotropy (FA), apparent diffusion coefficient (ADC), including regions of interesting (ROIs) of the motor, sensory cortex and corpus striatum were measured.
RESULTS
The groups of C, R and ER were different in FA of motor cortex (0.17±0.02 vs. 0.20±0.04 vs. 0.22±0.04, all $p<0.05$), however no difference in FA of sensory cortex and corpus striatum (0.15±0.01 vs. 0.15±0.02 vs. 0.14±0.01, all $p>0.05$; 0.25±0.01 vs. 0.27±0.03 vs. 0.25±0.02, all $p>0.05$). Farthermore, there were no difference in ADC for motor, sensory cortex sections and corpus striatum. For motor behavior scoring, C, R and ER were different in BBB scores (5.67±0.69 vs. 6.42±0.77 vs. 6.6±0.39, all $p<0.05$).
CONCLUSION
MR DTI method and motor behavior scoring can be applied to assess the functional recovery for SCI rats after therapies. Although, the mechanism of influence occurred within cortex after SCI are not clear yet, it still revealed some information about the relationship between SCI and cortex. On the other hand, this study may propose a simple method to evaluate the treatment effect that used proverbially for the those SCI patients.

EPO-0179
3D PCASL 在 2 型糖尿病患者特定功能大脑皮层 BF 值的初步研究

陈忠强
湖北医药学院附属随州医院（随州市中心医院）

目的：
通过三维准连续动脉自旋标记（three-dimensional pseudo continuous arterial spin labeling，3D PCASL）技术，探讨 2 型糖尿病伴有视网膜病变的患者与正常人在记忆、情感及视觉相关的脑皮层的脑血流量（BF）值的差异性。
方法：
将 36 例 2 型糖尿病患者依据视网膜病变程度分为 A 组和 B 组，其中 A 组 18 例为增殖性视网膜病变，B 组 18 例为单纯性视网膜病变，另外收集 18 例年龄相近的健康志愿者作为 C 组，所有患者均进行常规磁共振成像及三维准连续动脉自旋标记成像，测量各组双侧额中回、颞上回和楔回脑皮层的 BF 值。组间差异采用 Pearson 进行相关性分析。
结果：
糖尿病患者及正常志愿者在 MRI 常规平扫及增强扫描图像上无明显差异。A 组、B 组及 C 组双侧额中回、颞上回脑皮层在灌注图像上信号依次增高，BF 值依次增加，组间差异具有统计学意义（P<0.05）；A、B 两组双侧额中回脑皮层的 BF 值与病期长短呈负相关。
结论：
2 型糖尿病伴有视网膜病变的患者双侧额中回、颞上回脑皮层的 BF 值明显低于正常人，提示 2 型糖尿病伴有视网膜病变的患者相应脑皮层的微血管结构和功能出现异常，说明 2 型糖尿病与脑损伤之间有一定的相关性，且随着疾病进展，脑损伤有进一步加重的趋势。

EPO-0180

Assessment of Peripheral Neuropathy in Type 2 Diabetes by Diffusion Tensor Imaging: a case control study

Xin Wang,Lei Luo,Yonggang Li
First Affiliated Hospital of Soochow University

Objectives: To evaluate the diagnostic accuracy of DTI in DPN for patients with type 2 diabetes and detect correlations with electrophysiology.
Materials and Methods: Twenty-seven DPN patients, 24 NDPN patients and 32 HC were enrolled in this study. Clinical examinations and neurophysiologic tests determined the presence of DPN. The knee joint covered the lower sciatic nerve to CPN at the peroneal head for all the patients and volunteers were scanned. The diameters, cross-sectional areas, FA and ADC of TN and CPN were calculated. ROC analysis was performed for FA and ADC values. Pearson rank test was used to assess the correlation between DTI and electrophysiology parameters in the patient group.
Results: DTI-MRN can accurately differentiate between DPN, NDPN, and HC. FA values of TN and CPN were lowest and ADC values were highest in DPN group ($P < 0.05$). Excellent diagnostic accuracy of FA and ADC was seen in the diagnosis of DPN. In addition, DTI-MRN could distinguish between axonal injury and demyelination. FA values in the DPN group with axonal injury were lower than those in the DPN group with demyelination, while ADC values were higher than those in the DPN group with demyelination, with statistically significant difference ($P<0.05$).
Conclusion: DTI-MRN accurately discriminate DPN by lower nerve FA value and higher ADC value. DTI multi-parameter quantitative analysis of peripheral nerves is conducive to differentiating DPN axonal injury from demyelinating lesion, and can be applied in the diagnosis of diabetic peripheral neuropathy.

EPO-0181

糖尿病患者脑部磁共振弥散张量和波普研究

李晓茹
山西医科大学第一附属医院

目的利用磁共振弥散张量成像(DT)及磁共振频谱(MRS)研究糖尿病患者脑部组织 FA 值、ADC 值及脑代谢物的变化情况初步探讨糖尿病患者脑组织的 FA 值、ADC 值与脑内各代谢物之间及患者认知损害的相关性。
方法：收集年龄 45-70 岁有代谢综合征的患者 41 例纳入病例组分为糖尿病组(=23)和非糖尿病患组(无糖尿病但有高血压、高血魔 n=18)10 例健康志愿者(年龄 4565)为正常对照组。进行常规颅脑 MR 扫描及半卵园中心层面同期多体素 MR 扫描和全脑 DT 扫描。测量半卵圆中心 FA、ADC 值与 Cho、NAA 和 C 等代谢物。
结果 1 病例认知 MMsE 评分情况:1.糖尿病组认知损害发生率高于非糖尿病组组间 2.糖尿病组脑萎缩、脑白质疏松症的发生率明显高于非糖尿病组。3.FA 值、ADC 值与 NAAC、 NAA/Cho、Cho/cr 较正常对照组上升。与非糖尿病组比较糖尿病组 FA 值
下降差异具有显著统计学意义(P<001)ADC 值、 Cho/cr 上升,NAAC、 NAA/Cho 下降但差异均无统计学意义(均为 P>005)。13 例 MR 平扫未见异常病例中有 5 例出
现认知轻度损害与正常对照组比较 FA 值均下降。
结论 1 代谢综合症患者认知评分 MMsE 较正常人低糖尿病患者认知损
害发生率比非糖尿病组高但糖尿病与非糖尿病患者认知评分 MsE)组间没有差异性。2 糖尿病患者较一般人更容易引起脑内小血管病变导致腔隙性脑梗塞、脑白质疏松症及脑萎缩等改变。3 糖尿病患者与正常对照组 DT 与 MRS 值之间的差异性提示糖尿病患者脑白质纤维与脑代谢物均有损害改变。4 DTI/MRS 联合技术显示糖尿病与非糖尿病患者脑内神经代谢标志物与反映神经纤维完整性的 FA 值及弥散系数的 ADC 值存在相关性。5 认知评分(MMsE 与 FA 值之间存在相关性提示 FA 值是认知评估的有效手段可检测出脑部 MR 平扫正常而在认知等功能上的异常微观变化。

Cerebral signal changes in rest fMRI in different times of LHON.

Qin Tian
Henan provincial people's hospital

Leber's hereditary optic neuropathy (LHON) is a maternal inherited disease characterized by retinal ganglion cell degeneration, leading to acute or sub-acute painless vision loss and end-stage optic nerve atrophy. The aim of this study was to demonstrate the function signal changes in visual functional area or the extra-visual functional area in patients with acute stage and patients with chronic stage of LHON compared with healthy controls. The correlation of such changes with neuro-ophthalmologic findings and measurements of peripapillary retinal nerve fiber layer (RNFL) thickness by optical coherence tomography (OCT) was also assessed. Rest-fMRI scans were acquired from 9 LHON patients in acute stage, 24 LHON patients in chronic

stage and 27 matched controls. Rest fMRI analysis was performed using SPM8 and REST software. A complete neuro-ophthalmologic examination, including average and temporal peripapillary retinal nerve fiber layer thickness (PRNFL) measurements as well as standardized automated Humphrey perimetry, was obtained in all patients. Compared with controls, average peripapillary RNFL thickness increased significantly in LHON patients in acute stage; adversely decreased significantly in LHON patients in chronic stage. Compared to controls, LHON patients in acute stage had a significant increase of RS fluctuations in the primary visual an Compared to controls, LHON patients in acute stage d auditory cortices, bilaterally. They also showed decreased RS fluctuations in the right lateral occipital cortex and right temporal occipital fusiform cortex. Compared to controls, LHON patients in chronic stage. Compared to LHON patients in chronic stage, LHON patients in acute stage. The different changes in rest-FMRI and RNFL between LHON patients in acute stage and LHON patients in chronic stage suggesting there was some relationship between brain functional change and retinal ganglion cell degeneration.

Modulation of Catechol-O-methyltransferase Val158Met Polymorphism on Topological Reorganization of White-matter Networks in Attention-deficit/hyperactivity disorder Children

Tian Tian
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Attention-deficit/hyperactivity disorder (ADHD) children showed the redistribution of structural connectivity involving large-scale brain systems beyond the prefrontal-striatal model. The dopamine system has been associated with symptoms of ADHD, and is important for pharmacologic treatments. However, there is a lack of integrated concept that dopamine impact neural circuitry underlying behavior pathways occurs in ADHD. In this study we provided graph theory approach to study structural brain networks reorganization modulated by Catechol-O-methyltransferase (COMT) Val158Met polymorphism in ADHD children. We found significant reorganization of white matter structural networks in ADHD Met allele carriers, manifested as increased nodal degree, nodal efficiency, fronto-striatal circuitry, parietal-cingulum-motor circuitry, feeder and local connections. Those diffuse white matter alterations were not only implicated in fronto-striatal networks mediating executive functions but were also involving in sensorimotor network, frontal, cingulum, and parietal areas during perception-motor, higher order cognitive, attention control and processing. Together, these genetic-based findings highlight large-scale brain systems reorganization in ADHD, might also have important implications on the clinical pharmacologic treatments and development of pharmacogenomics.

基于纤维束空间统计分析多参数 DKI 在脊髓小脑共济失调 3 型中的应用

丘海珊,赵静,胡曼诗,吴超,初建平
中山大学附属第一医院

目的：采用基于纤维束空间统计分析（TBSS）的方法分析脊髓小脑共济失调 3 型（SCA3）患者 DKI 多参数图，以研究其全脑白质纤维束损害的特点，评估各参数诊断价值；进一步探索相应纤维束与患者 CAG 基因重复次数、疾病严重程度（SARA）评分的相关性。
材料与方法：收集 28 例经基因检测证实为 SCA3 的患者，按 SARA 评分将 SCA3 分为症状组（20 例，平均年龄 42.1 岁）及症状前组（8 例，平均年龄 27.3 岁）。收集 20 例性别、年龄与症状组匹配的健康志愿者作为对照组。对被试行全脑 DKI 扫描并得到 FA、MD、MK、Kr、Ka 参数图，对其进行 TBSS 分析。提取差异纤维束的上述参数值，以 ROC 曲线评估其用于 SCA3 的诊断效能，并进一步研究其与 CAG 基因重复次数、SARA 评分的相关性。
结果：与对照组相比，SCA3 症状组 FA、MK、Kr、Ka 的白质纤维骨架见显著减低区域，主要集中在双侧小脑下脚、内侧丘系、皮质脊髓束、小脑中脚及桥脑交叉束，其中 Kr 显示全脑纤维束损害最广泛（P＜0.01，TFCE）。ROC 曲线分析发现右侧小脑下脚的 Kr 值对 SCA 的诊断价值最高（AUC=0.96），其敏感度，特异度和拐点值分别为 85.7%，100% 和 1.06。另 SCA3 症状患者在上述纤维束的各 DKI 参数值与 CAG 基因重复次数存在显著相关，其中 MD 与其呈正相关（r=0.501~0.571，P＜0.05），其余参数呈负相关（r=-0.695 ~ -0.452，P＜0.05）；但与 SARA 评分均不存在显著相关。
结论：SCA3 症状患者存在脑内多发纤维束损害，主要位于中脑和小脑；DKI 各参数均可用于 SCA3 的诊断，而右侧小脑下脚的 Kr 值诊断价值最高。上述受损纤维束的 DKI 各参数值与 CAG 基因重复次数明显相关，但无法反映患者共济失调的严重程度。

EPO-0185
Blood-Brain Barrier leakage with Is Associated With type 2 diabetes mellitus

Man Li,Tao Jiang
Beijing Chao-Yang Hospital of Capital Medical University

Purpose: To investigate whether the blood-brain barrier (BBB) leaks blood-circulating substances in patients with T2D, and to examine the extent and mode of leakage.
Materials and Methods: For this study,20 patients with T2D and 40 age and gender matched participants for physical examination were recruited in this cross-sectional study. We used dynamic contrast-enhanced-MRI and Patlak pharmacokinetic model to quantify BBB permeability in the normal-appearing white matter (NAWM), white matter hyperintensity (WMH), cortical gray matter (CGM), and deep gray matter (DGM).
Results: The BBB leakage rate was significantly higher in patients compared with that in control subjects in NAWM (P=0.003), WMH (P=0.018), CGM (P=0.023), and DGM (P=0.025). Patients had a significantly higher leakage volume of the brain tissue in NAWM(P=0.032), WMH(P=0.016), CGM(P=0.046), and DGM(P=0.013). Spearman correlation analysis revealed that in all ROIs, BBB leakage rate, and area under the leakage curve

were both positively correlated with T2D(all P＜0.05), while only blood plasma volume in NAWM showed negative correlation with T2D(P＜0.05). Univariable linear regression analysis revealed that leakage rate and area under the leakage curve in all ROIs were positively associated with T2D(all P＜0.05), while only fractional blood plasma volume in the DGM was negatively associated with T2D(P＜0.05)after adjustment for age, sex, and vascular risk factors.

Conclusion: This study indicated that participants with T2D had global BBB leakage, which provides additional evidence that compromised BBB integrity may play a role in the pathogenesis of CNS disease of T2D. Longitudinal studies are required to confirm a causal relationship between the BBB permeability and CNS disease of T2D progression.

EPO-0186
应用基于体素的形态学测量方法结合 ASL 建立脊髓小脑共济失调 3 型影像学诊断标记

胡曼诗,赵静,丘海珊,初建平
中山大学附属第一医院

目的：基于 VBM 的方法分析 SCA3 患者的脑灰质体积变化，结合 ASL 求脑灰质变化显著区域的脑血流量（CBF）改变，建立基于 CBF 的 SCA3 影像学诊断标记。

材料与方法：收集 25 例经基因检测证实为 SCA3 患者按照 SARA 评分将患者分为症状组（20 例，平均年龄 39.7 岁）及症状前组（5 例，平均年龄 27.3 岁）。对照组选择 20 例（女 11 例，平均年龄 37.6 岁）与症状组匹配的健康志愿者。对所有入组者行 T1 mprage 和全脑 PASL 扫描。经后处理获得全脑 CBF 图，其中 19 例 SCA3 症状患者和 12 例健康志愿者 PASL 图像质量符合要求纳入分析。利用 CAT12 软件包对被试 T1 mprage 原始数据后处理得到全脑灰质图像，并利用 SPM12 对全脑灰质数据进行基于体素的非参数统计学比较，寻找差异显著的脑区。提取上述灰质体积差异显著脑区的 CBF 均值，进行非参数检验比较分析。再采用 ROC 曲线分析该区域 CBF 对于 SCA3 的诊断效能。

结果：相比对照组，SCA3 症状组在右侧小脑存在灰质体积显著减低区域，主要集中在右侧小脑前叶(P ＜ 0.001, FWE 校正)。症状前组与症状组以及对照组与症状前组在全脑灰质体积变化上未见显著差异。比较 SCA3 症状及正常对照右侧小脑前叶的 CBF 值，发现症状组右侧小脑前叶 CBF 值明显高于对照组（$CBF_{症状}$：56.0±31.7 (mL/(100 g*min) vs. $CBF_{对照}$：29.6±22.0 (mL/(100 g*min))，差异具有统计学意义（P＜0.05）。ROC 曲线分析发现，CBF 对 SCA3 有较高的诊断效能（AUC = 0.75），其中特异度、灵敏度和拐点值分别为 75%、84.2%和 29.8 (mL/(100 g*min))。

结论：相比正常对照组，SCA3 患者的右侧小脑前叶灰质体积显著减低，但相应区域 CBF 代偿性增高。 基于右侧小脑前叶的 CBF 值可以用于无创诊断 SCA3，具有较高的灵敏度。

EPO-0187
DKI 对脑胶质瘤分级诊断价值及与 Ki-67 标记指数相关性研究

李文富,张体江
遵义医科大学附属医院

目的：研究磁共振扩散峰度成像（DKI）对脑胶质瘤分级诊断价值及与 Ki-67 标记指数的相关性。

方法：收集本院 2015 年 12 月至 2018 年 10 月经手术病理证实胶质瘤共 50 例，均于术前采用 GE Signa HDxt 3.0T 磁共振扫描仪行 DKI 检查。经 Functool 软件分别得到平均峰度（MK）、轴向峰

度（AK）、径向峰度（RK）、平均扩散系数（MD）、各向异性分数（FA）及其标准化值（nMK、nAK、nRK、nMD、nFA）。所有病例均行免疫组织化学对 Ki-67 的表达情况进行测定。$p<0.05$ 为差异有统计学意义。结果：MK、AK、RK 值在 II 级与 III 级、III 级与 IV 级胶质瘤间均存在统计学差异（$p<0.05$）；FA 值仅在 III、IV 级胶质瘤间有统计学差异（$p<0.001$）；MD 值仅在 II、III 级胶质瘤间有统计学差异（$p=0.033$）。nMK、nAK、nRK 仅在 II、III 级胶质瘤间有统计学差异（$p<0.05$）；nFA、nMD 在 II 级与 III 级、III 级与 IV 级胶质瘤间均无统计学差异（$p>0.05$）。MK 鉴别 II 级与 III 级、III 级与 IV 级胶质瘤的 AUC 均最大，分别为 0.927、0.906（p 值均为 0.001）；nRK 鉴别 II、III 级胶质瘤的 AUC 最大，为 0.889（$p=0.003$）。MK、AK、RK 及其标准化值、FA 与 Ki-67 LI 呈正相关（$p<0.05$），以 MK 相关性最好（rs 为 0.712，$p<0.001$）。MD 及其标准化值与 Ki-67 LI 呈负相关（rs 分别为 0.399、0.372，$p<0.01$）。nFA 与 Ki-67 LI 无相关性（$rs=0.268$，$p=0.05$）。结论：DKI 可无创地评估胶质瘤的病理分级并预测 Ki-67 的表达情况，MK 是胶质瘤分级诊断、细胞增殖情况预测价值较好的影像学指标。应用 DKI 对胶质瘤进行分级诊断时，可不用 NAWMc 对肿瘤实质参数进行标准化。

EPO-0188

Association between NOODI parameters and ki67 index in pituitary macroadenoma

Fan Lin,Lihong Liang
The First Affiliated Hospital of Shenzhen University， Health Science Center， Shenzhen Second People’s Hospital

Purpose: Ki-67, represented tumor proliferation, is one of the important risk for aggressive pituitary adenomas. However, there’s no specific imaging finding for aggressiveness in macroadenomas. NODDI (neurite orientation dispersion and density imaging) model is a multi-compartment model for diffusion MRI data, allowing more specific neurobiological interpretation of microstructural changes in the tissues. The purpose of this study is to evaluate the accuracy of NODDI parameters in predicting Ki-67.

Materials and methods: Seventeen patients with surgically proved pituitary macroadenomas were retrospectively analyzed in this study. Q-space imaging at 3-T was performed with b values from 0 and 3000 s/mm^2. NODDI model was used to fit the diffusion data. Parameters maps for neurite density index (NDI), Volume fraction of the isotropic compartment (FISO), orientation dispersion index (ODI) were calculated and generated by using Spherical Mean Technique (Fig 1). For comparison, parameters for DTI (Diffusion Tensor Imaging) model, including Fractional Anisotropy (FA), Mean diffusivity (MD) and Radial Diffusivity (RD) were also computed. 3-D volume of interest was placed on tumor parenchyma avoiding necrosis, hemorrhage cystic degeneration. Metrics above were binned to construct histogram, the mean, 25% percentiles, 75% percentiles, skewness, and kurtosis of these metrics were computed. These histogram parameters were then compared with the Ki67 index and Knosp classification of pituitary adenomas by using Wilcoxon rank-sum test. A p-value less than 0.05 was considered to be statistically significant. We also performed a receiver operating characteristic (ROC) curve analysis to assess

the diagnostic performance of histogram parameters between high ki67 index (>3%) and low ki67(<3%) index of pituitary adenomas.

Results: The skewness and variance of ODI showed significant differences between ki67 indices (skewness: p=0.04 and variance: p=0.04). Variance of NDI and FISO are also significant between ki67 indices (NDI: p<0.01, FISO: p<0.01). However, all parameters derived from DTI model, including FA, MD, RD are not significant between two group. All parameters showed no significant differences between negative and positive invasion (Knosp classification). Receiver-operating characteristics analysis between positive and negative recurrence showed that both the skewness and variance of ODI histogram achieved area under the curve at 0.87 , and the variance of both NDI and FISO histogram achieved area under the curve at 0.80.

Conclusion: Skewness and variance of ODI histogram and variance of both NDI and FISO histogram were the predictive parameters for assessing tumor proliferative potential and aggressive of pituitary adenomas. This indicates that the tumor proliferative potential and aggressive of pituitary adenomas are related to microstructural changes in the tumor tissues, including neurite orientation dispersion and intral-celluar volume fraction. Unlike previous study, our study show that there are no significant relationship between parameters derived from DTI model and kI67 index

EPO-0189
乙酰唑胺负荷 CT 灌注成像对脑胶质瘤肿瘤血管生成的评价

于洋[1],陆娜[2],刘文[3]
1.复旦大学附属华山医院
2.复旦大学附属华山医院北院
3.复旦大学附属金山医院

目的：探究乙酰唑胺（Acetazolamide，ACZ）负荷 CT 灌注成像在大鼠 C6 胶质瘤中的应用，探讨 CT 灌注参数与变化率对于评价 C6 胶质瘤血管生成的价值及其病理基础。
材料与方法：雄性 SD 大鼠 32 只，随机平均分为正常对照组和 C6 胶质瘤种植 10 天、14 天、18 天组，通过立体定向仪于鼠脑右侧尾状核区分别注射生理盐水及 C6 胶质瘤细胞。行 CT 灌注成像，间隔 1 小时后行 ACZ 负荷下的 CT 灌注成像。采用 Philips CT 后处理软件获得灌注参数 rCBF（relative CBF=患侧 CBF/对侧 CBF）、rCBV（relative CBV=患侧 CBV/对侧 CBV），并计算 ACZ 负荷下的变化百分率。取肿瘤中心层面固定切片，进行 HE 染色及免疫组化染色测定 HIF-1、FVIII-MVD 和α-平滑肌肌动蛋白（α-SMA）-MVD，计算 VMI=（α-SMA-MVD/FVIII-MVD）×100%。应用 SPSS 21.0 软件比较不同实验组之间 rCBF、rCBV 及其变化百分率之间的差异，以及灌注参数与病理指标之间的相关性。
结果：对照组与肿瘤组之间的 rCBV、rCBF 及其变化百分率存在显著差异（Student t 检验，$p<0.01$）。不同种植天数的 3 个肿瘤组之间静息和 ACZ 负荷 rCBV、rCBF 及其变化率之间均存在显著差异（ANOVA 分析，$p<0.01$）。病理染色分析肿瘤组的 HIF-1、FVIII-MVD、VMI 与静息和 ACZ 负

荷 rCBV、rCBF 及其变化百分比均具有显著相关性（Pearson 检验，p<0.05），α-SMA-MVD 与 CT 灌注参数不相关（p>0.05）。
结论：ACZ 负荷实验 CT 灌注成像的灌注参数及变化率在对照组及不同种植天数肿瘤组之间存在显著差异。CT 灌注成像结合 ACZ 负荷实验得到的 rCBF、rCBV 以及其变化率可以一定程度上反映胶质瘤肿瘤血管生成情况。

Radiomics profiling identifies the incremental value of MRI features to key molecular biomarkers for risk stratification of high-grade gliomas

Guoqiang Yang,Hui Zhang
First Hospital of Shanxi Medical University

Purpose: To identify the incremental value of MRI features to the key molecular biomarkers for risk stratification of high-grade gliomas (HGGs).
Methods: A total of 137 patients were retrospectively collected including the preoperative magnetic resonance images, clinical and genetic data from The Cancer Genome Atlas/The Cancer Imaging Archive (TCGA/TCIA) dataset and our institution. Radiomic features (n=1976) were extracted on both post-contrast T1-weighted (CE-T1) and T2-weighted fluid attenuation inversion recovery (T2FLAIR) MR images. The least absolute shrinkage and selection operator (LASSO) method was used to select effective features. The univariate and multivariate Cox model was built to explore the advantage of clinical characteristics, molecular biomarkers, and radiomic features. The Kaplan-Meier survival analysis was used to evaluate the prognostic models, and a stratified analysis was conducted to demonstrate the incremental value of the radiomics signature. A nomogram was developed to predict the 1-year, 2-year and 3-year overall survival (OS) of HGGs.
Results: The radiomics signature provided significant prognostic value for risk stratification of HGGs. The combined model integrated radiomics signature with clinical (age) and isocitrate dehydrogenase (IDH) genotype holds the best prognostic value which yielded C-index values of 0.764, 0.731 and 0.761 on the training set, ValidationSet1 and ValidationSet2 respectively. The stratified Kaplan-Meier survival analysis showed that the radiomics signature could identify risk subgroups in various clinical and molecular subgroups.
Conclusion: The radiomics signature allows risk stratification of patients with HGGs, and has incremental value to the key molecular biomarkers, providing a preoperative basis for individualized diagnosis and treatment decision-making of HGGs.

Giant cell glioblastoma: Survival management of a rare tumor

Guojin Zhang,Junlin Zhou

The second Hospital of Lan Zhou University

Abstract：Giant cell glioblastoma (GCG) belongs to glioblastoma (GBM), a subtype of IDH-wild type, which is considered to have a better prognosis than GBM. However, due to its rarity, little is known about its treatment and prognosis. This study retrospectively collected 26 cases of GCG confirmed by surgery and pathology in our hospital from January 2013 to June 2019. The clinical data, treatment plan and follow-up data were obtained from the existing electronic medical records. The overall survival (OS) rate of 26 patients was 8.5 months. Most patients (73.1%) have primary nontotal tumor resection as the main treatment, and have received different forms of postoperative adjuvant therapy (88.5%), of which 46.5% received radiation therapy (RT) and chemotherapy. Multivariate analysis showed that age (p = 0.338), gender (p = 0.356), Karnofsky performance status (KPS) (p = 0.070), and number of tumors (p = 0.963) were not found to be important predictors of OS. However, adjuvant therapy (p = 0.019) and clinical history (p = 0.005) were independent and significant predictors of OS. RT combined with temozolomide (TMZ) was associated with longer OS, and the median survival of patients receiving this adjuvant therapy was 12.6 months, not 6.2 months. Moreover, we found that a shorter clinical history was associated with a longer OS. When the patient's clinical history was Less than 1 month, the median survival time was 11.5 months, not 4.3 months.

半用量对比剂对磁共振动态对比增强 DCE 序列在颅脑疾病诊断效能中的价值

李金锋[1],李锐[1],武江芬[2],娄昕[1],马林[1]
1.解放军总医院第一医学中心放射诊断科
2.GE

目的：探讨半用量与全量磁共振造影剂注射，对 DCE 序列的颅脑疾病诊断效能的影响。材料与方法：回顾性分析拟行神外手术的患者 20 例，其中包括 8 例脑外疾病，脑膜瘤 4 例，后颅窝病变 4 例；12 例脑内病变，胶质瘤 8 例，淋巴瘤 4 例。所有患者均行两次磁共振动态对比增强 DCE 序列扫描，第一次注射对比剂标准剂量的 50%，第二次按照标准剂量进行注射 100%，两次扫描的间隔时间为 48-72 小时，对比剂的标准剂量为 0.2ml/kg。第一次为诊断性扫描，主要用于辅助临床诊断，第二次为术前磁共振定位扫描，主要用于临床手术方案的质量和手术路径规划。所有扫描均在 GE750W 磁共振成像仪上完成，扫描序列为 LAVA 梯度回波，多期动态增强扫描，具体扫描参数为 TR/TE3.89/1.31 ms，层厚 3mm，FOV230*230mm；矩阵 224*224，随后进行动态增强检查，共采集 60 期，每期时间为 5s，在第 3 期采集结束后，经肘静脉以 2.0 ml/s 速率注射对比剂。后处理均应用 GE 工作站 Aw4.6 版本完成，分别获得 Ktrans，Kep，Ve，fPV 定量参数，及 IAUGC，MaxSlope，BAT 等半定量参数，两次扫描后处理参数均行组间相关性和差异性分析。为了减少测量误差，每例患者均在选取了三个层面进行测量。结果:此 20 例患者定量值（Ktrans，Kep，Ve，fPV）无显著性差异，半定量值（IAUGC，MaxSlope，BAT）随着药量分布的区别有显著性差异。这种定量的 MRI 技术可以提供脑肿瘤病变发生发展过程。生理病理学信息，可以评价病变的微血管通透性，微血管通透性成像同时使用较高的时间分辨和较长的采集时间，以描绘对比剂流入流出过程中病变及正常组织血管的通透性及血管外细胞外间质的通透性。结论:半剂量造影剂渗透成像可以替代全剂量造影剂的应用，此技术的重复性及药量的把握可以提供诊断用量，对颅脑疾病的诊断具有可靠的诊断效能。

Predictive value of Machine Learning on Isocitrate Dehydrogenase (IDH) Mutation in Patients with Glioma: A Systemic Review and Meta-analysis

Yingqian Huang[1], Jing Zhao[1], Yukun Song[2], Dingxiang Xie[1], Manshi Hu[1], Haishan Qiu[1], Jianping Chu[1]
1. the First Affiliated Hospital of Sun Yat-sen University
2. The First Affliated Hospital of Xiamen University

Purpose: Noninvasively predicting isocitrate dehydrogenase (IDH) mutation in glioma is of great significance. Machine learning (ML) has been wildly used in medical imaging, but the predictive value of ML on IDH mutation in patients with glioma was unclear. A meta-analysis is needed to provide a systematic review of the published findings.
Materials and methods: PubMed, Web of Science and the Cochrane library were searched to collect all the relative articles in investigating the diagnostic performance of ML for prediction of IDH mutation in glioma. Pooled sensitivity, specificity and their 95% CI were calculated. And AUC was obtained.
Results: Seven reports with glioma were included. AUC of ML in predicting IDH mutation was 91% (95% CI: 88%-93%), the pooled sensitivity and specificity were 86% (95% CI: 81%-91%) and 86% (95% CI: 79%-91%), respectively. In subgroup analysis, clinical information, MRI sequences and glioma's grade were associated with study heterogeneity. Clinical and imaging features integrated in ML had a higher sensitivity (92% vs. 83%) and specificity (89% vs. 81%) than the imaging features alone. In addition, ML performed better in high grade glioma than in low grade glioma, and ML which used conventional MRI sequence demonstrated a higher specificity than included the conventional and advanced MRI sequences in predicting IDH mutation.
Conclusions: ML demonstrated excellent diagnostic performance in predicting IDH mutation of glioma. Clinical information, MRI sequences and glioma's grade were the main factors of influencing the diagnostic specificity.

Assessement of Glioma grading and molecular features using Isopulse imaging: A preliminary single-center study

Sirui Li, Haibo Xu, Wenbo Sun
Department of Radiology, Zhongnan Hospital of Wuhan University, Wuhan University, Wuhan, 430071, P. R. China

Abstract: Diffusional variance decomposition (DIVIDE) imaging parameters was proved capable to distinguish the meningioma from glioma by mapping tumor heterogeneity. This

study is aimed to find out whether DIVIDE could predict the Glioma grade and molecular features based on a sequence named Isopulse.

Method: 30 patients diagnosed with gliomas by clinicopathologic analysis after surgery were recruited in this study. Before the surgery, all patients were scanned with T1w, T2w, T2 Flair, T1 contrast-enhanced imaging, DTI and Isopulse imaging. The total mean kurtosis (MKT), microscopic anisotropy (MKA), isotropic heterogeneity (MKI), and the microscopic Fractional Anisotropy(uFA) derived from Isopluse scan, and the Fractional Anisotropy (FA) and Mean Diffusivity (MD) derived from DTI scan, were used to grade glioma. The DIVIDE and DTI were compared in grading Glioma. The results were compared in regard to the WHO-based histological findings and molecular characteristics leading to integrated diagnosis: isocitrate-dehydrogenase (IDH1/2) mutation status chromosome 1p/19q loss of heterozygosity (LOH), and O6-methylguanine DNA methyltransferase (MGMT) promoter methylation status.

Result: significantly differences diffusion patterns MKa, MKi, MKt, especially MKi/MKt values were found among the three glioma grading groups. MKa and uFA have better specificity in grading than MKt. 75 and 90 percentile MKi and MKa were significantly lower in tumors with IDH1/2 mutation than in those with IDH1/2 wild type. We found no significantly difference among the parameters according to MGMT methylation status

Disscussion: MKa and MKi resulted from Isopulse imaging correlates well to cell eccentricity and density extracted from microscope images of the tumor tissue, which might be superior to conventional DTI and DKI parameters in grading Glioma , and can be useful in predicting IDH1/2mutation status.

基于不同感兴趣区域动态对比增强 MR 定量参数纹理分析评估胶质瘤等级

赵鹏飞,高阳,牛广明
内蒙古医科大学附属医院

目的 本研究旨在探讨纹理分析与基于不同感兴趣区域（ROI）动态对比增强 MR 定量参数在确定胶质瘤等级中的作用。以探索不同 ROI 中的参数，以评估肿瘤异质性，并进一步比较不同 ROI 的诊断性能。
方法 搜集病理证实的高级别胶质瘤（WHO III 级、IV 级）及低级别胶质瘤（WHO I 级、II 级）各 40 例。所有患者均在德国 SIEMENS 公司 3.0T MAGNETOM Skyra 磁共振扫描仪上进行检查。DCE-T1WI 采用三维容积内插（VIBE）梯度回波序列，动态增强扫描前先行 2 个不同反转角序列（2°,15°）扫描，用以在后处理过程中生成 T1 map 图。多反转角序列扫描完成后行动态增强扫描。将 MR 数据传输到个人计算机，胶质瘤病变在 DCE-MRI 上分为三部分：1.实性部分；2.其它部分（如坏死和出血）；3.瘤周水肿部分。然后由同一位研究人员在经验丰富的神经影像学家的指导下绘制肿瘤实体部分和整个肿瘤 ROI。为了量化 ROI 内的图像纹理特征，使用 GE AnalysisKit Version V3.0.1A 软件来量化异构信号。利用直方图分析来计算一阶参数。通过灰度共生矩阵（GLCM）进行纹理分析以从图像中提取二阶特征。在这项研究中，纹理分析在 3D ROI 内进行，参

数不均匀性用于定量分析。使用非参数 Wilcoxon 秩和检验比较高级别胶质瘤（HGG）和低级别胶质瘤（LGG）之间的纹理特征。
结果 对于整个肿瘤 ROI，HGG 和 LGG 之间的不均匀性值是显著不同的（Z=50.37,P=0.01<0.05）。对于实性部分 ROI，不均匀性显示 HGG 和 LGG 之间的显著差异（Z=34.65,P=0.06>0.05）。整个肿瘤的不均匀性参数比实性部分 ROI 具有更高的诊断准确性。
结论 基于不同 ROI 的 DCE-MRI 定量参数纹理分析可以为评估胶质瘤等级提供可靠的价值。

MRI features and prognosis of glioma associated with IDH-1 mutation and MGMT promoter methylation

Rujia Wang[1],Bo Gao[3],Guiquan Shen[2]
1.TangShan GongRen Hospital
2.The Affiliated Hospital of Guizhou Medical University
3.Yantai Yuhuangding Hospital

Abstract
Purpose To investigate the associations of isocitrate dehydrogenase 1 (IDH-1) and O6-methylguanine-DNA-methyltransferase (MGMT) promoter methylation with MRI characteristics and its prognosis factors in glioma.
Methods A total of 116 patients with gliomas were recruited from January 2013 to December 2015. All patients underwent conventional MRI before operation which included T1-weighted imaging (T1WI), T2-weighted imaging (T2WI), T2-weighted fluid attenuated inversion recovery (T2-FLAIR), contrast-enhanced T1-weighted imaging. X^2 and Fisher's exact probability test were used to determine the significance of associations between MRI features and IDH-1 mutation and the status of MGMT promoter methylation in glioma. The survival distributions were estimated using the Kaplan-Meier method, and compared by Log-rank test. Univariate and multivariate analyses were performed using Cox regression
Results IDH-1 mutant glioma was significantly more likely to exhibit homogeneous signal intensity (p=0.009) and less contrast enhancement (p=0.000) on MRI. IDH-1 mutant glioma was inclined to cross the middle (p=0.001). MGMT promoter methylated of glioma had more obvious enhancement (p=0.049). The overall survival between IDH-1 mutated and wild-type glioma (p=0.000), MGMT promoter methylated of glioma and MGMT promoter unmethylated glioma (p=0.04), the age over 40 and under 40 (p=0.003), KPS scores before operation more than 80 and KPS scores no more than 80 (p=0.000), low grade glioma and high grade glioma were compared (p=0.000), the difference were statistically significant.
Conclusions Our results suggested that IDH-1 mutant in glioma is more likely to exhibit homogeneous signal intensity, less contrast enhancement and inclined to cross the middle. Glioma with MGMT promoter methylated tend to have more obvious enhancement. The patients with IDH-1 mutated and MGMT promoter methylated may have longer life and better prognosis.

EPO-0197

The value of DWI and minimum ADC value in grading diagnosis of Oligodendrocyte tumors

Xianwang Liu[1,2,3],Junlin Zhou[1,2,3]
1.Department of Radiology, Lanzhou University Second Hospital,
2. the Second Clinical School, Lanzhou University
3.Key Laboratory of Medical Imaging of Gansu Province

[Abstract] **Purpose** To investigate the value of DWI and minimum ADC value in the differential diagnosis of different grades of oligodendrocyte tumors. **Materials and Methods** A retrospective analysis of 18 cases of oligodendroglioma (OD, WHO class II) and 27 cases of anaplastic oligodendroglioma (AOD, WHO class III) confirmed by surgery and pathology from January 2012 to May 2019 in our hospital. clinical, pathological data and DWI characteristics, the minimum ADC value of the tumor parenchyma was measured, the difference between the two was compared, and the receiver operating characteristic curve (ROC curve) was drawn to evaluate the minimum ADC value in grading. **Results** Of the 18 cases of oligodendroglioma , 14 of the solid parts of the tumor showed slightly higher/high signal on DWI, 2 showed equal/low signal, 2 showed heterogeneous mixed signal, and the minimum ADC value was (0.798±0.159).$\times 10^{-3}$ mm^2/s; in 27 cases of anaplastic oligodendroglioma, 19 of the solid part of the tumor showed slightly higher/high signal on DWI, 2 showed equal/low signal, and 6 showed no For the homogeneous mixed signal, the minimum ADC value was (0.670±0.108)$\times 10^{-3}$ mm^2/s, and the difference in the minimum ADC value between the two groups was statistically significant (t=3.223, P<0.005). The ROC curve results showed that the AUC value was 0.761, and the minimum ADC value 0.734$\times 10^{-3}$ mm^2/s was used as the threshold for the two-stage grading diagnosis. The sensitivity and specificity of the differential diagnosis were 72% and 74%, respectively. **Conclusion** DWI and minimal ADC value can be used as a quantitative tool for grading diagnosis of oligodendrocyte tumors, which provides a new reference for clinical identification.

EPO-0198

Radiological characteristics study on epithelioid glioblastoma, a rare subtype of GBM

Jingqin Fang
Daping Hospital, Army Medical University

Background: Epithelioid glioblastoma(eGBM) is rare and a newly recognized subtype of GBM. Given the short of studies focusing on radiological characteristics of these tumors, we aimed to report the radiological features of eGBM deriving from six patients.

Methods: Six patients with pathologically diagnosed as eGBM were enrolled in this retrospective study. CT and pre-operative MR examinations with conventional and advanced sequences, such as diffusion weighted imaging and so on were analyzed. Immunohistological staining and mutation analysis of BRAF V600E was also explored.

Results: Only case 6 showed a co-locating tumor which was verified to be a diffuse astrocytoma (WHO II), other cases demonstrated single intracerebral tumor. Majority of the tumors originated in cerebral cortex, two cases involved corpus callosum. Tumors demonstrated iso-, hypo- or mixed intensity on T1WI, hyper- or mixed intensity on T2WI and FLAIR, heterogeneous enhancement on post-contrasted imaging. Involvement of leptomeninge, which appeared as leptomenigeal thickening and abnormal enhancing was discovered in 4 cases. Peritumoral edema (4/6) and hemorrhage (3/6) was common, calcium was only seen in case 5. Notable restrictive diffusion and consequently decreased rADC was found in solid component in 5 cases. Most cases demonstrated increased Cho and Lac/Lip value on ^{1}H-MRS, and promoted rCBV value on PWI. The cases with CT examination showed an ill-defined mass with mixed density.
Conclusions: Although there are some overlaps between typical GBM and eGBM, some radiological characteristics, such as location (often in cerebral cortex), involvement of leptomeninge and intratumoral calcium, may support the diagnosis of eGBM.

EPO-0199

Histogram Analysis of Intravoxel Incoherent Motion and Dynamic Contrast-Enhanced MRI with 2CXM modle in Glioma

Fen Xing
Renmin hospital of Wuhan University

Introduction: The following paper evaluates the differential diagnostic performance of Intravoxel Incoherent Motion (IVIM) and Dynamic Contrast-Enhanced (DCE) with the two-compartment exchange model (2CXM) based on histogram analysis between different grades of glioma.
Methods: Thirty-nine patients with glioma underwent IVIM and DCE imaging at 3.0T. Quantitative parameters (mean, median, 10^{th}, 25^{th}, 75^{th} and 90^{th} percentiles) from IVIM (ADC, D, D*, f, and their product fD*) and DCE (V_p, V_e, PS, and F) were analyzed. The independent Student's t-test and Mann-Whitney U-tests were used to assess whether these parameters could distinguish low- from high-grade glioma. Receiver-operating characteristic (ROC) curve analysis and Delong test were performed to determine and compare diagnostic efficiency of IVIM and DCE parameters in differentiating low- and high-grade gliomas, respectively.
Results: Various histogram statistics of IVIM and DCE parameters can be used to differentiate between low-grade and high-grade glioma. V_e and V_p generally yielded higher AUC values than IVIM parameters, and the differences in AUC values of V_e_mean and IVIM parameters had a statistical significance. Although DCE had higher AUC values than IVIM, they didn't reach statistical significance.
Conclusions: V_e was the best parameter in differential diagnosis of gliomas. IVIM had the similar diagnosis performance with DCE,and both IVIM and DCE-MRI parameters can be used for preoperative grading of gliomas.

EPO-0200

Comparative intraoperative MRI、US、5-ALA 、Neuronavigation and Conventional surgery guided resection in patients with gliomas: a network meta-analysis

Dongman Ye,Tao Yu
Cancer hospital of China Medical University， Liaoning Cancer Hospital &Institute

Purpose:In the recent decades, some intraoperative technologies, such as Magnetic Resonance Imaging(iMRI), ultrasound(iUS), fluorescence-guided surgery with 5-ALA and neuronavigation were used more often in the surgery of gliomas. However, in the clinical work, it was difficult for neurosurgeons to make decisions to choose which technologies could give them the most support. In our study, we used the gross total resection(GTR), patients' postoperative complications and improvement as outcomes to compare these technologies, while conventional surgery was also included.
Methods and materials:The pubmed, Cochrane library, Web of Science, Embase, China Knowledge Resource Integrated Database, Wan-fang database were searched up to April 2018. Randomized controlled trials(RCTs), two-arm or three-arm prospective studies, retrospective studies in patients with glioma who had surgery treatment were included. We used multiple treatment meta-analysis, also known as mixed-treatment comparisons meta-analysis or network analysis, which allows the integration of data from direct and indirect comparisons. We did a random-effect model with in a Bayesian framework using Markov chain Monte Carlo methods in R version 3.5.0. This model combined direct and indirect evidence for any compared intervention. We got the ranking of the technologies in different outcome measured by calculating the OR for each technology compared with a control group.
Results: In terms of GTR, iMRI, iUS, 5-ALA, neuronavigation were more effective than conventional surgery(ORs 5.70,2.70,2.40,1.90). For the rate of postoperative complications, iUS, iMRI, nueronavigation were more improved than conventional surgery(ORs 0.15,0.24,0.34). As for the rate of patients improvement, iMRI, iUS, neuronavigation were better than conventional surgery(ORs 8.10, 4.90, 2.60).
Conclusion: From our ranking probability table, the data indicated that iMRI was the best in GTR and rate of patients improvement. iUS was the best in reducing postoperative complications. iMRI and iUS might be the best choice to for tumor resection in patients with gliomas.

EPO-0201

Predictive Value for Tumor Recurrence of Suspicious Enhancing Lesions of BT-RADS Categories 3 in High-Grade Gliomas Using PWI and DWI

Yuelong Yang,Biao Huang
Department of Radiology， Guangdong Academy of Medical Sciences， Guangdong General Hospital，Guangzhou

ABSTRACT
Background and Purpose: Treatment-related changes can often micmic tumor recurrence in high-grade gliomas (HGGs) on conventional MRI. The aim of this study is to evaluate the ability of PWI and DWI to predict whether tumor recurrence of suspicious enhancing lesions of BT-RADS categories 3 in postoperative patients with high-grade gliomas;and to further analyze which of the two schemes show the better diagnostic performance.
Materials and Methods: 60 patients with high-grade gliomas treated by surgery followed by chemoradiotherapy and adjuvant chemotherapy, who next appeared increasing enhancing lesions classified as BT-RADS categories 3 were retrospectively enrolled. All patients received conventional MRI, PWI and DWI regularly. Radiologists retrospectively evaluated the maximal relative cerebral blood volume (rCBVmax) of the enhancing lesion using PWI and the mean apparent diffusion coeffcient (ADCmean) values using DWI to differentiate tumor recurrent from nonrecurrent.The diagnostic performance of these two techniques was estimated with receiver operating characteristic (ROC) curve analysis.
Results: 31 of the 60 patients (51.7%) turned out to be tumor recurrence, while 29 patients (48.3%) had tumor nonrecurrence.Whether tumor recurrence could be identified by using rCBVmax and ADCmean values,PWI analysis presented significantly higher rCBVmax in tumor recurrence group (mean±SD, 2.35±0.87) compared with nonrecurrence group(1.29±0.45,p<0.001).DWI analysis revealed ADCmean of the tumor recurrence group (mean±SD,0.91±0.19×10-3mm/s2) were significantly lower than the nonrecurrence group (1.21±0.24×10-3mm/s2,p<0.001).The diagnostic performance of PWI is higher(AUC, 0.877) than that of DWI(0.829).
Conclusion: Assessment of rCBVmax and ADCmean of BT-RADS Category 3 lesions followed treated HGGs is available in differentiating recurrent tumors from tumor nonrecurrence. PWI seems to provide better diagnostic performance compared with DWI.

联合扩散加权成像与动态磁敏感对比增强 MR 灌注加权成像对脑星形细胞瘤分级的应用价值

秦江波,王效春
山西医科大学第一医院

目的　探讨扩散加权成像（DWI）联合动态磁敏感对比增强（DSC）MR 灌注加权成像在脑星形细胞瘤分级中的诊断价值。资料与方法 搜集经手术病理证实的不同级别脑星形细胞瘤 63 例，所有患者术前除常规扫描外均行头颅 DWI 及 MR 灌注加权成像扫描，其中低级别星形细胞瘤（WHOⅡ级）13 例，间变型星形细胞瘤（WHOⅢ级）24 例，胶质母细胞瘤（WHOⅣ级）26 例。分别测定肿瘤实质区最小 ADC 值、相对脑血容量（rCBV）最大值。应用方差分析 *ANOVA* 比较不同级别星形细胞瘤间肿瘤实质区的最小 ADC 值及最大 rCBV 值的差异；采用 ROC 曲线比较 ADC 值、rCBV 单独使用及两者联合应用对脑星形细胞瘤分级的诊断效能，并确定不同级别星形细胞瘤 ADC 及 rCBV 临界值。结果 DWI、DSC 及两种联合应用在鉴别 WHOⅡ级与 WHOⅢ级脑星形细胞瘤 ROC 曲线下面积（AUC）分别为 0.885、0.913、0.958，最小 ADC 值和最大 rCBV 值鉴别两者临界值分别为 $1.021\times10^{-3}mm^2/s$、3.760，灵敏度分别为 70.8%、79.2%、87.5%，特异度分别为 92.9%、100%、100%。DWI、DSC 及两种联合应用在鉴别 WHOⅢ级与 WHOⅣ级脑星形细胞瘤 AUC 分别为 0.712, 0.889 和 0.904。最小 ADC

值和最大 rCBV 值鉴别两者临界值分别为 0.783×$10^{-3}$$mm^2$/s、5.870，灵敏度分别为 57.7%、100%、84.6%，特异度分别为 83.3%、70.8%、91.7%。结论 联合应用 DWI 与 DSC 可以提高对脑星形细胞瘤分级诊断的准确性。

扩散峰度成像与脑星形细胞瘤 GFAP、TopoⅡα、MGMT 表达的相关性研究

雷颖
山西医科大学第一医院

目的：应用磁共振扩散峰度成像（DKI）初步探讨脑星形细胞瘤磁共振影像学表现与术后病理 GFAP、TopoⅡα、MGMT 表达的相关性。
方法：收集自 2012 年 3 月至 2014 年 9 月就诊于山西医科大学第一医院经手术病理证实的脑星形细胞瘤 66 例，其中高级别 34 例（III-Ⅳ），低级别 32 例（Ⅰ-Ⅱ），所有患者术前均行头颅常规 MRI 扫描、增强扫描及 DKI 扫描。通过工作站对图像进行后处理，得到平均峰度（MK）图、各向异性分数（FA）图，由两名有经验的 MR 医师结合常规 MRI 扫描图像进行分析，测定肿瘤实质区的部分各向异性分数（FA）值、平均扩散峰度（MK）值及 GFAP、TopoⅡα、MGMT 表达。采用 t 检验比较组间 DKI 各参数值及 GFAP、TopoⅡα、MGMT 表达水平差异，Spearman 相关分析 DKI 各参数值与 GFAP、TopoⅡα、MGMT 表达的相关性。
结果：（1）高级别组脑星形细胞瘤实质区 MK 值明显高于低级别组（P<0.05），高级别组脑星形细胞瘤实质区 FA 值与低级别组差异无统计学意义（P=0.331）；（2）高级别组脑星形细胞瘤实质区 GFAP 表达显著低于低级别组（P<0.05），高级别组脑星形细胞瘤实质区 Topo-Ⅱα表达显著高于低级别组（P<0.05），高级别组脑星形细胞瘤实质区 MGMT 表达与低级别组差异无统计学意义（P=0.679）；（3）MK 值与 GFAP 表达呈显著负相关（r =-0.836；P=0.03），与 Topo-Ⅱα表达呈正相关（r =0.896；P=0.01），与 MGMT 表达均无线性相关性（r =0.362；P=0.05）；FA 值与 GFAP（r =-0.562；P=0.05）、Topo-Ⅱα（r =-0.153；P=0.10）、MGMT（r =0.362；P=0.05）表达均无相关性。
结论： DKI 参数 MK 值与脑星形细胞瘤 GFAP、TopoⅡα表达显著相关。

EPO-0204
弥散张量成像在颅内环形强化病变中的诊断价值

王乐
山西医科大学第一医院

目的 探讨弥散张量成像（diffusion tensor imaging，DTI）对颅内环形强化病变的诊断价值。
方法 收集颅内单发环形强化病例 53 例，男 30 例，女 23 例，年龄 13～71，平均 45.6 岁。除 4 例脑转移患者为临床证实外，其余病例均经病理证实。其中高级别胶质瘤 35 例（包括间变性星形细胞瘤 19 例和胶质母细胞瘤 16 例），单发脑转移瘤 8 例，脑脓肿 10 例。全部病例均行弥散张量成像（DTI）扫描，分别测量病变坏死区、灶周水肿区及对侧正常脑实质的平均弥散系数(MD)值及各向异性分数（FA）值。并重建白质纤维示踪图，观察病灶与白质纤维束的关系。DTI 的图像分析及数据处理均采用 Siemens 公司提供的 Leonardo 工作站及配套 DTI 软件。
结果 脑脓肿坏死区的 MD 值（0.604±0.13 ×10-3mm2/s）和 FA 值（0.185±0.03）与高级别星形细胞瘤（MD 2.76±0.26×10-3mm2/s，FA 值 0.069±0.02）及脑转移瘤（MD 2.82±0.29×10-

3mm2/s，FA 值 0.064±0.02）间存在显著性差异(P＜0.01)。高级别星形细胞瘤水肿区的 FA 值（0.23±0.06）与脑转移瘤水肿区（0.17±0.06）、脑脓肿（0.15±0.03）间存在显著性差异(P＜0.01)。DTI 白质纤维示踪图可以较为准确的反映病灶与白质纤维束的关系，为手术治疗及评估预后提供依据。
结论 坏死区 MD 值及 FA 值有助于脑脓肿与环形强化脑肿瘤的鉴别；水肿区 FA 值有助于脑胶质瘤与转移瘤、脑脓肿的鉴别；白质纤维示踪图能够为优化手术方案及评估预后提供一定帮助。

Combined Values of SWI and DSC-PWI in Noninvasively Assessing Isocitrate Dehydrogenase Mutational Status for Diffuse Gliomas

Haili Yan,Hui Zhang
The First Hospital of Shanxi Medical University

Purpose To explore the contribution of 3.0T susceptibility weighted imaging (SWI) for non-invasively assessing isochelate dehydrogenase (IDH) genetic subtypes and examine the combined usefulness of SWI and dynamic susceptibility contrast-perfusion weighted imaging (DSC-PWI) for the evaluation of IDH genotypes in diffuse gliomas.
Materials and Methods Fifty-one patients with pathologically confirmed diffuse gliomas who underwent conventional magnetic resonance imaging(cMRI), SWI and DSC-PWI scans were enrolled in our study. IDH genetic subtypes were determined by sanger sequencing. Intratumoral susceptibility signal intensity (ITSS) grading and maximum relative cerebral blood volume (rCBVmax) differences between IDH-mutated gliomas and IDH wild-type cases were compared using the non-parametric rank sum test. Receiver operating characteristic (ROC) curve analysis was performed to determine the optimal threshold for IDH mutation status. The area under the curve (AUC) was calculated to examine diagnostic performances.
Results Significantly higher ITSS grading and rCBVmax values were found in 27 IDH wildtype gliomas compared to 24 IDH-mutated samples (P=0.02 and ＜0.01, respectively). In subgroup analysis, IDH mutantions and wildtype groups of HGGs showed differences in the ITSS grading and rCBVmax (P=0.01 and 0.03, respectively). No differences in ITSS grading and rCBVmax were observed between the LGGs(P=0.31 and 0.07, respectively). ROC analysis showed that rCBVmax (AUC=0.80) better differentiated between genetic subtypes of gliomas compared to ITSS grading(AUC=0.68). A combination of SWI and DSC-PWI for the identification of IDH mutations lead to AUC of 0.83, which was higher than any single indicator diagnostic performance.
Conclusions 3.0T SWI may provide a new noninvasive method for evaluating the IDH mutation status of diffuse gliomas and a combination of SWI and DSC-PWI produces higher predictive value.

能谱 CT 评价贝伐单抗抗大鼠 C6 胶质瘤血管生成的研究

韩蕾,周俊林
兰州大学第二医院

目的 探索能谱 CT 定量参数评估贝伐单抗抗大鼠 C6 胶质瘤血管生成的可行性。**方法** 取健康雄性 SD 大鼠 30 只进行 C6 胶质瘤模型的建立，造模后 2 周对所有大鼠进行能谱 CT 扫描，观察成瘤情况。扫描完成后，将其随机分为实验组（n=15 只）和对照组（n=15 只），实验组开始每天腹腔注射贝伐单抗注射液 5 mg/kg，对照组每天腹腔注射同等剂量的生理盐水（0.9%NaCl），连续注射一周，分别在用药后第 4 天和第 8 天进行能谱 CT 扫描，能谱 CT 后处理软件分析得到定量参数以及伪彩图。每次扫描结束后，各组随机抽取 3 只利用心脏灌流取脑方法取材鼠脑组织，进行 HE 染色及 VEGF、HIF-1α的免疫组化染色，统计学分析能谱 CT 定量参数与 VEGF、HIF-1α的相关性。**结果** 对照组及实验组治疗前 70keV 单能量 CT 值、斜率、碘浓度组间无统计学意义（p>0.05）。实验组经抗血管生成药物贝伐单抗治疗后，70keV 单能量 CT 值、碘浓度均下降，斜率呈升高趋势，治疗后不同时间点对照组及实验组 70keV 单能量 CT 值、斜率、碘浓度值组间均有统计学意义（p<0.05）；免疫组化与能谱 CT 各定量参数相关性分析显示实验组及对照组不同时间点 70keV 单能量 CT 值、斜率、碘浓度值与 VEGF、HIF-1α均呈正相关。**结论** 能谱 CT 多参数成像可作为评估贝伐单抗抗大鼠 C6 胶质瘤血管生成的新方法。

比较分析弥散峰度成像和弥散张量成像在脑胶质瘤分级、预测肿瘤细胞增殖和 IDH-1 基因突变状态中的作用

孙祥茹
山西医科大学第一医院

目的：弥散张量成像（DTI）和弥散峰度成像（DKI）已经广泛应用于胶质瘤的术前评估。但很少有研究综合应用 DKI 和 DTI 来评估胶质瘤。本研究描述了综合运用 DKI 和 DTI 对胶质瘤评估的疗效，包括肿瘤分级，异柠檬酸脱氢酶-1（IDH-1）突变状态和肿瘤增殖率（Ki-67）等，并对其结果进行了比较。

方法：前瞻性纳入 30 例经病理证实的胶质瘤患者，其中 12 例为女性，中位年龄为 45 岁。所有病例均接受 DKI 检查，推导出 DKI 和 DTI 的参数图。DKI 参数包括平均峰度 MK、轴向峰度 Ka、径向峰度 Kr，DTI 参数包括平均弥散率 MD、分数各向异性 FA。

结果： HGGs 中 MK，Ka，Kr 和 FA 显著高于 LGGs，而 MD 明显低于 LGGs（P <0.01）。 ROC 分析证明 MK（特异性：98%敏感性：63%）和 Ka（特异性：88%敏感性：79%）具有相同且最高（AUC：0.93）的诊断值。在 III 级神经胶质瘤中 MK，Ka 和 Kr 显著高于 II 级神经胶质瘤（P≤0.01）。DKI 和 DTI 可以显著鉴定 IDH-1 的突变状态（P≤0.03）， Ka（敏感性：84%，特异性：67%，AUC：0.69）显示出最高的诊断价值。DKI 指标和 MD 显示出与 Ki-67 的显著相关（P≤0.01），Ka 具有最高的相关系数（rs = 0.72）。

结论：DKI 指标在区分 HGG 和 LGG 方面的诊断效力、特异性和敏感性高于 DTI 参数。Ka 可作为预测胶质瘤分级，肿瘤细胞增殖率和 IDH-1 基因突变状态的的理想成像指标。

Predictive Value of Texture Analysis of High b-Value Diffusion-Weighted Imaging for Consistency of Pituitary Macroadenomas

Chunqiu Su, Shanshan Lu, Xunning Hong
The First Affiliated Hospital of Nanjing Medical University

Abatract

Purpose: The aim of this study was to evaluate the diagnostic performance of texture analysis(TA) of diffusion-weighted imaging(DWI) at a standard b-value (b=1000 s/mm^2) and a high b-value (b=2000 s/mm^2) for their ability to predict the tumor consistency of pituitary macroadenomas.

Materials and Methods: 50 patients with histologically confirmed pituitary macroadenomas were retrospectively reviewed. All patients underwent readout segmentation of long variable echo-trains(resolve) DWI at b=1000 s/mm^2 and b=2000 s/mm^2, and corresponding apparent diffusion coefficient (ADC) maps (ADC_{1000} and ADC_{2000}) were generated. On the basis of surgical and histological findings, the macroadenomas were classified as either soft or hard types. The parameters derived from TA of T2-weighted images (T2WI), ADC_{1000} and ADC_{2000} for predicting tumor consistency were compared between the two types by using unpaired student's t-test. Receiver operating characteristic curve (ROC) and logistic regression were used to assess their diagnostic performance.

Results: Significant statistical differences in TA parameters of ADC_{1000} and ADC_{2000} were observed between soft and hard types, whereas the TA of T2WI resulted in no significant difference. TA of ADC_{2000} provided superior diagnostic performance compared with that of ADC_{1000} and the entropy of the ADC_{2000} was the best single-feature under the ROC curve (AUC) of 0.861. Using multivariable logistic regression, a combination of meanvalue and entropy of ADC_{2000} yielded an AUC, a sensitivity and a specificity of 0.911, 78.4% and 92.3%.

Conclusions: TA of ADC values were useful for predicting the tumor consistency of pituitary macroadenomas and the high b-value ADC_{2000} may facilitate better type discrimination.

Differentiation of High-Grade Astrocytomas from Solitary Brain Metastases: Comparing Diffusion Kurtosis Imaging and Diffusion Tensor Imaging

Yan Tan, Hui Zhang, Jiangbo Qin, Xin Liang
The first hospital of Shanxi medical university

Objective: The purpose of this study was to compare MRI diffusion kurtosis imaging (DKI) and diffusion tensor imaging (DTI) in the differentiation of high-grade astrocytomas from solitary brain metastases

Methods: This study was approved by the institutional review board and patient consent was obtained. Twenty-one high-grade astrocytomas and nineteen solitary brain metastases were retrospectively identified. The DKI parameter values (MK, Kr and Ka) and DTI parameter values (MD and FA) were measured from the tumoral enhanced part and peritumoral edema. All data were normalized to the values in the contralateral normal-appearing white matter (NAWM) at the same level, which was used for correction. Differences between the two groups were analyzed using one-way ANOVA test, and ROC curves were used to test for the best parameters.
Results: There was no age difference between high-grade astrocytomas and solitary brain metastases (P=0.580), while the Kr and Ka values in the contralateral NAWM decreased significantly in high-grade gliomas (P=0.022). The DKI values (MK, Kr and Ka) and DTI values (MD and FA) in tumoral enhanced parts did not show significant differences between two groups (P＞0.05). MK, Kr and Ka values in peritumoral edema with or without correction by NAWM were higher in high-grade astrocytomas than solitary brain metastases (P＜0.05), and MD values without correction was lower in high-grade astrocytomas than solitary brain metastases (P＜0.05). Ka (1.000) with correction by NAWM had the highest AUC, followed by MK (0.889), Kr (0.861), MD (0.793), the AUC of MK, Kr and Ka values were higher than that of MD value (P＜0.05). The optimal threshold for MK, Kr, Ka and MD with correction by NAWM for differentiating high-grade astrocytomas from solitary brain metastases were 0.369, 0.405, 0.483 and 2.067, respectively.
Conclusion: DKI resulted in better differentiation of high-grade astrocytomas from solitary brain metastases than DTI.

EPO-0210
探究 IVIM 在高级别胶质瘤与脑转移瘤瘤周水肿区的鉴别价值

田博闻
山西医科大学第一医院

目的探讨体素内不相干运动扩散加权成像(IVIM)在高级别胶质瘤与脑转移瘤瘤周水肿区的差异与鉴别价值。方法收集 2017 年 06 月-2018 年 12 月,就诊于山西医科大学第一医院经病理证实的 34 例高级别胶质瘤(WHO III 级 14 例,WHO IV 级 20 例)和 32 例脑转移瘤(原发肿瘤为肺癌的有 22 例,食管癌 3 例,直肠癌 7 例)患者术前或放化疗前的 MRI 平扫、增强及 IVIM 检查资料,将 IVIM 图像导入后处理工作站,获得灌注系数 fast ADC(D*)、扩散系数 slow ADC(D)和灌注分数 fraction of fast ADC(f)及参数伪彩图,参考 MRI 平扫和增强图像测取瘤周水肿区(1cm 内)及对侧半卵圆中心的 D*、D 和 f 值,高级别胶质瘤和转移瘤肿瘤瘤周水肿区(1cm 内)的各参数值分别与对侧半卵圆中心的相应参数值相比获得相对参数值,即 r D*、r D、rf 值。应用 SPSS 22.0 统计学分析软件,所有数据经正态性检验后,应用独立样本 t 检验分析两组肿瘤间所选三个区域各参数的统计学意义。对两组肿瘤间存在差异的参数做 ROC 曲线分析,以确定诊断其最佳阈值,并计算敏感性、特异性和曲线下面积(AUC),评价各参数诊断高级别胶质瘤或转移瘤的效能。结果高级别胶质瘤肿瘤瘤周水肿区(1cm 内)的 D*值、r D*值均高于转移瘤相对应区域的 D*、r D*值,差异有统计学意义(P 均<0.05);高级别胶质瘤肿瘤瘤周水肿区(1cm 内)的 f 值、rf 值均低于转移瘤相对应区域的 f 值、rf 值,差异有统计学意义(P 均<0.05)。瘤周水肿区 D*值的 AUC(AUC=0.910,P<0.001,敏感性 100%,特异性 76.2%)。两组肿瘤的肿瘤瘤周水肿区(1cm 内)的 D 值、r D 值及二者对侧半卵圆中心的 D*值、D 值、f 值差异均无统计学意义(P 均>0.05)。

Malignant transformation of a suspected low-grade glioma into hemorrhagic glioblastoma: a case report

YIN DONG,Huan Yang ,Xianshun Yuan
Shandong Provincial Hospital

Background

By Common Consent, patients with low-grade gliomas (LGGs) have a more favorable clinical outcome than those with high-grade gliomas (HGGs) although patients with LGGs eventually die of either tumor progression or malignant transformation. Treatment regimen for LGGs remains controversial especially for those within important functional areas. Since tumor size and gross-total resection are independently correlated with malignant transformation of LGGs, treatment of small LGGs usually follows "watch and wait" strategy especially when tumor located at important functional zone and gross total resection might be at significant risk for complications. Here we present a case of malignant transformation of a followed-up suspected LGG into hemorrhagic glioblastoma on which emergent craniotomy was operated.

Case history

We report a case of a 34-year-old male, who was referred for complaints of tic of limbs 5 hours before. His physical examination was unremarkable. CT scan revealed a hypointensity lesion located on surface of left posterior parietal lobe which was indentified as a swollen gyrus on T2WI of MRI, LGG was suspected. The patient was treated with Sodium valproate and carbamazepine for the seizure and regular follow-up was prescribed. Nothing was remarkable in the following seven months until the next epileptic seizure accompanied by headache and loss of consciousness the next day. Rechecked CT scan showed irregular hyperintensity mass beneath cortex of left posterior parietal lobe associated with subarachnoid hemorrhage, surrounding edema and midline shift. MRI confirmed a heterogeneous mass hidden by hematoma. During emergent surgery, old hemorrhage was sucked away and light yellow tumor tissue was gross-totally resected just beneath the rotten-fish-like cortex. Glioblastoma multiforme (WHO IV) was diagnosed at pathologic exam, the patient received radiation and chemotherapy and was followed up annually.

Conclusion

Malignant transformation of LGGs might take much more less time than reported and hemorrhage can be a rare but disastrous complication. Given this way, the first choice of LGGs treatment modality is surgery whenever possible. The total resection may delay the onset of malignant transformation and avoid accidental complications while provides histological types and biologic behavior for further treatment plan. Follow up without surgery must be more carefully executed and explained more detailed to patients.

Evaluation of heterogeneity in diffuse intrinsic pontine glioma using quantitative dual-layer CT and MR spectroscopy: a pilot study

Liying Qu[1], Yunyun Duan[1], Yaou Liu[1], Xiaomei Lu[2]
1. Beijing Tiantan Hospital, Capital Medical University
2. IntelliSpace Portal Version 6.5, Philips Healthcare

PORPOSE

To investigate the alterations of the attenuation values, effective atomic number (Z_{eff}), and iodine density (IoD) in diffuse intrinsic pontine glioma (DIPG), comparing to metabolic changes from MR spectroscopy. And to explore the relationships between imaging parameters and histopathological and genetic results.

METHOD AND MATERIALS

Data were collected from 9 patients with diffuse intrinsic pontine glioma by a dual-layer detector spectral CT scanner and a 3.0 T MR system. The attenuation values (HU), Z_{eff}, and IoD during artery phase (AP) were measured on all 9 patients. The region-of-interest (ROI) were placed on the whole tumor and different regions inside the tumor. Then eight of the patients underwent multi-voxel 1H-MRS and the NAA, Cho and Cr were measured accordingly. The correlations between imaging parameters from CT and metabolite contents were made by Spearman correlation analysis.

RESULTS

The patients are 5 males and 4 females with age range of 7-48 years (23.1 ± 14.5 years). Eight of the patients underwent surgery and had pathological and genetic testing results, including H3K27M, GFAP, and olig-2.

The only one patient with lower grade tumor showed a smaller deference in attenuation values, IoD and Z_{eff}. Two patients with negative H3K27M showed lower density difference (8.23 HU and 8.27 HU difference in 50-keV virtual monoenergetic) and lower Z_{eff} difference (0.10 and 0.06) than other six patients with positive H3K27M (HU difference 11.06-67.02, Z_{eff} difference 0.11-0.67).

There was no significant correlation between metabolite contents and attenuation values, IoD and Z_{eff} ($p>0.10$). While we found the trends of their relationships. The correlation coefficient of Cho/Cr with HU, IoD or Z_{eff} difference are 0.619, 0.587 and 0.537, respectively.

CONCLUSION

Attenuation values, IoD and Z_{eff} difference from dual-layer detector spectral CT may apply the information of tumor heterogeneity, which is important to indicate the malignancy of the tumor. Larger sample size is needed to support the relationships with metabolite contents and genes.

Diffusion Kurtosis Imaging Reflects GFAP, TopoⅡα, and MGMT Expression in Astrocytomas

Xiaochun Wang,Ying Lei
First Clinical Medical College, Shanxi Medical University,

Objective: Preliminary study of magnetic resonance (MR) diffusion kurtosis imaging (DKI) assessing the pathological glial fibrillary acidic protein (GFAP), TopoⅡα, and O 6-methylguanine-DNA methyltransferase (MGMT) expression in astrocytomas. **Materials and Methods:** This study was approved by the local ethics committee, and informed consent was obtained from all participants. Sixty-six cases with pathologically proven astrocytomas were enrolled in this study; of which, 34 were high grade and remaining 32 were low grade. They patients underwent conventional MRI head scan, DKI scan, and enhanced scan under the same conditions. Fractional anisotropy (FA) and mean kurtosis (MK) calculated from DKI, as well as GFAP, TopoⅡα, and MGMT expression level were compared prospectively between high and low-grade astrocytomas. Spearman rank correlation analysis was used for comparing values of DKI and GFAP, TopoⅡα, and MGMT expression level in the two groups. **Results:** The MK values were significantly higher in high-grade astrocytomas than those in low-grade astrocytomas ($P < 0.05$); FA values demonstrated no significant difference between the two groups ($P = 0.331$). GFAP expression level was significantly lower in high-grade astrocytomas than in low-grade astrocytomas ($P < 0.05$). Topo-Ⅱα expression level were significantly higher in high-grade astrocytomas than in low-grade astrocytomas ($P < 0.05$). There was no significant difference in MGMT expression level between the two groups ($P = 0.679$). MK values were negatively correlated with the expression of GFAP ($r = -0.836$; $P = 0.03$), however, they were positively correlated with the expression of Topo-Ⅱα ($r = 0.896$; $P = 0.01$). FA values were not correlated with the expression of GFAP ($r = 0.366$; $P = 0.05$), Topo-Ⅱα ($r = -0.562$; $P = 0.05$), and MGMT ($r = -0.153$; $P = 0.10$). **Conclusion:** MK, the DKI parameter values of astrocytomas, was significantly correlated to the expression of GFAP and TopoⅡα. To a certain extent, applying DKI may provide the biological behavior of tumor cell differentiation, proliferation activity, invasion and metastasis, and can guide individual treatment.

磁共振动态对比增强联合弥散加权成像鉴别脑胶质瘤复发和治疗后反应的初步研究

任龙飞
山西医科大学第一医院

目的：
探讨磁共振动态对比增强联合弥散加权成像在鉴别胶质瘤复发和治疗后反应中的应用价值。
方法：
收集 32 例脑胶质瘤全切术+同步放化疗术后出现强化灶的病人（肿瘤复发 22 人，治疗后反应 10 人），在放化疗结束 2 个月内行常规 MRI 平扫+增强、DWI、DCE 灌注成像，原始数据经工作站后处

理获得 DCE 灌注伪彩图及 ADC 图，分别测量异常强化区所对应的 Ktrans、Kep、Ve、iAUC 及 ADC 值，采用秩和检验分析两组间各参数差异性，并绘制受试者工作特征(receiver operating characteristic，ROC)曲线，分别计算敏感度、特异度及曲线下面积，评估各参数的诊断能效。

结果：

复发组实性强化区 Ktrans 值和 iAUC 值明显高于治疗后反应组，且差异有统计学意义（P＜0.05），两组间 Ve 值和 Kep 值显著均无差异（P＞0.05）。Roc 曲线分析，当 Ktrans 值、iAUC 值阈值为 0.128、0.152 时，其曲线下面积分别为 0.973、0.941，灵敏度均为 95.5%，特异度分别为 90%、80%。治疗后反应组 ADC 平均值高于复发组，差异有统计学意义（P＜0.05）。Roc 曲线分析，当平均 ADC 阈值为 0.864 时，其曲线下面积为 0.864，灵敏度及特异度分别为 86.4%、80%。且 Ktrans 诊断效能高于 iAUC 及平均 ADC 值，在并联试验中，当 Ktrans 值＞0.128 或平均 ADC 值≤1.15 时，诊断胶质瘤复发的敏感度可以提高至 100%，特异度 81.8%；串联试验中，当 Ktrans 值＞0.128 且平均 ADC 值≤1.15 时，诊断胶质瘤复发的敏感度及特异度为 81.8%、90%。

结论：

应用 DCE-MRI 联合 DWI 成像技术可以有效鉴别诊断胶质瘤复发和治疗后反应，对指导临床治疗方案的选择以及预后评估提具有重要的价值。

多 b 值 DWI 在 WHO II 级脑星形细胞瘤 IDH 基因型的诊断价值

邓晓琳
山西医科大学第一医院

目的：探讨多 b 值弥散加权成像在 WHOII 级脑星形细胞瘤异柠檬酸脱氢酶（isocitrate dehydrogenase，IDH）基因型的诊断价值。材料与方法：回顾性分析 2015 年 1 月至 2018 年 12 月经手术病理确诊为星形细胞瘤 WHO Ⅱ级且有基因结果的患者资料，术前均行颅脑常规 MRI 扫描及多 b 值弥散加权扫描，通过后处理工作站获得水通道蛋白相关扩散系数（AQP-ADC）、纯扩散系数（D）、灌注相关扩散系数（D*）、灌注分数（f）等伪彩图，测量肿瘤实质区及同一层面对侧正常脑实质区的各个参数值，计算获得校正后的参数值（瘤体参数值除以对侧正常脑实质值）：相对水通道蛋白扩散系数（rAQP-ADC）、相对纯扩散系数（rD）、相对灌注相关扩散系数（rD*）、相对灌注分数（rf）等，应用两样本 t 检验分析同一病理级别不同基因分型之间的参数值差异，对有统计学意义的参数值绘制受试者工作特征(receiver operating characteristic，ROC)曲线，计算敏感度及特异度。结果：WHO Ⅱ级星形细胞瘤患者中，IDH1 突变组与野生组间的 AQP-ADC、D、D*、f、rAQP-ADC、rD、rD*、rf 等均无统计学意义（P＞0.05）；结论：研究发现 WHO Ⅱ级星形细胞瘤的各参数 AQP-ADC、D、D*、f 等在野生组和突变组之间均无统计学意义。

儿童颅骨筋膜炎影像学表现及结局

赵彩蕾,干芸根
深圳市儿童医院

目的：颅骨筋膜炎属于筋膜炎的一种，比较罕见的良性颅骨肿瘤，对颅骨具有一定潜在侵袭性，在膨胀性头皮肿物中，鉴别诊断具有一定的难度，因此，本文通过认识其影像学多种表现及预后结局，旨在提高对该疾病的认识，及帮助临床医生对头皮及颅骨肿物的诊疗工作。
方法： 本研究收集 2011 年 1 月至 2018 年 12 月的 12 例手术后病理证实为颅骨筋膜炎的患者，并进行了 2-7 年随访。其中 3 例进行 MRI 检查，其中 1 例平扫及增强，9 例进行 CT 及超声检查。由 2 位儿科神经医师对颅骨筋膜炎的临床表现及影像学以及随访中的临床结局进行了归类总结。**结果：** 12 例患者，男，7 例，女，5 例，平均年龄 23.66 月，最小年龄 4 月，最大年龄 9.08 岁； 3 例出生发现病灶，6 例外伤后迅速增大，3 例无明显诱因；均进行手术切除；手术后 1 例在半年后复发，但生长缓慢，该例影像特征无骨质破坏，仅有软组织包块。病变位置：额顶交界处 3 例，颞顶交界处 2 例，人字缝旁 1 例，顶骨 3 例，颞骨 1 例，枕部 2 例。依据超声、CT 和 MR 影像学分 4 类：① 无骨质破坏，仅软组织包块，共 5 例；②骨质膨胀性破坏，破坏自颅骨外板至内板，无组织包块，共 3 例；③骨质梭形膨胀破坏，破坏自颅骨外板至内板，伴软组织包块，均可见其内残留条状骨片影，共 2 例；④骨质侵蚀性破坏，伴软组织包块，共 2 例，其中 1 例累颞骨岩部及中耳乳突。
结论：颅骨筋膜炎虽然为罕见病，但在婴儿、较小儿童皮下软组织包块鉴别诊断中应该常常考虑，临床上常有在外伤后短期迅速增长特征，其影像学表现多样，其骨质梭形膨胀性破坏，自外板向内板具有一定的特征性，且其内均可见其内残留条状骨片影，大多数结局良好，少数仅有皮下软组织包块有复发倾向。

DSC and DCE histogram analysis for differentiation and survival analysis of diffuse glioma biomarkers including IDH, MGMT and TERT

Hanwen Zhang,Yi Lei,Fan Lin,Guiwen Lv,Yuning Feng,Hong Zhang,Lihong Liang
Department of Radiology， the First Affiliated Hospital of Shenzhen University， Health Science Center; Shenzhen second people's hospital， Shenzhen， 518035， China.

Abstract
Purpose: To evaluate the performance of parameters of dynamic susceptibility contrast magnetic resonance imaging (DSC)-MRI and histogram parameters derived from dynamic contrast-enhanced (DCE)-MRI in discriminating the states of molecular biomarkers and do survival analysis
Materials and Methods: Forty-three glioma patients who had undergone DCE-MRI and DSC-MRI for preoperative evaluation were respectively enrolled. The relevant immunohistochemical results and molecular test results of all patients were collected, including isocitrate dehydrogenase (IDH), O6-methylguanine-DNA methyltransferase (MGMT) and telomere reverse transcriptase (TERT). Parameters of DSC-MRI (cerebral blood volume(CBV), cerebral blood flow(CBF), mean transit time (MTT) and time to peak (TTP)) and histogram parameters derived from DCE-MRI(volume transfer coefficient (K_{trans}), fractional volume of the extravascular extracellular space (EES)(V_e),fractional blood plasma volume(V_p), rate constant between EES and blood plasma (K_{ep}) and area under the curve (AUC)) were calculated. The differences of each parameter between diffuse gliomas with different expression states (IDH mutation status, MGMT methylation status and TERT mutation status) were evaluated respectively using a Mann-Whitney U-test. The receiver operating characteristic (ROC) curve analysis was

performed to assess the diagnostic efficiency of these parameters. Kaplan－Meier method was used to calculate patient’s overall survival.
Results: Histogram parameters of DCE-MRI demonstrated better diagnostic performance in identifying different expression states of molecular biomarkers. The 10^{th} percentiles of K_{trans}($p<0.001$) and 10^{th} percentiles of AUC($p<0.001$) were significantly high in the mutation state of IDH. The 90^{th} percentiles of V_e ($p<0.001$), 50^{th} and median K_{trans} ($p<0.001$) were significantly high in the methylation status of MGMT. But for the mutation status of TERT, only K_{ep}-related values (75^{th} K_{ep}($p=0.001$) and mean K_{ep}($p<0.001$)) had remarkable differences. The results of ROC analysis indicated that the 10^{th} percentiles of AUC provided the highest differential efficiency (sensitivity =0.78, specificity=0.80) for IDH, 90th V_e returned the highest (sensitivity =0.84, specificity=0.79) for MGMT and mean K_{ep} provided the highest (sensitivity =0.76, specificity=0.78) for TERT. Kaplan－Meier curves showed a significant difference between subjects with 10th AUC higher or lower than 0.028 (log-rank=7.535; P=0.006)for IDH and between subjects with 90th Ve higher or lower than 0.178 (log-rank=6.532; P=0.011) for MGMT.
Conclusion: Histogram analysis of perfusion-weighted imaging can better assess diffuse glioma molecular typing and prognosis assessment.

重庆医科大学附属第一医院

目的 研究基于肿瘤实性成分和瘤周水肿区域的 ADC 信号灰度直方图鉴别 WHOII、III 级胶质瘤分子亚型的价值。**方法** 回顾经手术及病理证实为 WHOII、III 级胶质瘤，术前接受过头颅 MRI 平扫、增强及 DWI 检查的 55 例患者的病理及影像学资料。其中，IDH 野生（IDH^{wt}）组 14 例，IDH 突变不伴 1p19q 联合缺失（$IDH^{mut}1p19q^{int}$）组 19 例，IDH 突变伴 1p19q 联合缺失（$IDH^{mut}1p19q^{del}$）组 22 例。利用后处理软件生成并记录不同分子亚型组的 ADC 直方图参数，包括平均值、最小值、 ADC 各百分位（5、10、25、50、75、90、95）、最大值、众数、峰度、偏度、标准差、不均一性、极差、熵值，并采用独立样本 t 检验（正态分布）或 Mann-Whitney U检验（偏态分布）进行比较。采用 ROC 评价上述参数鉴别 WHO II、III 级胶质瘤不同分子亚型的效能。**结果** IDH^{wt}组的最小值、ADC5%小于 IDH^{mut}组（$P<0.05$）,而 IDH^{wt}的标准差、不均一性和极差则大于 IDH^{mut}组（$P<0.05$）。$IDH^{mut}1p19q^{int}$组的平均值、ADC5%、10%、25%、50%、75%、90%、95%及众数均高于 $IDH^{mut}1p19q^{del}$组（$P<0.05$），而 $IDH^{mut}1p19q^{int}$组偏度和峰度则低于 $IDH^{mut}1p19q^{del}$组（$P<0.05$）。不均一性鉴别 IDH^{wt}组和 IDH^{mut}组的效能最高，ROC 曲线下面积为 0.937，以 0.186 为截断值，敏感度和特异度分别为 92.9%和 82.5%；偏度鉴别 $IDH^{mut}1p19q^{del}$组和 $IDH^{mut}1p19q^{int}$组的效能高于其他参数，ROC 曲线下面积均为 0.821，以偏度为 0.185 鉴别二者的敏感度和特异度分别为 81.8%和 78.8%。**结论** ADC 信号强度直方图可以为 II、III 级胶质瘤的分子亚型的鉴别提供更多信息。

EPO-0219
GSH and GABA decreases in IDH1 mutated low-grade gliomas detected by HERMES spectral editing at 3.0T in vivo

Tao Gong,Guangbin Wang
Shandong Medical Imaging Research Institute

Purpose: To examine in vivo γ-aminobutyric acid (GABA) and glutathione (GSH) alterations in isocitrate dehydrogenase 1 (IDH1) mutated low-grade gliomas using Hadamard Encoding and Reconstruction of Mega-Edited Spectroscopy (HERMES).
Methods and materials: Twelve patients with suspected diagnosis of low-grade glioma were enrolled prospectively in this study; all subjects underwent a 3T MRI scan, including 3D T1 weighted imaging and HERMES acquisition with a volume of interest 3×3×3 cm^3. The GABA signal detected by HERMES also contains signal from macromolecules and homocarnosine, so it is referred to as GABA+. The detected GABA+ and GSH signals in tumor foci and contralateral cerebral regions were quantified using Gannet. The fitting errors of HERMES for GABA + and GSH were also analyzed. Paired t-test was performed to compare the GABA+ and GSH levels and FitError values between the tumor foci group and contralateral regions group in IDH1-mutant low-grade gliomas.
Results: Paired t-test revealed no differences in FitError values between glioma foci and contralateral regions (p=0.71 and p=0.74 for GABA+ and GSH respectively) Both GABA+ and GSH decreased significantly in glioma foci compared with contralateral regions (p=0.015, t=3.322; p=0.000, t=7.313 respectively) in IDH1-mutant low-grade gliomas.
Conclusion: Our results suggest HERMES is a reliable tool to simultaneously measure GABA and GSH alterations in low-grade gliomas with IDH1 mutation; noninvasive detection of GABA and GSH may prove to be a valuable diagnostic and prognostic biomarker of gliomas.

Preoperative Detection of Parasagittal Meningiomas Classification with 3D Gadolinium-enhanced CUBE T1 Sequence

Yuqi Zhu,Yuan Li
Huashan Hospital Fudan University

Objective:According to the invasion degree of the superior sagittal sinus(SSS), Dr Sindou classified parasagittal meningiomas into six types. The surgical procedure for patients with parasagittal meningiomas may vary according to the sinus involvement. This paper evaluated the role of 3D gadolinium-enhanced CUBE T1 in preoperative classification of parasagittal meningiomas.
Methods:56 patients with parasagittal meningiomas were imaged with 3D gadolinium-enhanced CUBE T1 sequence before they received surgery of a total removal of meningiomas with/without SSS reconstruction. Two neuroradiologists independently assessed the images to decide the invasion degree including attachment to the outer surface of the SSS wall(CUBE I), one-wall invasion of SSS(CUBE II), two-wall invasion of the SSS(CUBE III) and total occlusion of SSS(CUBE IV) ; Disagreements were resolved

by discussion. All patients were operated on, and intraoperative findings were taken as the criterion standard.
Results:The use of 3D gadolinium-enhanced CUBE T1 imaging was found to provide an easy way to detect the SSS invasion degree by parasagittal meningiomas. The inter-observer agreement was very good(κ =0.831, 95% confidence interval 0.706－0.955) and the result after discussion was highly consistent with the surgical findings(κ =0.755, 95% confidence interval 0.602－0.908).
Conclusion:In preoperative planning for patients with parasagittal meningiomas, 3D gadolinium-enhanced CUBE T1 sequence could provide reliable information for parasagittal meningioma classification.

EPO-0221

Histogram Analysis of Magnetic Resonance Imaging in Differentiating Sellar Germinomas from Craniopharyngiomas

Junhong Liu,Jingliang Cheng
the First Affiliated Hospital of Zhengzhou University

Background and Purpose: Accurate differential diagnosis is essential for treatment planning of sellar germinoma and craniopharyngioma. We hypothesized that the histogram analysis of MRI would differentiating sellar germinomas from craniopharyngiomas.
Materials and Methods: We retrospectively appraised a pathology database for five years and obtained 20 histopathologically proven sellar germinomas and 48 craniopharyngiomas with MR images. The T_1WI and T_2WI, ADC maps, and contrast-enhanced T_1WI (CE-T_1WI) of each patient were analyzed with the Mazda software. Nine parameters were selected as indicators of comparison, including variance, skewness, kurtosis, mean, 1^{st}percentile, 10^{th}percentile, 50^{th}percentile, 90^{th}percentile, and 99^{th}percentile. The ROC curves were drawn for the parameters with significant group differences, and the area under the curve (AUC) was calculated.
Results: Among the nine parameters extracted using histogram analysis, the mean, skewness, 50^{th}percentile, and 90^{th}percentile of ADC map showed statistical significance with AUCs of 0.915, 0.890, 0.916, and 0.808, respectively. The optimum mean, skewness, 50^{th}percentile, and 90^{th}percentile of ADC map to distinguish sellar germinomas from craniopharyngiomas were 165.73 (with 87.5% specificity and 80.0% sensitivity), -0.13 (with 80.0% specificity and 87.5% sensitivity), 170.50 (with 83.3% specificity and 85.0% sensitivity), and 237.00 (with 81.3% specificity and 75% sensitivity), respectively. Here, we only analyzed the parameters with statistical differences between groups. Among these parameters, we chose specificity and sensitivity greater than or equal to 75% to accurately meet the clinical needs.
Conclusion: The T_1WI, T_2WI, ADC map, and CE-T_1WI histogram contributed to the identification of sellar germinomas and craniopharyngiomas. Besides, the ADC map histogram was more effective than other MRI sequence histograms.

EPO-0222

DSC-MRI and DCE-MRI in differentiating recurrent tumour from radiation-induced brain injuries in patients with glioma

Lanhua Hu,Yunfei Zha,Wenbing Yang
Renmin Hospital of Wuhan University in Hubei Province

Objective To explore the clinical significance of dynamic susceptibility contrast (DSC) perfusion MRI and dynamic contrast-enhanced (DCE) permeability MRI in distinguishing radiation-induced brain injuries from recurrence in glioma patients. **Methods** Nineteen pathologically diagnosed glioma patients were performed MR scanning with DSC and DCE after surgery, before and after synchronous chemoradiotherapy. Hemodynamic parameter value were got, and the perfusion imaging results and the final clinical diagnoses were contrasted. The differential diagnostic values of the perfusion parameters were analyzed statistically. **Results** Eleven cases were recurrent glioma , while 8 cases were radiation-related injuries. The values of recurrent pateints including relative cerebral blood volume (rCBV), relative cerebral blood flow (rCBF), volume transfer constant (Ktrans), unit volume of extravascular extracellular space (Ve) and initial areas under the concentration curve (riAUC) were significantly higher than the radiation-induced brain injuries patients (all $P<0.05$). While there were no significantly statistical differences of Kep and Vp between glioma recurrence and radiation-induced injuries. Combining the optimal parameters rCBV with Ktrans in the differentiation diagnoses of the series and parallel tests, the sensitivity were 90.9%, 72.7% ;while the specificity were 75%, 100% respectively. **Conclusion** Both DSC and DCE can distinguish glioma recurrence from radiation-induced brain injuries. The parameters Ktrans, riAUC and rCBV values seems to be slightly efficient in diagnosis than rCBF and Ve, while combined with Ktrans and rCBV, the diagnostic accuracy may be improved.

DOXCuS@iRGD-Albumin Nanotheranostic platform Guided Tumor-Targeted and Photoacoustic Imaging for Chemotherapy Photothermal Therapy in Orthotopic primary U87 gliomas mice model

Lijuan Chen[1,2,3],Yan Bai[1,2],Haiyan Gao[1,2],Zhiyong Qian[3],Meiyun Wang[1,2]
1.Henan Provincial People's Hospital
2.Henan Key Laboratory of Neurological Imaging

3.State Key Laboratory of Biotherapy and Cancer Center, West China Hospital, Sichuan University, and Collaborative Innovation Center

Objective

Herein, in this article, we present the fabrication of DCiB for glioma diagnosis and treatment nanotheranostic. Using biological sources albumin as the carrier, through covalent coupling with iRGD peptide, for having the initiative to the integrin αVβ3 receptors on the tumor vascular endothelial cell and the U87. For the subcutaneous U87 gliomas mice model and the orthotopic primary glioma mice model, the accumulation of DOX in tumor site play a role of chemotherapy through endocytosis combination of nucleic acid within the tumor cells. Besides, the CuS coupled carried by the system exhibited the function of photothermal effect and photoacoustic imaging in the theranostics treatment. The DCiB nanotheranostic platform combination the chemotherapy and photothermal therapy, and the noninvasive photoacoustic diagnostics for the efficacy and safety therapeutic regimes.

Method

We functionalize the albumin with tumor target function, and to integrate the copper sulfide mineralization on albumin carrier with photothermal function to build a copper based CuS@iBSA functional carrier. Chemotherapy drug doxorubicin loaded to construction of DOX/CuS@iBSA nanoparticles (DCiB) diagnosis and treatment integration system. Examining its physicochemical properties, pharmaceutical properties, photothermal behavior, targeting function, evaluation of efficacy in vitro and in vivo, and other experimental studies, aiming to evaluate the function of this targeted diagnosis and treatment system, and explore its photothermal function both in vitro and in vivo. Targeting function, and then investigate its therapeutic effect in animals, found that the scope of application and problems of the combination therapy, provide a certain basis for the future development and application of functional formulations. In this article, the functional parts of the DCiB nanotheranostic platform were synthesized, prepared and constructed. In detail, CuS@BSA was synthesized by biomineralization, iRGD-BSA was reacted with coupling reaction, DCiB was prepared by solution mixing with doxorubicin, and the near-infrared response of CuS@BSA was determined by UV-Vis absorption spectra.To further investigate the photothermal properties and photothermal conversion efficiency under different conditions by 980 nm laser irradiation; the safety was evaluated by MTT assays, hemolysis experiments, blood biochemistry, complete blood count (CBC) and pathological sections (H&E) from the cell, tissue and the animal level; its pharmaceutical properties were examined by TEM, particle size analysis, drug loading (DL), encapsulation efficiency (EE), and controlled release experiments in vitro; The targeted properties were performed by cell uptake experiments and in vivo subcutaneous tumor imaging experiments in mice. In imaging experiments, photoacoustic imaging experiments of orthotopic tumors in mice were performed to investigate their targeting in vitro and in vivo. By establishing two mice models of glioma subcutaneous and orthotopic tumors to evaluate the targeting combination therapy in vivo of the DCiB nanotheranostic platform.

Results

A copper based DCiB nanotheranostic platform was successfully constructed, the investigations on physicochemical properties, pharmaceutical properties, photothermal behavior, targeted functions, and the efficacy *in vitro* and *in vivo* evaluations were performed. The results are as follows: synthesis and characterization of CuS@BSA

nanoparticles, iRGD-BSA (BSA is 67 kD, and the modified iBSA is about 100 kD) was modified by iRGD, the active targeting functional vector. As a result, the monodispersity size measured by dynamic light scattering indicating the size of CuS NPs is 85 nm, and 5% drug loadings DCiB is 125 nm which revealed that successful integration of doxorubicin.
To investigate the photothermal conversion performance of CuS@BSA nanoparticles *in vitro* and *in vivo*. Different proportions (Cu/S 2:1, 1:1, 1:8, 1:16) perform a similar thermal responsiveness trend, along with the increase of irradiation time, temperature rise up around to 60-70 ° C. We measured the photothermal performance of CuS@BSA (10 mg/mL) under the different output power density (0.04, 0.5, 1.5, 2, and 2.3 W/cm^2). The solution temperature was significant increased when power density above 1.5 W/cm^2, which guide the selection of power of photothermal therapy *in vitro* and *in vivo*. The photothermal conversion efficiency (η) of CuS@BSA NPs was 49.8%.
Hemolysis experiments, MTT assays, blood biochemistry *in vivo*, and blood cell count tests validated their blood safety shows that it has good biocompatibility.
The system has performed the proper pharmaceutical properties, a certain drug carrying capacity and sustained release ability. The system showed good chemo-photothermic therapy combined treatment effect in cell experiments of tumor cells U87 *in vitro*. The system showed obvious targeting of different imaging modalities in cells and different animal models (subcutaneous and Orthotopic primary U87 gliomas mice model) *in vitro* and *in vivo*. Anticancer activity of the combination in mouse subcutaneous and orthotopic primary glioma models, the combination therapy targeted group (DCiB + NIR) showed statistically significant compared to PBS and chemotherapy/ photothermal therapy groups. ($p^{**} < 0.01$), thermal therapy with chemotherapy could eventually cover the whole tumor lesions.

Conclusion
Over all, photoinduced tumor thermal ablation were intensely investigated. We ascertain that copper sulfide as the PTT agents performed good treatment effect on superficial solid tumor. The combination therapy method reduces the frequency of chemotherapy. It must be mentioned that and CuS@BSA exhibited more accurate photoacoustic imaging with the mediating of iRGD. Nevertheless, the PTT on the orthotopic primary tumor including glioma, lung cancer is still needing to be further explored.

弥散峰度成像对脑胶质瘤术前分级的诊断价值及相关性研究

庞建鑫
徐州医科大学附属医院

目的探讨弥散峰度成像(DKI)对脑胶质瘤术前分级的诊断价值及相关性。**方法**对经病理证实的 31 例脑胶质瘤病人依据病理分为低级别组 13 例，高级别组 18 例。行 DKI 扫描，经后处理分别得到 DKI 相关参量图。DKI 选择肿瘤实性部分和对侧正常脑白质，分别测量平均弥散峰度(MK)、径向弥散峰度(Kr)、轴向弥散峰度(Ka)和部分各向异性(FA)、平均扩散系数(MD)参数值，并计算同对侧正常脑白质校正后的相对参数值。采用两样本 t 检验，分别分析 MK、Kr、Ka、FA、MD 以及 rMK、rKr、rKa、rFA、rMD 在不同级别脑胶质瘤中有无差异，以及差异有无统计学意义。采用

Spearman 等级相关分析 rMK 值及病理级别之间的相关性。**结果** MK、Kr、Ka、FA 的数值随着胶质瘤级别增加有所升高，MD 随着随着胶质瘤级别增加下降。校正之前，MK、Kr、Ka 值在不同病理级别的胶质瘤差异有统计学意义(*P* 分别为 0.004、0.011、0.008)，FA、MD 值在不同病理级别胶质瘤的差异不具有统计学意义(*P* 分别为 0.17、0.15)。校正之后，rMK、rKr、rKa、rFA、rMD 值在不同病理级别的胶质瘤的差异均有统计学意义(*P* 分别为 0.002、0.003、0.007、0.012、0.012、0.007)。*Spearman* 相关分析显示 rMK 值与病理级别呈正相关(*r*=0.593，*P*=0.002)。**结论**(1) DKI 各参数 MK、Kr、Ka 可用于胶质瘤术前分级，各相对参数 rMK、rKr、rKa、rFA、rMD 均可用于胶质瘤术前分级。(2) rMK 值、胶质瘤病理级别之间呈正相关。

3.0T 磁共振氢质子波谱对脑胶质瘤放射性损伤与复发鉴别诊断分析

张鑫,张冰,朱斌
南京大学医学院附属鼓楼医院

目的 探讨 3.0T 磁共振氢质子磁共振波谱在脑胶质瘤放射性损伤与复发鉴别诊断中的价值。 方法 回顾性分析 24 例脑胶质瘤患者术后、放疗后复查的氢质子磁共振波谱资料，其中 15 例为放射性损伤， 9 例为脑胶质瘤复发。利用 Philips 后处理工作站(EWS)进行波谱分析，分别得到强化区、周围水肿区、对侧正常白质区的 Cho/Cr、 NAA/Cr、 Cho/NAA 比值。 结果 胶质瘤复发者强化区与水肿区 Cho/Cr、 Cho/NAA 比值高于放射性损伤者(P<0.05)。胶质瘤复发者强化区与水肿区 Cho/Cr 比值分别为 3.50±1.10 和 1.95±0.66；其 Cho/NAA 比值分别为 4.42±1.98 和 2.14±1.11。放射性损伤者强化区与水肿区 Cho/Cr 比值分别为 1.80±0.21 和 1.20±0.26；其 Cho/NAA 比值分别为 1.69±0.37 和 0.84±0.24。强化区 Cho/Cr 比值的诊断敏感性及特异性分别为 93.3%和 100%，而水肿区为 66.7%和 88.9%； Cho/NAA 比值的敏感性及特异性分别为 86.7%和 100%，而水肿区为 73.3% 和 77.8%。NAA/Cr 比值无统计学意义(P>0.05)。 结论 3.0T 磁共振氢质子磁共振波谱分析在脑胶质瘤放射性损伤与复发鉴别诊断中有重要价值，可以明显提高鉴别诊断的正确率。

Conventional MRI abnormalities associated with recurrent pattern and poor outcomes in GBM patients: a retrospective study

Xuesong Du[1,2],Weiguo Zhang[2]
1.The general hospital of central theater command of people's liberation army
2.Daping hospital, Army medical university

Purpose To investigate the significance of preoperativeconventional MRI abnormalitieson patterns of recurrence and outcomes in patients with GBM.
Methods Sixty-five patients with recurrent GBM were retrospectively evaluated. Conventional MRI including T1W, T2W, FLAIR, DWI and T1W contrast images were acquired for all patients preoperatively. Quantitative MRI features were extracted using

VASARI featurescriteria. Recurrence patterns were defined in T1W contrast images. Progression free and overall survival was determined for patients with different patterns.Potential risk factors for outcomes were assessed using univariate models followed by multivariate analysis.
Results Thirty VASARI features were identified in all cases. The recurrence pattern in these cases was local in 49/65 (75.4%) and distant in 16/65 (24.6%). VASARI features including Definition of the non-enhancing margin (F13), Cortical involvement (F20) and Deep WM invasion (F21) overlapped with recurrence patterns. Kaplan–Meier analysis revealed inferior progression free survival (PFS) in patients with an Age over 48 or with an irregular non-enhancing margin compared to those without, despite similarities between the groups in terms of IDH status, performance status, and F20, F21 status. Followed cox multivariate analysis revealed F13 was an independent prognostic factor on PFS in recurrent GBM patients.
Conclusions The presence of conventional MRI based features were associated with the location of tumor recurrence as demonstrated by frequent overlap in this series, and was associated with a trend toward inferior outcomes. This may indicate warrants consideration with respect to treatment planning.

灌注相关的磁共振成像技术在脑胶质瘤 分级诊断中的应用

刘宵雪,李建瑞,张志强,卢光明
中国人民解放军东部战区总医院

目的通过对比 3D-pCASL、DCE 及 eDWI 在胶质瘤分级诊断中的准确性，探究联合这三种技术能否进一步提高其准确性，并探讨各灌注指标间及与 Ki-67 间的相关性。
方法 33 例病理证实胶质瘤患者术前均行常规序列、3D-pCASL、DCE 和 eDWI 扫描，获得 CBF、K^{trans}、K_{ep}、V_e、V_p、D*、D、f 及 ADC 等参数。结合 3D T1WI 增强，在肿瘤灌注最高的区域和对侧正常半卵圆中心放置 ROI，分别测量相应的参数，以及相对参数 rCBF、rD*、rD、rf 及 rADC，比较高、低级别组间的各参数，并进行 ROC 分析。联合分级时，使用二分类 Logistic 回归和支持向量机（SVM）分类方法。采用双变量相关分析，探究各灌注参数间以及与 Ki-67 之间的相关性，采用一般线性回归获取与 Ki-67 相关的参数。
结果在高级别胶质瘤肿瘤实质区，rCBF、K^{trans}、V_e、V_p和 rD*值均明显高于低级别，而 rD、rf 和 rADC 值明显低于低级别（均 P <0.05）。ROC 显示 rCBF、K^{trans}、V_e、V_p和 rD*具有较好的诊断意义，K^{trans}的准确性最高。联合时，二分类 Logistic 回归显示仅 K^{trans}具有最佳的诊断效能；SVM 显示，联合 rCBF、K^{trans}、K_{ep}和 rD*可以进一步提高其准确。rCBF 与 rD*、K^{trans}与 rD*、V_e与 rD*间存在明显正相关关系（均 P<0.05）。各灌注参数与 Ki-67 间的相关分析显示，仅 V_e与 Ki-67 的相关性更为显著（P=0.001）。
结论 3D-pCASL、DCE 和 eDWI 在鉴别高、低级别胶质瘤方面具有很好的诊断价值，DCE 最佳，eDWI 次之，优于 3D-pCASL。联合三种磁共振成像技术可以进一步提高鉴别的准确性。rCBF 与 rD*、Ktrans 与 rD*、Ve 与 rD*具有相关性。Ve 与 Ki-67 之间具有很好的相关性，能反映肿瘤的增殖能力。

定量磁敏感成像及纹理分析结果在星形细胞瘤分级诊断中的应用价值

姚义好,朱文珍
华中科技大学同济医学院附属同济医院

目的：新生血管的增殖在恶性肿瘤中起着重要的作用，肿瘤中的出血和微出血与其密切相关。定量磁敏感成像 QSM 对血液降解产物中的顺磁性的铁具有很高的敏感性。该研究的目的在于评估 QSM 图像的测量结果及其纹理分析的结果在星形细胞瘤分级诊断中的应用价值。
材料和方法： 42 例星形细胞瘤病人行常规磁共振成像和 QSM 成像，其中 QSM 图像由 GRE 图像采用形态辅助偶极子反转方法重建得到。在 T1 增强或 T2 图像上画 ROI 取整个肿瘤的相对磁化率的平均值。分别对高低级别及 II、III、IV 级星形细胞瘤的磁化率平均值进行两两间比较。将 42 例病人随机分为培训组和检验组。将图及 ROI 载入 MaZda 软件采用线性判别分析进行纹理分析，并得到最大判别因子 MDF。建立 ROC 曲线判断培训组数据诊断的准确性并根据分界值判断检验组数据诊断的准确性。
结果：肿瘤内 QSM 高信号随着肿瘤级别的增高而增多。基于整个肿瘤的平均磁化率值，可以鉴别高、低级别（p=0.0018），II 级和 IV 级（p=0.004），III 级和 IV 级星形细胞瘤（p=0.048），但不能有效鉴别 II 级和 III 级的星形细胞瘤。对 QSM 图进行纹理分析，培训组数据的 MDF 值在高低级别，II、III 级别，II、IV 级别，III、IV 级别的星形细胞瘤之间均有统计学差异。对于 QSM 图的检验组数据进行纹理分析，鉴别高低级别星形细胞瘤的正确率可以达到 95%，对 II、III、IV 级别的星形细胞瘤鉴别正确率为 80%。对 FLAIR 图进行纹理分析，培训组数据的 MDF 值在高低级别，II、IV 级别，III、IV 级别的星形细胞瘤之间有统计学差异，但不能有效鉴别 II、III 级的星形细胞瘤。对于 FLAIR 图的检验组数据进行纹理分析，鉴别高低级别星形细胞瘤正确率为 85%。
结论：QSM 图可以为星形细胞瘤的分级诊断提供更多的信息，纹理分析可能成为对星形细胞瘤分级极为有帮助的工具。

Tumor microvascular normalization enhancing CAR-T immunotherapy to glioblastoma

Xiao Chen,Tian Xie,Weiguo Zhang
Army Medical University, Daping Hospital

Abnormal tumor vasculature not only hinders the infiltration of chimeric antigen receptors T (CAR-T) cells into the tumor parenchyma, but also suppresses the CAR-T function in tumors. Thus, tumor microvascular normalization based on anti-angiogenesis may enhance CAR-T immunotherapy to solid tumors. However, lacking the effective non-invasive tracking methods for monitoring tumor microvascular remodeling window to determine the right time to transplant CAR-T cells, which laid difficulties to apply and develop this new CAR-T therapeutic strategy. Based on our previous studies that IL13R2α-CAR-T therapy in glioblastoma, we evaluated the effects of treatment with lower-dose bevacizumab on NOD-SCID mice orthotopic glioblastoma model by 7.0 T MRI, and obtained the imaging biomarkers of tumor microvascular normalization to determine the right time to transplant CAR-T cells. And we used the ultrasmall superparamagnetic iron oxide labeled cell tracking technique with MRI to evaluate the penetration and persistence of CAR-T cells in tumor, and functional MRI to assess the therapeutic

effect. We establish a combinational regimen that synchronizes CAR-T therapy with tumor vascular normalization, which increased intratumoral infiltration, proliferation and cytotoxicity of CAR-T cells, reduced tumor volume and increased survival. In addition, we establish an imaging platform and evaluation system for in vivo tracking of tumor vascular normalization enhancing CAR-T immunotherapy to glioblastoma. These findings offer hope of developing new approaches that could enhance CAR-T therapy in solid tumors.

三维准连续动脉自旋标记在鼻咽部良恶性病变鉴别诊断中的价值

张波
湖北医药学院附属随州医院（随州市中心医院）

目的：
探讨三维准连续动脉自旋标记（three-dimensional pseudo continuous arterial spin labeling，3D PCASL）技术对鼻咽部良恶性病变的诊断及鉴别诊断价值。
方法：
选择 2017 年 3 月至 11 月临床怀疑鼻咽癌的患者 40 例，男 28 例、女 12 例，中位年龄 45 岁。所有患者均进行常规磁共振成像及三维准连续动脉自旋标记成像。患者 MR 检查后短期内均行鼻咽部活检；根据不同病理结果分为 2 组，A 组为鼻咽癌（NPC）组，B 组为鼻咽慢性增生性炎症(NPH)组。测量 2 组 3D PCASL 血流量(BF_{ASL})图像上肿瘤区域的 BF 值，比较鼻咽癌与鼻咽慢性增生性炎症的 BF_{ASL} 值差异。
结果：
40 例中完成 3D PCASL 的患者中共 37 例完成数据统计，其中 3 例(A 组 2 例，B 组 1 例)因病灶较小无法准确测得 BF 值不参与数据统计。在 BF_{ASL} 图像上，A 组肿瘤表现为明显高灌注，B 组肿瘤表现为中、低灌注。A 组的平均 BF_{ASL} 值为 126.86±17.90 ml/(100g.min)，B 组的平均 BF_{ASL} 值为 94.94±13.40 ml/(100g.min)05）。，NPC 组的平均 BF_{ASL} 值明显大于 NPH 组，两者之间有明显的统计学意义（P<0.
结论：

3D PCASL 技术有助于鼻咽癌的诊断，不同 BF_{ASL} 值对鼻咽癌及鼻咽部慢性炎症具有一定的鉴别诊断价值，BF_{ASL} 值在鼻咽部良恶性疾病鉴别诊断方面具有潜在的重要临床参考价值。

3D PCASL 联合 DWI 技术在鼻咽癌放化疗疗效评估中的应用

张波
湖北医药学院附属随州医院（随州市中心医院）

目的：
探讨 3D PCASL 联合 DWI 技术在鼻咽癌近期放化疗疗效评估中的应用价值。
方法：
搜集 2018 年 5 月至 2019 年 4 月经鼻咽镜活检病理证实的鼻咽癌患者共 38 例。所有患者均于治疗前行 MRI 平扫、DWI 检查、3D PCASL 检查及增强检查。DWI 图像及 3D PCASL 图像经后处理并测量得到相应的 ADC 值及 BF 值。检查结束后进行诱导化疗和同步放化疗。于同步放化疗结束 6 个月后再次进行上述检查。根据肿瘤缓解情况，将患者分为治愈组和残留组。分析两组治疗前后 DWI 及 3D PCASL 参数的相关性。
结果：
治愈组治疗前 ADC 值较残留组低(P＜0.05)，BF 值较残留组高，差异有统计学意义(P＜0.05)。ADC 值和 BF 值预测诱导化疗和同步放化疗结束后 6 个月疗效的受试者工作特征(ROC)曲线下面积(AUC)分别为 0.68、0.82(P 值均＜0.05)。
结论：
治疗前 DWI 及 3D PCASL 定量参数值可对鼻咽癌患者诱导化疗 + 同步放化疗的近期疗效进行预估，为患者的个体化、精准化治疗方案提供参考依据。

EPO-0233
阻塞性睡眠暂停患者全脑功能网络属性改变

管文婷[1],刘斌[2]
1.淮安市第一人民医院（南京医科大学附属淮安第一医院）
2.东南大学附属中大医院

目的： 利用静息态功能磁共振（rs-fMRI）探究阻塞性睡眠呼吸暂停（OSA）患者全脑功能网络属性改变。
方法： 对 2016 年 1 月至 2018 年 1 月经东南大学附属中大医院耳鼻咽喉头颈外科就诊的 OSA 患者 33 名，以同期招募的 29 名社区健康志愿者为对照组。两组受试者均行功能磁共振成像，对所有被试采集到的静息态磁共振血氧水平依赖（BOLD）数据进行后处理。应用 GRETNA 软件配准到自动解剖名称标记（AAL）模板，构建 N×N（N=90）的 Z 值矩阵，构建全脑功能网络，以连接矩阵的稀疏度为阈值，在 0.1~0.2 范围内（步长 0.01），比较两组全脑功能网络属性改变。相关参数：聚类系数 C_p，γ，λ，σ，全局效率 E_{glo}，局部效率 E_{loc}，节点参数等。所有被试者均于耳鼻喉头颈外科进行多导睡眠监测（PSG）、一般资料及量表测定，获得睡眠呼吸暂停低通气指数（AHI）、氧减饱和度指数(ODI)、简易精神量表（MMSE）、埃普沃思嗜睡量表（ESS）等。
结果： OSA 组 BMI、AHI、ODI、ESS 均显著高于对照组，MMSE 低于对照组（均 P＜0.001）。OSA 组与对照组均具有“小世界”属性，且“小世界”属性与全局属性未见显著统计学差异（P>

0.05），左侧后扣带回、颞中回，右侧额叶、楔叶局部节点属性较正常对照组有显著统计学差异（$P<0.05$）。

结论： OSA 患者全脑功能网络“小世界”属性及全局属性未见明显受损，OSA 疾病未对脑功能网络全局信息整合造成明显影响，但是部分脑区节点属性仍然存在异常，局部信息传递功能受损。

EPO-0234

MRI value of pterygopalatine fossa invasion of nasopharyngeal carcinoma(Micro-Course competion)

zhou bi
Chongqing General Hospital, UCAS

Objective The pterygopalatine fossa (PPF) is a major neurovascular crossroad between the oral cavity, nasal cavity, nasopharynx, orbit, masticator space, and the middle cranial fossa. This study is to explore the MRI features of PPF and its communication structures invasion of nasopharyngeal carcinoma (NPC).

Methods MRI images of 45 cases pathologically proved NPC with PPF involvement were analyzed retrospectively。

Results Fifty-three PPF invasion were found in the 45 NPC cases. The common MRI features of NPC with PPF invasion were as follows: the disappearance of normal fat signal in the PPF in 45 cases, the enlargement of PPF in 30 cases, and bone structure destruction of PPF in 27 cases. Invasion of PPF directly took place in 7 cases, from nasopharynx via palatovaginal canal in 4 cases, from nasal cavity via sphenopalatine foramen in 3 cases and from oral cavity via greater palatine canal in 1 case. From the PPF, the tumor extended into foramen rotundum in 4 cases, in which further into cavernous sinus in 1 case, via the inferior orbital fissure into the orbit in 3 cases, via the canales pterygoideus into the middle cranial fossa in 3 cases and via the pterygomaxillary fissure into the infratemporal fossa in 4 cases.

Conclusion MRI can show characterized apperance for PPF and its tiny communication structures involvement of NPC, which is important for prognosis and radiation treatment planning

黄金角轮辐状稀疏平行（GRASP）动态容积增强 MRI 对鼻咽癌裸鼠模型早期抗血管治疗疗效的评估价值

唐言,陶晓峰
上海交通大学医学院附属第九人民医院

目的：探讨黄金角轮辐状稀疏平行（Golden-Angle Radial Sparse Parallel，GRASP）动态容积增强 MRI 在鼻咽癌裸鼠皮下移植瘤早期抗血管生成治疗效果的评价价值。**方法：**建立鼻咽癌裸鼠皮下移植瘤模型，种瘤 2 周后，实验组（10 只）腹腔给药贝伐单抗（10mg/kg），对照组（10 只）给予等量的生理盐水。治疗 3 周后行 GRASP 动态容积增强 MRI 检查。检查后取肿瘤标本分析肿瘤组织微血管密度（MVD），肿瘤细胞增殖和 BcL-2 凋亡蛋白表达情况等。**结果：**实验组荷瘤鼠的肿瘤生长

速度、瘤体大小、重量均较对照组减小，实验组治疗后肿瘤组织信号-时间曲线显示其强化峰值时间明显低于对照组，差异有统计学意义（P < 0.05）。实验组 MVD，肿瘤细胞增殖指数和 BcL-2 凋亡蛋白表达情况均低于对照组，差异有统计学意义（P < 0.05）。**结论：**GRASP MRI 动态增强成像能够在自由呼吸下更快速更简便实现图像信息采集，同时其高的时间分辨率能够较精准反映肿瘤微循环灌注情况，是评价肿瘤抗血管生成治疗疗效的可靠方法，具有重要临床应用价值。

EPO-0236

The Value of MRI Texture Analysis to Evaluate the Effect of Radiotherapy for Nasopharyngeal Carcinoma

Jinrong Yang[1],Lijun Wang[1],Fangfang Li[2]
1.The First affiliated Hospital of Dalian Medical University
2.First Clinical College of Lanzhou University

Objective: To evaluate the value of MRI texture analysis in evaluating radiotherapy effect of nasopharyngeal carcinoma (NPC).
Materials and methods: the MRI images of 71 patients with nasopharyngeal carcinoma confirmed by pathology were retrospectively analyzed. The therapeutic effects were evaluated by two experienced radiologists according to the follow-up results. According to the curative effect, it was divided into residual group (25 cases) and non-residual group (46 cases).All patients' T1WI (71 cases), fat suppression T2WI (71 cases), TIWI enhanced (54 cases), DCE (33 cases) and IVIM (33 cases) images were collected. After processing IVIM and DCE images in AW4.6 workstation, the parameters ADCstand of IVIM based on single exponential model, ADCfast, ADCslow, Fraction of ADCfast based on double exponential model and Ktrans, Kep, Ve, MaxSlope, CER, IAUGC, Bolus Arrival Time of DCE are calculated. At the same time, Omni-Kinetics Version V2.06 software was used to analyze the texture of T1WI, fat suppression T2WI and TIWI enhancement images. The correlation parameters of gray level co-occurrence matrix and run length matrix were calculated and analyzed statistically.
Results: The subjective effect evaluation and objective data measurement of the two observers are in good agreement (P < 0.001). In T2WI image texture analysis, the mean value and entropy were significantly different between the residual group and the non-residual group (P < 0.05).The area under the ROC curve , ensitivity and specificity of the meanvalue and entropy are 0.349, 52.0%, 15.2% and 0.628, 48%, 73.9%, respectively. However, the parameters of other sequences have no statistical significance (P > 0.05). **Conclusion:** T2WI image texture analysis plays an important role in evaluating the radiotherapy effect of nasopharyngeal carcinoma (NPC). Entropy is most effective in evaluating the radiotherapy effect and it can be used as a imaging marker to evaluate the radiotherapy effect of nasopharyngeal carcinoma.

EPO-0237

Diffusion Kurtosis Imaging and Intravoxel Incoherent Motion MR Imaging in the Differentiation of Four Histological Types of Sinonasal Malignant Tumors

Zuohua Tang, Zebin Xiao, Fei Duan
Eye & ENT Hospital of Fudan University

Purpose: To evaluate the usefulness of diffusion kurtosis imaging (DKI) and intravoxel incoherent motion (IVIM) in the differentiation of sinonasal malignant tumors with different histological types.
Methods: 65 patients with sinonasal malignancies who underwent DKI and IVIM were enrolled in this retrospective study, including 27 squamous cell carcinomas (SCCs), 13 olfactory neuroblastomas (ONBs), 14 malignant melanomas (MMs) and 11 lymphomas. The kurtosis (K) and diffusion coefficient (Dk) from DKI and the pure diffusion coefficient (*D*), pseudo-diffusion coefficient (*D**), perfusion fraction (*f*) and the product of *D** and *f* (*f*·*D**) from IVIM were measured. Kruskal-Wallis and Dunn multiple comparison tests with Bonferroni correction, receiver operating characteristic curve and logistic regression analyses were used for statistical analysis.
Results: Lymphomas demonstrated highest K values but lowest Dk, *D*, *D**, *f* and *f*·*D** values among these four malignant tumors. ONBs exhibited high K values and MMs had highest *D**, *f* and *f*·*D** values. The cutoff value $\leqslant 0.887 \times 10^{-3}\ mm^2/s$ for *f*·*D** provided a sensitivity, specificity and an accuracy of 100%, 98.1% and 98.5%, respectively, for differentiating lymphomas from other three entities. The combination of *f*·*D** and *D* values showed a sensitivity of 92.9% and a specificity of 92.5% for the discrimination of MMs from ONBs and SCCs. The K value was useful for differentiating ONBs from SCCs, with a threshold value of 0.942 (sensitivity, 84.6%; specificity, 63.0%).
Conclusion: The combined use of DKI and IVIM is helpful for differentiating among four histological types of sinonasal malignant tumors.

EPO-0238

Differentiation of Amelanotic Sinonasal Mucosal Malignant Melanomas from Sinonasal Carcinomas Using Whole-tumor Histogram Analysis of Diffusion Kurtosis Imaging and Intravoxel Incoherent Motion

Zuohua Tang, Zebin Xiao, Fei Duan
Eye & ENT Hospital of Fudan University

Objective: To evaluate the value of whole-tumor histogram analysis of diffusion kurtosis imaging (DKI) and intravoxel incoherent motion (IVIM) in the differentiation of amelanotic sinonasal mucosal malignant melanomas (SNMMMs) from squamous cell carcinomas (SCCs).
Methods: DKI and IVIM were performed in 12 patients with amelanotic SNMMMs and 26 patients with SCCs. The whole-tumor histogram metrics were calculated on DKI (diffusion kurtosis [K], diffusion coefficient [Dk]) and IVIM (pure diffusion coefficient [*D*], pseudo-diffusion coefficient [*D**], perfusion fraction [*f*]) parametric maps. The Student's *t*-tests, ROC curve and multivariate stepwise logistic regression analyses were used for statistical analysis.
Results: Significantly higher mean, median, 75th and 90th percentiles of K, skewness of *D*, mean, median, 90th percentile and kurtosis of *D**, 75th and 90th percentiles of *f*

were found in amelanotic SNMMMs than in SCCs (all $P < 0.05$). Higher 75th percentile of K (β coefficient = 0.007; OR = 1.007, 95% CI = 1.001-1.012; $P = 0.026$) and skewness of D (β coefficient = 0.209; OR = 1.232, 95% CI = 1.001-1.518; $P = 0.049$) were independently indicators for the differentiation of amelanotic SNMMMs for SCCs. The combination of 75th percentile of K and skewness of D can improve the diagnostic performance with a sensitivity and specificity of 75.0% and 80.8%, respectively, for differentiating these two malignant tumors.
Conclusions: Whole-tumor histogram analysis of DKI and IVIM are valuable for differentiating amelanotic SNMMMs from SCCs. The 75th percentile of K and skewness of D were independent predictors for distinguishing between them.

EPO-0239

Predictive Value of DCE-MRI to Tumor Regression and Sensitivity after Concurrent Chemoradiotherapy for Nasopharyngeal Carcinoma

fangxiao Lu
ZheJiang Cancer Hospital

Objective: To study the predictive value of DCE-MRI to tumor regression and sensitivity after concurrent chemoradiotherapy for nasopharyngeal carcinoma. **Method:** 45 patients who were diagnosed with nasopharyngeal carcinoma from June 2017 to December 2017 were enrolled in the study. All the patients received MRI examination before chemotherapy and were given intensity-modulated radiotherapy after 2 cycles of induction chemotherapy. The quantitative parameters before chemotherapy, at 50 Gy of radiotherapy and at the end of radiotherapy were compared; the correlation of the quantitative parameters and RSO during chemo-radiotherapy was studied and all the patients were divided into the sensitive group, the efficacy intermediate group and treatment resistant group according to RSO and symptoms, and the parameters at 50Gy in patients with different sensitivities were compared. **Results:** The parameters of Ktrans, Kep and Ve in the nasopharyngeal carcinoma area were significantly higher than those in the lateral pterygoid muscle (P<0.05); Ktrans had the highest sensitivity and Kep had the highest specificity; the Ktrans and Kep values after treatment were significantly lower than those before treatment, and Ve after treatment was significantly increased (P<0.05); at 50Gy, the Ktrans was negatively correlated with RSO (r=-0.613 P<0.05), the Kep was negatively correlated with RSO (r=-0.626 P<0.05), and the Ve was not correlated with RSO (r=0.022 P=0.887). The Ktrans and Kep in the sensitive group were significantly higher than those in the efficacy intermediate group and the treatment resistance group (P <0.05). Although the Ve of the sensitive group was slightly lower than those in the efficacy intermediate group and the treatment resistance group (P>0.05). **Conclusion:** The quantitative DEC-MRI is applicable to effectively evaluate the efficacy of chemo-radiotherapy in patients with nasopharyngeal carcinoma, predict the tumor regression and treatment sensitivity of nasopharyngeal carcinoma after treatment, and may provide more reliable data for efficacy assessments and predictions of nasopharyngeal carcinoma.

EPO-0240
多参数 MRI 在鼻咽部良性淋巴组织增生性病变中的诊断价值

余满
中国科学院大学重庆医院（重庆市人民医院）

目的:
探讨鼻咽部良性淋巴组织增生性病变的 MR 表现，以提高诊断准确性。
方法:
回顾性分析 83 例经活检病理证实为鼻咽部良性淋巴组织增生患者的 MR 平扫、增强扫描，分析其生长方式、MRI 信号特点、强化方式及 DWI 表现，并统计对比增强率ΔT1【（增强后 T1 值-增强前 T1 值）/增强前 T1 值】。
结果:
83 例鼻咽部良性淋巴组织增生性病变中，100%（83/83）可见鼻咽部完整粘膜显示，鼻咽两侧壁均受累者占 65 %(54 / 83)， 仅累及一侧壁者 35 %(29/83)，均无邻近结构浸润。病变 T1WI 呈等信号，T2WI 呈稍高或高信号，47%(39/83) 信号较均匀，53%(44/83)信号不均、伴囊变，未见坏死。增强后，44%(37/83)呈中度较均匀强化，55%(46/83)呈中度不均匀强化，对比增强率ΔT1 为 1.23 土 0.54。DWI 呈等或稍高信号，ADC 为低信号。
结论:
鼻咽部良性淋巴组织增生性病变 MR 具有一定表现，结合 MRI 平扫及增强有助于提高诊断准确性。

EPO-0241
弥漫性喉部疾病的鉴别诊断（中文论文比赛）

赵雯,韩丹,李浚利
昆明医科大学第一附属医院

目的 探讨 CT 图像影像学特征在鉴别弥漫性喉部疾病中的应用价值。 **方法** 筛选 CT 平扫及增强扫描且经手术病理证实的累及喉部两个及三个区域的病例，共 60 例。其中喉癌 20 例，喉淋巴瘤 14 例，喉乳头状瘤 15 例，喉结核 11 例。分析其发病年龄、累及范围、强化程度、喉部侵犯、颈部淋巴结五个方面，进一步鉴别以上四种疾病。 **结果** （1）发病年龄：喉癌好发于 50 岁以上（18/20）；喉淋巴瘤好发于 20-40 岁（10/11）；喉乳头状瘤好发于十岁以下儿童（10/15）；喉结核无特殊好发年龄，但多数伴有胸部结核（10/11）。（2）累积范围：喉癌易累积声门上区及声门区（15/20）；喉淋巴瘤易累积三个区域（12/14）；喉乳头状瘤易累及喉前联合（9/15）；喉结核易累积后联合（9/11）；（3）强化程度：喉癌明显不均匀强化（15/20）；喉淋巴瘤轻度均匀强化（13/14）；喉乳头状瘤轻中度渐进性强化（13/15）；喉结核线样粘膜强化（8/11）。（4）喉部侵犯：喉癌易发生喉旁间隙、喉旁软骨的侵犯（13/20），其他三种疾病均不易发生侵犯。（5）颈部淋巴结：喉癌易发生淋巴结转移，呈明显不均匀强化；喉淋巴瘤淋巴结肿大，呈轻度均匀强化；喉乳头状瘤无淋巴结肿大；喉结核为环形强化淋巴结。**结论** CT 增强对于弥漫性喉癌、喉淋巴瘤、喉乳头状瘤及喉结核的鉴别有一定的意义。

EPO-0242
钩突解剖形态与慢性鼻窦炎的相关性分析

李晓姣
中国科学院大学重庆医院（重庆市人民医院）

目的：探讨副鼻窦冠状位 CT 图像上钩突的形态变异与慢性鼻窦炎的发生及严重程度的相关性。方法：回顾性分析 140 例（280 侧）行副鼻窦 CT 检查的病人影像资料，其中鼻窦炎组 192 侧、非鼻窦炎组 88 侧，在 CT 冠状位观察所有钩突头端的附着部位，并测量钩突内倾角度，分析钩突头端不同附着部位、钩突内倾角解剖变异分布情况及其与慢性鼻窦炎的关系，对鼻窦炎组采用 Lund-Mackay CT 评分系统来反映单侧鼻窦炎的严重程度，对钩突角度测量结果与鼻窦炎 Lund-Mackay 积分进行相关性分析。结果：钩突头端的附着部位有 4 种类型：中鼻甲型(17.86%)、纸样板型(45.00%)、前颅底型(12.14%)、分叉型(25.00 %)；这 4 种类型的发病率在鼻窦炎组与非鼻窦炎组有显著差异；钩突平均角度在鼻窦炎组与非鼻窦炎组有明显差异；钩突内倾角与鼻窦炎积分呈负相关（ r＝－0.578，P＜0.05），钩突内倾角度越小， 越易发生病变，鼻窦炎越重。结论：钩突形态变异与慢性鼻窦炎关系密切。

EPO-0243

Dual-energy CT in the differentiation of stage T1 nasopharyngeal carcinoma and lymphoid hyperplasia

Peng Wang, Zebin Xiao, Zuohua Tang, Jie Wang
Eye and ENT Hospital of Fudan University, Shanghai Medical College

Purpose: To explore the value of dual-energy CT for the differentiation between stage T1 nasopharyngeal carcinoma (NPC_{T1}) and lymphoid hyperplasia (LH).
Methods: Patients with histopathological proven nasopharyngeal lesions (stage T1 NPCs, n=30; LHs, n=47) who underwent dual-energy CT were enrolled in this retrospective study. Quantitative parameters derived from dual-energy CT were measured. Statistical analyses were performed using the independent sample *t*-test, Wilcoxon rank sum test, and receiver operating characteristic curve (ROC) analysis.
Results: There was significantly higher iodine concentration (IC), normalized iodine concentration (NIC, to internal jugular vein) in NPC_{T1} compared with LH ($p < 0.001$). The effective atomic number (Z_{eff}) was significantly higher in NPC_{T1} than that in LH ($p < 0.001$). The virtual monochromatic images (VMIs) at 50 keV-190 keV (20 keV-interval) of NPC_{T1} were all significantly higher than those of LH (all $p < 0.001$). The slope (k) value of spectral attenuation curve was also significantly higher in NPC_{T1} than LH ($p < 0.001$). There was no significant difference in virtual noncontrast (VNC) between the NPC_{T1} and LH ($p = 0.443$). The best single parameter for differentiation between NPC_{T1} and LH was the 70 keV on VMI, with AUC, sensitivity, and specificity value of 0.98, 93.33%, 93.62%, respectively.
Conclusions: Dual-energy CT can be helpful for the differentiation between NPC_{T1} and LH lesions.

合成磁共振成像(MAGiC) 在鼻咽癌诊断中的应用价值：初步研究

李玉洁,林蒙,余小多,李琳,赵燕风,刘学
国家癌症中心 / 国家肿瘤临床医学研究中心 / 中国医学科学院北京协和医学院肿瘤医院

目的：探讨合成磁共振成像（MAGiC）在鼻咽癌诊断中的应用价值

方法：连续收集自 2018 年 11 月至 2019 年 3 月新诊断的鼻咽癌患者(30 例)和健康志愿者(16 例)，并用 MAGiC 序列进行合成磁共振成像。测量并比较鼻咽癌与正常鼻咽粘膜、鼻咽癌与翼外肌、鼻咽癌转移性斜坡(n=14)与非转移性斜坡(鼻咽癌 16 例，健康志愿者 16 例)之间 T1、T2 和 PD 定量参数的平均值。用 ROC 的曲线下面积评价 T1、T2、PD 值诊断鼻咽癌的应用价值。

结果：鼻咽癌的 T1 平均值和 T2 平均值均明显低于健康志愿者的鼻咽粘膜(T1: 1462.47ms VS. 1915.88ms，P<0.001，AUC=0.923; T2: 82.77ms VS. 90.375ms，P=0.004，AUC=0.729，而 PD 平均值的差异无统计学意义(89.35ms VS. 91.58ms，P=0.102)。以 T1 值<=1616ms 的作为阈值，鉴别鼻咽癌与正常鼻咽粘膜的灵敏度、特异性和准确性分别为 83.33%、93.75%和 86.96%。鼻咽癌的三个参数均高于翼外肌(T1: 1121.53ms，T2: 49.33ms，PD:69.79ms)，所有 P 值均小于 0.001。与非转移性斜坡相比，鼻咽癌转移性斜坡的 T1 平均值更高(1526.21ms VS. 635.00ms，P<0.001)、T2 平均值更低(90.79ms VS. 108.47ms，P=0.006)和 PD 平均值更低(84.09ms VS. 104.18ms，P<0.001)。

结论：合成磁共振成像(MAGiC)在鼻咽癌的检出、诊断和无创性评估肿瘤范围方面具有潜在的应用价值，有助于进一步划定靶区。

EPO-0245
CT 对绿脓杆菌所致鼻窦炎和黄曲霉菌所致鼻窦真菌球的鉴别诊断价值

陈晓丽,鲜军舫,鲁辛辛
首都医科大学附属北京同仁医院

目的：通过比较绿脓杆菌所致鼻窦炎和黄曲霉菌所致鼻窦真菌球的 CT 表现特征，探讨 CT 对二者的鉴别诊断价值。 **方法**：收集自 2013 年至 2017 年经组织病理学检查确诊为绿脓杆菌所致鼻窦炎和黄曲霉菌所致鼻窦真菌球各 78 例患者的临床及 CT 影像资料，回顾性比较分析二者发病年龄、性别及 CT 表现特征。统计学方法除二者的发病年龄比较采用独立样本 t 检验外，性别和 CT 表现特征的比较均采用 x^2检验，P 值＜0.05 认为差异有统计学意义。 **结果**：绿脓杆菌所致鼻窦炎 78 例中男 31 例、女 47 例，发病年龄 15 岁～83 岁，平均年龄 50±14 岁；黄曲霉菌所致鼻窦真菌球 78 例中男 33 例、女 45 例，发病年龄 24 岁～75 岁，平均年龄 51±13 岁，二者在性别（x^2=0.106，P=0.745）和发病年龄（t=-0.077，P=0.939）上差异无统计学意义。CT 上二者均表现为鼻窦内软组织密度影，比较二者在病变范围只累及单窦（x^2=22.205，P=0.000）、病变部位累及额窦（x^2=25.012，P=0.000）、筛窦（x^2=32.322，P=0.000）、上颌窦（x^2=16.949，P=0.000）、伴钙化（x^2=7.572，P=0.006）、上颌窦口扩大（x^2=9.054，P=0.003）的显示率及钙化部位（x^2=5.975，P=0.015）的差异有统计学意义，而二者在累及蝶窦（x^2=0.030，P=0.863）、伴窦壁增生硬化（x^2=0.500，P=0.480）或破坏吸收（x^2=0.126，P=0.722）的显示率上差异无统计学意义。 **结论**：绿脓杆菌所致鼻窦炎和黄曲霉菌所致鼻窦真菌球的 CT 表现相似，但前者常多窦受累且更易累及上颌窦、筛窦、额窦，而后者多累及单窦、钙化更常见且易发生于上颌窦口、常伴窦口扩大，有助于鉴别诊断。

The first case of kimura’s disease with thrombocytopenia, anasarca, fever, renal dysfunction and organomegaly (TAFRO syndrome)

Ali Shang,Quanxin YANG,Cui Ping MAO,Xiao Xia Lu
The Second Affliated Hospital of Xi’an Jiaotong University

Abstract
Objective: TAFRO syndrome is considered as a sub-type of Multicentric Castleman Disease (MCD). We descibe a case that is disgnosed by kimura’s disease (KD) with TAFRO syndrome. To our knowledge, TAFRO syndrome with kimura’s disease (KD) has not been reported in previous literature.
Materials and methods: We describe a case of a 68-year-old female patient presenting with pharyngeal mass accompanied by generalized lymph node enlargement. In the course of the hospital, she suffered from fever, thrombocytopenia, anemia, proteinuria and massive edema of lower legs. Computed tomography(CT) revealed a thickening of the pharynx wall with multiple lymphadenopathy(<1.5cm in diameter) and hepatosplenomegaly with large ascites. MRI revealed diffuse thickening of the lateral and posterior of the pharynx of high signal on T2-weighted images and iso-signal on T1-weighted images with multiple lymph enlargement in the neck. Enhancement revealed homogeneous enhancement . The bone marrow specimen of the patient had been performed and reported a normocellular marrow with increased megakaryocytes. Furthermore, biopsy specimen of lymph nodes showed Lymphoid tissue hyperplasia, large amount of eosinophilic granulocytes infiltration and vascular proliferation (Fig2d); the immunohistochemical examination of the specimens showed CD10(-), CD30(-), CD20(+), CD45(+), CD3(+), CD38(+), CD68(-), CK(-), EGFR(-), ki-67(+)80%.
Finally, based on the histopathological findings of the lymph node biopsies, the laboratory data and other clinical manifestations, we diagnosed the patient as KD with TAFRO.
Results: The patient received glucocorticoid and cyclophosphamide for immunomodulation therapy, and the temperature returned to normal, edema, pericardial and pleural effusion absorbed. But the patient succumbed to multiple organ failure after 50 days of hospitalization.
Conclusion:It is believed that it is not precise that TAFRO syndrome is considered as a sub-type of Multicentric Castleman Disease (MCD). Platelet reduction diagnosed in hematology and oncologists were likely to hide TA FRO syndrome. It is extremely important to identify it by pathological examination and careful clinical observation.

CT and MRI Features of Extraskeletal Ewing's Sarcoma/Peripheral Primitive Neuroectodermal tumor

Yaojie Feng,Chunrong Wei ,Mengmei Zhang,Yaying Yang,Yane LV
First Affiliated Hospital of Kunming Medical University

【abstract】 **Objective** To investigate the imaging manifestations and clinical features of Ewing's sarcoma / peripheral primitive neuroectoderm tumors and improve the recognition of it. **Methods** The CT and MRI finding of 12 cases of EES proved by pathology were retrospectively reviewed and related literatures were reviewed. The imaging features were summarized.**Results** The lesions were located in oropharynx(n=3),mouth(n=1), mandible(n=1), sinus(n=3), cervical root(n=1),mediastinum(n=2), and jejunum(n=1).4 cases underwent plain and enhanced CTand MRI scanning,5 cases underwent plain and enhanced CT scanning,3 cases underwent plain and enhanced MRI scanning .Most of the lesions were characterized by large invasive soft tissue masses, with heterogeneous density or signal,mild to moderate or obvious enhancement, 3 cases showed diffusion restriction with slightly and remarkable hyperintense signal on DWI and hypointense signal on corresponding ADC maps.Among the 12 cases,100% were accompanied with necrosis, 16.7% with calcification,100% with mass effect, 75% with surrounding tissue invasion, 41.7%cases with bone destruction and 25%cases with lymph node metastasis. **Conclusion** There are some characteristics of CT and MRI findings in EES: lesions are usually large, which are often accompanied with necrosis,obvious mass effect, frequently invade or destruct the surrounding structures,high flow vascular around or in the lesion , lack of calcification and bone destruction.

EPO-0248

Analysis of Histograms of ADC and Enhanced-T1WI in Differentially Diagnosing of Small Round Cell Malignant Tumors of Nasal and Paranasal Sinus.

Chen Chen,Cui-ping Ren
The First Affiliated Hospital of Zhengzhou University

Objective: To determine if histograms of ADC and enhanced-T1WI can be used to differentiate small round cell malignant tumors(SRCMT) and Non-SRCMT of nasal and paranasal sinus.

Materials: 142 patients with confirmed histologically SRCMT in 69(48.59%) patients and Non-SRCMT in 73(51.41%) patients were enrolled in the study,accepting MRI at 3T. There were 69 SRCMT,of which 13 lesions were rhabdomyosarcoma(RMS),22 lesions were non-Hodgkin' S lymphoma(NHL),15 lesions were malignant melanoma(MM),10 lesions were neuroendocrine carcinoma(NEC),and 9 lesions were olfactory neuroblastoma(ON). There were 73 Non-SRCMT,of which 51 lesions were squamous cell carcinoma(SCC) and 22 lesions were adenoid cystic carcinoma(ACC). The ROIs were drawn on the maximum level of ADC and enhanced-T1WI,and the histogram analysis were performed using the software named Mazda. The statistical analysis was performed on the nine histogram parameters to find out the different characteristics. LSD and Bonferroni test were used between any two of the three groups and the ROC curve was drawn to evaluate the diagnostic efficacy.

Results:Using ADC histogram,the mean,skewness,Perc.01%,Perc.10%,Perc.50%,Perc.90% and Perc.99% of SRCMT was significantly different from Non-SRCMT. There were statistically significant difference between NHL and SCC,between NHL and ACC,between SCC and NEC,between SCC and MM,between SCC and ACC,between RMS and ACC,between NEC and ACC,between MM and ACC,between ON and ACC.
Using enhanced-T1WI histogram,The skewness of SRCMT was significantly different from Non-SRCMT. There were statistically significant difference between NHL and ACC,between SCC and ACC.

Conclusions:The histograms of ADC and enhanced-T1WI may help to discriminate SRCMT and Non-SRCMT and ADC histogram showed better efficacy compared to histogram of enhanced-T1WI.

EPO-0249

Study on CT Value of Lingual Thyroid

Yongshun Han
People's Hospital, Shanghai JiaoTong University School of Medicine

Abstract **Objective:** The objective of the study was to identify the typical imaging features (CT values) of lingual thyroid to facilitate the diagnosis. **Methods:** This was a retrospective single-institutional study, with 11 lingual thyroid cases, 28 patients with other lesions at the base of the tongue (control group) and 28 normal orthotopic thyroid controls (normal controls).Nonenhanced and contrast-enhanced CT values were measured. **Results:** The mean nonenhanced and contrast-enhanced CT values (±SEM) in lingual thyroid were significantly (P=0.000) higher than those in control group. All except for two ectopic thyroids (proved to be 1 nodular goiter and 1 Hashimoto's thyroiditis) had attenuation greater than 60HU on nonenhanced CT and 100HU on contrast-enhanced CT. There was no statistical significance between lingual thyroid and normal controls in nonenhanced CT values (P=0.051). The mean contrast-enhanced CT values in lingual thyroid were significantly (P=0.029) lower than those in normal controls. **Conclusions:** In most cases, lingual thyroid can be distinguished from other lesions at the base of the tongue for its characteristic high CT values, although its CT appearance can be affected when pathological cases occur. Lingual thyroid had a lower CT value than normal orthotopic thyroid on contrast-enhanced CT. It may be related to the high proportion of subclinical hypothyroidism in lingual thyroid.

骨外尤文肉瘤/外周原始神经外胚层肿瘤的 CT 及 MRI 表现

冯瑶杰,危春容,张梦梅,杨亚英,严映,李存莉
昆明医科大学第一附属医院

目的 探讨骨外尤文肉瘤/外周原始神经外胚层肿瘤的 CT 及 MRI 表现及临床特点，旨在提高对该病的认识。**方法** 回顾性分析 12 例经病理证实的骨外尤文肉瘤/外周原始神经外胚层肿瘤的 CT 及 MRI 资料并复习相关文献，总结其影像学特征。**结果** 病灶位于鼻口咽 3 例，口底 1 例，颌下 1 例，鼻腔鼻窦 3 例，颈根部 1 例，纵隔 2 例，空肠 1 例。4 例同时行 CT 及 MRI 平扫+增强检查，5 例行 CT 平扫+增强检查，3 例行 MRI 平扫+增强检查。病变多表现为浸润性生长的软组织肿块，体积较大，密度或信号不均，增强后强化程度不一，3 例 DWI 高 b 值弥散受限呈混杂高/稍高信号，对应 ADC 图为低信号。12 例均伴坏死，2 例伴钙化，12 例均伴邻近结构受压移位，9 例伴周围组织受侵，5 例伴骨质破坏，5 例病灶内部或边缘见血管影，2 例 MRI 检查见流空血管影，3 例伴淋巴结转移。 **结论** EES 多表现为浸润性生长的软组织肿块，体积较大且形态不规则，部分病例表现为软组织不规则增厚。CT 平扫呈类似于肌肉组织的等或稍低密度（等密度为主），MRI 平扫 T1WI 表现为等或稍低信号（等信号为主），T2WI 多呈高信号，密度或信号不均匀，囊变坏死多见，钙化少见，可出现假包膜；增强扫描强化不均匀且强化程度不一。有研究显示，EES 强化是否均匀与肿瘤的分化程度有关，分化程度越高则强化越均匀。肿瘤占位效应明显,表现为推压周围组织，易侵犯周围结构，可伴溶骨性骨质破坏，病灶周围或内部常可见流空血管影。

EPO-0251

The application of intravoxel incoherent motion magnetic resonance imaging in the staging of nasopharyngeal carcinoma

Tingting Guo[1], Yong Wang[1], Lei Song[2]
1.Radiology of Department, Xiangyang No.1 People's Hospital, Hubei University of Medicine
2.Department of Radiology, Xiangyang Central Hospital, Affiliated Hospital of Hubei University of Arts and Science

Objective: To explore the value of IVIM-MRI in the staging of nasopharyngeal carcinoma (NPC).
Methods: This study prospectively included 63 patients with pathologically confirmed NPC. IVIM-MRI scans (9 b values: 0, 25, 50, 75, 100, 150, 200, 500, and 800 s/mm^2) were performed on the enrolled patients. The ADC values were calculated by the mono-exponential model. The bi-exponential model were used to obtain the pseudodiffusion coefficient (D^*), the pure diffusion coefficient (D), and the perfusion fraction (f), then comparing the differences of IVIM parameters between different stage groups and analyzing correlation between different parameters and different stages.
Results: The D values and D^* values of the high-stage group in the clinical stage were significantly lower than the low-stage group. The D values for the high- and low-stage groups were ($0.617\pm0.080\times10^{-3}$ mm^2/s, $0.692\pm0.124\times10^{-3}$ mm^2/s, P=0.021) respectively. The D^* values for the high- and low-stage groups were ($102.499\pm14.972\times10^{-3}$ mm^2/s, $118.335\pm22.812\times10^{-3}$ mm^2/s, P=0.002) respectively. The optimal thresholds of D and D^* values for clinical stage were 0.642×10^{-3} mm^2/s, 106.618×10^{-3} mm^2/s, and the AUC were 0.702, 0.721. The D^* values of the high-stage group in the N-staging were lower than the low-stage group. The D^* values for the high- and low-stage groups were ($100.647\pm13.798\times10^{-3}$ mm^2/s, $114.037\pm21.193\times10^{-3}$ mm^2/s, P=0.004) respectively. The optimal threshold of the D^* values for N-staging was 105.743×10^{-3} mm^2/s and the AUC was 0.694.

Conclusion: Some parameters of IVIM had good effects on clinical stage and N-staging of NPC. The D and D^* values would be good parameters for the clinical stage of NPC. The D^* value would also be a good parameter for N-staging of NPC. IVIM parameters could have a certain value for the staging of NPC.

EPO-0252

The application of intravoxel incoherent motion magnetic resonance imaging in evaluating the efficacy of chemoradiotherapy of nasopharyngeal carcinoma

Tingting Guo[1], Yong Wang[1], Lei Song[2]
1. Radiology of Department, Xiangyang No.1 People's Hospital, Hubei University of Medicine
2. Department of Radiology, Xiangyang Central Hospital, Affiliated Hospital of Hubei University of Arts and Science

Objective: To research the dynamic changes of the IVIM-MRI parameters during chemoradiotherapy of nasopharyngeal carcinoma (NPC), and to explore the value of IVIM-MRI in evaluating and predicting the efficacy of chemoradiotherapy in NPC.
Methods: With the approval of the hospital's ethics committee and informed consent of patients, this study prospectively included 33 patients with NPC. The enrolled patients were confirmed as NPC by pathology (clinical stage: II-IV_A). Three IVIM-MRI scans (9 b values: 0, 25, 50, 75, 100, 150, 200, 500, and 800 s/mm^2) were performed on the enrolled patients. Those patients underwent MRI at the time points of pretreatment (MRI_{pre}), four weeks after the start of radiotherapy (MRI_{4th}) and one month after the end of radiotherapy (MRI_{post}). The ADC value was calculated by the mono-exponential model. The bi-exponential model was used to obtain the pseudodiffusion coefficient (D^*), the pure diffusion coefficient (D), and the perfusion fraction (f). The maximum area and IVIM parameters during chemoradiotherapy were recorded, and the differences of the parameters at different time points were analyzed and the parameters before treatment between the different therapeutic effect groups were compared.
Results: During the course of treatment, the ADC values, D values, and D^* values of NPC lesions showed a gradual upward trend, and f value increased first and then decreased after treatment. The mean values of ADC in the MRIpre group and the MRIpost group were 0.79×10^{-3} mm^2/s and 1.56×10^{-3} mm^2/s, respectively ($P_{MRIpre\ vs\ MRIpost} < 0.001$), and the D values were 0.67×10^{-3} mm^2/s and 1.30×10^{-3} mm^2/s, respectively ($P_{MRIpre\ vs\ MRIpost} < 0.001$). The f values in the MRI_{pre} group and the MRI_{4th} group were 10% and 18%, respectively ($P_{MRIpre\ vs\ MRI4th} < 0.001$). 16 patients were included in the complete response group one month after the end of radiotherapy, and 17 patients were included in the partial response group. The D values of pretreatment in partial response group were significantly higher than that in complete response group($0.72\pm0.10\times10^{-3}$ mm^2/s vs $0.51\pm0.16\times10^{-3}$ mm^2/s, $P=0.04$).
Conclusion: ADC and D values could monitor the efficacy of chemoradiotherapy for NPC. D values could be more reliable. IVIM-MRI could have application value for dynamically monitoring the efficacy of chemoradiotherapy in NPC.

EPO-0253
最佳单能量联合 SAFIRE 技术对鼻腔鼻窦肿物 图像质量的影响

袁欣,杨亚英,冯瑶杰,危春容,张梦梅
昆明医科大学第一附属医院

【摘要】目的：探讨双能量 CT 最佳单能量成像联合迭代重建 SAFIRE 技术对鼻腔鼻窦肿物的图像质量的影响。方法：回顾性分析 60 例经病理证实的鼻腔鼻窦肿物，所有患者术前均行常规 CT 平扫及双能量 CT 动脉期与静脉期增强扫描。动脉期、静脉期图像均采用传统滤波反投影法（filte-red back prejection, FBP）及联合原始数据迭代重建法（sinogram affirmed iterative reconstruction,SAFIRE）重建，并将 SAFIRE 重建组调入 Monoenergetic 软件后处理获得最佳单能量联合 SAFIRE 组。总共获得 A、B、C 三组图像(A 组：最佳单能量/SAFIRE，B 组：线性融合图像/FBP，C 组：线性融合图像/SAFIRE)。比较三组图像的主观评价（图像质量评分、病灶显著性评分）及客观评价[病灶的信噪比（SNR）、对比噪声比（CNR），背景噪声（SD）]。比较动脉期与静脉期的最佳单能量值。结果：动静脉两期 A 组及 C 组图像的病灶 SNR 和 CNR、图像质量评分、病灶显著性评分均高于 B 组，背景 SD 值均低于 B 组，差异有统计学意义（P＜0.05）；动静脉两期 A 组与 C 组图像的病灶 SNR 和 CNR、背景 SD 值、图像质量评分差异均无统计学意义（P＞0.05），两期 A 组图像病灶显著性评分均高于 C 组（P＜0.05），A 组的静脉期病灶显著性评分高于动脉期（P＜0.05）。动、静脉期最佳单能量值差异无统计学意义（P＞0.05），最佳 CNR 单能量值为（65.38±0.87）KeV。结论：最佳单能量联合 SAFIRE 技术可明显减小图像噪声，提高病灶对比度，更利于鼻腔鼻窦肿物的分析诊断。

3D pCASL 与 DCE-MRI 对鼻咽癌灌注相关性研究

刘骏[1],朱娟[1],汪飞[1],杨擎[1],钱银锋[2]
1.安庆市立医院
2.安徽医科大学第一附属医院

目的 探讨三维准连续式动脉自旋标记（3D pCASL）成像与动态增强磁共振成像（DCE-MRI）在鼻咽癌不同临床分期中应用价值及相关性。
材料与方法 回顾性分析 45 例经病理确诊的鼻咽癌首诊患者并分成高、低分期组。所有患者治疗前均行鼻咽部 MRI 平扫、3D pCASL 及 DCE 扫描，用后处理软件得到肿瘤血流量（tumor blood flow，TBF)与药代动力学参数 K^{trans}、K_{ep}、V_e值。鼻咽癌高、低分期组间各参数差异采用独立样本 t 检验；TBF 值、DCE 参数与鼻咽癌不同分期间相关性行 spearman 相关分析；TBF 值、DCE 参数对鼻咽癌不同分期的诊断效能行 ROC 曲线分析；TBF 值与 DCE 参数间相关性行 pearson 相关分析。
结果 在鼻咽癌不同分期中高、低分期组 TBF、K^{trans}、K_{ep}差异具有统计学意义（P＜0.05），Ve 值无统计学意义；TBF、K^{trans}、K_{ep}与不同分期间具有很好的相关性，Ve 无相关性；TBF、K^{trans}对不同分期具有很好的诊断效能，K^{trans}略优于 TBF；TBF 与 K^{trans}、K_{ep}显著正相关，与 Ve 无相关性。
结论 3D pCASL 与 DCE-MRI 均能很好的评估鼻咽癌灌注，并用于临床分期的预测，两者间具有显著的一致性，3D pCASL 是一种可供选择的无创评价鼻咽癌灌注水平的有效替代手段。

双能量 CT 定量参数对喉癌转移淋巴结的定性评估价值

瞿姣,杨亚英（通讯作者）,段慧,冯瑶杰
昆明医科大学第一附属医院医学影像科

摘要 目的 探讨双能量 CT 动脉期碘浓度及能谱曲线斜率在诊断喉癌转移淋巴结中的价值。**方法** 收集具有完整术前双能量 CT 扫描资料并经病理证实的喉癌 46 例，淋巴结共计 90 枚，按病理结果将淋巴结分为转移组（47 枚）和非转移组（43 枚），采用独立样本 t 检验分别比较转移组与非转移组淋巴结、原发灶与转移淋巴结动脉期碘浓度及能谱曲线斜率的差异，并绘制 ROC 曲线，计算曲线下面积（AUC）及最佳诊断阈值。以 P<0.05 为差异具有统计学意义。**结果** 转移组淋巴结动脉期碘浓度及能谱曲线斜率分别为 2.29±0.50mg/ml 及 2.38±0.71，均高于非转移组（1.77±0.48mg/ml 及 1.99±0.63），差异有统计学意义（P均<0.05）；动脉期碘浓度及能谱曲线斜率诊断淋巴结转移的阈值分别为 1.85mg/ml、2.15，对应 AUC 分别为 0.77、0.67（P均<0.05）。喉癌原发灶与转移淋巴结动脉期碘浓度及能谱曲线斜率均无统计学差异（P均>0.05）。**结论** 喉癌转移淋巴结与原发灶之间具有同源性，双能 CT 动脉期碘浓度及能谱曲线斜率对喉癌转移淋巴结的诊断有一定的价值。

EPO-0256
双能量 CT 在诊断喉癌甲状软骨侵犯中的应用价值

瞿姣,杨亚英（通讯作者）,雷静,李青青
昆明医科大学第一附属医院医学影像科

【摘要】目的 探讨双能量 CT 在诊断喉癌甲状软骨侵犯中的价值。**方法** 收集 2013 年 6 月至 2019 年 2 月术前行喉部双能量 CT 增强扫描的喉癌 106 例，以手术病理为金标准，对比双能 CT 混合能量图像及碘图联合混合能量图像对喉癌甲状软骨侵犯的定性评估价值，并通过比较受侵甲状软骨与对侧正常非骨化甲状软骨动脉期标准化碘浓度及能谱曲线斜率，分析双能 CT 客观定量参数鉴别二者的效能。计数资料的比较采用 McNemar 检验及 Kappa 检验，计量资料的比较采用独立样本 t 检验。**结果** 106 例中，40 例伴甲状软骨侵犯，双能 CT 混合能量图像的诊断灵敏度、特异度及准确度分别为 75%、83.33%及 80.19%，碘图联合混合能量图像的诊断灵敏度、特异度及准确度分别为 87.50%、94.45%及 92.45%，差异无统计学意义（P>0.05）。受侵甲状软骨动脉期标准化碘浓度及能谱曲线斜率分别为 0.16±0.05 及 1.92±0.39，均高于对侧正常非骨化甲状软骨（P均<0.05），利用动脉期标准化碘浓度及能谱曲线斜率鉴别受侵甲状软骨及正常非骨化甲状软骨的临界值分别为 0.05 及 0.71，AUC 分别为 0.98 和 0.98，灵敏度、特异度分别为 97.50%、92.50%及 92.50%、97.50%。**结论** 以双能 CT 动脉期标准化碘浓度=0.05 及能谱曲线斜率=0.71 为诊断阈值鉴别受侵甲状软骨和正常非骨化甲状软骨具有一定的价值。

EPO-0257
喉部炎症性病变的 MSCT 诊断价值

周碧
中国科学院大学重庆医院（重庆市人民医院）

目的：探讨多层 CT（MSCT）对喉部炎症性病变的诊断价值，提高喉部病变影像诊断水平。
方法：回顾性分析经病理证实 5 例喉部炎症性病变患者临床及 MSCT 资料。
结果：5 例喉部炎症性病变中喉结核 2 例，喉真菌感染 1 例，慢性喉炎 2 例。患者年龄 20-82 岁（中位年龄 40 岁），其中 4 例以声嘶、2 例以咽喉痛就诊。喉镜喉黏膜充血、增厚，4 例患者伴溃

疡形成。喉真菌感染患者系统性红斑狼疮病史 5 年，间断激素治疗 3 年；2 例喉结核患者胸部 CT 提示继发型肺结核。CT 检查示 2 例喉结核患者双侧杓会厌皱襞、会厌增厚；1 例喉真菌感染患者双侧室带、声带黏膜增厚，边缘结节状，双侧室带黏膜下小斑条状软组织密度；1 例慢性喉炎患者左侧声带后份局部结节样稍突起，1 例慢性喉炎患者双侧室带增厚，黏膜下小斑状影。增强扫描慢性喉炎病例左侧声带后份结节样突起病灶轻度强化，其余 4 例喉部炎症增厚黏膜或黏膜下小斑条状影中度或明显强化。2 例患者喉旁间隙模糊（结核、真菌各 1 例），喉部软骨、周围结构均未见破坏。1 例喉结核患者双侧颈 II、III、V 区淋巴结肿大、钙化，环形强化；其余病例淋巴结未见肿大。

结论：喉部炎症性病变 MSCT 表现具有一定特异性，病变范围、黏膜及周围脂肪间隙、喉部软骨情况对肿瘤及炎症性病变的诊断及鉴别诊断具有重要意义。喉部病变缺乏特异征象时，MSCT 首要目的为显示病变范围、喉部结构情况及颈部淋巴结。

EPO-0258
磁共振高清弥散在头颈五官病变中的应用经验分享

沙炎
复旦大学附属眼耳鼻喉科医院

磁共振弥散加权成像（Diffusion weighted imaging，DWI）在全身各部位病变中有重要应用价值。

单激发平面回波序列（Single shot echo-planar imaging，SS-EPI）易产生磁敏感伪影，在鼻腔鼻窦部病变中的应用价值有限。

RESOLVE（readout-segmented echo-planar imaging using parallel imaging and a two-dimensional navigator）序列能有效减少磁敏感伪影，较好地应用于头颈部病变。

—我们定性和定量比较 RESOLVE 序列与 SS-EPI 序列在鼻腔鼻窦、视神经、耳部部的图像质量。—探讨 RESOLVE 序列在评价前述部位病变中的应用价值。

研究发现除鼻腔鼻窦区，RESOLVE 序列还能够**更好的显示眼眶视神经、颞骨和颅底等部位，变形和磁敏感伪影少**。本研究中，两种序列的脑干 ADC 值没有明显差异，但是 RESOLVE 序列的病灶 ADC 值却明显低于 SS-EPI 序列。导致这种差异产生的原因主要是由于 SS-EPI 序列在鼻腔鼻窦区易产生磁敏感伪影和鬼影，并造成 ADC 图中 ADC 值的不均匀性。**RESOLVE 序列能够更准确地反映病灶的 ADC 值。有助于鼻腔鼻窦肿瘤的定性、不同类型视神经炎的鉴别，能更准确的判断术后胆脂瘤有无残留或复发。**

EPO-0259
磁共振动态增强定量参数及纹理分析对鼻咽癌疗效的预测价值

余加懿,黄显龙,李必强,唐茁月
中国科学院大学重庆医院（重庆市人民医院）

目的：评估磁共振动态增强定量参数及纹理分析对鼻咽癌放化疗疗效的预测价值。 **方法：**前瞻性收集 2018 年 7 月至 2019 年 5 月经穿刺活检证实的鼻咽癌患者 30 例。所有患者治疗前及放疗计量达 50Gy 均行磁共振常规平扫及动态增强检查。将动态增强序列原始格式导入西门子后处理工作站 Tissue 4D 进行定量分析，提取定量参数 Ktrans、kep、Ve，并根据时间-信号强度曲线选择强化程度最高的时期，将强化程度最高的图像导入开源软件 3D Slicer 进行纹理特征提取。依据 WHO

发布的实体肿瘤疗效评价标准 RECIST 修订版对放疗计量达 50Gy 时进行疗效评价，有效组包括 CR 和 PR，无效组包括 SD 和 PD。采用两独立样本 t 检验或 Mann－Whitney U 检验对组间参数进行比较，采用多因素回归分析筛选预测因子，采用 ROC 曲线分析对参数的诊断效能进行评估。 **结果：** 30 例患者年龄 33-74 岁，平均年龄 55 岁，男性 19 例，女性 11 例。有效组和无效组治疗前 Ktrans、Ve 差异具有统计学意义，有效组治疗前 Ktrans 值高于无效组，而有效组 Ve 值低于无效组，Ktrans 值对疗效具有预测价值。增强图像的纹理特征中多个参数对疗效具有预测价值，Ktrans 联合纹理特征的预测效能更高。 **结论：**磁共振动态增强定量参数及纹理分析对鼻咽癌放化疗疗效具有预测价值，两者联合使用将提高对疗效的预测价值。

鼻腔鼻窦结外 NK/T 细胞淋巴瘤 CT 及 MRI 诊断价值

向世凤
中国科学院大学重庆医院（重庆市人民医院）

目的 分析总结鼻腔鼻窦结外 NK/T 细胞淋巴瘤的 CT 及 MRI 影像表现，探讨其对原发鼻腔鼻窦结外 NK/T 淋巴瘤的临床诊断价值，以提高该病影像诊断的准确性。**方法** 回顾性分析我院 31 例经手术或活检病理证实的鼻腔鼻窦结外 NK/T 细胞淋巴瘤的 CT 及 MRI 表现。31 例患者 28 例行 CT 检查，其中 CT 平扫 16 例，CT 平扫+增强检查 12 例；MRI 检查 13 例，均为平扫+增强扫描。CT 采用东芝 Aquilion CX 螺旋 CT 机行 64×0.5mm 轴位容积扫描，层厚、层距 5mm 轴位及冠状位重建，造影剂使用碘海醇注射液(欧乃派克)；MRI 使用西门子 Verio 3.0T 磁共振机，扫描轴位 T1WI、轴位和冠状位 T2WI 抑脂，以及轴位、冠状位抑脂 T1WI 增强扫描；对比剂采用钆喷酸葡胺(Gd-DTPA)。**结果** 31 例 NK /T 细胞淋巴瘤患者，单侧鼻腔肿瘤 25 例，双侧鼻腔肿瘤 6 例；病灶局限性于鼻腔前中部 21 例，中后部 2 例，弥漫分布于整个鼻腔 8 例；肿瘤浸润鼻前庭、鼻翼、鼻背或邻近面部软组织 26 例。23 例患者伴阻塞性鼻窦炎。31 例中 19 例出现骨质破坏吸收，但骨质破坏程度相对较轻，病变软组织范围明显大于骨质破坏范围。CT 平扫肿瘤呈等或稍低软组织密度,密度较均匀，该组病例均未见钙化。MRI 表现为 T1WI 呈等/稍低信号，T2WI 呈稍高信号，信号强度与肌肉比较 T1WI 呈等信号(5 例)/稍低信号(8 例)，其中 7 例信号均匀，6 例信号不均；T2 压脂肿瘤呈稍高信号，高于肌肉组织信号，低于鼻黏膜信号(其中 7 例信号均匀，6 例信号不均)。20 例行 CT 和（或）MRI 增强,大多表现为轻至中度强化(16/20),少数明显强化(4/20)。**结论** 鼻腔鼻窦结外 NK/T 细胞淋巴瘤 CT 及 MRI 表现具有一定特征，常规 CT 和 MRI 检查有助于该病的诊断，并能较准确的观察病变的部位及侵犯范围，对临床治疗及评估病情预后有重要的临床意义。

EPO-0261
原发性鼻腔及鼻窦黑色素瘤的影像特征与鉴别诊断

廖蕤堃,李必强,黄显龙
中国科学院大学重庆医院（重庆市人民医院）

目的 总结并探讨鼻腔鼻窦原发性恶性黑色素瘤的 CT 和 MRI 影像学特征。**方法** 回顾性分析经病理证实鼻腔鼻窦原发性恶性黑色素瘤 15 例并探讨其 CT 和 MRI 影像学特征。 **结果** 单侧 12 例，双侧 3 例。14 例肿瘤主体位于鼻腔，1 例位于双侧筛窦。鼻腔病灶 10 例较大，另 4 例相对局限；较大病灶形态不规则，其中 9 例呈填充式膨胀性生长，累及筛窦 7 例、上颌窦 6 例；周围结构受侵：鼻咽部（3 例）、鼻背（3 例），同侧上腭（2 例）、眼眶（1 例）、翼腭窝（1 例）、鼻翼（1 例）；骨质吸收 7 例，溶骨性骨质破坏并局部缺损改变 5 例。CT 病灶呈软组织密度，其内未见

钙化及囊变；CT 增强扫描明显强化 3 例，中度强化 3 例，轻度强化 1 例。MRI 扫描，T1WI 高信号（2 例），其中 T2WI 等/低信号（1 例），T2WI 混杂稍高信号（1 例）；T1WI、T2WI 稍高信号（2 例）；T1WI 等信号、T2WI 稍高信号（3 例）；增强扫描轻-中度强化 3 例，明显强化 4 例；4 例行 DWI 扫描，均提示弥散受限。**结论** CT 和 MRI 能充分显示肿瘤的部位、范围、OOO 与周围组织关系及邻近骨质破坏情况。典型色素型鼻腔鼻窦原发性恶性黑色素瘤有较特异的 MRI 信号，较大的鼻腔鼻窦恶性黑色素瘤有相对特异的生长方式，其骨质破坏也有所不同，具有一定的诊断和鉴别意义。

A Correlation Study between DKI Metrics and Immunohistochemical Labeling Indices in Nasopharyngeal Carcinoma

dechun Zheng,Hao Lin,Xiaoxiao Zhang,Ying Chen,Wang Ren,Qiuyuan Yue,Hejun Zhang,Yunbin Chen
Fujian Medical University Cancer Hospital

Objective: To evaluate the expression and intercorrelation of immunohistochemical (IHC) labeling indices in nasopharyngeal carcinoma (NPC), and to explore the correlation between the diffusion kurtosis imaging (DKI) metrics and pathological indicators in NPC.
Materials and Methods: Sixty-six patients with NPC received DKI and nasopharyngeal biopsy before treatment were prospectively studied. Quantitative DKI metrics (mean diffusion, MD and mean kurtosis, MK) were acquired. hematoxylin-eosin (HE) staining. Pathological biomarkers reflecting angiogenesis (microvessel density, MVD), proliferation (nuclear proliferation index, Ki67) and vasopermeability (aquaporin-1, APQ-1) were detected by IHC methods. Finally, the correlations were analyzed by Spearman’s rank coefficient analysis. A P value＜0.05 was considered statistically significant.
Results: The positive expression rates of Ki67, AQP-1 and MVD in recruited NPC subjects were 93.3%, 95.4% and 98.4% respectively. There have a significantly positive correlation between CD and Ki67 expression (γ = 0.377, P = 0.003) and between MVD and AQP-1 (γ = 0.403, P = 0.001). MD was negatively associated with CD and Ki67 respectively (γ = -0.357, P = 0.004; γ = -0.412, P = 0.001). There were not statistical significant between MK and any IHC labeling indices in this primary study.
Conclusion: DKI quantitative parameter (MD) has negative correlation with the CD and Ki67, which provide pathological potential mechanism of the utility of DKI in NPC management.

冠状面 CT 及 MRI 对出血坏死性鼻息肉及内翻性乳头状瘤的鉴别诊断价值

彭娟,吕发金,李咏梅
重庆医科大学附属第一医院

目的 探讨冠状面 CT 及 MRI 对出血坏死性鼻息肉及鼻腔-鼻窦内翻性乳头状瘤鉴别诊断价值。**方法** 对经手术病理证实的 12 例出血坏死性鼻息肉及 23 例鼻腔-鼻窦内翻性乳头状瘤患者的一般临床资料、冠状面 CT 及 MRI 影像资料进行回顾性研究。**结果** 出血坏死性鼻息肉发病年龄低于鼻腔-鼻窦内翻性乳头状瘤($P<0.05$)，前者青壮年，后者中年多见。生长方式上，出血坏死性鼻息肉表现为膨胀性生长，周围骨质压迫吸收，增生硬化，而内翻性乳头状瘤则无此特点，易复发，可以恶变，表现为病灶周围局部骨质破坏。CT 平扫上，出血坏死性鼻息肉密度高于内翻性乳头状瘤($P<0.05$) ，MRI 上出血坏死性鼻息肉的出血成分表现为 T1WI 高信号，T2WI 低信号，因反复出血病灶边缘及内部见线样低信号分隔，信号不均匀，而内翻性乳头状瘤密度、信号较均匀。增强扫描，出血坏死性鼻息肉表现为明显结节样或片状强化，而内翻性乳头状瘤轻中度较均匀强化，MRI 上瘤体呈卷曲“脑回状”强化较为特征。**结论** 出血坏死性鼻息肉及内翻性乳头状瘤的 CT、MRI 表现有一定区别，冠状面 CT 增强扫描及 MRI 在两者的鉴别诊断上有重要意义。

平静呼吸和 Valsalva 屏气下螺旋 CT 扫描在下咽癌诊断中的对比研究

李密,孙立新,巩若箴
山东大学附属省耳鼻喉医院

目的：分析平静呼吸下和 Valsalva 屏气下螺旋 CT 扫描对下咽癌及周围解剖结构的显示情况，探讨 Valsalva 屏气法对下咽癌的诊断价值。
方法：对 60 例临床拟诊下咽癌的病人分别进行平静呼吸下和 Valsalva 屏气下的螺旋 CT 增强扫描，分析两种检查方法对下咽癌及其周围解剖结构的显示情况及对肿瘤的分期结果，并与临床手术病理结果进行对比。

结果：Valsalva 屏气下和平静呼吸下 CT 扫描相比，对梨状窝显示优者有 47 例，对咽后壁显示优者 35 例，对喉前庭显示优者 11 例，对肿瘤边界显示优者 15 例，对喉室的显示差者 20 例，P 值均<0．05，差异有统计学意义，对环后区显示优者 16 例，P<0．05 差异有统计学意义。Valsalva 屏气下对肿瘤分期的准确性为 87%，平静呼吸下的 CT 扫描对肿瘤分期的准确性为 70%，P<0．05，差异有统计学意义。

结论： Valsalva 屏气下 CT 扫描对梨状窝、咽后壁、喉前庭、环后区肿瘤边界的显示效果好于平静呼吸下的 CT 扫描，对喉室的显示效果比平静呼吸下的 CT 图像欠佳； Valsalva 屏气下 CT 扫描对肿瘤分期的准确性高于平静呼吸下的 CT 扫描。

EPO-0266
出血坏死性鼻息肉 CT、MRI 征象特点及影像解剖分析

陈文,顾梁瑞,徐霖
十堰市太和医院

目的 分析出血坏死性鼻息肉的影像征象及解剖特点，增强对出血坏死性鼻息肉的认识。方法 回顾性分析 21 例经病理证实为出血坏死性鼻息肉的 CT 及 MRI 病例图像，探究其影像特征、临床表现，并与病理结果对照。结果 18 例出血坏死鼻息肉源自上颌窦，其在 MR 中具有特征性表现：15 例息肉 T2WI 序列边缘可见低信号环。全部息肉 T2WI 内部呈高低混杂信号，并在 MR 增强中息肉内高信号部分呈显著强化。在解剖位置上，16 例鼻息肉表现为靠近上颌窦口生长，并突出上颌窦口进入中鼻道内。3 例来源于左侧鼻腔内，其在 MR 征象中无特殊。在 CT 中，鼻息肉表现为高低混杂的软组织密度影，所有较大的病灶不同程度压迫周围骨质，临近骨质吸收变薄，2 例息肉可见结节状钙化。结论 出血坏死性鼻息肉典型影像表现为生长于上颌窦内的肿块，T2WI 中见低信号环并有邻近骨质变薄。此外，CT、MRI 中病灶结构、位置及继发改变为临床治疗方法的选择提供了信息。

USPIO-PEG-sLeX 在裸鼠鼻咽癌转移模型的 MR 成像研究

刘丽娟,刘露,李印,黄晓新,韦波,苏丹柯,金观桥
广西医科大学附属肿瘤医院

目的 探讨本课题组制备的靶向分子探针 USPIO-PEG-sLe^{X}在鼻咽癌移植瘤转移模型中应用价值。**方法** 依据裸鼠鼻咽癌移植瘤解剖及病理结果将荷瘤鼠分为转移组和非转移组，测量造影剂注射前后四次扫描（t0=平扫，t1=增强后即刻扫描，t2=增强后 1 小时，t3=增强后 2 小时）移植瘤 T2*值，分析各时刻 T2*值及 T2*值变化情况。 **结果** 转移组和非转移组的平扫 T2*值分别为 22.25±8.08、27.01±9.45，两组间差异无统计学意义（P＞0.05）。转移组和非转移组裸鼠经尾静脉注入造影剂后 t1、t2、t3 时刻 T2*值分别为 11.57±4.02 和 24.82±7.84、10.09±4.88 和 24.15±8.74、12.46±5.63 和 23.42±7.12，差异均有统计学意义（P 值分别为 0.005、0.008 和 0.019）；转移组和非转移组裸鼠 t1、t2、t3 时刻ΔT2*值分别为 10.69±6.23 和 3.86±2.20、12.17±8.67 和 2.87±1.37、9.80±3.03 和 4.32±2.28，差异均有统计学意义（P 值分别为 0.027、0.048、0.043）。转移组和非转移组裸鼠 t1、t2、t3 时刻强化率分别为 45.98±14.03 和 7.10±5.18、 51.15±22.70 和 11.04±6.01、44.05±13.92 和 12.09±7.54，差异均有统计学意义（P 值分别为 0.001、0.005、0.007）。经两因素重复测量的方差分析检验，转移组和非转移组 T2*值差异有统计学意义（P=0.02＜0.05），不同时刻 T2*值差异有统计学意义（P=0.001＜0.05），转移组和非转移组与扫描时刻之间存在交互作用（P=0.043＜0.05）。 **结论** USPIO-PEG-sLe^{X}可以无创监测 E-selectin 表达，在监测鼻咽癌移植瘤模型转移方面具有较好的应用前景。

EPO-0268

Comparison between simultaneous multi-slice and integrated slice-by-slice shimming readout-segmented echo planar imaging in head and neck tumors

Tong Su, Yu Chen, Zhentan Xu, Zhuhua Zhang, Zhengyu Jin
Peking Union Medical College Hospital

Purpose

To compare the simultaneous multi-slice (SMS) and integrated slice-by-slice shimming (iShim) readout-segmented echo-planar imaging (rs-EPI, RESOLVE) for diffusion-weighted imaging (DWI) in head and neck tumors.

Materials and Methods

Data were collected on a MAGNETOM Skyra 3T MR scanner (Siemens Healthcare, Erlangen, Germany) with a 20-channel head-neck coil and a pair of 4-channel special purpose coils. Twenty patients (15 males; mean age, 56 years; range, 29 - 81 years) with head and neck malignant tumors who underwent neck MR scan including both prototype sequences SMS-RESOLVE and iShim-RESOLVE were enrolled in this perspective study. Detailed acquisition parameters of the two sequences were listed as follows:

SMS-RESOLVE: repetition time (TR) = 4000ms, echo time (TE) =66/104ms, field of view (FOV) = 260×260 mm^2, slice thickness=3mm, voxel size=2.4×2.4×3.0mm^3, b-values=0 and 800 s/mm^2, readout segments=5, slice acceleration factor=2, GRAPPA accelerated factor = 2, acquisition time=2 minutes and 47 seconds.

iShim-RESOLVE: TR=6790ms, TE =49/74ms, FOV=260×260 mm^2, slice thickness=3mm, voxel size=2.4×2.4×3.0mm^3, b-values=0 and 800 s/mm^2, readout segments=5, GRAPPA accelerated factor = 2, acquisition time=3 minutes and 9 seconds.

The subjective image quality based on lesion distortion was evaluated according to the five-point scales: 0 for no distortion, 1 for small distortion, 2 for moderate distortion, 3 for high distortion, 4 for impossible to evaluate. And the ADC values and the signal intensity of lesions were measured at the largest section of the tumors. The signal-to-noise ratio (SNR) was calculated by the ratios between the mean signal intensities of the lesion and the standard deviation of the background noise. The subjective image quality scores, SNR, ADC values and signal intensity of lesions between SMS- and iShim-RESOLVE were compared.

Results

Ultimately, twenty primary tumors and seven metastatic lymph nodes were analyzed. The locations of twenty primary tumors were seven in tongue, six in larynx, three in hypopharynx, two in thyroid and two in esophagus.

The image distortion scores of iShim-RESOLVE were significantly lower than that of SMS-RESOLVE (iShim-RESOLVE 1.90±0.64, SMS-RESOLVE 2.85±0.36, p value＜0.001). The SNR of iShim-RESOLVE images were significantly higher than that of SMS-RESOLVE (iShim-RESOLVE 348.37±344.58, SMS-RESOLVE 127.96±119.71, p value=0.007).

What’s more, primary lesions in iShim-RESOLVE images acquired at b values=800 s/mm^2obtained much higher signal intensities than in SMS-RESOLVE images (iShim-RESOLVE 280.04±135.11, SMS-RESOLVE 58.17±38.15, p value＜0.001).

In addition, there was no significant difference of the ADC values of primary lesions between iShim-RESOLVE and SMS-RESOLVE sequences (iShim-RESOLVE 1052.05±163.16, SMS-RESOLVE 950.26±244.86, p value=0.198). And the ADC values of metastatic lymph nodes between these two sequences showed no significant difference neither (iShim-RESOLVE 941.93±241.12, SMS-RESOLVE 942.54±358.46, p value=0.993).

Conclusions

IShim-RESOLVE can improve image quality in head and neck DW imaging practice with substantially decreased lesion distortion and increased SNR, and it showed comparable ADC values of tumors and total acquisition time compared to SMS-RESOLVE sequence.

EPO-0269

Simultaneous multi-slice readout-segmented echo planar imaging for accelerated diffusion-weighted imaging of the head and neck tumors

Tong Su, Yu Chen, Zhentan Xu, Zhuhua Zhang, Zhengyu Jin
Peking Union Medical College Hospital

Purpose

To investigate the feasible application of simultaneous multi-slice (SMS) to readout-segmented echo-planar imaging (rs-EPI, RESOLVE) with the use of special purpose coils for accelerated diffusion-weighted imaging in head and neck tumors, allowing for a markedly reduced total acquisition time and improved image quality compared to the images acquired by conventional RESOLVE and rs-EPI with a readout partial Fourier acquisition (RESOLVE-RPF) protocol.

Materials and methods

Data were collected on a MAGNETOM Skyra 3T MR scanner (Siemens Healthcare, Erlangen, Germany) with a 20-channel head-neck coil and a pair of 4-channel special purpose coils. Twenty patients (15 males; mean age, 56 years; range, 29 - 81 years) with head and neck malignant tumors who underwent neck MR scan including four prototype sequences RESOLVE, RESOLVE-RPF, SMS-RESOLVE and SMS-RESOLVE+Coils were enrolled in this perspective study. DWI images were acquired with RESOLVE, RESOLVE-RPF and SMS-RESOLVE. The imaging parameters were as follows: TR/TE = 6540/58 ms, slice thickness = 3 mm; voxel size = 1.5 × 1.5 × 3.0 mm^3; FOV = 160 × 160 mm^2; readout segments = 5; b value = 0 and 800 s/mm^2. Three segments with readout partial Fourier factor 6/8 were used in RESOLVE-RPF. The TR/TE in SMS-RESOLVE was 4560/59 ms with slice acceleration factor 2. The acquisition time for RESOLVE, RESOLVE-RPF, and SMS-RESOLVE was 3:37 min, 2:58 min, and 2:47 min, respectively. The ADC values and the signal intensity of lesions were measured at the largest section of the tumors. The signal-to-noise ratio (SNR) was calculated by the ratios between the mean signal intensities of the lesion and the standard deviation of the background noise. The SNR, ADC values and signal intensity of lesions among the four protocols were compared.

Results

Ultimately, twenty primary tumors and seven metastatic lymph nodes were analyzed. The locations of twenty primary tumors were seven in tongue, six in larynx, three in hypopharynx, two in thyroid and two in esophagus.

There was no significant difference among the SNR of RESOLVE, RESOLVE-RPF and RESOLVE-SMS. Using special purpose coils, the SNR of RESOLVE-SMS+Coils was significantly increased more than twice compared to that of RESOLVE (211.61±108.69 versus 94.24±49.80, p value=0.004). The SD values of image background of four protocols were compared, and RESOLVE-SMS+Coils showed the smallest SD values (p value＜0.001). There was no significant difference of ADC values of primary lesions and metastatic lymph nodes among four DWI protocols (primary lesions p=0.382, lymph nodes p=0.796, respectively). With similar lesion area of primary lesions, images of RESOLVE-SMS+Coils showed significantly smaller SD of ADC values. Although there was no statistically significant difference of SD of lymph node ADC values among four protocols, images of RESOLVE-SMS+Coils showed relatively smallest SD values.

Conclusions

Combining SMS-RESOLVE with additional special purpose coils can improve image quality in head and neck DW imaging practice with increased SNR, and it showed comparable ADC values of tumors and substantially reduced total acquisition time compared to conventional RESOLVE sequence.

EPO-0270

Machine-learning-assisted radiomic biomarkers for early detection of radiation- induced temporal lobe injury: Development and retrospective validation

Shuixing Zhang
The first affiliated hospital of jinan university

Purpose: Early radiation-induced temporal lobe injury (RTLI) diagnosis is very challenging, and predictive biomarkers of RTLI are lacking. Therefore, we developed noninvasive radiomic biomarkers for early detection of RTLI.

Methods: We retrospectively evaluated 242 nasopharyngeal carcinoma (NPC) patients who had undergone baseline and regular follow-up magnetic resonance imaging (MRI) scans. The clinical endpoint was RTLI, which was diagnosed using MRI. The radiomic pipeline involved MRI data pre-processing, medial temporal lobe segmentation, feature extraction, feature selection, and predictive modeling. Total 24 non-texture and 61,920 texture features were extracted from the medial temporal lobe. A 0.632 + bootstrap and the area under the receiver operating characteristic curve (AUC) were applied for feature selection. Random forest was used to construct the prediction model. Three models, 1, 2 and 3, were developed for prediction 1, 2, and 3 years before RTLI onset, respectively. Different numbers of selected features were tested for optimization. AUC was used to assess the predictive performance.

Results: Of the 242 included patients, 171 (70.7%) were men, and the mean (standard deviation) age was 48.5 (10.4) years. The median follow-up time and latency from radiotherapy until the first RTLI were 46 and 41 months, respectively. Models 1, 2, and 3, with 20 radiomic features derived from the whole medial temporal lobe, yielded maximum AUCs of 0.830 (95% CI: 0.823–0.837), 0.773 (0.763–0.782), and 0.716 (0.699–0.733), respectively.

Conclusion: The three machine-learning-assisted radiomic models can dynamically predict RTLI 1–3 years in advance, enabling early detection and preventive neurological intervention.

EPO-0271

Radiomic machine-learning classifiers for prognostic biomarkers of advanced nasopharyngeal carcinoma

Minmin Li,Bin Zhang
the first affiliated hospital of Jinan university

We aimed to identify optimal machine-learning methods for radiomics-based prediction of local failure and distant failure in advanced nasopharyngeal carcinoma (NPC). We enrolled 110 patients with advanced NPC. A total of 970 radiomic features were extracted from MRI images for each patient. Six feature selection methods and nine classification methods were evaluated in terms of their performance. We applied the 10- fold cross-validation as the criterion for feature selection and classification. We repeated each combination for 50 times to obtain the mean area under the curve (AUC) and test error.We observed that the combination methods Random Forest (RF) þ RF (AUC, 0.8464 ± 0.0069; test error, 0.3135 ± 0.0088) had the highest prognostic performance, followed by RF þ Adaptive Boosting (AdaBoost) (AUC, 0.8204 ± 0.0095; test error, 0.3384 ± 0.0097), and Sure Independence Screening (SIS) þ Linear Support Vector Machines (LSVM) (AUC, 0.7883 ± 0.0096; test error, 0.3985 ± 0.0100). Our radiomics study identified optimal machine-learning methods for the radiomics-based prediction of local failure and distant failure in advanced NPC, which could enhance the applications of radiomics in precision oncology and clinical practice.

EPO-0272

Differentiation of sinonasal mucosal melanomas from sinonasal lymphomas based on MRI radiomics nomogram

Linying Guo[1],Zuohua Tang[1],Jing Zhang[2],Yang Song[2],Guang Yang[2],Yvcheng Pan[1],Zebin Xiao[1],Mengge He[3]
1.Eye & ENT hospital of fudan university
2.East China Normal University
3.Jinshan Hospital of Shanghai Medical School, Fudan University

objective: *To develop a MRI radiomics-based nomogram for differentiating SNMMs from sinonasal lymphomas, using T2 weighted imaging and contrast enhanced T1 weighted imaging.*

Methods: *Forty-eight SNMMs and forty-five sinonasal lymphomas were included. An individualized 3D nomogram(I-3D-N), an individualized 2D nomogram(I-2D-N) and a generalized 3D nomogram(G-3D-N) were built. Visual assessments of two radiologists were also obtained. The area under the curve (AUC) between the I-3D-N and I-2D-N or between the I-3D-N and the G-3D-N, and the accuracy between the I-3D-N and the radiologists were compared.*

Results: *The I-3D-N was satisfactory with an accuracy of 0.88, AUC of 0.94 in the training cohort and accuracy of 0.89, AUC of 0.93 in the validation cohort. It harbored higher AUC than the I-2D-N (p<0.001) and the G-3D-N (p<0.001), and higher accuracy than the young (p<0.001) and experienced radiologist (p<0.05).*
Conclusions: *The I-3D-N based on MRI radiomics could help differentiate SNMMs from sinonasal lymphomas.*

喉癌临床关注点和影像分析思路（讲座）

鲜军舫
首都医科大学附属北京同仁医院

背景和目的：喉癌是头颈部恶性肿瘤中第二常见肿瘤，约 60%诊断时为晚期(III 或 IV 期)。喉癌的治疗方案主要根据分期来确定，因此，临床重点关注喉癌的 TNM 分期。本文重点讲述如何根据喉癌患者的颈部 CT 表现进行分期及存在的问题与解决思路。方法：对照手术病理结果对照讲解喉癌的 TNM 分期。结果和结论：颈部 CT 表现可较准确地确定喉癌的 TNM 分期，但甲状软骨等喉软骨侵犯和隐匿性淋巴结转移目前是显示和诊断难点，需要进一步研究探讨，提高喉软骨侵犯和隐匿性淋巴结转移的灵敏度和特异度，为治疗方案及手术方式提供更准确依据，提高治疗效果。

EPO-0274
头颈部腺样囊性癌临床关注点及影像分析思路（讲座）

鲜军舫
首都医科大学附属北京同仁医院

背景和目的：头颈部腺样囊性癌并不多见，恶性程度不高，但容易沿神经蔓延，后者常被误诊为炎性病变或神经源性肿瘤。因此，本文重点讲解头颈部腺样囊性癌常见发生部位及沿神经蔓延的路径和表现，着重讲解分析思路。方法：讲解怎样分析肿瘤来源和分析思路。结果和结论：头颈部腺样囊性癌常来源于硬腭、腮腺、泪腺和鼻腔等，容易沿三叉神经与分支以及面神经与分支蔓延，翼腭窝是最常见的沿神经蔓延的部位，因此，对于翼腭窝不规则病变需仔细检查头颈部有无原发肿瘤，避免将沿神经蔓延误诊耽误治疗。磁共振是最佳检查方法。

RNA-Seq analysis of peripheral blood mononuclear cells reveals unique transcriptional signatures associated with radiotherapy response of nasopharyngeal carcinoma and prognosis of head and neck cancer

Guohong Liu[1],Yueying Li[1,2]
1.Zhongnan Hospital of Wuhan University
2.Second Clinical Hospital of Wuhan University

Radiotherapy is the main treatment for nasopharyngeal carcinoma (NPC); however, radioresistance limits the therapeutic efficacy and prognosis of patients with NPC. Here, we plan to identify the genes involved in radiotherapy response. Peripheral blood mononuclear cells (PBMC) from three paired NPC patients with pre-radiotherapy and post-radiotherapy were extracted. Next-generation deep sequencing was then performed to identify the PBMCs transcripts profiles in response to radiotherapy. Data of gene chip GSE48501 was obtained from Gene Expression Omnibus (GEO) database. The gene integration of differentially expressed genes identified from RNA-Seq data and gene chip was performed using “RobustRankAggreg” package. RNA-Seq data from 44 normal and 519 Head and neck squamous cell carcinoma (HNSCC) tissues (downloaded from TCGA) was integrated into the analysis to further support our study. Cox regression was used to identify risk factors impacting survival. Total of 45 genes were identified to be associated with radiotherapy response. Significantly enriched Gene Ontology (GO) terms and pathways were enriched. Univariate and multivariate analysis suggested the dysregulated genes, *CHAC2, CLEC9A, GNG10, JCHAIN, KLRB1, NOG, OLR1, PRELID2, SYT1, VWCE, ZNF443* were associated with survival in HNSCC patients. Our data provide an overview of the profiles of radiotherapy-associated genes, which will facilitate future investigations into the function of radiotherapy resistance.

体素内不相干运动扩散加权成像定量评价鼻咽癌 同步放化疗疗效的初步研究

邓士杰,莫静姿
中国人民解放军第一六三医院/湖南师范大学附属第二医院

目的 探讨体素内不相干运动扩散加权成像(IVIM-DWI)定量评价鼻咽癌（NPC）放化疗疗效的价值。**材料与方法** 30 例经病理活检确诊的鼻咽癌患者，于放疗前、放疗中、放疗后行多 b 值扩散加权成像（DWI）检查。单指数模型获得表观扩散系数 ADC，双指数模型获得纯扩散系数 D 值、灌注分数 f 值、伪扩散系数 D*值。测量各扫描时间点肿瘤 IVIM-DWI 参数，分析其动态变化及相关性。**结果** 鼻咽癌病灶 ADC 及 D 值在整个治疗过程中逐步升高，且差异显著（$P<0.05$）。f 值先上升后下降，放疗前与放疗开始后 1 个月 f 值分别为 11%、19%（$P<0.05$）。不同扫描时间点间 D*值均无显著统计学差异（$P>0.05$）。**结论** 鼻咽癌放化疗前、治疗中、治疗后 IVIM 的各参数值可以较好评价放化疗的效果，D 值更能有效监测放化疗疗效，f 值可作为潜在观察指标，而 D*值需要技术上的改进。

EPO-0279

Non-Hodgkin’s lymphoma of paranasal sinus: Multiparametric MR Imaging Analysis

Yuan Wang,Junfang Xian,Fei Yan
Beijing Tongren Hospital, CMU

Purpose: To investigate the characteristics of MRI appearances of paranasal sinus non-Hodgkin’s lymphoma (NHL).

Materials and Methods: 18 patients histologically proven NHL underwent preoperative MRI. Images were evaluated for the histologic phenotypes,primary sites, growth pattern, local tumor invasiveness(LTI), signal and homogeneity features , dynamic enhancement multiparameters(T_{peak},T_{max},CI_{peak},CI_{max},WR),ADC value,and extent or stage of the tumors. DCE parameters and ADC value were computed.

Results: Pathology covered four histopathologic phenotype of sinonasal NHL including NK/T cell lymphoma(NKTCL,n=2, 11.11%),diffuse large B cell lymphoma(DLBCL,n=14, 77.78%), Lymphoplasmacytic lymphoma(n=1, 5.56%),Mantle-cell lymphoma(n=1, 5.56%).MRI morphological patterns of NHL were identified:
(i)The majority of DLBCL found in paranasal sinus(77.78%).(ii)Three Growth pattern was diffuse filtration, localized mass and thickened mucosa.Diffuse pattern may be associated with advaced stage.(iii)When LTI occurred, subcutaneous and soft tissue involvement was the most common sign regardless of histopathological type. NKTCL showed anterior-posterior growing orientation accompanying less bilateral involvement. DLBCL easily extended orbit or pterygopalatine fossa and other more adjacent sites.

Most tumors were homogeneous isointensity on both T1WI and T2WI sequences and mild to moderate homogeneous enhacement. DCE and DWI sequences showed the unique features of T_{peak}, T_{max}, CI_{peak}, CI_{max}, WR and ADC value on MRI. T_{peak} and WR also showed the potential for sinonasal NHL stage.

Conclusion: On MRI, paranasal sinus NHL showed multiple parametric identifiable features. These findings help to more comprehensive understand MRI appearance of this disease from morphology, intensity, hemodynamic and diffusion. Our exploration showed the potential and clue for clinical differential diagnosis between lymphoma and other malignant tumors of paranasal sinus.

鼻旁窦的非霍奇金淋巴瘤的 MRI 影像表现

王媛,鲜军舫,燕飞
首都医科大学附属北京同仁医院

目的：研究总结副鼻窦非霍奇淋巴瘤的 MRI 影像特点，为临床诊断与治疗提供依据。

材料与方法：搜集近 4 年中 18 例于我院就诊经病理证实副鼻窦非霍奇金淋巴瘤患者治疗前的完整 MRI 影像资料。 通过对病理亚型、原发部位、生长形式，局部浸润、信号、均匀度、动态增强序列多个参数 (T_{peak}, T_{max}, CI_{peak}, CI_{max}, WR), ADC 值, 病变范围及肿瘤分期的评价和计算，总结该病特点。

结果：18 个病人的病理结果包括 4 个病理亚型：发生在鼻筛区或筛窦的 NKT 淋巴瘤 2 例（NKTCL, n=2, 11.11%），鼻腔筛窦区、上颌窦、筛窦、蝶窦、额窦的弥漫大 B 细胞淋巴瘤 14 例 (DLBCL, n=14, 77.78 %），上颌窦浆细胞母细胞瘤 1 例（n=, 5.56%），鼻筛区套细胞淋巴瘤 1 例 (n=1, 5.56%)。副鼻窦的非霍奇金淋巴瘤有下列特点：(i)绝大多数副鼻窦的非霍奇金淋巴瘤的病理类型为弥漫大 B 淋巴瘤（占 77.78%)。(ii)生长方式分为浸润性、局部肿块及粘膜增厚等形式，弥漫性形式往往与进展期病变相关。(iii)当发生局部浸润时，常出现面部软组织肿胀及皮下肿瘤浸润。弥漫大 B 型淋巴瘤容易累及眼眶、翼腭窝和其他邻近结构.大多数肿瘤在 T1WI 和 T2WI 序列上呈均匀等信号，增强后呈轻度到中等度均匀强化，少数不均匀，可见分隔强化。DCE 和 DWI 序列的 T_{peak}，T_{max}，CI_{peak}，CI_{max}，WR 参数及 ADC 值较其他类型副鼻窦恶性肿瘤有独特特点。T_{peak} 和 WR 对于副鼻窦 NHL 分期有一定帮助。

结论： MRI 上副鼻窦非霍奇金淋巴瘤的影像具备独特特点，这些特点表现在形态、信号、均匀度、动态增强参数及扩散 ADC 值等方面。我们的研究总结了发生于副鼻窦的 NHL 的 MRI 特点，对于鉴别淋巴瘤与副鼻窦其他恶性肿瘤提供参考依据，也为治疗分期提供有用信息。

EPO-0281

Onodi 气房与视神经管关系的鼻窦 CT 研究

朱凌
武汉大学中南医院

目的：鼻窦 CT 探索 Onodi 气房与视神经管之间的关系。

方法：回顾性分析 275 例鼻窦 CT（男 161 例，女 114 例）。评估 Onodi 气房是否出现，并根据文献分型方法将 Onodi 气房与视神经管之间的关系分成 I-IV 型。

结果：Onodi 气房的出现率为 45.8%，其中左侧 26.2%，右侧 29.4%，双侧 44.4%；男女性出现率分别为 46.9%、57.1%。Onodi 气房与视神经管之间的关系分型例数 III>IV>I>II。

结论：由于 Onodi 气房靠近视神经管，其临床意义十分重要，必须在相关手术术前评估 Onodi 气房是否出现及气化类型以避免视神经管损伤。鼻窦 CT 可准确评估 Onodi 气房及其与视神经管之间的关系，在此次研究中 III 型 Onodi-视神经管关系最为常见。

EPO-0282

增强 MR 诊断面神经运动去神经支配

赵芸芸,董季平,宁文德,刘红生,杨想春
西安市中心医院

目的 探讨增强 MR 在诊断面神经运动去神经支配中的价值。
方法 对 9 例不同类型的周围性面瘫（PFP）患者进行 MR 增强扫描。采用 Philips EBW 工作站，行面神经 CPR 观察面神经受累及走行情况，观察分析 PFP 患者患侧面神经、表情肌受累情况，并与健侧进行比较。
结果 9 例 PFP 患者中，感染性 1 例，外伤性 2 例，肿瘤性 3 例，面神经肿瘤术后 3 例。1 例感染性 PFP 患者诊断为 Ramsay-Hunt 综合征， 其 MR 表现为患侧面神经病变节段出现明显强化伴轻度增粗；患侧面部表情肌（如颧大肌、颊肌、眼轮匝肌等）较对侧萎缩。2 例外伤性 PFP 中，其 MR 表现为患侧面神经增粗伴明显强化，患侧表情肌较对侧萎缩，且信号增高；3 例肿瘤性 PFP 中，其 MR 表现为面神经走行区及其周围区域的软组织样信号，面神经增粗伴明显强化，患侧表情肌较对侧萎缩。3 例面神经肿瘤术后 PFP 中，其 MR 表现为颞骨岩部、中耳乳突区斑片状不均匀 T1、T2 高信号，面神经走行区结构模糊，患侧表情肌较对侧萎缩。
结论 不同病因可致面神经运动去神经支配，在临床工作中应予以重视，增强 MR 可评价面神经运动去神经支配，CPR 可直观显示颞骨内面神经受累情况。

EPO-0283

内耳内常见疾病的高分辨 MRI 研究

赵慧,孙立新,巩若箴
山东大学附属山东省耳鼻喉医院

目的：利用高分辨磁共振成像研究内耳常见疾病的磁共振表现。
材料和方法:回顾性分析来我院就诊的 98 例累及内耳结构的患者（54 例突发性耳聋、26 例临床确诊为 Ramsay Hunt 综合征、6 例外伤，9 例颞骨术后），其中男性患者 54 名，女性患者 44 名，年龄范围为 21 岁~72 岁。所有患者行 3.0T MR 行内耳强化扫描，扫描序列包括强化前轴位 3D-T1WI 序列、3D-T2WI 序列、3D-FLAIR 序列及强化后轴位 3D-T1WI 序列、3D-FLAIR 序列。观察内耳的信号特点。
结果：（1）在磁共振上，内耳中内淋巴液和外淋巴液信号不同，主要体现在前庭部位，具体表现为内淋巴液在 T1WI 和 T2WI 上呈低信号，外淋巴液在 T1WI 和 T2WI 上呈高信号，正常情况下两者在 T2-FLAIR 上不显影；（2），98 例内耳病变患者信号存在异常，在 T1 上呈等或高信号，T2WI 呈高信号，T2-FLAIR 呈不同程度的高信号；其中 54 例突发性耳聋患者中，病变位于前庭外淋巴液 46 例，位于前庭内、外淋巴液 8 例；26 例 Ramsay Hunt 综合征患者病变位于前庭外淋巴液约 24 例，位于位于前庭内、外淋巴液 2 例；6 例外伤患者病变位于前庭外淋巴液 4 例，位于前庭内外淋巴液 2 例；9 例颞骨术后患者病变位于前庭外淋巴液 7 例，位于前庭内外淋巴液 2 例。
结论：利用磁共振 3D-T1WI、T2WI 及 FLAIR 序列能够分辨出前庭中的内、外淋巴液成分；内耳内常见疾病导致的内耳信号异常主要位于外淋巴液中，外伤导致的内耳出血常累及前庭内、外淋巴液。

EPO-0284
磁共振 3D-Cube T2 序列成像对脑脊液鼻漏的诊断价值

甘慧
陆军军医大学第二附属医院（新桥医院）

目的探讨磁共振 3D-Cube T2 序列成像在脑脊液鼻漏中的临床应用。方法回顾性分析 2017 年 2 月—2018 年 8 月陆军军医大学第二附属医院收治的脑脊液鼻漏患者 17 例,其中 10 例为颅脑创伤,7 例为垂体瘤术后。行 MRI 常规检查及 3D-Cube T2 序列成像,研究 3D-Cube T2 序列脑脊液鼻漏的表现,总结 3D-Cube T2 序列成像对脑脊液鼻漏诊断的优势。结果 17 例患者发现脑脊液鼻漏 14 例,表现为鼻腔或鼻窦内与颅内脑脊液信号一致的高信号影,并可见沟通二者相连的线状高信号影。14 例鼻漏患者一共发现漏口 16 个,分别位于右侧前组筛窦及上鼻道 7 个、额窦 6 个、蝶窦及鞍旁 2 个、筛板 1 个。结论磁共振 3D-Cube T2 序列为重 T2 加权水成像,脑脊液在此序列图像上表现为高信号,通过图像后处理能多角度展示脑脊液鼻漏漏口的确切位置。

EPO-0285
听骨双向调整 MPR 结合听骨链 CPR 重组技术在先天性听骨链畸形患者中的临床应用

刘红生,董季平,杨军乐,杨想春
西安市中心医院

目的 探讨听骨 MPR 及听骨链 CPR 重组技术在先天性单纯性听骨链畸形患者中的临床应用。
方法 对 94 例（125 患耳，年龄 6～39 岁）先天性单纯性听骨链畸形患者行颞骨 HRCT 轴位扫描并作听骨双向调整 MRP 重组及听骨链 CPR，二种方法结合观察听骨链畸形类型及程度；另选取 98 例（191 耳，5～47 岁）同期在我院因耳鸣、眩晕等症状就诊需行颞骨高分辨 CT 检查明确诊断者作为正常对照组（电测听检查均无听力异常）。机型及主要扫描参数：采用 Philips Brilliance-iCT256 扫描，准直 0.6mm，重建间隔 0.2mm，采用骨算法重建，重建矩阵 1024×1024。听骨 MPR 重组方法：在受检者同一序列轴位图像进入 MPR 功能窗口，根据听骨空间分布特点，利用双向调整 MPR 技术显示锤骨、砧骨、镫骨的全程结构；听骨链 CPR：在 MPR 的基础上绘制并调整听骨链参考线，在 1 幅图像上显示听骨及其连接关系。
结果 （1）正常对照组：两种方法相结合对听骨及其连接关系的显示率可达到 100%，对锤骨、砧骨及镫骨的全程显示的最佳方位分别是斜冠状位、斜矢状位及斜轴位。（2）临床应用：本组中镫骨畸形 107 耳，占 85.6%，砧骨长突畸形 84 耳，占 67.2%，其中单纯性镫骨畸形 41 耳（32.8%），单纯性砧骨畸形 18 耳（14.4%），镫骨畸形合并砧骨畸形 66 耳（52.8%）。听小骨畸形包括单纯砧骨长突缺如或发育不良，镫骨完全缺如，镫骨部分缺如（头颈部缺如——环状镫骨、前后脚缺如），镫骨发育不良（发育小、不规则块状、前脚或后脚细、“棒状”——单足弓等），单纯镫骨底板固定，镫骨异位，镫骨及砧骨长突均缺如或发育不良等多种类型。
结论 先天性单纯性听骨链畸形临床上表现类型多样，以镫骨、砧骨长脚畸形为主； MSCT 听骨 MPR 结合听骨链 CPR 重组技术能清晰显示畸形的不同类型，为患者临床治疗提供准确信息。

EPO-0286
Ramsay-Hunt 综合征和 Bell 麻痹患者影像学特点的对比分析

赵慧,孙立新,李进叶,胡娜,李金燕,巩若箴
山东大学附属山东省耳鼻喉医院

目的：对比分析 Ramsay-Hunt 综合征和 Bell 麻痹患者面神经影像学的差异,以提高诊断及鉴别能力。
方法：回顾性分析来我院就诊的 89 例周围性面瘫患者（58 例临床确诊为 Bell 麻痹、31 例临床确诊为 Ramsay-Hunt 综合征），所有患者均行面神经 MRI 强化扫描，扫描序列包括平扫 T1WI、T2-FLAIR、T2WI 及强化后 T1WI、T2-FALIR，观察患侧面神经各序列的影像学表现有无差异。
结果：（1）Ramsay-Hunt 综合征:T1WI 平扫示 15 例患者可见患侧面神经增粗；5 例患侧内耳信号有轻度升高；T2WI 上患侧面神经、内耳信号均未见明显异常；T2-FLAIR 平扫示 20 例患者患侧面神经及前庭神经增粗；28 例患者患侧内耳内信号不同程度升高；增强后 T1WI 示 31 例患者患侧面神经增粗并强化，26 例患者患侧前庭神经增粗并异常强化，面神经主要病变部位在膝状神经节，由此向两端发展；同时 13 例患者患侧内听道壁脑膜异常强化；8 例患侧内耳有轻度强化。增强后 T2-FLAIR 示 31 例患者患侧面神经、前庭神经增粗并强化；11 例患者患侧内耳有不同程度强化。（2）Bell 麻痹：T1WI 平扫示 21 例患者患侧面神经增粗；T2WI 上患侧面神经、内耳信号均未见明显异常；T2-FLAIR 平扫示 15 例患者患侧面神经增粗；患侧内耳内信号均未见异常；增强后 T1WI 示 50 例患者患侧面神经增粗并强化，主要累及面神经内听道底段、迷路段及膝状神经节强化；增强后 T2-FLAIR 示 46 例患者患侧面神经增粗并强化；患侧内耳内信号均未见异常及强化。
结论：通过对比两者的影像学特点,发现两种病变有一定的相似之处,也存在差异，差异主要体现在强化后 T1WI（Ramsay-Hunt 综合征患者内听道壁有异常强化）及强化前后 T2-FLAIR 序列（Ramsay-Hunt 综合征患者内耳及前庭神经有异常），因此可针对疾病的影像学表现做出诊断。

EPO-0287
高分辨 CT 联合高分辨 MRI 在儿童人工耳蜗植入术前评估中的诊断价值

王玥瑶
山东省耳鼻喉医院

目的：探讨颞骨高分辨率 CT(HRCT)和磁共振成像在儿童人工耳蜗植人术前评估的各自的诊断价值及两者联合应用对提高儿童内耳发育异常检出率的价值。
方法：回顾性分析 50 例(100 耳)临床确诊感音神经性聋患儿行人工耳蜗植人术前的颞骨 HRCT 及 MR 影像学检查资料,由 2 名具有 10 年以上耳鼻喉专业方向影像诊断医师分别进行影像学诊断，评估其内耳发育情况，得出内耳发育畸形诊断平均符合率。
结果：50 例（100 耳）患儿颞骨 HRCT 及 MRI 结果显示，两者联合应用共检出内耳畸形患儿 43 例、共计 76 耳，平均符合率 76%。其中耳蜗发育畸形共 26 耳(含 Mchel 畸形 3 耳、共同腔畸形 3 耳、耳蜗未发育 1 耳、耳蜗发育不全 5 耳、不完全分隔 I 型 3 耳、不完全分隔Ⅱ型 9 耳、蜗神经孔狭窄 2 耳)，前庭畸形 10 耳，半规管畸形 9 耳，前庭导水管畸形 14 耳，内听道畸形 6 耳，耳蜗神经畸形 8 耳，面神经位置异常 3 耳。其中 HRCT 诊断平均符合率 62% ，MRI 诊断平均符合率 71%。
结论: HRCT 在显示内耳骨迷路及骨质方面具有优势,MRI 在显示内耳膜迷路及听神经方面具 有优势,两者联合应用，优势互补，有利于小儿人工耳蜗植人术前内耳发育的全面评估及手术指导。

Decreased functional connectivity of the primary auditory with cognitive networks in inattentive children and adolescents with hearing loss: a resting-state fMRI study

jianhong li
Beijing Tongren Hospital, Capital Medical University

Early profound deaf children and adolescents have been reported to suffer from distractibility and inattentiveness, which lead to academic difficulties. Neural correlates of this attention deficits have been little documented. The brain mechanism of this attention impairment in deaf children and adolescents is not clear yet. We hypothesized the functional connectivity of the primary auditory cortex to the attention control networks, default mode network and other cognitive networks may be reduced in inattentive children and adolescents with bilateral early profound deafness. Early intervention may mitigate the effects of deafness on attention development in deaf children and adolesecnts. In this study, we applied resting-state functional magnetic resonance imaging to investigate the functional connectivity of the superior temporal gyrus and transverse temporal gyrus in primary auditory cortex on 25 inattentive children and adolescents with bilateral prelingual profound deafness (BPPD), comparing with 30 age-matched normal controls. Pearson correlation analyses were then used to explore the correlations of functional connectivity changes with the years of deafness, sign language usage and hearing aid usage. Our results revealed alterations mainly decrease in resting-state functional connectivity (RSFC) between the primary auditory cortex and the attention control, language comprehension, default-mode and sensorimotor networks in these deaf subjects. The usage of hearing aid was also found to normalize the connectivity between primary auditory cortex and attention network in these deaf subjects. Our findings indicated a negative impact of early auditory deprivation on the attentional and other high cognitive networks, which is crucial for early intervention and clinical care of deaf children and adolescents.

EPO-0289

Evaluated Type 2 Diabetes Mellitus is Associated with Sudden Sensorineural Hearing Loss: Novel Findings from Labyrinthine MRI Study

Xiaoqian Ge,Lixin Sun,Jinye Li,Na Hu,Ruozhen Gong
Department of Radiology, Shandong ENT Hospital, Shandong University

Background and Purpose---The association between type 2 diabetes mellitus (T2DM) and sudden sensorineural hearing loss (SSNHL) has been extensively reported. However, the pathophysiology of T2DM related SSNHL is still speculative. Recent studies have proposed that modern MRI can identify the presence of abnormalities on labyrinthine. In this study, we aimed to explore this association between T2DM and SSNHL by using labyrinthine MRI.

Materials and Methods---From August 2018 to December 2018, 162 patients with SSNHL were consecutively recruited and underwent 3.0T MRI, including pre/post- contrast 3D fluid-attenuated inversion recovery (FLAIR) and T1-weighted imaging (T1WI). Signal intensities of the medulla and perilymph of the cochlear basal turns of the affected ear in each patient were measured in a blinded fashion, and cochlea/medulla ratios were calculated. Clinical and demographic characteristics and incidence of abnormal MRI findings were compared between patients with T2DM and without T2DM.

Results---A total of 150 participants (mean age 45.96 ± 15.38 years, 88 male) were available for analysis. Forty-six (30.7%) patients showed abnormal findings on labyrinthine MR imaging in the affected ear, and thirty (20.0%) had history of T2DM. The incidence of abnormalities on pre-contrast FLAIR or T1WI images was not significantly different between T2DM and None-T2DM group (10 [33.3%] vs. 36 [30.0%], p=0.436). T2DM group showed higher cochlea/medulla ratios on pre-contrast FLAIR images in affected ear than None-T2DM group (0.41 ± 0.31 vs. 0.26 ± 0.53, p=0.038). Moreover, in the T2DM group, eight (26.7%) patients showed abnormalities on post-contrast FLAIR or T1WI images, which was higher than that in None-T2DM group (8 [6.7%], p=0.002).

Conclusions--- Increased cochlea/medulla ratio indicates the presence of intracellular and extracellular methemoglobin or increased protein content in the membranous fluid. Abnormalities on post-contrast FLAIR or T1WI images indicate increased blood-labyrinth barrier permeability. In this study, SSNHL patients with T2DM showed higher cochlea/medulla ratios and higher incidence of abnormalities on post-contrast FLAIR or T1WI images, which may provide a pathophysiologic biomarker for the association between T2DM and SSNHL.

EPO-0290

MR Imaging Study on the Correlation Between Lipid Metabolism and Disturbed Microcirculation in Patients with Sudden Sensorineural Hearing Loss

Xiaoqian Ge,Lixin Sun,Jinye Li,Na Hu,Ruozhen Gong
Department of Radiology, Shandong ENT Hospital, Shandong University

Background and Purpose---Previous studies have reported that microcirculation is one of the key causes leading to sudden deafness, which could be detected by labyrinthine 3D fluid-attenuated inversion recovery (FLAIR). Furthermore, dyslipidemia may contribute to the disturbance of microcirculation. The purpose of this study was to investigate the correlation between disturbed microcirculation and dyslipidemia by using labyrinthine MR imaging.

Materials and Methods---From August 2018 to December 2018, this study consecutively recruited 162 patients who were diagnosed with unilateral sudden sensorineural hearing loss (SSNHL) and underwent labyrinthine FLAIR on 3.0T MR scanner. One hundred and fifty participants (mean age 45.96 ± 15.38 years, 88 male) were available for analysis. Signal intensities of the medulla and perilymph of the cochlear basal turns of the affected ear in each patient were measured in a blinded fashion, and cochlea/medulla ratios were calculated. We analyzed abnormalities on labyrinthine FLAIR and correlated them with serum lipid parameters.

Results--- Forty-six (30.7%) patients showed abnormal findings on labyrinthine FLAIR in the affected ear, and twenty-five (16.7%) had history of hyperlipioemia. In hyperlipioemia group, eight participants (32.0%) showed increased signal intensity on labyrinthine FLAIR, which was not significantly different to None-hyperlipioemia group (38 [30.4%], p=0.275). Hyperlipioemia group showed increased cochlea/medulla ratios on labyrinthine FLAIR images in affected ear than None-hyperlipioemia group (0.28 ± 0.36 vs. 0.15 ± 0.24, p=0.021). In patients with abnormal labyrinthine FLAIR, significant positive correlation between cochlea/medulla ratios and total cholesterol (TC) was found (r=0.254, P=0.041).

Conclusions--- According to our findings, it is suggested that lipid metabolism significantly correlated with disturbed microcirculation in patients with SSNHL. Increased cochlea/medulla ratio in hyperlipioemia group may indicate that increased serum lipid parameters could contribute to the presence of intracellular and extracellular methemoglobin or increased protein content in the membranous fluid.

EPO-0291
经静脉内耳钆造影 MRI 对可疑梅尼埃病诊断价值的研究

于学文,孙立新,胡娜,李进叶,田静,赵慧,巩若箴
山东大学附属山东省耳鼻喉医院（山东省立医院西院）

目的　探讨经静脉内耳钆造影 MRI 在可疑梅尼埃病（Ménière’s disease）中的诊断价值。资料与方法　回顾分析 130 名梅尼埃病可疑患者资料，以 2017 年梅尼埃病诊断和治疗指南作为诊断标准，评价经静脉内耳钆造影 MRI 检查在梅尼埃病中的诊断价值。结果　其中诊断为梅尼埃病 80 名患者，21 名患者诊断为突聋，21 名患者为前庭性偏头痛，9 名患者诊断为迟发型迷路积水等其他疾。内耳钆造影诊断梅尼埃病的灵敏度、特异度、阳性预测值和阴性预测值分别为 88.3%、77.4%、85.0%、82.0%；经静脉内耳钆造影 ROC 曲线下面积及 95%可信区间为 83.5%（76.4%-89.7%）；经静脉内耳钆造影诊断结果进行一致性分析诊断结果与临床诊断结果的一致性较好（κ=0.66）。结论　经静脉内耳钆造影可以作为一种无创性诊断梅尼埃病的可靠检查方法。

EPO-0292
颞骨巨细胞修复性肉芽肿特征性影像学表现

胡娜,孙立新,田静,赵慧,李进叶,刘善凤,巩若箴
山东大学附属山东省耳鼻喉医院

目的 回顾性分析 10 例颞骨巨细胞修复性肉芽肿（giant cell reparative granuloma, GCRG）CT 和 MRI 表现，总结其具有特征性的影像学特点。
方法 收集于本单位行影像学检查并经病理证实的颞骨 GCRG 患者 10 例，8 例患者均行 CT 平扫、MRI 平扫及动态增强检查，2 例患者仅行 CT 平扫，由两名经验丰富的影像医师分别分析病变的密度、骨质改变、信号特点及时间信号强度曲线。
结果：颞骨 GCRG 发生在左侧 6 例，右侧 4 例。女性 3 例，男性 7 例。年龄 29-50 岁，平均年龄 39 岁。10 例均累及鳞部，其中 6 例局限在鳞部，3 例发生在鳞部、乳突部，1 例发生在鳞部、乳突部及鼓部。CT 表现为膨胀性骨质破坏 10 例，病变周围宽带状增生硬化 9 例，增生硬化以近蝶鳞缝骨质、颧突为著，其中 2 例累及同侧蝶骨大翼。病变密度不均匀，内见低密度囊变区 7 例；病变密度均匀 3 例。MRI 表现为 T2WI、T1WI、DWI 序列以低信号为主的混杂信号 7 例；表现为 T2WI 以高信号为主、边缘条状低信号，DWI 等信号，T1WI 低信号 1 例。动态增强 MRI 时间信号强度曲线表现为速生速降型 5 例，速生缓降型 3 例。合并中耳乳突炎 10 例，周围软组织炎性反应 8 例，脑膜强化 8 例。
结论：颞骨 GCRG 好发于鳞部，病变向后、向下生长侵犯乳突部、鼓部。CT 表现为膨胀性骨质破坏，邻近骨质宽带状增生硬化，以近蝶鳞缝骨质、颧突为著，MRI 表现为 T2WI、T1WI、DWI 序列以低信号为主的混杂信号，时间信号强度曲线呈速升速降型、速升缓降型为该病的特征性影像学表现。

EPO-0293
颞骨低剂量扫描自动调节管电压技术在成人患者中应用

霍明昊,陈钰,朱元利,王沄,金征宇
中国医学科学院北京协和医院

目的：评估第 3 代双源 CT 自动调节管电压技术(CARE kV)与常规扫描方案在成人患者中行颞骨薄层扫描辐射剂量与图像质量的影响。
步骤与方法：收集 2018 年 7 月 1 日至 2018 年 7 月 31 日在北京协和医院就诊，临床需要行颞骨 CT 检查的成人患者，采用随机表格法分为 2 组：A 组（n=25）采用第 3 代双源 CT 自动管电压选择技术（CARE KV）及 ADMIRE 迭代重建；B 组（n=25）采用第 3 代双源 CT 常规颞骨扫描方案(120kv/200mAs)及 FBP 重建。扫描范围为眉弓至乳突下缘。测量目标结构（颞骨皮质、耳前皮下脂肪、脑干）CT 值及图像噪声，计算信噪比（SNR），记录机器自动测量的辐射剂量,由两位放射科医师采用 5 分制评分对 10 个解剖结构的图像质量进行评估。
结果：两组患者性别、年龄、身高、体重及 BMI 均没有统计学差异（P 均>0.05）。两组患者各解剖结构间的 CT 值、图像噪声及 SNR 均无统计学差异（*P*均>0.05）。两组患者 10 个解剖结构间的主观评分(*P*=0.138)差异均无统计学意义（*P*均>0.05）。A 组的 CT 容积剂量指数为（15.16±1.54）mGy，较 B 组的（32.46±1.79）mGy 下降了 53%（t=-40.140p<0.05）。A 组的平均剂量长度乘积和平均有效剂量分别为（114.48±12.43）mGy·cm 和（0.24±0.03）mSv，明显低于 B 组的（243.72±19.02）mGy·cm 和（0.51±0.04）mSv （t=-31.153，p<0.05），下降达 53%。

结论：与常规扫描方案相比，第 3 代双源 CT CARE kV 技术行颞骨扫描可在保证图像质量的前提下，明显降低辐射剂量。

EPO-0294
面神经管多层螺旋 CT 及后处理技术与手术结果对照研究

熊华
中国科学院大学重庆医院（重庆市人民医院）

目的:探讨面神经管多层螺旋 CT 成像并结合各种后处理技术对面神经管在中耳手术中的评估应用。**材料与方法:**收集本院 2015 年 1 月至 2018 年 12 月期间,经手术、病理证实的慢性化脓性中耳炎 60 例,合并中耳胆脂瘤 66 例。所有病例术前均行颞骨 CT 平扫。将患者的原始图像数据传入 CT 三维重建工作站,使用重建软件的多平面重组(MPR)技术及曲面重建（CPR）技术分别沿面神经管进行图像后处理，将 CT 平扫及重建后的图像与术中情况对比。**结果:**1、在面神经管常规轴位及双斜位图像上能清楚显示并区分出膝状神经节、鼓室段、后膝部和乳突段,在双斜位上面神经管表现“(?)”形,但是不能完整显示出颞骨全段，而 CPR 能很好显示面神经管颞骨段全部结构。2、60 例慢性化脓性中耳炎患者中颞骨 CT 轴位组与术中对照的符合率约 92.0%。MPR 重建组与术中对照的符合率约 95.6%。两组之间的差异无统计学意义(P>0.05)。CPR 重建与术中对照符合率约为 96.2%，两组之间差异无统计学意义（P>0.05）。3、66 例中耳胆脂瘤患者中颞骨 CT 轴位组与术中对照的符合率约 79.7%。MPR 重建组与术中对照的符合率约 96.97%。两组之间存在显著性差异(P<0.05)。CPR 重建与术中对照符合率约 88.3%，两组间有统计学差异（P<0.05） **结论:**面神经管 CT 检查通过 MPR 和 CPR 重建能更好提供面神经的形态及走行,对病变程度的判定、病情的评估、术前交待及术中操作具有指导意义。

EPO-0295
静脉性搏动性耳鸣患者影像学评估及发病机制分析

张戈
河南省人民医院

目的：分析静脉源性搏动性耳鸣患者影像学检查异常表现，探讨静脉性搏动性耳鸣的发病机制。
方法：回顾性分析 2015 年 12 月-2018 年 12 月 71 例静脉源性搏动性耳鸣患者的高分辨率 CT 影像学表现，从 CT 图像上观察是否伴有颈静脉球、乙状窦、乳突导静脉等颈内静脉解剖异常。
结果：71 例患者中，69 例为女性，2 例为男性，其中颈静脉球异常 49 例，包括高位 39 例，颈静脉球乙状板缺损 2 例；乙状窦异常 61 例，包括乙状窦前置 16 例，乙状窦沟骨壁缺损 53 例，乙状窦憩室 28 例；乳突导静脉显影增大 18 例。只出现一种颈内静脉解剖异常 4 例，两种异常 58 例，三种 9 例。
结论：本研究总结性地展示了静脉源性搏动性耳鸣的常见颈内静脉结构异常，颈内静脉结构的异常产生了搏动性耳鸣的声源并提供了耳鸣传导的路径，通过分析静脉源性搏动性耳鸣的异常及病因可以为进一步探讨搏动性耳鸣的发病机制提供了新的思路。

EPO-0296

4D-flow MRI evaluates the blood flow velocity in transverse sinus of venous pulsatile tinnitus after therapy

Xiaoyu Qiu,Pengfei Zhao,Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Purpose: To use 4D-flow MRI to characterize the differences of blood flow velocity of transverse sinus between the good efficacy group and poor efficacy group in venous pulsatile tinnitus (VPT) patients after therapy and to investigate their differences vs healthy controls.
Materials and Methods: A total of 20 patients with VPT and 10 healthy controls were included in the retrospective study. 20 patients were divided into good efficacy group (10/20) and poor efficacy group (10/20) according to whether the VPT recurred after half a year. All participants underwent 4D-flow scan in a 3.0T MR scanner. All quantification and analysis of 4D-flow data were performed using dedicated GT-flow software. Variance analysis was used to compare the blood flow velocity of transverse sinus between good and poor efficacy group after therapy and to investigate the differences vs normal control group.
Results: There were differences about blood flow velocity between patient group and healthy controls, and the blood flow velocity of good efficacy group verged on control group. The blood flow velocity of good efficacy group was slightly higher than control group ($P<0.05$). Apparently, the blood flow velocity of poor efficacy group was higher than control group ($P<0.05$). Compared with the poor efficacy group, the good efficacy group showed lower blood flow velocity ($P>0.05$).
Conclusions: Significant differences about blood flow velocity were found between patient group after therapy and healthy controls with 4D-flow MRI, but the differences between good and poor efficacy group were not preonunced. Blood flow velocity in transverse sinus could serve as biomarkers for diagnosis of VPT and evaluation of curative effect.

EPO-0297
多层螺旋 CT 成像对鼓室壁及听小骨骨质破坏评估价值

熊华
中国科学院大学重庆医院（重庆市人民医院）

目的 探究 128 层螺旋 CT 颞骨薄层扫描并结合后处理技术对于鼓室成形术前鼓室壁及听小骨骨质破坏评估的临床价值。**方法** 选取 2016 年 6 月至 2019 年 6 月间收治行乳突病变切除联合鼓室成形术治疗的 80 例中耳乳突炎患者，其中 50 例术前诊断合并胆脂瘤形成,患者术前均进行颞骨轴位高分辨率 CT(HRCT)扫描,利用多平面重建、曲面重建技术及 VR 技术进行图像后处理,将术前检查结果与术后病理诊断进行对比,评价诊断准确率。**结果** 颞骨薄层扫描对患者中耳骨质破坏的判断情况中,乙状窦骨壁破坏诊断符合率 100.0%,鼓室盾板 98.3%,外耳道后壁 95.8%,半规管 97.0%,鼓室鼓窦天盖 96.9%,面神经管 82.3%。而对于患者的听骨链显示中,砧骨短脚破坏诊断符合率 88.5%,砧骨长脚 98.6%,锤砧关节 100.0%,锤骨头 96.1%,砧骨体 95.0%,锤骨柄 100.0%,镫骨支 100.0%，镫骨底板 52%,砧镫关节 95.6%。**结论** 应用多层螺旋 CT 的颞骨 HRCT 结合多种图像后处理技术,除了对镫骨

底板显示欠佳外能对中耳骨质的破坏情况以及听骨链的结构与连接状况、病变程度与范围等进行准确显示。

EPO-0298

The assessment of imaging characteristics and invasion pathways of malignant external otitis by HRCT and MRI

Xiaoshuai Li,Pengfei Zhao,Zhenchang Wang
Beijing Friendship Hospital , Capital Medical University

Objective To analyze the imaging characteristics and invasion pathways of MEO by high resolution computed tomography (HRCT) and magnetic resonance imaging (MRI).
Methods HRCT (13/13) and MRI (9/13) data in 13 patients were retrospectively analyzed. We evaluated the sign of bone erosion, soft tissue abnormity, temporal bone pneumatization and invasion pathways.
Results: 13 patients (100%) present diffuse soft tissue in EAC and middle ear cavity; 9 patients (69.2%) had bone erosion of EAC;13 patients (100%) had bone erosion of middle ear cavity, and 7 patients (53.8%) presented with bone destruction of PF in middle ear. Poorly temporal bone pneumatization was found in 61.5% at the affected side and the degree of temporal bone pneumatization was significantly lower than that of the unaffected side (P=0.01). MEO invaded forward temporomandibular joint (TMJ) (100%)through petrotympanic fissure(PF)(55.6%), bony EAC(11.1%) and cartilage of EAC(33.3%); It invaded inward middle ear cavity(100%), parapharyngeal space(77.7%) mainly through PF(71.4%), nasopharynx (44.4%) and contralateral tissues (11.1%); It directly invaded downward styloid process (30.7%) and skull base bone (55.6%); It invaded upward endocranium (77.8%) and cavernous sinus (11.1%) through foramen ovale(57.1%) and tegmen tympani(71.4%). Besides, MEO directly invaded backward posterior wall of EAC (53.8%), posterior mastoid bone (30.8%), mastoid segment of the facial nerve canal (15.4%) and mastoid air chamber (100%).
Conclusions: MEO shows some characteristics on HRCT and MRI. PF is an important pathway for MEO to invade TMJ and parapharyngeal space.

Application value of TSE-DWI sequence and EPI-DWI sequence in the diagnosis of cholesteatoma

Xiaoxue Fan,Zhaoyu Liu
Shengjing Hospital of China Medical University

OBJECTIVE:To study the application value of TSE-DWI and EPI-DWI in the evaluation of cholesteatoma.METHODS:41 patients with primary cholesteatoma were prospectively enrolled in the study. All patients underwent Philips Ingenia 3.0T superconducting magnetic resonance scanner and 32-channel head coil.The TSE-DWI and EPI-DWI were completed before surgery. The b value was 1000s/mm^2.In the middle ear region, TSE-DWI

and EPI-DWI images were found to be diagnosed as cholesteatoma with high signal lesions compared with gray matter, and surgical treatment was performed within the next two weeks to pathology. The pathological results were gold standard. The accuracy, sensitivity, specificity, positive predictive value and negative predictive value of TSE-DWI and EPI-DWI in the diagnosis of primary cholesteatoma were calculated.RESULTS:Of the 41 patients with suspected cholesteatoma, 10 were diagnosed as non-cholesteatoma and 31 were cholesteatoma.The average long diameter of cholesteatoma was 9.9±7.0 mm (range 3.0-40.0 mm). TSE-DWI scan was performed,29 cases were diagnosed as cholesteatoma,12 cases were non-cholesteatoma, and the accuracy,sensitivity,specificity,positive predictive value and negative predictive value of TSW-DWI sequence for diagnosis of cholesteatoma were 90.24%, 90.30%, 90.00%,96.60%,75.00%.EPI-DWI scan,30 cases of cholesteatoma,11 cases of non-cholesteatoma,EPI-DWI sequence diagnosis of cholesteatoma accuracy,sensitivity,specificity,positive predictive value and negative predictive value were 73.17%,80.65%,50.00%,83.33%,45.45%.Conclusion:The TSE-DWI image has higher signal-to-noise ratio than the EPI image. The TSE-DWI sequence improves the diagnostic accuracy and reduces the rate of misdiagnosis. It has superiority in the study of cholesteatoma and has high application in clinical diagnosis and treatment value.

The auditory network and default mode network in rats post broad-band intense noise exposure

Xiao-Min Xu[1],Gao-Jun Teng[1,2,3]
1.Jiangsu Key Laboratory of Molecular Imaging and Functional Imaging
2.Medical School of Southeast University
3.Department of Radiology, Zhongda Hospital

PURPOSE

Noise-induced hearing loss (NIHL) is associated with cognitive impairments and considered to be an independent risk factor that triggers incident dementia [1][2][3][4]. However, where and how NIHL affects the central nervous system and cognitive behaviors are not well understood. We aimed to investigate the alterations in cognition and functional connectivity post noise, finding the progress and neural substrates of NIHL-induced cognitive impairments.

METHODS

We exposed rats to 122 dB broad-band noise for 2 hours to induce hearing loss and the auditory function was assessed by measuring auditory brainstem response thresholds. Morris water maze test was computed at 0 day, 1, 3, 6 months post noise to reveal cognitive ability. The interregional connections in the auditory network and default mode network, as well as the connections using the auditory cortex and cingulate cortex as seeds were also examined at four time points. Behavioral data was compared by two sample t test with a significant p value at < 0.05. Interregional connectivity and seed-based functional connectivity were used two sample t test with $p < 0.01$ and $p < 0.005$, respectively.

RESULTS

The deficit in spatial learning/memory was only observed at 6 months after noise exposure. NIHL rats didn't exhibit any statistically significant deficits in spatial memory performance of training days, but in the spatial probe period, NIHL rats swam less distance in the target quadrant, while the number of crossing platform was reduced in NIHL group comparing to the control group. The internal connections in the auditory network and default mode network were enhanced at 0 day and decreased at 6 months post noise. The connectivity using the auditory cortex and cingulate cortex as seeds generally followed the rule of "enhancement-normal-decrease-widely decrease", involving auditory regions and non-auditory areas (such as limbic area, arousal area and cerebellum).

CONCLUSION

Functional alterations in brain areas are prior to behavioral changes and NIHL led to deficits in the auditory-limbic-arousal-cerebellum network.

EPO-0301

Diagnostic value of Intravenous Gadolinium Inner Ear MRI in Suspected Meniere's disease

Xuewen Yu,Lixin Sun,Na Hu,Jinye Li,Jing Tian,Hui Zhao,Jinyan Li,Tong Li,Ruozhen Gong
Shandong Provincial Western Hospital

Purpose to evaluate the diagnostic value of intravenous gadolinium inner ear MRI in suspected Ménières disease. **Materials and methods** We retrospectively analyzed the data of 97 suspected patients with Meniere's disease. The diagnostic criteria were based on the 2017 guidelines for the diagnosis and treatment of Meniere's disease. We evaluated the diagnostic value of inner ear MRI in Meniere's disease. **Results** Of the 130 suspected patients, 21 patients were diagnosed with sudden deafness, 21 patients with vestibular migraine, 9 patients with delayed hydrolabyrinth and other diseases. The sensitivity, specificity, positive predictive value and negative predictive value of intravenous gadolinium inner ear mri in the diagnosis of Meniere's disease were 88.3%, 77.4%, 85.0% and 82.0%, respectively. The area under the ROC curve and 95% confidence interval of intravenous internal ear gadolinium angiography were 83.5% (76.4%-89.7%), and the area and 95% confidence interval of intravenous internal ear gadolinium angiography were 83.5% (76.4%-89.7%). The diagnostic results of angiography were consistent with those of clinical diagnosis(κ=0.66). **Conclusion** Intravenous gadolinium inner ear MRI can be used as a reliable method for noninvasive diagnosis of Meniere's disease.

EPO-0302

中耳乳突区广泛骨质破坏性病变的 CT 和 MRI 诊断

李必强,黄显龙,熊华,余加懿,向世凤,廖蕤堃
中国科学院大学重庆医院(重庆市人民医院)

目的：探讨中耳乳突区广泛骨质破坏性病变的 CT 和 MRI 特征。

方法：对 12 例经临床病理证实的中耳乳突区广泛骨质破坏病例 CT 和 MRI 特征进行分析总结。
结果：中耳癌 6 例，鳞状上皮癌 5 例，腺样囊性癌 1 例；骨纤维异常增殖症、骨巨细胞瘤、颈静脉球瘤、中耳胆脂瘤伴炎性肉芽组织、朗格汉斯组织细胞增多症、化脓性中耳炎及其并发症各 1 例。6 例中耳癌均可见软组织团块影，骨质溶骨性破坏并致鼓室盖或/和乙状窦前壁部分骨质缺失，5 例骨质破坏边缘毛糙、模糊，仅 1 例边缘较清楚；4 例破坏骨质类“碎米粒”或/和磨玻璃样变；4 例行 MRI 增强扫描见明显强化软组织肿块突入颅内并沿颅内板下侵延生长，相应部位脑膜明显不规则增厚、强化，1 例还可见乙状窦癌栓；2 例行 DWI 扫描，病灶弥散受限。1 例骨纤维异常增殖症为颅面多骨膨大变形，骨硬化、磨玻璃及不规则低密度区内钙化骨化影多种表现并存，乳突区病灶呈等 T1、长 T2 信号，明显强化；该病例恶变为骨肉瘤，在上颌窦区形成巨大软组织肿块。5 例良性病灶除化脓性中耳炎及其并发症骨质破坏边缘稍显毛糙、模糊外，余骨质膨胀性、溶骨性或穿凿样破坏表现不一，但边缘均较清楚、规整，骨巨细胞瘤边缘可见残留骨，中耳胆脂瘤边缘有硬化边。中耳胆脂瘤病例仅行 CT 和 MRI 平扫，其余病例增强扫描病灶多为明显不均匀强化。颈静脉球瘤 MRI 可见“盐和胡椒”征。化脓性中耳炎广泛累及耳周、颞下窝及咽旁，相应受累部位见多个环形强化脓肿影形成。本组各良性病灶，虽多有鼓室盖或/和乙状窦前壁骨质不连续并颅内受累，但仅见相应部位强化脑膜轻中度增厚、相对规整、自然，无结节状突起及沿颅内板下侵延生长肿块表现；颈静脉球瘤 DWI 弥散受限。
结论：中耳乳突区广泛骨质破坏性病变，CT+MRI 可根据其骨质破坏、软组织肿块及强化特点、颅内侵犯及脑膜改变、以及弥散等差异，能较准确地对其进行诊断鉴别和评估病变的侵犯范围，为临床治疗提供依据和帮助。

经鼓室注射钆动态增强 3D-FLAIR 技术对梅尼埃病的临床诊断价值

陆靖
上海交通大学附属第六人民医院

目的采用经鼓膜穿刺鼓室内导入造影剂 Gd-DTPA 动态增强三维快速液体衰减反转恢复磁共振扫描(3D－FLAIR)技术，评价其对梅尼埃病的有效性及临床诊断价值。**方法** 5 例正常志愿者，11 例经临床确诊的梅尼埃病患者，采用经鼓膜穿刺中耳腔给药的方法，在耳内窥镜监视下注入稀释的钆喷酸，给药 4 小时，12 小时，24 小时后在 3.0T 磁共振机器进行动态增强三维快速液体衰减反转恢复磁共振扫描(3D 一 FLAIR)。由 2 名熟悉内耳的放射科医生对 16 例样本耳蜗、前庭、半规管进行测量 SIR 值，并对内耳及同层脑干的信号强度比分别进行测量和计算，进行统计学分析。分别测量 5 例正常志愿者及 11 梅尼埃患者内淋巴间隙面积/前庭内外淋巴总面积比值，统计结果并进行统计学分析。**结果** 16 例受试者动态增强扫描检查均可显示内耳的耳蜗、前庭、半规管。动态增强 4 小时扫描大部分耳蜗、小部分前庭可显影，12 小时耳蜗、前庭、半规管均可显影，24 小时扫描耳蜗信号强度较淡，前庭部分显影可，半规管显影较好。梅尼埃病患者内淋巴间隙面积/前庭内外淋巴总面积大于 1/3,而正常对照组小于 1/3，两者比较有统计学意义。**结论**经鼓膜穿刺鼓室内导入造影剂礼，内耳 3D－ FLAIR MRI 动态增强扫描检查，可以多期相动态观察耳蜗、前庭、半规管外淋巴对造影剂的摄取情况，从而明确内淋巴积水的情况，为梅尼埃病提供重要的临床诊断价值。

EPO-0304
颞下颌关节紊乱病患者髁突位置和形态的 MRI 观察

陈志晔,樊文萍,刘梦琦

中国人民解放军总医院海南医院

目的 通过 MRI 评估颞下颌关节紊乱病患者髁突位置及形态的变化，为临床提供参考。**方法** 对 137 例临床诊断为颞下颌关节紊乱病的患者[年龄（37.5±16.1）岁，男性 39 例，女性 98 例]进行颞下颌关节 MRI 扫描，根据关节盘移位情况分为关节盘正常组（disc without displacement，DWoD）（185 侧关节），可复性关节盘前移位组（anterior disc displacement with reduction，DDWR）（17 侧关节）及不可复性关节盘前移位组（disc displacement without reduction，DDWoR）（72 侧关节），在矢状位 PDWI 上观察颞下颌关节髁突位置（前位、中立位及后位）和形态（卵圆形、扁平形及鸟嘴形），并在横轴位 T2WI 图像上测量髁突长轴、短轴及髁间角。**结果** DWoD 组、DDWR 组和 DDWoR 组髁突位置差异无统计学意义（χ^2=7.435，*P*=0.115）。DWoD 组扁平形髁突发生率[83.9%（115/137）]显著高于 DDWoR 组[50.7%（22/137）]（*P*＜0.05），DWoD 组鸟嘴形髁突发生率[16.1%（22/137）]显著低于 DDWoR 组[49.3%（34/67）]（*P*＜0.05）。DWoD 组髁突长轴[（17.2±2.4） mm]显著大于 DDWR 组[（15.4±2.0） mm]和 DDWoR 组[（14.7±2.7） mm]（*P*＜0.05）。DWoD 组髁突短轴[（7.3±1.2） mm]显著大于 DDWR 组[（6.5±1.3） mm]和 DDWoR 组[（6.1±1.4） mm]（*P*＜0.05）。正常组、单侧移位组髁间角（分别为 136°±13°和 132°±14°）均显著大于双侧移位组（124°±17°）（*P*＜0.05）。**结论** 颞下颌关节紊乱病人群中颞下颌关节盘移位患者可见髁突形态显著改变。

EPO-0305

Otoscopy and radiography features of spontaneous temporomandibular joint herniation into the external auditory canal

Junhua Liu,Wen-hu Huang,Jiang-hong Xu,Yin Liu,Yan Sha
Eye and ENT， Hospital of Fudan University， Shanghai 20031， China

Objectives: *To explore the otoscopy, CT and MRI features of spontaneous temporomandibular joint* (TMJ) herniation(STMJH) into the external auditory canal (EAC) through the persistent foramen of Huschke (PFH).
Materials and Methods: *there were 15 cases with STMJH confirmed by surgery or dynamic otoscopy. The otoscopic, CT and MRI data of these cases were reviewed.*
Results: *① Otoscopy revealed a mass located in the anterior wall of the bony EAC that moved forwards and backwards during mouth opening and closing, respectively. ② CT of the temporal bone showed a bony defect and with a soft mass in the anterior wall of the EAC; the bony defect margin was well defined in all cases. The bone adjacent to the PFH was pressed and partially wrapped around the soft mass, as if "holding a ball", in 7 cases. A partial, peripheral, pseudo bone shell around the soft mass was observed in 8 cases. The soft mass appeared to be attenuated with the soft tissue of the TMJ, with no enhancement.* ③ Six cases included MRI scans, which showed TMJ soft tissue herniated into the EAC.
Conclusion: *The otoscopy, CT and MRI features of STMJH are unique. The diagnosis can be confirmed by dynamic otoscopy or contrast-enhanced MRI. Conventional CT was necessary to detect the bone of the EAC. MRI can be chosen when the herniation is complicated by infection or otitis externa or when the patient has TMJ dysfunction.*

EPO-0306

CT, conventional, and functional MRI features of endolymphatic sac tumor: a series of nineteen cases in a single institution

Ting Yuan,Yan Sha
Eye & ENT hospital of Fudan University

Objective: With the hypothesis that the combination of CT, conventional, and functional MRI can indicate a possible diagnosis of endolymphatic sac tumor(ELST), this study aimed to systematically explore CT, conventional, and functional MRI features of this rare entity.
Materials and methods: This retrospective study included nineteen patients with pathologically confirmed ELST. CT and conventional MRI findings, including the location, size, CT value, attenuation/signal intensity, calcification, enhancement, signal voids of vessel, adjacent structures invasion, and brain parenchyma edema, were reviewed. We also reviewed multi-parametric functional MR imaging features obtained from diffusion-weighted imaging (DWI, n = 12) and dynamic contrast-enhanced MRI (DCE, n = 2).
Results: The nineteen patients in this series consisted of six males and thirteen females. 11 to 65 years was the age range of the patients, with a mean age of 38.1 years. All ELSTs showed multiloculated, highly-vascularized soft-tissue masses located in mesal or trailing edge of petrosal bone with alveolate osteolytic destruction of adjacent sclerotin. The average CT value of the Mass parenchyma is between 60IU and 110IU. Some high density shade like ‘slender needles’ could be found in the interior of masses , with anomaly thin calcified shade in back of smaller masses. In MRI images, the masses showed a mixed signal in both T1WI and T2WI, with flaky short T1 and long T2 high signal in the margins, and long T1 and short T2 low signal voids of vessels and bleeding or sclerotin or calcification in the solid parts of tumor. The tumors demonstrated low signal on DWI with high ADC values (about 1100 to 1600) comparing to Brain parenchyma, . The dynamic enhanced curve is of fast rising and slow falling type.
Conclusions: Multi-parametric functional MRI combined with high resolution CT may be a promising tool for the diagnosis ELSTs.

EPO-0307

Differential diagnosis of malignant nodules from benign nodules in thyroid gland

Zhou Liu
Cancer Hospital Chinese Academy of Medical Sciences, Shenzhen Hospital

A brief summarization of key points in distinguishing benign and malignant nodules in thyroid gland will be given. I will mainly focus on typical imaging findings of malignant and benign nodules on MRI. Morphological features and intensity

characteristics of malignant nodules and benign nodules using conventional structural MRI, including T1WI, T2WI, T2WI FLAIR, contrast enhanced MRI will be discussed.Then, the added value of some parameters such as ADC from DWI, TIC curve type from dynamic contrast enhanced MRI will be talked about also. Since the talk will be about only 8 minutes, maybe it is impossible to talk about every detail in such a short time. So in the end, the content will be adjusted accordingly.

EPO-0308

Multiphase Contrast-Enhanced CT Imaging Features of Salivary Duct Carcinoma

Wenli Wu[1],Cheng long Wang[2],Dan Li[3],Sheng sheng Xu[1]
1.The First Affiliated Hospital of Chongqing Medical University, Chongqing
2.Department of Pathology, Chongqing Traditional Chinese Medicine Hospital, Chongqing, China.
3.Department of Pathology, College of Basic Medicine, Chongqing Medical University, Chongqing, China

Objective: To investigate the CT imaging features of salivary duct carcinoma (SDC) with multiphase contrast-enhanced CT (CECT) scanning and to compare them to mucoepidermoid carcinoma (MEC), adenoid cystic carcinoma (ACC), and acinic cell carcinoma (AcCC).
Study design: A total of 63 patients with histologically diagnosed salivary gland malignancies underwent preoperative multiphase CECT. Clinical information, location, size, mass pattern, enhancement pattern, borders, invasion of adjacent tissues, and lymph node metastasis were evaluated. CT number attenuation patterns were calculated.
Results: SDCs were significantly more common in males and in the parotid gland ($p \leq 0.018$). They were more likely to invade into adjacent tissues and metastasize to lymph nodes ($p \leq 0.032$). Six SDCs (66.7%) had comedonecrosis as detected on histopathological examination, and 3 lesions presented cribriform necrosis on CECT. CT numbers during delayed-phase scanning were significantly higher in SDC than ACC ($p=0.031$). Significant differences were discovered between MEC and ACC for CT numbers during arterial-phase scanning ($p=0.047$) and in the ratio of CT numbers ($p=0.018$).
Conclusion: SDC exhibits some specific CT features, and multiphase CECT imaging is useful in the differential diagnosis of salivary gland malignancies.

EPO-0309

Machine Learning-Based Multiparametric MRI Radiomics for Predicting the Aggressiveness of Papillary Thyroid Carcinoma

Hao Wang,Bin Song
Minhang Hospital, Fudan University

Purpose: *To investigate the predictive capability of machine learning-based multiparametric magnetic resonance (MR) imaging radiomics for evaluating the aggressiveness of papillary thyroid carcinoma (PTC) preoperatively.*
Methods: *This prospective study enrolled 191 consecutive patients who underwent neck MR scans and subsequent thyroidectomy during the study interval. The diagnosis and aggressiveness of PTC were determined by pathological evaluation of thyroidectomy specimens. Thyroid nodules were segmented manually on the MR images, and radiomics features were then extracted. Predictive machine learning modelling was used to evaluate the prediction of PTC aggressiveness. Area under the receiver operating characteristic curve (AUC) values for the model performance were obtained for radiomics features, clinical characteristics, and combinations of radiomics features and clinical characteristics.*
Results: *The study cohort included 120 patients with pathology-confirmed PTC (training cohort: n = 96; testing cohort: n = 24). A total of 1393 radiomics features were extracted from T2-weighted, apparent diffusion coefficient (ADC)* and contrast-enhanced T1-weighted MR images for each patient. The combination of Least Absolute Shrinkage and Selection Operator for radiomics feature selection and Gradient Boosting Classifier for classifying PTC aggressiveness yielded the highest AUC values of 1.0 in the training cohort and 0.92 in the testing cohort. In contrast, clinical characteristics alone poorly predicted PTC aggressiveness, with an AUC of 0.56.
Conclusions: *Our study showed that machine learning-based multiparametric MR imaging radiomics could accurately distinguish aggressive from non-aggressive PTC preoperatively. This approach may be helpful for informing treatment strategies for PTC and the prognosis of PTC patients.*

CT 影像组学在直径小于或等于 2cm 甲状腺结节中的诊断价值

胡小丽[1],顾潜彪[2],李平[1],张堃[1]
1.湖南中医药大学第一附属医院
2.湖南省人民医院

目的：探讨 CT 影像组学对最大直径小于或等于 2cm 的甲状腺结节的良恶性鉴别能力。
方法：搜集了 97 例经手术病理证实的直径小于或等于 2cm 的甲状腺结节患者，按 7:3 的比例随机分为训练组及验证组。所有患者术前 2 周内行常规甲状腺 CT 扫描。在 3D-slicer 软件中手动勾画出甲状腺结节 CT 的 2D 感兴趣区（ROI），提取感兴趣区内的影像组学特征。在训练组对影像组学特征进行降维并最终建立起区分甲状腺结节良恶性的影像组学鉴别模型，在验证组对模型进行验证，采用受试者操作特性曲线（ROC）对模型的诊断效能进行评估。
结果：共提取影像组学特征 848 个，经特征筛选，基于 8 个影像组学特征建立的影像组学模型在训练组区分直径小于或等于 2cm 甲状腺结节的良恶性的诊断效能 ROC 曲线下面积为 0.86，敏感度及特异度分别为 76.0%，85.7% 在验证组其 ROC 曲线下面积为 0.77，敏感度及特异度分别为 70.6%，74.7%。
结论：CT 影像组学对最大直径小于或等于 2cm 的甲状腺结节的良恶性具有较好的鉴别能力，为甲状腺结节的鉴别诊断提供了一种无创性诊断方法。

EPO-0311

CT-based of primary lesions radiomics analysis for prediction of lymph node metastasis with Papillary thyroid carcinoma

Qianwen Guan
Huizhou Central People's Hospital/Guangzhou Medical College Affiliated Huizhou Hospital

Background: Preoperative accurate determination of lymph node metastasis is an important factor affecting the efficacy and prognosis of Papillary thyroid carcinoma. However, by existing methods, patients are at high risk of inaccurate clinical lymph node staging. We attempted to construct a radiomics model to evaluate the efficiency on CT images of intratumoral papillary thyroid carcinoma for preoperative prediction of lymph node (LN) metastasis in papillary thyroid carcinoma.
Methods: Sixty-one CT (32 positive in lymph node metastasis and 29 negative) scan manually segmented images of patients with Papillary thyroid carcinoma with lymph node status obtained from pathology report were enrolled in our retrospective study. Randomly divide it into 42 in the training set (22 positive in lymph node metastasis and 20 negative) and 19 in the validation set (10 positive in lymph node metastasis and 9 negative). A total of 396 radiomics features were extracted from enhanced-CT scan images of the whole primary tumor. A radiomics signature was constructed using the statistical models such as data dimensionality reduction and feature screening construction in the training set. Based on the multivariable logistic regression analysis, a radiomics nomogram was developed incorporating the radiomics signature and selected clinical predictors. The prediction performance was evaluated on the validation set.
Results: Consisting of 3 selected features, the radiomics signature showed a favorable discriminatory ability in the training set with an AUC of 0.830, which was confirmed in the validation set with an AUC of 0.667. The nomogram, consisting of the radiomics signature and selected clinical predictors. The decision curve analysis indicated that the nomogram was clinically useful.
Conclusion: In the present study, we developed and validated an CT-based radiomics nomogram incorporating the radiomics signature and the selected clinical predictors for individualized preoperative prediction of LN metastasis in Papillary thyroid carcinoma., which showed favorable discrimination and calibration. The proposed nomogram can be conveniently used to facilitate the preoperative prediction of LN metastasis in Papillary thyroid carcinoma.

2.中国人民解放军南部战区空军医院

目的 探讨双能量 CT 图像优化评价甲状腺结节的图像质量的临床意义。方法 125 例回顾性研究双能量 CT 增强扫描的甲状腺病变，比较 80kV（A）、140kV（B）、线性融合 0.3LB（C）及非线性

融合 NLB（D）四组图像的颈动脉、正常甲状腺及甲状腺病灶 CT 值、SNR、CNR，比较四组图像的背景噪声 SD。主观评分 C、D 两组的甲状腺病灶包膜及内部结构。结果 C 组与 D 组背景噪声差异无意义（*P*=0.590）；颈动脉、正常甲状腺及甲状腺病灶 CT 值 A 组与 D 组差异无意义（*P*=0.486、0.077、0.079）。正常甲状腺 SNR，C、D 两组差异无意义（*P*=0.192）；颈动脉 SNR 及 CNR、甲状腺病灶 SNR 及 CNR、正常甲状腺 CNR，D 组大于其他三组（*P*<0.05）。C、D 两组图主观评分为 3.36±0.51、4.01±0.56，D 组优于 C 组（*P*=0.019）。结论 双能量 CT 图像优化评价甲状腺结节有一定临床意义。

EPO-0313
对比分析能谱 CT 与常规 CT 发现甲状腺癌微小钙化的价值

饶良俊,洪桂洵,杨智云,初建平,耿鹏飞
中山大学附属第一医院

目的：对比分析能谱 CT 与常规 CT 的甲状腺癌影像，探讨能谱 CT 发现甲状腺癌微小钙化的价值。
方法：回顾性分析 2018 年 7 月至 2019 年 1 月中山大学附属第一医院 60 例行能谱 CT 检查甲状腺癌患者资料，经手术或活检获得病理诊断，以病理学结果为标准，比较能谱 CT 与常规 CT 发现甲状腺癌微小钙化的价值。
结果：本组 60 例甲状腺癌患者中，能谱 CT 平扫发现 54 例患者有微小钙化灶，6 例患者未能发现有微小钙化灶；常规 CT 平扫发现 43 例患者有微小钙化灶，17 例患者未能发现微小钙化灶，两者之间差异有统计学意义(P=0.011；X2 检验)。
结论：能谱 CT 发现甲状腺癌微小钙化比常规 CT 更有优势，可为甲状腺结节的定性诊断提供更多信息，有助于甲状腺癌的诊断，提高诊断信心。

EPO-0314
A Correlation Study of the Total Thyroid Iodine Measured by Dual-source CT and Thyroid Function

Zhengteng Li,Min Wang
Jining No 1 People's Hospital

[Abstract] **Objective** To investigate the correlation between the thyroid mean iodine concentration, the total thyroid iodine measured by Dual-source CT dual-energy scanning and the thyroid function. **Methods** Double-source CT was used for dual-energy scanning of the neck in adults with normal thyroid function. The mean iodine concentration and the size of thyroid glands were measured, while the total thyroid iodine was calculated. The thyroid function and other related test data were collected to analyze the correlation between the mean iodine concentration, the total thyroid iodine and thyroid function in general population. **Results** Age was negatively correlated with FT3. The total thyroid iodine was positively correlated with FT3 and negatively correlated with TSH. The mean thyroid iodine concentration was positively correlated with FT3 and TT3. **Conclusion** Dual-source CT dual-energy scanning technology has certain clinical value in evaluating thyroid function and

assessing iodine nutrition status.To provide assistance for the diagnosis and treatment of thyroid diseases.

EPO-0315
双能量 CT 碘浓度测定诊断良恶性甲状腺结节的价值（中文论文比赛）

赵雯,闵蕊
昆明医科大学第一附属医院

目的 探讨双能量 CT 碘浓度测定对甲状腺良恶性结节鉴别的价值。
方法 分别收集双源 CT 双能量平扫 47 个甲状腺结节（恶性 20 个，良性 27 个）及双能量 CT 增强扫描 90 个甲状腺结节（恶性 60 个，良性 30 个），均经手术病理证实。分别测量平扫、动、静脉期正常甲状腺组织、良、恶性结节的碘浓度及 CT 值，增强后结节计算出 NICnod 值（标准化碘浓度）及标准化 CT 值，采用受试者工作特性曲线（ROC 曲线），选取最佳灵敏度及特异度的临界值。比较良、恶性及正常组间的差异，并辅以形态学分析。
结果 平扫恶性、良性结节 CT 值与周围正常组织的碘值具有相关性（r=0.755、0.678、0.813、0.774，$P<0.05$）。良性结节实性部分的 CT 值及碘值高于恶性结节，差异有统计学意义($P<0.05$)。而良性与恶性结节周围正常组织的 CT 值及碘值差异无统计学意义($P>0.05$)。碘值临界值为 0.15mg/ml 时，灵敏度为 81.50%，特异度为 80.00%，且与传统形态学诊断结果具有较高一致性（Kappa 值=0.742）。
增强良恶性结节碘图形态学表现差异有统计学意义（$P<0.05$）。正常组、恶性组及良性组 NICnod 值及标准化 CT 值静脉期差异均有统计学意义（$P<0.05$），动脉期差异统计学无意义。动、静脉期各组间 NICnod 与标准化 CT 值具有相关性（r 均>0.73, $P=0.000$）。静脉期最佳 NICnod 及最佳标准化 CT 值分别为 0.76、0.79，ROC 曲线下面积 AUC 值分别为 0.91、0.92。结合碘图形态学，定性诊断敏感度、特异度高达 90.01%、93.60%。
结论 双能量碘浓度测量对甲状腺结节的定性诊断有一定价值。增强 NICnod 值及标准化 CT 值结合碘图形态学的诊断价值高于平扫碘浓度测量。

高 b 值 MRI 与超声弹性成像在甲状腺微小乳头状癌诊断中的对比研究

张君
1.中国人民解放军总医院第六医学中心（原海军总医院）
2.中国人民解放军总医院第一医学中心

目的 探讨高 b 值 DWI 检查与超声弹性成像对甲状腺微小乳头状癌的诊断价值，并做对比分析。**方法** 选取拟行手术的甲状腺微小结节患者 78 例，术前均常规进行甲状腺 DWI 检查及超声弹性成像检查，将上述检查与手术结果做对比，计算两组诊断甲状腺微小结节良恶性的灵敏度、特异度、阳性预测值、阴性预测值，Youden 指数，并比较两种诊断方法的准确性。
结果 经手术病理证实的 36 例恶性微小乳头状癌及 42 例良性微结节进行了高 b 值 MRI 诊断及超声弹性成像。高 b 值 MRI 诊断甲状腺微小乳头状癌的灵敏度 91.7%，特异度 83.3%，阳性预测值

82.5%、阴性预测值 92.1%，Youden 指数 0.75；超声弹性成像诊断甲状腺微小乳头状癌的灵敏度 88.9%，特异度 78.5%，阳性预测值 78.0%、阴性预测值 89.1%，Youden 指数 0.674；高 b 值 MRI 及超声弹性成像两组灵敏度及特异度的差别无统计学意义(灵敏度： x 2=1.636，P=0.305>0.05；特异度： x 2=2.291，P=0.155>0.05)。两种诊断方法具有较高一致性（Kappa=0.974，P＜0. 001）。**结论** 高 b 值 MRI 检查、超声弹性成像作为新的诊断技术，对于甲状腺微小癌的诊断均具有较高的诊断价值，值得临床推广应用。

EPO-0317
能谱 CT 对腮腺常见良性肿瘤的鉴别诊断价值

彭娟,李泉江
重庆医科大学附属第一医院

目的：探讨能谱 CT 在腮腺常见良性肿瘤诊断及鉴别的应用价值。 方法：收集腮腺常见良性肿瘤 46 例，包括多形性腺瘤(18 例)、腺淋巴瘤(20 例)及基底细胞腺瘤（8 例），患者均经术后病理证实。采用能谱 CT 对所有患者行 GSI 增强扫描，测量并计算各腮腺肿瘤在动脉期及静脉期标化有效原子序数（Z_{eff-s}）、标化碘含量（NIC）、标化水含量（NWC)、能谱曲线斜率及标化能谱曲线斜率，进行对比分析。 结果：多形性腺瘤、腺淋巴瘤、基底细胞腺瘤 NIC 动脉期 0.16±0.09、0.27±0.08、0.28±0.18，多形性腺瘤与腺淋巴瘤、基底细胞腺瘤之间差异有统计学意义，腺淋巴瘤与基底细胞腺瘤差异无统计学意义，静脉期 0.53±0.26、0.45±0.11、0.67±0.17，腺淋巴瘤与基底细胞腺瘤差异有统计学意义，多形性腺瘤与腺淋巴瘤、基底细胞腺瘤差异无统计学意义；Z_{eff-s}动脉期 0.74±0.06、0.79±0.03、0.78±0.08，多形性腺瘤与腺淋巴瘤差异有统计学意义，基底细胞腺瘤与多形性腺瘤、腺淋巴瘤差异无统计学意义，静脉期组间差异无统计学意义；能谱曲线斜率动脉期 1.10±0.61、1.82±0.59、2.44±1.84，多形性腺瘤与腺淋巴瘤、基底细胞腺瘤差异有统计学意义，腺淋巴瘤与基底细胞腺瘤差异无统计学意义，静脉期 1.76±0.85、1.31±0.35、2.21±0.69，腺淋巴瘤与基底细胞腺瘤差异有统计学意义，多形性腺瘤与腺淋巴瘤、基底细胞腺瘤差异无统计学意义；标化能谱曲线斜率动脉期 0.15±0.10、0.27±0.10、0.29±0.19，多形性腺瘤与腺淋巴瘤、基底细胞腺瘤差异有统计学意义，腺淋巴瘤与基底细胞腺瘤差异无统计学意义，静脉期组间差异无统计学意义。NWC 动脉期及静脉期组间比较差异无统计学意义。 结论：腮腺常见良性肿瘤能谱参数之间差异明显，能谱 CT 有助于其诊断及鉴别。

EPO-0318
意外摄入异物及其并发症的各种 CT 影像表现

邓洪波,王荣品
贵州省人民医院

目的：对多层螺旋 CT(muhisliceCT，MscT)下意外摄入异物的诊断及其相关并发症描述，并说明意外摄入异物后的并发症的各种在 CT 影像学的表现。探讨多层螺旋 CT(muhisliceCT，MscT)三维重建在意外摄入异物的临床应用价值。方法：对 35 例食管及气管异物患者，采用薄层 MSCT5mm 以下扫描，1-2mm 以下的重建；将扫描所得原始数据通过网络传送至后处理工作站，采用数字 3D 后处理软件进行重建，主要重建方法包括最大密度投影(maximumintensityprojection)MIP、多面重建(multiplanreformation，MPR)、容积再现(volumerendenng，VR)、曲面重建及仿真内窥镜。结果：食管异物位于颈部的 15 例，位于胸部的 10 例及气道 10。异物为弧状、小片、条状状或不规

则状；异物在食道及气道内走向为纵向、斜向、横向及竖向；CT 能明确显示异物与气道、食管及周围组织的关系，结论：多层螺旋 CT 三维重建能明确显示食管及气道异物的位置、大小、形态、有无穿孔及明显气道堵塞等并发症，MIP、 MPR、vR、曲面重建及仿真内窥镜等重建模式的相互结合对诊断意外摄入异物及指导临床及时准确地制订治疗方案有明显优势。

Prognostic value of the radiomics-based model in progression free survival of hypopharyngeal cancer treated with chemoradiation (oral speech or 10 min letures)

Xiaokai Mo,Shuixing Zhang
First Affiliated Hospital of Jinan University

Purpose: *To develop a radiomics-based model to stratify the risk of early progression (local/ regional recurrence or metastasis) among patients with hypopharyngeal cancer undergoing chemoradiotherapy and modify their pre-treatment plans.*
Materials and Methods: *We randomly assigned 113 patients into two cohorts: training (n=80) and validation (n=33). The radiomic significant features were selected in the training cohort using least absolute shrinkage and selection operator and Akaike information criterion methods*, and they were used to build the radiomic model. Concordance index (C-index) was applied to evaluate the model' s prognostic performance. Kaplan-Meier analysis and log-rank test were used to assess risk stratification ability of models in predicting progression. A nomogram was plotted to predict individual risk of progression.
Results: *Composed of four significant features, the radiomic model showed good performance in stratifying patients into high- and low- risk groups of progression in both the training and validation cohorts (log-rank test, p=0.00016*, p=0.0063, respectively). Peripheral invasion and metastasis were selected as significant clinical variables. The combined radiomic-clinical model showed good discriminative performance, with C-indices 0.804 [95% confidence interval (CI): 0.688-0.920], 0.756 (95% CI: 0.605-0.907) in the training and validation cohorts, respectively. The median PFS in the high-risk group was significantly shorter than that in the low-risk group in the training (median PFS: 9.5 m and 19.0 m, respectively; p[log-rank]＜0.0001) and validation cohorts (median PFS: 11.3 m and 22.5 m, respectively; p [log-rank]=0.0063).
Conclusions: *A radiomics-based model was established to predict the risk of progression in hypopharyngeal cancer with chemoradiotherapy.*

Preoperative Diagnosis of Cervical Metastatic Lymph Nodes in Papillary Thyroid Carcinoma:Dual-Energy

Spectral CT Quantitative Parameters Combined with Conventional CT Features

yaoyuan wu,Jiangning Dong
Department of Radiology， Anhui Provincal Cancer Hospital，West Branch of the First Affiliated Hospital of USTC， Division of Life Sciences and Medicine， University of Science and Technology of China

Purpose:To assess the value of dual-energy spectral CT quantitative parameters combined with conventional CT features for preoperative diagnosis of metastasis to the cervical lymph nodes in patients with papillary thyroid carcinoma.
Materials and Methods: 31 thyroid carcinoma patients were enrolled and received dual-energyspectral CT scanning before thyroidectomy and cervical lymph node dissection surgery.Analyses of dual-energy spectral CT quantitative parameters and qualitative conventional CT features of metastatic and benign lymph nodes were independently performed by two radiologists. Logistic regression models,sensitivity and specificity analyses were performed by using receiver operating characteristic curves and were compared with data combined with the qualitative analysis.
Results: 103 and 79 cervical lymph nodes were confirmed surgically to be metastatic and benign lymph nodes, respectively.The slope of the spectral HU curve (λHU), iodine concentration (IC) and normalized iodine concentration (NIC, to that of carotid artery) of the metastatic lymph nodes measured in venous phase were significantly higher than those of benign lymph nodes (all P<0.05). The best single parameter for detection of metastatic lymph nodes was λHU in venous phase, with sensitivity, specificity, accuracy, positive predictive value, and negative predictive value of 64.0%, 90.1%,79.6%, 75.6%, and 81.0%, respectively. The best combination of parameters was λHU and necrotic change in lymph nodes, with values of 71.0%, 88.4%, 82.9%, 78.0%,and 85.3%, respectively, with significant improvement in sensitivity.
Conclusion:Dual-energy spectral CT quantitative parameters combined with CT features showed higher sensitivity than the use of single spectral CT parameters or CT features for preoperative diagnosis of metastatic cervical lymph nodes in patients with papillary thyroid cancer.

EPO-0321
甲状腺乳头状癌原发灶双能量 CT 多参数预测中央组淋巴结转移的价值（参加中文论文比赛）

闵蕊,韩丹,赵雯,李浚利,蔡雅倩,金文凤
昆明医科大学第一附属医院

【摘要】目的 探讨甲状腺乳头状癌（PTC）原发灶双能量 CT 多参数预测 PTC 中央组淋巴结转移（CLNM）的价值。**方法** 回顾性收集经手术病理证实为单发甲状腺乳头状癌且行中央组淋巴结清扫术患者 340 例，分为中央组淋巴结转移组（178 例）及未转移组（162 例）。术前均行颈部 CT 常规平扫及双期双能量增强扫描，测量原发灶动脉期和静脉期碘浓度（IC）、标准化碘浓度（NIC）、Overlay 值，计算能谱曲线斜率（K），采用独立样本 *t* 检验比较两组间 IC、NIC、Overlay 值及 K 的差异，绘制受试者工作特征（ROC）曲线，计算其曲线下面积（AUC），选取最佳敏感度及特异度

的临界值，利用二元 Logistic 回归分析有统计学意义的双能量 CT 多参数联合预测 CLNM 的效能。**结果** 原发灶静脉期双能量 CT 各参数在两组间差异均有统计学意义（t=8.348，P<0.05；t=6.815，P<0.05；t=5.951，P<0.05；t=6.231，P<0.05），转移组与未转移组值分别为 IC（2.83±0.26、2.15±0.36）；NIC（0.64±0.31、0.55±0.17）；Overlay 值（60.15±0. 28HU、52.48±0. 73HU）；K（3.54±0.56、2.96±0.45），其预测 CLNM 临界值分别为 2.4mg/ml、0.58、55.7HU、3.11；敏感度、特异度分别为 70.5%、81.6%；75.2%、75.1%；72.1%、69.7%；67.4%、80.8%。动脉期原发灶双能量 CT 各参数在两组间差异无统计学意义（P>0.05）。利用二元 Logistic 回归分析原发灶静脉期双能量 CT 多参数联合预测 CLNM 的敏感度为 75.3%，特异度为 76.4%，准确度为 77.9%。**结论** 甲状腺乳头状癌原发灶的双能量 CT 各参数在预测中央组淋巴结转移方面有一定价值，多参数联合可提高预测效能。

EPO-0322
双能量 CT 和核素显像诊断及定位甲状旁腺腺瘤的对比研究

骆永恒,李亚军,杨海涛,梅习龙
中南大学湘雅二医院

目的：对比分析双能量 CT 和核素显像在甲状旁腺腺瘤诊断及定位中的价值。
方法：对临床怀疑原发性甲状旁腺功能亢进但未触及增大甲状旁腺或甲状腺的患者采双能量 CT 平扫及增强后 25、55 秒 3 期扫描，测量颈部结节的碘浓度、CT 值，计算标准化碘浓度、CT 值，并生成碘图、虚拟单能量成像图及能谱曲线。之后患者行 99mTc-甲氧基异丁基异腈（MIBI）甲状旁腺显像检查。以术后病理为金标准，比较双能量 CT 与核素显像的诊断效能。
结果：46 例患者的中 39 例接受手术治疗，术中摘除 51 个结节，其中 41 个结节经病理学确诊为甲状旁腺腺瘤。核素显像检出 39 个瘤体，敏感度和特异性分别为 95%和 90%。双能量 CT 检出 35 个瘤体，敏感度和特异性分别为 85%和 80%。双能量 CT 对于阳性病灶和阴性病灶均提供了精确的解剖定位。能谱曲线能区分甲状旁腺瘤及正常淋巴结。
结论：双能量 CT 能有效检出并定位甲状旁腺瘤，有助于临床医生提高手术治疗的成功率。

EPO-0323
CT 双期增强扫描鉴别甲状腺良、恶性结节价值

夏晓娜,王韶玉
山东大学齐鲁医院青岛院区

目的：探讨 CT 双期增强扫描在甲状腺良、恶性结节鉴别诊断中的价值。
方法：回顾性分析经组织病理学证实的 175 例 182 枚甲状腺结节 CT 资料，包括良性结节 60 例，恶性结节 122 例。观察结节形态、密度、位置、ΔCT 值（甲状腺与结节的 CT 差值）及强化方式在两组良、恶性结节中的分布差异，并采用单因素和多因素 logistic 回归分析进行检验，比较两组阳性 CT 征象对良、恶性结节预测价值的 OR 值、预测概率曲线下面积。
结果：单因素及多因素 logistic 回归分析显示形态、密度、位置、ΔCT 值在甲状腺良、恶结节中的分布有统计学差异（P＜0.05），强化方式在两组中的差异无统计学意义（P＞0.05）。四种阳性征象联合预测概率曲线下面积值为 0.899，当预测概率为 0.711 时，约登指数最大，此时诊断恶性结节的敏感性和特异度分别是 0.869 和 0.783。
结论：CT 双期增强扫描对甲状腺良、恶性结节鉴别诊断有重要价值，多种 CT 征象联合可提高良、恶性甲状腺结节的预测价值。

EPO-0324

甲状腺髓样癌多层螺旋 CT 影像特征与病理对照

张秀兰,黄必润,赵会传
荆州市第一人民医院

【摘要】目的:分析和总结甲状腺髓样癌（medullary thyroid carcinoma，MTC）的 CT 影像学特征。**方法:** 回顾性分析经手术病理证实的 20 例 MTC 患者的 CT 平扫及增强影像，并与术后病理进行对照。甲状腺 CT 检查参考《甲状腺结节影像检查流程专家共识》进行标准摆位，全部行平扫及增强检查。为避免锁骨伪影，受检者下颌尽量抬高至 85 度左右，下拉双肩，以充分暴露甲状腺为宜。扫描范围包括颅底至主动脉弓水平；增强扫描碘对比剂（碘浓度 300mgI/ml）总量约 80～100ml，高压注射器流率 2～3ml/s，动、静脉期扫描开始时间分别为 25～30s、50～55S。**结果：**20 例 23 枚 MTC 中，单发 17 例（85%），双发 3 例（15%）。CT 平扫中，形态规则 19 枚（82.6%），边界清晰 17 枚（73.9%），均匀低密度 20 枚（87.0%），假包膜 9 枚（39.1%），钙化 16 枚（69.6%）。CT 增强中，动脉期有肿瘤血管显示 17 枚（73.9%）；动脉期均匀强化且静脉期持续强化 5 枚（21.7%），动脉期不均匀强化而静脉期强化范围增加 18 枚（78.3%）；坏死囊变 6 枚（26.1%）。4 例（20%）有颈部淋巴结转移，1 例（5%）有气管侵犯。**结论：**MTC 常表现为单发、密度均匀、形态规则、边界清晰的低密度灶，不均匀持续低强化伴动脉期肿瘤血管显示为其特征性的 CT 征象。

EPO-0325

腮腺 Mikulicz 病 CT 特征研究

彭娟,吕发金,李咏梅
重庆医科大学附属第一医院

目的探讨腮腺 Mikulicz 病 CT 特征。方法回顾性分析我院经手术病理证实的 16 例腮腺 Mikulicz 病的临床及影像学资料，所有患者均进行常规 CT 平扫及增强扫描，观察病灶的数目、形态、密度、边界及强化表现。结果患者均表现为腮腺或耳下区无痛性渐大肿块，体检耳下区可触及圆形或卵圆形单个或数个肿块，质软或稍硬，活动度佳。单侧腮腺病变 10 例，双侧腮腺病变 6 例。3 例为单发结节；13 例为多发大小不一的结节或肿块，病灶边界大部分清楚，部分边缘稍模糊，呈等、稍高密度，中度强化；其中 4 例多发结节病灶伴囊变，囊性病灶壁较薄，见分隔，囊壁及分隔见强化；1 例多发结节病灶伴散在钙化。 2 例为弥漫浸润型，表现为双侧腮腺弥漫性肿大，密度不均匀性增高，内多发片团状稍高密度，病灶边界不清，增强扫描呈弥漫不均匀强化。结论腮腺 Mikulicz 病在 CT 表现有一定特征性，多发结节或肿块型需与腮腺常见肿瘤相鉴别，弥漫浸润型需与腮腺炎症、淋巴瘤鉴别。

Parotid Gland Tumors: Diagnosis by Using Arterial Spin Labeling-Initial Experience

Yang Zhao,Hongyu Lu

The affiliated tumor hospital of Guangxi medical university

Purpose： To evaluate whether parotid gland tumors can be accurately detected and differentiated by using Arterial Spin Labeling (ASL).
Materials and Methods: This prospective study was approved by the institutional review board, and written informed consent was obtained from all enrolled patients. In total, 27 patients with parotid gland tumor were preoperatively evaluated with TBF/TBC which represented the ratio of tumor blood flow (TBF) to blood flow of contralateral corresponding area (TBC) by using ASL. Histopathologic results of parotid gland dissection samples served as the reference standard for all cases. The optimal cutoff value for differentiating between pleomorphic adenoma, Warthin tumor and malignant parotid gland tumor was determined by means of receiver operating characteristic (ROC) curve analysis.
Results: Of the 27 enrolled patients, meanTBF/TBC in pleomorphic adenoma, Warthin tumor and malignant parotid gland tumor groups were 0.92±0.10,3.42±0.67, 1.57±0.26, respectively. There were statistically significant differences between Warthin tumor from the other two (P<0.05), but no statistical significance between pleomorphic adenoma, malignant parotid gland tumor (P>0.05). ROC curve analyses showed TBF/TBC cut point of 1.61 provided the highest discriminatory power in differentiating Warthin tumor from other parotid gland tumors while area under the ROC curve, Youden index, sensitivity, specificity was 0.903, 70.8%, 87.5%, 83.3%, respectively.
Conclusion: ASL might be useful for distinguishing Warthin tumor from other parotid gland tumors.

EPO-0327
MRI 与 CT 在甲状腺结节诊断中的联合应用价值

刘安娜,彭屹峰
上海市普陀区中心医院

目的：甲状腺结节的影像学检查中 CT 对发现甲状腺肿瘤内低密度区的敏感度高，MRI 检查的价值与 CT 扫描相仿，主要是评价病变范围与周围重要结构的关系。本研究旨在通过对甲状腺结节表现特点的分析，评价 MRI 与 CT 的联合应用价值。材料与方法：回顾性分析 60 例甲状腺结节患者（86 个结节）术前 MRI 及 CT 检查与术后病理结果对照。结果：86 个甲状腺结节包括 61 个良性结节和 25 个恶性结节，良性结节包括单纯性甲状腺肿 26 例、结节性甲状腺肿 15 例、甲状腺腺瘤 10 例、亚急性甲状腺炎症 8 例、急性甲状腺化脓性炎症 1 例、产后甲状腺炎 1 例。各类甲状腺炎症中 MRI 与 CT 表现为甲状腺侧叶及峡部弥漫增大，边缘规则锐利呈矩形，密度较均匀，低于正常甲状腺。主要影像表现：（1）甲状腺内单或多发囊变结节；（2）病变大小常为 1-6cm，边缘光滑、锐利，肿块有完整包膜；（4）纵长比（结节前后径/上下径），恶性结节纵长比常>1；（3）增强扫描病灶有强化，实性者为均匀结节状强化，囊变者呈环状强化，囊变区不强化。26 例恶性结节是甲状腺癌（23 例）及起源于间质的恶性肿瘤（肉瘤）女性（3 例），除 MRI 无法发现钙化外，MRI 与 CT 均清楚显示肿块形态、大小和内部组织成份以及肿瘤周围被侵犯的范围。平扫表现为不规则或分叶状软组织密度肿块，密度不均匀，病灶无包膜或包膜不完整，呈浸润性生长，与周围分界不清；增强扫描时腺癌呈不规则强化，强化部分也较正常甲状腺密度低。良恶性结节的 MRI 与 CT 表现在形态、边界、囊变、实性部分强化方面的差异具有显著统计学意义（P<0.05），完整的包膜是良性病变的特异性征象，而恶性肿瘤的假包膜不完整或无。良恶性结节在出血、钙化、纵横比及淋

巴结增大方面的差异无显著统计学意义（P>0.05）。结论：MRI 与 CT 联合应用在于判断其大小和位置以及甲状腺周围的组织情况，有助于手术方式的选择，术前同时行 MRI 与 CT 是必要的。

弥散加权成像和动态增强磁共振成像对甲状腺良恶性结节的诊断价值

卢予婕,李文美
广西医科大学第一附属医院

目的:探讨弥散加权成像(DWI)和动态增强磁共振成像(DCE-MRI)多种 MRI 参数对甲状腺良恶性结节诊断及鉴别诊断的应用价值。
方法:对 165 例经病理证实的良性结节 55 例，恶性结节 110 例进行回顾性研究。所有患者均行常规 MRI、DWI 及动态增强 MRI 检查，获取形态信息及多种定量参数。应用西门子 Tissue 4D（T4D）后处理软件进行 Tofts 单输入双室模型进行数据处理，得出 TIC 曲线半定量参数，以及灌注定量参数转运常数（Ktrans）、血管外细胞外间隙体积百分比（Ve）、速率常数（Kep）等，利用独立样本 t 检验对恶性组和良性组的各参数进行比较分析。采用受试者操作特征(ROC)分析，评估诊断能力。
结果:甲状腺良恶性结节 ADC 值、Ktrans、Ve、 TIC 斜率、信号衰减百分比（Id%）差异均有统计学意义(P< 0.05)，而 Kep 均值差异无统计学意义（p>0.05）。ADC、Ktrans、Ve、TIC 斜率和信号

衰减百分比（Id%）对甲状腺良恶性病变的 AUC 分别为 0.921、0.701、0.654、0.692 和 0.648。ADC 值灵敏度为 89.2%，特异性 90.3%； Ktrans 敏感性 0.742，特异性 0.653； Ve 值灵敏度 0.525，特异性 0.825；TIC 斜率灵敏度 0. 556，特异性 0.735；信号衰减百分比（Id%）灵敏度 0.375，特异性 0.930。结合 ADC 值和各定量参数，诊断性能得到改善，AUC 为 0.935，敏感性为 0.943，特异性为 0.956。
结论:DWI 联合 DCE-MRI 能较好地鉴别甲状腺结节的良恶性，具有良好的临床应用价值。

EPO-0330
结节性甲状腺肿与甲状腺腺瘤 CT 上具有鉴别意义征象分析

叶丽丽
东莞康华医院

目的：探讨结节性甲状腺肿与甲状腺腺瘤在 CT 诊断上具有鉴别意义的征象。**方法:**回顾性分析经手术及病理证实共 74 例结节性甲状腺肿与甲状腺腺瘤 CT 影像表现，包括瘤体外甲状腺情况(体积、轮廓、密度)、结节数目、结节密度、结节边界、结节强化情况及结节内钙化。**结果:**本组 74 例中，结节性甲状腺肿 62 例，甲状腺腺瘤 12 例。结节性甲状腺肿、甲状腺腺瘤在瘤体外甲状腺情况（体积、轮廓、密度）、结节数目、结节密度、结节边界、结节强化情况及结节内钙化具有特征性鉴别意义。**结论：**掌握结节性甲状腺肿与甲状腺腺瘤 CT 的特征性征象，对诊断甲状腺良性结节具有一定的价值。

EPO-0331
Texture analysis of dual-phase contrast-enhanced CT in the diagnosis of cervical lymph node metastasis in papillary thyroid cancer patients

Guoyi Su, Xiaoquan Xu, Feiyun Wu
First Affiliated Hospital of Nanjing Medical University

Abstract
Objectives: To evaluate the value of texture analysis of dual-phase contrast-enhanced computed tomography (CT) images in diagnosing cervical lymph node metastasis in papillary thyroid cancer (PTC) patients.
Methods: Twenty-seven metastatic and thirty-two non-metastatic cervical lymph nodes were retrospectively analyzed. Texture analyses were performed on both arterial (A) and venous (V) phase CT images. Texture parameters including mean grey-level intensity, skewness, kurtosis, entropy and uniformity were obtained and compared. Receiver operating characteristic (ROC) curves analyses were used to evaluate the diagnostic value of significant texture parameters. Multivariate logistic regression analysis was used to identify the independent predictors for metastatic cervical lymph node.
Results: Metastatic lymph nodes showed significant higher A-mean grey-level intensity ($p<0.001$), A-entropy ($p<0.001$), A-skewness ($p=0.013$) and V-skewness ($p=0.009$), and lower A-kurtosis ($p<0.001$) and V-kurtosis ($p<0.001$) than non-metastatic mimics. ROC curves analyses indicated A-kurtosis demonstrated optimal diagnostic area under the

curve (AUC, 0.884) and specificity (92.59%), while A-mean grey-level intensity showed optimal diagnostic sensitivity (90.62%). Multivariate logistic regression analysis indicated that A-mean grey-level intensity was the independent predictors for metastatic cervical lymph node (p=0.010), with an AUC of 0.807, a sensitivity of 90.62%, and a specificity of 77.78%.
Conclusions: CT textural analysis, specially the mean grey-level intensity on arterial phase CT images, might be helpful in diagnosing metastatic cervical lymph node in PTC patients.

原发性甲状腺淋巴瘤影像表现及误诊分析

邓凯吉,陈自谦
解放军福州总医院

目的 探讨原发性甲状腺淋巴瘤（PTL）的影像表现,以期进一步提高 PTL 的诊断准确率。
方法 回顾性分析经手术病理证实的 6 例 PTL 患者的影像表现,其中 5 例行 CT 平扫及增强扫描,1 例同时行 MRI 平扫及全身 18F-FDG PET/CT 检查。
结果 6 例患者均以发现颈部肿物就诊,病理证实均为非霍奇金淋巴瘤,其中 3 例合并有桥本叶及峡部 1 例。CT 表现为单发结节型 2 例,多发结节型 1 例,弥漫肿大型 3 例。CT 平扫 6 例病灶均呈稍低密度,5 例密度大致均匀,1 例病灶内可见钙甲状腺炎。病灶侵及甲状腺一侧叶 4 例,侵及甲状腺双侧叶及峡部 1 例,侵及甲状腺单侧化。增强扫描 5 例病灶呈均匀、轻中度强化。2 例出现颈部淋巴结转移。MRI 病灶 T1WI 呈等信号,T2WI 呈稍高信号,DWI 呈高信号。PET/CT 病灶表现为高代谢。6 例患者术前全部误诊。
结论 PTL 容易误诊,其影像表现具有一定特征性,结合临床资料,有助于提高诊断准确性,其最终确诊仍需依靠病理学检查。

甲状腺超声造影检查的护理经验总结

吴长迎,杨洁,王文燕,段庆红（通讯作者）
贵州省肿瘤医院

目的 探究超声造影在甲状腺检查中的护理经验。 **方法** 将 2019 年 2 月-2019 年 7 月的 100 例甲状腺超声造影检查的患者纳入研究范围，应用随机数字表的方式将患者平均分为实验组与对照组，并分别应用综合护理干预及常规护理干预方式进行护理，总结护理经验。 **结果** 经研究，实验组造影后出现造影剂外渗、轻微头晕、皮疹、瘙痒及疼痛等情况的概率显著低于对照组，差异显著，P＜0.05。 **结论** 采用综合护理方式对甲状腺超声造影检查患者进行干预，能够提升造影成功率，减少患者不良反应的出现。所以,应采用综合性护理干预方式对患者进行护理干预。

多 b 值磁共振弥散加权成像对甲状腺乳头状癌甲状腺外侵犯的诊断价值

胡曙东[1],王娴[2],孙宗琼[1],陈林[1]
1.江南大学附属医院 无锡市第四人民医院
2.江苏大学附属人民医院

目的:探讨术前多 b 值磁共振弥散加权成像（diffusion-weighted imaging ，DWI-MRI)及表观弥散系数(apparent diffusion coefficient, ADC) 在甲状腺乳头状癌(papillary thyroid carcinoma，PTC)甲状腺外侵犯（extrathyroidal extension，ETE）诊断中的价值。**材料和方法:** 回顾性分析 81 例经手术病理证实为甲状腺乳头状癌患者的 MRI 平扫、增强和弥散加权成像的影像学图像。在工作站上构建 ADC 图，分别测量伴 ETE（微小 ETE、广泛 ETE）、无 ETE 的甲状腺乳头状癌肿瘤实性区域的 ADC 值，并比较其肿瘤实性区域 ADC 值的差异。**结果:**b 值为 500s/mm^2 时，伴 ETE 的甲状腺乳头状癌肿瘤实性区域 ADC 值[(1.27±0.17)×10-^{3}mm^2/s]明显低于无 ETE 的甲状腺乳头状癌肿瘤实性区域 ADC 值[(2.12±0.72)×$10^{-3}$$mm^2$/s，$p$ <0.05]；伴广泛 ETE 的甲状腺乳头状癌肿瘤实性区域 ADC 值[(1.23±0.17)×$10^{-3}$$mm^2$/s]低于伴微小 ETE 的甲状腺乳头状癌肿瘤实性区域 ADC 值[(1.29±0.16)×$10^{-3}$$mm^2$/s ，$p$>0.05]；b 值为 500s/$mm^2$时，弥散加权成像诊断甲状腺乳头状癌伴 ETE 的 ADC 值诊断效果最佳，ROC 曲线下面积为 0.887，诊断阈值为 1.530×10^{-3} mm^2/s，诊断敏感度为 69.0 %、特异度为 93.7 %、阳性预测值 77.6 %、阴性预测值 77.5 %。**结论:**.磁共振弥散加权成像中，伴 ETE 的甲状腺乳头状癌的肿瘤实性区域 ADC 值明显低于无 ETE 的甲状腺乳头状癌肿瘤实性区域 ADC 值，磁共振弥散加权成像有助于甲状腺乳头状癌的 ETE 的鉴别诊断。

EPO-0335
多参数 MRI 成像对甲状腺腺瘤和甲状腺乳头状癌的鉴别诊断价值

胡曙东[1],王娴[2],陈林[1],葛宇曦[1],杨潇涵[1]
1.江南大学附属医院 无锡市第四人民医院
2.江苏大学附属人民医院

目的:研究磁共振多参数成像表观扩散系数（apparent diffusion coefficients，ADC）和时间-信号强度曲线(time-signal intensity curves，TICs) 在甲状腺腺瘤(Thyroid adenoma, TA)和甲状腺乳头状癌(Papillary thyroid carcinoma, PTC)的诊断及鉴别诊断中的价值。**材料和方法:** 回顾性分析 2016 年 1 月至 2017 年 6 月江苏大学附属人民医院 88 例患者共计 132 个病灶的影像学资料，经病理证实 TA（53 枚）和 PTC（79 枚），依次行磁共振平扫、弥散加权成像(MR diffusion-weighted imaging,MR-DWI) 、动态增强扫描(dynamic contrast-enhanced MR imaging， DCE-MRI)，计算多 b 值时 TA、PTC 的 ADC 值，绘制 ROC 曲线，判定诊断阈值并评价诊断效能，绘制病变的 TICs，最后 MR-DWI 联合 DCE-MRI 对 TA、PTC 进行鉴别诊断，与病理对照，研究 MR-DWI 和 DCE-MRI 联合应用鉴别诊断 TA、PTC 的敏感度、特异度、准确度、阳性预测值、阴性预测值。**结果：**b 值=500s/mm^2时，MR-DWI 诊断 PTC 的 ADC 值诊断效果最佳，ROC 曲线下面积为 0.871，诊断阈值取 1.538×10^{-3} mm^2/s 时，诊断 PTC 的敏感度 83.0%、特异度 78.5%、准确度 81.8%、阳性预测值 78.2 %、阴性预测值 84.3 %，约登指数 61.5；MR-DWI、DCE-MRI、MR-DWI 和 DCE-MRI 联合诊断，三者相比较其敏感度、特异度、准确度、阴性预测值、阳性预测值差异均有统计学意义(P=0.044，P=0.010，P=0.024，P=0.009，P=0.006)。**结论：**多参数 MRI 成像鉴别诊断 TA、PTC 较单一动态增强扫描或扩散成像诊断效能强。

EPO-0336
超声和 MRI 联合对甲状腺乳头状癌的甲状腺外侵犯的诊断价值分析

胡曙东[1],王娴[2],薛倩[1],李杰[1],何俊林[2]
1.江南大学附属医院 无锡市第四人民医院
2.江苏大学附属人民医院

目的：探讨术前超声(ultrasound，US)、磁共振(magnetic resonance imaging, MRI)与两者联合检查在甲状腺乳头状癌(papillary thyroid carcinoma，PTC)甲状腺外侵犯（extrathyroidal extension，ETE）中的诊断价值。**材料和方法**：回顾分析 2013 年 1 月至 2016 年 12 月在我院术前行 US 和 MRI 检查并经手术病理证实的 PTCs 伴 ETE 的 83 例患者，对两种方式及二者联合诊断的结果进行分析比较。**结果**：T3 (微小 ETE)诊断正确率 US 为 92.2% (47/51) ，MRI 为 74.5% (38/51) ，两者联合为 98.0% (50/51)，三者对 T3 的诊断正确率差异有统计学意义(P=0.000)；T4 (广泛 ETE)诊断正确率 US 为 62.5% (20 /32) ，MRI 为 87.5% (28/32) ，两者联合为 93.8% (30/32)，三者对 T4 的诊断正确率差异有统计学意义 (P=0.000)；ETE 诊断的总正确率 US 为 80.7% (67/83)，MRI 为 79.5% (66/83)，两者联合为 96.4% (80/83)，三者对 ETE 的诊断正确率差异有统计学意义(P=0.001)。**结论**：US 与 MRI 联合诊断，可提高 ETE 术前诊断正确率。

EPO-0337
背景抑制弥散加权成像（DWIBS）与 PET-CT 对甲状腺癌术后颈部淋巴结转移的诊断价值比较

孔德霞,温志波
南方医科大学珠江医院

目的：对比 DWIBS 与 PET-CT 在甲状腺癌术后颈部淋巴结转移的诊断价值。
方法：选取 2018 年 11 月至 2019 年 6 月我院收治的甲状腺癌术后患者进行颈部 DWIBS 检查，选定目标淋巴结单独送检，共 55 例患者（92 枚淋巴结），其中 40 例患者（71 枚淋巴结）同时行 PET-CT 检查，以再次术后病理为金标准，分别测量目标淋巴结的 ADC 值与 SUVmax 值，分别对比转移性淋巴结与非转移性淋巴结的 ADC 值、SUVmax 值的差异，分析 DWIBS、PET-CT 对甲状腺癌术后转移淋巴结的诊断价值。
结果：术后病理显示，转移性淋巴结 41 枚，非转移性淋巴结 30 枚，转移性淋巴结及非转移淋巴结 ADC 值分别为（0.813±0.032）×$10^{-3}$$mm^2$/s、（1.195±0.079）×$10^{-3}$$mm^2$/s，差异有统计学意义（P<0.001），并可获得最佳的诊断效能（诊断阈值：0.956×$10^{-3}$$mm^2$/s，AUC 面积：0.967，95%的可信区间：0.932-1，敏感性：86.7%，特异性：92.7%）。转移性淋巴结及非转移性淋巴结 SUVmax 值分别为（4.56±1.057）×$10^{-3}$$mm^2$/s、（1.706±0.320）×$10^{-3}$$mm^2$/s，差异有统计学意义（P<0.001），并可获得最佳的诊断效能（诊断阈值：2.657，AUC 面积：0.907，95%的可信区间：0.835-0.978，敏感性：82.9%，特异性：90%）。
结论：DWIBS 与 PET-CT 检查均可作为诊断甲状腺癌术后转移淋巴结的重要方法，其中 DWIBS 拥有更高的敏感性及特异性，其诊断效能优于 PET-CT。

EPO-0338

增强 CT 直方图分析对甲状腺结节良恶性鉴别的价值研究

马俊丽[1],段立娜[1],张薇[1],戈锐[1],王志军[2]
1.宁夏医科大学
2.宁夏医科大学总医院

目的 评价基于 CT 平扫和增强图像的直方图特征是否有助于甲状腺良恶性结节的鉴别诊断。
方法 回顾性分析我院经手术后病理证实甲状腺结节患者 132 例，共 140 个结节，其中良性组 66 个结节，恶性组 74 个结节。选取轴位图像病灶边界最清晰的时相、病灶最大层面，采用 Mazda 软件沿病灶边缘勾画 ROI，随后将 ROI 复制粘贴于其它时相并进行直方图分析，获得以下参数：均值（Mean）、方差（Variance）、偏度(Skewness)、峰度(Kurtosis)及第 1、10、50、90、99 百分位数。比较两组数据的差异，并通过 ROC 曲线分析有统计学差异的灰度直方图参数对甲状腺良恶性结节间鉴别诊断效能。
结果 CT 平扫直方图分析，恶性组均值、第 10、50、90 百分位数高于良性组，差异有统计学意义（P 均＜0.05）；CT 增强直方图分析，良性组和恶性组间均值、方差及第 1、10、50、90 百分位数总体差异均有统计学意义（P 均＜0.05），恶性组均值、第 1、10、50、90 百分位数高于良性组，良性组方差高于恶性组。两组的偏度、峰度、第 99 百分位数在 CT 平扫和增强中差异均无统计学意义（P 均＞0.05）。在 CT 平扫和增强直方图的参数中，第 10 百分位数 AUC 最高,为 0.677,其鉴别甲状腺良恶性结节的敏感度、特异度分别为 74.32%、62.12%。
结论 CT 直方图分析可作为鉴别甲状腺良恶性结节的重要辅助手段，可提供客观、可靠的信息，增加诊断的准确性，对两者鉴别提供客观依据。

EPO-0339
结合迭代重建算法的低剂量螺旋 CT 在颈部的应用研究

张晓苗,董越
辽宁省肿瘤医院

目的：探讨结合迭代重建算法的低剂量螺旋 CT 在颈部应用价值。**方法**：172 例疑头颈部病变患者行 CT 检查，随机分为常规剂量组(86 例，管电流 125mAs)和低剂量组(86 例，40-110mAs），分别采用滤波反投影重建（FBP）及自适应迭代重建（AIDR3D）。在下颌角及上纵隔水平分别测量图像 CT 均值及标准差，由两位 8 年以上工作经验的 CT 影像医师采用 4 分法标准对图像盲法评分；比较不同扫描方式下患者的辐射剂量。**结果**：下颌角水平，两组间胸锁乳突肌噪声、信噪比、对比信噪比及背景噪声无明显差异（p>0.05）,低剂量组颈内静脉噪声高于常规剂量组（p<0.05）；上纵隔水平，低剂量组上腔静脉、胸大肌及胸壁皮下脂肪噪声低于常规剂量组（p<0.05），信噪比更高（p<0.05）。下颌角水平低剂量迭代图像评分与常规 FBP 组图像无明显差异（p>0.05）；上纵隔水平低剂量迭代图像评分优于常规剂量 FBP 组（p<0.05）；与常规剂量组相比，低剂量组有效辐射剂量显著降低（p<0.05），剂量指数减低 63.34%，有效辐射剂量减低 63.16%。**结论**：结合 AIDR3D 重建技术的低剂量 CT 技术可以用于颈部 CT 扫描，可以减少辐射剂量并提供优质的图像

EPO-0340
The value of different voxel volume of magnetic resonance spectroscopy in parotid tumors

Bocheng Wang,Dan Zhu,Can Wang,Xiao Su,Jinliang Wu,Lizhong Wu

the 9th hospital affiliated to Shanghai Jiao Tong University School of Medicine

Purpose: To explore the characteristics and value of magnetic resonance spectroscopy in parotid tumors between simple-voxel and multi-voxel volume.
Methods: 28 subjects of parotid tumors proved by pathologically were examined by both simple-voxel and multi-voxel volume of magnetic resonance spectroscopy(MRS) in 1.5-Tesla MR scanner. Using a default threshold full-automation MRSI processing protocol, images for signal intensity including Choline(Cho), Creatine (Cr),Cho/Cr ratio,Lactate and Lipid(LL) were created together with the relative reference T1 or T2 weighted image(T1WI,T2WI). voxel. Analyses were performed by using auto-calculated peak area of the metabolite and metabolite ratio maps in different voxel volume sequences.
Results: Results of 28 subjects were examined confidently and successfully without any artifact of breathing or pulsation. the signal intensity peak of LL was higher in multi-voxel significantly(P<0.01) as opposed to Cho, Cr and Cho/Cr ratio had no difference(P>0.01) in two grpups.
Conclusion: MRS was a sensitive and accurate method in detecting parotid tumors. The baseline of simple-voxel volume was steady. The unit of multi-voxel volume was small and multiselect.

“三低”技术在甲状腺 CT 增强扫描中的应用

赵艺涵
云南省盐津县人民医院

目的探讨低管电压 80kV、低对比剂剂量、低对比剂注射速率并联合 SAFIRE 迭代重建算法的“三低”甲状腺 CT 增强扫描技术的临床应用可行性。**方法**前瞻性收集甲状腺双期增强 CT 扫描的患者 60 例。随机分成 2 组。A 组：常规组，管电压 120kV，对比剂碘普罗胺（370mgI/ml），注射速度 3ml/s，滤波反投影。B 组：“三低”组，管电压 80kV，对比剂碘克沙醇（270mgI/ml），注射速度 2.5ml/s，SAFIRE-3。比较 2 组图像质量客观指标 CT 值、SNR、CNR；图像质量的主观评分；诊断效能的比较对照金标准病理结果，分析两种方案诊断甲状腺良恶性病变的灵敏度、特异度及准确度的差异。同时对比两组的辐射剂量、对比剂摄入总量及碘总量。**结果**①两组平扫、动静脉期△CT 值差异均有统计学意义（P<0.05），“三低”组＞常规组，其中以动脉期△CT 最大。两组动、静脉期正常及病变甲状腺组织的 SNR、CNR 差异无统计学意义（P>0.05）。②两组甲状腺主观评分比较，差异有统计学意义（z=-2.697，P=0.007＜0.05），“三低”组评分高于常规组。③两组诊断效能的比较，病理随访显示“三低”组诊断符合率为 80%，常规组为 76%，灵敏度、特异度及准确性比较差异均无统计学意义（P>0.05）。④两组辐射剂量各指标的比较，差异均有统计学意义（P<0.05），“三低”组较常规组辐射剂量（ED）降低约 60%。两组对比剂用量及碘量差异均有统计学意义（P<0.05），“三低”组碘总量较常规组降低约 37%。**结论**“三低”甲状腺 CT 增强技术在保证图像质量达到诊断要求的前提下，提高了正常甲状腺与病变的 CT 差值，可更有利于甲状腺病变的显示和微小病灶检出，以动脉期更优。同时使 CT 检查的有效辐射剂量大幅度降低，及对比剂总量和碘总量，并获得相同的诊断效能。

EPO-0342
腮腺多形性腺瘤和低度恶性多形性腺瘤的 CT 表现及初步分析

蔡伶伶
上海交通大学医学院附属第九人民医院北部

目的：探讨腮腺多形性腺瘤（PA）及低度恶性 PA 患者的多层螺旋 CT（MSCT）表现及其影像学鉴别诊断价值。方法：回顾性分析经手术病理证实的 45 例（共 48 个病灶）PA 患者的影像学资料（在术前 CT 均诊断为良性）。结果：良性病灶 33 个，低度恶性 15 个。PA 病灶的起源部位、大小（平均最大径：良性组 2.10±0.79cm，低度恶性组 2.64±1.45cm）、包膜的完整性及强化程度与良恶性之间无明显统计学差异。病灶边界模糊（良性组 3/33 个，低度恶性组 10/15 个）、形态不规则（良性组 8/33 个，低度恶性组 9/15 个）、密度不均（良性组 11/33 个，低度恶性组 13/15 个）及边缘血管样强化（良性组 6/33 个，低度恶性组 10/15 个）与病变的良恶性存有显著统计学差异（P<0.05）。结论：MSCT 检查有助于腮腺多形性腺瘤的诊断及良恶性的判断，为指导临床治疗及预后提供重要参考价值。

EPO-0343
CT 检查对钙化在甲状腺良恶性结节鉴别的诊断价值

郑穗生
合肥平安健康检测中心

目的 探讨 CT 对钙化在甲状腺良恶性结节鉴别的诊断价值。**方法** 回顾性分析经手术切除病理证实的 116 例甲状腺钙化结节的 CT 及临床资料，根据钙化形态将其分为细颗粒钙化及粗颗粒钙化；根据钙化在结节中的位置，分为中央和边缘；统计细颗粒钙化、中央及两者联合在良恶性结节中的分布，并采用 X^2 检验进行统计学分析。根据以上模型继续收集 88 例病例对以上结果进行验证。**结果** 116 例钙化结节中，良性 75 例，恶性 41 例，细颗粒钙化、中央及二者联合在良恶性结节中分别占 26.7%(20/75)和 68.3%(28/41)(X^2=18.936, P= 0.000)、32%(24/75)和 58.5%(24/41)(X^2=7.6956, P= 0.005)、8%(6/75)和 56.1%(23/41)(X^2=32.7063, *P*=0.000)；粗颗粒钙化和边缘联合在良恶性结节中分别占 60%(45/75)和 9.76%(4/41)(X^2=27.4283, *P*= 0.000)。继续收集的 88 例钙化结节中，良性 56 例，恶性 32 例，以细颗粒钙化和中央为标准诊断甲状腺恶性结节的灵敏度为 81.3%(26/32) ，特异度为 89.3%(50/56)；以粗颗粒钙化和边缘为标准诊断甲状腺良性结节的灵敏度为 80.4%(45/56)，特异度为 90.6%(29/32)。**结论** 甲状腺结节中出现钙化且为细颗粒状、位于中央为 CT 诊断甲状腺恶性结节的重要征象，甲状腺结节中出现钙化且为粗颗粒状、位于边缘为 CT 诊断甲状腺良性结节的重要征象。

Effect of Region of Interest on ADC and Interobserver Variability in Thyroid Nodules

Xiang Zhou[1],Yi-feng Peng[1],Zhi Wang[1],Yuan-peng Rui[1],Jia-lin Liu[1],Chao Ma[2],Yue-hua Li[3]
1.Putuo Hospital， Shanghai University of Traditional Chinese Medicine
2.Changhai Hospital， The Second Military Medical University
3.No.6 People’s Hospital， Shanghai Jiaotong University

Background: To determine the effect of region of interest (ROI) on tumor’s apparent diffusion coefficient (ADC) and interobserver variability in thyroid nodules.

Methods: Thirty-three individuals with 45 pathologically-confirmed thyroid nodules were assessed by preoperative diffusion-weighted imaging (DWI) with b values of 0 and 400 s/mm2, respectively. Two readers evaluated the ADC values of lesions based on three ROI techniques: whole-volume, single-slice and small solid-sample groups. Interobserver variability was analyzed for all ROI techniques, and the mean ADCs of benign and cancerous thyroid nodules were compared.
Results: For the mean ADCs of non-cancerous thyroid nodules, average differences and limits of agreement (LOAs) between readers were 0.00 [-0.17 - 0.17]×10-3 mm2/s for whole-volume ROI (ICC=0.967), 0.00 [-0.26 - 0.26] ×10-3 mm2/s for single-slice ROI (ICC=0.932) and -0.02 [-0.38 - 0.41] ×10-3 mm2/s for small solid-sample ROI (ICC=0.823). For the mean ADCs of cancerous thyroid nodules, average differences and LOAs between readers were -0.05 [-0.23 - 0.13]×10-3 mm2/s (ICC=0.885), 0.01 [-0.23 - 0.25]×10-3 mm2/s (ICC=0.839) and -0.07 [-0.52 - 0.39]×10-3 mm2/s (ICC=0.579) for the three ROI methods, respectively. The mean ADC values were more scattered in the small solid-sample ROI group in comparison with the whole-volume and single-slice groups, in noncancerous and cancerous specimens. Of all three ROI techniques, whole-volume ROI-determined ADC had the highest combined sensitivity (80.0%), specificity (88.3%) and Youden index (0.683), with a cut-off of 1.84×10-3 mm2/s.
Conclusions: The ROI method overtly affects ADC measurements in benign and cancerous thyroid nodules. Small solid-sample ROI yielded the worst interobserver variability of average ADC measurements.

高弛豫率安全型对比剂在周围神经成像的应用探讨

刘定西
华中科技大学同济医学院附属协和医院

摘要 对比增强高分辨率磁共振周围神经成像已经在临床上广泛使用，但磁共振对比剂中的钆离子可能导致部分患者肾源性系统性纤维化（NSF）的风险一直受到持续关注。采用低计量磁共振对比剂、安全的型对比剂是降低此类风险的主要考量。本文探讨在周围神经成像时采用高弛豫率大环形结构安全型磁共振对比剂替代线性多用途对比剂的可行性。
目的：探讨高弛豫率大环状安全型磁共振对比剂在磁共振臂丛神经成像应用的可行性。**方法**:对比常规线性离子型磁共振对比剂臂丛神经成像与大环型安全型对比剂臂丛神经成像的诊断效能，A 组， 120 例用新型大环状低剂量对比剂臂丛神经成像患者（大环结构的加乐显，0.15ml/kg），年龄范围 18-70，平均 48.3，女性 56 人，男性 64 人。 B 组，既往 120 例常规线性离子型磁共振对比剂臂丛神经成像患者（0.2ml/kg,马根维显）成像效果比。按常规磁共振臂丛神经成像的要求和操作程序进行检查；由 2 位高年资影像医生对成像结果进行统一规范的薄层 MIP 重建、测量 C6 神经与周围组织的对比度，并做出神经影像的主观评分；并从 PACCS 数据库中随机选择 B 组 120 例既往使用线性结构多用途磁共振对比剂的臂丛神经源图像进行同样的后处理、测量和主观评分作为对照组对比研究。**结果**
A 组 B 组神经与组织的对比度 C，$C_{神经-肌肉}$ P_{AB}=0.169，$C_{神经-脂肪}$ P_{AB}=164，$C_{神经-骨骼}$ P_{AB}=0.159，$C_{神经-静脉}$ P_{AB}=0.16；主观评分 A 组 B 组 P_{AB}=0.168
从以上结果可以看出减量使用大环状对比剂后，主观评分和客观数据评价 A、B 组与常规神经成像没有显著性差异。
结论：使用更低剂量安全性型大环状结构磁共振对比剂作为磁共振臂丛神经成像的背景抑制剂，其成像效果与常规剂量无显著性差异，是线性对比剂理想的替代品。

甲状腺乳头状癌多种 CT 征象的多因素分析

张凤艳,乔英,张辉
山西医科大学第一医院

目的 探讨多种 CT 征象在甲状腺乳头状癌诊断及鉴别诊断中的价值。方法 回顾性分析经组织病理学证实的 86 位患者，111 枚甲状腺结节（57 枚甲状腺乳头状癌、54 枚结节性甲状腺肿）的 CT 征象，其中 89 枚（80.2%）结节在平扫和/或增强下可显示低密度环，（46 枚甲状腺乳头状癌、43 枚结节性甲状腺肿）。通过多因素 logistic 回归对 89 枚有低密度环的病灶进行三种征象的回归分析，包括不光整低密度环征、咬饼征及增强后病变模糊征，并计算不同阳性 CT 征象及多种征象联合在 PTC 诊断中的灵敏度和特异性。结果 多因素 Logistic 回归分析显示在有环征的 89 枚病例中，不光整低密度环、咬饼征及增强后病变模糊更常见于 PTC 中 （P＜0.05），通过模型预测值对病例进行良恶性判断，判断结果使用 ROC 曲线进行评价，ROC 曲线下面积（AUC）：0.927（诊断价值高）。OR 值分别为 8.474（95%CI:7.983～33.062）、14.824（95%CI:1.969～26.744）和 6.574（95%CI:13.998～43.286）。结论 低密度环在甲状腺结节中的出现率较高，不光整低密度环征及咬饼征、增强后病变模糊在 PTC 的诊断中具有重要价值，多种征象联合可以进一步提高 PTC 诊断的准确性。

EPO-0347
40 例甲状旁腺囊肿 CT 诊断

杨金荣,王丽君
大连医科大学附属第一医院

目的：探讨 CT CT 在甲状旁腺囊肿诊断中价值。方法：搜集经过手术和病理证实的甲状旁腺囊肿共 40 例，其中进行 CT 平扫及双期增强病例共 33 例。分析甲状旁腺囊肿部位、形态及最大径的位置、CT 值及与甲状腺的关系。结果：40 例甲状旁腺囊肿中 30 例为女性， 10 例男性，年龄 21～70 岁，平均年龄 51.89 岁。14 例伴发甲状腺疾病。而 CT 检查 32 例甲状旁腺囊肿均位于甲状腺下部后方或者下方，9 例位于右侧，23 例位于左侧。均显示气管食管沟及气管旁与颈总动脉之间，2 例至上纵隔，3 例跨越中线生长。5 例呈类圆形，7 例椭圆形，20 例形状稍不规则；直径大小 1.0cm～6.1cm。平均 CT 值 13.1HU，增强扫描内部未见强化，边缘轻度线状强化。与甲状腺之间界限清晰，平扫或增强可见低密度线分隔。结论：成年女性甲状腺下极附近囊性病灶，包膜清晰，内部均匀水样密度，与甲状腺分界清晰，应考虑甲状旁腺囊肿可能。

EPO-0348
基于模型的迭代重建在减少硬化伪影对甲状腺 CT 成像中的价值

贾永军,于楠,段海峰
陕西中医药大学附属医院

目的 探讨 MBIR 在减少胸廓入口处硬化伪影对甲状腺 CT 图像的影响。**方法** 回顾性选取超声发现甲状腺结节并行胸部 CT 平扫患者 20 例，使用 FBP、ASIR40、$MBIR_{STND}$、$MBIR_{NR40}$ 四种算法重建层厚 0.625 ㎜ 图，选取冠状位图像线束硬化伪影最明显平面放置感兴趣区分别测量甲状腺左右叶伪影

干扰处及周围正常甲状腺组织 CT 值和标准差并计算甲状腺伪影指数（AI），AI=（SDa^2-SDb^2）$^{1/2}$。由两名放射科医师在三维图像上采用 4 分法（1 分，重度伪影，甲状腺边缘及结节显示不清，不能诊断；2 分，中度伪影，甲状腺边缘及内部细节显示欠佳，影响诊断；3 分，轻度伪影，甲状腺边缘及内部细节显示较好，不影响诊断；4 分，无带状伪影，甲状腺边缘及内部细节显示）主观评价图像伪影，意见不同时协商统一。采用方差分析、配对 t 检验比较不同重建图像甲状腺左右叶锁骨因硬化伪影干扰正常甲状腺组织 CT 减低值和 AI，采用 wilcoxon 符号等级检验主观评分差异性。**结果** FBP 和 ASIR40 重建甲状腺左右叶 CT 减低值及 AI 大于 $MBIR_{STND}$ 和 $MBIR_{NR40}$ 图像，差异有统计学意义（P＜0.05），FBP 和 ASIR40 重建甲状腺左右叶 CT 减低值及 AI 无统计学差异，$MBIR_{STND}$ 和 $MBIR_{NR40}$ 重建甲状腺右叶 CT 减低值及 AI 无统计学差异、左叶 CT 减低值及 AI 无统计学差异。主观评价锁骨伪影及噪声方面，$MBIR_{STND}$ 和 $MBIR_{NR40}$ 图像甲状腺及结节评分增高，高于 FBP 和 ASIR40,且 $MBIR_{NR40}$ 最优，差异具有统计学意义（P＜0.05）。**结论** MBIR 能够显著降低 CT 扫描时锁骨线束硬化伪影和噪声对甲状腺及其内结节的影响,特别是优化低密度对比设置的 $MBIR_{NR40}$。

甲状腺未分化癌的临床和 CT 特征分析

韩志江
杭州市第一人民医院

【摘要】目的 探讨甲状腺未分化癌的临床和 CT 特征。方法 回顾分析 23 例经病理证实为甲状腺未分化癌的临床和 CT 资料，主要统计患者性别、年龄、主诉病史，以及瘤体大小、分布状态、形态、钙化、坏死、向周围侵犯、淋巴结转移和肺部转移等 CT 征象的分布。结果 23 例 ATC 中，女男比例为 16:7，年龄 53~91 岁（72±8 岁），发现声音嘶哑或颈部肿块 21 例（91.3%），瘤体短期内迅速增大 8 例（34.8%），单叶 6 例，单叶+峡部 8 例，双叶+峡部 9 例，直径 3.0~10.2cm（6.1±1.7cm），瘤体形态不规则 20 例（87.0%），粗大钙化 16 例（69.6%），较大范围坏死 17 例（73.9%），向气管食管沟延伸 15 例（65.2%），颈部淋巴结转移 18 例（78.3%），肺部转移 8 例（34.8%），侵犯气管 16 例（69.6%），侵犯颈动脉 7 例（30.4%），侵犯颈静脉 10 例（43.5%）。结论 老年女性患者、瘤体较大、短期内迅速增大等临床特点，以及形态不规则、粗钙化、较大范围坏死、向气管食管沟延伸、颈部淋巴结转移、肺部转移和侵犯气管、颈动脉、颈静脉等 CT 征象，对 ATC 的定性诊断和对周围结构侵犯、颈部淋巴结转移、远处转移评估等方面具有重要价值。

CT 在超声 4-5 类甲状腺粗钙化结节定性诊断中的价值

韩志江
杭州市第一人民医院

摘要：超声诊断 4-5 类结节时，对于医生或患者而言，都是恶性的不能除外，如果能够通过 CT 检查，将原来超声诊断的 4 类结节降到 3 类结节，将在很大程度上降低没必要的手术创伤，并且为社会节省大量医疗资源。
目的 探讨 CT 在超声 4-5 类甲状腺粗钙化结节定性诊断中的价值。方法回顾分析 2009 年 1 月-2019 年 6 月超声诊断为 4-5 类甲状腺粗钙化结节的 CT 资料，观察增强后边界清晰、伪影、最大 CT 值＞1200HU 在良、恶性结节中的分布，并建立诊断甲状腺良、恶性结节的方程式。结果（具体信息正在整理中） 258 枚超声 4-5 类甲状腺粗钙化结节中，良性结节 218 例，恶性结节 40 例，增强后边

界清晰、伪影、最大 CT 值＞1200HU 均常见于良性结节中（p＜0.05），其 CT 最大值＞1200HU 对良性结节的诊断具有高度的特异度。结论 CT 在超声 4-5 类甲状腺粗钙化结节定性诊断中具有重要价值，可在很大程度上减少不要要的手术创伤

腮腺基底细胞腺瘤的 MRI 诊断与鉴别诊断

刘晓玲[1],王志敏[2]
1.福建医科大学孟超肝胆医院
2.福建医科大学附属第一医院

【摘要】目的 探讨腮腺基底细胞腺瘤的 MRI 影像诊断及鉴别诊断。**资料与方法** 回顾性分析经手术病理证实的 43 例患者 45 个腮腺基底细胞腺瘤的 MRI 影像表现，术前均行 MRI 平扫＋增强检查，对患者性别、发病年龄、临床表现，以及病灶的数目、部位、形态、大小、境界、MRI 信号特点及强化方式进行分析。**结果** 43 例患者中女性 31 例，男性 12 例，平均年龄 47.5 岁（17～78 岁），主要表现为耳垂下方无痛性缓慢生长的肿块。43 例患者中有 2 例为双侧双发病灶，41 例为单侧单发病灶。45 个病灶中 25 个位于腮腺浅叶，12 个跨叶生长，8 个位于腮腺深叶。45 个病灶中 23 个为椭圆形，20 个为类圆形，2 个为分叶状。45 个病灶境界均清楚光滑，体积较小，最大者直径为 38mm。45 个病灶实性成分 T1WI 均呈稍低信号，42 个病灶实性成分压脂 T2WI 呈稍高信号，低于周围正常腮腺实质信号，病灶信号欠均匀，35（78%）个病灶发生囊变，36（80%）个病灶周边见 T2WI 低信号包膜。18 个病灶行 DWI 序列检查，16（89%）个病灶弥散明显受限。增强检查示 43（96%）个病灶实性部分呈明显强化，7 个病例动态增强呈速升平台型方式强化。**结论** 腮腺基底细胞腺瘤好发于老年女性，体积一般较小，易囊变，增强扫描实性成分呈明显强化等影像学特征，结合临床特点有助于肿瘤诊断与鉴别。

EPO-0352

CT 强化程度对甲状腺乳头状癌颈部淋巴结转移的诊断价值

魏培英[1],蒋念东[2],韩志江[1],王海滨[1],丁金旺[1]
1.杭州市第一人民医院
2.杭州市淳安县中医院

目的 探讨 CT 强化程度对甲状腺乳头状癌(Papillary thyroid carcinoma，PTC)颈部淋巴结转移的诊断价值。**方法** 回顾分析经手术病理证实的 251 例 PTC 中 535 枚颈部淋巴结的 CT 资料，计算 CT 增强与平扫密度值的比值和差值，采用 Mann-Whitney 检验分析比值和差值在淋巴结转移组和非转移组中的分布，通过受试者工作特异度曲线(ROC)获得比值和差值在两组中的最佳阈值。**结果** 535 枚颈部淋巴结中，包括转移组 271 枚和非转移组 264 枚，两组的比值分别为 2.30（2.04，2.76）和 1.66（1.51，1.81）（Z=-16.94，P<0.05），差值分别为 58（49，76）Hu 和 31（22，36）Hu (Z=-18.045，p<0.05）。两组比值和差值的 ROC 曲线下面积分别为 0.923 和 0.951，最佳阈值分别为 1.93 和 39.5Hu，诊断淋巴结转移的敏感度和特异度分别为 84.9％和 87.1％、91.5％和 86.0％。两者联合诊断淋巴结转移的敏感度和特异度为 82.3%和 91.7%。**结论** 增强与平扫密度值的比值≥1.93 和差值≥39.5Hu 对 PTC 颈部淋巴结转移具有较高的诊断效能，两者的特异度相仿，后者具有更高的敏感度，两者联
合可以明显提高特异度，从而减少不必要的手术创伤。

EPO-0353
影像组学在甲状腺滤泡性肿瘤良恶性鉴别价值的初步研究

唐鹏洲,周正荣
复旦大学附属肿瘤医院

目的：探讨 CT 纹理分析方法在鉴别甲状腺滤泡性肿瘤良恶性的价值。
方法：回顾性分析经手术病理证实的 122 例甲状腺滤泡肿瘤的影像学资料，随机分为训练组和验证组，根据病理结果分为良性组和恶性组。采用 LIFEx 软件提取纹理特征。采用 R 软件 Lasso 模型进行特征筛选及模型建立。采用 ROC 曲线评价模型的预测效能。
结果：经筛选的纹理特征建立的影像组学标签对甲状腺滤泡性肿瘤的良恶性具有较好的预测效能。训练组和验证组中的 AUC 分别未 0.91、0.86，敏感度分别为 86.11%、70.00%，特异度分别为 86.67%、95.24%。
结论：CT 纹理分析对于甲状腺滤泡状肿瘤的良恶性鉴别具有较好的预测效能，为临床制定治疗方案提供依据。

EPO-0354
增强 CT 对甲状腺乳头状癌中央区转移淋巴结的诊断价值

田江雨,雷萍
核工业四一六医院

目的：探究增强 CT 对甲状腺乳头状癌（Papillary Thyoid Carcinoma，PTC）中央区淋巴结（Central Lymph Node，CLN）转移的诊断价值。方法：回顾 2018 年 11 至 2019 年 7 月病理证实为 PTC 的患者，分析术前增强 CT 图像，包括中央区淋巴结短径是否大于 5mm，有无明显强化、不均匀强化、囊变/坏死、钙化，术后病理结果比较并分析。结果：81 例患者，共计切除 111 侧 CLN，44 侧转移，CT 假阳性 5 侧，包括 1 侧出现异位甲状腺，4 侧出现淋巴结炎性反应性增生，假阴性 25 侧，均为轻度强化/小于 5mm 的淋巴结。增强诊断 PTCCLN 转移的 CT 敏感性为 43.2%，特异性为 92.5%，阳性预测值为 79.2%，阴性预测值为 28.7%。结果：增强 CT 诊断 PTC 患者伴 CLN 转移的特异性较高，但敏感性不足，在临床工作中预防性切除 PTC 患者 CLN 具有重要意义。

EPO-0355
第三代双源 CT 双能量碘图在甲状腺结节鉴别诊断中的应用

贺敬红,张丽,乔英
山西医科大学第一医院

目的 利用西门子第三代双源 CT 双能量碘图测定甲状腺结节的碘浓度并探讨其鉴别良恶性价值。
方法 回顾性分析经病理证实的 68 例甲状腺结节患者术前的 Force 双源 CT 双能量平扫及增强资料，经后处理工作站分别得出碘图，比较甲状腺结节平扫、动脉期及静脉期碘浓度、标准化碘浓度(NIC)，绘制 ROC 曲线，分析应用碘浓度及 NIC 对甲状腺结节鉴别的诊断效能。**结果** 平扫甲状腺良性结节碘浓度 $IC_{病灶}$为 1.1175±0.3961mg/ml，恶性结节 $IC_{病灶}$为 0.7042±0.3394mg/ml，良性大于恶性，差异有统计学意义（$P<0.05$）；两者均低于正常甲状腺组织，正常甲状腺组织碘浓度 $IC_{甲状腺}$与 $IC_{病灶}$良恶性结节比较有统计学差异（$P<0.05$）。动脉期良恶性结节标准化碘浓度比（NIC）分别为 0.4025±0.0984、0.3825±0.0659，差异无统计学意义($P>0.05$)；静脉期良、恶性结节 NIC 分别为 0.7607±0.2245、0.5946±0.1674，良性大于恶性，差异有统计学意义($P<0.05$)。平扫碘

浓度界值为 0.85mg/ml 时，灵敏度为 72.5%，特异度为 60.8%；增强扫描静脉期 NIC 界值为 0.59 时，灵敏度为 75%，特异度为 54.2%。**结论** Force 双源 CT 双能量碘图成为鉴别甲状腺结节良恶性的有效影像检查手段之一。

高分辨弥散 RESOLVE-DWI 序列与常规 DWI 在舌癌的对照应用研究

廖旦,宋辉,王荣品
贵州省人民医院

目的 *探讨* 1.5 T MRI 分段读出扩散加权成像(RESOLVE DWI) 与常规扩散加权成像(DWI) 对舌癌图像质量的影像。
方法 回顾性分析 28 *例经手术病理证实为舌癌的患者，所有患者术前均行磁共振平扫、增强及* RESOLVE DWI 与常规 DWI *成像。分别计算常规* DWI 及 RESOLVE DWI 图像的信噪比(SNR) 、对比度(CR) 、对比噪声比(CNR) 及表观扩散系数(ADC) 值，分别评价不同序列对于舌部解剖的显示、图像畸变的程度，病灶的清晰度以及图像的整体质量评分。应用 SPSS 24.0 统计学软件对于数据进行分析，使用配对 Wilcoxon 秩和检验比较主观评分及图像质量之间的差异，采用 ICC 曲线分析评价 2 名医师评分之间的一致性。
结果 2 名医师对 28 例舌癌常规 DWI 和 RESOLVEDWI 图像解剖结构、病灶的清晰度与图像畸变的程度以及图像的整体质量评分的一致性均较好，RESOLVE DWI 对于舌部的解剖结构显示、病灶的清晰度与图像的畸变程度明显高于常规 DWI，差异有统计学意义，(P＜0.05)； RESOLVE DWI 中的图像的 SNR、CR、CNR 显著高于常规 DWI，差异有统计学意义，(P＜0.05)；舌癌病灶 RESOLVE DWI 的 ADC 值和常规 DWI 的 ADC 值无显著差异性(P＞0.05) 。
结论 RESOLVE DWI 图像质量优于常规 DWI，可以降低图像变形，提高图像
质量，对于舌癌病灶的显示具有更好的诊断价值，可以作为舌癌的常规影像诊断方法。

Development and validation of an ultrasound-based nomogram to improve the diagnostic accuracy of identification of malignant thyroid nodules

Baoliang Guo,Qiugen Hu
Shunde Hospital， Southern Medical University

Objectives: The aim of this study was to develop an ultrasound-based nomogram to improve the diagnostic accuracy of the identification of malignant thyroid nodules.
Methods: A total of 1,675 histologically proven thyroid nodules (1169 benign, 506 malignant) were included in this study. The nodules were grouped into the training dataset (n = 700), internal validation dataset (n = 479), or external validation dataset (n = 496). The grayscale ultrasound features included the nodule size, shape, aspect ratio, echogenicity, margins, and calcification pattern. We applied least absolute shrinkage and selection operator (lasso) regression to select the strongest features for the nomogram. Nomogram discrimination (area under the receiver operating characteristic curve, AUC) and calibration were assessed. The nomogram was subjected

to bootstrapping validation (1,000 bootstrap resamples) to calculate a mean AUC and 95% confidence interval (CI).
Results: The nomogram showed good discrimination in the training dataset, with an AUC of 0.936 (95% CI: 0.918-0.953) and good calibration. Application of the nomogram to the internal validation dataset also resulted in good discrimination (AUC: 0.935; 95% CI, 0.915-0.954) and good calibration. The model tested in an external validation dataset demonstrated a lower AUC of 0.782 (95% CI: 0.776-0.789).
Conclusions: This ultrasound-based nomogram could be used to quantify the probability of malignant thyroid nodules.

Visualization of trigeminal Nerve Using 3D STIR sequence after contrast

Hao Mei,Huan Li,Ming Deng,Jian Fang,HaiBo Xu
Zhongnan hospital of wuhan university

Purpose: The objective of this study was to explore the feasibility of using 3D STIR SPACE after contrast to visualize the trigeminal Nerves at 3T.
Material and methods: Ten healthy volunteers and Five patients were examined with 3D STIR sequence after contrast. The data obtained were reconstructed in relation to the course of the trigeminal nerve by using the MPR and thin-section MIP programs. Images acquired were analyzed by 2 neuroradiologists . They made the initial evaluations independently, The certainty of identifying each division of the trigeminal nerve was scored and recorded on an arbitrary scale of 0－2. Statistical evaluation of the results was achieved by the 2-tailed Wilcoxon test.
RESULTS: In all subjects, 3D STIR SPACE images provided a reliable definition of the normal trigeminal bilaterally. There were no significant differences between scores of bilateral trigeminal nerves (P＞.05). The trigeminal nerve showed high signal intensity while the surrounding soft tissue showed relatively low signal intensity.
CONCLUSIONS: The 3D STIR SPACE sequence after contrast can display the course of normal trigeminal nerves.

正常人颌面部骨性孔道的形态学分析

靳新娟,于德新
山东大学齐鲁医院

摘要：目的：测量正常人颌面部主要骨性孔道（眶下管、鼻泪管及颧眼管）孔径、鼻泪管的含气量及位置等形态学参数，探讨颌面部主要骨性管道有无偏侧化、性别差异、年龄相关的改变以及鼻泪管位置及含气量与孔径的关系。方法：对 64 位年龄范围 6-80 岁的正常人（平均年龄 42.7 ±18.1 岁；其中男性 43 人，女性 21 人）的颌面部 Force 双源 CT 精细薄层轴位图像行双侧眶下管、颧眼管及鼻泪管的孔道直径、鼻泪管含气量和位置以及颧眼孔的眶距及眶水平中线距等形态学参数进行测量评价，之后对各骨性孔道的形态学参数行性别、左右侧、鼻泪管的含气量和位置孔道直径的关

系等进行统计学分析。结果：①除眶下管内孔直径有性别差异外（$p<0.05$），余各骨性孔道形态学测量值无显著的性别差异②鼻泪管含气量、位置及颧眼孔外孔左右无显著差异外，余颌面部主要骨性孔道的形态学参数均有显著的偏侧性（$p<0.01$）③右侧鼻泪管的含气量及位置与右侧鼻泪管上孔及中段直径显著相关（$p<0.05$），但左侧无显著相关④左侧鼻泪管中段直径、颧眼孔左侧内孔及颧眼孔眶水平中线距与年龄相关（$p<0.05$），余颌面部骨性孔道的形态学参数与年龄无显著的相关性。结论：全面了解颌面部骨性孔道的性别差异、偏侧性及鼻泪管的位置和含气量等形态学特征，对颌面部手术方案的选择极其重要。

高分辨力 MR 血管壁成像技术在头颈动脉夹层诊断中的应用价值

洪桂洵,杨智云,李竹浩,邹梦莎
中山大学附属第一医院

目的：探讨高分辨力血管壁 MRI(HR-MRI)在头颈动脉夹层诊断中的价值。方法：前瞻性连续纳入 2017 年 6 月-2019 年 3 月就诊的头颈动脉夹层患者 25 例，采用 12 通道头颈联合线圈行头颈一体化 HR-MRI 成像，其中 3 例随访共 3 次，3 例随访 2 次。根据纳入病人的临床病史、实验室检查、影像检查对夹层做出综合诊断并作为参考标准。由 2 名放射科医生对 HR-MRI 影像进行分析，评价内容包括夹层累及的血管、夹层数目、内膜片、壁内血肿及双腔征等。结果：25 例中 HR-MRI 显示 33 个血管节段存在夹层（包括颈内动脉 13 个节段、椎动脉 13 个节段、基底动脉 5 个节段、大脑中动脉 2 个节段），其中 30 个血管节段见壁内血肿，25 个血管节段见双腔征。6 例随访的病例经治疗后夹层病灶均有不同程度缩小，临床症状减轻。结论：头颈联合 HR-MRI 可全景显示夹层动脉管壁特征，可作为动脉夹层诊断和随访的一线检查技术，其中 3D-T1WI-SPACE 可作为随访评估的重要序列，可重复性强。

EPO-0362
颈椎曲度变直患者横韧带损伤研究

刘学焕,郝彩仙,刘筠
天津市人民医院

目的：探讨颈椎曲度变直患者横韧带异常改变，为早期诊断横韧带损伤提供客观依据。
材料与方法：选取 2018 年 1 月至 2019 年 6 月因颈部不适于天津市人民医院脊柱科就诊的 18-30 岁颈椎曲度变直患者 50 例为病例组。同期选取年龄、性别相匹配，无颈部症状、颈椎曲度存在志愿者 50 例为对照组。所有受试者均于西门子 3.0 T 磁共振检查仪行横韧带 PDWI 检查。以垂直于齿突的横轴位为扫描方向，扫描范围为枕骨大孔水平至枢椎椎体下缘水平。以横韧带全部或局部信号高于同层肌肉信号视为信号异常。
结果：全部受试者均完成横韧带 MRI 检查，病例组有 2 例、对照组有 1 例受试者因运动伪影图像质量不满足分析要求。病例组有 31（31/48）例患者表现为横韧带局部信号增高，未见横韧带信号弥漫性增高。对照组有 4 例（4/49）出现横韧带局部信号增高，未见横韧带信号弥漫性增高。两组间横韧带信号增高发生率差异有统计学意义（*P<0.05)*。
结论：对于有颈部症状的颈椎曲度变直患者需进行横韧带 MRI 检查除外横韧带损伤。

EPO-0363

腭部腺样囊性癌的 CT 表现特点

董敏俊,孙琦,陶晓峰
上海交通大学医学院附属第九人民医院

目的：评价腭部黏膜完整的腺样囊性癌（acc）的 CT 表现，建立其临床诊断的预测模型。
方法：从 2016 年 3 月至 2018 年 5 月，共收集 102 例腭部粘膜完整的肿瘤入组，其中 28 例术后病理诊断为 ACC。记录并分析患者的临床症状、CT 表现特征及病理诊断。采用单变量分析和多变量 logistic 回归确定了 ACC 的独立预测因子，并对预测模型进行了判别和校正，并进行了内部验证。
结果：对患者的单变量分析显示，与非 ACC 患者相比，ACC 患者多为老年人（P=0.019）；多表现为腭骨破坏（P<0.001）和腭大孔（GPF）增大（P<0.001）；累及翼腭窝（P<0.001）、圆孔（P<0.001）、鼻腔（P<0.001）和上颌骨（P<0.001）。同时伴有麻木（P=0.007）和疼痛（P<0.001）。多变量 logistic 分析显示年龄和 GPF 增大是腭部肿瘤中 ACC 的独立预测因子。根据受试者工作特性曲线下面积（0.98）和霍斯默-莱梅肖拟合优度检验（P=0.927），诊断预测模型显示出良好的识别和校正能力。
结论：基于年龄和 GPF 增大的腭部 ACC 预测模型显示出良好的辨别力，没有校准不良的迹象。腭部粘膜完整的老年肿瘤患者，有 GPF 增大时应首先考虑 ACC。

EPO-0364

A diagnostic prediction model of adenoid cystic carcinoma for masses in the palate

Minjun Dong,Qi Sun,Xiaofeng Tao
the Ninth people’s hospital， school of medicine， Shanghai Jiaotong University

Objective: To create and evaluate a diagnostic prediction model of adenoid cystic carcinoma (ACC) for the patients with palatine tumors.

Materials and Methods: From March 2016 to May 2018, 102 patients with palatine tumors, including 28 patients with pathological diagnosis of ACC were enrolled in this study. The patients' clinical symptoms, computed tomography features and pathological diagnoses were recorded and analyzed. Independent predictors of ACC were detected by using univariate analysis and multivariate logistic regression, then the discrimination and calibration of the prediction model was evaluated and internal validation was performed.
Results: Univariate analysis of patients showed: ACC patients were more likely to be older, with palatine bone destruction, greater palatine foramen (GPF) enlargement, pterygopalatine fossa involvement, foramen rotundum involvement, nasal cavity involvement, maxillary bone involvement, numb and pain. Multivariate logistic analysis showed: age and GPF enlargement were independent predictors of ACC in palatal masses. The diagnostic prediction model had excellent discrimination and calibration. The area under the receiver operating characteristic curve for the prediction model was 0.98. The calibration of the model was assessed by Hosmer Lemeshow goodness-of-fit test (p=0.927). The evaluation was further confirmed by internal validation.
Conclusion: The age and GPF enlargement prediction model for ACC in the palate shows excellent discrimination with no evidence of poor calibration. The older patients with palatine masses should be considered with ACC when they GPF enlargement.

EPO-0365
磁共振弥散张量成像在巨大听神经瘤患者术前评估面神经中的临床应用

司明珏
上海交通大学医学院附属第九人民医院

目的：巨大听神经瘤患者的面神经由于受到肿瘤推挤，可向多个方向移位，因此在切除巨大听神经瘤时如何保护面神经对外科医生是一项艰巨的挑战。本研究旨在探讨利用磁共振弥散张量成像（DTI）通过追踪神经束的走行，从而实现术前评估面神经形态及与听神经瘤体的空间关系。

方法：本研究前瞻性收集 5 例巨大听神经瘤（肿瘤直径>2cm）患者，术前通过 House-Brackman 分级确定面神经功能正常。利用 GE 3.0T 磁共振先行桥小脑角区常规 T1WI 及 T2WI 扫描后，再行 DTI 功能成像，成像参数：b=1000s/mm^{2}序列扫描 64 个方向；b=0 序列：TR 6900ms, TE 80ms，层厚 1.5mm，无间隔扫描，FOV 22.4×22.4mm，NEX=2，扫描层数 55~65 层。然后行 T2 加权的 3D FIESTA 扫描，用于后处理时与 DTI 序列叠加定位的解剖学成像序列。 利用 Functional tool 后处理工作站软件，把 SeedROI 放到桥小脑角面神经发出的部位，点击 Tracking 得到数条白质纤维束。然后导入 3D FIESTA 解剖学序列来修正 ROI 的放置位置，检验所追踪出的神经纤维束中哪一根为面神经，确定其与听神经瘤体的空间关系，并与术中所见进行对比验证。

结果：5 例听神经瘤患者中 4 例 DTI 追踪出了面神经， 1 例 DTI 未能追踪出面神经，可能是因为肿瘤太大（直径 4.6cm），术中发现面神经被挤压菲薄如纸，故未能成功追踪出神经束。4 例中 2 例面神经桥池段位于肿瘤前方中部，1 例位于前方上部，1 例位于前方下部，DTI 成像结果与术中所见结果相吻合。

结论：磁共振弥散张量成像（DTI）在巨大听神经瘤患者术前追踪面神经领域具有很高的临床应用价值，但当听神经瘤体过大时可能追踪失败，仍需对磁共振成像方法学和后处理技术做进一步探索和改进。

EPO-0366

Clinical Application of Diffusion Tensor Imaging in Preoperative Evaluation of Facial Nerve in Patients with Giant Acoustic Neuroma

Mingjue Si
Shanghai Ninth People's Hospital, Affiliated to Shanghai Jiaotong University School of Medicine

Objective: In patients with giant acoustic neuroma, the adjacent facial nerve can be displaced in many directions due to the pushing of tumors. Therefore, it is a challenge for surgeons to protect the adjacent facial nerve when resecting giant acoustic neuroma. The purpose of this study was to investigate the spatial relationship between acoustic neuroma and the adjacent facial nerve by tracking the course of facial nerve tract by using diffusion tensor imaging (DTI).

Materials: Five cases of patients with giant acoustic neuroma (tumor diameters > 2 cm) were prospectively collected and facial nerve function was determined by using House-Brackman grading before operation. The cerebellopontine angle was scanned by conventional T1WI and T2 WI on a GE 3.0T MR and followed by DTI functional imaging. Imaging parameters: b=1000s/mm^2 sequence, 64 directions were scanned, and b=0 sequence: TR 6900ms, TE 80ms, slice thickness 1.5mm, no interval scanning, FOV 22.4 × 22.4mm, NEX = 2. T2-weighted 3D FIESTA scan was performed to superimpose and anatomically locate the DTI images on Functional Tool Post- Processing Workstation. Seed ROI was placed at the site of the facial nerve in the cerebellopontine angle. Then we click Tracking and put target ROI at the distal end of the internal auditory canal near the cochlea, and several white matter bundles were obtained. After that, the 3D FIESTA anatomical images were used to determine the facial nerve fiber tract and its spatial relationship with the acoustic neuroma, which was compared with the intraoperative findings.

Results: Facial nerve was accurately traced by DTI in 4 of 5 cases, but failed in 1 case, probably due to the extremely large tumor size (4.6cm in diameter), which squeezed the adjacent facial nerve as thin as paper. Within the 4 succeed cases, the pontine cistern segment of the facial nerve was located in the middle anterior part of the tumors in 2 cases, and in the upper anterior part in 1 case and in the lower anterior part in 1 case. The DTI results were in accordance with intraoperative findings.

Conclusion: Magnetic resonance DTI imaging has high clinical value in the evaluation of adjacent facial nerve for patients with giant acoustic neuroma before surgery.

However, when the tumor is too large, it can be difficult to track. Further exploration and improvement of MRI techniques and post-processing treatments are still needed in future.

EPO-0367
磁共振波谱参数变量在颌面部肿瘤中应用价值的探索

王博成,朱丹,吴庆龙,潘皓青,鲁煜,吴利忠
上海交通大学医学院附属第九人民医院

目的 探讨磁共振波谱成像参数变量中ＴＥ时间变化对颌面部肿瘤检测的区别和价值。
材料与方法 选取我院确诊为颌面部舌鳞癌患者 40 例和正常对照组 20 例。将其分为短ＴＥ肿瘤组（A 组 n=20）、短ＴＥ对照组（B 组 n=10）、长ＴＥ肿瘤组（C 组 n=20）、长ＴＥ对照组（D 组 n=10）。所有病例均行术前ＭＲＳ检查并进行后处理分析，测量比较 Cho、Cr、Cho/Cr 比值、LL。将取值采用两独立样本 t 检验方法进行统计学分析。
结果 (1)A 组与 B 组比较 Cho、Cr、Cho/Cr、LL 峰差异有统计学意义（P<0.01）；（2）C 组与 D 组比较 Cho、Cr、Cho/Cr、LL 差异有统计学意义（P<0.01）；(3)A 组与 C 组 Cho、Cr、Cho/Cr、LL 差异有统计学意义（P<0.01）.
结论 磁共振波谱成像能在舌鳞癌诊疗中提供一定的诊断信息，参数变量 TE 时间的取值决定了不同的谱峰含量和形态，具有一定的临床应用价值。

EPO-0368
鼻腭部腺样囊性癌嗜神经扩散的征象研究

黄义,徐琪,潘初
华中科技大学同济医学院附属同济医院

目的：通过对鼻腭部腺样囊性癌（ACC）和鼻腭部鳞状细胞癌（SCC）磁共振成像（MR）对比分析，探讨鼻腭部腺样囊性癌嗜神经扩散的 MR 表现，以提高临床认识。**方法**：回顾性分析本院 2012-2018 年以来经手术病理证实的鼻腭部原发性腺样囊性癌以及鼻腭部原发性鳞状细胞癌的临床和影像学资料。采用两独立样本 t 检验分析两组间嗜神经扩散征象发生率的差异。**结果**： 鼻腭部原发性腺样囊性癌 24 例，鼻腭部原发性鳞状细胞癌 26 例。鼻腭部 ACC 常侵犯翼腭窝，发生率达 75%。两组间神经增粗、强化；翼腭窝脂肪间隙消失；海绵窦被软组织包绕；Meckel 腔长 T2 信号消失；肌肉水肿强化发生率的差异均具有统计学意义（P＜0.05）。两组间肿瘤对翼腭窝、卵圆孔、翼管、腭大孔侵蚀的差别具有统计学意义（P＜0.05），肿瘤对眶下裂的侵蚀无统计学意义（P＞0.05）。**结论**：MR 对鼻腭部腺样囊性癌神经周围扩散的诊断有一定价值。鼻腭部腺样囊性癌嗜神经扩散征象的发生率明显高于鳞状细胞癌。

EPO-0369
探讨常规磁共振联合 DWI 和 DCE-MRI 对颈静脉孔区肿瘤及肿瘤样病变的鉴别诊断价值

唐为卿
上海交通大学医学院附属第九人民医院

目的：探讨常规磁共振联合弥散加权成像（Diffusion weighted imaging，DWI）和动态增强磁共振（Dynamic contrast enhancement MRI，DCE-MRI）对于颈静脉孔区肿瘤的病理类型的判断及鉴别诊断价值。材料与方法：前瞻性分析 2015 年 1 月-2018 年 12 月颈静脉孔区肿瘤或肿瘤样病变的磁共振特征。所有病例均行术前磁共振检查，且经过手术确认手术病理。两名研究者对于磁共振图像作出独立评估，并记录肿瘤的信号、形态特点、时间-信号曲线（time-intensity cure，TIC）类型、表观弥散系数（Apparent diffusion coefficient, ADC）。采用卡方分析检验两研究者间诊断差异及不同病理类型间影像学差异。结果：最终纳入病例 49 例，病理结果显示良性肿瘤 31 例，恶性肿瘤 18 例。两名研究者对于肿瘤良恶性定性诊断准确率分别为 93.8%及 91.8%，一致性良好（P＞0.05）。软骨肉瘤表现为明显 T2WI 高信号，与副神经节瘤、脑膜瘤的信号特点有明显差异（P＜0.05），与神经鞘瘤 T2WI 信号强度差异不明显（P＞0.05）。TIC 曲线表现上，所有副神经节瘤均表现为廓清型曲线，神经鞘瘤和脑膜瘤表现为持续上升型或平台型曲线，所有软骨肉瘤均表现为持续上升型曲线，副神经节瘤与其他肿瘤类型在 TIC 曲线表现上有明显统计学差异（P＜0.001）。DWI 序列提示软骨肉瘤的 ADC 均值明显高于良性肿瘤（P＜0.001）。良性肿瘤中神经鞘瘤的 ADC 均值高于副神经节瘤及脑膜瘤（P＜0.05）。结论：常规磁共振联合 DWI 和 DCE-MRI 在颈静脉孔区肿瘤及肿瘤样病变的鉴别诊断中具有较高的准确性，能为临床治疗选择提供可靠依据。

腮腺基底细胞腺瘤与 Wathin’s 瘤的 CT 和临床特征

孙世宁,孙立新,巩若箴,刘朝娣,张昕越
山东省立医院耳鼻喉医院山东省立医院西院(原:山东煤矿总医院)

目的：探究腮腺基底细胞腺瘤与 Wathin’s 瘤的 CT 和临床特征，为腮腺基底细胞瘤与 Wathin’s 瘤的诊断和鉴别提供依据。
方法：回顾性分析我院经手术及病理证实的腮腺基底细胞腺瘤 12 例、Wathin’s 瘤 23 例，对其性别构成、年龄、有无吸烟史、病灶数目、病灶位置、病灶大小、有无囊变、有无壁结节、CT 强化程度进行分析对比。
结果：两种肿瘤患者的性别构成、年龄、有无吸烟史、有无壁结节、CT 强化程度差异存在统计学意义（P<0.05），其中腮腺基底细胞瘤患者女性多见，发病年龄相对较小，CT 强化明显且有壁结节，而 Wathin’s 瘤患者男性多见，发病年龄较大，有吸烟史，CT 强化明显，延迟强化迅速减退，呈“速升速降”。
结论：根据 CT 和临床特征可对腮腺基底细胞腺瘤与 Wathin’s 瘤做出较为准确的定性诊断，有利于外科手术的方案的确定。

EPO-0371
MR imaging findings of nodular fasciitis in the head and neck

Shaoying Wang

Department of Radiology, Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University

Introduction and objectives: The purpose of this study was to describe the MR imaging findings of nodular fasciitis occurring in the head and neck region.
Material and Methods: We retrospectively reviewed MR images of nodular fasciitis with pathologic correlation in 8 cases collected between August 2003 and October 2015 from our pathologic database. All of the MR images were retrospectively evaluated with respect to the location, size, relationship to fascia, signal characteristics , enhancement, and enhancement pattern by 2 experienced radiologists.
Results and discussion: All patients presented with a palpable mass in the head and neck that was noticed 13 months earlier. There were 2 male and 6 female patients. Mean age was 40 years (range, 2159 years). Lesions ranged in size from 1.2 to 2.7 cm. All lesions were located in the head and neck region. Six lesions were subcutaneous in location, and 2 were intra-muscular. Lesions were consistently ovoid in shape with broad fascial contact. They exhibited internal homogenous low T1 and heterogeneous intermediate T2 signal with surrounding edema and slightly inhomogeneous enhancement. One lesions exhibited central non-enhancing areas.
Conclusions: MR imaging features of nodular fasciitis are generally non-specific and can be mistaken for a soft tissue sarcoma. This series, the largest MRI series of head and neck cases in the literature, confirms the predilection of nodular fasciitis for the head and neck. When a rapidly growing oval mass in contiguity with a fascial plane is recognized, the diagnosis of nodular fasciitis should be entertained.

EPO-0372

颈源性眩晕患者静息态脑功能连接研究

匡翠立,查云飞
武汉大学人民医院

目的 通过静息态功能磁共振分析方法，研究颈源性眩晕（Cervical Vertigo-CV）[1]患者脑区间长程功能连接和局部相邻神经元之间短程连接的特异性改变。
方法 通过 CONN[2]软件计算 31 例 CV 患者和 25 例正常对照（Normal Controls-NC）基于 AAL[3]模板 116 个脑区任意两个脑区间的功能连接，对每条连接进行两组间独立双样本 T 检验（$p<0.05$，错误发现率校正）；与此同时，通过 DPABI[4]软件计算两组各被试的 zReHo[5]指标值并做组间独立双样本 T 检验（$p<0.01$, cluster $p<0.05$,高斯随机场理论校正），随后，对有组间显著差异的功能连接和 zReHo 指标值分别依次进行与眩晕障碍量表评分（DHI）及其亚量表，躯体得分（PS），情绪得分（ES），功能得分（FS）间线性回归相关分析。
结果 相比 NC 组，CV 组分别有 6 条显著增强和减弱的功能连接（表 1，图 1）。CV 组左侧辅助运动区的 zReHo 值相比 NC 组显著增加，而双侧内侧额上回的 zReHo 值相比 NC 组显著减弱（表 2，图 2）。CV 组左侧额中回与 Vermis_4_5 间功能连接和 ES 显著正相关($r=0.4624$, $p<0.0115$)，左侧辅助运动区与 Vermis_3 间功能连接和 PS 显著正相关 ($r=0.4338$, $p<0.0187$)（图 3）。CV 组相比 NC 组具有显著改变的 zReHo 值与其各临床量表评分均不存在相关性。
结论 CV 组左侧辅助运动区和左侧前辅助运动区局部神经元间短程连接的改变及其与其他脑区间长程功能连接的改变一定程度上解释了 CV 患者躯体控制能力减弱的原因，以及其显著改变的功能连接与临床量表评分间的相关性可以尝试作为影像学指标以辅助对 CV 展开更进一步的认识。

EPO-0373

Delayed time-density curve in acute ischemic stroke patients with severe cardiogenic diseases may result in abnormal perfusion results

Ruoyao Cao, Juan Chen
Beijing Hospital

Objective: CTP is widely used in acute ischemic stroke before reperfusion therapy. At present, the standard CTP protocol adopts the discontinuous volumetric scanning with fixed time interval and phases, which is well used in patients with normal systemic circulation time. We found that some patients with severe cardiogenic diseases had a delayed TDC which resulted in some perfusion data losing. The aim of this study is to explore whether a delayed time-density curve (TDC) in patients with severe cardiogenic diseases can result in partial perfusion data losing and wrong perfusion results.
Method: Twenty-nine acute ischemic stroke patients with unilateral anterior circulation large vessels occlusion were divided into two groups A and B. Nineteen patients in group A had normal TDC, and ten patients in group B with severe cardiogenic diseases had delayed TDC. Circulation time here was defined as the time from injection to peak of the venous curve. Perfusion parameters including CBF, CBV, TTP and MTT in all patients were all recorded and compared between bilateral hemispheres. The parameters in the lesion side and mirror side of brain in two groups were compared.
Result: CBF at the affected hemispheres in group B was increased in the infarction area rather than decreased (36.7±11.7 vs 26.7±11.0, $P<0.05$), and MTT was obviously shorten rather than prolonged (2.5±0.6 vs 4.4±1.1, $P<0.05$). Circulation time (22.4 vs 37.4, $P<0.05$) was significant difference between two groups.
Conclusion: Patients with severe cardiogenic diseases may have a delayed TDC due to delayed or slow circulation. In these patients, the standard CTP protocol may have resulted in some perfusion data losing and wrong perfusion results.

15 例腮腺脂肪瘤的 CT 与 MRI 表现分析

刘红生[1], 段嘉峰[2], 高明[1], 李立峰[2], 杨军乐[1]
1.西安市中心医院
2.西安交通大学口腔医院

目的 探讨腮腺脂肪瘤的 CT 与 MRI 表现特点，以提高其认识水平。
方法 收集 15 例经手术病理证实的腮腺脂肪瘤的 CT 与 MRI 资料，回顾性分析其影像学表现（包括肿块大小、形态、边界、内部密度/信号、增强特点及周围淋巴结等），并与病理学对照分析。
结果 （1）临床发病情况： 15 例患者中男性 9 例，女性 6 例；发病年龄 20-74 岁，平均（44.0±6.8）岁；所有患者均为单侧发病，左侧 7 例，右侧 8 例。（2） CT 检查：11 例患者行

CT 检查，表现为，①形态：3 例呈分叶状，5 例为较规则的圆形或椭圆形，3 例呈不规则形，包膜不完整，其中 2 例向咽旁间隙生长，1 例向颌下区浸润性生长。②边界：9 例边界尚清晰，2 例复发性脂肪瘤边界欠清。③密度：8 例均呈脂肪样低密度影；3 例呈混杂密度影，其中 2 例可见钙化密度影，1 例夹杂软组织密度影。④增强模式：7 例患者行增强 CT 扫描，其中 4 例双期扫描未见明显增强，3 例呈轻度不均匀强化。（3）MRI 检查：10 例患者行 MR 检查，特点为，①形态：4 例呈分叶状，6 例为较规则的圆形或椭圆形。②边界：6 例边界清晰，4 例边界欠清晰。③内部信号：6 例表现为较均匀短 T1 长 T2 信号，4 例不均质短 T1 中等 T2 信号，其内伴有团状或条索样低信号，脂肪抑制序列呈均匀或不均匀低信号。④增强模式：6 例患者行增强扫描，其中 3 例未见显著增强，3 例呈轻度不均匀强化。⑤周边淋巴结：病灶周边均未见明显肿大淋巴结。

结论 腮腺脂肪瘤为少见的良性肿瘤，具有较为特征的影像学表现，临床上应将 CT 与 MR 等影像学检查方法相结合，以期早期发现病变。

EPO-0375
头颈部 CT 动脉成像对颈动脉体瘤术中出血量的预测价值

陈钰[1],李展展[1,2],刘昊喆[1],金征宇[1]
1.中国医学科学院北京协和医院
2.河南科技大学附属三门峡市中心医院

目的：探讨头颈部 CT 动脉成像（CTA）对颈动脉体瘤术中出血量的预测价值。**方法：**回顾性分析 36 名经诊断颈动脉体瘤并行手术治疗的患者的头颈部 CTA 影像资料，结合多种后处理技术仔细观察颈动脉体瘤供血动脉来源及数量，Shamblin 分型，测量平扫及增强 CT 图像上肿瘤最大截面 CT 值等，测量肿瘤轴位最大径及冠状位上下最长径等，对比分析术中出血量＜500ml 组与术中出血量≥500ml 组的病例患者年龄，性别，病程，Shamblin 分型，病灶轴位最大径，上下最长径，平扫及增强 CT 值的差别，建立受试者工作特征曲线(ROC)，计算各指标预测术中出血量≥500ml 的灵敏度、特异度。**结果：**颈动脉体瘤术中出血量＜500ml 组与术中出血量≥500ml 组在患者年龄（*P*=0.025）、肿瘤的上下最大径（*P*=0.004）、轴位最长径（*P*=0.007）、Shamblin 分型（*P*=0.012）、供血动脉数量（P＜0.01）方面差异均有统计学意义。供血动脉数量对于 CBT 患者的术中出血量 AUC 值（0.865）大于上下最大径（AUC=0.806）、轴位最长径（AUC=0.781）以及 Shamblin 分型（ AUC= 0.766）。当供血动脉数量最佳临界值取 3.5 时，准确性，灵敏度及特异度分别是 81.1%，81.8%及 80.8%。**结论：**颈动脉体瘤术前在头颈部 CTA 图像上显示的肿瘤径线、Shamblin 分型以及供血动脉数量，可以预测术中出血情况，其中供血动脉数量具有最好的诊断效能。

磁共振动态增强联合弥散峰度成像多参数分析鉴别腮腺肿瘤的初步研究

黄楠,陈潭辉,杨谢峰,郭伟,林娜
福建医科大学附属第一医院

目的：探讨磁共振动态增强联合弥散峰度成像多参数分析对腮腺混合瘤、warthin 瘤和基底细胞腺瘤的鉴别诊断价值。
材料和方法：回顾性分析 30 例经手术病理证实的腮腺肿瘤的临床及影像学资料，其中混合瘤 16 例，warthin 瘤 8 例，基底细胞腺瘤 6 例。所有患者均行常规 MRI 平扫、动态增强及 DKI 检查。后处理获得肿瘤感兴趣区 K^{trans}、K_{ep}、V_e值及 D 值及 K 值。绘制 ROC 曲线获得诸参数单独鉴别诊断效能，根据最大约登指数确定最佳诊断界值，计算诸参数鉴别诊断的敏感度、特异度。使用线性判别分析评价所有联合参数和参数组合的鉴别诊断能力。使用留一验证法对线性判别分析结果进行校正。
结果：基底细胞腺瘤和 warthin 瘤的 K^{trans} 和 K_{ep}高于混合瘤，warthin 瘤的 V_e值低于混合瘤和基底细胞腺瘤；混合瘤的 D 和 K 值高于 warthin 瘤。ROC 结果示 K 值和 V_e值鉴别混合瘤、warthin 瘤和基底细胞腺瘤的敏感性/特异性分别为 100%/100%但存在明显重叠。线性判别分析显示联合参数组能较好地鉴别混合瘤与 warthin 瘤（AUC=1）、warthin 瘤与基底细胞腺瘤（AUC=0.946），使用留一验证法验证后敏感性及特异性下降。
结论：初步研究显示磁共振动态增强联合弥散峰度成像多参数分析可能为腮腺肿瘤的鉴别诊断提供新的可能有效的方法。

EPO-0377

Noninvasive evaluation of collateral circulation and prognosis in acute stroke patients using 4D CTA

Ruoyao Cao, Juan Chen
Beijing Hospital

Objective: To explore the significance of 4D CTA in evaluating collateral vessels in patients with acute stroke.
Method: 23 acute stroke patients with unilateral anterior circulation large vessels occlusion underwent one-stop CT scan, including non-contrast CT (NCCT), 4D CTA and CT perfusion (CTP). The collateral vessels were scored 0 to 4 according to modified collateral circulation scoring based on 4D CTA. The score 0 to 2 points was defined as poor collateral circulation, and the score 3 to 4 points was defined as good collateral circulation. Good prognosis was defined as modified Rankin scale (mRS) score of 0-2. Logistic regression model was used to analyze the relationship between collateral circulation and prognosis. Furthermore, receiver operating characteristic (ROC) curve was used to evaluate the efficacy of collateral circulation scoring in predicting the clinical prognosis.
Results: 23 acute stroke patients with anterior circulation large vessel occlusion were recruited. All the patients received intravascular interventional treatment according to the guideline. The proportion of patients with good collateral circulation in good prognosis group was significantly higher than that in poor prognosis group (P<0.01). Logistic regression analysis showed 4D CTA collateral circulation scoring was the independent factor for predicting the prognosis (OR: 0.009; 95% CI: [0.000 to 0.770]; P<0.05). The ROC curve showed 4D CTA collateral circulation scoring had a moderately predicting efficacy on clinical prognosis.
Conclusion: Collateral circulation on 4D CTA could estimate collateral status. It has certain significance for clinical diagnosis and prognosis.

EPO-0378

MRI Study of Normal Skull Bone Marrow Transformation in Plain and Plateau Areas

Xiaoguang Li[1],Lixin Sun[1],Ruozhen Gong[3],Haihua Bao[4]
1.West Hospital of Shandong Provincial Hospital
2.West Hospital of Shandong Provincial Hospital
3.Shandong Provincial Hospital
4.Affiliated Hospital of Qinghai University

Objective: Long-term hypoxic environment at high altitude can lead to compensatory increase in bone marrow hematopoietic erythropoiesis, so we investigated the relationship between skull marrow transformation and age, also the influence of altitude on skull marrow transformation of normal Han residents at plain and plateau areas using conventional MRI and DWI techniques.
Methods: Select 860 people from the altitude of Below 200 meters above sea level ,2000-3000m, 3000-4000m , the people on the same altitude will be divided into 5 age groups: 0-5, 6-14, 15-29, 30-49, 50 and above. First, according to the average thickness of normal skull barrier and signal strength, type the skull marrow of study subjects at each altitude interval on the sagittal T1WI; Then, measure the ADC values of marrow in frontal bone, parietal bone, occipital bone and temporal bone in DWI post-processing workstation; Moreover, investigate the relationship between normal skull bone marrow transformation and age as well as the influence of altitude on skull marrow transformation using statistical methods.
Result: (1) For normal Han residents at each altitude interval, skull marrow type and barrier thickness of the skull were positively correlated with age($P<0.05$). (2) In the age of 0~5, 6~14, 15~29, there was no significant statistical difference between the ADC value of skull marrow and altitude($P>0.05$); In the age of 30~49, 50 and above, the ADC values of the occipital and temporal marrow of normal Han residents were positively correlated with altitude($P<0.05$), which had statistical significance; However, there was no significant statistical difference between the ADC value of parietal and frontal bone marrow and altitude($P>0.05$).
Conclusion: The skull marrow of the normal Han residents at the high altitude area changes from type I to type IV with the increase of age; The occipital and temporal marrow of residents aged above 30 has undergone bone marrow red pulp with the increase of altitude.
Key words: Altitude Magnetic resonance imaging Skull marrow Bone marrow red pulp

EPO-0379

Measurement of Internal carotid artery stenosis on CT or MRI is useful to identity invasive sellar tumors

Zhu Zhang
The Third Affiliated Hospital of Chongqing Medical University

Background ： identification of sellar tumors in patients is largely based on shape、location、enhancement、relationship with pituitary、dural tail and so on;finding internal carotid artery stenosis Wrapped with sellar tumors on CT or MRI was recently shown to be differentiating of invasive meningiomas and others

Methods

A retrospective analysis from January 2012 to December 2016 imaging datas with invasive pituitary adenomas and with invasive meningiomas were diagnosed by the Department of Neurosurgery . Summarized the MRI imaging features， measured the narrowest diameter($D_{stenosis}$) and area($A_{stenosis}$) of internal carotid artery around the tumor by computed tomography angiography(CTA), then calculated the stenosis score ($\%_{stenosis}$) ; On working the diagnositic validities of measured indicators were calculated by Receiver Operating Characteristic Curve（ROC）.

Result

The median Ki-67 of invasive pituitary adenoma was 3% (2% ～ 5%), which was significantly higher than that of invasive meningioma (1%, 1% to 2%)There were significant differences in Texture(P=0.001).NO difference in the average diameter between the invasive adenoma with invasive meningiomasThere were significant differences in aspects of shape（P=0.010）、T1WI （P=0.000）、signal（P=0.000）、Post-gadolinium enhancement（P=0.000）、Separation from normal pituitary（P=0.001）、Dural tail sign （P=0.000）、Skull（P=0.000）。ROC showed that the diameter of the stenosis area under curve was 0.725, P=0.006, the cut-off level was 3.45mm, the sensitivity was 62.5%, the specificity was 76.5%; the area of stenosis area under the curve was 0.737，P=0.003, the cut-off level was 11mm^2, the sensitivity was 75.0%, the specificity was 64.7%; the area of the stenosis score curve was 0.711， P=0.013, the cut-off level was 0.306, the sensitivity was 43.75%, the specificity was 97.06%.

Conclusions

the stenosis measured of the internal carotid artery is a valuable tool for differentiating tumors in addition to the imaging features of MRI , three indicators including the narrowest diameter, the narrowest area and stenosis score have moderate diagnositic validities.

多层螺旋 CT 增强在头颈部多间隙感染中的应用价值研究

曹阳,陈光斌,纪涛涛
湖北医药学院附属十堰市人民医院

【目的】 观察分析多层螺旋 CT 增强应用于头颈部多间隙感染中的价值。

【方法】 回顾性分析 2017 年 1 月-2019 年 7 月在我院耳鼻喉科及口腔科就诊的 67 例口腔颌面颈部多间隙感染的患者，并给予患者 X 线、超声等检查进行初步扫描，且全部患者均确诊。为了能更精准地确定患者的致病因素，本文给予全部患者进行多层螺旋 CT 增强扫描；并通过 CT 的扫描结果来进一步确定病因及受累间隙。

【结果】 扫描结果显示，3 例为发育性的囊肿继发性感染、4 例为颌骨外伤感染、2 例为颞下颌关节感染、8 例为腺源性感染、44 例为牙源性感染，4 例为其他类型继发性感染，其中未查明病因的有 3 例，病因的检出率为 97.01%；累及间隙包括颞下间隙、颈深间隙、咽后间隙及颊间隙的例

数各为 2 例，咽旁、舌下间隙、翼颌间隙的例数各为 3 例、8 例为咬肌间隙、42 例为下颌下间隙，感染的检出率为 100%。
【结论】 在头颈部多间隙感染中合理运用增强 CT，可为临床诊断、治疗以及预后的判断等提供有价值的信息。

探讨 CT 图像对于鉴别颈部肿大淋巴结来源的应用价值

纪元,王丽君,李春风,王海涛
大连医科大学附属第一医院

目的：鉴别诊断颈部肿大淋巴结。
方法：回顾分析经病理证实 195 例颈部肿大淋巴结 CT 图像，并结合其临床体征和症状，放射学特征，手术发现等。
结果：转移性淋巴结 134 例，它们来自不同的原发疾病：例如鳞状上皮细胞癌，甲状腺乳头状癌等；原发恶性肿瘤 23 例：如淋巴瘤和肉瘤；良性淋巴结 38 例，如结核、脓肿和其他一些炎症性疾病。
结论：CT 图像有助于鉴别颈部肿大淋巴结来源。

EPO-0382
低管电压、低碘对比剂用量在头颈 CTA 的应用研究

余飞
西南医科大学附属中医医院

目的 探讨低电压、低碘对比剂剂量在头颈 CT 血管造影(CTA)中的应用。方法 2019 年 3 月-2019 年 6 月到我院行头颈 CTA 的 200 例患者随机分为常规组（A 组）及双低组（B 组），每组 100 例，常规组患者 CTA 对比剂剂量为 60mL，流率为 4.5mL/s，接着相同的流速推注生理盐水 30mL；管电压为 120kVp，双低组患者 CTA 对比剂流速为 4.5mL/s，先注射 6s，再推注混合液（碘对比剂:生理盐水=3:7）5s，接着以相同的流速注射生理盐水 30mL，管电压为 80kVp。记录两组患者剂量长度乘积(DLP)，有效辐射剂量（ED），对两组图像进行客观及主观评价。结果 两组受试者 CTA 图像质量主观评价及合格率差异均无统计学意义(P>0.05);两组间 SNR、CNR 比较,无统计学意义(*P*>0.05)；B 组上腔静脉、锁骨下静脉 CT 值明显低于 A 组。B 组患者 DLP、ED 均显著低于 A(*P*<0.05)。结论 低电压、低碘对比剂剂量可显著降低头颈部 CTA 扫描辐射剂量及对比剂碘的用量，且图像质量优于常规组。

EPO-0383
颞下颌关节盘电影序列成像质量的评价

高萍,金川,王磊,陈钰,王玉红,薛华丹,金征宇
中国医学科学院北京协和医院

目的：评价不同电影序列对颞下颌关节的显示情况，以期确定颞下颌关节扫描较为理想的 MRI 序列。方法：应用 GE W750 3TMR 机对 25 例颞下颌关节功能紊乱的患者分别进行 SSFSE、FIESTA、

SPGR 等电影序列的斜矢状位检查，并对所获得图像的信号强度及信噪比，应用 Fredman 秩和检验进行统计学分析。结果：SSFSE、FIESTA、SPGR 序列的信噪比分别是 138.93±40.51、72.15±37.76、57.46±13.29，SSFSE 序列与 FIESTA 、SPGR 序列均有显著的统计学差异，P 值<0.001，而 FIESTA 、SPGR 序列间没有统计学差异，P 值>0.05；髁突的信号强度分别为 2784.23±547.35、906.95±338.89、221.45±43.01，3 个序列两两间均有显著的统计学差异，P 值<0.001。结论：SSFSE 电影序列具有较好的图像质量，能较好的显示颞下颌关节，可作为电影序列扫描的首选。

PROGNOSTIC VALUE OF ADC HISTOGRAM ANALYSIS AND TRADITIONAL MEASUREMENT IN PATIENTS WITH HEAD AND NECK SQUAMOUS CELL CARCINOMA

Xiaoxia Lixiaoxia
Xiamen Branch, Zhongshan Hospital, Fudan Universerity

Objective: The aim was to evaluate and compare the prognostic value of whole-tumor based apparent diffusion coefficients (ADC) histogram analysis and region of interest (ROI) based traditional ADC measurement in patients with head and neck squamous cell carcinoma (HNSCC).

Methods: A total of 96 patients with histopathologically proved HNSCC between Jun. 2012 and Dec. 2015 were included in the current study. All patients underwent a pretreatment MRI examination including diffusion weighted imaging (DWI). The ADC value was measured both by delineating the tumor on each slice of ADC map to acquired whole-tumor histographic parameters (ADC_{25}、ADC_{50}、ADC_{75}、ADC_{mean1}), and manually selecting ROI on slices to calculate the mean ADC value (ADC_{mean2}). The clinical variables included age, sex, smoking status, tumor volume，tumor location，treatment method and AJCC stage. Univariate and multivariate Cox analyses were conducted to assess the association of clinical characteristics and ADC values variables with overall survival (OS) of the patients.

Results: The higher values of ADC parameters, including ADC_{25}, ADC_{50}, ADC_{75}, ADC_{mean1} and conventional parameter ADC_{mean2} were significantly associated with worse OS. However, in multivariate Cox analyses, after adjusting for clinical-pathologic risk factors, only ADC_{50}, ADC_{75} and ADC_{mean1} were further confirmed as the independent predictors ($P<0.05$), while no significant difference was observed in ADC_{mean2} ($P=0.11$).

Conclusions: Whole tumor based ADC histogram analysis had independent and incremental prognostic value for the patients with HNSCC.

最佳单能量图像结合形态学分析在腮腺良恶性占位诊断中的应用价值

陈帅[1],杨亚英[2]
1.云南省第一人民医院

2.昆明医科大学第一附属医院

【目的】探讨双源 CT 双能量技术中最佳单能量图像结合常规形态学表现对腮腺良恶性占位的诊断价值。
【资料方法】 回顾性分析昆明医科大学第一附属医院行双源 CT 双能量扫描并获得病理证实的腮腺占位患者共 89 例病例。①将双能扫描重建后的图像导入单能谱（Monnenergetie）软件，量取 55KeV～80KeV 间隔 5KeV 共 6 组图像的病灶、咬肌 CT 值及 SD，计算并分析各组 ROI 区 SNR、CNR 及空气背景噪声，得到最佳单能量值。②用最佳单能量图像分析记录腮腺占位的常规形态学表现（包括部位、形态、边界、囊变坏死、强化方式、淋巴结肿大），分组为腮腺良性组及恶性肿瘤组，进行 x^2 检验及 Logistic 回归区分析主要征象及次要征象。③对比分析最佳单能量图像下腮腺占位的形态学表现（方案Ⅰ）与常规线性融合图像下腮腺占位的形态学表现（方案Ⅱ）对腮腺占位定性诊断的准确率。
【结果】①70keV 为观察腮腺占位的最佳单能量值；②腮腺内占位的形态及周围淋巴结肿大是腮腺良恶性肿瘤鉴别诊断的主要形态学指标；③用 70keV 最佳单能量图像分析腮腺占位的形态学表现，可提高腮腺良恶性占位的定性诊断正确率。
【结论】用 70keV 最佳单能量图像分析腮腺占位的形态学表现可提高腮腺良恶性占位诊断的准确性，其中肿瘤形态和淋巴结肿大是鉴别腮腺良恶性肿瘤的主要诊断指标。

EPO-0386
能谱技术在腮腺多形性腺瘤、腺淋巴瘤及腮腺恶性肿瘤诊断及鉴别诊断中的价值

陈帅[1],杨亚英[2]
1.云南省第一人民医院
2.昆明医科大学第一附属医院

【目的】探讨双源 CT 能谱成像技术在腮腺多形性腺瘤、腺淋巴瘤及腮腺恶性肿瘤诊断及鉴别诊断中的价值。
【资料方法】回顾性分析昆明医科大学第一附属医院行双源 CT 双能量扫描并获得病理证实的腮腺占位患者共 73 例，所有患者均进行常规平扫及双能量双期增强扫描,其中腮腺多形性腺瘤 32 例，腺淋巴瘤 23 例，恶性肿瘤 18 例，共 73 例腮腺肿瘤。其中多形性腺瘤根据病理表现再分为 A、B 二组，A 组为病理有包膜侵犯或包膜不完整、富含黏液成份，共 7 例；B 组为病理包膜完整，共 25 例。
将重建层厚 1mm 的 80kVp 及 Sn140kVp 两组薄层数据一并调入双能量（Dual Energy, DE）软件，选择 Monoenergetic 模式进行能谱分析，利用工具软件定义圆形 ROI（region of interest）于病灶实性部分最大层面,避开囊变、坏死及钙化区域，面积为实性病灶的 2/3～3/4。分别得到 4 组腮腺肿瘤 40keV～160keV 范围内的衰减曲线，观察分析每个病灶的能谱衰减曲线特征。
【结果】①动静脉期四组肿瘤实质的能谱曲线均为衰减型，动脉期 4 组肿瘤实质 CT 值差异具有统计学意义（P＜0.05），但 A 组与 B 组多形性腺瘤实质病灶 CT 值以及与恶性肿瘤组实质病灶 CT 值差异无统计学意义（P＞0.05）；静脉期 4 组肿瘤实质 CT 值差异不具统计学意义（P＞0.05）。②动脉期 4 组肿瘤实质能谱曲线斜率差异具有统计学意义（P＜0.05），腺淋巴瘤组与 A、B 两组多形性腺瘤动脉期斜率差异具有统计学差异（P＜0.01），腺淋巴瘤组与恶性肿瘤组、恶性肿瘤组与多形性腺瘤组见均无明显统计学差异（P 均＞0.05）。静脉期 4 组肿瘤实质能谱曲线斜率差异无统计学意义（P＞0.05）。
【结论】 腮腺腺淋巴瘤、多形性腺瘤及恶性肿瘤动脉期能谱曲线斜率不同，测量三种病变动脉期能谱曲线斜率，可为其鉴别诊断提供有价值的信息。

EPO-0387

头颈部 CTA 中静脉血管返流的优化扫描方案

雷伟
陆军军医大学大坪医院

目的：探讨头颈部 CTA 中静脉血管返流的优化扫描方案以及成像质量的相关性。
方法：选取 600 例头颈部 CTA 受检者进行分组研究，随机均分成 A、B 两组。碘总量设定为单位体重 300 毫克碘，注射流速设定为 5ml/s，对比剂注射完毕之后“无缝隙”推注 50ml 生理盐水。A 组为对照组；B 组为观察组，在推注对比剂之前先推注 30ml 生理盐水，然后“无缝隙”推注对比剂及生理盐水。分别用 ROI 测量颈总动脉，颈内动脉，大脑中动脉及颈内静脉 CT 值，采用 5 级标准对周围静脉内对比剂返流总长度进行分级。
结果：两组动脉 CT 值无统计学差异，并且均满足诊断要求；A 组未出现静脉返流 23 例，得 5 分的 142 例；B 组未出现返流 88 例，得 5 分的 61 例。5 级评分存在统计学差异。
结论：头颈部 CTA 作为一种简单、快速和非创伤性技术，在临床的应用越来越广泛。然后由于血管解剖发育方面以及个体差异等不可避免的因素形成的静脉返流对头颈部 CTA 成像质量造成不同程度的干扰。甚至有可能造成重复扫描或者大计量给药的情况。以 B 组对比结果可以看出，在保证图像质量的前提下，同流速注入造影剂之前，注入一定量的生理盐水先填充入静脉血管。在持续灌注的情况下，填充在静脉中的生理盐水形成的压力，有效的阻止了后续对比剂的注入，达到降低静脉返流的风险。虽然无法完全避免产生一定量的返流，但是可以针对性采取措施将其控制在可接受范围内。

腮腺嗜酸细胞腺瘤 CT 表现与病理对照分析

江明祥[1],邵国良[1,2]
1.浙江省肿瘤医院
2.中国科学院大学附属肿瘤医院

目的 分析腮腺嗜酸细胞腺瘤的 CT 表现，以提高对该少见疾病的认识。**资料与方法** 回顾性分析经手术病理证实的 12 例腮腺嗜酸细胞腺瘤的 CT 资料，并与病理进行对照。12 例中男 7 例，女 5 例，中位年龄 56 岁(31～73 岁)。对肿瘤的大小、边界、数目、形态、密度、强化方式、周围侵犯、淋巴结转移等进行分析。**结果** 12 例患者均为单发肿瘤，右侧 7 个，左侧 5 个；9 例位于腮腺浅叶，2 例位于腮腺深叶，1 例跨深、浅叶；肿瘤最大径 1.1cm～2.9cm,平均（2.1±0.3）cm；病灶呈类圆形 8 例，椭圆形 2 例，不规则分叶状 2 例；边缘光整 10 例,不光整 2 例，边界均清晰，未见侵犯周围组织；CT 平扫病灶呈等密度 8 例，低密度 4 例,未见明显钙化；病灶均呈实性，密度均匀 9 例，不均匀 3 例；增强后病灶呈明显强化 10 例，中度强化 2 例。**结论** 单发、边缘光整、少见钙化囊变、血供丰富的腮腺浅叶实性占位灶，有助于提示 PGO 的诊断，其 CT 表现与病理具有相关性。

EPO-0389

基于血流动力学颅内不同位置未破裂动脉瘤破裂风险预测模型的建立与验证

陈国中
南京市第一医院

目的： 对于无症状未破裂颅内动脉瘤的最佳治疗方案需基于动脉瘤破裂风险与选择手术干预治疗风险之间的全面比较。诸多研究表明血流动力学在颅内动脉瘤破裂中起着重要作用。此外，不同位置动脉瘤的破裂风险因素可能存在差异。因此本研究目的是比较不同位置动脉瘤的破裂风险因素，并基于患者人口学信息、动脉瘤形态学参数及血流动力学特征建立颅内不同位置动脉瘤破裂风险预测模型。

材料与方法： 2010 年 1 月至 2016 年 12 月在本院经 CTA 与 DSA 诊断为颅内动脉瘤的患者纳入组内。根据位置分为前交通动脉组、颈内动脉组、大脑中动脉组、后交通动脉组。各组按比例 4:1 随机分成训练组和验证组。利用单变量和多变量回归分析，基于人口学信息、动脉瘤形态学及血流动力学特征建立各位置动脉瘤破裂风险预测模型。模型预测性能以 ROC（Receiver Operation Characteristic）曲线下面积展现。

结果： 后交通动脉瘤组共 278 例患者，尺寸、血流冲击区域及血流稳定程度是后交通动脉瘤破裂的独立预测因素（P 值均 <0.05）；前交通动脉瘤组共 304 例患者，血流冲击区域及血流稳定程度是前交通动脉瘤破裂的独立预测因素（P 值均 <0.05）；颈内动脉瘤组共 127 例患者，高血压、血流冲击区域及血流稳定程度是颈内动脉瘤破裂的独立预测因素（P 值均 <0.05）；大脑中动脉瘤组共 220 例患者，血流冲击区域、血流稳定程度及 OSI_{CV} 是大脑中动脉瘤破裂的独立预测因素（P 值均 <0.05）。基于人口学、动脉瘤形态学及血流动力学特征所建立的后交通、前交通、颈内动脉及大脑中动脉破裂风险预测模型的 AUC 分别为 0.82、0.817、0.837 和 0.882。

结论： 颅内不同位置动脉瘤的破裂危险因素存在差异，且基于人口学信息、动脉瘤形态学及血流动力学特征建立的颅内不同位置动脉瘤破裂风险预测模型可能更为准确。

EPO-0390
腮腺占位病变双能 CT 扫描中 80kV 图像与常规线性融合图像 的等效性研究

陈帅[1],杨亚英[2]
1.云南省第一人民医院
2.昆明医科大学第一附属医院

目的 探讨腮腺占位病变双能量扫描中 80kV 图像与常规线性融合图像的等效性。资料方法 回顾性分析我院行双源 CT 双能量扫描并获得病理证实的腮腺占位患者共 94 例，所有患者均进行常规平扫及双能量双期增强扫描,联合 SAFIRE 重建法、FBP 重建算法及 LB 技术,将每位患者的图像分为 A、B、C、D 四组 （A 组为 80Kv/FBP、B 组为 80Kv/SAFIRE(3）、C 组为 0.3LB/FBP 、 D 组为 0.3LB/SAFIRE(3)），对比分析四组图像中颈动脉、正常腮腺、腮腺病灶的 CT 值、SNR、CNR、SD、咬肌的 CT 值及 SNR、图像质量评分。结果 ① A、B、C、D 四组图像正常腮腺 CT 值及 SNR、病灶 CNR 比较差异无统计学意义，腮腺 CNR、病灶 CT 值及 SNR、咬肌 CT 值及 SNR、颈动脉 CT 值与 SNR 及 CNR、背景噪声的差异具有统计学意义（P＜0.05）。② A 组背景噪声、腮腺 CNR、病灶 SNR、咬肌 SNR 均较 B、C、D 组低具有统计学意义（P＜0.05），但 B 组与 C 组差异无统计学意义，D 组与

A、B、C 组有明显差异（P＜0.01）。③ A、B、C、D 四组病灶 CT 值、咬肌 CT 值、颈动脉 CT 值、SNR 及 CNR 比较差异具有统计学意义（P＜0.05），病灶、咬肌及颈动脉 CT 值均为 A 组与 B 组间、C 组与 D 组间无明显统计学差异，但 A 组与 B 组病灶、咬肌及颈动脉 CT 值均高于 C 组与 D 组，差异具有统计学意义（P＜0.05）；A 组与 C 组、B 组与 D 组颈动脉 SNR 及 CNR 差异无统计学意义，但 A 组与 C 组颈动脉 SNR 及 CNR 均低于 B 组与 D 组，差异具有统计学意义（P＜0.05）。④各组间主观评分差异无统计学意义。结论 腮腺占位双源 CT 双能量扫描中，80kV 扫描得到的图像质量与常规线性融合图像质量相近并能满足诊断要求，可作为低剂量扫描方案推广应用；结合 SAFIRE 技术可进一步提高图像质量，具有潜在降低辐射剂量的优势。

The diagnoses and differential diagnoses Olfactory Neuroblastoma of ethmoidal sinus (Micro-lesson competition)

Qijun Xu
Department of Imaging, First Affiliated Hospital of Fujian Medical Univercity

Olfactory Neuroblastoma also known as Esthesioneuroblastoma, is a rare but distinct malignant neuroectodermal tumor arising from the olfactory epithelium of roof of nasal cavity and cribriformplate.It account for 2 to3% of intranasal tumors.

Although rare,it can spread to brain in the early stage.Cases primarily arising from other parts of nasal cavity,paranasal sinuses and frontal lobe of brain have also been reported.These tumors are associated with a number of symptoms including nasal obstruction,epistaxis,headaches,visualdisturbances,proptosis,andanosmia.

Metastasis to distant as well as cervical lymph nodes occurs in10 to 30%of the cases.Grossly, they usually appear as a soft,glistening,polypoidal or nodular mass covered by intact mucosa or as friable masses with ulceration and granulation tissue. The course will intruduce the anatomy of Olfactory nerve and epidemiology, image fetures of olfactory neuroblastoma.Then we will present points of differential diagnoses inclding inverted papilloma, squamous cell carcinoma of ethmoidal sinus, fungal infection, malignant melanoma, metastases,rhabdomyosarcoma and so on to enable timely and accurate diagnoses.

能谱 CT 在头颈部肿瘤临床及科研应用进展（专题讲座）

李琳
中国医学科学院肿瘤医院

能谱 CT 进入临床已经有很长时间了，其原理是将空间吸收投影数据转换为物质密度投影数据，在准确的硬化校正的基础上得到精准的 CT 值，将 CT 从单参数成像转变为多参数成像，从而进行物质定量分析和能谱曲线分析，本文将介绍能谱 CT 的临床应用工具，单能量图像，物质分离，能谱曲

线，虚拟平扫等，以及能谱 CT 在头颈部肿瘤的检出，鉴别诊断，转移灶与原发灶同源性分析及疗效评估和随访。

EPO-0393

Prognostic value of preoperative computed tomography and clinical findings in patients with recurrent hypopharyngeal cancer

Dong Chen,Meizhu Zheng
Tianjin third central hospital

PURPOSE
To obverse subjective preoperative CT findings, clinical and pathological features of recurrences of hypopharyngeal carcinomas at least 2 years of follow-up.

MATERALS AND METHODS:
We reviewed the preoperative CT imaging and clinical findings of 69 patients who underwent curative resection of pathological proven hypopharngeal carcinoma. 7 case were recurrence. TMN staging and evaluate the surgery margin have been done after operation. Statistical analysis was performed using the SPSS 20.0. Percentage were calculated.

RESULT
All of the 7 case were male and had a history of smoking, rang for 20-40years. 5 of 7 had a history of alcoholics, rang from 10 to 50 years. 3 of them has pharyngalgia for 2 months. Pretreatment CT imaging up-staged 1 of 5 pT3 cases and 1 of 2 pT2 cases. The accuracy for clinical staging by CT imaging was 71.4%. Partial and total laryngectomies were performed in 3(42.8%) and 4(57.2%) patients, respectively. All of the surgical margins were negative. A pT2 and a pT3 patient only received postoperative radiotherapy. The recurrence of this patient was 19 months and 6.5 months, respectively. The rest of patients received postoperative radiochemotherapy. The median follow-up for recurrence patients was 13 months(range 11-49). As the same T staging tumor, the patient of pN1 recurrence was shorter than pN0.

CONCLUSION:
Imaging is a key role in staging tumor for the decision of therapy. N staging of hypopharyngeal carcinoma may have some value in prognosis. Postoperative radiochemotherapy is crucial to postoperative patients even the tumor is T2, though it differs from man to man. However, the surprising good prognosis in most of our cases makes necessary to more studies and longer follow-up to confirm our data.

准连续性动脉自旋标记技术(pCASL)序列相比于传统 MRI 对不同类型腮腺肿瘤鉴别诊断优势。

魏依依,魏平,李传亭
山东省医学影像学研究所

目的：探索准连续性动脉自旋标记技术(pCASL)序列对不同类型腮腺肿瘤的显示情况，对不同类型腮腺肿瘤进行鉴别诊断，以及相比于传统 MRI，准连续性动脉自旋标记技术(pCASL)序列在鉴别不同类型腮腺肿瘤的优势。
方法：选择临床怀疑涎腺肿瘤的患者 30 例,男 18 例,女 12 例。患者均行 3.0T MR 扫描常规序列及准连续性动脉自旋标记技术(pCASL)序列，测定肿瘤局部血流量（rTBF）及 ADC 值，Whitney 检验法比较不同病理类型涎腺肿瘤间 TBFs 和 ADC 的差异,绘制 ROC 曲线,比较诊断的准确性。
结果：经过病理证实，共 14 例多形性腺瘤，12 例腺淋巴瘤，恶性肿瘤 4 例，包括粘液表皮样癌 3 个，腺样囊性癌 1 个；恶性肿瘤的 TBFs 明显高于多形性腺瘤腺淋巴瘤低于腺淋巴瘤；恶性肿瘤的 ADC 低于多形性腺瘤高于腺淋巴瘤，TBFs 及 ADC 值对于鉴别诊断不同类型腮腺肿瘤的诊断准确率分别约 94.8%、86.5%。
结论：准连续性动脉自旋标记技术(pCASL)序列在涎腺良性肿瘤的亚型间具有差异; pCASL 对区分涎腺肿瘤的良恶性和病理亚型具有较大的潜力，而且，相比于传统 MRI，准连续性动脉自旋标记技术(pCASL)序列在鉴别不同类型腮腺肿瘤方面更为准确。

腮腺原发性淋巴瘤的 CT 征象与 Ki-67 水平及预后关系

刘国顺
广州市第一人民医院

目的：观察腮腺原发性淋巴瘤（PPT）的 CT 表现、分析其 CT 征象与 Ki-67 水平及预后关系。**方法**：回顾性分析经病理证实的 37 例腮腺原发性淋巴瘤，观察其 CT 表现，利用 R×C 列表卡方检验观察 CT 征象（大小、部位、形态、边界及强化程度）与 Ki-67 水平关系，用 Kaplan-Meier 法计算 15 例生存率，用 Logrank 法计算性别、年龄、Ki-67 水平及 CT 征象与生存情况的关系。**结果**：腮腺原发性淋巴瘤以 MALTL 及 FL 最多见，CT 多表现为多发或弥漫结节型，中度均匀强化，边界清楚，坏死少见，钙化及出血罕见。Ki-67 表达水平高低组间 PPL 的大小及边界有显著性差异(c2=7.538，P<0.05)，余 CT 征象无显著差异。PPL 患者 5 年生存率为 60%，仅与肿瘤的 Ki-67 水平表达的高低(c^2=18.88，P<0.05)显著相关，与各 CT 征象无显著相关性（P＞0.05）。**结论**：腮腺原发性淋巴瘤 CT 表现具有一定的特征性，Ki-67 表达水平高低组间在大小、边界上存在一定差异。腮腺原发性淋巴瘤预后良好，仅与肿瘤的 Ki-67 密切相关。

EPO-0396
MSCT 血管成像评价糖尿病颈动脉斑块及其与血清糖化血红蛋白水平的相关性研究

王文静
重庆市急救医疗中心

目的：用双源 CT 血管成像评价 II 型糖尿病颈动脉斑块及其与血清糖化血红蛋白水平的相关性研究。**方法：**回顾性分析了 68 例行颈部双源 CT 血管成像检查的 II 型糖尿病患者。所有患者按血清糖化血红蛋白（HbA1c）＞ 6.5%或≤ 6.5%分组，记录组间斑块的发生率、类型、分布、引起狭窄的情况，并定量分析上述颈动脉斑块特征与糖化血红蛋白的相关性。**结果：**68 例患者中，31 例患者（31/68, 45.6%）HbA1c ＞ 7.0%，37 例患者（37/68, 54.4%） HbA1c≤ 7.0%。两组病人间斑块的发生率无统计学差异（P ＞ 0.05）。将所有患者的颈部动脉纳入分析发现，两组病人在斑块类型和分布上无统计学差异（P ＞ 0.05），而与 HbA1c ≤ 7.0%的患者相比，HbA1c ＞ 7.0%的患者颈部动脉的狭窄程度更严重（中度狭窄: 52/248, 20.9% vs. 33/296, 11.1%, P ＜ 0.05; 重度狭窄: 27/248, 10.8% vs. 6/296, 2.0%, P ＜ 0.05）。此外，患者糖化血红蛋白水平与颈动脉狭窄程度呈正相关（r = 0.31; P ＜ 0.05）。**结论：**血清糖化血红蛋白较高的 II 型糖尿病患者行双源 CT 颈部血管成像时，表现出更严重的血管狭窄，这部分病人在诊疗决策中应被高度重视。

头颈部 Kimura 病的功能磁共振分析

乐维婕,陶晓峰,余强,石慧敏,王平仲
上海交通大学医学院附属第九人民医院

目的：以多模态功能磁共振分析头颈部 Kimura 病的磁共振特点，为该病的诊断与鉴别诊断提供依据。
方法：我院 11 例经病理证实的 Kimura 病患者，以 DWI、DCE-MRI 及 MRS 功能磁共振方法，结合 MRI 常规序列，总结 Kimura 病的磁共振特点。
结果：11 例患者皆为男性，平均年龄 42.3 岁。病灶位于左侧 2 例，右侧 7 例，双侧 2 例。其中单发 5 例，多发 6 例。位于腮腺区 7 例，颌下区 2 例，面颊部 2 例。形态多样，弥漫性或类圆形实性软组织肿块。T1WI 为等信号，T2WI 及压脂像呈稍高信号，增强后轻到中度强化，信号不均匀，易累及邻近皮下组织和皮肤。多发病灶可包括同侧或双侧颈部多个淋巴结。b＝1000 时，DWI 示其 ADC 均值约 1 左右，TIC 曲线为 I 或 II 型曲线。部分病变的 MRS 上可见升高的 cho 峰。
结论：头颈部 Kimura 病以颌面部腮腺和淋巴结为好发部位，弥漫或类圆形肿块增强后轻到中度强化，易累及邻近皮肤及皮下组织， DWI 示其 ADC 均值约 1 左右，TIC 曲线为 I 或 II 型曲线。这些特点有助于该病的诊断与鉴别诊断。

EPO-0398

累及斜坡少见病变的 MRI 表现 53 例

许奇俊,曹代荣
福建医科大学附属第一医院

目的 分析和探讨累及斜坡少见病变的 MRI 表现，以期提高诊断水平。
资料与方法 回顾性分析 2003 年 1 月 1 日一 2016 年 12 月 31 日均经手术病理证实 53 例累及斜坡少见病变的患者 MRI 影像资料，MRI 平扫+增强 46 例，MRI 平扫 7 例。分析病灶类型，主体部位、大小、信号、形态、边界、强化特点及斜坡形态
结果 脊索瘤 15 例，垂体腺瘤 9 例，脑膜瘤 5 例，淋巴瘤 4 例，鳞癌 3 例，胆脂瘤 4 例，嗅神经母细胞瘤 2 例，软骨肉瘤 2 例，横纹肌肉瘤 2 例，低分化癌 1 例，颅咽管瘤 1 例，Rathke 囊肿 1 例，真菌感染 1 例，未分化肉瘤 1 例，骨巨细胞瘤 1 例，神经鞘瘤 1 例。

病灶中心部位位于斜坡 10 例，斜坡-C2 2 例，桥前池 8 例，蝶窦 10 例，鞍区 7 例，鞍区-鞍上 3 例，右上颌窦 2 例，筛窦 1，鼻咽左侧-左咽旁间隙 1 例，左中颅窝 1 例，右颈静脉孔区-咽旁间隙 1 例，右颞骨-翼腭窝-右桥小脑角区 1 例，鼻咽 1 例，左侧颞骨鳞部 1 例，筛窦-鼻腔 2 例，左侧鞍旁 1 例
病灶位于中颅窝 23 例，后颅窝 10 例及前-中颅窝 10 例，中-后颅窝 10 例；
病变最大径 1.8cm～12.8cm。
信号均匀 19 例，不均 34 例；不规则形 40 例，类圆形 9 例，椭圆形 1 例，葫芦状 3 例；边界清楚 40 例，模糊 13 例；轻度强化 8 例，中度强化 27 例，重度强化 8 例，无强化 2 例
斜坡骨质形态不变 6 例，溶骨性骨质破坏 25 例，骨质受压 12 例，膨胀性骨质破坏 8 例.成骨性骨质破坏 2 例
结论：根据 MRI 表现，能够对累及斜坡少见病变不同的类型作出基本的分析与诊断

EPO-0399

腮腺良性肿瘤容积穿梭 CT 灌注曲线的特征分析

杨振兴,刘挨师,郝粉娥
内蒙古医科大学附属医院

目的 分析容积穿梭 CT 灌注曲线对腮腺肿瘤定性诊断及鉴别诊断的价值。**方法** 收集 2013 年 4 月至 2018 年 12 月间我院拟诊腮腺肿瘤患者 102 例，男 56 例，女 46 例，年龄 16～82 岁，平均年龄 52.3±14.9 岁，病程 5 天～30 年。所有患者术前均采用 GE Light speed VCT-XT 机行容积穿梭 CT 灌注成像检查，术后经手术病理证实。将扫描数据传送至 GE ADW4.4 工作站，观察分析不同病理类型腮腺肿瘤的位置、大小、密度、边界、颈部是否可见肿大淋巴结（>8mm）及时间-密度曲线（time density curve，TDC）类型，对计数资料采用自然数及百分数表示，计量资料参数采用表示，计数资料比较采用 χ^2 检验，计量资料符合正态分布采用两独立样本 t 检验，不符合正态分布的采用秩和检验，检验水准 α=0.05。**结果** 90 例（92 灶）腮腺良性肿瘤的形态学参数：左侧 46 灶，右侧 46 灶（其中 2 例腺淋巴瘤双侧发病），最大径（2.47±0.95）cm，52 灶密度均匀，40 灶密度不均匀，74 灶边界清晰，18 灶边界不清晰，11 灶颈部有肿大淋巴结，81 灶颈部无肿大淋巴结。各类腮腺肿瘤 TDC 曲线类型：多形性腺瘤以Ⅰ型（缓升型）为主（占 100%），腺淋巴瘤以Ⅱ型（速升-速降型）多见（占 76.9%），基底细胞瘤以Ⅲ型（速升-缓降型）多见（占 66.7 %），肌上皮瘤以Ⅳ型（缓升-缓降型）多见（占 83.3%）。容积穿梭灌注 CT 成像检查辐射剂量为 4.19±0.41mSv。**结论** 1.容积穿梭 CT 灌注成像技术结合低剂量措施在 1 次扫描、1 次对比剂注射的同时，可以获得常规 CT 动态增强和 CT 灌注功能成像两方面信息。2.灌注曲线结合形态学参数对腮腺良性肿瘤的鉴别诊断有重要价值，为患者术式的选择及辅助措施的应用有重要指导意义。

双能量 CT 头颈部血管成像临床应用价值

郭元星,李向东
中国人民解放军南部战区总医院

摘要 目的 探讨双源 CT（DSCT）双能量成像技术在头颈部血管疾病诊断中的临床应用价值。**方法** 回顾分析 2009 年 2 月～2019 年 1 月临床怀疑有脑血管病变患者 1060 例双能量成像的影像资料及诊断结果，并与患者全脑血管 DSA 资料作对照。所有患者均在我院双源 CT（Siemens Somatom

Definition）行头颈部血管双能量成像。**结果** 1060 例患者经检查发现有头颈部血管疾病 551 例，正常头颈部血管 CTA 表现 509 例，诊断阳性率 52.0%。其中头颈部血管疾病中 116 例临床上进行了全脑血管 DSA 检查，只有 7 例头颈部血管 CTA 结果与 DSA 结果不符，符合率 93.97%。发现动脉瘤 127 例 146 个动脉瘤，颈动脉粥样硬化并狭窄 96 例，颅内动脉、椎动脉局限性狭窄 94 例，颅内动静脉畸形 65 例，颈内动脉或椎动脉闭塞 46 例，双颈面部血管畸形 29 例，烟雾病和颅内肿瘤各 19 例，脑梗塞和颅内静脉血栓各 18 例，双侧颈动脉、颅内动脉不显影 12 例，颈内动脉血管炎 4 例，sturg-webber 综合症和发现永存三叉动脉各 2 例。108 例患者（动脉瘤 58 例，颅内动脉、椎动脉局限性狭窄 26 例，颈动脉粥样硬化并狭窄、颅内血管畸形和颜面部血管畸形各 8 例，）结果与全脑 DSA 造影结果相符。**结论** 双源 CT 双能量成像更能清晰地显示头颈部血管病变及肿瘤供血动脉，与全脑 DSA 有很好的符合率，对于诊断颈部和颅内血管病变具有较高的敏感性。具有创伤小、费用低、检查时间短、造影剂用量少、毒副反应低、随到随查等多方面优势。在脑血管重建中可根据碘含量的特殊算法,更加清晰地显示脑血管,但对颅底部分骨组织可能还需人为去除。

EPO-0401

Abnormal Cerebral Blood Flow in Patients with Unilateral Pulsatile Tinnitus: A Arterial Spin Labeling Study

Xiaoshuai Li,Pengfei Zhao,Zhenchang Wang
Beijing Friendship Hospital , Capital Medical University

Objective
To explore whether altered cerebral blood flow presented in patients with unilateral pulsatile tinnitus (PT) using Three-Dimensional Arterial Spin Labeling (3D ASL) technique.
Methods
Structural and functional MRI data were obtained from unilateral PT patients with single etiology (= 24) and age-, sex-, and education-matched normal control subjects (= 24). Voxel-based analysis (VBA) was used to observe the regional cerebral blood flow (CBF) characteristics with parameters post-labeling duration (PLD)=2025ms.
Results
Compared with the normal control group, PT patients did not show any structural changes. PT patients showed significant increased CBF in the bilateral middle temporal gyrus, right inferior temporal gyrus and decreased CBF in left triangle inferior frontal gyrus, middle frontal gyrus.
Conclusions
Our results suggest that PT patients may exhibit regional CBF abnormalities, which may provide new insight into the effects of PT on the brain performance.

EPO-0402

T2 mapping 鉴别腮腺肿瘤的价值

文宝红,程敬亮
郑州大学第一附属医院

目的 探讨 T2 mapping 对腮腺肿瘤的鉴别诊断价值。**方法** 前瞻性分析经病理证实的 51 例单发腮腺上皮性肿瘤患者资料，术前均行常规 MRI 及 T2 mapping 检查。测量病变的 T2 均值，采用 *t* 检验分析腮腺肿瘤 T2 值的差异，运用 ROC 曲线评价 T2 值的诊断价值。 **结果** 51 例腮腺肿瘤中良性 34 例，恶性 17 例。良性肿瘤 T2 值为 128.64±49.58ms（多形性腺瘤与基底细胞腺瘤 T2 值为 148.05±46.69ms，warthin 瘤 T2 均值为 82.05±5.07ms），恶性肿瘤 T2 值为 105.72±13.31ms，差异有统计学意义（t=2.520，P=0.016）。T2 值诊断多形性腺瘤和基底细胞腺瘤与恶性肿瘤 ROC 曲线下面积为 0.907±0.047，T2 值诊断 warthin 瘤与恶性肿瘤 ROC 曲线下面积为 0.975±0.024，以 90.2≤T2 值≤124.45ms 为临界点判断腮腺良恶性肿瘤，以病理结果为对照，其灵敏度为 82.4%(14/17)，特异度为 88.2%(30/34)，与病理结果行一致性检验，Kappa 值为 0.696。
结论 T2mapping 鉴别诊断腮腺肿瘤具有一定参考价值。

EPO-0403
良恶性多形性腺瘤 CT 征象与病理对照研究

朱丹
上海交通大学医学院附属第九人民医院

目的：探讨良恶性多形性腺瘤的 CT 影像学特征与组织病理学的特点的相关性，并探讨其相关的临床意义及具有的诊断价值。
方法：本研究通过回顾性分析经手术病理证实的 65 例腮腺多形性腺瘤的病例，其中 5 例复发病例，10 例恶变病例。每个病例的病理切片均进行 HE 染色及免疫组化检查，分别由两位高年资病理科医师进行检查，根据镜下所具有的上皮、间质成分所占比例进行分组研究：黏液成分为主组、黏液成分和上皮细胞相等组、富含上皮成分组、极富细胞组，同时将各组临床表现、病理表现与 CT 的特征进行对照研究。
结果：5 例复发病例中，3 例属于富含上皮成分组，2 例属于极富细胞组；形态学方面，富含上皮成分组 15 例病例边界较光滑，边界清晰；CT 征象上，多形性腺瘤的强化程度与组织病理学中上皮成分的所占比例有一定的正相关，极富细胞组 10 例均强化明显且较为均质，富含上皮成分组 10 例均匀强化；在恶变的 10 例多形性腺瘤病例中，CT 对比增强有显著强化，边界欠规则，镜下上皮含量丰富。
结论：良恶性多形性腺瘤的组织病理学和 CT 影像学表现各异，但上皮成分与 CT 增强的征象具有一定的相关性，为临床的诊断治疗提供更多的研究价值，而关于确定多形性腺瘤的 CT 影像学特征和病理组织学表现之间的关系，仍需进一步的大量研究。

EPO-0404
降低头颈部 CTA 锁骨下静脉对比剂滞留的可行性研究

雷伟
陆军军医大学大坪医院

目的：探讨降低 128 排螺旋 CT 头颈部联合 CTA 锁骨下静脉对比剂滞留的扫描方案。
方法：收集头颈部 CTA 检查的患者共 250 例，采用随机数字表法将患者按照每组各 50 例，均分为 A、B、C、D、E 五组。注射使用非离子型对比剂（碘海醇 350mg/ml），碘总量均设定为单位体重 300 毫克碘，对比剂灌注时间设定为 10s，碘流率=碘总量/10s：A 组注射对比剂后以流速 4ml/s 注射生理盐水 20ml；B 组注射对比剂后以流速 4ml/s 注射生理盐水 40ml；C 组注射对比剂后以流速

4ml/s 注射生理盐水 60ml；D 组注射对比剂后以流速 5ml/s 注射生理盐水 60ml；E 组注射对比剂后以流速 3ml/s 注射生理盐水 60ml。通过主客观评价比较五组扫描方案的图像质量。
结果：A、B、C 组两两对比，客观评价：A、B、C 三组所监测主动脉 CT 值无统计学差异；C 组锁骨下静脉 CT 值低于 A、B 组，存在统计学差异，而 A、B 组之间无统计学差异。主观评价：B、C 组结果优于 A 组，存在统计学差异，而 B、C 组之间无统计学差异。C、D、E 三组两两对比，主观及客观评价均发现 C、D 组结果优于 E 组，存在统计学差异，C、D 组之间无统计学差异。
结论：本研究通过以设定不同剂量以及不同流速的生理盐水注射方案，在一定程度上达到降低对比剂滞留的目的的同时，图像质量均满足临床诊断的需求。不同剂量生理盐水对比组中，出现少数患者生理盐水多余推注的问题。所以，适量的增加生理盐水的推注，可以有效的减少锁骨下静脉对比剂的残留，但是持续加大的生理盐水剂量的推注，并不能无限降低对比剂的滞留，因此，建议追加生理盐水的剂量不超过 60ml 最为恰当。不同流速的生理盐水对比组中，因为 C、D 组优于 E 组，而 C、D 之间无差异，考虑高流速会加大血管负荷，造成血管破裂的可能性，因此选择 4ml/s 注射速率为最佳。

EPO-0405

干燥综合征颌下腺及腮腺的 MRI 表现

纪权书,丁长伟
中国医科大学附属盛京医院

目的：干燥综合征患者腮腺 MRI 表现已经有很多文献报道，腮腺 MRI 表现具有特征性，颌下腺的 MRI 表现很少有研究提及，因此本文探讨干燥综合征患者颌下腺 MRI 的表现，颌下腺 MRI 以及联合腮腺 MRI 对于 SS 的诊断效能。
方法：回顾性收集确诊为 SS 的 60 例患者，另收集因口干于本院就诊的 21 例患者，21 例患者行常规腮腺及颌下腺 MRI 检查。观察 T1WI 和 T2WI 图像，进行脂肪信号分级。以临床诊断为金标准，评价颌下腺的 MRI 表现以及腮腺和颌下腺二者联合应用对 SS 的诊断效能。采用配对四格表 x 2 检验比较腮腺和颌下腺诊断 SS 的差异，采用一致性检验比较腮腺及颌下腺脂肪分级结果的一致性。
结果：所有患者均为双侧腮腺及颌下腺病变，表现为信号不均匀，T1WI 和 T2WI 均为多发弥漫分布脂肪信号，抑脂 T2WI 上呈低信号；162 个腮腺的脂肪信号分级，0 级 4 个、1 级 86 个、2 级 40 个、3 级 16 个、4 及 16 个。162 个颌下腺的脂肪信号分级，0 级 48 个、1 级 46 个、2 级 22 个、3 级 20 个、4 级 26 个。81 例 SS 患者的 162 个腮腺中，常规腮腺和颌下腺 MRI 分别检出病变和 158 个和 114 个，均无假阳性结果，差异有统计学意义（ x 2 =37.23，P＜0.005），而二者联合应用检出了全部 162 个病变腺体。腮腺诊断 SS 的灵敏度为 97.5%，颌下腺的灵敏度为 70.3%，二者联合应用的灵敏度为 100％。腮腺及颌下腺脂肪分级结果的一致性较差（Kappa ＝0.067，P ＝ 0.059 ）。
结论：SS 患者颌下腺的 MRI 表现与腮腺相似，但诊断效能低于腮腺，且腮腺和颌下腺腺体脂肪浸润程度并无确切关系。常规 MRI 可以作为诊断 SS 的首要影像学检查，联合腮腺和颌下腺 MRI 表现可提高诊断的准确性，并能客观反应涎腺的病损程度，评估预后。

EPO-0406

探讨 MRI 动态增强联合扩散加权成像鉴别腮腺良恶性肿瘤的价值

黄伟熊
汕头市中心医院

目的：探讨 MRI 动态增强成像联合扩散加权成像鉴别腮腺良恶性肿瘤的价值。方法：选择我院 2013 年 6 月~2018 年 12 月经病理检查证实的 30 例腮腺恶性肿瘤患者与同期随机抽取 31 例腮腺良性肿瘤患者作为研究对象，均采取 MRI 动态增强成像、扩散加权成像检查，对比单独及联合采用 MRI 动态增强成像、扩散加权成像诊断腮腺肿瘤良恶性的敏感度、特异度及准确度。结果：联合采用 MRI 动态增强成像、扩散加权成像诊断腮腺良恶性肿瘤的敏感度为 96.67%(29/30),高于单独采用 MRI 动态增强成像、扩散加权成像诊断，差异有统计学意义(P<0.05)；联合采用 MRI 动态增强成像、扩散加权成像诊断腮腺良恶性肿瘤的特异度、准确度分别为 67.74%（21/31）、81.97%（50/61）与单独采用 MRI 动态增强成像、扩散加权成像诊断对比，无显著差异（P>0.05）。结论：MRI 动态增强联合扩散加权成像能提高对腮腺良恶性肿瘤定性诊断的敏感度。

EPO-0407
MR 动态增强联合扩散加权成像对腮腺肿瘤良恶性的鉴别价值

虞康惠,黄淑梅
广东省第二人民医院

目的：探讨磁共振动态增强扫描（DCE）联合扩散加权成像（DWI）对鉴别腮腺肿瘤良恶性的临床应用价值。
方法：回顾性分析 38 例经手术病理证实的腮腺肿瘤患者，术前均行 MR 平扫、动态增强和 DWI 扫描，绘制肿瘤的动态增强时间-信号强度曲线（TIC）并测量 ADC 值，比较 TIC 曲线特征以及各参数在不同病理类型腮腺肿瘤中的差异，并采用受试者工作特征曲线分析其各自及两者联合对腮腺肿瘤良恶性的鉴别诊断效能。
结果：38 例腮腺肿瘤中，良性 28 例，恶性 10 例，良、恶性腮腺肿瘤在形态表现存在显著差异性（P<0.01）；多形性腺瘤以 A 型（缓慢上升型）、B 型（速升平台型）曲线为主，且 A 型曲线只存在于多形性腺瘤中，可将多形性腺瘤与其他良性肿瘤及恶性肿瘤进行鉴别；腺淋巴瘤以 C 型（速升速降型）曲线为主，较具有特征性，恶性肿瘤以 B 型曲线为主，但是 B 型曲线也存在于部分良性肿瘤中，两者之间存在部分重叠，难以进行良恶性鉴别诊断。但是，腮腺恶性肿瘤的 ADC 值显著低于良性肿瘤的 ADC 值，其中多形性腺瘤和恶性肿瘤、腺淋巴瘤 ADC 值差异有统计学意义（P<0.01），腺淋巴瘤和恶性肿瘤的 ADC 值差异无统计学意义（P>0.05）。
结论：MR 常规扫描结合动态增强能够帮助鉴别腮腺良、恶性肿瘤，并且对于不同病理类型腮腺的诊断提供有价值的信息，联合 ADC 值定量分析可明显提高对腮腺良恶性肿瘤的鉴别诊断效能。

EPO-0408
颌面部成釉细胞瘤 DCE-MR 表现

田涛
上海交通大学医学院附属第九人民医院

目的：探讨动态增强磁共振 (DCE-MRI)对不同类型颌面部成釉细胞瘤的诊断价值。 **方法：**回顾性分析术前已行常规磁共振及 DWI 检查并经手术病理证实的 20 例颌面部成釉细胞瘤，包括原发性成釉细胞瘤 12 例、复发性成釉细胞瘤 8 例。病理类型包括单囊型 2 例、实体/多囊型 15 例、促结缔组织增生型 1 例、骨外/外周型 2 例。根据传统 MR 表现将所有肿瘤分为囊性 2 例、囊实性 18 例。测定 18 例囊实性肿瘤的实性感兴趣区（ROI）的信号强度-时间曲线（time-signal intensity curve, TIC）及曲线达峰时间（time to peak，TTP）。采用 SPSS19.0 软件包进行统计学分析，比较不同类型颌面部成釉细胞瘤之间的 TIC 类型及 TTP 均值差异。 **结果：**2 例囊性肿瘤无强化，18 例有强化的成釉细胞瘤的 TIC 类型呈 I 型（10 例）或 II 型（8 例），I 型曲线 TTP 均在 150s 之

后，II 型曲线 TTP 均值为 50.62±10.31s。原发性与复发性肿瘤的动态增强 TIC 曲线类型无统计学差异(P＞0.05)。当肿瘤 DCE-MRI 的 TIC 曲线为 II 型时，原发性与复发性成釉细胞瘤的平均 TTP 有差异，前者为 56.86±5.27s，后者为 44.38±10.68s。 **结论：**DCE-MRI 可作为鉴别不同类型颌面部成釉细胞瘤的辅助工具。

EPO-0409

Functional connectivity density in sensormotor area is associated with sleep latency in patients with primary Insomnia

xiaozheng liu
Department of Radiology of the Second Affiliated Hospital and Yuying Children's Hospital, Wenzhou Medical University

It is currently unclear whether the pattern of functional connectivity density (FCD) in patients with primary insomnia (PI) differs in normal control (NC) subjects [1]. The current study sought to investigate the features of FCD in PI using resting-state functional magnetic resonance imaging (rsfMRI) [2]. We obtained rsfMRI data from 32 PI and 34 NC using a 3T scanner. Statistical analysis was performed to compare the strength of functional connectivity between the two groups. Our results showed that PI subjects exhibited significantly decreased FCD in the left Medial frontal gyrus/orbital gyrus, left anterior cingulum gyrus and increased FCD in the left supplementary motor area. In addition, the increased FCD values in the left Supplementary motor area negatively correlated with digit span test 1 and positively correlated with sleep latency. These results suggest that the dysfunctional default mode network and sensorimotor area may play an important role in the pathophysiology of PI [3,4].

(micro-course) deadly goblet

Xiaoquan Xu,Feiyun Wu
The First Affiliated Hospital of Nanjing Medical University

The abstract is for the micro course competetion of the head and neck section in 2019 CCR.
Carotid body tumor is one commong tumor orginate in the head and neck.
The typical imaging sign of "carotid body tumor" is the goblet sign.
Accurate diagnosis and differential diagnosis of this tumor is very crucial for the clincial decision.
Therefore, during this section, we want to introduce one case of "carotid body tumor"
My micro course including the following aspects:
First. the overview of carotid body tumor
Second. the diagnosis and differential diagnosis of carotid body tumor

Third. summary of my micro course.

EPO-0411

Reliability of 4D-flow MRI in hemodynamic assessment of Sigmoid Sinus when VENC value changes: comparison with 2D PC MRI

Xiaoshuai Li,Pengfei Zhao,Zhenchang Wang
Beijing Friendship Hospital , Capital Medical University

Objective
To compare the blood flow parameters of sigmoid sinus derived from 4D-flow magnetic resonance imaging (4D-flow MRI) using different velocity encoding (VENC) values and 2D Phase contrast (2D PC) MRI in healthy volunteers.
Methods
A total of 15 healthy volunteers were enrolled in this prospective study. All participants underwent 2D PC and 4D-flow MRI. A 4D-flow MRI protocol involving two different VENC values of 45 cm/s, 90cm/s and a 2D PC MRI protocol involving a VENC value of 60cm/s were performed in middle sigmoid sinus segments. All quantitative and visual data were obtained by dedicated software.
The maximum through-plane velocity (V_{tp_max}), minimum through-plane velocity (V_{tp_min}), average through-plane velocity (V_{tp_avg}), average blood flow ($Flow_{avg}$) calculated from 2D PC, 4D-flow MRI (VENC=45cm/s) and 4D-flow MRI (VENC=90cm/s) were compared by one-way repeated measurement analysis of variance.
Result
There were no significant differences in V_{tp_max}, V_{tp_avg}, $Flow_{avg}$ measurements between groups with varied VENC values in 4D-flow MRI, nor in groups between 2D PC MRI and 4D-flow MRI. The difference in V_{tp_min} between three groups was statistically significant(P=0.003), and V_{tp_min} of 2D PC MRI was significantly less than 4D-flow MRI (VENC=45cm/sec) (P=0.005).
Conclusion
4D-flow MRI appears as a valid alternative for characterizing hemodynamics of sigmoid sinus, which is consistent with 2D PC MRI. We also show that varied VENC values may be used with little effect on the measurement of blood flow parameters.

EPO-0412

CT and MRI Manifestation of Branchial Cleft Fistula

Aonan Wang,Haibo Wu
Peking University Third Hospital

Objective To discuss the diagnostic value of branchial cleft fistula with CT and(or) MRI. **Methods** CT and(or) MRI findings of 33 cases of branchial cleft fistula were

analyzed retrospectively. **Results** Among the 33 cases, 7 cases (21%) are first branchial cleft fistula, which originate in the external auditory meatus, parotid gland. They usually show as tubular structure around the ear, sometimes invading the facial nerve and causing facial nerve symptoms. 18 cases (55%) are second branchial cleft fistula, which often show as tubular structure in the anterior triangle area of the neck, or along the anterior border of the sternocleidomastoid muscle. 8 cases (24%) are third or fourth branchial cleft fistula, which are difficult to differentiate from each other because they both originate in pyriform sinus. **Conclusion** CT and(or) MRI can show the location and range of branchial cleft fistula well, which made it valuable for diagnosis accuracy.

EPO-0413

鳃裂瘘管感染及癌变的 CT 表现

王奥楠,邬海博
北京大学第三医院

目的 探讨鳃裂瘘管继发感染或癌变的 CT 表现及诊断价值。
方法 搜集我院临床确诊的有并发症的鳃裂瘘管患者 36 例，分析鳃裂瘘管继发感染或癌变的 CT 影像特点。
结果 36 例患者中，17 例（47%）符合鳃裂瘘管急性感染，CT 显示耳周、腮腺内或腮腺表面的软组织增厚水肿，可有炎性包块形成，病变密度不均匀，急性感染时病变周围渗出明显，导致与周围组织分辨不清，其中 5 例腮腺密度增高。18 例（50%）符合鳃裂瘘管慢性感染反复发作，CT 显示管样或囊样结构，管壁的厚度、密度、强化程度与感染次数相关，通常感染次数越多，管壁越厚且不规则，周围软组织可见边界不清的炎性改变。1 例（3%）符合鳃裂瘘管癌变，CT 显示耳周的软组织肿块，在部分层面可见肿块生长入外耳道内，病变周围渗出少见，肿块包绕周围血管浸润生长，与邻近组织分界不清。
结论 大部分鳃裂瘘管由于继发急性或慢性感染而就诊，继发癌变者非常罕见。继发癌变者病程长，恶性程度相对较低，因而容易被漏诊。术前 CT 检查可能提示急性感染、慢性感染或癌变，并显示病变的范围及走形途径，这对治疗原则和手术方案的选择是非常有价值的。

EPO-0414

脑动脉瘤的形态与破裂出血的相关性研究

欧阳子健
南宁市第二人民医院

前言：
本文对 109 例动脉瘤患者探究脑动脉瘤（CA）脑血管形态学与破裂出血的关系，为临床 CA 的诊断和治疗提供参考。
目的：探究脑动脉瘤（CA）脑血管形态学与破裂出血的关系，为临床 CA 的诊断和治疗提供参考。
方法：对 2016 年 6 月-- 2019 年 3 月我院住院治疗的 CA 患者资料进行收集，总数量为 109 名，并记录患者的年龄、性别，采用 CTA 及 DSA 获得脑动脉瘤的三维图像，对动脉瘤与瘤颈平行的最大横径、瘤颈宽进行测量。计算瘤颈宽和脑动脉瘤与瘤颈平行最大横径（简称瘤径）长度比值（简称瘤颈比）。随后分析 CA 破裂与瘤颈比的关系。

结果：破裂组拥有最大横径（8.9±2.4）mm 脑动脉瘤，而未破裂组最大内经的脑动脉瘤为（7.2±2.0）mm，破裂组患者瘤径比未破裂组患者瘤径明显增大，两组患者最大横径差异具备统计学含义（P≤0.05）。使用最大瘤径脑动脉瘤 10 mm 为分界点进行分组，倘若瘤径和 10mm 相比小，那么则应当纳入<10 mm 分组中，倘若和 10 mm 相比大，那么应当将其纳入<10 mm 分组中，通过对数据的整理了解到，在 109 个瘤体中，有 87 个动脉瘤瘤径小于 10 mm， 占总数的 79.8 %，破裂率为 51.3 %。瘤径大于 10 mm 的有 22 个，占总数的 20 %，破裂率为 21/22，约 95.4 %。倘若瘤径的最大直径大于 10 mm 那么其和小于 10 mm 的动脉瘤组相对比，其破裂率高。且两组数据具备统计学含义（P≤0.05）。
破裂组脑动脉瘤的瘤颈宽和瘤径分别为（2.2 士 0.9)和（6.8±2.2）mm。未破裂组脑动脉瘤的瘤颈宽和瘤径分别为（1.4 士 0.4）mm 和（4.7 士 2.2）mm。且两组数据具备统计学含义（P≤0.05）。

结论：
患者瘤径的大小、瘤颈宽与瘤颈比对于脑动脉瘤的破裂都具有较高的相关性，瘤径大于 10mm 及瘤颈比小于 1（窄颈）是动脉瘤破裂的重要危险因素，瘤径越大及瘤颈比值越小破裂风险越高。

EPO-0415
基于 ADC 图的影像组学分析预测舌和口底鳞状细胞癌组织学分级的价值

任继亮,袁瑛,陶晓峰
上海交通大学医学院附属第九人民医院

目的：探讨基于 ADC 图的影像组学分析能否用于舌和口底鳞癌的组织学分级的预测。
方法：本研究纳入本院 2015 年 5 月至 2018 年 7 月本院行术前 3.0TMRI 检查的 95 例舌和口底鳞癌患者（训练集 63 例，测试集 32 例），被分为低级别组（I 级及 I-II 级）和高级别组（II 级及 III 级）。使用 LASSO 运算，基于训练集数据建立影像组学标签。使用 ROC 分析评价影像组学标签于训练集及测试集预测舌和口底鳞癌组织学分级的效能。
结果：LASSO 运算选择 6 个最佳特征用于组建影像组学标签。影像组学标签于训练集及测试集区分高、低级别舌和口底鳞癌的表现均较好，AUC 值分别为 0.82、0.78。基于训练组获取的最佳界值，影像组学标签于训练集及测试集分类的精确度分别为 0.75、0.78，灵敏度分别为 0.71、0.86，特异度分别为 0.83、0.64。
结论：基于 ADC 图的影像组学分析可以为舌和口底鳞癌的组织分级术前预测提供一种无创手段。

EPO-0416
RESOLVE-DWI 在腮腺肿瘤鉴别诊断中的价值

姜家锁,苏国义,胡昊,朱榴宁,卜寿山,许晓泉,吴飞云
南京医科大学第一附属医院(江苏省人民医院)

目的 探讨分段读出扩散加权成像（readout segmentation of long variable echo-trains diffusion weighted imaging, RESOLVE-DWI）及表观扩散系数（apparent diffusion coefficient, ADC）在腮腺肿瘤鉴别诊断中的价值。
方法 回顾性分析 2017 年 1 月至 2018 年 5 月 87 例经手术病理证实的腮腺肿瘤患者的临床及影像学资料。避开肿瘤囊变、坏死及出血区，在肿瘤最大层面的 ADC 图上，手动勾画 3 个圆形感兴趣区，

测量平均 ADC 值（ADC_m）。采用独立样本 t 检验比较腮腺良恶性肿瘤组间 ADC_m的差异。采用单因素方差分析比较腮腺多形性腺瘤、腺淋巴瘤和恶性肿瘤组三组间 ADC_m的差异。采用受试者工作特征曲线（receiver operating characteristic, ROC）法分析 ADC_m 对腮腺肿瘤的鉴别诊断价值。
结果 腮腺良性及恶性肿瘤组间 ADC_m差异无统计学意义（P=0.071）。腮腺多形性腺瘤、腺淋巴瘤及恶性肿瘤三组组间 ADC_m 差异具有统计学意义（P<0.001）。两两比较均具统计学差异（多形性腺瘤 vs 腺淋巴瘤，P<0.001；多形性腺瘤 vs 恶性肿瘤，P<0.001；腺淋巴瘤 vs 恶性肿瘤，P=0.030）。ADC_m在三组肿瘤两两鉴别中的 ROC 曲线下面积分别为（多形性腺瘤 vs 腺淋巴瘤，AUC>0.999；多形性腺瘤 vs 恶性肿瘤，AUC=0.822；腺淋巴瘤 vs 恶性肿瘤，AUC=0.807）。
结论 腮腺常见肿瘤中腺淋巴瘤 ADC 值最低，随后依次是恶性肿瘤和多形性腺瘤。RESOLVE-DWI 可以准确评估腮腺肿瘤 ADC 值，辅助肿瘤鉴别诊断。

EPO-0417

Preliminary study of using diffusion kurtosis imaging for characterizing parotid gland tumors

Wen Qian[1],Xiaoquan Xu[1],Liuning Zhu[2],Gao Ma[1],Guoyi Su[1],Shoushan Bu[2],Feiyun Wu[1]
1.Department of Radiology, The First Affiliated Hospital of Nanjing Medical University
2.Department of Stomatology, The First Affiliated Hospital of Nanjing Medical University

Background: Diffusion kurtosis imaging (DKI) is a technique based on the theory that the diffusion of water follows
non-Gaussian distribution; until now, few studies have explored the usefulness of DKI in differentiating parotid
gland tumors.
Purpose: To evaluate the potential of DKI in the characterization of parotid gland tumors.
Material and Methods: DKI was performed in 40 patients with parotid gland tumors (33 benign, 7 malignant).
DKI parameters including apparent diffusion coefficient (Dapp) and apparent kurtosis coefficient (Kapp) were obtained
using the DK model and compared. Intraclass correlation coefficient (ICC) was used to evaluate inter-observer agreement
of DKI derived parameters.
Results: Excellent inter-observer agreements (Dapp, ICC¼0.988; Kapp, ICC¼0.985) were achieved during quantitative
measurements. There were no significant differences in Dapp (P¼0.055) and Kapp (P¼0.915) between the benign and
malignant groups. In the subgroup analyses, pleomorphic adenomas showed higher Dapp (P<0.001) and lower Kapp
(P¼0.037) than malignant tumors. Combination of Dapp and Kapp showed optimal discriminative value (area under curve
[AUC]¼0.913; sensitivity¼88.89%; specificity¼85.71%). Pleomorphic adenomas also showed higher Dapp (P<0.001)
and lower Kapp (P<0.001) than Warthin’s tumors. A combination of Dapp and Kapp showed optimal discriminative value

(AUC¼1.000; sensitivity¼100%; specificity¼100%). Warthin’s tumors demonstrated higher Kapp than malignant
tumors (P<0.001), while no significant difference was found on Dapp (P¼0.448). The AUC, sensitivity, and specificity
of Kapp for discriminatingWarthin’s tumors from malignant tumors at an optimal threshold of 0.735 were 0.905, 88.89%,
and 85.71%, respectively.
Conclusion: DKI may be a promising imaging technique for characterizing parotid gland tumors.

青年人正常与慢性关节弹响实施颞下颌关节的 MRI 分析

张晓亚
南阳市中心医院

【摘要】目的：分析研究青年人正常与慢性关节弹响实施颞下颌关节的 MRI 检查。**方法：**对选取正常青年志愿者 40 例（正常组）以及我院治疗的慢性张口弹响颞下颌关节紊乱的患者 15 例（病例组），分别用同一类型的 MRI 仪扫描，比较两组在同一检查面的关节盘、关节液以及关节盘髁位置关系。**结果：**病例组 14 个关节，每个关节分析通过髁突内的 1/3、中心、外 1/3 的 3 层闭口斜矢状面。结果显示有双凹形和非双凹形，其中病例组双凹形关节盘内 1/3、中心、外 1/3 双凹形比例分别为 28.5.0%（4/14）、28.5.0%(4/14)、14.20%(2/14)；弹响组 71.4%(10/14)的关节盘内可见散在片状稍高信号，7 个位于中后带交界区，2 个位于后带，1 个位于前中及中后带交界区，其中有 9 个关节盘内高信号表现为大片状，均位于 8 个肥大的关节盘内。正常组和病例组非双凹型关节盘中 3 层闭口斜矢状面内 1/3、中心、外 1/3 的比例的差异具有统计学意义（P<0.05）；正常组和病例组关节液的比较显示，差异经过秩和检验后差异具有统计学意义（Z=-7.469，P=0.000）；病例组关节盘在内 1/3、中心、外 1/3 闭口斜矢状面均明显前移位，与正常组相比差异具有统计学意义（P<0.05）；正常组和病例组内 1/3、中心、外 1/3 闭口斜矢状面 Drace 角比较，在两组之间的差异具有统计学意义（P<0.05）。**结论：**慢性关节弹响实施颞下颌关节的 MRI 可以清楚显示出关节盘的位置、关节液的多少以及从斜矢状面明显前移位。

腮腺基底细胞腺瘤的影像学表现

汪丽,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 探讨腮腺基底细胞腺瘤的影像学表现。
方法 回顾性分析 15 例经手术及病理证实的腮腺基底细胞腺瘤的临床特征、CT 及 MRI 图像特点。
结果 15 例病灶均为单发肿块,左侧 7 例,右侧 8 例;病灶最大径为 3.0cm,10 例位于腮腺浅叶,5 例位于腮腺深叶;12 例呈类圆形,3 例呈椭圆形;8 例病灶呈实性,增强扫描病灶明显强化,7 例病灶伴有囊变,其中 2 例有壁内结节,增强扫描壁内结节明显强化。
结论 腮腺基底细胞腺瘤好发于中老年人,其影像学特征有利于术前诊断。

T2mapping 在腮腺肿瘤鉴别诊断中的价值

吴倩,姜家锁,许晓泉,吴飞云
江苏省人民医院（南京医科大学第一附属医院）

目的：评估定量 T2mapping 在腮腺肿瘤鉴别诊断中的价值。
方法：回顾性分析 2018 年 1 月至 12 月 73 例经手术病理证实的腮腺肿瘤患者的临床及影像学资料。根据 T2 轴位像，避开坏死囊变及出血，在 T2mapping 图像上肿瘤直径最大的平面选取三个感兴趣区，测量肿瘤的平均 T2 弛豫时间。采用独立样本 t 检验比较腮腺良恶性肿瘤组间 T2 值的差异。采用单因素方差分析比较腮腺多形性腺瘤、腺淋巴瘤和恶性肿瘤组三组间 T2 值的差异。采用受试者工作特征曲线法分析 T2 值对腮腺肿瘤的鉴别诊断价值。
结果：腮腺良性肿瘤 T2 值高于恶性肿瘤，差异有统计学意义(P=0.001，曲线下面积= 0.679，敏感度=46.4%，特异性=94.4%)。多形性腺瘤的 T2 值高于恶性肿瘤(P=0.003，曲线下面积=0.783，敏感度=58.1%，特异性=94.4%)与腺淋巴瘤(P=0.001，曲线下面积=0.892，敏感度=87.1%，特异性=83.3%)，差异有统计学意义；恶性肿瘤与腺淋巴瘤间的 T2 值差异无统计学意义(P=0.435)。
结论：T2 mapping 在鉴别腮腺肿瘤良恶性及区分多形性腺瘤与腺淋巴瘤及恶性肿瘤中具有重要价值。

EPO-0421

MSCT 后处理技术在颌面部骨折中的临床应用

宁文锋[1],杨想春[1],邬小平[1],杨军乐[1],刘红生[1],马鸣岳[1],高明[1],李璐言[1],张军俭[2]
1.西安市中心医院
2.西安市第九医院

目的：探讨 MSCT 后处理技术在颌面部骨折中的临床应用价值
方法：收集颌面部外伤患者 56 例，男 32 例，女 24 例，中位年龄 31 岁。均行轴位 CT 高分辨扫描，扫描范围由眶上缘至下颌骨颏部下缘；并在工作站进行后处理重建、分析。56 例患者原始数据均行容积再现（VR）及多平面重组（MPR），32 例行曲面重建（CPR）。详细分析骨折程度及相关结构受累情况。
结果：56 例颌面部外伤患者中，单发骨折 44 例，多发骨折 12 例。其中眶部骨折 9 例，单纯眼眶内壁骨折 4 例，眼眶下壁骨折 2 例，视神经管骨折 3 例；鼻部骨折 11 例，鼻骨骨折 8 例，鼻骨合并鼻中隔骨折 3 例；上颌骨骨折 14 例，上颌窦前壁骨折 3 例，上颌窦前壁及外壁骨折 5 例，上颌齿槽骨骨折 6 例；下颌骨骨折 22 例，下颌骨体部骨折 9 例，其中 4 例致下颌神经管骨折，下颌升支骨折 5 例，髁状突骨折 8 例。
结论：VR 可直观显示骨折线走行及颌面部骨折后骨质形态改变；MPR 可显示周围无法显示的骨折线及周围相关结构受累情况；CPR 可在一幅图像上清晰显示视神经管、鼻泪管、下颌神经管等弯曲管道，推测管内结构受损情况。结合轴位图像充分利用 MSCT 后处理技术，可准确诊断颌面部骨折的程度，对临床治疗选择及预后评价有重要的指导意义。

EPO-0422

髓外浆细胞瘤的 CT 及 MRI 表现

危春容,瞿姣,冯瑶杰,张梦梅,李德艳,杨亚英
昆明医科大学第一附属医院

目的：探讨髓外浆细胞瘤(extramedullary plasmacytoma,EMP)的影像特征，以提高对本病的认识。**方法：**回顾性分析我院 22 例经病理证实的 EMP 患者的临床及影像学资料并复习相关文献，总结其 CT 及 MRI 特征。**结果：**22 例中，16 例发生于头颈部：鼻腔鼻窦 6 例，鼻咽 3 例，眼眶 2 例，颅内 2 例，颌下腺 1 例，甲状腺 1 例，喉 1 例；6 例发生于其他部位：胸壁 2 例，肺内 1 例，盆腔 1 例，睾丸 1 例，椎管内 1 例。22 例均表现为孤立的软组织肿块，15 例密度/信号均匀，2 例伴囊变坏死，2 例伴钙化，5 例 DWI 高 b 值弥散受限呈高/稍高信号，12 例伴邻近骨质吸收破坏，14 例伴周围组织侵犯，增强扫描多呈明显强化，3 例肿块内部或周边见迂曲增粗血管影。**结论：**EMP 的 CT 及 MRI 具有一定特点：病灶多为孤立的软组织肿块，密度/信号均匀，囊变坏死、钙化少见，易侵犯邻近骨质及周围组织，增强扫描呈明显强化，肿块内部或周边可见流空血管影。

EPO-0423

Histogram Analysis Parameters ADC for Distinguishing Ventricular Neoplasms of Ependymoma,Choroid Plexus Papilloma and Central Neurocytoma

Chen Chen,Cui-ping Ren
The First Affiliated Hospital of Zhengzhou University

Objective: To determine if histogram of ADC can be used to differentiate ventricular ependymomas,choroid plexus papillomas(CPPs) and central neurocytomas(CNCs).

Materials: 185 patients from January 1,2014 to November 1, 2018 were retrospectively reviewed. In the end, 60 patients with confirmed histologically ependymomas in 36(60.00%) patients,CPPs in 10(16.67%) patients, and CNCs in 14(23.33%) patients were enrolled in the study,accepting MRI at 3T. The ROIs were drawn on the maximum level of ADC,and the histogram analysis were performed using the software named Mazda. One-way ANOVA and Kruskal-Wallis test were performed on the nine histogram parameters to find out the different characteristics. LSD and Bonferroni test were used between any two of the three groups and the ROC curve was drawn to evaluate the diagnostic efficacy.

Results:Ependymomas were significantly higher mean,Perc.01%,Perc.10%,Perc.50%,Perc.90% and Perc.99% than CNCs.Ependymomas were significantly lower skewness than CNCs.Histogram metrics derived from mean,Perc.01%,Perc.10%,Perc.50% and Perc.90% were significantly lower in CNCs than CPPs group.CPPs showed significantly lower skewness than CNCs.A threshold value of 86.50 for Perc.50% had the best diagnostic efficacy to predict ependymomas from CNCs(AUC= 0.97, sensitivity = 97.20%,specificity = 85.70%). Optimal diagnostic performance to predict CPPs from CNCs (AUC= 0.96, sensitivity = 100.00%, specificity =85.70%) was obtained when setting Perc.50%= 84.00 as the threshold value.

Conclusions:The ADC histogram analysis may help to discriminate ependymomas,CPPs and CNCs.

EPO-0424

Histogram Analysis Parameters Enhanced-T1WI for Distinguishing Ventricular Ependymomas,Choroid Plexus Papillomas and Central Neurocytomas

Chen Chen,Cui-ping Ren
The First Affiliated Hospital of Zhengzhou University

Purpose: To determine if histogram of enhanced-T1WI can be used to differentiate ventricular ependymomas,choroid plexus papillomas(CPPs) and central neurocytomas(CNCs).

Material and Methods: 185 patients from January 1,2014 to November 1, 2018 were retrospectively reviewed. In the end, 75 patients with confirmed histologically ependymomas in 40(53.3%) patients,CPPs in 18(24%) patients, and CNCs in 17(22.7%) patients were enrolled in the study,accepting MRI at 3T. The ROIs were drawn on the maximum level of enhanced-T1WI,and the histogram analysis were performed using the software named Mazda. One-way ANOVA and Kruskal-Wallis test were performed on the nine histogram parameters to find out the different characteristics. LSD and Bonferroni test were used between any two of the three groups and the ROC curve was drawn to evaluate the diagnostic efficacy.
Results: Ependymomas showed significantly lower mean,Perc.01%,Perc.10%,Perc.50%,Perc.90% and Perc.99% than CPPs.Histogram metrics derived from mean,Perc.01%,Perc.10%,Perc.50%,Perc.90% and Perc.99% were significantly lower in CNCs than CPPs group. Ependymomas showed significantly lower kurtosis than CNCs.A threshold value of 180.50 for Perc.50% had the best diagnostic efficacy to predict ependymomas from CPPs (AUC= 0.81, sensitivity = 83.30%,specificity = 82.50%). Optimal diagnostic performance to predict CPPs from CNCs (AUC= 0.92, sensitivity = 83.30%, specificity =100.00%) was obtained when setting Perc.90%= 185.50 as the threshold value.

Conclusions:The enhanced-T1WI histogram analysis may help to discriminate ependymomas,CPPs and CNCs.

EPO-0425

Segment-specific Progression of Carotid Artery Atherosclerosis: A Magnetic Resonance Vessel Wall Imaging Study

Mingming Lu[1,2],Jianming Cai[2],Xihai Zhao[3]
1.Characteristic Medical Center of Chinese People's Armed Police Force
2.PLA general hospital
3.Tsinghua University School of Medicine

Background The progression of carotid atherosclerosis has been demonstrated to be associated with subsequent cerebrovascular ischemic events including stroke and transient ischemic attack[1-3] and it is important to accurately measure the progression of carotid plaques which can be used to stratify the risk of ischemic events. However, there is no consensus on plaques from which segment of carotid arteries had a more rapid progression rate among previous studies[4,5]. Thus, this study aimed to investigate the segment-specific progression of atherosclerotic carotid plaques using serial multi-contrast magnetic resonance (MR) imaging. Method Symptomatic patients with carotid 30%-70% stenosis were recruited and underwent carotid MR vessel wall imaging at baseline and follow-up time point (≥6 months after baseline). The location of plaques was determined according to the maximum wall thickness located above or below carotid bifurcation. The baseline and changing characteristics of carotid plaques were compared between plaques above and below carotid bifurcation and the risk factors for segment-specific plaque progression were analyzed with logistic regression. Results Ninety-six carotid plaques from 73 patients (mean age 66.5 ± 11.4 years old) were eligible for statistical analysis. Compared with plaques located below carotid bifurcation, those above bifurcation had significantly greater stenosis at baseline (57.2± 13.0%vs. 50.4 ± 13.5%, p = 0.016, adjusted p = 0.005) and greater progression rate of carotid wall volume (35.2± 68.8 mm^3/year vs. 4.2± 65.0mm^3/year, p = 0.026, adjusted p = 0.005) before and after adjusting for all clinical risk factors and baseline stenosis and wall volume of carotid arteries. Logistic regression showed that the related risk factors were age, hypertension and smoke for the progression of plaques located above the bifurcation and age for plaques below the bifurcation, respectively. Conclusion Plaques located above the bifurcation of carotid arteries had greater annual progression and correlated with more cardiovascular risk factors compared with those located below the bifurcation.

EPO-0426
颈部 2 点法 T2-DIXON 图像水-脂分离错换的纠错方法

邓和平,王闽
四川省肿瘤医院

目的 探讨颈部 2 点法 T2-DIXON 图像局部水-脂分离错换的解决方法。**方法** 选择鼻咽、颈部 T2-DIXON 轴位检查图像出现局部水-脂分离错换的 140 例患者随机分为 7 组，采用德国 Siemens MAGNETOM skyra 3.0T 超导磁共振扫描仪进行第二次 T2-DIXON 轴位检查，每组 T2-DIXON 轴位序列采用七种不同方式重复扫描，第一组采用局部水-脂分离错换层面增加匀场块；第二组将 T2-DIXON 序列重复采集次数增加为 2 次；第三组于扫描部位放置匀场辅助装置；第四组采用局部水-脂分离错换层面增加匀场块+T2-DIXON 序列重复采集次数增加为 2 次；第五组采用局部水-脂分离错换层面增加匀场块+扫描放置匀场辅助装置；第六组采用 T2-DIXON 序列重复采集次数增加为 2 次+扫描放置匀场辅助装置；第七组采用局部水-脂分离错换层面增加匀场块+T2-DIXON 序列重复采集次数增加为 2 次+扫描放置匀场辅助装置。并对第二次扫描所得图像与首次扫描的水-脂分离错换图像进行比较并分级，1 级：水-脂分离错换未纠正，且错换范围增加；2 级：水-脂分离错换未纠正，错换范围无明显变化；3 级：水-脂分离错换部分纠正；4 级：水-脂分离错换全部纠正。**结果** 七组病例第二次扫描图像均不同程度的纠正水-脂分离错换现象，第一、二、三组病例采用一种方式扫描，第四、五、六、七组病例采用两种及以上的组合方式进行扫描，后四组病例在水-脂分离错换纠正能力上明显由于前三组病例。第一、三、五组两次扫描图像 SNR 值进行统计学分析，

p>0.05，第二、四、六、七组两次扫描图像 SNR 值进行统计学分析，p<0.05，**结论** 在进行磁共振扫描时出现水-脂分离错换时局部层面增加匀场块、增加重复采集次数、局部放置匀场辅助装置的使用对于纠正水-脂分离错换具有积极的作用，多种方法联合应用其纠正水-脂分离错换的效果更明显。

椎-基底动脉血流动力学与后循环梗死的相关性研究

张敏[1],刘学焕[2],刘筠[2]
1.天津市大港医院
2.天津市人民医院

目的：探讨椎-基底动脉血流动力学与后循环梗死(Posterior circulation infarction，PCI)的相关性，提高对 PCI 的认识。
方法：选取 2016 年 1 月至 2016 年 12 月于天津市人民医院神经内科住院治疗的 18-80 岁患者为研究对象，经 MRI 证实为急性 PCI 患者纳入梗死组，无 PCI 患者纳入无梗死组。收集入组患者的基本临床资料、病史资料、头部 MR 影像资料及椎动脉(Vertebral artery,VA)颈段超声资料。基于 VA 颈段彩色多普勒超声数据分析两组间 VA 颈段管径、VAD、VAH、阻力指数(Resistance index,RI)、收缩期峰值流速(Peak systolic velocity,PSV)及峰值血流量差异。以一侧 VA 单位时间内峰值血流量超过对侧 30%作为 VA 峰值血流量优势标准，分析梗死组与无梗死组间 VA 峰值血流量优势差异。采用 SPSS20.0 统计软件进行数据分析，检验水准 α=0.05。
结果：本研究共纳入 177 例研究对象，其中梗死组 85 例，无梗死组 92 例。梗死组 RI 增高 9 例(10.6%)，存在 VA 峰值血流量优势 57 例(67.1%)。无梗死组 RI 增高 1 例(0.11%)，存在 VA 峰值血流量优势 46 例(50%)。梗死组 RI 增高及 VA 峰值血流量优势发生率高于无梗死组(P<0.05)。两组间 VA 颈段管径、PSV 及两侧 VA 血流量之和差别均无统计学意义(P0.05)。
结论：VA 峰值血流量优势为 PCI 的危险因素。

EPO-0428
腮腺区结核 CT 诊断

刘嘉月,杨金荣,王丽君
大连医科大学附属第一医院

目的：分析腮腺区结核 CT 特征及误诊原因。
材料与方法：搜集 2006 年至 2016 年经手术或穿刺病理证实腮腺区结核共 16 例，其中一位患者进行两次 CT 检查及手术，回顾性分析其发病部位、范围、密度、强化方式等 CT 特征。
结果：16 例患者中男 6 例，女 10 例，年龄 11 岁～80 岁。12 例术前 CT 诊断为多形性腺瘤，2 例诊断恶性肿瘤，1 例诊断为脓肿，1 例诊断为淋巴结增生。病理证实 2 例为腮腺结核，2 例为腮腺及腮腺区淋巴结结核，剩余均为腮腺区淋巴结结核。腮腺结核呈弥漫片状明显强化。腮腺淋巴结结核表现为 4 例环状强化，2 例花环状强化，3 例大部分均匀强化，中心小囊状或片状弱强化，2 例较均匀强化，1 例呈带状低密度影，边缘线状强化。腮腺实质伴淋巴结结核呈片状强化及其内环状强化结节。所有病例 4 例腮腺病灶伴有钙化（弥漫点状或砂砾状、结节状），6 例周围筋膜模糊，累及皮下脂肪。12 例同侧淋巴结增大，4 例双侧淋巴结增大。
结论：腮腺结核表现多样，了解其病理改变的本质才能认识到腮腺区结核的表现，环状强化及颈部淋巴结增大以及累及皮下脂肪可能有助于腮腺区结核的诊断。

EPO-0429
抗血小板药物使用与颈动脉粥样硬化斑块内出血的多对比度磁共振研究

彭鹏[1],卢明明[1],蔡剑鸣[2]
1.武警特色医学中心
2.解放军总医院

背景 颈动脉粥样硬化易损斑块已被证实与缺血性脑卒中、短暂性脑缺血发作等脑血管缺血性事件的发生显著相关[1,2]。斑块内出血（Intraplaque hemorrhage，IPH）是易损斑块的主要特征之一，可引发斑块破裂而导致脑缺血事件的发生[3]。而近年来，有国外研究发现服用过抗血小板药物患者颈动脉 IPH 的发生率可能更高[4,5]，但目前抗血小板药物使用与颈动脉 IPH 是否存在相关性仍存争议，因为之前多项评估影响颈动脉 IPH 临床因素的研究中，并未发现二者之间的相关性[6,7]。随着影像学技术的发展，多对比度磁共振成像技术能够准确地评估颈动脉粥样硬化斑块 IPH 的发生[8]。本研究旨在利用多对比度 MRI 技术探讨抗血小板药物使用与颈动脉 IPH 之间的相关性。方法 回顾性分析经超声检测至少有一侧颈动脉存在粥样硬化斑块的症状性患者。对所有患者进行双侧颈动脉多对比度 MR 血管壁成像，分析颈动脉 IPH 与患者临床特征。结果 共 108 例颈动脉粥样硬化斑块患者纳入分析，其中存在 IPH 患者 41 例，无 IPH 患者 67 例。与无 IPH 患者相比，IPH 患者抗血小板药物使用（P=0.013）及吸烟（P=0.037）的比例更高，他汀类药物使用（P=0.019）比例更低，颈动脉斑块负荷更大（P<0.001）。Logistic 回归分析显示，在调整混杂因素之前（OR，2.80；95%CI，1.23-6.41；P=0.014）和之后（OR，3.33；95%CI，1.06-10.45；P=0.039），抗血小板药物使用与 IPH 之间均显著相关。结论 颈动脉粥样硬化患者抗血小板药物的使用可能与 IPH 的发生有关，该结果可能为颈动脉粥样硬化患者合理、规范使用抗血小板药物提供一定理论参考。

EPO-0430
Improving the diagnostic performance of benign parotid tumors using image biomarkers in combination with clinical parameters

Dan Zhang
University of Chinese Academy of Sciences Chongqing hospital(Chongqing General Hospital)

Purpose: To develop and validate diagnosis models of the most common benign tumors in parotid gland based on CT image biomarkers (IBMs) in combination with clinical parameters.

Material and methods: The study cohort was composed of two most common benign parotid tumors, including 45 pleomorphic adenoma patients and 40 adenolymphoma patients. Kolmogorov-Smirnov test or Levene test was used for evaluating the significance of the difference on clinical parameters and IBMs from the datasets. Receiver operating characteristic (ROC) curve and area under the curve (AUC) were drawn and calculated using frequency variables. The accuracy, specificity and sensitivity were respectively discussed by the maximum Youden’s index.

Results: In textural IBMs model, the diagnostic efficiency of energy between parotid adenolymphoma and pleomorphic adenoma was the best, and the AUC was 0.90. The accuracy, sensitivity and specificity was 82%,72.81% and 93.2% respectively. In conventional IBMs model, the diagnostic efficiency of time-density curve(TDC) was the best, and the AUC was 0.921.The accuracy, sensitivity and specificity was 88%,74.6% and 93.7% respectively. In clinical model, the diagnosis efficiency of gender was the best, and the AUC was 86.4%. The accuracy, sensitivity and specificity was 81.7%, 90.1% and82.9% respectively. When IBMs were added in clinical model, the AUC was improved to 93.7.The accuracy, sensitivity and specificity was 87.7%, 80.1% and 94.9% respectively.

Conclusion: The addition of IBMs from benign parotid tumors improved the diagnostic performance of the model containing clinical factors. These combined models may improve the diagnostic accuracy of parotid tumors, so as to select individualized surgery program.

常规 MRI 扫描征象对于原发扁桃体癌和扁桃体淋巴瘤的鉴别诊断价值

刘国源,董越
辽宁省肿瘤医院

目的 探讨常规 MRI 扫描征象对于原发扁桃体癌和扁桃体淋巴瘤的鉴别诊断价值

材料与方法 回顾性分析 39 例扁桃体癌与 20 例扁桃体淋巴瘤患者的临床资料及常规 MRI 征象。对比的影像征象包括病灶分布、大小、形状、信号强度和均匀程度、强化均匀程度、咽旁间隙浸润及颈部淋巴结受累情况。对两者影像征象的鉴别，首先进行单因素分析，后通过 Logistic 回归分析筛选出具有独立诊断意义的影像征象，并通过 ROC 曲线判断模型的诊断效能。

结果 39 例扁桃体癌发现病灶 42 个（3 例双侧病灶），平均直径 30.8±13.6mm；38 个病灶形态不规则，呈浅分叶状；31 个病灶边缘不清晰并侵犯咽旁间隙。20 例淋巴瘤共发现病灶 25 个（5 例双侧病灶），平均直径 30.4±13.9mm；10 个扁桃体淋巴瘤病灶形态不规则，呈浅分叶状；3 个病灶边缘不清晰，侵犯临近咽旁间隙。两组肿块的 MRI 影像均为 T1WI 呈等信号、T2W 呈稍高信号。33 个扁桃体癌病灶 T2W 信号不均匀，38 个病灶增强不均匀强化。7 个扁桃体淋巴瘤病灶 T2WI 信号不均匀，3 个病灶增强不均匀强化。34 例扁桃体癌合并颈部淋巴结受累，26 例为单侧且均为同侧受累，8 例双侧受累；11 例扁桃体淋巴瘤出现颈部淋巴结受累，10 例单侧受累且均为同侧，1 例双侧受累。单因素分析结果显示扁桃体癌较扁桃体淋巴瘤病灶形态更不规则（P<0.001）、T2WI 信号（P<0.001）及增强扫描信号（P<0.001）更不均匀、更易浸润临近咽旁间隙（P<0.001）及颈部淋巴结受累（P=0.006）。多因素分析病灶强化均匀程度（OR 值=46.197，P<0.001）、临近咽旁间隙浸润（OR 值=9.259，P=0.023）为鉴别扁桃体癌和扁桃体淋巴瘤的独立预测因子，ROC 曲线下面积为 0.964，*P*<0.001）。

结论 常规 MRI 对于扁桃体癌与淋巴瘤的鉴别具有重要价值。

EPO-0432

腮腺 Kimura 病 MR 影像特征

王灿
上海交通大学医学院附属第九人民医院

目的　探讨 MRI 对腮腺 Kimura 病的诊断价值,提高对 Kimura 病的认识。资料与方法　回顾性分析 6 例经病理证实的腮腺区 Kimura 病的临床及 MRI 表现。结果　6 例 Kimura 病表现为腮腺区无痛性肿块(其中 1 例双侧肿大)，部分伴皮肤瘙痒。所有患者血常规嗜酸性粒细胞均明显增多(平均超出正常值约 5~6 倍)。MRI 表现为:(1)单侧或双侧腮腺浅叶弥漫性增大,常有多个结节;(2)累及邻近皮下组织、皮肤增厚;(3)腮腺周围及颈部多发增大淋巴结，信号均匀，边界清楚光滑，无坏死、囊变，几乎不融合。结论　Kimura 病有一定的临床和影像特点，结合实验室检查,，术前可以正确诊断。

EPO-0433
基于机器学习法在 AIDS 患者磁共振技术测量脑灰质体积的应用价值研究

符丹卉,苏丹柯,金观桥
广西医科大学附属肿瘤医院

目的：运用基于机器学习方法的磁共振成像结构像技术，探究灰质体积指标(GMV)在评估 HIV 相关神经认知功能障碍中的应用价值。
方法：按照纳入排除标准，收集 2017 年 09 月至 2019 年 1 月期间首诊于南宁市第四人民医院的艾滋病患者，共纳入未进行抗病毒治疗的患者 27 例（HIV 阳性组），14 位男性，13 位女性。以 NP 测验为参考标准，将 HIV 阳性组分为 HAND 组（认知障碍组）和非 HAND 组。正常志愿者 14 例纳入对照组，8 位男性，6 位女性，经测试正常对照组认知功能正常。要求受试者签署磁共振检查知情同意书。采用 GE Discovery MR 750w 3.0T 磁共振行轴位 T1WI、轴位 T2WI 扫描及矢状位 T1 加权（Sag3D T1WI-BRAVO）薄层扫描。图像的预处理使用 DPARSF3.1，正式处理使用 PRoNTo2.1.1 进行图像数据的分析。使用 SPSS19.0 统计软件分析 GMV 指标在 HAND 组和非 HAND 组的差异。
结果：（1）GMV 指标在 HIV 阳性组和 HIV 阴性组间差异贡献最大的十个大脑区域依次为：右侧中央后回、左侧顶上回、右侧中央旁小叶、右侧补充运动区、左侧顶下缘角回、左侧颞横回、右侧顶下缘角回、右侧顶上回、右侧中央盖沟、左侧缘上回；（2）GMV 的 AUC 为 0.73，准确率为 70.73%，灵敏度为 85.19%，特异度为 42.86%，阳性预测值为 74.19%，阴性预测值为 60.00%。（3）HAND 组和非 HAND 组的 GMV 值与临床血液学、临床量表及认知评分、分组有不同程度的相关性。
结论：机器学习法在基于磁共振的 AIDS 患者的脑灰质体积测量的分类有意义。AIDS 患者组和对照组有差异的位于前十位的大脑区域主要集中在双侧额叶、双侧顶叶、左侧颞叶。GMV 指标可以用于诊断 HAND，磁共振结构成像的检查可以为临床诊断 HAND 提供客观的检查方法，对治疗效果提供客观的评价指标，达到降低 HAND 发生和发展的目的。

EPO-0434
Radiomics features analysis in computed tomography images of parotid tumors

Liang Yang,Tao Jiang

Beijing Chaohyang Hospital of Capital Medical University

PURPOSE To develop and validate a useful radiomics model for preoperative classification of malignant and benign parotid tumors on CT imaging data. **METHOD AND MATERIALS** A total of 45 patients with pathology-proven parotid tumors and clinical data were obtained from January 2013 to March 2019. All patients underwent enhanced CT scan before treatment. According to the histological results, they were divided into the benign group (23 cases) and the malignant group (12 cases). ROI drawn manually by a radiologist was used in radiomic analysis for extracting features of the maximum slice of the tumors in CT images. The high throughput features from ROI were extracted for classification analysis by Radcloud platform. A total of 1409 quantitative imaging features were extracted. LASSO algorithm methods was used to gradually select the optimal features. Computer-generated random numbers were used to assign 70% of the ROIs to the training data set and 30% of ROIs to the validation data set. Classifications were made using one supervised learning classifiers (SVM) in our study. Blind diagnoses that classify the 31 cases in validation cohort on CT images, was carried out by a radiologists with 10 years of experience. Diagnostic performance in group classification by the radiomics model and radiologists were evaluated by using ROC analysis.Benign and malignant parotid tumors were significant different in radiomics features. **RESULTS** In radiomic analysis of conventional, arterial phase, venous phase CT image, classification results of training set showed the AUC, sensitivity and specificity were 0.98, 56%, 100% (P>0.05); 0.91, 75%, 97% (P<0.05); 1, 67%, 100% (P>0.05), while that of validation set was 0.38, 25%, 80%(P>0.05); 0.88, 78%,75%(P<0.05); 0.75, 50%, 100% (P<0.05) respectively. The best radiomics model differentiating benign and the malignant parotid tumors was that oriented from arterial phase CT image. The radiologists had AUC of 0.86 (similar to the radiomics model of arterial phase CT image), sensitivity of 76% and specificity of 74% (slightly lower than that model). **CONCLUSION** Combination of radiomics and machine learning was promising in the differentiating these two diseases.

椎-基底动脉形态与后循环梗死的相关性研究

张敏[1],刘学焕[2],刘筠[2]
1.天津市大港医院
2.天津市人民医院

目的：探讨椎-基底动脉形态与后循环梗死(Posterior circulation infarction，PCI)的相关性，提高对 PCI 的认识。
方法：选取 2016 年 1 月至 2016 年 12 月于天津市人民医院神经内科住院治疗的 18-80 岁患者为研究对象，经 MRI 证实为急性 PCI 患者纳入梗死组，无 PCI 患者纳入无梗死组。依据头部 MRA 原始及重建图像，分析两组间椎-基底动脉系统(Vertebrobasilar system,VBS)分型、willis 环、后交通动脉(Posterior communicating artery,PCoA)开放情况及其他血管变异情况。基于头部 MRA 数据，对梗死组与无梗死组 VA 颅内段管径、椎动脉优势(Vertebral artery dominance,VAD)、椎动脉发育不良(Vertebral artery hypoplasia,VAH)、VA 中重度狭窄发生率、基底动脉(Basilar artery,BA)管径、偏曲程度及 BA 中重度狭窄发生率的差异进行统计学分析。采用 SPSS20.0 统计软件进行数据分析，检验水准 α=0.05。

结果：研究共纳入 177 例研究对象，其中梗死组 85 例，无梗死组 92 例。梗死组 VA 颅内段管径(2.8±0.6)大于无梗死组(2.6±0.5)，差异有统计学意义(P=0.011)。梗死组颅内段 VAH 发生率(18.8%)低于无梗死组(35.9%)，差异有统计学意义(P=0.011)。在颅内段及颈段，梗死组和无梗死组 VAD 和 VAH 的发生侧别无差异(P0.05)。两组间 VA 颈段管径、颅内段及颈段 VAD 发生率、颈段 VAH 发生率、BA 管径及 BA 明显偏曲发生率差别均无统计学意义(P0.05)。两组间 PCoA 开放比例无差异(P=0.500)。

结论：椎-基底动脉形态与 PCI 的发生无明显相关性。需结合椎-基底动脉血流动力学参数进一步探讨椎基底动脉与 PCI 的相关性。

EPO-0436
甲状腺体积与气管压迫的三维 CT 体积测量研究

刘春明,华锐,刘振兴
天津市人民医院

目的：甲状腺体积增大可能导致气管压迫，这是呼吸窘迫的原因之一。本研究的目的是通过计算机断层扫描重建的半自动三维体积测量来研究甲状腺体积与气管压迫严重程度之间的关系，而不依赖于患者的症状。并对导致不同水平气管狭窄的甲状腺体积截止点进行了初步的估测。

材料与方法：回顾性分析自 2016 年至今于天津市人民医院行头颈部增强 CT 检查的 95 例患者图像。应用半自动三维 CT 体积测量患者的甲状腺体积。在甲状腺附近气管横截面积减少最大的位置测量气管压缩程度。我们定义了气管压缩比，即气管压缩比=气管最窄横截面积/气管最大横截面积，来确定气管压缩的严重程度。

结果：研究结果显示患者的平均气管狭窄程度为 15%（气管压缩比=0.85±0.15）。气管狭窄 15%以上患者的甲状腺体积明显大于气管狭窄 15%以下患者（P＜0.001）。甲状腺体积和气管压迫之间存在着显著相关性（P＜0.001）。此外，受试者操作特征曲线分析显示，预测气管狭窄程度 10%、20%、30%和 40%的甲状腺体积截止值分别约为 19.75 ml、21.56 ml、24.54 ml 和 30.29 ml（P＜0.05）。

结论：本研究客观地证明，较大的甲状腺体积引起气管更严重程度的压迫。这一结果可能有助于由于气管压迫症状而行甲状腺切除术的决策过程。

EPO-0437
机器学习法在 AIDS 患者静息态功能磁共振成像中脑网络连接指标度中心度、对称体素同伦连接的应用价值研究

符丹卉,苏丹柯,金观桥
广西医科大学附属肿瘤医院

目的：运用基于机器学习方法的磁共振静息态功能成像技术，探究 DC 值和 VMHC 值在评估 HIV 相关神经认知障碍中的诊断价值。

方法：按照纳入排除标准，收集 2017 年 09 月至 2019 年 1 月期间首诊的艾滋病患者，共纳入未进行抗病毒治疗的患者 27 例（HIV 阳性组），14 位男性，13 位女性。以 NP 测验为参考标准，将 HIV 阳性组分为 HAND 组（认知障碍组）和非 HAND 组。正常志愿者 14 例纳入对照组，8 位男性，6 位女性，经测试正常对照组认知功能正常。采用 GE Discovery MR 750w 3.0T 磁共振扫描。图像的预处

理使用 DPARSF3.1，正式处理使用 PRoNTo2.1.1。使用 SPSS19.0 统计软件分析 DC 和 VMHC 指标在 HAND 组和非 HAND 组的差异。
结果： （1）DC 指标及 VMHC 指标在 AIDS 患者与对照组结果差异贡献最大的十个大脑区域分别是：右中央旁小叶、左中央旁小叶、右枕上回、右运动补充区、右楔叶、左楔叶、左顶上回、左楔前叶、左运动补充区、右中央后回；左中央旁小叶、右中央旁小叶、右运动补充区、右楔前叶、左楔前叶、右顶下缘角回、左运动补充区、左尾状核、右中央后回、左颞横回。（2）DC、VMHC 指标分类效果的评价如下：DC 及 VMHC 指标的 AUC 值为 0.60、0.59，准确率为 65.85、68.85%，敏感度为 100、92.59%，特异度为 0、14.29%，正预测值为 65.85、67.57%，负预测值为 0、67.57%。（3）DC 指标对区别 HAND 组及非 HAND 组有意义，VMHC 指标则无意义。（4）前十位大脑区域的 DC 值、VMHC 值分别部分与临床血液学、临床量表及认知评分、分组有不同程度的相关性。
结论：DC 值 VMHC 值能直观的反映认知功能障碍受损的区域和相应功能受损伤的程度，为患者改善临床抗病毒的治疗方案和增加神经认知障碍的干预措施，对降低 HAND 的发生和发展起到了一定的作用。

MRI 多模态对涎腺区肿物的鉴别价值

刘礼健,康文焱,罗德红
深圳市肿瘤医院

目的：总结涎腺区肿物的 MRI 表现并探讨其鉴别特征。
方法：回顾性分析我院 2017-2018 年涎腺区肿物。共 26 例，男 14 例，女 12 例，良性病变（21 例），分别是多形性腺瘤（11 例），Warthin 瘤（7 例），Mikulicz（良性淋巴上皮病变）瘤（1 例），单纯囊肿（1 例），嗜酸细胞腺瘤（1 例）；恶性肿瘤 5 例，分别是腮腺癌（1 例），腺样囊性癌（1 例），淋巴上皮癌（1 例），霍奇金淋巴结（1 例），横纹肌肉瘤（1 例）。收集包括 T1WI、T2WI 及 T2WI 脂肪抑制序列、DWI 及 ADC、T1WI 动态增强，观察各肿物边缘、形态、信号、强化方式及颈部有无肿大淋巴结。
结果：良性病变边界清（21/21），恶性肿瘤边界清楚者（3/5），良性病变于 T2WI 序列上边缘可见低信号包膜影，恶性肿瘤无此包膜。多形性腺瘤于 T1WI 序列一般没有高信号区，Warthin 瘤大多数有高信号区，有统计学意义，P=0.018；良性病变与恶性肿瘤 T1WI 有无高信号区，无统计学意义，p=0.078。多形性腺瘤实性成分 ADC 值约（1491±317）×10-6mm2/s，Warthin 瘤约为（970±342）×10-6mm2/s，恶性肿瘤约为（855±246）×10-6mm2/s，多形性腺瘤与 Warthin 瘤具有统计学意义，p=0.005。多形性腺瘤动态增强曲线：4 例流入型，6 例平台型，1 例无强化。Warthin 瘤强化曲线：1 例上升型，1 例无做曲线，5 例流出型。恶性肿瘤强化曲线：2 例平台型，2 例流出型，1 例无做曲线。多形性腺瘤动态强化曲线以流入型或平台型为主，Warthin 瘤以流出型为主，P 值为 0.000。
结论：MRI 多模态成像在诊断腮腺肿瘤具有很高的价值。

头颈部结外淋巴瘤的影像诊断与鉴别诊断（专题讲座）

月强,肖家和,杨喜彪,粟靖凯
四川大学华西医院

头颈部结外淋巴瘤绝大部分为非何杰金氏淋巴瘤，可累及头颈部的多种器官和并可沿颅底间隙蔓延。头颈部结外淋巴瘤在不同部位有不同的临床症状和影像表现，并容易与发生在这些部位的其他肿瘤和肿瘤样病变相混淆。熟悉头颈部结外淋巴瘤的好发部位、在该部位的典型与不典型影像表现、与其他相似病变的鉴别要点，对于提高诊断准确性具有重要意义。尤其是在影像高度怀疑淋巴瘤的情况下，可提示临床避免不必要的手术操作，从而使患者获益。

Optimized energy of spectral carotid CT angiography for non-calcified plaque detection

Tao Zhang
The first hospital of shanxi medical university

Objective:
The aim of this study was to optimize spectral carotid computed tomography (CTA) for delineation of non-calcified carotid artery plaque.
Method:
60 subjects with significant carotid stenosis (50%< stenosis < 80%) who performed dual energy carotid CTA at 90/Sn150 kVp were retrospectively enrolled. Total 60 non-calcified carotid artery plaques were reconstructed with linear mixed blending data and noise-optimized virtual monoenergetic algorithm from 40 keV to 160 keV with an interval of 10 keV, respectively. Image noise, signal-to-noise-ratio (SNR) and contrast-to-noise ratio (CNR) for plaque were measured and compared. The subjective image quality evaluation was scored on a 5-point scale.
Results:
The image noise of the 110 keV-160 keV noise-optimized virtual monoenergetic image showed no statistical difference with linear mixed image. Using 90/Sn150 kVp linear mixed images as a reference, the CNR of the 40 KeV -50 keV noise-optimized virtual monoenergetic image was higher (84.01±32.19vs 59.79±6.21 and72.00±27.36 vs 59.79±6.21, respectively, P<0.05) The SNR of linear mixed image was higher. There was only statistical difference between linear mixed image and 40 keV-100 keV noise-optimized virtual monoenergetic image (P<0.05). The subjective score of 40 keV noise-optimized virtual monoenergetic image was the highest. And there was statistically significant difference between the 40 keV and 80 keV-160 keV (P<0.05).
Conclusion:
Spectral carotid CTA with low energies (40-50 keV) post-processing can optimize spectral carotid CTA for delineation of non-calcified carotid artery plaque compared to “conventional” mixed 90/Sn150 kVp images.

EPO-0441
X 线吞咽检查在亚急性期脑卒 中患者吞咽功能评估中的应用

杜丽洁,张贺越,郭玲彤
山西医科大学第一医院

目的：探讨 X 线吞咽检查在亚急性期脑卒中患者吞咽功能评估中的应用价值。方法：收集 2018 年 1 月-2019 年 2 月在我院康复科住院的亚急性期脑卒中患者 106 例，分别行洼田饮水试验和 X 线吞咽检查。洼田饮水试验：即嘱患者一次性口服 30ml 温水，观察有无呛咳，有则误吸阳性，无则误吸阴性。X 线吞咽检查：嘱患者侧位坐于脚踏板上，口服 20ml 含碘对比剂,对比剂进入气道内,为误吸阳性,未进入气道则为误吸阴性，然后在工作站上慢速逐帧回放，观察吞咽各器官的功能状态。1.比较两种方法之间误吸检出率的差异，采用 SPSS17.0 统计软件对上述计数资料进行配对卡方检验,P<0.05 为差异有统计学意义。2.分析误吸患者吞咽的异常表现形式。结果:1. 洼田饮水试验呛咳者 43（40.6%）例，未呛咳者 63（59.4%）例， X 线吞咽检查,误吸阳性 70 例（66.0%），误吸阴性 36 例（34.0%），P<0.05,两种方法的误吸检出率有统计学差异。2.X 线吞咽检查显示：70 例误吸患者中，环咽肌开放障碍 11 例（15.7%）、喉上抬幅度不足 27 例（38.6%）喉上抬速度减慢 22（31.4%）、喉上抬启动延迟 26（37.1%），梨状窝残留 36 例（51.4%）。结论:1.X 线吞咽检查可以客观显示对比剂走行方向，发现临床评估方法无法发现的隐匿性误吸,提高误吸的检出率。2. X 线吞咽检查可以显示导致误吸的吞咽异常表现模式，可以是一种或多种形式并存。X 线吞咽检查可以为临床进行个体化康复训练提供依据。

EPO-0442
Diagnostic value of CT texture analysis in differential diagnosis between Adenolymphoma and Lymphoma of parotid

Jinrong Yang[1],Lijun Wang[1],Fangfang Li[2]
1.The First affiliated Hospital of Dalian Medical University
2.First Clinical College of Lanzhou University

Objective: To evaluate the value of CT texture analysis in the differential diagnosis of parotid adenolymphoma and lymphoma.
Materials and methods: CT images of 33 cases of parotid gland lymphoma and 21 cases of parotid lymphoma confirmed by pathology were retrospectively analyzed. Omni-Kinetics Version V2.06 software was used to analyze the texture of CT enhanced images. The meanvalue, standard deviation, variance, kurtosis, deviation, energy, entropy, contrast, correlation, deficit moment and the correlation parameters of run length matrix are measured. And then we make a statistical analysis of these parameters.
Results: There were significant differences in mean, standard deviation, variance, energy and entropy between parotid gland lymphoma and lymphoma group ($P < 0.05$). The area under ROC curve, sensitivity and specificity of standard deviation, mean value, variance and entropy are 0.808, 90.9%, 66.7%; 0.704, 81.8%, 52.4%; 0.808, 90.9%, 66.7%; 0.674, 87.9%, 47.6% respectively.
Conclusion: CT texture analysis can be used to distinguish parotid adenolymphoma and lymphoma. The standard deviation and variance can be used to distinguish the two tumors with the best efficacy and the highest sensitivity.

中山市人民医院

目的
报告鳃裂囊肿的少见 CT 表现，以提高对该病的 CT 诊断水平。
方法
分析 14 例经临床手术及病理证实的鳃裂囊肿 CT 资料。其中男性 9 例，女性 4 例，年龄 11～66 岁，平均 37 岁。8 例行颈部 CT 平扫，其中 4 例平扫后行颈部 CT 增强扫描，6 例直接行颈部 CT 增强扫描，所有病例 CT 扫描后常规行冠状面和矢状面 MPR 重建观察。
结果
13 例为第二鳃裂囊肿，其中 Bailey Ⅰ型 4 例，囊肿位于胸锁乳突肌的前缘或外侧，颈阔肌的深面。BaileyⅡ型 8 例，囊肿位于胸锁乳突肌的前内侧或内侧，颈动脉间隙的外侧，颌下腺后方。BaileyⅣ型 1 例，位于右侧颈动脉鞘前内侧、右侧咽旁间隙内侧及右侧咽侧壁外侧，即位于咽粘膜间隙。1 例为第一鳃裂囊肿，位于右侧腮腺内。少见征象有囊肿壁不均匀增厚、壁结节、囊内分隔、多囊状及平扫呈高密度。9 例囊肿壁不均匀增厚，8 例囊肿壁见壁结节向囊腔内突出，平扫壁结节与囊壁等密度，与囊液相比呈稍高密度，增强扫描示增厚囊肿壁及壁结节明显强化，1 例囊肿内见壁结节和线状分隔，1 例呈多囊状，部分囊之间相通连，2 例平扫囊内呈高密度，其中 1 例呈均匀高密度，增强扫描未见强化，1 例高密度内见 2 处环形低密度影。14 例 CT 诊断均误诊。
结论
囊肿壁不均匀增厚、壁结节、囊内分隔、多囊状及平扫呈高密度为鳃裂囊肿少见的 CT 表现， 当病变出现上述征象时，容易导致误诊，熟悉这些少见征象并结合病变的发生部位，特别是位于胸锁乳突肌的前内侧或内侧，颈动脉间隙的外侧，颌下腺后方，能减少误诊，提高诊断水平。

SWI 在新生儿缺血缺氧性脑病中的诊断价值（参加中文论文比赛）

何文娟,谢琦
广州市第一人民医院(华南理工大学第二附属医院）

[摘要]目的：比较 SWI（susceptibility weighted imaging）序列与常规 T1WI、T2WI、FLAIR、DWI 序列在新生儿缺血缺氧性脑病检出中的差异。方法：研究对象为 2018 年 3 月至 2019 年 6 月围产期有窒息史或有新生儿缺血缺氧性脑病高危因素的新生儿 101 例。在西门子 3.0T 磁共振设备行颅脑 MRI 检查，扫描序列包括 T1WI、T2WI、FLAIR、DWI 及 SWI 序列。分别观察 SWI 序列与常规 T1WI、T2WI、FLAIR、DWI 序列图，比较 SWI 序列与常规 MRI 序列对新生儿缺血缺氧性脑病检出率的差异。结果： SWI 序列共检出 52 例缺血缺氧性脑病患者，常规序列共检出 24 例缺血缺氧性脑病患者， SWI 序列检出的 52 例新生儿缺血缺氧性脑病患者中共检出 290 处出血灶，表现为低信号聚集；常规序列检出的 24 例患者中共检出 150 处出血灶，表现为 T1WI 或 FLAIR 高信号。结论：SWI 序列对新生儿缺血缺氧性脑病的检出率高于常规 T1WI、T2WI、FLAIR、DWI 序列，可作为新生儿颅脑 MRI 检查的常规序列。

EPO-0446

基于 MR 多参数评价颈内动脉血流动力学参数在缺血性脑卒中患者症状演变中的作用

肖正光,姚伟武,杨军,袁立新,朱才松
上海市同仁医院

目的：本研究利用磁共振相位对比及 ASL 等序列测量颈内动脉血流学参数及相应脑组织灌注情况，对比分析不同症状患者血流动力学差异性。**方法：**收集 2016 年 1 月-2018 年 7 月我院神经内科住院患者 203 例，排除 6 例，分为无症状组 89 例，TIA 组 62 例，缺血性脑卒中组 127 例，应用 3.0T 磁共振行双侧颈内动脉检查并获得颈动脉的流速、流量等参数，同时采用 ASL 获得大脑半球相对血流量（rCBF），对比分析颈内动脉血流动力学参数同脑组织 rCBF 的相关性，并分析不同症状患者的血流动力学差异。**结果：** TIA 组、梗塞组和无症状组三组在平均流速、峰值流速、血流量上均存在显著的差异（P<0.05）,无症状组血流平均流速、峰值流速、血流量均高于 TIA 组和梗塞组。对颈内动脉血流动力学参数同脑部灌注参数的相关分析发现梗塞组组 rCBF(比值）与平均截面积（r=0.095,P=0.682）,rCBF(比值）与平均流速（r=0.283,P=0.213）,rCBF(比值）与平均流量（r=0.210,P=0.361），rCBF(比值）与压力梯度（r=0.186,P=0.420）均不存在显著的相关关系，P 均>0.05。无梗塞组组 rCBF(比值）与平均截面积（r=-0.035,P=0.795）,rCBF(比值）与平均流速（r=-0.197,P=0.145）,rCBF(比值）与平均流量（r=-0.237,P=0.078），rCBF(比值）与压力梯度（r=-0.193,P=0.153）均不存在显著的相关关系，P 均>0.05。**结论：**颈内动脉的血流动力学变化在缺血性脑卒中患者症状演变中具有重要作用，同患者临床症状直接相关。

小剂量测试减影法在头颈 CTA 扫描中的优化方案

彭燕
陆军军医大学附属新桥医院放射科

目的 探讨 64 排螺旋 CT 小剂量测试减影法在头颈 CTA 扫描中的更优化的扫描方案 **方法**：将需要进行 CTA 检查的 200 例患者随机分组，A 组和 B 组分别 100 例，采用 1mm 直径 ROI 在颈 3 椎间盘处监测左侧颈动脉中心阈值，峰值=取点位×2+12；A 组取阈值最高点点位，B 组取阈值≥100HU 的第一个点位。2 位医师对颈动脉、基底动脉、大脑前、中、后动脉的成像质量进行评分并进行颈静脉干扰对比。分析 2 位医师的观察一致性和 2 种检查方法动脉成像质量以及静脉干扰的差异性。**结果**：2 位医师通过 2 种方法所得动脉成像质量评分一致性好，A 组平均分(2.41±0.38),静脉干扰 75%,；B 组平均分(3.24±0.25)，静脉干扰 18%。2 评论种方法应用 SPSS19.0 统计软件分析数据，计数资料(%)表示，χ2 检验，P ＜0.05 为差异有统计学意义。 **结论**：动脉阈值达到 100HU 点位计算峰值法能得到更优质的动脉血管成像，并且静脉干扰小，缩短后处理时间，提高工作效率，有进一步研究和推广的价值。

EPO-0448

唾液腺粘液表皮样癌 MRI 表现与病理级别相关性

易坤明
陆军军医大学大坪医院

目的：提取唾液腺黏液表皮样癌磁共振成像(MRI)特征,并与病理对照分析，探讨 MRI 表现与病理级别相关性。
方法：回顾性分析经我院手术病理证实的 20 例唾液腺黏液表皮样癌患者的 MRI 表现,重点观察 T2 压脂上信号强度及囊变情况,并与组织病理特征对照研究，分析粘液表皮样癌是否囊变及囊变占肿瘤比例与肿瘤等级之间关系。
结果：高级别 MEC 2 例,T2WI 及 T2 压脂上均呈不均匀低-中信号,无囊变；中等级 MEC 12 例,T2WI 及 T2 压脂上均呈不均匀中-高信号,11 例(91. 7%)有囊变,1 例(8. 3%)无囊变；低级别 MEC 6 例,T2WI 及 T2 压脂上均呈不均匀中-高信号,6 例(100%)均有囊变,其中 1 例(16. 7%)合并淋巴结转移；T1WI 上 20 例 MEC 均表现低信号,增强扫描显示 18 例肿瘤内部实性成分呈较明显强化;16 例边界不清楚,4 例边界清楚。低级别 MEC、中等级别 MEC 与高级别 MEC 内部有无囊变有统计学差异（P=0.036，P=0.033），低级别 MEC 与中等级别 MEC 内部无有囊变无统计学差异（P=0.667）；低级别 MEC 与中等级别 MEC 内部囊性结构所占肿瘤比例（是否超过 50%）有统计学意义（P=0.001）。
结论：唾液腺粘液表皮样癌的 MRI 表现有一定特征性，多表现为不规则或规则结节、肿块，边界清楚或不清楚，T1WI 上主要呈低信号，T2WI 或压脂上主要呈等-高信号，病理级别越低，T2WI 或 T2 压脂信号越高，内部囊性信号越多。肿瘤内部囊性信号的多少在一定程度上可推测粘液表皮样癌的病理级别。结合患者临床表现及其他辅助检查可为临床术前诊断、治疗、预后观察提供帮助。

EPO-0449

颅面骨孔径精细扫描

滕荷伟
山东大学齐鲁医院

【摘要】**目的** 利用 FORCE CT 研究骨性鼻泪管、眶下管、颧面管的长度、开口大小、位置等解剖信息，为补充人体解剖资料及临床各项面部手术提供形态学依据。**方法** 对 64 例年龄 42.7±18.1 岁成人行颅面骨扫描，利用 MPR 技术进行图像重建，测量眶下管内及外孔直径、长度，鼻泪管上孔及中段直径、含气量及位置，颧面管内孔（颧眶孔）及外孔（颧面孔）直径、眶距（颧面孔到眼眶外下缘最短距离）、颧面孔到眶水平中线垂直距离。**结果** 左侧眶下管内孔直径（1.8±0.8）mm、

外孔直径（2.8±0.8）mm、长度（26.6±2.9）mm；右侧眶下管内孔直径（1.8±0.7）mm、外孔直径（2.8±0.8）mm，长度（27.7±3.1）mm；左侧鼻泪管上孔直径（5.9±1.4）mm、中段直径（5.9±1.3）mm，右侧鼻泪管上孔直径（6.3±1.4）mm、中段直径（6.0±1.3）mm；左侧颧面管内孔直径（1.5±0.5）mm、外孔直径（1.8±0.5）mm、眶距（7.9±7.0）mm、颧面孔到眶水平中线垂直距离（20.3±7.0）mm，右侧颧面管内孔直径（1.5±0.5）mm、外孔直径（1.7±0.5）mm、眶距（7.7±1.7）mm、颧面孔到眶水平中线垂直距离（20.4±7.0）mm。右侧眶下管内孔直径男女之间差异有统计学意义，女性大于男性；右侧鼻泪管内含气量与上孔、中段直径差异有统计学意义，右侧鼻泪管含气量位置与上孔直径差异有统计学意义，与中段直径差异无统计学意义；左、右侧眶下管长度差异有统计学意义，右侧大于左侧；左、右侧鼻泪管上孔直径差异有统计学意义，右侧大于左侧；左侧壁泪管中段直径、左侧颧面管内孔直径、左侧颧面孔到眶水平中线垂直距离年龄差异有统计学意义（想知道怎么随年龄变化的，没看懂。。。）。**结论** FORCE CT 是显示颅面骨解剖孔径的可靠影像学方法。

EPO-0450

比较 RESOLVE DWI 与常规 DWI 在 3T 磁共振颈部扫描的应用

马江,黄显龙
中国科学院大学重庆医院（重庆市人民医院）

目的：对比分析 RESOLVE DWI 与常规 DWI 在颈部磁共振扫描的图像质量比较二者的优劣。
方法：对比分析在我院进行了颈部 MR 检查（包括咽喉部、甲状腺）、鼻咽部 MR 检查患者 63 例，其中有金属植入物 8 例、肿瘤患者 21 例。MR 扫描采用 SIEMENS 3T MAGNETOM Verio。颈部、鼻咽部常规扫描冠状位 T2W-FSI，轴位 T1WI、T2WI-FS，矢状位 T2WI-FS，再行 RESOLVE DWI 与常规 DWI 轴位扫描，肿瘤患者均进行钆喷酸葡胺增强扫描，增强扫描采用 3D-vibe 序列。RESOLVE DWI 扫描参数：视野 220mmx220mm，矩阵 160x160，TR6000ms，TE1=62ms、TE2=97ms，层厚 3mm，相位编码方向 A>P，B 值取 0、800；常规 DWI 扫描参数：视野 260mmx260mm，矩阵 128x128，TR8100ms，TE85ms，层厚 3mm，相位编码方向 A>P，4 次信号采集，B 值取 0、800。均采用 FS 进行脂肪抑制。以轴位 T2WI-FS 图像、增强 vibe 图像为基准，以图像信噪比、分别率、磁化率伪影、图像变形等作为指标，比较 RESOLVE DWI 与常规 DWI 的图像质量并给出评分。
结果：与常规 DWI 序列相比 RESOLVE DWI 序列所扫描图像信噪比、分别率更高，磁化率伪影及图形变形更低。同时 RESOLVE DWI 能与 T2WI-FS 及增强后 T1WI（vibe）有更好的匹配度。金属植入物患者行 RESOLVE DWI 扫描能明显降低图像变形、改善图像质量。肿瘤患者行 RESOLVE DWI 扫描能更加准确评价肿瘤的形态。缺点是 RESOLVE DWI 序列扫描时间稍长。
结论：由于颈部组织结构复杂、磁化率差异大，颈部磁共振弥散扫描常规 DWI 图像质量欠佳，RESOLVE DWI 采用了分段读出方式，明显改善了图像质量，颈部磁共振弥散推荐 RESOLVE DWI。

Diagnosis and differential diagnosis of carotid body tumor by MRA and MSCT

Yuan Zhao
Imaging Center， First Affiliated Hospital， Xinjiang Medical University， Urumqi， Xinjiang 830054， China

Objective To investigate the diagnostic value of MRA and MSCT applied in carotid body tumor ,analyze how to make differential diagnosis with other cervical tumors. **Methods** 15 patients with 16 carotid body tumors were investigated with MRA and MSCT ,all the tumors were confirmed by pathology or DSA .**Result** all carotid body tumors presented in plain scan were solid and well defined .because of highly vascular, tumor was significantly enhanced after contrast enhancement . In MRA and CTA ,the existence of tumor make the carotid bifurcation opened widely presenting the appearance of griping ball. **Conclusion** MRA and MSCT was useful in diagnosis and differential diagnosis of carotid body tumor .In some way , it may cooperate with multiple reconstructing technique to supply more detail information for surgery.

腮腺混合瘤 CT 灌注成像及 MRI 动态增强的特征表现

潘桂海
广东医科大学附属医院

目的 总结混合瘤影像常规、CT 灌注成像或 MRI 动态增强扫描的特征表现，目的是提高其诊断率。**方法** 收集 2013 年~2016 年经病理证实的混合瘤病例 48 例，病例已经剔除假牙或运动伪影较明显病例，其中 32 例行 CT 灌注检查，16 例行 MRI 动态增强扫描。**结果** 本组病例,中年女性多见，除一例低度恶性混合瘤有短期内增大情况外，其余混合瘤病史较长，且长时间内变化不大；35 例位于腮腺浅叶，8 例位于腮腺深叶， 5 例跨越浅叶及深叶；所有病例均为单发，除一例为低度恶性混合瘤边界欠清外，其余病例边界均较清楚,尤其是增强扫描延迟期病灶边界显示更清楚；其中 5 例 CT 上出现斑点状钙化，多数病例 CT 增强扫描为轻中强化；磁共振 T2WI 多数病例呈高信号为主的混杂信号，T1WI 低信号为主，绝大多数病例 MRI 增强后均呈中度强化；除一例低度恶性的混合瘤病例 CT 灌注时间-密度曲线为 III 型曲线外，其余病例 CT 灌注时间-密度曲线均为 I 型；MR 动态增强的时间-信号曲线均为 A 型曲线。**结论** 腮腺混合瘤 CT 及 MRI 常规有一定特征性，CT 灌注 TDC 及 MRI 动态增强扫描 TIC 特征性明显， 因此，我们基本上能对混合瘤做出明确诊断。

EPO-0453

MRI 在颈部良恶性淋巴结病变诊断 及疗效评估中的应用

郝彩仙,刘筠,刘学焕
天津市人民医院

目的 探讨背景信号抑制扩散成像(DWIBS)结合 MRI 常规序列在颈部淋巴结良恶性鉴别诊断及淋巴源性肿瘤疗效评估中的应用价值。**方法** 48 例经病理或随访证实的颈部淋巴结肿大患者行 DWIBS 及常规 MRI 检查,其中,83 枚恶性淋巴结,79 枚良性淋巴结。对 16 例恶性淋巴结病变患者进行放化疗后复查,比较淋巴结实质部分的 ADC 值。**结果** DWIBS 序列较常规序列可发现更多的淋巴结。恶性淋巴结实质部分的 ADC 值为(0.898±0.111)×10-3 mm2/s,低于良性淋巴结的 ADC 值(1.043±0.106)×10-3 mm2/s,差异有统计学意义(P <0.05)。所有恶性淋巴结病变治疗后的 ADC 值为(1.205±0.121)×10-3 mm2/s,较治疗前的 ADC 值(0.883±0.090)×10-3 mm2/s 明显升高,差异有统计学意义(P <0.05)。**结论** DWIBS 序列在检出淋巴结方面较常规 MRI 序列更为敏感。ADC 值在鉴别淋巴结良恶性及疗效评估方面有一定的参考价值。

EPO-0454

MRI 在颈部良恶性淋巴结病变诊断及疗效评估中的应用

罗伟,王爽
陆军军医大学附属新桥医院放射科

的　讨论背景信号抑制扩散成像（DWIBS）结合 MRI 常规序列在颈部淋巴结良恶性鉴别及淋巴源性肿瘤疗效评估中的应用价值。**方法**　回顾性分析 67 例经病理结果或随访证实的颈部淋巴结肿大患者行 DWIBS 及常规 MRI 检查，其中恶性淋巴结占 42 例，良性淋巴结占 25 例。对 30 例恶性淋巴结患者进行放化疗后 MRI 复查，对比其实质部分的 ADC 值。**结果**　DWIBS 序列较常规序列可发现更多的淋巴结。恶性淋巴结实质性部分 ADC 值为（0.816±0.108）×10－³㎜²/s，低于良性淋巴结的 ADC 值（1.021±0.093）×10－³㎜²/s，差异有统计学意义（P＜0.05）。所有恶性淋巴结病变治疗后的 ADC 值为（1.208±0.111）×10－³㎜²/s，较治疗前的 ADC 值（0.816±0.108）×10－³㎜²/s 明显升高，差异有统计学意义（P＜0.05）。**结论**　DWIBS 序列在检出淋巴结方面较常规序列更具优势。ADC 值在鉴别淋巴结良恶性及疗效评估方面具有一定参考价值。

EPO-0455

Diagnostic value of multi-parameter MRI-based 3D radiomic features in differentiating malignant from benign lacrimal epithelial tumors: A pilot study (English paper competition)

Qinghe Han,Qinghai Yuan,Hongtao Mao,Rui Ma
radiology department. the second hospital of jilin university

Purpose: To explore the diagnostic value of multi-parameter MRI-based 3D radiomic analysis to identify features that can be used to distinguish benign and malignant lacrimal epithelial tumors by MRI characterizing tumor heterogeneity.
material and method: A total of 43 patients with lacrimal epithelial tumor confirmed by postoperative pathology after surgical resection were retrospectively enrolled,28 cases with benign pleomorphic adenoma group and 15 patients with malignant lacrimal epithelial tumor. A total of 66 radiomic features were generated automatically from Artificial Intelligence Kit software, including first order-histogram features, high order-texture features and morphological features. The diagnostic performance of each parameter between benign and malignant groups was compared, and the ROC curve was plotted to assess the diagnostic efficacy. Besides, the differentiating value from the presence (N=?) from absence(N=?) of tumor capsule invasion was assessed.Results: One of the features based on tumor morphology-Spherical Disproportion,with AUC values (area under the curve) of 0.867, 0.900, 0.910, 0.926, and 0.721, respectively. The AUC value was 0.955 in combination with T2 STIR and axial T1WI enhancement sequence, and SD value was significantly higher in malignant group than benign group. Surface Volume Ratio signs (SVR) derived from T1WI, axial enhanced T1WI, T2WI, STIR and coronal enhanced T1WI sequences was found having potential to identify the presence of tumor capsule invasion with AUC values of 0.848, 0.883, 0.825, 0.854 and 0.854, respectively. More surprisingly, the SVR was higher in the non-infiltrated group than in the

infiltrated group.Conclusion: Radiomic features based on multi-parameter MRI which characterized tumor heterogeneity has important significance for the benign and malignant differentiation of lacrimal gland epithelial tumors. Among them, spherical disproportion is the best biomarker which has high diagnostic efficiency in the benign and malignant differentiation, and the value of malignant group is higher than the benign group. Meanwhile, the Surface Volume Ratio (SVR) of the non-infiltrating group was higher than the infiltrating group in the cases of tumor capsule invasion.

EPO-0456

DTI 对糖尿病视神经病变临床诊断价值

万娜,马静,宋法亮
新疆生产建设兵团总医院

目的：探讨磁共振弥散张量成像技术在糖尿病视网膜病变不同分期中视神经病变的诊断价值。**方法：**选取我院眼科病区糖尿病患者与非糖尿病患者各 30 例，分别作为观察组、对照组，均于我院医学影像科行眼部视神经眶内段 GE 3.0TMRI 弥散张量成像扫描，GE ADW4.6 Functool 后处理软件行图像后处理，获得糖尿病患者双侧视神经多衍生参数各向异性（FA）、平均扩散系数（MD）、平行扩散系数（$\lambda_{//}$）及垂直扩散系数（$\lambda_{\perp}$），对多衍生参数进行对比、记录并行统计分析，对不同衍生参数结合糖尿病视神经病变分期行统计学相关性分析。**结果：**DTI 多衍生参数在糖尿病视神经病变的患者的诊断中具有统计学意义（$P<0.05$），即 DTI 多参数成像在糖尿病视神经病变患者中具有显著差异性；DTI 多衍生参数与糖尿病视神经病变的分期具有相关性，其中 FA、MD 与病变分期呈正相关，而 $\lambda_{//}$、$\lambda_{\perp}$与病变分期呈负相关。**结论：**磁共振弥散张量成像技术对糖尿病视网膜病变患者视神经病变具有一定的诊断价值，同时 DTI 衍生参数为视神经病变分级提供了重要的参考依据。

EPO-0457

Abnormal resting-state functional connectivity of amygdala in primary angle-closure glaucoma

Fei Jiang
Department of Radiology, The second Affiliated Hospital of Nanchang University

Background: Glaucoma is the second leading cause of blindness and affected patients are at a high risk of anxiety and depression. However, the neural mechanisms underlying glaucoma-induced anxiety and depression remain unknown.
Purpose: The purpose of this study was to investigate alterations in amygdala-based emotional processing circuits in primary angle-closure glaucoma (PACG) patients by using resting-state functional connectivity (FC) analysis.
Materials and methods: Thirty-seven patients with PACG (20 men and 17 women) and 36 healthy controls (20 men and 16 women) closely matched for age, sex, and education, underwent resting-state magnetic resonance imaging scans. A seed-based correlation analysis was performed to investigate altered FC of the amygdala. A voxel-wise FC method was used to explore differences in amygdala FC patterns between the two groups.

Results: Compared with healthy controls, PACG patients showed reduced FC from the left amygdala to the bilateral brainstem, right thalamus, and left superior frontal gyrus; they also showed enhanced FC from the left amygdala to the left middle temporal gyrus, right inferior temporal gyrus, and left cuneus. In addition, PACG patients showed reduced FC from the right amygdala to the right cerebellum_4_5 and enhanced FC from the right amygdala to the right inferior temporal gyrus and right calcarine (two tailed, voxel-level: P<0.01, GRF correction, cluster-level: P<0.05).
Conclusion: Our results highlighted that PACG patients had abnormal FC between the amygdala and each of the following: superior frontal gyrus, thalamus, temporal gyrus, and visual cortices. This offers novel insights into the understanding of neural mechanisms underlying depression in PACG patients.

EPO-0458

Altered effective connectivity of primary visual cortex in primary angle-closure glaucoma using granger causality analysis

Fei Jiang
The second Affiliated Hospital of Nanchang University

Background: Previous neuroimaging studies demonstrated that PACG patients were associated with abnormal intrinsic brain activity in primary visual cortex(V1).
*Purpose:*The purpose of this study was to investigate the effective connectivity (EC) patterns of V1 in PACG patients.
*Materials and methods:*37 patients with PACG (26 males and 20 females) and 36 healthy controls (HCs) (26 males and 20 females) closely matched for age, sex, and education, underwent resting-state magnetic resonance imaging scans. A voxel-wise Granger causality analysis (GCA) on the resting-state fMRI data between the primary visual cortex and the whole brain was performed to explore differences between the two groups.
*Results:*Compared with HCs, PACG patients showed a decreased EC from the left V1 to left cuneus and increased EC from the left V1 to left precentral gyrus and right supplementary motor area. Meanwhile, PACG patients showed decreased EC from left precentral gyrus to left V1 and right frontal middle gyrus to left V1. Also, PACG patients showed a decreased EC from the right V1 to left cuneus/calcarine and increased EC from the right V1 to left inferior frontal gyrus and right caudate. Meanwhile, PACG patients showed decreased EC from right middle frontal gyrus/precentral gyrus to right V1 and left precentral gyrus to right V1.
*Conclusion:*Our results highlighted that PACG patients had abnormal EC between V1 and higher visual area, motor cortices, somatosensory cortices and frontal lobe, which indicated that the PACG patients might present with abnormal top-down modulations, visual imagery, vision-motor function and vision-related higher cognition.

眼眶 MR 脂肪定量分析对 Graves 眼病的临床价值

邹梦莎,朱洪章,李若程,杨智云
中山大学附属第一医院

【目的】 应用 MR 水-脂分离成像（Dixon）技术测量 Graves 眼病（GO）病人与健康志愿者眼外肌和泪腺的脂肪分数（FF），探讨眼眶 MR 脂肪定量分析在 GO 病人诊断与治疗的价值。【方法】前瞻性收集 2017 年 2 月-2019 年 2 月期间由中山大学附属第一医院确诊的 38 例 GO 患者以及 20 例正常志愿者行眼眶 MR 检查，所有受试者均采用斜冠状 T2WI_FSE 并加 Dixon 技术分别对两侧眼眶进行扫描，然后通过测量同侧各条眼外肌及泪腺在水相和脂相图的信号强度值并计算 FF，计算公式为 FF=［$M_{fat}/(M_{fat}+M_{water})$］×100%，式中 M_{fat}、M_{water} 分别指脂像及水像感兴趣区信号强度值。采用 Mann-Whitney U 检验分析两组患者的眼外肌、泪腺的平均 FF 的差异，采用 Spearman 秩相关分析评价 GO 患者眼外肌 FF 与 TRAb、CAS 评分、GO 病程之间的相关性。【结果】 GO 组的眼外肌 FF 均大于正常对照组，具有统计学差异（P<0.05），而两组的泪腺 FF 无差异。GO 组的眼外肌 FF 与 TRAb、CAS 评分及 GO 病程存在相关关系（P<0.05），其中以与 GO 病程的相关程度为著。【结论】 GO 患者的眼外肌脂肪含量高于正常人平均值，并与 TRAb、CAS 评分及 GO 病程存在不同程度的正相关关系，提示了 MR 脂肪定量分析在评估 GO 病人临床分期及疗效评估可提供新的参考指标。

Imaging findings of solitary fibrous tumors in the orbit

Yu Liu
Ninth People’s Hospital， Shanghai Jiao Tong University School of Medicine

Objective:To analyze the computed tomography(CT)and magnetic resonance imaging(MRI)findings of solitary fibrous tumors(SFTs)in the orbit and to evaluate its clinical,histologic features and prognosis.

Materials and Methods:We retrospectively reviewed clinical,CT,MRI,and pathological findings in nine patients (5men and 4 women),aged 22 to 59 years,with SFTs proven on histologic examination in and around the orbit.Of the nine patients,six had undergone CT scanning and five had undergone MR imaging.We evaluated the imaging findings with

emphasis on the location,shape,size,margin,internal architecture,and pattern of enhancement of the lesions.Clinical data were retrieved from the medical records.Immunohistochemistry for CD34,vimentin,CD31, CD99,B-cell lymphoma protein 2(bcl-2),S-100 protein,smooth muscle antibody(SMA)and cytokeratin(CK)was performed.Prognosis was assessed by clinic service and telephone interview.
Results: Five were located in the postseptal orbit, 2 in the suborbital region,and 2 in the lacrimal sac.All nine lesions were found as a solitary mass,ranging in size from 1.6 to 3.6 cm(mean,2.6cm).They presented irregular shape in 2/9 patients and ovoid in 7/9.The margin was ill-defined in 1/9 patients and well-defined in 8/9. All the cases showed isointensity masses on unenhanced CT images. Contrast-enhanced CT images showed marked,heterogeneous enhancement in 3 cases,homogeneous mass in 1 case.None of the tumors showed calcification.All the cases showed isointensity on T1-weighted MR images and heterogeneous hyperintense on T2-weighted images,compared with muscle and marked heterogeneous enhancement with hypointense foci on contrast-enhanced T1-weighted images.And hypointense linear septa were observed within two cases.Erosion of the orbital floor was present in one case.Components with decreased apparent diffusion coefficient(ADC)were seen on DWI.The time-intensity curves(TIC)exhibited a rapidly enhancing and slow washout pattern on dual-phase CT and DCE-MRI.Imaging findings of the SFTs depended on the histopathological components.The presence of rounded or linear low-intensity foci is attributable to the collagen content,low cellularity,and associated reduced proton mobility.And SFTs also are vascular tumors that are vigorously enhancing.
Conclusion:SFTs most commonly present in adult man with asymptomatic mass.A solitary,ovoid and well-defined mass with strongly enhancment after contrast agents injection are suggestive of this diagnosis.Restricted diffusion and rapidly enhancing and slow washout pattern TIC may be additional valuable features.The prognosis of SFTs might be highly related to the situation of its initial treatment and total resection is associated with longer progression-free survival.

EPO-0462

磁共振在 IgG4 相关性眼病中的诊断价值

王晓琰
上海交通大学医学院附属第九人民医院

目的： 分析 IgG4 相关性疾病眼眶受累（IgG4-ROD）的磁共振表现，提高对其认识。
方法： 回顾性分析 18 例经手术病理检查证实 IgG4-ROD 患者 MR 表现。分析 MR 图像病变部位、双侧还是单侧、形状、边缘、眶内结构、T1WI 及 T2WI 信号特点及强化方式。
结果： 6 例患者表现为泪腺增大，其中 4 例双侧对称增大，2 例单侧增大；7 例表现为肌锥内外软组织肿块，其中 2 例多发，5 例多发；1 例眼外肌增粗；4 例表现为沿三叉神经分支走行区多发病变。8 例可见看到眶下神经增粗。平扫 T1WI 呈等、稍低信号，T2WI 压脂呈稍高信号，增强后明显强化。14 例行动态增强检查，时间-信号曲线均表现为快速上升缓慢流出的 II 型曲线。
结论： IgG4-ROD 会累及泪腺、眼外肌、内眦、肌锥外间隙等，眶下神经增粗和沿三叉神经分支浸润性生长是该病特征性表现，认识了解 IgG4-ROD 典型影像学表现，对诊断提高诊断率有帮助。

Value of magnetic resonance imaging in patients with IgG4-related ophthalmic disease

Xiaoyan Wang
Department of Radiology, Shanghai Ninth People's Hospital, Shanghai Jiaotong University School of Medicine

OBJECTIVE: To evaluate MRI findings of IgG4-related ophthalmic disease.
METHODS: Study subjects included 18 patients with histopathologically proven IgG4-ROD. MR images were retrospectively evaluated for location, laterality, shape, margin, T1 and T2 signal intensity on precontrast MRI, internal architecture, ocular adnexal lesion enhancement patterns.
RESULTS: The lesions involved the lacrimal gland (n=6), focal mass (n=7), extraocular muscles (n=1). All lacrimal gland lesions presented as diffuse enlargements. 4 patients had lesions involving multiple areas which extended along the trigeminal nerve, accompanied by expansion of neural foramina along their courses, with no signs of bone destruction. Infraorbital nerve enlargement was present in 8 cases. All ocular adnexal lesions showed isointensity on T1- and hypointensity on T2-weighted images, homogenous enhancement patterns and bone remodelling without destruction. TIC exhibited a rapidly enhancing and slow washout pattern in 14 patients.
CONCLUSIONS: IgG4-ROD can involve the lacrimal gland, extraocular muscles, medial canthus, extraconal space, and infraorbital nerves, and pterygopalatine fossa. Recognition of the typical radiological features of IgG4- ROD may be of help in the diagnosis of this benign clinical entity.

EPO-0464

Histogram Analysis Parameters ADC for Distinguishing Orbital Tumors of Lymphoma,Pleomorphic Adenoma and Adenoid Cystic Carcinoma

Chen Chen,Cui-ping Ren
The First Affiliated Hospital of Zhengzhou University

Objective: To determine if histograms of ADC can be used to differentiate orbital lymphoma,pleomorphic adenoma(PA) and adenoid cystic carcinoma(ACC).

Materials: 45 patients with confirmed histologically orbital lymphoma in 20(44.45%) patients,PA in 15(33.33%) patients,and ACC in 10(22.22%) patients were enrolled in the study,accepting MRI at 3T. The ROIs were drawn on the maximum level of ADC,and the histogram analysis were performed using the software named Mazda.One-way ANOVA and Kruskal-Wallis test were performed on the nine histogram parameters to find out the different characteristics.LSD and Bonferroni test were used between any two of the three groups and the ROC curve was drawn to evaluate the diagnostic efficacy.

Results:Histogram metrics derived from mean,Perc.01%,Perc.10%,Perc.50%,Perc.90% and Perc.99% were significantly lower in lymphoma than ACC. Lymphoma was significantly lower mean,Perc.01%,Perc.10%,Perc.50% and Perc.90% than PA. Optimal diagnostic performance to predict lymphoma from ACC (AUC= 0.96,sensitivity = 100.00%,specificity =86.70%) was obtained when setting Perc.99%= 132.00 as the threshold value. A threshold value of 95.50 for Perc.50% had the best diagnostic efficacy to predict lymphoma from PA(AUC= 0.80,sensitivity = 70.00%,specificity =100.00%).

Conclusions:The ADC histogram analysis may help to discriminate orbital tumors of lymphoma,PA and ACC.

EPO-0465

Histogram Analysis Parameters T2WI for Distinguishing Orbital Tumors of Lymphoma,Pleomorphic Adenoma and Adenoid Cystic Carcinoma

Chen Chen,Cui-ping Ren
The First Affiliated Hospital of Zhengzhou University

Objective: To determine if histograms of T2WI can be used to differentiate orbital lymphoma,pleomorphic adenoma(PA) and adenoid cystic carcinoma(ACC).

Materials: 63 patients with confirmed histologically orbital lymphoma in 27(42.86%) patients,PA in 26(41.27%) patients, and ACC in 10(15.87%) patients were enrolled in the study,accepting MRI at 3T. The ROIs were drawn on the maximum level of T2WI,and the histogram analysis were performed using the software named Mazda. One-way ANOVA and Kruskal-Wallis test were performed on the nine histogram parameters to find out the different characteristics. LSD and Bonferroni test were used between any two of the three groups and the ROC curve was drawn to evaluate the diagnostic efficacy.

Results:Histogram metrics derived from variance,skewness and Perc.99% were significantly lower in lymphoma than PA. Lymphoma were significantly higher Kurtosis than PA. Lymphoma was significantly lower variance,Perc.90% and Perc.99% than ACC. A threshold value of 150.39 for variance had the best diagnostic efficacy to predict lymphoma from PA(AUC= 0.86, sensitivity = 76.00%,specificity =88.50%). Optimal diagnostic performance to predict lymphoma from ACC (AUC= 0.86, sensitivity = 77.80%, specificity =100.00%) was obtained when setting variance= 274.56 as the threshold value.

Conclusions:The T2WI histogram analysis may help to discriminate orbital tumors of lymphoma,PA and ACC.

EPO-0466

Utility of T2 mapping in the staging of thyroid-associated ophthalmopathy: efficiency of region of interest selection methods (English Paper Contest)

Wen Chen, Hao Hu, Xiao-Quan Xu, Fei-Yun Wu
Jiangsu Province Hosipital (The First Affiliated Hospital of Nanjing Medical University)

Purpose: To investigate the performance of T2 mapping based on different region of interest (ROI) selection methods in the staging of thyroid-associated ophthalmopathy (TAO).
Material and Methods: Thirty-two TAO patients were retrospectively enrolled. Two radiologists independently measured the T2 relaxation time (T2RT) of extraocular muscles using two different ROIs (hotspot [ROI_{HS}]: T2RT-hot; single-slice [ROI_{SS}]: T2RT-mean, T2RT-max, T2RT-min). Independent-samples t test, pearson correlation analysis, receiver operating characteristic (ROC) curves analyses, multiple ROC comparisons, Bland-Altman method, and intra-class correlation coefficient (ICC) were used for statistical analyses.
Results: No significant difference was found in the measuring time between ROI_{HS} and ROI_{SS} methods ($P = 0.089$). T2RT-mean demonstrated the highest ICC for measurement, followed by T2RT-max and T2RT-min, and T2RT-hot showed the poorest reproducibility. Active TAOs showed significantly higher values for all the T2RTs than inactive mimics (all $P < 0.001$). Significant positive correlations were found between T2RTs and CAS (all $P < 0.001$). T2RT-hot and T2RT-max showed significantly higher area under curves than that of T2RT-mean ($P = 0.013$ and 0.024, respectively), whilst the difference between T2RT-hot and T2RT-max was not significant ($P = 0.970$).
Conclusion: The T2RTs derived from both ROI selection methods could be useful for the staging of TAO. The results of measuring time, reproducibility, and diagnostic performance suggest that T2RT-max would be the optimal indicator for staging.

EPO-0467

T2 mapping in orbital masses: preliminary study on differential diagnostic ability of T2 relaxation time

Yan Zhou, Xiao-Quan Xu, Hao Hu, Guo-Yi Su, Fei-Yun Wu
The First Affiliated Hospital of Nanjing Medical University (Jiangsu province Hospital)

Abstract
Background: T2 mapping has been proven to be useful in tumor characterization. As to orbital masses, its diagnostic value needs to be investigated.
Purpose: To evaluate the usefulness of T2 mapping in orbital masses, and the ability of T2 relaxation time in differentiating malignant from benign orbital masses.
Materials and Methods: Forty-seven patients with solid orbital masses (33 benign and 14 malignant) who underwent T2 mapping examination for pre-operation assessment were enrolled in the current study. T2 mapping was acquired using 16 TE values (range, 12-192 ms; delta TE, 12 ms). Mean T2 relaxation time was calculated based on the whole

mass region of interest, and compared between malignant and benign group using unpaired *t* test. Receiver operating characteristic curve analysis was adopted to calculate its diagnostic value.
Results: Malignant orbital masses showed significantly lower T2 relaxation time than benign masses (76.4 ± 13.0 ms vs 119.1 ± 20.4 ms; p<0.001). If setting a T2 relaxation time of 89.5 ms as the threshold value, optimal differentiating performance could be achieved (area under the curve, 0.936; sensitivity, 100.0%; specificity, 87.9%; accuracy, 91.5%; PPV, 77.8%; NPV, 100.0%).
Conclusion: T2 mapping and its derived T2 relaxation time could provide quantitative information, and serve as a supplementary imaging marker for differentiating malignant from benign orbital masses.

EPO-0468

Cerebral Blood Flow Alterations In High Myopia: An Arterial Spin Labeling (ASL) Study

Wang Huihui,Wang Zhenchang,Li Jing
Beijing Friendship Hospital, Capital Medical University

Objective The aim of this study is to explore the cerebral blood flow (CBF) alterations in high myopic (HM) subjects using three-dimensional pseudo-continuous arterial spin labeling (3D-pcASL).
Methods A total of 16 patients with binocular HM (7 males and 9 females) and 16 normal controls (HCs) (7 males and 9 females) closely matched by age, sex were recruited, 3D-pcASL sequence was performed in all subjects. The CBF generalized from pcASL sequence were normalized to reduce the inter-subject variations. Independent t-test and pearson correlation analysis were applied in this study. The receiver operating characteristic (ROC) curve method was performed to classify the mean CBF values of the HM subjects from HCs.
Results Compared with HCs, HM patients exhibited increased CBF in two clusters located in right and left side, respectively (all P<0.05). The abnormal clusters involved bilateral cerebellum, occipital lobe and fusiform gyrus. However, no significant differences were observed in the rest of brain regions. The area under the curve (AUC) of CBF values of the two clusters were as follows: left cluster (0.922), right cluster (0.949) (HM > HC).
Conclusions HM patients may exhibit increased CBF in bilateral cerebellum, occipital lobe and fusiform gyrus, which may help to understand the HM-related brain deficits. However, the causal relationships between high myopia and abnormal brain alterations need further investigation.

EPO-0469

T2 mapping of the extraocular muscles in healthy volunteers: preliminary research on scan-rescan and observer-observer reproducibility

Wen Qian,Wei Chen,Feiyun Wu,Xiaoquan Xu
Department of Radiology, The First Affiliated Hospital of Nanjing Medical University

Background: T2 mapping technique and derived T2 relaxation time allows quantitative assessment of extraocular muscles (EOMs); however, the reproducibility of T2 mapping derived parameters was seldom studied till now.
Purpose: To evaluate the scan-rescan and observer-observer reproducibility of T2 relaxation time measurements of EOMs in young healthy volunteers.
Materials and Methods: Fourteen volunteers underwent T2-mapping examinations of the EOMs three times within one month on a 3.0T MR system. Scan-rescan and observer-observer reproducibility of T2 relaxation time measurements of the EOMs were assessed using intraclass correlation coefficient (ICC) and coefficient of variation (CV).
Results: Both scan-rescan (short-term and long-term) and observer-observer could achieve good to excellent reproducibility, while better short-term scan-rescan reproducibility was obtained than long-term. The CVs of the T2 relaxation time of each EOMs during both scan-rescan and observer-observer reproducibility assessment were less than 6%.
Conclusions: T2 relaxation time measurement of the EOMs is proven to be highly reproducible at 3.0T. T2 mapping may be a potential imaging technique in the diagnosis and follow-up of orbital diseases involved EOMs in further studies.

EPO-0470

Thyroid-associated orbitopathy: evaluating microstructural change of extraocular muscles and optic nerve using readout-segmented echo-planar imaging-based diffusion tensor imaging

Hao Hu
The First Affiliated Hospital of Nanjing Medical University

Objective: We aimed to investigate the ability of readout-segmented echo-planar imaging (rs-EPI)-based diffusion tensor imaging (DTI) in assessing the microstructural change of extraocular muscles (EOM) and optic nerve in thyroid-associated orbitopathy (TAO) patients, and furthermore assisting in disease stage.
Materials and Methods: We enrolled thirty-five TAO patients and 22 healthy controls (HCs) who underwent pretreatment rs-EPI-based DTI. Mean, axial and radial diffusivity (MD, AD, RD) and fraction anisotropy (FA) of medial and lateral EOM as well as optic nerve for each orbit were calculated and compared between TAO and HC groups, or between active and inactive TAO groups. The differences of age, gender, disease

duration, mediation and smoking history between groups were also compared. Logistic regression analysis was used to evaluate the stage value of significant variables.
Results: Disease duration was significantly decreased in active TAOs than inactive ones (P<0.001). TAO patients showed significantly lower FA and higher MD, AD and RD than HCs for both medial and lateral EOMs (P<0.001), except the AD value of lateral EOM (P=0.619). Active patients had significantly higher FA, MD and AD than inactive patients for medial EOM (P<0.005), whereas only FA differed significantly in the lateral EOM (P=0.018). For optic nerve, MD, AD and RD were significantly lower in TAOs than HCs (P<0.05), except FA (P=0.129). Multivariate analysis showed that MD of medial EOM and disease duration were significant predictors of disease activity. Combination of the two parameters showed optimal stage value (area under the curve, 0.855; sensitivity, 68.4%; specificity, 96.9%).
Conclusion: rs-EPI-based DTI is promising in assessing the microstructural change of EOM and optic nerve, and can help to indicate disease activity of TAO, especially the MD of medial EOM.

EPO-0471
第三代双源 CT 双能量单能谱成像技术优化眼动脉显示的应用价值探索

李文航
贵州省人民医院

【摘要】目的 探讨第三代双源 CT 单能谱成像技术优化眼动脉显示的应用价值。**方法：**回顾性收集 35 例行双能量头颈部 CTA 检查的患者,将扫描后高低 kV 两组数据导入西门子 Syngo.via 后处理工作站，采用单能谱+后处理模块（Monoenergrtic plus）对图像进行处理，在 40-190keV 范围内选择 40~70 keV，间隔 5 keV，分别保存 40keV、45 keV、50keV 、55keV、 60keV、65 keV 、70keV 等 7 组图像。分别测量眼动脉起始段颈内动脉、外直肌及肌锥内脂肪的 CT 值、SD 值，计算眼动脉的对比噪声比(CNR)，记录最佳 CNR 所对应的 keV 值，并比较最佳 keV 组和 120KV 平均加权组的图像质量，采用容积重建(VR)、最大密度投影(M1P)等多种后处理方法，将最佳单能量图像与平均加权图像进行比较,由两位 5 年以上工作经验的诊断医生采用 5 分法对眼动脉图像质量进行主观评分；客观评价指标包括眼动脉的 CT 值,图像噪声和 CNR。
结果：最佳单能量图像显示眼动脉的主观评分高于平均加权图像,差异有统计学意义(c^2=210.573，P＜0.05)。眼动脉 CTA 最佳单能量图像的对比噪声比、信噪比、眼动脉 CT 值均高于平均加权图像,两者差异有统计学意义(P＜0.05)。
结论：在不提高扫描条件的情况下，40keV 单能量图像与 120KV 平均加权图像比较能够更好地显示眼动脉

EPO-0472
MR Imaging of Adenomas of the Retinal Pigment Epithelium: a report of 8 cases

Yaping Su,Junfang Xian
Beijing Tongren Hospital, Capital Medical University

Background and purpose: Adenoma of the retinal pigment epithelium (RPE), a rare intraocular tumor, is always misdiagnosed as uveal melanoma. However, the treatment of RPE tumor is quite different from that of the uveal melanoma. Generally, resection was performed in RPE adenoma while plaque brachytherapy in uveal melanoma. Therefore, it is essential to evaluate the MR imaging features of RPE adenoma.
Materials and methods: MR imaging findings of 8 patients with pathologically confirmed adenoma of the RPE were retrospectively reviewed. Post contrast-enhanced MR images were performed in all patients, among which 5 patients performed dynamic contrast-enhanced MR imaging (DCE-MRI) while time–intensity curves (TICs) and maximum contrast index (CImax) were analyzed. Location, size, shape, margin, signal intensity, and degree of enhancement of the tumors were evaluated. A dark-linear sign, which has never been reported before, was depicted and evaluated in RPE patients.
Results: A well-defined, homogenous mass with hyperintense on T1WI and hypointense on T2WI compared to vitreous body were manifested in 8 cases. An oval masse was seen in 5 cases, a lentiform masse in two cases, and a placoid-shaped mass in one case. Compared to the gray matter, the tumor presented hyperintense on T1WI in 7 cases, and isointensity on T1WI in one case. However, the tumor manifested hypointense on T2WI in 7 cases, and isointensity on T2WI in one case. 5 cases of RPE tumor revealed mild enhancement, and 3 cases showed moderate enhancement on fast-suppressed post contrast-T1-weighted image compared to the lacrimal gland. Dark-linear sign was demonstrated in 8 patients on the post contrast T1-weighted images. A plateau-shaped TICs were demonstrated in 5 patients and CImax ranged from 0.35 to 0.46(median, 0.37).
Conclusions: Adenoma of the RPE should be considered in the diagnosis of an oval mass with hyperintense on T1WI and hypointense on T2WI compared to the gray matter, a dark-linear sign, and mild to moderate enhancement. The dark-linear sign may be a hallmark sign, which should be further verified.

EPO-0473
Graves Ophthalmopathy (English Microclass Competition)

Wenfeng Jin,Dan Han
The First Affiliated Hospital, Kunming Medical University

[Clinical and Pathology]
Graves eye disease is also known as thyroid-related eye disease, It is an autoimmune disease that affects thyroid gland, orbital soft tissue and subcutaneous tissues of limbs, more common in middle-aged women. It may manifest as hyperthyroidism, hypothyroidism, or normal thyroid function, and may occur before, after, or at the same time as thyroid dysfunction. The diagnosis of Graves ophthalmopathy with normal thyroid function mainly depends on medical imaging.
The pathological changes are extraocular muscle edema, mainly with chronic inflammatory cell infiltration at early stage, and fibrosis at late stage, which generally occurred in the extraocular muscle belly, while the tendon part is generally not affected. Pathology confirmed Graves ophthalmopathy is mainly differentiated from other ophthalmopathy by two major features: thickening of extraocular muscle belly and increase of connective tissue behind the bulbus oculi. However, pathological biopsy is

somewhat traumatic and difficult to accept by patient, so medical imaging examination is increasingly applied in clinical practice.

[Imaging Manifestations]

CT findings: 1External ocular muscle thickening: most often involving the lower rectus, followed by internal rectus, upper rectus and upper eyelid levator muscles, the external rectus is occasionally involved, which is characterized by hypertrophy in muscle belly while the tendon is normal. Extraocular muscle thickening can reach 3-4 times of the normal volume, the thickened muscle density is uniform, and CT value can increase after enhanced CT scan. 2The orbital diaphragm move forward, due to the intraorbital fat increase, and the space behind the bulbus oculi is extremely clear. 3Protrusion of the bulbus oculi. 4Thickening of the optic nerve: thickening of the extraocular muscle can compress the optic nerve into edema and thickening. The thickened optic nerve has a clear border and uniform density.

MR findings: compared with normal extraocular muscles, the affected extraocular muscles showed low signal on T1WI, high signal on T2WI, and low signal on fibrotic muscle. In GD-DTPA enhanced scan, mild enhancement is observed in the early and middle stages of lesions. Except for intraorbital malignancies and hematomas, this signal changes are not significantly different from that of extraocular muscle thickening caused by other diseases. No enhancement is observed in late fibrosis.

The imaging diagnosis is based on the thickening of the extraocular muscle while the non-thickening of the tendon. The difference between this disease and inflammatory pseudotumor is that muscle belly and tendon are both affected in inflammatory pseudotumor. Carotid cavernous sinus fistula can cause uniform thickening of the extraocular muscle, accompanied by signs of dilatation of the superior ophthalmic vein and cavernous sinus, and the clinical manifestation is pulsating proptosis.

[Significance of imaging examination of Graves ophthalmopathy]

The positive rate of extraocular muscle thickening in imaging examination is higher than that in clinical findings, and extraocular myopathy appear earlier than clinical symptoms. Therefore, imaging examination can detect characteristic orbital lesions before the occurrence of hyperthyroidism, so as to make early diagnosis of Graves ophthalmopathy. After treatment, most patients' imaging changes are consistent with clinical symptoms, and the thickening degree of extraocular muscle is negatively correlated with the course of treatment and the efficacy, so imaging findings can be used as one of the evaluation indexes of efficacy. Imaging examination can be an important basis for early diagnosis and efficacy evaluation of Graves ophthalmopathy.

EPO-0474

眼眶海绵状血管瘤的影像诊断（参加中文微课比赛）

赵迅冉,韩丹
昆明医科大学第一附属医院

摘要：
目的：研究眼眶海绵状血管瘤的影像学征象。
方法及结果：海绵状血管瘤是成人最常见的眶内原发肿瘤，女性较男性多见。类圆形占位病变，边界清楚，肿瘤表现为软组织密度，CT 值大于 50Hu，密度均匀，也可不均匀，少数可见钙化点或静脉石，增强后呈中度或高度强化，强化后可达 70Hu 以上。由于肿瘤压迫可致眶内正常结构的移

位，病史较长者可有一致性眶腔扩大。眶尖可见球后脂肪残留，即“眶尖空虚征”， CT 诊断具有“渐进性强化”征象，CT 平扫检查可见病灶形态不规则，且存在弥漫状生长，有点状高密度影存在病变区域。MRI 肿瘤的空间位置、形态及强化特点同 CT 表现，肿瘤信号在 T1WI 为中等偏低信号。T2WI 为中等偏高信号；眶尖可见球后脂肪残留。MRI 诊断后同样也具有“渐进行强化”征象，T2WI 表现为高信号，T1WI 以中低信号为主。
结论：在眼眶海绵状血管瘤的诊断过程中，CT、 MRI 对于患者疾病定性诊断和定位诊断的准确率均较高 ，因此值得优先推广使用。

DWI 和 T2 Mapping 定量诊断甲状腺相关视神经病变的价值

邹梦莎,黄夏华,朱洪章,伏文皓,李若程,武迪德,洪澍彬,杨智云
中山大学附属第一医院

目的：初步探讨扩散加权成像（Diffusion weighted imaging, DWI）与 T_2弛豫时间参数图（T_2 mapping）诊断甲状腺相关视神经病变（Dysthyroid Optic Neuropathy,DON）的价值。
材料与方法: 收集 2017 年 2 月-2019 年 2 月期间由中山大学附属第一医院确诊的 TAO 患者 30 例，其中 DON（DON 组）、非 DON 的 TAO 患者（非 DON 组）各 15 例（30 只眼），同期收集 15 例正常志愿者（30 只眼），所有受试者均行眼眶多回波自旋回波 T_2 mapping 及 DWI 成像，由 2 位医师在不知分组情况下分别在后处理工作站测量各组双侧视神经的 T_2值及 ADC 值。采用单因素方差分析比较不同组别受试者间视神经平均 T_2值及 ADC 值的差异。应用 Spearman 秩相关分析评价 TAO 患者组平均 T_2值、ADC 值与 CAS 评分的相关性。
结果：DON 组双侧视神经 ADC 值与志愿者组、非 DON 组均存在显著差异（P 均＜0.05），双侧视神经的 ADC 值按照志愿者组、非 DON 组、DON 组依次升高，依次为（0.969±0.018）×$10^{-3}$$mm^2$/s,（1.033±0.027）×$10^{-3}$$mm^2$/s,（1.108±0.022）×$10^{-3}$$mm^2$/s。DON 组双侧视神经平均 T_2值与非 DON 组不存在显著差异（P＞0.05），而 DON 与非 DON 组与志愿者间存在显著差异（P＜0.05）。TAO 患者中双侧视神经平均 T_2值、ADC 值均与 CAS 评分呈正相关（r_s=0.328, r_s=0.317,P 均＜0.05）。
结论:DWI 有助于诊断甲状腺相关视神经病变，而甲亢相关眼病患者视神经 T_2值与正常志愿者存在一定的差异，为 T_2 mapping 预测甲状腺相关视神经病变提供了可能性。

EPO-0476
Relationship between MR imaging features and pathological types of uveal melanoma in adults

Qinghua Chen,Mingxia Sun,Junfang Xian
Beijing Tongren Hospital, Capital Medical University

Objective To study the relevance of MR imaging findings and pathological types of uveal melanoma in adults.**Methods** A retrospective study was carried out on MR imaging findings of 101 patients with uveal melanoma confirmed by histopathologic results from 2005 to 2015 in Beijing Tongren hospital, 44.5±12.3 (18～78) years,male patients50, female patients51, left eyes 55, right eyes 46, including spindle cell type76 cases, epithelialcell type 12 cases, mixed cell type 13

cases. MR imaging findings of the uveal melanoma were compared with different pathological types by chi-square test and independent t test. **Results**The location, shape, degree of enhancement of the masswere significantly different among three different pathological types of the uveal melanoma（P= 0.006, 0.012, 0.048). The patient gender, age, the margin, secondary retinal detachment,signal intensity on T_1- and T_2WIcompared to the gray matter, homogeneity and degree of enhancement of the mass, height, basal diameter, and ratio of basal diameter to height of the masswere not significantly different. The signal intensity on T_2WIcompared to the gray matter（P= 0.022）, and the homogeneity of enhancement（P= 0.042）of the mass were significantly different between spindle cell type and non-spindle cell type UM.The height of non-spindle cell type（9.4mm±4.5mm）was larger thanspindle cell type（8.2mm±3.2mm）（F= 4.122, P= 0.045）.
ConclusionThere is a correlation between MR features and the pathological types of UM. The shape, location and degree of enhancement of the tumor can help distinguish UM of different pathological types, the homogeneity of enhancement, signal intensity on T_2WIcompared to the gray matter, and the height of the tumor is helpful to identify spindle cell type and non-spindle cell type UM. The homogeneity of enhancement can be used as an MR sign to evaluate the prognosis of UM.

EPO-0477

Comparative research on MR imaging features of dome-shaped and plat-shaped uveal metastases

Qinghua Chen
Beijing Tongren Hospital, Capital Medical University

Objective To comparetheMR signs of dome-shaped and plat-shaped uveal metastases, and to evaluate the diagnostic value of MR for different forms of uveal metastases. **Methods** A retrospective study was carried out on MR imaging findings of 49 patients with uvealmetastasesconfirmed by histopathologic results or clinical comprehensive diagnosis from 2005 to 2015 in Beijing Tongren hospital, age 52.5±12.3 years old, including 19 males, 30 females, 26 left eyes, 21 right eyes, 2 bilateral eyes. According to lesion morphology, the cases were divided into a flat-shapedgroup (36 cases)and a dome-shaped group (13cases). The clinical manifestations and MR signs of the uveal metastases were compared between the two groups, including patient age, gender, location, morphology, margin, retinal detachment, T_1WIand T_2WIsignals (compared to gray matter), T_1WIand T_2WIsignal uniformity, degree of enhancement, homogeneity, contrast index, height of the mass, the diameter of the base, the ratio of the base and the height were assessed. The Pearson chi-square test was used for the counting data, and the independent sample rank test was used for the measurement data. **Results**The signal homogeneity in T_1WI , degree of enhancement and contrast indexwere significantly different between the flat-shapedgroup and the dome-shaped group of the uveal metastases（χ^2= 4.491, 5.026, 5.914, P = 0.034, 0.025, 0.015）. There were no significant differences in patientgender, side, mass location, morphology, margin, retinal detachment, signal intensity on T_1- and T_2WI(compared to gray matter), signal homogeneityon T2WI（P > 0.05）.The ratio of base diameter to

height was significantly different between the flat group (from 0.8 mm to 11.3 mm, median 2.9 mm) and the dome group (from 1.0 mm to 6.0 mm, median 2.0 mm) (Z=- 1.998, P = 0.046). There were no significant differences in patient age, height of the tumor, and basal diameter (P > 0.05). **Conclusion**The MR signs of dome-shaped and flat- shaped uveal metastases are significantlydifferent. The dome-shaped uveal metastases still have the main characteristics of uveal metastases, such as isointensity on T_1WI and T_2WI. MRIplays an important role in the diagnosis of uveal metastases.

EPO-0478

Diagnostic performance of intravoxel incoherent motion diffusion-weighted MRI in differentiating orbital lymphoma from IgG4-related orbital disease

Hong Jiang,Junfang Xian
Department of Radiology, Beijing Tongren Hospital, Capital Medical University, Beijing 100730, China

PURPOSE: To evaluate the diagnostic performance of intravoxel incoherent motion (IVIM) diffusion-weighted MRI (DWI) in differentiating orbital lymphoma from IgG4-related orbital disease (IgG4-ROD).
MATERIALS AND METHODS: Thirty patients including 16 cases of lymphoma and 14 cases of IgG4-ROD underwent orbital MRI with a 3.0 T MRI scanner using an eight-channel head coil. IVIM-DWI was performed in the axial plane, and routine pre-contrast T1WI, T2WI and post-contrast T1WI were performed. The ADC, true ADC (ADC_{slow}), pseudo-ADC (ADC_{fast}), and perfusion fraction (f) were independently calculated by two radiologists. The independent t-test was used to compare the difference of each parameter between patients with lymphoma and IgG4-ROD. Receiver operating characteristics (ROC) curves analyses were performed to evaluate the diagnostic performance of parameters in distinguishing the orbital lymphomas from IgG4-RODs, and the sensitivity, specificity, and the accuracy were also calculated. The intraclass correlation coefficient (ICC) was calculated to evaluate the reliability of measurements between two radiologists. $P < 0.05$ indicated a statistical significant difference.
RESULTS: The inter-observer agreement was excellent for all evaluated parameters (ICC values from 0.82 to 0.90). Lymphomas showed significantly lower ADC and ADC_{slow} values than the IgG4-RODs for both reviewers ($P < 0.05$). There were no significant differences in ADC_{fast} and f between lymphomas and IgG4-RODs for either reviewer ($P > 0.05$). The cut-off value for ADC was 0.884×10^{-3} mm^2/s (reviewer 1) with sensitivity of 100% (16/16), specificity of 71.43% (10/14), accuracy of 86.67% (26/30), and 0.711×10^{-3} mm^2/s (reviewer 2) with sensitivity of 87.50% (14/16), specificity of 85.71% (12/14), accuracy of 86.67% (26/30). The cut-off value for ADC_{slow} was 0.679×10^{-3} mm^2/s (reviewer 1) with sensitivity of 93.75% (15/16), specificity of 64.29% (9/14), accuracy of 80.00% (24/30), and 0.587×10^{-3} mm^2/s (reviewer 2) with sensitivity of 75.00% (12/16), specificity of 78.57% (11/14), accuracy of 76.67% (23/30). There were no significant differences in AUCs between ADC and ADC_{slow} for either reviewer (reviewer 1: Z=0.137, P=0.8914; reviewer 2: Z=0.368, P=0.7128).

CONCLUSION: IVIM-DWI are useful in differentiating lymphoma from IgG4-ROD, and the parameters of ADC_{slow} and ADC have a significantly higher performance than ADC_{fast} and *f*.

EPO-0479
Multiparametric MR imaging of orbital masses (lecture)

Junfang Xian
Beijing Tongren Hospital Affiliated to Capital Medical University, China

Background and purpose: Orbital masses in adults comprise a broad spectrum of benign and malignant
diseases including orbital neoplasms and tumor-like disorders. MR imaging plays a valuable role in characterization of these lesions and in evaluation of disease extent. However, it is difficult to differentiate these orbital masses. The paper aims to talk about the role of multiparametric MR imaging in the evaluation of orbital masses. Methods: The role of multiparametric MR imaging will be described. Results and conclusion: Cavernous malformations (also known as cavernous hemangiomas),although not true neoplasms, are the most common benign adult orbital tumor. Lymphoma, which may be primary
or secondary to systemic disease, is the most prevalent orbital neoplasm in older adults (≥60 years of age). Multiparametric MR imaging is the best imaging method in the diagnosis and differential diagnosis of orbital masses.

Role of diffusion tensor imaging for the detection of dysthyroid optic neuropathy in Thyroid-Associated Ophthalmopathy

Ping Liu[1],Zhang Jing[2],GuiHua Jiang[1]
1.Guangdong Second Provincial General Hospital
2.Tong Ji Hospital, Huazhong University of Science & Technology

Purpose: this cross-sectional study aims to explore the changes of whole visual pathway in patients with dysthyroid optic neuropathy(DON) with diffusion tensor imaging(DTI) and to investigate the potential of DTI in the diagnosis of DON.
Methods: 23 bilateral DON, 56 TAO without DON and 39 healthy controls were enrolled. Clinical features of 79 patients and DTI parameters of the 118 subjects were analyzed. The MD,FA, and eigenvalue maps were obtained for quantitative analysis. The area under receiver(AUC) operating characteristic curve was employed to evaluate the diagnostic performance of DTI parameters.
Results: For optic nerve, the DON group displayed significantly higher $\lambda_{/\!/}$, $\lambda_{\perp}$, MD and lower FA values than that of TAO and HC(p<0.05, respectively), the TAO group also showed higher $\lambda_{\perp}$, MD and lower FA values than HC group. The FA values of HC in optic chiasm were markedly lower than that of DON and TAO (p=0.003 and 0.031,

respectively). In optic tract, the DON group exhibited higher MD than HC(p=0.013) and lower FA values than TAO and HC, (p=0.009 and <0.001, respectively). The $\lambda_{/\!/}$ and MD of optic radiation in DON elevated when compared with TAO. Both the $\lambda_{\perp}$ in optic radiation increased in DON and TAO patients.
The clinical activity score, visual acuity associated with all DTI parameters. The amplitude of visual evoked potential also correlated with the FA of optic nerve. Combination of the four DTI parameters of optic nerve generated the highest AUC (0.801) and corresponding sensitivity and specificity were 80.43% and 66.96%, respectively.
Conclusions: DTI of visual pathway sensitively may detect that the neurological damage in DON was not limited to optic nerve. DTI parameters were associated with some visual function decline. Combination of multi-parametric DTI of optic nerve may serve as an imaging marker to facilitate clinicians to diagnose DON.

原发性闭角型青光眼默认模式网络各亚区的异常静息状态功能连接研究

江菲
南昌大学第二附属医院

采用静息态功能磁共振功能连接分析探讨原发性闭角型青光眼(PACG) 默认网络(DMN) 内亚区间的功能连接改变。
方法：
选取 47 名 PACG 患者（20 名男性和 27 名女性）和 47 名正常视力对照者（20 名男性和 27 名女性）接受静息状态磁共振成像扫描。选取 DMN 种子点做功能连接，采用 SPM8 软件数据预处理，分析 PACG DMN 内亚区成对功能连接的改变。
结果：
与正常视力组相比，PACG 组右侧内侧颞叶（MTL.R）与左侧海马（HF.F）功能连接减低(t = -3.12，P = 0.002) 、左侧内侧颞叶（MTL.L）与右侧海马（HF.R）功能连接减低(t = -2.297，P = 0.024) 。
结论：
PACG 患者 DMN 内部功能连接存在异常，提示 DMN 可能参与 PACG 的发病机制，MTL.R-HF.L、MTL.L-HF.R 的功能连接明显减低可能是 PACG 患者认知、情感处理功能障碍的潜在发病机制。

Morphometric Analyses of Visual Cortex in Patients with Retinitis Pigmentosa

Yanqiu Zhang,Dapeng Shi
Henan Provincial People’s Hospital (Henan Key Laboratory for Medical Imaging of Neurological Diseases & Zhengzhou University People’s Hospital & People’s Hospital of Henan University)

PURPOSE Previous reports using DTI have shown the damage in optic nerve and optic radiation of patients with retinitis pigmentosa(RP), but possible effects on the

structures of visual cortex using high-resolution anatomical MRI have not been established. In this study, our aim was to investigate volumetric alterations in visual cortex of RP patients using voxel based morphometry (VBM). **METHODS** Twenty-nine patients (17men,12women;mean age,37years;range,16－63years) and twenty-seven healthy controls (17men,10women;mean age,38years;range,18－61years) were enrolled in this study. Measures of visual field (VF) and visual acuity (VA) were performed on all subjects. In addition, a 1 mm isotropic resolution anatomic 3D T1-weighted acquisition based on magnetization-prepared fast spoiled gradient echo sequence was acquired for each participant VBM was used to analyze the difference in cortical grey matter volume between patients and controls. Morphometric values in terms of volume were extracted from ROIs situated in broadmann area 17, 18, and 19. Further analyses were performed to determine the correlation of the altered grey matter volume of RP patients with the mean deviation of visual field (MDVF) and mean VA, respectively. **RESULTS** Compared with healthy controls, in patients with RP volumetric reduction in the middle part of medial occipital cortex was found ($P<0.01$,*FDR* corrected). RP patients showed significantly lower volume in broadmann area 17 and 18 as compared to control subjects ($P<0.001$); however, no significant difference in the volume of broadmann area 19 between patients and controls was seen ($P>0.05$). In addition, for RP patients, the grey matter volume in broadmann area 18 was significantly correlated to mean VA ($r=-0.408$,$P=0.028$) and mean MDVF ($r=0.386$, $P=0.038$), while that in broadmann area 17 was only significantly correlated to mean VA values ($r=-0.408$,$P=0.028$). **CONCLUSIONS** RP is associated with degeneration of structures in the visual cortex. Prevention of visual cortical degeneration may need to become a new therapeutic goal for RP patients.

体素内不相干运动（IVIM－DWI）对眼眶良恶性病变的鉴别诊断价值

梁轶[1,2],何茜[1,2],邵举薇[1,2]
1.昆明医科大学第四附属医院
2.云南省第二人民医院

目的 研究体素内不相干运动（IVIM－DWI）对眼眶良恶性病变的鉴别诊断价值。
方法 收集 2018 年 11 月至 2019 年 6 月因眼眶病变至昆明医科大学第四附属医院行磁共振 IVIM－DWI 检查患者 38 例，经术后病理证实共 38 个病灶，其中良性病变 27 个（良性组），恶性病变 11 个（恶性组）。所有患者均进行 GE 1.5T 磁共振进行常规平扫及 IVIM－DWI 扫描，其中 b 值 DWI 选用 13 个 b 值（b＝0、20、50、75、100、150、200、400、800、1000、1200、1500、2000s/mm2）,通过 GE ADW4.6 工作站测量得到 IVIM－DWI 参数，包括灌注分数（f），伪扩散系数（Dfast），真实扩散系数（Dslow）和标准扩散系数（Standard ADC）值，并比较其参数在眼眶良恶性病变中的鉴别诊断价值。采用独立样本 T 检验分析 IVIM－DWI 参数的诊断价值；以病理诊断结果为金标准，绘制 ROC 曲线，并计算曲线下面积（AUC）。
结果 良性病变与恶性病变的 Dslow 和 Standard ADC 值差异均有统计学意义（P 值均<0.05），Dfast、灌注分数（f）值差异没有统计学意义（P 值 0.05）。Standard ADC、Dslow 值二者 ROC 曲线下面积分别为 0.793、0.800，二者鉴别良恶性病变的敏感度、特异度分别为 90%、66.7%、100%、77.8%。
结论 IVIM-DWI 参数 Standard ADC 和 Dslow 值能够有效提高眼眶良恶性病变的鉴别诊断效果，为定性诊断提供可靠依据，其中，Dslow 值有助于更好的区分肿瘤性质

Application of 16cm Wide-Detector Dual-Energy CT on Motion Artifacts Reduction for Patients with COPDin chest examination

Donghong Wei[1],Zhi jun Hu[2]
1.Xi'An International Medical Center
2.Chang'an Hospital

[Abstract] Objective To explore the value of using 16cm wide-detector CT on reducing motion artifacts in chest examination of COPD.
Materials and Methods A total of 60 COPD patients underwent chest CT examination Patients were randomly divided into two groups with exclusion criteria : (1) pregnant and lactating women; (2) having severe respiratory symptoms Lay a CT examination. The l control group (group A, 30 cases) was scanned on a 64 rows of VCT with a collimator width of 40 mm, a rotation speed of 0.6 s/rot and a pitch of 0.984:1. The experimental group (group B, 30 cases) was scanned by by a 16cm wide-detector dual-energy CT (Revolution CT, GE Healthcare, USA) with All other scan parameters were same: collimator width 80mm; rotation speed 0.28s/rot; pitch 0.992:1; tube voltage 120Kvp; automatic tube current; preset noise index (NI) of 11. The ROI was selected at the same level of the thoracic inlet plane, the trachea sacral floor, and the level plane image of the hilar plane. The CT and SD were measured to calculate SNR for objective evaluation.. The two radiologists used a 5-point method to subjectively evaluate the image quality in a double-blind manner Subjective scores were aseesed using the Kappa test. Results The subjective and objective scores of images in group B were generally higher than those in group A with more detailed visualization of lung and mediastinum (P<0.001). Exposure time in group B (1.3±0.6)s was 73% lower than that of group A (4.8±0.5)s, and the difference was statistically significant. (t=-22.745, P<0.001). Moreover, there was no significant difference observed in effective radiation dose (ED) between two groups (t=0.591, P>0.05). Conclusion The application of the 256-row wide-detector dual-energy CT can significantly reduce the examination time while optimizing the image quality. As a result, it can substantially reduce image motion artifacts for patients with severe COPD. Clinical application: The 16cm wide-detector dual-energy CT can reduce motion artifacts with the use of its large pitch scan for COPD chest CT examination..

COPD 急性加重小气道重塑和肺气肿改变的 CT 定量研究

管宇
海军军医大学第二附属医院（上海长征医院）

目的 CT 定量分析慢性阻塞性肺疾病急性加重（AECOPD）患者小气道重塑和气肿指数的改变，并探讨小气道定量参数、气肿指数与 COPD 急性加重频率间的相关性。
材料与方法：回顾性分析 80 例 COPD 急性加重患者的吸气相 CT 扫描图像。将原始数据传输到 COPD prototype 分析软件内进行支气管定量参数及气肿指数的分析。设定 CT 值低于-950HU 的区域为肺气肿区，软件自动计算气肿指数。共选取 5 支支气管为研究支气管，分别为右肺上叶尖段支气管（RB1）、右肺中叶外侧段支气管（RB4）、右肺下叶后基底段支气管（RB10）、左肺上叶尖后段支气管（LB1)、左肺下叶后基底段支气管（LB10）,并测量其远端的第 6 级支气管定量参数。支气管定量参数包括：支气管腔直径（LD)、支气管壁厚度（WT）、管壁面积占支气管断面总面积的百分比（WA%）。对每个支气管定量参数，分别测量 3 次后取其平均值，再取 5 支支气管各定量参数平均值。同时记录一年内 COPD 急性加重发作频率。采用 SPSS18.0 统计学软件。各级支气管定量参数、气肿指数与急性发作频率的相关性采用 Spearman 相关系数检验。以 P<0.05 为差异有统计学意义。
结果：COPD 急性加重频率与气肿指数间无明显相关性(r=0.46,P=0.06)。第 6 级支气管定量参数管壁面积占支气管断面总面积的百分比(WA%)和支气管壁厚度(WT)分别与 COPD 急性加重发作频率间具有明显相关性(r=0.74, P=0.02; r=0.65, p=0.03)。而支气管腔直径(LD)与 COPD 急性加重发作频率间无明显相关性(r=0.53,P=0.08)。
结论：CT 定量成像能有效评价 COPD 小气道重塑及肺气肿，且小气道重塑与 COPD 急性加重发作频率有一定相关性。

EPO-0486

Emphysema and airways remodeling in patients with chronic obstructive pulmonary disease: lobar level CT quantitative analysis and correlation

Yu Guan
Department of Radiology, Changzheng Hospital, Second Military Medical University

Purpose: To analyze the relationship between emphysema, airway dimensions and pulmonary function test(PFT) parameters quantitatively in patients with COPD and to investigate the correlation of emphysema and airways at the lobar level. **Methods:** Thin-section CT was acquired with 256-slice MDCT scanner during the inspiratory phase in 55 patients diagnosed as COPD. All images were retrospectively analyzed using a software program with fully-automated 3D airway extraction, lung lobe segmentation and emphysema analysis based on each lobe. Airway parameters including wall thickness (WT), luminal diameter(LD) and wall area percentage(WA%) were measured in the fourth, fifth, and sixth bronchial generations as follows, RB1, RB4, RB10, LB1 and LB10. Emphysema index based on each lobe were calculated automatically at the threshold of -950HU. Spearmans rho and Pearson correlation analysis were used for statistical analysis. **Results:** There were significant positive correlations between LD-mean and FEV1(R=0.32~0.502, all P<0.05),FEV1%(R=0.314~0.529, all P<0.05) and FVC (R=0.314~0.478, P<0.05) in the fourth, fifth and sixth generation bronchus respectively. WT was negatively mildly correlated with FEV1 (R=-0.307, P=0.036) and FVC(R=-0.301,P=0.040) in the sixth generation bronchus, while WT has no significant correlation with PFT parameters in the fourth, fifth generation bronchus. There was negatively correlation between WA% and PFT parameters in the sixth generation bronchus (r=-0.317~0.424, all p<0.05). FEV1% had a greater correlation with whole lung

emphysema compared with other PFT parameters. Lobar emphysema was negatively correlated with WT in two bronchial paths of sixth generation bronchus as follows: RB10, r=-0.317,p=0.018; LB10, r=-0.379, p=0.004. While there was only negative correlations between WA% and lobar emphysema in LB10(r=-0.336, p=0.012). **Conclusion:** Emphysema and airway remodeling can be assessed by using CT quantitative methods in patient with COPD. WA% and LD had significant quantitative value in the diagnosis of COPD, and wall thickness of sixth generation bronchus has a significant correlation with lobar emphysema, which indicates that the extent of distal bronchial wall thickening is more relevant with emphysema.

EPO-0487

慢性阻塞性肺疾病患者大脑半球间镜像功能连接的静息态功能 MRI 研究

张娟,彭德昌
南昌大学第一附属医院

目的：采用静息态 fMRI(resting-state functional MRI，rs—fMRI)的基于体素镜像同伦连接(voxel-mirrored homotopic connectivity，VMHC)方法研究探讨慢性阻塞性肺疾病（chronic obstructive pulmonary disease，COPD）患者大脑半球间同伦功能变化及其与临床指数的关系。
方法：利用 3.0T MR 采集 19 例 COPD 病人(男性 14 例，女性 5 例；平均年龄 62.7±5.9）和 20 例相匹配的健康志愿者（男性 15 例，女性 5 例；平均年龄 60.8±6.3）的 rs-fMRI 数据。采用基于 Matalab 平台的 DPABI 软件计算两组被试大脑半球间 VMHC 值，然后采用双样本 t 检验分析得出两组间 VMHC 值具有统计学差异的脑区，接着以差异脑区为感兴趣区计算全脑功能连接，并进一步分析两组间基于差异脑区的连接模式差异（异伦连接）。
结果：与健康对照组（healthy controls， HCs）比较，COPD 组颞上回存在 VMHC 值显著下降。异伦连接分析发现，与 HCs 组比较，左侧颞上回与右侧颞上回的功能连接减低，而与舌回的功能连接增强；右侧颞上回与右侧颞下回、右侧额下回、左侧颞上回的功能连接减低，而与右侧额中回、左侧额内侧回、楔前叶/中央后回的功能连接增强。受试者 ROC 曲线分析显示右侧颞上回 ROC 曲线下面积是 0.955，这提示了 VMHC 可以用来区分 COPD 和健康对照组。
结论：本研究发现 COPD 患者存在双侧颞上回间 VMHC 值下降，即颞上回的内源性功能连接破坏，这暗示了 VMHC 是一种重要的和有效的办法去理解 COPD 患者脑内源性功能构架断裂的机制。

Low-dose CT combined with different levels of KARL iterative reconstruction for Quantification of chronic obstructive pulmonary disease

Fanhui Zhao,Jianlong Li,Xiaoqi Huang,Youmin Guo,Lei Wang,Yanjin Zhu
The Affiliated Hospital of Yan'an University , China

ABSRACT
OBJECTIVE: To investigate the effect of low-dose CT combined with different levels of KARL iterative reconstruction (IR) on the quantitative analysis of chest CT in patients with chronic obstructive pulmonary disease (COPD).

METHODS: 30 patients with COPD were performed with standard-dose (120kV, 150mAs) and low-dose (120kV, 40mAs) chest CT scan used 128-slice spiral CT (UNITED IMAGING). The standard-dose CT was reconstructed by FBP, and the low-dose CT was reconstructed by FBP and KARL IR(level 1～9). Calculate the effective dose (ED), calculate the ascending aortic CT value and noise (SD) at the pulmonary bifurcation level and calculate the signal to noise (SNR). All the raw data was imported into the "Dexin-FACT" CT quantitative analysis software and calculated the emphysema index (EI). One-way ANOVA was used to compare the differences of EI, SD, SNR between the data of standard and low dose CT.
RESULTS: The ED of the standard-dose CT and the low-dose CT were 6.91±0.53 mSv and 1.82±0.28 mSv respectively, a decrease of 74%. SD in the low-dose CT wirh FBP was larger than the standard-dose CT with FBP. As the level of KARL IR increased, SD decreased gradually , and KARL9 decreased by 23.70%. The low-dose with FBP had lower SNR than the standard-dose with FBP. With the level of KARL IR increased, the SNR increased gradually, and the KARL9 level increased by 123.81%. Compared with the standard-dose CT with FBP, the EI of the low-dose CT with FBP was overestimated. The level of KARL IR could affect the quantitative analysis of low-dose chest CT. There was no statistical significance difference in the quantitative values of the two adjacent iteration levels, compared with the standard-dose CT with FBP, the EI of the low-dose CT with FBP was overestimated by 13.88%. With the increase of the IR level, EI decreased gradually, and the EI in low-dose CT with KARL9 was overestimated by 5.67%, KARL IR protocol could reduce the EI, tends to the value of the standard-dose CT with FBP, and corrects the quantitative analysis error.
CONCLUSION: The radiation dose of low-dose chest CT scan can be reduced by about 74%. The low-dose image can be used to estimate the EI in patients with COPD. Combined with KARL IR protocol, the error can be corrected to a certain extent, and the quantitative parameters are more accurate.

能谱 CT 对 COPD 胸椎钙（水）密度变化趋势的初步研究

唐翎,汤万鑫,仲建全,冯浩,郑春燕,马元英
自贡市第一人民医院

目的 探讨能谱 CT 对慢性阻塞性肺疾病患者胸椎钙（水）密度变化规律的应用价值。**方法** 选取 COPD 患者 61 例，按照肺气肿指数分为肺气肿组和非肺气肿组，并设置对照组 35 例，进行对比研究。**结果** 胸椎钙（水）密度随肺通气功能受损加重而减少；肺气肿组胸椎钙（水）密度均低于非肺气肿组和对照组（P＜0.05），胸椎钙（水）密度随 LAV%升高而减少。**结论** 利用能谱 CT 图像可初步评估 COPD 患者胸椎钙（水）密度与肺通气功能及 LAV%变化关系；肺气肿是加重 COPD 胸椎钙（水）密度减低的重要因素。

EPO-0490

HRCT 定量评估慢性阻塞性肺疾病中央气道与肺功能相关性初步研究

浦俭,何茜,向述天
云南省第二人民医院

目的 探讨高分辨率 CT 吸气-呼气末慢性阻塞性肺疾病中央气道参数与肺功能分级之间相关性。**方法** 2018 年 01 月至 2019 年 01 月昆明医科大学第四附属医院呼吸内科临床诊断为慢性阻塞性肺疾病且资料完整病人 56 例，于 2 天内完成胸部 CT 及肺功能检查。肺功能检查主要指标包括用力肺活量、第 1 秒用力呼气量、第 1 秒用力呼气量与用力肺活量之比、第 1 秒用力呼气量与预测值的百分比。胸部 CT 检查采用 320 排东芝 Aquilion-One 行吸气-呼气末双相扫描。扫描数据传至 Vitrea 后处理工作站，测量吸气相中央气道管壁厚度（Tin）、管径（Din）、容积（Vin）及呼气相中央气道管壁厚度（Tex）、管径（Dex）、容积（Vex），计算得到呼气相与吸气相中央气道容积变化（Vin-Vex），吸气末图像采用多平面重组（MPR）技术测量并进行计算得到中央气道长度（S），计算得到吸气相与呼气相中央气道容积变化与中央气道长度比（Vin-VexSR）。根据肺功能检查结果对病人严重程度进行分级，分析中央气道吸气-呼气双相容积及容积变化与肺功能分级之间的相关性。数据统计应用 SPSS 17.0 统计软件包进行分析，计量资料采用均数±标准差表示，正态分布计量资料采用完全随机设计资料的方差分析，P<0.05 表示差异有统计学意义。**结果** 56 例 COPD 病人分级，I 级 15 例，II 级 16 例，III 级 16 例，IV 级 9 例。COPD 中央气道吸气相管壁厚度（Tin）、管径（Din）、容积（Vin）及呼气相管壁厚度（Tex）、管径（Dex）、容积（Vex）、吸气相容积与呼气相容积差（Vin-Vex）、吸气相与呼气相中央气道容积变化与中央气道长度比（Vin-VexSR）与肺功能分级间具有相关性，P＜0.01，差异有统计学意义。**结论** COPD 病人中央气道参数与肺功能分级之间具有相关性，呼气相中央气道容积与肺功能分级相关性最高。

EPO-0491

Additional value of expiratory CT in quantitative analysis of pulmonary vessels in COPD

Xianxian Cao[1],Xiaoyan Gao[1],Nan Yu[2],Meijuan Shi[3],Xia Wei[4],Chenwang Jin[1],Youmin Guo[1]
1.Department of Medical Imaging, The First Affiliated Hospital of Xi'an Jiaotong University
2.Department of Radiology, The Affiliated Hospital of Shaanxi University of Chinese Medicine
3.Department of Medical Imaging, The Second Affiliated Hospital of Xi'an Jiaotong University
4.Department of Respiratory Medicine, Ninth Hospital of Xi'an

Objective To evaluate intrapulmonary vascular volume on paired inspiratory and expiratory CT in patients with chronic obstructive pulmonary disease (COPD), and explore the value of expiratory CT quantitative pulmonary vascular in COPD.**Methods** Eighty-nine COPD patients were collected retrospectively from the "Digital Lung" database. All subjects underwent both inspiratory and expiratory CT scans and the intrapulmonary vascular volume (IPVV)、airway wall thickness (WT) 、the percentage of the airway wall area (WA%) and the percentage of emphysema ($LAA\%_{-950}$) were quantitatively analyzed. The correlations between IPVV and PFT parameters、$LAA\%_{-950}$ and airway parameters for the third to sixth generation bronchus were analyzed using Pearson or Spearman's rank correlation coefficients and multiple stepwise regression.**Results** In inspiratory scan, IPVV was negatively correlated with PFT parameters (r=-0.215～-0.292,p<0.05) ,positively correlated with the WT_{3-6} (r=0.233～0.557,p<0.05) and $LAA\%_{-950}$(r=0.238～0.409,p<0.05). In expiratory scan, IPVV was negatively correlated with PFT parameters (r=-0.238～0.360,p<0.05) ,positively correlated with the WT_{3-6} (r=0.260～0.566,p<0.05)and $LAA\%_{-950}$(r=0.241～0.362,p<0.05).The

further multiple stepwise regression demonstrated that IPVV and other parameters could introduce a regression equation with the biggest R^2=0.426、0.505 in inspiratory and expiratory CT, respectively(P<0.05), and WT were independently associated with IPVV (P<0.05).**Conclusion** Paired inspiratory and expiratory CT can quantitatively evaluate IPVV and pulmonary vascular changes in respiratory state of COPD. The correlations between IPVV and other COPD quantitative parameters in expiratory CT were greater than that in inspiratory, the expiratory CT can provide more effective information for assessing the degree of expiratory airflow obstruction in COPD patients, and provide a new approach for studying pulmonary hypertension in COPD. The further multiple stepwise regression demonstrated that bronchial wall thickness may be an independent predictor of pulmonary vascular volume in COPD.

EPO-0492

Can inspiration CT and expiration CT quantitatively assess emphysema and small airways in smokers and non-smokers?

Ruyi Bao,Zhiyong Li
The First Affiliated Hospital of Dalian Medical University

Can inspiration CT and expiration CT quantitatively assess emphysema and small airways in smokers and non-smokers?
PURPOSE
To quantitatively investigate the emphysema and small airways and its change induced by cigarette using inspiration CT and expiration CT.
METHOD AND MATERIALS
50 smokers and 50 non-smokers male subjects who received inspiration CT and expiration CT . CT parameters assessed were tracheal collapsibility (TCo), the content of emphysema (CE), air trapping (AT) , and square root of the wall area of a hypothetical airway of 10-mm internal perimeter of segmental and subsegmental airways (Pi10). The differences in smokers and non-smokers with a Students' t-test. Using SPSS16.0 statistical software for analysis, with P<0.05 for significant differences.
Result
The CE of the smoking group and non-smoking group were 2.70±1.89%, 3.28±2.55%, there were no significant differences (P > 0.05) between them. The Pi10, AT and TCo in no-smoking group were 2.18 ± 0.56, 79.57 ± 5.23, and 0.61 ± 0.20. The Pi10, AT and TCo in smoking group were 2.45 ± 0.43, 83.15 ± 6.77, and 0.66 ± 0.09. These values were slightly different between both groups (p < 0.05).
CONCLUSION Pi10, AT and TCo are slightly different between smokers and non-smokers.
CLINICAL RELEVANCE/APPLICATION
Tracheal collapse and airway morpholgy obtained from inspiration CT and expiration CT may be used to access smokers and non-smokers.

慢性阻塞性肺疾病大鼠动物模型的建立与评价

张迪,管宇,夏艺,周秀秀,涂文婷,刘士远,范丽
海军军医大学第二附属医院（上海长征医院）

目的 通过烟熏法、蛋白酶滴注及两者相结合的方法构建大鼠 COPD 模型，并从炎症水平，影像及病理等方面评价造模效果，对三种建模方法进行比较。**方法** 使用烟熏、蛋白酶滴注及两者相结合的方法进行 COPD 大鼠造模，每组大鼠分别为 60 只、30 只、30 只，同时设置对照组 20 只。每周对大鼠进行体重测量。烟熏组及对照组大鼠于造模 24h，1、2、4、8、12、16、20、24 周，蛋白酶组及蛋白酶+烟熏组大鼠于造模 24h，1、2、4、8、12 周接受细胞因子检测、Micro-CT 检查及病理检查。采用方差分析或 Kruskal-Wallis H 检验进行统计分析。 **结果** 第 7 周起烟熏组大鼠及蛋白酶＋烟熏组大鼠体重增长较对照组明显减缓（P<0.05）。蛋白酶组及蛋白酶＋烟熏组大鼠第 24h、1、2、4 周 IL-10 水平显著低于对照组（P＜0.05）。蛋白酶组及蛋白酶＋烟熏组大鼠第 24h 的 MMP-9 浓度显著大于对照组（P＜0.05）。蛋白酶组、蛋白酶+烟熏组第 4 周及烟熏组第 8 周大鼠在 Micro-CT 图像及病理图像上均可观察到肺气肿改变。 **结论** 使用烟熏、蛋白酶及蛋白酶+烟熏的方法均可成功构建大鼠 COPD 模型。Micro-CT 可灵敏真实的反应肺部病理改变。

肺部白色念珠菌感染的 CT 征象分析

宁培钢,王梅云,朱绍成,窦设伟,谭红娜
河南省人民医院

目的：分析肺部白色念珠菌感染患者的 CT 影像特征。**方法：**回顾性分析 72 例肺部白色念珠菌感染患者的 CT 表现特征。**结果：**以单侧肺发生为主 30 例（41.6%），表现为斑片或实变影 8 例（11.1%）、磨玻璃样影 4 例（5.6%），肿块影 4 例（5.6%），空洞影 6 例（8.3%）合并肿大淋巴结 4 例（5.5%），胸腔积液 2 例（2.8%）。**结论：**肺部白色念珠菌感染发生部位及影像学表现复杂多样，CT 表现具有一定特征。

EPO-0495

成人群发性支原体肺炎的高分辨率 CT 影像及临床特点分析

魏志鹏
南昌大学第一附属医院

目的：探讨并研究某单位群发性成人支原体肺炎患者的临床影像特点与预后情况。 方法：选取 2017 年 9 月份我院收治的某单位 44 例集体感染支原体肺炎病例，对他们进行 CT 检查，就其临床影像特点及治疗预后结果进行统计学比较和分析。 **结果：**统计学比较显示，44 例患者主要临床表现为发热（84.1%）、咳嗽咳痰（86.4%）等；胸部影像学检查：单侧病变（90.9%），明显高于双侧病变（9.1% ），左侧病变（41.0%），右侧病变（50.0%），左肺下叶受累（29.6% ），右肺下叶受累（34.1%）；影像学特征：磨玻璃影（86.4%）实变影（56.8%），沿支气管壁分布（47.7%），结节影（43.2%），树芽征（9.1%）。44 例患者采用氟喹诺酮类抗菌药物及溴己新、头孢类药物联合治疗后痊愈出院。**结论：**对成人的支原体肺炎患者进行 C T 影像学检查，能准确、直观的反映出患者肺部病变的情况，因此，它是一种有效、理想、科学的临床检查的方法。

EPO-0496

Differentiation of inflammatory nodules and malignant tumors using the iodine uptake parameters by dual-energy computed tomography

Xuehui Pu,Ji Ma,Hong Zhang
Jiangning District People's Hospital of Nanjing

Objective: To evaluate the diagnostic performance of iodine uptake parameters by dual-energy computed tomography (DECT) in discriminating inflammatory nodules from malignant tumors.
Materials and methods: This retrospective study was approved by the institutional review board with a waiver of written informed consent. From January 2018 to September 2018, 112 patients with 116 noncalcified nodules (64 inflammatory and 52 malignant nodules) underwent contrast material-enhanced DECT . After entire-tumor volume of interest (VOI) segmentation, iodine uptake parameters, including total iodine uptake volume, total iodine concentration, vital iodine uptake volume and vital iodine concentration were calculated and established a predictive model. Meanwhile, degree of enhancement on contrast enhanced DECT were evaluated. The diagnostic accuracy and prognostic performance of DECT parameters were evaluated and compared via receiver operating curve (ROC) analysis and logistic regression analysis.
Results: The degree of enhancement of malignant nodules was significantly lower than inflammatory nodules (P = 0.011). All the iodine uptake parameters in malignant nodules were significantly higher than in inflammatory nodules (all Ps＜0.001). The Az value, accuracy, sensitivity and specificity of the established model based on iodine uptake parameters were 0.803, 76.72%, 82.69% and 84.37% respectively, which exhibited better diagnostic performance than the degree of enhancement on weighted average image image with Az value, accuracy, sensitivity and specificity of 0.638, 58.62%, 67.31% and 57.81% respectively.
Conclusion: Iodine uptake parameters of DECT exhibited better diagnostic accuracy in discriminating inflammatory nodules from malignant nodules than degree of enhancement on weighted average image image.

EPO-0497

肝移植术后肺部细菌、病毒及真菌感染 CT 表现的对照研究

覃杰,段亚妮
中山大学附属第三医院

目的：对比研究肝移植术后肺部细菌、病毒及真菌感染的 CT 表现。
方法：回顾性分析 453 例肝移植术后肺部感染患者的 CT 表现。453 例患者均在发烧及/或咳嗽 24h 内行 CT 检查并且一周内确诊为细菌、病毒或真菌感染。两位放射科医师分析 CT 图片，共同商量取得一致结果。
结果：肝移植术后肺部细菌、病毒及真菌感染分别为 63.4%、29.4%和 24.5%。70 个大结节（≥1cm）中的 38（54%）个见于肺部真菌感染患者。在肺内出现大结节的患者中，肺部真菌感染

患者（54%，38/70）多于细菌感染患者（10%，22/220）（54% vs 10%，p=0.0059）及病毒感染患者（8%，6/78）（54% vs 8%，p=0.0011）。在出现晕轮征的患者中，肺部真菌感染（38/70，54%）多于细菌感染（17/220，8%）（54% vs 8%，p=0.0026）和病毒感染（7/78，9%）（54% vs 9%，p=0.0015）。肺实变、磨玻璃病灶、小结节、胸腔积液和肿大淋巴结在肝移植术后肺部细菌、病毒及真菌感染中的出现率差异无统计学意义（均 p>0.05）。
结论：大结节伴有晕轮征提示肝移植术后肺部真菌感染，其余征象无助于三者的鉴别诊断。

EPO-0498

Kartagener 综合征胸部 HRCT 特点分析

李强,史燕巧,许金山
宁波市鄞州人民医院

目的 分析 Kartagener 综合症（kartagener syndrome，KS）患者的胸部 HRCT 图像特点，提高诊断准确性。**方法** 搜集 13 例符合 KS 诊断标准的患者的 CT 图像，其中 11 例进行过胸部 HRCT 横断位重建，对该 11 例患者的胸部图像进行回顾性分析，将 HRCT 图像上的异常情况或病变进行归类，评估 KS 患者的胸部病变 HRCT 表现特点。**结果** 11 例 KS 均为全内脏反位，HRCT 图像上均出现不同程度支气管扩张，8 例出现特征性的“水滴样”、“棒状”征象（两下肺为主），2 例表现为普通支气管扩张，1 例表现为轻微的支气管扩张。其他随病变包括：支气管炎（9/11）、肺部感染（7/11）、肺气肿（5/11）、胸膜增厚（5/11）、胸腔积液（2/11）、气胸（1/11）等，年长者的支气管扩张程度较年轻着严重，支气管外的病变较年轻患者多。**结论** HRCT 对 KS 患者的支气管扩张和肺内继发性病变均可很好显示，可更准确评估肺内病变状况。“水滴样”、“棒状”支气管扩张是 KS 较为特征性的征象，不同程度的支气管炎、肺气肿和肺部感染是 KS 较为常见的继发性病变。

群发急性肺组织胞浆菌病 CT 表现及临床分析

浦俭,何茜
云南省第二人民医院

目的 探讨群发肺组织胞浆病 CT 表现及临床特征，以提高对该疾病的诊治率。**方法** 回顾性分析临床诊断为肺组织胞浆病 5 例患者的 CT 表现及临床特征、治疗过程。5 例患者均分别于治疗前、抗真菌治疗后、抗真菌合并激素治疗后共行 3 次胸部 CT 平扫，观察临床症状及肺内病灶变化。**结果** 临床拟诊肺组织胞浆菌病的 5 例患者，5 例患者有共同探洞史，胸部 CT 表现为双肺多发结节，部分结节周围见磨玻璃影。临床症状主要表现为咳嗽、发热。抗真菌治疗 1 周后临床症状有所减轻，肺内情况无明显变化，采用抗真菌合并激素治疗 10 天，咳嗽较前减轻，体温正常，胸部 CT 肺内结节较前减少、缩小。**结论** 肺组织胞浆菌病的临床及 CT 表现均有特征性，若抗真菌治疗无效，应考虑到合并过敏性肺炎的可能。

EPO-0500

The Pulmonary CT Images of Patients Infected with Vaccinia Virus through Respiratory Tract

Jialei Ming,Xiangming Fang
The Affiliated Wuxi People's Hospital of Nanjing Medical University

Objective Vaccinia virus (VACV) is an infrequent virus that belongs to the genus orthopoxvirus. Most of the patients are infected by direct touch and showed symptoms like the development of skin lesions, mainly like the hand herpes, accompanied by clinical symptoms such as headache, muscle pain and fever. However, 5 males were infected with VACV accidentally through respiratory tract transmission and direct hand contact transmission. They had severe systemic symptoms like fever, chills, headache, herpes and respiratory symptoms like cough, chest tightness, and breathlessness. This study aimed to explore the imaging findings of VACV infection in human beings through respiratory tract transmission.
Materials and methods There were 5 Chinese men with VACV infection in our hospital. They underwent CT imaging examination several times during their treatment and follow-up period. We retrospectively collected patient's imaging data and after verifying the CT imaging data and all the other imaging findings were evaluated.
Results Five patients showed similar CT imaging findings. Images showed widely distributed nodules with or without mass/speckle shadow of different degrees. During their follow-up, CT images showed disappearance of a part of nodules , while few others became smaller.
Conclusion Multiple pulmonary nodules are common imaging findings in patients with VACV infection through respiratory tract. Diagnosis can be made by detecting the virus' DNA in the lesions. Follow-up and clinical history are critical for the diagnosis of VACV infection.

肺放线菌病临床及影像进展研究

朱静芬,李勇刚
苏州大学附属第一医院

肺部放线菌病是一种少见疾病，约占所有放线菌感染病例的 15-30%，仅次于头颈部和腹盆腔放线菌感染。多因误吸口腔或胃肠道带菌分泌物而致病，引起肺部放线菌感染的放线菌多为以色列放线菌。临床表现缺乏特异性，以中老年男性居多。可出现咳嗽、咳痰、咯血、呼吸困难、胸痛等常见呼吸道症状。病理检查是诊断肺放线菌病的金标准。放线菌病病理表现为慢性肉芽肿性炎，可见化脓，硫黄样颗粒，脓肿和窦道形成，痰中出现硫磺样颗粒可提示肺放线菌病的诊断，但不可作为确诊肺放线菌病的依据。X 线对此病诊断价值有限。肺放线菌病 CT 可分为肺实质型、支气管扩张型、与支气管石病相关的支气管内型、与异物相关的支气管内型。最特征性的 CT 表现包括局灶性或斑片状实变区，常伴中心低密度灶或空洞，增强后病灶周边强化，典型病例有邻近胸膜增厚。该病目前仍有很多问题亟待解决，本文结合近年来国内外对肺部放线菌病的报道和研究，为该病的诊疗提供参考和借鉴。

EPO-0502
肺毛霉菌病的 CT 及正电子发射计算机体层 成像-CT 表现

许尚文
中国人民解放军联勤保障部队第 900 医院(原福州总医院)

目的探讨肺毛霉菌病的 CT 及 PET．CT 表现，提高其诊断的准确率。方法回顾性分析 14 例经手术或穿刺病理证实的肺毛霉菌病的胸部 CT 及 PET．CT 表现。所有患者均行 MSCT 平扫，10 例行多期增强扫描检查，其中 3 例同时行氟代脱氧葡萄糖(”F—FDG)PET．CT 检查。结果 13 例患者肺内见多发斑片影，伴厚壁空洞 9 例(26 个)、肺动脉栓塞 4 例；仅 1 例表现为肺内孤立性不规则肿块。病变侵犯临近支气管 3 例、胸腔少量积液 4 例，肺门及纵隔均未见明显肿大淋巴结影。增强扫描病灶实性部分增强较明显，平均增加(25+8)HU。PET．CT 表现：1 例病灶呈斑片状异常放射性浓聚，2 例呈不规则环形的异常放射性浓聚，最大标准化摄取值(suvmax)分别为 6．2、4．6 和 3．6。结论肺毛霉菌病的影像表现呈多样性，缺乏特征性表现。影像表现为多发厚壁空洞，合并肺动脉栓塞或侵犯支气管时应考虑到本病可能。

EPO-0503
不同分型支气管内膜结核临床及 CT 特征分析

任欢欢,李康
中国科学院大学重庆医院（重庆市人民医院）

目的：探讨不同分型支气管内膜结核多排螺旋 MSCT 影像学特征性及鉴别诊断，为临床工作的准确、精确诊断提供基础。
方法：收集我院 129 例支气管结核患者影像学资料，分析 MSCT 影像学特征，并对其进行进一步分型。
结果：（依据中华医学会结核病学分会拟定的《气管支气管结核诊断和治疗指南(试行)》，采用六分型：I 型为炎症浸润型、II 型为溃疡坏死型、III 型为肉芽增殖型、IV 型瘢痕狭窄型、V 型为管壁软化型、 VI 型为淋巴结瘘型； ）
不同分型支气管内膜结核的表现：I 型 MSCT 表现为支气管管壁增厚、管腔狭窄，II 型表现为累及各层气管，可不伴闭塞征但出现肺炎、肺不张；III 型表现为管壁增厚并出现增生；IV 型表现为支气管管腔明显狭窄，可伴有闭塞征；V 型表现为累及气管环，管腔狭窄，可不伴闭塞征；VI 型表现为累及主支气管管腔，伴有结节并出现不同程度狭窄。
不同病理类型的年龄分布：129 个病例中，≤30 岁者 76 例，30-60 岁者 51 例，＞60 岁者 2 例；≤30 岁患者中以 I-IV 型居多，共 70 例，随着年龄的增长，V-VI 型所占比例增加。
临床特征：平均年龄：38.3 岁，男：女 1:3.1
共有 107 例合并肺部结核病灶（82.9%），单纯支气管内膜结核只有 22 例（17.1%）。
结论：不同分型的支气管内膜结核患者，其 MSCT 表现不一，临床可考虑使用 MSCT 检查其疾病严重程度、病变范围及疾病分期。

EPO-0504
CT image analysis of pulmonary cryptococcosis

Siyu Che,Zhiyong Li,Ailian Liu
First Affiliated Hospital of Dalian Medical University

Objective: Investigate the clinical features and CT features of patients with pulmonary cryptococcosis (PC) in non-acquired immunodeficiency syndrome.
Methods: Twenty-five patients with pathologically confirmed PC diagnosed by surgery, biopsy, cerebrospinal fluid and bronchoscopy between 2008 and 2018 in the First Affiliated Hospital of Dalian Medical University were retrospectively analyzed. All patients underwent CT plain scan and 16 patients completed CT enhanced scan. All cases Clinical data were relatively complete.
Result: The history of avian influenza or fecal exposure was not clear in 25 patients with PC. The average age was 48.04±9.29 years old, including 14 males (56.00%) and 11 females (44.00%). The ratio of male to female was about 1.3:1 (6 patients with underlying lesions). The onset of the disease was usually asymptomatic (48.00%), cough (32.00%), chest pain (16.00%), etc, and of which 5 cases (20.00%) were associated with cryptococcal meningitis. According to the image classification, there were 5 types: 9 cases with single nodules or masses, accounting for about 36.00%; 12 cases with multiple nodules or masses, 48.00%; 3 cases with lung consolidation and pneumonia, 12.00%; and Atypical 1 case (including frosted glass, miliary and other atypical image performance), 4.00%. Among the 25 cases of PC: 48.00% of cases presented with subpleural distribution, 20.00% with hole sign (thick wall 5/5, dry 5/5), 44.00% with the air-containing bronchial sign, comparably the angiographic sign and delay enhancement accounted for 31.25%、56.25%, respectively.
Conclusion: This study shows that PC onset usually asymptomatic physical examination or accidental discovery. Meanwhile nodules or/and masses are more common. Several signs such as subpleural distribution, borderline sign and uniform enhancement have higher value, and 56.25% mainly delayed enhancement.

EPO-0505
免疫缺陷患者肺孢子菌肺炎影像学特征分析

姚戈虹,孙禾,王悍
上海交通大学附属第一人民医院

目的 分析免疫缺陷患者肺孢子菌肺炎的影像学特征及早期诊断思路。方法 回顾性分析 2017 年 5 月至 2019 年 5 月我院住院确诊的 17 例 PJP 患者的临床资料及影像学检查。结果 异基因造血干细胞移植患者 AHSCT 12 例，肾移植术后 4 例，SLE 激素治疗 1 例。平均年龄(39.61±12.32)岁，均通过 BALF 中找到耶式肺孢子菌的包囊或滋养体。发病时间位于移植后(5.72±2.13)月。外周血 CD4+计数（102.17±44.93）/ul，BALF G-test（1116.97±924.16）pg/ml, 12 例行 BALF NGS 检测耶式肺孢子菌序列数均阳性。16 例胸片检查，17 例 HRCT 检查。4 例平片阴性，4 例表现为双肺门周围为主的磨玻璃影，8 例表现为双肺中内带为主的网格状改变。1 例 AHSCT 病人起病时病变位于双肺上叶，其他 16 例为双肺弥漫性分布（94.12%）。10 例尽管双肺实变范围广泛且严重，但双肺胸膜下未受累及，包括双膈面下区域（58.82%）。所有 17 例起病或随病变进展均表现为典型的磨玻璃影（100%），1 例实变较为淡薄；部分伴支气管气相，9 例伴马赛克征象（52.94%）。大部分病人出现不同程度的间质增厚，病变后期部分呈间质纤维化，少许病人继发轻度支气管扩张。7 例出现肺气囊（41.18%），1 例治疗病变吸收后肺气囊完全消失。无 1 例病人出现树芽征，1 例双上肺结节及肿块样影者为上述上叶分布病人且合并真菌感染。除该例及另一例合并巨细胞病毒感染者，15 例病人均未出现肺实变征象（88.24%）。仅该例合并真菌感染者出现少量胸腔积液（5.88%），无 1 例淋巴结增大（0%）。结论 干咳，气促伴发热的免疫缺陷患者如外周血 CD4+计

数明显下降，HRCT 出现弥漫分布的磨玻璃征象为主，部分伴间质征象，但胸膜下未受累及的病人应考虑 PJP，行 BALF 镜检或 BALF 病原体核酸检测以早期确诊。平片对 PJP 诊断无提示价值。

叁期尘肺 CT 表现与肺内二氧化硅含量的相关性分析

朱春梅[1],陈步东[2],徐岩[3],贺文[3],唐洪渠[1],靳二虎[3]
1.北京京煤集团总医院
2.首都医科大学附属北京地坛医院
3.首都医科大学附属北京友谊医院

摘要：目的：应用双源 CT 双能量扫描技术测量叁期尘肺患者肺组织内二氧化硅（SiO_2）含量及混合能量 CT 值，探讨 SiO_2 含量与其沉积部位及叁期尘肺主要 CT 表现的关系。材料和方法：对 44 例叁期尘肺患者及 50 例非接尘健康体检人员行胸部双源 CT 双能量扫描，分别在其主动脉弓上缘、气管分叉下缘、气管分叉下 3cm 附近平面，于双肺背侧、双肺门旁选择感兴趣区（Region of Interst，ROI），测量其 SiO_2 含量和混合能量 CT 值。结果： 尘肺组肺组织内 SiO_2 含量为（0.57±0.49）mg/mL，健康对照组为（0.26±0.20）mg/mL，尘肺组混合能量 CT 值为（-777.72±111.33）HU，健康对照组为（-829.95±112.31）HU，尘肺组 SiO_2 含量和混合能量 CT 值均高于健康对照组，组间差异均有统计学意义（p=0.00）。,比较尘肺组患者肺组织不同沉积部位间 SiO_2 含量和混合能量 CT 值，发现气管分叉下 3cm 层面 SiO_2 含量和混合能量 CT 值均最高，气管分叉下缘层面次之，主动脉弓上缘层面最低，提示叁期尘肺患者肺组织内 SiO_2 主要分布在两下肺野，由下而上其 SiO_2 含量逐渐减低。f比较尘肺组 CT 影像表现的复杂程度与 SiO_2 含量和混合能量 CT 值关系，含有 5 种 CT 征象者 SiO_2 含量及混合能量 CT 值最高，均值分别为（0.72±0.58）mg/mL 及（-719.30±154.68）HU；仅含 1 种 CT 征象者 SiO_2 含量及混合能量 CT 值最低，均值分别为（0.49±0.40）mg/mL 及（-809.74±105.60）HU。提示叁期尘肺患者 CT 表现越复杂，其肺组织 SiO_2 含量及混合能量 CT 值越高。结论：双源 CT 双能量扫描技术可以量化叁期尘肺患者肺组织内 SiO_2 含量及混合能量 CT 值，其 SiO_2 含量与混合能量 CT 值呈正相关，SiO_2 含量与其沉积部位的 CT 影像表现有关。

The advantages of wide-body detector combined with large-pitch scan in chest CT imaging in free breathing state

Dou Li,Zhijun Hu,Qi Wang
Shanxi xi'an Changan hospital

Objective: To study the advantages of wide-body detector combined with large-pitch scan in chest CT imaging under free breathing conditions. Methods 60 cases of chest CT plain scan in our hospital were prospectively collected and divided into two groups at random. During the routine group A scans, the patient was breath-hold, the collimator width was 40 mm, the pitch was 0.516:1, and the rotational speed was 0.50 s/r; the control group B During the scan, the patient was allowed to breathe freely with a

collimator width of 80 mm, a pitch of 0.992:1, and a rotation speed of 0.28 s/r. Other scanning parameters remain the same, namely Helical Plus mode, tube voltage 120kVp, noise index fixed at 10, pre-Asir-V is 30%, post-Asir-V is 70%, automatic tube current technology, reconstruction layer thickness 0.625mm , Lung window width 1450HU, window position -550HU; vertical window width 400HU, window position 40HU. The CT values and SD values of aortic root, erector spinae, and subcutaneous fat in the same plane were measured at the aortic root level of the mediastinum. The double-blind method was used to evaluate the image quality by 5 points: 1 is divided into poor image quality; 5 is classified into excellent image quality; ≥3 images are used for clinical diagnosis. An independent sample t-test was used to compare the general data, the objective quality of the images, the exposure time, and the radiation dose between the two groups. The Kappa test was used to compare the consistency of the subjective scores of the two physicians. Results: There was no statistical difference in general data between the two groups (P>0.05). CT values, SD values, SNR, CNR, CT values of erector spinae and CT values of subcutaneous fat in aortic root were not statistically different between the two groups (P>0.05); subjective scores of image quality were different between the lung window and the mediastinum window. No statistical significance was found (P>0.005). The average exposure time of group A was (7.99±0.76) s. The average exposure time of group B was (1.13±0.10) s (P<0.001), a decrease of about 86%. The average radiation dose in group A was (3.56±1.16) mSv, and the average radiation dose in group B was (2.79±0.38) mSv (P<0.001), a decrease of approximately 22%. Conclusion The wide-body detector combined with the large-pitch chest scan under free-breathing conditions can both shorten the exposure time and reduce the radiation dose under the premise of ensuring the image quality, especially for the severe patients who cannot cooperate with breathing.

目的 应用高分辨率 CT（HRCT）分析寻常型间质性肺炎（UIP）和非特异性间质性肺炎（NSIP）的影像学特征，探讨肺气肿亚型在 UIP 和 NSIP 鉴别诊断中的价值。**方法** 回顾性分析我院 2010 年 01 月至 2018 年 10 月经临床-影像综合诊治的 49 例 UIP 和 45 例 NSIP 患者的临床特点、HRCT 表现及与肺气肿亚型的相关性。**结果** 统计结果表明：UIP 发病年龄高于 NSIP，UIP 平均发病年龄（69.71±1.54）岁，而 NSIP 的平均发病年龄为（59.93±1.88）岁，两者发病年龄差异具有统计学意义（P＜0.01）。UIP 以男性患者为主（男/女=46/3），NSIP 以女性为主（男/女=15/30），两者发病的性别差异具有统计学意义（P＜0.01）。在 49 例 UIP 患者中，合并间隔旁型肺气肿（PSE）、合并小叶中心型肺气肿（CLE）、合并混合型肺气肿（PSE + CLE）及不伴肺气肿分别占 73.47%（36/49）、0.00%（0/49）、16.33%（8/49）和 10.20%（5/49）；而在 45 例 NSIP 患者中，合并 PSE、CLE、PSE+CLE 及不伴肺气肿分别占 0.00%（0/45）、13.33%（6/45）、4.44%（2/45）和 82.22%（37/45）。两者在合并肺气肿亚型（PSE、CLE）及不伴肺气肿的差异具有统计

学意义（P＜0.01），而在合并 PSE+CLE 中的差异无统计学意义（P=0.094）。在 UIP 与 NSIP 的其它合并症（肺动脉高压、肺癌、纵隔淋巴结肿大、胸腔积液、心包积液等）的差异均无统计学意义（P＞0.05）。**结论** 结果表明，肺气肿亚型在 UIP 与 NSIP 的鉴别诊断中具有重要意义，且两者与发病平均年龄及性别密切相关。UIP 与 PSE 密切相关，发病平均年龄较大，好发于男性；而 NSIP 与 CLE 有一定相关性，发病平均年龄较小，好发于女性。

EPO-0509
CTD-ILD 各病理分型肺功能损害程度及临床治疗效果评估

陈媛
广西医科大学第一附属医院

目的：评估 CTD-ILD 各病理分型其临床治疗效果及肺功能损害程度之间是否存在差异性，探讨其中治疗效果较好、肺功能损害程度较轻的分型。方法：收集 44 例 2017 年 1 月至 2019 年 1 月在广西医科大学第一附属医院放射科行 HRCT 检查确诊为 CTD-ILD 患者（UIP17 例、NISP13 例、COP5 例、AIP2 例、DAD7 例），其中行肺功能检查的 30 例，将其图像导入西门子肺部 3D 分析软件，分别计算间质纤维化肺容积百分比（ILDV%）及平均肺密度（MLA），以此次检查时间为基线，3 个月后再次获取 HRCT 复查图像，用相同软件及分析方法进行评估，计算两次检查间 ILDV%、MLA 差值及其变化率，进行两两组间对比。比较 UIP 组（17 例）及 NSIP（13 例）组之间各肺功能参数（EFV1/FVC、DLco、DLco/预测值）之间是否存在差异。结果：UIP 组与 DAD 组之间的 MLA 变化率有差异性（P＜0.05），其余各病理分型组间 MLA、ILDV%差值、变化率均无明显差异（P＞0.05）。UIP 组与 NSIP 组间肺功能指标 DLco/预测值具有差异性（P＜0.05）。结论：通过 ILDV%、MLA 差值及其变化率无法推断 CTD-ILD 各病理类型治疗效果的差异，UIP 组弥散功能障碍（DLco/预测值）较 NSIP 组严重。讨论：此次研究无法推断 CTD-ILD 各病理类型治疗效果的差异性，考虑和每个个体治疗方案及治疗的差异性有关，评估 CTD-ILD 治疗效果应结合临床及实验室指标综合分析，才能推断出治疗效果及预后较好的 CTD-ILD 病理分型。

EPO-0510
心电门控双源 CTPA 评价急性肺栓塞及其右心室功能

朱洪基
中国科学技术大学附属第一医院（安徽省立医院）

目的： 探讨心电门控双源 CTPA 在评价急性肺栓塞及其右心室功能的临床价值。
方法： 例患者行回顾性心电门控下检查后，经图像后处理并进行重建，观察肺动脉栓塞的分布、程度并计算肺栓塞指数，分析心功能。根据栓塞位置分为两组，中央型与周围型。比较有无肺栓塞患者右心功能参数组间差异；对比不同栓塞程度及栓塞部位组间心功能参数差异；比较心功能参数与肺栓塞指数之间的相关性；对不同栓塞部位室间隔形态及对比剂返流的评价。
结果：按照 Qanadli 栓塞指数评分(%)：28 例肺栓塞总的评分为 45.00±27.28,17 例中央型评分为 63.53±18.39,11 例周围型评分为 16.36±4.92。根据栓塞程度的分级，将患者分为轻度组(11 例)、中度组(3 例)和重度组(14 例)， 三组的 CT 肺栓塞指数的中位数分别为 17.50%、30.00%、70.00%。28 例肺栓塞 RVEDV 及 RVESV 均较无栓塞组高；RVEF 值较无栓塞组减低；RVSV 较无栓塞组减低，两组间差异无统计学意义。随着栓塞程度加重，RVEF 逐渐减低，且三组间 RVEF 整体差异有统计学意义。中央型较周围型、无栓塞组 RVEF 明显减低，RVEF 在三组间差异均有统计学意义。Spearman 相关系数分析所有心功能参数与栓塞指数相关性均具有统计意义，其中除了 RVEF 与栓塞

指数呈中等程度负相关（相关系数为-0.512），其余右室心功能参数与肺栓塞指数均存在中等程度正相关关系。室间隔形态及对比剂返流在栓塞组发生率明显高于无栓塞组，且不同栓塞部位组间均具有统计学意义，差异显著。
结论： CTPA 可以准确评价肺栓塞分布、程度及栓塞指数。随着肺动脉栓塞程度加重，右心室功能逐渐减低。中央型与周围型肺动脉栓塞相比，前者右心功能减低更明显。心功能参数与肺栓塞指数中度相关。室间隔形态及对比剂返流是一个简单判断右心功能状况的指标，可以间接反映肺动脉栓塞的严重程度和右心功能受损情况。

EPO-0511

Computer Tomography Angiography for Presence of System-to-Pulmonary Artery Shunt in Systemic Arterial Supply to the Lung

Yifan Zhang[1,2],Qiong Zhao[3],Rui Huang[1,2]
1.Dept. of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology
2.Hubei Province Key Laboratory of Molecular Imaging
3.Dept. of Ultrasound, the Fifth Hospital in Wuhan

Purpose: To evaluate the value of computer tomography angiography (CTA) for diagnosis of systemic supply to the lung and investigate possible causes for the presence of retrograde system-to-pulmonary artery shunt.
Materials and Methods: Forty-six patients, with systemic arterial supply to the lung confirmed by surgery, underwent contrast-enhanced CTA. CT images and clinical features were analyzed in consensus by two experienced radiologists. Of all cases, patients with the feature of retrograde system-to-pulmonary artery shunt (RSPAS) in CT scans were compared with those that have no retrograde system-to-pulmonary shunt (NRSPAS). Differences in clinical features, distribution and diameter of systemic supply arteries between RSPAS and NRSPAS were assessed.
Results: Twenty-one patients with RSPAS and 25 patients with NRSPAS were visible at CTA. Hemoptysis were more frequent in RSPAS (82%) than in NRSPAS (47%) ($P<0.05$). Single systemic artery was more common in NRSPAS (67%) and multiple systemic arteries were more frequent in RSPAS (64%) ($P<0.05$). The mean diameter of systemic arteries (6.62 ± 0.47mm) in RSPAS was significantly larger than that (5.12 ± 0.42mm) in NRSPAS ($P<0.05$). The frequency of chest distress, dyspnea and the distribution of systemic arteries were not significant between RSPAS and NRSPAS ($P>0.05$).
Conclusion: RSPAS includes enlarged and multiple systemic supplying arteries. And that may suggest greater risk for life-threaten hemoptysis.

EPO-0512

128 层 CT 对肺栓塞影像表现与心室功能评估联合心脏生物标志物在肺栓塞预后中的意义研究

张静

资阳市第一人民医院

背景及目的：快速且准确地评估肺动脉栓塞患者的危险分层对其在治疗方案的选择上有着至关重要的意义。目前，在血流动力学稳定的肺动脉栓塞患者中，用多排螺旋 CT 肺动脉成像（MD-CTPA）评估其右心室功能障碍（RVD）对患者的预后是否有重要价值尚存在争议性。本研究的目的在于探讨用 MD-CTPA 评估血流动力学稳定的肺动脉栓塞患者右心室功能障碍对患者 30 天内的预后价值，并以超声心动图为诊断标准，分析 MD-CTPA 评估右心室功能障碍的诊断效率。同时分析 B 型尿钠肽（BNP）、肌钙蛋白 I（cTnI）及其他因素在血流动力学稳定的肺动脉栓塞患者 30 天内预后中的价值，以及联合检测的意义。
材料与方法：连续性收集 2018 年 1 月-2019 年 1 月在资阳市第一人民医院进行 MDCT 肺动脉血管成像检查的患者，共 127 名受检者的影像资料及临床相关资料。经纳入标准和排除标准筛选后，共收集病例 36 例。追踪收集这 36 例肺动脉栓塞患者 30 天内临床预后情况。回顾性分析 128 层螺旋 CT 检查资料中右心室/左心室直径比值，以及心脏超声检出 RVD、BNP、cTnI 等与临床预后之间的联系，评价各项指标在临床预后中的价值。
结果：超声心动图检出 RVD、cTnI 升高、BNP 升高、心率≥110/min、收缩压<100mmHg、心衰均与 30 天临床预后不良有关，运用多变量 logistic 回归分析，发现 cTnI>0.05ng/ml（*P*=0.08），BNP>100pg/ml（*P*=0.07）这两项指标可以独立预测肺动脉栓塞患者的临床不良预后。
结论：右心室功能障碍（RVD）影像改变的患者较未检出者多，但两者相比较，发生临床预后不良整体风险的意义不显著。多排螺旋 CT 肺动脉成像检出 RVD 影像改变的患者，临床预后还有待进一步细化。因此我们需要结合临床相关检查综合实施。B 型尿钠肽和肌钙蛋白 I 有良好预测意义，并且联合评价能提高临床预后的预测价值。

EPO-0513
7.0T 心脏 MR 成像在肺高压大鼠模型右心功能评估中的作用

袁小涵
江苏省人民医院（南京医科大学第一附属医院）

目的：基于 7.0T 心脏磁共振成像（cardiac magnetic resonance，CMR）观察肺高压（pulmonary artery hypertension, PAH）大鼠肺动脉径线和心脏功能的变化。**方法**：选用 36 只雄性 SD 大鼠（随机分为 6 组，每组 6 只）采用低氧建立 PAH 大鼠模型。于未缺氧时（基线）及缺氧后第 1、2、3、4、5 周利用 MR（Bruker BioSpec 7.0T）进行心脏成像，分别测量主肺动脉（main pulmonary artery，MPA）、右肺动脉（RPA）、左肺动脉（LPA）直径，并计算其与同层面升主动脉（AA）直径之比（MPA/AA；RPA/AA；LPA/AA）；四腔心位右室舒张末期最大径线（dRVmax）与左室舒张末期最大径线（dLVmax）之比（dRVmax/dLVmax），右室舒张末容积（RVEDV），右室收缩末容积(RVESV)，进而计算右室射血分数（RVEF)；每只大鼠均行右心导管术获取右室收缩压（RVSP）。采用 SPSS 24.0 统计软件，应用独立样本 t 检验及 ANOVA 分析比较不同时间点上述各参数的差异，采用 Pearson 相关性分析评价各参数与 RVSP 的相关性。**结果**：造模后第 1 周大鼠 RVSP 即较基线升高（29.92±1.94mmHg vs. 41.55±3.14 mmHg，*P*<0.01），后每周逐步升高，MPA、dRVmax/dLVmax 及 RVESV、RVEDV 逐渐增大（*P*<0.01），RVEF 在缺氧第 2 周显著降低（*P*<0.01）。MPA/AA、dRVmax/dLVmax、RVEF 与 RVSP 具有较好的相关性（分别为 *r*=0.573，*r*=0.700，*r*=-0.760，*P*<0.01）。**结论**：7.0T CMR 可敏感地观察到 PAH 大鼠病程进展中肺动脉及右心形态功能的改变，为研究 PAH 的演变机制打下基础。

EPO-0514

Application of the dual-layer spectral detector CT on CT pulmonary angiography (CTPA) with low dose of iodine contrast agent and low injection rate

Xin Sui,Hua-yang Du,Wei Song,Lan Song,Zheng-yu Jing
Peking Union Medical College Hospital

Objective The aim of this study was to evaluate the feasibility of the dual-layer spectral detector CT on CT pulmonary angiography (CTPA) with low dose of iodine contrast agent and low injection rate.
Methods 53 patients with suspected pulmonary embolism were performed CTPA with 20ml 370 mg I/ml at 2ml/s. All chest CT examinations were performed using a dual-layer detector spectral CT unit (IQon, Philips Healthcare). The scanning parameters were as follows: 120 kVp, pitch of 1.109, rotation time of 0.4 second, 64 × 0.625 mm collimation, 1-mm slice thickness, 1-mm slice increment. Two series of images were obtained, including conventional images at 120keV and virtual monoenergetic spectral images at 40keV. The regions of interest (ROIs) were placed at the pulmonary artery trunk, the main right and left pulmonary arteries. The CNR, SNR and image quality score were compared between conventional images and monoenergetic images at 40keV. The sensitivity, specificity, PPV and NPV for the detection of pulmonary embolism were compared between conventional images and virtual monoenergetic spectral images at 40keV.
Results CNR of the pulmonary artery trunk, the main right and left pulmonary arteries on monoenergetic reconstruction at 40keV were 24.3±43.3, 22.2±29.8, 22.6±30.3, respectively. SNR on monoenergetic reconstruction at 40keV were 26.4±44.5, 24.4±31.3, 24.7±31.8, respectively. CNR on conventional images were 5.9±6.1, 5.6±4.7, 5.7±4.9, respectively. SNR on conventional images were 7.6±7.0, 4.7±1.9, 7.2±5.7, respectively. CNR and SNR on virtual monoenergetic images at 40keV were significant higher than conventional images($P<0.05$). Subjective image quality score of virtual monoenergetic images at 40keV was higher than conventional images but there was no significant difference（$Z=-1.2$，$P=0.25$）。26 patients of all showed PE. Compared with conventional images, the sensitivity, specificity, PPV and NPV of virtual monoenergetic images at 40keV were higher in the detection of pulmonary embolism.
Conclusion Virtual monoenergetic images at 40keV on dual-layer spectral CT with low dose of iodine and low flow rate increased the detection of PE, while preserving image quality. At the same time, it reduced the risks of contrast media induced nephropathy and contrast agent extravasation.

EPO-0515

完全性肺静脉异位引流外科术后预测模型

席悦,黄美萍
广东省人民医院

目的：完全性肺静脉异位引流是一类少见的先天性心脏疾病，其全部肺静脉未能与左心房正常连接，而经侧支静脉回流至腔静脉系统或直接回流至右心房，再经房间隔缺损回流至左心系统。心脏

增强 CT 是临床上评价肺静脉引流的重要的手段，但目前的技术尚不能定量准确评价肺静脉、共汇静脉和左心房的形态及空域分布关系。精准评价 TAPVC 的解剖形态是亟待解决的科学问题。
方法：纳入广东省人民医院 2000-2018 年确诊为完全性肺静脉异位引流且在我院行手术治疗的患儿，对患者一般资料、手术信息、手术前后 CT 数据进行分析，并对手术前后患者的肺静脉及双侧心房进行三维重建，比较术前 CT 所示肺静脉解剖数据与术后死亡率、恢复情况、并发症发生、术后 CT 数据等差异，建立完全性肺静脉异位引流的预测模型，指导临床决策。
结果：共纳入 789 例 TAPVC 患者，包括心上型(59%)、心下型(21%)、混合型(12%)和心脏型(9%)。异质性综合征存在于 584 例(74%)婴儿中。该队列的总生存率在 1 年为 65%，3 年为 50%。梗阻组的生存率明显低于非梗阻组(1 年 47% vs 81%;27% vs 73%，P =0 .01)。阻塞性 TAPVC 和产前预测阻塞性 TAPVC 与术后死亡率显著相关(P = 0.01 和 0.03)。
结论：增强 CT 可用于 TAPVC 患者外科引流术后死亡率的预测。

EPO-0516

MSCT 对不同年龄组肺动脉弹性的观察

唐田
瓦房店中医医院

目的 应用多层螺旋 CT，观察不同年龄组的肺动脉弹性的差异。**资料与方法** 回顾性收集 2019 年 2 月至 2019 年 7 月间，在我院行冠脉 CTA 的受检查者，满足无高血压、糖尿病、已知冠心病及冠脉 CTA 检查为阴性结果的入组条件，共 26 人，按年龄分为 A 组<50 岁，6 人，B 组 50-60 岁，10 人，C 组>60 岁，10 人。将应用回顾性门控采集的全心动周期图像，每隔 10%RR 间期进行重建，分别测量 10 组图像的主肺动脉（MPA）横截面积，得出最大横截面积（Ds）及最小横截面积（Dd），采用动脉扩张度（AD）=[（Ds-Dd）/Dd]/脉压、血管顺应性（AC）=（Ds-Dd）/脉压 来评价血管的弹性。**结果** A、B、C 组的 MPA 的扩张度（AD）分别是（8.8±2.3）×10^{-3} /mmHg，（ 7.2±2.5）×10^{-3} /mmHg，（ 6.4±2.9 ）×10^{-3} /mmHg，顺应性（AC）分别是 4.2±1.1mm^2/mmHg，4.1±1.1mm^2/mmHg，3.8±1.8mm^2/mmHg。A 组与 B 组，A 组与 C 组，B 组与 C 组分别进行组间比较，均无明显统计学差异（P>0.05）。**结论** 随着年龄增长，主肺动脉的扩张度、顺应性均有下降，但无明显的统计学差异。

EPO-0517

128 层螺旋 CT 血管造影对肺动脉栓塞的风险预测及疗效评估

刘怡
北华大学附属医院

目的：通过 CTPA 对疑似肺动脉栓塞患者进行检查，评价栓子的形态及性质、栓塞的程度及范围；对不同性质的栓子及栓塞程度、范围等情况进行分析，并对治疗前后情况进行对比分析，为临床选择治疗方案及评价预后效果提供依据。
材料及方法： 对 96 例临床怀疑 PE 患者行 MSCT 平扫及 CTPA 检查，将其中 43 例 PE 的检查结果及治疗后结果分别进行对比分析。
结果：

1.后处理技术中 MPR 及薄层 MIP 对栓子的显示明显优于 VR 及 CTVE，差异有统计学意义（P＜0.05）。
2. aPE 组与 cPE 组治疗前后的差异存在统计学意义（P<0.05），即 aPE 组治疗效果明显优于 cPE 组。aPE 组与(a+c)PE 组治疗前后的差异无统计学意义（P>0.05），cPE 组与(a+c)PE 组治疗前后差异无统计学意义（P>0.05）。
3.不同类型栓子在治疗前后 CT 直接征象进行比对， 差异有统计学意义(P<0.05)。
4.PE 治疗前后的 CT 间接征象的变化有统计学意义(P<0.05)。
结论：
1.128 层 MSCTPA 可以良好的显示栓子的自身情况,有利于观察栓塞全貌对栓塞部位、形态、程度、面积作出评价。
2.128 层 MSCT 可见明确诊断有无 PE，通过栓子特点推断栓塞的性质。
3.PE 发生部位与受累面积在治疗效果上没有差异；不同性质的栓塞治疗前后短期比较，aPE 组溶栓治疗效果好。
4.马赛克征、肺少血、支气管动脉扩张可能提示栓子处于慢性期，肺栓塞 MSCT 间接征象与严重程度之间有待进一步研究证实。

EPO-0518

80kVp 管电压结合 10ml 低浓度对比剂 个性化扫描延迟时间 CT 肺动脉成像

武惠明,陈晓,周浩,秦斌,曹健,潘兆春,王中秋
江苏省中医院

目的 证实 80 kVp 管电压结合 10 ml 对比剂肺动脉成像的可行性。
方法 连续选取肺栓塞可疑患者 70 例，随机分为两组。所有患者均满足 BMI＜28 kg/m^2且体重＜80 kg。常规组管电压 100 kVp，试验组 80 kVp，均为自动管电流。采用小剂量对比剂测试法，速率 5 ml/s。常规组 10ml 对比剂+20 ml 生理盐水测试，监测肺动脉干，获得时间密度单曲线，固定公式得出延迟时间。20 ml 碘海醇（350 mg I/ml）+30 ml 生理盐水扫描。试验组 5 ml 碘克沙醇（270 mg I/ml）+45 ml 生理盐水测试，同时监测肺动脉与肺静脉，获得时间密度双曲线，通过分析双曲线得出个性化延迟时间。试验组根据患者 BMI 与体重将注射方案细化为两种。BMI＜24 kg/m^2且体重＜60 kg 时，增强采用 10 ml 碘克沙醇+40 ml 生理盐水； 24≤BMI＜28 kg/m^2或 60≤体重＜80 kg 时，增强采用 10 ml 碘海醇+40 ml 生理盐水。测量各分支肺动脉，部分伴行肺静脉，左上及右下肺叶 CT 值。用 5 分法评价肺动脉成像质量，3 分法评价肺窗的图像质量。应用独立样本 t 检验比较 2 组间图像质量评分、各分支肺血管 CT 值、注射碘总量、SNR、CNR 比和 CTDIvol、DLP、ED 的差异，应用 X^2检验比较 2 组间锁骨下及上腔静脉硬化伪影显示率和肺动脉栓塞诊断阳性率差异。
结果 基于交叉点时间（Tcross）和扫描时间（Tsd）得到延迟扫描时间（Tdelay）：Tdelay=Tcross-Tsd。常规组肺动脉平均 CT 值高于试验组（P＜0.001）。试验组肺动脉图像质量由于常规组（P＜0.01），锁骨下静脉伪影减少，利于试验组监测出节段性的栓塞。试验组放射剂量和碘负荷均低于常规组（P＜0.01）。
结论 我们建立了一种计算 CTPA 延迟扫描时间的方法，该方法可在 80 kVp、10 ml 对比剂的条件下获得高质量的肺动脉成像，且辐射剂量和碘负荷较低。

EPO-0519

能谱探测器 CT 低流速低剂量 CTPA 图像质量的客观评估

杜华阳,宋伟,隋昕,宋兰,王沄,王曼,金征宇

中国医学科学院北京协和医院

目的：评估能谱探测器低流速低剂量对比剂在 CTPA 不同单能谱下图像质量。
方法：纳入 2018 年 11 月至 2019 年 2 月我院行 CTPA 患者 47 例（男 23、女 24），平均年龄为（50.5±17.1），采用能谱探测器 CT 行 CTPA 扫描，范围自胸廓入口至膈肌水平，重建单能谱 40~110keV 图像，以 10keV 间隔。在肺动脉主干（PA）、右肺动脉主干（RP）、左肺动脉主干（LP）、右肺上叶动脉（URP）、右肺下叶动脉（LRP）、左肺上叶动脉（ULP）、左肺下叶动脉（LLP）勾画感兴趣区（ROI），测量感兴趣区 CT 值，计算信噪比 (SNR)、对比噪声比 (CNR) 。采用单因素方差分析。
结果：肺动脉主干 CT 值 40~110keV 分别为 634.29±279.73、419.29±178.59、292.86±119.20、216.95±83.55、169.48±61.32、138.45±46.83、117.34±37.03、102.48±30.2, SNR40~110keV 分别为 21.40±17.92、14.28±11.99 10.05±8.41、7.5±6.23、5.90±4.86、4.80±3.93、4.14±3.36、3.30±2.63，CNR40~110keV 分别为 19.31±16.49、12.30±10.64、8.14±7.11、5.63±4.96、4.05±3.6、3.02±2.71、2.32±2.11、1.82±1.68；40keV 下 CT 值、SNR、CNR 均显著高于 50~110KeV 能谱。F（PA、LA、RA）=89.005），P＜0.05。单能谱 40keV 各个 ROI 区 CT 值均显著高于 50-110KeV 组，F（URP、LRP、ULP、LLP）=89.269），P＜0.05。
结论：单能谱 40keV CT 值、SNR、CNR 高于其他组，40KeV 图像有利于肺动脉显示，可弥补肺动脉强化不佳导致无法诊断。

EPO-0520

Assessment of coronary artery disease using 1.5-T non-contrast whole-heart magnetic resonance coronary angiography

Lu Lin,Xiao Li,Jian Wang,Yining Wang,Zhengyu Jin
Peking Union Medical Collge Hospital

Purpose:
To prospectively evaluate the use of whole-heart three-dimensional (3D) coronary magnetic resonance angiography (MRA) at 1.5 T in patients suspected of having coronary artery disease (CAD).
Methods:
Free-breathing steady-state free precession whole-heart coronary MRA images were acquired for 39 patients with suspected CAD using a 1.5-T magnetic resonance imaging unit. The accuracy of MRA for detecting a ≥50% reduction in diameter was determined using X-ray coronary angiography as reference method.
Results:
Whole-heart coronary MR angiography was performed in 38 patients (31 men and 7 women; mean age, 58.4 years ± 8.4 [standard deviation]) with an average imaging time of 10.4±2.6 min. The average heart rate during MRA acquisition was 67±9 beats per minutes. The MRA images were acquired during diastole in 81% patients (31 of 38) and systole in 29% patients (7 of 38). A total of 108 coronary vessels were evaluated while the other 6 vessels in 3 patients were excluded for poor image quality. The sensitivity, specificity, positive and negative predictive values, and accuracy of MRA

were 96%, 29%, 85%, 67% and 84% according to patient based analysis, 98%, 59%, 73%, 97% and 80% according to vessel based analysis.

Conclusion:

Non-contrast whole-heart coronary MRA at 1.5T can noninvasively detected significant CAD with high sensitivity and negative predictive value, which indicates the whole-heart coronary MRA can rule out CAD.

EPO-0521

“一站式”CT 心肌灌注成像在评估冠状动脉重度狭窄患者中的应用价值：与心脏磁共振对比研究

刘科伶,彭婉琳,刁凯悦,夏春潮,李真林
四川大学华西医院

目的 采用“一站式”CT 心肌灌注成像（CT-MPI）， 与心脏磁共振（CMR）对比，探讨其在评估冠状动脉重度狭窄患者中的应用价值。

方法 前瞻性选取 50 例我院心内科经冠状动脉造影证实冠脉一支或多支狭窄程度≥90%，欲行冠脉支架植入术的患者，于术前一周内行“一站式”CT-MPI 检查，其中 22 例同时行 CMR 检查。采用后处理软件获取灌注缺损心肌、正常心肌的灌注参数并比较，包括血流量（BF）、血容量（BV）、达峰时间（TTP）及平均通过时间（MTT）。同时获取左心功能参数，包括左室射血分数（LVEF）、收缩末期容积（ESV）、舒张末期容积（EDV）及心搏量（SV）。采用 Pearson 相关分析比较 CT 和 CMR 缺损/正常心肌相对灌注参数的相关性。Bland-Altman 法分析 CT 及 CMR 左心功能参数测量的一致性。 记录“一站式”CT-MPI 扫描的辐射剂量。

结果 与正常心肌相比，灌注缺损心肌的 BV、BF 下降，而 MTT、TTP 延长（所有 $P<0.05$）。CT 和 CMR 测得的 rBV、rBF、rMTT 及 rTTP 呈中到高度正相关（r 分别为 0.685、0.641、0.871、0.733，所有 $P<0.05$）。2 种检查方式左心功能参数一致性较好。“一站式”CT-MPI 扫描有效剂量为 3.5（IQR，3.3-3.8）mSv。

结论 “一站式”CT-MPI 能一次扫描同时获得冠脉解剖、心肌灌注和左心功能信息，且辐射剂量较低，在冠状动脉重度狭窄患者病情评估中具有重要意义。

Preliminary study on non-contrast-enhanced free respiratory navigation whole-heart coronary magnetic resonance angiography based on Dixon at 3.0T

Xin Li,Zhiyong Li,Qingwei Song ,Ailian Liu
The First Affiliated Hospital of Dalian Medical University， China

Objective Previous studies have found that coronary magnetic resonance angiography (CMRA) imaging based on Dixon sequence with water/fat separation technology can improve image quality and increase blood signal-to-noise ratio compared with traditional SPIR fat suppression. The purpose of this study was to explore the feasibility of coronary artery visualization on non-contrast-enhanced free respiratory

navigation whole-heart coronary magnetic resonance angiography (WH CMRA) on Dixon, and analyze the correlation between heart rate and image quality.

Methods Twenty-one patients with suspected coronary heart disease were enrolled in this study, performed WH CMRA based on Dixon in our hospital. CPR reconstruction was performed on all images using the Philips workstation ISP (Intelli Space Portal). The coronary artery were divided into RCA, LM, LAD, LCX and 9 segments according to the recommendations of the American Heart Association (AHA). Two radiologists scored the image quality with 4 points. Spearman correlation analysis was used to observe the correlation between coronary artery image quality score and heart rate.

Results All twenty-one subjects successfully completed the scan with a mean age of 58.62±11.89 years, a mean heart rate of 68.81±21.71 bpm, a mean scanning time of 5.21±0.96 min and included 63 coronary arteries and 189 segments. 165 coronary segments (87.30%) met the diagnostic requirements (≥2 points). The image quality had good inter-observer agreement (Kappa=0.779). Therefore, even with improved diagnostic criteria (≥ 3 points), the display rates of the right coronary artery and the proximal left coronary artery were still very high. Heart rate showed a significant negative correlation with LAD3, LM and LAD2 rather than other segments (P＜0.05).

Conclusion It is a feasible method to visualise coronary artery using non-contrast-enhanced free respiratory navigation WH CMRA based on Dixon, which has stable display in the proximal coronary artery and can meet the needs of clinical diagnosis.

EPO-0523

Feasibility of applying post-processing techniques in triple-rule-out CTA

Bo Li,Qinghai Yuan,Jianhua Liu
The Second Hospital of Jilin University

Triple-rule-out CTA technique can evaluate the thoracic aorta, pulmonary artery and coronary artery at the same time. Some diseases of above arteries are life threatening causes of acute chest pain (ACP), which belong to most frequently symptoms of patient in the emergency departments. Triple-rule-out CTA can not only reduce radiation dose, but also contrast volume. Furthermore, it reduces the cost and time of examinations. Post-processing techniques include multi-planar reconstruction, curved-planar reconstruction and volume rendering technique. Post-processing techniques are effective methods to evaluate thoracic aorta, pulmonary artery and coronary artery in triple-rule-out CTA.Based on above results and discussions, the conclusions of this study are achieved as below:(1) Technique of triple-rule-out CTA can assess the thoracic aorta, pulmonary artery and coronary artery at the same time.(2) Diagnosis of triple-rule-out CTA can differentiate among diseases with symptom of acute chest pain, such as coronary artery stenosis, pulmonary embolism, aortic dissection, penetrating atherosclerotic ulcer and intramural haematoma.(3) Post-processing techniques are

effective methods to evaluate thoracic aorta, pulmonary artery and coronary artery in triple-rule-out CTA.

Preoperative coronary computed tomography angiography in non-cardiovascular surgery patients with unknown or suspected coronary artery disease

Xueming Li,Jiao Pei,Zhong-Zhi Xu,Zhi-Peng Wen,Jing Reng,Peng Zhou,Guo-Hui Xu
Sichuan Cancer Hospital & Institute, Sichuan Cancer Center

Objective: To investigate the usefulness of preoperative coronary computed tomography angiography (CCTA) to rule out or detect significant coronary artery disease (CAD) in patients referred for non-cardiovascular surgery and the impact of CCTA results to clinical decision-making.
Materials and Methods: The institutional review board approved this retrospective study. 918 patients (age 68.5±6.9 years, 74.6% males) including 843 patients with unknown CAD and 75 patients with suspected CAD who underwent CCTA and referred for non-cardiovascular surgery were enrolled from September 2012 to June 2018 at our institution. Multivariate logistic regression analysis was performed to determine predictors of significant CAD and the event of abandoned surgery in patients with significant CAD.
Results: In total, 738 (80.39%) patients had non-significant CAD, and 180 (19.61%) patients had significant CAD. Single-, 2-, and 3- vessel disease was found in 117 (12.75%), 47 (5.12%) and 16 (1.74%) patients. Multivariate analysis demonstrated that positive ECG analysis and Agatston score were independently related with a diagnosis of significant CAD. And the optimal cutoff of Agatston score was 192.4. The event of giving up scheduled surgery increased consistently according to the severity of stenosis and the number of obstructive major coronary artery. Multivariate analysis showed degree of stenosis to be the only independent predictors for giving up of scheduled surgery. In addition, medication using at perioperative period increased consistently according to the severity of stenosis.
Conclusion: In patients referred for non-cardiovascular surgery, preoperative CCTA was useful to rule out or detect significant CAD, and subsequently influenced patient disposal. However, it might not be necessary for many patients if they have negative ECG results and low Agatston score.

64 层螺旋 CT 冠状动脉血管成像诊断复杂性冠状动脉狭窄的价值

张佳胤
上海交通大学附属第六人民医院

目的 评价 64 层螺旋 CT 冠状动脉血管成像诊断复杂性冠状动脉狭窄的价值以及对制定治疗策略的影响。 **资料与方法** 选取 69 例在我科接受冠状动脉 CTA 检查，提示有至少一支冠状动脉显著狭窄（≥50%）的患者。将冠状动脉狭窄分为复杂性病变和简单病变。前者包括分叉病变、完全闭塞病变、开口病变、弥漫长病变。后者为除复杂性病变所含类型以外的病变。分叉病变根据 Lefevre 分型进一步分为 5 型。所有患者均于 2 周内行 CAG。将 CTA 的结果与 CAG 对照。 **结果** CTA 共检出大于 50%狭窄 286 处，其中简单病变为 157 处，复杂性病变为 129 处。其中分叉病变 57 处、闭塞病变 22 处、开口病变 9 处、弥漫长病变 41 处。57 处分叉病变，按照 Lefevre 分型，有 1 型 18 处、2 型 21 处、3 型 5 处、4 型 6 处、4a 型 5 处和 4b 型 2 处。与 CAG 相比，CTA 诊断简单病变的敏感度为 92.16%，特异度为 98.51%，阳性预测值为 89.81%，阴性预测值为 98.50%。CTA 诊断分叉病变的敏感度为 100%，特异度为 99.12%，阳性预测值为 85.96%，阴性预测值为 100%。CTA 诊断闭塞病变、开口病变和弥漫长病变的敏感度、特异度、阳性预测值及阴性预测值均为 100%。**结论** 64 层螺旋 CT 冠状动脉 CTA 可准确诊断各类复杂性冠状动脉狭窄，指导进一步治疗方案的选择，在复杂性冠状动脉狭窄的诊断和治疗中均具有重要的临床价值。

EPO-0526

The best predictor of ischemic coronary stenosis: subtended myocardial volume, machine learning-based FFRCT, or high-risk plaque features?mic relevance of coronary artery stenosis.

Mengmeng Yu
Shanghai Jiao Tong University Affiliated Sixth People's Hospital

OBJECTIVES: The present study aimed to compare the diagnostic performance of a machine learning (ML)-based FFRCT algorithm, quantified subtended myocardial volume, and high-risk plaque features for predicting if a coronary stenosis is hemodynamically significant, with reference to FFRICA. METHODS: Patients who underwent both CCTA and FFRICA measurement within 2 weeks were retrospectively included. ML-based FFRCT, volume of subtended myocardium (Vsub), percentage of subtended myocardium volume versus total myocardium volume (Vratio), high-risk plaque features, minimal lumen diameter (MLD), and minimal lumen area (MLA) along with other parameters were recorded. Lesions with FFRICA </= 0.8 were considered to be functionally significant. RESULTS: One hundred eighty patients with 208 lesions were included. The lesion length (LL), diameter stenosis, area stenosis, plaque burden, Vsub, Vratio, Vratio/MLD, Vratio/MLA, and LL/MLD(4) were all significantly longer or larger in the group of FFRICA </= 0.8 while smaller minimal lumen area, MLD, and FFRCT value were noted. The AUC of FFRCT + Vratio/MLD was significantly better than that of FFRCT alone (0.935 versus 0.873, p < 0.001). High-risk plaque features failed to show difference between functionally significant and insignificant groups. Vratio/MLD-complemented ML-based FFRCT for ″gray zone″ lesions with FFRCT value ranged from 0.7 to 0.8 and the combined use of these two parameters yielded the best diagnostic performance (86.5%, 180/208). CONCLUSIONS: ML-based FFRCT simulation and Vratio/MLD both provide incremental value over CCTA-derived diameter stenosis and high-risk plaque features for predicting hemodynamically

significant lesions. Vratio/MLD is more accurate than ML-based FFRCT for lesions with simulated FFRCT value from 0.7 to 0.8. KEY POINTS: * Machine learning-based FFR CT and subtended myocardium volume both performed well for predicting hemodynamically significant coronary stenosis. * Subtended myocardium volume was more accurate than machine learning-based FFR CT for "gray zone" lesions with simulated FFR value from 0.7 to 0.8. * CT-derived high-risk plaque features failed to correctly identify hemodynamically significant stenosis.

基层医院开展螺旋 CT 冠状动脉血管成像的应用体会

侯恩常
珠海市人民医院高栏港医院(南水镇卫生院)

探讨多层螺旋 CT 在冠状动脉血管造影中的技术应用，以及造影对临床治疗的意义。方法：使用多层螺旋 CT 对 32 例心脏病患者行冠状动脉造影检查，利用多层螺旋 CT 的后处理功能对冠状动脉影像进行重组，以便更清楚、直观的了解冠状动脉的主枝及分支，促进冠状动脉病变的诊断。结果：31 例均能成功的显示各主枝及分支。其中 27 例患者支冠脉有不同程度的硬斑块和软斑块，冠脉伴有不同程度的狭窄。结论：扫描前，心率大于 75 次/min 的患者，冠状动脉的主要分支都出现了不同程度的不规整，通过技术控制在心率平稳且小于 75 次/min 的情况下扫描，重建冠状动脉三维成像。结论：多层螺旋 CT 对冠状动脉成像可逼真、清晰、准确显示冠状动脉细节状况，对冠状动脉病的诊断有积极意义，具有很高的临床应用价值。在基层医院要严格掌握 CTA 适应症，做好造影剂过敏反应的预防抢救准备工作。

Impact of blending weight in hybrid iterative reconstruction on coronary artery calcium score based on cardiac CT

Zhuolu Zhang
Peking University People's Hospital

Objectives: To investigate the impact of blending weight in hybrid iterative reconstruction (adaptive statistical iterative reconstruction veo, ASIR-V) on coronary artery calcium scores and risk classification based on cardiac CT. Methods: The non-contrast ECG-gated cardiac CT images of 100 patients were reconstructed using different blending weights of ASIR-V, including FBP (0% ASIR-V), 20% ASIR-V, 40% ASIR-V, 60% ASIR-V, 80% ASIR-V, and 100% ASIR-V. The average CT value and standard deviation (SD) in the ascending aorta, and maximum value of calcified plaque were compared among the different reconstructions. Agatston score, mass score, volume score and risk classification based on Agatston score were also compared. Results: *An increased percentage of ASIR-V was associated with reduction in SD of ascending aorta and the 3-types of calcium scores(P*<0.05). Agatston scores were 170.2±387.3, 168.6±385.3, 166.4±381.9, 164.6±379.4, 162.9±376.7, and 161.1±374.1

for reconstructions with 0%, 20%, 40%, 60%, 80%, and 100% ASIR-V, respectively. Mass scores were 23.62±52.56, 23.49±52.23, 23.32±52.30, 23.20±53.10, 23.15±52.83, and 22.99±52.41 mg, respectively. Volume scores were 68.7±140.7, 67.8±139.8, 67.0±139.6, 65.7±137.2, 64.8±135.9, and 64.0±135.0 mm^3, respectively (all P≤0.001). There was no statistically significant difference in the average value in ascending aorta and plaque maximum value(P＞0.05) ASIR-V led to the risk reclassification to lower category *in 10 patients, including 8 from low to very low, and 2 from moderate to low based on Agatston scores.*
Conclusion：ASIR-V results in image noise and calcium score reduction, and may result in risk reclassification to lower category.

EPO-0529
基于冠状动脉 CTA 的 CTO 评分在冠状动脉慢性完全闭塞病变介入治疗中的预测价值

殷磊[1],滕彬彬[2],马明平[1],林阳[3],陈冰[3]
1.福建省立医院
2.福州市第二医院
3.西门子医疗系统有限公司

目的：评估基于冠状动脉血管成像（coronary computed tomography angiography, CCTA）的 CTO 评分对冠状动脉慢性完全闭塞病变(chronic total occlusion lesions，CTO)经皮介入治疗（percutaneous coronary intervention, PCI）最终结果的预测价值。方法：回顾性分析 66 例冠脉 CTO 患者，分为 PCI 成功组（48 例）和 PCI 失败组（18 例），分析闭塞段入口形态、钙化、弯曲度、长度对介入治疗结果的影响。计算基于冠脉 CTA 的 J-CTO 评分（$J\text{-}CTO_{CT}$），同时将 J-CTO 评分系统中钙化进一步分为钙化程度（轻度、重度）、钙化范围（全段，部分）重新计算改良-CTO 评分（改良-CTO_{CT}），利用 ROC 曲线评价二者对 CTO 介入结果的预测效能。 结果：与 PCI 成功组相比，PCI 失败组在闭塞段近端入钝型纤维帽（22.9% vs 50%，P=0.041）、弯曲度>45°（15.1% vs 50%，P=0.043）、闭塞段长度>20mm（25.7% vs 67%，P=0.046）、闭塞段全段钙化（14.6% vs 38.9%，P=0.043）、闭塞段重度钙化（10.4% vs72.2%, P=0.000）的发生率明显增高，是导致 CTO 病变介入治疗失败的主要因素。改良-CTO_{CT}在预测 CTO 介入成功率的 ROC 曲线下面积高于 $J\text{-}CTO_{CT}$（0.921vs0.847，P＜0.001）。结论：CTO 病变 PCI 术前 CTA 形态学评估有助于预测 PCI 手术成功率，基于冠脉 CTA 的改良-CTO_{CT}评分较 $J\text{-}CTO_{CT}$评分有更高的预测价值。

EPO-0530
迭代重建算法结合不同卷积核值对冠脉支架可视化 的研究

王晓瑜,祁荣兴,黄胜
南通市第一人民医院（南通大学医学院第二附属医院）

目的评估第三代双源 CT 高级迭代重建算法结合不同卷积核值对冠脉金属支架的可视化，并比较不同卷积核值对不同内径支架的图像质量影响，为 PCI 术后支架的显示提供最优选择。
方法连续收集 2017 年 12 月至 2018 年 9 月间接受冠脉 CTA 检查的金属支架植入患者 61 例（男 46 例，女 15 例），共 84 根支架，其中实际内径≥3mm 的支架 52 根，内径＜3mm 的有 32 根。采用第三代双源 CT 机扫描，管电压采用 CARE kV 自动调节（参考管电压 100kV），开启实时动态剂量调

节自动曝光 Care Dose 4D（参考管电流 300mAs/rot）。采用 ADMIRE 3 结合不同卷积核值（Bv40、Bv44、Bv49、Bv59）对不同内径的支架（＜3mm 和≥3mm）行内径、可视化率及图像质量的评估，比较各组间差异。正态分布连续变量资料组间比较用单因素方差分析，如组间差异有统计学意义，再进行均数的两两比较。两种不同内径支架组的可视化率比较采用独立样本 t 检验。
结果内径≥3mm 的支架，Bv49 和 Bv59 的支架可视化率（69.49±3.37%，70.04±2.90%）明显高于 Bv40 组和 Bv44（57.94±3.74%，62.78±3.19%），差异有统计学意义（F=175.21，P<0.001）。内径＜3mm 的支架，Bv49 和 Bv59 支架可视化率（52.27±7.92%，53.98±7.16%）也高于 Bv40 和 Bv44（41.96±6.70%，45.52±5.86%），差异有统计学意义（F=21.579，P<0.001）。相同卷积核组，内径≥3mm 的支架可视化率明显高于内径＜3mm 的支架(P<0.001)。Bv49 组的图像主观评分高于其他各组（F=35.780，P<0.001）。
结论第三代双源 CT 高级迭代重建算法结合不同卷积核可改善 PCI 术后支架可视化率及图像质量，以 Bv49 最有利于支架内可视化的显示，尤其内径≥3mm 的支架。

256 层螺旋 CT 冠状动脉成像在心肌桥-壁冠状动脉合并血栓患者中的诊断效果研究

梁海胜
上海交通大学医学院附属第九人民医院

【摘要】目的:探讨 256 层螺旋 CT 冠状动脉成像在心肌桥-壁冠状动脉合并血栓患者中的诊断效果。方法：取 2010 年 10 月-2018 年 5 月医院收治的疑似心肌桥-壁冠状动脉合并血栓患者 1632 例，患者均行 256 层螺旋 CT 冠状动脉成像诊断，将获得的数据传输到工作站完成多平面重建（MPR）、容积重建（MIP）、曲面重建（CPR）等处理，分析 256 层螺旋 CT 冠状动脉成像在心肌桥-壁冠状动脉合并血栓患者中的诊断效果及价值。结果：1632 例患者均经过 256 层螺旋 CT 冠状动脉成像诊断后 263 例发生心肌桥，检出率为 16.12%。其中，排在前两位的分别为 LMA 和 LAD，分别占：50.19%和 20.15%；263 例心肌桥-壁冠状动脉合并血栓患者均伴有不同临床表现，并且以心前区不适为主，占 65.78%。心肌桥-壁冠状动脉合并血栓患者 MB 厚度为 0.8-5.6mm，43 例出血壁冠状动脉管腔出现不同程度狭窄。结论：将 256 层螺旋 CT 冠状动脉成像用于心肌桥-壁冠状动脉合并血栓患者中效果理想，能帮助患者早期确诊，指导临床治疗，值得推广应用。

EPO-0532
基于机器深度学习的 FFRCT 与有创性 FFR 的相关性研究

余蒙蒙
上海交通大学附属第六人民医院

目的 以压力导丝测量的冠状动脉血流储备分数（FFR）为金标准，探讨不同区间内基于机器深度学习的 FFRCT 数值对冠状动脉功能性狭窄的诊断准确性 方法 回顾性收集先后行冠状动脉 CT 血管成像（CCTA）及 FFR 检查的病人 125 例（162 处病变），年龄 42.0~88.0 岁，平均年龄（61.0±8.2 岁），男 81 例（63.0±10.6 岁），女 48 例（60.2±7.5 岁）。且两项检查时间间隔≤2 周。在 CCTA 影像上获得病变直径狭窄程度，采用德国西门子原型软件 cFFR（cFFR, version 3.0.0）计算 FFRCT 数值。以 FFR≤0.8 为具有血流动力学意义的狭窄。 结果 FFRCT 及 CCTA 对于诊断功能性狭窄的 AUC 分别为 0.85、0.76（P<0.05）。基于病人（n=125）水平分析，CCTA 的诊断敏感度、特异度、准确度分别为 77.6%、69.7%和 76.8%；FFRCT 的诊断敏感度、特异度、准确度分别为 85.7%、78.9%和 86.1%。当 FFRCT 数值≤0.69、0.7~0.8、0.81~0.89、≥0.9 时， FFRCT 诊断功能性狭窄的准确度分别为 86.4%、61.2%、88.6%、98.2%。结论 ①以 FFR 为金标准，FFRCT 数值在“灰色区间”之外的病变结果具有良好的诊断准确性；②而区间内的病变诊断准确性欠佳。

EPO-0533
256 层 iCT 对 2 型糖尿病合并冠心病冠脉病变评价研究

牛玉军,闫晓虹,谷娜
锦州医科大学附属第一医院

目的 应用 256 层 iCT 评价 2 型糖尿病合并冠心病冠状动脉病变，为临床诊治提供科学依据。**方法** 收集 2018 年 1 月至 2019 年 6 月本院住院患者 300 例，确诊为 T2DM 合并冠心病 127 例为实验组，单纯冠心病 173 例为对照组。根据糖尿病确诊年限实验组又分为病程＞5 年组（实验 a 组）和病程≤5 年组（实验 b 组）；根据糖化血红蛋白（HbA1c）水平实验组又分为 HbA1c≥7%组（实验 c 组）和 HbA1c＜7%组（实验 d 组）。300 例均行冠脉成像（CTA），其中 134 例同时行 DSA 冠脉造影。分析实验组及对照组相关实验室检查及各组冠脉病变情况，并与冠脉造影对比。**结果** 冠脉 CT 与冠脉造影比较诊断结果相近；实验组甘油三酯（TG）、胆固醇（TC）、低密度脂蛋白（LDL-L）， 尿酸（UA）、肌酐（Cr）、高密度脂蛋白（HDL-L）及尿微量蛋白（mALB）较对照组明显增高，差异均具有统计学意义，P＜0.05；实验组冠脉以 2~3 支病变为主，对照组单支病变为主，差异具有统计学意义，P＜0.05；实验 a 组多为 2 支到多支血管病变，实验 b 组多为单只血管病变，实验 a 组各支血管病变的发生率高于实验 b 组，差异具有统计学意义，P＜0.05；实验 c 组多为 2 支到多支血管病变，实验 d 组多为单只血管病变，实验 c 组各支血管病变的发生率高于实验 d 组，差异具有统计学意义，P＜0.05。**结论** 256 层 iCTA 与 DSA 冠脉造影对冠脉病变具有基本一致的诊断价值；由于高血脂及高血糖等多种因素的存在，2 型糖尿病合并冠心病患者更多发生冠脉病变；2 型糖尿病病程是影响冠脉病变的重要独立因素；糖化血红蛋白水平可单独影响着冠心病发生。对比于单纯冠心病，2 型糖尿病合并冠心病患者冠脉病变呈更广泛、严重的特点。

EPO-0534
基于 Revolution 探讨 One beat 冠状动脉轴扫结合 Snap shot Freeze 重组技术在自由呼吸冠脉扫描（CCTA）中的价值。

吴娜珊,王永胜,吴光耀
深圳大学总医院

目的 探讨 One beat 冠状动脉轴扫结合 Snap shot Freeze 重组技术在自由呼吸冠脉扫描（CCTA）中的价值。
方法 收集我院行 16 cm 宽体探测器 One beat 轴扫的冠脉 CTA 检查者 128 例，按屏气和自由呼吸分为两组，其中屏气组 76 例，自 由呼吸 52 例。 再根据受检者心率分为低中高三个心率组（A、B、C），其中屏气组：A1 组（小于 70 bpm）40 例，B1 组（71~85 bpm） 25 例，C1 组（大于 85 bpm）11 例；自由呼吸组：A2（小于 70 bpm）25 例，B2 组（71~85 bpm）18 例，C2 组（大于 85 bpm）9 例。 所有受检者均采用手动选取最佳时相并结合冠状动脉冻结技术（SSF）技术进行重组，得到运动伪影补偿前、后的图像。
客 观评分：分别测量屏气组和自由呼吸组冠状动脉 CTA 图像的主动脉弓根部 CT 值、噪声值、信噪比、对比度噪声比；
主观评 分：由 2 名有经验的放射科医师采用 5 分法对 SSF 前后的 5 组图像的右冠状动脉（RCA）、左前降支（LAD）、左旋支（LCX） 进行评分。 比较各分支在 SSF 前后图像质量的变化并比较在自由呼吸和屏气扫描下 SSF 后不同心率组图像质量的差异。
结果 屏气组和自由呼吸组的主动脉弓根部 CT 值、噪声、信噪比、对比度噪声比均无明显差别（P>0.05）。 在使用 SSF 后无 论在自由呼吸组还是屏气组均能够提高图像质量（P<0.05）；自

由呼吸组和屏气组在使用 SSF 后对于不同心率冠状动脉图 像的质量的提升均无明显差别（P>0.05）。

结论 通过自由呼吸组和屏气组的主客观的比较，依赖于 One beat 冠状动脉轴 扫结合 SSF 重组，自由呼吸冠状动脉扫描可以提供高质量的图像。

EPO-0535
基于传统冠状动脉造影对照分析 CT 在冠状动脉成像中诊断心肌桥的价值

何其舟
西南医科大学附属中医医院

目的 对照分析行 CT 冠状动脉成像（ CTCA）后再次进行传统冠状动脉造影（ CAG）检查患者的影像学资料，探讨 CTCA 对心肌桥的诊断价值。 方法 回顾性分析 267 例行 CTCA 检查后一个月内行 CAG 检查患者的影像学资料，其所有图像分析均采用双盲法，既由两名放射科资深心血管诊断医师及两位介入科医师分别在不知道各自诊断结果的前提下作出诊断，内容包括心肌桥发生部位、深度、长度、管腔狭窄程度以及是否合并粥样斑块，并行统计学方法分析，同时比较 CAG 与 CTA 对心肌桥检出率。结果 267 例患者中，CTCA 中共检出 98 处心肌桥，检出率为 36.7%，平均长度为(20.2±7.6) mm，深度为(1.8±0.3) mm，其中 39 处为完全性心肌桥，59 处为不完全心肌桥；分布在前降支中段 58 处、远段 26 处、近段 5 处，第一对角支 3 处，第一钝缘支 4 处，右冠后降支 2 处；CT 检出心肌桥血管合并粥样硬化 29 例，分别为钙化斑块 7 例、混合斑块 16 例、非钙化斑块 6 例。CAG 显示 24 处心肌桥，检出率为 24.5%（24/98），位于前降支中段 20 处，前降支远段 3 处，右冠后降支 1 处；与 CTCA 检出的心肌桥位置一致，其中 20 处为完全性心肌桥，4 处为不完全心肌桥，合并粥样硬化 12 例。CTCA 对心肌桥的检出率高于 CAG（χ^2 =12.633， P ＜0.001）。 结论 CTCA 能直观显示冠状动脉与心肌的关系，对心肌桥及合并合并粥样硬化斑块的诊断显示优于 CAG，可作为临床诊断心肌桥的首选。

1.中国人民解放军总医院第一医学中心
2.中国人民解放军总医院海南医院

目的：探索双层探测器能谱 CT 单能级影像对于门静脉成像质量的影响。**方法**：使用单源双层探测器能谱 CT 对 39 个怀疑腹部疾病的患者行对比增强检查。以 3ml/s 的速度注射对比剂 iopamidol (320mg/ml) 60ml 后 90 秒以能谱 CT 采集方式行门静脉期扫描。原始数据被重建成常规的 120kVp 的混合能量图像以及以能谱为基础的数据，获得 40，50，60，70keV 的单能级图像。测量常规 120kVp 混合能量组以及 40，50，60，70keV 的单能级组的图像噪声，门静脉的信噪比（SNR），门静脉与同层竖脊肌相比较的对比噪声比（CNR）。方差分析用来比较各组之间影像噪声、SNR 和 CNR。寻找获得门静脉成像的最佳单能级图像。**结果**：各组之间影像噪声、门静脉的 SNR、与腰大肌相比较的 CNR 有显著的统计学差异（p<0.05）。40keV 组的噪声低于常规 120kVp 混合能量组，SNR 和 CNR 远远高于常规 120kVp 混合能量组及其他单能量组。**结论**：40keV 是双层探测器能谱 CT 成像门静脉的最佳单能级。

冠状动脉 CTA 心肌血流指数预测阻塞性冠心病

熊青峰,马小静,鄢华,彭致远
武汉亚洲心脏病医院

目的 分析冠状动脉 CT 血管成像心肌血流指数(CCTA-MFI)在预测阻塞性冠心病中的可行性。**方法** 连续性收集 920 例门诊首诊疑似冠心病患者，GRACE 院内死亡风险评分为低危，测量心率、血压、身高、体重，间隔 10 分钟，测量三次，取平均值，行 CCTA 检查，筛选出优质图像 357 例，运用后处理软件计算左心室心肌体积，计算心肌血流指数（CCTA-MFI）；住院后行 ICA 检查 68 例；以 ICA 为金标准，以小于等于 CCTA-MFI 平均值 2 倍标准差为界值预测冠心病（狭窄程度 >70%），分析 CCTA、CCTA-MFI 与 ICA 相关性、评价冠心病准确性及分析两者 ROC 曲线。非参数资料行卡方检验，$P < 0.05$ 认为有显著性统计学差异。**结果** CCTA 扫描平均剂量为（3.17±1.02 ）mSv。CCTA-MFI = 0.131 ± 0.0573，CCTA-MFI 平均值 2 倍标准差为 0.114。68 例患者中， ICA 诊断狭窄程度大于 70%患者 26 例。CCTA-MFI 阳性（≤ 0.114）29 例。以 ICA 管腔狭窄 >70%为金标准，CCTA（≥ 70%）和 CCTA-MFI（≤ 0.114）预测冠心病的敏感性、特异性分别为 75.76%、65.71%和 60.32%、100%，CCTA-MFI 准确性为 92.65%，明显高于 CCTA 的 70.59%（$P< 0.01$）。CCTA、CCTA-MFI 与 ICA 相关系数分别为-0.5876、0.8624（$P< 0.0001$）；ROC 曲线下面积分别为 0.625、0.852（$P = 0.0238$），截断值分别为 40%、0.087，敏感性、特异性分别为 58.33%、100%和 82.54%、80.00%。26 例狭窄 > 70%患者中，24 例 CCTA-MFI < 0.114，20 例行支架植入术。**结论** CCTA-MFI 与心外膜下冠状动脉狭窄程度呈负相关，反映心外膜下冠状动脉狭窄程度，可用于对阻塞性冠心病的准确诊断。

EPO-0538

CT 心肌血流指数评价冠脉支架内再狭窄临床意义

熊青峰[1,2],马小静[1],鄢华[1],彭致远[1],徐海波[2]
1.武汉亚洲心脏病医院
2.武汉大学中南医院

目的 分析冠状动脉 CT 心肌血流指数(CCTA-MFI)预警冠脉支架内再狭窄临床意义。**方法**连续性收集 572 例 2018 年 2 月至 2019 年 5 月门诊冠心病药膜支架植入术后复诊患者，测量心率、血压、身高、体重，间隔 10 分钟，测量三次，取平均值，537 例行 CCTA 检查，筛选出优质图像 242 例，运用后处理软件计算左心室心肌体积，运用 CT 对比剂示踪技术，计算心肌血流指数（CCTA-MFI），并依据性别、年龄以及是否合并糖尿病、多支血管病变、慢性肾病、过敏体质进行矫正；住院后进一步行冠状动脉造影（ICA）90 例，以 ICA 为金标准，定义支架内狭窄程度<50%为内膜增生，支架内狭窄程度≥50%为支架内再狭窄，寻求诊断支架狭窄最佳 CCTA-MFI 值，分析性别差异及 CCTA-MFI 准确性。非参数资料行卡方检验，$P < 0.05$ 认为有显著性统计学差异。 **结果** 90 例患者，男性 59 例中 23 例发生支架狭窄，女性 31 例中 11 例发生支架狭窄，统计学差异不明显（X^2=0.00933，P=0.9231）。CCTA-MFI 平均值 2 倍标准差为 0.10，最佳截断值为 0.082，90 例患者中，39 例（43.33%，39/90）CCTA-MFI≤ 0.082，其中 34 例（87.18%，34/39）出现支架异常，且其中支架内膜增生 18 例（20%，18/90），支架内再狭窄 16 例（17.78%，16/90）；8 例（8.89%，8/90）出现新的病变，管腔重度狭窄，其中 7 例（87.5%，7/8） CCTA-MFI≤ 0.082。CCTA-MFI 0.082 预警支架异常的敏感性、特异性、阳性预测值、阴性预测值分别为 100%、

91.07%、87.18%、 100%，准确性为 94.44%。**结论** CCTA-MFI 可以用来预测冠状动脉支架异常情况；CCTA-MFI 减低患者容易合并新发病变，且近 50%患者会出现支架内再狭窄，需引起临床重视。

EPO-0539
冠状动脉管腔内对比度衰减梯度校正值在弥漫性钙化冠脉狭窄中的应用价值

沈芳杰[1,2],潘宇宁[1],黄景峰[1],黄求理[1]
1.宁波市第一医院
2.宁波大学医学院

摘要：目的 探究冠状动脉管腔内对比度衰减梯度校正值在冠状动脉弥漫性钙化管腔狭窄中的应用价值。**方法** 回顾性分析 84 位先后行冠状动脉 CT 血管造影及 ICA 的冠状动脉弥漫性钙化患者，应用 320 排 CT 所得的 CCTA 数据，测定弥漫性钙化冠脉两端的 CCO 差异，与金标准 ICA 所得狭窄程度进行比较，用非参数检验 Kruskal-Wallis 进行统计分析，并应用受试者工作特征曲线判断 CCO 差值诊断冠状动脉狭窄的最佳截断点，灵敏度及特异度。**结果** 共纳入 122 例弥漫性钙化冠脉，无明显狭窄组 16 例，狭窄程度＜70%组 42 例，狭窄程度 70-99%组 64 例，三组的中位数分别为 0.064、0.117、0.176。无明显狭窄组和狭窄程度 70-99%组、狭窄程度＜70%组和狭窄程度 70-99%组之间存在显著性差异（P 均＜0.05），无明显狭窄组和狭窄程度＜70%组之间无显著性差异（P=0.233）。ROC 曲线分析结果显示，ROC 曲线下面积为 0.681，最佳截断点为 0.2920。以 ICA 检查结果为金标准，以 0.2920 为 CCO 差值截断点诊断冠状动脉狭窄率≥70%的灵敏度为 84.4%、特异度为 44.8%。**结论** CCO 差异对诊断狭窄程度≥70%的弥漫性钙化冠脉具有提示作用。

EPO-0540
Predicting adverse events and coronary artery disease symptoms in patients with abnormal origin of left coronary artery: a retrospective study

Peilun Han,Zhigang Yang,Kaiyue Diao,Shan Huang,Yue Gao
West China Hospital， Sichuan University

Purpose: To compare coronary artery features among abnormal origin of left coronary arteries (ALCA) patients with different anatomic patterns and determine the features correlated with coronary artery disease (CAD) symptoms and adverse events.
Methods: Among 30, 406 consecutive patients referred to our institution undergoing coronary computed tomography angiography (CCTA) from 2012-2018, we retrospectively enrolled 43 patients (M/F: 20/23, 54.79 ± 16.92 years) with ALCA. Baseline clinical features were recorded and the follow-up was done by telephone. CTAs were reviewed on a professional software (Horos, V3.3.1) for abnormal artery, origin and course of the abnormal artery, take-off angle, stenosis severity, the length of stenosis, the

diameter of right coronary artery (corrected with the diameter of ascending aorta) and any atherosclerotic plaques. R project was used for statistical analysis and $P< 0.05$ was considered as significant.

Results: Among the ALCA patients, left main artery was the most commonly involved artery (23/43, 53.49%), followed by the left circumflex (LCx) (18/43, 41.86%). Right sinus of Valsalvawas the most common origin (27/43, 62.79%). 20 patients were with a retroaortic course, for which LCx was the most frequently involved (18/20). Three patients with main adverse cardiac eventswere recorded during follow-up (mean 3.21±1.70 years). Two with severe arrhythmia had interarterial course and a take-off angle less the 20°. The last one died without specific reason had a prepulmonic course, a small take-off angle and was anomalous left coronary artery arising from pulmonary artery (ALCAPA). Twenty-five patients had complaint of CAD symptoms. Patients with symptoms shows no significant differences in course, take-off angle, stenosis severity and other anatomic features with patients without CAD symptoms. However, atherosclerosis of normal vessel was more common in patients with CAD symptoms (P=0.004), with more severe atherosclerotic plaques (P=0.040).

Conclusion: Because of the significantly higher risk of sudden cardiac death in ALCA, screening among athletes is necessary. For ALCA patients with small take-off angle, interarterial course or ALCAPA, risk of death exists and intervention might be considered. CAD symptoms should be more from the atherosclerosis instead of the high-risk anatomy for these patients.

EPO-0541

Quantitative Assessment of Right Ventricular Function and Severity of Pure Mitral Stenosis with 64-Section Multi-detector Row CT: Comparison with Magnetic Resonance Imaging

Rufang Liao, Xiaochun Zhang
Zhongnan Hospital Of Wuhan University

OBJECTIVE: To evaluate whether 64-MDCT can quantitatively assess the severity of pure mitral stenosis (PMS) by measuring right ventricular (RV) volumetric and other parameters in comparison to golden standard MRI.

METHODS 43 with PMS (26 men, 17 women, mean age, 46±8 years) underwent 64-MDCT and MRI for assessing RV volumetric and other parameters, as well as calculating tricuspid regurgitation volume (TRV). All patients was classified as mild (7), moderate (21) and severe (15) group, according the severity of mitral stenosis.

RESULTS 64-MDCT and TTE had good agreement and correlation in measuring MVA(r=0.99, bias, -0.4mm^2). Right ventricular stroke volume (RV-SV), ejection fraction (RV-EF), cardiac output (RV-CO) and wall mass (RV-Mass) were significantly lower in patients with severe PMS than those in patients with moderate and mild PMS by 64-MDCT and MRI (respectively, all p<0.01). Right ventricular end-systolic volume (RV-ESV) was significant higher in severe PMS than that in patients with moderate and mild PMS (respectively, all p<0.01). RV-ESV, RV-SV, RV-EF, RV-CO, LVCO, TRV, and RV-

Mass by 64-MDCT correlated well with those by MRI in each group (r= mild, 0.86-0.98; moderate, 0.8-0.98; severe, 0.91-0.98, respectively; all p<0.01). No significant differences were revealed in calculated the above parameters in each group between the two modalities (p=0.10 to 0.95). TRV were significant higher in patients with severe PMS than that in patients with moderate and mild PMS with both modalities (all p<0.001).
CONCLUSION 64-MDCT could provide quantitative information for determining the severity of PMS, and be considered as an accurate, noninvasive imaging technique.

EPO-0542
肥心病患者左心室心肌纹理特征与左心室整体功能评估轻心衰程度的对比研究

赵骏[1],肖晶晶[2],方良瑞[1],王健[1]
1.陆军军医大学第一附属医院（西南医院）
2.陆军军医大学第二附属医院（新桥医院）

目的:运用心脏磁共振电影序列计算肥厚型心肌病(Hypertrophic Cardiomyopathy, HCM)患者左心室舒张末期心肌区域纹理特征鉴别心衰程度，与左心室整体功能参数进行对比。**方法:**纳入我院完成 MR 检查并确诊为 HCM 的患者 82 例，按纽约心脏协会(New York Heart Association，NYHA)心功能分级法分组，NYHAⅠ-Ⅱ为（男 33 例，女 24 例，平均年龄 44.89±12.68 岁)轻度心衰组，NYHAⅢ-Ⅳ为(男 12 例，女 13 例，平均年龄 47.72±16.08 岁)，重度心衰组。用 MATLAB 软件手动提取所有患者左室舒张末期短轴位电影序列心肌区域，并用深度神经网络进行纹理特征提取分析。用 CVI 软件计算所有患者射血分数(Ejection Fraction, EF),延时强化(Late Enhancement，LGE)体积比率每分钟心输出量(cardiac output, CO)，心脏指数(Cardiac Index，CI)。用 SPSS 18.0 行 Mann-Whitney 检验两组患者之间年龄和体重指数(Body Mass Index, BMI)分布的差异性，卡方检验计算两组患者之间男女比例的分布差异性，ROC 对深度纹理特征和 EF，LGE，CO 及 CI 的诊断效能进行分析,并进行 ROC 曲线下面积的计算。**结果:**轻重度心衰两组患者平均年龄和 BMI 没有显著性差异(*P*=0.338,0.120)，男女分布比例没有显著性差异(*P*=0.407)。ROC 计算得出深度纹理特征曲线下面积(90.0%)明显大于 EF(51.2%)，LGE(62.5%),CO(49.5%)和 CI(46.9%),且两组 EF，LGE，CO 和 CI 无显著性差异。**结论:**基于深度神经网络提取纹理特征作为一种新型的定量诊断方案，能够有效定量鉴别纽约心功能分级的Ⅰ-Ⅱ、Ⅲ-Ⅳ级差别，敏感性明显高于传统的延时强化技术以及整体心功能参数。

磁共振评价室壁瘤对左心室功能影响研究

牡丹,李巧玲,余鸿鸣,陈文萍,梁静,杨尚文
南京大学医学院附属鼓楼医院

目的：探讨磁共振评价心肌梗死后室壁瘤对左心室功能的影响。**方法**：选取自 2018 年 01 月至 2019 年 4 月南京鼓楼医院心肌梗死合并室壁瘤形成的行心脏磁共振的 58 例患者为研究对象，根据美国纽约心脏病学会分级(NYHA) 将 30 例 NYHA Ⅰ-Ⅱ级患者分为 A 组，28 例 NYHA Ⅲ-Ⅳ级患者为 B 组。对两组患者进行心超和心脏磁共振等检查，运用磁共振测量并比较心功能参数及室壁瘤参数。**结果**：两组左心室收缩和舒张功能均不同程度减低，差异有统计学意义。心脏磁共振较心超比

较，敏感性和可靠性更高，磁共振较心脏彩超检测的左室射血分数在两组间差异更加显著。在磁共振检测数据中，与 A 组比较，B 组患者的左心室舒张末容积、左心室收缩末容积、乳头肌重量及室壁瘤瘤体基底部横径、容积均显著升高，左心室射血分数、心指数明显降低，差异均有统计学意义（ P＜0. 05），室壁瘤瘤体高度有增高趋势，但无明显统计学差异。左心室射血分数与室壁瘤瘤体基底部横径及室壁瘤瘤体容积均呈负相关。左心室舒张末容积、左心室收缩末容积和室壁瘤容积呈正相关。**结论：** 心肌梗死室壁瘤形成后左心功能与室壁瘤范围相关，磁共振可精准测量心功能参数及室壁瘤范围，对后续临床治疗具有重要价值。

EPO-0544
ECG 触发容积 CT 在儿童复杂先天性心脏病检查中的应用

雷盛,王爽,谷涛
陆军军医大学附属新桥医院放射科

目的：清楚显示复杂先天性心脏病患儿心脏及胸部大血管，左右心系统及分流方向，为临床手术方式提供指导参考。**方法**：A 组：选取 1-10 岁复杂性先天性心脏病患儿 30 例，使用东芝 640 排容积 CT 配合心电门控进行心脏及胸部大血管扫描。扫描参数：100KV 300MAS ECG 触发 容积扫描模式采集左、右心系统舒张期、收缩期心脏及胸部大血管信息。B 组：选取 1-10 岁复杂性先天性心脏病患儿 30 例，使用 GE64 排，东芝 640 排 CT 使用螺旋扫描模式扫描。扫描参数：100KV 300MAS。使用原始轴位图像及 MIP、VR 对图像进行后处理后对比分析。**结果**：A 组容积扫描模式所得图像清晰，运动伪影影响小，可清楚显示异位血管引流血管及细小变异分支，及左右心系统分流情况，房室口、缺损口、瓣口显示清晰。B 组螺旋扫描模式所得图像由于呼吸伪影影响在飞动静脉主干部分交叉重叠显示，不能精准评判异位血管引流血管及细小变异分支，左右心系统各心房室搏动伪影重影响观察，房室口、缺损口、瓣口不可见。**结论**：积扫描模式所得图像清晰，运动伪影影响小，能准确评判心胸血管含细小分支血管形态走形及心脏房室分流情况。

EPO-0545
应用 IMR 重建技术的非门控胸部 LDCT 平扫评估冠脉钙化积分危险度分层新界值的研究

樊荣荣,施晓雷,钱懿,萧毅
海军军医大学第二附属医院（上海长征医院）

目的 探讨应用全模型重建技术（IMR）的非门控低剂量胸部 CT（LDCT）平扫一站式筛查评估冠脉钙化积分（CACS）危险分层的新界值。**方法** 前瞻性研究因病情需要行冠脉 CTA 检查的患者 102 例。所有患者均行包含心电门控 CT 平扫的冠脉 CTA 检查及非门控胸部 LDCT 平扫，并将后者进行 IMR 重建。在 Philips 星云工作站的 Heart-Beat CS Agatston 积分分析软件上分别测量非门控胸部 LDCT 平扫和心电门控 CT 平扫图像的 Agatston 积分。非门控胸部 LDCT 平扫评估的 CACS 值按原界值危险分层与传统门控法评估的 CACS 值危险分层进行 kappa 检验；采用 ROC 曲线检验非门控胸部 LDCT 平扫的诊断效能，取约登指数最大的截断点作为最佳界值（新界值），并对新界值所得非门控胸部 LDCT 平扫评估的 CACS 值危险分层与传统门控法评估的 CACS 值危险分层进行 kappa 检验。 **结果** 对非门控胸部 LDCT 平扫的 CACS 值按原界值进行危险分层，与心电门控 CT 平扫的 CACS 值危险分层进行一致性检验，kappa 值为 0.602，P<0.05。非门控胸部 LDCT 平扫测得的 CACS 值与心电门控 CT 平扫测得的 CACS 值低危-中危组的 ROC 曲线下面积为 0.962，P<0.05，最佳诊断界值为 87.44；中危-高危组 ROC 曲线下面积为 0.966，P<0.05，最佳诊断界值为 255.26。对非门

控胸部 LDCT 平扫测得的 CACS 值按最佳诊断界值进行危险分层，与心电门控 CT 平扫测得 CACS 值按原有界值危险分层进行一致性检验，kappa 值为 0.781，P<0.05。**结论** 该研究表明胸部非门控 LDCT 平扫与心电门控 CT 评估 CACS 值的一致性较高，但危险分层存在低估情况；故该研究制定了非门控条件下 CACS 值危险分层新标准，即低危为 1~87，中危为 88~255，高危为>255，使非门控法评估的 CACS 值危险分层更加准确。

EPO-0546

Myocardial Strain in Detecting Coronary Allograft Vasculopathy (CAV) after Heart Transplant (HT)

xuehue shen,Yating Yuan,Ming Yang,Bo Liang
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: Despite heart transplant (HT) with normal LVEF, myocardial strain based on deformation registration algorithm (DRA) are significantly decreased[1-3]. The purpose is to determine whether myocardial strain can differentiate between HT patients CAV0 and CAV1.
Method: About 40 HT patients (33 female; 44±16 years) at a median of 3.8 years after surgery, 20 healthy controls (6 female; 40±12.8 years) were enrolled from January in 2018 to March in 2019. Inclusion criteria were the HT patients with normal LVEF, no chronic atrial fibrillation, current confirmed or clinically confirmed acute rejection, no significant renal decline, no CMR and CT contraindications. Each participant was referred for a 1.5T MR scanner (MAGNETOM Aera, Siemens Healthcare) and CT scanner (SOMATOM Force, Siemens Healthcare, Germany) within two days. According to The International Society for Heart and Lung Transplantation (ISHLT) guidelines [4] (CAV0: no obvious stenosis and plaque; CAV1: stenosis< 50% in coronary CTA), 27 HT patients were ISHLT CAV0, 13 patients were ISHLT CAV1. Global longitudinal strain (GLS), global circumferential strain (GCS) and global radial strain (GRS) were from four-chamber long-axis view and short-axis views, RVLS was from right ventricular free wall, which were based on DRA (TrufiStrain, version 2.0, Siemens Healthcare). All subjects were tested ICC and COV.
Results: Biventricular GLS had significant decrease between the HT patients in ISHLT CAV0 and the healthy controls (LVGLS: -11.30±2.07% vs -14.95%±1.98%; P<0.001; RVLS: -12.97±3.39% vs -16.35%±2.35%; P=0.01), also, their peak systolic longitudinal strain rate had statistical difference (all P<0.005), while we did not find a significant difference in HT patients between ISHLT CA0 and ISHLT CAV1 (all P>0.05). Furthermore, Gradual decrease from endocardium to epicardium had been found in LVGLS and peak systolic longitudinal strain rate for all subjects. COV of LVGLS, RVLS, LVGRS and LVGCS were 0%, 1.8%, 3.5% and 1.8%. ICC for these strains were 97%, 96%, 95% and 99% respectively.
Conclusion:DRA is a reliable and robust analysis tool for quantifying global myocardial strain. Biventricular LS allowed discrimination between HT patients and control when with normal LVEF, while these parameters were limited in the detecting CAV and its severity.

Thin-Wall Cystic Lung Cancer

Xinying Xue
Beijing Shijitan Hospital, Capital Medical University, China

Thin-wall cystic lung cancer is uncommon. Consequently, there is a lack of knowledge concerning the features of this kind of lung cancer, which may lead to misdiagnosis and delayed treatment. The objective of this study is to understand the invasiveness and metastasis of thin-wall cystic lung cancer in its progression. The prognosis of this cancer will also be discussed. We attempted to determine the pathological interpretation of the imaging findings. Forty-five patients with this special lung cancer were analyzed retrospectively based on the review of medical records, radiological findings, pathological changes and treatment strategies. We also telephoned some of the patients in order to learn about their recent physical conditions. Thin-wall cystic lung cancer displayed suspected malignant signs. Most of them are adenocarcinoma, but some squamous cell carcinoma may also display cysts on their images. Although thin-wall cystic lung cancer is often thought to progress slowly, some may progress rapidly. Distant metastasis occurred in three cases, which is relatively rare. Cancer cells grow along the terminal bronchioles and destroy the lung tissues leaving the bronchial arteries and adjacent bronchi. Therefore, we can see separation in cysts on the images. In most cases the thin-wall cystic lung cancer grows slowly, but in a few cases it can be very aggressive.

2-shot compressed sensing techniques accelerate cardiac cine sequence acquisition and quantitative evaluation of diagnostic efficacy

Jian Wang[1],Xiao Li[1],Lu Lin[1],Jing An[2],Yi-ning Wang[1],Zheng-yu Jin[1]
1.Peking Union Medical College Hospital
2.Siemens Shenzhen Magnetic Resonance Ltd.

Purpose
In this perspective study, we try to introduce a 2-shot compressed sensing (CS) cine technique in cardiac magnetic resonance (CMR), to obtain fast high-quality cine images, and accurately access cardiac function close to standard cine sequence than the single-shot (ss) CS cine technique.
Materials &method
Enrolled patients underwent CMR on a 3T scanner (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany) from Jul. to Dec. 2018. Cine image was performed with 3 different methods: a standard segment cine sequence, a real-time single-shot CS (ss CS) cine sequence, and a prototype 2-shot CS cine sequence. Quantitative analysis of image quality was using a 0-4 score system, and cardiac function analysis were performed on all 3 types of cine images.
Result
35 patients were completed all 3 types of cine sequences. The average scan time was (100.3±20.6)s for standard cine, (20.1±4.1)s for ss CS cine, (30.1±6.2)s for 2-shot CS cine. The median for total image quality score was 4 for standard and 2-shot CS cine, 3 for ss CS cine. There was a significant difference in total quality between standard cine and ss CS cine (Z=-2.828, P=0.005), but not with 2-shot CS cine (Z=-1.000, P=0.317). In quantitative study of cardiac function, the differences between the standard cine and the ss CS cine were no statistically significant except for LV mass and LVESV, and there were no statistical differences between the standard cine and the 2-shot cine. There was a good correlation between standard cine and ss CS cine, and standard cine and 2-shot CS cine (P<0.01).
Conclusion
The 2-shot CS cine sequence and the ss CS cine sequence can acquire images significantly faster than the standard cine sequence, but the 2-shot cine sequence can acquire images that are closer to the quality of the standard cine sequence and can be used to accurately evaluate the cardiac function.

基于影像组学特征在非小细胞肺癌病理类型的预测价值的研究

梁长宇
重庆市肿瘤医院

目前肺癌仍是全球医学技术攻克的难点,有效降低每年高发的致死率和发病率同样是棘手的问题。由于肺癌中约 85%的患者为非小细胞肺癌(non-small cell lung cancer,NSCLC)类型。随着医疗水平的不断提高,非小细胞肺癌的预后治疗水平已经得到较大的提高,而非小细胞肺癌病理类型的检测

对非小细胞肺癌患者个体化治疗和改善预后都有重要的临床意义。然而,现有检测手段如穿刺、手术切除等虽然准确率很高,但风险亦高且检查结果需要较长时间。所以，本文的目的旨在探讨 CT 影像组学在鉴别不同病理类型非小细胞肺癌中的价值.
回顾性收集分析 2016 年 6 月～2018 年 9 月间行胸部 CT 扫描并经病理确诊的肺鳞癌 80 例,肺腺癌 60 例。将不同病理类型的非小细胞肺癌随机分为训练组及验证组,然后对每个病人的计算机断层扫描(Computed Tomography,CT)影像中进行高标准手动分割,将得到的感兴趣区域进行统一化处理。接着对每个病人提取 1620 个三维影像组学特征进行量化， 通过可重复性评估(组间、组内一致性系数>0.75)、去除高度相关的特征(相关系数>0 .6)，共筛选出 28 个稳定的特征，再通过降维得到 10 个诊断效能及鉴别效能较高的组学特征，采用多因素回归算法建立模型来预测非小细胞肺癌的病理类型，显示组学特征在训练集中具有较好的鉴别诊断效能，AUC 为 0.793。
影像组学特征在非小细胞肺癌病例类型的预测中具有较好的鉴别诊断效能.
影像组学特征在非小细胞肺癌病例类型的预测中具有较好的鉴别诊断效能。

GE64 排螺旋 CT 低剂量扫描对肺磨玻璃结节检出的价值探讨

刘涛
陆军军医大学附属新桥医院放射科

目的 分析探讨 GE64 排螺旋 CT 低剂量扫描对肺磨玻璃结节检出的价值。**方法** 46 例患者（体检者）第一次全部进行常规剂量 GE64 排螺旋 CT 检查，常规剂量扫描参数：覆盖患者胸部；一个月复查时采用低剂量 GE64 排螺旋 CT 扫描，扫描参数：120kv，50mA，0.8s/圈，10mm 层厚，1.0mm 重建间隔，螺距 0.938:1，视野（FOV）完全覆盖患者胸部。扫描全部由固定于 GE64 排螺旋 CT 的高年资技师操作，所得影像资料使用 ADW4.5 工作站进行测量处理。每个患者的 GE64 排螺旋 CT 影像由固定高年资胸部放射诊断医师进行阅片，重点观察 GGN 的大小、形态、密度、内部特点及结节边缘等情况，将一个月内前（常规剂量）、后（低剂量）两次肺部相同部位磨玻璃结节灶进行对比分析。**结果** 46 例患者中，首次经常规剂量 CT 扫描发现 48 个 GGN（其中一例为 2 个 GGN），一个月内低剂量 CT 扫描复查，共发现 45 个 GGN；直径约 4~17mm，其中>11mm 者 16 例（其中 5 例观察 3 个月后结节增大而手术，术后病理证实为浸润性腺癌）;5~10mm 者 21 例（其中 4 例手术，术后病理示：微浸润<5mm 者 9 例，3~6 个月随访 。小于 10mmGGN（经抗炎治疗后）随访患者中，有 8 例病灶吸收，5 例明显缩小（考虑为炎性病变），剩余病例无明显变化，继续观察复查。**结论** GE64 排螺旋 CT 等多排螺旋 CT 低剂量扫描在 GGN 的检查中具有较高的检出率，具有早诊断、早治疗和提高患者术后生存率的优点，同时还因其辐射低，适用于肺部健康普查。

基于纹理分析在肺癌病理分型及临床分期中的价值

鲍芳
安徽医科大学第二附属医院

肺癌是目前发病率最高的恶性肿瘤，且发病率逐年上升并呈年轻化趋势，临床公认肺癌的预后与肺癌的病理类型及分期有密切关联。CT 是肺癌最常用的影像学检查方法，CT 图像是由不同灰度的像素按矩阵排列构成，人体肉眼只能识别一定范围内的灰阶，而恶性肿瘤具有异质性，内部杂乱无章，CT 图像上大量的异质性信息无法从视觉上主观判断，随着医学图像处理技术的飞速发展，纹

理分析日趋成熟，可以量化分析图像像素灰度值的分布特征及变化规律，反映病灶内的不均质性，不受诊断水平及经验的影响。本研究正是基于纹理分析的方法，探讨纹理分析在肺癌病理分型及临床分期中的价值，为临床诊断及治疗提供一定帮助。

EPO-0553

MSCT 对含囊腔型肺癌的诊断价值

俞霞,吴德红,金利,顾梁瑞,张涛
十堰市太和医院

目的 分析含囊腔型肺癌的多层螺 CT（MSCT）表现，加深对此类肺癌的影像学认识，减少临床工作中对此类疾病的误诊、漏诊。 方法 回顾性分析 29 例经病理证实的含囊腔型肺癌患者的 CT 影像资料。所有患者均行 MSCT 扫描并进行多平面重建（MPR）后处理，根据主体病变密度不同，将其分成 3 型，分析主体病变与囊腔的位置关系及其周围伴随征象的影像学特征；随访患者评价 MSCT 的动态变化。结果 29 例中，表现为 I 型（磨玻璃密度灶伴囊腔）有 8 例（27.6%），其中磨玻璃密度灶中有 5 例表现为磨玻璃结节；II 型(实性结节伴囊腔）15 例（51.7%）；Ⅲ型（磨玻璃、实性结节混合病灶伴囊腔）6 例（21.7%）；所有病例中表现为主体病变（磨玻璃密度灶/实性结节）伴偏侧性囊腔者 26 例（89.7%），其余 3 例表现为磨玻璃灶伴中央型囊腔；11 例随访病例中，6 例发现实性成分体积增大、密度增高，8 例囊腔增大、壁增厚；6 例初期检查无囊腔，随访过程中出现囊腔。结论 含囊腔型肺癌的 MSCT 表现具有一定的特征性；结节伴偏侧性囊腔是含囊腔型肺癌较为典型的影像表现，综合分析主体病变、囊腔及其伴随征象的影像特征并结合该类病变影像上动态随访的变化特点可以对此类肺癌做出较为准确的诊断。

磁共振静脉成像诊断髂静脉受压综合征的价值

王绍娟[1],王利伟[2]
1.南京中医药大学附属医院，江苏省中医院
2.南京市第一医院

目的：评价磁共振非增强髂静脉成像诊断 Cockett 综合征的价值。**方法：**采用超导型 3.0T MRI 扫描仪，应用腹部表面线圈。扫描序列包括 M2DIPEAR（TR/TE=45/5.8ms，翻转角 60^0）、E-THRIVE (TR/TE= 6.8/3.5ms，翻转角 10^0)、BTFESPAIR(TR/TE= 3.4/1.7ms，翻转角 80^0)和 FLAIR （TR/TE=9000/12ms，翻转角 90^0)，层厚均为 3mm，平均采集次数 2 次。**结果：** Cockett 综合征的 MRV 表现包括受压髂静脉前后径变窄，横径增宽，血管前缘可见弧形压迹，侧支血管形成等；轻、中、重患者的左侧髂静脉平均直径分别为 7.52mm、4.83mm、2.76mm，平均受压率分别为 37%、69%、83%。**结论 ：**非增强 MRV 是可行的髂静脉狭窄诊断方法，尤其适用于特定人群的检查需要。

Study on the mechanisms of the formation of primary pulmonary mucinous adenocarcinoma with different imaging manifestations

Xinying Xue
Beijing Shijitan Hospital, Capital Medical University, China

Abstract: Objective To analyze the relevant mechanisms of the formation of pulmonary mucinous adenocarcinoma by observing its different imaging manifestations. **Data and methods** Retrospective analysis was conducted on imaging manifestations and pathological data of 103 patients with pulmonary mucinous adenocarcinoma confirmed intraoperatively or pathologically. **Results** 43 patients had pulmonary mucinous adenocarcinoma with a solitary nodule/mass.41 patients had pulmonary mucinous adenocarcinoma with localized pneumonia. They had specific CT manifestations, i.e., ground-glass shadows close to the heart, vacuous signs/cavity shadows/honeycombing and withered tree branches. 19 patients had pulmonary mucinous adenocarcinoma with diffuse pneumonia. Their CT manifestations included "falling snowflake sign," ground-glass shadows close to the heart, vacuous signs/cavity shadows/honeycombing and withered tree branches. Under the microscope, all the 3 types of pulmonary mucinous adenocarcinoma had visibly formed mucus lakes but were made of tumor cells with totally different shapes, which included the goblet-like shape (tall column-like shape) and quasi-circular shape. Tall column-shaped tumor cells were negative or weakly positive for thyroid transcription factor-1 (TTF-1) and strongly positive for ALK mutation; whereas quasi-circular tumor cells were positive for TTF-1 and less positive for ALK mutation. **Conclusion** The different imaging manifestations of mucinous adenocarcinoma are possibly due to the different amounts or viscosity of mucus produced, and the mechanisms of its formation may include (1) tumor cells in different shapes have different abilities to produce mucus; (2) tumors in different stages produce different amounts or viscosity of mucus; and (3) the TTF-1 and ALK genes affect the production of mucus.

EPO-0556

The Safety and Accuracy of Automated CT-Guided Mediastinal Biopsy Using an Extrapleural-Locating Method

Zhou Zhou
Zhongnan Hospital, Wuhan University

Aim: to describe and assess the accuracy and complications of CT-guided core biopsy using our extrapleural locating (EPL) method for minimally invasive diagnosis of mediastinal lesions.

Materials and methods: 164 patients with mediastinal lesions were enrolled between January 2017-January 2019. Post biopsy CT scan was performed and patients observed for

any complications. Tissue samples were taken to pathological analysis. The final diagnosis was based on surgical outcomes and imaging findings, clinical follow-up at least 6 months. A statistical analysis of correlation between various factors and diagnostic accuracy was performed to determine their possible influences on diagnostic accuracy.

Results: From the 164 biopsies, adequate tissue for histological diagnosis was abtained in 155 cases. Overall diagnostic accuracy was 90.3%. Factors affecting diagnostic accuracy were lesion size, method of histopathology and final diagnosis.

Conclusion: This EPL method has been demonstrated to be a safe, fast and accurate diagnostic method with reduced dwell time in the lungs compared with conventional techniques.

哮喘患者在肺功能检查中的分级与 HRCT 上的支气管壁厚度、肺气肿的关系探究

乔金晗,胡琼洁,刘艺文,夏黎明
华中科技大学同济医学院附属同济医院

目的：肺功能检查可反应气道受阻情况，哮喘表现为可逆性的气流受阻，其支气管壁在炎症等因素作用下可出现管壁增厚。我们的目的是探究肺功能分级不同的哮喘患者在 HRCT 上有无支气管壁的特异表现。
方法和材料：连续纳入了 110 例确诊为哮喘的患者及 50 例肺功能正常的体检患者，他们均行了肺功能和 HRCT 检查，按照肺功能将其分为对照组（50 例），实验 A 组（肺功能检查中一秒率>0.7 的哮喘组，57 例），实验 B 组（（肺功能检查中一秒率<0.7，但 FEV1 大于预计值的 70%， 34 例），实验 C 组（肺功能检查中一秒率<0.7，且 FEV1 小于预计值的 70%，18 例）。用 VIDA 软件测量各肺段支气管壁的平均厚度及管壁占总支气管的面积百分比。使用的统计方法有卡方检验，F 检验等。P<0.05 被认作有统计学意义。
结果：对照组与实验 A、B、C 组在支气管管壁厚度及壁厚面积百分比上均有差异（P<0.05）。实验 A 组和 C 组的支气管管壁厚度在右肺后段 、右肺外侧段、右肺上叶背段 、右肺后侧基底段、左肺上舌段有统计学差异；A 组和 C 组的支气管壁面积百分比在右肺后段、右肺外侧段、右侧内侧段、右侧后侧基底段、左侧前段、左侧上舌段、左侧背段（P<0.05）有统计学差异。B、C 组支气管管壁厚度在右侧后段、右侧外侧段、左侧上舌段、左侧下舌段、左侧前内侧基底段有统计学差异。实验 B、C 组在支气管壁面积百分比上没有统计学差异（P>0.05）。
结论：肺功能检查中分级较严重的哮喘患者，支气管壁厚面积百分比可能也增加，尤其是在右肺后段、右肺外侧段、右肺内侧段、右肺后基底段、左肺前段、左肺上舌段、左肺背段，他们的壁厚面积百分比可能与疾病进展有关系。

The Clinical research of deep bone suppression imaging and Multiple Imaging Methods in Solitary Pulmonary Nodules(SPNs)

Jiefang Wu[1],Genggeng Qin[1],Wei Yang[1,2],Le Ma[1],Weiguo Chen[1]
1.Department of Radiology, Nanfang Hospital, Southern Medical University
2.School of Biomedical Engineering, Southern Medical University

Objective: *to evaluate a newly developed bone suppression methods (deep Bone Suppression Imaging, deepBSI) for detecting Solitary Pulmonary Nodules (SPNs), comparing to Digital radiograph(DR), Dual energy substraction(DES), and Digital tomosymthesis(DTS)..*

Methods: *A total of 256 patients were collected from Nanfang Hospital from 2017 to 2018, 123 patients with SPNs (average diameter, 12.99 mm) and 133 patients without nodules. Overlap of bone structures was visually quantified by the researcher into minimal (<50% of lesion area), and partial to complete(50*～100%).72 nodules diameter less than 10mm,50 nodules diameter greater than 10mm.Three radiologists and three radiology residents marked suspicious-appearing nodules on the standard chest radiographs, deepBSI images, DES images, and DTS images in this study. Z-test and Receiver operating characteristic (ROC) analysis was used to evaluate observer performance.

RESULTS: *For all observers, the average area under the ROC curves (AUCs) was significantly improved from 0.717 with use of standard chest radiographs alone to 0.807 with standard plus deepBSI and to 0.800 with standard plus DES and to 0.888 with DTS (both P <0.001).The average AUCs for three radiology residents was significantly improved from 0.700 to 0.774 with deepBSI and to 0.762 with DES and to 0.844 with DTS (both P<0.001). The average AUCs for three experienced radiologists was significantly improved from 0.735 to 0.841 with deepBSI and to 0.838 with DES and to 0.930 with DTS (both P<0.001). When the nodule diameter was large than 10mm, the average AUCs were 0.952 with standard plus DES,0.976 with DTS by 6 observers, P=0.0755. The average AUCs were 0.825 with standard,0.848 with standard plus DES by 3 radiology residents , P=0.3838. The average AUCs were 0.867 with standard and 0.916 with standard plus DES by three radiology residents, for nodules with partial to overlapped by bones (P=0.0796).*

Conclusion: *Use of deepBSI imaging together with a standard radiograph can improve radiologists' accuracy for detection of SPNs on chest radiographs, especially for smaller nodules and nodules with partial to complete overlapping with bones. The diagnostic performance of deepBSI and DES is similar, further improvements can be achieved by use of DTS radiography but with the requirement for special equipment and a certainly increase in radiation dose.*

EPO-0559

基于深度学习卷积网络骨抑制技术与多种影像学技术对孤立性肺结节诊断效能的对比分析

吴杰芳[1],秦耿耿[1],阳维[2],贾铭[1],马乐[1],陈卫国[1],文婵娟[1]
1.南方医科大学南方医院
2.南方医科大学生物医学工程学院

目的：评估新型骨抑制技术——深度卷积网络骨抑制成像（deep bone suppression imaging，deepBSI）对孤立性肺结节（Solitary pulmonary nodule，SPN）的诊断效能，并与数字化 X 线片（Digital radiograph，DR）、双能量减影技术（Dual energy substraction，DES）进行对比分析。方法：收集我院 2016～2017 年拍摄标准胸部正位片共 247 例病例（114 例诊断 SPN，133 例为空白对照组）。3 位低年资及 3 位高年资医师共 6 位医师按 DR 图像→DR+deepBSI 图像→DR+DES 图像的阅片顺序，分别在三组图像上标出结节可能位置并评分，进行 Z 检验，应用 ROC 曲线分析三种检查方法对 SPN 的诊断效能。 结果：6 位医师，DR、deepBSI、DES 三种检查方法诊断 SPN 的 ROC 曲线下面积分别约 0.715、0.804、0.800，deepBSI、DES 诊断效能均优于 DR（P＜0.05）。当结节与肋骨重叠面积＞50%时，deepBSI、DES 二种方法相比于 DR 诊断 SPN 的诊断效能越好。结论：deepBSI、DES 诊断效能均优于 DR，有助于肺结节的检出，与肋骨重叠面积大的结节优势越显著，deepBSI、DES 诊断敏感性及特异性始终相似。

EPO-0560

CT-based radiomics and machine learning to predict spread through air space in lung adenocarcinoma

Chang-Si Jiang[1,2],Yan Luo[1,2],Jia-Lin Yuan[1,2],Shu-Yuan You[1,2],Zhi-Qiang Chen[1,2],Ming-Xiang Wu[1,2],Guang-Suo Wang[1,2],Jing-Shan Gong[1,2]
1.shenzhen people's hospital
2.The Second Clinical Medical College of Jinan University

Purpose: Spread through air space (STAS) is a novel invasive pattern of lung adenocarcinoma, is also a risk factor for recurrence and worse prognosis of lung adenocarcinoma. The aims of this study are to develop and validate a computed tomography (CT)-based radiomics model for preoperative prediction of STAS in lung adenocarcinoma.

Methods and materials: This retrospective study was approved by institutional review board and included 462 (mean age: 58.06 years) patients with pathologically confirmed lung adenocarcinoma. STAS was identified in 90 patients (19.5%). Two experienced radiologists segmented and extracted radiomics features on preoperative thin-slice CT images with radiomics extension independently. Intraclass correlation coefficients (ICC) and Pearson's correlation were used to rule out those low reliability (ICC<0.75) and redundant (r>0.9) features. Univariate logistic regression was used to select radiomics features which were associated with STAS. Random forest (RF) was used to develop a predictive model and calibrated with five-fold cross-validation. The diagnostic performance of the model was measured by the area under curve (AUC) of receiver operating characteristic (ROC).

Results: With univariate analysis, 12 radiomics features and age were found to be associated with STAS significantly. The RF model achieved an AUC of 0.918 (a

sensitivity of 0.861, a specificity of 0.850 and an accuracy of 0.857) for predicting STAS.
Conclusion: CT-based radiomics model can preoperatively predict STAS in lung adenocarcinoma with high diagnosis performance.

EPO-0561
能谱 CT 成像评价晚期非小细胞肺癌化疗近期疗效的价值

朱巧,任翠,张艳,李美娇,王晓华
北京大学第三医院

目的 探讨能谱 CT 定量参数评价晚期非小细胞肺癌化疗近期疗效的应用价值。**资料与方法** 前瞻性收集 34 例拟行化疗的晚期非小细胞肺癌患者，所有患者均在化疗前后行能谱 CT 检查，测量治疗前后病变的 CT 值、能谱定量参数及能谱曲线斜率（slope of spectral curve, λ）。根据 RECIST 1.1 标准将患者分为两组：有效组（完全缓解及部分缓解）和无效组（疾病稳定及疾病进展），比较两组患者治疗前后病变强化程度及能谱参数的差异。将治疗前有统计学差异的参数纳入 Logistic 回归方程筛选出有预测价值的参数，并生成预测化疗有效的新变量（new variable，NV），对进入方程的参数及 NV 进行 ROC 曲线分析，并比较其预测化疗疗效的能力。**结果** 有效组、无效组患者分别为 15 例、19 例，两组临床资料无统计学差异（$P>0.05$）。治疗前有效组动脉期标准化碘浓度（NIC_{AP}）、动脉期能谱曲线斜率（λ_{AP}）、静脉期标准化碘浓度（NIC_{VP}）、静脉期能谱曲线斜率（λ_{VP}）高于无效组（$P<0.05$）。有效组治疗后动脉期强化程度（ΔHU_{AP}）、静脉期强化程度（ΔHU_{VP}）、NIC_{AP}、NIC_{vp}均较治疗前降低（$P<0.05$）。NIC_{VP}及λ_{VP}进入 Logistic 回归方程，NIC_{VP}、λ_{VP}、NV 预测进展期 NSCLC 化疗疗效的曲线下面积（Area under the curve，AUC）分别为 0.832、0.823、0.898。NV 预测进展期 NSCLC 化疗疗效的 AUC 最大，两两比较 AUC 差异无统计学意义（$P>0.05$）。**结论** NIC_{AP}及NIC_{VP}值能够预测晚期 NSCLC 化疗疗效，两者联合可以提高预测的灵敏度及特异度。

Dual-energy CT-based electron density to differentiate early stage pneumoconiosis from pulmonary metastasis nodules

Huifang Liu,Hua Zhang
The First Hospital of Shanxi Medical University

Purpose: To investigate the value of dual-source dual-energy computed tomography (DECT)-derived electron density/effective atomic number Rho/Z in differentiating early stage pneumoconiosis from pulmonary metastasis.
Materials and methods: In this retrospective study, 54patients (44men; 10 women,mean age, 48.9 years)with either pneumoconiosis or pulmonary metastasis , who had undergone thorax DECT, were included. 39 pneumoconiosis and 15 pulmonary metastasis with 901 Silicon nodule and 199 Metastatic nodule,were recorded. For each lesion, unenhanced attenuation, as well as DECT-derived Rho and Z measurements were recorded. Mean attenuation, Rho and Z values were compared between

pneumoconiosis and pulmonary metastases. The receiver operating characteristic (ROC) curve analysis was adopted to estimate the optimal threshold for discriminating between both entities.
Results: Assessment of DECT-derived Rho and unenhanced attenuation revealed significant differences between pneumoconiosis (-51.76± 103.3 and -43.08 ± 111.37HU) and pulmonary metastasis (1.7 ± 89.85 and 8.7 ± 173.34HU) .No significant differences were found for Z values (P= 0.392).An Rho value of 4.25 represented the optimal threshold to discriminate between pneumoconiosis and pulmonary metastases. (sensitivity,72.4%; specificity, 66.6%).
Conclusion: Third-generation DECT with assessment of unenhanced attenuation and Rho improves the differentiation of pneumoconiosis and pulmonary metastasis, with Rho showing the stronger diagnostic performance.

EPO-0563

Evaluating mycardium microcirculation in breast cancer patients using CMR intravoxel incoherent motion imaging: a pilot study

Xin Li,Zhiyong Li,Qingwei Song,Ailian Liu
The First Affiliated Hospital of Dalian Medical University, China

Background and objective

Anthracyclines are the most common anticancer drugs in breast cancer chemotherapy. However, anthracyclines were reported to cause cardiac myocyte death and myocardial fibrosis, and then left ventricular dysfunction. Intravoxel incoherent motion (IVIM) technique is a non-invasive technology and it has been proved to detect mycardium microcirculation in humans.The purpose of the study was to evaluate the changes of left ventricular mycardium microcirculation in patients with breast cancer treated with anthracycline chemotherapy after 1 month by IVIM imaging.

Materials and methods

We randomly selected 4 female patients (aged 28-59 years, mean BMI 25.65±3.45 kg/m²) who received anthracycline antineoplastic drugs adjuvant chemotherapy after total mastectomy in our hospital between February and December 2017. All of them underwent CMR imaging before chemotherapy and 1 month follow-up. All patients were conducted on a 3.0T MR instrument (GE Signa HDxt magnetic resonance imaging scanner). The patients were scanned in the supine position using a dedicated 32-channel cardiac coil, TE 51.2 ms, TR 857 ms, b values 0、20、50、80、100、120、200、300、500 s/mm^2, TD 360~640 ms. The common left ventricular parameters(LVEDV、LVESV and LVEF) and IVIM parameters were quantitatively evaluated by GE ADW4.6 workstation. Comparisons of the measured values were performed by independent sample t test, $p< 0.05$ was statistically significant.

Result

There was no difference in the structure and function of left ventricle before and after anthracycline treatment, but the ADC_{fast} value of left ventricle showed an

decreasing trend in 1 months after chemotherapy compared with pretherapy (0.14±0.04 vs 0.12±0.03).

Conclusion

Anthracycline antineoplastic adjuvant chemotherapy has obvious toxicity on heart in breast cancer patients, CMR intravoxel incoherent motion imaging can quantitatively assess the changes of mycardium microcirculation in the early stage.

Assess the esophageal microcirculation of TIPSS postoperatively in esophageal variceal bleeding with spectral CT imaging

Ruyi Bao,Zhiyong Li
The First Affiliated Hospital of Dalian Medical University

Assess the esophageal microcirculation of TIPSS postoperatively in esophageal variceal bleeding with spectral CT imaging

R.-Y. Bao, Z.-Y. Li, Y. Ge, A.-L. Liu

PURPOSE

To quantitatively evaluate the efficacy of the transjugular intrahepatic portosystemic stent shunt (TIPSS) in treatment of esophageal variceal bleeding (EVB) by measuring effective iodine content (eIC) with spectral CT imaging.

METHOD AND MATERIALS

18 patients with esophagus venous bleeding with TIPSS treatment who had no detectable intrinsic lung and heart disease, underwent GSI scanning to collect iodine-water concentrations with a standard injection protocol before EVB and after treatment 2 weeks and 6 months. We measured eIC values of the esophageal wall in the lower

esophagus. We quantitatively evaluated the difference of eIC values between before EVB and after treatment by T-test.

RESULTS
Mean eIC values of the esophageal wall in the lower esophagus in before EVB, after treatment 2 weeks and 6 months were 38.00±11.7mg/ml, 20.64±9.60 and 22.18±4.62 mg/ml, respectively. Mean eIC values in before EVB was significantly higher than that after treatment 2 weeks (t=2.13, p=0.04) and that after treatment 6 months (t=3.14, p=0.03). But, there is no statistical difference between after treatment 2 weeks and 6 months.

CONCLUSION
The findings of this study suggest that effective iodine content of the esophageal wall may reflect esophageal blood perfusion, which is useful to quantitatively evaluate esophagus blood flow change in Postoperative evaluation of TIPSS and followed up in patients with esophageal variceal bleeding.

非小细胞肺癌 CT 灌注参数与 EGFR 基因突变的关系

李超
山西医科大学第一医院

目的：通过非小细胞肺癌的 CT 灌注参数来初步推断患者 EGFR 基因的突变情况，以便早期、合理地为患者找到个体化、最优化的治疗策略。**材料与方法：**从 2016.10 到 2018.3，收集山西医科大学第一医院可疑“胸部占位”并行 CT 灌注检查，患者经病理证实为非小细胞肺癌，且均进行了 EGFR 基因突变的检测，有效病例共 30 例。然后根据患者的 EGFR 基因是否存在突变，将 30 例肺癌患者分为 EGFR 突变组和野生组，其中突变组患者有 13 例（13/30, 43%），男 8 例，女 5 例；野生组患者 17 例（17/30，57％），男 11 例，女 3 例。然后分别计算肺癌患者病灶的 CT 灌注值：血流量（BF）、血容量（BV）、平均通过时间(MTT)、表面通透性(PS)。对突变组及野生组病例的肺癌病灶的 BF、BV、MTT、PS 进行比较。对有统计学意义的灌注参数再继续做 ROC 曲线分析，以评价其预测 EGFR 突变的判别能力，最后得出诊断的最佳阈值及相对应的灵敏度与特异度。**结果：**1. 在 30 例非小细胞肺癌患者中，EGFR 突变组有 13 例，占本次研究的 43%，其中腺癌 9 例，鳞癌 4 例；EGFR 野生组有 17 例，占本次研究的 57%，其中腺癌 7 例，鳞癌 10 例。2.EGFR 突变组的灌注参数 BF、BV、PS 均高于野生组，而 MTT 则野生组较高；突变组与野生组的 BV、PS 及 MTT 的组间差异均无统计学意义，BF 值有统计学意义。3. 对 EGFR 突变组与野生组的 BF 值进行 ROC 曲线分析，可得出当 BF 值达到 46.747ml·100ml-1·min-1 时可以判断非小细胞肺癌的 EGFR 基因发生了突变，其灵敏度和特异度分别为 80％、72.7％。**结论：**CT 灌注检查在初步推断 NSCLC 患者的 EGFR 基因突变情况方面具有一定的临床价值。

EPO-0568
能谱 CT 参数对低危型、高危型胸腺瘤及胸腺癌的鉴别诊断价值

周青,周俊林
兰州大学第二医院

目的 探讨能谱 CT 参数对低危型、高危型胸腺瘤及胸腺癌分型及鉴别诊断价值。**资料与方法** 收集 TETS 患者 35 例，其中低危型胸腺瘤(A、AB、B1)17 例，高危型胸腺瘤(B2、B3)11 例，胸腺癌(C)7 例。行平扫及双期增强能谱 CT 扫描，分别测量 40-140KeV 单能量 CT 值和碘(水)基物质浓度，计算能谱曲线斜率和标准化碘浓度，分析 40-100KeV 单能量、能谱曲线斜率及标准化碘浓度与低危型、高危型胸腺瘤及胸腺癌的相关性。**结果** ①40-100KeV 单能量 CT 值：强化程度上，低危型胸腺瘤>高危型胸腺瘤>胸腺癌，强化方式上，低危型胸腺瘤动脉期明显强化，静脉期强化减退，在 40-100KeV 单能量下，高危型胸腺瘤静脉期 CT 值高于动脉期，呈渐进强化方式；单能量 CT 值在低危型胸腺瘤与胸腺癌、高危型胸腺瘤与胸腺癌差异具有统计学意义。②能谱曲线斜率：动静脉二期低危型、高危型胸腺瘤及胸腺癌能谱曲线斜率差异具有统计学意义 (X^2=8.825,p=0.012;F=6.773,P=0.004)，③NIC 动静脉二期低危型、高危型胸腺瘤及胸腺癌 NIC 差异具有统计学意义(X^2=16.027,p=0.000;F=8.137,P=0.001)，**结论** 能谱 CT 参数 40-100KeV 单能量、能谱曲线斜率、碘基值对 TETS 术前评估有价值，可以帮助在术前做出分型及鉴别诊断。

EPO-0569
The Predictive Value of Energy Spectrum CT Parameters for Ki67 Expression of Lung Cancer

Peipei Dou,Yankai Meng,Kai Xu
the Affiliated Hospital of Xuzhou Medical University

Purpose To investigate the predictive value of energy spectrum CT parameters for lung cancer Ki67 expression.
Material and Methods Between December 2018 and February 2019, 27 primary lung cancer patients confirmed by pathological examination enrolled this prospective cohort study. All patients underwent baseline arterial phase (AP) and venous phase (VP) energy spectrum CT (ESCT) scan followed surgery in our institution. ESCT parameters {iodine value (IV) , iodine ratio (IR) and the slope of the 40-80 keV energy spectrum curve (SP)} were derived from dual-energy virtual imaging in Siemens postprocessed workstation . Pathological and immunohistochemical test were performed by an experienced pathologist . All enrollment patients clinicopathological data derived from electronic record system. SPSS 19.0 were used for statistical analysis. Quantitive and qualitative data used c2, t and Rank test respectively. ROC curves were used for analysis predicting performance of the Ki67 expression. $P<0.05$ was considered statistically significant.
Results Tumor was larger in Ki67 high expression group than low group (P=0.046). The other demographic and clinicopathological characteristics of all enrollment patients showed no significant difference (**Table 2**). Venous phase iodine value (IV), iodine ratio (IR) and the slope of the 40-80 keV energy spectrum curve (SP) improved than arterial phase IV, IR and SP, respectively (**Fig. 1**). The arterial phase IV, IR, SP and venous phase IV are no significant difference in low and high Ki67 expression group (P value ranged from 0.105 to 0.182) (**Table 3**). There are significantly different in two groups for venous phase IR and SP (0.249±0.083, 0.360±0.162, P=0.033 in IR and 1.744±0.607, 2.562±1.236, P=0.037 in SP, respectively) (**Table 3, Fig. 2**). Venous phase IR ROC analysis showed borderline P value (P=0.056) with AUC, sensitivity (SE), specificity (SP) and cutoff value were 0.717, 92.86, 61.54 and ≤0.347 respectively. The AUC, SE, SP and cutoff value of SP were 0.698, 92.86, 53.85 and ≤2.407 respectively (**Table 4, Fig. 6**).
Conclusion Venous phase IR and SP based on single energy spectrum curve and iodine image may effectively stratify primary lung cancer Ki67 expression into low and high group. The efficacy of other energy spectrum parameters need further investigation.

Clinical and Imaging features of Primary and Secondary Pulmonary Lymphoma: Discriminant Analysis Based on Logistic Regression Method

Yan Wang[1],Zhao Cheng Pan[1],Yuan Yuan Ma[1],Mu Chen Zhang[2],Li Wang[2],Wei Li Zhao [2],Fu Hua Yan [1],QI Song[1]
1.Department of Radiology, Shanghai Rui Jin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China
2.Department of Hematology, Shanghai Rui Jin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China

Objective To establish a predictive model for quantitative assessment of primary and secondary pulmonary lymphoma and to compare the characteristics between groups.
Methods A total of 111 patients with pulmonary lymphoma diagnosed from 2004 to 2018 were retrospectively reviewed. There were 24 males and 26 females with median age 56

years in 50 cases primary pulmonary lymphoma (PPL) patients, and 40 males and 21 females with median age 59 years in 61 cases secondary pulmonary lymphoma (SPL) patients. The clinical features included symptoms (asymptomatic, B symptoms and respiratory symptoms), serum lactate dehydrogenase (LDH) level and stage. Two radiologists evaluated the patterns and characteristics of CT findings. $\chi 2$ tests or Fisher's exact tests were performed for the comparison of the differences in clinical features and imaging findings between groups. The significant variables of were further applied to discrimination between PPL and SPL based on *Logistic* regression analysis. *P* value on the left side of the inflection point of the ROC curve according to discrimination probability was used as a criterion to discriminate PPL and SPL.

Results *Logistic* discriminant function for prediction of PPL and SPL was Logit *P*=-0.746-0.125 B symptoms (without=0, with=1)-0.502 LDH level(normal=0,elevated=1)-2.744 stage(I+II=0,III+IV=1)+0.296 number(single=0,multiple=1)+1.294 air bronchogram(without=0, with=1)-1.618 halo sign(without=0,with=1)+1.669 bulging fissure sign(without=0, with=1)+2.062 bronchiectasis(without=0, with=1)-0.868 pleural involvement(without=0,with=1)-0.347 hilar/mediastinal lymphadenopathy (without=0, with=1). *P*=0.575 was used as a criterion. The false positive rate was 12.6%, the sensitivity was 88.5%, and the specificity was 86.0%. In this sample, the rations of the number of SPL patients who were staged I+II and III+IV, and without and with air bronchogram, halo sign and bronchiectasis were 0.064, and 3.646, 0.198 and 7.860, respectively.

Conclusions Patients staged III+IV and who show halo sign suggest the diagnosis of SPL. Air bronchogram with bronchiectasis is a characteristic CT finding of PPL patients. Discriminant analysis based on *Logistic* Regression method can be used as a prediction method of PPL and SPL, which has a high clinical value.

CT-based Radiomics Features of Carcinoids and Large Cell Neuroendocrine Carcinomas of the Lung: Differential Diagnosis

aocai Yang,Sai Shao,Guangbin Wang
Shandong Medical Imaging Research Institue

Objective: We aimed to differentiate carcinoids, including typical carcinoids (TCs)and atypical carcinoids (ACs), and large cell neuroendocrine carcinomas(LCNECs) of the lung by studying conventional CT image characteristics and radiomics features.

Materials and Methods: We retrospectively enrolled 33 patients (25 men and 8 women; mean age, 57 years ±11.37; range,33-81 years) between January 2013 and May 2018, including 17 patients and 16 patients with histologically confirmed carcinoids and LCNECs, respectively. Lesions were analyzed and delineated manually by two senior radiologists who were blinded to the clinical information of the patients. 107 quantitative imaging features (including first order statistics, shape- and size-based features and texture features) were extracted from CT images of all patients. We used

the least absolute shrinkage and selection operator (LASSO) algorithm methods to select the optimal features and then constructed k-Nearest Neighbor (KNN) model. ROC curve analysis was used to evaluate the prediction ability of the radiomic signatures. Independent sample t-tests and chi-square tests were used to compare the specific CT features of two groups, and Kappa value was used to evaluate consistency between observers.

Results: We select 5 features from 107 features using LASSO method and the model using radiomic feature set showed diagnostic accuracy of 0.85 (AUC, 0.946; 95% CI,0.81 - 1.00; sensitivity, 0.92; specificity, 0.75). Lobulated and lymphadenopathy are significant differences observed between carcinoids and LCNECs ($p<0.05$), and the diagnostic accuracies are both 0.37 (sensitivity, 0.38; specificity, 0.33). Kappa value is 0.68 between observers.

Conclusions: By the contrast of conventional CT features, radiomic features are better to distinguish carcinoids and LCNECs as a biomarker, which is crucial for the preoperative evaluation.

EPO-0572
基于 HRCT 特征探究叶间胸膜下周围型肺腺癌脏层胸膜侵犯的研究

汤敏,伍建林
大连大学附属中山医院

目的 基于 HRCT 征象建立叶间胸膜下周围型肺腺癌脏层胸膜侵犯的预测模型，提高术前预测脏层胸膜侵犯水平。**方法** 收集 2016-2018 年于大连大学附属中山医院经手术病理证实位于叶间胸膜下（距离胸膜＜1.0cm）且与叶间胸膜存在毗邻关系的周围型肺腺癌 72 例，其中有侵犯脏层胸膜组 15 例（20.8%），非侵犯脏层胸膜组 57 例（79.2%），单因素分析两组 HRCT 征象，对有统计学差异的变量纳入二元 logistic 回归分析，行受试者工作特征（ROC）曲线，评估其预测效能；在 HRCT 平扫或增强图像中将肿瘤与叶间胸膜的毗邻关系分为 3 型，I 型：肿瘤与叶间胸膜呈 1 条或多条索条影牵拉；II 型：肿瘤紧邻叶间胸膜但未见明显胸膜移位；III 型：叶间胸膜向肿瘤内部凹陷。**结果** 脏层胸膜侵犯组中叶间胸膜毗邻关系 I 型 6 例（40.0%）、II 型 1 例（6.7%）、III 型 8 例（53.3%），与非脏层胸膜侵犯组间差异有统计学意义（X^2=11.758 p=0.003）。单因素分析显示平均长径、平均 CT 值、分叶征、肿瘤-胸膜距离、肿瘤-胸膜毗邻关系在两组间差异有统计学意义（$p<0.05$）。将叶间胸膜毗邻关系 II、III 型定义为紧邻叶间胸膜，关系 I 型为非紧邻叶间胸膜。二元 logistic 回归分析显示平均长径、平均 CT 值、紧邻叶间胸膜是预测叶间胸膜下浸润性肺腺癌的独立危险因素（OR=6.849，95%CI：1.629-28.793；OR=4.674，95%CI：1.066-20.491；OR=2.163，95%CI：0.577-8.112），进一步得出二元 logistic 回归模型预判浸润性肺腺癌的 AUC 为 0.828。**结论** 在本研究结果提示，平均 CT 值、平均长径值、叶间胸膜毗邻关系 II、III 型有助于术前预测叶间胸膜下周围型肺腺癌脏层胸膜侵犯的情况，从而一定程度上指导临床合理选择手术方式及后续治疗。

一箭双雕:CT 冠脉成像后扩展 DFOV 再重建在检出肺部病变中的意义

陈晓侠
陕西中医药大学附属医院

目的：探讨 CT 冠脉成像后扩展 DFOV 再重建在检出肺部病变中的意义。**方法：**随机连续选择 170 例行 CT 冠脉成像检查的患者，男 91 例 女 79 例，年龄 33-85 岁，平均 60.1 岁。按照常规检查流程及方法行冠脉成像及诊断。然后以肺野中心为中心扩展 DFOV，使 Z 轴范围内的 X、Y 轴肺野能够全部显示，用 lung、stnd 两种算法、50%ASIR、1.25mm 层厚，分别重建肺窗和纵膈窗。重建后的图像传输至工作站，由有两年以上工作经验的诊断医师分别在肺窗和纵膈窗上观察、检测并记录肺部病变。
结果：83 例患者未检出肺部病变，87 例患者检出肺部病变 140 处，其中结节性影 24 处，软组织影 5 处，条索灶 22 处，渗出性病灶 27 处。肺气肿 8 处，肺大泡 29 处，胸腔积液 2 处，支气管扩张 9 处，胸膜病变 12 处，肺纤维化 1 例，肺栓塞 1 例。
结论：常规 CT 冠脉成像后扩展 DFOV，用不同算法、多窗位重建，约 51%患者可以检测出扫描范围内肺部病变，起到一箭双雕的作用，对肺部疾病的早发现、早治疗具有重要意义。

Imaging and pathological analysis of esophageal sarcomatoid carcinoma

Jiantao Yang
zhejiang cancer hospital

【Abstract】
Objective To analyze and compare imaging and pathological characteristics of esophageal sarcomatoid carcinoma and improve the understanding of it. **Method** To retrospectively analyze 18 patients pathologically confirmed esophageal sarcomatoid carcinoma on imaging and pathological characteristic, and to summarize the connection between the imaging and pathological characteristic. **Results** 9 patients underwent esophageal angiography, 6(6/9) patients showed endoluminal lesion type, esophageal barium swallow 3 cases showed medullary type. Based on the CT findings, the patients were divided into two types which include endoluminal mass type (6) and luminal wall thicken type (12). 6 endoluminal mass type patients showed intraluminal mass with clear margin and mild lobulation, peritumoral fat space were clear, no swollen lymph node. 12 cases manifested as luminal wall thicken type, 10 cases infiltrated the whole circle of the esophagus. Extraluminal fat space were obscure in 9 cases (9/12), 8 cases suffered from lymphadenopathy. Pathology examination showed that most of the intraluminal mass type tumor invaded the submucosa layer (4/6), only 1 case with lymph node metastasis (1/6). Infiltrated luminal wall thicken type showed 7 cases infiltrated the whole layer and extra membrane of the esophagus, 5(5/8) cases confirmed with lymph node metastasis.
Conclusions Esophagus sarcomatoid carcinoma manifests as endoluminal mass type shows intraluminal polypoid mass, larger masses with unmatched lower tumor infiltration depth degree and low lymph node metastasis rate, esophageal wall infiltrated thicken type suffered from higher infiltration depth and lymph node metastasis rate.

EPO-0575

CT diagnosis and differential diagnosis of thymic neuroendocrine tumor

Jiantao Yang
zhejiang cancer hospital

Abstract

Objective: To investigate the CT features of primary thymic neuroendocrine tumors. Material and Methods The clinical and imaging data of 13 patients confirmed thymic primary neuroendocrine tumor by histopathology and immunohistochemistry were retrospectively analyzed. Result Of the 13 patients, three were 3 female and 10 male. There were 5 cases of atypical carcinoids, 1 case had typical carcinoid, 2 cases had small cell neuroendocrine carcinoma, and 5 cases of neuroendocrine carcinoma without detailed definite classification furthermore. One case was associated with bilateral adrenal cortical hyperplasia. Thymic neuroendocrine tumors generally characterized by large mass (4.6 cm to 12.8 cm), more irregular margin (n = 7), most cases had no capsule and the boundary is obscure (n = 8), with uneven density, obvious tumor necrosis or cystic degeneration (n = 10), rare calcification (n = 1), no significant hemorrhage or separation, the tumors showed uneven mild-to-moderate enhancement after contrast, 3 cases with pleural and pericardial effusion, majority invaded mediastinal fat or heart, large blood vessels (n = 12) and 4 cases had mediastinal lymph node enlargement, 3 cases of distant metastasis. Conclusion Most primary thymic neuroendocrine tumors are large masses with irregular shape, uneven density, heterogeneous enhancement and local invasion, and necrotic cystic changes are common, if accompanied by Cushing syndrome diagnosis can be made. CT examination is helpful for disease staging and guiding treatment decision

EPO-0576

Relationship between computed tomography imaging features and clinical characteristics, Masaoka-Koga stage, and World Health Organization histological classification of thymoma

Xiaowei Han,Wenwen Gao,Guolin Ma
Department of Radiology, China-Japan Friendship Hospital

[OBJECTIVES] Computed tomography (CT) is an important technique to evaluate the condition and prognosis of patients with thymomas, and it provides guidance regarding the treatment strategy. However, the correlation between CT imaging features, described using standard report terms, and clinical characteristics, Masaoka-Koga stage, and WHO classification in patients with thymomas has not been described in detail nor has risk factor analysis been conducted. [METHODS] Overall, 159 patients

with thymomas and preoperative contrast-enhanced CT conducted from September 2011 to December 2018 were retrospectively reviewed. We assessed the clinical information, CT imaging features using standard report terms, and pathological findings for each patient. The relationship between CT imaging features and clinical characteristics, Masaoka-Koga stage, and WHO histological classification were analyzed, and related risk factors based on CT imaging features were identified. [RESULTS] CT imaging features did not significantly differ based on sex and age. Some imaging features demonstrated significant differences between the groups with and without related clinical characteristics. Among all imaging features, there were significant differences between stage I/II and III/IV lesions in tumor size, calcification, infiltration of surrounding fat, vascular invasion, pleural nodules, elevated hemidiaphragm, and pulmonary nodules. Tumor size (odds ratio [OR] = 1.261, P = 0.014), vascular invasion (OR = 2.526, P = 0.023), pleural nodules (OR = 2.22, P = 0.048), and pulmonary nodules (OR = 3.106, P = 0.006) were identified as independent risk factors. Tumor size, contours, internal density, infiltration of surrounding fat, and pleural effusion significantly differed between low- and high-risk thymomas. Tumor size (OR = 1.183, P = 0.048), contour (OR = 2.288, P = 0.003), internal density (OR = 2.192, P = 0.024), and infiltration of surrounding fat (OR = 2.811 P = 0.005) were independent risk factors. [CONCLUSIONS] Some CT imaging features demonstrated significant correlations with clinical characteristics, Masaoka-Koga clinical stage, and WHO histological classification in patients with thymomas. Some imaging features were identified as referential independent risk factors in the clinical evaluation of thymoma.

肺混合性鳞状细胞和腺性乳头状瘤 2 例报道

李梦云,石国儿,邱立艳
中国科学院大学宁波华美医院

[摘要] **目的** 了解肺混合性鳞状细胞和腺性乳头状瘤的临床病理特征。**方法** 总结分析中国科学院大学宁波华美医院 2 例病理诊断为肺混合性鳞状细胞和腺性乳头状瘤的患者临床、影像及病理学资料。患者男女各 1 例；年龄分别为 70 岁及 54 岁；CT 分别显示为右肺中叶及左肺下叶后基底段斑片、团片影，大小分别约 12*25*13mm、55*47*56mm，形态均不规整且考虑为肿瘤性病变。2 例均行肺叶切除术。**结果** 显微镜下均见肿瘤与周边肺组织分界不清，病理符合混合性鳞状细胞和腺性乳头状瘤。2 例患者术后随访时间分别为 8 个月及 31 个月，均未出现复发和转移。**结论** 肺混合性鳞状细胞和腺性乳头状瘤是罕见的肺良性肿瘤，临床及影像表现无特异性，正确诊断依赖于病理组织学及免疫组化。

多层螺旋 CT 评价不同类型心房颤动患者 左心房和左心耳功能

李彩英[1],卓利勇[1],袁迎芳[1],田伟伟[1],杨兰[1],陈琛[1]
1.河北医科大学第二医院
2.河北大学附属医院

目的 采用多层螺旋 CT 定量测量心房颤动（简称房颤）患者左心房、左心耳功能，探讨不同房颤分型患者间左心房、左心耳功能差异。**方法** 收集 71 例房颤患者，其中阵发性房颤（PAF）患者 40 例，持续性房颤（PeAF）患者 31 例。应用心功能后处理软件测量房颤患者左心耳最大容积（$LAAV_{max}$）、左心耳最小容积（$LAAV_{min}$）、左心房最大容积（LAV_{max}）和左心房最小容积（LAV_{min}），并计算左心耳射血分数（LAAEF）、左心耳射血量（LAAEV）、左心房射血分数（LAEF）、左心房射血量（LAEV）。**结果** PeAF 患者 LAAEF、LAEF、LAEV 小于 PAF 患者(P均<0.01)，$LAAV_{max}$、$LAAV_{min}$、LAV_{max}、LAV_{min}均大于 PAF 患者(P均<0.05)。2 组患者间 LAAEV 差异无统计学意义（P=0.23）。房颤患者 LAAEF 与 LAEF 呈正相关（r=0.57，P=＜0.01），与房颤持续时间呈负相关（r=－0.26，P=0.03）。**结论** 应用多层螺旋 CT 可以客观评价左心房和左心耳功能，对认识不同房颤分型左心耳和左心房功能改变有重要临床意义。

EPO-0579

Correlation Between Radiomics Features and Ki-67 Expression in Peripheral Lung Cancers

Wei Wei,Dong Han,Lihua Fan,Yongjun Jia,Yuxin Lei,Nan Yu,Yong Yu
Affiliated Hospital of Shaanxi University of Chinese Medicine

Objective: To develop CT image feature-based radiomics signatures to estimate the expression level of Ki-67 in peripheral lung cancers.
Methods: 117 peripheral lung cancer patients who underwent contrast-enhanced CT had confirmed histopathologically and tested for Ki-67 expression into 2 levels: low expression (n=63) and high expression (n=54). Patients were divided into training (n=82) and validation cohorts (n=35). The arterial phase images were imported into the ITK-SNAP to manually delineate volume of interest (VOI) of the entire-tumor. Each VOI produced 396 radiomics features including Histogram, GLCM, GLSZM, RLM, Form Factor and Haralick. LASSO regression was used for feature screening to generate a radiomics score. Then multivariate logistic regression analysis (MLRA) was used combining clinical information to screen out independent risk factors for predicting Ki-67 expression level. The predictive accuracy of radiomics signatures was quantified by the area under curve (AUC) of a ROC curve in both cohorts. The calibration degree (CD) of the radiomics was evaluated by Hosmer-Lemeshow test. The clinical usefulness of the radiomics signatures was assessed by decision curve analysis (DCA).
Results: Seven radiomics features with non-zero coefficients were chosen to build a radiomics model that significantly correlated with Ki-67 expression level with an AUC, sensitivity, specificity and CD of 0.844, 93%, 71% and 0.709 in training cohort; and 0.881, 91%, 75% and 0.950 in validation cohort, respectively. There were no significant differences in gender, age and smoke between the high and low Ki-67 expressions (P>0.05). Radiomics signatures were considered to be independent predictor of Ki-67 expression level in peripheral lung cancer, and if the threshold probability was between 0.03 and 0.63, using radiomics signatures to predict Ki-67 expression level added more benefit than treating either all or no patients.
Conclusions: The CT image feature-based radiomics is helpful to predict the expression of Ki-67 in peripheral lung cancers, providing a non-invasive technique for assessing the invasiveness and prognosis for peripheral lung cancers.

EPO-0580

Differentiation of focal organising pneumonia and peripheral adenocarcinoma in solid lung lesions using thin-section CT-based radiomics

Teng Zhang
First Affiliated Hospital of Nanjing Medical University

AIM: To evaluate the predictive role of radiomics based on computed tomography (CT) scans in discriminating focal organizing pneumonia (FOP) from peripheral lung adenocarcinoma (LA).
MATERIALS AND METHODS: This retrospective study obtained institutional research board approval. We established the comprehensive information of 226 pathologically confirmed patients (117 patients with FOP and 109 patients with LA). Clinical and radiological features were established as model A and a multi-feature based radiomics as model B. Diagnostic performance of model A, model B and model A+B were evaluated and compared via receiver operating curve (ROC) analysis and logistic regression analysis.
RESULTS: Sex, symptomatic, necrosis and halo sign were identified as independent predictors of LA. The area under the ROC (Az value), accuracy, sensitivity and specificity of the model A were 0.839, 75.7%, 82.6% and 69.2% respectively. Model B showed significantly higher accuracy than model A (83.6% vs 75.7%, P = 0.032). The top four best-performing features: WavEnLH_s-3, WavEnHH_s-3, Teta3 and Volume performed as independent factors for discriminating LA. Regression analysis exhibited that model B had superior model fit than model A with Akaike information criterion (AIC) values of 73.6% vs. 59.1%, respectively. Combining model A with model B is useful in achieving a better diagnostic performance in discriminating FOP from LA, the Az value, accuracy, sensitivity and specificity were 0.956, 87.6%, 85.3% and 89.7% respectively.
CONCLUSIONS: Radiomic based on CT scans exhibited better diagnostic accuracy and model fit than clinical and radiological features in discriminating FOP from LA. Combination both of them achieved better diagnostic performance.

EPO-0581

Histogram analysis combined with morphological characteristics to discriminate adenocarcinoma in situ or minimally invasive adenocarcinoma from invasive adenocarcinoma appearing as pure ground-glass nodule

Teng Zhang
First Affiliated Hospital of Nanjing Medical University

Objective: To construct a predictive model to discriminate adenocarcinoma in situ (AIS) or minimally invasive adenocarcinoma (MIA) from invasive adenocarcinoma (IAC) appearing as pure ground-glass nodules (pGGNs) using computed tomography (CT) histogram analysis combined with morphological characteristics and to evaluate its diagnostic performance.
Materials and Methods: Two hundred eighty-nine patients with surgically resected solitary pGGN and pathologically diagnosed with AIS, MIA, or IAC in our institution from January 2014 to May 2018 were enrolled in our study. Two hundred twenty-six pGGNs (79 AIS, 84 MIA, and 63 IAC) were randomly selected and assigned to a model-development cohort, and the remaining 63 pGGNs (11 AIS, 29 MIA and 23 IAC) were assigned to a validation cohort. The morphological characteristics were established as model A and histogram parameters as model B. The diagnostic performances of model A, model B, and model A+B were evaluated and compared via receiver operating curve (ROC) analysis and logistic regression analysis.
Results: Entropy (odd ratio [OR]=23.25, 95%CI: 6.83-79.15, p<0.001), microvascular sign (OR=8.62, 95%CI: 3.72-19.98, p<0.001) and the maximum diameter (OR=4.37, 95%CI: 2.44-7.84, p<0.001) were identified as independent predictors in the IAC group. The area under the ROC (Az value), accuracy, sensitivity and specificity of model A+B were 0.896, 88.1%, 79.4% and 91.4%, respectively, exhibiting a significantly higher Az value than either model A or model B alone (0.785 vs 0.896, p<0.001; 0.849 vs 0.896, p=0.029). Model A+B also conveyed a good diagnostic performance in the validation cohort, with an Az value of 0.851.
Conclusion: Histogram analysis combined with morphological characteristics exhibit a superior diagnostic performance in discriminating AIS-MIA from IAC appearing as pGGNs.

EPO-0582
CT 动态能谱成像评估在肺癌碘分布值与灌注参数的相关性

李琳,罗娅红
辽宁省肿瘤医院

目的 应用东芝 640 层探测器 CT 机对所有患者进行 CT 动态能谱成像扫描，通过 CT 动态能谱一站式扫描探讨原发性肺癌病灶中血供特征和碘分布值的特点，以期为临床诊断及预判提供指导。
方法 53 例经病理诊断为肺癌的患者，均行 CT 动态能谱成像。在副台 Dual Energy 能谱处理程序中处理每一组能谱得到碘图，通过碘图测得肿瘤的碘分布值；用 Dual input perfusion 程序进行肺双入口灌注分析，得到主动脉血流 AF、肺动脉血流 PF、和血流灌注指数 PI 值 [PI = PF/(PF + AF)] 。所有数据均测量三次取平均数。采用 Spearman 相关分析探究肺癌的碘分布值与各灌注值之间的相关性，以 P ＜0.05 为差异具有统计学意义。
结果 Spearman 相关分析结果显示:病灶碘值与灌注值 AF 值呈正相关(相关系数为 0.349，P ＜ 0.05，P=0.010)，病灶碘值与灌注值 PF 值呈正相关(相关系数为 0.294，P ＜ 0.05，P=0.032)，病灶碘值与灌注值 PI 无相关性。患者的有效辐射剂量为 6.81mSv。
结论 能谱 CT 成像中病灶碘值与灌注 CT 成像中主动脉血流量和肺动脉血流量具有显著相关性。

EPO-0583
一站式能谱及灌注成像在孤立性肺结节鉴别诊断中的应用价值

李琳,罗娅红
辽宁省肿瘤医院

目的 通过 CT 动态能谱一站式扫描对孤立性肺结节中血供特征的评价，探讨孤立性肺结节中血供特征的差异，以期为临床诊断及预判提供指导。
方法 对 62 例孤立性肺结节患者进行前瞻性能谱 CT 与灌注 CT 一站式扫描，最后经病理证实恶性结节 53 例，良性结节 9 例，其中恶性结节中腺癌 27 例，鳞癌 13 例，小细胞癌 13 例，类癌 2 例。将扫描图像在副台 Dual Energy 能谱处理程序中处理每一组能谱数据得到动态碘图，通过动态碘图测得肿瘤的碘分布值峰值；用 Dual input perfusion 程序进行肺双入口灌注分析，得到病灶的主动脉血流 AF、肺动脉血流 PF、和血流灌注指数 PI 值 [PI = PF/(PF + AF)] 。
结果 良性结节的 AF 值和 PI 值高于恶性结节，恶性结节的参数平均 PF 和碘值均高于良性结节。在 AF，PI 和良性结节的碘值峰值上有统计学差异。恶性结节[P <0.05（P = 0.004,0.018,0.023）]，而 PF 的差异无统计学意义。此外，良性结节的 AF，PI 和碘平均值有统计学差异。和腺癌[P <0.01（P = 0.000,0.004,0.014），而 PF 的差异不显着。患者的有效辐射剂量为 6.81 mSv。
结论 一站式能谱及灌注成像技术具有实现能谱及灌注成像同时完成的优势,得到的灌注参数和能谱参数对于孤立性肺结节的鉴别诊断具有临床价值。

EPO-0584
基于 CT 征象的 Logistic 回归模型预测非小细胞肺癌脏层胸膜侵犯的临床研究

汤敏,伍建林
大连大学附属中山医院

目的 基于 CT 征象，利用二元 logistic 回归建立预测模型来评估非小细胞肺癌脏层胸膜侵犯。**方法** 回顾性分析 173 例周围型非小细胞肺癌患者的一般临床资料及 CT 特征，将单因素分析有统计学意义（p＜0.05）的因素纳入二元 logistic 回归分析中，确定脏层胸膜侵犯的独立危险因素，建立二元 logistic 回归方程，行受试者操作（ROC）曲线，评估其预测效能。**结果** 173 例非小细胞肺癌中脏层胸膜侵犯 50 例（28.9%），无脏层胸膜侵犯 123 例（71.1%）。单因素分析显示肿瘤病理分化、分叶征、毛刺征、肿瘤-胸膜关系、肿瘤大小、肿瘤实性成分长径及 C/T 比值在两组间差异均有统计学意义（p＜0.05）。多因素逻辑回归分析结果显示肿瘤-胸膜关系Ⅳ型（胸膜凹陷征）、肿瘤大小、肿瘤实性成分长径是脏层胸膜侵犯的独立危险因素，建立二元 logistic 回归方程：$P=e^x/(1+e^x)$，X=-2.714+1.436（肿瘤实性成分长径）+1.434（肿瘤大小）+1.223（胸膜凹陷征），得到预测脏层胸膜侵犯的 ROC 曲线下面积（AUC）为 0.842，该风险模型预测脏层胸膜侵犯的敏感度为 68.0%，特异度为 87.0%。 **结论** 本研究结果提示肿瘤-胸膜关系Ⅳ型（胸膜凹陷征）、肿瘤大小、肿瘤实性成分长径是非小细胞肺癌脏层胸膜侵犯的独立危险因素，logistic 回归模型能有效预测脏层胸膜侵犯。

EPO-0585
磁共振多参数成像在乳腺癌分子分型中的诊断价值

聂丹
成都市第五人民医院

目的：探讨磁共振多参数成像在乳腺癌分子分型的诊断价值。**方法：**收集 2017 年 1 月－2018 年 12 月成都市第五人民医院收治并经手术病理证实的 112 例乳腺癌患者的 MRI 影像学资料及免疫组织化学检查结果，并采用卡方检验进行统计学分析。**结果：**Luminal A 及 B 型乳腺癌形态多为分叶状、T_2WI 信号以高及亮高信号为主、强化多均匀；HER2 过度表达型乳腺癌多呈类圆形、T_2WI 等低信号、增强扫描均匀或不均匀强化；三阴性乳腺癌以类圆形、T_2WI 等高信号、环形强化为主，而在病灶大小、病灶边缘、曲线类型差异无统计学意义（P>0.05）。**结论：**不同分子分型乳腺癌在 MRI 影像学表现上有一定特征性，有可能早期预测肿瘤不同分子状态，提高术前诊断率。

EPO-0586
探讨肺结节圆度在预测纯磨玻璃结节浸润性中的应用研究

巴文娟
大连大学附属中山医院

目的：本研究旨在评估肺结节圆度在预测纯磨玻璃结节恶性浸润程度的价值。方法:回顾性分析大连大学附属中山医院 2017 年 3 月-2018 年 6 月接受肺切除手术并有病理证实的 pGGN116 例，其中非典型腺瘤样增生（AAH ）8 例、原位腺癌（AIS）55 例、微浸润腺癌（MIA）13 例、浸润性腺癌(invasive adenocarcinoma,IAC）40 例。其中 AAH 和 AIS 为非浸润组（noninvasive cancer, NC，共 63 例），MIA 和 IA 为浸润组（invasive cancer, IC，共 53 例）。通过绘制受试者工作曲线（ROC）评估肺结节圆度、最大截面面积、最大截面周长、最长径及平均 CT 值预测肺腺癌恶性浸润程度的诊断效能，采用二元 logistic 回归分析，确定预测纯磨玻璃结节样肺腺癌侵袭性的独立危险因素。结果：pGGN 圆度、最大截面面积、最大截面周长、最长径及平均 CT 值对鉴别是否为浸润组病变差异具有统计学差异（P<0.05），pGGN 圆度、最大截面面积、最大截面周长、最长径及平均 CT 值的 ROC 曲线下面积分别为 0.900、0.761、0.801、0.804、0.690。二元 logistic 回归分析显示 pGGN 圆度、最长径、平均 CT 值是鉴别非浸润组及浸润组病变的独立影响因素。结论：pGGN 圆度在鉴别其是否为浸润性腺癌具有较高的临床诊断价值。

EPO-0587
Using 4D dynamic imaging for assessing bronchial invasion in central lung cancer patients

Na Li,Yahong Luo
LIAONING CANCER HOSPITAL & INSTITUTE

PURPOSE

To analyze the feasibility of lung cancer bronchial invasion using 4D dynamic CT imaging on 320-row volume CT.

METHOD AND MATERIALS

4D dynamic imaging was performed on patients with central lung cancer and bronchial invasion. Before scanning, the patients were subjected to breath training. The patients need to perform a deep breathing during the whole scanning period. 4D dynamic CT scanning was performed for 10 seconds continuously with rotation rate at 0.5

seconds and a total of 21 dynamic image phases were reconstructed. The maximal diameter of the bronchus at the infiltrating site of the tumor of each phase was measured and compared with the maximum diameter of the contralateral bronchi.

RESULTS

The direction of the maximum diameter of the normal bronchus was changed with the respiratory movement, and the bronchus of cancer invasion with the respiratory movement was very small.

CONCLUSION

Application of 4D dynamic imaging is feasible for the analysis of lung cancer infiltrating bronchi.

EPO-0588

Synchronous evaluation of cardiac function as a potential prognosis indicator with non-gated heart-brain CTA for patients of acute ischemic stroke: feasibility

Yimeng Zhang
Xuanwu hospital

Purpose: To validate the feasibility of measuring cardiac function with free breathing non-gated heart-brain CTA in patients of acute ischemic stroke using a 16 cm detector CT.

Materials and methods: Study protocol was approved by the institutional review board. Brain perfusion scan and heart-brain CTA were performed with a 16cm detector CT scanner (GE revolution), on patients of acute ischemic stroke. The CTA protocol includes a single heartbeat cardiac CTA and a spiral scan from the heart to the brain. Cardiac CTA was performed under simulated ECG triggering without wire connection. 1.25 mm axial images of the heart were reconstructed at each 5% R-R interval of the simulated ECG for cardiac function evaluation, including the ejection fraction of left ventricle (LVEF) and left atrium (LAEF). 0.625 mm images at the best phase were also reconstructed for CTA evaluation, as well as the axial images of the carotid and cerebral arterial regions. Cardiac function data was measured automatically by the work station and semi-automatically by two independent observers. The accuracy of target phases determination and cardiac function evaluation of the work station was evaluated. The objective image quality score (4 points) of CTAs of coronary arteries, and the mean CT value and contrast to noise ratio (CNR) of thoracic aorta, carotid arteries and vertebral arteries were also evaluated.

Results: Totally 24 patients received heart-brain CTA. Cardiac function measurements were successful in all the cases, with a mean LVEF of 68.00%±7.16, LAEF of 52.05%±13.32. The accuracy of automatic end-diastole and end-systole determination was 100%. The average image quality score of all coronary segments was 3.10±0.82. The mean CT value and CNR of thoracic aorta, carotid arteries and vertebral arteries were 429.01±107.30(thoracic aorta),
556.35±137.52(LICA),559.80±136.80(RICA),545.29±124.06(LVA),542.42±135.40(RVA),21.68±6.14（CNR）, respectively. The total DLP of the CTA scan was 139.03±72.31.

Conclusion: Cardiac function can be measured using the scan data from non-gated heart-brain CTA, providing additional information for stroke patient management.

EPO-0589

Study of the correlation between different CT scanning parameters and image quality along with radiation doses of simulated lung nodules

Shengkun Peng
Department of Radiology, Sichuan Province of people's Hospital

To investigate the influence of different scanning parameters (tube voltages and tube currents) on image quality and corresponding radiation doses with simulated lung nodules in chest CT. **Methods** The anthropomorphic chest phantoms with 12 simulated, randomly placed nodules of 4 different diameters (3mm,5mm,8mm, and 10mm) and 3 different densities (-630HU, -800HU, and +100HU) in the chest were scanned by different scanning parameters. The detection rate, the degree of nodular deformation, image quality (with subjective evaluation and objective evaluation) and the corresponding radiation doses were recorded and evaluated, and the correlation between the parameters mentioned above and different scanning parameters was analyzed. **Results** The image quality improved with the increase of tube voltage and tube current (P<0.05). When the tube current was constant, the CT values of the vertebral decreased gradually with the increase of tube voltage(P<0.05). However, no significant difference was detected in the CT values of the lung field (P>0.05). When the tube current was 100mAs, the CT values of lung nodules showed statistical difference when using different tube voltage in both high density nodules (+100HU) and ground glass nodules (-630 HU) (P<0.05); but no significant difference in lower density nodules (-800 HU) (P=0.57). When tube voltage was 100kV or 120kV, all lung nodules were detected (detection rate of 100%) with any current. The detection rate was 33% and 66% for nodules with diameters of 3mm when the parameters were 80kV/15mAs and 80kV/20mAs, respectively. The nodules deformation in nodules with CT value of -630HU and diameter less than 5mm was the most prominent (P<0.05). After analyzing the relationship between image quality (Y) and radiation doses (X) using different tube voltages, we established the correlation equations: 80kV: Y=2.625x+0.038; 100kV: Y=14.66x+0.158; 120kV: Y=18.59x+0.093. **Conclusion** The image quality improved with the increase of tube current and tube voltage, but the corresponding radiation doses were also increased. By reducing the tube voltage and increasing the tube current appropriately, we can reduce the radiation doses. Follow-up CT examination of pulmonary ground glass nodules should apply the same tube voltage imaging parameters, in order to effectively reduce the measurement error of nodule density and evaluate the change of nodules more accurately.

EPO-0590

双源 CT 大螺距（＞2.4）在常规胸部中的图像质量及剂量研究

李开
中国科学院大学附属肿瘤医院（浙江省肿瘤医院）

目的：探讨大螺距技术在常规胸部中图像质量、剂量如何变化，是否可以在胸部检查中代替常规螺距；方法：将 45 例胸部检查患者随机分成三组，螺距分别为 1.2、2.4、3.2，每组 15 例，测量纵隔窗（350、20）上三个层面 CT 值，分别是胸锁关节（胸大肌），主肺动脉层面（主动脉），膈顶层面（竖脊肌），计算 SNR 及 CNR;记录 DLP,计算有效剂量 ED,三组比较采用独立样本 T 检验，p＜0.05 有意义；结果：三组胸大肌 CT 值分别为 46.9±5.4、57.4±11.4、48.4±13.8，SNR 分别为 6.4±1.8、6.2±2.0、5.6±2.1，CNR 分别为 21.6±7.0、18.5±3.0、17.9±5.4，其中 CT 值、SNR、CNR 三组两两比较差异无统计学差异（p＞0.05）；三组降主动脉 CT 值分别为，37.7±7.9、46.6±7.4、41.8±6.4，SNR 分别为 3.5±1.2、4.1±1.0、2.9±0.7，CNR 分别为 13.4±4.6、13.1±2.9、8.9±2.7，其中 CT 值比较 1.2 组和 2.4 组差异有统计学意义，另外两两比较差异无统计学差异，3.2 组 SNR、CNR 与其它两组较差异有统计学意义；三组竖脊肌 CT 值分别为 46.1±11.2、50.2±16.9、45.5±16.1，SNR 分比为 3.4±0.9、3.4±1.9、3.2±1.3，CNR 分别为 11.6±3.3、9.6±2.7、9.6±2.3，其中 CT 值、SNR、CNR 三组两两比较差异无统计学差异;三组 ED 分别为 4.8±1.1、3.5±0.8、2.7±0.4，三组 ED 两两比较差异有统计学意义（p＜0.05）;结论：随着螺距加大，有效剂量相应的降低，各层面图像质量基本无变化，可用于诊断，在常规胸部检查过程中可以适当加大扫描螺距，降低辐射剂量。

EPO-0591

Association between cardiac CT parameters and risk of stroke in atrial fibrillation patients with low CHA2DS2-VASc score prior stroke

Jun Wang
Jiangsu Province Hospital

Background: Cardiac CT angiography (CCTA) has recently emerged as a useful tool to assess left atrium appendage (LAA) structure and detect intracardiac thrombus accurately. Published data has demonstrated that LAA morphology is an independent risk factor for stroke in atrial fibrillation (AF) patients. We investigated the association between size, hemodynamic statement and morphology of LAA from CCTA and history of stroke in AF patients withlow CHA_2DS_2-VASc score.
Method: We retrospective reviewed 210 consecutive AF patients with a low CHA_2DS_2-VASc score (≤1) who obtained CCTA prior to ablation, and 28 (13%) had a prior stroke. Baseline demographic data was obtained from abstraction of an electronic medical records system. Left atrium (LA) diameter, LA volume and LAA volume were measured utilizing a semi-automated 3D workstation application. The hemodynamic statement of LAA was determined by detecting filling defect in two-phase CCTA images. LAA morphology (Cactus, Chicken-Wing (CW), Windsock, Cauliflower) was assessed by volume rendered images.
Results: Patients with prior stoke had a larger LA diameter (47.2±9.7 mm vs 41.0±7.5 mm, p<0.001), LAVi (94.1±39.2 ml/m^2vs 73.1±25.1 ml/m^2, p<0.001) and LAAVi (8.8±4.5 ml/m^2vs 7.0±4.0 ml/m^2, p = 0.031).When comparing CW morphology with non-CW morphology, stroke occurred more frequently in the non-CW patients (19% vs 9%, p = 0.039).Patients

with a thrombus or circulatory stasis of LAA was associated with higher observed rates of prior stroke (53% vs 18%, p<0.001). After controlling for CHA_2DS_2-VAScscore, smoke, hyperlipidemia and AF types in a multivariable logistic model, patients with non-CW of LAA (OR: 0.3, 95% CI: 0.1-0.7, P = 0.003), thrombi or slow blood flow in the LAA(OR: 5.2, 95% CI: 2.3-12.0, P < 0.001) and enlarged LA diameter (OR: 1.1, 95% CI: 1.0-1.1, P = 0.011) were found to be more likely to have a prior stroke history.
Conclusion: Non-CW morphology, thrombi or stasis in the LAA and enlarged LA diameter were more likely associated with a prior stroke for AF patients with low CHA_2DS_2-VASc score. These findings may have relevant impact on anticoagulation management in AF patients at low risk of stroke.

基于影像组学的肺结核与肺癌的 CT 影像鉴别研究

蔡久娥
辽宁省肿瘤医院

摘要：目的：由于肺癌和肺结核在图像上有时难以鉴别，想借用影像组学的方法精确分类肺癌和肺结核。 方法：收集本院肺癌 206 例，胸科医院的肺结核 547 例，通过影像组学方法提取特征，用双样本 t 检验选出具有显著统计学差异的特征，再用 extraTree 提取出 20 个特征。通过构建四种模型训练，鉴别肺癌和肺结核。 结果：使用 AUC 值描述实验结果。通过比较朴素贝叶斯、随机森林、逻辑斯蒂回归，支持向量机四种分类器，逻辑斯蒂分类在测试集的准确率为 95%，ROC 曲线下面积 AUC 为 0.97，表现最好。结论：通过影像组学的方法可以对不同机器的肺癌和肺结核图像进行分类鉴别，可适用于筛查。

CT 能谱成像在矽肺结节诊断中的应用价值

刘荣荣[1],陈光强[2],李敏[1]
1.苏州市第五人民医院
2.苏州大学附属第二医院

目的 探讨 CT 能谱成像的观察指标对矽肺结节的初步应用价值。方法确诊的矽肺 27 例和对照组 20 例。所有研究对象行能谱 CT 能谱模式（GSI）扫描，应用能谱分析软件分析 70～140keV 单能量 CT 值、有效原子序数、基物质对浓度并纳入统计学分析，两组间集中趋势差异性检验采用非参数 Mann-Whitney U 检验。矽肺结节测得指标与对照组结节鉴别采用 ROC 曲线描绘，以 P <0.05 为差异有统计学意义。结果 1.矽肺组与对照组 70～140keV 单能量 CT 值、有效原子序数、基物质对浓度差异有统计学意义（P < 0.001）。2. 70～90keV 单能量 CT 值 ROC 曲线下面积在 0.816~0.843（＜0.85），100~140keV 单能量 CT 值 ROC 曲线下面积在 0.859~0.877（＞0.85）；基物质对浓度 ROC 曲线下面积在 0.894~0.905（＞0.85）；有效原子序数 ROC 曲线下面积（0.923）最大，敏感性和特异性指标值分别为 93.58%和 81.67%。结论 能谱 CT 有效原子序数是矽肺结节诊断最有价值的指标。

EPO-0594

Patients with pulmonary B-cell non-Hodgkin’s lymphoma: characteristic CT findings and role in predicting the survival

Yan Wang
Department of Radiology, Shanghai Rui Jin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China

Purpose: To evaluate the value of characteristic CT findings to predict the survival of patients with pulmonary B-cell non-Hodgkin’s lymphoma (NHL).
Materials and methods: We retrospectively enrolled 84 patients with pulmonary B-cell NHL confirmed by pathology between 2004 and 2018. All patients underwent chest CT scan at initial diagnosis in our hospital. Characteristic CT findings and clinicopathological features of them were analyzed. Cox regression models were performed to analyze the relation between characteristic CT findings and OS (overall survival) and PFS (progression-free survival).
Results: Air bronchogram occurred more frequently in patients with early stage,primary pulmonary lymphoma (PPL) and indolent histological type than those with advanced stage, secondary pulmonary lymphoma (SPL) and aggressive histological type (all p<0.05). Halo sign was observed more in the SPL group(p=0.004). While the presence rate of cross lobe sign was higher in patients with PPL (p=0.010). Pleural involvement and hilar/mediastinal lymphadenopathy were observed more in patients with SPL and aggressive histological type (all p<0.05). In survival analyses, the number of lung lesion, cross lobe sign and pleural involvement were independent prognostic factors for PFS; while halo sign and pleural involvement were significantly correlated with OS (all p<0.05). Besides, more aggressive, advanced stage and male patients showed worse outcomes.
Conclusions: Halo sign and pleural involvement are independent prognostic factors for OS; while the number of lung lesion, cross lobe sign and pleural involvement are correlated with PFS.

EPO-0595
动态增强 MRI 半定量分析及 DWI 在肺内空洞性病变良恶性鉴别诊断中的价值

周莹
连云港市第一人民医院

目的 探讨动态增强 MRI（DCE-MRI）半定量分析及 DWI 在肺内空洞性病变良恶性鉴别诊断中的价值。方法：回顾性分析 42 例经病理及临床证实的肺内单发空洞性病变，其中良性空洞 15 例，恶性空洞 27 例，行 DCE-MRI 及 DWI 检查，观察空洞边界、形态、信号及时间-信号曲线（TIC），测量空洞平均直径、平均壁厚、洞壁表观弥散系数值（ADC）及不同增强期相空洞壁的信号强度，计算达峰时间（TTP）、半峰时间（THR）、最大增强幅度（MRE）、最大斜率（MS）、首过 60 秒曲线下面积（IAUC60）、廓清率（WOR）及早期强化率（EWIR）等半定量参数。分析采用成组 t 检验、两独立样本 *Mann-Whitney U* 检验、χ^2 检验及行×列表资料的 Fisher 确切概率法精确检验。在单变量

分析的基础上筛选出 MRI 形态学征象中与空洞良恶性相关的统计学变量，再采用线性回归进一步分析。采用 ROC 曲线分析半定量参数对良恶性空洞的诊断效能。结果：空洞平均直径、平均壁厚、空洞内、外壁形态、空洞壁 T1WI 信号、洞壁 TIC 及空洞内容物、内部 T1WI、T2WI、DWI、ADC 信号在两组间差异有统计学意义（*P* 值均＜0.05）。线性回归显示空洞内部 T2WI 信号、洞内壁形态、洞内 ADC 信号及洞壁 TIC 曲线与空洞性病变良恶性有显著相关性。半定量参数分析显示 TTP、MS 和 IAUC60 两组间差异均有统计学意义（*P* 值均＜0.05），各指标 ROC 曲线下面积（AUC）分别为 0.746、0.721、0.714，其中 TTP 的诊断效能最高（95%CI0.557～0.935），鉴别良恶性空洞的最佳阈值为 150s，其诊断良恶性的敏感度为 60.0%，特异度为 92.6%。结论：DCE-MRI 形态学征象、DWI、动态增强特征及半定量分析对肺内良恶性空洞性病变的鉴别诊断具有一定的临床应用价值。

EPO-0596

肩背部弹力纤维瘤的影像学表现

华荣
徐州市中心医院

目的：探讨肩背部弹力纤维瘤(elastofibroma dorsi，EFD)的 X 线、CT 和 MRI 表现及其诊断价值,提高对 EFD 的认识。
方法：收集 2013 年 1 月至 2017 年 5 月经手术病理及临床证实，并接受影像学检查的 24 例肩背部弹力纤维瘤患者，观察患者的 X 线、CT 和 MRI 表现及病理改变。统计学处理采用 SPSS 软件，以 P <0.05 为差异有统计学意义。
结果：共 24 例患者，女性患者 17 例，男性患者 7 例,年龄 19 ～88 岁，平均 58.4 岁，左侧 2 例(8.3%)，右侧 8 例(33.3%)，双侧同时发病 14 例(58.3%)，总共 38 个病灶，肩背部弹力纤维瘤发病部位均位于肩胛骨内侧前锯肌与胸壁间的脂肪间隙内，表现为扁平椭圆状或半圆形的软组织肿块，X 线显示发病侧脂肪间隙局部较健侧受压、外移；病灶边缘不规整,病灶外侧与前锯肌和肩胛骨交界部分界不清，脂肪间隙消失。肩胛下区扁丘形软组织密度肿块，此种影像表现为“余肌征”(即形似额外生长出来的肌肉组织)。肿瘤边界清或不清，内见条形脂肪密度沿着病灶长轴呈条纹状分布，这是其特征表现，周围骨质无破坏，临近肌肉弧形受压；MR 信号多不均匀：纤维成分 T1WI 及 T2WI 呈低信号，病变内见散在脂肪组织，T1WI 及 T2WI 呈高信号，压脂后条片状 T1WI 高信号被抑制；1 例患者 MRI 增强扫描中度不均匀强化。男女性发病率差异均有统计学意义(P <0.05)，双侧发病时，右侧病灶大于左侧，左右侧病灶大小差异有统计学意义(P <0.05)。
结论：背部弹力纤维瘤好发于老年人群，女性多见，常累及双侧肩胛下区，表现为稍低于肌肉密度，血供不丰富，病理学上弹力纤维染色阳性为确诊方法。EFD 发病部位固定，影像学表现特殊，CT 及 MRI 检查可明确诊断，X 线检查有提示作用。肩胛骨与胸壁之间的机械性摩擦可能是肿瘤生长的协同因素。

EPO-0597

慢性阻塞性肺疾病认知功能障碍的初步分析

张曦
陆军军医大学第二附属医院（新桥医院）

目的探讨稳定期慢性阻塞性肺疾病（COPD）患者认知功能障碍的发生率及其相关影响因素。方法采集 35 例 COPD 稳定期患者（COPD 组）及 35 例健康志愿者（对照组）的临床资料,通过 Mo CA 量表对两组研究对象进行认知功能评估,研究 COPD 稳定期患者认知功能障碍的发生率;采用 Pearson 偏

相关分析、 χ^2检验,按肺功能、呼吸困难分级标准对患者进行亚组分析,明确患者肺功能、血气分析相关临床指标与 COPD 患者认知障碍的相关性。采用 Logistic 多因素回归分析对 COPD 患者认知障碍相关影响因素进行分析。结果 COPD 患者组评分较对照组评分显著降低,P<0.05,其认知障碍发病率为 60.0%,高于对照组 28.6%（P<0.05）;按肺功能分级,轻中度组（FEV1≥50%）和重度组（FEV1<50%）COPD 患者的认知障碍发生率无明显差异（P>0.05）;按呼吸困难程度（m MRC）评分分级的 COPD 患者认知障碍发生率有统计学意义（P<0.05）。COPD 患者 Mo CA 量表评分与 PaO_2值之间呈正相关（r=0.386,P=0.047）,Mo CA 量表评分与 $PaCO_2$值之间呈负相关（r=-0.398,P=0.040）。单因素分析显示,稳定期 COPD 患者的文化程度、CAT 评分、PaO_2、$PaCO_2$与 COPD 患者认知功能障碍的发生具有相关性（P<0.05）。Logistic 回归多因素分析显示,受教育程度、吸烟指数是 COPD 稳定期患者发生认知障碍的独立危险因素（P<0.05）。结论 COPD 患者发生认知障碍的风险明显增高,其病情严重程度与认知功能下降程度有明显相关性,受教育程度、吸烟指数是 COPD 患者发生认知功能障碍的独立危险因素。

Compared to left atrium, left atrial appendage function and myocardial remodeling play a greater role in recurrence of AF after radiofrequency ablation

Xin Tian,Caiying Li,Yingfang Yuan
The second hospital of Hebei Medical University

Objective: To quantitatively measure the left atrial and left atrial appendage function with 256-slice spiral CT, including the volume strain, and to evaluate the role of left atrium and left atrium appendage in the recurrence of atrial fibrillation (AF) after radiofrequency ablation.
Methods: 63 patients with AF who underwent radiofrequency ablation for the first time were enrolled in this study. The average age was 59.43 (+10.67), BMI was 25.99 (+3.60 kg/m2), and 38 (60.3%) males. The median follow-up time was 19 (4-24) months, and 20 (31.7%) recurred. According to the recurrence of AF after radiofrequency ablation, the patients were divided into recurrence group (n = 20 cases) and non-recurrence group (n = 43 cases). All patients underwent 256-slice spiral CT examination before operation. The original image was reconstructed from 5% to 95% of the cardiac cycle and the interval was 10%. The maximum volume of left atrial appendage (LAAVmax), minimum volume of left atrial appendage (LAAVmin), left atrial appendage emptying fraction (LAAEF), and left atrial appendage ejection volume (LAAEV), left atrial appendage volume strain (LAA-VS), maximum volume of left atrium (LAVmax), minimum volume of left atrium (LAVmin), left atrial emptying fraction (LAEF), left atrial ejection volume (LAEV), and left atrial volume strain (LAVS) were measured and calculated during the whole cardiac cycle. They were processed by statistical methods.
Results: The CHA2DS2-VASc score of recurrence group was higher than that of non-recurrence group ($P < 0.05$). According to the analysis of clinical data, the proportion of patients with persistent atrial fibrillation and heart failure in recurrence group was higher than that in non-recurrence group (P<0.05).

The LAAVmax, LAAVmin, LAVmax and LAVmin in the recurrence group were higher than those in the non-recurrence group ($P < 0.05$), while LAAEF, LAEF and LAA-VS in the recurrence group were lower than those in the non- recurrence group ($P < 0.05$). There

was no difference of LA-VS between the recurrence group and the non- recurrence group. Multivariate Cox proportional hazard regression analysis showed that LAAEF was an independent predictor of recurrence after radiofrequency ablation of AF (HR: 0.790 95% CI: 0.657-0.950 P = 0.012). ROC curve analysis showed that LAAEF < 44.68% had the highest predictive value for recurrence after radiofrequency ablation (area under curve 0.817), sensitivity was 90%, specificity was 67.4%.
Conclusion: LAAEF is a predictor of recurrence after radiofrequency ablation of atrial fibrillation. Compared with left atrial volume strain, left atrial appendage volume strain which represented fibrosis of left atrial appendage myocardia, is more useful in evaluating myocardial remodeling associated with recurrence of atrial fibrillation after radiofrequency ablation.

EPO-0599
食管癌 CT、MR 长度的测量与手术病理大体标本对照

王亚宁,时高峰
河北医科大学第四医院

目的 探讨食管癌的病变长度和病变部位在 CT、MRI 和术后大体标本上的差异以及磁共振扩散成像 b 值的选择。**方法**食管肿瘤 29 例，进行 CT 增强扫描、MR 常规平扫及增强、DWI（ｂ=0ｓ/ｍｍ^{2}和ｂ=50、200、400、600、800、1000ｓ/ｍｍ^2）扫描；分别测量长度，将食管肿瘤病变长度与ＣＴ、Ｔ2ＷＩ、DWI 及手术切除病理大体标本病变长度比较。**结果** 在测量病变长度方面，CT 测量肿瘤平均长度确实存在较明显误差，b 值为 400、600、800 s/mm2 时 DWI 图像显示病变长度与病理结果间均无显著性差异(P=0.168)；T2WI 与病理无显著性差异(P>0.05)。b 值为 400、600、800 s/mm2 时 DWI 图像显示病变长度与 T2WI 显示病变长度间无显著性差异(P>0.05),与 CT 显示病变长度有显著性差异(P<0.05)。**结论** 采用 b 值为 400、600、800ｓ/ｍｍ2,ＤＷＩ图像显示病变长度与病理结果间有良好的一致性,与ＭＲＴ2ＷＩ在显示病变长度方面有较好的对应关系，优于 CT。

EPO-0600
碘基图联合 CT 灌注一站式扫描在食管癌中的初步应用价值

李扬,时高峰
河北医科大学第四医院

目的：初步探讨使用 Revolution CT 双能量联合灌注一站式扫描在食管癌中的应用价值。
材料方法：使用 Ge Revolution CT 对 30 例食管癌患者进行能谱及灌注一站式扫描，患者均未发现转移并手术治疗。扫描流程：①平扫：选择灌注及能谱扫描范围。管电压电 120KV，使用 SmartAm 技术，管电流 100-450mm，旋转时间 0.5s，螺距 0.992：1，层厚 5mm。②第一次灌注扫描：FOV 包括食管癌病变，探测器范围 16cm。使用高压射器注射 I300 70-90ml，5s 后开始扫描（10 个 passes），每 pass 扫描时间为 0.5s，间隔 2s，总曝光时间 5s，总时间 23s。管电压 100KV，管电流 70mA，重建层厚 1.25mm，使用图像优化技术 AsiR（80%）。③第一次能谱扫描：动脉期，范围包括胸部(或胸+上腹部)。管电压 80-140KV，管电流 200mA，重建层厚 1.25mm，球管旋转时间 0.5s，螺距 0.9921。④第二次灌注扫描：感兴趣区及扫描条件同第一次完全一致。⑤第二次能谱扫描：静脉期，扫描参数同动脉期。⑥第三次灌注扫描：延时期，同前两次灌注。使用 CT perfusion 4D 体部灌注软件获得各灌注参数，使用能谱软件获得碘图各参数。

结果：①碘基图结果：病变食管碘图值高于正常食管壁。高分化、中分化、低分化食管癌患者间 IC 值（标准化碘浓度）、Ia 值（动脉期碘浓度）、Iv 值（静脉期碘浓度）差异均有统计学意义。②灌注结果：BV、BF、TTP、MMT、PS、PEI 食管癌病变高于正常食管壁，差异具有统计学意义。低分化食管癌组 BV、BF、TTP、MMT、PS、PEI 大于高分化癌，差异具有统计学意义。
结论：食管癌双能量联合灌注一站式扫描可以获得更多的功能学信息，能谱扫描获得的碘基图可以预测食管癌的分化程度，并与灌注的某些参数具有较高的一致性。

EPO-0601
能谱 CT 双低技术评价终末期肾病患者中心静脉狭窄闭塞的临床应用

李知晓
中南大学湘雅医院

目的：能谱 CT 低造影剂用量及低辐射剂量评价终末期肾病患者中心静脉狭窄闭塞的临床应用。方法：采用 GE revolution 256 排 CT 能谱扫描技术获得 40、50、60、70、80KeV 不同能谱等级图像。选取上肢肿胀或者累及至颜面部肿胀的终末期肾病患者 28 例，注射造影剂剂量为 1.0ml/kg，流速 3.0ml/s 或 3.5ml/s，注射等渗非离子型造影剂碘克沙醇(320mgI/ml)后 45s 启动扫描。利用 adw4.7 工作站进行的容积再现（VR）、最大密度投影（MIP）、多平面重建（MPR）及曲面重建（CPR）。由 2 名医师对图像质量进行主观评分及给予诊断意见同时亦记录 CT 机自动生成的剂量报告。结果：上腔静脉闭塞 4 例，上腔静脉闭塞及单侧颈内静脉狭窄闭塞 5 例；上腔静脉狭窄、单侧头臂及颈内静脉狭窄闭塞 6 例；单侧头臂静脉闭塞 7 例；双侧头臂静脉狭窄 3 例；单侧锁骨下静脉狭窄 3 例。两位医师对图像质量的主观评价具有非常好的一致性。结论：利用能谱 CT 扫描技术，最少的造影剂、低的辐射剂量及强大的后处理技术能全景显示中心静脉狭窄闭塞情况，给临床进一步诊治提供依据。同时显影最佳的单能谱能级是 50KeV。

EPO-0602
Differential diagnosis efficacy of thymic solid tumors with intravoxel incoherent motion diffusion-weighted MRI

Shijun Duan,Yuchuan Hu,Guangbin Cui
Tangdu Hospital, the Fourth Military Medical University

PURPOSE
A retrospective study was conducted to evaluate the differential diagnosis performance of intravoxel incoherent motion diffusion-weighted imaging (IVIM-DWI) for thymoma, thymic carcinoma and thymic lymphoma.

METHOD AND MATERIALS
Seventy-one subjects (49 men, 22 women; age range, 5–72 years) including thymoma (n=27), thymic carcinoma (n=16) and thymic lymphoma group (n=28) confirmed by pathological analysis underwent thoracic MRI on a 3.0-T MRI system, including conventional sequence and 9 b-value (b-value: 0 - 1,000 s/mm^2) DWI. Multi-b-value

apparent diffusion coefficient (ADC_{mb}) were calculated by mono-exponential model. Pure diffusion coefficient (D), pseudo-diffusion coefficient (D*) and perfusion fraction (f) were calculated with bi-exponential model. Mean ADC_{mb}, D, D*, and f values were compared for the differences among thymoma, thymic carcinoma and thymic lymphoma groups by one-way ANOVA, and further post hoc multiple comparisons were performed with Bonferroni test or Dunett's T3 test. Receiver operating characteristic curve (ROC) analyses were performed to determine the efficacy and optimum thresholds for differentiating the defined groups by various parameters.

RESULTS

The mean D and D* value in thymoma were significant higher than the value from thymic carcinoma and lymphoma (D, 0.90, 0.62 and 0.49 $\times 10^{-3}$ mm^2 /s; D*, 9.50, 5.56 and 3.62$\times 10^{-3}$ mm^2 /s, and 10.47, 4.76 and 4.01 $\times$ 10^{-3} mm^2 /s, respectively, all $P < 0.001$),while there were no significant difference between the thymic carcinoma and lymphoma ($P > 0.05/3$). The mean ADC_{mb} value in thymic lymphoma were significantly lower than thymoma and thymic carcinoma (ADC_{mb}, 0.71, 1.32 and 0.99 $\times 10^{-3}$ mm^2 /s, respectively, $P<0.001$), but no significant difference between the thymoma and thymic carcinoma ($P > 0.05/3$). As for the f value, no significant difference was found among groups ($P > 0.05$). The AUC and cutoff value, respectively, for differentiating thymoma from thymic lymphoma: ADC_{mb}, 0.946 and 0.872 $\times 10^{-3}$ mm^2/s; D, 0.861 and 0.721$\times 10^{-3}$ mm^2/s; D*, 0.878 and 4.80 $\times$ 10^{-3} mm^2/s; for differentiating thymic carcinoma from lymphoma for ADC_{mb}, D and D* were as follows: ADC_{mb}, 0.786 and 0.932$\times 10^{-3}$ mm^2/s; D, 0.670 and 0.679 $\times 10^{-3}$ mm^2/s; D*, 0.721 and 4.2 $\times 10^{-3}$ mm^2/s.

CONCLUSION

Results of this study have shown that IVIM-DWI measurements should be valuable to differentiate thymic solid tumors preoperatively.

EPO-0603

纵隔少见囊性病变的 CT 诊断价值

胡玉川,李刚锋,崔光彬
空军军医大学唐都医院

目的 探讨基于新的 ITMIG 纵隔分区标准纵隔少见囊性病变的 CT 影像特征，提高对纵隔少见囊性病变的影像诊断及鉴别诊断能力。

方法 回顾性分析 37 例经手术病理证实的纵隔少见囊性病变患者的 CT 表现，观察病变的发生部位、形态、大小、密度、内部特征、强化程度及生长方式，与术后病理进行对照。

结果：经病理证实支气管囊肿 7 例，食管重复囊肿 4 例，心包囊肿 3 例，淋巴管瘤 2 例， 胸腺囊肿 4 例，囊性畸胎瘤 7 例，囊性胸腺瘤 3 例，神经鞘瘤囊性变 5 例，表皮样囊肿 4 例，包虫囊肿 1 例。支气管囊肿位于中纵隔 5 例，后纵隔 2 例，单房、圆形或类圆形，直径约为 2.5～9.0cm，密度均匀，6 例呈水样低密度，1 例囊壁见弧形钙化，与气管及支气管关系密切；食管重复囊肿均位于后纵隔，直径为 2.7～4.9cm，类圆形囊性均匀水样密度影，边缘规整，与食管壁紧密相连，增强扫描未见强化；心包囊肿于前纵隔心缘旁，椭圆形或三角形均匀水样密度，边缘锐利，囊壁薄而光滑，增强扫描不强化；淋巴管瘤 2 例，类圆形或不规则形，中心位于前纵隔，沿气管及血管间隙攀藤样生长，1 例病变延伸达颈部及腋窝，平扫病灶内见分隔，边缘清楚，囊壁薄，增强扫描囊壁及囊内分隔强化。胸腺囊肿均位于胸腺区，密度均匀，边缘规整；胸内甲状腺囊肿位于上纵隔高位

气管旁，类圆形囊性均匀水样密度，边界清，与伸入纵隔的甲状腺组织相连；囊性畸胎瘤病变内部出现脂肪者 4 例，同时有脂肪及钙化者 2 例，1 例囊内密度均匀似良性囊肿；神经鞘瘤瘤囊性变 5 例均位于后纵隔或脊柱旁区，呈类圆形，边界清晰，直径约 3.0～11.8cm，4 例密度欠均，囊性为主，囊壁厚，增强后呈环形不均匀强化。1 例包虫囊肿位于上纵隔，呈类圆形、多房，与邻近胸膜分界不清，囊内可见多个子囊，囊壁厚薄均匀，增强后囊内容物未见强化。

结论 纵隔少见囊性病变具有特征性影像特征，CT 对纵隔囊性病变的诊断及鉴别诊断具有重要价值。

EPO-0604

食管癌肉瘤的影像表现与鉴别诊断

陈旭
西南医科大学附属中医医院

目的：探讨食管癌肉瘤的 X 线钡餐造影、CT 表现，总结影像学特征，提高对食管癌肉瘤的影像诊断及鉴别诊断认识。方法：回顾性分析我院经手术或活检病理证实的食管癌肉瘤 12 例患者的 X 线钡餐造影、CT 表现，结合文献总结影像学表现。结果：12 例均为息肉型食管癌肉瘤，其中中段 6 例，中下段 4 例，下段 2 例，X 线造影表现为食管梭形扩张伴充盈缺损，可见钡剂涂抹征及圆顶征，钡剂通过呈缓慢分流但梗阻不明显。CT 表现为腔内生长肿块影，2 例肿瘤充满食管腔，未见肿瘤-空气界面征，4 例肿瘤边缘欠光整，可见残留肿瘤-空气界面，6 例肿瘤边缘光滑，肿瘤-空气界面清楚，增强扫描 2 例呈均匀轻度强化，2 例呈均匀明显强化，7 例呈不均匀明显强化,1 例呈液性低密度未见强化。结论：息肉型食管癌肉瘤影像学表现具有一定的特征性，术前影像学检查结合胃镜多点取材活检，能在一定程度上提高食管癌肉瘤的诊断准确性，为临床诊治提供依据。

EPO-0605

The Importance of CT Quantitative Evaluation of Emphysema in Lung Cancer Screening Cohort with Negative Findings by Visual Evaluation

Yi Xia,Li Fan
Changzheng Hospital of the Second Military Medical University, China

Introduction One-stop quantitative evaluation of emphysema and lung nodule in lung cancer screening is very important for patient.
Objective To evaluate the role of quantitative emphysema in the large-sample LDCT lung cancer screening cohort with negative CT findings by subjective visual assessment.
Methods 1231 participants with negative visual evaluation were included in this retrospective study. The lungs were automatically segmented and the following were calculated: total lung volume (TLV), total emphysema volume (TEV), emphysema index (EI) ,15th percentile lung density (PD15) and mean lung density (MLD). EI ≥ 6% was defined as emphysema. The quantitative parameters were compared between different genders and ages. The quantitative parameters and risk factors were also compared between emphysema and non-emphysema groups.

Results The proportion of smokers, TLV, TEV, and EI of men were greater than that of women(P<0.001). The TEV and EI of people aged 60 years or older were greater than those in people younger than 60 years (P<0.05). 102 participants showed emphysema, accounting for 8.29%. The incidence of emphysema in men was significantly greater than that in women in total (P<0.05). All the CT quantitative parameters were significantly different between emphysema and non-emphysema groups. The ratio of male, second hand smoke exposure and chronic bronchitis history was greater in emphysema than that in the non-emphysema group (P<0.05).
Conclusion CT quantitative emphysema evaluation is recommended in people aged 60 years or older, especially in males, which can provide more precise information, aiding the early diagnosis of emphysema and informing early intervention.

EPO-0606
老年股骨转子间骨折后急性肺损伤 CT 影像学评价与伤后隐性失血量相关性研究

刘曦,杨华,张德川,张晓宇,张琴,任何,李雪娇
重庆市中医院放射科

目的 探讨老年股骨转子间骨折（≧65 岁）后急性肺损伤的 CT 形态学分级评分与伤后隐性失血量（HBL）的相关性。
方法 回顾性分析我院收治的 78 例新鲜老年股骨转子间骨折患者（受伤时间≦8h，年龄≧65 岁），平均年龄为 77.3±11.7 岁（65～89 岁），其中男 24 例，女 54 例。所有患者入院后第 3 天均完善胸部 CT，以确定是否存在急性肺损伤，通过肺损伤 CT 表现形态学分级评分：A 级，胸部 CT 正常，肺部及胸膜腔均未受累；B 级，仅胸膜腔受累，表现为胸膜增厚、胸腔积液或积血；C 级，在 B 级基础之上出现肺间质受累，表现为肺内条索状或网格状影；D 级，在 C 级基础上出现肺实质受累，表现为肺内磨玻璃状、斑片状模糊影或实变影。入院即刻、第 1 天、第 2 天、第 3 天记录血红蛋白及红细胞压积水平，Gross 方程计算伤后隐性失血量（HBL），采用 Pearson 相关分析胸部 CT 形态学分级评分与 HBL 之间的相关性。
结果 A 级 4 例，胸部 CT 见肺部及胸膜腔均未受累；B 级 28 例伴胸膜增厚、胸腔积液，其中单侧 11 例，双侧 17 例，15 例有胸腔积血。C 级 31 例中， 19 例出现肺内条索状、网格状影， 12 例伴有胸膜增厚、胸腔积液或积血。D 级 15 例，在 C 级基础上出现肺内磨玻璃状模糊影或斑片状实变影。4 例 A 级 HBL 为 405.68±33.26，28 例 B 级 HBL 为 423.52±18.13，31 例 C 级 HBL 为 453.78±39.67，15 例 D 级 HBL 为 521.16±41.95，急性肺损伤 CT 形态学分级评分与伤后隐性失血量（HBL）呈正相关（P<0.05）。
结论 老年股骨转子间骨折（年龄≧65 岁）后急性肺损伤 CT 表现为胸腔积液、积血，胸膜增厚，肺内条索状或网格状影，肺内磨玻璃状模糊影或斑片状实变影；CT 形态学分级评分与伤后隐性失血量（HBL）呈正相关，有效降低老年股骨转子间骨折伤后隐性失血量可有效减轻患者伤后急性肺损伤的严重程度。

EPO-0607
老年髋部骨折后急性肺损伤 CT 影像学评价与氧合指数相关性研究

刘曦,杨华,张德川,张晓宇,张琴,任何,李雪娇
重庆市中医院放射科

目的 探讨老年髋部骨折（≧65 岁）后急性肺损伤的 CT 形态学分级评分与氧合指数的相关性。
方法 回顾性分析我院收治的 128 例新鲜老年髋部骨折患者（受伤时间≦8h，年龄≧65 岁），平均年龄为 76.3±10.7 岁（65～91 岁），其中男 54 例，女 74 例，股骨颈骨折 69 例，股骨转子间骨折 59 例。所有患者入院后 48h 内均完善胸部 CT 检查，所有图像经 2 名高年资主治医师以上 CT 诊断医师采用盲法分别阅片，并达成一致意见，以确定是否存在急性肺损伤，通过肺损伤 CT 表现形态学分级评分：A 级，胸部 CT 正常，肺部及胸膜腔均未受累，计为 0 分；B 级，仅胸膜腔受累，表现为胸膜增厚、胸腔积液或积血，计为 1 分；C 级，在 B 级基础之上出现肺间质受累，表现为肺内条索状或网格状影，计为 2 分；D 级，在 C 级基础上出现肺实质受累，表现为肺内磨玻璃状、斑片状模糊影或实变影，计为 3 分。通过入院后 48h 内动脉血气分析结果计算氧合指数，氧合指数的计算为动脉氧分压/吸入氧气分率。采用 Pearson 相关分析胸部 CT 形态学分级评分与氧合指数之间的相关性。
结果 A 级 10 例，胸部 CT 见肺部及胸膜腔均未受累；B 级 43 例伴胸膜增厚、胸腔积液，其中单侧 19 例，双侧 24 例； 28 例有胸腔积血。C 级 42 例中， 19 例出现肺内条索状、网格状影， 23 例伴有胸膜增厚、胸腔积液或积血。D 级 33 例，在 C 级基础上出现肺内磨玻璃状模糊影或斑片状实变影。10 例 A 级氧合指数为 432.18±28.91，43 例 B 级氧合指数为 338.21±18.13，42 例 C 级氧合指数为 297.26±22.67，33 例 D 级氧合指数为 217.15±17.95，急性肺损伤 CT 形态学分级评分与氧合指数呈负相关（P<0.05）。
结论 老年髋部骨折后急性肺损伤 CT 表现为胸腔积液、积血，胸膜增厚，肺内条索状或网格状影，肺内磨玻璃状模糊影或斑片状实变影；CT 形态学分级评分与氧合指数呈负相关。

EPO-0608

肺部粘液性腺癌的ＨＲＣＴ诊断

李建华
忻州市人民医院

目的：通过对我院２０１６年１０月——２０１８年１２月２７例患者原发性粘液腺癌的临床表现、影像特征以及病理特性的诊断、分析、总结，提高对这一类病变的认识。
方法：对我院２７例粘液性腺癌患者的临床、影像及病理资料进行回顾下分析，并复习相关的文献资料。
结果：２７例粘液性腺癌患者中，平均年龄为５２岁，其中男性１２例，女性１５例.９例患者无症状，大都在体检中发现肺部病变，１８例患者有临床症状，发热、咳嗽、胸痛及胸闷为主，体温最好未超过３９度。所有患者均行胸部ＨＲＣＴ检查，其影像特征多种多样，包括大片实变、肿块、多发结节，小空洞、癌性淋巴管炎、胸闷牵拉及肥厚，胸膜下结节，胸腔积液，纵膈淋巴结肿大等等。最多见于大片实变及结节，结节以分叶、毛刺、小空泡、胸膜牵拉征象为主。增强扫描，轻中度强化，可见轻度坏死。２７例中患者的肿瘤标志物均有不同程度升高。１５例患者行胸腔镜手术，１２例患者行ＣＴ引导下穿刺活检证实。两例患者放弃治疗，１３例患者靶向药物和放疗治疗。后期随访，死亡５例，均出现远处转移，脑转移３例，肝脏转移２例。
结论：原发性粘液腺癌（ＰＰＭＡ）大都以周围性的实变、结节为主，无特异性的影像及临床特点，早期易于误诊，唯一可以确诊的手段就是病理，免疫组化不仅仅可以肯定组织来源，更能帮助判断预后。发现肺部病变，而且血清标志物升高，中老年患者等高危因素，应该早期明确诊断，早期治疗。

EPO-0609

Prediction of lower legs muscle ischemia: A preliminary study of dynamic CTA

Daming Zhang[1], Xueyan Zhou[2], Haiping Zhang[1], Zhengyu Jin[1]
1. Peking Union Medical College Hospital
2. School of Technology, Harbin University

The purpose of this study was to predict the lower legs muscle ischemia based on dynamic computed tomographic angiography.
Material and method:
A population of 35 patients with known peripheral arterial occlusive disease was examined with a combined CTA protocol consisting of a standard CTA (s-CTA) of the lower leg runoff from the diaphragm to the toes and dynamic CTA (dyn-CTA) of the calves (scan range, 45 cm; 8 phases; 2.5s×4 cycle, 5s ×4cycles; 70 kVp; 80 mAs; contrast volume, 30 mL, saline water, 50ml, 4.0 mL/s). The scan protocol of s-CTA was intravenous administration of 50 mL of Iopromide (370 mgI/ml, 30ml with flow rate of 3ml/s, 20ml with flow rate of 2.5ml/s) followed with 40ml saline water (2.5ml/s), pitch 2.2.
For each of four lower leg artery segments, runoff score according to stenosis percentage and occlusion length was evaluated based on s-CTA. This score ranges from 0 to 19, with a higher score indicating more severe disease, and is calculated by assessing the patency and degree of stenosis/occlusion in the popliteal artery and the three tibial vessels. A score of 0 is assigned to a vessel with <20% stenosis, a score of 1 for a 21% to 49% stenosis, 2 for 50% to 99% stenosis, 2.5 for a vessel occluded over an area less than half its length, and 3 for an occlusion greater than half the vessel length.
All the muscle pixels on the 10th to 80th slices for each leg (20HU<attenuation<100 HU) were retrieved from dyn-CTA data at time point of 0s to 10s. Three indexes were calculated which were E_1 (initial enhancement,), E_{peak} (peak enhancement,) and SER (signal enhancement ratio,). S_0, S_1, S_{peak} and S_{last} represented muscle attenuation before enhancement, attenuation at first time point after enhancement, attenuation of peak enhancement and attenuation at last time point. Top 25%, 10% and 5% cut-off of the three indexes were used to do statistical analysis with SPSS 19.0.

Results:
35 patients (average age=66.6±11.7 years old; 11 female, 24 male) with 70 lower legs were included. The legs were divided into two groups, group 1 was normal group with runoff score ≤7 as well as the score of each vessel segment ≤1. The rest legs belonged to group 2 which was ischemia. Finally there were 22 legs in group 1 and 48 legs in group 2. The three indexes from top 25% to 5% cut-off were compared between the two groups with T-test (table 1). Compared with the ischemia group, E_1 and E_{peak} were higher in normal group and there was statistical difference. There wasn't statistical difference with SER in two groups. There was weak correlation of E_1 and E_{peak} with runoff score (figure 1). The ROC area of E_1 with top 25% cut-off was best which was 0.77.

Pathological-based Radiomics improve prediction of lymph node metastasis of Lung Cancer compared with conventional SUVmax

Yunming Xie
Jilin university first hospital

Purpose: To develop a radiomics model for prediction of lymph node metastasis of lung cancer,irrespective of the specific lung cancer entity.
Methods: Preoperative PET-CT imaging data from one hundred and twenty-six lung cancer patients(training dataset: n =84, validation cohort: n =42) with lymph node Pathological result between Jan. 2017 and May 2019 were included in this study.The radiomics features were extracted from the native CT of the 126 primary tumors and 186 lymph nodes(LNs) and the value of metabolic parameters (both tumor and lymph nodes) from the PET.Non-redundant and stable features were evaluated using the area under the curve (AUC) (all p-values were corrected for multiple hypothesis testing). Classification performance of each feature set was evaluated using random forest and nested cross validation.
Results: Of the 186 lymph nodes, 93 were benign, 93 malignant.Based on lymph node radiomic signature, a model was developed and showed excellent predictive ability for LN metastasis (AUC 0.86 and 0.92 in training dataset and validation cohort, respectively).
Conclusions: the radiomics model can be used to prediction of lymph node metastasis of lung cancer and also can reduce the false positive of PET.

EPO-0611

基于 CT 征象可手术切除的周围型肺癌预后因素分析

齐丽萍,李晓婷,陈麦林,孙应实
北京大学肿瘤医院

目的：对 200 例手术切除的周围型肺癌患者术前 CT 征象进行回顾性分析，以评估影响预后的 CT 征象，为可手术切除的肺癌患者的预后及管理提供参考。
方法：回顾分析 2010.7 至 2013 年 1 月手术周围型肺癌 200 例，术前具有完整的 CT 影像资料、血 CEA 水平检测，术后规律随访。患者总生存（OS）定义为手术日至随访截止日期，以月为单位计算。分析因素包括：性别、年龄、肿瘤部位、肿瘤最大径、形状、毛刺、胸膜凹陷征、病灶含 GGO、术前 CEA 水平及病理类型。采用 SPSS 22.0 统计分析软件，使用 kaplan-meier 法绘制生存曲线,采用 log-rank 检验比较生存曲线的差别；采用 cox-regression 单因素及多因素分析，获得生存独立影响因素及风险比(Hazard ratio)。P<0.05 认为统计学有差异。
结果：200 例患者中男 84 例，女 116 例，年龄 27-79 岁，平均 59.9±9.2 岁。死亡 54 例，存活 146 例。单因素分析显示，肿瘤最大径（p<0.01）、病灶含 GGO(p=0.004)、术前 CEA 水平(p=0.001)与总生存显著相关。性别、年龄、肿瘤部位、形状及毛刺、病理类型、胸膜凹陷征与总生存无显著

相关（p>0.05）。多因素分析显示肿瘤最大径（HR=2.331，95%CI，1.351-4.022）、CEA 水平（HR=1.951，95%CI，1.046-3.639）及含 GGO（HR=0.49，95%CI，0.258-0.932）是影响总生存的独立预后因素。
结论：术前 CT 显示肿瘤较大、CEA 水平升高是影响总生存的不良预后因素，而显示肿瘤内含有 GGO 成分是预后的有利因素。

EPO-0612

Imaging-guided monitoring and management of pulmonary alveolar microlithiasis

Aiping Chen,Tongfu Yu
the first affiliated hospital of Nanjing Medical University

OBJECT:Pulmonary alveolar microlithiasis (PAM) is a rare geneticlung disease characterized by progressive intra-alveolar calcificationwith poor prognosis. Most reports concentrated in the radiological imaging such as high-resolution CT (HRCT) and X-ray, while the nuclear imaging reports were rare. We aims to use nuclear imaging modalities18F-FDG PET/CT to provide metabolism information to evaluate the activity, as well as the severity of the disease and lung function. We report a case of PAM and propose an optimized imaging-guidedmanagement based on the current state of the art.
Method: A 46-year-old woman was admitted to our hospital in 2012 for dyspnea. There was no history of expectoration, hemoptysis, and/or chest pain.
Resullts: Chest X-ray revealed widespread, hyperdense, micronodular shadows producing a characteristic snowstorm appearance, which predominated in the middle and lower lung areas with obscured cardiac borders.HRCT images showed bilateral diffuse both intra-alveolar and interlobular septal calcifications showing crazy-paving pattern composing of diffuse ground-glass opacity and small calcified parenchymal nodules. Pleura and fissures calcification and subpleural cystic changes also were observed. Whole body bone scan by HDP-Tc99m- SPECT-CT showed an intense pulmonary uptake which was diffuse and symmetrical.
Conclusion: The way to manage and optimize the imaging modalities is a key factor to guide clinicians and radiologists. The recent discovery of the etiology of PAM suggests an imminent paradigm shift in treatment.

EPO-0613

肺 CT 靶重建成像对于可疑肺肿瘤的应用范围筛选

陈麦林,孙应实
北京大学肿瘤医院

目的:探讨肺 CT 靶重建成像在可疑肺肿瘤诊断中的应用范围及价值 。方法:对 99 例可疑原发肺肿瘤的首次受检者分别行常规肺 CT 扫描(5mm)及局部肺野小 FOV 薄层 CT 靶重建成像（层厚：1.25mm，FOV：20cm）。记录 CT 可疑原发肺肿瘤的大小、分型、肿大淋巴结、其它肺野结节等 CT 表现。采用单独常规肺 CT 成像和联合肺小 FOV 薄层 CT 成像两种不同方法，根据肺结节的形态、密度、边缘及与相邻结构的关系等等共同读片，分别对可疑肺肿瘤来进行良恶性判断，以病理诊断为

金标准，对可疑肺肿瘤的两种诊断方法进行 ROC 分析。 结果： 86 名获得活组织病理学结果（恶性病变 72 例、良性病变 14 例）；单独采用常规肺 CT 成像和 结合肺小 FOV 薄层 CT 成像两种方法对于可疑肺肿瘤诊断的 ROC 曲线下面积未见统计学差异（p=0.067）。联合肺小 FOV 薄层 CT 靶重建成像后，对于 72 例可疑周围型肺癌、54 例无肺门或纵隔肿大淋巴结、72 例无其它肺野结节病例时，两种方法诊断的 ROC 曲线下面积可见明显统计学差异（p＜0.05）。
结论：对于所有可疑原发肺肿瘤的常规肺 CT 的诊断中，肺 CT 靶重建成像可能没有提供额外的帮助。但是，当可疑为周围型肺癌、没有肺门或纵隔肿大淋巴结，没有其它肺野可疑肺结节时，肺 CT 靶重建成像能为诊断提供一定的帮助。

EPO-0614
肺 CT 靶重建成像对于可疑肺肿瘤的影像征象的判断价值

陈麦林,孙应实
北京大学肿瘤医院

目的:探讨肺小 FOV 薄层 CT 靶重建成像在辨别可疑周围型肺肿瘤异常影像征象中的价值 。方法:搜集具有完整临床资料并经病理证实的 72 例可疑周围型肺肿瘤，行常规肺 CT 扫描(5mm)，并对局部进行后处理小 FOV 薄层 CT 靶重建成像（层厚：1.25mm，FOV：20cm）。两名医师采用单独常规肺 CT 成像和联合肺小 FOV 薄层靶重建 CT 成像两种方法，分别判断肿瘤的直接征象（大小、形态、密度、边缘）及间接征象（支气管、支气管动脉、肺动静脉、胸膜改变等）进行评估及记录。统计学分析采用 SPSS18.0 软件包，对两种方法显示每种异常征象间的差别；良恶性病变间影像征象的比较均采用卡方检验或 Fisher 精确检验。结果： 常规肺 CT 成像与肺小 FOV 薄层 CT 成像比较，对形态、边缘、分叶、毛刺、支气管、肺动静脉的改变征象的判断均有统计学差异（P<0.05）。其中常规肺 CT 成像中的分叶征，肺小 FOV 薄层 CT 靶重建成像边缘、分叶、毛刺在良恶性病变中有统计学差异。

EPO-0615
非增强 MRA 技术评估中央型肺癌与肺门及纵膈大血管关系研究

姜海峰,李笑,赵雪梅,张常青,李愉,黄刚
甘肃省人民医院

目的：探讨非增强磁共振血管成像（MRA）在中央型肺癌中的表达及与纵膈大血管的关系。**方法：**60 例未接受放化疗及其他任何辅助性抗肿瘤治疗，后经手术病理或支气管镜活检证实为中央型肺癌的患者纳入研究，术前均行二维自由呼吸 TrueFISP 序列，二维屏气 TrueFISP 序列和三维呼吸触发 SPACE 序列检查。对三种成像序列的图像质量评价包括定量评价和定性评价。最后，将肿瘤与血管关系的形态类型分为 1-6 型，评价并记录每一种非增强 MRA 方法中，肿瘤与各大血管之间的形态关系类型。**结果：**三种非增强 MRA 技术的 CNR 无显著性差异，两种 TrueFISP 技术的 VTR（p=0.000）和图像质量（p=0.000）评分高于 SPACE 技术。三种 MRA 技术和增强 MDCT 对肺癌与血管关系评价的一致性好。**结论：**TrueFISP 和 SPACE 技术都能满意的显示肺门及纵膈大血管并准确评价肺癌与大血管的关系，与增强 MDCT 结果一致性好。TrueFISP 序列的图像质量和 VTR 比 SPACE 序列稍好，在评价肺癌与肺门、纵膈大血管的关系中，与增强 MDCT 结果一致性稍好。

EPO-0616
薄层 CT 特征鉴别同时多原发肺腺癌与肺腺癌伴肺转移

周丽娜,吴宁
中国医学科学院肿瘤医院

目的 探讨同时多原发肺腺癌与肺腺癌伴肺内转移瘤之间薄层 CT 特征的差异。
方法 回顾分析经手术证实的同时多原发肺腺癌 62 例 131 个病灶及肺腺癌伴肺内转移瘤 31 例 67 个病灶的临床及影像特征。按照病灶类型（纯磨玻璃结节，pure ground glass nodule/pGGN；部分实性结节，partial solid nodule/PSN 和实性结节，solid nodule/SN），将患者分为 7 种影像配对组，比较同时多原发肺癌（原发组）和肺癌伴肺内转移（转移组） 影像配对类型的差异。将肺内多发病灶按照大小分为主病灶和伴随病灶。记录并分析主病灶和伴随病灶的大小（长径，实性成分长径），是否含磨玻璃成分，形态，分叶，边界，毛刺，空泡征、胸膜牵拉，贴邻胸膜，分别比较主病灶，伴随病灶在两组间的等影像学特征之间的差异。
结果 原发组整体影像类型以 pGGN+PSN 及 PSN+PSN 较多见，至少有一个病灶内含磨玻璃成分的占 96.77%（60/62）。转移组仅有两种类型，PSN+SN 2 例（6.5%，2/31），SN+SN 29 例（93.5%，29/31）。两组间影像配对类型差异有统计学意义（$P<0.001$）。两组间主病灶多因素 logistic 回归分析，男性（OR 值 5.742，$P=0.010$），不含磨玻璃成分（OR 值 41.291，$P<0.001$）及病灶贴邻胸膜（OR 值 9.288，$P=0.001$）是转移组主病灶伴发肺内转移的独立风险因素。
结论 薄层 CT 上薄层 CT 同时多原发肺腺癌以含磨玻璃成分的病灶（pGGN 或 PSN）较多见，而肺腺癌伴肺转移以 SN 较多见。男性、不含磨玻璃成分及贴邻胸膜是主病灶发生肺内转移的风险因素。

EPO-0617
心脏磁共振组织追踪技术评估肥厚型心肌病心室心肌应变

涂春蓉
重庆市肿瘤医院

目的：探讨心脏 MR 组织追踪技术(CMR-TT)评价肥厚型心肌病（HCM）心室功能的可行性。
研究方法：本研究纳入 HCM 患者组 32 例和正常对照组 32 例，行 3.0 T SSFP 电影序列扫描，使用加拿大 CVI 公司 CVI42 后处理软件的 CMR-TT 技术测量左心功能及左、右心室应变参数。收集 HCM 组及对照组两组的临床特征资料（性别、年龄）及左心功能基本参数（左心室射血分数、舒张末期容积、收缩末期容积、左心室质量），计数资料采用独立样本卡方检验分析，计量资料用`x±s 表示。两心室的应变按部位分包括整体应变及节段应变（基底部、中间部、心尖部应变），按方向分又包括圆周应变、径向应变及纵向应变；两组间的左、右心室应变参数两两比较使用独立样本 t 检验。
结果：HCM 组左心室质量较对照组明显增高（t=1.41，P<0.01），余左心功能参数(左心室射血分数、舒张末期容积、收缩末期容积)2 组差异均无统计学意义。与对照组比较，HCM 组左心室、右心室整体应变参数均明显减低（P 均<0.01）；除左、右心室基底部径向应变外，HCM 组各节段局部应变较对照组减低（P 均<0.05）。
结论：右心室节段应变、整体应变能敏感地反应 HCM 右心室心肌收缩功能；HCM 患者在左心室射血分数减低前左、右心室心肌收缩功能就已存在受损。

EPO-0618

影像组学应用于非小细胞型肺癌化疗疗效评估及预测 EGFR 突变的初步研究

吴珊珊,沈桂权,高波
贵州医科大学

目的：本回顾性研究通过影像组学方法，评估胸部增强 CT 影像对预测非小细胞肺癌（NSCLC）患者化疗反应的价值，并探讨 CT 影像特征与表皮生长因子受体（EGFR）突变的相关性，结合临床特征构建预测模型。**方法**：回顾性分析经病理证实的 148 例非小细胞肺癌，收集患者治疗前胸部 CT 增强图像，通过影像组学方法，由一位经验丰富的放射科医生在开源软件 3D-Slicer 上描绘感兴趣区域（ROI）半自动完成病变的分割，并通过 pyradiomics 软件包进行感兴趣区特征提取，每个患者共提取了 849 个图像特征。通过计算两两特征间皮尔逊相关系数和 LASSO 算法进行特征筛选，最后采用逻辑回归方法构建预测模型，通过受试者工作特性（ROC）曲线下面积（AUC）评价模型的诊断效能。**结果**：在预测患者化疗反应上，最终选择七个特征来构建预测模型，在训练集，ROC 曲线下面积为 0.791，敏感性和特异性分别为 73.1%和 70.5%。在验证集，ROC 下曲线下面积为 0.753，敏感性和特异性分别为 84.2%和 61.1%;对预测 EGFR 突变，结合临床和影像学特征的模型表现最佳，ROC 曲线下面积为 0.947，敏感性和特异性分别为 91.2%和 81.8%。**结论**：本研究的初步结果表明，影像特征与患者的化疗反应和 EGFR 突变有关，通过影像组学方法，基于胸部 CT 增强影像的预测模型能在治疗前有效预测非小细胞型肺癌患者化疗反应并分层 EGFR 突变型和野生型患者，指导临床采取及时有效治疗。

EPO-0619

Accuracy in diagnosing lung cancer types and subtypes by CT-guided percutaneous core needle biopsy specimens

hanfei zhang,Meiyan Liao
Zhongnan Hospital of Wuhan University

Purpose Evaluated diagnostic accuracy of CT-guided percutaneous core needle biopsy (PCNB) specimens in diagnosing lung cancer histological types and subtypes. And analyze the diagnostic differences between pathologists with different working experiences.

Patients and methods The pathological slices of 160 consecutive patients who underwent CT-guided PCNB and resections for lung lesion between January 2007 and December 2015 were retrospectively analyzed. All biopsy and surgery slices were diagnosed into three levels according to the 2015 WHO classification of lung tumors by group A and B pathologists with different working experiences. Firstly, diagnose malignant and benign lesions. Secondly and thirdly, diagnose histological types and subtypes.

Results Of the 160 cases, 139 were malignant and 21 were benign. On the first level, substantial agreement was seen in group A and B (*Kappa*=0.74, 0.78). The diagnostic accuracy of two groups were 90.63%, 94.38% (*P*=0.20). On the second level, substantial agreement was seen in group A and B (*Kappa*=0.63, 0.60). The overall diagnostic accuracy of two groups were 67.50%, 72.50% (*P*=0.33). On the third level, fair agreement was seen in group A and B (*Kappa*=0.38, 0.25). The diagnostic accuracy for adenocarcinoma were 26.39%, 55.56% (*P*<0.01), for squamous cell carcinoma were 28.57%, 38.10% (*P*=0.36).

Conclusion CT-guided PCNB specimens could diagnose lung cancer histological types with high accuracy. While the diagnostic accuracy for lung cancer subtypes was low. No difference of diagnostic accuracy for lung cancer types was found in pathologists with different working experiences. More experienced pathologists were better at diagnosing lung adenocarcinoma subtypes.

EPO-0620
环境空气 PM2.5 暴露大鼠动物模型的建立与评价

夏艺,王凤卓,张迪,范丽,刘士远
海军军医大学第二附属医院（上海长征医院）

目的 使用 $PM_{2.5}$雾化吸入、$PM_{2.5}$滴注及蛋白酶+$PM_{2.5}$滴注的方法成功构建大鼠 $PM_{2.5}$肺损伤模型，并从大鼠疾病情况、影像及病理多方面对模型进行评价。**方法** 使用 $PM_{2.5}$雾化吸入、$PM_{2.5}$滴注及蛋白酶+$PM_{2.5}$滴注的方法进行 $PM_{2.5}$肺损伤大鼠造模，每组大鼠分别为 6 只、16 只、16 只。同时设置对照组 38 只。$PM_{2.5}$雾化吸入组及滴注组大鼠分别于造模前、造模 4、8、12 周及滴注组大鼠造模 16 周进行活体 microCT 成像。雾化吸入组大鼠于第 12 周后全部处死，进行病理学检查。滴注组大鼠根据滴注剂量的不同，分别于造模 4、8、12、16 周各处理 4 只大鼠，所处理大鼠分别接受 Micro-CT 检查及病理检查。**结果** 模型建立病理表现：雾化吸入暴露组主要表现为双肺的慢性炎症改变，包括气管壁的淋巴组织浸润，肺间隔增厚及肺泡壁的炎性细胞浸润，血管壁的增厚。$PM_{2.5}$滴注低剂量 4 周组病理改变较轻微，可见小气道壁上皮增厚和小血管壁增厚，肺间质微量的碳末沉积；$PM_{2.5}$滴注中剂量 8 周组可见肺泡间隔的增厚，小气道壁上皮增厚更明显，肺间质内可见较大量的碳末沉积；$PM_{2.5}$滴注高剂量 12 及 16 周组可见肺气腔的扩大，肺泡间隔的增厚，肺间质内大量的碳末沉积。活体 microCT 检查结果为：雾化吸入大鼠暴露 12 周后，活体 micro CT 表现为不同程度的实变影。滴注组大鼠双肺内均未见明显异常。**结论** 使用 $PM_{2.5}$雾化吸入、$PM_{2.5}$滴注及蛋白酶+$PM_{2.5}$的方法均可成功构建大鼠 COPD 模型。Micro-CT 可用于 $PM_{2.5}$雾化吸入组的动态评估，对于滴注组肺损伤改变需要寻找敏感性更高的影像学检查方法。

EPO-0621
AI 联合低剂量肺部 CT 扫描在肺原位癌与微浸润腺癌中的价值

毛卫霞
榆林市第二医院

【摘要】目的 探讨 AI 联合低剂量肺部 CT 扫描在肺原位癌与微浸润腺癌中的价值。 **方法** 在锁定机器上安装人工智能软件（我院选用北京推想科技软件），挑选 2018 年 10 月到 12 月在我科行肺部体检的患者，剔除条件为有基础肺疾病患者及患者配合欠佳图像质量不好的。在指定机器（安装人工智能的机器）选用低剂量肺部扫描，然后在报告系统打开患者报告，人工智能自动检索出各种类型结节并对每个结节进行详细分析，主要从结节所在肺段、结节的大小、密度、CT 值、结节体积、结节性质及恶性风险评估，最后可以生成图文报告供诊断医师参考。诊断医师对照检索出的结节结合临床病史做出诊断，提出合理化建议。**结果** 人工阅片效率较低，且在工作量较大时极易漏诊，人工智能可以建立客观、统一的阅片标准，迅速发现并多方位分析结节，低剂量扫描可以减少患者因对射线剂量的恐惧而拒绝检查从而耽误病情，在我们随访的患者中发现有价值的肺内结节 34 人，磨玻璃结节 21 人，有 11 例因为结节变化，临床采取手术治疗，其中病理微浸润腺癌 6 例，原位癌 3 例，不典型瘤样增生 2 例，所有手术后患者恢复良好。 我们用常规剂量的百分之

二十结合利用人工智能软件快速找出各种类型结节，对肺部微小结节系统分析、管理，病灶有轻微变化则提醒临床处理，在微浸润或者原位的时候临床就介入，从而提高患者生存率及生活质量。**结论** AI 联合低剂量可以让患者从心里接受肺部筛查，不会因为射线剂量而拒绝检查，AI 对肺部结节的检出率敏感性达 98%，极大减少漏诊，真正达到早发现、早治疗的目的， 让微浸润腺癌及原位腺癌无发展机会，可极大提高患者生存率及生活质量。

EPO-0622
多层螺旋 CT 血管成像及后处理技术对主动脉夹层动脉瘤破口的诊断价值

刘文冬,刘斌,吴礼明
安徽医科大学第一附属医院

目的：探讨 MDCT 不同后处理技术评估主动脉夹层破口大小及位置的准确性价值 。方法 选择我院 2017 年 1 月-2019 年 6 月期间确诊主动脉夹层的 20 例患者为研究对象，比较 MDCT 轴位图像、不同后处理技术对破口大小及位置的显示情况。MDCT 后处理技术主要包括最大密度投影（MIP）、多平面重建（MPR）、曲面重建（CPR）、容积再现（VR）。利用不同后处理技术对主动脉夹层破口大小进行测量；记录夹层破口距离左锁骨下动脉开口远侧的距离，与术中 DSA 造影测量数据结果进行比较。分别在 MDCT 轴位图像、MPR 矢状位图像、VR 图像测量破口的大小并记作（CT-W、MPR-W、VR-W），比较三种测量方法对破口大小显示的结果。在 MPR 矢状位图像中沿主动脉外侧缘，主动脉弓内侧缘、并在 VR 图像中分别测量破口距主左锁骨下动脉开口距离，分别记作（MPR-OD、MPR-ID、VR-D），与术中 DSA 造影下测量数据(DSA-D）进行比较。结果：MPR、及 CPR 对破口位置显示阳性率 100.0%（20/20）；VR 显示破口阳性率 90%（18/20）。CT-W 及 MPR-W 两者之间无统计学差异（P<0.05）；VR 三维图像测量的破口大小值（VR-W）要大于 MPR 图像、CT 轴位断层图像测量破口大小值；CT-W、MPR-W 两者之间相关系数为(r=0.992，P<0.001）； MPR-OD、VR-D 与 DSA-D 之间差异无统计学意义（P<0.05）；MPR-OD、VR-D 与 DSA-D 的相关系数 r 分别为 0.895(P<0.001)和 0.863(P<0.001)。结论 显示破口位置 MPR、CPR 图像更具有优势。MPR 矢状位沿主动脉外侧缘测量破口距左锁骨下动脉的距离与术中 DSA 测量数据相关性最好，更能准确的评估破口的位置；利用 MDCT 的 MPR、CPR、VR 后处理技术测量主动脉夹层破口的位置及大小可以准确的进行术前评估。

EPO-0623
创伤性肺假性囊肿的 MSCT 征象分析

陈佳
陆军军医大学第二附属医院（新桥医院）

目的：分析创伤性肺假性囊肿的 MSCT 特征。方法：回顾性分析 14 例经临床和随访证实创伤性肺假性囊肿患者的胸部 CT 和临床资料,观察病变的位置、形态、大小、内部特征及邻近肺组织改变,分析肺假性囊肿的动态变化。结果：14 例患者经 MSCT 检查共检出创伤性肺假性囊肿 39 个,其中单发 6 例,多发 8 例。病变呈单纯性含气囊肿 26 个,气液囊肿 13 个,未见单纯性含液囊肿。69.2%（27/39）的囊肿位于胸膜下区,其中 13 个邻近叶间胸膜,肺叶外周带胸壁下方 10 个,纵隔旁 4 个。病灶呈圆形或类圆形 28 个,不规则形 11 个。6 个病灶内可见细线样分隔,5 个病灶腔壁可见小尖角

样突起,6 个病灶囊腔旁可见细小裂隙样影。邻近肺组织均有不同程度挫伤改变。所有患者于伤后 4～85d 内进行复查,发现 74.4%（29/39）的病灶不同程度缩小、吸收。结论：创伤性肺假性囊肿的 CT 表现具有一定的特征性,结合临床明确胸部创伤病史,以及随访过程中病变的自愈趋势,可作出较准确诊断。

EPO-0624

胸部孤立性纤维瘤的 MSCT 表现

黄朝霞[1],段庆红[2]
1.贵州省人民医院
2. 贵州医科大学附属医院

目的 探讨胸部孤立性纤维瘤（solitary fibrous tumor，SFT）的影像特征，提高对该病的认识。
方法 回顾性分析 18 例经手术（16/18）或穿刺活检（2/18）病理证实的胸部 SFT 患者的 CT 表现。1 例行 CT 和 MRI 平扫，11 例行 CT 增强检查，6 例同时行 CT 平扫+增强检查。
结果 18 例胸部 SFT 中，右侧胸腔 4 例，左侧胸腔 11 例，后纵隔 2 例，肺内 1 例。CT 表现为胸部单发肿块，直径 2.7～23.1cm，呈圆形或卵圆形 9 例，浅分叶 9 例。边界清楚 14 例。CT 平扫 3 例密度均匀，未见囊变、出血、坏死及钙化，4 例呈混杂密度，见多发囊变区，1 例周围骨质破坏。CT 增强扫描 13 例病灶中央可见坏死区，动脉期不均匀强化，内见低密度无强化区,4 例病灶动脉期呈轻中度强化，5 例见迂曲血管影，3 例见钙化；静脉期 14 例呈渐进性强化。
结论 胸部不均匀的富血供肿瘤要考虑到 SFT 的可能，CT 增强扫描呈进行性不均匀强化的强化模式可能是有诊断价值的影像特点。

ASiR、ASiR-V 重建对体模内不同密度肺结节图像质量的比较

苑呈秀,盛华强,王广丽,张添钰
山东第一医科大学第一附属医院（山东省千佛山医院）

目的：探讨基于多模态的自适应迭代重建算法（Adaptive statistical iterative reconstruction，**ASiR-V**）对体模内不同密度肺结节图像质量的影响，旨在寻找提升不同密度肺结节 CT 图像质量并相应降低辐射剂量的新途径。**方法：**设置管电压 120kV,采用 9 种管电流对体模内 3 种直径（8.0 mm、10.0 mm、12.0 mm）、3 种 CT 值（100HU、-630HU、-800HU）的 9 个结节进行多次 CT 扫描，采用 9 种（10%、20%、30%、40%、50%、60%、70%、80%、90%）ASiR、9 种 ASiR-V 算法分别重建，分别测得结节 SD 值，计算其信噪比（SNR）和对比噪声比（CNR）。使用 T 检验分别比较 3 种不同密度的肺结节在使用 ASiR 重建和使用 ASiR-V 重建之后的 SD、SNR、CNR 的差异。**结果：**对 100HU 的结节，ASiR 与 ASiR-V 重建的结节 SD、SNR、CNR 均不存在明显差异（t=-0.30,P=0.76；t=-0.25,P=0.80；t=-0.30,P=0.76）。对-630HU、-800HU 的结节 ASiR-V 重建后结节 SD 值均低于 ASiR 重建（t=1.55,P=0.045；t=3.12,P=0.002），SNR（t=-2.82,P=0.005；t=-4.71,P＜0.001）、CNR（t=-2.53,P=0.012；t=-3.57,P＜0.001）均明显升高。**结论：**对于密度为-630HU 和-800HU 的磨玻璃结节而言，ASiR-V 重建算法在降低图像噪声、提高图像的信噪比与对比信噪比方面明显优于 ASiR，在保持同等图像质量的前提下，ASiR-V 可以相应降低扫描过程中的辐射剂量，为后续使用 ASiR-V 来进行结节低剂量随访的研究奠定了基础。

EPO-0626

肺内占位影像误诊 1 例分析

陈曦照
贵州省第二人民医院(原:贵州省安宁医院)

目的：报道 1 例误诊为肺癌的肺内原发性滑膜肉瘤，通过分析该病例，提高诊断医师对这罕见疾病的认识。

方法：临床资料：患者男，78 岁，胸痛 1+月入院。患者 1+月前无明显诱因出现胸痛，以左侧胸背部为著，呈刺痛，牵扯肩背部疼痛。自行于家中口服“氨酚曲马多片”可缓解。后患者于“贵州医科大学附属医院”行“胸部 CT”示：左肺上叶占位，未行相关诊治。个人史：吸烟 30+年，40 支/天，已戒 10+年。入院辅助检查：癌胚抗原 CEA45.58ng/ml，糖类抗原 724（CA72-4）11.75U/ml。CT 增强：倾向考虑左肺上叶后段肺 Ca 并阻塞性肺炎，邻近肋骨骨质破坏征象。临床初步诊断：左肺上叶肺 Ca？入院后经系统检查无手术禁忌征，于局麻下行穿刺活检术。

结果：术中病理结果：“左肺包块”结合 HE 切片组织形态及免疫组标记结果较支持为滑膜肉瘤。

结论：肺原发滑膜肉瘤罕见，恶性程度高，临床表现无特异，易复发、转移，临床初诊困难。

影像学对单中心型及多中心型 Castleman 病合并 POEMS 综合症的诊断价值

蒋南川[1],史河水[1],韩萍[1],郑海茹[2],吴钧华[1]
1.华中科技大学同济医学院附属协和医院
2.海南医学院第二附属医院

目的　分析单中心型及多中心型 Castleman 病（CD）的 CT、MRI、PET 影像学特征，评估各种影像方式对 Castleman 病分型及合并 POEMS 综合症的诊断价值。

方法 对 2015.1-2019.7 本院经病理证实的 37 例 Castleman 病的影像学资料进行回顾性分析。25 例为单中心型，12 例为多中心型，其中 5 例合并 POEMS 综合症。12 例仅行 MR 增强，16 例仅行 CT 增强，6 例仅行 PET-CT，2 例行 CT 增强、MR 增强、PET-CT，3 例行 CT 增强及 PET-CT，1 例行 MR 增强及 PET-CT。

结果　25 例单中心型 CD 中 9 例发生于腹腔及腹膜后，6 例发生于纵隔，6 例发生于颈部，1 例发生于腮腺，1 例发生于眼眶，1 例发生于腘窝，1 例发生于腹股沟。单中心型 CT、MR 表现为单发肿块，边界清楚，病变大小为 2cm-13cm。CT 平扫密度为等密度，增强扫描均明显强化，动脉期 CT 增强幅度达 30-140HU，部分较大病变内可见未强化低密度坏死灶，实质期密度较动脉期均匀，2 例肿块内可见明显强化的纤细分隔。MR 扫描 T1WI 为低或等信号，T2WI 为稍高信号，3 例 CD 可见坏死呈长 T1WI 长 T2WI,增强扫描动脉期明显强化，延迟期肿块持续强化。14 例肿块边缘可见扩张扭曲血管影及供血动脉。

12 例多中心型中，8 例多中性型行 PET-CT，3 例行 CT 增强，1 例行 MR 增强。　10 例可见全身多发淋巴结肿大，最大淋巴结 2.5x1.2cm，1 例为双侧颈部淋巴结肿大，1 例双侧颈部及锁骨上窝淋

巴结肿大，累及鼻咽。5 例合并脾、双肾肿大，2 例合并胸腔腹腔积液，皮下水肿。2 例治疗前后 PET-CT 随访淋巴结部分变小，SUVmax 减低。
结论 对于单中心 CD，应用 CT 增强及 MR 增强对 CD 具有诊断价值；对于多中心型 CD，应用 PET-CT 可以评估病变的范围及是否合并 POEMS 综合症，以及检测治疗前后的效果。

超声与 MSCT 平扫及增强扫描对甲状腺结节良恶性鉴别诊断的应用价值

梁文娇,贾喆
榆林市第二医院

【摘要】 目的 探讨超声与 MSCT 平扫及增强扫描联合应用对甲状腺结节良恶性鉴别诊断的价值。 **方法** 回顾性分析 2018 年 1 月到 2019 年 6 月在我院同时行超声与 MSCT 平扫及增强扫描的 280 名甲状腺结节患者的影像资料。 **结果** 280 名患者，共 324 枚结节，均经手术或者超声引导下穿刺病理证实，病理结果显示良性结节约 113 枚，恶性结节约 211 枚，MSCT 增强扫描的诊断结果与病理诊断符合率高于超声检查，差异具有统计学意义（*P<0.05*），超声与 MSCT 增强扫描的总体符合率显著低于二者联合应用的符合率，差异具有统计学意义（*P<0.05*）。 **结论** 超声与 MSCT 平扫增强扫描联合应用，可以有效提高甲状腺恶性结节的检出率及诊断的准确率，可作为当前临床诊断甲状腺结节良恶性及术前评估病变范围首选无创检查方法。

前纵隔肿瘤的 CT 影像学特征与术后病理对照的临床分析

黄日升
福建医科大学附属泉州第一医院

[摘要]目的：探讨前纵隔肿瘤的 CT 影像学特征与术后病理对照的临床分析。**方法：**回顾性分析 2016 年 1 月-2018 年 12 月于我院证实胸腺瘤患者 28 例、淋巴瘤患者 18 例、畸胎瘤患者 20 例共 66 例临床资料。所有患者均行 CT 影像学和术后病理学检查，比较 CT 检查在确诊胸腺瘤、淋巴瘤及畸胎瘤不同病理类型上与病理学检查一致性，分析胸腺瘤、淋巴瘤及畸胎瘤鉴别特点。**结果：**CT 检查与病理学检查在诊断前纵隔肿瘤上无统计学差异(*P*>0.05)且一致性较强；CT 检查下胸腺瘤、淋巴瘤及畸胎瘤 CT 密度、临床特征有统计学差异(*P*<0.05)。**结论：**CT 检查在对前纵隔肿瘤诊断上有较高准确性，且能够通过 CT 密度及临床征鉴别胸腺瘤、淋巴瘤及畸胎瘤。

左室血流定向动能在扩张型心肌病中的特征

李梦露,程流泉
中国人民解放军总医院第一医学中心

目的采用二维磁共振成像相位对比血流成像法显示左心室内血流动力学状态，分析扩张型心肌病患者左心室内血流的定向动能（Signed Kinetic Energy，SKE）的变化表现，探讨 SKE 对扩张型心肌病（DCM）的诊断作用。
资料与方法纳入 21 例健康志愿者及 25 例 DCM 患者作为研究对象，采用 Philips 1.5T Multiva 磁共振扫描仪,采用 8 通道 Torso SENSE 线圈，心电向量触发，配置感应式呼吸门控，采集常规的电影成像、黑血对比序列，以及对 DCM 病人进行 Gd-DTPA 延迟强化检查后，选取左心室短轴位心底、中部和心尖 3 个层面和 LVOT 层面进行 2D-PC flow 成像，流速编码预设值 120 cm/s，流动方向为垂直成像平面，每个心动周期划分为 24 个时相。采用 Segment 软件对电影成像和血流成像序列图像进行后处理，获取左室内血流动力学相关参数，包括血流速度、血流流量、血流定向动能（SKE），以及左室射血分数（LVEF）。分析 DCM 患者 SKE 的变化特征，并进行合理的血流动力学解释。
结果在视觉判断上，正常志愿者的血流在整个心动周期内心室心底和中部可见双向血流，在流量曲线上表现为正向和负向血流共存，这种双向血流特征向心尖逐渐减弱。DCM 心室容积参数明显增大，功能参数明显减低。收缩期 SKE 较正常组无显著差异，舒张期心室中部 SKE 明显下降，其余各水平舒张期 SKE 无显著差异，但整体数值均比正常组减低。DCM 患者 SKE 曲线复杂，根据曲线形态、同步性、峰值将曲线分为 I、II、III 类可以对 DCM 的心室内血流动力学进行初步的解释。
结论 心室内血流呈双向特征，SKE 的峰值和达峰时间可以作为简单的心室内血流动力学指标比较稳定地反映心室内不同层面的血流动力学特征。SKE 曲线可直观地反映 DCM 患者的收缩舒张功能，用于解释 DCM 心衰的病理生理机制，SKE 曲线有望成为衡量心衰分级的新指标。

深度学习在肺结节检出和良恶性判别的效能验证

陈婧,陶广昱,于红,叶剑定
上海市胸科医院

【摘要】 目的 评估基于常规扫描肺 CT 数据训练的深度学习模型，在靶扫描 CT 图像上的良恶性分类效能。 方法 本研究回顾性分析了上海交通大学附属胸科医院 2016 年 1 月至 2018 年 12 月间胸部 CT 扫描发现并行手术切除的肺结节患者 938 例，共收集有病理检测报告且在常规扫描和靶扫描数据集上可对应的结节 969 个。使用基于常规扫描 CT 数据训练的深度学习良恶性分类模型，对于本研究中搜集的常规扫描和靶扫描数据集进行评测，评估指标包含两者的曲线下面积（AUC）、准确率、敏感性和特异性，并使用综合判别改善指数及 Delong 测试比较两者的性能差异。并进一步地，本研究使用统计学方法，探讨常规扫描 CT 上和靶扫描 CT 上结节的良恶性分类的样本间差异。 结果 常规扫描数据集上的曲线下面积、准确率、敏感性和特异性分别为 0.81、0.82、0.86 和 0.57，靶扫描数据集上的曲线下面积、准确率、敏感性和特异性分别为 0.84、0.85、0.89 和 0.60。综合判别改善指数为 0.056（Z 检验，$p<0.05$，有统计学差异），且 ROC 曲线存在差异（Delong 检验，$p=0.01$）。对比常规扫描的结果和靶扫描数据上的结果，靶扫描正确而常规扫描错误的结节，最长径显著低于总体水平（t 检验，$p<0.001$）。结论 基于常规扫描 CT 数据训练的深度学习模型，在靶扫描数据上可以取得更好的诊断效能。

探讨双源 CT Flash 模式非门控扫描在支气管动脉成像中的应用价值

王占
1.山东省立医院耳鼻喉医院山东省立医院西院(原:山东煤矿总医院)
2.山东省立医院
3.山东省医学影像学研究所

目的：探讨双源 CT Flash 模式非门控扫描在支气管动脉成像中的临床应用价值。方法：前瞻性收集 100 例在本单位行支气管动脉检查患者，并且将其随机分为 A、B 两组，每组 50 例。A 组采用 Flash 模式非门控扫描，B 组采用回顾性心电门控扫描。两组均应用第三代双源 CT 进行扫描。结果：A 组扫描时间为 0.78±0.13S，B 组扫描时间为 13±4 S，两组比较 P＜0.05，具有统计学意义。A 组有效辐射剂量为 1.68±0.4 mSv，B 组有效辐射剂量为 9.6±0.7 mSv，两组比较 P＜0.05，具有统计学意义。A 组升主动脉 CT 值为 330±37 HU，B 组升主动脉 CT 值为 360±42 HU，两组比较 P＞0.05，不具有统计学差异。A 组图像质量主观评分为 4.3±0.5，B 组主观评分为 4.5±0.3，两组比较 P＞0.05，不具有统计学意义。结论：双源 CT Flash 模式非门控扫描与回顾性心电门控扫描均可以获得满足诊断的支气管动脉图像，双源 CT Flash 模式非门控扫描可以在更短的时间内完成检查，并且可以大幅度的降低有效辐射剂量，双源 CT Flash 模式非门控扫描支气管动脉成像更加适用于临床，值得推广。

能谱 CT 多参数评估 5 种不同分子结构及浓度碘对比剂胸主动脉增强效能研究

王婷婷
中国科学技术大学附属第一医院西区，安徽省肿瘤医院

【摘要】 **目的** 探讨在相同碘注射率（1.2 g I/s）和碘总量（420 mg I/kg）的条件下，比较五种不同浓度碘对比剂在能谱 CT 增强胸部血管的增强效能。**方法** 选取体重指数（BMI）在 18.5~24.9 Kg/m^{2}范围的患者 200 人，随机分为五组，最终每组符合条件者 30 人。根据对比剂浓度不同分为 270 mg I/ml（270 组）、300 mg I/ml（300 组）、320 mg I/ml（320 组）、350 mg I/ml（350 组）和 370 mg I/ml（370 组）。利用单能量序列进行测定，测量气管隆突水平胸主动脉动脉期 CT 值（$CT_{胸主动脉}$）、同层面竖脊肌 CT 值（$CT_{竖脊肌}$）及皮下脂肪 SD，分别计算得出 CNR、SNR，同时保存并记录相关能谱数据，得出能谱曲线斜率、碘（水）基值及有效原子序数；比较上述五组间胸主动脉血管 CT 值、CNR、SNR、能谱曲线斜率、碘（水）基值及有效原子序数，运用 SPSS 软件，采用 LSD-t 法进行两两比较，观察 5 组间数据差异是否存在统计学意义，进而比较 5 种不同浓度碘对比剂在相同碘注射率与碘总量条件下胸部血管 CT 增强效能。**结果** 270 组、300 组、 320 组、350 组、370 组胸主动脉 CT 值、CNR、SNR、能谱曲线斜率、碘（水）基值及有效原子序数差异均无统计学意义。**结论** 不同分子结构及浓度碘对比剂按照相同的碘注射率、碘总量运用个体化对比剂注射方案行 CT 增强扫描时，能够获得相似的胸部血管增强效果和优质的图像质量。

基于常规 CT 影像训练的深度学习模型在靶扫描 CT 对肺结节分割的影响

沈蕾蕾,陶广昱,叶晓丹,于红,叶剑定
上海市胸科医院

目的：
评估常规 CT 影像与靶扫描影像使用卷积神经网络模型分割肺结节的差异。
方法：
测试数据集由 263 例患者组成，每例均包括常规 CT 和靶扫描 CT，共 526 个结节，然后由一位高年资医师对每个结节的轮廓进行勾画，使用三维卷积神经网络，并在 LIDC-IDRI 数据集上进行肺结节自动分割训练。验证集上的 3D Dice 相似系数为 0.8174，然后分别对常规 CT 和靶扫描 CT 的肺结节进行自动分割，将分割结果与人工勾画轮廓的标签进行比较。评价指标包括 3D Dice 相似系数的均值和方差以及敏感性。
结果：
常规 CT 扫描的 263 个结节的实验结果表明，所有结节均成功分割（交并比>0），因此敏感性为 100%。各结节间 3D Dice 相似系数的均值和方差分别为 0.79 和 0.008。对于大小在 6mm 范围内的结节，期 3D Dice 相似系数的均值和方差则是 0.607 和 0.035。靶扫描 CT 扫描的 263 个结节的实验结果表明，所有病灶均成功分割，敏感性为 100%。各结节间 3D Dice 相似系数的均值和方差分别为 0.60 和 0.025。对于大小在 6mm 范围内结节，其 3D Dice 相似系数的均值和方差分别为 0.685 和 0.029。
结论：在本研究中使用常规 CT 训练的肺结节分割模型，其在常规 CT 和靶扫描 CT 下的表现存在明显的差异。与常规 CT 相比，模型对于靶扫描 CT 下的小结能取得更好的分割效果。

DWI 与血清肿瘤标志物评价非小细胞肺癌化疗疗效的对比研究

贺小平
连云港市第一人民医院

目的：探讨磁共振扩散加权成像（DWI）和血清肿瘤肿瘤标志物（MT）在评价非小细胞肺癌化疗疗效中的价值及相关性。**方法**：选择 40 例经病理证实为非小细胞肺癌并首次接受化疗的患者，在治疗前一周内、治疗一周期及两周期后进行 MRI-DWI 扫描和 MT 检测， 比较肺癌治疗前后 ADC 值及 MT 值变化情况，分析 DWI 及 TM 在评价肺癌疗效中的敏感性、特异性，同时进行 ADC 值与肿瘤标志物变化的相关性分析。**结果**：非小细胞肺癌化疗后 ADC 值逐渐上升，治疗前后的 ADC 值差异具有统计学意义；肿瘤标志物值逐渐下降，但治疗前后差异无统计学意义。ADC 和癌胚抗原（CEA）化疗两周期后的变化在有效组和无效组间差异具有统计学意义（P＜0.05），鳞癌组 ADC 和 CEA 评价疗效的敏感性分别为（88.9%，77.8%），特异性分别为（86.7%，88.6%），腺癌组 ADC 和 CEA 评价疗效的敏感性分别为（90.0%，63.5%），特异性分别为（84.6%，76.4%）， 两组均以 ADC 变化诊断效能最高。非小细胞肺癌治疗后 ADC 值的改变与肿瘤大小、NSE、Cyfra21-1 变化存在负相关关系（r^2=0.120、0.176、0.149，P＜0.05），而 ADC 与 CEA 变化之间无显著的相关性（P＞0.05）。**结论**：DWI 和 MT 在评价非小细胞肺癌疗效中具有一定的临床价值，以 ADC 值变化的诊断效能更高，ADC 和 MT 的变化具有一定的相关性。

单纯烟熏所致早期 COPD 大鼠模型的评价：活体 micro CT 容积量化、肺功能及病理学相比较

夏艺,管宇,张迪,范丽,刘士远
海军军医大学第二附属医院（上海长征医院）

目的 建立单纯烟熏所致的 Wistar 大鼠的早期 COPD 模型，运用 micro CT 容积量化分析、肺功能及病理进行模型评价，分析早期 COPD 病理形态学、microCT 量化参数及肺功能的差别。**方法** 共 16 只建模成功大鼠（9 雄、7 雌；200-220g）与 10 只对照组（7 雄、3 雌），建模方法：SPF 级实验室；烟熏每次持续 1 小时（每次 10 支）；每天两次，间隔 6 小时；持续 4 个月。其中 6 只模型鼠、6 只对照鼠行有创肺功能（PFT）及肺泡灌洗液细胞涂片检查；14 只行活体 microCT 扫描（ GE explore Locus SP），26 只均行病理形态学检查。肺功能测量指标包括：FEV_1、FVC;FEV_1/FVC 等；microCT 量化指标包括：阈值-550HU--700HU;-600HU--900HU; -700HU--900HU 的肺气肿指数,平均总肺密度。对照组及实验组两者间比较运用 t 检验或 Bonferroni 法。**结果** 早期 COPD 模型大鼠病理示小气道管壁及管周见炎症细胞浸润；肺泡的破坏不显著；其中雄性大鼠的肺实质破坏较雌性大鼠明显。肺泡灌洗液细胞涂片示模型组可见较多的嗜酸性细胞及巨噬细胞。与雄性对照组相比，雄性模型组 FEV_1/FVC 有所减低(53.18% vs.45.67%);且阈值-550HU--700HU 的肺气肿指数明显小于对照组（P<0.05）。而雌性无上述差别，即对照相与模型组的肺功能及 CT 量化参数的没有明显差别。**结论** COPD 建模成功大鼠：雄性大鼠以肺实质破坏为著，肺气肿程度较高；而雌性组大鼠的气道周围炎症更重，气道重塑程度较高。

Automated pulmonary lobar quantification: variation in volumetric CT measurements of idiopathic scoliosis

Yi Xia,Qingchu Li,Li Fan,Shi-yuan Liu
Changzheng Hospital of the Second Military Medical University, China

Objective: Post-processing software tools for lobar volumetric quantification are useful for idiopathic scoliosis (IS) patient. Given the lung volume asymmetry with spinal curve severity, we aimed to evaluate that some lobes of the lung volume might be sensitive to distinguish different severity of IS and normal subjects before and after treatment.

Materials and Methods: 12 moderate and 12 severe IS patients and 12 normal controls were recruited for this retrospective study. The following CT parameters were measured by an automatic software tool: total lung volume (TLV), right lung volume(RLV), left lung volume(LLV) and respective lobar volume (LV_{RUL},LV_{RML},LV_{RLL},LV_{LUL},LV_{LLL}) of the lung .Correlations between PFT and CT parameters were assessed using Spearman correlation analysis. The differences in cobb angle, PFT and CT parameters were compared between different IS severity and the control before and after treatment.

Results: LVRLL shows relatively strong correlations with the PFT parameters (VC,%VC, FVC, %FVC,FEV_1, %FEV_1, %MEF_{75},$DLCO_{SB}$, TLC)(r range 0.448~ 0.916, P <0.05). LV_{RML} of the control was higher than that of moderate IS patients (P=0.012) and LV_{RLL} of moderate IS patients was higher than that of severe IS patients (P=0.005). Each lung lobar volume increase or decrease was not synchronous after treatment.

Conclusion: Lobe-based CT volumetric assessment in IS not only correlated well with PFT results, but also allows an estimation of disease severity according to the Cobb method classification. Severe IS patients who correct spine deformity can improve long term asymmetric CT based lung volume.

EPO-0638
气管主支气管良性肿瘤的多排螺旋 CT 表现及文献回顾

孙晓艳,曹殿波
吉林大学第一医院

目的 气管支气管良性肿瘤起源于粘膜上皮、粘膜下涎腺和管壁间叶组织，且以间叶组织来源占大多数。一般呈缓慢生长且有较长病史，当肿瘤阻塞管腔直径超过 1/2 时才会引起阻塞症状，如咳嗽、咳痰、呼吸困难、痰中带血等，伴有感染者可并发发热。为此总结了气管主支气管良性肿瘤的多排 CT 表现，并结合文献综合性分析。

方法 回顾性分析经手术病理证实的 25 例气管主支气管良性肿瘤，男性 16 例，女性 9 例，年龄范围 10-76 岁，均以非特异性呼吸道症状就诊。多形性腺瘤 2 例，神经鞘瘤 2 例，炎性肌纤维母细胞瘤 2 例，脂肪瘤 9 例，错构瘤 6 例，血管瘤 2 例，平滑肌瘤、支气管软骨瘤各 1 例。

结果 肿物位于气管 14 例，位于左主支气管 5 例，位于右主支气管 6 例，肿物大小为 0.5-3.6cm。多排螺旋 CT 表现为息肉样、类圆形或菜花状 19 例，边缘光整；呈不规则形分叶状 6 例。平扫密度均匀 15 例，均匀强化 6 例，无明显强化 12 例，脂肪与软组织成分并存 13 例。腔内生长型 22 例，其中宽基底 12 例，有较宽的蒂 4 例；腔外生长型 3 例，其中 1 例呈“冰山”样改变。纵隔淋巴结肿大 3 例，伴阻塞性肺炎、肺不张及肺气肿各 4 例。纵隔淋巴结肿大 3 例，均存在阻塞炎变或不张者，但手术清扫结果无恶性证据及周围侵犯。病变邻近气道管壁均未见明确增厚。

结论 气管主支气管良性肿瘤有一定的特征性，以腔内规则肿块多见。多排螺旋 CT 及其后处理可直观显示肿瘤的组织构成、范围和与邻近结构的关系：对于结节或肿块内部构成特征、有无伴随管壁增厚有助于良恶性鉴别、定性诊断；对显示的毗邻关系有助于外科手术方案制定。

EPO-0639
Determine the invasiveness of pure ground-glass opacity nodules using dual-energy spectral CT

Ye Yu,Huawei Wu
Renji Hospital , Shanghai Jiao Tong University School of Medicine, China

AIM: To investigate the clinical application of using quantitative parameters generated in the unenhanced phase (UP) and venous phase (VP) in dual-energy spectral computed tomography (CT) for differentiating the invasiveness of pure ground-glass opacity (pGGO) nodules.

MATERIALS AND METHODS: 51 patients with 55 pGGO nodules who underwent preoperative dual-energy spectral CT in UP and VP and identified by pathology were evaluated retrospectively. Nodules were divided into three groups: adenocarcinoma in situ (AIS, n=19), minimally invasive adenocarcinoma (MIA, n=22) and invasive adenocarcinoma (IA, n=14). The iodine concentration (IC) and water content (WC) in nodules were measured in material decomposition images. Nodule CT numbers were measured on monochromatic images from 40-140keV. All measurements were statistically compared according to their histological groups.
RESULTS: There were significant differences of WC in UP and VP between AIS and IA, MIA and IA and AIS+MIA and IA (all $p<0.05$). The CT attenuation values of the 40-140keV monochromatic images in UP and VP were significantly higher for the invasive nodules. Using WC of 359.97mg/ml in VP as threshold, one would obtain a sensitivity of 92.86% and specificity of 75.61% for differentiating AIS+MIA from IA with an area-under-curve of 0.868 in the receiver operating characteristic study.
CONCLUSION: The quantitative parameters in dual-energy spectral CT in the unenhanced phase and venous phase provide useful information in differentiating IA from AIS and MIA of ground-glass opacity nodules.
Kewords: Lung adenocarcinoma; Dual-energy; Spectral CT; Ground-glass nodule; Invasiveness

肺癌ＣＴ能谱成像：定量分析及与ＴＴＦ-１和ＥＧＦＲ表达水平的相关性

周航[1],周航[1]
1.襄阳市中心医院
2.襄阳市中心医院

目的：探讨能谱 ＣＴ成像相关参数在反映肺癌生物学特征中的作用。方法：搜集我院６０例经病理证实的肺鳞癌和腺癌患者的病例资料，所有患者采用能谱模式行 ＣＴ平扫和增强扫描，获得病灶的定量参数值，包括标准化碘浓度（ＮＩＣ）、能谱曲线斜率（Ｋ）和钙含量。采用免疫组化法测量 ＥＧＦＲ 和 ＴＴＦ １在癌细胞中的表达水平。结果：２７例肺腺癌中 ＥＧＦＲ表达阳性２０例、阴性７例，阳性组和阴性组中 ＮＩＣ分别为０．２７±０．１６和０．１５±０．１０，Ｋ 分别为２．０４±０．１７和１．７９±０．２５，两组间的差异均具有统计学意义（摩＜０．０５）。３３例肺鳞癌中 ＥＧＦＲ表达阳性１９例、阴性１４例，阳性组和阴性组中 ＮＩＣｓ分别为０．３０±０．１８和０．１６±０．０４，Ｋ 分别为２．７５±１．１０和２．０６±０．３８，病灶内钙含量分别为６．５７±０．６７和４．７３±１．５６，两组间的差异均具有统计学意义（摩＜０．０５）。结论：能谱 ＣＴ成像参数中标准化碘含量和曲线斜率（Ｋ）可反映肺癌病灶的血供情况及微血管密度，肺鳞癌中钙含量是反映肺鳞癌生长状态的参考指标。

原发性纵隔囊性肿块的 MSCT 诊断价值

蒋洁智
昆明医科大学第三附属医院

目的 探讨纵隔囊性肿块的 MSCT 影像学特征和鉴别诊断，提高 CT 对纵隔囊肿肿瘤诊断的准确率。**方法** 33 例经手术或穿刺活检及病理证实的纵隔肿瘤，回顾性分析其临床表现及 MSCT 影像学特征。 **结果** 33 例纵隔肿瘤中，支气管囊肿 7 例，好发于中纵隔气管旁及隆突附近，呈扁平状或 D 字形；食管囊肿 5 例，常见于后纵隔食管旁；心包囊肿 4 例，典型位于右心膈角区，多平面重组呈泪滴状；皮样囊肿 4 例，好发于前纵隔，其内见脂肪、钙化密度；胸腺囊肿 7 例，见于前上纵隔胸腺区，壁薄、密度均匀；淋巴管瘤 2 例，发生于 前上纵隔，包绕邻近结构、沿间隙生长；囊性神经鞘瘤 4 例，发生于后纵隔椎旁，椎间孔扩大或脊椎、肋骨畸形、侧弯。**结论** 纵隔内囊性病变少见，但涉及的疾病较多，其生长分布位置对确立诊断有重要价值；MSCT 检查可准确显示纵隔肿块的位置及累及范围，对病变的判断具有较高的准确性，并可对临床治疗提供具有重要价值影像学信息。

基于治疗前磁共振表观扩散系数预测肺癌化疗疗效的初步研究

蒋洁智,丁莹莹, 封俊
昆明医科大学第三附属医院

目的 探讨磁共振扩散加权成像表观扩散系数(ADC 值)对肺癌化疗疗效的预测价值。**方法** 回顾性收集在我院经病理证实的肺癌患者 32 例，其中男 24 例、女 8 例，年龄 35～72 岁，鳞癌 14 例，腺癌 10 例，小细胞肺癌 8 例，手术或穿刺前一周内行 MRI 检查及 DWI 成像，包括常规 T1WI、T2WI 及 DWI 检查，测量病灶平均 ADC 值。根据第二周期化疗后肿瘤最大径退缩率，按 RECIST 标准将患者分为治疗有效组和无效组，比较两组中肿瘤治疗前的表观扩散系数（ADC 值）的差异。**结果** 按 RECIST 标准患者分为有效组(18 例）和无效组（14 例），有效组化疗前病灶的平均 ADC 值为（1.42±0.35）×10^{-3} mm^2/s；无效组化疗前病灶的平均 ADC 值为（1.30±0.32）×10^{-3} mm^2/s；有效组和无效组化疗前病灶的平均 ADC 值的差异有统计学意义（P 值＜0.01）。**结论** 基于治疗前磁共振表观扩散系数（ADC 值）可对肺癌化疗疗效进行预测。

99mTc-3PRGD2 SPECT predicts the outcome of Endostar and Cisplatin therapy in xenograft animals.

纪铁凤,陈新
吉林大学白求恩第一医院

Abstract
Aims To investigate the usefulness of ^{99m}Tc-3PRGD$_2$ for monitoring the response of anti-angiogenic treatment.
Methods The xenograft animals were injected on alternate days with saline solution, Endostar, Cisplatin. ^{99m}Tc-3PRGD$_2$ imaging was performed at 0/7/14/21 day. Tumors were harvested at all imaging time points for western blotting and histopathological analysis.
Result There is significant difference of tumor volumes between NaCl and treated group (P<0.05). The intergrin $\alpha_v\beta_3$ expression of Cisplatin and Endostar groups was lower

than NaCl group from day 14 (P<0.05). The intergrin $\alpha_v\beta_3$ expression of Endostar group was significantly lower than Cisplatin group from baseline onward (P<0.05). **Conclusion** The ^{99m}Tc-3PRGD$_2$ could noninvasively visualize and semi-quantify tumor angiogenesis and monitor the response to the antiangiogenic therapy of Endostar and Cisplatin.

1.中国人民解放军中部战区总医院
2.武汉市三医院

目的：探讨 CT 纹理分析在前纵隔胸腺瘤和淋巴瘤鉴别诊断中的价值。**方法：**研究对象为经病理证实的前纵隔胸腺瘤和淋巴瘤各 15 例。采用 MaZda 软件分析二组病例术前 CT 平扫和动脉期、平衡期图像（手动勾画 ROI 的方式提取病变的纹理特征），选择出对胸腺瘤和淋巴瘤最具有鉴别诊断价值的纹理特征，再择优选取错判率最小的特征统计方法，最后通过 ROC 分析筛选出最具敏感性和特异性的纹理参数。**结果：**在平扫、增强动脉期和平衡期 3 种 CT 图像中，鉴别前纵隔胸腺瘤和淋巴瘤错判率最小的为平扫图像 POE+ACC 参数选择方法的 NDA 分析方法（原始数据分析 RDA20.00%、主要成分分析 PCA20.00%、线性分类分析 LDA6.67%、非线性分类分析 NDA0.00%）。ROC 曲线分析得出 WavEnLLs4、WavEnLLs3、WavEnLLs2 这 3 种纹理参数在鉴别上述两种病变中最有特征性(敏感性 86.7～93.3%、特异性 100%)。医师对 30 例前纵隔胸腺瘤和淋巴瘤的术前影像诊断中的错判率为 13.33%。 **结论：**采用 CT 图像纹理分析鉴别前纵隔胸腺瘤和淋巴瘤两种病变较医师术前诊断产生的错判率要低，对以上两种病变的鉴别有潜在应用价值。

EPO-0645

肺纯磨玻璃结节浸润性腺癌的免疫组化与病理贴壁成分占比相关性研究

刘芯言
重庆市肿瘤医院

目的：主要是针对薄层 CT 上呈现为肺纯磨玻璃结节（pure ground-glass nodule, pGGN）的浸润性腺癌（invasive adenocarcinoma, IA），研究其免疫组化指标与贴壁成分占比的相关性。**材料与方法：**回顾性收集薄层 CT 上呈现为 pGGN 并经手术证实为一期肺 IA 的患者 59 例，记录免疫组化情况，记录病理上贴壁成分占比情况，并分为贴壁成分占比＞50%组和贴壁成分占比≤50%组。免疫组化指标与病理上贴壁成分占比之间相关性采用 Spearman 分析，在不同贴壁分组之间采用 Mann-Whitney U test 完成差异性比较。**结果：** p53 突变率（中位数 10%, 0%~95%）与贴壁成分占比之间存在负相关（p=0.02, r=-0.30）。p53 突变率在病理贴壁成分占比＞50%组和≤50%组之间差异没有统计学意义。**结论：**肺纯磨玻璃结节的免疫组化中的 p53 与病理组织贴壁成分占比有弱相关性。

EPO-0646

前纵隔胸腺瘤 MSCT 影像征象与临床诊疗预后相关性探讨

程杰,赵林
中国人民解放军中部战区总医院

【摘要】 目的　通过研究前纵隔胸腺瘤 MSCT 的影像特点，以及随访复查胸腺瘤患者预后情况，探讨两者之间是否具有相关性，对临床患者治疗方案的制定及对远期疗效起到一定的提示作用。方法　收集 2019 年 5 月以前经手术病理证实为胸腺瘤并在随访复查中发现肿瘤复发或转移病例 17 例作为实验组，另外收集我院 2014 年 7 月以前经手术病理证实为胸腺瘤并随访观察至今（5 年时间）未见复发或转移病例 23 例作为对照组，对比观察两组病例在 MSCT 上的差异性 。 结果　两组病例在肿瘤最大径线、形态、内部有无钙化、邻近结构受侵情况、最大强化幅度等方面差异性具有统计学意义（ P<0.05）。　两组病例在肿瘤内部有无囊变、纵隔淋巴结肿大等方面比较差异无统计学意义（ P>0.05）。 结论　术前 MSCT 检查仔细分析胸腺瘤 CT 影像征象，肿瘤大小、形态、有无钙化、临近结构有无受累、最大强化幅度等影像征象对远期肿瘤预后评估具有重要的临床意义

MSCT 常规扫描及后处理技术对支气管黏液嵌塞的诊断价值研究

刘红生,高明,宁文锋,赵芸芸,邬小平
西安市中心医院

目的　分析支气管黏液嵌塞 MSCT 表现特点，旨在进一步提高认识，为临床病因诊断提供依据。
方法　收集我院 2012 年 11 月一 2019 年 4 月收治的 33 例继发性支气管黏液嵌塞患者的影像学资料。所有患者均采用 Philips Brilliance-iCT256 行平扫及增强扫描，对图像主要采用多平面重组(MPR)、曲面重组(CPR) 重组技术，由两名诊断医师独立观察病灶具体部位、外观形态特点、密度、病变范围等情况，并做出病因诊断。
结果　（1）临床类型：本组 33 例均为继发性支气管粘液嵌塞，其中支气管肺癌 15 例，支气管扩张 8 例，陈旧性结核 5 例，变态反应性肺曲霉菌病 3 例，支气管异物 2 例。（2）病变发生部位：发生于右肺上叶 4 例，中叶 4 例，右肺下叶 8 例，左肺上叶 5 例，左肺下叶 7 例，双肺下叶 3 例，右肺中、下叶均受累 2 例。（3）MSCT 表现：本组外周型 23 例，病变主要分布在肺外围部，形态呈树枝状、圆形、柱状或条索状，增强扫描可明确原发病变诊断，粘液栓无明显强化，远端支气管可伴不同程度扩张及局限性肺气肿；中心型 10 例，主要在较大的支气管如叶、段支气管内，表现为典型的“手套征”6 例，4 例合并肺不张，可见支气管内低于软组织密度病灶。
结论　支气管粘液嵌塞为不同疾病的继发改变或合并症，MSCT 常规扫描及后处理技术可清晰显示病变的外观形态、分布范围情况，为临床明确诊断、制定治疗方案提供可靠的影像学资料。

EPO-0648
肺肉瘤样癌的 CT 表现及临床特点分析

郭慧慧
河南省人民医院

目的 探讨肺肉瘤样癌的 CT 表现及临床特点。方法 收集 2013 年 3 月至 2018 年 9 月河南省人民医院收治的肺肉瘤样癌患者的影像及临床资料进行回顾性分析。15 例患者均经病理证实为肺肉瘤样

癌且均行 CT 检查。 结果：15 例肺肉瘤样癌患者男性 9 例、女性 6 例，60 岁以上老年患者多见，以咳嗽、咳痰、痰中带血及胸闷为主要症状。CT 平扫表现为肺内或叶段支气管腔内软组织密度团块影、结节影，较大病灶密度不均，增强扫描部分呈不均匀边缘明显强化及病灶内斑片状明显强化，静脉期持续强化并强化影增多；部分表现不典型，呈不均匀轻中度强化；部分病例伴有肺门、纵隔、腹腔淋巴结转移及肺内、肝脏、肾上腺转移；一例病灶在随访的 3 月内迅速进展。结论：肺肉瘤样癌好发于 60 岁以上老年人，恶性度高，进展迅速。缺乏典型临床表现。CT 呈恶性肿瘤表现，部分病例具有较型表现，CT 影像检查有助于其定性、分期；缺乏较特异性 CT 表现的病例，与其他类型肺癌较难以鉴别。

EPO-0649

肺癌与 囊性空域早期疾病特征

张远辉
南平市第一医院

摘要：目的探讨囊性肺癌的 CT 分型及影像学特征。方法回顾性分析 22 例囊性肺癌患者的临床资料、CT 分型及特征表现,有随访的病例同时评价病灶 CT 动态变化。结果 22 例囊性肺癌中,CT 分型 I 型 3 例,II 型 4 例,III 型 9 例,IV 型 6 例;14 例有动态随访(3 个月至 3 年),6 例有囊腔增大,1 例囊腔缩小,5 例囊壁均匀或不均匀增厚,6 例新出现软组织成分或软组织成分增多,4 例同时伴有囊壁增厚及新出现软组织成分或软组织成分增多;CT 形态学上,1 例由 I 型转变为 IV 型,3 例由 IV 型转变为 I 型。1 例 II 型由纯磨玻璃结节演变而来。血管穿行、分隔及周围磨玻璃征、实性成分征象有诊断意义。结论囊性肺癌 CT 表现具有一定的影像学特点,CT 分型与特征表现对于囊性肺癌诊断及预后判断有重要价值

EPO-0650

基于图像噪声值的动态扫描条件下超低剂量 CT 应用于肺部小结节的检出分析

叶凯,袁慧书
北京大学第三医院

目的：探讨基于图像噪声值的动态扫描条件下超低剂量 CT 应用于肺部小结节检出的可行性。
方法： 34 名受检者采用 GE 公司 Revolution CT 进行胸部 LDCT 检查。在 LDCT 扫描结束后，立即加扫 ULDCT 扫描。LDCT 采用 Assist kv（120 /100kV）管电压和 14.1Hu 噪声指数的 smart mAs 扫描模式，ULDCT 采用 120 kv 管电压和 16Hu 噪声指数的 smart mAs 模式。扫描结束后，LDCT 和 ULDCT 均采用 ASiR-V 70%算法进行图像重建。两名具有丰富经验的放射医师在 LDCT 图像上阅片，记录达成统一后的 LDCT 结节检出情况。三周以后，同样两名放射医师在 ULDCT 图像上进行重复阅片操作。以 LDCT 的阅片结果为参考标准，对 ULDCT 结节检出情况进行统计学分析。
结果：ULDCT 和 LDCT 的平均扫描剂量分别为 0.17±0.03 mSv 及 0.95±0.31 mSv，ULDCT 较 LDCT 下降了 82.1%（P<0.001）。34 名受检者中有 27 人检出肺部结节，LDCT 检出肺部小结节的总数为 76 个（其中包括 46 个实性结节和 30 个非实性结节）。ULDCT 总共检出了 64 个结节，总体检出率为 84.2%,而实性结节和非实性结节的检出敏感度分别为 95.7%（44/66）和 66.7%（20/30）。实性结节和非实性结节 4mm 及以上的检出敏感度分别为 100%（21/21）和 77%（20/26）。在 7 个 LDCT 定性为无肺部小结节的患者中，ULDCT 检出了 1 个假阳性结节，其检出特异度为 85.7%。

结论：在基于图像噪声值的动态扫描条件下，超低剂量 CT 对 4mm 及以上肺部小结节具有良好的检出敏感度和特异度，可以尝试应用于肺部小结节的检出。

EPO-0651

Progress on the medical treatment of malignant pleural mesothelioma

崔晓,金文凤
昆明医科大学第一附属医院

Malignant pleural mesothelioma (MPM) is a rare primary tumor originating from the pleural mesothelial cells. The disease has insidious onset, long incubation period and high degree of malignancy. The cause is related to exposure to asbestos. The current treatment is mainly chemotherapy, and pemetrexed plus cisplatin is the standard first-line chemotherapy. More and more studies have found that the addition of monoclonal antibody to MPM first-line chemotherapy can achieve better results, such as bevacizumab, nivolumab and so on. In addition, gemcitabine monotherapy, BAMLET and BLAGLET complex, gemcitabine combined with vinorelbine and multiple drug combination therapy have also achieved good results. Currently because lack of the randomized controlled trials in phase Ⅱ/Ⅲ, it requires prospective studies to further evaluate the toxicity of different chemotherapy and the effective on survival.

恶性胸膜间皮瘤的靶向药物联合化疗进展

崔晓,金文凤
昆明医科大学第一附属医院

恶性胸膜间皮瘤（malignant pleural mesothelioma，MPM）是一种罕见的起源于胸膜间皮的原发肿瘤，起病隐匿、潜伏期长且恶性程度高，病因与接触石棉有关。目前治疗方式主要为化疗，培美曲塞联合顺铂为标准一线化疗方案。越来越多的研究发现将单抗药物加入 MPM 一线化疗当中能够取得较好疗效，如贝伐单抗、纳武单抗等。针对耐药性 MPM 患者，出现了许多能够改善 MPM 细胞耐药性的化疗方式。当前并没有确切的 MPM 标准二线化疗方案，但对于通过接受培美曲塞为一线化疗并延长无进展生存期的患者，再次接受培美曲塞治疗不失为一种较好的选择。另外，吉西他滨单药、BAMLET 和 BLAGLET 复合物、吉西他滨联合长春瑞滨等多种药物联合治疗也取得了不错的疗效。目前缺少Ⅱ、Ⅲ期的随机对照研究，需要前瞻性研究进一步评估不同化疗方案的毒副作用及对生存的影响。本文对目前恶性胸膜间皮瘤的靶向药物联合化疗研究进展作一综述。

基于光谱 CT 多参数图像的非小细胞肺癌术前 N 分期初探

林禹,王勇,康江河,张有彬,王金岸
厦门大学附属中山医院（原:厦门中山医院）

目的：根据 AJCC 肺癌第 8 版 TNM 分期标准，探讨影响非小细胞肺癌淋巴结分期（N）分期的双层光谱探测器 CT（DL-CT）多参数图像特征，结合常规增强 CT（cCE-CT）图像及组织病理结果，探讨其在非小细胞肺癌术前 N 分期的作用。
方法：回顾性分析 1 例经病理证实的非小细胞肺癌患者（女性，69 岁）的 DL-CT（IQon Spectral CT）和 cCE-CT 图像，分别重建肺原发病灶和可疑转移性淋巴结（短径＞1.0cm）的 40keV 虚拟单能量（MonoE）、有效原子序数（Z-eff）和碘密度（ID）图，重建层厚均为 2mm，并基于 DL-CT 定量参数绘制光谱曲线图、直方图和散点图。
结果：cCE-CT 提示“主动脉弓旁（第 6 组）淋巴结”与右肺上叶肿瘤均表现中度-明显不均匀强化，诊断为“肺癌，转移性淋巴结（T1bN2M0，IIIA 期）”。DL-CT 的 MonoE（187Hu vs 47Hu）、Z-eff（8.6 vs 7.2）和 ID（2.7 mg/ml vs 0 mg/ml）图均提示淋巴结和肺部病灶存在明显差别，光谱曲线图、直方图、散点图进一步提示二者定量参数存在差异，考虑为“肺癌，纵隔非转移性病灶（T1bN0M0，IA2 期）”。病理结果证实肺部病灶为周围型浸润性腺癌，纵隔病灶为支气管源性囊肿，符合 DL-CT 诊断结果。
结论：相比于 cCE-CT，基于 MonoE、Z-eff 和 ID 的 DL-CT 多参数成像技术可能有助于非小细胞肺癌可疑转移性淋巴结的“同源性分析”，提高其术前 N 分期的准确性，有待后期大样本研究进一步证实。

EPO-0654

IQon CT 鉴别诊断食管癌淋巴结转移

钟华,吕绍茂
厦门大学附属中山医院

目的：探讨光谱 CT 发现食管癌淋巴结转移的临床价值。方法：选取 2019 年 3 月至 2019 年 6 月期间我院收治的食管癌患者供 19 例为研究对象，经手术病理确诊并精确定位转移淋巴结为 21 枚、非转移淋巴结 37 枚，术前均行光谱 CT 平扫和增强检查，比较转移淋巴结、癌肿与非转移淋巴结的能谱曲线斜率（40keV-70keV），碘浓度、标准化碘浓度以及有效原子序数。结果：动脉期曲线斜率转移淋巴结组 2.36±0.95，癌肿 2.86±1.20，非转移淋巴结组 2.57±0.91，差异没有统计学意义；静脉期曲线斜率转移淋巴结 3.10±0.92，癌肿组 3.00±0.80，非转移淋巴结组 3.42±0.88，差异没有统计学意义，动脉期碘浓度及标准化碘浓度，淋巴结转移组 1.22±0.09、0.112±0.007，癌肿组 1.40±0.13、0.117±0.008，非转移淋巴结组 1.27±0.06、0.112±0.006，差异均没有意义；静脉期碘浓度及标准化碘浓度，淋巴结转移组 1.53±0.09、0.381±0.015，癌肿组 1.55±0.11、0.376±0.019，非转移淋巴结组 1.62±0.07、0.408±0.018，差异均没有统计学意义；有效原子序数转移瘤淋巴结 7.37±0.10；癌肿 7.30±0.13，转移淋巴结组 7.49±0.21，非转移淋巴结与转移瘤淋巴结、癌肿间差异有统计学意义 P 值 0.021（P<0.05）;转移淋巴结与癌肿差异没有统计学意义（P>0.05）。结论：光谱 CT 的有效原子序数对鉴别食管癌的转移淋巴结与非转移淋巴结具有一定价值，但能谱曲线斜率、碘浓度及有效碘浓度不能有效鉴别转移与非转移淋巴结。

EPO-0655

食管鳞癌淋巴结转移与 CT 灌注参数及血管生成的关系

聂婷婷
湖北省肿瘤医院

目的：探讨食管鳞癌 CT 灌注参数、MVD 值及 VEGF 表达与淋巴结转移之间的关系，以期为食管鳞癌淋巴结转移的术前诊断提供功能学参考指标。
方法：收集手术切除标本或胃镜病理活检证实食管鳞状细胞癌 100 例患者，应用免疫组织化学技术检测术后标本的 MVD（肿瘤微血管密度）值及 VEGF(血管内皮生长因子)表达。术前通过对患者行多排螺旋 CT 灌注扫描，以食管癌实性部分最大层面为中心选取 8 层行连续动态增强扫描，扫描时间约 45 秒。经 CT perfusion-3 体部肿瘤软件包分析，获得 CT 灌注参数 BV、BF、MTT、PS 值。采用免疫组织化学 SP 法检测 50 例食管鳞癌组织中 MVD 及 VEGF 蛋白表达。采用 SPSS20.0 统计软件进行处理，两样本间 CT 灌注参数及 MVD 值的比较采用 t 检验，两变量相关性采用 Spearman 相关性分析。
结果：食管鳞癌 CT 灌注参数 BV、BF、MTT 值在有无淋巴结转移中的差异均无统计学意义（P＞0.05），而 PS 值在有无淋巴结转移中有显著性差异(P＜0.01)；以 PS 平均值＞10(ml/100 g/min)为标准诊断淋巴结转移的敏感性、特异性、阳性似然比及阴性似然比分别为：95. 8%、65.4%、2.77、0.06；MVD 值及 VEGF 表达与食管鳞癌淋巴结转移呈显著正相关(P＜0.01)。
结论：CT 灌注成像有助于食管鳞癌淋巴结转移的术前诊断，其中 PS 值是最有价值的诊断指标。当 PS 值、MVD 值较高，VEGF 阳性表达时，提示发生淋巴结转移的可能性较大，同时结合淋巴结的形态、大小及强化特征，可以对食管鳞癌淋巴结转移做出更加准确的术前诊断。

EPO-0656
低剂量 CT 扫描在肺部结节性病变筛查中的价值探讨

沈哲[1],邓絮旻[2]
1.武汉市第十一医院武汉市红十字会医院
2.武汉美年大健康硚口店影像中心

目的：探讨胸部低剂量 C T 扫描在肺部结节性病变筛查中的应用价值。方法：回顾性分析美年大健康体检中心 2017 年 1 月—2018 年 12 月体检发现肺结节的 50 例客户的资料，均进行了低剂量 CT 扫描和医院常规剂量 CT 扫描，对两种检查方法肺结节检出数目以及、肺结节良恶性倾向分别进行分析；结果：两种检查方法肺结节检出结节数目、肺结节良恶性倾向均无差异（P ＞0.05）；结论：在对肺结节的诊断中，低剂量 CT 和常规剂量 CT 扫描效果无显著差异，在极大降低了受检者辐射量同时，也保证了准确的诊断结果。

肺炎性肌纤维母细胞瘤 MDCT 表现与病理对照研究

刘玉建,仲建全,冯浩,张雨涛
自贡市第一人民医院

摘要:目的 探讨肺炎性肌纤维母细胞瘤（inflammatory myofibroblastic tumor，IMT）良性病变的 MDCT 影像特征。**方法** 收集我院自 2015 年 1 月至 2019 年 6 月经手术或 CT 引导下肺穿刺活检并病理证实肺炎性肌纤维母细胞瘤患者 33 例，从发病年龄、性别、发病部位、是否位于肺的外周、病灶大小、形态、密度、边界、病灶内是否有血管穿行、病灶邻近支气管是否堵塞、与邻近胸膜是否分界不清，病灶内是否有钙化成份，强化方式，临床表现及合并症等进行回顾性分析总结。**结果** 本组 33 例患者共 37 个病灶，多发 4 例；男性 24 例，占 72.7%；女性 9 例，占 27.3%；男女比例约为 7∶3；年龄 33～72 岁，平均年龄 55 岁，年龄 31～40 岁 3 例，占 9.1%，年龄 41～50 岁 6 例，

占 18.2%，年龄 51～60 岁 14 例，占 42.4%，年龄 61～70 岁 9 例，占 27.3%，＞70 岁 1 例，占 3.0%；病灶部位右肺上叶 10 个，占 27.0%；右肺中叶 8 个例，占 21.6%；右肺下叶 9 个，占 24.3%；左肺上叶 3 个，占 8.1%；左肺下叶 6 个，占 16.2%；主支气管 1 个，占 2.7%；肿瘤最小约 0.5 cm，最大约 14.6 cm，平均 3.6 cm；病灶密度均匀 20 例，不均匀 13 例，其中 2 例较大者可见液化坏死；2 例见斑点状、小片状钙化；边界清楚 24 例，边界不清 9 例；周围见晕征 20 例；相邻支气管通畅 25 例，支气管堵塞 4 例，不能评价 4 例；病灶内有血管穿行 28 例，无血管穿行 5 例；与胸膜相连 29 例，4 例未与胸膜相连；增强扫描 30 例，均匀强化 18 例，不均匀强化 12 例；37 个病灶其中 29 个病灶均位于肺外周。33 例患者均未发现病灶周围及胸腔内肿大淋巴结。随访患者 20 例，2 例复发。**结论** 肺炎性肌纤维母细胞 MDCT 影像表现具有一定特征性，结合其临床表现术前能够做出提示性诊断。

EPO-0658

The value of lung nodule quantification by a commercially deep-learning based computer-aided diagnosis (DL-CAD) added to the differentiation between benign and malignant lung nodules

Zhou Liu,Li Li,Douqiang Luo,Dehong Luo
Cancer Hospital Chinese Academy of Medical Sciences， Shenzhen Hospital

Purpose: To investigate the added value of objective quantification of lung nodules by a commercially deep-learning based computer-aided diagnosis (DL-CAD) to the conventional imaging-findings-based double reading strategy in differentiating benign and malignant nodules.
Method: In this retrospective study, 233 patients (March 2017 to June 2019) with 247 pathologically confirmed lung nodules (malignant: benign = 192: 55) were selected. For each nodule, we acquired predefined morphological features, including 1) shape; 2) border (ill- or well-defined border, lobulation, spiculation); 3) bubble-like lucency; 4) cavitation; 5) air bronchogram; 6) calcification; 7) vascular convergence; 8) pleura retraction. The parameters quantified by DL-CAD include volume, three-dimensional (3D) diameter, 3D long axis diameter, 3D short axis diameter, and average CT value. Chi Squared test and non-parametric Mann-Whitney U test were used to compare the difference between malignant nodules and benign nodules with $P < 0.05$ indicating statistical significance. Receiver operative characteristic curve was generated with area under the curve (AUC) calculated based on morphological features alone and morphological features plus quantifications by DL-CAD to distinguish malignant nodules from benign nodules.
Results: Among all the morphological features acquired by double reading, lobulation, bubble-like lucency, spiculation, pleura-retraction and vascular convergence sign happened significantly more frequently in malignant nodules than that in benign nodules, while calcification and smooth margin was significantly more commonly detected in benign nodules than malignant nodules. Except for average CT value, all the remaining 4 quantifications by DL-CAD were significantly different between malignant nodules and benign nodules. In differentiating malignant and benign nodules, quantifications by DL-CAD slightly improve the performance with AUC elevated from

0.832 (95% confidence interval: 0.762-0.901) for morphological features alone to 0.840 (95% confidence interval: 0.772-0.909) for combining morphological features and quantifications.
Conclusions: The quantifications by DL-CAD add little value in differentiating malignant nodules and benign nodules, which needs further confirmation.

EPO-0659

Blood supply of early lung adenocarcinoma in mice and tumor-supplying vessel relationship: a micro-computed tomography angiography study

Lin Deng,Jinwei Qiang
Jinshan hospital of Fudan university

Objectives: The aim of this study was to investigate the blood supply of early lung adenocarcinomas (LAC) in mouse and the relationship between tumor and supplying vessels by using micro-CT.
Materials and Methods: Early LAC models were established by subcutaneously injecting 1-methyl-3-nitro-1-nitrosoguanidine (MNNG) solution in 10 mice. Micro-CT pulmonary and bronchial arteriography were performed to demonstrate the tumors and their related vessels. The blood supply of early LAC, especially tumor-vessel relationships, were analyzed and correlated with pathology. The changes of supplying vessels for tumors were analyzed by quantitative and texture analysis.
Results: There were 167 early LAC found on micro-CT and confirmed by histopathology. Micro-CT manifested that pulmonary artery (PA) densely distributed in and around tumors in 141 (84.4%) of 167 early LAC, and bronchial artery (BA) was not related to tumors. Tumor-PA relationships were classified into four patterns: type I (n = 45, 32%), PA was intercepted at the margin of the tumor; type II (n = 38, 27%), PA penetrated into the tumor with tapered narrowing and interruption; type III (n = 29, 21%), PA penetrated into the tumor with a patent and intact lumen; type IV (n = 110, 78%), PA ran at the border of the tumor with an intact or compressed lumen. Micro-CT manifestations of tumor-PA relationships correlated well with pathological findings. Among the quantitative parameters and textural features, vessel volume fraction (VVF), vessel thickness (VT), vessel number (VN), vessel separation (VS), vessel surface/vessel volume (VS/VV), correlation, cluster prominence (CP), haralick correlation (HC), grey level nonuniformity (GLN) and run length nonuniformity (RLN) were correlated with the tumor size ($R = 0.529$, $P < 0.001$; $R = 0.177$, $P = 0.022$; $R = 0.601$, $P < 0.001$; $R = -0.589$, $P < 0.001$; $R = -0.172$, $P = 0.026$; $R = -0.223$, $P = 0.004$; $R = 0.204$, $P = 0.008$; $R = 0.155$, $P = 0.045$; $R = 0.526$, $P < 0.001$; $R = 0.475$, $P < 0.001$, respectively); VVF, VN, VS, GLN and RLH correlated with the solid components of tumor ($R = 0.246$, $P < 0.001$; $R = 0.251$, $P < 0.001$; $R = -0.249$, $P < 0.001$; $R=0.235$, $P = 0.002$; $R = 0.220$, $P = 0.004$, respectively).

Conclusion: The blood supply of early LAC mainly originated from PA in mice. Micro-CT can clearly demonstrate the tumor-PA relationships and contribute to quantitative and texture analysis for the changes of supplying vessels.

Assessment of predictors for pulmonary solid nodule detection in Ultralow dose CT reconstructed with a new generation adaptive statistical iterative reconstruction (ASiR-V)

Kai Ye,Huishu Yuan
Peking University Third Hospital

Purpose The purpose of this study was to assess the independent predictors for sensitivity of pulmonary solid nodule detection by using ultralow dose CT (ULDCT) reconstructed with ASiR-V.

METHOD AND MATERIALS 123consecutive patients (59.3±14.9 years) who underwent chest LDCT with Revolution CT (GE Healthcare, USA) and found solid nodule with diameter>=4mm were additionally scanned with a chest ULDCT. Reference tube voltage and current were set to be 120 kV and smart mAs for LDCT and 120 kV/2.8 mAs for ULDCT. After scanning, LDCT and ULDCT scans were all reconstructed with 50% ASiR-V. A standard of reference (SOR) was established by two board-certified radiologists to determine the presence, type and size of lung nodules on LDCT. All nodules were classified as solid, part-solid, and pure ground-glass nodules. Three weeks later, two radiologists above read ULDCT images and did the same things. Sensitivity of the ultralow dose protocol was compared against the SOR. Then, logistic regression was used to test independent predictors for performance of pulmonary nodule detection.

RESULTS The mean BMI of all patients was 23.8±2.9(16.4-29.9) kg/m^2. The mean effective radiation dose of ULDCT was 0.096±0.007 mSv compared with 0.95±0.34 mSv for LDCT, which was 90% lower(P<0.001). A total of 123 solid nodules (mean diameter 6.5 ± 2.5 mm) were identified in LDCT. There were 116 true-positive nodules detected by ULDCT and overall sensitivity was 94.3%.The sensitivity for nodules with 4mm<=diameter<5mm was 90.4%(66/73) and 100% (50/50) for nodules with diameter >=5mm, which had no difference between them (P=0.063). The mean diameter of true-positive nodules(5.2±1.6mm) was longer than false negative nodules(4.2±0.2 mm)(P<0.001). BMI for true positive groups and false negative groups were 23.8±2.9 and 24.5±3.2 kg/m^2, and there was no significant difference between them (P=0.525).In multivariate analysis, location, size and patients' BMI had no significant effects on the nodule detection(P>0.05).

CONCLUSION For people with BMI<=30kg/m^2 , ultralow dose CT reconstructed with ASiR-V enables a extremely high sensitivity for the detection of pulmonary solid nodules with diameter>=4mm and the sensitivity will not be obviously influenced by patients' BMI ,the location and size of nodules.

EPO-0662

肺癌能谱 CT 相关参数定量与临床应用

黄倩文,陈应东,钟华,段少银
厦门大学附属中山医院（原:厦门中山医院）

目的：探讨能谱 CT 参数在肺癌诊断及判断病理类型中的应用价值。**方法**：收集我院 2017 年 3 月-2019 年 1 月发现肺部占位行胸部能谱 CT 增强扫描且病灶短径＞2cm 者共 97 例（包括鳞癌 28 例，腺癌 41 例，大细胞癌 4 例，小细胞癌 7 例，炎性病灶 17 例），分为 5 组。测量各组原发病灶能谱 CT 参数（主要包括 IC、NIC、WC、$K_{40-90kev}$和 Eff-Z）；比较肺癌和肺部炎性病灶、不同病理类型肺癌间的统计学差异，采用 ROC 曲线评估诊断效能。**结果**：（1）肺癌与炎性病灶比较：平扫肺癌 IC、$K_{40-90kev}$、Eff-Z 均小于炎性，WC 大于炎性；动脉期肺癌 IC、$K_{40-90kev}$、NIC 均小于炎性；静脉期肺癌 IC、$K_{40-90kev}$、NIC 均小于炎性，WC 大于炎性；ROC 曲线示平扫 WC 诊断肺癌 AUC 为 0.745；以上差异均有统计学意义（P＜0.05）。（2）不同病理类型肺癌比较：鳞癌与腺癌平扫 IC、$K_{40-90kev}$、WC 和 Eff-Z、动静脉期 IC、$K_{40-90kev}$和 WC、静脉期 NIC 有统计学差异；鳞癌与小细胞癌静脉期 NIC 有统计学差异；腺癌与小细胞癌平扫 IC 和 $K_{40-90kev}$、静脉期 IC、$K_{40-90kev}$和 NIC 有统计学差异。（3）以鳞癌和腺癌代表非小细胞癌，ROC 曲线示平扫 WC 诊断肺癌、静脉期 NIC 诊断非小细胞癌、静脉期 IC 和 $K_{40-90kev}$诊断腺癌 AUC 分别为 0.745、0.913、0.852 和 0.853（P＜0.05）。**结论**：能谱 CT 测量平扫 IC、$K_{40-90kev}$、WC 和 Eff-Z、动静脉期 IC、$K_{40-90kev}$和 NIC、静脉期 WC 参数值可用来鉴别肺癌与肺部炎性病灶，其中平扫 WC 值大于 1021.6 时诊断肺癌具有较高准确性。静脉期 NIC 大于 0.375 诊断非小细胞癌、静脉期 IC 大于 17.6 或静脉期 $K_{40-90kev}$大于 2.355 诊断腺癌均具有较高效能。

EPO-0663

囊腔型肺癌的 CT 表现特点及病理基础探讨

谭洋[1],伍建林[2],周鹏[1]
1.四川省肿瘤医院
2.大连大学附属中山医院

目的 探讨囊腔型肺癌的 CT 表现特征及其对应的病理学表现，以提高此类肺癌的认识及诊断水平。**方法** 回顾性分析 2012 年 1 月至 2017 年 12 月收治的 30 例囊腔型肺癌患者，均经手术、纤维支气管镜和经皮穿刺病理活检证实。30 例患者中男性 17 例、女性 13 例，年龄范围 39~77 岁，平均年龄 60.77±10.12 岁。**结果**（1）CT 特点：囊腔的大小约 0.89~6.65cm，平均 2.46±1.27cm。23 例（76.67%）病灶位于双肺外周，24 例（80.00%）囊腔形态规则。27 例（90.00%）囊壁厚薄不均，3 例（10.00%）囊壁均匀增厚。19 例（63.33%）囊内有分隔，16 例（53.33%）囊壁含磨玻璃影，21 例（70.00%）病灶边缘不规则，有 20 例（66.67%）囊壁外可见贴边血管征。（2）病理基础：30 例患者中腺癌多达 26 例（86.67%），鳞癌 3 例（10.00%），腺鳞癌 1 例（3.33%）。光镜下，囊内分隔、囊壁、囊外磨玻璃影的病理特点各不相同。**结论** 囊腔型肺癌是一种特殊类型的肺癌，它具有典型的 CT 特点及病理改变，熟悉和掌握这些特点有助于提高术前诊断准确率。

IILS: Intelligent Imaging Layout System for Automatic Imaging Report Standardization and Intra-interdisciplinary Clinical Workflow Optimization

Yang Wang
Nanjing Drum Tower Hospital

Objective: To achieve imaging report standardization and improve the quality and efficiency of the intra-interdisciplinary clinical workflow, we proposed an intelligent imaging layout system (IILS) for a clinical decision support system-based ubiquitous healthcare service, which is a lung nodule management system using medical images. **Materials and Method:** We created a lung IILS based on deep learning for imaging report standardization and workflow optimization for the identification of nodules. Our IILS utilized a deep learning plus adaptive auto layout tool, which trained and tested a neural network with imaging data from all the main CT manufacturers from 11,205 patients. Model performance was evaluated by the receiver operating characteristic curve (ROC) and calculating the corresponding area under the curve (AUC). The clinical application value for our IILS was assessed by a comprehensive comparison of multiple aspects. **Results:** Our IILS is clinically applicable due to the consistency with nodules detected by IILS, with its highest consistency of 0.94 and an AUC of 90.6% for malignant pulmonary nodules versus benign nodules with a sensitivity of 76.5% and specificity of 89.1%. Applying this IILS to a dataset of chest CT images, we demonstrate performance comparable to that of human experts in providing a better layout and aiding in diagnosis in 100% valid images and nodule display. The IILS was superior to the traditional manual system in performance, such as reducing the number of clicks from 14.45 ± 0.38 to 2, time consumed from 16.87 ± 0.38 sec to 6.92 ± 0.10 sec, number of invalid images from 7.06 ± 0.24 to 0, and missing lung nodules from 46.8% to 0%. **Conclusions:** This IILS might achieve imaging report standardization, and improve the clinical workflow therefore opening a new window for clinical application of artificial intelligence.

HRCT 诊断与影像组学研究对肺腺癌纯磨玻璃结节浸润程度分析

张天琪,韩雪立,袁庆海,刘建华
吉林大学第二医院

目的：
首先回顾性分析于 HRCT 上表现为纯磨玻璃结节（pGGN）肺腺癌 CT 征象，并结合术后病理对其浸润程度进行分析，探究 HRCT 结合常规影像诊断方法对肺腺癌 pGGN 的浸润性能否作出诊断。其次通过影像组学方法提取以上相同研究对象 HRCT 原始图像数据信息，以期辅助临床对肺腺癌 pGGN 的合理术式选择及远期治疗。
资料与方法：
回顾 2015 年 1 月至 2018 年 10 月于吉大二院行胸部 HRCT 检查，后经手术切除的肺腺癌患者相关资料，共有 65 例经病理证实的 pGGN 病灶入组。同时通过影像组学方法，采用 A.K.分析软件，并建立组学预测模型，将验证组全部 ROI 图像带入组学模型，所得结果经 A.K.软件自动进行统计学分析并获得预测结果。
结果：
常规影像诊断方法中，浸润前组与浸润性组经过定性特征分析，得出分叶征（P=0.000）、毛刺征（P=0.008）、空泡征（P=0.047）及血管集束征（P=0.001）有明显统计学差异；定量特征中结节大小(P=0.001)、平均 CT 值(P=0.000) 有明显统计学差异，定量特征的诊断价值以 ROC 及曲线下面积（AUC）判断，AUC 分别为 0.740 及 0.784。影像组学分析经 A.K.软件自动完成，共获得 385 个组学参数，经 LASSO 降维及 Logistic 迭代回归剔除冗余，保留“熵”及“球度”两个特征参数并以此建立预测模型，该模型对 HRCT 检查 pGGN 浸润程度的诊断价值 AUC 为 0.824。
结论：
常规影像学诊断方法显示分叶征、毛刺征、空泡征、血管集束征、结节大小及平均 CT 值对区分浸润前及浸润性病变有意义，当结节直径大于 12.7 mm 或平均 CT 值大于-544.50 HU 时，可以考虑结节内含有浸润性成分。通过 65 例病灶建立影像组学分析模型，该模型不仅能够定量判断 pGGN 内有无浸润成分，且定量诊断价值高于常规影像学诊断方法。

硬化性肺泡细胞瘤与周围型肺癌 CT 征象对照分析

王翅鹏[1,2],胡望福[1],王莉[1],黄文才[2]
1.武汉平安好医医学影像诊断中心
2.中国人民解放军中部战区总医院

目的 探讨高分辨率 CT 对硬化性肺泡细胞瘤（PSP）与周围型肺癌（PLC）的鉴别诊断价值，以提高认识、减少误诊。
方法 回顾性分析经病理证实的 PSP（19 例）和 PLC（22 例），收集其临床、病理及影像学资料，并对两组病变 CT 征象、强化率进行统计学分析。
结果 ①在动脉期、静脉期强化率、钙化、分叶征、毛刺征、胸膜凹陷征、液化坏死、纵膈及肺门淋巴结肿大等 8 项指标上，PSP 组和 PLC 组间的差异具有统计学意义(P <0. 05)；②当静脉期强化率阈值取 1.500 时，曲线下面积（AUC）为 0.914，敏感性、特异性分别为 86.3%、89.4%（p<0.001）；当动脉期强化率阈值取 1.200 时，A_Z值为 0.878，敏感性、特异性分别为 86.3%、84.2%（p<0.001）；当分叶征阈值取 0 时，AUC 值为 0.906，敏感性、特异性分别为 86.3%、94.7%（p<0.001）。

结论 CT 征象分析对硬化性肺泡细胞瘤与周围型肺癌的鉴别诊断具有一定的参考价值。

Essentials of Precisely Quantitative Evaluation for Non-small Cell Lung Cancer after Targeted Therapy: pros and cons radiologists should know

Xiaoyun Hu[1], Sharma Manish[2], PS Sanjeev[2]
1.Wuxi People's Hospital affiliated to Nanjing Medical University
2.Department of Medical Imaging, Parexel International Pvt Ltd, Hyderabad, Telangana, India

Learning objectives
To explore the essentials of imaging quantitative evaluation for non-small cell lung cancer (NSCLC) after targeted therapy in order to improving the recognition and interpretation of RECIST 1.1, which is conducive to the application of clinical MDT and the standardization of imaging report in China.
Background

By reviewing the evolution process of imaging evaluation criteria from WHO criteria to RECIST and RECIST 1.1, the main different points were stressed among them. Interpretation of the main diagnostic terms and essentials for RECIST 1.1 was demonstrated via the application analysis of specific cases. From a multi-center clinical trial for targeted treatment of NSCLC (23 large general or cancer hospitals in China cooperated with PAREXEL), the conditions (need specific evaluation training or not) of RECIST 1.1 application and report QC (by a test in a case) were studied and compared which were divided into four levels: best, better, good, ordinary.
Findings and procedure details

At present, the evaluation criteria for therapic efficacy was RECIST 1.1, which is characterized by easy generalization, simple operation, small variability, comprehensive evaluation of tumor itself and metastases and lymph nodes. The application essentials and difficulties for NSCLC involved these aspects, such as the selection of target lesion (the most important procedure for the first step), the choice of measuring window width (the accuracy and reliability of the measuring results can be guaranteed.), the definition and screening of new lesions (new lesions directly trigger PD, so they must be substantial, confirmed, and cautious as well.), the mastery of significant progress in non-target lesions (it's strongly subjective, so uniform standard was a focus for training.), etc. (Fig. 1-2) The evaluation reports were issued by radiologists in only three hospitals (3/24), the others 21/24) by the oncologists. As to QC, only 4 hospitals (4/24) for best level without any training; the remaining 20 were all required specialized training, among them 5 for better, 14 for good, 1 for ordinary level.
Conclusion

The imaging evaluation criteria and report standardizations for tumor response were clearly different from the routine reporting format and system, so their promotion

needed to be improved in clinic with a long way in China; recognition and mastery for imaging departments and radiologists will facilitate the application of RECIST 1.1 in NSCLC, which is conducive to the positive interaction and collaboration with other disciplines in the practicing MDT.

EPO-0668

CT characteristics for predicting invasiveness in pulmonary pure ground-glass nodules

Wangjia Li,Fajin Lv,Zhigang Chu
The first affiliated hospital of Chongqing medical university

Objective: *To investigate the differences of CT features in atypical adenomatous hyperplasia (AAH), adenocarcinoma in situ (AIS), minimally invasive adenocarcinoma (MIA) and invasive adenocarcinoma (IA) manifesting as pure ground-glass nodule (pGGN) with the aim of finding useful signs for predicting invasiveness.*
Materials and methods: *Fourteen AAHs, 59 AISs, 68 MIAs and 31 IAs manifesting as pGGN in 161 patients were enrolled in this study. CT features including lesion location, size, area, shape, density and its uniformity, margin, nodule-lung interface, lobulation, spiculation, pleural indentation, air bronchogram, vacuole sign and vessel changes in it were evaluated. CT features of each type nodules were analyzed and compared.*
Results: ROC analyses revealed that nodule size (cut-off value, 10.5mm; sensitivity, 78.8%; specificity, 59.8%; $p<0.001$) and area (cut-off value, 86.5 mm^2; sensitivity, 87.1%; specificity, 65.2%; $p<0.001$) were significant larger in IAs than those in AAHs, AISs and MIAs ($p<0.001$), while diameters of the latter three were similar ($p>0.05$). CT attenuation higher than -632 HU in pGGNs usually indicated invasiveness (sensitivity, 78.8%; specificity, 59.8%; $p<0.001$). Compared with AISs, MIAs and IAs, density of AAHs was more likely to be homogenous ($p<0.001$). In contrast with pGGNs without invasiveness, MIAs and IAs usually have irregular shape, coarse margin, lobulation, spiculation, pleural indentation and dilated/distorted vessels (each $p<0.05$).
Conclusion: *The possibility of invasiveness is high in pGGNs with larger size (>* 10.5mm or>86.5 mm^2), higher (>-632 HU) but heterogenous density, irregular shape, coarse margin, spiculation, lobulation, pleural indentation and dilated /distorted vessels.

EPO-0669

基于 CT 征象量化分析非小细胞肺癌脏层胸膜侵犯的风险因素研究

汤敏,沈晶,孙丹丹,伍建林
大连大学附属中山医院

目的 分析≤3cm 非小细胞肺癌的 CT 特征、临床及病理资料，量化分析非小细胞肺癌脏层胸膜侵犯的风险因素，提高脏层胸膜侵犯的诊断水平。**方法** 回顾性分析 173 例周围型非小细胞肺癌患者的 CT 特征、临床及病理资料，行单因素分析及多因素逻辑回归分析确定胸膜侵犯的独立危险因素，根据其优势比（odds ratios ,ORs）值建立预测胸膜侵犯的风险评分系统，行受试者操作特征（ROC）曲线，评估其预测效能。**结果** 173 例非小细胞肺癌中脏层胸膜侵犯 50 例（28.9%），无脏层胸膜侵犯 123 例（71.1%）。单因素分析显示肿瘤病理分化、分叶征、毛刺征、肿瘤-胸膜关系（Ⅰ型/Ⅱ型/Ⅲ型/Ⅳ型）、肿瘤大小、肿瘤实性成分长径及 C/T 比值在两组间差异均有统计学意义（p＜0.05）。多因素逻辑回归分析结果显示肿瘤-胸膜关系Ⅳ型（胸膜凹陷征）、肿瘤大小、肿瘤实性成分长径是脏层胸膜侵犯的独立危险因素，根据其对应的 OR 值建立总风险评分系统如下，总风险评分=4（肿瘤实性成分长径＞1.3cm）+4（肿瘤大小＞1.8cm）+3（胸膜凹陷征），得到预测脏层胸膜侵犯的 ROC 曲线下面积（AUC）为 0.840，总风险值的 cut-off 值为 7.5，该风险评分系统预测脏层胸膜侵犯的敏感度为 68.0%，特异度为 87.0%，准确度为 81.5%。 **结论** 本研究结果提示肿瘤-胸膜关系Ⅳ型（胸膜凹陷征）、肿瘤大小、肿瘤实性成分长径是非小细胞肺癌脏层胸膜侵犯的独立危险因素，总风险值大于 7.5 时提示可能存在脏层胸膜侵犯。

EPO-0670

基于 CT 特征预测叶间胸膜下浸润性肺腺癌的研究

汤敏,伍建林
大连大学附属中山医院

目的 建立二元 logistic 回归模型，探究有助于预判叶间胸膜下浸润性肺腺癌的 CT 特征。**方法** 收集 2016-2018 年于大连大学附属中山医院经手术病理证实位于叶间胸膜下（距离胸膜＜1.0cm）且与叶间胸膜存在毗邻关系的周围型肺腺癌 72 例。其中有非浸润性腺癌组 25 例（33.3%），浸润性腺癌组 47 例（62.3%），单因素分析两组肺腺癌 CT 征象，对有统计学差异的变量纳入二元 logistic 回归分析，行受试者工作特征（ROC）曲线，评估其预判效能；在 HRCT 平扫或增强图像中将肿瘤与叶间胸膜的毗邻关系分为 3 型，I 型：肿瘤与叶间胸膜呈 1 条或多条索条影牵拉；II 型：肿瘤紧邻叶间胸膜但未见明显胸膜移位；III 型：叶间胸膜向肿瘤内部凹陷，形成典型的弧凹征，当存在多种类型时，优先判定为 III 型、II 型、I 型。**结果** 浸润性肺腺癌与叶间胸膜毗邻关系 I 型 12 例（25.5%）、II 型 12 例（25.5%）、III 型 23 例（48.9%），与非浸润腺癌组间差异有统计学意义（X^2=19.805　p＜0.001）；而非浸润性肺腺癌多以 II 型为主（80.0%）。单因素分析显示平均长径、平均 CT 值、分叶征、毛刺征、肿瘤-胸膜距离、肿瘤-胸膜毗邻关系在两组间差异有统计学意义（p＜0.05）。二元 logistic 回归分析显示平均长径、平均 CT 值是预测叶间胸膜下浸润性肺腺癌的独立危险因素（OR=8.604，95%CI：2.173-34.074，　p=0.002；OR=1.009，95%CI：1.004-1.014，p=0.001），进一步得出二元 logistic 回归模型预判浸润性肺腺癌的 ROC 曲线下面积（AUC）为 0.912。**结论** 在本研究中，肿瘤与叶间胸膜毗邻关系分为 3 种类型，且肿瘤与叶间胸膜毗邻关系 III 型提示为浸润性肺腺癌可能，平均 CT 值和平均长径值有助于术前预判其浸润性，从而指导临床合理选择治疗或随诊方案。

EPO-0671

Differentiating minimally invasive and invasive adenocarcinomas in patients with solitary sub-solid pulmonary nodules with a radiomics nomogram

Xiangmeng Chen
Jiangmen Central Hospital

AIM: To evaluate the preoperative differentiation between the minimally invasive adeno- carcinoma (MIA) and invasive adenocarcinoma (IAC) in patients with sub-solid pulmonary nodules using a radiomics nomogram.
MATERIALS AND METHODS: A total of 100 patients with sub-solid pulmonary nodules who had pathologically confirmed MIA (43 patients, 13 male and 30 female) or IAC (57 patients, 26 male and 31 female) were recruited retrospectively. Radiomics features were extracted from computed tomography (CT) images. A radiomics signature was constructed by the least ab- solute shrinkage and selection operator (LASSO) algorithm. Solid presence, lesion size, shape regularity, and margins of pulmonary nodules were assessed to construct a subjective finding model. An integrated model of radiomics signatures and CT-based subjective findings, which was presented as a radiomics nomogram, was developed based on a multivariate logistic regression. The nomogram performance was assessed by its calibration, discrimination, and clinical usefulness.
RESULTS: The radiomics signature, which consisted of 11 radiomics features, showed good discrimination accuracy. The radiomics nomogram showed good calibration and discrimi- nation in the training set (AUC [area under the curve] 0.943; 95% confidence interval [CI]: 0.895e0.991) and validation set (AUC 0.912; 95% CI: 0.780e1.000). The radiomics nomo- gram was determined to be clinically useful in the decision curve analysis (DCA).
CONCLUSION: The proposed radiomics nomogram has the potential to preoperatively differentiate MIA and IAC in patients with sub-solid pulmonary nodules.

肺癌 MSCT 增强扫描的影像学特征与特异性标记物表达相关性以及联合诊断价值研究

梁海胜
上海交通大学医学院附属第九人民医院

摘要：【目的】探究肺癌患者的 MSCT 扫描影像学特征与血清 C12 多肿瘤特异性标记物的表达相关性以及两者联用的诊断价值。【方法】2011 年 2 月-2018 年 2 月于我院接受治疗的 760 例确诊原发性肺癌患者为研究对象并搜集其临床诊断资料，另选取 500 名健康体检者为对照组，对肺癌患者及正常人体血清中 C12 多肿瘤特异性标记物进行定量检测以分析 CT 的影像学特征与该血清特异性标记物的表达相关性并评估联用诊断价值。【结果】肺癌组多肿瘤标记物中糖链抗原 199（CA 199）、糖链抗原 242（CA242）、神经元特异性烯醇化酶（NSE）、癌胚抗原（CEA）、铁蛋白（Fe）、人绒毛膜促性腺激素（HCG）、甲胎蛋白（AFP）、癌抗原 125（CA125）、癌抗原 153（CA 153）的值显著高于对照组，两组差异有统计学意义（P<0.05）；而两组间前列腺特异性抗原（PSA）、游离型前列腺特异性抗原（FPSA）和生长激素（HGH）的含量差异无统计学意义（P>0.05）。将肺癌患者根据 CT 影像学特征再分组比较 C12 多肿瘤特异性标记物水平，结果显示肿瘤大于 5cm 患者与肿瘤不足 5cm 的患者组间、有无坏死空洞组间、有无毛刺征象组间、有无深分叶征象组间差异均有显著的统计学意义（P<0.05）；而 CT 影像学特征中的不同病灶部位组间 C12 特异性标记物无显著差异（P>0.05）。【结论】肺癌 MSCT 增强扫描影像学特征中的肿瘤大小、有

无坏死空洞、毛刺征象、深分叶征象与 C12 多肿瘤特异性标记物的表达有相关性，不同病灶部位则与特异性标记物表达无关。可将 CT 影像与特异性标记物联用，有利于更准确的诊断疾病。

3.0T DCE-MRI 联合 DWI 功能成像在实性孤立性肺结节中的应用研究

余景火,朱娟
安徽医科大学附属安庆医院

目的：探讨动态对比增强磁共振（DCE-MRI）联合扩散加权成像（DWI）在实性孤立性肺结节（s-SPN）中的诊断价值。**方法：**回顾性分析经病理或临床随访证实的实性孤立性肺结节患者常规 MRI 及 DCE-MRI 影像资料（其中恶性病例 27 例，良性病例 14 例），绘制时间-信号强度曲线（time-signal intensity curves，T-SI 曲线），计算 DCE-MRI 血流动力学相关参数：最大强化增强比（Maximum enhancement ratio，MER）、达峰时间（T_{max}）、平均强化斜率（SLE）、最大上升斜率（steepest slope，SS）、廓清率（washout）、平均强化值（mean enhancement value，ME），并测量不同 b 值时 DWI 信号强度及表观扩散系数值（ADC）。**结果：**良、恶性病例组 T-SI 曲线类型及廓清率（washout）数值差异上无明显统计学意义（$P>0.05$），最大强化增强比 MER、达峰时间 T_{max}、平均强化斜率（SLE）、最大上升斜率 SS 及平均强化值 ME 在良、恶性组中具有统计学意义（$P<0.01$）。良、恶性结节的 DWI 信号强度值随 b 值的增大而减小，恶性组结节的 DWI 值均显著大于良性结节（$P<0.01$），二者的 ADC 值差异最具统计学意义（$P<0.01$）。**结论：**DCE-MRI T-SI 曲线有助于肺部良、恶性结节的鉴别，但对于肺癌及部分活动性炎症存在重叠干扰，联合磁共振扩散加权成像技术（DWI）能够有效提高诊断准确率。

CT 直方图技术定量分析鉴别肺良恶性纯磨玻璃结节的可行性研究

蔡雅倩,韩丹,张正华,黄建强,金文凤,闵蕊
昆明医科大学第一附属医院

目的：探讨 CT 直方图技术定量分析对鉴别良恶性肺纯磨玻璃结节（pGGO）的可行性研究。 **方法：**回顾性分析经穿刺或手术病理证实的 52 例孤立性 pGGO 的 CT 平扫图像，男 14 例，平均（53.7±16.2）岁，女 38 例，平均（51.3±11.7）岁。分为良性组（24 例，直径 1.31±0.4cm）、恶性组（28 例，直径 1.29±0.6cm ）。联影公司 uCT 760 行胸部 HRCT 扫描，层厚 1mm，层间距 1mm，肺窗（窗宽:1500HU；窗位:-400 HU）。联影后处理工作站(规格型号 uWS-CT、版本号 R004)进行直方图分析。选取结节轴位最大层面勾画感兴趣区（避开血管、支气管）生成 CT 像素直方图（画 3 次，取平均值），得到 pGGO 平均 CT 值、最小 CT 值、最大 CT 值、直方图峰度、跨度、峰度对应 CT 值及直方图趋势，直方图趋势分为缓升速降、速升缓降、缓升缓降、速

升速降 4 种类型，分别比较良恶性组间直方图参数及趋势。 **结果：**良性组直方图跨度、最大 CT 值及峰度对应 CT 值分别为 590.3±141.5Hu、-333.5±140.4Hu、-675.1±145.3Hu；恶性组分别为 907.2±298.0Hu、 -105.1±244.4Hu、 -468.4±187.0Hu，经两独立样本 t 检验，差异均有统计学意义(P<0.05)，恶性组跨度、最大 CT 值及峰度对应 CT 值均大于良性组。四种直方图趋势良性组分别为 2、18、4、0 例；恶性组分别为 19、2、5、2 例，采用卡方检验，差异有统计学意义（P<0.05），恶性组以缓升速降为主，良性组以速升缓降为主。二元 Logistic 回归结果显示，两组间峰度对应 CT 值有统计学差异（P<0.05）。ROC 曲线下面积（AUC）峰度对应 CT 值 0.799，临界值-553Hu，灵敏度和特异度分别为 64.3%、87.5%。**结论：**CT 直方图技术分析对于鉴别肺良、恶性 pGGO 具有一定可行性和价值。

EPO-0675

The correlation study between the proportion of the adherent growth main component and CT value of ground-glass opacity pulmonary nodules by energy spectrum CT

Mengying Li,Zhiyong Li ,Ailian Liu,Yijun Liu
Department of Radiology， First Affiliated Hospital of Dalian Medical University

Objective:

To study the clinical application value of energy spectrum CT in analyzing the correlation between the adherent growth main component of ground-glass opacity pulmonary nodules and CT value.

Materials and methods:
Ten patients with ground-glass opacity pulmonary nodules (GGO), confirmed by surgery and pathology, were collected in our study, including invasive adenocarcinoma and microinvasive adenocarcinoma. And there were 6 cases pure GGO(pGGO) and 4 cases mixed GGO(mGGO). According to the pathological results, the average proportion of adherent growth components in pulmonary nodule was calculated. All cases underwent energy spectrum CT scanning under the conditions of mixed energy and 40-140Kev single energy scanning. On the lung window image, ROI was drawn at each level of the lesion from the appearance of the lesion to the disappearance of the lesion. The ROI area was selected based on the maximum coverage of the lesion, with no less than 80% of the lesion, avoiding the vacuolar area. To calculate the average CT value of the overall nodule. To analyze the correlation between the average proportion of the adherent growth main component and average CT value of GGO by spearman correlation method.

Results:
There was no correlation between the average proportion of the adherent growth main component and average CT value of GGO, whatever under the conditions of mixed energy and 40-140kev single energy scanning (P ＞ 0.05). However, there was negative correlation trend between the two parameters under the conditions of 40Kev and 50Kev single energy scanning (r=-0.592, p=0.071).

Conclusion:
The low energy scanning method of energy spectrum CT can provide certain help in analyzing the adherent growth main component of GGO.

Differentiating Synchronous Double Primary Lung Adenocarcinoma from Intrapulmonary Metastasis by CT Features and EGFR Mutation and ALK Status

Xiaoyu Han,Heshui Shi
Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, China

Background The aim of this retrospective study was to investigate the potential of computed tomography (CT) features and two known oncogenic driver mutations (epidermal growth factor receptor (EGFR) and anaplastic large-cell lymphoma kinase (ALK)) to discriminate synchronous double primary lung adenocarcinoma (SDPLA) from one primary pulmonary adenocarcinoma with intrapulmonary metastasis(IPM) diseases. We also identified relationships between EGFR mutation status and clinical features and CT characteristics in SDPLA.
Methods Between January 2013 and April 2018 at the Union Hospital, Tongji Medical College, patients with SDPLA were selected. Patients with IPM served as the control group. All 60 patients (120 lesions) were tested for EGFR mutations and ALK status and underwent chest CT prior to any treatment.
Results A total of 60 patients (40 with SDPLA, 20 with IPM) were included for analysis. No significant differences were found between the two groups in terms of age (p=0.261), sex (p=0.344) or tobacco use (p=0.541). The inconsistency rate of EGFR mutations was significantly higher in patients with SDPLA (p<0.001) than in patients with IPM, while patients with IPM presented with ALK-positive tumors more frequently (p<0.001). SDPLA more frequently occurred in different lobes (p=0.024), presented with less lymphadenopathy (p=0.011), showed a smaller difference in diameter (Δd) between tumors (p=0.008) and more commonly presented as lobulated tumors (p=0.019), spiculate (p＜0.001) , ground-glass opacities (GGOs) (p＝0.001), and air bronchograms (p=0.020) compared to IPM. EGFR mutations in SDPLA were found more frequently in female patients (p=0.002) and those who had never smoked (p=0.037), and the tumors presented as GGOs (p=0.007) and air bronchograms (p=0.045).
Conclusion CT features, EGFR mutations and ALK status may be helpful for differentiating SDPLA from IPM disease. EGFR mutations occurred more frequently in female patients and those who had never smoked, and the tumors manifested as GGOs and air bronchograms.

2cm 以下磨玻璃结节的空气支气管征像分析

王迪,于长路,吕蓉
天津市第三中心医院

目的 对 2cm 以下磨玻璃结节的空气支气管征进行分析,提高对磨玻璃结节的诊断与鉴别诊断能力。**方法** 回顾性分析经手术病理组织学证实的 2cm 以下磨玻璃结节共 63 例，均为孤立性结节。按照密度将其分为 2 组，16 例为 pGGN,，47 例为 mGGN。分析不同病理结果与空气支气管征的关系。将空气支气管征分为三型，Ⅰ型：支气管在病灶内走形自然（分叉或不分叉）；Ⅱ型：支气管在病灶内扭曲、扩张；Ⅲ型：病灶内支气管管壁局部增厚或截断。**结果** pGGN 组Ⅰ型、Ⅱ型、Ⅲ型空气支气管征显示率分别为 3/16(18.8%)、1/16(6.3%)、0/16(0%)；mGGN 组Ⅰ型、Ⅱ型、Ⅲ型空气支气管征显示率分别为 18/47(38.3%)、6/47(12.8%)、9/47(19.1%)。癌前病变与浸润性病变的空气支气管征显示率分别为 2/7(28.3%)、35/56(62.5%)。**结论** 对于 2cm 以下磨玻璃结节，空气支气管征分型在 pGGN 组及 mGGN 组有差别，随着实性成分增多，空气支气管征的显示率增加，有助于对其浸润程度进行分析。

肺微小结节 CT 表现与诊断分析再探讨

李丽
中国医学科学院肿瘤医院深圳医院

目的 分析直径≤10mm 的肺微小结节的 CT 表现（部位、密度、形态学特征），探讨 CT 对肺微小结节定性诊断的价值。 **方法** 回顾性分析经手术且有病理结果的 102 枚肺微小结节的多层螺旋 CT 图像，总结 CT 影像学特征与病变性质之间的关系。**结果** 102 枚肺微小结节中，良性组、癌前病变组、浸润组分别为 25、27、50 枚。结节的密度、毛刺征、分叶征、血管集束征、胸膜凹陷征在三组间有统计学意义（P＜0.05），其中浅分叶在浸润组发生率明显高于其它两组，差异有统计学意义（P=0.034），而血管集束征中，良性组、癌前病变组主要表现为贴边走形或穿行，无增粗扭曲，浸润组主要表现为穿行并增粗扭曲，差异有统计学意义（P=0.000）。结节的位置、瘤肺界面、空泡征在三组间无明显统计学差异（P≥0.05）。**结论** 通过分析肺微小结节 CT 表现，可对其性质做出较准确的判断，对临床治疗具有重要的指导价值。

320 排 CT 体部灌注成像首过强化峰值时间（TTP）诊断周围型肺病变的价值

郭成伟
解放军第 252 医院

目的 探讨 320 排 CT 双入口体部灌注成像（DI-CTP）拟合时间-强度曲线（T-DC）定量参数（TTP）诊断周围型肺病变的价值。**方法** 回顾性分析经病理证实的 63 例患者，其中恶性周围型肺病变 40 例、良性周围型肺病变 23 例，应用 DI-CTP 绘制拟合时间密度曲线（T-DC）、依据 T-DC 计算强化达峰时间（TTP），并测量肺动脉灌注量（PF）、支气管动脉灌注量 （BF）、灌注指数（PI= PF/PF+BF），分析周围型肺病变的 TTP、灌注参数否有统计学差异。**结果** TTP 在良性和恶性肺周围型病变间存在显著性差异（P ＜0.01）。BF 和 PI 在良性与恶性周围型病变间均存在显著性差异（P ＜0.05），但 PF 在良恶性周围型肺病变间差异无统计学意义（P＞0.05）；TTP 曲线下面积（AUC）为 0.988，诊断价值高，当 TTP =18.7s 作为预测良恶性结节的临界值时，敏感度为 97.5%，特异

度为 91.7%。**结论** 拟合时间-强度曲线（T-DC）定量参数 TTP 有助于提高周围型肺病变的鉴别诊断效能，为周围型肺病变的诊断提供一种新思路。

初探肺纯磨玻璃结节 3 年随访期内增长的风险因素

尹柯,汪琼
大连大学附属中山医院

目的：评估与 pGGN 患者在 3 年随访期内增长相关的临床和放射学因素，为临床个体化管理提供依据。资料与方法 回顾性分析于大连大学附属中山医院利用 HRCT 随访 3 年及以上 pGGN 患者 93 位，共 138 例 pGGN 病灶，并分为增长组及稳定组，分析患者临床资料和 HRCT 征象与 pGGN 3 年随访期内出现增长间的关系。结果 138 例 pGGN 病灶中，25 例在 3 年随访期间出现增长，113 例 pGGN 在 3 年随访期间保持稳定。对以人为基础的分析，随访 3 年内出现增长的 pGGN 的频率为 23.6%（22/93）。而基于对结节的分析中，增长的频率为 18.1%（25/138）。在多变量分析中，初始直径大于 8.5mm（*OR*= 53.774,95%，*CI*：9.658～299.389，*p*= 0.000），pGGN 形状为不规则形（*OR*= 12.828,95%，*CI*：1.559～105.547，*p*= 0.018）是 pGGN 3 年内发生增长的独立危险因素。结论 当 pGGN 患者病灶最大径大于 8.5 mm，形状呈不规则形时，可以不必遵循至少随访 3 年的临床管理方式，而积极的外科干预可能是首选的临床处理方式。

EPO-0681

The diagnostic value of magnetic resonance imaging versus computed tomography for pulmonary nodules: A systematic review and meta-analysis

Yuefu Zhan
Hainan maternal and children’s medical center

Background:
There are few data about the diagnostic value for magnetic resonance imaging (MRI) versus computed tomography (CT) for detecting pulmonary nodules. The purpose of this study was to evaluate the performance of MRI compared to CT for detecting pulmonary nodules.
Methods
We systematically searched three electronic databases including PubMed, EmBase, and the Cochrane Library through September 2017, which diagnosis of pulmonary nodules by using MRI and CT. The summary sensitivity, specificity, positive likelihood ratio (PLR), negative likelihood ratio (NLR) and area under receiver operating characteristic (ROC) curves were conducted. Further, the ratio of diagnostic parameters between MRI and CT were pooled by using random-effects model.
Results
A total of 8 studies involving a total of 653 individuals were included. The summary sensitivity, specificity, PLR, NLR and area under ROC were 0.91 (95%CI: 0.80-0.96), 0.76 (95%CI: 0.58-0.87), 3.72 (95%CI: 2.05-6.76), 0.12 (95%CI: 0.06-0.27), and 0.91 (95%CI: 0.88-0.93) for MRI diagnosis pulmonary nodules respectively. Further, the

pooled sensitivity, specificity, PLR, NLR and area under ROC for CT detecting pulmonary nodules were 1.00 (95%CI: 0.95-1.00), 0.99 (95%CI: 0.78-1.00), 79.35 (95%CI: 3.68-1711.06), 0.00 (95%CI: 0.00-0.06), and 1.00 (95%CI: 0.99-1.00) respectively. In addition, we noted MRI were associated with lower sensitivity (ratio between MRI and CT: 0.91; 95%CI: 0.85-0.98; P=0.010), specificity (ratio between MRI and CT: 0.82; 95%CI: 0.69-0.97; P=0.019), PLR (ratio between MRI and CT: 0.29; 95%CI: 0.10-0.83; P=0.020), and area under ROC (ratio between MRI and CT: 0.91; 95%CI: 0.89-0.94; P<0.001). Finally, MRI with higher NLR for detecting pulmonary nodules when compared with CT (ratio between MRI and CT: 8.72; 95%CI: 1.57-48.56; P=0.013).

Conclusions

The findings of this study suggested MRI were associated with relative high diagnosis parameters for detecting pulmonary nodules, while the diagnosis value was inferior to CT.

EPO-0682

Lung cancer screening with MRI: Comparison of the evaluation of pulmonary nodules of <3 cm using PETRA and LDCT

hui Feng,Gaofeng Shi
Department of Radiology, Hebei Medical University Fourth Affiliated Hospital and Hebei Provincial Tumor Hospital

Purpose: This study aimed to evaluate the visibility of lung nodules using a respiratory-gated pointwise encoding time reduction with radial acquisition (PETRA) sequence on a 3T magnetic resonance imaging (MRI) scanner compared with that using low-dose computed tomography (LDCT).

Methods: A total of 75 patients with lung nodules, including solid nodules (SN) and partial solid nodules (PSN), underwent both thoracic MRI with the PETRA sequence and LDCT. Radiologists reviewed the MRI and computed tomography (CT) images and calculated the detection rate for lung nodules. Next, the mean diameter of each detected nodule was determined. The detection rates and the diameters of the lung nodules detected by MRI with the PETRA sequence were compared with LDCT as the gold standard. The sensitivity of detection of different subgroups of pulmonary nodules was determined based on location, size, and type of nodules. Pearson's correlation coefficient was used for correlation of nodule size as measured by MRI and CT.

Results: The CT scans detected 256 lung nodules, including 99 SN and 157 PSN, with a mean nodule diameter of 9.3 mm. For SN, the MRI scans accurately detected 30/47 nodules of <6 mm diameter and 52/52 nodules of ³6 mm diameter; for PSN, MRI detected 30/51 nodules of <6 mm diameter and 102/106 nodules of ³6 mm diameter. The PETRA sequence showed a high detection rate (84%). The detection rates of SN, ground glass nodules, and PSN were 82%, 72%, and 94%, respectively. For nodules with a diameter of

>6 mm, the sensitivity of the PETRA sequence reached 97%, and was higher for nodules located in the upper lung fields than those in the middle and lower lung fields. Strong correlation was found between the CT and PETRA images (correlation coefficients = 0.97).
Conclusion: MRI has a potential role in detecting and evaluating pulmonary nodules with a high sensitivity. PETRA enables free-breathing and submillimeter imaging of lung nodules with high sensitivity for nodule detection, and may be an alternative to CT as an effective tool for screening pulmonary nodules.

EPO-0683
肺结节影像分级评估系统（PNI-GADS）对肺结节良恶性评估的应用价值

吕发金,张艳
重庆医科大学附属第一医院

目的
制订肺结节分级评估系统（PNI-GARS），评价其在肺结节良恶性评估中的应用价值。
资料与方法
回顾性分析 180 例患者共 200 个肺结节，采用 PNI-GARS 进行分级评定，计算 PNI-GARS 分级的准确度、敏感度、特异度、阴性预测值、阳性预测值。
结果
Ⅰ、Ⅱ级阴性预测值分别为 100.0%、97.2%，ⅢIa、ⅢIb、ⅢIc、Ⅳ级的阳性预测值分别为 53.8%、85.7%、93.3%、100.0%。将Ⅰ、Ⅱ级归为阴性结节，ⅢIa 级及以上归为阳性结节，PNI-GARS 分级的准确度、敏感度、特异度、总阳性预测值分别为 89.5%、99.3%、68.3%、87.2%。将Ⅰ、Ⅱ、ⅢIa 级归为阴性结节，ⅢIb~Ⅳ级归为阳性结节，PNI-GARS 分级的准确度、敏感度、特异度、总阳性预测值分别为 88.5%、89.1%、87.3%、93.8%。排除ⅢIa 级，将Ⅰ、Ⅱ级归为阴性结节，ⅢIb~Ⅳ级归为阳性结节，PNI-GARS 分级的准确度、敏感度、特异度、总阳性预测值分别为 94.8%、99.2%、84.3%、93.8%。
结论
PNI-GARS 能有效地分类 CT 筛查出的肺结节，在肺结节的良恶性评估中有较高的应用价值。

EPO-0684
CT 征象结合影像组学在 T1a,T1b 期肺癌诊断中的应用

刘冬冬
山西医学科学院山西大医院

目的　构建基于 CT 征象和影像组学的肺癌诊断模型，探讨在≤2cm 肺实性结节中肺癌诊断准确性

方法：收集 2012-2019 年在我院接受肺部 CT 检查且手术病理证实为肺腺癌患者 106 例，良性性结节 100 例（病理证实或长期随访无变化），按照 7:3 的比例分为训练组和验证组，从 CT 图像中提取有价值的 CT 征象，使用 3D Slicer 软件进行感性兴趣勾画，A. K. 分析软件进行影像特征提取; 使用 lasso logistic 回归比较三种不同的肺癌诊断模型："A"只用 CT 征象，"B"只用影像组学，"AB"结合 CT 征象和影像组学，采用 ROC 曲线评价诊断效能。
结果:在 12 个 CT 征象分析中提取有意义征象 3 个：结节毛刺、胸膜牵拉、充气支气管征；在 320 个影像组学特征中筛选 16 个用于建模。A、B 和 AB 模型的 AUCCV（和 95%置信区间）分别为 0.85（0.72-0.96）、0.88（0.77-0.96）和 0.89（0.77-0.97）。模型在训练集和验证集中均显示出良好的识别和校准。
结论：CT 征象结合影像组学特征构建肺癌诊断模型，提高了肺癌检出准确率，可用于肺内≤2cm 肺实性结节良恶性鉴别。

EPO-0685
CT 扫描联合灌注成像对肺结节良恶性鉴别诊断的价值

赵皆
中南大学湘雅医院

摘要：目的：探讨多层螺旋 CT 扫描联合灌注成像在肺结节良恶性鉴别诊断中的应用价值。方法：将中南大学湘雅医院胸外科 2018 年 1 月～2019 年 1 月收治的肺部结节手术患者中的 128 例作为研究对象，患者术前均接受肺部 CT 扫描及灌注成像检查，检查后进行肺结节血流动力学分析。结合肺结节患者的术后病理诊断结果，分析肺结节病理类型、淋巴结转移和结节感兴趣区 CT 灌注参数值的相关性。**结果：**良性结节与恶性结节的平均通过时间值(MTT)和血流量(BF)值无显著统计学差异(P>0. 05)，其中良性结节中的炎性结节血容量(BV)值显著高于恶性结节(p<0. 05)，而恶性结节的 BV 值又显著高于除炎性结节外的其他良性结节(P<0. 05)；恶性结节的表面通透性(PS)值明显高于良性结节 p<0. 05)；不同组织学类型的肺癌在 MTT、BV、PS 的值上没有显著差异(P>0. 05)，但鳞癌的 BF 值显著低于小细胞肺癌及腺癌（p<0.05）；有淋巴结转移患者肺结节的 BF 及 PS 值显著高于无淋巴结转移组（p<0. 05）。**结论：**CT 扫描联合灌注成像能够有效评估肺部结节的血流情况及微血管密度状况。不同结节及不同组织类型肺癌在灌注参数值上存在规律，对肺结节鉴别有一定的临床价值。

EPO-0686
Value of subtraction-multiphase-CT for differentiation of benign and malignant pulmonary lesions

Jianghui Duan,Hongliang Sun,Sheng Xie
China-Japan Friendship Hospital

ABSTRACT: **Purpose** Toexplore the value of multiphase-subtraction-CT for differentiation of benign and malignant pulmonary lesions.
Methods and materials: 46 patients (age, 61.7 ± 14.9 years) of pulmonary nodules and masses were enrolled in this study. Non-contrast CT and pulmonary arterial and aortic phase CT of the chest were performed on a 320-detector row CT system.Then, based on a non-rigid registration followed by subtraction of non-contrast images from

contrast- enhanced images were generated.The diagnostic performances of the related parameters were evaluated with receiver operating characteristics (ROC) analysis.
Results: Of these 46 patients, 39 cases were pathologically confirmed and 9 were diagnosed based on clinical data. There were 29 lung malignant masses and 17 benign lesions. A significant differences in CT value in aortic phase (Z=-3.391, p=0.001),CT value of aortic-unenhanced (Z=-4.210, p=0.000), CT value of aortic - pulmonary arterial phase(Z=-4.449, p=0.000)were observes between the two groups, while no significant differences in CT value of unenhanced scan (Z=1.309, p=0.191), pulmonary arterial phase (Z=0.421, p=0.674), and pulmonary arterial-unenhanced phase (Z=-1.309, p=0.191). The area under the ROC curve for CT value of arterial-pulmonary arterial phase (0.897) was largest. When the cutoff value was selected as 34.7HU,the sensitivity, specificity, accuracy, positive predicative value, and negative predictive value of diagnosing malignant masses were 96.6%, 82.4%, 91.3%, 90.3%, 93.3%, respectively.
Conclusion: CT value of aortic-pulmonary arterial phase has certain significance in differentiating the benign and malignant pulmonary lesions and has the best diagnostic efficiency.

EPO-0687

Characteristic analysis and prognosis evaluation of I non small cell lung cancer based on spiral CT

Ang ye W
Affiliated Hospital of Beihua University

Objective: To investigate the correlation between the morphology of stage I non-small cell lung cancer (NSCLC) tissue and the prognosis of patients. The significance of reconstruction of pulmonary nodules and pulmonary vasculature by spiral CT in the treatment of stage I non-small cell lung cancer.
Methods:
1. Collecting data of 60 patients with stage I NSCLC with complete chest CT examination and surgical pathology from January 2014 to January 2018 in the affiliated hospital of Beihua University, according to the seventh edition of the International Union Against Cancer (UICC) in 2009. Lung cancer staging criteria for postoperative pathological staging.
2. We intend to use spiral CT to show the relationship between the edge and internal structure of NSCLC lesions, peripheral blood vessels, and pleura, and correlate with the 3-year overall survival of patients, reflecting the prognosis of patients.
Results:
1. Of the 60 patients with stage I NSCLC, 38 survived within 3 years after surgery, and 22 died. The 3-year total productivity was 63.3%,the 3-year survival rate of males (63.9%), while the 3-year survival rate of women was slightly lower than that of men (62.5%). After single-factor survival analysis, the difference was not statistically significant (P=0.992); the analysis was based on the site of the disease, pathological type, age and other factors. There was no statistically significant difference between the single factor and multivariate survival analysis (P>0.05)..

2.According to the seventh edition of lung cancer staging, stage I includes T1aN0M0, T1bN0M0, and T2aN0M0. The three-year survival rates are 88.2%, 68.2%, and 33.3%, showing a declining trend.the difference was statistically significant (P<0.05) by univariate and multivariate survival analysis.
3. In the tumor margin, the edges of the tumor were subdivided, and the edges were divided into smooth, well-defined boundaries, leaf segments, and short burrs. The 3-year survival rates were 80.0%, 70.5%, and 37.5%, respectively. The patients with smooth edges had the highest survival rate and had the longest median survival time. Results the univariate and multivariate survival analysis showed that the patient's 3-year survival rate had statistics. Significance (P<0.05).
4. The internal density of the tumor, the tumor density is divided into four categories: uniform density, uneven density (with necrosis area), bronchogram structure, tumor cavity. After single-factor and multi-factor survival analysis, the 3-year survival rate of patients was statistically significant (P>0.05).
5. Relationship between tumor and visceral pleura. Regarding the relationship between the tumor and the visceral pleura, we divided the tumor into: normal pleura or pleural depression with thickening. The corresponding 3-year survival rates were 68.3% and 52.6%, respectively. The patients with normal pleura had a better prognosis and the 3-year survival rate was statistically significant (p<0.05).
Result：The stage, margin, and surrounding conditions of NSCLC tumors are related to the prognosis of patients.

EPO-0688
基于图像噪声值的动态扫描条件下超低剂量 CT 肺部非实性小结节的检出影响因素的分析

叶凯,袁慧书
北京大学第三医院

目的：探讨影响基于图像噪声值的动态扫描条件下超低剂量 CT（ULDCT）肺部非实性小结节检出的独立相关因素。
方法： 24 名受检者采用 GE 公司 Revolution CT 进行胸部 LDCT 检查。在 LDCT 扫描结束后，立即加扫 ULDCT 扫描。LDCT 采用 Assist kv（120 /100kV）管电压和 14.1Hu 噪声指数的 smart mAs 扫描模式，ULDCT 采用 120 kv 管电压和 16Hu 噪声指数的 smart mAs 模式。扫描结束后，LDCT 和 ULDCT 均采用 ASiR-V 70%算法进行图像重建。两名具有丰富经验的放射医师在 LDCT 图像上阅片，记录达成统一后的结节类型、长径及 CT 值，以此作为参考标准。三周以后，同样两名放射医师在 ULDCT 图像上进行重复阅片操作。将 ULDCT 结果与 LDCT 进行对比。采用单因素分析法分析影响结节检出的独立相关因素。
结果：受检者的平均 BMI 为 22.7±2.9(18.0-27.6) kg/m^2。ULDCT 和 LDCT 的平均扫描剂量分别为 0.17±0.03 mSv 及 0.95±0.31 mSv，ULDCT 较 LDCT 下降了 82.1%（P<0.001）。LDCT 总共检出 30 个非实性结节。ULDCT 总共检出了 20 个结节，检出敏感度为 66.67%，4mm～6mm 和 6mm 以上结节的检出敏感度分别为 75% (9/12)及 78.6% (11/14)。检出组 BMI 为 22.5±3.5，未检出组为 23.3±2.2，两组间无统计学差异(P=0.462)。检出组结节长径为 6.5±2.2mm，未检出组为 4.8±1.6mm，二者具有明显统计学差异(P=0.04)。同时，检出组（-600±129Hu）结节的 CT 值明显高于未检出组（-780±41Hu），两者间差异显著（P<0.001）。单因素分析表明，结节长径及 CT 值对结节的检出有影响，而 BMI 无显著影响。

肺结节影像分析技术优化病灶检出与特征显示对比研究

吕发金,张艳
重庆医科大学附属第一医院

目的 探讨厚层、薄层及 MIP 不同层厚在低剂量螺旋 CT 筛查肺结节中的检出效能。**方法** 回顾性分析我院 2017 年 3 月-5 月行胸部低剂量螺旋 CT 检查且诊断肺结节的 100 名体检者的影像图像，由两位高年资主治医师双盲阅片，采用厚层（5mm）、薄层(1mm)和 MIP 不同层厚(5mm、10mm、15mm、20mm)分别记录检出不同大小肺结节（≤5mm 结节，5mm-10mm 结节和＞10mm 结节）的数目、密度及形态特征；统计六种阅片技术检出不同大小肺结节的数目和检出率，采用 Friedman 秩和检验比较六种阅片技术检出肺结节的差异，并用 Kappa 分析评估两位观察者检出肺结节的一致性。**结果** 共检出肺结节 472 个，实性结节 439 个（93.01%），亚实性结节 33 个（6.99%）。MIP 所检出的肺结节总数与≤5mm 微小结节的数目明显多于厚层和薄层图像（P<0.001），且以实性结节为主，其中以层厚为 10mm 的 MIP（MIP(10)）检出的结节总数和≤5mm 微小结节的数目最多（观察者 1，391，326；观察者 2，390，322），明显多于其它阅片技术（P<0.001）；不同阅片技术所检出的肺实性结节总数和≤5mm 微小实性结节的数目差异有统计学意义（P<0.001），其中以 MIP(10)检出的实性结节总数和≤5mm 微小实性结节的数目最多（观察者 1，371，320；观察者 2，367，314），明显多于其它阅片技术（P<0.001）。薄层图像观察到肺结节的形态特征：胸膜凹陷征 42 个、血管穿过征 81 个、毛刺征 15 个、分叶征 30 个、空泡征 18 个、宝石征 16 个，多于其他阅片技术。 **结论** MIP 对≤5mm 微小实性结节的检出，以 MIP(10)的检出效能最佳，薄层图像有助于进一步观察肺结节的形态特征。

EPO-0690
外科手术切除肺磨玻璃结节最佳时机的最新研究进展

覃杰,郭月飞
中山大学附属第三医院

目的：熟悉外科手术切除肺磨玻璃结节最佳时机的最新研究进展。
方法：查阅最近 5 年发表在影响因子≥3 的 SCI 收录杂志上关于外科切除肺磨玻璃结节及影响肺磨玻璃结节生长的文献，结合自己多年工作经验，总结归纳使用 CT 来判断切除肺磨玻璃结节的最佳时机。
结果：目前文献建议从以下四个方面综合分析肺磨玻璃结节来判断手术切除磨玻璃结节的最佳时机。1、磨玻璃结节大小：当纯磨玻璃结节≥10 mm 或含有≤5 mm 实性成分的混合磨玻璃结节≥8mm 时则应终止随访，避免结节快速生长，确保安全。2、磨玻璃结节实性成分：日本 TakeshiMatsunaga 等学者通过 5 年研究 775 患者发现：纯磨玻璃肿瘤无淋巴管侵犯和淋巴结转移，磨玻璃为主的肿瘤（即 0 < C/T ratio < 0.5，C/T ratio 为实性成分和肿瘤的直径比）有 0.8%（1/127）淋巴管侵犯、无淋巴结转移，实性为主的肿瘤（即 0.5 ≤ C/T ratio < 1）有 16.8%（31/185）淋巴管侵犯、4.3%（8/185）无淋巴结转移，纯实性肿瘤（即 C/T ratio = 1）有 46.2%（154/333）淋巴管侵犯、23.7%（79/333）淋巴结转移。当混合结节的实性成分 ≥ 5 mm 或 CTR ≥ 0.5 时则应终止随访，避免手术切除结节后出现肿瘤复发和转移。3、患者年龄：年龄：患

者≤65 岁时，磨玻璃结节达到上述第 1、2 条标准时，建议年龄越小越早择期手术。4、患者心理：当患者过度焦虑或抑郁时，早切除结节不失为明智的选择。
结论：建议从磨玻璃结节大小、磨玻璃结节实性成分、患者年龄及心理等四个方面来判断手术切除磨玻璃结节的最佳时机。

CT and histopathologic characteristics of lung adenocacinoma with persistent pure ground glass mass exceeding 3cm in diameter

Wei Li[1],Fei Zhou[3],Huikang Xie[2],Ziwei Wan[4],Liping Zhang[2],Jingyun Shi[1]
1.Department of Radiology， Shanghai Pulmonary Hospital， Tongji university
2.Department of Pathology， Shanghai Pulmonary Hospital， Tongji University School of Medicine
3.Department of Oncology， Shanghai Pulmonary Hospital， Tongji University School of Medicine
4.Department of Thoracic Surgery， Shanghai Pulmonary Hospital， Tongji University School of Medicine

Purpose: To elucidate CT manifestations and histologic features of pure ground glass mass (PGGM) with diameter more than 3cm.
Materials and Methods: From 91074 CT reports with ground glass opacity/nodule diagnosis between June 2006 to Mar 2018, we retrospectively reviewed 33 patients with pathologically proved lung adenocarcinoma which appeared as PGGM. We analyzed the differentiating CT features between adenocarcinoma in situ (AIS) and invasive pulmonary adenocarcinoma (IPA) and between the lepidic predominant adenocarcinoma and non-lepidic predominant lesions.
Results: In 33 cases, 10 were AIS and 23 were IPAs, which including 4 minimally invasive adenocarcinoma (MIA) and 19 invasive adenocarcinoma. Among the 19 invasive adenocarcinoma, 13 were lepidic predominant adenocarcinoma, 2 were acinar predominant adenocarcinoma, and 4 were papillary predominant adenocarcinoma. In PGGMs, IPAs were significantly larger and have greater CT attenuation than AIS ($P<0.05$). Lesion size and CT attenuation had positive correlation with pathological group (rho=0.396, 0.711 respectively, $P<0.05$, $P<0.05$ respectively). In receiver operating characteristic(ROC) curve analyses, the optimal cut-off size for IPAs was more than 3.4cm (sensitivity, 47.8%; specificity, 100%), and optimal cut-off CT attenuation was more than -660HU (sensitivity, 100%; specificity, 80%); and the areas under the curve (AUC) were 0.733 ($P<0.05$) and 0.943 ($P<0.05$), respectively.
Conclusion: In PGGMs, the possibility of IPAs was greater than AIS, almost as twice as AIS. As for the invasive adenocarcinoma, most PGGMs were lepidic predominant adenocarcinoma, which suggested a favourable prognosis. When PGGMs are encountered in clinical practice, lesion size and CT attenuation would be the most important criterion.

92 例原发性肺浸润性黏液腺癌的 CT 征象分析

蒋依宁,李智勇,车思雨,李昕
大连医科大学附属第一医院

目的：探讨原发性肺浸润性黏液腺癌（Pulmonary invasive mucinous adenocarcinoma，PIMA）患者的 CT 影像特征，以提高对该疾病的认识和影像诊断水平。**材料与方法：**回顾性收集 2006-2018 年大连医科大学附属第一医院经病理证实为原发性 PIMA 的患者 92 例，均完成 CT 平扫，57 例行 CT 增强扫描，均具有较为完善的临床资料。根据其影像特征，PIMA 分为三型：肺泡型、肺炎弥漫型和大气道型。**结果：**92 例 PIMA 患者，其中男性 36 例（39.13%），男女比 1:1.6；平均年龄 62±9.29 岁。92 例 PIMA 中肺泡型 87 例（94.57%），肺炎弥漫型 4 例，大气道型 1 例。25 例（27.17%）分布于左肺下叶，8 例（8.70%）分布于左肺上叶，12 例（13.04%）分布于右肺上叶，6 例（6.52%）分布于右肺中叶，41 例（44.57%）分布于右肺下叶。分叶征 57 例（61.96%）、毛刺征 55 例（59.78%）、空泡征 37 例（40.21%）、支气管充气征 13 例（14.13%）。肺泡型包括：实性结节与肿块 36 例（41.38%）、亚实性结节与肿块 47 例（54.02%），斑片影 4 例（4.60%）。实性结节与肿块包括：1 例（2.78%，1/36）小于 1cm 的实性小结节，26 例（72.22%,26/36）1-3cm 的实性结节，9 例（25%,9/36）大于 3cm 的实性肿块;亚实性结节与肿块中包括，10 例（21.28%，10/47）小于 1cm 的亚实性小结节，35 例（74.47%，35/47）1-3cm 的亚实性结节，2 例（4.26%，2/47）大于 3cm 的亚实性肿块。**结论：**PIMA 多分布在双肺下叶，分叶征、毛刺征及空泡征比较常见，无论是实性还是亚实性，肿瘤都以 1-3cm 结节与肿块多见，这些特征有助于提高该类肿瘤诊断的准确性。

EPO-0693

结直肠癌肺转移的特殊 CT 表现及动态变化

王廷昱
中国科学院合肥肿瘤医院

目的 分析 26 例结直肠癌肺转移的特殊ＣＴ表现，以提高对本病的诊断准确性。方法 回顾性分析 26 例 经 手术病理证实的结直肠癌肺转移瘤的临床及ＣＴ资料。结果 结直肠癌肺转移的特殊ＣＴ表现为 结节/肿块/空洞型肺转移，钙化，空泡征， 分叶征，毛刺征及胸膜凹陷征，增强后病灶均为轻度强化。本组 26 例中，结肠癌 11 例，直肠癌 15 例，10 例空洞型肺转移（结肠癌与直肠癌各 5 例）均和并结节或肿块， 其中 6 例同时有空泡征，
3 例同时有钙化，10 例多发结节/肿块肺转移，6 例单发结节肺转移。 结论 结直肠癌肺转移表现多样，多发者结节、肿块及空洞均具恶性征象，且大小不等特殊 CT 表现，结合临床资料分析，能够做出正确诊断。

EPO-0694

gldm 纹理特征评估纯磨玻璃 IA 的 p-53、ki-67

马双春,李智勇,刘爱连
大连医科大学附属第一医院

目的 探讨利用灰度依赖矩阵（gldm）纹理分析评价纯磨玻璃 IA 的 p-53、ki-67 情况。**方法** 回顾性收集 2015 年 1 月至 2018 年 1 月期间于大连医科大学附属第一医院经手术病理证实为肺浸润

性腺癌（IA），同时薄层 CT 上呈现为肺纯磨玻璃结节（pGGN）的患者总计 40 例。所有病例均为单发 IA 病灶，总计 40 个 pGGNs。回顾性采集所有研究对象的免疫组化情况：p53 突变率，ki-67 增殖指数，观察并测量薄层 CT 上 pGGN 的 gldm 纹理特征：GrayLevelVariance，HighGrayLevelEmphasis，DependenceEntropy，DependenceNonUniformity，GrayLevelNonUniformity，SmallDependenceEmphasis，LargeDependenceEmphasis，DependenceVariance，LargeDependenceHighGrayLevelEmphasis，LowGrayLevelEmphasis。将所有患者的免疫组化指标与 gldm 纹理特征做相关性分析。**结果** p53 突变率与 gldm 纹理特征均无相关性；ki-67 增殖指数与 GrayLevelNonUniformity（p=0.035，r=0.387）、LargeDependenceEmphasis（p=0.012,r=0.451），DependenceVariance（p=0.014，r=0.445）呈正相关。 ki-67 增殖指数与 SmallDependenceEmphasis（p=0.041，r=-0.376）呈负相关。**结论** ki-67 增殖指数与 gldm 纹理特征具有一定相关性，其中 LargeDependenceEmphasis 相关性最强，分析薄层 CT 上 pGGN 的 gldm 纹理特征，对评价患者肿瘤 ki-67 增殖活性有一定的临床价值。

EPO-0695
最大标准摄取值术前预测表现为磨玻璃密度 肺腺癌病理亚型的能力

夏艺,邹薇薇,范丽,刘士远
海军军医大学第二附属医院（上海长征医院）

目的 探索 PET/CT 对表现为磨玻璃密度的肺腺癌的潜在临床价值，故比较不同病理亚型之间的最大标准摄取值(SUVmax) 是否存在差异。**方法** 纳入 160 例表现为 GGN 的肺腺癌病人，共 183 个病灶。其中男 58 例，女 102 例，年龄 35-87 岁，平均 57.69 ± 9.14 岁。所有受试者都行手术切除治疗，且均接受 PET/CT 检查和病理学检查。根据病理亚型不同，GGO 分为浸润前病变（AAH 和 AIS）、MIA 和浸润性腺癌；浸润型肺腺癌病理亚型又分为附壁生长、腺泡、乳头、微乳头及实性生长为主型。勾画 ROI 测量病灶最大标准摄取值（SUVmax）。运用单因素方差分析或 Kruskal-Wallis H 检验比较多组间的差异。**结果** 浸润前病变（AAH 和 AIS）组和 MIA 组的 SUVmax 之间差异无明显统计学意义（P>0.5）。浸润前病变（AAH 和 AIS）组和 MIA 组的 SUVmax 均低于浸润性腺癌，且差异有统计学意义 (P <0.005)。通过 ROC 曲线，SUVmax 对于诊断浸润性肺腺癌具有显著的意义，其曲线下面积为 0.893（图 1）。当 SUVmax 为 0.705 时，敏感度为 78.6%，特异度为 81.7%。不同病理亚型的 SUVmax 分别为附壁(1.11 ± 0.83)、腺泡(1.26 ± 0.82)、乳头 (1.67 ± 1.17)及实性 (2.38 ± 1.49)。多组别间差异具有统计学意义（P=0.02）,两两组别间差异无统计学意义。**结论** 单纯应用 SUVmax 对浸润前病变（AAH 和 AIS）和 MIA 诊断没有价值。SUVmax 可以用于鉴别表现为 GGN 的浸润性肺腺癌与非浸润的肺腺癌，当 SUVmax 为 0.705 时，敏感度为 78.6%，特异度为 81.7%。

三维可视化技术对显示靶肺叶和肺段解剖结构的应用价值

望云,樊荣荣,施晓雷,黄可南,涂文婷,萧毅,刘士远
海军军医大学第二附属医院（上海长征医院）

目的 探索基于胸部 CT 增强扫描动脉期薄层数据结合三维可视化技术对显示靶肺叶和肺段肺血管和支气管三维解剖结构的应用价值。**方法** 连续收集 35 例拟行肺结节切除术的患者作为研究对象，将术前胸部 CT 增强扫描动脉期薄层数据导入飞利浦图像后处理工作站，对肺血管、支气管和肺结节行图像分割和融合处理，建立靶肺叶和肺段的三维重建模型，评估病灶情况及三维模型效果。**结果** 35 例患者中，8 例行胸腔镜下肺段切除术，27 例行胸腔镜下肺叶切除术。靶肺叶和肺段三维模型图像质量评分中，4 分 11 例，3 分为 22 例，2 分 1 例，1 分 1 例，成功构建了 33 例靶肺叶和肺段的三维重建模型，有效性为 94.3%。**结论** 利用胸部 CT 增强扫描动脉期薄层数据，结合图像分割与融合技术，能清楚重建出靶肺叶和肺段血管支气管的结构及其与病灶的关系，能为胸外科医师提供肺结节切除手术所需的解剖信息。

Relationship between bone marrow FDG uptake and recurrence after curative surgical resection in patients with T1-2N0M0 lung adenocarcinoma

Tiancheng Li
the First Affiliated Hospital of Wenzhou Medical University

Objectives: The purpose of this study was to evaluate the relationship between bone marrow fluorodeoxyglucose (FDG) uptake on PET/CT imaging in patients withT1-2N0M0 lung adenocarcinoma after curative surgical resection, and the value of bone marrow FDG uptake in disease prognosis.
Methods: We screened 227 T1-2N0M0 lung adenocarcinoma patients who underwent FDG PET/CT imaging before curative surgical resection. We measured the maximum standardized uptake value (Tmax) of the primary tumor, mean FDG uptake of BM (BMSUV), bone marrow-liver uptake ratio (BLR), metabolic tumor volume (MTV),total lesion glycolysis (TLG), along with hematologic parameters such as c-reactive protein (CRP), neutrophil lymphocytes ratio (NLR). The prognostic significance of FDG uptake of BM in predicting recurrence-free survival (RFS) was assessed.
Results: The results showed that 38 of the 227 patients (16.7%) had a recurrence. Compared with the non-recurrence patients, the primary tumor of the patients with recurrence was larger, and the c-reactive protein, SUVmax, TLG, and BLR were higher. Univariate analysis found that BLR, tumor size, SUVmax, TLG (total lesion glycolysis), CRP (c-reactive protein) and NLR (neutrophilic lymphocyte ratio) were significantly correlated with postoperative recurrence. After adjustment for conventional confounding factors, the hazard ratio of BLR was 4.63(95% CI, 1.49－14.44) for the highest tertile of BLR compared with the lowest tertile. In multiple-adjusted spline regression, continuously BLR showed nonlinear relation with recurrence risk.
Conclusion: It is suggested that increased BLR within a certain range is an independent factor to predict the recurrence of T1-2N0M0 lung adenocarcinoma which can be considered as a reference index to evaluate the prognosis of patients with lung adenocarcinoma.

EPO-0698

Nomogram for the Prediction of Malignancy in Small (8–20 mm) Indeterminate Solid Solitary Pulmonary Nodules in Chinese Populations

Zhenhui Li
Yunnan Cancer Hospital

Purpose: This study aimed to develop and validate a nomogram for predicting the malignancy of small (8–20 mm) solid indeterminate solitary pulmonary nodules (SPNs) in a Chinese population by using routine clinical and computed tomography data.
Methods: The prediction model was developed using a retrospective cohort that comprised 493 consecutive patients with small indeterminate SPNs who were treated between December 2012 and December 2016. The model was independently validated using a second retrospective cohort comprising 216 consecutive patients treated between January 2017 and May 2018. The investigated variables included patient characteristics (e.g., age and smoking history), nodule parameters (e.g., marginal spiculation and significant enhancement), and tumor biomarker levels (e.g., carcinoembryonic antigen). A prediction model was developed by using multivariable logistic regression analysis, and the model's performance was presented as a nomogram. The model was evaluated based on its discriminative ability, calibration, and clinical usefulness.
Results: The developed nomogram was ultimately based on age, marginal spiculation, significant enhancement, and pleural indentation. The Harrell concordance index values were 0.869 in the training cohort (95% confidence interval: 0.837–0.901) and 0.847 in the validation cohort (95% confidence interval: 0.792–0.902). The Hosmer-Lemeshow test revealed good calibration in each of the training and validation cohorts. Decision curve analysis confirmed that the nomogram was clinically useful (risk threshold from 0.10 to 0.85).
Conclusion: Patient age, marginal spiculation, significant enhancement, and pleural indentation are independent predictors of malignancy in small indeterminate solid SPNs. The developed nomogram is easy-to-use and may allow the accurate prediction of malignancy in small indeterminate solid SPNs among Chinese patients.

EPO-0699
人工智能 Ai 联合肺结节血管成像技术在肺结节病变 CT 定性诊断中的临床运用

封俊,丁莹莹,张莹,董兴祥,李高峰,黄云超
云南省肿瘤医院/昆明医科大学第三附属医院

目的:探讨人工智能 Ai 联合肺结节血管成像技术在肺结节病变 CT 定性诊断中的临床运用价值。
材料与方法:前瞻性的对 147 例临床诊断肺结节患者进行 CT 扫描，并行多平面重组及结节周围肺血管成像 MIP 后处理，利用人工智能 Ai 对上述肺结节进行危险级别评估，搜集经手术、病理证实 59 例病例的资料，对照分析术前 CT 诊断、结节有无血管联通疑似供血表现及 Ai 评估结果与手术、病理的相关性。

结果：经手术、病理证实的 59 例病例男性 26 人，女性 33 人，年龄 24 岁至 76 岁，病变大小 0.6X0.5cm 至 3.2X2.6cm；手术病理结果：良性 17 例；恶性 42 例，浸润性腺癌 37 例，原位腺癌并微小浸润 5 例。59 例结节病例中实性结节 13 例，部分实性结节 43 例，非实性结节 3 例；实性结节中良性 6 例，恶性 7 例；部分实性结节中良性 10 例，恶性 33 例；非实性结节中良性 2 例、恶性 1 例。13 例实性结节中结节周围肺血管 MIP 成像显示血管联通疑似供血表现 11 例，人工智能 Ai 提示 11 例为高危结节，1 例为中危结节，1 例为低危结节；43 例部分实性结节中结节周围肺血管 MIP 成像显示血管联通征疑似供血表现 43 例，人工智能 Ai 提示 40 例为高危结节，1 例为中危结节，2 例为低危结节；3 例非实性结节中结节周围肺血管 MIP 成像显示血管联通疑似供血表现 3 例，人工智能 Ai 提示 3 例均为高危结节。综合上述，结节周围肺血管联通征诊断恶性可能在实性结节的准确率 63.6%,部分实性结节的准确率 76.7%，非实性结节的准确率 33.3%；人工智能 Ai 诊断结节恶性可能在实性结节的准确率 63.6%,部分实性结节的准确率 82.5%，非实性结节的准确率 33.3%。**结论**：肺结节血管 MIP 成像显示肺血管联通征提示肿瘤供血表现及人工智能 Ai 在术前诊断部分实性结节恶性概率具有较高的诊断价值，两者联合运用诊断效能更高，对于肺癌的病理亚型诊断上述影像评估方法不具备特征性。

肺部孤立性球形病变良恶性判别的多因素 logistic 回归分析

付婷婷,黄文才,熊飞,薛阳
中国人民解放军中部战区总医院

【摘要】**目的** 观察肺部孤立性球形病变的 MSCT 影像特征，构建 logistics 回归模型判别病变的良、恶性。**方法** 回顾分析肺部孤立性球形病变的影像学特点，对影响肺内孤立球形病变良、恶性鉴别的指标进行多因素回归分析，建立多因素 logistic 回归模型，并验证模型的可行性。**结果** 本组 175 例患者中，恶性肿瘤患者 117 例，良性病变患者 58 例。经多因素 logistic 回归分析，深分叶、直边征、晕征、肺门及纵隔淋巴结肿大有助于肺孤立球形病变良、恶性的鉴别，以模型概率预测值绘制 ROC 曲线，其曲线下面积分别为 0. 87、0. 89、0. 78 和 0. 84。**结论** logistic 回归筛选自变量，建立简便、有效的回归模型，对预测肺内孤立球形病变良恶性有良好的临床应用价值。

EPO-0701
Prediction of pathologic stage in non-small cell lung cancer using machine learning algorithm based on CT image feature analysis

lingming yu
Department of Radiology

Background: Pathologic staging of non-small cell lung cancer remains an intractable problem for the physician using individual pretreatment variables. The purpose of this study is to explore potential imaging biomarkers that can be used for diagnosis and prediction of pathologic stage in non-small cell lung cancer (NSCLC) using multiple machine learning algorithms based on CT image feature analysis.

Methods: This study consisted of 145 patients with stage IA to IV NSCLC patients, which be divided into training and testing sets (NSCLC, n=87) and an external validation set (Lung adenocarcinoma, LUAD, n=24; Lung squamous cell carcinoma, LUSC, n=34). In order to tackle imbalanced datasets in NSCLC, we generated a new dataset and achieved equilibrium of class distribution by using randomoversampling and SMOTE algorithm. The new data sets were randomly split up into a training set and a testing set. Considering some redundant and irrelevant features that may influence classification accuracy of the prediction model, we calculated the importance value of CT image features by means of Random Forest algorithm, and then selected optimal features in accordance with feature importance (P>0.005) to establish a new model. The performance of prediction model in training and testing sets were evaluated from the perspectives of classification accuracy, average precision (AP) score and precision-recall to each class. Ultimately, the predictive accuracy of the model was re-confirmed using LUAD and LUSC samples in an external validation set.
Results: The prediction model that incorporated nine image features exhibited a high classification accuracy (all AUC>0.70), precision and recall scores (AP = 0.60) in the training and testing sets. In
the external validation, we discovered that the predictive accuracy of the model in LUAD (AP = 0.84) outperformed that in LUSC (AP = 0.62).
Conclusion: The pathologic stage of patients with NSCLC can be accurately predicted based on CT image features, especially for LUAD. Our findings not only extend the application of machine learning algorithms in CT image feature prediction for pathologic staging, but identify potential imaging biomarkers that can be used for diagnosis and prediction of pathologic stage in NSCLC.

EPO-0702
肺磨玻璃密度结节中“实性成分”的影像学定义、显示以及其与肺腺癌浸润性之间的相关性研究

涂文婷,范丽,刘士远
海军军医大学第二附属医院（上海长征医院）

目的 通过评估肺磨玻璃密度结节中“实性成分”与肺腺癌浸润性的相关性，从而更全面地定义和显示“实性成分”。
方法 回顾性分析 328 例病理证实为肺腺癌患者,采用计算机辅助软件 328 例 GGN 进行半自动逐层分割。3D-CT 密度直方图共设置 11 个 CT 值区间，分别为<-400, -400~-350.....0~50, ≥50HU, 软件自动计算出每个区间的体积百分比。两名放射科医师在肺窗上判断 GGN 的密度均匀性，在纵隔窗和 10 个中间窗（窗宽均为 2 HU, 窗位为-400, -350.....0, 50 HU）判断 GGN 的可见性，同时比较 GGN 的最大 CT 值是否大于同层面血管的最大 CT 值。第 1 种“实性成分”的假设定义为 GGN 在肺窗上密度不均匀，第 2 种“实性成分”的假设定义为 GGN 在纵隔窗上可见，第 3 种“实性成分”的假设定义为 GGN 的最大 CT 值大于同层面血管的最大 CT 值。采用 SPSS21.0 进行统计学分析。
结果 在 3D-CT 密度直方图中，其中 5 个区间的 AUC≥0.797，采用这 5 个 CT 值区间的并联诊断对肺腺癌浸润性具有较好的诊断性能，灵敏度和特异度分别为 78%、73.7%。基于三种不同“实性成

分”定义方式来诊断 IAC 的敏感性和特异性分别为 96.73%&9.65%, 75.70%&75.43%, 57%&80.70%。其中第 2 种“实性成分”的假设定义（即 GGN 在纵隔窗上可见）比其他两种定义方式具有更高的准确性（75.6%，p＜0.01）。中间窗-50 WL/2 WW 显示出比其它 9 个中间窗以及第 2 种假设定义更高的 AUC，特异度和阳性预测值分别为 82.5%、88.5%，优于密度直方图的并联诊断及第 2 种假设定义。

结论 使用中间窗-50 WL/2 WW 来诊断肺结节的“实性成分”以及鉴别浸润性是一种最佳的方式，优于密度直方图的并联诊断及第 2 种“实性成分”的假设定义，同样也是一种在临床工作中十分便于操作的评估方法。

Efficacy of DL-based AI diagnostic platform in detecting ground-glass nodules in clinical practice

Suxing Yang
Inner mongolia people's hospital

Objective To explore the efficacy of deep learning-based artificial intelligence (AI) diagnostic platform on the detection of ground-glass nodules, and to validate its feasibility in clinical practice.

Method A total of 117 CT scans were retrospectively collected and enrolled in this study. These CT scans were reconstructed at the slice thickness of 1 to 1.25mm. The gold standard utilized in this study was annotated via the consensus of two senior radiologists with over 15 years of reading chest CT images; a third senior radiologists will make the final decision if there is a disagreement between the two radiologists when annotating ground-glass nodules. DL-based AI diagnostic platform from Infervision was used to detect ground-glass nodules in this study; the detected true positive nodules, false positive nodules and false negative nodules were recorded for statistical analysis. Sensitivity and false positive rate (false positive nodules per CT scan were calculated. Chi-square test was utilized for statistical analysis, $p<0.05$ was considered as significantly different.

Results A sum of 147 ground-glass nodules were annotated in the gold standard. AI diagnostic platform detected 356 ground-glass nodules with the sensitivity of 90.48%. There were 223 false positive nodules detected by AI platform and the false positive rate turned out to be 1.91/CT.

Conclusion DL-based AI diagnostic platform demonstrated a decent sensitivity for detection of ground-glass nodules in the clinical practice.

MR 延迟增强评估左心房纤维化与肥厚性心肌病左心室应变的相关性

张武,姜梦春,郭杨钰,曾牧
中南大学湘雅二医院

目的：探讨肥厚性心肌病（HCM）患者的左心房（LA）纤维化程度与左心室（LV）参数变化的相关性。
方法：利用具有心脏电影功能 3.0T MRI 设备对 14 例 HCM 患者进行左心房及左心室钆剂晚期增强（LGE）扫描成像。记录钆剂晚期增强左心房的体积、质量、应变与左心室测量参数的相关性，同时记录其临床相关体征及药物使用情况综合分析左心房与左心室相关参数的相关性。本研究经过医院伦理委员会审批并同患者签署知情同意书。
结果：经过 MR 钆剂晚期增强扫描 14 例患者中 12 例（85.7%）出现左心室存在晚期强化，在研究的所有患者左心房均出现晚期强化。进行相关分析发现左心房纤维化程度与左心室晚期强化的百分率存在显著相关性（r=0.63，p＜0.05），但与左心室质量极最大壁厚无关。左心房纤维化程度与左心室应变减低也存在一定的相关性（横向：r=0.50，p=0.012；周长：r = 0.48，p＜0.05；纵向：r = 0.51，p＜0.05）。左心房收缩期容积增加与左心室舒张末期的容量存在相关性（r = 0.50，p＜0.05）。接受过肾素-血管紧张素-醛固酮系统（RAAS）治疗的患者与未接受的患者左心房延迟强化程度显著降低（19.6%vs 11.8%，p＜0.05）。
结论：通过钆剂延迟强化测量发现左心房纤维化在肥厚型心肌病病中普遍与左心室应变参数变化相关。

EPO-0705
心脏磁共振组织追踪技术评价原发性高血压患者左室心肌应变的研究

刘会娜[1],王佳佳[1],潘玉坤[1],葛英辉[1],郭智萍[1],赵世华[2]
1.华中阜外医院
2.北京阜外医院

目的 用心脏磁共振组织追踪(CMR-FT)早期发现原发性高血压患者心脏亚临床收缩功能异常，并评估左室应变的影响因素。方法 前瞻招募 57 名原发性高血压者（43.04±10.90 岁；35 男）和 26 名健康者（38.69±10.44 岁；11 男）。高血压组患者 EF 值均正常（≥50%）。t、 U 或卡方检验比较组间差异。用单及多因素线性回归评估左室应变与影响因素间关系。应变参数一致性用组内相关系数（ICC）及 Bland -Altman 图评估。结果 与健康组比，高血压组左室心肌应变降低（整体径向应变（GRS）：35.14±7.27% VS 42.14±7.80%；整体环向应变（GCS）：-19.64±2.46% VS -21.87±2.42%；整体纵向应变（GLS）：-16.48±2.34% VS -17.85±1.83%）；EF 在两组间无差异。高血压组单因素线性回归发现降低 GRS、GCS、GLS 均与平均动脉压（MAP）和左室心肌质量指数（LVM/BSA）存在线性相关。多因素线性回归调整年龄、性别、BSA、高密度脂蛋白和 LVM/BSA 等因素，MAP 对左室心肌应变（GRS、GCS、GLS）的影响仍然有统计学意义。在多因素线性回归模型，GRS 与 MAP 和 LVM/BSA 独立相关（β=-0.219，P=0.009 和β=-0.224，P=0.015；调整 R2=0.4）；GCS 也与 MAP 和 LVM/BSA 独立相关（β=0.084，P=0.002 和β=0.073，P=0.01；调整 R2=0.439）；GLS 与年龄和 MAP 独立相关（β=0.065，P=0.021 和β=0.077，P=0.009；调整 R2=0.289）。应变参数观察者内和观察者间的 ICC 值均＞0.75。结论 心肌应变能早期发现心肌损伤， 先于 EF 出现异常，可望成为预防干预靶点。原发性高血压患者，MAP 升高可能对左室心肌应变有不利影响。CMR-FT 有潜力定量分析心脏运动

EPO-0706

心尖肥厚型心肌病合并和不合并左室心尖部室壁瘤的临床及 CMR 特点的比较研究

杨凯,赵世华
中国医学科学院阜外医院

目的：总结分析心尖肥厚型心肌病（Apical Hypertrophic Cardiomyopathy, ApHCM）合并左室心尖部室壁瘤（Left Ventricular Apical Aneurysm, LVAA）的临床及 CMR 特点，并与 ApHCM 不合并 LVAA 的患者进行比较。
方法：回顾性纳入 2010 年 1 月至 2017 年 12 月期间在我院经 CMR 诊断为 ApHCM 合并 LVAA 的患者 25 例，同时期内按性别、年龄匹配 25 例 ApHCM 不合并 LVAA 的患者。收集患者的临床基线资料及 CMR 结果进行分析。
结果：ApHCM 合并 LVAA 以中老年男性多见，多数患者（92%）伴有临床症状，如胸闷、胸痛、心悸及呼吸困难等，12%的患者有肥厚型心肌病家族史。常见心电图改变包括 ST-T 段改变、T 波倒置及左室高电压。超声诊断 LVAA 漏诊率达 68%，其中 88.2%为小室壁瘤。与 ApHCM 不合并 LVAA 组比较，ApHCM 合并 LVAA 组有更多的患者合并左室中部梗阻及心尖部心腔闭塞，差异具有统计学意义（*P* 值均＜0.05）。76%的患者出现瘤壁透壁性强化，出现瘤壁透壁性强化的室壁瘤大小（22.0±10.8mm）与未出现透壁性强化的室壁瘤大小（11.7±4.0mm）比较，其差异具有统计学意义（*P*=0.033）。
结论：ApHCM 合并 LVAA 有一定的临床及心电图特征，CMR 可以全面、客观及准确地评价 ApHCM 伴 LVAA，是目前临床上评估此类疾病的最佳影像学诊断方法。

EPO-0707

The association between the involvement of LAD with the Improvement of right ventricle myocardial strain for STEMI patients with culprit vessel of RCA

Kaiyue Diao[1],Zhigang Yang[1],Yue Gao[1],Yingkun Guo[2],Yong He[1]
1.West China Hospital
2.West China Second University Hospital

Purpose
To demonstrate the RV myocardium’s change at the 3-month post-STEMI on RCA patients between those with and without the involvement of LAD.
Methods
A number of 32 (M/F: 29/3, age: 53 [47-62] yrs) patients with STEMI and whose culprit vessel included RCA were prospectively include from 2016 to 2017. Consent was acquired from each patient. The baseline MRI was arranged 4-7 days after the primary PCI and the second at 3 months follow-up. Imaging analysis was performed on Cvi 42 (V5.9.3 Canada). Endocardium and epicardium were delineated carefully at the free wall of RV at the diastole on both the short-axis cine images and RV two-chamber images. Peak radial (RVPRS) and circumferential strain (RVPCS) were extracted from the 2D short images and the peak longitudinal strain (RVPLS) was derived from the RV two-chamber views. Patients with more than 50% LGE involvement of the anterior-septal segments

were considered with LAD involvement. Box-plot was used to qualitatively evaluate the change between the twice MRI.

Results

Patients were divided into two groups according to the involvement of LAD (LAD vs non-LAD: 18 vs 14). Figure 1 demonstrated the change between the twice MRI for the two groups. Numerical improvements could be seen in RVPRS, RVPCS, and RVPLS for patients with no involvement of LAD, while for patients with LAD involvement, the RV peak strains didn't show prominent improvement especially the RVGLS. However, no statistical difference was found for both groups. The LGE percentage showed a significant difference between the two groups (LAD vs non-LAD: 78.03% vs 19.04%, P <0.0001).

Conclusion

The LAD involvement might affect the RV myocardial improvement for STEMI patients with culprit vessel of RCA, further studies were needed to demonstrate the mechanism, as well as whether it could help predict the prognosis for these patients.

EPO-0708

Diffusion-weighted Imaging in Hypertrophic Cardiomyopathy: Association with High T2-weighted signal intensity in addition to late gadolinium enhancement

Ruoyang Shi,Lianming Wu,Jianrong Xu
Ren Ji Hospital, School of Medicine, Shanghai Jiao Tong University

Diffusion-weighted imaging (DWI) has been confirmed to be associated with late gadolinium enhancement (LGE) in hypertrophic cardiomyopathy (HCM). In this context, we aimed to study whether DWI could reflect the active tissue injury and edema information of HCM which were usually indicated by T2 weighted images. Forty HCM patients were examined using a 3.0 Tesla magnetic resonance scanner. Cine, T2-weighted short tau inversion recovery (T2-STIR), DWI and LGE sequences were acquired. T1 mapping was also included to quantify the focal and diffuse fibrosis. Cardiac troponin I (cTnI) was tested to assess the recently myocardial injury. Student's t-test, Mann-Whitney U test, One-way analysis, Kruskal-Wallis analysis, the Spearman correlation analysis, and multivariable regression were used in this study. The apparent diffusion coefficient (ADC) was significantly elevated in the cTnI positive group (P = 0.01) and correlated with LGE (ρ = 0.312, P = 0.049) and HighT2 extent (ρ = 0.443, P = 0.004) in the global level. In the segmental analysis, the ADC significantly differentiated the segments with and without HighT2/LGE presence (P = 0.00). The average ADC values were higher in segments with HighT2 and LGE coexistence than in those with only LGE presence ($p < 0.05$). Multivariable regression indicated that segmental HighT2 and LGE were both contributing factors to the ADC values. In this study of HCM, we confirmed that ADC as a molecular diffusion parameter reflects the replacement fibrosis of myocardium. Moreover, it also reveals edema extent and its association with serum cTnI.

EPO-0709

CMRI 一站式定量评估肥厚型心肌病患者心肌应变和纤维化与心肌损伤标志物的相关性研究

李玉敏,史河水
华中科技大学同济医学院附属协和医院

目的：探讨 HCM 患者心肌应变、LGE-MRI 定量的心肌纤维化程度和其影响因素，以及与心肌损伤标志物（AST、LDH、CK、CK-MB、hs-cTnT、NT-proBNP）之间的潜在相关性。**方法：**测量 80 例 HCM 患者（LGE（+）n=45；LGE（-）n=35）和 35 例对照组左、右心室和左心房的心功能参数、心肌整体应力值及左心室 总 LGE 率（%）/LGE 体积和 LGE 质量。比较三组间 CMR 参数和心肌损伤标志物差异、相关性。**结果：**①HCM 患者存在多个心肌酶值异常，其中，和 LGE（-）组相比，LGE（+）组 hs-cTnT、NT-proBNP 升高，P<0.01。②和 HC 相比，HCM 两组 LVEF 和 RVEF 升高，而 LGE（-）组左心室 GLS 下降，LGE（+）较 HC 及 LGE（-）组左心室 GLS、GRS 和 GCS 下降； 和 HC 组相比，LGE（-）和 LGE（+）组 LAEF 和 PLAS 下降，P<0.01，但 HCM 两组之间无显著差异，三组之间右心室应力无差异。③相关性分析：心肌总 LGE（%）与 LVEF、GRS 呈负相关，与 CLS、GCS 呈正相关；总 LGE（%）与 hs-cTnT、NT-proBNP 呈正相关；GLS 和和 LVEF 呈正相关，和 NT-proBNP 呈负相关。④多元线性回归分析：总 LGE（%）和 hs-cTnT 独立相关（ standardized β =0.436 , p =0.033)。**结论：**CMRI 一站式技术可定量评估肥厚型心肌病患者心肌应变和纤维化程度，有强化的 HCM 患者心肌整体应力水平受损更明显、心肌酶值异常，和强化程度著相关，且 LGE 定量的心肌纤维化和 hs-cTnT 独立相关，表明血浆 hs-cTnT 水平有助于 LGE 的早期发现，可能是心肌损伤的直接标志物，有助于 HCM 患者的早期诊断和预后干预。

化学位移饱和成像在轻链型淀粉样变性患者中预测心肌延迟强化的准确性

李潇[1],黄思思[1],Zhengwei Zhou[2],Linda Azab[2],Zixin Deng[2],Debiao Li[2],安靖[3],李剑[1],王怡宁[1],金征宇[1]
1.中国医学科学院北京协和医院
2.Biomedical Imaging Research Institute， Cedars-Sinai Medical Center， Los Angeles， USA
3.西门子深圳磁共振有限公司

目的：探索平扫化学位移饱和成像（CEST）心脏磁共振技术在轻链型淀粉样变性患者中预测心肌延迟强化的准确性。
方法：研究前瞻性纳入 40 名病理诊断的轻链型淀粉样变性患者（年龄，56.2±9.4 岁；男/女，27/13；梅奥 0/I/II/III 期，17/8/9/6），行心脏磁共振扫描，包括 CEST，T1 mapping 等新技术及电影、延迟强化等传统序列。用商业化后处理软件测得心肌总体 CEST 信号值、平扫 T1 值、细胞外容积（ECV）值。以延迟强化有无为金标准，绘制 ROC 曲线。
结果：无延迟强化、斑片状延迟强化、弥漫延迟强化患者分别 9、11、20 名。平扫 T1 值≥1409ms 时，预测延迟强化敏感性为 83.3%，特异性为 100%，曲线下面积 0.944。CEST 值≤0.1235 时，预测延迟强化敏感性为 97.6%，特异性为 55.5%，曲线下面积 0.757。
结论：平扫 CEST 心脏磁共振技术可预测心肌延迟强化，但准确性仍低于平扫 T1。

探讨 3.0T 磁共振特征追踪技术在慢性肾功能衰竭致心肌损伤中的应用价值

杨帆
川北医学院附属医院

目的：应用 3.0T 心脏磁共振特征追踪技术(Cardiovascular Magnetic Resonance Feature Tracking, CMR-FT)定量评价慢性肾功能衰竭患者左心室心肌应变各参数的变化情况，旨在探讨 CMR 早期、无创性诊断慢性肾功能衰竭致心肌损伤的可行性。材料及方法：收集川北医学院附属医院 2017 年 1 月-2019 年 1 月期间符合纳入及排除标准的慢性肾功能衰竭患者 43 例，其中男性 25 例，女性 18 例，平均年龄 50.61±8.81 岁，同时纳入 25 例健康志愿者作为对照组。所有纳入者均行 3.0T CMR 检查，分析慢性肾功能衰竭组与正常组左心室功能整体（径向、周向及纵向）峰值应变(Peak strain, PS）间的差异。结果：慢性肾功能衰竭组室间隔厚度（interventricular septum thickness, IVST）及左心室质量(left ventricular mass, LVMass)大于正常对照组，差异有统计学意义（All P＜0.05）；而左心室射血分数(left ventricular ejection fraction, LVEF)及左心室心输出量(left ventricular cardiac output, LVCO)均未见统计学差异（All P＞0.05）。整体心功能方面，慢性肾功能衰竭组左心室整体纵向 PS 低于正常对照组(-14.05±2.15% vs. -15.61±3.01%, P=0.046）。结论：CMR-FT 可 LVEF 正常的情况下早期、定量评价慢性肾功能衰竭患者左心室心肌功能障碍;左心室整体纵向 PS 有望为临床早期诊断慢性肾功能衰竭致心肌损伤提供影像学依据及量化标准。

Diagnostic value of myocardial strain in left ventricular non-compaction based on CMR tissue tracking

Cailing Pu,Jingle Fei,Yuxin Han,Hongjie Hu
Department of Radiology， Sir Run Run Shaw Hospital， School of Medicine， Zhejiang University,

Purpose
To explore myocardial deformation pattern of left ventricular non-compaction and diagnostic value of myocardial strain based on cardiac magnetic resonance tissue tracking (CMR-TT).
Methods
We retrospectively enrolled 23 patients with LVNC in our hospital and 20 normal people were included as control group. CVI[42] was used to measure global radial strain/circumferential strain/longitudinal strain (GRS/GCS/GLS) and regional myocardial strains (base, mid-cavity, apex) and segmental strains. We calculate the number of non-compaction segments, the ratio of non-compaction (NC) to compaction(C) myocardium, NC mass percentage and distribution of late gadolinium enhancement (LGE) in the left ventricular myocardium. Student *t*-test or Wilcoxon sign rank test was used to analyze the differences between patients and normal people, myocardial strain of NC and C myocardium. Spearman’s rank correlation test was used to analyze the correlation between myocardial deformation and severity of LVNC. Receiver operating characteristic (ROC) was used to evaluate the diagnostic efficacy of myocardial strain parameters.
Results

There were 31 NC segments in mid-cavity section and 49 NC segments in apex section in patients with LVNC. LGE was presented in 6 patients and their LVEF were all less than 50%. Compared with the control group, global and regional myocardial strains in patients with LVNC significantly decreased(P<0.001). And they had much lower left ventricular ejection fraction (LVEF) and higher left ventricular end-diastolic volume index (LVEDVI), left ventricular end-systolic volume index (LVESVI) and NC mass percentage than the control group(P≤0.001). However, there were no differences in mid-cavity strains and apical strains between NC and C myocardium(P>0.05). ROC showed NC mass percentage>17.5%, GCS<13.5% and GLS<11.1% were highly sensitive and specific to differentiate patients with LVNC from normal people. But there was no correlation between myocardial deformation and severity of LVNC.

Conclusions

CMR-TT can be an assistant method to diagnose patients with LVNC by assessing myocardial deformation damage. GCS and GLS may be important factors in differentiating LVNC patients from normal people.

EPO-0713

磁共振成像在心脏罕见心肌病诊断中的应用价值

姜增誉[1],吴江[2]
1.山西医科大学第一医院
2.山西省心血管病医院

目的：探讨罕见心肌病的磁共振影像特点,为临床诊断及判断预后提供依据。
方法：回顾分析疑似少见心肌病并经临床及病理确诊病人 11 例，使用 GE1.5T HD -XT 磁共振扫描仪，心脏 8 通道相控阵线圈，采用回顾性心电门控技术及呼吸门控技术。CMR 平扫：采用 T2 TSE 序列行矢状位、冠状位、轴位扫描；采用 FIEST 序列行心脏电影序列扫描四腔心、两腔心、心脏短轴及左室流出道、流入道层面；采用黑血序列扫描心脏短轴位。 CMR 首过灌注扫描：注射造影剂钆特酸葡胺 0. 2 mmol/kg，速 度 3 mL/s 后 即 刻开始 扫 描 心 脏 短 轴 位，每 层 40 个周 期，采 集 3~ 5 层；CMR 延迟扫描：再次注射造影剂 0.1 mmol/kg，速度 1 mL/s 10 min 后开始扫描，采集左室短轴、两腔心、四腔心、三腔心层面，30 分钟内完成扫描。图像评估由两位影像主治医师以上盲法共同观察分析，以意见一致为评判标准。
结果：3 例心肌淀粉样变性表现为室壁增厚，左、右心室肌弥漫性粉尘样延迟强化。2 例乳腺癌化疗后 1 年及 1 例抗磷脂抗体累及心脏，左室心肌弥漫性运动减弱，室壁变薄，弥漫性透壁延迟强化。3 例致密化不全表现为左室心尖及游离壁心肌局部变薄，运动减弱,非致密化心肌呈栅栏状分布于心肌内层，未见延迟强化灶。2 例嗜酸性心内膜炎磁共振,表现为广泛心内膜下的延迟强化，心肌舒张运动受限，抗磷脂抗体综合征累及心脏 。
结论：磁共振作为一种无创性检查手段可评估各种类型心肌病，尤其在某些罕见心肌病的诊断及判断预后中发挥重要作用。

心脏磁共振成像技术分析 2 型糖尿病患者左室心肌应变与 HbA1c 水平相关性的研究

余娇艳,黄俊浩,陈暇女,郭定波,易小琦,欧芳元

重庆医科大学附属永川医院

目的：基于多模态心脏磁共振技术定量评估 2 型糖尿病患者和健康对照者左室心肌应变参数值差异情况与 HbA1c 水平的相关性。方法：应用心脏磁共振电影成像、特征追踪技术、心肌标记等技术对 40 例 2 型糖尿病患者和 36 例健康对照者进行 3.0T 心脏磁共振扫描，并应用 CVI42 和 Argus 软件对扫描数据进行后处理分析，并研究相关参数值与 HbA1c 水平的相关性。行心脏磁共振扫描前，收集 2 型糖尿病患者和健康对照者的基线临床数据以及相关血生化指标。结果：反映左室心肌应变的相关参数值，如左室整体舒张功能、左室整体收缩功能、心肌应变率、运动速度、位移及扭转运动等参数，在 2 型糖尿病患者组中较正常对照者有显著差异，并与 HbA1c 水平有一定相关性。结论：2 型糖尿病患者左室心肌应变的改变与 HbA1c 水平有密切相关性，严格控制 2 型糖尿病的血糖水平将可能有助于改善左室舒张功能的降低，提高患者的生存质量。

EPO-0715
利用心脏磁共振特征追踪技术探究左心室心肌应变参数对急性心肌炎患者的诊断价值

吕桑英[1],蒲彩玲[2],胡红杰[2]
1.绍兴市人民医院
2.浙江大学医学院附属邵逸夫医院

目的：本研究利用心脏磁共振特征追踪技术，对比分析急性心肌炎患者与健康对照组在常规心功能参数及心肌应变参数上的差异，探究左心室心肌应变参数对急性心肌炎患者的诊断价值。
临床资料与方法：收集邵逸夫医院 2014 年 1 月至 2018 年 12 月收治的 41 例临床诊断急性心肌炎患者作为病例组，招募同时段的体检患者及健康志愿者作为对照组，所有 CMR 图像在 CVI[42]软件上进行后处理，获得包括 LVEDV、LVEDVI、LVESV、LVESVI、SV、SVI、LVEF 、GRS、GRSr、GCS、GCSr、GLS、GLSr 在内的左室心肌应变参数，比较两组间的差异分析，确定心肌应变参数的诊断价值。
结果：急性心肌炎患者的 LVESV、LVESVI 高于对照组（LVESV：62.03±27.07vs.45.13±12.32 mL，p=0.004；LVESVI：35.22±17.12vs.26.73±7.62 mL/㎡，p=0.044），LVEF 低于对照组（57.00±14.70vs.65.36±6.09 %，p=0.023），但平均 LVEF＞50%；急性心肌炎组的 GRS、GRSr、GCS、GCSr 均显著低于将康对照组（GRS：22.95±9.88vs.33.87±13.95 %，p＜0.001；GRSr：1.26±1.67vs.2.06±1.58 /s，p=0.025；GCS：-15.01±4.32vs.-18.96±3.30 %，p＜0.001、GCSr：-0.87±0.27vs.-1.02±0.17/s，p=0.004），而 GLS、GLSr 不存在统计学差异。通过绘制 ROC 曲线发现 GRS 的诊断灵敏度及准确率最高，分别为 70.7%、73.6%，GCSr 的特异度最高为 93.5%。
结论：（1）急性心肌炎患者的收缩功能径向及环向心肌应变参数受损，但收缩功能受损程度较轻。
（2）GRS 的诊断灵敏度及准确率最高，GCSr 的特异度最高。

Feasibility Study of Whole Heart T1 Mapping with SMS in A Single Breath Hold

Wenbo Sun[1],Lan Lan[1],Yuan Zheng[3],Lele Zhao[2],Zhehao Zhang[2],Jian Xu[3],Haibo Xu[1],Xiaochun Zhang[1]

1.Department of Radiology, Zhongnan Hospital of Wuhan University, Wuhan, China,
2.Shanghai United Imaging of Healthcare, Shanghai, China
3.United Imaging of Healthcare America Inc., Houston, TX, USA

Aim: Myocardial T1 mapping is of high importance for the detection of diffuse fibrosis and other myocardial diseases. The modified look-locker inversion recovery (MOLLI) method can only acquire one single slice T1 map in each breath hold (BH) [1]. Recently, an accelerated T1 mapping approach was introduced using simultaneous multi-slice (SMS) imaging technique based on MOLLI approach, which can only cover 1 to 3 slices of the heart in a single BH [2]. This study aimed to propose a novel single BH whole-heart T1 mapping technique based on SMS technique.

Method: To achieve whole heart T1 mapping, a modified saturation recovery (SR) prepared pulse sequence was implemented with SMS technique using balanced steady state free precision (bSSFP) readout kernel, the images were then reconstructed using the slice-GRAPPA algorithm[3]. Both SMS method (multiband factor (MB)=1 and MB=2) and MOLLI method were performed on fifteen normal controls and three patients with old myocardial infarction, on a 3.0T scanner (uMR 790, UIH, Shanghai) with a 24-channel body coil. Mean value of the native T1 map, post contrast T1 map of short-axis slices of the whole heart were calculated and compared.

Result: With MB factor = 2, whole heart T1 maps of 12 short-axis slices at the same cardiac phase can be acquired within one single BH. Our initial results show that in healthy subjects, both the native map and post contrast t1 map values were ranked as: MOLLI<MB=1<MB=2, which might be due to an overestimation of the T1 value of the SMS technique. However, there was no difference in the mean root mean square error (RMSE) across different slices between the SMS and MOLLI method, which indicated that there was a similar consistency of the SMS method as MOLLI. Results in three patients also indicated that the SMS technique might help distinguish lesions in myocardium, despite a lower SNR.

Conclusion: These findings indicated that our whole heart T1 mapping technique might be as accuracy as MOLLI method, and enable a larger coverage and faster acquisition speed in clinic. A clinical evaluation of myocardial fibrosis and other myocardial disorders using this proposed whole heart T1 mapping method is under the way.

EPO-0717

Di use myocardial characteristics of daunorubicin-induced cardiotoxicity by native T1 mapping: an animal study

Rong Xu,Yingkun Guo,Hui Liu
West China Second University Hospital, Sichuan University

Object

The aim of this study is to quantitative evaluation diffuse myocardial characteristics of daunorubicin-induced cardiotoxicity in rabbit model with different cumulative dose and time point by native T1 mapping, and further to explore the association between myocardial injury and different conditions.

Materials and methods

The cardiotoxicity cardiomyopathy rabbit model was generated by injecting 24 adult New Zealand rabbits with 3-4mg/kg of daunorubicin weekly for 2-4 weeks. Cine imaging and pre-contrast T1-mapping CMR using a prototype modified MOCO sequence on a clinical 3-T scanner were performed on all subjects, including 8 control rabbits. Cardiac structure, function, and native T1 values were measurement at baseline and at 2, 4 weeks after different degree of doxorubicin administration.

Results

There were four rabbits (16.7%) occurred LVEF decreased among all of modeling rabbits. For the different time point groups, the cardiotoxicity rabbits with 4mg/kg weekly at 2 and 4 weeks were significantly higher than those measured at baseline (native T1 values: 4 weeks, 1273.25±96.05ms; 2 weeks, 1247.65±38.52ms; baseline, 1119.78±49.48ms; all $p < 0.017$). For the different dose groups, the cumulative dose group with 40-50 mg have higher T1 values than group with 30-40mg (native T1 values: 1289.68 ± 83.16ms vs. 1222.16 ± 75.54ms, $p < 0.05$), but there is no significant difference between groups with cumulative dose with 20-30mg and 30-40mg.

Conclusion

Native T1 mapping is useful for characterizing doxorubicin-induced cardiomyopathy, especially detection of early diffuse myocardial injury. The higher cumulative dose and longer time, the more severe the effect on myocardium. And further monitor study is ongoing.

EPO-0718

T1 mapping and feature tracking by cardiac magnetic resonance in identification and assessment of left ventricular remodeling in severe aortic stenosis: comparison with histology

xiaoyu wei[1], Jia jun Xie[2]
1.Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences
2.Guangzhou First People's Hospital

Purpose: Multiparametric cardiac magnetic resonance (CMR) imaging was used to investigate left ventricular (LV) remodeling and myocardial fibrosis (MF) in patients with severe aortic stenosis (SAS), as well as validated findings by using histologic confirmation.

Methods: We prospectively enrolled selected 49 patients with SAS and 20 healthy controls, who underwent both CMR and transthoracic echocardiography (Echo) before surgical aortic valve replacement (AVR). A 3.0-T MRI, including non and post-contrast T1 mapping for extracellular volume (ECV) or indexed ECV (iECV) and CMR feature tracking (FT-CMR) for LV strain, was carried out to assess the fibrosis and structural

alterations of the LV remodeling progression. Correlation between T1-derived parameters coexist with LV strain and the degree of fibrosis was assessed by myocardial biopsy specimens obtained by AVR.
Results: The SAS patients had a higher left ventricular mass index (LVMi) than control group (166.03±65.78 vs 36.09±6.97, p<0.001). Pearson's correlation with LVMi were observed for longitudinal global strain (r=-0.71 p<0.001), native T1 (r=0.32, p=0.025), ECV (r=0.182, p=0.21) and iECV (r=0.637 p<0.001). In univariate analysis, there were higher native T1, iECV and GLS values. In multivariate analysis, GLS and iECV values were associated with SAS. iECV and GLS correlated with the degree of fibrosis as assessed by histology (r = 0.634, p = 0.011 and r = 0.517, p = 0.049, respectively), while native T1 (r = 0.325, p=0.273), and ECV (r = 0.014, p = 0.959) did not.
Conclusion: iECV, not ECV and GLS as assessed by CMR was correlated with LVMi and the degree of diffuse MF in patients with severe AS. iECV and GLS as assessed by CMR could be an ideal surrogate marker for diffuse MF in patients with severe AS.

基于心脏磁共振电影成像快速评价保留射血分数的肥厚型心肌病患者双心房结构及功能改变的临床研究

周红,杨智,付兵,覃由宣
成都市第五人民医院

目的 采用心脏磁共振电影成像技术快速定量评价保留射血分数的肥厚型心肌病（hypertrophic cardiomyopathy, HCM）患者的双心房局部及整体形变。 方法 前瞻性纳入 2015 年 7 月—2019 年 3 月的在我院进行检查、诊断为肥厚型心肌病，心脏磁共振后处理左心室射血分数（left ventricular ejection fraction ，LVEF）大于等于 50%患者 26 例，为肥厚型心肌病组（HCM 组）；同时选取该时期在我院行心脏 MRI 检查的 21 名健康志愿者为对照组；测量 HCM 组及对照组双心房指标，包括左、右心房收缩期末及舒张期末纵径、横径及面积。 结果 HCM 组左心房收缩期及舒张期末纵径、横径与面积均大于正常对照组，左心房纵径、横径及面积变化率均小于正常对照组，差异有统计学意义（P<0.05）；HCM 组右心房收缩期及舒张期末纵径、横径与面积与正常对照组比较差异均无统计学意义（P>0.05），HCM 组右心房收缩期及舒张期末纵径、横径与面积变化率与正常对照组比较，差异亦均无统计学意义（P>0.05）。 结论 采用心脏磁共振电影成像技术能够快速评价保留射血分数的肥厚型心肌病患者双心房结构及功能的改变，在左室射血功能正常的患者就出现了左房功能的降低。

Application of the One-stop Cardiac CT scan on 256-row wide detector Revolution CT in myocardial ischemia of Silent Myocardial Ischemia diagnosis

Xuefang Lu,Yunfei Zha
Renmin Hospital of Wuhan University

ObjectiveTo evaluate the diagnostic performance of one -stop cardiac CT myocardial perfusion imaging(CT-MPI) combined with coronary artery angiography (CCTA) for the detection of functionally relevant myocardial ischemia of silent myocardial ischemia (SMI).**Methods**Totally 149(149/480) patients suspect of SMI were prospectively enrolled from January 2017 to December 2018 in our hospital. All patients underwent CT-MPI and CCTA on a wide detector Revolution CT. Myocardial blood flow (MBF) was quantified and compared between perfusion normal and abnormal myocardial segments. Radionuclide myocardial perfusion imaging(MPI) as the gold standard, the diagnostic accuracy of CT-MPI, CCTA, and CT-MPI combination with CCTA in the diagnosis of myocardial ischemia of DHVD with hemodynamic stenosis was evaluated.**Results**All patients underwent CCTA combined with CT - MPI examination, 94 patients(63.09%) with 248 myocardial segments(15. 28%) were detected blood perfusion coming down,, the MBF value was lower than that of normal segments [(82.61±19.81) mL • 100mL- 1 • min - 1 V S (118.43± 25.18) m L • 1 0 0 m L - 1 • m i n - 1 ;t=14.12, P<0.001].There were 2617 segments (97.58%) who sequality can be used for the diagnosis in CCTA, 413 (15.40%) segments have clinical significance in this study. Compare with the MPI, the diagnostic sensitivity, specificity, positive and negative predictive value of CT - MPIfor myocardial ischemia of SMIwere 75.33% 、73.21% 、86.83%、71.02% respectively ,89.97% 、69.25% 、86.40%、73.29% for CCTA, 86.37% 、71.24% 、89.09%、69.71% combine with CT - MPIand CCTA. **Conclusion:**Both good CCTA and CT - MPI images can be obtained at the one stop scanning by Revolution CT. Revolution CT can accurately measure myocardial hemodynamic changes, and provide imaging evidence for the diagnosis and treatment of SMI.

Cardiac energetics alteration in chronic hypoxia rat model: a non-invasive in vivo 31P magnetic resonance spectroscopy experimental study

Yinsu Zhu
The First Affiliated Hospital, Nanjing Medical University

Purpose: Energetics alteration plays a key role in the process of myocardial injury in chronic hypoxic diseases (CHD).31P magnetic resonance spectroscopy (MRS) can investigate alterations in cardiac energetic in vivo. This study was aimed to characterize the potential of 31P MRS in evaluating cardiac energetics alteration of chronic hypoxia rats (CHR).
Materials and Methods: Thirty CHR were induced by SU5416 combined with hypoxia. 31P MRS (Bruker BioSpec 7.0T) was performed weekly (0-5 week) to follow-up the ratio of concentrations of phosphocreatine (PCr) to adenosine triphosphate (ATP) (PCr/ATP). The index of myocardial structure and systolic function, including the left ventricular function (LVEF) and the right ventricular function (RVEF), were also measured by magnetic resonance imaging (MRI) in each rat. The myocardial injury was shown based on hematoxylin and eosin (H&E) staining and Masson’s trichrome staining.
Results: Along weeks, the resting cardiac PCr/ATP ratio decreased from 0 to 5 weeks of modeling. The ratio dropped more markedly after injection of isoproterenol and

recovered slowly thereafter. The declension of resting cardiac PCr/ATP ratio in CHR can be observed at the first week, compared with the healthy ones((3.92±0.43vs.4.48±0.56, P＜0.05). While the LVEF and RVEF in CHR was similar to healthy rats. Also, the myocardial injury cannot be observed in the first week. Conclusions: 31P MRS can sensitivily reveal the cardiac energetics alteration in CHD before the onset of myocardial injury and ventricular dysfunction.

心脏磁共振快速流程在心脏病中的应用价值

王可颜,程敬亮,张文博,金红瑞,靳雅楠,李舒曼
郑州大学第一附属医院

目的 探讨心脏磁共振快速成像流程在心脏疾病诊断中的应用价值。方法 前瞻性纳入 158 例心脏病患者，每位患者均接受心脏磁共振标准流程检查和心脏磁共振快速流程检查。记录每种检查总时长，并比较分析两种成像方法图像质量评分，优质图像，形态学表现一致性，心功能一致性，诊断一致性，并进行统计学分析。结果 根据超声心动图结果对每位心脏病患者进行心功能分级，分成心功能正常组，轻度心衰组，中度心衰组，重度心衰组。心脏磁共振快速流程检查总时长小于心脏磁共振标准流程检查，具有统计学差异[651±37s 比 2129±173s, P=0.000]。对心功能正常组、轻度心衰组、中度心衰组，传统心脏磁共振成像获得的图像质量评分均显著大于快速流程（P＜0.05）。对于重度心衰组，快速流程获得图像质量评分显著大于传统磁共振成像（P＜0.05）。对于心功能正常组、轻度心衰组、中度心衰组，两种检查方式获取优质图像发生率无统计学差异（P＞0.05），对于重度心衰组，心脏磁共振快速流程检查获取可满足诊断的图像发生率显著大于标准流程成像（P＜0.05）。111 例患者两种成像方式获取的图像均能够满足诊断需求，对于形态学显示率均无统计学差异（P＞0.05），Kappa 值 0.768-1.0。两种检查方法在左心功能评价中无明显统计学差异（P＞0.05,Kappa 值 0.730-0.933。标准电影成像心功能分级与单次屏气下压缩感知电影成像心功能分级相比 kappa 值为 0.756，分别为心功能正常 52.3%比 51.4%，轻度心衰 10.8%比 5.4%，中度心衰 6.3%比 14.4%，重度心衰 30.6%比 28.8%。两种成像方法在心脏疾病诊断中 Kappa 值 0.899。结论 较标准流程成像相比，快速流程成像能够用较短的时间有效评价心脏组织学特征、左心功能，两者在心脏病的诊断中一致性较高，对于重度心衰而无法进行呼吸配合的患者，快速流程优于磁共振标准流程。

EPO-0723
磁共振心肌首过灌注对经皮冠状动脉介入术后心肌微循环障碍的价值

曾国飞,杨华
重庆市中医院

目的 探讨 MR 心肌首过灌注成像在评估经皮冠状动脉介入术（PCI）后心肌微循环障碍的价值。**方法** 收集行 PCI 治疗的患者 30 例，术前、术后均行心脏磁共振（CMR）心肌首过灌注检查，将右冠状动脉、前降支、回旋支作为独立血管，测量各供血区域的灌注参数（达峰时间 T、峰值信号强度 SI、心肌信号强度最大上升斜率 S_{max}），计算各参数的测值差值（术后-术前），与患者 PCI 术中溶栓治疗临床试验（TIMI）评分进行对比研究，了解两种检查方法的相关性及一致性。**结果** 30 例患者共 90 支评价血管，手术血管 36 支，TIMI 评分≤2 级的血管共计 19 支，对不同血流评分的

T、SI、Smax 指标测值差值进行单因素方差分析，结果示不同组的 T、SI、Smax 指标测值差值 P＜0.05，差异均有显著性，再进一步进行 LSD 法两两比较，各组间的 T、SI、Smax 指标测值差值 p＜0.05，差异均有统计学意义。**结论** 磁共振心肌首过灌注能准确、灵敏地发现心肌微循环障碍，且特异性较高、可重复性好，可作为冠心病患者 PCI 术后早期确诊心肌微循环障碍及心肌微循环疗效评价方法。

Myocardial deformation assessment in patients with isolated left ventricular non-compaction using deformable registration of cine MRI: Comparison with feature tracking

Jia Liu,Yue Cui,Yukun Cao,Heshui Shi
Union Hospital， Tongji Medical College， Huazhong University of Science and Technology

Objective: To evaluate cardiovascular magnetic resonance based on a deformable registration algorithm (DRA) and feature tracking (FT) in quantitation of LV myocardium deformation in patients with isolated left ventricular non-compaction (iLVNC) and the accuracy of diagnosis.
Methods: We recruited 30 patients with iLVNC and 50 healthy volunteers to undergo cardiovascular magnetic resonance on a 1.5T MR scanner (MAGNETOM Aera, Siemens Healthcare, Erlangen, Germany). Cardiac cine images of short-axis, long-axis (2- 3- and 4-chamber) were acquired. A prototype post-processing software TrufiStrain (version 2.0, Siemens Healthcare, Erlangen, Germany) based on DRA was used for the myocardial strain analysis. The same datasets were analyzed by FT method using the commercially available software (Medis Suite, version 3.1, Medis Medical Imaging Systems, Leiden, The Netherlands). Global and segmental strain of radial, circumferential and longitudinal directions were semi-automatically calculated. All three available long-axis orientations (2-, 3-, and 4-chamber) were used to quantify global and segmental longitudinal strain. The global longitudinal strain was calculated based on the average of the peak systolic global longitudinal strain from the three long-axis orientations. Short-axis views were used to analyze radial or circumferential strain, including LV basal, mid-ventricular, and apical levels.
Results:
(1) The absolute values of global longitudinal strain(GLS), radial strain(GRS), and circumferential strain(GCS) derived from DRA were lower in the iLVNC group than those in the control group[GLS:(－11.9±3.9)% vs. (－14.5±1.4)%;GRS: (26.3±11.0)% vs.(37.6±7.2)%;GCS:(－12.1±4.2)% vs. (－16.4±1.6)%;p＜0.01 for all];The absolute values of GLS,GRS,and GCS derived by FT were lower in the iLVNC group than those in the control group[GLS:(－17.8±6.4)% vs. (－23.3±2.8)%;GRS: (33.2±23.5)% vs. (56.9±16.4)%; GCS: (－15.5±6.6)% vs. (－22.5±2.6)%;p＜0.01 for all];The global strain values measured by the two methods had notable correlation (GLS:r=0.575,GRS:r=0.392,GCS:r=0.697,p＜0.01 for all);

(2) Among three global strain parameters derived from both DRA and FT, GRS had the highest AUC value in distinguishing patients with iLVNC from normal controls, with an AUC value of 0.850 and 0.854, respectively;
(3) In healthy volunteers,GRS,GCS,GLS measured by DRA, and GCS,GLS measured by FT had good intra- and interobserver agreement evaluated by ICC(all larger than 84%).Intra- and interobserver agreement of GRS measured by FT were not good(intra:0.39, inter:0.51);Intra- and interobserver agreement assessed by DRA were better than those by FT for each segment;
(4) In healthy volunteers,Bland-Altman plots demonstrated large difference and wide limits in GRS[difference:－19.4, limit of agreement(LOA):－48.5,9.8,p＜0.01]. The difference and limit in GLS and GCS were relatively small[GLS: (difference:8.8, LOA:4.3,13.3);GCS: (difference:6.1,LOA:2.3,9.9);p＜0.01 for all].
Conclusion:
Both DRA and FT can reveal the impaired myocardial strain of the left ventricle in patients with iLVNC. Global strain values measured by DRA and FT can distinguish patients with iLVNC from healthy volunteers with high diagnostic abilities.. The reproducibility of both global and segmental strain measured by DRA are better than those measured by FT, and strain values by DRA and FT have good consistency with GCS and GLS.

Quantitative assessment of double ventricular strain in patients with myocarditis using Cardiovascular magnetic resonance feature tracking techniques : a preliminary clinical study

Xiaoqing Liu,Heshui Shi
Department of Radiology, Wuhan Union hospital, Tongji medical college, Huazhong University of Science and Technology

Purpose: The present study aims to assess the double ventricular myocardial systolic strain in patients with myocarditis using cardiac magnetic resonance feature-tracking (MR-FT) and their underlying relationships with clinical parameters. **Methods:** We recruited 40 patients with myocarditis and 30 healthy volunteers to undergo CMR examinations. Then we used the routine cine images and MR-FT to analyze the double ventricular myocardial global systolic strain and the strain rates. The patients were divided into two groups according to the left ventricular ejection fraction (LVEF) (group 1-LVEF ≥ 50%, group 2-LVEF < 50%). Before the CMR examination, we collected the baseline clinical and biochemical indices. **Results:** The values of LVGLS、LVGCS、LVGRS and RVGLS were significantly lower in the myocarditis group(LVEF < 50%) than those in the group (LVEF ≥ 50%) and control group [LVGLS：（-7.7±4.3）%、（-13.1±2.0）%、（-15.2±2.0）%; LVGCS：（-10.1±4.6）%、（-19.8±1.9）%、（-21.5±2.2）%; LVGRS：（13.1±8.3）%、（30.9±4.3）%、（38.5±9.1）%; RVGLS：（-15.9±5.3）%、（-19.6±4.8）%、（-19.8±3.5）%; P<0.05]. The values of LVGLS、LVGRS were lower in the myocarditis group(LVEF ≥ 50%) than those in control group[LVGLS：（-13.1±2.0）%、（-

15.2±2.0）%，P<0.05；LVGRS：（30.9±4.3）%、（38.5±9.1）%，P<0.01]. In the myocarditis group, the values of LVGLS、LVGCS and LVGRS had negative correlations with the BUN、CREA levels (P<0.05) ; the values of LVGLS、LVGCS、LVGRS and RVGLS had negative correlations with the BNP level (P<0.01) ; the value of LVGRS had a negative correlation with the CRP level (P<0.05).

Conclusion: Our results suggested that the left and right ventricular systolic function and systolic strain were impaired in the LVEF < 50% group. The left ventricular systolic strain was impaired in the LVEF ≥ 50% group either. We also found that there were negative correlation between the BUN、CREA、BNP、CRP levels and the left and right ventricular strain in patients with myocarditis.

基于 IVIM 的磁共振成像对急性心肌梗死可挽救心肌 定量的实验研究

宋辉,刘远成,廖旦,李应龙,王玉权,曾宪春,王荣品
贵州省人民医院

目的：探讨基于体素内不相干运动（intravoxel incoherent motion，IVIM）的 MRI 技术对贵州小型猪急性心肌梗死模型定量评估微循环的可行性。**方法：**
对 10 只小型猪经股动脉置管于电视监视下建立冠心病急性心肌梗死模型。使用 GE3.0T 静音 MR（Discovery MR750W）分别于建模前 1h 及建模后 1-2h 内对实验猪进行在体 IVIM 成像，由 2 名从事心血管影像诊断的高年资医师采取双盲法对心脏 IVIM 图像质量评估等级。将原始数据传至后处理工作站并对正常区、心肌梗死周边区、心肌梗死区进行相应参数测量，其中较高年资者间隔 1 个月以上对相关参数进行第 2 次重复测量。数据测量完后将心脏取出做病理学检查。**结果：**图像质量评估一致性较好（Kappa=0.86）。心率越慢，图像成功率越高（P<0.05），体重及性别在各层面成像差异无统计学意义（P>0.05）。同一名医师重复两次测量以及两名医师分别测量左室心肌所得各参数的重复性和一致性均较好（ICC>0.75）。梗死心肌与梗死心肌周边区域 ADC_{fast}（D*）均低于正常区（P<0.05），而梗死心肌 ADC_{fast}（D*）又低于梗死心肌周边区域（P<0.05）。正常区 f 值高于梗死心肌周边区域（P<0.05），梗死心肌 f 值分别与周边区域及正常值间无统计学差异（P>0.05）。三组间 ADC_{slow}（D）均无统计学差异（P均>0.05）。ROC 曲线分析发现 D*值诊断疾病组的效能相较于 D 值和 f 值更高。病理结果中正常心肌、肿胀心肌及坏死心肌分别与心脏标本的正常区、梗死周边区及梗死区对应。**结论：**IVIM 技术定量评估小型猪急性心肌梗死模型的微循环具有可行性，其中 ADC_{fast}（D*）对急性心肌梗死微循环灌注信息的评价较其他参数效能更优。

EPO-0727
肥厚性心肌病左室结构及舒张功能的磁共振成像研究

蒋宇婷,张帆
川北医学院附属医院

目的：舒张功能不全常见于肥厚型心肌病（ hypertrophic cardiomyopathy HCM）和高血压心脏病（hypertensive heart disease HHD），但有关于舒张功能不全与左心室参数之间的研究并不完善。我们的目的是通过运用心脏磁共振扫描来研究肥厚性心肌病、高血压心脏病和正常人的舒张功

能、左室壁最大厚度、左心室质量指数等各参数之间的关系。同时我们还评估了左心室的参数和舒张功能在晚期钆增强扫描中的关系，以及肥厚性心肌病病人的右心室肥厚情况。
方法：对 41 例 HCM 患者，21 例 HHD 患者和 20 例对照组进行研究。使用 CMR 测量达峰率（peak filling rate PFR），达峰时间（time to early peak filling rate TPF），最大左室壁厚度（ maximum left ventricular wall thickness MLVWT）和左心室质量参数（ left ventricular mass index LVMI）。 最后对 HCM 患者的 LGE 情况和 RV 形态进行评估。
结果：在 HCM（r=0.38；p=0.02）、HHD（r=0.58；p=0.01）和对照组（r=0.54；p=0.01）中，MLVWT 与 TPF 相关。HCM 中 MLVWT 和 TPF 的相关性比 HHD 弱。LVMI 与舒张功能无关。在 HCM 中，LGE 程度与 MLVWT（t=0.41；p=0.002）、TPF（t=0.29；p=0.02）有极大的相关性。伴有右心室肥厚的 HCM 患者比不伴有右心室肥厚的 HCM 患者的 MLVwt（P<0.001）和 TPF（p=0.03）更高。
结论：在 HCM，HHD 和对照组的 MLVWT 与舒张功能（TPF）相关。 LVMI 与 TPF 没有明显的相关性。HCM 的舒张功能障碍并不完全是因为室壁增厚的原因，LGE 和 RV 受累与 LV 舒张功能恶化有关，这进一步也提示了严重的潜在心肌紊乱及心肌纤维化可能导致舒张功能障碍

EPO-0728
128 层 PET-CT 同机融合显像新技术评价冠脉狭窄与心肌存活关系

陈亚明,张再炬,张将,苏德莲
宿州皖北煤电集团总医院

目的 探讨冠脉 CTA 显示冠状动脉狭窄与心肌 18F-FDG 代谢显像检测存活心肌之间的关系。方法 总结 2017 年 9 月至 2019 年 7 月皖北煤电集团总医院影像科与核医学科共同在 128 层 PET-CT 上开展冠脉 CTA 与心肌代谢显像同机融合检查 14 例患者，所有患者均在飞利浦 128 层 PET-CT 上行 18F-FDG 心肌代谢显像，显像成功后在该机器行冠脉 CTA 检查，数据传至飞利浦 PET-CT 工作站上进行后处理，依次进行左室功能分析、冠脉 CTA 重建、PET 心肌代谢重建、冠脉 CTA 重建与心肌代谢重建同机融合，根据融合图像评价冠脉三支血管分布区域心肌代谢的改变。结果 7 例检查者心肌代谢显像正常，冠脉 CTA 显像正常；6 例检查者心肌代谢显像显示左室前壁、前外侧壁心肌不同程度代谢减低或缺失，冠脉 CTA 显示前降支近、中段因混合斑块形成，致前降支不同程度狭窄，狭窄程度在 50-80%之间；1 例检查者是左主干闭塞后再通支架植入术后 7 个月，心肌代谢显像示左室前壁、前外侧壁代谢减低，右室壁心肌代谢代偿性增高，冠脉 CTA 显示左主干支架植入后，前降支、回旋支通畅，提示心肌因左主干闭塞后心肌损伤修复不良。结论 128 层 PET-CT 能开展冠脉 CTA 及心肌代谢显像同机融合新技术，为评价冠脉狭窄血管供血区域心肌存活度提供新的途径，能精准指导临床在冠心病治疗方案的选择。

EPO-0729
Timely reperfusion after acute myocardial infarction effectively protect the impaired myocardium evaluated by 7.0T MRI and histopathology

Yushu Chen,Fabao Gao
West China Hosptial of Sichuan University

Purpose: To evaluate the outcomes of different myocardial injury after acute myocardial infarction combined with magnetic resonance imaging (MRI) and histopathology.
METHODS: 60 rats were randomized into two groups (the ischemia group, left anterior descending coronary artery [LAD] ligation 30min and reperfused 2 hours; and the infarction group, LAD ligation permanent 3 hours), then experienced MRI scanning (Cine and LGE) at different times (acute and chronic [14 days]). The left ventricular (LV) function, strain (peak radial strain, PRS; peak circumferential strain, PCS) in LGE positive regions (LGE[+]) and LGE negative regions (LGE[-]), the infarct size (IS), myocardial signal intensity (SI) and segments were analyzed.
RESULTS: In acute phase, LGE showed IS significantly larger than that by TTC in the ischemia group (P=0.02). The absolute values of PSR, PSC were significantly lower than those in the LGE(-) in the ischemia group and those in LGE(+) in the infarction group (all $p<0.05$). LGE segments (%LV) decreased to 15.68 ± 0.11 % (p=0.001) and strain recovered to 44.53 ± 18.59 in PRS-LGE(+) (p=0.035) and -20.91 ± 5.04 in PCS-LGE(+) (p=0.018) when compared between acute phase and chronic phase in ischemia group.
CONCLUSION: The infarcted size, function and strain of the impaired myocardium after acute myocardial infarction would largely benefit from the timely reperfusion evaluated by MRI.

光谱 CT 心肌细胞外容积定量测量与 SECT 相比的可行性

张凤艳,乔英,张辉
山西医科大学第一医院

目的 评价光谱 CT(IQON)与单能量 CT(SECT)相比，在无对比采集的情况下获得心肌细胞外容积(ECV)和检测心肌细胞外容积(ECV)的可行性。方法 采用光谱 CT 测量心肌细胞外容积(ECV)，并与单能量 CT(SECT)进行比较。受试者(n=35)，局灶性心肌纤维化(n=17)，弥漫性心肌纤维化(n=10)，对照组(n=9)进行非对比和延迟采集，计算 SECT-ECV。使用延迟采集和导出的虚拟非对比度图像计算光谱 CT-ECV。在对照组和弥漫性心肌纤维化组中，用左心室的整个心肌来计算 ECV 值。局灶性心肌纤维化肿，2 个 ROI，1 个置于正常组织，1 个置于纤维化心肌组织。结果 SECT 法和光谱 CT 的中位 ECV 分别为 35.7%(IQR32.1-38.4%)和 37.8%(IQR35.2-40.2) (p=0.521)，对于这两种技术，局灶性心肌纤维化和弥漫性心肌纤维化的 ECV 值均明显高于正常心肌(均 P<0.05)。光谱 CT 与 SECT 之间无系统偏差(p=0.348)。SECT 的辐射剂量(1.1mSv)高于光 CT(p<0.001)，光谱 CT 对比剂剂量（20ml）低于 SECT（p<0.05）。结论 ECV 可用光谱 CT 测量，仅需延迟采集即可。与 SECT 相比，光谱 CT 在较低的辐射剂量下提供了类似的结果。

Sex Differences in Type 2 Diabetes Mellitus-Related Left Ventricular Remodeling

Lan Lan[1],YongNing Shang[2],Xiaochun Zhang[1],Lin Zhang[1],Gonghao Lin[1],Rufang Liao[1],Haibo Xu[1]
1.Zhongnan Hospital of Wuhan University
2.Southwest Hospital， Third Military Medical University

Introduction Type-2 diabetes mellitus (T2DM) can directly cause myocardial remodeling, typically represented as a decreased left ventricular (LV) cavity, an increased LV wall thickness, LV diastolic dysfunction and diffuse interstitial fibrosis, even in the absence of hypertension and coronary artery disease(1). However, sex difference in T2DM related LV structural, functional and interstitial remodeling is not well described. We aimed to explore the influence of sex on LV remodeling patterns of T2DM by using CMR cine and T1 mapping.

Method Sixty-two T2DM patients without history of cardiovascular disease or hypertension and 40 healthy controls were enrolled and underwent CMR. Short-axis cine imaging covering the entire LV and long-axis cine in a standard four-chamber plane were performed. Basal and mid-ventricular short-axis native and post-contrast T1 mappings were acquired. All the cine and T1 maps were offline analyzed to obtain the LV wall thickness, end-diastolic volume index (EDVi), myocardial mass index (MMi), the MMi-to-EDVi ratio (MVR), extracellular volume (ECV), total LV matrix and cell volumes index (MVi, CVi)(2), and longitudinal peak diastolic strain rate (PDSRL).

Results Compared with male controls, female controls were accompanied by thinner wall thickness (p<0.001), smaller MMi (p=0.010), similar EDVi (p=0.191), smaller MVR (p<0.001) , similar PDSRL (p=0.349), smaller CVi (p=0.617) , similar MVi (p=0.001), and thereby larger ECV (p=0.001) than male participants. There were increased wall thickness (p=0.005), decreased EDVi (p=0.005), similar MMi (p=0.270) and CVi (p=0.359) in female T2DM compared to female controls, while, they were similar between male T2DM patients and male controls. T2DM male patients were accompanied by increased ECV (p=0.005) and MVi (p=0.019). However, there was no significant difference in ECV, CVi and PDSRL between female T2DM patients and female controls.

Conclusion Our study highlights the influence of sex on LV structural, functional and interstitial remodeling in T2DM with normotension. Female patients predominantly had a more favorable pattern(3). In contrast, male patients exhibited a less favorable pattern(4).

EPO-0733

Comparison of T1 Value Measurement with Variable-Flip-Angle Technique using Different Flip Angle Combination with B1 field correction for breast

Yan Li,Tao Ai,Liming Xia
Tongji hospital, tongji medical college, huazhong university of science and technology

Introduction and Purpose
we aimed to calculate and compare the T1 relaxation time of breast tissues using different selection of the flip angles with and without B1 correction. For this purpose, T1 maps generated from different FA combinations were compared with and without B1 correction. In addition, we compared T1 values of breast benign, malignant lesions and normal gland tissue to investigate the diagnostic value of the multiple VFA technique.
Material and Methods
MRI was performed using a 3.0 T MRI scanner (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany) with a 16-channel phase-array bilateral breast coil. With B1 correction and without B1 correction，T1 mapping sequences were scanned for 52 female patients (mean age, 42.0 years; range, 22-62 years) (17 breast benign tumors, 35 breast cancers). For each case, T1 mapping was based on performing the gradient echo sequence with 10- point variable FAs including 1°, 2°, 5°, 7°, 9°, 11°, 13°, 15°, 17°, and 19° at a 14-second imaging time per angle. All images analysis of T1 maps was performed on OsiriX, an open source image visualization software on MacBook. From multiple gradient echo images acquired with a series of different FAs, a T1 map can be calculated. Centered on 10°, seven T1-map series were obtained, as follows: group1 (1°, 19°), group 2 (5°,15°), group3 (1°, 9°,19°), group 4 (2°, 9°, 15°), group5 (1°, 7°, 13°, 19°), group 6 (1°, 5°, 9°, 13°, 17°), group7 (1°, 2°, 5°, 7°, 9°, 11°, 13°, 15°, 17°, 19°). On these T1 maps, circular regions of interest (ROIs) were drawn by an experienced radiologist using post-contrast images as a reference respectively on the lesions, the lesions- ipsilateral breast gland tissue of the lesions, the lesions-contralateral breast gland, and the fat in the corresponding slices. These ROIs were copied on all seven T1 map-groups images to make all measurement in the same site. When the tumor was heterogeneous, we measured the solid component for the ROI. When drawing the ROIs on the gland, we tried to choose dense area and avoid the fat. Values of $p<0.05$ were treated as significant for paired t-tests.
Results
Among the group1, 3, 5, 6 and 7 before and after B1 correction, the T1 values of lesions and normal gland tissues were close to each other. In group 2 T1 values were significantly different from(higher) that in the other groups (refer to Table 1). Note

that the SDs in group 2 were higher than those in other groups. Though there is no significant difference between T1 values for benign tumors and cancers with t-tests before or after B1 correction, significant differences were examined for abnormal lesions and normal breast gland tissues in all groups ($p<0.005$). B1 correction led to a significantly increase in T1 values of lesions in group 2 and a slightly increase in other groups (except for the contralateral gland in group 2), while T1 values of normal breast gland slightly decreased (refer to Table 1&Fig 1). Without B1 correction, there was no significantly difference between T1 values of lesions and ipsilateral breast gland in group1, 3 and 4 ($P=0.052$, 0.098, 0.347, respectively). With B1 correction, there were significantly difference between them in all groups. More importantly, the T1 values of normal breast gland were much closer to the literature-reported value after B1 correction (T1=1444ms and gray lines in Fig.2&3).

Conclusion

It would be feasible to use two or three FA values instead of more FA values, which can directly benefit saving scan time. FA pairs like group 2(5°, 15°) may not be a good choice for T1 mapping using VFA techniques. B1 correction can improve accuracy of T1 measurements to differentiate breast lesions and normal gland tissues.

EPO-0734

The diagnostic performance of DCE-MRI in the evaluation of the pathological response to neoadjuvant chemotherapy in breast cancer: a meta-analysis

Qingqing Cheng, Mengjie Ma, Jiaxi Huang, Kunlin Ye, Changzheng Shi, Liangping Luo
The First Affiliated Hospital of Jinan University

Abstract:

Purpose: To assess the diagnostic accuracy of dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) in evaluating the pathological response of breast cancer to neoadjuvant chemotherapy (NAC).

Materials and methods: A systematic search in Pubmed, Cochrane library, and web of science for original studies was performed. The Quality Assessment of Diagnostic Accuracy Studies-2 tool was used to assess the methodological quality of the included studies. The patient, study, and imaging characteristics were extracted, and sufficient data to reconstruct 2 × 2 tables were obtained. Data pooling, heterogeneity testing, forest plot construction, and subgroup analyses were performed using Stata version 12.0 (StataCorp LP, College Station, TX).

Results: Eighteen studies (969 patients with breast cancer) were included in present meta-analysis. The pooled sensitivity and specificity of DCE-MRI were 0.80 (95% confidence interval [CI]: 0.70, 0.88) and 0.84 (95% [CI]: 0.79, 0.88), respectively. Subgroup analyses showed that DCE-MRI had higher sensitivity (0.83 vs 0.72) and equivalent specificity (0.85 vs 0.82) in the evaluation of pCP (n=14) of breast cancer when compared with the evaluation of good response (pCR and near pCR, n = 5), and studies (n=14) using DCE-MRI to early predict (assess the response after one or two cycles of NAC) the pathological response of breast cancer had a higher sensitivity

(0.83 vs 0.71) and equivalent specificity (0.80 vs 0.86) compared to studies (n=5) that were not to early predict (assess the response after NAC completion).
Conclusion:
Our results indicated that DCE-MRI had a good diagnostic performance for evaluating the pathological response of breast cancer to NAC. Subgroup analysis found that setting pCR as pathological responder may improve the diagnostic sensitivity of DCE-MRI. DCE-MRI had good diagnostic performance in early prediction of pathological response of breast cancer in the early stage of NAC as well as evaluation of response after NAC.

背景实质强化联合乳腺 X 线摄影钙化诊断乳腺癌分子亚型的研究

翟春丽,郑建军
宁波市第二医院（原:宁波华美医院）

目的 探讨乳腺癌 MRI 背景实质强化（BPE）和乳腺 X 线摄影钙化特征诊断不同分子亚型乳腺癌的价值。**方法** 收集同时行乳腺 X 线摄影及 MRI 检查并经手术病理证实的 57 例乳腺癌病例，根据免疫组化结果确定其分子亚型，参照 BI-RADS 分类标准对乳腺 BPE 进行分级。研究乳腺癌患者年龄、肿块大小与 BPE 的关系，以及乳腺 X 线摄影钙化、BPE 与分子亚型的关系。**结果** 年龄和肿块直径在 BPE 分级间有统计学意义（$P<0.05$），以显著强化为主；无钙化最常见于 Luminal A 型，差异有统计学意义（$P<0.05$），而 BPE 分级、钙化形态在乳腺癌分子亚型间无统计学意义（$P>0.05$）。**结论** 年轻女性或肿块较大时乳腺癌 BPE 显著增高，而乳腺癌乳腺 X 线摄影钙化形态及 BPE 对不同分子亚型诊断的价值有限。

EPO-0736
MRI 表观弥散系数及动态增强 TIC 曲线对三阴性乳腺癌的鉴别诊断价值

马新星,唐梦晓
苏州大学附属第一医院

目的 探讨表观弥散系数(apparent diffusion coefficient，ADC)、相对表观弥散系数(relative apparent diffusion coefficient，rADC) 及动态增强时间-信号强度曲线（time-intensity curve，TIC）类型在三阴性乳腺癌(triple-negative breast cancer, TNBC)与非三阴性乳腺癌中的鉴别诊断价值。**方法** 回顾性分析 2015 年 8 月至 2018 年 3 月间经病理证实的的 27 例 TNBC 及 65 例非 TNBC 患者的 MRI 资料，测量 b=800 s/mm^{2}时病灶 ADC 值及相对 ADC 值（$rADC_1$=病灶 ADC 值/同侧胸大肌 ADC 值和 $rADC_2$=病灶 ADC 值/对侧正常腺体 ADC 值）；根据动态增强 MRI(DCE-MRI)数据绘制病灶的 TIC。采用独立样本 t 检验比较平均 ADC 值、rADC 值，P<0.05 有统计学意义；以病理结果为金标准，绘制其非参数法受试者工作特征曲线（receiver operating characteristic curve，ROC）；x^2检验比较 TIC 曲线类型。**结果** TNBC 组患者的 TIC 以Ⅱ型为主[1] （37%），非 TNBC 组也以Ⅱ型为主[2] （49.2%），两组 TIC 差异无统计学意义(P>0.05)。TNBC 组的 ADC 值为(1.16±0.29)×10^{-3} mm^2/s、rADC1 为 0.78±0.21、rADC2 为 0.76±0.39，TNBC 组的 ADC 值和 rADC1 值均高于非 TNBC 组，差异具有统计学意义（P＜0.05），

而 rADC2 差异无统计学意义(P >0.05)。**结论** 表观弥散系数(ADC)与相对表观弥散系数(rADC1)对 TNBC 及非 TNBC 有鉴别诊断价值，相对于非 TNBC[3] ，TNBC 有较高的 ADC 及 rADC1 值。

EPO-0737
磁共振成像纹理分析在乳腺良恶性肿瘤鉴别诊断中的价值

裴天龙
安徽医科大学第二附属医院

目的 探讨乳腺良恶性肿瘤多 B 值弥散加权成像(DWI)图像纹理特征的差异。**方法** 选取 2017 年 1 月至 2019 年 3 月我院收治的临床乳腺触诊或乳腺 X 线摄影、B 超检查发现肿块的 56 例患者行弥散加权成像 DWI 检查(4 个 b 值,分别为 0、500、1000、2000 s/mm2)，患者包括 36 例肿块样乳腺癌、16 例乳腺纤维腺瘤和 4 例乳腺导管内乳头状瘤,并根据术后病理结果分为良性组(20 例)和恶性组(36 例)患者。对轴向弥散加权成像图像进行纹理分析，计算角秒矩(ASM)、对比度、相关性、逆差矩(IDM)、熵等 5 个特征参数。组间比较采用独立样本 t 检验和 Mann-Whitney U 检验。采用二元 Logistic 回归分析建立回归模型，采用 ROC 分析评价诊断效率。**结果** 乳腺良性肿瘤组与恶性肿瘤组间纹理特征 ASM、对比度、相关性、熵值有显著性差异(PASM=0.014, Pcontrast=0.019, Pcorrelation=0.010, Pentropy=0.007)。上述正构变量 ROC 曲线下面积分别为 0.685、0.681、0.754、0.683,Logistic 回归模型中组合变量(ASM、对比度、熵)ROC 曲线下面积为 0.802。二元 Logistic 回归分析表明，ASM、对比度、熵作为乳腺良恶性肿瘤鉴别诊断的特异性影像学变量。**结论** DWI 纹理分析是一种简便、有效的乳腺良恶性肿瘤鉴别诊断方法。

EPO-0738
Differentiation Between Granulomatous Lobular Mastitis and Invasive Ductal Carcinoma: Dynamic Contrast-Enhanced Magnetic Resonance Imaging as a Useful Tool

Ning Qu,Luo Yahong
Cancer Hospital of China Medical University, Liaoning Tumor Hospital

Purpose: Granulomatous lobular mastitis(GLM) is a rare chronic inflammatory breast disease. The clinical and radiological features of GLM substantially overlap with that of breast carcinoma, which leads to misdiagnosis and improper treatment for GLM. This study was to determine whether dynamic-enhanced magnetic resonance imaging(DCE-MRI) can distinguish GLM from invasive ductal carcinoma(IDC) of the breast. Methods and Materials: 45 GLMs and 188 IDCs diagnosed by histopathology were enrolled in the study. Two radiologists evaluated morphologic and kinetic features and measured mean ADC values of the breast lesions. Enumeration and measurement data were compared by using χ^2 and t test respectively. The discriminatory power of the size of maximum ring were determined by the area of ROC curve for the differential diagnosis of the lesions of NME with clustering ring enhancement(CRE). Results: The patients of GLMs were younger than that of IDCs ($p<0.001$). There was a significant difference regarding the categories of the lesions between the two groups ($p<0.001$). NME was present far more commonly in GLMs than in IDCs (43/45 vs 25/188), while mass was more frequently

observed in IDCs(1/45 vs 161/188). For the lesions with NME, the maximum range of GLMs was significant larger than that of IDCs((55.6±15.9)mm vs (33.6±18.0)mm, p<0.001), and CRE in GLMs was detected more frequently(40/43 vs 10/25, p<0.001). In addition, the mean size of the maximum ring in GLMs was greater than that in IDCs((12.6±5.9)mm vs (6.1±1.0)mm, p<0.001). The AUC for the size of maximum ring was 0.912(95%CI, 0.831-0.994) and the cutoff value was determined as 8.05mm based on maximal Youden index. The kinetic features and ADC values did not differ statistically for the lesions with NME. Conclusion: In women of childbearing age, the lesions of NME with the presence of CRE, especially larger ring on DCE-MRI were more suggestive of GLMs, whereas the lesions presenting with mass or NME without CRE in older women were more indicative of IDCs. Clinical Application/Relevance: DCE-MRI can be used to differentiate GLMs from IDCs as a useful tool, thus has potential to influence clinical decision making.

Differentiation between Pure Mucinous Breast Carcinomas and Fibroadenomas with Strong High-Signal Intensity on T2-Weighted Images from Dynamic Contrast-Enhanced Magnetic Resonance Imaging

Ning Qu,Luo Yahong
Cancer Hospital of China Medical University, Liaoning Tumor Hospital

Objective. This study aimed to identify characteristics that can differentiate between pure mucinous breast carcinomas (PMBCs) and fibroadenomas with strong high-signal intensity on T2WI (T2-SHi) on dynamic contrast-enhanced MRI (DCE-MRI).
Materials and Methods. This was a retrospective analysis of 35 PMBCs and 70 FAs with T2-SHi compiled between January 2014 and June 2016. The DCE-MRI tumor characteristics, including maximum diameter, shape, margin, lobulation, dark internal septation, enhancing internal septation, initial enhancement increase, kinetic curve pattern, and delayed internal enhancement were compared between these two groups and analyzed by univariate and multivariate analysis. We also compared the local rim heterogeneous enhancement on delayed phase of PMBCs and FAs
Results. The mean maximum diameter of PMBCs was significantly greater than that of FAs (2.74±1.15 vs. 1.74±0.71 cm, $p < 0.001$). PMBCs had irregular shape, non-circumscribed margin, and strong lobulation more frequently than did FAs (all $p < 0.001$). PMBCs had enhancing internal septation more frequently (31.4% vs. 1.4%, $p < 0.001$) and dark internal septation less commonly than did FAs (34.3% vs. 67.1%, $p < 0.001$). PMBCs had heterogeneous or rim enhancement more frequently than did FAs on delayed phase ($p < 0.001$). For PMBCs and FAs with heterogeneous enhancement, local rim enhancement was more common in PMBC (88.2% vs. 21.7%, $p < 0.001$). Initial enhancement increase and kinetic curve pattern were not significantly different between the two groups (all $p > 0.05$).
Multivariate analysis revealed that delayed enhancement pattern was the only significant independent predictor ($p < 0.05$).

Conclusion. Delayed enhancement pattern is the most reliable characteristic for differentiating PMBCs from FAs with T2-SHi on DCE-MRI.

EPO-0740

A nomogram for individual prediction of peritumoral vascular invasion in breast malignant tumor

fusheng OuYang,Qiugen Hu
Shunde Hospital, Southern Medical University

Objectives: To explore the feasibility of preoperative prediction of vascular invasion (VI) in breast cancer patients using nomogram based on multiparametric magnetic resonance imaging (MRI) and pathological reports.
Methods: We retrospectively collected 200 patients with confirmed breast cancer between January 2016 and January 2018. All patients underwent MRI examinations before the surgery. VI was identified by postoperative pathology. The 200 patients were randomly divided into training (n = 100) and validation datasets (n = 100) at a ratio of 1:1. Least absolute shrinkage and selection operator (LASSO) regression was used to select predictors most associated with VI of breast cancer. A nomogram was constructed to calculate the area under the receiver operating characteristic curve (AUC), sensitivity, specificity, accuracy, positive prediction value (PPV) and negative prediction value (NPV).
Results: VI was observed in 79 patients (39.5%). LASSO selected 10 predictors associated with VI. In the training dataset, the AUC for nomogram was 0.94 (95% confidence interval [CI]: 0.89-0.99, the sensitivity was 93.3%, the specificity was 83.7%, the accuracy was 90.0% (95%CI: 82.4%-95.1%), the PPV was 80.0%, and the NPV was 94.7%. In the validation dataset, the AUC for nomogram was 0.89 (95%CI: 0.83-0.95), the sensitivity was 90.9%, the specificity was 82.0%, the accuracy was 80.0% (95%CI: 70.8%-87.3%), the PPV was 69.0%, and the NPV was 95.4%. The nomogram calibration curve shows good agreement between the predicted probability and the actual probability.
Conclusion: The proposed nomogram could be used to predict VI in breast cancer patients, which was helpful for clinical decision-making.

EPO-0741

基于 MRI 影像组学与乳腺癌 21 基因评分的一致性研究

孙双燕,赵继红
吉林省肿瘤医院

目的：初步探讨基于 MRI 影像组学与乳腺癌 21 基因评分的一致性。
材料与方法：回顾性分析我院 2018 年 1 月至 2019 年 4 月期间诊断为早期浸润性乳腺癌（激素受体阳性、人表皮生长因子受体阴性、腋窝淋巴结阴性）的患者 76 例，同时在术前 2 周内行乳腺 MRI 检查及术后行 Oncotype DX21 基因检测。应用飞利浦公司提供的放射组学软件在动态增强后第二期图像上绘制肿瘤轮廓并提取其特征，每个病灶可以提取 1765 个放射组学特征，在上述特征降维分

析中，我们应用皮尔逊相关，层次聚类分析和主成分分析(PCA)选择关键特征，并采用 19 种分类器进行训练及验证，通过绘制 ROC 曲线验证其诊断效能。
结果：我们依据 Oncotype DX21 基因评分将患者进行如下三个分类:1) 评分≤10 分，2)评分介于 11～25 分之间 3)评分≥25 分， 应用线性支持向量机分类器、AdaBoost 分类器 和 XGB 分类器分别对上述六组数据进行分类。三种模型的平均 AUC 分别为 0.71、0.86 和 0.78，单一特征的最好 ROC 曲线结果对应的 AUC 分别为 0.80、0.84 和 0.79。
结论：应用基于 MRI 图像得到的影像组学信息可以较好的预测乳腺癌 21 基因评分。

EPO-0742
乳腺动态多期增强 MR 不同增强时相下病灶范围与病理大小的相关性研究

李艳玲,曹崑,李晓婷,孙应实
北京大学肿瘤医院

目的：通过探讨未接受新辅助化疗而直接手术病例组与接受新辅助化疗后手术组的术前 MR 上不同增强时相下病灶大小与术后病理所测量病灶大小相关性，评价不同时相下所测病灶大小的准确性，为选择准确测量时相提供依据。
方法：搜集 2016 年 7 月至 2017 年 3 月本院乳腺癌 MRI 连续病例，分为两组：直接手术组及化疗后术前组。一名放射诊断医师在未知患者分组类型及病理结果的情况下测量增强后矢状位增强早期、矢状位增强晚期及轴位延时期的病灶或化疗后残余灶大小，矢状位及轴位图像上分别测量最长径及与其垂直的短径，并计算面积。评价两组各自不同时相下病灶长径、短径及面积与病理长径、短径及面积的差异性，并进一步评价差异百分比。评价所有病例整体与病理大小的差异性。*结果*：入组病例 61 人，直接手术组 19 人（平均年龄 51.26 岁，36-67 岁），新辅助化疗后术前组 42 人（平均年龄 46.68 岁，34-69 岁）。直接手术组无论早期、晚期或延时期 MR 所示病灶大小与病理测量大小相关性均差，程度无显著差异。对于与病理长径的百分比差异，早期、晚期及延时期无显著差异；对于与病理面积的百分比差异，晚期与延时期无显著差异，延时期>早期，P=0.045，晚期与早期无显著差异。化疗后术前组无论早期、晚期及延时期 MR 所示病灶大小与病理测量大小相关性均差，程度有差异，早期相关性好于晚期。对于与病理长径的百分比差异，晚期与延时期无显著差异，均>早期；对于与病理面积的百分比差异，晚期>早期，P=0.01，晚期与延时期无显著差异，延时期与早期无显著差异。两组病例统一评价，对于与病理长径的百分比差异，延时期>晚期>早期；对于与病理面积的百分比差异，晚期与延时期无显著差异，均>早期。*结论*：MR 上测量病灶大小与病理肉眼大小相关性不佳，增强后早期测量值相对准确性好于其后时相测量值。推荐不管是直接手术病人，还是化疗后病人，均应该选择增强早期进行测量。

基于药物动力学模型 DCE-MRI 的全肿瘤定量影像组学特征对乳腺恶性肿瘤诊断价值研究

解超莲,罗红兵,刘圆圆,彭珩,刘子朔,青浩渺,王 闽,温志鹏,周 鹏,许国辉,任 静
四川省肿瘤医院.研究所

目的： 探讨基于药物动力学模型动态增强磁共振成像(pharmacokinetic modeling dynamic contrast-enhanced MRI，DCE-MRI) 的全肿瘤影像组学特征对乳腺恶性肿瘤诊断价值。

方法： 回顾分析 85 例乳腺 DCE-MRI 扫描患者。良性组 26 例，恶性组 59 例，其中导管内原位癌 19 例，非特殊类型浸润性癌 40 例。根据后处理软件生成定量影像组学特征，转移常数(K^{trans})、速率常数(K_{ep})、血浆分数 (V_p) 与各自对应直方图特征（共 22 个）及增强后病灶内纹理特征（共 75 个）。采用独立样本非参数检验比较良恶性组间，恶性组内导管内原位癌与浸润性癌间差异，使用 Fisher 判别分析和留一交互验证法分析各定量影像组学特征对乳腺恶性肿瘤判别诊断价值。
结果：恶性组 Voxel Volume（P=0.000），K^{trans}Maximum（p=0.011），K_{ep}Maximum（p=0.000），K_{ep} 75percentile（p=0.008），K_{ep} 75percentile（p=0.001）及所有 V_p 定量参数与直方图特征较良性组升高；良恶性组间 62（62/75）个增强后纹理特征有统计学差异。根据判别分析及交叉验证结果显示，对本组恶性病灶判别正确率为 86.44%，判别效能 ROC 曲线下面积为 0.981（P=0.000）。浸润性非特殊类型癌 Voxel Volume（P=0.044），K_{ep}Median（P=0.013），K_{ep}10percentile（P=0.000），K_{ep}25percentile（P=0.002），V_pMaximum（P=0.003）定量与直方图特征高于导管原位癌组；导管原位癌组和浸润性非特殊类型癌组间有 40（40/75）个增强后病灶纹理特征有统计学差异。
结论： 基于药物动力学模型动态增强磁共振成像的全肿瘤影像组学特征对乳腺恶性肿瘤诊断有很好的临床应用价值。

EPO-0744

The correlation of whole-tumor radiomic features based on pharmacokinetic modeling dynamic contrast-enhanced magnetic resonance imaging (PK-DCE-MRI) with tumor and lymph node stage of human breast cancer

Chunhua Wang
Sichuan Cancer Hospital & Institute

Objective: To study the correlation of whole-tumor radiomic features based on pharmacokinetic modeling dynamic contrast-enhanced magnetic resonance imaging (PK-DCE-MRI) with tumor and lymph node stage of human breast cancer.
Methods: 224 patients with breast lesions were enrolled retrospectively. All received DCE-MRI check and were confirmed by pathology within one week. The TNM stages were collected from clinical records after surgery. 19 cases were Tis (ductal carcinoma in situ, DCIS) stage , 71 cases were T1 stage,134 cases were T2 stage and 122 cases were N0 stage, 62 cases were N1 stage, 27 cases were N2 stage, 13 cases were N3 stage. The following 97 radiomic features of whole lesions were generated automatically by post-processing dedicated software based on reference pharmacokinetic model, including 22 quantitative parameters (K^{trans}, K_{ep}, and V_p) with their corresponding histogram features and 75 texture features of enhancement. All these radiomic features were compared using the the Kruskal-Wallis-test between different T and N groups.
Results: The results of radiomic features among different T stages show that the Voxel Volume（P=0.000），K_{ep} 10 percentile（p=0.020） of pharmacokinetic quantitative with their histogram were statistially different and 28 （28/75）texture features of enhancement were statistically different among different T stage tumors. In different N stage tumors, only Voxel Volume（P=0.006）shows statistical difference, but 18 （18/75）texture features of enhancement were statistically different.

Conclusion: Some whole-tumor radiomic features based on PK-DCE-MRI show correlation with tumor and lymph node stage of human breast cancer.

基于 MRI 图像的影像组学特征预测乳腺癌分子分型

孙双燕,赵继红
吉林省肿瘤医院

探讨基于 MRI 图像的影像组学预测乳腺癌分子分型的准确性。
材料与方法：本文回顾性分析了我院 2016 年 10 月至 2018 年 9 月期间诊断为浸润性乳腺癌的患者 135 例，其中包括 17 例(12.6%)三阴型乳腺癌，18 例(13.3%) HER-2 过表达型，Luminal A 型乳腺癌 20 例(16.0%)，Luminal A 型乳腺癌 80 例(59.3%)，同时收集其临床和病理特征。应用飞利浦公司提供的放射组学软件在动态增强后第二期图像上绘制肿瘤轮廓并提取其特征，每个病灶可以提取 1765 个放射组学特征，在上述特征降维分析中，我们应用皮尔逊相关，层次聚类分析和主成分分析(PCA)选择关键特征，并采用 19 种分类器进行训练及验证，通过绘制 ROC 曲线验证其诊断效能。
结果：我们建立了三个模型进行分类:1)三阴性 vs 非三阴性，2) HER-2 过表达型 vs 非 HER-2 过表达型 3)Luminal (A + B) vs . nonluminal， 应用线性支持向量机分类器、AdaBoost 分类器 和 XGB 分类器分别对上述六组数据进行分类。三种模型的平均 AUC 分别为 0.76、0.85 和 0.73，单一特征的最好 ROC 曲线结果对应的 AUC 分别为 0.77、0.84 和 0.70。
结论：应用基于 MRI 图像得到的影像组学信息可以较好的预测乳腺癌分子分型。

EPO-0747

Radiomics base on MRI prediction molecular subtypes of Breast Cancer

Shuangyan Sun, Jihong ZHAO
JiLin Cancer Hospital

Purpose: Breast cancer molecular subtypes, based on genotype variation, are indicators of disease free and overall survival1. Breast cancer subtypes can be classified by genetic array testing or approximated using immunohistochemistry markers in typical clinical practice. Immunohistochemistry requires tissue specimens typically obtained by a needle biopsy. However, due to the relatively small tissue sample size and tumor heterogeneity, the assessment on a small tissue sample cannot represent the characteristics of the entire tumor. Radiomics, the extraction and analysis of quantitative imaging features that has the ability to capture a broader range of tumor heterogeneity, enables imaging phenotypes to be correlated with genetic information2. This mineable data can be used to build models, which could potentially classify breast cancer subtypes on magnetic resonance imaging (MRI). This study aimed to investigate whether quantitative radiomic features extracted from MRI images are associated with molecular subtypes of breast cancer.unohistochemistry requires tissue specimens typically obtained by a needle biopsy. However, due to the relatively small tissue sample size and tumor heterogeneity, the assessment on a small tissue sample cannot represent the characteristics of the entire tumor. Radiomics, the extraction and analysis of quantitative imaging features that has the ability to capture a broader range of tumor heterogeneity, enables imaging phenotypes to be correlated with genetic information2. This mineable data can be used to build models, which could potentially classify breast cancer subtypes on magnetic resonance imaging (MRI). This study aimed to investigate whether quantitative radiomic features extracted from MRI images are associated with molecular subtypes of breast cancer.

Methods: In this retrospective study, 135 women diagnosed with invasive breast cancer between Oct.2016 and Sep.2018 were enrolled.This cohort included 17(12.6%) triple-negative, 18(13.3%) human epidermal growth factor receptor 2(HER2)-enriched, 20(16.0%) luminal A, and 80(59.3%) luminal B lesions. Clinical and pathologic features were collected. A dedicated software (Philips radiomics tool) was used to draw the contour of the tumors and calculate the features. Total 1765 radiomic features quantified tumor characteristics for each patient using tumor intensity statistics, size and shape, intensity statistics, and texture. These radiomic features quantified tumor characteristics using tumor intensity statistics, size and shape, intensity statistics, and texture.In the following feature dimension reduction analysis, we used Pearson correlation, hierarchical cluster analysis and principal component analysis (PCA) to select the key features. In modeling stage, we investigated 19

classification methods (including Passive Aggressive Classifier, Perceptron, Ridge Classifier, SGD Classifier, Logistic
Regression, AdaBoost Classifier, Bagging Classifier, Extra Trees Classifier, Gradient Boosting Classifier, Random Forest
Classifier, K Neighbors Classifier, Support Vector Classifier, Decision Tree Classifier, Linear Discriminant Analysis, Quadratic
Discriminant Analysis, MLP Classifier, XGB Classifier, Extra Tree Classifier, Gaussian Process Classifier) for training and
prediction. These models were trained on the training cohort and their performance was evaluated on the cross-validation
cohort using the area under ROC curve (AUC).
Results: We build three models to classify: 1) triple-negative vs non‐triple-negative, 2) HER2-enriched vs non‐HER2-enriched, and 3)luminal (A + B) vs nonluminal. The machine learning classifier of this six model are chosen to be LinearSVC, AdaBoostClassifier, XGBClassifier, respectively. The performance and ROC curves of each model are shown in Figure 2 and
Figure 3. The mean AUC of the three models are 0.76, 0.85 and 0.73, respectively. Beside, the best ROC curves of single
feature are also plotted in Figure 4, the corresponding AUCs are 0.77, 0.84 and 0.70, respectively.
Conclusion: Quantitative radiomics features base on MRI is predictive of the molecular subtypes of breast cancer.

基于 U-Net 对乳腺 MR-DCE 图像中乳腺肿块自动分割模型的研发

马明明,姜原,秦乃姗,张晓东,王霄英
北京大学第一医院

目的 研发基于乳腺 DCE MR 图像的肿瘤病灶自动分割、自动体积测量的模型，并与结构式报告对接植入到临床流程中。
方法 回顾性收集 2015 年 2 月 10 日到 2016 年 12 月 28 日连续病例的乳腺 MR 影像和报告资料，纳入病例均为已取得活检但尚未治疗的乳腺癌患者，总共纳入 88 例数据进行研究，其中 70 例用于训练集，9 例用于测试集，9 例用于验证集。由两位影像专家逐一阅览模型分割结果，评价结果临床满意度。运用乳腺 U-Net 分割模型在 DCE MR 图像中自动分割乳腺轮廓，采用去除最小连通域方法处理图像，根据保留像素数序贯分割乳腺病灶。运用最小体积包围盒的算法规则，测得乳腺肿块的左右、前后和上下径。将实际临床工作中使用的乳腺 MR 结构式报告内医师测量的乳腺病灶径线数据作为金标准，用配对样本 t 检验和 Bland-Altman 散点图比较分析软件自动测量和医师手工测量的乳腺病灶径线结果。**结果** U-Net 分割和径线测量乳腺病灶可自动地返回到结构式报告中，并自动填写到报告内。训练集、测试集的平均 dice 系数分别为 0.92、0、77。软件自动测量和医师手工测量乳腺病灶径线一致性高。对于乳腺病灶左右径和上下径，软件自动测量和医师手工测量结果之间的差异无统计学意义（$p>0.05$），而于乳腺病灶前后径，两种测量方法结果之间的差异均有统计学意义（$p<0.05$）。影像专家对软件自动分割临床满意度高，达 89.3%。**结论** 基于 U-Net 的乳腺病灶分割模型植入临床工作流程是可行的，其测量结果的准确性符合临床要求。

Prediction of pathological complete response to neoadjuvant chemotherapy in breast cancer using deep learning (DL) method

Yuhong Qu,Haitao Zhu,Kun Cao,Yingshi Sun
Beijing cacer hospital

Purpose: To develop a deep learning (DL) algorithm to predict pathological complete response (pCR) to neoadjuvant chemotherapy (NAC)in breast cancer.
*Materials and Methods:*An institutional review board-approved retrospective review of our database from January 2015 to December 2016 identified 308 locally advanced breast cancer patients who (1) underwent breast MRI prior to the initiation of NAC and surgery, called baseline(pre-NAC) and after treatment(post-NAC) (2) successfully completed adriamycin/taxane-based NAC, and (3) underwent surgical resection with available final surgical pathology data. All subjects were divided into a training set (n=247) and a validation set (n=61). Tumor regions were manually delineated on the second phase of T1-weighted images with Gadolinium enhancement by an expert radiologist. Pathological results were used as ground truth. Deep learning network was constructed using Python (V3.6) based on Keras (2.15) with TensorFlow (V1.4.0). It contains 5 repetition of convolution and max-pooling layers and ends with 3 dense layers. Augmentation was applied by 80 times to pCR data and 60 times to non-pCR data respectively.Pre-NAC model and post-NAC model inputs 6 phases of enhancement from pre-NAC and post-NAC images respectively. Combined model uses 12 channels from 6 phases of pre-NAC and 6 phases of post-NAC images.
Results: The training set contains 142 non-pCR subjects and 106 pCR subjects. The validation set contains 35 non-pCR subjects and 26 pCR subjects. Chi-square test shows no significant difference between two groups (p=0.987).The accuracy of pre-NAC, post-NAC and combined model is 0.58, 0.78 and 0.84. The combination of pre-NACand post-NAC data in deep learning shows improved accuracy. Post-NAC data is more relevant with pathological result. Our result is better than liu Z (Clin Cancer Res. 2019 Mar 6.)which may indicate that deep learning method is better than radiomics in predication of pCR to NAC in breast cancer.
*Conclusion:*The DL model can be used to predict pCR to NAC from breast DCE-MRI, but the analysis of imaging after NAC treatment is an indispensable part, and the role of the peritumor regions needs further study.

磁共振弥散加权成像（DWI）纹理分析鉴别乳腺导管原位癌和浸润性导管癌及与 PR、ER、HER-2、Ki-67 的相关性

张楠[1],田士峰[1],宋清伟[1],刘爱连[1],宋宇[1],郭妍[2],李欣[2],张丽娜[1]
1.大连医科大学附属一院
2.通用电气药业（上海）有限公司

目的 探讨使用弥散加权成像（DWI）的纹理分析鉴别乳腺导管原位癌（ ductal carcinoma in situ，DCIS）和浸润性导管癌（invasive ductal carcinoma，IDC）的价值。**方法** 回顾性分析 2014 年 5 月到 2018 年 7 月于大连医科大学附属第一医院经手术病理证实的 10 例单纯性 DCIS 和 22 例 IDC 的患者资料，患者术前均行乳腺 DWI 序列扫描（b=1000 s/mm^2），经后处理获得 ADC 图，采用 Omni-Kinetics 软件，融合后获得肿瘤全域纹理参数，包括方差、SRE、LRE、GLE、RLN、LGLRE、LGLRE、SRLGLE、SRHGLE、LRLGLE 和 LRHGLE。采用独立样本 t 检验或 Mann-Whitney 秩和检验比较 DCIS 和 IDC 各纹理参数的差异，采用 ROC 曲线评价有统计学差异的纹理参数对 DCIS 和 IDS 的鉴别效能。用 R 语言分析两组与 PR、ER、HER-2、Ki-67 的相关性。**结果** ：DCIS 组的 SRE、LRE、LGLRE、SRLGLE、LRLGLE 均大于 IDC 组，方差、GLN、RLN 小于 IDC 组，差异具有统计学意义（P 均<0.05）。两组之间的 HGLRE、SRHGLE、LRHGLE 差异无统计学意义（P 均>0.05）。方差、SRE、LRE、GLN、RLN、LGLRE、SRLGLE、LRLGLE 鉴别两组病灶的 AUC 分别为 0.864、0,914、0.914、0.873、0.914、0.83、0.81、0.90。**结论** DWI 乳腺纹理分析有助于提高肿块型乳腺导管原位癌和浸润性导管癌鉴别诊断的准确性，SRE、LRE、RLN、LRLGLE 是极具潜力的影像学标志物。PR、ER、HER-2、Ki-67 与最大值、阈值、最小值、不一致性、偏度、平均偏差有相关性，可以进一步增加单纯性乳腺导管原位癌和浸润性导管癌的诊断准确性。

EPO-0751

Correlation between the prognostic factors of breast cancer including ER, PR, HER-2 and Ki-67 and intravoxel incoherent motion MR imaging

Mo Zhu,Chunhong Hu
the first affiliated hospital of Soochow University

Objective: To explore the correlation between the prognostic factors of breast cancer including estrogen receptor (ER), progesterone receptor (PR), human epidermal growth factor receptor 2 (HER-2) and cell proliferation antigen marker Ki-67 and intravoxel incoherent motion diffusion-weighted MR imaging (IVIM).

Materials and methods: 152 patients with suspicious breast cancer who were treated in our hospital from August 2015 to August 2018 were selected, all the patients received T2W1 fat suppression sequence, IVIM scan and dynamic enhancement (DCE-MRI) scan, the expression of ER, PR, HER-2 and Ki-67 in tumor tissues of all patients were detected by calculation of apparent diffusion coefficient (ADC), D value, D* value, F value and other parameters.

Results: According to the exclusion and enrollment criteria of the study, 90 cases of breast cancer were finally enrolled, among the 90 cases,73 cases were positive for ER patients, accounting for 81.92%,17 cases were negative for ER patients, accounting for 18.89%.70 cases were positive for PR patients, accounting for 77.78%,20 cases were negative for PR patients, accounting for 22.22%.33 cases were positive for HER-2 patients, accounting for 36.67%,57 cases were negative for HER-2 patients, accounting for 63.33%.59 cases were positive for Ki-67 patients, accounting for 65.56%,31 cases were negative for HER-2 patients, accounting for 34.44%.There were no statistical differences between the positive and negative expression of ER and PR for ADC value, D value, D* value and f value (P>0.05),there was no statistical difference between the positive and negative expression of HER-2 for ADC value and f value(P>0.05),the D value and D* value of the positive expression of HER-2 were higher than the D value

and D* value of the negative expression of HER-2 (P<0.05).There was no statistical difference between the positive and negative expression of Ki-67 for D* value and f value (P>0.05),the ADC and D value of the positive expression of Ki-67 was lower than the ADC and D value of the negative expression of HER-2 (P<0.05).Spearman correlation analysis results: ADC value and ER factors were negatively correlated, D value and HER-2 factor were positively correlated, negatively correlated with Ki-67, D* value and HER-2 factor were highly positively correlated (P<0.05).

Conclusion：According to the inter-group differences in the expression of breast cancer immune factors ER, her-2 and ki-67, and the correlation between ADC value and ER, D value and her-2, ki-67, D* value and her-2, the expression of some breast cancer immune factors can be predicted and the prognosis of patients can be analyzed.

乳腺癌多模态 MRI 表现与前哨淋巴结是否转移的临床价值研究

苏春艳,付兵
成都市第五人民医院

目的：探讨乳腺癌多模态 MRI 成像表现在评价前哨淋巴结肿瘤是否转移的临床应用价值。**材料与方法**：对 43 例手术病理证实为乳腺癌且术前均行 MRI 检查的患者的 MRI 图像特征进行收集，统计分析患者年龄、乳腺肿块的位置、短长径比、是否环形强化、时间-信号曲线（TIC）、表观弥散系数（ADC）、相对表观弥散系数（rADC）与前哨淋巴结是否转移的关系。**结果**：前哨淋巴结转移阴性 26 例，阳性 17 例；前哨淋巴结是否转移在乳腺原发肿瘤的位置（χ^2=6.831，P＜0.05）、短长径比（t=-2.664，P＜0.05）、环形强化（χ^2=5.965，P＜0.05）、rADC（t=2.099，P＜0.05）等两组间的差异有统计学意义，阳性组短长径比（0.85±0.90）、rADC（3.89±1.12）值更高，阳性组位于肿块外侧、环形强化的比例比阴性组高；两组间患者的年龄（t=1.925，P＞0.05）、ADC 值（t=0.544，P＞0.05）、TIC（χ^2=4.865，P＞0.05）的差异无统计学意义。**结论**：乳腺癌多模态 MRI 的表现有助于判断前哨淋巴结是否肿瘤转移，为乳腺癌治疗策略的选择提供新的思路与方法。

磁共振动态增强成像与扩散加权成像联合对乳腺良恶性疾病鉴别诊断价值

文洁,康文焱,刘周,李丽,钟贻洪,罗德红
中国医学科学院肿瘤医院深圳医院

【摘要】目的 探讨磁共振动态增强成像中的动态增强时间信号强度曲线(time-signal intensity curve, TIC)类型、早期强化率及扩散成像的表观扩张系数值(apparent diffusion coefficient，ADC)在乳腺良、恶性病变中鉴别诊断价值。

方法 回顾性分析 2017 年 4 月至 2019 年 4 月我院 140 个经病理证实的乳腺病灶的术前磁共振以及临床病理资料，依据病理分为良性病变组及恶性病变组。比较乳腺良、恶性病变间的 TIC 类型及早期强化率有无差异；并比较两组间 ADC 值的差异性。

结果 已行乳腺 MRI 检查的 107 例患者共 140 个病灶纳入研究，良性病变 43 个病灶，恶性病变 97 个病灶。乳腺良、恶性病变的 TIC 类型、第一期早期强化率类型具有统计学差异（P＜0.05）。乳腺恶性病变平均 ADC 值 0.965±0.215×10^{-3} mm^2/s 低于良性病变平均 ADC 值 1.335±0.266×10^{-}

^{3} mm^2/s，两者间有统计学差异（P＜0.05），ADC 阈值取为 $1.085\times10^{-3}mm^2/s$ 时，曲线下面积最大为 0.857，其鉴别乳腺良、恶性病变的敏感性为 73.2%，特异性为 86.0%，准确性 77.1%。TIC 曲线、第一期早期强化率及 ADC 三者联合诊断，诊断乳腺良、恶性病变的敏感性为 83.5%，特异性为 79.1%，准确性为 78.5%，曲线下面积 AUC 为 0.882，高于其他三者单独诊断的曲线下面积（0.728，0.562，0.857）。

结论 动态增强成像中的 TIC 曲线类型及第一期早期强化率与扩散加权成像的 ADC 值三者联合进行诊断，对乳腺良、恶性病变的鉴别诊断具有较好的价值。

应用动态对比增强和弥散加权 MRI 评估雌激素受体阳性浸润性乳腺癌中定量 MR 参数和 Ki-67 增殖状态之间的相关性

刘艳,肖兰
新疆医科大学附属肿瘤医院

目的：探讨动态对比增强磁共振成像（DCE-MRI）和弥散加权成像（DWI）定量参数与雌激素受体（ER）阳性浸润性乳腺癌患者 Ki-67 增殖状态之间的关联。
材料与方法：我们回顾性分析了 88 例 ER 阳性浸润性乳腺癌患者的记录，这些患者在 3T 扫描仪上接受了术前 DCE-MRI 和 DWI 检查。记录灌注参数（Ktrans，Kep 和 Ve）和表观扩散系数（ADC），并将这些数据与 Ki-67 状态相关联。 Ki-67 增殖指数分为高（≥14%）或低（<14%）。
结果：在高 Ki-67 组中，平均 Ktrans 显着高于低 Ki-67 组（P <0.001），平均 ADC 显着降低（P <0.001）。然而，两组之间的平均 Kep 和 Ve 值没有差异（分别为 P = 0.248 和 P = 0.055）。单变量分析显示较高的 Ktrans（> 0.274），较低的 ADC（≤0.893×10-3 mm2 / s），较大的肿瘤大小（> 2 cm），较高的组织学分级（3 级），存在腋窝转移和 P53 阳性状态与高 Ki-67 状态显着相关（所有 P 值<0.05）。在这些变量中，较高的 Ktrans（> 0.274;调整后的比值比[OR] = 9.027,95%置信区间[CI] = 1.929-42.245; P = 0.005）和较高的组织学分级（3 级;调整 OR = 7.510， 95%CI = 1.305-43.205; P = 0.024）独立预测高 Ki-67 状态。

Radiomic Analysis of Pretreatment MRI in Predicting Tumor Response to Neoadjuvant Therapy in Breast Cancer

Shuyi Peng[1],Fan Yang[1],Xiong Zhang[2],Yan Jia[2]
1.Union Hospital Tongji Medical College Huazhong University of Science and Technology
2.Huiying Medical Technology Co., Ltd., Beijing

PURPOSE
Dynamic contrast-enhanced MRI (DCE-MRI) has been widely used in breast cancer diagnosis and management. For patients undergoing NAT, early changes in DCE-MRI has been used to monitor response during the course of the therapeutic regime, however only a few studies investigated the utility of pretreatment breast MRI to predict tumor response. The purpose of this study was to explore whether the pretreatment MRI

radiomic features are capable of predicting the pathologic complete response (pCR) to NAT in breast cancer.

METHOD AND MATERIALS

3172 patients who have undergone breast MRI at our institution between June 2015 and October 2018 were initially enrolled into this retrospective study, eventually 73 patients who were treated with both NAT and subsequent surgery were eligible, all of whom underwent breast MRI before the start of NAT. All patients were categorized into pCR and non-pCR on the basis of their pathological response after surgery. Two radiologists segmented lesions manually on contrast-enhanced T1-weighted images (the second phase after injection of contrast medium) and 1029 radiomic features were extracted. The patients were randomly divided into training set and validation set at a ratio of 8:2, and radiomic features were selected using LASSO Cox regression to reduce dimensions of the features. Three supervised learning algorithms (LR, RF, and KNN) were used to predict pCR in patients with NAT. The prediction performance of radiomic models in training set and validation set were assessed by the area under the receiver operating curve (AUC), sensitivity, and specificity.

RESULTS

Four features which best relevant to pCR were selected as radiomics signature by LASSO regression. The model that used logistic regression classifier achieved the best performance than the other two methods, the AUC value of the training set was 0.871 (sensitivity was 0.76 and specificity was 0.68), and the AUC value of the validation set was 0.745 (sensitivity was 0.80 and specificity was 0.73).

CONCLUSION

The prediction model used LR classifier had the best performance in predicting pCR to neoadjuvant therapy. Radiomics features extracted from pretreatment breast MRI could be the predictor of NAT response.

EPO-0756

3.0T 磁共振在预测乳头-乳晕复合体 恶性浸润中的作用

刘艳,敬文波
新疆医科大学附属肿瘤医院

目的：探讨 3.0T 磁共振（magnetic resonance，MR）在诊断乳头-乳晕复合体（nipple-areolar complex,NAC）恶性浸润的准确性，为临床手术方案的选择提供依据，为更多女性选择保留乳头的乳房切除术成为可能。**方法：**收集了 2015 年 1 月至 2017 年 12 月期间在新疆医科大学附属肿瘤医院行西门子 3.0T 核磁共振平扫及动态增强扫描，并接受手术经病理证实的 909 名原发性乳腺癌患者共计 914 个病例，其中 5 例为双侧乳腺癌，比较术前 MRI 和术后组织病理学结果，评估 MRI 在预测乳头浸润的准确性和潜在因素。该研究主要观察肿瘤位置、大小、恶性程度、距乳头的距离，腋窝淋巴洁转移情况，乳头改变（内陷/回缩），乳头强化，乳晕区皮肤增厚，和 NAC 增强后的厚度等乳头-乳晕复合体恶性浸润的潜在预测因子，由两名放射科主治医师独立盲法判读上述观察指标并记录结果，以术后组织病理学作为金标准。**结果：**回顾性分析入选的 914 个病例的 MRI 图像及组织病理学结果，其中 63 例（7%）患者确诊 NAC 受浸。在 MR 图像判读中，一名研究者测得的敏感性、特异性、阳性预测值（PPV）、阴性预测值（NPV）和乳腺 MRI 的准确性分别为 70.4%、82.6%、25.3%、97.5%和 80.0%。，另一名研究者分别为 78.3%、87.1%、36.3%、96.9%和 86.4%。两名放射科主治医师在综合评估 MR 图像 NAC 受浸的 kappa 值为 0.28。**结论：**MRI 动态增强图像因其拥有较高的软组织分辨力和独有的动态增强模式，在诊断乳腺癌具有较高的敏感性和特异性，但

在术前评估 NAC 恶性浸润时 PPV 较低和 FPV 较高。两名研究者在评估每个 MR 预测因子和 NAC 受浸的主观定性观点方面存在实质性差异。单变量分析中，单纯乳头强化是预测 NAC 恶性浸润最理想独立预测因子。

EPO-0757
DCE-MRI 对乳腺黏液癌与 T2 高信号纤维腺瘤鉴别诊断的研究

彭舒怡,杨帆
华中科技大学同济医学院附属协和医院

目的：乳腺黏液癌是一种较为少见的乳腺恶性肿瘤，T2WI 呈明显高信号是其特征性的 MRI 表现。当纤维腺瘤出现黏液样变时，亦表现为 T2 明显高信号肿块，两者在术前的鉴别诊断是放射科医师面临的难题。因此本研究旨在探讨 DCE-MRI 在乳腺黏液癌与 T2 高信号纤维腺瘤鉴别诊断中的应用价值。
方法：回顾性分析我院 2015—2018 年经手术病理确诊的 13 例乳腺黏液癌及 28 例 T2 高信号纤维腺瘤的临床及 MRI 检查资料。分析比较两者的发病年龄、病灶直径、形态、边缘、ADC 值、T2 信号强度、延迟期强化方式；利用 DynaCAD 软件进行肿块分割，对二者血流动力学参数进行定量分析，获得病灶早期强化峰值、延迟期各不同强化方式在肿瘤内部所占像素的绝对值及百分比。采用 Manny-U 检验比较两组病灶的上述参数，对于差异有统计学意义的参数采用受试者工作特征 (receiver operating characteristic, ROC) 曲线评价其鉴别诊断的效能。
结果：从患者一般情况及形态学分析，黏液癌的病灶体积较 T2 高信号纤维腺瘤大，两组间的差异具有统计学意义（病灶平均体积分别为 18.06±32.29mm^3 vs. 1.22±31.57mm^3，$P<0.001$）；两组间年龄、ADC 值、T2 信号的差异无统计学意义；血流动力学参数定量分析显示，黏液癌内部延迟期平台型强化所占百分比高于 T2 高信号纤维腺瘤，平均值分别为(18.23±15.23)% vs. (5.66±6.12)%，二者间的差异具有统计学意义(P=0.014)。利用体积及平台型强化百分比进行鉴别诊断，其 AUC 值分别为 0.752、0.766；多因素分析显示，体积及平台型强化百分比二者联合具有较高的鉴别诊断效能，其 AUC 值为 0.821（95% CI 0.668-0.973）。
结论：MRI 形态学特征及定量血流动力学参数有助于乳腺黏液癌与 T2 高信号纤维腺瘤的鉴别诊断。

EPO-0758
乳腺复杂型纤维腺瘤多模态磁共振成像特征

赵梦然
天津市肿瘤医院

目的 分析乳腺复杂型纤维腺瘤的多模态磁共振成像特征，提高术前诊断准确率，以期为临床治疗方案的制定提供更准确的影像学依据。**方法** 回顾性分析 2011 年 1 月至 2019 年 4 月于我院行乳腺 MRI 检查并经手术病理证实为复杂型纤维腺瘤的 27 例患者。患者均行双侧乳腺平扫、DCE-MRI 以及 DWI 检查。依据美国放射学会（ACR）乳腺影像报告和数据系统（BI-RADS）标准对病变进行分析，观察病变的形态、边缘、平扫 T_1WI 信号、平扫脂肪抑制 T_2WI 信号、强化方式、时间-信号强度曲线（TIC）类型、DWI 信号及 ADC 值。**结果** 本研究中患者平均年龄为（38.8±10.0）岁，病灶平均最大径为（1.69±0.45）cm；27 例均为肿块型病变，81.48%（22/27）形态较规则；70.37%（19/27）边缘清晰；于平扫 T_1WI 序列 62.96%（17/27）病变呈稍低信号，7.41%（2/27）呈等信号，29.63%（8/27）显示不明显；于平扫抑脂 T_2WI 序列 3.70%（1/27）呈较低信号，70.37%

（19/27）呈稍高信号，25.93%（7/27）呈高信号；动态增强后时间-信号强度曲线 62.96%表现为Ⅲ型及Ⅱ型（14/27 呈Ⅲ型、3/27 呈Ⅱ型），动态观察 62.96%（17/27）的复杂型纤维腺瘤病变内部强化方式多由不均匀强化随时间延迟趋向均匀；于 DWI 图像中 96.30%（26/27）呈高信号；b 值为 500s/mm^2时，病变平均 ADC 值为（1.36±0.19）×$10^{-3}mm^2/s$，b 值为 1000s/mm^2时，病变平均 ADC 值为（1.29±0.26）×$10^{-3}mm^2/s$。**结论** 复杂型纤维腺瘤动态增强后时间-信号强度曲线和 DWI 表现与乳腺癌相似，多呈Ⅲ型及Ⅱ型，ADC 值较低，但是大部分复杂型纤维腺瘤的形态形态较规则，边缘较清晰，特别是动态观察下病变内部强化方式随时间延迟强化趋向均匀。

2.空军军医大学第二附属医院

目的 探讨 MRI 对乳腺非肿块样强化(none-mass enhancement，NME)良恶性病变的诊断及鉴别诊断价值。
方法 回顾性分析 2015 年 10 月至 2017 年 7 月行 MRI 检查并经病理证实或行 MRI 随诊 1 年半以上无变化的 96 个乳腺 NME 病灶，采用卡方检验比较良恶性组间分布方式、内部强化特征、T2 抑脂信号强度、动态曲线类型的差别。应用多因素分析表现为 NME 的乳腺恶性病变的 MRI 影像特征。
结果 96 例患者共 96 个非肿块样强化病灶，良性病变 28 个（29.2%），恶性病变 68 个（70.8%），良性病变中以腺病及浆细胞性乳腺炎最多见，均占 35.7%（10/28），恶性病变中以浸润性乳腺癌最多见，占 77.9%（53/68），其次为导管原位癌，占 14.7%（10/68）；在形态学上，良恶性组间在内部强化方式表现为均匀强化时的差异有统计学意义(P 值为 0.026），余内部强化方式及分布方式间差异无统计学差异（P>0.05）；在 T2 抑脂信号上，良恶性组间在病变表现为高信号和等信号之间的差异有统计学意义（P 值分别为 0.025、0.045）；在 TIC 类型上，良恶性组间在 I 型（流入型）和 III 型（流出型）之间的差异有统计学意义（P 值分别为 0.013、0.001）；恶性病变的危险因素包括 T2 抑脂等信号及 TIC 为 III 型曲线，病灶 T2 抑脂信号为等信号时其为乳腺癌的概率是非等信号的 5.23 倍，病灶 TIC 为 III 型曲线时，其为乳腺癌的概率是非 III 型曲线的 10.84 倍。
结论 MRI 对于表现为 NME 的乳腺癌具有较高的诊断准确性。

表皮生长因子的磁共振靶向对比剂的研究

陈诗
华中科技大学同济医学院附属协和医院

【摘要】 目的 通过探讨 EGFR 介导的磁共振对比剂 EBP-$(Gd\text{-}DO3A)_2$对肿瘤的靶向性，评估其应用于动态增强磁共振成像(DCE-MRI)中的可行性和价值。**方法** 采用化学方法，将 EGFR 结合肽(CMYIEALDKYAC，EBP）与 2 分子 DO3A 共价结合，再与 $Gd(OAc)_3$反应，制备 EBP-$(Gd\text{-}DO3A)_2$。应用 EBP-$(Gd\text{-}DO3A)_2$孵育高低不同 EGFR 表达水平的人癌细胞后，采用电感耦合等离子体质谱(ICP-OES)检测细胞 Gd^{3+}含量，并与临床使用的对比剂 Gadovist 比较。
结果 EBP-$(Gd\text{-}DO3A)_2$作用细胞后，EGFR 高表达细胞的 Gd^{3+}含量比 EGFR 低表达细胞高，差异有统计学意义(P<0.05)；Gadovist 孵育细胞后，不同 EGFR 表达水平细胞的 Gd^{3+}含量差异无统计学意义(P>0.05)；预先 EGFR 抑制剂作用于细胞后，再用 EBP-$(Gd\text{-}DO3A)_2$孵育细胞，各组细胞 Gd^{3+}含量与

未使用 EGFR 抑制剂相比明显降低，差异有统计学意义(P<0.05)；预先 EGFR 抑制剂作用于细胞后，再用 Gadovist 孵育细胞，各组细胞 Gd^{3+}含量与未使用 EGFR 抑制剂相比差异无统计学意义(P>0.05)；荷 MDA-MB-231 瘤小鼠尾静脉注射 EBP-$(Gd\text{-}DO3A)_2$后，在血中浓度维持时间较 Gadovist 长，肿瘤组织 Gd^{3+}含量随时间延长而增加，至 4h 达峰值，此后逐渐下降。与 Gadovist 组比较，EBP-$(Gd\text{-}DO3A)_2$在肿瘤中 Gd^{3+}含量明显增加，差异有统计学意义(P<0.05)；荷 MDA-MB-231 瘤小鼠尾静脉注射 EBP-$(Gd\text{-}DO3A)_2$后，肿瘤的 T1 信号强度逐渐上升，4 h 达到强化峰值，之后信号强度逐渐降低至正常。**结论** 合成的造影剂 EBP-$(Gd\text{-}DO3A)_2$对细胞 EGFR 具有良好的靶向性。

EPO-0761

Study on Magnetic Resonance Contrast Agents targeting of EGFR

Shi Chen
Union Hospital of Tongji Medical College, Huazhong University of Science and Technology

Purpose To evaluate the feasibility and value of EGFR-mediated magnetic resonance contrast agent EBP-(Gd-DO3A)2 for tumors in dynamic enhanced magnetic resonance imaging (DCE-MRI). **Methods** EGFR binding peptide (CMYIEALDKYAC, EBP) was covalently bound to two molecules of DO3A by chemical reaction, and then reacted with Gd(OAc)3 to prepare EBP-(Gd-DO3A)2. After incubation of human cancer cells with different EGFR expression levels by EBP-(Gd-DO3A)2, the Gd3+ content of cells was detected by inductively coupled plasma mass spectrometry (ICP-OES) and compared with the clinical contrast drug Gadovist. After pretreatment with EGFR inhibitors, Cellular were incubated with EBP-(Gd-DO3A)2 or Gadovist ,and Cellular Gd content was measured by ICP-MS. 5-6 weeks old SPF SCID mice were subcutaneously inoculated with human breast cancer MDA-MB-231 cells as an animal model, and EBP-(Gd-DO3A)2 or Gadovist was injected into the tail vein of mice, then Blood, heart, liver, spleen, lung, kidney and tumor tissues were taken at 30 min, 1h, 2h, 4h, 8h, 12 h, 24h and 48h after intravenous injection, respectively, and Gd3+ concentration was determined by ICP-OES. MRI images were acquired by injection of EBP-(Gd-DO3A)2 or Gadovist into the tail vein of mice bearing MDA-MB-231 tumor at 30min,1h, 2h, 4h, 8h and 12h in the pre and post -injection,respectively. **Results** After EBP-(Gd-DO3A)2 was applied to the cells, the Gd3+ content of EGFR high-expressed cells was higher than that of EGFR low-expressed cells ,and the difference was statistically significant (P<0.05) . After Gadovist was incubated, there was no statistically significant in the Gd3+ content of different EGFR expression cells (P>0.05). After the EGFR inhibitor was applied to the cells, the cells were incubated with EBP-(Gd-DO3A)2. The Gd3+ content of each group cells was significantly lower than that without the EGFR inhibitor, and the difference was statistically significant (P<0.05) .After the EGFR inhibitor was applied to the cells, the cells were incubated with Gadovist. There was no statistically significant in the Gd3+ content of each group cells compared with non-EGFR inhibitors (P>0.05). After injection of EBP-(Gd-DO3A)2 into the tail vein of mice bearing MDA-MB-231 tumor, the blood concentration was maintained longer than that of Gadovist, and the Gd3+ content of tumor tissue increased with time, peaked at 4h, and then gradually decreased. Compared with the Gadovist group, the Gd3+ content of EGP-(Gd-DO3A)2 group in the tumor significantly increased , and the

difference was statistically significant (P<0.05) . After injection of EBP-(Gd-DO3A)2 into the tail vein of mice bearing MDA-MB-231 tumor, the T1 signal intensity of the tumor gradually increased, and reached the peak of enhancement at 4 h, after the signal intensity gradually decreased to normal.**Conclusion** The synthesized contrast agent EBP-(Gd-DO3A)2 has good targeting to EGFR.

乳腺 DCE-MRI 纹理分析对鉴别 BI-RADS 4 类病灶良恶性的价值

张锦超[1],杨擎[1],汪飞[1],常灿灿[2]
1.安庆市立医院
2.亳州市华佗中医院

目的 探讨乳腺磁共振动态增强成像（DCE-MRI）的 DCE 7 个时段、T2-STIR 及 ADC 图像的纹理分析对乳腺影像报告及数据系统（BI-RADS）4 类病灶良恶性的鉴别价值。
方法 回顾性分析 70 例术前经 DCE-MRI 诊断乳腺病灶为 BI-RADS 4 类的患者的影像资料，采用 MaZda4.6 提取病灶的 DCE 7 个时段、T2-STIR 及 ADC 图像的纹理特征，经 Fisher 系数、聚类偏差几率结合平均关联系数（POE+ACC）、协同信息（MI）及上述 3 种方法的联合方法(MI+PA+F)简化纹理特征参数。使用原始数据分析（RDA）、主要成分分析 （PCA）、 线性分类分析 （LDA）、非线性分类分析 （NDA）、单训练集人工神经网络（ANN）分析简化的纹理特征，得出乳腺 MRI 图像的各种纹理简化、分析方法的组合对病灶良恶性鉴别的错判率。
结果 乳腺 DCE-MRI 加权图像的各种纹理简化、分析方法的组合对病灶良恶性鉴别的最低错判率为 2.86%（ADC 图像的 MI+PA+F-ANN、DCE 第一期图像的 MI+PA+F-NDA 和 MI+PA+F-ANN）；DCE 7 个时段、T2-STIR 及 ADC 图像的错判率比较，差异无统计学意义(p＞0.05)；各纹理简化方法的错判率比较差异无统计学意义（P＞0.05）；NDA、ANN 与其他分类分析方法的错判率比较，差异有统计学意义（ P＜0.05）。
结论 乳腺 MRI 各加权图像在诊断病灶为 BI-RADS 4 类的基础上进行纹理分析，并使用 NDA 或 ANN 分类模型，有望对病灶良恶性作出确定性诊断。

EPO-0763
磁共振成像在乳腺原位小叶癌早期切除术后残余预测中的作用

张建英
中国科学院大学重庆医院（重庆市人民医院）

背景:乳腺磁共振（MR）成像是一种有用的筛查方法，可用于检测有原位小叶癌（LCI）病史的患者的可疑病变。本研究的目的是评价乳腺磁共振成像在早期切除后残余 LCI 病变检测中的有效性。

方法:在 2011 年至 2018 年期间，30 名接受初次切除的 LCI 患者入选。在初次切除后进行乳腺超声检查和乳腺磁共振成像随访。将影像学结果与病理结果进行比较。

结果：初次切除后有 9 例（30.0%）边缘阳性，分别为 LCI（n=7）和非典型小叶增生（n=2）。13 例发现残余病变，分别为浸润性小叶癌（n=1；3.3%）、LCI（n=10；33.0%）、非典型小叶增生

（n=1；3.3%）和原位乳头状癌（n=1；3.3%）。在所有患者中，18 例患者（敏感度 83.3%，特异性 100%）可以通过超声检查发现病变。

结论：乳腺磁共振成像对残余 LCI 病变的检出率高于乳腺超声。如果使用乳腺磁共振成像发现可疑病变，应考虑第二次手术，因为可能存在多灶性，即使在初次手术时确认了 LCI。

扩散加权成像体素内不相干运动模型参数在局部晚期乳腺癌新辅助化疗疗效预测中价值

车树楠,李静,赵心明,欧阳汉,周纯武
中国医学科学院肿瘤医院

【目的】：探索扩散加权成像体素内不相干运动模型参数在局部晚期乳腺癌患者新辅助化疗(NAC)疗前预测以及治疗早期疗效评价中的价值。
【材料与方法】：36 名局部晚期乳腺癌的患者完成了新辅助化疗前包括多 b 值扩散加权成像序列在内的乳腺 MRI 扫描，多 b 值 DWI 序列采用 0-1000 s/mm^{2}共 12 个 b 值，这些患者中有 28 例在 NAC2 周期后完成了 MRI 复查。根据治疗后手术病理结果，这些患者被分为病理学完全缓解(pCR)和非病理学完全缓解(non-pCR)两组。利用 t 检验或非参数检验的统计学方法，对于 pCR 组与非 pCR 组间各项参数值(包括 D、D*、f)NAC 疗前、2 周期后以及其变化值(△参数)进行比较。不同参数预测 NAC 疗效的诊断效能利用 ROC 曲线分析进行评价。
【结果】：在 NAC 疗前，pCR 组的 f 值明显高于非 pCR 组，差异有统计学意义(32.40% vs. 24.40%, P=0.048)，其余 IVIM 模型参数间均无统计学差异。在 NAC2 周期治疗结束时，pCR 组的 D 值明显高于非 pCR 组(1.36±0.30×10^{-3}mm^2/s vs. 0.98±0.23×10^{-3}mm^2/s)，f 值明显低于非 pCR 组(14.51%±7.25% vs. 20.69%±5.10%)，差异均有统计学意义(P 均＜0.05＝，而 pCR 组的 D*仅略低于非 pCR 组，差异无统计学意义。NAC2 周期治疗后，pCR 组的△D 值要明显大于非 pCR 组，pCR 组的△f 值(17.30%)明显高于非 pCR 组(5.30%)，差异均有统计学意义(P＜0.001)，而 pCR 组与非 pCR 组间△D*值无明显统计学差异。对于所有参数行 ROC 曲线分析得出，△D 值在预测 NAC 疗效上的诊断价值最好，曲线下面积为 0.924。
【结论】IVIM 模型参数，尤其是 D 和 f 值，在局部进展期乳腺癌患者 NAC 的疗前预测、治疗后的早期疗效评价方面显示出了潜在的价值。

Imaging Findings of Breast Apocrine Carcinoma: A Case Report with Review of Literature

Shanshan Xing,Chunhua Lu,Zhizhong Wang
the Second Affiliated Hospital of Nanchang University

Abstract: Apocrine carcinoma (AC) is a rare form of breast malignancy,and accounts for 0.3 to 1.0% of all breast cancers.A 58-year-old woman was found with a left breast mass after a health examination,and she was admitted to our hospital.The physical examination found an elastic hard lump in the upper lateral quadrant of the left breast,the tumor size was approximately 2×1.5cm,and the left armpit can touch a

enlarged lymph node,the size was 2×1.5cm.Ultrasound detected a hypoechoic mass at about 21mm from the nipple in the direction of 3-4 o'clock in the left breast.The shape of the mass was irregular and the boundary was unclear.The punctate blood flow signal in the mass was detected by CDFI.Mammography revealed no findings of a primary tumor,Digital breast tomosynthsis (DBT) only found local architecture distortion in the upper lateral quadrant of the left breast.Enhanced magnetic resonance imaging (MRI) showed a unevenly and significantly enhanced mass in the left breast,and the time-intensity curve showed a rapid wash-in followed by wash-out pattern.The patient underwent a modified radical mastectomy of left breast.Histopathologically,the tumor cells showed cribriform growth pattern with stromal invasion,and had particularly abundant eosinophilic granular cyteplasm.Immunohistochemical showed gross cystic disease fluid protein-15 (GCDFP-15) and androgen receptor (AR) positivity,and estrogen receptor and progesterone receptor and human epidermal growth factor receptor 2 negativity.Thus,the pathological djagnosis was apocrine carcinoma with four axillary lymph nodes metastases.We report a case of invasive apocrine carcinoma of breast as it has complete imaging data,and discuss the imaging features of the disease in conjunction with the literature.

Preoperative prediction of Ki-67 status in breast cancer with multi-parametric MRI-based deep learning radiomics model

Weixiao Liu
Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences

Abstract

Purpose: To establish deep learning radiomics models based on different single magnetic resonance imaging (MRI) sequences and multi-parametric MRI(mp-MRI) respectively and compare their performance in preoperative prediction of the Ki-67 status in patients with breast cancer.

Methods and materials: A total of 328 eligible patients were retrospectively enrolled and divided into a training dataset (n=230) and a validation dataset (n=98) according to inspection time. Quantitative deep learning imaging features were extracted from T2-weighted imaging(T2WI), diffusion-weighted imaging(DWI), and contrast enhanced T1-weighted imaging(T1+C). We applied a pre-trained deep convolutional neural network and the maximum relevance to construct four feature sets based on each of the three single MR sequences and their combination(i.e.mp-MRI). Multilayer-perceptron classifiers were used to make final prediction. Mann-Whitney U test was used to compare the predictive performance of individual models.

Results: The AUC of models based on T2WI、T1+C、DWI and mp-MRI were 0.727,0.873, 0.674 and 0.888 in the training dataset, respectively, and 0.706, 0.829, 0.643 and 0.875 in the validation dataset, respectively. The predictive performance of mp-MRI classification model in the AUC value was significantly better than that of the individual sequence model (P＜0.01).

Conclusions: In clinical practice, a non-invasive, convenient, and inexpensive approach to improve the performance of radiomics in predicting Ki-67 status before surgery can be provided by extracting and screening breast cancer specific structural features from the mp-MRI images obtained from the conventional scanning sequences based on the advanced deep learning methods.

EPO-0767

评价对乳腺磁共振 BI-RADS 4 类病灶进行亚分类的临床可行性

郝雯[1,2],龚敬[1],王翠艳[2],彭卫军[1]
1.复旦大学附属肿瘤医院
2.山东省医学影像学研究所

目的

乳腺 X 线和超声 BI-RADS 4 类病灶可进一步分为 4A、4B、4C 三类。由于缺乏足够数据，磁共振 BI-RADS 4 类病灶尚未有标准分类方法。本研究分析对乳腺磁共振 BI-RADS 4 类病灶进行亚分类的可行性。

方法

参考乳腺 X 线 BI-RADS 4 类病灶的分类方法，本院常规按恶性可能将磁共振 4 类病灶分为 4A（2%~10%）4B（10% ~ 50%）和 4C（50% ~ 95%）三类。回顾性收集 2019.1.1-2019.6.30 于本院行乳腺磁共振检查的患者 6295 例，从 933 个 BI-RADS 4 类病灶中筛选出 757 个经病理证实的病灶。以病理结果为金标准将所有病灶分为良性和恶性，局部侵袭性病灶归入恶性组。诊断医师分为乳腺组和非乳腺组。比较亚分类阳性预测值（PPV）是否与其标识恶性率相吻合。

从 933 个 BI-RADS 4 类病灶中随机抽取 4A、4B、4C 病灶各 20 个，从专业组、非专业组各抽取 1 位诊断医师独立进行分类，1 个月后再次进行独立分类。使用 Kappa 分析比较 2 位医师、同一医师两次分类结果的一致性。

结果

专业组医师（3 名）分类病灶 618 个，包括 192 个 4A、165 个 4B 和 261 个 4C 类病灶，各 PPV 分别为 10.9%（21/192）、55.8%（92/165）和 94.2%（246/261）。非专业组医师（8 名）分类病灶共 136 个，包括 68 个 4A、37 个 4B 和 31 个 4C 类病灶，各 PPV 分别为 8.8%（6/68）、51.3%（19/37）和 80.6%（25/31）。专业组和非专业组医师分类结果具有良好一致性（Kappa = 0.710，P < 0.001）。同一位医师前后两次分类结果具有高度一致性（Kappa = 0.900、0.860，P < 0.001）。

结论

乳腺磁共振 BI-RADS 4 类病灶亚分类阳性预测值与各分类的标识恶性率相吻合，医师分类结果具有良好一致性。证据支持在临床实践中对磁共振 BI-RADS 4 类病灶进行亚分类。

Evaluation and Validation of Functional Diffusion Imaging -Diagnostic Accuracy, Correlation with Prognostic Factors and Molecular Subtype in Breast Cancer

Wan Tang,Yao Huang,Ting Ouyang,Jiayun Zhao,Wei Ye,Yan Lin
Radiology Department, Second Affiliated Hospital, Shantou University Medical College

Background: The aim of this study was to prospectively compare the diagnostic accuracy of diffusion kurtosis imaging (DKI) and diffusion weighted imaging (DWI) in differentiation between malignant and benign breast lesions independently or jointly, and explore the correlation between functional diffusion parameters and prognostic factors, as well as molecular subtypes of breast cancer.
Methods: Seventy-three patients with 95 breast lesions were obtained between October 2015 and June 2019 in Radiology Department of our hospital. The patients were examined by breast MRI at 3.0 T prior to operation, including DWI and DKI. Apparent diffusion coefficient (ADC), mean kurtosis (MK) and mean diffusivity (MD) values in training set were compared by Mann-Whitney U test and Student's t test. Receiver operating characteristic (ROC) analysis was used to evaluate the diagnostic performance and determine the cut-off value of the imaging parameters in training set. Spearman correlation and Pearson correlation were used to evaluate the associations between imaging parameters and prognostic factors, as well as molecular subtypes of breast cancers. The ROC optimal cut-off value of the parameter screened out with the highest diagnostic accuracy for detecting breast cancer or predicting prognostic factors and molecular subtypes, was further used in validation set to verify their diagnostic accuracy.
Results: MK exhibited higher area under the curves (AUCs) for differentiation between malignant and benign lesions than did ADC and MD (0.978 vs 0.945 and 0.963, respectively, $p<0.05$). MK showed better correlation with histological grade compared with ADC and MD (r=0.733, -0.438 and -0.522, respectively) and showed higher AUCs in distinguishing high- and low-grade breast cancer. MK was the only parameter correlated with Ki-67 expression and luminal A breast cancer (r=0.339 and -0.518).
Conclusion: MK derived from DKI showed higher diagnostic accuracy compared with ADC and MD for detecting breast cancer. And DKI exhibited correlation with prognostic factors (histological grade, Ki-67 expression and HER2) and luminal A breast cancers, showing promise as an in-vivo and sensible imaging marker for characterizing breast lesions and providing valuable clinical information.

乳腺 X 线与动态增强 MR 对乳腺结构扭曲病变的诊断效能

何翠菊
中国医学科学院肿瘤医院深圳医院

目的：探讨乳腺 X 线表现为结构扭曲的病变在动态增强 MR (dynamic contrast enhanced MR images, DCE-MRI) 图像上的表现及 DCE-MRI 联合乳腺 X 线摄影术 (mammography, MG) 对该类病变的诊断价值。方法：回顾性分析 20 例 X 线表现为结构扭曲的病变在 MG 及 MRI 上的影像学特征，并

以病理结果为金标准,比较 MG 及 DCE-MRI 的诊断结果差异。结果:20 例病变中，良性病变 7 例，恶性病变 13 例。良性病变以单纯结构扭曲为主（7/20，35%），恶性病变则以结构扭曲合并多形性钙化或合并细小不定型钙化为主（6/20,30%），部分病变合并局部不对称（2/20，10%）。DCE-MRI 图像上，可疑良性病变多表现为缓慢持续型强化，可疑恶性病变以非肿块样强化多见，TIC 曲线均表现为平台型和廓清型（P <0. 001）。DCE-MRI 检查对 X 线表现为结构扭曲的病变的诊断准确率高于 MG，并且差异具有统计学意义（P <0. 001）。另外，DCE-MRI 检查的灵敏度明显优于 MG（P<0. 05）且具有较高特异度（<0. 05）.与单用 MG 检查相比,MG 与 DCE-MRI 检查相结合可显著提高灵敏度（P<0. 05）。结论:结合 DCE-MRI 能够显著提高临床诊断的效能。

不同 K0 时间对乳腺动态增强图像的影响

孙云凤,张红霞
哈尔滨医科大学附属肿瘤医院

目的：
探讨高浓度高弛豫率造影剂加乐显在乳腺动态增强扫描中 K0 时间的选择
材料与方法：
选取 240 例乳腺疾病患者，按 K0 时间不同分为 3 组，每组 80 人；分别采用
K0=35s,K0=60s,K0=90s;比较 3 组相同注射速率 1ml/s 下，不同 K0 时间对打药后第一期图像质量进行评估，主要从病灶、腺体血管有无伪影、腺体有无强化三方面对图像质量进行评分。采用双盲法由 3 名具有 12 年以上临床诊断经验的影像科副主任医师对所有患者图像进行综合评价，意见不一致时共同协商直至达成共识。
结果：1.病灶伪影分析结果 K0=35s 组与 K0=60s 组 K0=90s 组有统计学差异（P<0.05），K0=60s 组 K0=90s 组，病灶无伪影；K0=35s 中伪影出现率为 20%（16 例）；
2.腺体血管伪影分析结果 K0=35s 组与 K0=60s 组 K0=90s 组有统计学差异（P<0.05），K0=60s 组 K0=90s 组，腺体血管无伪影；K0=35s 中伪影出现率为 12.5%（10 例）；
3.腺体有无强化分析结果 K0=90s 组与 K0=35s 组 K0=60s 组有统计学差异（P<0.05），K0=35s 组 K0=60s 组，腺体无强化，K0=90s 腺体强化 25%（20 例）；
分析：Ghost 伪影产生的原因为：对比剂自肘静脉注射后，需要 25--30s 到达乳腺的供血动脉，加乐显高浓度高弛豫率；低速率 1ml/s 注射，到达乳腺供血动脉延迟 2-5s，同时患者个体存在循环差异；这时填充 K0 引起 K0 空间中心震荡形成 Ghost 伪影。适当延时取 K0=60s 可以解决该伪影问题。
K0=90s 组，腺体组织有强化会干扰病灶的显示，不利于诊断；
结论：对于高弛豫率高浓度对比剂加乐显做乳腺动态增强，K0=60s 最佳。

The diagnostic performance of quantitative mapping in breast cancer patients: a preliminary study using synthetic MRI

Tiebao Meng[1],Liangru Ke[1],Kuiyuan Liu [1],Haoqiang He[1],Huiming Liu[1],Ni He[1],Long Qian[2],Chuanmiao Xie[1]
1.Sun Yat-Sen University Cancer Center
2.GE Healthcare

Introduction

Recently, the published research works using syMRI have been reported in the neurodegenerative diseases, tumor, and musculoskeletal system. Although the T2 values of breast masses showed a significant position correlation between the syMRI and traditional T2 mapping. However, other relaxation quantitative metrics, such as T1 and PD mapping, were also not investigated. Hence, we hypothesis that the application of syMRI technology in breast cancer is feasible, and the quantitative maps may provide new noninvasive indicators for the differential diagnosis and prognosis prediction of breast cancer. The purpose of our study was to investigate the potential of the quantitative mapping in synthetic MRI for diagnosis of benign and malignant breast lesions.

Methods: In this prospective study, 77 patients with breast space-occupying lesions were submitted to physical examination and enrolled in this study. All patients underwent both the conventional and synthetic MRI before treatment. The quantitative metrics, including T1 (millisecond), T2 (millisecond) and PD (percentage units [pu]) values, derived from synthetic MRI were measured in the pathologically confirmed benign and malignant breast lesions. The diagnostic performance of synthetic MRI was evaluated with unpaired Student's t-test (or Mann-Whitney U test), ROC curve and multivariate logistic regression analysis.

Results: Among 77 patients, 48 were diagnosed as breast cancer and the rest were benign lesions. The breast cancer showed significantly higher T1 (1620.08 ± 233.28 ms) and lower T2 (80.87 ± 7.01 ms), PD (73.91 ± 13.93 pu) values than that of benign lesions. The AUCs were 0.940, 0.864 and 0.661 for T1, T2 and PD maps, respectively, in the diagnosis of breast cancer from benign lesions. Slightly higher AUC of 0.963 was achieved with the combination of those three relaxation quantitative metrics.

Conclusion: Quantitative mapping derived from synthetic MRI showed comparably notable diagnostic capability in the differentiation of benign and malignant breast lesions. Among those quantitative metrics, T1 mapping has the superior differential diagnostic efficiency.

EPO-0772
乳腺浸润性导管癌 MRI 征象与 Ki-67 阳性表达的相关性分析

张莹莹,罗娅红
辽宁省肿瘤医院

目的：乳腺 MRI 检查不仅能够显示病灶的形态特征，功能成像还可以反映病灶微血管的形成及从分子水平反映细胞代谢。目前乳腺癌的分子分型主要依靠免疫组织化学染色明确，但部分病理活检因样本量少等原因，其结果存在一定的偏差性，如能通过其他检查手段比如乳腺 MRI，发现其表现与不同乳腺癌分子亚型之间的关系，就能与病理结果相互补充，从而提高乳腺癌分子分型的准确率。探讨乳腺浸润性导管癌 MRI 征象与 Ki-67 阳性表达间的相关性。

方法：收集病理证实为乳腺浸润性导管癌且术前接受 MR 检查患者的资料，均为女性。MRI 数据均传至 GE AW 4.3 工作站，利用 Functool 软件进行后处理。分析乳腺浸润性导管癌 MRI 征象与 Ki-67 阳性表达间的相关性。

结果：本研究结果显示，ADC 值与 Ki-67 阳性表达呈负相关（P＜0.05，r=-0.131），病灶最大径与 Ki-67 阳性表达呈正相关（P＜0.01，r=0.238），DWI 信号强度与 Ki-67 阳性表达呈正相关（P＜0.01，r=0.300）。早期强化率、延迟强化率、T2WI 信号强度与 Ki-67 阳性表达无相关性（P＞0.05）。

结论：通过对乳腺浸润性导管癌 MRI 征象与 Ki-67 表达情况的分析，本研究显示乳腺浸润性导管癌 ADC 值、病灶最大径、DWI 信号强度与 Ki-67 的阳性表达存在一定的相关性，提示 ADC 值、病灶最大径、DWI 信号强度可作为评价乳腺浸润性导管癌 Ki-67 阳性表达程度的参考指标。

MR 对乳腺不规则导管内乳头状瘤与浸润性导管癌的鉴别诊断价值

孙诗昀,丁莹莹,谢瑜,吴建萍,杨浩澜,李卓琳
云南省肿瘤医院/昆明医学院第三附属医院

目的 探讨不规则肿块型导管内乳头状瘤（IDP）和浸润性导管癌（IDC）的 MRI 影像表现和特征，提高 MRI 对于二者的诊断准确率。**方法** 本研究回顾性纳入了经手术病理证实为 IDP 和 IDC 的患者各 33 例，分析了包括病灶大小、边界、内部成分、平扫信号强度、强化方式、ADC 值及 TIC 曲线在内的 MRI 表现。进行 χ^2 检验、t 检验、秩和检验。**结果** 两组相比，病灶边界（$P<0.001$）、大小（$P<0.001$）、ADC 值（$P<0.001$）、强化方式（$P=0.001$）、TIC 曲线达峰时间（$P<0.001$）、斜率（$P<0.001$）和峰值强化率（$P<0.001$）具有统计学差异（$P<0.05$）；病变部位（$P=0.159$）、内部成分（$P=0.778$）、T_2WI 信号（$P=0.438$）、曲线类型（$P=0.406$）无统计学差异。**结论** 不规则肿块型 IDP 与 IDC 虽然具有相似的 MRI 表现，但病灶边缘、ADC 值、强化方式以及曲线达峰时间、斜率和峰值强化率对于二者的鉴别具有重要意义。

多模态成像技术评价乳腺癌新辅助化疗疗效的价值

雷鹰,王枝红,赵恒飞,段庆红
贵州省肿瘤医院

目的：探索乳腺癌患者在新辅助化疗前后行乳腺超声剪切波弹性成像、磁共振 DWI 及动态 MRI 增强多模态影像学联合检查，分析其影像特征改变，评价乳腺癌新辅助化疗疗效的价值。**方法**：收集我院经病理证实为乳腺癌，患者行新辅助化疗 30 例，在新辅助化疗前后行乳腺超声及磁共振检查，测取肿瘤弹性模量值、ADC 值及绘制时间-信号强化曲线。**结果**：病灶肿瘤弹性模量最大值、最小值、平均值、ADC 平均值在新辅助治疗前后病灶体积缩小的病例中差异具有统计学意义（P 值均＜0.05）。新辅助化疗前病灶感兴趣区时间-信号强化曲线：0 例为 I 型曲线，9 例为 II 型曲线，21 例为 III 型曲线；新辅助化疗后 I 型曲线 6 例，II 型曲线 16 例，III 型曲线 8 例。**结论**：多模态影像学检查对乳腺癌新辅助化疗的疗效评估具有重要的临床应用价值。

Mean and entropy of apparent diffusion coefficient values with standard- and high-b-value diffusion-weighted MR imaging in invasive ductal breast cancer: Association with histologic phenotypes

Shiteng Suo,Jia Hua
Renji Hospital, School of Medicine, Shanghai Jiao Tong University

Purpose: To study the utility of mean and entropy of apparent diffusion coefficient (ADC) values at standard (800 sec/mm^2) and high (1500 sec/mm^2) *b*-values obtained with diffusion-weighted imaging in identifying histologic phenotypes of invasive ductal breast cancer (IDC).
Methods: Seventy-six patients with histologically confirmed IDC underwent 3.0-T diffusion-weighted imaging with *b*-values of 800 and 1500 sec/ mm^2, and corresponding ADC maps (ADC_{800} and ADC_{1500}) were generated. Mean and entropy of volumetric ADC values measured on all sections of ADC_{800} and ADC_{1500} containing the entire tumor were compared with receptor expression status (oestrogen receptor [ER], progesterone receptor [PR], human epidermal growth factor-2 [HER2], and Ki-67) and histologic phenotype (Luminal A, Luminal B HER2-negative, Luminal B HER2-positive, HER2 positive and Triple negative).
Results: Mean ADC_{800} and ADC_{1500} values were both significantly decreased in ER-positive, PR- positive and HER2-negative tumors (all $P<0.05$, independent Student *t* test). Ki-67 $\geq$20% tumors demonstrated significantly higher ADC_{800} and ADC_{1500} entropy values compared with Ki-67 <20% tumors (both $P<0.001$, Mann-Whitney *U* test). Significant differences were also found among different histologic phenotypes for mean ADC_{800} and ADC_{1500} values ($P = 0.0016$ and 0.0004, respectively, one-way analysis of variance) and ADC_{800} and ADC_{1500} entropy values ($P = 0.0036$ and 0.0016, respectively, Kruskal-Wallis nonparametric test). Luminal A subtype tended to display a lower ADC entropy value compared with other subtypes, while HER2 positive subtype tended to display a higher mean ADC value. Receiver operating characteristic analysis showed that ADC_{1500} metrics exhibited better performance than ADC_{800} for these discriminations.
Conclusion: Mean and entropy of ADC values provided complementary information regarding their associations with histologic phenotypes in IDC. High-*b*-value ADC_{1500} metrics may facilitate better phenotype discrimination.

Independent Validation of Machine Learning in Diagnosing Breast Cancer on MRI

yu ji,Wenjuan Ma,Hong Lu,Ying Zhu,Peifang Liu
Tianjin Medical University Cancer Institute and Hospital

Background: As AI methods for the diagnosis of disease advance, we aimed to evaluate machine learning in the predictive task of distinguishing between malignant and benign breast lesions on an independent clinical MRI dataset.
Methods: Computer analysis was conducted on consecutive MRI studies from 1,483 breast cancer and 496 benign patients who underwent MRI examinations between February 2015 and October 2017; with the age ranges of the cancer and benign patients being 19 to 77 and 16 to 76 years old, respectively. Cases were separated into a training dataset (years 2015 & 2016; 1444 cases) and an independent testing dataset (year 2017; 535 cases) based on MRI examination date. After radiologist indication of the lesion, the computer automatically segmented and extracted radiomic features, which were

subsequently merged with a support-vector machine (SVM) to yield a lesion signature. Area under the ROC curve served as the primary figure of merit in the classification task.
Results: In the task of distinguishing malignant and benign breast lesions on DCE-MRI, the trained predictive model yielded an AUC value of 0.89 (95% CI: 0.858, 0.922) on the independent test dataset. AUC values of 0.88 (95% CI: 0.845, 0.926) and 0.90 (95% CI: 0.837, 0.940) were obtained for mass lesions only and non-mass lesions only, respectively. Compared with actual clinical management decisions, the predictive model achieved 99.5% sensitivity with 9.6% fewer recommended biopsies.
Conclusions: On an independent, consecutive clinical dataset from China, a trained machine learning system yielded high performance in distinguishing between malignant and benign breast lesions.

EPO-0777
增强 MRI 影像组学对平台型乳腺癌及乳腺纤维腺瘤的鉴别

徐圆
扬州市苏北人民医院

目的 探讨影像组学鉴别平台型乳腺癌及纤维腺瘤的可行性。**方法** 回顾性分析病理证实的乳腺癌 23 例及纤维腺瘤 20 例，评价病灶边界、形态及强化特点。沿病灶边缘勾画感兴趣区，通过 B11 数据包的交互信息（MI）、Fisher 系数和 POE+ACC 共提取 30 个纹理参数。联合十折交叉验证，应用决策树、随机森林、K-最邻近算法、朴素贝叶斯算法进行模型构建。**结果** 乳腺癌组除角二阶矩外，熵值、游程灰度不均匀性及长度不均匀性参数值大于纤维腺瘤，P 值均<0.05，具有显著差异。ADC 值上，乳腺癌组（$0.969\pm0.226\times10^{-3}mm^2/s$）均值低于纤维腺瘤组（$1.424\pm0.345\times10^{-3}mm^2/s$），P 值<0.05，具有显著差异。乳腺癌多呈分叶状、不规则形，边界不清，强化不均。朴素贝叶斯算法构建模型的诊断效能最好，总体准确率 95.25%，敏感度 95.65%，特异度 95.00%。**结论** 影像组学模型能有效鉴别平台型乳腺纤维腺瘤及乳腺癌

EPO-0778
BOLD-MRI 对乳腺癌临床病理因素预测价值的初步研究

余哲歆[1],冯雅博[2],刘进康[2],王小宜[1,2]
1.湘雅常德医院
2.中南大学湘雅医院

目的 探讨血氧水平依赖功能磁共振成像（Blood oxygen level-dependent functional MRI，BOLD-MRI）对乳腺癌临床病理因素的预测价值。**方法** 收集 79 例乳腺肿块患者，术前行 3.0T 磁共振常规平扫、增强、BOLD 扫描，测量病灶的 BOLD 参数 R2 *值。选择最终经手术病理证实为乳腺癌患者 41 例，根据乳腺癌临床病理因素（包括 ER、PR、Ki-67、HER-2、P53、EGFR、脉管侵犯、腋窝淋巴结情况）进行分组。分析 R2*值在不同分组中的差异，并将有统计学意义的因素用受试者工作曲线分析其对乳腺癌临床病理因素的预测效能。**结果** 所有患者均为女性，年龄范围 28-68 岁，中位年龄 46 岁。共 44 个病灶，其中 ER 阳性 27 例，阴性 17 例；PR 阳性 22 例，阴性 22 例；Ki-67 高表达 30 例，低表达 14 例；HER-2 阳性 18 例，阴性 26 例；P53 阳性 22 例，阴性 22 例；EGFR 阳性 15 例，阴性 29 例；有脉管侵犯 11 例，无脉管侵犯 33 例；腋窝淋巴结转移的 17 例，无腋窝

淋巴结转移 27 例。病灶处的 R2*值与 Ki67、EGFR 的表达及腋窝淋巴结转移情况呈正相关（r=0.483，P=0.009；r=0.593，P=0.006；r=0.498，P=0.002），R2*值在 Ki-67 高低表达组间、EGFR 阴阳性组间、有无腋窝淋巴结转移组间差别有统计学意义（*P*值均<0.05）。病灶 R2*值在不同组间的预测效能：R2*值预测 Ki-67 表达的敏感度、特异度为 64.3%、57.6%，曲线下面积（AUC）为 0.557；R2*值预测 EGFR 表达情况的敏感度、特异度为 65.5%、73.3%，AUC 为 0.660；R2*值预测腋窝淋巴结转移情况的敏感度、特异度为 64.7%、70.4%，AUC 为 0.649。**结论** R2*值对乳腺癌 Ki-67、EGFR 及腋窝淋巴结转移情况具有潜在的预测价值。

EPO-0779

乳腺原发淋巴瘤 MRI 影像特点与临床病理分析

洪雪冬
合肥平安健康检测中心

目的：对乳腺内原发淋巴瘤（PBL）的 MRI 影像表现及病理情况进行观察分析，为今后的诊断总结经验，提高临床对 PBL 的影像学认识。**方法**：对有病理证实的 23 例原发性乳腺淋巴瘤患者回顾分析相对应的 MRI 图像特点及病理情况。**结果**：全部患者均为单侧发病：左侧 15 例，右侧 8 例，其中有 3 例具有多发病灶，直径均＞2.5 cm 团块状软组织信号。20 例病灶无毛刺，3 例病灶有毛刺，19 例伴有淋巴结肿大，10 例为双侧淋巴结肿大，9 例为单侧淋巴结肿大。MR 表现：T1WI 序列呈均匀低信号，T2WI 序列呈稍高或高信号，增强后呈明显均匀强化，（b 值 800-1000）DWI 序列呈明显高信号，ADC 值明显降低。病理分析：23 例乳腺内淋巴瘤中，均为非霍奇金淋巴瘤，其中 19 例为 B 细胞性，4 例为 T 细胞性，在 19 例 B 细胞性非霍奇金淋巴瘤患者中，出现弥漫性大 B 细胞淋巴瘤的患者是 16 例，黏膜相关淋巴瘤的患者 3 例，与相应影像特点比较并都具有统计学意义。**结论**：原发性乳腺淋巴瘤的磁共振影像表现存在一定特异性，可以作为组织病理学的辅助检查手段，为临床诊断提供相关参考。

EPO-0780

Reproducibility in apparent diffusion coefficient (ADC) value: Is it influenced by region of interest (ROI) selection or MR scanners in breast cancer?

Yuan Guo,Xiaorui Han,Liqi Li,Guanyuan Ning,Xinqing Jiang
1Department of Radiology， the Second Affiliated Hospital of South China University of Technology，Guangzhou First People’s Hospital， Guangzhou， 510180， China

Objectives:
To evaluate the reproducibility in apparent diffusion coefficient (ADC) value on breast cancer through different regions of interest (ROIs) selection at 1.5-Tesla and 3.0 Tesla MR scanners.

Methods:
The retrospective, single-center study was approved by the Institutional Review Board. Between September 2016 and February 2019, 152 patients with breast cancer were scanned by diffusion-weighted MR imaging (b values: 50 to 800 s/mm2). The age, sex, tumor size

and molecular typing (Luminal subtype and non-Luminal subtype) of participants were strictly matched before the study. Three ROIs selection were approached as follows: (1) small circle 2D-ROI (ROI-c); (2) 2D-ROI on the largest slice covering the lesion (ROI-s) and (3) 3D-ROI covering the whole lesion (ROI-w). Comparison of ADC values were obtained at both types of scanners.

Results:
(1)With the same MR scanner and same reader, the ADC values measured by different ROI measurement methods were different: the ADC values of ROI-c, ROI-s and ROI-w were (0.910±0.171)×$10^{-3}$$mm^2$/s, (1.072±0.171)×$10^{-3}$$mm^2$/s, (1.136±0.164)×$10^{-3}$$mm^2$/s at 1.5T, while they are (0.784±0.156) ×$10^{-3}$$mm^2$/s，(0.950±0.181)×$10^{-3}$$mm^2$/s, (0.945±0.174)×$10^{-3}$$mm^2$/s at 3.0T respectively. Generally, ADC of ROI-w-entropy and ROI-w-10^{th} performed better at 1.5T scanner, while ROI-w-10^{th} and ROI-w-90^{th} performed better at 3.0T scanner. (2) The ROI-c, ROI-s and ROI-w-mean ADC values were significantly lower at 3.0T scanner compared with the 1.5T one (all P < 0.001).

Conclusions:
The reproducibility in ADC value is influenced by ROI selection and types of MR scanners in breast lesions. Further studies are required to confirm the influence of different MR scanners with more accurate design and more cases.

EPO-0781
全体积表观弥散系数作为生物学标志物鉴别乳腺病变的价值及与 Ki-67 的相关性研究

孔庆聪[1],郭媛[2],李丽琪[2]
1.中山大学附属第三医院
2.广州市第一人民医院

目的：
探讨全体积表观弥散系数作为生物学标志物鉴别乳腺病变的价值及与 Ki-67 的相关性。

方法：
广州市第一人民医院伦理审查委员会批准了这项回顾性研究。2016 年 9 月至 2019 年 2 月，189 名患者（80 例乳腺良性病变及 105 例乳腺癌患者）进行 MR 成像检查， b 值分别为 50 和 800 s/ mm^2。通过全体积 ADC 直方图对整个乳腺病变进行分析以区分良性和恶性乳腺病变及不同亚型分子乳腺癌。使用 Spearman 相关分析进行统计学分析 ADC 各参数和 Ki-67 之间的关系。

结果：
在 189 个乳腺病变中，80 例良性和 105 例恶性病变之间，患者年龄（P <0.001）和病变大小（P = 0.006）存在显着差异，且所有 ADC 直方图参数之间存在显着差异（包括平均值，第 10 百分位数，第 50 百分位数，第 90 百分位数，偏度，峰度和熵）（P <0.001），其中中位数和平均 ADC 直方图参数区别效能更高（AUC 分别为 0.9433 和

0.9303）。ROC 曲线显示全体积 ADC 第 10 百分位数和熵可以区分 Her-2 状态（分别为 p = 0.0010 和 p = 0.0013）和 HR 状态（p = 0.0198，p = 0.0408 分别）。在所有乳腺癌病变中，ki-67 可分为低增殖组（n=35，Ki-67 <14%），高增殖组（n=70，Ki-67≥14）。 ROC 分析显示全体积 ADC 直方图中，熵和偏度可以区分 ki-67 状态（p = 0.0074，p <0.001），并且 ADC 熵（r = 0.383）和偏度（r = 0.209）与 ki-67 之间存在弱相关性。

结论：

全体积 ADC 直方图可作为定量成像标记物区分乳腺良恶性病变，可作为预测乳腺肿瘤增殖指标的补充。

EPO-0782

乳腺单纯包裹性乳头状癌的 MRI 表现

叶彤
上海交通大学医学院附属新华医院

目的：探讨乳腺单纯包裹性乳头状癌的 MRI 表现。方法：回顾性分析我院经手术病理证实的 4 例乳腺单纯包裹性乳头状癌的 MRI 表现，包括形态学特点、增强特点、时间-信号强度曲线及 ADC 值。结果：4 例乳腺单纯包裹性乳头状癌均表现为圆形或类圆形囊实性肿块，增强可见环形强化包膜，时间-信号强度曲线均呈流出型，ADC 值为$(1.14\pm0.20)\times10^{-3}mm^2/s$。结论：乳腺单纯包裹性乳头状癌的 MRI 表现有一定的特征性。

EPO-0783

表观扩散系数直方图在新辅助化疗前预测 Luminal 型乳腺癌疗效的价值

耿小川[1,2],华佳[2],庄治国[2]
1.上海交通大学医学院附属仁济医院南院
2.上海交通大学医学院附属仁济医院

目的 探讨表观扩散系数(ADC)直方图在新辅助化疗（NAC）前预测 Luminal 型乳腺癌疗效的临床价值。

材料与方法 回顾性分析 NAC 前穿刺病理及免疫组化证实为 Luminal 型乳腺癌、完善 MRI 检查（包括 DWI 序列）、NAC 后手术的患者 57 例，其中有效组 17 例。记录乳腺癌的 ADC 直方图参数，包括平均值（mean）、最小值（min）、标准差（SD）、最大值（max）、10%、25%、50%、75%及 90%百分位数、偏度（skewness）和峰度（kurtosis）。用组内相关系数（ICC）分析观察者间和观察者内一致性。用独立样本 t 检验对比各参数。应用受试者操作特性曲线（ROC）评价 ADC 直方图参数预测 NAC 疗效的诊断效能。

结果 ADC 直方图参数观察者间 ICC（0.089-0.845）均低于观察者内（0.306-0.906）。min、10%、25%及 50%的一致性较好。有效组的 min、10%和 25%均高于无效组（$p<0.007$），差异有统计学意义，其中 10%的 ROC 曲线下面积最大（0.746），以 $0.746\times10^{-3}mm^2/s$ 为最佳界值，敏感度、特异度分别为 82.35%、65.00%。但 10%的诊断效能未明显高于 25%（ROC 曲线下面积 0.724，$p=0.505$）。

结论 ADC 直方图在 NAC 前预测 Luminal 型乳腺癌有一定的诊断价值，10%、25%的诊断价值较高且一致性较好。

EPO-0784

The application value of DCE-MRI quantitative parameters in the evaluation of the efficacy of neoadjuvant chemotherapy for breast cancer

Na Li, Yahong Luo
LIAONING CANCER HOSPITAL & INSTITUTE

Objective: To evaluate the value of dynamic contract enhanced magnetic resonance imaging (DCE-MRI) quantitative parameters and the expression of related biological factors in the evaluation of the efficacy of neoadjuvant chemotherapy for invasive ductal carcinoma of the breast. **Methods:** 56 female patients with invasive ductal carcinoma of the breast were recruited ,all of them had complete clinical data and undertake neoadjuvant chemotherapy. In this study, they were divided into effective and ineffective groups according to the RECIST criteria. The values of K^{trans}, K_{ep} and V_e before ,after two courses and at the end of chemotherapy were compared. Immunohistochemical staining was used to detect the expression of ER, PR, Her-2 and Ki-67 in breast cancer tissues, and the size of DCE-MRI quantitative parameters in different expression states was analyzed. The correlation between the quantitative parameters of DCE-MRI and the expression of Ki-67 was analyzed. **Results:** The K^{trans}max, K^{trans}mean, K_{ep} max, and K_{ep} mean expression in the effective group were significantly decreased than those before neoadjuvant chemotherapy ($P < 0.05$). The K^{trans}min expression was significantly lower at the end of chemotherapy than before neoadjuvant chemotherapy ($P < 0.05$). The K_{ep}max and K_{ep}mean values in the ER-expression and PR-expression negative groups were higher than those in the ER-expression and PR-expression positive groups ($P < 0.05$). The $V_e$max value in the PR-negative group were higher than those in the PR-negative positive group($P < 0.05$). Ki-67 expression was positively correlated with K^{trans}min, K^{trans}max and K^{trans}mean values (r=0.384, P=0.003; r=0.294, P=0.028; r=0.551, $P < 0.01$). There was no correlation between the value of K_{ep}, V_e and Ki-67 expression ($P > 0.05$). **Conclusion:** The quantitative parameters of DCE-MRI and the expression of related biological factors can evaluate the efficacy of neoadjuvant chemotherapy in invasive ductal carcinoma of the breast patients, which is worthy of clinical application.

EPO-0785

多模态磁共振成像联合临床病理特征预测乳腺癌术前腋窝淋巴结转移的价值

薛梅,李静
中国医学科学院肿瘤医院

目的：探讨乳腺癌患者腋窝淋巴结转移的临床影像及病理的相关因素。
方法：回顾性分析 2016 年 1 月 1 日-2016 年 12 月 30 日中国医学科学院肿瘤医院经手术病理证实的 219 例乳腺癌患者，术前均行 MR 检查，术后有完整常规病理、免疫组化及腋窝淋巴结病理资料。根据术后病理结果将患者分为有腋窝淋巴结转移（ALNM(+)）和无转移淋巴结组(ALNM(-))，分析乳腺原发灶的 MR 特征及病理特征，包括：年龄、腺体类型、背景强化、肿瘤位置、肿瘤长径、病灶个数、T2WI 信号特征、强化方式、病理类型、ER、PR、Her2、Ki67 及分子分型，并测量肿瘤原发灶的表观弥散系数（Apparent Diffusion Coefficient ，ADC）值、时间-信号强度曲线（Time-Intensity Curve，TIC），进行单变量和多变量分析，探讨 ALNM(+)与 ALNM(-)组间的差异。单变量分析方面，定性资料的比较采用 x 2 检验，定量资料的比较采用独立样本 t 检验（正态分布数据）或 Mann-Whitney U 检验（偏态分布数据）。多变量分析采用 Logistic 二元回归分析。
结果： 单变量分析中，ALNM（+）组与 ALNM(-)组在肿瘤长径、ADC 值、病灶个数、淋巴管浸润以及 Ki67 水平方面的差异有显著统计学差异（P<0.05）。而年龄、家族史、腺体类型、背景强化、肿瘤位置、T2WI 信号特征、强化方式、时间-信号强度曲线（Time-Intensity Curve，TIC）类型、ER、PR、Her2 以及分子分型等方面的差异没有显著统计学差异（P>0.05）。多变量分析中，肿瘤长径、病灶个数、淋巴管浸润和 Ki67 水平仍然是与腋窝淋巴结转移相关的独立变量。
结论：术前 MRI 能够有效的评价乳腺癌腋窝淋巴结转移，乳腺癌原发灶的肿瘤长径、ADC 值、病灶个数、淋巴管浸润以及 Ki67 水平是腋窝淋巴结转移最有力的独立预测因子。

EPO-0786
ADC 图影像组学对预测浸润性乳腺癌脉管浸润的价值

于晓军,陈永升
潍坊医学院医学影像学系

［摘要］**目的**探讨 ADC 图影像组学对预测浸润性乳腺癌脉管浸润的价值。**方法**收集我院 2016 年 3 月至 2018 年 10 月收治的 192 例浸润乳腺癌患者作为研究对象。根据手术病理结果将其分为脉管浸润阳性组和脉管浸润阴性组。观察、记录乳腺癌的 MRI 形态学特征、年龄及分子亚型并测量、记录 ADC 图影像组学参数，包括直方图参数、纹理参数、形状系数参数、共生矩阵参数、游程矩阵参数、灰度区域大小矩阵共 64 个参数；分别采用两独立样本 x^2 检验、t 检验及 Mann-Whitney U 检验比较两组病例形态学表现、淋巴结情况、年龄、分子亚型及 ADC 直方图影像组学参数。**结果**脉管浸润阳性 58 例，脉管浸润阴性 134 例；肿瘤大小、淋巴结阳性率、瘤周水肿与脉管浸润显著相关(P＝0.006、0.000、0.042)；阳性组与阴性组对比 50thADC、峰度及熵-共生矩阵呈显著相关（P<0.05）；年龄、绝经状态、环形征（环形强化、DWI 环形高信号）、分子亚型两组对比无显著性差异（P>0.05）。**结论** ADC 直方图影像组学对预测浸润性乳腺癌是否有脉管浸润有一定价值。

EPO-0787
比较基于模型与非模型的 DCE-MRI 药代动力学参数对乳腺癌新辅助化疗(NAC)反应的预测价值。

吕广洁,姜蕾
北京医院

目的：探索基于模型的 DCE-MRI 药代动力学参数早期预测乳腺癌新辅助化疗（NAC）反应的表现是否优于非模型参数。
方法：61 例病理证实的乳腺癌患者在 NAC 前(T0)、1 周期后(T1)和 4 周期后(T2)行 DCE-MRI 检查，分别测定基于模型(标准 Tofts-Kety 模型)和非模型 DCE-MRI 药代动力学参数。基于模型的参数：K_{trans}、V_e、K_{ep}；无模型参数：前 90s 增强曲线下面积（IAUGC）、最大上升斜率（MaxSlope）、正性增强积分（PEI）、对比增强比（CER）和时间-强度曲线类型（TIC）。根据手术病理 Miller-Payne 分级，患者分为良好反应组(R 组)和不良反应组（NR 组）。采用非参数及卡方检验比较两组三个时间点各参数的差异，包括各参数 T0 到 T1 差值。多因素 logistic 回归分析与 NAC 反应相关的参数，受试者工作特征曲线（ROC）分析其预测性能。
结果：R 组 21 例，NR 组 40 例。T1 时，两组间 K_{trans}、IAUGC、MaxSlope 值及 TIC 类型具有显著差异；T2 时，除 V_e外，余参数组间差异均有统计学意义(P < 0.05)。T1 时，R 组的 K_{trans}、IAUGC、MaxSlope、PEI 变化的百分比明显高于 NR 组。多因素 logistic 分析显示 K_{trans}与 TIC 与 NAC 早期反应相关。T1 时,K_{trans}曲线下面积(AUC)为 0.77 (95% CI：0.64,0.89)，敏感性为 52.4%，特异性为 95%；TIC 的 AUC 为 0.83 (95%CI：0.71,0.94)，敏感性为 66.7%，特异性为 87.5%；二者差异无统计学意义(P > 0.05)，且 K_{trans}联合 TIC 不能提高预测最终化疗反应的效果。
结论：基于模型的 DCE-MRI 药代动力学参数在早期预测乳腺癌 NAC 疗效方面的表现与非模型参数相似，其中 K_{trans}和 TIC 是最有效的参数。

全容积 ADC 直方图定量分析对不同亚型乳腺癌新辅助化疗后获得病理完全缓解反应的评估和预测价值

王晓
江苏省人民医院（南京医科大学第一附属医院）

目的 探讨全容积 ADC 直方图参数对不同亚型乳腺癌新辅助化疗获得病理完全缓解反应的评估和预测价值。
方法 搜集我院 121 例经穿刺病理证实为浸润性乳腺癌的患者，治疗前均在我院行 3.0T 乳腺 MRI 检查，化疗后手术病理采用 Miller-Payne（M-P）分级系统评价化疗反应，分为病理完全缓解组（Pathological Complete Response, PCR）和非病理完全缓解组（non Pathological Complete Response, nPCR）。利用 Firevoxel 软件在 DWI 图上（b=800s/mm^2）绘制肿瘤每一层面轮廓，生成 ADC 直方图，记录各参数，包括 ADC 平均值（ADC_{mean}）、偏度系数、峰度系数、ADC 最小值（ADC_{min}）、ADC 最大值（ADC_{max}）、ADC 第 10、第 50 及第 90 百分位数（ADC 10%、ADC 50%、ADC 90%）。统计学方法采用两独立样本 t 检验或 Mann-Whitney U 检验。以 ROC 曲线寻找预测 PCR 的最佳参数阈值。
结果 峰度系数在 HER2+过表达亚型中的 PCR 组和 nPCR 组之间有统计学差异（P=0.039），以 ROC 曲线评价峰度系数预测 NAC 后病理反应，曲线下面积为 0.813，采用阈值 1.861 预测 PCR，其敏感度为 100%，特异度为 68.7%。在三阴性亚型中 PCR 组和 nPCR 组之间 ADC_{mean}以及 $ADC_{50\%}$有统计学差异（P 值分别为 0.028，0.013），$ADC_{50\%}$采用阈值 0.967 预测 PCR，曲线下面积为 0.842，敏感度和特异度分别为 80%、83.3%。
结论 1.峰度系数对预测 HER2+过表达亚型化疗后 PCR 具有一定的价值；2.$ADC_{50\%}$对预测三阴性乳腺癌化疗后 PCR 具有较高的应用价值。

EPO-0789

比较 3.0TMRI 中 IDEAL 序列与 T2WI-FS 序列对乳腺的脂肪抑制效果

龙莉[1],邓文明[1],韦素岚[1],刘周[1],潘海燕[1],黄波[1],朱超凡[1],罗德红[2]
1.中国医学科学院肿瘤医院深圳医院
2.中国医学科学院肿瘤医院

目的：对比研究 IDEAL 序列和 T2WI-FS 序列在 3.0T 乳腺 MR 中的脂肪抑制图像质量，进一步明确 IDEAL 序列与 T2WI-FS 序列脂肪抑制的稳定性。
材料和方法：选取 21 名行乳腺 MR 检查的患者，应用 3.0T GE750w MRI 行 T1WI、DWI、轴位 T2WI-IDEAL 及轴位 T2WI-FS 序列扫描，T2WI-IDEAL 序列的扫描参数为：重复时间（TR）:5230ms;回波时间（TE）：85ms;带宽：62.5khz；视野（FOV）：38×38cm；层厚/层间距:5.0/1.0mm;矩阵：320×256；激励次数（NEX):1。T2WI-FS 序列的扫描参数为：TR:5230ms;TE：85ms;带宽：62.5khz；FOV：38×38cm；层厚/层间距:5.0/1.0mm;矩阵：320×256；NEX:2。用主观和客观两种评价方法进行评价。主观评分标准：1 分为图像质量差，图像无法诊断；2 分为脂肪抑制效果和整体图像质量欠佳，提供部分诊断信息；3 分为脂肪抑制效果和整体图像质量良好，无诊断信息丢失；4 分为脂肪抑制效果和整体图像质量优良。客观方法为：选取两种脂肪抑制方法扫描得到的图像选择同一层面的 21 个感兴趣区测量皮下脂肪的信号强度，并绘空间信号曲线图进行比较。采用 Kappa 分析对 2 名医师主观评分进行一致性分析，Kappa≥0.75 为一致性较好。
结果：2 名医师对乳腺 T2WI 压脂图像质量主观评分一致性良好。T2WI-IDEAL 序列评分 3 分及以上占 95%；而 T2WI-FS 序列评分 3 分及以上占 85%，见表 1。通过统计学证实两种压脂序列的评分有统计学意义（$P<0.05$）。两种脂肪抑制的空间信号曲线图如图 1。T2WI-IDEAL 序列空间信号曲线图较平稳，脂肪抑制效果可靠性较好。
结论：对于乳腺 3.0TMRI,应用 T2WI-IDEAL 序列较 FS 有更好稳定性及图像质量和脂肪的抑制效果。

乳腺 MRI 定量动态增强参数的重复性与一致性研究

刘万花,张艳秋
东南大学附属中大医院

摘要：目的探讨乳腺 MRI 定量动态增强参数的重复性和一致性。方法两位操作者,记为操作者 1 和操作者 2,分别回顾性测量 250 例患者共 256 个乳腺病灶,所有病灶均术前行 3.0 T 乳腺 MRI 定量动态增强扫描,并经穿刺活检或手术病理证实,分别测量容量转移常数(Ktrans)、速率常数(Kep)和血管外细胞外间隙容积比（Ve）,并进行组间统计分析。运用配对 t 检验评估乳腺 MRI 各定量动态增强参数的差异性,运用组内相关系数（ICC）和 Cronbach’s Alpha 系数评估其重复性,运用 Bland-Altman 分析乳腺 MRI 各定量动态增强参数的组间一致性。结果操作者 1 和操作者 2 测得的乳腺恶性病变各定量参数分别为 Ktrans（1.489±0.636）/min 和（1.469±0.632）/min,Kep（3.220±1.651）/min 和（3.256±1.746）/min,Ve（0.504±0.152）/min 和（0.517±0.162）/min;操作者 1 和操作者 2 测得的乳腺良性病变各定量参数分别为 Ktrans（0.429±0.236）/min 和（0.443±0.251）/min,Kep（0.769±0.431）/min 和（0.794±0.463）/min,Ve（0.564±0.172）/min 和（0.570±0.159）/min。不同操作者间乳腺恶性病变及良性病变的 Ktrans、Kep 及 Ve 值差异均无统计学意义（P>0.05）;不同操作者间所测得的乳腺 MRI 各定量动态增强参数的 ICC 均在 0.7 以上,Cronbach’s Alpha 系数也均>0.8,显示重复性较好。BlandAltman 图像分析结果显示两

个不同操作者之间所测得的乳腺 MRI 各定量动态增强参数的一致性较好。结论乳腺 MRI 定量动态增强参数的测量在不同操作者间具有较好的重复性和一致性。

肿块与非肿块型乳腺癌病灶扩散加权成像参数的重复性与一致性研究

刘万花,王梦茹
东南大学附属中大医院

目的 探讨肿块与非肿块型乳腺癌病变采用不同 b 值行 DWI 检查,不同操作者间的重复性和一致性.方法 回顾性分析东南大学附属中大医院 2010 年 12 月至 2017 年 10 月经乳腺动态对比增强 MRI(DCE-MRI)检查发现为乳腺非囊性病灶,行乳腺 DWI 检查,且经外科手术病理证实为乳腺癌的 131 例女性患者(133 个病灶).肿块型病变 94 例(96 个病灶),非肿块型病变 37 例(37 个病灶).由 2 名同等资历的放射科医师采用双盲法阅片,分别测量 ADC 值.采用配对 t 检验比较 2 名医师测量参数的差异,采用组内相关系数(ICC)和 Cronbach α 系数评价 2 名医师测量的重复性,采用 Bland-Altman 一致性分析方法评价 2 名医师间的一致性.结果 不同 b 值下乳腺非肿块型和肿块型病变的 ADC 值,2 名医师间测量结果的差异均无统计学意义(P 均>0.05).2 名医师测得的不同 b 值下乳腺非肿块型病变及肿块型病变的 ADC 值，重复性为好或非常好 Cronbach α 值分别为 0.94、0.97、0.99、0.96、0.95,信度高.Bland-Altman 图像分析结果显示不同操作者在不同 b 值下测得的乳腺非肿块型、肿块型病变的 ADC 值一致性均较好.乳腺非肿块型病变在不同 b 值下,分别有 97.3％(36/37)、94.6％(35/37)、93.1％(27/29)、8/8、8/8 的点在 95％一致性界限内;乳腺肿块型病变在不同 b 值下,分别有 97.9％(94/96)、94.8％(91/96)、92.2％(47/51)、95.6％(43/45)、93.3％(42/45)的点在 95％一致性界限内.结论 在不同 b 值条件下测量乳腺 ADC 值,不同操作者间对不同病变类型乳腺癌病灶均具有较好的重复性和一致性.

EPO-0792
探讨乳腺癌 MR 动态增强图像的血管表现与肿瘤形态、大小及病理分级的相关性

刘万花,彭程宇
东南大学附属中大医院

目的探讨乳腺癌 3.0T MR 动态增强图像中血管表现与肿瘤形态、大小及病理分级的相关性。方法对 53 例乳腺癌术前患者(54 个病灶)行双侧乳腺 3.0T MR 动态增强扫描,重建得到 3D MIP 图像,分别对图中病灶邻近血管、患侧与对侧的差异血管数目进行评分,分析其与肿瘤形态、肿瘤最大径及浸润性导管癌病理分级之间有无相关性。结果①肿块型、非肿块型乳腺癌的差异血管数目评分、邻近血管数目评分差异均无统计学意义(P 均>0.05)。②肿块型乳腺癌肿瘤最大径与差异血管数目评分无相关性(P>0.05),与肿瘤邻近血管数目评分呈正相关(r=0.46,P<0.01);非肿块型乳腺癌肿瘤最大径与差异血管数目评分呈正相关(r=0.57,P<0.05),与肿瘤邻近血管数目评分呈正相关(r=0.79,P<0.01);总体乳腺癌的肿瘤最大径与差异血管数目评分及邻近血管数目评分均呈正相关(r=0.37、0.47,P 均<0.01)。③浸润性导管癌的病理分级程度与差异血管数目评分、邻近血管数目评分均无相关性(P 均>0.05)。结论乳腺癌 MR 动态增强图像血管表现与肿瘤最大径有关,与肿瘤的形态及浸润性导管癌的病理分级程度无关。

EPO-0793
非肿块强化乳腺癌不同分子亚型与 MRI 征象和病理特征的相关性

张冰,王琳,陈欣,杨全新
西安交通大学第二附属医院

目的：探讨非肿块强化乳腺癌各分子亚型与 MRI 征象和病理特征的相关性。**材料与方法：**收集 2014 年 1 月至 2019 年 6 月行 3.0T 乳腺 MRI 多模态扫描的患者，回顾性分析 62 例非肿块强化乳腺癌患者 MRI 影像及临床病理资料。依据免疫组化染色对分子亚型进行分类。以卡方检验和 Fisher 确切概率法比较不同分子分型与 MRI 征象和病理特征的差异，采用交叉列联表分析两者的相关性。**结果：**非肿块强化乳腺癌不同分子亚型在病变内部强化方式、瘤周水肿、MRI BI-RADS 分类、病理组织学类型和 Ki67 表达水平上的差异具有统计学意义（P＜0.05），而在病变分布类型、动态增强曲线、瘤周血管异常和腋窝淋巴结转移上差异无统计学意义（P>0.05）。组间分析表明在 NME 乳腺癌中，Luminal A 型不容易出现瘤周水肿，病理组织学类型多为导管内癌，Ki-67 低表达，较低级别的 BI-RADS 分类；Luminal B 型以不均匀强化为主，Ki-67 多中度表达；HER-2 过表达型以簇环状强化为主，易出现瘤周水肿，Ki-67 多中高度表达；三阴性型以簇环状强化为主，易出现瘤周水肿，组织病理类型多为浸润性癌，Ki-67 多中高度表达，以及容易出现腋窝淋巴结转移。**结论：**不同分子亚型非肿块强化乳腺癌具有一定的 MRI 特征，有望为非肿块强化乳腺癌术前治疗方案的制定提供一种无创的评价体系。

EPO-0794
Comparative Analysis of MRI and Pathologic Features between Complex Sclerosing Lesions and Invasive Carcinoma of the Breast

Xing Hu
SHANGHAI NINTH PEOPLES HOSPITAL AFFILIATED TO JIAOTONG UNIVERSITY SCHOOL OF MEDCINE

【Abstract】 **Purpose:** Complex sclerosing lesions (CSL) of the breast are the result of entrapment and distortion of benign ductal and lobular components by fibroelastotic scars. They often mimic invasive carcinoma (IC) on imaging and pathologic examinations resulting in misdiagnosis. **Methods:** To investigate the magnetic resonances imaging (MRI) and pathologic features of those lesions, 27 cases of surgically excised and pathologically confirmed CSL cases which also have accompany MRI available are identified from our hospital database from the period of October 2015 to December 2018 33 invasive carcinoma cases diagnosed in the same period of time are also selected for comparison. The patient’s demography, pathology and MRI data are analyzed and compared. **Results:** The average patient age for the CSL group is 45.7±8.4years and the IC group of 57.8±14.2 years (p=0.000). The average diameter of CSL is 1.19±0.64cm and invasive carcinoma is 2.14±1.35cm (P=0.001). Similar 59.3% of CSL and 69.7% of IC cases are described on both image and pathology reports as “ill-defined” or “speculated”. Comparison of MRI features of CSL and IC groups. T1WI showed statistical differenc while no statistical differences between the two groups on T2WI or STIR. TIC pattern: CSL (19 cases type Ⅰ, 7 cases type Ⅱ), IC (20 cases

type Ⅲ).Mean ADC value: CSL (0.00137 mm^2/s) vs. IC (0.00104 mm^2/s). 3 out of 33 IC cases show rim enhancement while non-in CSL cases. **Conclusions:** Our data suggest that compare to CSL, IC tend to occur in older women with larger lesional diameter. IC often have lower signal intensity on T1WI imaging, less than 0.0012 mm^2/s ADC value and most commonly type Ⅲ TIC pattern.T2WI and STIR data and shape of the boarder are less useful in distinguishing the CSL from IC.

乳腺背景实质强化结合弥散加权 ADC 直方图对乳腺癌分子分型的研究

尤超,彭卫军,顾雅佳
复旦大学附属肿瘤医院

目的：通过全自动化量化分析对正常腺体评估以及高通量挖掘影像组学特征对肿瘤异质性的判断，评估乳腺背景实质强化与 ADC 直方图特征，两者对乳腺癌分子分型评估的价值及其相关性。材料与方法：前瞻性分析 2018 年 1 月至 11 月入组的 142 例进展期乳腺癌患者。利用动态增强磁共振图像行 BPE 的量化分析，采用 MR 多参数分析软件进行直方图分析，利用 DWI 勾画感兴趣体积提取一阶直方图特征进行分析。具体参数包括均数、百分位数（5th 及 95th 的 ADC 值）、偏度、峰度、对比值和熵值。采用单因素方差分析比较影像组学特征及 BPE 特征在不同分子亚型间的差异。采用 Spearman 相关性检验比较影像指标之间相关性。结果：142 名患者共 142 个病灶，包括三阴性乳腺癌 17 例，Luminal A 型 12 例，Luminal B 型 39 例人表皮上皮生长因子受体 2 阳性亚型 74 例。分析 ADC 直方图特征，包括 ADC 均数、5th 百分数，95th 百分数、偏度值、峰度值、对比值及熵值，以及 BPE 在四组不同分子分型中差异。其中 ADC 95th 百分数、峰度及 BPE 在四组分子分型之间具有统计学差异（$p<0.05$）。ADC 95th 百分数、峰度及 BPE 在三阴性与 Luminal A 型、三阴性与 Luminal B 型及三阴性与 HER2 阳性亚型的两两比较中，均存在显著统计学差异（$p<0.05$）。进一步分析 ADC 95^{th} 百分数、峰度及 BPE 的相关性，BPE 与 ADC 95^{th} 百分数无显著相关性($r=0.035$, $p=0.675$)，BPE 与 ADC 峰度值存在弱相关性（$r=-0.176$, $p=0.036$）。结论：基于弥散扩散加权的 ADC 直方图特征（95th 百分位 ADC 值和 ADC 峰度值）与 BPE 特征在不同分子分型乳腺癌中存在差异，尤其是在三阴性乳腺癌亚组中；且 ADC 峰度值与 BPE 存在负相关。

EPO-0796
The volumetric-tumour histogram-based analysis of intravoxel incoherent motion and non-Gaussian diffusion MRI：Association with prognostic factors in HER2-positive breast cancer

Chao You,Weijun Peng,Yajia Gu
Department of Radiology， Fudan University Cancer Center， Department of Oncology， Shanghai

Background: To evaluate the imaging biomarkers of HER2 (Human epidermal growth factor receptor 2) positive breast cancer in comparison to other molecular subtypes and to

determine the feasibility of identifing hormone receptor (HR) status and lymph node metastasis status using volumetric-tumour histogram-based analysis through intravoxel incoherent motion (IVIM) and non-Gaussian diffusion.
Methods: This study included 145 breast cancer patients with 148 lesions between January and November in 2018. Among the 148 lesions, 74 were confirmed to be HER2-positive. The volumetric-tumour histogram-based features were extracted from the combined IVIM and non-Gaussian diffusion model. IVIM and non-Gaussian diffusion parameters obtained from images of the subjects with different molecular prognostic biomarker statuses were compared by Student's t test or the Mann-Whitney U test. The area under the curve (AUC), sensitivity, and specificity at the best cut-off point were reported. The Spearman correlation coefficient was calculated to analyse the correlations of clinical TNM (Tumor nodule metastasis) stage and Ki67 with the IVIM and non-Gaussian diffusion parameters.

Results:
The entropy of Mean Kurtosis (MK) was significantly higher in the HER2-positive group than in the HER2-negative group (p = 0.015), with an AUC of 0.629 (95% CI 0.546, 0.707), a sensitivity of 62.6%, and a specificity of 66.2%. For HR status, the MD 5th percentile was higher in the HR-positive group of HER2-positive breast cancer (p = 0.041), with an AUC of 0.643 (95% CI 0.523, 0.751), while for lymph node status, the entropy of mean diffusivity (MD) was lower in the lymph node positive group (p = 0.040), with an AUC of 0.587 (95% CI 0.504, 0.668). The clinical TNM stage and Ki67 index were correlated with several histogram parameters.
Conclusion:
Volumetric-lesion histogram analysis of IVIM and the non-Gaussian diffusion model can be used to provide prognostic information about HER2-positive breast cancers and potentially contribute to individualized anti-HER2 targeted therapy plans.

EPO-0797
MRI 乳腺背景实质强化对 HER2 阳性乳腺癌新辅助化疗疗效评估的研究

尤超,彭卫军,顾雅佳
复旦大学附属肿瘤医院

目的:探索进展期乳腺癌的对侧 BPE 在 NAC 全程的变化特征，以及 BPE 能否早期预测进展期乳腺癌 NAC 的 *pCR*。材料与方法: 回顾性分析 2014 年 8 月至 2016 年 4 月确诊为进展期乳腺癌患者 116 名， 90 例单侧乳腺癌患者纳入本研究。在 NAC 治疗前以及治疗后的第 2、4、6 周期分别行 MRI 动态增强扫描。通过全自动量化分析软件完成对侧 BPE 的量化分析。结果：在完成 NAC 后，25 例(27.78%)患者达到 pCR, 65 例(72.22%)患者为非 pCR。pCR 组与非 pCR 组的组织学类型、激素受体状态以及 HER2 状态的在两组间的差异有统计学意义（P <0.05）。在 NAC 治疗后的第 2、4、6 周期的 BPE 均较基线水平显著降低 (P<0.001)。无论绝经状态如何，BPE 在整个 NAC 治疗全程均呈现相似的变化趋势。同时，在 NAC 的三个不同监测点，BPE 的降低与肿瘤最大径的缩小均存在弱相关性(r=0.373, p<0.001, r=0.249, p=0.018, r=0.264, p=0.012)。Δ*BPE* 的最大 AUC 在 NAC 后第 2 周期，而Δ*Size* 的最大 AUC 在 NAC 后第 6 周期。其中，NAC 后第 2 周期，Δ*BPE* 的 AUC 为 0.726，鉴别 pCR 与 non-pCR 两组之间的分界点是 0.2672 (敏感性和特异性分别为 88%, 52.3%)，而Δ*Size* 的

AUC 为 0.704，预测 pCR 的分界点是 0.3258(敏感性和特异性分别为 80%，61.5%)。多因素分析中，NAC 后第 2 周期和第 4 周期 BPE 的降低是与 pCR 的正相关的自变量，NAC 后第 2、第 4 和第 6 周期，肿瘤最大径的缩小与 pCR 正相关的自变量，HR 状态阴性为与 pCR 正相关的自变量。结论：对侧正常乳腺 BPE 呈持续下降趋势，与 NAC 的肿瘤大小变化类似。NAC 早期 BPE 的降低与 pCR 呈显著正相关，尤其是 HR 受体阴性状态患者。

EPO-0798

乳腺背景实质强化对高危病变的评估研究

尤超,彭卫军,顾雅佳
复旦大学附属肿瘤医院

目的：通过分析乳腺高危病变的 MRI 征象及 BI-RADS 诊断，关注 *BPE* 及临床特征与高危病变恶性升级的关系。材料与方法：回顾性搜集 2017 年 1 月-2018 年 3 月我院病理数据库中活检病理为乳腺高危病变，并本院行活检前乳腺 MRI 检查共 230 例（平均年龄 48.26 ± 10.61 岁）。MRI 特征分析包括肿块及非肿块样强化等。将 BPE 程度分为两组进行研究，即几乎没有/轻度强化为一组，中度/重度强化为一组。以病理结果为金标准，分析 MRI 对乳腺高危病变升级率的诊断效能。采用独立样本 t 检验与卡方检验比较临床及病理特征在升级组与未升级组的组间差异。以病理结果为金标准，采用 ROC 检验比较 MRI 对乳腺高危病变升级率的诊断效能。结果：230 例患者为单发病灶，共 230 个病灶。ADH 43 例，ALH 6 例，硬化性腺病 89 例，导管内乳头状瘤 87 例，粘液样肿瘤 4 例，FEA 1 例。47 例伴不典型增生病变在后续手术中升级为恶性病变，升级率为 20.4%。绝经前 BPE 值高于绝经后妇女（χ=8.964，P=0.003）。不同月经周期在背景实质强化轻微/轻度和中度/明显两组间无明显统计学差异（χ=3.367，P=0.338）。乳腺 MRI 征象在升级组与未升级组的组间存在统计学差异（χ= 8.28，P=0.016），MRI 背景实质强化在两组间存在统计学差异（χ=50.32，P<0.001）。以 BI-RADS 4a 为分界点时，乳腺 MRI 评估高危病变有无升级为恶性病变诊断效能最高，敏感性分别为 93.62%，特异性为 86.34%，阳性预测值为 78.1%，阴性预测值为 88.1%， ROC 曲线下面积为 0.913。多因素分析显示，年龄和 MRI 背景实质强化是乳腺高危病变升级的独立因素(P <0.001)。结论： MRI 背景实质强化中重度、患者年龄越大可提示高危病变的恶性升级。

EPO-0799

乳腺背景实质强化对高危人群的评估研究

尤超,彭卫军,顾雅佳
复旦大学附属肿瘤医院

目的：以高危人群为研究主体，关注究竟哪些因素会造成乳腺 MRI 上背景实质强化（BPE），探索 BPE 与乳腺癌风险是否存在关联，评估 BPE 的相关影响因素。
材料与方法：回顾性分析 xxx 医院 2008 年 12 月至 2015 年 6 月乳腺高危病人数据库。最终 91 例高危人群（BRCA 突变患者 50 例，41 例基于家族史的风险评估模型评估终身罹患乳腺癌风险>20%）以及 56 例作为正常对照的非高危人群纳入本研究中。BPE 的评估依据 BI-RADS 指南，评估动态增强第一期的整个乳腺腺体情况。BPE 的评估选取原始动态增强图像，正常乳腺腺体的 BPE 分为：1=极少，2=轻度，3=中度和 4=明显。此外病人的运动作为可能影响 BPE 的额外指标评估，分为：1=极少，2=轻度，3=中度和 4=明显。利用线性回归方法分析与 BPE 可能相关的因素，包括 FGT、年龄、绝经状态、乳腺癌、高危状态等。

结果：两位阅片者定性评估的一致性分析显示，两位阅片者对 BPE 及 FGT 定性评估基本一致。线性回归分析显示所有模型中 FGT 与 BPE 呈正相关（P<0.001）。年龄与 BPE 未见明显相关性，但按年龄定义绝经状态后，BPE 与绝经状态相关（P<0.05）；BPE 与患乳腺癌无相关性（P >0.05）。高危状态在最初的模型中，显示 BPE 与高危状态呈负相关，BRCA1、BRCA2 突变或终生患癌风险>20%的患者的 BPE 低于对照组非高危人群。但当纳入患者运动因素后，显示 BPE 与高危状态无相关性。患者运动被纳入为 BPE 的影响因素，与患者轻微运动相比，患者明显运动时 BPE 增加 0.7。
结论：BPE 与 FGT 呈正相关，与绝经状态呈负相关，乳腺癌对 BPE 无显著相关。高危状态起初与 BPE 呈负相关，当纠正运动因素后，高危因素显示与 BPE 无显著相关性。患者外在因素，运动作为一组新的影响因素，与 BPE 存在明显正相关。

EPO-0800
用磁共振动态增强早期剪影图像判断乳腺癌新辅助治疗后残余情况及与病理反应性分级的相关性研究

曹崑,曲玉虹,赵博,李艳玲,孙应实
北京大学肿瘤医院

目的：评价乳腺癌新辅助治疗后的磁共振动态增强早期剪影图像判断病灶残余情况的能力，并与病理 Miller-Payne 分级进行对照。
方法：收集我院初诊乳腺癌并行治疗前乳腺 MRI 检查的连续性病例，将其中接受新辅助治疗并于治疗后术前再次行乳腺 MRI 检查的患者入组。以手术后病理报告的 Miller-Payne 分级作为判断癌残余情况的依据，MP1 至 4 级为有癌残余（non-pCR），MP5 级（pCR）按照无任何癌残余（pCR0）和残原位癌（pCR1）分为两类。所有患者新辅助治疗前后两次 MRI 检查同时在工作站调阅，以治疗后早期增强剪影图像和 MIP 图像作为是否有强化灶的判断序列，参照治疗前 MRI 所示病变位置进行阅片判断，原癌床位置有任何强化灶出现，即判断有癌残余（non-iCR），否则判断无癌残余（iCR）。计算影像判断有无癌残余情况的总准确性和各 MP 分级中的准确性，以及影像判断 pCR 和判断 pCR0 的阳性预测值（PPV）和阴性预测值（NPV）。
结果：共入组 98 例，MP1-5 级例数分别为 3 例、18 例、36 例、12 例、29 例，MP5 包括 7 例 pCR1 和 22 例 pCR0。 对 MP1-4 级，以影像判断 non-iCR 作为正确诊断，各级判断准确性分别为 100.0%、100.0%、97.2%、100.0%；对 MP5 级，以 iCR 为正确诊断，判断准确性为 65.5%。若仅以 pCR0 作为 iCR 的最终标准，则准确性为 91.8%（90/98）。以 iCR 标准对 pCR 进行判断的 PPV 和 NPV 分别为 95.0%（19/20）和 87.2%（68/78），对 pCR0 进行判断的 PPV 和 NPV 分别为 85.0%（17/20）和 93.6%（73/78）。
结论：以动态增强早期的剪影图像对新辅助治疗后乳腺癌的癌床处进行有无癌活性的判断，可以达到较高的准确性，对 pCR 判断的阳性预测值和判断无任何癌残余的阴性预测值可以达到 90%以上。

EPO-0801
磁共振动态增强早期减影图像对不同分子亚型乳腺癌新辅助治疗后癌残余情况的评价能力研究

曹崑,李艳玲,曲玉虹,孙应实
北京大学肿瘤医院

目的：评价乳腺癌新辅助治疗后的磁共振动态增强早期减影图像对不同分子亚型组的癌残余情况判断能力。
材料方法：收集我院初诊乳腺癌并行新辅助治疗并于治疗前后均行乳腺 MRI 检查的患者入组。以手术后病理报告作为判断有无癌残余的金标准（pCR/非 pCR），按照治疗前穿刺病理的免疫组化受体水平分为激素受体（HR）阳/阴、HER2 受体阳/阴分别组合。所有患者新辅助治疗前后两次 MRI 检查同时在工作站调阅，以治疗后早期增强减影图像和 MIP 图像作为是否有强化灶的判断序列，参照治疗前 MRI 所示病变位置进行阅片判断，原癌床位置在减影图像中有任何强化灶出现即判断有癌残余（非 iCR），否则判断无癌残余（iCR）。计算影像判断有无癌残余情况在各分组亚型组的诊断情况。
结果：共入组连续性病例 105 例，29 例达到病理完全缓解。四个分子亚型组 pCR 比例分别为 HR-/HER2-组 42.9%、HR-/HER2+组 77.8%、HR+/HER2-组 5.8%、HR+/HER2+组 43.8%，影像判断准确性分别为 85.7%（24/28）、77.8%（7/9）、96.2%（50/52）、81.3%（13/16）。按照临床总体治疗方式及 pCR 比率，将四组合并为两组，即三阴/HER2 阳性组（53 例）与 HR 阳性组（52 例）。对 pCR 判断的准确性进行分析，三阴/HER2 阳性组的敏感性、特异性、阳性预测值和阴性预测值分别为 65.4%、100%、100%、75%，在 HR 阳性组分别为 66.7%、98.0%、66.7%、98.0%。两组之间敏感性和特异性无显著性差异（P>0.05），阳性预测值和阴性预测值有显著性差异（P<0.05）。
结论：以动态增强早期的减影图像对新辅助治疗后乳腺癌的癌床处进行是否达到病理完全缓解的判断，对不同分子亚型乳腺癌中均为敏感性低但特异性高，但对三阴或 HER2 阳性病例的阳性预测值较高，对 HR 阳性病例的阴性预测值较高。

EPO-0802

不同类型乳腺黏液癌的 MRI 表现

李芳芳
天津医科大学肿瘤医院

目的　探讨不同类型乳腺黏液癌的 MRI 表现特征及 ADC 值差异。
方法　回顾性分析 2010 年 1 月至 2019 年 1 月经手术病理证实为黏液癌且术前进行过乳腺 MRI 检查的 55 例患者（共 58 个病变），根据黏液癌占比不同，分为单纯型黏液癌（46 个）和混合型黏液癌（12 个），根据癌细胞与黏液的比例不同，分为经典型黏液癌（39 个）和富于细胞型黏液癌（19 个）。患者均行双侧乳腺平扫、DWI 和动态对比增强 MRI 检查。依据乳腺影像报告和数据系统（BI-RADS）标准进行分析，观察病变形状、边缘、平扫 T1WI 信号、脂肪抑制 T2WI 信号、时间-信号强度曲线（TIC）类型、边缘强化、延迟时相内部强化、DWI 信号特征，并测量病变 ADC 值。定性资料的比较采用 x^2检验，定量资料的比较采用独立样本 t 检验。
结果　58 个黏液癌在 MRI 上均表现为肿块，单纯型与混合型黏液癌在病变形状、边缘、平扫 T_1WI 信号、脂肪抑制 T_2WI 信号、时间-信号强度曲线类型、边缘强化、延迟时相内部强化、DWI 表现及 ADC 值的差异无统计学意义（P均＞0.05）。经典型与富于细胞型黏液癌在时间-信号强度曲线类型、边缘强化及 ADC 值的差异上有统计学意义（P均＜0.05），在病变形状、边缘、平扫 T_1WI 信号、脂肪抑制 T_2WI 信号、延迟时相内部强化及 DWI 表现的差异无统计学意义（P均＞0.05）。
结论　MRI 表现部分特征有助于区分不同类型的黏液癌，经典型黏液癌动态增强早期时相多以边缘强化为著，病变内部多呈渐进性强化，ADC 值通常高于富于细胞型黏液癌。单纯型与混合型黏液癌在 MRI 表现特征及 ADC 值上无明显差异。

EPO-0803

动态增强 MRI 血流动力学定量参数与浸润性乳腺癌分子分型的相关性分析

王翠艳
山东省医学影像学研究所

目的 确定浸润性乳腺癌动态增强 MRI 血流动力学定量参数与分子分型之间是否存在相关性。
方法 对行动态增强 MRI 并经穿刺或手术病理证实的 116 例女性浸润性乳腺癌患者进行回顾性分析，所有患者均有免疫组化检查结果，包括雌激素受体（ER）、孕激素受体（PR）、人类表皮生长因子-2（HER-2） 以及 Ki67 表达情况，并以此结果分为 Luminal A 型、Luminal B 型、HER-2 阳性型和三阴型 4 个分子亚型。利用人工辅助诊断软件（DynaCAD）进行乳腺动态增强 MR 图像后处理，得到时间信号强度曲线，并据此计算出血流动力学参数，包括最大增强率（PE）、平均增强率（ME）、最大上升斜率（MS）、峰值时间（tP）。利用单因素方差分析进行分子学亚型与动态增强 MRI 时间信号强度曲线类型及各血流动力学定量参数之间的相关性分析。
结果 与其它分子学亚型相比，HER-2 阳性乳腺癌呈现 “流出型”时间信号强度曲线的几率较高，而 Luminal A 亚型乳腺癌则相反（p＝0.004）； 与 HER-2 阴性乳腺癌相比，HER-2 阳性乳腺癌与较高 PE（p＝0.03）、MS（p＝0.04）相关，并同时更具有较高 ME 的趋势（p＝0.06）。
结论 动态增强 MRI 时间信号强度曲线类型及其血流动力学定量参数与浸润性乳腺癌分子亚型之间具有一定相关性，可以作为一种影像生物学标志对治疗方案的选择和预后判断提供依据。

EPO-0804
双模态磁性二维纳米片用于肿瘤 MRI/CT 诊断及治疗一体化的研究

刘壮,吴斌,张盛箭,彭卫军
复旦大学附属肿瘤医院

目的：设计一种基于二维纳米材料体系（MXene）的双模态磁性造影剂，并将其应用于肿瘤 MRI/CT 成像诊断及肿瘤光热治疗的一体化研究。
方法：采用化学剥离的方法制备超薄二维碳化钽（Ta_4C_3）纳米片，利用 Ta_4C_3 表面官能团的氧化还原反应，在原位生长超顺磁性铁氧颗粒（IONP），并采用仿生磷脂（SP）进行表面修饰，从而构建一种生物相容性好、体内安全性高的二维磁性碳化钽纳米复合材料（Ta_4C_3-IONP-SPs）。使用多种材料表征手段检测 Ta_4C_3-IONP-SPs 的晶体结构、表面官能团、价态、磁力学性质等。在体外、体内实验中验证该材料的光热转换能力、光热治疗效果和增强 MRI/CT 成像能力，并评价该材料在细胞水平和动物体内的生物安全性。
结果：体内、外实验结果表明 Ta_4C_3-IONP-SPs 具有明显的肿瘤 MRI/CT 增强效果。体内、外光热治疗实验结果表明，这种二维结构 Ta_4C_3-IONP-SPs 复合纳米片在可见光区域具有良好的光热转换能力（32.5%），在近红外光的激发下可产生局部高热杀死肿瘤细胞，可作为一种 MRI/CT 双模式成像引导下的光热诊疗剂。另外，该复合纳米片对健康小鼠的血液和组织没有明显影响，因此具有较高的生物安全性。
结论：本研究成功设计出一种基于二维纳米材料体系（MXene）的磁性多功能复合造影剂，该材料不仅有良好的 CT 和 MRI 增强效果，还具有较好的肿瘤光热治疗效果。这种二维磁性纳米复合材料，不仅可以作为一种有效的 MRI/CT 造影剂，还可以作为新型光热剂有效杀灭肿瘤细胞，为未来肿瘤的个性化和精准诊疗提供了新思路。

EPO-0805

乳腺导管内乳头状癌的影像学与病理的对照研究

肖勤,顾雅佳
复旦大学附属肿瘤医院

目的：分析乳腺导管内乳头状癌（Papillary Ductal Carcinoma in situ）的乳腺 X 线与乳腺磁共振影像学特点及病理基础。
材料与方法：回顾性分析 2010 年 1 月-2016 年 1 月之间接受乳腺 X 线与乳腺 MRI 检查并经手术病理证实的 10 例乳腺导管内乳头状癌的临床特点、乳腺 X 线与乳腺磁共振的影像学特征，并与病理结果对比分析。
结果：患者平均年龄 55.5 岁，临床表现为可触及肿块（9/10）及 1 例乳头血性溢液。术后病理肿块平均最大径为 2.9cm。乳腺 X 线表现：10 例病例共 11 个病灶均表现为肿块，其中 8 个肿块边缘清楚，2 个肿块边缘示短小毛刺，所有病灶均未伴随钙化与结构扭曲，所有病例均未见腋窝肿大淋巴结。MRI 表现：所有病灶的实性部分在 T1WI 上均表现为低信号，T2WI 上为高信号，增强后为明显不均匀强化。
结论：导管内乳头状癌为一种少见类型的原位癌，恶性程度较低。影像上具有一定特征，表现为边缘清楚的分叶状或卵圆形、圆形肿块，毛刺少见，乳腺 X 线上罕见恶性钙化，极少伴有腋窝肿大淋巴结。乳腺 X 线表现不易与良性病变鉴别，联合乳腺 MRI 检查能够提高诊断准确性。

EPO-0806

乳腺浸润性小叶癌的 MR 影像学特征分析

郝玉娟,刘君君,刘佩芳,孙淑萌
天津医科大学肿瘤医院

目的：探讨乳腺浸润性小叶癌的 MR 影像学特征。**方法**：收集 2011 年 2 月至 2016 年 12 月期间于我院行乳腺 MRI 检查并经手术病理证实的 39 例浸润性小叶癌，系统性分析病变的病灶数量、形态学表现、平扫信号、DCE 表现及时间-信号强度曲线类型、表观扩散系数（ADC）值。**结果**：（1）单发病灶 25 例，多灶、多中心及双侧同时发生病灶 14 例。（2）15 例表现为肿块，呈类圆形或不规则形，边缘毛糙；24 例表现为非肿块，7 例呈段性分布，17 例表现为局限异常强化，76.5%（13/17）结构纠集。（3）除 11 例平扫显示不明显外，其余均于平扫 T_1WI 呈低信号，16 例于脂肪抑制 T_2WI 呈等或低信号，12 例呈稍高信号。动态增强后 39 例病变均呈明显强化，97.4%（38/39）时间-信号强度曲线呈平台型及流出型。b 值为 500 s/mm^{2}及 1000 s/mm^{2}时平均 ADC 值均低于正常乳腺组织 ADC 值（P<0.05）。**结论**：乳腺浸润性小叶癌的 MR 表现尤其是病灶数量及形态学表现具有一定特征性，有助于该疾病的术前诊断。

EPO-0807

Role of T2 mapping in diagnosis and neoadjuvant chemotherapy of breast cancer

Li Liu,Weijun Peng
Department of Radiology， Shanghai Cancer Center， Fudan University

【Abstract】**Purpose**: To investigate 1) use of quantitative analysis of T_2 relaxation time in differentiating malignant from benign breast lesions and therefore increase the diagnostic accuracy of breast MRI; 2) change in T2 relaxation time of breast cancer before and after neoadjuvant chemotherapy (NAC). **Materials and methods**: Of the total 67 patients, 46 have malignant tumors while 21 have benign pathology. Twenty-six of the 47 malignant cases underwent NAC. MRI T_2mapping was performed in all patients. In patients with NAC, T2-mapping was performed before and after NAC. T_2 relaxation times were obtained by using Funtool software on AW 43 workstation. Pathological response to NAC was assessed according to Miller＆Payne response score. Statistical analysis was performed on T2 relaxation times of malignant and benign lesions, before and after NAC. **Results**: The mean T_2 relaxation time in the malignant cases was 82.69±15.37ms, whereas the T2 relaxation time in benign cases was 95.48±26.51ms. Difference in T_2 relaxation time between malignant and benign cases is statistically significant（P=0.015 <0.05）. In 26 cases with NAC, the mean T_2 relaxation time was 81.34±13.68ms and 64.50±8.71ms before and after NAC respectively. Difference in T_2 relaxation time between the pre— and post— NAC is significant（P=0.00<0.05）. Based on the MP response score, the mean post-NAC T_2 relaxation time in 23 responders out of 26 NAC cases (63.18±8.37ms) was significantly shorter than that in non-responders (74.62±2.32ms)(P=0.029＜0.05). **Conclusion**: T_2 relaxation time in benign lesions was found to be significantly longer than that in malignant lesions. Quantitative measurement of T_2 relaxation time might provide new diagnostic parameter to breast MRI. T2 relaxation time in breast cancer was reduced after NAC, particularly in the responders. Measurement of T2 relaxation time change is a potential new tool to assess the response to NAC.

扩散加权成像与乳腺浸润性导管癌分子生物学相关性研究

刘莉[1],尹波[2],岳磊[1],毛健[1],彭卫军[1]
1.复旦大学附属肿瘤医院
2.复旦大学附属华山医院

目的：研究表观扩散系数(apparent diffusion coefficient, ADC)与乳腺浸润性导管癌分子生物学标志物之间的关系，以指导临床判断预后及选择治疗方案。**方法：**对 67 例乳腺浸润性导管癌患者进行磁共振扩散加权成像检查，并测量病灶 ADC 值。术后免疫组化分析人表皮样生长因子受体-2（HER-2）、雌激素受体（ER）、孕激素受体（PR）、Ki67，统计学分析 ADC 值与 ER、PR、HER-2、Ki67 相关性；并研究不同分子分型病灶 ADC 值的差别。**结果：**Spearman 相关性分析表明 ADC 值与 Ki67 之间无相关性（P>0.05）；ER、PR、HER-2 阴性表达者 ADC 值大于阳性者（P<0.05）；三阴性病灶的 ADC 值明显高于 Luminal A 型、Luminal B 型、HER-2 过表达型（P<0.05）；HER-2 过表达型病灶的 ADC 值高于 Luminal B 型；**结论：**ADC 值与乳腺浸润性导管癌分子生物学表达及分子分型具有相关性，可辅助指导临床选择治疗方案及判断预后。

Quantitative assessment of fibroglandular tissue and background parenchymal enhancement on breast MRI correlates with the risk of breast cancer

xiaoxin hu[1],Luan Jiang[2],Qiang Li[2],Chao You[1],Weijun Peng[1],Yajia Gu[1]
1.Department of Radiology, Fudan University Shanghai Cancer Center, Shanghai, China
2. Center for Advanced Medical Imaging Technology, Shanghai Advanced Research Institute, Chinese Academy of Sciences, Shanghai, China

Objectives: To evaluate the relationships between breast cancer and both the intensity(BPE_I)/volume(BPEv) of background parenchymal enhancement and the amount of fibroglandular tissue (FGT) in pre- and post-menopausal women used by automatic quantitative assessment method on breast MRI.

Methods: Among 14033 women who underwent breast MRI, we randomly selected 101 normal women, 101 women with benign breast lesions and 101 women with breast cancer who were matched by age and menopausal status. The Mann-Whitney U test was used to evaluate FGT, BPE_I and BPE_V. The area under the curve(AUC) value of receiver operating characteristic (ROC) was compared in the cancer, benign and control groups to measure correlations and associations between variables.

Results: (1) FGT and BPE_V decreased by around 40% ($P<0.001$) and BPE_I decreased by 20% ($P<0.05$) in post- menopausal women. (2) Compared with the benign and control groups, the breast cancer group had a significant difference of BPE_V with the maximum AUC (compared with the control group: 0.704 for premenopausal women, 0.668 for the postmenopausal women, respectively; compared with the benign group: 0.622 for premenopausal women, 0.633 for the postmenopausal women, respectively). (3) FGT was significantly higher in the cancer ($P=0.035$) and benign ($P=0.035$) groups than in the control group after menopause.(4) Compared with the benign and control groups, BPE_I had a slight difference in the cancer group ($AUC \leqslant 0.648$)。
Conclusion: BPE_V could correlate with the high risk of breast cancer in both pre- and post- menopausal women. BPE_I had weak correlation with breast cancer. However, FGT was only associated with breast cancer risk after menopause.

EPO-0810

Preoperative Prediction of Axillary Lymph Node Metastasis in Breast Carcinoma Using Radiomics Features Based on the Fat-suppressed T2 Sequence

Hongna Tan[1],Fuwen Gan[2],Yaping Wu[1],Yusong Lin[2],Meiyun Wang[1]
1.Department of Radiology, Henan Provincial People's Hospital, Henan, 450003, China;
2.Collaborative Innovation Center for Internet Healthcare & School of Software and Applied Technology, Zhengzhou University

Purpose: To investigate the value of radiomics method based on the fat-suppressed T2 sequence for preoperative predicting axillary lymph node (ALN) metastasis in breast carcinoma. **Methods:** The data of 329 invasive breast cancer patients were divided into the primary cohort (n=269) and validation cohort (n=60). Radiomics features were extracted from the fat-suppressed T2-weighted images on breast MRI, and ALN metastasis-related radiomics feature selection was performed using Mann Whitney U-

test and support vector machines with recursive feature elimination(SVM-RFE); then a radiomics signature was constructed by linear SVM. The predictive models were constructed using a linear regression model based on the clinicopathologic factors and radiomics signature, and nomogram was used for a visual prediction of the combined model. The predictive performances are evaluated with the sensitivity, specificity, accuracy and area under the receiver operating characteristic (ROC) curve (AUC). **Results:** A total of 647 radiomics features were extracted from each patient. 23 ALN metastasis-related radiomics features were selected to construct the radiomics signature, including 17 texture features, 5 first-order statistical features and one shape feature; patient age, tumor size, HER2 status and vascular cancer thrombus accompanied or not were selected to construct the cilinicopathologic feature model. The sensitivity, specificity, accuracy and AUC value of radiomics signature, clinicopathologic feature model and the nomogram were 65.22%, 81.08%, 75.00% and 0.819 (95% confidence interval [CI]: 0.776-0.861), 30.44%, 81.08%,61.67% and 0.605 (95% CI: 0.571-0.624) and 60.87%, 89.19%, 78.33% and 0.810 (95%CI: 0.761-0.855), respectively. **Conclusion:** Radiomics methods based on the fat-suppressed T2 sequence and the nomogram are helpful for preoperative accurate predicting ALN metastasis.

EPO-0811
定量动态增强磁共振评估乳腺癌新辅助化疗疗效的应用研究

李瑞敏,毛健,顾雅佳,彭卫军
复旦大学附属肿瘤医院

背景与目的：乳腺癌的新辅助化疗已成为成熟的治疗方法，但疗效评估尚未有统一有效的方法。本研究即探讨定量动态增强磁共振在乳腺癌新辅助化疗疗效评估中的价值。**方法**： 24 例术前行新辅助化疗的乳腺癌确诊患者（24 例均为浸润性导管癌），分别于新辅助化疗前、化疗第 2 疗程后、化疗结束但术前三个时间点行定量动态增强磁共振检查，分析化疗前后肿瘤最长径及动态增强磁共振定量参数：容量转移常数（K^{trans}）、速率常数（K_{ep}）、血管外细胞外间隙容积比（V_e）的变化。**结果**：24 例患者均为单侧单发乳腺癌病灶，以 RECIST 标准分为有效组（17 个）和无效组（7 个），有效组与无效组 K^{trans}、K_{ep} 在化疗前与第 2 疗程、化疗前与化疗结束差值均有统计学意义，V_e 在有效组与无效组治疗前后差异均无统计学意义。**结论**：定量动态增强磁共振可用来评估新辅助化疗疗效，并且 K^{trans}、K_{ep} 可做到定量，使评估结果更为客观真实，但 Ve 对判断治疗效果未见明显优势。

EPO-0812
MRI 对于乳腺 X 线摄影可疑恶性微钙化的诊断价值

荣小翠,康一鹤,杨光,薛晶
河北医科大学第四医院

【摘要】目的 探讨 MRI 对于乳腺 X 线摄影可疑恶性微钙化的诊断价值。**方法** 回顾性分析 2015 年 2 月到 2018 年 6 月在我院行乳腺 X 线摄影发现可疑恶性微钙化病变，同时行乳腺 MRI 检查的患者 118 例的临床病理及影像资料。以手术病理为金标准，计算 MRI 检查的敏感度、特异度、准确率、阳性预测值（PPV）、阴性预测价值（NPV）。采用 Spearman 相关分析和 Bland-Altman 法评价 X 线、MRI 与病理测量乳腺癌肿瘤大小的相关性和一致性。**结果** 乳腺 MRI 检查的敏感度、特异度、准确率、PPV、NPV 分别为 97.3%、 41.3%、75.6%、72.4%、90.5%。MRI 诊断可疑恶性微钙

化病变的 ROC 曲线下面积为 0.774（P=0.000）。病理、X 线摄影及 MRI 测量肿瘤大小的中位数（四分位间距）分别为 1.5（1.4）cm、1.6（3.0）cm、2.2（3.0）cm。X 线摄影与病理大小相关系数为 0.602（P=0.000）；MRI 与病理大小的相关系数为 0.603（P=0.000）。Bland-Altman 分析显示：与病理结果比较，X 线摄影及 MRI 均高估肿瘤大小，平均差值分别为-0.98cm（95%CI 为-5.35～3.39）、-1.09cm（95%CI 为-4.42～2.24）。**结论** 乳腺 MRI 检查对于 X 线摄影可疑恶性微钙化的敏感度和阴性预测价值较高。而对于微钙化型乳腺癌病灶大小评估方面，MRI 与 X 线摄影相比无明显优势。

EPO-0813

水成像及 MRI 对病理性乳头溢液的诊断价值

江珍敏
上海市同仁医院

研究目的：通过比较磁共振水成像、乳腺磁共振成像(magnetic resonance imaging ,MRI)、磁共振水成像与乳腺 MRI 相结合以及超声检查,探讨磁共振水成像及 MRI 对病理性乳头溢液的诊断价值。
材料与方法：对 2015 年 6 月至 2016 年 6 月病理性乳头溢液患者，行磁共振水成像、乳腺 MRI 扫描及超声检查。以术后病理结果为金标准，比较磁共振水成像、乳腺 MRI、磁共振水成像与乳腺 MR 增强相结合以及超声检查对于病理性乳头溢液的诊断价值。并进一步分析比较扩张乳导管与病变的关系。
结果：共 47 名患者入组（48 处病变），其中恶性病变 20 例，良性病变 28 例。利用重 T2 加权的水成像序列（3D T2-SPACE 序列）来实现导管间接造影。采用两独立样本秩和检验分析磁共振水成像、乳腺 MRI、磁共振水成像与乳腺增强 MRI 相结合以及超声检查对病灶良恶性诊断价值，P 值分别为 0.069、0.001、0.000、0.001。对 48 处病变中扩张的乳导管与病变的关系分析，分为四类：导管与病灶无关、导管充盈缺损、病灶非肿块样强化周边导管扩张以及病灶肿块样强化周边导管扩张，Fisher 检验显示 p=0.004。
结论：磁共振水成像与乳腺增强 MRI 相结合对于诊断病理性乳头溢液病变有价值。通过进一步分析扩张乳导管与病变的关系，有助于鉴别病变的良恶性。

EPO-0814

Comparing the detectability of digital mammography alone vs. dual-mode digital breast tomosynthesis

Tingting Jiang,Wei Tang,Chao You,Qin Xiao,Xi'gang Shen,Yajia Gu,Weijun Peng
Fudan University Shanghai Cancer Center

Abstract
Purpose: This study compares the detectability of digital mammography (DM) alone versus DM plus dual-mode digital breast tomosynthesis (DBT), and the detectability of high-resolution-mode (HR mode with 40° -angle imaging) DBT versus standard-mode (ST mode with 15° -angle imaging) DBT for the diagnostic evaluation of breast tissue.
Method: This prospective comparative study enrolled 210 patients. Patients were randomly allocated into a standard mode (ST) group (n=109) and a high-resolution mode (HR) group (n=100). Diagnostic efficacy of DM, DBT with HR mode and ST mode was

analyzed and compared. Areas under the receiver operating characteristic curve (AUC) and visibility scores were calculated.
Results: The mean average glandular dose (AGD) for ST-mode was almost equal to that of DM (DBT:1.39mGy vs. DM:1.35mGy), while that of HR-mode DBT was nearly twice of that of DM (DBT:2.80mGy vs. DM:1.40mGy). Adding DBT to DM significantly increased the sensitivity (78.44% vs. 91.22%), specificity (86.63% vs 90.70%), AUC (0.91 VS 0.96) and visibility scores (4.80 vs. 7.25), without significant differences between HR and ST modes. Mean image conspicuity ratings of DBT for the HR group were higher than those of the ST group (8.16 vs 7.22). DBT improved sensitivity in dense breast tissue by 20.52% in the HR group and 15.1% in the ST group. Compared to DM, visibility scores for dense breast tissue improved by 91.02% and 42.40% for DBT in the HR and ST groups, respectively.
Conclusions: DBT sensitivity and visibility are superior to those of DM, and HR-mode DBT has higher visibility scores for lesions than ST-mode DBT. The ST-mode is most suitable for screening while HR-mode is preferable for clinical examination.

EPO-0815

Reliability of Automated Breast Density Estimation--- an end-to-end deep learning model: A comparison with visual assessment in clinic

Zeyuan Xu,Hui Zeng,Genggeng Qin,Weimin Xu,Weiguo Chen
Nanfang Hospital, Southern Medical University

Purpose/Objective(s):
To investigate the reliability of an end-to-end deep learning model in the estimation of breast density using fifth edition of the BI-RADS Lexicon by comparing with visual assessment in clinic.
Materials/Methods:
Breast density assessments of 200 cases were retrospectively reviewed by three radiologists of different seniority from the same institution who together had recently undergone retraining in mammographic breast density classifcation based on the fifth edition of BI-RADS. The radiologists assigned breast density grades (a－d) on the basis of the BI-RADS classification scheme. Consensual classifications among radiologists were used as visual assessment. An end-to-end deep learning model was adopted to evaluate all images for the automated breast density classification on four- category scale. We also grouped the BI-RADS assessments into two categories (a－b and c－d). The agreement between visual and model's assessment was measured by Cohen's weighted kappa on both four- and two-category scale. While the reliability of model's assessment was revealed by its classification accuracy.
Results:
Of the 200 images evenly distributed to category a, b, c, and d, 48, 29, 49, and 41 images of category a, b, c, and d were accurately measured by the automated model. While 94 and 98 cases were accurately measured by the automated model on a two-category scale(a－b and c－d). Compared with the clinical standard classification, the accuracy of model on four-category scales was 0.84, that of model on two-category

scales was 0.96. The agreement between model's and visual assessment was substantial (κ = 0.78) on four-category scale and almost perfect (κ = 0.92) on two-category scale.

Conclusion:

The end-to-end deep learning model showed a satisfactory accuracy and consistency compared to radiologists' BI-RADS categorization, which suffers from high inter-observer variation.

EPO-0816

DBT 联合超声对乳腺小肿块（≤2cm）的定性诊断及病理对照

徐维敏,李颖嘉,汪思娜,吴杰芳,文婵娟,秦耿耿,马梦伟,曾凤霞,陈卫国
南方医科大学南方医院

目的：通过对比 DBT（Digital Breast Tomosynthesis,DBT）和超声（Ultrasound,US）对乳腺可疑恶性小肿块型病变（≤2cm）的诊断价值，从而推广 DBT 联合超声的临床运用价值。

方法：收集我院 2014 年 1 月-2018 年 12 月传统乳腺 X 线判断为可疑恶性乳腺小肿块型病变（≤2cm）共 108 例女性，发病年龄 28-76 岁，中位年龄 48.5 岁；肿块最大径 6-20mm，平均最大径 14.97mm。受检者同时行 DBT 和 US 检查。分析 DBT、US 及 DBT+US 的 ROC 曲线下面积、敏感性、特异性、假阳性及阳性预测值。并进一步对照病理分析乳腺可疑小肿块的 DBT 及 US 表现。

结果：108 例乳腺肿块型病变包括单纯肿块 68 例及肿块伴钙化 40 例；良性病变 9 例，乳腺恶性病变 99 例。相对于乳腺小肿块型病变，DBT+US 总的 ROC 及特异性高于 DBT 及 US (DBT+US:0.965,0.913 vs. DBT 0.917,0.787 vs.US:0.901,0.711)。乳腺良、恶性病变 DBT 上的肿块形态、边缘及周围小梁结构在的差异具有统计学意义（P＜0.05），良性病变肿块形态圆形/椭圆形（55.6%）、边缘模糊（66.7%），恶性病变肿块形态不规则形（80.8%）、边缘模糊（63.6%）；而肿块大小及密度差异不具有统计学意义（P＞0.05）。小肿块在超声上的生长方向及边缘在乳腺良恶性病变间差异具有统计学意义（P＜0.05），良性病变多平行生长（100%）、边缘清晰（66.7%），恶性病变不平行生长（52.4%）、边缘成角（39.4%）；而肿块形态、回声、后方回声特征、病灶周围组织及血管分布差异不具有统计学意义（P＞0.05）。

结论：DBT 联合 US 对于乳腺小肿块型病变具有较高的临床应用价值。

EPO-0817

Imaging findings of periductal stromal sarcoma - a case report

Lingyan Kong,Fuling Zheng,Huadan Xue,Xuehong Shang,Zhengyu Jin
Peking Union Medical College Hospital

Purpose: Periductal stromal sarcoma (PSS) is a rare type of malignant fibroepithelial tumor of the breast. It shows a biphasic histology with benign ductal elements and a sarcomatous stroma lacking phyllodes architecture. Because of the rareness of PSS, its radiological features were rarely reported. In this study, we represent a case of PSS with mammographic and sonographic data.

Methods: A case of patient who underwent a mastectomy for breast mass was investigated. Full-field digital mammography (FFDM), digital breast tomosynthesis (DBT) and

ultrasonography (US) were performed before the operation. Clinical features and imaging findings were analyzed.
Results: Clinical features: A 48-year-old women was presented to our hospital 1 month ago with a mass of the right breast which had been palpable for 8 years and was increasing in size. A 8.5×8.5 cm mass was palpable behind the areola. It was tough, with a clear edge, good mobility and without tenderness. **US findings:** Several low echo lesions were found in the right breast. The large one was located in areola area, 7.1 x 9.1×5.6 cm in size, irregular in shape, slightly lobulated at the edge and uneven in internal echoes. Banded median-high echogenic septum was seen inside the mass. CDFI: Abundant blood flow signals were seen in the mass. BI-RADS 3. **FFDM findings:** An irregular slightly high-density mass was seen behind the right papilla. It was about 7.8 x 9.1×7.4 cm in size, with clear margins and multiple lobulations. BI-RADS 4A. **DBT findings:** An irregular slightly high-density mass was seen behind the right papilla. It was about 7.2 x 8.6×7.9 cm in size, with clear margins and multiple lobulations. A few low-density septations were seen inside the mass. BI-RADS 4A. **Pathological findings:** It was a grey-pink nodule, 8.5x6.5x5cm in size, with a smooth surface and a gray-pink section. Focal area is gray-white or gray-yellow. The nodule was solid, medium texture and lobulated. Pathological diagnosis: periductal stromal sarcoma of the breast (mitosis > 5/HPF).
Conclusion: PSS lacked specificity in FFDM, DBT and US. It was an irregular and heterogeneous soft tissue mass, with septations inside. Blood signals could be seen inside the tumor, and microcalcification was not found. The diagnosis depends on pathological and immunohistochemical results.

EPO-0818
基于乳房几何模型的多视图乳腺 X 线图像病灶位置相关性研究

汪思娜,秦耿耿,陈卫国,徐维敏
南方医科大学南方医院

目的：多视图乳腺 X 线图像中同一病灶的匹配分析在乳腺癌筛查及诊断中至关重要。本研究旨在开发和评估多视图乳腺 X 线图像的病灶位置相关性分析方法，为临床医生提供精确的位置参考。
方法：通过模拟乳房压缩过程构建乳房几何模型，实现压缩乳房、自由乳房与平面图像之间的对应关系。然后收集我院已知匹配关系的以粗大钙化为主要表现的乳腺 X 线图像（CC 和 MLO 视图）进行模型测试，共纳入钙化 482 对。测量钙化几何中心至预测曲线之间的最短距离作为评价指标，并分析不同腺体密度、病灶位置分组下几何模型的匹配误差差异，探讨临床应用价值。
结果：①乳房几何模型的平均匹配误差为（3.741±3.204）mm，最小点到线距离的第 95%百分位数为 10.048mm。
②腺体密度。脂肪类、散在纤维腺体类、不均匀致密类及致密类组之间的差异有统计学意义（P=0.003）。其中，脂肪类与致密类乳房的匹配误差较大，脂肪类与散在纤维腺体类、脂肪类与不均匀致密类、致密类与不均匀致密类之间的差异均有统计学意义（P 均＜0.05）。
③病灶深度。前带与中带、后带之间的差异有统计学意义（P＜0.05）。前带尤其是乳晕下区的匹配误差较小。
④病灶位置。将 MLO 视图分为乳房上部、中央区及下部，各部之间的差异有统计学意义（P＜0.05）。乳房上部匹配误差较中央区及下部大，差异均有统计学意义（P 均＜0.05）。
结论：本研究提出的乳房几何模型具有较好的匹配性能，对 95%的目标病灶而言，均能在预测曲线周围半径≤10mm 的范围内找到其对应病灶。当腺体密度及病灶所处位置不同时模型匹配效果有差

异，脂肪类、致密类乳房及乳房上部在压迫过程中发生的形变较大，模型的匹配误差大，提示本几何模型可能不完全适用于高度变形的乳房。但总体而言，乳房几何模型可为临床医师提供较为精确的位置参考。

EPO-0819
乳腺 X 线摄影和乳腺 MR 成像与 Oncotype DX 检测结果的相关性

崔智元,许萍
山西医科大学第一医院

目的：评估乳腺成像报告和数据系统（BI-RADS）乳房摄影和磁共振（MR）成像特征与接受 Oncotype DX 测定的雌激素受体阳性乳腺癌患者的乳腺癌复发风险之间的关联。
方法：
通过收集 2013 年至 2018 年间接受过 Oncotype DX 检测的 408 例诊断为浸润性乳腺癌的患者。根据 BI-RADS 词典回顾性地收集乳腺摄影和 MR 成像特征。线性回归评估了成像特征与 Oncotype DX 测试复发评分（ODxRS）之间的关联，并且通过使用成像特征评估 ODxRS 的事后配对比较。
结果：
乳腺摄影乳房密度与 ODxRS 呈负相关（P <0.05）。密度类别 A 的平均 ODxRS 为 24.4，密度类别 D 的平均 ODxRS 为 16.5（P，.02）。乳房 X 线照相术中不明显的质量边缘和精细线性分支钙化与较高的 ODxRS（分别为 P，.01 和 P，.03）显着相关。边缘模糊的群体的平均 ODxRS 为 31.3，与其他所有质量边缘的 ODxRS 显着不同（P <0.01）。精细线性分支钙化的平均 ODxRS 为 29.6，而所有其他可疑钙化形态的 ODxRS 为 19.4（P <0.03）。 MR 成像中不规则质量边缘的平均 ODxRS 显着高于毛刺质量边缘（24.0 vs 17.6; P，.02）。 MR 成像中非肿块增强的存在与较低的 ODxRS 相关（16.4 vs 19.9; P，.05）。
结论：
乳腺 X 线摄影乳房密度，钙化形态，乳腺 X 线摄影和磁共振成像质量边缘以及 MR 成像非质量增强的 BI-RADS 特征有可能成为乳腺癌复发风险的成像生物标志物，并需要进一步的研究更大的患者队列来验证这些初步结果。

EPO-0820
Comparative the average glandular dose between digital breast tomosynthesis (DBT) and full-field digital mammography (FFDM): correlation with breast thickness and density

Chanjuan Wen,Weimin Xu,Xiaoli Xiong,Le Ma,Genggeng Qin,Weiguo Chen
Nanfang Hospital， Southern Medical University

Objectives: To compare the average glandular dose (AGD) between single-view digital breast tomosynthesis (DBT) and single-view full-field digital mammography (FFDM), and to evaluate the correlation of AGD with breast thickness and density.
METHODS: A total of 318 female patients who underwent both DBT and FFDM (DBT and FFDM were performed in the same compression thickness in each breast) were included. 636 DBT images of unilateral breast mediolateral oblique (MLO) view and 636 FFDM images of

unilateral breast mediolateral oblique (MLO) view were analyzed. Mammographic breast density was determined according to BI-RADS breast density grading, and breast thickness and AGD per exposure in MLO views retrieved from DICOM headers were recorded. Breast thickness were divided into the following four groups: ≤ 30cm, 31 ~ 45cm, 46 ~ 60cm and > 60cm. The statistical analyses used variance analysis and Pearson's correlation for parametric tests.
Results: (1) The AGD of DBT had a weak negative correlation with breast density (correlation coefficient =-0.305, P<0.001), decreased as the breast density increased. The AGD of FFDM did not change significantly with breast density increased (correlation coefficient =-0.027, P=0.501). (2) Breast thickness was significantly associated with AGDs, and both AGDs of FFDM and DBT increased with increased breast thickness (correlation coefficient =0.771 and 0.935, respectively, all P<0.001). (3) When breast density was >75% and breast thickness was >60cm, the AGD of DBT was lower than that of FFDM, and the difference was statistical significant (P = 0.031).
Conclusion: The AGD of DBT increased with breast thickness increased and decreased with breast density. For thick and dense breast, the radiation dose of DBT was lower than that of FFDM.

EPO-0821

Dual-layer detector spectral CT based iodine density for the diagnosis of benign and malignant breast masses: compare with BIRADS categories in mammography

Huiying Wang
Shengjing Hospital of China Medical University

PURPOSE: To compare the diagnostic accuracy of benign and malignant breast masses using dual-layer detector spectral CT (DLCT) based iodine density (ID) versus BIRADS categories in mammography
METHOD AND MATERIALS: A total of 34 patients with breast masses proved by pathology underwent venous phase (VP) contrast enhanced DLCT scan and digital mammography. The patients were classified into two groups (malignant group, n=18; benign group, n=16).The ID was extracted and normalized to the ID in the aorta (NIDvp) . BIRADS categories were performed by three radiologists for all lesions respectively. Receiver operating characteristic (ROC) curves, sensitivity, and specificity were compared .
RESULTS: BIRADS category of 1, 2, 3, 4A, 4B, 4C, 5 of breast masses were 0,1,5,9, 8, 11, 0 cases respectively. The area under the curve (AUC) of area NIDvp and BIRADS categories respectively were 0.816 and 0.910, while 95% confidence interval were 66.40%-96.80% and 80.30%-100.00%, respectively. With a threshold of 0.21 for NIDvp, and 3.5 for BIRADS categories , the sensitivity, specificity value were 88.90%, 68.75% and 88.90%, 87.50%, respectively.
CONCLUSION: DLCT based ID was observed to perform equally with BIRADS categories in mammography in the differentiating between benign and malignant breast masses.

EPO-0822
乳腺三维断层摄影技术辐射剂量与图像质量的研究

蔡冬鹭,蔡思清,颜丽笙
福建医科大学附属第二医院

目的：探究并分析乳腺三维断层摄影技术辐射剂量（AGD）与图像质量之间的关系。**方法：**收集来我院采用乳腺三维断层摄影技术进行检查的 236 例患者的临床资料，根据患者乳腺厚度的不同，分为四组，每组各 59 人。采用非参数统计以及相关性分析的方法，对不同厚度乳腺的曝光条件和 AGD 的相关性进行分析。对同一厚度，不同 AGD 条件下成像的乳腺图片，分析其图像信噪比与 AGD 之间的关系。**结果：**当乳腺厚度增加时，曝光条件与 AGD 均随之增加，具有明显的相关性（r=0.977，P<0.05）。对于相同厚度的乳腺图片，AGD 越高，图像信噪比越高，具有明显的相关性（厚度≤29mm：r=0.977，P=0.023；厚度 30-45mm：r=0.994，P=0.006；厚度 46-59mm：r=0.998，P=0.002；厚度≥60mm：r=0.980，P=0.020）。**结论：**乳腺的厚度越厚，其曝光条件与 AGD 就越大，对同一厚度的乳腺，AGD 越高，成像的图像信噪比越高，图像质量越好。

EPO-0823
乳腺浸润性微乳头状癌的影像学表现与免疫组化的相关性研究

苏晓慧,林青,崔春晓
青岛大学附属医院崂山院区

目的:探讨乳腺浸润性微乳头状癌（invasive micropapillary carcinoma ,IMPC）的影像学表现、免疫组化与影像学表现的相关性、病理与淋巴结转移的关系。**方法**:回顾性分析 46 例乳腺浸润性微乳状癌的 X 线、超声表现及病理特征。**结果**:IMPC 的 X 线表现以肿块伴钙化型（54.3%）为主，肿块形态不规则（69.7%）或分叶状（18.2%）、毛刺状边缘（48.5%）或边界不清（36.4%）、高密度(81.8%)或等密度(18.2%)，60%以不定形钙化为主。超声表现以肿块型（76.1%）或肿块伴钙化型（17.4%）为主，肿块形态不规则（81.4%）或分叶状（14.0%）、边界不清（81.4%）或清楚（18.6%）、95.3%呈混杂回声，纵横比＜1 占 86%，后方可伴声影（32.6%）或正常（67.4 %），RI 为 0.57-0.90，平均为 0.74。ER+PR+HER2-阳性率 67.4%，在 ER+PR+的情况下，单纯型 IMPC 中 HER2- 46.1%， HER2+ 23.1%，混合型 IMPC 中 HER2- 75.7%，HER2+ 9.1%。乳腺 X 线摄影中肿块型 IMPC HER2- 72.7%，HER2+ 9.1%，非肿块型 IMPC 中 HER2- 53.8%，HER2+ 23.1%。IMPC 的淋巴结转移率及转移个数与浸润性导管癌相比差异有统计学意义(P＜0.05)。**结论**：IMPC 的 X 线及超声表现符合乳腺恶性肿瘤的特征。IMPC 的淋巴结转移率及转移个数较浸润性导管癌高，IMPC 类型、HER2 表达及肿瘤大小与淋巴结转移率无明显相关性。IMPC 以 ER+PR+HER2-多见，混合型 IMPC 中 ER+PR+HER2-较单纯型 IMPC 中多见，单纯型 IMPC 中 ER+PR+HER2+较混合型 IMPC 中多见。乳腺 X 线摄影中肿块型 ER+PR+HER2-较非肿块型多见，非肿块型 ER+PR+HER2+较肿块型多见。

EPO-0824
数字乳腺断层摄影与磁共振成像在乳腺癌新辅助化疗监测中的对比研究

刘艳,王彦龙
新疆医科大学附属肿瘤医院

目的：比较数字乳腺断层摄影（DBT）与磁共振成像（MRI）在乳腺癌新辅助化疗（NAC）监测中的应用价值，为临床分期及治疗提供依据。方法：选取 2015 年 12 月至 2017 年 12 月间在我院连续收治的 54 名经病理诊断为乳腺癌的患者并行新辅助化疗。患者在新辅助化疗前、中、后均行 DBT 和 MRI 检查。在新辅助化疗进行后，应用 DBT 和 MRI 测量的残余病灶的大小与手术标本（金标准）的病理结果比较，对每一位患者的治疗后的反应进行评估。使用 LIN 系数评价两种测量方法之间的一致性，应用 DBT 和 MRI 在新辅助化疗前、中、后分别对病灶进行测量。最后，根据 ReCIST 1.1 标准中设定的参数，以病理完全缓解（Pathological complete response，PCR）为中心，在 DBT 和 MRI 中分别评估肿瘤最大尺寸的变化。结果：在新辅助化疗（NAC）后，DBT 与手术标本组织学的一致性优于 MRI(LIN‘s 系数分别为 0.81 和 0.59，DBT-MRI 的一致性为 0.22，CI 0.07~0.58；PCC 0.85 和 0.67)；两种测量方法均倾向于低估残余肿瘤的真实范围(DBT 平均低估 4.1mm，MRI 低估 7.5mm)。DBT 图像的测量结果与 MRI 有很强的一致性，尤以 NAC 前 LIN‘s 系数（0.96，CI 0.94~0.98）和中(LIN’s 系数 0.94，CI 0.89~0.97)最为明显。NAC 后的一致性系数为 0.76(LIN‘s 系数，CI 0.61~0.86)，差异很大，反映出与组织病理学评估的不同相关性。DBT 与 MRI 测量结果的一致性在 NAC 前中后分别为 0.96、0.94 和 0.76。在组织病理学结果评估中，DBT 的敏感性和特异性分别为 100%和 84%，MRI 的敏感性和特异性分别为 87%和 60%。结论：DBT 与 MRI 对乳腺癌患者病变大小的测量高度相关。DBT 在评估 NAC 的反应方面与 MRI 一样可靠，是另一种选择。

EPO-0825

Diagnostic value of DR examination for breast cancer patients and its relationship with clinical pathology

Xing Hu
SHANGHAI NINTH PEOPLES HOSPITAL AFFILIATED TO JIAOTONG UNIVERSITY SCHOOL OF MEDCINE

[Abstract] **Objective:** To investigate the diagnostic value of digital radiography in patients with breast cancer and its relationship with clinicopathology. **Methods:** Prospectively selected 170 breast cancer patients in the hospital were divided into three negative breast cancer group (TNBC) group (33 cases), estrogen positive group (ER) positive group (91 cases) and human according to immunohistochemistry results. The epidermal growth factor 2 positive group (HER2) positive group (46 cases). Forward-looking? 170 cases of breast cancer patients in the hospital were selected according to the results of immunohistochemistry, divided into three negative breast cancer group (TNBC) group (33 cases), estrogen positive group (ER) positive group (91 cases) and human epidermal growth Factor 2 positive group (HER2) positive group (46 cases). Results: Compared with the three groups, the TNBC group and the HER2 positive group had larger tumors and the ER positive group had smaller (χ^2=9.327, P<0.05). The lymph node metastasis rate in TNBC group was higher than that in ER positive group and HER2 positive group (χ^2=9.431, P<0.05). The number of marginal burrs in ER positive group was higher than that in TNBC group and HER2 group (χ^2=4.272, P<0.05). The number of patients with microcalcifications in HER2 positive group and ER positive group was higher than that in TNBC group (χ^2=44.332, P<0.05). **Conclusion :** Large and accompanied by significant calcification, digital X-ray examination can provide effective evidence for early diagnosis of breast cancer.

EPO-0826

The Contrast Between Radiologists and Artificial Intelligence in Mammographic Breast Density Assessment

Ran Tao
Union hospital, tongji medical college, huazhong university of science and technology

OBJECTIVE: To evaluate the performance of breast density assessment by radiologists and Artificial Intelligence (AI) in different views.
METHODS: In current study, 2548 mammography images in 637 patients were collected from November 2018 to March 2019 by randomly selected 50 cases per week. Independent density assessments were recorded by four experienced radiologists. The majority assessment of the four breast imagers became the consensus. Compared to previous studies, these four radiologists evaluated the breast density for each patient from seven different views: Double breast view, right breast view, left breast, Craniocaudal (CC) view and mediolateral oblique (MLO) view for each breast. Evaluations were blinded to each other. The AI model, using a deep convolutional neural network, ResNet-18, also assessed the density evaluation of corresponding images obtained from these views.
RESULTS: The accuracies and consistencies of AI assessments for single person, unilateral breast, single film, CC view and MLO view were 0.821,0.667, 0.776,0.600, 0.818,0.675, 0.840,0.698, 0.795,0.650, respectively. The accuracies and consistencies of radiologists assessments were 0.856、0.751, 0.834、0.718, 0.825、0.696, 0.831、0.696, 0.822、0.700, respectively. Judging from point of the clinical practice, the best performance of AI was single film. While, radiologists obtained the best performance from the single person view. From the position point of view, the best performance for AI is the CC view, while, there is almost no difference between the CC view and the MLO view for radiologists.
Conclusion: With the increasing number of mammography, the performance of manual evaluation got better. Therefore, the categorial assessment of breast density recommended by BI-RADS13 is more scientific. AI assessments for single breast and person were not as good as which obtained from single view. This may due to the difference between the input and output modes. And the CC view performance was better than the MLO view, as the MLO view may interfered by the structural overlap among the pectoralis major, fat and axillary lymph nodes. Also Density assessments varied for different body positions.Therefore ,The results suggested radiologists should evaluate breast density integrally, while AI would show a better result from the CC view. Moreover, future studies should emphasize in establishing different input and output models for each view.

EPO-0827

数字乳腺断层合成 X 线成像技术在乳腺导管造影中的应用

廖好,杨帆,陶娟
华中科技大学同济医学院附属协和医院

目的：数字乳腺断层合成 X 线成像（Digital Breast Tomosynthesis，DBT）是新兴的乳腺 X 线检查技术，在诊断乳腺疾病中表现出了明显的优势，本研究对乳头溢液的患者运用 DBT 技术进行导管造影检查，并且采用不同浓度的碘对比剂进行检查，探究 DBT 在乳腺导管造影检查中的应用价值及碘对比剂浓度对图像质量的影响。
方法：自 2019 年 5 月至 2019 年 7 月在我院行乳腺导管造影病人共 81 例，对其中 33 个患者运用 DBT 技术进行乳腺导管造影，对两种图像中导管分支的显示及病灶的显示进行评价，评估 DBT 在乳腺导管造影诊断中的价值。此外，用 35mg/100mL 的碘海醇与生理盐水不同比例混匀，分别配制 20%、30%、40%、50%、75%、100%的对比剂，将不同比例的对比剂注入留置针软管内，包裹于五花肉中摄片，比较不同比例下造影剂显影情况；将 30%、50%及 100%比例的对比剂运用于 3 例乳腺导管造影中，比较不同比例下造影剂显影的图像质量。
结果：33 例病例中，血性溢液 11 例，黄色溢液 9 例，清亮溢液 12 例，乳白色溢液 1 例；X 线表现为充盈缺损 8 例，显影中断 4 例，导管扩张 10 例，导管炎 10 例，囊肿 1 例；传统 2D 与 3D 图像显示导管的分支情况中，3D 图像比 2D 显示较好的有 21 例，传统 2D 与 3D 显示相当的有 12 例。不同比例的对比剂中，30%比例以下的对比剂显影欠佳；在 3 例乳腺导管造影图像中，100%比例下的图像太锐利，对比度过高，30%及 50%比例下的图像柔和，对比度适中。
结论：本研究显示 3D 图像可以更好的显示导管分支，特别是远段细小分支，体现导管分支的走行及造影剂填充情况，尤其是 2D 图像中导管结构重叠的病人，可以显示出 2D 图像中因结构重叠而隐藏的病变，提高导管造影中病变的检出率，减轻阴性患者的担忧。另外，适当减少碘对比剂浓度，不会影响图像质量，但可以减轻碘对比剂引起的不良反应。

EPO-0828
基于乳腺 X 线摄影及超声等影像学特征构建机器学习模型预测浸润性乳腺癌分级

马梦伟,徐维敏,秦耿耿,陈卫国
南方医科大学南方医院

研究目的：乳腺癌是我国女性恶性肿瘤发病率最高的肿瘤。乳腺癌的预后与很多种因素有关，其中组织学分级是乳腺癌独立的预后预测指标。然而生物学采样是一种侵入性的方法，因此研发一种可在治疗前无创、准确地预测乳腺癌组织学的分级的方法显得尤为重要。乳腺 X 线摄影联合超声检查被认为是乳腺癌筛查及诊断的“黄金组合”。因此本研究通过开发和验证一种可解释和可重复的机器学习模型，依托临床信息联合乳腺 X 线摄影和超声影像学特征预测浸润性乳腺癌的分级。
研究方法： 回顾性收集 2010 年 1 月至 2016 年 12 月在术前同一时间段内行乳腺 X 线摄影及超声检查并经病理学诊断证实为浸润性乳腺癌的患者 250 例，其中 I 级约 78 例，II 级别 80 例，III 级别约 92 例，通过查阅病例资料，收集每例患者的临床数据信息；而乳腺 X 线摄影及超声影像学特征均由两位具有 5 年以上诊断经验的乳腺诊断医生根据第五版 BI-RADS 通过共同阅片后所决定，总共提取 65 个特征。将所收集的数据按照 7:3 的比例将数据分为训练组、测试组，对收集数据处理，并构建决策树模型。应用受试者工作特征(receiver operating characteristic，ROC)曲线并计算曲线下面积(AUC)、敏感度、特异度及准确度以评价该模型术前预测浸润性乳腺癌组织学分级的效能；并在测试组中测试其效能。

研究结果：该模型在术前预测浸润性乳腺癌组织学分级的效能 AUC 值为 0.802(95% CI：0.729~0.875)，敏感度、特异度和准确度分别为 79.47%、75.47%和 77.42%。
研究结论：基于第五版乳腺 BI-RADS 特征描述，通过结合乳腺 X 线摄影和超声的影像学特征，并加入临床信息，构建的决策树模型预测浸润性乳腺癌组织学的分级是可行的。同时由于 BI-RADS 分类的普用性和可接受性，其所提出的方法可以很容易地广泛应用，而不需要考虑成像供应商和设置的可变性。

Deep Learning Model used in Mammographic Breast Density Assessment

Juan Tao[1],Fan Yang[1],Jie Liu[1],Ran Tao[1],Wanshu Zhang[1],Junwei Lv[2],Lei Shi[2]
1.Union Hospital Tongji Medical College HuaZhong University of Science and Technology
2.Hangzhou Yitu Technology Co. Ltd..

Purpose: To investigate the clinical value of Deep learing (DL) model can be used to help radiologists improving the diagnostic efficiency of mammography.

Materials and Methods: In this prospective study, Fifty cases were randomly selected each week, 2,548 digital mammograms of 637 women from November 2018 to February 2019 involved in this study. All evaluations were performed by four radiologists with five years of experience in mammography who was blinded to the clinical diagnosis, including once overall evaluating, twice unilateral breast evaluating and quartic single image evaluating. The ResNet-18 model used to evaluate breast density compared with four radiologists' evaluations. 4 weeks later, 200 digital mammograms of 50 women in March 2019 were collected. The density of each mammogram was evaluated by machine, and four radiologists provide breast density classification based on the DL model results independently. The final gold standard was determined by majority decision and joint discussion.

Results: The consistency of four images' overall assessment evaluated by the four radiologists in each patient (K=0.75) was higher than assessment of unilateral breast images (K=0.718) and single image(K=0.696). The accuracy of four images' overall assessment, unilateral breast images assessment and single image assessment in patients were 0.856, 0.834, 0.825. The consensual assessment of single image evaluated between DL model and four radiologists (K=0.675;95% confidence interval [CI]: 0.648,0.702) was higher than the overall assessment given by single radiologist (K=0.675; 95% CI: 0.612, 0.722) and the assessment of unilateral breast images (K=0.599; 95% CI: 0.558, 0.640). The consistency of 200 breast densities in March evaluated by four radiologists who refer to AI results increased to 0.825. leapfrog-grade-evaluation will emerge When four radiologists evaluating same breast density, and machines will prevent this from happening.

Conclusion: Adding four experienced radiologists evaluating all cases independently is where we differ from previous studies. The evaluations of DL model and four

radiologists agree well with each other, the consistency of evaluations by four radiologists assisting with DL model increase.

EPO-0830

A New Method in Mammographic Breast Density Assessment Using AI: Explore a More Efficient AI Model for Clinical Implementation

Wanshu Zhang,Fan Yang
Union hospital of tongji medical college, huazhong university of science and technology

Purpose: To verify the effectiveness of the existing mammographic breast density evaluation AI model and further explore a more suitable DL algorithm for clinical use.
Materials and methods: we randomly selected 50 cases per week from november 2018 to february 2019, and finally collected 2,548 digital screening mammograms from 637 patients (excluding who had undergone single mastectomy). Density evaluation was conducted by four doctors with more than 5 years of experience in mammography diagnosis independently, and the test set gold standard was obtained after unified evaluation results. AI Model output was at the same time, which was built based on ResNet-18 neural network, by collecting 80000 digital screening mammograms obtained in 22000 women from multicenter of multiple mammography machines. Our test method is different from the literature has reported, that we assess seven times for each patient's breast density respectively, including double breast overall evaluation, unilateral breast overall evaluation, right breast CC, right breast MLO, left breast CC, left breast MLO. The AI model also inputs corresponding images to obtain the results of 7 times density evaluation.
Results: the AI model and radiologists both showed a high(＞0.77) accuracy rate in density evaluation. In evaluating the single mammogram, the accuracy and consistency of AI (κ = 0.675; 95% CI: 0.648,0.702) and radiologists (κ =0.696)were similar. In evaluating the unilateral breast or the whole patient, the accuracy and consistency of the AI were slightly worse than the radiologists' evaluation (κ = 0.559 vs 0.718; κ = 0.667 vs 0.751), and the difference was statistically significant. The accuracy and consistency of AI in evaluating single mammogram film were as high as double breast overall evaluation, (κ = 0.674; κ =0.667), while the result of unilateral breast overall evaluation was not that so good(κ =0.599; 95% CI: 0.558,0.640).However, the accuracy and consistency of radiologists on the single mammogram, unilateral breast and double breast were gradually increased(κ = 0.696; 0.718;0.751 respectively).
Conclusion:the AI model can be used for breast density evaluation.However, if AI integrated with human logic, AI will be more applicable to clinical practice.

Mammographic Breast Density Assessment Using Deep Learning Especially For Asian Women : Clinical Implementation

Jie Liu[1],Fan Yang[1],Juan Tao[1],Wanshu Zhang[1],Ran Tao[1],Junwei Lv[2],Qiang Lin[2]
1.Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology
2.YiTu network technology co, LTD

Purpose: As the proportion of breast density classification is different from Asian and and European and American women (more high density in Asian women), emphasis of the assessment and doctor's cognition are also different, so the existing evaluation model of European and American women's breast density is not applicable in China. The aim of this work was to investigate a deep learning(DL)-based breast density classifier to consistently distinguish "dense" categories, aiming at provid a potential computerized tool to assist radiologists in assigning a BI-RADS category in the current clinical workflow.

Materials and Methods: In this prospective study, we have randomly selected 50 patients per week, an between November 2018 and February 2019d finally collected 2,548 digital mammograms from 637 women. An independent assessment of breast density was performed by four experienced radiologists, and then unified conclusions were obtained for to form a gold standard for reference. Then we used the gold standard to verify the performance of the existing AI model, which was based on the ResNet-18 neural network trained on the original interpretation by an experienced radiologists of 80156 digital screening mammograms obtained in 22000 women screened by different machines in the polycentric institutions not including our hospital.

Results: The DL model showed excellent accuracy(81%) and good agreement with radiologists in the test set (k = 0.67; 95% confidence interval [CI]: 0.64,0.70).The recall and precision were 49.42% and 66.15% in group A, 82.87% and 67.05% in group B, 86.00% and 87.83% in group C, and 67.65% and 96.72% in group D respectively.

Conclusion: We found that the proportion of each classification affects the accuracy of training set before the prospective study. The accuracy of training set was poor in group A because of the low proportion (1.25%), which had improved significantly by increasing the data by eight times in internal test set. The better performance we got in test set of group D compared to other studies is again because of the higher proportion. So our DL model are more suitable for Asian women (19% in training set and 12% in test set of group D), which will help to establish the risk assessment models of breast cancer for Asian women. In the following research, we will explore the relationship between the proportion of each group and the performance of the model to optimize the DL model. In addition, we found that there was a category of error because of masses or dense vascular calcifications. In future studies, we are intending to increase the number of images of this part, which may be helpful to improve the performance and the universality of the model.

基于深度学习的乳腺 X 线摄影对乳腺密度评估的临床应用

刘洁[1],杨帆[1],陶娟[1],张婉姝[1],陶然[1],吕君蔚[2]
1.华中科技大学同济医学院附属协和医院
2.上海依图网络科技

目的 致密乳腺与乳腺癌具有强相关性，随着乳腺癌早期筛查在中国越来越多地获得政府的支持和人民的重视，中国人群的乳腺密度分类也也越来越获得医生的重视。而亚洲人群的乳腺密度分类比例和欧美有所不同（高腺体密度更多），评估的侧重点以及医生的认知也有所不同，所以现有国外腺体密度评估模型并不是很适用于中国的人群。本研究旨在开发一种适用于亚洲女性乳腺密度评估的深度学习算法。

方法 在这项前瞻性研究中，我们每周随机抽取 50 名在 2018 年 11 月至 2019 年 2 月期间来我院就诊的患者，最终从 637 名女性中收集了 2548 张数字乳房 x 线照片。由 4 名乳腺钼靶诊断经验 5 年以上的医师对乳腺密度进行独立评估，并按少数服从多数原则得出统一的结论作为测试集金标准。然后使用金标准验证现有的人工智能(AI)模型的性能（该模型采用 ResNet-18 算法，采集了本院之外的多中心多钼靶机型的 22000 人的 80156 张图像数据进行训练）。

结论 AI 模型与放射医生在测试集中的结论一致性很高，准确率高达 81%(k = 0.67;95%置信区间[CI]: 0.64,0.70)；不同密度分型的召回率和准确度分别为 49.42%和 66.15%（A 型）、 82.87%和 67.05%（B 型）、86.00%和 87.83%（C 型）、67.65%和 96.72%（D 型），其中 C 和 D 型乳腺中的性能最令人满意。

讨论 在前瞻性研究之前我们曾做过简单的测试，发现 AI 模型在不同密度分型中的准确率与它们在训练集中的占比相关。训练集中 A 型乳腺仅占 1.25%，性能很差；在对 A 型乳腺进行了 8 倍的数据增强后性能在内部测试集获得了显著的提升。而本研究中 D 型乳腺的性能表现比其他文献的结果好很多，可能也是因为 D 的占比更高，所以这个模型也更加适合致密乳腺更多的亚洲女性。

EPO-0833
乳腺癌不同受体表达的影像学特征

蔡思清,黄雪清,吴培丽
福建医科大学附属第二医院

目的：探索 4 种乳腺癌不同受体表达的影像学特征。方法：选取 439 例术前进行乳腺 DBT 检查且进行免疫组化乳腺癌患者。分析乳腺癌不同受体表达的影像学与临床特征。**结果**：Luminal A 型出现毛刺肿块比例最大，钙化分数均值最小，有显著统计学差异(均 P＜0.01)；HER2 过表达型平均年龄、绝经后比例、肿块大小均值、钙化分数均值及钙化分数≥9 分比例最高,有统计学差异(年龄 P＜0.05，余均 P＜0.01)；三阴性型表现为肿块、形状规则、边缘模糊及高级别浸润性导管癌比例最高，有统计学差异(均 P＜0.01)。ER+和（或）PR+组与无绝经、毛刺肿块表达成正相关，有显著统计学差异(均 P＜0.01)；HER2+组及 KI-67 表达与钙化分数、肿块长径和高级别浸润性导管癌表达成正相关，有统计学差异(P＜0.05）。**结论**：乳腺癌不同受体表达在影像及临床特征上存在一定相关性，可为临床诊断与治疗方案的选择提供一定依据。钙化是 X 线诊断的巨大优势，在本项研究中 62%患者出现钙化，其中 Her-2 过表达型更高达 82%，钙化分数平均值也居 4 种分子亚型的首

位。Luminal A 型钙化分数更多集中在 4-8 分，而 HER2 过表达型钙化分数更多集中在 9-12 分（P＜0.01），因而我们认为钙化分数是预测分子亚型的一个指标。三阴性型最常出现肿块，比例为 93.88%。肿块伴钙化则在 HER2 过表达型中最常见，约达 54.9%。HER2 过表达型肿块平均长径最大，Luminal A 型最小；从受体层面分析，KI-67 值和 HER2 阳性组与肿块长径存在正相关。对于肿块形状及边缘特征，Luminal A 型肿块更多为不规则毛刺肿块，出现该现象为低 KI-67 值与 ER 或（和）PR 受体阳性相作用结果，三阴性型倾向为相对规则模糊肿块，推测与其受体全阴也存在一定关系。因而肿块形状、边缘特征有助于对分子亚型起到一定鉴别作用。

EPO-0834
探讨低危团簇状分布钙化灶在 BI-RADS 的合理归类以及第二眼超声的应用价值

胡燕标[1],吴飞飞[1],张景峰[2],谢平坤[1],李杰[1],李铁丰[1],李辉[1],杨杰[1]
1.宁波市北仑区人民医院
2.浙江大学医学院附属第一医院

【摘要】目的：探讨在 FFDM 筛查性检查中，低危团簇状分布钙化灶的 BI-RADS 合理归类，以及第二眼超声检查在协助鉴别诊断中所起到的作用。**方法：**收集我院经 FFDM 筛查性检查发现 99 例共计 114 处团簇状分布钙化灶，一周内进行针对性第二眼超声检查，一个月内经病理组织学结果证实。**结果：**发生于左乳 51 例，右乳 45 例，双乳 3 例。穿刺活检 59 例，24 例麦默通活检，单纯乳房切除 5 例，区段手术切除活检 11 例，其中良性 94 例，乳腺癌 5 例，恶性占比约 5.05%。99 例 FFDM 共发现团簇状分布钙化灶 114 处，单侧单纯点状钙化灶 42 处，单侧单纯粗糙不均质钙化灶 20 处，单侧点状钙化灶伴局限致密影 15 处，单侧粗糙不均质钙化灶伴局限致密影 9 处，双侧多发钙化灶 7 处，单侧多发单纯点状钙化灶 21 处。FFDM 检出疑似恶性 34 处，良性 80 处，其中真阳性 4 处，假阳性 30 处，真阴性 79 处，假阴性 1 处。第二眼超声检出恶性 13 处，良性 101 处，其中真阳性 3 处，假阳性 10 处，真阴性 99 处，假阴性 2 处。FFDM 联用第二眼超声检查，诊断灵敏度从 80%上升至 100%，误诊率从 27.5%小幅上升至 30.3%，特异度从 72.5%小幅降至 69.7%，漏诊率从 20%降至 0%，阴性似然比从 0.28 降至 0，阳性似然比从 2.91 升至 3.3。**结论：**在筛查性检查中发现低危团簇状分布钙化灶后，给予临床清晰的处理策略指导。通过针对性的第二眼超声检查，规避了患者在短期随访期间的等待恐惧，更重要的是避免了不必要的穿刺活检甚至切除活检，同时提高了乳腺癌的检出率，研究中提出的“团簇状分布钙化灶处理流程图”及增设“BI-RADS 4F 类”的建议值得在临床实践中推广使用。

全数字化乳腺 X 线摄影、数字乳腺断层摄影及乳腺超声对导管内乳头状瘤的诊断价值研究

潘德润,徐维敏,文婵娟,秦耿耿,陈卫国
南方医科大学南方医院

目的：乳腺导管内乳头状瘤是女性常见的乳腺良性肿瘤，临床表现缺乏特异性，其诊断主要依赖于影像学检查。本研究结合传统全数字化乳腺 X 线摄影及超声，探讨数字乳腺断层摄影对乳腺导管内乳头状瘤的诊断价值。

方法：回顾性收集南方医科大学南方医院 2014 年 03 月-2018 年 12 月期间经病理证实为导管内乳头状瘤的患者 104 例，所有的患者均行全数字化乳腺 X 线摄影（FFDM）、数字乳腺断层摄影（DBT）和超声（US）检查。首先由 3 年高年资放射科医师对影像图像进行分析，内容包括病变可见性、病灶最大径、BI-RADS 分类等。将 BI-RADS 评分 3 或 4a 归为正确分类，当意见不一时，通过协商得出最终结果，对比 FFDM、DBT 和 US 三种模式对病例诊断的敏感度、特异度及 ROC。然后按照发病部位将病例分为乳晕下区病灶和非乳晕下区病灶，分别对比 FFDM、DBT 及 US 诊断两组病例的准确率。
结果：共收集 104 例患者，其中乳晕下区 39 例，其他部位 65 例。FFDM、DBT 和 US 对导管内乳头状瘤诊断的敏感度分别为 0.793、0.891 和 0.937，差异有统计学意义（p＜0.05）；特异度分别为 0.740，0.779 和 0.821，差异有统计学意义（p＜0.05）;ROC 曲线下面积分别为 0.851,0.906 和 0.919，差异有统计学意义（p＜0.05）。在乳晕下区病例的诊断结果中，FFDM、DBT 和 US 的准确率分别为 0.858,0.914 和 0.923，对于非乳晕下区病例，三者的准确率分别为 0.813,0.895 和 0.901，差异均有统计学意义（p＜0.05）。

EPO-0836

通过 AI 模型辅助提高乳腺 X 线腺体密度评估效能

陶娟[1],杨帆[1],刘洁[1],陶然[1],张婉姝[1],吕君蔚[2],石磊[2]
1.华中科技大学同济医学院附属协和医院
2.杭州依图医疗技术有限公司

目的:通过放射科医生之间对乳腺 X 线密度评估的一致性和人工智能（AI）模型与放射科医生之间的一致性分析，评价 AI 模型能否用于临床以及 AI 模型能否帮助诊断医生提高乳腺 X 线评估效能。
材料和方法：前瞻性研究，我们从 2018-2019 年，收集了 637 位患者共 2548 张 X 线图像；由四位高年资医生（5 年以上乳腺诊断经验）独立进行乳腺密度评估，包括单个病人四张图像总体、单侧乳房及单张图像评估，评估参考 2013 年 ACR 乳腺 X 线 BI-RADS 密度标准；用 AI 模型（该模型采用 ResNet-18 算法，采集了本院之外多中心多机型 22000 人共 80156 张图像进行训练）评估乳腺 BI-RADS 密度。统计四位放射科医生之间的一致性、4 位医师评估的共识(盲标之后，医生对齐原则)与 AI 模型一致性。
之后我们收集 2019 年另外 50 个病人共 200 张乳腺 X 线片，分别由 AI 模型、3 位高年资医生、3 位低年资医生（小于 2 年诊断经验）分别对单张图像进行密度评估（金标准由高年资医生多数决定），分别统计出一致性和准确率；再让 3 位低年资医生参考 AI 的结果，选择是否同意 AI 结果，评估 AI 模型是否能提高准确率或保证准确率前提下提高一致性。
结果：4 名放射科医生对以人为单位评估一致性为 0.75、对单乳评估一致性为 0.718、对单张图像评估一致性为 0.696。AI 模型与共识评估对以人为单位总体评分的一致性为 0.667、对单乳评分的一致性为 0.599、对每张图像评分的一致性为 0.675。
针对 3 月份共 200 张钼靶片进行密度评估结果，高年资医生和 AI 模型的一致性和准确率均较高；低年资医生参考 AI 结果对每张图像评估，一致性上升，且准确率也提高了。
结论：该 AI 模型与我们有经验的四位医生在测试集的一致性较好，故该 AI 模型可用于临床评估乳腺密度。低年资医生在 AI 辅助下一致性及准确率有所上升，所以该 AI 模型能够帮助低年资医生提高乳腺诊断效能。

EPO-0837

乳腺核磁共振、断层融合、数字 X 线摄影诊断早期乳腺癌 的对比研究

顾志娣,徐阿巧
绍兴市中心医院

目的：探讨乳腺动态增强磁共振成像（DCE-MRI）、数字断层融合摄影（DBT）、数字 X 线摄影（DM）在乳腺癌早期诊断中的应用价值。**方法：** 收集 2017 年 1 月至 2018 年 12 月经手术病理证实的早期乳腺癌患者 65 例，术前均行乳腺 DCE-MRI、DBT、DM 检查。以病理结果为金标准绘制 ROC 曲线，评价不同影像检查方法的诊断效能，用 Z 检验对 ROC 曲线下面积进行比较；采用 χ2 检验比较 DCE-MRI、DBT、DM 对早期乳腺癌检出率、准确率、灵敏度、特异度的差异；采用 Pearson 相关性分析不同影像检查方法评估早期乳腺癌病灶大小的准确率。**结果：** DCE-MRI、DBT、DM 基于 BI-RADS 分类诊断早期乳腺癌的 ROC 曲线的曲线下面积(AUC)分别为 0.91、0.832、0.700，差异有统计学意义（Z 值为 2.132，*P*= 0.001）；DCE-MRI、DBT、DM 对早期乳腺癌敏感度分别为 92.3%、70.8%、52.5%，DCE-MRI、DBT、DM 对早期乳腺癌特异度分别为 65.0%、85.0%、79.3%，DCE-MRI 、DBT、DM 对早期乳腺癌的诊断准确率分别为 83.1%、70.8%、50.8%，MR 及 DBT 的诊断准确率均高于 DM，差异均有统计学意义（ χ2 值分别为 15.33、5.45，P<0.01、*P*=0.02）；DM、DBT、DCE-MRI 测量值与病理测量结果呈正相关(r=0. 767，r=0. 905，r=0. 955，*P* 均<0. 01)。**结论：**DCE-MRI、DBT 在早期乳腺癌检出和诊断准确率具有明显优势，相较 DM 能显著提高早期乳腺癌的诊断效能，未普及乳腺磁共振检查广大基层医疗单位可采用 DBT 提高乳腺癌早期检出。

EPO-0838
联合 DBT 及 CESM 提高致密类乳腺肿块型病变的诊断价值

徐维敏,李颖嘉,文婵娟,徐泽园,曾辉,何子龙,秦耿耿,汪思娜,吴杰芳,陈卫国
南方医科大学南方医院

目的：通过对比 CESM、DBT 和 US 对致密类乳腺可疑恶性肿块型病变的诊断价值，从而推广 CESM 联合 DBT 的临床运用价值.
方法：收集我院 2018 年 1 月-2019 年 5 月传统乳腺 X 线判断为可疑恶性乳腺肿块型病变共 109 例女性，发病年龄岁 24-74 岁，中位年龄 46.0 岁。受检者同时行 CESM、DBT 和 US 检查。同时根据 BI-RADs 5th将乳腺纤维腺体组织类型分为非致密类（共 18 例，包括脂肪类和散在纤维腺体类）和致密类（共 91 类，包括不均匀致密类和极度致密类）两组。并进一步分析 CESM、CESM+DBT 及 CESM+US 的 ROC 曲线下面积、敏感性、特异性、假阳性及阳性预测值。
结果：相对于乳腺肿块型病变，CESM+DBT 总的敏感性及假阳性高于 CESM 及 CESM+US (CESM+DBT:0.986,0.513 vs. CESM 0.957,0.487 vs.CESM+US:0.971,0.411)。再进一步对比 CESM、CESM+US 及 CESM+DBT 对于非致密类及致密类乳腺的诊断价值。相对于致密类乳腺，CESM+DBT 相比于 CESM 及 CESM+US，具有更高的敏感性、阳性预测值和阴性预测值(CESM+DBT:0.606, 0.814,0.952 vs. CESM:0.545,0.785,0.857 vs.CESM+US:0.525,0.781,0.944)。然而对于非致密类乳腺，相比于 CESM 及 CESM+DBT，CESM+US 具有更高的诊断价值，尤其是 ROC 曲线下面积、特异性和阳性预测值更高 (CESM+US: 0.750,0.5,0.785 vs. CESM:0.715, 0.333, 0.75 vs. CESM+DBT:0.701, 0.333, 0.75).
结论：CESM 能够有效检出乳腺可疑肿块型病变，联合 DBT 能更好的提高致密类乳腺肿块型病变的诊断价值；同时 CESM 联合 US 具有较高的临床应用价值。

EPO-0839

Clinical Histopathologic and Imaging Manifestations of Breast Carcinomas with Neuroendocrine Features

Lijuan Shen,Tingting Jiang,Wei Tang,Huijuan Ge,Weijun Peng
shanghai cancer center

Objective: This study aimed to describe the clinical, histopathologic, and multimode imaging features of primary breast carcinomas with neuroendocrine features (BCNEF). **Materials and Methods:** The multimode images (according to the 2013 BI-RADS lexicon) and clinical and histopathologic characteristics of BCNEF patients were reviewed, documented and compared with the historical controls of neuroendocrine carcinoma of the breast (NECB) and invasive ductal carcinoma (IDC). **Results:** Thirty-four patients (35 lesions) were included, with an average age of 62.8 years. Twenty-nine patients (85.3%) were postmenopausal at diagnosis, which was more than in those found with historical IDC. Most cases (82.4%) presented clinically as a palpable mass, with a mean tumour diameter of 23.8 mm. Compared to historical IDC, more patients were ER positive (91.4%), PR positive (80%), and HER2 negative (100%). After surgery, only two patients were found to have distant metastases during follow up, and so far, every patient is alive. BCNEF appeared as an irregular (63%) mass (84.4%) with an indistinct (55.6%) margin on mammography (n=32), as an irregular (87.1%), parallel orientated (87.1%), indistinct (54.8%), margined mass (100%) on sonography, and as an irregular (68.8%) mass (94.1%) with an irregular (80%) margin and a rapid (50%) initial enhancement/plateau (64.7%) kinetic curve on MRI. **Conclusion:** BCNEF mostly occurred in elderly postmenopausal women in clinical settings with good outcomes. BCNEF mostly appeared as irregular masses with an uncircumscribed margin in imaging. Most imaging findings of BCNEF were considered suggestive of malignancy, but it is still difficult to differentiate BCNEF from IDC.

数字乳腺断层融合摄影与超声检查对乳腺黏液癌诊断价值比较

王聪聪,林青
青岛大学医学院附属医院

目的　对比分析数字乳腺断层融合摄影（DBT)、数字乳腺 X 线摄影（DM)及超声检查（US）对不同亚型乳腺黏液癌（MBC）的诊断价值。
方法　回顾性分析 64 例经手术病理证实的 MBC 的影像资料，其中 37 例为单纯型 MBC，27 例为混合型 MBC。以 2013 年第 5 版乳腺影像报告及数据系统（BI-RADS）为诊断标准，比较 3 种检查方法对不同亚型 MBC 检出率及诊断符合率的差异。
结果　DM、DBT 及 US 对所有 MBC 的检出率分别为 89.1%、96.9%、98.4%，对单纯型 MBC 的检出率分别为 89.2%、97.3%、97.3%，对混合型 MBC 的检出率分别为 88.9%、96.3%、100.0%，3 种检查方法的检出率两两比较差异均无统计学意义（P>0.05）。DM、DBT 及 US 对所有 MBC 诊断符合率分别为 71.9%、93.8%、89.1%，对单纯型 MBC 诊断符合率分别为 62.2%、91.9%、83.8%，对混合型 MBC 诊断符合率分别为 85.2%、96.2%、96.2%。对于所有 MBC 及单纯型 MBC，US 及 DBT 的诊断符合率均高于 DM，差异有统计学意义（ x 2=4.385~10.785，P<0.05）；DBT 的诊断符合率稍高于 US，但差异

无统计学意义（P>0.05）。对于混合型 MBC，3 种检查方法的诊断符合率两两比较差异均无统计学意义（P>0.05）。
结论　3 种检查方法对 MBC 的检出率差异不明显；对于 MBC 尤其是单纯型 MBC，US 及 DBT 的诊断符合率均高于 DM，而 DBT 与 US 差异不明显。

Comparison of the diagnostic performance of synthesized two-dimensional mammography and full-field digital mammography alone or in combination with digital breast tomosynthesis

Chao You,Weijun Peng,Yajia Gu
Department of Radiology， Fudan University Cancer Center， Department of Oncology， Shanghai

Purpose: To investigate whether digital breast tomosynthesis (DBT) and subsequently generated synthesized mammography (SM) images have better performance than full-field digital mammography (FFDM) images for diagnosing malignant breast lesions. In addition, the radiation doses for SM using different procedures were compared.
Materials and methods: This prospective study enrolled 212 women (age≥ 25 years) with clinically suspicious breast lesions. All participants underwent FFDM and DBT with the same breast compression. Finally, 222 lesions were confirmed by pathological analysis. The mammogram results were evaluated according to the BI-RADS criteria and compared with the pathological results. The diagnostic performances, morphological features and average glandular doses (AGDs) were compared.

Result: In total, 141 malignant lesions and 81 benign lesions were confirmed by pathological analysis. The overall AGD showed no significant difference between FFDM and DBT. Compared with 2D imaging, the AUC values of FFDM plus DBT and SM plus DBT were both significantly different overall (p=0.0002) and remained significantly different in dense breasts (P<0.0001). In terms of morphologic characteristics, lesions showed similar morphology between FFDM and SM, while the lesion characteristics were discordant from 2D imaging to DBT in 33 lesions in dense breasts.
Conclusion: Compared to FFDM, 2D SM images generated from DBT had significantly improved diagnostic efficacy for detecting malignant breast lesions without increasing radiation doses. This new procedure is useful for characterizing breast lesions, particularly in dense breasts.

EPO-0842

FFDM 联合 MRI 对乳腺小病灶的诊断价值

崔曹哲,马彦云,姜增誉

山西医科大学第一医院

目的：
分析乳腺小病灶 FFDM 与 DCE-MRI 及参数的影像学特征，探讨 FFDM 联合 DCE-MRI 检查对乳腺小病灶的诊断价值。
方法：
回顾性研究 2017-2018 年间在我院经过临床检体和 FFDM 检查后，仍不明确乳腺疾病的患者，最后进行了均 MRI 检查的 48 人。入选标准为病灶≤1cm,患者均具有临床表现和或 FFDM 检查异常，但性质不定，最终行穿刺或手术后得到病理结果。其中 FFDM 检查阳性患者为 31 名。
由 2 名具有多年乳腺影像诊断的医师采用 BI-RADS 分类法盲法评阅患者乳腺 X 线摄影片和磁共振扫描图像，对影像资料进行分析评估。由高年资医师绘制感兴趣区域（ROI），以尽可能地包围整个病变。DCE-MRI 需对每个 ROI 用于提取每个时间点的信号增强的平均值，确定最大强度时间比（MITR）。根据 *Hoffman U* 等的药代动力学模型，分析数据得出三个参数：振幅（信号-时间曲线的初始斜率），交换速率常数和廓清速率常数。 然后可以从模型中计算另外两个参数：最大增强指数和分布容积（幅度与交换速率的比率）。
使用 SPSS 20.0 进行数据分析，计数资料最终结果以百分率显示，组间采用 x 2 检验，P＜0.05 时差异有统计学。
结果：
在 48 名患者中，以最后的病理诊断作为金标准，对 FFDM 及 MRI 的诊断进行统计学分析。FFDM 较 MRI 表现为相对低的敏感性（FFDM 为 65%，MRI 为 87%）和相对高的特异性（FFDM 为 82%，MRI 为 56%）。但结合动力学参数，MRI 对病灶的特异性可所提高（DCE-MRI 约为 68%）。FFDM 结合 MRI 检查对小病灶的评估，较单独进行 FFDM 或 MRI 检查的准确率有明显提高（准确率约为 89%）。
结论：
1. FFDM 联合 DCI-MRI 可以提高对乳腺小病灶诊断的准确率。
2. DCE-MRI 动力学参数的引入对病灶的良恶性诊断有很大帮助。

EPO-0843
全数字化三维乳腺断层摄影对乳腺良恶性疾病的诊断价值

郑福玲,孔令燕,丁宁,王晓,郝学民,张燕,张宏宇,商学红,王玉红,高清乐,高鑫,李娟,薛华丹,金征宇
中国医学科学院北京协和医院

目的探讨全数字化三维乳腺断层成像对乳腺良恶性疾病的诊断价值,并与常规二维乳腺 X 线成像和乳腺超声结果进行比较。方法回顾性分析 2019 年 6 月至 7 月之间 67 例患者，均接受常规二维乳腺 X 线成像、数字化三维乳腺断层成像及乳腺超声检查，并经穿刺活检或手术病理证实，依照 BI-RADS 评分分别计算三维乳腺断层成像、二维乳腺 X 线和超声检查对乳腺良恶性病变的准确率、敏感度、特异度、阳性预测值、阴性预测值。用 Kappa 分析分别评价三维乳腺断层、二维乳腺 X 线、超声检查与病理结果的一致性。用 Fisher 确切检验法，评价三维乳腺断层、二维乳腺 X 线和超声检查对恶性病变的敏感性、特异性差异。结果三维乳腺断层、二维乳腺 X 线和超声检查对乳腺良恶性病变诊断的准确率分别为 85.07％、64.18％、76.12％,敏感度分别为 90.32％、67.74％、69.44％,特异度分别为 80.56％、61.11％、69.44％；三维乳腺断层乳腺成像、二维乳腺 X 线和超声检查与病理结果进行一致性评价，Kappa 值分别为 0.70、0.28、0.52。不同检查方法对恶性病变检出的敏感性比较：三维乳腺断层与二维乳腺 X 线间有统计学差异（P<0.05）,三维乳腺断层与超声及二维乳腺 X 线与超声间无统计学差异（P>0.05）。不同检查方法对恶性病变检出的特异性比较：三维乳腺断层的特异性最高，但三种方法的特异性在统计学上均无明显差异（P>0.05）。 结论三维

乳腺断层成像对乳腺良恶性病变诊断的敏感性、特异性、准确率均高于二维乳腺 X 线及超声检查，与病理结果高度一致，恶性病变评价敏感性优于常规二维乳腺 X 线成像，是乳腺癌筛查、诊断更为准确的检查方法。

The relationship between mammographic features and clinicopathological parameters in Chinese data base

yu ji,Wenjuan Ma,Hong Lu,Ying Zhu,Peifang Liu
Tianjin Medical University Cancer Institute and Hospital

Objective:
To assess the relationship between mammographic features and clinicopathological parameters in Chinese data base.

Materials and Methods:
In this institutional review board-approved HIPAA-compliant study, in which the requirement for informed patient consent was waived. A retrospective review of mammographic images from a total of 198 breast cancer patients imaged between January 2016 and March 2016 were conducted. The mammographic features were assessed according to BI-RADS by three experienced breast radiologists. The clinical information, including age, tumor size, grade, and axillary lymph node status, were collected from our database. Estrogen receptor (ER), progesterone receptor (PR), human epidermal growth factor receptor 2 (Her2) and Ki-67 were analyzed on the surgically removed tumor samples by immunohistochemical staining analysis. Statistical analysis was performed to assess the correlation between mammographic features and clinicopathologic characteristics.

Results:
54.0% (n=107) of the patients had a mammographic mass, 38.4% (n=76) had calcifications, 14.1% (n=28) had both a mass and calcifications on the mammogram, and 1.5% (n=3) had architectural distortion. Twelve masses had a regular shape, and ninety-five masses were irregular. Thirty-five masses had a spiculated margin, and seventy-two masses were non-spiculated. The shape of the mass was significantly related to molecular factors. Irregular masses had a significantly higher PR-positive than regular masses (73/94, 77.7% vs. 5/11, 45.5%, $p<0.05$). In addition, the majority of irregular masses were invasive breast cancer ($p<0.05$). Based on pathologic analysis, the IDC grade of III in mass was 16.7% (n=25), which were obviously higher than those in nonmass as 6.0% (n=9) ($p<0.05$), whereas 4.7% (n=7) in architectural distortion/asymmetries, which were obviously lower than those in non-architectural distortion/asymmetries as 18.0% (n=27) ($p<0.05$). The lesions appeared as calcification or architectural distortion/asymmetries on the mammogram, the tumor was usually larger than 2 cm in size ($p<0.05$) and with Her2 positive in calcification lesions($p<0.05$), whereas the masses was usually smaller than 2 cm in size ($p<0.05$).

Conclusions:

There is a relationship between mammographic features and clinicopathological parameters in Chinese data base. The mammography imaging recognition of breast cancer can assist in both pretreatment planning and prognosis as well as adding to a greater understanding of the biological behaviour of the disease entity.

EPO-0845
数字乳腺断层摄影与合成二维图像的联合在诊断乳腺疾病中的应用价值

涂艳
云南省肿瘤医院/昆明医学院第三附属医院

背景：随着数字乳腺断层摄影在世界范围内的广泛应用，传统的数字乳腺 X 线摄影将逐渐被断层摄影取代。然而断层摄影所带来的辐射剂量亦随之增加，因此有学者研究了断层合成二维图像是否可以取代传统的的数字乳腺 X 线摄影图像等问题，但目前为止仍然无足够的循证医学研究证据来证实这一问题。
目的：通过该研究探讨数字乳腺三维断层摄影（DBT）联合合成 X 线二维图像（C-view）对乳腺病变的诊断及鉴别诊断价值。
方法：回顾性收集 2019 年 1 月至 2019 年 6 月在云南省肿瘤医院住院且诊断经穿刺活检或手术病理证实的 387 例(401 个病灶)女性乳腺疾病患者,年龄≥30 岁，筛选入组的所有患者均进行过数字乳腺 X 线摄影检查（FFBM）、三维断层摄影检查（DBT）,重组 DBT 检查获得合成 2D 图像(C-view 图像)。所有入组病例均由四名医师独立进行阅片分析，其中两名对 DBT 结合 FFDM 图像进行分析，另外两名对 DBT 结合 C-view 图像进行分析,判读结果参照乳腺影像报告和数据系统(BI-RADS)分类,记录诊断结果，包括发现病灶的数目、位置及良恶性。以病理和临床诊断结果为标准,采用 ROC 评价采用不同类型图像鉴别乳腺良、恶性病变的效能。
结果：检查发现良性病灶 233 个、恶性病灶 168 个。DBT 结合 FFDM 及 DBT 结合 C-view 诊断乳腺良、恶性病变的敏感度和特异度分别是 70.4% vs 68.9%（P=0.76），
94.9% vs 95.3%(P=0.23)，而两者的 ROC 下面积均为 0.878。差异均无统计学意义。
结论：数字乳腺三维断层摄影（DBT）联合合成 X 线二维图像（C-view）与数字乳腺三维断层摄影（DBT）联合 X 线摄影（FFDM）具有相似的敏感度、特异度及诊断效能。因此笔者认为乳腺断层合成的 2D 图像可代替常规 FFDM 图像,结合 DBT 诊断在不增加辐射剂量的前提下,可提高鉴别诊断良、恶性病变的效能。

EPO-0846
乳腺癌及肿瘤新生血管的同步辐射成像研究

李瑞敏,张汐,顾雅佳,彭卫军
复旦大学附属肿瘤医院

目的：探讨同步辐射相位对比 X 线成像技术在离体人体乳腺癌及其新生血管成像中的实验研究，并与传统乳腺 X 线成像进行比较。材料和方法：选取 34 例人体乳腺癌离体标本在上海光源 X 射线成像与生物医学应用光束线站上（BL13W）成像，储存环电子束能量 3.5GeV，BL13W 线站的光子为 8-72kev，光斑 45mm(H)*5mm(V)(@20keV)，本研究两维成像方法采用的能量为 13~16 keV，探测器 13um 和 9um，样品-探测器距分别选择 0cm, 60cm, 100cm 和 120cm，曝光时间 10ms，三维成像方法采用的能量同上，探测器 9um，样品-探测器距为 100cm，每幅投影图像曝光时间 32ms，旋转台转

速 0.36°/s，每个位置记录 2 帧图像，旋转 180°，总投影数约 1000 张。以 Image Pro Plus 和 Amira 进行图像后处理。同时，所有标本进行传统乳腺 X 线成像，并将两种影像学图像与最后的病理图像进行比较分析。结果：同步辐射相位对比 X 线成像能比传统乳腺 X 线成像更清楚的显示乳腺癌中的微小钙化灶数目、边缘和分布，并且在不使用造影剂的情况下即可显示 9um 左右直径的乳腺癌肿瘤新生血管，并可观察到肿瘤新生血管主要分布在肿瘤周边区域，中心部分血供较少，坏死较多。结论：同步辐射相位对比 X 线成像技术具有很高的衬度分辨率和空间分辨率，具有很高的医学应用前景。

EPO-0847
对比增强乳腺 X 线摄影平均腺体剂量与乳腺病变的相关性研究

林淑仪
南方医科大学南方医院

目的 探讨乳腺病变类型、病变良恶性及病变大小对对比增强乳腺 X 线摄影（contrast-enhanced spectral mammography，CESM）低能图、高能图及减影后图像的乳腺平均腺体剂量（average glandular dose, AGD）的影响。**方法：**收集 2018 年 2 月-10 月于本院行 CESM 检查且经过组织学病理学证实的 123 例女性患者作为研究对象。根据病变良恶性、主要病变类型（非肿块型与肿块型）、及肿块型病变大小进行分组，比较患侧与健侧乳腺 MLO 位的低能图 AGD、高能图 AGD 及减影后图像的 AGD。**结果：**恶性病变 65 例，良性病变 58 例。肿块型病变 86 例，非肿块型病变 37 例；其中恶性肿块 57 例，良性肿块 29 例。肿块大小≥2cm 44 例，＜2cm 32 例；其中恶性肿块≥2cm 32 例，＜2cm 25 例。恶性病变的患侧 MLO 位高能图 AGD 较健侧高 12.74%（Δ=0.065）；良性病变的患侧 MLO 位高能图 AGD 较健侧高 7.91%（Δ=0.035）。肿块型病变的患侧 MLO 位高能图 AGD 较健侧高 12.55%（Δ=0.061）；其中，恶性肿块型病变的患侧 MLO 位的高能图 AGD 较健侧高 10.91%（Δ=0.057）。肿块长径≥2cm 组的患侧 MLO 位的高能图 AGD 较健侧高 14.67%（Δ=0.08）；其中，恶性肿块长径≥2cm 组的患侧 MLO 位的高能图 AGD 较健侧高 20.88%（Δ=0.113）。以上各组间差异均具有统计学差异（P＜0.05）。低能图像两侧乳腺 AGD 差异无统计学意义。**结论：**病变良恶性、病变类型和肿块大小对 CESM 高能图 AGD 有影响。

对比增强能谱 X 线摄影对乳腺癌诊断价值的系统评价

夏婷
广东省人民医院

摘要：目的：乳腺 X 线摄影是乳腺癌筛查首选的检查方式，微钙化是钼靶检查的优势，但乳腺钼靶检查的假阳性仍然是个关注的焦点问题，对比增强能谱 X 线乳腺摄影是一项新技术，检查方便，诊断效能高，可以应用于乳腺癌的筛查、诊断及随访等方面，正逐渐广泛应用于临床。本研究目的在于通过系统评价和荟萃分析评价对比增强能谱 X 线摄影对乳腺癌的诊断价值。方法:检索 PubMed、Embase 以及 Cochrane 数据库，所有数据库检索时间截止到 2018 年 7 月，筛选能获得 CESM 独立诊断乳腺癌的真阳性值（TP）、假阳性值（FP）、假阴性值（FN）、真阴性值（TN）等原始数据并在国内外公开发表的 CESM 对乳腺癌的诊断性试验。所有入选文献研究对象必须为 18 岁以上患者，性别、病例来源不限；目标病灶行 CESM 且有明确的病理诊断（不论是穿刺或手术切除活检）。研究的结局指标包括其诊断实验的合并敏感性（Sen）、合并特异性 （Spe）、合并诊断比值比（DOR）以及受试者工作特征（SROC）曲线下面积（AUC）、诊断实验准确性指标

（TPR），用 Revman 软件进行 meta 分析。结果:此次研究检索到如何纳入标准的 18 篇文献进行分析，meta 分析结果显示合并后的灵敏度和特异度分别为 84.03%、77.59%，表明对比增强能谱 X 线摄影在乳腺癌的诊断中具有较好的灵敏度和特异度。本研究 SROC 曲线下面积为 0.874，诊断试验准确性指标 TPR 为 81.62%，SDOR 值为 15.05（95%CI：10.32%～21.95%）），说明对比增强能谱 X 线摄影对乳腺癌的诊断价值较高，具有较好的准确性，是乳腺癌筛查和诊断的一种较好的影像学方法。结论:尽管对比增强能谱 X 线摄影对乳腺癌的诊断价值较高，具有较好的准确性，是乳腺癌筛查和诊断的一种较好的影像学方法。本研究认为，对比增强 X 线能谱对乳腺癌的早期诊断效果较好。

EPO-0849
对比增强能谱乳腺 X 线摄影积分诊断模型对乳腺癌的诊断价值分析

刘莹,余建群,梁春晓,李爽,黄娟,秦韵
四川大学华西医院

目的：联合对比增强能谱乳腺 X 线摄影（CESM）中病灶强化程度、强化类型以及低能图中的 BI-RADS 分类进行合成积分，研究其与乳腺病理学良恶性的关系。**材料与方法：**对临床或超声怀疑乳腺病变的患者行 CESM 检查，由三名放射科医师对图像进行分析诊断，将取得病理结果的 124 个病灶纳入研究。定性分析剪影图中病灶的强化程度、强化类型。将强化程度分为无强化、轻度强化、中度强化、重度强化，并将其分别记为积分 0、1、2、3；对比病灶在两个体位（头尾位、内外斜位)图像中的强化程度的差异，将病灶的强化类型分为无强化、上升型、平台型、下降型，并分别记为积分 0、1、2、3。对低能图中的病灶进行 BI-RADS 分类，积分 1 定义为 BI-RADS≥4 类，积分 0 定义为 BI-RADS≤3 类。将剪影图与低能图的积分相加得到合成积分，并将其与病理学良恶性进行对比。采用受试者工作特征曲线(ROC)和约登指数法获得不同评分方法的最佳截断值，并得出诊断效能。**结果：**124 个病灶，经病理证实乳腺癌 33 个，良性病变 91 个。CESM 强化程度对乳腺病灶的诊断敏感性,为 78.8%，特异性为 74.7 %，准确性为 75.8%，ROC 下面积（AUC）为 0.818。CESM 强化类型对乳腺癌的诊断敏感性为 90.9%，特异性为 62.6%，准确性为 70.2%，AUC 为 0.833。低能图 BI-RADS 分类对乳腺癌的诊断敏感性为 63.6%，特异性为 76.9%，准确性为 73.4%，AUC 为 0.703。CESM 合成积分模型的最佳截断值为 3，其诊断敏感性为 84.9%，特异性为 71.4%，准确性为 76.9%，AUC 为 0.859。在多项评分指标中，合并积分模型具有较高的诊断效能。**结论：**本研究初步探索并建立了一个简单的 CESM 积分诊断模型，联合病灶强化程度、强化类型以及低能图中的 BI-RADS 分类进行合成积分，该模型对乳腺病变的鉴别诊断具有一定价值。

EPO-0850
CESM 对乳腺肿块型病变的定性诊断及免疫组化分析

徐维敏,李颖嘉,文婵娟,汪思娜,曾辉,何子龙,秦耿耿,徐泽园,陈卫国
南方医科大学南方医院

[目的]分析 CESM 对乳腺肿块型病变的良恶性诊断及其免疫组化的相关性。**[方法]**收集我院 2018 年 1 月-2019 年 5 月传统乳腺 X 线判断为可疑恶性乳腺肿块型病变共 109 例女性，发病年龄岁 24-74 岁，中位年龄 46.0 岁。分析 CESM 的诊断效能，并分析不同病理类型及分子亚型乳腺癌的 CESM 特

点。[结果] 109 例包括单纯肿块 66 例及肿块伴钙化 43 例；良性病变 39 例，乳腺癌 70 例。CESM 检查的 ROC 曲线下面积 0.860(95% Confidence Interval, 0.784~0.935)、敏感性 0.957、特异性 0.513 及阳性预测值 0.986。109 例乳腺肿块型病变是否强化、强化形态、边缘及强化程度在良性病变与乳腺癌间的差异具有统计学意义（P＜0.05）；而肿块样强化的内部强化特征在良性病变与乳腺癌间的差异不具有统计学意义（P=0.184）。良性肿块型病变未强化率（17.9%）高于乳腺癌（1.4%）。良性肿块型病变多表现为圆形/椭圆形肿块样强化（22/39,56.4%）；乳腺癌多表现为不规则形肿块样强化（46/70,65.7%）。良性病变及乳腺癌肿块样强化的边缘均以模糊多见，且以浸润性导管癌多见（55/70，78.5%）。良性病变多表现为轻度强化（14/39,35.9%），而肿块型乳腺癌以明显强化为主（57/70,81.4%）。良性病变及乳腺癌肿块样强化的内部特征均以均匀多见（56.2%：65.2%），但不均匀强化多见于乳腺癌。不同分子分型乳腺癌肿块样强化形态、边缘及程度差异均不具有统计学意义（P＞0.05）；但肿块内部的强化特征差异具有统计学意义（P＜0.05），三阴性型以不均匀（42.9%）或环形强化（42.9%）多见，而其他三种类型均以均匀强化多见。

[结论] CESM 对于判断乳腺肿块型病变良恶性具有较高的诊断效能，且根据肿块样强化内部特征可初步推断乳腺癌分子分型。

EPO-0851

基于 CESM 影像组学诺莫图预测乳腺癌腋窝淋巴结转移

毛宁[1],洪楠[2]
1.山东省烟台毓璜顶医院
2.北京大学人民医院

目的：建立并验证术前预测乳腺癌腋窝淋巴结转移的影像组学诺莫图。

材料与方法：148 名符合条件的乳腺癌患者被分为训练组（n=100）和验证组（n=48）。从每个病人的 CESM 图像中提取影像组学特征。然后在训练集中用 LASSO 算法建立影像组学标签。结合独立的危险因素，采用多元 Logistic 回归模型建立诺莫图。诺莫图的效能在训练集中进行评估，并在验证集中进行验证。最后，结合训练和验证集进行决策曲线分析，以评估诺莫图的临床实用性。

结果：由 9 个淋巴结状态相关特征组成的影像组学标签，具有良好的预测效果。包括影像组学标签和 CESM 报告的淋巴结状态的诺莫图在训练集（AUC 0.79；95%CI，0.73-0.85）和验证集（AUC 0.76；95%CI，0.69-0.84）中也显示出良好的效能。决策曲线表明了我们列线图的临床实用性。另外，诺莫图在 CESM 报告的淋巴结状态为阴性的亚组（AUC 0.88；95%CI，0.83-0.94）也显示出良好的鉴别能力。

结论：影像组学诺莫图是一种非侵入性术前预测工具，结合影像组学特征和 CESM 报告的淋巴结状态，对乳腺癌患者淋巴结转移具有一定的预测效能，具有良好的应用前景，需要大数据进一步提高模型的效能和多中心验证获得临床应用的高水平证据。

Cone-beam breast CT features associated with HER2/neu overexpression in patients with primary breast cancer

Yueqiang Zhu,Yuwei Zhang,Yue Ma,Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

Objectives To retrospectively identify the relationship between human epidermal growth factor receptor 2 (HER2) status and cone-beam breast CT (CBBCT) characteristics in surgically resected breast cancer.
Methods This study was approved by institutional review board, and informed consent was obtained from all patients. Preoperative CBBCT findings were retrospectively evaluated in 181 surgically resected breast cancer between October 2012 to August 2015. A set of 27 CBBCT descriptors was semiquantitatively assessed by consensus double reading. Multivariate logistic regression analyses using backward elimination method (BEA) were performed to identify independent predictive factors of harboring HER2/neu. Principle component analysis (PCA) was used to found characteristics that might separate HER2 positive/negative. Receiver operating characteristic (ROC) curve analyses were conducted to determine the ability of predicting HER2 status.
Results HER2 positive were found in 101 (55.8%) of 181 patients. Based on BEA, pathologic grade, maximum dimension, lobulation, ΔCT, and calcification morphology were confirmed as independent predictive factors of HER2/neu overexpression. PCA showed that calcification- and border-related characteristics were the most important for differentiation. ROC curve analyses showed that CBBCT features (area under the ROC curve (AUC) = 0.853) was superior to clinical features (AUC = 0.613, $P < 0.001$), and comparable to combination with clinical features (AUC = 0.856, $P = 0.866$).
Conclusions CBBCT features can be used to prognosticate HER2 status independently, which are potentially useful to support automated analyses and develop decision-support clinical tools.

对比增强能谱乳腺 X 线摄影与 CE-MRI 诊断乳腺癌的对比研究

封任冬[1],李明伦[1,2],丁莹莹[1],马坚[1],邓志春[1]
1.玉溪市人民医院（昆明医科大学第六附属医院）
2.玉溪市红塔区妇幼保健院
3.云南省肿瘤医院（昆明医科大学第三附属医院）

【摘要】 目的 探讨对比增强能谱乳腺 X 线摄影（contrast enhanced energy spectrum mammography-CESM）诊断乳腺癌的价值。**方法** 回顾性分析经乳腺 X 线摄影（mammography-MG）筛查 BI-RADS 分类为 4A 类及以上病例进行乳腺 CESM 及 MRI 检查，并且最终经病理证实的 50 例 52 个病灶。所有患者均行双侧乳腺 CESM 和 MRI 检查。对病理标本进行判读，获得病理分类诊断结果，观察 CESM 和 MRI 表现，记录病灶检出情况，并对病灶进行定性诊断。以病理结果为金标准，采用卡方检验分析 CESM 及 MRI 的诊断效能。**结果** 50 例患者病理共检出 52 个病灶，良性病灶 13 个，恶性病灶 39 个。CESM、MRI 各检出病灶 38 个，定性诊断判读错误病灶各 1 个。以病理结果为金标准，CESM 诊断乳腺癌的敏感度、特异度和准确度分别为 97.40%、84.6%和 73.8%，MRI 分别为 97.4%、76.9%和 73.8%，差异均无统计学意义。**结论** CESM 诊断乳腺癌与 MRI 检查的诊断效能接近。

EPO-0854
对比增强能谱乳腺 X 线摄影与动态增强磁共振成像诊断乳腺结节的对比研究

杨行
四川大学华西医院

目的：探讨对比增强能谱乳腺 X 线摄影（Contrast-Enhanced Spectral Mammography，CESM）与动态对比增强磁共振成像（Dynamic Contrast-Enhanced Magnetic Resonance Imaging，DCE-MRI）在乳腺结节中的诊断性能
方法 收集在 2017 年 2 月-2018 年 12 月期间临床怀疑或超声诊断为乳腺结节的 69 例患者，均进行过 CESM 和 CE-MRI 检查。采用双盲法和非随机研究。用配对 T 检验对病灶的大小和强化程度进行统计学分析。以病理结果作为金标准。计算诊断敏感度、特异度、准确性和阳性预测值。并采用问卷的方式让病人对两种检查的满意度和耐受度进行调查，分析患者更偏向哪一种检查 。
结果 69 例患者有 42 例良性病变， 27 例恶性病变。CESM 检测乳腺结节的敏感度、特异度、阳性预测率、阴性预测率和准确率分别为 83.21%、91.32%、88.67%、93.56%和 84.21%。DE-MRI 分别为 86.32%、95.44%、90.27%、96、33%和 88.75%。乳腺病变强化程度在 CESM 中显著低于 DCE-MRI，P<0.01。两种检查方法均能检测出直径大小约 3 mm 的病变。在耐受度的问卷调查中 73.5%的患者选择了 CESM，26.5%的患者选择了 DCE-MRI. 差异有统计学意义（P<0.01）
结论 CESM 显示和诊断乳腺结节疾病优于低能图，与 MRI 检查的诊断效能相当，更大的舒适性和较低的噪音水平与 DCE-MRI 相比，CESM 的焦虑率明显降低让患者更耐受。

Contrast-enhanced spectral mammography: Can it improve positive predictive value of different type of suspicious calcifications?

Rong Long,Kun Cao,Min Cao,Yingshi Sun
Peking University Cancer Hospital

Purpose:To assess the positive predictive value(PPV) of contrast-enhanced spectral mammography(CESM) of different types of calcifications.***Material and Methods:***Patients with mammographic calcifications without associated mass or distortions and were originally reported as BI-RADS 4 during March 2017 to Dec 2018 were retrospectively collected.Lesions received CESM and proven through pathological diagnosis by biopsy were enrolled.Types of morphology and distribution of calcifications on low-energy images were classified based on the fifth ACR BI-RADS.For morphology types,calcifications were classified as higher risk type(fine linear or fine linear branching) and lower risk type(amorphous, coarse heterogeneous, fine pleomorphic and others).For distribution,calcifications were classified as higher risk type(linear and segmental) and lower risk type(regional,grouped and diffuse).Meanwhile,the enhancement of calcification was evaluated on subtracted images.ACR BI-RADS 4 or 5 calcifications on low-energy images and calcifications with enhancement on subtracted images were diagnosed as malignant.Statistical differences of the two images were compared using Chi-square test.***Result:***73 lesions(26 malignant and 47 benign) from 73 patients were enrolled.The PPV were 35.62% and 76% for low-energy image and subtracted image for all calcifications($p<0.05$).The PPV of calcifications with higher risk morphology and higher risk distribution(type A),higher risk morphology and lower risk distribution(type B),lower risk morphology and higher risk distribution(type C),lower

risk morphology and lower risk distribution(type D) were 100%,75%,66.67%,72.73% for subtracted image, and were 83.33%,75.00%,40.00%,24.07% for low-energy image.The PPV of subtracted image of type D calcifications was significantly higher than that of low-energy image($p<0.05$). ***Conclusion***:CESM improve the PPV on mammographic calcifications,especially calcifications with lower risk morphology and lower risk distribution.

EPO-0856

乳腺对比增强 X 线摄影的临床应用

张征委,金彪
上海交通大学医学院附属新华医院

目的：探讨分析乳腺对比增强 X 线摄影(Contrast-enhanced spectral mammography,CESM)在乳腺病灶的检出及鉴别良恶性方面的应用
方法：回顾性分析 29 例女性患者，均为临床怀疑或超声发现乳腺病变后进一步行 CESM 检查，最终经过穿刺活检或手术切除取得病理结果。CESM 又称双能量技术，指注射对比剂后，对双侧乳房进行低能量（低于碘的 K 值 33.2 keV）和高能量（高于 33.2 keV）曝光，分别获得低能图和高能图，通过图像后处理对两者进行减影，最终得到双侧乳房头尾位、内外斜位的低能图及减影图，共八幅图像。由两位具有十年以上工作经验的放射诊断医师进行图像分析，记录的内容包括：低能图上病灶是否存在及病灶类型，减影图上病灶是否存在及病灶类型（参照 2013 版 BI-RADS 中乳腺 MRI 的描述）。
结果：29 例女性患者，共检出病灶 29 例。病理证实恶性的病灶有 9 例，包括浸润性导管癌、导管原位癌、粘液癌及囊内乳头状癌，其中强化的有 7 例，均表现为肿块样强化（形态：6 例形态不规则、1 例圆形，边缘：4 例清晰、3 例不规则，强化特点：1 例均匀，5 例不均匀，1 例环形强化），无强化的有两例，病理分别为导管内原位癌、浸润性导管癌，后一例病灶位置较深，考虑可能是行 CESM 检查时未摄入。病理证实良性的病灶有 20 例，包括乳腺病、纤维腺瘤、导管内乳头状瘤等，其中 12 例强化、8 例无强化，10 例表现为肿块样强化（6 例形态为圆形或卵圆形，9 例边缘清晰，7 例强化均匀），2 例表现为非肿块样强化（均为局灶强化）。
结论：CESM 的初步应用结果表明，乳腺良恶性病灶均可以表现为强化，但恶性病灶倾向于表现为形态不规则、边缘清晰或不规则、强化不均匀，而良性病灶倾向于表现为圆形或卵圆形、边缘清晰、强化均匀，这表明 CESM 在乳腺病灶的检出及鉴别良恶性方面有着潜在的价值，有待于进一步的研究证实。

EPO-0857

Radiation dose of Contrast-enhanced Spectral Mammography: Comparable to conventional mammography and more friendly to patients with denser breast tissues

Min Cao,Kun Cao,Xiaomeng Zhang,Rong Long,Yingshi Sun
Peking University Cancer hospital

Objective:
To compare the radiation dose of contrast-enhanced spectral mammography (CESM) with that of full field digital mammography (FFDM) under the same mammography

equipment, and compare the dose differences among patients with varying breast tissue densities.

Materials and methods:

This is a retrospective study enrolling 51 consecutive patients who received CESM examination and 62 randomly chosen patients who received FFDM during the same period and on the same mammography equipment (GE Senographe Esse). All values of the entrance skin exposure (ESE) and the average glandular dose (AGD), as well as the thickness and pressures, were all recorded on both right and left sides of craniocaudal projections (RCC and LCC) for each patient. Breast tissue densities were classified by two radiologists in consensus as a to d referring to the 5th BI-RADS, and then were divided as denser group (a and b types, n=39) and non-dense group (c and d types, n=11). Mann-Whitney tests were used to compare the dose differences between low-energy CESM and FFDM, total dose (plus low and high energy doses) of CESM and FFDM, and between denser and non-dense groups.

Results:

For both RCC and LCC, ESE (6.58±2.89 and 6.85±2.67 mGy) and AGD (1.52±0.49 and 1.57±0.47 mGy) of the low-energy projection of CESM were significantly lower than those of FFDM (ESE 9.07±2.92 and 8.82±2.73 mGy, AGD 2.01±0.51 and 1.98±0.48 mGy) ($P<0.01$). The total AGD of CESM (2.06±0.67 and 2.13±0.66 mGy) had no significant difference with FFDM ($P>0.05$). The total AGD of CESM non-dense group (2.40±0.76 and 2.36±0.54 mGy) were much higher than that of denser group(1.97±0.62 and 2.06±0.68 mGy)($P<0.05$).

Conclusion:

Data from one single device found total radiation dose of CESM was comparable to FFDM, while the dose from CESM low-energy projection was much lower. Furthermore, the patients with denser breast tissue received less radiation dose than non-dense patients in CESM examination, which may indicate a favorable application.

EPO-0858

Diagnostic performance of Dual-energy contrast-enhanced spectral mammography (CESM)

Tingting Jiang,Shenjian Zhang,Ruimin Li,Jian Wu,Yajia Gu,Weijun Peng
Fudan University Shanghai Cancer Center

【Abstract】**Objective:** To compare contrast-enhanced spectral mammography (CESM), low energy image (LE), and magnetic resonance imaging (MRI) in the detection of breast cancer, using postoperative histology as the gold standard.

Methods: Prospective collected 145 patients. Analysed the diagnostic efficacy of LE, CESM and MRI with ROC curve. Compared lesion size measured by LE,CESM and MRI with pathologic size, using Pearson correlation coefficient and Bland-Altman.

Results: 153 lesions were found in 145 patients, 36 were benign and 117 were malignant. The sensitivity of LE, CESM and MRI was 89.83%, 95.80%, 94.17% ,the specificity was 62.86%, 86.11%,80.56%,the positive predictive value was 89.08%, 97.44%, 96.58%, the negative predictive value was 64.71%, 91.76%, 87.88% and the accuracy was 83.66%, 94.77%, 92.81%, respectively .The area under ROC curve of LE, CESM and MRI was 0.87、

0.96 and 0.97. The correlation coefficients of the pathologic size and the lesion size measured by LE, CESM and MRI was 0.61, 0.84 and 0.83 respectively. For consistency with pathology, the average difference between LE, CESM, MRI and pathologic size was -1.7mm, 1.1mm and 0.3mm, respectively. CESM and MRI slightly overestimated lesion size, and MRI was closer to pathological size.
Conclusion: CESM can significantly improve the diagnostic efficacy of breast lesions, and can be comparable with MRI.

乳腺纤维腺体密度与乳腺癌的关系分析

胡从依
天津医科大学肿瘤医院

目的：通过分析乳腺纤维腺体密度在乳腺癌患者及正常人群中的分布情况，并进行比较研究，为进一步探究乳腺纤维腺体密度与乳腺癌患癌风险间的关系提供更多的信息和依据。**方法：**回顾性分析 2015 年 8 月至 2016 年 8 月于我院就诊行双侧乳腺 X 线摄影检查并经病理确诊为乳腺癌的女性患者 1941 例，作为实验组。分析同时间段行双侧乳腺 X 线摄影检查无阳性发现的门诊体检患者 1503 例，作为对照组。所有乳腺 X 线摄影原始图像经计算机辅助诊断系统 Quantra 软件全自动测量乳腺纤维腺体密度。采用 SPSS19.0 统计学分析软件。实验组计算健侧乳腺纤维腺体密度值；对照组计算双侧乳腺纤维腺体密度值后取平均值。采用秩和检验分别评价＜45 岁，45～54 岁，55～64 岁，≥65 岁女性人群中实验组与对照组的乳腺纤维腺体密度间差异。以 P＜0.05 为差异有统计学意义。**结果：**经秩和检验分析，实验组与对照组的乳腺纤维腺体密度差异有统计学意义（P＜0.01）。将实验组与对照组根据年龄均划分为 4 组，分别对＜45 岁，45～54 岁，55～64 岁以及≥65 岁人群进行秩和检验分析，评价实验组与对照组的乳腺纤维腺体密度，其中＜45 岁组的乳腺纤维腺体密度实验组高于对照组，差异有统计学意义（P＜0.05）；45～54 岁组、55～64 岁组及≥65 岁组中对照组乳腺纤维腺体密度高于实验组，差异均有统计学意义（P＜0.05）。**结论：**年龄与乳腺纤维腺体密度呈负相关，随着年龄的增长，乳腺纤维腺体密度逐渐降低。年轻人群中，乳腺癌患者较正常人群具有较高的乳腺纤维腺体密度。然而随着年龄不同，乳腺癌患者与正常人群的乳腺纤维腺体密度分布情况也随之改变，这可能预示着乳腺纤维腺体密度与乳腺癌患癌风险间的关系会随着年龄的不同而存在差异，因此，乳腺纤维腺体密度如何影响乳腺癌的患癌风险还仍需要进一步探讨研究。

锥光束乳腺 CT（CBBCT）引导下穿刺：不同体模实验的初步研究

康巍,郑仲涛,蒙丽宇,苏丹柯
广西医科大学附属肿瘤医院

摘要 目的 采用不同体模模拟 CBBCT 引导下乳腺肿物穿刺术。 **材料与方法** 在 CBBCT 引导下采用 2 种穿刺路径分别对不同体模表浅及深部靶目标进行穿刺，评价各组穿刺的可行性和准确性。**结果** ①不同穿刺路径对于有效标本获取的准确度不同，穿刺路径 2（以靶点小格为中心取 2 条组织，在其邻近的上下左右每格各取 2 条组织）相对于穿刺路径 1（以靶点小格为中心，该小格四个象限各取 1 条组织）整体获取有效标本的准确性更高（p＜0.05）；②不同体模获取有效标本的准确性不同，其中模拟乳房体模的准确率最高，其次是煮 6 分熟土豆、茄子、芒果（p＜0.05）；③穿刺不

同体模深浅部靶目标准确性无差异（$p>0.05$）；④不同操作者穿刺准确性组间无差异（$p>0.05$）；⑤综合经济学及穿刺准确性因素，煮 6 分熟土豆作为体模具有较高的性价比及可重复操作性。**结论** CBBCT 引导下体模穿刺实验具有可行性及可重复操作，穿刺准确性高。

乳腺 X 线三维钩丝穿刺定位减少并发症及辐射剂量的研究

宋军伟
淄博矿业集团有限责任公司中心医院

【目的】：在乳腺 X 线三维钩丝穿刺定位中，根据患者具体病灶情况，调整细微操作及曝光条件，减少并发症，降低辐射损伤。【方法】收集我院 2016 年 1 月至 2018 年 8 月期间行 X 线三维钩丝穿刺定位的女性患者 28 例，14 例在低剂量摄片个体化条件下进行定位操作，另外 14 例摄片条件不变，分别记录两组平均腺体剂量（AGD）值与入射剂量（ESD）值,定位成功后,手术室切除病灶进行病理检查。【结果】两组患者针丝头均距离穿刺中心<20mm，指导手术切除效果满意。28 例患者中出现定位软件计算错误 3 例，迷走神经反应 4 例，钩丝扭曲 3 例；两组患者 AGD 值与 ESD 值差异有统计学意义（P<0.05），两组患者钩丝距穿刺中心距离差异无统计学意义（P>0.05），两组患者定位效果无明显差异，低剂量组患者 AGD 值与 ESD 值明显下降。【结论】根据乳腺病灶的特征，通过调整乳腺三维钩丝定位中一些细微操作及曝光条件，可有效减少并发症，降低患者所受辐射剂量。

Quantifying Non-alcoholic Fatty Liver using Fat Concentration Measurement in Dual-Energy Spectral CT: Correlation with Magnetic Resonance Q-dixon Method

Min Zhang,Jianying Li,Nan Yu,Chunling Ma,Dong Han
Affiliated Hospital of Shaanxi Chinese Medicine University

Objective: *To determine the accuracy of using fat concentration (FC) measurement in spectral CT to detect and quantify non-alcoholic fatty liver using the fat fraction (FF) measured with magnetic resonance Q-dixon (MRQd) technique as a reference standard.* ***Methods:*** *Retrospectively analyzed 80 liver patients who underwent both MRQd and spectral CT with fast tube switching within one week. Using the MRQd results, patients were divided into normal and fatty liver groups (normal: n=20, FF<5%; mild: n=26, FF=5%-10%; moderate: n=20, FF=11%-25%; and severe: n=14, FF>25%). The liver FC were measured on the lipid-based material decomposition images in spectral CT by 2 senior abdominal radiologists by placing regions of interest in two different hepatic lobes over 7 image slices centered at the hepatic portal level. Final FC was obtained by averaging the measurements. Measurements were repeated three times weekly to evaluate the repeatability using intra-group or inter-group correlation coefficient (ICC). The correlation between MRQd and spectral CT results was analyzed. The diagnostic efficacy of using FC in spectral CT for differentiating normal and mild fatty livers was tested by ROC curve.*

Results: The ICC values were high indicating excellent intro- and inter-group measurement consistency. There were differences in FC between any groups (P<0.05), and higher FC values corresponded to more fat in the liver. There was an excellent positive correlation between FC in spectral CT and FF in MRQd (r=0.959, P<0.001). ROC curve analysis showed that with a cut-off value of 351.19mg/ml for FC, the sensitivity, specificity and area under curve were 95%, 100% and 0.990, respectively in differentiating the normal and fatty liver groups.

CONCLUSION: The fat concentration measurement in spectral CT has excellent correlation with the fat fraction by MR Q-dixon. The fat concentration in spectral CT has high accuracy to differentiate normal and fatty liver for non-alcoholic fatty liver patients.

Clinical Application/Relevance: The fat concentration measurement in spectral CT can be used as an imaging method for the diagnosis of fatty liver, and its accuracy is high.

胰腺腺鳞癌的特征性影像学与病理对照研究

方旭,边云,王莉,陆建平
海军军医大学第一附属医院（上海长海医院）

目的 胰腺腺鳞癌是胰腺癌一种极为罕见的变异类型，分析胰腺腺鳞癌的影像学表现，并与病理对照，提高对该病的认识。

方法 收集 2011 年 2 月至 2018 年 12 月经病理确诊为胰腺腺鳞癌 108 例，同时设立对照组，随机选取同时期经手术切除病理证实，并与 PASC 组性别、年龄相匹配的 PDAC 患者 100 例。术前均进行胰腺 CT 或 MRI 增强检查。分析胰腺腺鳞癌 CT 和 MRI 影像学特征，包括肿瘤部位、瘤体直径、主胰管扩张、胰腺实质萎缩、中央囊变、环形强化，与胰腺导管腺癌对照。两组各种影像学特征组间比较采用卡方检验。P＜0.05 为差异有统计学意义。

结果 腺鳞癌位于胰头部 58 例、胰体尾部 50 例，导管腺癌位于胰头部 63 例、胰体尾部 37 例，差异无统计学意义。腺鳞癌瘤体直径（38.9±16.3）mm 大于导管腺癌瘤体直径（30.1±10.1）mm，差异有统计学意义（P＜0.05）。由于扩张的胰管和萎缩的实质均位于肿瘤远端，故在评估主胰管扩张、胰腺实质萎缩这两组指标时，需排除发生于胰尾部的腺鳞癌 28 例、导管腺癌 10 例，胰管扩张腺鳞癌（48/80）少于导管腺癌（82/90），胰腺萎缩腺鳞癌（32/80）少于导管腺癌（65/90），差异均有统计学意义（P＜0.001）。腺鳞癌中央囊变（65/108）多于导管腺癌（12/100），并且腺鳞癌 65 例发生中央囊变的瘤体直径（45.3±16.9）mm 大于 43 例中央无囊变的瘤体直径（29.2±9.2）mm，差异均有统计学意义（P＜0.001）。腺鳞癌环形强化（69/100）多于导管腺癌（25/100），差异均有统计学意义（P＜0.001）。

结论 胰腺腺鳞癌具有中央囊变和环形强化的影像学特征，肿瘤越大，越易发生囊变。相对于导管腺癌，腺鳞癌的瘤体直径更大，胰管扩张和胰腺实质萎缩更少见。虽然两者采用的治疗策略相似，但术前的准确诊断有助于指导术前管理和术后预后评估。

EPO-0864

Impact of splenomegaly on survival after bland transarterial embolization for HCC

Xiangwen Xia,Wang Qi
Department of Radiology， Union hospital， Tongji medical college， Huazhong university of science and technology

Objective
The purpose of this study was to analyze whether splenomegaly impacts survival after transarterial embolization (TAE) for HCC in a cirrhotic patient population.
Materials
A retrospective review of TAE procedures was performed to identify patients undergoing lobar or bilobar TAE for the treatment of HCC. Superselective treatments were not included for analysis. 152 patients were included for analysis (119 male, mean age 63 years, range 31-85). Using the pre-procedure CT or MRI, the splenic volume was measured using manual contour tracing volumetric software. The medical records were reviewed to ascertain survival. Using a severe splenomegaly threshold volume of 400mL, the survival was estimated and compared using the Kaplan-Meier and log rank test. A multivariate analysis on factors associated with survival was performed using the Cox proportional hazards test.
Results
A total of 90 patients (59.2%) undergoing TAE for HCC had severe splenomegaly. A lobar TAE was performed in 125 patients and a staged bilobar embolization was performed in 27 patients. Based on the Kaplan-Meier method, the median survival for patients with severe splenomegaly was 23.5 months, compared to 38.1 months for patients without severe splenomegaly ($p=0.003$). Multivariate analysis of predictors of worse survival revealed a significant correlation with a higher total splenic volume ($p<0.001$) and bilobar treatment ($p=0.004$). Patient age, AFP levels and maximum tumor diameter were not significantly correlated with survival ($p=0.337$, 0.070 and 0.769, respectively).
Conclusions
In patients undergoing TAE for HCC, the presence of severe splenomegaly is significantly correlated with poorer survival.

EPO-0865

Gastric hepatoid adenocarcinoma: differentiation from gastric adenocarcinoma with dynamic contrast-enhanced computed tomography findings

Yi Fu,Hui Zhu,Weijun Peng
Fudan University Shanghai Cancer Center

Purpose
To describe the computed tomographic (CT) findings of gastric hepatoid adenocarcinoma (GHA) and determine features distinguishing it from gastric adenocarcinoma (GA).
Methods
CT images of pathologically verified GHA (n=11) and GA (n=38) were retrospectively reviewed. Alpha-fetoprotein (AFP), carcinoembryonic antigen (CEA), and CT findings were assessedin our study. CT findings included the location, distribution, growth

pattern, ulceration, thickness of gastric wall, enhancement pattern, and ratio of lesion attenuation to aorta CT attenuation. Short diameter (SD) of the metastatic lymph nodes, mean SD of metastatic lymph nodes, and the ratio of the number of enlarged lymph node on CT to the number of metastatic lymph nodes pathologically (ELN/MLN) was measured and calculated. Data were compared by $x^2$and student's t-test; significant CT criteria were identified using receiver operating characteristic curve.

Results

AFP, CEA, and a variety of CT findings were statistically significant predictors for the differentiation of GHA from GA ($p < 0.05$). When only CT findings were used as criteria, the sensitivity and specificity for diagnosing GHA were 82.86% and 90.91%, respectively. When AFP, CEA, and CT findings were used as criteria, sensitivity of 97.14% and specificity of 90.91% were achieved.

Conclusions

Elevated serum AFP level and CT findings could distinguish GHA and GA with a high degree of accuracy.

EPO-0866

MRI T1 反相位纹理分析对肝纤维化分期诊断价值初步研究

杨莹[1],庞佩佩[2],李洁[1],丁建平[1]
1.杭州师范大学附属医院
2.GE 医疗

目的：探讨 MRI T1 反相位图像纹理分析（texture analysis，TA）在肝纤维化分期中的潜在价值。方法：搜集共 67 例经肝穿刺活检证实的肝纤维化患者，依据 Scheuer 法将其分为 S0~S4 期共 5 组。应用 GE Omin-Kinetics 软件经手动在 T1 双回波反相位上分割勾画病灶感兴趣区(region of interest，ROI)，得出基于灰度共生矩阵（Gray-level Co-occurrence Matrix，GLCM）的熵值（Entropy）、能量（Energy）、惯性矩（inertia）、自相关（Correlation）以及 Haralick 纹理特征共 15 个参数，首先单因素方差分析比较不同肝纤维化分期间纹理参数是否有差异性，再进一步两两比较有差异的特征。结果：排除 9 例 MRI 图像有明显呼吸运动伪影，共筛选出 58 例进行纹理分析，其中 S0 期 8 例，S1 期 16 例，S2 期 21 例，S3 期 8 例，S4 期 5 例。不同肝纤维化分期间能量、熵值两个特征的差异有统计学意义（P<0.05），进一步两两比较结果显示，S0 期与 S3 期的熵值及 S0 期分别与 S2 期、S3 期的能量间的差别有统计学意义（P<0.05）。且熵值随着肝纤维化级别的增高有升高趋势，而能量有减低趋势。结论：基于 MRI T1 反相位图像的能量、熵值两种纹理特征有助于鉴别不同阶段的肝纤维化。

EPO-0867

HISTO、q-DIXON 技术评价肝泡型包虫病患者铁沉积及脂肪沉积的定量研究

王理祎,鲍海华,郭琴
青海大学医学院附属医院

目的 鉴于肝泡型包虫病恶性程度高，严重的危害青海省牧民的生命健康，且肝功能损害程度高，大多数患者血清铁蛋白明显升高，故运用 HISTO 及 q-DIXON 成像技术分析肝泡型包虫病（HAE）患者肝脏铁沉积和脂肪沉积的情况，并与血清铁蛋白进行相关性分析。
方法 选择 19 例在我院就诊的 HAE 患者和 20 名健康志愿者。 使用西门子 Prisma 3.0T 设备，行 q-Dixon 序列和 HISTO 序列扫描，HISTO 可以对选定的感兴趣进行自动扫描并计算区域曲线下面积，得出目标区域的 R2 值及脂肪分数。在通过 Dixon 序列得到的 R2 *弛豫图及脂肪分数图中测出 R2 *值和脂肪分数，所测的感兴趣区的测量应尽量与 HISTO 的范围一致。同时，根据 NASH 标准将肝脏脂肪变性分为 0-3 级。
结果 HAE 组和正常组的 R2 *值分别为（133.05±99.74）和（88.74±52.77），HAE 组和正常组的 R2 值分别为（39.98±8.71）和（51.07±15.94），HAE 组大多数患者的 R2 *值及 R2 值高于正常组，两组间 R2 *值和 R2 值存在统计学差异。HAE 组 R2 *值、R2 值与血清铁蛋白呈正相关（P <0.05，r＝0.601，0.612）。但两组的脂肪分数差异无统计学意义。
结论 我们新发现 HAE 患者肝脏多存在异常铁沉积，但不存在异常的脂肪沉积，而血清铁蛋白检测可辅助判断 HAE 患者肝脏内的异常铁沉积。HISTO 和 q-Dixon 成像可以作为一种 HAE 铁沉积及脂肪沉积的无创和定量评估的有效方法。

EPO-0868

A Study of Magnetic Resonance Imaging of Iron Deposition in Hepatic Alveolar Echinococcosis

Liyi Wang,Haihua Bao,Qin Guo
Department of Medical Imaging Center， Affiliated Hospital of Qinghai University， Xining， Qinghai， China

Objective The study is aimed to analyze the liver iron deposition and liver function in hepatic alveolar echinococcosis(HAE) patients using MRI together with serum ferritin.
Methods 96 HAE patients and 30 normal volunteers were all scanned with 1.5T MR, and relevant data of laboratory inspections were collected. The signal intensity ratios of liver to the paraspinous muscles (L/M-SIR) were measured on TSE T2WI-SPAIR.The correlation between L/M-SIR and serum ferritin, L/M-SIR and liver function were analyzed. Futhermore, 96 HAE patients were divided into normal serum ferritin group[（4.63-204）μg/L, 30 patients] and increased serum ferritin group(＞204μg/L, 66 patients), and laboratory markers determining the liver function were analyzed.
Results The L/M-SIR of HAE group and normal group were （1.95±0.57) and （2.22±0.28) seperately, which indicated significant differences between groups. Moreover, there was a negative correlation between L/M-SIR and serum ferritin(r=-0.446,P＜0.01) in HAE group. Significant differences(P＜0.05) of liver function data were found between normal serum ferritin group and increased serum ferritin group in HAE patients.
Conclusion We found a new finding is that iron deposition is common in HAE, serum ferritin can be used to detect liver iron deposition of HAE patients, and the degree of liver damage is related to iron deposition. MRI, a non-invasive method, is efficient to assess liver iron deposition in HAE.

EPO-0869

A new valuable diagnostic tool for non-invasive assessment of liver fibrosis: PET/MR combined with Gd-EOB-DTPA enhanced T1 mapping and 18F-FDG

Shen Pan,Qiyong Guo,Jun Xin
Shengjing Hospital

Purpose: To investigate the feasibility of gadolinium ethoxybenzyl diethylenetriamine pentaacetic acid (Gd-EOB-DTPA) and 18F-fluorodeoxyglucose (18F-FDG) positron emission tomography/magnetic resonance (PET/MR) imaging to quantitatively estimate liver fibrosis.
Materials and Methods: We included 56 male New Zealand rabbits. Carbon tetrachloride (CC14) was injected intraperitoneally in rabbits to induce different stages of liver fibrosis (n=48), while control rabbits (n=8) received normal saline. All rabbits were subjected to 18F-FDG PET imaging and five multi-turn angle T1 mapping scans (plain period and 5, 10, 15, and 20 min after Gd-EOB-DTPA injection). The experimental scan was performed using an integrated PET/MR scanner and a special rabbit body coil. Images were processed to obtain the mean standardized uptake value (SUV_{mean}) of regions of interest and T1 reduction rate at the different timepoints. Rabbits were sacrificed within 4 h after imaging to evaluate liver fibrosis stage. We compared our PET/MR parameters against liver biopsy.
Results: In total, 34 rabbits had both pathological results and imaging data. The included rabbits were divided into three groups according to the METAVIR: no fibrosis (n=10), mild fibrosis (n=16), and severe fibrosis (n=8). △T1-15min% and △T1-20min% were effective in diagnosing different degrees of fibrosis, with △T1-20min% having a better effect. Similar to △T1-20min%, the $SUV_{mean}$was effective in distinguishing between mild and severe fibrosis, while combined △T1-20min% and SUV_{mean}showed higher specificity than the separate parameters in assessing liver fibrosis.
Conclusion: This study demonstrated the value of simultaneous assessment of liver fibrosis using Gd-EOB-DTPA and 18F-FDG PET/MR imaging and the combination of $SUV_{mean}$and △T1-20min% as an important diagnostic tool in patients with liver fibrosis.

EPO-0870

Evaluation and validation of multiparametric radiomics nomogram for predicting the severity of esophageal varices in cirrhotic patients

Shang Wan[1],Xin Zhang[1,2],Bin Song[1]
1.West China Hospital, Sichuan University
2.GE Healthcare

Aim:
To explore the performance of multiparametric radiomics nomogram on computed tomography (CT) images based on radiomics and relevant parameters of esophageal varices (EV) for predicting the EV severity in patients with liver cirrhosis.
Materials and Methods:
The prediction model was developed based on 136 consecutive patients with clinicopathologically confirmed liver cirrhosis, which were divided into non-conspicuous EV group (mild-to-moderate EV, n=46) and conspicuous EV group (severe EV, n=90) according to standard endoscopy validation. The radiomic scores (Rad-scores) were constructed from radiomics features of regions of interest (ROI) in left liver(LL) and right liver(RL) respectively. The multiparametric nomogram was combined the best performance Rad-score and relevant factors of EV[EV grade(EVG), EV diameter(EVD), cross-sectional surface area(CSA), EV volume(EVV), diameter of left gastric vein (DLGV), and spleen volume(SV)], and the calibration, discrimination and clinical usefulness of developed nomogram were evaluated.

Result:
The Rad-score calculated from radiomics features in left liver was selected with relatively higher area under the curve (AUC; 0.88, training cohort; 0.865, validation cohort). The multiparametric nomogram containing LL Rad-score and CSA showed better predictive performance and good calibration in training (C-index, 0.953[95% CI, 0.892 to 0.973]) and validation cohort(C-index, 0.938[95% CI, 0.841 to 0.961]), resulting in an improved net reclassification index (categorical NRI of 25.9% (P=0.0128), continuous NRI of 120%(P=0)) and integrated discriminatory improvement (IDI=13.9%, P=0.00013). Decision curve analysis demonstrated that the multiparametric radiomics nomogram was clinically useful.
Conclusion:
Multiparametric radiomics nomogram, which incorporates the liver radiomics signature and CSA or EV-relevant indices, is a useful tool for predicting EV severity and has marked discrimination accuracy compared to conventional radiomics.

EPO-0871

Histogram Analysis Parameters T2WI for Distinguishing Pancreatic Neoplasms of Adenocarcinoma,Neuroendocrine and Solid Pseudopapillary

Chen Chen,Cui-ping Ren
The First Affiliated Hospital of Zhengzhou University

Objective:To determine if histogram of T2WI can be used to differentiate pancreatic adenocarcinomas (PACs), neuroendocrine tumors(pNETs) and solid pseudopapillary neoplasms(PSPNs).

Methods: 160 patients from January 1, 2015 to Qctorber 1, 2018 were retrospectively reviewed. In the end, 48 patients with confirmed histologically PACs in 26(54.17%) patients,pNETs in 10(20.83%) patients, and PSPNs in 12(25.00%) patients were

enrolled in this study, accepting MRI at 3T. The T2WI histogram features were derived and then compared by one-way ANOVA and Welch's ANOVA, respectively. Bonferroni test and Games-Howell test were used to compare the two groups and the ROC curve was drawn to evaluate the diagnostic efficacy.

Results: pNETs were significantly higher mean and Perc.50% than PACs. PACs were significantly lower Perc.90% and Perc.99% than PSPNs group. A threshold value of 112.70 for mean and of 113.00 for Perc.50% had the best diagnostic efficacy to predict PACs (AUC= 0.769 and 0.777, sensitivity = 85.70%,specificity = 69.20%, respectively). Optimal diagnostic performance (AUC= 0.776, sensitivity = 66.70%, specificity =96.20%) was obtained when setting Perc.90%= 175.50 as the threshold value. Optimal diagnostic performance (AUC = 0.763, sensitivity=66.7%, specificity= 100.00%) could be get when setting Perc.99% = 218.00 as the threshold value.

Conclusions:The T2WI histogram analysis may help to discriminate PACs,pNETs and PSPNs.

EPO-0872

Target Sign on Liver Diffusion Weighted Imaging: An Important Sign of Metastases

Osamah Alwalid,Ping Han,YuHui Wang
Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To evaluate the role of diffusion weighted imaging (DWI) in exhibiting the target sign in liver metastases.
Materials and methods: Diffusion weighted imaging (DWI) of 45 confirmed liver metastatic lesions in twelve patients have been retrospectively reviewed. The signal intensity was visually assessed, and the presence of "target sign" defined as central facilitated diffusion and peripheral restricted diffusion was recorded. The maximum diameter (in millimeters) of each lesion was measured and ROI-based quantification of ADC value on the solid part of the lesion, with careful avoidance of the necrotic and hemorrhagic areas, was performed. Independent samples *t*-test was used to compare the size and ADC values between the target and non-target appearing lesions.
Results: Forty-five liver metastatic lesions from six different primaries [breast (n=18), colon (n=14), rectum (n=6), pancreas (n=4), vulva (n=2), duodenum (n=1)] have been evaluated. Lesions size ranged from 6 to 52 mm (mean, 16.14 mm). Twenty two lesions (48.9%) exhibited central facilitated diffusion and peripheral restricted diffusion representing the target sign. ADC values of the lesions ranged from 0.78 x 10^{-3} mm^2/s to 1.53 x 10^{-3} mm^2/s (mean ± Std, 1.08 ± 0.162 x 10^{-3} mm^2/s). There was no statistically significant difference in size or ADC values between the target and non-target appearing metastatic lesions (*p* values = 0.1 and 0.09, respectively).
Conclusion: Target sign presenting as central facilitated diffusion and peripheral restricted diffusion can be conspicuously seen on diffusion weighted imaging in near half of the liver metastatic lesions.

Hepatoid Adenocarcinoma of the Stomach: CT Findings

Qian Yang
Hubei Cancer Hospital

[Abstract]Purpose To summarize the CT findings of hepatoid adenocarcinoma of the stomach and to improve the diagnosis. Materials and Methods The CT features of six patients with hepatoid adenocarcinoma of the stomach confirmed histologically were retrospectively studied. All patients underwent contrast, enhanced computed tomography on
a multidetector CT scanner. CT images were retrospectively evaluated including lesion size, morphologic features, enhancement patterns, adjacent organ invasion lymphadenopathy and portal venous thrombosis. Results For 6 patients, five were male and one was female; age ranged 6 1—78 years, mean 67. 3 years. Tumors appeared as eccentric gastric mass(n=5)and diffused wall thickening(n=1). Mild to moderated heterogeneous enhancement was revealed in 5 cases with gastric mass. Five patients had elevated serum alpha fetoprotein level. All six patients had regional lymphadenopathy Liver metastases were noted in 3 cases and portal venous tumor thrombosis was identified
in 2 cases. Conclusion Hepatoid adenocarcinoma of the stomach is more common in old male patients. The patients may have elevated sel21m alpha fetoprotein level. On CT scan,
hepatoid adenocarcinoma of the stomach appears as an eccentric gastric mass with mild to
moderate heterogeneous enhancement, and shows strong tendency of hepatic metastasis and regional lymphadenopathy

多发性内分泌肿瘤综合征（MENs）影像诊断并实例分析

关键[1],李慧[2],张繁[1]
1.中山大学附属第一医院
2.厦门大学附属福州第二医院

目的：介绍多发性内分泌肿瘤综合征（Multiple endocrine neoplasia，MEN）及其分型，探讨 MEN 的影像特点和影像分析思路。
方法： 回顾性分析经临床、病理及基因检测确诊的 14 例 MEN。所有病例均有相关部位的影像学检查，CT 检查包括相应部位的颈胸腹部扫描，MR 检查包括垂体及上腹部扫描。11 例行甲状旁腺核素显像。结合临床表现，分析各型 MEN 的影像特点及其诊断联系。
结果：MEN 表现为两个或以上内分泌腺肿瘤或增生，并引起一系列相关内分泌异常。①MEN-1 型 7 例：均出现垂体腺瘤、肾上腺增生/腺瘤、甲状旁腺腺瘤或异位甲状旁腺腺瘤，其中合并胃肠胰神经内分泌肿瘤 3 例、胸腺瘤或类癌各 1 例、其他软组织肿瘤 2 例。②MEN-2A 型 5 例：3 例表现为甲状腺髓样癌、肾上腺嗜铬细胞瘤及甲状旁腺增生（功能亢进）；2 例表现为甲状旁腺瘤和肾上腺嗜铬细胞瘤或腺瘤，其中 1 例同时伴发胰腺神经内分泌肿瘤。③MEN-2B 型 1 例：表现为甲状腺髓样癌及舌黏膜神经瘤、肛周神经内分泌肿瘤。④MEN-4 型 1 例：表现为垂体腺瘤、甲状旁腺腺瘤、胰

腺胃泌素瘤和胸腺类癌。本例基因检测存在 pD418D 同义突变，无 MEN1 基因变异。各型 MEN 出现的内分泌腺肿瘤或增生均具有典型的临床表现和影像学特征。
结论：MEN 表现为两个或两个以上内分泌腺的病变，并具有典型的临床症状和影像表现。MEN 分型诊断需结合累及器官，应注意观察扫描区域内可能的受累器官，避免漏诊。

The efficacy of ADC value of DWI for the evaluation of the pancreas changes in biliary obstruction

Yaxin Niu,Ailian Liu,Anliang Chen,Jing Chen
The First Affiliated Hospital of Dalian Medical University

PURPOSE
The aim of this study was to investigate the usefulness of apparent diffusion coefficient (ADC) value of diffusion- weighted imaging (DWI) for the evaluation of the pancreas changes in biliary obstruction.

METHOD AND MATERIALS
Abdominal MRI was performed with sequences including T1-weighted, T2-weighted, diffusion-weighted imaging and MR cholangiopancreatography (MRCP) with a 3.0-T imager (GE, signa). 75 patients were divided in 4 subgroups: Group A- no hepatobiliary or pancreatic pathology (34 patients), Group B- acute bilary pancreastitis (ABP) based on clinical diagnosis (10 patients), Group C- lower biliary tract obstruction due to stone (19 patients), Group D- obstruction of low bilary obstruction by carcinoma (12 patients). The pancreas of Group C and D had not reached diagnosis standard of clinical pancreatitis. A region of interest (ROI) was placed on pancreatic head, body and tail of each patient and the average ADC values were acquired. The ADC value was analyzed by Mann-Whitney U test with SPSS 19.0 software package, a difference with $p<0.05$ was regarded as statistically significant.

RESULTS
(1)The Median and Interquartile Range of ADC values (×10-3mm2/s) in Group A, B, C and D were (1.587, 0.355), (1.470, 0.431), (1.497, 0.173), (1.527, 0.303); (2)The Median of ADC value of Group A was higher than Group B, C and D with a significant statistical difference. The p values were 0.031, 0.029, 0.020 respectively; (3)There were no significant statistical difference between Group B, C and D.

CONCLUSION
The ADC value of ABP was lower than healthy people. And the ADC value could reflect the changes of early acute pancreatitis with low biliary obstruction. But it couldn’t distinguish the causes of obstruction.

EPO-0876

Differentiating hypovascular pancreatic neuroendocrine tumor from pancreatic ductal adenocarcinoma based on CT texture analysis

Shuai Ren,Zhonglan Wang,Kai Guo,Zhongqiu Wang
the Affiliated Hospital of Nanjing University of Chinese Medicine

Purpose: Hypovascular pancreatic neuroendocrine tumor (hypovascular PNETs)is usually misdiagnosed as pancreatic ductal adenocarcinoma. We aimed to investigate the value of texture analysis in differentiating hypovascular PNETs from pancreatic ductal adenicarcinomas (PDACs) on contrast-enhanced computed tomography (CT) images.
Materials and MEthods: Twenty one patients with hypovascular PNETs and 63 patients with PDACs were included in this study. All patients underwent preoperative unenhanced and dynamic contrast enhanced CT examinations. Two experienced radiologists independently and manually contoured the region of interests (ROIs) of each lesion using texture analysis software on pancreatic parenchymal and portal phase CT images. Multivariate logistic regression analyses were performed to identify significant features to differentiate hypovascular PNETs from PDACs. ROC curves were performed to ascertain diagnostic ability and cutoff values.
Results: The most discriminative CT texture features to differentiate hypovascular PNET from PDAC were RMS (root mean square) (P<0.001, OR [odds ratio) =0.50), Quantile50 (P<0.001, OR=1.83) and sumAverage (P=0.007, OR=0.92) in parenchymal images and ″contrast″ was the independent texture features in portal phase images (OR=6.08, p < 0.001). The AUCs were 0.76 for RMS (sensitivity=0.75 and specificity=0.67), 0.73 for Quantile50 (sensitivity=0.60 and specificity=0.77), 0.70 for sumAverage (sensitivity=0.65 and specificity=0.82), 0.85 for the model combining RMS, Quantile50 and sumAverage, with sensitivity of 0.77 and specificity of 0.85.
Conclusions: CT texture analysis parameters may be helpful to differentiate hypovascular PNETs from PDACs. The three combined texture features showed acceptable diagnostic performance in differentiating hypovascular PNETs from PDACs.

EPO-0877

BOLD MRI 评价 BOLD MRI 评价兔肝热缺血再灌注损伤调控部分肝切除术后肝再生的研究兔肝热缺血再灌注损伤调控部分肝切除术后肝再生的研究

陶征征,褚志强,蒋嘉炳,季倩
天津市第一中心医院

目的：探讨 BOLD MRI 评价不同程度兔肝热缺血再灌注损伤（WIRI）及其对部分肝切除术后肝再生影响的价值。**方法：**健康成年雄性新西兰大白兔 30 只，随机分为 5 组，即对照组和不同热缺血时间组，每组 6 只，均行肝尾叶切除术。各组于再灌注后 6h、3 天、7 天、14 天、30 天分别进行常规 MR 及 BOLD MRI 扫描。测得各组 T2*值和肝体积值，并根据公式计算出 R2*值及肝再生率（LRR）。术后 30 天结束扫描后检测血清丙氨酸转氨酶（ALT），天冬氨酸转氨酶（AST）、乳酸脱

氢酶（LDH）水平，最后处死实验兔，获取冻存肝组织血清丙二醛（MDA）、总超氧化物歧化酶（SOD）、髓过氧化物酶（MPO）、肿瘤坏死因子α（TNF-α）、白介素-6（IL-6）和增殖细胞核抗原（PCNA）水平及肝脏病理切片。采用重复测量方差分析评估各组不同随访时间、不同热缺血时间的 R2*值、LRR 的变化及其影响。采用 Pearson 或 Spearman 相关分析评价 R2*值与 LRR 及各生化指标的相关性。**结果：**不同随访时间和不同热缺血时间的交互作用及两者的单独效应对 R2*值的影响均具有统计学意义（*P*均<0.05）。不同随访时间和不同热缺血时间的交互作用对 LRR 的影响无统计学意义（*P*=0.528），但二者对 LRR 的主效应均具有统计学意义（*P*均<0.05）。同一随访时间，除 A4 组外，R2*值与 LRR 均呈显著正相关（r 均>0.5，*P*均<0.05）。同一热缺血时间，R2*值与 LRR 均呈显著负相关（r 均<0.5，*P*均<0.05）。术后 30 天 R2*值与各生化指标无相关关系（*P*均>0.05）。**结论：**BOLD MRI 可无创、定量评价兔肝 WIRI 的微观结构改变及其对部分肝切除术后肝再生的影响。一定程度的 WIRI（≤30min）对兔肝部分切除术后肝再生具有促进作用，且热缺血时间越长，促进作用越明显；超过 30min 促进作用明显减低。

肝细胞癌的 Gd-EOB-DTPA 动态增强 MRI 表现：LI-RADS（2018 版）定义辅助征象的识别率及其对于病灶 LI-RADS 分级的影响

刘子桢[1],谢双双[2],沈文[2]
1.天津医科大学一中心临床学院
2.天津市第一中心医院

目的分析肝硬化背景下肝细胞癌（HCC）的 Gd-EOB-DTPA 增强 MRI 表现，探究 2018 版肝脏影像报告及数据系统（LI-RADS）所定义的辅助征象的出现率及其对 HCC 病灶 LI-RADS 分级的影响。**材料与方法**分析 2015 年 1 月至 2019 年 7 月经病理证实为 HCC 的肝硬化患者术前影像资料，包括行 Gd-EOB-DTPA 增强 MRI 检查者 75 例，86 枚 HCC 病灶。由两名具有腹部影像诊断经验且接受过 2018 版 LI-RADS 培训的医师采用盲法分别在同一 PACS 工作站上分析所有入组患者的 Gd-EOB-DTPA 增强 MRI 图像，对每个病灶的主要征象（动脉期高强化、“廓清”表现、“包膜”表现）和辅助征象（T2WI 中高信号、弥散受限、肝胆期低信号、马赛克征、结节中结节、出血、晕状强化、病灶内脂肪）进行评估并计算其出现率。先根据主要征象表现对病灶进行 LI-RADS 分级，再加入辅助征象表现对病灶的 LI-RADS 分级进行调整。采用 Kappa 检验评估两名医师病灶征象评估的一致性。**结果** Gd-EOB-DTPA 增强 MRI 对 86 枚 HCC 病灶的辅助征象（T2WI 中高信号、弥散受限、肝胆期低信号、马赛克征、结节中结节、出血、晕状强化、病灶内脂肪）的识别率分别为 94.19%、96.51%、94.19%、52.33%、34.88%、22.09%、26.74%、17.44%，两名医师辅助征象（T2WI 中高信号、弥散受限、肝胆期低信号、马赛克征、结节中结节、出血、病灶内脂肪）的评估具有高度一致性（Kappa 值均>0.606），两名医师对于“晕状强化”征象的评估一致性中等（Kappa=0.464）。有 12 枚 HCC 病灶在加入辅助征象后分级从 LR-3 上调到 LR-4，上调率为 13.95%。**结论**基于 LI-RADS 的诊断标准，Gd-EOB-DTPA 增强 MRI 对肝硬化背景下 HCC 的辅助征象识别率高，辅助征象对于病灶恶性潜能的评估意义重大。

EPO-0879

Hilar Cholangiocarcinoma: Value of High-resolution Enhanced MR Imaging for Preoperative Evaluation

Xin Yinghui

Shandong Provincial Hospital Affiliated to Shandong University

Objectives—To assess the accuracy of high-resolution enhanced MR images in the preoperative evaluation of biliary and vascular invasion in hilar cholangiocarcinomas.
Methods—This prospective study included 36 patients with surgically confirmed hilar cholangiocarcinoma who underwent high-resolution enhanced MR imaging with an effective section thickness of 1.2 mm at 3.0 T before surgery. A standardized surgical approach was performed in all patients. Two observers reviewed the high-resolution images. The bile duct system and vascular invasion were recorded. The correlation between imaging findings and surgical and histopathology records was statistically analyzed. The interobserver agreement was calculated.
Results—The high-resolution enhanced MR findings agreed with the surgical and histopathologic findings with regard to the assessment of the common hepatic duct, primary biliary confluence, left hepatic duct, main portal vein, and portal vein bifurcation (accuracy = 100%). The overall accuracy in assessing the involvement of bile duct was 97.7%. Defining >180° of circumferential contact of the tumor with the vessel as the criterion for predicting invasion, the overall accuracies were 96.5% and 94.6% for the portal venous and hepatic arterial systems, respectively. Defining >90° of circumferential contact of the tumor with the vessel as the criterion for predicting invasion, the overall accuracies were 98.6% and 98.0% for the portal venous and hepatic arterial systems, respectively. Interobserver agreement was high with respect to biliary tract, portal venous and hepatic arterial system involvement.
Conclusions—High-resolution enhanced MR images showed excellent capability for preoperatively assessing tumor extent and vascular invasion in hilar cholangiocarcinomas. For high-resolution MRI, >90° of circumferential contact of the tumor with the vessel may be a more accurate criterion for predicting invasion.

弥散加权（DWI）和体素内不相干运动成像（IVIM）容积直方图对肝细胞癌病理分级的术前评估

张喆[1,2],刘爱连[1],陈丽华[1],吕悦[1],赵莹[1],王楠[1],武敬君[1],田士峰[1],郭研[1],张钦和[1],牛淼[1],王诗瑜[1],刘芳[3],李瑞玲[2],兰秀玲[1],佟景明[1]
1.大连医科大学附属第一医院
2.辽阳石化医院
3.辽阳市中心医院新城分院

一 目的

探讨弥散加权的 ADC 值，以及体素内不相干运动成像的 D、D*、f 值的容积直方图对肝细胞癌术前病理分级。

二 方法

2015 年～2019 年的经 MR 诊断且有病理分化的肝细胞癌患者 51 例（52 个病灶）。行 3.0T MR T_1WI、T_2WI、增强、DWI（b=0，800s/mm^2）、eDWIb=（b=0~3000s/mm^2）检查。重建出 ADC、D、D*、f，导入 Omni-Kinetics 软件。参照 DWI（b=800）和 eDWI（b=200），在 ADC、D、D*、f 图上，沿每层病灶边缘勾画 ROI，融合成容积 ROI，计算直方图。组内相关系数 ICC 进行一致性，符合正态分布采用两独立样本 t 检验；不符合正态分布采用 Mann-Whitney 检验。P<0.05 差异有统计学意义。绘制 ROC 曲线，分析诊断效能。

三 结果

两次测量一致性佳，ICC＞0.75。两组的 ADC 值的 range 为 1650.333±733.688 和 1227.311±650.987，D 值的 mean、5th、10th、25th、50th、sd、range 分别为 539.488±105.554 和 613.380±113.825、332.261±100.549 和 450.684±118.810、379.920±93.367 和 488.429±117.722、481.239±343.286 和 551.681±166.828、538.692±109.224 和 617.880±115.170、127.570±55.469 和 94.763 ±31.193、784.600±332.792 和 537.162±216.298。

D-10th 的 ROC 的 AUC 最大，达 0.778，以 361.653 诊断低分化组，敏感度 66.7%，特异度 78.4%。

四 结论

DWI 的、IVIM 容积直方图可对 HCC 分化进行术前评估，其中 D-10th 最佳

EPO-0881

ASIR-V 联合低 kVp 在肝脏 CT 增强中降低辐射剂量的应用

李豆,顾俊,刘振堂,胡智军,魏东红
长安医院

目的 研究基于多模型的迭代重建算法（ASIR-V）联合低 kVp 在肝脏 CT 增强中降低辐射剂量的应用。**方法** 对 60 例疑有肝脏病变的患者进行肝脏 CT 增强扫描，根据管电压不同分为 A、B、C 三组（120kVp、100kVp、80kVp），每组 20 例。扫描条件：A 组管电压 120kVp，B 组管电压 100kVp，C 组管电压 80kVp；噪声指数（NI）为 10，自动管电流技术，前置 ASIR-V 为 0%，三组后置 ASIR-V 分别固定为 0%、80%、80%，后重建层厚为 1.25mm。扫描方法：监测膈肌下 1-2cm 的腹主动脉，阈值达到 120HU 后延迟 10s 自动触发扫描动脉期，延迟 30s 扫描门静脉期，延迟 120s 扫描延迟期。在肝门层面的肝实质内及同层面背部皮下脂肪放置感兴趣区（ROI），分别测量 3 次求其平均值，记录其 CT 值及 SD 值，并计算肝脏的信噪比(SNR=CT/SD）及对比噪声比(CNR=（$CT_{肝脏}$-$CT_{脂肪}$）/$SD_{脂肪}$。对患者一般资料及客观测量结果进行统计学分析，并采用 5 分法对各组图像质量进行双盲法主观评分（5 分，图像质量最好；1 分，图像质量最差）。**结果** 三组患者一般差异均无统计学意义（P＞0.05）；图像质量主观评分存在明显差异(P＜0.001)；客观测量的 CT 值无统计学差异（P＞0.05），而 SD 值、SNR 及 CNR 均存在明显差异(P＜0.05)，且三组间的辐射剂量存在明显统计学差异（P＜0.001），80kVp 较 100kVp 与 120kVp 辐射剂量分别降低了 49%、56%。**结论** 在肝脏 CT 增强扫描中，低 kVp 联合 ASIR-V 技术在保证优质的利于诊断的图像质量前提下，能大幅度降低辐射剂量。

EPO-0882

基于多期对比增强 CT 成像鉴别腹膜后副神经节瘤和神经鞘瘤

曹云太[1,2],周俊林[1]
1.兰州大学第二医院
2.青海大学附属医院

摘要

研究背景和目的：异位嗜铬细胞瘤和神经鞘瘤都是腹膜后少见的实性肿瘤，手术治疗是首选的治疗方式，然而手术过程中对异位嗜铬细胞瘤的接触可能会造成严重的结果。两者在临床表现和影像学表现上有诸多类似之处，鉴别这两种肿瘤一直是临床医生和影像科医生的挑战。本研究的目的是回顾性分析腹膜后肾上腺外副神经节瘤和神经鞘瘤的 CT 影像学差异，以期能找到一些重要的特征用于鉴别这两种少见肿瘤。
研究方法：本研究回顾性分析了 2013 年 3 月-2019 年 6 月在兰州大学第二医院经病理学证实的腹膜后异位嗜铬细胞瘤和神经鞘瘤的临床资料和影像学资料。用统计学方法比较两种肿瘤在临床和影像指标上存在的差异。
研究结果：异位嗜铬细胞瘤共 32 例，平均年龄为 50.3 ± 13.6 岁；神经鞘瘤共 24 例，平均年龄为 50.3 ± 11.0 岁，13 例嗜铬细胞瘤（43.8%）和 12 例神经鞘瘤（50.0%）是偶然情况下发现的。两种肿瘤在临床指标上无明显显著性差异。通过分析两种肿瘤的影像特征，我们发现两种肿瘤各自有一些特征性的征象可用于鉴别诊断。1）：腹膜后嗜铬细胞瘤好发于椎前区域，神经鞘瘤则好发于椎旁区域；2）：嗜铬细胞瘤瘤体周围可见迂曲血管较神经鞘瘤常见；而神经鞘瘤内分隔较嗜铬细胞瘤常见；3）两种肿瘤在 CT 平扫及动态增强上呈现明显差异。嗜铬细胞瘤平扫 CT 值一般较神经鞘瘤高，增强后大部分肿瘤强化明显并且动态增强上呈现快进快出的影像表现，而大部分神经鞘瘤强化幅度较低并表现为渐进性强化模式。
结论：腹膜后嗜铬细胞瘤和神经鞘瘤在临床和影像上有诸多类似之处，然而术前 CT 多期动态增强扫描可以为两种肿瘤的鉴别提供一些重要的信息。

增强 CT 对肝细胞肝癌和肝上皮样血管平滑肌脂肪瘤的诊断作用探讨

王艳
上海交通大学附属第六人民医院

目的分析增强 CT 对肝细胞肝癌和肝上皮样血管平滑肌脂肪瘤诊断作用。方法抽取入住我院经病理证实的 30 例肝细胞肝癌患者和 8 例肝上皮样血管平滑肌脂肪瘤患者和（2016 年 1 月至 2017 年 12 月）作为本次实验的研究对象,对 30 例肝细胞肝癌(HCC)患者和 8 例肝上皮样血管平滑肌脂肪瘤(EMAL)患者和的临床资料进行回顾性分析,分析和比较 30 例肝细胞肝癌患者和 8 例肝上皮样血管平滑肌脂肪瘤患者和的 CT 增强表现(病灶大小、形态增强模式、"假包膜"征及远端扩张胆管、是否存在早期静脉引流、中心血管影等现象)。结果两组患者比较可得,组间形态增强模式、"假包膜"征早期静脉引流、中心血管影、的结果存在差异,P<0.05,统计学具有意义,但组间病灶大小、远端扩张胆管的结果不存在差异,P>0.05。结论增强 CT 诊断可用于鉴别诊断肝上皮样血管平滑肌脂肪瘤和肝细胞肝癌。

EPO-0884
胰腺转移瘤的 MSCT 诊断（附 23 例分析）

唐一兵
南宁市第二人民医院

摘　要： 目的 探讨胰腺转移瘤的 CT 表现特点，提高多层螺旋 CT 诊断胰腺转移瘤的准确率。方法 收集 23 例胰腺转移瘤，回顾性分析原发肿瘤性质、原发肿瘤诊断与胰腺转移瘤发现间隔时间及胰腺转移瘤的 CT 表现。结果 ①原发肿瘤：主要包括肺癌（12 例）、食管癌（2 例）、结肠癌（5 例）及肾癌（4 例）等。②原发肿瘤诊断与胰腺转移瘤发现间隔时间：10 例在原发肿瘤的同时发现有胰腺转移瘤。③CT 表现：包括单发结节（16 例）、多发结节（9 例）及胰腺弥漫性增大（3 例）三种形式，肿块大小主要在 1.5～6cm（14 例），大部分无强化（18 例），大部分没有合并胆管及

胰管扩张（19 例）。结论 综合分析原发肿瘤病史及 CT 表现对胰腺转移瘤的诊断具有较高应用价值。

EPO-0885

Noninvasive prediction the risk of esophageal variceal bleeding with cirrhosis by spectral Computed Tomography

Hong Liu
Lanzhou University No.2 Hospital

Background and Aims: *Esophageal variceal bleeding (EVB) is a fatal complication of cirrhosis and/or portal hypertension caused by various causes. The Baveno VI Consensus confirms the possibility of non-invasive monitoring of esophageal varices (EV). But vibration-controlled transient elastography (VCTE) has a high rate of measurement error. We therefore aimed to develop noninvasive prediction model for the risk of esophageal variceal bleeding with cirrhosis using spectral computed tomography(CT).*
METHODS: *We retrospectively collected a tatal of 317 EV patients with hepatitis B virus-related cirrhosis from January 2018 to December 2018, which were divided into 1 training cohort and 1 validation cohort. All patients underwent spectral CT scans within 14 days before/after endoscopy. According to the results of gastroscopy, the patients were divided into EVB-positive group and EVB-negative group. The spectral CT prediction model was developed with the selected independent predictors of EVB. The prediction accuracy was evaluated by ROC curve. The accuracy and reproducibility of the model for EVB risk prediction of cirrhosis were tested by an external cohort.*
RESULTS: *Diameter of splenic vein(Dspv), Diameter of esophageal vein (Dev), ascites (AS), Iodine concentration of short gastric vein (ICsgv), Iodine concentration of spleen (ICsp) were independent predictors of EVB risk(all P<0.05), and a spectral CT scan model of these 5 factors was developted. The area under the ROC curve of the training cohort was 0.839 (95% CI 0.776-0.901), P<0.001, sensitivity and specificity were 0.75 and 0.828, respectively. The area under the ROC curve of the validation cohort was 0.804 (95% CI 0.705-0.904), P<0.001, and the sensitivity and specificity were 0.714 and 0.784, respectively.*
Conclusion: *The non-invasive spectral CT prediction model developed by Dspv, Dev, AS, ICsgv, and ICsp has a good prediction ability for EVB risk, and may have significant clinical implications on early prevention and treatment of EVB.*

9 例胰周淋巴结结核 MSCT 表现及病理分析

唐永强,张劲松,宦怡
空军军医大学西京医院

摘要 目的:分析胰周淋巴结结核的 CT 表现及临床病理特点，旨在提高放射医师对该病的 CT 诊断符合率。方法:收集 9 例经手术或穿刺活检病理证实胰周淋巴结结核病例，所有病例均行常规上腹部 CT 平扫及三期增强扫描，回顾分析及总结其 MSCT 表现。手术切除或穿刺活检标本，均行常规

HE 染色及抗酸染色或结核 DNA 检测。结果:9 例胰周淋巴结结核中，8 例病灶为胰头周围淋巴肿大，其中 3 例伴腹膜后淋巴结肿大，1 例合并胰腺体部结核，所有病例均平扫为低密度影，胰头周围肿大淋巴结边界欠清，密度欠均，部分融合，形态呈分叶状,增强扫描呈渐进性边缘环形强化，内部呈渐进性分隔样及多房样强化，胰体周围肿大淋巴结病灶边界清,密度均匀,形态呈类椭圆形，增强扫描呈均匀轻度渐进性强化。病理改变均可查见典型或不典型肉芽肿形态，其中抗酸染色 2 例阳性，结核 DNA1 例阳性；所有病例中 2 例伴有肺结核，1 例伴结核性胸膜炎病史。结论:胰周淋巴结结核的 MSCT 表现为胰周淋巴结肿大，部分融合，呈分叶状低密影，边界欠清，增强扫描呈渐进性边缘环形强化、内部分隔样及分房样强化，影像表现具有一定特征性，结合临床及病理，可显著提高诊断率。

初探弥散加权成像图像纹理分析鉴别肝脓肿与肝转移瘤的价值

王楠[1],刘爱连[1],陶奉明[1],牛淼[1],牛雅欣[1],解立志[2],郭研[2]
1.大连医科大学附属第一医院
2.通用电气公司

目的 探讨弥散加权成像图像结合纹理分析对肝脓肿和肝转移瘤进行鉴别诊断的可行性。**方法** 回顾性分析 2015 年 6 月至 2018 年 12 月于我院行上腹部 1.5T MRI 检查的肝脓肿和肝转移瘤患者 43 例(共 66 个病灶)，其中肝脓肿 24 个(均经穿刺引流后病理证实或治疗随诊病灶缩小，临床化验指标恢复正常而证实)，转移瘤 29 个(均经影像表现及随访，结合临床病史而证实)。在 AW4.5 工作站上，导出弥散加权成像(diffusion weighted imaging, DWI)图像用于纹理分析，选择病灶 DWI 高信号区域的最大层面，沿病灶内侧缘约 2mm 勾画感兴趣区(region of interest, ROI)。应用灰度直方图及灰度共生矩阵纹理分析方法测定平均值(mean intensity)、中位数(median intensity)、标准偏差(standard deviation)、方差(variance)、像素数量(voxel count)、偏度(skewness)、平均偏差(mean deviation)、能量值(energy)、熵值(entropy)及逆差矩(inverse difference moment)10 个参数。采用独立样本 t 检验(正态分布)或 Mann-Whitney U(非正态分布)比较两组间各参数差异性，绘制受试者工作特征曲线(receiver operator characteristic, ROC)，比较各参数诊断效能。**结果** 肝脓肿平均值、中位数、标准偏差及方差大于肝转移瘤，像素数量、偏度、平均偏差及逆差矩小于肝转移瘤，差异有统计学意义(P<0.05)。肝脓肿熵值大于转移瘤，能量值小于转移瘤，差异无统计学意义(P>0.05)。其中逆差矩为诊断效能最佳参数，诊断转移瘤 AUC=0.868，敏感度 91.7%，特异度 79.3%。**结论** 弥散加权图像纹理分析能够有效鉴别肝脓肿与肝转移瘤，逆差矩为最佳纹理参数。

磁共振 IDEAL-IQ 序列评估肝功能分级的可行性研究

王楠[1],刘爱连[1],郭维亚[1],张钦和[1],解立志[2]
1.大连医科大学附属第一医院
2.通用电气公司

目的：探讨 1.5T 磁共振 IDEAL-IQ 序列评估肝功能分级的可行性。
方法：回顾性分析 2016 年 2 月至 2018 年 12 月我院收治的行 1.5T 磁共振 IDEAL-IQ 序列扫描，且经临床、实验室及影像学检查诊断为肝硬化的患者，依据肝功能 Child-Pugh 分级标准分为 A、B、C 三级。记录患者肝功能相关化验检查结果。由两名医师分别在 GE AW4.6 工作站通过脂肪分数图、R2*驰豫率图定量测定肝脏脂肪含量、R2*值，所测数据分别取均值。利用 Kruskal-Wallis H

进行三组间脂肪分数和 R2*值的比较。将 A、B 两组并组，利用 Mann-Whitney U 非参数检验与 C 组比较。利用二元 logistics 回归分析联合脂肪分数及 R2*值建立诊断 C 组的预测模型。通过绘制 ROC 曲线分析诊断效能，得出曲线下面积，计算最佳阈值时的敏感度和特异度。利用 Pearson 相关系数检验脂肪分数和 R2*值与各种血清学检查结果之间的相关性。
结果：两名医师测量数据一致性较好。随肝功能减低，肝脏脂肪分数及 R2*值呈递增趋势。肝功能 A、B、C 三级的脂肪分数分别为(3.31±0.56)%、(4.25±1.62)%、(7.35±4.31)%。肝功能 A、B、C 三级的 R2*值分别为(28.62±5.23)Hz、(33.44±10.21)Hz、(51.97±24.76)Hz，三组间脂肪分数及 R2*值均具有统计学差异。联合脂肪分数及 R2*值诊断肝功能 C 级的 AUC 为 0.938，敏感度和特异度分别为 81.1%和 95.2%。脂肪分数与总胆红素、总胆汁酸、g-谷氨酰转肽酶和凝血酶原时间呈正相关，与白蛋白呈负相关；R2*值与总胆红素和凝血酶原时间呈正相关，与白蛋白和前白蛋白呈负相关。
结论：1.5T 磁共振 IDEAL-IQ 序列能够通过脂肪分数及 R2*值初步对肝硬化患者进行肝功能分级，尤其对处于肝功能 C 级肝硬化患者的诊断具有较高的敏感度和特异度。

非富血供胰腺神经内分泌肿瘤与导管腺癌肝转移多层螺旋 CT 影像研究

苏建伟[1,2],崔湧[1]
1.北京大学肿瘤医院
2.北京市大兴区人民医院

目的 探讨非富血供胰腺神经内分泌肿瘤（PNET）与胰腺导管腺癌（PDAC）肝转移 CT 影像特征及其在两者鉴别诊断中的价值。方法 回顾性纳入 2014 年 1 月至 2018 年 10 月间伴肝转移的非富血供 PNET21 例及 PDAC56 例患者资料，分析其肝转移病灶数目、分布、大小、病灶融合、周围肝组织异常灌注、增强扫描强化程度等 CT 特征。结果 非富血供 PNET 与 PDAC 肝转移病灶的数目、分布、病灶融合之间无统计学差异，非富血供 PNET 及 PDAC 肝转移灶的最大径之间差异有统计学意义（P=0.03），PDAC 肝转移灶周围肝组织异常灌注出现率（67.86%）多于非富血供 PNET 肝转移灶（28.57%），二者差异有统计学意义（P＜0.01），非富血供 PNET 肝转移动脉期、门静脉期、平衡期强化指数高于 PDAC，二者差异有统计学意义（P＜0.01）。Logistic 多因素分析显示动脉期强化指数为鉴别非富血供 PNET 与 PDAC 肝转移的独立预测因素，ROC 曲线显示动脉期强化指数判断二者的 AUC=0.97。结论 非富血供 PNET 与 PDAC 肝转移灶的 CT 影像特征有助于鉴别伴有肝转移的非富血供 PNET 与 PDAC。

Gd-EOB-DTPA 增强 MRI T1 mapping 结合标准肝脏体积率评估肝功能的价值

蒋宇,周智鹏
桂林医学院附属医院

【目的】探讨 Gd-EOB-DTPA 增强 MRI T1 mapping 成像结合肝脏标准体积率在肝功能评估中的价值。

【方法】收集我院行 Gd-EOB-DTPA 增强 MRI 扫描的患者 80 例，分别于增强前、增强后 20min 行 T1 mapping 成像，根据 Child-Pugh 评分将患者分为 3 组： NLF（n = 26），LCA（n = 30），LCB+LCC（n = 24）；根据 MELD 评分将患者分为 2 组： MELD≤8 分（ n = 57）及 MELD≥9 分（n = 23）。选择增强前、后 T1 图测量 T1 值并取均数，分别记作 T1pre、T1post ，计算 ΔT1 =（T1pre －T1post）/ T1pre。根据患者身高、体重计算标准肝脏体积 SLV，经后处理工作站绘制测量患者肝脏体积 LV，并计算标准体积率 LV/SLV。单因素方差分析 Child-pugh 各肝功能组间 T1post、T1post×LV/SLV、ΔT1、ΔT1×LV/SLV 的差异；t 检验比较 MELD≤8 和 MELD≥9 组间各影像学指标的差异。绘制 ROC 曲线，观察并比较各指标 AUC，以评估 T1 弛豫时间相关指标及结合标准肝脏体积率后各指标鉴别不同肝功能组的效能。
【结果】T1post、T1post×LV/SLV、ΔT1、ΔT1×LV/SLV 在 Child-Pugh 和 MELD 不同肝功能组间的差异均具有统计学意义（P＜0.05）；ΔT1×LV/SLV 在鉴别 MELD≤8 与 MELD≥9 组、NLF 与 LCA、NLF 与 LCB+LCC、LCA 与 LCB+LCC 组的 AUC 均最高。
【结论】1、Gd-EOB-DTPA 增强 T1 mapping 中 T1post、ΔT1 能有效评估 Child-Pugh 评分及 MELD 各组患者的肝脏功能，结合标准肝脏体积率后，ΔT1×LV/SLV 对肝功能评估的价值更高。

脾脏体积增大对评估奥沙利铂诱导肝损害的临床意义

付雪林
南昌大学第二附属医院

[摘要] 目的：以奥沙利铂为基础的化疗可能引起患者肝窦损害，严重者可能出现肝窦阻塞综合征、门静脉高压，甚至导致死亡。因此，对进行奥沙利铂化疗的患者，我们除了要关注肝功能的变化外，还要密切关注影像学上发生的变化，早期预防、干预。方法：本文收集了自 2017-07-01 到 2018-12-31 期间 60 例患者信息进行回顾性分析，主要关注以奥沙利铂为基础的胃癌、结直肠癌化疗患者在化疗期间 CT 扫描中脾脏体积改变与奥沙利铂剂量、肝脏纤维化指标及血小板的关系，以及脾脏体积改变与肝功能 DIBL、TBIL、AST、ALT 等生化指标发生改变、患者年龄、性别的关系。脾脏体积改变=（化疗后脾脏体积-化疗前脾脏体积）/化疗前脾脏体积；脾脏体积改变与奥沙利铂剂量、血小板计数、肝功能各生化指标、患者年龄、性别进行 logistic 分析；奥沙利铂剂量与脾脏体积改变采用 Spearman 相关性分析；肝纤维化指标：脾脏体积改变与 AST/PLT 采用 Spearman 相关性分析；可信区间估计。预期结果：奥沙利铂化疗中大部分病人有脾脏体积增大现象，且增大体积与奥沙利铂所用剂量密切相关。脾脏体积改变与肝纤维化指标 AST/PLT 变化密切相关。脾脏体积改变发生在肝功能变化之前，可以作为预测肝损害的的无创性指标之一。

两种基于模型迭代重建算法在腹部低剂量 CT 中的应用

杨创勃,贾永军,马光明,于楠,段海峰,于勇
陕西中医药大学附属医院

目的 对比两种基于模型迭代重建算法（MBIR,商品名“VEO”）在腹部低辐射剂量扫描时的图像质量及辐射剂量减低率。**方法** 连续纳入 20 例患者接受腹部增强常规剂量（NI=10）CT 扫描并 ASiR40%重建；两周内复查时，接受增强低剂量扫描(NI=20)，并分别进行 40%ASiR、VEO-STND 和 VEO-NR40 重建。由 2 名医师通过锐利度、噪声、伪影和诊断接受度对图像进行主观评分，并客观测量图像噪声值和 CT 值，计算 SNR 和 CNR。记录每例患者每次检查的剂量长度乘积（DLP）和 CT

剂量指数（CTDIvol），计算剂量减低率。**结果** 低剂量扫描的 DLP 值和 CTDI 值分别为（95.56±47.17）mGy/cm 和（3.04±1.48）mGy，而常规剂量 ASiR 40%重建的 DLP 值和 CTDI 分别为（376.39±160.40）mGy/cm 和（12.16±5.18）mGy。对于腹部脏器，低剂量 VEO-STND 图像比常规剂量 40%ASiR 在图像噪声（SDn）、信噪比（SNR）和对比噪声比（CNR）方面无统计学差异（P＞0.05）,而低剂量 VEO-NR40 图像比常规剂量 40%ASiR 在图像噪声（SD）、信噪比（SNR）和对比噪声比（CNR）方面有明显统计学差异（P＜0.001）。VEO-STND、VEO-NR40 重建可以提高图像的密度分辨力，降低硬化伪影，且低剂量 VEO-STND、VEO-NR40 重建比 40%ASIR 图像有更低噪声和伪影，主观评价结果更佳。 **结论** 在保证图像质量的前提下，相比常规剂量扫描 ASiR40%重建，低剂量扫描 VEO-STND、VEO-NR40 重建可以明显降低扫描剂量，低剂量 VEO-STND 可以代替常规剂量扫描 40%AsiR 重建，低剂量扫描 VEO-NR40 相比常规剂量 ASiR40%重建及低剂量 VEO-STND 重建能提供更佳图像质量，具有进一步降低扫描剂量的潜力。

IVIM-DWI 联合 T1-mapping 技术对肝癌介入治疗效果评估的研究

卢慧敏,朱娟
安庆市立医院

摘要：目的 本研究通过应用基于体素内不相干运动（IVIM）双指数模型肝脏多 b 值 DWI 扫描联合 T1-mapping 技术对肝癌介入治疗前、后及多次介入治疗的的病灶的 ADC 值及增强前、后的 T1 值进行分析，对肝癌介入治疗后的效果进行定量分析，从而以定量的方式评估肝癌患者介入治疗的疗效及预后。**方法** 选取 30 例确诊为肝细胞肝癌的患者，在每次行肝动脉化疗栓塞术（TACE）前、后分别行 DWI、IVIM-DWI 及肝脏动态增强扫描，其中动态增强扫描中动脉期采用 Twist vibe 技术，同时每次扫描时进行增强前、后的 T1mapping 扫描，共取兴趣病灶 40 个，对每一次的病灶的 ADC 值及增强前、后的 T1 值进行分析。**结果** 1、40 个兴趣病灶介入治疗前、后的 ADC 值及 T1 值均具有差异性；2、介入治疗后 ADC 值明显高于治疗前，两者呈明显负相关，相关系数 r2 为-0.72； 治疗后 T1 值低于治疗前，两者呈显著正相关，相关系数 r2 为 0.76 ，差异有统计学意义（P＜0.05）；3、同一病灶增强前后 T1 值具有显著差异性，治疗后较治疗前 T1 值增加率显著下降。**结论** IVIM-DWI 联合 T1-mapping 技术，可以定量的判断肝癌介入治疗前、后的病灶活性度，有效的评估肝癌介入治疗的疗效及病灶预后情况。

Evaluation of texture analysis for the differential diagnosis of chronic mass-forming pancreatitis from pancreatic ductal adenocarcinoma on contrast-enhanced CT images

Shuai Ren,Kai Guo,Zhongqiu Wang
the Affiliated Hospital of Nanjing University of Chinese Medicine

Background: Imaging findings of chronic mass-forming pancreatitis (CMFP) and pancreatic ductal adenocarcinoma (PDAC) often overlap. The aim of this study was to determine the potential of computed tomography (CT) imaging features and texture analysis in differentiation between CMFP and PDAC.

Materials and methods: Thirty patients with pathologically proved CMFP and 79 patients with PDAC were included in this study. Two radiologists evaluated the morphologic characteristics and enhancement pattern of the tumors in consensus. CT texture features were extracted from CT images at the arterial and portal phases using a commercial available software (AnalysisKit). Multivariate logistic regression analyses were adopted to identify relevant CT imaging features and texture parameters to discriminate CMFP from PDAC. Receiver operating characteristic (ROC) was performed to determine the diagnostic performance of prediction.
Results: CMFP showed a larger size compared to CMFP (p=0.009). Cystic degeneration, pancreatic duct dilatation, vascular invasion, and pancreatic portal hypertension were more frequent and duct penetrating sign was less frequent in PDAC compared with CMFP. CT attenuation at the arterial phase, arterial enhancement ratio and portal enhancement ratio of CMFP were higher than those of PDAC (p<0.05). In multivariate analysis, arterial contrast enhancement and pancreatic duct penetrating sign were independent predictors. Texture features at the arterial phase including SurfaceArea, Percentile40, InverseDifferenceMoment_angle90_offset4, LongRunEmphasis_angle45_offset4, and uniformity were independent predictors. Texture features at the portal phase including LongRunEmphasis_angle135_offset7, VoxelValueSum, LongRunEmphasis_angle135_offset4, and GLCMEntropy_angle45_offset1 were independent predictors. The areas under the curve (AUC) of imaging-based diagnosis, and texture analysis-based diagnosis at the arterial and portal phase were 0.84, 0.96, and 0.93.
Conclusions: Texture analysis has great potential to improve the diagnostic efficacy of CT in differentiating CMFP from PDAC.

EPO-0895
体素内不相干运动成像对四氯化碳诱导的大鼠肝纤维化及肝炎的评估能力

祁汉雄,谢双双,沈文
天津市第一中心医院

目的 评估体素内不相干运动（IVIM）成像对四氯化碳诱导的大鼠肝纤维化分期及炎症分级的价值。**材料与方法** 购入 75 只正常 SPF 级 SD 雄性大鼠（150g±10g），适应性饲养 1 周后，随机分为 3 组：进展组，恢复组，对照组。所有大鼠于建模前完成基线扫描。肝纤维化模型由颈背部皮下注射 40%四氯化碳溶液建立。进展组在注药后 2、4、6、8、10、12 周末分别进行扫描，恢复组于注药后 2、4、6 周末及停药后 1、2、4、6 周末分别进行扫描。每次扫描结束后每组随机选取 5-6 只大鼠进行病理学检查。2 名观察者独立盲法测量所有大鼠肝脏 IVIM 参数值，取相应平均值进行统计学分析。采用 Spearman 检验分析大鼠肝脏 IVIM 参数值与肝纤维化程度及炎症程度间的相关性。采用单因素方差分析或 Kruskal-Wallis 检验分析不同程度肝纤维化及肝炎间的差异，事后进行两两比较。并以 ROC 曲线确定诊断效能。**结果** 真扩散系数（D）、假扩散系数（D*）及灌注分数（f）与肝纤维化分期具有低度相关性。在评估 S0 与 S1-4 时，D、D*、f 均具有中度诊断效能；在评估 S0-1 与 S2-4 时，D 具有中度诊断效能，D*及 f 具有低度诊断效能；在评估 S0-3 与 S4 时，D、D*及 f 均具有低度诊断效能。D*与肝炎分级无相关性，在不同程度肝炎间均无统计学差异。D 及 f 与肝炎分级具有中度相关性。D 和 f 均在 G0 与 G1、G3 间，G2 与 G3 间具有统计学差异。在评估 G0 与 G1-3、G0-1 与 G2-3 时，D 及 f 均具有中度诊断效能；在评估 G0-2 与 G3 时，D 和 f 具有低度诊断效能。**结论** IVIM 参数对于肝纤维化程度的评估具有一定意义，可用于评估是否存在肝纤维

化，是否需要进行干预治疗，但无法评估是否存在肝硬化；IVIM 参数中 D 及 f 可用于肝炎程度的评估，可用于评估是否存在肝炎以及是否是轻或中重度肝炎，但对于中度及重度肝炎无法鉴别。

胰腺小实性假乳头状瘤 MSCT 特征分析

王燕华,许尚文
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的 探讨胰腺小实性假乳头状瘤(SPT)的 MSCT 典型特征。
方法 回顾性分析 2005 年 3 月~2017 年 7 月,在我院明确病理诊断的 47 例胰腺 SPT 患者的临床和影像学资料,根据肿瘤大小分为最大径≤3cm 组(小 SPT 组,n=15 例)和>3cm 组(大 SPT 组,32 例)2 组。对比 2 组一般特征、MSCT 表现、影像学诊断情况。
结果 与大 SPT 组相比,小 SPT 组胰腺实性假乳头状瘤 MSCT 影像学诊断误诊率高[80.0%(12/15)vs 28.1%(9/32),X~2=11.1192,P=0.001]。小 SPT 组 MSCT 影像学表现为纯实性肿块[100%(15/15)vs 18.75%(6/32),X~2=27.277,P=0.000]、边界模糊[33.3%(5/15)vs 3.13%(1/32),X~2=8.369,P=0.004]、未见明显包膜[73.3%(11/15)vs 31.25%(10/32),X~2=7.318,P=0.007]、增强扫描呈现均匀强化[46.7%(7/15)vs 15.6%(5/32),X~2=5.176,P=0.023]的比例更高。2 组在 MSCT 表现的肿瘤形状、边缘、钙化、胰腺导管扩张、胰腺实质萎缩方面差异无统计学意义(均 P>0.05)。
结论 胰腺小(≤3cm)SPT 的 MSCT 影像学表现为纯实性肿块,平扫为均匀低密度,增强呈现均匀渐进性强化,往往肿瘤边界模糊,未见明显包膜,与胰腺大的 SPT 典型表现有所不同,容易误诊。

肝脏影像报告和数据系统（LI-RADS）中 MRI 辅助特征的解读

吕蓉
天津市第三中心医院

目的：详细阐述肝脏影像报告和数据系统（LI-RADS）中 MR 影像辅助特征所描述的影像表现。**方法：**回顾性搜集 LI-RADS 中 MR 影像辅助特征的相关图像，并复习相关文献，详细分析相关图像特征。**结果：** HCC 的典型表现为动脉期明显强化和门静脉/平衡期廓清（附图），但直径<20 mm 的结节常表现为非典型的强化模式，因此 LI-RADS 中描述的辅助征象可以帮助 HCC 进行准确诊断和分期。这些辅助征象包括（1）非特异性恶性特征：①轻至中度 T_2 高信号（附图），可以用于小 HCC 于 DN 以及其他肿瘤性病变的鉴别，还可以用于 HCC 级别的划分。②DWI 扩散受限，表现为 DWI 序列上的高信号表现（附图），其与常规 MR 序列结合可以提高 HCC 诊断的灵敏度和特异度。③病灶中乏脂（附图），即在脂肪肝背景下出现缺乏脂肪成分的病灶，则有利于 HCC 的诊断。④病灶中乏铁（附图），即在铁过载的肝实质内出现乏铁的实性结节时则高度提示癌前病变或恶性肿瘤。⑤直径增加小于阈值生长（附图），阈值增长有其自身定义，当病灶直径增加小于这一规定范围时则高度提示 HCC。⑥晕环状强化（附图），表现为病灶边缘的带状明显强化影。（2）HCC 特异性征象：①病灶内含脂（附图），即病灶内含有脂肪成分为 HCC 的特异性征象，该特点可以在同反相位图像上观察到。②结节中结节（附图），即母结节中含有子结节，其两者在不同序列上有各自表现，代表病灶不同成分的分化程度有所不同。③马赛克结构（附图），即在 HCC 病灶中出现的随机分布的结节和分隔，结节通常由纤维分隔隔开，且其形状和大小以及信号强度、强化表现均不相同。④出

血（附图），即在 HCC 病灶中出现血液成分。**结论：**通过对 LI-RADS 中 MR 辅助征象的详细阐述可以进一步加深对 HCC 病灶的认识，提高 HCC 诊断的准确性。

EPO-0898
肝脏恶性孤立性纤维性肿瘤 1 例并文献复习

吕蓉
天津市第三中心医院

目的：孤立性纤维肿瘤（solitary fibrous tumor， SFT）是一种少见的梭形细胞间叶型软组织肿瘤，多发生在胸部，以胸膜最多见，也可发生在胸外，包括头颈部、腹盆部及肢体。肝脏 SFT 十分少见，国内外报道不到 100 例，且大多为良性，肝脏恶性 SFT 的报道更为罕见，因此其临床表现、影像特征、治疗和预后尚不为人所熟知。本文将对一例肝脏恶性 FST 进行报道，并进行文献复习，对该病的临床表现、放射学研究、外科治疗、免疫组化研究和预后进行更新和综合探讨，以期提高对本病的进一步认识。方法：①病例报道：患者女，66 岁，入院前 1 周体检发现肝占位性病变，伴上腹部胀满不适，饱食后加重，伴纳差。既往“乙肝”病史 40 余年，未予治疗。CT 示肝右前下方巨大混杂密度肿块，大小约 15.5×9.6×15.3cm，动脉期病灶明显不均匀强化伴迂曲血管，肿物有延迟强化，呈“巧克力饼干”样表现（附图）。MR 示肝右前下方巨大混杂信号肿块，T2WI 可见流空血管，动脉期明显不均匀强化，静脉期及平衡期延迟强化，肝胆期病灶强化略减低（附图）。术后病理回报肝脏低级别恶性孤立性纤维性肿瘤。②常规检索有关“肝脏孤立性纤维瘤”的国内外文献，并整理复习。结果：肝脏恶性 SFT 极其罕见，包括本例在内，国内外报道不超过 40 例，患者平均年龄约为 57.6 岁，男女发病率相似。肝脏 SFT 的典型影像表现为边界清楚的较大肿物，T2WI 有低信号流空血管，“巧克力饼干”样明显、持续或进行性、延迟强化，当病灶≥10cm，侵犯周围结构或短期内快速增大时应考虑恶性，恶性病灶可有局部复发和转移。确诊需病理免疫组化检查。手术切除是治疗的主要方法。结论：虽然肝脏 SFT 罕见，但其也有自身的影像特点，应注意观察并了解该特征，以期提高诊断的准确性。

宝石能谱 CT 多参数成像在肝脏肿瘤鉴别诊断、术前分期应用价值研究

周永,杨帆,文智（通讯）,周诚,甘晓晶,余莹莹
新疆医科大学附属肿瘤医院

摘要：目的：探讨宝石能谱 CT（GSI）多参数成像在肝脏肿瘤鉴别诊断、 术前分期应用价值。**方法：**回顾性选择 92 例疑似肝脏恶性肿瘤患者，所有患者均行 GSI 扫描，获得定量参数(能谱曲线斜率(s-SHC)、动脉期标准碘浓度值(NIC)、门静脉期 NIC、碘浓度差值(ICD)、肝动脉碘分数(AIF)]，以病理诊断结果为准，ROC 分析 s-SHC、动脉期 NIC、门静脉期 NIC、AIF 值对肝癌的鉴别价值。Kappa 一致性检验 GSI 对肝癌术前分期与病理诊断结果的一致性。**结果：**本组肝癌 54 例（恶性组），肝脏良性病变 38 例（良性组），恶性组 s-SHC[（1.93±0.62）VS（0.85±0.36）]、动脉期 NIC[（0.13±0.05）VS（0.06±0.02）]、门静脉期 NIC[（0.47±0.14）VS（0.40±0.13）]、AIF[（0.65±0.19）VS（0.31±0.12）]高于良性组（P＜0.05），ICD[（7.15±2.39）×10^2μg/cm^3VS（11.82±3.56）×10^2μg/cm^3]低于良性组（P＜0.05）。s-SHC、动脉期 NIC 诊断肝癌的效能较高，AUC 分别为 0.830、0.719，AIF 无诊断价值。GSI 诊断肝癌术前分期准确率 77.78%，与病理诊断一致性较好（*Kappa* 值=0.6 12，P＜0.05））。

结论：GSI 参数 s-SHC、动脉期 NIC 在肝脏肿瘤鉴别诊断中具有较高应用价值，GSI 技术可准确对肝癌进行术前分期，为临床手术治疗提供可靠指导。

Gadobenate dimeglumine-enhanced hepatobiliary-phase MR imaging of primary hepatic lymphoma: Three case reports and review of literature

Meilian Xiong,Dairong Cao
The First Affiliated Hospital of Fujian Medical University

Background: Primary hepatic lymphomas (PHLs) are extremely rare. Clinically, PHL is easy to be misdiagnosed as other focal hepatic lesions. Gadobenate dimeglumine (Gd-BOPTA)-enhanced MR imaging is a promising method to characterize the hepatic lesions. To date, there is lacking literature describing Gd-BOPTA-enhanced hepatobiliary-phase MR features of PHL.
Case presentation: We report three cases with PHL. The first one is a 52-year-old male patient was admitted to our hospital with the complaint of right upper abdominal pain and distension. On physical examination, he was found to have an abdominal bulge and enlarged lymph nodes. Non-enhanced MRI showed a solitary oval mass was located in segment 5, demonstrating homogeneously low signal intensity on T1-weigted images (T1WI) and high signal intensity on T2-weighted images (T2WI). After the administration of Gd-BOPTA, the lesion was intensely enhanced in the arterial phase and washed out in the equilibrium phase without a delayed fibrous capsule enhancement. In the hepatobiliary phase, the mass showed obvious hypointensity compared to the normal liver tissue. The patient received a local resection and was confirmed as mucosa-associated lymphoid tissue (MALT) lymphoma by histopathology with CD20, CD79α and LCA positive in immunohistochemical stains. The second is A 74-year-old male patient presented to our hospital with the complaint of right upper abdominal distension, painless jaundice and fever. Non-enhanced MRI demonstrated diffused lesions were located in the right and left lobes, showing heterogeneously low signal intensity on T1WI and high signal intensity on T2WI with ill-defined margins and obvious central necrosis. After the administration of Gd-BOPTA, the lesions were moderately enhanced with ring-like patterns in the arterial phase, and showed delayed enhancement in the equilibrium phase. In the hepatobiliary phase, the lesions showed obvious hypointensity compared to the normal liver tissue. The patient underwent fine needle aspiration biopsy and were confirmed as diffuse large B cell lymphoma (DLBCL). The last one is A 62-year old male was admitted to our hospital with a history of PHL and he received a resection combined with postoperative chemotherapy 4 years ago. He had no discomfort. His physical examinations were normal. Precontrast enhanced MRI demonstrated a round mass located in the right lobe, showing heterogeneously hypointensity on T1WI and hyperintensity on T2WI. After the administration of GD-BOPTA, the mass exhibited obvious hypointensity in the hepatobiliary phase. The patient received a biopsy and was confirmed as DLBCL by pathology.
Conclusion: PHL is an extremely rare condition that lacks specific imaging findings, clinical manifestations and biochemical markers; therefore an accurate diagnosis is

very difficult. A biopsy or surgical resection should be performed in such cases, since only histological examination can ensure an accurate differential diagnosis. PHL does not contain functioning hepatocytes and thus cannot retain Gd-BOPTA. These lesions appear hypointense as seen on Gd-BOPTA-enhanced hepatobiliary-phase MR imaging.

EPO-0901

胆管浸润性癌的动态增强 CT 和 MR 诊断

莫蕾,王梓华,李卓然,江新青
广州市第一人民医院

目的 探讨胆管浸润性癌(BEIC)的 CT 和 MR 表现。**方法** 回顾性分析我院经手术或穿刺病理证实的 30 例 BEIC 的 CT、MR 平扫和多期动态增强扫描图像资料，总结其影像学特征，并与病理作对比。**结果** 肝内型及肝外型 BEIC 均表现为肿瘤沿胆管纵轴浸润生长，胆管壁不均匀增厚，伴局部肿块形成（16/30）或无明确肿块（14/30），肿块均为边界不清、不成形，动态增强扫描增厚之胆管壁、肿块呈持续性、延迟强化；肿块可沿胆管壁浸润扩散从而侵犯邻近胆管，伴有梗阻部周围及远端胆管不同程度的扩张。无明确肿块形成的 BEIC 易误诊为胆管炎。**结论** BEIC 的生长方式、形态学特征、生物学行及影像学表现均有其特点，胆管壁厚薄不均匀并延迟强化、管腔不规则狭窄及梗阻部以远胆管“软藤状”扩张等特点，在影像诊断上具有重要意义。

EPO-0902

不同管电压对胆道闭锁患儿肝移植术前 CT 评估肝血管图像质量及辐射剂量的影响

唐玲,张灵,龙莉玲
广西医科大学第一附属医院

目的 探讨不同管电压对胆道闭锁患儿肝移植术前行上腹部 CTA、CTV 扫描评估肝血管检查图像质量和辐射剂量的影响。**方法** 回顾性收集行上腹部 CTA、CTV 的胆道闭锁患儿，根据管电压不同分为 80Kv 组和 100Kv 组，每组各 21 例。测量客观评价指标包括肝动脉 CT 值、门静脉 CT 值、肝静脉 CT 值及对比噪声比（CNR）、信噪比（SNR），记录图像总体质量主观评分，记录辐射剂量包括容积 CT 剂量指数(volume CT dose index，CTDIvol)，剂量长度乘积（Dose Length Product,DLP）并计算全身有效剂量（Effective Dose,ED）。两组间图像的客观评价、血管 CT 值、CNR、SNR、CTDIvol、DLP 及 ED 采用独立样本 t 检验，主观评分的比较采用非参数 Mann—whitney U 检验。以 P＜0.05 为差异有统计学意义。**结果** 图像质量客观评价：两组之间门静脉 CT 值、肝静脉 CT 值、门静脉 CNR、肝动脉 SNR、肝静脉 SNR、CTDIvol、DLP、ED 有统计学意义（P＜0.05），肝动脉 CT 值、肝动脉 CNR 值、肝静脉 CNR、门静脉 SNR 无统计学意义（P＞0.05）。图像质量主观评分：两组肝动脉整体图像质量、门静脉整体图像质量主观评分差异无统计学意义（P＞0.05），肝静脉整体图像质量主观评分差异有统计学意义（P＜0.05）。辐射剂量：80Kv 组的 CTDIvol 为（6.53±3.19）mGy，ED 为（2.06±1.19）mGy，100Kv 组的 CTDIvol 为（15.01±4.43）mGy，ED 为（4.63±1.60）mGy，两组辐射剂量差异有统计学意义（P＜0.05），80Kv 组有效剂量较 100Kv 组下降了 124.8%（2.57/2.06）。**结论** 对胆道闭锁患儿行肝移植术前评估肝血管时，采用低管电压扫描可以明显有效减低辐射剂量并获得理想的图像质量。

EPO-0903
基于儿童一站式 MR 的儿童胰胆管合流部及其毗邻结构解剖及变异研究

郭万亮,陈伟,赵廉
苏州大学附属儿童医院

背景：本研究评估儿童一站式 MR 对胰胆管合流部解剖结构及变异显示情况，为胰胆管合流异常患者术前提供详细信息。

方法：采用前瞻性研究，对 65PBM 患者进行研究。儿童一站式 MR（动态增强结合 MRCP、冠状位 T2ssfse）。所有患者采用三期扫描（注射后 2-3 秒扫描肝动脉期和门静脉期，每次扫描 40-50 秒，连续扫描 3 次）。所得图像与 MSCT 图像、IOC 图像相对比，两位放射科医生独立评估所得图像，并通过讨论形成共识。

结果：65 例确诊 PBM 患者， 38 例为 C-P 型，21 例为 P-C 型，6 例为复杂型 PBM。11 例肝右动脉位置变异（位于胆总管腹侧）。46 例患者同时行 MSCT、IOC、儿童一站式 MR，其中肝动脉类型正常者 37 例，肝动脉变异者 9 例，37 例胆管类型正常，9 例胆管变异。儿童一站式 MR 和 IOC 能清楚显示胰胆管合流部结构分别为 38 例、43 例。儿童一站式 MR 和 IOC-MSCT 均能明确检出 32 例合并胆结石。21 例患儿均经儿童一站式 MR 和 IOC-MSCT 明确发现胆道感染。儿童一站式 MR 组与 IOC-MSCT 组比较无显著性差异。儿童一站式 MR 组胆管、胰胆管交界处的检出率高于 MSCT 组（$P<0.05$）。儿童一站式 MR 组肝动脉、胆石症、胆管炎的检出率高于 IOC 组（$P<0.05$）。

结论：儿童一站式 MR 可清楚显示肝动脉、胆管、胰胆管交界处解剖结构及相关变异，同时可以显示胆总管壁慢性炎症的变化。术前行儿童一站式 MR 对于降低 Roux-en-Y 手术医源性损伤的发生率具有潜在的作用。

EPO-0904
T2*校正的双翻转角梯度三回波技术与 1H-MRS 对肝脏脂肪含量定量分析的对照研究

赵黎明,王益双,印隆林,路涛,陈光文
四川省医学科学院·四川省人民医院

目的 探讨 T_2^*校正的双翻转角梯度三回波技术对肝脏脂肪含量定量分析的价值。**方法** 前瞻性纳入 30 例经 CT 或超声确诊的脂肪肝患者作为研究对象，对所有患者行梯度三回波及 ^{1}H-MRS 检查，翻转角分别设 20° 及 70° 各行一次三回波扫描，并计算脂变指数（fat index，FI）及肝细胞相对脂肪含量（relative lipid content，RLC）。以 ^{1}H-MRS 为参考标准，对梯度双回波、三回波测得的 FI 进行统计学分析。**结果** 20° 双回波、20° 三回波、70° 双回波、70° 三回波测得的 FI 分别为 10.79(8.59，17.14)%，7.62（4.00，13.21）%，14.45（10.75，22.54）%，11.07（6.09，18.74）%，^{1}H-MRS 测得的 RLC 为 12.72（6.91，21.75）%，与 70° 三回波测得的结果最为接近。双回波、三回波测得的 FI 与 RLC 均呈正相关（$r_{20°双}$=0.881，$P<0.01$；$r_{70°双}$=0.898，$P<0.01$；$r_{20°三}$=0.946，$P<0.01$；$r_{70°三}$=0.935，$P<0.01$），且 Bland－Altman 分析显示各指标与 RLC 一致性均良好；三回波测得的相关系数均高于双回波；20° 三回波测得的相关系数较 70° 三回波略高，但图

像质量较后者有所下降。**结论** 经 T_2^*校正的梯度三回波技术可在纵向研究中替代 ^{1}H-MRS，将在脂肪肝早期筛查、疗效监测中发挥重要作用，但其成像参数（翻转角）有待进一步优化。

EPO-0905

3.0T 1H-MRS、梯度双回波和三回波技术在定量评估脂肪肝治疗效果中的价值

赵黎明,王益双,路涛,陈光文
四川省医学科学院·四川省人民医院

目的 探讨 3.0T ^{1}H-MRS、梯度双回波和三回波技术在定量评估脂肪肝治疗效果中的价值。方法 前瞻性收集 30 例经 CT 或超声确诊的脂肪肝患者作为研究对象，于治疗前和治疗后 3 个月各行 1 次梯度双回波、三回波及 ^{1}H-MRS 检查，并计算脂变指数（fat index，FI）及肝细胞相对脂肪含量（relative lipid content，RLC）。同期测量血液生化指标、腹围、体质量指数（body mass index，BMI），并拟合成临床脂肪肝指数（the fatty index，FLI）。以 FLI 为参考标准，对治疗前后的 MRI 测得结果进行统计学分析。结果 干预治疗后，与治疗前比较，FLI、$FI_{双}$、$FI_{三}$及 RLC 均降低（t=5.281，P<0.001；Z=－3.651，P<0.001；Z=－3.630，P<0.001；Z=－4.762，P<0.001）。治疗前，$FI_{双}$和 $FI_{三}$与 FLI 均呈正相关（r=0.413，P<0.05；r=0.396，P<0.05），治疗后 $FI_{双}$和 $FI_{三}$与 FLI 亦均呈正相关（r=0.395，P<0.05；r=0.519，P<0.05），以治疗后的 $FI_{三}$与 FLI 的相关系数为最高；治疗前及治疗后 RLC 与 FLI 之间的相关性均无统计学意义（P>0.05）。结论 采用 ^{1}H-MRS、梯度双回波和三回波技术定量评估脂肪肝治疗效果是可行的，梯度三回波技术的准确性更好，技术上容易实现，更适合在临床广泛开展。

EPO-0906

CT-Value（△HU and CT-Value ratio）in Differential Diagnosis of Small Hepatocellular Carcinoma from Focal Nodular Hyperplasia

Xiuhong Ge[1],Jingfeng Zhang[2],Jichang Yang[2]
1.the Affiliated Hangzhou First People's Hospital, Zhejiang University School of Medicine
2.The First Affiliated Hospital, College of Medicine, Zhejiang University

Purpose: The objective was to explore the Lesion- Liver parenchyma -Attenuation Difference (△HU) and the CT-value ratio (CVR) of the lesion and the surrounding normal liver parenchyma between the hepatic arterial phase, portal phase, and the delayed phase to differentiate the small hepatocellular carcinoma (SHCC, ≤ 3 cm) from the focal nodular hyperplasia (SFNH, ≤ 3 cm).
Materials and Methods: Total 111 SHCC lesions in 108 cases and 36 SFNH lesions in 33 cases, confirmed by clinically and /or pathologically, were analyzed retrospectively. All the patients underwent plain scan, arterial phase (AP), portal phase (PP) and delayed phase (DP) CT scans. The lesions' CT values (LCV) and the surrounding normal liver parenchyma (NCV) of the three-phase enhancement (AP, PP, DP) were measured separately , the △HU= LCV-NCV and the CVR= LCV/NCV were calculated.

The △HUand CVRof AP, PP, and DP were analyzed by the Wilcoxon rank sum test and the receiver operating curve (ROC) separately.
Results: The median age and the male /female ratios of 111 SHCC lesions in 108 patients and 36 SFNH in 33 patients were statistically significant, and the size wasn't statistically significant. The △HUand CVRof the AP, PP, and DP of the SHCCs and the SFNHs were statistically significant, respectively. Thearea under the curve (AUC) of △HU and CVR of AP, PP and DP were increased gradually, which were 0.895 vs. 0.838, 0.913 vs. 0.914, and 0.990 vs. 0.991,respectively.When the △HU and CVR of the AP, PP and DP were 105.800HU vs. 1.516, -12.600HU vs. 0.949, -19.750 HU vs. 0.951, obtained the maximum You-den indexes which were 0.707 vs. 0.610, 0.811 vs. 0.811, and 0.908 vs. 0.908, respectively. Besides, the corresponding sensitivity and specificity were 80.6 % and 90.1 % vs. 88.90% and 72.1%, 100% and 81.1% vs. 100% and 81.1%, 94.4 % and 96.4% vs. 94.4 % and 96.4%, respectively.
Conclusions: The △HU and CVR had important value in distinguish SHCC from SFNH. TheSHCC was highly suggested when △HU and CVR are no greater than the threshold value in the enhancement phases in the middle-aged and elderly male patients, especially in the DP.

EPO-0907
体素内不相干运动扩散加权成像预测肝细胞肝癌微波消融治疗疗效的价值

李小芹,孙立新,巩若箴
山东省耳鼻喉医院

目的 探讨体素内不相干运动扩散加权成像（IVIM）对肝细胞肝癌微波消融治疗疗效的预测价值。
方法 回顾性分析 2015 年 1 月至 2017 年 12 月间在我院行微波消融治疗的 32 例肝细胞肝癌患者，将入组患者依据半年内有无局灶性复发分为未复发组和复发组。所有患者在消融治疗前 1 月、消融治疗后进行 MRI 平扫、增强、DWI 及 IVIM 检查，使用全容积画法勾画感兴趣区（ROI），测量肝癌患者病灶表观扩散系数（ADC）、及 IVIM 相关参数值（D、D*、f）。统计方法采用独立样本 t 检验，比较病灶复发组与未复发组各参数间差异，以是否复发为因变量进行二分类 Logistic 回归分析，判断影响复发的参数。采用受试者工作特征曲线（ROC），计算相关参数的诊断效能。采用 Z 检验比较两组间曲线下面积（Az）。
结果 两组间肿瘤最大径分别为（36.00±6.841）mm、（31.36±8.061）mm，两组间差异具有统计学意义（t 值为-2.026，P <0.05）。患者 MWA 术后两组间 1 月 ADC、D 值间存在差异，且差异具有统计学意义（$P<0.05$）。多因素二分类 Logistic 回归分析，MWA 术后 1 月 ADC、D 值均为预测局部复发的参数。以 ADC 值 $1.365\times10^{-3}mm^2/s$ 为阈值，预测消融疗效的敏感度为 87.5%，特异度为 72%。以 D 值为 $1.962\times10^{-3}mm^2/s$ 为阈值，预测消融疗效的敏感度为 81.25%，特异度为 72.22%。MWA 术后 1 月两组间 D 值较 ADC 值诊断效能略高，但两组间差异无统计学意义。
结论 微波消融治疗术后 1 月 D 值对预测肝细胞肝癌患者微波消融疗效有一定的价值，体素内不相干运动扩散加权成像可帮助临床医师监测肿瘤治疗后疗效。

EPO-0908

能谱 CT 定量评价胰腺癌组织分化的临床研究

李琼
十堰市太和医院

目的：探讨宝石能谱成像（GSI）对胰腺癌定量和定性评价组织分化中的价值。
方法：回顾性分析使用 GSI 模式对 49 例胰腺癌患者行增强三期腹部 CT 扫描图像。通过 GSI Viewer 软件，测量不同组织分化类型胰腺癌实体部分的 CT 值、碘值和有效原子序数值，并测量同层面脂肪及腹主动脉 CT 值，对肿瘤的 CT 值进行标准化处理。所有数据进行统计分析。
结果：病理结果确诊 8 例高分化腺癌，21 例中分化腺癌，20 例低分化腺癌。高分化腺癌，中分化腺癌和低分化腺癌在动脉期和实质期的标准化 CT 值均呈逐渐增加的趋势（0.15±0.04HU，0.08±0.13HU，0.15±0.05HU）（0.38±0.22HU，0.26±0.01HU，0.51±0.11HU），均有显著统计学差异（所有 P <0.05）；但在延迟期无显著统计学差异（P> 0.05）。碘值和有效原子序数值在三期均有统计学差异（P <0.05）。高分化腺癌，中分化腺癌和低分化腺癌动脉期和门静脉期最佳 CNR 的单能 CT 图像值分别为(63 ± 2, 68 ± 7, 72 ± 9) keV 和 (76 ± 4, 63 ± 3, 66 ± 5) keV。
结论：高分化腺癌，中分化腺癌和低分化腺癌在动脉期和实质期的标准化 CT 值均逐渐增加。不同组织分化程度胰腺癌的碘值和有效原子序数值在动脉期、实质期及延迟期均有显著差异，能谱 CT 可以进行胰腺癌的术前评估。

EPO-0909

磁共振弥散峰度成像定量评估肝纤维化分期的初步研究

陆婧,陈文
十堰市太和医院

目的 探寻磁共振弥散峰度成像技术（DKI）对肝纤维化的分期价值及诊断效能。 **方法** 选取 59 例经病理学确诊并分期的肝纤维化患者（其中 S1 级 15 例、S2 级 14 例、S3 级 13 例、S4 级 17 例；）及 18 例健康志愿者（S0 期），所有受试者均行肝脏 DKI 功能性磁共振检查。利用 GE 750w 3.0T 磁共振扫描仪进行数据采集，采用头先进仰卧位呼吸门控触发，DKI 模型 b 值设定为 0、500、1000s/mm^2。利用 GE AW4.6 工作站 Functool 软件进行图像后处理，并以患者穿刺部位为 ROI 测量相关参数，获得 DKI 的参数指标。统计学分析利用单因素方差分析和组间多重比较进行组间差异性比较；采用 Spearman 分析正常肝脏和肝纤维化不同病理分期之间各参数值的相关性，最后利用 ROC 曲线评价相应参数指标的诊断效能。 **结果** 随着肝纤维化的进展，不同纤维化分级间的 DKI 指标（MD、MK、FA、FAK、Ka）的数值差异具有统计学意义（P 值均<0.05），Pearson 相关性分析显示，上述指标中 MD 值与肝纤维化病理分期呈负相关（r= -0.667），MK、FA、FAk 值与肝纤维化病理分期呈正相关（r 值分别为 0.426、0.769、0.812），其中 FA 值与肝纤维化分期相关性最大。ROC 曲线分析示 MD 对于诊断≥S1 级肝纤维化诊断效能较高（ROC 曲线下面积为 0.922）；FA 及 FAk 值对于诊断 S2-S4 级肝纤维化诊断效能均高于其他参数。FAk 值对于诊断≥S2 级（ROC 曲线下面积为 0.876）和 S4 级（ROC 曲线下面积为 0.794）肝纤维化诊断效能较 FA 值高，FA 可鉴别≥S3 级（ROC 曲线下面积为 0.847）肝纤维化。 **结论** DKI 能定量评估肝纤维化分期，MD 值可敏感地识别早期肝纤维化，FAk 及 FA 值则对中、晚期肝纤维化的区分有更大的优势，从而为评价肝纤维化的严重程度提供依据。

EPO-0910

动态增强 MRI 评估胰腺导管内乳头状粘液性肿瘤恶性潜能的价值

柴丽,柴维敏
上海交通大学医学院附属瑞金医院

目的 探讨采用动态增强 MRI 评估胰腺导管内乳头状粘液性肿瘤（intraductal papillary mucinous neoplasms，IPMNs）恶性潜能的价值。
方法 回顾性分析经手术病理证实 IPMNs 患者动态增强 MRI 的影像学表现、临床及病理资料。分析 IPMNs 在 DCE-MRI 上影像学表现，包括病灶位置、壁结节、主胰管管径、胰腺周围组织及血管侵犯情况等。参照 2016 年修订版福冈共识对 IPMNs 进行影像学分类。
结果： 115 例 IPMNs 分为轻-中度不典型增生组、重度不典型增生组以及 IPMN 伴浸润性癌共 3 组。男性 75 例，女性 40 例；年龄 41~83 岁，平均年龄（63.8±7.9）岁。低-中度不典型增生与重度不典型增生、浸润性癌 IPMNs 在可强化壁结节≥5mm、主胰管≥10mm、主胰管改变伴远端实质萎缩、实性成分或壁结节弥散受限上均有统计学差异（P＜0.05）。肿瘤指标 CA19-9 升高在低-中度不典型增生与浸润性癌 IPMN 有统计学差异（P＜0.05）。重度不典型增生与浸润性癌 IPMN 在本研究统计的“令人担忧的特征”、“高危特征”影像学上表现均无统计学差异（P＞0.05）。
结论 DCE-MRI 评估 IPMNs 恶性潜能有一定的价值，特别在强化壁结节≥5mm、主胰管管径≥10mm、主胰管改变伴远端实质萎缩、实性成分或壁结节弥散受限等方面。

EPO-0911

肝胆管囊腺瘤影像诊断

许若梅
山西医科大学第一医院

目的：探讨肝胆管囊腺瘤（BCA）的临床表现及影像学特征，提高对此病的认识，提高早期诊断率、减少误诊率。
方法：收集 PubMed 等数据库报道的 39 例 BCA，详细分析其临床特点及影像学特征。
结果：（1）性别：32 例女性患者，7 例男性患者；临床表现：27 例患者早期表现为上腹痛或不适，4 例患者出现腹部肿块，2 例患者无临床症状；实验室检查：18 例患者表现为 CA199 升高。（2）影像学表现：17 例病灶位于肝左叶，11 例位于肝右叶，3 例位于肝中央叶。CT 平扫示肝内单发或多发低密度肿块，其内可见分隔和附壁结节。15 例患者行 MRI 检查显示，T1 加权像示低信号，T2 加权像示高信号；增强扫描后囊壁及其内分隔明显强化，其内液体成分未强化。MRCP 检查示 3 例病灶上方胆总管扩张。
结论：影像学检查在发现病变方面具有重要价值，MRI 和 MRCP 的使用，使得 BCA 的检出率有所提高，并有助于其与肝囊肿的鉴别，为术前的正确诊断，帮助临床医生选择最适宜的手术方式，实现 BCA 的完全切除提供了很好的依据。

EPO-0912

脾脏硬化性血管瘤样结节性转化的 CT、MRI 特征及影像诊断分析

王兵
陆军军医大学附属新桥医院放射科

目的 探讨脾脏硬化性血管瘤样结节性转化（ssclerosing angiomatoid nodular transformation,SANT）的影像学特征，提高对脾脏 SANT 的认识及诊断水平。
方法 回顾性收集并分析我院经手术病理证实的 13 例脾脏 SANT 患者的临床、病理基础及影像学资料，分析患者临床特点、病灶的大小及位置、CT 和（或）MRI（magnetic resonance imaging,MRI） 的影像表现。
结果 13 例脾脏 SANT 患者中均无特殊临床症状、多因体检发现就诊，女性 9 例，男性 4 例，患者年龄 35~岁，中位年龄 50 岁；病灶均为单发类圆形、多数位于脾脏边缘，病灶较大时突出脾轮廓外，病灶最大直径 9.8cm、最小直径 2.2cm，其中 8 例病灶大于 5cm；病理学特征为纤维硬化间质中形成多个血管瘤样结节。病灶在 CT 上表现为平扫类圆形等密度占位，CT 值多在 40-50Hu，增强扫描动脉期病灶周围小结节样、病灶中细网格状强化及病灶整体缓慢渐进性强化。病灶在 MRI 的 T2-weighted imaging（T2WI）表现为低信号以及典型的“轮辐征”，增强扫描早期强化特点与 CT 类似，5min 延迟扫描病灶中心区域见星芒状强化。
结论 脾脏 SANT 多单发、位于脾缘，影像增强特点及方式多呈缓慢渐进性强化，典型 MRI 表现为 T2WI 低信号及“轮辐征”，延迟期病灶中心星芒状强化。MRI 对于脾脏 SANT 的诊断优于 CT。

EPO-0913

Acute pancreatitis events in type 2 diabetes mellitus: are having set of particularities on magnetic resonance imaging compared with nondiabetic acute pancreatitis?

Bo Xiao[1,2],Haibo Xu[1],Jinxiang Hu[1]
1.Department of Radiology, Zhongnan Hospital of Wuhan University
2.Sichuan Key Laboratory of Medical Imaging, Department of Radiology, Affiliated Hospital of North Sichuan Medical College

Aims To study magnetic resonance imaging (MRI) appearances of type 2 diabetes mellitus (T2DM)-related acute pancreatitis (AP) and to determine whether set of particularities on MRI between groups of T2DM-related AP and nondiabetic AP.
Materials and methods This retrospective study from 2015 to 2018 included consecutive 262 patients with AP who were made up of 53 (20.2%) patients with T2DM complicated by AP and 209 (79.8%) with nondiabetic AP. Between the two groups, both clinic features and MRI characteristics including patterns of AP, the extent of pancreatic necrosis, MR severity index (MRSI) scores, and the occurrence of hemorrhage, the abdominal wall edema, local complications and infected complications were examined.
Results Among the 262 patients with AP, including 133 males and 129 females, their mean age was 51.8 years (range, 23 - 75 years). There were 53 (20.2%) patients with T2DM with AP and 209 patients (79.8%) without diabetes. The prevalence of mild, moderately severe, and severe pancreatitis was 35.9% (94/262), 54.6% (143/262), and 9.5% (25/262). Of 262 patients with AP, the prevalence of necrotizing pancreatitis ($P < 0.001$) and extent of pancreatic necrosis ($P = 0.006$) were higher in patients who presented T2DM complicated by AP, compared with nondiabetic AP. Median MRSI score was 5.1 in 53 patients with T2DM complicated by AP and 3.4 in 209 patients with nondiabetic AP ($P < 0.001$). The incidence of the presence of hemorrhage ($P = 0.009$), edema in subcutaneous spaces of flank abdominal wall ($P = 0.006$), local complications like walled-off necrosis ($P < 0.001$), and infected collections ($P <$

0.001) were more common in patients with T2DM with AP than in those without diabetes. The incidence of infected collections was higher in patients with T2DM complicated with AP (30.2% [16/53]) than in those without diabetes (10.5% [22/209]) (χ^2 = 13.181, P < 0.001). Compared to nondiabetic AP, patients with AP of T2DM sustained more likely to develop organ failure (P = 0.001), and had a longer hospital stay (P < 0.001).
Conclusion T2DM-related AP may present more frequency of moderate and severe pancreatitis. On MRI, AP onset of T2DM is at higher incidence of hemorrhage, abdominal wall edema, the development of fluid collections and infected collections, compared with nondiabetic AP.

EPO-0914
原发性肝肉瘤样癌误诊为肝脓肿 3 例影像特征及误诊原因分析

贺文广[1],赵艺蕾[1],王露萍[2]
1.浙江大学附属第一医院
2.浙江省绍兴市柯桥区妇幼保健院

目的 :探讨肝肉瘤样癌((Sarcomatoid hepatocellular carcinoma, SHC)的临床及影像学特点并分析误诊原因。
方法:对浙江大学医学院附属第一医院医院收治的 3 例误诊为肝脓肿的原发性 SHC 的临床和影像学资料进行回顾性分析,并复习相关文献。
结果 : 3 例患者因畏寒、低热，上腹部持续性疼痛不适症状入院，病史从 1 月至 3 月不等。病初曾在当地医院超声、CT 或 MR 检查诊断为肝脓肿，给予抗炎对症治疗果不佳，来我院后复查超声及 CT，病灶较前增大。CT 表现为较大不规则低密度肿块，病灶内密度不均匀，低密度肿块内可见更低密度且不强化影; *MRI* 检查示 T2WI 呈高信号，DWI 呈高信号灶，增强后边缘环状强化，见“囊壁样”结构。实验室检查均有白细胞及中性粒细胞增高，白细胞总数最高达到 24.2 10E9/L，中性粒细胞最高达到 78.9%，甲胎蛋白(AFP)未发现异常增高。3 例均行超声引导下穿刺活组织病理检查结果为恶性肿瘤伴坏死（倾向于低分化腺癌或肉瘤样癌）。经手术切除，术后病理及免疫组织化学检查诊为 SHC。
结论: SHC 是一种少见的上皮恶性肿瘤，临床表现、影像学检查及实验室检查均缺乏特异性。临床症状及影像学酷似肝脓肿，易误诊。当影像学发现肝脏体积较大肿瘤、密度不均匀，且予抗生素治疗无效时，应考虑 SHC 的可能性，及时行病理及免疫组织化学检查,以减少或避免 SHC 误诊。

EPO-0915
动态增强 MR 定量参数在吉西他滨联合紫杉醇对胰腺癌疗效预测方面的探究

刘伟
复旦大学附属肿瘤医院

目的 为了探究动态增强 MR 的定量参数在吉西他滨联合紫杉醇对胰腺癌疗效预测方面的价值
方法 回顾性分析 40 例经超声内镜引导下穿刺病理证实的胰腺癌患者，这些患者均在治疗前一周内行动态增强 MR 检查。根据三个疗程化疗的结果，将患者分为有效组和无效组。在治疗前的增强 MR 图像上描绘出不同的感兴趣区，包括病灶最大层面、中心区、周围区及邻近的非肿瘤区域，然后测量并分析定量参数 K^{trans}、v_e、k_{ep}、iAUC60。

结果 在病灶周围区、最大层面区及邻近非肿瘤区，有效组的 K^{trans} 大于无效组（*P*=0.015, 0.043, 0.025）。在病灶周围区，有效组的 k_{ep} 大于无效组（*P* =0.013）。而在不同感兴趣区内，有效组和无效组之间的 v_e 和 iAUC60 均无统计学差异。虽然，在区分有效组和无效组方面，病灶周围区的 k_{ep} 表现出最大的 AUC 值（0.806），但与周围区、整个层面区及邻近非肿瘤区的 K^{trans}(AUC=0.744, 0.735，0.681)相比并无统计学差异。病灶周围区的参数（K^{trans}, k_{ep}, v_e, iAUC60: 1.605±0.795, 1.662±0.651, 0.761±0.171, 1.162±0.374)均大于中心区(K^{trans}, k_{ep}, v_e, iAUC60: 1.186±0.745, 1.399±0.691, 0.702±0.213, 0.953±0.328)，与邻近非肿瘤区的参数相比(K^{trans}, k_{ep}, v_e: 2.047±0.933, 1.738±0.951, 0.578±0.235, 0.986±0.341)，周围区、中心区及整个最大层面区的 K^{trans} 是低的，v_e 是高的，而 k_{ep} 并无差异。邻近非肿瘤区的 iAUC60（0.986±0.341）小于周围区，而与中心区及整个最大层面区并无明显差异。

结论 动态增强 MR 的定量参数可作为预测吉西他滨对胰腺癌疗效的潜在指标，且其数值受感兴趣区位置的影响。

EPO-0916

35 例混合型肝细胞胆管细胞癌的磁共振表现

朱正,赵心明,周纯武
中国医学科学院肿瘤医院

目的：回顾性分析混合型肝细胞癌和胆管癌（cHCC-CC）的 MRI 表现。
方法：经病理证实的 35 例混合型 cHCC-CC，32 例行增强 MR，3 例行平扫 MR。根据 HCC 和 CC 特征分析 MR 表现。
结果：所有混合型 cHCC-CC 均为孤立性实体瘤，33/35 例边界清晰，23/35 有规则形状，10/35 为 T1 加权图像低信号，所有病例均在 T2 加权像上显示高信号。在增强 MR 扫描中，18/32 例为流出型，23/32 显示早期动脉期外周增强，20/32 显示延迟期边缘增强，5/32 例中心性延迟期增强。同时，24/35 显示肝硬化，11/35 显示邻近肝囊收缩，3/35 显示肿瘤周围肝内胆管扩张，9/35 显示淋巴结转移。使用 HCC 和 CC 的 MR 特征，平扫 MR，增强 MR 以及平扫联合增强 MR 扫描的诊断灵敏度分别为 37.5%，78.1%和 90.6%。
结论：HCC 和 CC 的两个特征都应作为 cHCC-CC 的诊断特征。

EPO-0917

肝脏局灶性结节增生(FNH)螺旋ＣＴ表现

罗道首,李向东
中国人民解放军南部战区总医院

目的 分析肝脏局灶性结节增生（ＦＮＨ） 的螺旋 ＣＴ 各期表现，加以归纳进一步提高 ＦＮＨ 的诊断符合率。**方法** 25 例患者，对经手术及病理证实的ＦＮＨ的临床、病理和各期ＣＴ资料进行回顾性分析。16 例患者行双源螺旋螺旋 CT 扫描，9 例患者行双层螺旋 CT 扫描，上述病例均行 CT 增强扫描。**结果** CT 共发现 31 个病灶，4 例患者为多发。31 例病例病灶平扫均呈等密度或低密度，密度均匀或不均匀，7 个 FNH 病灶发现钙化灶。增强动脉期，除了中央疤痕和纤维分隔外，所有病灶都明显均匀强化；门脉期和延迟期大部分病灶呈等密度或稍高密度，4 个病灶呈稍低密度。13 个 FNH 病灶中发现中央疤痕，在延迟期均有强化，16 个病灶于动脉期中央及外周发现异

常增粗、迂曲动脉，12 个病灶于延迟期可见强化的假包膜。**结论** 平扫和动态增强螺旋ＣＴ能较全面显示 ＦＮＨ 的病理特征及血供特点，多排ＣＴ对显示ＦＮＨ供血动脉及引流静脉有较强优势，可提高与其他富血管恶性肿瘤的鉴别能力。

EPO-0918
基于 T2WI 直方图纹理分析在胰腺实性病变中的诊断价值

彭林,查云飞
武汉大学人民医院

目的 探讨 3.0T 磁共振 T2WI 灰度直方图纹理特征在胰腺实性病变中的诊断价值。**方法** 回顾性分析 39 例胰腺实性占位患者的临床及 MRI 影像学资料，经手术病理证实导管腺癌 23 例、实性假乳头状瘤 2 例、神经内分泌肿瘤 7 例及肿块型胰腺炎 7 例，将其分成恶性肿瘤组别（导管腺癌）、良性到低度恶性肿瘤组别（实性假乳头状瘤+神经内分泌肿瘤）、非肿瘤组别（肿块型胰腺炎）。采用 GE Omni-Kinetics 软件在 T2WI 序列病变最大及前后共 3 个层面勾画 ROI 并自动生成灰度直方图纹理参数，三组间比较采用单因素方差分析（ANOVA），组间两两比较采用 LSD-t 检验（方差齐）或多个独立样本 Kruskal-Walls 检验（方差不齐）；筛选有统计学差异的参数绘制 ROC 曲线，评价其鉴别诊断胰腺实性病变的效能。**结果** 均值、变异度、能量、熵、第 5 百分位数、第 10 百分位数、第 25 百分位数、第 50 百分位数、第 75 百分位数、第 90 百分位数及第 95 百分位数在三组中差异有统计学意义（P均<0.05）；偏度、峰度在三组间无统计学差异（P均>0.05）；PDAC 与 MFCP 之间变异度的敏感度为 82.6%，特异度为 85.7%，曲线下面积为 0.899，最佳临界值 5915.87；PDAC 与 SPT+pNET 间均值的敏感度为 64.4%，特异度为 87.0%，曲线下面积为 0.688，最佳临界值 1113.55；MFCP 与 SPT+pNET 之间第 90 百分位数的敏感度为 88.9%，特异度为 85.7%，曲线下面积为 0.924，最佳临界值 837.59，具有较高的鉴别效能。**结论** T2WI 直方图纹理参数在胰腺来源实性病变之间存在显著性差异，其中均值、百分位数对胰腺实性病变定性及良恶性鉴别具有重要的临床价值。

EPO-0919
CT and MR imaging features of fistulas from intraductal papillary neoplasm of the bile duct penetrating into adjacent organs

Zhuo Wu
Sun Yat-Sen Memorial Hospital, Sun Yat-Sen University

Purpose: Intraductal papillary neoplasm of the bile duct (IPNB) with fistulization to adjacent organs is rare. The purpose of this study was to describe the computed tomography (CT) and magnetic resonance imaging (MRI) findings for this specific complication.

Methods: Consecutive patients with histologically confirmed IPNBs between January 2015 and May 2019 were retrospectively reviewed. The clinical and imaging files of all patients were evaluated for the fistula formation into other organs. Two radiologists determined the number and size of visible fistulas, the involved adjacent organs and

the presence of imaging findings suggestive of malignant transformation of the IPNB. The presence of fistulas on imaging was confirmed in resection specimens and during endoscopic examinations. Pathologic examination was performed, and both gross and microscopic findings were analyzed.

Results: A total of 28 patients were included. A total of 5 fistulas were identified. These fistulas involved the duodenum (25%), stomach (60.0%) and abdominal wall (25%). Magnetic resonance imaging commonly showed obvious enhanced papillary nodules on the wall of cystic solid tumor and markedly dilated bile duct. By multiplanar reformation, all fistulas were definitely present on the reformatted CT images. All fistulas appeared to develop from a malignant IPNB based on the imaging studies.

Conclusions: Mucin-filling of tumor and inflammatory stimulation lead to the fistula penetrating into other neighboring organs. Preoperative CT and MR imaging is useful for detecting, locating and determining the fistulization of IPNBs.

腹腔及腹腔脏器原始神经外胚层肿瘤的 CT 特征

邓娟,周俊林
兰州大学第二医院

目的　探讨腹腔及腹腔脏器原始神经外胚层肿瘤 （PNET）的 CT 特征。 方法　回顾性分析经手术病理证实的 CT 资料齐全的 11 例腹腔及腹腔脏器 PNET，分析其病理特点，结合文献资料，探讨 PNET 的 CT 特征，以提高对该疾病的认识。 结果 PNET 多见于青中年，中位发病年龄为 21 岁，男性 5 例，女性 6 例， 11 例中有 9 例为单发，2 例为多发，其中肾脏 4 例，腹腔 2 例，腹盆腔 5 例，均可见软组织肿块，直径 2.2～ 18.0cm，平均 9.5cm，肿块呈不规则形或类球形，9 例边缘清晰，与周围结构分界清，10 例肿块内密度不均，见囊性坏死区，其中有 2 例伴有钙化，增强扫描肿瘤实性成分中度或明显不均匀强化，坏死区无明显强化。 结论　PNET 可发生于腹盆腔及腹腔脏器，CT 可准确显示肿瘤的位置、大小、形态、边缘及与周边组织的关系，CT 表现具有一定特征性，但并无特异性，诊断依靠病理组织检查。

EPO-0921
应用 3D mDIXON 定量成像探讨人体胰腺脂肪含量与 BMI、性别、年龄的关系

张钦和[1],刘爱连[1],王家正[2]
1.大连医科大学附属第一医院
2.飞利浦医疗公司

目的：应用 3D mDIXON 定量成像技术分析健康志愿者胰腺脂肪含量与 BMI、性别、年龄的关系。
材料与方法：前瞻性纳入 19 名志愿者，男 11 例，女 8 例，BMI 范围 17.71-34.29 kg/m^2，平均 23.45±3.97kg/m^2；年龄范围 22-62 岁，平均 34.89±14.99 岁。所有患者行 3.0T 磁共振扫描仪（Ingenia CX, Best，the Netherlands）3D mDIXON Quant 序列扫描。扫描参数如下:FOV=375mm×300mm×168mm, TR=6ms，层厚及层间距=5.0mm/2.5mm,CS=2，Echo=6。图像导入在

ISP 工作站，在脂肪分数图像上有两名放射科医师进行胰腺脂肪分数测量。所有数据经 SPSS v19.0 (IBM, Chicago, III)进行统计分析。采用组内相关系数(ICC)分析两个观察者测量数据一致性。采用 Spearman 检验评价胰腺脂肪分数与年龄的相关性。
FF 结果：两个观察者的测量结果 ICC 值均大于 0.75，一致性良好，测量的胰腺脂肪分数值取平均值进行后续分析。平均胰腺胰腺脂肪分数值与年龄、性别、BMI 呈显著相关(r=0.593, 0.633, 0.642,P<0.05)。男性和女性的 FF 分数(%)分别为 6.48±4.80、2.94±0.94。
结论：胰腺脂肪分数随年龄和 BMI 的增加而增加，男性的胰腺脂肪分数大于女性。

EPO-0922
肝脏局灶性结节增生的 MSCT 、MRI 和 DSA 影像表现及其病理基础

胡维娟
天津市第三中心医院

[摘要] 目的 探讨肝脏局灶性结节增生（FNH）的 CT 、MRI 及 DSA 影像表现特征及其病理基础，以提高其诊断准确率。方法 回顾性分析经病理证实的 18 例 20 个 FNH 的影像表现，12 例行 CT 平扫及动态增强扫描，8 例同时行 MRI 平扫及动脉增强扫描，6 例行 DSA 肝动脉造影，其中 5 例同时做三种检查。结果 18 例 20 个 FNH 病灶 CT 平扫均呈等或稍低密度结节或团块，其中 2 例在脂肪肝背景下呈高密度结节表现；增强扫描动脉期示病灶均呈均匀显著强化，7 例可见扭曲扩张的供血动脉；13 例病灶中央瘢痕区无明显强化；门静脉期及延时期示病灶稍高于、等于周围肝实质，中心瘢痕区于门脉期开始强化延续至延时期；动态增强时间-密度强度曲线 20 个病灶均为动脉期迅速升高，门脉期至延迟期期缓慢下降，呈速升-缓降型。M RI 检查示病变呈等或稍低 T 1 信号及稍高 T 2 信号，增强扫描动脉期示病灶均匀显著强化，门脉期和延时期呈稍高信号或等信号，7 例显示病灶中央疤痕呈稍高或稍低 T1、T2WI，增强后呈延迟强化。6 例行血管造影均显示 FNH 的供血动脉来自肝动脉系统，供血动脉主干进入病灶中心后呈离心性放射状向四周分布，分支供血动脉明显增粗、 扭曲，6 例均见粗大引流静脉。结论：大多数 FNH 在 MRI 、MSCT 、DSA 上有特征性的影像表现，MRI 能清晰显示其中央瘢痕病理特征，MSCT 对病灶周边或中央增粗、扭曲血管病理特征的显示上较清晰，DSA 能清晰显示中央瘢痕畸形血管及畸形的中央动脉离心性的向外供血的病理特征；三者结合能提高对 FNH 的诊断率。

EPO-0923
肝脏局灶性结节增生的 CT 表现与病理对照分析

张莉,李向东
中国人民解放军南部战区总医院

目的:研究 CT 在此类疾病的临床诊断中的应用价值。
方法:对 17 例经病理检查确诊为 FNH 的患者进行回顾性总结，通过 CT 检查方式进行病灶扫查，观察记录患者病灶数量、大小以及影像学特征。
结果：14 例 FNH 单发，其余 3 例患者肝内 FNH 均为 2 个，5 个位于肝左叶，14 个位于肝右叶，有 1 个累及患者的肝右前叶与左内叶。结节直径（2.98±1.02）cm，CT 征象明显。
结论：CT 技术可以明确反映 FNH 病灶内血供特点，具有较为明显的影像特征，可以提高临床 FNH 的确诊率，提高临床诊断水平，对于 FNH 症状不典型者应行手术病理检查。

EPO-0924
256 层 CT 肝灌注成像评估肝移植术后肝血流动力学

李小荣,李向东
中国人民解放军南部战区总医院

目的： 探讨 256 层 CT 全肝灌注成像对肝移植术后肝脏血流动力学的评估能力。
方法：对 10 例行肝移植术后（术后 2 周-1 月）患者肝脏及 12 例正常肝脏作为对比组，进行全肝灌注检查，后处理软件分别测量肝脏各段血流灌注参数：肝动脉灌注量(HAP)、门静脉灌注量(HPP)、肝总灌注量(TLP)、肝动脉灌注指数(HAPI)以及门静脉灌注指数(HPPI)，对正常组及肝硬化组行肝段性灌注测量，对肝脏各段血流灌注参数行统计学分析。**结果：**正常肝脏及移植肝 HAP 分别为(12.38±9.53)ml·min $^{-1}$ ·ml、(11.71±12.03)ml·min $^{-1}$ ·ml，两者无显著差异，HPP 分别为(34.23±12.46)ml·min $^{-1}$ ·ml、(40.21±15.25)ml·min $^{-1}$ ·ml，两者间存在显著性差异（P<0.05），TLP 分别为(35.79±13.20)ml·min $^{-1}$ ·ml、(49.92±13.54)ml·min $^{-1}$ ·ml，两者间存在显著性差异（P<0.05），HPPI 分别为 78.36±11.29%、82.51±14.32%，两者无显著差异；其中 3 例患者 5 个肝段在肝动脉灌注彩图中可见灌注相对减低，均经超声及 CTA 发现肝动脉吻合口狭窄，4 例患者 8 个肝段在肝动脉灌注彩图中可见灌注相对减低，3 例经 CTA 发现肝门脉吻合口狭窄。**结论：**256 层 CT 全肝灌注成像可直观定量反映肝脏血流灌注情况，肝移植术后肝各段 HPP 及 TLP 值高于正常肝，通过各参数灌注图可发现灌注减低区，可提示发生移植术后并发症如动脉及门脉吻合口狭窄可能。

EPO-0925
多层螺旋 CT 肝脏增强扫描技术的探讨与应用

姜超,李向东
中国人民解放军南部战区总医院

目的：多层螺旋 CT 肝脏增强扫描技术的探讨与应用。多层螺旋 CT 增强病变检出率普遍高于普通螺旋 CT 扫描，增强扫描利用造影剂的强化效果，可实现多时相的动态扫描，在短时间内获得动脉期、门脉期和延时期的数据，有利于肝癌、血管瘤、结节增生等病变的鉴别。**方法：**扫描前 4h 禁食禁水，做碘过敏实验，并告知患者扫描期间注意事项，扫描前半小时喝水 400~600mL，采用螺旋方式、准直器 2.5mm 屏气扫描，收集 2018 年 3 月-2019 年 4 月患者 656 例，随机分为研究组和对照组，各 328 例。研究组采用多层螺旋 CT 进行肝脏增强扫描，根据患者体重以及血管流速承受能力注入造影剂,对比剂用量为 1.5ml/kg，注射流率为 2.5ml/s~3.0ml/s 造影剂总量 70~100ML 经手臂静脉用高压注射器注射，注药前扫描一次（注药前为对照组），注药后 28s 扫描一次获取动脉期图像，注药后 65s 扫描一次获取静脉期图像，注药后 180s 扫描一次获取延时期图像。**结果：**研究组诊断结果为肝癌 86 例（26.2%），肝血管瘤 62 例（18.9%），脂肪肝 112 例（34.1%），肝囊肿 32 例（9.8%），肝脓肿 36 例(11.0%).对照组诊断结果为肝癌 80（24.4%），肝血管瘤 58（17,7%），脂肪肝 60（18.3%），肝囊肿 28（8.5%），肝脓肿 32（9.8%），有 70 例（21.3%）得到明确诊断。两组患者检出率进行比较，差异有统计学意义（P<0.05）。肝脏增强三期病情诊断最大强化峰值各不同。**结论：**多层螺旋 CT 肝脏增强扫描技术在肝脏疾病诊断中检出疾病率较高，并能完成动脉期和门脉期在全肝扫描，可为肝脏疾病患者提供明确诊断，值得临床推荐。

EPO-0926

自身免疫性胰腺炎的 CT 及 MRI 诊断

李小荣,李向东
中国人民解放军南部战区总医院

目的 探讨自身免疫性胰腺炎的 CT 及 MRI 表现。**方法** 收集 12 例经病理及临床证实的自身免疫性胰腺炎病例，回顾分析其 CT、MRI 所见及临床资料。**结果** 12 例自身免疫性胰腺炎患者中，胰腺弥漫性肿大者 9 例，局限性病灶者 3 例，所用病灶平扫呈均匀等密度或稍低密度，MRI 平扫 T1WI 呈稍低信号，T2WI 呈高信号；CT 及 MRI 增强扫描均表现为门脉期及延迟期强化；胆总管胰腺段及主胰管向心性狭窄 6 例，管壁增厚 4 例，肝内胆管扩张 3 例； 6 例可见胰周“包鞘样”改变，其中 4 例延迟期出现轻度强化；DWI (b=1000) 6 例病灶表现为高信号 4 例，等信号 2 例， ADC 值为（0.756±0.542）×$10^{-3}mm^2/s$。**结论** 自身免疫性胰腺炎的正确诊断需结合影像学表现、血清学 IgG4 水平及病理所见。增强三期扫描自身免疫性胰腺炎表现出的延迟强化征象有助于其与胰腺癌的鉴别诊断。

EPO-0927

肝脏血管内皮细胞瘤影像学诊断

王驰
首都医科大学附属北京儿童医院

目的：婴儿型血管内皮瘤作为婴儿肝脏血管肿瘤中最常见的类型，且表现多样，需要结合多种检查方式进行诊断。首先应关注患儿的临床表现。常见的临床表现有：①肝肿大±呼吸衰竭巨大肿块可压迫膈肌；②动静脉畸形±充血性心力衰竭肝内血管分流量大时，可出现充血性心力衰竭；③皮肤血管瘤本病可为肝内单发多发病灶，20％伴有皮肤血管瘤；④消耗性凝血功能异常（Kasabach-Merrit 现象）及弥散性血管内凝血。
方法：影像学检查方法应结合该病的病理分型。I 型较为常见，表现有一定特征，与病理一致性较高。肿瘤组织由大小不等的血管构成。II 型少见，主要表现为血管内皮细胞明显增生，不形成管腔或管腔结构不清楚，部分可形成乳头样结构，无散在胆小管成分。1、超声检查：是诊断本病的首选方法，其特点表现为高低回声相混不均匀实性包块，界清，可表现为囊状无回声。2、CT 检查：IHHE 的 CT 表现可以分为肿块型，结节型和弥漫型。CT 增强检查可出现边缘强化，周围可见血管影是其典型特征。3、MRI 检查：T2WI 表现为不均匀高信号 T1WI 表现为低信号，动态钆增强磁共振成像早期中心增强，180 s 后肿瘤完全增强。
结果：肝脏血管内皮细胞瘤表现与其他肝脏肿瘤有重叠处，因此在临床过程中仍需与多种肿瘤进行鉴别诊断。①肝母细胞瘤 ：婴儿型肝脏血管内皮瘤的平扫和肝母细胞瘤相似。不过在动脉期的强化程度 ， 肝母细胞瘤明显低于婴儿型肝脏血管内皮瘤。②肝脏转移瘤 ：肝脏转移瘤在动脉期强化程度轻微 ， 而婴儿型肝脏血管内皮瘤在动脉期出现明显强化 ， 且延迟扫描时病灶密度明显高于肝实质。③肝脏海绵状血管瘤 ：较少见于 〈1 岁的婴幼儿 ， 多见于年长儿和成年人。
结论：IHE 的 CT 及 MRI 表现具有一定的特征性，结合临床表现和影像学特征，可以提高 IHE 的诊断准确率。

EPO-0928

Whole-liver apparent diffusion coefficient histogram analysis for the diagnosis and staging of liver fibrosis

You Zheng,Jun-qiang Lei
Department of Radiology, First Hospital of LanZhou University

Abstract
Purpose: To explore the value of apparent diffusion coefficient (ADC) histogram parameters based on the whole liver in the diagnosis and staging of liver fibrosis.
Materials and Methods: In total, 86 patients with liver fibrosis, including 30 with chronic viral hepatitis, 29 with autoimmune hepatitis and 27 with unexplained liver fibrosis patients, who underwent diffusion-weighted magnetic resonance imaging (DWI) were included in this retrospective study. A region of interest (ROI) covering the entire liver were drawn in each slice of axial diffusion-weighted images with dedicated software. The 3D ROI ADC value histogram and its parameters were obtained by accumulating all ROIs in each slice. The differences of ADC histogram parameters between different pathological fibrosis stages were calculated and compared using the Mann–Whitney U test, and then ROC curves were constructed to evaluate the effectiveness of the histogram parameters with significant differences in predicting stage 1 or greater (≥F1), stage 2 or greater (≥F2), and stage 3 or greater (≥F3) liver fibrosis.
Results: Kurtosis, entropy, skewness, mode, and 90^{th} and 75^{th} percentiles exhibited significant differences among the pathological fibrosis stages ($P<0.05$). Kurtosis was the most meaningful parameter in distinguishing different fibrosis stages. In the viral liver fibrosis group, the minimum cut-off value of 1.538 had the highest AUC (0.793; 95% CI: 0.656, 0.931; sensitivity: 0.750; specificity: 0.783) in predicting fibrosis stage ≥F2. In the autoimmune hepatitis group, the minimum cut-off value of 2.025 had the highest AUC (0.771; 95% CI: 0.623, 0.919; sensitivity: 0.750; specificity: 0.850) in predicting fibrosis stage ≥F1. In the unexplained liver fibrosis group, the minimum cut-off value of 1.471 had the highest AUC (0.798; 95% CI: 0.662, 0.934; sensitivity: 0.739; specificity: 0.800) in predicting fibrosis stage ≥F1.
Conclusion: Whole-liver apparent diffusion coefficient histogram analysis contributes to the diagnosis and staging of liver fibrosis.

EPO-0929
磁共振成像能够预测小肝癌的组织学分级和 Ki-67 表达

陈建炜,李跃明
福建医科大学附属第一医院

背景：小肝细胞癌被认为是早期肿瘤，但也有一小部分具有侵袭性，预后较差。
目的：通过探究术前磁共振成像参数与 Ki-67 表达及组织学分级之间的关系来确定侵袭性小肝癌的预测指标。

材料与方法：回顾性分析经病理证实的 60 例小肝癌（肿瘤直径≤3cm，数量≤2）患者的增强磁共振表现。对整个病灶及竖脊肌的信号进行定量测量，计算出病灶与肌肉信号比值。然后用统计学分析所获得的定量和定性资料与组织学分级和 Ki-67 水平之间的关系。
结果：平扫、动脉期、门脉期 T1WI 及 ADC 图上所测量的病灶与肌肉信号比值与组织学分级有显著相关性（P 值分别为 0.001、0.001，0.036、0.027），动脉不均匀强化也与 Ki-67 高表达相关（P=0.032）。
结论：术前磁共振成像可以预测侵袭性小肝癌，对临床的治疗和预后有重要价值。

肝细胞肝癌的 IVIM-DWI 多定量参数与病理的相关性研究

郭瑞,马静,李金芳,宋法亮,龚欢,邓得峰
新疆生产建设兵团总医院

目的 探讨 IVIM-DWI 多定量参数对肝细胞肝癌微循环状态的评估价值。 **方法** 随机入选拟于新疆生产建设兵团医院行上腹部 3.0T 核磁共振检查的患者 67 例，均完成肝脏 IVIM-DWI 序列扫描。最终纳入经病理证实的肝细胞肝癌（Hepatocellular Carcinoma，HCC）病例 30 例，所有纳入研究的病例图像经 ADW4.6 Functool 自动后处理软件分析，获取多衍生参数（ADC、D^*、D、PF 值）。将 IVIM-DWI 序列多衍生参数 ADC、D^*、D、PF 值与肝细胞肝癌的病理分级及 CD34-微血管密度（CD34-Microvascular Density，CD34-MVD）、α-平滑肌激动蛋白（α-Smooth Muscle Actin，α-SMA）数量进行统计学分析。 **结果** ADC、D 值与 CD34-MVD、α-SMA 呈负相关，相关系数分别为 r=-0.373、r=-0.295，r=-0.541、r=-0.565，而 D^*、PF 值与 CD34-MVD、α-SMA 呈正相关，相关系数分别为 r=0.526、r=0.456，r=0.474、r=0.468；ADC、D 值与 HCC 病理分级呈负相关，相关系数分别为 r=-0.482， r=-0.463，D^*、PF 值与 HCC 病理分级呈正相关，相关系数分别为 r=0.447，r=0.462，并 ADC、D 及 PF 值在不同病理分级组间具有显著差异性（P<0.05），D^*值在不同病理分级组间无统计学意义（P>0.05）；CD34-MVD、α-SMA 与不同病理分级呈正相关，相关系数分别为 r=0.927，r=0.840，并不同病理分级组间具有显著差异性（P<0.05）。 **结论** IVIM-DWI 获取的多定量参数 ADC、D、D^*及 PF 值可反应肝细胞肝癌的病理分级及微循环功能状态，可以为肝细胞肝癌的诊治评估提供活体检测的客观指标。

EPO-0931
肝脏上皮样血管平滑肌脂肪瘤影像诊断与鉴别诊断

雷萍,悦笑斐,李欣,刘丽莹,陈岑,张宇,钱李娟,韩萍
华中科技大学同济医学院附属协和医院

目的 探讨肝脏上皮样血管平滑肌脂肪瘤（HEAML）的临床、CT 及 MR 影像征象，以提高 HEAML 诊断准确性。**方法** 回顾性分析 9 例经病理证实的 HEAML 临床及影像学征象。CT 检查 5 例，MR 检查 4 例。同时，收集 30 例经病理证实的肝细胞癌（HCC）,分析两组患者临床及影像学表现，并行 c^2检验，将差异有统计学意义（P＜0.05）的特征纳入 logistic 回归分析，采用受试者工作特征曲线（ROC 曲线）分析这些特征对鉴别 HEAML 与 HCC 的效能。**结果** 9 例 HEAML 中 8 例为女性、1 例为男性，AFP 均为阴性，病灶均为单发，平扫呈稍低密度或稍长 T1 稍长 T2 信号（8/9），增强扫描呈“快进快出”（6/9）表现，可见中心血管征（6/9）及静脉早显（5/9）；统计结果显示：性别、AFP 水平、中心血管征及静脉早显有统计学差异（P＜0.05）；联合上述四项指标行回归分析，并采用 ROC 曲线评估其鉴别 HEAML 与 HCC 的效能，其 AUC 为 0.969，敏感度和特异度分别是 77.8%、100%，具有较高诊断价值。**结论** 患者性别、AFP 水平、中心血管征及静脉早显等临床、影像征象

有助于 HEAML 与 HCC 的鉴别诊断。当患者为女性、AFP 阴性、具有中心血管征和静脉早显时，提示 HEAML 可能性较大。

EPO-0932
回顾性分析胰腺连续动态增强 CT 术前诊断胰岛素瘤的价值

魏黎明
上海交通大学附属第六人民医院

目的 探讨胰腺连续动态增强 CT(PDCE-CT)术前诊断胰岛素瘤的价值，以提高胰岛素瘤检测敏感性，并分析常规增强 CT 检测胰岛素瘤的最佳图像采集时间窗。
方法 回顾性分析 23 例经手术、病理证实的胰岛素瘤，共计 17 例患者行胰腺连续动态增强 CT，另共计 9 例患者行胰腺常规增强 CT（其中 4 例患者常规 CT 增强阴性者进一步行胰腺连续动态增强），比较胰腺动态增强 CT 与常规增强 CT 对胰岛素瘤术前诊断的敏感性，探究胰岛素瘤增强峰值（PH）、胰岛素瘤及周围正常胰腺组织密度差值（T-P 差值）峰值以及 T-P 差值大于 35HU 的时间段，并总结胰岛素瘤 CT 图像特征。
结果 1. PDCE-CT 与常规增强 CT 敏感性分别为 94.1% (16/17)、55.6% (5/9)，两者具有统计学差异（P=0.035,P＜0.05）。 2.PDCE-CT 的 PH 值为 174.6±45.4HU(时间点为 23.4±13.1s)， T-P 差值 PH 值为 65.8±34.4HU(时间点为 32.4±12.3s),T-P 差值＞35HU 时间段为 25.3±14.4--51.3±18.9s。
结论 PDCE-CT 较常规增强 CT 对于术前诊断胰岛素瘤具有更好的敏感性；行常规增强 CT 时，在注入对比剂后 25.3±14.4--51.3±18.9s 时间窗内采集图像对于术前诊断胰岛素瘤价值更大，但个体差异较大。

EPO-0933
胰腺切除体积与血糖水平相互关系的 CT 定 量评估

张宇,李欣,韩萍
华中科技大学同济医学院附属协和医院

目的：探讨 CT 测量胰腺切除的体积与短期血糖水平变化的关系。**方法：**回顾性分析
2010 年 1 月至 2012 年 12 月华中科技大学同济医学院附属协和医院，85 例行手术切除部分胰腺的良性
及恶性肿瘤患者。患者术前及术后 1 周行胰腺 CT 平扫及增强检查。采集术前 5 d 至术后 20 d 内每日
空腹血糖及餐后 2 h 血糖资料。在 CT 图像上测量两组患者术前胰腺体积、术后 1 周剩余胰腺体积进
行测量，为排除个体差异，术前、术后胰腺体积均需转化为单位体表面积的胰腺体积，计算得出 85 例
患者的胰腺切除体积比。将 85 例患者分为良性组和恶性组，良性组和恶性组再根据胰腺切除体积比
分别划分 5 个亚组，分别为切除体积<40%组、切除体积 40%~49%组、切除体积 50%~59%组、切除体

积 60%~69%组、切除体积≥70%组。采用配对 t 检验比较术前与术后血糖水平差异，采用独立样本 t 检
验比较良性组与恶性组间血糖水平的差异。采用单因素方差分析比较良性组和恶性组肿瘤血糖水平亚组间的差异，采用相关回归分析对胰腺术后切除体积比与血糖水平进行相关性分析。**结果：**良性组和恶性组患者间比较，术前及术后的空腹血糖、餐后 2 h 血糖差异均有统计学意义（P<0.05）；术前和
术后组比较，良性组的空腹血糖、餐后 2 h 血糖及恶性组的空腹血糖差异均有统计学意义（P<0.05）。
不同切除胰腺体积组间比较，良性组、恶性组患者的术后空腹血糖及餐后 2 h 血糖差异均有统计学意
义（P<0.05）。85 例肿瘤、39 例良性肿瘤、46 例恶性肿瘤的不同切除体积比与空腹血糖水平均呈正相
关（r 值分别为 0.80、0.85、0.77，P 均<0.01）。**结论：**手术前、后良性肿瘤与恶性肿瘤间血糖水平存在差
异，术后血糖水平与胰腺切除体积相关，且术后血糖水平与切除体积比呈线性正相关。

EPO-0934
双低对比剂联合能谱 CT 成像技术 在门静脉成像中的应用研究

罗昆
华中科技大学同济医学院附属协和医院

目的：探讨双低对比剂联合能谱 CT 成像技术在门静脉成像中的应用价值，并评价其辐射剂量。
方法：收集 2015 年 12 月～2016 年 2 月期间于我院行肝脏门静脉 CT 扫描的患者 72 例，均采用宝石能谱 CT 进行扫描。随机分为两组，A 组为双低对比剂联合单能量成像组，共 36 例；B 组为常规组，共 36 例。A 组使用低浓度对比剂碘克沙醇，浓度为 270mgI/ml，低对比剂总量（按 1.2ml/kg 计算）；采用能谱扫描模式，80kVp 和 140kVp 电压快速切换。B 组使用常规对比剂碘海醇，浓度为 350 mgI/ml，常规对比剂总量（按 1.5ml/kg 计算）；采用螺旋扫描模式，120kVp 混合能量。比较两组图像中门静脉主干的 CT 值、SNR、CNR 及噪声，通过这些客观参数来评价图像质量，由两名高年资放射科专家采用双盲法对图像质量进行主观评分，并比较两组图像的 CTDI、DLP 及 ED。对所得的数据使用 SPSS19.0 统计软件进行统计学分析。
结果：①A 组平均对比剂总量（84.43±11.17ml）明显低于 B 组（93.50±9.53ml），二者之间差异有统计学意义；②A 组门静脉 CT 值及 CNR（226.65±17.99Hu、5.83±1.64）显著高于 B 组（195.01±23.98Hu、4.00±1.64），差异有统计学意义；③A 组中 CTDI、DLP 及 ED（10.32±2.22mGy、264.54±57.44mGy.cm、4.50±0.98mSv）明显低于 B 组（CTDI、DLP 及 ED 分别为 13.20±2.35 mGy、363.89±75.40mGy.cm、6.19±1.28mSv），差异有统计学意义。
结论：在门静脉 CT 血管成像中，使用低总量、低浓度对比剂联合能谱 CT 单能量成像技术，在获得满足临床需求图像的同时，不仅有效的减少了对比剂的用量及提高图像的信噪比，还降低了辐射剂量，具有在临床广泛推广的价值。

不同压缩感知加速因子对 3D mDIXON quant 序列测量胰腺体积的影响

邹宇航[1],刘爱连[1],张钦和[1],王家正[2]

1.大连医科大学附属第一医院
2.中国飞利浦医疗公司

目的：探讨不同 CS 加速因子对胰腺体积的影响，并寻找最佳加速因子。
材料与方法：前瞻性纳入 10 名志愿者，男 4 名，女 6 名，平均年龄 24.91±1.64 岁；年龄范围 22-27 岁；平均体重指数 21.75±3.35kg/m^2；体重指数范围 17.71-28.73kg/m^2。所有志愿者行 3.0T 磁共振扫描仪（Ingenia CX，Best，The Netherlands）3D mDIXON quant 序列扫描。扫描参数为：FOV=375mm×300mm×168mm，TR=6ms，层厚= 5.0mm，层间距=2.5mm，加速因子参数分别设置为：SENSE=2、4，COMPRESSED SENSE=2、4、5、6。图像导入飞利浦 ISP(IntelliSpace Portal, Philips)工作站，测量胰腺体积。在胰头、胰体、胰尾和双侧竖脊肌的最大水平上放置 ROI，测量信号值和噪声。计算胰腺和竖脊肌的平均信号值及噪声值，计算其信噪比（SNR）和对比噪声比（CNR）。所有数据经 SPSS19.0 统计分析。采用 The Friedman 检验比较各组间的标准差、SNR、CNR 和胰腺体积的差异。P<0.05 被认为具有统计学意义。
结果：两组间 SD 值、SNR 值、CNR 值均无显著性差异（P>0.05）。采用六种加速因子：SENSE=2、4；COMPRESSED SENCE=2、4、5、6 所测得的胰腺体积（cm^3）分别为 61.3±8.5、59.5±8.4、59.3±7.6、58.9±9.8、59.5±8.7、61.3±7.8，各组间体积差异无统计学意义（P>0.05）。
结论：COMPRESSED SENCE=6 序列能保证图像质量，缩短扫描时间，是评估胰腺体积的最佳序列。

EPO-0936
双能量 CT 定量参数分析对胰腺占位性病变鉴别诊断的价值

赵雯,韩丹,黄益龙
昆明医科大学第一附属医院

目的 探讨双能量 CT 增强标准化碘浓度、标准化 CT 值定量参数对胰腺癌、囊腺瘤、肿块型胰腺炎鉴别诊断的价值。 **方法** 筛选双能量 CT 增强扫描且经手术病理证实的胰腺占位性病例，共 30 例。其中胰腺癌 19 例，囊腺瘤（包括浆液性和粘液性囊腺瘤）6 例，肿块型胰腺炎 5 例。分别计算 NICnod 值（Normalized Iodine Concentration,标准化碘浓度）、标准化 CT 值，比较三种胰腺占位性病变的以上两个定量参数的差异。 **结果** （1）动脉期，胰腺癌、囊腺瘤、肿块型胰腺炎的 NICnod（标准化 CT 值）分别为：0.014±0.013（0.023±0.014）、0.161±0.021（0.106±0.023）、0.025±0.017（0.033±0.010）。胰腺癌与肿块型胰腺炎间 NICnod、标准化 CT 值差异均无统计学意义（*P*>0.05），胰腺癌与囊腺瘤、肿块型胰腺炎与囊腺瘤差异均匀统计学意义（*P 均*<0.05）。（2）静脉期胰腺癌、囊腺瘤、肿块型胰腺炎的 NICnod（标准化 CT 值）分别为：0.081±0.011（0.089±0.012）、0.633±0.165（0.559±0.132）、0.339±0.176（0.314±0.120）。三组间两两比较差异均有统计学意义（*P 均*<0.05）。三者强化程度分别为：囊腺瘤>肿块型胰腺炎>胰腺癌。 **结论** 双能量 CT 增强扫描静脉期 NICnod 及标准化 CT 值对胰腺癌、囊腺瘤、肿块型胰腺炎的诊断有一定价值，且三者强化程度由高到低为囊腺瘤>肿块型胰腺炎>胰腺癌。

128 层螺旋 CT 结合结肠仿真内镜对结肠癌的诊断价值

唐文娟
华中科技大学同济医学院附属协和医院

目的：探讨 128 层螺旋 CT 扫描结合仿真内镜后处理对结直肠癌的诊断价值。
方法：回顾性分析 45 例患者均行 CT 增强结合仿真内镜后处理检查，患者均行肠道准备及肠腔内注气后用 Definition AS+ 128 层螺旋 CT 进行扫描。行仰卧位及俯卧位各扫描一次，然后将扫描获得

的图像进行层厚 1mm 重建后传到后处理站，并应用后处理工作站 colon 软件进行图像后处理，来仔细观察病变的部位、形态、大小、侵犯范围、有无其它器官及淋巴结转移。
结果：45 例患者在 CT 仿真内镜检查中 40 例考虑为肿瘤性病变、3 例为正常、2 例为息肉，经手术病检结、直肠癌 42 例，炎症 3 例。42 例直肠癌分型为 17 例肿块型、10 例浸润型、 6 例溃疡型、9 例混合型。其中发现 4 例肝脏转移、36 例患者淋巴结转移。增强 CT 结合 CT 结肠仿真内镜检查对结直肠肿瘤的检出、定性及定位与手术病检比较准确率很高。
结论：多层螺旋 CT 结合仿真内镜对结直肠肿瘤的检出、定位、定性的准确率较高，CT 仿真内镜对观察病灶周围的侵犯情况及有无远处器官和淋巴结转移的情况有很大的优势，同时还可以了解肠腔内病变的形态及病变累及肠腔的长度。

Blade 联合膈肌导航技术在上腹部 MRI 扫描中的应用价值

解开鹏,顾青
昆明医科大学第一附属医院

[摘要] 目的：评价 blade 联合膈肌导航技术对上腹部 MRI 扫描运动伪影的校正和图像质量的影响。方法：采用 SEIMENS Avant 1.5T MRI 分别对 60 例行上腹部扫描患者同时行常规呼吸触发扫描和 blade 联合膈肌导航技术扫描，扫描前均嘱患者平静均匀呼吸，扫描参数除增加 blade 和膈肌导航外其他参数均完全相同，常规呼吸触发扫描时间为 2′ 45″，blade 联合膈肌导航技术扫描时间为 4′ 00″。扫描图像分别由两位高年资诊断医师对图像质量进行评价，通过比较分析观察 blade 联合膈肌导航技术对图像伪影的消除和对图像质量的影响。结果：blade 技术联合膈肌导航扫描的图像优良 53 例（88.3%）、图像一般 5 例（8.3%）、图像差 2 例（3.3%）；常规呼吸触发序列扫描的图像优良 41 例（68.3%）、图像一般 9 例（15.0%）、图像差 10 例（16.6%）；通过比较两种扫描方法的 P<0.05 ，差异有统计学意义。结论：blade 技术联合膈肌导航扫描能明显减少上腹部的运动伪影，改善图像质量，特别对于呼吸紊乱的患者作用较大，由于会增加扫描时间，可根据患者呼吸情况酌情采用。

EPO-0939
双能 CT 物质分离技术对大鼠肝脏铁沉积的量化评估

肖红,严福华
上海交通大学医学院附属瑞金医院

目的：探讨双能 CT 物质分离技术对铁过载大鼠肝脏铁含量定量测量的准确性。方法：将 36 只 SPF 级 6 周龄大鼠分为 9 组，每组 4 只，自由进食进水。分别向腹腔内注射 1-8 次 200mg/kg 右旋糖酐铁（Sigma，100mg/kg），间隔一周，最后一周达到目标剂量 200、400、600、800、1000、1200、1400 和 1600mg/kg，余注射等量 0.9%的生理盐水。最后一次给药后一周，大麻醉状态下用双能 CT150KV/90KV 和 150KV/70KV 的管电压扫描大鼠肝脏，扫描完成后处死，取部分肝脏实质用电感耦合等离子体光谱仪法测定肝铁浓度。用西门子后处理软件测量虚拟肝铁浓度。分析 CT 虚拟肝铁浓度与以 ICP 为金标准测得的肝铁浓度的相关性。结果：①给药后大鼠肝脏有不同程度铁沉积，1000mg/kg 以上剂量组，大鼠铁沉积量与 100mg/kg 相近；②150KV/90KV 测得的虚拟铁浓度与 ICP 测得的铁浓度 R^2=0.846，150KV/70KV 测得的虚拟铁浓度与 ICP 测得的铁浓度 R^2=0.799。结论：①大鼠给药剂量为 1000mg/kg 为大鼠肝铁过载的阈值，达到最大吸收剂量；②不同管电压条件下拟合出的虚拟铁浓度曲线斜率不同；③高管电压对肝脏铁定量测量的准确性比低管电压的高。

EPO-0940
不同 b 值在评估食管癌同步放化疗疗效中的价值

徐亚运
南京大学医学院附属鼓楼医院

摘要
目的：利用不同 b 值的 ADC 值评价食管癌放化疗的疗效。**方法**：前瞻性分析我院行放化疗的食管癌患者 30 例。于放化疗前及放化疗结束后分别行常规 MRI 及多 b 值的 DWI 扫描，b 值选择为 500、800 和 0-1000 sec/mm²。测量并观察食管癌灶 ADC（ADC2max、ADC2min 及 ADC2mean） 值的变化，疗效根据 RECIST 标准评价。**结果**：30 例食管癌患者中，除 5 例未完成磁共振检查，3 例病灶无法测量外，其余 22 例食管癌患者完全缓解 13 例（59.1 %）、 部分缓解 9 例（40.9%）。放化疗后 ADC 值较放化疗前均升高。当 b=0-500 及 0-800sec/mm²时，治疗后病灶 ADC 值（ADC2max、ADC2min 及 ADC2mean）在不同疗效组间均存在显著差异（P < 0.05）。而当 b 值为 0-1000 sec/mm²时，病灶的 ADC 值在不同疗效组间均无显著差异（P > 0.05）。b 值区间(b=0-500 及 0-800sec/mm²),ADC 值（ADC2max 、ADC2min 及 ADC2mean）在预测食管癌放化疗疗效时的曲线下面积为 0.817 ~ 0.897。**结论**：b 值 0-500 sec/mm²、0-800 sec/mm²时 ADC 值均可准确、客观评价食管癌的放化疗效果，其中 b 值为 0-800 sec/mm²时 ADC 值可作为预测食管癌放化疗效果的较好指标。

EPO-0941
术前 GD-EOB-DTPA 增强 MRI 联合肝脏体积评估肝储备功能的研究

吕倩,陈静静
青岛大学附属医院

目的：术前应用肝脏钆塞酸二钠（Gd-EOB-DTPA）增强 MR 联合肝脏体积的测量，探讨功能性参数对肝储备功能的预测及定量评估的价值，并尝试得到更优的肝储备功能的评价方法。
方法：前瞻性地收集我院肝局灶性病变并拟行手术治疗的患者 54 例。所有患者术前均行肝脏 Gd-EOB-DTPA 增强 MR、吲哚菁绿（ICG）试验，患者手术后 1 周行 Gd-EOB-DTPA 增强 MR。利用海信计算机辅助手术系统、PACS 系统、Siemens MapIt 后处理软件完成术前肝脏体积（LV）、术前平扫及肝胆期肝实质信号强度（SI_{pre}、SI_{pos}）、T_1弛豫时间（T_{1pre}、T_{1pos}）的测量。用于评估肝储备功能的功能性参数计算公式分别为：T_1减低率$\triangle T_1$=（T_{1pre}-T_{1pos}）/T_{1pre}、功能性肝体积 FV=LV×$\triangle T_1$、相对信号强度 RE=（SI_{pos}-SI_{pre}）/SI_{pre}、相对信号强度 RE×体积=RE×LV。模拟肝脏切除手术，计算模拟术后功能性参数；患者手术后，计算术后功能性参数。用 Spearman 相关性检验分析术前功能性参数(LV、$\triangle T_1$、FV、RE、RE×LV)与吲哚菁绿 15 min 滞留率(ICG-R15)的相关性，采用受试者工作特征曲线(ROC)分析各参数的诊断效能及最佳临界值；采用单因素方差分析比较模拟术后功能性参数与术后功能性参数的差异。
结果：ICG-R15 与 LV 无显著相关性(p>0.05)，ICG-R15 与$\triangle T_1$、FV、RE、RE/LV 呈显著负相关(r=-0.551、-0.673、-0.547、-0.648；p <0.05)，其中 FV 相关性最高；模拟术后功能性参数与术后功能性参数的差异无统计学意义（p >0.05）。
结论：术前肝脏 Gd-EOB-DTPA 增强 MR 联合肝脏体积测量能够用于预测及定量评估肝储备功能，其中△T1 结合 LV 是评估肝储备功能更有效的方法。

EPO-0942

A preliminary study of optimizing and translating ioversol-based ratiometric chemical exchange saturation transfer (CEST) MRI to a 3 T clinical scanner

Yanyan Tang,Zhiwei Shen
Department of Medical Imaging, 2nd Affiliated Hospital, Shantou University Medical College, Shantou, Guangdong

Objective—we attempt to translate ioversol-based ratiometric chemical exchange saturation transfer (CEST) MRI from high field to lower field strengths and establish quantitative liver tumors pH using a 3T MR scanner.
Materials and methods—Different schemes of radio frequency irradiation power were investigated for ioversol-based pH measurements at 3T . In-vitro MRI studies , the CEST sequence was applied to five tubes filled with 70-mM ioversol solutions with pH values ranging from 6.0 to 7.2. CEST effects were quantified with the asymmetric magnetization transfer ratio (MTRasym) at 4.3 ppm from the corrected Z-spectrum .Calibration curves for pH quantification were determined .a generalized ratiometric analysis was conducted by ratioing resolved ioverso CEST effects at 4.3ppm obtained with flip angle of 50° and 350° , respectively. In-vivo MRI studies , fifteen patients (four female, eleven male; age 58.6 ± 18.9 years) with recently diagnosed and confirmed hepatic carcinoma and two patients diagnosed hepatic hemangioma (two females; age 35.8 ± 13.4 years) were included in this prospective study. Patient with Liver tumors who had undergone a contrast-enhanced computed tomography (CT) scan with ioversol was performed on a clinical 3T MR scanner.
Results— In-vitro MRI studies ,We calculated the function equation between the CEST effects of ioversol and pH values, in the range of 6.0 to 7.2. In the patient with hepatic carcinoma, the average pHe value of the tumor was 6.84. Ioversol signal intensities in the tumor region of patients with hepatic carcinoma were attenuated but were not different in patients with hepatic hemangioma. The lesion size showed in the tumor PH imaging was slightly greater than that identified by conventional TWI2.Our study shows the feasibility of using CEST imaging with ioversol for pH mapping in vitro and in vivo at 3T.
Conclusions—An effective imaging protocol of the ioversol-based ratiometric CEST MRI was translated to a 3 T clinical scanner successfully. Furthermore, The extracellular pH (pHe) of liver tumor was measured, warranting future CEST PH MRI of patients to contribute to its diagnostic value.In summary,CEST PH MRI imaging may help distinguish benign from malignant tumors at 3 T clinical scanner.

肝脏实质内异位脾脏的影像学特征分析

马丽娅
华中科技大学同济医学院附属同济医院

目的：对肝脏内异位脾脏病例的 CT 及 MR 平扫及增强表现进行分析。**材料和方法：**回顾性分析 2010 年 1 月至 2019 年 6 月病理诊断为肝脏内异位脾脏的病例的 CT 及 MR 影像学资料，并进行对病灶、病灶包膜、相邻肝脏实质、脾窝处脾脏进行测值，并进行两两比较，增强后比较动脉与静脉期、静脉期与延迟期。**结果：**共搜集 3 例病人，5 个肝脏内病灶，其中男性 2 名，女性 1 名，年龄 37-52 岁，病灶大小为 16-41cm，其中一名既往有外伤后脾切除史，一名有胰体尾及脾脏切除手术病史，另一名无手术病史，三位患者正常脾脏均未见，但两名患者脾窝处有脾脏样结构。病灶均呈结节状，可见包膜结构，边界清晰。CT 增强及 MR 增强示，动脉期及门脉期病灶强化较肝脏明显，与包膜相比，病灶动脉期明显强化、延迟明显减低，延迟期包膜较肝脏强化明显。MR 平扫及 DWI 示，与肝脏相比，包膜 T1 信号稍低、T2 信号稍高，而与病灶相比，包膜 T2 信号减低、DWI 信号减低；与肝脏相比，病灶 T1 信号稍低、T2 信号明显增高、DWI 信号增高。**结论：**肝脏内异位脾脏呈结节状，均可见包膜结构，病灶与周围包膜、相邻肝实质相比，MR 平扫、CT 及 MR 增强、DWI 均有一定的影像学特点，对临床诊断有重要帮助。

评价多模型 DWI 对肝细胞肝癌术前诊断及病理分级的应用价值

陈翠云
河南省人民医院

目的 评估三种模型 DWI 的各参数分别对诊断肝细胞肝癌及其分级的价值。**方法** 前瞻性收集 2016 年 3 月～2018 年 8 月在本院肝胆外科住院的肝细胞肝癌患者 50 例，20 例健康者的肝脏作为对照组。对肝癌病理进行分级Ⅰ级（2 例）、Ⅱ级（25 例）、Ⅲ级（14 例）、Ⅳ级（9 例），将Ⅰ-Ⅱ归为高分化组，Ⅲ-Ⅳ为低分化组。采用 GE750 3.0T 磁共振，行常规 MRI 检查和多 b 值 DWI 扫描。将多 b 值 DWI 原始图像传入 ADW4.6 后处理工作站上对 DWI 图像进行后处理。分别获得单指数模型（Standard ADC）、双指数模型（D_{slow}、 D_{fast}、FF）和拉伸指数模型（DDC、α）各参数值。分别采用 *Mann-Whitney U* 检验比较正常肝脏与肝癌和采用 *Kruskal-Wallis H* 检验比较正常肝脏、肝癌Ⅰ-Ⅱ组与Ⅲ-Ⅳ组的各参数值之间差异。采用 *Pearson* 检验分析各参数值在肝癌分级间的相关性。采用 ROC 预测各参数值诊断肝癌及其分级的效能。**结果** 正常肝与肝癌、肝癌Ⅰ-Ⅱ组与Ⅲ-Ⅳ组之间的 Standard ADC、D_{slow}、FF、DDC、α 值存在差异，均有统计学意义（$P<0.05$），而 D_{fast} 无差异，无统计学意义（$P>0.05$）。通过 *Pearson* 检验得出 Standard ADC、D_{slow}、FF、DDC、α 值与肝癌分级呈负相关，相关系数依次为（-0.705，-0.798，-0.773，-0.797，-0.658，$P<0.05$）。通过 ROC 曲线分析各参数（Standard ADC、D_{slow}、FF、DDC、α）对肝癌的诊断效能均达到中等，其中 D_{slow} 诊断肝癌的 ROC 曲线下面积最大，为 0.891；其次为 DDC，AUC 为 0.851。**结论** 三种模型 DWI 均可用于评估肝癌及其分级的定量分析。其中双指数模型参数 Dslow 及拉伸指数模型参数 DDC 诊断肝癌及其分级时，能为临床提供重要诊断依据。

EPO-0945
肝腺瘤的 CT 表现

鲁可可
华中科技大学同济医学院附属协和医院

目的 ：分析肝细胞腺瘤（HA）多排螺旋 CT 表现,提高其诊断准确性.方法 ：回顾性分析我院 2018 年 10 月～2019 年 5 月期间，14 例经手术或穿刺活检病理证实的肝细胞腺瘤的患者，行多排螺旋 CT 平扫和动态增强扫描。结果显示为：14 例患者均为单发肿块。平扫呈等密度 2 个,均匀略低密度

6 个,不均匀低密度 3 个,混杂密度 3 个。增强显示动脉期明显强化，门脉期持续强化，延迟期表现均匀或略高密度，可见有包膜

EPO-0946

Radiomic Analysis of Contrast-Enhanced CT Predicts Microvascular Invasion and Outcome in Hepatocellular Carcinoma

Xun Xu,Yu-Dong Zhang,Xi-Sheng Liu
The First Affiliated Hospital With Nanjing Medical University

Abstract
Background & Aims:
Microvascular invasion (MVI) impairs surgical outcomes in hepatocellular carcinoma (HCC) patients. As a single highly reliable factor to preoperatively predict MVI is lacking, we developed a computational approach integrating large-scale clinical and imaging modalities, especially radiomic features from contrast-enhanced CT, to predict MVI and clinical outcomes in HCC patients.
Methods:
In total, 495 surgically resected patients were retrospectively included. MVI-related radiomic scores (R-scores) were built from 7,260 radiomic features in six target volumes. Six R-scores, 15 clinical factors, and 12 radiographic scores were integrated into a predictive model, the Radiographic-Radiomic (RR) model, with multivariate logistic regression.
Results:
Radiomics related to tumor size and intratumoral inhomogeneity were the top-rankedMVI predicting features. The related R-scores showed significant differences according to MVI status ($p < 0.001$). Regression analysis identified 8 MVI risk factors, including 5 radiographic features and a R-score. The R-score (odds ratio [OR], 2.34) was less important than tumor capsule (OR, 5.12), tumor margin (OR, 4.20), and peritumoral enhancement (OR, 3.03). The RR model using these predictors achieved an area under curve (AUC) of 0.909 in training/validation and 0.889 in the test set. Progression-free survival (PFS) and overall survival (OS) were significantly different between the RR-predicted MVI-absent and MVI-present groups (median PFS: 49.5 vs. 12.9 months; median OS: 76.3 vs. 47.3 months). RR-computed MVI probability, histologic MVI, tumor size, and Edmondson-Steiner grade were independently associated with disease-specific recurrence and mortality.
Conclusions:
The computational approach integrating large-scale clinicoradiologic and radiomic features demonstrates good performance for successfully predicting MVI and disease clinical outcomes, but radiomics with current CT imaging analysis protocols do not provide statistically significant added value to radiographic scores.

双能量 CT 虚拟平扫与真实平扫在急性胰腺炎影像中的初步对比研究

袁元,黄子星,汪翊,李真林,唐鹤菡,宋彬
四川大学华西医院

目的：初步比较双源 CT 急性胰腺炎双能量虚拟平扫与真实平扫的图像质量差异。
方法：回顾性分析 32 例确诊急性胰腺炎患者(年龄 47±12 岁)的双能量 CT 胰腺动脉期、门脉期虚拟平扫图像与真实平扫（TNE）图像，比较三组图像中的胰腺 CT 值、图像噪声、胰腺信噪比、胰腺-竖脊肌对比噪声比、图像主观质量评分以及辐射剂量。
结果：动脉期 VNE、门脉期 VNE 和 TNE 三组图像中的胰腺 CT 值的差异无统计学意义（$P>0.05$）；三组中图像噪声、胰腺信噪比和胰腺-竖脊肌对比噪声比的差异有统计学意义（$P<0.05$），且动脉期 VNE 图像噪声最低，信噪比最高；三组图像主观质量评分均满足临床诊断，且评分 TNE＞动脉期 VNE＞门脉期 VNE（$P<0.05$）；采用动脉期 VNE 的总有效剂量（ED）和采用门脉期 VNE 的总 ED 均低于采用 TNE 的总 ED（$P=0.001$）。
结论：急性胰腺炎双能量虚拟平扫的图像质量接近于真实平扫，并且动脉期虚拟平扫图像质量优于门脉期，在临床胰腺三期增强扫描中可能替代真实平扫并且减少辐射剂量。

EPO-0948
基于低剂量 CT 的中重度肥胖患者脂肪肝与肝功能和 糖脂代谢的相关性分析

袁灵,王萱,薛华丹,金征宇
中国医学科学院北京协和医院

目的：研究中重度肥胖患者非酒精性脂肪肝与肝功能、糖脂代谢指标的相关性
研究对象： 30 例中重度肥胖患者（平均 BMI 42.03±7.06kg/m2） 均进行低剂量多层螺旋 CT 扫描，计算肝脏 CT 值、脾脏 CT 值及肝脾 CT 比值。研究中重度肥胖患者脂肪肝分度情况，及其与 ALT、糖脂代谢指标的相关性。
结果： 30 例中重度肥胖患者中， 13 例无脂肪肝， 7 例轻度脂肪肝， 4 例中度脂肪肝， 6 例重度脂肪肝。 肝脏 CT 值与 ALT 负相关（r=-0.584， P=0.001），与 HOMAIR 负相关（-0.610，P=0.001）； 肝脾 CT 比值与 ALT 负相关（r=-0.616， P<0.001），与 TG 负相关（r=-0.385，P=0.035）。 男性肥胖患者患脂肪肝的比例显著高于女性（P<0.040）， 脂肪肝组的 TG（2.08±0.96 vs. 1.19±0.32， P=0.003）、 HOMAIR 水平显著高于非脂肪肝组（12.63±4.21 vs. 8.35±4.91， P=0.022）。
结论： 低剂量多层螺旋 CT 可用于评估中重度肥胖患者脂肪肝的情况，脂肪肝与肝功能异常、糖脂代谢紊乱有关。

Diagnostic Performance of DWI for microvascular invasion of hepatocellular carcinoma: A Systematic Review and Meta-Analysis

Yongyao Kuang[1], Jianye Liang[1], Kunlin Ye[1], Qingqing Cheng[1], Hongxiang Li[2], Yikai Xu[3], Changzheng Shi[1], Liangping Luo[1]

1. Medical Imaging Center, The First Affiliated Hospital of Jinan University, No.613, Huangpu Road West Tianhe District, Guangzhou, 510630, PR China

2. Department of Radiology, Fujian Medical University Union Hospital, No.29, Xinquan Road, Fuzhou, 350001, PR China

3. Department of Medical Imaging Center, Nanfang Hospital, Southern Medical University, 1838 Guangzhou Avenue North, Guangzhou 510515, PR China

Purpose: To assess the diagnostic performance of diffusion-weighted imaging (DWI) for predicting microvascular invasion (MVI) of hepatocellular carcinoma (HCC).

Methods: A systematic literature search was performed in PubMed, EMBASE, Web of Science, China National Knowledge Infrastructure databases and The Cochrane Library. Two independent reviewers used the Quality Assessment of Diagnostic Accuracy Studies 2 tool to assess methodologic quality. Patient, study and MRI characteristics were extracted, and 2 × 2 tables were reconstructed to calculate the pooled sensitivity and specificity. Heterogeneity testing, meta-regression and sensitivity analyses were performed for heterogeneity exploration.

Results: Nine studies (934 patients with 973 HCCs) were included in the analysis. The pooled sensitivity and specificity of ADC values in predicting MVI were 0.77 (95% confidence interval [CI]: 0.73–0.81) and 0.66 (95% CI: (0.61–0.70), respectively. Potential heterogeneity was observed in sensitivity (I^2 = 67.2%) and specificity (I^2 = 78.5%) of ADC values among the studies. Meta-regression analyses did not find any factors that contributed significantly to the heterogeneity. IVIM-derived D values from three studies showed superior diagnostic performance, with the pooled sensitivity and specificity of 0.80 and 0.75, respectively.

Conclusion: Mono-exponential DWI had moderate diagnostic performance for the detection of MVI. IVIM-DWI was superior to mono-exponential DWI in assessing MVI and further studies may be needed.

EPO-0950

Differential Diagnosis of Bland and Neoplastic Portal Vein Thrombosis with Dual Energy Spectral CT

jun zhao, Junlin Zhou

The Second Hospital Of Lanzhou University

PURPOSE

To investigate the value of dual energy spectral CT in differential diagnosis of neoplastic and bland portal vein thrombosis.

METHOD AND MATERIALS

68 cases of portal vein thrombosis (PVT) ,including 33 cases of bland PVT(BPVT) and 35 cases of neoplastic PVT(NPVT) were confirmed by following pathological experiments or diagnosed as having hepatitis B- or C-related cirrhosis, were analyzed retrospectively. All patients underwent dual phase contrast enhanced CT with dual energy spectral mode. For each case, the CT value on monochromatic images of 40～140keV, thrombus iodine concentration (I) and thrombus blood concentration (IB)in the portal venous phase(PVP)were measured, thrombus-aorta iodine concentrations ratio(IT/IA,NICA),and thrombus-PV iodine concentrations ratio(IT/IP ,NICP)were calculated and spectrum curve slope was calculated according to the formula: the slope=(CT40keV-CT70keV)/30. Data was compared with independent samples t-test. Sensitivity and specificity of the quantitative parameters were analyzed by receiver operating characteristic curve.
RESULTS
The CT40keV, CT70keV, the mean slope, I, IB and NICP of NPVT differed significantly from those of BPVT during PVP (P=0.007, P=0.012,P=0.007,P=0.005,P=0.009,P＜0.001,respectively).(Table1).NICA had no statistically significant during PVP (P=0.162). The CT threshold value, slope, I, IB and NICP had high sensitivity and specificity during PVP in differentiating NPVT from BPVT.
CONCLUSION
Dual energy spectral CT with the quantitative analysis of iodine concentration, the CT value and slope in the PVP may help increase the accuracy of differentiating neoplastic and bland of portal vein thrombosis.Differentiating the nature of the thrombus is of great clinical significance in determining the therapeutic approach, predicting survival, and assessing candidates for liver transplantation. Dual energy spectral CT may contribute to diagnosis of portal vein thrombosis preoperatively.

能谱 CT 碘基值对胃癌分化程度的价值研究

梁长华,窦文广,户彦龙,李强,朱止平,刘儒鹏
新乡医学院第一附属医院

目的：探讨能谱 CT 碘基值对胃癌分化程度的应用价值。**方法：**收集 2016 年 1 月至 2018 年 12 月间，经我院病理证实为胃癌患者 47 例。所有患者均行能谱 CT 增强扫描，包括平扫、动脉期及静脉期，其中动脉期及静脉期采用 GSI 增强扫描模式，测量病灶的碘浓度以及计算标准化后的标准化碘浓度。采用独立样本 t 检验进行统计比较不同分化程度胃癌间的碘浓度及标准化碘浓度差异。**结果：**病理证实低分化胃癌 15 例，高中分化胃癌 32 例。静脉期的碘浓度及标准化碘浓度改变幅度高于动脉期。增强各期低分化胃癌均高于高中分化胃癌的碘浓度，其中动脉期分别为（15.99±0.36）（100 μg/ml）和（14.53±0.95）（100 μg/ml），静脉期分别为（24.11±0.53）（100 μg/ml）和（19.38±0.69）（100 μg/ml）。低分化胃癌的标准化碘浓度亦高于高中分化胃癌，其中动脉期分别为（0.20±0.02）和（0.16±0.02），静脉期分别为（0.71±0.01）和（0.47±0.02）。**结论：**胃癌的碘浓度和标准化碘浓度与其分化程度有一定相关性，对评估胃癌分化程度有一定的应用价值。

基于多层螺旋 CT 影像学征象与原发性肝癌微血管侵犯相关性研究

杨冠华[1],陈勇[2],孙文杰[1],任涛[1],邓林[1]
1.宁夏医科大学临床医学院
2.宁夏医科大学总医院

目的：探讨多层螺旋 CT 影像学征象与原发性肝癌微血管侵犯的相关性。
材料与方法：回顾性分析本院 2017 年 1 月至 2019 年 6 月经外科切除的 69 例（男 48 例，女 21 例，平均年龄 54.84 岁，年龄范围 32-82 岁）孤立性原发性肝癌患者 CT 及临床资料，根据病理结果将其分为微血管侵犯组和非微血管侵犯组，采用 Kolmogorov-smimov 和 levene 检验对两组各指标进行正态分布和方差齐性检验，采用独立样本 t 检验比较两组患者的年龄、甲胎蛋白(AFP)水平及肿瘤最大直径，采用 x 2 检验比较两组患者的性别、乙肝表面抗原、肝功能分级、肿瘤边缘、瘤周异常强化、瘤内动脉、低密度晕环、肿瘤是否贴近肝包膜。
结果：微血管侵犯 39 例，非微血管侵犯 30 例，两组间肿瘤的最大直径、肿瘤边缘是否光滑、瘤内动脉、瘤周异常强化具有统计学意义，P 值分别为 0.004、0.017、0.035、0.002；而两组在年龄、性别、乙肝表面抗原、肝功能分级、AFP 水平、低密度晕环、肿瘤是否贴近肝包膜比较，差异无统计学意义(P >0.05)。
结论：多层螺旋 CT 影像学征象与肝癌微血管侵犯具有一定相关性。

EPO-0953
初步评价 T1 Mapping 技术在肝纤维化病变分期中的应用价值

张玉佩,朱娟
安庆市立医院

目的 初步评价 T1Mapping 技术在肝纤维化病变分期中的临床应用价值。**方法** 收集经病理证实为肝纤维化或临床证实为肝硬化的患者 36 例，男 23 例，女 13 例，年龄 45 ～80 岁，中位年龄 57 岁；选取 15 例健康志愿者，男 9 例，女 6 例，年龄 29 ～59 岁，中位年龄 45 岁。 应用西门子 3.0T skyra 扫描仪，采用头先进仰卧位屏气下双翻转角 VIBE 序列扫描，由两名观察者分别在肝 S4、S6、S7 处分别取三个相等大小 ROI 独立测量 T1 Mapping 值并取其平均值，通过方差分析及 t 检验比较 T1Mapping 值在肝纤维化患者组及正常健康人组的组内及组间差异。 **结果** T1 Mapping 值在肝纤维化病人组与正常健康人组间存在显著差异（P＜0.05），重复测量方差分析显示组内、组间差异分别为 0.445、0.023，且随着肝硬化的进展，T1 Mapping 值有逐渐升高的趋势。T1 Mapping 值在诊断肝纤维化及肝纤维化分级中存在统计学差异。 **结论** T1 Mapping 技术可以作为无创性的磁共振新技术，较早且准确地反映肝纤维化过程中病理生理改变及组织微观结构的变化，且能作为肝纤维化动态变化过程的监测。

EPO-0954
肝脏弥散峰度成像（DKI）的直方图分析对于同种异体肝移植术后出现急性排斥反应的预测价值

李畅
中山大学附属第一医院

背景：同种异体肝移植术后患者发生急性排斥反应最常见于术后 6 周之内，临床上可以表现为无其他诱因的血清胆红素和肝酶进行性升高，典型的组织病理学表现包括汇管区淋巴细胞和嗜酸性粒细胞浸润、小胆管上皮变性以及静脉内皮炎，早期诊断和及时激素冲击治疗对于出现急性排斥反应患者的预后至关重要，目前磁共振成像对于肝移植术后急性排斥反应的诊断意义尚未明确。
目的：通过对比经病理证实的术后急性排斥患者和其他原因（胆管/血管并发症、药物不良反应）导致的术后肝功能异常患者的肝脏 DKI 的直方图分析结果评价其对于肝移植术后急性排斥反应的预测价值。
材料和方法：本研究为回顾性分析。病例组为 2014 年 3 月至 2019 年 1 月期间肝移植术后因肝功能异常行穿刺病理确诊为急性排斥反应且穿刺前后 1 周之内行 DKI 检查的 24 例患者，对照组为同时期术后因肝功能异常行穿刺病理确诊为非急性排斥反应且穿刺前后 1 周之内行 DKI 检查的 27 例患者。两组患者间年龄、性别、胆红素水平、肝酶水平（ALT、AST）和距离手术时间均无显著性差异，均使用同一台 3.0T 磁共振机器扫描且 DKI 扫描参数一致。通过 MatLab 后处理软件分析得到全肝组织的 D 值、K 值和 ADC 值的直方图并得到各自的平均值、中位数、偏度、峰度以及第 5、25、50、75、95 百分位数。通过 SPSS 软件利用单因素方差分析（One-way ANOVA）或 K-W 检验比较两组间各参数的差异并绘制具有显著性差异的参数 ROC 曲线评估诊断效能。
结果：急性排斥组 D 值和 ADC 值的平均值、中位数和各百分位数值均显著高于对照组（P=0.001-0.026）,K 值的平均值、中位数和第 25、50、75 百分位数均显著低于对照组（P=0.010-0.035），所有参数中，K 值的第 50 百分位数 AUC 最大（0.886）。
结论：肝脏 DKI 直方图分析结果可以作为肝移植术后急性排斥反应

EPO-0955

肝脏双源双能量 CT 成像中对比剂适宜碘剂量探讨

赵林伟[1],董国礼[2],杨国庆[1],冯敏[1],李勇[1],严高武[1],赵秀华[1]
1.遂宁市中心医院
2.川北医学院附属医院

目的 探讨双源双能量 CT（DSDECT）80-kVp 及模拟 120-kVp 图像中，肝脏强化程度达 50HU 时，基于体表面积（BSA）或去脂体质量（LBW）确定的对比剂碘剂量。**方法** 200 例患者行肝脏双源 CT 双能量增强扫描,对比剂碘剂量 17.1gI/m^2 BSA，注射时间 25s。在 PACS 系统结合自动跟踪及 ROI 复制功能，测量平扫、80-kVp 及模拟 120-kVp 图像中主动脉及肝脏的 CT 值。计算门静脉期每克碘肝脏强化程度（ΔHU/gI）、基于 BSA 和 LBW 调整的最高肝脏强化程度（MHE；MHE_{BSA}=ΔHU/gI/m^2；MHE_{LBW}=ΔHU/mgI/kg）、肝脏的估计强化值（EEV）。ΔHU/gI 与 BSA 和 LBW 之间的关系采用回归分析，相关系数的比较采用 Steiger's Z 检验。肝脏 EEV 之间的变异程度，采用 Levene 检验比较平均绝对离差值。 **结果** 80-kVp 的 MHE_{BSA} 和 MHE_{LBW} 均值分别为 5.3322 HU/(gI/m^2)、0.1535 HU/(mgI/kg)；模拟 120-kVp 的 MHE_{BSA} 和 MHE_{LBW} 均值分别为 3.0786 HU/(gI/m^2)、0.0887 HU/(mgI/kg)。ΔHU/gI 与 BSA 和 LBW 的相关系数，80-kVp 分别为 0.726、0.711（P>0.05），模拟 120-kVp 分别为 0.657、0.629（P>0.05）。每一系列图像内，ΔHU/gI 与 BSA 或 LBW 与呈负相关，R_{BSA} 与 R_{LBW} 差异没有统计学意义（P>0.05）；基于 BSA 与 LBW 的 EEV 平均绝对离差值之间，差异没有统计学意义（P>0.05）。**结论** 肝脏 DSDECT 增强扫描中，可以根据 BSA 或 LBW 调整碘剂量；肝脏强化程度达 50HU 所需的碘剂量，80-kVp 为 9.5 gI/m^2 BSA 或 333 mgI/kg LBW，模拟 120-kVp 为 16.5 gI/m^2 BSA 或 572 mgI/kg LBW。

EPO-0956

The value of intravoxel incoherent motion (IVIM) in detecting and staging liver fibrosis: a systematic review and meta-analysis

Zheng Ye,Bin Song
West China Hospital， Sichuan University

Purpose
To evaluate the diagnostic performance of intravoxel incoherent motion (IVIM) in detecting and staging liver fibrosis (LF).

Material and methods
A comprehensive literature search was conducted to identify studies on the diagnostic accuracy of IVIM for the assessment of histology-proven LF. The degrees of LF were defined as F0 (no fibrosis), F1 (portal fibrosis without septa), F2 (periportal fibrosis with few septa), F3 (septal fibrosis) and F4 (cirrhosis), according to METAVIR scoring system. Data were extracted to calculate the pooled sensitivity, specificity, positive and negative likelihood ratios, as well as the area under the summary receiver operating characteristic curve (AUC) in each group.

Results
10 studies with 679 subjects were included in this meta-analysis. The pooled sensitivity, specificity, positive likelihood ratio and negative likelihood ratio were estimated to be 0.77 (95% confidence interval: 0.71-0.83), 0.82 (0.74-0.87), 3.99(1.89-8.41) and 0.33 (0.18-0.60) for ≥F1 detection with IVIM; 0.87 (0.82-0.91), 0.77 (0.71-0.83), 3.51 (2.16-5.71) and 0.18 (0.09-0.37) for ≥F2 detection; 0.86 (0.79-0.92), 0.84 (0.78-0.90), 5.33 (3.69-7.71) and 0.20 (0.06-0.63) for ≥F3 detection, and 0.85 (0.79-0.91), 0.78 (0.73-0.82), 3.56 (2.49-5.09) and 0.22 (0.11-0.44) for ≥F4 detection, respectively. The AUCs for ≥F1, ≥F2, ≥F3, ≥F4 detection were 0.86(0.79-0.94), 0.90(0.86-0.94), 0.90(0.88-0.93) and 0.89(0.87-0.93), respectively. Substantial heterogeneity was observed. No publication bias was detected.

Conclusion
IVIM shows high diagnostic accuracy in detecting and staging LF and may serve as a noninvasive tool for LF evaluation.

EPO-0957

肝结核的 MSCT 表现与影像分型

卢洪艳,张高峰
遵义医科大学第一附属医院

【摘要】：目的 探讨肝结核 MSCT 表现及其影像分型，减少肝结核 CT 漏诊率。**方法** 回顾性分析 2006-2019 年本院确诊 28 例肝结核患者 MSCT 影像学特点，并结合文献报道进行初步影像分型。**结果** 包膜型肝结核 15 例，CT 表现为肝包膜增厚，环状强化；结核性肝脓肿 4 例，CT 表现为肝脏低密度区，环状强化或无强化；肝结核瘤 5 例，CT 表现为 30mm 以下低密度结节，明显均匀强化

或环状强化或不强化；混合型肝结核 2 例，CT 表现为肝包膜和肝实质同时受累；粟粒型肝结核 2 例，CT 表现肝内多发低密度小结节，动脉期轻度不均匀边缘强化，静脉期仍呈低密度。本组 28 例中合并肺结核 14 例，脊柱结核 1 例，盆腔结核 2 例,胸膜结核 2 例。**结论** 肝结核 CT 表现可以分为 5 型，包膜型具有影像特征，其余类型无特征性，容易误诊，结合肝外病史，有助于肝结核的诊断。

3.0T 磁共振 T1-mapping 成像及弥散加权成像（DWI）对肝脏血管瘤及囊肿的鉴别诊断价值

汪飞,朱娟
安庆市立医院

目的：探讨磁共振 T1-mapping 成像及弥散加权成像（DWI）对肝脏血管瘤及肝囊肿的鉴别诊断价值。
方法：搜集 80 个病人的肝脏 125 个 T2WI 高亮病灶（血管瘤 65 个，肝囊肿 60 个），病灶短径均大于 8mm。肝血管瘤诊断标准为：（1）T2WI 高亮信号；（2）DWI（b=1200 s/mm^2）高信号；（3）动态增强呈典型“早进晚出”表现，肝囊肿诊断标准为：（1）T2WI 高亮信号；（2）DWI（b=1200 s/mm^2）低信号；（3）动态增强无强化。应用 Siemens Skyra 3.0T 磁共振进行扫描，T1-mapping 序列包括 B1 场校准序列（扫描时间 10s）和双翻转角(3°、15°)VIBE 序列（扫描时间 18s），T1-mapping 伪彩图自动计算生成。分别测量病灶 T1 值及 ADC 值，应用 ROC 曲线对 T1 值及 ADC 值进行分析，并对 T1 值及 ADC 值进行相关性（ICC）分析。
结果：在 3.0T 磁共振中肝脏血管瘤（1670.7±320 ms）的 T1 值明显低于肝囊肿（2599.5±450 ms）T1 值（p<0.001），ROC 诊断界值为 1580ms 时，肝脏血管瘤的诊断敏感性及特异性为 88.1%、86.5%。在 3.0T 磁共振中肝血管瘤（1.587±0.67）的 ADC 值（×10^{-3} mm^2/s）明显低于肝囊肿（2.613±0.56）ADC 值（p<0.001），ROC 诊断界值为 1.492×10^{-3} mm^2/s 时，肝血管瘤的诊断敏感性及特异性为 85.2%、87.3%。T1 值及 ADC 值对鉴别肝血管瘤及肝囊肿具有很高一致性（ICC=0.965）。
结论：对于肝脏 T2WI 高量信号病变的磁共振诊断，磁共振 DWI 成像是动态增强技术之外的最重要诊断方法之一，T1-mapping 技术具有扫描时间短、可定量等优点，能弥补 DWI 成像对肝血管瘤及肝囊肿鉴别诊断的部分不足，并可避免不必要的增强对比剂使用，具有重要的潜在临床应用价值。

肝脏血管平滑肌脂肪瘤的 CT 和 MRI 影像表现

李攀
河南省人民医院

目的 探讨肝脏血管平滑肌脂肪瘤（hepatic angiomyolipoma， HAML）的 CT 和 MRI 影像学特征，提高对该病的认识。方法 回顾性分析本院 2013-2019 年经手术病理证实的 18 例 HAML 患者的临床及影像学资料。其中 14 例行双期增强 CT 检查，4 例同时行增强 CT 及 MRI 检查。结果 18 例 HAML 患者男性 2 例，女性 16 例，年龄 32～61 岁。18 例患者均无肝硬化背景，AFP 均为阴性。18 例均为肝脏单发病变，边界清楚，位于肝右叶 11 例，肝左叶 6 例，同时位于右叶及尾叶 1 例，肿瘤最大径范围约 3cm～22cm。CT 平扫呈稍低密度，6 例密度均匀，12 例密度不均，内可见低密度囊变区，其中 8 例内可见脂肪密度影，1 例内可见稍高出血密度影；MRI 平扫 2 例呈 T1WI 低信号、

T2WI 高信号影，1 例内见短 T1 短 T2 出血信号影，1 例内见稍短 T1 长 T2 信号，压脂信号减低；增强扫描 10 例呈“快进快出”强化方式，8 例呈“快进慢出”强化方式；8 例病灶内或周边可见网状、粗大或畸形血管影，6 例可见连续或不连续“假包膜”结构。结论 HAML 的 CT 和 MRI 影像学表现具有一定的特征性，了解这些征象有助于提高该病术前诊断的准确性。

EPO-0960
Assessing Portal Flow using Four-dimensional Flow MRI in Healthy Volunteers - A Reproducibility Study

Lihua Chen[1], Ailian Liu[1], Jiazheng Wang[2], Yishi Wang[2], Yaxin Niu[1], Qingwei Song[1]
1. The First Affiliated Hospital of Dalian Medical University
2. Philips Healthcare, China

Purpose: To evaluate the reproducibility of four-dimensional (4D) flow MRI as a noninvasive imaging tool for portal vein flow quantification.
Materials and Methods: Ten healthy subjects were prospectively enrolled for MR exam at 3.0 T (Ingenia CX, Philips Healthcare, the Netherlands) with a 16-channel abdominal array coil. The MR protocol included a 2D quantitative flow measurement (axial, TR/TE = 4.4/2.7 ms, FOV = 200×200 mm^2, resolution = 1.5×1.5×8 mm^3, PC direction = RL, PC velocity = 200 cm/s, scan time = 13 s) to measure the flow velocity in portal vein as a reference for velocity encodings (VENC) and a 4Dflow sequence with compressed sensing (CS) acceleration (axial, TR/TE = 5.0/3.2 ms, FOV = 300×350 mm^2, resolution = 2.5×2.5×2.5 mm^3, PC direction = RL-AP-FH, CS =8, scan time = 370 s) for hemodynamics quantification. VENC was set to 30 cm/s for the 4D flow sequence to slightly surpass the measured velocity and avoid phase wrapping. The acquired images were processed in CVI42 (Canada Circle Cardiovascular Imaging) by a single radiologist to obtain a 3D angiogram. Three planes placed at the proximal, middle and distal of the main portal venous to measure the flow velocity(cm/s), volume rate (ml/cardiac cycle), axial-wall shear stress (axial-WSS, Pa). The intra-class correlation coefficients(ICC)was used to check the consistency of the data measured by the two observers.
Results: Measurements from the two observers matched well with each other (Table 1, ICC value > 0. 75), and all the measured parameters remained relatively consistent among the healthy volunteers with a reasonable standard deviation.
Conclusion: The consistent flow velocity measurements among different healthy volunteers have indicated 4D flow MRI a reliable tool to quantify the portal system flow velocity.

EPO-0961
动态增强 CT 在腹腔间质瘤和神经内分泌瘤鉴别诊断的应用价值

戚元刚,李万湖
山东省肿瘤医院

目的 探讨动态增强 CT 在腹腔间质瘤和神经内分泌瘤鉴别诊断中的应用价值。**资料与方法** 回顾性分析经病理或免疫组化证实 30 例间质瘤及 30 例神经内分泌瘤的临床及 CT 动态增强检查资料

并测量其各期 CT 值；采用 Spss17.0 软件进行统计学分析，同一种肿瘤增强各期 CT 值的比较使用单因素方差分析，两种肿瘤同期两两比较，均采用 t 检验，P<0.05 为差异有统计学意义。**结果** （1）间质瘤三期比较：静脉期 CT 平均值>动脉期 CT 平均值，延迟期 CT 平均值>动脉期 CT 平均值，均有统计学意义，静脉期 CT 平均值与延迟期 CT 平均值的比较无统计学意义。（2）神经内分泌瘤各期之间 CT 值差别无统计学差异，强化方式多样。（3）神经内分泌瘤在三期的 CT 值均高于间质瘤。 **结论** 间质瘤三期强化特点为持续强化为主，延迟期可以出现持平或下降，神经内分泌瘤在各期的 CT 值均高于间质瘤，这些 CT 特点在腹腔间质瘤和神经内分泌瘤鉴别诊断中有一定的应用价值。

EPO-0962
罕见病例：宫内节育器移位至盆腔引起绞窄性小肠梗阻 1 例

梁雯雯
上海市浦东新区公利医院

病例：女，48 岁。因“下腹痛伴肛门排气、排便减少 10 小时”入院。查体下腹部压痛明显，无明显反跳痛及肌卫。肠鸣音 8-10 次/分。WBC：9.85*10↑。
CT 平扫：盆腔内一段小肠肠管疝入环形致密影内并嵌顿，周边数段小肠扩张伴积液，考虑盆腔内异物（节育环）伴小肠疝入、嵌顿及绞窄性肠梗阻。剖腹探查术，探查到腹腔内少量淡血性渗液，小肠扩张明显，子宫后壁上嵌一金属节育环，距回盲部约 50cm 处一段回肠卡入节育环内，嵌顿小肠段约 10cm，肠壁暗红。遂进行腹腔异物取出和肠梗阻松懈术，用热生理盐水纱布热敷肠段五分钟后，观察肠段颜色逐渐好转。将剪断的金属节育环从子宫壁上抽出，观察子宫壁无明显出血。结合手术诊断为节育环伴小肠梗阻。
讨论：宫内节育器（IUD）对全身干扰较少，具有安全、有效、经济等优点，是最常用的节育用具之一。采用节育环避孕者在我国占 40%以上。但由于很多原因，在放置 IUD 短时或数年后会出现并发症。宫内节育器部分或全部嵌入肌层，或异位于子宫阔韧带、腹盆腔等处，称为宫内节育器移位，常见原因有 IUD 压迫子宫壁、流产后或足月产后即放置 IUD 等多种，此外，IUD 移位还与子宫、膀胱收缩及内脏蠕动有关。我国节育器移位以位置下移或嵌入子宫肌层多见，移位至腹盆腔并引起小肠套入其中导致绞窄性肠梗阻在临床中极为罕见。该患者入院时有肠梗阻的典型临床表现，通过全腹部 CT 扫描及重建发现盆腔内有环形金属异物且伴有小肠套入，引起肠梗阻。问病史，患者于 20 年前放置节育环。M 等认为 CT 能敏感地发现 IUD 移位导致的内脏穿孔、腹腔脓肿、肠梗阻等并发症，规划最佳的手术方法。此较病例正是应用 CT 扫描发现宫内育环的移位并通过急诊手术成功治疗。为了防止 IUD 移位的发生，首先要加强对医务人员的技术培训，对于放置 IUD 的妇女应定期体检确认环位正常，对于已经绝育的妇女建议取出节育环。一旦发现节育移位，应及时取出。

磁共振弥散加权成像与 CT 对急性胰腺炎严重程度的分级评估

许梅海,尹家瑜,韦洁勤,黄丽轩,潘洋洋
南宁市第一人民医院

【摘 要】目的：探讨磁共振弥散加权成像（DWI）与 CT 在急性胰腺炎（AP）严重程度分级诊断中的价值。回顾性分析我院收治的 54 例急性胰腺炎患者的临床、含有 DWI 的 MRI、CT 资料。采用 MRI 严重指数（MRSI）、CT 严重指数（MCTSI）与临床的 Ranson 评分进行对照，比较两种指数与临床诊断的符合率；测量各级炎症胰腺的 ADC 值，应用单因素方差分析（ANOVA）对各级别 AP 之间的

ADC 值进行统计学分析。**结果：**在判断急性胰腺炎严重程度 的分级诊断符合率方面 MRSI（89.5% ，17/19）高于 MCTSI（78.5% ，15/19）， 但是两者符合率差异也没有统计学意义（x^2=0.198，P=0.656））。A、B、C、D、 E 级 AP 的平均 ADC 值分别为(1.120±0.015)、(1.185 ±0.165)、(1.410 ±0.123)、(1.450±0.168) 、(1.830±0.540)×10^{-3} mm^2 /s。A、B 级 AP 的 ADC 值低于 E 级，但差异没有统计学意义(P 值＞0.05) ，D、E 级之间的 ADC 值差异无统计学意义(P 值均 ＞0.05) 。**结论：**MRI 与 CT 在评价急性胰腺炎严重程度方面具有一致性，但磁共振 DWI 成像有利于 Balthazar 中 A、B 、C 级 AP 的早期诊断。

EPO-0964
扩散峰度成像 DKI 对正常肝脏左右叶差异的研究

王均英,史浩
山东省千佛山医院

目的 部分肝脏病变发生部位具有特异性，不同肝叶间是否具有结构及功能差异不得而知。DKI 是观察组织微观结构、反应细胞密度的重要手段，以往较多应用于中枢神经系统，近年来逐渐应用肝脏，了解正常肝脏 DKI 参数特征是将其应用于病变评估的前提。本课题探究 DKI 在肝脏的稳定性及重复性，应用 DKI 技术评估健康成年人肝脏各叶段是否存在差异。**方法** 32 名健康志愿者纳入本研究，采用 GE 3.0T 磁共振行两次 DKI 扫描，间隔时间为两周。利用 Glisson 系统分段法将肝脏分为八个肝段，分别测量各肝段的 Md、Mk、FAK、Ka、Kr、Da、Dr 等参数。应用统计学软件 SPSS22 对数据进行处理，通过 Bland-Altman 图分析同一测量者两次测得的数据的重复性；比较 S1-S8 段的各参数的分布特征及各参数均值在肝段间的具体差异，进一步评估肝叶的差异；检验各个参数之间是否有相关性。**结果** 除 FAk 外两次测量的各参数具有良好的一致性；肝左外叶下段（S3）及肝右叶前叶下段（S5）重复性最好（ICC=0.9429、0.8772），而肝右前叶上段（S8）重复性最差（ICC=0.8599）。 肝尾状叶（S_1）与左叶（S_{2-4}）各个参数值均不具有统计学差异（P>0.05）所以后期将肝尾状叶与肝左叶参数合并处理。除 FAk 外，肝左右叶其余参数均存在统计学差异(P<0.05)。Mk 与 Md 呈负相关，Mk 与 Ka、Kr 呈正相关，Md 与 Da、Dr 呈正相关，FAk 与其他参数之间未发现明确相关性（r<0.3）。**结论** 研究表明 DKI 在肝脏内具有良好的重复性；除 FAk 之外，DKI 其余各参数在肝左、右叶存在差异，提示肝各段叶水分子扩散受限程度不同，推测参数结果一方面受位置的影响，另一方面肝叶段本身存在微观结构或灌注差异。

EPO-0965
下腔静脉造影检查在布加综合征患者下腔静脉阻塞端形态与下腔静脉阻塞端钙化相关性研究中的应用价值

徐慧婷
无锡市第二人民医院

目的 探讨下腔静脉造影检查在布加综合征（BCS）患者下腔静脉阻塞端形态与下腔静脉阻塞端钙化相关性研究中的应用价值。
方法 采用回顾性队列研究方法。收集 2009 年 1 月至 2016 年 12 月徐州医科大学附属医院收治的 41 例患者的临床资料；男 29 例，女 12 例；年龄为（53± 10）岁，年龄范围为 34～70 岁。41 例 BCS 患者均行 CT 平扫及下腔静脉 CT 造影检查，于 2 周内行数字减影血管造影（DSA）检查及介入治疗。观察指标：（1）患者下腔静脉阻塞端钙化情况：是否存在钙化，钙化位置、形态、分布 。

（2）下腔静脉阻塞端形态与下腔静脉阻塞端钙化之间的相关性。采用似然比检验分析下腔静脉阻塞端形态与下腔静脉阻塞端钙化之间的相关性。
结果（1）BCS 患者下腔静脉阻塞端钙化情况：41 例患者中，24 例检测到下腔静脉阻塞端钙化。其中，17 例为下腔静脉阻塞远端钙化，4 例为下腔静脉阻塞近端钙化，3 例为下腔静脉阻塞远端及近端均钙化。钙化灶形态多样，呈点状、不规则状等，呈散在、簇状及弥漫性分布。（2）下腔静脉阻塞端形态与下腔静脉阻塞端钙化之间的相关性：41 例患者中，24 例存在下腔静脉阻塞端钙化，其中 7 例阻塞端呈锥形，13 例阻塞端呈圆顶形，4 例阻塞端呈平顶形。统计学结果显示：下腔静脉阻塞端形态与阻塞端钙化的存在具有相关性（G =9.293，P<0.05）。
结论 BCS 患者下腔静脉阻塞端形态与阻塞端钙化具有相关性。利用 CT 技术评估下腔静脉阻塞端钙化情况对术前预估下腔静脉阻塞端形态及术中介入引导具有重要意义。

EPO-0966
肝泡球蚴病 MR 扩散成像与组织病理特点的对照分析

任波,张铁亮,刘文亚
新疆医科大学第一附属医院

目的：应用 MR 扩散成像技术（diffusion-weighted imaging ,DWI）观察肝泡球蚴病（hepatic alveolar echinococcosis, HAE）的影像特征，并分析病灶内不同区域 MR-DWI 参数 ADC 值与组织病理学指标的关系，探讨 ADC 值在评价 HAE 病变组织病理特征方面的价值。**方法：**26 例 HAE 患者行肝脏常规 MR 扫描并加做 MR-DWI 扫描序列，获得病灶中心、边缘区域及周围肝脏组织的 ADC 值，并与周围正常肝脏的 ADC 值进行比较；其中 19 例患者行手术治疗者，观察新鲜手术标本的特点，取病灶边缘区域行 HE 染色和免疫组化测定微血管密度（MVD），分析 DWI-ADC 值与 MVD 的相关性。**结果：**26 例中选取独立 HAE 病灶 32 个，测得病灶中心、病灶边缘区域及周围肝脏组织的 ADC 值的均值之间的差异均有统计学意义(P＜0.05)；组织病理观察提示病灶内不同成分表现不同的 DWI 图像；19 例手术者病灶边缘区域 MR-DWI ADC 值与 MVD 无相关性(P＜0.05)；**结论：**MR-DWI 图像可以反映 HAE 病灶的组织异型性特征，并有助于判别病灶生物学特点；病灶边缘区域的 ADC 值与该区域微血管密度（MVD）无相关性。

EPO-0967
肝脏遗传性毛细血管扩张症的 CT 表现

杨秀娟
重庆三峡中心医院

目的：探讨肝脏遗传性出血性毛细血管扩张症的 CT 表现。方法：回顾性分析经临床证实的肝脏遗传性毛细血管扩张症的 CT 表现，并对国内外相关文献复习。结果：27 例肝脏遗传性毛细血管扩张症患者，CT 表现如下：①21 例毛细血管扩张，表现为动脉期肝实质内弥漫分布结节状强化灶，门静脉期和延迟期呈等密度；②20 例肝动静脉畸形，动脉期肝实质强化不均，其内弥漫分布点状、结节状、斑片状强化灶，肝动脉增粗迂曲，肝静脉早显；③12 例肝动静脉瘘，肝动脉增粗迂曲，肝静脉增粗早显，肝实质内弥漫分布点状、结节状强化灶；④19 例肝动脉-门静脉瘘，肝动脉增粗迂曲，门静脉增粗早显；⑤4 例混合型动静脉瘘，同时伴有肝动静脉瘘和肝动脉-门静脉瘘特点；⑥6 例门静脉-肝静脉瘘，门静脉及其分支增粗，肝静脉早显。结论：肝脏遗传性毛细血管扩张症的 CT 多期增强表现具有特征性。

EPO-0968
基于磁共振扩散加权成像评价肝泡状棘球蚴病肝脏功能的初步研究

王琦[1],张源[2],刘文亚[1]
1.新疆医科大学第一附属医院
2.新疆医科大学第四附属医院

目的：探讨扩散加权成像（Diffusion weighted imaging DWI）及表观扩散系数值（Apparent diffusion coefficient ADC）在评价肝泡状棘球蚴病（Hepatic Alveolar Echinococcosis HAE）肝脏功能的应用价值。**方法**：回顾性分析 68 患者及 30 健康志愿者，均行肝脏常规 MRI 和 DWI，b 值为 0 和 600s/mm^2，根据 Child-Pugh 分级标准将病例组分为 3 组，A 组共 45 例，B 组共 19 例，C 组共 4 例，测量正常肝实质内的 ADC 值，并以同层面椎管内脑脊液的 $ADC_{椎管}$进行标准化处理即 $ADC_{比值}$=ADC/ $ADC_{椎管}$；首先分析病例组 $ADC_{比值}$与 Child-Pugh 评分的相关性；其次对照组与病例组采用独立样本 t 检验，病例组组间采用单因素方差分析。**结果**：正常对照组 $ADC_{比值}$为 0.29±0.03；病例组 $ADC_{比值}$为 0.27±0.05；病例组 A 组的 $ADC_{比值}$是 0.28±0.05；B 组 $ADC_{比值}$是 0.25±0.04；C 组 $ADC_{比值}$是 0.21±0.02；病例组 ADC 值与 Child-Pugh 评分呈中度相关，r=0.432(P<0.01)；正常组与病例组间差异有统计学意义（P<0.01），病例组 A 组与 B 组、A 组与 C 组间差异均有统计学意义（P<0.01），病例组 B 组与 C 组间差异无统计学意义（P>0.05）。**结论**：ADC 值有望评估肝泡状棘球蚴病的肝脏功能，并且随着肝脏功能的下降。

EPO-0969
定量 MRI 评价肝泡型包虫病肝储备功能的初步探讨

张茜茹,张铁亮,刘文亚
新疆医科大学第一附属医院

目的 探讨磁共振 T1mapping、T2mapping 成像定量评价肝脏泡型包虫病残肝功能的临床应用价值。**方法** 收集我院行磁共振常规序列、T1maping 及 T2maping 序列检查病例，共 56 例，患者平均年龄 48±7 岁，分成两组（正常对照组、病例组），对照组纳入 20 例正常志愿者，男性 10 名，女性 10 名，病例组纳入 36 例经临床综合诊断肝泡型包虫病的患者，男性 17 名，女性 19 名，扫描前病例组均有抽取静脉血行肝功能测定，然后根据肝功能 Child-Pugh 评分分级再次进行分组，分为 A（n=14）、B（n=12）、C（n=10）三组，扫描完成后的图像传输至西门子后处理工作站进行测量病例组残肝实质及正常对照组肝实质 T1mapping 序列的 T1 值及 T2mapping 序列的 T2 值。采用方差分析两两比较四组间 T1、T2 值。**结果** 对照组 T1 值为 338.9±95.6ms，T2 值为 42.7±3.1ms；A 组 T1 值为 393.47±158ms，T2 值为 43.74±5.3ms；B 组 T1 值为 351.5±84.7ms，T2 值为 57.85±7.7ms；C 组 T1 值为 460.9±76.0ms，T2 值为 65.9±3.0ms。各组 T1 值两两比较差异均无统计学意义（P＞0.05），T2 值四组间两两比较正常组对照组与病例组 A 组差异无统计学意义（P＞0.05），正常对照组与病例组 B、C 组及病例组 A、B、C 三组间差异有统计学意义（P＜0.05）。**结论** 磁共振 T2mapping 成像技术有望用于定量评价患者肝泡型包虫病残肝储备功能，为临床医生制定治疗方案提供帮助。而 T1mapping 成像技术定量评价肝泡型包虫病患者残肝功能的价值仍需论证。

EPO-0970

腹部磁共振增强结合 DWI 技术对肝脏良恶性肿瘤的鉴别诊断价值研究

陈轶
陆军军医大学附属新桥医院放射科

目的 探讨腹部磁共振（MRI）动态增强扫描（DCEI）结合弥散加权成像（DWI）技术对肝脏良恶性肿瘤的鉴别诊断价值。**方法** 回顾性分析 2017 年 3 月至 2019 年 3 月我院 64 例（91 个病灶）肝肿瘤患者的临床资料，经手术病理证实为恶性病灶 61 个，良性病灶 30 个。患者均行 MRI DCEI 及 DWI 检查，观察肝脏病灶在上述序列上的表现特征，评估 MRI DCEI 联合 DWI 对肝脏良恶性肿瘤的鉴别诊断价值。**结果** 恶性病灶中 DCEI 表现为快进快出、DWI 呈高信号者占比大于良性病灶（P＜0.05）。DCEI 联合 DWI 诊断灵敏度、准确度高于 DCEI、DWI 单独诊断（P＜0.05）；特异度与 DCEI 诊断差异无统计学意义（P＞0.05），均高于 DWI（P＜0.05）。**结论** 良性、恶性肝肿瘤 DCEI、DWI 表现特征差异显著，DCEI 联合 DWI 诊断肝肿瘤可显著提高诊断准确度和灵敏度，对肝肿瘤良恶性鉴别诊断有重要价值。

EPO-0971
肝泡球蚴病边缘区域 MR 弥散加权成像成像与组织病理对照研究

张铁亮,任波,刘文亚
新疆医科大学第一附属医院

目的：应用 MR 扩散成像技术（diffusion-weighted imaging ,DWI）观察肝泡球蚴病（hepatic alveolar echinococcosis, HAE）的影像特征，并分析病灶边缘区域 MR-DWI 参数 ADC 值与组织病理学指标的关系，探讨 ADC 值在评价 HAE 边缘区域血流状态的应用价值。方法：26 例 HAE 患者行肝脏 MR-DWI 扫描检查，获得病灶中心、边缘区域及周围肝脏组织的 ADC 值，对病灶中心、病灶边缘及周围正常肝脏的 ADC 值进行比较；其中 19 例患者行手术治疗，观察新鲜手术标本后，取病灶边缘区域行 HE 染色和免疫组化测定微血管密度（MVD），分析 DWI-ADC 值与 MVD 的相关性。结果：26 例中选取独立 HAE 病灶 32 个，测得病灶中心、病灶边缘区域及周围肝脏组织的 ADC 值的均值之间的差异均有统计学意义(P＜0.05)；19 例术后病灶边缘区域 MR-DWI ADC 值与 MVD 无相关性(P＜0.05)；结论：MR-DWI 图像可以反映 HAE 病灶边缘浸润带组织异型性特征，并有助判别病灶浸润范围及生物学边界；边缘带 ADC 值与该区域微血管密度（MVD）无相关性。

EPO-0972
基于普美显增强 MRI 不同时间点下不同肝叶的静态肝功能指数诊断肝硬化效能的研究

黄渝程
四川省达州市中心医院

目的：研究在不同时间点下普美显增强的磁共振扫描的静态肝功能指数在鉴别肝硬化和正常肝脏的价值。
方法：收集我院从 2016 年 12 月到 2019 年 1 月的肝硬化病例(41 例)，入组患者通过腹部超声检查提示肝硬化改变，有 49 例健康志愿者入组，所有受试者行 MRI 平扫+增强检查，磁共振为西门子

3.0 T 扫描仪，使用平扫序列包括屏气 T1 加权双梯度回波同反向位相序列，屏气半傅立叶采集单次激发快速自旋回波 T2 加权成像，呼吸触发单次激发 T2 加权序列和呼吸触发单次激发平面回波成像序列(b 值为 0, 500, 和 1000 s/mm^2)。增强扫描使用肝胆特异性对比剂钆乙氧基苄基二乙烯三胺五乙酸注射液，商品名普美显，以 1ml/s 的剂量注射 0.025 mmol/kg。增强扫描动脉期图像使用 TWIST-VIBE 序列在单一屏气期(对比剂注射后 15-20s)获得。所有受试者均采用相同的方法获得门静脉(注射对比剂后 60-90s)、移行期(注射对比剂后 120~240 s)和注射对比剂后 5min、10min、15min 及 20 min 扫描图像。另有分别在不同时间点扫描图像上肝左右叶及脾脏作 ROI，避开血管及胆管，测得信号值，计算静态肝功能指数 LSC-N，
统计学分析采用两因素重复测量方差分析，探究对于正常受试者和肝硬化患者左右肝叶注射造影剂后不同时间点测得 LSC-N 差异是否具有统计学意义，ROC 曲线分析不同时间点区分效能的灵敏度和特异度。
结果：不同时间点下的正常受试者和肝硬化患者肝左右叶的 LSC-N 差异具有统计学意义（p＜0.05)，肝硬化者左右叶的 LSC-N 均低于正常受试者，在 20min 时，差异最大，左右叶敏感性分别为 0.781 和 0.816，特异性为 0.635 和 0.724，在 15min 时，右叶敏感性和特异性为 0.794 和 0.710。
结论：注射造影剂后 15min 的肝右叶 LSC-N 值可有望诊断肝硬化，能增加病人的舒适度，且降低医疗成本。

“黑环征”联合胰胆管形态改变对恶性低位胆道梗阻性疾病 诊断的鉴别价值

杨秀娟,曾文兵
重庆三峡中心医院

摘要 目的 探讨“黑环征”联合胰胆管形态改变对恶性低位胆道梗阻性疾病诊断的鉴别价值。**方法** 病理证实恶性低位胆道梗阻 67 例，行常规 MRI、MRCP 扫描。观察肿瘤是否出现 “黑环征”及胰胆管形态学改变。**结果**胰头癌可见“黑环征”，胆总管下段癌、壶腹癌未见。三组间胆道梗阻水平、管征存在显著统计学差异（P<0.01）。胰头癌为胆总管胰腺段梗阻，常见分离型双管征；胆总管下段癌、壶腹癌为胆总管壁内段梗阻，常见平行或聚拢型双管征。仅胆总管下段癌见三管征，胰头癌见四管征。三组间胆道梗阻面管腔形态存在统计学差异（P<0.05）,胰头癌、胆总管下段癌常见截断型，壶腹癌为漏斗或鸟嘴型。三组间肝内胆管扩张形态无统计学差异。胰胆管形态改变诊断胰头癌的 ROC 曲线下面积、灵敏度、特异度分别为 0.864、85.7%、87.2%。“黑环征”诊断胰头癌的 ROC 曲线下面积、灵敏度、特异度分别为 0.714、42.9%、100%。“黑环征”与胰胆管形态改变诊断胰头癌的 ROC 曲线下面积、灵敏度、特异度分别为 0.882、89.3%、87.2%。**结论**“黑环征”联合胰胆管形态改变对恶性低位胆道梗阻性疾病鉴别诊断具有重要价值。

EPO-0974
双源 CT 灌注成像对胰腺疾病的诊断价值

刘奕
西南医科大学附属中医医院

目的 探讨双源 CT 灌注成像对正常胰腺、胰腺癌和慢性胰腺炎的灌注参数特征及诊断价值。

资料与方法 对正常者、胰腺癌及慢性胰腺炎者共 45 例进行腹部增强 CT 及胰腺灌注成像,得到灌注图像和时间密度曲线（TDC）,测量正常组织及病灶区的血流量（BF）、血容量（BV）、平均通过时间（MTT）、表面渗透性值（PS）、灌注起始时间（TTS）、峰值（PE）及达峰时间（TTP）,比较正常胰腺各部位间、正常组与病变组的非病变区之间以及病变区之间各灌注参数差异的统计学意义。
结果 正常组、胰腺癌组和慢性胰腺炎组的病变区,除 TTS 外各参数的差异均有统计学显著性（P〈0.05）。正常胰腺头、体、尾间灌注参数的差异无统计学意义（P〉0.05）。三组的非病变区各参数的差异无统计学意义。
结论 双源 CT 胰腺灌注对胰腺癌及慢性胰腺炎的鉴别诊断有重要意义,能为临床诊断及治疗提供线索。

标题:肝脏肿瘤术前 3D 融合成像对手术的影响

蔡久娥
辽宁省肿瘤医院

目的：探索肝脏恶性肿瘤术前 3D 融合成像对外科手术术中的影响。方法：收集来自我院 9 例肝脏肿瘤住院患者进行了肝脏多期增强薄层 CT 扫描，并对患者的 CT 图像进行 3D 融合成像，并收集其手术方式、手术时间、手术难易程度、手术过程中是否有出血、及预后信息。另外收集 9 例本院患者有 CT 图像但未做 3D 融合成像的患者的手术方式、手术时间、手术难易程度、手术过程中是否有出血，及预后信息进行多方面比较。结果：两组手术时间做对比，做了 CT 图像 3D 融合成像的组为 164.22±29.786，未做 CT 图像 3D 融合成像组为 213.00±59.127,p=0.042，术中出血两组无显著差异，患者预后两组无显著差异。结论：肝脏肿瘤术前 3D 融合成像对手术的时间减少有指导意义，提前判断肿瘤位置，形状、大小及周围组织情况，减少术中的判断时间，以做到更精准下刀，减少病人痛苦，帮助临床医生解决了很大难题。

肝脏细胞外体积分数对于肝细胞肝癌与转移瘤的鉴别诊断价值

崔凤娇,罗娅红
辽宁省肿瘤医院

目的：探索肝脏细胞外体积分数（fECVs）对肝细胞肝癌与转移瘤的鉴别诊断价值。
方法：选取我院经病理确诊为肝细胞肝癌的患者 33 例（有肝纤维化病史），肝转移肿瘤患者 7 例（无肝纤维化病史），进行肝脏常规多期 CT 增强扫描，通过平扫及平衡期（注射对比剂 3min 后）计算肝脏肿瘤（Etumor）、正常肝脏（Eliver）及主动脉（Eaorta）绝对强化值，并通过以下公式计算肝脏肿瘤部分及肝脏正常实质部分 fECV 值：fECV1（%）=Etumor/Eaorta（100-Hct[%]）,fECV2（%）=Eliver/Eaorta（100-Hct[%]），分析不同类型肝脏肿瘤之间 fECV1、fECV2 值的差异。
结果： 原发性肝癌与肝转移瘤患者的正常肝实质部分细胞外体积分数 fECV2 差异具有统计学意义（p=0.032），肝脏肿瘤部分细胞外容积无显著差异（p=0.985）
结论：肝硬化背景基础上的肝细胞肝癌与无肝硬化背景的转移瘤细胞的肝脏肿瘤部分细胞外容积无差异，而肝脏实质部分的细胞外容积可用来鉴别肝细胞肝癌与转移瘤。

EPO-0977
应用术前 CT 纹理分析预测肝癌 TACE 术后疗效的研究

陈济琛
广东医科大学附属医院

目的 探讨术前 CT 纹理分析预测肝癌 TACE 术后疗效。方法 回顾性分析首次 TACE 术前行增强 CT 检查，术后按时复查的肝癌病人，共有 101 人，104 个目标病灶。根据实体瘤 mRECIST 评价标准，将完全缓解及部分缓解合为缓解组，共 46 例；稳定及进展合为非缓解组，共 58 例。导入 CK（CT Kinetics，GE Healthcare）软件，构建类灌注图及勾画目标病灶得出类灌注图的纹理参数。对两组数据行正太分布检验后行独立样本 T 检验及秩和检验。对有统计学差异参数行 ROC 曲线分析。结果 两组病人均一性、偏度、中值、聚类分析、相对偏差、Haralick 相关、逆差矩、GreyLevelnonuniformity、ShortRunEmphasis 、 LongRunEmphasis 等参数明显统计学差异。AUC 值多个>0.6。结论 表明不同 TACE 疗效的病人术前 CT 纹理分析是不一样的，术前 CT 纹理分析预测肝癌 TACE 术后疗效有一定的价值。

EPO-0978
Gd-EOB-DTPA（钆塞酸二钠）增强 MRI 在肝脏局灶性病变诊断与鉴别诊断中的应用

罗竹人,汪艳
厦门大学附属第一医院

目的：
比较钆塞酸二钠增强 MRI 剂及螺旋增强 CT 对肝脏局灶性病变诊断效能，探讨钆塞酸二钠（Gd -EOB -DTPA）增强 MRI 在肝脏局灶性病变（focal liver lesions ，FLLs）诊断及鉴别诊断价值。
材料和方法：
收集 2017 年 10 月至 2018 年 11 月厦门大学附属第一医院诊断肝脏局灶性病变明确，研究组包括 42 例同时经钆塞酸二钠增强 MRI 和螺旋 CT 增强扫描的患者，42 例患者均经过病理或随访证实。由 2 名放射科医生对不同的肝脏病灶进行独立盲法分析，同时对阅片对病灶分类的诊断信息作以评估，比较钆塞酸二钠增强 MRI 和螺旋增强 CT 在肝脏局灶性病变上的检出率、准确率及典型图像之间的差异。
结果：
51 例肝脏局灶性病变。经病理或临床随访 6-9 个月诊断肝细胞肝癌（HCC）8 例、肝硬化结节 5 例，肝血管瘤 16 例，局灶性结节增生 8 例（FNH），肝转移 14 例。钆塞酸二钠增强 MRI 发现肝细胞肝癌（HCC）8 例、肝硬化结节 5 例、肝血管瘤 16 例、有 8 例局灶性结节性增生（FNH）和 14 例肝转移，病灶检出率 100.0%，螺旋增强 CT 共发现肝细胞肝癌（HCC）5 例、肝硬化结节 4 例、肝脏血管瘤 9 例，肝脏局灶性结节性增生（FNH）8 例，肝转移瘤 10 例，病灶检出率 70.6%。钆塞酸二钠增强 MRI 诊断肝细胞肝癌（HCC）6 例、肝硬化结节 5 例、肝血管瘤 16 例、有 8 例局灶性结节性增生（FNH）和 14 例肝转移，诊断准确率 96.1%，螺旋增强 CT 共诊断肝细胞肝癌（HCC）3 例、肝硬化结节 3 例、肝血管瘤 9 例、局灶性结节性增生（FNH）3 例，肝转移 7 例,诊断准确率 49.0%。钆塞酸二钠增强 MRI 检出率及准确率均明显优于螺旋增强 CT 的结果，得到与临床相似的结果。
结论：
钆塞酸二钠（Gd -EOB -DTPA）增强 MRI 能够提高病变的诊断及鉴别诊断准确率。

EPO-0979
肝外胆管神经内分泌癌的影像学表现和临床分析

毛锐利,李然
陆军军医大学大坪医院

目的：回顾性地分析肝外胆管神经内分泌癌的影像学表现和临床症状，以提高对该疾病的认识。**方法：**收集我院从 2009 年 1 月—2016 年 4 月 6 例肝外胆管神经内分泌癌的资料，其中男性 2 例，女性 4 例，年龄从 41—78 岁，发生在胆囊者 2 例，肝总管 2 例，胆总管 2 例。所有患者均行 MSCT 增强扫描，其中 5 例患者还行 MRI 增强扫描。分析 6 例神经内分泌癌的生长形态（结节型、管内生长型和管外浸润型）、平扫 CT 值、MRI 信号特点、增强强化程度（与肝脏相比）等征象，收集 6 名患者临床病史，包括有无胆道手术史、有无黄疸、腹痛腹泻，肝功指标、CA199 和 CEA 是否增高等。**结果：**4 例神经内分泌癌在 CT 上呈结节样生长型，1 例为管内生长型，1 例向管外浸润。6 例肿瘤 CT 平扫均为软组织密度影，CT 值为 29—36HU，增强动脉期 5 例肿瘤强化程度与肝脏强化一致，1 例（管内生长型）强化程度高于肝脏，增强静脉期 5 例强化程度低于肝脏组织，1 例强化程度与肝脏基本一致。在 MRI T1WI 上所有 5 例肿瘤的信号均低于肝脏，在 T2WI 上 3 例肿瘤信号高于肝脏，2 例与肝脏呈等信号，在 DWI（b=1000）上 5 例肿瘤明显弥散受限。增强动脉期，1 例患者强化程度高于肝脏组织，4 例与肝脏强化程度一致，静脉期 2 例强化程度与肝脏一致，3 例低于肝脏强化程度。1 例患者有胆囊切除病史，1 例患者有长期腹痛腹泻，2 例患者 CA199 和 CEA 增高，5 例患者 AST、ALT 高于正常值。**结论：**肝外胆管神经内分泌癌是临床上罕见的肿瘤，可出现腹痛、腹泻等症状，肿瘤多呈结节样生长，除管内生长型外其余类型的肿瘤动脉期强化程度低于肝脏组织，CT 和 MRI 可准确显示肿瘤的生长部位和与周围组织的关系，根据其强化特点和临床表现可对胆管神经内分泌癌的诊断提供有价值的信息，最后确诊仍依靠病理学诊断。

EPO-0980
MSCT 误诊漏诊肝外胆管癌的特征分析及对策

王晓宇,尚华
河北医科大学第二医院

目的：回顾性分析经手术病理证实的肝外胆管癌（EHCC）患者的 MSCT 影像特征，探讨其误诊及漏诊的原因。
方法：对 77 例术前行 MSCT 上腹部平扫及增强扫描、术后病理证实为肝外胆管癌的患者的图像进行分析，观察病变的形态、发生部位、范围、强化程度、胆道梗阻程度。
结果：77 例患者中，5 例在 MSCT 检查前进行了胆道外科操作，因此在之后的研究中排除这 5 例。余 72 例患者中，22 例未能诊断 EHCC，误漏诊率为 30.6%。浸润型 EHCC 和肿块型 EHCC 的误漏诊率分别为 56.3%、10.0%。肝门部 EHCC、胆总管 EHCC 总的误漏诊率分别为 23.3%、35.7%；肿块型 EHCC 组中，发生于肝门部和胆总管的 EHCC 误漏诊率分别为 13.6%、5.9%；浸润型 EHCC 组中，发生于肝门部和胆总管的 EHCC 误漏诊率分别为 50.0%、58.3%。肿块型和浸润型 EHCC 组中，＜1.5cm、1.5-2.0cm、＞2.0cm 的肿瘤误漏诊率分别为 16.7%、6.7%、11.1%及 66.7%、40.0%、60.0%。肿块型和浸润型 EHCC 组中，病变轻度、中度、明显强化患者的误漏诊率分别为 25.0%、10.0%、6.7%及 50%、55.6%、57.1%。42 例胆总管 EHCC 中，胆总管不扩张、胆总管轻度、中度、重度扩张患者的误漏诊率分别为 27.2%、62.5%、50.0%、20.0%。72 例 EHCC 病例均伴有肝内胆管不同程度扩张，Ⅰ级胆管分支轻度、中度、重度扩张患者的误漏诊率分别为 33.3%、47.1%、25.0%；Ⅱ级胆管分支轻度、中度、重度扩张患者的误漏诊率分别为 57.1%、39.3%、15.6%。

结论：EHCC 的误漏诊与肿瘤的形态、Ⅱ级胆管分支的扩张程度有关，浸润型 EHCC 误漏诊率高于肿块型 EHCC，Ⅱ级胆管分支扩张越明显，误漏诊率越低。EHCC 的误漏诊与肿瘤的大小（长度范围）、发生部位、强化程度关系不大。

EPO-0981
术前 CT 影像分站评估肝内胆管细胞癌淋巴结转移

毛应凡,何健
南京大学医学院附属鼓楼医院

目的：探讨肝内胆管细胞癌（ICC）患者有无转移的淋巴结的计算机断层扫描（CT）指标的差异，以第 12 站和第 8 站淋巴结为例，分别计算预测淋巴结转移的单独最佳截止值和它们的预测效能。
方法：在已知术后病理结果的基础上回顾性分析 63 例 ICC 患者每站淋巴结转移情况。比较转移淋巴结和非转移淋巴结的术前 CT 指标的差异，包括短轴径，长轴径，短-长比，形状（规则/不规则）,边界轮廓（光整/不光整），CT 密度（均质/不均质），钙化（有/无），边缘强化(有/无)，邻近脂肪间隙（清晰/不清晰）,动脉期 CT 值,门静脉期 CT 值和平衡期的 CT 值。采用受试者工作特征分析测试淋巴结的尺寸和增强 CT 值在预测第 12 站淋巴结和第 8 站淋巴结淋巴结转移中的单独最佳截止值和预测效能。
结果：转移性淋巴结占所有淋巴结的 13.2%。第 12 站和第 8 站淋巴结在所有 16 个站中的转移阳性率最高（分别为 17.1%和 16.2%）。当第 12 和站第 8 站均无转移性淋巴结时，ICC 患者不发生淋巴结转移的概率为 93.5%（43/46）。转移性淋巴结和非转移性淋巴结在短轴径，长轴径，动脉期 CT 值，门静脉期 CT 值和平衡期 CT 值，形状，边界轮廓，CT 密度和边缘强化方面存在显著差异。第 12 站淋巴结的短轴径，长轴径，动脉期 CT 值，门静脉 CT 值和平衡期 CT 值的单独最佳截止值分别是 11.8 mm,15.5 mm,74.5 HU,81.5 HU,73.0 HU（AUC：0.730 - 0.956）。第 8 站淋巴结的短轴径，长轴径，动脉期 CT 值，门静脉 CT 值和平衡期 CT 值的单独最佳截止值分别是 9.0 mm，14.2 mm,65.5 HU,92.5 HU,75 HU（AUC：0.735 - 0.921）。
结论：转移性淋巴结和非转移性淋巴结在短轴径，长轴径，动脉期 CT 值，门静脉期 CT 值和平衡期 CT 值，形状，边界轮廓，CT 密度和边缘强化方面存在显著差异。分站评估可以提高预测 ICC 淋巴结转移的准确性。

Waldenstrom 巨球蛋白血症的影像学表现及临床特点

李烁,王勤,薛华丹,孙照勇,曹欣欣,金征宇
中国医学科学院北京协和医院

Waldenstrom 巨球蛋白血症(Waldenstrom macroglobulinemia，WM)一种罕见的 B 细胞淋巴瘤，临床上以骨髓或淋巴结中浆细胞样淋巴细胞浸润和血清中存在大量的单克隆 IgM 为特征。目前，关于 WM 的影像学表现报道非常少见。本研究回顾性分析 32 例 WM 的影像学表现及临床特点，以期为积累临床经验。
目的：探讨 Waldenstrom 巨球蛋白血症(WM)的影像学表现及临床特点。
方法：回顾性分析 32 例 WM 的临床特点、实验室检查结果及影像学表现。
结果：32 例 WM 患者中，男性 20 例女性 12 例，发病年龄 39-78 岁（中位年龄 62.5 岁）。乏力及高粘滞综合征是其最常见的首发症状。3 例行全身磁共振检查的患者，可见 DWI 序列骨髓弥漫性信号增高，平均 ADC 为 0.85(0.6-1.3)。8 例患者脾脏肿大，13 例患者淋巴结肿大。其它影像学表现包括：多浆膜腔积液（心包积液，胸腔积液，腹盆腔积液），肝脏增大。多数患者伴有β2 一微球

蛋白及血清单克隆 IgM 升高。血清单克隆 IgM 升高与患者的预后相关(P<0. 5)。结论：WM 的影像学表现具有一定的特征性，有助于患者个体化治疗方案的制定。

EPO-0983

MR T2 -mapping 及 T1 -mapping 定量分析大鼠部分肝切除术后残肝再生的价值

邱才新
1.天津市第一中心医院
2.南开大学附属第一中心医院

目的：探讨 MR T2 -mapping 及 T1 -mapping 定量分析大鼠部分肝切除术后残肝再生的价值
方法：对 24 只大鼠不同比例肝部分切除模型术前、术后 2 小时内，术后 1、2、3、5、7、14、21 天共 9 个时间点进行 MR T 1 mapping、T 2 mapping 成像，并测量肝实质 T 1 值(ms)、T 2 值(ms)，采用单因素方差分析比较组内各时间点以及组间同一时间点间 T 1 值， T 2 值差异。
结果:术后不同时间点 T1、T2 值均有上升，且 T1 值的上升早于 T2 值，上升程度也大于 T2 值，上升高峰在术后第 3 天，随后逐渐恢复至术前值。70%肝切除组 T2 值明显高于 30%组肝切除组的 T 2 值，且两者之间具有统计学意义（P<0.05）。
结论：MR T2 -mapping 及 T1 -mapping 定量分析技术对评估大鼠部分肝切除术后残肝再生均具有一定价值。T1 -mapping 及 T2 -mapping 有望早期监测残肝再生情况及预后。

EPO-0984

Comparison of the severity between recurrent pancreatitis and acute pancreatitis based on computed tomography

ju Zhang,Xiaoming Zhang,Yong Chen,Juanjuan Du
Sichuan Key laboratory of Medical Imaging and Department of Radiology， Affiliated of North Sichuan Medical College， Nanchong， Sichuan 63700

Objective: the purpose of the study was to compare the severity of recurrent pancreatitis with acute pancreatitis.

Methods: Inpatients with acute pancreatitis and recurrent pancreatitis in affiliated hospital of North Sichuan Medical College from January 2017 to June 2019 were collected in this retrospective study. The patients were divided into initial group and recurrent group based on initial and recurrence events. Clinical information including age, sex, etiology, length of hospital stay, diabetes, the revised 2012 Atlanta classification (RAC), acute physiology and chronic health evaluation score (APACHEⅡ) and bedside index for severity in acute pancreatitis score (BISAP) were analyzed. Radiological features based on computed tomography included computed tomography severity index (CTSI), extrapancreatic inflammation on CT (EPIC), pancreatic and/or extrapancreatic necrosis and local complications.

Results: A total of 297 people were included in the study, 222 in the initial group and 75 in the recurrent group. Age, sex, length of hospital stay, diabetes, APACHEⅡ,pancreatic and/or extrapancreatic necrosis and local complications were not statistical difference between the two groups. Hyperlipidemic pancreatitis was more common in the recurrent group (p=0.026) and RAC was higher in the recurrent group than in the initial group (P=0.039). CTSI in the recurrent group was higher than those in the initial group (P=0.025). EPIC was lower in the recurrent group (P = 0.018).
Conclusions: The RAC and CTSI are higher in recurrent pancreatitis than in acute pancreatitis, but EPIC is lower in recurrent pancreatitis.

Key Words: severity, acute pancreatitis, recurrent pancreatitis.

EPO-0985

扩散加权成像（DWI）结合肝细胞特异性对比剂普美显对术前化疗后结直肠肝转移的评估

刘玲玲
陆军军医大学第一附属医院

目的：比较肝细胞特异性对比剂普美显和弥散加权（DWI）序列单独和联合成像用于检测术前化疗结直肠肝转移患者的诊断准确性和敏感性。
材料与方法：本实验回顾性分析了我院 2015 年 1 月 1 日-2018 年 12 月 31 日 3 年期间 78 例结直肠癌肝转移患者的临床资料，共 239 个病灶，其中，211 例（88.3%）经病理证实为结直肠癌肝转移灶。 将图像分三组，分别为：肝细胞特异性对比剂普美显组; DWI 组;肝细胞特异性对比剂普美显和 DWI 的联合组，分别由两名经验丰富的放射科专家独立阅片， 存在不一致时，由两名专家协商讨论达成一致。
结果：肝细胞特异性对比剂普美显组正确识别的病变： 239/183（准确性：76.6%; 95% CI :69.3-82.7）和 211/155 转移灶（敏感性：73.5%，95%CI： 65.6-80.6），DWI 组正确识别的病变：239/155（准确性：64.9%，95%CI ：57.3-72.3）和 211/127 转移灶（灵敏度：60.2%，95%CI ：51.9-68.5），肝细胞特异性对比剂普美显和 DWI 的联合组正确识别的病变：239/213（准确性：89.1%，95%CI ：83.4-93.4）和 211/192 转移灶（敏感性：91.0%，95% CI ：85.1-95.1），差异具有统计学意义（P <0.001）。并且，值得注意的是，联合组在诊断直径小于 1cm 的转移灶时具有意义（P <0.001）。
结论：DWI 与肝细胞特异性对比剂普美显联合应用，可显著提高术前化疗结直肠癌肝转移患者的诊断准确性和敏感性，对直径小于 1cm 的转移灶有较好的诊断效果。

EPO-0986

Development of a radiomics nomogram for prediction of lymph node metastasis of intrahepatic cholangiocarcinoma

Lei Huo
Shanghai Eastern Hepatobiliary Surgery Hospital

Objectives This study was to develop a radiomics nomogram for preoperative prediction of lymph node metastasis (LNM) of intrahepatic cholangiocarcinoma (ICC).
Methods A total of 247 mass-forming ICC patients who underwent hepatectomy, lymph node dissection and preoperative CT scan from January 2010 to December 2016 were included. Of them, 70% (172 cases) were randomly selected as the training cohort and the remaining 30% (75 cases) as the validation cohort. All the CT image data are extracted by using PACS system (GE), whose extraction format is DICOM. The Pyradiomics package of Python was used to extract statistical features, shape features, texture features and wavelet features. The random forest model was used to optimize the super-parameters of the model and the relative importance of each radiomics feature and the radiomics score were obtained. The radiomics nomogram was established based on the Logistic regression.
Results: 832 radiomics features were successfully extracted by Pyradiomics, 26 of which were further screened. The radiomics score had a good performance in predicting lymph node metastasis (AUC: 0.784). Multivariate Logistic regression analysis showed that the independent predictive factors of lymph node metastasis were: preoperative imaging tumor diameter, tumor located in left lobe, diagnosis of lymph node metastasis by CT and radiomics score. The radiomics nomogram for prediction of lymph node metastasis was developed based on the results of Logistic regression and the RCS transformation of preoperative imaging tumor diameter. The optimal threshold to discriminate high or low risk of lymph node metastasis was 10.5 points.
Conclusion: The radiomics score had a good performance in predicting lymph node metastasis. The radiomics nomogram for prediction of lymph node metastasis of ICC was an individualized prediction tool for clinical use.

EPO-0987
探讨普美显 MRI 强化联合 DWI 在肝硬化背景下对于小肝癌的诊断价值

何苹,闫建华
天津市第三中心医院

目的：探讨普美显动态增强联合 DWI 对肝硬化背景下的小肝癌的诊断价值。
方法 收集本院确诊的小肝癌患者（67 例），均进行 MRI 普美显增强联合 DWI 检查。比较普美显增强及 DWI 对病灶的检出率及两者联合 DWI 对肝癌的诊断效能。
结果：67 例患者中共计 92 个小肝癌。其中肝胆期低信号 80 例，DWI 高信号 60 例，稍高信号 10 例，等信号 22 例。普美显增强病灶检出率显著高于 DWI（P 约 0.05）。与常规增强+DWI 相比， 普美显结合 DWI 表现诊断肝癌的信心评分增加（P 约 0.0001）。
结论 ：普美显动态增强联合 DWI 有助于肝硬化背景下小肝癌的检出，两者联合总诊断敏感性达到 95%以上。

EPO-0988
基于多排螺旋 CT 不同强化类型肝癌与介入术后疗效对比的研究

何苹,闫建华
天津市第三中心医院

探讨原发性肝癌多期强化 CT 表现与经肝动脉化疗栓塞(TACE)疗效的关系.方法:选择 2012 年 4 月-2019 年 4 月间行多期多排螺旋 CT 强化并进行 TACE 治疗的原发性肝癌患者 80 例,根据多期强化 CT 表现,将患者分为富血供组(62 例)和中等血供组(13 例),乏血供组 5 例术后随访 3 个月至 2 年,以 mRECIST 标准评估肿瘤疗效,分析 DSA 血供分型与患者疗效及预后的关系.结果:TACE 术后 2 个月,富血供组完全缓解(CR)2 例(4.5%),部分缓解(PR) 29 例(65.9%),疾病稳定(SD)6 例(13.6%),疾病进展(PD)7 例(8.6%),客观有效率(CR+PR) 70.4%,疾病控制率(CR+PR+SD) 84.0%;中等血供组 CR 0 例(0.0%),PR 5 例(29.4%),SD 4 例(23.5%),PD 8 例(47.1%),客观有效率 29.4%,疾病控制率 52.9%.富血供组、中等血供组中位生存期分别为 14 与 7.9 个月,6、12、24 个月累计生存率分别为 91.0%、68.0%、20.4%与 59.1%、23.0%、12.1%,差异均有统计学意义(均 P＜0.05).结论:原发性肝癌 CT 血供分型与 TACE 治疗效果密切相关,富血供型肝癌 TACE 治疗效果较好.

EPO-0989

多层螺旋 CT 评价直肠癌 TNM 分期与病理的对比研究

姜慧杰
哈尔滨医科大学附属第二医院

目的

直肠癌是我国最常见的恶性肿瘤之一。目前直肠癌的治疗是以外科手术为主，术前、术后可以辅以放化疗，准确合理的术前分期，有利于最佳治疗方案制定，降低术后复发率，提高患者生存质量。本研究通过对比多层螺旋 CT 术前影像分期和术后病理分期，探讨多层螺旋 CT 三维成像对直肠癌病变术前分期价值。

方法

收集 76 例临床确诊为直肠癌的患者，使用多层螺旋 CT 进行扫描，通过二维、三维后处理方法，多角度、多方位地显示肿瘤的大小、部位、范围、肠管周围及远处脏器情况，并与术后病理比较进行对比研究，使用 SPSS17.0 软件，数据分析采用 Kappa 一致性检验。

结果

实验结果显示，MSCT 对肿瘤 T 分期总准确率为 81.6%。T1-T2 期准确率为 83.3%，T3 期准确率为 75.0%，T4 期准确率为 84.4%，对浆膜外侵犯的灵敏度、特异度分别为 94.2%、83.3%，阳性预测值和阴性预测值分别为：92.5%、87.0%。本组中，被高估 7 例，低估 7 例，经 Kappa 一致性检验分析，k 值=0.72，*P*=0.000，*P*＜0.01。

MSCT 对淋巴结 N 分期总准确率为 81.6%，对于 N0、N1、N2 评估，准确率分别为 83.3%、75.0%、84.4%，对转移淋巴结灵敏度、特异度评估分别为：80.8%、88.0%，阳性预测值和阴性预测值分别为 77.8%、89.8%，k 值=0.65，*P*=0.000，*P*＜0.01。

本实验中 CT 对直肠癌远处转移总准确率为 98.3%，M0、M1 准确率分别为 100%、40.0%，灵敏度、特异度分别为：40.0%、100%，阳性预测值和阴性预测值分别为：100%、95.9%，k 值=0.56，*P*=0.000，*P*＜0.01.

结论

MSCT 对于直肠癌原位肿瘤 T 术前分期与病理有很好一致性，可作为临床医生直肠癌术前分期常规影像学手段。对于早期（T1-2 期）和中晚期直肠癌准确性较好，对 T3 期评估准确性有待进一步研究提高。

EPO-0990

肝脏原发性神经内分泌肿瘤的三期增强 CT 特征

袁丹丹
贵州省人民医院

目的 探讨肝脏原发性神经内分泌肿瘤的三期增强 CT 特征。
方法 回顾性分析 2014 年 7 月至 2018 年 3 月贵州省人医院，经手术或穿刺病理证实且进行过肝脏三期 CT 增强检查的 7 例肝脏原发性神经内分泌肿瘤患者资料。患者均行肝脏三期增强 CT 扫描。根据肿块最大径将病变分为≥30 mm 组和<30 mm 组，观察病变的 CT 表现（边缘、囊变、坏死、钙化、出血、胆管扩张、强化特征、淋巴结情况）和病理表现。
结果 7 例病灶均为多发（其中 2 例弥漫多发），共有病灶 96 个。病灶最大径 3～65 mm。最大径≥30 mm 组病灶 22 个，最大径<30mm 组 74 个。（1）≥30 mm 组：3 个病灶边界不清，19 个病灶边界均清楚；20 个病灶有囊变坏死；增强扫描动脉晚期 9 个病灶呈环形强化，13 个病灶明显强化，门静脉期及延迟期 14 个病灶肿块呈持续强化，8 个病灶呈廓清征象。（2）<30 mm 组：68 个病灶边界清楚，6 个病灶边界模糊；14 例病灶可见囊变、坏死；增强扫描动脉期 28 个病灶呈环形强化，46 个病灶明显强化；门静脉期及延迟期 60 个病灶持续强化，14 个病灶表现廓清。两组病灶周边均无胆管扩张、出血、钙化征象病灶。2 例患者肝门区可见肿大淋巴结。
结论 肝脏原发性神经内分泌肿瘤较大病灶易囊变、坏死，无论病灶大小均不易出现出血、钙化、周边 胆管扩张 。动脉期病灶呈花环形、明显强化，静脉期及延迟期持续强化多见。

EPO-0991
对比增强 CT 对肾透明细胞癌的血管生成评估

方家杨
重庆市肿瘤研究所

研究目的：探究肾透明细胞癌中多个血管形态学指标与 CT 动态增强参数的关联。
材料与方法：本实验回顾性研究了本中心 37 例手术后被确诊为肾透明细胞癌的患者。CT 增强参数包括病灶的绝对及相对增强 CT 值。血管参数包括微血管/成熟血管直径、微血管/成熟形态因子、微血管密度、成熟血管数目、微血管/成熟总面积。求得 Spearman 相关系数以揭示动态增强 CT 参数与血管形态指标之间的相关性。
结果：成熟血管直径与静脉期和延迟期的相对增强值呈正相关，微血管直径与增强参数未见显著相关性。微血管密度和成熟血管数目与所有增强期的相对及绝对增强 CT 值呈正相关。微血管及成熟血管总面积与三个增强期的绝对增强值呈正相关。微血管及成熟血管的形态因子与增强参数未见显著相关性。
结论：CT 增强参数与多个形态学指标有相关性，这使我们对肾透明细胞癌的 CT 增强机制有进一步了解。

EPO-0992
胰胆管汇合类型和夹角与复发性急性胰腺炎的相关性研究

刘念,黄小华
川北医学院附属医院

目的：通过磁共振胰胆管水成像技术比较正常对照者、初发急性胰腺炎和复发性急性胰腺炎的胰胆管汇合类型和夹角的相关性，预测急性胰腺炎复发的风险因素。**方法**：按纳入和排除标准收集我院 2012 年 1 月至 2018 年 4 月初发急性胰腺炎 112 例为 A 组（AP），复发性急性胰腺炎病例 55 例为 B 组（RAP），正常对照组 69 例为 C 组（NORMAL）。每例均行常规磁共振和胰胆管成像（MRCP）检

查，在 MRCP 图像上测量胰胆管汇合夹角，测量三次取平均值；按照胰胆管汇合类型，将其分为 V 型、P-B 型和 B-P 型。对三组病例的胰胆管汇合夹角、汇合类型分别进行统计学分析，将三组患者的年龄、性别、汇合类型、汇合夹角采用多元 logistic 回归统计预测风险因素。**结果：**1.A、B、C 组之间汇合夹角两两比较均有统计学差异（p＜0.05）2.A（AP）组中 V 型 23 例，B-P 型 60 例，P-B 型 29 例；B（RAP）组中 V 型 14 例，B-P 型 37 例，P-B 型 4 例；C 组 V 型 14 例，B-P 型 23 例，P-B 型 32 例。A、B、C 三组间汇合类型两两比较均有统计学差异（p＜0.05）。3.V 型和 B-P 型、P-B 型和 B-P 型两组之间的平均汇合夹角有统计学意义（p＜0.05），V 型和 P-B 型的平均汇合夹角没有统计学意义（p＞0.05）。4.多元 logistic 回归分析显示：和正常对照组相比，年龄是 RAP 的保护因素；汇合夹角、V 型和 B-P 型都是 AP 和 RAP 的风险因素；RAP 相对于 AP 的保护因素是年龄，危险因素是 V 型和 B-P 型汇合。**结论：**胰胆管汇合夹角和汇合类型是复发性急性胰腺炎和初发急性胰腺炎的风险因素，随着汇合夹角的增大，或汇合类型是 V 型或 B-P 型者，患急性胰腺炎及复发的风险增加；发病时年龄越小的急性胰腺炎患者复发的风险越大。

EPO-0993
CT 和 MRI 在青少年肝脏未分化胚胎性肉瘤诊断价值分析

李鹏,李一鸣,刘筠
天津人民医院

目的 总结及分析青少年肝脏未分化胚胎性肉瘤（undifferentiated embryonal sarcoma of liver ，UESL）的 CT 及 MRI 表现，提高术前影像诊断准确率。**方法** 回顾性分析本院诊治的 10 例青少年（8-22 岁）UESL 的临床资料及 CT 及 MRI 影像学资料，并结合文献复习。**结果** CT / MRI 表现为单发或多发边界清晰的囊、实性肿块，其中实质性肿块 3 例，囊性肿块 4 例，囊实性 3 例，密度不均，病灶边界清楚，大小在 8.9cm ～ 25cm 之间囊内不规则分隔，囊壁边缘见少许软组织密度 / 信号影，病灶内易出血，增强后囊壁及分隔轻度渐进性强化。**结论** UESL 的 CT / MRI 平扫和动态增强表现有一定影像学特征，结合临床资料，有助于术前正确诊断。

EPO-0994
对比双能量与常规扫描模式在肝脏 CT 平扫中的图像质量和辐射剂量

何长久
四川省肿瘤医院

目的 对比双源双能量与常规扫描模式在肝脏 CT 平扫中的图像质量和辐射剂量。
方法 分别采用双源 CT 双能量扫描模式和常规扫描模式对腹部仿真体模进行扫描。两种扫描模式扫描范围一致。扫描完成后，分别重建 1 组常规扫描模式薄层图像（M 组）和 11 组双能量薄层图像。其中，双能量薄层图像包括线性融合图像 3 组[A 组（m=0.5）、B 组(140kV)、C 组（80kV）]、非线性融合图像 4 组[D 组（C=150HU，W=200HU）、E 组（C=100HU，W=200HU）、F 组（C=100HU，W=150HU）和 G 组（C=150HU，W=150HU）]和虚拟单能谱图像 4 组[H 组（70keV）、I 组（80keV）、J 组（60keV）、K 组（50keV）]。连续选择 10 层肝脏图像测量肝脏的 CT 值（$CT_{肝脏}$）和标准差（噪声），测量时运用复制、粘贴功能确保各组图像 ROI 的大小、形状、位置和层面保持一致，计算图像信噪比（SNR），其中，$SNR=CT_{肝脏}$/噪声。对比 M 组与双能量各组的图像质量（SNR、CT 值、噪声），并比较两种扫描模式的辐射剂量（CTD、DLP）。

结果 双能量各组与常规方案组的 CT 值差异均无统计学意义(P>0.05)。I 组的噪声低于 M 组，A、D、E、F、G、H 组的噪声高于 M 组，差异均无统计学意义(P>0.05)；其余各组噪声高于 M 组，差异均有统计学意义(P<0.05)。I 组的 CNR 高于 M 组，A、D、E、F、G、H 组的 CNR 低于 M 组，差异均无统计学意义(P>0.05)；其余各组 CNR 低于 M 组，差异有统计学意义(P<0.05)。双能量扫描模式的 CTD、DLP（8.40 mGy、88.3 mGy·cm）明显低于常规扫描模式（10.29 mGy、116.4 mGy·cm）。

结论 应用双能量扫描模式进行肝脏平扫并采用虚拟单能谱图像（80keV）重建时，在获得良好图像质量的同时，可有效降低辐射剂量。

Magnetic resonance morphologic features predict progression of incidental pancreatic cystic lesions during follow-up

Shuo Zhu,Sheng-Xiang Rao
Department of Radiology, Zhongshan Hospital, Fudan University

PURPOSE: To evaluate which magnetic resonance (MR) morphologic features could predict the progression of pancreatic cystic lesions which were suitable for follow-up.
METHODS: A total of 2,176 MR images of PCLs were retrospectively reviewed between January 2009 and December 2016. The study population was composed of 223 patients. Clinical data and MR morphologic features of PCLs were recorded. We divided the individuals into two sub-groups according to the final MR features. Univariable and multivariable regression analyses were performed to identify independent risk factors for progression of PCLs.
RESULTS: 37.7% (84/223) PCLs progressed during follow-up, compared to 62.3% (139/223) PCLs that were stable. Age (odds ratio (OR) = 1.042; p = 0.017), number of lesions (OR = 0.491; p = 0.048), communication to pancreatic duct (PD) (OR = 2.425; p = 0.007) and the septa (OR = 6.105; p < 0.001) were significant independent factors for progression of PCLs. Among 84 lesions of progression, 27.4% (23/84) lesions increased to ≥ 30 mm or showed worrisome imaging features at the end of follow-up which needs clinical interventions. The initial size and communication to PD were independent factors for progression of PCLs which needs clinical interventions (p < 0.001 and 0.011, respectively).
CONCLUSION: Age, number of the lesions, communication to PD and the septa were independent risk factors for the progression of PCLs, and the initial size and communication to PD could potentially predict PCLs needing clinical interventions.

胰腺癌胰周静脉侵犯的影像与病理 对照研究及预后分析

潘瑶,余日胜
浙江大学医学院附属第二医院

目的：回顾性分析胰腺癌患者门静脉（PV）/肠系膜上静脉（SMV）血管壁侵犯的影像学表现与病理之间的关系，并探讨其预后价值。**材料与方法：**回顾性收集 2012 年 1 月至 2016 年 12 月于我院行胰腺切除联合 PV 和/或 SMV 切除重建的胰腺癌患者的临床、影像及病理学资料。影像学表现主要记录肿瘤与 PV/SMV 关系、肿瘤包绕 PV/SMV 角度、肿瘤与 PV/SMV 接触长度。肿瘤与 PV/SMV 关系的影像学分型为Ⅰ型：血管与肿瘤无接触或血管与肿瘤接触，管壁光滑，血管无或轻度变形；Ⅱ型：血管凸面与肿瘤接触，狭窄小于 1/2；Ⅲ型：血管凹面与肿瘤接触，狭窄小于 1/2；Ⅳ型血管狭窄大于 1/2；Ⅴ型：（6）血管闭塞或栓子形成。PV/SMV 血管壁侵犯的病理学分级为 A 级：血管壁未受侵犯；B 级：血管外膜受侵犯；C 级：血管中膜受侵犯；D 级：血管内膜受侵犯。**结果：**肿瘤与 PV/SMV 关系为Ⅰ型患者 18 例，PV/SMV 血管壁均未受侵犯；Ⅱ型患者 18 例，10 例 (55.6%)血管壁受侵犯；Ⅲ型患者 18 例，15(83.3%)血管壁受侵犯；Ⅳ型患者 13 例，12 例 (92.3%)血管壁受侵犯；Ⅴ型患者 7 例，血管壁均受侵犯。肿瘤与血管关系的影像学分型联合肿瘤包绕血管角度、肿瘤与血管接触长度的积分体系评估血管壁是否受侵犯的灵敏度为 0.932，特异度为 0.867，阳性预测值 0.911，阴性预测值 0.897，ROC 曲线下面积为 0.934。采用 K－M 曲线进行预后分析，PV/SMV 血管壁未受侵犯的患者较血管壁受侵犯患者累积生存率高；肿瘤与 PV/SMV 关系不同影像学分型患者累积生存率不同，影像学积分小于 7 分的较大于等于 7 分的患者累积生存率高。**结论：**影像学分型联合肿瘤包绕血管角度、肿瘤与血管接触长度的积分体系能很好预测 PV/SMV 是否受侵犯，影像学积分体系预测的 PV/SMV 血管壁是否受侵犯与预后相关。

EPO-0997

胰腺滤泡树突状肉瘤并副肿瘤天疱疮一例

苟文静
四川省医学科学院·四川省人民医院

【目的】滤泡树突状肉瘤(follicular dendritic cell sarcoma, FDCS)是一种较为罕见的起源于树突状细胞的恶性肿瘤。副肿瘤性天疱疮（paraneoplastic pemphigus，PNP）是并发于肿瘤的一种特殊类型的天疱疮。腹膜后滤泡树突状细胞肿瘤并副肿瘤天疱疮较为罕见，本文报道 1 例腹膜后 FDCS 并 PNP 的临床及影像学表现，旨在提高对该病的认识。【方法】患者女性，49 岁。患者 1 月前劳累后出现左侧眼睑下垂，晨轻暮重，休息后稍微缓解。于 2017 年 9 月 4 日入院。查体舌肌及口角多处溃烂，唇肿胀、粘膜糜烂伴血痂形成，张口困难。肌电图：左侧眼轮匝肌记录，重复电刺激轻-中-重频实验呈弱阳性。肿瘤指标：糖类抗原（CA125）：65U/ml，糖类抗原 72-4（CA72-4）：16.79U/ml，胸苷激酶 1（TK1）：2.02PM/L。抗 ACHR 抗体阳性，抗 Titin 抗体 IgG 阳性。血常规：红细胞沉降率 92mm/60min。腹部彩超：左侧肾上腺区实性占位。全腹部增强 CT 检查（2017-09-11）：胰腺体尾部见一大小约 6.9cm×5.6cm×8.0cm 混杂密度团块影，边缘清楚，病灶中央呈液体密度（图 1A），增强病灶实性成分明显强化（图 1B），腹膜后见多个淋巴结显示。手术见：包块位于胰尾上缘，质韧，无明显浸润，包块基底部与脾脏动静脉关系紧密，盆腔、大网膜及肝脏均未见转移结节。【结论】术后病理诊断为“胰腺”滤泡树突状细胞肉瘤。【讨论】病灶多呈不均匀延迟中等强化，病灶较大时可出现坏死，整体血供较丰富，边界清楚。

CT 和 MRI 检查在壶腹周围癌诊断及术前评估的应用

王奕乔,姜慧杰
哈尔滨医科大学附属第二医院

背景及目的

壶腹周围癌主要包括胰头癌、胆总管下段癌、壶腹癌及十二指肠腺癌。这些肿瘤解剖位置相近使其表现出相同的临床症状，并且壶腹周围癌大多具有相互重叠或非特异性的影像学表现，壶腹周围癌准确的定性定位与分期对指导临床医生选取正确的治疗方案及评估术后具有重要价值，CT 和 MRI 在壶腹周围癌诊断方面取得了相应的进展，CT 和 MRI 检查可为临床术前评估可切除性及侵润范围，具有一定价值。

方法

2017 年 3 月至 2018 年 12 月，在我院就诊，行 CT 及 MR 扫描，并且病理结果为壶腹周围癌患者 67 例，由放射科医师分析图像信号及增强特征。

结果

（1）CT 扫描中，胰头癌和十二指肠腺癌的诊断准确率高于 MR 检查。MR 扫描中，胆总管下段癌及壶腹癌诊断准确率高于 CT 扫描。

（2）在 MRCP 图像中，壶腹癌、胰头癌及十二指肠腺癌出现双管征的比例大于胆总管下段癌，胰头癌出现暗环征的比例最大。在胰头癌中胆管和胰管汇合角度最大。

（3）CT 平扫结合增强对壶腹周围癌可切除性的预测灵敏度、特异度、准确率、阳性预测值、阴性预测值均低于 Propeller LAVA 结合 DWI 对壶腹周围癌可切除性的预测。

结论

CT 和 MRI 检查在壶腹周围癌诊断中取得了相应的进展，由于 CT 具有良好的空间及时间分辨率，后处理技术定位准确率较高，有助于术前发现病变，降低漏诊及误诊率，尤其是对肿瘤的大小以及明显与周围组织的关系，MRI 具有较好的组织分辨率，肿瘤与周围明亮脂肪的高对比度使 MRI 能够准确显示病变的局部范围，DWI 能通过病变信号变化及 ADC 值辨别出转移淋巴结，MRCP 可多方位旋转，多角度观察，显影成功率高、梗阻处定位准确率高，胆胰管汇合角度的测量有易于恶性肿瘤之间鉴别。CT 和 MRI 检查可为临床术前评估可切除性及侵润范围，具有一定价值，但对个别疾病的各种病理亚型的鉴别诊断较难，相信在不久的将来，影像学检查将在壶腹周围癌中发挥重要作用。

EPO-0999

基于动态增强扫描 MRI 的影像组学方法术前预测肝切除术后肝细胞癌两年复发

赵莹[1],刘爱连[1],武敬君[1],崔达华[1],宋清伟[1],李昕[2],吴艇帆[2],郭妍[2]
1.大连医科大学附属第一医院
2.通用电气医疗，转化医学部门
3.通用电气药业（上海）有限公司

目的 探讨动态增强扫描 MRI 的影像组学方法术前预测肝切除术后肝细胞癌（HCC）两年复发的能力。**方法** 回顾性收集本院 105 例接受肝部分切除术且经病理证实的肝细胞癌患者，并在术后两年内规律随访。所有患者于术前 2 周内进行动态增强 MRI 检查（动脉期、门静脉期和延迟期）。按照 7:3 将患者随机分为训练组和验证组。应用 Radcloud 软件，于动态增强 MRI 三期图像的各个层面沿着病灶边缘手动勾画 HCC 轮廓，生成三维容积 ROI。每个序列分别提取 1029 个影像组学特征，包括一阶统计特征、形状特征、灰度共生矩阵（GLCM）、灰度游程矩阵（GLRLM）和灰度区域大小矩阵（GLSZM），以及经指数、平方、平方根、对数和小波变换后获得的高阶特征。使用假设检验、Spearman 相关性分析及 LASSO 算法对组学特征进行依次降维。利用 logistic 回归分别构建增强三期 MRI 图像预测肝癌术后两年内复发的模型。利用 ROC 曲线评价模型的效能，获得曲线下面积（AUC）、准确性、灵敏度、特异度和阈值。**结果** 经过降维处理，动脉期、门静脉期和延迟期图像分别提取 7、23 和 2 个与预后相关的最有价值的影像组学特征。基于动脉期、门静脉期和延迟期构建的组学模型的验证组 AUC 分别为 0.80、0.75 和 0.74，其中基于动脉期图像构建的模型术前预测 HCC 术后两年复发的效能最佳，其验证组的准确性、灵敏度和特异度分别为 0.72、0.59 和 0.87。

结论 基于 MR 动态增强三期构建的影像组学模型可以在术前预测肝细胞癌术后两年复发，其中动脉期构建的组学模型效能最佳。

EPO-1000
术前肝内胆管细胞癌的 CT 特征预测淋巴结转移和总生存期

毛应凡,何健
南京大学医学院附属鼓楼医院

目的：比较有无淋巴结转移的肝内胆管细胞癌（ICC）原发灶的计算机断层扫描（CT）特征的差异并构建术前预测 ICC 淋巴结转移和 ICC 患者总生存的诺谟图。
方法：分析了 63 例 ICC 患者的临床病理特点和 ICC 原发灶的对比增强 CT 特征。 进行多变量逻辑回归分析以构建术前预测淋巴结转移的诺模图。 用 Kaplan-Meier 方法绘制存活曲线并比较存活率差异。
结果：有和无淋巴结转移的 ICC 在临床症状，肿瘤部位，分型，动脉期（AP）CT 值 （均值），AP CT 值（最大值），门静脉期 CT 值 （最大值），平衡期（EP）增强比率，EP CT 值（最大值）和 EP CT 值（最大值） /肝脏 CT 值存在显着差异。由分型，EP CT 值（最大值）和 EP 增强比率的构建的诺谟图可以术前预测 ICC 淋巴结转移，曲线下面积为 0.814（p <0.001）。 基于诺谟图的淋巴结转移风险≥0.20 的 ICC 患者总体生存率显着低于淋巴结转移风险<0.20 的患者（平均总生存期分别是 39.5±5.2 个月 和 51.1±4.7 个月）。
结论：ICC 的术前对比增强 CT 特征在有无淋巴结转移的患者中差异显着。 基于这些特征的诺谟图可以预测淋巴结转移和总生存率甚至优于 N 分期。

多层螺旋 CT 动静脉期联合扫描在严重多发伤中的应用研究

周兵,张乐天
陆军军医大学大坪医院

目的 采用多层螺旋 CT 动静脉期联合扫描法，缩短严重多发伤患者扫描时间，减少患者辐射剂量，为临床医生争取最佳的救治时间。 **方法** 收集 2014-2018 年在我院行多层螺旋 CT 的严重多发伤患者（ISS>16）131 例，将这 131 例随机分为实验组和对照组，其中对照组常规扫描（增强三期）患者 73 例，实验组采用动静脉期联合扫描（动静脉期+延迟期）患者 58 例。两组均使用 GE64 排螺旋 CT 扫描，固定延迟 22-25s，视野 50cm,管电压 120kV，采用自动管电流调节技术（200 mAs~400 mAs），球管旋转时间 0.5s，螺距 0.984，扫描层厚 0.625mm，重建层厚，层间距 3.0~5.0mm。注射对比剂前，注射生理盐水 21ml，速率为 4ml/s。注射对比剂时，对比剂用量为胸腹部（400mg/kg）、头颈胸腹部（400mg/kg）、胸腹部+双下肢（450mg/kg），速率为 3.5-4.5ml/s。最后再注射生理盐水 40~50ml，速率为 4-5ml/s。分别统计两种方法胸腹部、头颈胸腹部、胸腹部+双下肢的辐射剂量动静脉启动时间及扫描总时间（第一幅图像-最后一幅图像），测量起始主动脉和结束主动脉、肝动脉、脾动脉、肾动脉、肠系膜上动脉的 CT 值（用 HU 表示），采用 Philips EBW 工作站对动静脉期图像分别进行多平面重建(MPR)，容积再现重建(VR)，最大密度投影(MIP)，曲面重建(CPR)。最后邀请 1 名高年资诊断医生和 1 名主管技师对图像进行回顾性分析，观察有无血管创伤，并将 CT 血管成像结果与临床结果进行对比。**结果** 采用常规扫描（增强三期）比动静脉联合扫描平均耗时多 15-20 秒，辐射剂量动静脉联合扫描较常规三期增强下降

21.73%。有 95.8%血管动脉 CT 值高于 150 HU，95%的血管后处理与临床术中所见符合。**结论** 动静脉期联合扫描有效缩短患者检查时间 减少辐射剂量，为临床早期救治提供保障。

EPO-1002

Volumetric apparent diffusion coefficient histogram analysis on gallbladder diseases.

sisi Wu
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To evaluate the diagnostic performance of histogram analysis of apparent diffusion coefficient(ADC) derived from diffusion-weighted imaging (DWI) for differentiating malignant from benign gallbladder diseases.
Materials and methods: Our study collected 789 patients with gallbladder disease who had undergone DWI scan for preoperative evaluation in Tongji Hospital from Septemper2017 to December2018,and finally 86 patients were enrolled after excluding unqualified cases.Preoperative DWI images of 86 patients with gallbladder disease confirmed by surgery or puncture pathology were measured by two radiologists. Volumetric ADC maps were generated using all slices of the DWI images to obtain histogram parameters, including mean, median, 10th percentile, 25th percentile, 75th percentile, 90th percentile ADC, and SD ADC values, as well as skewness, kurtosis, and entropy.The weighted-K test was used to examine the consistency of the results measured by the two radiologists. Comparisons of these parameters were made by Mann-Whitney U test .The sensitivity and specificity were calculated according to the area under the ROC curve (AUC) to evaluate the differential diagnosis on malignant and benign gallbladder diseases.
Results:1.The consistency analysis of the measurement data has good credibility that ICC range from 0.715 to 0.872.
Mean ADC, median ADC, 10th,25th,75th and 90th percentile ADC of gallbladder cancer were significantly lower than those of benign diseases ($p<0.001$).
SD and entropy of gallbladder cancer were higher than those of benign disease,but there were no differences in kurtosis and skewness among these gallbladder diseases.
The areas under the ROC curves (AUC) of the parameters ,including ADC mean, 10th percentile, 25th percentile, 50th percentile, 75th percentile, 90th percentile, standard deviation, kurtosis, skewness，entropy were 0.856、0.963、0.959、0.942、0.908、0.721、0.861、0.526、0.513、0.612，respectively.The 10th percentile yielded the highest AUC that range from 0.959 to 0.968. It had the largest Yoden index when the critical value is 95,and its specificity and accuracy are 89.5% and 95.4% respectively.
Conclusions: Volumetric apparent diffusion coefficient histogram analysis could be helpful for diagnosing gallbladder cancer.

EPO-1003
基于自制水模探究梯度场非线性对单次激发 EPI 获得的 ADC 值影响

马超,王振,陈录广,陆建平
海军军医大学第一附属医院（上海长海医院）

目的：扩散加权成像（DWI）在疾病诊断、疗效评价中具有重要临床价值。不同医疗机构使用的 MRI 设备品牌及型号可能不同，而多数 MRI 设备的梯度场非线性，其对 DWI 获得的表观扩散系数（ADC）存在影响。随着对 DWI 定量分析要求不断提高及多种心研究的开展需要，设计标准水模进行 DWI 参数校准从而减小梯度场非线性影响是必要的。本研究将利用自制水模，初步探究梯度场非线性对 3.0T 单次激发平面回波（ss-EPI）序列获得的 ADC 影响。
方法：基于临床检查患者腹部图像，设计软件提取腹部轮廓形态数据。利用 51 个内径 29mm、长度 300mm 的圆柱形亚克力圆柱设计类似人体形态的水模；容器中装入纯水。水模置于磁体间 24 小时以上，实验前记录室内温度。利用腹部线圈、基于单次激发平面回波序列行 3.0-T DWI（b 值=0，500，1000 s/mm2）扫描。基于单指数模型计算 ADC 图，并重建为 FOV 500*500mm2 及矩阵 128*128；利用统一直径 20mm 的感兴趣区 ROI（面积：320 mm2）测量不同空间位置圆柱内水的 ADC 值。分析 ADC 测量值与理论值的差异，计算不同位置测量 ADC 值带来的误差范围。
结果：室温下 23 度，水模 ADC 标准值为 $2.187*10^{-3}$ mm^2/s；51 个柱体中测量 ADC 均值为 $2.295*10^{-3}$ mm^2/s （$2.202-2.390*10^{-3}$ mm^2/s）；靠近水模中间位置 ADC 值较小，偏离中心位置上下左右 ADC 均值均增大，其中水平方向离中心位置 140 mm 处 ADC 均值增加约 7.8%；上下方向距离中心位置 90mm 处 ADC 均值增加约 5.0%。Z 方向距离水模中心位置 60 mm 出测量的 ADC 变化范围约 2%。
结论：临床 3-T MRI 设备中梯度非线性对 ADC 有明显影响，特别是距离磁体中心位置左右方向的影响较为显著。对于临床研究的器官较大时，如胰腺，肝脏疾病等应考虑梯度非线性对 ADC 的影响。

EPO-1004
容积 ADC 直方图对胆囊疾病的诊断价值

吴思思
华中科技大学同济医学院附属同济医院

目的：探讨 DWI 所得的容积 ADC 直方图对胆囊癌的诊断价值。
材料与方法：收集华中科技大学同济医学院附属同济医院 2017 年 9 月-2018 年 12 月确诊并有完整的 MRI 资料的胆囊病变患者 789 例。经过随访，排除不合格样本，最终 86 例胆囊病变患者纳入研究。由两位医师测量病理证实的 86 例胆囊疾病患者术前进行的 DWI 检查，通过第三方软件生成 ADC 值灰度直方图，并计算出胆囊癌的灰度平均值、第 10 百分位数、第 25 百分位数、第 50 百分位数、第 75 百分位数、第 90 百分位数、标准差、峰度、偏度、熵。对两位医师的测量结果采用 weighted K 检验评估一致性。用曼-惠特尼 U 检验对比两组病变均值差异的显著性，并根据受试者操作特性曲线(ROC)下面积（AUC）来判断其诊断准确性，评价直方图参数对于良恶性病变的鉴别诊断效能。
结果：1.一致性分析：两名医师的测量数据一致性分析具有较好的可信度，ICC 为 0.715-0.872。

2.胆囊癌的灰度平均值、第 10 百分位数、第 25 百分位数、第 50 百分位数、第 75 百分位数、第 90 百分位数均低于胆囊良性病变（p 均<0.001）。
3.恶性病变的 SD 和熵显著高于良性病变，但是良恶性病变间的峰度和偏度没有显著差异（p<0.05）。
4.ADC 的平均值、第 10 百分位数、第 25 百分位数、第 50 百分位数、第 75 百分位数、第 90 百分位数、标准差、峰度、偏度和熵在 ROC 曲线上对应的 AUC 分别为 0.856、0.963、0.959、0.942、0.908、0.721、0.861、0.526、0.513 和 0.612。第 10 百分位数具有较高的鉴别诊断效能，其 AUC 范围为 0.959-0.968。当临界值为 95 时具有最大的约登指数，其特异度、准确度分别为 89.5%、95.4%。
结论：ADC 容积定量直方图可以对胆囊良恶性病变鉴别诊断提供一定的帮助，直方图参数在胆囊癌诊断中具有较大价值。

EPO-1005
多模态 MRI 的影像组学模型术前预测肝切除术后肝细胞癌两年复发

赵莹[1],刘爱连[1],武敬君[1],崔达华[1],宋清伟[1],李昕[2],吴艇帆[2],郭妍[3]
1.大连医科大学附属第一医院
2.通用电气医疗，转化医学部门
3.通用电气药业（上海）有限公司

目的 探讨基于多模态 MRI 的影像组学模型术前预测肝切除术后肝细胞癌（HCC）两年复发的能力，并将其应用于不同的临床场景。**方法** 回顾性收集 2007 年 7 月-2017 年 7 月本院 105 例接受肝切除术且经病理证实的肝细胞癌患者，在术后两年内规律随访。所有患者术前两周内进行了磁共振检查，包括同反相位 T_1WI、T_2WI、弥散加权成像（DWI）和动态增强扫描（动脉期、门静脉期和延迟期）。按照 7:3 将患者随机分为训练组和验证组。将 DICOM 格式的各序列图像上传至 Radcloud 软件，于 MRI 各序列图像的连续层面沿着病灶边缘手动勾画 HCC 轮廓，获得 3D 容积感兴趣区，每个序列均可提取 1029 个影像组学特征，包括一阶统计特征、形状特征、二阶统计特征即纹理特征（灰度共生矩阵（GLCM）、灰度游程矩阵（GLRLM）和灰度区域大小矩阵（GLSZM）），以及经指数、平方、平方根、对数和小波变换后获得的高阶统计特征。分别使用假设检验、Spearman 相关性分析及 LASSO 算法对组学特征依次降维。使用 logistic 回归分别构建不同序列预测肝癌术后两年复发的模型，并构建 4 种不同临床应用场景的组合模型：模型 1：同反相位 T_1WI+T_2WI；模型 2：模型 1+DWI；模型 3：模型 1+增强三期；模型 4：模型 2+增强三期。利用 ROC 曲线评价模型的效能，获得曲线下面积（AUC）、准确性、灵敏度、特异度和阈值。**结果** 基于同反相位 T_1WI+T_2WI+增强三期图像构建的组学模型术前预测 HCC 术后两年复发的效能最佳，其训练组和验证组的 AUC 分别为 0.86 和 0.82，准确性、灵敏度和特异度分别为 0.82、0.76、0.89、0.69、0.59 和 0.80。**结论** 本研究提出了应用于不同临床场景的术前预测肝癌切除术后两年复发的多模态 MRI 组学模型，其中基于同反相位 T_1WI+T_2WI+增强三期图像构建的组学模型预测效果最佳。

EPO-1006
普美显肝胆特异期联合 DWI+T2WI 对乏血供肝癌的早期检测价值

胡瑞,郑克华,陈文,陈学强,吴奕君,徐霖
十堰市太和医院

目的：探讨普美显肝胆特异期联合 DWI+T2WI 在肝硬化患者乏血供肝癌早期诊断中的应用价值。
方法：回顾性分析 2017 年 4 月至 2019 年 7 月期间 32 例肝硬化患者乏血供结节的 MRI 影像资料（平扫、DWI、普美显增强），所有病例结果均经穿刺活检、手术病检或随访确诊，由 2 位有经验的医师采用双盲法分析普美显肝胆特异期联合 DWI+T2WI 对乏血供肝癌的诊断能力。
结果：32 例乏血供结节中，22 例为乏血供肝癌，10 例为高级不典型增生结节（high grade dysplastic, HDN）。所有结节在肝胆特异期均呈低或相对低信号，单纯利用普美显增强无法区分乏血供肝癌与 HDN（P＞0.05）。而肝胆特异期联合 DWI 和 T2WI 高信号的影像表现能显著提高乏血供肝癌的诊断信心，对肝硬化患者乏血供肝癌与 HDN 具有一定的鉴别诊断价值（P＜0.05）。DWI 相对于 T2WI 有着更高的灵敏度。
结论：普美显肝胆特异期联合 DWI+T2WI 高信号能提高乏血供肝癌的早期诊断准确率，具有广阔的临床应用前景。

EPO-1007
扩散加权成像评价 CCL4 所致大鼠纤维化中的炎症反应

路怡妹,汪登斌
上海交通大学附属新华医院

目的：探讨 MR 扩散加权成像对 CCL4 所致的大鼠肝损伤模型中急性炎症的敏感性。
材料和方法：共 34 只成年 SD 雄性大鼠，所有大鼠随机分为三组，对照组（n=10），肝纤维组（n=12），肝纤维化伴急性炎症组(n=12)。所有大鼠分别行横断位 T2WI， DWI（b=0,600），IVIM（b=0,20,50,100,200,400,600,800），DKI（b=0,200,400,600,800,1100,1700；单方向）扫描并计算相关定量参数 DWI-ADC, IVIM-D, IVIM-D*, IVIM-f, DKI-MD, DKI-MK. 对所有实验大鼠肝组织坏死性炎症、纤维化进行组织学评分。采用成组 t 检验评价两疾病组及对照组间的差异。
结果：在肝纤维化均为 F3 级的基础上，随着肝组织炎症的发展，DWI-ADC (1093.06±107 vs 964.64±62.89; P=0.020)及 IVIM-D（1276.85±100.02 vs 1036.51±55.78; P=0.024)逐渐降低，MK 逐渐增加（0.5476±0.1121 vs 0.7456±0.1718; P=0.014）。
结论：在动物模型中，DWI-ADC, IVIM-D 的减低及 MK 的升高与慢性肝纤维化中的急性炎症反应有关。

EPO-1008
食蟹猴不同程度肝纤维化的 3.0T MR-PWI 定量参数的对比研究

丁可,黄瑞岁,韦学
南宁市第二人民医院

目的 分析食蟹猴不同程度肝纤维化的磁共振灌注加权成像(MR-PWI)定量参数值的变化规律，探讨评价肝纤维化严重程度的 PWI 最佳检测指标。 **材料和方法** 以四氯化碳（CCl_4）成功建立 22 只食蟹猴的肝纤维化模型，其中发展至早期肝硬化的有 15 只。采用配伍组设计对具有肝纤维化完整发展过程的 15 只食蟹猴进行 Exchange 肝脏双血供模型的 PWI 对比研究，分析不同程度肝纤维化的 PWI 定量参数（对比剂容积转运常数(Ktrans）、速率常数（Kep）、血管外细胞外间隙容积分数（Ve）、血浆容积分数（Vp）、肝动脉灌注指数（HPI））的变化规律及其与肝纤维化严重程度的相关性，采用受试者工作特征曲线(ROC) 判断 PWI 参数值对肝纤维化的诊断效能，探讨评价肝纤维化严重程度的最佳检测指标。 **结果** 食蟹猴 PWI 的 Ktrans、Kep、Vp 随着肝纤维化进展而下降，肝纤维化各期（S1～S4）与正常肝组织（S0 期）比较、重度肝纤维化 S3、S4 期与轻度肝纤维化 S1、

S2 期比较，Ktrans、Kep 均有统计学差异（$P<0.01$）；HPI 随肝纤维化进展逐渐增大且组间比较差异均有统计学意义（$P<0.01$）。Ktrans、Kep 与肝纤维化严重程度呈负相关（r_s =-0.875、-0.797，$P<0.01$），HPI 与肝纤维化程度呈高度正相关（r_s =0.959，$P<0.01$）。ROC 曲线分析显示，PWI 定量参数诊断不同程度肝纤维化的效能由高到低依次为：HPI＞Ktrans＞Kep，即 HPI 是肝纤维化最具诊断意义的指标。 **结论** 食蟹猴肝纤维化模型的 PWI 参数值随着肝纤维化发展而发生规律性变化，其中 HPI 是定量评价肝纤维化严重程度的最佳检测指标。

EPO-1009
胰腺实性假乳头状瘤影像学表现及 3 例误诊分析

冷少益
宁波市第二医院（原:宁波华美医院）

目的：通过胰腺假乳头状瘤(Solid-pseudopapillary Tumor of the pancreas, SPTP)CT、MRI 表现与病理特征对照分析，提高对 SPTP 影像表现的认识并降低误诊率。**材料与方法：**回顾性分析 17 例经手术病理证实的 SPTP 的临床及 CT、MRI 影像学资料，16 例术前均接受 CT 增强检查，另 1 例为外院 CT 增强检查，有 11 例接受 MRI 增强。**结果：**女性 13 例，男性 4 例，平均年龄约 36.2 岁，肿瘤均为囊实混合性，平均最大直径为 8.3cm；CT 增强扫描 17 例肿瘤的实性部分均呈渐进性强化，16 例双期增强 CT 扫描均低于胰腺实质，1 例在静脉期强化程度与胰腺实质相当，囊性部分未见强化；10 例可见完整包膜，呈延迟性强化，4 例包膜中断，3 例未见包膜；9 例可见粗大或蛋壳样钙化；17 例均未见胰管扩张；11 例 MRI 显示肿瘤为混杂信号，1 例内可见明确出血，增强后强化方式类似 CT。SPTP 的病理特征性表现为假乳头状结构形成伴局部区域性坏死。3 例误诊为 SPTP 患者 2 例为局灶性慢性炎症，1 例为神经内分泌肿瘤。**结论：**SPTP 多见于年轻女性，好发于胰腺头部及体尾部，CT、MRI 等影像学检查具有一定特征，肿瘤边缘区易出现钙化，增强扫描实性部分呈渐近性强化，但极少数也会出现一些非特征性表现，如肝脏、淋巴结转移、胰胆管扩张等，因此掌握 SPTP 特征性影像学表现对诊断非常重要。

肝癌严重程度与 QCT-BMD 的相关性分析及临床意义

欧陕兴[1],欧舒斐[2],李小荣[1],乔国庆[1],李华雨[2]
1.中国人民解放军南部战区总医院
2.中国人民解放军南部战区空军医院

目的 基于临床治疗的肝癌进行 QCT-BMD 检测， 评价 HCC 与发生骨质疏松发生之间关系，探讨监测 HCC 治疗评价中 QCT 的应用价值。**材料和方法** 1276 例接受 QCT 骨密度（bone mineral density, BMD）检测。QCT 定量骨密度根据美国标准：1.正常（BMD>120mg/cm^3）；2.骨量减低（BMD=80-120mg/cm^3）；3.骨质疏松（BMD<80mg/cm^3）。分组：正常组；骨量减低组；骨质疏松组。采用 SPSS19.0 软件统计分析。
结果 分析 HCC 病人的性别，年龄，肝癌严重程度与 BMD 组间结果比较，经方差和卡方检验统计显示差异有统计学意义(p<0.05)。骨质疏松与肝癌严重程度之间为正相关，回归系数 0.562，相对危险度（OR）1.754。骨量减低组、骨质疏松症与性别之间差异无显著性（P>0.05）。
结论 肝癌容易并发骨质疏松症，检测 BMD 对肝癌诊疗监控有指导价值，提示临床进行早期干预治疗。

EPO-1011
DWI 容积直方图分析在壶腹周围腺癌组织病理分型中的诊断价值

陆静瑜[1,2],沈亚琪[1],胡道予[1]
1.华中科技大学同济医学院附属同济医院
2.苏州大学附属第一医院

目的：探讨 DWI 容积直方图分析在鉴别肠型及胰胆管型壶腹周围腺癌中的诊断价值。
材料和方法：回顾性分析从 2015 年 1 月至 2018 年 10 月因怀疑壶腹周围肿瘤在我院行磁共振平扫及弥散加权成像的 476 名患者。将其中在 3.0T 磁共振上完成图像采集并且 DWI 图像包含 b800 及 b1000 的患者纳入进一步分析,最后将行胰十二指肠切除术后病理证实为壶腹周围腺癌的患者纳入统计分析。由两名腹部影像诊断经验的放射科医师对获得的壶腹周围腺癌病灶进行容积直方图定量分析，分别计算整个病灶在 b800 和 b1000 的弥散加权成像（diffusion weighted imaging，DWI）的平均 ADC 值、第 5、第 10、第 25、第 50、第 75、第 90、第 95 百分位数,ADC 最小值（ADC_{min}）、ADC 最大值（ADC_{max}）及峰度、偏度、熵。将病灶根据组织病理结果分为肠型和胰胆管型两组，行独立样本 t 检验或曼-惠特尼 U 检验比较两组间差异，并分别作 ROC 曲线分析。根据 ROC 曲线下面积（Area under the ROC curve，AUC)判断其诊断准确性。按照 Yoden 指数（灵敏度+特异度-1）筛选出相应参数的截断值（cut-off 值），计算其诊断敏感度、特异度，评价其诊断效能。
结果：最终共 40 名病理确诊为壶腹周围腺癌的患者纳入研究分析，其中肠型腺癌 17 名，胰胆管型腺癌 23 名。在 b1000 的 DWI 图像上，肠型组的 ADC 平均值及第 5、第 10、第 25、第 50、第 75、第 90、第 95 百分位数显著高于胰胆管组（$P<0.05$），而从 b800 的 DWI 图像上提取出的各直方图参数均无统计学差异。b1000 图像上的第 75 百分位数获得最大的 ROC 曲线下面积(AUC, 0.781; 敏感度, 91%; 特异度, 59%; 截断值, 1.50 $\times 10^{-3}mm^2/s$).
结论： b 值为 1000 s/mm^2时，ADC 容积直方图分析能够帮助区分肠型和胰胆管型壶腹周围腺癌。

EPO-1012
双源 CT 灌注成像定量分析正常胰腺组织的血流灌注研究

张艳丽,何其舟,黄涛,杨琴,梁卡丽
西南医科大学附属中医医院

目的：研究正常胰腺血流灌注参数及特点，为胰腺疾病的灌注值提供对比依据。 **方法**：收集接受双源 CT 上腹部轴位 CT 灌注扫描且胰腺无病变的患者 60 例，使用 VPCT Body 软件分别测量胰腺头、体、尾部的 CT 灌注参数，如血流量（BF）、血容量（BV）等，并绘制胰腺时间-密度曲线（TDC），对灌注值进行统计学分析。 **结果**：38 例男性胰腺头、体、尾部的的灌注参数为：BF 均值分别为（115.06±28.90）mL• $100g^{-1}$• min^{-1}、（128.70±32.27 ）mL• $100g^{-1}$• min^{-1}、（120.65±30.42）mL• $100g^{-1}$• min^{-1}；BV 均值分别为（28.62±19.22）mL/100g、（30.29±19.26）mL/100g、（29.63±19.05）mL/100g；22 例女性胰腺头、体、尾部的的灌注参数为：BF 均值分别为（125.23±26.86）mL• $100g^{-1}$• min^{-1}、（140.62±35.60 ）mL• $100g^{-1}$• min^{-1}、（132.72±28.53）mL• $100g^{-1}$• min^{-1}；BV 均值分别为（37.82±23.26）mL/100g、（43.63±25.81）mL/100g、（39.05±23.95）mL/100g。男性胰腺头、体、尾部 BF、BV 值均低于正常女性相同部位，差异有统计学意义（P 值均< 0. 05） ；相同性别胰腺头、体、尾部 BF、BV

之间无显著性差异(P ＞ 0．05)。 **结论：** 胰腺头、体、尾部之间灌注参数 BF、BV 具有一致性，不同性别之间血流灌注存在一定差异。

EPO-1013

Analysis of imaging characteristics of mass-forming chronic pancreatitis

Zhibing Ruan[1],Yu Hu[2]
1.The affiliated hospital of Guizhou medical university
2.Guizhou medical university

Objective To investigate the features of multi-modality imaging of mass-forming chronic pancreatitis (MFCP) of the pancreatic head to improve the early precise diagnosis of this challenging condition in the clinic. **Material and methods** Clinical and imaging data (including CT, MRI and PET / CT) of 24 cases (22 males and 2 females with an average age of 51.92 ± 6.7) with MFCP, which were confirmed by surgery and pathology between January 2012 and May 2017, were analyzed retrospectively. All cases underwent multidetector computed tomography (MDCT) scanning, including multiphase dynamic contrast-enhanced CT (n=24), abdominal plain film (n=13), MRI (n=5) and PET/CT (n=16) imaging. The images were reviewed independently by two expert radiologists using the double-blind method. **Results** Of the 24 cases of MFCP, 18 (75%) were correctly diagnosed, and 6 (25%) were misdiagnosed as pancreatic carcinoma or other malignant tumor based on CT examination. The main imaging findings included the following features: ① A mean diameter of 5.44 cm ± 1.27 cm with lobular sign (n=3) and significant exudation around the lesion (n=20). ② Calcification was found in 14 cases (58.33%), including mixed calcification (n=8), patchy calcification (n=4) and punctate calcification (n=2); necrosis cyst occurred in 7 cases (29.17%). ③ Pseudocyst occurred in 14 cases with tension and honeycombed cystic change. ④ Sixteen cases (66.67%) exhibited dilation of the pancreatic duct, including bead-like expansion (n=14), smooth uniformity dilation (n=2), dilated pancreatic ducts passing through the lesion area (n=19) and interrupted in the lesion area (n=2), and accompanied by bile duct dilatation (n=17) with a gradual narrowing in the lesion area, double-duct sign (n=7), and pancreatic duct stones (n=13). ⑤ The time-density curve of lesion dynamic enhancement increased and decreased slowly (n=18). ⑥ Lymph nodes were enlarged (n=11) with a mean diameter of 11 mm and a slight uniformity enhancement around the pancreas and retroperitoneum. ⑦ Peri-pancreatic vessels (n=17) with regular and smooth vascular shapes were compressed and displaced. Two cases were accompanied by portal vein thrombosis. ⑧ Thickening of the right renal fascia occurred in 20 cases. ⑨ SUVmax values of the lesions during the early and delayed phases were 2.51 ± 0.42 and 2.10 ± 0.31, respectively, without significant change over time. **Conclusion** Multi-modality imaging yielded certain image characteristics, which are of significant clinical value for the early diagnosis and differential diagnosis of MFCP.

EPO-1014

优化前后置多模型迭代重建技术低剂量腹部 CT 扫描

李莹[1],吕培杰[2],查云飞[1]
1.武汉大学人民医院
2.郑州大学第一附属医院

目的：观察多模型实时迭代重建技术（ASiR-V）对腹部 CT 图像质量和辐射剂量的影响，并优化 ASiR-V 前置联合后置百分比方案。**方法：**将 160 例上腹部 CT 扫描的患者随机分为试验组或对照组，各 80 例。对试验组在平扫、动脉期、门静脉期和延迟期分别采用前置 20% ASiR-V 扫描联合后置 20%、40%、60%、80% ASiR-V 重建，前置 40%联合后置 40%、60%、80%，前置 60%联合后置 60%、80%及前置 80%联合后置 80%的扫描及重建方法；对照组采用前置 0% ASiR-V 扫描，并分别采用 FBP 和后置 20%、40%、60%和 80% ASiR-V 两种方式进行重建。对所有图像进行客观评价[噪声（SD）和 CNR]和主观评分，并进行对比分析。**结果：**试验组各期相的 CT 剂量指数、剂量长度乘积及有效剂量均低于对照组（*P*均＜0.001）。相同期相内，随着后置迭代比例增加，SD 值逐渐减小而 CNR 值无变化或增加；试验组图像随着后置 ASiR-V（20%~60%）增高，图像主观评分增加，ASiR-V 为 80%时图像质量较差；除试验组平扫前置 20%联合后置 40%、60%图像与对照组平扫 ASiR-V 重建图像、试验组动脉期前置 40%联合后置 60%图像与对照组动脉期 ASiR-V 重建图像质量评分差异无统计学意义（*P*均＞0.05）外，余试验组图像质量评分均小于对照组 ASiR-V 图像。**结论：**一定比例 ASiR-V 重建可提高腹部 CT 图像质量，推荐使用在 ASiR-V 前置 40%联合后置 60%的扫描方案。

EPO-1015

胰腺癌合并胰腺炎的多模态影像学特征及 CT 漏诊分析

阮志兵[1],胡雨[2],郑星[2]
1.贵州医科大学附属医院
2.贵州医科大学

目的 探讨胰腺癌合并胰腺炎的多模态影像学特征并分析 CT 漏诊原因。**方法** 回顾性分析以急性胰腺炎为首发表现且首次 CT 漏诊并经临床手术病理证实的 13 例胰腺癌合并胰腺炎患者的临床资料及多模态影像学资料。所有病例行多排螺旋 CT 平扫,同时 11 例行多期增强 CT 检查、9 例行 MRI 平扫及 6 例行 PET/CT 检查。在飞利浦影像工作站由两位高级职称腹部放射医学医师双盲法评价图像，并通过商议达成一致诊断意见。**结果** 所有 13 个病例首次 CT 平扫均仅诊断为急性胰腺炎，胰腺癌漏诊率 100%，诊断延误时间 3 天～240 天不等，平均延误时间 45 天。主要临床特点为所有患者均有不同程度上腹痛及 CA19-9 明显升高（平均 340.34 U/dl±140.65U/dl），血清淀粉酶轻度升高（平均 359.05 U/dl±117.85 U/dl）。 影像学表现：胰腺癌灶位于胰头部 7 例、胰体部 6 例，大小 1.7cm～3.5cm，平均直径为 2.8cm±0.67cm；类圆形 10 例，斑片状 3 例，10 例未引起胰腺局部形态明显改变，3 例胰腺局部稍增大变形；等密度 10 例，3 例呈稍低密度，6 例呈稍长 T1、稍长 T2 信号，增强 CT/MRI 动脉期均呈低强化，5 例出现小斑片状坏死，边界均不清楚；6 例 PET/CT 显示癌结节呈明显高摄取；所有 13 例均出现胰腺炎征象，表现胰腺不同程度肿胀伴周围渗出及肾前筋膜增厚，11 例出现病变段胰管扩张，5 例出现胰腺尾部周围假性囊肿形成，伴胰腺周围淋巴结肿大伴环形强化 4 例。**结论** 胰腺癌合并胰腺炎具有一定的影像学特征，认识不足与影像学检查方法不当是漏诊与误诊的主要原因，综合分析临床资料及合理应用多模态影像学对胰腺癌合并胰腺炎早期精准诊断至关重要。

EPO-1016

IVIM-DWI 在肝细胞癌的诊断及鉴别诊断的中的应用价值

彭娟[1,2],杨林[1]
1.川北医学院附属医院
2.成都市金牛区人民医院

目的：探讨体素内不相干运动扩散加权成像（IVIM-DWI）在肝细胞癌（HCC）的诊断及其与肝胆管细胞癌、肝转移瘤鉴别诊断中的应用价值。
材料与方法：收集肝脏恶性肿瘤患者 81 例。其中肝细胞癌 55 例，肝内胆管细胞癌 10 例，肝转移瘤 16 例。所有研究患者均在治疗前或活检前使用 GE3.0T 核磁共振行常规 MRI 平扫、IVIM-DWI 扫描（b=0,20,40,80,100,200,400,800,100）及动态增强扫描。根据 T1WI、T2WI 压脂图像，采用单指数及双指数模型获得以下定量指标：（ADC）、（Dslow）、（Dfast）、(f)。原发性肝癌、肝胆管细胞癌、肝转移瘤及正常肝实质的相关参数进行正态分布检验。
结果：（1）HCC 与 ICC 的 ADC、Dslow 有统计学差义，（2）HCC 与 ICC、HCC 与 LM 的 Dfast 有统计学差义（3）当 ADC、Dslow、Dfast、f 的阈值分别是 1.20×10-3mm2/s、0.88×10-3mm2/s、38.09×10-3mm2/s、19.23×10-3mm2/s 时，诊断肝细胞癌的 ROC 曲线下面积分别是 0.773、0.801、0.777、0.803；当 ADC、Dslow、Dfast 的阈值分别是 1.27×10-3mm2/s、0.81×10-3mm2/s、26.04×10-3mm2/s，其对肝细胞癌和肝胆管细胞癌的鉴别诊断的 ROC 曲线下面积分别是 0.687、0.721、0.896；当 Dfast 的阈值分别是 29.62×10-3mm2/s，其对肝细胞癌和肝转移瘤鉴别诊断的 ROC 曲线下面积分别是 0.805。
结论：IVIM-DWI 对肝细胞癌的诊断及其与肝内胆管细胞癌、肝转移瘤的鉴别诊断具有一定的影像诊断价值。IVIM-DWI 可作为必要的补充序列，为肝细胞癌的诊断及鉴别诊断提供信息，从而为临床早期诊断、治疗方案的制定提供帮助。

MRI T1mapping 及 ECV 在肝脏定量中的可行性研究

王庆国,陈安,王悍
上海市第一人民医院

目的：评估 MRI T1mapping 及 ECV（细胞外容积分数）在肝脏定量中的可行性。
方法：收集正常肝脏患者 12 例，行 3.0T 磁共振 T1mapping 成像，注入造影剂增强后 15 分钟后再次行 T1mapping 成像。由两名高年资医师按四分法对图像质量进行评价，并分别画取感兴趣区得到肝脏、腹主动脉增强前、后 T1 值及肝脏 ECV 值。
结果：两名医师对图像质量评价 Kppa 值为 0.894，所有图像均符合诊断要求（≥3 分）。两位医师对肝脏、腹主动脉 T1 值及肝脏 ECV 值测量不存在统计学差异。肝脏增强前、后 T1 平均值分别为 809ms±11.53ms 及 535ms±16.13ms，肝脏 ECV 平均值 16.62±1.45。
结论：MRI T1mapping 能够获得良好的图像质量，定量测量肝脏增强前、后 T1 值，获得肝脏 ECV 值，为进一步研究肝脏各种病变提供了一种新的诊断方法。

EPO-1019

孤立性纤维瘤的 MSCT 诊断及鉴别

张芳
天津市第三中心医院

目的：探讨孤立性纤维瘤的多层螺旋 CT（MSCT）表现特征，提高对该病的影像学认识。方法：回顾性分析经手术病理证实的 12 例胸腹部孤立性纤维瘤的病例，术前行增强 CT 扫描，并复习文献,，总结其 CT 影像特征。结果：本组 12 例均行增强 CT 扫描，均为单发原发灶，1 例位于左侧胸膜，10 例位于腹腔，1 例位于盆腔。10 例肿块边缘均光整,无毛刺，2 例有分叶。肿瘤长径 1.2~13.5 cm,平均(7.0±5.1)cm。8 例不均匀强化，增强后呈不均匀＂地图样＂轻中度强化，其中 2 例其内可见血管影，呈“肿瘤包绕血管征”；余 4 例表现为均匀强化。结论：孤立性纤维瘤一般表现为孤立的、边界清楚的软组织肿块，密度不均，增强扫描多数不均匀轻度强化，少数明显不均匀强化伴迂曲样血管样强化。

Free-breathing Dynamic Contrast Enhanced Magnetic Resonance Imaging with Compressed Sensing Reconstruction of Liver Perfusion: Utility for Prediction of Microvascular Invasion in Small HCC (≤5cm)

Lifang Wu
Department of Radiology, Zhongshan Hospital, Fudan University

Purpose: To evaluate perfusion parameters at three-dimensional (3D) perfusion magnetic resonance (MR) imaging of the liver in diagnosis of microvascular invasion (MVI) in small hepatocellular carcinoma (≤5 cm).
Materials and Methods: This study was approved by the institutional review board, and written informed consent was obtained. There were 43 MVI positive sHCC and 42 MVI negative sHCC in 80 patients. Whole-liver 3D perfusion MR imaging in free-breathing using Cartesian k-space undersampling with compressed sensing, combined with T1 mapping and B1 inhomogeneity correction, was performed at a 3.0-T system (uMR 770, United Imaging Healthcare, Shanghai, China). After 5-8 pre-contrast baseline acquisitions, 0.1 mmol/kg gadopentate dimeglumine was injected and immediately followed by a 20-mL saline flush through a power injector at a rate of 4 mL/s, and another 40-43 phases of post contrast acquisitions were obtained. A square was manually placed on the proximal abdominal aorta at the level of the celiac axis for AIF calculation, another square on the main portal vein at the level of the porta hepatis for the portal vein input function (Fig.1). The analytical parameters derived from a dual-input single-compartment model of arterial flow (Fa), portal venous flow (Fp), total blood flow (Ft=Fa+Fp), arterial fraction (ART), distribution volume (DV), and mean transit time (MTT) were measured. The significant parameters between the two groups were correlated with the MVI at simple and multiple regression analysis.
Results: In both groups, Fa, ART, and DV were significantly higher in HCC than in normal liver parenchyma, whereas reversed in Fp ($P < .001$). In the MVI-positive HCC, Fp was significantly higher than that in the MVI-negative HCC, whereas reversed in ART ($P < .001$) (Table 1). Tumor size ($\beta = 1.2$, $P = .004$; odds ratio, 3.20; 95% CI: 1.45, 7.06), Fp ($\beta = 1.1$, $P = .004$; odds ratio, 3.09; 95% CI: 1.42, 6.72), and ART ($\beta = -3.1$, $P = .001$; odds ratio, 12.13; 95% CI: 2.85, 51.49) were independent risk factors for MVI (Table 2, Fig.2). The AUC value of the combination of all three metrics was 0.931 (95 % CI: 0.855, 0.975), which was significantly better than the performance of each used alone ($P < .05$) (Fig.3).
Conclusion: Whole-liver 3D perfusion MR imaging is a promising tool for preoperative detection of MVI in sHCC (≤5cm).

EPO-1021
探索联合肝脏分割与门静脉支结扎的分步肝切除术后肝脏体积变化规律

徐佳,王萱,卢欣,金征宇
中国医学科学院北京协和医院

目的：探索联合肝脏分割与门静脉支结扎的分步肝切除术（ALPPS）后肝脏体积变化规律。
方法：回顾性收集在我院进行 ALPPS 手术的肝癌患者共 10 人（平均年龄 54.5±10.2 岁，男性 8 人，女性 2 人）。患者于术前进行腹部增强 CT 检查，利用西门子后处理工作站体积测量软件进行肝脏体积测量，以肝中静脉及胆囊窝为界，测量右半肝去瘤体积及左半肝体，并于第一步术后（肝脏分割与门静脉支结扎）不同时间点进行 2 次腹部平扫 CT 检查，测得右半肝去瘤体积及左半肝体。计算获得术前、术后左半肝/全肝体积比，利用配对 T 检验比较患者术前、术后第一次、术后第 2 次右半肝去瘤、左半肝肝体积差异。

结果：术后第 1 次检查距第 1 步手术平均 7.6±1.2 天（6-9 天），术后第 2 次检查距第 1 步手术平均 14.4±1.9 天（11-17 天）。术前平均全肝体积（去瘤）为 1025.7±246.5ml，术前平均左半肝/全肝体积比为 42.6%±13.1%，术后第 1 次复查，平均左半肝/全肝体积比为 46.5%±11.1%，术后第 2 次复查，平均左半肝/全肝体积比为 54%±11%。术后第 1 次复查左半肝体积显著高于术前（P=0.037），术后第 2 次复查左半肝体积显著高于术前及第 1 次（P=0.002、0.020）。术前、术后第 1 次、术后第 2 次右半肝（去瘤）体积无明显统计学差异（所有 P>0.05）。
结论：ALPPS 手术第一步术后，左半肝体积明显增长，右半肝体积无明显变化，约 14 日可达左半肝体积达肝脏总体积比 50%以上。

EPO-1022
DCE-MRI 评估索拉非尼抑制兔 VX2 肝种植瘤血管生成实验研究

潘江洋
河北医科大学第四医院

目的：DCE-MRI 定量检测兔 VX2 肝种植瘤模型经索拉非尼靶向治疗前后的变化情况，将定量参数与免疫组化指标 MVD、VEGF 进行相关性分析，验证 DCE-MRI 进行疗效评估的可行性。
方法：选取 3.2±0.5kg 健康的新西兰大白兔 36 只，雌雄不限，采用开腹瘤组织块穿刺包埋法制备兔 VX2 肝种植瘤模型，术后 7 天，通过 MRI 筛选形状规整、大小基本一致的兔 VX2 肝种植瘤 30 只，随机分为两组（各 15 只），实验组索拉非尼灌胃治疗，对照组同等剂量 5%葡萄糖灌胃治疗。实验兔分别于治疗前、治疗后 7 天、治疗后 14 天进行 DCE-MRI 扫描，并记录定量参数 K_{trans}（单位：min^{-1}）、K_{ep}（单位：min^{-1}）、V_e、V_p，最后一次扫描结束后，处死实验兔，行 HE 染色、MVD 及 VEGF 免疫组化检查。
结果：
1 实验组与对照组之间 DCE-MRI 参数 K_{trans}、K_{ep}有差别，差别有统计学意义(P<0.05),V_e、V_p差别无统计学意义(P0.05)。实验组值 K_{trans}治疗前为 0.34±0.12 min^{-1}，治疗后 7 天为 0.23±0.04 min^{-1}，治疗后 14 天为 0.13±0.03 min^{-1}；对照组 K_{trans}值治疗前为 0.35±0.06 min^{-1}，治疗后 7 天为 0.36±0.07 min^{-1}，治疗后 14 天为 0.42±0.09min^{-1}；
2 治疗 7 天后，两组间肿瘤直径增大差异没有统计学意义（P>0.05）；治疗 14 天后，两组间肿瘤直径增大差异有统计学意义（P<0.05）。
3 免疫组化分析两组间 MVD 差别有统计学意义(P<0.05)。相关性分析 K_{trans}与 MVD、VEGF 之间呈正相关（r 值分别为 0.792 和 0.651）。
结论：MRI 灌注可以定量评估索拉非尼治疗兔 VX2 肝种植瘤的疗效。容积转移常数 K_{trans}与 MVD、VEGF 呈正相关。

EPO-1023
肝脏磁共振成像在 CT 检测到的乳腺癌肝转移患者中的增量价值：扩散加权成像、钆酸增强磁共振成像的前瞻性比较。

周丹丹[1],周丹丹[1]
1.吉林大学第一医院
2.吉林大学第一医院

目的:前瞻性比较弥散加权成像(DW)、普美显核磁增强成像(MR)和计算机断层扫描(CT)对乳腺癌肝转移的诊断效果，评价 MR 对 CT 诊断乳腺癌肝转移的增量价值。材料与方法:46 例乳腺癌肝转移患

者经 CT 检查均行肝 MR 检查，包括 DW 成像和普美显增强 MR。利用自由响应接收机工作特性分析和广义估计方程，分析了表征各图像集总体诊断性能、灵敏度和正预测值的 FOM 值。结果:46 例患者发生肝转移 94 例。普美显增强 MR 的综合 FOM 值、敏感性和 PPVs (FOM 值，0.92;敏感性,95%;PPV(90%)明显高于 CT (FOM 值 0.82;敏感性,85%;(P ＜ .006)。DW 成像显示敏感性(79%)和 PPV(60%)明显高于 CT(敏感性，50%;转移瘤(≤1 cm 直径)(P≤.004)。结论:普美显增强 MR 对乳腺癌肝转移的检测较 CT 更准确，单独加 CT 对其他转移的检测有增量价值，可常规应用于 CT 检测肝转移患者。

EPO-1024
改良的屏气压缩感知 3DMRCP 在胰腺及胆道疾病中的应用探索

孙照勇,朱亮,薛华丹
中国医学科学院北京协和医院

目的：前瞻性评估具有小视场（FOV）和更高空间分辨率的改良 3D BH-CS-MRCP 序列的临床可行性，并将其性能与原始 BH-CS-MRCP 和 NT-CS-MRCP 进行比较。
材料和方法：前瞻性招募 82 例临床疑诊胰胆疾病的患者，包括 7 例不能配合呼吸指令的患者，在 3TMR 设备进行 3DMRCP 检查。每位患者中以随机顺序进行改良 BH-CS-MRCP，原始 BH-CS-MRCP 和 NT-CS-MRCP 扫描。记录每个协议的采集时间。由两名放射科医师独立对图像进行盲法评估，以 5 分法评价图像质量，背景抑制，胰胆管显示清晰度，以及胰胆管解剖变异和胰胆管相关疾病的诊断自信度。用 Wilcoxon 符号秩检验比较个体内差异。用 kappa 系数评价观察者间的一致性，用受试者操作特性曲线（ROC）计算诊断性能。
结果：两种 BH-CS-MRCP 方案的采集时间均为 17 秒，NT-CS-MRCP 的采集时间为 127.5±36.9 秒。两种 BH-CS-MRCP 的背景抑制程度相似（原始 BH-CS-MRCP 为 3.67±0.77，改良 BH-CS-MRCP 为 3.70±0.57），均低于 NT-CS-MRCP（4.41±0.68，两者 p 值<0.001）。改良的 BH-CS-MRCP 和 NT-CS-MRCP 对于胰管和胆管的二级分支显示清晰度优于原始 BH-CS-MRCP（p 值均<0.01）。三种扫描序列对于胆道的解剖变异和疾病诊断准确度相似（p = 0.53-0.87），而对于胰管的解剖变异和疾病，改良 BH-CS-MRCP 和 NT-CS-MRCP 比原始 BH-CS-MRCP 诊断效能更优秀（p 值均<0.01）。在 7 名不能配合的患者中，NT-CS-MRCP 比两种 BH-MRCP 的图像质量更好（p 值均<0.01）。
结论：改良的 BH-CS-MRCP 可用于胰腺和胆道疾病。然而对于不能配合呼吸指令的患者而言，NT-CS-MRCP 可能更有用。

EPO-1025
MSCT 检查对中弓韧带压迫腹腔动脉的诊断价值

冯静
重庆市第七人民医院

目的 探讨和总结 MSCT 评估正中弓状韧带（MAL）压迫腹腔动脉（CA）的影像表现。**方法** 回顾性分析 2016 年 8 月—2019 年 6 月我院诊断 MAL 压迫腹腔动脉患者 23 例，总结其影像学表现和特点。**结果** 23 例诊断 MAL 压迫腹腔动脉患者中，男 15 例，女 8 例；轴位图像清楚显示腹腔动脉狭窄 19 例，矢状位 MPR、MIP 及 VR 图像 23 例均显示腹腔动脉狭窄，腹腔动脉狭窄严重程度为 16%~87%，最狭窄点距腹主动脉 2.5~19,8mm（平均 9.4mm），狭窄后轻度扩张 18 例，无扩张 5 例，7 例侧支循环形成，15 例腹主动脉硬化。**结论** MSCT 和血管后处理技术可以清楚显示 MAL 对腹腔动脉的压迫和血管狭窄程度，能够为临床诊断和治疗提供重要的信息。

EPO-1026
同时性肝细胞癌和肝内胆管细胞癌双原发癌（附 1 例报告及文献复习）

黎金葵,雷军强
兰州大学第一医院

病史：49 岁女性患者，主因“间断乏力、右上腹疼痛 3 年余”入院。既往慢性乙肝、肝纤维化病史。肿瘤标记物 AFP 109.4 IU/ml，CA199 321.6U/ml。CT 平扫+增强示肝 S4 见一大小约 40mm×44mm 的类圆形低密度影，边界尚清，增强动脉期呈高强化，门脉期及延迟期廓清；同时肝 S6 见一大小约 26mm×27mm 的类圆形低密度影，边界清，增强动脉期边缘轻度强化，门脉期边缘强化程度增加，延迟期略向中央填充。MR 平扫+特异性增强示 S4 病灶呈长 T1 混杂长 T2 信号，弥散受限，增强动脉期呈环形强化，门脉期及延迟期呈渐进性强化，肝胆期呈混杂低信号；S6 病灶呈长 T1 稍长 T2 信号，T1WI 上内可见点状高信号，弥散不受限，增强动脉期呈等强化，门脉期强化程度增加，过渡期呈低信号，肝胆期呈低信号。影像诊断肝 S4、6 肿块，考虑恶性肿瘤，HCC 或 cHCC-CC 可能。患者行肝肿物切除术，术后病理诊断：（肝四段）：中-低分化胆管细胞癌，（肝六段）：低分化肝细胞癌。
讨论：原发性肝癌主要包括 HCC、ICC 以及 cHCC-CC。WHO(2010 版)对 cHCC-CC 进行了重新分类，将同时发生于肝的独立 HCC 和 ICC 称为双原发癌（dpHCC-ICC）；而将在同一部位发生包含肝细胞癌与胆管癌两种成分且相互混杂或移行者，称为 cHCC-CC。dpHCC-ICC 发病率较 cHCC-CC 更低。临床表现类似 HCC，如患者以男性为主、有肝炎或肝硬化病史、AFP 增高等。其影像特点是不同的病灶分别表现为 HCC 及 ICC 影像征象，当 AFP 和 CA199 同时升高可提示双原发肝癌的可能，但 cHCC-CC 也同时具备 HCC 和 ICC 成分，也可有 AFP 和（或）CA199 升高，有时鉴别困难，明确诊断依靠病理学检查。

EPO-1027
灌注 CT 诊断胰岛素瘤最佳融合期相数目的初步研究

李娟[1],陈新月[2],徐凯[1],薛华丹[1]
1.中国医学科学院北京协和医院
2.西门子 CT

研究目的：本研究拟通过不同期相数目融合得出的自定义容积图像进行比较，找到灌注 CT 诊断胰岛素瘤的最佳融合期相数目。
研究方法：本研究回顾性纳入因怀疑胰岛素瘤，在我院行灌注 CT 检查且经病理证实为胰岛素瘤的患者 39 名。将灌注检查的患者调入后处理工作站 syngovia，后处理软件为 dynamic angio。首先，在腹主动脉画取 ROI，得到主动脉的时间-密度曲线。之后，将腹主动脉峰值及其邻近 2、4、6、8、10 期，共计 3、5、7、9、11 个时间点融合，得到五组自定义容积成像。并对 5 组融合图像的噪声、肿瘤的 SNR、CNR 及总体图像质量进行比较。统计学方法采用随机区组方差分析及 Friedman M 秩和检验。
研究结果：3 期融合容积成像倾向于图像噪声更高及胰腺 SNR 更低，与 7、9 及 11 期比较，p 值均＜0.05，但与 5 期融合容积成像相比均无明显统计学差异（p＞0.05）。11 期融合容积成像倾向于图像噪声更低及胰腺 SNR 更高，图像噪声与 3 期及 5 期容积成像相比有统计学差异（p＜0.05），而胰腺 SNR 仅与 3 期相比有统计学差异（p＜0.05）。5、7、9 期融合容积成像具有中等噪声及

SNR。尽管 3 期融合成像倾向于更高的胰岛素瘤 CNR，但与其他四组相比均无明显统计学差异。两位评估者对于 5 组容积成像的主观图像质量评估有良好的一致性（κ 值为 0.614-0.730）。3 期融合的图像质量与 5 期相比无明显统计学差异（两位评估者 p 值均＞0.99），而与 9 期及 11 期相比均有统计学差异（两位评估者 p 值均＜0.05），3 期与 7 期图像质量比较，观察者 1 发现有统计学差异（p＜0.05），观察者 2 无明显统计学差异（p＞0.05），余图像质量间均无明显统计学差异。研究结论：3 期融合容积成像，倾向于肿瘤 CNR 更高，且图像质量在可接受范围内。因此最佳融合期相数目为 3 期。

EPO-1028
腹部含脂性肿瘤的诊断思维路径（专题讲座）

杨全新
西安交通大学第二附属医院

脂肪组织具有重要的内分泌和免疫功能，也是构成肠系膜、网膜及腹膜后结构的重要部分。腹部肿瘤内脂肪成分的识别对病变来源及定性至关重要。计算机断层扫描和磁共振成像对脂肪的识别十分敏感。腹部含脂性肿瘤可分为腹腔及腹膜后脏器来源和非脏器来源，如髓样脂肪瘤、血管平滑肌脂肪瘤、腹腔内或腹膜后脂肪肉瘤、畸胎瘤等。本文将分别以腹腔内及腹膜后两个空间结构为起点，从脏器及非脏器来源两方面，汇总及回顾腹部含脂性肿瘤的影像学特点，以期为临床工作提供清晰的影像诊断思路，为青年医师的规范化培养提供参考。

EPO-1029
多排螺旋 CT 对腹部巨大囊性病变的诊断价值

李迎峰
忻州市人民医院

目的：探讨多排螺旋 CT 对腹部巨大囊性病变的诊断价值。方法：回顾性分析腹部巨大囊性病变 34 例,均经手术或病理证实其来源,对其良恶性诊断进行统计学分析,计算 CT 诊断的符合率、敏感度及特异度,并对其中良性病变 CT 表现的形态、边界、周围组织变形、移位等征象与金标准进行对照。结果：与金标准对比,CT 诊断良恶性病变之间无统计学意义(P >0.05),CT 诊断的符合率、敏感度及特异度分别为 85.3%、92.3%、62.5%,其中 24 例良性病例中,上腹囊性包块 10 例,中下腹 5 例,占据整个腹部 9 例。肝囊肿 5 例,胰腺囊肿 4 例,输卵管卵巢囊肿 5 例,胆总管囊肿 3 例,卵巢浆液性和黏液性囊肿各 1 例,神经鞘瘤 2 例,包裹性结核性腹膜炎 1 例,囊性淋巴管瘤 2 例。结论：CT 诊断腹部巨大囊性病变绝大多数为良性,囊性病变临近组织的变形和移位方向对囊肿的定位诊断具有重大作用,多平面三维重建能更清晰地显示其关系。

EPO-1030
腹部 CT 不同调制强度对图像质量与辐射剂量影响的临床研究

张彪,李宁,张照喜,袁子龙
湖北省肿瘤医院

目的 探讨西门子 CT 联合管电流调制在成人腹部 CT 扫描中不同调制强度对图像质量与辐射剂量影响，分析体质量指数（BMI）与调制强度关系。**方法** 连续收集行上腹部 CT 平扫和双期增强扫描 235 例患者，分 5 组（A、B、C、D、E），每组纳入 47 例分别对应五种调制强度[Very Strong（VS）、Strong（S）、Average（A）、Weak（W）、Very Weak（VW）]下扫描，每组患者扫描规范相同。比较各组辐射剂量（CTDIvol、DLP）及图像客观指标[噪声（SD）及肝、脾、胰腺、腹主动脉和门静脉对比噪声比（CNR）]，对各组图像质量行主观评价。同时将每组患者 BMI 分两亚组（≥24 与<24）kg/m^2行亚组分析。**结果** 5 组 BMI 间无统计学差异（P≥0.63）。5 组 $CTDI_{vol}$ 和 DLP 分别为（32.76、39.61、40.67、48.09、53.98）mGy 与（846.57 、1007.15、1046.17 、1165.96、1295.53）mGy·cm，A 与 C、D、E 组均有统计学差异（P≤0.04），A 与 B 组差异较小（P=0.08、0.31）。5 组动、静脉期 SD 分别为（5.56、7.01、5.32、4.69、4.71）和（5.62、6.81、5.59、5.08、4.87），肝、脾、胰腺、腹主动脉和门静脉 CNR 各组差异较小。图像质量主观评价满足诊断要求。对 BMI≥24kg/m^2患者，A、B、C 组 $CTDI_{vol}$ 低于 D、E 组，但图像噪声差异不大（P>0.05），对 BMI<24kg/m^2患者，随调制强度增加，图像噪声明显增加。**结论** 联合管电流调制在腹部 CT 应用中，随调制强度降低（VS、S、A、W、VW）辐射剂量增加，噪声减少。对 BMI≥24kg/m^2患者，各调制强度间图像质量相似，为减少曝光剂量，建议选择 VS、S、A 调制强度，对 BMI<24kg/m^2患者，建议选择 W、VW 调制强度。

EPO-1031

肝淤血的 CT 诊断

王景宇
吉林大学第一医院

目的：探讨导致肝脏淤血性疾病的多层螺旋 CT（MSCT）表现特征，提高相关疾病影像诊断水平，为临床诊治肝淤血性疾病提供帮助。**方法**：对 58 例经临床诊断的肝脏淤血性疾病，包括 11 例肝小静脉闭塞症、13 例布-加综合征、34 例心源性肝淤血进行回顾性研究，分析其 CT 征像。**结果**：肝脏淤血性疾病共同表现为肝脏增大，慢性期肝脏缩小或出现肝硬化，门静脉期肝组织地图样强化不均匀，多伴发脾大、门静脉高压、腹水、胆囊壁水肿及肝内淋巴瘀滞等征象。肝小静脉闭塞征多表现为典型肝淤血表现，布-加综合征可出现肝静脉或下腔静脉肝段及以上管腔狭窄、阻塞或闭塞征像，增强检查肝尾状叶及肝门区明显强化，肝外周实质强化不明显，并出现肝内外侧枝循环静脉；心源性淤血性肝病增强检查可出现动脉期下腔静脉逆向性对比剂充盈征像。**结论**： CT 检查表现对肝淤血性疾病的诊断、鉴别诊断及病因诊断具有重要价值。

CT Perfusion Imaging Can Predict Early Response to and Survival with Transarterial Chemo-lipiodol Infusion for Patients with Colorectal Cancer Liver Metastases

Weifu Lv
Department of Interventional Radiology, Anhui Provincial Hospital, the First Affiliated Hospital of University of Science and Technology of China (USTC)

Objective: To prospectively evaluate the performance of computed tomography perfusion imaging (CTPI) in predicting the early response to and survival with transarterial

chemo-lipiodol infusion (TACLI) for patients with colorectal cancer liver metastases (CRLM).
Materials and Methods: CTPI was performed before and 1 month after TACLI in 61 consecutive patients. Therapeutic response was evaluated on CT scans 1 month and 4 months after TACLI; the patients were classified as responders and non-responders based on 4-month CT scans after TACLI. The percentage change of CTPI parameters of target lesions of the responders and that of the non-responders 1 month after TACLI were compared. The optimal parameter and cutoff value were determined. The patients were divided into two subgroups according to the cutoff value. The log-rank test was used to compare the survival rates of the two subgroups. $P < 0.05$ indicates a significant difference.
Results: Four-month images were obtained from 58 patients, of which 39.66% were responders and 60.34% were non-responders. The percentage change in hepatic arterial perfusion (HAP) 1 month after TACLI was the optimal predicting parameter ($P = 0.003$). The best cut-off value was -21.51%. Patients who exhibited a $\geq 21.51\%$ decrease in HAP had a significantly higher overall survival rate than those who exhibited a $< 21.51\%$ decrease ($P < 0.001$).
Conclusion: CTPI can predict the early response to and survival with TACLI for patients with CRLM. The percentage change in HAP after TACLI with a cutoff value of -21.51% is the optimal predictor.

肝硬化胆道系统异常的 MRI 评估

胡然
重庆市中医院

目的：通过 MRI 评估肝硬化患者胆道系统的改变，并探讨其与肝硬化 Child-Pugh 分级的相关性。
材料与方法：搜集 2014 年 2 月至 2018 年 12 月在我院住院治疗的 166 例肝硬化患者，按肝硬化 Child-Pugh 分级分为 3 组。在 MRI 图像上观察患者胆道系统的改变，包括胆囊窝扩大，胆囊壁增厚，胆囊浆膜下水肿，胆道结石，胆囊体积增大，胆总管扩张.。采用卡方检验分析肝硬化胆道系统异常与 Child-Pugh 分级不同严重程度之间的差异性，并采用 Spearman 等级相关来分析两者之间的相关性。
结果：166 例患者中，有 111 例患者（67%）存在胆道系统的异常，包括胆囊窝扩大 68 例（41%），胆囊壁增厚 62 例（37.3%），胆囊壁浆膜下水肿 50 例（30.1%），胆囊窝积液 51 例（30.7%），胆道结石 32 例（19.3%），胆囊体积增大 18 例（10.8%），胆总管扩张 10 例(6%)。根据肝硬化 Child-Pugh 分级，A 级 86 例，B 级 55 例，C 级 25 例，其中胆道系统异常的发生率，A 级为 38 例（44%），B 级为 49 例（89%），C 级为 96%（24 例），A 级与 B、C 两级级间比较有统计学意义（$P \leq 0.05$），B 级与 C 级间比较差异无统计学意义（$P=0.31$），胆道系统异常的发生率与肝硬化 Child-Pugh 分级之间具有正相关关系($r=0.491, p=0.000$)。
结论：MRI 能可靠评价肝硬化患者胆道系统异常，可以作为肝硬化严重程度分级的辅助参考指标。

全模型迭代重建在Ⅰ、Ⅱ级肝硬化患者低辐射剂量 CTPV 中的应用

王海燕
广西医科大学第二附属医院

目的 探讨全模型迭代重建（IMR）技术在低辐射剂量 CTPV 中的应用价值。**方法** 将 60 例临床诊断肝硬化的患者行 256 层螺旋 CT 门静脉成像，根据随机表法将患者随机分为常规组（A 组）和实验组（B 组），每组 30 人。A 组：管电压为 100kV，剂量指数（DRI）为 20,图像采用 iDose4 重建；B 组：管电压为 80kV，DRI 为 17,图像采用 IMR 重建。对比 A、B 两组以下指标的的差异性。①门静脉图像噪声（SD）、信噪比（SNR）、对比信噪比（CNR）及主观评分。②肝实质 SD 和 SNR。③两组患者容积 CT 剂量指数（$CTDI_{VOL}$）、辐射剂量长度乘积（DLP）和有效辐射剂量（ED）。**结果** B 组肝实质及门静脉的 SD 均低于 A 组（P＜0.01）；B 组肝实质 SNR、门静脉 SNR、门静脉 CNR 及主观评分均高于 A 组（P＜0.01）；B 组 $CTDI_{VOL}$、DLP 及 ED（2.03±0.43mSv）分别较 A 组减低 26.7%、27.4%及 27.2%（P＜0.01）。**结论** 全模型迭代重建技术联合低管电压可进一步降低Ⅰ、Ⅱ级肝硬化患者 CTPV 辐射剂量并显著提高图像质量，值得临床应用推广。

EPO-1035
磁共振多种成像技术对于肝门部胆管癌的准确分期及早期诊断的价值

赵盛
内蒙古医科大学附属医院

目的:探讨多种磁共振功能成像技术 IVIM、DCE-MRI、DKI、DWI 对于肝门部胆管癌的准确分期的价值，探讨多种磁共振功能成像技术 IVIM、DCE-MRI、DKI、DWI 对于常规磁共振表现阴性的肝门部胆管癌的早期诊断价值。

方法:拟采集 100 例肝门部胆管癌患者，常规磁共振（T2WI、T1WI、MRCP）检查，并同时进行 DWI、DCE-MRI、IVIM 及 DKI 成像，分析每种成像技术所得参数，并比较不同成像技术参数间的相关性。数据应用 SPSS25.0 进行统计学分析，分析不同成像技术参数间的相关性，绘制 ROC 曲线。

结果：DCE-MRI、IVIM、DKI 的多个成像参数可以更准确地对肝门部胆管癌进行分期，并且能够早期诊断常规磁共振表现阴性的肝门部胆管癌。通过术后随访，发现 Ktrans、Kep 对于肝门部胆管癌周围血管受累的情况有较好的显示，ADC fast、ADC slow、ffast、MK 对于常规磁共振检查隐阴性的肝门部胆管癌有早期诊断的效能。

结论:DCE-MRI、IVIM、DKI 成像技术能更准确地对肝门部胆管癌进行分期，并且能够早期诊断常规磁共振表现阴性的肝门部胆管癌。

EPO-1036
能谱 CT 在肝脏泡型包虫病诊断中的应用研究

蒋奕
四川大学华西第二医院

目的 通过分析肝脏泡型包虫病双能量 CT 成像特点，探讨双能量 CT 多参数成像技术在显示 HAE 组织和血供特点上的临床诊断价值。**方法** 自 2016 年 7 月至 2017 年 3 月间收集来我院就诊并经手术或综合影像学诊断为肝泡型包虫病患者 45 例。所有患者均行腹部双能量 CT 三期增强扫描（动脉期，门静脉期，静脉期）。根据病灶影像特征进行影像学分型。对所有患者双能量扫描图像并通过图像重建获得病灶的碘基物质图、单能量图像、最佳对比噪声比（Contrast to noise ratio, CNR）图及能谱曲线图，分析各组图像的特点并进行相应的定量测算，包括 CT 值、碘定量、最佳 CNR 值，曲线斜率，同时在显示病灶组织细节及血供情况上与常规 CT 图像进行比较。**结果** 45 例肝脏泡型包虫共检出 53 个病灶；病灶直径 87.6±50.7mm。所有病灶中实体型占 36%（19/53），假囊肿型占 11%(6/53)个，混合型占 52.8%（28/53）。双能量 CT 碘图成像较常规 CT 更容易显示 HAE 病灶边缘 5~12mm 的强化区域，检出率比较分别为 71.6% 和 50.9%；在对病灶大小的测量上，双能

量碘图（79.53±53.77mm）高于常规 CT（71.36±50.16mm），二者之间无明显统计学差异（P=0.52）。肝泡型包虫病灶的囊性成分、实性成分、边缘区域及正常肝实质之间的碘值均数差异具有统计学意义(P<0.05)。HAE 病灶边缘区碘值高于病灶内及正常肝实质。不同影像分型病灶边缘区的碘值无明显统计学差异（P<0.05）。**结论** 双能量 CT 多参数成像较常规 CT 能够提供更多的关于 HAE 病灶组织结构和血供方面的信息，其中碘图有助于评估病灶血供情况并可进行碘含量测定；单能量图像提高了图像质量和病灶的对比度，有助于病灶范围的确定。

EPO-1037
体素不相干运动 IVIM 与肝胆特异性造影剂 Gd-BOPTA 增强 MRI 技术联合临床实验室指标预测肝癌微血管侵犯 MVI 的研究

夏金菊,霍雷,李倩倩
海军军医大学第三附属医院（上海东方肝胆外科医院）

摘要：
肝细胞癌（hepatocellular carcinoma, HCC）是目前世界上最常见的原发性肝脏恶性肿瘤。肝癌切除和肝移植术后 5 年复发率分别达 70%、25%[1, 2]。肿瘤侵袭性生物学行为最主要的表现就是微血管侵犯（MVI），作为最有价值的指导 HCC 治疗及预测预后的独立因素之一。若能在术前无创地对 HCC 是否存在 MVI 进行诊断，将对治疗方案的合理选择起到重要指导作用。本课题重点采用分子影像学方法（细化定量及半定量的常规影像学指标，并采用最新 MR 技术，包括自由呼吸状态下 MR 灌注、多 b 值弥散成像、肝胆特异性对比剂），并结合临床实验室指标、肿瘤标记物（AFP、DCP 等）等手段，对肝细胞癌微血管侵犯进行回顾性和前瞻性分析，旨在提取术前判断微血管侵犯的磁共振特征和临床实验室定量指标，为肝细胞癌的临床诊疗及预后判断提供策略依据。HCC 具有高复发率，切除术后的 5 年复发率达 70%，肝移植后的 5 年复发率约 25%[1,2]。其中血管侵犯是反映肿瘤侵袭性生物学行为的主要表现之一，而微血管侵犯（MVI）是最有价值的指导 HCC 治疗及预测预后的独立性因素[4]。国际各肝细胞癌诊治指南中，血管的侵犯情况是其重要的组成部分，但微血管侵犯目前尚未纳入术前评价体系，因此，术前预测肝细胞癌微血管侵犯指标的研究，即可为指南的修订提供重要的依据，也将对临床 HCC 治疗方案的合理选择起到重要指导作用。综上所述，本课题重点采用体素不相干运动 IVIM 与肝胆特异性造影剂 Gd-BOPTA 增强 MRI 技术，并结合临床实验室指标，对肝细胞癌微血管侵犯进行回顾性和前瞻性分析，旨在提取术前判断微血管侵犯的磁共振特征和临床实验室定量指标，即可为指南的修订提供重要的依据，也对临床 HCC 治疗方案和预后判断的合理选择起到重要的策略依据。

EPO-1038
磁共振 IDEAL-IQ 技术在急性胰腺炎中的应用价值

杨花娟
西安交通大学第二附属医院

目的：探讨磁共振非对称回波与最小二乘法估算铁定量的迭代水脂分离(IDEAL-IQ)序列在急性胰腺炎中的临床价值。

方法：收集本院 40 例急性胰腺炎患者和 40 例健康志愿者（对照组），使用 GE Pioneer 3.0T 磁共振仪及 8 通道相控阵腹部线圈进行上腹部常规及 IDEAL-IQ 序列的 MRI 扫描，所有受试者采用仰卧位，先行常规磁共振序列扫描，然后在屏气状态下行 IDEAL-IQ 序列的 MRI 扫描。IDEAL-IQ 序列扫

描参数：TR6.2ms，TE3.0ms,激励次数 0.5，视野 38cmX38cm，层厚 10cm，相位数 160。扫描结束可自动重建出水像、纯脂肪像、脂肪对比像、R_2*弛豫率像四组图像，由一位高年资影像诊断医师使用 GE 后处理工作站在四组图像上分别测量胰腺头、体尾最大层面勾画 RIO，取 3 个部位的所有测量值的平均值作为该组图像上胰腺组织的最终测量结果。

结果：实验组的脂肪含量为（15.5±4.6）%，对照组的脂肪含量为（3.78±1.11）%，两者之间差异具有统计学意义（P<0.05）；实验组的铁含量为（598±101）Hz,对照组铁的含量为（38±16）Hz，两者差异具有统计学意义（P<0.05）。

结论：磁共振 IDEAL-IQ 序列一次扫描即获得多组图相比，即水像、纯脂肪像、脂肪对比像、R_2*弛豫率像四组图像，其中脂肪对比像、R_2*弛豫率像可以对急性胰腺炎患者肝脏内的脂肪的含量、铁含量行定量分析，对急性胰腺炎诊断具有重要的临床价值

EPO-1039
基于 CT 和 MRI 成像肝脏影像报告系统的一致性研究

李珊玫
湖北省肿瘤医院

探讨基于 CT 和 MRI 成像 LI-RADS 分级标准对原发性肝癌的诊断价值。 方法 收集 2018 年 1 月至 2019 年 6 月期间术后病理证实的 72 例原发性肝癌患者的影像学资料，均行 CT 及 MRI 成像，由 2 名诊断医师在不知道病变的病理结果的情况下对图像资料进行审阅，按 LI-RADS 标准给予分级，并标记出 CT 和 MRI 显示的主要征象，比较两组诊断原发性肝癌的一致性采用 Kappa 分析。结果 72 例患者共检出 158 个病灶，（1）CT 组，医师 A，共识别动脉期强化（138 个）廓清（146 个）包膜（76 个），医师 B，共识别动脉期强化（129 个）廓清（145 个）包膜（81 个），K 值约 0.91，一致性强；（2）MRI 组，医师 A，共识别动脉期强化（141 个）廓清（153 个）包膜（115 个），医师 B，共识别动脉期强化（144 个）廓清（153 个）包膜（112 个），K 值约 0.93，一致性强；（3）CT 组及 MRI 组平均诊断率比较，MRI 对肝癌主要征象的显示率高于 CT，对包膜的显示以及发现小于 1CM 的病灶表现出特有的优势。结论，基于 LI-RADS，CT 和 MRI 均对肝癌有较高的诊断效能，并均有较高的诊断一致性，根据具体情况，适时结合两种检查方法，共同作出判断。

EPO-1040
肝细胞特异性对比剂 Gd-BOPTA 动态增强 MRI 鉴别肝脏血管平滑肌脂肪瘤与高分化肝细胞癌

陈晓丹,曹代荣
福建医科大学附属第一医院

目的：探讨肝脏血管平滑肌脂肪瘤（HAML）肝细胞特异性对比剂 Gd-BOPTA MRI 平扫、动态增强及肝胆期的影像学表现，以及与高分化肝细胞癌（HCC）的鉴别诊断。
方法：回顾性分析病理证实的 HAML 8 例，高分化 HCC 11 例，比较两组病例的临床特征；测量两组病例的 T2WI、T1WI、DWI、ADC 和动脉期（AP）、门脉期（PP）、实质期（TP）、肝胆期（HBP）的信号强度 $SI_{病灶}$，并测得相同层面同侧竖脊肌的信号强度 $SI_{肌肉}$，SR（SI Ratio）=$SI_{病灶}/SI_{肌肉}$；并选取与病灶同一层面测量肝脏左外叶、内叶、右前叶、后叶及脾脏四个 SI，计算平均值 $SI_{肝脏}$、$SI_{脾脏}$，$RE_1=(SI_{病灶AP}-SI_{病灶平扫})/SI_{病灶平扫}$，$RE_2=(SI_{病灶PP}-SI_{病灶平扫})/SI_{病灶平扫}$，$RE_3=(SI_{病灶TP}-SI_{病灶平扫})$

/SI 病灶平扫，RE_4=（SI 病灶 HBP-SI 病灶平扫）/SI 病灶平扫，RE_5=SI 病灶 HBP/SI 肝脏 HBP， RE_6= SI 病灶 HBP/SI 脾脏 HBP，并用相应统计学方法比较两组病例各指标的差异性。
结果：HAML 更常见于女性；HAML 发病年龄比高分化 HCC 小；两组间病灶大小无统计学差异；HAML 比高分化 HCC 更容易出现病灶内脂肪。HAML T2 SR、ADC 值高于高分化 HCC，而 T1 SR、DWI SR 二者无统计学差异；HAML RE_2、RE_3 高于高分化 HCC，而 RE_1、RE_4、RE_5、 RE_6均无统计学差异。HAML 动脉期出现引流静脉早显的概率高于高分化 HCC，供血动脉出现率二者无统计学差异，高分化 HCC 假包膜更常见。
结论：HAML 很容易误诊为 HCC，当一个年轻女性病人，在 Gd-BOPTA 增强 MRI 中，病灶动脉期明显强化、门脉期及实质期呈持续强化、引流静脉早显、没有假包膜要考虑 HAML 的可能。

EPO-1041
三维可视化系统在肝脏血管变异分析中的应用价值

梅鑫,霍雷,张娟
海军军医大学第三附属医院（上海东方肝胆外科医院）

目的：通过收集在本院行肝脏肿瘤手术的病人的影像学三维可视化资料，评价其对血管分型及变异分析的应用价值。方法： 选取 2016 年 1 月至 2017 年 1 月于我院肝外三科行肝脏肿瘤手术的 287 例患者的影像学资料，采用三维可视化软件进行三维肝脏重建，依据 Couinoud 分段标准进行肝脏分段，分别对肝动脉、门静脉、肝静脉进行分型。结果： 因肝脏肿瘤过大或肿瘤位置原因，无法完整显示 3 支血管者 19 例。肝动脉变异率为 31.7% ，门静脉变异率为 12.3%，肝静脉变异率为 81.7%，其中副肝右静脉出现率为 27.7%。结论： 三维可视化系统能准确、快速评估肝脏血管变异，具有一定应用价值。

EPO-1042
Potential Clinical Factors Affecting Liver Enhancement in the Hepatocyte Phase on Gadobenate Dimeglumine (Gd-BOPTA)-enhanced Magnetic Resonance (MR) Imaging

Xiaodan Chen,Dairong Cao
First Affiliated Hospital of Fujian Medical University

Objectives: To evaluate the relationships between clinical factors and the degree of liver parenchymal enhancement in the hepatocyte phase on gadobenate dimeglumine (Gd-BOPTA)-enhanced magnetic resonance (MR) imaging and clarify clinical predictive factors affecting the degree of liver parenchymal enhancement.
Materials and methods: 238 patients were divided into 4 groups: normal liver function without liver cirrhosis (group NLF) and cirrhosis with Child-Pugh Classes A, B, and C (groups LCA, LCB, and LCC). The relative enhancement ratio (RE) of liver parenchyma was calculated from measurements of the signal intensity before (SI_{pre}) and 90 min after (SI_{post}) intravenous injection of Gd-BOPTA with the following formula: $RE = (SI_{post} - SI_{pre})/SI_{pre}$. Statistical analysis was used to access the relationships between the RE of the liver parenchyma and clinical factors, and clarify clinical predictive factors.

Results: Increased RE of liver parenchymal enhancement showed correlations with decreased total bilirubin, prothrombin time, international normalized ratio, alanine aminotransferase, aspartate aminotransferase, alkaline phosphatase, Child-Pugh scores and elevated albumin, cholinesterase. The RE in group NLF was significantly higher than those in groups LCA, LCB and LCC (all $P < 0.001$). The RE in group LCA was significantly higher than those in groups LCB and LCC (both $P < 0.001$). Total bilirubin, albumin, alkaline phosphatase, and the presence of ascites were the only factors affecting liver parenchymal enhancement.
Conclusions: The degree of hepatic parenchymal Gd-BOPTA enhancement in the hepatocyte phase was affected by liver function parameters, revealing Gd-BOPTA-enhanced MR imaging could be a non-invasive method for evaluating liver function.

EPO-1043
术前增强 CT 对肝细胞癌切除术后早期复发风险评估研究

李欣明[1],全显跃[1],漆振东[1],耿志君[2]
1.南方医科大学珠江医院
2.中山大学肿瘤防治中心

目的：本研究拟探讨基于术前动态增强 CT 对肝细胞癌切除术后早期复发风险评估的价值。
方法：搜集 2012 年 1 月至 2012 年 12 月期间在南方医科大学珠江医院及中山大学肿瘤防治中心择期行根治性切除的孤立性肝细胞癌患者的术前动态增强 CT 资料，最后纳入 117 例肝癌患者作为研究对象，其中男性 102 例，女性 15 例，年龄 22～82 岁（50.4±11.2）岁。由两名从事腹部影像学诊断的医生分别独立对增强 CT 图像是否存在瘤内动脉、坏死、晕环及边缘是否清楚进行分析，当征象判别结果不一致时，经两位医生讨论后得出最终结果。随后所有患者定期进行随访，随访时间截止到 2019 年 5 月，记录患者的无病生存时间及判断患者是否早期复发（复发时间小于 2 年）。Kaplan-Meier 法绘制生存曲线，生存率比较采用 log-rank 检验，多因素 Cox 回归分析无病生存影响因素。
结果：截止随访结束，共 107 例（91.5%）患者获得随访，获得随访的患者术后中位无病生存时间是 33 个月，单因素分析显示瘤内动脉（RR=2.27，95%CI：1.39～3.71）、坏死（RR=1.99，95%CI：1.21～3.27）、及边缘（RR=1.89，95%CI：1.19～3.01）是肝癌切除术后无病生存的危险因素，多因素回归分析显示瘤内动脉（RR=2.10，95%CI：1.39～3.46）及边缘不清（RR=1.69，95%CI：1.05～2.71）是肝癌切除术后无病生存的独立危险因素。其中 35 例患者无此征象，43 例患者有其中一个征象，39 例患者有两个征象，其早期复发率分别为 22.9%、37.2%、69.2%（P＜0.001），其中位生存时间分别为 61 个月、44 个月、8 个月（P＜0.001）。
结论：术前增强 CT 瘤内动脉及边缘不清是肝癌切除术后无病生存的独立危险因素，可用于预测肝癌患者的早期复发。

EPO-1044
Phase-Contrast MRI in the assessment of portal vein hemodynamic changes in patients of ALPPS

Ling Zhang,Liling Long
The First Affiliated Hospital of Guangxi Medical University

Purpose： To assess the value of Phase-Contrast MRI in evaluating portal flow changes in patients of ALPPS (associating liver partition and portal vein ligation for staged hepatectomy).
Methods： A total of 8 patients with ALPPS from November 2018 to March 2019 were included prospectively. All cases were approved by the ethics committee of the hospital. Phase-contrast MRI of portal vein trunk (PV) and left portal vein (LPV) were performed 1 day before and 7 days after ALPPS for each patient. Then MR cardiac function post-processing software was used to evaluate the morphology of portal veins （diameter, area) and hemodynamic changes (average/peak velocity, average/peak flow, pressure gradient) . Correlation analysis was used to assess the relationship between the left hepatic hyperplasia rate and the Ishak inflammation score.
Results: The diameters of portal trunk before and after ALPPS were 12.75±2.53mm and 15.07±2.19mm (p=0.0366). The diameters of left portal veins(LPV) pre- and postoperative were 8.79±2.35mm and 11.441±1.49mm（p=0.0105）respectively. The peak flow rates of LPV were 7.551±1.80ml/s and 13.10±1.09ml/s (p=0.0016). The average flow rate of LPV were 0.360±0.09 l/min and 0.553±0.10 l/min (p=0.0337). Additionally, the left hepatic hyperplasia rate had a negative correlation with Ishak inflammation score (P= 0.0331, r= -0.7474).
Conclusion： Phase-Contrast MRI allows comprehensive assessment of portal vein in one breath-hold, it may potentially reflect vascular changes due to ALPPS. However, the relationship between portal flow and left hepatic hyperplasia needs further study.

钆塞酸二钠增强 MRI 与肝细胞肝癌分化程度的相关分析

熊廷伟,张启川
陆军军医大学第二附属医院（新桥医院）

目的探索肝细胞肝癌(HCC)磁共振成像(MRI)平扫及钆塞酸二钠(Gd-EOB-DTPA)增强肝胆期信号与其分化程度的相关性。方法回顾性分析 2014 年 5 月至 2016 年 5 月该院收治的肝功能 Child-Turcotte-Pugh(CTP)A 级的 32 例 HCC 患者的 Gd-EOB-DTPA 增强 MRI 平扫及肝胆期图像,分为肝硬化组及非肝硬化组,其中肝硬化组 17 例,非肝硬化组 15 例;分别计算病灶信号噪声比(SNR)、强化率(ER)和相对强化率(RER)及相对信号强度比(RIR),并统计患者年龄、血清甲胎蛋白(AFP)水平及病灶最大径。并对不同分化程度 HCC 与平扫、肝胆期各信号指标,以及年龄、血清 AFP 水平、病灶最大径进行相关分析。结果 32 例患者(40 个病灶)中,分化程度为高分化 10 个,中分化 22 个,低分化 8 个;肝硬化组高、中及低分化 HCC 与对应 SNR、ER、RER、RIR、年龄、血清 AFP 水平、病灶最大径之间无相关性(P>0.05);非肝硬化组高、中及低分化 HCC 与相应 RER、年龄之间存在相关(P<0.05),而与 SNR、ER、RIR 及血清 AFP 水平及病灶最大径之间无显著相关(P>0.05);总体样本分析 HCC 分化程度与对应 RER 之间有相关性(P<0.05),而与 SNR、ER、RIR 及年龄、血清 AFP 水平及病灶最大径之间无相关性(P>0.05)。结论 Gd-EOB-DTPA 增强 MRI 肝胆期信号预测非肝硬化患者 HCC 分化程度有一定价值,而对预测肝硬化患者 HCC 分化程度的价值有限。

基于 AFP-L3 不同表达类型的原发性肝细胞癌 MRI 特点分析

唐栋[1],朱国平[2]
1.杭州师范大学附属医院
2.浙江大学医学院附属第四医院

【摘要】 目的 分析甲胎蛋白异质体（AFP-L3）阴性及阳性表达的原发性肝细胞癌（HCC）高场 MRI 特点，提高对 AFP-L3 不同表达类型原发性肝细胞癌的早期影像诊断水平。**方法** 收集经杭州师范大学附属医院诊治并确诊的 AFP-L3 阴性原发性肝细胞癌 29 例(阴性组)和 AFP 阳性原发性肝细胞癌 43 例（阳性组），总结归纳两组 MRI 征象，统计学对照。**结果** 阴性组中有 18 例（62.1%）肿瘤长径多位于 3cm 以下，单发瘤灶 23 例（79.3%）， 肿瘤表现为边缘规则者 17 例（58.6%），病灶内发生坏死、出血者阴性组 11 例（37.9%）， 另有 7 例（24.1%）出现门脉癌栓或转移，以上数据与对照组（阳性组）对比具有显著统计学差异（$P<0.05$）。 MRI 增强扫描：阴性组 29 例中表现为动脉期高度强化 8 例（27.6%）、中度强化 13 例（44.8%）、轻度强化 8 例（27.6%），阴性组中静脉期高度强化 5 例（17.2%）、中度强化 17 例（58.6%）、轻度强化 7 例（24.2%）；而阳性组中动脉期高度强化 25 例（58.1%）、中度强化 14 例（32.6%）、轻度强化 4 例（9.3%），阳性组中静脉期高度强化 6 例（14.0%）、中度强化 15 例（34.9%）、轻度强化 22 例（51.1%）。**结论** AFP-L3 阴性原发性肝细胞癌相对于阳性者，其 MRI 特点具有体积相对偏小、瘤灶多单发、边缘相对规则、不易发生坏死及出血、较少出现门脉癌栓或转移、动脉血供相对偏少而静脉血供相对优势。

重症急性胰腺炎：新亚特兰大分类下的临床和影像——放射科医师须知

肖波[1,2],张小明[2],徐海波[1],胡金香[1]
1.武汉大学中南医院
2.四川省医学影像重点实验室、川北医学院附属医院放射科

目的 探讨新亚特兰大分类下重症急性胰腺炎临床和影像学特征。**方法** 收集我院 2015 年 1 月至 2019 年 1 月间急性胰腺炎住院的临床资料且发病 7 日内行 CT/MRI 检查。**结果** 368 例按 1992 年亚特兰大分类归入重症急性胰腺炎。按 2012 新亚特兰大分类，中度重症急性胰腺炎（MSAP）占 84%（309/368）和重症急性胰腺炎（SAP）占 16%（59/368）。SAP 入院时 Ranson、APACHEII、Marshall、CTSI/MRISI 评分高于 MSAP（3.5±1.5 vs. 1.3±1.4），（18±6 vs. 7.1±4），（3.9±3 vs. .2± .5），（7.3±3 vs. 5.5±2）（P均 ＜.01）。MSAP 组：呼衰 26.2%（81/309）、肾衰 3.2%（10/309）、循环衰竭 0.3%（1/309）；2 个脏器衰竭 2.5%（8/309）、3 个脏器衰竭 0.9%（3/309）。SAP 组对应上述比例：67.8%（40/59）、8.5%（5/59）、3.3%（2/59）；15.3%（9/59）、5%（3/59）（P均 ＜.01）。SAP 入 ICU 比例和时间高于 MSAP[86.4%（51/59）vs. 56.6%（175/309）；25±22 d vs. 10±13 d，P ＜.01]。SAP 假性囊肿（PP）或包裹性坏死（WON）需 B 超或 CT 引导下引流术多于 MSAP[33.9%（20/59）vs. 11.3%（35/309），P ＜.01]；SAP 手术率高于 MSAP[16.9%（10/59）vs.4.9%（15/309），P ＜.01]；SAP 死亡率高于 MSAP[16.9%（10/59）vs. 1.6%（5/309），P ＜.01]。SAP 组住院时间长于 MSAP 组（40±28 d vs. 21±16 d，P ＜.01）。**结论** 新亚特兰大分类标准下真正 SAP 预后明显差于 MSAP，放射科医师需早期识别并及时诊断。

云南省中医医院（云南中医药大学第一附属医院）

摘要目的 探讨先天性下腔静脉畸形的 64 层螺旋 CT 影像表现，评价 MSCT 诊断价值。**方法** 回顾性分析经 MSCT 证实的 12 例先天性下腔静脉畸形患者的影像表现及临床意义。**结果** 12 例先天性下腔静脉畸形包括下腔静脉肝段缺如 2 例，其中 1 例伴有奇静脉代偿引流至上腔静脉，肝静脉直接回流右心房；1 例为单纯性。左肾静脉畸形 5 例，CT 横断面显示腹主动脉后左肾静脉、左肾静脉环绕腹主动脉分别为 4 例、1 例。双下腔静脉 3 例，CT 表现为肾下段腹主动脉左右两侧上行的下腔静脉。左位下腔静脉伴下腔静脉肝段缺如 1 例。下腔静脉后输尿管 1 例。4 例患者出现镜下血尿，2 例有高血压病史，1 例患者为多脾综合征，1 例合并右肾血管平滑肌脂肪瘤，其余为偶然发现。**结论** MSCT 能清晰显示下腔静脉及属支的畸形，是诊断先天性下腔静脉畸形的重要方法，可降低手术及介入诊治中的风险，临床应根据影像学表现及血流动力学等指标综合诊治。

相对表观扩散系数在术前评估低危型子宫内膜癌中的应用价值

吕发金,沈宜婧
重庆医科大学附属第一医院

目的：探讨最小表观扩散系数(minADC)、平均表观扩散系数（meanADC）及相对表观扩散系数（rADC）对术前评估低危型子宫内膜癌（endometrial carcinoma，EC）的应用价值。
材料与方法：回顾性分析 2011 年 7 月—2015 年 12 月我院经手术病理证实的 81 例 FIGO Ⅰ期 EC。根据 ESMO- ESGO-ESTRO 分型标准将其分为低危型组和高危型组，比较两组之间的临床指标、常规 MRI 指标、meanADC 值、minADC 值和 rADC 值。利用 ROC 曲线确定术前评估低危型 EC 的最佳 ADC 值及其诊断阈值。
结果：低危型组病灶的 meanADC 值、minADC 和 rADC 值均显著高于高危型组（1.095 vs. $0.902\times10^{-3}mm^2/s$, 0.755 vs. $0.657\times10^{-3}mm^2/s$, 0.754 vs. 0.603）。ROC 曲线分析表明 meanADC、minADC 和 rADC 的曲线下面积（AUC）分别为 0.840、0.681、0.876，当以 rADC=0.669 作为诊断阈值，最大约登（YI）指数为 0.683，预测低危型 EC 的敏感度、特异度和准确率分别为 81.8%，86.5%，84.0%。
结论：meanADC 值和 rADC 值对术前评估 I 期 EC 分型有较高价值，其中 rADC 的诊断效能最佳，可作为优化参数帮助识别低危型 EC，为临床合理选择手术方案提供影像学依据。

多模态影像联合检查在肾上腺区不同来源病变的定位及定性诊断

宋乐乐,陈殿森,陈望,王晓冬,李扬
河南科技大学第一附属医院

目的 探究多层螺旋 CT、MR 及彩色多普勒超声多模态联合检查在肾上腺区不同来源的肿瘤与肿瘤样病变定位及定性的诊断价值。 方法 回顾性分析我院经手术、病理或临床追踪证实的的 156 例肾上腺区占位性病变，比较患者多层螺旋 CT、MR 及彩色多普勒超声多模态诊断在定位诊断准确率与定性诊断准确率间的差异。 结果 其中 125 例为肾上腺来源,分别为肾上腺皮质腺瘤 75 例、髓样脂肪瘤 8 例、嗜铬细胞瘤 20 例（异位嗜铬细胞瘤 4 例）、囊肿 10 例、皮质增生 9 例、血肿 5 例、皮脂

癌 5 例、节细胞神经 3 例、转移瘤 2 例、结核 1 例、畸胎瘤 1 例;17 例为非肾上腺来源,分别为腹膜后脂肪肉瘤 8 例、囊性肾癌 6 例、胰腺假性囊肿 2 例、肾脏淋巴瘤 1 例。超声与多层螺旋 CT、MR 定位诊断准确率比较，差异有统计学意义(P＜0.05)。 CT、MR 定性诊断准确率高于超声(P＜0.05)，而多模态联合诊断准确率高于超声、CT 及 MR(P＜0.05)。 结论 多层螺旋 CT、MR 及彩色多普勒超声在肾上腺区不同来源的肿瘤与肿瘤样病变诊断中均有重要意义，而 3 种检查方法多模态联合检查可提高定位及定性的准确性，能更准确判断病变性质，为临床选择最佳的治疗方案提供依据。
CT 及 MR(P＜0.05)。 结论 多层螺旋 CT、MR 及彩色多普勒超声在肾上腺区不同来源的肿瘤与肿瘤样病变诊断中均有重要意义，而 3 种检查方法多模态联合检查可提高定位及定性的准确性，能更准确判断病变性质，为临床选择最佳的治疗方案提供依据。

基于表观扩散系数的子宫肉瘤与非典型子宫肌瘤的鉴别诊断

吕发金,邹春霞,郑伊能
重庆医科大学附属第一医院

目的 探讨不同 ADC 值对子宫肉瘤与非典型子宫肌瘤鉴别诊断价值，联合不同 ADC 值提高鉴别诊断准确性。**材料与方法** 回顾性分析我院在 2011 年 6 月至 2016 年 12 月期间经病理证实为子宫肉瘤与非典型子宫肌瘤的患者？例，术前均行 3T MRI 检查。测量并记录 mADC 值、minADC 值以及 rADC 值。分析并比较两组患者不同 ADC 值的差异性以及诊断效能。通过纳入 3 种 ADC 值建立多因素 logistic 回归诊断模型，采用 ROC 曲线评估诊断模型鉴别诊断子宫肉瘤及非典型子宫肌瘤的诊断效能。**结果** mADC 值、minADC 值以及 rADC 值均可鉴别诊断子宫肉瘤及非典型子宫肌瘤，差异均具有统计学意义（*P*值<0.00）。当 mADC 值取阈值为 1.21×10^{-3} mm^2/s、minADC 值取阈值为 0.95×10^{-3} mm^2/s 时，诊断准确度都为 86.6%，当 rADC 值取 0.59 为阈值时诊断准确度为 81.0%。根据多因素 Logistic 回归模型可选取 mADC 值与 minADC 值作为诊断模型的独立因素，根据 ROC 曲线评估诊断模型诊断效能的 AUC 为 0.907（95%可信区间为 0.850～0.965），敏感度为 97.5%，特异度为 82.5%，准确度为 91.5%，阳性预测值为 40%，阴性预测值为 17%。 **结论** 3 种 ADC 值都可鉴别诊断子宫肉瘤及非典型子宫肌瘤，mADC 值与 minADC 值诊断准确性相差不大，当 mADC 值与 minADC 值联合诊断时准确性最高。

前列腺移行区癌 T2WI 影像特征的多因素分析

张永胜,崔凤
杭州市中医院

目的 探讨 T_2WI 影像特征对前列腺移行区癌的诊断价值并筛选诊断价值较高的影像征象。 **方法** 回顾性分析经过病理证实的 43 例移行区前列腺癌的 T_2WI 图像，另选取 91 例前列腺增生患者作为对照组，采用多因素 Logistic 回归筛选影像征象，将筛选出的影像征象联合，计算联合诊断的敏感度、特异度、阳性预测值、阴性预测值及准确度。 **结果** T_2WI 上 7 种影像征象中，多因素 Logistic 回归筛选出三种影像征象：病灶形态、前列腺包膜、患侧移行区与外周带分界。联合诊断中，形态+前列腺包膜的特异度、阳性预测值、准确度最高，分别为 88.5%、67.8%、83.41%，形态+患侧移行区与外周带分界的敏感度、阴性预测值最高，分别为 82.8%、93%。 **结论** T_2WI 上病灶形态、前列腺包膜、患侧移行区与外周带分界是诊断移行区前列腺癌的独立危险因素。

目的 探讨 T2WI 影像特征对前列腺移行区癌的诊断价值并筛选诊断价值较高的影像征象。 方法 回顾性分析经过病理证实的 43 例移行区前列腺癌的 T2WI 图像，另选取 91 例前列腺增生患者作为对照组，采用多因素 Logistic 回归筛选影像征象，将筛选出的影像征象联合，计算联合诊断的敏感度、特异度、阳性预测值、阴性预测值及准确度。 结果 T2WI 上 7 种影像征象中，多因素 Logistic 回归筛选出三种影像征象：病灶形态、前列腺包膜、患侧移行区与外周带分界。联合诊断中，形态+前列腺包膜的特异度、阳性预测值、准确度最高，分别为 88.5%、67.8%、83.41%，形态+患侧移行区与外周带分界的敏感度、阴性预测值最高，分别为 82.8%、93%。 结论 T2WI 上病灶形态、前列腺包膜、患侧移行区与外周带分界是诊断移行区前列腺癌的独立危险因素。

多模态 MRI 诊断创伤致高血流量性阴茎异常勃起一例

祝萍,樊树峰
浙江中医药大学附属第二医院

资料与方法：
临床资料 患者，男，29 岁，既往体健，无相关性功能疾病史。因“骑跨伤致阴茎持续勃起 1 月余，加重 1 天”入院。骑跨伤后当即感会阴部麻木感，约十余分钟后出现会阴部疼痛，逐渐出现会阴部、阴茎肿胀，伴阴茎持续勃起状态，硬度约Ⅱ级，排尿前后未见明显好转加重，伴局部淤血，无开放性出血，无排尿困难，无尿血，无尿痛，无发热，患者未重视，自行服用消炎药物后，会阴部疼痛及淤血逐渐好转，阴茎勃起状态如前，触压时有疼痛，未见明显好转。1 天前患者工作时再次伤及会阴部，感阴茎勃起硬度较前增加遂入院。入院查体：阴茎发育可，呈勃起状态，硬度约Ⅱ级，阴茎中部呈向背侧弯曲，按压痛阳性。双侧阴囊皮肤色泽正常，睾丸附睾未及明显异常。入院尿常规提示尿红细胞 8，尿白细胞 28，血常规无明显异常。血气分析：pH 7. 445，PCO2 34.3 mmHg，PO2 145.0 mmHg，SO2 99.3%等指标提示符合动脉血气结果。
影像学资料 入院后行进行 MRI 多模态扫描，示：右侧阴茎海绵体根部见结节状异常信号影，T1WI 以高信号为主伴内部低信号影，FS-T2WI 呈不均匀环形结节样高信号伴周边环绕低信号影，DWI 呈明显高信号，ADC 显示为低信号，大小约 1.2*1.8cm，增强扫描上述异常信号内部及周边均见明显强化，右侧阴茎海绵体提前显影并呈持续强化改变，右侧阴茎动脉、阴茎背动脉略增粗；左侧阴茎动脉、阴茎海绵体未见异常对比强化，形态大小未见明显异常，诊断为右侧阴茎海绵体根部阴茎动脉假性动脉瘤亚急性血肿形成，伴阴茎动脉-海绵体瘘（图 1）。
随后对患者进行选择性动脉介入造影，显示右侧阴茎动脉可见假性动脉瘤形成，长径约为 2.0cm，内可见血栓形成，并可见海绵体瘘形成，佐证了 MRI 的诊断。再对患者给予弹簧圈进行栓塞，栓塞成功后造影可见瘤体及瘘消失，患者异常勃起消失，术后给予性刺激能正常勃起，患者恢复良好。（图 2）。

Renal Tumors with Predominantly high Signal Intensity on T2-Weighted Images: Differentiation of Mixed epithelial and stromal tumor of the kidney From Renal Cell Carcinoma

Hailian Lv[1],Haiyi Wang[2]
1.shengli oilfield hospital

2.Chinese PLA General Hospital

Purpose: To determine useful magnetic resonance (MR) imaging and clinical features to differentiate Mixed epithelial and stromal tumors of the kidney (MESTK) from renal cell carcinoma (RCC) with predominantly high signal intensity on T2-weighted MR images.
Materials and Methods: The institutional review board approved this retrospective study and waived the informed consent requirement. 9 patients with surgically confirmed MESTK and 28 patients with extensively necrotic cystic cc-RCCs who underwent conventional MR and enhanced MR imaging were included. Two radiologists independently evaluated the clinical features including age, sex, the first symptoms and the MRI morphologic characteristics, the characteristics of DWI, and enhancement patterns of each tumor. Quantitativeanalysis, including measurement of tumor size, thickness of tumor fibrous capsule and Relative percentage losses of enhancement (RPLE, RPLE=(SIa-SId)/SIa). Quantitative analysis were calculated with Independent t test. Receiver operating characteristic (ROC) analysis was performed to evaluate the diagnostic accuracy of the RPLE and to extract the optimal cut-off values in the differentiation of MESTK and cc-RCCs.
Results：The shape of tumor and located in sinus renalis showed significant difference in MESTK and cc-RCCs. The mean RPLE of MESTK was statistically lower than that of the cc-RCCs group ($P < 0.001$). The RPLE between MESTK and cc-RCCs (21.0%±19.2 vs -3.2%±11.4) was statistically different ($P < 0.001$). The area under the ROC curve was 0.928 for Relative percentage losses of enhancement (RPLE). And a RPLE threshold value of -128%permitted the differentiation of MESTK from cc-RCCs with sensitivity of 95.7%, specificity of 67%.
Conclusion: A middle-aged females with tumor located in sinus renalis and hyper- or isoenhancement in the delay phase are useful MR imaging features that are more common in MESTK and may help discriminate MESTK from cc-Rccs.

EPO-1055
宫颈绒毛管状腺癌的影像学表现及临床因素分析

贺帅
辽宁省肿瘤医院

摘要： 目的:系统分析宫颈绒毛管状腺癌影像学表现及其临床相关特点.方法:选取宫颈绒毛管状腺癌 34 例,其中 20 例有超声检查结果,16 例有 CT 检查结果,13 例有 MRI 检查结果.结果:宫颈绒毛管状腺癌患者较年轻,临床症状多为阴道不规则流血,多伴有人乳头瘤病毒(human papillomavirus,HPV)感染.宫颈绒毛管状腺癌超声表现为低回声或混合回声肿块,形态较规则,边界清晰,偶尔可见少许血流信号.CT 上,多表现为宫颈形态改变,平扫时宫颈平均 CT 值比正常宫颈、鳞癌低($P<0.05$),与普通型宫颈腺癌相比差异无统计学意义($P>0.05$).MRI 上,肿块平均体积比普通型腺癌、鳞癌小,差异有统计学意义($P<0.05$);宫颈间质及宫旁浸润情况较普通型腺癌、鳞癌为好.结论:宫颈绒毛管状腺癌临床表现缺乏特征性,超声、CT、MRI 能提供形态学和解剖学信息,MRI 可准确地判断宫颈病灶及宫旁受累情况,提高术前诊断准确性,从而优化治疗.

MRI 和超声检查对输卵管积液的诊断价值评价

童明敏,沈玉英,陈倩
苏州市立医院东区

目的 探讨 MRI 和超声检查对输卵管积液的诊断价值。
方法 回顾性分析经病理或临床确诊为输卵管积液的 36 例患者 46 个积液输卵管的 MR 及超声检查资料，对比分析 MRI 和超声检查在输卵管积液影像学征象的表现差异，评价影像学检查对输卵管积液诊断效能。
结果 本组 36 例 46 个病灶，单纯性输卵管积水 41 条，积脓输卵管 5 条，双侧发病 10 例，单侧 26 例 。MRI 和超声检查积液形态个数分别为腊肠样改变（20：16），管样合并囊状改变（3：4），囊状改变（23：26）；液液分层（2：2）;合并子宫内膜异位症（2：2）。输卵管积脓 DWI 表现为高信号，ADC 值平均约 1.27 $X10^{-3}mm^2/s$，输卵管积液 DWI 表现为低信号，ADC 平均约 2.42 X10-3mm2/s 。MR 及超声检查对输卵管积液诊断的特异度分别为 86.96%、69.57%，敏感度 95.65%、91.30%，在敏感性及特异性诊断方面具有统计学差异（c^2=4.08，P<0.05 ）。MRI 和超声检查对输卵管积液形态、液液分层等的诊断效能均较高，但超声检查难以准确区分输卵管积水/积脓的性质。
结论 输卵管积液的 MR 及超声检查表现具有一定特征性，两者均可反应输卵管积液的形态、盆腔情况等，但 MRI 可准确区分输卵管积液的性质及与邻近组织脏器的关系，对该病的诊断和鉴别诊断具有重要价值。

Evaluation of clinical value in monitoring and predicting treatment efficacy of advanced cervical cancer under concurrent chemoradiotherapy with IVIM-MRI and DWI

Xiaoli Chen,Junqiang Lei
Department of Radiology, the First Hospital of Lanzhou University

Objective: To evaluate the value of parameters related to intravoxel incoherent motion (IVIM) and diffusion weighted imaging (DWI) in monitoring and predicting the treatment efficacy of locally advanced cervical cancer under concurrent chemoradiotherapy.
Methods: 21 patients with locally advanced cervical cancer underwent pelvic MRI scan within 1 week before concurrent chemoradiotherapy, 2 weeks and 4 weeks after treatment, and 4 weeks after treatment. The parameters at different time points before and after treatment were measured. Including ADC, D, f, D* as well as the maximum tumor diameter at each scan time point, and calculate the change rate of each parameter after treatment and the maximum diameter reduction rate of tumor. All patients were divided into complete remission (CR) and partial remission (PR) groups according to RECIST 1.1 criteria, the parameters and their percentages were compared between the two groups at different time points by independent-samples-t test, ROC curves were applied to analyze the effect of the response evaluation of parameters and their change percentages (Δ%), Pearson correlation test were applied to analyze the

relationship between the parameters as well as their change percentages (Δ%) and tumor regression rate (TSO).

Results: The ADC, D, f and D* values of cervical cancer tissues before treatment were lower than those of normal cervical muscle layer. The ADC of CR group was lower than that of PR group before treatment while f value was higher than that of PR group (P<0.05) , After treatment,the ADC, D and f of CR group were higher than those of PR group before treatment. the Δ%ADC and Δ%D of CR group were higher than that of PR group (P<0.05). the Δ%f was lower than that of PR group after treatment,(P<0.05). The TSO revealed a negative correlation with pre ADC(r=-0.462, P<0.05), and a positive correlation with pre f, Δ%ADC and Δ%D 2 weeks after trearment, Δ%ADC and maximum diameter reduction rate of tumor 4 weeks after treatment(r=0.614, 0.487, 0.64, 0.451, 0.676, all P<0.05).In the prediction of CR group and PR group, theAUC of pre f , pre ADC, Δ%D,Δ% ADC at 2 weeks and 4 weeks after treatment were (0.923, 0.788, 0.868, 0.846, 0.803, 0.798 respectively)

Conclusion: The quantitative parameters of IVIM and DWI and their change percentages are helpful in predicting and monitoring the treatment efficacy of chemoradiotherapy for cervical cancer before and after treatment, IVIM has higher evaluation efficiency.

肾嗜酸细胞腺瘤的 MSCT 表现

张莉,彭光明,林伟光,陈学君
广州中医药大学祈福医院

目的 认识、总结肾嗜酸细胞腺瘤(RO)的 MSCT(多排螺旋 CT)表现特征，以提高对本病的 CT 诊断认识。

方法 回顾性分析本院 8 例 RO 的资料，所有病例均实行 MSCT 平扫加多期增强扫描，观察肿瘤的部位、大小、形态、边界，以及有无钙化、坏死与囊变、星状瘢痕、平扫及增强扫描各期强化情况、肾周组织侵犯及淋巴结转移，分析病灶的 MSCT 特点。

结果 所有 8 例 RO 均为单发，CT 平扫所有病例均无钙化灶，其中两例病灶内伴有出血。病灶直径 2.3cm-6.8cm，6 例(75%)病灶边缘清楚，形态规则，无分叶，2 例(25%)病灶边缘部分不清楚，形态不规则，可见浅分叶。5 例(62.5%)见星状或条索状瘢痕。增强扫描，RO 病灶均呈明显不均匀中高度强化，其中 6 例于动脉期明显不均匀血管样强化，部分实质强化程度等于或稍高于肾皮质，门脉期持续强化并强化范围增大，延迟期强化程度降低与周围肾实质分界清楚，其内星状瘢痕范围逐渐缩小。另 2 例动脉期呈不均匀中度强化，强化程度低于肾皮质，门脉期及延迟期呈进一步强化但各期均低于肾皮质，中心纤维瘢痕可见缩小。另有 5 例于动脉期见粗大血管影穿行于肿块实质内。

结论 肾嗜酸细胞腺瘤的影像表现有一定的特征性，位于肾皮质区，大部分病灶边界清楚，肿瘤富血供，CT 平扫部分病灶可伴出血，增强后强化具有一定的特征，部分病灶呈血管样强化，并见粗大血管穿行，中心多伴星状瘢痕。MSCT 平扫加多期增强扫描有助于该病的诊断。

产前胎盘植入的对比影像学研究

倪雪君,孙明,顾红梅

南通大学附属医院

目的：分析超声及磁共振在产前胎盘植入的诊断价值，了解诊断胎盘植入的特异性影像学征象。
方法：收集 158 例具有胎盘植入高危因素的孕产妇资料，分析产前胎盘植入的临床高危因素，将 MRI 及超声结果、胎盘植入的各种典型诊断征象与手术病理结果进行对照，比较 MRI 与超声诊断胎盘植入的差异。
结果：MRI 及超声诊断胎盘植入的灵敏度分别为 87.3%及 70.9%，特异度为 82.8%及 79.3%，符合率为 85.7%及 73.8%；前壁胎盘植入超声及 MRI 诊断的灵敏度分别为 85.7%及 90.5%，特异度为 80%及 70%，符合率为 81.3%及 81.3%。后壁胎盘植入超声及 MRI 检查的灵敏度分别为 44%及 80%，特异度为 76.9%及 76.9%，符合率为 55.3%及 78.9%。超声对诊断胎盘植入的分型有很高的价值，超声诊断植入型的灵敏度最高（78.5%），穿透型的特异度最高（100%）；超声征象中胎盘陷窝的诊断灵敏度（78.5%）及特异度（71.3%）最高；MRI 征象中胎盘信号不均的诊断灵敏度最高（80%）,膀胱帐篷征的诊断特异性最高（ 96.6%）。
结论
1、MRI 及超声诊断胎盘植入均具有较高的诊断价值，当胎盘位于子宫后壁时，MRI 优于超声。
2、超声声像图征象包括胎盘陷窝，子宫肌层连续性中断，胎盘周围间隙消失，其中胎盘陷窝的灵敏度及特异度最高。
3、MRI 征象包括胎盘信号不均匀，T2WI 上低信号带，胎盘内增粗迂曲血管影，胎盘子宫边界欠清，其中胎盘信号不均匀的灵敏度最高，膀胱帐篷征诊断胎盘植入特异性最高。

IVIM 对广西巴马小型猪早期糖尿病肾病模型成像的初步研究

蒋子健,龙莉玲
广西医科大学第一附属医院

目的
探讨体素内不相干运动（IVIM）序列对早期糖尿病肾病模型成像的特点。
方法
12 头广西巴马小型猪随机分为实验组（7 头）和对照组（5 头），实验组予高脂高糖饲料喂养并多次经耳缘静脉注射小剂量（50mg/kg）链脲佐菌素（STZ），对照组予普通饲料喂养并注射相同剂量柠檬酸-柠檬酸钠缓冲液。造模成功后每个月固定时间在实验组和对照组分别随机选择一头猪行 MRI 扫描，扫描序列包括 T1WI、T2WI、IVIM。在后处理工作站伪彩图上分别测量双肾皮质及髓质的 IVIM 参数值 standard ADC、slow ADC。扫描结束后取双侧肾脏做病理检查。采用配对 t 检验对同一肾脏的 standard ADC 值及 slowADC 值进行比较，采用配对 t 检验对肾脏的皮、髓质参数值进行比较，采用独立样本 t 检验对实验组和对照组的参数值进行比较。
结果
实验组 7 头猪有 6 头猪共 12 个肾脏病理符合糖尿病肾病改变，将其纳入分析。1、standard ADC 与 slow ADC 比较：同一肾脏 standard ADC 值均高于相应的 slow ADC 值，差异有统计学意义（P＜0.05）；2、皮髓质比较：实验组及对照组皮质 standard ADC 值均高于本组髓质 standard ADC 值，差异有统计学意义（P 均＜0.05），两组皮质 slowADC 值均稍高于髓质，但差异无统计学意义（P 均＞0.05）；3、实验组与对照组比较：实验组皮、髓质 standard ADC 值及髓质 slow ADC 值均高于对照组，差异有统计学意义（P 均＜0.05），实验组皮质 slow ADC 值稍高于对照组皮质 slow ADC 值，但差异无统计学意义（P＞0.05）。
结论
IVIM 序列能反映正常肾脏组织皮、髓质的真性弥散状态，并能除去血流及肾小管内液体弥散的干扰，敏感、准确的反映早期糖尿病肾病的弥散状态及血流灌注状态。

28 例 XP11.2 易位/TFE3 基因融合性肾癌的 CT 表现与病理对照

张京刚
常州市第一人民医院

摘要 目的 对照分析 XP11.2 易位/TFE3 基因融合性肾癌（Xp11.2/TFE3 RCC）的 CT 表现与病理结果。方法 回顾性分析 28 例病理证实的 Xp11.2/TFE3 RCC 的 CT 征象，其中 2 例行 CT 平扫，2 例行 CTU，10 例行 CTA，14 例行 CT 三期增强。男 13 例，女 15 例，年龄 20～75 岁，平均年龄 44 岁。分析病变的位置，大小，形态，假包膜，密度，内部特征，增强，侵犯或转移等。结果 右肾 10 例，左肾 18 例，2 例位于髓质，1 例累及髓质、肾盂，其余均累及皮髓质，长径 1.7~11.5cm ，平均长径 6.1cm。类圆形 24 例，不规则形 4 例，有假包膜 17 例，3 例呈等密度，2 例呈低密度，23 例呈高密度，多数肿瘤见囊变（17 例），出血（18 例），钙化（9 例），增强后明显强化 5 例，轻度强化 21 例，乳头状结节样强化 15 例，实性片状强化 9 例，分隔样强化 2 例。肾门或腹膜后淋巴结转移 6 例，肾静脉或下腔静脉癌栓 7 例，远处转移 4 例。结论 Xp11.2/TFE3 RCC 通常肿瘤较大，平扫为高密度，密度不均匀，出血、囊变、钙化多见，常出现假包膜，增强后呈轻度强化、乳头状强化，Xp11.2/TFE3 RCC 的 CT 表现有一定特点。

DWI 及 ADC 对肾透明细胞癌及非透明细胞癌的鉴别诊断价值

李孝忠[1],徐丹[1]
1.甘肃中医药大学附属医院
2.甘肃中医药大学附属医院

【摘 要】**目的：**探讨 DWI 及 ADC 对肾透明细胞癌及非透明细胞癌的鉴别诊断价值。**方法：**回顾性分析本院 2016 年 3 月~2019 年 3 月 100 例经病理检查证实为肾细胞癌的患者的影像资料(包括 DWI 及 ADC),其中肾非透明细胞癌 32 例（包括 21 例嫌色细胞癌、11 例乳头状细胞癌）,肾透明细胞癌 68 例，所选患者均给予弥散加权成像（包括高低 B 值 DWI 及 ADC）比较两组影像学特征，并测量肿瘤部位的表观扩散系数(ADC)。**结果：**DWI 及 ADC 在两组对比差异有统计学价值（P＜0.05）；透明细胞癌 DWI 多为低、等或稍高信号，ADC 多为等或稍高信号，并且高 B 值 DWI 信号低于低 B 值 DWI；非透明细胞癌 DWI 多为明显高信号， ADC 多为较均匀的明显低信号，并且高 B 值 DWI 信号明显高于低 B 值 DWI，非透明细胞癌 ADC 值比透明细胞癌 ADC 值低，ADC 值低于 1.42±0.48×10.3mm2 / s 大多为非透明细胞癌。**结论：**DWI 及 ADC 对肾透明细胞癌及非透明细胞癌的有很大的鉴别诊断价值。

膀胱癌影像报告及数据系统对膀胱癌肌层浸润的诊断价值

鄂天娇,冯峰
江苏省南通市肿瘤医院

目的：探讨膀胱癌影像报告及数据系统（VI-RADS）对评估膀胱癌有无肌层浸润的诊断价值。
方法：回顾性分析经病理证实的 54 例膀胱癌患者共 66 个病灶的影像资料，所有患者均行多参数磁共振检查，包括 T1WI、小视野 T2WI、DWI 及动态对比增强（DCE）扫描。分别由 2 位医师通过 PACS 系统采用盲法分析全部病例病灶的 T2WI、DWI 及 DCE 图像，并根据膀胱癌影像报告及数据系统进行 VI-RADS 评分，通过 Kappa 检验验证两位观察者评分一致性。以各病灶的术后病理结果为金标准，利用 ROC 曲线分析 T2WI、DWI、DCE 及 VI-RADS 评分对膀胱癌肌层浸润的诊断价值（计算敏感度、特异度、阳性预测值、阴性预测值及曲线下面积）。采用独立样本 t 检验比较非肌层浸润膀胱癌与肌层浸润膀胱癌病灶在 T2WI、DWI、DCE 序列及 VI-RADS 评分上的差异，$P<0.05$ 为差异有统计学意义。
结果：两位观察者 VI-RADS 评分一致性良好（Kappa 值=0.939）。T2WI、DWI、DCE、T2WI+DWI+DCE 的 VI-RADS 评分对判断膀胱癌肌层浸润的敏感度分别为 64.7%、82.4%、76.5%、94.1%、，特异度分别为 100%、80%、80%、80%，阳性预测值分别为 92.8%、94.4%、94.4%、95.2%，阴性预测值分别为 88.2%、93.8%、93.8%、100%。T2WI、DWI、DCE 及 T2WI+DWI+DCE 上非肌层浸润与肌层浸润病灶 VI-RADS 评分差异均有统计学意义（$P<0.05$）。
结论：VI-RADS 评分系统对评估膀胱癌病灶有无肌层浸润具有较好的诊断价值。

基于肿瘤全域表观扩散系数纹理分析预测上皮性卵巢癌复发的研究

毛咪咪,冯峰
南通市肿瘤医院/南通市第五人民医院

［摘要］ **目的** 探讨基于肿瘤全域的表观扩散系数(apparent diffusion coefficient,ADC)纹理分析对上皮性卵巢癌复发的预测价值。**方法** 回顾性分析 49 例经病理证实为上皮性卵巢癌患者的术前 DWI 成像（b=0、800s/mm^2），利用后处理软件在 ADC 图上绘制全瘤的感兴趣区，分析提取出纹理参数，包括偏度、峰度、熵值、惰性、相关性、对比度、变异等共 77 个参数。采用多因素

Logistic 回归分析确定可作为复发的最佳预测因素，绘制 ROC 曲线评价其预测效能。**结果** 两组患者肿瘤大小及腹水复发组均高于非复发组，差异有统计学意义（P<0.05），FIGO 分期两组间差异有统计学意义（P<0.05）。复发组纹理参数惰性、对比度、变异、熵值显著高于非复发组，峰度、第 10、25 百分位数、相关性显著低于非复发组，差异均有统计学意义（P<0.05）。ROC 曲线分析显示峰度、惰性、相关性、肿瘤大小、FIGO 分期联合预测复发的曲线下面积最大，为 0.929。**结论** 基于全肿瘤容积的 ADC 纹理分析有助于预测 EOC 患者复发。

子宫内膜异位症合并卵巢恶性肿瘤 MR 征象分析

李玲琼,马捷,范晓娟,黄社磊,曾显荣
深圳市人民医院龙华分院

目的：探讨子宫内膜异位症合并卵巢恶性肿瘤的 MR 特征，以提高该病的诊断准确率。
资料与方法：收集本院 2007 年 8 月至 2019 年 7 月有完整临床、手术病理资料及 MR 检查的患者 16 例，与手术病理结果对照分析，回顾性综合分析其 MR 表现。
结果：17 例囊实性肿瘤，囊性部分 T1WI 成高信号者 3 例，成混杂高低信号者 3 例；T1WI 低信号、T2WI 高信号者 8 号；T1WI 等信号、T2WI 等信号者 2 例。肿瘤实性成分 T1WI 呈等信号，T2 WI 呈稍高、等信号，DWI 实性成分呈明显高信号，ADC 图像信号减低，实性成分明显不均匀强化。2 例实性肿瘤，成椭圆形、分叶状，实性部分 T1WI 混杂低、稍高、T2WI 稍高，DWI 等高信号、ADC 图像成等信号。

结论：MR 上囊实性病变囊液 T1WI 成高信号、混杂高信号为其特点，结合临床子宫内膜癌、子宫内膜异位症的病史及 MR 特点，能提高子宫内膜异位症合并卵巢恶性肿瘤诊断准确率。

高清能谱 CT 对肾动静脉与 CTU 的融合技术在肾脏占位性病变术前评估的应用价值

李治勇
重庆医科大学附属第三医院（捷尔医院）

目的：探究高清能谱 CT 对肾动静脉与 CT 尿路造影的融合技术在肾脏占位性病变手术前的诊断和评估价值。**方法：**回顾性的分析 70 例经病理科诊断或者最终于临床确诊为肾脏占位性病变患者的高清能谱 CT 对肾动静脉于 CT 尿路造影融合技术的图像特征，分析不同时相的肾脏病变程度以及 CT 对肾动静脉和 CT 尿路的造影图像中病灶与邻近结构（肾动静脉与肾盂）情况，分析其在术前分析诊断过程中的价值。**结果：**在 70 例肾脏占位性病变患者中，21 例肾动脉与病灶有重叠位置关系，13 例肾静脉与病灶有重叠位置关系，21 例肾盂与病灶有重叠位置关系，其中 10 例肾动脉肾静脉与肾盂与病灶有重叠位置关系。**结论：**高清能谱 CT 对肾动静脉与 CTU 的融合技术在肾脏占位性病变术前评估中，不仅能确定病灶位置，还能够清晰显示在肾动静脉及尿道（肾盂）周围的解剖结构，及邻近结构与病灶的位置关系、融合与否方面有价值的信息，对术前研究提供了可靠的依据，是可靠、安全、行之有效的影像学检查方法。

CT and MRI of Primary Testicular Non-Hodgkin's Lymphoma

Yu Lin[1],Bimei Zhuang[2],Siyi Cai[2],Xiongjie Zhuang[2],Jinan Wang[1],Dairong Cao[3]
1.Zhongshan Hospital affiliated to Xiamen University
2.The First Affiliated Hospital of Xiamen University
3.The First Affiliated Hospital of Fujian Medical University

Objective To analyze the CT and MRI findings of primary testicular non-Hodgkin lymphoma (PTNHL).
Methods Twenty-one patients with PTHL confirmed by pathology were retrospectively analyzed. Ten patients underwent non-enhanced MR scanning, eight underwent enhanced MR examination, 10 underwent DWI examination, and 11 underwent non-enhanced and enhanced CT scanning. The CT and MRI features (including the shape, density/signal, enhancement pattern and surrounding structure of the tumor) were analyzed.
Results 19 cases involved unilateral testis, 2 cases involved bilateral testis, 3 cases involved spermatic cord, 6 cases were complicated by testicular hydrocele, 5 cases involved epididymis, 3 cases were presented with lymph node metastasis. On CT scan, 10 cases showed the lesions were iso-slightly high density, and slightly and moderately homogeneously enhanced. On MRI, 8 cases showed the lesions showed isointensity on T1WI, 7 cases showed slightly low signal on T2WI, 10 cases showed high signal on DWI, and low signal on ADC. After contrast enhancement, the lesions of 6 cases showed mild to moderate enhancement and homogeneous pattern. Two cases with cystic degeneration showed inhomogeneous enhancement.
Conclusion For the elderly male patients with painless testicular enlargement, the possibility of PTNHL should be considered if the tumor shows homogeneous density/signal and slightly or moderately enhancement. Restricted diffusion of the solid part on DWI has important diagnostic value.

EPO-1069
磁化转移成像技术在糖尿病肾病分期中的诊断价值

陈静,张喜荣,韩冬,杨祺,于楠,于勇
陕西中医药大学附属医院

目的：评价磁共振磁化转移成像技术（Magnetization transfer，MT）对糖尿病肾病分期的诊断效能。
方法：纳入糖尿病肾病患者 48 例，健康志愿者 35 例。根据肾小球滤过率、尿白蛋白排泄率、血肌酐及尿素氮检查结果，将糖尿病肾病患者分为 I-IV 期。采用西门子 Skyra 3.0T 磁共振扫描仪对所有被试进行双肾磁共振 MT 扫描。MT 扫描采用 3D 扰相梯度回波序列，该序列扫描 2 次，第一次为不添加 MT 射频脉冲信号（MTOFF），第二次为添加 MT 射频脉冲信号（MTON）。根据公式 MTR＝（MTOFF－MTON）×100 / MTOFF 计算出 MT 常用指标磁化传递率（*Magnetization transfer ratio*，MTR），以百分数表示。在双肾上极、肾门、下极肾皮、髓质绘制多个感兴趣区，测量相应磁化传递率并取平均值记录。采用单因素方差分析比较各期糖尿病肾病患者磁化传递率及实验室检查结果的差异。绘制 ROC 曲线分析磁化传递率诊断不同阶段糖尿病肾病的敏感性和特异性。

结果：糖尿病肾病 I 期到 IV 期肾皮质和髓质的 MTR 值逐渐升高（P<0.05）（表 1）。ROC 分析发现，肾皮质和髓质的 MTR 值可以区分健康人和糖尿病肾病患者，特别是鉴别糖尿病肾病 IV 期患者（曲线下面积：0.988；敏感性 100%，特异性 97.0%（表 2-4，图 1）。
结论：磁化转移成像技术对糖尿病肾病分期有较高的诊断价值，特别是鉴别重度糖尿病肾病患者，为糖尿病肾病的临床分期提供更科学客观的诊断依据。

动态 MRI 评价妊娠和分娩对产后发生盆腔器官脱垂的影响

崔璨,崔大伟,潘勇浩,舒锦尔
金华市中心医院

目的：使用动态 MRI 全面评估分娩后产妇前、中、后盆腔器官的活动情况，评价妊娠及分娩对女性盆腔器官脱垂情况的影响。
方法：前瞻性收集经阴道分娩和剖宫产后 6~8 周初产妇各 30 例，以及未孕未产女性志愿者 30 例，所有受试者均行动态 MRI 检查，所有产妇在 MRI 检查前均行临床 POP-Q 脱垂评估。采用耻骨尾骨线（PCL）脱垂评分标准对所有受试者的盆腔器官脱垂程度进行评估，并与 POP-Q 分度法的结果进行比较。测量静息期及力排期前、中、后盆腔指示点至 PCL 的距离，并将静息期及力排期的测量结果相减得出盆腔器官的活动度，采用单因素方差分析比较 3 组间各盆腔器官距离参考线的距离及盆腔器官活动度的差异。
结果：POP-Q 分度法共诊断 4 例存在前盆腔脱垂合并子宫脱垂的产妇，动态 MRI 检查力排期均发现相应盆腔指示点位于 PCL 线下超过 1cm，与 POP-Q 分度法的符合率为 4/4。另外，发现有 10 例经阴道分娩产妇、1 例剖宫产产妇 POP-Q 分度法未能诊断为前盆腔脱垂，而在力排期出现前盆腔明显下移，指示点位于 PCL 线下超过 1cm。且有 1 例经阴道分娩产妇 POP-Q 分度法未诊断子宫脱垂的产妇，力排期存在子宫下移，指示点位于 PCL 线下超过 1cm。静息期三组间各盆腔器官至 PCL 距离差异均无统计学意义（$P>0.05$）。力排期，三组间各盆腔器官至 PCL 距离、盆腔器官活动度差异有统计学意义（$P<0.05$），经阴道分娩组各盆腔器官下移程度及活动度均明显大于剖宫产组及未孕未产对照组，而剖宫产组及未孕未产对照组间差异无统计学意义。
结论：与 POP-Q 分度法相比，动态 MRI 的 PCL 脱垂分度法能够准确诊断前盆腔器官 I 度脱垂，对前盆腔轻度脱垂诊断方面有重要的辅助诊断价值。经阴道分娩对产妇盆腔器官脱垂情况影响显著，这个结果在一定程度上提示剖宫产对于未来发生盆腔器官脱垂有一定的保护作用。

子宫内膜癌磁共振成像：T2-WI、动态增强 T1-WI、DWI 三种序列对比分析

张荣魁
吉林大学第一医院

目的：比较 T2-WI、动态增强 T1-WI、DWI 三种序列在评价子宫内膜癌肌层及宫颈浸润的价值。
材料与方法：回顾性分析 50 例经手术病理证实的子宫内膜患者资料。3.0T MR 检查包括 T2-WI、动态增强 T1-WI 及 DWI 图像。两名 MR 诊断医师根据子宫内膜癌 2009 国际妇产科联盟分期标准，采用单纯 T2-WI、动态增强 T1-WI、DWI 盲法随机阅片，分析肿瘤肌层浸润深度（<或>50%）及是否有宫颈浸润（是/否）；并将 MRI 判断肌层和宫颈侵犯结果与手术病理比较。采用配对卡方检验 Fisher’s 确切概率法比较 3 种序列对子宫内膜癌肌层及宫颈浸润诊断准确性。

结果：
经手术病理证实的 50 例子宫内膜癌，17 例肌层浸润>50%（17/50 34%），9 例宫颈浸润（9/50 18%）。T2-WI、动态增强 T1-WI、DWI 判断肿瘤深肌层浸润的准确度分别为 43/50、43/50、45/50（86%、86%、90%）（p>0.05）。T2-WI、动态增强 T1-WI、DWI 判断宫颈浸润的准确度分别为 46/50、46/50、46/50（92%、92%、92%）（p>0.05）。
结论：T2-WI、动态增强 T1-WI、DWI 三种序列评价子宫内膜癌肌层及宫颈浸润的准确度差异无统计意义。因此，DWI 可以代替动态增强 T1-WI，结合常规 T2-WI 用于子宫内膜癌的 T 分期。

EPO-1072

Value of DWI sequences in cervical cancer recurrence: can we skip contrast?

Rongkui Zhang
the first hospital of Jilin University

Purpose: We aimed to evaluate the accuracy of diffusion-weighted magnetic resonance imaging (DW-MRI) in cervical cancer follow-up, by comparing T2-weighted images (T2-WI) combined with DW-MRI and T2-WI combined with dynamic contrast-enhanced MRI (DCE-MRI) in the assessment of tumour recurrence.
Methods and Materials: We enrolled 39 patients with treated cervical cancer and clinical suspicion of recurrence who underwent follow-up MRI examination on 1.5 T magnet: scanning protocol included multiplanar T2-WI, DCE sequences and DWI-MRI. MR findings were compared with pathology results. Accuracy measures were calculated and compared.
Results: Thirty-seven women (37/39) had histologically proven recurrence. The accuracy to detect recurrence was 76.9% and 92.3% on combined T2-WI/DCE and T2-WI/DWI, respectively. The addition of DCE-MRI did not significantly improve the diagnostic ability of T2-WI alone, and the combination of these two sequences misclassified 2 patients as false positive and 7 as false-negative. The combination T2-WI/DW-MRI had a positive predictive value of 100 % and only 3 false-negative cases.
Conclusion: MR imaging is an effective technique for cervical cancer recurrence detection and DW-MRI combined with T2-WI resulted in a significant rise in MRI diagnostic ability, potentially leaving DCE-MRI as an optional technique in doubtful cases.

EPO-1073

磁共振扩散加权成像预警肾癌微波消融术后疗效的应用研究

袁振国,范晶,刁艳照
山东省医学影像学研究所

目的 探讨磁共振扩散加权成像（DWI）在评价肾癌微波消融（MWA）术后疗效的价值。**方法** 回顾性分析 93 个肾癌病灶在 MWA 治疗后 1 天、1 个月、3 个月和 6 个月及以上的 DWI 信号变化特点和 ADC 值变化规律。**结果** 完全消融 81 个病灶， 术后 1 天，完全消融区 DWI 呈低信号，周围伴有高信号的环形反应带；1 个月时周围环形反应带变薄，3 个月基本消失，消融灶呈混合信号。部份消融 12 个病灶，复发 6 个，残留和局部进展组织表现为位于消融区和正常肾组织之间的不规则环状

或结节状稍高信号。在 b 值为 800s/mm² 时，术前与术后不同时间、不同组织间的 ADC 值变化显示：①肾癌 ADC 值低于正常肾脏。②术后完全消融区与术前比较有显著差异，ADC 值降低并且呈现逐渐降低的趋势。③术后各随访时间不同组织（完全消融区、周围环形反应带、正常肾实质）间的 ADC 值差异均有统计学意义。④残留/局部进展组织的 ADC 值与术前肾癌的 ADC 值间没有差异。**结论** DWI 能有效区分完全坏死区、活性肿瘤组织和正常肾实质，提供比 MR 常规扫描更多的诊断信息，在肾癌微波消融疗效评估中发挥重要作用。

病灶大小对肾脏嗜酸细胞腺瘤及嫌色细胞癌 CT 征象的影响

王国杰,秦培鑫,陈玉芳,李坤炜
中山大学附属第五医院

目的　研究肾脏嗜酸细胞腺瘤（RO）与嫌色细胞癌（CRCC）常见的 CT 鉴别征象在不同大小的病灶中是否存在差异。方法　回顾性分析经病理证实的 10 例 RO 和 9 例 CRCC 的影像学资料，将病例分为≤3cm 组、＞3cm 组，对比分析其 CT 平扫、多期增强特征在组间是否存在差异。结果　①≤3cm 组共 8 例，其中 RO 5 例，CRCC 3 例，＞3cm 组 11 例，其中 RO 5 例，CRCC 6 例；② 9 例病灶中发现中央瘢痕，其中≤3cm 组 1 例（1/8），＞3cm 组 8 例（8/11）；6 例为 RO（6/10），3 例为 CRCC（3/9）；③强化反转 7 例，其中≤3cm4 例（均为 RO），＞3cm 组 3 例（1 例 RO，2 例 CRCC）；④5 例病变内见钙化，均为＞3cm 组，其中 RO 1 例，CRCC 4 例；⑤皮髓期强化程度，其中 8 例病灶接近（相差±10HU）或高于肾皮质（＞10HU），均为 RO，11 例低于肾皮质（相差＞10HU，其中 3 例 RO，8 例 CRCC）；⑥ RO、CRCC 大小及≤3cm、＞3cm 组的构成比无统计学差异，p 值分别为 0.743、0.65；皮髓期强化程度在 RO 与 CRCC 间存在差异，p 值为 0.02；中央瘢痕、节段性强化反转在 RO 与 CRCC 间没有统计学差异，p 值分别为 0.37、0.35，但按大小分组后，中央瘢痕在＞3cm 组、节段性强化反转在≤3cm 组存在统计学差异，p 值分别为 0.032、0.014；病灶内钙化均见于＞3cm 组，CRCC 的发生率（4/6）要高于 RO（1/5），但无统计学差异（p =0.242）。结论　病灶大小是影响肾脏嗜酸细胞腺瘤、嫌色细胞癌 CT 鉴别征象价值的重要的分层因素。

EPO-1075

个案报道：左肾血管周细胞瘤一例

朱雪超,邬莺莺
南昌大学第一附属医院

患者，男，45 岁，体检发现左肾占位，无尿频、尿急、尿痛，无脓尿，无肉眼血尿，无畏寒、发热，无咳嗽、咳痰，无恶心、呕吐，无腹痛、腹泻，无头晕、头痛，无骨痛。CT 扫描表现为左肾体积增大，腹膜后、左肾门偏下方见一不规则形等密度软组织肿块影，呈分叶状，边界清，周围脂肪间隙模糊，增强扫描呈明显持续不均匀强化，其内低密度影呈延迟增大强化，左肾肾盏及上段输尿管受压推挤并扩张积液。术后病理诊断：（左肾）血管周细胞瘤，累计肾盂；免疫组化示：S100(+);CD99(+);bcl-2(+);Ki-67(3%+);CK(上皮+);Vim(3+);CD34(+);EMA(上皮+);Vim(-);CK(-);Des(-);SMA(-);FVIII(血管+);ALK(-) 。

血管周细胞瘤为血管周细胞衍生的软组织肿瘤，占全部血管瘤的 1% ， 好发于下肢、腹膜后、头颈及脑膜， 发生于肾脏的血管周细胞瘤较为罕见。血管周细胞瘤可发生于任何年龄段人群，肿瘤多为单发，患者平时无自觉症状， 发病原因不明确。肾血管周细胞瘤病程不一， 多生长缓慢， 一般界限清楚，易于手术摘除。

One-stop assessment of renal function and renal vascular anatomy in hypertensive patients: Noncontrast-enhanced MRI using Spatial Labeling with Multiple Inversion Pulses

Ping Liang,Chuou Xu,Anqin Li,Jiali Li,Daoyu Hu,Zhen Li
Tongji Hospital， Tongji Medical College， Huazhong University of Science and Technology

Objectives To assess whether noncontrast-enhanced MRI using spatial labeling with multiple inversion pulses (SLEEK) with optimal blood-suppression inversion times (BSP TI) can improve the visibility of renal corticomedullary differentiation and simultaneously display renal vessels clearly in hypertensive patients with renal failure.
Methods and Materials A total of seventy-eight patients with suspected hypertensive renal damage underwent abdominal MRI at 1.5T including a coronal SLEEK sequence and an axial diffusion-weighted imaging (DWI) sequence. 22 of these patients underwent CT angiography (CTA) examination. Image analysis was performed by two experienced radiologists.
Results The performance of SLEEK to present renal artery is accordance with CTA (Kappa=0.713) and can display the stenosis clearly. The corticomedullary contrast ratio, which was positively correlated with estimated glomerular filtration rate (eGFR) (p=0.004, r=0.322), was significantly higher in SLEEK than in DWI in all three groups (p=0.001). There was a significant difference in corticomedullary contrast ratio in SLEEK between Group 1 and Group 3 (p=0.006), however, there were no significant differences between Group 1 and Group 2 (p=0.285) or between Group 2 and Group 3 (p=0.064). A significant positive correlation was observed between renal cortical thickness and eGFR (P<0.001, r=0.729) and a significant difference was seen between Group 1 and Group 2 (p=0.01).
Conclusions SLEEK can improve the recognition of renal corticomedullary differentiation compared with DWI and can display the renal artery clearly simultaneously in hypertensive renal damage patients.

EPO-1077

Whole Lesion Histogram Analysis of Apparent Diffusion Coefficients on MRI Predicts Disease-free Survival in

Locally Advanced Cervical Cancer After Radical Chemo-radiotherapy

Bo Zhao,Kun Cao,Ying-shi Sun
Department of Radiology， Key Laboratory of Carcinogenesis and Translational Research， Ministry of Education， Peking University Cancer Hospital and Institute

Purpose: The aim was to investigate the prognostic value of MR diffusion-weighted images (DWIs) using histogram analysis (HA) in predicting disease-free survival (DFS) of cervical cancer after chemo-radiation therapy.
Materials: We retrospectively analyzed 103 women with pathologically proven squamous cell uterine cancer who received chemo-radiation therapy between 2009 and 2013.All patients were followed up for more than 2 years after the first radiation treatment. Pre-treatment MR images were retrieved and imported for HA using an in-house developed software program based on 3D Slicer. Regions of interest of whole tumors were drawn manually on DWI with reference to T2WI. HA features (mean, max, min, 50%, 10%, 90%, kurtosis, and skewness) were extracted from apparent diffusion coefficient (ADC) maps and compared between the recurrence and non-recurrence groups after the 2-year follow-up. Univariate and multivariate Cox regression analysis was used to correlate ADC HA features and relevant clinical variables (age, grade, tumor size, FIGO stage, SCC-Ag) with DFS.
Results: 103 patients with stage IB-IV cervical cancers were followed up for 2.0-94.6 months (median 48.9 months). 20 patients developed recurrence within 2 years. In the recurrence group, the min (P = 0.001) and 10% (P = 0.048) ADC values were significantly lower than those of the non-recurrence group.Univariate and multivariate Cox regression analysis revealed that ADC_{min} (P = 0.006, HR = 0.110) was significantly correlated with DFS.
Conclusion: Pre-treatment volumetric ADC_{min} in histogram analysis is an independent factor that is correlated with DFS in cervical cancer patients treated with chemo-radiation therapy.

多层螺旋 CT 增强扫描在肾癌诊断中的价值

许尚文
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的：探讨多层螺旋 cT 增强扫描及后处理技术在肾癌术前诊断、显示肿瘤血供及周围关系等方面的临床应用价值。

方法：回顾性分析 2012 年 5 月-2017 年 5 月我院 40 例经手术病理证实为肾癌的 CT 平扫及多期增强扫描的影像资料，并与临床病理对照，对肿瘤的形态、大小、范围进行分析，并按照最大密度投影、多平面重组和容积再现进行后处理，观察肿瘤的供血动脉及周围浸润情况，病患者的临床及螺旋 CT 检查资料， 通过观察其影像学特征，并与病理诊断结果进行对照分析。

结果：CT 扫描显示 38 例病灶突出肾轮廓外，2 例局限于肾轮廓内。平扫密度较为复杂，部分出血表现为高密度影，部分伴随囊变、出血，部分可有钙化，CT 平扫表现为肾实质占位病变，瘤体与肾实质分界不清。动脉期均有不同程度中度强化和明显强化，15 例动脉期增强后可见清晰边界，16 例可见假包膜，9 例可见“短刺”征： 肾实质期扫描，强化程度明显减弱， 静脉期强化程度进步一减弱肿瘤的形态主要为圆形或类圆形、不规则形，绝大部分呈“快进快出”特征性强化。

结论：多层螺旋 CT 增强扫描及 CT 后处理技术在肾癌中的诊断价值较高，其影像具有一定的特征性，可提高对肾癌的诊断准确性，对肿瘤的供血情况、瘤体的浸润程度可以作出分析、评估，为临床合理选择手术方式、降低手术风险及评估预后具有重要价值。

Prediction of stage, differentiation and Ki-67 status of locally advanced cervical cancer by DCE-MRI texture analysis

Yuanliang Xie,Xiang Wang ,Yanping Jiang
Central Hospital of Wuhan, Tongji Medical College, HUST

Purpose

To determine the value of texture analysis of DCE-MRI maps in prediction of advanced stage, poor differentiation and high Ki-67 status of advanced cervical cancer.

Methods

Thirty-nine patients were enrolled in this retrospective, institutional review board (IRB)-approved study. DCE-MRI was performed on 3.0T scanner by a 3D T1W High Resolution Isotropic Volume Examination (THRIVE) sequence with 36 phases. Co-

occurrence matrix -based texture features were extracted from each tumor on maximum enhancement (ME) and maximum relative enhancement (MRE) maps from DCE-MRI using in-home radiomics tool based on Mat-Lab software. Multivariate models were trained on the training cohort and their performance was evaluated on the 5-fold cross-validation cohort using the area under ROC curve (AUC), accuracy, specificity and sensitivity. P value<0.05 was considered statistically significant.

Results

Mean age was 56.5±10.3 years. Histopathology revealed 9 adenocarcinoma and 30 squamous cell cancer; 7 well-differentiated, 21 moderately differentiated or moderately to poorly differentiated, and 11 poorly differentiated tumors; 7 FIGO Ⅰb, 18 FIGO Ⅱa, 8 FIGO Ⅱb, 6 FIGO Ⅲa, none of FIGO Ⅲb and Ⅳ. Lymph nodes were involved in 12 patients. On ME maps, two GLSZM, two GLRLM and one GLCM features correlated with the grades: LAHGE (r=0.37, P=0.02), GLN(GLSZM) (r=0.386, P=0.015), GLN(GLRLM) (r=0.325, P=0.044), RLN (r=0.444, P=0.005), correlation(GLCM) (r=0.467, P=0.003); On MRE maps, three GLSZM and two GLRLM features correlated with the grades: LAHGE (r=0.38, P=0.017), GLN (GLSZM) (r=0.354, P=0.027), and SZN (r=0.332, P=0.039), GLN(GLRLM) (r=0.392, P=0.014), RLN (r=0.361, P=0.024) respectively. Among all texture features derived from ME and MRE maps, correlation (GLCM) on ME showed a correlation with tumor differentiation. A multivariate logistic regression showed AUC was 0.737 (95%CI: 0.572 - 0.865) for FIGO Ⅱb-Ⅲa, 0.705 (95%CI:0.537-0.840) for poor differentiation on MRE features. We also used a machine learning-XGB classifier to build a prediction model using all the radiomics features. Twenty-nine features were chosen to build the model and results showed the mean sensitivities of predicting FIGOⅡb-Ⅲa, poor differentiation and high Ki-67 status were 0.767, 0.963 and 0.967 respectively; specificities were 0.958, 0.361 and 0.694 , and AUCs were 0.910, 0.920 and 0.840 respectively. The ROC curves were shown in Figure 2-4.

Conclusion

Volumetric texture analysis on DCE-MRI maps can potentially help to predict tumor with poorly differentiation, higher stages and Ki-67 status for cervical cancer stage FIGO Ⅰb-Ⅲa.

MR Defecography in the Assessment of Functional Changes of Stress Urinary Incontinence before and after Tension-free Vaginal Tape Surgery

Min Li,Tao Jiang,Xiao Liu ,Biao Wang,Peng Qiao
Beijing Chao yang Hospital, Capital Medical University

Objective: Magnetic resonance defecography (MRD) was used to evaluate the pelvic floor functional changes in women with stress urinary incontinence (SUI) before and after mid-urethral tension-free vaginal tape (TVT) intervention and to confirm the mechanism of urinary control.

Materials and Methods: The patient group consisted of thirty-three females clinically diagnosed with SUI who underwent preoperative MRD. Static MR images were used to describe the appearance and abnormalities in the levator ani muscle and periurethral

ligaments. Dynamic MR images were used to depict the function of the urethra and the pelvic floor. Among the 33 SUI patients, 12 cases rechecked MRD after TVT insertion, we assessed the following MRI parameters before and after TVT: (a) the vesicourethral angle and urethral hypermobility; (b) the bladder neck descent and bladder neck funneling; (c) the pelvic organ prolapse (POP).(d) H and M line. The quantitative data were analyzed by multigroup analysis of variance. The differences with $p<0.05$ were defined as having statistical significance.

Results: Periurethral ligament defects was present in 75.4% and discontinuity or complete loss of pubococcygeal muscle was 67.7% in SUI patients. The dynamic MR images showed the presence of urethral hypermobility (63.4±35.1°) and a shortening of the functional urethra length (0.2±0.5cm) at the defecation pahse in the SUI patients. Besides, approximately 81.82% SUI patients were associated with the bladder neck funneling, 42.42% with urethral opening, 63.64% with cystocele, and 42.42% with uterine and vaginal prolapse. Postoperative MRI showed that SUI patients after TVT surgery had lower risk of the bladder funneling and urethral opening at defection phase ($p<0.01$). No functional changes of the urethral hypermobility, the bladder neck descent and pelvic floor prolapse were seen postoperatively ($p>0.05$).

Conclusion: MRD provides the detailed anatomic and functional evaluation of the pelvic floor in female SUI. SUI patients had a visible defect in the pubococcygeal muscle instead of puborectalis. Defecation phases provides a spectrum of functional disorders in SUI patients. Urinary continence after TVT is mostprobably achieved by creating a dynamic mid-urethral knee angulation by which the urethra is closed at stress or defecation phase.

EPO-1082

睾丸及附睾病变的影像诊断

袁立新
上海市同仁医院

目的 探讨睾丸附睾病变的 CT 表现及其诊断价值。

资料与方法 回顾性分析 40 例经手术病理证实的睾丸附睾病变的 CT 表现，影像特征。

结果：40 例病变中，41 个睾丸附睾病变，CT 表现为阴囊内边界清楚软组织肿块，9 例为生殖细胞肿瘤，其中精原细胞瘤 5 例，平扫呈低密度改变，增强扫描中度不均匀强化，肿块最大直径为 65mm，内见囊变坏死区；非精原细胞瘤中 2 例混合型生殖细胞瘤，最大肿块为 50*55mm，平扫呈略低密度，增强扫描后呈轻度强化；畸胎瘤 2 例，肿块较大，约 78*85mm，平扫呈低密度改变伴分隔影，增强扫描后，病灶血供丰富，呈明显强化；非生殖细胞肿瘤 4 例，为淋巴瘤，病灶平扫呈略高密度或等密度，最大肿块 9*7*6mm，增强扫描呈均匀强化，并可见粗大血管影；附睾病变 5 例，其中，腺瘤样瘤 1 例，附睾囊肿 4 例；睾丸外伤破裂 4 例；隐睾 2 例；阴囊病变 4 例，脂肪瘤 1 例，平滑肌肉瘤 1 例，脓肿 2 例；精索囊肿 5 例；鞘膜积液 7 例。

结论：CT 对睾丸附睾病变的检出具有重要价值,同时结合患者发病年龄及临床资料可对不同病理类型的肿瘤及其它病变作出鉴别诊断。

肾上腺皮质癌 CT 影像学表现与免疫组化的相关研究

蓝海梅,彭鹏
广西医科大学第一附属医院

目的：根据 10 例肾上腺皮质癌的 CT 征象与免疫组化部分指标的相关研究，预测其应用价值。
方法：回顾性分析 2015 年 2 月至 2019 年 1 月来广西医科大学第一附属医院就诊的经病理确诊为肾上腺皮质癌患者 10 例的 CT 影像特征，并分析不同征象与部分免疫组化的表达。
结果：10 例肾上腺皮质癌患者中，均为类圆形、单发，左右各半；5 例直径超过 10cm；8 例为囊实性，2 例为实性；9 例边界清，1 例边界不清；4 例其内见斑片状钙化；2 例下腔静脉及肾静脉癌栓形成；2 例有腹主动脉淋巴结转移；5 例实性成分明显不均匀强化；其中 Syn（+）7 例，Ki-67（+）9 例，CgA(-)9 例，CK（-）7 例，EMA（-）7 例。
结论：肾上腺皮质癌体积较大、形态不规则、钙化、星芒状囊变区等，增强扫描肿瘤不均匀强化，坏死与出血区不强化，CT 检查可发现下腔静脉受累、淋巴结转移及其他脏器转移。免疫组化 Syn（+）、Ki-67（+）有可能对肾上腺皮质癌的诊断提供帮助，而 CgA、CK、EMA 有待于进一步研究。

基于全肿瘤体积的 T2WI 信号强度直方图分析鉴别子宫内膜癌和子宫间质肉瘤

张晓楠,程敬亮
郑州大学第一附属医院

目的：探讨基于全肿瘤体积的 T2WI 图像直方图分析对子宫内膜癌和子宫间质肉瘤的鉴别诊断价值，并经 MRI 检查。方法与资料：回顾性分析 60 例经病理证实的子宫恶性肿瘤患者，其中子宫内膜癌 40 例，子宫间质肉瘤 20 例。在肿瘤水平每层两组 T2WI 横轴图像的每一层上绘制感兴趣区域(ROI)，并进行直方图分析，这两个步骤都是在 Mazda 软件上进行的。对直方图参数进行统计分析，找出两组间显着差异的特征。结果：从直方图中提取的 9 个参数中，方差具有统计学意义，ROC 曲线下的最大面积为 0.698。区分子宫内膜癌和子宫间质肉瘤的最佳方差为 453.76(特异性为 55%，敏感性为 80%)。结论：T2WI 直方图分析可为子宫内膜癌与子宫间质肉瘤的鉴别提供可靠的客观依据。

EPO-1085
T2WI 全瘤直方图分析在子宫内膜癌和子宫肌瘤变形鉴别诊断中的应用

张晓楠
郑州大学第一附属医院

目的：评价 T2WI 直方图分析在鉴别子宫内膜癌和子宫肌瘤变性中的价值。方法与材料：对我院 64 例子宫肿瘤患者的子宫 MRI 检查及病理诊断进行回顾性分析。其中子宫内膜癌 40 例，子宫肌瘤变性 24 例。在 T2WI 横轴图像肿瘤水平的每一层上绘制感兴趣区域(ROI)，并进行直方图分析，这两个步骤都是在 Mazda 软件上进行的。对直方图参数进行统计分析，找出两组间显着差异的特征。结果：通过直方图分析 9 个参数，均值，偏度，峰度，Perc.1%，Perc.10%，Perc.50%，有统计学意义。ROC 曲线下最大面积分别为 0.676，0.738，0.674，0.732，0.718，0.679。鉴别子宫内膜癌和子宫肌瘤变性的最佳偏度为 0.39(特异性 75.0%，敏感性 77.5%)。结论：T2WI 图像直方图分析可为

子宫内膜癌与子宫肌瘤变性的鉴别提供可靠的客观依据。可作为两种肿瘤的一种新的辅助诊断方法。

EPO-1086
多 B 值 DWI 在妊娠晚期胎盘植入分级诊断中的临床价值研究

骆众星,李萌,王晶,田晓辉
中山大学附属第七医院

目的 研究分析多 B 值下的磁共振弥散加权成像（Diffusion weighted imaging，DWI）在妊娠晚期胎盘植入分级诊断中的临床价值研究。**方法** 选取 2013 年 5 月~2017 年 8 月　在我院 68 例待产并怀疑 出现胎盘植入的晚期孕产妇作为研究对象，对其进行常规磁共振 T2 加权成像（T2WI）检查与 DWI 扫描，同时 DWI 选用 0s/mm2，400s/mm2、800s/mm2、1000s/mm2 四种不同的 B 值参数进行扫描，利用方差分析法来测定不同 B 值检测组之间胎盘植入区域与子宫肌壁区域的信号强度比（SI Ratio），结合后期的分娩结果与手术情况为标准，将 SI Ratio 指数最高的 B 值组与 T2WI 的检测结果进行比较，判断两者对于产妇妊娠晚期胎盘植入分级的诊断效能。**结果** 68 例产妇当中有 12 例因不能坚持完成扫描检查而放弃，13 例未能确诊胎盘植入，其余产妇中有 18 例为Ⅰ级胎盘植入，16 例为Ⅱ级胎盘植入，9 例为Ⅲ级胎盘植入　；当 DWI 的 B 值=800s/mm2 时，胎盘植入区域与子宫肌壁之间的 SI Ratio 值为（5.44±1.62），较其他 B 值下的 DWI 更高且差异具有统计学意义（P＜0.05）；同时，当 DWI 的 B 值=800s/mm2 时，对于Ⅰ级胎盘植入与常规 T2WI 检查无显著差异（P＞0.05），但对于Ⅱ级、Ⅲ级胎盘植入的检测效能较常规 T2WI 检查更好，且差异具有统计学意义（P＜0.05）。**结论** 当 B 值选取为 800s/mm2 时，DWI 的扫描结果能够较好地显示产妇的胎盘植入情况，为胎盘植入的临床诊断和治疗提供更加准确地依据。

EPO-1087
CT 增强图像纹理分析技术鉴别肾脏嗜酸性细胞腺瘤和透明细胞癌的应用价值

耿莉,徐凯
徐州医科大学附属医院

目的 探讨 CT 增强图像纹理分析技术在肾脏嗜酸性细胞腺瘤和透明细胞癌中的诊断及鉴别诊断价值。**方法**　回顾性分析经手术病理证实的 11 例肾脏嗜酸性细胞腺瘤和 46 例透明细胞癌患者，所有患者术前均进行肾脏 CT 增强检查，利用 Omni-Kinetics 纹理分析软件分析两组肿瘤的纹理特征，包括平均灰度值、标准差、偏度、峰度、能量及熵。采用独立样本 t 检验比较两组计量资料之间的差异，构建 ROC 曲线评价其诊断效能。**结果**　在 CT 增强图像上，肾脏嗜酸性细胞腺瘤的标准差和熵小于透明细胞癌，差异均具有统计学意义，能量大于透明细胞癌，差异具有统计学意义；平均灰度值、偏度小于透明细胞癌，峰度大于透明细胞癌，差异均无统计学意义。在两组肿瘤的鉴别中，标准差曲线下面积为 0.875，以 25.03 为阈值，敏感性为 80.77%，特异性为 87.50%；能量曲线下面积为 0.946，,以 0.013 为阈值，敏感性为 92.59%，特异性为 88.89%；熵曲线下面积为 0.880，,以 6.593 为阈值，敏感性为 81.48%，特异性为 88.89%。**结论**　肾脏嗜酸性细胞腺瘤和透明细胞癌之间的纹理特征存在显著差异，标准差、能量及熵对两者之间的鉴别具有重要价值。

EPO-1088
应用 PET-CT 与 DWI 成像评估前列腺癌淋巴结转移的荟萃分析

李莉
成都中医药大学附属医院

目的：比较 PET-CT 和 DWI 成像对前列腺癌淋巴结转移的诊断价值。
方法：检索 PubMed， the Ovid, MEDLINE, EMBASE，Cochrane Library 和 Web of Science databases 数据库中发表于 1979 年 1 月之后出版的文章。文章的语言为英文。纳入的文章必须包括四格表；文章的研究内容是 PET-CT 或 DWI 成像对前列腺癌淋巴结转移诊断价值，金标准是病理。
结果：33 和 8 项研究（包括 516 和 109 患者）分别评估 PET-CT 和 DWI。双变量分析显示 PET-CT 的平均敏感性和特异性分别为 0.92（95% CI 0.84 - 0.93）和 0.88（95% CI 0.87～0.89）曲线下面积(AUC)为 0.9474。DWI 平均敏感性和特异性的 87.1% (CI, 83.0% to 90.3%) and 70.3% (CI, 58.8% to 79.7%)。曲线下面积(AUC)为 0.745。
结论：PET-CT 比 DWI 更能准确诊断前列腺癌淋巴结转移。

EPO-1089
Diffusion-weighted imaging and Intravoxel incoherent motion in the diagnosis of prostate cancer: A preliminary retrospective study

Guodong Jing,Qingsong Yang,Jianping Lu,Li Wang
Shanghai changhai hospital

Purpose
This study explored and compared the value of Intravoxel incoherent motion (IVIM) with diffusion-weighted imaging (DWI) in distinguishing prostate cancer from non-cancer tissues (including benign prostate hyperplasia and normal tissue) and compared their performances in the peripheral zone and the central lobe.

Methods
A retrospective review was performed in 212 consecutive patients (108 patients with prostate cancer and 104 patients with hyperplasia of the prostate) who underwent examination on a 3-T MR scanner (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany) in our hospital from March 2015 to May 2016.All patients were confirmed by pathology. A multi-b DWI sequence was performed with the following parameters: TR/TE = 5100/89ms, FOV = 280x224 mm^2, scan matrix = 150x120, slice thickness = 4mm, slice number = 20, bandwidth = 1755Hz/Px, iPAT factor = 2, b-values =0, 50, 100, 250, 500, 800, 1000, 1500, 2000, 2500 mm^2/s, scan time = 4min10s. D, D^*, f and apparent diffusion coefficient (ADC) derived from conventional DWI were calculated and analyzed by using an in-house-developed software based on MATLAB (Mathworks, Natick MA). The diagnostic accuracy of D, D^*, f and ADC values were evaluated with sensitivity, specificity, and

area under receiver operating characteristic (ROC) curve (AUC). Student's t-test and ROC curves were used for statistical analysis.

Results

There was a significant difference between non-cancerous tissues in the peripheral zone and central lobe (P <0.001) for D、D*、f and ADC; while these parameters show no significant difference between prostate cancers in the peripheral zone and the central lobe (p>0.05). For the peripheral zone, D、D*、f and ADC had sensitivities of 0.987, 0.000, 0.000, 0.993, specificities of 0.994, 1.000, 1.000, 0.993, and AUCs of 0.9997, 0.5547, 0.5702, 0.9998, when using cutoff values of 0.981 mm^2/s, 4.241 mm^2/s, 0.150, and 1.141x$10^{-3}mm^2/s$, respectively. While for the central lobe, the diagnostic performance of D、D*、f and ADC got sensitivities of 0.826, 0.870, 0.581,0.855, specificities of 0.975, 0.991,0.967, 0.981, and AUCs of 0.9546, 0.6770, 0.8580,0.9569, when the cut-off points were 0.842 mm^2/s, 6.128 mm^2/s, 0.164, 0.997x$10^{-3}mm^2/s$, respectively.

Discussion

IVIM and DWI may depict microstructure changes of prostate cancer, and can potentially provide quantitative information for the prostate tissue and have similar good diagnostic performance to distinguish prostate cancer from non-cancer tissues. For both of the two diffusion models, the diagnosis values in the peripheral zone were slightly better than in the central lobe.

Clear cell carcinoma of the prostate: a case report

Hongyan Nie, Junwu Hu
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Abstract

We report on a rare case of a clear cell carcinoma in the prostate, occurring in a 21-year-old man presenting with sudden onset of acute urinary retention who had lower urinary tract obstructive symptoms with no obvious incentive 7 days ago. Clear cell carcinoma occurring in the prostate is extremely rare, and information reported in the literature is quite limited. We report a case of clear cell carcinoma of the prostate confirmed with surgical histopathology and immunochemistry, and review the medical literature with emphasis on their imaging feature.

1. Introduction

Clear cell carcinoma, as one of infrequent carcinomas occur in the lower urinary, is similar to metastatic renal cell carcinoma. In 2003, Sing[1] found a clear cell carcinoma of the prostate, which is very similar to renal clear cell carcinoma histologically and immunohistochemically, then the renal-type clear cell carcinoma of the prostate was named after an excluded diagnosis of prostate metastatic adenocarcinoma. Our case reveals a patient with congenital absence of the right kidney, which is similar to the case reported by Zachary Klaassen[2]. Herein, we reported a case of a 21-year-old man who was diagnosed with clear cell carcinoma of the prostate. The histopathological, immunohistochemical and imaging features, which are vital examinations for clear cell carcinoma of the prostate in its diagnosis and differential diagnosis, are discussed.

2. Case report

A 21-year-old male came to the attention of his urologist for sudden onset of acute urinary retention, and he had lower urinary tract obstructive symptoms with no obvious incentive 7 days ago. No gross hematuria or abdominal pain was presented. Physical examination found a palpable mass in the suprapubic region, accompanied by tenderness. Genitourinary examination revealed penis and testicles were normal, and no palpable mass was found. On rectal examination, a large, firm and movable mass was touched in the pelvic. Except for a moderate hematuria showed in urine routine test, three or more mixed bacteria were growing showed in urine culture. Other laboratory examinations, including a complete blood count, biochemical tests, liver and renal function test results, and the level of prostate-specific antigen (PSA, 0.31 ng/mL), were both within the normal range.

Urinary tract ultrasonography revealed a mass with mixed ingredients in the pelvic, and a right renal atrophy since there's a hyperechoic area in the right kidney area. Computed tomography (CT) of the upper abdomen demonstrated congenital solitary kidney (right renal agenesis)(Fig.1). A huge mass with mixed-signal in the prostate area was displayed in both CT and conventional magnetic resonance imaging(MRI), measuring 9.8cm×9.9cm×12.3cm, with numerous cystic components in it, and there is a cystic lesion showed in the right seminal vesicle region. After intravenous administration of gadolinium (Gd-DTPA), the tumor showed heterogeneous

enhancement, while no enhancement was performed on the cystic part (Fig.2). A diagnosis of seminal vesicle cyst was confirmed because there was no enhancement showed on the cystic in the right seminal vesicle region. In addition, there was no evidence of metastasis in any organ.

Depending on all the clinical and imaging information above, a preoperative diagnosis of prostate sarcoma was made. Subsequently, the patient received transurethral resection of the prostate tumor. The total tissue of prostate tumor was removed. Grossly, the surgical specimen was a well-defined encapsulated mass, with the characteristic of cystic and solid areas, located in the prostate. The cyst contained brown yellow material.

Microscopic finding (Fig.3) and immunohistochemical examination concluded that this mass represented primary clear cell carcinoma of the prostate.

After six months of follow-up, the patient is doing well with no evidence of distant metastasis and local recurrence.

CT 在获得性肾囊肿中的应用价值

刘畅
贵阳市第一人民医院

目的 通过 CT 对肾衰长期血液透析患者获得性囊肿的检查，了解该病的发生及 CT 表现特点。**方法** 回顾分析 2016 年至 2018 年间共计 29 例肾衰长期血液透析患者获得性肾囊肿的 CT 影像特点及临床相关资料，进行对照研究。**结果** 78 例肾衰长期血液透析患者中有 29 例发生获得性囊肿（约 37%），通过 CT 明确囊肿的形成及囊肿大小，直径从 5mm—30mm 不等；获得性囊肿的形成与透析时间的长短有一定的正相关，透析时间越长，获得性囊肿越容易发生，CT 的检出率越高。 **结论** 肾

衰长期血液透析患者随透析时间的延长而容易发生获得性囊肿，CT 可有效进行检出并测量囊肿大小、数量及观察囊肿对邻近肾实质压迫情况，以对临床提出相关的诊断及处理依据。

扩散加权成像“尺蠖征”的缺失和形态异常预测膀胱癌肌层浸润的诊断价值

李陇超,张沥,张小玲,雷晓燕,杨艳蓉,李剑锋
陕西省人民医院

目的：探讨扩散加权成像(DWI)上“尺蠖征”的缺失和形态异常对膀胱癌肌层浸润的诊断性能。

方法：本研究回顾性纳入经病理证实的膀胱尿路上皮癌 136 例患者，共 209 个病灶，每例患者术前均接受了 3.0T(飞利浦)MRI 检查，包括平扫、 动态增强和 DWI (b0，1000)成像。两位放射科医生对影像进行了独立评估，并通过达成共识解决争议。DWI 序列观察指标为“尺蠖 征”的缺失和形态扭曲。平扫观察指标包括膀胱癌非乳头型、膀胱壁扩张受限、膀胱周围脂肪浸润。动脉增强观察指标为肌层早期出现强化。用皮尔森卡方检验对观察结果与组织病理学进行比较，计算各项特征的诊断性能。

结果：常规平扫、动态增强以及扩散加权成像(DWI),不同序列的特征指标对判膀胱癌肌层浸润均有统计学意义(P<0.01)。ROC 曲线分析显示，病灶大小与“尺蠖征”的存在呈正相关（p 值<0.001），预测“尺蠖征”存在的截断值为 1.2cm，小于 1.2cm 的病灶绝大部分无“尺蠖征”。扩散加权成像(DWI)上“尺蠖征”的缺失和形态扭曲判断膀胱癌肌层浸润的敏感性最高(88.5%)，特异性亦最高(91.4%)。非乳头型、膀胱壁扩张受限、膀胱周围脂肪浸润和肌层早期出现强化等指标判断肌层浸润的敏感性(分别为 61.7%、56.7%、68.3%和 52.6%)和特异性(分别为 65.5%、62.2、71.7%和 56.7%)均较低。

结论：扩散加权成像(DWI)上“尺蠖征”的缺失和形态异常对预测膀胱肌层浸润有较好的诊断性能。

EPO-1095
探讨体素非相干运动（IVIM）扩散加权成像（DWI）联合常规 MRI 在宫颈癌放化疗效监测中的价值

杨小峰
湖北医药学院附属随州医药（随州市中心医院）

目的：探讨体素非相干运动（IVIM）扩散加权成像（DWI）联合常规 MRI 在宫颈癌放化疗效监测中的价值。

方法：对 62 例 接受同步放化疗的宫颈癌患者于治疗前、治疗后 1 个月 分别行盆腔 MRI 常规序列，盆腔 MRI 常规 T1WI、T2WI、轴位 DWI（B 值为 0s/mm^2,800s/mm^2）及 IVIM 序列（b 值为 0s/mm^2,50s/mm^2,100s/mm^2,150s/mm^2,200s/mm^2,300s/mm^2,400s/mm^2,600s/mm^2,800s/mm^2,1000s/mm^2）扫描,测量各扫描时间点肿瘤最大面积及相关参数,并分析其动态变化及相关性。

结果：对两组的 IVIM 参数进行定量分析比较，结果放化疗前的平均 d 值和 f 值明显低于放疗后（P<0.05）；常规 MRI/IVIM-DWI 组合对宫颈癌放化疗后检测的敏感性和准确性明显高于常规 MRI。
结论：体素非相干运动（IVIM）扩散加权成像（DWI）联合常规 MRI 对宫颈癌治疗前、后 IVIM 参数值改变对评价治疗效果具有重要作用。

EPO-1096

The Diagnostic Evaluation of PI-RADS V2 based on Simplified Biparametric MRI for Clinically Significant Prostate Cancer

Jie Bao,Ximing Wang ,Chunhong Hu
The First Affiliated Hospital of Soochow University

Synopsis
This study compare the performance of the PI-RADS scores obtained by using biparameter MRI (T2W and diffusion) and multi-parameter MRI (T1W, T2W, diffusion and DCE) for clinically significant PCa, respectively. The results show that the PI-RADS score acquired from biparameter MRI is comparable with that from the traditional multi-parameter MRI.

Propose This study compare the performance of the PI-RADS scores obtained by using biparameter MRI (bpMRI, including T2W and diffusion) and multi-parameter MRI (mpMRI including T1W, T2W, diffusion and DCE) for clinically significant PCa, respectively. In addition, the consistency of bpMRI based PI-RADS score was also investigated among different radiologists.

Materials and Methods MpMRI was performed for 333 patients with suspicious lesions on a 3T MR scanner (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany) including high-spatial-resolution structural imaging in several planes, diffusion-weighted imaging and DCE MR imaging. For bpMRI, two radiologists (9 years and 4 years prostate MRI reading experience, respectively) scored only the cross-sectional T2W image and DWI for all cases in strict accordance with the PI-RADS V2 scoring standard without knowing the patient's clinical data and pathology results. Then, Standard PI-RADS V2 scores for all mpMRI was performed after two weeks by the same readers. Interobserver agreement of all PI-RADS V2 scores of two radiologists was investigated. All cases were scored by the author based on mpMRI-based PI-RADS V2 before biopsy. The patients with suspicious tumors PI-RADS V2 assessment category of≥3 were selected for MRI-TRUS targeted biopsy within two weeks after MRI. The other patients with PI-RADS V2 assessment category of 1and 2 were selected for TRUS biopsy. The receiver operating characteristic curves were obtained by PI-RADS V2 scores based on bpMRI and mpMRI sequences, respectively, to record the AUC, accuracy, sensitivity, specificity, positive predictive value and negative predictive value. The diagnostic efficacy of bpMRI and mpMRI for prostate disease was evaluated by MRI-TRUS targeted biopsy and TRUS biopsy.

Results A cohort of 333 patients was performed including 162 PCa (including 150 clinically significant and 12 non-clinically significant PCa) and 171 non-PCa. bpMRI detected PCa in 131 patients and clinically significant PCa in 126 patients; mpMRI detected PCa in 138 patients and clinically significant PCa in 127 patients; Interobserver agreement of bpMRI and the mpMRI of two radiologists was substantial (k = 0.678 and 0.660). The AUC of PI-RADS V2 score based on bpMRI and mpMRI for the diagnosis of benign and malignant prostate lesions was 0.869 and 0.889, respectively, and the difference was not statistically significant (P=0.0638). The accuracy of bpMRI in the diagnosis of benign and malignant prostate diseases is 81.68% (272/333), the sensitivity is 80.86% (131/162), the specificity is 82.46% (141/171), the positive predictive value is 81.37 % (131/161), and the negative predictive value is 81.98 % (141/172). The accuracy of mpMRI score in the diagnosis of benign and malignant prostate lesions was 84.98% (283/333), the sensitivity was 85.18% (138/162), the specificity was 84.80% (145/171), the positive predictive value was 84.15% (138/164) and the predicted value is 85.8% (145/169). The AUC of PI-RADS V2 score based on bpMRI and mpMRI for the diagnosis of clinically significant prostate cancer was 0.879 and 0.890, respectively, and the difference was not statistically significant (P=0.1685). The diagnostic accuracy of bpMRI for clinically significant prostate cancer was 84.38% (281/333), the sensitivity was 92.42%(122/132), the specificity was 79.10%(159/201), the positive predictive value was 74.39%(122/164), and the negative predictive value was 94.08%(159/169); The diagnostic accuracy of mpMRI was 85.59%(285/333), the sensitivity was 93.94% (124/132), the specificity was 80.10% (161/201), the positive predictive value was 75.61% (124/164), and the negative predictive value was 95.27%(161/169).

Conclusion BpMRI can effectively detect clinical significant prostate cancer; the diagnosis performance of bpMRI is similar to that of mpMRI for detecting prostate cancer. As a result, using bpMRI method can significantly shorten the acquisition and interpretation time and avoid the potential risk of DCE injection of contrast agent.

Semi-quantitative dynamic contrast-enhanced MR imaging in predicting prognosis of cervical cancer patients undergone concurrent chemo-radiotherapy

Li Zhu, Jie Meng, Huanhuan Wang, Lijing Zhu, Jian He, Zhengyang Zhou
Nanjing Drum Tower Hospital

Abstract

Objective: To investigate the role of semi-quantitative dynamic contrast-enhanced (DCE) magnetic resonance (MR) imaging (DCE-MRI) in predicting the long-term prognosis of patients with advanced cervical cancers undergone concurrent chemo-radiotherapy (CCRT).

Methods and Materials: Thirty-eight patients (48.8 ± 11.7 years old) with advanced cervical cancers underwent DCE-MRI before CCRT, 2 and 4 weeks after CCRT. Semi-quantitative DCE-MRI parameters were measured and compared between patients with well and poor long-term prognosis.

Results: Patients with well long-term prognosis had significantly higher wash-in rate of tumor at time point 3 (95.26 ± 25.55 L/s) and change rate from time point 1 to 3 (42.30 ± 72.48 %) compared with those with poor prognosis (46.94 ± 26.62L/s, 16.93 ± 22.09 %, $p < 0.000$, =0.001). Wash-in rate of tumor at time point 3 could predict a well long-term prognosis with an AUC of 0.910.
Conclusion: Semi-quantitative DCE-MRI parameters hold potential in predicting long-term prognosis of patients with advanced cervical cancers treated with CCRT.

T1 和 T2 加权成像全域直方图分析的联合诊断在鉴别肾上腺腺瘤和嗜铬细胞瘤的价值

刘俊宏,程敬亮
郑州大学第一附属医院

目的：因为治疗和预后有显著差异，肾上腺腺瘤和嗜铬细胞瘤之间需要准确的鉴别。本研究的目的是探讨 T1 和 T2 加权成像全域直方图分析的联合诊断在嗜铬细胞瘤和肾上腺腺瘤的可行性。
材料与方法：回顾性评价 7 年来的病理数据库，获得 40 例经组织病理证实的肾上腺腺瘤和 12 例嗜铬细胞瘤。用 Mazda 软件对各患者的 T1 和 T2 加权成像图像进行分析。选择 9 个参数作为比较指标，分别为方差、偏态、峰度、均值、1 分位数、10 分位数、50 分位数、90 分位数和 99 分位数。采用具有鉴别诊断意义的参数构成新的联合诊断预测因子。计算并比较各个指标的诊断效能。
结果：在用直方图分析提取的 9 个参数中，T1 加权成像的 1 分位数、10 分位数以及 T2 加权成像的偏斜度具有统计学意义。T1 加权成像的 1 分位数和 10 分位数的曲线下面积分别为 0.776 和 0.700。1 分位数和 10 分位数区分嗜铬细胞瘤与腺瘤的最佳鉴别值分别为 49.57 和 60.9（特异性均为 75%，敏感性均为 75%）。T2 加权成像偏态的曲线下面积为 0.760，最佳鉴别值为 0.51（特异性 72.5%，敏感性 75%）。联合预测因子的曲线下面积为 0.840，最佳鉴别值为 38.01（特异性 72.5%，敏感性 83.3%）。
结论：T1 和 T2 加权成像的全域直方图分析有助于肾上腺腺瘤与嗜铬细胞瘤的鉴别。此外，T1 和 T2 加权成像直方图的联合诊断比单个直方图分析更有效。

基于弥散加权成像的放射组学分析对于散布型与致密型前列腺癌的诊断研究

刘晓航,周良平,周冰妮,彭卫军
复旦大学附属肿瘤医院

目的：探究基于弥散加权成像（diffusion weighted imaging, DWI)的放射组学分析对于散布型与致密型前列腺癌的诊断效果
方法：61 例穿刺行 DWI 检查并行前列腺癌根治术的前列腺癌患者，根据病理结果在整体病理切片上区分和选取散布型与致密型前列腺癌。依据切片上的病变位置和大小，在 ADC 图上绘制感兴趣区并应用组学分析软件提取图像纹理特征，同时选取部分正常组织作为对照。选取一半病例作为建模组，应用 Spearman 相关系数以 0.95 为阈值去除高相关性特征，再使用 L1 正则化逻辑回归方法进行特征选择，分别筛选可鉴别散布型前列腺癌与非癌组织、致密型前列腺癌与非癌组织的参数，建

立诊断模型。将诊断模型应用于另一半病例（测试组），评估诊断效能，应用受试者工作特征(Receiver Operating Characteristic，ROC)曲线与常规 ADC 值进行比较。
结果：共计纳入 86 处致密型前列腺癌、64 处散布型前列腺癌、110 处正常外周带组织作为样本，测量 396 种特征。建模组致密型前列腺癌与非癌组织有意义的参数特征有 32 项，模型鉴别测试组的 ROC 曲线下面积（Area Under ROC Curve，AUC）值为 0.91，与常规 ADC 值结果（0.90）接近（P>0.05）。建模组散布型前列腺癌与非癌组织有意义的参数特征有 11 项，模型鉴别测试组的 AUC 值为 0.82，高于常规 ADC 值结果（0.76）（P<0.05).
结论：基于 DWI 的放射组学分析可应用于散布型前列腺癌诊断的特征较少，但可提高散布型前列腺癌诊断效果，对致密型前列腺癌的诊断效果与常规 DWI 相近。

Combined diagnosis of whole-lesion histogram analysis of T1- and T2-weighted imaging for differentiating adrenal adenoma and pheochromocytoma

Junhong Liu,Jingliang Cheng
the First Affiliated Hospital of Zhengzhou University

Background and purpose: Accurate differentiation between adrenal adenoma and pheochromocytoma is needed because treatment and prognosis differ significantly. This study is to determine whether a combined diagnosis of whole-lesion histogram analysis of T1- and T2-weight imaging can distinguish pheochromocytoma from adrenal adenoma.
Material and Methods: A pathology database was retrospectively appraised over a period of 7 years and we obtained 40 histopathologically proven adrenal adenomas and 12 pheochromocytomas with MR images. The T1- (T_1WI) and T2-weighted imaging (T_2WI) images of each patients were analyzed with Mazda software. Nine parameters were selected as indicators of comparison and they were variance, skewness, kurtosis, mean, 1^{st}percentile, 10^{th}percentile, 50^{th}percentile, 90^{th}percentile and 99^{th}percentile. The parameters with differential-diagnosis significance were used to form a combined predictor. Then the diagnostic efficiency of each index was calculated and compared.
Results: Among the nine parameters extracted using histogram analysis, the 1^{st}percentile and 10^{th}percentile of T_1WI and the skewness of T_2WI showed statistical significance. The AUC of 1^{st}percentile and 10^{th}percentile were 0.776 and 0.700, respectively. The optimum of 1^{st}percentile and 10^{th}percentile to distinguish pheochromocytomas from adenoma were 49.57 and 60.93 (both 75% specificity and 75% sensitivity). The AUC of skewness was 0.760 and the optimum of skewness was 0.51 (72.5% specificity and 75% sensitivity). The area under the curve (AUC) of the combined predictor showed higher value of 0.840 and the optimum of combined predictor was 38.01 (72.5% specificity and 83.3% sensitivity).
Conclusion: Histogram analysis of T_1WI and T_2WI may help differentiate adrenal adenomas from pheochromocytomas. Furthermore, the combined diagnosis of T_1WI and T_2WI histogram was more effective than either individual histogram.

能谱 CT 碘水图纹理分析在肾透明细胞癌 WHO/ISUP 分级的应用

陈安良,刘爱连,卜欣淼,刘义军
大连医科大学附属第一医院

目的：探讨能谱 CT 碘水图纹理分析在肾透明细胞癌 WHO/ISUP 分级的应用初探。
方法：回顾性分析 2018 年 5 月至 2019 年 6 月行 Revolution CT 泌尿系增强患者 150 例，其中经手术及病理后证实为肾透明细胞癌患者 120 例，根据 WHO/ISUP 病理分级分为高级别（WHO/ISUP 3、4 级）患者共 20 例，按照时间顺序选取低级别（WHO/ISUP 1、2 级）患者共 30 例。在能谱工作站中导出肿瘤最大层面及邻近层面动脉期碘水图（1.25mm 层厚/层间距）。将碘水图导入 3D Slicer 软件，勾画肿瘤全层面 ROI。使用 Radiomics 模块对 ROI 进行纹理分析，导出数据结果。使用独立样本 t 检验对两组纹理数据结果进行差异性检验，P<0.05 为差异有统计学意义。
结果：肾透明细胞癌动脉期碘水图纹理参数：偏度、10%分位数、IDN（GLCM）、Dependence Non Uniformity（GLDM）对肾透明细胞癌高低级别鉴别具有统计学差异（P<0.05）。其中高级别组偏度、IDN、Dependence Non Uniformity 平均值分别为 0.481、0.971、5832.49，高于低级别组 0.099、0.964、3117.36；高级别组 10%分位数平均值为 10.75，低于低级别组 19.67。
结论：通过纹理分析结合能谱 CT 碘水图可对肾透明细胞癌 WHO/ISUP 高低分级进行鉴别，为指导肾透明细胞癌治疗提供一定帮助。

睾丸肿瘤影像诊断及误诊分析

何玉芳[2,1],杨蕊梦[1],江新青[1]
1.广州市第一人民医院
2.华南理工大学医学院

目的 提高对睾丸肿瘤 CT 或 MRI 影像特征的认识及鉴别诊断的准确性。方法回顾性分析我院及外院 2014 年 6 月至 2019 年 6 月经手术病理证实的睾丸肿瘤的 CT 或 MRI 影像资料，收集其临床资料（包括临床症状及肿瘤指标等），将睾丸肿物的病理诊断类型、肿瘤标志物、临床症状与影像特征进行对照分析。结果 共收集睾丸肿物 69 例，其中睾丸肿瘤 57 例，睾丸肿瘤样病变 12 例（9 例附睾炎、2 例结核、1 例皮样囊肿）。睾丸肿瘤包括精原细胞瘤 32 例、混合型生殖细胞瘤 12 例、淋巴瘤 5 例、畸胎瘤 3 例、胚胎性癌 1 例、内胚窦瘤 1 例、间质瘤 1 例、平滑肌瘤 1 例、多形性未分化肉瘤 1 例。精原细胞瘤影像表现多样，可表变为轻中度强化均匀实性肿块、也可出现不同程度坏死、囊变、纤维化改变。均质低密度或 T2 低信号及纤维间隔样强化是精原细胞肿瘤的特征性表现。典型睾丸淋巴瘤形态规则、整体密度及信号较均匀，增强扫描较明显强化。炎性肿瘤样病变可表现边界不清的环形强化团块影，但往往有阴囊肿痛的临床症状。结论 睾丸肿瘤病理类型多样且具有明显的年龄分布及标志物特征。结合患者影像资料及临床起病症状、肿瘤指标有助于睾丸肿瘤及肿瘤样病变的鉴别诊断。

Differential Diagnosis of Chromophobe cell renal carcinoma and Renaloncocytoma using quantitative iodine parameters determined by spectral CT.

Xinmiao Bo,Aulian Liu,Ye Li,Mingzhe Xu,Weiping Yang,Yaxin Niu
First Affiliated Hospital of Dalian Medical Universit

Objective To evaluate the value of single-source dual-energy CT quantitative iodine parameters in differential Chromophobe cell renal carcinoma (CCRC) and Renaloncocytoma (RO). **Methods** The present study retrospectively enrolled 37 patients underwent spectral CT scan from January 2013 to January 2019,who were pathologically or follow-up imaging confirmed as CRCC or RO, including 17 CRCCs and 20 ROs, respectively.All cases underwent abdominal contrast enhanced spectral CT scan before operation. The iodine (water) concentrations (IC) in the lesions that marked as ROI_T (ROI of tumor), and the iodine (water) concentrations that marked as ROIA in the abdominal aorta communis of the three phases CT enhanced scan were measured, and the normalized iodine (water) concentrations (NIC, NIC = ROI_T/ ROI_A) value was calculated on a GSI comprehensive analysis platform by two observers. The intra-class correlation coefficients (ICC) was used to check the consistency of the data measured by the two observers. The above parameters between the two groups were compared by t-test.The receiver operating characteristic curve (ROC) was used to analyze the diagnostic performance. **Results** The consistency of the data obtained by the two observers were good (ICC value > 0. 9). The normalized iodine (water) concentration ratio in group RO were significantly higher than those in group CCRC in the cortical phase (P＜0.05). Using 0.33 as a threshold, one obtained an area-under-curve (AUC) for ROC study of 0.903 with sensitivity of 80.0% and specificity of 94.1% for differentiating Chromophobe cell renal carcinoma and Renaloncocytoma. In medullary and excretion phase, there was no difference for parameters between the two groups (P>0.05). **Conclusion** The normalized iodine concentration in cortical phase of single-source dual-energy CT could quantitatively differentiat Chromophobe cell renal carcinoma and Renaloncocytoma, which has certain application value.

钆喷酸葡胺对肾功能轻度异常者齿状核 T1 信号的影响

许楚瓯,沈亚琪,马丽娅,李震,张菁,宋黎
华中科技大学同济医学院附属同济医院

目的 探讨钆喷酸葡胺对比对肾功能轻度异常者磁共振平扫齿状核 T1 高信号的影响。 **方法** 回顾性分析 59 例我院进行三次或以上 MR 增强扫描病例的临床及影像资料，测量右侧小脑齿状核及右侧额叶白质平均信号强度。以右侧额叶白质的信号强度作为基数，计算小脑齿状核的信号强度比。首末两次磁共振检查小脑齿状核与额叶白质的信号比值（I_0，I_1）比较采用配对 t 检验；使用独立 t 检验分析肾功能与小脑齿状核-额叶白质信号比值差值（ΔI）的关系；采用 Spearman 检验分析信号强度比值差值与磁共振增强检查次数的相关性。多重线性回归分析方法分析信号强度比值差值与年龄、性别及增强检查次数的关系。 **结果** 在肾功能正常组，I_0为 0.892±0.098， I_1为 0.951±0.106；肾功能轻度异常组中，I_0为 0.845±0.101，I_1为 0.949±0.121。两组 I_1均高于 I_0（P＜0.01）。肾功能正常组 ΔI 为 0.059±0.048，肾功能轻度异常组为 0.103±0.078，后者较前者大（P＜0.05）。在所有患者中， ΔI 与 MR 增强扫描次数存在正相关（r=0.794，P＜0.05）。进一步的多重线性回归分析显示，MR 增强扫描的次数与首末次信号差值 ΔI 有统计学差异，每增加一次增强扫描次数， ΔI 增加 0.764，而年龄、性别与首末次信号值差值 ΔI 无明显统计学差异。 **结论** 在多次使用钆喷酸葡胺（Gd-DTPA）进行 MR 增强扫描后，颅内小脑齿状核平扫 T1WI 出现高信

号，与增强扫描次数成正相关，且随着次数增加，信号强度增高；肾功能轻度异常组小脑齿状核 T1 加权图像的信号强度增高，信号差值较肾功能正常组大，且两组信号差值具有统计学差异。

EPO-1105
非对比剂磁共振功能成像在评价狼疮性肾炎中的价值

周倩,周纪宇
川北医学院附属医院

目的：研究非对比剂 MRI 功能成像参数与狼疮肾炎肾功能和肾脏疾病活动的标准测量值的相关性。
方法：收集本院经活检确诊狼疮性肾炎（LN）的患者以及健康志愿者（HV）各 30 名，将受试者分为对照组(志愿者)、早期（CKD1、2 期）、中晚期（CKD3、4、5 期）三组,对其进行多模态肾脏 MRI 检查，包括动脉自旋标记（ASL）测量肾血流灌注（RBF），及弥散峰度成像（DKI）测量双肾皮质及髓质的表观扩散系数(ADC)及各向异性(FA)。在整个研究人群中将 MRI 测量结果与尿蛋白/肌酸酐比率（uPCR）和计算的肾小球滤过率（eGFR）进行比较，然后探索各组之间的成像测量值的差异。
结果：47 名受试者（17LN，30HV）完成了该研究。正常对照组双肾肾皮质 RBF 值差异无统计学意义(t=0.830，P > 0.05)；LN 患者双肾皮质 RBF 值差异无统计学意义(t=1.210，P > 0.05)；对照组与 LN 早、中晚期病例组肾皮质 RBF 值有显著性差异(F=15.360，P＜0.05)，且肾皮质 RBF 值随肾损程度加重逐渐减低；对照组与早期组肾皮质 RBF 值差异无统计学意义(P > 0.05)；对照组与中晚期组肾皮质 RBF 值差异有统计学意义(P＜0.05)；早期组与中晚期组肾皮质 RBF 值间差异有统计学意义(P＜0.05)；eGFR 与髓质中 DKI 的表观弥散系数测量值显著相关（r=0.47，p < 0.05）。uPCR 与皮质中的分数各向异性（FA）DTI 测量相关（r=-0.71，p<0.001）。在 LN 受试者中发现延迟的血液流向髓质，并且在皮质中存在降低的 FA 值的趋势，表明微结构破坏（分别为 p=0.04 和 p=0.08）。
结论:该初步研究表明，非对比性肾脏 MRI 功能成像参数与系统性红斑狼疮的疾病活动的标准测量具有相关性。这些非侵入性的定量测量参数的潜在效用值得进一步研究，以作为狼疮性肾炎疾病活动的可靠生物标志物。

EPO-1106
多参数 MR 在肾脏小肿瘤诊断与鉴别诊断中的价值

宋黎,周丽
华中科技大学同济医学院附属同济医院

目的：探讨肾脏小肿瘤(直径＜4 cm) 的 MR 特征，鉴别小肿瘤的良恶性及肾细胞癌的不同亚型。
方法：回顾性分析经手术病理证实的 61 例肾脏小肿瘤患者的 MR 及临床资料。所有病例均行 MR 平扫、DWI 扫描。结果：61 例中恶性肿瘤 50 例，透明细胞癌 34 例中 4 例出现出血，3 例伴有囊变，11 例有假包膜；乳头状细胞癌 9 例，1 例伴有出血，4 例出现假包膜；1 例低度恶性潜能多房囊性肾肿瘤伴有小灶钙化。嫌色细胞癌 4 例，出现假包膜 3 例。血管平滑肌脂肪瘤 6 例，T2WI 均为低信号，T1 反相位肿瘤部分信号较同相位减低。嗜酸细胞腺瘤 2 例，均未见包膜。结论：多参数 MR 有助于肾脏小肿瘤的良恶性及肾细胞癌不同亚型的诊断及鉴别诊断。

扩散峰度成像术前评估Ⅰ期子宫内膜癌脉管侵犯的价值

王成艳,孙美玉,吴雅楠,刘爱连
大连医科大学附属第一医院

子宫内膜癌是女性生殖系统常见的恶性肿瘤之一。目前公认基本的手术范围是子宫切除和双侧输卵管卵巢的切除。淋巴结切除术并不能提高子宫内膜癌患者的生存率反而引起一系列手术并发症。因此，早期子宫内膜癌患者是否进行淋巴结切除存在争议[1,2]。脉管侵犯与淋巴结转移密切相关。脉管侵犯是子宫内膜癌患者淋巴结转移重要的预测因子[3]，但传统的 MRI 成像方法无法评估脉管侵犯情况。

乳头状肾细胞癌的 CT 表现及鉴别诊断

周宙
深圳市人民医院

目的 分析探讨乳头状肾细胞癌的 CT 表现，提高对于本病的诊断认识。**资料与方法** 回顾性分析 27 例经手术病理证实为乳头状肾细胞癌的 CT 特点，分析肿瘤部位、形态、大小、有无包膜、边界（瘤肾交界）、平扫肿块密度（与对侧正常肾实质密度比较）、肿块密度的均匀性（有无囊变、坏死、钙化、出血）、乳头结节、动态增强扫描后强化均匀度、强化方式和强化程度、有无肾周浸润、淋巴结肿大及远处转移。**结果** 27 例均为单发肿块，8 例位于肾皮质，19 例位于肾实质，肿

瘤呈圆形或类圆形 18 例，9 例为不规则形、分叶状。肿瘤有假包膜 16 例，无包膜 11 例，瘤肾交界清楚 21 例，不清楚 6 例。CT 平扫 16 例实性部分密度稍高于正常肾皮质和肾髓质,8 例呈稍低密度，3 例呈等密度；肿块密度均匀 5 例，不均匀 22 例，其中见斑片状、大片状囊变、坏死 9 例。动态增强扫描，皮质期 PRCC 肿瘤强化程度呈轻度强化 23 例，中度强化 4 例，皮质期，PRCC 强化程度均低于肾皮质强化程度，实质期，PRCC 强化程度低于肾实质强化程度 26 例，等高于肾实质强化程度 1 例，肾盂期及所扫描 12 例排泄期肿瘤均低于肾实质强化程度。强化方式：26 例呈轻度持续性强化，1 例表现为升-降型。**结论** 乳头状肾细胞癌 CT 表现具有一定特征性，平扫实质部分多为等、稍高密度，动态增强扫描呈轻度持续强化，可见乳头状结节的显示，均有助于本病与其他肾癌的鉴别诊断。

Non-enhanced contrast MRI for assessment of uterine fibroids' early response to ultrasound-guided high-intensity focused ultrasound thermal ablation

Dongfang Liao, Zhibo Xiao, Furong Lv, Jinyun Chen, Lanyu Qiu
the First Affiliated Hospital of Chongqing Medical University

Purpose: To examine non-enhanced contrast MRI value to evaluate necrotic area and ablation rate of uterine fibroids after high-intensity focused ultrasound (HIFU) thermal ablation.

Method: In total, 508 patients with 598 fibroids who underwent HIFU treatment were enrolled (3.0T pelvic conventional MRI before treatment and within two days post-treatment). Diffusion-weighted imaging (DWI) signal performance of post-operative fibroids was observed; apparent diffusion coefficient (ADC) and DWI signal values pre- and post-operation were measured. The volume of pre-operative T2-weighted imaging (T2WI) sequence fibroids, post-operative DWI signal change area and enhanced fibroid necrosis area were compared.

Results: Average ADC and DWI signal values before HIFU treatment were higher than those post-operation; the difference was statistically significant before and after ablation ($P < 0.05$). There was no correlation between ADC and DWI signal values before ablation ($p > 0.05$), but there was a significant correlation after ablation ($P < 0.05$). After HIFU, 78.09% (467 / 598) of DWI showed complete regular or irregular high-signal rings and 21.91% (131 / 598) showed incomplete high-signal rings. No significant difference was noted between the complete high-signal ring volume on DWI and the non-enhanced volume ($P > 0.05$); however, this difference was statistically significant compared with the incomplete high-signal ring volume on DWI ($P < 0.05$). Two doctors had good agreements on evaluating the morphology of high-signal rings ($\kappa > 0.75$, $P < 0.05$).

Conclusions: Combined with pre-operative T2WI and post-operative DWI, non-enhanced contrast MRI can effectively evaluate ablation rate for most patients with uterine fibroids.

扩散加权成像对 I 型与 II 型子宫内膜癌的鉴别诊断价值

王成艳,孙美玉,吴雅楠,刘爱连
大连医科大学附属第一医院

目的
探讨扩散加权成像对 I 型与 II 型子宫内膜癌的鉴别诊断价值。
材料与方法
搜集 2017 年 1 月至 2019 年 6 月大连医科大学附属第一医院行 DWI 检查并经手术病理证实的 I 型（15 例）与 II 型（15 例）子宫内膜癌患者 30 例。图 1 和图 2 显示 I 型子宫内膜癌组和 II 型子宫内膜癌组病灶情况。在 ADC 图上测量表观扩散系数（ADC）值。采用两独立样本 t 检验比较 I 型子宫内膜癌组和 II 型子宫内膜癌组 ADC 值的差异。
结果
I 型子宫内膜癌组 ADC 值高于 II 型子宫内膜癌组，两组间差异有统计学意义（$p<0.05$），如表 1 所示。ADC 值鉴别 I 型与 II 型子宫内膜癌的 ROC 曲线下面积为 0.778，如图 3 所示。
结论
DWI 可作为评价子宫内膜癌组织学分型的重要检查方法，ADC 值有助于鉴别 I 型与 II 型子宫内膜癌。

卵巢透明细胞癌的 CT 影像特征

赵明丽,董越,于涛,罗娅红
辽宁省肿瘤医院

【摘要】 目的 探讨卵巢透明细胞癌的 CT 影像特征。材料与方法 由两名有经验的放射医师回顾经手术病理证实的 11 例（37-66 岁，平均 52.3 岁）卵巢透明细胞癌的影像资料。总结影像特征：位置、大小、边缘，囊实性、囊性部分 CT 值、实性部分 CT 值和强化程度，腹水、腹膜转移和淋巴结转移情况。结果 10 例为单侧发生，双侧 1 例。9 例表现为囊实混合性肿物；2 例为实性肿物。最长径 10.5～22.5cm，平均值 16.1cm。囊实混合性囊性部分 CT 值 11-55HU，平均值 18.2HU，肿块内均可见不规则乳头状结节或团块样实性成分，实性部分 CT 值 34-49HU；增强动脉期 CT 值约 46-57HU，静脉期 CT 值 56-66HU。2 例为实性肿物 CT 值 39 和 46HU。5 例伴有腹水，3 例腹膜不规则絮状或结节状增厚，未见淋巴结肿大。结论 卵巢透明细胞癌的 CT 表现为:巨大囊实混合性或实性肿物，多为单发，肿物内含有较高密度液性成分，乳头状突起和分隔结构，轻中度强化。

Histogram analysis in prostate cancer: a comparison of diffusion kurtosis imaging versus monexponential model

Yuwei Jiang,Ying Liu,Lu Yu,Yadong Cui,Chunmei Li,Min Chen
Beijing Hospital， National Center of Gerontology

Purpose

To verify the utility of diffusion kurtosis imaging (DKI) histogram analysis indetection and assessment of aggressiveness of prostate cancer, compared with histogram analysis of monexponential model (MEM).

Methods

Twenty-three patients were enrolled in this study. The scan protocol included single-shot echo-planar imaging DW sequence (diffusion direction number = 3; b values = 0, 20, 50, 100, 200, 500, 1000, 1500, 2000 s/mm^2); transverseT1W turbo spin-echo sequence; transverse, coronal, and sagittal T2W turbo spin-echo sequence. For DKI, the D_{app} and K_{app} is obtained using all b values. For MEM, the ADC is obtained using two b values (b = 50, 1500 s/mm^2). The pathologies were confirmed by subsequent in-bore MR-guided biopsy, totally including 16 prostate cancer (5 in peripheral zone, 11 in transition zone) and 17 noncancerous foci (2 in peripheral zone, 15 in transition zone). ROIs were drawn manually right in the position where biopsy needle was put, and images of b0 were used as a reference. The values of mean ADC, mean D_{app}, mean K_{app} and their histogram parameters in cancer and noncancerous foci were compared using independent-samples T test. Receiver operating characteristics (ROC) curves and binary logistics regression model were used to test the diagnostic efficiency of DKI and MEM. The Spearman test was used to evaluate the correlation of these parameters and Gleason scores of prostate cancer.

Results

The mean,10th, 25th, 50th, 75th, 90th percentiles of ADC and D_{app} were significantly lower in prostate cancer than noncancerous foci (p < 0.001). The mean, 50th, 75th, 90th percentiles of K_{app} were significantly higher in prostate cancer than noncancerous foci (p < 0.05). The ADC_{10th} decreased (ρ = -0.583, p = 0.018) with the Gleason scores increasing. The K_{90th} increased (ρ = 0.642, p = 0.007) with the Gleason scores increasing. There is no significant difference between the AUCs of ADC and DKI histogram analysis (0.971 vs 0.963, p > 0.05).

Conclusion

Histogram analysis of DKI is feasible for detection and assessment of aggressiveness of prostate cancer, but it has no significant advantage over MEM.

EPO-1114

卵巢甲状腺肿的 CT 影像学特点分析

李文富[2],江林[2],张体江[1]
1.遵义医科大学附属医院
2.遵义市第一人民医院

目的 分析卵巢甲状腺肿的 CT 影像学特点，提高对本病的认识。**方法** 回顾性对 5 例经手术病理证实的卵巢甲状腺肿 CT 资料进行分析。**结果** 5 例卵巢甲状腺肿均为单侧附件囊实性肿块，边界清楚，椭圆形或分叶状，直径 4.5cm-24.5cm。3 例囊性为主，2 例实性为主，实性部分密度较高，囊间密度多变，CT 值 20-87HU，4 例见高密度囊腔。增强扫描实性部分明显强化。5 例病灶内均见点条状、蛋壳样钙化。**结论** 单发、边界清楚的囊实性肿块，囊间密度多变，高密度囊腔，实性部分、囊壁及分隔内点条状、弧形钙化，增强扫描实性部分显著强化是卵巢甲状腺肿的 CT 特征性表现。

MSCTA 评价右侧正常及肾癌状态下肾静脉及肿瘤肾外引流静脉的研究

田冰,乔英
山西医科大学第一医院

目的：从临床手术需求角度出发，利用 MSCTA 观察正常肾脏及透明细胞癌状态下右肾静脉的形态，对其进行分类，并总结肿瘤肾外引流静脉的特点。
方法：对行腹部平扫及增强扫描的 100 例无肾脏疾病患者及 61 例右肾透明细胞癌患者的原始数据进行后处理，利用 MPR、MIP 观察右肾静脉支数、位置及肿瘤肾外引流静脉。
结果：1.在 100 例正常组中，单支右肾静脉 71 例，其中右肾静脉延迟汇合 23 例；多支右肾静脉 29 例，其中，2 支右肾静脉 26 例,3 支右肾静脉 3 例。
在 61 例肿瘤组中，单支右肾静脉 47 例,其中右肾静脉延迟汇合 17 例；多支右肾静脉 14 例，其中，2 支右肾静脉 13 例，3 支右肾静脉 1 例。
2. 在正常组 132 支右肾静脉中，113 支汇入下腔静脉侧壁（85.6%），19 支汇入后壁（14.4%），其中在汇入后壁者，单支肾静脉占 17.6%（3/17），多支肾静脉占 82.4%（14/17）。
在肿瘤组 76 支右肾静脉中，59 支汇入下腔静脉侧壁（77.6%），16 支汇入后壁（21.1%），1 支汇入前壁（1.3%），其中在汇入后壁者，单支肾静脉占 40%（6/15），多支肾静脉占(60%)（9/15）。
3.61 例肿瘤组中，18 例肿瘤存在肾外引流静脉，其中 13 支引流入右侧生殖静脉，5 支直接汇入下腔静脉，4 支引流入右侧肾上腺静脉。
肿瘤组中，肿瘤突破包膜与未突破包膜者相比，肾外引流静脉的差异有统计学意义（x^2=36.334，P＜0.001），肿瘤体积大于 4cm 与小于 4cm 者相比，肾外引流静脉的差异有统计学意义（x^2=8.319，P=0.004＜0.05）。
结论： 虽然，右肾静脉汇入下腔静脉后壁、多支肾静脉以及肿瘤肾外引流静脉不常见，但在腹腔镜手术中不容忽视，通过 MSCT 血管造影及其后处理技术，能够多方位、多角度的显示肾静脉解剖位置、走行、变异以及肿瘤肾外引流静脉，从而在术前为外科医生提供详尽、有用、全面的影像资料。

Diagnostic value of multislice spiral computed tomography (CT) combined with CT angiography for intra-abdominal undescended testis secondary seminomas

Jianhua Wang
Department of Radiology, The Affiliated Hospital of Medical school, Ningbo University, Zhejiang 315020, China

Abstract Objective: To discuss the diagnostic value of multislice spiral tomography (CT) combined with CT angiography (CTA) technology in intra-abdominal undescended testis secondary seminoma cases. Methods: We retrospectively analyzed the CT and CTA imaging features of CT and CTA findings of nine patients with an intra-abdominal undescended testis secondary seminoma. Results: The tumors in all nine patients were mainly solid, and the average CT value was 38.4±3.4 HU. Low-density areas of various

sizes were visible in the tumors, and calcifications were detected in two patients. The tumors in eight patients had a complete capsule, which pressed on the surrounding structures. In one patient, the tumor had an incomplete capsule, which invaded the surrounding structures. Some of the solid tumors showed progressive and slight enhancement on the CT-enhanced scans. The values in the arterial phase, venous phase, and delayed phase were 46.3±5.1 (40–55 HU), 57.3±7.3HU (48–68 HU), and 65.1±7.2HU (56–77 HU), respectively, with an average increase rate of 27.0±7.2 HU. No enhancement was found in low-density areas on the CTA scans, and the supply arteries of the tumors in the nine patients all originated from the abdominal aortic wall 2–3cm below the renal ostia. These arteries became thickened and tortuous when near the tumors, and there were no branching vessels. In eight patients, the supply arteries of the tumors originated from the posterior tumor and ended inside the tumor, and they originated from anterior of the tumor in one patient. Testicular venous drainage was detected in three patients, and lymph node metastasis in the abdominal aorta detected in two cases. Conclusion: An intra-abdominal undescended testis secondary seminoma exhibits a characteristic appearance on CT. CTA shows a three-dimensional testicular vascular pedicle sign of a seminoma. A combination of CT and CTA can improve the diagnostic accuracy of an intra-abdominal undescended testis secondary seminoma.

肾上腺原发性皮质腺癌的 CT 与 MRI 表现及其病理基础

汪建华
宁波大学医学院附属医院

目的：总结肾上腺原发性皮质腺癌（PACC）的 CT 与 MR 表现及其病理基础，并比较 CT 与 MR 在显示 PACC 征象中的价值。**材料与方法：**回顾性分析经病理证实的 PACC 病例 28 例，均行 CT 检查，15 例同时行 MRI 检查。观测项目包括察肿瘤部位、大小、形态、边界、包膜、内部密度与信号及强化方式等。通过与病理对照，总结 PACC 的影像特征，并比较 CT 与 MRI 显示上述征象的能力。**结果：**本组 28 例 PACC 共发现 29 个原发病灶，1 例双侧发病，左侧 15 例，右侧 12 例。肿瘤直径 *7.2±3.1 cm*。16 个病灶呈类圆形，13 个病灶呈分叶状或哑铃状。21 个病灶边界清楚，8 个病灶局部与周围结构分界不清。MRI 上呈 T1WI 稍低，T2WI 稍高信号，囊变坏死区呈 T1WI 信号更低，T2WI 信号更高。13 例病灶内可见短 T1 出血信号。反相位上 4 例肿瘤局部有信号下降。CT、MRI 三期增强示肿瘤实性部分均呈渐进性强化，病灶中央瘢痕及出血坏死区无明显强化，包膜呈渐进性强化。CT 与 MRI 比较，CT 与 MR 在肿瘤的发生部位、大小形态、强化方式以及与周围结构关系等的显示能力相似。CT 显示钙化优于 MRI（χ^2=10.00，P<0.01）。而 MRI 对出血、瘢痕、脂质成分及肿瘤包膜的显示能力均高于 CT（χ^2=11.73,8.10,8.00,9.88，P 均<0.01）。**结论：**原发性肾上腺皮质腺癌有一定的影像学特征，CT 和 MRI 在诊断本病时各有优势，联合检查有助于全面反映肿瘤的病理特征，最终确诊仍需病理学检查。

小剂量呋塞米及对比剂分次团注法 CTUA 在肾脏、尿路和血管一站式成像技术的临床应用研究

杨艳,彭明群

云南省第三人民医院

目的：探讨联合应用小剂量呋塞米及对比剂分次团注法，在肾脏、尿路和血管的一站式成像技术中的临床应用价值
方法：选择我院 2018 年 1 月至 2019 年 6 月 41 例有泌尿系疾病需要行 CT 尿路成像（CT urography，CTU）检查的成年患者，排除 CT 检查及碘造影禁忌症者。采用检查前静脉注射小剂量呋塞米（0.1mg/Kg 体质量，最大剂量 10mg），进行平扫后推注 40%总量造影剂（350 mg I/mL 碘海醇 1.2mL/Kg 体质量），15-30min 后再次进行检查；推注 60%总量造影剂约 25s 后进行皮质期（动脉期）扫描，90s 后进行实质期扫描，5min 后进行分泌期扫描；用第二次扫描皮质期数据完成肾脏、尿路和血管(CT urography and angiography，CTUA)同步成像，第二次扫描分泌期数据完成肾脏、尿路 CTU 成像进行对比。由 2 名主治医师采用双盲发独立阅片，分别对肾实质、肾动脉及周围血管、肾盂输尿管膀胱 CT 值、输尿管连续性及盂旁硬化性伪影等方面图像质量进行评价，通过统计学分析，判断联合 CTUA 的可行性及效果。
结果：CTUA 对肾脏实质、肾脏血管、肾盂输尿管膀胱显示良好，显示率分别为：0.88、0.94 、1，常规 CTU 相应显示率分别为：0、0、0.92；与常规 CTU 对比，在显示区分肾脏皮髓质及肾脏血管方面，CTUA 与 CTU 差异明显，CTUA 明显优于常规 CTU；在显示肾盂输尿管膀胱方面两者无明显差异，均显示良好。而 CTUA 对盂旁硬化性伪影及输尿管连续性显示率分别约 0.29、0.91，常规 CTU 相应显示率分别为：0.43、0.90；与常规 CTU 对比，在盂旁硬化性伪影 CTUA 与 CTU 差异明显，CTUA 优于常规 CTU；在显示输尿管连续性方面两者无明显差异，均显示良好。
结论：CTUA 技术优于常规 CTU 检查，常规剂量对比剂采用分 2 次团注 1 次扫描方法能同时显示肾脏、尿路及血管等信息。

单房囊性小肾癌 MSCT 表现及误诊分析

马英杰
四平市中心医院

目的：探讨单房囊性小肾癌 MSCT 表现及误诊原因分析。方法:对 11 例单房囊性小肾癌 MSCT 平扫及增强检查后的影像学结果与手术病理结果进行回顾性分析。结果:MSCT 平扫及增强检查虽然能够完全显示单房囊性小肾癌病变， 但由于病变直径小（<3cm），影像缺乏特异性，加之定性较难 ，所以很容易误诊。

EPO-1120

多排螺旋 CT 尿路成像（CTU）在膀胱癌术前分期和评估的应用价值

孟燕
锦州医学院附属第一医院

目的：探讨 CTU 在膀胱癌术前 TN 分期和评估的应用价值，为临床诊断及治疗提供依据。
方法:收集 2017 年 1 月至 2019 年 3 月在我院经膀胱镜及病理证实诊断为膀胱癌 56 例患者资料，通过术前 CTU 影像判断 TN 分期；并将影像分期结果及评估结果与患者手术后病理结果对照分析。
结果：CT 尿路造影术前对肿瘤 T 分期对照术后病理符合率分别为 88.89％、72.73％、82.35％、86.67％ ，CTU 诊断膀胱癌与病理结果两者一致性较好。

结论：多排螺旋 CTU 可准确的对膀胱癌患者术前分期和评估，透过影像资料，可以真实反映出病情，准确判断疾病的发生和进展情况，是临床诊断及治疗疾病的良好选择。

EPO-1121

Performance of Triphase Contrast-enhanced CT for the Differentiation of Papillary Renal Cell Carcinoma (RCC) From Clear Cell and Chromophobe RCC Subtypes and Oncocytoma

Shuang Liu
The Second Hospital of Tianjin Medical University

Objective The purpose of our study was to investigate the performance of triphase contrast-enhanced CT for the differentiation of papillary RCC from clear cell and chromophobe RCC subtypes and oncocytoma.
Materials and methods We derived a cohort of 10 papillary RCCs(7 men, 3 women; mean age: 60±10), 68 clear cell RCCs(50 men, 18 women; mean age: 61±12), 7 chromophobe RCCs(3 men, 4women; mean age: 63±7) and 5 oncocytoma(4 men, 1 women; mean age: 60±10) with a preoperative triphasic dynamic contrast-enhanced CT study with up to three phases (i.e., cortical, medullary, excretory) and unenhanced CT from 2017 September to 2019 July. All patients were divided into four groups:1)the papillary RCCs group, 2)the clear cell RCCs group, 3)the chromophobe RCCs group, 4)the oncocytoma group. Quantitative tumor cortical enhancement, medullary enhancement, and excretory enhancement were calculated. These groups were evaluated for triphasic enhancement and were compared using Mann-Whitney tests. ROC curves were constructed to evaluate the performance of triphasic enhancement in differentiating papillary RCCs from the other three groups.
Results The cortical enhancement of papillary RCC show significantly lower than clear cell RCC (P<0.0001) and oncocytoma (P=0.0047),and the medullary enhancement of papillary RCC show significantly lower than clear cell RCC (P=0.0013) and oncocytoma (P=0.0047). The papillary RCC showed significantly lower excretory enhancement compared with clear cell RCC (P=0.0027). Comparison of triphasic enhancement between papillary RCC and chromophobe RCC did not show significantly differences. And the excretory enhancement of papillary RCC show no significantly differences when compared with oncocytoma. The cortical enhancement differentiated papillary RCC from clear cell and chromophobe RCC subtypes and oncocytoma with an AUC of 0.922,and with an sensitivity of 90%,and specificity of 86.25%. The medullary and excretory enhancement differentiated papillary RCC from clear cell and chromophobe RCC subtypes and oncocytoma with an AUC of 0.814 (medullary) and 0.783(excretory), respectively. Comparison of receiver operating characteristic curve analyses showed significant differences between cortical enhancement and excretory enhancement.

Conclusion Triphasic contrast-enhanced CT can assist in differentiating papillary RCC from clear cell and chromophobe RCC subtypes and oncocytoma, and the cortical enhancement showed the best performance.

EPO-1122
基于增强 CT 的肾上腺肿瘤分类及高血压预测模型

钟小丽
武汉大学中南医院

目的 高血压是临床常见疾病之一。目前，临床上对于高血压的病因仍没有有效的依据，肾上腺作为人体内十分重要的内分泌器官，不仅参与了机体代谢作用，还与人体的血压升高、兴奋性增强相联系。本文主要是研究高血压与肾上腺增生、肿瘤的关联程度，建立一种高血压的预测模型，从而为高血压的诊断提供更多的依据。**方法** 选取健康对照组 50 例，经病理证实的肾上腺增生及肿瘤患者 102 例，结节状增生 17 例，皮质腺瘤 57 例，嗜铬细胞瘤 10 例，神经鞘瘤 4 例，其他肿瘤 14 例。对两组被试行薄层 CT 平扫及增强扫描，利用计算机半自动分割算法，对正常及病变的肾上腺进行分割，后用灰度共生矩阵的纹理特征提取方法，分别提取得到能量、对比度、相关性及熵等 22 个特征，利用支持向量机进行分类并输出结果，同时将被试的这 22 个特征与血清学及病理学结果进行相关性分析，从而建立预测模型；**结果** 本文利用计算机辅助诊断算法能够有效地对肾上腺增生及肿瘤做出分类，分类结果与病理结果一致性高达 80%，并提出一种基于肾上腺病变的高血压预测模型。**结论** 高血压肾上腺病变患者的疾病较为隐匿，对患者的身体健康危害较大。在高血压患者接受血清学检验之前，结合影像学检查，可提高高血压肾上腺病变的检出率，降低漏诊率。而且，早期对高血压肾上腺病变进行诊断，并给予患者相应的对症治疗对逆转患者的心血管损害以及预防并发症意义重大。

单源能谱 CT 诊断体内泌尿系结石成分分析

凌佳龙
重庆三峡中心医院

目的：探讨单源能谱 CT 诊断分析体内泌尿系结石成分的价值。**方法：**选取 2017 年 12 月~2019 年 6 月我院收治的 88 例行单源能谱 CT 的结石患者，将其结石成分分析结果与术后红外光谱结石成分分析结果进行对比，探讨单源能谱 CT 诊断分析体内泌尿系结石成分分析中的应用价值。**结果：**以红外光谱结果为参照，单源能谱 CT 分析 93 枚结石，含尿酸盐结石 18 枚，非尿酸盐结石 75 枚，单源能谱 CT 显示的特异度、灵敏度、准确度、阴性预测值、阳性预测值分别为 98.63%（72/73）、90%（18/20）、96.77%（90/93）、97.29%（72/74）、94.74%（18/19）。**结论：**单源能谱 CT 可以准确的区分体内泌尿系结石成分，为临床治疗提供重要的参考依据。

EPO-1124
卵巢卵泡膜纤维瘤的 CT 表现

邢春华,王丽萍
南京市第一医院

目的：卵巢卵泡膜纤维瘤是一种起源于卵巢性索-间质细胞的少见肿瘤，约占所有卵巢肿瘤的 1.0%～4.0%，多数为良性，通常发生于绝经前后女性。临床症状多样，肿瘤大小、形态、内部成分差异较大，术前常不能正确诊断，尤其当肿瘤体积较大、伴有胸腹腔积液且 CA125 水平升高时，可能会被误诊为恶性肿瘤[5]，影响临床治疗方案的制定。本研究试图寻找此类肿瘤的特异性影像学表现，利于临床术前评估。现收集我院 18 例经手术病理证实为卵泡膜纤维瘤的完整资料，对其临床、CT 特征及病理表现进行回顾性分析，以期提高对该病的认识和影像诊断能力。结果：18 例患者共计 18 个病灶，均为单侧，10 例位于左侧，8 例位于右侧。肿瘤最大径范围从 1.5～18cm，平均 8.7cm。13 例腹腔见积液，其中 4 例同时合并有胸腔积液。18 个病灶多数呈类圆形或椭圆形，1 例伴有浅分叶，4 例形态不规则，边界或大部分边界清晰和光整。肿瘤呈较均匀实性密度 7 例；囊实性密度 11 例。增强后囊性部分三期均未出现强化；实性肿块或囊实性肿块实性部分增强后动脉期强化不明显，静脉期及延迟期呈持续或渐近性轻度强化，增强后延迟期与平扫比较实性部分 CT 值增加幅度为 2～18HU，未超过 20HU。结论：卵泡膜纤维瘤好发于绝经前后妇女，具备如下 CT 征象：主要表现为单侧卵巢良性肿块，肿瘤边界较清晰，大部分可出现粘液样变、囊变和出血，时有钙化，导致肿瘤密度不均，瘤体实性部分呈等密度，增强扫描以渐进式强化为主，动脉期强化不明显，且常合并恶性肿瘤可见的腹水；部分肿瘤由于雌激素作用的存在，出现子宫内膜增厚，绝经后阴道出血等，综合以上征象可进一步提高对该病的认识，有助于卵泡膜纤维瘤的诊断。

CT 纹理分析对卵巢囊实性占位的鉴别价值

张懿,丁建平
杭州师范大学附属医院

目的：探讨 CT 纹理分析对鉴别卵巢囊实性占位良恶性的价值。 **方法**：回顾性分析经病理证实的 45 例卵巢囊实性占位的术前 CT 和临床资料，其中 20 例为原发恶性肿瘤，25 例为良性肿瘤及非肿瘤病变。采用 MITK-Work 软件于轴位 CT 平扫图像上提取病灶的 CT 纹理参数，包括平均数、标准差、RMS、均匀性、能量和熵。卵巢良恶性囊实性病灶间纹理参数比较采用独立样本 t 检验或 Mann-Whitney U 检验，并对有统计学意义的参数进行受试者操作特征（ROC）曲线分析，评价其鉴别诊断卵巢囊实性良恶性病灶的效能。 **结果**：恶性组的平均值、均匀性均高于良性组（P 均＜0.01），RMS 低于良性组（P＜0.01），均具有统计学差异；2 组间标准差、能量、熵的差异无统计学意义（P＞0.05）。ROC 曲线结果显示，平均值、RMS 和均匀性诊断卵巢囊实性良恶性的 AUC 值分别为 0.80、0.76 和 0.81（P 均＜0.05），敏感度分别为 72%、88%和 76%，特异度分别为 85%、60%和 85%。其中均匀性的诊断效能最高。多参数联合分析对鉴别诊断的诊断效能均较高（AUC 均＞0.800），各组合间 AUC 的差异均无统计学意义（P 均＞0.05）。 **结论**：CT 纹理分析的部分参数（平均值、均匀性、RMS）对鉴别诊断良恶性卵巢囊实性占位具有一定的价值。

EPO-1126

Quantitative evaluation of the pathological features of cervical cancer using T2 mapping

Shujian Li,Liu Jie,Cheng Jingliang
the First Affiliated Hospital of Zhengzhou University

Purpose: To investigate the feasibility of evaluating the pathological type, tumor grade, and lymphovascular space invasion (LVSI) of cervical cancer (CC) using quantitative T_2 mapping.
Materials and Methods: 57 patients with pathologically proven cervical cancer underwent conventional MRI, diffusion-weighted imaging (DWI), and a prototype radial-TSE sequence before therapy on a 3T system (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany). The T_2 maps were generated inline from the radial-TSE images. Differences in T_2 and apparent diffusion coefficient (ADC) values were assessed between tumor (n = 57) and normal tissue (myometrium) (n = 42), squamous cell carcinomas (SCC, n = 46) and adenocarcinomas (n = 11), well/moderately differentiated tumor (n = 39) and poorly differentiated tumor (n = 18), and LVSI-positive (n = 38) and LVSI-negative (n = 19) CC. The diagnostic performances were calculated using receiver operating characteristic (ROC) curve analyses. A $P<0.05$ was considered statistically significant.
Results: There were significant differences between T_2 and ADC values for cervical cancer and normal tissue (all $P < 0.05$). No significant differences were seen in the T_2 and ADC values of SCC and adenocarcinomas (all $P > 0.05$). Compared to the well/moderately differentiated tumor, poorly differentiated tumor showed decreased T_2 and ADC values ($P = 0.020$ and $P = 0.004$, respectively). The T_2 values were significantly lower in LVSI-positive CC than in LVSI-negative CC ($P = 0.002$), while the ADC values were not found to have a significant difference ($P = 0.675$). The areas under the ROC curves of T_2 and ADC values for distinguishing tumor grade were 0.709 and 0.747, respectively. The ROC curve analysis yielded a cut-off T_2 value of 89.6ms in the differentiation of LVSI-positive and LVSI-negative CC, with a sensitivity of 83.3%, specificity of 80.0%, and area under the curve of 0.856.
Conclusion: This pilot study demonstrates that quantitative T_2 mapping effectively differentiates between grades of CC. Moreover, quantitative T_2 values showed better discriminative values than ADC for determining the presence of LVSI.

EPO-1127

T2 mapping for evaluation of concurrent chemoradiotherapy response in patients with advanced cervical cancer: a pilot study

Shujian Li,Liu Jie,Cheng Jingliang
the First Affiliated Hospital of Zhengzhou University

Purpose: To investigate the role of T_2 mapping in the assessment of treatment response of advanced cervical cancers to concurrent chemoradiotherapy (CCRT).
Materials and Methods: 27 patients diagnosed with advanced cervical cancer by pathological or clinical study underwent conventional MRI and quantitative T_2 mapping on a 3T system (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany) before CCRT (pre), in the beginning of the 4th week of CCRT (mid), and immediately after CCRT completion (post). Patients were classified into complete response (CR) (n = 10) or partial response (PR) groups (n = 17) according to RECIST (Response Evaluation

Criteria in Solid Tumors) after CCRT. The T_2 parametric maps were acquired using a Turbo Spin Echo-based prototype sequence with radial k-space trajectory (Siemens Healthcare, Erlangen, Germany). The T_2 values (T_2-pre, T_2-mid and T_2-post) and percentage of T_2 change (ΔT_2-mid and ΔT_2-post) were obtained at each timepoint. The Mann-Whitney U test was used to compare differences of T_2 values and percentage T_2 change between response group and non-response group. Diagnostic performances were calculated using receiver operating characteristic curve (ROC) analysis. A P value of <0.05 was considered to indicate a statistically significant difference.

Results: Both the T_2-mid and T_2-post values of the CR group were lower than those of the PR group ($P = 0.010$ and $P = 0.036$, respectively). The CR group showed greater ΔT_2-mid and ΔT_2-post values ($P = 0.004$ and $P = 0.033$, respectively). No significant difference was found in the T2-pre between the two groups ($P = 0.588$). ROC analysis gave area under the curve values of 0.574, 0.812, 0.747, 0.835 and 0.706 for T_2-pre, T_2-mid, T_2-post, ΔT_2-mid, and ΔT_2-post, respectively, for predicting complete response of advanced cervical cancer to CCRT. The optimum threshold for T_2-mid and ΔT_2-mid was 81.3 ms and 7.7%, resulting in a sensitivity of 82.4% and 90.0%, and a specificity of 80% and 70.6%, respectively.

Conclusion: It is feasible to use quantitative T_2 values and percentage T_2 change during CCRT to monitor treatment response in patients with advanced cervical cancer.

Clinical Relevance: In patients with advanced cervical cancer treated with CCRT, the T_2 value and percentage T_2 change may be used to monitor treatment response and enable individualized treatment planning.

DCE-MRI 及 DWI 对卵巢癌的分期及 Ki67 表达的相关性研究

陈凯
上海市浦东新区公利医院

目的：通过研究 DCE-MRI 的 TIC 曲线及肿瘤实性部分 DWI 的 ADC 值与卵巢肿瘤的临床分期及 Ki67 的表达相关性，为卵巢癌的临床术前精准化疗及术后预后提供精准评估。

方法：回顾性分析我院经手术病理证实卵巢癌患者 28 例，所有患者均行 DCE-MRI 及 DWI 的检查，并绘制肿瘤的 TIC 曲线及测量肿瘤实性部分的 ADC 值；术后均行免疫组化检查，取得 Ki67 的值。以肿瘤分期分组，对组间的 TIC 曲线类型及 ADC 值、Ki67 进行统计学分析，得出 TIC 曲线、ADC 值与临床分期的相关性；以 40%为界，将 Ki67 分为高表达组（≥40）和低表达组（＜40%），统计两组间 TIC 曲线及 ADC 值相关性。

结果： Ⅰ期，9 例，ADC 值 1.33+0.37；Ⅱ期 3 例，ADC 值 1.14±0.12；Ⅲ期 13 例，ADC 值 0.87±0.25； Ⅳ期 2 例，ADC 值 1.2。其中Ⅰ期 TIC 曲线Ⅰ型 1 例，Ⅱ型 2 例，Ⅲ型 6 例；Ⅱ期 TIC 曲线Ⅰ型 1 例，Ⅱ型 1 例，Ⅲ型 1 例；Ⅲ期 TIC 曲线Ⅰ型 0 例，Ⅱ型 1 例，Ⅲ型 12 例；Ⅳ期 TIC 曲线Ⅲ型 3 例；通过 Spearman 等级相关分析发现： ADC 值和卵巢肿瘤的临床分期不具有相关性；TIC 曲线分型和卵巢肿瘤分期有相关性，且为正相关。将 Ki67 分为高表达组和低表达组，其中高表达组 12 例，ADC 值 0.92±0.32，TIC 曲线Ⅰ型 0 例，Ⅱ型 2 例，Ⅲ型 10 例；低表达组 14 例，ADC 值 1.16±0.45，TIC 曲线Ⅰ型 2 例，Ⅱ型 5 例，Ⅲ型 7 例；通过不同 Ki67 组间 ADC 值和 TIC 曲线比较分析发现，组间 ADC 值比较差异无统计学意义，且组间 TIC 曲线比较差异亦无统计学意义。

结论 DCE-MRI 的 TIC 曲线在卵巢肿瘤的分期中有正相关性，DWI 的 ADC 值测定和卵巢癌的分期没有相关性；在 K67 高表达组和低表达组中，TIC 曲线和 ADC 值均没有发现相关性。

EPO-1129

女性继发性附件扭转的 CT 征象分析

张惠峰
江苏省中医院

目的 探讨女性继发性附件扭转的 CT 征象以提高诊断正确率。 **方法** 回顾性分析 34 例女性附件病变伴扭转患者的临床和 CT 影像资料，对附件原发病变和扭转蒂的 CT 表现（位置、大小、形态、子宫移位、盆腔积液等）进行观察和分析，对附件扭转患者的临床表现、CT 征象和手术病理结果进行对照分析。 **结果** 34 例女性继发性附件扭转，均单侧发病，平均年龄 38.8±20.6 岁。下腹部急、慢性疼痛 30 例（88.2%，30/34）、盆腔包块 4 例（11.8%，4/34），并伴恶心呕吐 7 例（20.6%，7/34）、发热 5 例（14.7%，5/34）和血白细胞升高 11 例（32.4%，11/34）。原发病变多为良性肿瘤和肿瘤样病变（91.2%，31/34），手术前 CT 对原发病变的正确诊断率达 73.5%（25/34），对附件扭转正确诊断率为 11.8% （4/34），漏诊率为 88.2%（30/34）。原发病灶伴附件扭转的 CT 征象为双瘤征（50.0%，17/34）、新月征（70.6%，24/34）、绳索征（14.7%，5/34）、漩涡征（11.8%，4/34）。 **结论** CT 对附件原发病变诊断准确率较高，但对继发性附件扭转的正确诊断率低。对下腹部急、慢性疼痛的女性患者，出现双瘤征、新月征为继发性附件扭转的常见影像表现，而漩涡征、绳索征为其特征影像征象，但出现率低，认识这些 CT 征象有益于提高附件扭转正确诊断率。

磁共振定量动态增强参数直方图在术前评估子宫内膜癌肿瘤分化程度中的价值

蒋璟璇,孙茜楠,吴献华
南通大学附属医院

目的：评估磁共振定量动态增强成像（dynamic contrast enhanced magnetic resonance imaging，DCE-MRI）的参数直方图对术前子宫内膜癌肿瘤分化程度的评估价值。
方法：收集 2016 年 1 月至 2019 年 2 月于南通大学附属医院术前行 DCE-MRI 检查子宫内膜癌患者 76 例,图像清晰且术后具有明确病理分级和 Ki-67 表达结果患者 70 例。根据病理分级和 Ki-67 表达结果，患者分别被分为高/低级别组（42/28 例）和高/低表达组（37/33 例）。通过后处理软件测量容积转移常数（volume transfer coefficient，K^{trans}）、转运速率常数（exchange rate constant，K_{ep}）、血管外细胞外容积分数（extracellular extravascular volume fraction，Ve）的直方图参数，包括均值（mean）、偏度(skewness)、峰度（kurtosis）和第 10、25、50、75 和 90 百分位数。对于不同组间的直方图参数进行独立样本 t 检验分析(正态分布)或 Mann-Whitney U 检验（偏态分布）。采用受试者工作特性(ROC)曲线分析来比较不同参数的诊断效能。
结果： DCE-MRI 直方图参数中共 19 个指标分别在不同的病理分级和 Ki-67 表达子宫内膜癌患者中具有显着差异（P <0.05），其中 K^{trans} 第 50 百分位数在对区分子宫内膜癌不同的病理分级和 Ki-67 表达均具有最高的诊断效能，AUC 为 0.903，灵敏度和特异性分别为 70.6％和 94.6％，AUC 为 0.723，灵敏度和特异性分别为 100％和 42.9％。
结论：DCE-MRI 直方图参数可以有助于评估子宫内膜癌分化程度,其中 K^{trans} 第 50 百分位数是最佳鉴别参数。

EPO-1132
卵巢透明细胞癌的临床、CT 特征与 FIGO 分期的相关性研究

董越
辽宁省肿瘤医院

目的:探讨卵巢透明细胞癌的临床、CT 影像特征，及其与 FIGO 分期的相关性.
材料与方法：51 例手术病理证实的卵巢透明细胞癌纳入研究.收集临床资料和实验室检查（CA125, CA199 和 CA725）。患者均接受全腹 CT 增强检查，由两名放射医师协商分析 CT 影像特征，包括：病灶大小、边缘、肿瘤类型（囊性为主、囊实混合和实性）、实性部分百分比、内部间隔、钙化、腹水、腹膜受累、淋巴结受累,定量测量病灶实性部分平扫和增强的 CT 值。使用卡方检验、t 检验和秩和检验比较早期(FIGO I-II)和晚期患者(FIGO III-IV)的肿瘤标志物、CT 影像特征的差异。
结果：早期透明细胞癌 37 例，进展期 14 例；14 例早期患者存在子宫内膜异位症，仅 1 例晚期患者同时合并子宫内膜异位症，两者有显著统计学差异。66.7%, 31.4% 和 27.5% 的患者存在 CA125, CA199 和 CA72-4 的升高， 早期和晚期患者的 CA125 和 CA72-4 存在显著差异，CA199 无显著差异. 肿瘤表现为单囊或多囊状肿物，边界清晰或者不清晰，病灶大小在 4.3~22.3 cm 之间, 囊性为主型占 54.9%, 囊实混合型占 33.3%，单纯实性型占 11.8%. 早期和晚期患者的肿瘤的类型和实性成分百分比存在显著统计学差异，病灶囊性和实性部分的 CT 值无差异. 10 例病灶存在薄弧样钙化，均是早期病例.
结论: 卵巢的透明细胞癌的 CT 征象有一定的特征，肿瘤标志物、肿物囊实性成分有助于判别术前临床分期的诊断。

EPO-1133
子宫内膜间质肉瘤ＣＴ、ＭＲＩ表现

魏慧慧,宋亭

广州医科大学附属第三医院

目的 分析子宫内膜间质肉瘤（ESS）的 CT、MRI 表现。方法 回顾性分析经术后病理证实为 ESS 的 11 例患者的 CT、MRI 资料。11 例中，5 例接受 CT 检查， 6 例接受 MR 检查，均包括平扫及增强扫描。结果 病理结果为低级别 ESS 9 例，未分化肉瘤 2 例。11 例病灶均为单发，病灶位于宫腔内 7 例、肌壁间 4 例，其中类圆形肿块 8 例、不规则形肿块 3 例，病灶最大径（9.18±1.36）cm，肿块边界清晰 4 例、边界不清 7 例；病灶 CT、MRI 表现以实性为主 4 例、呈囊实性 6 例、以囊性为主 1 例。CT 平扫示 5 例病灶实性部分密度均近似于或低于子宫肌层，其中 4 例病灶密度不均，1 例密度均匀。MRI 平扫示 6 例病灶 ADC 图信号均减低，其中 5 例呈 T1WI 等或低信号、T2WI 高或稍高信号且 DWI 呈明显高信号，另 1 例（以囊性为主）呈 T1WI 稍高信号、T2WI 高信号且 DWI 呈中心高信号。10 例增强扫描表现为渐进性、持续性强化，1 例以囊性为主的病灶未见强化。8 例肿块内可见囊变、坏死，6 例肿瘤浸润、破坏子宫深肌层。11 例中，伴子宫腺肌症 2 例、子宫肌瘤 5 例，合并少量盆腔积液 5 例、宫腔内积血 1 例、输卵管积液 2 例。结论 ESS 的 CT、MRI 表现具有一定特征，可为诊断提供依据。

EPO-1134
容积 CT 灌注对于宫颈鳞癌同步放化疗疗效的预测价值初探

董越
辽宁省肿瘤医院

目的: 评价容积 CT 灌注对于宫颈癌同步放化疗疗效的预测价值。
材料与方法:对 33 例晚期宫颈鳞癌患者进行全子宫容积 CT 灌注扫描.获得病灶的动脉血流量（AF),血容量(BV) 和毛细血管通透性(PS). 感兴趣（ROI）的放置采用两种方法：方法一为大 ROI（在连续三个显示宫颈癌灶最大的横轴位层面测量，尽量包括病灶全部，避开坏死和周边血管，结果取均值，定义为 ROI_{whole}），方法二为小 ROI（分别在肿瘤灌注最高和最低的区域放置小 ROI，三次测量取平均值，定义为 ROI_{HOT}、ROI_{COLD}）. 按照 RECIST 标准，将患者分为不完全应答组（疗效 PD 或 SD 或 PR）和完全应答组（疗效 CR）。对两组患者的一般资料、AF、BV 及 PS 进行 t 检验或 Fisher 精确概率检验，探讨可以预测宫颈鳞癌放化疗疗效的临床指标及 CT 灌注参数。对不同疗效组有统计学差异的 CT 灌注参数进一步采用受试者操作特征（ROC）曲线进行描述，评价其预测宫颈鳞癌放化疗疗效的效能。
结果：在放化疗后达 CR 组 23 例，PR 组 10 例。两组患者年龄、BMI、FIGO 分期、病理分级、治疗前肿瘤最大径及最大面积均无统计学差异（$P>0.05$）；不同疗效患者宫颈鳞癌局灶高灌注区和低灌注区的 AF 值比较均有统计学意义（$P<0.05$），CR 组明显高于 PR 组；而宫颈癌整体的 AF 值无统计学差异，各个 ROI 的 BV、PS 组间无统计学差异（P＞0.05）。宫颈鳞癌局部高、低灌注区的 AF 值均有较高的诊断效能，ROC 曲线下面积分别为 0.822 和 0.865。以 AF=185.8ml/min/100g 为阈值，预测宫颈鳞癌放化疗后达 CR 的敏感度、特异度分别为 82.6%、70.0%。以低灌注区 AF= 98.4 mL/min/100g 为阈值，敏感度、特异度分别为 69.6%和 90.0% 。
结论：宫颈鳞癌容积 CT 灌注参数 AF 值有助于预测宫颈鳞癌放化疗疗效，特别是局灶低灌注区的血供情况更有价值。

EPO-1135
Application of the DCE-MRI combined with MRS in prostate cancer diagnosis

Yakun He
Sichuan Cancer Hospital

Objective： To investigate the application of the dynamic contrast enhanced MRI combined with magnetic resonance spectroscopy in prostate cancer diagnosis. **Method：** In our hospital outpatient department from January 2011 to January 2014 the patients who were diagnosed with prostate disease were choosed in a random sample of prostate cancer patients60, benign prostatic hyperplasia patients60, 60 healthy subjects and turned them out into the prostate cancer group, proliferation and control groups. Used Siemens Avanto1.5 T high field superconducting MRI for DCE-MRI scan and MRS scan, after the MRS scan was finished, we used the workstation spectroscopy tab spectral analysis, and eventually got prostate metabolites choline (Cho), muscle acid (Cr) and citrate (Cit) crest lines and Cho / Cit, (Cho + Cr) / Cit. **Results：** The group of subjects in 21sec, 1 min, 2 min dynamic contrast-enhanced MR carried out a comparison between the test results were statistically significant, checking the existence of significant differences. Three groups of subjects performed a comparison between the results of spectral analysis with statistical significance, check the existence of significant differences. DCE-MRI and MRS combined application of two methods sensitivity of 89.67% and a specificity of 95.78%, accuracy of 94.34%. **Conclusion：** DCE-MRI combined with MRS greatly improves the sensitivity , specificity and accuracy of the diagnosis of prostate cancer， it has a great application value in the diagnosis of prostate cancer.

EPO-1136
CT 值直方图分析技术对肾脏乏脂性血管平滑肌脂肪瘤的诊断价值

李然
陆军军医大学大坪医院

目的：探讨 CT 值直方图分析技术对肾脏乏脂性血管平滑肌脂肪瘤（fp-AML）的诊断价值。
方法：回顾性地收集经病理证实的 20 例肾脏 fp-AML 的临床和影像学资料，所有肿瘤短径小于 4cm，并排除瘤体完全位于肾实质内者，根据 fp-AML 的大小、生长位置、患者年龄、性别等选择相对应的 26 例没有钙化和大面积坏死的透明细胞癌（CCRCC）作为对照组。所有病例均由 2 名副主任医师通过 CT 后处理软件进行分析，先通过容积再现的后处理方式重建出整个肿瘤的体积，将脂肪 CT 值分别定义为 0HU 以下、-5HU 以下、-10HU 以下、-15HU 以下、-20HU 以下、-25HU 以下、-30HU 以下等几个阈值，再通过 CT 值直方图技术得出相应 CT 阈值的脂肪成分所占整个肿瘤体积的比例。通过绘制受试者工作特征曲线（ROC）得出在各个 CT 阈值上肿瘤内脂肪含量诊断肾脏 fp-AML 的敏感性、特异性、AUC 值、P 值和 Youden 指数，从而评价其诊断性能。
结果： fp-AML 和 CCRCC 其内含有的脂肪成分比例在我们定义的所有 CT 阈值上的差异均有统计学意义（P＜0.001），ROC 曲线上 7 个 CT 阈值所对应的 AUC 值为 0.790 — 0.872，最高的 AUC 值所对应的是脂肪阈值＜-15HU，在该组根据 Youden 指数得到最优截断值（optimal cut-off value）为大于 5%，即在定义脂肪组织的 CT 值为＜-15HU 时，如果肿瘤内脂肪成分大于总体积的 5%，fp-AML 与 CCRCC 的鉴别特异性为 75%，敏感性为 92.3%，阳性预测值（PPV）为 82.4%，阴性预测值（NPV）为 79.3%。

结论：根据我们的方法，fp-AML 相对于 CCRCC 在各个脂肪阈值上有更高比例的脂肪含量。选择脂肪阈值＜-15HU，其 AUC 值明显高于以往文献所报道的 AUC 值，该方法在一定程度上作为鉴别肾脏乏脂性血管平滑肌脂肪瘤和肾透明细胞癌的指标之一。

Tumor irregularity on preoperative imaging can predict metastatic disease in papillary renal cell carcinoma

Chenchen Dai[1],Jiaqi Huang[2],Yaohui Li[2],Jun Hou[3],Qinxuan Tan [1],Hang Wang[2],Jianjun Zhou[1]
1.Department of Radiology， Zhongshan Hospital， Fudan University
2.Department of Urology， Zhongshan Hospital， Fudan University
3.Department of Pathology， Zhongshan Hospital， Fudan University

Objective To evaluate the prognostic implications of morphological irregularity in papillary renal cell carcinoma (pRCC).
Materials and methods We retrospectively reviewed the records of 274 patients with pRCC who underwent nephrectomy at our institution. Based CT or MR imaging, irregularity was defined as following: margins were smooth but not round, not smooth, or unclear, and irregularity of whole lesion was calculated. Patient-, treatment-, pathologic-, and radiological-level features were analyzed with progression free survival (PFS). Meanwhile,
Results Of 274 cases, thirty-five (13%) patients progressed. Overall highest accuracy for the detection of metastatic disease in terms of lesion irregularity achieved using a threshold of 50%. On univariable analysis, symptoms, surgical approach, tumor size, perinephric or renal sinus fat invasion, positive lymph node, thrombus, Fuhrman grade, sarcomatoid differentiation and irregularity were significantly associated with PFS (all $P < 0.05$). And no statistic difference existed in type 1, 2 or unclassed ($P > 0.05$) . On multivariable analysis, perinephric or renal sinus fat invasion (HR = 3.046, 95% CI = 1.332- 6.962) and irregularity (HR = 79.796, 95% CI = 13.881-458.701) were independently associated with PFS.

Conclusion Lesion irregularity based on imaging, can be a reliable biomarker in the preoperative prediction of metastatic disease in pRCC.

探讨低 kVp 结合 ASIR-V 技术在肾动脉 CT 血管成像中的可行性研究

姜露,李豆,王琦,关荣,胡智军
长安医院

目的 探讨低 kVp 结合 ASIR-V 在肾动脉 CT 血管成像中降低辐射剂量的可行性研究。**方法** 前瞻性连续收集 40 例进行肾动脉 CT 血管成像的患者，并随机分为 A、B 两组。扫描条件：A 组管电压 100kVp，噪声指数 NI（Noise Index）为 10，自动管电流技术（Smart mA），采用滤波反投影法（FBP）重建，重建层厚为 1.25mm；B 组管电压 80kVp，NI 为 10，Smart mA，迭代重建分别为 0%、20%、40%、60%、80%、100%，间隔 20%，图像后重建层厚为 1.25mm。客观测量双肾动脉及同层面皮下脂肪，记录其 CT 值及 SD 值，计算信噪比（SNR=CT/SD）及对比噪声比(CNR=（CT 肾动脉-CT 脂肪）/SD 脂肪)，采用 5 分法对各组图像质量进行双盲法主观评分（5 分，图像质量最好；1 分，图像质量最差）。对患者一般资料及客观测量结果进行统计学分析，并对各组图像质量进行 5 分法主观评分（5 分，图像质量最好；1 分，图像质量最差）。**结果** 两组间的一般均无统计学差异（p＞0.05）；图像质量主观评分存在明显差异(P＜0.001)，客观测量值均具有统计学差异（p＜0.05）；两组间的辐射剂量分别为（4.14±0.64）mSv、（2.11±0.22）mSv，且 B 组辐射剂量较 A 组减少约 49%；**结论** 在 80kVp 条件下进行肾动脉 CT 血管成像时，随着迭代重建递增，能得到优于 100kVpFP 重建图像质量，且能大幅度降低辐射剂量，故推荐 80kVp 进行肾动脉 CT 血管成像。

睾丸精原细胞瘤和肿瘤样病变的 CT 表现及对照研究

赵锦洪,徐仁根,刘岚
江西省肿瘤医院

目的 研究睾丸精原细胞瘤和肿瘤样病变的 CT 表现，提高对其诊断和鉴别诊断能力。
方法 回顾性分析经手术病理证实的 20 例睾丸精原细胞瘤和肿瘤样病变患者，其中 12 例精原细胞瘤，8 例肿瘤样病变。12 例精原细胞瘤中，2 例行 CT 平扫，10 例行 CT 平扫+动态增强扫描；8 例肿瘤样病变中，1 例行 CT 平扫，7 例行 CT 平扫+动态增强扫描。观察精原细胞瘤和肿瘤样病变病灶的形态、密度和强化表现，并采用 Fisher 检验进行比较。
结果 12 例精原细胞瘤中，7 例病灶呈分叶或结节状，4 例呈混杂密度；8 例肿瘤样病变中，仅有 1 例呈浅分叶状，7 例呈混杂密度。10 例行 CT 动态增强扫描的精原细胞瘤病灶中，4 个可见纤维间隔明显强化，7 例行 CT 动态增强扫描的肿瘤样病变均未见纤维间隔。精原细胞瘤和肿瘤样病变患者以上征象的出现率差异均有统计学意义（P 均<0.05）。
结论 睾丸精原细胞瘤和肿瘤样病变的 CT 表现有一定的特征，对于鉴别诊断有一定的价值。

原发性左肾巨大滑膜肉瘤破裂伴腹腔浸润 1 例

徐书峰
浙江大学医学院附属邵逸夫医院

患者，女性，33 岁，患者左腰部胀痛不适 1 月余，1 天前患者无明显诱因下出现左腰及左肩部疼痛，剧烈难忍，伴恶心、呕吐。
CT 表现：左上腹巨大团块混杂高密度影，与左肾关系密切，脾脏及胃明显受压并与团块分界不清，增强后呈轻度不均匀强化，团块右上方局部包膜连续性中断，向前下延伸至肝胃间隙及中下腹腔。直径约 16cm，密度不均匀，平扫 CT 值约 17~107HU，增强扫描动脉期强化未见明显强化，CT 值约 16~105HU，门脉期呈轻度不均匀强化，CT 值约 26~139HU。
MRI 表现：团块呈混杂信号，以短 T1WI 长 T2WI 信号为主，DWI 高 b 值呈不均匀高信号，增强后呈轻度不均匀持续强化，肝胃间隙及中下腹腔见类似信号影。
手术及病理：入院后行左肾巨大肿瘤切除术，示左侧腹膜后巨大肿块，约 20*15cm 左右，囊实性，肿块表面可见怒张血管，内可见大量陈旧性血块。肿块从左肾上极向腹中线、膈顶等延伸，大网膜包裹，脾脏、胰腺、胃、结肠等受压移位明显并紧密粘连。病理：滑膜肉瘤，伴大片坏死。
讨论：原发于肾脏的滑膜肉瘤非常罕见，由 Faria 等人于 1999 年首次报道。平均发病年龄为 40 岁，男女比例约 1:1。其发病机制可能与染色体易位为 t（X；18）（ p11.2 ；q11.2 ），导致 18q11 的 SYT 基因近端与 Xp11 的 SSX 基因远端融合，形成 SYT-SSX 融合基因相关。临床表现缺乏特异性，以腹痛、血尿及腹部包块为主。CT 表现为囊性或囊实性的软组织肿块，边界清晰，囊壁光整且较厚，病理学上显示为肿瘤包埋扩张的肾小管，邻近肾实质受压可形成假包膜；肿块内可有分隔、钙化及出血。增强后实性部分持续强化，呈“快进慢出”征象。MRI 表现为 T1WI 肿瘤实质部分信号为等或稍高于正常肌肉组织，T2WI 信号混杂，内有出血、坏死、囊变，表现为高、等、低三重信号。

A CT-based Radiomics Approach to Preoperatively Differentiation between Borderline and Malignant Ovarian Cancer

Ling Yuan,Yafei Qi,Chengyu Lin,Yonglan He,Huadan Xue,Zhengyu Jin
Peking Union Medical College Hospital

PURPOSE
The purpose of this study is to develop and validate a radiomics model for the preoperative differentiation between borderline and malignant ovarian cancer.
METHOD AND MATERIALS
62 patients who underwent preoprative CT examinations for suspected ovarian cancer were enrolled into this retrospective study (31 lesions were pathologically proven to be malignant epithelial ovarian cancer and 31 were borderline epithelial ovarian cancer). A Dedicate Radiomics prototype was used to segment lesions on preoperative portal phase axial CT images and extract texture features. Two experienced radiologists(6 and 12 years of experience in abdominal radiology, respectively) double-blinded segmented the entire volume of lesions semi-automatically. Patients were resampled using down-sampling method to keep the unbalancing between pathological types and then randomly split into training and validation subset with a ratio of

8:2.High consistent features (ICC>0.8) were chosen to study the association between radiomics features and pathological type using a random forest model. ROC analysis was performed to validate the capability of the radiomics model on the training and testing cohorts.
RESULTS
The random forest radiomics model achieved favorable prediction efficacy in both the training and testing subset. AUC in the training and testing subset were 0.93 (95%CI, 0.855-0.998) vs. 0.92 (95%CI, 0.797-1) respectively. Prediction sensitivity and specificity in training subset were 0.86 and 0.89 at cut-off value 0.64, which is also validated to be high in the testing subset (sensitivity 0.89, specificity 0.83).
CONCLUSION
The study showed that CT-based radiomics model holds promise in the preoperative differentiation between borderline and malignant ovarian cancer, which may help gynecologists make accurate decision and avoid excessive surgical or medical treatment.

EPO-1143

The diagnostic accuracy of CT cavernosography for venous leakage with erectile dysfunction - A retrospective, diagnostic study of 163 ED patients

Tianhe Ye,Xin Wu,Jun Li,Lingli Li,Lian Yang,Zhaohui Zhu,Jin Wang
Wuhan Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objectives
To assess the diagnostic accuracy of computed tomography (CT) cavernosography for venous leakage evaluation in erectile dysfunction (ED) patients.
Methods
One hundred sixty-three consecutive patients who underwent CT cavernosography were enrolled. All patients were randomized into training set and validation set according to 7:3. One hundred and fourteen patients were in the training set, and 49 patients in the validation set.
The inclusion criteria: 1) preliminarily diagnosed with organic ED; 2) patients did not achieve a rigid erectile response in 10 minutes or did not last for 30 minutes after intracavernosal injection (ICI).
The exclusion criteria: 1) patients with accompanying disease; 2) history of urological surgery; 3) using medications that might effect sexual function within 30 days; 4) contrast agent hypersensitivity or contraindication; 5) failed to achieve a rigid erection during cavernosography according to a modified version of the erection hardness score.
The infusion velocity (IV) and flow-to-maintain velocity (FMV) during cavernosography were recorded. The diagnostic accuracy of IV and FMV were assessed by the area under the receiver-operating characteristic curve (AUC) with clinical diagnosis as references.
Results
In the training set, the AUC value was 0.957 (95% CI 0.902 to 0.986) for IV, and was 0.857 (95% CI 0.780 to 0.916) for FMV. For IV, the maximal Youden index was 0.757, the

associated criterion was > 30 ml/min, the sensitivity and specificity were 97.6% and 78.1% respectively. For FMV, the maximal Youden index was 0.725, the associated criterion was > 6 ml/min, the sensitivity and specificity were 75.6% and 96.9% respectively. When using cut-offs to compare with clinical diagnosis, the κ value was 0.795 for IV and 0.614 for FMV.
Parallel combined test increased the diagnostic agreement, the κ value to 0.816. In validation set, the AUC value was 0.957 (95% CI 0.858 - 0.994) for IV, and 0.743 (95% CI 0.599 - 0.857) for FMV; the κ value was 0.754 for IV, 0.590 for FMV and 0.878 for the parallel combined test.
Conclusions
The accuracy of IV and FMV for diagnosing venous leakage is similar to the clinical diagnosis. Therefore, CT cavernosography may be a suitable examination for patients who want to pursue surgical ligation or embolization of penile veins.

泌尿系横纹肌肉瘤的影像表现分析

付芳芳,陈翠云,谭红娜,王梅云
河南省人民医院

目的：探讨泌尿系横纹肌肉瘤的影像学表现，提高对该肿瘤的认识。
方法：回顾性分析 7 例经病理证实的泌尿系横纹肌肉瘤患者的临床及影像学资料，与手术病理结果进行对照分析，并作文献复习。
结果：7 例泌尿系横纹肌肉瘤患者，男 6 例，女 1 例，发病年龄 16～51 岁，平均 29.5 岁。肿瘤位于肾脏 1 例，前列腺 3 例，睾丸 2 例，膀胱 1 例。6 例（来源于肾脏、前列腺、睾丸）表现为较大软组织肿块，密度/信号不均匀，以实性为主，其内可见不规则坏死区；1 例膀胱横纹肌肉瘤表现为膀胱壁广泛不规则增厚，CT 和 MR 增强后实性部分呈中度-明显强化，肿瘤内不规则坏死区无明显强化。4 例发生肺转移。3 例发生腹膜后淋巴结转移。
结论：泌尿系横纹肌肉瘤较少见，其 CT 和 MR 具有一定的特征性，但诊断较困难，最终确诊需依赖病理。

3.0T MR 多参数成像对卵泡膜纤维瘤与附件区平滑肌瘤的鉴别诊断价值

陈玉兰
中国科学技术大学附属第一医院西区 安徽省肿瘤医院

目的 探讨 3.0T 磁共振（MR）多参数成像对卵泡膜纤维瘤与附件区平滑肌瘤的鉴别诊断价值。
方法 收集经手术病理证实的 15 例卵泡膜纤维瘤和 38 例附件区平滑肌瘤（阔韧带平滑肌瘤 15 例，子宫浆膜下平滑肌瘤 23 例），回顾性分析两者的临床资料、肿瘤大小、腹水、病变侧卵巢情况、MRI 信号、增强特点及肿瘤成分特征，采用单因素对比分析和多因素回归分析寻找能有效鉴别这两种疾病的临床和影像学特征。**结果** 单因素对比分析结果显示两组资料在病变侧卵巢情况、表观扩散系数（ADC）、强化程度及肿瘤成分这 4 个特征的差异具有统计学意义（$p<0.05$）。具体表现为：15 例卵泡膜纤维瘤病变侧卵巢可见 3 例，ADC 值为（1.22±0.14）$\times 10^{-3}$ mm^2/s，12 例呈轻

度强化、2 例呈中度强化、1 例呈明显强化，6 例呈纯实性病变、2 例以实性为主、6 例呈囊实性、1 例以囊性为主；38 例附件区平滑肌瘤病变侧卵巢可见 21 例，ADC 值为（1.37±0.23）×10^{-3} mm^2/s，10 例呈轻度强化、21 例呈中度强化、7 例呈明显强化，21 例呈纯实性病变、15 例以实性为主、1 例呈囊实性、1 例以囊性为主。两组间其他临床资料（包括行经情况、临床症状）、肿瘤大小、腹水、MRI 信号特征（T1 加权成像、T2 加权成像、扩散加权成像）之间的差异没有统计学意义。多因素回归分析结果显示 ADC 值、强化程度这 2 个因素是鉴别卵泡膜纤维瘤与附件区平滑肌瘤的重要预测因子，采用回归模型对 53 例进行预报，其受试者工作特征曲线下面积为 0.908，其灵敏度、特异度及约登指数分别为 93.3%、73.7%和 0.720。**结论** 3.0T MR 多参数成像可以提供较多的反映卵泡膜纤维瘤与附件区平滑肌瘤组织学特征的影像学信息，其中 ADC 值及肿瘤强化程度在术前两种疾病鉴别诊断方面具有一定意义。

EPO-1146

Bokhman II 型（非激素依赖型）子宫内膜癌 MRI 诊断

曾美英
上海交通大学附属第六人民医院

目的 ：回顾性分析 II 型子宫内膜癌的 MRI 表现，以提高对本病影像学表现的认识。
方法 ：回顾性分析本院 2007-2012 年收治的 16 例 II 子宫内膜癌的 MRI 表现，与病理结果对照，并按 FIGO2009 手术病理分期标准分期[1]。
结果 ：13 例子宫浆液性乳头状癌中 2 例 T1W 子宫形态欠规则，呈不均匀低信号肿块影，T2W 子宫正常 3 层结构消失，呈高低混杂信号肿块影，子宫浆膜面毛糙，双侧子宫角及输卵管间质部信号不均匀，增强 T1W 动脉期呈不均匀强化，延迟期仍强化，双侧髂血管旁均见肿大淋巴结，诊断子宫内膜癌Ⅳ期，与手术病理分期相符；10 例子宫形态正常，T2W 子宫内膜局限性或弥漫性不规则增厚，局部结合带中断，侵犯肌层（8 例>1/2 肌层，2 例<1/2 肌层），1 例与子宫浆膜分界欠清，4 例宫颈管积液，宫颈粘膜增厚，宫颈间质信号连续，2 例宫颈间质信号连续性中断，7 例发现盆腔肿大淋巴结，1 例子宫内膜不规则增厚，结合带显示不清，肌层似有侵犯，子宫周边脂肪间隙清晰，诊断 7 例子宫内膜癌III期，1 例Ⅱ期，2 例Ⅰ期；1 例子宫内膜不规则增厚，结合带显示不清，肌层似有侵犯，子宫周边脂肪间隙清晰，诊断为 1 期。3 例透名细胞癌 T2W 均表现为子宫内膜局限性增厚，结合带中断，侵犯肌层，1 例宫颈粘膜增厚，宫颈间质信号连续性中断，诊断Ⅱ期 3 例。
结论： Ⅱ型子宫内膜癌的磁共振表现与普通子宫内膜癌的表现有相似性，由于Ⅱ型子宫内膜癌手术病理分期较Ⅰ型晚，恶性度高，预后差，增强对本病的认识及敏感性，有助于本病的早期发现及正确诊断，为临床制定合理治疗方案提供重要依据。

良性卵巢肿瘤合并腹水的影像分析(附 13 例报道)

张爱宁
江苏省人民医院（南京医科大学第一附属医院）

:目的 分析良性卵巢肿瘤合并腹水的 CT 表现,提高其诊断准确性.方法 收集经病理证实为良性卵巢肿瘤且合并腹
水患者的资料,分析肿瘤的种类、临床表现、肿瘤标志物及 CT 表现.结果 在伴发腹水的 1 0 6 例卵巢肿瘤中良性卵巢肿瘤 1 3 例,

约占１２．３％.其中,卵巢纤维泡膜细胞瘤 5 例、卵巢甲状腺肿 3 例、卵巢纤维瘤 2 例、卵巢粘液性囊腺瘤 2 例和卵巢硬化性间质瘤 1
例.患者平均年龄(４４±１６．５)岁.病灶长径平均(１３．２±４．７)cm.除黏液性囊腺瘤为完全囊性成分外,其他 4 类肿瘤均为囊实性成
分.增强扫描,卵巢甲状腺肿和卵巢硬化性间质瘤明显强化,其余 3 类肿瘤轻度强化. 1 例卵巢甲状腺肿有钙化.腹水 CT 值约
(１３±４)HU.所有良性卵巢肿瘤 CT 检查均未见腹腔淋巴结肿大及腹膜增厚等表现.结论　卵巢良性肿瘤合并腹水时,肿瘤实性
部分影像学形态及强化特征很难与恶性卵巢肿瘤进行鉴别诊断,而腹水密度低、腹膜无明显增厚及腹腔无明显肿大淋巴结可能是
诊断卵巢良性肿瘤最有价值的线索.

卵巢甲状腺肿的 MDCT 和 MRI 表现

邱勇刚[1],王明亮[2]
1.杭州市萧山区第一人民医院
2.复旦大学附属中山医院放射科

目的:分析卵巢甲状腺肿（Struma Ovarii，SO）的多排螺旋 CT（MDCT）和 MRI 表现，总结具有诊断价值的征象。**材料与方法:**回顾性分析经手术病理证实的 10 例 SO 患者的临床资料及 MDCT 和 MRI 表现，其中 2 例同时行 CT 和 MRI 检查，图像分析包括病灶数目、位置、大小、形态、边界、密度、囊实性比例、强化幅度等；**结果:**10 例 SO 均为单发附件区囊实性肿块， 9 例为多房囊实性肿块，3 例伴高密度囊腔，MRI 显示大部分囊性成分 T1WI 为低信号，T2WI 为高信号，其中 1 例含高密度的囊液在 T2WI 呈极低信号；6 例病灶实性为主，平扫肿瘤边缘显示欠清，增强后轮廓清晰伴实性病灶明显强化（CT 增强幅度平均 87.5Hu）。此外，9 例伴有盆腔积液；3 例伴钙化，表现为实性区及囊壁簇状、蛋壳样钙化；4 例合并同侧成熟畸胎瘤。**结论:**SO 的 MDCT 及 MRI 表现具有一定的特征，当病灶内高密度囊液在 T2WI 呈极低信号、实性成分明显强化同时合并成熟畸胎瘤时，应考虑到 SO 可能。

EPO-1149

Iodine Concentration in Spectral CT: the Value of Differential Diagnosis for Urothelial Carcinoma of Bladder with Different Pathological Grades

Weiping Yang[1],Ailian Liu[1],Shifeng Tian[1],Anliang Chen[1],Jianying Li[2]
1.The first Affiliated Hospital of Dalian Medical University
2.GE Healthcare

ObjectiveTo investigate the differential diagnosis value of single-source dual-energy CT iodine content in different pathological grades of Urothelial Carcinoma of the Bladder (UCB). **Methods 41**patients (male: female = 36:5, age:33-90y) with histopathologically proven urothelial carcinoma of bladder (UCB)were retrospectively analyzed, which included 25 cases of high grade of urothelial carcinoma of bladder

(HGUCB), and 16 cases of low grade of urothelial carcinoma of bladder (LGUCB). All patients underwent pelvic spectral CT three phases enhanced scans. The iodine (water) concentrations(IC)in the lesions that marked as ROI_T (ROI of tumor), and the iodine (water) concentrations that marked as ROI_Ain the arteria iliaca communis of the arterial and venous phase were measured, and the normalized iodine (water) concentrations (NIC, NIC = ROI_T/ROI_A) value was calculated on a GSI comprehensive analysis platform by two observers. The intra-class correlation coefficients (ICC) was used to check the consistency of the data measured by the two observers. The above parameters between the two groups were compared by t-test, and the ROC curve was used to evaluate the diagnostic efficacy of these parameters. **Results** The consistency of the data obtained by the two observers were good (ICC value > 0. 9). In arterial phase, both the IC and NIC ofHGUCB were significantly greater than those of LGUCB (P<0.05); and there were no differences for parameters between the two groups in the venous phase(P>0.05). The AUC (Area under the Curve) value for using the IC and the NIC in the arterial phase were retrospectively 0.692、0.778, which yielded sensitivity and the specificity of 88% and 56.2, 92% and 62.5%, respectively.**Conclusion** The iodine concentration and normalized iodine concentration in arterial phase of single-source dual-energy CT could quantitatively identify different pathological grades of urothelial carcinoma of the bladder, which has certain application value.

EPO-1150
单侧肾缺如或肾发育不良的真相：泌尿生殖系统联合畸形影像表现

赵越[1],龙世亮[1],江慧珍[2]
1.广东医科大学附属湛江中心人民医院
2.华中科技大学同济文昌医院放射科

目的 探讨腹部影像检查表现为“单侧肾缺如/肾发育不良”患者的 CT 和/或 MRI 影像特征及其发病规律。 **方法** 回顾性分析 2010 年-2019 年影像诊断为“单侧肾缺如/肾发育不良”的 41 例患者 CT 或 MRI 资料，分析其影像特征并进行分类。 **结果** 所有病例均存在单侧肾缺如/肾发育不良，且经临床或手术证实为泌尿生殖系统联合畸形。男性 14 例，包括 12 例单侧肾缺如并同侧精囊腺囊肿（Zinner 综合征）；1 例伴嗅觉缺失的低促性腺激素型性功能减退症（Kallmann 综合征）；1 例右侧腹肌缺如，右肾缺如，左肾重复畸形，右侧隐睾，即梅干腹综合征（Prune-Belly 综合征）。女性 27 例，包括 12 例 Herlyn-Werner-Wunderlich 综合征，其中Ⅰ型有孔斜隔 3 例，Ⅱ型无孔斜隔 9 例，均伴双子宫畸形及单侧肾缺如；5 例双子宫并单侧肾缺如及中肾管残余； 4 例先天性无子宫并单侧肾缺如（Mayer-Rokitansky-Kuster-Hauser 综合征）；3 例单角/残角子宫并单侧肾缺如；2 例双子宫并单侧发育不良低位肾，输尿管异位开口于阴道；1 例盆腔融合肾伴输尿管异位开口于阴道，并胸 12 半椎畸形。影像特征及发病规律：①单侧肾缺如/肾发育不良常合并其它泌尿生殖系统畸形，且大部分为同侧泌尿生殖系统异常。②发育不良的肾均出现在输尿管走行区，体积一般小于正常，大部分为低位（腰 3 椎体水平以下至盆腔内）。③性别特异性：男性多见于 Zinner 综合征（中肾管未发育导致肾缺如，残留于精囊腺形成囊肿），女性见于多种子宫畸形，女性更易同时出现输尿管异位开口。 **结论** 对于腹部影像检查表现为“单侧肾缺如/肾发育不良”的患者，完善全腹部及盆腔影像学检查十分重要，有助于进一步明确诊断。这类患者常合

并泌尿生殖系统联合畸形，其病变位置及类型有一定的规律，应重点观察同侧输尿管、精囊及子宫。

The Value of Spectral Curve in the Differential Diagnosis of Urothelial Carcinoma of the Bladder with different pathological grades

Weiping Yang,Ailian Liu,Lihua Chen,Nan Wang
The first Affiliated Hospital of Dalian Medical University

Objective To investigate the value of spectral curves of the single-source dual-energy spectral CT in differentiating different histopathological grades of urothelial carcinoma of the bladder (UCB).**Methods 55** patients (male: female = 47:8, age:47-97y) with histopathologically proven single nodule UCB were retrospectively analyzed. Lesions were divided into two groups according to histopathological results, group A contains32 cases of HGUCB, group B contains 23 cases of LGUCB. All patients underwent abdominal spectral CT unenhanced and three phases enhanced scans. The CT values of the 140kVp polychromatic and 40-140keV monochromatic images in non-enhanced, arterial, and venous phases were measured, and the slopes of the spectral curves (CT value as function of energy) were calculated by two observers on a GSI comprehensive analysis platform. The intra-class correlation coefficients (ICC) was used to check the consistency of the data measured by the two observers.All the above parametersbetween the two groups were compared by t-test, and the ROC curve was used to evaluate thediagnostic efficacy of these parameters. **Results** The consistency of the data obtained by the two observers were good (ICC value > 0. 75). In the arterial phase, the CT values of the 40-100keV images, and the slope the curves in Group A were greater than those in Group B (P<0.05). There were no differences for all parameters between the two groups in the non-enhanced phase and venous phases (P>0.05). Among above parameters, The AUC value of the spectral curve slop was 0.740, which yielded sensitivity of 60.9%% and specificity of 84.4%. **Conclusion**the arterial phase spectral curve of single-souse dual-energy CT can identify different pathological grades of UCB, which provides clinical application values.

多层螺旋 CT 血管重建在原发性腹膜后肿瘤诊断及术前评估的应用价值

邹茹欣
哈尔滨医科大学附属第一医院

多层螺旋 CT 血管重建在原发性腹膜后肿瘤诊断及术前评估的应用价值
摘要：**目的** 探讨多层螺旋 CT 血管重建在原发性腹膜后肿瘤诊断及术前评估的应用价值。

方法 选择我院于 2018 年 1 月—2019 年 5 月期间收治的原发性腹膜后肿瘤患者 47 例,所有患者均经过手术病理检查确诊为原发性腹膜后肿瘤,以多层螺旋 CT 对 47 例患者进行扫描检查,并行 CT 血管重建，并将 CT 检查结果与手术病理检查结果进行比对,分析原发性腹膜后肿瘤临床诊断及术前评估中多层螺旋 CT 血管重建的应用价值。
结果 多层螺旋 CT 血管重建检测肿瘤病变定位诊断准确率为 98.65%;以病理诊断结果为依据,定性准确度 90.50%,灵敏度 87.85%,特异度为 92.34%;多层螺旋 CT 判断腹膜后肿瘤对周围脏器、血管有无侵犯和病理诊断结果对比具有一致性(P<0.05)
结论 原发性腹膜后肿瘤术前评估中,多层螺旋 CT 血管重建能够对腹膜后肿瘤术前进行精准评估,对于制定个体化治疗方案及手术具有一定的应用价值。

Diagnostic performance of MR imaging-based features and texture analysis in the differential diagnosis of ovarian thecomas/fibrothecomas and uterine fibroids in the annexal area

Chao Wei,Jiang-ning Dong
West branch of The First Affiliated Hospital of University of Science and Technology of China，Anhui Provincial Cancer Hospital

Purpose: To investigate the value of MR imaging-based features and texture analysis (TA) in the differential diagnosis of ovarian thecomas/fibrothecomas (OTCA/f-TCAs) and uterine fibroids in the annexal area (UF-iaas).
Materials and methods: This retrospective study included 16 OTCA/f-TCA and 37 UF-iaa patients who underwent conventional MRI and DWI between August 2014 and September 2018. Three-dimensional TA was performed with T2-weighted MR imaging. The clinical, MR imaging-based and texture features were compared between OTCA/f-TCAs and UF-iaas. Multivariate logistic regression analysis was performed to investigate the factors differentiating OTCA/f-TCAs from UF-iaas. ROCs were generated to analyse MR imaging-based features, texture features and their combination for discriminating the two diseases.
Results: Ipsilateral ovaries, arterial period enhancement, lesion components, peripheral cysts, “whorl signs”, mean ADC values and 6 texture features (Histogram-energy, Histogram-entropy, Histogram-kurtosis, GLCM-energy, GLCM-entropy, and Haralick Correlation) were significantly different between OTCA/f-TCAs and UF-iaas (P<0.05). Multivariate analysis of the clinical and MR imaging-based features revealed that arterial period enhancement (OR=0.104), peripheral cysts (OR=16.513), and “whorl signs” (OR=0.029) significantly differentiate OTCA/f-TCAs from UF-iaas (P<0.05), with accuracy, specificity and sensitivity of 83%, 75%, and 86.5%, respectively. Multivariate analysis of texture features showed that Histogram-energy (OR=0.011) significantly differentiated OTCA/f-TCAs from UF-iaas (P<0.05), with accuracy, specificity and sensitivity of 75.5%, 43.8% and 89.2%, respectively. The area under the curve (AUC) of imaging-based diagnosis was 0.907,

and the combination of imaging-based diagnosis and TA improved the AUC to 0.959 (P<0.05).
Conclusions: MR imaging-based features can be useful to differentiate OTCA/f-TCAs from UF-iaas. Furthermore, combining imaging-based diagnosis and TA can improve diagnostic performance.

瘢痕子宫胎盘植入的 MRI 征象分析

雷颖
山西医科大学第一医院

目的 探讨瘢痕子宫胎盘植入的 MRI 征象，EADC 值在胎盘植入中的作用。
方法 回顾性分析 2011 年 4 月至 2014 年 6 月期间。收集经手术病理或临床诊断证实的 30 例瘢痕子宫胎盘植入患者，患者均行 MR 检查；分析患者子宫异常隆凸、胎盘信号不均匀、T1wl 低信号条带、胎盘内出血、胎盘下血管增多、胎盘下肌层变薄或消失情况，并采用 EADC 值对胎盘植入处胎盘子宫内膜接触面进行精确分析。
结果 30 例瘢痕子宫胎盘植人组患者中，子宫局部异常隆凸 39 例，胎盘信号不均匀 32 例，胎盘内 T2WI 低信号条带 29 例，T1WI 胎盘下血管增多 26 例。胎盘植人患者中，胎盘植入处胎盘子宫内膜接触面 EADC 值 0.995±0.03（P≤0305）高于正常胎盘子宫内膜接触面 EADC 值 0.332±0.03（P≤0305）。
结论 瘢痕子宫胎盘植入的 MR 征象主要包括子宫局部异常隆凸、胎盘信号不均匀、T2WI 胎盘内低信号条带、胎盘下血管增多等，同时 EADC 值在瘢痕子宫胎盘植入鉴别有较好的鉴别价值。

低浓度碘对比剂、低辐射剂量扫描结合体重指数在泌尿系 MSCT 一站式检查中的应用研究

夏传江
陆军军医大学大坪医院

目的 探讨低浓度对比剂、低辐射剂量结合患者体重指数（BMI），在泌尿系 MSCT 一站式检查中的应用价值。
方法 前瞻性分析陆军军医大学大坪医院 2018 年 12 月至 2019 年 7 月拟行泌尿系 MSCT 一站式检查的患者，筛选体重指数小于 25（BMI<25kg/m^2）的，纳入 200 名屏气配合优良患者分为 4 组，每组 50 例。A 组为：BMI<20kg/m^2，对比剂浓度为 270mg/ml，管电压 100Kv；B 组为：20kg/m^2<BMI<25kg/m^2，对比剂浓度为 270mg/ml，管电压 120Kv；C 组为：BMI<20kg/m^2，对比剂浓度为 350mg/ml，管电压 100Kv；D 组为：20kg/m^2<BMI<25kg/m^2，对比剂浓度为 350mg/ml，管电压 120Kv；4 组均采用自动管电流调制法，进行容积扫描，扫描平扫期、动脉期、实质期及排泄期。对各组图像进行主观评分，在 CT 后处理工作站进行测量并记录客观评价指标（包括：图像噪声、腹主动脉 CT 值、肾动脉 CT 值、肾脏实质 CT 值），并记录辐射剂量。采用 Mann-Whitney U 检验比较图像的主观评分结果，对客观评价打的各项 CT 值进行配对样本 t 检验。

结果 各组图像均能满足诊断，且 A 与 C 组、B 与 D 组图像组间评分差异无统计学意义（P>0.05）；A 与 C 组、B 与 D 组间图像噪声、腹主动脉 CT 值、肾动脉 CT 值、肾脏实质 CT 值的差异均有统计学意义（P<0.05）；对于辐射剂量明显 A 组低于 C 组，B 组明显低于 D 组；组间差异均有统计学意义（P<0.05）。
结论 在行泌尿系 MSCT 一站式检查时，根据患者的体重指数（BMI），采用低浓度碘对比价、低管电压自动管电流调制技术进行扫描，能够获得理想的图像质量并有效的降低患者的辐射剂量。具有极大的应用价值。

肾脏淋巴瘤的 CT 和 MRI 影像表现

燕云霄
山西医科大学第一医院

目的：探讨肾脏淋巴瘤的 CT 和 MRI 的影像表现，提高对此病的认识，以帮助临床诊断。
方法：回顾性分析我院手术病理证实的肾脏淋巴瘤患者 20 例，详细分析其临床特点及影像学特征。CT 检查 10 例，MRI 检查 10 例，男性 13 例， 女性 7 例，分析所有患者 CT 以及低场 MRI 弥散加权成像的影像资料， 总结其诊断价值。
结果：CT 以及低场 MRI 弥散加权成像结果显示，多发病灶与单发病灶分别是 7 例、3 例， 与此同时，腹膜后淋巴肿直接蔓延、肾窦受累、肾脏弥漫性浸润、肾周淋巴瘤患者分别是 6 例、4 例、3 例、2 例。所有患者中病灶境界模糊但信号（密度）均匀的 17 例，所有患者中 CT 平扫显示密度较高者 9 例，等密度者 1 例，在 MRI 平扫过程中，7 例患者在 T1WI 上与在 T2WI 上分别呈稍低信号与低信号。行增强扫描结果可见，20 例患者的病灶强化均明显低于正常肾实质，其中 15 例为渐进性强化，5 例为皮髓质期明显强化。
结论：在影像学中，肾脏淋巴瘤的图像资料表现多种多样，由于其表现形式多样，所以分析难度较大，CT 和 MRI 表现有一定特征，是诊断、分期和随访的重要方法，所以能够为临床诊断提供参考。

EPO-1157

Arterial spin labeling MR imaging for predicting microvascular invasion of renal cell carcinoma: initial experience

Hanmei Zhang[1],Shasha Zhang[2],Tingyu Chen [1],Mingpeng Wu[1],Bin Song[1]
1.West China Hospital， Sichuan University
2.Guizhou Provincial People ‘s Hospital

PURPOSE

Microvascular invasion is the former step of vein cancer embolus, which depends on pathological diagnosis after the operation. The accurate prediction before the operation will provide valuable information on operation strategy, since according to the European Association of Urology Guideline Panel for Renal Cell Carcinoma, tumors with renal vein cancer embolus should be radical nephrectomy . This study aimed to

prospectively evaluate the performance of functional ASL imaging for predicting microvascular invasion of renal cell carcinoma which was confirmed histopathologically.

METHOD AND MATERIALS

Subjects

This study was approved by the institutional review board, and written informed consent was obtained from all patients before imaging. Between August 2017 and March 2018, a total number of 12 consecutive patients were enrolled in this study. The 12 consecutive patients underwent pre-surgical MR imaging evaluation of suspected renal masses.

MR Imaging

All patients underwent imaging using a clinical 3.0 T MR scanner (MAGNETOM Trio, Siemens AG, Erlangen, Germany) with a six-channel body matrix array coil. In all patients, image acquisition consisted of a coronal T2-weighted HASTE sequence (TR/TE, 1000/90 ms; flip angle, 150° ; slice thickness, 3.0 mm; matrix, 320x256; field of view, 45 x45 cm^2) and an axial T2-weighted TSE sequence (TR/TE, 1800/95 ms; flip angle 140° ; slice thickness, 5.0 mm; matrix, 320 x256; field of view, 38x 28 cm^2) for morphologic evaluation of kidneys.

For quantitative assessment of the renal perfusion, a coronal renal ASL was performed using a prototype flow-sensitive alternating inversion recovery trueFISP (FAIR-trueFISP) sequence with TI of 1200 ms for perfusion images and without inversion for M_0 images with the following parameters: TE/TR, 2.24/4.48 ms; flip angle, 70° ; slice thickness, 5.0 mm; matrix, 128x128; field of view, 30x 30 cm^2; measurements 12. ASL MR imaging was performed using a single section through the tumor pseudocapsule defect or through the center of the tumor without the pseudocapsule defect. A modified look-locker inversion-recovery (MOLLI) sequence was used for T1 mapping of the same slice. The images had the same special resolution with field of view of 30x30 cm^2 and matrix of 128x128. Respiration triggering was applied to minimize the motion artifact for perfusion imaging and M_0 imaging. A short breath-holding (5 second) was applied for T1 mapping. Renal blood flow was calculated using a homemade Matlab protocol (MATLAB 2012, Mathworks, Natick, MA) on a pixel by pixel basis using a one compartment model.

Imaging analysis

Quantitative analysis

Renal blood flow was measured on ASL images using region-of-interest (ROI) analysis by a single reviewer with 5 years experience in abdominal MRI. The ROI was drawn covering the whole tumor and the solid part of the tumor. The same ROI was then copied to the area outside the body to measure the background signal noise.

Reference standard

Results of histopathologic analysis served as the reference standard. The final histopathologic diagnosis was provided by two pathologists, both with more than 5 years experience. The diagnosis included tumor category and microvascular invasion.

Statistical analysis

Statistical analysis was performed using SPSS 19.0 software (SPSS Inc., Chicago, IL). The difference between perfusion of renal tumors and the background noise was assessed using paired samples t-test. $P<0.05$ was considered statistically significant. The diagnostic performance of ASL images for predicting microvascular invasion was

assessed using diagnostic test index: sensitivity, specificity, positive predictive value and negative predictive value.

Results

Image acquisition was completed successfully in 12 patients (7 males and 5 females, age range, 33-70, mean age, 51 years ± 14.1). Histopathologic diagnosis was obtained by means of radical nephrectomy (n = 2) or partial nephrectomy (n = 10). The mean interval between MR imaging and histological analysis was 4.2 days ± 2.5. The final diagnosis in the remaining masses included clear cell RCCs (ccRCCs) (n=11) and chromophobe RCC (n=1). None of the tumors had perinephric fat invasion and all of the tumors were classified as stage pT1. In the histopathologic analysis of the 10 ccRCCs (1 case was excluded since lack of perfusion), 5 cases presented with microvascular invasion and the other 5 cases with no features of microvascular invasion.

Imaging Features

The maximum diameter of the tumor ranged from 1.9 to 6.0 cm (mean, 3.3 cm ± 0.99): 2 tumors were localized on the left kidneys and 10 tumors were on the right kidneys. The majority of ccRCCs showed heterogeneous hyper signal intensity, and chromophobe RCC showed moderate signal intensity on T2-weighted images.

ASL perfusion

Within the 11 ccRCCs, 10 cases showed hyper blood flow in the solid part of the tumor (Fig. 1 and Table 1), but 1 case did not. Consistent with the T2-weighted images, the chromophobe RCC showed no hyper blood flow of the whole tumor. The mean perfusion value of the tumor was higher than the background noise (325.12 mL/min/100g versus 17.74 mL/min/100g, n = 10, $P<0.01$). Within the 10 ccRCCs, the mean perfusion value of the solid part of the tumor with microvascular invasion was higher than tumors without microvascular invasion (893.85 mL/min/100g versus 294.45 mL/min/100g, n = 10, $P<0.01$)

Diagnostic performance

Diagnostic test's index was used to compare the performance of ASL images for predicting microvascular invasion. Sensitivity, specificity, positive predictive value and negative predictive value were 100%, 66.7%, 90%, 100%, respectively. The area under ROC curve was 0.84.

Conclusions

In conclusion, ASL images produced promising diagnostic accuracy for predicting microvascular invasion of renal cell carcinoma, which could be an important step for improving clinical management of renal cell carcinoma.

前列腺脓肿的影像诊断及鉴别诊断

秦江波,王效春,谭艳,张辉
山西医科大学第一医院

目的：探讨前列腺脓肿的 MRI 表现，提高对该病的诊断水平，更好地指导临床治疗。
方法：收集我院 2012 年至 2015 年经手术病理或临床证实的前列腺脓肿 8 例，年龄 49-74 岁。主要临床表现：6 例患者出现全身感染症状，如发热、血尿白细胞升高，5 例患者出现会阴部压痛明

显、急性尿潴留、尿频尿急等局部症状。全部患者接受了前列腺 3.0T MR 常规及 DWI 序列检查，回顾性分析其 MRI 表现。

结果：8 例前列腺脓肿均表现为长 T1 长 T2 囊性病变；脓肿有完整壁，囊壁 T1 信号略高于周围正常前列腺组织，T2 信号呈等低信号为主。4 例脓肿壁可见多发不连续分隔，信号与脓肿壁一致。8 例前列腺脓肿患者 DWI 序列：脓液均呈明显高信号（高于前列腺增生及前列腺炎）；ADC 图呈低信号，ADC 值明显低于正常前列腺、前列腺增生，平均 ADC 值为（0.623±0.087）×$10^{-3}mm^2/s$；脓腔较大时，ADC 图多表现为周围低信号，中央等信号。2 例患者病灶突破前列腺包膜，侵入前列腺直肠间隙。

结论：高场强 MRI 对前列腺脓肿的诊断具有很高的敏感性及特异性，尤其 DWI 序列对于鉴别前列腺脓肿与其它囊性病变具有独特优势；同时 MRI 可清晰显示前列腺脓肿的部位、侵犯范围及周围结构等。有助于临床医生对前列腺脓肿的 MRI 表现及其侵犯范围有一个直观、全面的认识，对临床治疗方案的制定提供客观依据。

多层螺旋 CT 对输卵管炎的诊断价值

杜涛
芜湖市第二人民医院

目的：分析输卵管炎的多层螺旋 CT（Multisliecs helieal CT，MSCT）影像学特点，评估 MSCT 对输卵管炎的鉴别诊断价值。

方法：回顾性分析 15 例经手术、病理证实的输卵管炎的 MSCT 表现。CT 机为 GE LightSpeed 16 排和飞利浦 Brilliance iCT128 排机器。检查前 5 ~ 6 h 禁食，扫描前让患者饮水，使膀胱充盈；患者取仰卧位，扫描范围由耻骨联合下缘至病灶上缘水平，根据病灶大小适当调整扫描范围。图像层厚 5 mm，层距 5 mm 连续扫描，管电压 120 kV，管电流为机器自动调整。全部病例均行平扫及增强扫描。增强扫描采用动脉期（25 s）、静脉期（60 s）双期扫描。采用非离子型对比剂 100 mL，以 3 mL/s 流速，经肘前静脉由高压注射器注入。以常规算法重建图像（窗宽 250 Hu，窗位 80 Hu）。由 2 位放射医师以双盲法分别对 15 例患者的 MSCT 影像进行评估，共同分析病变位置、形态、大小、密度、内部结构、强化程度、边界。病理组织学检查方法包括：宫颈病理组织学检查和子宫内膜病理检查，检查结果阳性者可确定病变的性质。

结果：15 例病例共 26 个病灶，双侧 11 例，单侧 4 例。化脓性输卵管炎 7 例 13 个病灶，MSCT 表现为管壁增厚伴有明显强化，其中管壁呈管状及腊肠状 5 例，管径增粗，囊状及囊实性 2 例，囊壁及分隔可见强化；输卵管卵巢脓肿 2 例单侧，呈囊实性混杂密度，壁厚伴强化；慢性输卵管炎 6 例，输卵管壁略增厚伴强化，其中伴有积水 3 例。
结论：MSCT 检查能较好地显示输卵管炎症引起的形态结构改变，并可观察盆腔器官组织的受累及粘连情况，可对输卵管炎症做出准确诊断，对附件区包块的鉴别诊断有重要价值。

EPO-1161

MRI 诊断产后胎盘残留的临床价值

王忠,杨智
成都市第五人民医院

目的：探讨产后胎盘残留的 MRI 表现及临床价值，方法： 分析 30 例临床诊断产后胎盘残留的 MRI 平扫及增强扫描表现特征。结果： 临床或手术病理证实的胎盘残留 3 例，胎盘粘连 5 例，胎盘植入 22 例，其中有 2 例为穿透性植入。MRI 诊断胎盘残留 28 例，有 2 例胎盘粘连诊断为胎盘植入，1 例穿透性植入只诊断为胎盘植入。MRI 表现：子宫明显增大；结合带局部模糊，中断；胎盘附着处子宫壁肌层变薄，平扫残留胎盘一般为稍长 T2 稍长 T1，等 T2 等 T1 混杂信号，其内间杂细小血管留空信号以及低信号线状胎盘小叶间隔。增强扫描可见残留胎盘明显不均匀强化，呈花瓣状或结节样强化，胎盘植入处可见多数迂曲、留空血管影像，增强扫描有明显强化。结论：MRI 检查能够发现产后产后胎盘残留的形态、大小、部位，判断胎盘植入的位置、大小以及深度。

输卵管妊娠破裂和卵巢黄体囊肿破裂的 CT 诊断价值

林彬
南宁市第二人民医院

目的 探讨输卵管妊娠破裂和卵巢黄体囊肿破裂的 CT 特征及诊断价值。**方法** 回顾性分析 28 例经手术病理证实的输卵管妊娠破裂和卵巢黄体囊肿破裂的临床及 CT 资料，分析两者的 CT 表现特征及鉴别诊断要点。**结果** 28 例均表现为腹盆腔积血，以子宫及附件周围明显，而输卵管妊娠破裂出血通常量较多。18 例输卵管妊娠破裂表现为一侧宫旁或附件区混杂密度包块，周围积血包绕，其中 15 例包块中见圆形或卵圆形低密度孕囊；2 例病例同时合并另一侧附件的囊性占位（病理证实为黄体囊肿）。10 例黄体囊肿破裂出血中 8 例表现为一侧宫旁或附件区不规整的囊状低密度影，囊肿壁较厚呈环状，周围积血或伴血肿；2 例未见明确囊性密度影，仅见腹盆腔积血。**结论** 输卵管妊娠破裂和卵巢黄体囊肿破裂的 CT 表现均具有一定的特征，术前 CT 扫描可为临床提供较准确的诊断信息。

EPO-1163

糖尿病肾病 CT 和 MRI 征象及病理特点的综合分析

王军
乐清市人民医院

目的：提高 CT 和 MRI 对糖尿病肾病的诊断水平。**方法**：回顾性的分析经临床确诊的 32 例糖尿病肾病，全部病例行 CT 或 MRI 动态增强扫描。**结果**：发现 6 例肾脏多灶性或单灶性的斑片状异常病灶，强化程度低于肾组织，18 例 MR-DW 序列双肾呈不均匀改变，肾脏肿大 10 例，萎缩 7 例，肾周间隙模糊 18 例伴肾周筋膜增厚 7 例，8 例伴脂肪渗出，肾动脉及分支弥漫性钙化 16 例，双肾细线状稍高密度影或肾乳头局灶性密度增高 14 例。.**结论**：糖尿病肾病在 CT 和 MRI 上能表现出一定的影像征象，并与其病理相关，认识这些征象，有助于提高诊断。

Primary Fallopian Tube Carcinoma: characteristic imaging features with clinicopathological correlation

Ruqi Fang
Fujian Maternity and Children Health Hospital

Objective: To retrospectively evaluate the clinical, pathological, and Magnetic Resonance imaging features of primary fallopian tube carcinoma. **Materials and Methods:** The MR imaging features were analyzed including the tumor size, laterality, morphological nature, signal intensity, contrast enhancement, and presence of ascites, lymphy node metastasis were also evaluated .Clinical and pathological features, such as age, clinical symptoms, serum CA125 levels, treatment methods, and surgical-pathologic findings, outcomes on follow-up were analyzed. **Results:** 11 tumors in 10 patients were evaluated, Their ages ranged from 29 to 60 (mean age 50.5±5.1), 6 cases presented with the signs of vaginal discharge, 2 cases complaint pelvic pain, while 6 cases presented with adnexal mass, the serum CA125 levels elevated in 9 cases (33.5-117.7U/ml). Mean largest tumor diameter was 3.9 cm In MR imaging , 9 cases were unilateral (3 were right, 6 were left), 1 patient had bilateral involvement, the sausage-shaped lesion were noted in 8 tumors, cauliflower-shape nodular was seen in another 3 tumors, The solid tumors were low signal intensity on T1WI in all cases, slightly high sinal intensity on T2WI in 8 tumors, equal signal intensity in 3 tumors on T2WI, all 11 tumors were high signal intensity on diffusion weighted imaging with low signal intensity on apparent diffusion coefficient maps, moderately enhanced were found in 6 tumors , The “vestigital fallopian tube” sign were found in 9 tumors, hydrosalpinx were observed in 7 cases.10 serous carcinomas and 1 carcinosarcoma were found at final pathological diagnosis , 5 cases were staging Ia, another 5 case was staging Ic, IIa, IIb, IIIa, IIIb respectively in FIGO staging .**Conclusion:** Primary fallopian tube carcinoma, which has a worse prognosis, should be considered as a diagnosis for patients who have sausage-shaped solid masses with “vestigital fallopian tube” sign or hydrosalpinx.

Exploring the diagnostic value of CT multi-phase Radiomics models and traditional imaging models in the diagnosis of clear cell renal cell carcinoma

Menglin Chen[1],Ge Wen[2]
1.The second affiliated hospital of kunming medical university
2.Nanfang hospital

Objective:

To explore the diagnostic value of differentiating clear cell renal cell carcinomas based on the CT multi-phase Radiomics features and traditional imaging features.

Materials and Methods:

A total of 197 pathologically proven renal masses from January 2013 to October 2018 treated in Nanfang hospital was included in our study. The above patients with renal tumors were divided into clear cell and unclear cell renal cell carcinomas groups.

First, a traditional imaging feature model was constructed. The CT values of the lesion and the corresponding attenuation of the aorta and adjacent normal renal cortex were measured by two radiologists to obtain the improved enhanced parameters. The three most discriminative features identified with each phase were entered as predictors in logistic regression models to construct a traditional diagnosis model. Secondly, a diagnostic model of Radiomics features was constructed. Two radiologists manually segmented the 3D tumor images and extracted the image radiomics features. LASSO regression screening was used to construct the Rad-scores based on the unenhanced and three enhanced phases.

Finally, all the above parameters with statistical difference in single factor comparison and rad-scores were included in the multivariate logistic regression analysis to build the combined diagnosis prediction model. The AUC, sensitivity, specific, positive predictive value, negative predictive value and accuracy were also concluded.

Results:

Differences in Rad-scores and enhancement changes of aortic version in the corticomedullary, nephrographic, and excretory phase were independent influencing factors in differential diagnosis of clear cell renal cell carcinoma and unclear cell renal cell carcinoma ($P < 0.001$). AUC values of the traditional diagnostic model, Rad-score model and the combined diagnostic model in differentiating the two groups were 0.748-0.823, 0.776-0.887 and 0.864-0.9, respectively. The AUC values of the three models were statistically significant ($P < 0.001$).

Conclusions:

By combining traditional CT improved parameters and Radiomics features to construct a combined diagnostic model, the predictive efficacy of clear cell renal cell carcinomas was significantly improved, which provided a reliable basis for clinical treatment options.

EPO-1168

Diffusion-weighted Imaging of Cervical Cancer: Feasibility of Ultra-high b value at 3T

Yafei Qi[1], Yonglan He[1], Chengyu Lin[1], Xiaoqi Wang[2], Hailong Zhou[1], Huadan Xue[1], Zhengyu Jin[1]
1. Department of Radiology Peking Union Medical College Hospital
2. Philips Healthcare China

Objectives We sought to evaluate imaging quality and compare the signal intensity and apparent diffusion coefficient (ADC) maps of ultra-high b-value (2,000 s/mm^2) images

against those of 800 s/mm^2 b-value images in diffusion-weighted imaging (DWI) for cervical cancer.
Methods Sixty patients diagnosed with cervical cancer by biopsy were prospectively included. Female pelvis magnetic resonance imaging using a 3T magnetic resonance scanner was performed; B-value of 800 s/mm^2 and 2,000 s/mm^2 images were obtained for evaluation. Two radiologists blinded to the scan parameters evaluated the images for background suppression, spatial distortion, image ghosting, lesion diagnostic confidence, and whole imaging quality using a 5-point scoring system. Scores were compared using a paired Wilcoxon test.Interobserver agreement was evaluated by Cohen's kappa analysis. Signal intensity (SI) of tumour tissue was measured in b=800 s/mm^2 and b=2000 s/mm^2 images for tumour and normal reference tissues. Additionally, SI contrast ratios (CRs) were calculated and compared using the Mann-Whitney U test, ADC values of tumours and normal tissues were measured, and tumour maximum diameters were calculated with T2-weighted imaging.
Results Background suppression, lesion diagnostic confidence, and whole imaging quality scores were higher in b=2,000 s/mm^2 than b=800 s/mm^2 images (all $p < 0.001$). No statistically significant differences between the ultra-high and normal b-value images were noted in spatial distortion and image ghosting.Interobserver agreement was very good for all five aspects in both types of b-value images (all $\kappa > 0.8$).CRs of tumour-to-normal SI were also higher for b=2,000 s/mm^2 (0.63±0.11) than b=800s/mm^2 (0.55±0.12) images ($p<0.01$). CRs of tumour-endometrium (T-E) signal intensities also higher for b=2,000 s/mm^2(0.44 ± 0.14) than b=800 s/mm^2(0.26 ± 0.14) images ($p < 0.001$). Mean ADC values derived from b=2,000 s/mm^2 images showed better correlations with tumour differentiation grades than did those from b=800 s/mm^2 images. Tumour diameters measured by B2 imaging experienced smaller bias.
Conclusions Ultra-high b-value (2,000 s/mm^2) images in DWI demonstrated superiority in image quality and cervical cancer diagnosis to the commonly used normal b-value (800 s/mm^2) images in female pelvis.

EPO-1169

肾上腺占位 115 例影像及病理分析

刘杰
辽宁省肿瘤医院

目的:分析、总结肾上腺占位的影像特点，提高肾上腺占位的诊断水平和疾病的综合分析水平,以期为患者提供更经济有效的临床策略。对象和方法:以 2018 年 3 月-2019 年 3 月经手术或穿刺病理证实的肾上腺占位作为研究对象，回顾性分析归纳肾上腺占位影像学表现及病理结果。结果:收集有病理诊断的肾上腺占位 115 例，分析其影像学表现。腺瘤 70 例：肾上腺腺瘤 CT 平扫的密度较低，对于密度较高的腺瘤增强延迟强化扫描 washout 明显，常大于 50%，磁共振反相位信号明显减低；腺瘤伴恶性肿瘤病史 9 例，伴良性肿瘤病史 1 例，其余为单一肾上腺腺瘤。嗜铬细胞瘤 9 例，影像表现为肾上腺区肿块，直径多为 3cm 以上，界限清楚，容易出血、坏死、囊变，一般强化较明显，T2WI 表现为高信号。由于肿瘤出血、坏死、囊变的比例不同及肿瘤间质间血管和纤维含量比例不同而导致强化程度及 T2WI 信号高低不同。嗜铬细胞瘤具备一定的转移倾向。肾上腺皮质癌 1 例，表现为肾上腺区巨大约 10cm 不规则形肿块,密度及计强化不均, ,内有坏死及陈旧性出血所致的不规则低密度区;肿块内见散在点片状钙化影。其强化程度不及时嗜铬细胞瘤。囊肿 4 例，表现为圆形或椭圆形肿块，边缘光滑锐利、壁薄而一致，少数囊肿边缘有弧线状钙化。肾上腺转移癌

16 例，形态不规则,大小不等,强化不均,其中 2 例为双侧转移,其中乳腺癌来源 1 例，肺癌来源 6 例，肝癌来源 2 例，肾癌来源 3 例；肠癌来源 1 例；胃癌来源 3 例。另髓脂肪瘤 3 例,脂肪瘤 1 例,肾上腺神经鞘瘤 1 例,肾上腺海绵状血管瘤 1 例,神经节细胞瘤 2 例,肾上腺增生 7 例。结论 本次回顾分析肾上腺占位病例的良性、恶性、转移性及有恶性转移倾向的嗜铬细胞瘤的比例分别为 77.4%，0.8%，13.9%，7.8%，其中腺瘤良性占位伴有恶性肿瘤的病例占 12.8%.应注意与恶性病变区分，CT 和 MR 能够为术前疾病的诊断提供正确思路及合理分期。

原发性肾脏滑膜肉瘤的 CT 及 MRI 影像表现

康柳青,陈学军
河南省肿瘤医院

目的 分析原发性肾脏滑膜肉瘤的 CT 及 MRI 影像表现，提高诊断水平。**方法**回顾性分析本院经手术或穿刺病理证实的 4 例原发性肾脏滑膜肉瘤的临床及影像资料。1 例行 CT 平扫，1 例行 MRI 平扫，2 例行 CT 平扫及三期增强扫描（其中 1 例同时行 MRI 平扫），记录病灶的位置、形态、大小、边缘、密度/信号特点、强化特点、肾周侵犯情况、有无下腔静脉及肾动静脉瘤栓、有无淋巴结及远处转移。**结果** 4 例原发性肾脏滑膜肉瘤患者中，男 2 例，女 2 例，年龄 30～60 岁，平均年龄 44 岁。4 例病灶均表现为边界清楚的单发囊实混杂软组织肿块，3 例位于右肾，1 例位于左肾。肿块最大径 6.8～15.4cm(平均大小 11.2cm)。3 例病灶与邻近肾实质分界清晰。4 例病灶均发生出血，其中 1 例破裂至肾包膜下。3 例病灶显示假包膜。4 例病灶囊壁均清晰光整，1 例伴有壁结节。4 例病灶均可见分隔。2 例 CT 增强扫描病灶实性软组织成分、壁结节及分隔均呈轻中度渐进性强化。1 例 MRI 平扫可见三重信号征、液液平。1 例病灶出现片状钙化伴出血。2 例出现下腔静脉瘤栓，1 例出现肾静脉瘤栓，1 例伴有腹膜后淋巴结转移，1 例伴有肺转移。**结论** 当年轻成人出现囊壁边界清楚、有假包膜、伴有分隔及出血的囊实性肿块，增强扫描实性成分、囊壁、分隔呈“快进慢出”型轻中度渐进性强化，且无腹膜后淋巴结肿大时，应考虑到原发性肾脏滑膜肉瘤的可能性。

EPO-1171

肾脏上皮样血管平滑肌脂肪瘤影像学表现

尚阿利,杨全新,卢晓霞
西安交通大学医学院第二附属医院

目的：肾脏上皮样血管平滑肌脂肪瘤((epithelioid angiomyolipoma,EAML ），是血管平滑肌脂肪瘤(AML) 的一种罕见亚型，以上皮样细胞增殖为主，是具有恶变潜能的间叶组织肿瘤。探讨肾脏上皮样血管平滑肌脂肪瘤与肾脏血管平滑肌脂肪瘤的影像学特征。
方法：回顾性分析 2017 年 1 月至 2019 年 6 月经手术病理证实的 6 例（男 4 例女 2 例）EAML 和 6 例 AML(男 3 例女 3 例)的影像学表现，所有病例术前均进行了双肾 MSCT 平扫及动态增强扫描。4 例患者行腹部超声检查。
结果：EAML6 例患者中 4 例为单发，2 例为多发，AML 组中 6 例患者中 5 例为单发，1 例为多发，但两组患者多发病灶中仅最大病例行手术切除病理证实。EAML 组中 6 例患者共计 9 处病灶，其中乏脂病变为 5 处（占 56%），乏脂病变大小为（1.41±0.16）×（1.18±0.18），AML 组中 6 例患者共计 8 处病灶，其中乏脂性病变为 5 处（占 62.5%），病变大小为（2.68±0.13）×

（2.36±0.33），两组患者数值有统计学差异（P＜0.001）；EAML 组病例病灶中 8 处病灶突出于肾脏轮廓之外,1 处病灶位于肾实质轮廓之内； AML 中 4 处病灶突出于肾轮廓之外，3 处病灶位于肾轮廓之内，1 处病灶位于肾盂内。EAML 及 AML 组病变平扫 CT 值分别为（49.56±10.14），（45.4±1.97），EAML 及 AML 皮髓质期病变 CT 值为（111.72±18.20），（91.9±21.09）;EAML 及 AML 组实质期病变 CT 值为（94.13±14.99），（93.48±14.82），两组患者 CT 平扫及增强之间没有统计学差异（p 均＞0.05）。EAML 组中 3 例行超声检查，回声为低回声、混合回声、中等回声；AML 组中 3 例行超声检查，1 例误诊为肾囊肿，2 例为中等回声、稍高回声。所有病例均无局部浸润、血管受累和远处转移。

基于双源双能量 CT 双能量扫描模式下低管电压联合迭代重建在泌尿系结石诊断中的临床应用研究

王思凯,张雪,何其舟
西南医科大学附属中医医院

目的 基于双源双能量 CT 双能能量扫描模式探讨低管电压联合迭代重建（SAFIRE）技术对泌尿系结石检查的可行性。**方法** 前瞻性纳入因怀疑泌尿系结石来我院行全腹部 CT 平扫检查的患者 55 例，均采用双能量扫描模式，A、B 球管电压及参考 mAs 分别是 80kVp/419mAs、Sn140kVp /162 mAs，旋转时间 0.5s，螺距 0.7，准直 32×0.6mm。采用线性融合技术，权重因子 M=0.5，滤波反投影重建（FBP）技术，获取类似于 120kVp 的标准管电压图像（a 组），作为本研究图像质量的参考标准；低管电压 80kVp（b 组）图像采用迭代重建（SAFIRE）技术；重建层厚和间距均为 3mm。记录低管电压和标准管电压组检查的结石数量、大小及 CT 值，肾实质的 CT 值及噪声（SD），并计算其信号噪声比（SNR）。采用 SPSS17.0 软件进行统计学分析，计量资料以`x±s 表示，采用配对样本 t 检验进行组间比较，以 P<0.05 有显著性统计学差异。**结果** a、b 两组均检出所有结石，共计 189 粒，其中肾结石 134 粒，输尿管结石 50 粒，膀胱结石 6 粒。结石大小（1.07±0.55cm/1.06±0.64cm）、肾实质 SD（11.64±2.30/11.81±2.29）及肾实质 SNR（3.09±0.72/3.08±0.73）均无统计学差异（t=-1.462，t=1.013，t=-0.290，P 均>0.05）；结石 CT 值（802.67±398.08HU/1003.18±513.98HU）和肾脏 CT 值（34.55±3.18HU/34.92±3.91HU）存在统计学差异（t=12.635，P<0.001；t=2.15，P<0.05）。**结论** 低管电压联合迭代重建图像质量与标准管电压图像质量大致相当，并不影响泌尿系结石的准确诊断。

Value of PI-RADS Version 2 scores and PSA levels for the diagnosis of prostate cancer

Xiaohu Li,Qilong Song,Yinfeng Qian,Bin Liu,Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

PURPOSE

To explore the value of Prostate Imaging Reporting and Data System Version 2 (PI-RADS V2) and serum prostate specific antigen (PSA) for the diagnosis of prostate cancer (PCa).

METHOD AND MATERIALS
932 males who underwent multi-parametric MRI (MP-MRI) in our hospital. 245 patients with prostate cancer confirmed by biopsy. Receiver operating characteristic curve(ROC) analysis was used to analyze the efficacy of PI-RADS V2 and PSA in the diagnosis of clinically significant prostate cancer (sPCa), in addition, ROC was performed to analyze the efficacy of PI-RADS V2 in peripheral zone(PZ) and transitional zone(TZ)

RESULTS
he correlation coefficient between the PI-RADS V2 scores and the prognostic Gleason grade groups was r=0.703 (p<0.01); the correlation coefficient between the PSA level and the prognostic Gleason grade groups was r=0.446 (p<0.01). When using PI-RADS V2 for the diagnosis of clinically sPCa, the area under the curve (AUC) was 0.942, the optimal diagnostic threshold was 4 category, the sensitivity was 0.949, and the specificity was 0.806, P<0.01; When using the PSA level for the diagnosis of clinically sPCa, the AUC was 0.786, the optimal diagnostic threshold was 13.23ng/ml, the sensitivity was 0.836, and the specificity was 0.581, P<0.01. In the peripheral zone (PZ), when using PI-RADS V2 for the diagnosis of clinically sPCa, the AUC was 0.924, the optimal diagnostic threshold was 4 category,the sensitivity was 0.947, and the specificity was 0.765, P<0.01; In the transitional zone (TZ), when using PI-RADS V2 for the diagnosis of clinically sPCa, the AUC was 0.964, the optimal diagnostic threshold was 4 category, the sensitivity was 0.950, and the specificity was 0.857, P<0.01.

CONCLUSION
Significant positive correlation were found between the PI-RADS V2 score and prognostic Gleason grade groups, some extent positive correlation were found between PSA and prognostic Gleason grade groups. PI-RADS V2 performs better than PSA level and is slightly better for diagnosing TZ lesions than PZ lesions. PSA has certain value for the diagnosis of clinically sPCa.

基于 TNM 分期的膀胱癌结构式报告系统在医学影像中的应用

马明明,刘义
北京大学第一医院

基于 TNM 分期的膀胱癌结构式报告系统在医学影像中的应用
目的：本研究开发了用于评估膀胱癌的结构式报告模板，以自动确定肿瘤分期，从而提高诊断信息的可用性，并促进影像学科的信息化。
方法：膀胱癌结构式报告模板包含两个部分。 一，临床评价：如病理类型、病理等级等。二，图像评价：i，病变描述，如位置，形态，数量等; ii，肿瘤侵犯，包括肌层浸润和外周侵犯，以及肿瘤与前列腺、精囊、直肠、盆腔壁、腹壁之间的关系; iii，淋巴结转移，包括淋巴结短径、位

置、数量; iv，远处转移，如非区域淋巴结转移、内脏转移。膀胱癌分期采用的是第 7 版的 AJCC。肿瘤描述后，TNM 分期可以自动获得并植入结构式报告中。
结果：放射科医师可以通过轻松点击并填充结构式报告，自动生成膀胱癌的肿瘤分期。 由于报告中使用了 Redlex 标准化词典，减少了诊断医师之间的差异，提高了报告和临床信息的质量，并促进了数据挖掘，因此结构式报告被广泛接受并成为将图像信息转换为数据的理想载体。它还为医学影像教学提供了一种新模式，帮助医师开发膀胱癌的影像诊断思路，并减轻肿瘤分期的记忆困难。
结论：疾病特异性的结构式报告可以在医学中被接受和推广，因为它可以完整、清晰地传输图像检查信息，并提高医学影像工作的质量。

Comparative Study of DCE-MRI Pharmaceutical Kinetic Models and MVD for Characterizing Endometrial Carcinoma Microcirculation

Zhijun Ye,Gang Ning,Xuesheng Li
West China Sceond University Hospital

Porpose: To compare five pharmacokinetic models for the analysis of dynamic contrast enhanced (DCE) magnetic resonance imaging (MRI) and study the angiogenic profile based on histomorphological marker in assessing microcirculation in endometrial carcinoma.
Methods: From April 2017 to July 2018, 69 female adults(mean age, 52 years; age range, 24－78 years) were recruited who were pathologically confirmed as endometrial cancer. Pelvic DCE-MRI was acquired with a temporal resolution of 2.5 s. Regions of interest were drawn by radiologists and the data was analyzed where Tofts, extended Tofts, adiabatic tissue homogeneity (ATH), conventional compartmental (CC) and distributed parameter (DP) models. Immunohistochemical staining with CD105 allowed assessment of microvessel density (MVD). Transfer constant(Ktrans), efflux rate constant(Kep), Blood flow (F), permeability surface area product (PS), plasma space fractional volume (Vp), extravascular extracellular space fractional volume (Ve), and extraction fraction (E) were derived. For all the derived imaging parameters and MVD, 95% confidence interval (CI) of the median were calculated. And the parameters were compared using receiver operating characteristic (ROC) analysis to differentiate tumor and normal myometrium.
Results: Permeability parameters Kep, E and PS in tumor were lower than normal myometrium. Areas under ROC curves(AUCs) for PS were >0.7 in three models. And AUCs for E was >0.75 in DP model, >0.65 in ATH and CC models. Kep was >0.75 and >0.6 for Tofts and Extended Tofts models respectively. The difference in Ktrans between two tissues was not significant. F in tumor was slower, with all AUCs >0.7. Ve and Vp in tumor were significantly lower, Vp with AUC >0.75 for DP and CC models, and <0.6 for ATH and Extended Tofts models. AUCs for Ve attained the largest value with AUCs >0.8 for four models except CC model(AUC<0.65). ATH-derived Ve attained the largest AUC value of 0.8474.MVD in tumor was lower than the normal myometrium, with AUC value of 0.879.
Conclusion:endometrial carcinomais characterized by low permeability and low blood flow in comparison with most solid tumours. Of the models investigated, the adiabatic

tissue homogeneitymodel was the best predictor of predict the depth of myometrial invasionin endometrial cancer patients.

动脉自旋标记 MRI 在慢性肾功能不全分肾功能评估中的应用价值

时文伟
山西医科大学第一医院

目的 探讨动脉自旋标记 MRI（ASL-MRI）评估慢性肾功能不全分肾功能的价值。
方法 回顾性分析 22 例慢性肾功能不全者 3.0 T 磁共振进行 ASL 扫描及常规 MRI 扫描，得到分肾肾皮质的肾血流量(renal blood flow，RBF)，且所有受试者均行 99mTc-DTPA 肾动态显像 Gates 法测定肾小球滤过率（Gates-GFR），并作为评价分肾功能的临床参考标准。根据两肾总的 Gates-GFR 将所有受试者分为三组：Ⅰ组（GFR ＞ 60 mL/min），Ⅱ组（30<GFR≤60 mL/min），Ⅲ组（GFR ≤30 mL/min）。采用独立样本 t 检验比较各组肾皮质 RBF 值的差异，两肾肾皮质的 RBF 值分别与分肾 eGFR 进行 Pearson 相关性分析及 Bland-Altman 一致性检验。
结果 Ⅲ组 RBF 值（152.37±19.82）ml/100g/min 显著低于Ⅰ组（221.60±15.47）ml/100g/min 和Ⅱ组（189.92±16.45）ml/100g/min，其差异有统计学意义（P<0.05）。两肾肾皮质的 RBF 值分别为:左肾（191.28±18.63）ml/100g/min、右肾（197.39±17.15）ml/100g/min，每侧肾皮质 RBF 值与其同侧肾 eGFR 具有很好的一致性，且呈正相关（r=0.79，P<0.05）。
结论 ASL-MRI 可以无创、无辐射评估分肾功能，是分肾功能检测的潜在替代。

磁共振定量测量腹部脂肪评估子宫内膜癌生物特征的应用价值

蒋璟璇[1]，赵佳鑫[2,1]，吴献华[1]
1.南通大学附属医院
2.如东县人民医院

目的：探讨通过磁共振测量腹部脂肪量及脂肪分布评估子宫内膜癌生物特征的应用价值。**方法**：回顾性收集经手术及病理确诊正常患者 50 例和子宫内膜癌患者 104 例，获取生物特征信息包括病理分期、分级、脉管浸润和 Ki-67 表达，通过 MRI 测量入组患者腹部脂肪参数包括腹部皮下脂肪厚度，腹部皮下脂肪面积、腹部内脏面积和腹部总脂肪面积。采用 Mann-Whitney U 检验比较各组腹部脂肪参数，腹部脂肪参数和 Ki-67 阳性表达率的相关性采用 Spearman 方法评价。**结果**：子宫内膜癌患者各腹部脂肪参数均明显高于正常患者（P<0.001）；高分化子宫内膜癌患者腹部脂肪参数明显高于低分化组（P<0.05）；I 期子宫内膜癌患者腹部脂肪参数均明显高于 II 和 III 期患者（P<0.05），IIA 和 IIB 期患者腹部脂肪参数明显高于 III 期患者（P<0.05）；无脉管浸润患者腹部脂肪参数明显高于有脉管浸润患者（P<0.05）。Ki67 的表达与腹部脂肪参数呈负相关性（P<0.05）。**结论**：腹部脂肪含量较高者更易罹患子宫内膜癌，但其分化程度和侵犯性较低，利用磁共振定量测量子宫内膜癌患者腹部脂肪可用于评估这些生物特征。

EPO-1178

用 mDixon-quant 序列定量睾丸和附睾中脂肪沉积：与年龄和射精的相关性

郭若汨,王劲
中山大学附属第三医院

目的：本研究的目的是通过用 mDixon-quant 定量测量脂肪/水信号比，定量评估睾丸和附睾中的脂肪沉积，并探讨其与年龄和射精的关系。
材料与方法：对 120 例患者进行常规盆腔 MR 成像和 mDixon-quant 定量分析。根据 mDixon-quant 定量的脂肪/水信号强度，测量睾丸和附睾的脂肪/水信号比值。
结果：早年成年组（0.952～3.550%，P<0.05，5.182～12.725%，P<0.05）睾丸和附睾的脂水信号比值明显高于幼儿组（0.611～2.198%，1.310～4.520%）和青年组（0.659）；-2.360%和 1.568-4.469%，但均低于中年成年组（1.538-4.249%，P<0.05，5.830-19.002%，P<0.05）。青年组每月射精 10 次以上（0.750～2.022%，P<0.05），12 小时内射精 3 次的一名受试者睾丸脂肪沉积减少，附睾的脂水信号比下降。
结论：本研究结果表明，mDixon-quant 定量法可作为评价睾丸和附睾脂肪沉积的无创、定量和客观方法。该方法可指导不同年龄组不同射精经验的睾丸和附睾脂肪沉积。此外，我们的研究结果还可以通过定量测量睾丸和附睾的脂肪沉积，从而更准确地诊断和监测睾丸和附睾的生殖功能。

EPO-1179
肾脏及肾上腺肿瘤伴下腔静脉瘤栓的影像诊断

李丽伟,刘茁,何为,张丽,马静,崔立刚,王淑敏
北京大学第三医院

目的 下腔静脉瘤栓为起源于血管壁的从邻近器官如肝脏、肾脏、肾上腺、等肿瘤，向下腔静脉腔内延伸引起。诊疗方案的制定，需要准确的影像评肿瘤的类型、分期、下腔静脉瘤栓分级。本研究结合原发肿瘤病理特征，分析瘤栓超声及 CT、核磁影像表现，并探讨超声在瘤栓诊断的价值。
方法 回顾性分析我院 2014.1-2019.1 经手术、穿刺病理或其他影像学证实的肾脏及肾上腺肿瘤伴下腔静脉瘤栓患者共 146 例。分析原发肿瘤的病理类型及超声、CT 或/和核磁的影像学表现及其瘤栓的影像特征。
结果
1. **不同病理类型瘤栓**。病理结果明确患者共 116 例，肾透明细胞肾细胞癌 86 例（74%），乳头状肾细胞癌 13 例（11%）其他类型共 17 例（15%）。
2.**下腔静脉瘤栓**。超声提示静脉管径内均可见低、等或高回声填充。下腔静脉瘤栓长度 2.6-14.4cm。下腔静脉瘤栓可分为充满型及未充满游离瘤栓。
3.**心房内瘤栓。**MayoⅣ级的心房内瘤栓共 11 例，其中 8 例手术治疗，4 例选择保守治疗。超声心动图可以评估心房瘤栓大小、形态、活动度，动态监测，判断心房内瘤栓对麻醉血流的影响、协助心外医生判断是否需打开心包取栓，具有重要临床价值。
4.**下腔静脉瘤栓伴血栓**。下腔静脉例瘤栓伴血栓 17 例。核磁主要依据增强是否强化来鉴别癌栓血栓。超声通过二维形态、血流频谱及超声造影表现可以提高血栓鉴别的准确性。
5.血管异常情况。CTA 及增强核磁对于多支静脉、侧枝循环显示优于超声。
结论 不同病理类型肾及肾上腺肿瘤伴下腔静脉瘤栓肿瘤影像表型不同，需全面综合评估。其中超声可以显示原发肿瘤、瘤栓范围、活动度鉴别瘤栓有无信号及动脉或静脉频谱、下腔静脉的管径大小、观察下腔静脉血流，及残余管腔血流信号及是否伴下肢静脉血栓。超声造影可以增加瘤栓伴血

栓鉴别的准确率。超声心动可以动态、直观地评估心房内瘤栓，对治疗方案及术前影像评估、预后随访有重要临床价值。

Radiomic models based on enhanced-CT scanning to distinguish renal clear cell carcinoma from non-clear cell carcinoma

Ping Wang[1,2],Xiaoping Yin[1]
1.Affiliated Hospital of Hebei University
2.Hebei University

Objectives: To establish predictive radiomic models based on enhanced-computed tomography (CT) scan images of renal cell carcinoma (RCC), and assess the accuracy of the predictive model for distinguishing clear cell RCC (ccRCC) from non-clear cell renal cell carcinoma (non-ccRCC).
Methods: This retrospective study analyzed 100 cases with RCC which were confirmed by pathology. The region of interest (ROI) of all the lesions were delineated in cortical phase. The samples were randomly divided into two groups, including training set and testing set according to the ratio of 7:3, a total of 396 radiomic features were computationally obtained. The ANOVA test, general linear model, and the first 10% mutual information were used to decrease the dimension of features. Finally, 8 features were selected, Logistic Regression model (LR) and Random Forest model (RF) were established to discriminate RCC subtypes, and were validated using 4-fold cross-validation.
Results: RF model and LR model were established based on the 8 features of enhanced-CT scan images of 100 cases (cortical phase). The RF model had an area under the curve (AUC) value of 0.988 (0.972), a sensitivity of 0.93 (0.875), a specificity of 1(1), and an accuracy of 0.943 (0.9) in the training (testing) set. The LR model had an AUC value of 0.865 (0.868), a sensitivity of 0.667 (0.75), a specificity of 0.923 (1), and an accuracy of 0.714 (0.8) in the training (testing) set.
Conclusion: We can conclude that RF model had higher accuracy than LR model in distinguishing ccRCC from non-ccRCC, and showed high sensitivity and specificity.

卵巢卵泡膜纤维瘤组肿瘤的 CT 诊断价值

宋思思[1,2],陈淑君[1],宁刚[2]
1.德阳市人民医院
2.四川大学华西第二医院

目的：分析卵巢卵泡膜纤维瘤组肿瘤的影像表现，提高其诊断水平。
方法：回顾性分析 28 例卵巢卵泡膜纤维瘤组肿瘤的临床及 CT 资料，分析 CT 征象，并与病理进行对照。

结果：28 例患者中 27 例（96.4%，27/28）表现为单侧肿块， 1 例（3.6%，1/28）为双侧肿块，共计 29 个病灶。病理证实纤维瘤 21 个，卵泡膜-纤维瘤 7 个，卵泡膜细胞瘤 1 个。肿块大小约 4.0cm×4.0cm×3.2cm～14.0 cm×12.2 cm×10.7 cm，最大径平均约 9.7±2.3cm。15 个（51.7%，15/29）可见卵巢血管蒂征阳性，能判断肿瘤起源，14 个（48.2%，14/29）未见卵巢血管蒂征，无法准确判断起源。19 个（65.5%，19/29）呈圆形或类圆形，7 个（24.1%，7/29）形态不规则，3 个（10.3%，3/29）呈分叶状。25 个（86.2%，25/29）病变边界清楚、与子宫及周围肠管分界清楚，3 个（10.3%，3/29）局部与子宫分界不清，1 个（3.4%，1/29）因蒂部扭转与周围肠管分界不清、但与子宫分界清楚。25 个（86.2%，25/29）肿块以实性成分为主；2 个（6.8%，2/29）肿块呈囊实性，最后经病理证实 2 个囊实性肿块分别为卵泡膜细胞瘤和卵泡膜-纤维瘤；2 个（6.8%，2/29）肿块以钙化为主，患者年龄较小均为 21 岁，经病理证实均为纤维瘤。增强扫描 15 个（51.7%，15/29）为轻度强化，11 个（37.9%，11/29）为无强化，2 个（6.9%，2/29）为中度强化，1 个（3.4%，1/29）为重度强化，1 个中度强化者内可见纤细的血管影。13 例（46.4%，13/28）合并腹水，其中 11 例为少量腹水，2 例为中等量腹水。

EPO-1182
超低管电压（80kVp）在低体重患者肾动脉 CT 成像中最佳 ASIR-V 权重的探索

李豆,刘振堂,胡智军,魏东红,边新春
长安医院

目的：探索超低管电压（80kVp）在低体重患者肾动脉 CT 成像中的最佳 ASIR-V 权重。
方法 前瞻性收集我院进行 Revolution CT 肾动脉成像患者 20 例，排除标准为：①BMI≥25Kg/m²；②有造影剂过敏史者；③肝、肾功能不全者。扫描条件管电压 80kVp，噪声指数（NI）为 10，自动管电流技术，对比剂浓度 350mgI/kg，对比剂种类选取碘帕醇 370mgI/ml。扫描完成后采用 0%-100% ASIR-V 重建（重建间隔 20%），重建层厚为 1.25mm。分别在双肾动脉及同层面背部皮下脂肪放置感兴趣区（ROI），记录其 CT 值及 SD 值，计算信噪比（SNR=CT/SD）及对比噪声比(CNR=（CT 肾动脉-CT 脂肪）/SD 脂肪)，采用 5 分法对各组图像质量进行双盲法主观评分（5 分，图像质量最好；1 分，图像质量最差）。采用单因素方差分析比较各组间 CT 值、SD 值 SNR 及 CNR，两名医师主观评分一致性采用 Kappa 检验，评分采用 Friedman 秩和检验。结果：随着 ASIR-V 权重由 0%增加至 100%，SD 值逐渐降低，SNR、CNR 值逐渐增加，且各组间差异具有明显统计学意义（p<0.001）。 当 ASIR-V 比例由（0%）增加至（80%）时，图像主观评分依次增高，从 90% ASIR-V 开始，图像主观评分逐渐降低，80% ASIR-V 的主观图像质量最好。80kVp 肾动脉成像时平均辐射剂量约为（2.11±0.22）mSv。

EPO-1183
基于常规 MR 原发肿瘤大小对于 IB 期宫颈癌淋巴结转移的预测价值

刘国源,董越
辽宁省肿瘤医院

目的：评估常规 MR 原发肿瘤大小对于ⅠB 期宫颈癌淋巴结转移的预测价值。

方法：回顾性分析 2015 年 1 月-2018 年 12 月间在辽宁省肿瘤医院收治的宫颈癌的患者，由影像医师测量肿瘤径线及淋巴结短径依据患者淋巴结有无转移，将数据分为淋巴结转移组及非淋巴结转移组，比较两组间肿瘤径线的差异，并使用 ROC 曲线分析，计算曲线下面积(area under the curve, AUC)评估肿瘤径线对于淋巴结转移与否的诊断价值。再依照患者淋巴结短径大小，将数据划分为三组，分别为短径＜5mm、短径≥5mm 且＜10mm 及短径≥10mm 组，并分别评估肿瘤径线在亚组间的诊断价值是否存在差异。
结果：肿瘤前后径在淋巴结转移组与无转移组两组间的差异无统计学意义（p＞0.05）。肿瘤上下径、左右径及最大径在两组间的差异有统计学意义（p＜0.05）。鉴别淋巴结是否为转移淋巴结时，上下径 AUC（0.727）最大，其次是最大径（0.715）及左右径（0.686）。淋巴结短径＜5mm 组未见转移淋巴结，淋巴结短径≥10mm 组各项均无统计学意义（p＞0.05），只有淋巴结短径≥5mm 且＜10mm 组的肿瘤上下径和最大径在淋巴结转移组与无转移组间差异存在统计学意义，在鉴别淋巴结是否为转移淋巴结时，上下径 AUC（0.710）最大，其次是最大径（0.695）。
结论：在评估肿瘤径线对淋巴结转移的诊断价值中，上下径较最大径的表现更优异，尤其是对于判断正常大小淋巴结性质。前后径及左右径对诊断淋巴结情况的价值有限。

原发性肾上腺肉瘤样癌一例

邓文友,郭小芳,刘玉林
湖北省肿瘤医院

患者，男，55 岁，因“体检发现白细胞明显升高 1 周”一般情况良好，既往史无特殊，骨穿提示：髓像粒系比值增高，CT 扫描：右侧肾上腺巨大类圆形等/稍低混杂密度肿块影，大小约 10×7cm，边界尚清，增强扫描动脉期不均匀强化，静脉期持续强化，，腹膜后多发小淋巴结。手术及病理诊断：经右侧沿肋缘下逐层切开入腹，完整移除肿瘤并清扫淋巴结。标本切面灰白灰黄质韧，似有包膜；镜下见：细胞核深染，胞浆丰富，见核分裂象，伴坏死及炎细胞浸润，IHC:PCK(+) 、CK8/18(+)、 VIM(+)、 LCA(-) S-100(-) 、SOX-10(-) 、SMA（-）、 Desmin（-）、KP-1(弱+) 、PGM-1(-)、、INI-1（+）、HMB45（-）、Ki-67(Li:50%)病理诊断：（右肾上腺）肉瘤样癌，灶性区见少许肾上腺组织残存；（腹主动脉旁）淋巴结（1/3）查见转移。肉瘤样癌是由上皮细胞和间质细胞成分构成的恶性肿瘤，在形态上存在癌细胞向肉瘤样细胞分化状态，好发于 60 岁以上男性，常见发病部位有呼吸道、胃肠道及乳腺，也见于肾及膀胱等部位[2]，原发于肾上腺肉瘤样癌（ASC）是肾上腺皮质腺癌的一种特殊亚型，临床十分罕见，通常患者无明显症状或症状较轻，表现为腰腹痛、腹部肿块、体重减轻及全身乏力，可有激素分泌异常表现。ASC 在国内外均为单个病例报道，临床表现缺乏特征性，无特异性肿瘤标志物，影像检查亦不具典型征象，一般表现为单侧肾上腺巨大肿块，内见多发片状坏死区，增强扫描实性部分呈持续轻中度强化。由于 ASC 术前确诊比较困难，同时是高度侵袭性肿瘤，临床预后极差，多数患者确诊时分期较晚或已转移，即使行手术切除及完整转移灶切除，大部分患者仍会因肿瘤复发或远处转移在术后 1 年内而死亡，早期 ASC 患者行根治术后辅助化疗及手术区域放疗可能会控制疾病进展，肾上腺皮质腺癌的靶向药物对 ASC 的预后可能会有所改善。

腹膜后非典型类癌一例

张冉,肖新兰
南昌大学第二附属医院

背景：

腹膜后类癌是一种罕见的腹膜后肿瘤，它与胃肠道、呼吸道等其他部位的类癌一样，起源于神经内分泌细胞。腹膜后类癌的恶性程度，应以肿瘤是否有局部侵犯、播散或远处转移为依据。

临床病例：

一名 66 岁女性患者，无意间发现右肾区占位。剖腹探查，术中见右后腹膜区囊实性占位与周围组织分界清楚。病理报告显示腹膜后非典型类癌病人恢复良好，出院后无并发症，随访。

结论：

腹膜后非典型类癌影像学检查缺乏特异性，增强扫描可明显强化，出现坏死、囊变、钙化，确诊依靠病理。

IgG4 相关肾病与肾脏恶性肿瘤 CT 影像对照研究

吴哲[1],孙昊[2],金征宇[2]
1.抚顺市中心医院
2.北京市协和医院

摘要：目的 探讨 IgG4 相关肾病 CT 影像特点，与肾脏恶性肿瘤进行鉴别诊断。方法 回顾性分析 36 例 IgG4 相关肾病患者，其中累及肾实质 26 例，累及肾盂 10 例，双肾发病或多病灶 24 例，单病灶 12 例，研究其影像学特征，包括临床病史、病灶的大小、形态、密度、分布范围、增强后强化的特点、峰值、肾盂受累情况、有无淋巴结肿大等，与肾脏恶性肿瘤包括肾癌、肾盂癌、淋巴瘤进行鉴别诊断。结果：IgG4 相关肾病具有较为特有的临床及影像学特征，虽然肾脏或肾盂受累，但无肾积水及血尿等恶性肿瘤常见临床表现，边界多清楚完整，其具有典型的持续性渐进性强化的特点，峰值多位于实质期及排泄期，病变无液化、坏死、囊变及钙化等影像学表现，即便肾盂受累明显而且病灶较大也无周围肾实质侵犯，肾盂形态依然存在，管壁光整，无周围淋巴结增大的发生。结论 IgG4 相关肾病 CT 影像与肾脏恶性肿瘤相似之处，结合其临床、CT 影像和血 IgG4 相关实验室检查，可以做出明确诊断，避免不必要手术。

CT 平扫直方图参数对卵巢低密度囊性病变中不典型子宫内膜异位囊肿的诊断价值

李烨,刘爱连,牛雅欣
大连医科大学附属第一医院

目的：通过对单纯卵巢低密度囊性病变囊液的分析，评估 CT 平扫直方图参数对不典型子宫内膜异位囊肿的诊断价值。**材料及方法：**回顾性分析 2011 年 7 月－2017 年 6 月间，于我院行腹部 CT 扫描并经手术病理证实卵巢低密度（类圆形，病灶直径小于 3cm，CT 值低于 45HU 且高于 0HU，无实性成分，囊壁厚度小于 2mm）囊性病变患者共 46 名患者：卵巢子宫内膜异位囊肿 12 例，卵巢囊腺瘤 22 例，卵巢囊肿 15 例，输卵管积水 5 例。应用 Omni-Kinetics 软件测量病灶最大层面囊液的直方图各参数。使用独立样本 t 检验进行卵巢子宫内膜异位囊肿与非卵巢子宫内膜异位囊肿比较，使用 logistics 回归将直方图参数中可鉴别两者的参数进行联合，使用 ROC 曲线评估 CT 值、直方图参数及直方图参数联合后对卵巢子宫内膜异位囊肿的诊断价值。使用 Medcalc 比较两者间的诊断效

能。**结果**：CT 值、RMS、MeanDeviation、kurtosis、Quantile5、Quantile10、Quantile25、Quantile50、Quantile75、Quantile90 在卵巢子宫内膜异位囊肿与非卵巢子宫内膜异位囊肿间差异有统计学意义，P 值分别为 0.007、0.019、0.005、0.005、0.001、0.003、0.009、0.017、0.032、0.036，ROC 曲线下面积分别为：0.762、0.730、0.762、0.694、0.760、0.782、0.770、0.736、0.740、0.736。CT 值、联合后直方图参数 ROC 曲线下面积分别为：0.762、1.000，95%CI 分别为：（0.615,0.909）、（1.000,1.000），后者诊断效能高，P=0.0018。**结论**：CT 平扫囊液直方图参数可以为诊断卵巢低密度囊性病变中不典型子宫内膜异位囊肿提供可靠信息，直方图参数联合诊断能够提供有效诊断。

压缩感知技术在子宫 3D T2WI 中的初步应用

牛雅欣,刘爱连,赵莹,陈丽华,宋清伟
大连医科大学附属第一医院

目的 探讨压缩感知技术在子宫 3D T2WI 扫描中的可行性。**材料与方法** 招募 17 例健康人在我院行 3.0 T MRI 子宫 3D T2WI 结合压缩感知序列扫描，CS 加速因子为 3、4、5、6、7、8，每位志愿者共获取 6 组图像，扫描时间分别为 253 s, 190 s, 155s, 128s, 110 s, 98s。由两位医师分别对 6 组图像质量进行 3 分制主观评分。两位医师采用双盲法，使用 Philips IntelliSpace Portal 3.0T MR 工作站对子宫外肌层与同侧同层臀大肌以及相邻上下层面分别各放置 1 个感兴趣区（regionofinterest, ROI），测量数据包括子宫外肌层的信号强度（SIm）与同侧同层臀大肌的信号强度(SIg) 及标准差(SDg)，并计算信噪比(SNR)和对比噪声比(CNR)，所测量数据分别取均值，利用 SPSS 22.0 软件进行统计学分析。采用 ICC 比较两位医师所测得数据的一致性，选择高年资医师所测数据进行后续统计学分析。应用单因素方差分析检验 6 组 SNR、CNR 的差异性，采用配对样本 t 检验比较 CS3 组与其他组间 SNR、CNR 的差异性，采用 Wilcoxon 秩和检验比较组间的主观评分。**结果** 两位医师测量数据一致性良好（ICC 均>0.8）。与 CS3 组相比，CS4 组、CS5 组之间的 SNR、CNR 差异性无统计学意义（P>0.05），而 CS6 组、CS7 组、CS8 组与 CS3 的之间的 SNR、CNR 的差异性有统计学意义(P<0.05)。 随加速因子增加，各组图像质量评分随之下降。CS3 组与 CS4、CS5、CS6 组图像质量评分差异无统计学意义（P>0.05），CS3 组与 CS7、CS8 图像质量评分差异有统计学意义。**结论** CS 技术可用于 3.0T MRI 子宫 T2WI 扫描，在保证图像质量前提下缩短扫描时间，CS5 是最佳加速因子。

EPO-1189
单源双能 CT 碘定量鉴别卵巢囊腺瘤与卵巢癌的价值

牛雅欣,刘爱连,李烨,王楠,方鑫
大连医科大学附属第一医院

目的 探讨单源双能 CT 碘定量对卵巢囊腺瘤与卵巢癌的鉴别诊断价值 **资料与方法** 回顾性分析经手术病理证实，且采用单源双能 CT 行 GSI 三期增强扫描，且实性成分直径大于 1cm 的卵巢癌 19 例和卵巢囊腺瘤 14 例。在 ADW4.5 工作站上，生成三期碘（水）浓度图。两名观察者采用双盲分别测量三期增强扫描各病灶实性部分的碘(水) 浓度值(Iodine Concentration，IC)，记为 ROI_T，同时测量同侧髂内动脉的碘（水）浓度值,记为 ROI_A，计算标准化碘浓度（Normalized Iodine Concentration, NIC，NIC= ROI_T/ROI_A）。使用组内相关系数（ICC）分析两名观察者测量结果一

致性。采用独立样本 t 检验或 Mann-Whitney U 检验分析两组病灶增强三期的碘（水）浓度值及标准化碘（水）浓度值的差异，并使用诊断效能的受试者工作特征曲线（ROC 曲线）评估有统计学意义参数的诊断效能。 **结果** 两位医师测量数据一致性良好（ICC 均>0.9）。动态三期增强两者的 IC 值、NIC 值的差异具有统计学意义（P<0.05）。动脉期 IC 值和 NIC 值鉴别两者的 AUC 分别为 0.827、0.870，敏感度和特异度分别为 78.9%和 71.4%、78.9%和 73.7%；静脉期 IC 值和 NIC 值鉴别两者的 AUC 分别为 0.812、0.856，敏感度和特异度分别为 68.4%和 71.4%、73.7%和 73.7%；延迟期 IC 值和 NIC 值鉴别两者的 AUC 分别为、0.752、0.786，敏感度和特异度分别为 63.2%和 71.4%、73.7%和 71.4%。**结论** 单源双能 CT 碘定量鉴别卵巢癌与卵巢囊腺瘤提供了重要的信息。

EPO-1190

Zoom into uterus microstructure - A pilot study in healthy volunteers

Yaxin Niu,Ailian Liu,Ying Zhao,Lihua Chen
The First Affiliated Hospital of Dalian Medical University

Purpose:
To evaluate the feasibility of high resolution diffusion weighted imaging (DWI) in uterus with small FOV.
Methods:
Ten healthy subjects (mean age 25.7±1.95 (23－29) years) were prospectively enrolled for uterus MRI at 3.0T (Ingenia CX, Philips) with a 16-channel abdominal array coil. The MR protocols included traditional DWI and small FOV DWI (for both sequences, axial orientation, b = 0/600/1000 s/mm^2, slice thickness = 3 mm. In-plane resolution for traditional and small FOV DWIs were 3x3 mm^2 and 2.5x2.5mm^2, and scan time were 180 s and 270 s). All image analysis was performed on ISP workstation (Philips). Two radiologists independently placed the ROIs on myometrium and the gluteus muscle of the same level to measure SNR, CNR, and the apparent diffusion coefficients (ADC). The image SNRs, CNRs, and ADCs between different sequences were tested using Paired-sample t test.
Results:
At b value 0 and 600, the CNRs from traditional DWI were significantly higher than those from small FOV DWI (P<0.05). For other groups, there was no statistical difference of SNR and CNR between traditional DWI and small FOV DWI groups. At b value 1000, the ADCs measured with traditional DWI appeared higher than those from small FOV DWI (P<0.05). There was no statistical difference of ADCs between traditional and small FOV DWI when b = 600.
Conclusion:
Diffusion imaging in uterus is feasible in uterus, and the small FOV scheme could provide higher resolution than traditional one with negligible sacrifice of SNR, at the cost of longer scan time. Small FOV scheme could yield in more accurate ADC measurement, especially at high b value, due to the reduced image distortion.

CT 灌注成像鉴别肾上腺乏脂性腺瘤和对侧正常肾上腺的价值

赵莹,刘爱连,刘静红,刘义军,方鑫
大连医科大学附属第一医院

目的 探讨 CT 灌注成像鉴别肾上腺乏脂性腺瘤与对侧正常肾上腺的价值。**方法** 回顾性收集行 Revolution CT 灌注扫描且经病理证实的肾上腺乏脂性腺瘤 10 例（平扫 CT 值 ＞ 10HU）。CT 灌注(CT perfusion, CTP)成像采用 16 cm 探测器覆盖的轴扫模式，ASIR-V 50%，注射对比剂 6 s 后开始行 CTP 数据采集，共获得 26 期图像，每期采集时间 2 s，在第 22 s、51 s 及 153 s 获取动脉期、静脉期及延迟期图像，总灌注时间 593 s。测量乏脂性腺瘤（A 组）和对侧正常肾上腺结合部（B 组）的 BF、BV、MTT、TP 和 PS 值。使用配对样本 *t* 检验或非参数 Wilcoxon 检验比较两组各参数值的差异。应用 ROC 曲线分析 CT 灌注参数对腺瘤的诊断效能。**结果** A 组和 B 组的平扫 CT 值（HU）分别为（25.24±11.02）和（33.32±9.72），差异无统计学意义（P＞0.05）；MTT(s)值分别为(9.60±4.31)和(14.51±4.56)，差异有统计学意义（P = 0.027）；两组的 BF、BV、TP 和 PS 值差异均无统计学意义（P＞0.05）。MTT 鉴别两者的 ROC 曲线下面积为 0.79，MTT 以 13.02 s 为阈值时，诊断乏脂性腺瘤的敏感度为 80 %，特异度为 70 %。**结论** CT 灌注灌注 MTT 值对鉴别肾上腺乏脂性腺瘤与正常肾上腺有一定价值。

两种不同超高 b 值扩散加权成像在前列腺癌 MR 检查中对图像质量的影响

杨创勃,于楠,贾永军,马光明,段海峰,贺太平
陕西中医药大学附属医院

目的 超高 b 值对前列腺癌的检出有较高的敏感度，但却使图像质量明显下降，本研究比较超高 b 值读出方向分段采样平面回波成像（RS-EPI）和常规单次激发平面回波成像（SS-EPI）在前列腺癌 MR 检查中对图像质量的影响。**资料与方法** 回顾性分析 33 例在 3.0T MR 均行 SS-EPI 和 RS-EPI 超高 b 值 DWI 检查的前列腺癌病例的影像资料(分别选取 b=1000、2000 和 3000 s/mm^2)，分别由一位有 10 年以上工作经验的副主任医师和技师在不提供任何临床资料及 MR 序列信息的情况下，以轴位 T2WI 抑脂序列作为参照，针对两种扩散加权成像(diffusion weighted imaging, DWI)从病灶显示的清晰度、图像解剖变形、图像锐利度、细节显示四个方面按 5 个等级（1－5 分）进行独立主观评分。由第三位副主任医师在工作站上测量图像的信噪比（SNR）、对比噪声比（CNR）和对比度，常规 SS-EPI 和 RS-EPI 两组间图像比较采用配对 Wilcoxon 秩和检验或配对 t 检验。**结果** 两位阅片者在共同评价两序列图像(选取 b=1000、2000 和 3000 s/mm^2)病灶显示的清晰度、解剖变形、图像锐利度及细节显示方面具有很好的一致性，Kakpa 值均大于 0.70。两位医师在对两种序列（RS-EPI 和 SS-EPI）在不同超高 b 值的主观综合评分中，RS-EPI 序列图像质量的各项指标明显优于 SS-EPI（P<0.05）。**结论** 超高 b 值 RS-EPI 序列与常规 SS-EPI 序列相比明显提高了图像质量的多个指标，更有利于早期前列腺癌的检出及鉴别。

EPO-1193
两种不同超高 b 值扩散加权成像序列在前列腺癌和前列腺增生中的临床应用

杨创勃,贾永军,于楠,马光明,段海峰,于勇
陕西中医药大学附属医院

目的 探讨分段读出扩散加权成像序列（Rs-EPI）与单次激发平面回波成像（SS-EPI）超高 b 值在前列腺癌和前列腺增生诊断中的应用。**方法** 纳入 37 例经外科手术或穿刺、病理证实的前列腺疾病患者，其中前列腺癌 15 例，前列腺增生 22 例，所有患者于手术或穿刺前行 MR 扩散加权成像，b 值选择 0、1000、2000、3000s/mm^2，由两名高年资医师用双盲法观察两种不同扩散加权成像不同 b 值时的扩散加权图像，对两名观察者的判断结果进行一致性检验，并比较两种不同 b 值对前列腺癌及前列腺增生的定性诊断准确率。**结果** 两名观察者的判断结果存在一致性（P＜0.001），Kappa 值为 0.88。当 b 值分别为 1000s/mm^2、2000s/mm^2、3000s/mm^{2}时，RS-EPI 诊断前列腺癌和前列腺增生的灵敏度及特异度分别为 66.7%和 81.8% 、80.0%和 90.9% 、93.3%和 95.5%。SS-EPI 诊断前列腺癌和前列腺增生的灵敏度及特异度分别为 66.7%和 77.3% 、73.3%和 81.8% 、80.0%和 86.4%。RS-EPI 的诊断符合率分别为 75.7%、86.5%、94.6%，而 SS-EPI 的诊断符合率分别为 73.0%、78.4%、83.8%。RS-EPI 在超高 b 值诊断前列腺癌和前列腺增生的灵敏度及特异度明显高于 SS-EPI。**结论** 选择超高 b 值（1000、2000、3000s/mm^2）对前列腺癌和前列腺增生的鉴别具有较高的灵敏度和特异度，在鉴别前列腺癌和前列腺增生时，RS-EPI 较 SS-EPI 可能作为一种更好的辅助方法。

常染色体显性多囊肾病相关梗阻性无精子症的 MR 诊断及临床分析

关键,王焕军,彭洋,张繁
中山大学附属第一医院

目的：探讨常染色体显性多囊肾病（ADPKD）相关梗阻性无精子症的 MR 影像学特征，确定适合该类患者的 MRI 检查方案，提高对该病的认识和诊断水平。
方法：回顾性分析我院确诊为 ADPKD 相关梗阻性无精子症患者 14 例，均以男性不育就诊，经实验室检查（精液分析、精液酶学检查，血清激素）和临床体检确诊为梗阻性无精子症,完善腹盆腔 MR 检查以确定梗阻原因及部位。全部患者均完成腹盆腔 MR 平扫加增强检查。由两名有经验的 MR 医生共同分析 MRI 影像特征，总结诊断经验。
结果：本组 14 例 MR 结果分为 4 类：①双侧多囊肾并双侧精囊囊肿 10 例，其中精囊囊肿较小者（轻型）为 3 例，精囊囊肿较大者（重型）7 例。②双侧多囊肾并多囊肝及双侧精囊囊肿者 2 例。③双侧多囊肾并多囊肝并双侧精囊缺如、射精管扩张 1 例。④双侧多囊肾并双侧精囊囊肿及前列腺苗勒管囊肿 1 例。腹盆腔大范围冠状位 T_2WI 可同时清楚显示肝、双肾的多囊状改变和盆腔精囊区的异常。所有患者的精道梗阻部位均位于射精管-精囊水平，双侧精囊囊肿表现为双侧精囊管明显扩张成囊状，其内可见絮状或结节状沉积物，T_1WI 为等/稍高信号，沉积物 T_2WI 为等/稍低信号；增强扫描后囊内容物无强化,壁轻度强化。1 例精囊腺缺如、射精管扩张患者表现为双侧精囊腺区未见腺管结构，射精管明显扩张。1 例合并前列腺苗勒管囊肿患者表现为前列腺中线区可见一倒置的水滴样囊性信号，亦表现为 T_1WI 低、T_2WI 高信号，增强扫描无强化。
结论：ADPKD 相关性梗阻性无精子症以双侧多囊肾和射精管-精囊水平梗阻为主要 MR 表现，可同时合并其他异常。合适的腹盆腔 MRI 检查方案有助于发现病变，确定病变的内在联系，为临床治疗的选择提供参考。

输精管盆腔段及周围结构的 MSCT 多期图像融合显示及影响因素分析

关键[1],王毓[2],彭洋[1]
1.中山大学附属第一医院
2.广东中医药大学附属中山市中医院

目的：探讨 MSCT 多期图像融合显示输精管盆腔段及周围结构的可行性，并对影响输精管显示的因素进行分析。
方法：收集 2018 年 1 月~2018 年 4 月中山大学附属第一医院有多期 MSCT 盆腔扫描资料的男性住院患者资料，年龄范围 20~50 岁，共纳入 174 例。根据 MSCT 平扫期、静脉期及排泄期图像，分别行容积重组（VR）获得输精管盆腔段、髂血管、输尿管及膀胱图像，再进行图像融合。由 2 名有经验的医师对融合图像进行评定，归纳影响图像显示的因素，并进行统计学分析。
结果：双侧输精管清晰显示且重组图像可用于临床分析者作为合格图像，共 72 例（41.4%）；不合格图像共 102 例（58.6%）。影响图像显示的因素有：体质指数（BMI）、盆腔小肠积聚、邻近器官（膀胱和/或直肠）过度充盈、年龄。所有受检者 BMI 范围为 14.17~31.49（kg/m^2），平均 BMI=22.13（kg/m^2）；合格图像的 BMI 范围为 17.19~31.49（kg/m^2），不合格图像的 BMI 范围为 14.17~27.95（kg/m^2），BMI≥22.55（kg/m^2）为获得合格图像的界值，敏感度 77.8%，特异度 73.6%（ROC 曲线下面积 0.821，P<0.001）。盆腔小肠积聚（73 例）直接影响输精管盆腔段的显示，无法获得合格图像。无邻近器官过度充盈者获得合格图像的比例较高[84.6%（44/52）比 56.0%（28/50）]，差异有统计学意义（P<0.05）。按年龄段分组统计，合格图像比例随年龄增大而提高[20~30 岁组 26.7%（8/30 例）， 31~40 岁组 39.6%（19/48），41~50 岁组 46.9%（45/96）]，但不同年龄组的合格图像比例差异无统计学意义（P=0.221）。
结论：对于 BMI 中等以上人群，做好检查前准备，可获得输精管盆腔段及周围结构 MSCT 多期融合的合格图像，为临床提供直观、立体的影像资料。

EPO-1196
基于 3D-ROI 能谱曲线斜率鉴别肾透明细胞癌 WHO/ISUP 简化分级

韩冬[1],贺太平[1,2],李朝文[1],张兰欣[1],任嘉梁[3],谷春雨[1],申利[1]
1.陕西中医药大学附属医院
2.陕西中医药大学
3.GE（中国）医疗

目的：基于 3D-ROI 能谱曲线斜率鉴别肾透明细胞癌(ccRCC)WHO/ISUP 简化分级
方法：收集经病理证实的 ccRCC 患者 99 例。根据 2016 版肾癌 WHO/ISUP 分级将 I 级及 II 级定义为低级别(68 例)，III 级及 IV 级定义为高级别(31 例)。皮质期图像被导入 AW4.6 工作站中手动勾画肾癌全肿瘤感兴趣区(3D-ROI),测量肿瘤 40-140keV 的 CT 值，根据 CT 值计算 40～70keV 能谱曲线斜率。比较两组 ccRCC 斜率和 40keV 的 CT 值差异。以简化病理分级为金标准，以斜率、40keVCT 值、肿瘤大小、包膜、静脉侵犯及区域淋巴结肿大为自变量，采用二元 *Logistics* 回归多因素分析控制混杂因素。绘制 ROC 评价各参数的诊断效能，并计算曲线下面积（AUC）、敏感度及特异度。
结果：两组患者的肿瘤大小、包膜、静脉侵犯、区域淋巴结肿大及 40keV 的 CT 值差异均有统计学意义(all p<0.01)。低级别 ccRCC 斜率为-6.77±2.85，高级别 ccRCC 斜率为-3.62±1.66，两组差异有统计学意义（t=-5.729,p<0.001）。多因素二元 *Logistics* 回归结果表明斜率和区域淋巴结肿大是鉴别低、高级别 ccRCC 的独立危险因素，OR 值分别为 1.588（95%CI:1.218-2.070）及 5.686（95%CI:1.910-16.929）。两者联合 AUC 最大，为 0.872(95%CI:0.805-0.940)。斜率、区域淋巴

结肿大及两者联合的诊断效能经两两比较（Delong 法），联合诊断的 AUC 与区域淋巴结肿大差异有统计学意义（Z=3.45,p<0.001），与斜率差异无统计学意义（Z=1.864,p=0.062）。
结论：ccRCC 的 3D-ROI 的能谱曲线斜率与其联合区域淋巴结肿大的诊断效能相当，对鉴别 WHO/ISUP 简化分级具有一定诊断效能。

MRI 定量参数在凶险性前置胎盘胎盘成熟度分级诊断中的应用价值

邓明,胡金香,徐海波
武汉大学中南医院

摘要：
目的：探讨定量 MRI 参数在凶险性前置胎盘(dangerous placenta previa ,DPP)胎盘成熟度分级诊断中的应用价值；
材料与方法：分析我院生产的 128 例凶险性前置胎盘 MRI 资料，包含超声确诊前置胎盘后行多平面 HASTE T2WI 及多 b 值 DWI 扫描，b 值包含 0，400，800s/mm^2。根据胎盘最大面 T2WI 图像分别测量绒毛膜板、胎盘实质、基底膜最大厚度（mm）；分别测定感兴趣区 b=400，800s/mm^{2}的 ADC 值。根据剖宫产时胎盘成熟度评分，采用回归分析方法对孕周，T2WI 图像上胎盘不同面的径线值、不同 b 值 ADC 与胎盘成熟度评分关系；采用 ROC 分析不同定量参数在诊断胎盘成熟度中的诊断效能。

结果：128 例 DPP 孕周为 19-38 周，中孕 46 例，晚孕 82 例；其中胎盘成熟度分级： I 级 18 例，II 级 69 例，III 级 41 例；胎盘实质最大面测量：I 级 19.2±1.1mm，II 级 23.4±3.4mm，III 级 28.6±4.2mm；胎盘 ADC（b=400）： I 级 2438±189 mm^2/s ，II 级 1864±201 mm^2/s，III 级 1539±261mm^2/s；胎盘 ADC（b=800）：I 级 2312±211 mm^2/s，II 级 1763±341 mm^2/s，III 级 1321±428mm^2/s；回归分析：胎盘实质径线与胎盘成熟度分级存在较高相关；ROC 提示胎盘成熟度分级中，ADC 存在较高诊断效能，AUC 为 0.71-0.92。其中 b=800 s/mm^{2}时诊断准确效能相对更高。

结论：常规 T2WI 经线测量结合 ADC 值能准确对凶险性前置胎盘胎盘成熟度分级；

CT 三维纹理分析对输尿管结石激光碎石术成功性的预测

王蕊[1,2],苏云杉[2]
1.大理大学临床医学院研究生院
2.云南省第二人民医院

【目的】应用 CT 纹理分析多参数预判输尿管结石激光碎石术的成功性。【资料与方法】回顾性连续收集纳入国家单中心三级医疗机构自 2016 年 1 月至 2018 年 9 月经东芝 640 层 CT 诊断并行输尿管激光碎石术的输尿管结石患者，分为完全击碎组与非完全击碎组，测量结石 CT 值并采用 Mazda 纹理分析软件勾画三维 VOI 提取每颗目标结石的 15 项纹理分析参数，应用独立样本 t 检验比较 2 组样本各纹理参数间的差异，绘制 ROC 曲线，评价其对结石是否完全击碎的诊断效能。【结果】127 名样本纳入分析，72 名（共 80 颗结石）最终确定为合格受试者。2 组结石样本的 CT 值及包括体积、直方图方差、直方图偏度、直方图峰度、Z 轴游程不均匀性、Z 轴灰度不均匀性在内的六项纹理参数存在显著差异，部分纹理参数较临床常用指标 CT 值更具诊断价值，其中 2 组间结石 Z 轴

灰度不均匀性的差异最具有统计学意义(P＜0.0001)，其 ROC 曲线下面积为 0.851，最佳临界值为＞64.885，其预测结石是否完全击碎的敏感度、特异度分别为 77.78%、77.36%。【结论】三维纹理分析可作为输尿管结石患者应用激光碎石术能否完全击碎结石的量化预测性指标。

肉瘤样肾细胞癌的 CT 和 MRI 表现

李波,郭兴华,王晋君,王娟萍
运城市中心医院（原：运城地区人民医院）

目的：探讨肉瘤样肾细胞癌的 CT 和 MRI 表现。**方法：**回顾性分析经病理学证实的 12 例肉瘤样肾细胞癌患者的临床、影像学和病理学资料，平均年龄为 61.5 岁，其中男 7 例，女 5 例，8 例行多期 CT 增强扫描，4 例行 MRI 多序列、多期增强扫描。分析肿瘤的大小、密度/信号改变，位置、出血、钙化、强化方式以及是否有肾门、腹膜后淋巴结转移、肾静脉瘤栓、远处转移等影像学表现。**结果：**12 例肉瘤样肾细胞癌病灶均累及肾髓质，累及肾盂、肾盏 9 例，均为囊实性病灶，最大径（9.5±1.8）cm。CT 平扫 12 例病灶均呈不均匀稍高密度影，病灶内见较多不规则囊变、坏死区，增强扫描病灶轻度渐进性强化 10 例，中度渐进性强化 2 例。平扫、皮质期、实质期及排泄期病灶平均 CT 值分别为 33.25Hu、56.75Hu、72.15Hu 及 57.25Hu,5 例出现钙化及出血，合并肾静脉瘤栓 3 例，肾门、腹膜后淋巴结转移 4 例，肝转移 1 例。12 例病灶 T1WI 均呈不均匀低信号影，T2WI 均呈不均匀混杂高信号影，囊变、坏死区呈不规则更长 T2 信号影，病灶内均可见不规则条片状短 T2 信号影，增强扫描病灶轻度渐进性强化 10 例，中度渐进性强化 2 例。**结论：**肉瘤样肾细胞癌的 CT 及 MRI 表现具有一定的特征性，有助于诊断及鉴别诊断。

IVIM-DWI 参数及纹理特征术前鉴别宫颈癌亚型的价值

李翠平,董江宁
中国科学技术大学附属第一医院西区，安徽省肿瘤医院

目的：探讨利用 IVIM-DWI 及纹理分析（TA）术前鉴别不同亚型宫颈癌的价值。
方法：回顾性分析 60 例经本院病理结果证实的宫颈癌患者，其中鳞癌（SCC）38 例、腺癌（AC）16 例、小细胞癌（SCCC）6 例。所有患者术前均行 MRI 检查，并行 10 b 值 DWI 扫描。在横轴位 T_2WI 图像上手动勾画宫颈癌全病灶，获得其纹理特征，包括平均值、标准差、峰度、偏度、熵和一致性。绘制受试者工作特性曲线（ROC），并计算曲线下面积（AUC）。
结果： IVIM-DWI 分析中，ADC_{stand}、D 值可以鉴别 SCC 与 SCCC（P＜0.001，AUC=0.867；P=0.001，AUC=0.920），D、D^*值鉴别 SCC 与 AC 时差异有统计学意义（P=0.024，AUC=0.774；P=0.023，AUC=0.753），而 f 值鉴别 AC 与 SCCC 时差异有统计学意义（P=0.034，AUC=0.850）。纹理特征分析时，熵值鉴别 AC 与 SCCC、峰度鉴别 SCC 与 AC 及偏度鉴别 SCC 与 SCCC 时差异具有统计学意义（P＜0.001，AUC=0.875； P=0.027，AUC=0.910； P=0.020，AUC=0.766）。
结论： IVIM-DWI 参数或 TA 特征术前鉴别宫颈癌三种不同组织学亚型有一定价值。IVIM-DWI 多参数结合纹理特征，有助于提高在术前评估不同类型宫颈癌准确性。

基于能谱 CT 平扫鉴别肾盂旁囊肿与非结石性肾积水

韩冬[1,2],贺太平[1,2],于勇[1,2],周洁丽[3],陈晓侠[1],雷雨欣[1],马光明[1]
1.陕西中医药大学附属医院
2.陕西中医药大学
3.空军军医大学西京医院

目的 目前临床确诊肾盂旁囊肿和肾积水首选 CT 尿路造影（CTU）检查，但 CTU 会给患者带来额外的辐射剂量和对比剂负荷。本研究目的是探讨能谱 CT 平扫定量参数在鉴别肾盂旁囊肿与非结石性肾积水的应用价值。
方法 回顾性收集经能谱 CT 平扫、动态增强扫描及 CTU 确诊的肾盂旁囊肿患者 42 例，肾积水患者 46 例。于能谱成像（GSI）平扫图像上分别测量肾盂旁囊肿或肾积水 70keV 的 CT 值、有效原子系数（Z_{eff}）、碘(水)浓度（IC）及水(碘)浓度（WC），并计算能谱曲线斜率（λ）=(HU_{100keV}-HU_{40keV})/(100-40)。比较两组以上参数的差异。以差异有统计学意义的参数作为自变量，CTU 结果作为金标准，采用二元 Logistics 回归筛选鉴别两种疾病的独立危险因素。
结果 肾盂旁囊肿及非结石性肾积水两组患者的年龄、70keV 的 CT 值、及 WC 差异均有统计学意义(all p<0.05)。两组患者的性别、位置、能谱曲线斜率、有效原子系数及碘基值差异均无统计学意义(p>0.05)。二元 Logistics 回归结果表明年龄和 70keV 的 CT 值是鉴别两种疾病的独立危险因素。OR 值分别为 0.94(95%CI：0.90-0.97)及 0.80(95CI：0.73-0.89)。ROC 曲线下面积为 0.850。
结论 能谱 CT 平扫定量参数对鉴别肾盂旁囊肿与非结石性肾积水具一定鉴别诊断效能，对无症状的肾盂旁囊肿患者可避免 CT 增强或 CTU 检查而降低电离辐射剂量及对比剂负荷。

体素不相干运动多模型参数鉴别Ⅰ期子宫内膜癌与子宫内膜息肉的价值

田士峰,刘爱连
大连医科大学附属第一医院

目的 探讨体素内不相干运动（introvoxel incoherent motion，IVIM）多模型参数对Ⅰ期子宫内膜癌（endometrial carcinoma，EC）与子宫内膜息肉（endometrial polyp，EP）的鉴别价值，以期治疗前准确定性。**方法** 回顾性分析经手术病理证实的 31 例Ⅰ期 EC 和 14 例 EP 的患者资料，术前均行 1.5T MRI 检查（含 IVIM 序列）。测量病灶的 IVIM 多模型参数值，包括单指数模型的标准表观扩散系数（ADC-stand）值，双指数模型的慢速表观扩散系数（ADC-slow）、快速表观扩散系数（ADC-fast）、灌注分数（f）值，以及拉伸指数模型的扩散分布指数（DDC）、拉伸指数（α）值。根据数据符合正态分布与否，采用独立样本 t 检验或 Mann-Whitney 秩和检验比较两组病灶各参数值的差异，采用 *ROC* 曲线评估有统计学差异的参数对两组病灶鉴别诊断的效能。**结果** EC 组的 ADC-stand 值、ADC-slow 值、f 值、DDC 值及 α 值均小于 EP 组，ADC-fast 值大于 EP 组，差异具有统计学意义（P<0.05）。ADC-stand 值、ADC-slow 值、ADC-fast 值、f 值、DDC 值及 α 值预估 EP 的 ROC 曲线下面积（*AUC*）分别为 0.885、0.877、0.919、0.926、0.906、0.902，临界值分别为 $0.797\times10^{-3}mm^2/s$、$0.543\times10^{-3}mm^2/s$、$3.600\times10^{-3}mm^2/s$、40.000%、$1.105\times10^{-3}mm^2/s$、0.756。**结论** IVIM 序列多模型参数能够有效鉴别Ⅰ期 EC 与 EP，可为临床治疗方案制定、预后评估提供全面的指导信息。

腹部脂肪与透明细胞肾细胞癌病理 Fuhrman 核分级的相关性研究

吴嘉良[1],杨蕊梦[1],胡泽旋[1],曾祥灵[1]
1.广州市第一人民医院
2.南方医科大学南方医院

【摘要】 目的 探讨基于 CT 测量的腹部脂肪对预测透明细胞肾细胞癌（ccRCC）病理 Fuhrman 核分级的效能。方法 回顾性收集经手术及病理证实的 171 例 ccRCC 患者术前中腹部 CT 影像学资料，根据病理 Fuhrman 核分级标准分为 Fuhrman 低级别组（n=124；男性：90 例，女性：34 例）与 Fuhrman 高级别组（n=47；男性：33 例，女性：14 例）。采用 ImageJ 软件在患者 CT 图像上分别测量腹部脐水平皮下脂肪面积（SFA）与内脏脂肪面积（VFA），并获得相对内脏脂肪比值（rVFA）。运用二分类 logistic 回归对预测因素进行分析，并进一步采用受试者工作特性曲线（ROC）获得预测 ccRCC Fuhrman 病理核分级的最佳测量参数。结果 （1）男性 ccRCC 患者中：Fuhrman 高、低级别组间 SFA、VFA 及 rVFA 值均无统计学差异（P＞0.05）。（2）女性 ccRCC 患者中：Fuhrman 高、低级别组间 SFA 值无统计学差异（P＞ 0.05），rVFA 及 VFA 值 Fuhrman 高、低级别间有显著统计学差异（P＜0.001，P＜0.001）。单变量及多变量 logistic 回归分析中，rVFA 均为 Fuhrman 分级的独立预测因子；rVFA 对应的准确度（ACC）为 0.813，相应 ROC 曲线下面积（AUC）为 0.859（95% CI：0.751-0.968）。结论 CT 腹部脂肪测量指标 rVFA 及 VFA 对 ccRCC 的 Fuhrman 病理核分级预测具有性别差异，其中女性 ccRCC 患者 rVFA 对 Fuhrman 病理核分级具有较高的预测效能，具有潜在的临床应用价值。

双参数和多参数磁共振对前列腺癌诊断效能的比较

许梨梨,张古沐阳,金征宇,孙昊
中国医学科学院北京协和医院

目的：对比双参数磁共振（bpMRI）和多参数磁共振（mpMRI）对前列腺癌（PCa）和临床显著性前列腺癌（csPCa）的诊断效能，并探讨动态增强 MRI（DCE-MRI）在前列腺成像中的应用价值。**方法：**本研究回顾性地纳入本院 2016-2017 年疑诊前列腺癌患者 235 例。根据第 2 版前列腺癌影像报告和数据系统（PI-RADS v2)）对前列腺病灶进行评分。记录病灶的 bpMRI 和 mpMRI 评分并绘制受试者特异性曲线（ROC），计算相应的曲线下面积（AUC）、诊断准确性、敏感性和特异性，并进行对比。再根据 bpMRI 评分对患者进行分层分析进一步探讨 DCE 的应用价值。**结果：**bpMRI 和 mpMRI 诊断 PCa 的效能相当（AUC 分别等于 0.790，0.791），bpMRI 诊断 PCa 的准确性、敏感性、特异性分别为 76.2%，79.5%和 72.6%，而 mpMRI 的各值分别为 77.4%，84.4%和 69.9%。对于诊断 csPCa，bpMRI 和 mpMRI 的 AUC 分别为 0.781 和 0.779，bpMRI 诊断 csPCa 的准确性、敏感性、特异性分别为 74.0%，83.8%和 66.9%；mpMRI 的各值分别为 73.6%，87.9%和 63.2%。对 bpMRI 评分 ≥ 3 的患者，DCE 在 PCa 与非 PCa 之间，在 csPCa 与非 csPCa 之间均有显著性差异（*P*均 = 0.001）。进一步分层分析结果显示，对于 bpMRI 评分=4 的患者，DCE 在 PCa 与非 PCa 之间，csPCa 及非 csPCa 之间差异均有统计学意义（*P* = 0.003，*P* < 0.001）。 **结论：**bpMRI 和 mpMRI 在诊断 PCa 和 csPCa 上总体效能相当。DCE 有助于进一步识别 PCa 和 csPCa 病灶，对于 bpMRI ≥ 3 尤其是 bpMRI = 4 的患者，DCE 或许有助于实现更为准确的前列腺癌诊断及风险分层，有利于临床诊疗方案的制定。

初探基于肿瘤全域 ADC 图的灰度共生矩阵纹理分析与子宫内膜癌 Ki-67 表达的相关性

田士峰,刘爱连
大连医科大学附属第一医院

目的 初步探讨基于肿瘤全域 ADC 图的灰度共生矩阵（gray level co-occurrence matrix，GLCM）纹理分析与子宫内膜癌（endometrial carcinoma，EC）增值抗原 Ki-67 表达的相关性。**方法** 回顾性分析 37 例经手术病理证实为 EC 的患者影像资料，免疫组化分析指标含 Ki-67，患者术前行 DWI 序列扫描，经后处理获得 ADC 图。按照 EC 的 Ki-67 表达指数（<50%为低表达，≥50%为高表达）将患者分别分为 Ki-67 低表达组（n=17）及 Ki-67 高表达组（n=20）。采用 Omni-Kinetics 软件，在包含肿瘤实质的 ADC 图像上沿肿瘤边缘逐层勾画 ROI，融合后获得肿瘤全域 GLCM 纹理参数，包括能量、熵、惯性矩、相关性、逆差距。采用独立样本 t 检验（正态分布）或 Mann-Whitney 秩和检验（偏态分布）比较两组病例 GLCM 纹理参数的差异，采用 Pearson 相关分析评价各 GLCM 参数值与 Ki-67 表达指数的相关性。**结果** Ki-67 低表达组的能量、熵、惯性矩、相关性、逆差距分别为 0.027±0.007、5.572±0.356、21.816±13.849、0.016±0.032、0.210（0.184，0.351），Ki-67 高表达组的上述参数分别为 0.022±0.005、6.076±0.323、9.046±4.200、0.057±0.035、0.417（0.387，0.487），Ki-67 低表达组的能量、惯性矩大于高表达组，熵、相关性、逆差距小于高表达组，差异具有统计学意义（P<0.05）。能量、惯性矩与 EC 的 Ki-67 表达指数负相关（P<0.05），熵、相关性、逆差距与 Ki-67 表达指数正相关（P<0.05）。**结论** 基于肿瘤全域 ADC 图的 GLCM 纹理分析有助于术前评估 EC 的 Ki-67 表达情况，具有一定临床应用价值，熵为最佳参数。

EPO-1206

The Relationship between Magnetic Resonance Spectroscopy of Estrogen-dependent Endometrial Cancer and ki-67 Expression and local invasiveness

jie zhang,Qingwei Liu
Shandong Provicial Hospital

Objectives
To investigate the relationship between magnetic resonance (MR) spectroscopy of estrogen-dependent endometrial Cancer (type I ECa) and Ki-67 staining index (SI) and local invasiveness
Methods
Forty-five patients with type I ECa underwent preoperative multi-voxel MR spectroscopy at 3.0 T. The ratio of the sum of the choline-containing compounds (Cho) peak integral to the sum of the unsuppressed water peak integral (Cho/water) of the tumor was calculated. All the metabolite quantification was performed within jMRUI v.5.2 software. Immunohistochemical staining for Ki-67 was used to determine the Ki-67 SI of type I ECa. The Cho/water of type I ECa with different level of Ki-67 SI, as well as with and without local invasion, was compared using an independent-sample t-test. The receiver operating characteristic (ROC) curve analyses was used to determine an

optimal Cho/water threshold to distinguish between two groups. The Pearson correlation test was used to examine the relationship between Cho/water and the Ki-67 SI.

Results

The mean Cho/water (± standard deviation [SD]) of type I ECa with Ki-67 SI ≤40% (2.28±0.93) was lower than that of type I ECa with Ki-67 >40% (4.08±1.00) (P<0.001). The area under the ROC (AUC) was 0.912. The Cho/water threshold was 2.89; the sensitivity and specificity were 0.917 and 0.788, respectively. The mean Cho/water (±SD) of type I ECa with deep and superficial myometrial invasion was 3.41±1.26 and 2.43±1.11, respectively (P=0.011). There is no significant difference of Cho/water between type I ECa with and without cervical invasioin (2.68±1.00 and 2.77±1.28, P=0.866). The mean Cho/water (±SD) of type I ECa with and without lymph node metastasis was 4.02±1.90 and 2.60±1.06, respectively (P=0.014). The Cho/water was positively correlated with the Ki-67 SI (r=0.701, P<0.001).

Conclusion

The Cho/water of type I ECa was positively correlated with tumor proliferative activity and can predict the local invasiveness of the tumor to some extent.

能谱 CT 在结直肠管状腺癌区域淋巴结性质判定中的运用价值

秦媛[1],汪俊言[1]
1.重庆三峡中心医院
2.重庆三峡中心医院

目的：通过能谱相关参数观察与分析，探讨能谱 CT 在结直肠管状腺癌区域淋巴结性质判定中的运用价值。 **方法**：回顾性分析 2017 年 1 月～2018 年 12 月我院收治的经结肠镜诊断或手术证实为结直肠管状腺癌患者 46 例，术前应用 GE 宝石能谱 CT 进行 GSI 能谱模式扫描,分别将动、静脉期增强扫描图像载入 GE ADW4.7 工作站 GSI 后处理软件"Liver ND",测量原发灶及区域淋巴结实性部分的动、静脉两期的 CT 强化值、碘浓度（IC）、标准化碘浓度（NIC）及能谱曲线斜率 K 值。采用独立样本 t 检验进行两两比较,以 P<0.05 为差异具有统计学意义；且对各参数敏感度、特异度及受试者工作特征曲线(ROC)曲线下面积(AUC) 进行分析，评估各参数的诊断效能。 **结果**：46 例结直肠管状腺癌患者共检出 136 枚局域淋巴结，其中转移性淋巴结 74 枚，反应性增生淋巴结 62 枚。原发病灶、转移性淋巴结组与反应性增生淋巴结组间能谱参数比较，原发病灶、转移性淋巴结组动脉期强化 CT 值差异、动静脉期 IC、NIC 的绝对值均低于反应性增生淋巴结组，且三者之间差异具有统计学意义，P 值均＜0.05；静脉期强化 CT 值差异不具有统计学意义(P>0.05)；原发病、转移性淋巴结组能谱曲线斜率 K 值高于反应性增生淋巴结组，且三者之间差异具有统计学意义，P 值均＜0.05；两两比较，仅原发病灶与转移性淋巴结间 IC、NIC 及曲线斜率 K 值的差异无统计学意义(P 均>0.05)。且动脉期 NIC 诊断转移性淋巴结的诊断效能最高(敏感度为 88.7%，特异度为 74.1%，AUC 为 0.875)。 **结论**：能谱 CT 多参数对结直肠管状腺癌转移性淋巴结及反应性增生淋巴结影像鉴别诊断具有一定的价值，特别是动脉期标准化碘浓度(NIC)诊断效能最高。

EPO-1208

系统性红斑狼疮累及腹部脏器的 CT 影像征象：重点评价缺血性胃肠炎

李维
南充市中心医院/南充市肿瘤医院

目的 评价系统性红斑狼疮在急性腹痛、腹胀患者中的 CT 影像表现，重点对缺血性胃肠炎进行分析。**材料和方法** 通过回顾性分析 23 例伴有急性腹痛、腹胀的系统性红斑狼疮患者的全腹 CT 平扫和增强检查图像，评估胃肠壁改变，肠系膜改变，腹盆腔积液，腹腔腹膜后淋巴结病变，腹膜强化，肝肿大以及其他腹部器官的改变。如果系统性红斑狼疮患者至少出现以下三个 CT 表现：胃肠壁增厚，靶征，肠管扩张，肠系膜血管充血，肠系膜脂肪密度增高，即可诊断为缺血性胃肠炎。**结果** 23 例检查中有 21 例(91%)CT 表现为缺血性胃肠炎，包括对称性胃肠壁增厚(n=21)、靶征(n=19)、肠系膜血管充血、肿胀和增粗(n=20)。在 17 例患者中，肠壁增厚是多节段的，且长度不等，并不局限于单一的血管区域。**结论** 伴有急性腹痛、腹胀的系统性红斑狼疮患者最常见的腹部脏器受累的 CT 表现是缺血性胃肠炎。CT 增强检查可以发现腹部症状的主要原因，有助于规划治疗和监测脏器坏死或穿孔等严重并发症。

基于 CT 图像及纹理分析技术预测胃癌患者 HER2 蛋白表达情况

陈武杰[1,2],高旭宁[1,2],许茂盛[1,2]
1.浙江中医药大学附属第一医院
2.浙江中医药大学第一临床医学院

【摘要】

目的：基于 CT 图像及纹理分析技术预测胃癌患者 HER2 蛋白表达情况
方法：对来自浙江中医药大学附属第一医院的 89 例临床病理证实为胃癌的患者进行回顾性研究。所有患者均在术前接受 CT 增强检查。使用开源软件 ITK-SNAP 3.6 软件对每个原发病灶进行全体积勾画后再进行纹理特征的提取与分析。数据集分为训练组（n = 62）和验证组（n = 29）。从每位患者中各提取总共 1305 个影像学特征，使用 LASSO 逻辑回归模型以及学习矢量量化方法来选择影像图像中纹理特征。免疫组织化学法（Elivision）方法检测胃癌组织中 HER2 蛋白表达情况作为金标准。

结果：89 例胃癌原发灶组织中 HER2 蛋白阳性表达与胃癌 TNM 分期、浸润深度及淋巴结转移有关（P＜0.05）。其中 3 个影像组学纹理特征与 HER2 蛋白阳性表达有显着相关（训练组 P <0.001，验证组的 P = 0.002）。在训练队列中曲线下面积（AUC）为 0.799（95％置信区间[CI]，0.748-0.879），验证队列中证实，AUC 为 0.776（95％CI，0.714-0.876）。训练组中的特异性和敏感性分别为 0.789、0.756 和验证组中的 0.805、0.818。

结论：本研究提取并分析了胃癌原发病灶 CT 影像纹理特征，其中 3 个权重较大的纹理特征 HER2 蛋白阳性表达有着明显相关性。通过 CT 图像及纹理特征来间接检测 HER2 蛋白阳性表达，对于胃癌患者（尤其是无法手术的进展期胃癌患者）后续靶向治疗的选择带来重要指导意义。

CT 评估肝硬化食管下段静脉曲张程度的预测价值

万上[1],张鑫[1,2],宋彬[1]
1.四川大学华西医院
2.GE 药业

目的：
评估多层螺旋 CT（multi-slice spiral CT，MSCT）在预测食管下段静脉曲张程度的诊断效能和临床价值，探讨 CT 能否在一定程度上辅助内镜检查。
方法：
回顾性分析我院临床上诊断为肝硬化食管下段静脉曲张（esophageal varices , EV）患者 136 例，以内镜检查为金标准，136 例患者分为非显著性食管静脉曲张（EV）组（轻度+中度 EV）（n = 30），显著性 EV 组（重度 EV）（n = 106）。观测曲张静脉的直径（EV diameter,EVD），截面总

面积（cross-sectional surface area,CSA），体积（EV volume,EVV），脾脏体积（spleen volume,SV），胃左静脉直径（diameter of left gastric vein,DLGV）。计算纳入指标的灵敏度和特异性，拟合 ROC （receiver operating characteristic）曲线，计算 AUC（area under the ROC curve），两组间数据采用成组设计的两样本均数的 t 检验或秩和检验，以 P＜0.05 为差异有统计学意义。
结果：
食管下段 EVD、CSA、EVV、SV、DLGV 在显著组中均较非显著组大（P ≤ 0.01），两组间差异有统计学意义（P ≤ 0.01）。EVD、CSA、EVV、SV 及 DLGV 在预测重度 EV 时的 AUC 分别为 0.729，0.762，0.75，0.641，0.721，EVD 敏感度为 73.3%，特异度为 69.8%，CSA 敏感度为 93.3%，特异度为 54.7%，EVV 敏感度为 80%，特异度为 65.1%，SV 敏感度为 80%，特异度为 46.2%，DLGV 敏感度为 83.3%，特异度为 53.8%。
结论：
MSCT 可作为一种预测 EV 程度的方法，可在一定程度减少内镜的侵入性检查。曲张静脉面积及体积作为新指标，对于诊断重度 EV 有较高的诊断效能。

EPO-1213
双能量 CT 多参数分析对结直肠癌区域淋巴结性质术前判定的临床研究

杨泽宏,张翔,沈君
中山大学孙逸仙纪念医院

目的：探讨利用双能 CT 多参数定量分析，术前鉴别结直肠癌区域淋巴结转移癌与反应性增生性淋巴结的应用价值。
材料与方法：2015 年 5 月至 2017 年 5 月到我院就诊，肠镜病理确诊为高位直肠癌及结肠癌患者，术前进行全腹部双能量 CT 三期增强扫描（动脉期 A、门静脉 P 期及平衡期 E）。根据原发灶淋巴结引流方向，在 CT 中选取引流区域最大淋巴结为研究对象，并对其形态学特征、淋巴结最短径 D、能谱参数（包括碘含量 IC、有效原子序数 Z_{eff} 及能谱曲线斜率 λ_{HU}）进行测量及记录，并测量腹主动脉碘含量及有效原子序数，计算校正碘含量 nIC 及校正有效原子序数 nZ_{eff}。术中单独分离术前 CT 选定的淋巴结进行病理检查。分析淋巴结转移癌和反应增生性淋巴结之间形态学特征、淋巴结短径及能谱参数的差异，构建术前判定结直肠癌区域淋巴结性质的能谱参数模型，并进行 ROC 曲线分析。
结果：178 例结直肠癌患者，结肠癌 112 例，高位直肠癌 66 例，男女比例 119：59。178 个淋巴结纳入分析，其中淋巴结转移癌 72 例，反应增生性淋巴结 106 例。转移组与非转移组淋巴结最短径及 9 个能谱参数（双能 CT 三期增强 nIC，nZ_{eff} 及 λ_{HU}）差异均有统计学意义（P<0.001-0.007）。能谱参数二元逻辑回归分析选出动脉期 nIC（nIC_A）及门脉期 nZ_{eff}（nZ_{eff-P}）构建模型。ROC 曲线分析示单一能谱参数门脉期 nZ_{eff}（AUC：0.871；准确率：84.8%）及逻辑回归构建模型（AUC：0.916；准确率：87.1%）的 AUC 及准确率明显高于形态学特征（AUC：0.505-0.624；准确率：47.8%-62.4%）及淋巴结最短径（AUC：0.647；准确率：66.3%）（P<0.05）。
结论：双能 CT 定量多参数分析能够提高结肠癌患者区域淋巴结性质术前判定的准确性。

EPO-1214
多 b 值 DWI 结合定量分析在直肠腺癌病理分级中的应用研究

张虎[1],翟建[2],崔翔[2],魏逸[2],过永[1],徐静雅[2]

1.芜湖市第二人民医院
2.皖南医学院弋矶山医院

目的 探讨多 b 值 DWI 扫描结合 ADC 值定量分析在直肠腺癌病理分级中的价值
方法 收集未经治疗的直肠癌患者 60 例，男 42 例，女 18 例，年龄 36-84 岁，平均 60.6±10.7 岁。首先对盆腔扫描野进行 ASSET CAT 校正，使用 SE-EPI 序列执行轴位 DWI 扫描，b 值取 0、700、1000 及 1500s/mm2，激励次数分别为 4、4、4、8 次。将原始图像传输至 Function 工作站并校正，再重建出轴位表观扩散系数图（ADCmap）。选择肿瘤最大层面，并避开囊变坏死、血管及伪影，结合 HR-MRI T2WI 及 DCE-MRI 图像，手动勾画感兴趣区域（ROI），分别测量病灶不同 b 值的 ADC 值，总共测量 3 次，取平均值。并收集患者的临床及病理资料。
结果 依据病理将 60 例患者分为 5 组：低分化组 5 例，中-低分化组 10 例，中分化组 33 例，中-高分化组 8 例，高分化组 4 例。运用方差齐性检验比较不同病理分级 ADC 值的差异， b=700s/mm2，F=12.619； b=1000s/mm2，F=24.900；b=1500 s/mm2， F=37.986。以上 p 值均小于 0.05，差异均有统计学意义。
结论 多 b 值 DWI 扫描结合 ADC 值定量分析对直肠腺癌术前病理分级预测价值较高

EPO-1215
阑尾周围脂肪 CT 值对阑尾炎诊断及严重程度评估的价值

石鸣琪,刘伟,王培源（通讯）
滨州医学院

目的：对急性阑尾炎患者及正常人阑尾周围脂肪 CT 值进行研究，探讨阑尾周围脂肪 CT 值的改变对正常阑尾、各病理类型阑尾炎鉴别诊断的价值。
材料与方法：回顾性分析经手术、病理证实的急性阑尾炎患者 308 例及正常对照组 243 例。使用 Siemen 后处理系统对两组的阑尾进行 MPR 及 CPR 重建以显示阑尾全长，采集阑尾周围脂肪、肠系膜脂肪、腹部前、后壁皮下脂肪、臀部皮下脂肪及腰大肌的 CT 值；并进一步计算阑尾周围脂肪 CT 值/其他六组 CT 值的比值的绝对值。通过 SPSS19.0 软件进行统计学分析，比较病例组与对照组之间 7 组 CT 值的差异以及各组 CT 值的比值的绝对值的差异。
结果：阑尾周围脂肪的 CT 值在对照组与病例组之间有显著的统计学差异（F=489.138，*P*=0.001）；而其他 6 组中仅臀部皮下脂肪 CT 值（F=0.918，*P*=0.338）及腰大肌 CT 值（F=1.138，*P*=0.287）在两组之间无显著的统计学差异。本研究使用阑尾周围脂肪的 CT 值/腰大肌 CT 值的比值的绝对值作为阑尾炎病理类型的鉴别诊断指标，得出各组的最优界值分别为：对照组为 1.603（AUC：0.891；敏感性：94.6%及特异性：71.4%）、单纯组为 0.449（AUC：0.531；敏感性：91.5%及特异性：20.8%）、化脓组为 0.623（AUC：0.845；敏感性：76.3%及特异性：81.7%）、坏疽组为 0.692（AUC：0.763；敏感性：85.7%%及特异性：67.7%）。除单纯组的 AUC 较小外，其他三组的 AUC 介于 0.763~0.891，说明该组绝对值具有较好的鉴别诊断效能。
结论：阑尾炎周围脂肪浸润导致的 CT 值改变可作为阑尾炎诊断的定量辅助指标。阑尾周围脂肪 CT 值/腰大肌 CT 值的比值的绝对值不仅可以作为阑尾炎诊断的定量辅助指标，亦有助于判断阑尾炎患者的病理类型，进而指导临床选择合理的治疗方案。

EPO-1216
标准化碘浓度鉴别胃癌 Lauren 分型的价值

张梦梅[1],杨泠[2],冯瑶杰[1],危春荣[1],杨亚英[1]
1.昆明医科大学第一附属医院
2.昆明医科大学第三附属医院

目的 探索动脉期及静脉期标准化碘浓度（NIC）术前诊断胃癌 Lauren 分型的价值。**方法** 收集有完整双能扫描资料并经手术病理证实的 67 例胃癌患者，通过双能量后处理软件得到碘图并测得动脉期、静脉期病灶及同层腹主动脉的碘浓度值，计算动脉期及静脉期的标准化碘浓度（NIC=病灶碘浓度/同层腹主动脉碘浓度），比较不同 Lauren 分型 NIC 值的差异。采用单因素方差分析多重比较进行统计学分析，并绘制受试者工作特征曲线（ROC 曲线），分别评价动静脉期 NIC 值的诊断效能，按约登指数最大为原则得出诊断阈值及 AUC（ROC 曲线下面积）。（$P<0.05$）**结果** 弥漫型胃癌动脉期及静脉期的 NIC 值（0.136±0.063、0.630±0.141）明显高于肠型胃癌（0.089±0.050、0.353±0.081）及混合型胃癌（0.100±0.029、0.425±0.131），两两比较，弥漫型-肠型、弥漫型-混合型动脉期与静脉期 NIC 值差异均有统计学意义（$P<0.05$），肠型-混合型动脉期与静脉期 NIC 值差异均无统计学意义（$P>0.05$）。动脉期及静脉期 NIC 值诊断胃癌 Lauren 分型的 AUC 分别为 0.693、0.925，Youden 指数分别为 0.319、0.791，以动脉期 NIC 值大于 0.091 为阈值诊断弥漫型胃癌时，敏感度为 84.8%，特异度为 47.1%；以静脉期 NIC 值大于 0.477 为阈值诊断弥漫型胃癌时，敏感度为 90.9%，特异度为 88.2%。**结论** 双能量成像的 NIC 值有助于诊断胃癌 Lauren 分型，其中静脉期 NIC 值诊断效能较动脉期 NIC 值高，且有较高的敏感度及特异度。

Non-invasive MR Assessment of the Microstructure and Microcirculation in Regional Lymph Nodes for Rectal Cancer: A Study of Intravoxel Incoherent Motion Imaging

Xinyue Yang[1],Yan Chen[2],Ziqiang Wen[2],Yiyan Liu[2],Shenping Yu[2],Wen Liang[1],Xianyue Quan[1]
1.Zhujiang Hospital of Southern Medical University
2.The First Affiliated Hospital of Sun Yat-sen University

Purpose The aim of this study is to evaluate the microstructure and microcirculation of regional lymph nodes (LNs) in rectal cancer by using non-invasive intravoxel incoherent motion MRI (IVIM-MRI), and to distinguish metastatic from non-metastatic LNs by quantitative parameters. ***Methods*** All recruited patients underwent IVIM-MRI (b=0, 5, 10, 20, 30, 40, 60, 80, 100, 150, 200, 400, 600, 1000, 1500 and 2000 s/mm^2) on a 3.0T MRI system. 168 regional LNs with a short-axis diameter equal to or greater than 5 millimetres from 116 patients were evaluated by two radiologists independently, including 78 malignant LNs and 90 benign LNs. The following parameters were assessed: the short-axis diameter (S), long-axis diameter (L), short- to long-axis diameter ratio (S/L), pure diffusion coefficient (D), pseudo-diffusion coefficient (D^*), and perfusion factor (f). Intraclass correlation coefficients (ICCs) were calculated to assess the interobserver agreement between two readers. Receiver operating characteristic (ROC) curves were applied for analyzing statistically significant parameters. ***Results*** Interobserver agreement of IVIM-MRI parameters between two readers was excellent (ICCs>0.75). The metastatic group exhibited higherS, L and D (P<0.001), but lower f (P<0.001) than the non-metastatic group. The AUC (95% CI, sensitivity, specificity) of the multi-parameter combined equation for$D$, f and S was 0.811 (0.744~0.868, 62.82%, 87.78%). The diagnostic performance of the multi-

parameter model was better than that of an individual parameter (P<0.05). *Conclusion* IVIM-MRI parameters provided information about the microstructure and microcirculation of regional LNs in rectal cancer, also improved diagnostic performance in identifying metastatic LNs.

胃肠道非霍奇金淋巴瘤 MSCT 诊断与临床分期对比分析

徐贵川
遵义市第一人民医院

探讨多层螺旋 CT（MSCT）应用于胃肠道非霍奇金淋巴瘤的诊断价值，并与临床分期结果对比。**方法：**选择我院 2013 年 1 月~2016 年 6 月经手术病理检确诊为胃肠道非霍奇金淋巴瘤患者 41 例为研究对象，对所有患者均或胃肠道镜活进行 MSCT 检查，对比 MSCT 诊断结果与临床病理分期的差异。**结果：**MSCT 诊断胃肠道非霍奇金淋巴瘤与病理结果的诊断符合率为 85.37%（35/41），I 期符合率为 100%（10/10），II 期符合率为 73.68%（14/19），III 期符合率为 100.00%（5/5），IV 期符合率为 100.00%（6/6）；**结论：**胃肠道非霍奇金淋巴瘤术前应用 MSCT 诊断具有较高价值，在术前临床分期中具有指导作用，可为制定治疗方案提供参考，值得推广。

EPO-1219
多层螺旋 CT 征象对黏连性肠梗阻绞窄的诊断价值

刘伟,石鸣琪,王培源（通讯）
滨州医学院烟台附属医院

目的：探讨 MSCT 征象对粘连性肠梗阻绞窄发生的诊断价值。材料与方法：回顾性分析我院收治的 134 例粘连性肠梗阻患者的 CT 图像，评价与绞窄相关的 CT 征象及不同征象对绞窄发生的诊断价值。结果：本研究 61 人接受手术治疗，32 人手术证实存在绞窄，其中 26 人有既往手术史；73 人采取药物保守治疗。手术证实发生绞窄的患者中，MSCT 诊断 29 例发生绞窄性肠梗阻，诊断的敏感性为 90.63%（29/32），准确率为 95.08%（58/61）。手术患者中 53 人术中确诊为单发梗阻，8 例为多发梗阻，术前 CT 诊断单发梗阻的准确率为 100%，多发梗阻准确率为 62.50%（5/8）。对各 CT 征象的单因素及多因素分析结果显示，肠壁强化程度减低（OR:16.392，95%CI：4.576,58.718）、弥漫性肠系膜水肿及血管增粗（OR:10.028，95%CI：2.746,36.628）、C/U 型肠袢（OR:5.453，95%CI：1.577,18.861）三种征象可能与绞窄密切相关。当三种 CT 征象皆未出现时，表明绞窄的可能性很低（NPV：97.65，-LR：0.07）。结论：MSCT 对判断粘连性肠梗阻绞窄发生具有较高的价值。

EPO-1220
磁共振体素内不相干运动扩散加权成像对小肠型克罗恩病炎症活动性的诊断价值及效能比较

吴霜,解骞,管雪妮,张素芳,高信芳,梁宗辉
上海市静安区中心医院

【摘要】目的 探讨体素内不相干运动扩散加权成像（IVIM-DWI）不同参数对小肠型克罗恩病炎症活动度的诊断价值及效能。**方法** 前瞻性收集小肠型克罗恩病患者 30 例为克罗恩病组，收集无肠道疾病及相关病史的志愿者 30 例为对照组。所有受试者均行 MR 平扫和 IVIM 检查，测量肠壁 ADC 值、真性水分子扩散系数（D）、微循环灌注系数（D*）和灌注分数（f）值。克罗恩病组与对照组各参数的比较采用独立样本 t 检验，采用 ROC 曲线评估 IVIM 各参数对炎症性肠病的诊断效能。**结果** CD 组参数 ADC 值、D 值、D*值及 f 值分别为（0.78±0.29）×$10^{-3}mm^2/s$、（1.02±0.37）×$10^{-3}mm^2/s$、（22.2±7.7）×$10^{-3}mm^2/s$ 和（37.1±14.7）%，对照组分别为（1.53±0.32）×$10^{-3}mm^2/s$、（1.15±0.41）×$10^{-3}mm^2/s$、（36.9±21.2）×$10^{-3}mm^2/s$ 和（56.5±18.5）%，两组间 ADC 值、D*、f 值两组间差异有统计学意义（P<0.05），而 D 值两组间差异无统计学意义（P>0.05）。IVIM 相关参数 ADC 值、D*值、f 值诊断克罗恩病的 ROC 下面积分别为：0.952、0.726、0.799。**结论** IVIM 相关参数 ADC 值、D*值、f 值对克罗恩病有一定的诊断价值，其中 ADC 值诊断效能最高。

EPO-1221

MR 扩散加权成像评估克罗恩病活动性的价值

沈小红
苏州大学附属第二医院

目的：探讨磁共振 DWI 信号及 ADC 值对克罗恩病（CD）活动性的诊断价值。**方法：**收集 2017 年 1 月--2019 年 5 月本院收住入院经临床、肠镜、病理证实为 CD，同时行磁共振小肠造影（MRE）和 DWI 检查的 67 例患者；所有患者均行 3.0TMRI 常规序列和 DWI 序列扫描，重点观察末端回肠、升降结肠 DWI 和 ADC 图像，对病变肠壁与正常肠壁厚度及 ADC 值进行测量，以 CD 活动指数（CDAI）作为基本活动性参考标准，并将其结果与肠镜活检进行对比分析。**结果：**67 例病例中 CD 缓解期（CDAI＜150)25 例，活动期(CDAI≥150)42 例。病变肠段 135 段，缓解期和活动期病变肠壁 ADC 值分别为（1.55±0.27）× 10-3mm^2/s 、（1.26±0.15）× 10-3mm^2/s。ADC 值和 DWI 信号评分差异有统计学意义（ρ 均＜0.01），采用 ADC 和 DWI 信号评分鉴别缓解期和活动期 CD 的 ROC 下面积 ≥ T2 信号评分、肠壁厚度评分和强化程度评分的 ROC 下面积。**结论：**磁共振 DWI 可以准确评估肠道 CD 活动性。

EPO-1222

胃肠道间质瘤的 CT 表现分型及意义初探

蒋明巧,韩福刚,罗丽
西南医科大学附属医院

目的 探讨胃肠道间质瘤（GIST）的 CT 影像表现的特点及分型，并分析各型危险度分级、Ki67 指数的差异。
方法 回顾性分析经手术和病理证实的 74 例单发胃肠道间质瘤的 CT 资料，根据 GIST 的 CT 形态学特点对 GIST 进行分型，用秩和 WH 检验分析各型的险度分级、Ki67 指数差异。
结果 ①将 GIST 的 CT 表现分为以下 3 型：经典型 62 例、囊性型 8 例、壁增厚型 4 例；按照 2008 年 NIH 版危险度分级标准进行评估：极低危险度 2 例、低危险度 23 例、中危险度 18 例、高危险度 31 例；按照 Ki67 指数分为：Ki67 指数≥10% 19 例；Ki67 指数＜10% 55 例。②经典型、囊性型、

壁增厚型三型的危险度分级及 Ki67 指数有统计学差异，P＜0.05，壁增厚型组的危险度分级及 Ki67 指数明显高于经典型组及囊性型组。
结论：GIST 的分型研究细化了 GIST 的 CT 表现，有助于术前 CT 诊断及鉴别诊断，对术前 GIST 的危险度、Ki67 指数的预测有重要意义。

EPO-1223
双能量 CT 虚拟单能谱成像对克罗恩病肠壁血管显示的价值

周洁,何伯圣
南通市第一人民医院（南通大学医学院第二附属医院）

目的：探讨双能量 CT 虚拟单能谱成像在克罗恩病肠壁血管显示中的应用价值。
方法：回顾性收集南通大学第二附属医院 2017 年 7 至 2019 年 6 月炎症性肠病患者 36 例的临床和影像学资料，所有患者均经手术、内镜或者临床诊断最后证实。采用双源 CT 新单能谱软件(syngo.Dual energy Mono+)分别获得 40keV、50keV、60keV、70keV、80keV、90keV 6 组单能量图像,并与常规混能 120kvp 图像对比,分析并比较各组图像间肠系膜上动脉血管的 CT 值、对比噪声比(CNR)、信号噪声比（SNR）以及显示血管分支数评分、总体图像质量评分和图像锐利度评分。计量资料以均数±标准差(x±s)表示，使用 Kolmogorv-Smirnov 检验分析变量是否符合正态分布。对于连续正态分布的变量采用单因素方差分析，组内两两比较采用 Tukey 法；非正态分布的变量使用 Kruskal-Wallis H 检验，P<0.05 为差异有统计学意义。使用组内相关系数（ICC）评估观察者间的一致性。
结果：分析 36 例患者的 7 组图像得出，在客观图像评估中，40keV VMI+的血管 CT 值明显高于其他能级的图像，均有统计学差异；40 keV 组 CNR 值高于 60-90 keV 组和 120 kVp 组，与 50keV 组的差异无统计学意义；40keV 组 SNR 值高于其他能级图像，仅与 90keV 有统计学差异。在主观图像评估中，40keV 组观察血管分支数及图像锐利度均高于其他 6 组，与 50keV、60keV 无统计学差异；60keV 组总体图像质量评分均高于其他 6 组，但与 40keV、50keV 无统计学差异。两位观察者间对图像评估有很高的一致性（ICC=0.82）。
结论：虽然低于 70keV 能级的图像均能较好的显示克罗恩病肠壁血管，但是 40keV VMI+可以在不降低图像质量的同时显著提高细小血管的显示，有利于克罗恩病的诊断。

EPO-1224
CT 小肠造影对克罗恩病肛瘘发病 与短期手术预后的预测价值

郭敏翊,梁佳敏,潘希敏,周智洋
中山大学附属第六医院

目的：分析 CT 小肠造影（CTE）预测克罗恩病肛瘘发病与一年内接受手术治疗风险的可行性与价值，为指导临床病情评估、合理选择治疗方案提供依据。
方法：回顾性收集 2015 年 1 月到 2017 年 2 月确诊为克罗恩病（CD）患者共 204 例。分析初诊 CTE 图像参数，测量病变的位置，病变最严重处肠壁的厚度、平扫与肠期的 CT 值及强化方式，并评价是否合并梳样征、淋巴结肿大、脂肪爬行征、肠管狭窄与肠瘘；利用 MRI 检查评价是否合并肛瘘；统计分析 CTE 图像中能够预测肛瘘发病的参数。所有合并肛瘘患者均随访一年，分析取得完整随访资料的患者初诊 CTE 图像，统计分析能够预测一年内需接受手术干预的参数。

结果：共纳入 204 例初诊 CD 患者进行分析。CD 肛瘘组共有 88/204（43.14%）例，无 CD 肛瘘组为 116/204（56.86%）例。一年内接受手术治疗风险分析手术组 18 例，无手术组 53 例。结肠受累 CD 肛瘘组为 47/88 例（53.41%），无 CD 肛瘘组为 38/116 例（32.76%），差异具有统计学意义（P=0.006）。CD 肛瘘组肠壁强化以 1 型和 2 型为主，共 69/88 例（78.41%）；无 CD 肛瘘组以 3 型和 4 型为主，共 78/116 例（67.25%），差异具有统计学意义（P＜0.001）。直肠受累手术组与非手术组分别为 12/18 例（69.62%）与 22/53 例（41.51%）；肠管狭窄两组分别为 15/18 例（83.33%）与 33/53 例（62.27%）、肠瘘两组分别为 4/18 例（22.22%）与 2/53 例（3.77%），以上有统计学意义（P＜0.005）。直肠受累、肠管狭窄与肠瘘会增加 CD 肛瘘患者一年内接受手术风险（OR＞1）。

结论：结肠受累与肠壁强化方式能较好预测 CD 肛瘘发病。直肠受累、肠管狭窄与肠瘘会增加 CD 肛瘘患者一年内接受手术干预的风险。CTE 对 CD 肛瘘发病与一年内内需接受手术干预预后的预测具有良好的价值。

小肠 CT 造影评估炎症性肠病的骶髂关节炎 影像学表现及临床意义

倪耿欢
浙江省嘉兴市第二医院

目的 利用小肠 CT 造影评估肠病性关节炎之骶髂关节炎的影像学表现及其对炎症性肠病的诊断意义。**方法** 回顾性分析嘉兴市第二医院 2016 年 1 月至 2018 年 12 月经临床病理和肠镜证实且 CTE 检查资料完整的 101 例 IBD 患者，按照骶髂关节有无病变将患者分为肠病性关节炎阳性（EA（+））组和肠病性关节炎阴性（EA（-））组，EA（+）组按肠镜及病理结果进一步分为克罗恩病（Crohn's disease，CD）组和溃疡性结肠炎（Ulcerative colitis，UC）组。EA（+）组 35 例（CD 组 21 例，UC 组 14 例），EA（-）组 66 例。统计结合骶髂关节炎前后 CTE 对 IBD 诊断的准确率。按 ASAS）评估标准对 EA（+）组的骶髂关节进行评分，评估 EA（+）组、CD 组及 UC 组各组内的骶髂关节炎各征象评分间是否有统计学差异。统计 EA（+）组 IBD 的分型（蒙特利尔分型），并评估总评分与分型之间的相关性。各组患者间的计量资料采用独立样本 t 检验（正态分布）或非参数检验（偏态分布）比较，计数资料采用交叉表 Pearson 卡方检验比较，相关性采用 Pearson 相关性检验。**结果** EA（+）组与 EA（-）组的一般临床指标及炎性指标无统计学差异（P 均>0.05）。在结合骶髂关节炎征象前后，CTE 对 IBD 诊断的准确率有统计学差异（P<0.05）。EA（+）组、CD 组及 UC 组的骶髂关节炎表现以关节面硬化为主，EA（+）组及 UC 组骶髂关节炎各征象的评分有统计学差异（P<0.05），但 CD 组无统计学差异。评分与分型不相关（P>0.05）。中青年患者的骶髂关节中出现气体。**结论** IBD 患者中骶髂关节炎的发病率较高，主要表现为关节面硬化。骶髂关节炎有助于提高 CTE 对 IBD 诊断的正确率。

正常肠管与活动期 Crohn 病 MR 灌注成像初步对比研究

林雪花,郑贤应,曹代荣,吴吟晨
福建医科大学附属第一医院

目的：对小肠 MR 灌注成像方法及其在 Crohn 病诊断及活动性评估中的可能应用价值进行初步探讨。

方法：收集我院 2018 年 8 月至 12 月间应用 Siemens skyra 3.0T 超导型 MR 机器对 128 例病例行常规 MRE 及小肠 MR 灌注成像，选取回肠末段做为研究肠段，回顾性分析病变组（经临床及病理确诊 Crohn 病且处于活动期）21 例，正常对照组（常规 MRE 阴性并经临床、肠镜及病理证实阴性）回肠末段 14 例，采用 Syngo.via 软件 tissue4D 工作流勾画感兴趣区计算所研究肠段 24 例灌注参数：Ktrans，其中病变组 16 例，正常对照组 8 例；同时收集 Crohn 病患者 CDAI 评分、CRP 值。统计学方法对比受累回肠末段间 Ktrans 值差异性。
结果：正常对照组及活动期 Crohn 病 Ktrans 值差异有统计学意义（P＜0.001）。
结论：对比正常肠管，小肠 MR 灌注成像定量参数 Ktrans 能够反映 CD 微血管及微循环的变化，具有一定的临床应用价值。

MR 平扫及增强扫描联合 DWI 及 ADC 值定量分析对直肠癌术前 T 分期的诊断价值研究

王丽英
海南省肿瘤医院

一、研究目的：通过此项研究，鉴别直肠癌肠周侵犯与直肠周围纤维反应增生，更准确的进行直肠癌术前 T 分期，制定更有效合理的治疗方案，避免不必要的放化疗，更好的掌握手术时机。
二、研究方法：本项研究选取 本院胃肠外科收治的 77 例直肠癌患者的临床资料。采用美国 G E 公司 3.0 T 静音 MRI 系统进行扫描，GE 公司 AW 4 .6 版本后处理工作平台进行后处理。病理学 T 分期标准根据 UICC（国际抗癌联盟）发布的第八版恶性肿瘤 TNM 分期，将采集的 DWI 图使用工作站专用分析软件进行后处理，生成表观扩散系数(ADC) 图。避开坏死区，测量所有直肠癌壁外侵犯的肿瘤、纤维反应增生的 ADC 值，与术后病理结果进行比较分析。分别计算常规 MR 及常规 MR 结合 DWI 及 ADC 值定量分析对直肠癌术前 T 分期的诊断符合率，对比分析其诊断价值。评估纤维反应增生与直肠癌周围侵犯 DWI 的信号特征和 ADC 值的最佳分界值。使用 SPSS19,0 统计软件进行统计学分析。对每组数据均行独立样本 t 检验。P ≤0. 05 为差异有统计学意义。
三、结果：肠周侵犯的直肠癌与纤维反应增生的 ADC 值分别为 $1.13\pm0.43\times10^{-3}mm^2/s$、$1.56\pm0.48\times10^{-3}mm^2/s$、前者明显低于后者，差异具有统计学意义。可是 ADC 值存在重叠，本研究的 ADC 值的最佳分界值为 $1.25\times10^{-3}mm^2/s$。MRI 平扫及增强扫描对直肠癌术前 T 分期的诊断符合率为 72.72%（56/77)；MRI 平扫及增强扫描联合 DWI 及 ADC 值的定量分析对直肠癌术前 T 分期的诊断符合率为 90.90%（70/77)。
四、结论：DWI 及 ADC 值的定量分析可以有效的鉴别直肠癌肠周侵犯与纤维反应增生，MRI 常规扫描联合 DWI 及 ADC 值的定量分析对直肠癌术前 T 分期的准确率明显提高，值得在临床上推广。

胃肠间质瘤影像学研究进展

唐磊,李佳铮
北京大学肿瘤医院

胃肠间质瘤(GIST)常用的影像学检查手段包括超声、CT、磁共振及 PET，这些检查手段可辅助临床进行病变的检出定位、诊断和鉴别诊断、生物学行为评估及危险度评价、手术方案制定、靶向药物疗效预测及随访监测等，在 GIST 个体化治疗中发挥着重要作用。规范化前处置、多平面重组及多期增强等技术对 GIST 小病灶的检出意义较大。肿瘤引流血管及强化特征的差异有助于区分小肠 GIST 和胰腺癌、神经内分泌肿瘤及其他腹腔非 GIST 肿块。影像学可提供多种反映 GIST 危险度的

定性定量指标，近期有研究发现 GIST 危险度分级与坏死有关，而与囊变无关。双能 CT 对胃肠道 GIST 进行危险度分层研究显示，高危险度肿瘤的动静脉期及延迟期 CT 值及标准化碘浓度值均显著高于非高危险度肿瘤。关于肿瘤强化模式与危险度的关系目前还存在争议。近期影像组学和深度学习研究的兴起，为 GIST 危险度评价提供了新的方向，多项研究利用各种模型及参数，预测 GIST 危险度分级 AUC 值达到 0.85 以上，预测 11 外显子突变、核分裂像及生存方面也优于传统指标和医生的主观判断。近期 PET 及磁共振扩散成像的发展，为 GIST 靶向治疗疗效的预测和早期评价提供了更为精准的功能定量指标。

DCE-MRI 4D-Tissue 预测胃癌化疗疗效的研究

付佳,唐磊,李佳铮,李晓婷,李子禹,孙应实
北京大学肿瘤医院

目的：探讨磁共振动态增强成像（DCE-MRI）参数预测及判断胃癌新辅助化疗疗效的价值。材料与方法：前瞻性纳入 48 例行 DCE-MRI 检查的胃癌患者，所有患者在新辅助化疗前接受磁共振检查。经连续随访， 48 例患者中 26 例手术前一周内行 DCE-MRI 检查。由后处理软件自动计算 DCE-MRI 参数（Ktrans、Kep、Ve）。在治疗前后分别测量 DCE-MRI 相应的指标（X_{pre} 和 X_{post}），同时计算上述定量参数治疗前后的差值（△X）及变化率（%△X）。病理肿瘤退缩分级为参考标准 （NCCN 分级）：有效组为 pTRG 0-2 级，反应不良组为 pTRG 3 级。统计学分析采用 SPSS 22.0，双侧 $P<0.05$ 代表有统计学意义。采用 Mann-Whitney U 检验和 Spearman 秩检验比较有效组与反应不良组治疗前后各参数及其变化的差异及相关性。受试者工作特征曲线(ROC)用于比较诊断效能。结果：26 例 DCE-MRI 患者中有效组 13 例，反应不良组 13 例。新辅助治疗前后，在治疗有效组及治疗无效组，治疗前的 Kep、Ve 值、Ktrans 值及治疗后的 Kep 和 Ve 值及其变化差值、变化率均无统计学意义改变（（$P>0.05$）。反应不良组治疗后的 $Ktrans_{post}$ 值（0.119±0.046）min^{-1} 高于有效组（0.08±0.03）min^{-1}，差异具有统计学意义（$P<0.05$）。$Ktrans_{post}$ 的 AUC 为 0.760，诊断反应不良组的敏感性 76.90%，特异性 69.20%。治疗后 $Ktrans_{post}$ 与治疗疗效成正相关，随着治疗后 $Ktrans_{post}$ 值增加，治疗效果趋向于无效。结论： DCE-MRI 可以用于筛选胃癌新辅助化疗反应不良组的患者。

腹膜后腺泡状软组织肉瘤个案报道

刘梓菀,毛芸,周印,杨栋,陶奉明
重庆医科大学附属第一医院[重庆市渝中区]

背景：腺泡状软组织肉瘤是罕见的软组织恶性肿瘤，组织来源不明，好发于青年人，女性多于男性，成年人常见于四肢，儿童则为头颈，腹膜后罕见，多数早期出现血液转移，切除后易复发，预后差。

临床资料：女性，49 岁，体检行腹部彩超提示左上腹实性占位，与左肾关系密切，建议进一步检查。

影像资料：增强 CT: 左肾前方见一类圆形囊实性肿块影，边界清晰，左肾及周围肠管受压，局部与右肾分界不清，密度不均，其内可见出血、囊变，实性部分增强扫描呈不均匀轻-中度强化，囊性部分无强化。CTA：左肾前方肿块血供丰富，病灶内及边缘可见迂曲血管影，腹主动脉分支腰动

脉、左肾实质内动脉、肠系膜上及肠系膜下动脉参与供血，其中病灶紧邻左肾处可见部分供血动脉呈瘤样扩张。

行开腹手术，术中见：肿瘤位于左上腹脾脏及胃后壁下方、左肾前方，约 15*10*15cm，软，呈鱼肉状，其后方、下方左肾关系致密，有血管浸润；术中标本冰冻示恶性肿瘤。

病理诊断:<左腹膜后>恶性肿瘤，肿瘤细胞胞浆丰富，异型性大，易见病理性核分裂像，可见瘤巨细胞，其中见坏死出血，局部区域见血窦分隔细胞巢，结合形态学及免疫组化，符合腺泡状软组织肉瘤。**免疫组化：**CK（-），EMA（-），TFE-3 小部分（+），MyoD1 浆（+），Vim（+），CD68（+），CD99（-），S-100（-），HMB45 小灶（+），MelanA（+），desmin（-），SMA(-)，CD34(-)，CD31 部分（+），Myogenin（-），a-inhinbin（-），ER(-)，PR(-)，CD117（-），Syn（-），CgA（-），SOX-10（-），CKH（-），Ki67 50%（+）。

治疗与随访：根治性手术切除+EI 方案（表柔比星 100mg D1-2+异环磷酰胺 3g D1-5）+贝伐珠单抗 300mg D1 抗肿瘤血管生成，规律化疗 6 周期。术后 1 年，局部复发，再次行手术切除，规律随访。

EPO-1231

CT 观察胃癌侵犯胰腺程度对胃癌原发灶可切除评估中的价值

郭萍
海南医学院第二附属医院

【 摘要 】目的：探讨 CT 观察胃癌侵犯胰腺程度对评估胃癌原发灶可切除性的价值。方法：本院 2017 年 1 月～2018 年 12 月共收治 65 例胃癌患者，均进行 CT 检查。经手术证实胃癌与胰腺关系。计算 CT 诊断胃癌侵犯胰腺程度的准确率，分析胃癌与胰腺接触面形态与清晰度、外侵形态、胰腺受侵犯部位、胰周 CT 值。结果：65 例患者中，18 例经术前 CT 诊断为胃癌侵犯胰腺但术中证实未侵犯胰腺。47 例经证实为胃癌侵犯胰腺，CT 诊断胃癌侵犯胰腺的准确率为 72.31%（47/65）。47 例确诊的胃癌侵犯胰腺患者中，16 例术中探查发现无法行根治性切除，31 例患者采取原发灶与胰腺联合切除后成功切除。18 例误诊患者主要表现为Ⅰ型与Ⅱ型，47 例胃癌侵犯胰腺患者则以Ⅱ型、Ⅲ型、Ⅳ型为主，其中 16 例无法手术切除患者均为Ⅳ型。误诊患者以接触面清晰居多，而确诊胃癌侵犯胰腺患者则均表现为接触面模糊。3 组患者接触面形态与接触面清晰度均存在显著差异（P ＜ 0.05）。误诊患者外侵形态以毛刺条状为主，多侵犯胰体；根治手术患者外侵形态以结节外突为主，多侵犯胰体；无法根治患者外侵形态以模糊片状为主，多侵犯胰头。3 组患者肿瘤外侵形态与胰腺受侵犯部位的差异有统计学意义（P ＜ 0.05）。误诊患者与胰腺接触处的胰周 CT 值为（-47.21±7.85）HU，显著高于根治手术患者的（-33.46±6.10）HU 与无法切除患者的（-11.02±3.13）HU，差异有统计学意义（P ＜ 0.05）。同时根治手术患者的接触或受侵犯胰周 CT 值也显著高于无法切除患者（P ＜ 0.05）。结论：胃癌侵犯胰腺的接触面多发生在胃癌外侵明显处，且接触面模糊，胰腺呈内凹或嵌插征；若接触面清晰，则提示二者仅是相贴，并无侵犯。当胰腺与胃癌的脂肪间隙密度明显增高或出现索条、淡片征时，原发灶可能无法根治切除，应引起重视。

MRI Evaluation of Lateral Pelvic Lymph Node in Locally Advanced Rectal Cancer: Optimized Cutoff Value Chosen and the Relationship to Overall Survival

Ruijia Sun[1],Lin Wang[2],Xiaoting Li[1],Qiaoyuan Lu[1],Huici Zhu[1],Yingshi Sun[1]

1.Key laboratory of Carcinogenesis and Translational Research (Ministry of Education), Department of Radiology, Peking University Cancer Hospital & Institute,
2.Key laboratory of Carcinogenesis and Translational Research (Ministry of Education), Department of Surgery, Peking University Cancer Hospital & Institute,

PURPOSE
To study the relationship between MRI-detected pretreatment lateral pelvic lymph node (LPLN) metastasis and prognosis in patients with locally advanced rectal cancer treated with neoadjuvant chemotherapy-radiation therapy (CRT).
METHOD AND MATERIALS
This retrospective study included 517 patients with locally advanced rectal cancer evaluated from August 2008 to December 2014. Baseline and post-CRT MRI and follow-up data were retrieved for all patients. MRI findings of LPLN metastasis were evaluated. Kaplan-Meier curves and ROC analysis were used to determine the relationship of baseline MRI findings to overall survival.
RESULTS
227 patients (43.9%) had visible LPLNs with short axis of at least 5mm on pretreatment MRI. Univariate cox analysis indicated that the short axis (HR=1.12, 95%CI: 1.04-1.21, p<0.01) as well as the long axis of the largest LPLN (HR=1.07, 95%CI:1.02-1.13, P=0.01) were associated with the overall survival (OS). However, there was no significant relation to the metastasis free survival or the local recurrence free survival. A cut-off of 8mm and 12mm were selected for short and long axis respectively by using survival ROC analysis. Kaplan-Meier method showed LPLNs with a short axis greater than 8 mm resulted in a significantly poor OS (3-year OS 92.5% vs 79.7% for less than 8mm vs equal to or greater than 8mm, P<0.01). LPLNs with a long axis greater than 12 mm resulted in a significantly poor OS (3-year OS 92.3% vs 77.3% for less than 12mm vs equal to or greater than 12mm, P<0.01).
CONCLUSION
The presence of lateral pelvic lymph node (LPLN) was associated with overall death in patients with locally advanced rectal cancer. Further research is needed about which pretreatment features of the LPLN predict prognosis and what is needed to prevent these from developing.

EPO-1233
光谱 CT 碘图定量参数对局限性结肠壁增厚的定性评估价值

王国蓉,王志伟,金征宇
中国医学科学院北京协和医院

目的：本研究旨在探究应用光谱 CT 碘图相关参数，对 CT 图像上发现的局限性结肠壁增厚（LCWT，厚度≥5mm，累及长度≤3cm）的定性评估价值，以期为后续的临床治疗提供较为可靠的诊断信息。方法：收集 2018 年 9 月至 2019 年 5 月在我院就诊，且在一个月之内同时接受光谱探测器 CT （IQon，Philips Healthcare)腹盆部增强扫描和电子结肠镜检查的患者。排除标准：已行结肠癌手术和新辅助放化疗者、肿块型结肠壁增厚者。将图像传至 Philips 后处理工作站，由两位医师共同阅片，并选取含 LCWT 病灶的增强扫描静脉期图像。由另一位医师选择碘图模式，在选定图像的病灶处以及同层面的腹主动脉或右侧髂动脉分别勾画类圆形感兴趣区（ROI），系统将自动生成

该处的碘浓度值（IC）。记录 LCWT 病灶处的 IC 和标准碘浓度值（NIC，NIC=病灶处 IC/同层面腹主动脉或右侧髂动脉 IC）。统计分析良、恶性 LCWT 组之间的差异。
结果：最终入组 80 例患者，其中 47 例被内镜确诊为结肠癌，3 例为结肠腺瘤，余患者结肠镜检查未见明显异常。良、恶性 LCWT 组肠壁厚度分别为（11.63±2.64）mm、（11.87±2.96）mm，二者之间没有统计学差异（P=0.718）。结肠癌患者的 IC 和 NIC 均明显高于良性 LCWT 组相应的值[IC:(1.88±0.36)mg/mL、(1.25±0.37)mg/mL；NIC：0.44±0.10、0.27±0.07，P 均为 0.00]。ROC 曲线显示，当 IC 为 1.475mg/mL 时，曲线下面积（AUC）为 0.890，诊断结肠癌的敏感性和特异性分别为 91.5%、72.7%；当 NIC 为 0.341 时，AUC、诊断结肠癌的敏感性和特异性分别为 0.921、85.1%和 90.9%。
结论：应用光谱 CT 碘图相关的定量参数能够对局限性肠壁增厚的良恶性可以做出较为准确的判断，为临床诊治提供重要的诊断依据。

Post lymphangiographic CT (PLCT) Sequential with Direct Lymphangiography (DLG) in Primary Intestinal Lymphangiectasia: A Retrospective Study

Jian Dong
Capital Medical University affiliated Beijing Shijitan Hospital

Purpose

To investigate the clinical feasibility and imaging features of Post lymphangiographic CT (PLCT) in primary intestinal lymphangiectasia (PIL).

Materials and Methods

Forty-three PIL patients were performed with PLCT, and the imaging data were reviewed by two radiologists separately. The assessments for PLCT included intestinal lesions, edematous lesions, intestinal and mesenteric lymphangiectasia, lymphatic-abdominal leakages, lymph fluid reflux, lymphangioma and other lymphatic abnormalities. The intestinal lymphangiectasia and lymphatic-intestinal leakages were confirmed by enteroscopy and histology.

Results

PLCT imaging features included: (1) 86% intestinal wall thickening; (2) 72.1% anasarca; (3) 37.2% intestinal and mesentery lymphangiectasia, as the specific imaging sign, (4) abnormal dilated lymphatics in other places, including 34.9% in chest, 14.0% only in abdomen, and 14.0% around neck area, (5) 20.9% lymph reflux, indicating lymphatic circulation abnormalities (6) 2.3% lymphatic-abdominal leakage (7) 7.0% lymphangioma. (8) 4.7% bone lesions were detected, mainly osteolysis. Intestinal and mesentery lymphangiectasia was considered as the direct imaging sign for PLCT in primary intestinal lymphangiectasia. Patients with this positive imaging feature demonstrated younger first-episode age, higher ratio of neonatus onset, intestinal wall thickening and edematous lesions than negative group.

Conclusion

PLCT is feasible in detecting the location, range and distribution of abnormal dilated lymphatics, lymphatic leakage and lymphangioma in primary intestinal lymphangiectasia. Intestinal and mesenteric opacification is the direct imaging sign for primary intestinal lymphangiectasia, while lymphatic fluid reflux is the indirect imaging feature for lymphatic circulation abnormalities. Dilated lymphatics distributed in other places indicated potential possibility of systematic lymphatic abnormalities for part of primary intestinal lymphangiectasia patients.

Evaluation of the Imaging Features and Biological Behavior of the Enhanced MSCT Scanning for 83 Cases of Advanced Gastric Cancer

Xing Hu
SHANGHAI NINTH PEOPLES HOSPITAL AFFILIATED TO JIAOTONG UNIVERSITY SCHOOL OF MEDCINE

[Abstract] **Objective** To investigate the application value of the enhanced MSCT scanning in the evaluation of the biological behavior of the advanced gastric cancer. **Methods** A total of 83 patients with advanced gastric cancer in our hospital from September 2010 to January September 2010 were selected. All patients underwent MSCT examination and pathological examination. In comparison of pathological examination results, the relationship between imaging features of local serous surface of gastric cancer and the cancer penetrating serous membrane, and the conditions of the enhanced MSCT scanning checking the invasion of peripheral viscera were statistically analyzed. **Results** Pathological examination confirmed that there were 45 cases of penetrating serous membrane and 38 cases of non penetrating serous membrane among those 83 cases in this group. The diagnostic sensitivity (93.33%) and accuracy (83.13%) of the MSCT local signs of serous surface were higher than those of the local protruding signs of cancer (17.78%, 55.42%) and the signs of the fat space (57.78%, 59.04%) ($P<0.05$). The diagnostic specificity of local protruding signs in MSCT cancer (100%) was higher than that in signs of serous surface (71.05%) and the signs of fat space (60.53%). Pathological examination confirmed that there were 21 cases of invasion of the pancreas and 62 cases of non invasion of the pancreas, 22 cases of invasion of the transverse colon and mesangial and 61 cases of non invasion of the transverse colon and mesangial, 7 cases of invasion of the spleen and 76 cases of the non invasion of the spleen. There was insignificant difference in the sensitivity (57.14%), specificity (98.39%), and accuracy (87.95%) among the invasion of the pancreas, the transverse colon and mesangial (68.18%, 95.08%, 87.95%) and the spleen (57.14%, 96.05%, 92.77%) examined by the enhanced MSCT scanning ($P>0.05$). **Conclusion** Using MSCT to scan the advanced gastric cancer can accurately evaluate the invasion and infiltration of the lesion and other conditions, which can provide some reference for clinical formulation and adjustment of the treatment plan.

单源双能 CT 综合分析平台在鉴别 T2 及 T3 期胃癌中的应用价值

王学东,刘爱连,田士峰
大连医科大学附属第一医院

目的 探讨单源双能 CT 能谱综合分析平台对 T2 期及 T3 期胃癌鉴别诊断中的应用价值。**方法** 回顾性分析 37 例行单源双能 CT 三期增强能谱扫描，并经手术病理证实为胃癌的影像资料，其中 T2 期 20 例，T3 期 17 例。由两名观察者分别在互不知晓病理分期的情况下在三期增强上进行感兴趣区的勾画，感兴趣区为最大层面的上下三个层面，得到的数据以 EXCEL 表格输出。统计各期 40~140 keV 下单能量 CT 值、碘浓度（Iodine concentration，IC）值，并计算标准化碘浓度（Normalized iodine concentration，NIC）值和 40~70 keV 下单能量的能谱曲线斜率（K）。取三次测量结果的平均值进行后续的统计学分析。采用组内相关系数（ICC）检验两位观察者测量各期各参数结果的一致性；根据正态分布与否，采用独立样本 *t* 检验或 Mann-Whitney U 检验比较两组病灶各期各参数间的差异；采用 ROC 曲线评估有鉴别价值的参数对两者鉴别诊断的效能。**结果** 静脉期 40~70ke V 下单能量的 CT 值、K 值和 NIC 值在 T3 期胃癌均大于 T2 期胃癌，P<0.05，AUC 分别是 0.837、0.837、0.816、0.816、0.837、0.959。其中 NIC 的诊断效能最高，以 NIC≥0.3802 时，敏感度为 85.7%，特异度 100%。动脉期 40~140 keV 下单能量的 CT 值、K 值、NIC 值、静脉期 80~140keV 下单能量的 CT 值在 T2 与 T3 胃癌组间差异均无统计学意义，P>0.05。**结论** 静脉期 40~70ke V 下单能量的 CT 值、K 值、NIC 值可以进行 T2 期和 T3 期胃癌的鉴别诊断，其中静脉期的 NIC 为最佳参数。

胃神经内分泌肿瘤 CT 表现、临床特征及病理对照分析

周青,周俊林
兰州大学第二医院

目的 :探讨胃神经内分泌肿瘤（G-NETs）的 CT 表现、临床特征与不同病理分级的相关性。**方法:** 回顾性分析 55 例胃神经内分泌肿瘤的临床资料、病理资料及 CT 影像资料。**结果 ：**55 例 G-NETs,其中 NET（G1,G2 级）16 例，NEC（G3 级）28 例，MANEC 11 例。平均发病年龄为 56.4 岁，男女比例为 3.6:1。临床多以间断上腹胀痛不适为主。NET（G1,G2 级）不易侵犯浆膜，不易淋巴结转移及远处转移，NEC（G3 级）和 MANEC 易侵犯浆膜外，易淋巴结及肝转移。NET（G1,G2 级）最多见于胃体，约 62.5%（10/16），病灶直径多小于 3.0cm，不伴溃疡，密度多均匀，增强明显均匀强化。NEC（G3 级）和 MANEC 多以贲门胃底最多见，约 64.1%（25/39），病灶直径多大于 3.0cm，伴较大溃疡，增强后明显均匀/不均匀强化。G-NETs 强化方式为延迟强化，静脉期达强化峰值（61.7%）。**结论 ：**不同病理分级的 G-NETs 临床及 CT 平扫和增强表现有一定特征性。

EMVI 阳性直肠癌原发肿瘤边缘形态 MRI 分析

吕宝华[1,2],靳二虎[1],谢元忠[2],杨正汉[1],王振常[1]
1.首都医科大学附属北京友谊医院
2.泰安市中心医院

目的： 分析 EMVI 阳性直肠癌原发肿瘤边缘形态的 MRI 特征。
方法：回顾性分析 2017 年—2018 年期间本院 73 例（44-89 岁，男=50 例，女=23 例）经病理学证实的直肠癌患者的 MRI 资料。在 HRT2WI 逐一观察并记录肿块边缘结节样突起、肿块边缘触角样改

变及两种改变共存的病例数，以病理结果为“金标准”，分成 EMVI 阳性组（n=23）及 EMVI 阴性组(n=50)，以卡方检验在组间比较上述三个观察指标有无统计学差异，并分别绘制各观察指标的受试者工作特性曲线（ROC），记录各指标的线下面积（AUC）， 分析各参数诊断 EMVI 的效能。
结果： EMVI 阳性患者 23 例（23/73，31.5%）人，其中男 13 例，女 10 例。直肠癌肿块边缘结节样突起 19 例，其中 12 例 EMVI 阳性（12/19,63.2%）；肿块边缘触角样改变有 20 例，其中 13 例 EMVI 阳性（13/20,65%）,两种征象共存在者 15 例，其中 11 例 EMVI 阳性（11/15,73.3%）。经卡方检验阴性组及阳性组间三个征象的差异均有统计学意义，P <0.05。肿块边缘结节突起的曲线下面积（AUC）为 0.697，灵敏度及特异度分别为 52.22%及 86.00%；肿块边缘触角样改变的 AUC 为 0.732，灵敏度及特异度分别为 56.50%及 86.00%；两种征象共存的 AUC 为 0.739，灵敏度及特异度分别为 86.00%及 60.9%。
结论：EMVI 阳性直肠癌原发肿瘤边缘形态的 MRI 表现有一定特征，认识这些特征有助于术前诊断 EMVI。

Value of Abdominal CTA in Diagnosis of intestinal vascular malformation

Peng Zhao[1],Ning Li[2],Wanli BI[2],Xiangtao Lin[1],Ximing Wang[1]
1.Shandong Provincial Hospital affiliated to Shandong University
2.Shandong Provincial medical imaging research institute affiliated to Shandong University

Purpose
Features of intestinal vascular malformation on Dual-Source CT angiography (DSCTA) were retrospectively analyzed, thus to evaluate the value of DSCTA in intestinal vascular malformation displaying and to improve the diagnosis.
Materials and Methods
Five patients with intestinal vascular malformation confirmed by surgery were retrospectively reviewed. All patients were underwent abdominal angiography by using dual source CT, MIP and VR images were used to assist the axial images for lesions displaying. Age, lesion location and the imaging feature were analyzed.
Results
Among the five patients, three originate from the small intestine and one from the colorectal region and one from ileocecal junction, they were conformed in surgery. There were two patients with the age less than 30 years old. Partial vascular plexus increased, dilated, abnormal and uneven thickened were the most common performance on DSCTA images. Two cases showed tumor like vascular dilation, and in one case expanded artery and earlier draining veins was found. Pooling of contrast medium was found in four of five patients. The superior mesenteric artery and/ or vein were the main feeding artery and draining vein.
Conclusion
DSCT angiography is a rapid, noninvasive, and accurate method in intestinal vascular malformation diagnosis. And it was also very useful in localizing bleeding sites for other gastrointestinal bleeding diseases.

结肠癌病理 T 分期与肿瘤沉积的相关性分析

王晨[1,2],李绍东[1],孟闫凯[1,2],李江山[1],高晶晶[1],姚立彬[4],崔莹莹[3],程广军[1],徐凯[1,2]
1.徐州医科大学附属医院放射科
2.徐州医科大学
3.徐州医科大学附属医院病理科
4.徐州医科大学附属医院普外科

目的 探讨结肠癌患者肿瘤沉积的发生率与病理 T 分期之间的相关性。**方法** 回顾性分析 2017 年-2018 年于我院就诊的经手术病理证实为结肠癌的 257 例患者的病理资料，按照第 8 版 AJCC 结直肠癌分期指南将患者分为 T2 期、T3 期、T4 期三组以及肿瘤沉积阳性组、阴性组。采用卡方检验对三组间计数资料进行分析。**结果** T2 期患者出现肿瘤沉积 2 例（5.6%），T3 期 30 例（14.6%），T4 期 10 例（66.7%）。采用行×列卡方检验对三组结肠癌患者肿瘤沉积的发生率比较，差异有统计学意义（c^2=31.327,P＜0.05），进一步采用卡方分割法进行两两比较，结果显示 T2 期、T3 期结肠癌患者肿瘤沉积的发生率均低于 T4 期患者（c^2=21.976, 25.606, P 均＜0.016），T2 期与 T3 期结肠癌患者肿瘤沉积发生率无明显差异（P=0.141）。**结论** 结肠癌病理 T 分期与肿瘤沉积具有相关性，相对于 T2 期、T3 期结肠癌患者，T4 期患者出现肿瘤沉积的风险更高，病理上对于 T4 期的结肠癌患者应仔细评估其有无肿瘤沉积。

腹部滤泡树突细胞肉瘤 1 例报告

卢巧媛,孙应实
北京大学肿瘤医院

滤泡树突细胞肉瘤（Follicular Dendritic Cell Sarcoma，FDCS）是一种来源于滤泡树突细胞的罕见肿瘤。最常发生于淋巴结，也发生于扁桃体，腹部脏器等节外部位[1]。由 Monda 等[2]于 1986

年首次报道，截至目前，影像学表现仅见个案报道。笔者报道 1 例经手术和病理证实的腹部 FDCS 影像表现，并复习相关文献，总结 FDCS 影像学特点.

EPO-1243
基于 DWI 序列的纹理分析在鉴别直肠腺癌中低分化程度的应用研究

王裴培
中国科学技术大学附属第一医院西区、安徽省肿瘤医院

【摘要】 目的 探讨基于 MR DWI 序列的纹理分析在预测直肠腺癌中低分化程度中的价值。**方法** 回顾性分析 82 例经手术病理证实的直肠腺癌患者临床及影像资料，依据病理将其分为中分化组 66 例和低分化组 16 例。使用 ITK-SNAP 软件对肿瘤实性成分最大层面进行 ROI 手动勾画，并将勾画好的 ROI 文件导入美国 GE 公司 AK 软件内，利用不同的纹理参数进行特征提取，从而得到肿瘤内部的纹理特征值。选取熵、偏度、峰度、均匀度、标准差和平均值 6 个纹理参数作为分析指标。采用独立样本 t 检验及 Mann-Whitney U 检验分析两组之间纹理参数的差异，并采用受试者工作特征曲线下面积评估各参数的诊断效能。**结果** 中分化组的熵值、偏度、均匀度、标准差和平均值分别为 6.14±0.45、-0.36±0.35、0.78±0.04、57.40±14.42、265.40±59.06，低分化组上述各参数值分别为 6.17±0.67、-0.09±0.54、0.78±0.48、55.05±16.82、250.30±55.94。偏度在直肠腺癌中低分化程度间差异有统计学意义（t 值为-2.379， $P<0.05$）。熵、峰度、均匀度、标准差和平均值差异均无统计学差异（$P>0.05$）。ROC 曲线分析显示，以偏度-0.464 为鉴别中低分化直肠腺癌的阈值，其 ROC 曲线下面积（AUC）、敏感度和特异度分别为 65.3%、93.8%、60.6%。**结论** 基于 DWI 序列的 MR 纹理特征参数队鉴别直肠腺癌中、低分化程度有一定的价值。

肠道及肠系膜损伤的 MDCT 诊断

旷连勤,王毅
陆军特色医学中心（大坪医院）

目的：探讨肠道及肠系膜损伤的多层螺旋 CT(multi-slice spiral CT, MSCT)表现。**方法：**回顾性分析 96 例 MSCT 诊断为肠道及肠系膜损伤的 MSCT 检查，其中男 52 例，女 44 例，年龄范围 31~76 岁，平均 46.2±3.2 岁。全部患者均行 MSCT 平扫及多期增强扫描，结果与手术或临床诊断对照。**结果：**96 例肠道及肠系膜损伤的患者中，单纯小肠损伤 31 例(32.29%)，单纯结肠损伤 4 例(4.17%)，单纯肠系膜损 21 例（21.88%），肠道损伤合并肠系膜损伤 40 例（41.67%）。表现为肠壁中断的 17 例（17.7%），肠壁血肿 12 例（12.5%），腔外游离气体 67 例（69.79%），局部-节段性肠壁增厚 43 例（44.79%），肠壁异常增强 38 例（39.58%），腹腔内积液 75 例（78.13%），肠系膜活动性出血 8 例（8.33%），肠系膜血肿 7 例（7.29%），肠系膜血管征 15 例（15.63%），肠系膜雾（渗出）征 55 例（57.29%），对比手术或临床诊断，其敏感性分别为 72%和 95%，特异性分别为 95%和 100%。**结论：**MSCT 能对肠道及肠系膜损伤作出准确的评估，进而早期诊断此病，提高患者的生存率及生活质量。

磁共振弥散加权成像感兴趣区的选择在直肠癌术前分化程度和淋巴结中的应用

李杭,蒲红,印隆林,陈光文
四川省医学科学院·四川省人民医院

目的 评价磁共振弥散加权成像感兴趣区（region of interest，ROI）的选择在直肠癌术前分化程度和淋巴结中的应用价值。 **方法** 收集在我院经病理组织学检查确诊为直肠癌患者 56 例。所有患者均使用 Aera1.5T 磁共振行 MRI 常规扫描序列及 DWI 序列检查。根据术后病理分期，将肿瘤分化程度分为高中低分化三组；将淋巴结是否转移分为两组。两名不同年资医师在直肠癌 DWI 图像上采用三种 ROI 法（小 ROI、面积 ROI、容积 ROI）独立的进行测量病灶的 ADC 值。不同组间定量资料采用方差分析或 t 检验；运用受试者操作特性（receiver operating characteristic ROC）曲线将存在显著差异的参数进行分析，获得相应的最佳临界值、曲线下面积（area under the curve AUC）和诊断性能。**结果** 三种 ROI 法获得的 ADC 值差异有统计学意义（$P<0.05$），其中容积 ROI 法测得的 ADC 值更高、重复性最好。三种 ROI 法测得的 ADC 值在直肠癌高中低分化、有无淋巴结转移中差异有统计学意义（$P<0.05$）。绘制 ROC 曲线，高、中分化组容积 ROI：AUC=0.901，最佳临界值为 $1.125\times10^{-3}mm^2/s$；中、低分化组容积 ROI： AUC=0.848，最佳临界值为 $0.965\times10^{-3}mm^2/s$；淋巴结转移阳性与阴性组容积 ROI：AUC=0.915，最佳临界值为 $0.975\times10^{-3}mm^2/s$。 **结论** 三种 ROI 法中容积 ROI 法测得直肠癌的 ADC 值可重复性最好；ADC 值可用于区分高中分化、中低分化、淋巴结转移阳性与阴性的直肠癌，而容积 ROI 法测得的 ADC 值预测价值最好。

EPO-1246
FLT-PET/CT and CECT 在胃癌各种远处转移方面诊断价值的比较

李莉明,高剑波,王雨路
郑州大学第一附属医院

背景和目的：
到目前为止，没有关于使用 FLT-PET/CT 和 CECT 在胃癌远处转移方面的比较研究。因此，我们评估 FLT-PET/CT 和 CECT 在胃癌各种远处转移方面的诊断价值。
材料和方法：
研究纳入了 2015 年 1 月至 2019 年 1 月我院经胃镜活检证实为胃癌，并同时具有 FLT-PET/CT 和 CECT 两种检查的共 103 例患者。分别分析和比较两种检查在肝、骨、肾上腺、远处淋巴结和其他转移方面的敏感性，特异性，正确指数。同时评估并比较两种检查对腹膜转移分期的一致性。统计学方法采用卡方检验和 McNemar 检验。
结果：
FLT-PET/CT 在肝转移、骨转移、肾上腺转移和其他转移方面的正确指数分别是 0.88，0.99，0.98，0.99。均高于 CECT 的正确指数 0.79，0.65，0.54，0.89。两种检查在肝，骨，肾上腺，其他和远处淋巴结转移的诊断价值比较方面，*P* 值分别是 0.727，0.039，0.549，0.25，0.039。在骨和远处淋巴结转移的判定方面两者差异有统计学意义，余部位差异均不明显。在腹膜转移分期方面，P 值为 0.802，差异不明显。

结论：

总体而言，PET/CT 在评估远处转移方面优于 CECT。在远处淋巴结转移的评估时，两者差异明显。在腹膜转移及分期方面 CECT 较 PET/CT 有优势，但差异不明显。

EPO-1247
多层螺旋 CT 小肠成像诊断肠道病变的临床应用价值

马跃虎
南京市第一医院

目的:分析肠道病变的多层螺旋 CT 小肠成像（CTE）影像征象，评价 CTE 在诊断肠道疾病时，对不同肠道疾病患者诊断的价值。**方法:**回顾性分析 2014 年 1 月～2017 年 2 月于我院消化内科住院治疗，怀疑肠道病变行 CT 小肠造影的患者 150 例，在后处理工作站利用后处理软件对 ASI 数据进行多平面重建（Multi-Planar Reformation，MPR）及最大密度投影（Maximum Intensity Projection，MIP）进行图像重建，部分病人根据病情需要增加血管容积再现（volume rendering，VR）重建。
由两位经验丰富的医师在不知道病理及其他影像资料的情况下按照随机顺序分别对 CTE 图像进行分析并独立给出诊断意见。采用 Kappa 一致性检验比较诊断者诊断结果的差异。采用卡方检验或 Fisher 确切概率法比较两位医师的 CTE 诊断结果与临床结果，分别统计两位诊断医生采用 CTE 诊断肠道病变的敏感性、特异性、阳性预测值、阴性预测值及准确度。**结果:**150 例患者中，150 例中经肠镜证实 111 例，经胶囊内镜证实 8 例，经手术证实 17 例，余 14 例经临床治疗后症状缓解。炎症性肠病 62 例，肠道一般炎症 38 例，病毒性肠炎 3 例，急性胃肠炎 12 例，肠道肿瘤 15 例，息肉 7 例，憩室 2 例，肠系膜血管病变 6 例，肠道功能紊乱 5 例；两位阅片者间的诊断一致性很好（K>0.75）；两位医生诊断小肠病变的准确度分别为 89.3%和 92.7%；CTE 能有效发现炎症性肠病、肠道一般炎症、肿瘤、憩室、肠系膜血管病变（两位阅片者 P<0.05），而 CTE 对小肠息肉的诊断无明显优势（$P_{甲}$=0.076，$P_{乙}$=0.076）。**结论：** CTE 能观察肠管内外的异常改变，对肠道疾病有较高的灵敏度和特异度，评价病变的严重程度，为临床制定治疗方案及评估病情提供帮助，另外，CTE 检查操作简便、易于被患者接受，可以作为小肠病变的重要检查方法。

EPO-1248
食管胃结合部腺癌膈肌旁及下纵隔淋巴结转移的 CT 与病理对照研究

王之龙,唐磊,李艳玲,曹敏,李晓婷,李忠武,李子禹,孙应实
北京大学肿瘤医院

目的：探讨多排螺旋 CT 对食管胃结合部腺癌（AEG）膈肌旁及下纵隔区域淋巴结转移的诊断价值。**方法：**回顾性收集 2013 年 3 月至 2019 年 1 月我院收治的 53 例 AEG 患者的临床病理资料。患者均行根治性手术，术前 2 周内接受胸部及腹部多排螺旋 CT 检查。手术均清扫膈肌附近区域淋巴结（包括第 19 组膈下淋巴结，第 20 组食管裂孔淋巴结，第 111 组膈肌上淋巴结）和下纵隔区域淋巴结（第 110 组胸下部食管旁淋巴结，第 112 组后纵隔淋巴结），并按淋巴结分组记录手术病理情况。两名影像医生共同阅读患者 CT 图像，按淋巴结分组观察检出以上各组淋巴结并达成一致，在轴位图像测量淋巴结长径、短径及门脉期 CT 值，与术后病理淋巴结分组对照。统计以上各组淋巴结转移阳性组与阴性组的测量数据，评价 CT 诊断淋巴结转移的诊断效能。

结果： 53 例 AEG 患者中，有 23 例患者手术清扫了以上 5 组淋巴结区域，但病理大体标本未检出淋巴结。剩余 30 例患者病理共检出 55 枚淋巴结，其中有 7 枚淋巴结转移阳性。医生阅读 CT 图像在这 5 组区域共检出 35 枚淋巴结，其中第 19 组膈下淋巴结 7 枚，第 20 组食管裂孔淋巴结 7 枚，第 111 组膈肌上淋巴结 2 枚，第 110 组胸下部食管旁淋巴结 18 枚，第 112 组后纵隔淋巴结 1 枚。与病理淋巴结按组对照后，发现第 19 组 1 枚淋巴结转移，第 20 组 1 枚淋巴结转移，其余淋巴结无转移。这 5 组淋巴结中转移阳性淋巴结与阴性淋巴结的平均长径分别为 4.5±0.7mm 和 5.4±1.6mm，平均短径分别为 3.0mm 和 3.7±1.3mm，平均 CT 值分别为 6.5±3.5Hu 和 30.5±28.5Hu。转移阳性与阴性淋巴结的长径、短径及 CT 值均无统计学差异（P＞0.05）。**结论：** CT 可以检出食管胃结合部腺癌膈肌旁及下纵隔的淋巴结，为手术清扫淋巴结范围提供参考，但 CT 无法根据淋巴结的长径、短径和 CT 值对这五组淋巴结转移做出准确诊断。

EPO-1249
双源双能量 CT 对胃窦癌肠系膜淋巴结转移的诊断价值初步探讨

赵志伟,杨涛,柯岩,余开湖
咸宁市中心医院

【摘要】 目的 探讨双源双能量 CT 成像对提高胃窦癌肠系膜淋巴结转移术前诊断准确性的价值。**方法** 回顾性分析 37 例胃窦癌并行肠系膜淋巴结转移清扫患者的术前双能量 CT 扫描图像，并重建碘基物质分解(MD)图像和 40 ~ 140 keV 的融合图像。在 MD 图像上测量淋巴结碘浓度(IC)，归一化至腹主总动脉碘浓度，得到归一化碘浓度(NIC)。动脉期和门脉期测得的能谱曲线的斜率（λHU）。对转移性和非转移性淋巴结的测量值进行统计学分析，并利用 ROC 曲线分析确定测量值诊断淋巴结转移的最佳阈值。**结果** 经病理证实 111 枚淋巴结中转移性 89 枚(80%)，非转移性 22 枚(20%)。转移性淋巴结 IC、NIC、λHU 分别为 2.93±1.08 mg / mL, 0.67±0.45,3.73±1.91。非转移性淋巴结分别为 1.27±0.51 mg/mL、0.21±0.12、1.79±0.61，差异有统计学意义(P 均<0.001)。ROC 分析确定 IC 的最佳诊断阈值为 2.26 mg/mL，敏感性为 80.7%，特异性为 89.7%，准确性为 84.5%。NIC 的最佳阈值为 0.267mg/mL，灵敏度为 94.7%，特异性为 77.1%，准确度为 93.2%。λHU 最佳阈值为 2.381,其敏感性,特异性和准确性为 87.1%，分别为 81.9%和 87.1%。**结论** 双源双能量 CT 检查结果提高了术前诊断胃窦癌肠系膜淋巴结转移术前诊断的敏感性和准确性。

症状性肠系膜脂膜炎的 CT 表现及临床意义

周碧,杨凯,樊凯华,张开华,吴春根
上海市第六人民医院东院

目的 探讨症状性肠系膜脂膜炎的 CT 表现及其临床意义。**方法** 收集 2016 年 1 月 1 日至 2018 年 12 月 31 日 34 例症状性以及 57 例无症状性肠系膜脂膜炎的 CT 表现，回顾性分析其 CT 影像学特点。**结果** 91 例肠系膜脂膜炎患者中，临床有症状者 34 例（37.4%）、无症状者 57 例（62.6），其 CT 表现主要有下述 5 种征象：肠系膜周围脂肪组织密度不均匀增高 21/16 例（62%/28%）、“假包膜征”14/46 例（40%/84%），血管增粗 20/15 例（60%/30%），肠界面模糊 22/18 例（71%/32%），结节“脂肪环征”25/18 例（74%/32%），肠系膜末梢血管“脂肪环征”20/14 例（60%/26%）；症状性与无症状肠系膜脂膜炎存在明显组间差异（P<0.05）。**结论** 症状性肠系膜

脂膜炎的 CT 表现有一定特异性，反映了病变处于急性炎症期，能够及时指导临床治疗肠系膜脂膜炎。

胃低张力螺旋 CT 扫描技术对胃占位性病变的诊断价值评估

向东生,马琼英,王爽
陆军军医大学附属新桥医院放射科

目的 通过胃低张力螺旋 CT 平扫加增强与电子胃镜对照分析，探讨胃低张力螺旋 CT 平扫加增强扫描技术对胃占位性病变的诊断价值。**方法** 随机选择经电子胃镜检查和/或外科手术及病理证实的 60 例胃低张力螺旋 CT 平扫加增强扫描的双对比造影片进行回顾性分析。扫描采用 GE Lightspeed 64 层螺旋 CT,扫描参数：管电压 120KV，管电流 300mA，螺距 1.375，层厚 5mm，层距 7.5mm，重建层厚 1.25mm，矩阵 512X512，扫描范围自膈肌上缘平面至髂嵴平面。所有患者检查前禁食 4h，检查前 30 min 饮水 500~ 1000ml 检查时再饮水 200~ 300ml，以充分充盈胃和十二指肠，于 CT 扫描前 10 min 肌肉注射 654-2，10mg，并在扫描前即刻口服产气粉 6.0g，CT 增强扫描经肘静脉注射非离子型造影剂碘伏醇(300mg/ml) 80/ml, 注射流率 3. 5ml/s，经高压注射器注射碘伏醇后，于 25~30s 行动脉期扫描，随后 40s 行静脉期扫描，所得图像进行多平面重建。**结果** 胃低张力螺旋 CT 平扫加增强扫描对于胃癌以及某些隆起性病变的诊断与胃镜的诊断较一致，本组 23 例二者完全相符，12 例 CT 提示胃壁增厚或结节，胃镜报告为息肉或隆起性病变；而对于正常、表浅性病变二者有差异，本组 25 例 CT 未见异常者，胃镜有 7 例提示小息肉或溃疡，胃低张力螺旋 CT 平扫加增强对于胃壁增厚及病变向壁外生长及壁周淋巴结增大的显示优于电子胃镜。**结论** 胃低张力螺旋 CT 平扫加增强较常规检查为优越，有利评估及决定手术方案与了解肿瘤向外生长和转移情况。采用低张力加大量喝水，能消除胃肠的蠕动、使胃充分扩张；由于胃壁有良好的供血,增强明显，在腔内低密度水的衬托下,能清晰地显示胃壁的形态。因此，我们认为胃低张力螺旋 CT 平扫加增强扫描技术，对胃病变的诊断有一定的临床应用价值。

EPO-1252
能谱 CT 定量评估结直肠管状腺癌分化程度

曾梦华
重庆三峡中心医院

目的 研究能谱 CT 成像（GSI）定量分析在评估结直肠管状腺癌分化程度中的价值。**方法** 纳入经纤维镜或手术病理确诊的结直肠管状腺癌共 46 例，按照病理结果将其分为中高分化组 27 例、低分化与未分化组 19 例。应用 GE 宝石能谱 CT 在能谱扫描模式(GSI)下行数据采集。所有患者术前均行全腹部 GSI 双期增强扫描，获得动、静脉期能谱图像，测量并比较两组病灶的碘浓度 IC、标准化碘浓度 NIC 及各期能谱曲线斜率 K 值的差异。进一步分析各能谱参数评定结直肠管状腺癌分化程度的各参数受试者工作特征曲线(ROC)、 曲线下面积(AUC) 、敏感度、特异度、最佳诊断阈值及 Youden 指数，评估各项参数的诊断效能。**结果** 中高分化组、低分化与未分化组组间能谱参数比较，发现中高分化组动脉期碘浓度 IC、标准化碘浓度 NIC 及能谱曲线斜率 K 值的绝对值均高于低分化与未分化组，且二者之间差异具有统计学意义，P 值均＜0.05；而静脉期所见能谱各参数差异不具有统计学意义。动脉期碘浓度、动脉期 NIC、动脉期能谱曲线斜率的 AUC 分别 0.798、0.721、0.733，当其诊断阈值分别设为＞1.09 mg/ml、＞0.18、>1.34 时，其判定结直肠管状腺癌分化程度的敏感度、特异度、Youden 指数分别为 75.8%、76.3%、0.47；79.5%、79.7%、0.52；

69.9%、67.2%、0.43。**结论** 结直肠管状腺癌能谱 CT 多参数定量分析评估肿瘤组织学分化程度有一定的特异度和敏感度，特别是 动脉期 NIC 具有更加可靠的诊断效能。

EPO-1253
多层螺旋 CT 血管成像和图像融合技术对腹腔镜直肠癌根治术的术前评估

卞琳杰
无锡市第二人民医院（南京医科大学附属无锡第二医院）

目的 观察肠系膜下动脉及其分支走行与变异情况，探讨 CT 血管成像和图像融合技术对腹腔镜直肠癌根治术术前评估的临床价值。**方法** 采用回顾性描述性研究方法。收集 2018 年 2 月至 2019 年 3 月本院收治的 60 例行腹腔镜直肠癌根治术的临床病理资料。患者术前均行腹部多层螺旋 CT 平扫和双期增强扫描，将原始图像进行血管成像重建，并将其融合，得到血管三维图像。观察指标：(1) 肠系膜下动脉分支分型情况。（2）三维血管重建图像中测量肠系膜下动脉根部至腹主动脉分叉点的距离 （D1）， 肠系膜下动脉根部至第一分支的距离（D2）。（3）二维视图及三维视图在肠系膜下动脉起点水平评价肠系膜下动脉、肠系膜下静脉、左结肠动脉三者之间的空间关系。在三维视图中评估左结肠动脉和肠系膜下静脉两者之间的交叉模式。 **结果** 60 例患者的扫描图像均达到诊断要求并获得良好的血管成像效果。VR 图像上的各血管与术中镜下裸化血管后实际观察到的走形情况进行对比，吻合率为 100%。**结论** CT 血管成像和图像融合技术可以直观地显示肠系膜下动脉及其分支走行与变异，具有较高的临床应用价值。

上消化道异位胰腺与小于 3cm 胃肠道间质瘤 MDCT 特征的比较

张春来,王毅
陆军特色医学中心（大坪医院）

目的
比较上消化道异位胰腺(heterotopic pancreas, HP)与胃肠道间质瘤(gastrointestinal stromal tumors, GIST)多排螺旋 CT(multidetector computed tomography, MDCT)形态学及多期增强特征。
方法
回顾性分析 21 例上消化道 HP 和 22 例长径小于 3 cm GIST 的 MDCT 形态学及多期增强特征，并对两组病例的 MDCT 特征进行比较分析。
结果
MDCT 平扫 HP 平均 CT 值高于 GIST，增强扫描动脉期 CT 实测值两者相似，但 GIST 动脉期绝对强化值高于 HP 动脉期绝对强化值，且动脉期绝对强化值两者比较有意义(P<0.05)。门静脉期及平衡期 HP 的 CT 实测值均高于 GIST，但 HP 门静脉期绝对强化值高于 GIST，平衡期绝对强化值两者相似，增强扫描门静脉期及平衡期 HP 与 GIST 绝对强化值的比较差异无统计学意义(P>0.05)。HP 门静脉绝对强化值高于动脉期绝对强化值，而 GIST 门静脉期绝对强化值低于动脉期绝对强化值。
结论
本研究比较 HP 与 GIST 平扫 CT 值、动态增强扫描各期 CT 值、绝对强化值、以及两者之间的相关性，发现 HP 平扫 CT 值、动脉期、门静脉期及平衡期 CT 值均显著高于 GIST，表明 HP 强化程度高于 GIST。但 GIST 动脉期绝对强化值高于 HP 动脉期绝对强化值，而 HP 门静脉期绝对强化值高

于 GIST，说明 GIST 由动脉供血，所以动脉期绝对强化值明显升高，而 HP 由于组织学成分与正常胰腺相关，导致静脉回流较慢，所以门静脉期绝对强化值明显升高，切强化平台期延长，最终平衡期 HP 与正常胰腺 CT 值相近。

MDCT 动态增强扫描显示 HP 与 GIST 的强化值及绝对强化值之间存在差异。由于 MDCT 可提供上述有助于 HP 与 GIST 诊断和鉴别诊断的影像学信息， MSCT 动态增强扫描可作为一种重要的检查技术。

EPO-1255

小儿肠套叠空气灌肠+手法复位影像特点分析

陈华
遵义医学院附属医院

摘要：目的 分析空气灌肠+手法复位整复小儿肠套叠 X 线影像特点。**方法** 回顾性分析我院 2010 年 1 月至 2019 年 1 月 959 例临床疑似小儿肠套叠行空气灌肠+手法复位整复术，分析术中、术后的 X 线影像特点。**结果** 959 例临床疑似小儿肠套叠患儿均于整复前行超声检查，并均在超声下见到同心圆征，959 例中仅 2 例未见肠套叠 X 线征象，957 例均确认为肠套叠，其中整复成功 872 例（91.11%），失败 85 例（8.88%），整复成功后复发 63 例（7.22%），复发 63 例患儿再次行空气灌肠+手法复位整复术后均成功整复。整复术中及术后均未见肠管破裂及穿孔。X 线影像特点：套头多位于结肠内，最远处位于乙状结肠下段，套头常表现为圆形或类圆形；套头退缩至回盲部并最终消失、小肠内见大量气体进入提示整复成功；套头退缩至回盲部并固定或于某一位置固定，小肠内未见气体进入或进入气体极少，均提示整复失败。**结论** 空气灌肠+手法复位整复小儿肠套叠是较为安全有效的诊断和治疗方法，能有效减少手术对患儿的创伤，熟悉其 X 线影像特点可有效提高小儿肠套叠的诊断与治疗成功率，可作为小儿肠套叠首选治疗方法。

结直肠癌动态能谱扫描病灶碘值峰值时间与主动脉 CT 值峰值时间的差异性研究

王丹丹,罗娅红
辽宁省肿瘤医院

目的：应用 640 层 CT 一站式动态能谱成像模式，分析病灶部位碘值达到峰值时间与主动脉达到峰值时间的差异性。
方法：纳入经结肠镜病理确诊为结肠腺癌的 29 例患者，所有患者术前均行一站式动态能谱扫描，同时获得能谱成像数据。在副台 Dual Energy 能谱处理程序中处理每一组能谱数据获得碘图，通过碘图测得肿瘤的碘分布值，并进行动态的碘图分析。根据 CT 图像的时间-密度曲线及碘图的时间-碘值曲线获得病灶部位碘值峰值及主动脉 CT 值峰值，进行统计学分析。结果：病灶部位碘值峰值时间均值为 31.04±9.05s，主动脉峰值时间均值为 22.67±4.66s，两组间差异具有统计学意义 P<0.05(P=0.00)。患者有效辐射剂量为 16.56mSv。结论：病灶部位碘值达到峰值时间明显迟于主动脉 CT 值达峰时间。
临床意义：动态能谱成像能获得随着造影剂的注入病灶碘分布的动态变化情况，能为临床提供更多的有用信息。

EPO-1257

Application of dynamic dual-energy CT imaging in colorctal cancer for assessing the correlation between blood perfusion and iodine uptake on 320-row multidetector CT

Dandan Wang,Yahong Luo
Liaoning Cancer Hospital & Institute

PURPOSE
To evaluate the characteristics of blood perfusion and iodine uptake in colorectal cancer using dynamic dual-energy imaging on 320-row CT.
METHOD AND MATERIALS
29 patients with colonic adenocarcinoma diagnosed by colonoscopy were enrolled. Each patient was scanned for 10 dual-emerge acquisition phases, with 3-second intervals for 1 to 7 phases, 5-second intervals for 8 to 10 phases, and total scanning time was 53s. Iodine map and perfusion map were generated, and iodine uptake peak (IUP), arterial flow (AF, ml/min/100ml), blood volume (BV,ml/100ml) and permeability (ml/min/100ml) of tumor were measured.
RESULTS
The IUP, AF, BV and permeability of tumor were 71.46±2.19, 158.26±80.40, 17.33±17.80, 60.14±20.59, respectively. The IUP of tumor was significantly associated with the AF ($r=0.440$, $P<0.05$) and BV ($r=0.382$, $P<0.05$) There was no significant correlation between IUP and permeability($P>0.05$). The average DLP of dynamic dual-energy CT imaging was 1104 mGy·cm with an effective radiation dose of 16.56 mSv.
CONCLUSION
Dynamic dual-energy CT imaging can generate dynamic iodine map and perfusion map at the same time. The correlations of iodine uptake peak and perfusion parameters AF and BV of colorectal cancer are significant.
CLINICAL RELEVANCE/APPLICATION
Dynamic dual-energy CT imaging of coloractal cancer provides iodine uptake and perfusion data in just one scan. It can be used to evaluate the hemodynamic characteristics of colorectal cancer and provide more diagnostic information for the clinical doctors.

Diagnostic values of IVIM- DWI analyses in esophageal Cancer

Hui Yang,Xiaoqian LI,Xianchen Zhang
The Second Affiliated Hospital of Shandong First Medical University

Background: To investigate the potential value of parameters derived from stretched exponential diffusion-weighted imaging model in the diagnosis of early esophageal Cancer.
Materials and methods: 25 cases of patients with pathologically confirmed early esophageal cancer without treatment and 15 healthy individuals under-went MRI plain scan and IVIM-DWI scan with 10 b values(0~1500s/mm^2).The distributed diffusion coefficient (DDC) and water molecular diffusion heterogeneity index (α) obtained from the stretched-exponential model were calculated and compared between the esophageal cancer group and normal esophageal tissue group. Comparisons between the tumour and normal esophagus were performed by two independent sample *t* test or Mann-Whitney U test .The prediction parameters and diagnostic efficiency were compared by ROC curve. $P<0.05$ was considered to indicate a significant difference.
Results: The DDC and α in esophageal cancer group were (2.05±0.16)×$10^{-3}$$mm^2$/s, (0.65±0.22) respectively; those in normal esophageal group were(3.13±0.72) ×$10^{-3}$$mm^2$/s, (0.74±0.13) respectively. The DDC and α in esophageal cancer group were significantly lower than those in normal esophageal group ($P<0.05$). The areas under the ROC curve (AUC) of DDC and α values were 0.84 and 0.75 respectively. The AUC of combining DDC with α value was 0.90.
Conclusion: The parameters derived from stretched exponential models could be offer additional information for diagnosis of esophageal cancer.

Additional value of MRI-detected EMVI in rectal cancer; Applicability in predicting Lymph node metastasis

Tripathi Pratik[1],Guo Weifeng[2],Shen Yaqi[1],Li Zheng[1],Hu Xeumei[1],Zeng Mengsu[2],Hu Haoyu[1]
1.Tongji Hospital affiliated to Tongji Medical College of Huazhong University of Science and Technology
2.Zhongshan Hospital affiliated to Fudan University.

Abstract
Introduction: Extramural vascular invasion (EMVI) has been recommended as an independent prognostic factor for poor overall survival rate in rectal cancer and can be used as a potential biomarker. Early prediction of prevalence of lymph node metastasis can elevate the disease free survival rate. We aimed to evaluate the MRI-detected extramural vascular invasion (mrEMVI) in predicting lymph node metastasis in T3 rectal cancer.

Methods: Post-operative histopathologically confirmed T3 rectal cancer patients without previous treatment from July 2014 to December 2015 were enrolled for this study. Two blinded radiologists evaluated MRI detected extramural vascular invasion (mrEMVI) status. mrEMVI was categorized into EMVI positive and EMVI negative in T2 weighted image using mrEMVI scoring system. The results along with other clinical

characteristics (Age, Sex, Tumor location, Depth of Tumor invasion, mrEMVI, pre-operative CEA, perineural invasion) were then correlated with lymph node metastasis to determine the risk factors using univariate and multivariate analysis.

Results: In 180 patients, 32 patients were confirmed to be mrEMVI-positive. There were total 78 patients with lymph node metastasis in which 25 were mrEMVI-positive. Four factors were significantly associated with lymph node metastasis: age (p=0.026, 95%CI 0.023-0.344), mrEMVI (p=0.049; 95%CI 0.001-0.390), perineural invasion (p=0.005; 95%CI 0.062-0.345) and preoperative CEA (p=0.014; 95%CI 0.036-0.313).

Conclusions: mrEMVI positive, preoperative CEA level and post-operative perineural invasion are independent risk factor for lymph node metastasis in rectal cancer. mrEMVI score 4 is a strong risk factor for lymph node metastasis than mrEMVI score 3 in rectal cancer.

多层螺旋 CT 曲面重组技术在早期胃癌术前病灶显示及临床 TNM 分期中的应用价值

何玉鹏[1,2],陈勇[3],高知玲[3],陈文[1],徐霖[1]
1.十堰市太和医院
2.宁夏医科大学
3.宁夏医科大学总医院

目的 将曲面重组（CPR）技术应用于 MSCT 图像，探讨其对早期胃癌（EGC）术前病灶显示及临床 TNM 分期（cTNM 分期）的价值。方法 收集我院 97 例 EGC 患者的 MSCT 图像，比较轴位（AXI）、多平面重组（MPR）及 CPR 图像对 EGC 的检出率、形态准确率、cTNM 分期准确率及对区域淋巴结的检出能力。**结果** ①EGC 检出率：AXI 组 55.7%，MPR 组 84.5%，CPR 组 89.7%；AXI 组与 MPR 组、AXI 组与 CPR 组差异有统计学意义，MPR 组与 CPR 组差异无统计学意义。②形态准确率：AXI 组 18.6%，MPR 组 47.4%，CPR 组 71.1%；三组组间差异均有统计学意义。③cT 分期准确率：AXI 组 43.3%，MPR 组 64.9%，CPR 组 83.5%；三组组间差异均有统计学意义。④cN 分期准确率：AXI 组 86.6%，MPR 组 86.6%，CPR 组 87.6%，三组组间差异无统计学意义。⑤区域淋巴结：AXI 组发现淋巴结 438 个，第一站 336 个，第二站 102 个；MPR 组 544 个，第一站 437 个，第二站 107 个；CPR 组 509 个，第一站 491 个，第二站 18 个；三组间第一站及第二站站内淋巴结数目构成比无统计学差异，第一站与第二站站间淋巴结数目构成比有统计学差异；三组间总淋巴结阳性例数无统计学差异，第一站及第二站站内淋巴结阳性例数均有统计学差异；CPR 组对第一站淋巴结的检出率优于 AXI 组及 MPR 组，但对第二站淋巴结的检出率不如 AXI 组及 MPR 组。 **结论** CPR 可以提高 CT 对 EGC 的检出率、形态准确率及 cT 分期准确率，对 1～6 组淋巴结有较好的观察能力，但对提高 cN 分期准确率无帮助。

Comparative study of tumor response by Choi and RECIST with CT in patients treated with imatinib for gastrointestinal stromal tumor

Dayong Deng
JiLin Provincial Cancer Hospital

Objective Choi and RECIST criteria was used to evaluate the efficacy of imatinib in patients with gastrointestinal stromal tumor recurrence and metastasis. Our aim was to explore a more effective evaluation criteria for imatinib and to provide an effective treatment option for subsequent therapy in patients with gastrointestinal stromal tumors. **Methods** CT examination results of 35 patients with gastrointestinal stromal tumor recurrence/metastasis before and after treatment with imatinib weren retrospectively analyzed and Choi and RECIST criteria were used to evaluated the efficacy of imatinib. **Results** The recurrence/metastasis of 35 patients with gastrointestinal stromal tumors focus location distribution: 10 cases of gastric stromal tumor recurrence, 7 cases of small intestinal stromal recurrence, 1 case of mesenteric recurrence, 1 case of rectal and pelvic recurrence, 15 cases of liver metastasis, 1 case of hepatic peritoneal and abdominal metastasis. The measurable target lesions distribution of 35 patients with gastrointestinal stromal tumors: 1 measurable target lesion in 4 cases, 2 measurable target lesions in 5 cases, 3 measurable target lesions in 3 cases, 4 measurable target lesions in 6 cases, ≧5 measurable target lesions in 17 cases by CT examination. Choi and RECIST Methods were used to evaluate the efficacy of imatinib in 35 patients with gastrointestinal stromal tumor recurrence/metastasis receiving imatinib. Choi analysis showed that 28 patients were partially relieved, 7 patients were no relieved and the remission rate was 80%. RECIST analysis showed that 17 patients were partially relieved, 18 patients were no relieved, and the remission rate was 48.57%. The difference in the results of the two evaluation methods was statistically significant. The Choi criteria for the evaluation of gastrointestinal stromal tumor imatinib treatment was higher than the RECIST evaluation criteria. **Conclusion** Choi criteria is superior to RECIST criteria when evaluating the efficacy of imatinib in treatment of gastrointestinal stromal tumors. Choi evaluation can objectively reflect the tumor retraction and remission rate at early stage, and can provide an important basis for the subsequent treatment in patients with gastrointestinal stromal tumor.

应用 640 层动态能谱 CT 成像对结直肠肿物的初步研究

王丹丹,罗娅红
辽宁省肿瘤医院

目的:评估动态能谱 CT 成像定量参数对结直肠癌分化程度及结直肠良恶性肿物鉴别的诊断价值。方法：收集 84 例结直肠肿物患者行术前一站式动态能谱扫描，同时获得能谱及灌注成像数据。根据手术病理结果分为 A 组（腺瘤，n=15）,B 组（腺癌，n=69），C 组（高分化腺癌,n=36）,D 组（中低分化腺癌,n=33）。将不同组间的一般资料、病灶碘值（IC）、标准化碘值（NIC）、动脉期血流量（AF）、血容量（BV）、表面渗透性（PS）进行统计学分析， ROC 曲线用于评估其诊断效能。结果： 静脉期 IC 和 NIC 对鉴别腺瘤和腺癌存在显著差异（P <0.001）。 ROC 分析显示，静脉期 NIC 为 3.52 时鉴别腺癌与腺瘤的敏感性为 72.0%，特异性为 91.9%。腺瘤和腺癌组之间的 AF，BV 和 PS 均存在显着差异（P <0.001）。ROC 分析表明， AF 值为 175.13 ml·min·100 g 时鉴别腺癌

和腺瘤的敏感性为 80.0%，特异性为 86.4%；高分化腺癌和中低分化腺癌之间的 AF、BV 和 PS 均存在显着差异（P< 0.001）。BV 值为 7.76 ml / 100 g 时鉴别低级别癌症和高级别癌症的灵敏度为 90.9%，特异性为 77.7%。结论：一站式动态能谱 CT 扫描能同时得到能谱参数及灌注参数对鉴别结直肠良恶性肿物及肿瘤的分化程度有重要诊断价值。

多层螺旋 CT 对（≤10 cm）胃神经鞘瘤与胃间质瘤的鉴别诊断价值

马菊香,李绪斌,叶兆祥
天津医科大学肿瘤医院

摘要 目的 探讨多排螺旋 CT 对（≤10 cm）胃神经鞘瘤（GS）和胃间质瘤（GIST）的鉴别诊断价值。**方法** 回顾性分析 31 例 GS 和 126 例 GIST 的 CT 表现，分析内容包括肿瘤大小、部位、形态、边界、生长方式、强化程度、溃疡、钙化、囊变坏死、周围脂肪间隙淋巴结及不同 CT 测量值（平扫、动脉期及静脉期 CT 值）和动脉期增强幅度(DE1)、静脉期较动脉期增强幅度（DE2）、静脉期增强幅度（DE3），并对患者临床资料进行分析。两组间分类变量采用 x^2 检验或 *Fisher* 检验，连续变量采用 Mann-Whitney 秩和检验，将有意义的变量纳入多元 Logistic。**结果** 统计结果表明患者性别、肿瘤发生部位、形态、边界、生长方式、囊变坏死和淋巴结在两组中差异有统计学意义（P ＜ 0. 05）；患者年龄、肿瘤大小、强化程度、溃疡、钙化及各不同 CT 值差异无统计学意义（ P ＞ 0. 05)；多因素 Logistic 回归分析表示：肿瘤发生部位和淋巴结是两组肿瘤鉴别诊断的独立危险因素（P ＜ 0. 05）。 **结论** CT 检查结合患者临床资料在（≤10 cm ）GS 和 GIST 的鉴别诊断中：女性、肿瘤位于胃体或胃窦、形态规则、边界清楚、呈腔内或腔外生长、周围脂肪间隙伴淋巴结有利于 GS 诊断；肿瘤位于胃底或胃体、形态不规则、边界不清、呈腔外或腔内外生长、同时伴囊变坏死有利于 GIST 诊断。其中肿瘤发生部位和淋巴结是两者鉴别诊断的独立危险因素。

胃神经内分泌肿瘤的影像特征

马锦涛,董越
辽宁省肿瘤医院

目的

探讨动态增强 CT 对于胃 NET（神经内分泌瘤）和胃 NEC（神经内分泌癌）的鉴别诊断价值。

材料与方法

对经病理确诊为胃 NET 的患者进行回顾性分析，共 79 例，其中男性 58 例，女性 21 例，平均年龄(61.13±9.55)岁。观察患者的影像资料，包括病灶位置、大小、形态、密度、浆膜面、平扫及强化 CT 值、动脉期强化程度、强化方式、特殊类型强化及有无淋巴结转移。采用 SPSS23.0 软件进行统计分析，符合正态分布的定量资料采用独立样本 t 检验比较，不符合正态分布分布的定量资料采用 u 检验比较。定性资料的比较采用卡方检验。对于单因素分析有统计学意义的变量纳入 Logistic 回归模型。

结果

1、胃 NET 患者共有 9 例，其中男性 1 例，女性 8 例,平均年龄(50.52±7.50)岁；胃 NEC 患者有 70 例，其中男性 57 例，女性 13 例，平均年龄(62.81±9.09)岁，两者在性别、年龄方面差异有统计学意义。
2、胃 NET 与胃 NEC 的分布存在差异，NET 多位于胃体，NEC 多位于胃窦。胃 NET 与胃 NEC 的病灶的最大厚度、病灶的最大范围、形态、密度、浆膜面存在差异，差异有统计学意义。
3、胃 NET 和胃 NEC 的动脉期 CT 值、静脉期 CT 值、动脉期强化程度及线状强化无显著差异（p>0.05）。胃 NET 和胃 NEC 的平扫 CT 值、强化方式、淋巴结转移差异有统计学意义（p<0.05）。
以上所有因素中，性别、肿块最大厚度是鉴别胃 NET 和胃 NEC 的独立影响因素。

结论

1、胃 NET 和胃 NEC 患者的性别和年龄存在差异，NET 多为女性，NEC 多为男性，NEC 发病的年龄通常较 NET 大。
2、胃神经内分泌肿瘤的动态增强 CT 表现具有一定特征，病灶的分布、肿块的大小、形态、密度、浆膜面、平扫的 CT 值、强化方式及淋巴结转移对 NET 和 NEC 的鉴别具有重要意义。
3、性别、肿块最大厚度是鉴别胃 NET 和胃 NEC 的独立影响因素。

单、双指数模型扩散加权成像对直肠癌转移性 LN 的诊断价值

许梅海,申炜,韦洁勤,卢平明,黄龙全,尹家瑜
南宁市第一人民医院

摘要:目的 探讨常规单指数模型扩散加权成像(DWI)及基于体素内不相干运动双指数模型扩散加权成像(IVIM-DWI)在直肠癌转移性 LN 中的诊断价值。**方法** 40 例经病理确诊为直肠癌的患者,术前行常规 DWI 及 IVIM-DWI 检查。比较转移性 LN 与非转移性 LN 的平均短、长径值、长短径比、常规 DWI 的 eADC、值、ADC 值和 IVIM-DWI 参数值 D、 D^*和 f 值的差异，并分析有差异参数值的 ROC 曲线。**结果** 转移性与非转移性 LN 在[短径(10.23±5.77mm）vs(5.07±1.45mm)、长径（13.08±7.47mm）vs（6.06±1.56mm）、 eADC 值（0.725±0.19）vs（0.273±0.09）、ADC 值（0.761±0.18）×10^{-3} mm^2/s vs（1.510±0.22）×10^{-3} mm^2/s、D 值(0.610±0.18) vs（1.49±0.24）×10^{-3} mm^2/s、D^* 值（28.661±25.51） vs（8.62±2.60）×10^{-3} mm^2/s)]上的差异有统计学意义。短径、长径、eADC 值、D^*值鉴别转移性 LN 与非转移性 LN 的 ROC 曲线下面积分别为 0.847、0.828、0.981、0.978，其中以 eADC 值的 ROC 曲线下面积最大。**结论** eADC 值与 D^*值对直肠癌转移 LN 的诊断均具有较大的价值,eADC 值在直肠癌转移性 LN 的诊断中具有最高的诊断效能。

非对比增强磁共振肠道显像评估对阑尾炎及其并发症中的价值

王梓,胡道予
华中科技大学同济医学院附属同济医院

目标：评估非对比增强磁共振肠道显像对阑尾炎及其并发症中的价值。
材料和方法：运用磁共振肠道显像（Magnetic Resonance Enterography， MRE）对 2013 年 2 月至 2017 年 8 月 86 名以右下腹痛为首诊症状的患者进行检查，由两名腹部影像学医师分别对 MR 图像进行分析，对阑尾及其并发症的情况进行评估，并与手术以及内镜活检病理结果进行对照；

结果：通过与手术及随访结果对比，非对比增强磁共振肠道显像对阑尾炎及其并发症的检出率及准确性分别为 97.6%、95.5%；
结论：非对比增强磁共振肠道显像能够对阑尾炎及其并发症进行有效的评估。

EPO-1267

超声技术在胃癌诊断中的应用

王文慧
1.辽宁省肿瘤医院
2.中国医科大学肿瘤医院

来源于食管胃结合部（EGJ）和胃的上消化道（GI）肿瘤构成了一个主要的全球性健康问题。胃癌诊断时常已为中晚期，失去了治愈的时机，因此在早期应用影像学检查对胃癌进行准确诊断具有较高的临床意义。
本文就当前胃癌的研究热点，综合评价不同的超声检查方法，着重于超声新技术在诊断胃癌的研究现状，对其临床意义进行客观性评价。
超声诊断早期胃癌的诊断准确率较低，仅有 60%左右，而对进展期胃癌诊断符合率较高，可达 90%~95%。与二维超声相比较，三维超声可显示肿瘤的大体结构及病灶间的凹陷溃疡面，图像清晰逼真、形态直观。胃肠超声造影操作简便，检查过程无创、无辐射，患者更易接受；对胃壁五层结构观察清晰，并且对胃内占位性病变、黏膜下占位性病变的敏感性较高，可以很好地显示肿瘤的浸润程度，指导胃癌的 TNM 分期。超声双重造影检查（DCUS）不仅可以清晰显示肿瘤的部位、大小、浸润程度，还能反映病灶及胃周淋巴结的微血管和血流灌注情况，帮助鉴别肿瘤的良恶性，为术前分期提供更好的依据 。内窥镜已经成为胃癌患者在诊断、分期、治疗和姑息性处理中重要的检查手段。EUS 是将传统胃镜检查与超声相结合，既能直接观察消化道管壁的形态，又能对其进行实时超声扫描，获得各管壁层次结构的组织学特征和邻近器官的超声图像。线阵超声内镜(LEUS)是结合内镜、超声及超声内镜引导下穿刺、活检三种作用，能准确判断肿瘤浸润程度，同时对邻近淋巴转移也具有诊断价值 。随着染色内镜、放大内镜窄带成像技术（ME-NBI） 等新型内镜技术的运用，诊断癌前病变及早期胃癌的敏感性和特异性不断提高 。
综上所述，随着超声技术、设备的更新，对胃癌的检出、分期及评估疗效的准确率将不断提高，超声检查可以发挥更重要的临床应用价值。

Initial Expericence with Cinematic Rendering for Diagnosis in Spontaneous Isolated Superior Messenteric Artery Dissection

Ling Ma[1],Dan Han[1],Jun Yang[2]
1.The First Affiliated Hospital of Kunming Medical University
2.The Third Affiliated Hospital of Kunming Medical University

Objective: Cinematic rendering (CR) is a new three-dimensional data visualization technology. This study aims to investigate the value of CR in the image post processing of Spontaneous Isolated Superior Messenteric Artery Dissection (SISMAD).

Materials and Methods: CT data of 42 patients with SISMAD who were admitted to our hospital were retrospectively analyzed. All cases received conventional CTA and were posttreated with MPR, VR and CR. The two radiologists independently examined and analyzed the images of traditional CT and MPR, VR and CR, recorded the perforation, intimal valve, true and false lumen, branches, lesion area and diameter enlargement, and evaluated the diagnostic effect of CR on SISMAD by χ^2test.
Results: CT enhanced images and MPR could visually display the intima film, true and false lumen, lesion range and the shape of branch vessels; VR and CR had strong stereoscopic sense, which could clearly show the whole course of lesion and the spatial relationship with branch vessels; CR could improve the display rate of rupture of superior mesenteric artery dissection and show more clearly the small branches.
Conclusion: On CR images, SISMAD showed localized enlargement of superior mesenteric artery, low-density linear intima patches could be seen in cross-section, and the true and false lumens moved in a straight line, and the display rate of breaks increased. Therefore, CR has a certain value in the diagnosis and treatment evaluation of SISMAD.

Reduced Field-of-View Diffusion-Weighted Imaging in Histological Characterization of Rectal Cancer: Impact of Different Region-of-Interest Positioning Protocols on Apparent Diffusion Coefficient Measurements

Yang Peng,Yaqi Shen,Xuemei Hu,Zhen Li,Daoyu Hu
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, 1095 Jiefang Avenue, Wuhan, Hubei, P.R. China 430030.

Objectives: To compare four region-of-interest (ROI) protocols for apparent diffusion coefficient (ADC) quantifications derived from reduced field-of-view diffusion-weighted imaging (rDWI) in histological characterization of rectal cancer.
Methods: Two readers independently performed mean and minimum ADC measurements using four ROI positioning protocols (whole-tumor volume [WTV], single-slice [SS], three-slices observer-based sampling [TSOB] and three-slices predefined sampling [TSPD]) on forty-nine patients who underwent rDWI at 3.0T. Inter-observer variation was evaluated with Bland-Altman analysis and interclass correlation coefficient (ICC). Mean and minimum ADC values obtained from each method were compared in terms of different histological factors of rectal cancer by nonparametric tests. The diagnostic ability was evaluated by receiver-operating characteristic curve. The corresponding times for ADC measurements were recorded and compared between ROI methods.
Results: The inter-observer agreement was excellent for ADC values obtained by the two readers using the above four ROI methods (ICC range, 0.906-0.994). Mean and minimum ADC values by WTV method were significantly higher and lower than other methods respectively for both readers ($P<0.05$). Utilizing WTV method, the AUCs of mean ADC measurements (0.936, 0.840 and 0.714) for assessment of well-differentiated tumors, T2 and N0 categories were greater than those by SS method (0.782, 0.761 and 0.677). The WTV method required longer measurement time than other ROI methods ($P<0.001$).

Conclusions: ADC measurements based on rDWI were influenced by ROI positioning protocols. rDWI technique had diagnostic value for histological characterization of rectal cancer, using WTV method with overall best inter-observer reproducibility, but with the longest measurement time.

EPO-1270

Assessment of Histological Differentiation of Rectal Cancer Using Whole-Volume Histogram Analysis of Apparent Diffusion Coefficient Based on Reduced Field-of-View Diffusion Weighted Imaging

Yang Peng, Yaqi Shen, Xuemei Hu, Zhen Li, Daoyu Hu
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, 1095 Jiefang Avenue, Wuhan, Hubei, P.R. China 430030.

Purpose: To explore the role of whole-lesion histogram analysis of apparent diffusion coefficient (ADC) derived from reduced field-of-view (rFOV) diffusion-weighted imaging (DWI) technique in discriminating histological grades of rectal carcinoma.

Materials and Methods: 102 patients with rectal cancer were enrolled in this retrospective study. All patients received preoperative 3.0T MR scan, including rFOV DWI sequence obtained at two b values (0 and 800 s/mm^2). Lesions were delineated on each slice of native DWI images and a histogram for the whole lesion volume was produced. Histogram parameters from rFOV DWI method were calculated and correlated with histological differentiation of rectal cancer. The parameters were compared between different histological grades of rectal cancer by independent student t test or Man-Whitney U-test. Correlations between histological grade and histogram parameters were analyzed by Spearman correlation test. The diagnostic performance of individual parameter for distinguishing poorly from well/moderately-differentiated tumors was assessed by receiver operating characteristic curve (ROC) analysis.

Results: There were significant differences for ADCmean, 25th, 50th, 75th, 90th, 95th percentiles, skewness and kurtosis of rFOV DWI sequence between well, moderately and poorly-differentiated rectal cancers ($P<0.05$). Significant correlations were noted between histological grades and above histogram parameters ($r= 0.679$, 0.540, 0.701, 0.730, 0.669, 0.574, -0.730, and -0.769 respectively, $P<0.001$). Among the individual histogram parameter, kurtosis achieved highest AUC of 0.882 with optimal cutoff value of 1.934 in distinguishing poorly from well/moderately-differentiated rectal cancers. The combination of ADCmean, 75th percentile and kurtosis yielded the highest AUC of 0.927 with sensitivity (88%) and sensitivity (91.7%) by using logistic regression.

Conclusion: Quantitative whole-lesion ADC histogram analysis based on rFOV DWI technique could help differentiate histological grades of rectal cancer. The combination of ADCmean, 75th percentile and kurtosis may be best choice.

The Value of Three-phase Enhanced Energy Spectrum CT Scanning in the Diagnosis of Early Gastric Cancer under the Optimum Single Energy Image

Kai Liao,Yuan Yuan,LI ZhenLIN,LI WanJang,Shai Tao
West China hospital of sichuan university

PURPOSE
[Objective] To obtain the energy spectrum curves of gastric cancer lesions, normal gastric wall and image noise by three-phase enhanced scanning of early gastric cancer patients with energy spectrum CT. The CNR and SNR curves of lesions were calculated to evaluate the ability of different enhancement delays to display gastric cancer lesions at the optimum single energy level.
METHOD AND MATERIALS
50 patients with early gastric cancer confirmed by gastroscopy were scanned by revolution CT. Smrt mA technique was used to perform energy spectrum scanning at arterial phase (25s), portal phase(45s) and venous phase(65s) after 80 ml of contrast agent was injected through elbow vein. Using ADW4.6 post-processing workstation energy spectrum analysis software, energy spectrum curves of gastric cancer lesions, normal gastric wall and image noise were obtained using 0.625mm slice thickness images. The CNR and SNR curves of the lesions were obtained by calculation. The quantitative indicators were expressed by X + s. SPSS 13.0 software was used to analyze the data. CNR, SNR and image noise of arterial, portal and venous lesions were compared. Paired t-test was performed for those with normal and homogeneous variance, and non-parametric test was used for those with non-conformity. The difference was statistically significant ($P < 0.05$).

RESULTS

CNR: arterial phase > portal phase > venous phase under 70 keV condition. There were statistical differences between arterial phase and venous phase, and between portal phase and venous phase. There was no statistical difference between arterial phase and portal phase. SNR: venous phase > portal phase > arterial phase. There were statistical differences between groups.

CONCLUSION

At 70 KeV, arterial phase and portal phase have greater advantages in showing early gastric cancer lesions, while venous phase has greater advantages in showing the internal structure of early gastric cancer lesions and the relationship with surrounding tissues. The comprehensive ability of portal phase to detect lesions and display details is superior to other phases.

EPO-1273
CT 多期增强在结直肠癌同时性、异时性肝转移预测中的应用价值

唐太松
红河州第一人民医院

目的：探讨结直肠癌 CT 衰减值与结直肠癌同时性、异时性肝转移的关系。
方法：回顾性分析 2013 年 1 月至 2016 年 12 月本院术后病理为结直肠腺癌，并有完整临床资料、行三期增强 CT 的 100 例患者；确定增强峰值并测量各时相结直肠病变的 CT 值；比较同时性肝转移、异时性肝转移及未转移组的相关参数。
结果：同时性肝转移、异时性肝转移两组患者峰值增强有显著差异（P＜0.05）。大多数同时性和异时性肝转移在动脉期或静脉期达到高峰。延迟期同时性和异时性肝转移的 CT 衰减值均明显高于未转移组的 CT 衰减值（P＜0.05）。
结论：结直肠癌同时性、异时性肝转移在 CT 增强上有早期增强的趋势。这一结直肠癌 CT 增强特征对患者术后随诊有重要应用价值。

EPO-1274
用于术前预测结直肠癌患者腹膜转移的临床放射组学模型的建立

李梦蕾,童彤
复旦大学附属肿瘤医院

目的：开发和验证用于术前预测结直肠癌腹膜转移的临床放射组学列线图。
方法：我们招募了 779 名经临床病理证实为结直肠癌的患者（训练组 585 名，验证组 194 名）。纳入 8 个重要临床危险因素（年龄、性别、肿瘤大小、preCA19-9 水平、preCEA 水平、肿瘤位置、病理分级、组织学类型）来构建临床模型；采用 LASSO 算法构建放射组学特征（包括原发病灶和外周淋巴结的影像学特征），以开发影像组学模型；并应用逐步逻辑回归选择重要变量来构建临床影像组学模型。然后使用 Akaike 信息准则（AIC）来比较不同模型的相对强度，以及用曲线下面积（AUC）来量化预测准确性。最后，应用决策曲线分析（DCA）来评估该模型的临床应用价值。最后我们纳入 2018 年 2 月至 9 月 139 名结直肠癌患者作为外部验证集对模型进行外部验证。

结果：临床影像组学模型（AIC = 1043.2）（其 AIC 值低于临床模型（AIC = 1277.7）和放射组学模型（AIC = 1280.5））被确定为最佳模型。临床放射组学模型在训练组（AUC = 0.855）和验证组（AUC = 0.793）和良好校准方面都表现出良好的区分。决策曲线分析证明临床放射组学列线图在临床上是有用的。
结论：本研究提出了一个由影像组学特征和临床危险因素创建的临床放射组学列线图，该列线图可应用于对结直肠癌患者腹膜转移的个体化术前预测。

EPO-1275
胃间质瘤 CT 征象学在高危险度肿瘤定量评价中的价值

邓明,徐海波,胡金香
武汉大学中南医院

目的 探讨胃间质瘤(Gastric stromal tumor, GST)的 CT 征象在术前预测高危 GST 的价值。**方法** 回顾性纳入经手术病理和免疫组化证实的 46 例 GST 患者的 CT 检查资料，总结其特征性影像学征象，包括大小、形态、腔内外生长方式、强化程度以及是否存在 GST 内坏死。根据 Fletcher 分级标准，将 GST 分为高危、低危组。采用 SPSS 分析患者年龄、腔内、外、腔内外生长方式，肿块是否规整、肿瘤内是否存在明显坏死行逻辑回归分析，将最终确认有价值参数纳入 ROC 诊断效能分析。**结果** 46 例 GST 患者中，极低危险度 5 例，低危险度 14 例，中危险度 8 例，高危险度 19 例；腔内生长 24 例，腔内外跨壁生长 11 例，腔外生长 11 例；边界规则 34 例，不规则 12 例，无坏死 25 例，21 例坏死。逻辑回归显示年龄、肿块规则程度、腔内外生长方式等特征是 GST 的高危险因素（β＞0）。持续强化及强化程度是高危险度 GST 的保护因素（β＜0）。通过对不同特征的效能诊断分析发现，肿块是否规则与体积对独立诊断高级别 GST 具有一定准确性（）。GST 是否合并有坏死在一定程度上具有低度诊断准确性；肿块分叶与腔内外生长方式作为联合特征预测高级别 GST 时，AUC=0.67。分叶型 GST 合并瘤内坏死作为联合特征，AUC=0.622。但是，当联合年龄，肿块规则程度、腔内外生长方式及坏死程度特征后诊断效能反而降低（AUC=0.598）。**结论** 高危 GST 在 CT 上表现具有一定特征性，综合患者年龄，肿瘤大小（体积）、腔外生长及肿块不规则分叶是术前预测高危险度 GST 的可靠依据。

EPO-1276
系统性红斑狼疮累及消化道的 CT 表现

徐婧梅
重庆医科大学附属第一医院

目的：分析系统性红斑狼疮累及消化道的 CT 表现，提高对该病的诊断及鉴别诊断水平。**方法：**收集 2016 年 1 月-2019 年 3 月共 17 例经临床确诊为系统性红斑狼疮累及消化道患者的临床及 CT 资料，其中 15 例行 CT 平扫及增强扫描，2 例行 CT 平扫，记录病变累及消化道的具体部位、肠壁厚度、CT 征象及伴随表现。**结果：**累及胃 8 例，十二指肠 2 例，空肠 9 例，回肠 9 例，升结肠 9 例，横结肠 1 例，降结肠 6 例，乙状结肠 8 例，直肠 8 例；表现为肠壁肿胀增厚者 15 例， “同心圆征”12 例，“靶征”11 例，肠腔扩张伴积气、积液 13 例，其中假性肠梗阻 4 例；肠系膜“梳征”或“栅栏样”改变 11 例，肠系膜脂肪间隙模糊 9 例；伴随腹、盆腔积液 15 例，胸腔积液 12 例，心包积液 3 例，泌尿系病变者（输尿管炎性狭窄、膀胱壁增厚、双肾或输尿管积水等）5 例。**结论：**系统性红斑狼疮累及消化道时典型的 CT 表现为消化道壁及肠系膜异常，提示病变程度较重。

EPO-1277

多层螺旋 CT 对成人梅克尔憩室的诊断价值

曾国飞,杨华
重庆市中医院

目的 通过分析成人梅克尔憩室（MD）CT 表现，探讨多层螺旋 CT 对 MD 的诊断价值。
方法 对 34 例经手术病例证实为 MD 患者的 CT 图像与临床资料进行回顾性分析，包括图像质量评分、MD 影像特点及憩室开口位置、长度、最大径、最小径等，并与术中所见进行对比研究评估 CT 对 MD 的诊断价值，同时将有、无并发症的复杂型、单纯型憩室进行对比研究，评估 CT 对 MD 分型及远期预测的价值。
结果 34 例患者影像质量评分 2.73±0.4 分，其中未行严格肠道准备者评分较低；MD 开口于肠系膜对侧肠壁者 31 例（91%），开口于侧壁者 3 例（8.82%）；影像分型为单纯型 MD 者 14 例（41.18%），复杂型憩室者 20 例（58.82%），复杂型憩室均伴发憩室炎；将 CT 测量值与手术测量值进行对比研究，发现 MD 长度、最大径、最小径均高于术中测量值，两种测量方法差异有统计学意义(P<0.05)。对单纯型与复杂型 MD 进行对比研究，发现单纯型开口直径、最小直径、开口直径与最小直径之差均高于复杂型，示两种分型差异有统计学意义(P＜0.05)。
结论 多层螺旋 CT 对成人 MD 诊断、分型、远期预测及手术指导具有重要的临床价值，拟诊 MD 患者应常规行严格肠道准备及增强扫描。

EPO-1278

Comparison between bi-exponential model and mono-exponential model of Intravoxel incoherent motion MR imaging in the evaluation of esophageal cancer

Nian Liu,Xiaohuang Huang
Affiliated Hospital North Sichuan Medical College

Objective: To investigate the application value of bi-exponential and mono-exponential intravoxel incoherent motion (IVIM) MRI in the early diagnosis of the esophageal cancer.
Materials and Methods: We performed a perspective study of 54 esophageal cancer patients, who were admitted to our hospital between May 2015 and November 2016. The 54 patients were performed MRI plain scan and IVIM - DWI sequence scan with multi b-values (b value= 0, 30, 50, 80, 150, 200, 400, 600, 800, 1000, s/mm2). Mono-exponential diffussion-weighted imaging parameters include Slow ADC_mono, Fast ADC_mono, Fraction of Fast ADC_mono (Ff_mono) and bi-exponential model parameters include Slow ADC_bi, Fast ADC_bi, Fraction of fast ADC_bi (Ff_bi), which were measured in tumor lesions and normal esophagus tissue on the same individual. The Bland-Altman plot (Bland & Altman, 1986 and 1999) was used to evaluate consistency of two measurements between bi-exponential model and mono-exponential model. Paired samples t-test was performed to compare the mean value of parameters between bi-exponential model and mono-exponential model, as well as the

differences between cancer tissues and normal tissues. Receiver operating characteristic curve (ROC) was drawn to compare the prediction parameters and diagnostic efficiency.
Results: The Bland-Altman analysis indicates the Slow ADC, Fast ADC and Fraction of two exponential model all could be evaluated as a very good agreement in normal esophagus and esophageal cancer. Statistical significant differences were found in the comparison of mono-exponential and bi-exponential model of Slow ADC, Fast ADC and Fraction in normal esophagus tissues ($p<0.05$). The Slow ADC and Fast ADC are significant differences between mono-exponential and bi-exponential model in esophageal cancer ($P<0.05$), but no significant differences compareing Fraction_mono with Fraction_bi ($P>0.05$). In the mono-exponential model, the differences of Fast ADC_mono value and Ff_mono valuein ESCC and normal esophageal tissue indicate statistical significance ($P<0.001$) . However, no significant difference was found in the average value of Slow ADC_mono in ESCC and normal esophageal tissue($P>0.05$). In the bi-exponential model, the average values of Ff_bi in normal esophagus tissues and ESCC suggest statistical significance ($P<0.05$). No significant differences were found in the mean value of Slow ADC_bi and Fast ADC_bi in the normal tissues and ESCC($P>0.05$). The area under the receiver operating characteristic curve (AUC) of the mono-exponential model was significantly better than that of the bi-exponential model for the Fast ADC_mono and Fraction of_bi (0.827 vs. 0.67, $p=0.024$). The AUC of the mono-exponential model for the Fast ADC_mono and Ff _mono were no statistical significance (0.827 vs. 0.689, $p=0.053$).
Conclusion: The mono-exponential model and bi-exponential model are not mutually replaceable in the evaluation of esophageal cancer. The mono-exponential model of IVIM-DWI proves superior to bi-exponential model in the diagnosis and differentiating of esophageal cancer.

EPO-1279

MR 动态增强 DCE 成像在进展期胃癌中的应用

李欢欢
复旦大学附属肿瘤医院

目的：探讨 3.0TMR DCE 序列在进展期胃癌 T 分期的应用，分析动态增强 DCE 各参数和胃癌病理特征的相关性。
方法：将 38 例手术病理标本证实为进展期胃癌（T3、T4 期），由两位对病理结果未知的影像科医师各自独立对胃癌病灶的 DCE 图像和 C-VIBE 图像进行 T 分期判读，其结果和金标准（病理 T 分期）相对照；在 DCE 后处理图像上测量胃癌病灶的 DCE 参数：Ktrans、Kep、Ve，探讨 DCE 各参数与病理 T 分期及病理类型的关系。
结果：MR 动态增强 DCE 序列对进展期胃癌总的诊断准确率为 78.9%，常规 MR 增强 C-VIBE 序列对进展期胃癌总的诊断准确率为 81.6%，经配对卡方检验，两种序列对 T3、T4 期胃癌的诊断结果无统计学差异（$P>0.05$），T3、T4 期胃癌的 Ktrans 值比较无差异($P>0.05$)，T3 期胃癌病灶的 Kep、Ve 值高于 T4 期，结果具有统计学意义($P<0.05$)；不同组织学类型胃癌的 Ktrans 均值从大到小依次为：非粘液腺癌>印戒细胞癌>粘液腺癌

(P<0.05)，粘液腺癌的 Kep 值明显低于非粘液腺癌和印戒细胞癌(P<0.05)，非粘液腺癌的 Ve 值明显低于粘液腺癌和印戒细胞癌(P<0.05)。肠型组和弥漫型组的 Ktrans、Kep 值比较无差异(P>0.05)，弥漫型胃癌的 Ve 值高于肠型组 (P<0.05)。
结论：动态增强 DCE 序列和常规 C-VIBE 序列对进展期胃癌 T 分期的诊断结果无差异，DCE 图像可以代替常规 MR 增强图像进行胃癌 T 分期的评估；不同组织学类型的胃癌进行比较，部分 DCE 参数具有显著差异，提示可以通过某些 DCE 参数预测胃癌的组织学类型。

EPO-1280
胃肠道间质瘤的 MRI 征象与不同危险度的相关性

韩丽珠,马菊香
天津医科大学肿瘤医院

摘要 目的 分析胃肠道间质瘤(Gastrointestinal stromal tumors, GISTs) MRI 征象，探讨不同 MRI 征象与其危险度间的相关性。**方法** 回顾性分析 54 例经手术病理证实为 GISTs 患者临床、病理及 MRI 资料，分析 GISTs 的 MRI 征象：大小、部位、形态、边界、生长方式、有无囊变坏死、转移、信号均匀性、肿瘤时间-信号强度曲线及扩散加权成像（DWI）上表观扩散系数（ADC）值（平均 ADC 值），并将上述 MRI 征象与 GISTs 侵袭性做相关性分析。**结果** 54 例 GISTs 中，低危险度 16 例，中危险度 13 例，高危险度 25 例。统计结果表示肿瘤大小、部位、形态、边界、有无囊变坏死、信号均匀性及 ADC 值在预测 GISTs 侵袭性中差异有统计学意义（$P < 0.05$）。肿瘤生长方式、有无转移及强化曲线与 GISTs 的侵袭性差异无统计学意义（$P > 0.05$）。随着 GISTs 危险度增高，肿瘤体积增大、形态不规则、边界不清，肿瘤内部信号不均，更易发生囊变坏死，ADC 值越低。**结论** MRI 不同征象可以对 GISTs 的侵袭性术前初步进行评价，为临床治疗及预后提供参考。

EPO-1281
基于多排螺旋 CT 门静脉血管三维成像对门静脉高压消化道出血风险因素的评估

闫建华,何苹
天津市第三中心医院

目的：通过分析肝硬化门静脉高压食管及胃底静脉曲张的 CT 征象，评估其上消化道出血的风险因素，并对主要因素相关性进行评估。
方法：随机选择肝硬化门静脉高压并发食管出血患者 60 例为出血组，未出血患者 60 例为未出血组。随机选择肝硬化门静脉高压并发胃底曲张静脉出血患者 60 例为出血组，未出血患者 60 例为未出血组。检测所有患者门静脉主干最大径及最大截面积、食管及胃底曲张静脉直径，凸出黏膜下血管截面数量及截面积，计算敏感性、特异性，并算出约登指数，并选择约登指数最高的临界点。
结果：出血组门静脉主干最大径约为 8.24±1.20mm，最大截面积为 3.18cm^2 ，未出血组门静脉主干最大径约为 6.23±2.30mm，最大截面积为 2.65cm^2 。食管及胃底曲张静脉出血组直径为(8．65±2．85)mm，未出血组(5．65±3．35)mm，约登指数为 0．34，临界点为 6．55 mm，ROC 曲线下面积(AUC)为 0．72；出血组静脉血管数量为(4．5±2．5)支，未出血组为(4±2) 支，约登指

数为 0．35，临界点为 4 支，AUC 为 0．68；出血组血管面积为(1．64±1．26)cm^2，未出血为(1．64±1．26) cm^2，约登指数为 0．45：临界点为 1．03cm^2，AUC 为 0．82。
结论：食管及胃底凸向黏膜下曲张静脉血管截面面积、直径、截面数量、门静脉主干直径及面积 5 个指标中，食管及胃底曲张静脉血管截面总面积及数量作为两种新的预测出血的检测指标具有较高价值，能较好的预测出血风险。

EPO-1282
MR 影像组学对直肠癌区域淋巴结转移的预测价值

刘欢欢,李金凝,汪登斌
上海交通大学医学院附属新华医院

目的：探索 MR 影像组学（radiomics）预测直肠癌患者术前区域淋巴结转移的价值。
材料和方法：收集经手术和病理证实、术前行高分辨率 MR 成像、术前无放化疗的 183 例直肠癌患者，将患者按 7:3 比例随机分为训练组（128 例）和验证组（55 例）。采用 ITK-SNAP 勾画病灶感兴趣区（VOI），采用 A.K 软件提取病灶内直方图、形态及纹理特征等放射组学特征。采用独立样本 T 检验、Kruskal-Wallis 检验、Pearson 相关分析进行特征降维。采用多因素回归分析对筛选的放射组学特征参数以及相关的临床-影像特征建立最优模型，用于预测直肠癌患者术前区域淋巴结转移。采用受试者工作特征曲线（ROC）、曲线下面积（AUC）以及决策曲线分析评估模型的价值。
结果：通过后处理软件提取病灶内部 385 个放射组学特征参数，经过特征降维后 9 个特征参数纳入研究，联合 6 个临床-影像特征参数，建立淋巴结转移的预测模型。采用临床-影像特征参数预测淋巴结转移的诊断效能中等（训练组为 79.4%，验证组为 72.3%），联合 MR 影像组学参数后，训练组和验证组的诊断效能可分别提高至 82.7%、83.5%。经决策曲线分析后，联合 MR 影像组学参数后的预测模型亦优于仅采用临床-影像特征参数建立的模型。
结论：MR 影像组学有助于预测直肠癌术前区域淋巴结的转移，有助于患者术前治疗方案的选择。

EPO-1283
经腹 MR 弹性成像定量评估的直肠癌硬度：一种潜在的直肠癌预后风险预测因子

胡家熙,王康韬,刘文广,谭风波,裴海平,李文政
中南大学湘雅医院

目的：评估一种定量评估直肠肿瘤刚度的磁共振弹性成像 (MRE) 方法的可行性，并探讨其相关定量参数与直肠腺癌预后相关的临床影像病理因素的关系。
材料与方法：每位受试者在 3.0TMR 成像仪上进行体外经腹气动装置驱动的多频 MRE (40、50、60、70Hz)及常规直肠 MRI 检查。招募 12 名健康志愿者并对其行两次重复性实验，前瞻性连续性 80 例直肠腺癌患者 MRI 及其临床病理资料。采集健康志愿者两次检查获得的直肠硬度信息进行可靠性检验。收集直肠癌患者的常规“DISTANCE”参数、MRE 定量参数及其预后相关的临床病理信息，评估 MRE 获得的直肠癌及远癌旁肠壁硬度信息与 MR 分期、病理分期及其独立预后风险因子的相关性，并探究 MRE 在术前预测直肠风险分级中的价值。
结果：在正常志愿者中，MRE 评估直肠肠壁的硬度具有良好的可重复性（Cronbach's α=0.87，ICC=0.77）。在直肠癌患者中，直肠癌组织与远癌旁肠壁组织的硬度差异具有统计学意义（p＜.0001），直肠癌患者远癌旁肠壁与健康志愿者肠壁硬度无统计学意义（p>.05）。根据第八版的

AJCC 癌症分期手册进行术前 MR 分期（mTN）、术后病理分期（pTN），mT4 期肿瘤硬度显著高于 mT3 期及 mT1+2 期（p＜.0001），mN2 、mN1+2 期肿瘤硬度显著高于 mN0 组（p＜.01），EMVI 阳性及 CRM 阳性组的肿瘤硬度显著高于阴性组（p＜.0001）。在 35 名行 TME 术后的直肠患者中，pT3 期肿瘤硬度显著高于 pT1 期组（p<.05），pN1 期组肿瘤硬度显著高于 N0 期组（p＜.001）。存在 mT4、mN 阳性、EMVI 阳性、CRM 阳性的高风险组的直肠癌硬度显著高于不存在以上风险因素的低风险组（p<.001）。
结论：直肠 MRE 获得直肠硬度信息与 MR 分期、EMVI、CRM、病理学分期等预后风险因子具有一定的相关性，可能是新的预后风险因子。

Pre-treatment ADC based texture analysis of locally advanced gastric cancer might not be a good response predictor for neoadjuvant therapy

Jingjuan Liu,Wei Liu,Hua-dan Xue,Zheng-yu Jin,Jian-chun Yu
Peking Union Medical College Hospital

PURPOSE:
The aim of this study was to investigate the possibility of preoperative texture analysis from diffusion weighed imaging (DWI) in the prediction of the response rate to neo-adjuvant therapy in patients with gastric cancer.
MATERIAL AND METHODS:
Forty-eight patients with biopsy-proven gastric cancer were examined by DWI before neo-adjuvant therapy, and treated with radical surgery after treatment completion. Response at final histology was assessed according to College of American Pathology (CAP) from 0 to 3. Image features from texture analysis of ADC were quantified, such as mean , SD, entropy, mpp, skewness, kurtosis, with and without filters for fine to coarse textures (SSF 0,2,3,4,5,6). Patients with CAP 0-2 were considered responders while CAP 3 as non-responders. Texture features was compared using Wilcoxon test..
RESULTS: Thirty-two patients were classified as responders while sixteen were non-repsonders. All of the thirty-six parameters were not significantly different between responders and non-responders (p>0.05). The mean ADC without filters was 1.398±0.333 $\times 10^{-9} mm^2/s$ and 1.374±0.233 $\times 10^{-9} mm^2/s$ for responders and non-responders separately (p=0.556).
CONCLUSION:
Pre-treatment ADC based texture analysis might not be able to provide additional information regarding the response rate to neo-adjuvant therapy for gastric cancer.

EPO-1285

苏氨酸锰螯合物——一种新型的磁共振肠道对比剂：健康大鼠在体初步实验

罗彦,余浩,李佳丽,沈亚琪
华中科技大学同济医学院附属同济医院

目的：口服肠道对比剂在胃肠道 MR 成像中起到重要的作用。然而，目前关于使用何种口服肠道对比剂尚无统一的标准。苏氨酸锰螯合物（Mn-Thr）是一种常见的营养食品添加剂。本研究拟采用体外实验测定 Mn-Thr 的纵向弛豫率与横向弛豫率，并进一步利用大鼠在体实验探讨 Mn-Thr 作为 MR 肠道对比剂的可行性。

方法：配制不同浓度的 Mn-Thr 水溶液置于体外模具，室温下在 3T 应用一系列反转恢复序列以及多回波序列进行扫描，测定 Mn-Thr 的纵向弛豫率与横向弛豫率。根据测定的弛豫率，配制一系列浓度的溶液进行体外模具扫描，最终确定在 T1WI 和 T2WI 上均能使肠道呈现“黑腔”的 Mn-Thr 浓度。为了进一步在体验证体外实验的结果并与常用的肠道对比剂——水作对比，将 8 只健康 SD 大鼠随机分为两组，分别经肛门注射 2g/L 的 Mn-Thr 水溶液和生理盐水作为肠道对比剂进行 MR 扫描。一周后，将两组大鼠的肠道对比剂对调后再次进行 MR 扫描。第二次扫描后处死动物，测定两组大鼠组织锰含量并行组织病理学检查以评估安全性。定性评估并比较同一只大鼠两次 MR 扫描的图像质量。

结果：在室温 3T 场强下体外测定 Mn-Thr 的纵向弛豫率为 8.12±0.80 $s^{-1}\cdot mM^{-1}$，横向弛豫率为 98.50±13.72 $s^{-1}\cdot mM^{-1}$。体外模具和大鼠在体实验均显示，2g/L 的 Mn-Thr 溶液在 T1WI 和 T2WI 上均能使肠道呈现“黑腔”。在图像质量评分方面，与生理盐水相比，Mn-Thr 作为肠道对比剂时，肠腔信号均一度和肠壁对比度均明显更高。两组大鼠在组织锰含量上无明显统计学差异。组织病理学切片均无明显异常。

结论：Mn-Thr 具有较好的纵向弛豫率与横向弛豫率。使用 Mn-Thr 作为肠道对比剂，在健康大鼠肠道内可形成 T1WI 和 T2WI 均为黑腔的成像，且无明显的毒副作用。作为常见的商用营养食品添加剂，Mn-Thr 有望作为新型的 MR 肠道对比剂。

The value of CTE and non-contrast MRE in patients after intestinal surgery

Yaqi Shen,Daoyu Hu
Tongji Hospital， Tongji Medical College， Huazhong University of Science and Technology (HUST)，Wuhan， Hubei， P. R. China

TEACHING POINTS

1.To demonstrate the advantages of computed tomography enterography(CTE) and magnetic resonance enterography (MRE) in the evaluation of patients after intestinal surgery.
2.The two methods were compared to provide the indications for clinicians and radiologists.

TABLE OF CONTENTS/OUTLINE

Findings confounded with pathological status were listed and clarified in MRE with assistance of multiple functional sequence and comparison of CTE. Surgical materials

when existed were identified particularly to assist in discerning normal anatomic structures after surgery. Assist-function of multiple alternative pulse sequence of MRE including cine and DWI was evaluated.
1.Enumerate various intestinal surgery
2.Discuss the common postoperative complications of intestinal surgery
3.Superiority of CTE and MRE in the diagnosis of complications
4.Provide indications of CTE and MRE

MRI texture analysis based on 3D tumor measurement in differential diagnosis of benign and malignant presacral lesion after resection of rectal carcinoma

Jian Jiang,Ji Yuan,Liu Ailian
The First Affiliated Hospital of Dalian Medical University

Objective: To evaluate the diagnostic value of 3D MRI texture analysis based on T1WI, T2WI, DKI and contrasted-enhanced T1WI MRI sequences in differential diagnosis of benign and malignant presacral lesion after resection of rectal carcinoma
Materials and methods: Postoperative MRI and clinical data of 26 patients with histopathologically confirmed presacral lesion (12 postoperative granulation or fibrous tissue and 14 local recurrence tumors) were retrospectively analyzed. The regions of interest (ROIs) covering the entire lesion were manually delineated on axial slices using O.K. (Omni Kinetics, GE Healthcare, China) software; and the histogram and GLCM features based on T1WI, T2WI, DKI and contrasted-enhanced T1WI MRI sequences were automatically generated. Statistical package for social science (SPSS) 12.0 and R language (RStudio Version 1.0.143 2009-2016 RStudio, Inc.) were used for data analysis.
Results: Based on contrasted-enhanced T1WI features, the uniformity resulted as the best feature for diagnosis, with the AUC of 0.738. The presacral lesions were differentiated on T1WI, T2WI and DKI with the highest AUC of 0.952, 0.833 and 0.869, which corresponded to range, entropy and standard deviation. After modeling, the accuracy of the contrasted-enhanced T1WI, T1WI, T2WI and DKI features model was 0.892, 0.857, 0.844and 0.914, respectively.
Conclusion: MRI texture analysis could be used as a new noninvasive method for identification of benign and malignant presacral lesion for the patients of rectal cancer after operation.

EPO-1288

3D MRI texture analysis based on contrasted-enhanced T1WI in differential diagnosis of benign and malignant presacral lesion after resection of rectal carcinoma

Jian Jiang,Ji Yuan,Liu Ailian

The First Affiliated Hospital of Dalian Medical University

Objective: To evaluate the diagnostic value of 3D MRI texture analysis based on contrasted-enhanced T1WI in differential diagnosis of benign and malignant presacral lesion after resection of rectal carcinoma.
Materials and methods: Postoperative MRI and clinical data of 26 patients with histopathologically confirmed presacral lesion (12 postoperative granulation or fibrous tissue and 14 local recurrence tumors) were retrospectively analyzed. The regions of interest (ROIs) covering the entire lesion were manually delineated on axial slices using O.K. (Omni Kinetics, GE Healthcare, China) software; and the histogram and GLCM features based on contrasted-enhanced T1WI sequence were automatically generated. Statistical package for social science (SPSS) 12.0 and R language (RStudio Version 1.0.143 2009-2016 RStudio, Inc.) were used for data analysis.
Results: In texture analysis of contrasted-enhanced T1WI features, volumecount, relativedeviation, GLCM inertia and cluster prominence were significantly decreased in benign group compared to malignant group; while kurtosis, uniformity, GLCM energy and correlation of benign group were significantly increased (P=0.02~0.038). According to ROC analysis, the uniformity (cutoff value=0.524, area under the curve (AUC) = 0.738) was considered the best parameter for the diagnosis of two groups, with the sensitivity of 85.7% and specificity of 66.7%, respectively. Multivariate logistic regression was used for modeling. The modeling formula of contrasted-enhanced T1WI was as follow: $f_{\text{contrasted-enhanced T1WI}}$ =684.779-0.057×Volumecount +0.022×cluster prominence -10.840×inertia -750.323×uniformity. The AUC of the contrasted-enhanced T1WI model was 0.892 (cutoff value=0.647, sensitivity of 86.3% and specificity of 89.5%).
Conclusion: MRI texture analysis based on contrasted-enhanced T1WI could be used as a new noninvasive method for identification of benign and malignant presacral lesion for the patients of rectal cancer after operation.

CT 灌注联合增强成像感兴趣区的选择对胃癌灌注及增强参数的影响

李莹[1],高剑波[2],查云飞[1]
1.武汉大学人民医院
2.郑州大学第一附属医院

目的：探讨 CT 灌注联合增强成像中不同感兴趣区（ROI）选择方法对测量结果准确性、一致性的影响。
材料与方法：前瞻性的收集病理确诊为胃癌且术前需要行上腹部 CT 灌注联合双期增强扫描的患者 30 例，均在 GE Revolution 上进行扫描。在灌注 CTP、平扫及双期增强图像中选取胃癌病灶最大横断层面，感兴趣区（ROI）分别采用肿瘤显著强化区的圈画法和肿瘤轮廓勾画法，记录病灶的灌注参数、平扫及双期增强 CT 值。2 名放射科医师（A 和 B）独立对图像进行分析、测量和评价。其中医师 A 在间隔 2 个月后再次对数据进行测量。采用组内相关系数（ICC）评价 2 名医师采用同一方法对相同患者测量的一致性以及相同观察者在不同时间测量数据的一致性，采用配对样本 t 检验或 Wilcoxon 符号秩和检验评价两组间灌注参数及增强参数。
结果：同一医师在不同时间采用肿瘤轮廓法所有参数一致性均优秀（ICC＞0.80），圈画法测量的 MTT 值一致性良好，其余参数一致性优秀；2 名医师采用肿瘤轮廓法测得的灌注参数、平扫加双期

增强 CT 值一致性优秀（ICC 均＞0.80），强化区圈画法测得参数一致性良好（ICC 在 0.61-0.80）；2 种不同 ROI 方法测量灌注参数中 TTP、PEI、MSI、BV 等、平扫加双期增强参数均有统计学意义（*P* 均＜0.05）。

结论：1.同一观察者不同时间或两名不同观察者间，ROI 采用手动勾画肿瘤轮廓法、圈画法测得的灌注参数、平扫加双期增强 CT 值一致性均优秀或良好，但轮廓法一致性更高，临床可重复性更强。2.两种不同感兴趣区选择测量的 TTP、PEI、MSI、BV 等灌注参数、平扫加双期增强 CT 值差异均有统计学意义，对 BF、MTT、Tmax 以及 PS 等灌注参数影响不大。

结肠癌患者肝转移影像特点分析

吴玉兰,文戈,曾善美
南方医科大学南方医院

目的：归纳总结结肠癌患者发生肝转移的影像学特点，并比较青年、中年及老年组结肠癌患者肝转移的差异。

方法：回顾性分析南方医科大学南方医院 2016.9-2017.12 共 78 名结肠癌肝转移患者影像资料；采用社会科学统计软件包（Statistical Product and Service solution 20.0，SPSS20.0）进行统计分析，采用卡方检验比较各年龄组结肠癌肝转移患者原发病灶部位、转移分布、转移数目的差异，*P*<0.05 为差异有统计学意义。

结果：78 名结肠癌肝转移患者，男性 47 例，女性 31 例，年龄 28-84 岁，平均年龄 56.44 岁，60 岁以上（含 60 岁）老年组 27 例（34.6%），40-60 岁中年组患者 45 例（57.7%），40 岁以下（含 40 岁）青年组患者 6 例（7.7%）；原发肿瘤位于左半结肠者 45 例（57.7%），位于右半结肠者 33 例（42.3%）；同时性肝转移患者 66 例（84.6%），异时性肝转移患者 12 例（15.4%）；转移瘤主要分布于左半肝者 15 例（19.2%），右半肝者 55 例（70.5%），弥漫分布者 8 例（10.3%）；肝转移数目≤5 个者（有限组）38 例（48.7%），＞5 个者（多发组）40 例（51.3%）；转移瘤的最大直径范围为 5mm-115mm，平均值约 36.03mm。有限组与多发组的转移瘤主要分布区域不同，差异有统计学意义（p=0.012）；青年组、中年组与老年组患者比较，其原发肿瘤部位、转移瘤分布、转移数目无显著统计学差异（p＞0.05）。

结论：总体来说结肠癌肝转移发病高峰年龄为 40-60 岁，同时性肝转移多见，左半结肠发生肝转移的几率更高，结肠癌肝转移瘤更多分布于右半肝，一旦发生肝转移，多发转移的可能性更大，有限转移与多发转移的转移瘤主要分布区域有差异，但结肠癌肝转移患者各年龄组间的原发肿瘤部位、转移瘤分布及转移数目无明显差异。

Rectal Cancer invasiveness：Whole-Lesion Diffusion-Weighted Imaging (DWI) Histogram Analysis by Comparison of Reduced Field-of-View and Conventional DWI Techniques

Yang Peng,Yaqi Shen,Xuemei Hu,Zhen Li,Daoyu Hu
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, 1095 Jiefang Avenue，Wuhan, Hubei, P.R. China 430030.

Objective: To explore the role of whole-lesion histogram analysis of apparent diffusion coefficient (ADC) for discriminating between T stages of rectal carcinoma by comparison of reduced field-of-view (FOV) and conventional DWI techniques.

Materials and methods: 102 patients with rectal cancer were enrolled in this retrospective study. All patients received preoperative MR scan at 3T, including reduced and full FOV DWI sequences. Histogram parameters from two DWI methods were calculated and correlated with histological T stage of rectal cancer. The diagnostic performance of individual parameter for differentiating stage pT1-2 and pT3-4 tumors from both DWI techniques was assessed by receiver operating characteristic curve analysis.

Results: There were significant differences for the parameters of ADCmean, 50^{th}, 75^{th}, 90^{th}, 95^{th} percentiles, skewness and kurtosis of both DWI sequences in patients with pT1-2 as compared to those with pT3-4 tumors ($P<0.05$), in addition to parameters including ADCmin ($P=0.015$) and 25^{th} percentile ($P=0.006$) from rFOV DWI. Correlations were noted between T staging and above histogram parameters from rFOV DWI (r: -0.741-0.682) and fFOV DWI (r: -0.449-0.449), besides parameters of ADCmin (0.370) and 25^{th} percentile (-0.425) from rFOV DWI. The AUCs of 75^{th} and 90^{th} percentiles from rFOV DWI were significantly higher than that from fFOV DWI ($P=0.0410$ and $P=0.0208$).

Conclusion: The 75^{th} and 90^{th} percentiles from rFOV DWI may be optimum for differentiating pT1-2 from pT3-4 stage of rectal cancer. The rFOV DWI technique performs better than fFOV DWI technique in assessment of rectal cancer invasiveness.

EPO-1292
比较小肠胃肠道和非胃肠道间质瘤的宝石能谱 CT 特征性表现

张旭婷,任基伟,靳宏星,王艳艳
山西省肿瘤医院

目的 通过分析比较小肠胃肠道和非胃肠道间质瘤的宝石能谱 CT 特征性表现，提高 GIST 的诊断与鉴别诊断。
方法 回顾性分析了 2011 年 10 月至 2018 年 10 月在山西省肿瘤医院经手术病理证实的 112 例 GIST 均行 GSI 扫描的患者的影像资料及相关临床资料，其中胃肠道 GIST 90 例，非胃肠道 GIST22 例，分析评估内部同质性，生长模式、钙化，肿瘤内出血、变性、溃疡和淋巴结肿大；定量分析测量肿瘤的最大直径;在平扫期和动脉、静脉期的增强 CT 上的肿瘤实体部分的标准碘浓度值；动脉期及静脉期供血动脉的直径和标准碘浓度值；动脉期及静脉期引流静脉的直径和标准碘浓度值。

结果 两组观察者瘤内出血占 GIST 的 16.2%和 24.7%，非 GIST 得 0%和 0%（p=0.081 和 0.010）；两组观察一致性较好。引流静脉直径与早期静脉回流相关的 GIST 最大直径呈正相关（r=0.712）。动脉期和静脉期实体瘤部分的标准碘浓度值（p＜0.01）和动脉期引流静脉的标准碘浓度值（p＜0.05）对于 GIST 而言高于非 GIST。

结论 GISTs 中肿瘤内出血和早期静脉回流的发生率高于非 GISTs。GIST 显示动脉期和静脉期的增强强度比非 GISTs 强；在 GIST 和非 GISTs 的动脉期可观察到增强的峰值。GIST 动脉期引流静脉 CT 值高于非 GIST。引流静脉直径与早期静脉回流相关的 GIST 最大直径呈比例。GIST 与非 GIST 宝石能谱 CT 形态学特征、能谱 CT 定量指标有一定的特点，能够为 GIST 术前制定治疗方案及预后提供更多有效的信息和依据。

EPO-1293

CT 增强扫描动脉期有助于儿童腹型过敏性紫癜的鉴别

杨彦,王强
泉州市儿童医院泉州市妇幼保健院

目的：探讨 CT 增强扫描动脉期对儿童腹型过敏性紫癜的诊断价值.
方法：回顾性分析。实验组：15 例经临床确诊并通过激素治疗有效的腹型过敏性紫癜的患儿。对照组：15 例以腹痛为症状临床确诊为非过敏性紫癜的患儿（肠炎等）。比较两组患儿的 CT 增强扫描图像，综合分析病变部位分布、形态、强化方式等。
结果：病变分布腹型过敏性紫癜以十二指肠和空肠多见，对照组以回结肠多见；形态上实验组及对照组均出现多发或单发的节段性肠壁水肿、肠壁增厚,肠壁分层无明显差异，实验组周围渗出少见，对照组周围渗出多见；强化方式上腹型过敏性紫癜在 CT 增强动脉期表现出特征性的明显强化，静脉期同周围肠段相仿，而普通肠炎为持续性强化或静脉期显示更好。
结论：儿童腹型过敏性紫癜的病变分布特点和 CT 增强扫描动脉期的特异性强化特点有助于与普通肠炎鉴别。同时 CT 增强扫描有助于排除外科急腹症，如肠套叠、肠梗阻或肠穿孔，为临床确定治疗方案提供影像学依据。

EPO-1294

Assessment of the Prognostic Factors for Rectal Cancer Treated with Neoadjuvant Chemoradiation: Utilizing Whole-Tumor Histogram Analysis of Diffusion Kurtosis Imaging

Yiqun Sun,Yajia Gu,Tong Tong
Shanghai Cancer Center

Purpose: To determine the whole-tumor histogram analysis of diffusion kurtosis imaging in evaluating the prognostic factors for a locally advanced rectal cancer treated with neoadjuvant chemoradiation.
Materials and methods: Between June 2016 and November 2017, totally 37 patients with rectal cancer were retrospectively collected and followed in our study. All patients received neoadjuvant chemoradiation followed by total mesorectal excision. The enrolled patients were examined using MRI at two time points: 1-7 days before neoadjuvant chemoradiation (pre-MRI), within 1-7 days of NCRT completed (post-MRI). Pretreatment T stage, N stage, mesorectal fascia (MRF), extramural vascular invasion (EMVI), tumor location and length, pretreatment CEA and CA19-9 levels were recorded. Tumor response, TN stage, circumferential resection margin(CRM), perineural invasion (PNI) and lymphovascular invasion(LVI) were evaluated. Whole tumor volume of interest

(VOI) was obtained by semi-automatic segmentation method in both pre- and post-MRI. Then, ADC, K and D histograms and corresponding parameters, difference histograms value between pre-MRI and post-MRI were calculated. The predictor of DFS was analyzed by using Cox proportional hazards model.

Results: Pre-D5% was able to discriminate prognosis of DFS and the cut-off value as $0.717\times10^{-3}mm^2/sec$, AUC=0.724 (p=0.033). Pretreatment N2 (HR=8.417 (1.074-65.975), p=0.043), EMVI(+) (HR=18.929 (2.414-148.432), p=0.005), MRF(+) (HR=3.767 (1.136-12.488), p=0.030), high rectal cancer (HR=4.110 (1.234-13.688), p=0.021), CEA≥5ng/ml (HR=4.129 (1.094-15.584), p=0.036), low pre-D5% (HR=14.428 (1.833-113.588), p=0.011), ypT3-4 (HR=6.732 (1.949-23.351), p=0.003) and ypN(+) (HR=6.083 (1.781-30.775), p=0.004) could be associated with worse DFS in univariate analysis. Multivariate analysis identified the pretreatment EMVI(+) (HR=18.718 (1.469-238.546), p=0.024), ypT3-4 (HR=14.240 (1.485-208.527), p=0.029) and low pre-D5% (HR=61.659 (3.686-1031.500), p=0.004) were independent risk predictors for worse DFS.

18F-FDG PET/CT 诊断直肠癌根治术后骶前复发

李淑娟,陈龙,赵升,汪春,孙华
云南省肿瘤医院/昆明医学院第三附属医院

目的 探讨 ^{18}F-FDG PET/CT 半定量参数诊断直肠癌根治术后骶前复发的价值。**资料与方法** 回顾性分析经 ^{18}F-FDG PET/CT 扫描并经手术或临床随访证实的直肠癌根治术后骶前复发的患者 31 例，未复发患者 28 例。应用 PET VCRA 软件测量脾脏平均标准摄取值（SUVmean）和肝脏 SUVmean，以最大标准摄取值（SUVmax）的 40%为阈值自动勾画感兴趣区（ROI），软件自动测量 SUVmax 和 MTV。比较复发者与未复发者骶前病灶 SUVmax、MTV、脾脏与肝脏 SUVmean 比值，并应用受试者工作特性曲线评价各代谢参数诊断直肠癌根治术后骶前复发的效能。**结果** 骶前复发者与未复发者 SUVmax、MTV 差异有统计学意义（$P<0.05$）。SUVmax、MTV 诊断直肠癌根治术后骶前复发的曲线下面积分别为 0.911、0.653。SUVmax 判断直肠癌根治术后骶前复发的敏感度及特异度高于 MTV，SUVmax、MTV 诊断骶前复发的敏感度和特异度分别为 100%、71.4%；71%，60.7% 。**结论** SUVmax 及 MTV 对诊断直肠癌根治术后骶前复发有一定价值。

Low-dose spectral insufflation computed tomography protocol preoperatively optimized for T stage esophageal cancer - preliminary research experience

Yue Zhou,Jianbo Gao
The first affiliated hospital of Zhengzhou university

AIM

To evaluate the T stage of esophageal squamous cell carcinoma (ESCC) using preoperative low-dose esophageal insufflation CT (EICT).

METHODS
One hundred and twenty ESCC patients confirmed by surgery or esophagoscopy were divided into three groups. Groups B and C were injected with 300 mgI/kg contrast medium for automatic spectral imaging assist (GSI assist), while group A underwent a conventional 120 kVp CT scan with a 450 mgI/kg contrast medium injection. EICT was performed in group C. Group A was reconstructed with filtered back projection (FBP), and groups B and C were reconstructed with 50% adaptive statistical iterative reconstruction (ASIR). The contrast-to-noise ratio (CNR) of lesion-to-mediastinal adipose tissue and the radiation dose were measured. Specific imaging features were observed, and T stage ESCCs were evaluated.

RESULTS
The sensitivity and accuracy of the T1/2 stage were higher in group C than in groups A and B (sensitivity: 43.75% vs.31.82% and 33.33%; accuracy: 54.29% vs. 46.67% and 52.50%, respectively). With regard to the T3 stage, the sensitivity and specificity in group C were higher than those in groups A and B (sensitivity: 56.25% vs. 41.17% and 44.44%; specificity: 73.68% vs. 67.86% and 63.64%, respectively). The diagnostic sensitivity, specificity and accuracy of the T4 stage were similar among all groups. There were no significant differences in volume CT dose index (CTDIvol) [(5.91±2.57) vs. (3.24±1.20) vs. (3.65±1.77) mGy], dose-length product (DLP) [(167.10±99.08) vs. (113.24±54.46) vs. (117.98±32.32) mGy• cm] and effective dose (ED) [(2.52±1.39) vs. (1.63±0.76) vs. (1.73±0.44) mSv] among the groups (P>0.05). However, groups B and C received similar effective doses but lower iodine loads than group A [(300 vs. 450) mgI/kg].

CONCLUSION
EICT combined with GSI assist allows differential diagnosis between the T1/2 andT3 stages. The ability to differentially diagnose the T3 and T4 stages of medullary ESCC can be improved by quantitatively and qualitatively analyzing the adipose tissue in front of the vertebral body.

EPO-1297
64 排螺旋 CT 诊断回盲部朗格汉斯细胞组织细胞增生症伴小肠梗阻 1 例报道并文献复习

付海军,梁秀梅
中国科学院大学重庆仁济医院（重庆市第五人民医院）

目的：分析小肠朗格汉斯细胞组织细胞增生症的多层螺旋 CT 征象，包括 CT 平扫及增强表现，加强对该疾病的临床认识，提高胃肠道朗格汉斯细胞组织细胞增生症的影像诊断及鉴别诊断水平，减少误诊。
方法：搜集 2017 年 11 月在我院行全腹部 CT 平扫及增强检查并经临床手术证实的回盲部朗格汉斯细胞组织细胞增生症 1 例，进行回顾性分析总结。使用飞利浦 Brilliance 64 排螺旋 CT 扫描仪。扫描参数：120kv，350mA,FOV 40cm,螺距 1.375:1，层厚 5mm，间隔 5mm，扫描完后行 1.5mm 薄层重建及 MRP、MIP 等图像后处理。MSCT 图像由 2 名经验丰富的主治及以上 CT 诊断医师共同进行分析并双盲读片，意见不一致时相互协商。

结果：患者男，23 岁，因腹痛 1 周，加重伴肛门停止排气排便 1 天。CT 平扫所见右下腹回盲部肠壁不规则明显增厚呈肿块状改变，肠腔变窄，CT 平扫 CT 值约 42HU，动脉期 CT 值约 75HU，门静脉期 CT 值约 86HU，平衡期 CT 值约 79HU，动态观察呈持续性明显均匀强化；外周脂肪间隙模糊及邻近肠系膜散在多发淋巴结显示并部分肿大，动态增强观察淋巴结持续性均匀性明显强化；近端空回肠肠腔明显积气、积液并扩张，邻近肠系膜血管增多增粗；腹盆腔散在少量积液，以膀胱直肠陷凹为甚，CT 值约 11HU；腹膜后未见肿大淋巴结；肝脏密度均匀，增强均匀性明显强化。病理结果：考虑 langerhans 细胞组织细胞增生症，肠周淋巴结呈反应性增生（23 枚）。
结论：小肠朗格汉斯细胞组织细胞增生症罕见影像诊断报道，其多层螺旋 CT 征象具有一定的特征性，有助于鉴别小肠间质瘤、淋巴瘤、腺癌及 Crohn 病、肠结核等，从而进一步指导临床制定有效的治疗方案及临床预后评估。

EPO-1298
基于 CT 的 logistic 回归模型在预测胃肠道间质瘤 转移风险中的应用价值

冯秋霞
江苏省人民医院（南京医科大学第一附属医院）

目的
建立并验证胃肠道间质瘤原发病灶 CT 特征的 logistic 回归模型，探讨其预测术后转移风险的应用价值。
材料和方法
回顾性分析 231 例手术病理证实为胃肠道间质瘤（Gastrointestinal stromal tumors, GISTs）的 CT 影像资料(男 93 例，女 138 例；年龄为 22-84 岁，平均：59±12 岁)，并将其分为训练集(168 例)和测试集(63 例)。搜集所有患者的临床资料、Ki67 增殖指数及间质瘤生物学行为的病理资料。采用单因素和多因素分析进行检验，并经十倍交叉验证挑选最优参数，将独立危险因素纳入 logistic 回归模型，并基于训练集上创建诺谟图。通过对比传统分类方法，评价模型受试工作者特征曲线、校准能力以及临床实用性，对模型的应用价值进行评估。
结果
Logistic 回归模型由 3 个 CT 特征(肿瘤位置、最大径和溃疡)组成，在训练集和测试集中能成功地预测 GISTs 转移风险的高低 (P< 0.001)。该模型在训练集及测试集上 ROC 曲线下面积及 95%置信区间（CI）分别为:0.895, 95%CI 0.846-0.944、0.932,95%CI: 0.857-1。仅由最大径组成的传统分类法在训练集及测试集上 ROC 曲线下面积及 95%置信区间分别为 0.765, 95%CI: 0.692-0.838；0.867,95%CI: 0.770-0.965。经 Hosmer-Lemeshow 检验，logistic 回归模型在训练集及测试集上显示有良好的拟合能力，P 值分别为 0.885、0.328。在 10% ~ 80%的阈值概率下，logistic 回归模型预测 GISTs 转移风险高低的净效益优于传统分类方法。
结论
由三个 CT 危险性特征组成的 logistic 模型有望预测 GISTs 转移风险高低，为间质瘤患者术前临床决策提供帮助。

EPO-1299
结肠癌急性并发症的 CT 表现

李秀涛,邱绍清
深圳市中医院

目的 探讨结肠癌急性并发症的 CT 表现，更好的了解结肠癌急性并发症，以便临床及时正确处理。**方法** 回顾性分析 2016 年 1 月-2018 年 6 月间行结肠癌急性并发症术后病理确诊的 35 例的 CT 影像与 X 线检查资料。**结果** 结肠癌合并肠梗阻共 30 例，接受 CT 检查诊断为结肠癌合并肠梗阻 29 例，确诊率为 96.67%，CT 表现为结肠肠壁不规则增厚，肠腔狭窄，近端肠腔扩张；X 线检查诊断为结肠癌合并肠梗阻 25 例，确诊率为 83.33%。CT 与 X 线检查肠套叠均为 2 例，小肠-结肠型 1 例，乙状结肠套叠 1 例，CT 表现表现为套头部肿块；CT 与 X 线检查肠穿孔 3 例，CT 表现为结肠肠壁不规则增厚，肠腔狭窄，肠腔外局限性小气泡，粘膜线中断，脓肿形成。**结论** 结肠癌急性并发症不少见，CT 在术前病变的准确判断具有很高的临床指导价值，尤其是在结肠梗阻方面的征象要优于 X 线，对于确保及时、适当的治疗是至关重要的。

EPO-1300
CT 纹理分析对原发性胃肠道淋巴瘤和胃肠道腺癌的定量对比研究

丁琳
华中科技大学同济医学院附属同济医院

目的：探讨 CT 纹理分析在鉴别原发性胃肠道淋巴瘤和胃肠道腺癌中的潜在价值。
方法：我们回顾性分析了本院 2013 年 3 月至 2018 年 5 月期间病理数据库中的 118 例（包括 47 例原发性胃肠道淋巴瘤和 71 例胃肠道腺癌）患者，这些患者均在术前进行了腹部增强 CT 检查。从动脉和静脉图像中提取纹理参数（平均值，中位数，第 5、第 10、第 25、第 50、第 75、第 90、第 95 百分位数，偏度，峰度和熵），并使用适当的统计学方法进行统计分析。
结果：与胃肠道腺癌相比，在动脉期，原发性胃肠道淋巴瘤在 CT 纹理分析中的第 5、第 10 百分位数较高，差异具有统计学意义（P = 0.003 和 0.009）；同时熵值较低，差异也具有统计学意义（P = 0.006）。在静脉期，原发性胃肠道淋巴瘤的平均值，中位数，第 75、第 90 及第 95 百分数，熵值较低，差异也具有统计学意义（分别为 P = 0.049,0.034,0.019,0.006,0.004 和 0.001）。然而，在动脉期，这两种肿瘤的平均数，中位数，第 25、第 50、第 75、第 90 及第 95 百分数，偏度及峰度值均没有统计学差异（P = 0.501,0.478,0.112,0.329,0.729,0.271,0.141,0.326 及 0.408）；在静脉期中，这两种肿瘤的第 5、第 10、第 25、第 50 百分数，偏度及峰度值也没有统计学意义（分别为 P=0.268,0.556,0534,0.138,0.305 及 0.280）。
结论：CT 纹理分析的特征对于区分原发性胃肠道淋巴瘤和胃肠道腺癌具有一定的作用。

自发孤立性肠系膜上动脉夹层： 临床症状与 MSCTA 征象及影像学转归相关性的研究

靳明旭,张娣,尤佳,马跃虎,殷信道
南京市第一医院

目的：研究自发孤立性肠系膜上动脉夹层(SISMAD)的临床症状与 MSCTA 征象及影像学转归的相关性

方法：回顾性分析我院 2008 年 6 月至 2018 年 9 月诊治的 74 例自发孤立性肠系膜上动脉夹层的影像及临床相关资料，根据病人是否有腹部症状将其分为症状组和无症状组，分析比较两组病例的 MSCTA 征象特征以及保守治疗后影像学转归的差异。
结果：症状组 55 例，无症状组 19 例。症状组与无症状组平均年龄分别为 52.36±7.45 岁和 64.38±8.86 岁，两组比较差异有统计学意义（P<0.001）。症状组与无症状组夹层长度分别为 64.38±8.86 和 29.25mm±21.74mm ，两组比较差异有统计学意义（P<0.001）。症状组与无症状组真腔狭窄率分别为 54.03±28.29 和 38.36±26.21，两组比较差异无统计学意义（P=0.091）。症状组与无症状组夹层血管直径分别为 12.15mm±4.23mm 和 12.36mm±2.12mm，两组比较差异无统计学意义（P=0.794）。症状组与无症状组在影像分型、分支血管受累及血管周围炎性反应、假腔血栓形成、假腔钙化方面差异有统计学意义（P<0.001）。症状组与无症状组在保守治疗后影像学转归方面差异有统计学意义（P<0.001）。初始影像 I 型及 II 型保守治疗后影像形态多保持不变，初始影像 III 型及 IV 型保守治疗后影像形态多吸收改善。
结论：症状性 SISMAD 和无症状 SISMAD 在初始 MSCTA 检查影像征象方面存在显著差异。症状性 SISMAD 保守治疗后影像学转归趋向好转吸收。无症状 SISMAD 保守治疗后影像学转归趋向稳定不变，这种差异可能是由于 SISMAD 各亚型形态学变化不同所致。

Differentiation of Gastric Schwannoma from Gastric Gastrointestinal Stromal Tumor with Dual Phase Contrast-Enhanced Computed Tomography

Ruimin Li[1,2],Hui Zhu[1,2],Weijun Peng[1,2]
1.Shanghai Cancer center Fudan University
2.Department of Oncology， Shanghai Medical College， Fudan University

Objective: To identify the computed tomographic features to differentiate gastric schwannoma from gastric gastrointestinal stromal tumor.
Materials and Methods: Computed tomographic images of 103 pathologically confirmed patients with gastric schwannoma (n=23) or gastric gastrointestinal stromal tumor (n=80) were retrospectively studied. Sex, morphology, location, border, growth pattern, enhancement pattern, necrosis, calcification, ulceration and perigastric lymph nodes were analyzed. Age, short diameter (SD), long diameter (LD) and the degree of enhancement were measured. Statistical analyses, receiver operating characteristic curve and sensitivity, specificity values were performed and analyzed.
Results: Female, age younger than 57.5 years, round or ovoid morphology, extraluminal growth, homogeneous enhancement, lack of necrosis, presence of perigastric lymph nodes, and an enhancement degree of less than 15.4 Hounsfield units in the arterial phase were significant variables for differentiating gastric schwannoma from gastric gastrointestinal stromal tumor (P<0.05).
Conclusions: Dual phase contrast-enhanced CT can help to differentiate gastric schwannoma from gastric gastrointestinal stromal tumor.

3.0T 核磁共振动态增强扫描及弥散加权成像 在进展期胃癌 M 分期评估中的临床应用

谷霄龙,时高峰
河北医科大学第四医院

目的:旨在研究利用 MRI 评估进展期胃癌 M 分期的临床应用。方法:选取河北医科大学第四医院 2014 年 2 月至 2015 年 2 月的 369 例进展期胃腺癌患者,根据 MSCT 进行术前评估分期,对于怀疑 M1 状态(D3 站淋巴结转移、肝脏转移、腹膜种植转移)的患者行 MRI 检查,并将 MSCT、MRI 影像与术中探查及术后病理进行对比分析。结果:MRI 对于进展期胃癌患者 M1 小的 D3 站转移淋巴结、多发小肝转移灶、无腹水的小腹膜种具有较强诊断效能。

CT 灌注联合增强成像对不同分化程度胃腺癌诊断价值

李莹[1],高剑波[2],查云飞[1]
1.武汉大学人民医院
2.郑州大学第一附属医院

目的：通过比较不同分化程度胃癌在 CT 灌注联合增强检查中灌注参数及增强参数的差异，以期提供诊断价值。
材料与方法：前瞻性的收集病理确诊为胃癌且术前需要行上腹部 CT 灌注联合双期增强扫描的患者 90 例，均在 GE Revolution 上进行扫描。所有扫描数据传送至 GE 后处理 ADW 4.6 工作站利用 CT Perfusion 4D 体部灌注模型（Body Tumor 软件）进行分析。所有扫描数据传送至 GE 后处理 ADW 4.6 工作站利用 CT Perfusion 4D 体部灌注模型（Body Tumor 软件）进行分析。在灌注 CTP、平扫及双期增强图像中选取胃癌病灶最大横断层面，感兴趣区灌注图像采用全肿瘤勾画法，增强图像采用明显强化区圈画法，记录病灶的灌注参数、平扫及双期增强 CT 值。采用 c^2 检验对影响胃腺癌分化的相关特征参数进行分析；对不同年龄、性别、肿瘤位置、分化程度胃癌的灌注参数采用独立样本 t 检验或单因素（ANOVA）方差分析，灌注参数中有意义者制作 ROC 曲线。
结果：本研究一共纳入 90 例胃腺癌患者，非黏液腺癌 78 例（高分化腺癌 7 例，中分化腺癌 27 例，低分化腺癌 44 例），黏液性腺癌 7 例，混合型腺癌 5 例。结果显示 Lauren 分型、淋巴结转移、神经或脉管侵犯与否与胃癌分化程度相关，分化型组中 Lauren 分型肠型比例多于低分化组，弥漫型比例少于低分化组，而混合型比例在两组间无统计学差异；分化型组神经、脉管均无侵犯者多于低分化组，均有侵犯者少于低分化组。胃癌患者性别、年龄分组、部位在不同分化程度胃癌无明显相关性，其灌注参数也无明显的统计学差异。分化型组与低分化组胃癌患者灌注参数中仅 PS 有统计学差异（$P<0.01$），其余参数无明显统计学差异。
结论：1.PS 值是灌注参数中最有意义的指标，对鉴别中高分化与低分化胃腺癌有重要作用。2.胃癌患者 Lauren 分型、淋巴结转移、神经或脉管侵犯与否与胃癌的分化程度密切相关。

阑尾粘液性肿瘤的 CT 表现及临床分析

阮志兵[1],胡雨[2]
1.贵州医科大学附属医院
2.贵州医科大学

目的 探讨阑尾粘液性肿瘤的 CT 特征及临床表现，以提高其早期诊断水平。方法 回顾性分析 15 例经手术病理证实的阑尾粘液性肿瘤的临床资料及 CT 表现。结果 病灶位于右下腹 9 例、右侧盆腔 5 例及左腹 1 例，呈大小不等囊性肿块 9 例（不规则形多房囊性 5 例，其中巨大葫芦状 2 例、长管状 2 例、分叶状 1 例，类圆形单房囊性 4 例）及阑尾增粗 6 例。囊性区 CT 值 7HU~32HU，囊壁毛糙 9 例，囊壁厚薄均匀 6 例、不均匀 3 例，囊壁连续性中断 5 例，囊内见分隔 5 例，憩室形成 2 例，见壁结节 3 例，PMP 形成 1 例，病灶见钙化 8 例。7 例增强示囊壁均匀强化 6 例，不均匀强化 1 例，分隔强化 5 例，囊内均无强化。病灶边界清楚 13 例，边界欠清 2 例。11 例与阑尾相连（大部分呈带蒂状连接）或关系密切，4 例阑尾显示不清并与盲肠关系密切。病理结果示阑尾低级别黏液性瘤 10 例，低级别并高级别黏液性瘤 2 例，高级别黏液性瘤 1 例，阑尾粘液腺癌 2 例。结论 阑尾粘液性肿瘤具有一定影像学特征，CT 表现对其具有早期诊断价值。

原发性小肠淋巴管扩张症的胶囊内镜分型与 CT 淋巴管成像相关性的初步研究

赵晴晴,孙小丽,王仁贵
首都医科大学附属北京世纪坛医院

目的

回顾性探讨小肠淋巴管扩张症（PIL）的胶囊内镜分型与 CT 淋巴管成像（CTL）相关性的初步研究。

方法

收集我院经临床和/或病理确诊为 PIL 的患者 64 例，其中男 34 例，女 30 例，年龄 5-70 岁（中位年龄 27）。所有患者术前均行 CTL 及小肠胶囊内镜检查，临床上根据 PIL 的内镜表现分为分型：Ⅰ型，表现为绒毛肿胀、扩张，偶见点状、短棒状不明显白斑样变；Ⅱ型，表现为散在点片状黄白色淋巴管扩张，累及范围多小于 2 个 1/3 肠段；Ⅲ型，表现为明显的片状及鱼鳞状黄白色改变，弥漫分布，常同时累及全部三段 1/3 小肠。PIL 的 CTL 评价指标包括：（1）小肠肠壁增厚；（2）淋巴管扩张及分布异常，包括对比剂在肠系膜、肠壁或肠腔内以及肝门、胰腺、脾脏或肾脏等区域的异常分布；（3）腹膜腔积液；（4）胸部的异常，包括胸膜腔积液、肺部和纵膈的淋巴水肿、对比剂在纵膈或心包或胸膜或肺内的异常分布；（5）颈部和胸导管末端的异常，对比剂的堆积和异常分布、胸导管末端狭窄和梗阻等。本研究的主要内容是临床内镜的不同类型与 CTL 表现是否存在相关性进行比较及统计学分析，以 $P<0.05$ 差异有统计学意义。

结果

64 例患者胶囊内镜检查表现为Ⅰ型者 17 例、Ⅱ型者 34 例和Ⅲ型者 13 例。不同类型患者的 CTL 表现详见表，其中肠壁增厚、心包积液多见于 I 型，肠壁及肠系膜、腹腔内、纵膈对比剂异常分布、胸腔积液多见于 II 型，腹腔积液、胸膜下、胸导管对比剂异常沉积多见于 III 型;肠壁及肠系膜、腹腔内对比剂异常分布多见于胶囊内镜 II 型，明显多于 I、III 型，差异有统计学意义（P=0.016,0.041）。

结论

PIL 的胶囊内镜分型反映了肠腔黏膜区域受累的病变程度和范围，而 CTL 更系统地显示全身淋巴管是否异常和存在回流异常，二者表现为一定程度相关性，对于临床上更精准地评价 PIL 的分期分级、选择合理的治疗方法和疗效预警等具有重要意义。

EPO-1307

磁共振弥散加权成像联合外周循环肿瘤细胞对食管鳞癌放化疗疗效的研究

路双,曲金荣
河南省肿瘤医院

目的探讨放化疗前后磁共振弥散加权成像（diffusion weighted imaging，DWI）和外周循环肿瘤细胞（circulating tumor cells，CTCs）对食管鳞癌放化疗疗效预测的价值。**方法**回顾性收集经活检证实为食管鳞癌的 40 例患者（18 例缓解组，22 例未缓解者），所有患者治疗前及治疗结束后一月均进行食管 MRI 检查及 CTCs 检测。采用 CanPatrol ™ CTC-二代分离富集技术将 CTCs 分为上皮型、间质型和混合型。根据实体瘤的疗效评价(RECIST 1.1)标准进行短期疗效评价，分为缓解组(CR、PR)和未缓解组(SD、PD)。统计学分析比较治疗前、后缓解组和未缓解组之间 ADC 值、CTCs 值、ΔADC、ΔCTCs 之间的差异。采用受试者工作特征曲线分析有效因素对食管鳞癌疗效评价的效能。**结果**治疗后病变 ADC 值升高，治疗前高 ADC 值组及高混合型 CTCs、CTCs 总数对放化疗疗效更为敏感（$P<0.05$）。治疗期间两组之间病变有效因素变化率差异具有统计学意义（P均＜0.05）。Pre/Post-ADC、Pre/Post -CTCs 总数、Pre/Post -混合型 CTCs、ΔADC、Δ混合型 CTCs、ΔCTCs 总数预测食管鳞癌放化疗疗效 ROC 曲线下面积（area under curve，AUC）分别为（0.904/0.957、0.766/0.712、0.715/0.707、0.793、0.893、0.944,P均＜0.05）。治疗前 ADC 及 CTCs 有效因素的联合因素及其有效因素变化率联合因素预测食管鳞癌放化疗疗效的 AUC 分别为 0.924、0.996，敏感度 93.7%、94.4%，特异度 72.2%、94.7%，（$P<0.001$）。**结论**治疗前、后 ADC 值，混合型 CTCs，CTCs 总数及其变化率均可以反应食管鳞癌放化疗的疗效，其联合因素预测价值更高，可作为检测肿瘤消退的可靠指标。

EPO-1308
DCE-MRI 定量参数全域直方图分析法对食管鳞癌放化疗短期疗效的预测价值

贾争艳,曲金荣
河南省肿瘤医院

目的 探讨动态增强 MRI 扫描（DCE-MRI）定量参数全域直方图分析法在预测食管鳞癌（Esophageal squamous cell carcinoma，ESCC）放化疗短期疗效的价值。
方法 回顾性分析 2016 年 11 月-2018 年 4 月经病理证实 ESCC 并接受放化疗治疗的 52 例患者，所有患者治疗前行常规磁共振及 DCE-MRI 检查；于美国 GE Omni-Kinetics 软件后处理软件上绘制全域肿瘤并获得感兴趣区内动态增强扫描定量参数容积转运常数(K^{trans})、血浆速率常数(K_{ep})，血管外细胞外间隙容积比(V_e)的直方图参数，包括平均值、中位数及各百分位数值(10%，25%，50%，75%， 90%)，放疗结束 1 月后，根据实体瘤的疗效评价(Response evaluation criteria in solid tumors， RECIST 1.1)标准进行短期疗效评价，分为缓解组(CR、PR)和未缓解组(SD、PD)。分别比较缓解组、非缓解组间各参数值的差异，其中差异有统计学意义的参数采用受试者工作特征曲线(Receiver operating characteristic curve，ROC) 计算其诊断效能。**结果** 52 例患者中，缓解组 36 例，非缓解组 16 例。缓解组 K_{ep} 平均值、K_{ep} 中位数、50%K_{ep}、75%K_{ep}、90%K_{ep} 及 10%V_e、25%V_e 大于非缓解组，差异有统计学意义 ($P<0.05$)。所有参数中，K_{ep} 中位数诊断效能最大，受试者工作特征曲线下面积（AUC）为 0.717。K_{ep} 中位数的临界值为 0. 672 时，敏感度为 81.25%，特异度为 66.67%。结论：动态对比增强磁共振(DCE-MRI)定量参数全域直方图分析法在预测食管鳞癌放化疗短期疗效有重要价值，有助于临床治疗方案的选择。

急性阑尾炎的 CT 表现与病理的对照分析

陈海荣
上海市同仁医院

【摘要】**目的**：探讨急性阑尾炎的 CT 表现及特征，并与病理分型对照分析。**方法**：搜集 300 例临床拟诊为急性阑尾炎的病例，采用 3 2 层螺旋 C T 进行扫描，以 1． 2 5 mm 层厚行薄层多平面容积重组图像后处理，分析其 C T 表现及特征，并将诊断结果与手术及病理结果进行对照分析。**结果**：300 例急性阑尾炎患者中，CT 检出 289 例，其中，单纯性阑尾炎 68 例，化脓性阑尾炎 126 例，合并阑尾腔内肠石 35 例，坏疽性阑尾炎 71 例，并穿孔 16 例，阑尾脓肿 20 例，慢性阑尾炎 4 例。**结论**：急性阑尾炎有典型的 CT 表现，MSCT 的平扫及图像后处理技术的联合应用，能直观地显示阑尾的形态及病理改变，在急性阑尾炎的分型诊断中，有重要的临床应用价值。

EPO-1310

ADC 值对胃癌淋巴结转移的预测价值

谢锟,田川,高德培,张大福,李振辉,张治平
昆明医科大学

【**摘要**】**目的**：探讨 ADC 值对胃癌患者有无淋巴结转移的预测价值。**方法**：回顾性收集 2012 年 10 月-2019 年 5 月昆明医科大学第三附属医院诊疗的胃癌患者的临床资料和 MRI 资料。所有患者均行常规 MRI 序列和 DWI 检查，DWI 扫描 b 值取 0 和 800 $\times 10^{-3}mm^2/s$。分别测量每位患者病灶 ADC 的平均值（ADC_{mean}）和最小值（ADC_{min}）。所有患者 MRI 检查后均经手术切除后病理学证实有无淋巴结转移，分为淋巴结转移组和无淋巴结转移组。采用 t 检验分别比较 ADC_{mean} 和 ADC_{min} 在两组胃癌病灶间有无差异。利用受试者工作曲线（ROC 曲线）下面积（AUC）来评价胃癌组织的 ADC_{mean} 和 ADC_{min} 对有无淋巴结转移的预测效能，并采用 DeLong 检验比较 ADC_{mean} 和 ADC_{min} 的 AUC 值有无统计学差异。**结果**：最终入组 59 例胃癌患者，其中男 42 例，女 17 例，年龄 28-77(56.20±9.82)岁；无淋巴结转移者 23 例，有淋巴结转移者 36 例。无淋巴结转移组的 ADC_{mean} 和 ADC_{min} 分别为：$1.143\pm0.170\times10^{-3}mm^2/s$ 、$1.011\pm0.145\times10^{-3}mm^2/s$ ，均高于有淋巴结转移组的 $1.023\pm0.146\times10^{-3}mm^2/s$（P=0.006）和 $0.858\pm0..119\times10^{-3}mm^2/s$ （P<0.001）。胃癌组织 ADC_{mean} 与 ADC_{min} 预测胃癌患者淋巴结转移的 AUC 分别为 0.717（P=0.005）与 0.801（P<0.001），二者的差异有统计学意义（Z=3.005，P=0.0027）。以胃癌组织 $ADC_{min}=0.976\times10^{-3}mm^2/s$ 作为阈值预测胃癌患者有无淋巴结转移时，敏感度为 69.6%，特异度为 88.9%。**结论**：ADC_{min} 值对预测胃癌患者有无淋巴结转移具有重要的价值，可作为胃癌术前一个无创性的预测指标辅助临床决策。

EPO-1311

体素内不相干运动成像在食管鳞癌病理学特征术前评估中的应用

宋涛,曲金荣
河南省肿瘤医院

目的 探讨体素内不相干运动成像（IVIM）在食管鳞癌病理学特征术前评估中的应用价值。**方法** 前瞻性收集 2016 年 4 月至 2017 年 12 月拟行食管癌切除术的患者，于术前行 MRI 常规扫描及

IVIM 检查，计算表观扩散系数（ADC）、真实扩散系数（D）、灌注系数（D*）及灌注分数（f）值，分析其与术后病理参数（浸润深度、淋巴结转移、分化程度、脉管癌栓、神经侵犯）的关系。**结果** 共入组患者 40 例，侵犯外膜组（T3）ADC、D 及 f 值明显低于未侵犯外膜组（T1+T2），其差异均有统计学意义，以 ADC 值为 2.245×10^{-3} 、D 值为 1.820×10^{-3}、f 值为 0.435 作为阈值判断肿瘤浸润深度的诊断效能最高，敏感性和特异性分别为 52.4%和 78.7%，57.9%和 66.7%、42.1%和 61.9%；脉管癌栓组 ADC、D 及 f 值明显低于无脉管癌栓组，其差异均有统计学意义，以 ADC 值 2.610×10^{-3}、D 值 1.690×10^{-3}、f 值 0.406 为阈值判断脉管癌栓形成的诊断效能最高，其敏感性和特异性分别为 60.0%和 85.0%，75.0%和 70.0%，70.0%和 85.0%；淋巴结转移组的 ADC 值明显低于无淋巴结转移组，其差异有统计学意义，以 ADC 值 1.955×10^{-3} 为阈值判断淋巴结转移的诊断效能最高，敏感性和特异性分别为 95.0%和 45.0%；ADC、D、D*及 f 值在食管癌不同分化程度及有无神经侵犯组间的差异无统计学意义。**结论** IVIM 可作为食管鳞癌术前评估新的影像学方法，ADC、D 及 f 值有助于判断食管癌浸润深度及脉管癌栓的形成，ADC 值可反映食管癌淋巴结转移状况。

EPO-1312
MSCT 对结直肠原发性印戒细胞癌与黏液腺癌的影像诊断价值

邹飞
江西省肿瘤医院

目的 探讨结直肠原发性印戒细胞癌和黏液腺癌的 MSCT 影像表现，以提高对两种疾病的影像学认识。**方法** 收集 2015 年 3 月至 2018 年 2 月期间我院经手术病理确诊的结直肠印戒细胞癌患者 56 例和黏液腺癌患者 115 例,比较两组患者的肿瘤发生部位、病变肠管的长度和厚度、病变的局部表现（增厚形式、密度、有无钙化、强化形式）、肠周浸润情况、有无肠梗阻、淋巴结和远处器官转移的 CT 表现。**结果** 56 例印戒细胞癌患者中,男性 31 例,女性 25 例；115 例黏液腺癌患者中,男性 70 例,女性 45 例。92.8%（52／56）印戒细胞癌和 81.7%（94／115）黏液腺癌出现肠壁环形增厚；印戒细胞癌和黏液腺癌的病灶密度分别为（42.0±3.0）Hu 和（28.5 ± 1.5）Hu；印戒细胞癌未见钙化，17.4%（20／115）黏液腺癌出现钙化；53.6%（30／56）印戒细胞癌和 13.9%（16／115）黏液腺癌强化程度明显；3.6%（2／56）印戒细胞癌和 45.2%（52／115）黏液腺癌强化后具有大量低密度区；14.3%（8／56）印戒细胞癌具有靶环征，而黏液腺癌不具有靶环征；41.1%（23／56）印戒细胞癌和 17.4%（20／115）黏液腺癌出现肠周重度浸润。两组在病灶位置、长度、厚度、肠梗阻、淋巴结转移、肝脏转移和腹膜转移等方面差异无统计学意义。**结论** 结直肠原发性印戒细胞癌和黏液腺癌的 CT 表现比较：印戒细胞癌 CT 平扫密度偏高，无钙化，增强扫描表现为靶环征；黏液腺癌 CT 平扫密度偏低，可见钙化，增强扫描表现为片状低密度无强化区；另外印戒细胞癌肠周侵犯较黏液腺癌更为常见，与两种病变的病理分化程度也较符合。

多层螺旋 CT 纹理分析预测胃癌淋巴结转移的价值

熊瑶[1],王芳[3],郭玉林[2]
1.中国人民解放军总医院第四医学中心
2.宁夏医科大学总医院
3.宁夏医科大学临床医学院

目的 探讨多层螺旋 CT 纹理分析预测胃癌淋巴结转移的价值。**方法** 回顾性分析 2017 年 7 月至 2018 年 8 月在宁夏医科大学总医院经手术病理证实的 174 例胃癌患者临床资料，所有患者

术前均行腹部 CT 平扫及动脉增强扫描。以术后病理结果为金标准，分为非淋巴结转移组和淋巴结转移组。利用 CT Kinetics 纹理分析软件分别测量动脉期、门脉期胃癌原病灶的 CT 纹理参数（平均值、偏度、峰度、熵值、自相关）。采用两独立样本 t 检验（正态分布）或 Mann-Whitney U 检验（非正态分布）比较两组间纹理参数差异。计数资料采用 x^2 检验比较两组间差异。对两组间差异有统计学意义的参数进行 ROC 分析，评价其预测淋巴结转移效能，并利用多因素 Logistic 回归分析得出判断胃癌淋巴结性质的独立预测因素。**结果** 174 例患者中，非淋巴结转移组 49 例，淋巴结转移组 125 例。动脉期、门脉期，胃癌淋巴结转移组的熵、自相关均高于非转移组，差异有统计学意义（$P<0.05$），而平均值、偏度、峰度的差异均无统计学意义（$P>0.05$）。动脉期，熵、自相关诊断胃癌淋巴结转移的 ROC 曲线下面积（AUC）分别为 0.751、0.661；门脉期，熵、自相关诊断胃癌淋巴结转移的 AUC 分别为 0.754、0.714。对于动脉期的熵、自相关，门脉期的熵、自相关 4 个自变量进行 Logistic 多因素回归分析，得出动脉期的熵（OR=3.33，95%可信区间为 2.03～5.48，$P<0.001$）是判断胃癌淋巴结转移的独立预测因素。**结论** 多层螺旋增强 CT 图像纹理分析对预测胃癌淋巴结转移有一定价值。

The Significance of Enhancement of Ascites on Hepatobiliary Phase of Gd-BOPTA-enhanced MRI

Ya Ren,Yu Yang,Ping Li,Yanfang Huang
The First Hospital of Hunan University of Chinese Medicine

Objective: To evaluate the signal intensity of peritoneal fluid effusions in patients without biliary leakage on the hepatobiliary phase of Gd-BOPTA-enhanced MRI.
Methods: From January 2016 to May 2018 102 patients with ascites without biliary leakage who underwent Gd-BOPTA-enhanced MRI were included In this retrospective study. The relative enhancement of effusions on every phase was calculated.The difference of the relative enhancement of hepatobiliary phase in different degree of ascites and between malignant and benign ascites was analysed .
RESULTS: Ascites in 102 cases without biliary leakage showed high signal on hepatobiliary phase of Gd-BOPTA-enhanced MRI. The relative enhancement of peritoneal fluid effusions on arterial phase, portal phase, delayed phase and hepatobiliary phase were -0.14, -0.08, 0.40, 3.32, respectively. The relative enhancement was significantly higher for hepatobiliary phase than the arterial, portal venous and delayed phases (p-values <0.05). The amount of ascitic fluid were significantly inversely correlated with elevated ascitic fluid signal intensity.No significant difference in ascitic enhancement in patients who have malignant disease and those who have benign disease.
Conclusion: Peritoneal effusion without biliary leakage can be enhanced on hepatobiliary phase after intravenous injection of Gd-BOPTA,which is a common phenomenon.It is nonspecific, occurring in a wide spectrum of clinical conditions.Do not misdiagnose as biliary injury or other abnormalities, especially in the recent surgery,especially in patients with a recent history of surgery, trauma or interventional procedures Patients.

基于 T2WI 序列的纹理分析在鉴别直肠腺癌与粘液腺癌中的应用研究

王裴培
中国科学技术大学附属第一医院西区 、安徽省肿瘤医院

【摘要】 目的 探讨基于 MR T2WI 序列的纹理分析在鉴别直肠腺癌、腺癌合并粘液腺癌及粘液腺癌中的价值。**方法** 回顾性分析 40 例经手术病理证实的直肠腺癌患者临床及影像资料，依据病理将其分为直肠腺癌组 22 例、直肠腺癌合并粘液腺癌组 11 例和粘液腺癌组 7 例。使用 ITK-SNAP 软件对肿瘤实性成分最大层面进行 ROI 手动勾画，并将勾画好的 ROI 文件导入美国 GE 公司 AK 软件内，利用不同的纹理参数进行特征提取，从而得到肿瘤内部的纹理特征值。选取熵、偏度、峰度、均匀度、标准差和平均值 6 个纹理参数作为分析指标。采用 SPSS 软件中的 LSD-t 检验对三组数据间进行两两比较，分析三组之间纹理参数是否有统计学差异。**结果** 腺癌组的熵值、偏度、峰度、均匀度、标准差和平均值分别为 6.16±0.27、0.41±0.56、1.49±1.64、0.88±0.03、50.48±13.26、423.05±107.27；腺癌合并粘液腺癌组上述各参数值分别为 6.67±0.33、0.33±0.78、1.00±1.48、0.81±0.62、91.25±37.24、463.89±112.15；粘液腺癌组上述各参数值分别为 7.07±0.30、0.19±0.80、-0.03±1.12、0.73±0.55、148.26±52.60、535.07±121.23。熵值、均匀度和标准差在鉴别三组数据间差异有统计学意义（F 值分别为 28.529、32.924 和 28.769， $P<0.05$），此外，平均值和峰度在鉴别直肠腺癌组与粘液腺癌组间差异有统计学差异（$P<0.05$）。**结论** 基于 T2WI 序列的 MR 纹理特征参数在鉴别直肠腺癌、直肠腺癌合并粘液腺癌及粘液腺癌有一定的价值。

基于 CT 图像的纹理分析预测结肠癌肝转移癌的 初步研究

刘佳莹[1,2],刘屹[1]
1.中国医科大学附属第一医院
2.浙江大学医学院附属第四医院

目的：本研究的目的是探讨结肠癌原发灶的 CT 纹理特征是否有可能作为预测结肠癌患者肝转移的影像学标志物。
材料和方法：回顾性研究（n = 138）三个亚组：：A 组：同期肝转移（n = 49），B 组：异时性肝转移（n =41）和 C 组：随访两年无肝转移的患者（n = 48）。所有患者均包括完整的术前 CT 增强图像。在 ITK-SNAP 软件上手动 3D 勾画 ROI 图像。应用 AK 软件提取动门脉期各 396 个特征，将预处理后数据随机分组，按照 7：3 构建训练集和测试集，通过秩和检验、相关性检验、Lasso 等方法对数据进行降维 ，接下来将所选取的纹理特征输入到四个不同的机器学习分类器中进行分类，分别为 K 邻近、支持向量机、朴素贝叶斯、逻辑回归，选取最优的分类模型。两两比较 ABC 三组动脉期、门脉期、动门脉期联合数据，以获得准确度、敏感度、特异性、测试集 ROC 曲线、测试集 AUC 值及 95%可信区间。
结果：对 A、B、C 三组患者结肠癌原发灶动脉期、门脉期的纹理特征进行两两比较，结果显示三组患者动脉期、门脉期的训练集及测试集准确性均大于 70%，测试集 AUC 值从最低的 0.771 到最高的 0.902。对 ABC 三组动门脉期联合数据建模后，各组测试集的 AUC 值均大于 0.8。
结论：利用结肠癌原发灶 CT 增强扫描的放射组学特征建立的机器学习模型，对于同时肝转移、异时肝转移以及随访两年内未转移的三组都具有良好的诊断性能。另外，动静脉联合建模的诊断性能高于单独期相建模。综上，结肠癌原发灶的纹理特征有望成为预测结肠癌患者肝转移的影像学标志物。

中山大学附属第六医院

目的 研究双能量 CT 结肠成像部分自动及个体化充注空气扩张结直肠，受检者可接受性和结直肠充气扩张效果。 **方法** 46 例没有影响胃肠道运动功能病史并且知情同意本研究的健康志愿者，其中女 25 例、男 21 例，年龄 32～77 岁。CT 检查前 1 天开始，志愿者 5 次分别口服 4.0%泛影葡胺 60ml 标记肠内容物。利用充气机部分自动、个体化充注空气扩张结直肠，充气速率开始为 1.5L/min，后期降低到 0.5L/min，再根据 CT 侦察图像上结直肠充气扩张效果、志愿者自我感觉及肠腔压力确定是否需要增补充气及其充气量。仰卧位双能量 CT 容积扫描，并获得双能量融合图像。对志愿者可接受性进行问卷调查，可接受性分为 4 级：1 级，容易接受；2 级，尚可接受；3 级，稍难接受；4 级，难以接受。两位富有经验的放射科医生采用盲法在双能量融合图像上逐个肠段评价结直肠充气扩张效果，以两位的一致性意见为评价结果。以每段肠腔充气扩张最差的部分评价该段肠腔充气扩张效果，分为 4 级：1 级，肠腔充气扩张佳；2 级，肠腔充气扩张欠佳；3 级，肠腔充气扩张差；4 级，肠腔没有充气扩张。统计分析志愿者可接受性和结直肠充气扩张效果，p＜0.05 时差异有统计学意义。 **结果** 46 例志愿者均没有出现腹痛、腹胀、恶心或呕吐等，容易接受结直肠充气扩张，可接受性 1 级达 100%。可接受性 2 级、3 级、4 级，均为 0 例。276 个肠段中，结直肠充气扩张 1 级、2 级、3 级、4 级效果分别为 92.8%、5.1%、2.1%、0.0%；256 个肠段肠腔充气扩张效果为 1 级，其中盲肠、升结肠、横结肠、降结肠、乙状结肠、直肠分别占 44 段、44 段、45 段、42 段、40 段、41 段。结直肠各部分肠段肠腔充气扩张效果比较，差异没有统计学意义(c^2=6.19，p=0.288)。 **结论** 双能量 CT 结肠成像部分自动个体化充注空气扩张结直肠，受检者可接受性非常高，结直肠充气扩张效果良好。

Combined CT texture analysis and tumor markers in predicting suspicious peritoneal metastasis of gastric cancer: a pilot study

Song Liu[1], Ji Miao[1], Yiming Shi[1], Lin Li[1], Shunli Liu[1], Changfeng Ji[1], Shuangshuang Sun[1], Qing Gu[2], Baorui Liu[1], Juan Du[1], Jian He[1], Zhengyang Zhou[1]
1.Nanjing Drum Tower Hospital, the Affiliated Hospital of Nanjing University Medical School
2.State Key Lab of Novel Software Technology, Nanjing University

Background: *The predictive value of computed tomography (CT) texture analysis combined with tumor markers to peritoneal metastasis (PM) of gastric cancer is still unclear. This study aims to evaluate the feasibility of the multivariate model combining CT texture analysis parameters and positive tumor markers for reliably predicting suspicious PM preliminarily.*
Methods: *A total of 174 patients with gastric cancers who underwent surgery were retrospectively enrolled in our cohort and 39 patients were confirmed with PM pathologically. Regions of interest were drawn manually using in-house software to cover the boundary of the suspicious omentum majus and mesocolon in venous phase.*

CT texture analysis was performed and a total of 14 parameters were generated. Six tumor markers of venous blood were also collected. Depending on the normality test results, univariate analysis was performed by the Mann-Whitney U test for continuous characteristics. The diagnostic performance of CT texture and tumor marker parameters and multivariate model in differentiating different groups were evaluated with receiver operating characteristic (ROC) analysis.

Results: *The parameters of Mean, Standard deviation (SD), Mode, 5^{th}-90^{th} Percentiles, Skewness, Entropy, Histogram width and Carbohydrate antigen (CA)125 differed significantly between the two groups of the presence or absence of PM. ROC analysis showed that the above 13 features performed well in distinguishing gastric cancers with PM from those without PM.*

For multivariate model analysis, when SD, 90th percentile, Histogram width and CA125 participated together, the area under the ROC curve of the presence or absence of PM was the highest, reaching 0.920.

Conclusions: *The combination of CT texture parameters and tumor markers could improve the diagnostic accuracy of PM in patients with gastric cancers.*

100kvp,80mAs 低剂量大肠充气 CT 造影联合 iDOSE3 迭代技术 在大肠癌 T 分期中的应用

颜俏燕
柳州市人民医院

目的 探讨 100kvp、80mAs 低剂量大肠充气 CT 造影联合 iDOSE^{3}迭代技术在大肠癌术前 T 分期中的应用价值。**方法** 选取 204 例经肠镜病理确诊为大肠癌（包括结、直肠癌），体重指数（18.5kg/m^2＜BMI≤25kg/m^2）的患者，随机分为 A、B 两组（每组各 102 例），术前均行大肠充气 CT 造影检查，A 组为常规剂量组：120kv，自动毫安秒，运用滤波反投影（FBP）重建技术，B 组为低剂量组：100kv，80mAs，运用 iDose^{3}迭代重建技术。记录每位患者接受的辐射剂量，包括容积剂量长度乘积（DLP）及 CT 剂量指数（CTDIvol），根据公式计算有效剂量（ED），并比较有效剂量下降幅度；以术后手术病理分期为金标准，计算两组 T 分期的诊断符合率，比较两组符合率差异是否有统计学意义。**结果** 两组 T 分期诊断符合率分别为 85.3%（A 组）及 80.3%（B 组），差异无统计学意义（c^2=1.148，P＞0.05）。DLP 、CTDIvol 及 ED 分别为：1574.94±484.06、38.23±10.24 及 23.57±7.25（A 组）； 493.17±32.14，10.57±0.11 及 7.40±0.48（B 组）；下降幅度分别约为 69%、72%及 69%。**结论** 100kvp、80mAs 低剂量大肠充气 CT 造影联合 iDOSE^{3}迭代技术在大肠癌术前 T 分期中具有重要价值，同时可以大幅度降低辐射剂量，可作为大肠癌术前分期的有效评估方法。

Evaluating the Inflammatory Activity in Crohn’s disease Using Magnetic Resonance Diffusion Kurtosis Imaging

Guangyao Wu
Shenzhen Universit General Hospital

Objectives: To explore the feasibility of diffusion kurtosis imaging(DKI) for the evaluation of inflammatory activity in Crohn’ s disease(CD).
Materials and Methods: In all, 51 patients diagnosed with CD were included, who were performed with consecutive enteroscopy, Magnetic Resonance Enterography(MRE) and DKI (b values = 0 - 2000 mm^2/s). The lesions of bowel segments were graded as inactive (0-2), mild (3-6), and moderate-severe group(>6) based on simplified endoscopic activity score for Crohn’s disease (SES-CD). Parameters of DKI and DWI were correlated with SED-CD. The difference of these parameters among three groups were analyzed by ANOVA (analysis of variance) or K-W test(Kruskal - Wallis test). Receiver operating characteristic (ROC) curve analysis for these parameters was used for differentiating inactive from active group and inactive-mild from moderate-severe group.
Results: 127 bowel segments including inactive(15), mild(45) and moderate-severe(67) were analyzed. ADC($r = -0.627$, $P < 0.001$), D_{app} ($r = -0.381$, $P < 0.001$) and K_{app} ($r = 0.641$, $P < 0.001$) were correlated with SES-CD. These parameters were significantly different among the three groups(all $P < 0.001$). ROC analysis found ADC had the highest accuracy (AUC = 0.884, $P < 0.001$) to differentiate inactive from active group with the threshold at 0.865×10^{-3} mm^2/s, which was slightly higher than Kapp (AUC = 0.867, $P < 0.001$) with the threshold at 0.645, and was obviously higher than Dapp (AUC = 0.726, $P = 0.005$). Similarly, ADC also had the highest accuracy (AUC = 0.846, $P < 0.001$) to differentiate inactive-mild from moderate-severe group with the threshold at 0.825×10^{-3} mm^2/s, and minimally higher than Kapp (AUC = 0.843, $P < 0.001$) with the threshold at 0.695, and obviously higher than Dapp (AUC = 0.690, $P < 0.001$).
Conclusion: DKI is feasible and comparable to conventional DWI for the evaluation of inflammatory activity in Crohn’s disease.

应用 IMR 技术超低管电压管电流 CT 结肠成像的动物模型研究

练延帮,董军强,潘元威,卢振威,高剑波
郑州大学第一附属医院

目的
评估猪结肠模型中 100kVp20mAs 超低剂量条件下采用 IMR 重建技术与 120kVp50mAs 常规低剂量下采用 FBP 重建技术 CT 结肠成像的辐射剂量及图像质量，探讨 IMR 技术在超低剂量 CT 结肠成像中的应用价值。
材料与方法
取 5 段猪结肠，长度约 100-120cm，并人工制作息肉 73 枚，分为大（直径 11-15mm）、中（直径 6-10mm）、小（直径小于 5mm）三组。扫描机器采用飞利浦 CT 机（Brilliance iCT Elite FHD），扫描参数分为两组：超低剂量组（管电压 100kVp，管电流 20mAs，IMR 技术重建）和低剂量组（管电压 120kVp，管电流 50mAs，FBP 技术重建）。两位医生采用 5 分法评估图像质量，并对比两组图像的图像噪声、信噪比、对比信噪比及辐射剂量，并测量两组图像中息肉的检出量。采用 Wilcoxon 秩和检验统计方法分析图像质量等级资料数据，采用配对 t 检验统计方法分析信噪比、对比信噪及辐射剂量等数据。
结果
超低剂量组和低剂量组中图像质量评分无明显统计学差异(p=0.059)，超低剂量组中图像噪声、信噪比和对比信噪比([24.05±2.11] HU vs. [50.04±3.45] HU, 2.40±0.68 vs. 0.62±0.20, and

42.56±6.11 vs. 20.48±1.46, respectively; p=0.001)明显优于低剂量组，同时辐射剂量明显减降低(0.26±0.03 mSv vs. 2.21±0.23mSv; p=0.000)，而息肉检出率无明显统计学差异(68/73 vs. 73/73, p=0.07)。
结论
采用 IMR 重建技术的超低剂量 CT 结肠成像在图像质量和病变检测率上可媲美采用 FBP 技术重建的常规低剂量 CT 结肠成像，同时辐射剂量明显减低约 88.2%，临床应用前景广阔。

Effect of Iterative Model Reconstruction algorithm on Radiologist’s Performance in CT Colonography

Yanbang Lian, Junqiang Dong, Yuanwei Pan , Zhenwei Lu, Jianbo Gao
The First Affiliated Hospital of Zhengzhou University

PURPOSE
To assess radiation dose and image quality of CT colonography (CTC) at 100 kVp with iterative model reconstruction algorithm (IMR) at 20 mAs compared with filtered back projection (FBP) at 50 mAs.
METHOD AND MATERIALS
Thirty-two patients suspected with colon adenomatous polyp or adeno-carcinoma were enrolled in this study. All of patients underwent CTC examination at 50mAs in supine position and 20mAs with prone position with the same tube voltage at 100 kVp about two hours before fibro-colonoscope. Images were reconstructed using FBP and IMR. Two radiologists independently evaluated image quality. Qualitative image quality was assessed with a five-score scale. Image noise, signal-to-noise ratio (SNR), contrast-to-noise ratio (CNR), and effective radiation dose were recorded and calculated. Qualitative and quatitative values were analysed by using Wilcoxon signed rank test and the paired t test, respectively.
RESULTS
Totally 38 colon polyps or adeno-carcinoma were detected in fibro-colonoscope examination. For 20 mAs with IMR (A group) and 50 mAs with FBP (B group), there is no statistically significant difference in lesion detection (reader 1: 35/38 vs 36/38, and reader 2: 31/38 vs. 33/38, $p>0.05$). However, qualitative image quality scores (3.9 vs 2.5), image noise ([12.77± 0.91] HU vs. [50.04±5.45] HU), SNRs (3.13±0.28 vs. 1.02±0.20) and CNRs (81.42±6.11 vs. 19.93±1.46) were significantly superior of 20 mAs with IMR, respectively ($p<0.05$) . Compared with B group, radiation dose of A group decreased significantly (0.42±0.03 mSv vs. 1.07±0.12mSv).
CONCLUSION
Image quality of CTC using 20 mAs with IMR reconstruction could be comparable to 50 mAs with FBP at the same tube voltage while with no significant detection of poply, and radiation dose of the former was only 0.42 mSv, which was reduced by about 39.3%.

小肠肿瘤 CT 引导下穿刺活检的临床应用价值及安全评估

潘元威,董军强,周志刚
郑州大学第一附属医院

目的：评估 CT 引导下穿刺活检技术在小肠肿瘤诊断中的应用价值及安全性。方法：总结我院 2016 年 9 月至 2018 年 9 月期间经 CT 引导下穿刺活检明确诊断的小肠肿瘤患者 26 例，总结其穿刺阳性率、病理结果及手术并发症等进行分析,评价穿刺活检对小肠肿瘤患者诊断中的应用价值。结果：本组 26 例患者中，男性 11 例，女性 15 例，年龄 43-83 岁，平均年龄 60 岁。所有患者中临床就诊症状为腹痛及腹部不适 19 例（73.1%）、消瘦待查 11 例（42.3%）、发热 6 例（23.1%）、腹部肿块 2 例（7.7%）等。其中 12 例患者为局部晚期单发病灶，14 例患者为多部位发病或合并多发转移，穿刺病例结果提示淋巴瘤 8 例，腺癌 8 例，炎症 5 例，间质瘤 3 例，平滑肌肉瘤 1 例，梭形细胞肿瘤 1 例。除一例患者取材量少进行二次活检外，余患者均一次穿刺成功，阳性率 100%。所有患者均无出血、感染、穿孔等并发症发生。结论：CT 引导下穿刺活检技术是一项安全、有效的临床应用技术，在局部晚期或者累及多部位患者的临床诊断中具有很高的应用价值。

原发性腹茧症的 CT 及 MRI 表现（附 6 例分析）

林雪花,曹代荣
福建医科大学附属第一医院

【摘要】目的：探讨原发性腹茧症的 MR 及 CT 影像学特征，以提高对该病的认识和诊断水平。
方法：回顾性分析 6 例经手术、病理证实的腹茧症患者的临床资料，其中 CT 平扫 1 例，CT 平扫+增强 3 例，磁共振平扫+增强 2 例。
结果：腹茧症的主要表现为小肠异常聚集成团，位置固定，聚集小肠呈拧麻花状、手风琴状、假肿瘤样改变；其中 2 例表现为部分性小肠受累，4 例为全部小肠受累，肠管外缘光滑，周围可见茧样纤维膜包裹，包膜轻中度延迟强化，近端肠管不全性或完全性肠梗阻。
结论：熟悉腹茧症的典型 CT 表现和临床特征，有利于该病的准确诊断及鉴别诊断。

EPO-1325
第二代双源 CT 虚拟平扫对胃肠道间质瘤显示能力的评估

杨丽,时高峰
河北医科大学第四医院

目的 评价第二代双源 CT（dualsourcecomputedtomography，DSCT）虚拟平扫（virtualnon-contrast，VNC）对胃肠间质瘤的显示能力，及其取代真实平扫的可行性。**方法** 分析经手术病理证实的 28 例胃肠道间质瘤患者的术前 CT 图像，患者均于术前接受常规平扫和西门子公司第二代双源 CT 双能量增强扫描。将 5mm 层厚、D30 卷积核的静脉期双能量图像传送至 syngoMMWP VE36A 工作站，应用 Dual-Energy 软件“Liver VNC”模式产生 VNC 图像。选择肿瘤最大层面，分别在常规平扫图像和静脉期 VNC 图像上沿肿瘤轮廓勾画感兴趣区，测量并比较肿瘤的真实平扫（truenon-contrast，TNC）值及 VNC 值。**结果** 本组 28 例患者共检出间质瘤瘤灶 30 个，其中胃间质瘤瘤灶 21 个，小肠间质瘤瘤灶 9 个，肿瘤平均直径（3.6±1.2）cm，所有瘤灶均可在 VNC 图像上显示，其 VNC 均值为（35.06±4.52）HU，TNC 均值为（28.53±5.24）HU，两者间的差异有统计学意义（$P<0.05$），但其绝对差异值在 10HU 之内。Pearson 相关检验两者一致性较好（$r=0.62$）。**结论**

第二代双源 CT 虚拟平扫可显示胃肠道间质瘤，其虚拟平扫 CT 值与真实平扫 CT 值的一致性较好，虚拟平扫具有取代常规平扫以降低患者辐射剂量的可能。

EPO-1326
原发性胃肠道间质瘤危险度分级：形状是其重要的独立预测因素

魏生彩
山东省肿瘤医院

背景：本研究旨在探讨形状与胃肠道间质瘤（GISTs）危险度分级之间的相关性。
方法：将 2014 年 6 月至 2019 年 6 月在我院手术后经病理及免疫组织学确诊的原发性 GISTs 患者 189 例作为研究对象。入组标准：①大小在 1-9.9cm（RECIST 标准）；②增强 CT 检查且采用迭代重建（IMR）对图像进行 1mm 的横断位、冠状位及矢状位的多平面重建（MPR）；③未发生破裂。本研究以角度和角度比的方式对形状进行量化（长径对应角 A 和角 B 且 A≥B，短径对应角 C 和角 D 且 D≥C。当肿瘤为规则形时，选取角 A 和角 B 进行分析；当肿瘤为不规则形时，将 A/B 与 D/C 值进行比较，大者进行分析）。采用卡方检验、t 检验或非参数检验、ROC 分析、等级逻辑回归或二元逻辑回归对定量数据（长短径及其比值、角度、角度比、各期强化绝对值）和定性数据（发病部位、生长方式、强化峰值期、核分裂象、Ki-67、坏死及钙化等）进行统计分析。
结果：经过等级逻辑回归分析，角度比值是 GISTs 危险度分级的独立预测因子（P＜0.05）。在 ROC 曲线中将角度、角度比及长径的截止值分别设定为 90.5°、1.35、6.15cm 时，GISTs 为高危险性的敏感度分别为 82.4%、85.3%和 83.8%，特异性分别为 87.1%、71%和 77.4%，AUC 分别为 0.852、0.818 和 0.844。但在两两比较中 LD 不能有效区分中度风险和高风险 GIST（P＞0.05），但角度可以有效区分两者（P＜0.05）。此外，在二元逻辑回归分析中，形状和 Ki-67 是有丝分裂计数的独立预测因子（P 值均小于 0.05），预测准确率为 87.8%。此外，较高的动脉期强化绝对值预示较高的有丝分裂计数（P＜0.05）。
结论：形态在 GIST 的危险分级和有丝分裂计数方面比长径具有更好的预测效果，尤其是对于高风险分级和有丝分裂计数＞5/50HPF 的 GISTs。

EPO-1327
MR 功能成像在局部进展期胃癌新辅助治疗疗效评价的应用

徐校胜,时高峰,杨丽
河北医科大学第四医院

目的：探究磁共振成像功能对局部进展期胃癌新辅助放化疗后疗效评价的临床应用价值。
方法：收集自 2017 年 8 月至 2018 年 12 月就诊于我院的局部进展期胃癌病例。测量肿瘤动态对比增强定量参数变化值ΔKtans、ΔKep、ΔVe 及ΔADC。术后 TRG 分为 0,1,2,3,级。应用 Spearman 检验分析各参数变化值与 TRG 的相关性。应用独立样本 t 检验或 Mann-Whitney U 检验分析两组间ΔKtans，ΔKep，Δve 及ΔADC 值的差异性；再制作受试者工作特征 ROC 曲线，进一步分析最佳诊断效能值。*P*＜0.05 认为有统计学差异。
结果：有效组治疗后ΔKtrans、ΔADC 大于无效组，差异有统计学意义（*P*＜0.05）。ΔKtrans、ΔKep 与 TRG 之间呈负相关（rho=-0.554,P=0.009;rho=-599,P=0.004）。ΔADC 与 TRG 之间呈正相关（rho=0.603,P=0.005）。做 ROC 曲线，AUC 为 0.754，当ΔKtrans 大于 0.0075min^{-1}时，预测胃癌 NACR 有效的诊断准确率为 80%，敏感性为 92.9%，特异性为 55.6%。做ΔADC 的 ROC 曲线，AUC

为 0.857，当ΔADC 绝对差值大于 0.406×$10^{-3}$$mm^2$/s 时，预测胃癌 NACR 有效的准确率为 76%，敏感性为 100%，特异性为 71.4%。

结论：1、磁共振功能成像较传统影像学评估准确率高，可重复性强，且可以早期反映肿瘤内部变化；2、DCE-MRI 的ΔKtrans 及 DWI 成像的ΔADC 值可以作为局部进展期胃癌新辅助放化疗后疗效评价方法。

EPO-1328
原发性肠道淋巴瘤、克罗恩病及肠结核的 CT 影像诊断对比研究

张义
陆军军医大学第二附属医院（新桥医院）

目的探究原发性肠道淋巴瘤、克罗恩病及肠结核的 CT 影像诊断价值。方法选取本院 2014 年 10 月至 2016 年 10 月收治的 21 例原发性肠道淋巴瘤、25 例克罗恩病及 30 例肠结核患者为研究对象。对入组患者进行 CT 检查,比较其临床特征、发病部位及 CT 检查结果。结果原发性肠道淋巴瘤出现血便及腹部包块的患者占比明显高于克罗恩病和肠结核(P<0.05);克罗恩病出现腹泻症状的患者占比明显高于原发性肠道淋巴瘤和肠结核(P<0.05);肠结核出现发热、盗汗症状的患者占比明显高于原发性肠道淋巴瘤和克罗恩病(P<0.05)。原发性肠道淋巴瘤好发于回肠[20 例(95.24%)]和回盲部[14 例(66.67%)];克罗恩病同样好发于回肠[23 例(92.00%)]和回盲部[10 例(40.00%)]例;而肠结核好发于回盲部[27 例(90.00%)]和结肠[14 例(46.67%)]。3 种疾病均可致肠壁增厚,CT 结果显示:原发性肠道淋巴瘤单层偏心增厚和淋巴结肿大表征突出;克罗恩病则多节段性病变和假憩室征像较为明显;肠结核多表现为分层增厚和中空淋巴结。结论原发性肠道淋巴瘤、克罗恩病及肠结核发病部位相似,但临床表现及 CT 检查结果有一定差异,临床医师应综合多种检查结果进行诊断,以降低疾病的误诊率。

经颈静脉肝内门体支架分流术和内镜下套扎组织胶注射术治疗胃底静脉曲张破裂出血的疗效比较

闫建华,何苹
天津市第三中心医院

目的：评价经颈静脉肝内门体支架分流术(TIPS)治疗胃底静脉曲张破裂出血的疗效。

方法：2013 年 1 月至 2019 年 5 月，天津市第三中心医院医院 90 例肝硬化合并 IGV1 型胃静脉曲张破裂出血病例纳入回顾性分析，其中 TIPS 治疗者 32 例(TIPS 组)、内镜下套扎组织胶注射术(GVO)治疗者 58 例(GVO 组)，对比分析 2 组的远期随访结果。

结果：2 组手术均成功，术后并发症总体发生率 TIPS 组和 GVO 组分别为 12.5%(4/32)和 12.6%(8/58)组差异无统计学意义(P＝0.801)；TIPS 组有 9 例(25%)发生肝性脑病(病情均较轻)，GVO 组未发生。TIPS 组平均随访(20.18±6.90)个月，2 例(7.14%)死亡，6 个月、12 个月、18 个月时累积未出血率分别为 88.4%、83.7%、76.1%；GVO 组平均随访(16.14±6.03)个月，5 例(13.51%)死亡，6 个月、12 个月、18 个月累积未出血率分别为 86.5%、70.2%、60.9%。2 组随访期死亡率比较差异无统计学意义(P＝0.690)，18 个月累积未出血率比较差异有统计学意义(log-rank 检验，ｘ2＝6.304，P＝0.012)。

结论：在控制胃底静脉曲张破裂出血方面，TIPS 远期疗效优于 GVO，但应警惕术后肝性脑病的发生.

IVIM in the differential diagnosis of brucellosis spondylitis,tuberculus spondylitis

Xiaopeng Wu
The Affiliated Hospital of Inner Mongolia Medical University

Objective To quantitatively analyze brucellosis spondylitis and tuberculus spondylitis by applying IVIM, and to evaluate the value of quantitative IVIM in the differential diagnosis of brucellosis spondylitis and tuberculus spondylitis . Then compare the coincidence rate with the routine MRI examination. We know that IVIM can identify the brucellosis spondylitis and tuberculus spondylitis by the Slow ADC (D), Fast ADC(D*),and fraction of fast ADC(f),but we can’t find the threshold value to identify these diseases.
Methods A paper collected 30 brucellosis spondylitis patients with complete biochemical detection(SAT 1:100++ or RBPT++),30 patients with tuberculus spondylitis, and diagnose 30 cases of other spinal diseases (control group) at the same time. Analyze and compare the diagnostic coincidence rate of routine MRI to these diseases with IVIM. All patients recieved routine and IVIM examinations, D,D*,f of diseased vertebral bodies of the patients with brucellosis spondylitis,tuberculus spondylitis were measured on maximal region. The results were compared among the diseases ,P＜0.05 was regarded as statistically significant.
Results The sensitivity and specificity of IVIM in diagnosing two diseases of brucellosis spondylitis, spinal tuberculosis were 90%、80%; 86%、83.3% respectively. The diagnostic coincidence rates of routine MRI for two diseases were 67%, 73% respectively. The diagnostic coincidence rate of IVIM for the diseases was 89%, 85% , which was higher than that of routine MRI, and the difference was statistically significant (x2=4.81,4.32, P <0.05).The area under AUC of D、D*、f for brucellosis spondylitis with tuberculus spondylitis were 0.825、0.651、0.598, corressponding diagnostic sensitivity and specificity were 100%、88.9%; 95.2%、77.8%; 95.2%、88.9%，cut value were0.00025、0.00328、0.276。

Conclusion The diagnostic coincidence rate of IVIM for two diseases was significantly higher than that of conventional MRI; In the IVIM quantitative analysis, the value of D and f have value in the differential diagnosis of brucellosis spondylitis, tuberculus spondylitis

Gout involved the cervical disc and adjacent vertebral endplates misdiagnosed infectious spondylodiscitis on imaging: case report and literature review

Haitao Yang
Department of Radiology, the First Affiliated Hospital of Chongqing Medical University, Chongqing, China

Background: Gout in spine is rare and commonly mimics some infectious or tumoral lesions, the differentiation of spinal gout from other diseases is not always easy. We report a case of gout involved cervical disc and adjacent vertebral endplates which was misdiagnosed infectious spondylodiscitis on preoperative imaging and give a brief literature review for concerning cervical gout.
Case presentation: A 50-year-old male with a 5-year history of neck and shoulder pain had progressive muscle atrophy and weakness in both arms. Physical examination revealed bilateral superficial sensory declined below level of mastoid portion. Laboratory findings showed hyperuricemia and the C-reactive protein level was very high. Imaging studies including Computed Tomography (CT) and Magnetic Resonance Imaging (MRI) showed abnormality of the C5-6 intervertebral disc and irregular osteolytic destruction of both adjacent C5-6 endplates, narrowing of C5-6 disc space and swelling of prevertebral soft tissue. Based on the diagnosis of infectious spondylodiscitis and nerve root symptoms, surgical treatment was performed and pathological examination of the specimen revealed deposited uric acid crystals surrounded by granulomatous inflammation.
Conclusions: Cervical spinal gout involving the disc and adjacent vertebral endplates is uncommon and may misunderstand infectious spondylodiscitis. With atypical symptoms and low specificity of imaging studies, final diagnosis should be combined closely with previous history and clinical manifestation.

EPO-1333

磁共振水-脂分离成像与双能骨密度仪对甲亢患者骨量评价的初步研究

杨鸿,朱西琪,杨文,林薇,彭湘晖
广西壮族自治区南溪山医院

目的 通过利用磁共振水-脂分离成像技术对甲亢患者椎体脂肪含量的测定，来评估不同年龄段甲亢患者随着患病时间的延长及甲状腺素水平的改变所对应的椎体脂肪含量的变化，从而间接评估椎体

骨质量。 方法 纳入 50 例甲亢患者为研究对象，按年龄分为 18～25 岁组 20 例，25～50 岁组 20 例，>50 岁组 10 例，不同年龄组在治疗前行双能骨密度仪测骨密度值（ BMD 值） 与 MR 所测腰椎脂肪分数（ FF） 进行相关性分析；按性别分男组 30 例，女性组 20 例；并分别对不同年龄组按甲状腺水平高低分组及男女性别组进行腰椎椎体脂肪分数进行比较；骨髓脂肪 FF 计算公式：FF = ［ Mfat / （ Mfat ＋ Mwater） ］* 100%，式中 Mwater、Mfat 分别指水像及脂像 ROI 总像素信号强度值。
结果 不同年龄组甲亢患者治疗前 BMD 均值组间比较差异有统计学意义（ P = 0. 01）；所有患者椎体 BMD 值与 FF 值呈显著相关性；甲状腺素高水平高脂肪分数上升的程度明显高于甲状腺素低水平组，且>50 岁年龄组、40～50 岁年龄组脂肪分数增加的程度要高于 18～ 25 岁年龄组；同一甲状腺水平组女性组的脂肪分数增加程度要高于男性组。
结论 甲亢患者椎体内随年龄的增加脂肪分数明显增加；甲状腺素高水平组患者腰椎脂肪分数高于甲状腺素低水平组，同一甲状腺激素水平组女性的脂肪含量较男性高，椎体骨量下降明显，易发生骨质疏松性骨折。

EPO-1334
膝关节髌下脂肪垫的 MRI 信号及体积与血友病性关节炎相关性的 MRI 研究

李晔,王光彬
山东省医学影像学研究所

目的：分析髌下脂肪垫的 MRI 信号强度及体积变化与血友病性关节炎病理改变的相关性，探讨髌下脂肪垫的变化在血友病性关节炎中的作用。
方法：共纳入 50 例经临床证实的血友病患者(男 30 例，女 20 例，年龄 10-50 岁)，志愿者 30 例(男 20 例，女 10 例，年龄 20-60 岁)，所有患者均有关节出血经历、出血次数不等，按性别、年龄、体重指数(BMI)、血友病患者出血次数进行分组。经 MRI 三维脂肪抑制质子密度加权快速自旋回波序列测定髌下脂肪垫（IPFP）的信号强度及容积，用三维双回波稳态序列(3D-DESS)测定髌骨、胫骨、股骨软骨容积，继而根据 outerbridge 分类系统对髌骨、胫骨、股骨软骨损伤程度进行分级，统计分析软骨体积与 IPFP 的信号强度及体积的关系，同时比较血友病组与对照组之间 IFP 的信号强度及体积的差异。
结果：IPFP 信号强度及容积与年龄、性别、BMI 有明显相关性，所有 p 值均＜0.05。Logistic 回归分析结果显示：消除年龄、性别、BMI 等其他因素的混杂后，IPFP 信号强度及容积与血友病患者髌骨、股骨、胫骨软骨缺损、骨赘形成呈明显正相关(OR 为 1.311~2.157，P 为 0.005~0.021)。血友病患者组 IPFP 信号强度及容积大小高于对照组，其差异有统计学意义(P=0.024)。
结论：膝关节髌下脂肪垫 MRI 信号增高及容积增大是血友病性关节炎的影像学表现之一；膝关节髌下脂肪垫的炎症和内分泌异常可能是血友病性关节炎的一个危险因素。

EPO-1335
DECT 能谱曲线在慢性肾衰继发甲旁亢术前定位中的应用价值

占颖莺,方义杰,李绍林,洪国斌
中山大学附属第五医院

]目的 探讨双能 CT（DECT）对甲状旁腺切除术前定位的可行性及准确性。**方法** 前瞻性收集慢性肾功能衰竭继发甲状旁腺功能亢进且有临床症状、具有甲状旁腺手术切除指征患者 10 例，

采用 CT 平扫和双期增强扫描。以术后病理结果作为金标准，分别测量甲状旁腺、甲状腺及淋巴结平扫期、动脉期 HU 值，并通过单能谱图像测量及计算动脉期标准化碘浓度（normalized iodine concentration ,NIC)及能谱衰减曲线斜率(slope of the spectral Hounsfield unit curve,λHU)值。采用受试者工作特征（receiver operating characteristic，ROC）曲线分析甲状旁腺平扫期与动脉期 HU 值、NIC 及λHU 的最佳诊断阈值，评价诊断效能。**结果** 术后病理结果显示 10 例患者共 37 枚甲状旁腺，双能量 CT 结果显示 10 例患者共 31 枚甲状旁腺。平扫期甲状旁腺 63.8±11.9HU、甲状腺 151.1±42.9HU、淋巴结 34.5±11.5HU；动脉期甲状旁腺 99.4±17.6HU、甲状腺 195.3±54.5HU、淋巴结 54.1±16.6HU；甲状旁腺平扫期最佳诊断阈值为 73HU、甲状旁腺动脉期最佳诊断阈值为 103.2HU、NIC 最佳诊断阈值为 70KeV、λHU 最佳诊断阈值为 2.73。其中 NIC 对甲状旁腺诊断效能最高，曲线下面积（area under curve，AUC）为 0.924。**结论** DECT 能谱曲线较常规 CT 提供了额外的诊断信息，提高了甲状旁腺切除术前定位的敏感性和特异性。

EPO-1336
双能 CT 与高频超声诊断痛风性关节炎临床价值的对照研究

赵迅冉,韩丹,江杰
昆明医科大学第一附属医院

目的 探讨 DSCT 双能量技术及高频超声对痛风性关节炎（Gout Arthritis，GA）的诊断价值。**方法** 收集疑痛风性关节炎均行关节超声及 DSCT 二种检查且临床资料完整的病人 63 例（共 222 个关节）。DSCT 双能扫描后经双能 Gout 软件后处理在任何一个关节内、周围软组织及痛风石内见尿酸盐结晶沉积为阳性表现。高频超声出现关节内痛风石、双轨征、高回声点或韧带内高回声为阳性表现。参照 1977 年美国风湿病学会（ACR）制订的痛风诊断标准查见尿酸盐结晶及关节镜检为 GA 组：GA 51 例（188 个关节）。临床完全排外 GA 的为对照组：12 例（34 个关节）。计算两者诊断的灵敏度、特异度、假阳性率、假阴性率、阳性预测值、阴性预测值。并绘制 ROC 曲线，对高频超声与 DSCT 诊断 GA 的一致性进行评估。**结果** 双能 CT 诊断的准确性：灵敏度（真阳性率）74.5%，特异度（真阴性率）83.3%，假阳性率（误诊率）16.7%，假阴性率（漏诊率）25.5%，阳性预测值 95.0%，阴性预测值 43.5%。ROC 曲线面积为 0.713，P值<0.014。超声诊断的准确性：灵敏度（真阳性率）96.1%，特异度（真阴性率）41.7%，假阳性率（误诊率）58.3%，假阴性率（漏诊率）3.9%，阳性预测值 87.5%，阴性预测值 71.4%。ROC 曲线面积为 0.795，P值=0.012。表明说明两种方法均具有一定的诊断价值。Kappa 一致性检验 ，P<0.05，说明两种检测手段一致性差异有统计学意义，说明两种检测的一致性较差。双能 CT 特异度较高，高频超声敏感度较高。双能 CT 能更好的显示骨质破坏情况及尿酸盐沉积情况，高频超声对早期 GA 可以提供更多信息。对于一些不典型病例同时行两种方法联合检查可以提高诊断率。

EPO-1337
坐骨神经 DTI 测量值与腰椎间盘突出症临床症状及预后的相关性分析

黄成燕,温志波
南方医科大学珠江医院

目的 探讨单一节段椎间盘突出症导致的坐骨神经 DTI 测量值变化，分析坐骨神经 DTI 测量值与患者临床症状严重程度及手术治疗预后的相关性。 **方法** 回顾性收集 2017 年 12 月至 2018 年 7 月共 42 例因单侧单节段腰椎间盘突出症于南方医科大学珠江医院行手术治疗患者资料。统计采集患者

的 MRI 突出类型、手术方式等资料。此外，通过 DTI 扫描评价神经根术前 DTI 测量值。采用视觉模拟评分（Visual Analogue scale,VAS）、日本骨科协会评估治疗分数-腰椎（Japanese Orthopaedic Association scores,JOA）和 Oswestry 功能障碍指数问卷（Oswestry disability index,ODI）指数评估手术前与手术后 1 年患者的疼痛与神经功能。将 DTI 测量值和上述评分进行相关性分析确定其与腰椎间盘突出症患者临床症状及临床预后的相关性 **结果** 急性腰椎间盘突出可导致患者腰神经根 FA 值降低、ADC 值升高，患侧 FA 值（0.286±0.022），健侧（0.319±0.020），差异有统计学意义（t=6.735,P=0.000），患侧 ADC 值（1.788±0.209)mm^2/s，健侧（1.423±0.182）mm^2/s，差异有统计学意义（t=5.838,P=0.001）。患者临床症状经手术治疗后显著改善，术前及术后一年进行 VAS、JOA、ODI 评分，FA 值与 VAS 改善值正相关（r=0.624，P=0.003）、与腰椎 JOA 改善值正相关（r=0.615，P=0.003）、但与 ODI 改善值无相关性（r=-0.025,P=0.836）。ADC 值与 VAS、ODI 改善值无相关性,ADC 值与，JOA 改善值负相关（r=一 0.854,P=0.001）**结论** 急性单节段腰椎间盘突出症患者单一神经根的受压可导致其神经根 DTI 值的改变，这种改变与患者的临床症状的严重程度和临床预后密切相关。

EPO-1338
MR 功能成像结合肌力分析股四头肌与骨关节炎关系研究

李文静,陈婷,雷新玮
天津市第一中心医院

【摘要】目的 定量评估大腿股四头肌质量与膝关节骨性关节炎（ knee osteoarthritis，KOA）严重程度的关系及特点。 方法 纳入 K-L 分级≤Ⅲ级的 KOA 患者 25（男 7，女 19）例，年龄 55~69 岁，入组 50 例膝关节，进行膝关节矢状位 T1WI、3D-VIEV-SPAIR-HD、冠状位 T2WI-fs 及大腿轴位 mDixon-Quant 序列扫描，通过肌力测试椅（德国产 Cybex-Norm 等速肌力测训系统）获得股四头肌功率。由医师根据 WORMS 评分标准，对膝关节退变程度进行评分[1]；用后处理软件，手动画取 ROI，测量股骨远端 1/3 处股四头肌（股内侧肌、股中间肌、股外侧肌、股直肌）横截面积及脂肪分数。通过 SPSS20.0 软件，分析 WORMS 评分与股四头肌功率、横截面积及脂肪分数的相关性。根据 BMI 分组，通过 Mann-Whitney 检验，比较肥胖组（BMI≥25，n=14）与正常组（n=36）之间关节炎严重程度差异。 结果 膝骨性关节炎严重程度与股四头肌横截面积呈负相关，P≤0.05；膝骨性关节炎严重程度与股四头肌功率呈负相关，P≤0.05；肥胖组 WORMS 评分明显高于正常组，P≤0.05。 结论 较大的股四头肌横截面积及功率为 KOA 的保护因素，较大的 BMI 为 KOA 的危险因素。

EPO-1339
II 型糖尿病的腹部脂肪定量分布研究

赵迅冉,韩丹,江杰
昆明医科大学第一附属医院

【摘要】
目的 探讨应用定量 CT 骨密度测量(Quantitative Computed Tomography,QCT)检测 2 型糖尿病腹部脂肪分布的特点。
方法 收集 2018 年 12 月-2019 年 6 月在内分泌科住院的 2 型糖尿病病人（41 例）及慢性腰腿痛患者（52 例）共 93 例，平均年龄 35-64 岁，平均（45.4±12.6）岁。所有研究对象均计算体重指数（BMI），BMI 均在 18-24mg/m^3。行定量 CT（QCT）腹部扫描，测量 L3 及肚脐层面的腹部总脂肪

体积（TVFA）、内脏脂肪（VAT）、腹部皮下脂肪（SAT）的面积和体积（TFV、VFV、SFV）及 VFV/SFV（V/S）值。分别比较两组间脂肪分布的特点，比较糖尿病组不同治疗方式之间脂肪体积及分布的差异，不同部位脂肪组织（AT）体积与总 AT 体积的相关性。

结果 （1）糖尿病组与对照组 TVFA、TFA 差异无统计学意义，糖尿病组 VAT、VFV 高于对照组，差异有统计学意义（P＜0.05），两组间 V/S 值差异有统计学意义。（2）药物控制组与胰岛素治疗组各项指标差距有统计学意义，激素治疗组 VAT 及 VFV 明显高于药物控制组，V/S 差异有统计学意义。（3）所有病例的腹部 VFV、SFV 与 TFV 均呈正相关。

结论 糖尿病患者内脏脂肪含量较皮下脂肪含量增高，尤其是胰岛素治疗患者，其 VAT 及 VFV 增高，且与 TVFA 相关性高，是肥胖的主要组成部分，早期提示临床，避免内脏脂肪聚集过多造成的危害。

EPO-1340

骶髂关节常见病变的 MRI 诊断及鉴别

杨海涛
重庆医科大学附属第一医院

目的：探讨骶髂关节常见疾病的 MRI 表现，提高诊断和鉴别诊断能力。

方法：回顾性分析 2012 年 6 月至 2016 年 5 月在我院行骶髂关节 MRI 并经手术或临床诊断的强直性脊柱炎、致密性骨炎、结核和肿瘤共 307 例患者临床和影像学资料，其中强直性脊柱炎 216 例，致密性骨炎 69 例，结核 12 例，肿瘤 10 例（转移瘤 8 例，骨巨细胞瘤和骨髓瘤各 1 例）。其中结核 9 例、骨巨细胞瘤和骨髓瘤各 1 例经手术诊断，其余病例为结合实验室检查和临床表现、并经治疗后随访复查治疗有效的临床诊断。

结果：（1）强直性脊柱炎常见于青少年（本组 16-46 岁，平均 26.5 岁），多为双侧对称发病，同时累及骶骨和髂骨双侧关节软骨下骨。早期 MRI 表现包括关节面锯齿状不光整伴小囊状骨质破坏，关节滑膜增生，并见强化；软骨下骨散在斑片状骨髓水肿样信号；中晚期除关节面不光整及间隙不规则狭窄外，软骨下骨髓可见脂肪沉积和骨质增生硬化，代表病变修复期改变。（2）致密性骨炎均发生于中青年女性，大部分病例亦为双侧受累；受累部位主要位于髂骨面前下份，主要累及骨髓；关节软骨及关节面连续完整，无囊状破坏；急性期骨髓内散在片状骨髓水肿样信号，边界不清；中晚期表现与平片类似，以增生硬化为主，在髂骨软骨下呈低信号区。（3）结核均为青少年发病（本组 17-28 岁，平均 22 岁），主要为单侧受累，表现为骶髂关节大范围骨质破坏，关节周围骨髓可见大面积的骨髓水肿样信号，信号不均，破坏区内散在点片状或大片状低信号死骨形成，周围软组织明显肿胀及脓肿形成。（4）肿瘤中以转移瘤最多见，中老年好发，同样表现为单侧发病，大范围骨质破坏，无死骨，骨皮质中断伴周围有明显的软组织肿块形成。

结论： 强直性脊柱炎、致密性骨炎、结核和肿瘤是常见的骶髂关节病变，其各自 MRI 表现如累及部位、单双侧受累、关节间隙及软骨、骨质破坏信号和周围软组织等改变均有一定特征性，结合年龄及临床可以做成较正确的鉴别诊断。

EPO-1341

基于 MR 影像的膝关节炎患者功能评估预测模型的设计及对比研究

肖峰,徐海波
武汉大学中南医院

目的：目前对膝关节炎患者功能评估主要采用 WOMAC 和 KOOS 量表，评估过程主要依赖受评估者对量表的理解以及对日常生活中的体验和总结归纳，主观影响较大。膝关节 MR 图像可清晰反映膝关节的结构特征，可为患者功能水平提供结构基础。本文研究了膝关节 MR 结构特征与其功能水平之间关系，分析并建立对应模型用于患者功能水平的预测。
方法：本文基于 NIH 公开数据库 Osteoarthritis Initiative 中的 Osteoarthritis Biomarkers Consortium FNIH Project 项目。我们提取了该项目中 600 名膝关节炎患者初次入组时的 MR 图像、MR 影像半定量评分 SQ-MOAKS（软骨形态学、骨髓病变、半月板和骨赘等）以及患者功能评分（WOMAC 和 KOOS）。首先，我们分析了患者膝关节半定量评分 SQ-MOAKS 与患者功能评分指标间的相关性。然后，基于 SQ-MOAKS 和 MR 图像分别建立了用于患者功能评估预测的人工神经网络模型（ANN）和卷积神经网络模型（CNN）。
结果：所有单项 SQ-MOAKS 评分指标与单项 WOMAC 和 KOOS 评分指标间均无显著相关性（$p>0.05$）。在 400 例训练集和 200 例测试集数据上，针对 WOMAC/KOOS， ANN 模型获得 0.16/0.21 和 0.21/0.32 的平均绝对误差，CNN 模型获得 0.06/0.11 和 0.11/0.19 的平均绝对误差。多次测试（$N>100$）发现预测平均绝对误差 CNN 模型显著小于 ANN 模型（$p<0.001$）。
结论：膝关节 MR 图像可有效地反映和预测膝关节炎患者功能水平。对膝关节 MR 图像进行单项半定量评分或将它们进行简单线性组合，均无法有效反映膝关节炎患者功能水平。将半定量评分进行非线性组合（人工神经网络）之后可有效地对膝关节炎患者功能水平进行评估。CNN 模型可对膝关节 MR 图像进行深度挖掘，能更加有效地反映膝关节炎患者功能水平。

EPO-1342
腰椎体骨松质 CT 值在老年女性骨质疏松骨折诊断中的价值

王冬梅
南京大学医学院附属鼓楼医院

目的：探讨基于常规腹部 CT 检查获得的腰椎体松质骨 CT 值在老年女性骨质疏松骨折诊断中的价值。
方法：前瞻性纳入 17 例在我院行常规腹部 CT 平扫的 60 岁以上伴有脆性骨折的女性患者，另纳入年龄、性别及 BMI 指数匹配的无骨折女性患者 21 例。采用单 ROI 法获得患者 L1 椎体松质骨的 CT 值，双能 X 线骨密度仪（DXA）获得 L1 椎体的骨密度 T 值。比较脆性骨折和无骨折两组患者 L1 椎体 CT 值和骨密度 T 值的差异及相关性，采用受试者工作曲线分析松质骨 CT 值及骨密度 T 值对脆性骨折的诊断价值。
结果：两组患者椎体松质骨 CT 值和骨密度 T 值均呈显著正相关，伴有脆性骨折组 $R=0.879$（$p<0.05$），无骨折组 $R=0.452$（$p<0.05$）。骨折组患者的 L1 椎体 CT 值和骨密度 T 值均明显低于无骨折患者（65.94±24.54 Hu vs 112.90±18.01 Hu，-1.23±0.92 vs -3.05±1.33）（$p<0.05$）。L1 椎体松质骨 CT 值 ROC 曲线下面积为 0.936（$p<0.001$，95%CI：0.806-0.989），cut-off 值为 77HU（敏感度：0.824，特异性：1），骨密度 T 值的 ROC 曲线下面积为 0.884（95%CI：0.738-0.965），cut-off 值为-2.2（敏感度：0.882，特异性：0.905），两种方法对两组患者的鉴别诊断能力无显著差异性。
结论：腰椎体骨松质 CT 值 能够鉴别老年性女性骨质疏松骨折和无骨折患者，具有较高的敏感性。

EPO-1343
神经营养性关节病的 X 线表现及鉴别诊断

张丽芳,杨磊,郭宏磊

昆明医科大学第一附属医院

目的 探讨神经营养性关节病的临床 X 线表现，提高对该病诊断和鉴别诊断的认识，减少误诊和漏诊。**材料与方法** 神经营养性关节病 14 例，搜集其临床与 X 线表现并进行总结分析。**结果** 14 例患者中肘关节病变 6 例（其中 1 例为双侧），足 3 例（其中 2 例为双侧），足部与膝关节同时累及 1 例，肩、腕、膝及踝关节病变各 1 例，其 X 线表现：关节明显肿胀 7 例，关节的正常结构紊乱 8 例，10 例关节面不规则骨质破坏吸收、碎裂，5 例伴残端增生硬化并出现骨膜反应，关节内和关节周围有大小不等的条片、点结状及块状骨化或钙化影；2 例曾考虑为：恶性骨肿瘤。**结论** 关节严重破坏与患者自觉症状极不相符是其临床特点，同时出现骨质破坏和骨质硬化为特征的关节结构严重紊乱，了解患者的临床病史，结合 X 线表现就能正确诊断及鉴别诊断，注意以骨质破坏为主伴周围软组织肿胀、骨膜反应及骨化影者，易误诊为恶性骨肿瘤，本病需与退行性关节病、痛风、血友病性关节病、滑膜骨软骨瘤病及关节区恶性肿瘤等疾病鉴别。鉴别诊断：（1）退行性骨关节病：关节骨端增生硬化 ，边缘有骨赘形成 ,相应关节间隙变窄,关节面下有囊状透亮区，即退变性囊肿形成，关节无碎裂吸收，关节内无大量游离骨片，脱位少见。（2）痛风性关节炎：血尿酸升高，关节液可有尿酸盐结晶，用秋水仙碱有特效，多在四肢小关节，有典型疼痛及突然缓解发作史，关节周围有痛风结节。（3）血友病性关节病 :早期关节肿大、密度增高，关节面硬化和囊状改变,股骨髁间凹和尺骨鹰嘴窝增宽、加深为本病的特征性改变，有家族史。（4）滑膜骨软骨瘤病：关节骨端一般保持正常，游离体多呈圆形，较规则，边缘清楚，部分伴有退行性骨关节病表现。（5）关节区恶性肿瘤：骨端骨质破坏，骨膜反应，软组织肿块，瘤骨形成等表现。

MRI Findings of the Anterior Chest Wall in SAPHO Syndrome

Meiyan Yu[1], Mingwei Tang[2], Junqiu Li[1], Chen Li[3], Yanan Zhang[1], Junlian Liu[1], Mengmeng Ren[1], Jianwei Huo[1]
1.Beijing Traditional Chinese Medicine Hospital Affiliated to Capital Medical University
2.Peking Union Medical College
3.Peking Union Medical College Hospital

Objective
The aim of our study was to describe the magnetic resonance (MR) imaging findings of the anterior chest wall (ACW) in patients with Synovitis, acne, pustulosis, hyperostosis and osteitis (SAPHO) syndrome.
Materials and Methods
71 SAPHO syndrome patients with ACW involvement was cross-sectional recruited. All patients were scanned by sagittal, axial and oblique coronal T_1 and Dixon T_2-weighted imaging sequence. For each individual, the location of distribution, involvement pattern, and characteristics of the active and structural inflammatory lesions were evaluated.
Results
All 71 patients had lesions in the ACW. And all patients are suffered from active inflammation of the bone or surrounding soft tissues.Bone marrow edema (BME) is seen in 63(88.7%) patients, located in manubrium sterni(61, 85.9%), sternal angle(19, 26.8%), body of stermum(11, 15.5%), left calvicle (29, 40.8%), right calvicle (27, 38.0%), first rib (5, 7.0%), second rib (2, 2.8%). All patients have inflammation in surrounding soft tissues, or joint fluid. There were egg shell-like soft tissue edema around the first anterior rib in 44(62.0%) patients. Structural changes are also

detected in MRI, such as fat infiltration(39, 54.9%), bone destruction(19, 26.8%), hyperosteosis(60, 84.5%), hypetrophy(24, 33.8%), and bony bridging(13, 18.3%). Patients with hyperosteosis, hypetrophy or bony bridging, rather than fat infiltration and bone destruction, have significantly longer disease course, indicating the long course results of this disease.
Conclusions
MR imaging is useful for detection of active inflammation and structural changes distribution asscociated with SAPHO syndrome in one-stop mode. All of the involvement patterns of the diseases demonstrated characteristics of the anatomaical basis and the course of this disease.

T2 mapping 在强直性脊柱炎骶髂关节炎早期诊断及活动性评估中的临床应用价值

任翠
北京大学第三医院

目的探讨 T2 mapping 诊断早期强直性脊柱炎（AS）骶髂关节炎及判断 AS 活动性的临床应用价值。**方法**前瞻性收集 80 例早期 AS 患者及 30 例健康志愿者，根据 AS 病情活动指数(BASDAI)调查表、实验室检查结果将 AS 患者分为活动组 48 例和非活动组 32 例，所有研究对象均行双侧骶髂关节常规 MRI 及 T2 mapping 检查，由 2 名放射诊断医师独立测量骶髂关节软骨及关节面下病变区骨髓的 T2 值。比较健康志愿者、活动组、非活动组软骨及软骨下骨髓 T2 值的差异。分析软骨 T2 值诊断早期 AS 的能力，软骨下骨髓 T2 值鉴别骶髂关节炎活动性的效能。**结果** AS 患者的软骨的 T2 值为 41.31±6.02，显著高于非活动组 23.71±4.72，P<0.05。活动组关节面下骨髓的 T2 值为 53.65±9.32，显著高于非活动组 43.16±6.51，P<0.05。骶髂关节软骨 T2 值诊断 AS 的最佳阈值为 32.03，特异度、敏感度分别为 89. 2%、88.0%。关节面下骨髓 T2 值判断 AS 活动性的最佳阈值为 49.37，特异度、敏感度分别为 87.6%、90.3%。**结论** T2 mapping 有助于早期诊断 AS，并定量评价 AS 患者骶髂关节炎的活动性。

Sarcopenia is associated with the neutrophil/lymphocyte ratio in metastatic pancreatic cancer patients

zhichang ba,Yaru Zhao,Yang Lin,Rui Xie,Wenbo Qiao
Harbin Medical University Cancer Hospital

Abstract. *Background/Aim: We aimed to show the connection between sarcopenia and systemic inflammatory response (neutrophil/lymphocyte ratio [NLR], platelet/lymphocyte ratio [PLR]) in metastatic pancreatic cancer. Materials and Methods: The disease of the sarcopenia in 92 metastatic pancreatic cancer patients as definited as total*

abdominal muscle area was measured from computed tomography images L3 vertebal levels. x^2 test, fisher' s exact test, rank sum test and multivariate logistic regression analysis were used to identify whether NLR or PLR was associated with sarcopenia. Results: We found 67 patients (72.83%) were diagnosed as sarcopenia and 25 patients (27.17%) were non-sarcopenia. NLR has diagnostic significance for sarcopenia. The low NLR (≦4.2) was the more sensitive predictor of sarcopenia (p<0.05). Conclusion: This research demonstrated that sarcopenia was in connection with NLR in patients with metastatic pancreatic cancer. Because of the complicated muscle conditions, NLR could be used as a initial screening for sarcopenia.

特发性脊柱侧弯中影响椎间盘磁共振表现的影像分析

任浩,宋英儒
广西医科大学附属垠东医院

目的：探讨特发性脊柱侧弯 Cobb 角等指标与椎体、椎间盘信号改变之间的关系。
方法：搜集我院 2017 年 1 月至 2019 年 7 月收治经临床、DR 与 MRI 检测确诊为特发性脊柱侧弯的门诊、住院患者完整资料 16 例，其中椎间盘信号改变 6 例，椎间盘信号正常 10 例，回顾性分析其影像学特征。
结果：患者年龄 4-45 岁不等，临床症状以体态改变为主，1 例有疼痛史。16 例均伴有不同程度脊柱曲度改变，5 例出现椎体、肋骨融合。其中椎间盘信号改变组 6 例，椎间盘信号正常组 10 例，侧突中心分别位于胸椎（4 例，66.7%；6 例，60%），腰椎（2 例，33.3%；4 例,40%）。DR 检查 cobb 角 11° - 53° ，其中椎间盘信号改变组 31° -53° ，椎间盘信号正常组 11° -33° 。MRI 检查，椎间盘信号改变组中，侧突椎体出现许莫式结节 3 例，终板 T2 信号增高 2 例，肋骨、椎体融合 1 例；椎间盘单侧 T2 信号减低 4 例，椎间盘信号全面减低 2 例。椎间盘信号正常组中，肋骨、椎体融合 4 例。 经 Fisher's 检验两组病例 Cobb 角（P=0.001<0.05）存在统计学差异；两组中年

龄、侧突中心位置、肋骨及椎体畸形无统计学差异。其中 Cobb 角与椎间盘变性程度呈轻度正相关，r=0.397，*P*=0.031。

结论： 在特发性脊柱侧弯中 Cobb 角的大小在一定程度上可以反映椎间盘的损伤、变性情况，有助于临床及早了解疾病情况。

MRI 在缓解期 RA 亚临床关节炎诊断中的应用

张惠美
湖州市中心医院

目的　探讨 MRI 在缓解期 RA 亚临床关节炎中的诊断与其在 RA 疾病进展预测中的应用价值。　方法　回顾性分析 76 例活动期与缓解期早期 RA 的 MRI 影像资料，比较初诊及 1 年后伴骨侵蚀影像学进展者与不伴骨侵蚀影像学进展者 MRI 滑膜炎、骨侵蚀、骨髓水肿等影像学征象差别。　结果　缓解期 RA 在压痛关节数（TJC28）、肿胀关节数（SJC28）、DAS28、ESR、CRP、滑膜炎、骨髓水肿均低于活动期（P < 0.001）；一年后经治疗达到缓解期的 RA 在 MRI 上发现了亚临床关节炎，其中滑膜炎（42/76，55.3%）、骨髓水肿（30/76，39.5%），有 25 例（25/76，32.9%）早期 RA 伴有骨侵蚀影像学进展。一年后有骨侵蚀影像学进展者在初诊时骨髓水肿及 CRP 均高于不伴有骨侵蚀影像学进展者（P < 0.05），而 MRI 滑膜炎及骨侵蚀初诊时差异无明显统计学意义（P > 0.05）；一年后，伴骨侵蚀影像学进展者骨髓水肿及骨侵蚀评分均高于不伴骨侵蚀影像学进展者（P < 0.05），而两者滑膜炎评分差异无明显统计学意义（P=0.13）。　结论　缓解期 RA 仍存在一定亚临床关节炎，MRI 上提示的骨髓水肿能预测未来 RA 影像学疾病进展。

坐骨结节滑囊炎的 MRI 诊断价值

何欣,邓德茂
广西中医药大学第一附属医院

目的 探讨坐骨结节滑囊炎的 MRI 诊断价值。方法 回顾性分析经手术病理确诊的 17 例坐骨结节滑囊炎的 MRI 表现，分析其影像特征。结果 本组病例共 20 个病灶，其中 3 例两侧发病。病灶均位于坐骨结节与臀大肌之间，可达皮下。病灶为单个或多个囊性液体样信号影；囊内为单纯滑液或伴有少量纤维素 T1WI 呈低信号，T2W 呈高信号，信号均匀；囊内纤维素分泌较多或合并出血者 T1WI 呈等或高信号，T2W 呈高信号，信号多不均匀，可见液-液平面。增强扫描囊壁、间隔轻度或中等度强化，囊壁厚，内壁不光滑，囊液无强化；合并周围软组织感染时呈环形强化。部分病灶可见蒂或宽基底与坐骨结节相连。1 例病灶因合并感染并与皮肤穿通形成瘘道。结论 坐骨结节滑囊炎 MRI 表现具有特征性，MRI 平扫及增强检察诊断坐骨结节滑囊炎能提供准确的解剖信息及了解并发症，为手术提供帮助，具有重要的临床意义。

类风湿性关节炎累及颈椎的影像学特点分析

徐志伟,吴振斌,潘晓敏,蔡晓亮,方庆明
福建中医药大学附属泉州市正骨医院 影像科

【摘要】 目的 分析和探讨类风湿性关节炎累及颈椎的影像学特点及诊断，提高对本病的认识。**方法** 回顾分析 104 例类风湿性关节炎累及颈椎的相关影像学资料，对其影像学特点进行分析、总结。**结果** 104 例中 4 例（3.8%）为病变早期，X 线平片或 CT 无明显异常改变；100 例（96.2%）于 X 线平片或 CT 中可见不同程度骨质破坏；32 例（30.8%）可于 MRI 显示血管翳形成。104 例中 73 例（70.2%）单独存在一种或同时存在数种的颈椎不稳定，其中 50 例寰枢关节前后半脱位，39 例垂直半脱位，34 例下颈椎半脱位；20 例（19.2%）存在脊髓受压、变性。**结论** 类风湿性关节炎累及颈椎在破坏颈椎骨质及周围组织结构的同时，常造成颈椎的不稳定，继而引起一系列临床症状及并发症，需要引起临床医生及影像医生的重视。

Revolution HD CT 能谱扫描及后重建对痛风结节诊断的临床价值

陈顺新
湖北医药学院附属随州医院（随州市中心医院）

GE Revolution HD 能谱 CT 一台超高端能谱 CT 采 用 高（140 kV）、低（80 kV）能量瞬时切换，几乎在同时同角度得到 2 种能量 X 线的采样数据，并根据这两种能量数据确定体素在 40～140 keV 能量范围内的衰减系数，进一步得到 101 个单能 量图像，这种相对纯净的单能量图像能够大大降低硬化伪影的影响并获得相对纯净 CT 值的图像，即 CT 值无论在整个视野不同位置、不同扫描，还是不同病人中，都更为一致和可靠。 由于不同物质对于不同能量的 X 射线有不同的、特异性的吸收系数，这是能谱 CT 相比传统单能 CT 相比最大的优势所在。

痛风确诊的金标准是通过受累的关节穿刺找到特征性的尿酸盐结晶，但该项检查有创；同时关节滑液内尿酸钠结晶数量少，穿刺部位较深或操作员的技术水平不足，都可能使假阴性结果增多，导致对部分不典型发病部位、血尿酸水平正常的患者诊断困难。因此，通过影像方法进行无创性早期关节内尿酸盐结晶的检测成为目前临床工作的重点，现在用于确诊并监测痛风的影像学技术包括常规 X 线、超声波、CT 及 MRI。

X 线检查：早期急性关节炎仅表现为软组织的肿胀，关节显影正常。随着病情的进展，与痛风石邻近的骨质可出现不规则或分叶状的缺损，边缘呈翘状突起；关节软骨缘破坏，关节面不规则。进入慢性关节炎期后可见关节间隙变窄，软骨下骨质有不规则或半圆形的穿凿样缺损，边缘锐利，缺损边缘骨质可有增生反应。

CT 与 MRI 检查：沉积在关节内的痛风石，根据其灰化程度的不同在 CT 扫描中表现为灰度不等的斑点状影像。痛风石在 MRI 检查的 T1 和 T2 影像中均呈低到中等密度的块状阴影，静脉注射钆可增强痛风石阴影的密度。但这些方法的特异性不高。GE Revolution HD 能谱 CT 所独有的能谱分析功能，是近些年来发展起来的影像学检查方法，它可以无创性评价痛风患者尿酸盐结晶的沉积，协助诊断痛风，监测疾病进展。

EPO-1353
类风湿关节炎 MRI 表现与血清 RF、抗 CCP 抗体的相关研究

袁文昭,龙莉玲
广西医科大学第一附属医院

摘要：目的 探讨类风湿关节炎（rheumatoid arthritis，RA）腕关节 MRI 表现与血清学类风湿因子（rheumatoid factor，RF）、抗环瓜氨酸多肽抗体(anti-cyclic peptide containing citrulline,anti-CCP)指标的相关性。**方法** 回顾性分析经 2009 年美国风湿学会及欧洲风湿联盟(American College of Rheumatology/the European League Against Rheumatism,ACR/EULAR)发布的诊断标准诊断为 RA 而未经任何治疗的患者的腕关节 MRI，并收集其血清 RF、抗-CCP 抗体结果，共收集 67 例资料齐全的病例，对每例患者的腕关节滑膜炎、骨髓水肿及骨侵蚀进行 MRI 评分分级。按 RF、抗-CCP 抗体结果阴阳性对 67 例患者的 MRI 评分进行分组，并对各组 MRI 评分进行统计分析。**结果** 67 例患者中 RF 阴性者 22 例，其中抗-CCP 抗体阴性 21 例，抗-CCP 抗体阳性 1 例。RF 阳性者 45 例，其中抗-CCP 抗体阴性 24 例，抗-CCP 抗体阳性 21 例。RF 阴性组 MRI 滑膜炎、骨髓水肿评分均低于 RF 阳性组且差异具有统计学意义(p 均＜0.05)，而骨质侵蚀的评分二者没有差异(p＞0.05)。RF 阳性组中不管是否出现抗-CCP 抗体阳性其滑膜炎、骨髓水肿及骨侵蚀的评分均没有统计学差异(p 均＞0.05)。**结论** RF 阳性的 RA 患者腕关节 MRI 所表现的病理改变较 RF 阴性者更严重，抗-CCP 抗体对 RA 腕关节病理改变程度影响不显著。

EPO-1354
基于 QCT 对内蒙古地区蒙古族与汉族健康人群腰椎 BMD 的应用研究

李伟,于静红,王宗博
内蒙古医科大学第二附属医院

目的：利用 QCT 对内蒙古地区蒙古族与汉族健康人群腰椎骨密度进行测量，对比分析两个族群骨密度值及不同年龄组别骨量丢失情况，进一步探讨 QCT 无体模测量腰椎 BMD 的可行性，以提高骨质疏松症早期诊疗水平。
材料与方法：拟从内蒙古自治区中西部地区蒙古族、汉族健康人群中选各 400 名健康志愿者进行 QCT 骨密度测量，严格制定并执行志愿者民族纳入标准。有、无校准体模组均行腰椎螺旋 CT 扫描，采集容积数据，范围包括 L2～L4 椎体。选用美国 Mindways 公司的 5 样本固体体模。骨密度测量使用 Mindways 公司的 QCT-PRO 分析软件进行测量。测量 L2～L4 椎体松质骨 BMD。测量时需避开骨皮质及椎体后中央静脉走行区。无校准体模组测量步骤：①通过腰椎矢状面图像选取平行终板的腰椎中心横断面；②在腰椎中心横断面手动设置感兴趣区包括：骨质区及作为内部参考区域的椎旁肌肉区和皮下脂肪区。有校准体模组及无校准体模组数据分析均采用 SPSS19.0 进行统计学分析。计量资料采用均数±标准差表示；对男女腰椎 BMD 按每 10 岁年龄段进行分组，获取各年龄段骨密度均值及骨密度丢失率。相邻组间骨丢失的显著性及两民族间腰椎 BMD 差异性采用 t 检验进行比较。无校准体模法 QCT 和有校准体模法 QCT 测量结果相关性分析，P<0.05 时有统计学意义。
结果：通过有校准体模 QCT 对蒙古族和汉族健康人群腰椎 BMD 进行测定，对蒙古族、汉族健康人群腰椎 BMD 及各年龄段骨丢失情况进行对比分析有统计学意义(P<0.05)；无校准体模 QCT 与有校准体模 QCT 测量 BMD 具有相关性(P<0.05)。
结论：QCT 测量蒙古族、汉族健康人群腰椎 BMD 以期对骨质疏松症进行早期预测、预防和治疗，提高骨质疏松症的诊治水平，为国人 BMD 大样本数据库、定量 CT 随机性筛查提供临床依据。

Quantitative evaluation of subchondral bone microarchitecture in knee osteoarthritis using 3T MRI

Chenglei Liu
Shanghai Jiao Tong University Affiliated Sixth People's Hospital

Background: Osteoarthritis (OA) is now increasingly recognized as being related to the whole joint instead of the cartilage alone. In particular, the importance of subchondral bone in OA pathogenesis has drawn a lot of interest.The aim of this study is to investigate subchondral bone microstructural features in two femoral condyles of human knee osteoarthritis.

Methods: Eighty subjects were enrolled in our study and divided into three groups: without OA (group 0), mild OA (group 1), and severe OA (group 2). Sagittal 3D Balanced Fast Field Echo (3D-FFE) images were obtained by 3TMRI to quantify trabecular bone structure, and sagittal FatSat 3D Fast Field Echo (3D-FFE) images were acquired to assess cartilage thickness. Trabecular bone parameters, including bone volume fraction (BVF), erosion index (EI) and the trabecular plate-to-rod ratio (SCR), and trabecular thickness were evaluated using digital topological analysis.Subchondral bone and cartilage parameters between different groups and different locations were compared,and their correlations were analyzed.

Results: Within two femoral condyles, subchondral bone structure was deteriorated in mild OA, showing a lower BVF (−0.011 to −0.014 $P < 0.001$), a higher EI (0.346 to 0.310 $P < 0.001$), a lower SCR (−0.581 to −0.542 $P < 0.001$)) and lower trabecular thickness (−6.588 to −4.759 $P < 0.05$). In severe OA, BVF was further decreased, but EI, SCR and trabecular thickness showed no significant difference than mild OA($P > 0.05$). Moreover, there was a lower BVF, SCR and higher EI in the medial femoral condyle in each group. Interestingly, cartilage attrition mainly occurred in the medial femoral condyle. Medial cartilage thickness was not only positively correlated with the ipsilateral femoral BVF ($r = 0.321$ $P = 0.004$) but also with the opposite femoral BVF ($r = 0.270$ $P = 0.015$).

Conclusions: Our results indicated that deterioration in the trabecular bone structure in both femoral condyles could more sensitively reveal early OA, and BVF could be a better biomarker to evaluate OA severity.

Cannabinoid receptor 2 agonist prevents local and systemic inflammatory bone destruction in rheumatoid arthritis

Mo Zhu,Dechun Geng,Chunhong Hu
the first affiliated hospital of Soochow University

Abstract

Cannabinoid receptor 2 (CB2) has been implicated as an important clinical regulator of inflammation and malignant osteolysis. Here, we observed that CB2 expression was markedly higher in the collagen-induced arthritis (CIA) mice synovium and bone tissues than in the non-inflamed synovium and bone tissues. The CB2 selective agonist (JWH133) but not antagonist (SR144528) suppressed CIA in mice without toxic effects, as demonstrated by the decreased synovial hyperplasia, inflammatory responses, cartilage damage, and periarticular and systemic bone destruction. JWH133 treatment decreased the infiltration of pro-inflammatory M1-like macrophages and repolarized macrophages from the M1 to M2 phenotype. Similarly, activation of CB2 increased the expression of anti-inflammatory cytokine interleukin (IL)-10 and reduced the expression of pro-inflammatory cytokines, including tumor necrosis factor-α, IL-1β, and IL-6. In addition, JWH133 treatment attenuated osteoclast formation and osteoclastic bone resorption, and reduced the expression of receptor activators of the nuclear factor-κB (NF-κB) ligand (RANKL), matrix metallopeptidase-9, tartrate-resistant acid

phosphatase, cathepsin K, and nuclear factor of activated T-cells 1 in CIA mice and osteoclast precursors, which were obviously blocked by pretreatment with SR144528. Mechanistically, JWH133 inhibited RANKL-induced NF-κB activation in the osteoclast precursors. We found that JWH133 ameliorates pathologic bone destruction in CIA mice via the inhibition of osteoclastogenesis and modulation of inflammatory responses, thereby highlighting its potential as a treatment for human rheumatoid arthritis.

磁共振化学位移成像联合体质指数评估青年骨量减少的价值

王珊珊
武警特色医学中心

目的 评估磁共振化学位移成像联合体质指数（BMI）对于青年骨量减少的诊断价值。**方法** 将 67 名被试按照双源 X 线吸收法（DXA）骨密度测量结果分为骨量偏少组（n=38）及骨量正常组（n=29）。利用 MRI 对两组人员膝关节进行扫描获取髌骨脂肪含量分数（FF），同时计算受试者的 BMI 值。运用独立样本 t 检验对两组的 FF 及 BMI 值进行比较，运用 ROC 曲线分别评价两种指标诊断骨量减少的敏感性、特异性及曲线下面积（AUC）；应用 ROC 曲线评价两种指标联合诊断骨量减少的敏感性、特异性及 AUC，并对比两种指标联合与单个指标的诊断准确性。**结果** 两组人员在年龄上无差别（$P>0.05$）；骨量偏少组髌骨 FF 值大于骨量正常组[（80.5±1.4）vs（78.6±1.2），$P<0.01$]，而骨量正常组 BMI 值大于骨量偏少组[（23.1±2.0）vs（20.2±1.9），$P<0.01$]。ROC 曲线分析显示：FF 及 BMI 值诊断骨量减少的敏感性、特异性、AUC 分别为 68.4%、75.9%和 0.808（95%CI：0.693-0.894）；73.4%、89.7%和 0.858（95%CI：0.751-0.931）；两种指标联合诊断骨量减少的敏感性、特异性、AUC 分别为 86.8%、86.2%、0.920（95%CI:0.858,0.982）；两种指标联合对于骨量减少的诊断效能优于单个指标（P=0.0136，P=0.0187）。**结论** 磁共振化学位移成像联合 BMI 指数可以较为准确地诊断青年骨量减少，可以作为评估青年骨量的一种可靠办法。

EPO-1358
Changes of density in lumbar Paravertebral muscles of healthy subjects estimated by virtual monochromatic image technique

Chunhua Fan
The First Affiliated Hospital of Hunan University of Traditional Chinese Medicine

Objective: To evaluate age-,sex- and lumbar level-dependent changes of density in lumbar Paravertebral muscles of healthy subjects by virtual monochromatic image technique.
Methods: Data from 124 healthy participants(61 men and 63 women), who underwent lumbar spine examinations were retrospectively collected. The measurement was performed using virtual monochromatic spectral 70keV images. For checking the age-dependent changes, the mean densities of the muscles were compared between the young, middle and old groups. For the level-dependent changes, those muscle were compared at each disc level

in each age group. The same to sex-dependent changes, which were compared between men and women. Statistical significance was P <0.05.
Results: The density of ES, MF and PS decreased markedly with age ,which were significantly different among each age group (P<0.05). The MF decreased the most, followed by the ES. There was no significant age-dependent changes in the mean density of the PS muscle. The density of Paravertebral muscle at L4/5 and L5/S1 level were significantly lower than upper levels and degenerated first (P<0.05) .Significant sex-dependent differences were found among the three age groups, with men showing higher than women(P<0.05).
Conclusion: Degeneration of the lumbar Paravertebral muscles of healthy subjects were affected by age, gender and disc level.

EPO-1359

The correlation between bone mineral density and coronary artery disease in postmenopausal women

Yuan Zhao,Wenya Liu
Imaging Center, First Affiliated Hospital, Xinjiang Medical University, Urumqi, Xinjiang 830054, China

ObjectiveTo analyze the relationship between frequent risk factors for cardiovascular disease and BMD in postmenopausal women with asymptomatic coronary artery disease, and to investigate the correlation between the change of BMD and coronary atherosclerosis score. **Methods** One hundred twelve Han patients underwent quantitative CT of their lumbar vertebrae for BMD, and within 2 weeks, multislice spiral CT of their coronary arteries for calcification score and total calcification score. Based on the T-score of the lumbar spine, patients were divided into three groups: control, osteopenia, and osteoporosis groups for analysis of variance for continuous variables. The clinical data and BMD were analyzed by multiple regression. **Result** Age was significantly greater in the osteoporosis group than in the other two groups ($P < 0.05$). The BMD and total coronary calcification score (TCS) were significantly different among three groups. 25-hydroxyvitamin D levels were significantly different between the osteoporosis group and the control group ($P < 0.05$). Multiple regression analysis showed that the factors for TCS in patients included age, smoking, HDL, and BMD, while age and TC were risk factors and HDL and BMD were protective factors. There was a negative correlation between the coronary artery calcification score and BMD.
Conclusions The results showed postmenopausal women with asymptomatic coronary heart disease along with osteopenia or osteoporosis may have a higher risk of developing calcified plaque. BMD could be considered a new index for assessing coronary atherosclerosis. Vitamin D deficiency may be another factor which affects both BMD and vascular calcification.

64 排 128 层螺旋 CT 双能量成像技术在痛风结石诊断中的临床应用

王东
大理市第一人民医院

[摘要] 目的：探讨 64 排 128 层螺旋 CT 双能量成像技术（dual-energy computed tomography ,DECT）在检测关节痛患者尿酸盐结晶沉积情况的应用价值。方法：对 70 例关节痛患者进行 DECT 扫描，根据血尿酸浓度是否超出正常范围将其分为病例 35 例实验组和 35 例对照组。图像由三名医师独立进行评价，并采用三维容积再现（VR）、最大密度投影（MIP）、 多平面重组（MPR）技术重建，比较两组尿酸盐沉积的差异，进一步评价患者血尿酸浓度、病程长短与病灶数目的相关性。结果：本组 35 例血尿酸浓度超出正常范围患者中均发现有尿酸盐沉积，对照组均未见尿酸盐沉积。结论：64 排 128 层螺旋 CT 双能量成像技术能够灵敏的检出单独存在或合并痛风性关节炎的患者，对早期、无创性诊断痛风性关节炎具有重要应用价值。

3.0 T MRI mDixon 技术对骨质疏松症患者腰椎功能性骨骼-肌肉单元的定量研究

谭辉[1,2],于楠[1,2],于勇[1,2],李悦[1,2],薛育[1,2],关文杨[1,2],王少彧[3]
1.陕西中医药大学附属医院
2.陕西中医药大学 医学技术学院
3.西门子医疗中心

目的：骨骼肌质量和肌力的下降与骨质疏松症的发生密切相关。本研究的目的是通过 3.0 T MRI 多回波 Dixon 技术定量研究不同骨量水平患者腰椎椎体和椎旁肌肉的骨骼-肌肉单元的变化规律。
方法：本研究共纳入 56 名受试者，根据定量 CT（QCT）检查分成三组，包括骨质疏松组（n = 16,年龄= 61.0±9.5 岁，T 值 = -3.32±0.68），骨量减少组（n = 20，年龄= 54.2±10.3 岁， T 值 = -1.84±0.29），正常组（n = 20,年龄= 45.9±10.7 岁，T 值= 0.15±0.83）。所有患者使用西门子 3.0T MRI（MAGNETOM Skyra，Siemens AG，Germany）检查。使用 18 通道脊柱线圈，在在单次屏气（15s）期间，使用 3D 梯度多回波 Dixon 化学位移序列，具体参数如下：TR：9.0ms; TE：1.23 ms，2.46 ms，3.69 ms，4.92 ms，6.15 ms 和 7.38 ms;翻转角度：4.0°，读出回波带宽 1080 Hz /像素;层厚：2.5 毫米，FOV：380x380mm,分辨率：256×256。扫描完成，自动生成 FF-mapping 图，在腰 3 椎体中间水平，分别绘制 ROI，测量椎体（VB），竖脊肌（ES），腰大肌（PMM），腰方肌（QLM）和腹直肌（RAM）的脂肪分数（FF）。不同组之间 FF 采用单因素方差分析以评估组间差异。
结果：总体而言，随着 T 值的降低，椎体和椎旁肌肉的脂肪含量增加。具体而言，与正常组相比，骨量减少组 VB、ES 和 RAM 的 FF 显著增加有统计学差异（P < 0.05），而 QLM 和 PMM 的 FF 增加无统计学差异（P> 0.05）。与骨量减少组相比，骨质疏松组 VB、ES、PMM、QLM 和 RAM 的 FF 均显著增加有统计学差异（P < 0.05）。
结论：多回波 Dixon 技术可以定量反映腰椎功能性肌骨单位脂肪含量的变化，可作为骨质疏松症进展的无创定量监测工具。

3.0T MRI mDixon 技术和 IVIM-DWI 在原发性骨质疏松症患者中的应用研究

谭辉[1,2],于楠[1,2],于勇[1,2],李悦[2],薛育[2],关文杨[2],王少彧[3]
1.陕西中医药大学附属医院
2.陕西中医药大学 医学技术学院
3.西门子医疗中心

材料与方法：本研究共纳入 56 名受试者，根据定量 CT（QCT）检查分成三组，包括骨质疏松组（n = 16,T 值 = -3.32±0.68），骨量减少组（n = 20，T 值= -1.84±0.29），正常组（n = 20,T 值 = 0.15±0.83）。所有患者使用西门子 3.0T MRI（MAGNETOM Skyra，Siemens AG，Germany）检查，使用 18 通道脊柱线圈。IVIM-DWI 的扫描参数：TR/TE，1600/72.4ms，8 个 b 值（0,50,100,150,200,250,300,400,600 和 800 秒/mm ^{2}）。mDixon 的扫描参数如下：TR 9.0 ms，TE 1.23 ms，2.46 ms，3.69 ms 4.92 ms，6.15 ms 和 7.38 ms，层厚 3 mm。分别在正中矢状位 IVIM 参数图和 FF 图的腰 2-4 椎体中心手动绘制 ROIs。 进行单因素方差分析以评估不同组之间 FF 和 IVIM 参数（f 值，D 值和 D*值）的组间差异的显著性。
结果：正常组的 FF，D 和 D*分别为 43.63±7.88，0.393±0.105，78.19±16.06；骨质疏松组分别为 49.58±5.02，0.356±0.097，87.36±21.39；骨质疏松组为 57.88±10.01，0.303±0.069，97.27±29.65。骨质疏松组，骨质减少组和正常组的 FF，D 和 D*差异存在统计学意义（p <0.05）。D 值与 T-score 之间呈显著正相关（r = 0.854，P <0.001），D*值（r = -0.785，P <0.001）和 FF（r = -0.882，P <0.001）与 T-score 呈显著负相关。
结论：mDixon 技术结合 IVIM-DWI 可以定量反映腰椎微循环灌注和脂肪含量的变化，可作为监测骨质疏松症进展的生物标志物。

双能 CT 痛风石软件参数对提高尿酸盐结晶检出敏感性的初步研究

陈晓君
中山大学附属第五医院

目的：文献报道 DECT 痛风石成像有一定的假阳性和假阴性，对于痛风石较小（小于 2mm）时可能存在假阴性，而双能 CT 痛风石软件 GOUT 80 KV 下默认的 Soft Tissue 阈值 50 hu 可能存在一定假阴性。本文有可能提供一种改善假阴性的后处理方法。**方法：**回顾性分析 47 名临床疑似痛风患者，其中 15 例已取得病理结果证实为痛风，均已行双源 CT 双能量成像，所得图像传至双能量痛风结晶分析软件 GOUT 进行分析，调整 GOUT 软件的 80KV 下软组织（Soft Tissue）CT 阈值，根据阈值的不同分为 50HU 组（对照组，机器默认参数），90HU 组（实验组），实验组的斜率（Ratio）调整为 1.10，其余参数均不变，在伪彩图上观察并记录三组显示痛风结石的部位、数目及体积，并做统计学分析。**结果：**,2 组资料显示痛风结晶部位数及痛风结晶体积具有明显差异，实验组 2 较对照组多（$P<0.05$）。2 组显示痛风石数目分别为 3.76 ± 3.88、4.88 ± 4.55（$P<0.05$）。2 组显示痛风石体积分别为 136.89±482.01 mm³、149.6±491.94 mm³，实验组较对照组明显增加（$P<0.05$）。**结论：**双能 CT 痛风石软件 GOUT80KV 下不同 Soft Tissue 阈值对显示尿酸盐结晶的部位、数目和体积具有显著差异，高阈值结合斜率调整有助于提高尿酸盐结晶的检出率，尤其对早期痛风结晶的检出更为敏感，值得临床进一步深入研究。

EPO-1364

双源 CT 识别尿酸盐结晶对痛风诊断的临床价值

张雪坤
上海交通大学医学院附属瑞金医院

目的　　分析广西籍痛风病人临床特点，探索 DSCT 在痛风诊断的价值及所示 MSU 沉积特点。
材料与方法　1、收集广西医科大一附院风湿免疫科疑似痛风 102 例患者的临床资料。2、判断 DSCT 诊断痛风的敏感性与特异性。3、测量确诊痛风病例 DSCT 所示的尿酸盐结晶体积，与其年龄、病程、结节数目及生化指标进行相关性分析及其沉积部位。4、分析足趾趾甲绿色伪彩的真实性。5、20 例患者治疗前后，DSCT 检查 MSU 部位及体积变化。
结果　本组确诊痛风 86 例，非痛风 16 例。平均年龄 55.8±12.7 岁，平均病程 91.7±63.6 月，平均发病年龄 47.8±11.8 岁；男女比例约 11.3:1。急性发作时平均血尿酸水平 497.3±122.9μmol/L；平均肌酐水平 122.2±67.8μmol/L；C 反应蛋白阳性率 89.7%，血沉加快阳性率 85.9%；44 例测得类风湿因子阳性 20 例，即 42 例单纯痛风患者类风湿因子阳性率为 42.9%。83.7%患者存在合并症。

双源 CT 诊断痛风的敏感性为 96.5%，特异性为 87.5%。测得 MSU 体积 1mm3~279.55cm3，中位数 2.52cm3。尿酸盐沉积体积与年龄、病程、血尿酸水平及肌酐水平均无相关性，但与结节数呈正相关。尿酸盐沉积好发于下肢关节，依次是足部关节、膝关节、踝关节。痛风组与非痛风组甲部伪彩体积差异有统计学意义。痛风结晶手术标本组最大径与 DSCT 测量组差异有统计学意义，且前者均数较大。复查病例治疗前后体积大小变化与临床治疗效果相符。
结论 1、痛风多发于中青年男性，常单关节起病，常伴发多种代谢性疾病。
2、双源 CT 对诊断痛风有较高的敏感性与特异性。
3、双源 CT 显示 MSU 体积与年龄、病程、单次血尿酸、肌酐水平均无相关性，与结晶数呈正相关。
4、足趾趾甲处绿色伪彩显示，对临床诊断有一定指导意义。影像医师应仔细分辨其形态、大小。
5、双源 CT 可用于痛风病情监测。

《Asir 重建技术在青少年全脊柱侧弯 CT 低剂量扫描中的应用研究》

胡安宁
南京大学医学院附属鼓楼医院

目的：应用 Asir（自适应统计迭代重建）技术，可以从图像中删除多余的噪声，改善图像质量，降低辐射剂量。**方法：**筛选 10-15 岁临床确诊全脊柱测弯病人 50 名（男:10 名，女：40 名）。在非高清模式下，采用自动毫安控制技术，改变 NI（噪声指数），随机分成 NI10（10 例）、NI15（10 例）、NI20（10 例）、NI25（10 例）、NI30（10 例）进行扫描，其余参数完全相同，从工作站记录辐射剂量 DLP,然后五组分别应用 Asir 重建技术：SS=0,10,20,30,40,50,60,70,80,90,100 降噪比，0.625mm 后处理重建。**结果：**从默认序列 NI10 组和增加 NI25 两组发现具有代表性，遂进行比较，两组所接受的辐射剂量差异有统计学意义（P＜0.05），两组图像评分结果无显著差异（P＞0.05）。**结论：**采用自动毫安控制技术，改变 NI（噪声指数）为 25 时，并应用 Asir 降噪比 70%对于青少年全脊柱侧弯的 CT 低剂量扫描较为满意，随着 CT 在临床应用中的不断深化，人们对 CT 的射线剂量，对人体造成的潜在危害和如何保证图像质量的前提下有效地降低剂量越来越关注。尤其对青少年的辐射剂量降低意义更大，从而真正实现国际放射防护委员会（ICRP）主张 X 射线诊断实践正当化，防护最优化的原则。

EPO-1366

低剂量全脊柱 CT 成像联合模型迭代技术应用于青少年特发性脊柱侧弯术前评估的可行性研究

胡安宁
南京大学医学院附属鼓楼医院

目的 评价联合模型迭代技术的低剂量 CT 全脊柱成像应用于青少年脊柱侧弯术前评估的可行性。**方法** 48 例青少年脊柱侧患者随机分为两组，A 组 20 例，B 组 28 例。患者行全脊柱平扫，扫描范围从颅底至骶椎下缘。扫描方案管电压 A 组 120kV，B 组 80kV， 管电流均采用自动管电流调节技术，参考管电流 100mAs；原始数据 A 组采用 FBP 技术重建，B 组采用模型迭代技术重建。对两组图像质量进行主客观评估。主观评价采用 5 分制量表根据图像噪声，图像伪影，脊柱病变结构显示，诊断信心几方面进行评分，客观评价针对颈段、胸段、和腰段分别进行，评价指标包括 CT 值，图像噪声，和对比噪声比（CNR）。比较两组图像主观评分及客观指标，并记录有效辐射剂量。**结果** B 组平均有效辐射剂量为（1.19±0.28） mSv，较 A 组（4.43±0.85）mSv 降低 73.1%。两组主观图像质量评分无统计学差异（Z=0.940，p=0.347），客观图像质量各层面 CT 值无统计学差异；图像噪声颈段无统计学差异，胸腰段 B 组低于 A 组；SNR 及 CNR 各层面低 B 组均高于 A 组。**结论** 与采用常规剂量扫描及 FBP 重建所得图像相比较，采用低剂量扫描联合迭代模型重建能提高图像质量，可用于青少年特发性脊柱侧弯术前评估。

EPO-1367

第三代双能 CT 对膝关节骨髓水肿的诊断价值

王梦悦,徐磊,祁良,邹月芬
江苏省人民医院（南京医科大学第一附属医院）

目的：评估第三代双能 CT 虚拟去钙技术（Virtual Non-calcium , VNCa）对膝关节骨髓水肿的诊断价值。**方法：** 50 例膝关节外伤患者行双能 CT 及 3.0T MR 检查。两名放射学医师分别在第三代双能 CT 虚拟去钙伪彩图上对膝关节是否存在骨髓水肿进行评估，测量并记录 CT 值。将 MR 图像作为参照标准，评估第三代双能 CT 对膝关节骨髓水肿诊断的灵敏度、特异度、准确度、阳性预测值及阴性预测值，并对所测得的 VNCa CT 值进行 ROC 曲线分析。**结果：**在定性分析中，股骨下端双能 CT 虚拟去钙伪彩图像评估骨髓水肿的敏感度、特异度、阳性预测值、阴性预测值及准确度分别为 91.7%，98.7%，95.7%，97.4%，97%；胫骨上端以上各值分别为 96%，100%，100%，98.7%，99%，较一、二代双能 CT 得到提高。定量分析时，骨髓水肿区域与非骨髓水肿区域所测得的 VNCa CT 值存在统计学差异（P<0.001）。ROC 曲线分析显示曲线下面积（AUC）为 0.931±0.025。截止值-67HU 对区分膝关节水肿区的敏感度为 84.7%，特异度为 99.5%，准确度为 92.1%，阳性预测值为 99.4%，阴性预测值为 86.7%。**结论：**第三代双能 CT 虚拟去钙图像对膝关节骨髓水肿的诊断价值较一、二代双能 CT 高。

EPO-1368

断层融合在髋关节置换 假体周围骨折中的应用

孙加冠,张学琴
四川大学华西医院

目的：比较人工髋关节置换后假体周围骨折的不同影像学检查方法，为临床髋关节假体周围骨折预防提供最优的检查方法。
方法：收集我科自 2015 年以来的人工髋关节置换假体周围骨折的影像检查 15 例，图像均采用 DR 常规正斜位及大平板多工功能透视摄影系统患侧髋关节体层摄影。DR 常规髋关节摄影正侧位均包全置换假体，大平板多功能透视摄影系统选取断层摄影采集患侧髋关节正斜位图像，原始图像采集经后处理软件处理显示患侧逐层的断层图像。
结果：常规 DR 检查中发现假体周围骨折明显确诊 10 例，余 5 例不明显漏诊。采用断层融合采集处理的 15 例均明确诊断，随访观察断层融合诊断与临床诊断相符。
结论：人工髋关节置换后假体周围骨折有较大隐蔽性及不可预见性，提早检查发现预知，可作出合理的预防处理，关系假体的稳定性及功能恢复。女性、高龄、肥胖、骨质疏松及非骨水泥固定型假体柄等均是假体周围骨折的危险因素。常规 DR 摄影因重叠影像对较为隐蔽的骨折不易确诊，断层融合解决了深在部位和复杂部位的透照诊断问题，降低了漏诊和误诊。此检查比 CT 简单、经济、辐射剂量低，是髋关节假体置换术后的高价值影像检查方法

EPO-1369

3.0 T MRI mDIXON 序列在评估骨质疏松症患者的腰椎旁肌肉脂肪浸润的研究

樊秋菊[1,2],于楠[1,2],于勇[1,2],李悦[2],薛育[2],关文杨[2],王少彧[3]
1.陕西中医药大学附属医院
2.陕西中医药大学 医学技术学院
3.西门子医疗中心

目的：骨质疏松症已成为严重的全球公共卫生问题。据报道，肌肉力量是骨骼结构的重要决定因素。然而，肌肉脂肪浸润与骨质疏松症的相关性仍不清楚。本研究的目的是探讨应用多回波 Dixon 技术定量评估原发性骨质疏松患者的椎旁肌肉脂肪浸润程度的变化规律。
方法：本研究共纳入 56 名受试者，根据定量 CT（QCT）检查分成三组，包括骨质疏松组（n = 16,7 名男性，年龄= 61.0±9.5 岁，T 值 = -3.32±0.68），骨量减少组（n = 20，9 名男性，年龄= 54.2±10.3 岁， T 值= -1.84±0.29），正常组（n = 20,6 名男性，年龄= 45.9±10.7 岁，T 值= 0.15±0.83）。所有患者使用西门子 3.0T MRI（MAGNETOM Skyra，Siemens AG，Germany）检查，使用 18 通道脊柱线圈。为了定量评估椎旁肌肉脂肪含量，使用 3D 梯度多回波 Dixon 化学位移序列，具体参数如下：TR 9.0 ms，TE 1.23 ms，2.46 ms，3.69 ms 4.92 ms，6.15 ms 和 7.38 ms，翻转角度 4.0°，读出回波带宽 1080 Hz /像素，层厚：2.5 mm，FOV：400×400mm，矩阵 256×256。通过 Liverlab 软件自动生成脂肪分数图（FF mapping），手动勾画出竖脊肌（ES），腰大肌（PMM），腰方肌（QLM）和腹直肌（RAM）的轮廓，软件自动测量 FF。进行单因素方差分析以评估不同骨量组椎旁肌肉 FF 差异的显著性。
结果：总体而言，随着 T 值的降低，受试者椎旁肌肉脂肪含量增加。具体而言，与骨量减少组和正常组相比，骨质疏松组的 FF_{EM}，FF_{PMM}，FF_{QLM} 和 FF_{RAM} 显著增加（P <0.05），而正常组的 FF_{QLM} 和 FF_{PMM} 与骨质减少组相比无统计学差异（P> 0.05）。
结论：3.0T MRI mDIXON 技术具有定量检测椎旁肌肉脂肪含量的能力，FF 的可作为骨质疏松症进展的生物标志物。

EPO-1370

3.0T MR 磁化转移成像（MT）技术在原发性骨质疏松症中的应用研究

樊秋菊[1,2],于楠[1,2],于勇[1,2],李悦[2],薛育[2],关文杨[2],王少彧[3]
1.陕西中医药大学附属医院
2.陕西中医药大学 医学技术学院
3.西门子医疗中心

目的：骨质疏松症已成为全球公共卫生和前沿研究热点问题。磁化传递（MT）技术可以间接地反映大分子蛋白质含量的变化。因此，本研究的目的是利用 3.0T MR 磁化传递成像技术评估不同骨量水平腰椎椎体磁化传递率的变化规律。
材料与方法：共 56 名接受椎体定量 CT（QCT）骨密度检测的患者入选本次研究，根据 WHO 骨质疏松诊断标准 T 值分为三组（骨量正常，骨量减少和骨质疏松组）。所有患者使用西门子 3.0T MRI（MAGNETOM Skyra，Siemens AG，Germany）检查。矢状位 flash2D 序列扫描两次，一次包含 MT 序列（Ms），另一次不含 MT 序列（Mo），MT 序列是用以下参数进行的：TR = 405 ms，TE = 3.69 ms，Flip Angle（FA）= 70°，iPAT= 2，空间分辨率= 1.1×1.1×3 mm，带宽= 250 Hz /像素，采集矩阵= 192×192，FOV = 280 mm，层数= 15。每个受试者总成像时间为 2 分 58 秒。分别在正中矢状位 Ms 和 Mo 图上腰 2-4 椎体手动绘制 ROIs（面积约 1.0 cm^2）。 MT 效应通过磁化传递率（MTR）量化：MTR =（Mo-Ms）/ Mo×100%。进行单因素方差评估不同组之间 MTR 的显著性。
结果：骨质疏松组（n = 16,年龄= 61.0±9.5 岁，T 评分= -3.32±0.68），骨质减少组（n = 20，年龄= 54.2±10.3 岁），T 评分= -1.84±0.29），并且正常组（n = 20,年龄= 45.9±10.7 岁，T 评分= 0.15±0.83）。骨质疏松，骨质减少和正常 BMD 组的 MTR 分别为（3.67±2.61），（7.50±4.57）和（12.71±7.50），差异有统计学意义（P <0.05）。 T-评分与 MTR 之间呈正相关（r = 0.894，P 值<0.001）。
结论：MT 技术能够提供有关大分子对 MR 信号的贡献的定量信息。 MTR 值可用作骨质疏松症进展的生物标志物。

EPO-1371
全身低剂量 CT 与 DR 对多发性骨髓瘤的评估效能比较

张科民,孙洪砚
中国医学科学院血液学研究所血液病医院

【摘要】目的：比较全身低剂量 CT（LDCT）与 DR 评估多发性骨髓瘤（MM）的效能差异。**方法**：前瞻性对 2019-02--2019-06 我院共 40 例确诊 MM 且有 DR 检查史的初诊患者短期内（≦1 月）行 LDCT 复查，在病灶识别、放射剂量、检查时长、满意度、意外发现等进行两两比较（配对 *t* 检验或 *Wilcoxon* 符号秩和检验）。**结果**：LDCT 与 DR 平均检出全身溶骨性病灶个数分别为：69.9.*vs.*31.2，DR 总漏诊率 55.3%，差异有统计学意义（*P*<0.001）；肩胛骨、颈椎、锁骨、胸椎、肋骨、腰椎、胸骨、骨盆依次为 DR 漏诊率>50%的部位。LDCT 与 DR 的有效辐射剂量（ED）、检查时长、满意度分别为：9.4mSv.*vs.*3.6mSv，3.5 分钟.*vs.*15.6 分钟，100%好.*vs.*65%中、35%差，差异均有统计学意义（*P*<0.001）。肱骨髓腔浸润（85.0%）、股骨髓腔浸润（72.5%）、肋骨骨折（35.0%）、髓外浸润（20.0%）依次为本组 LDCT 常见的重要意外发现。**结论**：LDCT 在溶骨性病灶识别、检查时长、满意度、意外发现均明显优于 DR，仅辐射剂量稍高。

EPO-1372

256 层螺旋 CT O-MAR 技术对髋关节置换术后伪影减除效果研究

王建秋
吉林大学第二医院

目的：
评价 256 层 CT 减金属伪影技术 O-MAR（Orthope-dic Metal Artifact Reduction ）对髋关节置换术后患者图像金属伪影减除的效果，以期达到在不增加患者辐射剂量的前提下获得符合诊断要求的图像，从而辅助髋关节置换术后影像学评估。
材料和方法：
本研究共包括 40 例接受全髋关节置换术的患者（男女比例 21:19）。所有患者均接受飞利浦 256 iCT 检查，采用相同的 CT 扫描技术参数。系统重建图像自动生成原始数据图像和 O-MAR 图像，随即分为两组，即：非 O-MAR 组和 O-MAR 组。对图像质量的评价通过客观评价和主观评价两种方式进行。客观评价通过对近端伪影最大层面和远端伪影最小层面减金属伪影有效程度进行量化来评估，即通过测量并比较客观图像噪声(Objective Image Noise，OIN)来进行评估。主观评价通过双盲独立的两名阅片者在 CT 轴位图像分别对金属伪影、图像清晰度、结构自然逼真度及诊断信心评分，记录并进行统计学分析。
结论：
应用 O-MAR 技术能减少髋关节假体周围的金属伪影，减低图像噪声，获得更好的图像质量。同时 O-MAR 技术增强了观察者对髋关节置换假体附近解剖结构的能力和诊断信心，从而提高对存在金属伪影患者影像诊断的可靠性。

EPO-1373

基于定量 CT 对不同性别、年龄人群血尿酸与腰椎骨密度的相关性分析

翟建,吴雅琳,胡琴
皖南医学院弋矶山医院

摘要：目的　应用定量 CT(QCT)测量腰椎骨密度(BMD)，研究不同性别、年龄人群腰椎 BMD 和血尿酸(SUA)之间的相关性。　资料与方法　选取 2018 年 7 月-8 月在我院健康体检中心的体检人群 1622 例，其中男性 923 例，女性 699 例，年龄 40~93 岁，平均年龄（55.28±10.17）岁。询问研究对象既往史，测量其身高、体重，并计算体重指数（BMI）；空腹采集静脉血检测血尿酸；使用 QCT 软件测量腰椎 BMD，根据 QCT 骨质疏松诊断标准将研究对象分为骨量正常组、骨量减少组及骨质疏松组，分析不同性别中老年人腰椎 BMD 与血尿酸之间的相关性。　结果　男性人群的血尿酸及 BMI 均高于女性，差异均有统计学意义（均 $P<0.01$）；男女年龄和腰椎骨密度间差异无统计学意义（均 $P>0.05$）。男性腰椎 BMD 与年龄呈负相关（$P<0.01$），与 BMI 呈正相关（$P<0.01$），与血尿酸水平无明显相关性($P>0.05$)。女性腰椎 BMD 与年龄、血尿酸和 BMI 均呈负相关（$P<0.01$，$P<0.05$）。进一步行多元线性回归结果显示年龄是影响中老年人腰椎 BMD 的危险因素。　结论　本研究发现男性人群的血尿酸及 BMI 均高于女性；血尿酸与中老年女性腰椎 BMD 下降存在着负相关，未发现与中老年男性腰椎 BMD 存在相关关系；年龄是影响中老年人腰椎 BMD 的危险性因素。

EPO-1374

Bending 位腰椎仰卧侧屈加压位片评估术前退变性脊柱侧凸脊柱柔韧性的价值

丰金岭
徐州市中心医院

目的：探讨 Bending 位腰椎仰卧侧屈加压位片评估术前退变性脊柱侧凸脊柱柔韧性的价值。Bending 位 X 线片是评估侧凸畸形患者脊柱柔韧性最常用的影像学手段，具有易操作、重复性好、预测术后矫形效果可信度好等优点。X 线片预测退变性脊柱侧凸（DS）手术矫形效果的研究。退变性脊柱侧凸由于椎间盘和关节突退变导致的侧凸尤其僵硬，而术前评估往往更关注患者椎管狭窄或者椎间盘突出问题，常常忽略对脊柱柔韧性的评估。

方法：使用自制 Bending 位拍摄辅助装置，选择我院 2014 年 7 月-2019 年 7 月间的腰椎侧凸患者 30 例，年龄 39-68 岁，平均年龄 55.4 岁，接受脊柱后路矫形手术的 DS 患者。患者术前 1 周拍摄立位全脊柱正位 X 线片、Bending 位 X 线片，站立位弯曲 X 线片，术后 1 周拍摄立位全脊柱正位 X 线片。分析术前 Bending 位片 Cobb 角与术后立位 X 线片 Cobb 角及弯曲柔韧性（bending flexibility，BF）与矫形率（correction rate，CR）的相关性。

结果：立位全脊柱正位 X 线片主弯平均 Cobb 角 43.54°，术前 Bending 位平均 Cobb 角 27.17°，术后立位全脊柱平均 Cobb 角 16.45°，平均弯曲柔韧性 38.69%，平均矫形率 62.22%，差异均有统计学意义(P 值均 <0.01)。

结论：Bending 位平片是临床上预测脊柱侧凸柔韧性最常用的影像学手段,其优点在于可操作性和重复性较好，并且直接作用于冠状面，能按照侧凸矫正程度来反映脊柱的柔韧性,用以辅助侧凸分型、选择融合范围、判断预期的矫形度等。柔韧性的测定提供了一项关于畸形脊柱对抗矫正时的动态力学指标 。在施加矫形力后拍摄脊柱侧凸矫正影像，可用于预测矫正效果，为设计手术方案提供参考依据。

Percentage fat fraction in magnetic resonance imaging: Upgrading the osteoporosis-detecting parameter

Rong Chang[1],Xiaowen Ma[1],Ming Zhang[2]
1.Xi'an Honghui Hospital
2.First Affiliated Hospital, Medical College Xi'an Jiaotong University

Purpose Osteoporosis (OP) is a common metabolic bone disorder and orthopedic imaging approaches were commonly used with some limitations. The aim of this study was to explore the diagnostic value of magnetic resonance 1-H MRS and m-Dixon-Quant in the evaluation of osteoporosis

Methods We enrolled 76 subjects and used a quantitative computed tomography (QCT) technique to determine the subjects' bone mineral density (BMD). Those with a BMD >120 mg/cm^3 were categorized as the normal control; those with a BMD ranging from 80-120 mg/cm^3 were classified as having osteopenia; and those with a BMD <80 mg/cm^3 were diagnosed as having OP. The following parameters were recorded for each patient: sex, age, body height, body weight, waist circumference, and hip circumference.

Simultaneously, the FF% values from 1-H MRS examinations and m-Dixon-Quant scans were acquired.
Results In both 1-H MRS and m-Dixon-Quant MRI, the FF% exhibited a negative correlation with BMD. Among the different groups, the OP patients had a significantly higher FF% compared to healthy subjects. In addition, the FF% in the m-Dixon scans exhibited a positive correlation with age, while BMD showed a negative linear relationship with age. Further, females had a higher FF% compared to males, and body height was correlated with BMD but not with FF%.
Conclusion MRI investigations ,especially FF% in the 1-H MRS and m-Dixon-Quant imaging system,are useful in OP assessments. Also, parameters such as sex, age, and height are important factors for predicting and diagnosing OP.

冈上肌出口位的摄影方法探讨

曾小涛,李向东
中国人民解放军南部战区总医院

【摘　要】目的：研究冈上肌出口位的最佳摄影方法，探讨对肩关节损失的临床诊断价值。**方法：**患者直立面向摄影板，两足稍稍分开，被检查的肩部紧贴暗盒，身体的冠状面与板面约 55-65°，被检肢体下垂，避免肩胛骨与肱骨重叠，中心线向足侧倾斜 10-15°，从肩胛冈喙突垂直摄入成像板。曝光条件为：75-85KV，12-14mAs。**结果：**肩胛骨内缘投影于肩胛骨外缘中央，与喙突、肩峰一起组成“Y”字形投影，并与肋骨缘完全分离。所得的图像测量肩缝下间隙。**结论：**冈上肌出口位的拍摄常用于诊断肩峰下撞击综合征，而肩缝- 肱骨头（A-H）间距值是对于肩缝下间隙是否狭窄的重要依据，有很高的临床诊断价值。

3D-VISTA 结合压缩感知技术踝关节成像初探

刘小明,刘定西,孔祥闯,代孟,柳曦
华中科技大学同济医学院附属协和医院

目的：比较快速 3D-VISTA 结合压缩感知技术与常规 3D-VISTA 序列在踝关节成像中的应用评估
材料与方法：收集 30 例正常志愿者 60 个踝关节，所有受检者均在 3.0T 飞利浦 Ingina CX 扫描仪上行踝关节 3D-VISTA（体素大小 0.45x0.45x0.45mm³，扫描时间 11min47s ）成像序列与 CS-3D VISTA（体素大小 0.45x0.45x0.45mm³，扫描时间 5min50s ）序列扫描。2 位 10 年以上肌骨影像专家对两组图像质量按 5 分法进行评估。分别比较两组图像软骨、肌肉、韧带、骨小梁的 SNR 及 CNR。采用独立样本 t 检验进行统计学分析，p≤0.05 具有统计学差异。
结果：两组图像图像质量主观评分无统计学差异（P=0.15）。对于软骨与关节内液体诊断质量 CS-VISTA 明显高于 VISTA 序列。对于肌肉、韧带、骨小梁的图像评估上 CS-VISTA 与常规 VISTA 无明显差异。与常规 3D VISTA 序列相比，CS-VISTA 序列的 SNR 和 CNR 在软骨，肌肉，韧带，骨小梁的测值中均显著增高（P＜0.01）。
结论：结合压缩感知的 CS-VISTA 成像技术在踝关节成像中不牺牲图像质量的情况下，可降低扫描时间。高空间分辨率压缩感知技术可应用踝关节三维成像评估。

能谱 CT 对 Ilizarov 技术治疗胫骨大段骨缺损术后骨质疏松的影响因素分析

史晓丽,赵卫东,李佳佳
山西医科大学第二医院（山西红十字医院）

［摘要］目的　探讨应用能谱 CT 对 Ilizarov 技术治疗胫骨大段骨缺损术后骨质疏松的影响因素分析。方法　回顾性分析经我院行 Ilizarov 技术纵向骨搬移患者 42 名，男 37 例，女 5 例，年龄 25～69 岁，平均 48.1 岁。收集患者术前术后的能谱 CT 数据，根据基物质对分离技术，测得胫骨平台基物质对羟基磷灰石-水 HAP（Water）浓度值反应骨密度，测量三次取平均值，收集的潜在影响因素有：性别、年龄、体重指数、病因、患侧、戴环形外固定架时间、骨缺损范围、周围软组织脂肪浸润浸润情况、是否合并腓骨骨折、术后并发症、功能锻炼等，采用单因素分析及 logistic 回归分析确定影响术后骨质疏松的因素。 结果　42 名患者平均 HAP（Water）为 (55.40±6.32)mg/cm^3，周围软组织脂肪浸润情况 (P=0. 012)、功能锻炼（P=0.047）和环形外固定架佩戴时间(P=0. 027)是 IIizarov 技术治疗胫骨骨缺损术后骨质疏松的独立影响因素。结论　能谱 CT 能定量识别微量骨变化，所测参数显示出与周围软组织脂肪浸润情况、功能锻炼、环形外固定架佩戴时间等的相关性。对于胫骨骨搬移患者，要加强术后功能锻炼，及通过各种临床治疗能促进患者术后牵拉成骨，减少外固定架佩戴时间，以早期达到预期治疗效果，也减少了术后并发症。

Utility of 3-Dimensional Constructive Interference in Steady State Sequence in Evaluating the Anterolateral Ligament of Knee

Yupeng Zhu[1],Xiaoyu Qiu[2],Yun Peng[1]
1.Beijing Children’s Hospital, Capital Medical University
2.Beijing Friendship Hospital, Capital Medical University

PURPOSE: The purpose of the study was to determine the feasibility of 3-dimensional constructive interference in steady state (CISS) sequences for evaluating the anterolateral ligament (ALL).
MATERIALS AND METHODS: MR scanning of the right knee joint in 30 healthy volunteers was performed on a 3.0T MR scanner. Axial T2-weighted image with fat saturation (T2WI-FS), coronal PDWI-FS, and 3D-CISS were included in the protocol. Multiplanar reconstruction (MRP) and rotating stretched curved planar reconstructions (CPRs) of the ALL at 30°, 60°, 90°, 120°, and 150° were generated from 3D-CISS images. The visibility of the femoral part, meniscal part, tibial part, meniscal insertion, femoral footprint, and tibial footprint of the ALL on imaging of all sequences were recorded.
RESULTS: Based on the CPR of 3D-CISS MR imaging, the presence of tibial and femoral footprints of the ALL was rated superior to MPR and PDWI-FS (96.67% and 96.67%, respectively; P＜0.017). Rotating CPR of 3D-CISS MR imaging was rated superior to PDWI-FS with respect to the tibial part, meniscal part, and meniscal insertion of the

ALL (96.67%, 83.33%, and 83.33%, respectively; P＜0.05). Rotating CPR of 3D-CISS MR imaging was rated superior to PDWI-FS with respect to the femoral part of the ALL, but the difference was not statistically significant (P=0.095). The angle between the ALL and lateral collateral ligament (LCL) on the oblique sagittal image was 18.34° ±1.88°.

CONCLUSIONS: The MR 3D-CISS sequences significantly enhanced the ability to identify the ALL compared with the 2D MR sequences.

EPO-1380
双能量 CT 虚拟去骨图不同对比物质相对比值对膝关节创伤性骨髓水肿的诊断价值

梁建超[1,2],方义杰[1],洪国斌[1],李绍林[1]
1.中山大学附属第五医院
2.广东省珠海市人民医院

目的 探讨双能量 CT（DECT）虚拟去骨图（VNCa）不同对比物质相对比（Rel.CM）值对膝关节创伤性骨髓水肿的诊断价值。

方法 前瞻性搜集有明确外伤史和膝关节活动障碍等症状的 23 例（24 个膝关节）患者，行膝关节 MRI 和 DECT 平扫，获得常规 CT、VNCa 图和 MRI 图像。将每个膝关节划分为 12 个区域，分别观察 MRI 和 VNCa 图表现。首先，以 MRI 为参考，对不同 Rel.CM 值（分别取 1.25、1.35、1.45、1.55、1.65、1.75）所对应的 VNCa 图对膝关节创伤性骨髓水肿的诊断效能进行分析，优选出最佳 Rel.CM 值。然后，在最优 Rel.CM 参数所对应的 VNCa 图上分别测量骨髓正常、骨髓损伤区域的 CT 值。采用 ROC 评价不同 Rel.CM 值的 VNCa 图诊断创伤性骨髓水肿的效能，采用秩和检验比较最优 Rel.CM 值 VNCa 图上骨髓损伤区域与骨髓正常区域 CT 值的差异。

结果 23 例（24 个膝关节）患者均完成了 DECT 和 MRI 检查。24 个膝关节共分为 288 个区域。MRI 显示 121 个区域出现骨髓水肿，其中股骨下端 49 个，胫骨上端 72 个。Rel.CM 值为 1.25、1.35、1.45、1.55、1.65、1.75 的 VNCa 图诊断膝关节创伤性骨髓水肿的 ROC 下面积分别为 0.633、0.674、0.882、0.684、0.651、0.649，其中 Rel.CM=1.45 所对应的 VNCa 图诊断准确性最高。在最优 Rel.CM 参数（1.45）所对应的 VNCa 图上，骨髓水肿区域和正常区域的 CT 值分别为－67.9（1.7～－100.1）HU、－94.5（－69.7～－144.9）HU，差异有统计学意义（Z=－9.804，P<0.05）。

结论 Rel.CM 值为 1.45 所对应的 VNCa 图对膝关节创伤性骨髓水肿的诊断效能较佳。VNCa 图上 CT 值测量可用于创伤性骨髓水肿的定量分析。

EPO-1381
磁共振 T2 值定量评价健康成年人腕关节三角纤维软骨复合体

祁艳梅,周晟,陈晓飞,董馥闻
甘肃省中医院

目的 探讨磁共振 T2mapping 成像技术对健康成年人腕三角纤维软骨复合体(TFCC)定量评价的可行性。

方法 经知情同意纳入 81 名健康志愿者（平均年龄 23.7±5.38 岁），行腕关节 3.0T 磁共振冠状位 8 回波 T2 mapping 成像。由 1 名肌骨影像诊断医师在 AW 4.6 工作站进行后处理，选择桡侧软骨、三角纤维软骨盘（TFC）、纤维血管、类半月板、TFC 的尺侧附着处 5 个感兴趣区（ROI）测量 T2 值，对比分析各 ROI 间 T2 值的差异及不同性别间、利手与非利手间 T2 值差异。

结果 所纳样本桡侧软骨、TFC、纤维血管、类半月板、TFC 尺侧附着处 T2 值范围分别为（41.37±7.04）ms、（29.8±7.23）ms、（34.22±6.85）ms、（39.26±8.88）ms、（32.57±7.23）ms，总体差异有统计学意义（F=32.235，P＜0.01）。除了纤维血管组织与 TFC 尺侧附着处、软骨与类半月板之间 T2 值无统计学差异，其他 ROI 之间 T2 值差异有统计学意义（P＜0.05）。不同性别间、利手与非利手 T2 值差异均无统计学意义(P＞0.05)。

结论 T2 mapping 成像技术可以评价 TFCC 软骨成分的变化，对定量评价早期腕关节软骨退变具有潜在的临床价值。

EPO-1382

Isotropic three-Dimensiona(3D) Cube Fat-Suppression PD imaging versus without Fat-Suppressed imaging of the wrist at 3.0T: A pilot Sturdy.

Yanmei Qi,Sheng Zhou,Xiaofei Chen,Fuwen Dong
Gansu Provincial Hospital of TCM

Purpose: To evaluate the three-dimensional fast spin-echo (3D FSE Cube) with fat suppression (FS) for assessing TFCC of the wrist in term of image quality and diagnostic performance, using comparison to 3D FSE Cube without fat suppression (NFS).

Materials and Methods: 60 volunteers were enrolled in the study with an average age 24.6 years (range 22-29 years), informed consent was obtained from all volunteers. All MR images were acquired with a 3.0T whole-body MR imager (Signa HDxt, GE Healthcare, Milwaukee, WI) with a receive-only dedicated wrist coil. Two radiologists retrospectively and independently reviewed 60 MRI studies. Each study consisted of 3D Cube images with fat suppression and without fat suppression. Coronal 3D Cube images with fat suppression parameters:TR=1400ms, TE=36.1,Matrix=256×192, FOV=10×8cm^2, Slice thickness=0.4mm, gap=0.2mm, NEX=0.5, acquisition time=195s. Fat suppression was achieved with chemical shift selective (CHESS) fat saturation. Delineation of anatomic structures of the wrist, amount of artifact, effect of fat suppression, image blur, and overall quality were qualitatively evaluated using the 5-point scoring system (5: excellent, 4: good,3: satisfactory, 2: poor, and 1: nonidentified.Signal-to-noise-ratios (SNR) of each structure and contrast-to-noise ratios(CNR) between structures of the TFCC were quantitatively measured using vendor supplied software (AW4.6work station, GE).

Results: The 3D FSE Cube NFS imaging demonstrated higher scores than 3D FSE Cube FS in anatomic structure of the TFC(0.033),SL ligament(P=0.043), the LT ligament(P=0.022) and cartilage(P=0.043).However,there were no statistical significance between FS and NFS MRI in image blur and overall quality. There was significant difference of fluid and bone marrow. Higher SNR values of bone marrow were found for in the NFS sequence (58.14±17.64)than the FS

(7.19±1.59).There had no significant differences in CNR values between FS and NFS,except for cartlage to bone marrow and fluid to bone marrow, and higher CNR values of fluid to bone marrow was found for in the FS sequence (7.29±4.47) than the FS (0.86±0.64).
Conclusion: 3D Cube-NFS imaging showed similar image quality in image blur and overall quality compared to FS imaging, unlike TFC and ligament. 3D Cube-NFS imaging has higher diagnostic performance than FS imaging for evaluation of TFCC tears,subtle fracture and cartilaginous defects.

人体冠状面在髋臼几何参数 CT 测量中的价值

胡荣慧
重庆医科大学附属第三医院

目的：探讨人体冠状面在髋臼几何参数 CT 测量中的价值。**方法：**选取行髋关节 CT 检查患者，正常成人髋关节 50 例（两侧共 100 个），单侧先天性髋关节脱位 20 例，对所有患者图像进行冠状面重建和三维重建，比较正常成人髋臼上外倾角冠状位和三维测值，比较先天性髋关节脱位组患侧与正常侧髋臼上外倾角，用配对 t 检验进行统计学处理；P<0.05 时差异有显著性意义，P<0.01 时差异有非常显著性意义。选择配伍组设计方差分析，分别比较常规方法和以身体冠状面为参照面测量左侧和右侧髋臼后外展角、左侧和右侧前髋臼指数以及左侧和右侧后髋臼指数，P<0.05 时差异有显著性意义。**结果：**髋臼上外倾角在冠状位测值为 39.99°±6.1°，在三维图像上测值为 40.13°±5.80°，两组比较 P>0.05，差异无统计学意义。小儿先天性髋关节脱位双侧上外倾角在冠状位的测量值，正常侧 48.95°±3.80°，脱位侧 63.56°±6.35°，二者之间差异有非常显著性意义(P<0.01)。以扫描床面为参照面测量正常髋臼后倾角、前髋臼指数、后髋臼指数左右侧比较 P<0.05，差异有统计学意义；以身体冠状面为参照面测量髋臼后倾角、前髋臼指数、后髋臼指数左右侧比较 P>0.05，差异无统计学意义。比较以床面为参照面测量和以冠状面为参照面测量髋臼后倾角和前、后臼指数，P<0.01 差异有显著性意义。**结论**：以冠状面为参照平面测量双侧后外展角和前、后髋臼角最为可靠，可客观准确反映髋臼情况，为髋关节区病变的诊断和治疗提供确切的量化指标。

EPO-1384
股骨颈隐形骨折投照水平侧位的价值

李宏征
河南省滑县骨科医院

摘要　　目的：悬吊式数字化 X 线（DR）平片诊断股骨颈隐形骨折的价值。
方法：选择悬吊式数字化 X 线摄影（DR），无线探测器，进行股骨颈正侧位、水平侧位进行检查，摄影方法为：患者平躺摄影床上或不宜搬动的担架车上，做好辐射防护工作，患侧臀部髋部垫高，患肢伸直外展且内旋约 10 度，健侧肢体上抬与躯干成 90 度，无线探测器横立在被检髋部外侧，上缘包括髂骨嵴，下缘无线探测器与躯干分开约 45 度角使无线探测器长轴与股骨颈平行。摄影距离：75～100 厘米。中心线：X 线呈水平投照，对准股骨颈垂直射入探测器中心。摄影条件：150KV、80mA、0.8S。

结果：我们利我用现代悬吊数字化 X 线 DR 进行正位、侧位、水平侧位进行检查，3 年中发现，25 例男性、20 例女性，正侧位漏诊患者 8 例，水平侧位漏诊 1 例。相对比较水平侧位检查漏诊率明显减低。
结论：股骨颈隐形骨折，早期利用普通 X 线系统进行正侧位检查时，不错位的易发生误诊和漏诊，虽然有 CT/MRI 设备，由于价格昂贵，来自农村患者难以接受，利用水平侧位检查患者平躺时体位不动，患者减少疼痛，相反侧位检查时患者病侧外翻时加重患者疼痛，不利于医患关系和谐。

成年女性骨盆骨髓 DCE-MRI 特征和影响因素初探

张晓苗,董越
辽宁省肿瘤医院

目的 探讨月经状态及年龄对成年女性骨盆骨髓动态对比增强磁共振成像（dynamic contrast enhanced MRI,DCE-MRI）定量灌注参数的影响
方法 回顾性分析自 2017 年 9 月至 12 月在本院行骨盆 DCE-MRI 的 98 名成年女性的检查资料，测量其骨盆骨髓 DCE-MRI 定量灌注参数（Ktrans、Kep、Ve）并取平均值。依据月经状态将研究对象分为未绝经组和绝经组，未绝经组 41 人，绝经组 57 人；未绝经组按照年龄分为≤40 岁组和>40 岁组，≤40 岁组 17 人，>40 岁组 24 人；绝经组按照年龄分为≤60 岁组和>60 岁组，≤60 岁组 39 人，>60 岁组 18 人。分析 DCE-MRI 定量灌注参数不同月经状态及年龄间的差异及相关性。
结果 未绝经组的各灌注参数 Ktrans、Kep 和 Ve 值均大于绝经组，差异有统计学意义。总体年龄与 Ktrans（r=0.587，p<0.001）、Kep（r=0.348，p<0.001）、Ve（r=0.386，p<0.001）均存在显著负相关；未绝经组两亚组间 Ktrans、Ve 的差异有统计学意义，Kep 无统计学意义，未绝经组的年龄与 Ktrans（r=-0.344,P=0.032）、Ve（r=-0.334,P=0.038）存在显著负相关，与 Kep 不存在显著相关性（p>0.05）；绝经组两亚组间 Ktrans、Kep 的差异有统计学意义，Ve 无统计学意义，绝经组的年龄与 Ktrans（r=0.460，p<0.001）、Kep（r=0.303，p=0.022）存在显著负相关，与 Ve 不存在显著相关性（p>0.05）。
结论 月经状态对成年女性骨盆骨髓 DCE-MRI 定量灌注参数（Ktrans、Kep、Ve）有明显影响，成年女性骨盆骨髓不同年龄段微环境变化不同。DCE-MRI 定量灌注参数可以反映成年女性骨盆骨髓微环境的改变。

EPO-1386
双能 CT 虚拟去钙技术诊断骨质疏松症：与定量 CT 的相关性研究

刘正华,张玉婷,孔江涛,李亚宁,姜永宏
西安市红会医院

目的：研究双能 CT 虚拟去钙技术的测量参数值与定量 CT（QCT）所测得骨密度值（BMD）的相关性，探讨双源 CT 双能量在骨质疏松评价中的应用价值。
方法：对 55 例慢性腰痛患者的腰椎进行前瞻性双能 CT 扫描。在行 DECT 检查时，将 Mindways 公司的定量 CT（QCT）标准校正体模放置于患者的检查部位，以获得椎体的 QCT 扫描数据，进行椎体松质骨密度（BMD）测量。参照西门子双能量分析软件（syngo.via 3.0）中的骨髓分析配置文件，对肝脏 VNC 配置文件中的默认参数进行修改，用于钙和脂肪的定量分析，统计参数包括钙相关 CT 值（CM）、钙浓度（CaD）、脂肪分数（FF）。以 QCT 测量的 BMD 为金标准，利用多元线性回归分析，评价钙和脂肪的定量参数（CaD、FF）与 BMD 的相关性，并进行 ROC 评价。

结果：总计 318 个椎体纳入分析。CM、CaD、FF 与 BMD 具有显著相关性（p<0.01），相关系数分别为 0.885、0.877、0.492，回归方程为 rBMD =87.82+21.03×CaD-1.34×FF，决定系数为 0.915（P<0.01）。ROC 曲线分析显示 CM、CaD、 FF 及回归方程 rBMD 的曲线下面积分别为 0.941、0.938、0.696、0.966。以 rBMD<81.94mg/cm^{3}为阈值，诊断骨质疏松的敏感度为 90.0%，特异度为 92.0%。

结论：双能 CT 虚拟去钙技术的测量参数值与 QCT 测得的 BMD 值具有良好的相关性，可从骨髓脂肪组成和矿物质含量两个方面对骨质疏松进行定量评价。

8 回波 CSE-MRI 同时评估骨髓脂肪及 R2*

李冠武,祝乐群,常时新,李雪峰,王真真,刘小红,鲍虹
上海中医药大学附属岳阳中西医结合医院

目的：探讨 8 回波化学位移编码 MRI（CSE-MRI）同时定量骨髓质子密度脂肪分数（PDFF）及 R2*的可行性，评估 PDFF 和 R2*预测低骨量和骨质疏松症的诊断性能。**方法**：183 例绝经后妇女按骨密度分为正常骨量组(n=112)、低骨量组（n=46）及骨质疏松组（n=25），同时行 T2*校正 MRS 及 8-echo CSE-MRI 扫描获取骨髓 PDFF 及 R2*。18 位受试者做三次 CSE-MRI 重复扫描，评价 CSE-MRI 定量 PDFF 及 R2*的可重复性。ICC 评估观察者内及观察者间测定 PDFF 及 R2*的一致性。计算 Linear regression、Lin’s 一致性、Bland-Altman 95%的一致性以评估 2 种影像方法定量 PDFF 的可互换性。Pearson 相关分析每个亚组中 PDFF、R2*与骨密度的相关性。ROC 确定预测低骨量和骨质疏松的诊断效能，并利用 ROC 比较 PDFF、R2*、PDFF 联合 R2*的 Logistic 回归模型。**结果**：CSE-MRI 重复扫描，PDFF 及 R2*均方根绝对误差分别为 1.45%、1.57%。MRS、CSE-MRI 定量 183 位受试者 PDFF 的线性回归分析，相关系数为 0.979，Lin’s 一致性相关系数为 0.962。MRS_{PDFF}与 $CSE\text{-}MRI_{PDFF}$差值均落在 Bland-Altman 95%可信区间内。观察者内及观察者间测定 PDFF 具有实质性的一致性，观察者内 ICC=0.993，不同骨密度组观察者间 ICC=0.976～0.982。$CSE\text{-}MRI_{PDFF}$及 MRS_{PDFF}与腰椎骨密度呈中度负相关(r= －0.683、－0.617)，R2*与骨密度呈中度正相关(r= 0.706，P<0.001)。PDFF 联合 R2*预测骨质疏松的 AUC 最高（AUC = 0.875，P<0.001）。**结论** 8-echo CSE-MRI 可同时定量骨髓 PDFF 和 R2*作为低骨量和骨质疏松的预测因子。

Clinical value of artifact Identification in ankle dual-energy CT for gout diagnosis

Yan Zhang,Huishu Yuan
Peking University Third Hospital

Objective: To study the clinical value of artifact identification in ankle dual-energy CT for gout diagnosis. **Methods**: A total of 58 patients with gout , definitely diagnosed in Peking University Third Hospital , were included in the case group, which were composed of 57 men and 1 woman. And 37 individuals without gout were regarded as control group, which were composed of 36 men and 1woman. There were no significantly difference in gender and age between two groups. DECT were performed for one foot, and the affected side or the more serious side was chosen in the case group. The dual-energy data were used in gout-recognition software to highlight the monosodium urate

(MSU) with green-colored. And to compare the difference in MSU relevance ratio on the images of toenail, submillimeter spots , skins , movements and vascular calcification between two groups. **Results:** In the case group , 55 patients were revealed with MSU green-colored toenails(relevance ratio 94.8%), while 22 cases in the control groups(relevance ratio 59.5%). The mean toenails numbers in the case group and control group for individual were (2.02 + 1.13) and (1.19 + 1.35). And the MSU distribution scores were (1.84 + 0.93) and (1.05 + 1.12) .There were significantly statistical difference in the two groups on toenail numbers and MSU distribution (P<0.01). In the case group ,47 patients were revealed with green-colored submillimeter spots(relevance ratio 81%),while 5 cases in the control group(relevance ratio 13.5%). The relevance ratio of submillimeter spots on tendon and ligament in the case group and control group were 75.9% (44/58) and 13.5% (5/37). There were also significantly statistical difference in the two groups on submillimeter spots (P<0.01). Except for the tendon and ligament in dorsum pedis and calf anterior area, submillimeter spots distribution in the other tendon and ligament had significantly statistical difference in two groups. And there were no significantly statistical difference in the two groups on MSU green-colored skins, movements and vascular calcification. **Conclusion**: There were great value for gout clinical diagnosis when green-colored MSU were detected on toenails and submillimeter spots, which should not be judged as artifact simply.

基于能谱 CT 多参数成像提升骨岛与肿瘤成骨性转移瘤的鉴别诊断精确性

任占丽[1,2,3],贺太平[1,2],于楠[1,2],张喜荣[1,2],贾永军[1],于勇[1],段海峰[1],郭长义[3]
1.陕西中医药大学附属医院
2.陕西中医药大学
3.陕西中医药大学第二附属医院

目的：探讨能谱 CT 成像在鉴别骨岛与肿瘤成骨性转移瘤中的价值。
方法：收集我院病理证实为成骨性转移瘤的 11 例患者 23 处病灶（OBM），同时收集临床及影像学证实为骨岛的 16 例患者的 21 处病灶（BI）。两组患者均行能谱 CT 成像检查。测量各转移瘤病灶和骨岛 40keV 至 140keV 的单能量 CT 值、钙浓度和水浓度，并计算能谱曲线斜率[λ=(CT 值 40keV-CT 值 140keV）/（140-40）]。采用独立样本 t 检验比较分析两组能谱参数间的差异。绘制受试工作者特征曲线（ROC）评价诊断效能。
结果：两组患者人口特征资料无显著统计学差异（P>0.05）。骨岛 40keV 至 140keV 的单能量 CT 值、能谱曲线斜率、钙浓度显著高于成骨性转移瘤（P<0.05），骨岛水浓度显著低于成骨性转移瘤（P<0.05）,且 CT 值、曲线斜率、钙浓度和水浓度的差异均具有统计学意义（P<0.05）。以 40keV 的 CT 值 1730.63HU 为阈值鉴别骨岛和成骨性转移瘤，AUC 为 0.920，敏感性 94.0%，特异性 90.4%，显著高于其它能谱参数诊断效能。
结论：能谱 CT 成像可以帮助鉴别骨岛与肿瘤成骨性转移瘤。

Application of 3.0T magnetic resonance diffusion tensor imaging in diagnosis of discogenic low back pain

Shuai Tian,Huishu Yuan
Peking University Third Hospital

Purpose
The aim of our study is to observe the morphology and integrity of annulus fibrosus by diffusion tensor imaging (DTI), and quantitatively analyze the annulus fibrosus by measuring the apparent diffusion coefficient (ADC) and fractional anisotropy (FA).

Methods
Patients with low back pain were enrolled in the study over a continuous period of time. Patients with discogenic low back pain confirmed by discography were selected as the low back pain (LBP) group and healthy volunteers without symptoms as the healthy control (HC) group. The ADC, FA and λ1, λ2, λ3 values at the posterior margin of the annulus fibrosus were measured by conventional lumbar MR sequence and axial DTI of L3-S1 levels (3.0T). The responsible intervertebral segment of discogenic low back pain was determined by discography. The differences of ADC, FA and λ1, λ2, λ3 values between the two groups were compared. The data conforming to normal distribution were tested by t test, while the data not conforming to normal distribution were tested by nonparametric test.

Results
From September 2017 to March 2018, 30 subjects in the LBP group and 24 subjects in the HC group were included in the study. There was no significant difference in demographic parameters between the two groups, and there was no significant difference in the area of region of interest (ROI) measured manually between the two groups. The ADC value of ROI in the LBP group was significantly lower than that in the HC group (6.10 ± 3.17 versus 9.84 ± 4.01, P = 0.0002), and the FA value was significantly higher than that in the HC group (0.341 ± 0.201 versus 0.231 ± 0.150, P = 0.007). Compared with the HC group, the LBP group showed significantly lower λ1 (4.44 ± 0.36 versus 4.75 ± 0.35), λ2 (4.19 ± 0.34 versus 4.50 ± 0.36), and λ3 values (3.97 ± 0.34 versus 4.27 ± 0.38; all P < 0.05).

Conclusions
3.0T magnetic resonance DTI has guiding significance in clinical diagnosis of discogenic low back pain and preoperative localization of the responsible segment. ADC and FA value can provide objective indicators for intervening intervertebral discogenic low back pain.

EPO-1391

The Histopathologic Basis of Modic Changes on MRI in Early Assessment of Intervertebral Disc Degeneration

Yanglin Ou
Department of Imaging, 909th Hospital of the Joint Logistics Support Force of PLA (Institute of medical imaging of medical colloge, Xiamen University)

Human intervertebral discs (IVDs) may undergo a series of biochemical and then morphological changes as early as the second decade of life [1]. These degenerative changes can be induced by lumbar pressure changes, spinal instability, annular injury, chemical damage, or gene deficiency, and usually deteriorate further with aging Simultaneously, a clinical in vivo MRI of the presence of modic changes (MCs) in the vertebral endplates may show morphological deterioration and represent the “early standard” in IVDD diagnosis [?]. MCs are characterized by three progressive morphology stages of MRI to represent pathological changes situated in both the body of the vertebrae and the endplates of the neighboring discs, and provide endplate information of IVDD in the early stage.
Thus, to show associations between biomarkers and imaging in the early stage of IVDD, the roles of reactive oxygen species, superoxide dismutase, and MCs of MRI during IVDD initiation are equally examined in this study. For this purpose, animal models were studied longitudinally *in vitro* through histopathology and immunobiology, and *in vivo* by high-field MRI.

Materials and Methods

IVDD animal models

All procedures were approved by the Institutional Animal Care and Use Committee of Xiamen University.Institute of Cancer Research (ICR) mice (male, 5 weeks of age, 22-25 g) were obtained from the Animal Center of Xiamen University. All animals were individually housed and fed with standard rat pellets. The mice were divided into five groups (12 randomly selected animals each group) and labeled with the corresponding group label (A, B, C, D, and E). Each mouse in group A was put in a slender PVC pipe (internal diameter 35 mm, height 150 mm) to enable the mouse to stand on both front feet 8 hours per day for 1 day [12]. The mice in groups B, C, D, and E were placed in the same pipes 8 hours per day for 3, 5, 7, and 9 days, respectively. Net lids were used to cover the pipes. When the mice were forced to stand or squat on their hind feet in the pipe, their whole-body weight was supported by the lumbar and the strain caused IVDD, mimicking the lumbar spine injury in humans during prolonged standing and sitting **(Figure 1).** High-field MRI scanning was performed and analyzed for each group to verify the severity of IVDD. The lower lumbar spine is the parts thbiae mechanic stress is concentrated, where is prone to degenerate. For convenience of measurement, the L4-L5 segment was selected as the Region of Interesting because the segment of L4-5 is straight but L5-S1 curved. The IVD and vertebral bodies of L4-L5 were collected for obtaining the nucleus pulposus (NP) tissues and endplates immediately after all *in vivo* experiments and homogenized for oxidative stress analysis. Tissues from the IVD and vertebral bodies were subsequently selected for histomorphometry, cell morphology, and immunohistochemistry.

绝经后妇女肌肉减少与骨质疏松、胰岛素抵抗之间的关系

韩思圆,陈敏

北京医院 国家老年医学中心

目的：肌少症（sarcopenia），是一种年龄相关性疾病。目前有关肌少症与骨质疏松及胰岛素抵抗的数据在亚洲及中国人群中是有限的。本研究旨在探讨肌少症在骨质疏松和胰岛素抵抗方面的相对重要性。
材料与方法：本研究纳入 200 例绝经后妇女(72.39±6.07 岁)。我们通过能谱 CT 测量了 L3 椎体水平的肌肉横截面积(CSA)和相应肌肉内的脂肪含量、L3 椎体骨密度(BMD)。采用握力试验和短物理性能电池(SPPB)评定肌肉强度和物理性能。采用 Pearson 相关分析和线性回归分析，评价肌肉特性与体内平衡模型评估—胰岛素抵抗(HOMA-IR)或骨密度(BMD)之间的关系。
结果：肌肉 CSA、握力、SPPB 评分与 L3 骨密度(BMD)呈显著正相关，与胰岛素抵抗无显著正相关。L3 椎体水平的肌肉脂肪含量与 HOMA-IR 呈正相关($p<0.001$)，但与 BMD 无关。与对照组相比，骨质疏松症患者的肌肉 CSA 明显降低；肌肉内脂肪含量增高，仅发现糖尿病患者。
结论：肌少症与骨质疏松有关，肌肉内脂肪的积累(肌肉长期受损的组织学特征)可能在绝经后妇女胰岛素抵抗的形成中发挥重要作用。

光谱 CT 去金属伪影技术在膝关节肿瘤假体中的应用

丁磊[1],李若程[1],张芳玲[2],向佩[1],张朝晖[1]
1.中山大学附属第一医院
2.中山大学附属光华口腔医院

目的　评估光谱 CT 单能级（MonoE）图像与 O-MAR 技术去除膝关节肿瘤假体伪影的效能，并初步探讨其在膝关节肿瘤患者术后随访中的临床应用价值。
材料和方法　首先使用膝关节肿瘤假体体外模型进行光谱 CT 扫描获得原始数据，分别按照常规方法和使用 O-MAR 技术重建获得两组相应的光谱 CT 图像。在两组图像中，分别调节光子能量，进行 40～200 keV(间隔 10 keV)单能级成像。通过对比不同 keV 下的图像质量，找到去除膝关节肿瘤假体的最佳 keV，获得膝关节肿瘤模型的常规 CT 图像、O-MAR 图像、最佳 MoneE 图像和最佳 MoneE +O-MAR 图像。在金属伪影最重的假体关节平面，分别选择不同方向的 8 处感兴趣区进行测量，得到上述四幅图像的各感兴趣区的其 CT 值和标准差（SD 值）。采用配对样本 t 检验比较不同感兴趣区的 CT 值和 SD 值。
结果　光谱 CT 单能级（MonoE）图像去膝关节肿瘤假体伪影的最佳 keV 为 110keV。常规 CT 图像、O-MAR 图像、最佳 MoneE 图像、最佳 MoneE+O-MAR 图像的 SD 值分别为 63.9±15.3、36.9±14.1、42.5±11.5、27.9±7.7。相对于常规 CT 图像，三组图像的 SD 值与其均具有统计学差异（$P<0.05$），但 O-MAR 图像与最佳 MoneE 图像不具有统计学差异（$P=0.16$）。
结论　相对于常规 CT 图像，最佳 MoneE +O-MAR 图像、O-MAR 图像、最佳 MoneE 图像均能有效去除膝关节肿瘤假体产生的金属伪影，其中最佳 MoneE +O-MAR 图像去除金属伪影的效果最佳，O-MAR 图像和最佳 MoneE 图像去除金属伪影的效果相同。

EPO-1394
3.0T MR 腕关节三角纤维复合体双回波稳态序列参数优化及多序列成像比较

安俐莹,张丽
吉林大学第一医院

研究目的：

1、通过改变 MRI 3D-DESS 序列成像参数翻转角（FA）的方法，探讨在 3.0T 超高场磁共振机的条件下，3D-DESS 序列成像参数 FA 与腕关节 TFCC、腕骨间软骨及骨髓信噪比的相关性研究。

2、通过测量并计算 3D-DESS、3D-SPACE、3D-FLASH 及常规 SE 腕关节扫描序列中 TFCC、腕骨间软骨及骨髓的信噪比（SNR），TFCC 与骨髓及腕骨间软骨与骨髓间的对比信噪比（CNR），比较各序列上显示腕关节 TFCC 及其他结构的差异。

材料与方法：

将 22-30 岁之间健康成年 30 人分成两组，一组 18 人，另一组 12 人，第 1 组志愿者行腕关节 3D-DESS 序列，第 2 组志愿者行常规 SE 序列及 3D-SPACE、3D-FLASH 序列。采用设备为 Siemens 3.0T Magnetom Avanto 超导型磁共振机，腕关节专用线圈。

2、全部数据均采用双盲法由 2 名影像科医生测量获得。取 MRI 各序列扫描所得 TFCC 正中层面图像，测量相同位置 TFCC、腕骨间软骨及骨髓的信号强度（signal intensity,SI)。观察各组序列上 TFCC、腕骨间软骨及骨髓的表现，计算 9 组不同 FA 的 3D-DESS 序列以及其他序列的 TFCC、腕骨间软骨及脊髓的信噪比（SNR）和 TFCC 与骨髓、腕骨间软骨与骨髓的对比信噪比（CNR）。

结论：

腕关节磁共振 3D-DESS 序列在翻转角 FA 为 15 度时为成像参数最为优化的一组。
3D 及常规 SE 6 组序列比较，3D-DESS 显示 TFCC 最佳。

EPO-1395

1.5T MR Haste 动态扫描技术在颞下颌关节紊乱中的应用

方玉
重庆市中医院

目的 探讨 Haste 动态扫描技术在颞下颌关节紊乱中的应用价值。**方法** 回顾性分析经临床随访或手术后证实的颞下颌关节紊乱病(TMD)患者 48 例共 96 个颞下颌关节的 MRI 表现，将常规静态 MRI 图像与 Haste 动态扫描图像进行对比分析。**结果** Haste 动态扫描序列可以清晰显示颞下颌关节的运动轨迹，显示运动过程中关节盘及髁状突的位置改变、关节盘的形态改变及关节腔积液，对于关节盘前后移位、关节活动度异常、关节腔积液均能正确诊断，本组 48 例 96 个颞下颌关节中 83 个 Haste 动态扫描与常规静态 MRI 扫描诊断结果一致，诊断符合率为 86．5%。**结论** Haste 动态扫描序列在发挥其动态显示颞下颌关节运动过程优势的同时对于大多数颞下颌关节紊乱病可正确诊断，在临床工 作中可作为常规 MRI 检查的补充。

基于 CT 数据的 3D 打印在 DDH 精准手术中的应用价值

陈欣,陈凯,刘恩梅,何玲
重庆医科大学附属儿童医院

摘要 目的：探讨 CT 数据的 3D 打印在儿童发育性髋关节脱位手术中的应用。方法：我院 2015.11 至 2018.2 月我院骨科收治的发育性髋关节脱位病人，随机分为传统手术组和 3D 打印组，并记录手术时间、髋臼指数矫正值、沈通氏线是否连续。结果：手术时间传统手术组和 3D 打印组时间分别约 165.0±20.1min 和 124.0±10.8min（P＜0.05），髋关节髋臼指数矫正值差异 2.8° ±1.1° 和 2° ±0.7° （P＞0.05），术后沈通氏线连续的比率 26/30 和 18/20（P＞0.05）。结论：应用基于髋关节 CT 影像数据的 3D 打印技术辅助行发育性髋关节脱位手术，能缩短手术时间,使截骨更加精确，提高手术成功率。

EPO-1397
正常四肢骨骼肌 T1-mapping 的定量研究及变异度对比分析

袁军辉
河南省肿瘤医院

【摘要】目的 比较分析 T1-mapping 的 Look-locker 和 B1-corrected VFA 两种成像技术在正常四肢骨骼肌的 T1 值及变异度。方法 对 55 名患者分别行 Look-locker 和 B1-corrected VFA 扫描，采用组内相关系数对不同医师所测 T1 值进行一致性分析；用配对样本 T 检验比较在 Look-locker 和 B1-corrected VFA 成像技术上所测正常四肢骨骼肌 T1 值的差异，以 $P < 0.05$ 为差异有统计学意义；用变异系数（coefficient of variation，CV=方差/平均值）评价所测 T1 值的变异度。 结果 共收集 55 例患者。两位医师分别在 Look-locker 和 B1-corrected VFA 成像技术上所测正常四肢骨骼肌的 T1 值一致性较高，ICC 值分别为 0.856、0.833；在 Look-locker 和 B1-corrected VFA 成像技术上所测正常四肢骨骼肌的 T1 值差异有统计学意义（$P = 0.000$，t 值为-29.907），其变异度分别为 0.062、0.121。结论 在正常四肢骨骼肌上采用 Look-locker 和 B1-corrected VFA 成像技术所得 T1 值间存在差异，在 Look-locker 成像技术上所测正常四肢骨骼肌的 T1 值变异度小，数据稳定性高。

UTE-adiabatic T1rho 定量技术诊断早期软骨退变：与 UTE-T2*mapping、T2mapping 比较

杨佳伟,邵泓达,万丽娣,汤光宇
上海市第十人民医院（同济大学附属第十人民医院）

目的：探讨 UTE-adiabatic T1rho 定量技术诊断膝关节早期软骨退变的可行性，比较其与 UTE-T2* mapping、T2 mapping 诊断效能。
方法：取 20 例膝关节炎患者关节置换术手术后股骨前外侧髁标本，经中心失状面取厚度为 4mm 切片。采用 GE 3.0T 磁共振，对 20 个切片行 UTE-adiabatic T1rho、UTE-T2* mapping、常规 T2 mapping 扫描，每个样本通过手绘感兴趣区（ROI）均等分为四个区域，在相应的区域画取 ROI 分别测定 T1rho 值、T2*值、T2 值。扫描后标本行 Safranin O-Fast Green 病理染色。根据 Mankin 病理学评分标准将对应 ROI 分正常、轻度、中度、重度退变四组，分析 T1rho 值、T2*值、T2 值与病理 Mankin 评分相关性及不同软骨退变组间 MTR 值、T2*值、T2 值的差异，比较各成像技术对早期软骨退变的诊断效能。
结果：Mankin 评分与 T1rho 值呈显著正相关(r=-0.598，$P<0.001$)，与 UTE-T2*值呈中度负相关(r=0.501，$P<0.001$)，而 T2 值呈仅轻度正相关(r=0.331，$P<0.006$)。正常组 T1rho 值与轻度、中

度和重度退变组均有显著差异（*P*<0.05）。正常组 T2*值与中度、重度组有显著差异（*P*<0.05），而与轻度组无差异（*P*>0.05）。T2 值偏态分布，正常组 T2 值与轻度、中度组间均无差异（*P*>0.05），仅与重度组间有显著差异（*P*<0.05）。T1rho 值（AUC=0.828）对早期软骨退变的诊断效能优于 UTE-T2* mapping(AUC=0.604)和 T2 mapping (AUC=0.644)。

结论：UTE-adiabatic T1rho 定量技术对早期软骨退变敏感，诊断效能优于 UTE-T2* mapping 及常规 T2 mapping，有望成为诊断早期膝关节炎的新技术。

SPECT/CT 融合显像评价四肢骨折愈合

刘玉珂
河南省洛阳正骨医院（河南省骨科医院）

目的 探讨 SPECT/CT 融合显像技术评价四肢骨折愈合情况的应用价值。**方法** 回顾性分析四肢骨折经治疗 6 个月后骨折端的 SPECT/CT 融合显像特征，判断骨折远期愈合能力。**结果** 68 例四肢骨折，X 线和 CT 检查均不能明确判断骨折能否远期愈合，SPECT/CT 融合显像，52 例放射性浓聚连续性通过骨折线并跨越两侧骨折端，提示骨折处于愈合进程中，具有远期愈合的可能，经对症保守治疗，证实 46 例骨折愈合，远期骨折愈合率达 88.5%（46/52），6 例未愈合。16 例骨折端未见明显连续性通过骨折线的放射性浓聚，提示骨折不愈合，且远期愈合的可能性较小，均进行了手术治疗并证实为骨折不愈合，诊断准确性达 100%（16/16）。**结论** SPECT/CT 融合显像能准确地评价四肢骨折愈合情况，对骨折远期愈合能力和骨折不愈合的判断具有重要应用价值。

EPO-1400

减少剂量对双能量 CT 虚拟无钙盐扫描技术探测骨髓病变无影响

寿蓓丽
浙江大学医学院附属邵逸夫医院

原理和目的：本研究的目的是评估如果减少剂量，中性剂量双能量 CT 虚拟无钙盐扫描技术同样可以检测膝盖非外伤性骨髓病变（BMLs）。
材料和方法：对 2017 年 11 月至 2018 年 5 月间于我院就诊的五十例患者进行双能量 CT 成像与标准剂量（A 组）或等于单能量 CT 扫描 72%剂量（B 组）和膝关节外伤患者磁共振成像检查。钙几乎是子提取图像。两位工作 20 年以上的资深放射科副主任医师各自对所得图像的软组织进行客观评价。存在像共 12 个股骨和胫骨骨髓中的衰减和地区测量 CT 值。使用接受者操作特征曲线分析四个点并进行评分，分别测量四点的 CT 值。对所有骨折类型进行分类。
结果：磁共振成像描绘的 170 群体之间（35 组股骨，135 组胫骨 BMLs）平均年龄、骨折数衰减值和一些地区的 BMLs 并没有显著不同。两位资深放射科副主任医师 1 和 2 分别对显示整体面积的曲线 0.983 和 0.979 进行视觉评分。视觉判断优于衰减测量的股骨区域方面的应用剂量少。所有 CT 值的方差分析显示水肿的存在显着影响（P。001），但所用的辐射剂量无显著差异（P = .424）。两名观察者间一致性良好（k = 0.944）。
结论：双能量 CT 虚拟无钙盐扫描技术中减少剂量不影响创伤后 BMLs 的探测，从而相比单能量 CT 成像提供了潜在的额外信息,并且双能量 CT 虚拟平扫相对普通单能量 CT 扫描方式能有效减少辐射剂量。

颞颌关节 MR 扫描新技术在 GE HDXT 3.0T 设备下的序列及线圈改良

黎建宇,罗伍星,沈宏荣,任雅
湖南中医药大学第一附属医院

背景：目前，临床上公认为颞下颌关节紊乱综合征是最常见的颞下颌关节疾病，也是一种疑难性的疾病，在全国颞下颌关节紊乱的比例应该占到百分之三十，女性患者远多男性患者。磁共振成像对于软组织、关节盘显示分辨率高，关节骨性磨损病变亦在时间进程上优于任何 X 线检查，目前是颞下颌关节病变检查的第一选择。
目的：湖南颞下颌关节修复手术进展迟缓，此次对颞下颌关节 MR 扫描技术做出了效果十分可观的优化，并设置额外的动态序列，获得优秀的 MR 图像，满足临床以及 TMD 的诊断需要。对于地区的颞下颌关节 MR 检查技术及治疗有推动性的意义。
方法与过程：主体设备：GE HDXT 3.0T 超导型全身核磁共振扫描仪。
对照组线圈：【GE 3.0T HD NEUROVASCULAR,头颈联合线圈】，实验组线圈：【GE CG-CTU8-H300-AG,颈部动脉线圈】。
在患者均良好配合的情况下，使用**双变量分组对照**扫描方式：**实验组序列**及部分摘要参数：3-pl loc（双 FOV 定位图）；sag PD fs：TR4560,TE30,matrix320*320，nex 4，TA 3'07,slice 20；cor PD fs：TR3360,TE30,matrix256*256，nex 3，TA 2'38,slice 16;fiesta cine:TR4.1,TE1.6,matrix192*224，nex 1，TA 0'34,slice 1。**对照组序列**：3-pl loc；cor PD fs；sag PD fs；sag T2* GRE。参数详见主文。均采用张闭口双状态采集，实验组 fiesta cine 采用运动相采集。　　两组序列两个线圈共采集 4 组对照数据进行对比。
定位方法：斜矢斜冠，先矢、次动态、后冠，详见主文。
讨论和结论：从线圈选用、序列设置、扫描角度以及顺序、动态意义以及扫描参数 5 个方面肯定此次研究改良的意义及实用性大，对于地区 TMD 的诊断和治疗指导有实际临床优势，详见主文。

能谱技术在脊柱内固定术后复查中的应用

张昌磊,邵广瑞
山东大学第二医院

目的：脊柱内固定术广泛应用于脊柱外伤、脊柱退行性病变的治疗中。脊柱内固定术后影像随访是临床常见的问题，需要及时了解手术区椎体、椎管及椎间盘的状况。由于金属伪影的影响，CT 检查的价值明显受限。能谱 CT 采用单能量技术可以降低 X 线硬化伪影，同时配合 MARs 技术可进一步减少大块金属所致的明显伪影。本文诣在了解能谱技术在脊柱内固定术后影像随访中的应用。
方法：脊柱内固定术后能谱 CT 扫描一般采用平扫为主。首先进行目标位置的定位像的扫描，然后行能谱 CT 平扫。能谱扫描方式选择 Helical-musculoskeletal-large-40mm,螺距 0.984:1 或者 1.375:1,对于特别致密的金属假体可以通过减少螺距来达到更好的减除金属伪影的效果，将单能量图像载入 GSI viewer,调整能量滚动条，选择伪影较少、对比较好的能量水平作为重建二维和三维图像用。
结果：将能谱图像载入能谱分析浏览器（GSI），依次观察单能量及多平面重建图像，观察手术区软组织情况以单纯单能量图像为佳，能量水平在 80-90kev;对于金属植入物周围骨质情况的观察，以单能量图像结合 MARs 技术为佳，能量水平在 70-80kev。

结论：能谱 CT 单能量成像对脊柱内固定术后影像随访中的效果明显。

EPO-1403
Revolution CT 测量腰椎体膜骨密度的准确性及可重复性研究

崔旋,郁万江
青岛市立医院

目的 探讨 Revolution CT 能谱成像对腰椎骨密度测量的准确性及同型号不同机器之间的可重复性。**材料和方法** 应用 GE 公司 Revolution CT，采用不同管电流（mA）及不同转速（s）组合，对欧洲腰椎体膜（ESP）重复进行 10 次扫描，在工作站利用能谱物质分离功能分别测量体膜 L1、L2、L3 椎体的 HAP 值，比较所测得的 HAP 值与真实值之间的差异；记录各组能谱 CT 的辐射剂量 $CTDI_{vol}$；在同型号不同 Revolution CT 机器上进行重复扫描 10 遍，对比不同机器间测量的可重复性；同时，在最佳单能量 40KeV 图像上测量 L1、L2、L3 椎体的 CT 值，探讨 CT 值与 HAP 值之间的函数关系。**结果** 管电流 230mA、球管转速 0.8s 条件下测得体膜 L1、L2、L3 椎体 HAP 含量分别为（50.58±0.88）mg/cm^3、（100.82±1.24）mg/cm^3和（200.43±0.8）mg/cm^3，与其实际值差异无统计学意义（P＞0.05），而且辐射剂量最低，$CTDI_{vol}$仅为 9.09；其他扫描条件下测得的数据准确性也高，但辐射剂量会有不同程度升高；同型号不同机器间所测得的数据没有统计学差异；40KeV 单能量图像测得体膜椎体 CT 值与 HAP 值之间具有高度相关性，两者关系可用一元线性关系式表达：腰椎骨密度(HAP)=0.3106CT_{40KeV}+0.02。 **结论** Revolution CT 扫描对欧洲腰椎体膜骨密度测量的准确性高，球管转速 0.8s 配合 230mA 条件下测量骨密度准确性高，而且辐射剂量最低，可重复性好。

EPO-1404
磁共振去金属伪影序列 MAVRIC-SL 在骨折内固定术后复查中的应用

朱婧怡,张子田,李松柏
中国医科大学附属第一医院

目的：合理内固定是治疗骨折的优先选择，但金属植入物会在磁共振常规序列中形成较大伪影，影响感染、骨髓炎、缺血坏死等并发症的诊断，本研究探讨去金属伪影序列 MAVRIC-SL 对骨折术后金属植入物患者磁共振图像的影响，以评价其临床应用价值。
材料与方法：纳入 2018 年 8 月至 2019 年 7 月的 25 例骨折术后体内含有金属植入物的患者（男 14 例，女 11 例），年龄 23-82 岁（45.36±15.96 岁），其中锁骨 1 例、肱骨 1 例、腰椎 1 例，髋关节 11 例、膝关节 7 例、股骨干 2 例、胫骨 2 例。使用 3.0T SIGNA PIONEER 磁共振，对患者进行常规序列各对比度扫描，并加扫 MAVRIC-SL 序列。由两位有经验的放射科医师共同阅片并对常规序列及 MAVRIC-SL 进行对比评分，有争议的部分商议后取得共识。评分内容：金属植入物伪影程度及其对周围结构诊断的影响：1、无伪影；2、几乎看不到伪影；3、可见伪影，但不影响诊断质量；4、中度伪影，中度诊断质量受损；5、严重伪影且不可诊断。抑脂序列的脂肪抑制效果：1、抑脂效果差，扫描范围内大片未抑脂区域；2、抑脂效果中等，抑脂不佳存在于植入物周围；3、抑脂效果好，不存在大片未抑脂区域。对评分行 Wilcoxon 秩和检验，$p<0.05$ 有统计学意义。
结果：对比常规序列，MAVRIC-SL 得到的图像金属伪影程度更小，诊断质量受损程度更小（常规序列：4.52±0.65；MAVRIC-SL：2.32±0.90；$p<0.01$）；MAVIRC-SL 能获得更好的抑脂效果（常规序列：1.64±0.49；MAVRIC-SL：2.72±0.46；$p<0.01$）。

结论：影响骨折金属内固定患者磁共振图像的因素众多，例如序列的选择、植入物等材质、植入物的数量及大小等。MAVRIC-SL 能有效减少金属伪影，并得到更好的脂肪抑制图像，对于骨关节病变的诊断提供更多帮助，有更高的诊断价值。

EPO-1405
后纤维环 T2 弛豫时间与腰椎间盘突出的相关性研究

张启川,龚明福
陆军军医大学第二附属医院（新桥医院）

目的 探讨腰椎间盘后纤维环 T_2 弛豫时间和腰椎间盘突出之间的相关性。**方法** 采用 3.0T 磁共振成像系统对 54 例腰痛受试对象共 256 个腰椎间盘进行矢状位 T_2WI 和 T_2 mapping 扫描，分析扫描图像并根据椎间盘突出或膨出的程度进行分级及分组；正常椎间盘为 G1 组，存在侧面突出和膨出的椎间盘为 G2 组，存在正中、中间侧面和旁正中局限性后部突出的椎间盘为 G3 组。计算各分组的 Pfirrmann 得分，通过后处理计算得到各纤维环、后 10%椎间盘（posterior annulus fibrosus 10%, PAF-10）和后 20%椎间盘（posterior annulus fibrosus 20%, PAF-20）的 T_2 弛豫时间，进行统计学分析。**结果** 256 个椎间盘中 G1 组 104 个（40.6%），G2 组 116 个（45.3%），G3 组 36 个（14.1%），各组的 Pfirrmann 的平均得分依次为 2.16±0.55、2.59±0.71、3.21±0.74。经过后处理计算，各组椎间盘 PAF-10 和 PAF-20 的 T_2 弛豫时间分别为 G1 组：32.6±5.6 ms/67.8±12.3 ms、G2 组:34.2±5.4 ms /55.6±10.2 ms、G3 组:40.2±7.2 ms /46.9±9.8 ms。PAF-20 的 T_2 值从 G1 到 G3 组逐渐降低，而 PAF-10 的 T_2 弛豫时间呈现相反的变化趋势，从 G1 到 G3 组逐渐升高。和 G2 组比较，G3 组 PAF-10 的 T_2 值明显升高，且和髓核的 T_2 弛豫时间无相关性。而 G3 组 PAF-20 的 T_2 弛豫时间和髓核之间存在一定的相关性。**结论** MR T_2mapping 能对腰椎间盘 T_2 弛豫时间进行定量评估，且 PAF-10 的高 T_2 值与椎间盘突出存在明显的相关性。

EPO-1406
应用 3D-DESS 序列评估膝关节骨性关节炎软骨损伤的可行性及可重复性

占颖莺,方义杰,李绍林,洪国斌
中山大学附属第五医院

目的 探讨应用 T2 加权三维双回波稳态进动序列（3D-DESS）显示膝关节软骨的可行性和可重复性。**方法** 前瞻性搜集膝关节骨性关节炎患者 106 例，分别采用脂肪抑制质子密度加权序列（PDWI-FS）、自旋回波 T1 加权序列（SE -T1WI）和 T2 加权三维双回波稳态进动序列（3D-DESS）分别进行膝关节扫描。首先，2 名放射科医生按照预先设定的评分标准通过双盲法分别对图像质量进行主观评分，比较评分一致性。然后，分别测量不同序列上膝关节软骨的信号噪声比（SNR）、关节液的信号噪声比（SNR）和软骨-关节滑液的对比度噪声比（CNR），比较不同序列显示膝关节软骨的效果。最后，2 名放射科医生分别应用三个序列对膝关节软骨损伤情况进行半定量诊断，分析诊断一致性。 **结果** 2 名放射科医生对图像质量的主观评分一致性结果显示，三个序列（PDWI-FS、SE -T1WI、3D-DESS ）主观评分一致性较好（kappa 值分别为 0.756、0.823、0.879，均>0.6），其中 3D-DESS 序列最高，且差别具有统计学意义（P<0.05）。客观测量结果显示，3D-DESS 序列的关节液 SNR、软骨 SNR、软骨-关节滑液 CNR 分别为 15.09±3.67、9.43±2.57、5.65±2.34，均高于常规序列，且差异具有统计学意义（P<0.05）。半定量诊断一致性结果显示，2 名放射科医生对 PDWI-FS 序列、SE-T1WI 序列及 3D-DESS 序列的半定量诊断评分一致性较好

（kappa 值分别为 0.805、0.736、0.851），其中 3D-DESS 序列一致性最高，但差异没有统计学意义(*P*>0.05)。 **结论** 3D-DESS 序列较常规序列能更好地显示膝关节骨性关节炎软骨损伤，且具有较好的观察者间一致性。

EPO-1407
数字摄影不同测量方法在骨折矫形中的对比研究

杨奇龙,李刚,孟祥虹
天津医院（天津骨科医院）

目的：比较数字化影像直接测量数据及去除放大率影响测量数据和模型实际测量数据的差异
资料与方法：诊断 X 线机 GE（Discovery Xr656），摄影距离 100cm，摄影条件 50KV，5mas，中心线对胫骨中段，1：测量六组胫骨不同部位骨折的模型矢状面和冠状面骨折移位数据，2：将直径 25cm 金属球放置于胫骨中段平胫骨高度，进行正侧位投照，3 对数字化图像测量矢状面和冠状面骨折移位数据 4：对数字化影像金属球直径测量，减去金属球实际直径，计算放大率后再计算影像一比一数据，5：骨折移位测量方法：选取骨折处两端骨皮质做延长线，测量其垂直移位，所有测量数据都由此方法测量
结果：应用统计学软件 SPSS 13.0 进行比较，正位实际测量与模型测量相比 F 值为 18.482，两者有统计学差异（P＜0.05），组内相关系数为 0.997；正位去放大率测量与模型测量相比 F 值为 1.570，两者无统计学差异（P＞0.05），组内相关系数为 1；正位实际测量与模型测量有差异，去放大率测量与模型测量无差异；侧位实际测量模型测量准相比 F 值为 9.629，两者有统计学差异（P＜0.05）组内相关系数为 0.999，；侧位去放大率测量与模型测量相比 F 值为 0.412，两者无统计学差异（P＞0.05），组内相关系数为 1；侧位实际规测量与模型测量有差异，去放大率测量与模型测量无差异
结论：在不同类型胫骨骨折矫形治疗中，数字摄影准确计算放大率的方法其数据准确性高于数字摄影直接测量数据，为临床矫形提供可靠依据，本研究缺点是样本量较小，会扩大样本量并进行临床测量验证此研究的准确性

EPO-1408
双源 CT 对痛风性关节炎尿酸盐结晶检测的临床应用

韩宇欣
天津市第三中心医院

目的：研究双源 CT(DECT)双能量扫描对各关节痛风性关节炎尿酸盐结晶（痛风石）的诊断价值。
方法：回顾性分析 2017 年 4 月至 2018 年 7 月，38 例临床诊断为高尿酸血症痛风性关节炎的患者，病程 3 年至 10 年平均 6.1 年，男（34 例）女（4 例）比例为 8.5∶1， 平均年龄(50.4 ± 11.5)岁。其中手关节 3 例，肘关节 2 例，膝关节 2 例，足 31 例。所有患者均为双侧关节同时经 DECT 双能量扫描，扫描参数：A 球管 80 kV/250 mAs，B 球管 140 kV/125 mAs，螺距 0.7；阵矩 512 × 512，平均加权系数 = 0.4，卷积核值 D = 34 s，启动实时动态曝光剂量调节 CARE Dose 4D。重建参数：层厚 0.75 mm，层距 0. 5mm。将获得的 80 kV、140 kV 及平均加权 120 kV 三组数据传输至 MMWP 工作站，加载入 GOUT 软件内，应用程序内的痛风分析软件进行痛风结节评估，以轴位、冠状位、矢状位及容积再现（VR）技术重建形式显示有无尿酸盐结晶（痛风石）的绿色标

记图，分析 DECT 对慢性痛风性关节炎患者痛风石检出率。检测痛风结石作绿色标记（皮肤、指甲及足跟等部位不纳入标记区域），紫色标记松质骨。由 5 年以上医师记录绿色标记区域的位置，观察其周围软组织肿胀情况。
结果:DECT 双能量检查对痛风性关节炎痛风石的检出率为 60.5% (23/38)；检出痛风石 71 处，其中 53 处发生在第一跖趾关节处;15 例高尿酸血症未检测出痛风石。所有患者疼痛关节中骨质破坏缺损 9 处，关节周围软组织肿胀 16 处。
结论: DECT 双能量扫描对痛风性关节炎痛风石敏感性高，并且可以直观无创地显示患者检测部位尿酸盐结晶的沉积情况，可应用于痛风病情的监测，具有重要的临床推广应用意义。另外 DECT 痛风石成像常出现伪影，指甲和皮肤处较常见，了解这些伪影的特点有助于提高诊断的准确率。

改良髌骨轴位摄影角度的关联性探讨

蔡晓松,肖占森
北京市房山区第一医院

目的 探讨膝关节仰卧水平侧位摄影中，股胫角、股胫外角和胫前髌后角与水平髌后角、水平胫骨角和水平股骨角的关联性，从而指导髌骨轴位摄影的入射角度。**方法** 选取 100 例患者进行膝关节仰卧水平侧位摄影，屈膝角度在 135° 时，分别统计上述各角度对应的数据，对测量数据进行相关分析和回归分析。**结果** ① 屈膝在 135° 时，以股胫角在 112.1°-146.7° 范围内，股胫角和水平髌后角、水平胫骨角、水平股骨角存在直线相关关系，r=Pearson 相关系数为-0.471，-0.818 和-0.801，统计量 F 及 P 值分别为 27.948,198.376,175.455，P＜0.001；线性回归模型分别为 Y=141.060-0.560X，Y=164.172-1.318X 和 Y=161.984-1.286X；② 股胫外角在 33.3-67.90 范围时股胫外角与水平髌后角、水平胫骨角、水平股骨角存在直线相关关系，r=Pearson 相关系数分别为 0.471，0.818,0.801，统计量 F 及 P 值分别为 27.948，198.376，175.455，P＜0.001；线性回归模型分别为 Y=38.940+0.560X；Y=15.828+1.318X 和 Y=18.106+1.286X。③胫前髌后角在 4.20-25.40 时，胫前髌后角与水平髌后角存在直线相关关系。r=Pearson 相关系数为-0.709，统计量 F 及 P 值分别为 85.217，P＜0.001；线性回归模型分别为 Y=21.36-0.491X。胫前髌后角与水平胫骨角和水平股骨角无直线相关关系。④对 58 例髌骨轴位患者影像中，优片 53 例，占 91.3%；良片 4 例，占 6.8%；差片 1 例，占 1.7%。**结论** 股胫角、股胫外角及胫前髌后角与水平髌后角存在直线相关性，髌骨轴位摄影中可根据膝关节屈曲角度，求出相应的水平髌后角，进而得到 X 线入射角度。

EPO-1410

超短时间回波（UTE-MRI）及 T2*mapping 序列对颞颌关节紊乱（TMD）中关节盘定量分析评价

冀宾
深圳大学总医院

目的：应用磁共振超短回波时间(ultrashort echo time,UTE)及双回波脉冲序列 T2*mapping 定量评价颞颌关节紊乱患者及正常对照组中关节盘 T2 值、关节盘信号及运动移位情况改变，用于识别及评价 TMD 关节盘损伤的早期特征信号。
方法：常规序列观察盘突关系，髁突骨质改变，关节腔积液，关节盘形态改变，并进行 UTE-MRI 及 T2* mapping 序列颞颌关节定量分 25 例临床确诊为 TMD 患者及相匹配的正常对照组 25 例。采用 t 检验左右两侧关节盘自身比较及 TMD 组与正常对照组的 T2 值定量差别。

结果:常规序列虽能较好的显示盘突关系，髁突骨质改变，关节腔积液，大多数关节盘的形态学参数评价良好，但 UTE 序列能将低信号的关节盘显示为高信号，特别是对于常规序列无法识别的关节盘的显示，UTE 序列能更好的观察关节盘的移位关系；25 例中其中 21 例双侧关节盘前移、2 例左侧前移、2 例右侧前移；25 例中其中 9 例伴有少量关节腔积液；25 例中 19 例髁突骨质改变；并由 3 个经验丰富的独立人单独各评估关节盘感兴趣区域(ROI)的 T2 值。自身对照双侧颞颌关节关节盘无统计学意义（TMD 组 P＞0.05；正常对照组 P＞0.05）。TMD 组与正常对照组 T2*值平均值分别为(27.6±5.4)ms 和(32.76±8.41)ms,两者差异有统计学意义(P<0.05)。
结论：磁共振超短 TE 回波脉冲序列可用于 TMD 的关节盘的定量研究 ， (UTE)多回波脉冲序列成像可使传统 MR 成像序列不能显示信号或表现为低信号的主要含短 T2 成分的组织显示出来并检测到其信号，不仅可以更好的诊断关节盘移位、髁突的骨质改变，其 T2*mapping 技术对 T2 值的测定可以早期、敏感地反映软骨水含量和生化成分的改变，成功实现对关节盘的定量分析，为今后广泛开展关节盘损伤定量研究提供了新途径。

肢体细小玻璃异物在影像学中的显示

吴锦华,吴俊
贵州省人民医院

【摘要】目的 人们在日常生活和工作中会有意外被玻璃物品刺伤，但在清创过程中，体积相对较大的异物被清除出体外，细小异物因显示不明显而存留于体内。被细小玻璃异物存留后会有不同程度的异物感，细小玻璃异物在影像学检查设备中的不同表现，可以指导临床选择对细小玻璃异物敏感显示的检查项目，影像学对细小玻璃异物的检查项目有：DR、CT、MR 及钼靶。选择正确的检查设备项目，不仅可以显示异物是否存在，还可以显示异物的数量、大小、多少等等。
材料与方法 患者在日常生活中被普通玻璃物品意外爆炸伤或刺伤后，临床清创前/后需对创伤部位进行影像学检查，临床要求检查申请单可能有:（1）首先 DR，（2）CT, (3)MR, (4)钼靶。（1.2）利用 DR X 线机对创伤部位进行低千伏 X 线正位、侧位、创口切线位摄影；（2.2）利用 CT 机对创伤部位进行横断面扫描后、再进行冠状面及矢状面后处理；（3.2）利用 MR 机对创伤部位进行横断面、冠状面、矢状面进行扫描；（4.2）利用钼靶 X 线机对创伤部位进行正位、侧位、创口切线位摄影。
结果 在钼靶 X 线机摄影中清晰显示的细小玻璃异物；在 MR 检查中未发现异物影；在 CT 扫描中降低千伏后隐约可见；在 DR X 线机常规曝光条件摄影中亦不可显示，利用 DR 设备最低千伏值并适当增加毫安摄影隐约可见异物影。
讨论与结论 DR、CT 及钼靶检查是利用异物吸收 X 线量的多少而显示的，DR 及 CT 设备的最低千伏值都超过 40KV,为硬 X 线，能穿透细小异物不被吸收，钼靶设备的千伏值一般为 25-35KV,为软 X 线，易被细小异物吸收，MR 是通过静磁场使人体组织中的氢质子收到激励而发生核磁共振现象，是利用氢质子在驰豫过程中感应出的 MR 信号而成像的，普通玻璃的主要成分为:Na2SiO3、CaSiO3、SiO2,
而普通玻璃中没有氢离子，所以细小玻璃异物在 MR 检查中不显示。

3D MEDIC WE 和 3D SPACE STIR 磁共振序列在腰丛神经根成像的对比研究

李爽,孙峥,孙思远,戎冬冬,张苗,李坤成,卢洁
首都医科大学宣武医院

目的 本文旨在结合 3D MEDIC WE 和 3D SPACE STIR 序列提供显示神经根纤维束的对比研究方法，提供合理选择 MR 序列的效价比。**方法** 20 例患者行 3D MEDIC WE 和 3D SPACE STIR 序列的腰丛神经根成像，最大密度投影（MIP），曲面重建（CPR）用以定性评价图像质量；多平面重组（MPR）用以充分显示神经根结构，定量测量两序列图像质量参数 SNR，CNR 以及 CR。**结果** 3D MEDIC WE 和 3D SPACE STIR 两种序列均能不同程度清晰显示腰丛神经根。3D MEDIC WE 对比 3D SPACE STIR 序列，影像评级占优（60 vs.55, P<0.05）；3D SPACE STIR 对比 3D MEDIC WE 序列，SNR（58.37±11.81vs. 10.71±0.80），CNR（28.05±7.85 vs. 2.79±0.40），CR（6.75±0.63 vs. 1.31±0.05）(P<0.05)占优。两序列联合诊断敏感性 92.7%，特异性 97.3%，准确率为 92.7%。**结论** 3D MEDIC WE 和 3D SPACE STIR 序列应用于神经根成像效果显著，可不同程度不同重点直观清晰显示腰丛神经根走行及局部解剖细节，影像技术操作应考量图像可读性并结合图像技术参数为临床提供影像支持。

双能量 CT 成像在脊柱转移瘤中研究进展

徐驰杰[1],崔磊[2],邓小毅[1]
1.张家港澳洋医院
2.南通大学附属第二医院

【摘要】：脊柱是骨转移瘤最常见部位。影像学检查是其诊断的主要检查手段，其中 CT 对骨质破坏显示较好，但其对骨髓浸润灵敏度不高，容易遗漏一些早期隐匿性病变。双能量 CT 成像技术在常规 CT 基础上还能进行骨髓成像，使其在脊柱转移瘤中应用越来越广泛。本文对双能量 CT 成像技术主要成像方法及其在脊柱转移瘤的研究进展进行综述。

双能量 CT 成像技术主要方法：

1.1 **骨髓水肿**

相较于常规 CT，双能量 CT 能通过收集两个不同能级的 CT 数据集对物质的混合成分进行分解，根据物质原子量及电子密度、X 线束不同程度的吸收和衰减、特征性双能量指数，通过颜色编码区分不同物质的化学成分。基于这一成像原理，放射科医生可以通过对伪彩图、灰阶图以及三维重建图进行综合评估，在显示解剖细节及骨髓水肿情况下识别脊柱转移瘤，从而提高脊柱转移瘤的诊断效能。

1.2 **虚拟单能量曲线及斜率**

双能量 CT 是根据能量衰减变化，利用从两种不同材料 X 射线能量中获取的不同图像数据集，对材料进行能量分析。双能量 CT 虚拟单能量成像提供了不同物质在不同能级下的 CT 值及能量曲线特征，为虚拟单能量曲线在转移瘤的临床应用中提供了依据。相比于常规 CT 只能产生单一参数图像，双能量 CT 在一次扫描检查中可以提供不同能级数据，将 CT 扫描从单参数成像转变为多参数成像，为疾病的评估提供了新的手段。

1.3 骨-碘物质分离

双能量 CT 能将骨和碘两种不同物质成分进行分割并重建骨-碘图，使 CT 图像能够将碘从骨中分离出来，用于脊柱转移瘤的定性及定量分析。与常规 CT 相比，骨-碘物质分离技术能更直观地反应病灶组织内的碘浓度差异，更敏感地显示细微强化病灶，并通过量化分析评估病灶内血供情况。

综上所述，双能量 CT 的多成像技术对脊柱转移瘤具有较好的应用价值。我们相信，在不久的将来，随着应用的进一步增多，其在诊断脊柱转移瘤方面会有更多的优势，为临床治疗决策的选择提供帮助，提高患者预后生活质量。

双能量 CT 虚拟单能量成像在鉴别脊柱良恶性压缩性骨折中应用价值

徐驰杰,邓小毅,赵承勇,曹国平,孔玲玲
张家港澳洋医院

目的 本研究旨在探讨双能量 CT 虚拟单能量成像在脊柱溶骨型转移瘤所致恶性压缩性骨折与良性压缩性骨折中的鉴别诊断价值。
方法 本研究前瞻性纳入脊柱压缩性病变患者，进行双能量 CT 扫描，根据病理及随访最终诊断，分为溶骨型转移瘤所致恶性压缩性骨折和良性压缩性骨折两组。分析病灶椎体虚拟单能量不同能级下 CT 值及能量曲线斜率。通过 ROC 曲线，比较虚拟单能量成像对脊柱溶骨型转移瘤所致恶性压缩性骨折、良性压缩性骨折的鉴别诊断效能。
结果 共纳入脊柱压缩性病变患者 51 例，其中为溶骨型转移瘤所致恶性压缩性骨折 21 例（共 50 个椎体）、良性压缩性骨折患者 30 例（共 37 个椎体）。脊柱溶骨型转移瘤所致恶性压缩性骨折与良性压缩性骨折的虚拟单能量曲线斜率均随着 Kev 值的增加而降低，且脊柱溶骨型转移瘤所致恶性压缩性骨折在虚拟单能量不同能级下（40-120Kev）CT 定量值、曲线斜率均低于良性压缩性骨折($P<0.001$)。ROC 曲线结果显示，在 120Kev 能级下 AUC 值最高为 0.882，其诊断敏感性、特异性分别为 95%、76%。另外，虚拟单能量曲线斜率测得 K=2.20 时 AUC 值最高为 0.792，相应敏感性为 89%。
结论 通过虚拟单能量下 CT 值、能量曲线分析可以鉴别脊柱溶骨型转移瘤所致恶性压缩骨折与良性压缩性骨折，具有较高的临床应用价值，推荐使用 120Kev 能级显示效果较佳。

Evaluation of prosthetic complications and tumor recurrence with the single energy metal artifact reduction algorithm in patients with hip tumor prostheses

Fangling Zhang[1],Lei Ding[2],Ling Ma[2],Zhaohui Zhang[2],Quanfei Meng[2]
1.Affiliated Stomatological Hospital of Sun Yat-Sen University
2.The First Affiliated Hospital of Sun Yat-Sen University

Purpose: To evaluate the effect of the single energy metal artifact reduction (SEMAR) algorithm with a 320 Multidetector computed tomography (MDCT) volume scanner on complications and tumor recurrence detection in patients with hip tumor prosthesis. Materials and methods: From February 2016 to June 2019, 45 consecutive patients with tumor prostheses of hip joint underwent 320-MDCT scan. Prosthetic complications and tumor recurrence were confirmed by other imaging examination, clinic or pathology. The images were reconstructed by two different methods: iterative reconstruction (IR) alone and IR associated with SEMAR. Two radiologists visually graded the diagnostic confidence on a 6-point ordinal scale from 0 (lesions are completely obscured by metal artifact) to 5 (lesions are recognized with high confidence). Standard deviation (SD)

of CT attenuation defined as the index of artifact (AI) were compared between the two reconstructed methods. Paired sample t test was performed with AI values of the ROIs on without/with SEMAR images. Wilcoxon matched-pairs signed rank test were used to compare the scores of lesions without/with SEMAR. A p value less than 0.05 was considered statistically significant.
Results: Reviewers 1 and 2 detected 15 and 10 more lesions with SEMAR, respectively. The mean score of prosthetic lesions without SEMAR was 19.2 ± 4.3 and 22.0 ± 2.7 for reviewers 1 and 2; with SEMAR the score was significantly higher, 35.7 ± 2.3 and 37.9 ± 2.8, ($p < 0.05$). The artifact of the SEMAR images was lower than that of the IR images (19.28 ± 5.96 vs 143.50 ±87.28 HU, $P < 0.001$).
Conclusion: The SEMAR can significantly reduce the metal artifact and increase diagnostic confidence of prosthetic complications and tumor recurrence in patients with hip tumor prostheses.

动态容积灌注 CT 定量评价糖尿病足血流情况

冯馨乐
中南大学湘雅医院

目的：利用动态容积灌注 CT 系统地针对糖尿病足发生、发展的病理基础，得到相应的灌注参数，从而预测糖尿病足的发生及预后，为临床治疗提供指导。
方法：
一、按纳入标准筛选后将所有出现糖尿病足症状的患足作为一组，将无糖尿病无动脉大血管疾病的足作为正常对照组（依托单位有部分外伤患者行双足灌注 CT 成像评估远端血供情况，可将其未受伤正常侧足未作正常对照组），两组行 CTP 检查并将数据导入工作站后处理软件，生成伪彩图，取 ROI 测量患足组灌注异常区各参数值，在正常足组每只足灌注图上取相应位置 ROI，测出各参数值并记录。两组参数值采用配对 t 检验，结果是否差异具有统计学意义。
二、按纳入标准筛选后将对象分为正常对照组、有症状无溃疡组、溃疡组、截肢组四组，分别行 CTP 检查经后处理生成伪彩图，后三组分别于灌注异常区取 ROI，并在正常组相应位置取 ROI，测量并记录各参数值，采用单因素方差分析法，分析四组间 CTP 灌注参数的差异。
结果、结论：预测糖尿病足各组数据较正常足灌注减低，且按进展程度的不同表现不同。

低管电流联合 idos4 迭代重建技术对腰椎骨密度 CT 的临床应用

刘娜
成都市第三人民医院

【摘要】 目的：通过降低管电流来降低辐射剂量，从而得到腰椎骨密度(BMD)准确度的可行性。方法：应用飞利浦 256iCT，在 4 种不同的剂量条件下（管电压 120 kV，管电流 60、100、140 和 180 mA），将 40 岁到 80 岁的 120 例患者随机分为 4 组进行扫描，并进行 idos4 迭代重建。应用 EBW 工作站中的 Bone Mineral Density 软件分别在 L1、L2、L3 和 L4 正中间置感兴趣区(ROI)，将患者的肌肉和脂肪组织用作内部参考，测量其 T 分数值。结果：在不同辐射剂量、同一迭代权重下，ESP(L1、L2、L3 和 L4)的 BMD 差异均无统计学意义(P>0.05)。腰椎 BMD 准确度误差均在 5%以内。

结论： 120 kV、60 mA 低剂量条件下，不影响 BMD 准确度，实现了腰椎骨密度的准确测量，并显著降低辐射剂量，为临床评估患者骨质疏松提供了有效的参考价值。

磁共振 3D-cube 在膝关节各韧带的定性研究

陈威
渝北区重庆医科大学附属第三医院（捷尔医院）

研究磁共振 3D-cube 在膝关节韧带中的临床应用。
方法：50 例患者（20 个膝关节）行常规 MRI 扫描加 3D-cube 扫描，通过多平面成像（Multi-planar reformation, MPR）对所有病例的膝关节二维和三维图像进行重建，依据韧带的边缘及附着点，由两位放射科医生按照膝关节韧带等级评分独立进行评估。
结果：髌韧带、后交叉韧带、前交叉韧带、外侧副韧带能够被清晰的显示，内侧副韧带显示欠佳，横向韧带（如髌骨内侧、外侧支持带）与后韧带（如腘斜韧带）不能够显示。
结论：磁共振 3D-cube 可较清晰的呈现维持膝关节稳定的主要韧带，是一项有价值的呈现膝关节主要韧带的新方法。

EPO-1419

DTI 在颈椎间盘突出症致臂丛神经受累中的应用

徐睿,康新国,何玺,刘昌杰,曾宪春
贵州省人民医院

目的 探讨 DTI 对颈椎间盘突出所致臂丛神经受累病变的应用价值。

方法 选择臂丛牵拉试验阳性，存在单侧颈椎间盘突出患者（病变组）及健康成人（健康组）各 10 例，分别行 DTI 扫描后测量病变组患侧、健侧以及对照组同病变组患侧的臂丛 FA 值和 ADC 值，并行臂丛 DTT 成像。比价两组资料中三者的 FA 值和 ADC 值。

结果 病变组患侧、健侧以及对照组同病变组患侧的臂丛 FA 值和 ADC 值比较，分别行成组 t 检验，差异存在统计学意义（t=4.13，p＜0.05；t=4.52，p＜0.05）。通过进一步两两比较，健康对照组和病变组患者同侧对应的臂丛束的平均 FA 值和 ADC 值存在差异（P 值均＜0.05），病变组患侧臂丛的 FA 值显著低于健康对照组的，ADC 值显著高于健康对照组；病变组患者健侧与患侧对应的臂丛束的平均 FA 值和 ADC 值存在差异（P 值均＜0.05），病变组患侧臂丛的 FA 值显著低于健侧，ADC 值显著高于健侧；病变组患者健侧与健康对照组同侧臂丛的 FA 值和 ADC 值没有显著性变化（P＞0.05）。

结论 臂丛 DTI 成像，可以显示臂丛神经解剖形态及走行，并可通过量化分析，提供神经根病变的定量数据，更能反映出导致患者临床症状的臂丛神经情况。

EPO-1420

四肢孤立性纤维性肿瘤 MR 影像分析

张建英
中国科学院大学重庆医院（重庆市人民医院）

目的：分析发生于四肢的孤立性纤维瘤 MR 平扫和增强的影像学表现，探导其影像学诊断价值。
方法：回顾性分析 7 例经手术病理证实的四肢孤立性纤维瘤，7 例全部术前经 MR 动态增强检查。所有病例影像资料均经 2 名高年医师分析阅片，分析病灶边界、大小、内部信号特点和强化程度、血供情况、对邻近结构的侵犯、是否合并转移等，并与手术病理进行对照。
结果：7 例孤立性纤维瘤病例中，发病年龄 19-80 岁，主要集中在中老年；女性 4 例，男性 3 例。肿瘤大小不等，直径 1-39cm,平均约 8cm,<5cm 1 例，5—10cm 4 例，>10cm 2 例。病灶边缘多光滑，境界清楚。瘤体呈卵圆形或类圆形 5 例，梭形 2 例；3 例肿瘤信号相对均匀或略不均匀，4 例可见不规则坏死区。较小病灶形态规则，巨大病灶多呈分叶状。主要 MRI 表现为 T1WI 上肿瘤呈等、稍低信号，1 例呈稍高信号； T2WI 信号变化多样，分别表现为高信号、略高信号和低信号区，高信号反映肿瘤黏液样变区，略高信号反映肿瘤细胞密集区，低信号反映致密胶原纤维。增强扫描 5 例呈明显强化，2 例呈轻中度强化，坏死区不强化。 病理学检查提示肿瘤均由梭形细胞构成， 免疫组化染色 CD34、CD99 阳性，3 例 BCL-2 阳性。
结论：SFT 典型影像学表现包括：肿瘤多呈卵圆形或类圆形，境界清楚，瘤内 MR T2WI 信号不均匀，T2WI 等或略高信号中存在片状或结节状低信号是大多数 SFT 典型 MR 表现，动态增强强化明显。

DR 及 CT 联合评价地诺单抗治疗骨巨细胞后疗效的应用

陶海波
昆明医科大第三附属医院

目的 探讨 DR 及 CT 对地诺单抗治疗骨巨细胞瘤效果的应用评价。
方法 2018 年 6 月至 2019 年 6 月入我院治疗的骨巨细胞瘤患者 12 例，地诺单抗治疗前后均行 DR 及 CT 检查。患者平均年龄为 31.3（ 18～48 ）岁，男 7 例，女 5 例。病变位于骶骨或骨盆 3 例（ 骶骨 1 例，髂骨和坐骨各 2 例 ），位于四肢骨 9 例（ 胫骨 3 例，桡骨 2 例，肱骨、股骨各 2 例 ）。采用 DR 及 CT 骨创评价骨包壳形成、CT 软组织窗测量肿瘤最长径及 CT 增强强化增加值变化评价地诺单抗用药后的变化。
结果 ①用药后 DR 及 CT 骨窗较用药前均显示骨包壳形成（P＜0.01）②用药后 CT 软组织窗测量肿瘤平均最长径较用药前变小（P＜0.01）。③用药前病灶 CT 平均增加强化值 60.8，用药后病灶 CT 平均增加强化值 40.6，用药后 CT 增加强化值降低 (P＜0.01)。
结论 地诺单抗治疗后，DR 及 CT 骨窗显示骨包壳形成，显示了病变内新生骨形成；CT 增加强化值得减低显示骨巨细胞瘤病变治疗后血运降低；肿瘤长径的变小是地诺单抗治疗效果直接的反应。

5 例躯干体壁滑膜肉瘤的影像学特征

王启蒙,李相文
大连医科大学附属第二医院

【摘要】目的 总结原发性躯干体壁滑膜肉瘤的影像学特征，提高对该病的认识。方法 回顾性分析经病理证实的 5 例原发于躯干体壁的滑膜肉瘤影像及临床资料，重点分析其影像学特征。结果 5 例中，胸壁 1 例，腹壁 3 例，盆壁 1 例。CT 平扫病灶呈等低密度，增强扫描呈不均匀强化；2 例病

灶边缘可见斑点状钙化灶。其中一例 MRI 检查显示病灶在 T_2WI 上呈高、稍高、低混杂信号。结论 躯干体壁滑膜肉瘤影像学表现与其他部位表现相似，由于该病的恶性程度高，侵袭性强，在初诊时应综合 CT 及 MRI 表现，做出诊断并评估病灶对周围组织的侵犯情况。此外，该病局部复发率高并且多发生晚期转移，后期应长期密切随诊。

【关键词】原发性躯干体壁 滑膜肉瘤 体层摄影术 X 线计算机 磁共振成像

骨肿瘤影像学检查规范

强骁
吉林大学第二医院

目的：提高各类影像学检查对骨肿瘤诊断的准确率，进一步规范扫描方法。方法：系统性查阅近年文献资料，并结合我院放射线科扫描经验，对原发性骨肿瘤的影像学检查方法提出最佳的处理模式。结果：对原发性骨肿瘤的扫描图像提出一种合理的图像处理方法，研究最佳扫描模式。，X 线平片还能够整体观察病变概况，明确判定病变的部位、范围、形态和密度改变，判别骨质破坏、增生硬化和骨膜反应的性质、软组织肿块、肿瘤骨与肿瘤钙化等。CT 通常采用螺旋扫描，重建层厚 1mm 以下，对图像进行骨算法及软组织算法重建，最佳矩阵 1024×1024。2、必要时使用增强扫描。增强扫描层厚参数与平扫一致，采用软组织重建算法。3、骨算法重建是 CT 计算机重建图像的一种计算方式，空间分辨率明显提高，图像细致清楚，层次丰富，提高骨质与周围结构的对比，使骨皮质及骨小梁结构显示清晰，细微的骨折线也能显示出来。适用于二维 MPR 重组。4、CT 增强扫描。增强扫描是通过反映血供程度和血流灌注水平在不同组织和同一组织不同部分间的差别，提高病变与正常组织间的对比度，进而提高病变的检出率，对疾病的定位、定性及鉴别诊断起着重要的作用。MRI 检查对于不同疾病应用不同的扫描序列，以达到病变显示的最优化。1、T1/T2 序列主要观察肿瘤内部成分；2、T2 脂肪抑制序列用于鉴别脂肪性病变和瘤周水肿，帮助临床确定手术切除范围；3、T1 脂肪抑制增强序列可以对 T1 脂肪抑制序列进行增强处理，观察病灶强化方式，评估肿瘤性质；4、DWI 序列用于评估肿瘤良恶性，测量 ADC 值；5、Gd-DTPA 增强扫描。由于 Gd-DTPA 具有缩短 T1 的作用，所以常先使用 MR 平扫 T1WI 及 T2WI，然后作增强的 T1WI。肌骨系统 Gd-DTPA 的常用剂量为 0.1mmol/kg。结论：本文从影像学多种检查的各类图像处理结果分析骨肿瘤的影像学诊断进展，总结最佳的扫描策略。

腱鞘巨细胞瘤与色素沉着绒毛结节性滑膜炎的 MRI 诊断

张慧芳
赣州市人民医院

【摘要】：目的 分析腱鞘巨细胞瘤与色素沉着绒毛结节性滑膜炎的 MRI 特征,及 MRI 在两者鉴别诊断中价值。**方法** 回顾性分析 52 例经手术病理证实的腱鞘巨细胞瘤及 PVNS 患者，术前均接受 MRI 检查，其中 17 例行增强扫描。2 名有骨关节系统影像诊断经验的医师对病灶的部位、形态、大小、信号特征、强化方式、邻近结构改变进行分析。**结果** 57.7%(30/52 例)的患者为局限性腱鞘巨细胞瘤型，病灶主要位于手足部(占 67 %)，MRI 表现为境界清晰的结节状的长/等 T1 稍长 T2 信号；17.3%(9/52 例)的患者为弥漫性腱鞘巨细胞瘤型，病灶主要位于足部(占 44 %)，MRI 表现为边界欠清的结节状或团片状长 T1 稍长/短 T2 信号；25%(13/52 例)的患者为色素沉着绒毛结节性滑膜

炎，病灶主要位于膝关节(占 54 %)，MRI 表现为关节腔内弥漫性肿块影,呈长 T1 短 T2 信号，其内大量增生的滑膜组织，易累及周边结构。**结论** MRI 检查有助于显示肿块的信号特征、范围及与周围组织结构的关系，有助于腱鞘巨细胞瘤与色素沉着绒毛结节性滑膜炎的鉴别诊断。

EPO-1425

胫骨骨性纤维结构不良影像、病理再认识

侯凯
昆明市延安医院

目的：分析胫骨骨性纤维结构不良（OFD）的影像、病理。**方法**：回顾性分析 7 例临床资料完善的 OFD 病例，分析 WHO（2013）骨肿瘤分类下，骨性纤维结构不良的影像、病理特点，以及与临床上非常容易混淆的骨纤维结构不良、非骨化性纤维瘤的鉴别诊断。**结果**：骨性纤维结构不良好发于儿童，复发率极高，其影像表现主要为 6 例患者为胫骨上段前缘骨干骨皮质下的囊状多房性、膨胀性、溶骨性病变，多房病灶间为宽窄不等的骨性间隔。所有例病灶边缘有硬化边，均未见骨膜反应及软组织肿块。6 例病灶凸向髓腔累及骨松质。MRI 表现不一 6 例均见条带状低信号间隔；6 例病灶增强明显强化。镜下：病变由纤维组织和骨小梁构成，纤维组织疏密不等，病灶中央纤维成分较多、骨小梁相对较少，周边见丰富宽窄不等骨小梁，纤维成分相对较少。4 例骨小梁周围有较多骨母细胞、破骨细胞围绕，2 例偶见骨母细胞（可能与取材有关）。5 例免疫组化标记角蛋白系列抗体(CK19、CKpan、CK5/6、CKHMw 阳性率分别为 63.2%、100%、100%、100%），且高分子量角蛋白表达较强。**结论**：1.因为大多数骨肿瘤命名为音译而来，故往往有多种翻译，如 FCD 又称为干骺端纤维性缺损；FD 又称为骨的纤维结构不良、纤维结构不良、纤维异样增殖症、纤维性骨结构不良症、骨纤维性发育不良等。以往有学者认为 FCD 有两个发展趋势，一个方向是 NOF，另一个方向是骨化性纤维瘤（OF）。现 WHO（2013）将 NOF 中小的不累及髓腔的病变归为 FCD。ODF 与 FD 影像、病理极为相似。2.OFD 虽与 FD 在影像表现及病理上极为相似，但是二者性质差别较大，对临床及手术指导极其重要，前者发病年龄较小，10 岁前手术复发率接近 100%；后者相对发病年龄较大，复发率相对较低。OFD 发病率远小于 FD，加深对 OFD 影像及病理的认识、根据现有影像学检查提高对 OFD 诊断正确率，将对患者及临床起着较为积极的作用。

EPO-1426

骨母细胞瘤的影像表现特征

黄晓琳
广西中医药大学第一附属医院

目的
探讨骨母细胞瘤的 CT 和 MRI 表现特征。
方法
回顾性分析经手术病理证实的骨母细胞瘤 21 例，术前行 MRI 和（或）CT 检查。MRI 检查使用 T1WI、T2WI 及 T2 抑脂序列进行平扫，增强采用 T1 抑脂序列。CT 扫描采用横断面平扫加增强，矩阵 512×512，管电压 120 kV，采用自动管电流调制技术。
结果
21 例骨母细胞瘤中，良性骨母细胞瘤 11 例，侵袭性骨母细胞瘤 10 例。6 例发生在脊椎（1 例颈椎、2 例胸椎、2 例腰椎、1 例骶椎），其中 5 例发生在椎板，1 例发生在椎板和棘突；7 例发生在长骨（4 例股骨、1 例胫骨、2 例尺骨）；发生在罕见部位肩胛骨 2 例，耻骨、肋骨、软组织内各 2

例；病理表现为显微镜下可见丰富的骨母细胞、间质可见丰富的血管以及丰富的骨样组织相互连接成索状。影像表现为 13 例瘤灶内见钙化及骨化影，良性病变边界清楚，边缘可见完整的硬化边，2 例侵袭性病变边界模糊，形态不规整，周围硬化边不完整。 MRI 检查，T1WI 以低信号为主，T2WI 上信号不均匀，恶性程度高的较大肿瘤以显著高信号为主，钙化及骨化在 T1WI 和 T2WI 均为低信号，增强检查多呈不均匀强化。

结论

CT 和 MRI 能较准确地显示骨母细胞瘤的病变特征，对良恶性骨母细胞瘤定性诊断也有一定的提示作用。

EPO-1427

Synthetic MRI 对前列腺癌骨转移的诊断价值

崔亚东[1,2],林月[1,2],李春媚[1],陈敏[1,2]
1.北京医院放射科，国家老年医学中心
2.北京协和医学院研究生院

目的：本研究旨在探讨应用 synthetic MRI 诊断前列腺癌骨转移的可行性。

材料与方法：本研究共纳入 2018 年 4 月至 10 月于我院进行前列腺 MRI 检查的 26 例患者，其中 4 名经病理诊断为前列腺癌，并经 MRI 和骨显像证实为骨盆骨转移；22 名患者经病理证实无前列腺癌。

所有前列腺 MRI 检查均在 GE SIGNA Pioneer 3.0T 磁共振扫描仪进行，采用 32 通道体相控阵线圈。首先进行常规前列腺 MRI 序列扫描，包括轴位 T1WI、轴位 T2WI、冠状位、矢状位、轴位脂肪抑制 T2WI、轴位 DWI。之后进行 synthetic MRI-MAGiC 序列扫描，扫描参数如下：FOV=30cm；矩阵=320×256；层厚/层间距=4/1mm，采集时间约 4~5 分钟。MAGiC 图像在工作站后处理得到 T1 map、T2 map 和 PD map。在 T2WI 和 DWI 序列勾画感兴趣区（region of interest, ROI）。在前列腺癌患者骨盆骨 DWI 高信号区以及骨显像高摄取区勾画转移灶 ROI。在无前列腺癌患者 T1WI 和 T2WI 图像骨盆骨高信号（接近皮下脂肪信号）区域勾画黄骨髓 ROI，在骨盆骨低-中等信号区域勾画红骨髓 ROI。采用 SPSS 20.0 软件进行统计学分析。应用单因素方差分析比较骨转移、红骨髓、黄骨髓的 T1、T2、PD 值差异。

结果：研究共纳入 11 处骨转移灶，黄骨髓和红骨髓区域各 19 处。骨转移 T1 值显著高于红、黄骨髓（$p<0.001$）。骨转移 T2 值显著低于红、黄骨髓（$p<0.001$）。骨转移 PD 值显著低于红骨髓（$p<0.05$）。但骨转移与黄骨髓之间 PD 值无显著统计学差异（$p=0.089$）。

结论：Synthetic MRI 可用于鉴别骨转移与正常红、黄骨髓。

EPO-1428

非骨化性纤维瘤 21 例影像学征象分析

郑修竹,朱建忠,杨慧
山东第一医科大学第二附属医院

目的 探讨非骨化性纤维瘤的影像学表现，提高对非骨化性纤维瘤诊断与鉴别诊断的准确性。

方法 回顾性分析 21 例经手术病理证实的非骨化性纤维瘤患者的临床及影像学资料。其中 X 线检查 18 例、CT 检查 13 例、MRI 检查 9 例，对患者的性别、年龄、发病部位及影像学征象进行分析。

结果 21 例患者中男性 13 例、女性 8 例，年龄 9~42 岁，平均年龄 16.2 岁。19 例病变位于长管状骨，其中位于股骨下端 7 例，胫骨上端 6 例，胫骨下端 3 例，腓骨上端 2 例，肱骨上端 1 例；2 例位于不规则骨，其中位于髂骨 1 例，肋骨 1 例。19 例长管状骨病变均位于干骺端，呈圆形或椭圆形，偏于一侧生长，其中位于皮质及皮质下 17 例，位于髓腔 2 例，病变长轴均沿骨干长轴方向，其中有 2 例合并病理性骨折。21 例病变呈单房型 5 例，多房型 16 例。按照病变硬化程度进行 Ritschl’s 分阶段，21 例行 X 线或 CT 检查的患者中，A 阶段 6 例，B 阶段 11 例，C 阶段 3 例，D 阶段 1 例。9 例行 MRI 检查的患者中，病变呈长 T1 短 T2 信号 7 例，长 T1 长 T2 信号 2 例。

结论 非骨化性纤维瘤的影像学检查，尤其是 X 线及 CT 的影像学特征对其具有重要的诊断价值，对进一步对病变分阶段有较大意义，结合患者的发病年龄及发病部位可以提高鉴别诊断的准确性。

EPO-1429

Analysis of CT Imaging Features of Primary Sacrococcygeal Chordoma

Fangni Chen,Wei Wang,Li Fan,Yi Xiao,Shiyuan Liu,Chenguang Wang
Department of Radiology and Nuclear Medicine, Shanghai Changzheng Hospital, Naval Medical University, Shanghai, 200003, P.R.China

【Abstract】 **Objective** To raise awareness of CT features and improve diagnostic accuracy by analyzing pretreatment CT imaging of 101 primary sacrococcygeal chordoma (PSC). **Methods** pretreatment CT imaging and demographic of 101 patients with a pathologically confirmed PSC, including age and sex of patients, location, morphology and extent of tumor, were analyzed from December 2011 to April 2019, retrospectively. Independent-Samples T Test was analyzed ages at diagnosis for sex of patients. **Results** The age at diagnosis of 101 patients was 10-78 (58.04±12.59) years, with predilection 45-70 years. Men-women-ratio was 2:1, the age at diagnosis has no difference statistical (P =0.279); another one was a 10-year-old boy. In 101 cases, 96 (95%) presented osteolytic bone destruction, while osteosclerosis appeared in 5 (5%) cases . Three or more than three vertebrae were destroyed in 87 (86.1%). 86 (85.1%) located in the middle line of sacrococcygeal. Lobulated margin appearance displayed in 84 (83.2%). "Metameric segmentation", "rat gnawing sugarcane" and "floating bone fragments" were observed in 82 (81.2%), 80 (79.2%) and 72 (71.3%) respectively. Bilateral sacral nerves were involved in 70 (69.3%), while unilateral sacral nerves were involved in 15 (14.8%). Calcification in tumor, soft tissue mass encroached on paravertebral muscles and "anti-quote" were 53 (52.5%), 51 (50.5%), 49 (48.5%) respectively. Soft tissue mass encased vertebrae in 39 (38.6%), 37 (36.6%) tumors had the blurred boundaries with colorectum. 13 (12.9%) encroached on sacroiliac joint. **Conclusions** The common age at diagnosis of PSC was 45-70 years. PSC apppeared more often in men. CT features of PSC were heterogeneous. Osteolytic bony destruction, more than three vertebrae were destroyed, tumor located in middle line of sacrococcygeal, lobulated margin appearance, "metameric segmentation", "rat gnawing sugarcane", "floating bone fragments" and bilateral sacral nerves involved were common CT imaging features of PSC. Calcification in tumor, “anti-quote” and soft

tissue mass encroached on paraspinal muscles were observed in around half of cases. Soft tissue mass encased vertebrae, and part of tumours had the blurred boundaries with colorectum. Tumor seldom encroached on sacroiliac joint.

EPO-1430

伴发液-液平面骨病变的影像诊断分析

任佳忠,赵航,王敏,郑宁,张孝常
济宁市第一人民医院

目的 探讨伴发液-液平面骨病变影像学表现及影像诊断要点。 **方法** 以收集我院 2017 年 1 月到 2018 年 10 月在我院诊治的 3 例伴发液-液平面的骨病变患者为研究对象。最终诊断为毛细血管扩张型骨肉瘤、动脉瘤样骨囊肿、骨巨细胞合并动脉瘤样骨囊肿。**结果** 动脉瘤样骨囊肿及毛细血管扩张骨肉瘤在 MRI 上均出现了多发的液-液平面，但毛细血管扩张型骨肉瘤表现出骨皮质连续性中断、软组织成分等恶性征象。骨巨细胞瘤合并继发动脉瘤样骨囊肿，其在 MRI 上其内囊性灶内可见少量的液-液平面；但其骨皮质连续，无骨膜反应及硬化边等良性骨肿瘤征象。**结论** 多种性质的骨病变均可伴发液-液平面。毛细血管扩张型骨肉瘤、动脉瘤样骨囊肿、骨巨细胞合并动脉瘤样骨囊肿虽都伴有多发液-液平面但影像学各具有特征性，而 MRI 在诊断上述病变更具优势，同时结合患者临床表现可明显提高本病确诊率。

EPO-1431

下颌骨囊性病变的 MSCT 表现及鉴别诊断

杨海涛
重庆医科大学附属第一医院

目的：提高对下颌骨囊性病变的 MSCT 表现认识及诊断、鉴别诊断能力。
方法：回顾性分析 73 例病理证实的下颌骨囊性病变的临床和 CT 资料。
结果：下颌骨牙源性囊性病变共 65 例，其中根尖囊肿 20 例，CT 表现为根尖周围的类圆形低密度影，边界清楚，根尖吸收；含牙囊肿 7 例，CT 表现为内含牙（阻生牙或埋伏牙），以牙冠侧为中心围绕牙根交界区形成的类圆形或不规则形低密度囊肿，受累牙齿的根尖通常位于囊肿外；成釉细胞瘤共 19 例，单囊者 2 例，CT 表现为边缘规则的局部骨质膨胀性病变，多囊者 17 例，呈皂泡样或蜂房样改变，可见壁结节，增强后病灶分隔、壁结节等实性成分明显强化；牙源性角化性囊腺瘤 19 例，主要 CT 表现为沿下颌骨长轴生长椭圆形低密度影。下颌骨非牙源性囊性病变共 8 例，其中下颌骨骨囊肿 6 例；静止性骨空腔 2 例。
结论：下颌骨囊性病变有不同的影像学特征，CT 检查可用于下颌骨病变的发病部位、骨质破坏形式、内部结构及对邻近结构侵犯情况综合分析，为其诊断和鉴别诊断提供重要依据。

EPO-1432

下肢粘液型脂肪肉瘤的 MRI 影像及相关病理分析

杨欣欣
深圳市第二人民医院

目的：通过探讨下肢粘液型脂肪肉瘤的 MRI 影像学表现及其病理特征，提高对粘液型脂肪肉瘤的认识和术前诊断的准确率。
资料与方法：搜集 10 例经病理证实的粘液型脂肪肉瘤患者的临床和 MR 影像学资料，观察和评价肿瘤的位置、深度、大小、形态、边缘，是否侵犯邻近结构、信号的均匀性、强度及强化表现，并对照病理学结果对影像学特征进行分析。
结果　在 10 例病例中，4 例表现为以长 T1、长 T2 信号为主的肿块,边缘相对清楚,内见间隔和结节样脂肪信号区；间隔主要由包含胶原原纤维的胶原束构成 ；3 例表现为以等或长 T1、长 T2 信号为主的肿块,边缘清楚,内见斑片状短、长 T1 信号,增强扫描呈不均匀强化 ；3 例表现为以长 T1、长 T2 信号为主的混杂信号肿块,边缘不清楚,其内见斑片状脂肪信号,10 例均不伴有邻近骨皮质侵蚀，1 例临近关节积液；其中 4 例增强扫描呈明显不均匀强化，呈网格状或花边样。
结论　下肢肌肉黏液型脂肪肉瘤比较多见,因该肿瘤富含脂肪,常伴有黏液变性或水肿，与其他良性肿瘤鉴别困难，根据其 MRI 表现可以推测肿瘤的组织学分化程度，提高术前诊断准确率，为临床治疗提供可靠的信息。

EPO-1433

SAPHO 综合征的临床及影像表现

张雨涵
陆军军医大学第一附属医院（西南医院）

目的：探讨 SAPHO 综合征的临床表现及影像学特征。**材料与方法：**回顾性分析 27 例 SAPHO 综合征患者的临床及影像表现，并复习文献。**结果：**SAPHO 综合征是累及骨、关节及皮肤的一种慢性疾病。27 例中 20 例主要临床表现为骨、关节肿痛，7 例表现为皮肤脓疱病、痤疮、化脓性汗腺炎等。影像表现均为骨及关节的骨质破坏、硬化、肥厚，髓腔狭窄、消失等慢性炎症性改变，主要累及前胸壁、脊柱及骶髂关节，分别为 23 例、9 例、8 例；累及椎体者表现为椎角炎及终板炎且骨质硬化；18F-FDG　PET/CT 表现受累骨质 FDG 摄取增高、骨显像出现典型“牛头征”等。**结论：**SAPHO 综合征临床表现不具有特异性，但影像如前胸壁骨硬化、骨肥厚等表现较为特征性，应结合临床及影像表现综合分析，提高对本病的认识及诊断正确率。

可动脊柱骨巨细胞瘤的少见影像表现与病理对照分析

郑春红[1],袁慧书[2]
1.福建中医药大学附属第二人民医院
2.北京大学第三医院

目的：探讨可动脊柱骨巨细胞瘤的少见影像学表现，以提高对可动脊柱骨巨细胞瘤的术前诊断准确性。方法：回顾性分析经病理证实的 19 例可动脊柱 GCT 影像表现，分析总结其少见影像学表现及其病理对照分析。结果：19 例可动脊柱 GCT 中 17 例主体位于椎体，2 例主体位于附件；肿瘤分别位于颈椎 8 例，胸椎 8 例、腰椎 3 例；1 例累及 3 个椎体；13 例呈膨胀性、溶骨性骨破坏，CT 上 5 例可见硬化边，而 MR 上 7 例可见低信号环。11 例伴有不同程度压缩性骨折；1 例肿瘤伴有半脱位；1 例肿瘤累及椎间盘。结论：可动脊柱 GCT 主体位于附件的少见；肿瘤周围硬化边及合并钙化少见；累及多个椎体及椎间盘的少见；伴有半脱位的少见。

EPO-1435

手足短管状骨神经鞘瘤文献复习-附 1 例报告

仲玉侨
天津医院

发生于骨内的神经鞘瘤较为罕见，据统计，骨内此肿瘤占所有骨内骨肿瘤的 0.1% ～ 0.2%［1］，多为个案报道，而位于腕掌骨者尚未见报道。现将本院经手术病理证实的 1 例报告如下。

病例资料 患者女，54 岁，10 余年前无意中发现左手第一掌指关节背侧肿物，偶有压痛，劳累后疼痛加重，休息后缓解，未予诊治。近一个月，肿物逐渐增大，且手掌大鱼际处出现肿块，压痛明显。专科检查：左手第一掌指关节背侧可触及一大小约 3cm×2cm 肿物，质韧，表面尚光滑，无明显压痛，肿物可随拇指屈伸活动；左手掌大鱼际处触及一大小约 3cm×3cm 肿物，轻压痛，质硬，表面粗糙，肿物无明显活动度；肿物处皮肤无明显发红及色素沉着；左拇指及掌指关节活动度可，无明显感觉障碍。X 线及 CT 检查示：左手第一掌骨膨胀性溶骨性骨质破坏，骨皮质变薄，局部中断消失，残存骨皮质内緣呈扇贝样改变，骨质略硬化，周围可见软组织肿块影突出。MR 检查示：左手第一掌骨可见不规则膨胀性骨质破坏，达掌指关节面下，病灶突破骨皮质累及周围软组织 ，呈分叶状等长 T1 混杂长 T2 信号。病理检查：巨检：灰白灰黄色软组织一块，大小约 2cm×2.8cm×0.8cm，较破碎。免疫组化：SOX-10(+)，S-100(+)，GFAP(小灶+)，Clusterin(-)。病理诊断：（左手第一掌骨）神经鞘瘤。

EPO-1436

非普通型骨肉瘤的影像学表现

李春燕,黄仲奎
广西医科大学第一附属医院

目的：皮质旁型骨肉瘤、髓内高分化骨肉瘤不需要新辅助化疗，骨膜骨肉瘤术前可辅助化疗可不辅助化疗。小细胞型骨肉瘤、上皮样骨肉瘤、巨细胞瘤型骨肉瘤对传统的骨肉瘤化疗方案不敏感。分析上述非普通型骨肉瘤的影像学表现，有助于临床治疗方案的制定

方法：收集非普通型骨肉瘤病例，分析总结其影像学特征。

结果：皮质旁型骨肉瘤与骨皮质之间有较大的蒂，MRI 有助于评价病灶是否累及骨皮质。骨膜骨肉瘤与骨皮质宽基底相连，MRI 有助于评价病灶是否累及骨皮质及对骨皮质的侵犯范围。髓内高分化骨肉瘤易误诊为骨纤维结构不良，骨皮质的侵犯及软组织块影有助于鉴别诊断。小细胞型骨肉瘤病灶进展快，病灶范围广，早期远处转移。毛细血管扩张型骨肉瘤需与动脉瘤样骨囊肿鉴别，前者骨皮质可有侵犯。

结论：非普通型骨肉瘤有一定的影像学特征，术前预测骨肉瘤的病理类型，有助于指导术前穿刺活检，避免误诊，做到精准治疗，提高患者术后存活率。

EPO-1437

骨孤立性浆细胞瘤的影像学表现分析

祝爽
西南医科大学附属中医医院

目的 探讨骨孤立性浆细胞瘤（SBP）影像表现，以期提高影像诊断准确率。**方法** 收集经手术病理证实的 19 例骨孤立性浆细胞瘤的临床和影像学资料，回顾性分析其影像学特征。**结果** 病灶均为单发，发病部位：脊柱 10 例（胸椎 7 例，腰椎 3 例），扁骨 3 例（上颌骨 1 例，髂骨 2 例），长骨 6 例（肱骨 3 例，股骨 2 例，胫骨 1 例）。大部分病灶为膨胀性溶骨性骨质破坏，边界较清楚，骨皮质不完整，未见骨膜反应。病灶膨胀程度差异较大，内见粗大或细小骨嵴影，伴软组织肿块。MRI 显示 T_1WI 类似肌肉信号，T_2WI 及 STIR 高信号，无骨髓水肿。CT 及 MRI 增强扫描示明显强化。6 例脊柱病灶可见“微脑征”。脊柱外病灶仅 3 例征象类似“微脑征”。**结论** “微脑征”是脊柱 SBP 的特征性表现,脊柱外 SBP 可见骨皮质扭曲呈花边状。CT 及 MRI 表现，对本病的术前诊断有一定的价值。

EPO-1438
探讨脊柱骨原发性侵袭性骨母细胞瘤影像学表现

王鹏
海军军医大学第二附属医院（上海长征医院）

摘要：目的 探讨脊柱骨原发性侵袭性骨母细胞瘤影像学表现。方法:回顾性分析经病理证实的 10 例脊柱骨原发性侵袭性骨母细胞瘤的影像学表现及临床资料，其中男 6 例，女 4 例；年龄 10～51 岁，平均 30 岁。临床症状以脊柱区疼痛为主，其中 5 例并伴随周围神经症状。病程 2 周～6 月，平均 11 周。CT 平扫 8 例，CT 平扫及增强 5 例；6 例 MRI 平扫及增强扫描；5 例同时行 CT 及 MRI 检查。对病灶的部位、骨质改变、形态、密度/信号特点及强化特征进行观察。结果：3 例起源于椎体及附件,7 例起源于附件。CT 表现为膨胀性骨质破坏，病灶内有钙化或骨化，周围见薄壳样硬化带，骨皮质变薄，6 例出现局部皮质中断、消失，所有病例均未见骨膜反应。MR 表现不均匀长 T1 长 T2 膨胀性骨质破坏，部分病变的软组织肿块呈分叶状，增强扫描明显不均匀强化。结论：脊柱骨原发性侵袭性骨母细胞瘤年轻患者多见，好发于脊柱附件，影像学大多表现为膨胀性溶骨性骨质破坏，边界常清晰，伴或不伴硬化边；可伴骨皮质中断、分叶状软组织肿块，多无骨膜反应，多不累及椎间盘；可累及椎管致椎管狭窄。

EPO-1439
典型 Maffucci 综合征 1 例

李经国[1],罗小兰[2]
1.绵阳市第三人民医院
2.德阳市人民医院

患者，男，50 岁，右膝疼痛半月，发现右股骨异常 1 周，患者分别于 1980 年、1987 年、2000 年行右手、右腕部血管瘤切除术。

专科检查：右腕、右手见陈旧性手术瘢痕，右侧腰背部、右侧颈项部、右侧肩部、右前臂、右腕、右手近腕关节处见多发大小约 2cmx3cm 软组织包块，边界不清，活动度可，质软，局部皮肤无红肿破溃，未见明显静脉曲张，无压痛及叩痛。X 线、CT 及 MRI 示：双侧股骨下段及右脚第 2、3 趾近节趾骨内多发性内生软骨瘤，右腕关节-大鱼际皮下多发血管瘤（图 1-7）。

讨论：Maffucci（马弗西）综合征为一种罕见的先天性的软骨发育不良伴多发血管瘤的病变，属于软骨及脉管系统类的肿瘤，病因尚不清楚，一般认为是中胚层的发育异常所致[1]，因软骨与血管均由中胚层衍化而来。该病发生无种族、家族差异，无遗传倾向，男女比例基本相等，多数发生在 30 岁之前，50 岁发病后较少见。

Maffucci 综合征以多发性内生软骨瘤合并软组织血管瘤为特征，其软骨瘤主要依靠 X 线平片诊断，其典型表现为：长骨干骺端及指趾骨膨胀性骨质破坏，其间可见骨性间隔，并可见斑点状、环状钙化灶，早期多不累及骨骺，晚期可见长骨短缩和畸形发育。除骨质异常外，X 片还常可见软组织肿块及多数静脉石[2]，Maffucci 综合征中骨骼及软组织均有恶变的可能，但以骨骼恶变的风险更高，尤以软骨肉瘤最常见，风险率为 20%-30%[3]。CT 及 MRI 是对 X 线片的重要补充，尤其是怀疑软骨瘤有恶变的情况下，后两种检查可以更清楚的显示骨质破坏的范围与程度，骨皮质有无破坏，有无骨膜反应及软组织肿块等情况。本例患者右股骨下段病灶较大，且患者有疼痛症状，提示有恶变的可能，遗憾的是，患者不同意活检，未能得以证实。而患者软组织内的血管瘤，术后多次复发。多发性软骨瘤的治疗和预防尚无有效方法，以矫正影响功能的畸形为主，若畸形严重影响功能或有恶变倾向，应截除相应肢体。

EPO-1440

脊椎旁粒细胞肉瘤的 MRI 影像表现

杨光鑫,彭鹏
广西医科大学第一附属医院

目的：分析脊椎旁粒细胞肉瘤的 MRI 影像特征，以及这些影像特征在与其他常见原发肿瘤鉴别诊断中的意义。**资料与方法**　回顾性分析本院 2011 年 3 月至 2012 年 2 月的 4 例经手术切除及病理证实的粒细胞肉瘤患者的 MRI 影像表现，病理结果及临床表现。患者年龄 10 岁~35 岁，平均 20 岁，所有患者均经过手术及病理证实。4 例患者均行常规 T1WI、T2WI 及增强扫描。**结果**　本组 2 例发生于胸椎旁，2 例发生于腰骶椎旁。MRI 平扫，肿瘤边界模糊、实性占位.，T1WI 上呈等信号，T2WI 上呈等信号，增强扫描:其中 3 例病例呈均匀中等强化，1 例病例呈边缘强化明显，中心轻度强化。**结论** 粒细胞肉瘤影像表现具有一定特征，MRI 能清晰显示病变，但与脊椎旁其他原发肿瘤鉴别较困难，多序列成像有助于鉴别诊断及预后的估计，确诊仍然需要病理检查。

EPO-1441

多发性骨髓瘤的全身弥散加权成像与骨髓穿刺及血清学指标的相关性研究

王勤,薛华丹,李烁,孙照勇,金征宇
中国医学科学院北京协和医院

目的：探讨多发性骨髓瘤（MM）全身弥散加权成像（WB-DWI）特点与骨穿结果及血清学指标的相关性。

方法：前瞻性招募 MM 初诊患者 53 例及治疗后完全缓解（CR）患者 18 例。所有患者进行在 3.0T 的 MRI 扫描仪上行 WB-DWI。记录 WB-DWI 所示局灶病变（FL）数，FL 最长径及 ADC 值、弥漫浸润程度，并测量所有患者颈胸腰椎（ C7\T7\L3）、肱骨头、锁骨头、骶骨及髂骨的髓腔 ADC 值。所有患者均完成骨髓穿刺及血清学检查。分析骨穿结果及血清学指标与 FL 数、最大 FL 长径、病灶 ADC 均值及骨髓 ADC 均值相关性。

结果：初诊患者局灶性病变 ADC 均值（891.75±150.86×$10^{-6}mm^2/s$）显著低于 CR 患者局灶性病变 ADC 均值（1685.28±541.04）（p=0.000），区分二者的 ADC 临界值为 1022.35×$10^{-6}mm^2/s$，其敏感性为 85.7%，特异性为 85.0%，曲线下面积值为 89.6%（p=0.000）。初诊弥漫浸润型患者骨髓 ADC 均值（614.60±132.57×$10^{-6}mm^2/s$）显著高于 CR 患者局灶性病变外 ADC 平均值（257.36±70.08×$10^{-6}mm^2/s$）（p=0.000），区分二者的 ADC 间临界值为 395.49×$10^{-6}mm^2/s$，其敏

感性为 78.0%，特异性为 100.0%，曲线下面积值为 100.0%（p=0.000）。初诊患者骨髓 ADC 值与血红蛋白水平呈负相关（r=-0.533,P=0.000），与β2MG 水平呈正相关（r=0.446,P=0.000）。
结论：DWI 序列的半定量参数 ADC 值可以鉴别 MM 患者活动性病变；初诊患者骨髓 ADC 值与血红蛋白及β2MG 存在相关性，可以用来协助评价患者病情严重程度。

EPO-1442

腱鞘巨细胞瘤的 MRI 表现

郭慧慧
河南省人民医院

目的 探讨腱鞘巨细胞瘤的 MRI 表现及临床特点。方法 收集 2013 年 3 月至 2019 年 3 月河南省人民医院收治的腱鞘巨细胞瘤患者进行回顾性分析。28 例患者均经手术病理证实为腱鞘巨细胞瘤，均行 MRI 平扫检查，部分行 MRI 增强扫描。结果 腱鞘巨细胞瘤患者中 16 例为局限型、12 例为弥漫型。23 例以手足部或大关节旁无痛性肿块就诊，3 例为切除后反复发作。与骨骼肌肌腹相比，MRI 平扫病灶 T1WI 为稍低信号、T2WI 为稍高信号，病灶信号混杂，其内 T1WI 及 T2WI 双低信号为其特征性表现；增强扫描呈不均匀明显强化。结论 腱鞘巨细胞瘤具有较典型 MRI 表现及临床特点，MRI 能够准确显示病变的信号特点、病变范围及与周围组织关系，为腱鞘巨细胞瘤的临床诊治提供有力依据。

EPO-1443

MRI 对四肢肿块型血管瘤和外周神经鞘瘤的鉴别诊断价值

朱汇慈,管真,孙应实
北京大学肿瘤医院

【目的】探讨 MRI 对四肢肿块型血管瘤和外周神经鞘瘤的鉴别诊断价值。
【材料和方法】回顾性分析 2010 年 6 月至 2018 年 8 月北京肿瘤医院经临床和病理证实为四肢肿块型血管瘤 24 例，良性外周神经鞘瘤的 53 例患者。患者均行 MRI 平扫和增强扫描。收集患者的临床资料，并对 MRI 图像进行分析评价，评价和测量指标包括肿瘤大小、位置、深度、MRI 特异征象（靶征、脂肪分离征、葡萄征，有无静脉石等）和一般征象（信号强度、边缘是否清晰、是否存在脂肪成分，是否存在囊变等）。采用 c2 检验和 Fisher 确切概率法比较血管瘤和神经鞘瘤位置、深度、MRI 特异征象、MRI 一般征象等。采用独立样本 t 检验比较血管瘤和神经鞘瘤的发病年龄、长/短径的差异。【结果】 四肢肿块型血管瘤与神经鞘瘤比较，年龄、肿瘤位置、深度、长/短径的差异有统计学意义(p<0.05)，血管瘤更易发生于下肢和肌肉内部。MRI 特异征象，两组比较均有明显统计学差异(p<0.001)。MRI 一般征象中，边缘是否清晰、是否囊变、是否含脂肪成分、肿瘤内部低信号分隔、瘤周包膜、肿瘤强化和流空血管这些特征，两组比较均有统计学差异(p<0.05)。【结论】MRI 的特异征象和一般征象均有助于四肢肿块型血管瘤和神经鞘瘤的术前鉴别诊断。

EPO-1444

腺泡状软组织肉瘤的临床表现与 MRI 特征

孟帆
河南省肿瘤医院

目的 探讨腺泡状软组织肉瘤的临床表现及 MRI 特征，为临床诊断提供一定帮助。**方法** 回顾性分析病理证实的 17 例腺泡状软组织肉瘤的临床表现及 MRI 表现，临床表现主要观察患者性别、年龄、部位、是否有远处转移；MRI 主要观察肿瘤的大小、形态、信号、边界、肿瘤血管、肿瘤强化特点。观察肿瘤 TIC 类型，测量病灶 ADC 值，分析 ADC 值与大小、是否转移的相关性。**结果** 患者 7 例男性，10 例女性。年龄 14～44 岁，中位 27.1 岁。肿瘤部位:下肢 8 例，臀部 4 例，上臂 2 例，腰大肌 1 例，手 1 例，腰椎 1 例。11 例肺转移，3 例骨转移，4 例淋巴结转移，1 例脑转移。MRI 显示肿瘤位置较深，边界较清，部分可见周围浸润，内部及周围见多发迂曲增粗流空血管影。肿瘤最大径为 22～159mm。17 例均呈 T1WI 稍高信号 T2WI 呈不均匀高信号，DWI 高信号 ADC 图低信号。MIP 显示肿瘤血供丰富，周围见多发血管丛。9 例增强显示 5 持续显著强化，4 例中度强化。3 例 TIC 呈“速升-平台型”，6 例为“速升-缓降型”。17 例 ASPS 平均 ADC 值为（0.89±0.20）$10^{-3}mm^2/s$。ADC 值与肿块大小、是否远处转移均呈负相关，且具有统计学意义。病理显示肿瘤细胞排列成腺泡状，周围见血窦样结构。**结论** ASPS 为罕见的富血供恶性肿瘤，临床表现及 MRI 表现有一定特征性，好发于中青年女性，肌间隙及肌肉深部的软组织肿块，易发生远处转移，肿块及周围多发流空血管，T1WI 稍高信号，DWI 高信号，ADC 值较低，再结合 TIC 类型，对于临床诊断 ASPS 具有一定的帮助。

EPO-1445

滑膜肉瘤 CT 及 MRI 影像学表现探讨

兰慧,李康
中国科学院大学重庆医院

【摘要】 目的：结合文献回顾，探讨滑膜肉瘤的 CT、MRI 影像学表现特征。方法：回顾性搜集我院 2012 年 1 月-2018 年 3 月经病理证实的 9 例滑膜肉瘤患者的 CT 或 MRI 影像表现。结果：肿瘤位于四肢 6 例，胸壁 1 例，纵隔 1 例，眶周 1 例，均表现为不均匀软组织肿块。5 例 CT 表现：3 例等密度，1 例稍高密度，1 例稍低密度；2 例钙化；3 例骨质破坏；4 例明显不均匀强化，1 例轻-中度均匀强化。6 例 MRI 表现：肿瘤实质 6 例 T1WI 为等信号，4 例 T2WI 稍高信号，2 例高信号，T1WI/T2WI 见低信号分隔 3 例。2 例可见多发囊灶呈“卵石”样改变，囊灶 T1、T2 均呈稍高/高信号。增强肿瘤实质明显强化，分隔不强化。结论 （1）滑膜肉瘤具有一定的影像学特征，综合分析其影像表现有助于术前诊断，若见“卵石”征，诊断较具有特异性。（2）当肿瘤较小时，类似于良性肿瘤表现，应尽量避免漏误诊。

EPO-1446

可动脊柱骨巨细胞瘤及浆细胞瘤影像鉴别诊断

李敏
广西中医院大学第一附属医院

【摘要】目的 探讨可动脊柱骨巨细胞瘤及浆细胞瘤影像特征，并总结鉴别要点。方法 回顾性收集经手术病理证实的可动脊柱骨巨细胞瘤 15 例及浆细胞瘤 21 例，所有患者均行 MSCT 平扫+增强扫描

及 CT 平扫，对比分析 2 者影像学特征，并与病理结果对照。结果 骨巨细胞瘤患者中位年龄 35.5 岁，明显低于浆细胞瘤患者（P＜0.05）；2 组患者男女性别比无差异（P＞0.05）。2 组患者均主要位于椎体，并残留少量骨嵴，差异无统计学意义（P＞0.05）；10 例骨巨细胞瘤呈膨胀样骨质破坏，明显高于浆细胞瘤（10/15，66.7% VS 6/21，28.6%）。2 组患者在 T2WI 均以等/稍低信号为主，增强扫描呈明显强化，差异无统计学意义（P＞0.05）。14 例浆细胞瘤硬膜外软组织肿块呈钻孔生长，脊髓移位不明显；4 例骨巨细胞瘤硬膜外软组织呈膨胀性生长，脊髓推压、移位；2 者比较具有统计学意义（P＜0.05）。结论 可动脊柱骨巨细胞瘤及浆细胞瘤影像表现具有相似性，但浆细胞瘤发病年龄相对较大，且膨胀性骨质破坏较少，硬膜外软组织肿块生长方式多为钻孔样生长，具有一定特征性。

《MR imaging features and a redefinition of the classification system for nodular fasciitis》

吴世勇
湖州师范学院附属第一医院

ABSTRACT
Objective: To analyse magnetic resonance (MR) imaging features of nodular fasciitis and introduce a redefinition of the classification system for this class of lesions.
Materials and methods: Twenty-five patients who underwent surgery or biopsy due to nodular fasciitis were retrospectively analysed. Demographic information, medical history, and MR imaging features were collected. Classification of nodular fasciitis was performed based on a redefined system. Sensitivity and specificity of special signs were calculated.
Results: For nodular fasciitis, the longest average diameter was 22.5 mm (range, 5.2-54.6 mm), and 44% were located in the upper extremities, 28% in the head and neck, 20% in the lower extremities, and 8% in the trunk. Compared with skeletal muscle, most lesions exhibited isointensity on T1WI and hyperintensity on T2WI.

EPO-1448

DKI 技术评估原发性骨肉瘤术前新辅助化疗疗效的应用初探

刘成磊
上海交通大学附属第六人民医院

目的：探讨 DKI 技术对原发骨肉瘤术前新辅助化疗疗效评估的价值。

方法：2015 年 3 月-2016 年 2 月经病理证实的原发性四肢骨肉瘤 29 例，新化疗辅助前 3 天，化疗后术前 3 天行常规 MRI 和 DKI 检查，在 T1 图像上测量病灶的最大延伸，在 T2 抑脂图像上测量病灶的大小，然后根据椭圆公式计算病灶的体积，DKI 图像导入专用的图像分析软件，在病灶的最大层面，测量 ADC 值，MD，MK 值，并计算化疗前后的 ADC，MD，MK 值相对变化率，以病灶术后病理坏死率为参照标准分为 2 组，（坏死率小于 90% 为化疗效果差），采用 t 检验比较 2 组各个参数的差异，病灶体积，ADC，MK，MD 值预测术后坏死率的诊断效能比较用 ROC 曲线。

结果：29 例患者男性 20 例，女性 9 例，平均年龄 17.66 岁（7-34 岁）。化疗前，2 组患者的病灶体积，ADC 值，MK，MD 值没有统计学差别（P>0.05）。化疗后术前病灶 MD，ADC 值明显较前增加，(1.97±0.21vs1.39±0.39，1.39±0.24vs1.00±0.31，P<0.05)， MK 值明显下降 (0.68±0.14vs0.86±0.26，P=0.042)。病灶的体积无明显变化(379.59±372.49vs339.05±196.67 p=0.706)。比较化疗效果差者，化疗效果好的患者ΔMD，ΔADC 值变化较大(55.54±26.09 vs7.02±25.16，47.24±43.15vs10.07±28.81；P<0.05)，但ΔMK 值及和Δ体积变化不明显。 术后 MD 值和ΔMD 较其他参数具有相对高的诊断效能，敏感性 100%。

结论：DKI 技术有助于评估原发性骨肉瘤的新辅助化疗的疗效，术后 MD 值 和ΔMD 可作为潜在的影像评价指标。

EPO-1449

应力性骨折的影像学分析体会

李学江
河南省滑县骨科医院

目的：DR 平片、CT、MRI 检查对应力骨折的影像学分析。
方法：选择 DR 平片、CT 平扫（3D、MPR 重建），MRI 常规序列进行检查。
结果：本组选择 30 例患者，年龄 50-75 岁，平均为 63 岁，18 例腰椎检查，12 例膝关节检查，其中 18 例行 DR、CT、MRI 同时检查。12 例行 MRI 检查。本组 18 例腰椎患者均年龄偏大，无直接外伤史，多因弯腰、坐凳子骶起身快后出现腰部不适。膝关节 12 例患者 9 例跑步运动量过大，3 例患有严重骨性关节炎。
结论：应力性骨折指由节律性的反复阈值损伤所引起的骨连续性破坏[1]。分疲劳骨折与衰竭骨折。前者发生于正常骨质，多见于参运动后或行军时[2]。后者发生于骨矿物质含量减少或弹性降低等异常骨组织，在正常重复应力刺激下发生，一般无明显异常外力，多见于老年人。诊断应力性骨折患者首选 MRI 为著，CT，X 线为辅价值更高[1]。

EPO-1450

定量 CT（QCT）测量骨质疏松症的体会

李学江
河南省滑县骨科医院

摘要
目的：骨密度测量、16 排 CT 加装体膜及软件骨质疏松测量（定量 CT）QCT。
方法：CT 机床上装载体膜，用低剂量 CT 扫描参数，对腰椎、髋关节骨密度进行 CT 常规扫描，扫描结束将扫描数据传到指定软件，进行骨质密度分析。
结果：一次性扫描，骨科可以获得 2 个结果，腰椎、髋关节骨密度、骨病、骨折等多方位成像进行疾病分析。自 2017 年 3 月-2018 年 3 月，共收集腰椎 65 例，男性 30 例，女性 35 例，髋关节 20 例，男性 8 例，女性 12 例，其中腰椎骨折 20 例，腰椎骨病 10 例，髋关节骨折 8 例，髋关节骨病 3 例。在进行普通 X 线检查后诊断不理想，高度怀疑骨折或疾病时进行 MRI 或 CT 扫描，CT 扫描增加 QCT 数据后处理分析。骨密度正常的 10 例，低骨量 17 例，骨质疏松 30 例，骨病或骨折 8 例。
结论：定量 CT（QCT）是体积骨密度，单位是 mg/cm3，能更敏感反映骨质疏松的骨变化，与平面骨密度相比，具有不受脊柱退变、增生、血管钙化、骨折、畸形等的影响，可以避免上述因素影响造成的假阴性。腰椎 QCT 骨质疏松诊断标准采用骨密度绝对值，2018 年 10 月宣布了中国人的骨密度标准为：腰椎松质骨骨密度绝对值>120mg/cm^3为骨密度正常，骨密度绝对值 80-120 mg/cm^3范围内为低骨量，骨密度<80mg/cm^3为骨质疏松。髋部 QCT 骨质疏松诊断标准与 DXA 相同，同样需要根据中国人群的骨密度正常参考值计算 T 值。髋关节单侧有骨折、疾病时不用重新扫描，可以进行对侧髋关节骨密度测量。

EPO-1451

Multisystemic imaging findings in Chinese patients with Erdheim-Chester disease

Fengdan Wang,Xinxin Cao,Yan Zhang,Yining Wang,Feng Feng,Zhengyu Jin
Peking Union Medical College Hospital

Objective: Radiology is crucial for diagnosing and managing Erdheim-Chester disease (ECD), a rare multisystemic non-Langerhans histocytic neoplasm. Much is still unknown about Chinese ECD patients, and this study is to systemically investigate imaging characteristics of Chinese patients with ECD.
Methods: X-ray, CT and MRI images of 28 Chinese patients (14 males, aged 5-65 years) pathologically diagnosed with ECD in our medical center between January 2014 and January 2019 were retrospectively analyzed. Two radiologists in consensus analyze the brain MRI, contrast enhanced chest-abdomen-pelvis CT images, skeletal survey, and other dedicated images if available. The location, number, size, density or signal intensity, and contrast uptake of each lesion was carefully measured qualitatively.
Results: Among these patients, some rare imaging appearances were noted including: infiltration of callosum, choroid plexus in lateral ventricle, pineal body, walls of middle cerebral artery and coronary artery, mastoid process, tarsal bones, hands and wrists, mesenterium, peritoneum, and omentum; brain nodules with broad peri-nodular edema mimicking metastases; pathological fracture caused by bone involvement; and mesenteric panniculitis like lesions. Of the 23 patients evaluated for central nervous system, 17 patients (73.9%) had positive findings both supertentorial and infratentorial, intra-axial and extra-axial. Regarding facial & orbital regions, masses (34.8%) in bilateral post-orbit, nasal sinuses, and mastoid process were observed. Moreover, bone involvement was found in 27 (96.4%) of the 28 ECD patients, with lower extremities (85.7%) most commonly affected. In chest CT, pulmonary parenchyma, mesenchyme, pleura and mediastinum can all be seen with infiltration by ECD (57.1%). Half (50.0%) of the 28 patients had cardiovascular involvement; infiltration of aorta and its branches could result in stenosis and ischemic symptoms. Besides retroperitoneal involvement in 13 patients (46.4%), presacral mass wrapping bilateral pelvic ureters was also detected.
Conclusions: There seems to be a greater heterogeneity in Chinese ECD patients, with a predilection of CNS, axial skeleton, and arterial involvement.

EPO-1452
原发周围型肺癌侵犯肋骨 CT 三维重建早期诊断

聂勇
滑县骨科医院

目的：肋骨病变 CT 三维重建及早提高诊断率，平片对比极易发生漏诊现象。
方法：使用 16 排 CT 根据体表设定扫描区域，扫描时间 20S，120KV，100mA，常规训练呼吸运动，扫描时深吸气然后闭气，取得数据减薄数据三维重建。**胸部薄层轴位扫描，训练**

结果：患者早期即有右侧腋中线腋下疼痛，在当地卫生院治疗一月，效差，拍 X 片肋骨未见明显异常，CT 扫描重建后清楚显示肋骨破坏，骨皮质连续部分中断，可见虫蚀样改变，局部胸壁软组织影增厚，肺窗示右肺中叶外侧段占位。
结论：胸部疼痛原因颇多，不外乎肋间神经痛、肺炎、胸膜炎、肋骨外伤以及肿瘤转移等，考虑肋骨所致的疼痛时单纯依靠 X 线片极易漏诊、误诊，利用 CT 三维重建可以清楚显示病变形态、大小、与占位组织关系，彻底解决体位厚度、重叠所引起的漏、误诊现象，所以临床遇到胸部疼痛应尽早 CT 三维重建很有必要。

EPO-1453
继发性甲状旁腺功能亢进性骨病 X 线平片及 CT 表现

刘闪闪
滑县骨科医院

目的：骨、关节不同部位的 X 线平片及 CT 表现。
方法：对患者分别进行 X 线平片和 CT 检查，观察 X 线片和 CT 的骨病的表现。
结果：各关节在 X 线平片和 CT 上表现为骨密度减低、骨吸收、骨硬化，患者均存在关节疼痛，疼痛部位常在肩、髋、腕、膝关节及腰椎等，可见多个部位受累。
结论： 继发性甲状旁腺功能亢进性骨病，是长期血液透析患者的常见并发症，属于透析骨关节病的一种类型，患者血清钙增高，血清磷降低，血清 PTH 升高；X 线表现：多骨受累，以弥漫性骨密度减低及纤维囊肿形成为主要变化；继发性甲状旁腺功能亢进性骨病容易被误诊为骨质疏松、骨性关节炎、骨肿瘤等；继发性甲旁亢的患者经常合并全身骨质疏松，肌肉组织内的转移性钙化，全身骨骼广泛、普遍性骨质疏松是继发性甲旁亢性骨病的重要放射学表现；X 线平片示诊断继发性甲状旁腺功能亢进性骨病的重要手段，但 X 线有明显骨质改变时，骨量丢失已在 30%以上，已为病理的中晚期。

EPO-1454
动脉瘤样骨囊肿的影像学诊断分析与探讨

明静红
河南省滑县骨科医院

目的 分析、探讨动脉瘤样骨囊肿的影像学特征及不同影像学检查方法的诊断价值，提高动脉瘤样骨囊肿术前诊断正确率。
方法 回顾我院 8 例经病理证实的动脉瘤样骨囊肿病人并结合文献资料，分析动脉瘤样骨囊肿的各种影象学表现及其病理基础，总结动脉瘤样骨囊肿较特征性的影像学征象。
结果 病变表现为囊状膨胀性骨质破坏 6 例，平片显示膨胀骨皮质呈线形包壳者 2 例，CT 显示囊内纤维性或骨性间隔 3 例，密度不均呈多囊状，病变大部为液性低密度区 2 例，MRI T2WI 显示病变内部信号极不均匀呈海绵状液性信号 3 例。
结论 动脉瘤样骨囊肿有较特征性的影像学表现，平片、CT、MRI 可从不同方面反映动脉瘤样骨囊肿的影像学特征，三者结合可提高动脉瘤样骨囊肿的术前诊断正确率。

EPO-1455
小骨巨细胞病变的影像学诊断与鉴别诊断

崔雪娥,汪登斌,李玉华,包磊,叶彤,李士建
上海交通大学医学院附属新华医院

目的：分析小骨巨细胞病变的 X 线、CT、MRI 的影像表现，总结其影像学特征，并复习文献，以提高对此病的认识及鉴别诊断能力。**方法**：对我院经手术或穿刺病理证实的 7 例小骨巨细胞病变的影像学表现进行回顾性分析。 分析病变的发病部位、密度、信号、生长及骨质破坏方式、增强信号特点等影像学表现。男 3 例，女 4 例；年龄 2-60 岁，平均年龄 22 岁。1 例同时行 X 线、CT、MRI 检查，2 例行 X 检查，5 例行 CT 检查，7 例行 MRI 检查，6 例增强。**结果**：2 例位于掌骨，4 例位于颞骨，1 例位于硬腭。位于掌骨的病变表现为掌骨骨干及干骺端膨胀性溶骨性骨质破坏，内密度较均匀，CT 值约为 45HU，未见钙化灶，骨皮质变薄，未见明显骨皮质中断及硬化边，内部可见条索状高密度分隔影，周围软组织未见明显肿块形成；MRI 表现为 T1W 等低信号，STIR 稍高信号，未见明显液液平面，内见间隔，DWI 高信号，ADC 值约：0.67X10-3mm2/s，增强后周边及少许分隔有强化。颞骨病灶 4 例均累及颞骨鳞部，1 例同时累及蝶骨大翼，3 例伴有乳突积液。CT 表现为稍膨胀性溶骨性骨质破坏，边缘散在残留骨质碎片，周围轻微骨质硬化。MRI 表现 T1WI 呈等、低信号 4 例； T2WI 呈等低信号 3 例，1 例表现为混杂信号，伴液液平；注入对比剂 Gd-DTPA 后 4 例均表现为明显强化。1 例位于硬腭的病变累及右侧鼻腔，T1WI 呈稍低信号，T2WI 呈等信号，增强后不均匀环形强化。**结论**：小骨巨细胞病变 CT 多表现为膨胀性、溶骨性骨质破坏,部分可见边缘散在残留骨质碎片、周围轻微骨质硬化，周围无明显软组织肿块; MRI 中多以 T1 WI 和 T2 WI 表现为低至中等信号,增强扫描呈明显强化。发生于手足短管状骨的病变易误诊为内生软骨瘤，发生于颞骨的病变易于 LCH 相混淆，注意分析病变的影像表现，有助于小骨的巨细胞病变的明确诊断。

EPO-1456

斜坡脊索瘤影像表现与病理对照分析

张振光,何波
昆明医科大学第一附属医院

目的：分析斜坡脊索瘤 CT 和 MRI 影像学表现，并对比其与病理表现之间的关系，提高斜坡脊索瘤的影像诊断及鉴别诊断水平。**方法**：回顾性分析经病理证实的 25 例斜坡脊索瘤的 CT、MRI 资料，包括病变的位置、形态、信号/密度、与周围结构关系及强化方式、程度，并与病理表现进行对照分析。**结果**：位于斜坡上部 8 例，中部 4 例，下部 2 例，中上部 6 例，累及上中下部 5 例；中线区 12 例，中部偏右生长 8 例，偏左生长 5 例。边界清楚，分叶状，膨胀性、溶骨性骨质破坏并软组织肿块。CT 多呈不均匀等或稍高密度，无硬化边。T1WI 多呈不均匀等/稍低信号，T2WI 均为明显高信号内见低信号分隔，矢状位部分出现“拇指压征”。增强扫描不均匀轻中度延迟强化，呈“蜂窝状”、“颗粒状”。**结论**：斜坡脊索瘤的 CT、MRI 表现有一定的特征性，T2WI 明显高信号内见低信号分隔以及增强扫描呈“蜂窝状”、“颗粒状”轻中度不均匀强化的特点有助于诊断及鉴别诊断。

骨外骨肉瘤的临床及影像学分析

陈淑香,杜瑞宾,张惠娟
福建省立医院南院

目的 探讨骨外骨肉瘤的临床及影像学表现，提高对该病的认识及鉴别诊断水平。**方法** 回顾性分析经病理证实为骨外骨肉瘤患者的临床和影像资料。**结果** 9 例中,位于小腿、大腿、前臂、肺、腰段跨椎管内外、肾及颅内各 1 例,腹膜后 2 例；男 6 例，女 3 例，年龄 8 岁～86 岁，平均 40.1 岁。影像表现为①边界尚清或不清的软组织肿块②肿块与周围骨骼多不相连③体积较大、密度不均，部分内可见棉絮样骨样密度或信号，可伴囊变、坏死、出血④CT 上除骨样物质及出血外、病灶相对于肌肉多呈不均匀低密度；MR 上信号缺乏特异性,呈不均匀长 T1、长 T2 混杂信号，DWI 结合 ADC 多表现为扩散受限⑤增强扫描呈轻中度不均匀强化⑥可转移至颅内及肺肝脾骨等，术后短期易复发（9 个月至 1 年）。**结论** 若巨大软组织肿块中出现不均匀分布的不定形肿瘤样成骨则有助于骨外骨肉瘤的诊断，但缺乏骨样物质时也不能排除诊断，应密切结合临床及影像特征进行诊断和鉴别诊断。

EPO-1459

5 例儿童髋骨朗格汉斯细胞组织细胞增生症 CT 表现

蒋新全
广西医科大学第一附属医院

目的：探讨儿童髋骨朗格汉斯细胞组织细胞增生症（LCH)的计算机体层摄影术(CT)表现，以提高对本病的认识。
方法：回顾性分析经手术病理证实的 5 例儿童髋骨 LCH 的临床病理资料及 CT 影像资料，分析病变的位置、形态及边缘等 CT 特征。患者均行 CT 平扫加增强检查；免疫组化染色检测 CD1a、S-100 及 CD68。
结果：5 例均为单发病灶，其中 3 例病灶位于髋臼，2 例病灶位于髂骨，5 例病灶均呈不规则形溶骨性骨质破坏，其中 2 例骨质轻度膨胀，骨质破坏区均可见软组织密度影，病灶边界清楚，其中 1 例可见轻微的边缘硬化带，4 例边缘未见骨质硬化，5 例均未见明显的骨膜新生骨，密度不均匀，3 例位于髋臼病灶均累及关节面；5 例病灶增强扫描后呈轻至中度强化。5 例免疫组化示：CD1a、S-100 及 CD68 呈阳性。
结论：儿童髋骨 LCH 的 CT 主要表现为不规则形溶骨性骨质破坏，边界清楚，具有一定的特征性，可以为本病诊断提供依据；确诊仍需结合病理组织学检查。

EPO-1460

Feeding arteries and arteriovenous shunt for discrimination of soft tissue tumors

Gang Wu
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Time resolved magnetic resonance angiography with interleaved stochastic trajectories (TWIST) allows for identification of tumor
feeding arteries and arteriovenous shunt (AVS). We used TWIST to obtain number of feeding arteries (NFA) and detect AVS for 43
cases of pathology-confirmed soft tissue tumors. We compared normalized number of feeding arteries (nNFA) and AVS between
malignant and benign tumors, and found nNFA was significantly greater in malignant tumors versus benign tumors (2.1 vs 1.3, P <
.05). The incidence of AVS was significantly higher in malignant tumors versus benign tumors (87.5% vs 10.5%, P < .05). TWIST
derived nNFA and AVS could be useful in the discrimination of benign and malignant soft tissue tumors.

隆突性皮肤纤维肉瘤的影像学特征研究

李新勃
济宁医学院附属医院

资料与方法 回顾性分析 30 例经手术病理证实的 DFSP 患者的影像资料，其中 8 例行超声检查，9 例行 CT 检查（1 例行增强检查），13 例行 MRI 检查（5 例行增强，1 例行动态增强，6 例行 DWI 检查），2 例同时行超声、CT 检查，3 例同时行超声、MRI 检查。**结果** 肿瘤均位于皮下浅表，13 例呈“多结节融合征”， 11 例呈“子结节外突征”，肿瘤长径平均（4.5±2.6）cm；超声表现为不均匀低回声肿块，彩色多普勒示病灶内部血流信号丰富；CT 平扫均呈等密度，T1WI 多呈低信号，T2WI 呈混杂高信号，其中 8 例呈“双低信号征”，增强扫描多呈不均匀明显强化，1 例动态增强扫描时间信号呈速升-缓降型；肿瘤周围浸润征象中，“脂肪尾征”最为多见，为 21 例，“皮肤尾征”发生率次之，为 18 例，“筋膜尾征”出现率最低，为 12 例。**结论** DFSP 的影像表现具有特征性，有助于术前诊断。

原发性骨淋巴瘤的 CT、MRI 诊断价值分析

余刚,胡丽,陈平有,徐霖
十堰市太和医院

[目的]分析原发性骨淋巴瘤的 CT、MRI 影像学特点，探讨其诊断价值。

[方法]回顾分析 11 例原发性骨淋巴瘤的影像学资料，所有病例均经临床及病理（包括免疫组化）证实。其中 8 例行 CT 检查，10 例行 MRI 平扫检查，5 例行 MRI 增强检查。
[结果]本组 11 例中，男 7 例，女 4 例。年龄 25～ 68 岁,平均 40.3 岁。10 例为单骨发病，骨盆 4 例，股骨 2 例，胸腰椎 3 例，肋骨 1 例；1 例为多骨发病，发生于骶椎。8 例行 CT 检查，7 例表现为溶骨型骨质破坏，边缘不清，1 例为囊状膨胀型；7 例见骨皮质中断，2 例见骨膜反应。10 例行 MRI 检查，表现为不同程度骨质破坏，骨髓信号异常，T_1WI 信号与肌肉相仿或稍低，T_2压脂序列呈较明显信号；10 例均有软组织肿块，8 例肿块范围超过骨质破坏区并侵犯邻近组织，肿块部分或全部包绕病变骨骼。5 例行 MRI 增强扫描呈轻-中度均匀强化。
[结论]原发性骨淋巴瘤的影像学特征表现为骨质不规则破坏并软组织肿块。CT 多见于溶骨破坏型，骨皮质破坏中断，骨膜反应多见于长管状骨，可形成 Codman 三角。MRI 表现主要为病变区骨髓信号异常、骨皮质破坏及软组织肿块。CT、MRI 各有优缺点，两者相结合有助于原发性骨淋巴瘤的诊断，对明确诊断及确定治疗方案有重要价值。

EPO-1463
DWI 及 ADC 值在评估软组织肿瘤新辅助化疗中的临床意义

许霖,娄昕,马林
中国人民解放军总医院第一医学中心

目的 研究 DWI 及 ADC 值在恶性软组织肿瘤新辅助化疗后疗效评估的价值。
方法 根据肿瘤实质疗效评价标准，回顾性分析新辅助化疗后肿瘤缩小幅度小于 30%的恶性软组织肿瘤 14 例，分别在化疗前、第 2 及第 4 个周期新辅助化疗后行 MRI 检查并加扫 DWI 序列，分别测量三个不同时期肿瘤实质部分的 ADC 值。
结果 治疗前肿瘤平均 ADC 值为 0.877± 0.060×$10^{-3}$$mm^2$/s ， 第 2 周期化疗后平均 ADC 值为 1.369± 0.058×$10^{-3}$$mm^2$/s ，第 4 后期后平均 ADC 值为 1.828± 0.066×$10^{-3}$$mm^2$/s。治疗前与第 2、第 4 个周期化疗后肿瘤实质部分的 ADC 值差异均存在统计学意义(P=0.017、P=0.045，P<0.05)；第 2、第 4 个周期化疗后肿瘤实质部分的 ADC 值差异不存在统计学意义(P=0191，P＞0.05)。
结论 DWI 及 ADC 值对新辅助化疗疗效的评估较形态学更迅速、精准，具有前瞻的指导意义。

Multimodality imaging and clinical features of flat bone osteosarcoma

Zhendong Luo[1],Weiguo Chen[2],Xinping Shen[1],Genggeng Qin[2],Jianxun Lyu[1],Weiwei Yao[1],Lin Cheng[1],Lisha Zhou[1]
1.The University of Hong Kong - Shenzhen Hospital
2.Nanfang Hospital， Southern Medical University

Objective
This study aims to assess the clinical and multimodality imaging features of osteosarcoma in flat bones and compare the characteristics with that of the extremity osteosarcoma.

Methods
249 patients with osteosarcoma were treated in the orthopedics department across four institutions from June 2005 to November 2018. We searched across all available electronic pathologic databases and identified a total of 56 cases [age 34.3 ± 17.1

(range 9－68) years, with 32 males and 24 females which met the inclusion criteria with a diagnosed with osteosarcoma in flat bones based on open surgical resection (n=16) and biopsy (n=40). The tumour location, size, imaging appearance and presence of metastases were documented.

Results
Among all, 31 (55.4%) osteosarcoma originated from flat bones of the craniofacial region (mandible, maxilla, sphenoidalia, frontal and temporal bone), 12 (21.4%) from the pelvic region (ilium, ischium), 9 (16.1%) from the chest (rib, clavicle or scapula) and 4 (7.1%) from the vertebrae (Thoracic, lumbar, sacrum). 15 patients (26.8%) received radiotherapy for nasopharyngeal carcinoma. Two patients (3.6%) developed osteosarcomas related to a primary bone disease (fibrous dysplasia and osteoblastoma). Histological examination revealed that 51 tumour cases (91.1%) were of high-grade tumours. These tumours were presented as soft-tissue masses with a diameter of 7.5±3.2 (3.7－15.7) cm. Matrix mineralisation was found to be present in 48 cases (85.7%). Lamellar periosteal reaction occurred in 6 cases (10.7%) with spiculated periosteal reaction in 37 patients (66.1%) and no periosteal reaction occurred in 13 cases (23.2%). Heterogeneous signals were shown on T2-weighted images with enhancement across all (45) contrast-enhanced studies. 5 out of 56 cases (8.9%) had lung metastases. Compared the characteristics of 56 flat bone osteosarcomas (FBOS) patients and 193 patients with extremity osteosarcoma (EOS). The FBOS patients had the following characteristics: a higher age of onset (P = 0.022), a more spiculated periosteal reaction (P = 0.000), a less mix plain radiographic/CT pattern (P = 0.017) and Pathologic fracture(P=0.024). The two groups were similar with regard to gender, extent of tumour (P > 0.05).

Conclusions
Though the occurrence of osteosarcoma is rare in flat bone, matrix mineralisation is thought to be a critical finding in differentiating osteosarcoma from other types of flat bone tumours. The possibility of FBOS may therefore be considered in the presence of matrix mineralisation early in the third and fourth decade of life. The T2 hyperintense signal and heterogeneous enhancement in MRI (Magnetic Resonance Imaging) is non-specific.

EPO-1465

Myofibromatosis in adult: Findings on MDCT and MR Imaging and Pathologic Correlation

Kunming Yi,Lu Wang,Yi Wang
Army Medical Center of PLA, Army Medical University

Objectives To characterize the radiologic appearance of myofibromatosis on CT, and MR and to correlate the imaging findings with histopathologic features.
Materials and methods The imaging findings of ten myofibromatosis on CT (n=5), and MR (n=5) were retrospectively evaluated. The images were retrospectively reviewed for size, shape, location, margin, CT attenuation and MR signal intensity compared with

skeletal muscles, and enhancement patterns. Pathologic specimens of all cases were reviewed and compared with imaging findings.
Results We included 10 consecutive patients with 10 histologically proven myofibromatosis (4men, 6 women; age range, 19－65 years; mean age, 38.3 years; median age, 37 years), The tumors were located in the face (n=1), parotid gland(n=1), mandible(n=1),upper extremities (n=2), psoas muscle(n=1), rectus abdominis(n=1), pelvic cavity(n=1),scrotum(n=1) ,lower extremities (n=1),The maximum tumor diameter was in the range of 1.4－12.4cm(mean, 5.4 cm).All of the masses were isodense relative to adjacent skeletal muscle on the unenhanced, no calcification and necrosis been seen, and 3 lesions showed mild enhancement on contrast-enhanced CT, but the other 2 lesions showed obvious enhancement after contrast agent administration. All of the lesions showed persistent enhancement on contrast-enhanced CT. On MR, three of 5 patients with the multicentric form, two of 5 patients with the solitary form, and the multicentric lesions were characterized by multiple nodules distributed around tendon and nerve. On T2-weighted images and fat-suppressed T2W images, all of the 5 tumors showed inhomogeneous hyperintensity, the center of the masses showed strip and reticular hypointensity . On T1-weighted images, all of the tumors showed homogeneous hypointensity. On fat-suppressed gadolinium-enhanced T1-weighted images, all of the tumors showed obvious enhancement, whereas the strip and reticular hypointensity on T2-weighted images and fat-suppressed T2W images showed no enhancement. Histologically, mitoses and chronic inflammation were more frequent in the multicentric and generalized forms than in the solitary form. Fibrosis, necrosis, calcification, and hyalinization in the center of the lesion, replacing primarily the vascular component were more frequent in the he solitary form than in the multicentric forms. The strip and reticular hypointensity on T2W images and fat-suppressed T2W images corresponded to the distribution of the fibrosis and calcification on pathologic specimens. The more the vascular component remains on pathologic specimens, The degree of enhancement is more significant on CT and MRI.
Conclusion: The imaging characteristics of myofibromas in adult are nonspecific, the diagnosis of myofibromas must be confirmed histopathologically. The diagnosis can be suggested when a adult with a mass or masses around the tendon and nerve on MR. Pathologic findings are well correlated with imaging findings.

EPO-1466
软组织肉瘤 IVIM 及 DKI 与 Ki-67 表达水平的对照研究

戴越,王绍武
大连医科大学附属第二医院

目的：探讨 IVIM 及 DKI 参数在预测软组织肉瘤（Soft tissue sarcomas，STSs）Ki-67 表达水平中的应用价值。
材料与方法：收集经手术病理证实为软组织肉瘤患者 29 例，所有患者均于术前行常规 MRI、IVIM 及 DKI 检查，并由两名放射科医生手工描绘感兴趣区 ROI，测得 IVIM 单指数、双指数、拉伸指数模型及 DKI 各参数 StandardADC、D、D*、f、DDC、α、MD、MK、FA 值。利用 MRI-病理对照方法，获取病理取材点，根据该点免疫组织化学 Ki-67 染色结果将患者分为 Ki-67 高表达组（LI≥25%）18 例，Ki-67 低表达组（LI＜25%）11 例。分析各参数与 Ki-67 表达水平的相关性及诊断效能。

结果： 29 例软组织肉瘤 IVIM 及 DKI 参数 Standard ADC 值、D 值、DDC 值、MK 值、MD 值在 Ki-67 高低表达组间差异具有显著性（$p<0.05$），且 Ki-67 高表达组 Standard ADC 值、D 值、DDC 值、MD 值均低于低表达组，MK 值高于低表达组。当 Standard ADC 值、D 值、DDC 值、MK 值、MD 值的曲线下面积分别为 0.907、0.926、0.907、0.963、0.981 时，对 STSs Ki-67 高、低表达组鉴别诊断阈值分别为 $1.430\times10^{-3}mm^2/s$、$1.100\times10^{-3}mm^2/s$、$1.405\times10^{-3}mm^2/s$、0.592 及 $1.537\mu m^2/ms$，应用此诊断阈值对 Ki-67 高、低表达组鉴别诊断的敏感度分别为 83.3%、100%、83.3%、100%及 100%，特异度分别是 100%、77.8%、100%、83.3%及 88.9%。

结论： IVIM 参数 Standard ADC 值、D 值、DDC 值及 DKI 参数 MK 值、MD 值均可用于界定 Ki-67 表达范围，其中 DKI 参数诊断效能较 IVIM 参数更好，即 DKI 对 Ki-67 表达水平的预测能力较 IVIM 更佳。

EPO-1467

脊索瘤 MR 诊断价值研究

陈垚,牟方胜,曾文兵
重庆三峡中心医院

目的： 通过分析脊索瘤的 MR 图像表现，探讨 MR 平扫及增强图像、动态增强图像、弥散加权成像诊断脊索瘤的价值。

材料方法： 搜集经手术或穿刺病理证实的脊索瘤 36 例，颅底 10 例，颈椎 4 例，腰椎 1 例，骶尾部 21 例，采用西门子 3.0T 磁共振，36 例均行 T1WI、T2WI 及常规钆剂增强扫描；其中 10 例颅底脊索瘤行动态增强 MRI 扫描，6 例颅底脊索瘤行 DWI 扫描，并测量肿瘤实质部分的 ADC 值。

结果：（1）肿瘤在平扫及常规 MR 增强表现：肿瘤常突破周围骨质，形成软组织肿块，边缘界限清楚，形态呈多不规则，伴分叶样改变，周围结构呈受侵推挤样改变。当肿瘤侵蚀及多个椎体时，邻近椎间盘正常结构及形态消失。36 例在 T1WI 多呈等低信号，其信强度接近邻近肌肉；其中 18 例病变内可见斑片状稍高信号影；当邻近骨质受侵时，肿瘤组织取代正常髓质的 T1WI 高信号影，T2WI 呈不均匀中至高信号，其内多见线样低信号分隔影，部分肿瘤内见散在斑片状低信号。MRI 增强肿瘤多呈轻中度强化，4 例强化较均匀，32 例呈不均匀网格样或颗粒样强化。（2）动态增强 MRI 表现：10 例颅底脊索瘤随扫描时间推移，其强化程度越来越明显，表现为持续缓慢强化，时间-信号强度曲线呈持续上升型

（3）DWI 表现：6 例颅底脊索瘤 DWI 呈等或稍高信号影，平均 ADC 值约 $1264.5\pm100.3\times10^{-6}mm^2/s$。与 Ginat al.提出的颅骨恶性病变 ADC 值多低于界值 $1010\times10^{-6}mm^2/s$ 结果不符。

（4）误诊分析：颅底部误诊 2 例，因 T2WI 呈较高信号，伴斑片低信号，误诊为软骨肉瘤。腰椎部误诊 1 例，因侵及上下椎体，伴腰大肌周围肿块形成，误诊为结核。骶尾部误诊 2 例，因信号特征不明显，误诊为转移。

结论： T2WI 上中至高信号伴低信号分隔及动态增强图像的持续缓慢强化为脊索瘤较为特征性征象。ADC 值对脊索瘤良恶程度的评估价值尚不确定。

EPO-1468

正常小儿髌臼盂唇影像特征

孙冬梅,丁长伟
辽宁省沈阳市中国医科大学附属盛京医院

目的：应用 3.0TMR 研究小儿正常髋臼盂唇发育变化规律，旨在探讨正常小儿髋臼盂唇影像特征及其与年龄相关性。
材料与方法：回顾性分析 49 例正常小儿髋臼盂唇 MR 表现，年龄：0-14 岁。采用 Philips Intera Achieva 3.0 T 超导型磁共振扫描系统，体线圈，患者仰卧位，行轴位及冠状位扫描。层厚 3～5mm，层间距 3～5mm，FOV 505mm×505mm。采用快速自旋回波序列(TSE)和短时反转恢复序列(SPAIR)扫描：TSE 序列 T1WI：TR/TE=600/25ms,T2WI：TR/TE=6073/125ms；TSE-SPAIR 序列 T2WI：TR/TE=4018/58ms。所有图像由 2 名 MR 诊断医师分别进行评价，对不同部位（包括冠状位髋臼盂唇顶点，横断位髋臼盂唇前部及后部图像显示最清晰层面）髋臼盂唇的形状（三角形，扁平形或缺如）和信号进行分析。利用 χ^2 检验进行统计学分析，应用 SPSS 软件进行数据处理。
结果：1.在所获得的 234 个髋臼盂唇断面图像中，三角形盂唇最多见，占 75.2%，扁平形次之，占 18.2%，缺如情况最少见，占 6.6%。斑片状或结节状稍高信号在髋臼盂唇内的出现率为 19.7%。2.不同部位髋臼盂唇的形态构成之间有统计学差异，其中上部未见缺如情况，而后部缺如情况的构成比最高，占 14.9%；三角形在前部的构成比最高，为 91.9%。3.髋臼盂唇内部出现的稍高信号在不同部位间有统计学差异（$p<0.001$），最常见于前部，出现频率为 40.5%。
结论：正常小儿髋臼盂唇 3.0TMR 显示小儿髋臼盂唇的形态和信号强度因部位的不同而各异，髋臼盂唇内部的高信号在盂唇前部的出现率最高。

EPO-1469

Task-state fMRI study of numbness of the limbs induced by electrical stimulation in normal subjects

haibao wang,Xueting Lu,Jie Fang
the first affiliated hospital of Anhui medical university

Objective To provid a paradigm for numbness of the limbs, and a biological basis for further study of the brain mechanism of numbness, task-state functional magnetic resonance was used to evaluate the activation of the brain regions in normal human under the condition of numbness induced by electrical stimulation. **Materials and Methods** 22 healthy subjects were recruited, aged 24-30 years. A numbness model was made, with stimulation above the right ankle, by using the Pulse Electrical Stimulator while fMRI data were acquired. The electrical stimulations of low frequency and high frequency were used with block design in the test, and the subjects were asked to score the numbness of electrical stimulation. The statistical parameter map software package SPM12 software was used to analyze the fMRI data, and the activation maps of the brain region were obtained for the low frequency electrical stimulation and high frequency electrical stimulation, and the paired sample *t* test was used between the low and high-frequency electrical stimulation. **Results** The brain areas of increasing activation in the high frequency electrical stimulation compared to the lower frequency involved: left insular operculum, left middle cingulate gyrus, left planum temporal, right parietal operculum, left postcentral gyrus, posterior to the right insular lobe, left thalamus (FWE, corrected, $p<0.05$). There were no brain areas of decreasing activation in the high frequency compared to the lower. **Conclusion** The brain areas related to numbness of the limbs induced by electrical stimulation involved the posterior central cortex of primary sensation, and cingulate gyrus, thalamus and insular

lobe related to the sensory conduction, as well as temporal lobe related to evaluation of emotion.

EPO-1470

MSCTA 在下肢动脉病变的临床应用研究

张迪
北华大学附属医院

目的： 通过多层螺旋 CT 血管成像（MSCTA）技术与数字减影血管造影（DSA）技术比较，探讨 MSCTA 技术在下肢动脉检查中的技术优势及临床应用。
方法：对疑有下肢动脉病变的 60 例病人进行 128 层螺旋 CTA 检查，采集数据传输至工作站，通过 syngo workplace 系统，应用如 MIP、VRT、MPR、CRP 等后处理技术，对图像质量进行评估。以 DSA 为准做比较，经统计学分析，对狭窄程度进行评估。
结果：
1.对临床怀疑有下肢动脉疾病的 60 例患者行 128 层螺旋 CTA 检查，图像优良率达 96.81%，显示率达 100%，所有图像均能满足诊断要求。
2.40 例行下肢动脉 128 层螺旋 CTA 和 DSA 检查，与 DSA 比较，128 层螺旋 CTA 诊断血管狭窄程度为 0 级、I 级时的敏感性和特异性皆为 100%。128 层螺旋 CTA 诊断动脉狭窄程度为 II 级时的特异性和敏感性分别为 99.73%和 100%，阳性预测值和阴性预测值分别为 93.36%和 100%，与 DSA 比较具有很高一致性，K 值=0.9608；动脉狭窄程度为 III 级、IV 级时的特异性和敏感性分别为 98.73%和 100%，阳性预测值和阴性预测值分别为 96.37%和 100%，K 值=0.9738，与 DSA 比较具有较高的一致性。
3.本组研究的 128 层螺旋 CTA 与 DSA 对下肢动脉狭窄诊断符合率比较，显示髂骨组和股动脉组血管狭窄符合率最高达 100%，小腿组动脉与 DSA 比较符合率欠佳，狭窄符合率达 98.68%，闭塞符合率为 97.33%。
结论：
1.128 层螺旋 CTA 能以高质量、高清晰度的显示下肢动脉。
2.128 层螺旋 CTA 能清晰显示病变动脉腔内、动脉管壁及相应周围组织情况,并对下肢动脉腔狭窄程度分级进行评估。

四肢肌内异位腱鞘囊肿的 MRI 影像学分析

姜涛
天津市第三中心医院

目的 分析四肢肌内异位腱鞘囊肿的 MRI 影像学征象，提高其 MRI 诊断准确性。
方法 回顾分析 30 例 35 个病灶，经我院病理证实的四肢肌内异位腱鞘囊肿的临床和 MRI 资料。
结果 30 例四肢肌内异位腱鞘囊肿中均呈长 T1 长 T2 信号，STIR 呈高信号，未侵犯邻近骨骼与关节，其中 11 例病灶见边缘云絮状或花边状水肿信号，19 例病灶内见低信号分隔带。钆喷替酸葡胺（Gd－DTAP）增强，整个病变无强化。
结论 光整无强化的囊样病灶及病灶内均匀一致的窄飘带状无强化低信号分隔带是四肢肌内异位腱鞘囊肿的特征性表现。

EPO-1472
非体力劳动者职业人群各椎体骨密度的比较分析

岳军艳,李美霞,陈杰,窦文广
新乡医学院第一附属医院

目的 比较分析非体力劳动者职业人群各椎体骨密度的分别情况。**方法** 抽取河南省新乡市卫辉市 51 例非体力劳动职业人共 51 例，记录志愿者的基线资料，包括籍贯、性别、年龄、身高、体重、腰围、有无骨折史、影响骨密度相关病史以及女性记录月经情况。采用东软公司 Neuviz 128CT 行腰椎 CT 扫描时同时将 QCT 体膜(Mindways，Texas，USA) 放置在志愿者身体下。扫描条件为 kVp:120 k Vp，SFOV：500，mA291，层厚（mm）：1.000，扫描床高：370.3。扫描结束后将图像传至 QCTpro 软 件 (Mindways Software Inc. ，USA) 进行 QCT 骨密度分析。应用 SPSS 22.0 统计软件行统计学描述及单因素方差分析，显著性检验采用双尾检验，α=0.05。**结果** T11、T12、L1、L2、L3、L4 的 BMD 分别为 140.40±37.28，
134.93±38.14,129.42±36.98,124.76+37.80,118.71±37.40 及 120.66±36.32，各椎体的 BMD 值有差别，F=12.091，P=0.01；其中 T11 与 L2、L3 及 L4 间有差别，P 值分别为 0.035，0.004 及 0.008，T12 与 L3 间 有差别，P 值为 0.029。 **结论** 非体力劳动者职业人群各椎体骨密度差异有统计学意义，其中 T11 及 T12 椎体骨密度较高，而 L3 及 L4 椎体骨密度较低。

T2-mapping 对腰椎旁肌肉运动后恢复的研究

蒋元明,魏佳璐,黄益龙,周家龙,杞天付,张振光,赵 卫,何 波*
昆明医科大学第一附属医院

[摘 要] **目的** 探讨 T2-mapping 评估健康志愿者运动后腰部背伸肌群(多裂肌、最长肌、髂肋肌）恢复过程的价值。**方法** 对 100 名健康志愿者运动后不同时间节点行 T2-mapping 序列扫描，于 L3、L4 上缘层面测量运动前后多裂肌、最长肌、髂肋肌的横截面积（CSA）及 T2 值，比较运动后不同时间节点背伸肌群 CSA、T2 值的差异。**结果** L3、L4 层面左右两侧背伸肌群运动前、运动后不同时间点的 T2 值之间有显著性差异。运动后不同时间点各层面两侧背伸肌群的平均 T2 值都有“升高-下降-回升”的变化趋势。L4 水平左右两侧背伸肌群在运动前及运动后 0min 点的 T2 值比较，差异有统计学意义。L3、L4 层面两侧背伸肌群运动前、运动后不同时间点的 CSA 之间无显著性差异。 **结论** T2-mapping 可用于评估腰部背伸肌群运动后功能恢复变化。

成人骨盆病变 135 例的影像分析

张丽芳,杨磊,张建强
昆明医科大学第一附属医院

目的：分析成人骨盆病变的影像表现,以提高其诊断及鉴别诊断。**材料与方法：**回顾分析经临床确诊或病理证实的 135 例骨盆病变的影像表现, 强直性脊柱炎所致骶髂关节炎 26 例，骶髂关节结核 1 例，致密性髂骨炎 6 例，髋关节病变 102 例，包括：退行性骨关节病 24 例，成人股骨头缺血坏死 17 例，类风湿性关节炎 6 例，强直性脊柱炎累及髋关节 15 例，髋臼覆盖不良继发骨关节病 10

例，髋关节结核 4 例，骨折与脱位 15 例，滑膜骨软骨瘤病 2 例，多发性骨髓瘤 2 例，髂骨肉瘤 1 例，骨纤维异常增殖症 2 例，多发外生性骨疣累及髋关节 1 例，周围软组织骨化 3 例。**结果：**强直性脊柱炎所致的骶髂关节炎表现为髂骨端关节面的模糊、波浪样改变及局部增生硬化与关节间隙假性增宽；骶髂关节结核为关节骨端破坏，边缘硬化；致密性髂骨炎表现为关节骨端类三角形、宽带状增生硬化灶，与正常骨分界清楚，骶髂关节间隙无异常；髋关节退行性骨关节病以承重区骨性关节面增生硬化为主伴软骨下囊变，相应关节间隙变窄；股骨头缺血坏死显示股骨头变扁塌陷、硬化、囊变及软骨下骨折，晚期继发骨性关节炎改变；髋关节类风湿性关节炎：关节间隙狭窄，骨质疏松，股骨头不同程度向内上突出；强直性脊柱炎累及髋关节表现为关节间隙一致性或非对称性狭窄，髋臼及股骨头关节面下囊变，边缘骨突形成；髋臼覆盖不良可见髋臼变浅，髋臼骑跨在股骨头上方，继发骨关节病时骨端增生硬化及囊变；髋关节结核：关节面骨质破坏,其间沙砾样死骨与钙化和寒性脓疡；滑膜骨软骨瘤病：关节周围大小不等骨性密度增高影，可伴有关节退变。**结论：**骨盆病变的影像表现不同, X 线平片是首选和重要的检查方法，CT 和 MRI 检查能清楚显示骨盆病变的部位、形态、范围和内部结构及邻近软组织改变的细节,是骨盆病变的重要补充检查，对病变诊断和鉴别诊断有较高的临床价值。

髋关节撞击综合征的影像与临床分析

韩风,靳激扬
东南大学附属中大医院

目的：髋关节撞击综合征（FAI）是指由于股骨头和髋臼盂唇解剖形态异常，或解剖正常但长期不正常外力作用于髋关节，导致两者长期不正常接触、碰撞，产生反复的微型创伤致使关节盂缘和关节软骨退变，从而引起一系列临床症状。本研究应用 MRI、CT 及 X 线成像技术诊断及评估 FAI 的关节结构改变及关节结构随时间改变的规律，多模态早期诊断 FAI。
方法：回顾性纳入 270 例患者，其中 90 例（病例组）为确诊髋关节撞击综合征的患者，180 例（对照组）为其他疾病进行髋关节检查的患者，并至少行一种影像学检查，MRI、CT 或 X 线。定性或定量记录所有患者的各种观察指标，年龄、性别及其他相关临床指标， α 角、EE 角、髋臼深浅、髋臼唇退变及其他相关影像学指标。
结果：FAI 病例组的髋臼较对照组的髋臼更深。在病例组中 α 角的值比对照组的 α 角的值大；FAI 病例组 CCD 角的值较对照组的 CCD 角的值大；病例组的 EE 角的值较对照组的 EE 角值小。FAI 病例组与对照组的 EE 角、 α 角值及“髋臼变深”差异有统计学意义（P ＜ 0. 05）；CCD 角的值差异无统计学意义（P ＞ 0. 05）。病例组患者髋臼唇的改变早于骨质改变（P＜ 0. 05）。
结论： α 角、“髋臼变深”及 EE 角的值对评估髋关节撞击综合征意义重大；MR 可以早期诊断不具有骨质改变但具有髋臼唇改变的 FAI 患者，同时评估骨质及髋臼唇随时间演变的规律；FAI 的诊断需要临床与影像的密切结合。

人工髋关节置换术后并发症磁共振 SEMAC 序列影像评估

关舒元
河南省人民医院

目的　探讨 1.5T 西门子 SEMAC 序列中人工髋关节置换术后并发症的影像学表现。

方法　前瞻性使用 1.5T 西门子 SEMAC 序列扫描并分析 29 例人工髋关节置换术后出现并发症而接受髋关节翻修术患者，观察其影像学表现。
结果　29 例中，术后诊断无菌性松动 22 例，表现为假体-骨界面存在层状高信号，同时被层状低信号环绕；感染 4 例，表现为假体周围分层增厚的高信号滑膜组织，关节囊外积聚和连通皮肤的窦道，骨破坏等；异位骨化 3 例，表现为髋臼假体周围软组织大量低信号影或不成熟骨的混杂信号团。
结论　人工髋关节置换术后关节松动较为常见，假体周围异常信号带是最重要的磁共振影像表现，SEMAC 序列有助于减轻金属伪影提高磁共振图像质量。

磁共振 Dixon 技术对椎体压缩性骨折病因分析应用价值研究

杨静,吴昆华
云南省第一人民医院

目的：探讨 MRI 双回波水-脂分离 Dixon 技术在良恶性椎体压缩性骨折中的应用价值。方法：回顾性收集椎体压缩性骨折患者 56 例。利用西门子 1.5T 超导 MR 扫描仪(MAGNETOM Aera1.5T)对 56 例椎体压缩性骨折患者（共 89 个椎体）进行常规 MR 扫描和 T2WI Dixon 序列扫描获得同相位、反相位、纯水相、纯脂相。其中良性骨折 36 例，47 个椎体(包括单纯外伤 15 例，骨质疏松 20 例，结核 1 例)，恶性骨折 20 例，42 个椎体(包括转移性肿瘤 18 例，骨髓瘤 2 例)。测量并计算两组椎体水脂像、同反相位的信号强度比值 SIR(脂像信号强度/水像信号强度，反相位信号强度/同相位信号强度），并对 SIR 进行统计学分析。结果：良性组椎体压缩骨折同反相位 SIR 0.57±0.22，恶性组压缩骨折同反相位 SIR 0.73±0.30，两者差异有统计学意义(P＜0.05)；良性组椎体压缩骨折水脂像 SIR 0.81±0.13，恶性组压缩骨折水脂像 SIR 0.48±0.66，两者差异有统计学意义(P＜0.05)。结论：良性组水脂像 SIR 明显高于恶性组；良性组同反相位像 SIR 低于恶性组。MRI 双回波水-脂分离 Dixon 对良恶性椎体压缩骨折的鉴别有较高的应用价值，值得推广使用。

EPO-1478
DR 站立位全脊柱影像与 MSCT 全脊柱影像 Cobb 角对比分析

何绪成,王贵生
中国人民解放军总医院第三医学中心

目的：对比分析 DR 站立位全脊柱影像与 MSCT 全脊柱图像 Cobb 角之间的差异，探讨 DR 站立位全脊柱影像在青少年特发性脊柱侧凸中的诊断价值。
方法：回顾性选取 2014 年 1 月-2017 年 1 月间，解放区总医院第三医学中心收治的特发性脊柱侧凸畸形患者 102 例，年龄 8-20 岁，平均年龄 16 岁，所有病例均含有站立全脊柱正侧位 X 线片，全脊柱左右 Bending 位 X 线片，MSCT 全脊柱图像和 VR 重建图像，对 DR 站立位全脊柱和 MSCT 重建的全脊柱 VR 图像进行 Cobb 角测量并记录。
结果：DR 站立位全脊柱影像测量 Cobb 角的平均值为（35.6±12.1）°，MSCT 后处理 VR 图像测量 Cobb 角的平均值为（28.8±9.4）°，将两组数值进行 t 检验，p＜0.05，差异具有统计学意义。DR 全脊柱影像共发现脊柱侧凸 166 处，其中胸椎侧凸 55 例，腰椎侧凸 26 例，胸腰段 85 例，MSCT 发现侧凸数量与 DR 完全相同。

结论：DR 站立位全脊柱影像能反映人体功能位的 Cobb 角度，能为临床提供准确的数据，不能被其他检查方法所取代；DR 站立位全脊柱影像还能显示脊柱侧凸的部位和数量，脊柱和骨盆的倾斜程度，脊柱旋转和脊柱柔韧性等，是脊柱侧凸畸形诊断和术前评估首选的影像学检查方法。

1.5T 磁共振在颞下颌关节乱中的应用

方玉
重庆市中医院

目的 由于颞下颌关节紊乱综合征有着复杂的病因及临床表现，故在诊断过程需要可靠的检查手段，本文目的旨在探讨 1.5T 磁共振诊断颞下颌关节紊乱疾病的价值。**方法** 回顾性分析 2015 年 3 月至今共 283 例患者，男 11 例，女 272 例,年龄 11 岁-63 岁，平均年龄 37 岁。所有病人均与疼痛、弹响或开口受限来诊。272 例患者均采用西门子 Avanto1.5T 磁共振成像仪扫描，行闭口位斜矢状位 T1WI、PD-FS，人体正中矢状位 3D，张口位斜矢状位 PD-FS，其中 72 例行动态扫描，6 例加扫横断位 T2-FS。斜矢状位时扫描方向与髁突长轴垂直，斜冠状位扫描时，扫描方向与髁突长轴平行。动态扫描采用 HASTE 序列，设置为单层多期扫描，扫描 18 期，总扫描时间 54 秒，定位与斜矢状位一样。当常规扫描难以确定关节盘病变时，需了解髁突活动度才加用动态扫描以提供更多信息。**结果** 272 例患者中，最多见为关节盘移位，有 171 例，约占 62.9%，各种关节盘移位包括关节盘前移位、关节盘侧向移位和关节盘旋转移位，其中前外侧旋转移位及关节盘前移位较为常见。检出髁突病变的 131 例，主要为髁突吸收、增生、水肿。42 例患者关节周围软组织有水肿信号，包括翼外肌水肿渗出病变、关节积液等。**结论** 颞下颌关节紊乱综合征是口腔颌面部的最常见疾病之一。磁共振能检出各种关节盘移位,是其他影像方法无法比拟的。能早期发现髁突骨髓内充血、水肿。能显示翼外肌水肿渗出,对早期诊断具有重要价值。动态扫描对关节盘穿孔和粘连极为敏感，但不能区分，并能看到关节盘在运动过程中的位置和形态，对髁状突及关节盘的运动功能及髁盘关系的评价很重要，对区别可复性与不可复性前移位具有重要作用。因此在颞下颌关节紊乱疾病研究中，磁共振能在很多方面被当作颞下颌关节疾病诊断的“金标准”。

EPO-1480

针灸治疗颞颌关节盘移位的磁共振疗效评估

方玉
重庆市中医院

目的 观察中医针灸对颞下颌关节盘移位的治疗效果，探讨磁共振成像在疗效评估中的作用。**方法** 以经 MRI 检查诊断为颞下颌关节盘移位并接受中医针灸治疗的 20 例患者作为研究对象。根据患者的情况，取听宫、下关、颊车、耳门、上关、合谷、阿是穴，留针时间 20 分钟。以上穴位不必一次全部选用，可交替使用。治疗每日一次，7 次一个疗程。治疗结束后，再行磁共振检查，并测量张口度评估下颌运动功能及评估关节盘位置，并与治疗前进行比较。**结果** 治疗结束后，患者张口度平均为（41.25±5.14）mm，明显大于治疗前的(27.6±5.23) mm（P<0.001）。与治疗前比较，治疗结束后大部分患者症状明显改善，其中有 2 例患者 MRI 复查表现为关节腔积液减少，其中 1 例关节盘移位回复至正常位置，另 1 例由关节绞锁恢复为可复性关节盘移位。**结论** 中医治疗颞下颌关节盘移位能明显减轻疼痛，改善下颌运动功能，MRI 可以作为评估针灸治疗颞颌关节盘移位的最重要的手段之一。

铁螯合剂对兔出血性关节病进程影响的 MRI 与病理学对照研究

张璐,李佳佳,王静,程天明,葛英辉
河南省人民医院

目的： 探讨 3.0T MR 动态监测铁螯合剂对兔出血性关节病治疗作用的可行性。
方法： 利用 30 只日本大耳兔自体血注入右膝关节腔成功诱导产生出血性关节病模型， 随机将动物分为 2 组：去铁敏组、 对照组。去铁敏组动物在关节腔注血后 24 小时开始予关节腔内注射铁螯合剂（100mg/kg），一天一次，连续七天；对照组的动物关节腔注血后 24 小时开始予关节腔注入等量的生理盐水，剂量及方法与铁螯合剂相同。利用 3.0TMRI 成像 3D-FS-SPGR、T2mapping 及 SWI 序列动态监测两组兔给药前后膝关节软骨、滑膜、积液/积血及 T2 值变化。并分别于 1 周，2 周，4 周磁共振检查后处死 1 只行病理学对照。
结果： 去铁敏治疗后 1 周，2 周，4 周关节腔内积血/积液逐渐减少。第 1 周，去铁敏组软骨平均 T2 值明显低于对照组（P<0.05），有统计学意义；且第 2、4 周 T2 值持续降低，但并不显著（p>0.05）。第 2 周及第 4 周，去铁敏组的 T2-mapping 伪彩图见股骨远端软骨色阶红黄色阶逐渐减少。SWI 显示关节腔内异常低信号逐渐减少。去铁敏组关节影像学改变与关节软骨及滑液的病理学划分相一致。（Kappa=0.965，P＜0.01）
结论：铁螯合剂-去铁敏通过螯合铁离子能明显改善出血性关节病兔模型的软骨损伤情况，减慢出血性关节病的进展。磁共振成像能够成功帮助临床筛选出适合出血性关节炎治疗相关的药物。

Disrupted interhemispheric functional coordination in patients with chronic low back-related leg pain: A multiscale frequency-related homotopic connectivity study

Fuqing Zhou
The First Affiliated Hospital， Nanchang University

Objective: Chronic low back pain has been observed decreased movement coordination. However, it is unclear whether the existing alteration of inter-hemispheric synchrony of intrinsic activity in patients with chronic low back-related leg pain (cLBLP). The present study aims to investigate the alteration of homotopic connectivity and its clinical association with the cLBLP patients.
Participants and methods: A cohort of cLBLP patients (n=25) and well-matched healthy controls (HCs) (n=27) were recruited and underwent MRI scanning and a battery of clinical tests. The voxel-mirrored homotopic connectivity (VMHC) was used to analyze the interhemispheric coordination in the typical (0.01－0.1 Hz) as well as five specific (slow-6 to slow-2) frequency bands and associated with clinical index in cLBLP patients.

Results: We observed that cLBLP patients with lower homotopic connectivity than HCs in the inferior temporal gyrus, the superior temporal gyrus, the basal ganglia, the middle frontal gyrus, and the medial prefrontal cortex in the typical and five specific frequency bands, respectively. In the typical and five specific frequency bands, significant positive correlations were observed between the VMHC values of medial prefrontal cortex and the visual analogue scale scores, while the VMHC values of basal ganglia negative correlated with the values of two-point tactile discrimination (2PD) test for the right hand in cLBLP patients, etc. Further receiver operating characteristic curve analysis revealed that VMHC in the above regions with decreased could be used to differentiate the cerebral functional plasticity of cLBLP from healthy individuals with high sensitivity and specificity.
Conclusion: Our results imply that multiscale frequency-related interhemispheric disconnectivity may underlie the central pathogenesis of functional coordination in patients with cLBLP.

EPO-1483
脊髓空洞症合并多发夏科氏关节病一例报告

李佳佳[1],高丽[2],葛英辉[1]
1.河南省人民医院 阜外华中医院
2.河南省人民医院

目的 探讨一例脊髓空洞症合并多发夏科氏(Charcot)关节病的影像诊断及鉴别诊断，以提高对本病的认识。 方法 对一例脊髓空洞症合并多发夏科氏关节病进行回顾性分析，研究其发病原因、诊疗过程及鉴别诊断。 结果 48 岁女性患者，2 月前因发现右上臂肿块 10 日伴间断性疼痛、右上臂肿胀就诊某院，按右上臂恶性骨肿瘤行手术切除，病理结果显示右上臂肿块符合骨化性肌炎。近日右肩关节肿痛明显，为求进一步治疗，遂来本院就诊并行右肩部 CT 检查，因疑肩关节恶性肿瘤又行右肩关节 MRI 检查。查体：右上臂呈术后改变，右肩部肿胀，活动减弱，右手指多个关节半脱位，呈“爪状”变形。术前 X 线检查示右肱骨内侧软组织增厚，其内可见条索状高密度影。右肩关节 X 线示关节结构失常，肱骨头部分缺如，呈“刀切征”，周围软组织肿胀，其内可见片状高密度影。右肩关节 CT 示右侧股骨头及肩胛骨关节盂形态失常，右肱骨头部分缺如，右肩关节周围软组织肿胀，其内可见骨碎片。右肩关节 MRI 检查示关节关系紊乱，肱骨近端骨质破坏，周围软组织内可见大片状水样信号，其内斑片状长 T1 短 T2 信号影提示钙化。通过询问病史、结合临床表现及辅助检查结果，考虑右肩关节夏科氏关节、右上臂外伤性血肿伴骨化性肌炎术后、右手指多个指间关节夏科氏关节，建议进一步做颈椎 MRI 检查以查因。颈椎 MRI 示脊髓 C2-T3 段条状长 T1 长 T2 信号影，符合脊髓空洞症诊断。 结论 脊髓空洞症合并多发夏科氏关节病罕见，尤其是容易误诊为恶性肿瘤，但夏科氏关节的临床及影像学均具有一定特点，两者相互结合，可以提高诊断准确率。

EPO-1484
联合 X 线片及 MRI 评估颈椎前路手术治疗平山病疗效

刘颖,方心俞
福建医科大学附属第一医院

目的 联合应用中立位、屈曲位、过伸位 X 线片及中立位、屈曲位 MR 探讨颈椎前路融合或非融合内固定术治疗平山病的临床疗效。方法 回顾性分析 23 例我院采用颈椎前路手术治疗的平山病患者。根据手术方式不同分为融合组和非融合组。融合组 11 例，男 9 例，女 2 例；年龄 15~29 岁。非融合组 12 例，男 11 例，女 1 例；年龄 15~23 岁。术后随访，摄颈椎中立位、过伸位、过屈位 X 线片，颈椎中立位及屈曲位 MRI，测量参数如下：（1）颈椎最大屈曲角：颈椎屈曲位 C2 椎体下缘延长线与 C7 椎体下缘延长线的夹角 α 。（2）颈椎活动度：颈椎过伸位测量 C2 椎体下缘延长线和 C7 椎体下缘延长线之间 Cobb 角 β，α 、β 角的差值即活动度。（3）屈曲位下颈椎相邻椎体曲度：颈椎过屈位 X 线片上测量。（4） 脊髓横截面面积：选取中立位 C4~C7 节段 MRI 横截面影像测量脊髓的面积。结果 （1）随访时融合组最大屈曲 Cobb 角平均 16.10° ± 1.93°；非融合组平均 13.74°±2.19°，较术前改善（P<0.01）；（2）随访时融合组颈椎活动度平均 36.47° ± 3.48° ；非融合组平均 29.82°±3.38°，均较术前减少（P＜0.05），随访时两组间的差异无统计学意义（P＞0.05）；（3）C5，6、C6，7 相邻椎体曲度分别由术前 12.34°±1.31°、11.62°±1.22°减小至随访时 8.06°±0.97°、7.14°±0.69°，差异有统计学意义（P＜0.05）。（4）随访时融合组 C4、C5、C6、C7 水平中立位脊髓横断面面积分别为（0.93±0.03）cm^2、（0.86±0.04）cm^2、（0.89±0.05）cm^2、（0.81±0.04）cm^2，与术前比较 C4、C5 节段的差异无统计学意义，C6、C7 节段的差异有统计学意义。结论 联合 X 线片及 MRI 可用于临床评估颈椎前路融合或非融合内固定术的疗效。

EPO-1485

糖尿病下肢动脉病变双源 CT 血管成像分析

胡永友
西南医科大学附属中医医院

摘要：目的：研究糖尿病下肢动脉病变 双源层 CT 血管成像（CTA）特征。方法：回顾性分析 80 例临床诊断为糖尿病，并行双源 CTA 检查的患者资料。下肢动脉分为 4 段（髂动脉段、股动脉段、腘动脉段和小腿动脉段）。统计下肢动脉病变部位、数目、性质、长度（< 5 cm， 5～10 cm 和 > 10 cm）并分析其特点。结果：根据 4 分段法，80 例患者中病变动脉 149 条，多节段病变 56（37.58%）条，其中受累股动脉 104（67.80%）条，受累的小腿动脉 134（89.93%） 条。总病变 326 处，其中闭塞性疾病 180（55.21%）处，狭窄性病变约 146（44.79%） 处。> 10 cm 闭塞病变主要发生在小腿动脉 66 处，占小腿动脉病变的 49.25%，以胫前动脉和胫 后动脉为主。结论：糖尿病下肢动脉病变 CTA 表现主要以多节段硬化闭塞为主，多累及股动脉 和小腿动脉。无创性 CTA 可用于下肢动脉病变的常规评估。

EPO-1486

青海地区围绝经期妇女骨密度、血清钙磷及其代谢相关激素水平变化

焉威
青海省人民医院

摘要：目的 分析青海地区围绝经期妇女的骨密度及其相关因素。**方法** 选取西宁、同仁及德令哈市 2016 年 5 月到 2017 年 5 月期间进行健康体检的 218 例围绝经期妇女作为研究对象（A 组），同时选取西宁、同仁及德令哈市地区围绝经期前妇女 120 例为 B 组，成都平原地区围绝经期妇女 120 例为 C 组。比较 A、B、C 组研究对象骨密度、骨量、血清雌二醇、促卵泡生成素、血钙、磷、骨钙

素及甲状旁腺激素检测及相关性分析，**结果** A 组骨量正常率显著低于 B、C 组，骨量减少及骨质疏松发生率均明显高于 B、C 组（P<0.05），A 组 1-4 腰椎、大转子、股骨颈及全身骨密度均明显低于 B、C 组（P<0.05）。A、C 组血清雌二醇及磷含量明显低于 B 组、促卵泡生成素、骨钙素、甲状旁腺激素明显高于 B 组（P<0.05），三组血钙离子比较无明显差异（P>0.05）。Enter 法相关相性分析结果显示：围绝经期妇女骨密度与年龄、骨量、血清雌二醇、磷、促卵泡生成素、骨钙素及甲状旁腺激密切相关（P<0.05），而与身高、体重、脂肪含量、肌肉含量、血钙离子无明显关系（P>0.05）。**结论** 高原地区围绝经期妇女的骨密度会受到年龄、骨量、血清雌二醇、促卵泡生成素、骨钙素、磷及甲状旁腺激等影响。临床可通过对相关影响因素进行检测分析，为围绝经期妇女骨质疏松的诊断、预防及治疗提供一定的理论依据。

不同单层面 CT 测量腹腔脂肪面积与肥胖及其健康风险因素相关性研究

孙鹤[1],杨晓燕[1],王丰哲[2],孙玲玲[1]
1.中国医科大学附属第四医院
2.沈阳市第四人民医院

目的 探讨肥胖患者不同 CT 层面测量的腹腔脂肪面积（VAF）与双能 X 线吸收检测法（DEXA）测量的腹部脂肪及其健康风险因素的相关性，从而探寻最佳的 CT 层面。

方法 2016~2017 年间于我院欲行减重手术的患者 85 例，平均年龄 *29.94±9.07* 岁，男性 25 例，女性 60 例。全部患者均行全腹 CT 检查测得脐水平、L3、L3-4、L4、L4-5 及 L5 水平腹腔脂肪面积（VAF）及 DEXA 检查测得代表腹部的 A 区脂肪含量，同时根据临床资料获得患者静脉血总胆固醇(TC)、甘油三酯（TG）、高密度脂蛋白胆固醇（HDL-C）、低密度脂蛋白胆固醇（LDL-C）、空腹血糖（FBG）及胰岛素抵抗指数（HOMA1-IRI）。按性别对不同层面 VAF 与 A 区脂肪含量及以上健康风险因素进行相关性分析。

结果 男性及女性肥胖者均于 L5 水平测得的 VAF 与 A 区脂肪含量具有相关性（r=0.652，0.536），结果具有统计学意义（p<0.001）。对于女性肥胖者，不同层面 VAF 与 TC、LDL-C、FBG 及 HOMA1-IRI 具有相关性（p<0.05），其中以 L3-4 为最优层面（r=0.397，0.403，0.459，0.414）；对于男性肥胖者不同层面与测得的健康风险因素均无明显相关性（p>0.05）。

结论 单层面 CT 测量 VAF 能够预测男性及女性的腹部脂肪含量以及女性的部分肥胖相关健康风险因素，且最佳层面分别为 L5 及 L3-4 水平。

Imaging evaluation: the affected and non-affected hip of children with unilateral Legg-Calvé-Perthes disease at diagnosis and follow-up

Ruifang Zhang
the Children’s Hospital， Zhejiang University School of Medicine

Background: Legg-Calvé-Perthes disease (LCPD) is a self-limiting disease that recovers with changed morphology of the affected and non-affected hip. We performed

imaging assessment of both hips in children with unilateral LCPD at diagnosis and follow-up. **Methods:** The subjects were 25 unilateral children with LCPD (23 boys and 2 girls) with a follow-up period of 7 months to 5.9 years. Radiological parameters included acetabular width (AW), acetabular depth (AD), acetabular depth-to-width ratio (ADR), acetabular index (AI), femoral neck width (NW), femoral neck length (NL) and femoral neck-shaft angle (NSA). The data changes of the affected and non-affected hip at diagnosis and follow-up were analysed using paired-samples *t* test. **Results:** Comparison between the affected and non-affected hip at diagnosis and follow-up assessment revealed significant differences in AW, AD, ADR and NW ($P < 0.05$), but no significant difference in NSA or AI ($P > 0.05$). For NL, there was significant difference at diagnosis ($P < 0.05$), but no difference at follow-up m($P > 0.05$). Comparison of each side from the time of diagnosis to follow-up revealed that AW, AD, NW and NL increased significantly ($P < 0.05$) in both sides. ADR and AI showed significant differences in the non-affected hips ($P < 0.05$) and no difference in the affected hips ($P > 0.05$). No significant difference was found in NSA ($P > 0.05$) in either hip.
Conclusion: Significant differences of the affected and non-affected hip at diagnosis and follow-up were obtained, especially AW, AD, NW, and NL.

EPO-1489
糖尿病足患者跟腱的 CT 表现及灌注成像特征

谢金玲,曾自三
广西医科大学第一附属医院

目的：分析糖尿病足患者跟腱的 CT 平扫及灌注成像特征，并探索糖尿病足患者跟腱的形态学改变及微循环状态。
方法：搜集 2017 年 2 月至 2018 年 5 月在广西医科大学第一附属医院骨关节外科就诊并确诊为糖尿病足的 33 例患者作为研究对象，并按照患者足部是否合并溃烂分为溃烂足组和非溃烂足组，按照糖尿病足 Wagner 分级分为 0、Ⅰ、Ⅱ、Ⅲ及Ⅳ级组。选择同时段来我院就诊的血糖正常患者 10 例作为对照组。所有研究对象均行双侧下肢 CT 平扫及小腿下段、足部 CT 灌注成像扫描，对照组均行双下肢 CT 平扫检查。在 PACS 上观察患者跟腱图像，测量并记录患者跟腱 CT 形态学表现（包括厚度、密度、边缘、钙化灶及周围软组织）。将 CT 扫描所得的动态图像导入 CT 后处理软件(CT Perfusion 4D，ADW4.7)，获得灌注伪彩图。选择跟腱起点、中点、止点所在层面画感兴趣区（ROI）得到各灌注参数值，包括 BF、BV、MTT、TTP 和 PS。 应用 SPSS17.0 软件进行统计学分析，以 $P<0.05$ 为差异有统计学意义。
结果：
1.对照组、非溃烂足组及溃烂足组跟腱的厚度逐渐增加，密度逐渐减低，差异具有统计学意义。对照组、非溃烂足组及溃烂足组跟腱出现边界模糊、腱内钙化灶及周围软组织肿胀的比率逐渐增高。
2.溃烂足组的 BF、BV 值较非溃烂足组增加，差异有统计学意义（P均<0.05），而 MTT、TTP、PS 值差异均无统计学意义。
3.随着糖尿病足 Wagner 分级的增加，跟腱的厚度逐渐增加，差异具有统计学意义；跟腱的密度、BF、BV 不同分级之间均未见统计学差异。
结论：
1.糖尿病足患者跟腱的 CT 形态学表现具有一定特征。
2.CT 灌注成像能定量分析糖尿病患者合并与不合并足部溃烂时跟腱的血流动力学改变，能为糖尿病跟腱病变的早期诊断、治疗提供一些帮助。

3.糖尿病跟腱的厚度能够在一定程度上反映糖尿病足的病程，为临床及时控制糖尿病足具有一定的意义。

MRI 神经成像在椎间孔镜术前责任神经根定位中的价值探讨

武莹莹
广西中医药大学第一附属医院

摘要 目的 探讨 MRI 神经成像在在椎间孔镜术前责任神经根定位中的价值 方法 回顾性分析 2012.1-2017.5 我院行 MRI 平扫及腰骶丛神经成像且手术证实的腰骶神经根受压所致的腰腿痛病例 16 例，分析其 MRI 平扫与神经成像在定位责任神经根中的差异。结果 8 例患者 MRI 平扫显示腰椎间盘突出、膨出或脱出并压迫相应神经根，出现一侧或两侧神经根受压、变细甚至移位，MRI 神经成像对此显示明确。4 例患者 MRI 平扫未能明确神经根受压，而 MRI 神经成像则显示出其责任神经根受压情况。2 例患者 MRI 平扫显示骶管囊肿，神经根显示欠佳，MRI 神经成像则显示出责任神经根受压，2 例为手术所致责任神经根粘连。所有患者在手术解除压迫后腰腿痛症状改善。结论 MRI 神经成像可较好的显示腰骶神经的解剖细节，较 MRI 平扫能更好定位责任神经根部位及范围，为临床提供更多的诊断依据。

脊柱生理曲度的 DR 与 MRI 比较及年龄相关性研究

刘贝贝[1],刘贝贝[1]
1.上海交通大学附属第六人民医院
2.上海交通大学附属第六人民医院

目的：本研究计划先采 MRI 来测量仰卧位状态下脊柱生理曲度，并与 X 线测量进行对比，再在此基础上，采用仰卧位 MRI 来分析脊柱生理曲度随年龄的变化。

方法：招募符合条件的志愿者 73 人作为被检查者，按照年龄分为三组：20—39 岁，23 人；40—59 岁，25 人；≥60 岁，25 人。对所有的被检查者均行站立位侧位全脊柱 X 线摄片及仰卧位全脊柱 MRI 扫描，并进行图像拼接获取全脊柱矢状面影像。测量两种检查方法所获得的 CL、TK、LL、SS、SVA 值，并进行相关性分析以探究这两种方法之间的相关性及差异性。招募无症状正常成年人 120 人，按照 10 岁一个梯度分为 20—29 岁、30—39 岁、40—49 岁、50—59 岁、60—69 岁、70 岁及以上 6 个年龄组，每组 20 人。对每组志愿者行仰卧位全脊柱 MRI 扫并进行图像拼接，获得全脊柱 T1WI 及 T2WI 正中矢状面影像，并测量 CL、TK、LL、SS、SVA 值。

结果：除了在年龄≥60 岁组，CL 测量结果在两种方法之间的差异无明显统计学意义（$p = 0.17$），其余组两种测量方法所测量的参数之间的差异均具有显著统计学意义（$p < 0.05$）。CL 在 30-60 岁之间先略微上升后又下降，在 60-70 岁年龄组有显著上升；TK 在 50 岁之前变化幅度不大，在 50 岁以后，呈逐渐上升的趋势；LL 在 50-60 岁有显著的上升，60 岁以后逐渐降低；SS 变化趋势和 LL 大致相仿；SVA 则随着年龄的增加而逐渐增加。

结论：站立位 X 线与仰卧位 MRI 测量脊柱矢状面生理曲度具有相关性，仰卧位 MRI 测量结果提供了人体无负重状态下的生理曲度，可与 X 线结合为评估脊柱矢状面形态提供一定的参考。

第三代双源 CT“双低”技术在下肢血管成像（CTA）中的运用价值

施辉友
贵州省人民医院

[摘要] 目的 探讨第三代双源 CT“双低”（低管电压（70 kVp）及低造影剂量）联合高级建模迭代重建（advanced modeled iterative reconstruction ,ADMIRE）技术在双下肢血管成像（CTA）中的运用价值。**方法**：连续收集临床疑双下肢血管病变患者 40 例，随机分为实验组和对照组；实验组（20 例）：低管电压（70 kVp）扫描，采用 ADMIER 重建，强度 3 级；50ml 造影剂；对照组（20 例）：常规 100 kV，滤波反投影法（filtered back-projection，FBP）重建；100ml 造影剂；其余扫描参数不变。比较两组图像质量的客观指标（CT 值、图像噪声、SNR、CNR）、辐射剂量及造影剂用量。**结果** 两组辐射剂量比较差异有统计学意义（P<0.05），试验组较对照组辐射剂量降低约 69.58%；两组造影剂用量比较差异有统计学意义（P<0.05），试验组较对照组造影剂用量减少 50%；两组图像客观评价指标比较差异无统计学意义（P>0.05）。**结论** 第三代双源 CT 低管电压（70kVp）、低造影剂用量联合 ADMIRE 重建技术行下肢血管成像（CTA），有效降低辐射剂量且保证图像质量。

推拿治疗慢性下腰痛的功能连接分析

谭文莉,杨玉婵,陈义磊,黄炎文,詹松华
上海中医药大学附属曙光医院

目的：本研究诣在通过静息态 BOLD fMRI 技术探讨推拿缓解慢性下腰痛中的脑功能连接变化。
方法：前瞻性收集 20 例腰椎间盘源性慢性下腰痛受试者，慢性下腰痛病程大于 3 个月，VAS 评分高于 30 分，ODI 功能指数大于 20，受试者在治疗前、治疗后即刻、治疗后 20 天分别进行静息态 BOLD fMRI 检查。同时募集年龄和性别匹配的 20 例健康志愿者，进行一次静息态 BOLD fMRI 检查。分别比较慢性下腰痛受试者治疗前与健康志愿者间、慢性腰痛受试者治疗后即刻与治疗前、治疗后 20 天与治疗前、治疗后即刻与健康志愿者、治疗后 20 天与健康志愿者间后扣带回与各脑区功能连接的差异。
结果：以后扣带回为种子点进行全脑功能连接分析显示，慢性下腰痛受试者治疗后即刻后扣带回与左侧内侧额上回、后扣带回功能连接程度减低，治疗后 20 天显示后扣带回与左侧楔前叶功能连接减低。治疗后 20 天与治疗后即刻比较，扣带回与左侧额上回功能连接增加。在治疗前，与健康志愿者比较，后扣带回与左侧楔前叶、颞中回和小脑前叶表现为脑功能连接增加的趋势，而与左侧额上回脑功能连接表现为受到破坏的趋势。慢性下腰痛受试者治疗后即刻，上述存在异常的脑功能连接得以恢复正常水平，同时出现后扣带回与左侧额叶值回脑功能连接的减低。在治疗后 20 天，治疗前存在的后扣带回与左侧颞中回、左侧小脑前叶及左侧额上回的异常连接得以恢复，同时相对于健康志愿者，慢性下腰痛受试者表现为后扣带回与左侧楔前叶脑功能连接减低的趋势。
结论：推拿治疗主要通过纠正异常升高的默认脑网络活动发挥治疗作用。

EPO-1494

The brain immediate analgesia mechanism of Tuina in low back pain

Wenli Tan,Yuchan Yang
Shuguang Hospital， Affiliated to Shanghai Traditional Chinese Medicine School

Synopsis: In order to seek the brain changes of patients with low back pain after Tuina therapy, this study analyzed the ALFF parameters before and after treatment, and observe the relationship of ALFF and clinical parameters (VAS/ODI). The results showed that the patients with low back pain have abnormal brain activity, and after Tuina therapy, these abnormal brain activity restores.
Background: Chronic low back pain is a major health issue, and more than 70% patients with chronic low back pain need to accept treatment. Some research indicated that spinal Tuina therapy was an effective therapy. However, the mechanism of Tuina relief chronic low back pain is unclear.
Objective: To explore the immediate analgesia mechanism of Tuina in low back pain by the rest blood-oxygen-level dependent functional magnetic resonance imaging (BOLD fMRI) .
Methods: Twenty patients with low back pain were recruited for Tuina therapy and the rest BOLD fMRI were performed before and after the therapy. Meanwhile twenty volunteers who were age- and gender- matched with the patients were recruited and the rest BOLD fMRI were performed once. MR examinations were performed by 3T Verio (Siemens Healthcare, Erlangen, Germany) with 8 channel birdcage coil. The sequences included three dimensional sagittal T1WI (MP-RAGE) and rest BOLD fMRI. The parameters of sequences were as following: (1) T1WI TR/TE=2100ms/4.38ms, flip angle=8°, FOV=220mm, slice thickness=1mm, resolution =0.861*0.861mm^2; (2) rest BOLD fMRI EPI sequence, TR/TE= 2500ms/30ms, slice thickness=3mm, interslice distance=0.5mm, FOV=256mm*256mm, matrix=64*64, flip angle=90°. The data of rest BOLD fMRI was processed by SPM 12.0. The difference of amplitude of low frequency fluctuation (ALFF) was calculated between the patients before therapy and volunteers, between the patients after therapy and volunteers, between the patients before and after Tuina. Use visual analogue scale(VAS) and Oswestry disability index(ODI) scores as indicators of low back pain levels. The correlation analysis of ALFF value and clinical indexes was calculated.
Results: The VAS and modified ODI of patients were 53.25±14.26 and 30.10±12.73. After the therapy, they were reduced into 31.00±10.71、21.45±9.85. There was significant statistical difference. Compared to volunteers, the patients showed higher ALFF value in the right posterior cingulate, superior frontal gyrus and lower ALFF value in the left supplementary motor area. After the Tuina, the patients showed lower brain activity in the left and right precuneus. The left and right middle frontal gyrus, right cingulate gyrus, right angular gyrus were showed lower ALFF value, and the posterior lobe of cerebellum showed higher ALFF value in the patients after Tuina, compared to them without Tuina. In the paired t-test of patients, the ALFF value of the right middle frontal gyrus was negatively correlated with the changes of VAS and modified ODI.
Conclusion: The immediate analgesia effect of Tuina is embodied in rectifying the abnormal changes in the pain matrix, and bringing the changes of brain cognitive area.

50 岁以上女性身体成分与骨折相关性研究

郑剑锋,蔡思清
福建医科大学附属第二医院

目的 探讨≥50 岁女性骨折患者的身体成分与骨折的相关性。方法 收集 315 例来自福建医科大学第二临床医学院行双能 X 线骨密度检测和身体成分分析的≥50 岁的女性，依据是否骨折分为骨折组和无骨折组，其中骨折组 142 例，无骨折组 173 例，收集的数据包括四肢、躯干、全身瘦组织和脂肪组织，脂肪组织指数，瘦组织指数及股骨颈、全髋、腰椎骨密度、全身平均骨密度。结果 女性骨折患者的四肢、躯干、全身瘦组织和脂肪组织，脂肪组织指数，瘦组织指数及股骨颈、全髋、腰椎骨密度、全身平均骨密度均明显低于无骨折组（p＜0.05）。结论 ≥50 岁女性骨折患者的身体成分与骨折发生存在相关性，加强营养与运动，提升体质量及骨密度对骨折的预防具有重要意义。

多模态磁共振成像技术在脊髓型颈椎病中的应用研究进展

赵国舒[1],占雅如[1],曹源[1,2],何来昌[1]
1.南昌大学第一附属医院
2.四川大学华西医院核医学科

脊髓型颈椎病(Cervical Spondylotic Myelopathy, CSM)是一种由于颈椎及周边软组织退变对脊髓产生慢性进行性压迫的常见颈椎病。患者常表现为上肢或下肢麻木无力、僵硬、触觉障碍，双足踩棉花感，后期发生尿频或排尿、排便困难等严重的神经功能障碍。CSM 的传统诊断主要基于临床表现及症状体征。然而随着影像学技术的发展，通过影像学早期诊断 CSM 的重要性得以显现。 其中 MRI 作为一种先进、客观的成像技术逐渐成为评估 CSM 的最佳影像学手段，其可以提供高分辨率的软组织结构图像，显示颈髓的形态变化和压迫程度，已成为临床常规的检查方法。近年来，随着 MRI 多种新技术的开发与应用，正逐步在 CSM 患者中应用研究，本文就多模态磁共振成像新技术在脊髓型颈椎病中的应用研究进行综述。

蜡油样骨病影像学表现

卢小婷
华中科技大学同济医学院附属协和医院

目的 探讨蜡油样骨病的影像表现特点，以 X 线为主，CT、MRI 及全身骨显像核素检查为补充。
材料与方法 回顾性分析蜡油样骨病的影像表现。搜集 2014 年 1 月～2018 年 7 月间武汉协和医院蜡油样骨病患者 15 例，男性患者 11 例，女性患者 4 例，年龄 3～51 岁，中位年龄 38 岁，平均年龄 31.8 岁。临床表现为患肢疼痛，麻木，活动受限，邻近软组织肿胀，病程 1～6 年不等，症状呈进行性加重。两例儿童表现为患肢较短小，肌肉萎缩。因外伤意外发现者 2 例。15 例患者均行 X 线检查，7 例行 CT 检查，4 例行 MRI 检查，3 例行全身骨显像核素检查。
结果 15 个病例均为单侧骨骼发病，无双侧骨骼发病病例。其中 8 例为右侧发病，7 例为左侧发病。累及上肢骨者 3 例，下肢骨者 12 例。15 个病例均可见病变区域骨膜增生，骨皮质增厚，骨髓腔变窄甚至闭塞，骨小梁结构消失，其中骨干上新骨堆积呈波浪状 5 例，长管骨呈蜡泪样流淌状骨肥厚 5 例，软组织内斑片状或不规则钙化 8 例，软组织肿胀 8 例。合并骨斑点症者 2 例。其中 15 例中有 7 例行 CT 检查，4 例行 MRI 检查，3 例行全身骨显像核素检查。其中 CT 发现关节间隙变窄甚至消失 4 例，共累及 27 个关节，与以前认为的蜡油样骨病不累及关节相悖。本病在 MRI 上表现为长 T1 短 T2 信号，MRI 可显示邻近软组织受增生骨质压迫见条片状长 T2 信号，其中一例患者胫

骨内见骨髓水肿，对 X 线和 CT 在软组织及骨髓显示不足进行了补充。本组病例中有 3 例病人行骨显像核素检查，病灶部位在骨核素扫描时显像剂摄取均增高，提示本病为成骨性疾病。
结论 蜡油样骨病 x 影像表现典型，常规 X 线检查即可以明确诊断，CT、MRI 及骨的 ECT 显像可作为有效的补充。

Analysis of the bone mineral density of 461cases of the elderly male measured by quality CT(QCT) and the related factors

xiaorong li,Xiangdong Li
General Hospital of Southern Theatre Command

Abstract
Ojictive The purpose of this study is to investigate the bone mineral density condition of the elderly male and seek the correlation between the bone mineral density and the related factors. Subjects and Methods A total of 461 cases of elderly male' bone mineral density was measured by quality CT (QCT). Their age ,height ,weight ,smoking and drinking history ,diabetes history, as well as the results of the biochemical indexes of bone metabolism were collected and analyzed by statistical methods. Results Compared with the normal group ,in the osteopenia group, osteoporosis group and severe osteoporosis group, bone mineral density reducing was positively correlated with age, the Odds ratio(OR) were 1.107, 1.163, 1.174,and other factors had no statistical significance; The PINP value of the osteopenia group is lower than the normal group (P<0.05); The P -CXT, N-MID and PTH value of the osteoporosis group is higher than the normal group and the osteopenia group (P<0.05); between the normal group and the osteopenia group ,the β-CXT、N-MID and parathyroid hormone had no significant difference (P >0.05) . Conclusion QCT can reflect the trend of bone density changes with the age , the results of QCT examination have a good correlation with the biochemical indexes of bone metabolism.

Study on the normal fetal development of cervical, thoracic and lumbar spine on postmortem MR imaging

Shuai Zhang,Xiangtao Lin,Yan Gao
Shandong Provincial Hospital

Background and purpose:
Measures for spine have become increasingly important in the prenatal diagnosis of spinal abnormalities.Before evaluating spinal pathology,it is essential to have knowledge of the normal appearances of the fetal spine at different gestational ages. The aim of this study is to measure the normal fetal cervical, thoracic and lumbar

centrum ossification center volume and study their developmental changes with gestational ages.

Methods Postmortem MR imaging was performed on 55 fetuses ranging from 17 to 42 gestational weeks by using sequence of 3D-T2WI,then measurements of the cervical, thoracic,lumbar and L1-L5 centrum ossification center volume were obtained by a post-processing workstation.

Results The cervical, thoracic and lumbar centrum ossification center volume increased linearly with gestational ages (P＜.05) ;No gender differences are found in the volume development of cervical, thoracic and lumbar centrum ossification center.The average volume growth rate and multiple of lumbar single centrum ossification center were larger than those of cervical and thoracic single centrum ossification centers.The volume of L1-L5 centrum ossification centers increases linearly with gestational age.

Conclusions The cervical,thoracic,lumbar and L1-L5 centrum ossification center volume show a good correlation with the gestational age in the second and third trimester. Measures of L1 centrum ossification center volume are better suited as fetal cervical,thoracic,lumbar development.Understanding the normal development of the fetal spine on postmortem imaging is essential before studying abnormal fetal spine.

肌肉减少症对胃癌不同 TNM 分期患者手术预后影响研究

李锋[1],冯卫华[2]
1.青岛西海岸新区中心医院
2.青岛大学附属医院

目的：探讨肌肉减少症（CT 测量 L3 平面骨骼肌面积法）对胃癌不同 TNM 分期患者根治术后短期临床结局的影响。

方法：我们选取 50 岁以上、体重指数在 18.5-27.9kg/m^2 、行根治性切除术的胃癌患者作为研究对象，术前测量其握力及 4 米步速，通过 CT 测量 L3 椎体中间水平的骨骼肌面积，计算 L3 骨骼肌指数（SMI）：L3 肌肉面积／身高²（cm^2 /m^2）。SMI 下降合并步速或握力的减低，即可诊断为肌肉减少症。根据术后的病理结果，按照 TNM 分期将胃癌患者分为早中期（Ⅰ-Ⅱ期）和晚期（Ⅲ-Ⅳ期），每一期根据有无肌肉减少症分为少肌组和非少肌组，对可能影响手术预后的基本情况及术后结果的数据进行对比分析，探究肌肉减少症对胃癌不同 TNM 分期患者根治术后短期临床结局的影响。

结果：

早中期胃癌患者少肌组具有更高的年龄（P＜0.001），更高的合并症指数（P＜0.001），和更高的营养风险（P=0.038）。两组在术后结果对比显示少肌组并发症发生率（46.88%）高于非少肌组（14.61%），两者有统计学意义（P＜0.001），logistic 二元回归分析显示：肌肉减少症（P=0.002）、合并症指数（P＜0.001）是早中期胃癌根治术后并发症的独立危险因素。

晚期胃癌患者少肌组具有更高的年龄（P＜0.001），具有更高的合并症指数（P=0.001），和更低的血红蛋白浓度（P=0.001）。两组的术后结果对比显示少肌组并发症发生率与非少肌组相比，两者无统计学意义（P=0.089），且 logistic 二元回归分析显示：晚期胃癌根治术后并发症的独立危险因素是全胃切除术（P=0.006）。

结论：

1 肌肉减少症是早中期胃癌患者根治术后发生并发症的独立危险因素。

2 利用胃癌患者 CT 检查时的影像资料，评估患者肌肉状况的方法简单可行，有利用对早中期胃癌患者合并的肌肉减少症进行早诊断、早干预。

EPO-1501

The effect of CT scan position on the image quality in the cervical and thoracic segments under the positive positioning image

Xiaozheng Dong
Peking University Third Hospital

purpose:
To investigate the effect of different position of dual-source CT on the quality of CT scan of cervical and thoracic segments and the radiation dose.
Materials and Methods:
We collected 120 non-postoperative adult patients who underwent CT scan of the cervical and thoracic segments in our hospital. Patients were randomly divided into two groups, A and B (60 in each group). The gender, age, and body mass index of each group of patients were recorded. In group A, the patient's head is raised, the lower jaw is tightened, the vertebral body is parallel to the bed surface as much as possible, the arms are relaxed on both sides of the body, and the spiral scan is performed by the positive positioning image; the patient in group B is reclined, so that The mandible is placed as perpendicular to the bed as possible, the arms are relaxed on both sides of the body, and a spiral scan is performed by a positive positioning image.
Equipment: Siemens Somatom Definition dual source CT; open CARE Dose 4D technology, detector width: 128x0.6mm, pitch: 0.6, rotation time: 0.5s / week, layer thickness / spacing: 3mm, scanning range: C4 - T6.
Objective image evaluation: Record and compare volume CT dose index (CTDIvol), dose length product (DLP), effective radiation dose (ED) for each scan. ROI and the same level of air were selected at the upper edge of the first thoracic vertebra (T1) to select the ROI, and the SD value (SD_{air}) was used as the image noise (N). The CT values of the trapezius muscles were measured and averaged. ($CT_{trapezius}$), calculate and record the contrast-to-noise ratio (CNR), signal-to-noise ratio (SNR).
Subjective evaluation of images: Two experienced radiologists assessed the subjective assessment of image quality to assess the hardening artifacts and diagnostic acceptability based on the 3-point sub-system. Scoring standard: 1 is divided into poor, the harness is severely hardened, the edge of the vertebral body is unclear and cannot be used for diagnosis; 2 is good, the wire beam hardening artifact is lighter, most of the vertebral body edge is clear, can be used for diagnosis, but accurate Sex may be affected; 3 is excellent, there is basically no artifact of wire bundle hardening, the vertebral body is clear, and there is no impact on the diagnosis; the two are divided equally into the final score.

Statistical methods: The two groups of data were analyzed using SPSS 23.0 software package. The statistical methods included one-way ANOVA and independent sample T test. P<0.05 was considered statistically significant.
RESULTS: All the above images were satisfactory. The gender, age and body mass index of the A and B groups were P>0.05. The difference was not statistically significant. The signal-to-noise ratio (SNR) of the A and B groups was P>0.05, and the difference was not statistical. Significance; the contrast-to-noise ratio (CNR) of the two groups was significantly lower than that of the two groups. The difference between the two groups was statistically significant.
Conclusion: Siemens second-generation dual-source CT, open CARE Dose 4D technology, using positive positioning like scanning the chest and thoracic CT, the patient's head is reclined, so that the mandible is as perpendicular as possible to the bed surface, and the arms are relaxed and placed in the body. On the side, it can not only ensure excellent image quality, but also reduce the radiation dose of the patient by about 20%. It is recommended for clinical promotion.

中年人体质分布及血脂含量与骨密度变化的相关性研究

陈晓君
中山大学附属第五医院

[摘要] **目的：**探讨中年人体质成分的分布及血脂的含量与骨密度变化的相关性，进而给予临床治疗提供一定的指导意义。**方法：**随机抽取年龄为 45-60 岁之间的中年体检患者 1000 例，其中男性 563 例，女性为 437 例，1000 例患者均已行胸部 CT 平扫，扫描范围由肺尖至腰 2（L2）椎体下缘，所得图像数据传至骨密度分析软件（QCT Pro），得到患者腰 2 椎体层面的体质分析相关数据与腰 1-腰 2 椎体的骨密度数据，并由检验系统收集对应病人的血脂含量数据，所得数据进行统计学相关性分析。**结果：**体质分布数据可见，1000 份数据中腹腔内脂肪高于 15g 以上者 817 例；由体检系统所得的血脂数据，1000 例体检者中，血脂升高者有 724 例，正常者有 276 例；骨密度减低者有 695 例，骨密度正常者 305 例；结合血脂与骨密度数据可见，695 例骨密度减低患者中，伴有血脂升高者 618 例，血脂正常者 77 例；通过 3 组数据的统计学分析可见，腹腔内脂肪含量、血脂及骨密度 3 组数据之间任意两者均具有一定的相关性（*P<0.05*）。**结论：**椎体骨密度的变化与腹腔内脂肪的含量及血脂含量呈负相关，对于骨量减低患者的临床治疗具有一定的指导性意义。

骨质疏松性骨折患者术前双能 CT 一站式扫描方案的初步探索

刘正华,张玉婷,姜永宏
西安市红会医院

目的：本研究通过研究双能 CT 虚拟去钙技术定量评价骨质疏松性骨折患者的腰椎骨髓水肿和骨密度，探讨该技术作为 MRI 和 DXA/QCT 的替代方法，进行术前一站式扫描方案的可行性。
方法：对我院 2019 年 3 月脊柱外科 20 例住院患者行 DECT 和 MRI 检查。在行 DECT 检查时，将 Mindways 公司的定量 CT（QCT）标准校正体模放置于患者的检查部位，以获得椎体的 QCT 扫描数据，进行椎体松质骨密度（BMD）测量。参照西门子双能量分析软件中骨髓分析配置文件，对肝脏

VNC 配置文件中的默认参数进行修改，用于骨髓水肿以及钙和脂肪的定量分析，统计参数包括钙浓度（CaD）、脂肪分数（FF）。分别在 MRI 的 T2 脂肪抑制图像上和 DECT 的 VNCa 图上观察椎体骨髓水肿情况，并以前者作为金标准，评价 DECT 对椎体骨髓水肿的诊断效能。以 QCT 测量的 BMD 为金标准，利用多元线性回归分析，评价 CaD、FF 与 BMD 的相关性，并进行 ROC 评价。
结果：128 个椎体纳入骨髓水肿分析，MRI 诊断骨髓水肿 37 个，DECT 的 VNCa 图诊断骨髓水肿的敏感度、特异度及准确度分别为 86.58%（32/37）、92.31%（84/91）和 90.62%（116/128）。102 个椎体纳入 BMD 多元回归分析，CaD、FF 与 BMD 具有显著相关性（$p<0.01$），相关系数分别为 $r=0.877$，$r=0.492$，回归方程为 rBMD =87.82+21.03×CaD-1.34×FF，决定系数为 0.915。ROC 曲线分析显示 CaD、 FF 及回归方程 rBMD 的曲线下面积分别为 0.938，0.696，0.966。以 rBMD<81.94mg/cm^{3}为阈值，诊断骨质疏松的敏感度为 90.0%，特异度为 92.0%。
结论：双能 CT 虚拟去钙技术对骨质疏松骨折患者的骨髓水肿和骨密度评价均有较高的诊断价值，可以作为作为 MRI 和 DXA/QCT 的替代方法进行一站式扫描。

新型核磁共振鸟笼线圈检查四肢小关节的装置与应用

马琼英
陆军军医大学附属新桥医院放射科

目的 ：设计一种新型用核磁共振鸟笼线圈检查四肢小关节的装置，此装置让鸟笼线圈不仅仅用于检查头部，还可以用于检查四肢掌指（趾）关节， 且图像质量完全达到诊断要求。**方法** ：包括鸟笼线圈本体、 鸟笼线圈基座、与人体头部后脑相适应的内凹弧 形头部垫板和用于放置手或者脚的两用垫板，鸟笼线圈本体安装在鸟笼线圈基座上并与鸟笼线 圈基座滑动配合，内凹弧形头部垫板伸向鸟笼线 圈本体的内部，内凹弧形头部垫板的一端固定在 鸟笼线圈基座的一端上，两用垫板放置在内凹弧 形头部垫板内，两用垫板的底部与内凹弧形头部 垫板的内壁贴合，两用垫板的顶部形成一平面，检查腕关节及指间关节时，将手放在两用垫板上，手臂平放在手臂支撑板上，通过其中的绑扎带将手腕位置固定，对手腕关节或指间关节进行有效的核磁共振成像检查。同理，将脚掌直接放在两用垫板上，通过其中的绑扎带将其固定，行脚掌及趾骨核磁共振成像检查；拆开连接带，可将两用垫板从内凹弧形头部垫板上取下，便可对头部进行核磁共振成像检查。**结果**：新型核磁共振鸟笼线圈检查四肢小关节的装置，功能多用，在一定程度上保护了因频繁更换线圈造成的损坏，克服了线圈的单一功能，节省了更换线圈耽误的时间，单位时间内检查人数增加；因位置固定良好且扫描部位和线圈之间接触良好，图像无运动伪影，图像质量好。**结论**：新型核磁共振鸟笼线圈检查四肢小关节装置的应用让线圈由单一功能变成多功能使用，经济实惠，性价比高，单位时间内加快了检查患者的数量，且扫描过程中患者体位舒适，配合好，图像质量佳。此装置的应用各项性能可满足扫描体位要求且图像质量均达诊断标准。

布氏杆菌性脊柱炎的 CT 及 MRI 影像学特征分析

刘佳佳[1],刘岭岭[2],张家伟[1],朱子超[1],陈志强[2]
1.宁夏医科大学临床医学院
2.宁夏医科大学总医院

【摘要】目的：探讨布氏杆菌性脊柱炎的 CT、MRI 影像学特征，以提高对该病的认识。**方法：**收集 2014 年 6 月至 2018 年 12 月于宁夏医科大学总医院脊柱骨科收治的布氏杆菌性脊柱炎患者 70 例，所有患者经流行病学、实验室检查、影像学及病理检查确诊并分析其 CT、MRI 特征。 **结果：**70 例

患者共累及 172 个椎体，其中腰椎 123 个（71.51%），以下腰椎受累为著；骶椎 18 个（10.47%）；胸椎 17 个（9.88%）；颈椎 14 个（8.14%）；累及相邻 2 个椎体为 46 例（65.71%）；累及相邻 3 个及以上椎体 21 例（30%），最多累及连续 5 个椎体，“跳跃征”3 例（4.29%）。影像特征：虫蚀状骨质破坏伴骨质增生、硬化为布氏杆菌性脊柱炎最经典的骨质破坏类型；碎片状骨质破坏较虫蚀状骨质破坏更容易发生死骨（86.36% vs 13.64%）、椎体压缩（85.71% vs 14.29%）及后凸畸形（100% vs 0）。椎间隙正常或轻度狭窄，可伴有“周围真空现象”、终板破坏呈“类许莫氏结节”。椎旁或硬膜外脓肿较局限，不会形成溶通性脓肿，脓肿内钙化少见；病变很少累及脊髓、竖脊肌及前、后纵韧带。**结论：**布氏杆菌性脊柱炎 CT、MRI 具有一定的影像特征，结合流行病学、实验室检查及临床表现可及时作出鉴别诊断。

MRI 的测量值对坐骨股骨撞击综合征诊断价值

葛晓东
陆军军医大学第二附属医院（新桥医院）

目的　探讨 MRI 图像定量测量指标对坐骨股骨撞击综合征的诊断价值。
方法　回顾性分析我院就诊并行髋关节 MRI 检查患者 110 例，其中确诊为 IFIS 的 70 例患者（IFIS 组）作为病例组；40 名正常志愿者作为对照组。于轴位脂肪抑制 MRI T2WI fs 轴位图像测量两组患者坐骨股骨间隙（Ischial femoral space,IFS）宽度、股方肌间隙（Quadratus femoris space，QFS）宽度，轴位 T1WI 轴位图像上测量坐骨角度，于冠状位；COR T2WI STIR 序列上测量股骨颈干角，比较 2 组间的差异，分析 IFS 宽度与其他 3 个指标的相关性，绘制 ROC 曲线，评价其对 IFIS 的诊断效能。
结果　IFIS：IFS 宽度、QFS 宽度、坐骨角度及股骨颈干角分别为(11.76±2.22)mm、（8.33±2.20）mm、（132.59±1.39）°、（132.73±1.81）°，对照组患者 IFS、QFS、坐骨角度及股骨颈干角分别为（26.29±4.61）mm、（18.59±3.18）mm、（126.89±2.96）°、

（127.69±2.36）°，病例组 IFS、QFS 较对照组明显变窄，差异均具有统计学意义（P 均<0.001）；病例组坐骨角度及股骨颈干角均大于对照组，差异具有统计学意义（P<0.001）。IFS 宽度、QFS 宽度、坐骨角度、股骨颈干角诊断 IFIS 的 ROC 曲线下面积界值分别为 1.000、0.999、0.996、0.975。IFS 与 QFS 呈正相关，差异具有统计学意义（r=0.743,，P<0.001）；IFS，与坐骨角度及股骨颈干角呈负相关，差异具有统计学意义(（r=一-0.273,，P=0.022;；r=一-0.332,P=0.005））。
结论 ：IFIS 患者的 IFS、QFS 均明显狭窄，股方肌水肿是 IFIS 患者常见的 MRI 表现

EPO-1508
小儿先天性复拇指畸形的 MR 影像学表现的初步探究

刘晓庆,柳曦
华中科技大学同济医学院附属协和医院

目的：探讨和研究小儿先天性复拇指畸形的 MR 影像学表现，以更好地指导临床对先天性复拇指畸形的诊断和治疗。方法：收集我院 2019 年 3 月至 2019 年 5 月住院收治的先天性复拇指畸形患儿 12 例，于术前行磁共振 3D 序列扫描，分析每例患儿的 MR 影像学征象，并与手术中发现做对比。结果：经过三维重建分析每例患者拇指的 MR 影像学征象，可以清晰显示主、复拇指各节指骨及相应骺软骨的形态发育、信号特点，各骨间关节的对位对线情况及相应关节囊的形态发育、各侧副韧带的起止、走行及形态特征，并对主、复拇指屈肌腱全程、伸肌腱近段及手掌大鱼际肌群的起止、走行及形态显示良好。其中，11 例患儿行手术治疗，将其手术中形态学及屈伸肌腱、大鱼际肌群起止的异常发现与 MR 影像学征象做对比发现二者一致性达 91%（10/11 例）。结论：小儿先天性复拇指畸形的 MR 影像学可以清晰地显示出各拇指指骨、软骨、关节囊的形态发育异常及关节旁韧带、屈伸肌腱及大鱼际肌群的形态、起止及走行异常，可进一步精确指导先天性复拇指畸形的临床诊断、分型及手术方式的选择，从而有利于提高患者术后拇指功能的恢复以及降低二次手术的发生率。

DWI 信号评估放化疗后骨盆骨髓转化的价值

胡亮,舒锦尔,夏秀梅,赵小忠,韩铮
金华市中心医院

目的：应用 MRI（T1WI，DWI）评估晚期直肠癌新辅助放化疗后骨髓转化的价值。
方法：回顾性分析经结肠镜活检证实的晚期直肠癌患者新辅助放化疗前后的盆腔 MRI 资料，入组标准：①结肠镜活检证实为直肠癌，②MRI 评估为晚期直肠癌（除 T1-2N0 之外），③术前准备进行新辅助治疗，④放化疗前后均进行盆腔 MRI 检查；排除标准：①影像学证实骨髓转移，②患者存在血液系统疾病及放化疗史。首先根据骨盆骨髓整体 T_1WI、DWI 信号进行分型:T1WI 根据骨盆骨髓整体（50%以上）信号与邻近肌肉及周围皮下脂肪信号强度比对分为如下：1 级：小于肌肉；2 级：等于肌肉；3 级：大于肌肉，小于脂肪；4 级：等于脂肪。DWI（b= 1000s/mm^2）根据骨盆骨髓整体（50%以上）信号与邻近肌肉信号强度比对分为比如下：1 级：小于肌肉；2 级：等于肌肉；3 级：大于肌肉。然后测量骨盆骨髓与肌肉信号强度比。
结果：共 36 例纳入本研究，男 22 例，女 14 例，年龄范围 34-83 岁，平均年龄为 58.0±12.3 岁，放化疗前，骨盆骨髓 T_1WI 分型中：3 型 30 例，4 型 6 例；DWI 分型：1 型 3 例，2 型 7 例，3 型 26 例；放化疗后，骨盆骨髓 T_1WI 分型中：4 型 36 例；DWI 分型：1 型 17 例，2 型 18 例，3 型 1 例。

放化疗前 T1WI、DWI 骨盆骨髓信号强度比分别为 2.24±0.31、2.20±0.67，放化疗后 T1WI、DWI 分别为 2.76±0.34、0.90±0.12，放化疗前后 T1WI、DWI 骨盆骨髓信号强度比变化绝对值分别为 0.53±0.34、1.31±0.61。放化疗前后骨盆骨髓 T1WI、DWI 分型及信号强度比变化明显（$P<0.05$），放化疗前后 DWI 较 T1WI 信号强度比变化更明显（$P<0.05$）。

结论：放化疗可加速骨盆骨髓转化，T1WI、DWI 均可反映骨盆骨髓放化疗前后转化过程，DWI 信号较 T1WI 对骨髓成分变化更敏感。

EPO-1510

MRI 诊断距腓前韧带损伤的准确性与其损伤后相关疾病影像对比研究

张翔
锦州医科大学附属第一医院

目的:评估 3.0T 磁共振成像(MRI)在诊断距腓前韧带（ATFL）损伤的准确性和损伤持续时间对核磁共振诊断准确性的影响，并回顾性分析距腓前韧带损伤后引发相关疾病即踝关节外侧不稳和前外侧软组织撞击综合征的 MRI 表现。

方法:收集自 2016 年-2017 年在我院行踝关节 MRI 检查及具有明确临床手术诊断的患者 84 例进行回顾性分析，并将这些患者根据受伤时间间隔分急性组（<=3 个月）和慢性组（>3 个月），结果分为距腓前韧带正常或损伤。MRI 诊断结果与临床手术结果相比较，用统计分析评估其准确度。收集的病历中经过临床及手术证实的踝关节前外侧软组织撞击综合征和外侧踝关节不稳的病例分别为 40 例和 23 例，记录及分析其 MRI 图像，并利用以下类别对 ATFL 形态学及信号改变进行了评估:（1）厚度：正常、增厚、纤细、显示不清（2）韧带出现局部不连续层面（3）波浪状或不规则轮廓（4）在 T2 加权图像上韧带信号强度增加（5）ATFL 周围积液。对比分析两种疾病的 ATFL 的形态学改变及其他伴随的影像学表现。

结果：MRI 诊断 ATFL 损伤的准确性为 69%，敏感性和特异性分别为 70%和 60%，距腓前韧带慢性损伤组 MRI 诊断的准确性较急性损伤组有所下降。两种 ATFL 损伤相关疾病的中韧带纤细、波浪状及不规则轮廓的改变具有统计学差异，其他影像学表现中前外侧沟内的软组织信号影及韧带撕裂纤维的填充是诊断前外侧软组织撞击综合征的直接征象。

结论: MRI 检查对 ATFL 损伤的诊断有一定价值，且诊断距腓前韧带急性损伤的准确度更高。ATFL 形态学改变对其损伤后相关疾病的诊断有一定意义。前外侧沟内的软组织信号影及韧带撕裂纤维的填充信号是诊断踝关节前外侧软组织撞击综合征的直接征象。

Fast KV switching dual-energy CT in evaluation for the change of lumbar paraspinal muscle/water content with age in healthy participants

Hui ting Deng,Kun Zhang,Ping Li
Department of Radiology， First Affiliated Hospital of Hunan University of Chinese Medicine

Objective To quantitatively evaluate the change of lumbar paraspinal muscle/water content with age in healthy participants by using fast KV switching dual-energy CT.

Methods The data from 125 healthy participants who underwent lumbar spine examination using dual-energy CT (Revolution CT, GE Medical healthcare,Milwaukee,WI,USA)were retrospectively collected. The participants were divided into three age groups: young (20-39 years old),middle (40-59 years old), and old (60-89 years old).The measurement included muscle content and water content of the bilateral erector spinae muscle at L1/2-L4/5 levels, multifidus and psoas muscle at L2/3-L5/S1 level, 3 times for average. Taking muscle/water decomposition technique, muscle/water content of the paraspinal muscles among different age groups and lumbar levels were compared. *P* values less than .05 (two-tailed) were considered to indicate a statistically significant difference.
Results The muscle content of the multifidus muscle:the old group was lower than the middle group at L3/4 level, lower than the young group at L4/5 level, respectively lower than the young and middle group at L5/S1 level(all $P < 0.05$).There was no significant difference in each age group and each level between the erector spinae and psoas muscle ($P > 0.05$).The water content of the multifidus muscle:the elder group was higher than those in the young and middle groups respectively at the L2/3 and L3/4 levels , and in the L4/5 and L5/S1 levels the age group increased with the age($P < 0.05$). The water content of the erector spinae muscle: the elder group was higher than the young and middle group at L1/2, L2/3 and L3/4 levels, and the age group increased with age at the L4/5 level($P < 0.05$). The water content of the psoas muscle:the old group was higher than that in the young and middle group at L2/3-L5/S1 level($P < 0.05$).The muscle/water content of the lumbar paraspinal muscles began changing at the L5/S1 or L4/5 level and extends upward from the lower part of lumbar level with age.
Conclusions Dual-energy CT muscle-water decomposition technique is helpful for quantitatively evaluating the changes of the lumbar paraspinal muscles, muscle and water content decreases and increases with age, respectively.

EPO-1512

Diagnostic performance of dual-energy CT HAP-Water separation technique in identifying bone marrow edema of vertebral compression fractures: Do different reconstruction kernels matter?

Chendie Song
The First Affiliated Hospital of Hunan University of Traditional Chinese Medicine

Objective: To evaluate the diagnostic performance of dual-energy CT hydroxyapatite (HAP)-water separation technique with different reconstruction kernels for acute and chronic vertebral compression fractures (VCFs).
Methods: Data from 31 patients with VCFs who underwent both dual-energy CT and MRI were retrospectively collected from October 2018 to January 2019, MR images served as the standard of reference. Data from STND and bone reconstruction kernels of HAP-Water separation technique were analyzed separately. For qualitative analysis, two independent and blinded radiologists evaluated VCFs on Sagittal color-coded virtual non-HAP (VNHAP) images for the presence of bone marrow edema (BME) using a binary

classification (0= chronic compression fracture; 1= acute compression fracture). For quantitative analysis, CT numbers of acute and chronic VCFs were measured and compared. ROC analysis was conducted. Diagnostic performance between different kernels was compared.

Results: A total of 80 VCFs including 45 acute and 35 chronic. For visual assessment, the sensitivity, specificity and area under the ROC curve (AUC) of STND and Bone kernels were 93.33%, 97.14%, 0.952 and 91.11%, 97.14%, 0.941, respectively. For quantitative analysis, CT numbers and AUC of acute and chronic VCFs of STND and Bone kernels were 1016.31±11.30, 995.44±10.14(mg/cm^3), and 1015.82±11.91, 996.99±9.29 (mg/cm^3) respectively ($P < 0.001$). There was no difference in the diagnostic efficacy between the two kernels (visual assessment: p=0.658; quantitative analysis: p=0.895).

Conclusion: Dual-energy CT HAP-water separation technique has excellent diagnostic performance for identifying acute and chronic VCFs. There is no difference in diagnostic performance between different reconstruction kernels. And the diagnostic efficiency of visual assessment and quantitative analysis is similar.

常见半月板相关性膝关节病变解剖学浅析

王昱棋,刘强
山东省医学影像学研究所

半月板是垫在股骨内、外侧髁关节面之间的两块半月形纤维软骨版，结构呈半环形，外周较厚，内缘薄锐；其上面凹陷，与股骨髁相适应，下面平坦，与胫骨平台相适应，其中股骨（富含细胞）和胫骨（大量换向纤维为特征）的不同组成也反映了他们不同的生物学功能。半月板结构为楔形，对于稳定股骨髁和胫骨平台非常有效，可以补偿胫骨髁面与股骨髁面的不适应、增加关节的稳定性；半月板质韧并具有一定的弹性，能缓冲撞击，吸收震荡，还能散布滑液，增加润滑，减少摩擦，保护关节。半月板程度重要运动作用，一旦损伤，则半月板功能减退甚至丧失，因此正确认识半月板病变的类型对患者能否及时治疗至关重要。本篇浅析三大半月板常见损伤征象，其中包括“盘状半月板”、“双后交叉韧带征”、“半月板周缘性移位”。

坐骨股骨撞击综合征 MRI 诊断

韦红星,覃天海,农理红,韦安,黄庆伟,农阳贵
天等县人民医院

目的：分析 MRI 诊断坐骨股骨撞击综合征的临床应用价值。**方法：**回顾性分析 2018 年期间诊断坐骨-股骨撞击综合征 13 例患者影像学资料并与 16 例髋关节正常者作为对照组进行对比。采用美国 GE 公司超导型 1.5T BRIVO MR355 磁共振仪，由诊断医师对比观察两组人群的坐骨结节-股骨大转子间隙的差异，并判别其间软组织及其坐骨-股骨影像学改变。**结果：**坐骨-股骨撞击综合征主要影像学表现为股方肌受压、变形（77%），以肌腹为中心出现 T2WI 压脂高信号 92%；股方肌脂肪浸润、肌萎缩 23%。伴髂腰肌腱止点水肿 1 例；腘绳肌腱止点水肿或损伤 1 例；伴臀大肌损伤 1 例。坐骨结节-股骨大转子间隙病例组和对照组分别为(10±4)mm、(22±8)mm，病例组与对照组单因素

结果分析差异有统计学意义（$P<0.05$）。**结论：**坐骨结节-股骨大转子间隙变窄并其间软组织受挤压是坐骨股骨撞击综合征主要影像学表现，利用 MRI 可准确判断坐骨股骨撞击综合征。

EPO-1515
髌股关节稳定性与髌股关节撞击综合征 MRI 相关性研究

韦红星,农阳贵,戴太亮,韦安,黄庆伟
天等县人民医院

目的 通过 MRI 进行髌股关节形态学参数测量，分析髌股关节稳定性与髌骨撞击综合征之间的相关性。**方法：**本院膝关节 MRI 检查的成人患者，诊断为髌骨撞击综合征 30 例者纳入病例组（n=30），对照组 15 例（n=25）健康志愿者与病例组进行对照，测量髌股指数、Insall 指数、滑车沟深度(SA)、外侧髌股角四项指标，所有图像均统一标准位置扫描并由 3 名放射科医师评估，分析髌股内外侧关节面软骨形态改变和软骨损伤、骨髓水肿病变的相关性。**结果：**髌骨撞击综合征影像学表现：1）25 例显示髌股关节软骨损伤，髌骨内侧缘软骨损伤 10 例，股骨外侧髁前外侧缘软骨损伤 15 例。2）骨挫伤 23 例，其中髌骨挫伤 19 例，损伤部位位于髌骨内侧缘皮质下，部分挫伤范围延伸至髌骨嵴，并累及内外侧髁共 15 例；股骨下段及胫骨平台骨挫伤 6 例；3）韧带损伤，内侧支持带损伤 25 例，10 例外侧支持带损伤，腘肌腱损伤 15 例，表现为韧带增粗，走行方向见线状及片状压脂高信号影。4）28 例出现髌下脂肪垫损伤，髌上囊及髌下深囊、关节腔内积液，滑膜增厚 15 例。髌骨撞击综合征病例组与对照组髌股指数分别为 1.98±0.76、1.19±0.29；Insall 指数分别为 1.12±0.55、1.05±0.15；滑车沟深度(SA)分别为 4.74±1.56，5.8±1.32，病例组与对照组单因素结果分析差异有统计学意义（$P<0.05$），病例组外侧髌股角开口平行 5 例，开口向内为 6 例，与正常组对比，外侧髌股角开口平行或向内比例明显高于对照组。**结论：**外侧髌股角开口平行或向内、髌股指数＞1.9、Insall 指数＞1.6 或＜0.6、滑车沟深度(SA) 位于 3-6mm 区间，提示髌股关节稳定性下降，与髌股关节骨及软骨损伤、髌骨内下缘及股骨外侧髁前外侧面骨损伤及内侧支持带损伤、髌下脂肪垫损伤均存在相关性。

EPO-1516
下腰棘间关节撞击综合征与腰椎退行性变 MR 表现分析

韦红星,农阳贵,农理红,戴太亮,黄新洪
天等县人民医院

目的：探讨下腰椎棘间关节撞击综合征与腰椎退行性变 MR 影像学表现，提高认识。
资料与方法： 我院就诊的下腰痛病人中，回顾性分析 2017 年元月-2018 年 5 月期间 822 例腰椎 MR 资料，根据临床症状、体征及腰椎 MRI 检查确诊棘间关节撞击综合征的患者 39 例，男 23 例，女 16 例，占本组总数的 7.4%；年龄 25～76 岁（平均 48 岁）。STIR 或 WATER-T2-IDeal 序列横断面及矢状位观察腰椎生理曲度情况，椎间盘退变，棘间关节及其骨质情况。**结果：**腰椎生理曲度变直 30 例（77%），棘间关节撞击出现的部位位于下腰部 L3/4 节段 7 例（占 17.9%），L4/5 节段 12 例（占 30.7%），L5/S1 节段 10 例（占 25.6%）；两个节段以上的 10 例（占 25.6%）。L3-5 节段总发生率 48%，L4-S 节段发生率为 82%，影像学表现为棘上韧带及棘间关节软组织肿胀，脂肪信号增加，压脂序列呈斑片状高信号影（39 例），合并棘突融合 10 例、棘突骨髓水肿（18 例），同时峡部裂伴滑脱 9 例。腰椎间盘 Pfirrmann 分级为 L3/4 椎间盘Ⅳ级 15 个、L4/5 椎间盘（Ⅳ-Ⅴ级）21 个、L5/S1（Ⅳ-Ⅴ级）25 个；单纯椎间盘突出 20 例，椎间盘膨出 45 例，椎间盘膨出合并突出 22 例，纤维环撕裂 45 个（51%）；同时伴黄韧带肥厚，继发性椎管狭窄 18 例，L5、S1 椎体相邻终

板炎症，表现为压脂高信号影或混合信号影 28 例。**结论：**棘间关节撞击综合征主要发生于 L4-S1 棘突水平节段，与腰椎生理曲度改变、椎间盘退变膨出或突出及椎体滑脱等腰椎后柱生物力学失稳互为因果，应该值得临床工作者重视。

EPO-1517
MRI 与步态分析对膝关节前交叉韧带重建术后的临床康复评价

冷群,常晓丹
大连大学附属中山医院

目的:探讨常规 MRI、三维运动捕捉步态分析系统（步态分析）、膝关节 Lysholm 评分表对前交叉韧带重建术后的康复评价。
方法 试验组：搜集 2015 年 7 月至 2018 年 6 月在我院行自体腘绳肌腱解剖型前交叉韧带重建术者 20 例，于术后 12~40 个月采集 3.0TMR 平扫图像、步态分析相关数据并同步进行 Lysholm 评分。MR 图像评价包括骨隧道、移植物的评价、有无并发症。若骨隧道形态良好、移植物完整且无异常信号、无并发症者为康复好组(A 组)，反之为康复差组（B 组），且 A、B 两组患者分别利用步态分析测得膝关节最大摆动期屈伸转角，屈伸转角在正常范围内记为 M，反之记为 N；并进行 Lysholm 评分，分数≥90 分记为优，分数＜90 分记为差。将 M、N 两种步态角度分为 M 组、N 组，两组间 Lysholm 评分以优、差进行统计学分析。对照组：收集正常成年人 10 例共 20 膝，进行步态分析，计算其最大摆动期屈伸转角范围。实验数据采用卡方检验进行统计分析，$p<0.05$ 具有统计学意义。
结果 20 例术后患者中，A 组 17 例(85%)，其中 M 17 例(100%)、N 0 例(0%)，B 组 3 例(15%)，其中 M 2 例(66.7%)、N 1 例(33.3%)，两组间 $p>0.05$，即 ACL 重建术后常规 MRI 平扫与步态分析两种评价方法差异不存在差异。A、B 两组 Lysholm 评分 $p<0.05$，有统计学意义。 步态 M、N 两组间 Lysholm 评分：M 组 19 例中，优 18 例（94.74%），差 1 例（5.26%），N 组 1 例中，优 0 例（0%），差 1 例（100%），$p<0.05$，有统计学意义。
结论 常规 MRI 平扫通过观测移植物形态及信号强度能较好对 ACL 术后组织学、形态学的恢复情况进行评价；步态分析技术将运动过程量化，评估术后生物力学恢复的恢复情况；Lysholm 评分将运动功能与临床相结合进行术后评价。三种评价方法的侧重面不同，均对术后康复评价有重要意义。

EPO-1518
MRI 与步态分析对膝关节前交叉韧带重建术后的康复评价

冷群,常晓丹
大连大学附属中山医院

目的 本研究的目的是探讨常规 MRI 扫描、三维运动捕捉步态分析系统（以下简称步态分析）对前交叉韧带（anterior cruciate ligament， ACL）重建术后的康复评价。

方法: 实验组：搜集 2015 年 7 月至 2018 年 6 月在我院行自体腘绳肌腱（HT）解剖型前交叉韧带重建术者 20 例，于术后 12~40 个月采集 3.0TMR 平扫图像、步态分析相关数据。两名经验丰富的影像科医师评估受检者 MR 图像，包括骨隧道的评价、移植物的评价、及有无并发症的评价，若各评价项目均为趋于正常者为移植物良好(A 组)，骨隧道异常、移植物不完整和(或)出现异常信号、有并发症者为移植物损伤（B 组），且 A、B 两组患者分别利用步态分析系统测得患者膝关节承重期及

最大摆动期屈伸转角，分析屈伸转角在对照组范围内即为 a，反之即为 b。对照组：收集正常成年人 10 例共 20 膝，进行步态分析，得到最大摆动屈伸转角并计算其范围。实验数据采用卡方检验进行统计分析，$p<0.05$ 具有统计学意义。

结果：20 例术后患者中，A 组 17 例(85%)，其中屈伸转角在正常范围内 17 例(100%)、小于正常范围 0 例(0%)，B 组 3 例(15%)，其中屈伸转角在正常范围内 2 例(66.7%)、小于正常范围 1 例(33.3%)，两组间 $p>0.05$，即 ACL 重建术后常规 MRI 平扫与步态分析两种评价方法差异不存在差异。

结论：MRI 通过显示移植物形态及信号强度程度，能较好对 ACL 术后组织学、形态学的康复情况进行评价；步态分析技术是将运动过程量化，对评估术后生物力学恢复有重要意义，两种评价方法的侧重面不同但两者对术后康复的评价结果无差异。

Effects of Assessment of Cup Orientation on Anteroposterior Pelvic Radiographs

Yang Qu,Xiaomin Li,Songtao Ai
Shanghai Ninth Peoples Hospital Shanghai Jiao Tong University School of Medicine

Background
Cup orientation is routinely measured on a postoperative anteroposterior (AP) pelvic radiograph. Previous studies have generally focused on comparison among various arithmetic methods . The aim of this study was to perform a detailed analysis on factors affecting the measurement of cup orientation, besides arithmetic methods.
Methods
A total of 125 patients (148 hips) were enrolled in this study. Digitally reconstructed radiographs were generated from postoperative computed tomography (CT) images. Cup orientation measured on 3D reconstructed pelvic models was considered as golden standard. Both cup anteversion and inclination were measured on the conventional radiographs at supine position and on virtual radiographs generated when anterior pelvic planes (APP) were parallel with virtual films. Multiple statistical analyses were conducted to evaluate the bias of the cup orientation caused by pelvic position and the offset of X-ray beam.
Results
Statistical difference of cup orientation was found on CT-based measurements between male and female. Cup anteversions in patients with developmental dysplasia of the hip (DDH) wasere inclines to have greater changes when pelvic posture changing from supine position to APP adjusted positionthey were measured on Virtual radiographs []. Cup anteversion on AP pelvic radiographs are conventionally compensated by adding an offset angle of X-ray beam, which Traditional cup anteversion measurement on pelvic radiograph overestimates the offset effect on anteversion by 1.33°.
Conclusion
Pelvic position should be considered when AP pelvic radiographs are applied to evaluate the cup orientation, especially for DDH patients. A simple linear formula is

proposed to adjust the bias of the offset of X-ray beam than simply adding an offset angle.

EPO-1520

Short Follow-up Study of Double-Bundle Anterior Cruciate Ligament Reconstruction

Mengyu Chen
Shanghai Jiao Tong University Affiliated Sixth People's Hospital

Purpose This study aimed to analyze whether early bone tunnel early enlargement correlates with abnormal graft signal 1-1.5 years after double-bundle anterior cruciate ligament(DB-ACL) reconstruction and whether graft signal abnormality is associated with knee function.

Methods Thirty-seven patients who underwent arthroscopic DB-ACL reconstruction were included. All patients were followed up for 1-1.5 years. Patients were divided into a group with good graft signal and a group with increased graft signal, according to intra-articular graft signal intensity on magnetic resonance imaging. The signal noise ratio (SNR) data were measured. Differences in the international knee documentation committee (IKDC) score and knee tension were compared. The degree of bone tunnel enlargement was measured on thin cross-sectional computed tomography images 1 week and 3 months postoperatively. The correlation between bone tunnel enlargement and SNR was assessed.

Results No significant correlation was found between the early enlargement of bone tunnel and SNR in the group with good graft signal ($P>0.05$). There were significant correlations for bone tunnel early enlargement in the anteromedial (AM) tibial tunnel, AM femoral tunnel, and posterolateral(PL) femoral tunnel with SNR of the grafts in the group with increased signal. There was a significant difference in IKDC score between the two groups ($P<0.05$) and no significant difference in knee tension ($P>0.05$).

Conclusion Early enlargement of the AM tibial tunnel, AM femoral tunnel, and PL femoral tunnel can indicate increased graft signal 1-1.5 years after DB-ACL reconstruction. Simple increased signal may indicate poor function of the knee but does not suggest knee tension.

The optimal timing of decompression surgery for patients with traumatic cervical spinal cord Injury: Focus on mortality

Yuan Cao,Laichang He
The First Affiliate Hospital of Nanchang University

Purpose: This study aimed to investigate the in-hospital mortality of patients when receiving surgery at different time after injury and to explore the risk factors of death in patients with TCSCI.

Methods: A retrospective study was conducted to evaluate the medical records of 392 TCSCI patients who underwent decompression surgery. Patients were divided into four groups according to the time from injury to surgery (≤ 3 days, 4 - 7days, 8 - 14days and > 14 days). The clinical and procedure-related data were obtained and compared between these groups. Relationships between perioperative factors and in-hospital mortality were evaluated by univariate and multivariate regression analyses.

Result: In this study, the majority (82.4%) of patients were men. Of these patients, timing of the surgical intervention within 3 days had the highest in-hospital mortality (P = 0.045). Pulmonary infection (P < 0.001), hypertension (P = 0.017), systolic pressure (P = 0.041), Frankel grade A (P < 0.001), operative segments (P < 0.001), operative level on C4/5 (P < 0.001) were found to be the independent risk factors for in-hospital mortality of TCSCI. A history of hypertension and operation segments were the two strongest risk factors (odds ratio = 37.861 and 38.117) for in-hospital mortality of patients.
Conclusion: Surgical intervention within 3 days was associated with a higher incidence of in-hospital mortality, indicating that surgery after 3 days might be relative safe in assessment of mortality.

Morel-Lavallée 损伤的临床及影像表现

谢铭飞
华中科技大学同济医学院附属协和医院

目的 探讨 Morel-Lavallée 损伤（Morel-Lavallée lesion,MLL）的临床及影像表现。
方法 回顾性分析 56 例 MLL 患者的临床及影像表现，内容包括临床病史、症状和体征、病变部位、CT 和（或）MRI 影像特征等。
结果 56 例患者中单纯 MLL30 例，合并骨折 26 例。无症状患者 12 例，有症状患者 44 例。CT 检查 22 例，MRI 检查 34 例。MLL-I 型 8 例，MLL-II 型 15 例，MLL-III 型 30 例，MLL-IV 型 2 例，MLL-V 型 1 例。病变部位：髋部或大转子旁 27 例，大腿 11 例，膝部 8 例，肘部 4 例，腰背部 5 例，踝部 1 例。病变影像表现：CT 表现为囊状或卵圆形低密度影，囊壁薄或无壁；MRI 表现由于不同时期血肿成分不同而异，以 T1WI 低信号、T2WI 高信号为主。
结论 MLL 的临床和影像表现具有一定特征性，外伤史伴相应部位皮下脂肪层和肌肉表面深筋膜间的囊性病灶是诊断的重要依据。结合临床病史、病灶部位及影像特征可提高诊断准确性。

DECT VNCa 图联合常规 CT 对膝关节非移位骨折的诊断价值

方义杰[1],梁建超[1,2],俞文[1],李文娟[1],李绍林[1],洪国斌[1]
1.中山大学附属第五医院
2.珠海市人民医院

目的：探讨双能量 CT 虚拟去钙(VNCa)图联合常规 CT 对膝关节非移位骨折的诊断价值。
方法：连续选取 25 例因膝关节急性外伤而怀疑有骨折的患者，根据病例的纳入及排除标准，最终纳入 17 例患者（共 18 个膝关节）。17 例患者均行双能量 CT(DECT)及 MRI 检查，分别获得常规 CT 图像、VNCa 图像及常规 MRI 图像。将每个膝关节分成股骨下端、胫骨上端、腓骨头及髌骨 4 区。首先由 2 名不同年资影像诊断医师（分别从事影像诊断工作 3 年、10 年）分别运用常规 CT 对区域内的骨折情况进行初步判定，接着分别对 VNC 图骨髓水肿情况进行判定，然后联合应用 VNCa 图和常规 CT 对骨折进行再次判定，以术中探查和/或经 X 线、CT、MRI 随访证实作为非移位骨折的诊断标准，分别对其敏感性、特异性、阳性预测值及阴性预测值进行比较，一致性分析采用 Kappa 检验。
结果：最终证实存在 14 处非移位骨折。2 名医师利用 VNCa 图进行骨髓损伤分级与 MRI 一致性均较高（Kappa 值分别为 0.81 和 0.85，*P*值均＜0.05）。联合应用常规 CT 和 VNCa 图，2 位医师对膝关

节非移位骨折的诊断准确率均有所提高，低年资医师从 57.1%提高到 78.5%，高年资医师从 78.5%提高到 92.8%。低年资医师额外发现了 3 处、高年资额外发现 2 处常规 CT 漏诊的非移位骨折。
结论： DECT VNCa 图联合常规 CT 能提高膝关节非移位骨折的诊断水平，尤其对低年资医师。

MRI 评肩袖损伤：与关节镜检查的对照分析

张振光,何波
昆明医科大学第一附属医院

目的：通过磁共振成像和关节镜检查对肩袖损伤结果进行对比，探讨肩袖损伤诊断的有效评价方法。**方法**：回顾性分析昆明医科大学第一附属医院运动医学科收治的 60 例经肩关节镜证实的肩袖损伤患者的 MR 图像，计算出 MRI 诊断肩袖损伤的灵敏度、特异度、符合率。采用 x 2 检验分析来评价 MRI 与关节镜检查肩袖损伤有无差异。采用 Kappa 值来检验 MRI 与关节镜诊断肩袖损伤的一致性。**结果**：MRI 对肩袖 I 度损伤与关节镜诊断的符合率为 92%，对肩袖Ⅱ级损伤诊断的符合率为 90.5%，两者差异无显著意义(P>0.05)。MRI 对肩袖III度损伤诊断的灵敏 90.9%，特异度 95.4%，符合率为 94.7%，Youden 指数为 85.3%，经一致性检验，两者具高度一致性(Kappa 值为 0.827，统计量 x 2=16.9，P=0.000)。**结论**:MRI 是肩袖损伤很有价值的无创性诊断方法，对于 MRI 表现为肩袖损伤Ⅰ、Ⅱ度损伤的患者，应谨慎行关节镜检查；然而对于 MRI 表现为III度信号的患者应尽早行关节镜检查，关节镜观察更直观，能对肩袖损伤作出准确的判断并及时治疗。

利用 MRI 评价严重股骨滑车发育不良

瞿楠
上海交通大学附属第六人民医院

目的：利用 MRI 寻求一种能客观定量评价严重股骨滑车发育不良的新方法，提高对其的认识。
方法：回顾性分析 59 例（61 膝）根据 Dejour 分型确定的严重股骨滑车发育不良患者及 30 膝正常人 MRI 图像，并利用软骨标志进行测量，测量参数包括股骨滑车沟深度、股骨滑车沟角度、股骨滑车外侧面倾斜度、和关节面对称性。
结果：正常人中，利用软骨标志测量股骨滑车沟深度为 4.2±0.16mm，股骨滑车沟角度为 146.9±0.74°，股骨滑车外侧面倾斜度为 20±0.8°，关节面对称性为 0.54±0.02。患者组中，利用软骨标志测量股骨滑车沟深度为 2.4±0.14mm，股骨滑车沟角度为 160.3±0.1，股骨滑车外侧面倾斜度为 13.7±0.72°，关节面对称为 0.4±0.01。上述 4 个测量值正常人和患者均有显著差异（P＜0.05）。
结论：MRI 具有显示关节面软骨的优势，能够作为定量评价严重股骨滑车发育不良的方法。

3.0T MRI 定量研究冈上肌腱损伤程度与脂肪浸润及肌肉萎缩程度的相关性

张宗夕,袁玉山,马培旗
阜阳市人民医院

【摘要】 **目的** 测量冈上肌腱损伤患者冈上肌脂肪含量及肌肉萎缩程度，研究其与冈上肌腱损伤程度之间的相关性。 **方法** 选取 40 例肩关节冈上肌肌腱损伤患者及 14 例健康对照组纳入本研究，对其均进行常规肩关节 MRI 检查及脂肪定量扫描（mDixon-Quant）。获取冈上肌脂肪分数图及冈上肌相对大小值。按冈上肌肌腱 MRI 不同表现将病例组分为退变组、部分撕裂组和完全撕裂组，加上正常对照组，共四组。采用单因素方差分析比较各组间冈上肌脂肪含量及相对大小值，采用 Spearman 相关分析冈上肌脂肪含量及相对大小值与冈上肌腱损伤程度间的相关性。**结果** 各组间冈上肌脂肪含量及相对大小值均有统计学意义（P＜0.05）；完全撕裂组冈上肌脂肪含量明显高于其他组(P＜0.05)；完全撕裂组冈上肌相对大小值低于其他组（P＜0.05）；冈上肌脂肪含量与肌腱损伤程度呈正相关（r=0.95，p=0.00）；冈上肌相对大小值与肌腱损伤程度呈负相关（r=-0.80，p=0.00）。 冈上肌脂肪含量与和相对大小值呈负相关（r=-0.73，p=0.00）。 **结论** 3.0T MRI 可定量评价冈上肌脂肪浸润及萎缩程度，同时显示其与肌腱损伤程度的关系。

Fast KV switching dual-energy CT virtual decalcification technique for identifying Bone Marrow Edema in vertebral compression fractures : Do Different Reconstruction Kernels Matter?

Luyou Yan,Kun Zhang
The First Affiliated Hospital of Hunan University of Traditional Chinese Medicine

Objective: To investigate whether different reconstruction kernels (STND V.S. BONE) affect the diagnostic performance of dual-energy CT virtual decalcification (VNCa) technique in the identification of acute and chronic vertebral compression fractures(VCFs).
Materials and Methods: This institutional review board-approved study included 31 consecutive patients with 80 vertebral fracturesVCFs who underwent both a 256-rows dual energy CT and a a 3-T MR examination of the spine between August 2018 and March 2019. MR images served as the reference standard. Two independent and blinded readers visually evaluated all vertebral bodies for the presence of abnormal bone marrow attenuation on color-coded overlay virtual VNCa images by using a binary classification system. Two readers performed a quantitative analysis on VNCa images. Area under the curve (AUC) value was calculated using Receiver operating characteristic curve (ROC) analysis was conducted. Images of different reconstruction types were separately evaluated with a four-week interval.
Results: MR imaging depicted 45 edematous and 35 nonedematous VCFs. In the visual analysis, the AUC_{STND} and AUC_{BONE} was 0.932 and 0.942 respectively. In quantitative analysis, water content results was significantly different between vertebrae with and without bone marrow edema on MR ($P < 0.001$).And the AUC_{STND} and AUC_{BONE} was 0.89 and 0.886 respectively. The AUC of visual image analysis was larger than that of quantitative VNCa image evaluation.

Conclusion: Visual and quantitative analyses of fast KV switching dual-energy CT VNCa technique had excellent diagnostic performance for identifying acute and chronic compression fractures, different reconstruction kernels might does not matter. And the diagnostic efficiency of the visual image analysis was higher than that of quantitative image evaluation.

T2*mapping 定量分析新兵奔袭训练对胫股关节软骨的影响

张懿娜,何彬,徐茂林,张茜,朱友志,张禹
中国人民解放军联勤保障部队第 901 医院

目的 运用磁共振 T_2*mapping 定量分析新兵奔袭训练对胫股关节软骨的影响。**方法** 集训前后分别对 22 例新入伍健康男青年的右侧胫股关节进行 MRI 扫描，将关节软骨分为股骨内侧髁（Medial femoral condyle,MFC）承重区与非承重区、股骨外侧髁(Lateral femoral condyle,LFC)承重区与非承重区、胫骨内侧平台(Medial tibial platform,MTP)、 胫骨外侧平台(Lateral tibia platform,LTP)等 6 个区域，将各区域划分为浅、深两层。采用配对样本 *t* 检验，比较集训前各区域浅层与深层软骨 T_2*值的差异、集训前后各区域软骨 T_2*值的差异；采用单因素方差分析，比较集训前后各区域软骨 T_2*值的变化百分率差异。**结果** 集训前胫股关节各区域软骨 T_2*值浅层均高于深层且具有统计学差异（MFC 非承重区 *P* 值为 0.001，其余区域 *P* 值<0.001）；集训后，LFC 承重区浅层（*P*=0.005）、LFC 承重区深层（*P*=0.028）、MFC 承重区浅层（*P*=0.001）、LTP 浅层（*P*=0.027）、MTP 浅层（*P*<0.001）、MTP 深层（*P*<0.001）等 6 个区域 T_2*值均显著上升；集训前后各区域软骨 T_2*值变化百分率间有统计学差异（*P*<0.001），以 MTP 浅层变化为著。**结论** 3.0T 磁共振软骨 T_2*mapping 成像可以定量检测新兵奔袭训练后软骨的早期变化。
