目的 通过分析有内侧半月板脱位的膝关节 MRI 影像表现，探讨内侧半月板脱位与内侧副韧带的松紧程度的相关性，为预测及诊断内侧半月板脱位提供依据。 **方法** 收集重庆医科大学附属永川医院 2015 年 1 月至 2019 年 1 月膝关节 MRI 表现正常及存在膝关节内侧半月板脱位的患者各 50 例，脱位患者分为 A 组，表现正常分为 B 组，。在膝关节 MRI 冠状面上分别测量 A、B 组内侧副韧带的长度 a 和 b，其起止点的直线距离 l_a、l_b，计算内侧副韧带的松紧度 R_a=a/ l_a、R_b=b/ l_b，以及 A 组患者半月板边缘距胫骨平台关节面边缘的最大距离 c。用 t 检验比较 A、B 组间松紧度的差异性，再分析 A 组内侧副韧带的松紧度与半月板脱位程度的相关性。**结果** 半月板脱位组与正常组的 R 值存在显著性差异（P <0.05）。A 组 R 值与半月板脱位程度 c 存在正相关性。**结论** 内侧副韧带的松紧度与内侧半月板脱位存在相关性，内侧副韧带越松弛，内侧半月板脱位程度越重。

EPO-1530
急性髌骨一过性外侧脱位的 MR 分析

胡俊娇
暨南大学附属第一医院

目的：分析急性髌骨一过性外侧脱位（TLPD）伴发损伤的 MRI 表现。**方法：**回顾性分析 44 例 TLPD 患者的 MRI 及临床资料，记录骨及软骨损伤、内侧支持带复合体（MRC）及股内斜肌(VMO)损伤、髌骨位置、髌骨倾斜及股骨滑车发育不良、关节积液及其他伴发性损伤情况。其中 20 例进行了关节镜探查术。**结果：**44 例（100%）均出现髌骨内下侧份和股骨滑车外侧髁的对吻性骨髓水肿，22 例（50%）合并髌骨的骨软骨损伤，4 例（9%）合并股骨的骨软骨损伤，16 例（36%）存有关节内游离体；34 例（77%）伴发 MRC 撕裂，21 例（48%）伴发 VMO 损伤；27 例(61%)存在股骨滑车发育不良； 24 例（55%）合并髌骨半脱位，4 例(9%)合并高位髌骨；关节积液出现率为（100%），3 例出现关节积脂血症，1 例有关节囊破裂；36 例有半月板或其他韧带的伴发性损伤。**结论：**髌骨内下侧份和股骨滑车外侧髁的对吻性骨髓水肿是 TLPD 的典型 MRI 表现，常伴发髌骨内下侧缘骨软骨的骨折和 MRC 的损伤，常合并股骨滑车发育不良和髌骨位置异常。

大腿肌肉损伤的 MR 表现及分类

毛怡,刘春华,孙华彪,邓晓娟
陆军军医大学大坪医院

目的： MR 在肌肉损伤中的运用越来越广泛，旨在提高对于肌肉损伤的 MR 诊断及分类。
方法： 回顾性的分析我院有肌肉损伤病史，并行大腿 MR 检查的患者 28 例，统计其受伤类型（直接损伤、间接损伤）、累及肌群、肌肉损伤部位（肌肉、肌肉肌腱结合部、肌腱）、散在出血、血肿、水肿范围、损伤分级等。
结果：1）直接损伤 5/28 例，累及前群者 4/5 例，累及后群者 1/5 例，均有血肿形成，4/5 例为肌内血肿，1/5 为肌间血肿，最大水肿范围均匀肌群横断面积 50%以上。 2）间接损伤 23/28 例，9/23 后群（腘绳肌），10/23 前群（股四头肌），4/23 损伤内收肌群。累及肌-腱结合处者 9/23 例（7 例位于腘绳肌内）；8/23 例位于肌肉内；单纯损伤肌腱者 6 例（股直肌肌腱 3 例，腘绳肌腱 2 例，股四头肌肌腱 1 例）。伴有散在出血者 3/23 例，形成 2cm 以上血肿者 1/23 例。 8/23 为临床分期 I 期（水肿），表现为 MRT2 上为羽毛状高信号，伴或不伴肌间积液，不伴肌肉肌腱断裂。13/23 例为肌肉部分撕裂，表现为 MR 上肌肉的断裂或肌腱的张力降低。1/23 例为肌肉或肌腱的完全断裂，断端圆钝挛缩。
结论 :1）直接损伤以前群多见，多伴有较大的血肿形成，水肿明显。 2）间接损伤以股四头肌及腘绳肌损伤多见，血肿较为少见，累及肌-腱结合部较多。 3）本文中发生在肌肉内的损伤较多，可能包含了延迟性肌肉酸痛。 4）大腿的肌腱损伤，以股直肌肌腱、腘绳肌肌腱损伤较为多见。

EPO-1532

膝关节 MR 多征象对前交叉韧带损伤的诊断价值研究

谷娜,吕晓虹,牛玉军
锦州医科大学附属第一医院

目的 评价膝关节 MR 多征象对前交叉韧带（ACL）损伤的诊断价值。**方法** 收集本院 2017 年 07 月-2019 年 06 月膝关节 MR 及同时关节镜检查患者 207 例，男性 138 例，女性 69 例，MRI 均诊断为 ACL 损伤，关节镜证实 160 例（观察组）（完全断裂 13 例，部分撕裂 147 例），余正常 47 例（对照组）。**结果** ACL 损伤直接征象 观察组 ACL 消失 13 例，萎缩、变细 25 例，不连续 114 例，行

走异常 121 例，水肿、变粗 115 例；对照组分别 0 例，1 例，2 例，2 例，2 例。2 组对比，5 个直接征象的发生率观察组明显高于对照组，差异有统计学差异，P＜0.05。ACL 损伤间接征象　观察组 Blumensaat 角 94 例，后交叉韧带角 90 例，后交叉韧带指数 73 例，对吻性骨挫伤 101 例，股骨外侧髁凹陷征 61 例，胫骨前移 99 例，空髁间窝征 37 例，半月板后角裸露征 73 例，后交叉韧带单层显示 95 例，外侧副韧带单层显示 86 例；对照组分别 4 例，6 例，3 例，6 例，1 例，5 例，0 例，1 例，7 例，10 例。10 个间接征象的发生率观察组明显高于对照组，差异有统计学差异，P＜0.05。ACL 损伤 2 种及 2 种以上间接征象同时存在　观察组 2 种征象同时存在 69 例，对照组 2 例；3 种征象同时存在 13 例，1 例；4 种征象同时存在 3 例，1 例；5 种及 5 种以上征象同时存在 2 例，0 例；2 种间接征象同时存在发生率观察组明显高于对照组，差异有统计学差异，P＜0.05；3 种及以上间接征象同时存在差异无统计学差异，P＞0.05。**结论**　直接征象是 ACL 损伤的主要诊断依据，不连续、行走异常、水肿增粗诊断价值较高；间接征象具有辅助诊断价值，股骨外髁凹陷征、空髁间窝征、半月板后角裸露征辅助诊断价值较高；2 种间接征象同时存在有较好的提示诊断价值。

EPO-1533

MRI 在坐骨-股骨撞击综合征的诊断应用研究

孙沛毅,邓德茂,李敏
广西中医药大学第一附属医院

【摘要】　**目的** 探讨ＭＲＩ在诊断坐骨－股骨撞击综合征的临床价值。**方法**　回顾性选取本院有临床症状的坐骨-股骨撞击综合征 12 例患者与无临床症状的且仅坐骨－股骨间隙狭窄的 12 例患者 MRI 图像，分析两组患者的股方肌信号、坐骨结节与股骨小转子间距（IFS）、股方肌通过 IFS 的最窄间隙（QFS）、坐骨角（α角）、股骨颈前倾角（FNA）；对比其两组患者上述测量指标的差异性。**结果**　临床有症状组：股方肌均有信号异常； IFS、QFS、α角、FNA 分别为(9.37±2.70)mm、（6.12±1.85）mm、（124.6±1.8）°、（29.5±0.8）°。临床无症状组：股方肌信号未见异常；IFS、QFS、α角、FNA 分别为(11.23±2.50)mm、（7.82±1.35）mm、（129.5±2.6）°、（22.5±1.2）°。两组间 IFS、QFS、α角差异无统计学意义（P>0.05）。FNA 差异有统计学意义(P<0. 05)； **结论**　MRI 扫描对于坐骨-股骨撞击综合征的诊断具有重要价值，其股方肌信号异常是其临床诊断的重要参考依据，股骨颈前倾角增大对于诱发坐骨-股骨撞击综合征可能有一定意义。

Automated classification and localization of rib fractures on thoracic CT using convolutional neural networks: Accuracy and feasibility

Qingqing Zhou[1],Yu Yu-Sheng[1],Hu Zhang-Chun[1],Li Xue-Song[1],Xia Zi-Yi[1],Wang Jiashuo[2],Chen Yu-Chen[3],Zhang Bing[4],Zhang Hong[1]
1.The affiliated Jiangning hospital of Nanjing medical university
2.Research Center of Biostatistics and Computational Pharmacy， China Pharmaceutical University
3.Department of Radiology， Nanjing First Hospital， Nanjing Medical University
4.Department of Radiology， the Affiliated Nanjing Drum Tower Hospital of Nanjing University Medical School

Objectives: To analyse a convolutional neural network (CNN) model that can automatically classify and locate rib fractures and output structured reports from CT images.
Methods: A total of 1049 patients (25054 annotations) from three hospitals were divided into a monocentric training set (n = 876) and multicentre/multiparameter validation sets (n = 173). Three classifications (fresh fractures, healing fractures and old fractures) combined with fracture locations (corresponding CT slices) were detected automatically and delivered in structured reports. Precision, recall and F1-score were selected as metrics to measure the optimum CNN model. Detection/diagnosis time, precision, and sensitivity were employed to compare the diagnostic efficiency of automatic structured reporting and experienced radiologists.
Results: The detection efficiency was higher for fresh fractures and healing fractures than for old fractures (F1-score: 0.834, 0.856 > 0.77, respectively, $P = 0.039$), and there were no significant differences in detection efficiency across five multicentre/multiparameter validation sets (all $P > 0.05$). The precision of five radiologists improved from 80.33% to 91.16%, and the sensitivity increased from 62.4% to 86.35% with the implementation of artificial intelligence assisted (AI-assisted) diagnosis. The diagnosis time of the radiologists was reduced by an average of 73.9 seconds with AI assistance.
Conclusions: Our CNN model for automatic rib fracture detection could assist radiologists in improving diagnostic efficiency and reducing diagnostic time. These effects would be helpful for the clinical prognosis of patients and could expedite the treatment of severe injuries by shortening diagnostic time. Additionally, AI-assisted diagnosis could reduce the eye-strain and workload of radiologists.

双能量 CT 扫描虚拟去钙技术对膝关节骨挫伤的诊断价值

温鹏,于长路,韩玉娟,杨剑
天津市第三中心医院

目的：探讨双能量 CT（DECT）扫描虚拟去钙技术（VNCa）对膝关节骨挫伤的诊断价值。 **方法：**选取 2018 年 11 月-2019 年 3 月来我院就诊膝关节损伤病人 56 例，分别行双能量 CT 扫描（A 管球 60mAs/rot,B 管球 200mAs/rot）和核磁共振（MRI）扫描（轴位扫描行 T2WI 加脂肪抑制，层厚与 CT 扫描一致为 3mm）。DECT 扫描后行 VNCa 技术，由两位高年资（副主任医师）诊断医生对膝关节骨挫伤程度进行分级并与 MRI 轴位抑脂 T2WI 进行比较。 **结果：**DECT 扫描后行 VNCa 对膝关节骨挫伤的分级与 MRI（膝关节骨挫伤分级金标准）高度一致（P<0.05）。 **结论：**DECT 扫描 VNCa 技术对膝关节骨挫伤的诊断具有重要的指导意义。

EPO-1536
Detection of Bone Marrow Adema in Fatigue Fractures: Utility of a Virtual Noncalcium Dual-Energy CT Application

Zhou Liu,Baoying Chen
Xi'an International Medical Center Hospital

Purpose: To quantify the sensitivity and specificity of dual-energy computed tomographic (CT) virtual noncalcium images in the detection of fatigue fractures and to assess whether obtaining these images as a complement to bone reconstructions alters sensitivity, specificity, or diagnostic confidence.
Materials and Methods: The clinical research ethics board approved chart review, and the requirement to obtain informed consent was waived. The authors retrospectively identified 30 patients who presented to the Orthopedic clinic and who underwent dual-energy CT for suspicion of afatigue fractures. Clinical follow-up was the standard of reference. Two radiologists interpreted virtual noncalcium images for traumatic bone marrow edema. Bone reconstructions for the same cases were interpreted alone and then with virtual noncalcium images. Diagnostic confidence was rated on a scale of 1 to 10. McNemar, Fleiss k, and Wilcoxon signed-rank tests were used for statistical analysis.
Results: Eighteen patients had fatigue fractures (13 filbula fractures,5metatarsal fractures),and 12 did not have fractures. Sensitivity with virtual noncalcium images was 94% and 89% (16 and 17 of 18 patients), and specificity was 92%-100% (11–12 of 12 patients). Sensitivity increased by 6%–5% over that with bone reconstruction images alone for two readers when both bone reconstruction and virtual noncalcium images were used. Specificity remained unchanged (92% and 100%). Diagnostic confidence in the exclusion of fracture was improved with combined bone reconstruction and virtual noncalcium images (median score: 10and 10) compared with bone reconstruction images alone (median score: 7and 8).
Conclusion: When used as a supplement to standard bone reconstructions, dual-energy CT virtual noncalcium images increased sensitivity for the detection of fatigue fractures and improved diagnostic confidence in the exclusion of these fractures.

能谱 CT 双基物质成像在椎体骨髓水肿诊断中的应用研究

陈靖
大连医科大学附属第一医院

目的：探讨能谱 CT 双基物质成像在椎体骨髓水肿诊断中的应用价值。
方法：收集 2019 年 1 月至 2019 年 6 月期间脊柱外伤患者 24 例，所有患者均用 Discovery CT750 HD 宝石能谱 CT 行能谱扫描，并在 48 小时之内行相同部位 MR 扫描。能谱扫描参数：管电压为 80-140 kVp 瞬时切换，自动 mAs 调制，层厚 1.25 mm，间隔 1.25 mm ，矩阵 512×512 ，螺距为 0.984，转速为 0.6 秒/周。扫描后用 AW4.4 后处理工作站 Functool 软件行 Ca/Water 及 Water/Ca 双基物质成像后处理，选取矢状位正中层面色彩异常区画兴趣区，面积大于 60mm，得出 Ca/Water 及 Water/Ca 值作为诊断参考，并应用彩图重建；同时获得传统 CT 扫描图像，行矢状位重建。两位有 4 年以上工作经验的放射科医生，在不知道 MR 表现的情况下，对能谱 CT 及传统 CT 扫描的脊柱水肿情况进行评分，应用李克特量表（1=没有水肿；2=可疑没有水肿；3=可疑有水肿；4=水肿）作为评分标准。两种方法所得的的准确性、敏感性（李克特量表 3 和 4）分别与 MR 诊断结果对比。

结果：传统 CT 扫描的敏感性，准确性分别为 0.73-0.76，0.78-0.83，能谱 CT 扫描的敏感性，准确性分别为 0.93-0.95，0.89-0.92。比较差异有统计学意义（ P<0.05 ）。
结论：能谱 CT 基物质成像技术提高了椎体水肿的诊断准确率。这可以避免患者进行额外检查。

双源 CTVNCa 技术在骨骼肌肉系统外伤性隐匿性骨折（骨髓水肿）及肌腱韧带成像中的应用研究

杨杰,徐宁,蔡中,杨春华
宁夏回族自治区人民医院

探讨双能 CT(DECT)虚拟去骨(VNC)图及 CT 值测量在脊柱四肢急性骨髓损伤中的诊断价值。方法对急性脊柱四肢外伤的患者分别行 MR 及 DECT 成像,以 MRI 作为参考标准,DECT 数据经双能去骨后处理得到显示骨髓信息的 VNCa 图,分别测量 VNC 图中骨髓正常区域和损伤区域的 CT 值,采用单因素方差分析法进行统计分析,比较骨髓正常区域与骨髓损伤区域的 CT 值是否存在差异,并与 MR 进行对照。结合 DECT 伪彩图,DECT VNCa 图中骨髓 CT 值的测量评价对急性骨髓损伤的诊断及临床应用价值。双源 CT 根据物质的不同化学成分在两种不同能量水平下对 X 射线的衰减不同（即物质分解技术）来区分不同的物质，随着双源 CT 的发展，可以通过虚拟非钙质（Virtual non-calcium，VNC）技术使 BME 可视化。因此双源 CTVNCa 图像能够视觉分析及定量分析 BME 的相关衰减变化，在临床工作中这种异常衰减的可视化分析比定量分析更实用简便。双源 CTVNCa 技术的价值主要是检测 CT 骨三维重建图像上不易发现的骨折。双源 CT 可以根据骨挫伤的位置和形状来推断骨关节内部结构紊乱及相关软组织异常情况，双源 CT 将会成为评估创伤继发的骨关节内部结构紊乱的一种实用性方法。在此过程中还可细观察韧带损伤，进行韧带可视化三维成像，可以更早地联合 MRI 来评估损伤程度并为临床手术治疗提供影像学依据。

EPO-1539
第 1 跖骨头下籽骨与踇外翻的相关性

李孝忠
甘肃中医药大学附属医院

目的 研究第 1 跖骨头下籽骨与踇外翻的相关性。**方法** 对 300 例正常足及 300 例踇外翻足拍摄足正、斜位片，并测量以下参数：踇外翻角（HVA）、第 1、2 跖骨间角（IMA）、第 2 跖骨长度（CD）、胫侧籽骨与第一跖骨中线长轴相交值（TSP）、籽骨与第一跖骨外侧皮质相切值（FSP）、胫侧籽骨至第一跖骨中线长轴距离(AB)、籽骨至第 1 跖骨中线长轴距离(EF)和胫侧籽骨与籽骨距离（GH），并计算 AB 与 CD 的比值（K_1）、 EF 与 CD 的比值（K_2）和 GH 与 CD 的比值（K_3）。采用多重线性回归分析 FSP、K_1、K_2、K_3与 HVA 的线性相关关系，并获得线性回归方程。**结果** 踇外翻组与对照组间 TSP、 FSP、K_2、和 K_3值差异均有统计学意义（P均＜0.05）。所有受试者中，FSP、K_2、K_3与 HVA 具有相关性，其线性回归方程为 HVA=63.976－10.541FSP－0.446K_2－1.115K_3。经多重线性相关分析，剔除了变量 K_2和 K_3，结果显示在 HVA≥20° 的受试者中，HVA 与 TSP、FSP 呈中度负相关（r=－0.494，P<0.05），线性回归方程为 HVA=27.720+5.044×TSP-6.028FSP；在踇外翻足组中，HVA 与 TSP、FSP 呈高度负相关（r=－0.824，P<0.05），其线性回归方程为 HVA=26.842+5.021×TSP-6.011FSP。**结论** 第 1 跖骨头下籽骨脱位是导致踇外翻的一个重要病理因素，HVA 与 TSP 呈正相关、与 FSP 呈负相关。

弥散加权成像对膝骨关节炎早期软骨损伤的诊断研究

阚泽文,马贺骥
锦州医科大学附属第一医院

目的：探讨弥散加权成像对膝骨关节炎早期软骨损伤的诊断价值。**方法**： 40 例早期膝骨性关节炎患者纳入病例组。40 例正常膝关节纳入对照组，两组除常规序列及三维抑脂扰相梯度回波序列外再行 DWI 序列扫描。应用 DWI 序列测量对比两组膝关节软骨 ADC 值。**结果**：对照组膝关节软骨 ADC 平均值为（13.9±1.3）x$10^{-4}$$mm^2$/s；病例组膝关节软骨 ADC 平均值为（15.7±1.4）x$10^{-4}$$mm^2$/s，二者差异有统计学意义（$t$=14.397，$P$<0.001）。股骨及胫骨内侧面软骨 ADC 值高于外侧面（股骨组 t=2.056，P=0.046；胫骨组 t=2.362，P=0.023）。**结论**：DWI 作为一种生理成像技术应用于软骨损伤诊断，表现为损伤软骨 ADC 值升高。损伤软骨 ADC 值分布有一点的空间特性，与膝关节生理力学特点之间有密切关系。

EPO-1541
MRI 三维扰相脂肪抑制梯度回波序列在三角纤维软骨复合体损伤诊断中的应用

李志奎
哈尔滨市第五医院

摘要：目的:探讨 MRI 三维扰相脂肪抑制梯度回波序列在腕关节三角纤维软骨复合体(TFCC)损伤诊断中的应用价值。方法:因腕关节尺侧疼痛就诊的患者 50 例,均经非手术治疗症状不缓解超过 1 个月。按入组顺序采用随机数字表分为常规序列组和常规加三维扰脂相组,每组 25 例。常规序列组行 MRI 常规序列(冠状位 T1 加权、T2 加权脂肪抑制序列及横断位 T1 加权、T2 加权脂肪抑制序列和矢状位 T2 加权脂肪抑制序列)检查,常规加三维扰脂相组在常规序列的基础上加上三维扰相脂肪抑制梯度回波序列检查。由 2 名高年资影像医师阅片后出具影像诊断报告。MRI 检查后 1 周内均行腕关节镜检查,明确诊断为 TFCC 损伤者镜下行 TFCC 修复术。根据腕关节镜检查结果分别计算 MRI 常规序列和常规序列加三维扰相脂肪抑制梯度回波序列诊断 TFCC 损伤的灵敏度、特异度、阳性预测值和阴性预测值。结果:MRI 常规序列上,TFCC 损伤表现为关节盘内中等信号、条带状异常高信号,严重者关节盘磨损、变薄或出现裂隙,可见连续性中断;MRI 三维扰相脂肪抑制梯度回波序列上,TFCC 损伤表现为在高信号的软骨盘中出现相对低信号的软骨损伤及缺损改变。常规序列组,MRI 检查诊断为 TFCC 损伤 15 例,腕关节镜检查诊断为 TFCC 损伤 18 例。MRI 常规序列检查诊断 TFCC 损伤的灵敏度为 72.2%,特异度为 71.4%,阳性预测值 86.7%,阴性预测值 50.0%。常规加三维扰脂相组,MRI 检查诊断为 TFCC 损伤 17 例,腕关节镜检查诊断为 TFCC 损伤 18 例。MRI 常规加三维扰相脂肪抑制梯度回波序列检查诊断 TFCC 损伤的灵敏度为 88.9%,特异度为 85.7%,阳性预测值 94.1%,阴性预测值 75.0%。结论:在 TFCC 损伤的诊断中,MRI 常规序列和常规序列加三维扰相脂肪抑制梯度回波序列均具有较高的灵敏度、特异度、阳性预测值和阴性预测值,且后者的诊断价值高于前者。

EPO-1542

双足 CT 不同扫描方向对辐射剂量和图像质量的影响

张小勇,曾宪春,王荣品,唐滢,喻石光
贵州省人民医院

目的：探讨双足 CT 扫描时足部放置方向对辐射剂量和图像剂量的影响。**方法**：收集因足部外伤需要进行 CT 检查 60 例，以检查时双足放置方向不同，随机分为两组。A 组：30 例，年龄 18-75 岁，男/女：20/10，双足长轴方向与检查床垂直。B 组：30 例，年龄 20-65 岁，男/女：17/13，双足长轴与检查床平行。2 组方案扫描条件相同：参考管电压 120kV，参考管电流 150mAs，CARE Dose4D 均打开。由两名骨关节系统影像诊断医生分别对 2 组图像的跟骨、第三趾骨、第三趾中节趾骨骨质结构进行主观评价，并测量邻近软组织的噪声作为足跟部、足掌部和足尖部客观评价指标，记录两组患者的 CTDI 和 DLP，采用统计分析软件对两种方案的图像质量和辐射剂量进行比较。**结果**：2 组图像的主观评分差异无统计学意义（P>0.05）。A、B 两组足跟部、足掌部和足尖部分别为（43±12.5、36.5±14.3、42.5±9.9）&（36.2±15、44.5±11.1、42.3±19.8），差异均无统计学差异（P>0.05），与 B 组双足长轴平行与扫描床相比，A 组 DIP 降低约 36.3%，差异有统计学意义（P<0.05）。**结论**：双足 CT 扫描时，与双足平行扫描床的扫方案相比，垂直于扫描床方向摆位可以降低辐射剂量，且图像质量没有显著差异。

EPO-1543
股骨外侧髁比率增大与非接触性前交叉韧带断裂中前外侧韧带损伤的风险增加相关

李佳,厉轲
重庆医科大学附属第一医院

目的：探讨膝关节非接触性前交叉韧带（anterior cruciate ligament，ACL）断裂中股骨外侧髁比率（Lateral Femoral Condyle Ratio，LFCR ）与前外侧韧带（anterolateral ligament，ALL）损伤的相关性。
方法：回顾性分析 2013 年 1 月至 2018 年 3 月我院收治的 3332 例关节镜半月板或 ACL 重建手术患者的临床资料。通过纳入排除标准共纳入 40 例 ACL + ALL 损伤患者（研究组），40 例孤立性 ACL 损伤患者（孤立性 ACL 损伤组）和 40 例无 ACL 及 ALL 损伤的半月板撕裂患者（对照组），且按年龄、性别和 BMI 以 1：1 的比例与研究组（ACL + ALL 损伤）进行匹配。LFCR 在标准侧位片上以盲法测量。通过 ANOVA 分析三组之间的差异，产生受试者工作特征（Receiving Operator Characteristic，ROC）曲线。
结果：ACL + ALL 损伤组平均 LFCR 为 71.9％±3.1％，ACL 损伤组为 68.4％±3.2％，对照组为 66.8％±2.6％。ACL + ALL 损伤组的 LFCR 明显高于孤立性 ACL 损伤组（p <0.017）。ACL 损伤组（包括孤立性 ACL 损伤和 ACL + ALL 损伤）的 LFCR 值显著高于对照组 LFCR（p <0.05）。ROC 曲线分析表明，LFCR> 68.3％可预测 ACL 损伤的风险增加，LFCR> 69.4％可预测非接触性 ACL 断裂患者 ALL 损伤的风险增加。
结论：非接触性 ACL 断裂患者的股骨外侧髁比率增大与 ALL 损伤风险增加有关。此外，研究进一步证实股骨外侧髁比率增大与亚洲人群 ACL 损伤风险增加相关。

EPO-1544
CT 定量测量指标对髋关节撞击综合征在中国无症状人群中的应用价值

陈静
南京鼓楼医院

目的：通过多层螺旋 CT 重建图像探讨中国无髋关节症状人群中与髋关节撞击综合征（FAI）相关的参数在性别、年龄的差异性，并分析符合凸轮型和钳夹型的异常参数所占的人群在无症状总人群中的发生率。
材料与方法： 搜集我院 2017 年 2 月～10 月因与髋关节症状无关的其他原因行下腹部或盆腔 CT 扫描的病人共 235 名，即 470 例单髋。通过 CT 测量与 FAI 相关的参数包括:髋臼前倾角(AV)、髋臼前方区域角(AASA)、髋臼后方区域角(PASA)、中心边缘角(LCE)、α角(AA)以及偏心距(FHNO)。
结果：在男女性别上分析，所有测量的参数均具有显著性的统计学差异。男性的髋臼前倾角在三个层面的平均值均小于女性，男性的髋臼后方区域角平均值小于女性，而髋臼前方区域角、中心边缘角、α角和偏心距的平均值均大于女性。在年龄组上分析，年轻男性三个层面的髋臼前倾角平均值均小于老年男性，而老年女性三个层面的髋臼前倾角平均值均小于年轻女性，因此，年轻男性和老年女性更容易出现髋臼后倾的可能性。CT 测量结果显示，25 %的女性和 34.5 %的男性至少具有一个与 FAI 相关的异常参数，其中 FAI 钳夹型的患病率(19.2 %)高于凸轮型 (9.2 %)。
结论：多排螺旋 CT 对评估 FAI 具有很重要的临床价值。本研究显示，中国无症状人群也存在患有 FAI 的风险，其中男性的发生率高于女性，钳夹型所占的比例比凸轮型更多。另外，对于 FAI 相关的解剖参数，我们应该根据性别、年龄和其他因素重新考虑这些异常参数的阈值来提高诊断的准确性。

膝关节 MR 检查中对前交叉韧带斜冠状位的研究

关欣
泰山医学院附属医院

在 MR 冠状位多角度扫描膝关节的前交叉韧带，探索膝关节前交叉韧带冠状位最佳显示的影像表现。方法：选择 40 例膝关节前交叉韧带受检者，每组均以横断位 T1WI 序列定位，以膝关节为扫描范围，从 5 种不同的角度进行扫描。第 1 组以股骨内、外髁后缘连线做基准线进行扫描；第 2~ 5 组以股骨髁间窝水平后缘连线偏离基准线 5°、-5°、10°及-10°进行扫描。将各扫描所得数据进行统计学分析。结果:5 种扫描方式中，第 2、3 组完全显示前交叉韧带分别为 72.5% (29/40)和 70% (28/40)，两者与其余组进行统计学分析，P < 0.05，差异具统计学意义。结论：膝关节采用斜冠状位 5°扫描方式时，前交叉韧带的显示度、清晰度最佳，是临床理想的扫描倾角，同时能清晰地显示前交叉韧带的正常解剖及便于发现病变，为可靠的诊断提供良好的影像学资料。

EPO-1546
继发性半月板撕裂在膝关节前交叉韧带损伤中的 MR 误诊病例分析

玉开温,邓德茂
广西中医药大学第一附属医院

背景 目前前交叉韧带损伤的 MR 主要关注前交叉韧带，而对半月板的继发性损伤 MR 表现的相关报道较少。 **目的** 分析 ACL 断裂合并半月板撕裂的 MRI 误诊原因， 以提高对继发半月板撕裂的术前 MRI 诊断正常率。**方法** 回顾性分析我院经手术证实的 ACL 断裂合并半月板撕裂患者的临床及 MR 资料，统计术前 MR 诊断的正确率，分析合并半月板撕裂的误诊原因。**结果** ACL 断裂合并半月板撕裂共 180 例，其中误诊合并半月板撕裂 28 例。误诊病例中，内侧半月板后角关节囊缘撕裂 21 例（75%），外侧半月板后角撕裂 3 例（11%），外侧半月板根部撕裂 4 例（14%）。**结论** ACL 断裂继发的半月板后角关节囊缘撕裂较容易漏诊，需加强对 ACL 断裂合并半月板撕裂 MR 征象的认识。

EPO-1547

膝关节损伤 MRI 与关节镜对比研究

王卓骥
北华大学附属医院

目的：
研究膝关节损伤 MRI 及关节镜表现，探讨 MRI 对膝关节损伤的诊断价值以及对临床的指导意义。
方法：
对 90 例膝关节损伤患者行 MRI 检查，并且所有患者均经关节镜证实为膝关节损伤。主要扫描序列包括：自旋回波序列：SE2D T1WI ,TSE2D T2WI。多回波数据图像联合序列：MED3D T2WI。翻转回波序列 : TIR2D T2WI。将 MRI 诊断膝关节损伤与关节镜结果进行对照，应用 SPSS17.0 统计学分析软件，采用 Kappa 检验分析 MRI 诊断膝关节损伤与关节镜诊断膝关节损伤结果之间的一致性。
结果：
1. MRI 与关节镜共同诊断半月板正常 45 例，损伤 140 例，对照分析后 Kappa 值=0.830；MRI 与关节镜共同诊断前交叉韧带正常 4 例，损伤 188 例，对照分析后 Kappa 值=0.643；MRI 与关节镜共同诊断后交叉韧带正常 10 例，损伤 173 例，对照分析后 Kappa 值=0.556；MRI 与关节镜共同诊断内侧副韧带正常 7 例，损伤 175 例，对照分析后 Kappa 值=0.530；MRI 与关节镜共同诊断外侧副韧带正常 45 例，损伤 140 例，对照分析后 Kappa 值=0.426。
2. MRI 诊断半月板损伤的敏感性为 83.3%、特异性为 97.2%、准确性为 93.4%；MRI 诊断前交叉韧带损伤敏感性为 72.9%、特异性为 91.3%、准确性为 86.9%；MRI 诊断后交叉韧带损伤敏感性为 57.1%、特异性为 98.4%、准确性为 97%；MRI 诊断内侧副韧带损伤敏感性为 62.5%、特异性为 95.1%、准确性为 92.4%；MRI 诊断外侧副韧带损伤敏感性为 63.6%、特异性为 93.6%、准确性为 91.9%。
结论：
MRI 对膝关节损伤的诊断价值很高，与关节镜诊断膝关节损伤结果之间有较好的一致性。

膝关节内侧副韧带损伤及常见合并损伤的高场强 MRI 诊断

白卓杰,卜顺林,张雨涵,寇君伟,于莉
南京江北人民医院

【摘要】目的 探讨内侧副韧带损伤及其合并损伤的磁共振影像表现。方法 回顾性分析 60 例内侧副韧带损伤的高场强 MRI 资料，60 例中，MRI 诊断内侧副韧带轻度损伤 9 例，中度损伤 34 例，重度损伤 17 例。17 例 MRI 诊断为重度损伤的患者符合率为 100%。轻度损伤表现为韧带内外缘纵行线条样高信号；中度损伤主要表现为低信号内见条状或斑点样 T2WI 高信号，重度损伤为低信号带完

全中断，韧带区呈不均匀高信号。本组合并邻近股骨远端骨损伤 40 例，合并半月板损伤 37 例，合并前交叉韧带损伤 19 例。结论 磁共振可以准确诊断内侧副韧带损伤程度，特别是重度损伤，并发现其合并损伤，为临床治疗或康复提供有用信息。

EPO-1549

半月板下表面撕裂的 MRI 诊断

史洪建,刘潇
武警江西总队医院

目的：探讨半月板下表面撕裂的 MRI 表现及特征。**方法：**回顾性分析 28 例半月板下表面撕裂患者的 MRI 资料，观察其撕裂发生的特定部位、半月板碎片的移位方向及 MRI 典型征象。**结果：**24 例患者中，内侧半月板 17 例（60.7%），外侧半月板 11 例（39.3%）；下表面部分缺失 28 例（100%）；水平方向撕裂 28 例（100%）；半月板碎片向后角移位 19 例（67.9%），向髁间窝移位 14 例（50.0%），向下隐窝移位 10 例（35.7%），向前角移位 9 例（32.1%）；半月板上表面完整 24 例（85.7%）；双后交叉韧带征 4 例（14.3%）；后角异常肥大征 15 例（53.6%）；半月板翻转征 9 例（32.1%）；双前角征 5 例（17.9%）；空领结征 3 例（10.7%）；领结残破征 18 例（64.3%）；碎片内移征 6 例（21.4%）；外周残半月板征 6 例（21.4%）；熔岩流动征 8 例（28.6%）。**结论：**上表面完整、下表面部分缺失是半月板下表面撕裂的直接征象，领结残破征、后角异常肥大征、半月板翻转征、熔岩流动征是其特征性的间接征象。

EPO-1550

儿童巨大肝脏未分化胚胎性肉瘤影像表现 1 例

卢欣,舒健
西南医科大学附属医院

1 病例 患者女，6 岁，因腹胀 1 周入院，无腹痛、腹泻、呕吐等不适。查体：体温 36.70C，脉搏 86 次/分，呼吸 24 次/分，血压 90/54mmHg。专科检查：腹膨隆,右下前胸壁及右上腹局限性膨出，触及包块，下界达脐上两横指，内侧达前正中线，质地硬，无活动，无压痛。
辅助检查：（1）实验室检查：甲胎蛋白未见明显升高（1.76ng/ml），CA199 明显升高（265.04IU/ml）。（2）全腹部 CT 增强：肝内见巨大囊实性肿块影，大小约 13.3×11.5×13.0cm，内见多发分隔及少许结节影，增强扫描分隔及包膜明显强化，病灶内见迂曲血管影。（3）全腹部 MRI 平扫及增强：肝内见巨大类圆形囊性为主的囊实性肿块影，大小约 12.8×10.5×12.0cm，内见多发分隔及少许结节影，T1WI 呈低信号；病灶内液性成分信号不均，T2WI 及 SAPIR 呈高信号；DWI 呈混杂稍高信号；增强扫描分隔及包膜明显强化。（4）手术所见：肝脏增大，肿瘤位于右半肝，大小约 13.0×12.0×12.0cm，为囊实性成分，具有较完整的包膜，囊性成分占 80%左右，呈多房分隔，部分为深褐色胶冻状，部分为黄绿色清澈液；实性部分呈鱼肉状，质脆，部分坏死。（5））病理检查：病检提示右肝“梭形细胞瘤”，结合免疫组化，病理诊断符合肝脏未分化胚胎性肉瘤(undifferentiated embryonal sarcoma，UES)。
2 讨论 UES 是发生于肝原始间叶组织的恶性肿瘤，发病年龄主要在 6 到 10 岁左右[1-2]。UES 的临床表现无特异性,主要有肝脏肿大或上腹部包块等 [3]。
UES 的影像表现主要为巨大单囊或多囊性病灶,边界清楚,其内有不同程度的实性部分，多分布于边缘,病灶内可多见分隔，UES 为少血供肿瘤，CT 和 MRI 增强扫描实质常轻度强化，边缘较明显[4]。鉴别诊断包括肝母细胞瘤、原发肝细胞癌、肝间叶错构瘤等。

EPO-1551

Images of giant undifferentiated embryonal sarcoma of the liver in a child: a case report

xin lu,健 Shu
Affiliated Hospital of Southwest Medical University

1 Case
The 6-year-old female patient was admitted to hospital with abdominal distension for 1 week. Physical examination: body temperature 36.7℃, pulse 86 times/min, respiration 24 times/min, blood pressure 90/54mmhg. Specialist examination: abdominal distention and touching mass. Lower boundary reach two horizontal fingers above umbilicus, medial reach anterior median line, hard texture.
Auxiliary examination: (1) Laboratory examination showed no significant increase in alpha-fetoprotein (1.76ng/ml), and CA199 was significantly increased (265.04IU/ml). (2) Total abdominal CT enhancement: large cystic solid mass shadows were seen in the liver, the size was about 13.3×11.5×13.0cm, multiple septa and a few nodular shadows were seen in the liver, the septa and capsule were significantly enhanced in the enhanced scan. (3) Total abdominal MRI enhancemen: a large round cystic mass with a size of 12.8×10.5×12.0cm was observed in the liver, with multiple septa and a few nodules, showing low signal on T1WI. The signals of liquid components in the lesion were uneven, and T2WI and SAPIR showed high signals. DWI showed slightly higher mixed signal. Enhanced scan septa and capsule markedly enhanced. (4) Surgical findings: the liver was enlarged and the tumor was located in the right half of the liver, about 13.0×12.0×12.0cm in size. The cystic component accounted for about 80%, showing multilocular septa. (5) Pathological examination: spindle cell tumor was found in the right liver. Combined with immunohistochemistry, the pathological diagnosis accorded with undifferentiated embryonal sarcoma (UES) of the liver.
2 Discussion
UES is a malignant tumor in the primitive mesenchymal tissue of the liver, which mainly occurs between 6 and 10 years old [1-2].UES's clinical manifestations are not specific, mainly liver enlargement or epigastral mass [3].
UES is mainly presented as a huge cystic lesion with clear boundaries, and there are solid parts in it to varying degrees, which are mostly distributed on the edges, and much space can be seen within the lesion. UES is a tumor with little blood supply, and the parenchyma is often slightly enhanced in CT and MRI enhanced scans, with obvious edges[4].The differential diagnosis includes hepatoblastoma, primary hepatocellular carcinoma, and hepatic mesenchymal hamartoma.

EPO-1552

儿童能谱 CT 单能量结合 ASiR 技术对肠系膜上动脉的研究

王子鉴
天津市儿童医院

目的：采用能谱单能量，比较不同水平的自适应迭代重建算法（ASiR）在儿童肠系膜上动脉成像中的图像质量，进而优化肠系膜上动脉的成像参数。
方法：选取儿童上腹部增强扫描检查患者 30 例，所有患儿体重均大于 20kg，均采用能谱 C+方案，固定时间注射法进行扫描。通过后处理工作站，选取每个患者动脉期，采用 120kVp，范围从膈顶部下至肾下缘，不同体重组采用相同 dFOV，用从 0%到 100%的算法进行重建，每组间间隔 10%，共 11 组。分析比较各组图像中肠系膜上动脉的 CT 值、图像噪声 SD、CNR 及 SNR。采用双盲法对 11 组数据进行主观评估并记录评分。
结果：所有患儿在 120kVp 情况下，肠系膜上动脉的密度值在 170HU-300HU。该 11 组在 SD、CNR 及 SNR 均具有统计学差异（P ＜ 0.05），在 CT 值方面无统计学差异（P ＞ 0.05）。随着 ASiR 比例的增加，图像噪声逐渐降低，在 120kVp 联合 100%ASiR 时图像噪声最低，但是随着 ASiR 比例的增加，蜡像感也越明显。该 11 组在主观评分差异方面有统计学意义（P ＜ 0.05）。50%ASiR 组图像质量主观评分高于其他组。
结论：单能量（120kVp）+50%ASiR 在能谱 CT 中可以提高细小动脉的显示率，有助于诊断方面的应用，同时有进一步减少辐射剂量的趋势

EPO-1553

同相位和反相位成像在腹部病变中的应用

张旭,王芳
哈尔滨市儿童医院

目的 探讨同相位与反相位成像在腹部含脂病变中的应用价值。
方法 回顾性分析 12 例腹部含脂病变的患儿，均采用常规 MR 扫描及同相位与反相位成像 T1WI 序列，直接观察脂肪信号在常规 MR 图像及同相位与反相位成像 T1WI 序列中的信号变化，测量病变在 T1WI 同、反相位图像上的信号强度比值。
结果 12 例包括肝脏局灶性脂肪浸润 5 例，弥漫性脂肪浸润 4 例，肝腺瘤 2 例，肾上腺腺瘤 1 例，脂肪信号在常规 MR 图像及同相位与反相位成像 T1WI 序列中的信号存在明显差异，反相位脂肪信号明显抑制。
结论 含脂病变在 MRT1WI 梯度回波同相位与反相位图像上有明显的信号强度差异，诊断敏感准确。 在 US 或 CT 变现不典型的含脂病变具有重要诊断价值。

EPO-1554

儿童美克尔憩室的 MSCT 诊断价值

周婧
华中科技大学同济医学院附属武汉儿童医院

目的：分析小儿美克尔憩室的临床及影像资料，以提高对本病的认识。方法：回顾性总结分析我院 2010 年 10 月～2019 年 5 月本院经手术及病理证实 78 例小儿美克尔憩室的临床及 MSCT 表现。结果：美克尔憩室是小儿较常见的消化道畸形之一，系胚胎期卵黄管退化不全所致，往往以消化道出血、肠梗阻、肠穿孔等症状就诊或因其他手术探查而诊断，因此该病术前诊断率不高，时有误诊。我院病例临床表现主要为腹痛、呕吐、消化道出血，经手术证实并发消化道穿孔 2 例，肠梗阻 2 例，肠套叠 2 例，腹股沟疝并嵌顿 1 例，脐部包块 1 例，阑尾炎 10 例，脐膨出 1 例。MSCT 表现包括腹腔囊性占位（肠重复畸形或肠系膜囊肿），肠扭转，阑尾炎、消化道穿孔、肠梗阻、肠套叠

（多发肠套叠）、结肠细小、腹腔积液、肠间隙模糊、肠管积气积液、腹膜炎、感染性病变并脓肿形成、腹股沟疝并嵌顿、脐部包块（脐膨出）、肠壁增厚及肠管积血等。78 例中仅 7 例术前明确诊断，其余病例术前均未能诊断。结论：美克尔憩室是真性憩室，包括有回肠肠壁的各层及异位的组织（胃及十二指肠粘膜，胰腺组织，空肠黏膜等），以胃粘膜最多见，异位的胃粘膜分泌液（胃酸）可以损伤憩室粘膜引起憩室壁炎性增厚和毛细血管增生，从而引起溃疡、出血及穿孔；闭塞而未吸收的卵黄管索带导致憩室与脐恒定连接，憩室引流不畅或有粪石、异物、寄生虫滞留，可引起肠梗阻、肠套叠、肠扭转或内疝，内翻型憩室。美克尔憩室多数在无合并症的情况下，可终身不表现出任何症状，往往因并发症发现，如消化道出血、肠梗阻、阑尾炎、肠穿孔、肠套叠、肠扭转等，术前诊断较困难。MSCT 增强扫描结合临床病史能提高本病的诊断率。

EPO-1555
先天性门体分流的影像学特点与临床表现相关性

姚琼,乔中伟
复旦大学附属儿科医院

目的：探讨先天性门体分流的影像学特点及其与临床相关性。
材料与方法：回顾性分析 21 例先天性门体分流患儿的临床资料和影像学表现。由 2 名放射科医生独立读片，观察门静脉及其属支的形态及走行，门体分流血管形态及侧枝血管分布。
结果：本研究包括 21 例先天性门体分流患儿，其中 12 例为肝外型门体分流（Ib 型 4 例，II 型 8 例），回流静脉包括:下腔静脉 2 例、左肾静脉 3 例、髂内静脉 5 例、胃冠状静脉 2 例，回流入髂内静脉/胃冠状静脉患儿均合并直肠静脉丛/胃底静脉丛扩张及上、下消化道出血。肝内型门体分流共 9 例（I 型 4 例，II 型 2 例，III 型 2 例，IV 型 1 例），门静脉及肝内属支发育正常。2 例肝外型 II 型因 CTA 未明确显示肝内门脉属支而误诊为 Ib 型，DSA 准确性高，应作为诊断金标准。
结论：先天性门体分流解剖结构多变，CTA / MRA 诊断准确率高，但对于肝外型 I 型诊断需谨慎，以 DSA 结果为金标准。

EPO-1556
儿童卵巢肿瘤的影像学鉴别诊断

宋修峰
青岛市妇女儿童医院

【目的】提高对儿童卵巢肿瘤临床及影像学表现的认识。
【材料和方法】对我院经病理证实的儿童卵巢肿瘤总结分析其临床表现、实验室检查及影像学表现。
【结果】小儿卵巢肿瘤尽管较为少见，但却是小儿最常见的生殖系统肿瘤。因儿童骨盆狭小及肿瘤生长迅速，临床常表现为腹部包块；肿瘤蒂扭转的发生率明显高于成人，易导致小儿急腹症。儿童原发性卵巢肿瘤大多 数是生殖细胞源性肿瘤，约占 60%-90% ，性索间质肿瘤占 10%-13% ，上皮源性肿瘤仅占 5%-11%。约 75% 的小儿卵巢肿瘤为良性，以囊性畸胎瘤、上皮样囊肿等常见；恶性肿瘤常见为无性细胞瘤、卵黄囊瘤、未成熟畸胎瘤、混合性生殖细胞瘤等。
超声是卵巢肿瘤首选的影像学检查方法，但 CT 和 MRI 能更准确的显示肿瘤内部成分，判断肿瘤是否为卵巢来源，是否有腹水、腹膜种植灶，是否有淋巴结肿大，肝、脾、肺等器官有无转移等，有助于临床术前分期。
儿童卵巢肿瘤表现多样，但在诊断上仍有一定的规律性。实验室检查：AFP 升高可见于内胚窦瘤、未成熟畸胎瘤、无性细胞瘤等；HCG 升高可见于绒癌、无性细胞瘤、胚胎癌等；E2 升高则见于性索间质肿瘤、绒癌。影像学表现：囊性为主最常见于囊肿、囊性畸胎瘤、浆液性/粘液性囊腺瘤；实

性为主最常见于无性细胞瘤；囊实性最长见于畸胎瘤、内胚窦瘤、绒癌等；多样性常见于颗粒细胞瘤。特征性的影像学特点：畸胎瘤：脂肪、钙化；无性细胞瘤：实性为主，可有小钙化、囊变、强化的纤维分隔；内胚窦瘤：钙化少、强化显著、瘤内见增粗血管；颗粒细胞瘤：子宫增大；粘液性囊腺瘤：各囊信号不一。
【结论】儿童卵巢肿瘤实验室检查结合影像学表现特征，可对多数肿瘤做出正确的术前诊断及分期。

EPO-1557

新生儿先天性巨结肠的影像表现分析

王爽
天津市儿童医院

目的 提高对新生儿先天性巨结肠的影像表现的认识
材料和方法 回顾性分析本院经 X 线诊断、并经手术及病理证实的新生儿先天性巨结肠影像学资料 30 例，男 23 例，女 7 例，年龄 2 天-28 天，临床表现：胎便排出延迟，伴不同程度腹胀、呕吐。
结果 腹平片小肠、结肠不同程度充气扩张，或表现为功能性低位肠梗阻。钡灌肠检查中，8 例表现为直肠远端狭窄，9 例表现为直肠至乙状结肠远端狭窄，5 例直肠至升结肠狭窄，2 例全段结肠狭窄，6 例未见明显狭窄段，24 小时后延时观察均有不同程度钡剂残留。
讨论 先天性巨结肠是以先天性肠壁肌间神经节细胞缺如为特征的肠道发育畸形。病理学特征上分为痉挛段、移行段和扩张段，且随病程时间越长，表现越明显。新生儿病程短，病变近段肠管尚未形成代偿性扩张，移行段、扩张段可不明显，或由于对新生儿期先天性巨结肠的表现认识不足，导致新生儿先天性巨结肠是影像诊断的难点之一。影像学检查方法主要为腹 X 线平片和钡灌肠。腹平片不具特异性。钡灌肠为诊断先天性巨结肠的首选影像学方法，典型表现为痉挛段僵直、不规则收缩，移行段呈漏斗状，移行段以上肠管扩张，结肠袋减少。依痉挛段的长短分为短段型、常见型、长段型、全结肠型和全肠型，超短段型病变限于肛门括约肌部位，痉挛段不明显，尚存争议。不典型表现包括：（1）延时 24 小时观察钡剂残留；（2）直肠下段及乙状结肠螺旋形或不规则锯齿状收缩；（3）直肠下段局限性切迹；（4）直肠/乙状结肠最大横径比值异常；等。具有不典型表现的患儿多为短段型或超短段型。全结肠型巨结肠多在新生儿早期出现症状，腹平片表现为低位、中位或高位小肠梗阻，钡灌肠典型表现为结肠框短缩，肝脾曲钝化，呈“？”征。
结论 新生儿期先天性巨结肠是巨结肠诊断中的难点，腹平片表现不具特异性，钡灌肠为首选检查方法，短段型及超短段型表现可不典型，延时 24 小时观察对于诊断尤为重要。钡灌肠难以诊断者应结合临床其它检查或定期复查。

EPO-1558

儿童非酒精性脂肪肝的磁共振成像定量评估

曹卫国
深圳市儿童医院

目的 多回波（multi-echo，ME）Dixon 技术结合 MRS 定量评估儿童非酒精性脂肪肝（Nonalcoholic fatty liver disease, NAFLD）的准确性。
方法：对 50 例 NAFLD 儿童及与之年龄、性别相匹配的正常儿童志愿者行 ME Dixon 及 MRS 检查，观察 NAFLD 组和正常对照组间质子密度脂肪分数（hepatic proton density fat fraction，PDFF）的变化。**结果：**NAFLD 组的 PDFF 较正常对照组明显升高，两组间差异有统计学意义

（P<0.01）。采用 Spearman 分析表明两种技术测量的结果间高度相关（r=0.783，P=0.000）。Bland-Altman 分析显示他们之间具有良好的一致性。**结论：**ME Dixon 技术和 MRS 能准确地测量儿童肝脏的 PDFF，有助于早期诊断儿童的 NAFLD。

EPO-1559
探讨 GE revolution ct 最佳单能量图像在学龄儿童肾脏 CTA 的运用

郑美敏
天津市儿童医院

目的：探讨使用 revolution ct 在学龄儿童肾脏 CTA 检查中最佳单能量的选择，进而对儿童胡桃夹综合征的影像诊断提供最佳对比。
方法：选取我院因血尿行肾脏 CTA 检查的学龄儿童，男 30 例，女 25 例，平均年龄（10±2.1）岁，采用 GE revolution CT GSI 能量扫描模式，运用智能 mA，NI 为 13，转速为 0.5s/r，螺距 1.375:1，层厚 5mm，扫描范围从腹主动脉起始部至耻骨联合层面，使用 24s 固定注射时间进行剂注射，ROI 选择腹主动脉起始部，触发对比值设 220HU 团注跟踪，触发阈值后开始扫描，对静脉期图像进行 40%ASIR 重建，重建得到 40keV～80keV 共 41 组单能量图像，测量各组单能量图像竖脊肌和左肾静脉最大截面积轴位、冠状位的 CT 值及标准差，测量 ROI 均为 10mm2。计算各组单能量图像左肾静脉 CNR 及 SNR，将所算得最优 CNR 与工作站 optional CNR 进行比较，选择最优 CNR 的单能量 keV。
结果：55 例行肾 CTA 检查的患儿中，肾静脉都显示清晰，40 例肾静脉正常，15 例肾静脉符合胡桃夹综合征表现；各单能量组图像的 CNR 的变化曲线总体呈下降趋势，SNR 的变化曲线总体呈上升趋势，40keV CNR 值最大，SNR 最低，80keV CNR 值最低，SNR 最高，而在 50keV 附近 CNR 与 SNR 综合最优，和工作站 optional CNR 显示值相符；在不同 mA 条件下，相同光子能量图像的 CNR 及 SNR 随着 mA 的增大而增大；在显示胡桃夹综合征时，50keV 能量下 CNR 与 SNR 最优。
结论：单能量图像能够为影像诊断提供丰富信息，50keV 能量下在显示肾静脉时 CNR 与 SNR 综合最优，尤其在对胡桃夹综合征的显示对比更突出。

EPO-1560
婴幼儿先天性中胚叶肾瘤临床及影像表现分析

薛婷
广州市妇女儿童医疗中心，广州市儿童医院

目的：研究并探讨分析婴幼儿先天性中胚叶肾瘤的临床及影像学表现特点。
方法：回顾分析在广州市妇女儿童医疗中心 2009 年 7 月至 2019 月 7 月经手术病理证实的 14 例先天性中胚叶肾瘤的影像学及临床学资料，并进行文献复习。
结果：14 例患儿年龄 2 天至 14 月不等，平均年龄约为 1-3 月。其中，1 例行 MRI 检查，表现为右肾一巨大占位性病变，边缘清晰，T1WI 呈略低信号，T2WI 呈略高信号，增强扫描呈明显强化，肿物局部向前突，未越过中线生长。13 例行 CT 检查，位于左肾者 5 例、右肾者 8 例、肾外腹膜后 1 例：肿瘤均表现为巨大低-等混合密度肿物占位影，边界清晰，平扫密度均匀或欠均匀，以低密度为主，增强扫描肿物呈不均匀强化。其中，9 例可见肾动脉穿行其中，6 例伴有囊变坏死，2 例伴有散在钙化。1 例伴有肾包膜下积液。12 例肿瘤较大，超出肾轮廓，瘤周见残余肾实质。

结论：典型婴幼儿先天性中胚叶肾瘤可表现为巨大等-低密度肿物占位影，大部分可超越肾轮廓，囊变坏死多见，伴或不伴有钙化，且常伴肾动脉穿行其中。婴幼儿先天性中胚叶肾瘤与肾母细胞瘤易于混淆，通过分析总结其影像学表现，可有助于两者的鉴别诊断。

CT 对小儿肠重复畸形的诊断价值

朱百奇
华中科技大学同济医学院附属武汉儿童医院医学影像中心

目的：探讨 CT 平扫和增强扫描对小儿肠重复畸形的诊断价值 **方法：**回顾性分析我院 2015 年 1 月~2019 年 6 月 18 例经手术证实的肠重复畸形的临床资料及 CT 表现。采用 GE Optima 64 排螺旋 CT 扫描仪，扫描参数：层厚 0.625mm，层间距 0.625mm，螺距 1.25：1，矩阵 512×512，管电压 100kV，管电流 100mA。扫描方法：螺旋扫描，平扫后高压注射离子型造影剂碘普罗胺行双期增强扫描，注射量为 1.5~2.0ml/kg，注射速率：0.8~1.5ml/s，注射 26~30s 行动脉期扫描，注射 60~70s 行实质期扫描。扫描范围：剑突下至耻骨联合水平。得到图像后利用后处理软件 Reformat 进行冠状位、矢状位、斜位重建，观察病灶部位、大小、形态、边缘以及与周围脏器的关系。**结果：**18 例肠重复畸形中，发生在十二指肠 1 例，空肠 3 例，回肠 5 例，回盲部 6 例，结肠 2 例。病理类型：肠外囊肿型 16 例，肠内囊肿型 2 例。CT 平扫均表现为囊性肿块，18 例中 17 例囊壁较厚，增强扫描囊壁均有强化，CT 表现特征为圆形、椭圆形或管形、单房、液性低密度、厚壁囊肿。术前 CT 诊断 10 例，误诊 5 例，漏诊 3 例。其中 8 例有其他合并症，4 例并发不全性肠梗阻，1 例穿孔并发感染，3 例并发肠套叠。结论：小儿肠重复畸形常合并急腹症发病，容易误诊、漏诊。CT 表现具有一定的特征性，可作为本病定位、定性诊断的重要影像学手段。

EPO-1562

小儿腹部肠系膜淋巴管瘤的 CT 表现

王明慧
青岛市妇女儿童医院

目的 分析小儿腹部肠系膜淋巴管瘤的 CT 影像学征象。
方法 收集我院经手术病理证实为肠系膜淋巴管瘤的儿童 12 例，采用回顾性分析方法，总结其 CT 影像特征。
结果 12 例患者年龄为 7 个月-5 岁，病灶均为单发，手术证实 12 例病灶中 6 例起源于结肠系膜，4 例起源于小肠系膜，2 例起源于大网膜。其 CT 征象如下：①病灶大小：12 例病灶最长径为 7-21cm，平均径长 14cm，其中 10 例最长径超过 10cm。②病灶形状：12 例病灶形态均欠规则，略呈“爬行”生长。③病灶生长部位：11 例病灶位于腹腔内，其中 7 例位于上腹部-下腹部，4 例位于下腹部-盆腔，另有 1 例位于腹膜后。④病灶与周围组织及血管关系：12 例病灶边界均光整，与周围组织脏器分界清晰，其中 8 例病灶局部钻入肠间隙内，推压周围肠管， 2 例包绕部分肠管，肠管受压狭窄； 10 例增强患者病灶边缘均可见多条肠系膜血管走行，5 例病灶包绕血管，血管未见进入病灶。⑤囊壁及分隔：12 例病灶囊壁均较薄且均匀，囊壁厚度＜2mm，均未见壁结节，7 例可见分隔，其中 6 例分隔厚薄均匀，1 例局部分隔欠均，较厚处厚度＞3mm，囊壁及分隔密度均匀，未见钙化影。⑥囊腔密度：10 例囊腔密度均匀，CT 值为 3-17Hu，2 例局部可见稍高密度，CT 值约 26Hu，其中 1 例另可见小片状脂肪密度，病灶内均未见出血及钙化。⑦CT 增强方式：10 例增强病

灶囊内容物均未见强化，9 例囊壁呈轻度强化，1 例中度强化，7 例存在分隔病例均行增强检查，其中 6 例分隔轻度强化，1 例中度强化（此例与上述囊壁中度强化病例为同一患者）。
结论 当腹部出现边界清楚、体积较大的单房或多房囊性病灶，囊内密度均匀，病灶呈塑性生长，推压或包绕邻近血管，病灶更大时包绕邻近肠管，囊壁及分隔薄且均匀，增强扫描时囊壁及分隔轻度均匀强化，病灶边缘见肠系膜血管走行，可对诊断肠系膜淋巴管瘤有较高提示作用。

EPO-1563
儿童罕少见肾脏原发肿瘤的影像表现

李杨,宋修峰
青岛市妇女儿童医院

目的：分析儿童罕少见肾脏原发肿瘤的 CT 表现特点，提高对该类疾病的认识及诊断水平。
方法：回顾性分析 15 例经病理证实的儿童罕少见肾脏原发肿瘤的临床及影像资料，分析其 CT 表现特点，并复习相关文献，总结其影像特征。
结果：15 例患儿中，先天性中胚层肾细胞瘤 4 例，肿块平均最大径（6.75±2.75）cm，平扫呈不均匀等低密度密度，增强扫描多呈渐进性强化，实质期肿块边缘出现环形强化为其经典表现（3 例）；多房囊性肾瘤 3 例，肿块平均最大径（9.67±3.79）cm，表现为单发多房囊性灶，轮廓光整，3 例囊壁和囊内分隔均显示清晰，增强后部分囊壁和间隔显示较清；肾透明细胞肉瘤 3 例，肿块平均最大径（9.17±1.53）cm，平扫呈不均匀等低密度，增强扫描皮质期呈轻中度不均匀絮片状强化，3 例均有不同程度的坏死；Xp11.2 易位/TFE3 基因融合相关性肾细胞癌 2 例，肿块平均最大径（7.75±4.25）cm，瘤内可见低密度囊变坏死区及斑片状稍高密度出血影，增强扫描病灶皮质期呈轻中度不均匀强化，实质期强化程度可略低或略高于皮质期，1 例见肾门淋巴结转移；其余 3 例为囊性部分分化肾母细胞瘤 1 列，肾恶性横纹肌样瘤 1 列，后肾腺瘤 1 例，参考相关文献均具有较典型 CT 表现。
结论：本组儿童原发肾脏肿瘤均罕少见，影像学表现有一定的特征性，工作中对儿童肾脏占位性病变应考虑上述肿瘤的可能性，以减少漏诊、误诊，提高诊断准确率。

EPO-1564
临床表现为黄疸的婴儿卡波西样血管内皮瘤——5 例病例报道

龚英
复旦大学附属儿科医院

目的：卡波西样血管内皮瘤多发生于躯干、四肢和头面部，发生在胰腺、肝门区卡波西样血管内皮瘤罕见。由于肿块容易压迫胆总管，临床上有黄疸表现。肿块形态不规则，表现为侵袭性生长，容易误诊为恶性肿瘤。本文通过分析其临床、影像学表现，提高对此病的认识。
材料与方法：收集、分析我院成功治疗的 5 例临床表现为黄疸的卡波西样血管内皮瘤的临床、影像资料。
结果： 5 例病例中 2 例为 CT/MR 检查，3 例为 MR 检查。均为男性，年龄最小 23 天，最大 120 天，平均 70 天。临床都表现为黄疸和血小板减少（卡梅现象）。5 例病例肿块均累及胰腺、肝门区，其中 2 例沿着肝内胆道分布，3 例肝内胆管扩张。病灶形态不规则，CT 平扫为低密度；MR 检查 T1WI 为低信号，3 例 T2WI 表现为低信号，2 例 T2WI 表现为低信号为主、夹杂少许高信号；增强肿块均明显均匀强化。所有病例均口服西罗莫司治疗，其中两例黄疸严重者予以经皮胆管引流术，治疗后随访病灶均明显缩小、消失。

结论：临床上卡波西样血管内皮瘤临床容易伴发血小板减低（卡梅现象）； MR 检查病灶 T2WI 呈低信号或低信号为主，增强明显均匀强化。口服西罗莫司治疗有效。上述特点可助于和其他肿瘤鉴别。

EPO-1565
易被忽视的儿童腹部急症： 网膜轴型胃扭转的影像学特征

程建敏
温州医科大学附属第二医院

目的：探讨儿童急性胃扭转的影像学特征：急性胃扭转的上消化道钡剂造影的影像特点已得到了广泛的描述。然而，被送到急诊室的急腹症的病人往往直接进行 CT 扫描，并将其作为首先的影像学检查方式。因此，放射科医师应该熟悉该该疾病 CT 影像特征。
材料与方法：回顾性分析 22 例患者的临床、影像学和手术结果，所有患者均接受上消化道钡剂造影，其中 10 例术前行 CT 检查。分析了上消化道钡剂造影和 CT 的影像学特征，并与手术结果进行对比。
结果：影像和手术结果证实所有病人都存网膜轴型胃扭转。上消化道钡剂造影显示了胃扭转的典型 GI 表现。10 例患者 CT 影像颇具特征：（1）定位像显示一个巨大球状扩张胃腔。断面图像证实了巨大的扩张胃腔内另见巨大气液平面;（2）“假贲门征”：异常高位的胃窦出现在食管下段层面上，形似“贲门”，幽门靠近胃食管连接处；（3）MPR 冠状位显示“倒置幽门征”。正常情况下，胃窦位于上腹右前份，呈现的层面较贲门位置低；正常贲门与胃窦幽门有较长的间距。（4）胃左动脉牵拉征。
结论：上消化道钡剂造影及 CT 扫描均能准确的诊断和描述急性胃扭转。 “假贲门征” 或“倒置幽门征”系网膜轴型胃扭转的 CT 影像学特征。

EPO-1566
能谱 CT 对肝硬化患儿肝移植受体术前肝脏血流动力学变化的评估

韩昕君,商书范,赵丽琴
首都医科大学附属北京友谊医院

目的：探讨能谱 CT 对肝硬化患儿肝移植术前肝血流动力学评估的价值。方法：分别回顾性选取 20 例肝移植术前行 CT 检查的胆道闭锁致胆汁淤积性肝硬化患儿（A 组）及 20 例遗传代谢性疾病患儿（B 组）。A 组患儿肝功能 Child-Pugh 分级为：A 级 8 例，B 级 7 例，C 级 5 例。B 组肝功能均正常。增强 CT 扫描采用能谱 GSI 模式。选取动脉期及门脉期的碘（水）基图像，分别在肝 S2、S4、S7 和 S8 四个肝段内设立一类圆形 ROI（面积约 60～80mm2）以测量碘基值，动脉期、门脉期的 ROI 保持一致；分别取其平均值作为动脉期、门脉期肝实质的碘含量（IA，IP），并计算出肝动脉碘分数（AIF）：AIF=IA/IP。对两组患儿的 IA，IP 及 AIF 行单因素方差分析，以 $P<0.05$ 为差异有统计学意义。结果：A 组肝硬化患儿的 IA，IP 及 AIF 分别为肝功能 A 级:（4.25±1.8）100μg/cm3，（11.44±2.7）100μg/cm3 及 0.37±0.11；肝功能 B 级:（5.61±2.8）100μg/cm3，（14.30±3.6）100μg/cm3 及 0.39±0.13；肝功能 C 级:（7.23±2.7）100μg/cm3，（13.49±3.6）100μg/cm3 及 0.53±0.15。两独立样本 t 检验结果显示，两组间的 IA 及 AIF 的差异具有统计学意义（$P<0.05$），A 组的 IA 及 AIF 均大于 B 组，而 IP 差异不具有统计学意义

（P>0.05）。结论：能谱 CT 扫描获得的 IA 及 AIF，可以用于简单、便捷的定量评价不同原因肝硬化肝移植受体术前血流动力学状况的评估。

EPO-1567
儿童 Xp11.2 易位/TFE3 基因融合性肾癌的影像学表现——附 7 例病例报道

龚英
复旦大学附属儿科医院

目的 分析儿童 Xp11.2 易位/TFE3 基因融合性肾癌的 CT 和 MRI 的影像学表现。

材料与方法 回顾性分析 7 例经手术病理证实的 Xp11.2 易位/TFE3 基因融合性肾癌患者的影像表现。男 6 例，女 1 例，年龄最小岁，最大 10 岁。3 例行 CT 检查，4 例行 MRI 检查。4 例因体检偶然发现，2 例血尿,1 例自己扪及肿块。评估肿瘤的位置、大小、密度 / 信号、钙化、出血和强化特点及是否有转移等影像学特征。

结果 所有肿瘤均为单发,4 例位于左肾,3 例位于右肾； 3 例肿瘤位于肾皮质，3 例累及肾皮髓质，1 例侵犯全肾；肿块类圆形 5 例，不规则形 2 例，最大径范围为 2.4-118 cm。6 例为实性肿瘤，1 例为囊性。肿瘤内坏死 4 例，出血 2 例，钙化 2 例，3 例出现假包膜。3 例 CT 检查患者 1 例呈囊性，增强边缘可见小结节状强化；2 例为实性，平扫表现为等、稍高密度，均有钙化，增强 1 例为均匀中等强化；1 例为不均匀强化，可见条索状间隔强化。4 例 MR 检查患者均表现为实性肿块，T1WI 稍低、等信号，T2WI 稍低信号,增强不均匀中等强化。肾周淋巴结转移 3 例。7 例病例无肾静脉癌栓，无远处转移。

结论 Xp11.2/TFE3 肾癌多为类圆形实性肿瘤，可见假包膜，容易出现出血、坏死。CT 平扫肿块呈稍高密度，T2WI 呈稍低信号，增强后强化较周边肾脏组织低。Xp11.2/TFE3 肾癌影像学表现有一定特征性。

EPO-1568
利用空气灌肠评估婴幼儿结肠正常解剖测量值

黄晓强,王强
泉州市儿童医院泉州市妇幼保健院

目的：利用研究没有便秘的 3 岁以下婴幼儿空气灌肠的结肠解剖学特征，以提供正常婴幼儿结肠大小比例的正常值。
方法：收集我院自 2018 年 1 月至 2018 年 12 月总计 1 年期间因为怀疑肠套叠经经空气灌肠整复治疗后并无便秘症状的 3 岁以下婴幼儿 403 例。选定清晰显示完整结肠圈的图像，测量主要指标包括预定结肠段（包括直肠，乙状结肠，降结肠，横结肠和升结肠）的直径以及分别与 L3 椎体宽度的比率。所获图像由两名有经验的影像诊断医师进行测量，最终值取两者平均值。
结果：在 403 例病例中，年龄最小的 5 月龄，年龄最大的 2 岁 11 月龄，中位年龄 1.5 岁，男性 225 例，女性 178 例。各结肠段与椎体长度比率随年龄没有显着变化（P ＜0.05）。直肠和升结肠直径与 L3 椎体宽度的比率随着年龄显着增加，而其他结肠段的直径与 L3 椎体宽度的比率则没有明显增加。3 岁以下婴幼儿对于性别和种族的差异并不显著。

结论：利用对 3 岁以下无便秘婴幼儿空气灌肠的图像进行测量，获得正常结肠解剖学测量值，为进一步研究婴幼儿结肠相关疾病提供例基础性数据。

EPO-1569
儿童炎性肌纤维母细胞瘤的影像诊断及病理特征对照分析

庄一鹏,王强
泉州市儿童医院

目的：探讨炎性肌纤维母细胞瘤(IMT)的病理分型与 CT、MRI 特征性表现。方法：回顾性分析我院经手术病理证实的 16 例 IMT 患者的影像学资料，16 例均行 CT 平扫及增强扫描，5 例同时行 MRI 平扫及增强扫描，记录患者的一般临床资料、病理表现及基本影像学特征，比较不同病理分型的 IMT 影像形态学差异。结果：肺内、肝脏、胆囊、胃、腹腔及腹膜后区 IMT 各 7 例、3 例、1 例、1 例、4 例。病灶密度或信号多不均匀，5 例伴少量点状钙化，出血及坏死少见。增强扫描胸部肿瘤表现为明显均匀强化，腹部肿瘤多表现为动脉期瘤内轻度片絮状强化，或边缘花环样明显强化，静脉期及延迟期强化范围持续扩大，强化程度无明显衰退。强化方式与瘤内组织成分比例有关，而恶性程度及预后转归与瘤细胞的核异型性有关。结论：IMT 的影像表现具有特征性，CT 能精准显示病灶的血供及解剖结构特征；MRI 有助于评价病灶组成成分及预判病理分型。CT 和 MRI 结合有利于提高 IMT 良恶性倾向诊断的符合率。

EPO-1570
应用全身扩散加权成像探查小儿腹部恶性肿瘤原发及转移灶的初步研究

刘鑫春,郝明珠
哈尔滨市儿童医院

目的 评价 MR 全身扩散加权成像(WBMR-DW IBS)探查小儿恶性肿瘤原发及转移灶的价值。**方法** 选取我院经影像及临床共同确诊为腹部恶性肿瘤的小儿患者 30 例及健康志愿者 20 例行 WBMR-DW IBS 检查。对比分析 WBMR-DW IBS 图像、常规 MR 图像和 CT 图像。测量原发灶及可疑转移病灶的平均表观扩散系数（ADC）值，并与正常对照组平均表观扩散系数（ADC）值对比。**结果** WBMR-DW IBS 均检出小儿腹部恶性肿瘤患者的原发灶，并检出除原发灶外的全身转移灶 115 处，检出率 90%（115/128），病变部位在 WBMR-DW IBS 呈像为高信号，平均表观扩散系数（ADC）值低于相应部位正常对照组。**结论** WBMR2DW IBS 适用于探查小儿腹部恶性肿瘤原发及转移灶，具有较高的检出率，可以作为小儿恶性肿瘤全身转移灶筛查的有力工具。

EPO-1571
3D 打印技术在小儿先天性门体静脉分流中的应用价值

郭辰,王谦,顾晓红,胡立伟,姚晓芬,曹剑锋,邱海峣,钟玉敏
上海交通大学医学院附属上海儿童医学中心

目的：运用 3D 打印技术建立具有精确解剖结构的先天性门体静脉分流病例的三维模型，探讨 3D 打印的模型对于该症临床诊断和手术计划制定的意义。方法：收集我院两例诊断明确的先天性门体静脉分流病例进行回顾性分析，两例病例均行 CT、DSA 检查及手术治疗。根据 64 排增强 CT 图像资料，通过 MIMICS 19.0 软件将 CT DICOM 数据导入并对感兴趣区（ROI）进行图像后处理，使用区域生长的方法分割图像之后生成标准镶嵌语言（Standard Tessellation Language，STL）文件数据，将数据导入 OBJET 260 3D 打印机后完成建模。结果：3D 打印模型能够准确清晰显示门体静脉分流的异常分支，且能更好显示该异常分支与周围血管的关系。结论：3D 打印模型能够在辅助诊断先天性门体静脉分流的基础上，更好地显示其与周围血管的空间关系，能有效地应用于术前手术方案的制定，为手术治疗提供帮助。

EPO-1572
CT 能谱 MAR 去金属伪影技术对儿童体内消化道金属异物的应用

马双
天津市儿童医院

要:**目的** 研究 GE revolution CT 能谱 MAR 去金属伪影技术对儿童体内消化道异物的临床作用.**方法**:选取误食消化道金属异物的患儿(15)例,分为两组,在相同扫描条件下分别行 120kvp 和 120kvpMAR 重建，A 组为患儿进行普通腹部 CT 扫描.B 组为患儿进行能谱 CT 的腹部扫描.能谱 CT 采用专用软件进行重建,在传统螺旋扫描和单能量扫描重建图像上放四个 ROI。选取靠近金属异物区域,测量图中的 CT 方差值,记为 SDr,再选取以空气为背景的区域,测量其 CT 的方差值记为 SD,按照公式可描述硬化伪影的指标-伪影指数(AI)的计算,即 AI=√(SD2-SDr2).硬化伪影去除率(BAR)=(AI120kvp-AIkvpMAR
) /AI120KVPX100%。**结果**：在 120kev 的单能量成像上，通过伪影指数 AI 的计算，比较 A 组与 B 组，有明显差异 P<0.05，有统计学意义。**结论**：CT 能谱能够有效的去除消化道金属异物的伪影，提高图像质量，增加医学影像诊断的准确性。

1 例造血干细胞移植后淋巴组织增生性疾病 MSCT 影像表现及文献复习

翟爱国,邵剑波,彭雪华
华中科技大学同济医学院附属武汉儿童医院

目的 移植后淋巴组织增生性疾病（post-transplantation lymphoproliferative disease，PTLD）是指实体器官、骨髓或造血干细胞移植后发生的一种严重并发症，临床表现及病理类型多样，发生率低，主要与移植后免疫抑制治疗和 Epstein-Barr 病毒（EBV）感染相关。本文旨在探讨造血干细胞移植后肺部及胰腺淋巴组织增生性疾病（PTLD）的 MSCT 影像表现及诊断价值。
方法：回顾性分析我院一例 β 地中海贫血患儿行造血干细胞移植后半年确诊为 EBV 相关淋巴组织增生性疾病的临床资料及 MSCT 影像表现。
结果：MSCT 平扫表现为双肺散在大小不等的软组织结节及肿块影，边界清晰，部分病灶中央密度稍减低，胰头及体尾部形态局部饱满，实质密度欠均匀；增强后扫描，双肺病灶呈轻度不均匀强化，胰头及体尾部分别可见斑片状低密度影，与正常胰腺组织强化对比明显，边界清楚，局部见类圆形更低密度灶。

结论：MSCT 影像表现结合移植病史对于 PTLD 的初步诊断、活组织检查术前定位及治疗后效果评估等方面有很大的参考价值。

EPO-1574
基于体重指数调整的不同体重儿童上腹部低剂量 CT 扫描研究

陈添峰,王强
福建省泉州市妇幼保健院儿童医院

目的：研究基于体重指数调整的儿童上腹部低剂量 CT 扫描方案的辐射剂量、主客观图像质量和诊断准确性。**方法：**对比分析不同体重指数儿童上腹部低剂量 CT 扫描中的差异，前瞻性分析 50%ASIR 重建常规剂量和基于体重指数调整的上腹部低剂量 CT 扫描方案检查，年龄范围 1 月-14 岁。使用五点量表主观评估包括噪音，清晰度，伪影和诊断可接受性在内的图像质量。使用配对 t 检验比较两组之间的辐射剂量。**结果：**各组图像质量主观评分的一致性大，图像质量可接受。基于体重指数调整的上腹部低剂量组所有辐射剂量参数均显着降低（P <0.01），超重儿童剂量减少 44%以上。**结论：**在正常体重和超重儿童中，50%ASIR 重建的个性化低剂量 CT 扫描方案平均剂量明显低于常规剂量，而不会显着影响儿童上腹部 CT 检查的诊断图像质量。

EPO-1575
多层螺旋 CT 对小儿骶尾部恶性生殖细胞瘤的诊断价值

孙海林
首都儿科研究所附属儿童医院

目的：回顾性分析小儿骶尾部恶性生殖细胞瘤多层螺旋 CT 表现、病理学及临床特征，评估多层螺旋 CT 对小儿骶尾部恶性生殖细胞瘤的诊断价值。
方法：经过临床、病理或影像证实的恶性生殖细胞瘤 9 例，男 5 例，女 4 例。年龄 5 月-4 岁，中位年龄 16 月。全部患者术前均进行螺旋 CT 增强检查，依据肿瘤的螺旋 CT 表现，按照 Altman 分型系统，对肿瘤进行分类，并分析肿瘤大小、形态、密度、血运情况、转移情况及血清 AFP 值。
结果：Altman 分型中，本组 II 型 1 例，III 型 3 例，IV 型 5 例。全部肿瘤均较大，大小范围 42mmx43mm-132mmx21mm，实性肿瘤居多，占 67%，肿瘤密度不均匀，无脂肪成分或仅含有点状脂肪成分肿瘤占 89%，全部肿瘤均可见丰富血运，增强后肿瘤呈不均匀明显强化，均可见局部浸润或远处器官转移，其中骶骨及椎体骨破坏最常见，呈虫蚀样改变，占 89%；其次为下腔静脉或髂静脉瘤栓，占 67%；并可见肝转移、肺转移及椎管浸润。全部病例中血清 AFP 均升高，明显升高者（大于 300ng/ml）占 89%。CT 诊断敏感度为 89%；病理学检查敏感度为 67%。
结论：螺旋 CT 不仅能显示骶尾部恶性生殖细胞瘤原发灶特征，更能显示其在不同器官上转移灶特点，结合血清 AFP 明显升高不难做出定性诊断，因此，多层螺旋 CT 可以补充并完善病理组织学对骶尾部恶性生殖细胞瘤的诊断不足。

EPO-1576
巨大肝母细胞瘤术前介入治疗的疗效评价及影响因素

胡颖姿
浙江大学医学院附属儿童医院

目的　探讨肝母细胞瘤术前介入性肝动脉化疗栓塞(transarterial chemoembolization,TACE)的疗效及影响因素。方法　2014 年 2 月～ 2018 年 3 月不能Ⅰ期手术切除的 18 例巨大肝母细胞瘤患儿(男 10 例,女 8 例)接受 1～ 4 次栓塞化疗。年龄 3 月～ 7 岁(中位年龄 1 岁 2 月)。每次栓塞化疗前均行数字减影血管造影(DSA)检查,栓塞化疗时首先超选择进入肿瘤的供血动脉,经该动脉先灌注化疗药物，注入超液化碘油的混悬乳液。介入术后评估其疗效及影响因素。结果　18 例患儿行介入治疗的次数 1-4 次不等，其中 7 例患儿一次，8 例 2 次，2 例 3 次，1 例 4 次。TACE 后，15 例（83%）肿瘤体积缩小明显（30-50%），在肿瘤缩小后做了手术切除，14 例（77%）无瘤存活至今，其中 1 例出现门静脉海绵样变性，1 例手术切除后相继出现肺转移及脑转移。2 例肝母细胞瘤 TACE 效果不佳，1 例为肝母细胞瘤伴肝动脉门静脉瘘，未行碘油栓塞，仅注入化疗药物，做了 3 次化疗药物灌注后，肿瘤缩小不显著，未能施行外科手术；1 例为肝左叶肿瘤，主要由肝左动脉供血，但导管未能进入肝左动脉，仅在肝右动脉行肿瘤碘油栓塞治疗，治疗效果不明显。结论　TACE 能有效杀死肿瘤细胞，控制肿瘤生长，使大部分不能Ⅰ期手术的患儿重新获得手术机会，改善预后，无严重并发症，是一种安全、有效、实用的肝母细胞瘤的辅助治疗方法, 术中尽可能进入肿瘤供血血管，使碘油混悬剂能均匀分布整个瘤体是治疗的关键所在。导管难以进入靶血管及肝母细胞瘤伴肝动脉门静脉瘘是影响肝母细胞瘤介入治疗疗效的原因。

EPO-1577

阴道斜隔综合征的影像学表现及其诊断价值

杨宾,龚英
复旦大学附属儿科医院

目的　探讨阴道斜隔综合征的影像学表现及其诊断价值。
方法　回顾性分析 1 例 12 岁女性阴道斜隔综合征患儿的临床及影像学资料并复习相关文献。患儿主诉反复下腹坠痛数月，与月径周期相关，可自行缓解。此例患儿术前行超声、CT 及 MRI 检查，并分析其斜隔的位置，隔后腔的大小，隔后腔与宫颈的位置关系，双侧附件及泌尿系统的伴发改变。
结果　该患儿因腹痛急诊入院，CT 平行显示盆腔不规则软组织团块影，向会阴部延伸。第二日行超声、MRI 增强检查，超声示右下盆腔探及琵琶状子宫，宫腔内及无回声平段，下方阴道探及弱回声区，内及数个低回声团块；左下盆腔探及子宫组织。MRI 检查显示右下腹盆腔见葫芦状异常信号灶，其内见液体信号，向会阴部延伸。左下盆腔内另见一子宫样组织信号。双侧卵巢正常。故术前诊断为双子宫、双宫颈、双阴道且右侧阴道闭锁，斜隔位于右侧，斜行附着于左侧阴道壁；同时 MRI 发现斜隔侧右肾缺如。
结论　阴道斜隔综合征又称 Herlyn-Werner-Wunderlich 综合征。典型表现为双子宫、双宫颈、双阴道且一侧阴道完全或不完全闭锁，均伴闭锁阴道侧泌尿系统畸形，以肾脏缺如多见。本病多于青春期发病，主要表现为周期性下腹痛、痛经、月经不规则、阴道流脓、盆腔包块以及因盆腔炎引起的一系列症状。超声检查因其简易、便捷、无创、重复性好等优点，常作为该病的首选筛查方法。MRI 检查在阴道斜隔综合征的显示方面更具优势。MRI 检查可非常清晰地显示子宫畸形的类型，斜隔的位置及走行，隔后腔与积液宫颈的关系，且在斜隔及阴道全貌的显示、子宫内膜及宫颈发育情况的判断、积液性质的确定方面更具优势，隔后腔积血在 T1 WI 呈高信号或在 T2 WI 呈低信号，隔后腔积脓在 DWI 呈高信号。阴道斜隔综合征的影像学表现颇具特征性，超声、CT 和 MRI 对准确诊断有一定价值。

儿童睾丸肿瘤的 CT、MRI 表现

蔡雪梅
上海交通大学医学院附属儿童医院、上海市儿童医院

目的 探讨儿童睾丸肿瘤的 CT 与 MRI 影像征象，提高对睾丸肿瘤的影像诊断能力。 **方法** 回顾性分析 60 例经手术和病理证实的儿童不同类型睾丸肿瘤的 CT 和 MRI 资料。**结果** 60 例睾丸肿瘤样病变中，睾丸肿瘤 54 例，其中良性畸胎瘤 17 例（成熟性畸胎瘤 15 例，未成熟性畸胎瘤 2 例），卵黄囊瘤 10 例，其中混有成熟性畸胎瘤 1 例，伴有肺转移 1 例，良性囊肿 23 例（皮样囊肿 5 例、表皮囊肿 14 例、胚胎残留囊肿 4 例），睾丸性索间质细胞瘤 2 例，血管来源肿瘤（毛细血管瘤）1 例，副脾 1 例，多睾 1 例。5 例未手术者分别为白血病双侧睾丸浸润 5 例（穿刺取病理证实）。其共同表现为睾丸不同程度增大，不同类型的睾丸肿瘤及肿瘤样病变有其各自的较为特征的 CT 和 MRI 征象，对病变检出、定性和肿瘤分型、分期有重要诊断价值。**结论** CT 及 MRI 对儿童睾丸肿瘤的检出、分型诊断和分期等具有重要价值。

EPO-1579
儿童睾丸生殖细胞肿瘤的 MRI 诊断与良恶性鉴别

段修华,杨秀军,胡慧勇,蔡雪梅
上海市儿童医院、上海交通大学附属儿童医院

目的 探讨不同病理类型儿童睾丸生殖细胞肿瘤的 MRI 诊断与良恶性鉴别。**方法** 回顾性分析 56 例儿童睾丸生殖细胞肿瘤的临床资料、MRI 表现和病理结果，依据病理结果分为畸胎瘤组、表皮样/皮样囊肿组和卵黄囊瘤组。分组比较畸胎瘤组、表皮样/皮样囊肿和卵黄囊瘤组肿瘤的部位、大小、边界、形态、信号特征、脂肪变、患侧精索增粗情况、强化程度、MRI 诊断肿瘤良恶性的符合率等。**结果** 56 例儿童睾丸生殖细胞肿瘤中，良性肿瘤组 41 例（41/56，73.2%），恶性肿瘤组 15 例（15/56，26.8%），最常见的良性肿瘤为畸胎瘤,其次为表皮样囊肿，最常见的恶性肿瘤为卵黄囊瘤。**结论** MRI 检查诊断睾丸肿瘤良恶性符合率较高，患侧精索静脉增粗和强化程度方面鉴别不同病理类型的儿童睾丸生殖细胞肿瘤有特异性，可作为超声的替代检查手段。

EPO-1580
儿童卵巢恶性肿瘤的 CT 特征的再认识

陶然,袁新宇
首都儿科研究所附属儿童医院

目的 总结和分析儿童卵巢恶性肿瘤的 CT 特征，提出与良性卵巢肿瘤的鉴别要点。**方法** 回顾性分析 2015 年 1 月至 2017 年 12 月经手术病理诊断为卵巢肿瘤且术前经螺旋 CT 增强扫描的女性患儿的术前 CT 图像，包括卵巢肿物的性质、肿物内有无钙化或脂肪成分、囊壁及囊内分隔情况、肿物强化程度及强化方式、有无瘤内血管及肿物最大径、实性成分比等影像特征；统计分析不同 CT 影像特征在良恶性卵巢肿物之间的差异采用 c^2 检验或 Mann-Whitney U 检验；计量资料在良恶性卵巢肿物之间的差异有统计学意义时绘制相关卵巢恶性肿物的 ROC 曲线。**结果** 共 74 例卵巢肿物患儿接受了 CT 增强扫描，其中卵巢恶性肿瘤 11 个（14.9%），卵巢良性肿瘤 63 个。卵巢肿物的性质、实性成分比、强化程度、强化方式及有无瘤内血管等 CT 影像特征在良恶性卵巢肿瘤之间的组间差异具有统计学意义（P=0.004、0.001、0.013、0.038、0.003）。肿物实性成分比大于 0.17 作为判定卵巢恶性肿物的临界值时，其敏感度为 81.8%，特异度为 82.5%。**结论** 儿童卵巢恶性肿物的 CT 特征

包括实性成分多、增强后强化明显、强化不均匀、瘤内出现迂曲血管影等，特别是实性成分比大于 0.17。

CT manifestation of retroperitoneal neuroblastoma in children

Chao Chen, zengjun Zhang, Xin Hu, Dong Wang, Xin Hou
xian children ‘s hospital

Abstract: Objective To study CT scan finding of retroperitoneal neuroblastom. **Methods** 32 cases confirmed by surgery and pathology were retrospectively analyzed, **Results** In 15 cases of neuroblastom , round mass was presented in 12 cases, tumor with poorly defined margins in 2 cases, tumorous calcifications in 2 cases, involvement of retroperitoneal vessels in 2 cases ,and invasion of retroperitoneal lymph nodes in 3 cases .None of the nephroblastoma invaded retrocrural lymph nodes .Irregular mass with calcification, involvement of retroperitoneal vessels, retrocrural and retroperitoneal lymp nodes were more common in cases of neuroblastoma than in nephroblastoma .Moreover, involvement of retrocrural lymph nodes and encasement of retroperitoneal vessel had higher positive predication value on neuroblastoma .**Conclusion** CT scan is able to localize the primary retroperitoneal tumors accurately, involvement of retrocrural lymph nodes and encasement of retroperitoneal vessels were the specific CT findings of neuroblastoma.

EPO-1582

婴幼儿原发性小肠淋巴瘤的 CT 表现

陈超, 王小飞, 张增俊, 胡文, 侯欣, 白慧萍
西安市儿童医院

目的：探讨小儿原发性小肠淋巴瘤的 CT 特征。旨在提高诊断率，为临床诊断治疗提供依据。方法：对 39 例手术病理证实的原发性小肠淋巴瘤 CT 表现和临床资料进行回顾性分析，所有病例行 CT 平扫加增强扫描。结果：39 例小肠淋巴瘤中 16 例有病变段管腔扩张 13 例主要表现为肠壁的局限或弥漫性增厚，5 例表现为腔内溃疡型肿块，39 例肠淋巴瘤中 5 例误诊为肠重复畸形和炎性肿块 21 例伴有淋巴结肿大。结论：CT 可以清楚显示原发性淋巴瘤的病变特点及其周围组织浸润情况，典型 CT 征象对定性诊断有较大价值。

EPO-1583

LCH 累及肝脏的 CT 表现

张增俊, 陈超, 侯欣, 王冬, 胡文, 陈华
西安市儿童医院

目的 探讨婴幼儿朗格罕细胞组织细胞增生症（Langerhans cell histiocytosis, LCH ）侵犯肝脏的 CT 特点，提高对本病的认识。**方法** CT 检查发现 6 例仅侵及肝脏并经病理及免疫组化证实的朗格罕细胞组织细胞增生症进行回顾性分析。其临床表现与受累程度关，主要为发热、黄疸、肝功的异常。**结果** CT 平扫表现为肝脏弥漫增大，肝内病灶呈多发性结节状及片状低密度病灶。朗格罕细胞组织细胞增生症侵犯肝脏的基本病理是汇管区的组织细胞增生，中央汇管区有较好的框架，易沿框架发展，周围汇管区不明显，容易形成局灶性结节样堆积，故增强扫描呈多发性结节状强化，部分结节呈环形强化。**结论：**朗格罕细胞组织细胞增生症侵犯肝脏的影像表现有一定的特点，但最终需结合临床及病理明确诊断。

EPO-1584

MRI 在先天性肛门直肠畸形诊断中的应用

张黎,何玲
重庆医科大学附属儿童医院

目的：探讨 MRI 检查在先天性肛门直肠畸形患儿术前诊断的价值。
方法：搜集我院 2018 年 6 月~2019 年 7 月行 MRI 检查的先天性肛门直肠畸形患儿 36 例，其中男性患儿 25 例，女性患儿 11 例，年龄范围为 2 月~10 月，中位年龄为 3 月。入组患儿均已于新生儿期行一期横结肠双腔造瘘术，二期术前均行 MRI 检查。
结果：36 例患儿中包括高位闭锁 3 例，中位闭锁 13 例，低位闭锁 21 例。25 例男性患儿中，有 22 例合并泌尿系生殖瘘，其中尿道球部瘘 9 例，尿道前列腺部瘘 9 例，直肠膀胱瘘 3 例，直肠会阴瘘 1 例；11 例女性患儿为直肠会阴瘘。36 例患儿合并其他发育异常 17 例，其中脊椎发育异常 9 例，终丝脂肪变性 7 例，子宫发育畸形 4 例，肾脏发育异常 2 例，脊髓栓系 2 例，脊髓中央管扩张 2 例。
结论：MRI 可以准确、无创、全面地显示先天性肛门直肠畸形的类型、瘘管存在与否及瘘口位置以及伴发的其他畸形情况，为手术方式的选择、手术预后的评估提供可靠依据。

EPO-1585

儿童肾脏少见原发性恶性肿瘤临床及影像特征

陈晶晶,李京恩
苏州大学附属儿童医院

目的：对比分析儿童肾脏少见原发性恶性肿瘤的临床与影像特征，为临床手术和治疗方案的制订提供依据。
方法：回顾性分析我院 11 例肾脏少见原发性恶性肿瘤患儿，其中男性 6 例，女性 5 例，年龄最大 12 岁，最小 11 月。采用 GE-Optima 64 排螺旋 CT 机进行腹部 CT 扫描。增强扫描对比剂为欧乃派克，剂量为 2ml/kg 体重(最大不超过 100ml)。不能合作的患儿 1 0 %水合氯醛灌肠（2ml/kg 体重），待患儿睡熟后进行腹部 CT 扫描。扫描结束后将原始图像数据重建成层厚 0.625mm 的图像，传输至工作站，采用多种后处理对图像进行分析。患儿临床症状表现包括血尿，发现腹部肿块，持续间断发热，反复白细胞升高，或者行超声检查发现。所有患儿均行腹部 CT 平扫和增强扫描，并经手术、病理证实，术后部分患儿进一步予以化疗，分析其临床特点、腹部 CT 影像表现以及与肾母细胞瘤的鉴别要点。
结果：11 例患儿中，包括恶性横纹肌样瘤 3 例，透明细胞肉瘤 2 例，肾细胞癌 6 例。1 例发生于双侧肾(恶性横纹肌样瘤)，其余 10 例均发生于单侧。1 例恶性横纹肌样瘤合并中枢神经系统肿瘤；1

例恶性横纹肌样瘤合并两肺转移；2 例肾细胞癌复发，再次行手术切除；1 例恶性横纹肌样瘤放弃治疗，1 例恶性横纹肌样瘤去世。
结论：虽然儿童肾脏原发性恶性肿瘤的术前诊断有一定的困难，但综合患儿的临床资料及影像特征，比如年龄，临床症状，肿瘤的大小，影像特征以及转移及合并症等，有助于肾脏原发性恶性肿瘤的术前诊断，从而可以帮助临床医生精密地制订手术方案和后续治疗方法，提高患者的生存率。

EPO-1586

8 例儿童嗜铬细胞瘤 CT 影像及临床分析

杨梅
首都儿科研究所附属儿童医院

目的：探讨儿童嗜铬细胞瘤的 CT 影像征象及临床特点。材料与方法：收集 2000 年 1 月至 2017 年 12 月收治的 8 例经手术病理证实的嗜铬细胞瘤病例，回顾性分析临床表现及 CT 影像征象。结果：女孩 2 例，男孩 6 例；年龄 1.6-13 岁，中位年龄 5.2 岁。仅 2 例患儿儿茶酚胺代谢产物增高，临床出现典型的阵发性高血压；1 例患儿伴神经纤维瘤病，1 例出现性早熟；其余 4 例无典型临床症状。本组肿瘤位于左侧肾上腺者 3 例，右侧肾上腺者 3 例，腹膜后者 2 例；肿瘤均为单发。良性 5 例，表现为类圆形实性肿瘤，边界清晰，直径 17-113mm，中位直径 30mm；增强扫描中可见肿瘤明显强化，边缘显著。恶性 3 例，为囊实性肿瘤，囊性成分显著，直径 104-186mm,中位直径 134mm，增强扫描中可见实性成分强化程度低于良性嗜铬细胞瘤；1 例肝脏转移，1 例淋巴结转移，1 例椎管、骨骼、肌肉转移。2 例恶性嗜铬细胞瘤可见腹主动脉的供血动脉。结论：通过典型临床表现及 CT 影像学征象可于术前提出嗜铬细胞瘤的诊断。肿瘤的供血动脉有助于分辨肿瘤的起源。

EPO-1587

胡桃夹综合征——“肾淤血”的 CT 影像表现及临床相关性研究

高思婕,徐晔,马维,李伟,张高福
重庆医科大学附属儿童医院

目的： 利用影像学技术分析胡桃夹综合征(nutcracker syndrome，NCS）肾淤血对肾功能的影响。
方法： 收集我院（2016.1-2018.12）的 86 例经临床筛查排除性诊断为 NCS 的患儿的临床、影像资料，根据增强实质期双肾髓质强化程度是否有差异、侧支循环情况分组，分析腹主-肠系膜上动脉夹角（aortomesenteric angle, AMA）、左肾静脉（left rein venous，LRV）受压段与扩张段的径线之比、CT 增强实质期双肾髓质 CT 值差值的绝对值、侧支循环发生等主要影像特征，比较上述征象与 24 小时尿蛋白定量、血尿发生率的关系。数据统计学处理采用统计软件 SPSS 17.0，检验方法包括两独立样本 t 检验、曼尼-惠斯 U 秩和检验、卡方检验。**结果：** 1．淤血 A 组与非淤血 A 组：增强实质期淤血 A 组的双肾 CT 值之差显著高于非淤血 A 组（P=0.000,＜0.05），其 AMA 角较小（P=0.001, ＜0.05），其径线之比较高（P=0.001, ＜0.05），发生侧支循环的比率明显较低（P=0.040,＜0.05）。2．淤血 B 组与非淤血 B 组：增强实质期淤血 B 组的双肾 CT 值之差显著高于非淤血 B 组（P=0.000,＜0.05），其 AMA 角较小(P=0.008, ＜0.05)，其径线之比较高（P=0.008,＜0.05）；24 小时尿蛋白定量的差异有统计学意义（P=0.041, ＜0.05）。**结论：** 在 AMA 角偏小、径线之比较大（LRV 受压较明显）、侧支循环发生率较低的情况下，NCS 患儿在 CT 实质期双肾髓质的强化程度可能会发生明显的差异，其 24 小时蛋白尿定量可能会增加，提示胡桃夹综合征对患儿的影响较大，左肾淤血程度较高。

EPO-1588

儿童阴囊淋巴管瘤 3 例报道

赵滨
天津市儿童医院

【摘要】目的：探讨儿童阴囊淋巴管瘤的 MR 表现及鉴别诊断。**材料和方法：**本组 3 例患者均为男性，年龄 1-3 岁。均以一侧阴囊肿大就诊。查体均无明显红肿、触诊无疼痛。无发热，血常规白细胞计数正常。3 例患者均采用西门子 1.5T 磁共振仪扫描完成检查。其中 2 例同时行增强检查。**结果：**2 例患者为右侧阴囊内包块。1 例为左侧阴囊内包块，且延伸至同侧腹股沟区。超声显示肿块均匀低回声不规则形包块，其内可劲分隔，未检测到血流信号。3 例 MR 平扫显示阴囊内不规则形包块，以长 T1 长 T2 液体信号为主，内部见多发短 T2 线样分隔影像，其中 1 例延伸至同侧腹股沟区。同侧睾丸稍显受压，但与包块分界清楚。睾丸信号未见异常。2 例行增强检查包块内部均未见强化，包块边缘及内部分隔轻度强化。3 例均行手术切除，术后病理淋巴管瘤。**结论：**淋巴管瘤是儿童常见的先天性脉管畸形，是由间叶组织的原始淋巴囊及淋巴管发育形成，极少发生癌变。泌尿生殖系统淋巴管瘤可发生于肾脏、膀胱、输尿管、阴囊及精索。根据病理和临床表现可分为单纯性、海绵状和囊性三类。MR 平扫上淋巴管瘤为多房囊性包块，形态不以则，沿组织间隙蔓延生长，内部以长 T1 长 T2 液体信号为主，如合并出血可见液液平面。增强后一般内部无强化，仅边缘和内部分隔轻度强化。儿童阴囊淋巴管瘤影像上需与睾丸畸胎瘤、睾丸鞘膜积液等疾病鉴别。睾丸畸胎瘤常引起同侧睾丸显示不清，且包块内部可见液体、脂肪甚至钙化成分。而淋巴管瘤一般不累及同侧睾丸，信号以液体成分为主，比较容易鉴别。睾丸鞘膜积液一般为液体信号，但其内部无明显分隔，可与淋巴管瘤鉴别。

EPO-1589

GALD-NH 2 例报道

闫锐,张翼,张婧婧,代勤
西北妇女儿童医院（陕西省妇幼保健院）

目的：提高对妊娠(胎儿期)同族免疫性肝病(gestational alloimmune liver disease，GALD) 所造成新生儿血色病（NH）的认识。
方法：回顾性分析产妇 2 次足月顺产新生儿均于出生后数天死亡病例的临床及影像学资料。
结果：1、同一产妇分别于 2016 年 4 月及 2018 年 2 月分别足月顺产 1 男婴，2 名患儿出生后均以新生儿低血糖收入院，后出现重度黄疸、凝血功能障碍、心功能衰竭、DIC，分别于出现后 70 天死亡及 5 天后放弃治疗自动出院（后死亡）。2、既往史：产妇 2015 年人工流产一次，否认遗传病及传染病。3、实验室检查：患儿 1：生后 5 分钟血糖 1.2mmol/l，外院治疗 5 天，转入我院后，出现肝功异常，转氨酶高，直接胆红素高；巨细胞病毒定量<500.00；腹水逐渐增加，直接胆红素高，总胆汁酸盐 177.91umol/L；AFP>2000ug/L；肾功正常；出现凝血功能异常、心功能异常。患儿 2：生后发现血糖低 1 小时，血糖 0.6mmol/l；临床表现同第一胎，低蛋白，凝血功能异常，休克。4、影像学检查：患儿 1：头颅 MRI 平扫（外院）示 1）双侧枕顶部改变，不除外低血糖脑损伤；2）右侧额叶皮层下及右侧脑室体旁异常信号影，弥散轻度受限，考虑损伤性改变；西京医院肝胆核素检查：不考虑完全性胆道闭锁，肝脏炎症明显；本院腹部 MRI 平扫示大量腹水，胰腺呈短 T2 信号影。患儿 2：腹部 CT 平扫+增强检查示腹水。5、分子遗传学检查：患儿 1：全外显子基因检测阴性；线粒体相关基因检测阴性；血尿串联质谱：酪氨酸高 350（25-250）。患儿 2：无。
结论：对产前或生后短期内即有肝病表现均应疑诊 NH；对于无法解释的新生儿死亡或死产也应考虑 GALD-NH。

EPO-1590
MRU 在儿童先天性泌尿系疾病中的临床应用价值

刘菁华
上海市儿童医院

【摘要】**目的**：评价磁共振尿路造影(MRU)对儿童先天性泌尿系疾病的临床应用价值。**材料和方法**：我院就诊有完整病史患儿 205 例，女 98 例，男 107 例，年龄 1 月-17 岁。采用快速自旋回波(FSE)重 T2 加权序列对患者进行泌尿系冠状位扫描，将图像按最大强度投影(MIP)法重建出 MRU 图像。经手术、临床随访或病理证实为单侧及双侧肾积水 168 例，其中伴有输尿管扩张 77 例，伴重复肾 5 例，单侧肾发育不良 3 例，多囊肾 2 例，尿路结石 1 例；单侧异位肾脏 1 例，马蹄肾 2 例，输尿管囊肿 10 例，膀胱憩室 1 例，膀胱外翻 1 例，双侧及单侧重复肾 18 例，单侧肾发育不良或缺如 3 例，髓质海绵肾 1 例。**结果**：各例的 MRU 均清晰显示泌尿性病灶，尤其对肾盂积水及尿路梗阻部位显示良好，解剖结构清晰。结合 MRI 与其他影像资料，可对先天性泌尿系疾病作出定性定位诊断。**结论**： MRU 是无创伤的检查方法，不接触射线，不需碘对比剂，诊断儿童先天性泌尿系疾病定位、定性准确，是一种新的安全的影像检查手段，尤其适用于因严重梗阻 IVP 显影不良的病例。

EPO-1591
探讨彩色多普勒超声与 MSCT 在小儿非外伤性急腹症中的临床应用价值

王小飞,魏思文,胡文,张增俊
西安市儿童医院

目的 探讨彩色多普勒超声与 MSCT 在小儿非外伤性急腹症中的临床应用价值 **方法** 取本院 2018 年 1 月至 2019 年 3 月收治的 90 例小儿非外伤性急腹症患儿，收集患者临床及影像学资料。将 MSCT 检查和彩色多普勒超声检查的诊断结果进行讨论和分析；对比经 MSCT 检查和彩色多普勒超声对小儿非外伤性急腹症的诊断准确度、敏感度和特异度。 **结果** 经彩色多普勒超声检查对小儿非外伤性急腹症的诊断灵敏度、特异度和准确度分别为 67.78%、70.00%、74.44%，MSCT 检查对小儿非外伤性急腹症的诊断灵敏度、特异度和准确度分别为 88.89%、91.11%、87.89%。MSCT 检查对小儿非外伤性急腹症的诊断灵敏度、特异度和准确度明显高于彩色多普勒超声检查。两者比较差异有统计学意义（*P<0.05*） **结论** 彩色多普勒超声和 MSCT 检查均可有效的显示小儿非外伤性急腹症的影像学特点，但 MSCT 检查鉴别诊断小儿非外伤性急腹症的能力优于彩色多普勒超声。

EPO-1592
新生儿及小婴儿卵巢囊肿的 MRI 诊断价值

闫喆,赵滨,王春祥
天津市儿童医院

目的 分析总结 3 月龄以下新生儿及小婴儿卵巢囊肿的 MRI 表现特点及其诊断价值。**方法** 收集 18 例经手术病理证实的卵巢囊肿患儿，年龄范围 1 天～2 月 10 天，中位年龄为 23 天。所有入组患儿均行 MRI 平扫及增强检查，分析其临床资料及 MRI 表现，观察内容：1.病灶大小、形态、位置、囊壁及囊内信号特征、强化方式；2.如根据基本征象疑为卵巢来源者，需注意病灶同侧及对侧附件、病灶与子宫的位置关系、腹盆腔内有无明显渗出等。**结果** 18 例中 16 例患儿产前超声诊断出腹部

囊性占位，MRI 显示 18 例均为单侧发病。11 例未发生扭转者在 MRI 上均表现为囊肿信号特点，呈薄壁均匀的长 T_1 长 T_2 信号，囊内无分隔，增强后囊内无强化或囊壁局部轻度强化，病灶边界清楚且周围无明显渗出，子宫位置正常或偏向病灶同侧。另 7 例卵巢囊肿扭转者病灶张力较大，于 T_1WI 序列信号不同程度增高，其中 3 例出现液-液平面，2 例囊壁出现弧形增厚，2 例病灶外带卵泡增大呈串珠状排列，2 例与同侧子宫角之间存在条索状等 T_1 信号，3 例病灶转向子宫对侧，子宫发生牵拉移位。**结论** 新生儿及小婴儿卵巢囊肿的发病率不高，临床常无明显症状或体征，主要依靠影像学检查来明确诊断。MRI 可清晰显示卵巢囊肿的形态、信号，明确是否合并囊内出血、囊肿继发蒂扭转等，同时可评估同侧残存卵巢组织，为手术治疗提供依据。本病需与其他腹部脏器外囊性病变相鉴别，如卵巢畸胎瘤、肠系膜囊肿、肠重复畸形，MRI 可根据病变的信号特点及子宫附件的显示情况作出鉴别诊断。

EPO-1593

腹内疝的分型及多层螺旋 CT 诊断思路

王礼同
扬州大学附属医院

目的 腹内疝（intraperitoneal hernias）是指腹腔内脏器或组织（主要是小肠及其系膜）通过腹膜或肠系膜正常或异常的孔道、裂隙离开原有位置而进入腹腔内的某一解剖间隙。探讨多层螺旋 CT（MSCT）多平面重建（MPR）技术在腹内疝诊断及分型中的临床应用价值。**方法** 回顾性分析 2010 年 8 月～2018 年 2 月经临床随访或手术证实的 27 例腹内疝患者的横轴面 CT 及 MPR 表现。发病至首次 CT 时间为 2h～5d，CT 随访检查 16 例。**结果** 27 例腹内疝包括肠粘连束带疝 13 例，右侧十二指肠旁疝 4 例，盆腔内疝 3 例，乙状结肠周围疝 2 例，盲肠周围疝 2 例，左结肠系膜裂孔疝 1 例，经肠系膜疝 1 例，吻合口后方疝 1 例，疝内容物均为小肠及其系膜。13 例肠粘连束带疝包括 7 例术后小肠粘连、小肠系膜粘连、小肠与腹壁粘连、大网膜与小肠及回盲部肠系膜粘连和 6 例无手术小肠系膜粘连、空肠与大网膜粘连、升结肠系膜与侧腹壁粘连、胆囊与结肠粘连、大网膜及小肠与回盲部肠系膜粘连束带疝。3 例盆腔内疝均为 Douglas 疝，其中 2 例有子宫肌瘤手术史。CT 表现为小肠形态异常，小肠管移位，扩张积液小肠袢呈肿块状、囊袋状、簇状聚集、扇状排列，小肠系膜血管增粗、曲张、牵拉、移位，肠系膜皱缩呈条状，血管纠集及皱缩条状肠系膜向疝口部位集中形成缆绳征 18 例，疝口呈鸟嘴征 19 例，小肠壁水肿增厚 11 例，部分见粘连束带。合并闭襻性小肠梗阻 17 例，近端小肠梗阻 13 例，小肠扭转 3 例。腹盆腔积液 13 例，盆腔积液 7 例。CT 随访检查中 8 例闭襻性小肠梗阻或近端小肠梗阻加重，4 例减轻，4 例无明显变化。**结论** 多层螺旋 CT 多平面重建能较准确地诊断腹内疝，并可进行分型，不但能清晰地了解肠袢位置变化，同时可以了解肠系膜血管情况及肠壁血供情况，为临床诊断和手术治疗提供了可靠依据，已成为目前腹内疝诊断及分型的首选检查手段。

DIXON 水脂分离联合 T2mapping 技术评价杜氏肌营养不良儿童骨骼肌炎性水肿的应用价值

伏川,李学胜,许华燕,郭应坤,陈锡健
四川大学华西第二医院

目的：杜氏肌营养不良（Duchenne Muscular dystrophy, DMD）是一种常见的 X 连锁隐性遗传性疾病，因肌营养不良蛋白（Dystrophin）基因突变或缺失，导致渐进性肌肉变性、最终纤维化及脂肪

替代等病理改变。本研究旨在应用 DIXON 水脂分离联合 T2mapping 技术量化评价 DMD 儿童骨骼肌炎性水肿情况，分析两种技术的对骨骼肌水肿的诊断价值。
材料及方法：纳入标准为临床基因测定诊断为 DMD，所有患者均进行臀部肌肉 MRI 检查，包括 DIXON 水脂分离序列及 T2mapping 序列。选取臀部肌肉作为目标测量肌肉，采用 DIXON 水脂肪分离图中的水图对所有患者的炎性水肿及脂肪变程度进行评分（评分标准：轻度为 1 分、中度为 2 分、重度为 3 分）；采用 T2mapping 技术量化对应区域肌肉的 T2 值。
结果：通过 DIXON 水脂分离序列中生成的水图发现，20 例患者中，8 例（40%）患者水肿评分为 1 级，10 例（50%）患者水肿评分为 3 级，仅 2 例（10%）患者水肿评分为 2 级；评价脂肪图发现，脂肪替代达 1 级患者共 12 例（60%） 达 2 级患者共 5 例（25%） 达 3 级患者共 3 例（15%）。通过双变量相关性分析发现，患者 T2mapping 测量所得的 T2 值与 DIXON 水肿评分成正相关（r=0.652，p=0.002）,与脂肪替代程度评分成负相关（r=-0.514，0.020）。同时水肿评分 3 级患者其 T2 值明显高于水肿评分为 1 组患者（32.95ms vs.23.92ms，p=0.001）。
结论：DIXON 水脂分离序列可以分别成水像及脂肪像，其生成的水图脂肪信号，使水肿信号更为突出，能初步评价 DMD 骨骼肌的水肿情况，但其量化价值有限。T2mapping 技术可量化骨骼肌信号，其信号值与 DIXON 水脂肪分离技术所得水图的水肿评分有较好的一致性。

EPO-1595
儿童四肢长骨郎格汉斯组织细胞增生症的影像诊断

吴主强,丁山
江西省儿童医院

目的：探讨儿童四肢长骨郎格汉斯细胞组织细胞增生症（LCH）的影像表现及病理特点，提高影像诊断水平。方法：方法回顾性分析 19 例经手术及病理证实的四肢长骨 LCH 患儿临床及影像资料。本组 19 例行 X 线及 CT 检查，5 例行 MR 检查，对其影像特征进行分析。结果：本组均为单发病灶，其中股骨 9 例、胫骨 4 例、肱骨 4 例、腓骨 1 例、尺骨 1 例。X 线及 CT 检查病灶表现为溶骨性、虫蚀样或膨胀性骨质破坏，骨膜反应常见；CT 及 MR 显示周围软组织肿胀常见，未见软组织肿块。结论：四肢长骨 LCH 好发于长骨骨干及干骺端，表现为溶骨性、虫蚀样或膨胀性骨质破坏伴软组织肿胀，发病部位及影像征象具有一定特点，但与恶性骨肿瘤等鉴别仍有一定难度。综合 X 线、CT 及 MR 表现能提高本病的术前诊断率，并为评估预后提供重要依据。

EPO-1596
SAPHO 综合征临床及影像学表现

宋修峰
青岛市妇女儿童医院

【目的】提高对 SAPHO 综合征临床及影像学表现的认识。
【材料和方法】对我院一例 13 岁男性 SAPHO 综合征患者个案报道并文献复习。
【结果】患者右上臂及右膝关节疼痛 1 周，发热 2 天。8 月前面部、后颈部反复出现少量痤疮。2 月前痤疮大量增多，分布于颈部、前胸及后背，皮疹顶端有脓点、脓疱。血常规示血象略高，C 反应蛋白增高，血沉增快。MRI 显示右肩关节、右膝关节滑膜炎并积液，右肱骨、右胫骨、右腓骨骨髓炎。CT 显示右侧锁骨近端骨质破坏，胸锁关节破坏。
滑膜炎(synovitis)、痤疮(acne)、脓疱病(pustulosis)、骨肥厚(hyperostosis)和骨髓炎(osteomyelitis)综合症简称 SAPHO 综合征，是主要累及皮肤骨和关节的一种慢性疾病，其病因和

发病机制研究尚不明确。发病年龄以青年和中年多发，发病年龄最小 10 岁，最大 59 岁。女性报道稍多于男性。影像学表现：CT 及 MRI 对本病滑膜炎和骨炎的早期诊断有很大意义。90%的患者出现骨关节病，可累及中轴骨及外周骨，主要表现为滑膜炎、骨肥厚和骨炎。骨炎常累及骨皮质、骨髓腔或者同时累及两者，但是典型病变是累及胸骨上端，锁骨内端及第一对肋软骨的骨质硬化和骨肥厚。胸骨为 62%，其次为骶髂关节(33%)，脊柱(24%)，周围骨(19%)，周围关节(10%)；81%的病人有两处以上病变，同时可伴有关节周围炎症。52%～66%的病人有掌跖脓皮病，14%～15%的病人有痤疮，9%～24%的病人有银屑病。皮肤病变可发生在骨关节病之前或之后。本病预后良好。本病进展缓慢，无明显的致残性，无严重的并发症发生。大部分病例为自限性，疾病平均持续时间约 4-5 年。

【结论】SAPHO 综合征临床及影像表现典型，了解此病多数可做出正确的诊断。

EPO-1597

Value of both Tumor and Peritumoral MR Parameters in Osteosarcoma Patients for Monitoring Chemotherapy Response

yuewen hao[1],Hong Yin[2]
1.Department of Radiology, Xi'an Children's Hospital
2.Department of Radiology, Xijing Hospital, Fourth Military Medical University

Purpose: To evaluate the diffusion weighted imaging (DWI) and dynamic contrast-enhanced MRI (DCE-MRI) as early imaging indicators of tumor histologic response to preoperative neoadjuvant chemotherapy and as probable prognostic factors for event-free survival (EFS) and overall survival in osteosarcoma (OS) with the region of both tumor and peritumoral area.
Materials and Methods: Thirty-four osteosarcoma patients received three courses of neoadjuvant chemotherapy followed by surgery during 2014-2018 were enrolled in this study. All patients underwent baseline and post-chemotherapy diffusion-weighted and dynamic contrast-enhanced MRI to monitor the response to preoperative neoadjuvant chemotherapy. Lesion region was defined as tumor area and peritumoral area (periphery within 2cm) and delineated in the workstation. Parameters of ADC, Ktrans, Kep, Ve and IAUC as well as corresponding differences (ΔADC, ΔKtrans, ΔKep, ΔVe and ΔIAUC) between pre- and post- chemotherapy in both tumor and peritumoral area were evaluated. Receiver operating characteristic analysis was used to evaluate the diagnostic performance of these parameters. The associations of all parameters with tumor histologic response, EFS, and overall survival were also calculated.
Results: Ktrans and ADC were significantly decreased in responders and non-responders post-chemotherapy in both area. ΔKtrans and ΔADC were significantly difference between groups in both area. Lower post-Ktrans in tumor area and lower pre-Ve in peritumoral area significant prognosticate for longer EFS (P=0.002, P=0.026) and overall survival (P=0.003, P=0.023).
Conclusion: In osteosarcoma, DW- and DCE-MRI parameters in both tumor and peritumoral area can well reflect chemotherapy response and prognosticate EFS and overall survival.

EPO-1598

64 排螺旋 CT 对儿童骨骺损伤的诊断价值

黎耀文,干芸根,郑小丽,徐淑敏
深圳市儿童医院

目的：探讨 64 排螺旋 CT 在儿童骨骺损伤的诊断价值。材料和方法：回顾性分析 2016-2019 年 981 例因关节损伤在我院检查的儿童骨关节 CT 片，使用 GE 64 排螺旋 CT 扫描，轴位扫描，扫描后重建图像为层厚 0.625mm，层间距 0mm，于 GE 工作站行多平面重建及 SSD，调整窗宽窗位，清晰显示骨骺的骺软骨及骺板。所有患者均治疗后 X 线平片随访。79 例行 MRI 检查。343 例行切开钢针固定手术并术后石膏固定，638 例石膏固定治疗。结果：CT 扫描诊断为骺板损伤 I 型 11 例，II 型 891 例，III 型 41 例，IV 型 33 例，V 型 5 例，多平面重建时窗宽为 210-260，窗位为 30-60，清晰显示骨骺的骺软骨及骺板。X 线平片诊断为无骨折 31 例，骺板损伤 I 型 11 例，II 型 894 例，III 型 6 例，IV 型 34 例，V 型 5 例；将 21 例 II 型骨折误诊为无骨折，1 例 III 型骨折误诊为无骨折， 4 例 III 型骺板损伤误诊为 II 型，3 例 IV 型骨折误诊为无骨折，7 例 IV 型骺板损伤误诊为 II 型。当长骨干骺端有骨片撕脱并有移位时，往往是骺板损伤。MRI 检查可以敏感显示损伤水肿信号及血肿，但细小骨片不易显示。结论：64 排螺旋 CT 可以较为清晰显示 X 线平片无法显影的骺软骨、骺板，能为儿童骨骺损伤的诊断和分型提供较为准确可靠的信息，并能显示 MRI 不易诊断的细小骨片，为临床制定合理有效的治疗方案、判断预后提供客观的而有价值影像依据。

MRI 诊断儿童孟氏骨折骨间膜损伤的临床价值

郭侨阁
郑州市骨科医院

目的 探讨 MRI 检查在诊断儿童新鲜孟氏骨折骨间膜损伤中的临床应用价值。**方法** 2017 年 1 月至 2018 年 1 月，我院接受手术治疗的儿童新鲜孟氏骨折 30 例，其中男 17 例，女 13 例；年龄 4∽13 岁，平均 7.2 岁；左侧 9 例，右侧 21 例；所有患儿术前均进行了 MRI 检查，包括矢状位（T2WI；T2WI+FAT）、冠状位（T1WI;T2WI;T2WI+FAT）、横轴位（T2WI+FAT）。观察并记录儿童孟氏骨折的 MRI 表现及损伤程度，并与手术中表现进行对比分析并统计 MRI 影像诊断符合率。**结果** MRI 检查显示单纯膜部撕裂 23 例，单纯腱部撕裂 7 例，两者均撕裂 9 例，后期经手术证实对于骨间膜连续性中断的诊断符合率达到 95%，经手术治疗所有 7 例腱部撕裂均进行修补，膜部撕裂 9 例进行手术修补；30 例患者均进行了 3∽12 个月的随访，治疗后影响旋后功能的 8 例，愈后未影响生理功能的 22 例。**结论** MRI 检查可以清晰的显示出儿童新鲜孟氏骨折骨间膜损伤的程度及范围，对其临床治疗方案的判断及手术方式的制定具有一定的指导意义。

浅析儿童肘关节隐匿性骨折的 X 线征像

高美荣
天津市儿童医院

摘要

目的 分析儿童肘关节隐匿性骨折的 X 线征像，增强对此病 X 线征像的认识。

方法 回顾性收集 201701-201901 期间因肘关节外伤来我院就诊并首次 X 线平片阴性诊断的 100 例患儿的影像学资料，将随诊确诊为隐匿性骨折的 20 例患儿作为研究组，回顾性分析研究组的 X 线征象。
结果 研究组中脂肪垫征阳性率为 100%，除此之外骨皮质丘状突起/皮质凹陷、骨小梁中断及肱骨前线阳性的检出率也较高。
结论 X 线检查能够发现许多对诊断儿童肘关节隐匿性骨折有参考价值的征象，深入分析各种 X 征象有助于降低隐匿性骨折的漏诊率，提高临床诊断准确性。

Imaging findings of inclusion body fibromatosis with bone destruction:a case report and literature review

Qiuyue Yu,Yulin He
The first affiliated hospital of nanchang university

A 3-year-old boy was admitted to hospital with a markedly enlarged mass on his left foot.A lump on the middle toe of his left foot was found at birth. It was not obvious at that time, and his parents had not paid attention to it. In the last 8 months, the mass increased significantly. After admission, the MRI and X-ray examination of the foot showed that the mass grew around the phalanx and invaded the adjacent phalanx. At the same time, the mass squeezed the toes on both sides, affecting joint activity. Therefore, his parents asked for surgery for him. The postoperative pathological results were inclusion body fibroids. At present, the patients recovered well and no recurrence was found. Here, We report a rare case of Inclusion body fibromatosis with bone invasion..

Foot MRI (Magnetic resonance imaging) showed a lump with a maximum cross-section of about 2.3*3.2*3.3cm in the soft tissue near the third phalanx of the left foot. It showed a hypointense on T1WI and slightly hyperintense on T2WI, and a sheet and strip signal which is isointense to muscle on T2WI was seen inside.Also, the mass showed a non-uniformly hyperintense on the Fat suppression sequence and a unevenly and obvious enhancement on contrast enhanced T1-weighted image.Most of the mass is subcutaneously located on the dorsolateral side of the 3rd phalanx, enclosing the 3rd phalanx of the left foot,the bone of the 3rd toe is invaded ,and the 4th toe is pushed outward (fig.1).Also,The X-ray shows a soft tissue shadow between the 3rd-4th toes of the left foot, and the 4th toe is pushed outward. The proximal bone of the third toe was locally damaged, with slight hardening of the edges (fig.2).

儿童颅锁骨发育不全综合征 3 例并文献复习

杨扬
天津市儿童医院

目的

目的：探讨儿童颅锁骨发育不全综合征的临床表现和 X 线特点，提高对颅锁骨发育不全综合征的认识。

方法
方法：在文献数据库中对颅锁骨发育不全综合征的病例报道进行检索，收集本院近期 3 例颅锁骨发育不全综合征病例资料，利用 X 线检查全面了解患者骨骼发育情况并总结分析。

结果
结果：颅锁骨发育不全综合征是一种累及骨骼和牙齿的常染色体显性遗传性疾病，具有明显的家族聚集性，男女发病率无明显差别。颅锁骨发育不全综合征可以出现牙颌面畸形、锁骨发育不全、锥形胸、跗跖关节外移畸形、耻骨联合增宽等是诊断颅锁骨发育不全综合征的主要 X 线特征，骨盆畸形、掌指及跖趾关节的畸形是诊断该病重要的辅助 X 线特征。本组 3 例病例均存在上述表现。

结论
结论：颅锁骨发育不全综合征存在特征性临床及影像学表现，通过详细的临床资料采集，不难对本病作出早期诊断。

儿童骨龄评价—《中国人手腕骨发育标准-中华 05》及其应用

蒋盛平
玉林市第一人民医院

骨龄是一种生物年龄，是生长发育的重要参数。骨龄评价可确定发育年龄、预测身高、预防生长迟缓，是性早熟的重要诊断依据，同时在司法鉴定中有重要作用。本文初步介绍《中国人手腕骨发育标准-中华 05》，并通过实例着重介绍 RUS－CHN 法计算儿童骨龄具体操作过程及应用。

EPO-1604
儿童钙化性椎间盘炎的影像学诊断

宋修峰
青岛市妇女儿童医院

【目的】提高对儿童钙化性椎间盘炎临床及影像学表现的认识。
【方法】总结我院确诊的儿童钙化性椎间盘炎 4 例并文献复习。
【结果】儿童钙化性椎间盘病是一种罕见的综合征。1858 年 Luschka 第一次提及。本病可以发生在从新生儿到青春期，但其发病高峰为 6～10 岁，无性别差异。全身症状有颈部疼痛、活动乏力、发热和乏力等。病变有自愈性，症状体征在短期内能很快减轻或消失
影像学表现：多发生在颈椎，以单个椎间盘发病为主 ，偶有多椎间盘钙化发生，X 线表现为椎间盘钙化，髓核脱出，椎体改变和曲度失常。椎间盘钙化可表现为团块状、盘状、碎裂状，团块状髓核钙化代表髓核整体钙化，盘状钙化表示髓核钙化并被压扁，碎裂状钙化可能是团块状钙化灶处于吸收、消散期改变，也可能为髓核破裂。髓核可脱出或移位，向后脱出可表现神经系统压迫症状。向前脱出一般无明显症状，严重者可表现为食管吞咽异常。椎体形态异常，椎体的改变主要为:椎

体变扁、楔状改变，椎体缘尖刺样改变，严重者呈“口钳征”， 椎间隙一般无明显改变。患者随访观察，钙化一般在 3～6 个月内消失，最短的为 2 周，最长则有 11 年的报道。
鉴别诊断：本病有自限性，时间对于本病的诊断与鉴别诊断有重要意义。如果在诊断上有疑虑，通过密切观察，定期复查 x 线片都可以得到确诊。需要鉴别的疾病主要有：颈椎结核，椎间盘的感染或创伤。二者症状体征可类似钙化性椎间盘炎，但均无椎间盘钙化。
临床治疗上，主要采取保守治疗，本病有自愈性，症状可很快缓解，一般只需对症处理。对有神经压迫症状的患者，经保守治疗不缓解或有进行性加重的脊髓压迫症状者应进行手术治疗。
【结论】钙化性椎间盘炎的临床及影像学表现具有特征性，随访可自愈，因此认识此病对临床治疗具有重要意义。

儿童胸腔骨外尤文氏肉瘤一例

盛茂,冯洁
苏州大学附属儿童医院

病例：患者女性，7 岁 2 月，因“咳嗽十天，伴发热”入院。入院查体：右肺呼吸音粗，左肺呼吸音明显低，肋骨无压痛，右肺叩诊清音，左肺叩诊浊音，心律齐，心音有力，心界偏右。胸片检查：左白肺改变，炎症伴胸腔积液。B 超提示：左侧胸腔内稍高回声团，占位考虑。CT 检查：左侧纵隔及左侧胸腔可见巨大软组织肿块影，呈多个大小不等的团状及分叶状改变，其边界欠清晰，其内可见砂砾样高密度影，增强扫描可见明显不均匀强化，肿块内见多出杂乱迂曲肿瘤血管影，纵隔结构明显受压右偏，左侧支气管受压变窄，左侧第 3 肋骨骨质密度不均匀，部分呈虫蚀样破坏。右肺可见多发大小不等的结节影及团状高密度影。左侧胸膜腔可见较多液体密度影。两侧锁骨上窝可见多发小淋巴结影。病理检查肉眼：质地软、切面灰白、实性。镜下：成片的肿瘤细胞增生浸润、细胞形态较一致，呈圆形或卵圆形，伴灶性坏死。免疫组化：KI67(60%+),INI1(+),WT1(-),BCOR(+),NKX2.2(+),NTRK(弱+)，DES(-),AE1/3(-)。病理诊断:（左胸腔）骨外尤文氏肉瘤/外周原始神经外胚层瘤（E-EWS/pPNET）。
讨论：骨外尤文氏肉瘤是一种罕见的肿瘤，通常见于骨盆、躯干和四肢。Tefft 等人于 1969 年首次报道了 4 例骨外尤氏肉瘤。其形态学上与骨尤文氏肉瘤相似，病理组织化学染色为小而圆形的蓝色细胞，细胞核深染，免疫组织化学染色 CD99 阳性。临床上早期症状不典型，后期常表现为软组织肿块伴疼痛。转移最常见通过血液转移至肺。影像学表现：超声显示，轮廓清晰的低回声肿块及肿块内的血流信号；CT 表现为与肌肉密度相似的肿块影，密度欠均匀；MRI：T1 加权图像上常表现为低至中等信号强度的肿块，在 T2 加权图像上表现为高信号强度的肿块，并伴有不均一增强。骨外尤文氏肉瘤的影像学表现与其他的小圆形恶性肿瘤难以鉴别，确诊多依赖于病理学和免疫组化检查。

EPO-1606

X 线测量在在脑瘫患儿继发髋关节发育不良中治疗评价中的应用

张同贞
郑州大学第三附属医院

目的　通过对 20 名脑瘫患儿继发髋关节发育不良治疗前后的观察，评估 X 线测量治疗中评估的应用价值。方法 通过对 2012.6-2018.6 于我院治疗的 1-3 岁 20 名继发性儿髋关节发育不良采用家庭髋关节姿势管理治疗前后观察，行骨盆正位片检查，测量治疗 6 月、12 月、18 月、24 月的颈干角（ NSA)、髋臼指数（AI）及股骨头偏移百分比(MP)，并进行步行功能评估采用粗大运动功能量表（GMFM）的 E 区评定，平衡能力评估采用 Berg 平衡功能量表（BBS）评定。结果 颈干角(NSA)、

髋臼指数（AI）及股骨头偏移百分比(MP)逐渐减低；治疗 6 月、治疗 12 月 差异无统计学意义（P>0.05）。治疗 18 月、治疗 24 月差异有统计学意义（P<0.05）；颈干角(NSA)、股骨头偏移百分比(MP)与粗大运动功能量表（GMFM）、Berg 平衡功能量表（BBS）呈负向相关，差异有统计学意义 （P＜0.05）。髋臼指数（AI）与粗大运动功能量表（GMFM）、Berg 平衡功能量表（BBS）呈负向相关，差异无统计学意义 （P>0.05）结论 X 线测量在治疗评价中具有良好的应用价值，通过骨盆正位片评估发育髋臼发育情况 ,对临床制定进一步治疗方案、指导手术有着重要作用。

EPO-1607

AI 骨龄评价（以 TW 法为基础）的临床应用

宁刚
四川大学华西第二医院

比较研究五种骨龄测定方法——CHN 法、TW2 法中英日三种标准和 TW3 法骨龄（skeletal age, SA）对中枢性性早熟患儿的诊断价值。CHN 法 ROC 曲线下面积 A_{CHN}为 0.919±0.024，TW_2法英国人标准 A_{TW2}为 0.931±0.022，TW_2法中国南方人标准 $A_{TW2\text{-}CHN}$为 0.945±0.019，TW_2法日本人标准 $A_{TW2\text{-}JP}$为 0.936±0.023，TW_3骨龄测定法 A_{TW3}为 0.926±0.023。 五种方法的诊断价值没有统计学差异（u=0.85，P<0.2）。表明五种骨龄测定方法对于中枢性性早熟患儿的诊断价值都较高；而 TW_2法中国南方人标准（TW2-CHN）的诊断价值最高。
我们以 TW2 中国南方人标准、TW3 两种诊断标准为基础，利用 U-NET 卷积神经网络结合传统图像处理的算法对原始 DICOM 数据进行预处理，包括图像灰度值归一化、手骨区域图像分割、正位校正、大小匹配等，以减少图像采集过程中差异性对图像识别的干扰；然后，利用基于区域的卷积神经网络（region-based convolutional neural network, R-CNN）对手腕部骨龄片中 13 块桡尺骨、掌指骨，以及 7 块腕骨进行了骨骺位置及骨化中心的识别定位；用类似 VGG CNN 的深度网络分类回归算法进行 9 个级别的骨龄自动评级（A-I），将骨龄分级转换成相应的分值并最终换算成骨龄（TW2-20 骨、TW2-13 骨、TW2-7 骨、TW3-13 骨及 TW3-7 骨骨龄）。同时建立骨龄大数据平台系统，每一个患儿自动生成个人电子档案、纳入样本数据库，并自动生成骨龄报告并支持自助打印。

LCH 累及多器官的影像学表现

张增俊,侯欣,陈超,王冬,张雷,王小飞,张雅,白慧萍
西安市儿童医院

目的 探讨朗格汉斯细胞组织细胞增生症(Langerhans cell histiocytosis, LCH）累及多器官的影像学表现及鉴别诊断, 提高对本病认识。 方法 我们复习 59 例经组织病理学免疫组化证实朗格汉斯细胞组织细胞增生症的影像学及临床资料。结果 59 例中，15 例为孤立性骨病变, 23 例为多灶性骨病变，主要表现为溶骨性骨质破坏，病变一般境界清楚，6 例出现骨膜反应。其中 23 例可见软组织肿块；术前诊断为骨肿瘤 5 例, 炎症或其他良性病变 4 例。59 例中有 21 例进行了手术治疗，38 例穿刺活检。侵犯实质脏器的主要影像多发密度软组织肿块或结节, 因部位不同形态各异。本病的病因尚未明确，可累及全身多个器官 , 包括骨、肺、肝、脾、垂体、皮肤 、黏膜以及淋巴组织。临床表现取决于单器官或多器官以及受累的程度，当单器官受累时常常需要与肿瘤、炎症及结核等病变鉴别。 结论 朗格汉斯细胞组织细胞增生症，结合临床特点及影像表现能准确显示病变范围及邻近的组织病变，且结合临床基本作出诊断。

磁共振测量声门下环状软骨水平最狭窄处气道数值用于小儿无囊气管导管选择的临床效果

李海燕,马晓文,宋晓彬
西安市红会医院

目的 探讨磁共振测量声门下环状软骨水平最狭窄处气道前后径、左右径及面积用于小儿无囊气管导管选择的临床效果。
方法 测量 120 例 0～12 岁患儿颈椎磁共振声门下环状软骨水平最狭窄处气道前后径、左右径及面积，其中行手术需气管插管的 1～11 岁患儿 59 例，通过磁共振测量选择气管导管(磁共振声测量法)；插管后视临床实际情况决定是否更换导管，至临床插管成功(临床最适)；同时应用年龄公式法计算每位患儿的气管型号，以插管成功导管型号为标准，对磁共振测量法与年龄公式法选择导管的准确率进行统计学分析。
结果 120 例患儿，其中女患儿 54 例，男患儿 66 例，男患儿声门下环状软骨水平最狭窄处气道前后径：5.76mm～13.94mm，左右径：5.30mm～12.32mm，面积：21.80mm^2～120.71mm^2；女患儿声门下环状软骨水平最狭窄处气道前后径：5.95mm～15.83mm，左右径：5.25mm～16.33mm，面积：21.80mm^2～173.8mm^2；男女患儿各径线差异无统计学意义（P>0.05）。90%患儿左右径小于前后径，差异有统计学意义（P<0.05）。120 例患儿中 59 例行手术需气管插管，其中女患儿 32 例，男患儿 27 例，声门下环状软骨水平最狭窄处气道前后径：5.95mm～13.69mm，左右径：5.25mm～10.82mm，面积：20.69mm^2～127.62mm^2。磁共振测量法和年龄公式法的准确率分别为 96％和 64％，差异有统计学意义(P＜0.05)。
结论 根据磁共振测量声门下环状软骨水平气道数值选择小儿无囊气管导管优于根据年龄选择。

EPO-1610
3.0TMR 在先天性尺桡骨融合治疗前后的指导意义

闫丽红,赵鑫,董彦昭
郑州大学第三附属医院

目的：探讨并研究 3.0TMR 在先天性尺桡骨融合治疗前后的作用。
方法：收集 2016 年 5 月 25 日至 2019 年 7 月 14 日在我院就诊的先天性尺桡骨融合的病例 33 例 45 侧，年龄分布自 6 月至 16 岁，平均 3.3 岁，其中女 11 例，男 22 例，其中 13 例 20 侧经我院手术治疗，余 25 侧保守治疗，并选取 20 侧先天性尺桡骨患儿健康对侧和因前臂皮肤血管瘤而就诊的患儿作为对照组，分为三组，手术组，保守治疗组，健康组，分析治疗前后的肘关节 MR 图像，通过测量 3D-PD 像上每层图像旋前圆肌、旋后肌的肌肉的面积，计算其体积；对手术组及保守治疗组进行跟踪随访 1.5 年到 3 年，并比较治疗前后的差异，以及三组之间的差异，采用 t 检验和 q 检验分别对两组之间以及组间进行比较，P<0.05 为差异有统计学意义。
结果：1.先天性尺桡骨融合的患儿的旋前圆肌、旋后肌的体积与相同年龄对照组相比，P<0.05，差异具有统计学意义。2.手术组中两例术后发生再融合，一例发生缺血性肌筋膜室综合征。3.比较治疗前后，旋前圆肌、旋后肌体积增加比例：手术组>保守治疗组>健康对照组（P<0.05），差异具有统计学意义。

结论：本院先天性尺桡骨截骨术可明显改善患儿前臂旋前功能，但手术有一定的风险，前臂保守治疗在一定程度上也能改善患儿的肘关节功能，MR 在指导先天性尺桡骨融合病变的治疗中有重要意义。

EPO-1611
儿童郎格罕细胞组织细胞增生症的影像学表现

张小安,陆林,赵鑫
郑州大学第三附属医院

目的：回顾性分析郎格罕细胞组织细胞增生症(LCH)的影像学表现特点,做到早期、准确诊断,以提高临床治愈率。
方法：收集 2017 年 1 月至 2018 年 12 月郑州大学第三附属医院收入院的 32 例 LCH 患儿临床资料，总结其影像学检查结果。32 例中年龄最小患者 1 个月,年龄最大患者 15 岁 3 月,32 例患儿中男性患儿 18 例,女性患儿 13 例。32 例患者中，夏季发略高于其他季节。临床表现主要为发热、皮疹、肝脾和/或淋巴结肿大、贫血、耳溢、突眼、尿崩、骨骼表现、腹泻等；28 例胸部影像学（平片+CT）检查，异常 23 例，骨影像学检查（平片+CT+MRI）30 例，异常 26 例，多个部位骨损害比单个部位骨损害多见，10 例腹部检查，3 例异常。
结果：1、胸部影像学检查 28 例,23 例异常,主要为两肺中上野较对称分布的多发小结节影，部分可见囊泡影，晚期可见反复气胸出现；
骨影像学检查 30 例(头颅骨 28 例、躯干骨 23 例、四肢骨 23 例、骨盆骨 15 例),30 例有骨质破坏，多为溶骨性骨质破坏，多个部位骨损害比单个部位骨损害多见。骨质破坏常见部位依次为颅骨、股骨、椎体、肋骨、髂骨、肱骨。蝶鞍破坏 4 例(2 例有尿崩、2 例无尿崩)。垂体 CT 或 MRI 检查 10 例,垂体影像学异常 5 例(2 例有尿崩,3 例无尿崩)。肝脾肿大患儿中有 3 例腹部 CT 检查可见多发结节影，增强扫描轻度强化。
结论：儿童郎格罕细胞组织细胞增生症可累及多个脏器,表现多样，影像学检查结合临床有助于本病的早期诊断。

EPO-1612
儿童肱骨上段骨肿瘤临床特点与影像学分析

李海燕,马晓文
西安交通大学附属红会医院

目的　分析儿童肱骨上段骨肿瘤的临床特征及影像学表现，以提高对该部位骨肿瘤的认知及疾病诊断水平。
方法　回顾 2010 年至 2018 年本院收治的经病理证实的 63 例肱骨上段骨肿瘤。总结分析患儿的年龄、性别、病理类型及影像学表现。两名放射科诊断医师分别对 DR、CT、MRI 诊断骨肿瘤的价值进行评价。
结果　发病年龄 1～18 岁，平均 10.81 岁，最高发病年龄集中于 6～16 岁组之间。男 42 例，女 21 例，男女比为 2:1。其中，动脉瘤样骨囊肿 20 例，纤维结构不良 12 例，单纯骨囊肿 11 例，朗格汉斯细胞组织细胞增多症 5 例，骨软骨瘤 4 例，骨肉瘤 4 例，软骨母细胞瘤 2 例，非骨化性纤维瘤 2 例，内生软骨瘤 2 例，纤维黄色瘤 1 例。良性骨肿瘤 32 例，占 50.79%，常见病种是纤维结构不良、单纯骨囊肿；中间型骨肿瘤 27 例，占 42.86%，常见病种是动脉瘤样骨囊肿、朗格汉斯细胞组织细胞增多症；恶性骨肿瘤 4 例，占 6.35%，全部是骨肉瘤；朗格汉斯细胞组织细胞增多症患儿年

龄较小，平均发病年龄为 7.60 (2～12)岁，肱骨上段肿瘤以未明确肿瘤性质的肿瘤为主，占 76.19%。排在前三位的动脉瘤样骨囊肿、纤维结构不良和单纯骨囊肿共计 43 例，占 68.25%。动脉瘤样骨囊肿：轻度膨胀性骨质破坏，病灶内可有骨嵴或分隔，“液-液平面”为特征性表现。纤维结构不良：典型表现为磨玻璃样及丝瓜瓤状骨质破坏，常有硬化边。单纯骨囊肿：病灶边界清楚，可无硬化边或细薄硬化边，其中液性成分有助于诊断。其中，骨肿瘤诊断符合率 CT 及 MRI 高于 DR ($P<0.05$)，良性、中间型骨肿瘤诊断符合率 CT 高于 MRI，CT 和 MRI 两者没有统计学意义 ($P>0.05$)。

结论　儿童肱骨上段骨肿瘤发病年龄集中于 6～16 岁，绝大多数为良性及中间型骨肿瘤，以未明确肿瘤性质的肿瘤为主，发病率前三位分别是动脉瘤样骨囊肿、纤维结构不良和单纯骨囊肿。儿童肱骨上段骨肿瘤诊断符合率 CT 检查最高。

EPO-1613

儿童钙化上皮瘤的影像学诊断

吴于淳,杨秀军
上海市儿童医院 、上海交通大学附属儿童医院

目的：总结分析儿童钙化上皮瘤的影像学特点，提高诊断水平，减少误诊。

方法：2012-2019 年经手术病理证实的钙化上皮瘤 128 例，其中男 75 例，女 53 例，年龄 3 月-15 岁，中位数 5 岁。回顾性分析其影像学（122 例 CT，其中平扫 28 例，增强 94 例；8 例 MR，其中平扫 7 例，增强 1 例）表现，包括肿瘤钙化、轮廓、增强后改变、瘤周皮下脂肪（间隙）及局部皮肤改变等，并据此总结其影像学特征性改变。

结果：128 病例中，单病灶 119 例，2 病灶 7 例，3 病灶 2 例，共 139 个病灶，CT、MRI 上病变均（100%）表现为轮廓清晰的真表内软组织密度/信号结节或肿块影，增强后无强化 16 例（16.8%），轻度非均质强化 49 例（50.5%），中度度非均质强化 30 例（31.6%）。瘤内钙化表现为：弥漫砂砾样浅淡钙化 71 例（51.1%）、散在斑点状浅淡钙化 42 例（30.2%）、斑块状/结节样浓钙化 25 例（18.0%）和无钙化 1 例（0.01%）。0.625mm 或 0.5mm 层厚的薄层图像软组织窗或中间窗显示钙化特征佳，骨窗能清晰显示浓钙化斑块但浅淡钙化几无显示。肿块向皮下或同时（病变巨大时）向皮肤表面突出，前者呈“吸顶灯征”、后者呈“戴帽征”表现，均出现“皮下脂肪间隙撑宽征”，部分病灶毗邻皮肤增厚并呈“皮肤尾征”改变。

结论：儿童钙化上皮瘤在 CT、MRI 上多为轮廓清晰、呈软组织“硬”结节影，具有 “吸顶灯征”、“戴帽征”、“皮下脂肪间隙撑宽征”、“皮肤尾征”等特征性表现；瘤内钙化常见为多发砂砾样钙化、散在斑点状浅淡钙化和斑块状/结节样浓钙化，钙化显示以 1mm 以内薄层图像为佳，软组织窗或中间窗显示为主；增强扫描后大部分病灶有轻-中度非均质强化。其特征性影像表现有助于其术前正确诊断，为临床早期诊断、及时治疗提供有益帮助。

EPO-1614

儿童进行性骨化性肌炎影像诊断及临床特征

于啸,张欣贤,辛涛
徐州市儿童医院

目的：探讨儿童进行性骨化性肌炎（MOP）的影像诊断及临床特征。

方法：通过 1 例进行性骨化性肌炎病例报告并复习相关文献, 总结该病临床特点及影像学表现。

结果：本病多在儿童期出现，临床表现以先天性拇趾(指)畸形（双侧对称性踇趾短小外翻、手指弯曲畸形）、全身进行性软组织内异位骨化为特点。骨化出现具有一定规律：从上到下；从背部到腹侧；从近端到远端(躯干首发，四肢远端受累较晚)，
MRI 能早期发现异位骨化前软组织肿胀及其内信号异常，CT 可发现相关部位软组织内的骨化及软组织肿胀,在病变急性期后 X 线可整体反映病变部位、形态及钙化情况。
结论：对于小儿发现先天性拇趾(指)畸形，存在进行性全身软组织包块，影像学检查提示多中心进行性异位骨化，应考虑到本病可能，且一旦确诊，应避免一切穿刺创伤及医源性损伤，防止继发感染，加重病情。

EPO-1615

探讨儿童罕见部位动脉瘤样骨囊肿的影像学特点

周志鹏
广州市妇女儿童医疗中心

回顾性分析 1 例位于斜坡，1 例位于下颌骨，经手术病理证实的动脉瘤样骨囊肿患者为研究对象，2 例患者均施行 CT 及 MRI 扫描检查。结果：斜坡及下颌骨 CT 显示囊内骨性间隔及囊状膨胀性骨质破坏；MRI T2WI 示病灶内信号不均呈海绵状液性信号并见液-液平。结论：儿童罕见部位动脉瘤样骨囊肿患者 CT、MR 影像学表现都具有特征性的， CT、MRI 从不同的角度反映动脉瘤样骨囊肿的影像学表现，二者结合可显著提升动脉瘤样骨囊肿的术前诊断率。

儿童跟距联合症及时手术治疗与影像表现

牛亮
河南省滑县骨科医院

摘要：
目的：探讨儿童疼痛性跟距联合症及时手术的必要性与影像表现。
方法：初步选定 X 线平片（侧轴位）、CT 平扫（3D 重建+MPR）进行检查。
结果：跟距联合局限于距跟后关节面，影像表现为；CT 断层所示关节面不光整，跟距关节间隙变窄，有明显骨赘表现、骨桥连接。临床表现疼痛、痉挛、距下关节僵硬、活动受限，时常出现足或踝部损伤，这些症状通常定于距下关节，并随活动量增加而加重，甚至有些病例会导致畸形改变。在我手术切除治疗后随访，影像表现跟距关节面光整、距下关节间隙可，恢复正常解剖功能。临床症状消失，日常活动不受限制。
结论：儿童跟距联合症及时手术治疗可以获得满意的临床治疗效果。

EPO-1617

儿童脂肪母细胞瘤的磁共振表现

孙惠苗
山西省儿童医院/山西省妇幼保健院

【摘要】**目的：**探讨儿童脂肪母细胞瘤的磁共振表现特点 **方法：** 回顾性分析 14 例脂肪母细胞瘤患儿磁共振表现，男 7 例，女 7 例，年龄范围为 2 月-7 岁，平均 1 岁 6 个月。所有患儿行磁共振平扫，其中 8 例患儿同时行磁共振增强检查，探讨该病发病部位，肿瘤形态、边界、信号及强化特点，其中臀部、肩部、骶尾部、背部、上臂、胸壁、腰背部、右内踝各 1 例，腋下及右小腿、右大腿各 2 例。所有病例均有完整临床资料、磁共振检查图像，手术及病理证实为脂肪母细胞瘤。 **结果：**磁共振表现：分为局限型及弥漫型，病灶多不规则，以脂肪信号为主，T1WI 呈高信号 可稍低于皮下脂肪组织，T2WI 呈中高信号，而脂肪抑制序列呈低信号，脂肪信号被抑制。病灶内可见粗细及多少不等间隔 呈线条状或网格状，部分病例含结节状或团块状软组织信号影，增强扫描瘤体分隔呈轻度不均匀性强化。与局限型相比较，弥漫型肿块较大、形态不规则、边界不清、术后复发率高。部分病例无特征性改变。本组病理 13 例表现为局限型，1 例表现为弥漫型。局限型手术完整切除，随访未见明显复发。1 例弥漫型病变位于肩部，瘤体较大，边缘不规整，与周围肌肉及肩胛骨紧密相连，术中见肩胛骨破坏，术后复发。**结论：** 脂肪母细胞瘤患儿磁共振表现有一定特征性，有助于脂肪母细胞瘤术前诊断、术前评估及预后的判断。

EPO-1618

Assessing cerebral white matter microstructure in children with congenital sensorineural hearing loss: a tract-based spatial statistics study

Muliang Jiang[1,2], Zuguang Wen[1], Liling Long[1], Chi Wah Wong[2], Ningrong Ye[2], Chi Shing Zee[3], Bihong T. Chen[2]
1.The first Affiliated Hospital of Guangxi Medical University
2.City of Hope National Medical Center Duarte, United States
3.Keck School of Medicine, University of Southern California Los Angeles, United States

Objectives: To assess the microstructural properties of cerebral white matter in children with congenital sensorineural hearing loss (CSNHL).
Methods: Children (> 4 years of age) with profound CSNHL and healthy controls with normal hearing (the control group) were enrolled and underwent brain MRI scans with diffusion tensor imaging (DTI). DTI parameters including fractional anisotropy, mean diffusivity, axial diffusivity and radial diffusivity were obtained from a whole brain tract-based spatial statistics analysis and were compared between the two groups. In addition, a region of interest approach focusing on auditory cortex, i.e. Heschl's gyrus, using visual cortex, i.e., forceps major as an internal control was performed. Correlations between mean DTI values and age were obtained with the region of interest method.
Results: The study cohort consisted of 23 children with CSHNL (11 boys and 12 girls; mean age±SD: 7.21±2.67 years; range: 4.1–13.5 years) and 18 children in the control group (11 boys and 7 girls; mean age±SD: 10.86±3.56 years; range: 4.5–15.3 years). We found the axial diffusivity values being significantly greater in left anterior thalamic radiation, right corticospinal tract, and corpus callosum in the CSHNL group than in the control group (p<0.05). Significantly higher radial diffusivity values in

the white matter tracts were noted in the CSHNL group as compared to the control group (p<0.05). The fractional anisotropy values in the Heschl's gyrus in the CSNHL group were lower compared to the control group (p=0.0015). There was significant negative correlation between the mean fractional anisotropy values in Heschl's gyrus and age in the CSNHL group < 7 years of age (r=-0.59, p=0.004).

Conclusion: Our study showed higher axial and radial diffusivities in the children affected by CNHNL as compared to the hearing children. We also found lower fractional anisotropy values in the Heschl's gyrus in the CSNHL group. Furthermore, we identified negative correlation between the fractional anisotropy values and age up to 7 years in the children born deaf. Our study findings suggest that myelination and axonal structure may be affected due to acoustic deprivation. This information may help to monitor hearing rehabilitation in the deaf children.

EPO-1619

Application of a 3D pseudocontinuous arterial spin-labeled perfusion MRI scan combined with a postlabeling delay value in the diagnosis of neonatal hypoxic-ischemic encephalopathy

Shilong Tang
Children's Hospital of Chongqing Medical University

Background

Currently, there are many studies on the application of the 3D pseudocontinuous arterial spin-labeled (3D-pcASL) perfusion MRI technique for adult brain examinations, but few studies exist on the application of the technique for child brain examinations.

Objective

To explore the application of a 3D-pcASL perfusion MRI scan combined with postlabeling delay (PLD) for assessing neonatal hypoxic-ischemic encephalopathy (HIE).

Materials and Methods

Two-hundred neonates diagnosed with neonatal HIE were equally divided into five groups (40/group): 0- to <24-hour-old HIE group, 1- to <3-day-old HIE group, 3- to <7-day-old HIE group, 7- to <15-day-old HIE group and 15- to 28-day-old HIE group; 200 healthy neonates were equivalently divided. All 10 groups received a conventional and a 3D-pcASL perfusion MRI scan. For groups <3 days old, PLD values for the 3D-pcASL cerebral perfusion MRI scan were preset at 1025 ms; in all other groups, PLD values were preset at 1525 ms. CBF values for the 3D-pcASL cerebral perfusion MRI were compared between the HIE and corresponding control groups to determine the distinguishing characteristics of CBF values in HIE neonates.

Results

On the 3D-pcASL cerebral perfusion MRI scan, in the 1- to <3-day-old groups, HIE neonate CBF values were higher than those of controls in all brain regions (excluding the frontal lobe); in the 0- to <24-hour-old and 3- to <7-day-old groups, HIE neonate CBF values were lower than those of corresponding controls in all brain regions; in

the 7- to <15-day-old and 15- to 28-day-old groups, there were no significant differences in the CBF values between groups in any brain regions.

Conclusions

The 3D-pcASL perfusion MRI scan combined with a PLD can assist in the early diagnosis of neonatal HIE, as this method more comprehensively reflects the HIE pathological process.

EPO-1620

对比剂分次注射方式在儿童头颈部 CT 动静、脉血管成像中的应用

唐世龙
重庆医科大学附属儿童医院

目的：探讨对比剂分次注射方式对儿童头颈部 CT 动、静脉血管成像图像质量和辐射剂量的影响。**方法：**前瞻性选取 3-4 岁年龄段病情需要做头颈部 CT 动静脉血管成像患儿 100 名，随机分为对照组和研究组，每组 50 名，使用相同的扫描参数和重建方法，右肘正中静脉注射对比剂欧乃派克（350mg I/ml）；对照组为一次性团注未稀释对比剂(剂量为 2ml/kg，上限为 50ml),分别扫描头颈部血管的动、静脉期相；研究组：先团注用生理盐水稀释为 20％浓度对比剂(剂量为 1ml/kg，上限为 25ml)，再团注未稀释对比剂（剂量为 1ml/kg，上限为 25ml），使用阈值触发扫描头颈部动脉期相。对比分析两组患儿头颈部动、静脉血管 CT 图像质量、辐射剂量和对比剂剂量。**结果：**动脉血管 CT 图像质量主观评价：对照组 4 分 46 例，3 分 4 例，研究组 4 分 33 例，3 分 17 例；静脉血管 CT 图像质量主观评价：对照组 4 分 48 例，3 分 2 例，研究组 3 分 47 例，2 分 3 例；两组病例脑部动脉血管强化 CT 值对比，对照组高于研究组，差异有统计学意义（P＜0.05）；静脉血管强化 CT 值对比，对照组高于研究组，差异有统计学意义（P＜0.05）；X 线辐射剂量研究组比对照组低 53％；对比剂剂量研究组比对照组低 45％。**结论：**儿童头颈部增强 CT 检查时先团注稀释浓度为 20％对比剂，再团注未稀释对比剂的注射方式，可一次扫描清晰显示头颈部动、静脉血管，减少 X 线辐射剂量和对比剂剂量，在儿童头颈部疾病增强 CT 检查中具有临床实用价值。

儿童急性坏死性脑病 MRI 诊断

陈静,李欣,王春祥,赵滨
天津市儿童医院

目的 探讨儿童急性坏死性脑病的 MRI 特点，提高对本病影像学表现的认识。**资料与方法** 回顾性分析 14 例急性坏死性脑病患儿的临床资料和颅脑 MRI，其中男性 6 例，女性 8 例，年龄范围 1 岁 8 个月～13 岁，平均年龄 5.8±3.5 岁。患儿均有前驱感染病史，临床表现主要为发热、抽搐、头痛、呕吐、局灶性神经功能障碍、精神差、意识障碍。14 例患儿均行常规 MRI 平扫，5 例扫描磁敏感加权成像 SWI 序列。其中 4 例行增强检查。常规平扫包括轴位 T_1WI、T_2WI、FLAIR、DWI 序列以及矢状位 T_1WI。增强检查为注入造影剂后行轴位 FLAIR 以及轴位、冠状位、矢状位 T_1WI 扫描。14

例中有 11 例患儿进行多次复查。**结果** 14 例患儿常规 MRI 平扫均显示脑实质内多发病变，大多数病变呈对称性分布，主要累及双侧丘脑、脑干、基底节区、侧脑室周围白质区、小脑半球。所有患儿脑实质内病变首次 MRI 平扫表现为 T_1WI 稍低信号，T_2WI 及 FLAIR 高信号，病变边界模糊，其中 12 例于 DWI 序列呈不同程度高信号。1 例患儿脊髓受累，颈胸段脊髓内于 T_2WI 可见稍高信号。14 例中 5 例行 SWI 序列扫描，双侧丘脑区可见斑片状低信号。4 例行 MRI 增强检查患儿中，2 例患儿双侧丘脑对称性病变呈不规则环形强化，余患儿病变部位均未见强化。14 例患儿中有 11 例进行复查，其中 8 例在首次复查中显示双侧丘脑区病变出现 T_1WI 高信号。**结论** 急性坏死性脑病 MRI 表现具有特点，常为多部位受累，且均累及双侧丘脑并呈双侧对称性，随访复查双侧丘脑病变易发生出血。SWI 序列对双侧丘脑病变内出血的显示敏感性优于常规序列。

EPO-1622
基于小波变换的常规 MRI 图像在儿童颅后窝 脑肿瘤分类中的应用

王树杰,杨明 Yang
南京医科大学附属儿童医院

目的 评估基于小波变换的肿瘤全域 T1 加权像(T1WI)、T2 加权像(T2WI)与表观扩散系数(ADC)序列的特征参数对于鉴别儿童颅后窝三种常见脑肿瘤的价值。**方法** 回顾性分析经手术及病理证实的 59 例髓母细胞瘤、13 例室管膜瘤与 27 例星形细胞瘤的术前 MRI 图像，进行不同序列间的配准，获得三个序列感兴趣区的小波特征参数，按照基尼指数排名得到对分类贡献排名前十的特征参数，并利用随机森林分类器进行特征训练和测试，根据分类结果进行对比分析。**结果** 对分类器贡献排名前十的小波特征参数均来自 ADC 序列，随机森林分类器在训练集中达到 100%的准确性，测试集中由排名第一和第三的小波特征构建的模型对三种脑肿瘤鉴别的准确性最优为 0.868，室管膜瘤、髓母细胞瘤和星形细胞瘤三种脑肿瘤的敏感度分别为 1.000，0.948，0.769；特异性分别为 0.976，0.880，0.988。**结论** 基于肿瘤全域 ADC 序列感兴趣区的小波特征能提供更多量化信息特征，可帮助鉴别诊断儿童三种常见颅后窝脑肿瘤。

EPO-1623
儿童癫痫发作间期脑血流量的应用研究

胡文
西安市儿童医院

目的 观察癫痫发作间期患儿脑血流量情况 ,探讨 ASL 在癫痫诊断中的意义
方法 回顾 2017 年 11 月-2018 年 11 月 1-14 岁癫痫患儿，MRI 结果阴性的 63 例，收集 30 例健康儿童作为对照组，应用 GE Discovery 750 3.0T 超导磁共振扫描仪 ASL 技术得到全脑定量脑血流量（CBF）图。记录 CBF 图高灌注和低灌注的脑叶分布情况，分析 CBF 阳性率与癫痫发作类型、脑叶位置有无关联，比较癫痫组 CBF 与脑电图（EEG）的阳性率有无差异。
结果 1.对照组 CBF 两侧对称，皮质 CBF 值略高于白质，而癫痫患者中有 36 例 CBF 出现了高灌注，单侧不对称分布，多位于两叶，高灌注对侧仅 2 例出现低灌注。2.额颞叶的 CBF 阳性率高于顶枕叶，而 CBF 阳性率与癫痫发作形式无关 3. 癫痫患者 CBF 和脑电图的阳性率无显著性差异。

结论 对于 MRI 阴性的癫痫，ASL 可以探及不对称分布的高灌注改变,癫痫患儿脑灌注的变化，对于癫痫的诊断和评估会有重要意义。

EPO-1624

新生儿脑梗塞的病因及影像学表现分析

白娟,徐树明
山西省儿童医院/山西省妇幼保健院

摘要：目的：探讨新生儿脑梗塞的病因、临床表现及影像学特点；**方法**：回顾性分析山西省儿童医院 2016 年 1 月至 2018 年 10 月间经临床及磁共振检查确诊为脑梗塞的 17 例住院患者的临床及影像学资料。其中男性 8 例，女性 9 例，日龄：7 小时-19 天，平均日龄 5.606 天，其中足月 15 例，早产 2 例；Apgar 评分 10 分 4 例，＜10 分 1 例，不详 12 例；分娩史异常者 3 例（胎动减少 1，难产 1，双胞胎姐胎死宫内 1），宫内窘迫 3 例；母亲孕期合并糖尿病 2 例，合并低血压 1 例；**结果**：临床诊断：新生儿缺氧缺血性脑病 3，羊水粪染 3，肺炎 8，化脑 2，败血症 2，低氧血症 1，低血糖症 1，溶血病 2（ABO 不合 1，RH 不合 1），先心病 4，颅内出血 7。临床表现：惊厥 12 例，反应差 4 例，呻吟 4 例，烦躁 1 例，易激惹 1 例，生后阵发性口唇青紫 1 例，生后窒息 1 例，拒乳 1 例，发热 1 例，黄疸 4 例。影像学表现：病变部位：累及单侧者多见，病变位于左侧 10 例，位于右侧 5 例，双侧 2 例；其中累及多个脑叶 11，基底节区 7，胼胝体压部 3，大脑脚 5，侧脑室旁 1，半卵圆中心 3，放射冠 2，背侧丘脑 8； MRI 信号特点： 所有病例 T1WI 以等信号为主，T2WI 为高信号，FLAIR 以等-稍高信号为主，DWI 序列为明显高信号，ADC 图呈低信号；8 例行颅脑 MRA 检查，其中 2 例未见明显异常，余 6 例中大脑中动脉异常 3 例，大脑前动脉异常 2 例，大脑中动脉及大脑前动脉异常 1 例，均表现为不同程度的纤细、分支减少或狭窄。
结论：新生儿脑梗塞的病因、临床表现种类多样，进展迅速，影像学表现具有一定特征性，MRI 可做为首选检查对新生儿脑梗塞做出早期诊断，另需结合其他相关检查以明确病因，对于指导临床治疗以及促进预后都有很大的帮助。

EPO-1625

儿童流行性乙型脑炎的临床、MRI 表现及预后分析

白娟,徐树明
山西省儿童医院/山西省妇幼保健院

目的：探讨儿童流行性乙型脑炎的临床特点及 MRI 特征。**方法**：回顾分析 28 例经临床及血清学检测确诊的儿童流行性乙型脑炎患儿的临床及 MRI 资料，平均年龄：7.1 岁（1-13 岁），男 17，女 11，所有患者治疗前后均行头颅 MRI 扫描，获得 T1WI，T2WI，T2FLAIR，DWI 等图像，分析脑部 MRI 表现：病变累及部位、各序列信号特点、ADC 值以及病变随访变化等。**结果**：病程：2-9 天，平均 3.9 天；症状：发热 25，惊厥抽搐 14，意识障碍 11，嗜睡 4，呕吐 4，昏迷 2，气促 1，胡言乱语 1。MRI 表现：病变累及部位：双侧丘脑 26（其中 2 例仅见于丘脑，1 例伴丘脑出血），中脑大脑脚 21，基底节区 16，累及广范围大脑皮层及皮层下 8，颞叶 5，额叶 3，海马区 3，顶叶 2，桥脑 1，延髓 1，内囊后肢 1；病变 T1WI 呈等或稍低信号，T2WI 及 FLAIR 相均呈稍高信号或高信号，DWI 序列多呈高信号。其中 19 例经时随访复查 MRI，随访时间最短 0.5 月，最长 7 月，平均 2.24 月，MRI 发现：2 例未出现软化灶，17 例出现软化灶，软化部位：丘脑 9 例，丘脑+大脑脚 5，丘脑+大脑脚+部分脑叶 2，大脑脚 1 例；测量出现软化灶部位首次 MRI 检查时的 ADC 值，平均

为 0.803×$10^{-3}$$mm^2$/s，未出现软化灶部位 ADC 值平均为 1.004×$10^{-3}$$mm^2$/s，其差异具有统计学意义（$P$<0.05）。对于出现软化灶的病例继续随访，随访时间最短 4 月，最长 2 年，平均 9.083 月，发现软化灶缩小消失 6 例（35.1%），其中缩小 2 例，明显缩小 3 例，消失 1 例；**结论**：儿童流行性乙型脑炎起病急，临床以发热、抽搐及意识障碍为主，病变主要累及丘脑、大脑脚及基底节区，以长 T1 长 T2 信号为主要表现，FLAIR 相及 DWI 序列均呈高信号，大多数患儿于治疗后出现软化灶，ADC 值对于软化灶出现的预测具有一定意义，可为流行性乙型脑炎的早期诊断及预后评估提供帮助。

儿童基底节生殖细胞瘤的影像学特点

夏正荣,李玉华
上海交通大学医学院附属新华医院

目的：颅内生殖细胞瘤是最常见的恶性颅内生殖细胞肿瘤。它通常发生在儿童和年轻人中，并且通过目前的疗法，许多患者经历长期存活。早期放化疗可以显著改善生活质量,但早期诊断有一点难度。方法：共有 23 个儿科患者基底神经节的生殖细胞瘤治疗,其中 14 例经手术或活检,另 9 患者诊断凭借诊断放射治疗与临床和放射学特征、临床特征、影像学检查、治疗和结果病人进行回顾性分析。结果：男女比例为 10:1，平均年龄为 11 岁。最主要的临床症状为偏瘫。CT 显示为高密度，部分内见钙化灶。所有患儿均行 MRI 检查，1 例显示为 T1WI、T2WI 及 DWI 等高信号；9 例呈斑片状、13 例呈团块状，实性部分信号不均匀，呈 T1WI 等低信号，T2WI 上 3 例呈等信号、19 例呈等高信号，DWI 上 7 例显示等信号，13 例显示等高信号。增强后，5 例无强化，16 例不均匀强化，2 例明显强化。结论：对于,儿童及青少年男性基底节病变，同时出现偏瘫时，需高度怀疑生殖细胞瘤的可能。

EPO-1627

儿童胚胎发育不良性神经上皮瘤的 MRI 诊断

张晓亚
南阳市中心医院

目的　探讨胚胎发育不良性神经上皮瘤(DNT)的 MRI 影像特点，提高对 DNT 的诊断。方法　收集经手术病理证实的 10 例 DNT 患者临床资料，回顾性分析其影像学表现及临床特点。结果　10 例患者中，9 例位于幕上大脑半球皮层，颞叶 3 例，额叶 5 例，顶叶 1 例，其中 2 例累及皮层下白质。MRI 平扫中，T1WI 呈低、等低混杂信号，T2W1 呈高信号，FLAIR 呈稍高信号，可见高信号“环征”，部分瘤内见分隔。3 例表现为高信号“环征”，2 例表现为“三角征”，3 例表现为“脑回征”，1 例表现为圆形病灶。肿瘤均无明显瘤周水肿及占位效应，增强扫描仅 1 例有轻度不均匀强化。1 例肿瘤位于小脑半球，表现为囊实性肿块，壁结节较明显强化，可见瘤周水肿及占位效应。结论　DNT 的 MRI 表现有一定的特征性，有助于术前正确诊断。

磁共振多序列联合检查对早产儿脑损伤的早期诊断的临床意义

殷洁
南阳市中心医院磁共振室

摘要］目的 探讨磁共振多序列联合检查对早产儿脑损伤的早期诊断临床意义。**方法** 回顾性分析新生儿重症监护室收治的 160 例早产儿的头颅磁共振影像表现。**结果** 160 例早产儿，76 例发生脑损伤，发生率为 47.5%。早产儿脑损伤以缺血性病灶多见，最常见是脑白质损伤，尤其是脑室周围白质软化。缺血性脑损伤表现半卵圆中心、侧脑室周围斑片状或大片状 T1 加权成像（T1WI）高信号、T2 加权成像（T2WI）低信号影，弥散加权成像(DWI)序列呈明显高信号。脑室周围白质软化 MRI 表现为斑片状 T1WI 低信号、T2WI 高信号影，DWI 序列呈低信号。出血性损伤以脑室周围-脑室内出血多见，出血灶因其出血时期不同其信号表现不同，急性期 MRI 表现为 T1WI 等信号或稍低信号、T2WI 高信号；亚急性早期呈 T1WI 高信号，T2WI 稍低信号，亚急性晚期呈 T1WI 和 T2WI 高信号,在磁敏感加权成像（SWI）上呈明显低信号。DWI 对缺血灶的检出率高于常规扫描，比常规 MRI 能更早地显示早产儿脑白质损伤。SWI 对出血灶的检出率高于常规扫描，比常规 MRI 能更早地显示出血性脑损伤。与常规 MRI 比较，DWI 与 SWI 序列对缺血及出血性病灶的检出差异具有统计学意义。**结论** 磁共振检查，尤其是多序列联合检查，可以给早产儿脑损伤的早期诊断提供了准确的影像学依据。

3.0TMR 多 b 值 DWI 在急性复杂型儿童热性 惊厥海马应用研究

韦勇
海南省妇女儿童医学中心（海南省妇幼保健院/省儿童医院）

目的 探寻复杂型儿童热性惊厥急性发作时双侧海马组织的弥散特点。
方法 收集 2017 年 8 月-2018 年 2 月期间急性期复杂型热性惊厥患儿 20 例作为研究实验组，同年龄段非中枢系统疾病儿童 20 例为对照组，进行两组双侧海马多 b 值（0－1000s/mm2）DWI 扫描，ADC 图重建，及 ADC 值测量。最后用 SPSS17.0 统计软件包进行统计分析。
结果 在 b 值等于 1000 时，左侧海马实验组与对照组之间 ADC 值，有统计学差异（t=2.690，p=0.01）。在 b 值等于 1000 时，右侧海马实验组与对照组 ADC 值，有统计学差异（t=3.02，p=0.005）。
结论 当 b 值等于 1000 时，相应 ADC 值可以敏感捕捉到急性复杂型儿童热性惊厥海马损伤证据，具有一定临床应用价值。

高场强 MRI 在儿童脑颜面血管瘤综合征诊断中的应用价值

于啸[1],张欣贤[1],汪秀玲[2]
1.徐州市儿童医院
2.徐州医科大学附属医院

目的：探讨 MRI 在儿童 Sturge-Weber 综合征影像学表现及其临床应用价值。**方法：**搜集 PACS 系统中 8 例 Sturge-Weber 综合征患儿的 MRI 图像进行回顾性分析，8 例患儿均行 MRI 平扫及增强检查，2 例行 SWAN 序列扫描。**结果：**本组患儿均存在面部三叉神经分布区的血管瘤，MRI 扫描显示 7 例病变累及单侧大脑半球，1 例累及双侧大脑半球，5 例见患侧侧脑室脉络丛扩大，4 例伴有局部脑萎缩，5 例可见病变区脑白质 T2WI 信号明显减低。8 例均行增强 SET1WI 及增强 T2FLAIR 序列扫描，患侧脑回表面软脑膜均有强化，其中软脑膜血管瘤在增强 T2FLAIR 序列显示 5 例，在增强

SET1WI 序列显示 2 例。SWAN 序列检查可见多发扩张增粗深静脉影。**结论：**对临床高度怀疑 Sturge-Weber 综合征的儿童，MRI 可以明确诊断及确定病变范围，增强 T2FALIR 序列可更好的显示脑部病变，对临床早期干预及评估患儿预后有重要价值。

苍白球与壳核 T1WI 比值在新生儿亚临床胆红素脑损伤诊断中的价值

尹家瑜,申炜,卢平明
南宁市第一人民医院

目的 探讨双侧苍白球与壳核 T1WI 比值（G/P）在诊断亚临床胆红素脑损伤中的价值。**方法** 回顾性分析 109 例新生儿头颅磁共振 T1WI 信号特征，并将其分为对照组、非脑损伤组、脑损伤组；测量各组双侧苍白球、壳核 T1WI 信号值并计算 G/P 值；各组间采用独立样本 t 检验进行比较分析。通过 ROC 曲线分析 G/P 值在诊断亚临床胆红素脑损伤中的价值。**结果** （1）对照组、非脑损伤组、脑损伤组间 G/P 值依次递增，各组间差异有统计学意义（$P<0.05$）。（2）当足月新生儿患病理性黄疸且未出现临床症状，通过 ROC 曲线分析发现：左、右侧 G/P 比值分别位于 1.45~1.68、1.44~1.70 时，则可以考虑为新生儿亚临床胆红素脑损伤。**结论** G/P 值具有简单易行的实用特点，其与 TSB 相结合，可以提高新生儿亚临床胆红素脑损伤诊断的准确性，推广至广大基层医院。

MELAS 综合征的 MRI 随访分析

严志汉,朱雅馨
温州医科大学附属第二医院

[目的]随访分析线粒体脑肌病合并高乳酸血症与卒中样发作（MELAS）综合征的动态 MRI 影像学特征。[方法]回顾性分析 2005 年 9 月至 2015 年 4 月确诊的 MELAS 综合征患者 15 例，男 9 例，女 6 例，平均 15.5 岁。所有病例在急性发作期（30 d 内）均行常规 MRI 检查（包括 T1WI 平扫、T2WI、FLAIR 及 DWI ），14 例在急性发作后（30～60 d）复查 MRI，其中 8 例随访时行磁共振波谱（MRS）检查；10 例在缓解期（＞60 d）复查常规 MRI。着重分析病变的部位、信号、范围及其动态变化。[结果]在急性发作期（30 d 内），单侧大脑皮层或皮层下受累占 46.7%（7/15），　双侧大脑皮层或皮层下同时受累占 53.3%（8/15），双侧基底节受累 4 例，脑干受累 1 例。病灶在 T1WI 上呈低信号，在 T2WI 上呈高信号，在 DWI 上呈等或高信号。在急性发作后（30～60 d），14 例中，64.3%(9/14)病例的部分病灶范围扩大；71.4%（10/14）病例的部分病灶缩小，42.9%(6/14)的病例出现新的病灶。8 例 MRS 检查中均出现 Lac 峰增高，　2 例病灶对侧脑组织出现 Lac 双峰，6 例出现 NAA 峰降低。在缓解期（＞60 d），40%（4/10）的病灶出现脑萎缩，40%（4/10）的病灶出现软化灶。[结论]MELAS 综合征的病灶多为大脑皮层或皮层下游走性病灶，MRS 会出现增高的 Lac 峰，随着病程发展会出现脑萎缩和病灶减小，结合临床资料，可早期提高其诊断的准确性。

新生儿低血糖脑病的 MRI 分析及研究进展

严志汉

温州医科大学附属第二医院

葡萄糖为人体大脑所必需的能源物质，稳定的血糖对于人体正常的代谢发挥着重要的作用，如果葡萄糖量减少将导致一系列短暂的或持续的脑功能障碍。新生儿期是大脑发育最关键的时期，此时期葡萄糖的利用率较低，而且随着年龄的增长，脑功能活动增强，能量的需求越来越多，因此葡萄糖的需要量也在增加。新生儿特别是早产儿，由于其糖原储备较少,容易出现血糖的波动,常导致低血糖的发生,又因为低血糖临床症状常不典型，多为其他疾病的合并症，常被原发病所掩盖，当出现低血糖持续时间过长或程度加重时常导致大脑的损伤，还可能导致新生儿远期的学习和记忆功能障碍。

1.新生儿低血糖范围及与脑损伤的关系

我国临床上对于诊断标准:足月儿全血血糖值< 1.7 mmol /L （ 30 mg/dL ）;早产儿< 1.1mmol /L (20 mg/dL)。目前多主张无论胎龄及日龄大小,全血血糖测定<2.2 mmol /L (40 mg/dl)可以诊断为低血糖。

研究表明新生儿低血糖的严重程度及持续时间对神经系统损伤程度及预后发挥着重要的作用。当血糖越低时损伤程度越重，持续时间越长,脑损伤程度也同样加重，且预后效果将更差，低血糖持续的时间较血糖降低的程度对脑损伤作用更显著。

2.新生儿低血糖脑损伤的 MRI 表现

在成人中，影像学及有关病理研究发现低血糖脑损伤主要累及海马、尾状核、豆状核；新生儿中主要累及顶枕叶、额叶、海马、丘脑、基底节区、内囊后肢。akeuchi 等认为胼胝体压部、内囊和放射冠等部位也与低血糖脑的损伤有关。Filan 等认为与新生儿低血糖有关的脑损伤较少累及深部灰质核团. Dolinak 等认为与低血糖有关的脑损伤一般不累及小脑和脑干，但主要见于顶枕叶区，这是由于枕叶皮层的视觉皮层的 4 层明显增厚，有较多的神经元和突触，新生儿期枕叶的轴突和突触形成，增减了对葡萄糖的需求所致；大脑后动脉供应枕叶的血流，代谢较活跃，更敏感，更容易损伤。

EPO-1634

新生儿胆红素脑病临床与 MRI 特征的再认识

严志汉
温州医科大学附属第二医院

新生儿胆红素脑病是指胆红素引起脑组织的病理性损害，主要病变有大脑基底核，视丘下核、苍白球等神经核被黄染。是新生儿高胆红素血症的严重并发症，后遗症严重，死亡率高。根据新生儿胆红素脑病的神经系统毒性表现分为急性胆红素脑病（新生儿期）、慢性核黄疸后胆红素脑病（即慢性胆红素脑病，发病后 1-2 月）。

急性期胆红素脑病的临床诊断标准：临床症状加上血清总胆红素高于 342mmol/L(20mg/dl)。其临床初期: (1)轻度迟钝; (2)轻度肌张力低下,运动减 少;(3) 吸吮不好, 哭声稍高尖。 中期表现: (1)中度迟钝、激惹,肌张力变化不一、常增高; (2)有些出现颈后仰、角弓反张; (3)吃奶极少,哭声高尖。 进展期表现: (1)极度迟钝至昏迷; (2)张力常增高,有些有颈后仰、角弓反张; (3)不进食,声高尖。慢性胆红素脑病急性胆红素脑病到慢性胆红素脑病即核黄疸的后遗症期有一个演变过程。慢性胆红素脑病的典型表现通常在 1 岁前，婴儿喂养困难，进而高调哭声和肌张力减低，但持续颈强直，运动发育迟缓。

双侧苍白球在 T1WI 呈对称性高信号是急性期胆红素脑病相对特征性表现，与临床预后无必然联系 。病理基础：苍白球对称性 T1WI 高信号可以反映急性损伤时胶质细胞的饲肥星型细胞反应,也可能是超胆红素本身引起的 。 双侧苍白球在 T2WI 呈对称性高信号是慢性核黄疸所致脑性瘫痪的 MRI 特征性表现，有助于判断脑性瘫瘫的类型。病理基础：组织学上胆红素脑病后期胶质增生。

EPO-1635
儿童病毒性脑炎、ADEM 及 ANE 的 1.5T MRI 诊断价值

李梅芳,宋嘉华,郭庆清
莆田学院附属医院

目的：探讨儿童病毒性脑炎、ADEM 及 ANE 的 MRI 诊断价值。**材料与方法：**回顾 2014 年 1 月-2019 年 5 月我院 42 例患儿(男 27 例,女 15 例 , 年龄 7 月 ～11 岁, 平均 6.8 岁)，其中病毒性脑炎 23 例、ADEM 14 例，ANE 5 例，临床表现相似，如发热、头痛、四肢抽搐、眩晕、失语、嗜睡等。使用 Siemens Magnetom Essenza 1.5 T MR ,常规行 SE 序列横断位及矢状位成像, 13 例行 T1WI 增强扫描，静脉注射 Gd-DTPA 0.1mmol/kg 体重，所有病例均在发病后 2-7d 内行 MRI 检查。**结果：**由两位有经验医师回顾阅读患儿 MR 影像，发现病毒性脑炎、ADEM 及 ANE 病变的分布、信号特征及强化方式有差异。23 例病毒性脑炎均位于皮质、皮质下脑实质，以额颞叶为主，11 例累及基底节，5 例累及单侧丘脑，5 例同时累及脑白质，病灶为斑片状、脑回状及片状 ,T1WI 为不均匀低信号、T2WI 为稍高信号，DWI 为高信号，3 例额颞叶见斑片状出血、一例单侧丘脑见斑状出血，增强 14 例未见明显强化，7 例出现斑片状、脑回状强化，2 例为斑点状强化，1 例出现脑膜强化。14 例 ADEM 10 例位于侧脑室周围白质、2 例位于额顶颞枕白质区，2 例累及小脑，3 例二者同时受累，3 例累及胼胝体，2 例同时累及皮质 ，病灶 T1WI 低信号、T2WI 高信号，DWI 为高信号，12 例为斑点状、小片状, 2 例为结节状，不对称分布，增强 1 例未见强化，13 例均为环形、斑点状强化。5 例 ANE 均累及双侧丘脑，1 例累及脑干，3 例累及脑室旁白质、1 例累及小脑半球、内囊、豆状核，3 例双侧丘脑 T1WI 出现斑片状高信号，2 例 T1WI 等略高信号、DWI 见磁化率伪影提示出血，2 例增强出现环形强化。**结论：**儿童病毒性脑炎、ADEM 及 ANE 病灶的分布、信号特征、强化方式存在明显差异(P <0.05)，1.5T MRI 对病毒性脑炎、ADEM 及 ANE 具有较高的诊断价值。

EPO-1636
基于多模态磁共振对于早产儿脑白质损伤的应用研究

尤宇晴
浙江大学医学院附属儿童医院

摘要：目的采用弥散加权成像 (DWI)及弥散张量成像（DTI）成像方法，对诊断为早产儿脑白质损伤的患儿进行成像分析，并对损伤的脑白质区域进行定量的 ADC 值及 FA 值的测量。方法：选取 29 例符合临床诊断标准的早产儿患者和 29 例性别、年龄匹配的正常儿童对照。采用梯度回波序列和 32 通道头线圈采集镇静状态下被试儿童的 DWI 及 DTI 脑功能成像，经过预处理时间校正,头动校正,空间标准化,获得两组的 DWI/DTI 图，并通过软件计算出表观弥散系数（ADC)及分数各向异性值（FA）,进行两组之间的独立样本 t 检验,观察早产儿组和对照组之间的组间图像差异及数值差异。簇水平的校正水准为 0.05(即 P<0.05)。结果：与对照组相比,早产儿组 DWI 信号在脑的白质区域明显增高， DTI 在运动纤维和躯体感觉纤维亦存在差异性改变。与对照组相比,早产儿组 ADC 值及 FA 值明显增高（P＜0.05）。结论：通过回顾性分析发现早产儿患者脑白质区域 DWI、DTI 较正常儿童明显改变，ADC 值及 FA 值明显增高，差异在统计学上有意义，故在临床工作中，DWI 及 DTI 成像对早产儿脑白质损伤的临床诊断中具有重要意义。

小儿四脑室区肿瘤影像学鉴别诊断

杨兴惠
浙江大学医学院附属儿童医院

目的：四脑室区是小儿脑肿瘤的好发部位，术前影像学明确诊断有助于手术方案的制定和对预后的判断，本文目的是探讨小儿四脑区肿瘤的影像诊断和鉴别诊断。
方法：回顾性分析 2010.1-2018.10 四脑区肿瘤 127 例，男 71 例，女 56 例。其中髓母细胞瘤 60 例、室管膜瘤 16 例、毛细胞星形细胞瘤 35 例、脉络丛乳头状瘤和 AT/RT 各 5 例，其它 5 例。研究参数：年龄、性别、部位、钻孔生长、CT 密度、钙化、FLAIR 信号比值、ADC 值等。影像分析由二位有经验小儿放射医师完成。统计软件采用 SPSS 16.0。
结果：
1、Flair 上信号比值：髓母 < 室管膜瘤 < 毛星，$p < 0.05$。
2、CT 值：髓母≈室管膜瘤：$p=0.233$，髓母 > 毛星：$p < 0.05$，室管膜瘤 > 毛星：$p < 0.05$，髓母≧室管膜瘤 > 毛星。
3、钻孔生长：室管膜瘤多，$p < 0.05$。
4、大囊变：毛细胞星形细胞瘤，$p < 0.05$。
5、ADC：髓母 < 室管膜瘤 < 毛星， $p < 0.05$。
结论：CT 检查：肿瘤密度有助于区分胚胎性还是非胚胎性肿瘤；胚胎性肿瘤 ADC 低、FLAIR 等或稍低；室管膜瘤钻孔生长；毛细胞星形细胞瘤常有大囊；认真分析影像学表现，四脑区肿瘤大多术前能做出正确诊断。

初发 1 型糖尿病儿童静息状态脑血流灌注改变研究

宋佳雯
温州医科大学附属第二医院

研究目的：
糖尿病与脑血管功能障碍和血管性认知障碍有关。本研究的目的是使用 3 维伪连续式动脉自旋标记（3D-PCASL）功能磁共振成像技术比较 1 型糖尿病儿童（T1DM）及正常对照组之间脑血流灌注（CBF）的差异，并对脑灌注差异与认知和临床参数进行相关分析，探讨初发 T1DM 儿童的脑血流灌注变化情况及其与认知及临床参数的相关性。
研究方法：
本研究纳入 2017 年 1 月至 2018 年 2 月之间在我院就诊的初发 1 型糖尿病患儿 34 例及年龄性别相匹配的正常对照组儿童 34 例。收集两组人口社会学资料、临床资料及智力测评资料。使用 3D-PCASL 功能 MRI 评估两组受试者脑血管灌注情况。我们通过 REST 软件中双样本 t 检验检测两组之间局部脑血流灌注差异，并且对差异脑区的 CBF 值与认知和临床参数进行偏相关分析。
结果：
糖尿病组和对照组间在年龄、性别上无统计学差异（$p > 0.05$）。 糖尿病组 HbA1c 和血糖水平均高于对照组，差异有统计学意义（$p < 0.05$）。而糖尿病组总智商并无明显差异（$p < 0.05$）。
与正常对照组相比，T1DM 患儿在左侧楔前叶、距状沟、中央后回和右侧中央前回的 CBF 下降。相关分析表明中央后回的脑血流灌注与患儿 IQ 表现相关。但在 T1DM 儿童中，我们并没有发现其他脑区的 CBF 值与 HbA1c,血糖水平和 IQ 呈相关性。
结论：

初发 1 型糖尿病儿童表现为默认模式网络（DMN），视觉和感觉运动区域 CBF 的下降，中央后回脑血流灌注的下降可能对 IQ 表现产生不利影响。我们的研究结果可能有助于了解 T1DM 诱发的行为 - 认知缺陷的潜在病理生理学。

EPO-1639
增强 MRI 直方图鉴别儿童后颅窝髓母细胞瘤和室管膜瘤的价值

汪卫建[1],程敬亮[1]
1.郑州大学第一附属医院
2.郑州大学第一附属医院

目的 探讨增强 MRI 直方图分析鉴别儿童髓母细胞瘤和室管膜瘤的价值。**材料和方法** 回顾性分析我院经手术病理证实的 36 例儿童后颅窝肿瘤，其中髓母细胞瘤 20 例、室管膜瘤 16 例。收集该两种肿瘤的 T_1、T_2加权和增强 T_1磁共振图像，用软件 MaZda 提取肿瘤的感兴趣区（region of interest,ROI),针对肿瘤最大层面的感兴趣区进行直方图分析，利用平均值、方差、偏斜度、峰度、第 1、10、50、90、99 百分位数特征，找出两种肿瘤之间的显著性差异。**结果** 利用直方图提取出的 9 个纹理参数中,1 百分数具有统计学意义（），并绘制 C1 ROC 曲线，ROC 曲线下的最大面积为 0.82，取 46.5 的特异性和敏感性分别为 82%、75%。**结论** 直方图分析可以提供更多量化信息特征，为儿童髓母细胞瘤和室管膜瘤的鉴别诊断提供了新的思路和方法。

EPO-1640
DTI 在早产儿 HIBD 中的应用价值

张小安,王雪源,程美英,赵鑫
郑州大学第三附属医院

目的： 探讨扩散张量成像（diffusion tensor imaging,DTI）在早产儿缺氧缺血性脑损伤（hypoxic-ischemic brain damage,HIBD）中的应用价值。 方法 选取 2017 年 9 月至 2018 年 6 月入住我院新生儿科的 HIBD 早产儿 46 例为研究对象，应用 3.0T 磁共振扫描仪对所有研究对象行常规 MRI 及 DTI 扫描。待到患儿纠正年龄 7～8 个月时，到我院儿童保健科使用贝利婴幼儿发展量表（bayley scales of Infant Development,BSID）进行神经行为发育评分，并根据评分结果将研究对象分为预后好组和预后差组两组。进而比较两组患儿感兴趣区（region of interest,ROI）的各向异性分数（fractional anisotropy,FA）及表观扩散系数（apparent diffusioncoefficient,ADC）的差异是否有统计学意义。
结果： DTI 技术与常规 MRI 相比，对脑白质异常区域更为敏感；预后分组中，两组间参数的差异具有统计学意义（ $P<0.05$）。
结论： 与常规 MRI 相比，DTI 对早产儿 HIBD 的早期诊断更为可靠；DTI 可作为病情判断和预后预测的影像学参考指标。

EPO-1641
正常足月儿胼胝体发育的 MR 初步观测

张小安,朱功升,赵鑫

郑州大学第三附属医院

目的： 探讨正常婴儿胼胝体生长发育变化，为评价生后胼胝体发育状态寻找可靠的判断依据。
方法：采用高场 MR 液体衰减反转恢复成像观察正常婴儿胼胝体生长发育中各部厚度变化及信号特点。
结果： 膝、压部厚度呈不均匀增加趋势，膝部最早增厚，约在 2~3 月龄时超过压部，4~5 月龄时压部迅速增厚，约 7 月末膝部与压部厚度接近，体部厚度增加缓慢。各部信号不均匀增高，与厚度增加具有相关性。
结论： 每 3 月龄可代表胼胝体的一个发育阶段，可以初步评价生后胼胝体的发育状态，间接反映脑发育情况。

EPO-1642
特发性中枢性性早熟患者大脑微结构改变的 TBSS 及 VBM 研究

张莹
安徽医科大学第二附属医院

摘要: 目的 应用功能磁共振弥散张量成像(DTI）及基于体素形态学测量(VBM)方法观察特发性中枢性性早熟患者大脑白质纤维束细微结构的损伤及灰质体积的改变并探讨其改变的意义。方法:本研究通过纳入 21 名经本院内分泌科确诊的符合我国性早熟诊断标准及卫生部发布的性早熟诊疗指南的特发性中枢性性早熟患者及 21 名年龄、性别与之相匹配的正常对照组。采用我科 3.0T 磁共振机器扫描并采集大脑结构图像和 DTI 数据,应用 VBM 和基于纤维束示踪的空间统计（TBSS）方法比较两组受试者间的大脑灰质体积,白质纤维束部分各向异性(FA)值差异,并进一步探讨结构损伤与患者临床症状间的潜在联系。结果:与正常对照组相比,特发性中枢性性早熟患者大脑中央后回脑灰质体积存在差异，(P＜0.05);双侧大脑半球部分白质纤维束完整性受损,主要以左侧前放射冠、双侧丘脑前辐射、胼胝体辐射线额部 FA 值减低为著(P＜0.05);结论:特发性中枢性性早熟患者较正常对照组大脑中央后回脑灰质体积存在差异及双侧大脑半球部分白质纤维束受损,并且初步推测脑结构损伤可能就是影响患者临床上情绪不稳及出现各种心理问题等的组成原因。

EPO-1643
完全性生长激素缺乏患儿大脑皮质形态变化的 3.0 T MRI 研究

张忠和[1,2,3],林祥涛[1,2,3],侯中煜[1,2,3],于乔文[1,2,3],王锡明[1,2],刘树伟[3,4]
1.山东省立医院
2.山东第一医科大学附属省立医院医学影像科
3.山东大学齐鲁医学院断层影像解剖学研究中心
4.山东大学数字人研究院

目的：应用 3.0T MRI 及图像后处理技术分析完全性生长激素缺乏（CGHD）患儿与特发性矮小（ISS）患儿大脑结构的灰质体积、皮层表面积及皮层厚度差异情况。
方法：24 例 CGHD 患儿（男 14 例、女 10 例，年龄 5~14 岁，GH 刺激实验峰值浓度小于 5.0 μg/l）与 24 例 ISS 患儿（男 15 例、女 9 例，年龄 5~14 岁，GH 刺激实验峰值浓度大于 10.0 μg/l）被纳入本研究中。在首次就诊时采集患者高分辨率、高信噪比三维（3D）T_1WI MRI。利用 FreeSurfer 软件图像后处理方法获得两组患儿左右大脑半球及全脑灰质体积、皮层表面积与皮层厚度值，并统计分析组间的差异情况。将每组患儿的上述形态学参数值分别进行平均以获得该

组患儿的均值分布图。将两组患儿的测量均值进行相减，即获得两组患儿该测量均值的差异值分布图。

结果：CGHD 患儿与 ISS 患儿的双侧半球与全脑的灰质体积（$F_{左}$=17.884, $F_{右}$=20.115, $F_{全}$=19.009）、皮层表面积（$F_{左}$=11.105, $F_{右}$=11.453, $F_{全}$=11.337）及皮层厚度（$F_{左}$=5.907 $F_{右}$=6.109, $F_{全}$=6.066）的差异均具有显著性意义（P值均<0.05）。测量值的均值分布图与均值的差异值分布图发现两组患儿的灰质体积、皮层表面积与皮层厚度在诸多脑区存在差异。

结论：CGHD 患儿较 ISS 患儿的大脑灰质体积、皮层表面积与皮层厚度均较小，这可能与其智力、运动或其它功能发育相对落后相关。

EPO-1644

EV-D68 脊髓炎的 MRI 诊断

杨兴惠
浙江大学医学院附属儿童医院

目的：肠道病毒 D68(EV-D68)脊髓炎是近几年新发现的疾病实体，国内未见报导，认识较浅，本文回顾性分析其 MRI 表现，归纳其特点，从而提高认识，为临床诊断和治疗提供参考。

方法：回顾性分析 2018 年 8-10 月间在我院收治的经浙江省疾病预防控制中心病毒分离确认的 18 例 EV-D68 脊髓炎的临床及 MRI 表现，其中男 10 例，女 8 例，平均年龄 4.3 岁。诊断标准包括：临床表现，MRI 表现和实验室病毒分离。MR 检查采用 Achieva 3.0T 超导检查仪(Philips, Best, The Netherlands)。扫描序列包括：矢状位和横断位 STIR-T2WI，矢状位 T1WI；增强扫描采用矢状位和横断位 T1WI+SPIR。

结果：18 例均有脊髓 MRI 检查，其中 15 例有脊髓炎表现，共 19 个病灶，累及颈髓 10 例、胸髓 4 例、腰骶髓 5 例；矢状位上呈长段型脊髓炎共 8 个病灶，短段型 11 个病灶，未见有播散型病灶；横断面全部病灶主要累及灰质为主，其中仅累及灰质 16 个病灶，同时累及白质 3 个病灶。其中 2 例有增强扫描，1 例在脊髓病灶见斑片轻度强化灶；2 例均有腰骶段脊神经和前组马尾神经强化，呈轻度均匀强化。

结论：EV-D68 脊髓炎高发季节是夏季和初秋，大多累及脊髓灰质，以前角为主，呈弛缓性脊髓表现；少数表现为横贯性脊髓炎。累及长度不一。病变以颈髓多见，其次是腰髓；增强扫描病灶内可斑片状强化，大多有神经根和马尾强化。尽管 MRI 表现缺乏特征性，但 MRI 检查是临床不可获缺的诊断依据。

DWI 在新生儿低血糖脑损伤中的应用价值

林开武
福建省妇幼保健院

目的：探讨新生儿低血糖脑损伤的 MRI 特征及扩散加权成像(DWI)在低血糖脑损伤诊断中的应用价值。

方法：分析 39 例经临床证实的新生儿低血糖症患者的 MRI 资料，所有病例均在出生后 1～5 天行 MRI 检查；扫描序列包括常规 T1WI、T2WI、FLAIR 及 DWI 序列。

结果：双侧顶枕叶皮层及皮层下白质均见受累，其中伴发胼胝体受累 7 例、侧脑室旁脑白质受累 12 例，基底节受累 4 例，其中表现为弥漫性脑损伤 6 例，损伤部位广泛累及脑皮质及皮质下白

质，所有患儿小脑与脑干均未见明显异常信号。DWI 序列均表现为高信号，表现为斑片状、条状及脑回样高信号，胼胝体及基底节病变于常规 T1WI 及 T2WI 信号改变不明显。
讨论：1、低血糖是新生儿时期最常见的代谢紊乱之一，可引起较为严重的后遗症，因此，早期诊断早期干预对预后尤为重要；2、鉴于新生儿脑发育由下向上、由后向前的特点，在影像学上新生儿低血糖脑损伤以双侧枕顶叶后部脑组织及胼胝体压部最常受累，常对称性分布，具有定特征性；3、小脑与脑干均未见明显异常信号，主要是因为新生儿在出生前该处的神经纤维发育基本完成；因此 DWI 序列较常规 T1WI 及 T2WI 在低血糖脑损伤的发现及评估上更具优越性，具有重要的诊断价值。

儿童首发精神分裂症患者脑功能异常：一项磁共振低频振幅的研究

程勃超,伏川,陈锡建,鲍莉,郭应坤,宁刚
四川大学华西第二医院

目的：通过研究儿童首发精神分裂症患者基于静息态功能磁共振低频振幅（ALFF）值的改变，探讨早发精神分裂症患者静息态下功能异常的脑区。
方法：分别入组 30 例首次诊断精神分裂症、并未经过治疗的儿童，以及 30 例年龄、性别、IQ 和教育程度等人口学资料相匹配的对照组儿童。患者和对照组儿童符合美国精神障碍诊断与统计手册第 4 版诊断标准（DSM-Ⅳ）对首发未用药精神分裂症患者以及健康志愿者的诊断标准。采集人口统计学资料、临床量表评分后分别对其进行静息态功能磁共振扫描，处理影像学数据后计算低频振幅值，并进行统计学分析。
结果：与正常对照组相比，儿童首发精神分裂症组左侧枕叶、双侧楔前叶、双侧后扣带回、左侧丘脑、左侧海马旁回，左侧距状沟 ALFF 值增高（P<0.05，经过 FDR 校正）；同时右侧颞上回，右侧小脑后叶 ALFF 值降低（P<0.05，经过 FDR 校正）。
结论：儿童首发精神分裂症患者在静息态下有多处脑区 ALFF 值改变，提示其在静息态下存在脑功能异常。

EPO-1647
0-12 月婴儿脑组织 T1W-3D 序列的优化研究

张洪锡
浙江大学医学院附属儿童医院

背景和目的：众所周知，婴儿大脑图像对比度低且快速变化，这对解剖定义和自动分割具有极大的挑战性。本次研究将使用相对对比度作为度量标准，通过优化中心编码 3D-MPRAGE 序列来实现 0 - 12 月婴儿颅脑理想的灰白质图像对比度。

方法：弛豫图：使用 MIX 序列同时量化 T1、T2 和质子密度（PD）图，以测定颅脑不同部位灰白质的 T1、T2 和 PD 值。

Bloch 仿真：根据颅脑灰白质 T1 和 PD 值进行 Bloch 仿真，定义了三组：1）0 - 3 月，与成人相比呈相反对比；2）3 - 7 月，灰白质具有等对比；3）7 - 12 月，与成人具有相似对比。对于第 1 组和第 3 组，我们根据具有高相对对比度的确定最佳反转时间（TI_S）；而对于第 2 组，我们使用产生相反对比度的双 TI_S 获取图像。

结果：在 0 - 3 月的婴儿中，TI=800ms 的中心编码前后脑灰白质对比度最高（呈负性对比）（$P < 0.01$）。我们通过基于脑图谱的自动分割结果证明了 TI800ms 图像具有最高的分割准确度。在 3 - 7 月的婴儿中，中心编码 500 ms 和 700 ms 的 TI 产生了相反的对比。差异图像（TI700 - TI500）明显增强了灰白质对比度。在 7 - 12 月婴儿中，TI=700 ms 的对比度最高，与模拟结果一致。

结论：0 - 3 月婴儿使用中心编码的 MPRAGE 序列 TI≈800 ms，7 - 12 月婴儿使用 TI≈700 ms，而 3 - 7 月婴儿则使用双 TI 差异图，可以获得颅脑灰白质最佳相对对比度。这种针对婴儿特定年龄阶段优化的方法能，能方便地应用于临床常规检查，也有利于对婴儿大脑发育的定量分析。

EPO-1648

1.5T 磁共振多功能表面组合线圈在新生儿颅脑扫描中的应用研究

张洪锡
浙江大学医学院附属儿童医院

背景与目的：在 1.5T 磁共振检查中，由于场强较 3.0T 低一半，而且自带标准头颅适合成人颅脑检查，对于新生儿头颅来说，线圈内径偏大，新生儿颅脑图像信噪比差。本研究旨在利用多功能高性能表面线圈进行自由组合，探索搭建与新生儿颅脑大小匹配的自制线圈，提高信噪比，提高病变检出率。

方法：根据新生儿颅脑大小 3D 打印支撑与新生儿颅脑弧度相匹配的有机玻璃架，进而搭建多功能高性能表面线圈新生儿头颅线圈。然后，先进行水模测试，最后进行新生儿颅脑扫描验证。

结果：机器自带颅标配脑线圈扫描得出水模前部信噪比为 172.81，多功能高性能表面组合线圈扫描得出的水模前部信噪比为 369.9，两者差异 P>0.05；机器自带标配颅脑线圈扫描得出水模后部信噪比为 300.34，多功能高性能表面组合线圈扫描得出的水模前部信噪比为 406.92，两者差异 P>0.05。多功能高性能表面组合线圈扫描新生儿颅脑图像显示信噪比很高，结构显示细腻、清晰。

结论：使用多功能高性能表面组合线圈扫描新生儿颅脑能获得较常规标配自带头颅线圈所得图像明显改善的图像质量，值得推广应用。

EPO-1649

Clinical and Imaging Analysis of Acute Necrotizing Encephalopathy of Childhood

Zhiyao Tian,Jianbo Shao
Wuhan Children's Hospital

Acute necrotizing encephalopathy of childhood (ANEC) is a rare and rapidly progressive encephalopathy.Occurrence of ANEC is usually associated with diefferent virus infection after febrile diseases,presented with rapid neurological

deterioration[1].Death frequently occurs after onset,approximately 65% of patients will have different degrees of neurological sequelae or death [2].

1 Objective

To investigate the clinical and imaging features of acute necrotizing encephalopathy of childhood (ANEC), and try to find a correlation between them.

2 Materials and method

23 children patients with ANEC admitted to Wuhan Children's Hospital from January 2013 to October 2018 were retrospective analyzed. The male to female ratio is 0.9,and the age is (3.5±2.7) years old.Except for one dead patient, the remainer underwent CT and/or MR examination.

3 Results

All children were presented with hyperpyrexia and rapidly developed into rapid neurological deterioration after prodromic infection.The neuroradiologic hallmark of ANEC typically involved in bilateral thalamus(100%). Other lesions included the brain stem, white matter, basal ganglia and cerebellum. Except the symmetrical thalamus, the other lesions may be asymmetrical. The typical head MRI showed "tricolor pattern"[2] with the thalamus on DWI.Without the disadvantage of T2 penetration effect,the typical feature is more obvious on ADC map[3]. In mild cases, the ADC map may only show "bicolor pattern".

The long follow-up imaging(18 patients) demonstrated patients with white matter lesions disappeared(hypo-intense on T_1WI ang hyper-intense on T_2WI), while the thalamic lesions did not disappear.There are varying degrees of residual performance, mainly brain softening (8 cases), brain atrophy (9 cases) and ventricular enlargement (6 cases).

Wong and colleagues[4] created a scoring system to evaluate patients with ANE based on MRI.Our children's score showed hemorrhage and encephalomalacia on MRI may suggest poor clinical outcome.

4 Conclusion

ANEC is a rapid progressive encephalopathy with typical imaging features and poor prognosis. Hemorrhage and encephalomalacia on MRI may contribute to predicting clinical prognosis.

Congenital TORCH infections of the head CT and MRI manifestation

Zengjun Zhang,Chao Chen,Xin Hou,Dong Wang,Wen Hu
Department of Medical Imaging, Xi'an Children's Hospital, Xi'an, Shaanxi Province

Abstract: Objective: To study the CT and MRI manifestation and clinical in congenital TORCH infections. **Materials and Methods :**CT and MRI feature of 90 cases

of congenital TORCH infections demonstrated by serum examination were retrospectively analyzed. **Results:** CT and MRI scan of brain revealed in-tracranial calcification in 15 patients, encephalic hyperplasia in 20 cases, dilated ventricles in 31 cases, brain anomalies in 38 cases. Simultaneous subependymal and brain tissue calcification occurred in 55 cases.he extent and appearance of calcification in brain were related to the degree and course of TORCH infection .The earlier the infection ,the more severe the brain developmental anomalies. **Conclusion:** Our findings indicated that injury of central nervous System following TORCH infections was severe. Typical CT and MRI feature together Clinical picture may suggest TORCH infection.

儿童 HIV 相关颅内感染的 CT 表现特点

程美英,赵鑫,张小安
郑州大学第三附属医院

目的 分析儿童 HIV 相关颅内感染的 CT 表现特点，以提高对该疾病的认识。**方法** 回顾性分析 2016 年 5 月-2017-5 月在赞比亚大学教学医院经实验室检查证实的 HIV 相关颅内感染患儿 24 例的 CT 表现特点。**结果** 24 例患儿中，结核性感染 13 例，其中脑脓肿 2 例，HIV 脑炎 5 例，弓形虫感染 3 例，隐球菌感染 2 例，非洲锥虫病 1 例。CT 表现，18 例见年龄不相关脑萎缩；15 例见脑实质低密度病变（结核性感染病变多见基底节区、丘脑且多无强化，脑膜强化明显；HIV 脑炎低密度影多对称见于侧脑室旁，无强化；弓形虫感染多见于灰白质交界处，呈结节状或环状强化伴脑回样强化，隐球菌感染病变见于基底节区、丘脑、脑干、小脑半球，伴环形强化，锥虫病见于基底节区、大脑半球，无强化）；14 例脑膜强化，6 例脑积水。**结论** 儿童 HIV 相关颅内感染的 CT 表现有一定特点，但缺乏特异性，定性诊断仍需结合临床及实验室检查。

EPO-1652

Diffusion tensor imaging study of brain in children with congenital hypothyroidism

Zengjun Zhang,Chao Chen,Xin Hou,Dong Wang,Wen Hu,Hua Chen
Department of Medical Imaging, Xi'an Children's Hospital, Xi'an, Shaanxi Province

Abstract: Objective To investigate the white matter microstructure changes by using DTI in children with congenital hypothyroidism(CH). Methods 50 children with CH and 50 normal children matched in terms of age and gender accepted routine MRI examinations and DTI scanning of whole brain. FA values of Frontal subcortical white matter, Anterior limb of internal capsule, Posterior limb of internal capsule, Genu of corpus callosum , Splenium of corpus callosum, Centrum semiovale were measured. The group t-text was used to compare the FA values of the white matter between the case group and noraml group.Results FA values of Frontal subcortical white matter, Anterior limb of internal capsule, Genu of corpus callosum, Splenium of corpus callosum, Centrum semiovale in the case group were significantly lower than that in normal group(P<0.05).There was no significant difference in FA of Posterior limb of internal

capsule between case group and normal group (P>0.05). Conclusion DTI can reflect the changes of the cerebral white matter
microstructure and provides a realiable objective evdience for assessing brain development quantitatively in children with congenital hypothyrodism.

EPO-1653
脑瘫患儿认知功能损害的 3T 多模态脑功能磁共振成像研究

郝明珠,张晓凡,王芳,张旭
哈尔滨市儿童医院

目的 DKI、BOLD 技术与常规 T2WI、高分辨 T1WI 及 DTI 联合应用，探讨磁共振功能成像对伴有认知功能损伤的脑瘫患儿的早期诊断及预后评价。**资料与方法** 对 30 例临床诊断为伴有认知功能损伤的脑瘫患儿及 20 例年龄相匹配的正常小儿行头颅常规 MRI、DTI、选择性 DKI 及 BOLD 扫描，观察患儿的大脑皮层功能与白质损伤信号改变特点，多模态着重分析探测异常功能区域白质损伤微结构的关系，对临床干预的脑瘫患儿 6 月-12 月进行纵向跟踪。**结果** 30 例伴有认知功能损伤的脑瘫患儿，T2WI 像呈脑室旁高信号 12 例，高分辨 T1WI 像呈低信号 14 例，DTI 像纤维束部分缺失和纤维束走行欠规则 21 例。左侧额叶、左侧顶叶、左侧枕叶、右侧枕叶、左侧颞叶、右侧颞叶、左侧后扣带回、右侧后扣带回 FA 值低于正常对照组；左侧额叶、右侧顶叶、左侧枕叶、右侧枕叶、左侧颞叶、左侧后扣带回 MD 值高于正常对照组；左侧颞叶、右侧颞叶、左侧后扣带回 MK 值低于正常对照组。后扣带回、楔前叶、双侧额叶及双侧顶下小叶的 ALFF 值低于正常对照组；双侧海马旁回、右侧额顶叶、右侧小脑后叶和双侧基底节区的 ALFF 值高于正常对照组。**结论** DTI、DKI、BOLD 技术对伴有认知功能损伤的脑瘫患儿可更敏感、更准确的探测脑白质微观结构的改变，为进一步探讨脑白质异常与认知功能损害之间的关系提供影像学支持。

EPO-1654
小儿代谢性脑病临床 MR 特点

张晓凡,郝明珠
哈尔滨市儿童医院

代谢性脑病系由不同代谢障碍引起全脑功能紊乱的一种临床综合征。轻者表现为行为障碍、精神异常，可伴惊厥、偏瘫等局灶性脑损害，重者昏迷、去大脑或去皮质强直。引起代谢性脑病的原因很多，包括氨基酸、有机酸、脂肪酸、糖等代谢异常，以及线粒体功能障碍等，导致高氨血症、低血糖、酸中毒和能量缺乏，引起脑功能障碍。
临床以急性或亚急性起病，于感染、饥饿、手术等应激时好发。引起代谢性脑病的系统疾病众多，发病机制复杂，总结其机制为：脑血流量的变化、流体的变化，干扰神经递质物质的变化，大脑的能量状态和脑屏障功能的改变，自由基损伤和细胞凋亡等。代谢性脑病常常在婴儿期与儿童期发病，少数延迟至成人期。除线粒体病外，其他急性代谢性脑病在发病早期积极治疗，大多可完全恢复，但如果延误治疗或反复发作，有可能导致不可逆的神经系统损伤或死亡。在发育落后或有慢性神经系统异常的儿童，尤其是既往有过脑病的患儿，出现上述症状时应首先除外代谢性脑病。
多数代谢性脑病 MR 表现为两侧大脑半球白质水肿，背侧丘脑、基底节区、脑干、皮质脊髓束走行区及皮层下 U 形纤维对称性扩散受限。如鸟氨酸氨甲酰基转移酶缺乏症 OTCD--X 连锁显性遗传基因突变，尿素循环障碍导致高氨血症的中枢神经系统功能障碍的疾病。MR 表现为双侧额顶枕叶的皮层弥漫性长 T1 长 T2 信号；肾上腺脑白质病-性联隐性遗传病伴外显不全、过氧化物体病，乙酰辅

酶 A 缺乏使长链脂肪酸(C25-26)产物聚集于各系统而致病，MR 表现为双顶枕白质对称性长 T1 长 T2 信号，脑室三角区更显著，形成特征性蝶翼状。由于小儿代谢性脑病的临床症状不具特异性，病因复杂，无明确的影像学诊断标准，临床早期基因检测诊断，对患儿早期救治、降低死亡率、减少神经系统损害具有重要临床意义。

EPO-1655

急性淋巴细胞性白血病髓外浸润的影像学表现

陈超,张增俊,胡文,侯欣,陈华
西安市儿童医院

目的：探讨儿童急性淋巴细胞性白血病(acute lymphoblastic leukemia，ALL)病髓外浸润的 CT、MRI 表现，旨在提高对本病的诊断、疗效观察及预后评估。方法：回顾性分析我院 2013 年 1 月至 2018 年 12 月，56 例经临床诊治和病理证实的白血病髓外浸润患者的临床和影像资料。主要临床表现为发热， 淋巴结肿大， 肝、 脾肿大，皮肤出血点和贫血等。结果：69 例中，累及脑实质 9 例；累及脑膜 16 例并伴有颅骨破坏；眼眶浸润 14 例；累及肝 6 例，呈弥漫性及结节性；脾脏 3 例均表现为弥漫性；肾脏 9 例，均为双侧肾弥漫性增大；有 5 例肝脏、肾脏、脾脏同时累及。肺部浸润 7 例伴胸腔积液 4 例。结论：CT、MRI 可充分显示白血病髓外浸润所累及器官，但缺乏特征性，注意与淋巴瘤、 肝母细胞瘤、肾母细胞瘤及转移瘤等相鉴别。 单从影像学表现无法确定是白血病浸润， 最终诊断应该密切结合临床表现、病史、组织学、免疫组化检查等。

EPO-1656

侧脑室旁白质软化症的影像诊断

张增俊,白慧萍,侯欣,陈超,张雅,魏思文
西安市儿童医院

探讨小儿侧脑室旁白质软化症(Periventricular Leukomalaeia ；PVL)的病因与临床及影像诊断价值。方法 选择临床证实的 130 例 PVL 典型病例进行回顾性分析。结果 早产儿 85 例,占 65. 4%。患有缺氧缺血性脑病的足月儿 45 例,占 34. 6%。MRI 表现脑室不同程度扩大,侧脑室旁白质减少。根据脑白质减少及脑室扩大程度将 PVL 分为轻、中、重 3 度。①轻度:表现为双侧侧脑室周围白质减少,灰质达侧室缘,脑室无扩大。其中足月儿 31 例,早产儿 15 例。②中度:侧脑室周围白质明显减少或部分消失,灰质达侧室缘,侧室外侧壁不规则,脑室轻度扩大。足月儿 9 例,早产儿 28 例。③重度:侧脑室周围白质消失,被灰质代替,侧脑室明显扩大且外侧壁不规则呈锯齿状或波浪状。结论 MRI 扫描在 PVL 的诊断方面有着重要的价值。

EPO-1657

儿童颅内幕上 PNET 影像学表现及鉴别诊断

徐蓉,杨秀军
上海交通大学医学院附属儿童医院

目的:探讨儿童颅内幕上原始神经外胚层肿瘤 (PNET)影像学表现，以提高儿科影像学诊断水平。**方法**:回顾性分析我院经手术和病理证实颅内幕上 PNET 患儿 8 例 CT 和 MRI 影像学表现，其中行 CT

平扫检查 2 例，CT 平扫及增强检查 2 例，行 MRI 平扫检查 1 例， MRI 平扫及增强检查 7 例。**结果**:8 例 PNET 病灶均位于幕上大脑半球实质内,其中额叶 4 例，额颞叶 2 例,额顶叶 1 例，颞顶叶 1 例,病变 体积均较大,边界较清，呈类圆形、分叶状或不规则形。CT 平扫 4 例病变密度明显不均匀性改变，呈囊实性，伴散在斑点状钙化 3 例，伴出血 1 例；CT 增强实性成分明显异常强化 2 例。MRI 平扫 8 例 T1WI 上均呈稍低信号,T2WI 上均呈高低混杂信号,DWI 上 7 例未见明显弥散受限征象，1 例部分轻度弥散受限，病灶内出血 2 例,瘤周无明显水肿 2 例,轻度水肿 6 例；MRI 增强扫描 7 例病灶内实性成份均呈明显不均匀性强化,囊变区未见强化。**结论**:儿童颅内幕上 PNET 影像学表现具有一定的特点，可根据肿瘤发生部位、形态、囊实性成分、无或轻度瘤周水肿、伴钙化、出血等特征可为该病的影像诊断和鉴别诊断提供可靠依据。

EPO-1658

MRI 在新生儿胆红素脑病中的诊断价值(摘要)

王芳,张旭
哈尔滨市儿童医院

目的：
本研究旨在探讨 MRI 成像在新生儿胆红素脑病（Newborn bilirubin encephalopathy-NBE）中的诊断价值。
材料与方法：
研究对象日龄为 2-9 天新生儿 10 例，临床症状主要表现为拒乳、双目凝视、角弓反张、颈强、四肢肌张力高等。黄疸时间最早者在出生后第 2 天，MRI 检查时血清总胆红素峰值均＞164.5umol/L（正常参考值 3.4-17.1umol/L），最高为 448.3 umol/L，其中 3 例新生儿在血清总胆红素高峰值期过后进行 MRI 检查。
采用 Phlips3.0T 全数字磁共振，头颈联合神经血管专用线圈。婴儿检查前 15～20 min 使用 10%水合氯醛 1ml/kg 直肠给药镇静并双耳塞好耳塞。全部影像资料经 2 名有经验的高职影像医师共同读片评价苍白球和底丘脑的信号高低及有无。苍白球 T1WI 有高信号的评价参照同一患儿的壳核 T1WI 信号差别。底丘脑 T1WI 高信号的评价参照同一患儿的背侧和腹侧丘脑 T1WI 信号。
结果：10 例新生儿中全部双侧苍白球 T1WI 可见对称性高信号；2 例丘脑外侧 T1WI 可见对称性高信号，两侧小脑齿状核 T1WI 呈高信号；2 例豆状核信号略高。
结论：由于新生儿的特殊性，临床诊断 NBE 还存在一定的难度，CT 不能显示颅内病变受累情况，因此 MRI 技术的应用成为诊断 NEB 的重要影像学方法。

EPO-1659

非综合性唇腭裂腭成形术及语音康复后儿童脑网络改变

饶波[1],程华[1],范阳[2],张文婧[3],廖旭红[1],彭芸[1]
1.首都医科大学附属北京儿童医院，国家儿童医学中心
2.通用电气医疗集团中国研究部
3.首都医科大学附属北京口腔医院
4.北京师范大学

目的：语言问题困扰唇腭裂（CLP）患者，甚至发生在腭裂术后[1]。通过神经成像技术已经确定了 CLP 患者大脑的结构和功能变化[2,3]。语音训练已广泛应用于非综合征 CLP（NSCLP）患者腭成形术后的语言恢复治疗[4]。本研究采用静息状态功能磁共振成像（fmri）和图论方法，探讨非综合性唇腭裂（NSCLP）患儿术后全脑网络是否能恢复正常。

方法：28 名 NSCLP 患儿（平均年龄 10.0±2.3 岁）和 28 名年龄和性别匹配的健康对照组在 3.0 T MRI 扫描仪上进行静息态功能 MRI 检查，获得功能拓扑属性。用双样本 t 检验（Bonferroni 校正 $p<0.05$）评估这些拓扑属性的组间差异[5]。对非综合性唇腭裂患者进行汉语语言清晰度（CLCDS）评分，计算其所有拓扑属性与 CLCDS 评分的相关性。
结果：在 0.05-0.50（step=0.01）的稀疏度范围内，在语言相关脑区[6]检测到在局部节点属性上具有显著组间差异的节点。组间集聚系数、特征路径长度、网络的全局效率和局部效率和标准化的特征路径长度差异无统计学意义。两组间标准化的集聚系数（P=0.0006，T=3.64）和小世界属性（P=0.0015，T=3.33）有显著差异。进一步相关分析，右顶上小叶节点度（正）和左岛叶皮质节点介数（负）与 CLCDS 评分显著相关。
结论：语言网络在 NSCLP 儿童言语训练中发挥了重要作用。与健康对照组相比，语音矫正后的患者在全局网络指标方面没有显著差异，但有更高的小世界指数。局部节点参数，标准化的集聚系数和小世界指数可作为临床语音矫正的生物标志物。左岛叶和右顶上小叶的拓扑属性可作为预测语音治疗效果的影像生物标志物。

基于静音磁共振序列的 IVIM-DWI 联合 SWI 对新生儿缺血缺氧性脑病的应用价值的研究

卢慧敏,朱娟
安庆市立医院

摘要：目的 探讨应用静音磁共振中的体素内不相干运动扩散加权成像(IVIM-DWI)及磁敏感成像（SWI）在新生儿缺血缺氧性脑病诊断中的价值。**方法** 应用西门子 Skyra 3.0T 超导型磁共振中的静音模式下的 IVIM-DWI 及 SWI 序列，对 50 例临床怀疑缺血缺氧性脑病的新生儿进行检查，同时采集常规 T2WI、T1WI 及 DWI,回顾性的分析联合两种检查方法对缺血缺氧性病灶的检出率，比较常规 DWI 与 IVIM-DWI 对疾病的诊断及病灶检出敏感性的差别，同时比较 IVIM-DWI 联合 SWI 与常规 MR 对病灶检出的效果。**结果** 1、在 50 例患儿中，常规 DWI 序列检出 19 例患儿有缺血缺氧性脑病，检出率 38%；IVIM-DWI 序列检出 25 例，检出率 50%；IVIM-DWI 联合 SWI 检出 30 例，检出率 60%。2、在共同检出的 19 例患儿中，常规 DWI 共发现病灶 76 处，IVIM-DWI 共发现病灶 100 处，IVIM-DWI 联合 SWI 共发现病灶 120 处，相比常规序列 IVIM-DWI 联合 SWI 检出病灶数明显增多，敏感性显著提高。3、对于同一病灶的显示，联合使用 IVIM-DWI 及 SWI 更为清晰，病灶范围更大。**结论** 基于静音磁共振序列的 IVIM-DWI 联合 SWI 对新生儿缺血缺氧性脑病的诊断价值明显高于常规的 DWI，对病灶的检出率及敏感性都有很大的提升，为临床治疗提供了可靠依据，同时此方法还可对患儿的预后情况做更为准确的评估。

多模态功能磁共振成像诊断急性播散性脑脊髓膜炎

刘彦超,张小安,赵鑫
郑州大学第三附属医院

摘要：目的 探讨多模态功能磁共振成像对急性播散性脑脊髓炎（ADEM）的诊断价值。 **方法** 选取 ADEM 患儿 4 例为观察组 4 例正常同龄儿为对照组。收集患儿多模态磁共振资料，对两组患儿颅脑感兴趣区(ROI)测得各向异性分数(FA)值并进行统计学分析。**结果** 疾病早期脑磁共振波谱（MRS）示额叶、颞叶、基底节及胼胝体 Cho 上升，NAA 下降，其中额叶可见 Lac 峰及高大 Lip

峰，NAA/（Cho+ Cr）降低。观察组壳核、额叶白质、胼胝体膝部、胼胝体压部 FA 值明显小于对照组，差异有统计学意义（*P*＜0.05）。丘脑、内囊后肢、内囊前肢与对照组比较差异无统计学意义（*P*＞0.05）。随访时壳核 FA 值上升最多。**结论** 多模态磁共振成像发现 ADEM 早期脑多处代谢异常，壳核处受累且恢复较慢，为疾病早期诊断、临床治疗及预后提供影像学证据。

DTI 评价高危妊娠新生儿脑发育及与胎儿期脐动脉血流频谱相关性

刘彦超,张小安,赵鑫
郑州大学第三附属医院

【摘要】 目的 探讨 DTI 评价高危妊娠早产儿脑发育的价值及与脐动脉（UA）血流频谱的相关性。 **方法** 选择本院 51 例妊娠期高血压孕妇（HDP）、32 例妊娠期糖尿病孕妇（GDM）及 18 例妊娠期高血压合并糖尿病孕妇（HDP+GDM）分娩的新生儿为观察组，无合并症孕妇分娩新生儿 54 例为对照组。比较两组新生儿头颅感兴趣区（ROI）各向异性分数(FA)值，并与胎儿 UA 收缩期峰值流速(PSV)与舒张末期流速(EDV)的比值(PSV/EDV,S/D)及搏动指数(PI)等其他数值做相关性分析。**结果** HDP 及 HDP+GDM 组额叶、内囊后肢、尾状核及豆状核的 FA 值低于对照组，差异有统计学意义（*P*＜0.05），GDM 组内囊后肢、豆状核 FA 值低于对照组，差异有统计学意义（*P*＜0.05）。组内比较，GDM 组的尾状核的 FA 值与 HDP 及 HDP+GDM 组比较差异有统计学意义（*P*＜0.05），GDM 组的豆状核 FA 值与 HDP 组比较差异有统计学意义（*P*＜0.05）。内囊后肢 FA 值与 S/D 值及 PI 值、张路指数（ZLI）正相关（P＜0.05）。豆状核 FA 值与 PI 值正相关（*P*＜0.05）。**结论** 高危妊娠新生儿脑多处 FA 值减低，内囊后肢的 FA 值与 S/D 值相关性更大。

妊高症新生儿脑发育与胎儿期血流频谱的相关性研究

刘彦超,张小安,赵鑫
郑州大学第三附属医院

【摘要】 目的 探讨妊高症新生儿脑发育与胎儿期脐动脉(UA)及大脑中动脉（MCA）血流频谱的相关性，应用扩散张量成像（DTI）评价。**方法** 选择本院高血压疾病孕妇分娩新生儿 37 例为观察组，无高危围产因素孕妇分娩新生儿 54 例为对照组。比较两组的新生儿头颅感兴趣区（ROI）各向异性分数(FA)值，FA 值与两组胎儿期 UA 和 MCA 的搏动指数(PI)、收缩期峰值流速(PSV)与舒张末期流速(EDV)的比值(PSV/EDV,S/D)等其他数值进行相关性分析。**结果** 两组内囊后肢、胼胝体压部及额叶白质的 FA 值差异有统计学意义（*P*＜0.05）。内囊后肢的 FA 值与 MCA-S/D 及 UA-PI 呈明显正相关（*P*＜0.05），胼胝体的 FA 值与 UA-S/D 及 ZLI 值呈明显正相关（*P*＜0.05），额叶的 FA 值与 UA/MCA-S/D 呈明显正相关（*P*＜0.05）。UA-PI 与内囊后肢、额叶及胼胝体的 FA 值总和及其均值呈明显正相关（*P*＜0.05）。张路指数（ZLI）与所有 ROI 的 FA 值总和及其均值呈明显正相关（*P*＜0.05）。 **结论** DTI 表明胎儿大脑中动脉联合脐动脉可以预测妊高症早产儿脑发育情况。

评价磁共振 T2-Flair 序列对诊断儿童颅脑髓鞘发育不良的敏感性

李婷婷
上海市儿童医院、上海交通大学附属儿童医院

目的 应用磁共振 T2-Flair 序列诊断评价儿童脑白质髓鞘化发育情况。**方法** 将 150 例经儿保确认为脑发育障碍的患儿（3 岁内）分为 4 组:新生儿（至生后满 28 天）组共 16 例(A 组)；1 月-1 岁组共 35 例(B 组)；1 岁-2 岁组共 39 例(C 组)；2 岁-3 岁组共 60 例(D 组)。采用同年龄段 MRI T1WI、T2WI、DWI 显示的正常脑髓鞘发育的标准，对每组患儿 12 个脑区域 MRI 检测结果进行评定。应用 SPSS 23.0 软件进行统计学分析。**结果** 病史以 HIE、早产为主，约 73.2%；临床表现以运动障碍或语言发育迟缓为主，约 82.5%。头颅 MRI T2-Flair 所示脑白质髓鞘化延迟 A 组 66.2%；B 组约 72.6%；C 组 86.2%；D 组约 92.7%。**结论** 头颅 MRI T2-Flair 对诊断儿童脑白质髓鞘化延迟临床意义重大，且其诊断 3 岁年龄组脑发育迟缓敏感性最大。

EPO-1665
磁共振 MOLLI（Modified Look-Locker Inversion Recovery）序列在新生儿高胆红素血症脑部定量测定评估中的应用

廖怡,曲海波,宁刚,刘赛,李学胜,贾凤林,伏川
四川大学华西第二医院

目的
新生儿高胆红素血症患者定量测定苍白球的 T1 值能够为精确描述影像特征提供依据。本研究拟采用 MOLLI 序列对新生儿高胆红素血症患者脑部苍白球区进行定量评估，并且与其血胆红素水平进行相关性分析，为影像诊断新生儿胆红素脑病提供技术依据。
方法
采用 3T 磁共振扫描仪（Siemens, Skyra），32 通道头线圈，采用 MOLLI 对新生儿进行脑部扫描。扫描具体参数如下：重复时间= 520.47ms, 回波时间= 1.73ms,采集及恢复时间：5（7）3（5）10， TI=312ms，翻转角=35o,层厚= 3.0mm, FOV = 360mm×360mm, 体素大小= 1.2×1.2×3.0mm3,全脑共采集 104 层矢状位图像。图像处理：对生成的 T1 mapping 图像在双侧苍白球区用 Siemens Workstations 的 Circle 进行感兴趣区（ROI）的画取，并提取该 ROI 区域的 T1 值。计算双侧苍白球 T1mapping 测值的平均值，进行两组双样本 t 检验比较，再将病例组的 T1mapping 测值与患儿血总胆红素水平进行 Pearson 相关性分析。
结果
本研究纳入 10 名新生儿高胆红素血症患儿作为病例组，7 名健康新生儿作为对照组。病例组和对照组性别构成比（χ2=0.460）、年龄（t=0.769）差异无统计学意义。病例组苍白球 T1mapping 测值平均值为 1510.30±197.33，对照组苍白球 T1mapping 测值平均值为 1212.86±146.45，两组测值差异有统计学意义（t=0.004）。病例组苍白球 T1mapping 测值与血总胆红素水平进行相关性分析显示两者呈正相关（r=0.671）。
结论
MOLLI 序列优势在于可以定量测值。本研究通过 MOLLI 序列能够提取出 ROI 的 T1 值，并且与临床指标血总胆红素水平呈正相关，揭示了 MOLLI 序列为新生儿脑部定量扫描提供了有力的技术依据。

EPO-1666
左侧中颅窝蛛网膜囊肿儿童脑微结构 MRI 研究

易婷,金科
湖南省儿童医院

目的：探讨左侧中颅窝蛛网膜囊肿（AC）儿童脑微结构改变。
材料与方法：入组 2015-2018 年间经湖南省儿童医院手术证实为 AC 的 12 名患者，在术前应用西门子 3.0T Skyra 磁共振扫描仪获取 T1 结构像数据。12 名儿童均为男性（年龄范围为 5-7 岁）。同时获得与之年龄及性别匹配的健康对照者 12 例。基于体素的形态学测量（VBM）及基于体素的皮质厚度测量（VBCT）的方法，应用双样本 T 检验比较组间双侧额顶枕叶脑结构差异。以上指标比较在 Statistical Parametric Mapping12 自带统计软件中进行，$p<0.001$ 为差异有统计学意义。
结果：VBM 结果表明与对照组相比，AC 患者颅内体积及灰质体积均增高（p 值分别为 0.002，0.007），左侧额极及右侧顶上小叶灰质体积增加（$p<0.001$）。VBCT 结果显示 AC 组右侧顶上小叶、角回、缘上回、岛盖部及左侧枕叶皮层厚度较正常组增高（$p<0.001$）。
结论：左侧中颅窝 AC 患者较正常儿童存在皮质微结构差异，以语言、视觉及体感联络相关脑区主。T1 结构像可作为术前定量评估脑结构的有效手段。

儿童白血病中枢神经系统并发症的影像表现

孙燕
上海交通大学医学院附属上海儿童医学中心

目的 探讨儿童白血病中枢神经系统并发症（CNSCL）的影像表现及临床联系。**方法** 回顾性分析 52 例儿童 CNSCL 的 CT、MR 表现及临床资料。**结果** （1）血管性病变 26 例，其中出血 23 例，脑梗塞 2 例，静脉窦栓塞 1 例。23 例颅内出血包括硬膜外出血 1 例，脑内出血 22 例，均为多发。CT 表现为团状或斑片状高密度影，MR SWI 序列呈低信号；（2）中枢神经系统浸润 23 例，其中硬膜和（或）颅骨浸润 18 例，表现为硬膜和（或）颅骨梭形增厚或肿块，CT 呈高密度，T1WI 呈低信号，T2WI 呈中等信号，明显强化；软脑膜浸润 6 例，表现为软脑膜增厚、强化；脑实质浸润 2 例，肿块形成，CT 呈偏高密度；2 例动眼神经、1 例视神经浸润，MR 显示增粗、强化。（3）脑白质病变 2 例，表现为片状 T2WI 高信号影。（4）二次 肿瘤 1 例，为脑干胶质瘤。**结论** 儿童 CNSCL 影像表现多样，CT、MR 具有重要诊断价值，根据患者的临床症状、检验结果等选择最优影像检查方式及序列能为临床提供更多有价值的信息，对临床诊治有重要意义

EPO-1668
儿童视神经脊髓炎在常规磁共振表现

沈瑾
复旦大学附属儿科医院

目的：视神经脊髓炎（neuromyelitis optica，NMO）是视神经和脊髓同时或相继受累的急性或亚急性脱髓鞘病变；探究常规磁共振成像在儿童视神经脊髓炎诊断中的价值。

方法：回顾性分析我院 2011 年-2015 年临床确诊的 3 例患儿的常规磁共振成像，包括头颅磁共振平扫和脊髓磁共振平扫。所有 3 例患儿的血清抗 NMO IgG 抗体均为阳性结果。
结果： 3 例患儿中，男 2 例，女 1 例，年龄 8 岁-12 岁。脊髓磁共振影像显示均为颈、胸髓长节段病灶 T1WI 低信号，T2WI 高信号，病灶未见明显偏侧性。2 例患儿随访脊髓磁共振成像，其中 1 例可见颈胸髓明显萎缩。头颅磁共振影像显示 1 例为阴性，1 例为左侧内囊及右顶叶斑片状状异常信号，但是临床检查无相应区域神经损伤，且随访后未见其范围缩小及范围增大。1 例为延髓 T1WI 低信号 T2WI 高信号，与其颈髓病灶相连。头颅及脊髓病灶中均未见明显出血信号。
结论：NMO 的特异性抗原抗体：水通道蛋白-4 主要存在于视神经与脊髓，同时在下丘脑室上核、室管膜细胞的基底外侧面也有明显表达。主要影像表现是视神经炎和脊髓炎；在脊髓病变多为对称长节段病灶，病变位于脊髓中央，范围超过脊髓断面的一半，纵向跨度超过 3 个椎体节段；病灶早期表现为肿胀，晚期则呈萎缩改变。而其在头颅磁共振表现却是多变的。

小儿脊髓非典型畸胎瘤样/横纹肌样瘤的 MRI 表现

陈臻
广州市妇女儿童医疗中心

目的 探讨小儿脊髓非典型畸胎瘤样/横纹肌样瘤（AT/RT）的 MRI 表现，以期提高对该病的认识。
方法 收集我中心自 2016 年 6 月至 2018 年 6 月经手术病理及免疫组化证实的小儿脊髓 AT/RT 8 例，结合临床及病理资料回顾性分析其 MRI 表现。 **结果** 8 例患儿中男性 4 例，女性 4 例,平均年龄为 5.14±3.99 岁。小儿脊髓 AT/RT 临床症状以下肢乏力伴疼痛多见。MRI 表现为椎管内境界不清的长条样肿块，病变范围约为 2.3-11.7cm， T1WI 和 T2WI 肿瘤呈混杂信号，T2WI 图像呈略高/等信号，T1WI 图像呈等/略高信号，增强扫描呈不均匀强化。8 例均合并出血。其中肿瘤累及胸腰段脊柱的 5 例，累及腰骶段脊柱的 2 例，仅累及腰段脊柱的 1 例。马尾神经受侵的 7 例，发生椎旁组织转移的 3 例，椎管内转移的及颅内多发转移的 3 例。**结论** 小儿脊髓 AT/RT 罕见，MRI 的表现具有一定特征性，如肿瘤境界不清，并且常伴出血或血肿形成，马尾神经受累，这些表现有助于该病的诊断。

ADC histograms and texture feature for evaluating brain alterations in neonates with cardiac septal defect: single-slice or multi-slice measurements?

Meijiao Zhu,Ming Yang
Children’s Hospital of Nanjing Medical University

Background and Purpose *Cardiac septal defect is associated with the phenotype information of lesions that reflect in diffusion weight imaging (DWI), while quantitative descriptors of brain tissues might improve the diagnostic accuracy. We aimed to evaluate neonatal brain alterations with congenital heart disease through single and multi-slice DWI.*
Materials and Methods Functional imaging data was acquired from sixty neonates with cardiac septal defect (CSD) confirmed by echocardiography and twenty-two normal

controls in Nanjing Children's Hospital, China from January 2012 to December 2016. Histograms of apparent diffusion coefficient (ADC) and texture features were extracted and correlated to gestational weeks for both single and multiple slices of the whole brain. Diagnostic performance of the two measurements for CSD was then evaluated and compared through independent-samples *t* test and receiver operating characteristics.
Results *In both the two groups, single-slice measurement suggested a significant inverse correlation between histogram metrics and gestational ages (P<0.05), and multi-slice measurement suggested a significant correlation between ADC values and gestational ages (P<0.05). The ADC histogram showed significant difference between the two groups (P<0.05), but no differences in texture features.While multi-slice DWI showed better diagnostic performance than single-slice DWI. The area under the curve for the 90th ADC value of single-slice was the largest, which was 0.698, multi-slice was 0.759.*
Conclusion *Quantitative analysis of DWI provide beneficial information of brain development in neonates with CSD. Multi-slice DWI with selected texture features could provide better diagnostic performance for CSD in clinical practice.*

妊娠期高血压对早产儿脑发育影响的 DTI 评估

王程程[1],赵鑫[1],张烁[2],刘彦超[1],张小安[1]
1.郑州大学第三附属医院
2.郑州大学第一附属医院

【摘要】目的 采用弥散张量成像（DTI）评估母亲妊娠期高血压对早产儿脑发育影响。**方法** 选取 2018 年 2 月至 2019 年 4 月在河南郑州大学第三附属医院新生儿重症监护室收治的进行 DTI 筛查的早产儿 78 例，妊娠期高血压疾病孕妇分娩的 36 例早产儿作为观察组，另 42 例无高危围产因素孕妇分娩的早产儿作为对照组，应用 3.0T 磁共振扫描仪对所有研究对象行常规 MRI 序列扫描和 DTI 扫描，分析两组围生期资料、颅脑损伤情况和脑白质微结构的改变。对病例组额叶白质 FA 值与出生时 Apgar 评分进行相关性分析，计算相关度。**结果** 两组早产儿的内囊后肢、胼胝体压部、额叶白质、顶叶白质、大脑脚 FA 值平均值差异有统计学意义（均 *P*<0.05），病例组早产儿额叶白质 FA 值与出生后 1min、5minApgar 评分无明显相关性（r=0. 244，*P*>0.05；r=0.273，*P*>0.05）。**结论** 母亲妊娠期高血压疾病可导致早产儿脑发育落后，以磁共振 DTI 序列检测内囊后肢、胼胝体压部、额叶白质、顶叶白质以及大脑脚的 FA 值对于评估母亲妊娠期高血压疾病对早产儿脑发育的影响具有重要的价值。

MRI features of reversible corpus callosum compression lesions in children

Chunhong Yin
Qingdao Women and Children's Hospital

Objective: In order to raise awareness of the disease to explore the clinical manifestations and MRI features of reversible corpus callosum compression lesions

(MERS) in children. **Methods:**The clinical features, imaging changes, electroencephalogram and follow-up results of 16 children with MERS were retrospectively analyzed, including7 males and 9 females, aged from 4 months to 6 years, with an average age of 3.7 + / -2.4 years.All the 16 cases were performed with GE Signa Excite 1.5t scanner, and MRI cross-sectional T1WI, T2WI and DWI were performed.**Results:**16 cases of imaging changes involving the corpus callosum, lesion characteristics show class circular, T1WI, or slightly low signal, T2WI and FLAIR is slightly high signal, DWI is obviously high signal, can the corresponding apparent diffusion coefficient (ADC) sequences in low signal as the typical characteristics, including 11 cases in DWI showed corpus callosum can isolation of involvement and diagnosed MERS I type;The other 4 cases were extended to the whole corpus callosum, 1 case was extended to a half egg circle center white matter was diagnosed MERS Ⅱ type, 7 d ~ 1 month follow-up with review of cranial MRI in addition to involving more than half egg white circle center are back to normal.**Conclusion:** MERS is clinically manifested as acute mild encephalitis/encephalopathy, which is a good clinical syndrome.MRI is of great value for its diagnosis, differential diagnosis and clinical treatment.

儿童罕见脑室内中枢神经细胞瘤 1 例

谢英杰,赵滨,陈静
天津市儿童医院

目的：探讨儿童脑室内中枢神经细胞瘤相关特征性影像学表现，以进一步提高临床及放射科医生儿童脑室内中枢神经细胞瘤的认识。
方法：回顾性分析本院一例因“左眼向内斜视”入院，最终病检查证实为中枢神经细胞瘤患儿的流行病学资料、临床特点、影像学表现及并复习总结相关文献。
临床资料：患儿男，10 岁，主因“左眼向内斜视 5 天”入院。入院查体：患儿眼球活动自如，左眼向内斜视，无眼震，双侧瞳孔等大等圆，对光反射存在。头部 CT 平扫示：右侧脑室内可见混杂稍高密度肿物影，其内可见多发小片状低密度影，大小约 3.8cm×3.7cm×3.7cm，右侧脑室扩张（图 1）。头部 MRI 平扫及增强检查示：右侧脑室内可见不规则等-长 T1、等-长 T2 信号肿物影，于 DWI 上呈高信号，右侧脑室明显扩张，透明隔向左侧移位；增强后可见右侧脑室内肿物实性部分呈不均匀强化，其内多发囊性部分未见明显强化（图 1）。初步诊断：右侧脑室内混杂信号肿物伴囊变、坏死，呈不均匀强化，考虑室管膜或脉络丛来源可能。最终病理诊断为右侧脑室内中枢神经细胞瘤。
结论：CNC 是一种非常罕见的神经元起源肿瘤，其发病率低，2016 年 WHO 中枢神经系统肿瘤将其归属于神经元和混合神经元-神经胶质肿瘤，WHOⅡ级，占原发性中枢神经系统肿瘤的 0.25%~0.5%。CNC 好发于 20~40 岁的青年人，在儿童极其罕见。其主要发生于侧脑室及第三脑室近 Monro 孔区，少数位于四脑室或脑实质内。CNC 在影像学上具有一定特征性，多囊和钙化被认为是 CNC 特征性 CT 表现。其在 MRI 上可表现为 6 种特征性征象：扇贝征、宽基底征、周围泡泡征、皂泡征、液-液平面及宝石征。儿童脑室内 CNC 十分罕见，综合分析病变的 CT 及 MRI 表现，熟悉以上所述特征性征象，尤其是扇贝征及其在 DWI 上的信号特点，可在术前提供相对准确的诊断信息。

Multimodal Image Analysis of Sexual Dimorphism in Developing Childhood Brain

Xiujun Yang[1,2],Manhua Liu[2]
1.Department of Radiology, Shanghai Children's Hospital, Shanghai Jiao Tong University. Shanghai 200062, China
2.MoE Key Lab of Artificial Intelligence, AI Institute, Shanghai Jiao Tong University, China

Objective: It is well known that there are great differences in human brain anatomy and functions between males and females. With the development of noninvasive neuroimaging techniques, the sex differences in adult human brain have been well studied in some works. However, the sexual dimorphism of human brain anatomy and functions has not been well-studied during the developmental period of childhood brain. The objective of this study was to identify specific patterns of the sexual dimorphism of developing human brain structure in children using multimodal brain image analysis.
Methods: We performed a multivariate and data-driven analysis by combining multiple neuroimaging technologies including the T1-weighted structural MR images (sMRI) and diffusion tensor imaging (DTI) in a prospective cohort of 198 children (133 male) with their ages varying from 0 to 15. First, we segment the brain images into 50 regions of interests and extract the ROI volume and connectivity features. Then, we identify the individual multimodal imaging biomarkers associated with sex differences. Finally, we make the classification of the selected features into male or female.
Results: Results show that our method achieved sex classification accuracy 66% for the children with their ages below 3 and 71% for the children with their ages above 3. We found that the volumes of right middle occipital gyrus, right middle frontal gyrus, and left superior marginal gyrus are more related to sexual dimorphism of developing brain structure than those of other regions. In DTI, the connectivities between right middle occipital gyrus and right suboccipital gyrus, between left superior marginal gyrus and left middle temporal gyrus, and between right triangle inferior frontal gyrus and right putamen are also related to the sexual dimorphism. These sexually dimorphic patterns of brain may be related to the observed sex differences in developing childhood brain structure and function.
Conclusion: The sexual dimorphism in developing childhood brain is identified in brain structures and neural network connectivity using the multimodal MRI analysis.

基于 rs-fMRI 动态度中心度对伴中央颞区棘波儿童良性癫痫研究

江林[1],张体江[2],李仕广[1]
1.遵义医科大学第三附属医院/遵义市第一人民医院
2.遵义医科大学附属医院

目的：现代脑网络科学研究表明，人脑功能架构是一个复杂动态交互网络，异常发育和电活动都会影响功能网络节点配置和动态交互。静息态功能磁共振成像（resting-state functional MRI, rs-fMRI）是目前无创研究人脑功能最重要手段之一。因此，本研究旨在使用 rs-fMRI 衡量 BECTS 患儿动态度中心度改变，为理解 BECTS 患儿一段时间内动态网络信息提供帮助，进而探讨 BECTS 静息态自发活动的分布及时间变异。

方法：纳入 26 例（8~14 岁）BECTS 患儿作为病例组，26 例性别、年龄、社会地位相匹配的儿童作为对照组。使用 GE HDxt 3.0T 磁共振扫描仪采集 rs-fMRI 数据。静息态数据处理采用 DPARSF_V3.0 软件，在基于 MATLAB7.6 和 SPM8 的基础上进行计算，先对原始图像预处理，继之构建全脑体素水平的功能连接矩阵，设置基于体素功能连接相关系数 r=0.25 为阈值，构建正向的二值化（binary）和加权（weighted）体素水平连接邻近矩阵，然后使用 6mm 空间平滑和 z 标准化，基于 hamming 时间窗动态度中心度变异，最后采用软件分别进行组内分析和组间两样本 t-test 统计学分析。
结果：通过计算病例组和对照组每个体素的平均 DC 值，分别获得两组动态 DC 空间分布图（TFCE 团块校正，$p<0.05$）。两组 DC 空间分布图视觉显示广泛的相似性。进一步行动态 DC 时间变异分析，病例组二值化增加脑区位于双侧楔前叶、右侧颞上回，然而二值化减少脑区位于左颞下回；加权组间分析显示增加脑区位于双侧楔前叶、右侧颞上回、左侧丘脑及左侧角回，减低脑区位于左侧颞下回、右侧梭状回及右侧额下回三角部。
结论：本研究结果表明中央节点，特别是异常功能网络节点配置内高度连接脑区选择性和特异性破坏可能与 BECTS 发病机制有关。

儿童中枢神经系统非典型畸胎样／横纹肌样瘤的影像学表现

徐祖高
华中科技大学同济医学院附属武汉儿童医院

目的：探讨儿童中枢神经系统非典型畸胎样／横纹肌样瘤（ＡＴ／ＲＴ）的影像学特征。方法：回顾性分析 ２０１７ 年 １ 月－２０１９ 年 ６ 月经病理和免疫组化诊断为 ＡＴ／ＲＴ 的 8 例患者的 ＣＴ（ｎ＝3）和 ＭＲＩ（ｎ＝6）表现，并复习相关文献。结果：8 名患者平均年龄 2.5 岁。肿瘤位于幕上 6 例，幕下 2 例。其中含有囊变 6 例，出血 2 例，钙化 2 例。CT 平扫多表现为混杂密度，肿瘤实质部分密度稍高，增强扫描中重度强化，周边部分强化较明显，强化多不均匀，肿瘤周围常有水肿带。 磁共振检查瘤体信号混杂，实质部分以稍长 T1 稍长 T2 信号为主，坏死囊变区呈长 T2 信号，T２WI-FLAIR 上呈混杂等高信号，扩散加权成像（ＤＷＩ）呈高信号或稍高信号，增强扫描实质部分强化较明显 ，肿瘤内常可见偏心性坏死囊变区。增强扫描表现多样，周边呈环形条带样不均匀强化，中央坏死区无明显强化、也可呈结节状强化、斑片样强化，或者无强化。幕上肿瘤体积多大于幕下，有明显的占位效应。结论：中枢神经系统非典型畸胎样／横纹肌样瘤是多发生在婴幼儿高度恶性胚胎性肿瘤，影像表现多样，肿瘤周边呈环形条带样不均匀强化，中央不均匀多样可变的强化，应考虑 AT／RT 的可能性，但确诊最终要靠病理和分子遗传学特征。

儿童睡眠中癫痫性电持续状态患儿的的静息态脑功能研究

莫潼,庄义江,王晓玉,干芸根,曾洪武
深圳市儿童医院

目的：采用区域一致性（Regional Homogeneity, ReHo）方法分析 ESES 患儿和正常对照组的静息态脑网络，探讨患儿认知功能损害神经网络改变的机制。**方法：**ESES 患儿 25 例，8.57±1.99 岁；正常对照组共 6 例，9.50±1.80 岁。利用西门子 MAGNETOM Skyra 3.0T 超导型磁共振成像系统采集结构图像和脑功能数据。使用 REST 和 DPARSF 等软件对数据进行处理分析，处理步骤包括：①去

除 EPI 数据前 10 个时间点；②头动校正；③时间校正；④空间平滑；⑤时域滤波；⑥配准；⑦标准化。舍去头部平动＞2mm 或转动＞2° 的数据。对 ESES 组和正常对照组分别进行单样本 t 检验，经 AlphaSim 校正，最小簇大于 10 个体素，P＜0.001 视为有统计学意义，得到 t-map 后观察相对于全脑平均水平的 ReHo 峰值所在脑区。随后进行独立样本 t 检验，将性别、年龄作为协变量，对比两组间的 ReHo 值差异，经 AlphaSim 校正，最小簇大于 10 个体素，P＜0.01 视为有统计学意义。**结果：**与正常对照组比较，1、ReHo 值降低的区域包括：（1）默认网络：扣带回后部、左侧前额叶内侧部及左侧楔前叶；（2）语言网络：双侧颞叶上部和右侧颞区岛盖；（3）思维知觉相关网络：左侧额叶中部。2、ReHo 值增高的区域包括：（1）语言网络：双侧小脑半球 Crus1 区和 Crus2 区；（2）视觉网络：双侧枕叶中部及下部、左侧枕叶上部、左侧额叶中部以及左侧舌回。**结论：**1、ESES 患儿的语言中枢、默认网络及额叶等区域的神经活动功一致性降低，能较好地解释患儿在临床上出现的语言功能及知觉推理能力等认知能损害。2、大脑半球语言功能下降，与语言功能相关的小脑半球 Crus1 区和 Crus2 区的功能可能会代偿性地增高。静息态脑功能磁共振能够反映病理状态下 ESES 患儿神经网络的改变，是深入探讨患儿认知功能损害机制的良好技术。

3.0T 磁共振 ASL 联合 DTI 技术对早产儿缺氧缺血性脑损伤及预后研究

郝明珠,张晓凡,张旭,王芳
哈尔滨市儿童医院

目的 DTI、ASL 技术与常规 T2WI、T1WI 及 DWI 联合应用，探讨多模态功能磁共振成像对早产儿及 PVL 后遗患儿的大脑异常发育的早期诊断及临床干预疗效的评估。**方法** 对 36 例临床诊断、常规 MRI 明确诊断为缺氧缺血性脑白质损伤的患儿及 15 例日龄相匹配的早产儿行头颅常规 MRI、DWI、DTI 及 ASL 扫描，观察患儿的大脑结构以及白质和灰质损伤、功能异常信号改变特点，多模态着重分析探测异常功能区域白质损伤微结构的关系，并对其病例进行随访，对临床干预治疗及未干预治疗的患儿进行纵向跟踪。**结果** 1、早产儿缺血缺氧性脑损伤组与正常早产儿对照组脑组织 rCBF 值比较：早产儿缺血缺氧性脑病组低于同日龄正常新生儿灌注值（P＜0.05）。2、早产儿缺血缺氧性脑损伤后遗症患儿组及正常对照组脑组织 rCBF 值比较：后遗患儿组低于同月龄正常对照组灌注值（P＜0.05）；后遗患儿组及正常对照组 DTI：PVL 后遗患儿组不同程度稀疏或部分缺失，伴走行异常，FA 值不同程度降低，两者间差异有统计学意义（P＜0.05）。3、脑瘫 PVL 患儿临床系统早期干预与未系统干预组脑兴趣区 rCBF 值、FA 值两组比较差异有统计学意义（P＜0.05）。**结论** ASL 联合扩散张量成像 DTI 技术，用以评估小儿脑部疾病尤为早产儿缺氧缺血性脑损伤及预后不同阶段血流灌注情况，并可以监测局部区域脑血流量与该区域神经活动的关系，同时提供病变血流动力学特征和治疗后组织灌注情况；PVL 后遗的早期临床干预方案制定和疗效评价，积极实施综合康复治疗，减少脑瘫儿的发病率；为今后对多种脑部疾病的临床早期干预、疗效评价、随访及科研等活动提供重要的影像学指导依据。

磁共振动脉自旋标记(ASL)和磁共振波谱(1H-MRS)对儿童偏头痛的诊断价值

朱凯
哈尔滨市儿童医院

目的 儿童偏头痛是常见的一种病症,常规磁共振检查无异常发现。动脉自旋标记 ASL 磁共振灌注成像是通过对循环动脉血液中的水分子进行磁化标记，使其成为可扩散的示踪剂的一种技术，此技术可以无侵袭性的测定动脉血流。磁共振质子波谱(^{1}H proton MR spectroscopy, ^{1}H-MRS 可以在活体无创地检测组织代谢物浓度,已广泛应用于神经系统多种疾病的诊断。本文目的主要是应用磁共振动脉自旋标记(ASL) 和磁共振波谱(^{1}H-MRS)评估儿童偏头痛,以了解发病机制。
资料和方法 65 例临床诊断偏头痛的儿童（年龄 3-15 岁）排除其他疾病引起的头疼。使用 GE 1.5T 磁共振扫描仪，应用头部 8 通道线圈，患者仰卧，行轴位、冠状、矢状位位扫描，层厚 5mm，使用标准化的兴趣区域（ROI），总扫描时间约 7min。在后处理平台对所要研究的数据处理。
结果 我们发现了偏头痛侧颞叶区明显低灌注，相对 CBF 降低和 NAA/Cr 比值下降。
结论 磁共振动脉自旋标记(ASL)不用注射对比剂，直接定量 CBF 和磁共振波谱(^{1}H-MRS)观察神经元细胞的情况可能因此成为有用的工具，无创检测儿童偏头痛，为临床提供一个有力的影像学依据。

EPO-1680

磁共振扩散张量/扩散张量纤维束示踪成像对小儿脑瘫早期诊断及康复评价的意义

张旭,蔡静怡
哈尔滨市儿童医院

目的：从脑功能影像学角度，探讨 MRI 扩散张量成像/扩散张量纤维束示踪成像（DTI/DTT）对小儿脑瘫早期诊断的意义，评价临床康复和干预疗效。
方法:2008 年 1 月年-2018 年 5 月，1 月～ 3 岁临床怀疑脑瘫的 60 例患儿作为研究组，分 1～6 个月、6 个月～1 岁、1～3 岁三段研究；设 60 例年龄匹配为正常对照组。行 DTI/DTT 检查，对脑瘫接受正规康复治疗 6 月随访 DTI/DTT。选取胼胝体、内囊后肢、半卵圆中心、额顶叶深部白质、小脑中脚区域作为感兴趣区，测定各向异性 FA 值。选定连合束、皮质脊髓束及弓状纤维等区作为研究区，重建三维纤维束图。分析各选定区纤维束的形态、数量、走行、分布及间联系。判定方法：与同龄组正常儿童脑白质纤维束（DTT 图）及 FA 值比较；复查患儿的 DTI/DTT 结果与同年龄组正常儿童对比。
结果： 1、年龄段研究组和对照组胼胝体膝部、胼胝体压部、内囊后肢、半卵圆中心、额叶深部白质、顶叶深部白质、小脑中脚区域 FA 值分别行组间 t 检验，$P < 0.05$，差异有统计学意义。 2、研究组与正常组对比 DTT 扩散张量纤维束示踪成像结果：正常 6 例、中度异常 36 例、重度异常 18 例。3.15 例研究组接受规范干预治疗半年后复查，显示健侧白质纤维束纤维数量增多，ADC 值降低，FA 值增高。
结论：1、DTI： 研究组患儿各兴趣区 FA 值低于正常对照组。提示研究组脑白质发育髓鞘化迟缓或损伤，测量 FA 值可对临床怀疑脑瘫患儿进行量化分析。
2、DTT：研究组 54 例（90%）脑白质纤维束不同程度损伤，对临床脑瘫早期诊断的确立有重要意义，可立体直观显示白质纤维束的发育和损伤情况。3、随访接受规范干预治疗半年后的脑瘫患儿，显示健侧白质纤维束纤维数量明显增多，ADC 值降低，FA 值增高，提示发生代偿。4、上述技术联合应用有助于临床对小儿早期脑瘫诊断；定期随访可对脑瘫康复和临床干预疗效做出客观影像学评价。

EPO-1681

eswan 和 dwi 成像评估早产儿不同程度脑损伤的深部髓静脉表现

石晶晶,王剑,朱文珍
华中科技大学同济医学院附属同济医院

目的：评估纠正足月的早产儿缺血缺氧损伤后深部髓静脉表现。
材料和方法：连续收集 2012 年 10 月至 2014 年 7 月在华中科技大学同济医院就诊行磁共振检查的纠正足月早产儿患者。其中，新生儿缺血缺氧性脑损伤满足以下标准：（1）胎儿或新生儿窒息史，如胎心或/和胎动减少、Apgar 评分≤7 分、呼吸衰竭等；（2）生后一周出现新生儿脑损伤的临床指征，如精神状态异常（激惹、昏睡或昏迷）、肌张力异常（增高或减低）、原始反射减弱或消失等；（3）异常的磁共振或经颅多普勒超声表现。排除怀疑/合并存在颅内感染、代谢性疾病或不能解释的脑积水的患儿，以及中枢神经系统先天发育缺陷的患儿。最终，50 例缺血缺氧损伤的早产儿纳入研究。另外，收集 8 例没有窒息史和其他可能引起脑损伤疾病的足月儿作为对照。评估所有纠正足月早产儿的常规磁共振和 DWI 表现。其中，基底节损伤、多发点状白质损伤、囊性 PVL、DEHSI、III-IV 度出血为预后不良组。在 ESWAN 幅度图上侧脑室体部层面及半卵圆中心层面，进行七分法评估深部髓静脉表现。应用 GE 后处理工作站(GE, Advantage workstation, edition 4.4)处理 DWI 数据得到 ADC 图，在半卵圆中心层面从前向后放置大小约 20mm2 的圆形感兴趣区，得到前额叶白质、中心白质和顶叶白质的 ADC 值。
结果：BG/PWML/PVL/DEHSI/HE III 组的 DMVs 评分低于 HE I-II 组和 NA 组，以上各组的髓静脉扩张程度评分低于 HE IV 组。DWI 各损伤组 ADC 值高于正常组，严重损伤组与轻度损伤组间没有统计学差异。
结论：ESWAN 可检测到不同损伤程度组之间的差异，可作为常规和弥散检查的有效补充。

EPO-1682

儿童脑血管炎 MR 进展

蔡静怡,王芳
哈尔滨市儿童医院

目的：研究探讨小儿颅内血管炎的 MR 进展。方法：患儿进行颅脑 MRI 平扫、增强及 3D-TOP MRA 检查。**结果**：头颅 MRI 典型表现为血管分布区域局灶急性缺血改变。T2 相高信号多具有偏侧性、多灶性特点，常常累及白质及灰质结构。传统的脑血管造影或磁共振血流成像(MRA)是诊断大-中血管炎的必要手段，后者在影像学上主要表现为血管狭窄、扭曲、串珠形成和闭塞。MRA 在检测远端血管异常方面较传统脑血管造影来说具有一定局限性，但对明确异常血流动力学，MRA 是相当可靠的。**结论**：儿童脑血管炎确诊较困难，并非所有的病例都有炎症的典型临床和实验室表现，经典脑血管造影所见是非特异性的，尤其小血管炎造影常常显示为阴性，需要临床进行必要的鉴别诊断，包括血管性及非血管性疾病。只有认识到该疾病的特点，才有利于临床早期评估并逆转神经系统功能损伤。

EPO-1683

儿童颅内非典型畸胎瘤样/横纹肌样瘤 MRI 表现及与髓母细胞瘤对比研究

吴菲潇
复旦大学附属儿科医院

【摘要】目的探讨比较磁共振成像（MRI）及磁共振加权成像（DWI）儿童颅内中枢神经系统非典型畸胎瘤样/横纹肌样瘤(AT/RT)与髓母细胞瘤两者诊断及鉴别诊断中的价值。
方法 回顾性分析我院 2015 年-2018 年经病理及免疫组化证实为 AT/RT 的 21 例患儿及髓母细胞瘤的 40 例患儿术前影像学表现与特征，探讨比较两种肿瘤实质部分的 DWI 多个参数。
结果 21 例 AT/RT 确诊中位年龄(2.33±2.9)岁，40 例髓母细胞确诊中位年龄(5.64±3.7)岁，除年龄外，性别、病灶部位及病灶最大径差异均无统计学意义，常规 MRI 征象中偏中线生长、幕上脑室扩张、囊变及强化方式的差异具有统计学意义，而 T1WI、T2WI、瘤周水肿、出血、播散的差异均无统计学意义。两组 ADCmean 差异具有统计学意义，肿瘤实质 ADCmean 诊断 AT/RT 与髓母细胞瘤的曲线下面积（AUC）为 0.786，界限值为 0.796×10-3 mm2/s，此时诊断敏感度为 61.9%，特异度为 87.5%。
结论 常规 MRI 特征与 DWI 参数可为儿童颅内 AT/RT 与髓母细胞瘤的鉴别诊断提供相对可靠的信息，肿瘤实质 ADCmean 的特异度较高，当呈现囊变、幕上脑室扩张以及瘤周水肿等征象时，结合患儿年龄以及病灶部位等特征有助于该病的诊断和鉴别诊断。

EPO-1684

儿童椎管粒细胞肉瘤 MRI 表现分析

何晓芳
广州市妇女儿童医疗中心，广州市儿童医院

目的 ： 国内外对于儿童椎管粒细胞肉瘤影像表现报道甚少，当外周血指标未见异常时，探讨儿童椎管粒细胞的 MRI 表现分析并结合临床表现有助于诊断。
方法 ： 回顾分析并比较经手术病理证实的 6 例儿童粒细胞肉瘤的临床特点与 MRI 征象。
结果 ： 6 例儿童椎管粒细胞肉瘤其中 5 例为男性，1 例为女性，平均年龄为 7.9 岁，其中 5 例以脊髓压迫为首发症状，其余 1 例以骶尾部外伤入院。有 2 例是由多发或相邻的多发病灶组成，4 例为孤立的单发病灶。其中累及胸段椎管 2 例，腰骶段椎管 2 例，胸腰段及胸腰骶椎管各 1 例。6 例椎管粒细胞肉瘤的髓外位置均在硬膜外，其中 4 例合并有椎旁或椎前软组织肿块，2 例合并有神经根增厚，所有病例均浸润单侧或双侧椎间孔，5 个病例有椎体和/或附件浸润。6 例均侵犯椎管及椎间孔；椎管硬膜外病变包绕脊髓，呈“围髓”样生长。与骨骼肌信号相比，椎管内病灶在 T1WI 呈略高信号，在 T2WI 呈稍高或高信号；增强扫描时椎管内病灶呈中度-明显均匀强化，椎间孔、椎旁及椎前病灶多呈边缘性强化。
结论 ： 儿童椎管粒细胞肉瘤发病率较低，但较成人多见，男性多见，常累及胸段，椎管及椎旁受累时常常会同时侵犯椎间孔，甚至沿椎间孔沟通椎管内外。因此，当儿童或青少年以脊髓压迫为首发临床表现，即使无出血、贫血、感染等白血病的典型临床表现，无外伤史，脊髓神经压迫症状发展快，病程短，MRI 提示病灶位于椎管内硬膜外并向椎间孔浸润，且信号均匀时，需考虑本病的可能性。

EPO-1685

儿童脊柱 Ewings 肉瘤、PNET 的 CT、MRI 的表现分析

何晓芳
广州市妇女儿童医疗中心，广州市儿童医院

目的 ：探讨儿童椎管内尤文肉瘤/原始神经外胚层肿瘤的 CT 及 MRI 表现分析。
方法 ：回顾分析并比较经病理证实的 6 例儿童椎管内尤文肉瘤/原始神经外胚层肿瘤与 CT 和 MRI 征象。
结果 ：6 例儿童椎管内尤文肉瘤/原始神经外胚层肿瘤，5 例表现为椎管内硬膜外肿物，1 例表现为椎管内硬膜下、髓内肿物，全部病例在 T1WI 上为等、稍低或低信号，在 T2W I 为稍高或高信号，脂肪抑制序列上为高信号，增强扫描 5 例呈不均匀明显强化，1 例呈不均匀轻度强化，6 例强化不均匀 ，可见坏死囊变；全部病例的软组织肿块同时侵犯椎管内外 ,其中 5 例在椎管内硬膜外呈弥漫性生长，其中侵犯椎管全周 3 例，侵犯椎管达 1/2 周 2 例 。
周围脊柱骨质受累 5 例，同时累及椎体及附件 3 例，其中胸椎 1 例，腰椎 2 例，单纯累及附件 2 例，胸椎、腰椎各 1 例。CT 检查显示 3 例表现为溶骨性骨质破坏，边缘呈虫蚀状，有膨胀性改变 1 例，有骨膜反应 1 例，椎体压缩 1 例；2 例病变呈成骨性改变，椎体有膨胀，可见骨膜反应。
结论 :儿童椎管内尤文肉瘤/原始神经外胚层肿瘤的 CT/MRI 表现具有一定特征性，多表现为硬膜外软组织肿块，其 T1WI 上为等信号，在 T2W I 为稍高信号，容易发生囊变，增强扫描多呈明显不均匀强化，且多累及椎管内外，形成椎旁软组织肿块，并且对周围脊柱的骨质产生很大的破坏。

EPO-1686
儿童神经系统副肿瘤综合征诊断思路

邵剑波
华中科技大学同济医学院附属武汉儿童医院

摘要
目的：副肿瘤综合征（paraneoplastic syndrome）是发生在某些恶性肿瘤患者体内，在未出现肿瘤转移的情况下即已产生能影响远隔自身器官功能障碍而引起的疾病。如影响到神经系统则称之为神经系统副肿瘤综合征(neurologic paraneoplastic syndrome)。本文主要介绍儿童神经副肿瘤综合征的临床表现，影像学表现，诊断和治疗。提高对儿童神经系统副肿瘤综合征的认识。
方法：收集我院 3 例神经系统副肿瘤综合征的病例，进行回顾性分析。
结果：（1）患者 1，女，7 月龄，出现发作样抽搐，影像学表现为骶前实质性占位性病变，病理结果为神经母细胞瘤，诊断为神经系统副肿瘤综合征；
（2）患者 2，男，10 月龄，出现持续发热 9 天，阵发性肌张力增高 10 小时，影像学表现为左侧腹部软组织肿块，病理结果为神经母细胞瘤，诊断为神经系统副肿瘤综合征；
（3）患者 3，女，18 月龄，出现全身抖动 1 周，影像学表现为右侧肾上腺区条片状高密度影及软组织密度影，右侧肾上腺显示欠清，病理结果为肾上腺神经母细胞瘤，诊断为神经系统副肿瘤综合征；
结论：神经系统副肿瘤综合征在儿童中十分罕见，常发生在肿瘤临床表征出现之前。常见的特异临床表现主要为眼阵挛，共济失调或肌阵挛，行为改变或睡眠障碍，精神病学特征（焦虑，抑郁，精神分裂症，精神病），短期记忆丧失，情绪变化和癫痫发作，病毒样前驱症状等。当患者出现这些症状，且常规治疗无明显改善时，应进一步进行肿瘤相关筛查，并且对血清或脑脊液中相关自身抗体进行检测，可以及时发现和治疗肿瘤，有助于稳定或改善神经疾病。

EPO-1687
基于高分辨率 MRI 婴儿痉挛症患儿神经功能损害研究

王晓玉,黄钰纯 ,唐雨曼,庄义江
深圳市儿童医院

目的：采用 DARTEL－VBM 法及 SBM 法，分析 IS 患儿脑精细结构改变，联合临床资料，探讨 IS 患儿神经功能损害的机制。

方法：同时纳入确诊 IS 的患儿（IS 组）及健康志愿者（HC 组）各 20 例。利用西门子 MAGNETOM Skyra 3.0T 采集结构像数据。再用 CAT12 和 TOM 生成基于本研究被试的脑模板及组织概率图；通过 SPM12，用 DARTEL 算法分割图像； VBM 法分析两组间脑灰、白质体积差异，SBM 法分析两组间皮层厚度差异，不校正 P 值。独立样本 t 检验比较两组间灰、白质体积及皮层厚度差异，性别、年龄为协变量，cluster size＞10，P＜0.001 认为差异有统计学意义。

结果：1、组间比较：（1）颅内总容积（cm^3）：IS 组为 1064.40±156.45，HC 组为 1188.24±140.59；与 HC 组相比，IS 组颅内总容积减少（P＝0.026）。（2）灰质总体积（cm^3）：IS 组为 581.93±93.77，HC 组为 661.59±76.51；与 HC 组相比，IS 组灰质总体积减少（P＝0.015）。（3）白质总体积（cm3）：两组间的白质体积差异无统计学意义。2、差异脑区分析：（1）IS 患儿的左侧岛叶及前扣带回灰质体积较 HC 组增加（P＜0.001）；右侧颞上回、颞中回、颞极、额上回、顶上小叶及楔前叶灰质体积较 HC 组减少（P＜0.001）。（2）两组间的白质体积及皮层厚度均未见有统计学意义的差异脑区（P＞0.001）。

结论：1、IS 组颅内总容积及灰质总体积减少，反映 IS 患儿脑发育受影响是其运动和认知整体发育落后的基础。2、IS 患儿右颞叶、额叶、顶上小叶及楔前叶灰质体积减少，反映了其听觉、视觉及语言功能受损的解剖基础，能解释临床中表现出的追声、追物功能下降及认知功能发育迟滞。3、IS 患儿右侧额上回灰质体积减少，反映了其复杂肢体运动功能受损的解剖基础，能解释临床中表现出的精细运动差。

EPO-1688

学龄前孤独症儿童的磁共振脑功能脑网络研究

钦斌,王龙伦,张云,蔡金华
重庆医科大学附属儿童医院

目的：目前针对学龄前孤独症儿童的脑功能的研究较少，其脑网络特性尚不明确，本研究拟通过构建学龄前孤独症儿童的功能脑网络，分析其与正常发育儿童的脑功能网络的异同，以进一步理解学龄前期儿童的孤独症发病机制。

对象与方法：本研究采用静息态功能磁共振的方法对孤独症学龄前儿童及对照组学龄前儿童进行了扫描，其中孤独症组 32 人（年龄：3.03±0.99 岁），对照组 22 人（年龄：2.95±0.90 岁），然后先计算两组人群的功能连接的差异，再采用图论的分析方法获得功能连接的网络属性。

结果：孤独症功能网络的研究中，静息态磁共振的功能连接的结果显示：孤独症组相对于对照组有 25 组脑的功能连接增强，11 组脑的功能连接减弱；在功能连接的网络属性中，孤独症组的功能网络的集群系数及局部效率较对照组增高，其中左侧岛盖部额下回、右侧颞中回的节点效率增高，左侧距状裂周围皮层、左侧舌回、右侧海马较对照组的节点效率减低。

结论：本研究发现在功能连接中，学龄前孤独症患儿的默认网络及颞叶部分脑区的连接增高，而与记忆相关的海马区的连接降低；同时在脑网络的属性中，功能及结构的局部网络效率均增加，功能网络全局效率无明显提高。

EPO-1689

胎儿静脉窦畸形影像表现的再认识

夏薇[1],邵剑波[1],陈欣林[2],杨文忠[2]
1.武汉市妇女儿童医疗保健中心
2.湖北省妇幼保健院

目的：利用超声及磁共振评价胎儿静脉窦畸形的影像表现。
方法：收集自 2013 年 7 月至 2016 年 2 月的 4 例胎儿静脉窦畸形的病例。所有孕妇因超声发现颅内占位性病变而行磁共振检查。
结果：4 例患静脉窦畸形的胎儿中，两例磁共振表现为典型的静脉窦扩张伴窦汇内血栓形成。而另两例分别不典型病例位于上矢状窦及横窦并伴有其他畸形。两例妊娠终止，另两例出生后失随访。
讨论：超声医师应对不典型部位的静脉窦畸形提高警惕，必要时行磁共振检查提高诊断信心。综合以上 4 例病例影像学特点，对胎儿静脉窦畸形的发生及演变有了进一步认识。

EPO-1690
超声及磁共振诊断胎儿 Joubert 综合征的经验

夏薇[1],邵剑波[1],陈欣林[2],杨文忠[2]
1.武汉市妇女儿童医疗保健中心
2.湖北省妇幼保健院

目的：描述超声及磁共振的胎儿 Joubert 综合征的影像特征。
方法：我们收集 2012 年 1 月至 2015 年 3 月我院 3 例胎儿 Joubert 综合征。所有孕妇均行超声检查，两例进行了产前磁共振检查后终止妊娠，1 例活产行产后磁共振检查。
结果：超声及磁共振均诊断正确有 1 例胎儿，1 例胎儿仅磁共振诊断正确，1 例活产胎儿超声诊断错误。
讨论：超声医师提高认识后可以发现胎儿 Joubert 综合征，但在大多数情况下，Joubert 综合征容易被超声医师漏诊。超声医师应认识 Joubert 综合征的典型表现，必要时行磁共振检查提高诊断信心。

EPO-1691
探讨产前 MRI 对胎儿 Ganlen 静脉动脉瘤样畸形的诊断及预后评估价值（附 3 例报道）

薛婷,刘鸿圣,艾斌
广州市妇女儿童医疗中心，广州市儿童医院

摘要：目的：探讨产前 MRI 对胎儿 Ganlen 静脉动脉瘤样畸形的诊断及预后评估价值。方法：回顾性分析、采集广州市妇女儿童医疗中心 2013 年 9 月至 2019 年 12 月经产前超声及磁共振成像检查诊断为 Galen 静脉动脉瘤样畸形的 3 例胎儿影像学及临床学资料，并进行文献复习。结果：3 例胎儿病例均在孕晚期行胎儿头颅平扫并诊断为 Galen 静脉动脉瘤样畸形，3 例 MRI 表现如下：1 例表现为胎儿脑内大脑大静脉增宽，上矢状窦、下矢状窦均明显增宽，以左侧乙状窦增宽为明显，并伴有心脏增大表现；另外 2 例则均表现为大脑大静脉及镰窦呈囊样扩张，边界清晰，T1WI 呈等信号，T2WI 呈低信号，其中一例伴有右侧额叶脑出血、双侧脑室轻度扩张的表现。结论：胎儿 MRI 能清楚的显示胎儿 Ganlen 静脉动脉瘤样畸形的形态及信号改变，并观察脑室大小、脑实质是否缺血损伤等，对胎儿的诊断及预后评估具有重要价值。

EPO-1692
MRI 在胎儿脊柱与脊髓发育异常的产前诊断中的应用

尚红磊,赵鑫
郑州大学第三附属医院

目的: 探讨 MRI 在产前诊断胎儿脊柱与脊髓发育异常中的临床应用。 **方法**: 回顾性分析在我院产前彩超怀疑胎儿脊柱、脊髓发育异常的 89 例单胎胎儿，行产前脊柱和脊髓 MRI 检查，分析其影像学表现，并与其产前彩超诊断结果对比。89 位孕妇年龄 21-41 岁，平均 27±4 岁，孕龄 22-39 周，平均 28±4 周。评价最终诊断以产后超声或 MRI 检查结果为准。**结果**: 89 例胎儿包括椎体发育异常 26 例，脊髓发育异常 24 例，椎体脊髓复合畸形 35 例，产前 MRI 对其诊断符合率分别 100%(26/26)、91.7%(22/24)、85.7%(30/35)，产前 US 对其诊断符合率分别为 88.5%(23/26)、45.8%(11/24)、45.7%(16/35)，其中产前 MRI 和 US 对于单纯椎体发育异常的诊断符合率无统计学差异（p>0.05），MRI 对胎儿脊髓发育异常及椎体脊髓复合畸形的诊断符合率高于 US（p<0.05）。MRI 结果与超声诊断一致 50 例，进一步完善产前超声诊断 18 例，纠正超声诊断 14 例。**结论** MRI 检查特别是磁敏感加权成像（ sensitive weighted imaging ，SWI）序列对胎儿脊髓发育异常具有更好的诊断价更具优势，对于胎儿脊柱与脊髓发育异常的产前诊断具有重要的临床应用价值，是产前超声检查的重要补充方法。

EPO-1693
MRI 在胎儿泌尿系统畸形中的应用

尚红磊,赵鑫
郑州大学第三附属医院

目的 探讨 MRI 在胎儿先天性泌尿系统畸形中的应用价值。 **方法** 46 例产前超声检查怀疑胎儿泌尿系统畸形的孕妇，行产前 MRI 检查，并与产前彩超相对比。所有胎儿均为单胎。评价最终诊断以产后超声或 MRI 检查结果为准。**结果** 46 名孕妇年龄为 21-40 岁，平均 26±4 岁，孕龄为 20-39 周，平均 28±3 周。46 例先天性泌尿系统异常胎儿中，包括羊水量正常的 30 例（羊水正常组）、羊水过少 16 例（羊水过少组）。羊水过少组胎儿通过 MRI 测量胎儿肺肝信号强度比(LLSIR)评估是否存在胎儿肺发育不良。产前 MRI 改变产前 US 检查结果 5 例，产前 MRI 证实产前 US 检查结果 4 例，产前 MRI 进一步完善产前 US 检查 12 例，产前 US 诊断准确而 MRI 诊断不正确 2 例，产前 US 及 MRI 诊断均不正确 1 例。产前超声诊断符合率为 73.9%（34/46），产前 MRI 总诊断符合率为 93.5%（43/46）。羊水过少组胎儿均合并肺发育不良，LLSIR 为 1.01～1.87，平均值为 1.19±0.05，较正常组明显减低(P=0.000<0.05)。 **结论** MRI 检查在胎儿泌尿系统异常的诊断中具有较高的临床应用价值，是产前超声检查的重要补充方法，特别是在胎儿肾脏异常合并羊水过少的产前诊断具有更好的发展前景。

EPO-1694
MRI 对胎儿骶尾部畸胎瘤的评价

刘鸿圣,陆苑婷
广州市妇女儿童医疗中心

目的：探讨产前 MRI 对胎儿骶尾部畸胎瘤影像学诊断及意义。

资料与方法：回顾性分析我院 2015 年 01 月至 2019 年 1 月有病理结果证实，并进行了产前 MRI 检查的 28 例胎儿，分析骶尾部畸胎瘤的位置、大小、成分、邻近器官受压情况及是否合并其他畸形。结果：产前 MRI 骶尾部的畸胎瘤表现为囊性/囊实性,可向体腔内、外突出，呈 T1WI 低信号，T2WI 高信号为主。MRI 能准确对胎儿骶尾部的畸胎瘤进行分型（定位及累及范围）、无创，多次测量肿瘤大小、评估生长情况、评价瘤体成分（囊实性比），能显示与毗连器官的关系、能提示合并其他畸形。结论：MRI 能够作为产前超声的有效补充，提供更全面的信息；MRI 为骶尾部畸胎瘤的胎儿的预后判断及后期的临床治疗提供依据。

The correlation research between ADC value and gestational age in normal fetal brain region with b value = 1000 s / mm2

Mengying Xuxumengying[1],Bing Chen[2]
1.Ningxia medical university
2.General hospital of ningxia medical university

Objective Using diffusion weighted imaging with B value 1000 s / mm^2 to analayse the relationship between apparent dispersion coefficient (ADC) value of the fetal brain region and gestational age.The ADC values in different regions of the normal fetal brain during the middle and late pregnancy were measured, and the relationship between the ADC values in this region and the gestational age was studied to assist prenatal diagnosis and prognosis evaluation **Methods** 106 normal fetuses in the middle and late pregnancy were scanned using DWI sequence (b value = 1000 s / mm^2).DWI examination (b value =1000 s/mm 2) was performed on 106 fetuses with suspicious prenatal ultrasound abnormality and normal MRI results in the middle and late pregnancy.The ADC values of white matter (frontal lobe, parietal lobe, temporal lobe and occipital lobe), basal ganglia, thalamus, brainstem and cerebellum were measured, and the relationship between the ADC values in different areas of fetal brain and fetal age was analyzed by linear regressionADC values of supratentorial white matter (frontal, parietal, temporal, and occipital), basalganglia, thalamus, pons, and cerebellum were measured.Linear regression was used to analyze the relationship between ADC values in different regions of fetal brain and gestational age. **Results** The ADC value of Fetal brain were variable in these regions,The order from high to low is:parietal white matter>other white matter>cerebellar>basalganglia>thalamus,pons.ADC values of supratentorial white matter (parietal,temporal,occipital), basalganglia , thalamus, cerebellum and pons were negatively correlated with fetal age.There was no linear correlation between ADC values and gestational age in the white matter of the frontal lobe.With the increase of gestational age, the ADC value of cerebellum decreased fastest, the ADC value of thalamic decreases the second fast.**Conclusion** The ADC value of normal fetal brain region is variable, it changes regularly with the increase of fetal age, it can reflect the development process of fetal brain, and provide the imging evidence for prenatal diagnosis and prognosis evaluation of fetus brain.

EPO-1696

基于胎儿磁共振的胎儿脑结构图谱构建

付玏[1],李克[2]
1.上海市第一妇婴保健院
2.复旦大学附属华山医院

目的：探讨利用胎儿磁共振技术分析正常孕晚期胎儿脑部发育情况及脑结构图谱构建。方法：选择 MRI 3D-FIESTA 检查孕晚期（孕周 28-40 周）脑部正常发育胎儿各 10 例，共 130 例，利用纵向数据群组配准以及稀疏学习的方法，分割胎儿颅脑额叶，顶叶，颞叶，基底节，脑室系统，小脑，并计算胎脑脑室与脑横径比率。结果：所有 130 例胎脑均分割成功。孕 28-33 周，胎儿大脑皮层可见脑沟形成，其中枕叶和中央回区域较明显，37 周后脑实质分区与成人相类似。脑室与脑横径比例逐渐缩小，但差异不明显。结论：利用胎儿磁共振技术构建胎脑图谱，为准确评价胎儿大脑随着孕龄有规律发育成熟过程中的变化提供依据。

MRI 对胎儿空回肠闭锁的诊断价值

曹亚先
广州市妇女儿童医疗中心

目的：探讨 MRI 对胎儿空回肠闭锁的诊断价值。方法：收集我院 2010 年 1 月至 2018 年 12 月间经产后手术及病理证实为空肠或回肠闭锁且产前曾接受 MR 检查的病例共 13 例。所有病例均为单胎妊娠，男胎 8 例，女胎 5 例。回顾性分析 13 例胎儿的产前 MRI 及产后临床资料。 结果：最终诊断 9 例为回肠闭锁，其中 2 例为多处闭锁；4 例为空肠闭锁，其中 1 例为多处闭锁。9 例回肠闭锁患儿中有 5 例合并有肠穿孔，MRI 呈现大量腹水，肠管聚拢，无肠管扩张。4 例空肠闭锁患儿中有 1 例合并肠穿孔，MRI 表现为假囊肿并小肠扩张。7 例未合并肠穿孔的胎儿，小肠均有单个或多个肠袢扩张。11 例胎儿结肠内无胎粪充盈，无法分辨其结构；2 例胎儿结肠形态纤细，T1WI 上呈细条状高信号。8 例胎儿直肠内无胎粪充盈，无法分辨其结构；2 例直肠胎粪充盈少，形态纤细；3 例直肠胎粪充盈良好，形态正常。4 例孕妇羊水过多。3 例男胎合并鞘膜积液。结论：胎儿小肠闭锁具有肠管扩张、腹腔积液、假囊肿、小结肠及小直肠等特征性 MRI 表现。产前 MRI 可较准确地诊断空回肠闭锁并判断病情严重程度，为产后对新生儿的及时治疗提供重要依据。

Added value of fetal magnetic resonance imaging in diagnosis of malformations of cortical development: a retrospective analysis of 35 cases

xu li
APCH

http://Abstract Objective: To explore the added value of fetal MRI to ultrasound in diagnosis of fetal malformations of cortical development (MCD), which may help with clinical decision marking. Methods: From January 2013 to May 2019, we performed 3153

fetal MRI examinations, 35 fetuses in our medical center were diagnosed as MCD by fetal MRI (including one case was misdiagnosed by fetal MRI and confirmed after birth) after a prenatal ultrasound diagnosis of brain abnormalities or other anomalies, the images were analyzed by two radiologists, and the results were compared with findings on US. Results: Thirty-five cases were diagnosed as MCD. On prenatal ultrasound, the findings included ventriculomegaly (n=19), agenesis of the corpus callosum(n=5), dysplasia of the cerebellar hemisphere or vermis (n=5), absent septum pellucidum (n=3), small head circumference(n=3). Holoprosencephaly (n=2), midline cyst(n=2), thoracic and abdominal wall lymphangitic deformity (n=1), posterior fossa pool widened(n=1), suspected schizencephaly (n=1). MRI diagnosed 17 cases of lissencephaly (13 cases of type I and 4 cases of type II); 6 cases of open-lip of schizencephaly (2 cases of bilateral and 4 cases of unilateral); 6 cases of heterotopia (combined with one case of lissencephaly type I), included one case was misdiagnosed by fetal MRI while confirmed after birth by MRI; 4 cases of polymicrogyria, 4 cases of microcephaly and one case of hemiegalencephaly. Additional findings by MRI included agenesis of the corpus callosum(n=9), absent of corpus callosum(n=2), right side diaphragmatic eventration (n=1), Cleft lip and palate(n=1), duplex kidney(n=1). Conclusions: Compared to US, fetal MRI has a wide field, higher soft tissue resolution and an higher sensitivity in diagnosis of MCD, It can be used as a complementary means to US in diagnosis of fetal MCD and help clinical decision marking.

胎儿脊柱及脊柱发育畸形产前 MRI 诊断

宁刚
四川大学华西第二医院

胚胎发育的第四周，体节开始形成，第六周，椎体结构开始融合，并诱导软骨化；第八周开始矿化，胎儿脊柱在椎体及两侧的椎弓根出现三个骨化中心。如果脊索退化发生异常，则会导致椎体发生先天畸形，常见的先天畸形有半椎体、蝴蝶椎、融合椎及椎体冠状裂等畸形，椎体异常的发生率为 0.5-1/1000，可累及一个或多个椎体，最常受累的为胸椎，其次依次为腰椎及骶椎。

胎儿脊柱影像检查首选超声，MRI 具有软组织分辨率高、多参数、多平面成像等优点，胎儿骨化中心、软骨及软组织成份可显示为明显不同的信号对比，在脊柱骨骼畸形的诊断方面也具有一定优势。

由于胎儿活动范围大，脊柱椎体较小，组织成分较为复杂，含有椎体骨化中心、软骨、纤维环及髓核等成分，在 MRI 尤其是 1.5T 磁共振许多序列上观察受限，易于漏诊和误诊。3.0T 磁共振仪的梯度场强及切换率均高，以及高通道的高密度一体化线圈系统，图像信噪比高；稳态自由进动（Steady state free precession sequence）序列可以清晰地显示低信号的胎儿脊柱骨骼骨化中心，高信号的髓核、软骨及纤维环，能够明确诊断胎儿脊柱的常见畸形，如半椎体、蝴蝶椎、冠状裂以及椎管狭窄等。极大地增强了产前影像诊断医师对胎儿脊柱骨骼畸形的诊断信心，提高了胎儿脊柱畸形的产前检出率；为优生优育提供较为准确的信息。
其他如 EPI 序列、SWI 序列也可以很好地显示骨骼，但 EPI 序列较多用于长骨的评估，对脊柱的显示没有明显的优势。SWI 序列可清晰地显示胎儿脊柱结构，但不属于常规，增加扫描序列可能会增加扫描时间及 SAR 值，扫描成功率相对偏低，扫描时间相对较长、需要孕妇屏气；另外，SWI 序列是通过牺牲软组织之间的对比度而达到椎体显示的效果。需要进一步研究。

3.0T MRI 半傅立叶单激励快速自旋回波序列在胎儿头颅扫描中的参数优化

殷星,赵鑫
郑州大学第三附属医院

目的 探讨 3.0T MRI 半傅立叶单激励快速自旋回波序列在胎儿头颅扫描中的参数优化。方法 对我院 Siemens 公司的 skyra 3.0T MRI 成像仪对胎儿头颅正中矢状位半傅立叶单激励快速自旋回波序列参数进行初步优化。结果 对比初始参数为 TR1400，TE63，FA120，FOV400，初步调整参数为 TR1400，TE105，FA160，FOV300，层厚均为 5mm，间隔 5.5mm。对小脑蚓部细微结构进行分析，发现初步调整后参数在更小胎龄下（孕 24 周）能够对小脑蚓部细微结构进行更好的区分，在较大孕周（大于 30 周）对小脑蚓部脑沟进行观察，优化后的参数能够分辨出更多脑沟。结论 目前我院原始胎儿正中矢状位半傅立叶单激励快速自旋回波序列约于 28 周可较明确分辨小脑原裂，这与国外文献报道 21 周可以分辨仍存在一定差距，初步优化后的参数对比分析图像质量，能够更好的对小脑蚓部细微结构观察。

EPO-1701
产前核磁诊断胎儿颅脑发育异常的分析

孟醒
大连市妇女儿童医疗中心

目的：探讨胎儿颅脑发育异常中产前磁共振检查的价值。
方法：从 2017 年 1 月至 2018 年 7 月在我中心接受产前磁共振检查且孕周在 28-34 周的孕妇中，选出 30 例胎儿颅脑发育异常的病例进行研究，并经病理或产后相关检查证实者。
结果：30 例胎儿中，磁共振检查侧脑室增宽 17 例、后颅窝增宽 8 例、胼胝体发育不良 4 例、小脑蚓部发育异常 1 例。经病理或产后相关检查发现有 27 例颅脑发育异常，侧脑室增宽 17 例、后颅窝增宽 7 例、胼胝体发育不良 2 例、小脑蚓部发育异常 1 例。符合率 90%，$P<0.05$。
结论：随着磁共振技术的不断发展，MRI 已成为产前检查的重要手段，尤其是对胎儿颅脑发育异常中的侧脑室、后颅窝、胼胝体、透明隔等检查效果显著。对于胎儿颅脑出现发育异常的产妇，产前予以核磁检查，可以获得更加准确、全面的信息，为临床的下一步诊疗提供帮助，具有较高的临床应用价值。

EPO-1702
胎儿大脑中线结构异常的 MRI 表现

陈兵[1],徐梦莹[2]
1.宁夏医科大学总医院
2.宁夏医科大学

目的 通过总结胎儿大脑中线结构异常的 MRI 特点，探讨中线结构胼胝体缺如的间接征象出现概率和相关关系。

方法 收集我院产前胎儿 MRI 检查诊断为大脑中线结构异常（胼胝发育不全、透明隔腔缺如、前脑无裂畸形）的中晚孕病例 45 例，39 例纳入研究。回顾分析胎儿大脑中线结构异常的 MRI 图像，总结 MRI 特点，记录胼胝体缺如的 MRI 直接及间接征象，并对间接征象两两之间进行相关分析。
结果 39 例病例，胼胝体发育不全（ACC）31 例，透明隔腔缺如（ASP）33 例，前脑无裂畸形（HPE）2 例。31 例 ACC 的 MRI 间接征象出现概率从高到低排列依次为：侧脑室增宽（VM）93.5%(29/31 例)、ASP83.9%（26/31 例）、半球间裂异常 71.0%（22/31 例）、“牛角形”侧脑室 61.3%（19/31 例）、“泪滴状”侧脑室 54.8%（17/31 例）、第三脑室异常接近纵裂 51.6%（16/31 例），大脑半球内侧面脑沟回呈放射状改变 35.5%（11/31 例）。7 组间接征象中 VM、脑沟回放射状改变与其他 5 种间接征象不存在线性相关关系，“泪滴状”侧脑室与“牛角形”侧脑室、“泪滴状”侧脑室与第三脑室异常接近纵裂、“泪滴状”侧脑室与半球间裂异常、“牛角形”侧脑室与第三脑室异常接近纵裂间线性相关性均较大(r=0.876、0.678、0.659、0.661，P 均<0.001)。
结论 ：
1 MRI 能较好的显示大脑中线结构异常的直接及间接征象。
2 本组研究中 ACC 的 7 个间接征象中，VM 和 ASP 的出现概率相对较高；VM、ASP、半球间裂异常等间接征象对 ACC 产前诊断具有一定价值，且大部分 ACC 的间接征象之间存在相关关系。
3 本组研究中单纯型 ASP 较少见，ASP 伴 ACC 的病例较多见，因此当产前 MRI 发现 ASP 时，应仔细观察是否存在合并发育异常情况。

EPO-1703
磁共振弥散加权成像在胎盘植入临床诊断价值的初步探讨

郑昌业,邹玉坚,郑晓林
东莞市人民医院

目的
探讨磁共振弥散加权成像(DWI)诊断胎盘植入的价值。
方法
产前超声检查怀疑前置胎盘或胎盘植入的病例 26 例，均在我院生产及行 MRI 检查影像学检查。所有资料采用西门子 1.5 T（Avonto）超导型 MRI 扫描系统，8 通道体表线圈。孕妇首选仰卧位，如有不适，可采用左侧卧位。足先进，防止幽闭恐怖感。不予以镇静剂。正确输入孕妇体重，以精确控制 SAR 值。
序列；①梯度回波序列（Gradient Ech GRE）T1WI，TE 2ms，TR 6ms，层间距 0.5mm，层厚 5mm，矩阵 320-256，视野 20-320mm②半傅里叶采集单次激发快速自旋回波序列（half Fourieracquisition single shotturbospin echo HASTE）T2WI 及 T2WI-FS， TR 2500ms，TE 86.7ms，其他参数同横断面 T1WI 一致；③DWI 扫描采用单次激发 SE-EPI DWI 序列，取 b 值=0、500、1000s/mm2 分别进行扫描。
结果
26 例患者均取得了手术病理结果，其中 2 例为前置胎盘、无胎盘植入， 5 例为粘连性胎盘，16 例为植入性
胎盘，3 例为穿透性胎盘。各型胎盘植入的影像表现如下：①粘连性胎盘，DWI 序列上胎盘信号与肌层表现不同，肌层表现为中等稍低信号，胎盘表现为中等稍高信号，二者间的底蜕膜间隙消失，胎盘局部出现轻微凸出；②植入性胎盘，DWI 图像均可以显示子宫肌层的局部变薄，程度不同，胎盘基底面信号欠均匀，中等稍低信号的子宫肌层内见点状、斑片状不均匀稍高信号；③穿透性胎盘， DWI 图像上显示胎盘基底面与子宫壁相互融合，分界不清楚，中等稍低肌层信号部分中断，胎盘浆膜层成幕顶状突起或与周围分界不清。
结论
DWI 序列上子宫肌层与胎盘的信号不同、较易区分，可以显示不同植入程度的病例影像特征。

EPO-1704

磁共振在胎儿唇腭裂诊断中的应用

周清,张鹤,尹璇,王雪珍,刘雪芬,张国福
复旦大学附属妇产科医院

目的：评价 MRI 对胎儿唇裂和腭裂畸形的诊断价值。**材料和方法：**分析 20 例临床提示胎儿唇颚裂畸形的孕妇前瞻性行 MRI 扫描。扫描序列半傅立叶单激发自旋回波（half-Fourier single-shot turbo spin echo, HASTE 序列）和真性快速稳态进动（true fast imaging with steady-state precession, TRUE-FISP 序列）。所有图像经两名 10 年以上产科 MRI 诊断经验医师进行阅片。分别对唇腭裂的有无以及图像质量进行评分。**结果：**针对唇裂：医师 1 在 HASTE 和 TRUE-FISP 两个序列的诊断准确性分别为 100%和 95%；医师 2 诊断准确性为分别为 95%和 95%。针对腭裂：医师 1 在 HASTE 和 TRUE-FISP 序列的诊断准确性分别为 85%和 90%；医师 2 诊断准确性为分别为 85%和 100%。扫描失败的层面：HASTE 序列中 6 个扫描关键层面缺失。TRUE-FISP 序列中 12 个扫描关键层面缺失。**结论**：MRI 扫描时合理运用序列可以更好地评价胎儿唇腭裂畸形。

EPO-1705

探讨三种磁共振脉冲序列在胎盘植入诊断中的应用价值

刘小艳
南通大学附属医院

目的 本研究旨在探讨 SSFSE 序列、2D-FIESTA 序列以及 DWI 序列在胎盘植入诊断中的价值 **方法** 选取 28 例临床或 B 超疑为胎盘植入的孕妇，应用 GE signa HDX t 1.5T 磁共振成像仪行轴位、矢状位、冠状位扫描，行 DWI 序列轴位扫描。**结果** 本研究发现 SSFSE 序列对胎盘信号不均匀、胎盘内条状低信号影、胎盘内增粗的血管影的显示率高于 2D-FIESTA 序列；而 2D-FIESTA 序列对子宫结合带中断、胎盘突入子宫肌层、胎盘突出子宫浆膜层的显示率更高；DWI 序列，植入性胎盘中，植入与非植入部分 ADC 值差异具有统计学意义。**结论** 三种脉冲序列在胎盘植入诊断中各具价值，SSFSE 序列、2D-FIESTA 序列联合 DWI 序列一起应用，可以提高胎盘植入诊断的正确率。

EPO-1706

胎儿尿道下裂的 MR 诊断并 4 例报告

蔡登华,马星卫
贵州省人民医院

【摘要】 **目的** 分析男性胎儿尿道下裂的的 MRI 表现，并与产后临床诊断及分型对照。**方法** 在超声筛查的基础上，超声检查怀疑尿道下裂后后均做胎儿泌尿系 MR 检查。搜集 4 例超声怀疑尿道下裂的胎儿，并在产后进入小儿外科诊治，有明确临床诊断分型。**结果** (1)胎儿泌尿系 MRI 检查诊断胎儿尿道下裂 4 例，产后随访结果显示，确诊 4 例，误诊 0 例，准确率为 100% ，确诊的 4 例尿道下裂患者中 1 例有并发畸形，并发畸形包括胎儿左肾旋转不良，左肾轻度积水。(2)胎儿尿道下裂的 MR 表现：①阴茎末端变钝，②阴茎向腹侧弯曲；③阴茎短小；阴囊分离和阴茎阴囊部分转

位形成特征性的“郁金香征”。④尿道显示异常（尿道开口于阴茎体部、根部，或尿道显示不清）。⑤尿道下裂可单独发生或合并其他异常，如隐睾、斜疝、膀胱尿道反流、泌尿系统异常等。也可作为综合征的表现之一。本组中 1 例合并有左肾旋转不良及轻度积水。

结论 MRI 可清楚显示胎儿尿道下裂的病变程度及范围,同时能够发现其他生殖系统发育畸形。但不能准确分型，需在产后临床诊断分型。

胎儿先天性中胚叶肾瘤产前ＭＲＩ表现、生后 CT 表现及病理分型

黄莉,刘鸿圣,何秋明,钟微
广州市妇女儿童医疗中心

胎儿先天性中胚叶肾瘤产前ＭＲＩ表现、生后 CT 表现及病理分型

黄莉[1]，刘鸿圣[1*] ，何秋明[2]，钟微[2]
（1 广州市妇女儿童医疗中心放射科，2 广州市妇女儿童医疗中心新生儿外科 广东 广州 ５１０１２０）

［摘 要］ 目的 观察胎儿先天性中胚叶肾瘤产前ＭＲＩ表现、生后 CT 表现及病理分型。方法 回顾性分析经病理确诊的 3 例 CMN 患儿的 产前ＭＲＩ资料，生后 CT 资料及病理资料， 观察肿瘤的位置、大小、形态、产前 MRI 信号特点、生后 CT 强化特点及病理特征。结果 3 例 CMN，2 例为左侧肾区， 1 例为右侧肾区。3 例均呈类圆形。2 例产前 MR 特点为 T2WI 稍高信号，T1WI 等信号，1 例产前 MR 特点为 T2WI 稍高信号，T1WI 稍低信号。2 例生后 CT 强化特点呈“包裹征”，1 例生后 CT 呈结节状不均匀强化并瘤内出血。2 例病理分型为经典型，1 例为细胞型。1 例突发宫内窘迫、心包积液且肿物明显增大。1 例孕期羊水过多。结论 胎儿中胚叶肾瘤具有一定影像特征，孕晚期密切随访有助于提高预后。

EPO-1708

胎儿侧脑室扩张的 MRI 诊断价值评价

逄利博,陈刚,翟敬芳
徐州市中心医院

目的：通过对胎儿侧脑室扩张 MRI 分析，探讨 MRI 在胎儿脑发育结构异常的诊断价值。

材料和方法：收集本院 2017 年 3 月至 2019 年 7 月间，行超声筛查后一周内行 MR 检查病例 203 例。MRI 有胎儿侧脑室扩张 122 例，其中 30 例 B 超阴性者为自愿做 MR 检查，患者年龄 18-44 岁，平均年龄 27 岁，MR 检查时间为妊娠 23-40 周，平均 28.5 周，胎位头位 95 例，臀位 21 例，足位 1 例，横位 5 例。使用 GE、PHILIPS1.5T 超导 MR 机，扫描序列 2D FIESTA、2D Balance FFE，层厚 4mm，对胎儿头部行横断面、冠状面、矢状面扫描。

结果：

MR 表现：侧脑室扩张 122 例，两侧脑室扩张 48 例，单侧脑室扩张 74 例；左侧脑室扩张 65 例，右侧脑室扩张 9 例，轻度扩张 69 例，中度扩张 5 例；两侧脑室轻度扩张 41 例，两侧脑室中度扩张 7 例，对称性扩张 7 例，不对称扩张 41 例；后颅窝池增宽 36 例，7 例单纯增宽，23 例伴有小脑下蚓部发育小，5 例变异型 D-K 畸形，1 例典型 D-K 畸形；胼胝体发育不良 14 例，其中胼胝体缺如 5 例；透明隔腔增宽 34 例；蛛网膜下腔增宽 17 例；大脑皮层发育不良 2 例；左侧脉络丛增大 1 例，

左侧脑室脉络丛囊肿 1 例，左侧脑室脉络丛出血 1 例；小脑幕下蛛网膜囊肿 1 例；叶状全前脑 2 例，脑叶发育异常 1 例。97 例侧脑室扩张同时伴发其它一种或多种脑结构异常。
B 超表现：侧脑室扩张 73 例，两侧脑室扩张 26 例，单侧脑室扩张 47 例，分别为 MR 同比检出的 59.8%，54.2%，63.5%；后颅窝池增宽 20 例；两侧脉络丛囊肿 1 例，叶状前全脑 1 例，胼胝体缺如 1 例，下蚓部欠规整 2 例，脑内无回声区 7 例。B 超阴性者 30 例。14 例侧脑室扩张同时伴发其它脑结构异常。
结论：MRI 对胎儿侧脑室扩张诊断明确且不易漏诊，较超声具有明显的优势，同时诊断伴发的其它脑发育结构异常增多；胎儿脑 MRI 应用需要及早普及，有利于优生优育。

EPO-1709
不同类型胎儿轻度脑室扩张的扩散加权成像变化

蔡舒蕾,张国福
复旦大学附属妇产科医院

目的：评估双侧脑室轻度扩张胎儿与孤立性单侧脑室轻度扩张胎儿各区域 ADC 值变化。
方法：选择 2015 年 1 月至 2019 年 7 月期间 64 个轻度脑室扩张的胎儿（其中 47 个胎儿孤立性单侧脑室轻度扩张，17 个胎儿双侧脑室轻度扩张，脑室扩张程度（1.1cm-1.5cm），孕周位于 22-35。另选择 36 个正常胎儿。进行扩散加权成像（DWI），两个 b 值为 0 和 800s/mm^2，测量胎儿两侧额叶、颞叶、枕叶、顶叶、基底节区、丘脑、小脑半球、脑桥及脑室脑脊液 ADC 值，每个区域测量三次、计算平均 ADC 值；比较各组 ADC 值差异。
结果：对照组与脑室扩张组之间，孕妇的年龄，胎龄没有统计学差异（P=0.905；P=0.922）;三组胎儿左右两侧额叶、两侧颞叶、两侧枕叶、两侧顶叶、两侧基底节区、两侧丘脑、两侧小脑半球之间无统计学差异（P>0.05），计算各脑区平均 ADC 值。与对照组相比，孤立性单侧轻度脑室扩张胎儿的额叶 ADC 值减低（对照组 1.81±0.12 vs 1.72±0.11），颞叶 ADC 值减低(对照组 1.72±0.14 vs 1.63±0.13)，差异有统计学意义(P=0.001；P=0.003)。两侧脑室轻度扩张组与对照组各脑区 ADC 值差异无统计学意义。与对照组相比，孤立性单侧脑室轻度扩张组、双侧脑室轻度扩张组脑脊液的 ADC 值均升高（对照组 2.74±0.19 vs 2.83±0.16 vs 2.89±0.13），差异有统计学意义(P=0.025；P=0.002)。
结论：脑室轻度扩张的不同类型与 ADC 值存在相关性；双侧脑室轻度扩张组与对照组各部位 ADC 值无统计学差异，可能提示双侧脑室轻度扩张对脑微结构的影响较小；孤立性单侧脑室轻度扩张胎儿额叶及颞叶 ADC 值降低，提示孤立性单侧脑室轻度扩张胎儿存在潜在额叶及颞叶的变化，ADC 值的变化可能有助于了解脑室微结构的损伤。

EPO-1710
儿童格兰尼格（岩尖）综合征的 MR 和 CT 的影像表现

莫宗明
广东省广州市妇女儿童医疗中心

格兰尼格综合征是急性岩尖炎较为罕见的一种临床症状，通常是中耳炎治疗不及时而引起的更严重的临床症状，另外外伤、肿瘤病变等也可以引起此症状，其特点是中耳炎、眶后疼痛和外展神经麻痹(CN VI 麻痹)影响外侧直肌(CN VI 麻痹)，因为岩尖部的解剖位置特点，当出现岩尖部的炎症时，可引起格兰尼格综合征的一系列症状，尤其是颅脑神经症状，如果不及时治疗，其后果会很严重，所以需要及时诊断并且了解病变的范围。

通过影像资料（CT 及 MRI），能清楚病显示变累及的范围，给予临床足够的诊断证据，尤其是当病变累及到海绵窦区时，应警惕颅内感染的可能性，本文旨在通过其影像资料及临床资料，总结出格兰尼格综合征的影像特点，并尝试对格兰尼格综合征行感染程度分级，及时提醒及指导临床治疗病人。

本文通过使用我院电子病历系统，筛选出我院曾患有格兰尼格综合征的儿童 10 名，这些患者曾于我院型 CT 及 MRI 检查，其中 CT10 例，MRI2 例，通过观察这些患者的影像资料及查询其电子病历系统了解其临床病史，部分提早出院或转院的病人则行电话询问其治疗情况及预后。

结果显示本院 10 名患儿的影像图像均可见岩尖部水肿，强化明显；CT 可见 2 例患儿岩尖部骨质欠光整，可见破坏并形成脓肿；2 例 MRI 均提示岩尖周围有长 T1、T2 液性信号影，DWI 显示弥散受限；其中 1 例患儿海绵窦内还可见栓子形成。MR 及 CT 有助于病变的定位及其累计范围，影像表现有一定的特征性，通过观察我院影像图片，在此对其影像特征进行总结。

结论：笔者结合部分文献资料尝试将岩尖综合征的感染分级如下：I 级：岩尖部只有水肿而无骨质破坏或栓子形成；II 级：岩尖部除了水肿还并发骨质破坏，但没见到栓子形成；III：单见到栓子形成，无论有无骨质破坏均应列为此级别。

在婴幼儿内耳神经显示中 3.0TMRI 的诊断价值的探讨

徐守成,王更辉
哈尔滨市儿童医院

目的 在婴幼儿内耳神经显示中的 3.0T MRI 的影像表现特点及其对临床诊断中的应用探讨
方法：回顾性分析哈尔滨市儿童医学医院影像科经 Philips 3.0T MRI 检查的 25 例 50 耳先天性听力筛查未通过怀疑神经性耳聋患儿的内耳神经影像学资料.所有患儿均进行 T2WI 3D DRIVE 内耳水成像序列检查。
结果：轴位像示前庭蜗神经及面神经均显示为 19 例 34 耳，其中单侧显示 4 例 ，双侧均显示 15 例。仅面神经显示前庭蜗神经显示不清为 4 例 4 耳 ，均为单侧。前庭蜗神经显示、面神经显示不清 1 例 1 耳。
面神经与前庭蜗均未见显示的为 1 例 2 耳。经斜矢状位后处理内耳道底示：面神经、蜗神经、前庭上神经、前庭下神经四根神经的影像表现可分为以下几种情况：1、四根神经均清晰显示 19 例 34 耳，其中单侧 4 例　双侧 15 例；2、面神经和蜗神经正常显示，前庭上下神经呈混合细条状显示 14 例 28 耳，均为双侧；3、面神经正常显示，前庭上下神经与蜗神经呈一根显示的为 2 例 4 耳；4、所有四根神经均为未见的为 2 例 3 耳;5、面神经未见显示，前庭蜗神经显示 1 例 1 耳。统计发现：耳蜗神经显示程度与患儿耳聋程度呈正相关，与患儿年龄呈负相关。
结论：3.0T MRI 可以清晰显示婴幼儿耳部面神经及前庭蜗神经，能够给临床提供神经性耳聋明确的证据。

Nasal Chondromesenchymal Hamartoma (NCMH): a systematic review of the literature with a new case report

Fan Yu
Xuanwu Hospital, Capital Medical University

*[Abstract] **Purpose** To present a systematic review of NCMH cases alongside a case report of an infant with asymptomatic NCMH. **Methods** A systematic review was conducted in accordance with PRISMA guidelines from March, 2015 to November, 2018. A PubMed, EMBASE, CNKI, WANFANG Med Online and manual search through references of relevant publications was used to identify all published case-reports of NCMH. Data was collected from each case-report on: patient demographics, laterality, size and location of NCMH, presentation, treatment and follow-up. **Results** On the basis of Mason's article in March 2015 (48 patients), The systematic review updated 21 patients (including ours): 12 male, 8 female, 1 not mention. Mean age of NCMH was 9.1 years (range: 1 day–70 years). Presentations were mostly nasal congestion (n = 28). NCMH also involved the paranasal sinuses (n = 40). DICER1 mutations in 5 NCMH patients, establishing a link to the DICER1 tumor spectrum. Only 12 patients had tumor recurrence in the follow-up. For the 21 updated-cases of NCMH, 17 cases underwent CT examination and most of them presented as well-defined soft tissue mass with surrounding bone destruction and calcification (n=5). 15 patients underwent MRI examination, with solid (n=9), cystic-solid (n=5) or cystic lesions (n=1). NCMH demonstrated a heterogeneous mass on T1 weighted images and T2 weighted images show the presence of cystic components. **Conclusion** NCMH is a rare benign tumor causing of nasal masses, but with malignant imaging trait of extensive bone destruction. It is associated DICER1 tumors in young children and adults, and should be known by more people.*

儿童鼻眶部原始神经外胚层肿瘤的影像学表现及临床、病理特征

李洋,宋修峰
青岛市妇女儿童医院

【摘要】目的：总结发生于儿童鼻腔鼻窦及眼眶部原始神经外胚层肿瘤（primitive neuroectodermal tumor，PNET）的 CT 和 MRI 表现，结合其临床、病理特征，进一步提高对本病的认识。 **方法** 回顾性分析 10 例经手术病理证实的鼻腔鼻窦及眼眶部原发性 PNET 的 CT 和 MRI 征象，患者年龄 4~13 岁，10 例 PNET 例均行 CT 平扫，8 例同时行 MRI 平扫，7 例行 MRI 普通增强扫描，另有 1 例同时行 MR 动态增强扫描检查，后处理得到时间信号变化强度曲线（TIC 曲线）及其非定量参数。**结果** 10 例肿瘤主体均位于鼻眶部并向颅底或颅内浸润，呈不规则状、边缘不清。CT 表现：8 例病变主体均呈等密度，2 例呈稍低密度，病变内部密度欠均匀；10 例肿瘤主体均呈纵向生长，周围骨质均呈明显溶骨性骨质破坏，肿块突破筛板侵及颅内，其中脑组织受累 8 例，前颅凹 7 例，中颅凹 4 例。MRI 表现：行 MRI 平扫的 8 例肿瘤主体在 T1WI 上呈等信号 4 例，低信号 4 例，T2WI 呈等信号 3 例，高信号 5 例，内部信号皆不均匀，硬脑膜均见受累，MRI 普通增强示肿块明显不均匀强化，硬脑膜均见强化，4 例海绵窦异常强化。1 例 MRI 动态增强扫描所得 TIC 曲线呈速升-平缓型，T_{peak} 为 56.25s，SI_{peak} 为 1792.5，MSI 为 1.26%，WR 为 3.03%，ER 为 78.57%。**结论** 儿童患者发生累及鼻、眶部的实性肿块，内部伴坏死灶、呈不均匀明显强化，沿纵轴生长侵犯硬脑膜以及易向颅底、颅内转移是鼻眶部 PNET 较具特异性的表现。

126 例儿童眼眶眶周肿瘤的 CT 影像学特征分析

任翔,杨秀军
上海市儿童医院、上海交通大学附属儿童医院

目的 分析 126 例儿童眼眶眶周肿瘤的影像学特征，了解儿童眼眶眶周肿瘤在眼眶周围的分布特点，提高术前疾病的诊断率和为手术入路提供影像学依据。**方法** 回顾性分析上海儿童医院 2015 年 1 月-2018 年 12 月儿童眼眶眶周肿瘤患儿共 126 例，结果均由手术后病理学检查或组织活检证实。总结各种不同类型眼眶肿瘤的 CT 影像学特征，为术前定位定性诊疗提供影像学依据，比较良、恶性肿瘤的 CT 影像学差异。**结果** 在 126 例儿童眼眶眶周肿瘤中，排在首位的是皮样囊肿及表皮样囊肿，占所有眼眶肿瘤的 73%，其次为钙化上皮瘤（6%）及脂肪纤维组织增生（6%）。非良性肿瘤比例少，仅为 4 例。**结论** 儿童眼眶眶周肿瘤中最常见的为皮样囊肿及表皮样囊肿，恶性肿瘤的突眼度较良性肿瘤高;良恶性肿瘤的 CT 影像学特征进行对比，发现恶性肿瘤的骨质破坏比例较良性肿瘤高，且更易压迫或侵犯眼外肌。而视神经改变的 CT 影像学特征在良、恶性肿瘤中鉴别诊断中意义不大。眼眶肿瘤的 CT 影像学特征在疾病的诊断和术前定位方面应用价值高。

EPO-1716
我国 6 岁以下汉族儿童正常咽腔上气道和周围软组织的 MRI 图像线性测量

仪晓立

首都儿科研究所附属儿童医院

目的:获得不同年龄组咽腔上气道和周围软组织的正常参考值范围，并分析其在各组内的性别差异和年龄进行相关性
方法:选取 521 名 6 岁以下无睡眠呼吸障碍的中国籍汉族儿童为研究对象，选择标准依据睡眠呼吸障碍量表评分、临床病史和颅脑 MRI 图像制定执行。所有的颅脑 MRI 扫描均在受试者镇静状态下使用同一台 GE 公司 1.5T Signa HDx MRI 扫描仪（GE, Healthcare, Waukesha, WI, USA）进行。在颅脑 MRI 图像上以垂体柄和中脑导水管同时显示来确认正中矢状面，然后在正中矢状面上确定 11 个标志点用于后续线性测量。咽腔上气道和周围软组织共有 12 个测量项目在正中矢状面上获得，分别是：软腭长度、软腭厚度、腺样体厚度、鼻咽腔高度、舌长度、舌高度、咽腔上气道长度、颏棘-斜坡间距离、沿着颏棘-斜坡连线的舌、软腭、鼻咽腔、腺样体宽度。在轴位 MRI 图像上以双侧扁桃体的最大层面作为目标层面，获得双侧扁桃体宽径和扁桃体间腔 2 个测量项目
结果:1）六组受试者年龄、身高、体重和 BMI 值组内性别之间无统计学差异（P ＞ 0.05），BMI Z-score 均在标准±1.96 范围内；2）获取了六组受试者咽腔上气道及周围软组织 MRI 线性测量项目的平均值和 95%置信区间参考值；3）所有的 MRI 线性测量项目在不同性别间未表现出显著差异（P ＞ 0.05）；4）所有的 MRI 线性测量项目均与年龄呈正相关（P ＜ 0.05）；5）上气道的长度与身高呈正相关(P ＜ 0.001)，与 BMI 不相关（P ＞ 0.05）
结论： 本研究采集了我国 6 岁以下各年龄段无睡眠呼吸障碍的汉族儿童咽腔上气道和周围软组织线性测量的正常值，在 6 岁以下儿童中不存在性别间差异，与年龄之间存在密切的相关性。

EPO-1717

MRI 在诊断半侧巨脑畸形的价值

关牧娟,赵鑫
郑州大学第三附属医院

目的 分析并总结半侧巨脑畸形（HME）的磁共振（MRI）表现，以提高对 HME 的认识及诊断准确率。
方法 回顾性分析自 2015 年 1 月至 2019 年 6 月本院收治的 20 例 HME 患者的临床及 MRI 表现。
结果 20 例 HME 患者临床表现为单纯精神运动发育迟滞者 9 例，合并顽固性癫痫者 5 例，单纯表现为癫痫者 6 例。MRI 表现为 10 例大脑半球体积增大，10 例部分脑叶体积增大；3 例广泛皮层发育不良伴白质大面积异常信号，17 例单脑叶皮层发育不良伴受累脑叶白质异常信号；胼胝体膝部增厚者 15 例，压部增厚者 2 例，二者同时增厚者 3 例；枕极摇摆征阳性者 12 例，中线结构前份向对侧移位者 15 例；同侧侧脑室增宽者 10 例，侧脑室前角变窄、拉直 13 例，其中 3 例同时合并对侧侧脑室增宽；3 例合并中脑及小脑体积增大。2 例行 MRI 波普分析，病变侧基底节区及受累脑白质 NAA/(Cho+Cr)比值降低，P 值小于 0.05。
结论 HME 临床表现主要为精神运动发育迟滞及癫痫；MRI 表现具有一定特征性，在诊断半侧巨脑畸形方面具有很大应用价值。

EPO-1718

三叉神经根部与周围血管关系的临床意义

王更辉,徐守成
哈尔滨市儿童医院

方法 观察脑干薄层 3D-TOF 扫描的病例 150 例，MR 检 查采用 SIMENS3.0T 磁共振机，使用头部 8 通道线圈平扫，采用 3DTOF 扫描程序，扫描参数 :TR 23 ms，TE 3.6 ms，翻转角 15°，FOV

165×220，层厚 1 mm。 统计分析了三叉神经痛组 69 例及无三叉神经痛组 81 例的三叉神经与周围血管的关系。

结果压迫三叉神经及有接触关系的血管有小脑上动脉、小脑前下动脉、基底动脉。原发性三叉神经痛组 69 例中，表现为压迫关 系 15 例，占 21.7%;接触关系 47 例，占 68.1%;无接触关系 7 例，占 10.1%。 非三叉神经痛组 81 例中，表现为接触关系 24 例， 占 29.6%;无接触关系 57 例，占 70.4%。 经 x2 检验，三叉神经痛组与非三叉神经痛间压迫关系、接触关系及无接触关系间均 差异有统计学意义(P<0.05)。
结论 脑干薄层 3D-TOF 磁共振扫描可清晰显示三叉神经与血管的关系，是指导临床治疗血管 压迫三叉神经痛的非常有价值的无创检查，从而为三叉神经痛的病因诊断及临床的治疗提供一定的影像学依据。

EPO-1719

HRCT 与 MRI 联合应用在小儿内耳畸形的对照研究

张毅,王志伟
哈尔滨市儿童医院

目的：研究 HRCT 与 MRI 在小儿耳部畸形的影像诊断方面的应用价值，通过两者的比较及综合应用分析，更加准确的对小儿耳部畸形进行诊断，探讨实行 HRCT、MRI 检查的对小儿耳部畸形诊断意义，为临床治疗提供更有利的帮助。
方法： 2010 年 1 0 月～2 0 1 2 年 5 月我院临床诊断听力障碍的儿童 5 5 例，男 31 例，女 24 例，年龄最小者 6 月，最大 10 岁，平均年龄 6±2.6 岁，分别进行 HRCT 及 MRI 检查。CT 采用 Philips64 排螺旋 CT，检查病人仰卧,头位摆正, 以听眶上线为扫描基线自外耳道下缘扫至岩骨上缘, 获得横轴面 CT 图像。层厚、层距均为 0.675mm, 窗位 500-600Hu,窗宽 3500-4000Hu。扫描结束后在专业工作站上分别进行垂直于双侧颞骨的多平面及多参数重建。
磁共振技术采用 3D FIESTA 序列，是采用 GE Signa 1.5T 超导型 MR 系统，相控阵头线圈，。常规冠状面 T1WI、T2WI 及横断面 T2WI 扫描后，行 3D-FIESTA 序列扫描，扫描参数 TR=4.9 ms，TE=2.9ms，翻转角 65 度 FOV=20cm，Bandwidth：31.25 kHz，Matrix=320×256，层厚 0.6mm，NEX=4，扫描时间 3 分 10 秒。扫描结束后在 GE AW4.3 工作站上分别进行垂直于双侧内耳道的重建，重建范围自内耳道底至桥小脑角区。
结果：本组 55 例患儿，未见明显中内耳畸形患儿 23 例，内耳畸形患儿 32 例，其中双侧畸形 21 例，单侧畸形 11 例，其中 Mondini 畸形 4 耳，单纯前庭导水管扩大 16 耳，前庭导水管扩大伴有内淋巴囊扩大 23 耳， Michel 畸形 1 耳，共腔畸形 2 耳， 内耳道畸形 3 耳，蜗神经不发育或发育不良 4 耳。

EPO-1720

儿童眼部疾病的影像学表现

张增俊,陈超,胡文,侯欣,王冬,王小飞
西安市儿童医院

目的 提高对儿童眼部先天性及后天性疾病认识，旨在准确诊断。方法 对我院近 2013 年 1 月-2018 年 12 月经病理证实的小儿眼部病变进行回顾性分析。结果 先天性无眼球畸形 1 例。先天性小眼球合并眼眶囊肿 1 例，影像表现为眼球各径线明显缩短，眼球内结构正常，球后见境界清楚的水样低

密度囊肿。双侧上直肌发育不良 2 例。双侧外直肌发育不良 2 例。眼球后部缺损或视网膜脉络膜缺损 3 例；进行性视网膜毛细血管扩张伴有不同程度的视网膜渗出及视网膜脱离 6 例，好发年龄为 5-10 岁，男性多见，单眼发病，球内均匀的梭形高密度影，无强化、钙化及眼球缩小。永存原始玻璃体增生症（ PHPV）9 例，单眼发病，病眼变小，玻璃体密度增高，有不规则肿块，典型者承“高脚酒杯”形略高密度影直达视盘，未见钙化。骨纤维异常增殖症 7 例，影像表现为眼眶壁、筛骨、蝶骨骨质膨大弥漫性增厚，呈磨玻璃样改变，视神经管狭窄。血管性病变 15 例，影像学表现为类圆或椭圆形，边界清楚，表面较光滑，部分有钙化或静脉石，眼球、眼外肌、视神经有移位或分界不清，眼眶扩大，骨受压变形或吸收，增强扫描大部分肿瘤呈渐进性明显均匀强化。颈动脉海绵窦瘘 5 例，眼球突出，眼上静脉扩张，增强明显强化呈迂曲扩张的静脉团，海绵窦扩张，眼外肌常呈弥漫性梭形肥厚。视网膜母细胞瘤 19 例，单侧发病 15 例，双眼发病 4 例；主要临床表现为“白瞳症”， 影像表现为团块状软组织影，常伴有钙化；眼球内期眼球大小正常，眼球内有肿块，常有钙化，其发生率高达 90%以上；青光眼期：眼球玻璃体内甚至前房充满肿块，眼球增大，眼压增高；眼球外期：肿瘤沿视神经向眼眶侵润，视神经增粗>4mm，沿视神经侵犯至颅内。远处转移期：肿瘤转移至肺、肝等全身器官。转移瘤 6 例，白血病浸润 7 例，横纹肌肉瘤 4 例。 结论 眼部病变影像表现虽有一定特点，但病史和临床决不能忽视，某些病变最终诊断仍然依靠病理学。

EPO-1721

MRI 内耳水成像技术在内耳畸形诊断的应用价值

赵鑫,郝济森,邢庆娜,常高瑞
郑州大学第三附属医院

目的：探讨磁共振内耳水成像在人工耳蜗植入术前影像学评估中的应用价值
方法：对 115 例临床拟进行人工耳蜗植入的患儿常规行 MRI 平扫及内耳水成像检查。采用 GE 公司生产的 1.5TMRI 头部相控阵线圈,快速三维自旋回波。头颅必须摆放正确,使两侧对称。MRI 检查技术：颞骨横断面三维快速稳态自由进动梯度回波序列(3D-FIESTA)。层厚 0.8mm,TR 4.8ms,TE 1.5ms,矩阵 256×256。在 GE ADW4.1 工作站行最大强度投影(MIP)内耳重建。内耳与内耳道的 MRI 水成像检查，并将原始图像传送至工作站，分别用多平面重组影像（MPR）、最大信号强度投影（MIP）和立体透视技术（VRT）3 种方法进行三维重建。对不能自然入睡的患儿给予 10%水合氯醛 0.5 ml/kg 通过口服或肛门给药镇静。
结果：所有患者顺利完成检查，115 例中，耳蜗与蜗神经显示正常 70 例，Mondini 畸形 13 例，其中伴有半规管异常 5 例，Michel 畸形 2 例，耳蜗未发育 2 例，共同腔畸形 2 例，蜗神经发育不良 7 例，大前庭导水管综合征 14 例，
结论：磁共振内耳水成像能清晰显示内耳膜迷路与前庭蜗神经的解剖形态和发育状况，作为术前影像学评价的一种重要手段，能够为人工耳蜗植入的成功实施提供重要的信息。

EPO-1722

The value of DTI in the evaluation of auditory pathway in children with bilateral hearing loss

Xin Zhao,Xiang YUE ,XING YIN
The third AFFILIATED hospital of Zhengzhou University

Objective:To study the difference of auditory pathway in children with different degrees of bilateral hearing loss (USNHL), and to observe the changes of auditory pathway with age in normal children.
Materials and methods :Patients with USNHL were involed and divided into three groups subjectivley according to the audiometery threshold value(A/mild, B/moderate and C/severe), severe sensorineural deafness patients also involved in . 24 normal subjects with the age of 3 - 42 days as a control group Before the examination for infants and young children ,10% hydration of chlorine aldehyde enema was implemented with the does of accurately. Start scanning when the subjects fall asleep, soft ear insertion to reduce noise and wearing a SIEMENS special anti noise headphones. All subjects examined using a3.0T scanner(MAGNETOM Skyra,Siemens Healthcare,Erlangen Germany). DTI was performed using a prototype sequence of 2.2×2.2×4mm^3,TR=3700ms, TE=92ms, B=1000mm^2/s.MPRAGE imaging was acquired using a prototype sequence with voxel size of 2.3×2.3×1.0 mm^3 ,TR=2200ms, TE=2.48ms, flip angle 8 degrees. SIEMENS 3T SKYRA postprocessing station position measurement of The FA vulue of inferior colliculus and medial geniculate were measured using the SIEMENS Syngo Via workstation.
1) inferior colliculus in the horizontal plane through the mammillary body (the brain) level of the suprasellar cistern is located in the central section (Figure 1).
2) the medial geniculate body in the horizontal plane: choice of mound skull (by side horizontal section of midbrain level) (Figure 2).
Using the Wilcoxon rank test for statistical data postprocessing 1.4 statistical analysis, linear correlation analysis using Pearson correlation method, using SPSS17.0 for data processing and statistical analysis, and $P<0.05$ statistical test standard.

Results: there was no statistically significant difference between group A and control group about FA value ($P>0.05$); group B, group C and control group of inferior colliculus and medial geniculate body between the FA value difference was statistically significant ($P<0.05$), and were less than the control group; there is a linear relationship at FA value of inferior colliculus and the medial geniculate body in the control group,and the control group at FA value of 2 ROIs increase with age. See Figure 3, figure 4.
Conclusion:as for now ,CI is an important way of treating children with bilateral hearing loss,and DTI is very important to evaluate the microscopic change of auditory pathway,and it can tell us more valuable information that if the patient can performent CI.Moderate and severe USNHL were inferior colliculus, medial geniculate body FA decreased; FA value in the diagnosis of normal and mild USNHL in limited value.

EPO-1723

学龄期儿童鼻咽癌 MRI 影像学分析

班美累,冯潇
广西医科大学第一附属医院

【摘要】目的 探讨学龄期儿童鼻咽癌临床症状、影像学特征，以提高早期诊断能力，减少误诊漏诊。 **方法** 回顾性分析 2011.3—2019.3 期间经病理组织学证实的 10 例学龄期儿童鼻咽癌的临床资料及 MRI 影像学表现，主要分析鼻咽部病灶及颈部、咽后淋巴结的影像学特征。 **结果** 10

例患儿年龄 9-14 岁， 平均年龄 12.5 岁。 临床表现因颈部肿块 7 例，鼻出血 1 例，头痛 1 例，鼻塞 1 例，痰中带血 1 例，耳部不适 1 例，耳鸣 1 例症状就诊，出现 2 种及以上症状 7 例，无视力下降、复视或斜视等症状患者。影像诊断结核 1 例，纤维血管瘤 1 例。病理结果未分化性非角化性癌 7 例，分化性非角化性癌 1 例，非角化型鳞状细胞癌 1，未分化性癌 1 例。MRI 表现为鼻咽部局限性不规则软组织肿块 9 例，鼻咽粘膜弥漫均匀增厚 2 例，边界不清并向深部软组织浸润 9 例，颅底骨质破坏 9 例；T1WI 均呈等信号，T2WI 呈稍高信号为主，其中 7 例内见斑片状液化坏死高信号，增强扫描肿瘤均呈明显强化，不均匀强化 7 例，均匀强化 3 例。两侧颈部及咽后淋巴结肿大 10 例，其中出现淋巴结融合成团 9 例，增强扫描不均匀明显强化 9 例，均匀明显强化 1 例。合并鼻窦炎 9 例，合并中耳炎 9 例。据 2017 年鼻咽癌分期，T3N2M0 7 例，T3N3M0 1 例，T4N3M0 1 例，T2N2Mx 1 例。 **结论** 学龄期儿童 MRI 表现为鼻咽部不规则软组织肿块合并周围深部软组织浸润、颅底骨质破坏及颈部、咽后转移性淋巴结肿大，应考虑到鼻咽癌的可能。

EPO-1724
磁共振电影相位对比法评估婴幼儿脑血流量

付明翠,杨明
南京市儿童医院（南京医科大学附属儿童医院）

目的 用磁共振电影相位对比法（cine phase contrast MRI，Cine PCMRI）观察婴幼儿颈内动脉血流动力学参数，评估婴幼儿大脑血流量。**方法** 收集我院 2019 年 1～5 月因临床需要做磁共振检查的年龄为 11～132 周的婴幼儿 37 例。采用多个编码速度的 Cine PC MRI 序列测量颈内动脉的峰值流速（Peak velocity，Vp）、颈内动脉的供血流量。在 MRIcron 及 ImgJ 软件上勾画测量脑体积，进一步计算单位体积大脑脑血流量（cerebral blood flow，CBF）。采用线性相关分别分析婴幼儿年龄与颈内动脉 Vp、颈内动脉供血流量、CBF、颈内动脉血管直径、大脑体积之间的关系。采用线性相关分析颈内动脉 Vp 与血管直径、心率之间的关系。**结果** 本组婴幼儿颈内动脉 Vp 平均值为 67.6±4.8cm/s，与年龄没有明显相关性（P = 0.532）。颈内动脉供血流量、颈内动脉直径、大脑体积及 CBF 随着年龄增长而增长（均 P<0.01）。本组婴幼儿 CBF 为 12～68ml/100g/min,与年龄的拟合曲线中以三次多项式的 R^2 最大。峰值流速与血管直径、心率之间无明显相关性。**结论** Cine PC MRI 能无创获得婴幼儿颈内动脉血流动力学特点，可为量化评估婴幼儿的脑发育情况提供更多的信息。

儿童胆脂瘤性中耳炎诊断及鉴别诊断

赖灿
浙江大学医学院附属儿童医院

目的：儿童慢性化脓性中耳炎是常见病、多发病，其中分成单纯性、骨疡性和胆脂瘤型三类，但临床误诊较多，需要探索该病的影像特点及鉴别要点。
材料和方法：收集了本院最近两年的发生误诊的 6 例患者的图像，其中慢行化脓性中耳炎三例，郎格罕组织细胞综合症 2 例，横纹肌肉瘤 1 例，纤维血管瘤 1 例。在临床上这些病变都表现为颞部肿块，外耳反复流脓、耳部疼痛，听力下降，在临床上鉴别存在一些困难。然后这些病变都做出 CT、MRI 平扫及增强检查。同时这些病人都做了手术及病理，诊断结果明确，我们随后回顾性分析这些病变的影像表现特点，以便我们能在未来提高影像诊断水平。
结果：首先化脓性中耳炎又分三个类型，影像上表现不一样，单纯性中耳炎比较常见，骨疡性和胆脂瘤性比较少见，特别容易误诊的是胆脂瘤性中耳炎，影像表现为乳突小房呈膨胀性、溶骨性破坏，骨壁变薄，部分可以有破坏。郎罕乳突也可以有破坏，呈大范围溶骨性破坏，增强后病灶内可以有明显强化。横纹肌肉瘤发病位置一般在颞骨下方，向上可以累及破坏乳突，病变以软组织肿块为主。
结论：慢性化脓性中耳炎是临床常见病，与郎罕、横纹肌肉类、纤维血管瘤表现有一定的相似性，因此误诊较多，影像表现各有一定特点，掌握他们之间的鉴别要点对临床早期正确诊断、合理治疗，具有重要意义。

儿童脑实质室管膜瘤的 CT、MRI 诊断

吴于淳,任翔,杨秀军
上海市儿童医院 、上海交通大学附属儿童医院

目的：探讨儿童颅内脑实质室管膜瘤的 CT、MRI 影像特点及其组织病理相关性，提高其影像学术前诊断能力。**方法** 回顾性分析 2015-2018 年我院经手术病理证实的异位室管膜瘤 9 例 CT、MRI 及组织病理学资料。所有患儿均行了 CT、MRI 检查，其中 CT 增强 9 例，MRI 检查至少包括轴位 SE-T1WI、T2WI、T2-FLAIR、DWI（b 值为 0 和 1000）和矢状面 T1WI 或 T2WI 及 Gd-DTPA 增强轴位、矢状面、冠状面 T1WI。**结果** 9 例病理均为间变型室管膜瘤、WHO III 级。肿瘤起源于幕上脑实质 8 例、起源于幕下脑实质 1 例，7 例位于大脑凸面，均为不规则多分叶团块状， CT 表现为等低或等高混杂密度，瘤内均可见颗粒状及斑片状钙化灶，增强后呈中等至明显强化改变；MRI 表现为 T1WI 等低信号、T2WI 等高混杂信号，DWI 均为等-稍高信号为主改变、部分区域 ADC 值下降，增强扫描显示实质部分不均匀明显强化及不典型环形强化，9 例均出现囊性变、囊变区域无强化，瘤周脑水肿较明显。**结论** 颅内脑实质室管膜瘤多为间变性室管膜瘤，CT、MRI 表现有一定的特征性，有助于术前明确诊断

研究探讨 3.0TMR 超高 b 值 DWI 在新生儿缺血缺氧性脑病的应用

高凯
山西省儿童医院/山西省妇幼保健院

摘要：目的:研究探讨 3.0TMR 超高 b 值 DWI 对新生儿缺血缺氧性脑病（HIE）诊断应用价值.方法:选取本院自 2019 年 1 月至 6 月 100 例结合病史、临床表现诊断为新生儿缺血缺氧性脑病的患儿行 3.0TMR 高 b 值 DWI 检查，b 值分别为 1000s/mm2,2000s/mm2 **结果:**,比较两组 b 值的 DWI 检查结果.结合 ADC 图，结果:b 值=1000s/mm2 与 b 值=2000s/mm2 时检查出的新生儿缺血缺氧性脑病的敏感性,特异性,准确性以及阳性预测值比较,差异具有统计学意义(P<0.05).**结论：**经过我们对 100 例患儿扫描图像的对比研究，虽然超高 b 值 DWI 较常规 b 值 DWI 的 SNR 更低，但超高 b 值 DWI 的脑组织中的多成分扩散，慢速扩散成分比常规 b 值更敏感，3.0TMR 超高 b 值 DWI 对新生儿缺血缺氧性脑病尤其是微小病灶的缺血灶敏感度更高，对患儿的诊断及临床治疗很大的价值。

624 例生长激素缺乏矮小儿童垂体的 MRI 表现及常见病因分析

徐超
徐州市儿童医院

摘要：目的 探讨生长激素缺乏(GHD)矮小儿童垂体疾病的 MRI 表现，提高对该类疾病的诊断水平。**方法** 回顾性分析 624 例经临床确诊为 GHD 矮小儿童垂体病变的 MRI 表现及临床资料。**结果** GHD 矮小儿童垂体疾病包括腺垂体发育不良 383 例(61.4%)，垂体柄阻断综合征（PSIS）49 例(7.9%)，原发性甲状腺功能减退性垂体增生 16 例(2.6%)，Rathke 囊肿 41 例(6.6%)，空泡蝶鞍综合征 74 例(11.9%)，朗格汉斯细胞组织细胞增生症（LCH）垂体侵犯 17 例(2.7%)，鞍区蛛网膜囊肿 2 例(0.3%)，颅咽管瘤 42 例(6.7%)。腺垂体发育不良表现为垂体前叶高度小于正常值，垂体后叶位置及信号正常，垂体柄未见中断、变细及异常信号。PSIS 表现为垂体前叶发育不良，垂体柄缺如或变细，垂体后叶异位。垂体增生由甲状腺功能减退所致，表现为垂体前叶体积增大，上缘隆起，增强扫描呈明显均匀强化，垂体柄未见中断及异常信号，激素替代治疗后垂体缩小。LCH 垂体侵犯表现为垂体柄增粗，垂体后叶在 T1 上失去高信号，垂体前叶大小及信号可正常。Rathke 囊肿、空泡蝶鞍综合征、鞍区蛛网膜囊肿及颅咽管瘤均表现为垂体前叶萎缩变薄。**结论** MRI 能清晰地显示垂体及鞍区的微细结构，是检出垂体病变的重要手段，能够准确的显示 GHD 矮小儿童各种垂体疾病的特点，具有很高的临床实用性，有助于临床疾病的早期诊断和鉴别诊断，并可监测其治疗效果。

磁敏感加权成像技术在早产儿颅内微小出血的应用

赵沁萍[1],赵沁萍[1]
1.广西南宁市第二人民医院
2.广西南宁市第二人民医院

目的 探讨 3.0T 磁敏感加权成像（SWI）技术在早产儿颅内微小出血的临床应用价值。**方法** 收集我院 2016 年 1 月至 2019 年 1 月早产儿患者 126 例，均行常规 T1WI、T2WI、FLAIR 及 SWI。**结果** 126 例头颅 MR 平扫 T1WI、T2WI、FLAIR 像均显示阴性，SWI 清楚地显示了脑内微出血灶，表现为点状

及斑点状低信号，相位图呈高信号，一共发现病灶 168 个。**结论** 在早产儿颅内微小出血患者中，SWI 较常规 MRI 扫描序列更多的显示微出血状况，为临床提供更多的诊断信息，可作为早产儿颅内微小出血诊断的常规扫描序列。

Survival outcomes of patients with advanced retinoblastoma: a multi-center comparative analysis of different treatment strategies

Qiuying Chen,Bin Zhang,Shuixing Zhang
The First Affiliated Hospital Of Jinan University

Purpose: To compare the survival outcomes and high-risk histopathological features of intravenous chemotherapy (IVC), ophthalmic artery chemosurgery (OAC), and IVC plus OAC in patients with advanced retinoblastoma.
Design: Retrospective, comparative, multi-center study.
Participants: From April 2006 to February 2017, 492 patients with advanced retinoblastoma (group D and E eyes according to the International Intraocular Retinoblastoma Classification) from multi-centers were included for analysis. They underwent IVC (n = 279), IVC plus OAC (n = 103), or OAC (n = 110).
Methods: Kaplan-Meier analyses were performed to compare 1-year and 3-year rates of ocular survival, overall survival (OS) and event-free survival (EFS) among the three groups. Details of enucleation and histopathological results were recorded.
Main outcome measures: Ocular survival, OS, EFS, and histopathological results.
Results: The corresponding ocular survival rates at 1, 3 years were 20.7% and 8.8%, 79.3% and 61.7%, and 84.2% and 63.2% in the IVC, IVC plus OAC, and OAC groups, respectively. The IVC group showed obviously worse ocular salvage compared with the other two groups ($P < 0.001$), while the IVC plus OAC and OAC groups had no difference ($P = 0.612$). The corresponding OS rates at 1, 3 years were 95.1%% and 85.0%, 97.4% and 94.5%, and 97.2% and 93.5% in the IVC, IVC plus OAC, and OAC groups, respectively. The OS rates of the three groups showed no significant differences. The EFS rates at 1, 3 years also had no significant differences between the IVC plus OAC group and OAC group (86.0% vs 85.6%, $P = 0.884$; 73.2% vs 71.5%, $P = 0.884$; respectively). After histopathologic examination of enucleated eyes, high-risk features were identified in 31.5% (76/241) of the IVC group, 10.5% (4/38) of the IVC plus OAC group, and 16.7% (5/30) of the OAC group eyes, with a p value of 0.010.
Conclusions: Our findings indicated that traditional treatment strategy of enucleation after IVC for advanced retinoblastoma maybe no longer applicable. The combination of IVC and OAC or OAC alone could save more eyes and lead to an improved prognosis. Therefore, OAC may be recommended as the primary treatment for children with advanced retinoblastoma to avoid the side effects of IVC. However, the role of IVC still needs to be investigated by randomized controlled trials in the future .

HRCT 在正常儿童耳蜗的标准化测量

胡文
西安市儿童医院

目的 利用 HRCT 多平面重建耳蜗标准方位图像并测量正常耳蜗的相关径线,为评价内耳发育提供影像依据。
资料与方法 收集本院颞部 CT 内耳正常和听力正常的儿童 200 例（400 耳），按年龄分为 A 组 100 例（200 耳，8 月-6 岁）和 B 组 100 例（200 耳，>6 岁且<18 岁）。通过多平面重建技术((MPR)得到标准方位图像，根据国际认定的耳蜗标准坐标系统，测量耳蜗相关径线：耳蜗底转长径（BL）、耳蜗底转宽径（BW）、耳蜗高度（CH）、斜轴位蜗神经管宽度(CNCa)、斜矢位蜗神经管宽度(CNCs)，曲面重建（CPR）测量耳蜗管长度（CL）。
结果 男性耳蜗的 BL、BW、CL 较女性长，差异有统计学意义，CH、CNCa、CNCs 性别间无统计学差异（$p<0.05$）；耳蜗各径线在年龄及左右侧间相比，差异无统计学意义（$p>0.05$）.

结论：儿童正常耳蜗的标准化径线测量有助于了解内耳结构的发育特点，对诊断耳蜗发育异常有重要意义。

3D-FIESTA 联合高分辨 CT 对儿童内耳不完全分隔畸形并自发性脑脊液耳漏的诊断价值

王冬,张增俊,胡文,陈超,陈华
西安市儿童医院

目的：探讨三维稳态进动快速成像（3D-FIESTA）序列联合高分辨 CT（HRCT）对儿童先天性内耳不完全分隔畸形并自发性脑脊液耳漏的诊断价值。**方法：**回顾性分析本院 6 例内耳不完全分隔Ⅰ型畸形并自发性脑脊液耳漏患儿的 3D-FIESTA、HRCT 表现及临床资料，总结其影像及临床特点。**结果：**共 6 例患儿，4 例为单侧畸形，2 例为双侧畸形，6 例脑脊液耳漏均为单侧发病；6 例耳蜗与前庭间均可见分隔，耳蜗均呈囊状，无蜗轴，5 例耳蜗内可见少许残余分隔，1 例耳蜗为完全囊状，6 例均伴前庭扩大及水平半规管增粗；6 例均可见乳突蜂房、鼓室及咽鼓管积液；6 例冠状位 HRCT 均可见内耳道底骨质缺损及前庭窗扩大，6 例冠状位 FIESTA 均可显示位于前庭窗与中耳鼓室间的瘘道。5 例患儿有反复化脓性脑膜炎病史，1 例有脑外伤病史。**结论：**内耳不完全分隔Ⅰ型畸形伴反复化脓性脑膜炎病史时，HRCT、3D-FIESTA 可精准显示内耳、中耳的细微结构，尤其冠状位 HRCT 及 FIESTA 可显示内耳道底骨质缺损及漏口的位置，对于明确病因有重要价值。

EPO-1734

MSCT 在婴幼儿上呼吸道梗阻诊断中的应用价值

刘菁华
上海市儿童医院

【摘要】**目的**探讨多层螺旋 CT（MSCT）及多平面重组（MPR）重建技术在婴幼儿上呼吸道梗阻的病因诊断中应用价值，以期早期诊断、治疗，改善预后。**方法**回顾性分析 2014 年 2 月至 2018 年 12 月上海市儿童医院的 117 例上呼吸道梗阻（除外气道异物）患儿的临床资料，年龄 3 天～5 岁，女

39 例，男 78 例，全部病例(110 例颈部，9 例鼻咽部)行 MSCT 平扫+增强，并 MPR 及三维重建检查，59 例进一步行喉镜检查，49 例术后行病理检查。**结果** MSCT 扫描结果：舌根部囊肿 50 例，其中 1 例（喉镜证实）伴有先天性喉软骨软化病，咽喉部淋巴管瘤 3 例，舌根部异位甲状腺 1 例，舌根部、咽喉侧壁及声门下血管瘤 7 例，颈部多发纤维瘤压迫咽部气道 1 例，巨舌症 1 例，鼻后孔闭锁 9 例（4 例为单侧，5 例为双侧），声带赘生物 2 例，咽喉部乳头状瘤 1 例，脂肪瘤 1 例；另 41 例中 39 例显示咽喉部气道左右径较窄，经喉镜检查结果确诊为先天性喉软骨软化症，2 例显示声门区局部软组织影略增厚，经喉镜检查结果诊断为喉蹼。MSCT+MPR 诊断上呼吸道梗阻的病因定位准确率达 100%，定性准确率达 92%。**结论**婴幼儿上呼吸道梗阻多数以吸气性喉鸣为首发症状，除先天性喉软骨软化症外，还有很多器质性病变，其中囊肿最常见。对以喉喘鸣发病或不明原因的上呼吸道梗阻，应尽早完善 CT 扫描。MSCT 薄层图像结合 MPR 后处理技术对病灶定性定位准确率高，为临床的诊断治疗起到有效快捷的指导作用。

64 排螺旋 CT 对多生牙的定位诊断应用

丁聪兴
昆明市儿童医院

目的　探讨螺旋 CT 三维重建对上颌埋伏牙定位诊断的应用价值　口腔上颌埋伏牙由于其埋伏生长于牙槽骨内以及多生牙相混交错生长的结构特点，临床医师定位常较困难，临床定位常依据根尖位片、曲面断层片及咬合片、侧斜位片和 CT 二维图像等,工作站后处理成像，来探讨 3D 技术对于埋伏阻生牙及多生牙的定位在临床诊治中的价值。

方法　使用美国 GE 螺旋 CT 机，患者仰卧位，听眦线定位，咬住棉签。轴位扫描范围:上颌窦底至口咽部。扫描参数:层厚 3.75mm;重建间隔 0.625mm 电流 100mA，电压 100kV。将所得到的二维图像传送到 ADW4.5 工作站，利用 3D 软件及二维成像软件。3D 成像后以 SSD 方法切割去除不感兴趣区域或伪影区域，再利用 MPR 技术选择最佳显示窗，多方位、多角度进行观察和存储图像。

结果　三维重建后多角度观察单个牙埋伏阻生,三维重建图像在多生牙埋伏阻生定位诊断中明显优于二维图像。

三维重建技术在上颌埋伏牙及多生牙定位诊断中的意义在于:（1）可确定埋伏阻生牙的位置是软组织阻生还是颌骨内阻生;（2）可确切显示骨内埋伏多生牙的数目、大小和形态;（3）可确切显示埋伏多生牙的方向是在牙列的唇颊侧还是舌侧;（4）可确切显示所在颌骨中位置的高低;（5）可确切显示埋伏多生牙与相邻牙胚和牙根的距离或嵌入关系等，提供了可靠的依据，便于临床医师确诊和选择最佳治疗时机

EPO-1736

基于颞骨 CT 平扫的面神经曲面重建技巧

徐盛威
重庆医科大学附属儿童医院

目的：分享基于颞骨 CT 平扫的面神经曲面重建（CPR, curved plannar reconstruction）技巧，辅助临床诊断，提高工作效率。

方法：用 Philips 公司 Brilliance iCT 行颞骨 CT 平扫，120kV，200mA，调节窗宽 3200、窗位 700，原始图像在 GE 公司的 AW4.7 后处理工作站上进行 reformat 处理，左右两侧面神经分开做 CPR。首先在横断面层面找到内耳入口处，通过逐渐变换横断面层面可以完成面神经内耳道段、迷路段的 CPR；随后找到膝状神经节处，此处面神经迷路段近似垂直于岩大浅神经和面神经鼓室段，呈“T”型结构，借助三线定位，将中心位置放于鼓室段，然后在斜矢状面上可以清楚的看到面神经鼓室段和乳突段的走形，沿此路径即可轻松完成面神经鼓室段和乳突段的 CPR。
结果：面神经出脑桥后全长可分为 6 段：小脑、桥小脑角段；内耳道段；迷路段；鼓室段（水平段）；乳突段（垂直段）；颞骨外段。一般在颞骨 CT 扫描范围包含内耳道段、迷路段、鼓室段和乳突段。从解剖上看，面神经出迷路段后有一膨大区，为膝状神经节，由此向前有一分支为岩大浅神经，向后为面神经鼓室段，此结构呈“T”型，即面神经迷路段垂直于岩大浅神经和面神经鼓室段，这就是做 CPR 时显著的定位参考标志。因此，借助此方法做面神经 CPR 方便快捷，极大提高了工作效率。
结论：随着低剂量 CT 应用普及和临床诊断需要，越来越多的临床医生在检查申请单上特意备注要了解患者面神经情况。因此，该面神经 CPR 技巧简化了工作流程、提高了效率、有益于影像诊断和满足临床需要。

64 排 MSCT 后处理技术在儿童正畸埋伏阻生牙诊疗中的价值分析

唐贤超
昆明市儿童医院

目的 探讨 64 排螺旋 CT 后处理技术在儿童正畸埋伏阻生牙诊疗中的价值分析。**方法** 分别搜集近期 50 例我院生多生牙患儿 CT 影像资料信息，通过容积再现（VR），最大密度投影（MIP），多平面阻重组（MPR)和曲面重组（CPR)等技术对扫描图像进行后期处理，对颌骨内埋伏阻生多生牙进行三维定位，辅助临床进行正畸治疗。**结果** 50 例患者共有 56 颗埋伏牙，通过 64 排螺旋 CT 多种重建技术的组合应用，CT 扫描能清晰看清多生牙生长位置、大小、形态、萌出方向、比邻关系，与正畸手术符合率 100％。**结论** 64 排螺旋 CT 后处理技术可充分显示埋伏牙的位置，给临床正畸治疗提供了客观依据，具有重要的临床应用
价值。

128 层螺旋 CT 低剂量扫描对儿童腺样肥大的诊断价值

甘宁
贵州省铜仁市印江土家族苗族自治县人民医院

[摘要] 目的 探讨 128 层螺旋 CT 低剂量扫描技术对儿童腺样体肥大的诊断价值。方法：连续收集临床诊断腺样体肥大患儿 60 例，且术前均行 128 螺旋 CT 扫描，随机分为实验组和对照组；实验组（30 例）：80 kV 扫描，参考管电流 150 mAs；对照组（30 例）：常规 100 kV，参考管电流 150 mAs；两组均采用滤波反投影法（filtered back-projection，FBP）重建。比较不同扫描条件下两组鼻咽气腔前后径 A/N 比值、图像主观评分及有效辐射剂量。结果 两组腺样体 A/N 比值比较差异无统计学意义；两组图像的主观评分差异无统计学意义（P>0.05）且均能达到诊断要求；两组辐射剂量比较差异有统计学意义（P<0.05），实验组较对照组辐射剂量降约 15.58%；结论 128 层螺旋 CT 儿童腺样体低剂量扫描，有效降低辐射剂量的同时保证了图像质量。

EPO-1739
基于 aw4.7 工作站的儿童胸部气管树 CT 重建应用体会

徐盛威
重庆医科大学附属儿童医院

目的：分享日常工作中儿童胸部气管树 CT 三维重建应用体会，旨在提升 CT 后处理工作效率。

方法：本科室购买使用 GE 公司的 aw4.7 工作站，在该工作站上对需要行气管树三维重建的患儿薄层图像进行后处理。回顾性分析重建流程，对于气管树 CT 三维重建主要包含如下内容：1 虚拟内窥镜，旨在查看气道有无堵塞、是否通常；2 矢、冠状面 batch 图，旨在从不同平面诊断是否异常；3 做横、矢、冠状面 MinP(最小密度投影)图，旨在观察完整气道是否流畅或异常；4 玻璃肺，即透明肺，主要是看形态、发育是否异常；5 单独的（支）气管树，可以很清楚的看气道是否发育异常或是否有异物堵塞。

结果：儿童胸部气管树 CT 重建常规包含以上五个步骤，而 aw4.7 工作站在前几个版本基础上 UI 界面有所优化。因此当用 aw4.7 工作站行儿童胸部气管树 CT 重建时更方便快捷，整个流程 3 分钟左右即可完成。

结论：儿童胸部气管树 CT 重建常见于临床需求诊断肺部炎症、气道发育异常、（支）气管异物等，在本院所占比例较大，以上五个步骤的重建可以全方位的对儿童肺部病变进行诊断，在 aw4.7 工作站上熟练操作可以极大提高工作效率。

EPO-1740
Application of artificial intelligence(AI) assisted cardiac function analysis in pediatric patients

Chuan Fu,Xue Sheng Li,Ying Kun Guo,Hua Yan Xu
West China second hospital of sichuan university

Purpose: to testify the feasibility and potentiality of artificial intelligence (AI) in cardiac function analysis of CMR examination in pediatric patients, and further comparing the consistency with traditional manual analysis.

Methods and Materials : We enrolled 26 pediatric patients (age: 3-13) coming for CMR examination. All patients were scanned 8-10 slices cardiac short axis cine_tf2d sequence (Siemens, 3T Skya) covering the whole LV. Both AI (Siemens, inline VF technique) and manual analysis (Simpson volume method) were used. All patients were divided and compared according to age (>10/≤ 10 years old), heart rate(HR) (> 80 / ≤80/min), and whether holding breath. Bland–Altman and Pearson correlation were performed.

Results: AI traced 16(61.5%) patients with the wrongly endo-/ epi-cardial border, located in liver, aorta, atrium, right ventricle respectively. In patient with older age, AI show better consistency (bias: -1.6±13.7; r=0.748.)with manual method than

younger patients (bias: 2.6±21.6; r=-0.041). Patients with lower HR also displayed good conformity (bias: -1.9±11; r=0.748.) for these two techniques than high HR ones (bias: 3.0±17.6; r=-0.041). More importantly, in our study, the two methods had good agreement in these holding breath patients, and poor consistency in those with free-breathing.

Conclusion: AI technique assisted cardiac function analysis had good agreement with manual method in older, low HR or breath holding pediatric patients. However, for some high HR, young or free breathing patients, computer generated contours may not be accurate, and may not correspond to anatomy. Thus, the AI technique need more improvement for the accuracy and clinical feasibility.

EPO-1741
肺动脉闭锁 II 型合并室间隔缺损影像分析

柴清华,杨瑞,刘继伟
河南省胸科医院河南康复中心医院

患者 男 3 岁，出生时颜面青紫、反应差，听诊心脏杂音，我院心脏彩超示：先天性心脏病：肺动脉闭锁 室间隔缺损（漏斗部 右向左）主-肺动脉交通支形成，主动脉瓣少量反流。建议手术治疗，家属因风险大拒绝手术。期间患儿哭闹口唇紫绀加重，伴杵状指，无昏厥、抽搐，为求进一步诊治再次就诊于我院。行心脏 CTA 检查：右室流出道级肺动脉瓣、肺动脉干未见显示， 左右肺动脉直接连通，管腔细小；主动脉根部顺时针旋转并轻度骑跨，室间隔上部见缺损。考虑肺动脉闭锁Ⅱ型合并室间隔缺损；右上肺尖后段肺动脉分支与右侧支气管动脉于右主支气管后方形成侧枝循环，并局限管径扩张；左右支气管动脉近心段级肺门段扩张，升主动脉及近段降主动脉相对增宽，降胸比＞2。经心外科学术委员会讨论，认为患儿无手术指证，与家属沟通后，患儿出院。
讨论：肺动脉闭锁合并室间隔缺损（PAVSD）是一组少见的严重紫绀型先天性心脏病。其定义是心室与肺动脉之间不存在管道连接，也无血液流通，合并室间隔缺损。本畸形占先天性心脏病的 0.2%。根据 Castaneda 等分型法，肺动脉闭锁合并室间隔缺损分为四型：肺动脉瓣及肺动脉主干近段闭锁为Ⅰ型；肺动脉融合分叉的近端闭锁，左右肺动脉连接为Ⅱ型；闭锁累及肺动脉分叉处至左右肺动脉连续性中断为Ⅲ型；无中央肺动脉，为Ⅳ型。本病例为Ⅱ型，且形成支气管动脉-右上肺尖后段肺动脉侧枝循环，主动脉根部旋转并轻度骑跨。

EPO-1742
基于 Revolution CT 的非镇静状态下婴幼儿快速低剂量胸部扫描的可行性研究

吴雨萌
上海市儿童医院、上海交通大学附属儿童医院

目的 探讨未镇静婴幼儿采用 Revolution CT 16cm 宽探测器行胸部轴扫前的患儿检查准备时间、扫描所得图像质量及辐射剂量；并与同月龄、口服镇静剂后、行 64 排 CT 胸部螺旋扫描的患儿其准备时间、图像质量、辐射剂量做比较，评价 Revolution CT 在婴幼儿胸部断层扫描中的重大意义。
方法 分别随机抽取我院 2019 年 6 月至今，2 岁内因肺部感染，使用 Revolution CT 及 64 排 CT 进行胸部断层扫描的婴幼儿各 40 例，收集此 80 例患儿胸部 CT 检查所有数据资料并按月龄分组。

结果 1、Revolution CT 转速快、总扫描时间短，有效解决了婴幼儿检查依从性差的问题，确保患儿在未镇静状态下能顺利完成胸部 CT 扫描，节省检查前准备时间。2、Revolution CT 使用 16cm 探测器，较传统 64 排 4cm 探测器范围更宽，可一次轴扫完成整个胸部断层扫描，较 64 排螺旋扫辐射剂量大大下降。3、同月龄婴幼儿 Revolution 及 64 排 CT 所得胸部断层的图像质量相仿，均具有客观诊断价值。4、婴幼儿采用 Revolution CT 进行胸部检查，无需镇静，缩短准备时间，效率提高工作流程改进，与临床工作更进一步接轨。**结论** 与口服镇静剂后采用传统 64 排螺旋 CT 检查相比，未服用镇静剂婴幼儿所使用的 Revolution CT 16cm 宽探测器胸部轴扫成像能够有效减少辐射剂量、检查前准备时间及总扫描时间，同时呈现相仿的胸部图像质量；Revolution CT 的快速扫描及宽体探测器给 CT 检查带来全新代技术，能更好地服务于临床。

基于模型的迭代重建算法对儿童低电压低浓度对比剂胸部 CT 图像质量的优化

孙记航,彭芸
首都医科大学附属北京儿童医院，国家儿童医学中心

目的 评价基于模型的迭代重建算法（full model-based iterative reconstruction，MBIR）对联合应用 100kV、低浓度对比剂儿童胸部增强 CT 图像质量的优化能力。**方法** 收集低剂量胸部增强的儿童患者 56 例作为观察组，扫描电压 100kV，自动管电流调节技术设置管电流，根据年龄设置噪声指数 11-15，增强扫描注射对比剂浓度为 270mgI/ml，重建为 50%自适应迭代重建算法图像（adaptive statistical iterative reconstruction，ASIR）图像与 MBIR 图像；对照组选取 56 例应用 120kV 扫描的病例，扫描方案相同，对比剂浓度为 320mgI/ml，对比剂注射方案相同，图像重建为 50%ASIR 图像。评价 3 组图像的主观质量及客观质量，图像主观质量包括整体图像噪声、强化程度、病变显示以及硬化伪影情况；客观质量分别测量左心室最大层面的左心室、背侧竖脊肌的噪声值，并计算相应的信噪比（SNR）以及对比噪声比（CNR）。**结果** 观察组放射剂量 CTDIvol=1.79±1.45mGy，对照组为 1.68±0.92mGy，两组放射剂量无统计学差异（p=0.65）；观察组平均用碘量为 5837.13±2689.32mgI，对照组用碘量较对照组的 7272.00±3803.75mgI 减少了 19.73%（$p<0.05$），整体图像噪声、强化程度、病变显示以及硬化伪影情况观察组 MBIR 图像均可以满足诊断要求，优于 2 组 ASIR 图像；MBIR 图像噪声较 ASIR 图像降低了 42.80-59.93%；两组 ASIR 图像 SNR、CNR 差异不明显，但 MBIR 图像 SNR、CNR 明显增高，观察组 MBIR 图像较对照组的 ASIR 图像 CNR 提高了 165.70%。具有统计学差异。**结论** MBIR 可以优化儿童 100kV 低对比剂浓度胸部 CT 图像质量，达到减少肾脏损伤的目的。

EPO-1744
idose4 重建技术在儿童气管及支气管 CT 低剂量扫描的应用

王颖
南京医科大学附属儿童医院

目的研究迭代重建技术 idose4 在儿童气管及支气管 CT 低剂量扫描的应用及对图像质量的影响。**方法** 60 例年龄为 5 个月至 5 周岁气管及支气管 CT 检查患儿纳入研究，随机分成两组，每组 30 例。常规剂量组（A 组）：管电压 80kV，管电流 55mAs，采用 idose^{4}3 级重建。低剂量组（B 组）：管电压 80kV；管电流 30mAs，分别采用 idose^{4}2～6 级五种重建技术。两组均采用自动管电流调制技术。比较两组患儿 CT 容积剂量指数（CTDIvol）、剂量长度乘积（DLP）、有效辐射剂量（ED）及

体型特异性剂量评估（SSDE）之间的差异，并研究各参数值与患儿身高及体重的相关性。比较 A、B 两组图像噪声、信噪比（SNR）、主观图像质量。**结果** B 组 CTDIvol、DLP、ED 及 SSDE 值（0.54±0.08，16.78±4.16，0.41±0.05，1.18±0.16）均较 A 组（1.09±0.13，31.91±6.16，0.70±0.11，2.37±0.19）显著降低约 50%（t=14.53，8.63，10.11，20.22，P<0.05）。SSDE 值与患儿身高（r = 0.49, P<0.05）及体重（r = 0.64, P<0.05）有强相关性。B 组所有图像噪声较 A 组高，差异有统计学意义(P<0.05)；B 组图像 SNR 降低，在 idose^{4}2,3,4 级时与 A 组差异显著(P<0.05)，在 idose^{4}5,6 级时，与 A 组 SNR 无明显差异(P >0.05)；主观图像质量评价 B 组 idose^{4}2,3,4,6 级低于 A 组，差异显著(P<0.05)，idose^{4}5 级与 A 组间差异不具统计学意义(P > 0.05)。**结论**儿童胸部 CT 检查，管电压 80KV，管电流 30mAs（自动管电流调制技术），结合 idose^{4}5 级重建技术，图像质量满足临床诊断要求，同时辐射剂量比常规扫描降低约 50%；SSDE 评价辐射剂量与受检者体型因素关系较大。

不同权重多模型迭代算法（ASIR-V）对“双低”儿童胸部 CT 图像质量的影响

胡智军
西安长安医院

[摘要] **目的** 探究不同权重迭代重建技术（ASIR-V）对“双低”（低剂量、低 kVp）儿童胸部 CT 图像质量的影响。**方法** 随机选取 19 例儿童胸部 CT 平扫;年龄（5.82±3.47）排除标准：患有心脏病、胸廓畸形、胸部肿瘤及肥胖患儿。采用 GE Revolution CT，扫描条件与方法：嘱患儿自由呼吸，从胸廓入口扫至肺底，80kVp，自动毫安技术（ATCM），噪声指数（NI）为 14，前置 Pre-ASIR-V 为 0%，对图像进行不同权重 Pos-ASIR-V 重建（从 0%-100%，重建间隔为 10%），重建层厚为 0.625mm，共 11 组不同权（ASIR-V）图像；测量并计算每组图像胸廓入口、气管分叉及膈肌层面感兴趣区的皮下脂肪、竖脊肌及降主动脉的 CT 值及 SD 值，计算 SNR（CT 值/SD 值）并记录 CTDI、DLP，并计算有效辐射剂量 （ED）；统计学分析：由两位住院医师采用双盲法对各组图像进行 5 分法主观评分（≥3 分被认定为临床可诊断）采用单因素方差分析比较 11 组间各组织的 CT 值及 SNR 进行统计学分析，主观评分：采用 Kappa 检验两名医生一致性良好，秩和检验对各组图像进行主观评价。**结果：客观评价： 有效辐射剂量 ED 为（0.40± smv）较常规小孩胸部辐射剂量（1.00±0.20 smv）减少了 60%；噪声指数 SD 值，**随着迭代重建权重的递增而下降，图像质量逐步提升，采用 80%的迭代重建权重时图像质量最好。**结论** “双低”儿童胸部 CT 扫描中，Pos-ASIR-V 重建可显著降低图像噪声，提高图像质量，采用 80% Pos- ASIR-V 重建算法图像质量最好。**临床相关性与应用：**不同权重多模型迭代算法（ASIR-V）对“双低”儿童胸部 CT,采用 80% Pos- ASIR-V 重建算法图像质量最好，值得临床借鉴和推广应用。

EPO-1746
儿童毛细支气管炎的影像学表现

孔俊洋,曾文兵,刘嵩,钟雯,王怀武
重庆三峡中心医院

目的：探讨胸部 X 线片及高分辨率 CT(HRCT)对儿童毛细支气管炎的诊断价值。**方法：**回顾分析 136 例经临床诊断证实并有影像学资料的毛细支气管炎患儿的病历资料，其中男 59 例，女 77 例，年龄 2 月～2 岁 8 月，所有患儿为首次喘息发作并有典型临床表现。患儿行胸片检查 71 例，行 HRCT 检

查 104 例，既行胸片又行 HRCT 检查 49 例。**结果：**胸部 X 线片表现为：未见异常 39 例；肺野局部透光度不均匀 15 例；肺纹理增强 21 例；斑片状阴影 9 例。HRCT 表现为：未见异常 18 例；局部肺过度充气征 77 例；斑片状浸润影或（和）磨玻璃影 53 例；局部肺不张 19 例；支气管周围炎 28 例。**结论：**儿童毛细支气管炎影像表现有一定特征性，HRCT 比胸片更能显示儿童毛细支气管炎影像改变及影像特征，诊断儿童毛细支气管炎可基于临床表现、胸部 HRCT 及实验室检查。

EPO-1747
CT 在儿童纵隔神经母细胞源性肿瘤诊断、分期及治疗方案选择中的应用价值

刘玉奇,盛茂
苏州大学附属儿童医院

目的 探讨 CT 在儿童纵隔神经母细胞源性肿瘤诊断、分期及治疗方案选择中的应用价值。 **方法** 回顾性分析经病理证实的 29 例儿童纵隔神经母细胞源性肿瘤的临床资料、CT 表现及分期，并与病理结果进行对照分析。其中神经母细胞瘤（NB）20 例，节细胞神经母细胞瘤（GNB）4 例，节细胞神经瘤（GN）5 例。平均发病年龄 NB 为（34.35±24.12）个月，GNB 为（91.75±53.65）个月，GN 为（67.40±68.00）个月。所有病例均行 CT 平扫及增强扫描。**结果** 29 例神经母细胞源性肿瘤均位于后纵隔。80.0%（16/20）NB、25.0%（1/4）GNB 密度不均匀，100.0%（5/5）GN 密度均匀。80.0%（16/20）NB 呈不规则斑片状、点条状钙化，75.0%（3/4）GNB 和 80.0%（4/5）GN 呈点状钙化。增强后 75.0%（15/20）NB、50.0%（2/4）GNB 呈不均匀强化，且 85.0%（17/20）NB 和 75.0%（3/4）GNB 呈中度及明显强化，而 100%（5/5）GN 呈渐进性轻度强化。70.0%（14/20）NB、50.0%（2/4）GNB 见局部侵犯或远处转移。肿瘤 INRGSS 分期中 L1 期 3 例，L_2期 15 例，M 期 11 例。随访中 3 例 M 期 NB 发生复发转移。肿瘤生物因子检测显示 7 例 NB VMA 升高，8 例 NB、1 例 GNB 及 1 例 GN 的 NSE 升高，6 例 NB 的 *N-myc* 基因阳性。**结论** CT 在纵隔神经母细胞源性肿瘤的诊断、分期及治疗方案的选择中具有重要价值。

EPO-1748
儿童副心支气管的 MSCT 表现及分型

陈欣,王春祥,赵滨
天津市儿童医院

【目的】探讨儿童副心支气管（accessory cardiac bronchus, ACB）的 MSCT 表现及分型，以期提高儿科医生的认识。
【材料与方法】回顾性分析我院 2017 年 6 月至 2019 年 1 月诊断的 7 例副心支气管患儿的临床资料及胸部 MSCT 表现。7 例患儿中 4 例男孩，3 例女孩，年龄 9 个月～5 岁，平均年龄 2 岁。7 例患儿均行胸部 MSCT 扫描，并进行图像后处理，包括多平面重组（MPR）、最大密度投影（MIP）和容积再现（VR），分析总结其 MSCT 表现并分型。
【结果】7 例患儿的副心支气管均起源于右侧中间段支气管内侧壁，直径为 2.2㎜~3.8㎜，平均为 2.9㎜，长度为 3.1㎜~6.9㎜，平均为 5.0㎜。副心支气管与右侧中间段支气管的夹角为 27.0 °~63.9 °，平均为 47.8 °，与气管隆突的距离为 11.1㎜~18.9㎜,平均为 14.4㎜。7 例患儿中 2 例患儿副心支气管末端为盲端（Ⅰ型：憩室型），1 例患儿副心支气管末端伴有囊状结构（Ⅱ型：囊变型），4 例患儿副心支气管末端伴有通气肺小叶（Ⅲ型：副叶型）。

【结论】副心支气管是一种少见的气管支气管先天性异常，在临床上可并发反复感染。MSCT 可以清晰地显示儿童副心支气管的起源部位、直径、长度以及末端形态，为临床诊断提供重要依据。

EPO-1749

低剂量肺部 CT 在小儿支气管肺炎的诊断价值

陈春霞,林开武
福建省妇幼保健院

目的：利用低剂量肺部 CT 成像，提高小儿支气管肺炎肺部 CT 的诊断价值。
方法：回顾性分析 2016 年 1 月-2018 年 12 月来我科行肺部 CT 检查，采用 GE16 排螺旋 CT，扫描条件为 120KV、30mA、0.5s、5mm 层厚，均经细菌学和病毒学检查者共 252 例资料，其中男 142 例（占 56.3%），女 110 例（占 43.7%），年龄 2 月-10 岁，平均年龄 2.8 岁；所有患儿出现不同程度的发热、咳嗽、气促，肺部固定性的中、细湿罗音等临床表现。
结果：单侧肺病变者 39 例，占 15.1%；双侧肺病变者 213 例占 84.9%；其中，肺段实质侵润性病变（大片实变影）为主 113 例；肺小叶实质侵润性病变（斑点状或斑片状实变影）为主 57 例；肺间质侵润性病变（散在斑点或斑片状影）为主 49 例，淡薄磨玻璃影为主 27 例，伴发脓肿或肺气囊者 6 例，多数大片实变影和斑点或斑片状实变影共同存在。
结论：
1、低剂量肺部 CT 成像越来越受到影像科医师和患者家属的重视，在不影响诊断质量的前提下，应推广低剂量 CT 成像，本组低剂量扫描条件的患儿接受剂量均控制在平均每人 0.5msv 以内。
2、支气管肺炎，又称小叶性肺炎，是儿科常见的呼吸系统疾病，发病率较高，2 岁以内儿童多发，多发生于冬春寒冷季节及气温骤变时。
3、病毒性肺炎以间质受累为主，细菌性肺炎以肺实质损害为主，但常由病毒和细菌混合感染，CT 表现多样化；治疗不及时会出现脓胸、脓气胸、肺气囊等。
总之，低剂量肺部 CT 虽然与常规扫描条件相比图像质量有降低，但并不影响图像的诊断质量，且显著降低患儿接受的辐射剂量，是值得推广和广泛应用的技术，有着很好的临床应用价值和社会效益。

CTA 在 TOF 伴发畸形中的诊断价值

张小安,朱功升,王之祥
郑州大学第三附属医院

目的：探讨 CTA 在法洛四联症及其伴发畸形诊断中的诊断价值。 方法：对 64 例法洛四联症患者 CT 资料进行回顾性分析, 与手术或 B 超结果对照。选取 2017 年 1 月—2019 年 3 月郑州大学第三附属医院经手术证实的法洛氏四联症患儿 64 例的 MSCTA 资料，所有病例均行 MSCT 和心脏超声（ECG）检查，其中男 37 例，女 27 例。年龄 11 天—12 岁，所有病例均采用西门子 64 排 CT 扫描机检查，扫描范围为胸廓入口至左膈面下 5 cm ,常规进行第二期扫描, 延迟时间为 19～23s, 对于显示异常静脉引流有很大帮助。为避免腔静脉内高浓度对比剂干扰周围结构显示，经头皮或手背静脉增强者，扫描方向为足头方向,经足背静脉增强者，扫描方向为头足方向。 将轴位图像传 AW4.2 工作站对薄层图像连续滚动观察并进行三维重建，主要进行多平面重建(multipleplanar reformation ,MPR)，最大密度投影(,MIP)，曲面重组(,CPR)，容积成像

(volumerendering ,VR) 等方法重建。所有图像胶片由 2 位放射科主治医师进行分析，共同商讨得出一致
结论。对结果采用计数资料 x2 检验，P < 0.05 为差异有统计学意义。 结果：多层螺旋 CT 对 64 例患者均显示了肺动脉狭窄、室间隔缺损、主动脉骑跨及右室壁肥厚。合并畸形包括肺动脉闭锁 3 例，房间隔缺损 10 例，残存左侧上腔静脉 27 例，镜面右位心 4 例，左侧无名静脉低位 7 例，迷走右侧锁骨下动脉 35 例，右位主动脉弓 9 例，动脉导管未闭 4 例，双主动脉弓 2 例，迷走左头臂静脉 3 例，单支冠状动脉 1 例，大的主肺侧支动脉 16 例。 结论：多层螺旋 CT 不仅能显示心脏的解剖畸形，还清晰显示肺动脉及分支发育、伴发畸形，为外科手术方案制定提供依据，对术后评估提出依据。

EPO-1751
MSCT 及多平面重建及 CVE 对儿童气管支气管疾病的诊断价值

赵鑫,殷星,程美英
郑州大学第三附属医院

目的：评价胸部 CT 多平面重组及仿真内窥镜技术在气管支气管疾病诊治中的应用价值。
方法：回顾性分析 30 例反复咳喘患儿的影像学表现，检查设备选用西门子公司生产的 Definition AS+128 排螺旋 CT，胸部 MSCT 扫描前，患儿口服或灌肠 10%水合氯醛，剂量 0.5ml/Kg，最多不超过 10ml。扫描模式：螺旋扫描，螺距 0.875：1。扫描参数：120KV，200mA，层厚 1.25mm，层间隔 1.25mm。常规行多平面重组(MPR) 、最大密度投影(M IP)及容积再现(VR)等技术重组图像。由两名高年资 医师在工作站上对气管及支气管的内径分别进行测量，然后进行比较。
结果：CT 气道重建及仿真内窥镜技术检出气管支气管狭窄 8 例，支气管桥 1 例，原发性气管憩室 1 例，支气管发育不全 2 例，肺动脉吊带所致的气管压迫 2 例，双弓畸形所致的气管压迫 2 例，气管性支气管 4 例，气管性支气管是指叶或段支气管直接开口于气管的一种气道的先天发育异常,均起自于气管隆突上方右后侧壁，气管支气管异物 6 例，其中发生在左侧支气管异物 2 例，右侧支气管异物 4 例，MSCT 及仿真内窥镜正常 4 例。
结论：CT 气道重建及仿真内窥镜技术对气管支气管疾病具有重要的价值。MSCT 平扫在显示气管支气管的微小狭窄、气道与临近纵隔的关系方面存在一定的限制,而气道重建可清晰显示气管、支气管狭窄的部位、形态、内部特征及程度。对于生后不久出现喘息、呼吸困难、吸气性喉鸣等患儿，活尤其是活动后加重并严重气道狭窄者可伴有慢性缺氧、生长发育迟缓的患儿常常伴有心血管发育畸形，胸部 MSCT+多平面重建及气道仿真内窥镜可发现异常表现。

EPO-1752
先天性肺气道畸形的 CT 学表现

张增俊,陈超,侯欣,张雅,白慧萍,张雷,王冬
西安市儿童医院

探讨先天性气道畸形的 CT 表现，旨在提高对本病的诊断。资料及方法 对 11 例进行回顾性分析，其中男 6 例，女 5 例，年龄最大的 4 岁 6 个月，最小的 6 天。平均年龄 2 岁 7 月。临床以反复呼吸道感染，咳嗽、发热，气喘等来就诊。病史 9 天至 4 年。11 例均经手术、病理证实，术前胸部 CT 平扫，7 例病变区高分辨率 CT 扫描。结果 双肺受累 3 例，右肺受累 5 例，左肺受累 3 例，CT 表现单个或多个含气囊腔（直径≥2cm）6 例，多发蜂窝样囊腔（直径≤1cm）的 5 例，囊内含气 9 例，2 例囊内含少量液体,7 例伴有不同程度肺气肿，5 例合并纵隔疝。1 例合并先天性肺隔离

症。所有病变有一定的占位效应。结论 X 线平片虽然有一定的价值但定位和定性均不如 CT。CT 可更好地显示病变细节、间隔及邻近肺组织改变，明显地提高了 CCAM 小囊腔病变的检出率，有利于鉴别诊断及临床治疗方案的选择。

宽体超高端能谱 CT 在小儿体部肿瘤性病变的应用

张晓凡,郝明珠,王志伟,徐守成
哈尔滨市儿童医院

小儿原发性体部肿物的最常见部位为纵隔。肿瘤种类繁多，良恶各异。常见肿瘤为神经源性肿瘤、恶性淋巴瘤、气管囊肿及脉管畸形等，少见肿瘤为胸膜肺母细胞瘤等。患儿临床症状不典型，随肿瘤增长可出现压迫症状或并发感染，临床最常见的症状为咳嗽，呼吸困难和发绀咯血。不同病理类型肿瘤有其特殊的好发部位及影像学特征。

随着超高端 CT 影像技术的迅猛发展，能谱 CT 已应用于各部位肿瘤诊断中。能谱 CT 的水基图一定程度上可替代常规平扫图像，用于病灶内钙化成分的显示；碘基图反映肺组织的血供状态，选择合适的扫描时间，碘基图及碘浓度定量测量结果，可一定程度替代常规 CT 动态增强所获得的灌注信息。能谱 CT 可选择合适时间直接进行肺部增强扫描，免去增强前平扫，从而减少辐射剂量。单能量图像或基物质图像上所显示的病灶及最佳单能量的检测，采用最佳对比噪声比技术，将病灶作为目标，周围组织作为背景，获取最佳单能量，调整能量滚动条至最佳单能量水平观察病灶，可对病灶进行散点图，直方图及能谱曲线的分析。对判断肿瘤的良、恶性及其组织来源有较高的诊断价值；还能精确反映肿瘤与邻近脏器的解剖关系及其外侵和转移情况，有助于评估手术切除的风险和可能性，有助于术前拟定手术路径和切除方案，判断患者的疗效和预后。掌握小儿纵隔肿瘤能谱 CT 影像学特点对疾病诊断、手术方式的选择、风险评估和预后有重要意义。

CT A ppearances of Pulmonary Sequestration in Children

Chao Chen,zengjun Zhang,Wen Hu,Dong Wang,Xin Hou
xian children ‘s hospital

Department of Radiology, Xi’an Children’s hospital, Xi’an 710002,China

Abstract：Objective To study CT appearances of congenital pulmonary sequestration in children. Methods 71 children with pulmonary sequestration from 2013 to 2018 confirmed by surgery and pathology were retrospectively analyzed. All cases were examined with plain CT scans and contrast--enhanced CT scan. There were intra—pulmonary type in 63 and extra—pulmonary type in 8. Results The lesions in all cases located in the posterior basal segments of low lobes on CT images .The lesions appeared as cystic in 23 cases, solid in 11,cystic-solid in 37. Abnormal systemic feeding arteries were revealed by thin slice enhanced CT scans. Conclusion The main CT sign of pulmonary sequestration is a soft tissue shadow in the posterior basal segments of low lobes. Contrast--enhanced CT scans can show the supplying arteries of the lesions.

64 排 CT 在先天性主动脉缩窄及合并其它畸形中的诊断价值

张文涵
华中科技大学同济医学院附属武汉儿童医院

【摘要】**目的** 探讨 64 排螺旋 CT 血管成像(CTA)对先天性主动脉缩窄及合并其它畸形中的应用价值。**方法** 回顾性分析 2010 年 1 月至 2018 年 3 月临床诊断先天性主动脉缩窄合并其它畸形并经手术证实的 126 例患者资料，在工作站利用容积再现（VR），最大密度投影（MIP），多平面重组(MPR)等三维重建方法进行图像后处理。**结果** 64 排螺旋 CT 血管成像清晰显示 126 例主动脉缩窄（单纯主动脉缩窄 24 例，102 例合并心血管复杂畸形），24 例单纯主动脉缩窄中，12 例伴狭窄后扩张，12 例伴广泛侧支循环，6 例伴升主动脉瘤样扩张；102 例主动脉缩窄伴复杂畸形中，合并动脉导管未闭 19 例，合并肺动脉高压 33 例，合并室间隔缺损 44 例，合并房间隔缺损 48 例，合并静脉异位引流 3 例，合并大动脉转位 1 例，合并法洛四联症 1 例，合并双奇静脉弓 6 例，合并右室双出口 3 例，合并迷走右锁骨下动脉 10 例，合并动脉异位起源 8 例。结论：64 排螺旋 CT 血管成像可以清晰显示主动脉缩窄的类型、程度、范围、侧支循环及合并的心血管发育畸形，可以作为先天性主动脉缩窄合并心血管发育畸形的首选影像学检查，为临床诊断及治疗方案的选择提供最有价值的指导。

EPO-1756
主动脉缩窄儿童的主动脉弓 CTA 影像分析

吕莹,何玲
重庆医科大学附属儿童医院

目的: 探讨儿童主动脉缩窄患儿的主动脉弓发育的影像学特点。
方法: 回顾性分析本院 2014 年 10 月至 2017 年 4 月期间经手术确诊主动脉缩窄患儿 47 例及同期非心血管疾病的 47 例儿童的 CTA 影像及临床资料，两组均排除主动脉弓分支变异者。分别测量升主动脉平肺动脉主干水平最大内径（AOA）、横弓前部最大内径（D1）、横弓后部最大内径（D2）、峡部最大内径（D3）、主动脉缩窄最窄处内径（MD）及降主动脉穿横隔最大内径（DA），计算 D1/AOA、D2/AOA、D3/AOA、DA/AOA 进行组间比较；计算 MD/AOA 与 D1/AOA、D2/AOA、D3/AOA 进行相关性分析；若 D1/AOA≤0.6、D2/AOA≤05、D3/AOA≤0.4，则认为合并主动脉弓发育不良。
结果: CoA 组 D1/AOA、D2/AOA、D3/AOA 均低于对照组（P均<0.01），2 组 DA/AOA 差异无统计学意义（P=0.33）。COA 组 MD/AOA 与 D1/AOA 的相关性分析无统计学意义（P > 0.01），但与 D2/AOA、D3/AOA 呈正相关（P < 0.01）。CoA 组合并主动脉弓发育不良 26 例（55.3%），其中 D1/AOA≤0.6 11 例（23.4%）、D2/AOA≤0.5 15 例（31.9%）、D3/AOA≤0.4 13 例（29.8%）。
结论: CoA 患儿的主动脉弓发育较差，且 CoA 程度越重，主动脉横弓后部及峡部的发育越差，部分可合并主动脉弓发育不良，以横弓后部最多见。

EPO-1757
婴幼儿 II 型右位主动脉弓的 CT 影像表现与临床意义

马帅
首都儿科研究所附属儿童医院

目的：探讨先天性 II 型右位主动脉弓的 CT 影像表现以及对该疾病的诊断价值。 方法：回顾性分析 2014.6 至 2016. 5 在本院就诊发现的 3 例 II 型右位主动脉弓患儿的影像资料，认识并分析其解剖结构，总结其形态特点。结果：3 例 II 型右位主动脉弓中，1 例合并心内畸形及肺动脉韧带，1 例合并主动脉弓狭窄，1 例产生气管压迫。3 例中合并 Kommerell 憩室者 2 例。CT 增强扫描断层图像及重建图像能很好的显示大血管的解剖结构及位置关系，最小密度投影可以显示气管有无受压及程度。结论：临床诊断目前以动脉 CTA 诊断最为确切，可以很好的显示心脏大血管的形态学改变，对临床提供直观的治疗依据。

EPO-1758

Revolution CT 单次快速轴扫联合低管电压条件在儿童胸部大血管低剂量 CT 成像的临床研究

陈锡建,宁刚,李珮,刘赛
四川大学华西第二医院

目的 探讨和分析应用 Revolution CT 宽探测器单次轴扫在低管电压条件下扫描对儿童胸部 CT 血管成像图像质量及辐射剂量的影响。
方法 随机选择行胸部大血管 CTA 成像的 28 例儿童患儿为 A 组，行单次轴扫联合低管电压扫描。患儿年龄 3 月-6 岁，扫描条件：管电压：BMI≥15，80kVp，BMI＜15， 70kVp；管电流：SmartmA,噪声指数 10.0；扫描模式：axial，探测器宽度 120-160mm，单圈扫描时间 0.28s，迭代重建 ASIR-V:50%。选择 28 例同年龄段采用东软 NeuViz 128 多排螺旋 CT 行胸部 CTA 成像的病例作 B 组对照，扫描条件：100kv，自动管电流，噪声指数 1.2，扫描模式：helical，探测器 40mm，单圈扫描时间：0.35s，迭代重建: 50%。对比剂 1-1.5ml/kg@1.5-3ml/s 在 10s 内经留置针注入，采用肺动脉主干阈值 100HU 触发扫描肺动脉期，并于 5s 后扫描主动脉期。两组图像分别测量肺动脉主干、左右肺动脉、肺静脉，主动脉期升\降主动脉的 CT 值及标准差，计算信噪比(SNR)进行客观影像评价。并由两名高年资诊断医师以 5 分制对各组图像质量进行评分。同时记录患者扫描剂量长度乘积（DLP）数值。
结果 比较两组患儿年龄及体重指数，无统计学差异。A 组各点的 CT 值和 SNR 均高于 B 组，经 t 检验对比有统计学差异（P＜0.001）。主观图像评价比较，A 组评分为 4.36±0.86, B 组为 3.48±1.12，A 组显著高于 B 组（P＜0.001）。辐射剂量比较，A 组 DLP 为 86.46±12.86mGy*cm，显著低于 B 组 148.84±18.32mGy*cm。
结论 Revolution CT 采用探测器单次轴扫联合低管电压扫描行儿童胸部大血管成像，辐射剂量较 64 排螺旋 CT 常规成像下降了 40%, 图像质量却有较大程度提高。

EPO-1759

先天性支气管闭锁的多层螺旋 CT 诊断

杨宾,徐容
复旦大学附属儿科医院

目的:探讨先天性支气管闭锁的多层螺旋 CT 表现。
方法:回顾性分析我院收治的 3 例先天性支气管闭锁的病例，患儿均为男性，年龄 5 月～5 岁，分析多层螺旋 CT 上病变的位置、边界，病灶内支气管及肺血管情况，占位效应等特征。

结果：先天性支气管闭锁发生于上肺病灶 2 例，下肺病灶 1 例。单个肺段发生 1 例，多个肺段发生 2 例。所有病例病灶表现为局限性透亮度异常增高区，与正常肺组织分界欠清，其内肺血管细小，可见正常肺组织呈尖角状突入病灶内。所有病变内均见支气管扩张合并支气管黏液栓 3 例，指套状改变 3 例，病灶具占位效应 2 例，合并感染 1 例。
结论：支气管闭锁为支气管树的先天性发育畸形。当肺野内局限性肺过度充气合并管状、指套状密度影，以及肺血管细小时需考虑到支气管闭锁。

EPO-1760

儿童肺淋巴增殖性疾病影像诊断与鉴别

胡莎莎
北京儿童医院

目的：探讨儿童多种肺淋巴增殖性疾病的 CT 及临床表现，提高 CT 对该类病的诊断及鉴别诊断的准确性
材料与方法：搜集并回顾性地分析了我院 15 例经病理检查确诊为肺淋巴增殖性疾病患儿的临床、影像资料，并对相关文献做一复习。
结果：我们收集了 15 例例经病理检查确诊为肺淋巴增值性疾病患儿，包括 1 例淋巴肉芽肿，1 例淋巴样间质性肺炎，1 例滤泡性细支气管炎，1 例病毒感染相关的 T 细胞增殖性疾病，5 例肺粘膜相关淋巴组织淋巴瘤（MALT），6 例弥漫大 B 细胞淋巴瘤。淋巴肉芽肿 CT 表现为沿支气管血管束分布的多发大小不等结节或肿块,部分结节周围伴磨玻璃影，未见明显环形强化。淋巴样间质性肺炎可见双肺对称分布的磨玻璃影，及边缘不清结节影。滤泡性细支气管炎临床表现及肺功能无特异性,影像学以小结节、支气管扩张及间质改变多见。病毒感染相关的 T 细胞增殖性疾病 CT 表现为影像学检查呈局灶-弥漫样变化，结节早期边界清晰，晚期相互融合，并伴有磨玻璃影。MALT 的 CT 表现为两侧肺单发或多发结节或实变影，多位于支气管血管束旁，肺门或纵隔淋巴结肿大。弥漫性大 B 细胞淋巴瘤 CT 表现为肺内结节或肿块，可见空洞影。
结论：儿童各类肺淋巴增殖性疾病的 CT 表现多种多样，缺乏特异性，影像表现、临床表现相结合，可以初步诊断部分肺淋巴增殖性疾病，但其最终确诊需依赖病理结果。

EPO-1761

MRI 诊断儿童心脏肿瘤的价值

沈全力
复旦大学附属儿科医院

目的：探讨儿童常见心脏肿瘤的 MRI 特点。
方法：13 例经手术证实的心脏肿瘤病例，男 10 例，女 3 例，年龄 1 个月～11 岁。心脏 MRI 检查采用西门子 Magnetom Avanto 1.5T 磁共振机，序列包括 TrueFISP 心脏多断面成像、TSE T1/T2WI 和 T2WI 抑脂平扫、对比剂注射后肿块层面 TurboFLASH T1WI 动态增强、TSE T1WI 增强和延迟 10 分钟 TurboFLASH T1WI PSIR 增强扫描。对比剂采用欧乃影，剂量 0.2mmol/kg。
结果：13 例肿块中横纹肌瘤 6 例（4 例位于左心室，2 例位于右心室），纤维瘤 5 例（2 例位于左心室，3 例位于右心室），左心室错构瘤 1 例，右心房粘液瘤 1 例。平扫 T1WI 和 T2WI 肿瘤信号与心肌相仿，增强后延迟 10 分钟 TurboFLASH T1WI PSIR 序列扫描横纹肌瘤强化程度和心肌相仿，其余肿瘤强化程度明显高于心肌。

结论：心脏 MRI 能明确心脏肿瘤的部位和强化特征，对肿瘤类型的判断及是否需要手术干预具有重要的价值。

多排螺旋 CTA 技术在诊断婴儿右心室双出口的价值

王志伟,王芳
哈尔滨市儿童医院

目的：评价前门控 128 层螺旋 CTA 技术在术前诊断婴儿右心室双出口中的应用价值。
方法：128 层螺旋 CTA 技术诊断右心室双出口 9 例，均采用前门控扫描技术，图像后处理技术包括：多平面重组（MPR）、容积重建（VR）、最大密度投影（MIP）及最小密度投影（MinP）。诊断性评价右心室双出口分型及其病理特征。
结果：右心室双出口按室间隔缺损的部位分为主动脉下室间隔缺损型 3 例，肺动脉下室间隔缺损型 3 例，双动脉下室间隔缺损型 2 例，远离大动脉室间隔缺损型 1 例；按有无肺动脉狭窄分为无肺动脉狭窄型-艾森曼格型 3 例，合并肺动脉狭窄-法罗四联症型 6 例；术前 CTA 诊断与手术结果完全相符。
结论 128 层螺旋 CTA 前门控技术在术前诊断右心室双出口中具有重要价值，能够为心外科术前手术方案制定提供十分可靠依据。

不打药儿童磁共振冠状动脉血管成像质量的初步研究

陈新春
浙江大学医学院附属儿童医院放射科

摘要：
目的：评价儿童自由呼吸状态下不打药膈肌导航 3D 平衡式自由稳态进动序列（3D B-TFE)全心扫描序列在儿童磁共振冠状动脉成像中的图像质量。
方法：用 3.0TMRI 三维(3D)B-TFE(balanced turbo field echo)全心扫描序列，膈肌导航技术，心电门控技术，自由呼吸状态下对 2 例（13 岁、14 岁 4 月）儿童进行磁共振冠状动脉成像（MRCA），经最大信号强度投影（MIP）,多平面重建（MPR）,曲面重建（CPR),容积再现（VR）后处理获得冠状动脉图像.观察冠状动脉的显示率,测量各冠状动脉的显示长度及心肌,冠脉的信号强度及信噪比。
结果:2 例受检者均完成检查,右冠状动脉、左冠状动脉主干、前降支全部显示;左冠状动脉回旋支显示良好。
结论:自由呼吸不打药膈肌导航 3D B-TFE 序列冠脉成像方法显示成功率高,图像信噪比好,可作为不能屏气，心率快，需药物镇静儿童心脏冠脉检查的一种无创性手段

320 排动态容积 CT 在诊断婴幼儿肺静脉畸形引流中的应用价值

邹佳妮
中国人民解放军中部战区总医院

目的 探讨 320 排动态容积 CT 血管成像对诊断婴幼儿肺静脉畸形引流 (anomalous pulmonary venous drainage,APVD)的临床应用价值。**方法** 回顾性分析 320 排 CT 血管成像诊断 21 例 APVD 患儿的影像资料，并将 APVD 影像学表现与手术结果进行对照。**结果** 21 例患儿的术前影像诊断均与手术观察到的情况一致。其中,完全型 APVD 17 例(心内型 5 例，心上型 12 例)，部分型 APVD 4 例(心下型 3 例，心内型 1 例)。所有 APVD 患儿均合并房间隔缺损,13 例并存室间隔缺损，3 例存在动脉导管未闭，10 例存在肺动脉狭窄或闭锁，2 例存在气管性支气管，1 例存在左冠状动脉起源变异。**结论** 320 排动态容积 CT 血管成像可以全面、准确、清晰显示婴幼儿 APVD 情况以及合并心血管发育畸形。

Graft-versus-host disease after hematopoietic stem cell transplantation: A retrospective analysis of chest CT features in pediatric recipients

Yuchun Yan
Capital institute of Pediatrics

Objective: To investigate the chest CT features of graft-versus-host disease (GVHD) in pediatric recipients after hematopoietic stem cell transplantation (HSCT) in order to improve early diagnosis.

Methods: 1637 consecutive allogeneic HSCT pediatric recipients at Beijing Ludaopei Hematonosis Hospital and the Affiliated Children's Hospital of Capital institute of pediatrics (Beijing, China) between January 2014 to August 2018 were reviewed. And a total of 133 pediatric patients who were clinically diagnosed pulmonary GVHD were enrolled. Two observers evaluated the presence, extent and distribution (bilateral, unilateral) of the chest CT. The evaluation of ground-glass opacity (GGO) (localized, patchy, diffuse), consolidation (localized, patchy, diffuse), reticulation (localized, patchy, diffuse), nodules (localized, multiple), bronchiectasis, pleural effusion, air trapping, tree-in-bud sign and pneumomediastinum were included.

Results: The range of onset time was 10 to 664 days. There was no significant difference of the incidence of GVHD between sex. The top three underlying disorders for HSCT were acute lymphoblastic leukemia, acute myeloid leukemia and aplastic anemia. GGO, consolidation, reticulation and nodules were commonly seen in GVHD patients. In the distribution pattern of GGO in acute phase, there difference was significant ($p<0.02$) which was more diffuse than that of the other group. Bronchiectasis, air trapping and tree-in-bud sign were commonly seen in the chronic phase, and the difference showed statistically significant.

Conclusion: The common signs of pediatric GVHD includes GGO, consolidations, reticulations and nodules. The diffuse interstitial and alveolar opacities could resemble pulmonary edema. Diagnosis should be made in combination with clinical manifestations, signs and laboratory tests.

儿童肺动脉闭锁的 MSCTA 表现

赵俊锋,崔书红,赵鑫,张小安,陆林
郑州大学第三附属医院

目的：探讨儿童肺动脉闭锁及合并畸形的 MSCTA 表现。方法：搜集 2015 年 1 月至 2019 年 4 月间郑州大学第三附属医院术前超声及术后确诊为 PA 的 29 例 MSCTA 资料，男 16 例，女 13 例。结果：29 例 PA 中，PAVSD 23 例，PAIVS 6 例；PA 伴 PDA 11 例，伴右位主动脉弓及右位降主动脉 5 例，伴房间隔缺损 10 例，伴左侧上腔静脉 4 例，镜像右位心并矫正型大动脉转位 1 例，双主动脉弓伴左弓闭锁 1 例。其中 PAVSD 伴 PDA 5 例，6 例 PAIVS 均伴 PDA 存在。23 例 PAVSD 中 5 例伴 PDA 病例未见明显 MAPCAs，18 例不伴 PDA 的可见不同程度的 MAPCAs，侧支血管数目 1～10 支不等，共 32 支，多来源于降主动脉和主动脉弓，未见肋间动脉、内乳动脉供血侧枝；PAVSD 病例均存在升主动脉扩张，不同程度的主动脉骑跨 21 例（>50%），对应连接不良型室间隔缺损，主动脉完全起自右心室 2 例，20 右心室均发育可，3 例右心室存在发育不良，形态偏小；PAVSD 中 PA 闭锁的部位右室流出道 2 例，肺动脉瓣闭锁 2 例，肺动脉干近心端闭锁 15 例，肺动脉干全段闭锁 2 例，肺动脉干及左右肺动脉均未见 2 例。6 例 PAIVS 病例均存在 PDA 与肺动脉分叉处或左肺动脉相连接，PA 闭锁部位右室流出道 1 例，肺动脉干闭锁 1 例，肺动脉瓣闭锁 4 例。29 例 PA 中 9 例可见典型的“海鸥征”。结论：肺动脉闭锁常见不同数量和不同程度的侧枝血管，PAIVS 均伴 PDA 开放，而 PAVSD 部分存在 PDA 且少见侧枝血管。

3D 打印在儿童先天性胸骨缺如诊疗中的应用

姚小芬,钟玉敏,胡立伟,张海波,邱海嵘
上海交通大学医学院附属上海儿童医学中心

目的：运用 3D 打印技术建立儿童先天性胸骨缺如术后补片移位再行手术模型，探讨 3D 打印建模对于临床诊断、手术评估和手术计划制定的意义。**方法：**1 例胸骨缺损重建术后补片移位的患儿，行 CT 扫描后获得影像资料；使用 Mimics 17.0 软件导入 CT DICOM 数据并对感兴趣区域（ROI）做图像重建后处理，得到三维重建模型；再运用 Magics19.0 软件对三维模型等进行添加支撑、表面修整、光滑处理等操作；将胸骨缺如三维重建模型保存成 STL 格式；最后把三维数据导入 OBJET 260 3D 打印机后即完成建模过程。**结果：**依据 3D 打印模型，进行胸骨缺损术后评估，发现补片移位并设计再次修补手术方案。**结论：**本研究通过 3D 打印技术按 1:1 的比例打印了患儿的胸骨缺如模型，给先天性胸骨缺如术前辅助诊断、手术方案设计和术后评估提供有效的帮助。

EPO-1768

儿童肺炎支原体感染的胸部 CT 表现

徐蕾
上海交通大学医学院附属新华医院

目的：分析儿童肺炎支原体感染的胸部 CT 特征。方法： 2017 年全年上海交通大学医学院附属新华医院儿呼吸内科住院治疗并行病原学检查和胸部 CT 平扫检查的患儿共 1103 例，其中 266 例为病

原学明确的单纯性肺炎支原体（MP）感染，纳入分析，主要评价影像表现和临床特征。结果：1. 临床和流行病特征：单纯 MP 感染患儿男女比例约为 0.8：1，年龄 1 月-11 岁，平均年龄（4.0±2.2）岁，中位年龄 4.0 岁。2. 胸部 CT 特征：两肺广泛性病变（≥4 叶）最多见（41.3%）；具体征象以实变/不张（66.1%）最常见，其中 22.7%伴有支气管充气征，全部为不典型支气管充气征；其次为肺门淋巴结肿大(62.8%)及弥漫性支气管壁增厚(60.5%)，后者中 81.3%伴有磨玻璃影、40.1%伴有网合结节、39.1%伴有空气潴留。其余表现包括胸腔积液（6.4%）、胸膜增厚（8.2%）、马赛克样分布（4.5%）、结节（0.4%）以及纵隔积气（0.8%）。结论 肺 MP 感染好发于学龄前期儿童，女童发病率略高，两肺弥漫性分布多见，最常见 CT 征象包括伴有不典型支气管充气征的实变/不张、肺门淋巴结肿大以及支气管壁弥漫性增厚，结合流行病学及影像学特征，可提出肺炎支原体肺炎感染的诊断。

EPO-1769

肺炎支原体感染所致儿童坏死性肺炎 胸部 CT 表现（附 30 例分析）

李素荣,袁新宇
首都儿科研究所附属儿童医院

【摘要】 目的 总结肺炎支原体感染所致儿童坏死性肺炎的胸部 CT 表现、转归及 CT 检查临床指标。**方法** 回顾性分析 30 例肺炎支原体感染所致儿童坏死性肺炎的临床与 CT 资料，比较坏死性肺炎组与对照组临床指标，统计坏死性肺炎不同病程的 CT 表现，绘出坏死性肺炎大叶肺实变及相关征象动态变化曲线。**结果** 肺炎支原体感染所致坏死性肺炎占同期坏死性肺炎的 57.7％（30／52）。坏死性肺炎组高热持续时间、外周血 WBC 峰值、中性粒细胞比率、WBC 异常持续时间、CRP 峰值、CRP 异常持续时间均高于对照组，两组间有极显著性差异（$P<0.01$）。肺炎支原体感染所致坏死性肺炎胸部 CT 表现包括：93.3％为单侧大叶肺炎，56.7％为 1 个肺叶实变，行增强 CT 扫描者肺实变内均存在强化减低区，90％见空腔。50.0％强化减低区或空腔累及肺段范围，33.3％为整个肺叶受累，16.7％为 2 个肺叶受累。中位时间 6 个月（范围 4 个月～3.5 年）10 例坏死性肺炎复查 CT，2 例肺实变吸收，4 例肺不张，4 例肺叶囊性变，其中 1 例行囊性变肺叶切除术。**结论** 肺炎支原体感染所致儿童坏死性肺炎临床表现与非坏死性肺炎支原体肺炎有显著区别，坏死性肺炎病程迁延，转归包括痊愈、肺不张或肺叶囊性变，肺叶囊性变长期不闭合需手术切除。

智能曝光参数的临床运用探索

彭海腾
上海交通大学医学院附属新华医院

目的 通过进行数据的分析建立智能化的 X 线曝光参数(kV mAs)，为实现全自动化影像摄片模式进行前瞻性数据分析。**方法** 本研究过程分三个阶段，第一阶段为收集 500 例患儿的数据，包括基本的身高、体重、年龄，使用常规的拍摄方法获得用于影像诊断的图像。第二个阶段通过分析图像数据和计算出 BMI 值，结合实际年龄和收集以 AEC 方式获取的 mAs 值，分析出可用的 mAs 值并建立相关的参数表 Age-kV、Age-mAs 和 Age-BMI 表。最后在验证阶段，通过查表获得的曝光参数再

经由经验丰富的技师认可才能用于实际拍摄工作，再进行图像分析。**结果** 分段建立了十条以 BMI 为依据的曝光参数表，在验证阶段使用模拟全自动拍摄模式的方式获取的参数运用于实际拍摄，经高年资的诊断医师评估得到认可。**结论** 实验证明以 BMI 为依据分段建立的曝光参数表给出的曝光参数完全可以获得达到临床诊断要求和质量控制要求的图像。

Vascular imaging findings with MRI in children with Kawasaki disease

Xihong Hu,Quanli Shen,Qiong Yao
Children's Hospital of Fudan University

PURPOSE
Determining the presence of aneurysms, thrombosis, and stenosis is very important for the diagnosis of Kawasaki disease (KD) and in the follow-up of KD patients with aneurysms. We aimed to demonstrate MRI angiography and cardiac MRI findings in pediatric patients with KD.
METHODS
Over a 2-year period, MRI angiography and cardiac MRI were performed to determine vascular aneurysms or occlusions in 15 patients who had diagnosed KD. The patients ranged from 6 months of age to 12 years, with a median age of 3 years. The American Heart Association's criteria were used to diagnose KD.
RESULTS
Arterial aneurysms were present in 15 patients (aged 6 months to 12 years; median age of 3 years; 11male, 4 female). Coronary artery aneurysms were detected in 15 patients and systemic artery aneurysms were detected in 5 patients. In 5 patients, there were thrombus at coronary arterial aneurysm.
CONCLUSION
Our results suggest that MRA and CMR can detect all types of aneurysms, stenosis and occlusions of vessels in patients with KD who were not previously diagnosed. This useful, easy, robust and fast technique may be preferred to diagnose KD.

EPO-1772

Characteristics and Fate of Systemic Artery Aneurysm after Kawasaki Disease

Xihong Hu,Qiong Yao,Quanli Shen
Children's Hospital of Fudan University

Objective
To determine the long-term outcome of systemic artery aneurysms (SAAs) after Kawasaki disease (KD).
Study design

We investigated the characteristics of SAAs in 25 patients using medical records and MR angiograms. The age of onset of KD ranged from 1 month to 20 months. The interval from the onset of KD to the latest angiogram ranged from 16 months to 12 years.

Results

The mean duration of fever was 7-12 days. All 25 patients had at least 1 symmetric pair of aneurysms in bilateral peripheral arteries, and 21 patients had multiple SAAs. The distributions of SAAs was as follows: brachial artery, 10; common iliac artery, 6; internal iliac artery, 5; abdominal aortic aneurysm, 5; and others, 20. The diameter of all SAAs in the acute phase leading to stenotic lesions in the late period was >10 mm.

Conclusion

SAAs occurred symmetrically and were multiple in younger infants and those with severe acute vasculitis. Larger SAAs can lead to stenotic lesions in the late period.

CCTA 在儿童先天性冠状动脉瘘诊断及术后评估中的应用

李宁[1],赵鹏[2]
1.山东省医学影像学研究所
2.山东省立医院

目的

冠状动脉瘘(CAF)是指冠状动脉绕过正常的毛细血管系统与心腔（CCF）或大血管（CAVF）形成的异常交通，影像表现复杂，对其解剖结构的精确显示有利于恰当手术方式的选择。本文通过回顾性分析儿童先天性 CAF 的 CT 冠状动脉成像（CCTA）表现，评估 CCTA 在儿童先天性 CAF 术前诊断及术后评估中的应用价值并熟悉其影像表现。

方法

回顾性分析 2013 年 1 月至 2018 年 12 月间于我所行 DSCT 冠状动脉成像检查的 21 966 例患者的影像资料。统计年龄小于 18 岁患者中 CAF 的发生率及类型，重点描述瘘管的起源、终点及受累冠状动脉走形及管腔扩张情况，并对患儿进行术后 CTA 评估。

结果

1. 本组共检出 73 例冠状动脉瘘（0.33%，73/21966）。小于 18 岁者 15 例，发生率 0.07%(15/21 966)。

2. 冠状动脉-肺动脉瘘（CPAF）3 例(20%，3/15)，均源于右冠状动脉；冠状动脉心腔瘘（CCF）12 例（80%），右冠状动脉 6 例，左冠状动脉 4 例，回旋支 1 例，左、右冠状动脉同时受累 1 例；其中右心室瘘 7 例，左心室瘘 3 例，右心房 2 例，其中 1 例右心房瘘伴两个瘘口。CAF 为独立发育畸形者占 73.3%（11/15）。

3. CCF 主要表现为异常血管扩张、迂曲延长（8 例），瘤样扩张（2 例）；结合 VR 和 MIP，可清晰显示瘘血管的整体形态。瘘口处出现高密度“喷射征”是 CPAF 的典型征象。

4. 术后随访 9 例，随访时间 1 个月-3 年，术后瘘血管远端出现血栓时间长短不一，最短 1 周，最长 7 个月，1 例封堵血管内大量血栓形成伴右心室心肌梗死表现。

结论 先天性冠状动脉瘘是一种少见的冠状动脉发育畸形，本组小于 18 岁者中发生率为 0.07%，以 CCF 最常见。DSCT 冠状动脉成像可多方位清晰显示冠状动脉瘘的整体形态，明确其类型及瘘口情况，为 CAF 诊断及术前术后评估提供重要信息。

EPO-1774

儿童重症肺炎的病原菌与影像表现分析

吴美仙
广西省柳州市妇幼保健院

目的：分析不同病原菌导致的重症肺炎影像的表现特点。**方法**：选取 2018 年 3 月 ～2019 年 2 月期间在我院 PICU 进行治疗的 115 例重症肺炎患儿，回顾性分析所有患儿病原菌结果以及胸部检查影像表现特点。**结果**:115 例重症肺患儿支原体感染有 11 例，腺病毒有 13 例，流感嗜血杆菌 15 例，肺炎链球菌 8 例，金黄色葡萄球菌感染有 6 例，肺炎克雷伯菌 10 例，白假丝酵母感染有 9 例，铜绿假单胞菌感染 16 例，嗜麦芽窄食单胞菌 14 例，孢曼不动杆菌 7 例，其他菌类 6 例，其中多重病原体感染 12 例。所有患儿的一般临床表现均符合重症肺炎的临床诊断标准。不同病原菌影像表现多样化，呈斑片状、片状、团块状等，可累及整个肺叶、肺段，小叶间隔，部分形成空洞、肺气囊、合并胸腔积液，部分病原菌感染后期可发展闭塞性毛细细支气管炎。**结论**： 重症肺炎患儿不同的呼吸道病原菌与影像学表现有一定的特点。

EPO-1775

儿童系统性疾病胸部 HRCT 影像

宋洋
天津市儿童医院

目的：儿童系统性疾病累积肺部较常见。HRCT 可用于评估该类患儿肺部受累情况。可以帮助发现异常，寻找特征性表现，评估疾病范围，协助鉴别诊断，随访评价及引导肺部穿刺活检。许多情况下 CT 影像不能作出明确诊断，某种 CT 表现较其他表现更常见，但并不具特异性，其组织病理学来源各异。
方法：本文回顾儿童系统性疾病胸部 HRCT 影像表现，涉及：结缔组织病（青少年特发性关节炎、皮肌炎、系统性硬化、系统性红斑狼疮以及混合结缔组织病）、血管炎、原发性及获得性免疫缺陷、纤毛不动综合征、囊性纤维化、朗格罕斯细胞组织细胞增生症。
结果：结缔组织病特点是以免疫系统异常，有各器官炎症。该病可累及肺泡、肺间质、血管及气道，HRCT 反映了炎症和纤维化的相对比率。CT 影像表现在疾病种类间无特异性，但可代表扫描期间肺部累及严重程度。青少年特发性关节炎以胸膜和心包渗出常见，60%患者可见。最初常表现为磨玻璃样改变，逐渐发展为小叶间隔增厚以及肺纤维化。皮肌炎肺部 CT 表现与其他结缔组织病相似，取决于疾病的进展情况，但皮肌炎累及肺部，病变可迅速进展且具致命性，需结合影像表现与肺功能测试对症状可疑患儿进行细致评估。系统性硬化肺脏受累为该病患儿最常见死因。次常见表现有胸膜及心包渗出，食道扩张。可有主肺动脉扩张，肺部病变晚期肺动脉高压，硬皮病患者更常见。系统性红斑狼疮最常见的影像表现是胸膜及心包积液，肺炎、肺出血、狼疮性肺炎以及隐源性肺炎属于该病急性表现，HRCT 可出现实变。肺出血是该病常见且致命的并发症，HRCT 表现为磨玻璃样改变，合并出现小叶间隔增厚则形成所谓“铺路石”征。
结论：临床可疑系统性疾病，HRCT 用于发现病变，显示病变特征以及确定病变严重程度与累及范围。对于无呼吸道症状，肺功能检测正常的儿童，HRCT 可发现其肺部病变，有助于此类疾病早期诊断与及时治疗，对病程可有较大影响。

EPO-1776

Revolution CT 能谱扫描模式在儿童漏斗胸胸廓内支架固定术后的图像评价

李成龙
徐州市儿童医院

目的：Revolution CT 最佳单能量技术在儿童漏斗胸胸廓内支架固定术后的图像评价；材料与方法：A 组：20 例漏斗胸胸廓内支架植入术后的患儿，年龄 8-12 岁，GSI 扫描模式，扫描参数：80-140Kv，NI：10，ASIR-V：50%，最佳单能量重建+MAR，重建 110Kev 图像，B 组：20 例，回顾性分析漏斗胸胸廓内支架植入术后的患儿的常规胸部平扫，100Kv，自动毫安，NI：10，ASIR-V：50%，由两位副主任医师对两组病例读片并主观评分，评分标准 1-5 分，3 分以上图像可以满足诊断要求，并对评分进行一致性分析。结果：A 组图像质量良好，均>3 分（3.83±0.20），DLP：90.22±6.31mGy·cm，ED：1.52±0.15mSv；B 组图像质量不能满足诊断要求<2 分（1.63±0.13），DLP：36.43±4.20mGy·cm，ED：0.62±0.34mSv，两位医师读片一致性良好（K=0.726），A 组 DLP、ED 大于 B 组，差异具有统计学意义（P<0.05）。结论：GSI 扫描模式下的单能量图结合 MAR 算法可以有效去除漏斗胸胸廓内支架造成的伪影，但辐射剂量高于普通胸部平扫。临床应用：Revolution CT 能谱扫描模式下的最佳单能量结合 MAR 算法的图像大幅提高漏斗胸胸廓内支架术后患儿的 CT 图像质量，对临床治疗效果的评估有重要意义。

磁共振成像 T2*测量与地中海贫血不同基因型的临床评估初步研究

罗晓,王旎,吕贵文,雷益
深圳市深圳大学第一附属医院

目的 β地中海贫血症不同的基因型组心血管磁共振（CMR）T2*测量评估是否与心脏功能受损水平相关。
方法 以 2014 年 11 月至 2019 年 3 月期间我院收治的地中海贫血患者，根据基因组分组确定了三组患者：杂合子β+/β°（N=45），纯合子β+（N=20），纯合子β°（N=39）接受过 MRI 横向弛豫时间(T2*)检查为研究对象，心肌铁超负荷（MIO）。通过 T2*技术评估 MIO。同时通过心脏超声获得左心室射血分数(LVEF)，检测双心室功能。预估心肌铁负荷与心功能关系。
结果 研究对象心脏 T2*与患者的年龄(r=-0.276，P=0.008)、LVEF(r=0.288，P=0.007)间存在相关性，其中有输血史的患者心脏 T2*与输血量呈明显负相关(r=-0.701，P<0.001)。LVEF 是否正常与组间心脏 T2*值升高有统计学意义(P=0.005)，但心脏铁过载比例(T2*<20ms)在各组中无统计学意义。与其他组相比，纯合β+TM 患者的输血需求显着降低。纯合β+组与杂合和纯合β°组相比，心脏 T2*值更高（P<0.0001），心脏 T2*值<20ms 的患者数量更少（P<0.001）。纯合子β+显示病理性左心室射血分数（LVEF）患者数量低于其他两组（P<0.05）
结论 心脏 T2*技术测量患者脏器铁过载结合 LVEF 对心肌功能评估有早期预测性。β+纯合子的患者较少出现铁过载的现象并且该基因型患者心脏收缩功能较其他组型更好。

儿童胸膜肺母细胞瘤的影像表现与病理对照

李洋,宋修峰
青岛市妇女儿童医院

目的：探讨儿童胸膜肺母细胞瘤（Pleuropulmonary Blastoma，PPB）的影像学表现，并与其病理学表现进行对比分析，以提高对本病的认识。材料和方法：收集我院 7 例经穿刺活检、手术病理确诊为 PPB 患儿的临床资料。7 例患儿年龄 2 个月-8 岁，平均年龄 3 岁。临床表现以呼吸困难和咳嗽为主。7 例患儿均行 X 线和 CT 平扫，5 例同时行 CT 增强扫描，回顾性分析 7 例 PPB 的 X 线和 CT 表现。按 Dehner 分型法（根据病理及免疫组织化学结果）可将 PPB 分为Ⅰ、Ⅱ、Ⅲ三型；对照分析不同病理分型 PPB 的 X 线和 CT 特点。结果：本组 7 例均为单发，肿瘤位于右侧 4 例、左侧 3 例；其中Ⅰ型 1 例，Ⅱ型 2 例，Ⅲ型 4 例。X 线表现：Ⅰ型表现为巨大囊状含气密度影，内见纤细分隔；Ⅱ型和Ⅲ型 PPB 表现为一侧胸腔高密度占位性病变，2 例伴有肺纵隔疝，3 例病灶体积较大而表现为
一侧“白肺”，心缘消失，5 例伴有胸腔积液。CT 表现：7 例均表现为胸膜下巨大团块状、不规则状或占据整个胸腔的肿块影，密度不均匀，伴患侧肺不张并纵隔移位。Ⅰ型肿块以囊性为主，表现为单侧局限性薄壁囊肿， 内见多个纤细分隔，增强后囊性区域未见强化；Ⅱ型表现为囊实性混杂密度肿块，1 例病灶内可见多个气液平面，增强后实性部分呈明显强化， 内可见强化的迂曲血管影， 1 例伴有患侧胸腔积液；Ⅲ型表现为实性肿块，密度不均匀，增强扫描呈明显不均匀强化，肿块边缘强化显著。7 例 PPB 肿块均压迫支气管和临近肺组织而引起肺不张，5 例与纵隔组织分界不清，4 例与主动脉、肺动脉关系密切。5 例伴有胸腔积液，2 例侵犯胸膜导致胸膜增厚。3 例伴有纵隔淋巴结肿大，2 例伴有肺门淋巴结肿大。结论：不同病理分型的 PPB 具有一定的影像学特点，分析其 X 线和 CT 表现，有助于本病诊断。

EPO-1779

儿童塑型性支气管炎的 CT 表现

代学杨
天津市儿童医院

目的 探讨儿童塑型性支气管炎（plastic bronchitis，PB）的 CT 表现、诊断及鉴别诊断，提高对儿童塑型性支气管炎影像学特点的认识。方法 回顾性分析天津市儿童医院自 2016 年至 2018 年收治确诊的 22 例塑型性支气管炎患儿的 CT 表现。结果 22 例患儿均以发热咳嗽为主要症状，均行纤维支气管镜检查，取出粘液栓，内镜诊断支气管塑型。CT 表现均可见肺实变影像，其中肺不张（ 6 例），支气管远端显示不清（16 例），管腔内分泌物阻塞（ 3 例），合并胸腔积液 11 例，累及胸膜 11 例。结论 儿童塑型性支气管炎是一种发病凶险的罕见病，其临床表现无特异性，诊断较困难，早期进行 CT 检查，有助于提高该病的诊断，最终需依靠纤维支气管镜及病理组织学检查进行确诊及治疗。

EPO-1780

儿童胸壁病变的影像学表现与临床分析

吴朔春,袁新宇
首都儿科研究所附属儿童医院

目的 探讨儿童胸壁病变的临床及影像表现特点，提高对胸壁病变的诊断水平。

方法 收集我院 2009 年 10 月—2018 年 6 月间手术及病理证实的 50 例胸壁病变患儿，包括感染组（4 例）和非感染组（46 例），非感染组进一步分为良性肿瘤组（41 例）和恶性肿瘤组（5 例）。50 例患儿均行超声、CT 或 MRI 检查。对所有病例的临床及影像表现进行回顾性分析。
结果 3 组病例的临床及影像表现的发生率各有不同。①临床表现：感染组病人全部出现发热、胸痛、局部红肿热的临床表现，且病变均质软；良性肿瘤组中质软出现率为 90.2%（37/41）；恶性肿瘤组全部病变均质韧。3 组病变移动性均差。感染组及恶性肿瘤组全部病例均有局部压痛，而良性肿瘤组压痛的发生率仅为 7.3%（3/41）。②影像表现：良性肿瘤组中，75.6%（31/41）病变显示内部均匀，65.9%（27/41）边缘清晰；而感染组及恶性肿瘤组病灶内部不均匀，边缘模糊。良性肿瘤组中仅 9.8%（4/41）病灶可见钙化，2.4%（1/41）病灶有出血，19.5%（8/41）病灶内部出现囊腔影，14.6%（6/41）病例可见肋骨破坏；恶性肿瘤组全部侵犯入胸腔并破坏肋骨；感染组均无肋骨破坏。感染组与恶性肿瘤组病变均呈明显强化，而良性肿瘤组中 80.5%（33/41）表现为无/轻度强化。
结论 不同性质胸壁病变临床特点各异，熟悉影像特征有利于胸壁病变的定性诊断。

EPO-1781
磁共振检查在评价胎儿先天性膈疝预后中的价值

池润民
上海交通大学医学院附属新华医院

目的：评估胎内先天性膈疝患儿的磁共振影像表现及其与预后的关系

方法：回顾性分析产前检查怀疑先天性膈疝的胎儿 35 例，所有胎儿均行磁共振检查，检查序列包括横断面及冠状面单次激发快速自旋回波序列（SS-FSE）及平衡稳态自由进动序列（bSSFP）。评价膈疝内容物、是否含有疝囊、测量并计算肺头比、全肺体积（TFLV）、观察肺体积与正常预期肺体积比值（O/e FLV）、胎肺体积与胸腔容积比值(FLV/FCV)。所有胎儿均成功生产并进行手术，将患儿分为预后良好组及预后不良组（包括长期感染、并发症、死亡）。运用卡方分析、logistic 回归等统计方法分析胎儿影像结果与预后间的关系。
结果：含有疝囊的患儿预后较无疝囊患儿预后好（86% vs 34%，P<0.05）,预后不良患儿的实测肺体积与正常预期肺体积比值较预后良好患儿明显减低（23.6% ± 12.2vs.36.1% ± 13.0, P < 0.001)），预后良好组中胎肺体积与胸腔容积比值(FLV/FCV)也较预后不良组高（0.357±0.096vs0.195±0.201）。Logistc 回归分析结果示是否有疝囊、实测肺体积与正常预期肺体积比值、胎肺体积与胸腔容积比值与患儿预后相关，且以胎肺体积与胸腔容积比值为 0.24 作为阈值判断膈疝患儿预后有最大的诊断效能。
结论：胎儿磁共振检查对于评价患儿肺发育情况及预后有很大价值

EPO-1782
胸部 X 线及 CT 在小儿坏死性肺炎的诊断和治疗中的价值

袁理想,王慧贤
天津市儿童医院

目的：探讨胸部 X 线及 CT 在小儿坏死性肺炎的诊断和治疗中的价值。

方法：回顾性分析并总结 2017 年 10 月至 2019 年 7 月住院确诊为坏死性肺炎的 59 例患儿的影像学及临床资料，包括胸部 X 线、胸部 CT、病原学特征、炎性指标、治疗方法及预后。
结果：59 例坏死性肺炎患儿，男 31 例，女 28 例；中位年龄 2 岁。59 例患儿初次（病程第 3-10 天）均行胸部 X 线检查显示肺内实变影，其中 20 例显示实变内密度不均及多发小空洞，32 例患儿于病程第 10-22 天行胸部 CT，其中 30 例显示实变内大小不等的空洞，8 例见支气管扩张，52 例并发胸腔积液。患儿的临床症状重，病情进展迅速，C 反应蛋白高；其中肺炎支原体感染 21 例，肺炎链球菌 18 例，肺炎衣原体感染 6 例，金黄色葡萄球菌 1 例，10 例细菌培养阳性。17 例采用纤维支气管镜肺泡灌洗，10 例采用胸腔闭式引流术，1 例行患侧肺大部切除术。56 例患儿预后良好。
结论：对于影像学表现为肺部实变并内部密度不均，甚至出现小空洞的患儿，结合临床表现，如同时持续高热，炎性指标明显升高时，应考虑坏死性肺炎。治疗上除积极抗感染及对症支持治疗外，还需采用纤维支气管镜肺泡灌洗及胸腔闭式引流甚至部分肺切除术等侵入性治疗，提高患儿长期预后。

EPO-1783

合并有其他血畸形的肺静脉异位引流

孙应绮,乔中伟
复旦大学附属儿科医院

目的：研究合并有其他血畸形的肺静脉异位儿童的影像学表现。
方法：回顾性分析我院 2008 至 2018 年期间 382 名肺静脉异位引流患儿，发现 5 名患儿合并其他血管畸形。
结果：这 5 名合并肝静脉畸形的患儿，均为男性，年龄分别为 6 天、2 个月、5 个月、6 个月和 12 岁。先心类型均为右下肺静脉异位，均异位静脉均回流入下腔静脉，即弯刀综合征。五名患儿中有 4 名合并有右下隔离肺，有 2 名合并有肝静脉畸形。合并肝静脉畸形的其中一例为肝右静脉起源异常，由下腔静脉发出后环形下行，最后汇入下腔静脉。另一肝静脉畸形患儿为肝内出现多发异常静脉分支。有 3 名患儿出现右侧膈疝，均为肝脏疝入。其中有 4 名患儿进行了手术治疗，预后良好。
讨论：弯刀综合征这一名称由 Halasz 等人首次提出[1]。弯刀综合征发病率约 2/100000，男女比例约 1:2。它有 2 种类型，婴儿/儿童型和成人型，婴儿/儿童型临床症状较轻、死亡率较低。另一方面，下腔静脉肝内段梗阻常常引发异常肝内静脉侧枝形成[2]。Çullu 等人曾报道过一例 37 岁下腔静脉发育不良的患者在肝右静脉与下腔静脉之间出现一巨大分流血管[3]。但是我院的两例肝静脉畸形患者下腔静脉未见异常。弯刀综合征中合并出现肺隔离症、肝静脉畸形较其他肺静脉异位引流多见，是否为弯刀综合征所特有，还需要后续更多的临床数据来佐证。

EPO-1784

新生儿气胸早期床边胸片特殊征象分析

王昶,李庚武
安徽省儿童医院

目的：探讨新生儿床边胸片上特殊影像学征象在气胸早期诊断中的应用。**方法：**回顾性分析 2017 年 3 月至 2018 年 2 月的新生儿气胸患儿，由 2 位高年资放射科医师共同评估每张胸片是否存在少量气胸影像学征象。**结果：**共发现 50 例新生儿少量气胸病例，其中 5 例同期有胸部 CT 检查，26%床边胸片上发现单个征象，74%有多个征象。**结论：**肋膈角“深窦征”、纵隔及心缘异常透亮影，是少量气胸的特征性表现；膈面锐利、膈下透亮度增高、肺纹理压缩、双膈面提示气胸局限于于膈

面上部。由于漏诊气胸与死亡率相关，因此关注危重婴儿的临床医生应确保他们能够识别这些体征，对隐匿性气胸的影像学征象的识别将有助于医生在气胸病程中更早地识别气胸。

EPO-1785
评估智能期相选择重建在低剂量儿童冠状动脉 CTA 中的应用

李颖
天津市儿童医院

目的　评估智能期相选择重建技术在低剂量儿童冠状动脉 CT 血管成像（CCTA）中应用的可行性及准确性。方法　收集我院 2019 年 4 月—6 月拟诊为川崎病冠状动脉瘤或冠状动脉起源发育异常要求行 CCTA 检查的患儿 28 例，其中男 13 例，女 15 例，平均年龄（4.4±3.0）岁，平均心率（99.2±18.0）次/min。使用 GE-Revolution 256 排宽体 CT 行低剂量 CCTA 检查扫描方案，根据扫描后本机自动记录的剂量报告记录剂量长度乘积（Dose Length Product，DLP），并计算有效辐射剂量（effective dose，ED）。扫描原始数据使用 2 组方法重建图像，一组使用智能期相选择技术重建图像（SP 组）；另一组手动选择期相重建图像（MP 组）。重建图像由两位医师采用美国心脏病协会推荐的冠状动脉 15 分段法进行评分。评分采用 4 分制。采用配对样本 t 检验统计学方法比较 MP 组和 SP 组重组影像中冠状动脉及其分支的主观评分。2 位评分者之间的一致性采用 Kappa 分析。 结果　患儿受到有效辐射剂量 ED 为（0.96±0.74）mSv 全部冠状动脉血管及其分支显示 386 支(386/420),其中 S10 节段有 15 例患儿显示，S14 节段有 24 例患儿显示，S15 节段有 11 例患儿显示。其余血管节段均为 28 例患儿全部显示。两位医师图像评分一致性适中（κ=0.62）。重建期相一致性为 85.7%（24/28）。重组图像主观评分均>2 分，即满足诊断要求。 结论　在儿童低剂量 CCTA 扫描方案中配合使用智能期相选择重建技术可以获得满足诊断的影像质量，在降低患儿所受到的辐射剂量的同时节省影像技师时间提高工作效率。

EPO-1786
儿童坏死性肺炎的胸部 CT 诊断

林飞飞
深圳市儿童医院

【摘　要】目的：总结儿童坏死性肺炎的胸部 CT 表现和特点。
材料和方法：回顾性分析 2018-2019 年 29 例因肺部感染确诊为坏死性肺炎者在我院检查的儿童胸部 CT 片，使用 GE 64 排螺旋 CT 扫描，横断位扫描，扫描后重建为层厚 0.625mm，层间距 0mm，于 GE 工作站行 SSD、多平面重建及表面遮盖法重建，其中 7 例行增强 CT 扫描。所有患者均行治疗前 X 线平片检查，并治疗后 X 线平片随访。21 例行支气管镜检查。
结果：临床确诊腺病毒感染 11 例，支原体感染 10 例，8 例为合并腺病毒及支原体感染。CT 扫描均显示肺叶实变，其中一叶实变 21 例，两叶实变 8 例；实变伴散在高密度影 13 例；实变内均低密度坏死区，7 例增强检查均显示坏死区不强化或低强化，周围环形强化；实变内见多发类圆形、弯曲条形气体密度影 23 例；支气管堵塞 12 例；伴肺气囊 5 例；伴胸腔积液 9 例；伴心包积液 1 例。
结论：因腺病毒、支原体所致儿童坏死性肺炎胸部 CT 显示为大叶实变伴坏死、气体影，影像表现有特征性，能为临床诊断肺炎致病菌提供有力参考，并未临床提供病变程度准确指导，为临床制定合理有效的治疗方案、判断预后提供客观的而有价值影像依据。

EPO-1787

Validity and clinical significance of multi-slice spiral CT in evaluation of small airway changes in patients with pectus excavatum before and after operation

Xiaofei Wang,Siwen Wei,Wen Hu,Zengjun Zhang
Xi'an Children's Hospital

Objective: To observe the effect of small airway changes and the value of multi-slice spiral CT by CT observation of small airway changes before and after operation in funnel chest patients. **Methods:** A total of 58 children with funnel chest who were treated with cardiothoracic surgery in our hospital were enrolled in the study group (study group), and 58 normal children (control group) were selected. Multi-slice spiral CT was used to examine Haller index and small airway changes. The lesions in the left lower lobe and the changes in the angle of rotation of the heart. **Results:** The multi-slice spiral CT was used to observe the contrast of the different degrees of depression of the funnel chest. The depth of sternal sag (L) increased, the CT sag index (b/a) increased, and the sternal sag angle (∠dAc) became smaller. The heavier the sternum to the thoracic vertebrae, the Haller index, the small airway lesions, and the left lower lobe lesions in different degrees of sag by multi-slice CT scan, the Haller index in the degree of chest sag (light, moderate, severe), The changes of small airway lesions and left lower lobe changes were significantly increased in moderate and severe cases ($P<0.05$). In the analysis of Haller index and cardiac rotation angle before and after surgery, preoperative and there was a significant difference in the Haller index and the angle of rotation of the heart after surgery, and there was a significant difference between the preoperative and control groups in the study group ($P<0.05$). The Haller index and the angle of rotation of the heart were measured before and after surgery. In the measurement analysis, there was a significant difference between the Haller index and the heart rotation angle before and after surgery ($P<0.05$), and the Haller index and heart rotation angle of the preoperative and control groups in the study group. There was a significant difference between the two groups ($P<0.05$), but there was no difference between the Haller index and the heart rotation angle of the postoperative control group ($P>0.05$). In the analysis of small airway changes before and after surgery in different age groups, the results of preoperative and postoperative patients <3 years old and >6 years old were not significantly different ($P>0.05$), but in 3-6 There was a significant difference between the preoperative and postoperative years ($P<0.05$), indicating that the preoperative small airway changes were less severe in children less than 3 years old, and the postoperative recovery was rapid; 3-6 years old children The preoperative small airway function was changed to a higher degree, and the postoperative recovery was normal. However, the small airway function was significantly lower in children older than 6 years old, and the airway function was also reduced, and the postoperative recovery was poor. **Conclusion:** Multi-slice spiral CT has significant efficacy in small airway changes before and after surgery in patients with funnel chest.

EPO-1788

Pediatric superior vena cava syndrome

Yingyan Shi
Children Hospital of Fudan University

Superior vena cava syndrome (SVCS) is rare in childhood. Twelve cases of SVCS were seen in children ranging from 8months－11 years with a mean age of 5.6 years. There were 8 males and 4 female children. Diagnosis was confirmed by pathology. The commonest cause of SVCS was lymphoma (7/12). Non-Hodgkin’s lymphoma (NHL) was more common than Hodgkin’s disease. In two cases the final diagnosis was leukemia. The diagnosis of the other two cases was rhabdomyoid tumor and another one was primitive neurotodermal tumour. The computed tomography imaging characteristics were analyzed and compared in different groups. Superior vena cava syndrome (SVCS) results from various pathologies.

EPO-1789

A case of posterior mediastinal thymoma

Lili Hu,Chunxiang Wang,Xin Li
TianJin Children’s hospital

A 11-month-old male infant was referred to our hospital after a mass was detected on a chest computed tomography (CT) because of fever 8 days ago.
Findings from the physical examination and laboratory workup were within normal ranges. Serum antiacetylcholine receptor antibody (anti-AchR Ab) CT showed a tumor measuring 40 mm in the upper posterior mediastinum. Enhanced CT showed slight enhancement.
The patient underwent surgical intervention without preoperative pathologic or cytologic diagnosis. The tumor could be dissected from the surrounding tissue. Macroscopically, the resected specimen was an encapsulated firm tumor measuring 1.4×2.4cm. The cut surface was milky white and solid, featuring fibrous septa.
On pathological examination, infiltrating lymphocytes, and large oval or spindle-shaped thymic epithelial cells were recognized in sections stained with hematoxylin and eosin. Immunohistochemical staining showed the thymic epithelial cells to be positive for parakeratin and CKA1－AE3. The nuclei were regular, devoid of mitotic activity and CD20-negative. Consequently, a diagnosis of type thymoma(B1, World Health Organization classification) was made.
Thymoma is a neoplasm that arises from the thymus. Although most thymomas are located in the anterior mediastinum, 4% arise from other locations, including the neck and posterior mediastinum.
Embryologically, thymic epithelium arises bilaterally from the third and probably the fourth bronchial pouches and migrates into the anterior-superior mediastinum. Ectopic thymomas are considered to arise from distributed thymic tissues that fail to migrate into the anterior-superior mediastinum.

Regarding the differential diagnosis for posterior mediastinal tumors, ganglion tumors and paraganglioma.Although rare, thymoma should be included in the differential diagnosis for posterior mediastinal tumors.

EPO-1790

肺隔离症伴蒂扭转的影像表现

王永姣
华中科技大学同济医学院附属武汉儿童医院

目的　提高对肺隔离症伴蒂扭转的认识。
方法　收集本院经病理证实的 3 例肺隔离症伴蒂扭转的病例并复习相关文献，分析总结影像表现及临床特点。
结果　3 例患儿均以腹痛为主，偶伴有胸闷，CT 扫描发现肺底可见异常稍高密度软组织影，密度均匀，增强扫描未见强化或轻度强化，周围未见明显异常供血血管影，患侧可见少量胸腔积液，并且胸水量增加迅速。
结论　肺隔离症是一种儿童常见的先天性肺发育畸形，但肺隔离症伴蒂扭曲比较罕见，其影像表现与典型的肺隔离症有所不同，常因异常供血动脉未见明确显示而误诊。因此，术前提升影像医师对此病的认识具有重要意义。

EPO-1791

256 层 iCT 低剂量技术、低浓度等渗对比剂联合前瞻性心电门控技术在婴幼儿复杂性先天性心脏病中的应用

王龙伦,代大建,秦勇,田露,蔡金华
重庆医科大学附属儿童医院

目的　探讨应用低浓度等渗对比剂、低管电压、高级混合迭代重建技术（iDose 4）联合前瞻性心电门控方法的优化 CTA 扫描方案在降低婴幼儿复杂先天性心脏病的辐射剂量和对比剂用量的价值。
方法 采用 256 层 iCT 低剂量技术、低浓度等渗对比剂联合前瞻性心电门控技术对临床诊断为复杂先天性心脏病的患儿 51 例进行心脏 CTA 检查，采用 5 分法评价图像质量。以手术结果或 DSA 检查为金标准，对比心脏 CTA 和心脏彩超对疾病的检出率和诊断准确率，分析该扫描方案的应用优势。
结果　51 例患儿共 24 种独立的先天性心血管畸形，包括 9 种心内结构畸形，6 种心脏-大血管连接畸形，9 种心外大血管畸形。对于先天性心内结构畸形，心脏彩超的检出率为 96%（86/87）高于 CTA 的检出率 89%（77/87）；心脏-大血管连接畸形，两者的检出率一致，均为 90%（28/31）；心外大血管畸形，CTA 的检出率 97%（89/91）高于心脏彩超的检出率 89%（81/91）。对于先天性心外大血管畸形，CTA 的诊断符合率高于心脏彩超（$\chi^2=7.86$，$p<0.05$）。CTA 的有效辐射剂量为（0.45±0.14）mSv，碘对比剂用量为（3.1±0.9）g，图像质量评分为（4.19±0.69）分，均符合影像诊断要求。
结论　采用 256 层 iCT 低剂量技术、低浓度等渗对比剂联合前瞻性心电门控技术在降低婴幼儿复杂先天性心脏病患儿的有效辐射剂量和碘对比剂用量的同时，能获得良好的图像质量和诊断效能，对婴幼儿复杂先天性心脏病的术前诊断具有重要的临床应用价值。

EPO-1792
子宫腺肌症合并不良孕产史或不孕症的 MRgFUS 诊疗策略初探

唐纳,王悍
上海市第一人民医院

目的：探讨子宫腺肌症合并不良孕产史或不孕症的磁共振引导聚焦超声(MRgFUS)诊疗策略。方法：36 例子宫腺肌症合并不良孕产史或不孕症的患者进行 MRgFUS 治疗，通过术前临床预估及药物准备方案，术中定位调整及消融方案及术后联合诊疗方案的实施，以增强 MRI 比较手术前后子宫腺肌症体积 、非强化体积（NPV）、宫腔空间、月经量、疼痛评分、Ca125、血红蛋白（Hb）、自然受孕或 IVF（in vitro fertilization，体外受精)成功率的变化来判断诊疗效果。结果 ：MRgFUS 诊疗策略的实施，手术治疗后子宫腺肌症体积缩小 50%以上占 80.6% ，NPV 大于 70%占 83.3%，宫腔空间增大 50%以上占 41.7% ，月经量、疼痛评分及 Ca125 下降占 100%，Hb 增高占 100%，自然受孕或 IVF 成功率占有怀孕计划的 19.2%。术中及术后无严重并发症。结论 ：子宫腺肌症合并不良孕产史或不孕症的 MRgFUS 诊疗策略具有 良好的安全性和有效性。

经皮微创双通道髓芯减压人工骨支撑棒联合异体骨植入治疗早期股骨头缺血性坏死探讨

王世平
云南昆钢医院

目的：探讨经皮髓芯减压人工骨支撑棒联合异体骨植入治疗早期股骨头缺血性坏死临床疗效探讨。**材料与方法：**收集我院 2016 年 7 月至 2019 年 6 月的手术适应症患者 44 例，47 个关节，男性 40 例，女性 4 例，最大年龄 71 岁，最小年龄 30 岁，平均年龄 55.6 岁。术前分期采用股骨头坏死 ARCO 分期(国际分期）分 4 期，其中 2a 期股骨头缺血性坏死 32 个关节；2b 期股骨头缺血性坏死 15 个关节。影像学资料：所有患者术前标准的双髋关节正位片、双髋关节多层螺旋 CT 的薄层重建及双髋关节 MRI 成像。临床症状为无疼痛及轻度疼痛。手术方法：采用腰麻，患者置于可透视的多功能手术床上，取仰卧位，患髋垫高，患肢维持外展内旋位固定，经皮髓芯减压至坏死区。沿减压通道用刮匙进一步刮除股骨头内坏死骨。准备植骨，选取异体骨 9-12g 置于减压通道最顶端的软骨下骨坏死区域，专用器械打压夯实，确认股骨头范围内减压区被植骨完全覆盖。根据减压通道再次旁入路钻孔将人工骨支撑棒植入，逐层缝合伤口。术后卧床休息，单侧手术者术后 2-3 天可拄双拐下床活动，术后 3 个月内患肢避免负重， 3 个月后部分负重，根据随访情况直至完全负重。随访评估其疗效及并发症情况。**结果：**49 例患者中，术后使用 Harris 髋关节综合评分标准（满分 100 分），90 分以上为优良，80-89 分为较好，70-79 为尚可，小于 70 分为差。本组病例术后随访优良 14 例（31.8%）；较好的 59.1 例（63.3%）；尚可的 3 例（6.8%），差 1 例（无效）（2.3%），1 例患者术后 1 后负重致股骨颈骨折行人工髋关节置换。本组病例未出现严重并发症。**结论：**经皮髓芯减压人工骨支撑棒联合异体骨植入术具有微创、恢复快、保髋、保头的优点，患者易于接受，对早期股骨头缺血性坏死的患者治疗的难点，不失为一种治疗方法，远期疗效待随访观察。

EPO-1794
磁共振介入的技术优势　未来发展普及措施

肖越勇
解放军总医院第一医学中心

磁共振介入在引导与监测技术上必须优于超声与 CT，发挥磁共振介入的优势只能在高场强设备上实现，低场强设备成像时间长、图像质量不够，无法实现磁共振特有的功能，如以消融为例：MRI 透视实时引导、术中热图监测、DWI 即刻监测。低场强磁共振介入相关设备的研发已经终止。高场强 MRI 介入已经成功地用于全身各个脏器，其中包括颅脑肿瘤消融、切除及放射性粒子植入，MRIg 颅脑聚焦超声治疗肿瘤、功能靶点毁损，磁共振联合腔镜治疗、磁共振引导干细胞治疗等等。目前国内面临的主要问题是仅仅局限在少数医院应用、缺乏配套产品和耗材、基层医院医生在观望厂家生产磁共振介入相关产品是否齐备。
未来普及措施：一定是医工结合公共研发、携手推广应用、填补空白、造福广大中国患者。

Preliminary effect and safety of image-guided irreversible electroporation ablation in the treatment of renal cell carcinoma

Chaojie Li
Ruijin Hospital Luwan Branch, Shanghai Jiao Tong University School of Medicine

Objective To investigate the preliminary effect and safety of irreversible electroporation (IRE) for renal-cell carcinoma. Methods 4 patients with renal-cell carcinoma having no indication of operation were enrolled. Operations were performed under genetal anesthesia. The therapeutic efficacy was evaluated according to response evaluation criteria in solid tumors of WHO. Results All the procedures were completed successfully. The tumour volume was (16.84±16.45) cm3 (0.9-40.8 cm3). The procedure time were (76.40±19.40) minutes (42-88 minutes). The total procedure rounds were (7.00±0.71) times (6-8) times. The total number of pulses were (1706.00±587.78) times (750-2240) times. No obvious complications occurred during and after IRE. Enhanced CT and/or MRI scans were performed immediate postoperative, 1month and 3 months after operation. All lesions showed hypodense / low signal ablation areas without enhancement and the peritumoral tissue were undamaged. The postoperative 3 months dynamic imaging showed complete response (CR) in all 5 lesions. Conclusion CT-guided percutaneous IRE is safe and effective in patients with renal-cell carcinoma and can be a promising alternative way to treat renal-cell carcinoma with no indication of operation.

Experimental study of biological effects of 125I seeds and 60Co radiation on non-small cell lung cancer cells

Zhijin Chen
Ruijin Hospital Luwan Branch, Shanghai Jiao Tong University School of Medicine

To investigate the biological effects of ^{125}I seeds compared with ^{60}Co radiation on non-small cell lung cancer (NSCLC) cells A549 and normal bronchial mucosa epithelial cells BEAS-2B. **Methods:** A549 and BEAS-2B cells were exposed to ^{125}I seeds radiation and ^{60}Co radiation, respectively. The experimental groups were exposed to ^{125}I seeds radiation and ^{60}Co radiation at 2, 4, 6 and 8Gy, control groups were subjected to the same procedure without radiation (0Gy). The survival fraction, cell apoptosis, cell cycle, and the expression of apoptosis related proteins were detected, respectively. **Results:** The surviving fraction of A549 and BEAS-2B cells induced by ^{125}I seeds radiation and ^{60}Co radiation were significantly decreased compared with control group. And the surviving fraction induced by ^{125}I seeds radiation was significantly lower than that of ^{60}Co radiation. A G1 arrest in A549 cell was observed after irradiation with ^{125}I seeds at 4, 6 and 8Gy. Both ^{125}I seeds radiation and ^{60}Co radiation led to a markedly increase of apoptotic cells at 4, 6 and 8Gy on A549 cells. ^{125}I seeds radiation led to a higher percentage of apoptotic cells than that of ^{60}Co radiation. Both ^{125}I seeds radiation and ^{60}Co radiation significant up-regulated the expression of Bax protein and down-regulated the expression of Bcl-2 protein at 4 and 8Gy on A549 cells, moreover the effects induced by ^{125}I seeds radiation were more obvious than that of ^{60}Co radiation. The apoptotic ratio and the expression of apoptosis-ralated protein in BEAS-2B cells had little difference between two types of radiation. **Conclusions:** Both ^{125}I seeds radiation and ^{60}Co radiation led to a remarkable growth inhibition and apoptosis promotion on NSCLC cells, ^{125}I seeds radiation was more prominent compared with ^{60}Co radiation. The imbalance of Bcl-2/Bax and the activation of Caspase-3、PARP proteins may play an important role in the antiproliferative effect induced by ^{125}I seeds radiation.

EPO-1797

The efficacy evalution of image-guided 125I radioactive seed interstitial brachytherapy for advanced non-small cell lung cancer in clinical study

Ning Xia
Rui Jin Hospital, LuWan Branch, Shanghai Jiao Tong University School of Medicine

Objective: The aim of this study was to examine the clinical efficacy of image-guided ^{125}I radioactive seed implantation therapy in patients with advanced non-small cell lung cancer (NSCLC).

Methods: 28 patients with advanced NSCLC who had medical contraindications for surgical resection were treated with CT-guided iodine 125 seeds implantation between December 2013 and March 2015. Treatment planning system (TPS) was used to reconstruct 3-Dimensional image of lung tumor. According to the target imaging, the quantity and distribution of ^{125}I seeds were defined before treatment. The visual analog scale (VAS) was used to determine pain intensity one month before and after treatment. The karnofsky performance scale (KPS) was used as a measure of functional status before and after treatment. Tumor curative effect was evaluated according the the newly revised solid tumor curative effect evaluation in 2000. Serum CEA and CYFRA21-1 were detected by radioimmunoassay in NSCLC

Results: Median implanted number of seeds was 25 (range 8~45). The tumor matched peripheral dose (MPD) was 80~130Gy. Follow-up period was 1~37 months. Pain symptoms were significantly reduced post-treatment (P<0.05). VAS decreased from 4.14±1.69 points before treatment to 2.29±1.41 points one month after treatment. Karnofsky score went up dramatically (P<0.05). Median control time for all patients was 15.5 months. The 1-, 2-year cumulative local control rate were 58.04%, and 20.31%. The median survival period for all enrolled patients was 17 months. The 1-, 2-, and 3-year cumulative survival rates were 71.95%, 30.84%, and 6.17%. The levels of serum CEA and CYFRA21-1 were induced significantly (P＜0.05) one and three months after planting. The mortality rate was 53.85% in increased levels group and 86.67% in decreased levels group in serum CEA detection. Similarly the mortality rate was 36.36% in increased levels group and 94.12% in decreased levels group in serum CYFRA21-1 detection. A small amount of bleeding of lung tissue was observed in all patients. 11 cases patients had pneumothorax with no obvious self-conscious symptoms and improved after conservative treatment. 5 patients appeared with small amount of blood in phlegm one week post-treatment and with no special handling to ease. No seed migration was found in radiographic follow-up. There were no serious complications such as haemoptysis, tracheal fistula and radioactive pneumonia detected during the follow-up period.
Conclusions: The study suggested that CT-guided ^{125}I seeds implantation was a safe, effective, less complicated option in treating advanced NSCLC. However, this result required further evaluation to determine its long-term efficacy.

EPO-1798

MRI and 3D reconstruction used in microwave ablation: initial research

Nannan Yang
Ruijin Hospital Luwan Branch, Shanghai Jiao Tong University School of Medicine

Purpose: To verify the feasibility of the multi-series MRI and three-dimensional (3D) reconstruction in planning and evaluating the treatment response of liver metastasis microwave ablation (MWA). Material and methods: From Aug.2015 to May.2016, according to enrolled standard, 16 patients (21 lesions) were enrolled. MRI (T1WI/T2WI/multi-b value DWI) were performed for Pre-operation and follow up. All data were auto-transfer to work station syngo.via for analysis. Results: Till 1-3 month after operation, no serious or fatal complication, no recurrence was observed. Operation train was 100% match with 3D reconstruction planning. Compared with CTA, MRI shows 99% (29/30) small vessel nearby. No dilated biliary duct was fund in all case; MRI shows 12 normal biliary ducts 1cm area around. Multi-series 3D reconstruction efficiently showed post-operation signal change and ablation margin. Conclusion: three-dimensional (3D) reconstruction of MRI is feasible and effective in the treatment planning and evaluating the treatment response of MWA for liver metastasis.

Bioinformatics analysis reveals new genes and outcomes in HBV-related hepatocellular carcinoma

Lijie Zhang,JOYMAN MAKAMURE,DAN ZHAO,YIMING LIU,XIAOPENG Guo,CHUANSHENG ZHENG,BIN LIANG
Department of Radiology, Hubei Key Laboratory of Molecular Imaging, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, 1277 Jiefang Road, Wuhan 430022, China.

Hepatocellular carcinoma (HCC) is the most common malignant neoplasm in the world with a high morbidity and mortality. Extensive research has been done concerning the morphology of HCC. However, the molecular mechanism of the development of Hepatitis B virus (HBV)-related HCC has not yet been fully understood. This article aims to identify crucial genes and pathways associated with the development and progression to HCC. First, we downloaded expression profiles GSE121248 from the GEO database and then identified the differentially expressed genes (DEGs). The gene ontology (GO) and Kyoto Encyclopedia of Gene and Genome (KEGG) analyses were performed by using DAVID. Next, protein-protein interaction (PPI) networks were constructed for detecting hub genes. In this article, 1153 DEGs (777 up-regulated genes and 376 down-regulated genes) and 15 hub genes were discovered. GO analysis revealed that the DEGs were prevailingly enriched in protein binding, cytoplasm and extracellular exosome. KEGG analysis discovered that DEGs gathered in metabolic pathways, chemical carcinogenesis and fatty acid degradation. After constructing the PPI network, CDK1 (cyclin-dependent kinase 1), CCNB1 (cyclin B1), CCNA2 (cyclin A2), MAD2L1 (mitotic arrest deficient 2 like 1), CCNB2 (cyclin B2), TOP2A (DNA topoisomerase II alpha), BUB1 (BUB1 mitotic checkpoint serine/threonine kinase), TTK (TTK protein kinase), NCAPG (non-SMC condensin I complex subunit G), NDC80 (NDC80 kinetochore complex component), AURKA (aurora kinase A), KIF11 (Kinesin family member 11), CDC20 (cell division cycle 20), BUBIB and ASPM (abnormal spindle microtubule assembly) were identified as hub genes, based on the high degree of connectivity, by using the Cytoscape software. Additionally, overall survival (OS) and disease-free survival (DFS) analyses were performed by the GEPIA online database, and the receiver operating characteristic curve (ROC) was conducted using the Graphpad prism 7.0 software. Furthermore, we selected 3 genes to identify the expression level in tumor sample and normal sample by The Human Protein Atlas database. The above mentioned findings could offer supplementary information about the underlying mechanisms of HCC, as well as provide potential therapeutic targets for the treatment of HCC.

EPO-1800
可降解镁金属对人胆管癌细胞抑制作用的实验研究

李天,徐文涵,邵海波
中国医科大学附属第一医院

目的分析可降解性质的镁金属对人胆管癌细胞是否具有抑制作用。
方法培养 RBE 细胞生长至对数期时用于实验。使用铸态纯镁、挤压态纯镁及 Ti，消毒后按体表面积为 1.25cm^2/ml 加入含 10%FBS 的细胞培养液内，置于 37℃恒温箱中浸提，第 1、3、5 天检测各组

PH 值，分别用各组浸提液处理 RBE 细胞，作用时间为 24h，使用 CCK-8 试剂盒检测细胞毒性，使用 Annexin V-FITC/PI 双染法检测细胞凋亡。将一定数量 RBE 细胞接种在铸态纯镁、挤压态纯镁、MAO 及 Ti 金属片表面，共培养 30min、60min、120min 后使用 DAPI 试剂盒进行荧光染色，对各组金属片上粘附细胞数量进行拍照并计数；共培养 24h 后使用 Phalloidin-FITC 试剂盒对细胞骨架进行免疫荧光染色观察各组金属片上的细胞形态。

结果镁金属对 RBE 具有细胞毒性，铸态纯镁组毒性最大，挤压态纯镁组次之，与对照组相比有统计学意义。随着可降解 Mg 浸提天数增加，浸提液 PH 值逐渐增加，其对 RBE 细胞毒性也逐渐增高。Ti 组浸提液对 RBE 的细胞毒性，与对照组相比无统计学意义。镁金属能诱导 RBE 细胞凋亡，铸态纯镁组诱导作用最大，挤压态纯镁组次之，与对照组相比有统计学意义。随着浸提时间延长，细胞凋亡率逐渐增高。Ti 组浸提液对 RBE 凋亡无诱导作用，与对照组相比无统计学意义。共培养后，不同状态的可降解镁金属对 RBE 细胞的粘附能力有抑制作用，铸态纯镁组对其抑制作用最强，挤压态纯镁次之，MAO 组虽减弱了 Mg 的降解速率但其对 RBE 粘附能力抑制作用仍高于 Ti 组，相同时间段各组差异有统计学意义。铸态纯镁组和挤压态纯镁组可以抑制 RBE 细胞的铺展和延长，对 RBE 细胞形态有明显影响；Ti 组可见大量细胞骨架染色。MAO 组仍有少量的 RBE 细胞粘附在涂层上，但细胞铺展的形态比 Ti 组的差。

结论具有可降解性质的镁金属对人胆管癌细胞生长具有抑制作用，其机制暂不清楚。

CT 引导经皮不可逆电穿孔消融治疗肾细胞癌的临床应用与研究

王仓义
上海交通大学医学院附属瑞金医院卢湾分院

目的 探讨经皮穿刺不可逆电穿孔（irreversible electroporation，IRE）消融术治疗肾细胞癌的初步临床效果及安全性。

方法 临床经穿刺病理证实的 7 例无手术适应症的肾细胞癌患者的 8 个病灶，经术前评估后，在全身麻醉下行 IRE 消融治疗。术后采用 2000 年新修订的实体瘤疗效评价标准评价治疗的有效性，并观察并发症。

结果 7 例患者均顺利完成治疗。病灶大小 0.9～40.8cm^3，平均（12.41±13.92）cm^3，消融时间 42～174min，平均（88.63±37.49）min，消融次数 6-9 次，平均（7.13±1.25）次，总脉冲数 750～2240 次，平均（1710.00±466.60）次。术中、术后均无明显并发症。术后即刻及 1 个月、3 个月、6 个月、9 个月行增强 CT 和/或增强 MRI 复查，病灶消融区均呈低密度/低信号改变，增强扫描未见异常强化区，肿瘤周围组织形态、密度（信号）未见异常。术后复查评价疗效，8 个病灶均完全缓解。

结论 CT 引导下经皮 IRE 消融术治疗肾癌安全、有效，近期疗效显著，是临床上无手术适应症肾癌患者可选择的治疗方法。

CT-guided percutaneous irreversible electroporation ablation in the treatment of renal cell carcinoma:clinical application and research

Cangyi Wang
Ruijin Hospital Luwan Branch， School of Medicine， Shanghai Jiaotong University

Objective To investigate the preliminary effect and safety of irreversible electroporation (IRE) for renal-cell carcinoma.
Methods Seven patients with renal-cell carcinoma having no indication of operation were enrolled. Procedures were performed under general anesthesia. The therapeutic efficacy was evaluated according to response evaluation criteria in solid tumors of WHO.
Results All procedures were completed successfully. The average tumor volume was (12.41±13.92) cm^3 (0.9-40.8 cm^3). The average procedure time were (88.63±37.49) minutes (42-174 minutes). The average procedure rounds were (7.13±1.25) times (6-9) times. The average number of pulses were (1710.00±466.60) times (750-2240) times. No sever complications occurred during and after IRE procedure. Enhanced CT and/or MRI scans were performed immediate post procedure, 1 month and 3 months after procedure. All lesions showed hypodense/low signal ablation areas without enhancement and the peritumoral tissue were undamaged. The post procedure 3 months dynamic image showed complete response (CR) in all 8 lesions.
Conclusion CT-guided percutaneous IRE is safe and effective in patients with renal-cell carcinoma and can be a promising alternative way to treat renal-cell carcinoma with no indication of operation.

EPO-1803

Preliminary clinical study of biliary tract irradiation stent for hilar cholangiocarcinoma with malignant obstructive jaundice

Jie Gong
Rui Jin Hospital, LuWan Branch, Shanghai Jiao Tong University School of Medicine

Objective To evaluate the efficacy and safety of biliary stent loaded with ^{125}I seeds in treatment of hilar cholangiocarcinoma with malignant obstructive jaundice.
Methods Totally 43 patients with malignant obstructive jaundice caused by cholangiocarcinoma were included. All the paitents were underwent percutaneous transhepatic puncture ,of, the left and right side branch of the bile duct. In the hilar stenosis, the biliary stent with ^{125}I seeds were implanted, and the biliary drainage tube had been kept in 3 to 5 days after procedures. The drainage tube was removed and the puncture road was closed after the patency of stents were confirmed by cholangiography. The changes of liver function before and after procedures were recorded, and the survival time was observed. **Results** Five biliary stents loaded with ^{125}I seeds were implanted in type Ⅰ (n=5), 36 in type Ⅱ (n=18), 8 in type Ⅲ (n=4) and 25 in type Ⅳ (n=16). The Serum total bilirubin and direct bilirubin of paitents before procedures were (145.54±65.35) μmol/L and (124.73±35.04) μmol/L respectively, and (65.91±29.43) μmol/L and (35.50±15.12) μmol/L respectively after procedures. Compared with preoperative, the alanine aminotransferase, aspartate aminotransferase, alkaline phosphatase, C-reactive protein and gamma glutamic transaminase decreased significantly (all P<0.05); and the lactate dehydrogenase increased significantly (P=1.05). The median survival time was 13 months (3.0 to 22.5 months). The serious complications such as biliary puncture, pancreatitis, severe

biliary tract infection or biliary bleeding were not occurred. **Conclusion** Biliary stent loaded with ^{125}I seeds is an effective therapy to alleviate symptoms of jaundice and prolong the survival time of patients with malignant obstructive jaundice caused by hilar cholangiocarcinoma.

CT 四维电磁导航在引导 125I 放射性粒子植入脊柱转移瘤术中的作用研究

陈志瑾
上海交通大学医学院附属瑞金医院卢湾分院

目的：通过对 CT 四维电磁导航和传统 CT 在引导 ^{125}I 放射性粒子植入治疗脊柱转移瘤术中的对照研究，记录并分析两种影像引导方法下穿刺靶目标的时间、辐射剂量等方面的差异，从而对两种引导技术的优劣做出初步评价。
方法：共收治 45 例椎体转移性肿瘤伴脊髓压迫的患者，其中男性 22 例，女性 23 例，年龄 52-76 岁，平均年龄 62 岁。随机分为两组，其中 20 例患者行 CT 四维电磁导航引导下经皮穿刺 ^{125}I 放射性粒子植入脊柱转移瘤，对照组 25 例患者行常规 CT 引导下经皮穿刺 ^{125}I 放射性粒子植入脊柱转移瘤。记录两种引导方法下穿刺靶目标时间、穿刺针调整次数、CT 扫描次数及 CT 辐射剂量（剂量长度乘积）等进行对比分析。
结果：两组 ^{125}I 粒子植入针穿刺操作均获得成功。经统计分析，两组引导方式下的扫描次数、穿刺针调整次数、穿刺靶目标时间、辐射剂量差异均有统计学意义(均为 $P<0.0001$)，导航组的穿刺靶目标时间、调整次数、扫描次数均较 CT 组少，辐射剂量也小于 CT 组。电磁导航图像瞄准精度<5 mm 为 18 例，5～10 mm 为 2 例，未出现>10 mm 的情况。两组手术过程中均未出现大出血、脊髓损伤等相关严重并发症。
结论：在引导 ^{125}I 放射性粒子穿刺针置入脊柱转移瘤的过程中，CT 四维电磁导航较传统 CT 引导能有效减少穿刺调整次数、缩短手术时间、减少扫描次数、降低辐射剂量，穿刺精确度较高。两组引导方法均具有较好的安全性。

EPO-1805

Percutaneous intraductal radiofrequency ablation in the treatment of biliary stent occlusion: A preliminary result

Ning Xia
Rui Jin Hospital, LuWan Branch, Shanghai Jiao Tong University School of Medicine

AIM: This study sought to assess the feasibility and effectiveness of a novel application of percutaneous intraductal RF(Radiofrequency) for the treatment of biliary stents obstruction. We specifically report a retrospective study presenting the results of percutaneous intraductal RF in patients with biliary stent occlusion.

METHODS: A total of 43 cases involving biliary stents obstruction were treated by placing an EndoHPB catheter and performed percutaneous intraductal RF to clean stents.

The stents patency was evaluated by cholangiography and follow-up by contrast enhanced CT or ultrasound after the removal of the drainage catheter.

RESULTS: Following the procedures, Of the 43 patients, 40/43 survived and 3/43 die with a median survival of 80.5 days (range:30－243). One patient was lost to follow-up. One patient had their stent patent at the time of last follow-up.Two patients with stent blockage at 35days and 44days after procedure underwent percutaneous transhepatic drain insertion only.
The parameters of bilirubin before and after the procedure were 128(±65) to 63(±29)μmol/L, There were no related complications(haemorrhage,bile duct perforation, bile leak or pancreatitis) and all patients' stent patency was confirmed by cholangiography after the procedure,with a median patency time of 107 (range:12~ 180 days).

CONCLUSION: This preliminary clinical study demonstrated that percutaneous intraductal RF is safe and effective for the treatment of biliary stent obstruction, increasing the duration of stent patency, although randomized controlled trials are needed to confirm the effectiveness of this approach.

EPO-1806

Clinical application of CT-guided RFA combined immediately postoperative biopsy of pulmonary GGO

Yingtian Wei,Yueyong Xiao
Chinese PLA General hospital

Abstract Objective To investigate the effectiveness and safety of an innovative method of CT-guided RFA combined immediately postoperative biopsy of GGO in lung. **Method** 31 patients with 42 pulmonary GGOs had found during October, 2015 to October, 2017 in our department. 39 lesions had underwent CT-guided RFA combined with immediately postoperative biopsy whereas 3 had history of proven metastatic tumors were excluded. Postoperative 1-, 4-, 12-, and 24 month follow-up enhanced CT and adjuvant serum tumor markers were performed to evaluate the therapeutic effectiveness of RFA. The endpoints include 2-year local control rate and positive incidence of immediate post-op biopsy. **Result** All the procedures were completed successfully. 32 of 39 (82.1%) lesions got expectative pathologic results. 18 of 39 (46.2%) got subtype results. The complications after RFA include 9 (22%) pneumothorax with 5 (55.6%) needed catheter drainage, 1 (11.1%) needed air aspiration and 3 (33.3%) did not need to deal with. 4 (10.3%) patients had suffered local hemorrhage without hemoptysis. Post-op 1-month follow-up showed enlargement and consolidation of the ablation area than Pre-op GGOs ((2.41±0.98) cm vs (1.53±0.79) cm, p＜0.0001 on CT images whereas 4-month follow-up images showed a shrink of the ablation area than 1-month ones ((1.97±0.74) cm vs (2.41±0.98) cm, p=0.0015) .2-year local control rate after RFA was 96.97% (95%CI, 80.38%-99.57%) and 2-year OS was 100%. **Conclusion** CT-guided RFA combined immediately postoperative biopsy of GGO in lung is safe, effective, and

minimal invasive. This innovative method can bring clinical benefit to the control and diagnosis of GGO lesions in lung.

探索 MR 成像 ADC 图联合 CT 成像在肺穿刺活检中的应用

司海峰
南通市肿瘤医院

目的：分析 MR 成像 ADC 图联合 CT 图在肺穿刺活检中的作用，探讨该技术在临床肺部病变中的诊断价值。
方法：根据严格的纳入条件及排除标准，将 2017 年 11 月至 2018 年 12 月符合要求的 CT 引导下肺穿刺病例术前按照穿刺体位进行 MRI 检查，得到的 MR 扩散加权 ADC 图与穿刺时第一期轴位 CT 图通过工作站中图像融合软件根据骨性结构或形态解剖结构进行精准融合，获得“类 PET/CT”图像。根据融合图像判断肿瘤实性区并选择该区域为穿刺靶区进行穿刺活检。术后常规随访每一个病例的脱落细胞、组织学、免疫组化及基因检查结果。将使用该方法穿刺病例的临床基本资料（年龄、性别、有无肺气肿）、病灶情况（大小、位置）、穿刺情况（穿刺体位、深度、取材满意度、取材次数）、并发症情况（有无出血、气胸、种植、空气栓塞）和病理结果作为实验组数据。根据严格的纳入条件及排除标准，回顾性收集 2016 年 1 月~2017 年 10 月本院开展的通过 PET/CT 图辅助肺穿刺病例 53 例及常规 CT 引导的肺穿刺病例 120 例，将使用这两种方法穿刺的相关数据作为两组对照组数据。对三组数据分别进行两两对比，根据统计学分析结果，评价三种穿刺方法在临床中应用价值及优缺点。
结果：3 组数据在病人年龄、性别、有无肺气肿，病灶大小、位置，穿刺体位、深度，并发气胸、出血方面均无统计学差异（P＞0.05）。实验组、PET/CT 图辅助组在穿刺次数、取材满意度及病理结果阳性率方面均与常规 CT 引导下肺穿刺组有统计学差异（P＜0.05）。实验组与 PET/CT 图辅助组各项数据均无统计学差异（P＞0.05）。1 次穿刺及 2 次穿刺分别引起的并发症（气胸、出血）有统计学差异（P＜0.05）。
结论：相比于常规 CT 引导的肺穿刺，MR 扩散加权 ADC 图联合 CT 图辅助肺穿刺等效于 PET/CT 图辅助肺穿刺，病理结果阳性率更高，并且可以明显减少二次进胸活检次数，减少并发症的发生。

EPO-1808
经皮穿刺介入栓塞成功治疗乳糜漏

陈仁彪,钱力可,刘陈汉,郑伟良,胡红杰
浙江大学医学院附属邵逸夫医院

目的：探讨经皮穿刺介入栓塞治疗乳糜漏的有效性。方法：4 例经严格内科保守治疗失败的腹部外科手术后乳糜漏的患者行经皮穿刺介入栓塞，其中两例为经皮穿刺乳糜池后注入无水酒精和碘化油混合物；一例为经皮穿刺乳糜池后注入微弹簧圈后再注入组织胶水；一例为经皮穿刺瘘口位置注入组织胶与碘化油混合物。结果：所有患者介入栓塞术后即刻乳糜引流量即显著减少，平均 3-5 天拔除引流管，平均随访 6 个月到一年，所有患者均无复发，未发现手术相关并发症。结论：直接经皮穿刺介入栓塞治疗乳糜漏为一种快速有效安全且微创的治疗方式。

FTRO 联合微弹簧圈用于输卵管积水介入栓堵的效果分析

谭一清
武汉大学附属同仁医院.武汉市第三医院

目的：探究 FTRO 联合微弹簧圈用于输卵管积水介入栓堵的治疗效果。
方法：随机抽取 2015 年-2018 年输卵管积水来院进行介入栓堵的病例 80 例，对照组传统方法栓堵 40 例，观察组采用 FTRO 联合微弹簧圈栓堵 40 例。随访栓堵后超声复查情况、造影情况、月经改善情况、胚胎移植、宫内妊娠情况。
结果：FTRO 联合微弹簧圈栓堵组超声复查积水明显改善，82.5%患者月经改善，与对照组相比有显著性差异；胚胎移植及宫内妊娠率较对照组也有所提高。
结论：FTRO 联合微弹簧圈用于输卵管积水介入栓堵，临床效果明显优于传统栓堵法，技术简单，值得推广。

EPO-1810
TIPS 分流术后对肝硬化逆转的临床研究

罗仕华,徐海波,张笑春
武汉大学中南医院

目的：揭示经 TIPS 手术治疗后肝硬化逆转的现象。**方法**：回顾性分析 2000.1- 2013.1 期间 1950 例肝硬化门静脉高压合并消化道出血和难治性腹水患者的临床资料。评价 TIPS 治疗的临床效果，并揭示肝硬化程度、年龄、肝脏影像学表现与肝脏病理改变之间的关系。**结果**：所有患者 TIPS 技术成功，成功率为 100%，无严重手术相关并发症，平均门静脉压力下降，大部分临床症状得到控制。5 年随访影像学评分与病理 METR 评分改善共 72 例，其中术前 Child-pugh A 级 3 例，B 级 67 例，C 级 2 例；术前 40（含 40 岁）岁以下 41 例，40 岁以上 31 例。年龄（R=0.019,P=0.106）对影像学评分、病理评分不具有相关性,Child-pugh 分级（R=0.0180,P=0.0109）对影像学评分、病理评分具有相关性。**结论**：肝硬化门静脉高压患者经 TIPS 手术治疗后肝硬化可有逆转现象的发生。

EPO-1811
影像学及病理学对土三七所致肝窦阻塞综合征术前诊断及 TIPS 术后疗效的评估

刘开才,吕维富,何玉圣,周春泽,成德雷
中国科学技术大学附属第一医院（安徽省立医院）

目的：探讨 MRI 和 CT 影像学检查及病理学在土三七所致肝窦阻塞综合征（HSOS）患者术前诊断及术后恢复情况评价的价值；**方法**：选取 2014 年 09 月至 2018 年 12 月在我院行 TIPS 治疗的 HSOS 患者 54 例，其中因外伤或脑卒中等病因服用土三七浸泡药酒或中药病史，且服药后 10 天-6 个月出现临床症状的患者共 19 例，分别于术前一天及术后一月行腹部 CT 或 MR 平扫增强及超声引导下肝脏穿刺活检术，标本进行 HE 染色；**结果**：19 例患者中男性 11 例，女性 8 例；有 14 例患者行 CT 检查，5 例患者行 MRI 检查。术前：CT 平扫肝脏体积增大，密度不均匀减低，腹腔中-重度积液；增强扫描动脉期肝动脉增粗、扭曲，门静脉期及实质期肝实质灌注不均，呈斑片状不均匀强化，邻近肝静脉三大分支走行处的肝实质强化程度较余部分肝实质高且均匀。MRI 平扫较 CT 可清楚显示

肝实质的不均匀情况，增强可见沿肝静脉三大分支走行处的肝实质信号较余部分的肝实质信号更高及均匀，三支肝静脉纤细或显示不清，肝段下腔静脉纤细或扁平，但仍然通畅。病理：肝细胞呈广泛水肿变性，点状或轻度碎屑状坏死，肝窦明显淤血、扩张，汇管区扩大，纤维结缔组织增生，纤维间隔内有扩张的小静脉。术后一月：CT 及 MR 提示肝脏密度及信号均匀，其内未见明显异常密度及信号灶，肝动脉走形自然，腹腔积液明显较少甚至消失；术后病理提示肝细胞水肿明显好转，未见明显淤血、扩张的肝窦及小静脉。**结论：**土三七所致肝窦阻塞综合征（HSOS)的 CT 和 MRI 表现具有一定的特征性，反映了其病理特征，同时 MRI 和 CT 影像学检查及病理学亦能够评价 TIPS 治疗该病的有效性。

微弹簧和钩针用于 CT 引导下肺小结节术前穿刺定位的前瞻性对照研究

胡立宝,高健,洪楠
北京大学人民医院

目的：比较微弹簧和钩针用于肺小结节电视辅助胸腔镜切除术（video-assisted thoracoscopic surgical, VATS）前定位的有效性和安全性。
方法：本研究于 2017 年 10 月至 2018 年 10 月共纳入 60 例肺小结节患者。入选标准如下：（1）拟行 VATS；（2）放射学特征符合：1）肺结节<20 mm；2）病灶位于肺 1/3 外周，可进行楔形切除或节段切除；3）病灶无胸膜牵拉；（3）同意参加本研究并签署知情同意书。所有患者随机分为两组。A 组 30 例患者于手术当天行 CT 引导下肺小结节经皮穿刺微弹簧圈定位术；B 组 30 例患者于手术当天行 CT 引导下肺小结节经皮穿刺钩针定位术。比较这两种方法的成功率和并发症发生率。
结果：所有患者的 VAST 均成功，无转为开胸手术者。A 组定位术成功率为 96.7%（29/30），B 组定位术成功率为 93.3%（28/30）（P>0.05）。A 组总并发症发生率为 26.7%（8/30），无症状气胸 5 例，轻度肺出血 3 例。B 组总并发症发生率为 66.7%（20/30），14 例无症状气胸，7 例轻度肺出血，1 例胸痛需药物干预（P=0.002）。
结论：CT 引导下肺小结节微弹簧圈定位与钩针定位均有高成功率，两者有效性无统计学差别；而使用微弹簧进行定位发生的并发症更低，其安全性更好。

HIFU 治疗子宫肌瘤患者的妊娠结局分析

汤蕊嘉,赵卫
昆明医科大学第一附属医院医学影像科

摘要：目的　探讨高强度聚焦超声（HIFU）治疗子宫肌瘤患者的妊娠结局。方法　回顾性分析我院 2012 年 1 月-2019 年 1 月行 HIFU 治疗的子宫肌瘤患者 220 例，随访患者术后的妊娠情况并分析其影响因素。结果患者平均年龄 32.95±4.85 岁，均顺利完成 HIFU 治疗（成功率 100%）。HIFU 术后，92 名患者怀孕（妊娠率 41.82%），妊娠期并发症发生率为 2.17%，围产期并发症发生率为 1.08%。两组患者一般情况比较结果表明,年龄、术后临床症状改善情况、术后 3 月肌瘤体积≤30%、术后 3 月影像学疗效评价差异有统计学意义（P<0.05）；经多因素分析后发现年龄、术后 3 月疗效为影响术后妊娠结局的主要因素，差异有统计学意义（P<0.05）。结论　HIFU 可以提高子宫肌瘤患者的生育能力，影响其术后妊娠的主要因素为年龄和术后 3 月影像疗效评价,表明越年轻的患者更易怀孕，术后 3 月疗效越明显的患者更容易怀孕。

介入治疗股骨头缺血性坏死的临床研究

芮兵,陆玉和
滁州市第一人民医院

目的 观察基于血管内溶栓和改善微循环理论的血管介入技术治疗股骨头缺血性坏死的疗效。**方法** 对于单侧患者，超选择插管患侧旋股内动脉、旋股外动脉造影了解股骨头血液供应情况，脉冲式注入扩血管、溶栓药物。对其中 7 例两侧股骨头病变患者我们尝试利用成袢技术，一次完成两侧股骨头溶栓、扩血管治疗。间隔 1 周、1 个月后行第二、三次介入手术。**结果** 11 例患者均成功超选择插管目标血管。对其中 7 例两侧股骨头病变患者一次性完成两侧旋股内、外动脉插管。术后评价：①按照 Harris 髋关节评分系统，6 例显效，3 例有效，2 例无效。②按照治疗前后影像学检查的变化情况：通过对比介入治疗前后 X 线、CT 及 MRI 等影像学资料，9 例患者病情得到改善或稳定。2 例患者股骨头继续塌陷。**结论** 股骨头缺血性坏死的动脉溶栓治疗是一种操作简单、微创、安全、治疗并发症少、高效的治疗方法。为患者提供了一条新的治疗途径。尤其是对于年轻患者，可以大大延缓换髋时间。

经眼动脉灌注化疗视网膜母细胞瘤并发症的影响因素分析

姜华
广州市妇女儿童医疗中心

目的：评估经眼动脉灌注化疗（Intraophthamic artery Chemotherapy，IAC）作为一线治疗视网膜母细胞瘤（RB）的临床疗效及安全性，并探讨影响其眼球内陷并发症的因素。方法：回顾性分析 2014 年 9 月至 2016 年 9 月期间我科收治的视网膜母细胞瘤患儿 23 例 24 只患眼行 IAC 治疗的临床资料，并对患儿的性别、年龄、单-双侧眼别，眼球的供血情况（介入手术的途径）、肿瘤分期、药物灌注方案因素与 IAC 眼球内陷并发症的关系进行单因素和多因素分析。结果：总体保眼率为 83.3%（20/24）。局部并发症主要为眼睑水肿（41.6%）、眼睑下垂（20.1%）、斜视（4.2%）、眼球内陷（45.8%），全身并发症主要为发热和骨髓抑制。经单因素和多因素分析结果显示，影响 IAC 眼球内陷发生率的独立预后因素为术中灌注药物方案(P<0. 01)。结论：IAC 是治疗 RB 有效的治疗方法，但需重视其相应的并发症，尤其是灌注化疗药物引起的血管毒性。

无水乙醇栓塞治疗儿童四肢动静脉畸形的临床疗效分析

李海波,张靖
广州市妇女儿童医疗中心

目的评价无水乙醇栓塞(PEE)治疗儿童四肢动静脉畸形的安全性及疗效。**方法**回顾性分析 2007.02-2017.01 年我科收治的 31 例无水乙醇行治疗的儿童四肢动静脉畸形患儿临床资料,评估临床症状、瘤巢分型、疗效及术后并发症。**结果**（1）31 例患儿，其中男 16 名，女 15 名，平均年龄 6 岁。共行 PEE93 次，平均 3 次/例。随访时间为 6～48 个月，平均随访时间为 24 月。（2）临床症状表现为明显肿物 21 例（67.7%），疼痛 18 例（58%），跛行 8 例（25.8%），皮肤缺血溃疡 5 例（16.1%）。（3）Do 分型Ⅲb28 例（90.3%），Ⅱ型 3 例（9.7%）。按照 Yakes 分型Ⅳ型 30 例

（96.7%），Ⅱa 型 1 例（3.3%）。（4）有效 27 例（90%），其中治愈 17 例（54.8%），部分缓解 12 例（38.7%）；治疗失败 1 例（3.2%），其中无缓解 1 例（3.2%），恶化 0 例。（5）并发症其中水疱 2 例（6.4%），局部皮肤溃疡 3 例（9.6%）术中一过性血氧下降 3 例（9.6%），足趾一过性缺血 5 例（16.1%）。未见严重并发症。**结论** PEE 是一种治疗儿童四肢动静脉畸形安全有效的方法。

EPO-1817

First-line intra-arterial chemotherapy versus two cycles of intravenous plus intra-arterial chemotherapy for treating retinoblastoma: A comparative study

Hua Jiang
Guangzhou Women and Children's Medical Center

Objective: The aim of this study was to compare the outcomes of retinoblastoma (RB) patients treated with either first-line intra-arterial chemotherapy (IAC) or two cycles of intravenous plus intra-arterial chemotherapy (IV-IAC).
Methods: A total of 83 patients diagnosed with RB between September 2013 and February 2016, without any treatment history, were included. Of these, 45 patients were treated with primary intra-arterial chemotherapy and defined as the IAC group, while 38 patients were treated with primary two cycles of intravenous plus intra-arterial chemotherapy and defined as the IV-IA group. Eye salvage rate, enucleation-free survival and mid-to-long term complications were assessed.
Results: A total of 52 eyes of 45 patients in the IAC group were classified according to the International Intraocular Retinoblastoma Classification (IIRC) as group B (n=3, 5.8%), group C (n=3, 5.8%), group D (n=37, 71.2%), or group E (n=9, 17.3%). IAC was performed for 1–7 sessions (median: 3.3). During the median follow-up period of 22.2 months, overall eye salvage rate was 86.8%, six eyes developed recurrence, and two patients died due to metastasis. Complications included enophthalmos (n=21), cataract (n=4), vitreous hemorrhage (n=1), orbital edema (n=17) and ptosis (n=12). A total of 49 eyes of 38 patients in the IA-IVC group were classified as group B (n=3, 6.1%), group C (n=2, 4.1%), group D (n=33, 67.3%), and group E (n=11, 22.4%). IAC was performed for 1–5 sessions (median: 2.9). Overall eye salvage rate was 79.6%, with a median follow-up period of 21.2 months. Seven eyes developed recurrence, and one patient died due to metastasis. Complications were enophthalmos (n=10), orbital edema (n=15) and ptosis (n=12). The differences in the overall eye salvage rate, recurrence rate, metastatic rate and death rate between the IAC and IV-IAC groups were not statistically significant, but the enophthalmos rate was higher in the IAC group (p=0.006).
Conclusions: Two cycles of IVC plus IAC for RB may not reduce the overall metastatic rate. The risk of developing cataract and enophthalmos should be considered during IAC treatment.

介入治疗在介入后复发的视网膜母细胞瘤中的应用价值

姜华
广州市妇女儿童医疗中心

目的 探讨经眼动脉灌注化疗术在经眼动脉灌注化疗治疗后复发的视网膜母细胞瘤（Retinoblatoma, RB）中的应用价值。**方法** 回顾性分析 2010 年 1 月至 2016 年 12 月我院收治的 41 例行经眼动脉灌注化疗术（Transcatheter Ophthalmic Arterial Chemotherapy, TOAC）治疗后复发再次行 TOAC 治疗 RB 的临床资料，其中双眼 23 例，单眼 18 例，患眼共 51 只（其中 13 例双眼患儿只有一直患眼复发）；男性 20 例，女性 21 例。行 TOAC 术 176 次，平均每例行 3.4 次。随访时间 3~72 月，平均随访 23.6 月。**结果** 176 次眼动脉插管中，174 次成功插至眼动脉，技术成功率为 98.9%。术后 33 只眼（33/51，64.7%）稳定；其余 25 只眼行眼摘。**结论** TOAC 对治疗 TOAC 术后复发的 RB 患儿依然是安全有效的治疗方法，但远期疗效有待继续观察。

EPO-1819
CT 引导下非小细胞肺癌耐药后再次肺穿刺活检的临床应用

王阳阳,周志刚
郑州大学第一附属医院

目的：探讨 NSCLC 患者治疗耐药后再次肺穿活检的可行及安全性
方法：回顾分析 2017 年 1 月至 2018 年 9 月在我院行肺穿刺活检的 185 例 NSCLC 患者临床资料、并发症及影响因素。
结果：（1）共穿刺 185 次，成功率 100%，诊断率 100%，恶性肿瘤细胞检出率 89.7%。病理诊断：腺癌 137 例，鳞癌 18 例，大细胞癌 4 例，低分化癌 1 例，肉瘤样癌 3 例，小细胞癌 2 例，炎症细胞 19 例，双源性肺癌 1 例；（2）病灶平均直径 3.3cm，进针平均深度 6.6cm，平均调针次数 2.4 次，手术平均时间 13.7min。并发症包括：气胸 16 例（8.6%），肺内出血 15 例（8.1%），咯血 3 例（1.6%），皮下气肿 2 例（1.1%），胸膜腔出血 2 例（1.1%），液气胸 1 例（0.5%）。
结论：CT 引导下肺穿活检对 NSCLC 治疗失败后需再次活检来重新评估肿瘤组织时是安全可行的。

EPO-1820
Value of Virtual Monochromatic Spectral Images with Metal Artifact Reduction Algorithm in Dual-Energy Spectral CT-guided Microcoil Localization for Pulmonary Nodules

Zhuolu Zhang
Peking University People's Hospital

Objective: To evaluate the clinical value of virtual monochromatic spectral (VMS) images with metal artifact reduction (MAR) algorithm in dual-energy CT (DECT)-guided microcoil localization for pulmonary nodules.

Methods: 51 consecutive patients underwent DECT after placement of microcoils nearby small pulmonary nodules before video-assisted thoracoscopic surgery (VATS) for tagging purpose. The optimal energy level (in keV) was defined as the level at which CT values of nodules were equivalent to those of the conventional 120kVp and with no serious metal artifacts. VMS images at the optimal keV and at 50, 90, 110 and 140keV with and without MAR were reconstructed. Image quality was assessed qualitatively by visual rating utilizing a three-point scale: 1=excellent, minimal artifacts; 2=good, mild artifacts; 3=poor, extensive artifacts. Image quality scores between the VMS-only and VMS+MAR groups were compared using the Mann-Whitney U test, and reader consistency was evaluated using Kappa analysis.
Results: 74±5.7keV was found to be the optimal level for VMS images to have similar CT value as the 120kVp images. The image quality scores of the VMS+MAR images at 74keV were significantly better than those of VMS-only images (1.35±0.59 vs. 2.11±0.87, P=0.005), and were all diagnostically acceptable. There was no difference in image quality score among VMS+MAR images at 74keV and higher energy levels. Inter-reader agreements of evaluation were high (K=0.78).
Conclusion: Virtual monochromatic spectral (VMS) images at 74keV with metal artifact reduction (MAR) algorithm (VMS+MAR) can reduce artifacts from microcoils and improve image quality for accurate microcoil localization of pulmonary nodules.

Prognostic Nomogram for the Combination Therapy of Percutaneous Catheter Drainage and Antibiotics in Pyogenic Liver Abscess Patients

Sheng Xu, Bao-Qi Shi, Lu-Meng Chao, Yong-Sheng Tan, Xue-Jun Zhang
Inner Mongolia People's Hospital

Aim: To identify the predictors of recovery in pyogenic liver abscess (PLA) patients treated with combination therapy of percutaneous catheter drainage (PCD) and antibiotics, and then develop an effective prognostic nomogram.
Materials and Methods: The study was approved by the institutional ethics review boards. This retrospective study included consecutive PLA patients treated with PCD plus antibiotics. We defined the overall recovery time (ORT) as the time from PCD procedure to the confirmation of clinical outcomes. Based on the ORT, the predictors of ORT were identified with univariate and multivariate analyses, and a prognostic nomogram was developed and internally validated using Harrell's *c* statistic.
Results: A total of 116 patients and 142 PCD procedures with a median ORT of (15.0±10.6) days were included. Gas-formation (GF; HR: 0.486 [95% CI: 0.312- 0.757]; $P=0.001$), diabetes mellitus (DM; HR: 0.455 [95% CI: 0.303- 0.682]; $P<0.001$) and preinterventional septic shock (PSS; HR: 0.276 [95% CI: 0.158- 0.483]; $P<0.001$) were identified as predictors for ORT of combination therapy after univariate and multivariate analyses, which indicated a significantly longer ORT than those patients without. The prognostic analyses demonstrated that the more predictors (GF, DM and PSS) a patient exhibited, the longer ORT for the combination therapy. A prognostic nomogram was developed and revealed high accuracy, with Harrell's *c* statistic of 0.73.

Conclusion: GF, DM and PSS were predictors for recovery of PLA patients treated with PCD plus antibiotics. The nomogram was effective to predict the ORT of combination therapy.

Morphological Effects of Power-Treatment Duration Settings and Microcirculation on Thermal Ablation Zones -- a Preliminary in Vivo Animal Study with an MRI-Compatible Microwave Ablation Device

Weitao Ye,Yang Wanqun,Feng Shi,Changhong Liang
Guangdong Provincial People's Hospital

Objectives: To explore the morphological effects of power-treatment duration settings and preoperative intravoxel incoherent motion diffusion-weighted imaging (IVIM-DWI) parameters on microwave ablation (MWA) zones in porcine livers.
Methods: According to the liver parenchyma available, the power and treatment duration were assigned as five groups based on experience: A, 60W×5min (n=5); B, 80W×3min (n=3); C, 80W×5min (n=9); D, 100W×5min (n=8) and E, 100W×5min (n=5). Morphological metrics among the five groups were compared with analysis of variance and Bonferroni post-hoc test / Student-Newman-Keuls test. Pearson correlation and linear regression analysis between power settings, preoperative IVIM parameters and morphological metrics were performed.
Results: There was significant difference in short axis of the white zone (WS) (P=0.04) among the five groups, but no significant difference in the long axis (WL) (P=0.281) , the area (Wz) (P=0.242) or the spherical ratio (P=0.417) of the white zones among the five groups. Post-hoc tests showed significant difference in WS between group A and D (and E in Student-Newman-Keuls test) .There was correlation between WL (r=0.375, P=0.041), Wz (r=0.417, P=0.022), WS (r=0.539, P=0.022) and wattage, and the r^2s of the regression models were 0.352, 0.148, 0.257 for WS, WL and Wz. No correlation between treatment duration IVIM parameters and morphological metrics was observed (P all >0.05).
Conclusions: For MRI-compatible MWA device, greater short axis of the white zone can be produced at higher wattage with shorter treatment duration.

EPO-1827

Acute ischemic dissection of an ‘‘S”-shaped carotid artery: The ‘‘one-stop” value of using a detachable Solitaire AB stent

Wanyin Shi
The First Affiliated Hospital of Anhui Medical University

This study aimed to evaluate the efficacy and safety of endovascular repair using detachable Solitaire AB stents for acute ischemic dissection of ‘‘S”-shaped carotid arteries. From May 2015 to December 2016, a total of 127 patients with acute ischemic stroke (AIS) underwent endovascular treatment in our center. Among them, five AISs were due to acute dissection of an ‘‘S”-shaped carotid artery. Coexisting carotid embolism was identified in all five patients, who first underwent successful Solitaire AB stent-based retrieval of the embolism. All patients then underwent Solitaire AB stenting to reopen the occluded car- otid arteries, all of which were successfully recanalized. There were no procedure-related complications, except for minor hemorrhage transformation in one patient. The mean NIHSS scores were 12 ± 3.7 and 3.8 ± 3.4 at admission and 90 days after stenting, respectively (P = 0.018). The median modified Rankin Scale score at 90 days was 2.0 ± 1.4. Follow-up computed tomography angiography demonstrated in- stent patency in four of the five patients. Dissection of an ‘‘S”-shaped carotid artery infrequently leads to AIS. Such dissected arteries can be safely and reliably repaired by this stenting, ensuring successful reconstruction of the carotid arterial circulation.

125I 粒子植入联合经皮椎体成形术治疗伴硬膜囊受压的脊椎转移瘤

田庆华
上海市第六人民医院

目的 探讨 125I 粒子植入联合经皮椎体成形术（PVP）治疗伴硬膜囊受压的脊椎转移瘤临床疗效。

方法 回顾性分析 2015 年 6 月—2017 年 12 月行 125I 粒子植入联合 PVP 治疗累及硬膜囊的脊椎转移瘤 43 例患者 56 节病变椎体。采用视觉模拟评分（VAS）、体力状况评分（KPS）和肿瘤病灶大小（mm3）3 方面评价其疗效。 分别记录术前 VAS、KPS 评分；术后 24 h， 1、3 和 6 个月 VAS 及 KPS 评分；利用图像处理软件计算出术前肿瘤病灶大小、测量术后 1、3 和 6 个月残余肿瘤病灶大小，观察肿瘤有无增大。

结果 43 例患者手术均成功，每个椎体骨水泥平均注射量为（3.4±1.3）ml，每节椎体粒子平均植入量为（34±5）粒。 随访 6 个月 ~ 1 年，平均 9 个月。术前 VAS 平均得分为 7.8 ± 1.1；术后 24 h，1、3 和 6 个月 VAS 平均得分

分别降为 5.5 ± 0.8、3.9 ± 0.9、3.2 ± 0.7 和 2.7± 0.7；术前 KPS 平均得分为 58.6 ± 11.7；术后 24 h，1、3 和 6 个月 KPS 平均得分分别为 68± 7.2、80.3 ± 4.5、84.5± 5.1 和 82.1± 6.2。术前肿瘤病灶平均大小为（550 ±18）mm3，术后 1、3 和 6 个月残余肿瘤病灶大小分别为（315±12）、（139± 11）和（127±9）mm3，术后 1、3 和 6 个月肿瘤控制有效率达到 70.5%、76.8%和 88.9%。

结论 125I 粒子植入联合 PVP 治疗累及硬膜囊脊椎转移瘤在技术上可行，可有效控制病灶累及脊髓，保护脊髓神经功能健全。

EPO-1829
射频消融术联合经皮骨成形术治疗椎外转移性骨肿瘤的临床应用

田庆华
上海交通大学附属第六人民医院

的 探讨 DSA 引导下射频消融术（Radiofrequency ablation，RFA）联合经皮骨成形术（Pecutaneous Osteoplasty，POP）治疗椎体外转移性骨肿瘤的手术方法及临床疗效。

方法 回顾性分析 38 例（54 个病灶）行 RFA 联合 POP 治疗的椎外骨转移性肿瘤患者资料，年龄 23~75 岁，平均(52.6±12.2)岁。共 54 个转移灶得到治疗，其中髂骨 24 处、髋臼 21 处、股骨 7 处、坐骨 1 处、胫骨 1 处。所有病人至少随访 3 个月，通过术前、术后视觉模拟评分（Visual Analog Scale，VAS）、止痛药服用剂量的变化以及运动功能的改善情况评价临床效果。

结果 38 例手术均获得成功。术后 24 小时 VAS 评分由术前平均（7.1±1.5）分降至术后（2.2±2.0）分，术后 3 个月降至（1.6±1.8）分，术后 6 个月降至（1.3±1.8）分。术后 7 例(18.4%)疼痛完全缓解，25 例(65.8%)完全不需止痛药，10 例(26.3%)止痛药用量减少或止痛药级别降级，2 例(5.3%)维持原剂量，1 例(2.6%)使用止痛药级别升级。33 例行走困难的患者中 20 例（61%）术后行动功能改善，其中 4 例完全可以正常行走；12（36.4%）仍然行走困难；1 例（3%）行动不便加重，稍微活动即疼痛难忍。术后患者中位生存时间为 15 个月，一年生存率为 68.9%，两年生存率为 27.3%。8 例(21.1%)发生肿瘤周围软组织骨水泥渗漏，但无明显临床症状，1 例(2.6%)发生皮肤灼伤。

结论 DSA 引导下行 RFA 联合 POP 治疗椎外转移性骨肿瘤临床效果良好、创伤小、并发症少，可以明显提供患者生存质量。

经皮经腹前入路髓核摘除术治疗复杂 L5-S1 椎间盘突出的临床应用

田庆华
上海交通大学附属第六人民医院

目的 探讨经皮经腹前入路髓核摘除术（TPLD）治疗复杂 L5-S1 椎间盘突出的手术方法和临床疗效。

方法 收集从 2013 年 1 月到 2018 年 3 月因 髂骨棘过高、或腰骶角过大或过小的复杂 L5-S1 椎间盘突出症在我院行 TPLD 术治疗的 56 例患者资料，疗效评价采用 VAS 评分、 ODI 指数及影像学评价，至少随访 3 月。

结果 56 例患者均顺利完成手术。腰腿痛 VAS 评分及 ODI 指数在随访中改善（术前腰部及下肢平均 VAS 评分分别为 6.5 ± 1.1、7.5 ± 1.2，ODI 指数平均为 64.5 ± 7.4， 术后腰部及下肢平均 VAS 评分分别为 1.8± 0.9、1.5 ± 0.7、 ODI 指数平均为 14.6±4.2），均具有统计学意义（P<0.01）。无其他严重并发症发生。

结论 经皮经腹前入路髓核摘除术是治疗复杂 L5-S1 椎间盘突出症的一种可行、 疗效好、 并发症少的微创治疗手段。

EPO-1831
A Case of Brachiocephalic Artery Stenting Through the Carotid Artery

Fang Xu,Feng Wang,Yongsheng Liu
The First Affiliated Hospital of Dalian Medical University

As the population ages and people's living standards gradually improve, the incidence of cerebrovascular disease in China is increasing annually, posing a serious threat to people's health[1-4]. Ischemic cerebrovascular disease is the main type of cerebrovascular disease, accounting for more than 70% of cerebrovascular disease patients. It mainly includes vertebrobasilar insufficiency, cerebral insufficiency, transient ischemic attack and cerebral infarction, and its main cause is atherosclerosis[5-6]. Regardless of the location, interventional therapy and open

surgery are the standard methods of treatment. The stenosis or occlusion of the origin of the brachiocephalic artery has unique characteristics. If endarterectomy is used, making the incision in the neck makes it difficult to reach the target blood vessels and requires thoracotomy. These open surgeries are traumatic, risky and difficult to perform. Interventional minimally invasive surgery has therefore become the main method to treat stenosis at the beginning of the brachiocephalic artery. The femoral artery approach is the most common approach used for endovascular exclusion of the aorta. However, in cases involving an abnormal aortic arch or obvious distortion of the arteries, the trans-femoral approach is difficult to use because of its low success rate and high incidence of complications during the perioperative period. In addition to avoiding the occurrence of this situation and achieve faster and more effective hemostasis, we used a Perclose Proglide vascular stapler to suture the carotid puncture point. Herein, we report a case of sustained the possibility and safety of brachiocephalic arterioplasty through a carotid artery. It also illustrates the feasibility of suturing the carotid puncture site with a suturing device.

HDL 抑制 NLRP3 炎性小体对脑缺血再灌注损伤的保护作用及机制

王黎洲,周石
贵州医科大学附属医院

目的: 研究高密度脂蛋白（high density lipoprotein，HDL）对大鼠缺血再灌注脑损伤的保护作用及相关机制。**方法：**建立缺血再灌注脑损伤模型（middle cerebral artery occlusion，MCAO），模型组缺血后 1.5h，分别再灌注 12h、24h、72h 后处死大鼠，取脑损伤组织进行 TTC 染色，检测不同再灌注损伤时间后大鼠脑梗死体积，根据 Bederson 评分标准对大鼠神经功能损伤进行评分，实时荧光定量 PCR（Quantitative Real-time PCR， qRT-PCR）检测不同灌注时间脑损伤后炎性小体 NLRP3 的 mRNA 表达情况。选择脑损伤程度严重的缺血再灌注模型在缺血前 15min，尾静脉注射 10mg/kg、25mg/kg、50mg/kg 不同剂量的 HDL，缺血 1.5h 后再灌注 72h 后处死大鼠，取脑损伤组织进行 TTC 染色，检测不同剂量的 HDL 对缺血再灌注大鼠脑梗死体积的改善程度。利用酶联免疫（enzyme-linked immunosorbent assay，ELISA）和 qRT-PCR 检测大鼠缺血半暗带脑损伤组织中 IL-18 和 IL-1β 因子的蛋白和 mRNA 表达情况。免疫印迹法（Western blotting，WB）检测 NLRP3 和 caspase1 的表达。**结果：**随着缺血再灌注时间的延长，大鼠脑组织梗死程度加剧，大鼠神经功能损伤更严重，炎性小体 NLRP3 的 mRNA 表达水平显著上调。中、高剂量 HDL 治疗对缺血再灌注引起的大鼠脑部有保护作用，中、高剂量的 HDL 可显著降低缺血再灌注大鼠神经功能评分，改善缺血再灌注 72h 后缺血再灌注大鼠脑梗死体积，下调脑缺血再灌注引起的 IL-18 和 IL-1β 因子的蛋白和 mRNA 的表达。**结论：**高密度脂蛋白可通过抑制脑组织中炎性小体 NLRP3 的激活而对缺血再灌注损伤的脑组织起到保护作用。

miRNA-29b 调控 COL4A1 在 N2a 细胞氧糖剥夺/再灌注损伤中的机制研究

王黎洲,周石
贵州医科大学附属医院

目的:通过对 N2B 神经细胞氧糖剥夺/再灌注(oxygen and glucose deprivation/reperfusion，OGD/R)模型的构建，验证 miR-29b 对神经细胞的保护作用，探索 COL4A1 在 miR-29b 对神经细胞 OGD/R 损伤的保护作用中的机制。**方法：**正常和缺氧条件培养 N2B 细胞，实时荧光定量核酸扩增检测（Real-time Quantitative PCR，qPCR）miR-29b 的表达水平；分别用 CCK-8、克隆形成、Hoechest 和流式细胞术、蛋白印迹试验（Western Blot，WB）检测两组细胞的增殖、凋亡情况；双荧光素酶验证 miR-29b 的靶基因是否为 COL4A1；N2B 细胞转染 miR-29b mimics，qPCR 和 WB 检测 COL4A1 的表达。构建 COL4A1 的 3’UTR 的野生和突变载体，靶基因；设计合成 COL4A1，转染 N2B 细胞，缺氧培养，CCK8、克隆形成、Hoechest 和流式细胞术、WB 检测不同处理组细胞的增殖、凋亡情况。**结果：**OGD/R 细胞中 miR-29b 的表达较正常细胞组降低；在相同缺氧/复氧条件下培养的细胞中，上调 miR-29b 的表达，细胞的增殖能力明显增强，细胞的凋亡明显受到抑制。上调 miR-29b 的表达能够抑制 COL4A1 的表达；而在转染 COL4A1 及其对照后，COL4A1 对照组的细胞增殖较过表达组细胞明显增加，COL4A1 对照组的细胞凋亡较过表达组细胞明显降低。**结论：**miR-29b 对 N2B 神经细胞 OGD/R 模型具有保护作用，其通过抑制 COL4A1 的表达降低缺氧对 N2B 神经细胞的损伤，miR-29b 能够通过调节 COL4A1 的表达降低缺血/缺氧再灌注对神经细胞的损伤。

Endovascular treatment for acute large artery occlusion due to intracranial atherosclerosis and cardioembolism

Tengfei Zhou
Henan Provincal People’s Hospital

ABSTRACTION
Background and Purposes Intracranial atherosclerosis disease(IAD) and cardioembolism(CE) are two main reasons of large artery occlusion in acute ischemic stroke, Our aims were to evaluate the efficiency and safety of endovascular revasculization in the management acute large artery occlusion due to intracranial atherosclerosis and cardioembolism.
Methods Patients with acute large artery occlusion due to IAD and CE underwent endovascular treatment were analyzed retrospectively. The clinical and angiographic data were recorded, endovascular treatement methods were compared, and outcome was measured using modified Rankin Scale (mRS) scores at 90 days.
Results A total of 192 cases with large intracranial artery occlusion enrolled in the study, 101 in the IAD group and 91 in the CE group. Male, diabetes, CHD and dyslipidemia were more frequent in patients in IAD group, and the rate of atrial fibrillation was significantly higher in the CE group. The initial recanalization rate was significantly lower (18.75%) with stent retriever as first method in the IAD group than in the CE group, 77% of patients in the IAD group received one (or more) adjunctive treatment, which was significantly higher than in the CE. The final rate of recanalization, clinical outcome, complications, and mortality were comparable between two groups.
Conclusions There were differences of risk factors between IAD and CE, patients with acute large artery occlusion due to IAD react poorly to stent retrieval when compared with CE. However, the successfully revascularization rate at the end of procedure, the outcomes and complications at 90d were comparable among two groups.

Wingspan 支架治疗术后即刻残余狭窄与疗效及预后的关系研究

王震宇,蒋业清,黄磊,葛亮,鲁刚,狄若愚,万海林,张晓龙
复旦大学附属华山医院

目的 探讨颅内动脉狭窄血管内治疗的安全性及有效性，以及术后即刻残余狭窄率与疗效及长期临床预后的相关性。**方法** 回顾性分析本中心 2014 年 1 月至 2018 年 6 月 Wingspan 支架治疗的 59 例患者，62 处颅内动脉狭窄，评价手术技术成功率，手术前后血管狭窄率的改善，围手术期并发症及转归，比较高术后即刻残余狭窄率组（>30%）及低术后即刻残余狭窄率组（≤30%）围手术期并发症及预后的差异。**结果** 手术技术成功率 93.5%（58/62），术后血管狭窄率（22.5±9.7%）较术前（60.8±7.8%）明显下降（Pp<0.001）；围手术期并发症 6 例（6/59，10.2%），其中术中出血 2 例，术中血栓形成 1 例，术中夹层形成 2 例，术后再灌注损伤出血 1 例；5 例术中并发症患者出院时 mRS 评分无增加，1 例术后再灌注损伤患者，病情稳定后转外院康复。59 例患者中 53 例临床随访，，48 例影像随访。术后随访 mRS 评分（0.83±1.40 分）较入院时（1.63±0.98 分）显著下降(p<0.01)；Barthel 指数（87±17 分）由较入院（时 69±20 分）显著升高升高至随访时 87±17 分（Pp<0.001）。62 处狭窄病变中 51 例影像随访中影像随访 3 例（3/51，5.88%）再狭窄，其中 1 例（1/51，1.96%）再治疗[1] 。与低术后即刻残余狭窄率组相比，高术后即刻残余狭窄率组更多见于椎-基底动脉汇合处病例(Pp<0.05)、高术中并发症率率(Pp<0.05)及高手术风险（Pp=0.08）的病例。但是两组长期随访 mRS 评分及日常生活活动能力等级无明显变化。**结论** 颅内动脉狭窄的

Wingspan 支架治疗安全有效，高术后即刻残余狭窄率可能与椎-基底动脉汇合处、高风险病例、高术中并发症率相关，并不能作为血管内治疗的长期临床预后的预测指标。

EPO-1837
血管内栓塞治疗脑动静脉畸形合并动脉瘤的疗效分析

赵卫,蔡顺然
昆明医科大学第一附属医院

【目的】探讨介入栓塞治疗脑动静脉畸形（BAVM）合并动脉瘤疗效的影响因素，帮助制定治疗策略。
【方法】回顾性分析 49 例 BAVM 合并动脉瘤行介入治疗的患者，以 Redekop 分型对 47 例患者进行分型，分析不同分型患者颅内出血的风险。采用多重线性回归分析术后格拉斯哥转归评分（GOS）的影响因素并构建回归模型。所有患者术后 3 个月复查脑血管造影。
【结果】BAVM 合并动脉瘤的患者颅内出血的风险，合并供血动脉远端型及团内型动脉瘤者明显较高。通过多因素分析发现性别、年龄、Redekop 分型、动脉瘤最大径及 BAVM 位置与 GOS 评分无明显相关性，而 GCS、Spetzler-Martin（SM）
分级、动脉瘤形态及 BAVM 栓塞体积与 GOS 评分明显相关。多重线性回归分析显示 GCS 评分、BAVM 栓塞体积与 GOS 评分呈正相关，SM 分级、动脉瘤形态与 GOS 评分呈负相关。49 例患者中有 2 例合并有多发动脉瘤。除 1 例多发动脉瘤患者的两个血流相关性动脉瘤未予治疗，其余动脉瘤均给予栓塞治疗；畸形血管团给予不同程度栓塞。所有患者中，视力受损患者 1 例，肢体活动障碍患者 2 例，死亡患者 1 例。其余 48 例患者在术后 3 个月后复查脑血管造影均未见病灶残余及复发。
【结论】BAVM 合并动脉瘤的患者出血风险高，合并团内型和供血动脉
远端型动脉瘤的患者更容易发生颅内出血，而 Redekop 分型对术后 GOS 评
分无明显影响，因此患者应尽早治疗。
对于 GCS 评分较高、SM 分级较低、动脉瘤形态较规则的患者一般疗效较好，可积极栓塞治疗。通过回归模型可以对患者术后疗效进行预评估，制定合适的治疗策略，可减少术后出血等并发症，提高介入治疗的安全性及有效性。治疗 BAVM 合并动脉瘤时应优先处理其相关动脉瘤，以降低术后压力增高导致相关动脉瘤破裂出血的风险，且治愈性栓塞 BAVM 可提高疗效，降低复发。

• Quantitative Assessment of Correlation between Wall Enhancement Degree and Rupture Risk PHASES score of Intracranial Saccular Aneurysms based on 3D HR-MRI

Yeqing Jiang[1],Lei Huang[1],Gang Lu[1],Liang Ge[1],Ruoyu Di[1],Hailin Wan[1],Xiaolong Zhang[1],Yeqing Jiang[1],Lei Huang[1],Gang Lu[1],Liang Ge[1],Ruoyu Di,Hailin Wan[1],Xiaolong Zhang[1]
1.Huashan hospital affiliated to Fudan university
2.Huashan hospital affiliated to Fudan university

BACKGROUND: Aneurysm wall enhancement related to inflammatory was considered the intracranial aneurysm unstable risk factor. PHASES score was a model providing absolute risk of aneurysm rupture and growth risk. The relationship between aneurysm

wall enhancement and aneurysm rupture risk is still not clear. This study aims to investigate the relationship between intracranial aneurysm wall enhancement index (WEI) and PHASES score based on the 3D HR-MRI quantitative approach.

METHODS:From March 2016 to October 2017, 108 consecutive patients 127 intracranial saccular aneurysms were prospectively enrolled in our center. PHASES score including six specific predictors and WEI calculated by 3D HR-MRI were analyzed.
RESULTS:
1.WEI was positively related with PHASES score (Spearman r=0.487, P<0.001). WEI can predict PHASES score based on the linear regression analysis.
2. After compared WEI with six predictors of PHASES, aneurysm size was the critical element on aneurysm wall enhancement (ANOVA P<0.001).
3. In post hoc test, significant difference was between <7.0mm and ≥7.0mm groups (7.0-9.9mm P=0.015; 10.0-19.9mm P<0.001; ≥20.0mm P=0.003 respectively).
4. WEI was positively correlated with maximum diameter (Spearman r= 0.507, p<0.001) instead of age (Pearson r=0.025, p=0.783).
5. After the WEI comparison in various PHASES score level, statistical difference was revealed among three risk level groups (ANOVA P<0.001).
6. In post hoc test, significant difference was between high risk group and intermediate (P<0.001), low risk group (P<0.001) respectively.
7. The receiver operating characteristic curve (ROC) analysis can efficiently differentiate between the high risk and intermediate-low risk group (AUC =0.780, P<0.001), which have a reliable WEI cutoff value (1.04; sensitivity ,0.815; specificity 0.65) to predict high rupture risk.
CONCLUSIONS: Higher WEI is associated with an increased PHASES score which can provide absolute risk of aneurysm rupture and growth risk. Therefore, High WEI might be quantitatively predicting high rupture risk aneurysm.

经静脉途径栓塞破裂颅内动静脉畸形的前瞻性单中心研究

贺迎坤,白卫星,李天晓,何艳艳
河南省人民医院

目的：本研究通过分析影响畸形巢出血的相关因素，旨在评估经静脉途径血管内栓塞技术治疗国人破裂颅内动静脉畸形的安全性和有效性。

方法：本研究连续纳入自 2016 年 11 月至 2018 年 12 月在郑州大学人民医院颅内动静脉畸形专科住院行经静脉途径治疗的颅内动静脉畸形患者，收集患者的基线资料和临床资料。共纳入 21 例患者（21 个动静脉畸形），详细记录患者基线资料及随访资料。术后 1、3、6、12、24、36 个月对患者行临床随访，采用 mRS 评分对预后进行评估；术后 6、12、24、36 个月对患者行影像学随访，评估动静脉畸形治疗效果。采取有关统计学方法分析影响畸形巢闭塞及并发症发生的相关因素。
结果：共纳入 21 例患者，手术技术成功率为 90.5%。共实施 34 次手术，其中行经静脉途径栓塞 21 次，血管内经动脉栓塞 8 次，外科开刀 3 次，立体放射治疗 2 次。19 例技术成功患者中静脉端入路有 6 例通过上失状窦，9 例通过直窦，其余 4 例经过横窦进入。供血动脉控制方式使用弹簧圈者 6 例，3 例采取液体栓塞剂，4 例单独应用球囊辅助，液体栓塞剂结合球囊者 4 例，弹簧圈加液体栓塞剂者 1 例，1 例同时应用弹簧圈、球囊和液体栓塞剂。有 15 例患者获得影像学随访，中位影

像学随访时间为 5（2-15）个月，其中 14（93.3%，14/15）例患者的畸形巢获完全闭塞，且无畸形巢复发。其中 1 例在 13 个月随访时 DSA 证实残余畸形巢自行闭塞。21 例患者获得临床随访，中位随访时间 15.5（2-26 个月）个月，mRS 评分≤2 分的患者 19 例（90.5%,19/21）。严重致残致死性并发症者 2（9.5%，2/21）例。1 例患者于术后第 3 天 CT 证实脑室出血，另 1 例术后发生脑水肿和脑梗塞。

结论：本研究随访结果显示经静脉途径治疗国人破裂颅内动静脉畸形中期随访治愈率明显提高，随访期间未见畸形复发，但其安全性有待提高和大样本数据论证。

如何做好冠状动脉血流储备分数测定技术

梁稳生
广东省人民医院

目的

目前各地的冠脉介入手术量日益增加，新技术新设备也不断增加，相应地对介入技师也有了新的更高的要求。在当前实践中，基于冠状动脉造影（CAG）对病变进行主观视觉评估依旧主导着冠心病患者的治疗决策。通常认为，CAG 显示的狭窄程度超过 70%的病变会引起明显的心肌缺血，主张对其行 PCI。而对于狭窄程度为 50%～70%的临界病变，无论是有创的解剖形态学评估血管内超声（IVUS）和光学相干断层扫描技术（OCT）还是无创的生理学评估均不能准确判断狭窄对远端血流的影响程度，而血流储备分数（FFR）作为一种通过压力测定推算冠状动脉血流的指标，可以弥补上述检查的技术缺陷，为证明 CAG 显示的狭窄是否导致心肌缺血提供了一种非常好的方法。目前各地的情况并不一致，但介入技师负责 FFR 的非无菌操作部分，辅助心血管医师规范做好每一台 FFR，得出准确结果是一种趋势，也是介入技师能力与价值的体现。因此，让更多的介入技师可以掌握 FFR 在各种适应证中的应用，学会规范测量方法，获得准确数值，正确解读 FFR 数值十分必要。

材料与方法

从最大充血药物（主要是腺苷或 ATP）、校零和 EQ、测量与记录、压力导丝回撤、校验等各个 FFR 步骤了解其中的意义及标准操作、注意事项，排除各个步骤中由于不规范操作引起的故障以得出准确 FFR 数值。

结果

影响 FFR 数值准确性的常见因素包括：使心肌达到最大充血状态的药物的选择、剂量及给药方式；Pa 传感器的高度、EQ 时压力导丝的位置；测量时压力导丝的位置；压力导丝回撤的时机及速度；信号漂移。规范操作，排除这些因素引起的故障，才能得出准确的 FFR 数值。

结论

1 FFR 可以证明 CAG 显示的狭窄是否导致心肌缺血，可以辅助指导治疗策略，改善患者预后。
2 FFR 技术看似简单，但影响 FFR 数值准确性的因素繁多。
3 介入技师需掌握 FFR 各操作步骤的意义及影响因素，懂得规范操作及排除故障，配合心血管医师做好每一台 FFR。

EPO-1841

心脏介入手术术中的 X 线剂量管理

许美珍
南昌大学第二附属医院

心脏介入手术必须在 X 线下进行，其 X 线的辐射危害不可忽视。**目的：**术中优化 X 线照射方式，做好术中 X 剂量管理，使 X 线剂量尽量控制在较低水平。**方法：**我院 2018 年 1 月至 2018 年 12 月共行心脏介入手术 7671 例，其中冠脉介入手术 5510 例，高血压、结构性心脏病介入治疗 458 例，心率失常介入治疗 1703 例。使用的机器为飞利浦公司的 Xper FD20 和 Xper FD10 机。术中采用不同的 X 线采集方式，针对患者的不同的治疗目的，个性化定制。① 冠脉介入治疗可选择心脏冠脉模式， 15 帧/秒（Cardio-Cardiac-Left Coronary 15fps）或心脏电生理模式，7.5 帧/秒（Electrophysiology-Cardiac EP-Exposure 7.5fps）；遇慢性闭塞性（CTO）病变介入治疗，在看清侧枝血管显影后，可采用小视野开通血管，诺操作时间过长，DSA 机器上显示患者体表入射剂量值 ESD (Entrance skin dose)过大，超过 2000 mGY 以上，提醒术者，考虑分次治疗。② 高血压、结构性心脏病介入治疗，儿童采用心脏冠脉模式， 15 帧/秒；成年人可采用心脏电生理模式， 7.5 帧/秒，在看清心脏、血管解剖结构后可小视野透视采集进行下一步的介入治疗。③ 心率失常介入治疗采用心脏电生理模式， 3.75 帧/秒（Electrophysiology-Cardiac EP-Exposure 3.75fps），小视野透视采集。每台介入治疗均需做好术者、患者非照射部位的辐射防护；充分利用 DSA 机的固有防护；治疗床台升高适当位置，尽量使影像平板靠近患者，以减少散射线的产生。**结果：**经过有效的 X 剂量管理，可有效的减少术者及患者的 X 剂量 60%左右，使其控制在尽可能低的水平。结论：满足介入图像诊断质量要求的情况下,使用尽可能低的 X 线脉冲透视频率。介入治疗过程中，采用对 X 线剂量的综合管理措施，可以有效的减小 X 剂量

EPO-1842
三维旋转血管造影在射频消融治疗房颤术中的指导价值

简能日,周轩
四川大学华西医院

目的：探究三维旋转血管造影在射频消融治疗房颤中的临床价值。方法：选取 2018-2019 年我院收治的 40 例要行射频消融的房颤患者，研究组采取三维旋转血管造影，对照组按传统方式进行射频消融，比较两组的治疗效果，手术时间，X 线曝光时间等。结果：在治疗效果上，研究组 100%，对照组 95%。研究组手术时间短于对照组，差异有统计学意义。结论：三维旋转血管造影能缩短射频消融手术时间，缩短 x 线曝光时间

EPO-1843
室间隔缺损 XA 术中猪尾型导管造影危险因素分析

周松[1],李天纵[1],王咏梅[1,2],刘晓桥[1,2],张萍[1,2],谭洪文[1,2],张长海[2],唐峰[1,2],梁勤[13],章建平[14]
1.贵州省人民医院介入科
2.贵州省心血管病医院心内科
3.贵州省人民医院心脏彩超室
4.贵州省人民医院麻醉科

目的:探讨室间隔缺损(ventricular septal defect,VSD),在 x 线心血管造影(XA)介入诊疗术中猪尾型（Pigtail）导管造影可能出现的危险因素,以利于造影前及时干预,并减少不良事件的发生.

方法:回顾分析 2017 年 6 月至 2019 年 8 月在贵州省人民医院、贵州省心血管病研究所心内科、心外科,术前超声心动图(Transthoracic echocardiography,TTE)检查示 VSD,并行 VSD 介诊疗术患者,术中猪尾型导管造影出现的危险因素.

结果:共有 220 例行 VSD 介入诊疗患者,其中男性 101 例(48.8%),女性 119 例(51.2%),年龄 2 岁至 17 岁 146 例,年龄 18 岁至 73 岁 74 例.本研究发现其中 11 例 VSD 行介入诊疗患者中,其中 4 例猪尾型导管误入右心室,并行造影,然后将猪尾型导管重新调整至左心室造影(图 1),7 例猪尾型导管误入右心室,及时发现重新调整猪尾型导管进入左心室造影(图 2).其中 5 例猪尾型导管置于左心室位置不当,造影时引起二尖瓣返流(图 3).3 例造影时诱发频发早搏.

结论:猪尾型导管误入右心室造影,不但不能达到 VSD 造影的目的,而且增加右心室损伤的风险.重新左心室造影不仅增加患者对比剂用量,增加患者辐射剂量,而且延长手术时间,增加手术风险.因此 VSD 术中行左心室造影时,一定要仔细研判猪尾型导管的影像学位置,造影前先测量导管所在位置的心腔压力,并加以分析,如是右心室压力要及时调整导管,防止猪尾型导管通过缺损进入右心室误造影.导管过于接近心尖部时,易诱发频发室早,影像左心室正常收缩,舒张.用猪尾型导管进行左心室造影时,将导管放置于后乳头肌正上方的位置最好,诱发期外收缩的频率较少,而且不影响二尖瓣[2],优良的左心室造影为 VSD 介入诊疗提供有益的影像学支持和帮助(图 4).

血流动力学数值模拟结合 3D 打印在髂总动脉瘤腔内治疗中的应用

曾欢,赖化平,王金珺,谢丽霞
赣州市立医院

摘要

目的
基于医学影像资料利用医学三维可视化软件重建出髂总动脉瘤，获得的动脉瘤三维模型用于血流动力学数值模拟和 3D 打印。通过分析髂总动脉瘤的解剖结构和血管内血流情况，对髂总动脉瘤做风险评估，分析血流动力学参数对动脉瘤疾病的影响 ，有助于手术方案的制定及降低手术风险提高手术成功率。
方法
选择 2019 年 7 月 25 日赣州市立医院介入血管外科住院部收治的经过 CTA 诊断为右髂总动脉瘤一例，用 mimics21 读取 CTA 数据，三维重建得到髂总动脉瘤模型，包括腹主动脉部分，左右髂总动脉分叉部。应用 ansys-fluent 软件模拟出人体髂总动脉瘤血管内血流情况及用 3D 打印机将髂总动脉瘤模型打印出来。分析探讨髂总动脉瘤的解剖结构和血流动力学的改变，利于手术方案的制定及风险的规避。
结果
通过三维可视化技术 1；1 还原髂总动脉瘤，可了解人体真实解剖下的动脉瘤。基于三维重建模型应用血流动力学数值模拟计算和 3d 打印。可计算出髂总动脉瘤内血流速度流线分布，涡流，壁面压力等血流参数，3D 打印出血管模型可在三维可视化的基础上更加直观的了解动脉瘤的解剖结构，方便手术医生全面评估动脉瘤的风险。分析不同部位的壁面压力，动脉瘤体内涡流明显，血流速度缓慢，瘤体壁面压力高于正常血管壁面压力。近心端与远心端的血流速度明显高于瘤体部的血流速度。
结论
基于高分辨率下的 CTA 数据通过三维可视化技术构建人体真实解剖血管模型，在三维可视化的基础上 3D 打印出动脉瘤型，可更加精准的反映出血管的病变解剖部位。血流动力学数值模拟方法是分

析人体血管内血流动力学参数的有效手段。在血管畸形中，髂总动脉瘤血流流场复杂，复杂的血管模型对流动方式有很大的影响。通过仿真分析，印证了髂动脉瘤体部壁面压力最大，涡流明显，血流速度最小，此处破裂风险最高。同时更加利于手术方案的制定和风险的规避。

铁死亡在造影剂肾病中的作用机制研究

刘洋,李丹,吴可通,赖海洋,曾照飞,张波
中山大学附属第六医院

目的：探索铁死亡在造影剂肾病中的作用机制，为防治造影剂肾病提供新的作用靶点。
方法：SD 大鼠采取外科切除 5/6 肾脏组织的预处理，随机分为对照组、CIN 组、及 CIN+Fer-1 组。对照组为术后 6 周时的大鼠；CIN 组为经尾静脉注射造影剂碘克沙醇（10mg/kg）；CIN+Fer-1 组为经尾静脉注射造影剂碘克沙醇（10mg/kg），并经腹腔注射铁死亡抑制剂 Fer-1（5mg/kg）。测定血中尿素氮、肌酐的水平， HE、Masson、qRT-PCR、WB、IHC 等检测肾损伤水平和氧化应激、铁死亡及炎症相关的基因、蛋白的表达。
结果：CIN 组及 CIN+Fer-1 组肾脏组织中 Nrf2 及 HIF-1 表达水平明显高于对照组（P＜0.01），肾脏组织中 GSH 表达水平显著低于对照组（P＜0.01）。CIN 组 48 小时的血清肌酐及尿素氮水平、肾小管纤维化、脂质过氧化程度显著高于对照组（P＜0.01），而 CIN+Fer-1 组各项指标显著低于 CIN 组（P＜0.05）。CIN 组肾脏组织中 IL-33 表达水平显著高于对照组（P＜0.01），而 CIN+Fer-1 组则明显低于 CIN 组（P＜0.05）。且 CIN 组肾脏组织中 TNF-α、MCP-1、RANTES mRNA 表达水平显著高于对照组（P＜0.01），而 CIN+Fer-1 组各 mRNA 表达水平明显低于 CIN 组（P＜0.05）。CIN 组肾脏组织中 F4/80－阳性表达面积显著高于对照组（P＜0.01），而 CIN+Fer-1 组干预后明显低于 CIN 组（P＜0.05）。
结论：造影剂肾病发生发展过程中存在氧化应激损伤，且 Fer-1 能减轻氧化应激所致的脂质过氧化，并能改善肾功能，减轻肾组织损伤。同时 Fer-1 能降低肾组织中 IL-33、TNFα及 MCP-1 的水平，提示了铁死亡在造影剂肾病中可能是炎症及细胞死亡的早期始动因子。调节细胞铁死亡水平可能为防治造影剂肾病提供新的干预手段。

EPO-1846
一种用于虚拟介入造影剂示踪的血流动力学仿真方法

孙文博,阮兆,王亚勋,徐海波
武汉大学中南医院

目的：研究一种基于计算流体力学仿真的方法是否可以用于虚拟介入手术中造影剂示踪，减少造影剂的注入和辐射剂量。
方法：基于 3D-DSA 图像或 CTA,MRA 图像，在 MIMICS 软件中提取血管三维几何结构，对烟雾病患者的脑血管，包括颈内动脉和颞浅动脉【2】，在有限元仿真软件 Comsol 中进行计算流体力学瞬态仿真。瞬态仿真的边界条件由超声或磁共振相位对比法测得，将流体建模设置为血液和造影剂的不可压缩非牛顿液体混合物。其中碘造影剂密度为 1349kg/m^3, 黏度为 0.0063Pa.s，血液的密度为 1060kg/m^3, 黏度为 0.0035Pa.s 【1】。将混合物黏度建模为受造影剂注入浓度和流速影响的函数。仿真周期为 5 个心动周期，仿真步长为 0.01s，将仿真结果与注入碘剂后真实的 DSA 成像示踪结果做对比。对比指标为造影剂浓度变化曲线及不同时刻的造影剂分布图。

结果：虚拟介入造影剂示踪仿真结果与 DSA 成像结果在不同时间点的造影剂分布图和浓度变化曲线接近，无显著差异。
结论：一种用于介入造影剂示踪的血流动力学仿真方法，可能可以在烟雾病搭桥介入术中模拟不同角度、不同流速造影剂注入后的仿真结果，达到减少造影剂的注入和手术辐射剂量的目的。该仿真方法同样可以用于人体其它血管介入造影剂示踪。

一站式治疗左髂静脉压迫综合征并左下肢静脉血栓回顾性研究

刘亚民
西安交通大学第一附属医院

【摘要】 **目的：**回顾性研究“一站式”介入治疗左髂静脉压迫综合征并下肢深静脉血栓效果及对凝血系统影响。**方法：**对 46 例 IVCS 合并 DVT 患者行“一站式”的疗效进行了回顾性研究，比较术前与术后 1 周凝血指标和与小腿中点周径测量值差异、开通显效率和总有效率、通畅评分及开通率，观察并发症。术后随访 6 个月。**结果：**46 例患者治疗前后静脉通畅评分，差异有统计学意义（t =27.234, P ＜ 0.05），治疗后静脉通畅率(94±8.7)%，总有效率 100%；患者凝血指标术后、前相比，APTT[（22.77±3.61）s 比（17.92±2.61）s P ＜0.05]、PT[（14.12±1.61）s 比（14.42±1.81）s P ＞0.05]、血栓弹力图 R 值[（4.48±8.1）min 比（3.12±0.41）min, P ＜0.05]、D-二聚体[（2876.32±3476.31）ug/L 比（4625.18±3692.24）ug/L, P ＜0.05]、小腿中点周径[（62.14±0.64）cm 比（41.32±0.71）cm, P ＜0.05]较术前好转。46 例患者治疗期间无出血和肺动脉栓塞，术后随访髂静脉支架通畅，35 例耐受正常体力活动，未出现下肢肿胀，5 例活动后出现轻度肿胀，休息后消失，1 例出现静脉血栓后综合征。**结论：**一站式治疗急性静脉血栓型髂静脉压迫综合征疗效确切，并发症少并且能改善患者内源性凝血系统。

低浓度 1%聚多卡醇注射治疗 60 例淋巴管畸形临床分析

刘浪
广州市妇女儿童医疗中心

郭铁群广州妇儿中心:
疗儿童囊性淋巴管瘤 60 例的临床资料；60 例术前均经彩色超声、CT 或 MRI 检查确诊,治疗时在彩色超声联合 DSA 引导下经皮穿刺抽尽囊液后注入药物,对多囊性患儿则彩超引导下依次抽液后分别注入药物；根据瘤腔位置和大小不同，对颈部、颌下、腹股沟及瘤腔内淋巴管液体超过 10ml 的 42 例采用 1%聚多卡醇+空气（按 1:3 比例）泡沫进行泡沫硬化注射,其余 18 例淋巴管瘤瘤体淋巴管液小于 10 毫升及微囊型均采用 1%聚多卡醇原液进行瘤内注射。术后 1 月复查彩超或 MRI，观察瘤体大小变化、治疗次数和并发症；评价标准：a 治愈：瘤体消失,1 年后无复发;b、有效：瘤体缩小 50％以上,1 年后无增大。c、无效：瘤体缩小 50％以下或治疗后 1 年内复发。结果：60 例治疗 2～5 次,平均(3.5±0.8)次。治愈 49 例(81.7％)；有效 6 例(10.0％),无效 5 例(8.3％),总有效率为 91.7％(55/6)。注射治疗常见的并发症有 1、发热,通畅体温不超过 38.5° 可予物理降温后缓解。2、局部肿胀 60 例，几乎全部患儿经过治疗后均有肿胀，可给予喜辽妥外用及局部热毛巾外敷，一

般约 2~3 周左右可缓解。3、轻微疼痛 52 例，无需特殊处理，观察 1～3d 后消失；4、局部皮肤淤青或类似色素沉着 2 例。未发现其它明显并发症。结论：1%聚多卡醇瘤腔内注射治疗儿童囊性淋巴管瘤是一种微创、安全、有效的方法，在传统硬化剂平阳霉素缺乏的情况下不失为一种安全有效的替代方案。

228 例布-加综合征血管造影表现

吕维富,李爽
中国科学技术大学附属第一医院（安徽省立医院）

目的 分析布-加综合征(BCS)的数字减影血管造影(DSA)的表现，为 BCS 的诊断和选择合适的治疗方法提供科学依据。方法 采用回顾性分析的方法收集我院的 228 例 BCS 患者病例资料，分析其 DSA 表现。结果 患者中下腔静脉隔膜型 29 例，节段型 184，肝静脉型 10 例，混合型 5 例。DSA 图像特征：下腔静脉或肝静脉梗阻，不同分型表现不一。结论 DSA 能够清晰显示下腔静脉及肝静脉的部位和范围，认识这些表现有助于对 BCS 的分型及治疗方式的选择具有重要意义。

改良导管介入治疗输卵管阻塞的疗效观察

杨敏玲
山西医科大学第一医院

【目的】探讨改良导管介入治疗输卵管阻塞的临床疗效。
【方法】回顾性分析山西医科大学第一医院与山西现代妇产医院介入科 2012 年 1 月至 2013 年 12 月收治的不孕患者均经子宫输卵管造影诊断输卵管阻塞 198 例，年龄 22～43 岁，平均年龄 32 岁，不孕平均年限 2～6 年，其中原发性不孕 82 例，继发性不孕 116 例，198 例患者共 387 条输卵管不同部位阻塞（其中因输卵管宫外孕术后切除一条输卵管 7 例，单角子宫 2 例），输卵管近段阻塞（间质部与峡部）263 条，输卵管远端阻塞（壶腹部与伞端）124 条。经改良导管介入治疗输卵管阻塞观察其再通率，并通过随访记录妊娠情况。
【结果】387 条阻塞输卵管经改良导管再通治疗后，其中 263 条输卵管近段阻塞（间质部与峡部）疏通 252 条，再通率 95.8%。失败 13 条，失败率为 4.94%。124 条输卵管远端阻塞（壶腹部与伞端）疏通 98 条，再通率 79%。失败 26 条，失败率为 20.97%。总共疏通 350 条，总疏通率 90.4%。术后随访 162 例患者 1～24 个月，妊娠 63 例，妊娠率 38.9%，其中 1 例胎停育，3 例输卵管妊娠。输卵管近段疏通率明显高于远段疏通率，$P<0.05$，有统计学差异。
【结论】应用改良导管行输卵管阻塞介入治疗，取材方面经济，插管容易，操作时间短，可以与进口专用输卵管导管相媲美。为基层医院提供使用简便经济的介入器材治疗输卵管阻塞提供理论依据。本文结果提示输卵管近段疏通率明显高于远段疏通率, 再通术后 1 年内宫内妊娠率明显高于 1 年以上宫内妊娠率。

Transcatheter Obligation Feeding Artery Embolization for Management of Hemoptysis:Follow-Up- Eight-Year Single-Center Experience

Donghong Shi
Interventional Ward of Medical Imaging Department Eastern Theater General Hospital

PURPOSE: To review the authors' 8-year experience with transcatheter obligation feeding artery embolization (TOFAE) for the treatment of hemoptysis.
MATERIALS AND METHODS: TOFAE were performed in 169 patients (121:48 F:M) with mean age of 56.22 years (range:17-86), using coaxial catheter technique. The technical and clinical outcomes were followed in terms of immediate control of bleeding, recurrence of hemoptysis and complications of the procedure. Cumulative survival, correlations and the relapse rate were evaluated using the Kaplan-Meier method, Binary logistic and Pearson's Chi-Square test or Likelihood Ratio's test, respectively. All P value < 0.05 was considered statistically significant.
RESULTS: The average number of obligation feeding arteries embolized per patient was 1.62. Technical success rate was 98.82% (167/169), immediate clinical success rate (ICSR) 96.45% (163/169). The follow-up period ranged from one day to eight years (mean 25.04 months). The relapse rate was 18.44% (26/141) during the entire follow-up period of 8 years. The mean of the first recurrent time was 16.04 ± 2.96 months in benign lung diseases, 14months in malignant lung diseases. Among 26 recurrent patients, 9 patients were treated with1 TOFAE once again, 2 with 2 TOFAE, 11 with antibiotics treatment and 3 underwent a lung resection of lesion lobe, and 1died of recurrent hemoptysis. Severe complications took place in 3 patients(infarction of spleen and left kidney 1, brain infarction 1 and spinal cord infarction 1, respectively). The median survival time after TOFAE (Kaplan-Meier estimate) was 83.95 ± 2.31 months in benign diseases, 11.66 ± 2.12 months in malignant lung diseases (x^2 = 103.99, P < 0.001). PIA correlated with pleural thickening and aetiology of the haemoptysis (x^2 = 47.114, P < 0.001; x^2 = 69.476, P < 0.001). The relapse rate correlated with the aetiology (x^2 = 26.528, P = 0.005).
CONCLUSIONS: TOFAE was effective and palliation hemostatic techniques. It was critical for successfully finding and embolizing of obligation feeding arteries. A multidisciplinary team approach was the key to improve the long-term curative effect.

EPO-1852
TACE 及 MWA 联合 TIPS 治疗肝癌并门脉高压患者的疗效分析

万程,赵卫
昆明医科大学第一附属医院

目的 回顾性分析经导管肝动脉化疗栓塞术（TACE）及微波消融（MWA）联合经颈静脉肝内门体分流术（TIPS）治疗肝癌合并门脉高压患者的疗效分析。**方法** 收集 2012 年 6 月至 2018 年 7 月 42 例肝癌合并门脉高压患者，其中 10 例在我科行 TACE+MWA+TIPS 术；11 例行 TACE+TIPS 术；21 例行 TACE+MWA 术；记录手术技术成功率、术前及术后门静脉压力变化情况、再出血率、治疗前后肿瘤指标变化及死亡事件等。**结果** （1）TACE+MWA+TIPS 组，手术成功率 100%，门静脉压力平均减低

14cmH2O,症状缓解率 100%，肝性脑病 14.7%（轻度），1 年内支架通畅率 97%，再出血率 15%,肿瘤复发转移 2 例，1 例死于肝衰竭。（2）TACE+TIPS 组，手术成功率 100%，门静脉压力平均减低 15cmH2O,症状缓解率 100%，肝性脑病 15.2%（轻度），1 年内支架通畅率 96%，再出血率 16%,肿瘤复发及转移 5 例，1 例死于肿瘤破裂。（3）TACE+MWA 组 手术成功率 100%，随访期内，4 例死于消化道出血，肿瘤复发及转移 5 例，2 例死于肝衰竭。**结论** 1、TIPS 对肝癌合并门静脉高压症患者能够有效降低门静脉压力，减少消化道出血风险；2、TACE+MWA 可有效治疗肝癌,明显降低病灶复发及转移概率；3、TACE+MWA+TIPS 在抑制肿瘤复发的同时，可明显降低出血风险，改善患者生存时间及生存质量，增加患者获益。

EPO-1853

Efficacy and safety of hepatic artery embolization in patients with delayed postoperative hemorrhage following hepatobiliary pancreatic surgery

Zhiwei Wang
Peking Union Medical College Hospital

Purpose: To evaluate the efficacy and safety of hepatic artery embolization in patients with delayed postoperative arterial hemorrhage after hepatobiliary pancreatic surgery.
Material and Methods: We retrospectively reviewed 28 patients who underwent proper or common hepatic artery embolization for delayed postoperative arterial hemorrhage after hepatobiliary pancreatic surgeryin our hospital between January 2008 and December 2018. To evaluate the frequency and severity of ischemic liver injuries, the liver enzyme levels and CT findings before and after hepatic artery embolization were retrospectively compared and the clinical outcomes after hepatic artery embolization were analyzed.
Results: Successful hemostasis was accomplished with the hepatic artery embolization in all patients, except for one. Eight patients with portal vein stenosis. Ischemic liver injuries were observed in 23 (85%) of 27 patients. Injuries included subsegmental hepatic infarction in 17 (74%) patients, and transient hepatic ischemia/dysfunction in six (26%).
Conclusion: Proper or common hepatic artery embolization is sage for delayed postoperative arterial hemorrhage after hepatobiliary pancreatic surgery, even if a patient has portal vein stenosis .

门静脉分支选择对于经颈静脉肝内门体分流术治疗食管胃静脉曲张出血的疗效影响

郑晖,杨维竹,黄宁
福建医科大附属协和医院

目的 探讨门静脉右支分流及左支分流对于经颈静脉肝内门体分流术（TIPS）治疗食管胃静脉曲张出血（EGVB）的疗效影响。**方法** 回顾性分析 68 例接受 TIPS 治疗的 EGVB 患者临床资料，包括 34 例行穿刺门静脉右支建立分流道（门静脉右支组），34 例行穿刺门静脉左支建立分流道（门静脉左支组），比较两组疗效差异。**结果** TIPS 手术成功率 100%。门静脉右支组患者术后 6、12 及 24 个月累积无消化道再出血率 80.87%、76.61%及 69.64%，而门静脉左支组分别为 84.87%、80.83%及 75.44%（*P*=0.67）。门静脉右支组患者术后 6 及 12 个月分流道累积通畅率分别为 84.58%及 68.34%，而门静脉左支组分别为 90.23%及 83.78%（*P*=0.78）。门静脉右支组患者术后 12 及 48 个月累积生存率分别为 90.14%及 72.12%，而门静脉左支组分别为 91.08%及 70.06%，差异无统计学意义（*P*=0.57）。门静脉右支组和门静脉左支组术后肝性脑病发生率分别为 17.65%和 26.47%，差异无统计学意义（*P*=0.38）。**结论** 门静脉分支选择对于经颈静脉肝内门体分流术治疗食管胃静脉曲张出血的疗效无影响。

胎盘植入患者子宫血供来源分析及术后出血栓塞血管选择

张凯,赵鑫,张文哲,任红瑞
郑州大学第三附属医院

目的：分析胎盘植入患者子宫血供来源及各分支供血区域，并为产后出血责任动脉栓塞止血提供指导。**方法：**回顾性搜集 2015 年 9 月至 2019 年 6 月在我院接受治疗的 968 例胎盘植入患者资料，所有患者均经超声及磁共振明确胎盘植入。超声评分 5 分以下 193 例、5-8 分 516 例、8 分以上 259 例。所有患者均行介入辅助下剖宫产术，术后给予患者行腹主动脉、双侧髂内动脉、双侧髂外动脉造影明确子宫供血动脉来源。**结果：**968 例患者共存在 4719 支供血动脉，其中子宫动脉 2193 支（左侧 1108 支、右侧 1085 支）；阴部内动脉 887 支（左侧 403 支、右侧 484 支）；子宫圆韧带动脉 659 支（左侧 323 支、右侧 336 支）；卵巢动脉 980 支（左侧 416 支、右侧 564 支）。其中子宫动脉供应全子宫血供；阴部内动脉供应宫颈及宫体部血供；子宫圆韧带动脉供应宫体及宫底部血供；卵巢动脉供应宫底部血供。所有患者均未见卵巢动脉造影剂外溢。**结论：**胎盘植入患者子宫血供来源丰富，对于术后出血患者在介入栓塞过程中需仔细查找供血动脉并做到彻底栓塞。卵巢动脉供应宫底部位，非出血责任动脉，无需栓塞。

关键词：胎盘植入；供血动脉；栓塞；选择

EPO-1856
介入治疗在移植肾血管并发症中的应用

卢浩浩
华中科技大学同济医学院附属协和医院

【目的】探讨介入治疗在移植肾血管并发症处理中的安全性和可行性。【方法】收集 2009 年-2016 年于武汉协和医院行肾移植后出现血管并发症患者 11 例，男 7 例，女 4 例；年龄 32-61 岁；起病时间为肾移植术后 1-24 月，影像学检查提示移植肾动脉狭窄 5 例，假性动脉瘤 3 例，肾动静脉瘘 2 例，移植肾静脉狭窄 1 例；所有 11 例患者均行介入治疗术。【结果】5 例移植肾动脉患者（3 例行单纯球囊扩张术，2 例行球囊扩张+支架置入术），随访期间肾动脉未出现再狭窄，血压控制满意。2 例移植肾动静脉瘘患者再无血尿等，肾功能正常。3 例假性动脉瘤患者瘤腔血栓化，支架内血流通畅。1 例移植肾静脉狭窄患者，尿量、肾功能正常，移植肾静脉血流通畅。【结论】肾移植

血管并发症的患者基础情况差，外科手术难度大、风险高，介入治疗安全、有效、微创，可以有效挽救肾功能，减少移植肾丢失。

EPO-1857
动脉置管术中溶栓治疗肝移植术后近期肝动脉急性血栓性闭塞

陈柱
中南大学湘雅二医院

目的：解决肝移植术后短期内肝动脉血栓性闭塞，全身抗凝溶栓效果差、出血风险高，目前国内外报导较少的动脉内溶栓成为降低溶栓风险，提高治疗成功率的新方法，本文在传统介入溶栓的基础上，仅运用术中溶栓，进一步缩短溶栓时间，希望达到进一步减少并发症的可能性，同时探讨脾动脉盗血综合征所致肝动脉供血不足引起的血栓形成的介入治疗方法。本文主要研究肝移植术后近期肝动脉急性血栓性闭塞时动脉术中溶栓的可行性及安全性。
材料与方法：经典式原位全肝移植术后患者 4 例，其中男性 3 例，女性 1 例，年龄 45 岁到 55 岁，均于术后 3 天内出现转氨酶及胆红素升高，行急诊超声检查显示肝动脉急性血栓形成，均行急诊介入治疗。造影显示肝动脉吻合口明显狭窄，肝动脉分支未见显影，微导管超选通过狭窄段，先经外周静脉团注 5000 单位肝素，再经微导管以 1ml/min 的速度缓慢注射 20 万单位尿激酶，边注射边适当退微导管，注入完成后等待 30 分钟后造影，如肝动脉不通，重复注射尿激酶 10 万单位，如显示肝动脉通畅，分支显影，则中止手术 。所有病例均未留置溶栓导管。4 例患者中有 1 例溶栓 2 天后超声示肝动脉血流信号差，再次造影显示肝动脉吻合口狭窄，分支未见显影，脾动脉增粗迂曲，脾大，考虑为脾动脉盗血综合征，遂行肝动脉置管溶栓及球囊辅助脾动脉主干弹簧圈栓塞。
结果：4 例肝移植术后肝动脉急性血栓形成的患者经过动脉术中溶栓后，肝动脉均成功开通，其中 3 例未再次出现肝动脉血栓形成，另外 1 例短期内再次出现肝动脉血栓形成，造影发现脾动脉盗血，置管溶栓及脾动脉近端栓塞后肝动脉开通，并且未再次出现血栓形成，4 例患者随访三个月未见异常表现。
结论：肝移植术后肝动脉急性血栓形成不仅有吻合口本身的原因，也有脾动脉盗血所致的肝动脉供血不足的因素，急诊肝动脉内溶栓治疗具有可行性及较高安全性，而对于脾动脉盗血所致肝动脉血流缓慢，血栓，辅助脾动脉主干栓塞是安全及有效的治疗方法。

EPO-1858
急性下肢深静脉血栓形成（LEDVT）患者在经导管直接溶栓（CDT）过程中血浆 D-二聚体（D-D）及纤维蛋白原（FIB）的变化规律的临床应用价值

刘强
上海交通大学附属第六人民医院

目的 通过分析急性下肢深静脉血栓形成（LEDVT）患者在经导管直接溶栓（CDT）过程中血浆 D-二聚体（D-D）及纤维蛋白原（FIB）的变化规律，评估其临床应用价值。方法 选取 2015 年 12 月至 2016 年 12 月在我院行 CDT 疗的急性 LEDVT 的患者 18 例，均采用 CDT 治疗，治疗过程中每隔 8h 测定患者血浆 D-D 及 FIB 浓度，治疗后计算血栓溶解率并进行疗效分级。计算每位患者的 D-D 峰值、D-D 上升速度、FIB 下降速度及 D-D 增高时间，用统计学方法分析 D-D 及 FIB 的变化规律，同时分析 D-D 峰值与血栓量、D-D 上升速度与血栓溶解率、D-D 上升速度与 FIB 下降速度、D-D 增高时间与血栓溶解率之间的相关性。结果 平均血栓溶解率为 78%，其中 6 例患者血栓完全溶解。疗效达到“优”或“良”的患者占 72%，无脑出血等严重并发症发生。在 CDT 治疗过程中，尿激酶剂量不变的情况下，D-D 先上升后下降，FIB 为持续下降；尿激酶剂量减半后，D-D 下降速度变缓，FIB 则逐渐上升。统计学分析显示 D-D 峰值与血栓量呈正相关（Pearson ratio=0.81，p<0.01），D-D 上升速

度与 FIB 下降速度呈正相关（Pearson ratio=0.49，p=0.04），D-D 上升速度与血栓溶解率之间没有相关性，D-D 增高时间与血栓溶解率之间没有相关性。结论 在 CDT 治疗急性 LEDVT 过程中对 D-D 及 FIB 进行监测及分析，有助于指导溶栓药物的使用，延长血栓溶解的时间，提高 CDT 治疗的有效性。

EPO-1859

三七皂苷 Fc 调控自噬和氧化应激促进大鼠颈动脉损伤后的再内皮化

刘晶晶
上海交通大学附属第六人民医院

再内皮化是放射介入治疗后血管损伤修复的重要过程，糖尿病中的高血糖在损伤内皮层完整性方面发挥主导作用，导致再内皮化的延迟和新内膜的过度增生。三七皂苷 Fc 是一种从三七叶中分离出来的新型化学单体，能有效地抵抗血小板聚集，且大量研究已经证明三七皂苷具有良好的心血管保护作用。研究表明血管介入损伤后大量血小板聚集和沉积是导致再内皮化延迟的重要原因，然而，Fc 对血管再内皮化的潜在作用和分子机制目前仍没有研究。

体内实验，将 SD 大鼠分为四组：假手术组、对照组、糖尿病组、糖尿病+Fc 组。使用高脂喂养加 40mg/kg 链脲霉素腹腔注射造成二型糖尿病，通过大鼠颈动脉导丝损伤模仿血管介入损伤后状态。伊文蓝和 HE 染色分别用来评估再内皮化率和新生内膜的形成。体外实验，用 30mM 葡萄糖加入细胞培养基模拟高糖环境，通过细胞周期实验、划痕实验、Transwell 小室实验观察内皮细胞的增殖和迁移；通过自噬相关蛋白的表达、双荧光标记自噬流形成以及电镜下观察自噬小体数量反映内皮细胞自噬程度；通过测定细胞产生的 ROS、MDA、SOD 含量评估氧化应激水平；此外，通过小干扰 RNA 转染抑制相关蛋白表达阐明其作用的信号通路。

在体内，损伤后第 7,14 天糖尿病组大鼠再内皮化率均显著降低，而糖尿病+Fc 组相对于糖尿病组再内皮化率显著增加，并且随后的新内膜增生在 Fc 治疗组中也显著降低。体外研究中，实验数据证明了 Fc 通过增加自噬来促进高糖环境下的内皮细胞增殖和迁移。同时，用 Fc 处理后的内皮细胞氧化应激水平降低。然而，当 AMPK-PGC-1α-Sirt3 信号通路被抑制时，高糖条件下 Fc 对内皮细胞的保护作用消失。

三七皂苷 Fc 可通过 AMPK-PGC-1α-Sirt3 信号通路促进自噬、抑制氧化应激，从而加速糖尿病大鼠颈动脉损伤后的再内皮化，提示 Fc 可能对糖尿病血管病变介入治疗后的早期内皮损伤的恢复和减轻再狭窄具有潜在的治疗益处。

Endovascular treatment of subclavian artery pseudoaneurysm

Yingliang Wang,Huimin Liang
Department of Radiology， Union Hospital， Tongji Medical College， Huazhong University of Science and Technology， Wuhan， 430022， China

Purpose: The aim of this study is to evaluate the safety and efficacy of the endovascular treatment of subclavian artery pseudoaneurysm (SAP).
Materials and Methods: A total of 8 consecutive patients with SAP were treated with endovascular treatment in our hospital between 2010 and 2018. We retrospectively reviewed the patient’s clinical characteristics, physical examinations findings, diagnostic imaging results, endovascular treatment, clinical outcome, and follow-up results.
Results: All the 8 patients received endovascular treatment using covered stents initially. The primary technical success rate was 87.5%, one patient complicated with severe tortuosity of the proximal subclavian artery failed to release stent through the femoral artery approach in the primary operation and successfully released stent via the brachial artery approach in the secondary operation. No complications occurred in the perioperative period. All the symptoms and signs were significantly relieved.

During a follow-up of 4.5-84.5 months (average 31.5 months), one patient developed endoleak 4 months after operation and re-intervention was attempted but failed. No adverse events occurred in other patients during the follow-up period.
Conclusion: Endovascular treatment of SAP is safe and effective, and should be used as a first-line treatment. Stent placement through the brachial artery approach is recommended for SAP with severe proximal vascular tortuosity.

EPO-1861

复杂腹主动脉瘤腔内治疗策略

梁惠民
华中科技大学同济医学院附属协和医院

目的：目前腔内治疗成为腹主动脉瘤（AAA）的主要选择，对于复杂的 AAA，无论从治疗的技术策略和疗效，都有深入探讨的必要。本研究通过复杂和非复杂 AAA 的对比，分析器材和技术对疗效的影响。材料和方法：本院共有 155 例 AAA 患者实施完成了 EVAR，将高危复杂 AAA 患者进行回顾性分组，凡符合标准的患者纳入高危复杂组（A），剩余患者纳入普通组（B）。A 组围手术期成功率：全部成功完成 EVAR，1 例患者因髂动脉入路困难，手术辅助后获得成功。手术成功率合计为 100%。围手术期死亡率：4 例入院时动脉瘤破裂立即急诊行 EVAR，其中 1 例死于术后多器官衰竭，围手术期死亡率为 1.6%。结果：A 组在围手术期：1、内漏、血管损伤较多；2、住院天数较高。A 组在随访期：需要处理的内漏（Ⅰ型）、髂支阻塞的发生率较高；3、因其它系统疾病死亡率较高。但多项指标的差异无统计显著性。提示：两组患者实施 EVAR 的近、中期临床疗效大致相当。结论：EVAR 微创，适合高危人群。动脉瘤解剖复杂可能导致内漏等并发症增加，随访对维持长期疗效非常重要。随着器材和技术进步，复杂解剖 AAA 疗效提高。

经颈静脉肝活检 25 例分析

马富权,李伟之,李培杰,刘梦莹,薛挥
西安交通大学第一附属医院

目的： 探讨经颈静脉肝活检术（TJLB）的有效性及安全性。
方法： 通过对我院自 2018 年 9 月至 2019 年 7 月行 TJLB 的 25 例患者所获取肝脏组织特征和诊断结果，以及术中术后相关并发症等资料进行回顾性分析，统计分析 TJLB 的技术成功率、诊断效能，以及并发症的发生率。
结果： 25 例患者 TJLB 的技术成功率为 100%，平均手术持续时间为 25.4±6.6 分钟，平均穿刺针数为 3.1 次，所获取肝组织平均长度为 12.1±4.7mm，平均汇管区数目为 6.8 个，所有患者均完全或部分达到肝活检相关预期目标；2 例患者发生轻微并发症，分别为误穿颈部动脉及术后腹痛，并发症发生率约为 8%。
结论： TJLB 是一项技术成功率高且安全的肝活检技术。

门静脉闭塞的介入治疗策略探索

刘家成,熊斌
华中科技大学同济医学院附属协和医院

目的 探索介入方式治疗门静脉闭塞（portal vein occlusion，PVO）的有效性、安全性及适用人群。
方法 回顾性分析 2017 年 1 月至 2019 年 4 月间的 13 例接受介入治疗的 PVO 患者， 其中 2 例急性 PVO 患者接受经皮门静脉再通术（portal vein recanalization，PVR）治疗，10 例慢性肝硬化 PVO 患者接受经颈静脉肝内门体分流联合门静脉再通术（transjugular portal vein recanalization with creation of intrahepatic portosystemic shunt，PVR-TIPS）治疗，另外 1 例先天性门静脉闭锁患者接受肝内门静脉分支-粗大侧枝血管分流术治疗。
结果 所有患者均完成介入技术操作，技术成功率达 100%。13 例 PVO 患者中，7 例患者同时合并肠系膜上静脉近端血栓，8 例患者同时合并门静脉海绵样变。接受 PVR-TIPS 治疗的患者门静脉压力梯度（portal pressure gradient，PPG）从 31±4mmHg 降至 12±3mmHg。所有患者术前临床症状均有效控制，术中未发生危及生命的并发症，术后随访期间患者均存活，未发现再出血、显性肝性脑病发生的患者，1 例患者发生支架内血栓形成，累积支架通畅率为 92%。
结论 介入方式治疗 PVO 是一种安全有效的方式。对于不合并肝内高阻力因素的 PVO 患者，只要有可见的流入道（肠系膜上静脉或脾静脉）和流出道（肝内门静脉三、四级分支），可考虑使用 PVR 方式；如果仅具有可见的流入道而流出道闭塞，应考虑 PVR-TIPS 方式。对于合并肝内高阻力因素的 PVO 患者，只要有可见的流入道，均推荐使用 PVR-TIPS 方式。对于流入道和流出道均闭塞的患者，介入方式已无法开通门静脉，可考虑其他介入治疗方式如部分脾栓塞（partial splenic embolization，PSE）进行对症处理。

EPO-1864
慢性下肢深静脉血栓应用球囊挤压联合置管溶栓效果观察

汪永平
云南省第三人民医院

目的：探讨球囊挤压联合置管溶栓治疗慢性下肢深静脉血栓（LEDVT）的安全性和临床效果。**方法：**选择既往健康的外伤后慢性 LEDVT 成年患者，植入下腔静脉滤器，用小于目标血管（腘静脉）直径 2mm 的球囊扩张挤压碎裂血栓，然后在球囊扩张状态下拖移使血栓移位，随后留置导管溶栓 3～7 d，拔出导管后继续顺行溶栓 3 d，1 个月内取出滤器，随访观察疗效和并发症。**结果：**用球囊挤压联合置管溶栓治疗慢性 LEDVT 29 例均成功，球囊扩张后血管全部即时再通；溶栓 3～10 d 后下肢肿痛消褪，超声复查腘静脉以上深静脉均再通、局部狭窄显著改善，无严重并发症；随访平均近 5 年，临床效果好、其中病程≤3 月者效果最好。**结论：**既往健康的外伤后慢性 LEDVT 患者应用球囊挤压联合置管溶栓治疗安全有效，以病程≤3 个月者为佳。

Application of the separate gene/drug release segment-covered stent for the treatment of intracranial internal carotid artery aneurysm in dog models and the study of

its endothelialization promotion and in-stent stenosis prevention

Junyuan Xiao
Shanghai Jiao Tong University Affiliated Sixth People's Hospital

The self-expandable segment-covered stent we have developed demonstrated excellent flexibility, target lesion arrive ability and arterial wall adherence ability when applied to treat aneurysm models and achieved good outcomes. However, after stent placement in vivo, it runs high risks of the endothelial cell creeping delay, prolonged endothelialization, increased chances of thrombosis in stent due to complicated hemodynamic changes in the curved arterial lumen, the coverage of the membrane material and absence of the normal arterial wall component at the aneurysm neck. The covered membrane outside the stent may also increase the foreign bodies contacted to the arterial wall, likely to induce obvious inflammatory reaction, and to result in intimal hyperplasia and in-stent stenosis. In view of this, based on our preliminary studies, we are intend to develop a new kind of self-expandable segment-covered stent based on the separate release of gene/drug techniques, which is able to capture the endothelial progenitor cells in circulation and promote division and growth of the endothelial cells (endothelialization promotion) and inhibit smooth muscle cell proliferation (in-stent stenosis prevention), and to assess its feasibility, safety and efficacy via placing in the aneurysm models, furthermore, to investigate the detailed mechanism of the interactions among the hemodynamics, endothelialization and in-stent stenosis.

单导丝门静脉定位技术在 TIPS 中的应用

赵丹,梁斌,郑传胜,冯敢生
华中科技大学同济医学院附属协和医院

【摘要】 目的：探讨采用单导丝定位门静脉辅助经颈静脉肝内门体分流（transjugular intrahepatic portosystemic shunt, TIPS）术中肝内门静脉穿刺的有效性及其安全性。**材料与方法：**连续性收集 2017 年 1 月至 2018 年 8 月期间我院 12 例 TIPS 术中采用单导丝定位穿刺门静脉的患者资料。术前通过门静脉 CTV 观察门静脉解剖并预先选定肝内门静脉穿刺点；术中在 B 超引导下采用 21G Chiba 针经皮经肝穿刺肝内门静脉分支，引入 0.014in 导丝，将其远端置于脾静脉内；再以导丝为靶向经肝静脉穿刺门静脉左支或右支主干；穿刺成功后完成后续 TIPS 操作；最后拔除门静脉定位导丝，无需封堵穿刺道。观察门静脉穿刺次数、穿刺成功率及穿刺相关并发症。**结果：**12 例 TIPS 患者肝内门静脉穿刺均获成功，其中 8 例患者采用经III段门静脉分支入路放置细导丝导向经肝静脉穿刺门静脉左支主干建立分流道，4 例患者采用经Ⅷ段门静脉分支入路放置细导丝导向经肝静脉穿刺门静脉右支主干建立分流道。平均穿刺次数为 1.25±0.45 次(1～2 次),穿刺成功率为 100%,患者术后均未出现门静脉穿刺相关并发症。**结论：**采用单导丝定位门静脉辅助 TIPS 术中门静脉穿刺操作简单、安全、有效，适合于 TIPS 分流道穿刺高风险患者。

血管腔内介入治疗联合抗凝对预防深静脉血栓形成后综合征的价值

程斌,何强,庞尊中
贵州省人民医院

目的：探讨血管腔内介入治疗联合抗凝治疗对预防深静脉血栓形成后综合征的临床价值。**方法：**选取贵州省人民医院介入科 2014 年 2 月至 2016 年 5 月 32 例急性下肢深静脉血栓形成（中央型）患者，分为置管溶栓（CDT)+抗凝（A 组，15 例）， AngioJet 机械血栓抽吸(PTM）+抗凝（B 组，5

例），单纯抗凝治疗（C 组，12 例）。A 组采用经健侧股静脉入路置入下腔静脉滤器，然后在 B 超引导下患侧腘静脉入路插管，保留溶栓导管于股、腘静脉血栓内，定时定量导管内泵人溶栓药物，同时给予全身抗凝治疗。B 组入路选择方法同 A 组，采用 AngioJet 6F 导管予距离病变处 1cm 开始吸栓。C 组采用单纯全身抗凝治疗。比较 3 组患者血栓溶解率及随访期间静脉通畅情况。**结果：**A、B 两组患者均全部置入滤器，溶栓及吸栓治疗后全部成功取出。A 组平均溶栓时间为（78h-120h），B 组平均溶栓时间为（3-58h），P<0.05、差异有统计学意义。溶栓后造影显示 A 组血栓完全溶解 13 例（86.67%）、B 组完全溶解 4 例（80.00%），两组溶栓结果比较差异无统计学意义（P>0.05）。治疗 2 周后 3 组复查下肢静脉 B 超提示：A 组髂股静脉完全通畅 14 例（93.33%）、部分通畅 1 例（6.67%），B 组髂股静脉完全通畅 5 例（100.00%）。C 组髂股静脉 2 例完全再通（16.67%）、10 例部分再通（83.33%），A、B 组间比较差异无统计学意义（P<0.05),A、B 两组与 C 组通畅率比较明显改善、差异有统计学意义（P<0.05）。**结论：**CDT 与 PTM 联合抗凝治疗急性髂股静脉血栓疗效确切，对溶解血栓、预防深静脉血栓形成后综合征疗效优于单纯全身抗凝治疗，其中 PTM 疗效优于 CDT、且 PTM 在治疗时间上较 CDT 明显缩短。

12-months outcomes of uterine artery embolization in patients with symptomatic adenomyosis with and without ovarian endometriosis

Siqi Hu,Wenbo Guo
The First Affiliated hospital of Sun yat-sen university

Abstract
PURPOSE *To investigate the mid-term outcomes of uterine artery embolization in patients with symptomatic adenomyosis withand without ovarian endometriosis(OE).*
METHODS *This was a retrospective, single-institute study of 76 patients with adenomyosis who underwent UAE between 2009 and 2016,. These patients were divided into two groups based on whether their diagnosis was complicated with ovarian endometriosis.*

The follow-up review lasted 12 months after UAE. Improvements in dysmenorrhea and menorrhagia were evaluated based on the symptom relief criteria. The improvement rates in both groups were analyzed and compared.
RESULTS *Among the 76 patients, 17 (22.3%) patients had adenomyosis combined with ovarian endometriosis, and 59 (77.6%) patients did not have ovarian endometriosis. In the group with OE, all patients(17/17,100%) had dysmenorrhea and 11 patients(11/17,64.7%) had menorrhagia. In the group without OE, 57 patients(57/59,96.6%) had dysmenorrhea and 50 patients(50/59,84.7%) had menorrhagia. The improvement rates for dysmenorrhea in the two groups[a6] were 47.1% (with OE) and 86.0% (without OE) separately, at the* 12-month follow-up (*P* < 0.05). *The improvement rates for menorrhagia in the two groups were 63.6% (with ovarian endometriosis) and 84.0% (without ovarian endometriosis) at 12 months* (*P*=0.263).
CONCLUSION *Improvement of dysmenorrhea in patients with adenomyosis companying ovarian endometriosis after UAE might be less than those without endometriosis according to the mid-term outcomes. The improvement of menorrhagia in patients with adenomyosis after UAE might not be affected by the ovarian endometriosis.*

血液透析患者上腔静脉闭塞后锐性再通的有效性和安全性研究

赵宇亮,杨乐天,付平,崔天蕾
四川大学华西医院

目的：随着维持性血液透析患者数量的不断增加，血管通路维护的重要性日益凸显，上腔静脉闭塞无疑是对血液透析患者血管资源的巨大破坏。在常规血管内血管成形术无效的情况下，导管相关性上腔静脉闭塞常需要采取锐性再通。本研究旨在评估难治性上腔静脉闭塞后锐性再通的可行性和安全性。
方法：本研究回顾性纳入 2014 年 1 月至 2017 年 11 月在四川大学华西医院诊断为上腔静脉闭塞的血液透析患者。在数字减影血管造影定位引导技术的辅助下，纳入的患者在常规血管内血管成形术失败后接受了上腔静脉闭塞后锐性再通和球囊扩张术，术后置入隧道式涤纶套管，记录并评估相关影像学资料和临床指标。
结果：本研究共纳入了 16 名维持性血液透析患者，所有患者经 DSA 提示中心静脉闭塞的存在，常规介入方法无法穿过导丝，在获得知情同意后接受锐性再通手术。14 名患者手术成功，1 名患者因上腔静脉全节段及部分无名静脉闭塞（闭塞节段长度 7 厘米）导致再通失败，1 名患者因术中突发心律失常而中止手术，手术成功率为 87.5%。2 名患者术后出现了中等程度的心包积液，但在住院期间其血流动力学稳定，未接受其他特殊治疗顺利出院。1 名术中心搏骤停患者在心肺复苏成功后入住重症监护室，3 天后因胃肠道出血去世。出现并发症的 3 名患者使用的球囊直径为 12 毫米，未出现并发症的患者使用的球囊平均直径为 8.67±1.30 毫米。在 5 个月随访中，只有 1 名患者出现了导管功能不良，使用尿激酶封管后恢复通常。随访中未发现手术相关远期并发症。
结论：本研究证实了难治性上腔静脉闭塞后锐性再通的有效性，同时也提示了并发症风险的存在。长节段中心静脉闭塞再通一直是临床难题，该类患者在接受锐性再通之前必须经过严格的准入筛选。本研究亦提示在扩张上腔静脉时应控制球囊的直径以避免相关并发症。严格的患者筛选、精湛的手术操作以及避免上腔静脉的过度扩张，是降低严重手术并发症（如心律失常、心包填塞）风险的有力保证。

EPO-1871
静脉透析右上肢动静脉瘘并右侧头臂静脉闭塞直接穿刺开通疗效及安全性

赵许亚,周石
贵州省肿瘤医院

目的：右侧头臂静脉狭窄及右侧头臂静脉闭塞为同侧肢体动静脉瘘(arteriovenous fistula, AVF)透析的常见并发症。随着血管内治疗技术的发展，经皮腔内血管成形术（PTA）及经皮血管支架植入术（ PTS ）已成为右侧头臂静脉狭窄性病变的首选治疗方法，但对于少数右侧头臂静脉闭塞患者，常规血管导丝导管介入技术开通失败的患者，我们采用直接穿刺再通技术，具有较高成功率且较安全。**方法:**收集从 2016 年 1 月 1 日至 2018 年 12 月 31 日共 455 例因终末期肾脏病长期在我院接受规律血液透析治疗的患者，筛选出使用右上肢动静脉内瘘作为血液透析通路且因右侧头臂静脉闭塞不能满足血液透析需求或出现肿胀手综合征患者，在我院接受常规导管、导丝开通不成功，最终选择经皮直接穿刺右侧头臂静脉再通治疗的 20 例患者的临床资料，分别在直接穿刺再开通术后 24 小时、第 3、6、12 个月对患者进行随访复查，随访的主要内容为肿胀手症状消退情况、右侧头臂静脉通畅率检查及透析时 AVF 流量监测，对直接穿刺开通术后右侧头臂静脉的通畅时间进行生存资料分析。**结果：**右侧头臂静脉闭塞直接穿刺开通技术成功率 100%，一次性开通技术成功率 17 例(17/19，89.5%)，19 例（19/19，100%）患者术后 24h 肿胀手症状均明显消退。术后 24 小时右侧头臂静脉的首次通畅率为 100%，术后 3 个月首次通畅率为 100%（19/19），术后 6 个月为 89.5%（17/19），术后 9 个月为 78.9%（15/19），术后 12 个月为 68.4%（13/19）。术中出现 2 例胸腔积血，3 例出现纵隔小血肿，2 例出现气胸。**结论：**对于静脉透析右上肢动静脉瘘患者，右侧头臂静脉通路闭塞或有肿胀手综合征，利用经皮直接穿刺闭塞头臂静脉的再通术，为我们延长或再建上肢通路提供的了一种方法。

射频消融和再切除术治疗原发性肝癌根治性切除术后复发（≤5cm）的疗效对比研究

冯跃民[1],吴昊[1], Qingyao Daniel Huang[2],肖锋[4],钟宁[5],梁波[1],Mindie H. Nguyen[3],朱强[1]
1.山东大学附属山东省立医院
2.Division of Gastroenterology and Hepatology， Department of Medicine， National University Health System， Singapore
3. Division of Gastroenterology and Hepatology， Stanford University Medical Center， Palo Alto，CA， United States
4.山东第一医科大学第二附属医院
5.山东大学齐鲁医院

背景与目的
肝细胞癌根治性切除后 5 年内复发的风险高达 70%。然而，肝细胞癌切除后复发的最佳治疗方法尚未确。目前，射频消融和再切除是临床上治疗复发肝癌的常用治疗方法。此研究目的是比较射频消融和再切除治疗切除后复发肝癌的疗效和安全性。

材料与方法
本研究为多中心回顾性研究,纳入 2006 年 1 月至 2016 年 1 月原发性肝癌根治性切除术后复发接受射频消融或再切除的病例共 290 例（复发肝癌结节≤3 个，最大结节长径≤5cm），来自山东大学

附属山东省立医院、齐鲁医院、山东第一医科大学第二附属医院、斯坦福大学医学中心和新加坡国立大学医院。研究比较了射频消融和再切除患者并发症、住院时间、总体生存和无进展生存情况及危险因素分析。运用倾向性评分配对，并在配对队列和乙肝患者队列中进行了同样的研究。在亚组分析中，对比了不同肿瘤大小（≤3cm 和 3-5cm）、肿瘤个数（单个和 2-3 个肝癌结节）和 Child 分级（Child A 和 B）的复发肝癌患者接受射频消融和再切除后的总体生存和无进展生存。

结果

研究纳入的 290 例病例中，射频消融 191 例，再切除 99 例。中位随访期为 27 个月(1-149 个月)。总队列中，射频消融和再切除后 1 年，3 年和 5 年总体生存率（p=0.11）和无进展生存率（p=0.80）无统计学差异。射频消融并发症发生率和住院时间优于再切除（严重并发症 0.5%vs.9.1%；轻微并发症 39.3% vs.94.9%；中位住院时间 5 天 vs.14 天，all $p\leqslant 0.001$）。在 PSM 队列和乙肝队列中观察到了类似的结果。亚组分析发现，总队列中 2 或 3 个复发肝癌结节患者，射频消融后的中位总体生存期明显优于再切除 (6.4 年 vs.2.5 年，p=0.009)。

结论

射频消融对切除后复发肝癌与再切除疗效相当，但并发症较少。对于 2 或 3 个复发性肝癌结节的患者，射频消融比再切除更有效、更安全。

Efficacy and safety of short-term interval TACE-RFA sequential therapy for advanced hepatocellular carcinoma

Shiji Fang,Liyun Zheng,Zhongwei Zhao,Xiaoxi Fan,Jianting Mao ,Jiansong Ji
Lishui central hospital

To investigate the efficacy and safety of short-term TACE-RFA sequential therapy for advanced hepatocellular carcinoma(HCC). **Method** The clinical data of 117 patients with advanced HCC enrolled in our hospital from March 2010 to January 2019 were retrospectively analyzed. All patients received TACE-RFA sequential therapy. The patients were divided into two groups including short interval (S group, 61 cases) and long interval (L group, 56 cases) according to the interval between TACE and RFA. The differences of response rate and complication between the two group were compared. The median survival time (OS), median progression-free time (PFS) and survival rate were calculated by Kaplan-Meier. The risk factors affected the efficacy of TACE-RFA sequential therapy for advanced HCC were analyzed by cox multivariate analysis. **Result** The total response rate in S group was significantly higher than that in L group (72.13% vs. 41.07%, χ^2=11.50, P=0.00). The PFS (14.9 months vs. 9.1 months, χ^2=5.96, P=0.01) and OS (34.7 months vs. 20.3 months, χ^2=6.66, P= 0.01) in S group was longer than that in L group. Cox analysis showed tumor size (HR=2.42, 95% CI: 1.26～3.69, P=0.001), cirrhosis (HR=2.04, 95% CI: 1.27～3.26, P=0.003), interval (HR=0.44, 95% CI: 0.27～0.71, P=0.001), AST (HR=1.71, 95% CI: 1.05～2.77, P=0.029) were the independent risk factors affecting the efficacy of TACE-RFA sequential therapy for advanced HCC. There was no significant difference in the complication incidence between the two groups (P>0.05). **Conclusion** Short-term interval improves the efficacy of TACE-RFA sequential therapy for advanced HCC, which is a protective factor for advanced HCC

receiving TACE-RFA sequential therapy. Short-term interval TACE-RFA sequential therapy is a safe and effective treatment for advanced HCC.

Lipiodol-based clinical efficacy prediction and survival prognostication for transcatheter arterial chemoembolization for patients with hepatocellular carcinoma

Hairui Wang
Shengjing Hospital Affiliated to China Medical Universit

Purpose To propose a guidance for lipiodol deposition (LD) classification after transcatheter arterial chemoembolization (TACE) in patients with hepatocellular carcinoma (HCC), and propose non-invasive preoperative and postoperative prognostic models to optimize the potential benefit of TACE for primary HCC.
Methods Existing LD evaluation methods one month after TACE were systematic reviewed to propose the quantitative LD stratification guidance. Potential survival benefit of TACE in first diagnosed HCC patients was quantitatively predicted by a non-invasive preoperative model consisting of preoperative clinical biomarkers. These biomarkers and postoperative LD were then integrated to construct the postoperative prognostic model for time to progression (TTP) prediction. All the results were tested in multiple independent validation datasets.
Results 40 literatures in total 3683 TACE-treated HCC patients were reviewed to propose the LD stratification strategy. The strategy, based on synergetic prognosis effect of LD percentage, pattern, and distribution, and tumor necrosis, classifying LD into three levels. Independent validation on 1302 HCC patients indicated that those who probability unable to benefit from TACE could be detected one-month after TACE by this strategy, without need for conventional imaging monitoring programmes to observe tumor response. Primary tumor size, tumor capsule, and metastasis was employed to construct the preoperative prognostic model based on the training cohort (205 HCC patients, C-index: 0.743). Its prognostic value was demonstrated in internal validation dataset, and two independent validation datasets from another center (192, 103, and 181 patients, C-index<0.69). By adding the postoperative LD, TTP prediction accuracy was significantly improved by the postoperative prognostic model ($p<0.0001$).
Conclusions Based on the proposed LD stratification method, our study provides suggestions for clinical efficacy prediction and survival prognostication of TACE in individual HCC patients.

Liver Abscess Formation Following Transarterial Chemoembolization: Clinical Features, Risk Factors, Bacteria Spectrum, and Percutaneous Catheter Drainage

Weifu Lv
Department of Interventional Radiology, Anhui Provincial Hospital, the First Affiliated Hospital of University of Science and Technology of China (USTC)

Purpose—To investigate the clinical features, risk factors, and bacterial spectrum of liver abscess following transarterial chemoembolization (TACE) and evaluate the therapeutic effect of percutaneous catheter drainage (PCD) on the abscesses.
Patients and Methods—A retrospective review of patient charts was performed in 3613 patients who suffered from liver malignancies (2832 patients with hepatocellular carcinoma and 781 with metastatic hepatic tumor) and had undergone 11,054 TACE procedures from January 2005 to October 2013. Liver abscesses were found in 21 patients. PCD was performed in all abscess patients. The clinical features, risk factors, and bacterial spectrum of liver abscess following TACE were investigated and the therapeutic effect of PCD was evaluated.
Results—The incidence of liver abscess was 0.58% per patient and 0.19% per procedure. Approximately 57.1% of the patients had a medical history of bilioenteric anastomosis or biliary stent implantation. On CT scans, the abscesses appeared as low-attenuation lesions and high-density iodinate oil scattered in the abscesses. The ultrasound showed the well defined, heterogeneously hypoechoic lesions. Positive microbiological isolates were obtained in all pus cultures and in 47.6% of blood cultures. The most common bacterium was Escherichia coli (52.4%). Twenty patients (95.2%) were cured from abscesses by using PCD, and one died of sepsis.
Conclusions—Patients with predisposing factors are prone to an increased risk of liver abscess following TACE. Bacterial culture and antibiotic sensitivity tests on pus and blood help on the antibiotics selection. PCD combined with aggressive antibiotics can be recommended as the first-line therapeutic regimen.

Microwave ablation versus cryoablation for treatment of primary and metastatic pulmonary malignant tumors

hongwei li,Lihua Zhuo
the Third Hospital of Mianyang

Objective At present, minimally invasive surgery is prevalent at home and abroad. Although, there are some comparative studies between microwave ablation and radiofrequency on treatment of lung malignant tumors, there are few studies between microwave ablation and cryoablation. The aim of this study was to retrospectively compare the efficacy and complications of microwave ablation (MWA) and cryoablation in the treatment of malignant pulmonary tumors.**Methods** A retrospective analysis was performed on 48 patients with malignant lung tumors, who were treated with microwave

ablation or cryoablation in our hospital from June 2013 to June 2016. Of these patients, 29 received microwave ablation and 19 received cryablation. Intraprocedural pain was evaluated by using visual analog scale (VAS).. The Intraprocedural pain, response rates, overall survival (OS), and complications rates between the MWA group and cryoablation group were compared. **Results** The results showed that the patients in the MWA group felt more pain than those in cryoablation group. The VAS scores in the MWA group were much higher than those in cryoablation group ($P<0.05$). The overall response rates of microwave ablation group [72.41% (21/29)] was not significantly different from cryoablation group [73.68% (14/19)] ($P = 0.92$). The 6-, 12-, 24-, 36-month overall survival (OS) rates in MWA group and cryoablation group were 92.72%, 81.28%, 64.54%, 54.91% and 94.07%, 81.13%, 57.33%, 43.04% respectively. No significant differences were found in the OS rate between the two groups ($P = 0.79$). The complication rates in the microwave ablation group was 34.48% (10/29) and in the cryoablation group was 42.10% (10/19). There was no significant difference between the two groups ($P = 0.59$). No patients died during the peri-operative period. **Conclusion** Cryoablation had similar therapeutic effect compared with microwave ablation in the treatment of pulmonary malignant tumors, but with less pain.

Efficacy of Transcatheter Arterial Chemoembolization (TACE) Combined with Microwave Ablation (MWA) in The Treatment of Early And Intermediate Stage Hepatocellular Carcinoma > 5cm: A Meta-analysis

Chong Liu,Haibo Shao
The first affiliated hospital of China medical university

Background For early and intermediate stage (BCLC classification) hepatocellular carcinoma (HCC) with a diameter >5 cm that cannot be surgically resected, hepatic arterial chemoembolization (TACE) or ablation alone has limited curative effect. The purpose of this study was to summarize the clinical efficacy of hepatic arterial chemoembolization combined with microwave ablation (MWA) compared with TACE alone in the treatment of early and intermediate stage hepatocellular carcinoma with tumor size > 5cm.

Method PubMed, The China National Knowledge Infrastructure (CNKI) and Wan Fang electrotic databases were searched according to inclusion and exclusion criteria to collect randomized controlled trials (RCTs) and cohort studies which were evaluated according to the Cochrane risk Assessment tools and Newcastle - Ottawa Quality Assessment Scale (NOS), respectively. For the homogeneous study, Meta-analysis was performed using Stata15.0 software. The relative risk (RR) was used as the effect indicator to analyze the clinical efficacy and the 1-, 2-, and 3-year survival rates of the MWA+TACE group (combined group) and the TACE group (control group).

Result A total of 20 articles (1736 patients) were included. Meta-analysis showed that the 1-, 2-, and 3-year survival rates of the combination group were significantly higher than those of the control group (1 year survival rate: RR = 1.36, 95% CI: 1.28-

1.44, P < 0.001; 2-year survival rate: RR = 1.31, 95% CI: 1.40-1.74, P < 0.001; 3-year survival rate: RR = 2.07, 95% CI: 1.67-2.57, P < 0.001). Complete response (CR), partial response (PR) and effective rate were higher in the combined group than in the control group, and the difference was statistically significant (P < 0.001). stable disease (SD), progress disease (PD) rate in the combination group were lower than those in the control group, and the difference was statistically significant (P < 0.001). Egger test or Begg test showed no significant publication bias. Sensitivity analysis did not show statistical significance.
Conclusions The short-term and long-term effects of TACE combined with MWA on early and intermediate stage hepatocellular carcinoma with tumor size >5cm were superior to TACE alone.

EPO-1878
脊柱肿瘤外科治疗前血管栓塞术的意义与价值

曹佳
武汉大学中南医院

目的：探讨椎体肿瘤外科手术前血管栓塞术对脊柱肿瘤外科手术治疗的意义与价值。方法：选取近年来我院十来例有椎体肿瘤及其相关临床症状的患者，在手术前行“椎体肿瘤血管栓塞术”，再进行外科椎体肿瘤切除及重建术，并与对照组（选取近年来术前未行椎体肿瘤血管栓塞术的患者）进行对比。结果：栓塞组的术中出血量平均约 2100ml，手术时间约 3～4 小时，术中出血量及手术时间明显缩短，手术视野更清晰，异体血的输注及其所带来的并发症和不良后果将大大减少，手术成功率比非栓塞组高，术后并发症也相对减少。结论：在脊柱肿瘤行外科手术治疗之前，行“椎体肿瘤血管栓塞术”，可降低术中出血量及异体血的输注，并且减少肿瘤血供有利于降低手术操作的难度，提高肿瘤的切除率。因此，椎体肿瘤血管栓塞术具有较好的临床应用前景与价值，是椎体肿瘤患者临床治疗的一种新方法，也为临床医生处理椎体肿瘤手术提供了一种全新的思路和全新的视角。

EPO-1879
Intra-procedural Transcatheter Intra-arterial Contrast-enhanced Ultrasonography as a Predictor of Tumor Response in Conventional Transarterial Chemoembolization for Hepatocellular Carcinoma

Zhijun Wang,Xiang Fei ,Ye Li,Peng Hai,Xiao Hui Li,Bo Jiang
Chinese PLA General Hospital

PURPOSE
To evaluate whether intraprocedural corona enhancement and intratumor perfusion features of intra-procedural transcatheter intraarterial contrast-enhanced ultrasonography(ICEU) can predict tumor response on follow-up contrast-enhanced magnetic resonance imaging (CE-MRI) in patients with hepatocellular carcinoma (HCC) treated with conventional transarterial chemoembolization (cTACE).

METHOD AND MATERIALS
This IRB approved, prospective analysis included 39 patients with 51 HCC target lesions, who underwent cTACE with ICEU. CE-MRI was acquired at baseline and 1 month after cTACE. Tumor response on CE-MRI was assessed using modified Response Evaluation Criteria in Solid Tumors (mRECIST). Nonparametric spearman rank order correlation were used to correlate the percentage of intratumor perfusion,, and the peak value and sickness of corona enhancement of ICEU immediately after cTACE with tumor response.

RESULTS
39 patients with 51 target lesions were assessed tumor response. CR were 22(43.1%) PR SD PD The percentage of intratumor perfusion correlated strongly with tumor response on CE-MRI (Spearman rho=0.513, p<0.001). The peak value and sickness of corona enhancement showed the more strongly correlation with tumor response on CE-MRI respectively (Spearman rho=0.671, p<0.001, rho=0.704, p<0.001)

CONCLUSION
Combination of intratumor perfusion and corona enhancement features on intra-procedural ICEU can be used to predict tumor response on follow-up CE-MRI.

TACE 治疗原发性肝细胞肝癌中洛铂导致血小板减少的回顾性研究

吕银章,徐安辉,王南,穆可涛,王梓,赵凌云,黄艳荣,彭羚,项鹃,胡道予,漆剑频
华中科技大学同济医学院附属同济医院

目的 探讨经导管肝动脉化疗栓塞术治疗原发性肝细胞肝癌中，单用洛铂作为化疗药物，术后发生血小板减少的情况 **材料与方法** 回顾性分析我院 2013 年 5 月至 2018 年 5 月行 TACE 治疗的 HCC 患者 1945 人次，其中第一次使用洛铂患者 1289 例，第二次使用洛铂 417 例，第三次及以上使用洛铂 239 人次，回顾性分析其性别、年龄、术前多项检查指标（血小板水平、肝功能评级、AFP 水平）及腹水情况、术前有无消化道溃疡、术后初期（3-7 天）和远期（21-90 天）两期的血小板水平。按照 WHO 抗癌药血液学毒副反应的分度标准评价血小板水平。 **结果** 介入前血小板水平正常（WHO 标准 0 度）的 HCC 患者，经单用洛铂为化疗药的 TACE 治疗后，介入后初期轻度减少（WHO 标准 I 度）、中度减少（WHO 标准 II 度）、重度减少（WHO 标准 III 度和 IV 度）发生率分别为 16.50%、10.47%、4.88%，介入后远期血小板三种程度减少的发生率分别为 13.25%、4.73%、1.65%。介入前血小板水平轻度减少患者，介入后初期血小板三种程度减少的发生率分别为 29.52%、47.14%、16.19%，介入后远期的发生率分别为 30.92%、26.32%、8.55%。介入前血小板水平中度减少患者，介入后初期三种程度减少发生率分别为 6.63%、43.09%、48.07%，介入后远期发生率分别为 15.71%、46.43%、30.71%。介入后初期减少程度更重，与远期的差别有统计学意义。介入后血小板减少的水平与使用洛铂的周期无关。 **结论** 单用洛铂为化疗药的 TACE 治疗 HCC 患者，介入后远期的血小板减少发生率不高，比较安全；且介入后血小板减少的发生有一定的特点，探讨这些特点可以指导临床，可以减少血小板减少的发生率或有效地针对性给予对症支持治疗。

经眼动脉灌注化疗治疗视网膜母细胞瘤的临床研究

夏杰军,张靖
广州市妇女儿童医疗中心

目的：探讨经眼动脉灌注化疗（Intra-arterial chemotherapy, IAC）治疗视网膜母细胞瘤（Retinoblastoma，RB）患儿保眼率、生存率以及不良反应，为临床评估 RB 患儿预后及指导个体化治疗提供临床参考。
材料与方法：回顾性分析广州市妇女儿童医疗中心 2009 年 4 月至 2016 年 4 月介入血管瘤科收治行 IAC 治疗的 271 例(305 只患眼)视网膜母细胞瘤患儿，对其临床特征、治疗情况、患者保眼率及生存率进行研究；采用 Kaplan-Meier 法绘制保眼率生存曲线与生存曲线，对性别、国际眼内 RB 肿瘤的分级、年龄、术前的治疗史等因素与疗效的关系进行单因素分析，用 COX 比例风险模型探讨 RB 预后影响因素。
结果：共有全部 271 例患儿纳入研究，患儿 IAC 术后中位随访时间为 15 个月（1～96 个月），246 例生存（5 年生存率 92.8%），15 例死亡。经眼动脉灌注化疗共 943 次（中位 3 次）。246 例生存患儿自最后一次 IAC 治疗日开始，RB 患儿最短保眼时间 1 月，最长保眼时间 96 月，5 年总体保眼率为 63.1%，根据 IIRC 分期，其中 A 期（n=1）、B 期（n=12）、C 期（n=22）RB 患者随访时间内保眼率为 100%，D 期（n=208）1 年保眼率为 77.4%，2 年保眼率为 74.1%，3 年保眼率为 70.0%，5 年生为 64.1%；E 期（n=42）1 年保眼率为 42.9%，2 年保眼率为 32.2%，3 年保眼率为 26.8%，5 年保眼率为 26.8%； 经单因素分析结果显示，临床分期与 RB 患儿保眼率有统计学关联。多因素 COX 回归分析显示 IIRC 分期(RR3.866, 95% CI：2.558-5.843)是 RB 患者保眼率的影响因素。
结论：IAC 是一种安全有效的治疗 RB 方法。肿瘤分期是影响其保眼率的重要因素，治疗史、性别、治疗时年龄对保眼率无统计学意义，为临床提供了重要参考。
关键词：经眼动脉灌注化疗

磷脂酰肌醇-3 激酶调节亚基 1 的过度表达对肝细胞癌进展的影响

王黎洲,周石
贵州医科大学附属医院

目的： 研究磷脂酰肌醇-3 激酶调节亚基 1（Phosphoinositide-3-kinase, regulatory subunit 1，PIK3R1）的表达对肝细胞癌（Hepatocellular carcinoma，HCC）进展的影响。**方法：**HCC 组织中 PIK3R1 的表达由免疫组化和 qRT-PCR 检测。不同 HCC 细胞系中 PIK3R1 的 mRNA 和蛋白表达通过 qRT-PCR 和 Western blot 检测，然后选择 MHCC97H 和 HCCLM3 细胞作为模型研究 PIK3R1 对 HCC 进展的影响。 通过 MTT 实验，克隆形成实验，划痕愈合实验和流式细胞术评估 PIK3R1 下调对 HCC 细胞株增殖、迁移和凋亡的影响。 进行蛋白质印迹分析以评估 PI3K/AKT/mTOR 信号传导途径的表达变化。**结果：**下调 PIK3R1 的表达能够抑制 HCC 细胞株的增殖和迁移并促进细胞凋亡。另外，我们证明了 PIK3R1 的下调抑制了 MHCC97H 和 HCCLM3 细胞中的 p-PI3K、p-AKT 和 p-mTOR 的表达。**结论：**PIK3R1 在 HCC 中表达显著上调，沉默 PIK3R1 能抑制 HCC 细胞株的增殖、迁移并加速凋亡，其可能是将来肝癌治疗的一个潜在靶点。

长链非编码 RNA 尿路上皮癌相关基因 1 的表达在宫颈癌顺铂耐药性中的研究

王黎洲,周石
贵州医科大学附属医院

目的： 研究长链非编码 RNA (long non-coding RNA, lncRNA)尿路上皮癌相关基因 1(urothelial cancer associated 1, UCA1)的表达对宫颈癌顺铂耐药性的影响。**方法：**使用递增剂量顺铂和高剂量刺激建立顺铂耐药的宫颈癌 HeLa 细胞株，然后用实时荧光定量 PCR 法检测 UCA1 在 HeLa 细胞和 Hela/DDP 细胞中的表达水平，并采用 CCK-8 法、EDU 法、流式细胞仪分析 HeLa 细胞的增殖活性，了解 UCA1 过表达对宫颈癌细胞生长的影响；通过 qRT-PCR 分析评价 UCA1- siRNA 敲除 UCA1 表达，用 CCK-8 法、EDU 法和流式细胞术测定 Hela/DDP 细胞的增殖活性；最后用 qPCR 法分析 caspase-3、p21、survivin 和 CDK2 在各组细胞中的表达水平。**结果：**UCA1 的过表达能够通过促进宫颈癌细胞的增殖和抑制其细胞凋亡来诱导顺铂耐药，敲除 UCA1 可显著降低宫颈癌细胞对顺铂的耐药性；UCA1 参与了调控宫颈癌细胞凋亡和增殖的信号通路，其通过下调 caspase-3 和上调 CDK2 来抑制宫颈癌细胞的凋亡，通过增加 survivin 水平和降低 p21 水平来促进宫颈癌细胞的增殖。**结论：**UCA1 可能在宫颈癌顺铂耐药中发挥重要作用，UCA1 表达水平的上调会促进宫颈癌细胞对顺铂的耐药性。因此，UCA1 将来可能是一个宫颈癌治疗新策略的潜在靶点。

EPO-1884
M2 型丙酮酸激酶同工酶的表达对肝细胞肝癌化疗敏感性的影响

王黎洲,周石
贵州医科大学附属医院

目的： 研究 M2 型丙酮酸激酶同工酶(Pyruvate kinase isozyme type M2，PKM2)对肝癌细胞 HepG2 增殖、迁移、侵袭及细胞凋亡的影响，探讨 PKM2 的表达对肝细胞癌化疗敏感性的影响。**方法：**通过免疫印迹（Western blotting，WB）和荧光定量聚合酶链式反应（Quantitative Real-time PCR，qRT-PCR）检测正常肝细胞株 HL-7702 与肝癌细胞株 HepG2 中 PKM2 的蛋白和 mRNA 的表达水平，构建靶向 PKM2 基因的重组质粒（PKM2-siRNA）及其对照质粒（siRNA-NC）并转染到 HepG2 细胞中，WB 和 qRT-PCR 检测 PKM2 的敲低情况，细胞克隆形成实验、Transwell 趋化实验及 TUNEL 实验分析 PKM2 的表达对细胞增殖、迁移侵袭能力以及凋亡的影响。用不同浓度的多柔比星（Doxorubicin，DOX）处理各组细胞后通过 CCK-8 实验及 TUNEL 实验检测细胞活性及凋亡情况。**结果：**HepG2 细胞株中 PKM2 的蛋白和 mRNA 的表达较 HL-7702 显著上调（mRNA 1.01±0.01 vs. 5.04±0.02;蛋白 1.34±0.04 vs. 4.03±0.02，$P<0.05$）。转染 PKM2-siRNA 的 HepG2 细胞中 PKM2 在转录和翻译水平的表达显著降低；细胞克隆形成率、细胞侵袭数均低于空白转染组和转染 siRNA-NC 的对照组；细胞凋亡率高于空白转染组和转染 siRNA-NC 的对照组；DOX 的半数抑制浓度（IC50）为 7.25μg/ml，转染 siRNA-NC 的对照组 IC50 为 18.51μg/ml，随着 DOX 给药浓度增加，细胞凋亡率明显增加，转染 PKM2-siRNA 细胞组的凋亡数明显高于转染 siRNA-NC 的对照组

（P<0.05）。**结论：**敲低 PKM2 的表达能抑制其细胞增殖及迁移侵袭能力，促进细胞凋亡并增强对多柔比星化疗的敏感性

CT 引导下经皮肺穿刺活检减少并发症的研究

宋军伟
淄博矿业集团有限责任公司中心医院

目的：探讨 CT 引导下经皮肺穿刺活检对于肺部疾病诊断的应用价值及操作安全性。
方法：回顾性分析 2017 年 1 月至 2018 年 7 月在淄矿集团有限责任公司中心医院及中国人们解放军总医院行 CT 引导下经皮穿刺活检的患者 861 例，分析其穿刺结果及并发症发生情况。
结果：861 例患者均成功完成穿刺操作，结节性病变 296 例，团块状病变 405 例，肺实变病变 77 例，磨玻璃样病灶 83 例。病理学诊断恶性病变 736 例，明确诊断率 90.7%，提示性诊断率 6.3%，非特异性诊断率 3%。良性病变 125 例，明确诊断率 49.6%，提示性诊断率 21.6%，非特异性诊断率 28.8%。并发症出现气胸 77 例（8.9%），结节样病变发生率最高（15.2%）；肺出血 103 例（11.9%），磨玻璃样病变发生率最高（20.4%）；胸膜反应 17 例（1.9%）；穿刺后心腔内出现气体 2 例（0.2%）。
结论：在 CT 引导下经皮肺穿刺活检术，安全实用，并发症少，有助于尽早明确诊断，对恶性病变的确诊率高于良性病变。

EPO-1886
CT 引导下非小细胞肺癌耐药后再次肺穿刺活检的可行性及突变分析

王阳阳,周志刚,王猛
郑州大学第一附属医院

目的：探索非小细胞肺癌耐药后再次行 CT 引导下肺穿刺活检后的可行性及突变状态分析。
方法：回顾性研究 2017-2018 年郑州大学第一附属医院进行的 220 例 CT 引导下非小细胞肺癌经过 EGFR-TKI 和（或）化疗治疗后再次活检患者病例。
结果：220 例患者平均年龄 58.7±9.8 岁，腺癌多见；共活检 220 次，穿刺成功率 100%，55.9%在原发病灶取材，多为实性结节，肺内进针平均深度为 2.4±1.8cm，平均手术时间 13.8±5.6min；并发症发生率为 31.8%，主要包括气胸 41 例（18.6%）和出血 24 例（10.9%）；恶性细胞检出率为 91.8%（202/220），4 例（2%）肺腺癌 EGFR-TKIs 治疗后转化为小细胞肺癌；治疗后 EGFR 基因突变不一致率为 53.8%（49/91），45 例（49.5%）出现 T790M 获得性耐药突变；19 缺失突变伴 T790M 突变最常见，占 38.5%。
结论：NSCLC 患者治疗耐药后再次行肺穿刺活检是安全可行的，可为病理诊断及分子分析提供足够样本；治疗前后 EGFR 基因突变具有较大差异性；组织学活检可以阐释耐药机制，为靶向药物治疗失败或耐药的患者后续治疗方案提供指导意义。

肝癌合并门静脉癌栓术后辅助肝动脉化疗栓塞联合门静脉化疗的效果评价：meta 分析

柯桥
福建医科大学孟超肝胆医院

目的：系统评价肝癌（HCC）合并门静脉癌栓（PVTT）患者术后辅助肝动脉化疗栓塞（TACE）联合门静脉化疗（PVC）的临床疗效及安全性。
方法：通过计算机检索 Cochrane Library、PubMed、Medline、EMbase、Web of Science、中国生物医学文献数据库、中国知网、万方及维普等数据库，纳入比较 HCC 合并 PVTT 患者术后辅助 TACE、TACE 联合 PVC 临床效果的对照研究，检索时间均从建库至 2019 年 5 月 31 日，采用 Review Manager 5.3 进行 meta 分析，用比值比（OR）及 95%可信区间（CI）评价生存率、无复发生存率。
结果：共纳入 10 项研究，其中术后 TACE 组 355 例、TACE 联合 PVC 组 319 例。Meta 分析结果表明：联合组 1 年、2 年、3 年生存率均优于单纯 TACE 组，两组差异有统计学意义（*OR*=2.20，95%*CI*：1.53-3.17，*P*＜0.001；*OR*=2.44，95%*CI*：1.69-3.53，*P*＜0.001；*OR*=2.30，95%*CI*：1.52-3.46，*P*＜0.001）。同时，联合组 1 年、2 年、3 年术后无复发生存率也优于单纯 TACE 组，两组差异有统计学意义（*OR*=2.30，95%*CI*：1.52-3.46，*P*＜0.0001；*OR*=2.27，95%*CI*：1.19-4.32，*P*=0.01；*OR*=3.03，95%*CI*：1.55-5.92，*P*=0.001）。主要不良反应为发热、恶心呕吐、肝功能不全，未发现 TACE 联合 PVC 治疗相关死亡病例报道。
结论：HCC 合并 PVTT 患者辅助 TACE 联合 PVC 治疗可提高术后生存率并降低复发率，且明显优于单纯辅助 TACE 治疗。但由于纳入病例数较少，文献质量不高，该结论尚需多中心、前瞻性随机对照研究进一步证实。

Perioperative nursing care of patients with renal hamartoma undergoing interventional therapy

Di Wu,Min Li
THE FIRST BETHUNE HOSPITAL OF JILIN UNIVERSITY

Objective: to explore the perioperative nursing care of patients with renal hamartoma. Methods: the perioperative nursing points of patients with renal hamartoma were summarized.The contents include: psychological nursing of patients before intervention, patients due to lack of knowledge of related diseases, and to be treated under local anesthesia, will produce tension and fear. To give patients more sympathy, care and consideration before operation, and according to the characteristics of psychological changes, psychological nursing can improve patients' compliance to operation by means of psychological counseling, help and encouragement.Fasting for 4 hours and water forbidding for 2 hours before operation, we should also pay attention to the pulsatility of the distal artery at the puncture site, which is convenient for the control during operation and after operation. The vital signs of the patients were observed closely after intervention, and the bleeding and hematomas occurred at the puncture site. Observe the fluctuation of the dorsal artery of the affected foot, as well as the temperature, color and so on.Encourage patients to eat more fresh vegetables, fruits, drinking more water, promote defecation and diarrhea, if necessary, use Kaisailu. Tell the patient to reduce activity to reduce bleeding.Postoperative complications include vascular bleeding, injury and edema, arteriovenous fistula and thrombus complications, so it is necessary to closely observe the changes of the

disease, pay attention to the body temperature and, if necessary, cooperate with physical and drug cooling. To observe whether the patients have embolic side renal pain and gastrointestinal reaction, mild nausea and aneurysm rupture are serious complications of endovascular intervention, The patient must be told to stay in bed to reduce the activity of the patients, monitor the changes of vital signs, and effectively prevent the occurrence of this complications.
Results: After careful care, 5 patients with renal hamartoma were discharged from hospital without complications.
Conclusion: strengthening the perioperative nursing care of patients with renal hamartoma can reduce the occurrence of postoperative complications and improve the satisfaction of patients, which is worthy of clinical promotion.

Arsenic trioxide delivery by mitochondrial-targeted triphenylphosphine-coated mesoporous nano-zirconium dioxide combined with microwave therapy improves the efficacy of hepatocellular carcinoma treatment

Qirun Wu,Ke Xu
The first Affiliated Hospital of China Medical University

Background: Arsenic trioxide is effective in the treatment of hematological malignancies and solid tumors. However, its toxicity and side effects are severe, posing an obstacle in its clinical application, especially in tumors which are not sensitive to chemotherapeutic drugs. **Methods:** We constructed a controlled-release arsenic trioxide carrier with mitochondrial targeting. The safety and efficacy *in vitro* were investigated using a hemolysis test, cytotoxicity, proliferation, migration, apoptosis, and other changes in cell behavior. The safety and efficacy were verified *in vivo* by hematoxylin-eosin staining, TdT-mediated dUTP nick end labeling staining and blood test in tumor-bearing mice. Immunohistochemical and western blotting experiments were conducted to explore the mechanism of combination therapy of the material and microwave hyperthermia *in vitro*. **Results:** We demonstrated that the nano-zirconia loading platform may be used to administer the broad-spectrum chemotherapy drug, arsenic trioxide, with local, precision-controlled release, and mitochondrial targeting. Furthermore, we showed the safety of this approach for delivering high doses of arsenic trioxide. In addition, we explored this new method in combination with *in vitro* microwave heat therapy, providing a potentially novel intravenous chemotherapy approach. **Conclusion:** We described a new non-invasive treatment that improved the efficacy of arsenic trioxide chemotherapy for hepatocellular carcinoma through nano-zirconia carriers.

The efficacy of transarterial chemoembolization combined with iodine 125 seeds implantation versus transarterial chemoembolization combined with radiofrequency ablation in the treatment of early-intermediate hepatocellular carcinoma

Lei Chen,Chuansheng Zheng
Union Hospital Affiliated with Tongji Medical College of Huazhong University of Science and Technology

Abstract
Background
Radiofrequency ablation (RFA) plus transarterial embolization (TACE) does present good efficacy on patients with early-intermediate hepatocellular (HCC). However, RFA cannot be used to treat some special patients with early HCC. This study is to evaluate the efficacy of TACE with iodine 125 seeds implantation compared with TACE combined with RFA in the treatment of patients with early-intermediate HCC.
Methods
From January 1, 2014 to May 31, 2018, 134 patients with early-intermediate HCC were included in this research. Among them, 47 patients received TACE-iodine 125 treatment, 87 patients received TACE-RFA treatment. The efficacy of both treatments was compared. To reduced selective bias, propensity score matching (PSM) analysis was used to analyze the outcomes of both treatments.
Results
Before PSM, the median OS of TACE-RFA group was slightly longer than TACE-iodine 125 group (42 months vs 37 months), and the median PFS of TACE-RFA group was slightly longer than TACE-iodine 125 group (18 months vs 15 months). However, there was no significant difference of median OS and PFS between the two groups (P>0.05). There was no significant difference of ORR between the two groups (P>0.05). Subgroup analysis results showed that TACE-RFA subgroup had similar median OS and PFS compared with TACE-iodine 125 subgroup (P>0.05). After PSM, 35 pairs patients were matched, and there was no significant difference of median OS and PFS between the two groups.
Conclusion
TACE-iodine 125 seeds implantation might be an efficient treatment for patients with early-intermediate HCC.

125I 粒子腹腔神经节植入术治疗局部进展期胰头癌疼痛的价值研究

辛玉晶
中国医学科学院肿瘤医院

目的　评价超声引导下 ^{125}I 粒子腹腔神经节植入治疗不可切除及复发胰头癌顽固性癌痛的疗效以及其安全性。
方法　对 18 例不能切除的胰头癌患者及 7 例术后局部复发患者行超声引导下 ^{125}I 粒子腹腔神经节植入术，术前禁食 4—6h，静脉输注 0.9%氯化钠 500～1000ml，仰卧位，常规腹部皮肤消毒，术者及助手做放射防护，经皮经胃穿刺，于腹腔动脉干旁，调整超声探头方向，进行穿刺距离测量，采用血流多普勒避开血管，经活检孔道插入穿刺针，负压持续吸引下进行穿刺，到达靶部位后，拔出穿刺针针芯，粒子枪释放粒子，通过针芯送入粒子至靶部位，穿刺完毕，拔出穿刺针；按照同样方法，对其他神经节种植粒子。术中全程监测氧饱和度及心率、呼吸、血压等生命体征。术中及术后 3 天静滴盐酸环丙沙星 400mg。术后 2 天行上腹部 CT 增强扫描及摄腹部平片了解粒子定位情况术后每周随访 1 次，观察腹痛评分、麻醉药物的使用情况并记录手术相关的并发症。

结果　所有患者均一次性手术成功，平均每例患者植人 4 枚粒子(2—6 枚)。术后 1 周，1 例患者出现疼痛缓解，4 例患者疼痛略有进展。术后 2 周，患者的疼痛评分由平均 7.56 分降至 3.36 分($P<0.05$)，所需要麻醉药物的剂量由术前 87.60　mg 迅速减少到 50.00mg($P<0.05$)，随访过程中在其生存期内一直维持在较低水平，无 1 例出现进展；并发症胃潴留 1 例，腹泻 2 例，站立性晕厥 1 例，辅助治疗后消失。

结论　超声引导下 ^{125}I 粒子腹腔神经节植入术，对效缓解不可切除及复发胰头癌顽固性癌痛安全有效。

NRF2/ABCB1-mediated efflux and PARP1-mediated dampening of DNA damage contribute to doxorubicin resistance in chronic hypoxic HepG2 cells

Xiangwen Xia,Chuansheng Zheng
Department of Radiology, Union hospital, Tongji medical college, Huazhong university of science and technology

Transarterial chemoembolization (TACE)-induced hypoxia can trigger residual liver cancer cells to present a more aggressive phenotype associated with chemoresistance, but the underlying mechanisms are still unknown. In this study, the human liver cancer cell line HepG2 was pre-cultured in different oxygen environments to examine the possible mechanisms of hypoxia-induced doxorubicin resistance. Our study showed that HepG2 cells pre-cultured in a chronic intermittent hypoxic environment exhibited significant resistance to doxorubicin, evidenced by increased intracellular doxorubicin efflux, relatively higher cell proliferation, lower apoptosis and decreased DNA damage. These changes were accompanied by high levels of NRF2 and ABCB1 under conditions of both chronic and acute hypoxia; and PARP1 gene expression only under conditions of chronic hypoxia. SiRNA-mediated silencing of NRF2 gene expression down-regulated the expression of ABCB1 and increased the intracellular doxorubicin accumulation and cell apoptosis both in acute and chronic hypoxic HepG2 cells. Moreover, silencing of PARP1 gene expression increased the doxorubicin-induced DNA damage and cell apoptosis in chronic hypoxic cells. On the basis of these findings, we concluded that NRF2/ABCB1-mediated efflux and PARP1-mediated DNA repair contribute to doxorubicin resistance in chronic hypoxic HepG2 cells.

Combining transcatheter arterial embolization with iodized oil containing Apatinib inhibits HCC growth and metastasis

Chen Zhou,Xiong Bin
Union Hospital of Huazhong University of Science and Technology

PURPOSE
To investigate the treatment effect and mechanism of combining transcatheter arterial embolization (TAE) with adopted iodized oil containing Apatinib on suppressing tumor growth and metastasis.
METHOD AND MATERIALS
In vivo study, 40 tumor-bearing rabbits were randomly divided into four groups and respectively treated transarterially with saline (Group NS); iodized oil containing Apatinib (Group AI); iodized oil alone (Group I); Apatinib solution (Group A). Tumor harvest, sectioning and Immuno-histochemistry, and the tumor growth rates of each group were measured. And in vitro experiment, HUVECs were cultured with different concentration gradients Apatinib(0, 1, 10, 50μmol/L, 24h) in the culture medium of HepG2 with normal oxygen or hypoxia. The effect and mechanism of Apatinib was explored by bioassays, and the PI3K-akt, RAF-mek-erk and P38MAPK pathways were detected.
RESULTS
The tumor growth rate of Group AI was significantly lower than other three groups ($P=0.000<0.01$), and the result was further confirmed by CCK-8 assays. Immunohistochemistry results showed that CD31 of Group AI was significantly lower than that of the other three groups ($P<0.01$). Apatinib have a stronger inhibitory effect of multiplication, migration and invasion of HUVECs in anoxic environment rather than in normoxia. Apatinib inhibits HUVECs proliferation by down-regulating the PI3K-akt, RAF-mek-erk and P38MAPK pathways.
CONCLUSION
Combining TAE with adopted iodized oil containing Apatinib has a stronger inhibitory effect in VX2 liver tumors. Apatinib inhibits the angiogenesis and growth of liver cancer by down-regulating the PI3K-akt, RAF-mek-erk and P38MAPK pathways, and has a stronger inhibitory effect in hypoxic environments.

EPO-1894

肝动脉化疗栓塞联合射频消融治疗巴塞罗那 A 或 B 期肝癌的 临床分析

任衍乔,郑传胜
华中科技大学同济医学院附属协和医院

目的：评估经导管动脉化疗栓塞术联合射频消融术对巴塞罗那 A 期或 B 期原发性肝癌患者的治疗效果和安全性，并且探讨适合联合治疗的肿瘤直径大小，从而评估哪些患者能够从中获益。
方法：回顾性分析我科 2009 年 9 月至 2018 年 9 月 399 例符合条件的患者。其中 TACE 联合 RFA 组有 128 例患者，单纯 TACE 组有 271 例患者。治疗后观察比较两组患者的总生存期，无进展生存期，肿瘤的治疗应答反应和并发症等方面的差异。
结果：TACE 联合 RFA 组患者 1，3，5，8 年的生存率高于单纯 TACE 组患者的生存率（*P*<0.001）。TACE 联合 RFA 组患者 1，3，5，8 年的无进展生存率明显高于单纯 TACE 组患者的无进展生存率（*P*<0.001）。亚组分析结果显示，对于 3-5cm 组的患者，TACE 联合 RFA 治疗与单纯 TACE 治疗的 1 年生存率无统计学差异（*P*=0.05），而接受联合治疗的患者的 3，5，8 年生存率均明显优于接受单纯 TACE 治疗的患者的 3，5，8 年生存率。采用 TACE 联合 RFA 治疗的其余三个亚组患者的 1，3，5，8 年生存率均高于采用单纯 TACE 组患者。四个亚组患者的 1，3，5，8 年无进展生存率统计结果显示，TACE 联合 RFA 组优于单纯 TACE 组。死亡风险曲线和决策树模型结果表明，单纯 TACE 组患者死亡风险明显高于 TACE 联合 RFA 组。
结论：TACE 联合 RFA 能够显著提高 BCLC A 或 B 期 HCC 患者的 OS，延长患者的 PFS，同时较为安全。此外，对于不同肿瘤直径大小的 BCLC A 或 B 期 HCC 患者，TACE 联合 RFA 治疗均能使其获益，并且肿瘤直径越大，获益程度越高。

中性粒细胞与淋巴细胞比值在晚期肝细胞癌接受肝动脉化疗栓塞联合阿帕替尼治疗的预后意义

王富权
华中科技大学同济医学院附属协和医院放射科

目的：中性粒细胞与淋巴细胞比值（NLR）被认为是肝癌治疗预后的一个影响因素。目前，肝动脉化疗栓塞术（TACE）联合阿帕替尼治疗晚期肝细胞癌在临床上已经有前瞻性的应用。本研究目的在于探讨 TACE 治疗术前 NLR 水平在接受 TACE 联合阿帕替尼治疗晚期肝细胞癌的预后意义。
材料和方法：本研究回顾性分析符合纳入和排除标准的 57 名巴塞罗那分期 C 期（BCLC-C）的肝细胞癌并接受 TACE 联合阿帕替尼治疗的患者的临床资料，分析第一次 TACE 术前外周血 NLR 的水平与预后生存的关系。采用受试者工作生存曲线（ROC）确定 NLR 的最佳截止值，并采用 COX 回归多因素分析影响晚期肝细胞癌的预后因素。
结果：ROC 曲线求得出在接受 TACE 联合阿帕替尼的肝癌患者中，在 TACE 术前患者 NLR 的截止值是 2.46。NLR>=2.46（54%）定义为 NLR 高水平组，该组患者的中位生存时间为 6.2 月{95%CI：5.0-7.4}，NLR<2.46（46%）定义为 NLR 低水平组，该组患者的中位生存时间为 8.9 月{95%CI：7.2-11.2}，两组患者的中位生存时间差异具有统计学意义（P<0.05）。在 COX 回归多因素分析结果显示，ECOG 评分>=1 分（P<0.05）、腹水（P<0.05）、肝性脑病（P<0.05）均为影响患者预后的危险因素。
结论：在 BCLC-C 期肝细胞癌患者接受 TACE 联合阿帕替尼治疗的患者中，在第一次 TACE 术前监测外周血 NLR 水平对患者的治疗效果具有预测意义，NLR 水平越高，则患者可能预后越差。

Transcatheter arterial embolization combined with hypoxia-replicative oncolytic adenovirus perfusion enhances the therapeutic effect of hepatic carcinoma

Hongsen Zhang,Chuansheng Zheng,Bin Xiong,Bin Liang,Fan Yang
Department of Radiology, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Abstract
Purpose: Transcatheter arterial embolization (TAE) or transcatheter arterial chemoembolization (TACE) has become a critical therapy for unresectable hepatocarcinoma (HCC). Although hypoxia caused by embolization can induce apoptosis and necrosis of the majority of tumor cells, a small proportion of cells can survive with hypoxia and chemotherapy resistance. HIF-1α induced by hypoxia is the key factor rendering surviving tumor cells invasive and metastatic properties. Thus, we generated a synthetic hypoxia-replicative oncolytic adenovirus (HYAD) expecting to further eliminated the surviving tumor cells which expressed HIF-1α.
methods: In our study, we detected protein expression, proliferation, apoptosis and necrosis of hepatic tumor cell line when infected with HYAD under hypoxia and normoxia. And we constructed VX2 hepatic cancer rabbit models to explore the therapeutic effect of transcatheter arterial embolization combined with HYAD perfusion under Digital Subtraction Angiography (DSA). Inhibition of tumor growth and invasion was detected by histopathological examination and contrast-enhanced CT scan.
Results: Experiments in vitro verified that HYAD expressed and replicated along with HIF-1α expression or hypoxia. Compared with wild adenovirus type 5 (WT), HYAD expressed more higher under hypoxia, which was the main principle of HYAD killing surviving tumor cells post transarterial embolization. In vivo experiment of VX2 models, HYAD perfusion combined with PVA embolization achieved the highest expression quantity and the longest expression duration compared with simple HYAD perfusion, WT perfusion combined with PVA embolization and simple WT perfusion. Because adenovirus expression protein E1A had the properties of promoting apoptosis, inhibiting invasion and inhibiting metastasis, HYAD perfusion combined with PVA embolization group efficiently repressed tumor growth and intrahepatic metastases compared to other processing groups.
Conclusion: HYAD can overcome the hypoxic tumor microenvironment post-embolization and target the surviving tumor cells with specificity. In turn, HYAD perfusion combined with PVA embolization can bring out the best effect in each other.

急症介入放射学体系-

郑传胜
华中科技大学同济医学院附属协和医院

急症介入诊疗学是介入放射学的重要组成部分,经过近 40 年的发展，其早已由成为临床急救的重要手段，经血管和非血管途径的介入技术在救治危重患者中的作用也受到肯定和重视；急症介入诊疗

学的特点包括：微创性、可重复性、定位准确、疗效好，见效快、并发症发生率低和可与其他诊疗技术配合，而与介入放射学相比，外科治疗风险大,内科疗效不佳。介入急症诊疗范围包括：1.活动性出血疾病的急症介入诊疗，其中创伤是导致出血的最常见原因，其次是溃疡、肿瘤、炎症等腐蚀血管造成出血。当药物治疗、支持治疗（输血及血液制品）、外科治疗等止血失败者，应首先考虑做血管内介入止血治疗。活动性出血性疾病的急症介入诊疗技术包括定位诊断（有时可提供疾病的定性诊断信息）和治疗双重作用。2. 急性缺血性疾病的急症介入诊疗，急性动脉栓塞：常由于风湿性心脏病、房颤、心梗后、心内膜炎等激发心腔内血栓脱落，引起急性动脉闭塞；急症介入可了解血管闭塞部位和范围，酌情做经导管取栓、抽吸血栓和溶栓治疗，必要时可置入支架开通阻塞血管；急性动脉血栓形成：继发于动脉粥样硬化、创伤、邻近肿物或肿块压迫等。其中急性脑梗塞的急症介入溶栓治疗对出现急性脑梗死症状 6h 内的患者是行之有效的方法(注意急症 CT 鉴别脑出血和梗死)；3. 急性静脉系统血栓形成的急症介入诊疗，包括肺动脉栓塞，上肢-上腔静脉血栓形成和急性肠系膜静脉血栓形成等急症的介入诊疗；4.医源性并发症的急症介入诊疗，包括穿刺活检术后大出血，血管损伤及医源性异物等急症的介入诊疗；5. 器官移植术后的急症介入诊疗，主要包括肝脏、肾脏移植术后发生的急性出血、血管吻合口狭窄及闭塞等急症的介入诊疗；6.其他疾病的急症诊疗，包括各部位的急性炎症、急性腔道阻塞和重症梗阻性黄疸等急症的介入诊疗。

Image-Guided Radiofrequency Hyperthermia-Enhanced Direct Chemotherapy of Hepatic Tumors: The Underlying BioMolecular Mechanisms

Kun Qian[1],Chuansheng Zheng[1],Xiaoming Yang[2]
1.Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology
2.Image-Guided Bio-Molecular Intervention Research, Department of Radiology, University of Washington School of Medicine

For thermal ablation of unresectable primary and metastatic liver malignancies, RFA is universally adapted, well studied, and recommended by different organizations around the world, while use of MWA has been increasing in the recent years. Both techniques can be applied for up to 3-5 lesions in a single treatment session. However, to date the two thermal ablations are basically best suited for treatment of small tumors (< 3 cm). For ablation of medium (3-5 cm) to large (5-7 cm) hepatic lesions, these thermal ablations usually suffer from the drawback of incomplete ablation at the tumor periphery, leaving a positive tumor margin. This is attributed to the challenge of creating an effective and safe ablative zone with a 1-cm surgical margin or “clear safety margin” beyond the tumor confinement using the current thermal ablation technology. This setback is often caused by 1) RFA heat carried away by neighboring vasculatures at the tumor periphery (so-called “heat-sink” effect); 2) intentional avoidance of MWA’s rapid over-heating by the operator in order to protect adjacent critical structures (such as vasculatures, bile ducts, gastrointestinal tracts, and diaphragm); and 3) infiltrative growth patterns of malignant tumors to form micro-satellite lesions or micro-venous tumor emboli at the 1-cm surgical margin of ablated tumors. Recent studies from our group and others have successfully confirmed that image-guided interventional radiofrequency hyperthermia (RFH, at a sub-lethal

temperature <60℃) can greatly enhance chemo-, gene-, and immunotherapies of various malignancies, including hepatic tumors.[1, 2]
The recognized mechanisms of RFH-enhanced therapies include tissue fracture via heating, increased permeability of cytoplasmic membranes, disruption of cellular metabolism, and activation of the heat shock protein pathway.[3] These mechanisms effectively facilitate the entrance of therapeutic agents into target tumor cells, and thereby promote the destruction of tumor tissue.
In this project, we aimed to revolutionize the treatment capability of RFA technology in medium-to-large liver tumors, by developing a novel, "one-stop-shop" interventional oncologic technique, named "Image-guided and RFA-associated RFH-enhanced direct chemo-destruction of tumor cells at malignant tumor margin"

EPO-1899
膈下肝癌经肝动脉化疗栓塞联合射频消融的临床疗效分析

石钦,熊斌
华中科技大学同济医学院附属协和医院

目的 评估经肝动脉化疗栓塞（TACE）联合射频消融（RFA）治疗膈下肝癌的安全性与有效性。
方法 选取我科 2014 年 3 月～2018 年 11 月行肝动脉化疗栓塞联合射频消融治疗的膈下肝癌患者 55 例。随访期间，评估所有患者术后肿瘤反应及生存率，比较治疗前后血生化、AFP 及肝功能指标变化，并总结患者术后并发症的发生情况。
结果 在 55 例肝癌患者共 61 处膈下病灶中，30 处病灶（49.2%）完全缓解（CR），24 处病灶（39.3%）部分缓解（PR），7 处病灶（11.5%）疾病稳定（SD），无病灶疾病进展（PD）。客观反应率（ORR）为 88.5%，疾病控制率（DCR）为 100%，所有患者均获益。治疗前后肝功能及血生化指标无明显差异（P＞0.05），但 AFP 差异具有统计学意义（t=3.277,p＜0.05）。所有患者在围手术期内未出现严重并发症。
结论 经肝动脉化疗栓塞联合射频消融对膈下肝癌治疗效果显著。在射频消融治疗过程中出现的疼痛，通过术前静脉滴注氟比洛芬酯或地佐辛并联合利多卡因局麻，术中加入适量利多卡因与生理盐水 1:1 稀释液经进水孔对肿瘤病灶进行灌注麻醉，必要时给予吗啡肌注，可显著缓解患者疼痛。

双模式自显影栓塞微球介入治疗肝癌的实验研究

刘一鸣,郑传胜
华中科技大学同济医学院附属协和医院

目的：栓塞剂是评价经导管肝动脉栓塞治疗肿瘤疗效的关键。本研究采用微流控技术制备一种具有双模式 T1/T2 加权磁共振成像的聚乙烯醇复合微球，证实其具有良好的磁热效应、显影性及栓塞效果。
方法：本研究将 Gd_2O_3和 Fe_3O_4纳米粒子分别作为 T1 和 T2 加权磁共振成像造影剂，通过微流控一步法制备纳米聚乙烯醇微球。采用 VX2 荷瘤兔模型，评价其安全性，观察 TAE 对肝癌生长、坏死和增殖的影响。采用瘤内注射法对微球在动物体内 MR 成像效果进行评价。
结果：Gd_2O_3/Fe_3O_4@PVA 微球具有良好的 MRI 显影效果、栓塞效果及磁热效应，生物安全性高。

结论：Gd_2O_3/Fe_3O4@PVA 微球不仅可以作为栓塞剂用于 TAE 治疗，而且由于 Fe_3O_4纳米粒的超顺磁性和 Gd_2O_3纳米粒的成像性，使其具有良好的磁热效应和双模式 T1 和 T2 加权磁共振成像的特性。
关键词：纳米栓塞微球；微流控；自显影

EPO-1901
联合改良呼吸训练方案与对比剂稀释法：减少磁共振 GD-EOB-DTPA 上腹部增强肝脏动脉期一过性伪影的初步研究

赵骏,贺姝瑶,王玉婷,程琳,黎川,王健
陆军军医大学第一附属医院（西南医院）

目的：对比渐进式与非渐进式呼吸训练方案磁共振(Magnetic Resonance, MR)钆塞酸二钠(Gadoxetic acid，GD-EOB-DTPA)上腹部增强检查肝脏动脉期图像质量，选取优势训练方案对比剂稀释 50%采集动脉期图像与非稀释法对比，优化呼吸训练和扫描方案。
方法：2019 年 5 月-8 月在我科行 MR 上腹部 GD-EOB-DTPA 增强检查患者，纳入人口统计资料(性别、年龄、体重指数和疾病分布)无差异且完成 MR 检查的两组患者，第一组，渐进式呼吸训练法，26 名患者，先行吸气后 5 秒闭气，全腹无起伏达标，之后闭气时间延长至 10 秒，15 秒到 20 秒。第二组，33 名患者，吸气后直接闭气 20 秒，达标要求同第一组。两组患者对比剂均采用每秒 1 毫升的注射速度进行高压注射，之后相同速度注射 20 毫升生理盐水，GD-EOB-DTPA 注射剂量为每千克 0.1 毫升，透视法采集。动脉期图像质量评分标准，1 分=无呼吸伪影，2 分=轻度呼吸伪影可诊断，3 分=中度呼吸伪影可诊断，4 分=重度呼吸伪影可诊断，5 分=无法诊断。评估每名患者动脉期图像呼吸伪影，肝动脉，门静脉，腹主动脉，肝脏实质的图像评分，计算总分，Mann-Whitney 检验比较差异性。图像优质组训练法纳入第三组人口统计学无差异患者 21 名，对比剂稀释 50%，注射速度变为每秒 2 毫升，再行动脉期图像评估比较。
结果：第一组呼吸伪影，肝动脉，门静脉，腹主动脉，肝脏实质评分及总分略优于第二组对应指标评分，但差异显著性不大（P=0.141, 1, 0.192, 0.733, 0.529, 0.318）。第二组呼吸训练方案，对比剂稀释法动脉期各项评分略优于对比剂非稀释法动脉期各项评分，其中肝动脉更优(P=0.023)。
结论：采用直接闭气 20 秒呼吸训练方案，GD-EOB-DTPA 稀释 50%注射法可明显降低一过性呼吸运动产生的呼吸伪影。

EPO-1902
Gd-EOB-DTPA MRI 上类似肝细胞癌强化的肝脏结节：影像诊断困境

黎金葵
兰州大学第一医院

背景：肝细胞癌（HCC）是最常见的原发性肝脏恶性肿瘤，其诊断可基于影像诊断而不依赖病理学。 HCC 的典型表现是动脉期高强化、门静脉或延迟期廓清、假包膜。CT 和 MRI，尤其是 Gd-EOB-DTPA MRI，提高了 HCC 检出和诊断准确性，但 HCC 的误诊在临床实践中并不少见，假阳性诊断可导致不必要的治疗。
方法：我们报告了 8 例类似 HCC 强化的肝脏结节的假阳性病例，分析其临床和病理特征，加强认识，以减少误诊。

方法：回顾性分析 8 例患者（5 例男性，3 例女性，年龄范围 46-69）包括 9 个肝脏病变的临床特征和病理特征，所有患者均行 Gd-EOB-DTPA MRI 检查，所有病灶强化类似 HCC。
结果：术前诊断为 HCC 1 例，肝腺瘤可能但 HCC 不能排除 1 例。仅 1 例 AFP 轻度升高，1 例 AFP 及 CA199 轻度升高。7 例患者接受肝切除术，2 例行穿刺活检。最终结果为 2 例（3 个病灶）是混合型肝细胞-胆管癌（cHCC-CC）、1 例恶性 T 细胞淋巴瘤、1 例 DN，这些患者伴肝硬化或慢性肝炎病史；1 例淋巴滤泡瘤样增生和 1 例血管平滑肌脂肪瘤（AML）、1 例肝转移性胃肠道间质瘤、1 例非肝细胞来源恶性肿瘤（因组织坏死严重未能定性），这些患者无 HCC 危险因素。
结论：总之，虽然 HCC 患者通常伴有慢性肝病，但一些良性病变如 AML、DN 和淋巴滤泡瘤样增生以及恶性病变例如 cHCC-CC、淋巴瘤等表现可类似 HCC，导致诊断困难。当血清 AFP 正常且患者没有 HCC 的危险因素，应考虑其他鉴别诊断。

EPO-1903
磁化传递技术评价 II 型糖尿病患者早期肾功能改变的初步研究

陈静,张喜荣,韩冬,杨祺,于楠,于勇
陕西中医药大学附属医院

目的：采用磁共振磁化传递技术（Magnetization transfer，MT）研究 II 型糖尿病患者早期肾脏微观结构的改变。
方法：选择 14 例临床诊断为Ⅰ期 II 型糖尿病肾病的患者作为观察组，35 例健康志愿者作为对照组。采用西门子 Skyra 3.0T 磁共振扫描仪，体部 18 通道相控阵表面线圈对所有被试进行双肾磁共振 MT 扫描。MT 扫描采用 3D 扰相梯度回波序列，该序列扫描 2 次，第一次为不添加 MT 射频脉冲信号（MTOFF），第二次为添加 MT 射频脉冲信号（MTON）。根据公式 MTR＝（MTOFF－MTON）×100／MTOFF 计算出 MTR，以百分数表示。在双肾上极、肾门、下极肾皮髓质绘制多个感兴趣区，测量相应磁化传递率并取平均值记录。采用两样本 t 检验比较组间皮髓质 MTR 值差异（P＜0.05 有统计学意义）。ROC 曲线分析 MTR 值在Ⅰ期 II 型糖尿病肾病诊断中的敏感性和特异性。
结果：两组被试肾髓质的 MTR 值均高于皮质（表 1）。相较对照组，观察组肾皮质和髓质的 MTR 值升高，且具有统计学意义（p <0.05）（表 1，图 1）。ROC 分析发现，肾髓质 MTR 值Ⅰ期 II 型糖尿病肾病诊断效能曲线下面积（*Area under the curve* ，AUC）为 0.798，敏感性和特异性分别为 78.60％和 85.70％；肾皮质 MTR 值的诊断效能与肾髓质无统计学差异 （Delong’s 检验，$Z = 0.718$，$P = 0.473$），AUC 为 0.843，敏感性和特异性分别是 78.60％和 80.00％（表 2，图 2）。
结论：MT 可用于早期糖尿病肾病的筛查，为早期糖尿病肾病的临床变化提供更科学的依据；MTR 值可以评估早期糖尿病肾病引起的肾脏微观结构损害，对肾功能的评价具有潜在应用价值。

EPO-1904
IVIM 联合 DTI 对急性胰腺炎定量诊断与严重程度分级研究

李兴辉
川北医学院附属医院

目的：研究体素内不相干运动扩散加权成像（intravoxel incoherent motion diffusion-weighted imaging, IVIM-DWI）与扩散张量成像（diffusion tensor imaging, DTI)对急性胰腺炎（Acute Pancreatitis, AP）的定量诊断和严重程度分级的评估价值。**方法**：采用 3.0T MR 对 85 例 AP 患者和 30 例健康自愿者行上腹部常规、IVIM 和 DTI 序列扫描，测量胰腺单指数模型下参数（Standard average diffusion coefficient, ADC)及双指数模型下的参数（Slow ADC、Fast ADC 及 Fraction of fast ADC，Ff ADC）和 DTI 的参数（ADC 和 fractional anisotropy, FA)。比较其对 AP 的诊断效能，并与 AP MR 严重程度指数（MR severity Index, MRSI）进行相关分析。**结果**：AP 组与健康组 Standard ADC、Ff ADC 及 DTI 的 ADC、FA 差异具有统计学意义，Slow ADC、Fast ADC 值差异无统计学意义。Standard ADC、Ff ADC、DTI 的 ADC、FA 有诊断效能（曲线下面积分别为 0.692、0.707、0.676、0.669， P ＜0.05)，但四者之间诊断效能差异无统计学意义。Standard ADC、Ff ADC、DTI 的 ADC、FA 与 AP MR 严重程度指数之间呈负相关（R 分别为-0.419、-0.271、-0.391、-0.339，P＜0.05)，而 slow ADC、fast ADC 值与 MRSI 评分不具有相关性。 **结论**：胰腺的 IVIM 和 DTI 参数对 AP 有较好的诊断价值，其值的大小与 AP MR 严重程度指数呈负相关。因此，胰腺的 IVIM 和 DTI 参数的测量可作为诊断 AP 和严重程度影像分期的依据之一。

EPO-1905
国产压缩感知技术在肝脏磁共振检查中的应用研究

苏文婷,潘自来
上海交通大学医学院附属瑞金医院北院

磁共振在疾病诊断与鉴别诊断的应用日益重要，但肝脏扫描期相精准捕捉较困难，与病 屏气配合程度、自身体循环及对 剂注射流速相关，在 定程度上影响了对肿瘤不同期相的表现捕捉。压缩感知是 种新的信号采集理论，利用信号的稀疏性特点，通过非相 式采样及 线性迭代重建来恢复完整的图像信息。通过结合压缩感知技术使磁共振极大地提高扫描速度，且同时保证不牺牲空间分辨率，一次 屏气获得 48 个期相（0.5 秒/期相），全 肝覆盖。因此，在一定程度上它对于肝脏肿瘤磁共振血供动态捕捉具有独 特优势，可以精确获得多动脉期图像 ，为 HCC 的检出提供最直接的诊断依 据。

虽然发展迅速，各项研究均表明其应用的可行性，但是到目前仍然没有在临床进行广泛的应用。主要原因有以下几点：一次性采集多个期相会产生大量的临床图像数据，虽然较传统方法可以提供更为充足的信息，但从中筛选最有诊断价值的图像往往需要花费较多时间，给报告医生增加了工作负担；由于 CS 重建技术需要大量迭代计算，传统的方法往往需要花费很长时间，不能满足高通量临床检查的日常需求；如何与其他成像技术结合也是亟待解决的问题。

无论如何，CS-MRI 快速成像都能极大地缩短扫描时间，提高了 MR 检查的舒适性，减少了运动伪影，提供肿瘤不同期相的血供捕捉，如同并行采集技术一样，必将成为肝脏磁共振检查革命性的新技术。

EPO-1906
流入反转恢复 MR 血管成像在肾动脉成像的可行性研究

苏文婷,潘自来
上海交通大学医学院附属瑞金医院北院

目的 比较肾动脉流入反转恢复 MR 血管成像（NC FIRM MRA）和增强 MR 血管成像（CE-MRA）的图像质量，探讨肾动脉 NC FIRM MRA 的价值。

方法 前瞻性收集因病情所需行肾动脉 CE-MRA 检查的 73 例患者，均行肾动脉 NC FIRM MRA 检查。由 2 名高年资放射科医师单独阅片，分别对不同检查方法的图像行肾动脉图像质量评分及肾动脉分支显示评分，分别采用配对样本的 Wilcoxon 符号秩检验和 2 检验进行比较。结果 NC FIRM MRA 和 CE-MRA 的肾动脉图像质量评分差异无统计学意义（P＞0.05），对各程度狭窄的正确诊断率之间不具有统计学差异(P＞0.05)。NC FIRM MRA 和 CE-MRA 图像的肾动脉分支显示差异有统计学意义（P<0.05）。

结果 NC FIRM MRA 和 CE-MRA 的肾动脉图像质量评分差异无统计学意义（P＞0.05）。NC FIRM MRA 和 CE-MRA 图像的肾动脉分支显示差异有统计学意义（P<0.05）。

结论 CE-MRA 和 NC FIRM MRA 对肾动脉各级分支的显示差异有统计学意义，而对于肾动脉主干及狭窄及图像质量的显示差异无统计学意义。由于 NC FIRM MRA 成像无需注入对比剂，没有对比剂肾病的潜在危险，并且可以短期内重复检查，可以作为肾动脉狭窄的初步筛查手段。

EPO-1907
主胰管胰头段水平角及开角方向与急性胰腺炎相关性的 MRI 研究

潘珂
川北医学院附属医院

目的：探讨主胰管胰头段水平角及开角方向与急性胰腺炎相关性。材料与方法：回顾性连续收集临床及上腹部 MRI 检查确定为急性胰腺炎患者 119 例，按纳入和排除标准入选 32 例为观察组，同期收集 49 例正常胰腺为对照组。两组均行 MRCP，数据上传至工作站行图像处理，在主胰管显示清晰完整的层面上连续三次测量主胰管胰头段及主胰管头尾两端连线与水平线的夹角，记录平均数值及主胰管胰头段水平角方向并行统计学分析。结果：急性胰腺炎组，主胰管胰头段及主胰管头尾两端连线与水平线的夹角分别为 28.19±18.97° 和 31.24±11.74°，其中，而正常胰腺组为 28.77±18.38° 和 28.16±10.52°（t=0.137/-1.168; P=0.981/0.247 ）。32 例急性胰腺炎组中，主胰管胰头段开角向上 19 例，主胰管胰头段与水平线的夹角为 30.93±19.76°， 向下 13 例，其夹角为 15.67±6.93°；49 例正常胰腺组，开角方向上 40 例，主胰管胰头段与水平线的夹角为 31.72±18.91°， 向下 9 例，其夹角为 24.18±17.75°。急性胰腺炎组与正常胰腺组，向上或向下开角方向，主胰管胰头段与水平线的夹角均无统计学意义（t=-0.146/0.883; P=-1.360/0.189 ），而主胰管胰头段与水平线的开角方向具有统计学差异（ x^2=4.847，P=0.041）。全部病例中向上开角的角度（31.46±19.12°）与向下开角的角度（20.69±14.72°）间有统计学差异（t=2.398，P=0.019）。结论：急性胰腺炎与主胰管胰头段水平角大小无关，但与水平角的开角方向密切有关，临床急性胰腺炎多以开角向下方向为主。

DCE-MRI 灌注成像对中低位 LARC 新辅助放化疗应答的预测及评估价值

印隆林[1],杨李[2],曾桔[1],孙菊[1],张传德[1]
1.四川省医学科学院.四川省人民医院
2.绵阳市中心医院

目的 探讨 DCE-MRI 灌注成像对中低位局部进展期直肠癌（LARC）新辅助放化疗（CRT）疗效的预测及评估价值。方法 前瞻性纳入 41 例符合纳入排除标准的中低位 LARC 患者作为研究对象。每位患者均在 CRT 前 1 周内、完成 CRT 后 6-10 周后行常规 MRI 及 DCE-MRI 检查，在完成 CRT 且 MRI 检查

后 1 周内行全系膜切除术及术后标本病检。根据肿瘤退缩分级（TRG）评分系统，将患者病理结果分为 CRT 有应答组与无应答组、CRT 反应良好组与不良组，比较灌注参数在各组间及组内的差异性；差异有统计学意义的参数绘制相应 ROC 曲线、计算 AUC 并确定阈值。结果 ①有应答组 CRT 前 Ktrans 高于无应答组（$p<0.05$），CRT 后两组间各灌注参数差异均无统计学意义。Ktrans 预测 CRT 有应答组 AUC 值 0.954，当 Ktrans=0.122 min^{-1} 时约登指数最大。②应答良好组 CRT 前 Ktrans 值高于不良组、CRT 后低于不良组（$p<0.05$）。Ktrans 值预测 CRT 反应良好组 AUC 值 0.953，当 Ktrans=0.158 min^{-1} 时约登指数最大。③CRT 应答良好组与应答不良组 CRT 治疗前、后自身灌注参数比较，应答良好组 CRT 前 Ktrans、kep 值高于 CRT 后（$p<0.05$），应答不良组 CRT 前 Ktrans 值高于 CRT 后（$p<0.05$）。CRT 前、后灌注参数变化百分比结果显示应答良好组 ΔKtrans 和 ΔKep 高于应答不良组，ΔKtrans 及 ΔKep 值评估 CRT 反应良好的 AUC 分别为 0.952、0.764，且 ΔKtrans 的 AUC 值大于 ΔKep（Z=2.063,p=0.039），当 ΔKtrans=-38.8%时约登指数最大。结论 DCE-MRI 灌注参数特别是 Ktrans 值对中低位 LARC 患者的 CRT 疗效预测及评估具有一定的指导价值。

EPO-1909

IVIM-MRI 与 DCE-MRI 在鉴别直肠癌良恶性淋巴结的价值比较

龙玲
重庆市肿瘤医院

目的： 评估体内不相干运动成像（intravoxel incoherent motion magnetic resonance imaging，IVIM-MRI）和磁共振动态对比增强（dynamic contrast-enhanced MRI，DCE-MRI）对直肠癌患者转移性和非转移性淋巴结的鉴别诊断价值。 并探讨 IVIM 与 DCE 相关灌注参数在鉴别直肠癌良恶性淋巴结之间的关系。
方法： 所有患者术前行 IVIM 及 DCE 检查，将淋巴结的原始 IVIM 及 DCE 数据导入后处理工作站，分别得相关参数（standard ADC， D，D*，f， Ktrans，Kep， Ve，Vp ，TTP，MAX Conc ，AUC and MAXSlope)，应用独立样本 t 检验比较良恶性淋巴结之间短径、IVIM 及 DCE 参数之间的差异性，利用 Pearson 相关性分析分析 IVIM 与 DCE 灌注参数之间的相关性。

结果： 本研究共收集 60 例（149 个淋巴结）经手术病理证实的直肠癌患者。转移性淋巴结的 D，Ktrans，Ve 及 TTP 值明显大于非转移性淋巴结，并具有统计学意义(P <0.05)；转移性淋巴结的 standard ADC 和 Kep 大于非转移性淋巴结，转移性淋巴结的 D*, f , Vp, MAX Conc ,AUC 和 MAXSlope 小于非转移性淋巴结，但是以上均无统计学意义（P> 0.05）。

结论： D，Ktrans，Ve 及 TTP 对鉴别直肠癌良恶性淋巴结具有价值，但 IVIM 与 DCE 相关灌注参数在鉴别直肠癌良恶性淋巴结之间无相关性。

EPO-1910

宫颈小细胞神经内分泌癌的 MRI 诊断

陆林,Xin
郑州大学第三附属医院

摘要 目的 分析宫颈小细胞神经内分泌癌（SCCC）的 MRI 表现，以提高对该病的诊断水平。**方法** 回顾性分析 3 例 SCCC 患者的临床及影像学资料，重点分析其 MRI 表现。**结果** SCCC 平扫 T1WI 均为

低信号，T2WI 信号混杂，以中等稍高信号为主，DWI 上扩散受限呈明显高信号，ADC 图呈明显低信号，3 例平均 ADC 值为 0.699×$10^{-3}$$mm^2$/s。增强后扫描，2 例动脉期不均匀明显强化，1 例不均匀轻度强化，延迟期 3 例持续性强化。3 例发生盆腔淋巴结转移，2 例发生远处骨转移，转移淋巴结融合呈块状，边界模糊，较大者 T2 信号不均匀，增强后呈花环状或结节状明显强化。**结论** SCCC 有特征性表现，T2 信号不均匀，ADC 值比较低，淋巴结转移常见，且较易融合成大块状，这些有助于临床精确诊断 SCCC。

附件区肿瘤与同侧卵巢关系的磁共振成像研究

王杰[1,2],强金伟[1]
1.复旦大学附属金山医院
2.陆军军医大学附属新桥医院

【目的】探讨附件区肿瘤与同侧卵巢的 MRI 形态学关系，为肿瘤的定位和定性诊断提供帮助。
【材料与方法】回顾性分析经手术和病理证实的 496 个附件区肿瘤患者（卵巢来源 400 个，非卵巢来源 96 个；良性 183 个，交界性 120 个，恶性 193 个）的临床及 MRI 资料，观察和比较不同来源、良恶性、构型的附件区肿瘤同侧卵巢显示情况及所显示的卵巢形态，同时分析附件区肿瘤同侧卵巢的显示与患者年龄、月经状态以及肿瘤大小的关系。
【结果】卵巢来源的肿瘤同侧卵巢显示率为 23%，非卵巢肿瘤同侧卵巢显示率为 45%，两者差异有统计学意义（$p < 0.001$）；卵巢肿瘤中仅 7%可见正常的卵圆形同侧卵巢，而非卵巢肿瘤中有 26%可见正常形态的同侧卵巢结构（$p < 0.001$）。良性肿瘤同侧卵巢显示率为 38%，交界性肿瘤为 35%，恶性肿瘤为 11%，差异有统计学意义（$p < 0.001$）；囊性肿瘤同侧卵巢显示率为 24%，囊实性肿瘤为 27%，实性肿瘤为 28%，差异无统计学意义（$p = 0.737$）；附件区肿瘤同侧卵巢显示在绝经前患者为 40%，绝经后仅为 7%，差异有统计学意义（$p < 0.001$）。同侧卵巢显示组患者平均年龄 35 ± 10 岁小于未显示组 48 ± 15 岁，差异有统计学意义（$p < 0.001$）；附件区肿瘤同侧卵巢显示组最大径平均为 9.2 ± 4.8 cm，未显示组最大径平均为 10 ± 5.3 cm，两组肿瘤在最大径方面差异没有统计学意义（$p = 0.148$）。
【结论】附件区肿瘤同侧卵巢的显示与肿瘤来源、肿瘤良恶性、及与患者的年龄和月经状态有关。同侧卵巢的显示有助于附件区肿瘤的定位和定性诊断，它更多见于非卵巢来源肿瘤，也可见于卵巢良性或交界性肿瘤。

Value of clinical application of MRCP on the biliary anastomotic stricture after liver transplantation

Jiaxin Cao,Jie Zhang,Erhu Jin
Beijing Friendship Hospital, Capital Medical University

Objective Combining with the clinical manifestations and the follow-up changes of laboratory indicators after the treatment for biliary stricture, to investigate the correlation between imaging findings of biliary anastomotic stricture (AS) following orthotopic liver transplantation on MRCP and its prognosis.
Methods Collect a total of 21 patients with 29 cases of MRCP examinations. Two readers independently observe and record the findings of MRCP about the anastomotic

site, abnormal signal inside or around the biliary and the degree of biliary dilation. Combined with the follow-up changes of patients clinical symptoms (abdominal pain, fever, jaundice, etc.) and laboratory indicators (T - BIL, D - BIL, CRP, GGT and ALP, AST, ALT, etc.) after the treatment for biliary stricture to evaluate the prognosis including the single treatment effect, biliary stricture recurrence, showing up other biliary complications. Then we analyze the correlation between imaging findings of biliary AS on MRCP and its prognostic indicators.

Results In the 29 cases of MRCP examinations, 20 cases of single treatment were effective, 9 cases of single treatment was ineffective. Fisher's exact test was conducted on the correlation between the MRCP sign of biliary AS and the single treatment effect. The test results suggest that the single treatment effect of different stricture sites had statistical significance, P value < 0.05, and the single treatment effect of stricture site in the lower common biliary was poor. The difference in the therapeutic effect of different degrees of stricture was statistically significant, P < 0.05. The single treatment effect of mild to moderate stricture was better. There was no statistically significant difference in single treatment between different degrees of biliary dilation and abnormal signals inside or around the biliary lumen, and both with P value of > 0.05.

Conclusions This study preliminarily explored the correlation between some MRCP findings of biliary AS and the prognostic indicators. The single treatment effect of mild to moderate AS was better, and stenosis in the lower common bile duct was worse. MRCP findings has certain application value in evaluating prognosis of patients and guiding the clinical decision.

EPO-1913

Deep learning with Convolutional Neural Network for Predicting Fuhrman Grade of Clear Cell Renal Cell Carcinoma at MSCT

Xiao Li
Department of Medical Imaging, Jinling Hospital, School of Medicine, Nanjing University, Nanjing , China

Purpose: To investigate diagnostic performance by using a deep learning method with a convolutional neural network for the prediction of histologic grade in clear cell RCC at dynamic contrast agent-enhanced computed tomography.

Methods and Materials: In this institutional review board-approved clinical retrospective study from January 2013 to July 2018, patients with clear cell RCC were identified from the pathology database. There were 69 low grade ccRCC patients and 28 high grade ccRCC patients. The 97 cases comprised 72 males and 25 females with a mean age of 55.64 years (range 28-83 years). All patients were examined with a 320-slice dynamic volume CT by using same four phase renal protocol (unenhanced phase, corticomedullary phase, nephrographic phase and excretory phase). The first and second step of preprocess are in the same method with section one. A total number of 4936

segmented images (there were 390, 1499, 1547, and 1500 images for unenhanced phase, corticomedullary phase, nephrographic phase and excretory phase respectively) assign for 97patients were collected as the experiment data. The third step is to place all the images into the train folder containing two folders with two categories, category 0=negative (with all images of low grade ccRCCs) and category 1=positive (with all images of high grade ccRCCs). The CNN was composed of four convolutional layers, four maximum pooling layers, a flatten layer and three fully connected layers. The process used in building models was consistent with section one. The diagnostic performance of CNN models in differentiating grade of ccRCC were evaluated by using a receiver operating characteristic (ROC) analysis. The area under the receiver operating characteristic curve (AUC) for each model was calculated. The mean AUCs of six different models were compared by DeLong's test. A P value of less than 0.05 was considered to indicate a statistically significant difference.
Results: The mean AUC for distinguishing low-grade ccRCC and high-grade ccRCC inmodel unenhanced, model corticomedullar, model nephrographic, model excretory, model enhanced and model quadruple with the test data cohorts was 0.55 (95% CI: 0.49,0.61), 0.77 (95% CI: 0.74,0.79), 0.76 (95% CI: 0.74,0.79), 0.69 (95% CI: 0.66,0.72), 0.78 (95% CI: 0.76, 0.79), 0.75 (95% CI: 0.74, 0.77).
Conclusion: Our results show that maybe the CNN models except model unenhanced could be used to differentiate the Fuhrman grade of ccRCC at dynamic CT. This technique requires further validation on a larger scale prior to implementation into clinical practice.

自身免疫性胰腺炎假包膜征的 MRI 表现及诊断价值研究

王佳妮
首都医科大学附属北京友谊医院

目的：分析自身免疫性胰腺炎（AIP）假包膜征在不同 MR 脉冲序列的表现，探讨其诊断价值。
方法：回顾性分析北京友谊医院 2014 年 12 月-2019 年 2 月间收住院的 46 例 AIP 患者的临床及 MRI 影像资料。收纳标准：有完整的 MRI 影像学资料，经过血清学检查、病理检查及临床治疗随访观察确诊为 AIP，所有患者均有随访记录。排除标准：检查资料不全，未确诊以及中断随访的患者。最终共纳入符合诊断标准的 AIP 患者 46 例。其中男性 40 例，女性 6 例，平均年龄 58±7.4 岁。分析胰腺病变的 MRI 表现，观察胰腺周围是否出现“假包膜征“及其假包膜征在不同 MR 脉冲序列的表现。
结果：MRI 显示“假包膜征“39 例，占比为 84.8%。包膜部分覆盖胰腺 24 例，完全覆盖胰腺 15 例。包膜在双回波 T1WI 及 FSE T2WI 呈低信号，DWI（b=800）呈低信号，静脉注射钆对比剂后脂肪抑制 FSPGR T1WI 动态增强扫描呈渐进性强化，延迟期强化较明显。
结论：自身免疫性胰腺炎假包膜征的 MRI 表现有一定特征，认识不同 MR 脉冲序列上假包膜征的表现有助于提高 AIP 诊断水平。

前列腺 MR 集合序列重建高 b 值 DWI 图像临床价值

韩思圆
北京医院

目的：探究前列腺 MR 集合（MAGIC）序列用低 b 值 DWI 图像重建高 b 值 DWI 图像的临床应用价值。
材料与方法：56 例患者均采用（Siemens, MAGNETOM Prisma, 3.0T）行前列腺常规序列 MR 扫描及 MAGIC 序列 MR 扫描，以常规 DWI 图像与 MAGIC 序列以低 b 值重建的高 b 值 DWI 序列（MAGIC DWI）为研究对象，由两位由 2 年以上读片经验的影像科大夫分别就常规 DWI 与 MAGIC DWI 的图像质量进行评分，并分别读片，意见不同时由 5 年以上读片经验的上级大夫做最终评判。以常规 T2 图像为参照计算病灶检出率。采用 SPSS. Statistics. 25.0 行配对 t 检验，比较常规 DWI 与 MAGIC DWI 之间病灶检出率及信噪比（signal-noise ratio, SNR）是否存在统计学差异，行配对秩和检验比较常规 DWI 与 MAGIC DWI 之间图像质量评分是否存在统计学差异。
结果：前列腺常规 DWI 与 MAGIC DWI 的图像质量、病灶检出率及信噪比组间没有统计学差异。
结论：MAGIC 序列重建的高 b 值 DWI 与 DWI 图像质量、病灶检出率、及信噪比方面临床应用价值相当。

肝脏相位导航和膈肌导航在腹部自由呼吸 T2WI 压脂序列中 的对比研究

潘海燕,邓文明,韦素岚,龙莉,朱超凡,黄波,罗德红
中国医学科学院肿瘤医院深圳医院

目的:比较肝脏相位导航和膈肌导航技术应用在上腹部自由呼吸 T2WI 压脂序列的图像质量以及采集时间。
方法:使用 Siemens Avanto 1.5TMR 成像仪、Syngo 工作站和 16 通道体部相控阵线圈,对 20 例患者行上腹部 MR 检查运用相位导航技术和膈肌导航技术在腹部 T2WI 压脂序列扫描,记录两组图像的采集时间。计算并比较两组图像间同一层面包括：肝脏的右后叶（门静脉主干及其右分支层面），脾脏的中部以及胰尾部的 SNR 以及 CNR。由两名有丰富经验的高年资医生单独评价 2 组图像运动伪影,肝内外脉管显示的清晰度及图像的整体质量。呼吸运动伪影评价标准:1 分，无伪影/轻微伪影；2 分，中等伪影；3 分，严重伪影；肝内外脉管显示的清晰度的评价标准:1 分，清晰/轻微模糊；2 分，中等伪影；3 分，非常模糊；整体图像质量的评价标准:1 分，图像质量差；2 分，质量一般；3 分，质量较好；4 分，图像质量好。采用配对 t 检验比较 2 种图像的噪声、SNR、CNR；以 Kappa 检验评估 2 名医师不同评价的一致性，并计算 Kappa 值。（P＜0.05 为差异有统计学意义）
结果:(1)主观评价上，20 例患者的上腹部 T2WI 压脂图像中，应用相位导航技术肝内外脉管显示的清晰度更佳，解剖细节显示更清晰；两者图像运动伪影无统计学意义；应用膈肌导航技术和和相位导航技术的图像质量相当，差异无统计学意义。关于图像质量评价，两位观察者之间的一致性结果为优（Kappa=0.86，P＜0.05）。
比较三种导航回波技术采集时间,20 例患者扫描中相位导航技术平均采集时间为 4min10s；膈肌导航平均采集时间为 4min35s。
SNR 和 CNR 两组的比较：应用相位导航技术显示图像肝脏、胰腺、脾脏的 SNR 和 CNR 更高些。
结论:肝脏相位导航技术应用在上腹部自由呼吸 T2WI 压脂序列的图像 SNR 和 CNR 高，解剖细节显示更清晰，扫描时间较短，图像质量好。

EPO-1917
MRI 在早期宫颈癌局部浸润中的研究价值

庞慧婷,董越
辽宁省肿瘤医院

目的：探讨 MR 成像对早期宫颈癌深间质浸润、脉管癌栓（LVSI）等的术前评估价值。
方法：对 206 例早期宫颈癌患者术前行盆腔常规 MRI 和 DWI 扫描。在横轴位上测量各序列肿瘤最大径，在经肿瘤最大层面 ADC 图上测量 ADC 值。在 T2W 序列上评估宫颈癌的深间质浸润状态并与病理结果对比，并比较临床（年龄和绝经状态）及 MR 各参数对深间质浸润及 LVSI 的预测价值。采用卡方检验评价 MR 判断深间质浸润的准确度及手术方式对病理 LVSI 状态的影响。两组间比较应用独立样本 t 检验或秩和检验。采用 Logistics 多因素回归分析判别预测的独立影响因素，建立预测回归方程，应用受试者工作特征曲线（ROC）验证模型的诊断效能。
结果：（1）共 132 例患者存在深间质浸润。MR 上直接判断深间质浸润的准确度为 80.1%，敏感度为 98.5%，特异度为 47.3%，阳性预测值为 77.0%，阴性预测值为 94.6%；MR 深间质浸润状态与病理结果差异无统计学意义（$p>0.05$）。各 MR 参数及临床指标与病理上深间质浸润情况无显著关联（$p>0.05$）。回归分析将 DWI 序列肿瘤最大径、ADCmin、ADCmean、ADCmin/ ADCmean、MR 深间质浸润状态纳入模型；模型的 ROC 曲线下面积为 0.843，敏感度为 0.879，特异度为 0.689。（2）共 83 例患者存在 LVSI，手术方式对 LVSI 状态无显著影响（$p>0.05$）。LVSI 阳性组 MR 各序列所测肿瘤最大径大于 LVSI 阴性组（$p<0.001$），而病灶 ADC 值及各临床指标与 LVSI 状态无显著关联（$p<0.05$）。回归分析将增强 T1WI 及 DWI 序列上肿瘤最大径纳入模型；模型的 ROC 曲线下面积为 0.568，敏感度为 0.373，特异度为 0.764。（3）共 1 例患者存在宫旁浸润。
结论：MR 可对早期宫颈癌深间质浸润情况进行较准确的评估与预测；宫颈病灶越大，存在 LVSI 的机率越大。

EPO-1918

Advanced diffusion-weighted imaging with multiple parameters in differential diagnosis of prostate transitional zone carcinoma and benign prostatic hyperplasia

huipeng ren,Zhuanqin Ren,Qing Fan,Xiaohu Wang
Baoji Central Hospital

Objective: To evaluate the value of traditional DWI, incoherent motion magnetic resonance diffusion-weighted imaging (IVIM-DWI), tensile index DWI and DKI in the differential diagnosis of prostate transitional zone carcinoma and prostatic hyperplasia.
methods: 35 cases of prostate transitional carcinoma and 40 cases of benign prostatic hyperplasia were collected. MRI routine sequence, single index DWI, double index DWI, tensile index DWI and DKI scan were performed before operation. The apparent diffusion number (ADC), slow diffusion ADC value (ADC-slow), rapid diffusion ADC value (ADC-fast), perfusion score of tumor and hyperplastic nodules were measured respectively. The number (Ffast), diffusion distribution index (DDC), diffusion anisotropy (FA), mean diffusion coefficient (MD), axial diffusion coefficient (Da), radial diffusion coefficient (Dr), diffusion kurtosis anisotropy (FAK), average diffusion kurtosis (MK), axial diffusion kurtosis (A) and radial diffusion kurtosis (Kr) are used in two groups of parameter values of two alone. Samples were analyzed by T test, and ROC curve

values were drawn, and the diagnostic efficiency of each parameter was analyzed, and the diagnostic threshold was determined.

Results: the values of ADC, ADC-slow, DDC, alpha, Md, Da and Dr in the cancer group were lower than those in the hyperplastic group ($p<0.01$). The areas under the ROC curve were 0.912, 0.985, 0.991, 0.796, 1.445, 0.963 and 0.984 respectively,The diagnostic thresholds were 0.836×10-3mm2/s, 0.785×10-3mm2/s, 0.882×10-3mm2/s, 0.705, 1.36um2/ms, 1.65um2/ms and 1.16um2/ms. The FA, MK, Ka and Kr values in the cancer group were higher than those in the proliferative group ($p<0.01$), The areas under the ROC curve were 0.730, 0.995, 0.948 and 0.991 respectively, and the diagnostic thresholds were 0.193, 0.835, 0.824, 0.793 respectively. The diagnostic efficiency of ADC-slow, DDC, Md, Da, Dr, MK, Ka, Kr was high, and the sensitivity was 100%, 95%, 85%, 100%, 90%, 100%, 95%, 100% respectively. The specificity was 91.3%, 91.3%, 91.3%, 82.6%,95.7%,91.3%,82.6%, 91.3%, the ADC-fast,Ffast and FAK were unable to identify the prostate transitional zone cancer and hyperplasia..

Conclusion: ADC-slow, DDC, Md, Da, Dr, MK, Ka and Kr have great help in differentiating prostate cancer from hyperplasia. Multiparametric quantitative analysis of advanced diffusion weighted imaging can improve the accuracy of differentiating prostate transitional zone carcinoma from benign prostatic hyperplasia.

EPO-1919

DCE-MRI 纹理分析鉴别宫颈鳞癌与腺癌及预测分级的价值

谢元亮,杜丹,谢伟,王翔,江燕萍
武汉市中心医院

【摘要】目的：探讨基于动态增强 MRI（DCE-MRI）的影像组学特征鉴别宫颈鳞癌与腺癌及预测肿瘤分级的价值。**方法**：回顾性分析 2016 年 1 月－2018 年 6 月本院经手术病理证实且行子宫 DCE-MRI 的 39 例宫颈癌患者的临床和影像资料。分析宫颈癌的常规 MRI 表现，对 DCE-MRI 数据进行后处理，获得最大强化率（ME）和最大相对强化率（MRE）伪彩图，对病灶进行手动分割后[11] 提取一阶灰度直方图和二阶纹理特征的共 64 个特征参数值[12] 。比较鳞癌与腺癌纹理特征参数值的差异，分析肿瘤纹理特征参数值与病理分级和分化程度的相关性。采用 ROC 曲线分析有统计学差异的纹理特征对腺癌和高 FIGO 分期的预测价值。**结果**：64 个纹理参数中，基于 MRE 图提取的 13 个纹理特征参数和基于 ME 图提取的 1 个纹理特征在鳞癌与腺癌间的差异有统计学意义（$P<0.05$）。在 MRE 图提取的纹理特征参数中，3 个灰度区域大小矩阵（GLSZM）和 2 个灰度游程长度矩阵（GLRLM）特征[13] 参数与肿瘤的 FIGO 分级呈正相关（r=0.332～0.392，P=0.014～0.039[14] ）。多参数预测宫颈腺癌的 *AUC[15]* 为 0.830（95%CI：0.675～0.931），预测 FIGOⅡb～Ⅲa 宫颈癌的 AUC 为 0.737（95%CI：0.572～0.865），预测低分化肿瘤的 AUC 为 0.705（95%CI：0.537～0.840）。**结论**：基于 DCE-MRI 的纹理分析有助于在术前预测宫颈癌的组织病理学分型和 FIGO 分级，尤其是对腺癌与鳞癌的鉴别诊断有较大价

EPO-1920

钆贝葡胺肝胆期成像在肿块型胆管细胞癌和低分化肝细胞癌鉴别诊断中的应用价值

郑婉静

福建医科大学附属第一医院

目的：比较肝脏特异性对比剂钆贝葡胺在动态增强扫描及肝胆期图像特征，以了解莫迪司肝胆期成像在鉴别肿块型胆管细胞癌和低分化肝癌的临床价值。**方法：**回顾性分析经病理证实为 24 例肿块型胆管细胞癌和 44 例低分化肝细胞癌患者的临床资料，所有患者均已接受钆贝葡胺肝胆期扫描且影像资料完整，测量两组肝胆期 SNR 和 CNR。**结果：**肿块型胆管细胞癌和低分化肝癌在年龄、性别构成、肿块大小及形态的差异均无统计学意义，38 例（86.3%）低分化肝癌有慢性肝病病史，动态增强扫描两者均可表现为环形渐进性强化，在肝胆期图像上，16 例（66.4%）胆管细胞癌中央区域呈不均匀云絮样或均匀高信号，典型者呈“靶环”征，而 30 例（68.2%）低分化肝癌在肝胆期呈低信号，肝胆期 SNR 和 CNR 在两组差异有统计学意义；病灶出现强化包膜提示肝癌的可能性大，肝包膜皱缩、肝叶节段性或叶段萎缩及远端胆管扩张有助于诊断肿块型胆管细胞癌。**结论：**结合钆贝葡胺肝胆期成像特点，有助于鉴别肿块型胆管细胞癌和低分化肝细胞癌。

磁共振扩散加权成像对肝细胞癌化疗栓塞术后疗效的随访价值

李爽,吕维富
中国科学技术大学附属第一医院/安徽省立医院

目的　探讨磁共振扩散加权成像(DWI)对肝细胞癌(HCC)经导管肝动脉化疗栓塞术(TACE)术后疗效评估的应用价值。方法　选取安徽省某三甲医院 2014 年 1 月至 2016 年 12 月收治的经临床或病理检查确诊的 52 例 HCC 患者为研究对象，所有患者均经 1～3 次 TACE 治疗，并于 TACE 术前、术后 4～6 周行上腹部磁共振平扫及 DWI 检查，术后 4 个月行磁共振增强扫描，上述检查均在 1 周内完成。依据实体肿瘤疗效评估标准(mRECIST)，将病例分为稳定组和进展组，分析 TACE 术前、术后病灶的坏死、复发转移情况以及表观弥散系数(ADC)值；采用受试者工作特征曲线(ROC)确定鉴别稳定组和进展组的诊断效能以及 ADC 的最佳截断值。结果　52 例 HCC 患者术前共计检出 68 个病灶；参照 mRECIST 标准，评价为稳定的病例为 20 例，进展的为 32 例；术前病灶以稍长 T1 和 T2 信号为主，DWI 序列上呈高信号，ADC 图上呈低信号，TACE 术后，肿瘤坏死区呈等或稍长 T1、T2 信号，DWI 序列上呈等或稍低信号，进展组于 T1WI 和 T2WI 序列上信号表现多样，DWI 序列上呈不均性高信号；稳定组和进展组术前肿瘤病灶的 ADC 值差异无统计学意义(P=0.473)，稳定组术后 ADC 值较术前升高(P＜0.05)，其手术前后 ADC 的增加量高于进展组(P＜0.01)。ROC 分析提示：鉴别稳定组和进展组 ADC 的最佳截断值为 1.28×10-3　mm2/s，此时曲线下面积(AUC)为 0.773(P＜0.05)、灵敏度为 76.3%、特异度为 68.9%。结论　DWI 扫描能够及时、客观的评估 HCC 患者化疗栓塞术后疗效，具有较高的随访价值。

不同亚型腹膜后脂肪肉瘤 CT 和 MRI 表现及病理基础

张九龙,施楠楠,张屹俊,叶雯,王琳,单飞,施裕新
上海市公共卫生临床中心/复旦大学附属公共卫生临床中心

目的 探讨不同亚型腹膜后脂肪肉瘤（RLS）的 CT 和 MRI 影像学特征及其病理基础。
方法 回顾性分析经手术病理证实的 172 例 RLS 患者的影像和病理资料（包括组织成份、出血、坏死、钙化/骨化、纤维分割、包膜、脂中结节、强化特点及免疫组化），其中 97 例行 CT 平扫+增强检查，53 例行 MRI 平扫+增强检查。

结果 高分化型脂肪肉瘤（WDLS）81 例，去分化型脂肪肉瘤（DDLS）63 例，黏液型脂肪肉瘤（MLS）18 例，多形性脂肪肉瘤（PLS）10 例，89 例为原发肿瘤，83 例为继发肿瘤，40.7%（70/172）的患者合并肾积水，其中四组 WD/DDLS、MLS 及 PLS 的影像学特征：出血、坏死、钙化/骨化、纤维分割、脂中结节、远处转移及强化方式均匀有显著的统计学差异（P=0.000）；病理所见 MDLS 以成熟脂肪成份为主（>75%），DDLS 和 PLS 以低分化软组织成份为主，MLS 以粘液成份为主，其中四组免疫组化指标 MDM2（P=0.023）、CD34（P=0.000）和 S-100（P=0.000）具有显著统计学差异，而 CDK4、CD68、CK、HMB45、SMA 和 MyoD1 无统计学差异（P>0.05）；FNCLCC 肿瘤危险度评分显示四组肿瘤危险度具有显著统计学差异（P=0.000）。
结论：不同类型 RLS 的影像学表现和生物学行为具有显著特征，WDLS 以成熟脂肪、脂中结节和纤维分割样强化为特征，DDLS 和 PLS 生物危险度较高，常见腹膜和腹壁种植转移，DDLS 的钙化/骨化发生率较其他亚型高，MLS 中粘液成份可明显强化及肺转移等特点，掌握 RLS 的 CT 和 MRI 影像学表现和病理特征有助于临床诊断和鉴别诊断。

EPO-1923

The Differential Diagnostic Value of Intravoxel Incoherent Motion Diffusion-Weighted Imaging in Cervical Squamous Cell Carcinoma

Bin Shi[1],Li-xiang Zhang[2],Jiang-ning Dong[1],Fei Gao[1],Nai-yu Li[1],Chuan-bin Wang[1],Xin Fang[1],Pei-pei Wang[1]
1.The First Affiliated Hospital of USTC， Division of Life Sciences and Medicine， University of Science and Technology of China
2.The Third Affiliated Hospital of Xinxiang medical college

Objective. To explore the correlation between intravoxel incoherent motion diffusion-weighted imaging (IVIM-DWI) and pathological differentiation of cervical squamous cell carcinoma.
Methods. 87 patients with pathologically confirmed (poor differentiation group, 50; moderate differentiation group, 26; high differentiation group, 11) underwent IVIM-DWI examinations with 10 b values (b = 0, 10, 20, 50, 100, 200, 400, 800, 1200, 2000 s/mm^2) to calculate the ADC_{stand}, D, D* and f values. All parameters were analyzed by the steps of normality test, homogeneity test for variance, analysis of variance or nonparametric test, pearson or spearman correlation analysis. Finally, the receiver operating characteristic curve was extracted.
Results. First, the comparison of D, D*, f values for the different pathological differentiation reached statistically significant levels ($p<0.05$). The D and D* values were positively correlated with the pathological differentiation (r = 0.853, 0.880; $p<0.05$), while the correlation between f value and the pathological differentiation was negative (r = -0.730; $p<0.05$). In the diagnosis of poor differentiation group, the D value had the best diagnostic efficiency (cutoff value = 0.53*10^{-3}mm^2/s, AUC = 0.992); in the diagnosis of moderate differentiation group, the f value had the best diagnostic efficiency (cut-off value = 27.00%, AUC = 0.820); in the diagnosis of high differentiation group, the D value had the best diagnostic efficiency (cut-off value = 0.63*10^{-3}mm^2/s, AUC = 0.996).
Conclusion. The D, D* and f values of IVIM-DWI had the potential to evaluate the pathological differentiation of cervical squamous cell carcinoma.

Key Words. Intravoxel Incoherent Motion Diffusion-Weighted Imaging, Magnetic Resonance Imaging, Cervical Squamous Cell Carcinoma, pathological differentiation

非对比剂 IFIR 序列在腹部血管的临床应用

戴太亮,韦红星,黄新洪
天等县人民医院

目的：探讨非对比剂 IFIR 血管成像序列在腹部血管的临床应用价值。**材料与方法:**收集本院 20 例腹部平扫加增强扫描的正常患者（患者签署知情同意书）MRI 影像学资料,回顾性分析非对比剂 IFIR 序列扫描、增强腹部序列的腹部血管成像。采用美国 GE 公司超导型 1.5T BRIVO MR355 扫描仪，IFIR 扫描参数：TR4.5ms，TE 2.2ms，TI1200，FA70ms，序列视野 38cm×38cm，层厚层间距 2thk/0.9sp，Matrix=256×256,NEX=auto，采用呼吸导航扫描，将非对比剂 IFIR 和增强腹部序列分别进行血管后处理重建。图像效果评价：由 3 位有经验的放射科医师对非对比剂 IFIR 和增强腹部序列后处理血管成像进行双盲 3 分法评分。使用 SPSS22.0 统计学软件对所得资料进行分析处理。图像的血管成像效果评分、信噪比的比较采用配对 t 检验，以 $P<0.05$ 为差异有显著性意义。**结果：**经三位医师对比非对比剂 IFIR 和增强腹部序列图像血管的吻合性，发现在 1、2 级血管的显示上，两个序列的吻合性极高，两者对比的差异有统计学意义($P<0.05$)。**结论：**通过非对比剂 IFIR 序列能获得腹主动脉、门静脉、肝静脉及下腔静脉成像，避免由于不容易把握循环时间和造影剂浓度低等原因而导致显影不佳，有利于减少对比剂肾病，值得推广应用。

慢性胰腺炎患者胆总管病变的 MRCP 特征及其解剖基础研究

杜利娟[1,2],靳二虎[1],杨正汉[1],王振常[1],王山林[2]
1.首都医科大学附属北京友谊医院
2.北京密云区中医医院

目的：探讨慢性胰腺炎患者胆总管病变的 MRCP 特征与胆总管胰腺段解剖分型的关系。
方法：搜集符合入组标准的 98 例慢性胰腺炎患者的 MRCP 和 MRI 资料，在 MRCP 上观察每一例患者胆总管形态改变，并测量胆总管最大直径及胆总管狭窄段长度；在轴面 T2WI 上观察胆总管胰腺段与胰头病变的相对解剖关系并归纳分为无覆盖型、部分覆盖型、完全覆盖型。用卡方检验比较不同分型之间慢性胰腺炎患者胆总管形态改变发生率的差异，用 *Kruskal-Wallis* 检验比较不同分型之间慢性胰腺炎患者的胆总管扩张程度和胆总管狭窄长度的差异。
结果：本组 98 例慢性胰腺炎患者胆总管病变的 MRCP 表现为：胆总管扩张（41 例）、胆总管外形粗细不均（48 例），胆总管远端逐渐变细（46 例）。本组病例扩张胆总管的最大直径范围 8.6～15.9mm，平均值为（11.2±2.1）mm，胆总管狭窄段长度范围 4.4～19.5mm，平均值为（9.9±2.9）mm。将本组病例根据胆总管下段通过胰腺区域的方式分型，无覆盖型有 28 例（28.6%），部分覆盖型有 63 例（64.3%），完全覆盖型有 7 例（7.1%）。无覆盖型、部分覆盖型、完全覆盖型三组慢性胰腺炎患者的胆总管扩张程度及胆总管狭窄长度差异具有统计学意义（$P<0.05$），完全覆盖型慢性胰腺炎患者胆总管扩张最明显，胆总管狭窄段的长度最长。无覆盖型、部分覆盖型、完全覆盖型三组慢性胰腺炎患者胆总管外形粗细不均发生率的差异没有统计学意义（$P>0.05$）。

结论：慢性胰腺炎患者胆总管病变的 MRCP 表现与胆总管胰腺段解剖分型有一定关系，覆盖型（部分覆盖型、完全覆盖型）慢性胰腺炎患者胆总管扩张及胆总管远端逐渐变细的发生率高于无覆盖型，完全覆盖型慢性胰腺炎患者不仅发生胆总管狭窄及其上游胆管扩张的几率最高，而且病变程度最重。

EPO-1926
磁共振成像胰外炎症评分早期预测急性胰腺炎严重程度研究

周婷,张小明
川北医学院附属医院

目的：探讨磁共振成像（MRI）上胰腺外炎症 (EPIM) 对急性胰腺炎 (AP) 早期严重程度的预测价值。
目的和方法：本回顾性研究共纳入了 337 例 AP 患者，他们在发病后三天内接受了 MRI 检查。对所有纳入患者的 EPIM 评分、磁共振严重程度指数（MRSI）评分、急性生理和慢性健康评估（APACHE-II）、床旁 AP 严重程度指数（BISAP）以及血清超敏 C 反应蛋白（Hs-CRP）浓度进行评估和计算。其中 86 例 AP 患者进行了 CT 检查，他们的 CT 上胰腺外炎症（EPIC）评分也将被评估。采用受试者工作曲线 (ROC) 分析评估这些评分系统及实验室数据对严重 AP 和器官衰竭的预测价值。
结果：在 337 个 AP 患者中，55 (16.3%) 例有器官衰竭，其中 17 (5.0%) 例发展为持续性器官衰竭，诊断为重症 AP。EPIM 评分与 EPIC 评分有较强的正相关性(r= 0.794, P<0.001)，且 EPIM 评分与 APACHE-II、住院时间的相关性均高于 EPIC 评分。EPIM 评分预测重症 AP 和器官衰竭的准确性(AUC=0.844 和 0.817)与 APACHE-II(0.894 和 0.850)和 BISAP(0.866 和 0.818)预测的准确性无明显差异，且均高于 MRSI 预测的准确性(0.683 和 0.716)；在预测器官衰竭上也高于 hs-CRP(0.688)。短暂性和持续性器官衰竭患者之间的 EPIM 评分无统计学差异(P=0.163)。
结论：EPIM 评分比 EPIC 评分更有助于评估 AP 的严重程度，且 EPIM 评分可以早期提示潜在的重症 AP 和器官衰竭的发生。

EPO-1927
MRI 观察进展期浆液性卵巢癌肝脾受侵与 BRCA 基因突变型和预后的相关性研究

徐晓娟,陈雁
中国医学科学院肿瘤医院

目的：评价进展期浆液性卵巢癌伴有肝脏和脾脏受侵的 MRI 特点，并分析其与 BRCA 基因突变型和预后的相关性。
方法：本研究为回顾性研究，经医院伦理委员会审查并豁免患者知情同意。回顾性收集自 2012 年 1 月到 2015 年 12 月间于我院妇瘤科收治、经病理检查证实为浆液性卵巢癌、临床分期处于进展期（FIGO 临床 III 期和 IV 期）、并接受盆腔 MRI 平扫和增强检查的患者共计 121 例（平均年龄±标准差：58 岁±12.1，全距：36-72 岁）。MRI 检查主要序列包括 T2WI、DWI 和动态增强扫描。分析肝脏和脾脏受侵的类型、部位和影像学特点。所有患者的平均随访时间为 23 个月（随访时间范围为 6-33 个月）。采用单因素和多因素方差分析、COX 风险比例回归模型和 Kaplan-Meier 生存曲线来分析肝脾受侵的 MRI 特点与 BRCA 基因突变型和生存期之间的相关性。
结果：共有 35 例患者（28.93%）出现肝脏受侵，其中 30 例为肝脏表面腹膜侵犯伴有 8 例被膜下肝实质侵犯，有 5 例为肝实质血行转移；共有 33 例患者（27.27%）出现脾脏受侵，其中 31 例为脾脏

表面腹膜侵犯伴有 4 例被膜下脾实质侵犯，有 2 例为脾实质血行转移。不同肝脾受侵类型与 BRCA 基因型（非致病突变型和致病突变型）之间无显著关联性（P=0.18）；患者年龄、CA125、组织分化程度与肝脾受侵的类型有关（P=0.01）；肝脾的单纯被膜侵犯和被膜下伴有实质侵犯两者的总生存期无显著性差异（中位数，21 个月，P=0.6）；肝脾血行转移的总生存期明显短于单纯被膜侵犯和被膜下实质侵犯（中位数，12 个月，P=0.006）。

结论：进展期浆液性卵巢癌肝脾血行转移患者的总生存期明显小于单纯被膜侵犯和被膜下实质侵犯，MRI 观察肝脾实质转移较有优势；被膜下是否伴有实质侵犯并不影响总生存期，在影像鉴别困难时可暂不做分类。不同肝脾受侵类型与 BRCA 基因型之间无显著关联性。

Value of Normalized Apparent Diffusion Coefficients in Differentiating Between Borderline and Malignant Epithelial Ovarian Tumors

Jing Lu[1], Shan Pi[1], Fenghua Ma[2], Shuhui Zhao[3], Haiming Li[1], Jinwei Qiang[1]
1. Jinshan Hospital Fudan University
2. Obstetrics and Gynecology Hospital Fudan University
3. Xinhua Hospital, Medical College of Shanghai Jiao Tong University

Purpose: To compare the diagnostic performance of normalized apparent diffusion coefficients (nADCs) of different references with that of ADCs at different *b* factors in differentiating borderline epithelial ovarian tumors (BEOTs) from malignant epithelial ovarian tumors (MEOTs).

Method: This retrospective study included 53 BEOTs and 148 MEOTs. Conventional magnetic resonance and diffusion-weighted imaging with *b* factors of 800 and 1000 s/mm^2 were performed. ADC was measured three times at solid components of tumors, gluteus maximus muscle (GMM), iliopsoas muscle (IM) and urine and then averaged. ADC_{tumor}, nADCs were then obtained. Differences and the diagnostic performance of ADC_{tumor} and nADCs between BEOTs and MEOTs with different *b* factors were compared.

Results: ADC_{tumor}, nADCs regardless of *b* factors were significantly higher in BEOTs than MEOTs. The diagnostic performance of $nADC_{urine}$ regardless of *b* factors was significantly larger than that of $nADC_{GMM}$ and $nADC_{IM}$. There was no significant difference in the diagnostic performance between ADC_{tumor} and $nADC_{urine}$ regardless of *b* factors. A significantly lower ADC_{tumor} and a larger diagnostic performance for ADC_{tumor} was found with a *b* factor of 1000 s/mm^2 than 800 s/mm^2. There were no significant differences in $nADC_{urine}$ of BEOTs or MEOTs or in the diagnostic performance of $nADC_{urine}$ with *b* factors between 800 and 1000 s/mm^2.

Conclusions: ADC_{tumor} and nADCs were both capable of differentiating BEOTs from MEOTs. $nADC_{urine}$ was the best of all nADCs and was superior to ADC_{tumor} because of its stable performance in differentiating BEOTs from MEOTs, regardless of *b* factors.

Effect evaluation of magnetic resonance R2* combined with t1-mapping on liver iron overload deironing in patients with blood transfusion

Huimin Lu
Anqing city hospital

Objective：this study used magnetic resonance R2* and T1-mapping technology to quantitatively analyze liver iron overload, quantitatively analyze liver iron overload of patients with long-term repeated blood transfusion, and quantitatively analyze the degree of liver iron deposition before, after and during iron removal therapy.**Methods** ：the experimental group included 40 patients with liver iron overload due to long-term blood transfusion.Patients were divided into two groups of 20, one group was treated with ferritin alone, and the other group was treated with ferritin combined with ferritin. The correlation between R2* value and T1-mapping before and after treatment and serum ferritin concentration and transferrin saturation was explored to evaluate the iron overload clearance effect of the two treatment schemes.**Results**： the correlation coefficients of liver R2* value and SF and ASF R2 in 40 patients with iron overload were 0.678 and 0.647, respectively, which were statistically significant (P < 0.05).The correlation coefficients of T1 SF and ASF r in liver were -0.625 and -0.639, respectively, with statistical significance (P < 0.05).There were differences in R2* and T1 values between the two treatment groups before and after iron removal.**Conclusion**： the combination of R2* and T1-mapping can detect liver iron overload with higher accuracy, with a high consistency with serum ferritin, and can effectively evaluate the degree of liver iron overload before and after treatment with iron removal.The therapeutic effect of deferrine combined with deferrine on liver iron overload was significantly higher than that of deferrine alone.

IVIM DWI 评估糖尿病肾病的初步临床应用

梁龙,李国旻,刘梦晨,吴筠凡,江桂华
广东省第二人民医院

目的 GFR（肾小球滤过率）可反应肾脏损伤，但通常需要侵入性方法测量并受许多因素干扰。IVIM DWI（体素不相干运动扩散加权图像）是一种非侵入性成像技术，能够根据 D，D *和 f 值评估肾功能。本研究旨在探讨 IVIM DWI 评估 DN（糖尿病肾病）肾损伤的可行性。
方法
糖尿病肾病组招募 46 名患者。根据 eGFR（估计肾小球滤过率），将患者分为三组：早期 18 例;中期 15 例;末期 13 例。对照组招募了 17 名健康志愿者，IVIM DWI 采用飞利浦 3.0-T MR 扫描仪，并使用 10 个 b 值。FOV32cm，层厚 3.0mm，间距 0.6mm，TR3,000ms，TE60.3ms，矩阵 96×96，NEX = 8。扫描时间 2 分 06 秒。测量 ADC，D，D *和 f 值。选择右肾皮髓质定位感兴趣区（ROI）。
结果
结果显示，在早期 DN 组中，皮髓质中的 ADC 值低于对照组（P <0.05），与对照组相比，皮髓质中的 D 值降低（P <0.05）。在中期 DN 组，皮髓质中的 ADC 值和皮髓质中的 D 值低于早期 DN 组（P <0.05）。在末期 DN 组，皮髓质中的 ADC 值皮髓质中的 D 值低于（P <0.05）中期 DN 组；三组 D 值

始终低于 ADC 值（P <0.05），ADC 值和皮质 D 值均高于髓质组（P <0.05）。在早期 DN 组中，皮髓质中的 D *值低于对照组（P <0.05），皮髓质中的 f 值高于对照组（P <0.05）。在中期 DN 组，皮髓质中的 D *值和皮髓质中的 f 值低于早期 DN 组（P <0.05）。在末期 DN 组，皮髓质中的 D *值、f 值与中期 DN 组相比明显降低（P <0.05）；在三组中，皮质中的 D *值总是低于髓质（P <0.05）。

结论

本研究表明，IVIM DWI 可以无创并有效地显示糖尿病肾病肾功能的动态变化过程，反映了糖尿病肾病病理变化的微观机制。对糖尿病肾病肾功能进行评估，为临床诊断和治疗提供参考，因此，IVIM DWI 显示出临床应用的潜在价值。

EPO-1931

Preliminary Application of Incoherent Motion Diffusion Weighted Imaging (IVIM) in Normal People

qian tian,Xirong Zhang,Jing Chen,Nan Yu,Taiping He
Affiliated Hospital of Shaanxi University of Traditional Chinese Medicine

Objective: Evaluate the correlation between different parameters of IVIM and baseline data in normal people.

Methods:35 healthy volunteers with nothing renal disease were included in the study.The gender, age, BMI(Body Mass Index), WHR((Waist-to-Hip Ratio), family history of diabetes and hypertension of all subjects were recorded. MRI examinations were performed with a 3.0T MRI system (MAGNETOM Skyra; Siemens Healthcare,Germany) equipped with an 18-channel body phased-array surface coil.The IVIM(b=0,50,100,150,200,400,600,800sec/mm²) and Diffusion weighted imaging(DWI,b=50,800 sec/mm²) sequence were obtained . A total of 12 regions of interest were drawn for each subject in the cortex and medulla region of the upper pole, the renal hilum and the lower pole of the kidneys.The average value of all results is taken to ensure consistency of measurement results.ADC map was automatically generated on the Siemens MRWP workstation after DWI sequence executed. IVIM parameters(ADC,D,f and D* values) were generated by using a prototype software body diffusion toolbox(Siemens healthineers). The Pearson correlation analysis was performed to determine the relationship between between the age, BMI, WHR and blood pressure with different parameters of IVIM. A two-sample t-test was used to compare the difference in ADC,D, f, and D* values between gender and family family history.

Results: In healthy volunteers kidneys with nothing renal disease , the ADC, D values of the cortex and medulla were decreased with age and BMI, D values of the cortex were decreased with WHR,with statistical significance (p<0.05) (Figure 1).The ADC value of no family history of hypertension was higher than that with hypertension, , with statistical significance (p<0.05) (Figure 2).

Conclusion: IVIM is feasible in the examination of healthy volunteers kidneys. IVIM can supply useful information for kidney,especially the ADC, D values.

Clinical significance: IVIM can reflect changes in microstructure and provide a more scientific basis for clinical changes in the kidney.This is a preliminary study of the basic assessment of IVIM in kidney disease.

3.0T 磁共振 PC 法评价健康青年志愿者门静脉血流的可行性

陈丽华,刘爱连,宋清伟,李烨,陈安良
大连医科大学附属第一医院

目的 探讨 3.0T 磁共振相位对比（Phase-contrast，PC）法测量并评估健康自愿者门脉血流的可行性。
方法 招募年轻健康自愿者 14 名，男性 7 名，女性 7 名。所有自愿者均应用 3.0T MR 行肝脏 T_2WI 及 PC 扫描。每名志愿者扫描两次，两次间隔一周。利用流速分析软件分析门脉血流量（AF）及血流速度（PPV）。采用组内相关系数（ICC）检验两次扫描及测量数据的一致性。应用两独立样本 t 检验，比较性别对 AF、PPV 值的影响；采用单因素方差分析，检验不同编码流速对 AF、PPV 值的影响。P< 0.05 认为差异有统计学意义。
结果 两次不同流速编码门脉 AF、PPV 测量值一致性良好，ICC 值均大于 0.75；编码流速为 30cm/s 时一致性最好，此时男性门脉 AF、PPV 值（10.07±3.01 ml/beat, 20.72±3.33cm/s）均高于女性（5.38±1.04 ml/beat, 17.07±2.38 cm/s），差异有统计学意义（P< 0.05）。不同编码流速间 AF、PPV 值差异无统计学意义。
结论 3.0T 磁共振 PC 法测量门脉血流值结果稳定，健康青年志愿者男性门脉 AF、PPV 值均高于女性；不同编码流速对 AF、PPV 值无影响。

Comparison of diagnostic imaging modality including Gadoxetic Acid-Enhaned MRI,Contrast-Enhanced CT and Contrast-Enhanced Ultrasound for the detection of liver metastases.

Ruijia Hua,Jinyuan Liao
The First Affiliated Hospital of Guangxi Medical University

Purpose: To compare the diagnostic performance of Gadoxetic acid enhanced MRI(Gd-EOB-DTPA) , Contrast Enhanced Computed Tomography(CECT) and Contrast Enhanced Ultrasonography(CEUS) for the detection the of Liver metastases.
Material and Method: Retrospective study carried out from January 2014 to June 2019 ,included 60 patients who were pathologically and clinically diagnosed as the Liver metastases.Lesions detected by EOB-MRI, CECT and CEUS were interpreted. Patients with recent hepatic surgery, diffuse hepatic metastases and recent undergone chemotherapy treatment were excluded. Sensitivity were calculated and compared.
Results: Total 153 lesions were detected by EOB- MRI, which was significantly higher than other modality, 77 lesions by CECT and 51 lesions by CEUS . Sensitivity of Gadoxetic acid enhanced MRI, CECT and CEUS were 100%,74.4% and 80% respectively.EOB-MRI has higher significant difference than CECT and CEUS($p<0.05$) .CECT and CEUS have no significant difference ($P>0.05$).
*Conclusion:*EOB-MRI was significantly performed better than other diagnostic modality, It was also better to diagnose lesion <1cm.It should be the first choice of diagnosis modality for the suspected case of Liver metastases.

DCE-MRI 联合 DKI 对前列腺影像报告和数据系统指南（PI-RADS）评分中 3 分良、恶性病变诊断的初步探索及与其 KI-67 表达水平关系

李俊杰
山西医科大学第一医院

目的：探讨磁共振动态增强成像（DCE-MRI）联合扩散峰度成像（DKI）对前列腺影像报告和数据系统指南（PI-RADS）评分中 3 分良、恶性病变诊断的初步探索及与其 KI-67 表达水平关系。
方法：由两名高年资影像诊断医师采用盲法阅片，基于 PI-RADS 评分 3 分共计 45 例，术前均未经过任何放化疗，经病理证实的有 30 例，30 例患者均有行术前 DCE-MRI、DKI 检查，并测定动态增强参数（时间-信号曲线 TIC 及其参数增强峰值到达时间 T_{peak}、最大流入曲线率 K_1、最大增强线性斜率 S_{max}）、DKI 参数（平均扩散峰度 MK 值），将这些参数与病理结果进行统计分析，采用 ROC 曲线用于识别最佳参数。使用 spearman 相关分析来评估 KI-67 表达水平与每个参数的相关性。
结果：前列腺癌 PI-RADS 评分 3 分中恶性病变 S_{max}、MK 值均高于良性病变（S_{max}：2.02±0.8，P＜0.05；MK 值：0.87±0.23，P＜0.05）；S_{max}联合 MK 值时，诊断效能优于各自诊断价值，AUC 为 0.91。MK 值与前列腺癌中 KI-67 的表达水平具有统计学意义（P＜0.05）。

结论：磁共振动态增强成像（DCE-MRI）联合扩散峰度成像（DKI）可以提供一种准确诊断前列腺影像报告和数据系统指南（PI-RADS）评分中 3 分良、恶性病变的方法，并且 MK 值似乎与前列腺癌中 KI-67 的表达水平具有一定相关性。

直肠癌患者经肛门注入耦合剂行磁共振扫描 的图像质量分析

彭新壹
四川省乐山市乐山人民医院

目的：探讨直肠癌患者行 MR 扫描的最佳方法，且用常规法与注入耦合剂法的图像质量对比。方法：收取我院 2018 年 3 月-2019 年 5 月 78 例患者（内镜确诊为直肠癌），分为常规组 39 人实验组 39 人，常规组正常灌肠排空肠道，进行扫描。实验组灌肠排空肠道后注入 280ml 超声耦合剂进行扫描。结果：常规法患者肠腔内空气与自由水干扰较大，尤其 DWI 序列高 B 值时有部分空气干扰和水干扰伪影，，观察肿瘤位置显示不佳，图像质量优秀率为 84.3%，观察肿瘤外周切缘与 T 分期图像优秀率 95.6%。注入耦合剂患者肠腔充盈后肿瘤位置清晰，DWI 序列减小了伪影干扰图像优秀率为 94.8%，外周切缘与 T 分期图像优秀率为 94.3%（P<0.001）。结论：注入超声耦合剂可以在高 B 值 DWI 序列内减小伪影，但是由于注入耦合剂扩大了肠腔观察外周切缘与 T 分期要比未注入耦合剂的图像优秀率稍低。

Diagnostic value of quantitative analysis of ADC value and DCE-MR parameters for prostate cancer with seminal vesicle invasion

Zhaojun Zeng
Renmin Hospital of Shiyan, Hubei University of Medicine

【Abstract】 **Objective** To investigate the diagnostic value of quantitative analysis of ADC value and parameters of dynamic contrast-enhanced MR(DCE-MR) for prostate cancer (Pca)with seminal vesicle invasion(Svi). **Methods** The collected case datas were divided into five groups according to the surgical pathology: Pca with Svi group (Pca+Svi), Pca with normal seminal vesicle group (Pca), Pca with seminal cystitis group (Pca+Sc), benign prostatic hyperplasia (BPH) with seminal cystitis group (BPH+Sc), BPH with normal sminal vesicle group (BPH). The preoperative MR images of the five groups of patients were retrospectively analyzed, and the values of ADC ,K^{trans}, K_{ep}, and V_e of the five groups were quantitatively measured. **Results** ① In the Pca+Svi group, the signal of the seminal vesicles on T2WI was decreased, and the signal on DWI was significantly increased. The Pca+Sc group and BPH+Sc were similar to the Pca+Svi group. There was no abnormality in the seminal vesicles in the Pca group and the BPH group. ② The value of ADC in the Pca+Svi group was significantly lower than that of the other four groups ,The values of K^{trans} and Kep were significantly higher than the other four groups, and

the difference was statistically significant. ③There was no satatistical significance in values of ADC , K^{trans} and Kep between Pca+Sc group and BPH+Sc group. There was no satatistical significance in values of ADC , K^{trans} and Kep between PCa group and BPH group. ④ The difference of Ve values in the four groups were not statistically significant. . **Conclusion** Quantitative analysis of ADC values and DCE-MR parameters may contribute to the diagnosis of Pca with Svi.

Evaluation of hepatic fibrosis in chronic hepatitis B with parameters obtained from multi-models of diffusion-weighted MR imaging

Fangfang Fu,Xiaodong Li ,Cuiyun Chen,Dapeng Shi,Shaocheng Zhu,Meiyun Wang
People′s Hospital of Henan Province

Objective To quantitatively compare the value of various diffusion parameters obtained from monoexponential, biexponential and stretched exponential diffusion-weighted imaging models in assessing hepatic fibrosis in patients with CHB.
Methods: 52 patients with CHB had undergone prospectively muti-b values DWI on a 3.0T magnetic resonance imaging (MRI) unit. ADCst was calculated by using the monoexponential model. Dt, Dp, and f were calculated by using the biexponential model. DDC and α were calculated by using the stretched exponential model. The Kruskal-Wallis test was employed for the comparison of each parameter among the fibrosis stage groups. The Mann-Whitney U test was adopted to compare each parameter between fibrosis stage≤S1and≥S2, between fibrosis stage≤S2 and≥S3. Spearman rank correlation coefficients were obtained to assess the correlation of all the parameters with the fibrosis stages. ROC analysis was used to evaluate the performance of various diffusion parameters in predicting the presence of the fibrosis stage≥S2 and ≥S3.
Results:
The ADCst, Dt, f and ADCst all showed a negative correlation with the fibrosis stages, and the correlation of Dt value was the best (r=-0.630, P<0.001) , followed by DDC (-0.603, *P*<0.001), ADCst (r=-0.464, *P*<0.001), f (r=-0.464, *P*<0.05). The ADCst, Dt, f and DDC values all showed significantly different between fibrosis stage≥S2 and ≤S1,between fibrosis stage≥S3and≤S2 (all *P*<0.05). Dt had the highest AUC(0.835) in detecting fibrosis stage≥S2, followed by DDC(0.831), ADCst(0.738), f(0.740). And Dt also had the highest AUC(0.811) in detecting fibrosis stage≥S3, followed by DDC (0.798), ADCst (0.716), f (0.672).
Conclusion: The Dt value derived from biexponential and DDC value derived from stretched exponential of DWI could be helpful for the staging of hepatic fibrosis in chronic hepatitis B patients.
Keywords: magnetic resonance imaging; hepatic fibrosis; intravoxel incoherent motion; stretched exponential

Evaluation of the changes of blood supply pattern in Hepatocellular Carcinoma for mice by Dynamic Contrast-Enhanced MR Perfusion Weighted Imaging

Rong Cao[1], Ruokun Li[2], Jinwei Qiang[1], Ying Li[1], Luna Wang[1]
1. Jinshan Hospital, Fudan University
2. Ruijin Hospital, Shanghai Jiaotong University of School of Medicine

Objective To investigate the value of dynamic contrast-enhanced MR perfusion weighted imaging (DCE-PWI) for evaluation of the changes of blood supply pattern in hepatocellular carcinoma for mice.
Materials and methods Ten MHCC97-H tumor bearing mice were scanned DCE-PWI at 2nd, 3rd, 4th and 5th weeks after inoculation. The perfusion parameters, including volume transfer constant (Ktrans), rate constant (Kep), fractional volume of extravascular extracellular space (Ve), initial areas under the curve (IAUC) and pattens of time signal-intensity curve (TIC) were derived using postprocessing software. The perfusion parameters and patterns of TIC at different time points were compared and correlated with microvessel parameters.
Result Three TIC patterns were identified as follows: (I) rising (10/23, 43.5%); (II) plateau (4/23, 17.4%); (III) washout (9/23,39.1%). The Ktrans value at the 3rd week was significantly lower than that at the 5th week [0.077±0.006(min^{-1}) vs 0.141±0.053(min^{-1}), P=0.000], and significantly higher than that at the 4th week [0.105±0.006(min^{-1}) vs 0.141±0.053($min^{-1)}$, P=0.031]. The Kep value at the 3rd week was significantly higher than that at the 4th week [0.325±0.023 (min^{-1}) vs 0.174±0.008 (min^{-1}), P=0.048]. The Ve value at the 3rd week was significantly lower than that at the 4th week [0.416±0.027 vs 0.640±0.011, P=0.001], and significantly higher at the 5th week [0.416± 0.027 vs 0.633±0.009, P=0.005]. The IAUC value at the 2nd week was significantly higher than that at the 3th week [7.136±0.614 (mmol·min/L) vs 4.039±0.446 (mmol·min/L), P=0.018], and significantly higher at the 5th week [4.039±0.446 (mmol/min/L) vs 9.540±0.449 (mmol·min/L), P<0.001], and from the 4th week to the 5th week [5.025 ± 0.271 (mmol·min/L) vs 9.540 ± 0.449 (mmol·min/L), P=0.012]. The Ktrans was positively correlated with the microvascular density (MVD) in the overall sample (r=0.338, P=0.029)
Conclusion The quantitative parameter Ktrans of DCE-PWI was a useful tool to evaluate the changes of blood supply pattern in hepatocellular carcinoma in mice at the level pf microcirculation

EPO-1940
门静脉非对比增强磁共振血管成像的可行性研究

吴吟晨,曹代荣
福建医科大学附属第一医院

目的：

联合时间空间标记反转脉冲（Time-SLIP）技术和真稳态自由进动（true-SSFP）序列，探讨健康志愿者非对比增强磁共振门静脉成像（NCE-MRP）的可行性及最佳的黑血反转恢复时间（BBTI）参数。

材料与方法：

本研究纳入 36 名健康志愿者，男性 15 例，女性 21 例，使用 1.5T 磁共振设备采用 Time-SLIP 技术结合 true-SSFP 序列，获得原始图像，进行减影后得到门静脉非对比增强血管图像。BBTI 值均设置 700ms、900ms、1100ms 及 1300ms 共 4 组进行扫描，对原始图像及减影图像根据门静脉系统显示分支级数、图像质量评分、减影图像血管信号强度、血管-肝脏相对信号强度（vessel-to-liver ratio, VLR）进行评估。使用 Kruskal-Wallis 检验比较不同 BBTI 值设定下门静脉系统分支显示级数的差异。使用 One-way ANOVA 分析和 SNK 检验比较肝实质、门静脉系统信号强度及 VLR 在不同 BBTI 值设定下的差异。

结果：

36 例志愿者门静脉系统显现至 5 级分支 8 例（22.22%），至 6 级分支 18 例（50%），至 7 级及以上分支 10 例（27.78%）。BBTI 值为 1100ms 时显示 5 级以上血管分支及图像质量评分达 4 分的例数均较其他值明显增多。门静脉主干、左支、肝 4 段（3 级 P4）、肝 8 段（3 级 P8）门静脉分支信号强度在 BBTI 值为 1100ms 时明显高于其他值（$P<0.05$）。门静脉主干、左支、3 级 P4 分支及 3 级 P8 分支 VLR 在 BBTI 值为 900ms、700ms、1100ms 及 1300ms 时依次递减。

结论：

通过 Time-SLIP 技术结合 true-SSFP 序列获得原始图像，最终减影获得的门静脉非对比增强磁共振血管成像在显示血管结构、图像质量等方面均是可行的，并且在 BBTI 值等于 1100ms 时能获得最优秀清晰的磁共振门静脉系统血管图像。

高场开放式磁共振自由手透视技术引导肝顶部结节穿刺活检术

李成利,何祥萌
山东省医学影像学研究所

目的：分析及评估 1.0T 高场开放式磁共振自由手透视技术引导穿刺肝顶部结节的准确性、安全性及有效性。**方法**：选取 57 例肝顶部占位患者，病灶最大直径范围为 6-38mm，采用 MR 引导自由手透视技术行病灶穿刺活检。与外科手术病理诊断或临床和影像学随访至少 12 个月的诊断进行对比，计算穿刺活检诊断的准确性、特异性、敏感性和平均手术时间。同时，根据结节最大直径分为两组：≤1.5cm 组（n=21）和＞1.5cm 组（n=36），两组之间采用卡方检验行相关参数对比。**结果**：57 例患者穿刺成功率达到 100%，且均取得了足量的病理组织。MR 引导经皮穿刺肝顶病变诊断疾病性质的准确性、敏感性和特异度分别为 98.2%、97.9%、100%。≤1.5cm 病灶的准确性、敏感性、特异性分别为 95.2%、93.8%、100%。＞1.5cm 病灶的准确性、敏感性、特异性分别是 100%、100%、100%。两组之间没有明显的统计学差异（P＞0.05）。穿刺针通过皮肤到病变的平局时间为 1.1min，穿刺手术平均时间为 27.7min。穿刺过程中无严重并发症的发生。**结论**：1.0T 高场开放式 MR 自由手透视技术引导穿刺肝顶部病灶是一种准确、安全及有效的技术。

初探压缩感知技术（CS）对于 3D mDIXON Quant 肝脏脂肪定量中的应用

王学东,刘爱连,张钦和

大连医科大学附属第一医院

目的 初探压缩感知技术（CS）对于 3D mDIXON Quant 肝脏脂肪定量中的应用。**方法** 前瞻性收集利用飞利浦 3.0 T MR scanner（Ingenia CX, Philips Healthcare, the Netherlands）扫描的 10 名志愿者，男 8 例，女 2 例，年龄 24.8±1.62 岁。扫描序列包括常规 SENSE 和 CS（加速因子分别为 2、4、5、6）的 3D mDIXON Quant。扫描后将数据传到工作站通过软件进行分析，由两名影像科诊断医师分别在志愿者肝门水平的左外叶、左内叶、右前叶和右后叶各放置一个圆形的 ROI(大小 300mm^2，尽量避开肝内血管和胆管)，ROI 的放置确保在 SENSE 序列和 CS 序列的不同加速倍数下在相同的位置和相同的大小（图 1），分别记录每个 ROI 对应的 Mean 值和每个序列的扫描时间。采用组内相关系数（ICC）检验两位观察者测量结果的一致性，取两名观察者的平均值进行统计学分析，取四个叶段 Mean 值的平均值进行统计学处理，采用 Mann-Whitney 秩和检验比较 SENSE 组分别和不同加速倍数下的 CS 组 Mean 值之间的差异,统计结果采用中位数±四分位间距表示。**结果** 两位观察者测量各组数据的一致性较好（ICC 值为 0.988-0.994），Mean 值在 SENSE 技术下和 CS 在不同加速倍数下（2、4、5、6）均无统计学差异（P>0.05），扫描时间分别为 13.01s，15.02s，7.69s，6.18s，5.1s。**结论** CS 技术在不影响肝脏脂肪定量分析的情况下，可以明显缩短扫描的时间，其中 CS 在加速因子为 6 时，扫描时间最短，且数据的稳定性较好。

EPO-1943
磁共振同时多层（SMS）技术在肾脏扩散加权成像中的可行性研究

汪飞,朱娟
安庆市立医院

目的：探讨应用磁共振同时多层（Simultaneous Multi-slice, SMS）加速技术对肾脏扩散加权成像（DWI）图像质量进行系统分析。
材料和方法：前瞻性收集接受双肾磁共振扫描的 60 名患者。采用西门子 Skyra 3.0T MRI 扫描仪。三套 DWI 扫描协议分别为：A、平面回波 DWI（EPI-DWI）：FOV 400mm×318mm、TR/TE 5700ms/93ms、层数 24、分辨率 1.1×1.1×6、b 值为 50s/mm^{2}及 1000 s/mm^2，扫描时间为 2min47s；B、C（SMS-DWI）：除 TR 时间外其他参数与 A 协议完全一致，B、C 协议的 TR 为 2900ms、2000ms，层数加速因子为 2（AF2）、3（AF3），扫描时间为 1min25s、54s。图像质量评估：以 A 协议为参考标准，（1）主观评价：应用 5 点量表法对三组图像质量进行分级评估；（2）客观评价包括信噪比（SNR）及 ADC 值对比。图像质量分级的差异采用秩和检验比较；采用配对 t 检验比较 A 和 B、A 和 C 图像 SNR、ADC 值的差异。
结果：与 A 协议相比，C 协议图像质量明显降低，分级差异具有统计学意义（p=0.002），B 协议表现出稳定的图像质量，组间图像质量分级差异无统计学意义（p=0.325）。B 协议与 A 协议具有相似的 SNR，差异无统计学意义（p=0.162），C（AF3）SNR 明显低于 A 标准协议，差异具有统计学意义（p<0.05）。B、C 与 A 协议肾皮质、肾髓质 ADC 值比较，差异均无统计学意义（p=0.17 、p=0.85）。
结论：在显著减少扫描时间且不会对图像 SNR、ADC 值定量产生影响的情况下，使用 SMS-DWI（AF2）扫描协议能取得很好的临床应用效果；SMS-DWI（AF3）图像 SNR 明显下降，无法满足临床诊断需求。因此，SMS 作为一种新的磁共振加速技术，在肾脏 DWI 中具有良好的应用前景。

Gadolinium retention in mother and pup mice after administrations of gadolinium contrast in a rat model: effect of pregnancy and type of gadolinium- based contrast agents

Xiang Yao,Ke Ren
The Xiang'an Hospital of Xia Men Uneversity

Objectives: To investigate the effect of pregnancy and type of gadolinium (Gd)-based contrast agents (GBCAs) on organ retention of Gd in mother and pup mice after maternal administration.
Materials and methods: Gd-DTPA-BMA (gadodiamide) or Gd-DOTA (gadoterate dimeglumine) was administered (2.0 mmol/kg of maternal weight) four times to pregnant Balb/c mice from gestational day 16–19, respectively. At 28 days after birth, they were euthanized and their organs (blood, brain, liver, kidney, spleen, and bone) were removed for the measurement of Gd by inductively coupled plasma mass spectrometry.
Results: Gd retention in maternal organs was generally lower than that in the organs of non-pregnant mice in both Gd-DTPA-BMA and Gd-DOTA groups. Significantly higher Gd retention was observed in the organs of pups whose mothers were administered Gd-DTPA-BMA as compared to those whose mothers were administered Gd-DOTA. Tissue-to-muscle ratio in the brains of pups was higher than that of mothers.
Conclusions: We demonstrated in utero transplacental Gd retention in pups. In various organs in both mothers and pups, Gd retention was consistently higher for Gd-DTPA-BMA than Gd-DOTA administration. Pregnancy affected Gd retention in many maternal organs.

EPO-1945
局部晚期直肠癌新辅助放化疗后早期扩散加权成像参数值对疗效的预测

王铮
广西医科大学附属肿瘤医院

目的 探讨局部晚期直肠癌新辅助放化疗（NCRT）后早期 DWI 参数的变化值对 NCRT 最终疗效预测价值。**方法** 前瞻性收集局部晚期直肠癌患者，将 NCRT 治疗后 1 周作为疗效评估的观测点，在 NCRT 规定周期完成后行 TME 术式获取完整病理结果。记录 37 例患者 NCRT 前、一周后病灶最小 ADC 值，最小 ADC 值变化值（最小ΔADC）、最小 ADC 变化率（最小ΔADC%）。结合术后病理将患者分为病理完全缓解组（pcR 组,18 例）和非病理缓解组（非 pcR 组，19 例）。采用 Mann-Whitney U 检验比较 pcR 与非 pcR 组间最小 ADC 值及其变化值、变化率的差异。绘制 ROC 分析早期最小 ADC 各参数值预测 pcR 组和非 pcR 组疗效评价的诊断效能。**结果** 37 例患者直肠癌 NCRT 治疗前 pcR 组和非 pcR 组病灶最小 ADC 值分别为（0.783±0.15）×10-3 和（0.721±0.16）×$10^{-3}mm^2/s$，NCRT 治疗后 1 周的最小 ADC 值为（0.975±0.15）×10-3 和（0.857± 0.16）×$10^{-3}mm^2/s$，差异有统计学意义（t=－3.175，P=0.010），NCRT 治疗前、后 1 周 pcR 组和非 pcR 组病灶Δ最小 ADC 为

（0.192±0.233）×$10^{-3}$$mm^2$/s，（0.136±0.341）×$10^{-3}$$mm^2$/s，差异有统计学意义（$t$=－4.734，$P$=0.010）。以 ADC 最小值为 0.756×$10^{-3}$$mm^2$/s 为阈值绘制 ROC 曲线，曲线下面积为 0.687，对新辅助化疗效预测的敏感度为 77.3%，特异度为 65.2%；以Δ最小 0.106×$10^{-3}$$mm^2$/s 为阈值绘制 ROC 曲线，曲线下面积为 0.790，对新辅助化疗效预测的敏感度为 84.1%，特异度为 73.4%；

结论 早期扩散加权成像有助于局部晚期直肠癌患者临床及时调整化疗方案，ΔADC 最小值的敏感度最高，特异度最好。

DCE-MRI 量化分析在早期评估肝转移瘤化疗疗效的应用价值

丁爽,贾文霄,艾尔肯·阿不力孜
新疆医科大学第一附属医院

目的 探讨 DCE-MRI 技术定量评估结直肠癌肝转移瘤抗肿瘤药物早期疗效的应用价值。方法 收集接受贝伐单抗及细胞毒性药物联合化疗的结直肠癌肝脏转移患者，分别在化疗前、化疗后第 4 天、化疗 3 个周期后行常规 MRI 及 DCE-MRI 检查，动态观察转移病灶的影像学表现，根据 RECIST 标准将病灶分为治疗有效组（CR，PR，SD）和治疗无效组（PD）；测量 DCE-MRI 技术中微血管转运常数（K^{trans}）、血浆容积分数（V_p）、血管外细胞外容积分数（V_e）、反流速率常数（K_{ep}）等定量指标，动态观察其在治疗前后不同时期的变化情况，与血清 VEGF 水平之间行相关性分析。结果 结直肠癌肝脏转移瘤患者化疗前及化疗后第 4 天，治疗有效组及治疗无效组中病灶横径差异无统计学意义；结直肠癌肝转移瘤化疗前，治疗有效组的 K^{trans}、K_{ep} 值大于治疗无效组的相应参数值；结直肠癌肝转移瘤化疗后第 4 天，治疗有效组肿瘤病灶的 K^{trans}、K_{ep} 值明显下降；K^{trans}、K_{ep} 值与血清 VEGF 水平之间存在正相关性。结论 DCE-MRI 定量参数可无创性的评价结直肠癌肝转移瘤联合化疗的早期疗效，且可通过 K^{trans}、K_{ep} 值在治疗前的高低来预测结直肠癌肝脏转移瘤的治疗效果。DCE-MRI 定量指标可为抗肿瘤药物疗效的早期评估、药物敏感性的预测及治疗方案的个体化选择提供重要的影像学依据。

Comparison of Intravoxel Incoherent Motion, Diffusion Kurtosis Imaging and Dynamic Contrast-Enhanced MRI for Differentiating Borderline from Malignant Epithelial Ovarian Tumors Using Histogram Analysis

Mengge He[1],Jinwei Qiang[1],Haiming Li[2]
1.Jinshan Hospital of Fudan university
2.Fudan university Shanghai cancer center

Objectives: To compare the value of whole-tumor histogram analysis of intravoxel incoherent motion (IVIM), diffusion kurtosis imaging (DKI) and dynamic contrast-enhanced (DCE) MRI in the differentiation of borderline from malignant epithelial ovarian tumors (BEOTs vs. MEOTs), and to identify the correlations between the perfusion parameters derived from IVIM and DCE-MRI.

Methods and materials: IVIM, DKI and DCE-MRI were performed in 21 patients with BEOTs and 42 patients with MEOTs. The whole-tumor histogram metrics were calculated on

parametric maps of IVIM (pure diffusion coefficient [D], pseudo-diffusion coefficient [D*], perfusion fraction [f]), DKI (diffusion kurtosis [K], diffusion coefficient [Dk]) and DCE-MRI (volume transfer constant [K^{trans}], rate constant [k_{ep}], and extravascular extracellular volume fraction [v_e]). The Mann-Whitney U test and the receiver operating characteristic (ROC) curves comparison were constructed to determine the best diagnostic accuracy. Spearman's rank correlation was used to analyze the correlations between DCE-MRI and IVIM parameters.
Results: Most of the metrics of D and Dk, and 90th percentile and root mean squared of f were significantly higher in BEOTs than in MEOTs ($P < 0.05$). While most of the metrics of K and K^{trans} and median of k_{ep} were significantly lower in BEOTs than in MEOTs ($P < 0.05$). Additionally, the 10th percentile of Dk value appeared to be the most reliable for tumor differentiation as it yielded a sensitivity of 93.75%, a specificity of 88.00%, an accuracy of 90.24%, and an AUC of 0.928, with a cut-off value of 1.406×10^{-3} mm^2/s. However, there were no differences in the diagnostic performances among Dk, D and D* (all $P > 0.05$). Moreover, weak inverse correlations were found between D and K^{trans} ($r = -0.346$, $p = 0.027$), D and k_{ep} ($r = -0.460$, $p=0.003$).
Conclusions: Whole-tumor histogram analysis of IVIM, DKI and DCE-MRI are valuable for differentiating BEOTs from MEOTs. The 10th percentile of Dk is the best diagnostic parameter. IVIM findings correlate with DCE-MRI results and may represent an alternative to DCE-MRI.

Using the DKI Technology to Explore Normal Hepatic Microstructure Difference Between Left and Right Lobe

Junying Wang[1],Hao Shi[2]
1.Shandong First Medical University
2.Shandong Qianfoshan Hospital

Rationale and Objectives: In addition to to test the feasibility of DKI in normal liver and explore hepatic preliminary DKI parameters, to make a basis for DKI better application on intrahepatic lesions.Besides to assess the left and right lobe diffusion and structural differences in the liver, in view of the different locations of different lesions in the liver.
Meterials and Methods: The livers of 32 healthy volunteers were examined twice on the GE 3.0 T MR scanner on the 2th weekend after first scan.Eight liver segment (S1-S8)DKI derived parameter MK, MD,FA, KA、KR、DA、DR data were collected. Statistical analysis was to evaluate correlation between parameters and differences of parameters in the left and right liver lobe. Bland-Altman method was used to assess Intra-observer and inter-observer reproducibility.
Results: The kurtosis coefficient (MK, KA, KR) of the left liver lobe of the was significantly lower than the right liver lobe , while the diffusion coefficient (MD, DA, DR) was lower than right lobe of the liver, and the difference was statistically significant($P<0.05$).According to the principle of DKI,There is a positive correlation between the three kurtosis metrics MK、KA、KR,and also positive correlation between

the three diffusion metrics MD、DA、DR，besides we found negatively correlation between MK and MD(r=-0.638).No significant correlation was found between FAk and other parameters (r<0.3).Except for FAk, the consistency of each parameter in the two scans is better, among all parameters the consistency of DR is the highest(ICC=0.827);Regarding the repeatability of each segments, we found that the lower right lobe of the right lobe (S5, S6) possess the best repeatability, while the upper left lobe of the liver (S2) deserved the worst repeatability.

Conclusions In addition to FAk, the remaining DKI parameters in the left and right liver lobe exist significantly difference,which suggests that there should be microscopic structures or perfusion differences in the left and right liver lobe. In addition, studies have shown that DKI possess good repetitiveness in the liver. especially in the lower segments of right liver (farthest away from the heart and lungs)which suggests that when DKI is applied to the liver, the segment or lobe of lesion should be selected or chose the relatively stable liver segment(S5,S6)as the control group .

ADC 值联合纹理特征评估宫颈鳞癌分化程度的价值

郑明雪[1,2],董江宁[1]
1.中国科学技术大学附属第一医院西区，安徽省肿瘤医院
2.蚌埠医学院

目的：探讨 MR 扩散加权成像(DWI)表观扩散系数(ADC)值联合纹理特征评估子宫颈鳞癌病理分化程度的价值。 **方法：**对 88 例经病理证实宫颈癌患者行常规 MRI 及 DWI 扫描，b 值取 1 000 s/mm2，获得病灶的 ADC 值。在 T2WI 序列进行纹理分析，获得熵值、能量、峰度、标准差、均值及偏度等参数。所得结果应用 SPSS 软件,采用单因素 ANOVA 分析及 LSD 进行两两比较,P＜0.05 有统计学意义。并采用受试者工作特征（receiver operating characteristic curve, ROC）曲线判断有统计学差异的 ADC 值及纹理值评估不同分化程度宫颈鳞癌的价值，计算曲线下面积（area under the curve, AUC）、灵敏度及特异度，AUC＞0.5 表示差异有统计学意义。 **结果：**88 例患者中，低分化组 47 例，平均 ADC 值(0.71±0.027)×10^{-3} mm^2/s;中分化组 30 例，平均 ADC 值(0.77±0.046)×10^{-3} mm^2/s;高分化组 11 例，平均 ADC 值(0.78±0.075)×10^{-3} mm^2/s;中、高分化组分别与低分化组之间差异有统计学意义(P＜0.05)，而中分化组与高分化组之间差异无统计学意义(P＞0.05)。3 组间纹理特征比较，标准差和熵值具有统计学差异(P＜0.05)，而能量、峰度、均值及偏度比较无统计学差异(P＞0.05)。除低分化组与高分化组间纹理参数标准差的 AUC 小于 0.5 外，其余均大于 0.5，差异有统计学意义。 **结论：**单一 ADC 值只能区分低分化宫颈鳞癌与中高分化鳞癌，但不能鉴别中分化与高分化宫颈鳞癌；ADC 值结合纹理特征可以在术前提高子宫颈鳞癌的分化程度的效能。

2.南方医科大学珠江医院
3.中山大学附属第八医院

目的：探讨高分辨 MRI 诊断直肠癌患者有无壁外血管侵犯（extramural vascular invasion, EMVI）与动态对比增强 MRI（dynamic contrast-enhanced MRI, DCE-MRI）各定量灌注参数的相关性。**方法：**收集 2014 年 11 月至 2015 年 12 月经病理证实为直肠腺癌的患者，共纳入未接受新辅助治疗且于直肠 MRI 检查 2 周内行直肠癌根治术的患者 72 例。基于高分辨 MRI 评价患者 EMVI 情况，并在 DCE-MRI 上勾画全肿瘤体积获得该患者的定量灌注参数（K^{trans}、k_{ep}和 v_e）。比较分析 mrEMVI 阴性组与阳性组间 DCE-MRI 各定量灌注参数及临床病理资料的差异。**结果：**mrEMVI 阳性患者的 k_{ep} 值较阴患者显著降低（0.938 min^{-1} vs. 0.710 min^{-1}, P = 0.012），v_e值较阴性患者显著升高（0.288 vs. 0.344, P = 0.021），而 K^{trans}值在 mrEMVI 阴性组和阳性组间无显著差异（0.238 min^{-1} vs. 0.217 min^{-1}, P = 0.390）。另外，mrEMVI 阳性患者的肿瘤体积更大、具有更高的肿瘤病理分期及更易出现区域淋巴结转移（2.9 cm vs. 3.5 cm, P = 0.011; 63.8% vs. 92.0%, P = 0.010; 36.2% vs. 76.0%, P = 0.001）。**结论：**本研究首次发现 mrEMVI 阳性的直肠癌患者的肿瘤局部微循环发生改变，k_{ep}值显著降低，v_e值显著升高，且肿瘤体积更大、肿瘤病理分期更高及更易出现区域淋巴结转移。

EPO-1951
临床结合多参数 MRI 评分模型对子宫肉瘤及不典型子宫肌瘤的鉴别诊断

毕秋,吴昆华
云南省第一人民医院

目的：寻找能够鉴别子宫肉瘤及不典型子宫肌瘤的临床指标、MRI 定性及定量参数，得出子宫肉瘤的预测指标，并对其量化评分。
方法：在 2011 年 6 月至 2016 年 12 月间，收集到由我院病理证实的 96 例子宫肉瘤和 88 例不典型子宫肌瘤的临床资料，术前曾行 MRI 扫描并符合条件的有 63 例子宫肉瘤和 79 例不典型子宫肌瘤。分析并比较两组肿瘤在临床参数、MRI 定性图像特点、DWI 及增强定量参数方面的差异性，通过逻辑回归等统计学方法计算出术前预测子宫肉瘤的参数评分。
结果：单变量分析证明患者年龄、临床症状、肿瘤部位、形态、前后径、边界、实质 T2WI 信号、mADC（平均表观扩散系数）值、minADC（最小表观扩散系数）值、TIC（时间-信号强度曲线）均能准确区分子宫肉瘤及不典型子宫肌瘤（P均＜0.001）。通过多元逻辑回归模型及参数估计最后得出：年龄＞50.5 岁（1 分）、以阴道流血流液为主诉（3 分）、病灶主要位于宫腔（4 分）、边界不清（4 分）、实质存在 T2WI 稍高信号（2 分）、minADC 值＜0.951×$10^{-3}$$mm^2$/s（4 分）均能用于术前预测子宫肉瘤。当总评分≥8 时，敏感性、特异性、准确性、阳性及阴性预测值分别为 90.5%、98.7%、95.1%、98.3%、 92.9%。
结论：临床结合多参数 MRI 制定出的子宫肉瘤预测评分模型能够准确区分子宫肉瘤及不典型子宫肌瘤，以利于治疗方式的选择。

EPO-1952
DCE-MRI 对早期宫颈癌盆腔淋巴结转移的评估

张晓苗,董越
辽宁省肿瘤医院

目的:探讨 DCE-MRI 在评估早期宫颈癌盆腔转移淋巴结与非转移淋巴结中的应用价值。材料与方法:回顾性分析经病理证实的 57 例 IB1～IIA1 期宫颈癌患者，其中 19 人存在盆腔淋巴结转移，纳入术前 DCE-MRI 与术后病理相对应淋巴结 94 枚（转移性淋巴结 30 枚，非转移性淋巴结 64 枚），其中包括正常大小淋巴结（短径＜10mm）78 枚（转移性淋巴结 17 枚，非转移性淋巴结 61 枚）。测量各淋巴结短径及其 DCE-MRI 定量灌注参数（K^{trans}、K_{ep}、V_e）以及原发肿瘤的 DCE-MRI 定量灌注参数。通过秩和检验对各参数进行比较分析；通过 Logistic 回归模型拟合联合预测因子；绘制淋巴结短径、DCE-MRI 定量灌注参数及联合预测因子的 ROC 曲线，获取诊断界值。结果:转移性与非转移性原发肿瘤之间 K^{trans}、K_{ep}、V_e均无统计学差异。转移淋巴结组短径、K^{trans}、K_{ep}、V_e均大于非转移淋巴结组，且差异有统计学意义（P＜0.05）；淋巴结短径、K^{trans}、K_{ep}、V_e、淋巴结短径与 Ktrans 值的联合预测因子 pre1 的 ROC 曲线下面积分别为 0.834、0.784、0.648、0.703、0.883。在正常大小的淋巴结中，转移淋巴结组短径、K^{trans}、V_e均大于非转移淋巴结组，且差异有统计学意义（P＜0.05）；淋巴结短径、K^{trans}、V_e、淋巴结短径与 K^{trans}值的联合预测因子 pre2 的 ROC 曲线下面积分别为 0.759、0.768、0.727、0.839。结论:DCE-MRI 定量灌注参数可用于评估早期宫颈癌盆腔淋巴结转移，且在不同径线的淋巴结中有较好的诊断稳定性，以 K^{trans}结果最佳；在正常大小淋巴结中，K^{trans}诊断性能优于淋巴结短径。淋巴结短径联合淋巴结 K^{trans}值评估早期宫颈癌盆腔淋巴结转移效果最优。但 DCE-MRI 无法表明早期宫颈癌患者原发肿瘤的转移潜能。

EPO-1953
磁共振扩散峰度成像与拉伸指数模型评价裸鼠原位肝细胞癌异质性

杨烁慧[1],郭然[2],林江[2]
1.上海中医药大学附属曙光医院
2.复旦大学附属中山医院

目的 探讨磁共振（MRI）扩散峰度成像（DKI）和拉伸指数模型（SEM）评估自然生长状态下裸鼠原位肝细胞癌（HCC）异质性的价值。**方法** 将 25 只原位 HCC 裸鼠模型随机分为 A、B、C、D 和 E 组，每组 5 只，分别于原位种植瘤生长至第 21、28、35、42 和 49 天进行 1.5T MRI 扫描，获得 DKI 和 SEM 以下各参数：平均峰度（MK）、平均扩散系数（MD）、扩散异质性指数 a 和扩散分布指数（DDC）。比较各组间肿瘤 DKI 和 SEM 各参数的差异。使用 Spearman 相关分析评价 DKI 和 SEM 各参数与组织病理学上坏死分数（NF）、微血管密度（MVD）、肿瘤细胞增殖指标 Ki-67 指数、苏木精伊红染色肿瘤最大径切面直方图异质性指标标准差（SD）和峰度以及肿瘤大小之间的相关性。**结果** 各组间肿瘤 MK、MD、a 和 DDC 值均有显著统计学差异（P 均< 0.05）。D 组肿瘤 MK 值明显高于 A、B 和 E 组，a 值明显低于 A、B 和 E 组，D 组肿瘤 MD 和 DDC 值显著高于 B 组，E 组显著高于 B 组和 C 组，P 均< 0.05。5 组肿瘤的 MK 值与 SD 和峰度值显著高度正相关（r = 0.603 和 0.604），a 值与 SD 和峰度值显著高度负相关（r = -0.627 和 -0.620）。从第 21 天至第 42 天肿瘤 MK 值与 NF（r = 0.587）、MVD（r = 0.490）、Ki-67 指数（r = 0.569）和肿瘤大小（r = 0.503）中度正相关，a 值与 NF（r = -0.577）、MVD（r = -0.490）、Ki-67 指数（r = -0.574）和肿瘤大小（r = -0.488）中度负相关。从第 28 至第 49 天肿瘤 MD 和 DDC 值与 NF（r = 0.706 和 0.664）显著高度正相关，与肿瘤大小（r = 0.492 和 0.525）中度正相关，P 均< 0.05。**结论** DKI 和 SEM 可反映 HCC 的异质性，或可成为临床无创性评价 HCC 肿瘤异质性的生物影像学指标。

EPO-1954
基于压缩感知技术的 3D-MRCP 的临床应用探索

马培旗,袁玉山,张磊
阜阳市人民医院

目的：探讨压缩感知技术（CS）在 3D-MRCP 成像中的可行性。
方法：对 30 名志愿者在 3.0T-MRI 仪上行 3D-MRCP 扫描，完成常规 MRCP 扫描和 CS-MRCP 扫描，两次扫描的采集范围、空间分辨力相同。CS 组图像按不同降噪（denosing，DS）水平进行重建：DS_{weak}（5%）、CS-DS_{medium}（10%）、CS-DS_{strong}（20%）。每位志愿者共获得 4 组图像，通过主、客观对图像质量进行评价。主观图像质量评价：由 2 名高年资影像诊断医师分别独立阅片，采用 3 级评分标准分别对图像质量进行评价，标准如下：1 分，图像伪影较重、SNR 较低、不能用于临床评估；2 分，图像伪影较轻、SNR 尚可、可用于临床评估；3 分，图像无明显伪影、SNR 高、可用于临床评估。图像质量主观评价采用 Wilcoxon 符号秩和检验，采用 Kappa 系数对阅片者之间评价结果进行一致性分析（k≥0.75 代表一致性较好）。客观评价：选取胆总管显示最佳层面，测量该层面表观信噪比（signal-to-noise ratio，SNR）和对比信噪比（contrast-to-noise ratio，CNR）。客观评价采用单因素方差分析，组间两两比较采用 LSD 法检验。以 p<0.05 为差异具有统计学意义。
结果：2 位高年资影像诊断医师的对图像质量的主观评价结果的评分一致性高(k=0.94)，阅片者倾向将 CS-DS_{strong}组图像作为最佳诊断图像。客观评价中，CS-DS_{strong}在 4 组图像中 SNR 最高(p<0.05)，且 CS-DS_{strong}组与常规 MRCP 组的 CNR 差异无统计学意义。
结论：CS 技术可用于 3.0T MRI 仪行 MRCP 检查，在保证了图像质量的同时，大大缩短了扫描时间。

EPO-1955
Gd-EOB-DTPA 增强后 Look-Locker 评估肝细胞分数诊断慢性乙型/丙型肝炎后肝纤维化的临床研究

潘珅,辛军,郭启勇
中国医科大学附属盛京医院

目的：探究钆塞酸二钠（Gd-EOB-DTPA）增强后 Look-Locker 测量肝细胞分数（HeF）的方法在评估肝纤维化等级上的价值，并与肝细胞期相对下降率（RE）进行对比。拟为肝纤维化的定量评估，特别是早期肝纤维化的评估提出一种新的影像学方法。
研究方法：研究共纳入慢性肝炎患者 109 人，采用 3.0T 磁共振设备进行 Gd-EOB-DTPA 增强磁共振扫描。所有患者均进行包含 2 次（Gd-EOB-DTPA 注射前及注射后第 20min）Look-Locker 同层图像采集及 2 次（Gd-EOB-DTPA 注射前及注射后第 18min）的 T1 图像采集。患者于磁共振检查后 48 小时内行肝脏穿刺活检。计算感兴趣区肝实质的 HeF 值及 RE 值，将 HeF、RE 与患者病理分期结果进行比较。
结果：共 73 人同时具备肝纤维化病理结果和磁共振检查结果，这些纳入分析患者按照肝纤维化病理 METAVIR 等级分为:F0，n=23(31.5%)；F1，n=19 (26.0%)；F2，n=13 (17.8%)；F3，n=6 (8.2%);F4，n=12（16.4%）。随着肝纤维化等级升高，肝细胞分数值减小，肝纤维化程度与肝细胞分数存在相关性(r = -0.81，P < 0.05)。HeF 在评估有纤维化(≥F1)，显著纤维化(≥F2)，进展期纤维化(≥F3)和肝硬化(F4)的 ROC 曲线下面积分别为 0.84(0.73－0.91)，0.89(0.80－0.95)，0.96 (0.88－0.99)和 0.96 (0.88－0.99)，诊断效果优于肝细胞相对增强分数。

结论：Gd-EOB-DTPA 增强后 Look-Locker 肝细胞分数技术可作为定量评估肝纤维化等级的一种有效的影像学诊断方法。

EPO-1956
基于 MR Dixon 技术定量分析 2 型糖尿病患者肝胰脂肪含量

俞顺,吕洁勤
福建省立医院

目的：应用磁共振（MR）Dixon 技术测量 2 型糖尿病患者与健康对照组的肝胰脂肪含量，分析两组肝胰脂肪含量的差异及影响 2 型糖尿病的因素。 **方法：**收集 2 型糖尿病者 118 例，健康者 39 例，所有研究对象均行腹部 MR Dixon 序列扫描。采用图像后处理软件得出腹部脂肪分数图，测量肝脏、胰腺的脂肪分数及胰腺径线，同时进行人体学参数、FPG、HLD、LDL、TG、CHOL 指标的检测，比较两组间肝脏、胰腺脂肪含量的差异，分析影响 2 型糖尿病的因素。 **结果：**2 型糖尿病患者的肝脏脂肪分数为（10.6±8.14）%，胰腺脂肪分数为（9.26±3.47）%，均高于对照组[（4.7±2.95）%、（7.37±2.45）%]，差异有统计学意义。2 型糖尿病患者的 FPG、TG、CHOL 显著高于对照组，HLD 低于对照组，以上差异具有统计学意义。FPG、HDL、TG、CHLO、肝脏平均脂肪分数、胰体脂肪分数、胰尾脂肪分数、胰腺平均脂肪分数为 2 型糖尿病的影响因素。 **结论：**应用 MR Dixon 技术能够准确测量肝脏、胰腺脂肪含量。2 型糖尿病患者肝胰脂肪含量与高于健康人，且肝胰脂肪含量为 T2DM 的影响因素。

EPO-1957
联合使用体内非相干运动（IVIM）和磁化转移成像（MT）检测早期糖尿病肾病的初步研究

张喜荣,贾永军,陈静,田骞,田欣
陕西中医药大学；陕西中医药大学附属医院

目的：体内非相干运动（IVIM）和磁化转移技术（MT）用于评估早期糖尿病肾病（DN）患者肾功能的初步研究。
方法：共纳入 14 例确诊为Ⅰ期 DN 的患者作为观察组，35 例健康志愿者作为对照组.IVIM（b = 0,50,100,150,200,400,600,800sec /㎜²）和弥散加权成像（DWI， b = 50,800sec / ㎜ 2）序列在 3T 扫描仪（Skyra，Siemens Healthineers）上获得。执行 DWI 序列后，在 Siemens MRWP 工作站上自动生成 ADC 映射。通过使用原型软件体扩散工具箱（Siemens healthineers）生成 IVIM 参数（ADC，D，f 和 D *值）。使用 3D 快速低角度拍摄（FLASH）序列进行 MT 研究，该序列运行两次;第一个没有 MT 饱和脉冲（MToff），第二个没有 MT（MTon）饱和脉冲。对于 MT 成像后处理，MTR =（MToff MTon）×100 / MToff，MTR 值以百分比单位表示。在每个受试者的 MT 图上使用以下区域测量肾皮质和髓质的磁化传递速率（MTR）。在上极，肾门和肾的下极的皮质和髓质区域中，每个受试者共绘制了 12 个感兴趣的区域。所有结果的平均值用于确保测量的一致性。
结果：采用 IVIM，肾皮质 D 值是区分健康志愿者和早期 DN 的最佳参数，曲线下面积（AUC）为 0.835，诊断敏感性和特异性分别为 74.3％和 92.9。通过 MT，肾皮质的 MTR 值是区分健康志愿者和早期 DN 的最佳参数，AUC 为 0.843，诊断敏感性和特异性分别为 78.6％和 80.0％。结合使用肾皮质的 D 和 MTR 值，AUC 为 0.916，诊断敏感性和特异性分别为 85.7％和 88.6％。
结论：体内非相干运动和磁共振磁化转移成像相结合，对早期 DN 的检测具有较高的诊断效率。

临床意义：源自 IVIM 的 D 值和源自 MT 的 MTR 值可能是用于检测 DN 的早期变化的潜在成像生物标志物。

EPO-1958
MRI 定量参数在凶险性前置胎盘成熟度分级诊断中的应用价值

邓明,胡金香,徐海波
武汉大学中南医院

摘要：
目的：探讨定量 MRI 参数在凶险性前置胎盘(dangerous placenta previa ,DPP)胎盘成熟度分级诊断中的应用价值；
材料与方法：分析我院生产的 128 例凶险性前置胎盘 MRI 资料，包含超声确诊前置胎盘后行多平面 HASTE T2WI 及多 b 值 DWI 扫描，b 值包含 0，400，800s/mm^2。根据胎盘最大面 T2WI 图像分别测量绒毛膜板、胎盘实质、基底膜最大厚度（mm）；分别测定感兴趣区 b=400，800s/mm^{2}的 ADC 值。根据剖宫产时胎盘成熟度评分，采用回归分析方法对孕周，T2WI 图像上胎盘不同面的径线值、不同 b 值 ADC 与胎盘成熟度评分关系；采用 ROC 分析不同定量参数在诊断胎盘成熟度中的诊断效能。

结果：128 例 DPP 孕周为 19-38 周，中孕 46 例，晚孕 82 例；其中胎盘成熟度分级： I 级 18 例，II 级 69 例，III 级 41 例；胎盘实质最大面测量：I 级 19.2±1.1mm，II 级 23.4±3.4mm，III 级 28.6±4.2mm；胎盘 ADC（b=400）： I 级 2438±189 mm^2/s ，II 级 1864±201 mm^2/s，III 级 1539±261mm^2/s；胎盘 ADC（b=800）：I 级 2312±211 mm^2/s，II 级 1763±341 mm^2/s，III 级 1321±428mm^2/s；回归分析：胎盘实质径线与胎盘成熟度分级存在较高相关；ROC 提示胎盘成熟度分级中，ADC 存在较高诊断效能，AUC 为 0.71-0.92。其中 b=800 s/mm^{2}时诊断准确效能相对更高。

结论：常规 T2WI 经线测量结合 ADC 值能准确对凶险性前置胎盘胎盘成熟度分级；

EPO-1959
颈椎动力位磁共振检查在评估椎间盘突出中的价值研究

郭广阔
陆军军医大学大坪医院

目的：颈椎磁共振检查是诊断评估椎间盘突出的常用方法，但颈椎中立位不能模拟日常颈椎的“工作”状态，因此常规体位（中立位）的颈椎磁共振检查不能很好的评估椎间盘突出。由此进行颈椎动力位磁共振检查，并结合中立位，对颈椎椎间盘突出症进行诊断评估分析。**方法：**搜集我院 2019 年 6 至 2019 年 7 月，临床拟诊断为颈椎椎间盘突出的患者并行 MR 检查共 47 例，同时行颈椎中立位与动力位检查，并对颈椎磁共振中立位及动力位的椎间盘检出率与临床症状进行对比。**结果：**颈椎磁共振中立位椎间盘突出 35 例，颈椎磁共振动力位椎间盘突出 41 例，临床症状符合率中立位 74.5%，临床症状符合率动力位 87.2%，动力位与中立位在评估椎间盘突出中存在差异，有统计学意义(P ＜ 0.05) 。**结论：**颈椎动力位磁共振检查可以辅助颈椎中立位，更好的提供椎间盘突出的诊断价值，从而为颈椎椎间盘突出的评估诊断，临床进行椎间盘手术提供更好的影像学依据。

EPO-1960
3.0T 磁共振 IDEAL 技术联合 T2 mapping 成像在下腰痛中的诊断价值

贾有福
甘肃省中医院

目的：探讨 3.0T 磁共振 IDEAL 技术联合 T2 mapping 成像技术对腰椎间盘退行性变的诊断价值及在下腰痛疾病中的应用。
方法：前瞻性纳入 2018 年 3 月－2019 年 4 月因下腰痛（low back pain,LBP）于甘肃省中医院就诊并行腰椎 3.0T MRI 检查的患者 150 例(女性 70 例 ，男性 80 例 ，年龄 43-85 岁)。所有病例均采用 GE Signa HDxt 3.0T 磁共振行常规矢状位 T1WI 及 T2WI、横断位 T2WI，并行正中矢状位 T2 mapping 成像。根据 Pfirrmann 标准将 L1-S1 腰椎间盘分级，标准化感兴趣区域后测量髓核（NP）及纤维环（AF）前、后缘的 T2 及 WSF 值（water signal fraction,水的信号分数）。分别比较各级 NP 和 AF 前、后缘 T2 值及 WSF 值，并分析 NP 及 AF 前后缘 WSF 值分别与 Pm 分级、T2 值、位置、年龄及性别间的相关性。
结果：共计测量 490 个椎间盘。① 腰椎间盘各分级 NP 的 T2 值除 IV 级与 V 级间差异无统计学意义（P>0.05）外，其余各级间差异均有统计学意义（P<0.05）；② 腰椎间盘 NP T2 值与各分级呈高度负相关（r=－0.77）；30 例腰痛患者间隔半年测得椎间盘 AF 前、后缘及 NP T2 值间差异均无统计学意义（P>0.05）；③ 各分级椎间盘髓核 WSF 值总体随分级的增加而减小；I-III 级分别与各级间比较差异均有统计学意义；④ 髓核的 WSF 值与 Pm 分级呈高度负相关（r=-0.771，p＜0.01），与 T2 值呈高度正相关（r=-0.662，p＜0.01），与年龄呈中度负相关（r=-0.532，p＜0.01），与椎间盘解剖部位呈弱负相关（r=-0.360，p＜0.01）。
结论：IDEAL 成像及 T2 mapping 成像技术能够无创性定量评估活体椎间盘微结构的变化，椎间盘髓核 WSF 值及其空间分布联合 T2 值的改变有助于早期评价下腰疼。

EPO-1961
钙化性腱膜纤维瘤的临床及 MRI 影像特征

王帅,刘鸿圣
广州市妇女儿童医疗中心

目的：通过探讨钙化性腱膜纤维瘤（CAF）的临床及 MRI 表现，提高对 CAF 的诊断水平。

方法：收集经病理证实的钙化性腱膜纤维瘤 6 例，回顾性分析其临床资料及 MRI 表现并复习相关文献。所有病例均行 MRI 检查，其中 1 例行 MRI 增强检查。

结果：本组病例发病年龄 1-44 岁，平均年龄 13 岁，中位年龄 8 岁，性别比例 1:1，分别位于足底部 3 例、腕掌侧 2 例、椎管后方（硬膜外）1 例，其中单发 5 例，多发 1 例，临床均以无痛性包块就诊。MRI 均表现为类圆形结节影，长径 0.8cm-4cm 不等，5 例紧贴肌腱生长，其中 3 例边界不清，侵犯周围肌腱、肌肉及脂肪组织。本组 5 例 CAF 均表现为 T1WI 等、T2WI 等信号，压脂序列呈稍高信号，1 例 T1WI 呈不均匀高信号、T2WI 及压脂序列均为低信号改变；增强扫描可见病灶呈轻中度均匀强化；本组病例中 2 例病灶内可见特征性双低信号改变。镜下见瘤细胞梭形，束状排列，局灶有软骨样细胞分化，并见钙化，免疫组化：SMA(-)、S-100(-)、CD68(-)、CD34(-)

结论：钙化性腱膜纤维瘤是一种罕见的具有局部侵袭性的软组织肿瘤，结合临床特点及特征性影像表现可确诊，MRI 能够清楚显示钙化性腱膜纤维瘤的病灶部位、大小、信号特点以及病灶周围组织关系，是目前钙化性腱膜纤维瘤的重要术前检查方法。

EPO-1962
腰椎管狭窄患者中马尾神经冗余 MRI 定量分析的临床价值

李会侠,王祺
冀中能源邢台矿业集团总医院（邢台市骨科医院）

目的 分析 MRI 对腰椎管狭窄患者中马尾神经冗余(RNRs)定量检测数据，探讨其对手术方式选择和预后的临床指导价值。**方法** 收集 2017 年 7 月至 2018 年 6 月我院临床确诊腰椎管狭窄患者 275 例。采用 Siemens 3.0T Skyra 磁共振成像仪，腰椎 MRI 常规序列扫描。根据是否存在 RNRs 分为冗余组和非冗余组。测量腰椎管狭窄程度、RNRs 相对长度；完成腰椎 JOA 评分和腰椎 ODI 评分；对有 RNRs 并做椎管减压手术者行术后 3-6 个月随访。两组数据采用独立样本 t 检验；冗余相对长度与相关指标做相关性分析。**结果** 冗余组 122 例，非冗余组 153 例，RNRs 发生率为 44.36%。年龄：冗余组 31～81 岁，平均(63.16±7.76)岁、非冗余组 18～78 岁，平均(58.39±9.09)岁；椎管狭窄程度：冗余组(0.85±0.20)、非冗余组(1.17±0.21)；JOA 评分：冗余组(8.45±1.91)、非冗余组(13.15±2.46)；ODI 评分：冗余组(73.11±5.22)、非冗余组(69.89±8.12)，两组间比较，差异均有统计学意义。冗余组中，RNRs 相对长度(4.35±1.41cm)与 JOA 评分呈负相关(r=-0.678)，与 ODI 评分呈正相关(r=0.626)，与病程呈弱正相关(r=0.297)。共随访术后患者 39 例，31 例 RNRs 解除，8 例仍存在 RNRs。两组术后 JOA 评分、ODI 评分对比差异有统计学意义(P<0.05)，RNRs 未解除影响患者椎管狭窄的手术疗效。两组术前 RNRs 相对长度对比差异有统计学意义(P<0.05)。**结论** 在腰椎管狭窄患者中，RNRs 较为常见，且冗余长度越长，临床症状越严重。单纯椎管减压术可以解除多数 RNRs，但有少数 RNRs 未解除，认为与 RNRs 相对长度因素有关。因此，MRI 对腰椎管狭窄患者 RNRs 的定量分析对选择手术方式和判断预后具有临床指导意义。

高场强磁共振应用于膝关节隐匿性骨折诊断的临床分析

徐建国,宋侨伟,赵骏,叶飒飒,郑小丽
浙江省人民医院

目的 分析膝关节隐匿性骨折诊断采用高场强磁共振的临床价值。方法 本次研究对象为我院收治的 90 例膝关节隐匿性骨折患者，选取时间段为 2018 年 5 月至 2019 年 5 月，按照诊断方式的不同将患者随机分为两组，分别为对照组（45 例）、观察组（45 例），其中对照组采用多排螺旋 CT 诊断方法，观察组给予 MBI 诊断方法，对两组患者的诊断效果进行比较。结果 与对照组相比，观察组患者的诊断准确率更高（P＜0.05）；且观察组检查表现优于对照组（P＜0.05）；另外，观察组所采用的检查诊断符合度高于对照组，两种检查方法的数据的比较具有统计学意义（P＜0.05）。结论 在诊断膝关节隐匿性骨折过程中采用高场强磁共振能取得良好效果，尤其体现在诊断准确率的提高，以及有着较为明显的检查表现方面，因此，该诊断方法具有重要临床应用价值，其值得推广使用。

3.0TMRI 造影及平扫对诊断髋臼盂唇撕裂差异的比较

颜方方
上海交通大学附属第六人民医院

目的：本研究旨在比较单髋 3.0TMRI 平扫及直接造影对诊断髋臼盂唇撕裂敏感性及准确性的差异。方法：收集我院两年内 39 例因髋关节疼痛而拟诊为髋臼盂唇撕裂并经关节镜检查确诊患者的影像学资料，其中 22 例行单髋 3.0TMRI 关节直接造影，17 例行单髋 3.0TMRI 平扫。将所有患者髋臼盂唇均分为前上、前下、后上及后下 4 个区域，以关节镜检查为金标准，比较 MRI 髋关节直接造影及平扫对诊断盂唇撕裂的敏感性及准确性。结果：MRI 造影诊断盂唇损伤撕裂部位共 24 处。包括前上 21 处、前下 1 处及后上 2 处。关节镜所见损伤部位共 20 处，均位于前上盂唇。后下盂唇在 MRI 及关节镜均未见撕裂。其中，前上盂唇直接造影及关节镜同时诊断为撕裂的共 19 处，直接造影对前上盂唇撕裂敏感度为 95%、准确度 86.4%。前下及后上部位直接造影诊断的盂唇撕裂均为假阳性。MRI 平扫 2 例为阴性，余 15 例患者发现髋臼盂唇撕裂共计 18 处。包括前上 14 处、后上 2 处及后下 2 处。关节镜所见损伤部位共 19 处，17 例位于前上盂唇，后上及后下各 1 例。前下盂唇在 MRI 及关节镜均未见撕裂。MRI 平扫对前上盂唇撕裂敏感度为 82.4%、准确度 82.4%。单髋 3.0TMRI 髋关节直接造影与平扫对诊断盂唇撕裂敏感性及准确性差异无统计学意义(P >0.05)。讨论：单髋 3.0TMRI 直接造影在诊断髋臼盂唇撕裂时敏感性及准确性高于 3.0TMRI 平扫，但两者之间并无统计学差异。因此，单髋 MRI 平扫可以基本满足髋臼盂唇损伤的诊断要求。如果临床医生有更精确的要求，可行髋关节直接造影检查。

肺腺癌与鳞癌骨转移的鉴别：MR 影像组学

赖庆园,董越
辽宁省肿瘤医院

摘要　目的 探讨采用影像组学的方法分析骨转移 MR 影像特征鉴别肺腺癌和鳞癌的可行性。**方法** 回顾性分析 2016-2018 年经病理证实的 80 例肺癌患者（腺癌 40 例，鳞癌 40 例）的影像及临床资料，所有患者经综合影像学（CT、骨扫描或 MR）或病理证实为脊柱骨转移。应用 ITK-SNAP 软件对 MR 发现的骨转移病灶进行手动分割，通过 AK 软件提取纹理特征，然后通过训练组使用 ANOVA+MW 和 Correlation Analysis 方法进行筛选，最后根据筛选后的特征集使用随机森林（RTree）构建影像组学模型。用受试者工作特性曲线下面积（AUC）和准确度来评价该模型在鉴别肺鳞癌与肺腺癌中的表现。**结果**　T1WI 上，模型诊断准确度和 AUC 在验证组中分别为 0.701 和 0.687；T2WI 上，模型诊断准确度和 AUC 在验证组中分别为 0.663　和 0.579；T2WI 脂肪抑制上，模型诊断准确度和 AUC 在验证组中分别为 0.601 和 0.554。**结论** 采用影像组学研究方法分析骨转移 MR 影像特征对鉴别肺腺癌和鳞癌具有一定的参考价值。

基于 MRI 在腰椎滑脱中对腰椎间盘变化与中医证型间相关性的研究

王琳
甘肃中医药大学附属医院

目的：了解腰椎滑脱症中医证型与 MRI 变化的相关性研究。方法：回顾分析 112 例腰椎滑脱患者的 MRI 资料。观察椎间盘的 Pfirrmann 分级、软骨终板的 Modic 改变、突出症、真空征、许莫氏结节的情况。同时辩证分析腰椎滑脱症的证型。结果：研究发现：中医证型与滑脱椎体未见显著差异（$P>0.05$）；与滑脱段椎间盘的形态变化和信号分级变化程度差异显著（$P<0.05$）；**风湿痹阻**

证：椎间盘的 Pfirrmann 分级Ⅰ-Ⅱ级约占 87%；软骨终板的 Modic 改变Ⅰ-Ⅱ级约占 67%；突出程度较轻；真空征较少；许莫氏结节形成较少；**寒湿痹阻证**：椎间盘的 Pfirrmann 分级Ⅰ-Ⅱ级约占 57%；软骨终板的 Modic 改变Ⅰ-Ⅱ级约占 65%；突出程度较轻；真空征较少；许莫氏结节形成较少；**气滞血瘀证**：椎间盘的 Pfirrmann 分级Ⅱ-Ⅲ级约占 46%；软骨终板的 Modic 改变Ⅱ-Ⅲ级约占 51%；突出程度较中；真空征少；许莫氏结节形成较少；**湿热痹阻证**：椎间盘的 Pfirrmann 分级Ⅱ-Ⅲ级约占 66%；软骨终板的 Modic 改变Ⅱ-Ⅲ级约占 61%；突出程度较重；真空征较增多；许莫氏结节形成增多；**肾阳虚衰证**：椎间盘的 Pfirrmann 分级Ⅱ-Ⅲ级约占 74%；软骨终板的 Modic 改变Ⅱ-Ⅲ级约占 68%；突出程度重；真空征增多；许莫氏结节形成增多；**肝肾阴虚证**：椎间盘的 Pfirrmann 分级Ⅲ级约占 51%；软骨终板的 Modic 改变Ⅲ级约占 62%；突出程度重；真空征增多；许莫氏结节形成增多。结论：MRI 的变化与中医各证型之间有着相对的内在联系,为腰椎滑脱症的中医辨证提供了较为可靠的影像学依据。

Multi-compositional MRI evaluation of repair cartilage in knee osteoarthritis with treatment of allogeneic human adipose-derived mesenchymal progenitor cells

Xinxin Zhao[1], Jingjing Ruan[1], Hui Tang[1], Suke Li[2], Jia Li[3], Meng Li[2], Cuili Xu[2], Qing Lu[1], Chengxiang Dai[2]
1. Department of Radiology, Ren Ji Hospital, School of Medicine, Shanghai Jiao Tong University
2. Cellular Biomedicine Group, Inc., No. 85 Faladi Road, Building 3, Zhangjiang, Pudong New Area, Shanghai, 201210, China
3. Department of Rheumatology, Ren Ji Hospital, School of Medicine, Shanghai Jiao Tong University, No. 160, Pujian Road, Shanghai, 200127, China

Background: *We used multimodal compositional magnetic resonance imaging (MRI) techniques, combined with clinical outcomes, to differentiate the alternations of composition in repair cartilage with allogeneic human adipose-derived mesenchymal progenitor cells (haMPCs) in knee osteoarthritis (KOA) patients.*
Methods: *Eighteen patients participated a phase I/IIa clinical trial. All patients were divided randomly into three groups with intra-articular injections of haMPCs: the low-dose (1.0*$\times 10^7$ cells), mid-dose (2.0×10^7), and high-dose (5.0×10^7) group with six patients each. Compositional MRI examinations including quantitative T1rho, T2, T2 star, R2star and ADC mappings were performed at 1 day before first injection to collect the base time point and 48 weeks to collect terminal point, and clinical evaluations including WOMAC and the SF-36 scores were conducted at 1, 3, 4, 8, 12, 24weeks after the first injection. Changes from base time in all measures that were scale variables were determined with a paired t-test (two-tailed) followed by Mann-Whitney U tests. We used the difference before and after treatment (D-values) as the object to avoid errors caused by individual differences.
Results: Compared with base time, significant differences were observed in quantitative measurements, including T1rho ($P < 0.0001$), T2 ($P = 0.0001$), T2 star ($P < 0.0001$), R2star ($P = 0.0001$) and ADC ($P = 0.0003$), suggesting a possible compositional changes of cartilage with the treatment of allogeneic haMPCs. Significant reduction in WOMAC ($P < 0.0001$) and SF-36 ($P < 0.0001$) scores showed the symptoms might be alleviated with this innovative treatment. Multiple comparisons showed significant differences in T1rho values among three dose groups ($F = 6.31$, $P = 0.025$), whereas no

significant differences in other measurements, which suggested different sensitivities of these mappings to detect compositional changes of cartilage.
Conclusions: *Multi-compositional MRI sequences could evaluate the promotion of the repair of cartilage with allogeneic haMPCs by providing supplementary information of compositional alterations of articular cartilage, which might be an effective tool for demonstrating efficacy of this new drug and guiding clinical decision-making in the follow-up treatment.*

Diffusion weighted cardiovascular magnetic resonance imaging for discriminating acute from non-acute deep venous Thrombus

Gang Wu
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: The importance of discriminating acute from non-acute thrombus is highlighted. The study aims to
investigate the feasibility of readout-segmented diffusion weighted (DW) cardiovascular magnetic resonance (CMR)
for discrimination of acute from non-acute deep venous thrombus (DVT).
Methods: For this prospective study from December 2015 to December 2017, 85 participants (mean age = 53 years,
age range = 34~74) with DVT of lower extremities underwent readout-segmented DW CMR. DVT of ≤14 days were
defined as acute (n = 55) and > 14 days as non-acute (n = 30). DVT visualization on b = 0, b = 800, and apparent
diffusion coefficient (ADC) images were assessed using a 4-point scale (0~3, poor~excellent). DW CMR parameters
were measured using region of interest (ROI). Relative signal intensity (rSI) and ADC were compared between acute
and non-acute DVT using a Mann Whitney test. Sensitivity and specificity for ADC and rSI were calculated.
Results: ADC maps had higher visualization scores than b = 0 and b = 800 images (2.7 ± 0.5, 2.5 ± 0.6, and 2.4 ± 0.6
respectively, P<0.05). The mean ADC was higher in acute DVT than non-acute DVT (0.56 ± 0.17 × 10- 3 vs.
0.22 ± 0.12 × 10- 3mm2/s, P<0.001). Using 0.32 × 10- 3mm2/s as the cutoff, sensitivity and specificity for ADC to
discriminate acute from non-acute DVT were 93 and 90% respectively. Sensitivity and specificity were 73 and 60% for
rSI on b = 0, and 75 and 63% for rSI on b = 800.
Conclusions: Readout segmented diffusion-weighted CMR derived ADC distinguishes acute from non-acute DVT.

EPO-1969
高分辨率毁损梯度回波序列在脊髓动脉磁共振成像中的应用研究

廖云杰
中南大学湘雅三医院

介绍
脊髓动脉成像一直是临床难以解决的问题，解剖复杂，直径小，仅 0.5mm 左右,常规影像学检查技术难以显示。为了开发能够可视化最相关的脊髓动脉新型成像技术，必须满足高空间分辨率，时间分辨率和范围足够覆盖这三个条件，因此进行 MR 序列参数优化更具有挑战性。常规的 MRA 序列如 TOF、PC 等方法均因脊髓动脉细小，且血流速度较慢均不适用。因此我们在本研究中实施了一种创新方法，使用 3D 高空间分辨率+Keyhole 技术的可控时间分辨率血管造影序列，以更好地观察脊髓动脉。
方法
征集 30 名正常志愿者，随机分 A,B,C 三组，每组 10 名，平均年龄 45.25±6.52 岁，使用扫描仪 Philips Ingenia3.0T，12 通道相控阵脊柱线圈对下胸段脊髓进行扫描，
A 组：使用 4D Trak XD 高时间分辨率序列并绘制 TIC 曲线，测量其造影剂达峰时间，key-hole20%。
B 组：使用高分辨率 3D T1FFE 毁损梯度回波序列，不开 Keyhole,TR / TE /Flip：2.9ms / 5.6ms / 25°，体素 0.5x0.5x1 mm，层间距：-0.5mm，层数：70，NSA:2.Time: 3：28 min
C 组：使用高分辨率 3D T1FFE 毁损梯度回波序列，keyhole20%，DYN：4，48s/期，其余几何参数与 B 一致，扫描时间= 5：36 min
结果
1：对 A 组数据进行 t 检验统计分析，得出脊髓动脉的造影剂达峰时间比肾皮质晚，呈慢血流型，达峰时间约为 50-110 秒
2：由两位高年资影像诊断医生对 BC 两组图像进行评分（根据信噪比，对比度，伪影等参数制定评分表），结果显示 C 组评分远高于 B 组。
结论
脊髓动脉是呈慢血流型的，对时间分辨率要求不高，使用高分辨 3DT1FFE 序列结合 key-hole 技术可以实现脊髓动脉的良好可视化，其效果均优于其余的影像学检查方法，可以清楚显示病变血管的形态，且成功率很高，对临床的诊疗方案具有重要的指导价值。

EPO-1970
基于 CycleGAN 网络模型从下肢骨肉瘤 CT 图像生成伪 MRI 图像的方法及质量评价

王传彬
中国科学技术大学附属第一医院西区，安徽省肿瘤医院

目的：和 CT 图像相比，MR 图像具有更高的软组织对比度，但其价格昂贵，采集时间长，检查禁忌症多。本文旨在研究基于 CT 图像转化成伪 MRI（sMRI）的方法，以帮助有需要的患者无需进行 MR 扫描便可获取 MR 图像，辅助临床诊疗。
方法：数据来自中科大附属第一医院西区的 24 例下肢骨肉瘤患者。首先对原始 CT 和 MR 图像进行预处理：去噪并结合 Canny 边缘检测算子和 Otsu 阈值算法获得 ROI（Region of Interest），校正偏差场，重采样体素大小至 $0.8\times0.8\times5mm^3$，并以参考病例为基准进行直方图标准化，重设图像

分辨率至 256×256；然后采用 CycleGAN 网络模型，生成器为 ResNet 网络，鉴别器为 PatchGAN 网络，使用 18 例病人的 CT 和 MR 图像进行训练，学习两者之间的映射关系。通过设置循环一致性损失，判断由输入 CT 生成的 sMRI 是否可以再转回成原输入 CT，从而增强输入 CT 与输出 sMRI 间的结构相似性，减少无效输出图像的产生；最后使用另外 6 例病人的 CT 图像进行测试。以两名主治以上高年资医师在不知 MR 真伪的情况下进行主观评分，分别评价健侧下肢解剖结构的显示以及患侧骨肉瘤瘤体信号的显示，评分标准均采取 5 分制（1 分：极差；2 分：差；3 分：一般；4 分：良好；5 分：优秀）。

结果：使用 CycleGAN 网络模型成功将 6 例测试病人的下肢 CT 图像转化成 sMR 图像，健侧下肢解剖结构显示的得分为（3.83±1.03）分，骨-软组织对比度较好，层次分明；患侧骨肉瘤瘤体信号显示的得分为（2.05±0.63）分，骨肉瘤病变能够辨识，瘤体内部信号对比度差。

结论：CycleGAN 网络模型可以有效地根据下肢骨肉瘤的 CT 图像生成质量较高的 sMRI 图像，能够帮助无法进行 MR 图像采集的患者得到更好的影像诊断及相应治疗。未来增大训练集的数量以及改进网络，可能进一步提高 sMRI 的质量以及瘤体的显示，以满足临床需求。

T2mapping 定量评价健康成年人腰椎间盘早期退变

陈晓飞
甘肃省中医院

目的：探讨 T_2mapping 技术对健康成年人腰椎间盘早期退变的定量评价价值，分析髓核（nucleus pulposus,NP）及纤维环(anulus fibrosus,AF)T_2值与椎间盘退变 Pfirrmann 分级及性别的相关性。**方法**：经知情同意，纳入 28 例健康志愿者，男性，16 人，女性 12 人，平均年龄（25.6±2.13）岁。在 3.0 T 磁共振扫描仪上行 Sagittal T_2mapping，T_2WI，T_1WI 和椎间盘轴位 T_2WI 数据采集。T_2mapping 序列参数设定为 8 个回波时间（9.4, 18.9, 28.3, 37.8, 47.2, 56.7, 66.1, 75.6）ms。图像传至 AW4.6work station，采用 Functool T_2mapping 软件测量 T2 值。分别在椎间盘前后 AF 及 NP 选择兴趣区（ROI）。利用 Sagittal T_2WI 对椎间盘进行 Pfirrmann 分级，Spearman 等级资料相关性分析纤维环及髓核的 T_2值与椎间盘退变分级的相关性。方差分析椎间盘 NP 和 AF 不同性别之间的差异。**结果**：所有纳入的椎间盘，NP 都明显高于 AF，有 115 个（PfirrmannⅠⅡ级的椎间盘显示了一定范围的 T_2值。在 NP 和 Pfirrmann 分级（r=-0.505，p<0.001）呈中等的负相关。AF 和 Pfirrmann 分级之间没有显著的相关性（r=-0.053，p=0.265）。此外，在不同性别之间，AF 的 T_2值差异有统计学意义（z=-3.508，p<0.001），NP 的 T2 值差异无统计学意义（t=-0.455，p=0.650）。**结论**：磁共振 T_2mapping 对定量评价椎间盘退变具有较为可靠的潜在临床价值。椎间盘 NP 的 T_2值与 Pfirrmann 分级负相关。不同性别之间椎间盘 AF 的 T_2值存在差异。

回顾性分析 45 例外周原始神经外胚层肿瘤的 CT 和 MRI 影像特征

窦银聪[1],王梅云[1]
1.河南省人民医院
2.河南省人民医院

背景:外周型原始神经外胚层肿瘤(pPNET)是一种罕见的起源于神经外胚层的恶性肿瘤，准确的影像诊断对 pPNET 的早期发现及治疗至关重要。

方法：收集我院 2012 年 3 月至 2019 年 6 月经临床病理结果证实的 pPNET 患者 45 例进行回顾性分析，以回顾 pPNET 独特的 CT 和 MRI 影像特征。评估 45 例 pPNET 患者的肿瘤位置、形态学特征、密度及信号强度、CT、MRI 增强特征及局部软组织受累情况。
结果:本组病例中男性(28/45)多于女性，未增强 MRI(17 例)显示 T1WI 等强 14 例，低信号 3 例。T2WI 等信号强度 9 例，高信号 8 例。大多数 pPNETs 病灶的信号/密度不均匀，小坏死(CT: 14/20;MRI: 23/25)。肿瘤通常边界不规则，形状不规则(CT: 17/20;MRI: 22/25)。病理检查显示所有肿瘤均有小范围坏死，pPNET 的病理结果中均有 CD99+的高度表达。
结论:在年轻男性中，当影像学表现为单个大的病变实性肿块伴小范围坏死时，应考虑 pPNET 的诊断，尤其是在 T1WI 和 T2WI 上表现为软组织肿块大部分为等信号强度、不均匀性强化的患者。

EPO-1973
磁共振 mDixon Quant 技术对腰椎骨质疏松型压缩性骨折的应用

张军俭,王龙龙,高延忠,张李楠,李娜,王警建
西安市第九医院

目的：利用飞利浦 3.0T 磁共振 mDixon Quant 技术测量腰椎骨质疏松型压缩性骨折的邻近椎体骨髓脂肪含量（FF），计算平均值，间接代表压缩椎体的 FF，为骨质疏松症（OP）致压缩性骨折提供量化方法。方法：收集 2018 年 7 月至 2019 年 7 月在本院就诊的腰椎压缩性骨折患者 46 例,收集患者的临床资料和病史等,剔除 11 例，包括服用过激素 2 例，明确的重大外伤、高处跌落致骨折 2 例，青少年椎体骨骺发育不良致骨折 1 例，肿瘤性骨折 5 例，其中转移瘤致骨折 4 例，多发性骨髓瘤致骨折 1 例，图像金属伪影干扰 1 例，研究对象剩余 35 例，均进行压缩骨折椎体邻近椎体 FF 指标的测量，由两位主治医师分别、独立测量，后录入统计学软件，求得平均值 FF。结果：FF 在 57.60~79.54 之间，均数 X=68.57＞65.20。结论：MRImDixon Quant 技术测得压缩性骨折邻近椎体的 FF，快速间接的反映压缩骨折椎体骨质疏松的程度,并且为 OP 致压缩性骨折提供量化方法。

EPO-1974
T2WI 水脂分离成像（T2WI-Dixon）技术在中轴型脊柱关节炎诊断中的临床应用研究

黄宏杰,张宇阳,张桦,陈君敏,郑擎,曹代荣
福建医科大学附属第一医院

目的：通过比较单独采用 T2WI-Dixon 序列与常规序列（SPAIR-T2WI 和 T1WI）对中轴型脊柱关节炎（axSpA）的诊断效能，探讨单独采用 T2WI-Dixon 序列的对 axSpA 的诊断价值。
材料和方法：收集并分析临床怀疑 axSpA 并行 3.0T 骶髂关节 MRI 检查患者 107 例。MRI 扫描序列包括常规序列（SPAIR-T2WI 和 T1WI）以及 T2WI-Dixon 序列（正相位、反相位、脂像、水像）。两名影像科医师先独立分析常规序列，间隔两周后再独立分析 T2WI-Dixon 序列。分析内容包括“MRI 阳性骶髂关节炎”、急性和慢性骶髂关节炎、SPARCC 评分和 SSS 评分；第二名影像科医师测量 T2WI-Dixon 序列和常规序列骨髓水肿和脂肪沉积的 SNR 和 CNR。以临床诊断为金标准，比较 T2WI-Dixon 序列和常规序列“MRI 阳性骶髂关节炎”诊断 axSpA 的效能；使用 Kappa 检验比较急性、慢性骶髂关节炎的诊断一致性；使用组内相关系数（ICC）比较 SPARCC 评分和 SSS 评分的一致性；使用配对 t 检验比较信噪比（SNR）和信号噪声比（CNR）。

结果：常规序列和 T2WI-Dixon 序列“MRI 阳性骶髂关节炎”诊断 axSpA 的敏感性分别为 0.67-0.70、0.73、特异性为 0.78-0.86、0.74-0.78。Kappa 检验和 ICC 表明各指标观察者内和观察者间一致性相似；其中 T2WI-Dixon 序列对骨髓水肿和脂肪沉积的观察者间一致性稍高于常规序列。T2WI-Dixon 序列骨髓水肿和脂肪沉积的 SNR 和 CNR 均优于常规序列（P 均＜0.05）。
结论：单独采用 T2WI-Dixon 序列与常规序列（SPAIR-T2WI 和 T1WI）对 axSpA 的诊断效能相似。因此，单独采用 T2WI-Dixon 序列的 MRI 检查可以作为临床诊断、评估以及随访 axSpA 简便、有效的影像学方法。

EPO-1975
成人脊柱朗格汉斯组织细胞增生症骨质破坏修复形式探讨

任武科
忻州市中心医院

【摘要】目的 探讨成人脊柱朗格汉斯组织细胞增生症（LCH）骨质破坏修复形式。方法 对 9 例 11 个椎体病理确诊的明显骨质破坏的成人脊柱 LCH 骨质修复过程的跟踪随访，通过 CT、MRI 影像变化，分析骨质修复的形式。结果 9 个病例 11 个病灶，其中颈椎 5 例 6 个病灶，胸椎 2 例，腰椎 1 例 2 个病灶；单纯放疗 3 例，化疗 2 例，放化疗 1 例，另外 3 例随访观察；其中 2 例只进行 CT 复查，其余 7 例均有 CT、MRI 复查。从确诊到修复最短 6 个月，最长 50 个月；复查最少 3 次，最多 6 次；修复形式以破坏区中残存骨为中心修复 3 例，破坏区内斑点状多中心修复 5 例，多中心修复加边缘硬化边增生修复 1 例。结论 脊柱 LCH 骨质修复完全破坏区以斑点状多中心修复为主，中心有残存骨的以残存骨为中心修复为主，少部分以多中心加边缘硬化缘增生修复，这与文泽军[13]等单纯从边缘残存骨向中心推进看法略有不同。部分存在破坏区边缘骨质硬化带的病灶在随访中病灶破坏区仍有扩大，硬化带外移，压缩更明显，然而随后病灶缩小时硬化带却逐渐吸收，密度下降，所以破坏区边缘的硬化带可能是机体在应力下快速成骨反应，不能作为认定进入修复期的依据。

EPO-1976
Value of evaluating the risk of osteoporosis in diabetic patients by IDEAL-IQ

Yu Song,Qingwei Song,Nan Zhang,Haonan Zhang,Ailian Liu,Yanwei Miao
Dalian First Hospital affilliated to Dalian Medical University

Objective: To investigate the value of IDEAL-IQ in the assessment of osteoporosis risk in diabetic patients .**Materials and Methods :**After providing informed consent,16 diabetic patients underwent magnetic resonance lumbar vertebraIDEAL-IQ sequence scan and dual-energy X-ray absorptiometry (DXA) scan ,body mass index(BMI)20.21～28.08kg/m^2. After the dual-energy X-ray absorptiometry (DXA) was performed, all patients with diabetes were divided into three groups: Group A was normal bone mass group, group B was bone mineral density decrease group, and group C was osteoporosis group. The IDEAL-IQ sequence automatically generates 6 images, including Fat Fractionimages, R2* relaxation rate images, water images, fat images, in-phase and out-phase images. The FF values of vertebral bone marrows were measured on GE AW4.6 post processing workstation. The FF values of lumbar vertebra in groups A, B and C were analyzed and compared. The data were analyzed by SPSS 19.0 statistical software, P <0.05 was considered statistically significant .**Results :**There was no significant difference in age between groups A, B and C (P>0.05).The average FF values of lumbar vertebral

bodies between groups A, B and C were 43.65±3.91, 49.78±6.67 and 57.85±3.84, respectively .One-way ANOVA showed significant difference in FF values between different groups (ANOVA,F=5.515,P=0.036). There was a statistically significant difference in FF between group A and group C (Post-Hoc LSD, P=0.013). There was no significant difference in FF between group A and group B, group B and group C (Post-Hoc LSD, P=0.084; Post-Hoc, P=0.171) .**Conclusion** :IDEAL-IQ can quantitatively evaluate the fat fraction of lumbar vertebral and invasively evaluate the risk of osteoporosis in diabetic patients, which has guiding value for clinical diagnosis and treatment.

MR 双斜冠状位扫描肩关节诊断肩袖损伤的临床价值

宁文锋[1],马鸣岳[1],邬小平[1],杨军乐[1],刘红生[1],杨想春[1],李璐言[1],弓甜甜[1],李鹏飞[1],张军俭[2]
1.西安市中心医院
2.西安市第九医院

目的:探讨 MR 双斜冠状位扫描肩关节诊断肩袖损伤的临床价值。
方法:对 2017 年 2 月~2018 年 10 月期间我院收治的 64 例疑似患有肩关节肩袖损伤患者的临床资料进行回顾性研究分析。将这 64 例患者分为对照组和研究组,每组各有 32 例患者。我科为对照组患者进行肩关节 MR 斜冠状位扫描,对研究组患者进行肩关节 MR 双斜冠状位扫描。然后比较两组患者图像显示的结果。
结果:研究组患者进行的肩关节 MR 双斜冠状位扫描可以完全将冈上肌、冈上肌腱和肱骨长轴同时显示在一张图像上(显示率为 100%)。而对照组患者进行的肩关节斜冠状位 MR 扫描不能将冈上肌、冈上肌腱和肱骨长轴同时显示在一张图像上(显示率为 0%)。研究组患者采用肩关节 MR 双斜冠状位扫描诊断肩袖损伤的敏感性(指在诊断过程中未漏诊的几率)为 93.33%。对照组患者采用肩关节 MR 斜冠状位扫描诊断肩袖损伤的敏感性为 66.67%。敏感性与准确性分别为 93.33%与 89.29%，均明显较对照组高，P＜0.05；两组的特异性对比，无明显差异，P＞0.05。
结论:进行肩关节 MR 双斜冠状位扫描可以清楚地显示标准的肩关节冠状位图像,其对冈上肌腱病变的显示效果要优于肩关节 MR 斜冠状位扫描。对临床诊断治疗有很大指导意义，因此,此检查方法可作为临床上诊断肩袖损伤的首选方法。

经皮椎间孔镜下治疗椎间盘突出症术后 MRI 疗效评价

张伟
甘肃中医药大学附属医院

[摘要]目的 探讨经皮椎间孔镜下治疗椎间盘突出症术后不同时间 MR 检查疗效评价。方法 选取本院 51 例行 TESSYS 髓核摘除及神经根松解术患者，均在术前、术后一周及术后一月做 MRI 检查，对术区图像对比分析。结果 51 例术前检查结果为椎间盘突出并单侧神经根症状，测量侧隐窝矢状径（4.483mm 平均值，最大值 7.8mm，最小值 2.3mm）；术后一周 MR 检查无法精确测量侧隐窝矢状径，发现并发症 3 例（2 例术后血肿形成，1 例术后髓核再脱出）；1 例髓核再脱出再次行 TESSYS 髓核摘除术；术后一月 MR 检查术区渗出吸收、神经根水肿消失，2 例术后血肿吸收；测量侧隐窝矢状径（12.834 平均值，16.4mm 最大值，最小值 8mm）；术前与术后隐窝矢状径比较增大（P＜

0.05）。结论 术后一周 MR 检查对术后并发症的发现有较大价值；术后一月渗出、神经根水肿吸收，测量量侧隐窝矢状径与术前对比增大，对术后并发症（血肿形成）吸收有较大意义。

浅谈波谱不同体素大小的选择对乳腺胆碱 Cho 峰的影响

黄华[1,2],谭碧雯[1,2],徐雅静[1,2]
1.深圳大学总医院
2.深圳大学临床医学科学院

目的：探讨波谱不同体素大小的选择在乳腺胆碱 Cho 峰中的影响，获取更精准的谱线基线。方法：选取女性乳腺 MRI 检查患侧、健侧各 10 例（体质指数 BIM<30），年龄段为 20-55 岁，排除术后、外伤、遗传性疾病等因素后纳入本次研究，取增强后 ROI①患侧病灶和 ROI②周边正常乳腺组织容积定位（避免脂肪、骨骼），可忽略不计对比剂对病灶 MRS 的影响。分 A 组（2.0X2.0X2.0cm）、B 组（1.8X1.8X1.8cm）、C 组（1.5X1.5X1.5cm）、D 组（1.0X1.0X1.0cm）。扫描参数：检查方法为单体素，TR2000ms,TE155ms，将对 MRS 做后处理量化分析：谱线的共振频率、谱峰高、半峰全宽 FWHM 及谱线下面积。3.2ppm 处由胆碱和含胆碱复合物组成的复合胆碱峰,可以作为恶性肿瘤的标志，故使 Cho 峰的基线平稳、突出以及与周边峰的间距大，方可作为评价标准。由 2 位副主任医师采用扫盲法评价，运用 SPSS 24 软件对其数据进行对比性分析。结果：A 组总采集次数为 96 次，总扫描时间 2min48s；基线平稳，ROI①胆碱峰突出明显，敏感性为 50.6%，特异性为 82.4%，ROI②敏感性为 30.4%；B 组总采集次数为 180 次，总扫描时间 5min；基线较平稳，ROI①胆碱峰较明显，敏感性为 39.6%，特异性为 58.2%，ROI②敏感性为 30.4%；C 组总采集次数为 540 次，总扫描时间 14min；基线较波折，ROI①胆碱峰陡平，涵盖病灶不全，敏感性为 27.6%，特异性为 33.1%，ROI②敏感性为 18.7%；D 组总采集次数为 6144 次，总扫描时间 2.5h；基线波浪短小曲折，涵盖部分病灶，但获取的谱线成分多，ROI①胆碱峰较陡平，敏感性为 15.6%，特异性为 23.4%，ROI②敏感性为 12.3%。结论：乳腺波谱单体素可实现量化分析，大体素的选择可涵盖大病灶范围，波谱的谱线基线稳定。

乳腺癌 MRI 影像学征象与 Her-2 表达关系的研究

周晶[1],白岩[1,2],王梅云[1,2]
1.河南省人民医院
2.河南省神经疾病影像诊断与研究重点实验室

目的：探讨乳腺动态增强 MRI(Dynamic contrast-enhancement magnetic resonance imaging, DCE-MRI)影像表现与人表皮生长因子受体 2 (Human epidermal growth factor receptor 2, Her-2)表达状态之间的关系。**方法：**收集我院 2019 年 3 月-2019 年 7 月经手术病理证实为乳腺癌患者 82 例，所有患者术前均行 GE 750 MRI 3.0 乳腺 DCE-MRI 扫描。主要观察的 DCE-MRI 影像学征象包括病灶大小、形态、边缘、T2WI 信号强度、强化类型和时间-信号强度曲线(time-signal intensity curve,TIC)类型，肿块形态分为圆形、椭圆形和不规则形；边缘分为清晰、模糊、分叶和毛刺；T2WI 信号分为等信号和高信号；强化类型分为均匀强化、不均匀强化和环形强化；TIC 类型分为Ⅰ型（持续上升型）、Ⅱ型（平台型）和Ⅲ型（廓清型）。将术后病理组织进行 Her-2 免疫组织化学(Immunohistochemistry, IHC)染色分为 Her-2 阳性组(3+)和阴性组(0+或 1+)，2+进行荧光原位杂交检测并根据结果纳入阳性组或阴性组。观察乳腺癌 DCE-MRI 影像学征象与 Her-2 表达之间的关系。**结果：**乳腺癌 MRI 影像学征象与 Her-2 表达状态中肿块大小、形态、边缘、强化类型和

时间-信号强度曲线类型(time-signal intensity curve,TIC)与 Her-2 表达状态之间具有统计学意义，P 值＜0.05。乳腺癌 Her-2 阳性肿块大小为 2.68±1.52cm，肿块形态多不规则形、边缘毛刺、强化类型以不均匀样强化居多、TIC 类型多为III型（廓清型）。**结论：**乳腺癌 DCE-MRI 影像学征象可以反映 Her-2 表达状态，对指导临床治疗决策和预后判断有一定意义。

EPO-1981

DCE-MRI 联合 DKI 在提高 BI-RADS-MR 中Ⅲ、Ⅳ类良恶性病变鉴别及与 Ki-67 表达水平的关系

李俊杰
山西医科大学第一医院

目的：探讨磁共振动态增强成像（DCE-MRI）联合扩散峰度成像（DKI）对乳腺磁共振报告数据系统（BI-RADS-MR）中III-Ⅳ类良、恶性病变诊断的初步探索及与其 KI-67 表达水平的关系。
方法：由两名高年资影像诊断医师采用盲法阅片，基于 BI-RADS-MR 分类共计III、Ⅳ类 35 例，术前均未经过任何放化疗，经病理证实的有 30 例，30 例患者均有行术前 DCE-MRI、DKI 检查，并测定动态增强参数（时间-信号曲线 TIC 及其参数增强峰值到达时间 T_{peak}、最大流入曲线率 K_1、最大增强线性斜率 S_{max}）、DKI 参数（平均扩散峰度 MK 值），将这些参数与病理结果进行统计分析，采用 ROC 曲线用于识别最佳参数。使用 spearman 相关分析来评估 KI-67 表达水平与每个参数的相关性。
结果：乳腺癌III-Ⅳ类恶性病变 S_{max}、MK 值均高于良性病变（S_{max}：2.02±0.7，P＜0.05；MK 值：0.87±0.21，P＜0.05）；S_{max}联合 MK 值时，诊断效能优于各自诊断价值，AUC 为 0.94。MK 值与乳腺癌中 KI-67 的表达水平具有统计学意义（P＜0.05）。
结论：磁共振动态增强成像（DCE-MRI）联合扩散峰度成像（DKI）可以提供一种准确诊断乳腺癌磁共振报告数据系统（BI-RADS-MR）中III-Ⅳ类良、恶性病变的方法，并且 MK 值似乎与乳腺癌中 KI-67 的表达水平具有一定相关性。

基于影像组学诺莫图预测乳腺癌腋窝淋巴结转移

毛宁[1],洪楠[2]
1.山东省烟台毓璜顶医院
2.北京大学人民医院

目的：建立并验证术前预测乳腺癌腋窝淋巴结转移的影像组学诺莫图。
材料与方法：148 名符合条件的乳腺癌患者被分为训练组（n=100）和验证组（n=48）。从每个病人的磁共振图像中提取影像组学特征。然后在训练集中用 LASSO 算法建立影像组学标签。结合独立的危险因素，采用多元 Logistic 回归模型建立诺莫图。诺莫图的效能在训练集中进行评估，并在验证集中进行验证。最后，结合训练和验证集进行决策曲线分析，以评估诺莫图的临床实用性。
结果：由 9 个淋巴结状态相关特征组成的影像组学标签，具有良好的预测效果。包括影像组学标签和磁共振报告的淋巴结状态的诺莫图在训练集（AUC 0.79；95%CI，0.73-0.85）和验证集（AUC 0.76；95%CI，0.69-0.84）中也显示出良好的效能。决策曲线表明了我们列线图的临床实用性。另外，诺莫图在 MR 报告的淋巴结状态为阴性的亚组（AUC 0.88；95%CI，0.83-0.94）也显示出良好的鉴别能力。

结论：影像组学诺莫图是一种非侵入性术前预测工具，结合影像组学特征和磁共振报告的淋巴结状态，对乳腺癌患者淋巴结转移具有较好的预测效能，具有良好的应用前景，需要大数据进一步提高模型的效能和多中心验证获得临床应用的高水平证据。

The Effect of Temporal Resolution on Quantitative Parameters of DCE-MRI in Benign and Malignant Breast Lesions

Jia Huang
Tongji Hospital, Huazhong University of Science and Technology

Purpose
To explore the effect of different temporal resolutions on the pharmacokinetic parameters of breast lesions and its value in differential diagnosis of benign and malignant breast lesions.
Materials and Methods
30 patients with 31 masses were scaned with Siemens MAGNETOM Skyra 3T scanner, 16-channel breast special array coil. DCE-MRI was performed with a temporal resolution of 6s for 60 phases, and spatial resolution is 1.0 × 1.0 × 1.5 mm. Different image acquisition resolutions are constructed for the dynamic sequence after injection of contrast agent (phases 4th to 60th) using the method of isochromatic sampling. A total of eleven sets of image sequences of different data acquisition resolutions are composed of 6s, 12s, 18s, 24s, 30s, 36s, 42s, 48s, 54s, 60s and 90s. Quantitative pharmacokinetics parameters (Ktrans and Kep) were then calculated for all lesions at the different temporal resolution, using the Extended Tofts model. The Kruskal-Wallis test was used to compare the quantitative parameters obtained at different temporal resolutions. The areas under ROC curve of each quantitative parameter of different temporal resolutions were compared to judge the influence of temporal resolution on the quantitative parameters and the ability to distinguish benign and malignant breast lesions.
Result
No matter benign or malignant lesions, when the temporal resolution is reduced from 6s to 90s, the Ktrans and Kep decrease. Ktrans and Kep of different temporal resolutions were statistically significant. The Ktrans and Kep values of malignant lesions were higher than that of benign lesions. The differences of Ktrans and Kep values between benign and malignant lesions at different temporal resolutions were statistically significant ($P < 0.01$). The temporal resolution decreased from 6s to 90s, and the AUC values of Ktrans and Kep decreased as a whole. When the temporal resolution is 6s, the AUC value of Ktrans and Kep are the maximum, which are 0.889 and 0.915, respectively.
Conclusion
With the decrease of temporal resolutions, the Ktrans and Kep of benign and malignant breast lesions showed a decreasing trend, and the diagnostic efficiency in differentiating benign and malignant lesions decreased gradually. When the temporal resolution is 6s, Ktrans and Kep are the best for differential diagnosis between benign and malignant lesions.

The Role of Deep network framework based on "divide and conquer" strategy (DC-DNN) in Classification of Breast Lesions

Di Yang[1,2], Jiaqi Cao[2], Baoying Chen[3]
1.Department of Radiology , Air Force Military Medical University
2.School of Information Science and Technology, NorthWest University
3.Department of Radiology , Xi'an International Medical Center

【 **Abstract**】 ***Purpose*** *Combining Multi-sequence MRI features of breast lesions, Deep network framework based on "divide and conquer" strategy (DC-DNN) was used to classify benign and malignant breast lesions, and the effectiveness of this method was also be evaluated.* ***Materials and Methods*** *A retrospective analysis was made of 90 lesions in 90 patients from May 2015 to May 2017. Dynamic Contrast Enhanced MRI and Diffusion Weighted Imaging images were adopted. All lesions were confirmed by pathological results obtained by surgery and biopsy or by follow-up observation for at least 2 years. All lesions were randomly allocated to 80% as the training group and 20% as the test group. Deep network framework based on "divide and conquer" strategy (DC-DNN) was used to classify benign and malignant lesions. The sensitivity, specificity and accuracy of the method were calculated.* ***Results*** *Experiments on 90 MRI studies with 1835 images have demonstrated that the proposed DC-DNN achieves sensitivity, specificity, and accuracy respectively of 96.9%, 78.6% and 91.1%* ***Conclusion T****he DC-DNN can provide an effective tool for radiologists to analyze breast multi-sequence MRI.*

磁共振酰胺质子成像联合动脉自旋标记灌注成像鉴别胶质瘤复发与治疗反应

芮琦虹,温志波
南方医科大学珠江医院

目的　旨在探讨酰胺质子（Amide proton transfer, APT)成像和伪连续动脉自旋标记（pseudo-continuous arterial spin labeling, pcASL)灌注成像在鉴别高级别胶质瘤治疗后复发与治疗相关反应中的诊断价值

资料与方法　对 19 名有临床症状的怀疑复发的胶质瘤患者行 APT 和 pcASL 磁共振扫描，并获取 APTw 及灌注伪彩图。在病变的最大横截面，参照 Gd-T1w 图像上异常强化区域进行感兴趣区的勾画。记录每名患者病灶的所有 ROI 最大、平均 APTw 值（即，mAPTw、aAPTw）和 CBF 值（即，mCBF、aCBF）。同时还评估了病变的相对 APTw 值[病变的减去对侧正常白质（CNAWM）的 APTw 值]和相对 CBF 值（病变的除以 CNAWM 的 CBF 值）。采用 Student t 检验或 Mann-Whitney U 检验（非正态分布时）比较复发病变与治疗相关反应病变之间的 aAPTw 值、mAPTw 值、aCBF 值、mCBF 值、相对 APTw 值和相对 CBF 值。

结果　所有病例均经外科手术病理诊断或临床影像学随访证实，其中 5 例为治疗相关效应（图 1），14 例为肿瘤复发（图 2）。复发病变的 mAPTw 值、aAPTw 值、相对 APTw 值、mCBF 值、aCBF 值和相对 CBF 值明显高于治疗相关反应的病变（P<0.05）。
结论　磁共振 APT 成像和 pcASL 灌注成像有助于区分高级别胶质瘤手术并同步放化疗后的状态，这两种非侵入性成像有鉴别胶质瘤复发与治疗相关反应的能力。

EPO-1986

On the nodal degree configuration of multimodal brain connectomics in severe asymptomatic carotid stenosis

Lei Gao,Haibo Xu
Department of Radiology, Zhongnan Hospital of Wuhan University, Wuchang District, Wuhan City, 430071, Hubei Province, China;

INTRODUCTION

Severe asymptomatic carotid stenosis (SACS) refers to severe (70-99%) stenosis of the internal carotid artery but without previous stroke or transient ischemic attack (TIA). SACS is frequently associated with cognitive impairment (vascular cognitive impairment) and gait disturbance, [1] and an independent risk of future ischemic strokes. [2] Although SACS represents a clinically significant condition, [3] the remote brain consequences of the “silent” stenosis are less well known. Therefore in this study we have two aims, the first is to inquiry the topological configurations of multimodal connectomics that correlated with cognitive impairment in the patients with SACS. The second is sought to explore the vulnerable foci and predict the cerebrovascular risks. We utilized a unique MRI dataset to build multimodal imaging derived connectomics (networks) and investigated their nodal configuration, network resilience, and wiring cost. We calculated lesion loads of hypoperfusion and white matter hyperintensity (WMH) and drew a meta-analytical coactivation map of stroke from previous publications. We hypothesized that SACS will lead to burdens on nodes and network operation, followed by changes in nodal configurations and ultimately the cortical hierarchy.

MATERIALS AND METHODS

Twenty-four SACS patients and 24 comorbidity- and demographically-matched healthy controls (HCs) were recruited. MRI was performed with a 3.0-T MR system (Siemens, Germany) including T1 anatomical, resting-state BOLD, 64 directions diffusion tensor, susceptibility-weighted imaging (SWI), fluid-attenuated inversion recovery (FLAIR) and pulsed arterial spin labeling (PASL) sequences covered the whole brain.
Multimodal MRI data were preprocessed and connectomics were constructed using the 90 regions as nodes and correlation coefficients (connectivity) as edges. Normalized measures (i.e., degree centrality, global and local efficiency) were obtained by comparison with 1000 constrained null (i.e., random) networks. Meta-analytic map of stroke and MRI brain imaging in humans were conducted (coordinates in the MNI space, a total of 108 publications) in *Neurosynth* (www.neurosynth.org).[4] Cerebral microhemorrhages and WMHs were calculated using the SWI, FLAIR and T1-weighted images.

RESULTS

Patients with SACS showed significant converging decreases in nodal degree, mainly across sensorimotor, posterior cingulate/parietal, thalamic, and insular regions ($p < 0.05$, FDR corrected), and many of these are also located in the hub topography (Figure 1 & 2B), and better matched with the stroke meta-analytical map (Figure 2A). Subsequent multimodal degree rank identified a shift in hub distribution from association to the sensorimotor cortex in the patients with SACS (Figure 2B & 3). In addition, a significantly higher efficiency of functional networks and a higher wiring cost of structural networks were found in the patients with SACS ($p < 0.05$) (Figure 2C). The brain lesions of SACS patients were mainly located around the periventricular region (Figure 4). *Lastly,* structural wiring cost was significantly negatively correlated with WMH lesion size (Spearman $r = -0.47$, 95% CI -0.77 to -0.01, $p = 0.04$) and MMSE (Spearman $r = -0.55$, 95% CI -0.81 to -0.11, $p = 0.02$), and positively correlated with delayed recall (Spearman $r = 0.49$, 95% CI 0.04 to 0.78, $p = 0.03$).

CONCLUSION

Our study suggests that patients with SACS is predominantly characterized by hub pathology and maladaptive pattern of network efficiency and wiring cost, following primary sensorimotor-transmodal cortical gradient. These results will contribute to a better understanding of the cognitive impairment and future cerebrovascular events in these patients with SACS, from multimodal information and network perspective.

EPO-1987
基于激素冲击疗效分组的甲状腺相关眼病(TAO)患者眼眶软组织差异化研究

马艳强,张菁
华中科技大学同济医学院附属同济医院

目的：应用 cube flex 序列定量分析甲基强的松龙冲击（MPPT）治疗好转 TAO 患者与治疗未见好转 TAO 患者的眼外肌(ETM)及眶脂肪(OF)治疗前后体积及水分数，探讨 TAO 患者眼眶软组织测量值与 MPPT 治疗效果的联系。

材料和方法：20 名志愿者在 1 周内接受两次 CUBE FLEX 成像。39 例 TAO 患者（19 例治疗好转 TAO 患者；20 例治疗未见好转 TAO 患者）均在 MPPT 前后进行 CUBE FLEX 成像。测量了 39 例 TAO 患者及 20 例志愿者的总 ETM 及 OF 的体积及水分数。使用阈值法(MDT)和人工分割法(MS)对 Cube Flex 中的总 ETM 及 OF 体积进行测量。ETM 及 OF 的 ROI 被绘制在水图像上，并复制到相应的 in-phase 图像中，记录平均信号强度(SI)。定义并计算了 TEM 及 OF 的水分数为(SI 水/SIin-phase 相)。对 TAO 患者与志愿者 ETM 及 OF 的 WAF 与体积分别进行比较。对比治疗好转组与治疗未见好转组 ETM 及 OF 治疗前后体积及 WAF 之间的差异。TAO 患者的治疗后的好转程度由一位经验丰富的眼科医生进行。

结果：(1)MPPT 治疗前，好转组与未见好转组的 ETMS 及 OF 的水含量和体积均显著高于对照组。(2)MPPT 治疗后，TAO 患者的 ETMs 及 OF 的 WAF 和体积均显著降低(P<.001)。(3)治疗好转组治疗前眼外肌 WAF 显著高于治疗未见好转组(P<.001)。(4)好转组与未见好转组治疗前后容积无明显差异。

结论：TAO 患者对激素冲击治疗有不同的反应，我们发现，眼外肌水分数更高的 TAO 患者对激素冲击治疗的效果更明显。

Altered Long- and Short-range Functional Connectivity Density Associated with Poor Sleep Quality in Patients with Chronic Primary Insomnia: A Resting-state fMRI Study

Fuqing Zhou
The First Affiliated Hospital， Nanchang University

Previous neuroimaging studies have suggested that brain functional impairment and hyperarousal occur during the daytime among patients with chronic primary insomnia (CPI); however, alterations to the brain’s intrinsic functional architecture and their association with sleep quality have not yet been documented. In this study, our aim was to investigate the insomnia-related alterations to the intrinsic connectome in patients with CPI (n=27) at resting state, with a data-driven approach based on graph theory assessment and functional connectivity density (FCD), which can be interpreted as short-range (intraregional) or long-range (interregional) mapping. Compared with healthy controls with good sleep, CPI patients showed significantly decreased long-range FCD in the anterior hub regions of the default-mode network and the putamen. These patients also showed decreased short-range FCD in their multimodal-processing regions, executive control network, and supplementary motor-related areas. Furthermore, several regions showed increased short-range FCD in patients with CPI, implying hyper-homogeneity of local activity. Together, these findings suggest that insufficient sleep during chronic insomnia widely affects cortical functional activities, including disrupted FCD as well as increased short-range FCD, which is associated with poor sleep quality.

EPO-1989

The increased neurovascular coupling pattern in reward related loop in smartphone addiction

Zhe Zheng,Peng Qin,Ying Yu,Bo Hu,Wen Wang,Guangbin Cui
Department of Radiology ， Tangdu Hospital， Fourth Military Medical University

Introduction

Smartphone addiction has become an increasingly common public mental health problem [1]. However, the neurological mechanism of smartphone addiction remains unknown. Neurovascular coupling (NVC) is appreciated to be functional unit of high-level information organization by magnetic resonance imaging [2]. Besides, previous functional connectivity studies strengthened the reward-memory-executive loop to be

the target impaired regions in addiction. Therefore, this study attempts to explore the neurovascular coupling pattern in reward related loop in smartphone addiction population.

Methods
Eleven smartphone addicts and 11 control subjects were recruited. All subjects were examined with the Mobile Phone Addiction Index (MPAI). Oxygen level dependent signals and arterial spin labeling imaging were performed to calculate indicators for neuroactivity and cerebral perfusion. Potential NVC dysfunction was investigated by exploring the relationship between neuronal activity and cerebral perfusion maps. The Pearson correlation coefficients between these 2 maps were defined as the NVC biomarkers. Besides, the correlations between NVC coefficients and addiction index were also estimated.

Results
Comparing to control subjects, MPAI scores of the addiction group generally decreased. NVC coefficients in hippocampus, putamen, orbitofrontal cortex and caudate increased significantly implicated in mediating the memory, motivation and reward circuit, respectively. No intergroup difference was found in anterior cingulate cortex and amygdala which implicated in mediating control circuit. In addition, there was a positive correlation between NVCs and addiction index.

Conclusions
Smartphone addition might result from the strengthening of memory, motivation and reward circuit rather than impairing control circuit. NVC may be a promising indicator for evaluating smartphone addiction.

Influence of the low and high b-value distribution on the pseudodiffusion parameter derived from IVIM DWI in normal brain?

Yuchuan Hu[1],Linfeng Yan[1],Yu Han[1],Shijun Duan[1],Qian Sun[1],Gangfeng Li[1],Wen Wang[1],Xiaocheng Wei[1,2],Dandan Zheng[1,2],Guangbin Cui
1.Department of Radiology & Functional and Molecular Imaging Key Lab of Shaanxi Province, Tangdu hospital, the Military Medical University of PLA Airforce (Fourth Military Medical University)
2.MR Research China, GE Healthcare China, Beijing, 100176, China

Background: This study aims to answer whether the low b-values distribution, high b-values upper limit, and the number of excitation (NEX) influence the accuracy of the intravoxel incoherentmotion(IVIM) parameter derived from multi-b-value diffusion-weighted imaging (DWI) in the brain.
Methods: This prospective study on five consecutive multi-b DWI with different b-value protocols (0 - 3500 s/mm^2) were performed in 22 male healthy volunteers on a 3.0-T MRI system. The IVIM parameters from normal white matter (WM) and gray matter (GM) including slow diffusion coefficient (D), fast perfusion coefficient (D*) and

perfusion fraction (f) were compared for differences among defined groups with different IVIM protocols by one-way ANOVA.
Results: The D* and f value of WM or GM in groups with less low b-values distribution (less than or equal to 5 b-values) were significantly lower than ones in any other group with more low b-values distribution (all $P < 0.05$), but not significant among groups with more low b-values distribution ($P > 0.05$). Besides, no significant differences among the D, D* and f value of WM or GM were found between group with one and more NEX of low b-values distribution (all $P > 0.05$). IVIM parameters in normal WM and GM strongly depended on the choice of the high b-value upper limit.
Conclusions: Metrics of IVIM parameters can be influenced by low and high b value distribution. Eight low b-values distribution with high b-value upper limit of 800 - 1000 s/mm^{2}may be the relatively proper set when performing brain IVIM studies.

EPO-1991

Increased Iron Levels in Injured Hippocampus of T2DM Detected with MRI quantitative susceptibility mapping

Qian Sun,Yuxuan Shang,Ying Yu,Linfeng Yan,Wen Wang,Guangbin Cui
Tangdu Hospital, The Fourth Military Medical University

Background: Type 2 diabetes mellitus (T2DM) is associated with cognitive impairment. T2DM-related cognitive impairment may be the early stage of dementia. Iron can catalyze destructive free radical reactions and accumulate in the gray matter of the brain, increasing the risk of cognitive-related diseases. Previous studies have shown an increase in iron deposition in deep gray matter nuclei. However, in T2DM, the severely impaired hippocampus and the comparative areas of anti-cognitive impairment, such as thalamus, have rarely been studied. In the current study, we examined the hypotheses that elevated tissue iron and tissue breakdown is associated with T2DM-related cognitive impairment by assessing the hippocampus, a region affected early and severely by the disease, and the thalamus, a comparator region that is relatively spared.
Methods: Twenty T2DM patients and age, sex, and education matched healthy controls (HCs) were recruited. The high‐resolution Quantitative susceptibility mapping (QSM) data were subsequently acquired on a 3.0T MR scanner. QSM values were used as an index of tissue iron deposition. Cognitive function was evaluated by using Mini-Mental State Examination (MMSE), Montreal Cognitive Assessment (MoCA) and auditory verbal learning test(AVLT). Brain region volumes and densities were also evaluated among these participants.
Results: Neuropsychological tests showed impaired short-term and long-term free recall in patients with T2DM (all $P<0.05$). The QSM ratio of hippocampus to thalamus significantly decreased in T2DM groups. The QSM ratio of hippocampus to thalamus were closely related with the decreased short and long delayed free recall scores in T2DM($P<0.01$).
Conclusions: This study a has shown that hippocampal injury occurred in conjunction with iron accumulation in T2DM. The abnormal iron concentration of the hippocampus may be a biomarker of T2DM-related cognitive impairment.

磁共振灌注成像在烟雾病评估的应用初探

巨昕薇[1],张帅[2]
1.吉林大学第一医院
2.吉林省肿瘤医院

目的：运用核磁灌注成像技术评价烟雾病的血流动力学情况，探讨代偿性侧支循环形成与灌注的关系，探讨核磁灌注成像在烟雾病中对病情的应用价值。
方法：选取本院 2015 年 4 月~2018 年 10 月在吉林大学白求恩第一医院神经血管外科确诊为烟雾病的住院患者 98 名，其中男 47 例，女 51 例，年龄 10-63 岁，所有患者均行脑血管造影（DSA）和核磁灌注检查。并选取 15 名无神经系统病史的患者作为对照组。运用西门子 TrioTim3.0T 设备进行 MRI、MRA 及核磁灌注扫描。
以 MTT 图像为标准，将异常灌注范围划为感兴趣区（Region of Interest，ROI），勾画 ROI 避开明显大血管部位及陈旧梗死区域，用镜面法测得对侧的绝对灌注值，每个感兴趣区测量 3 次，取其均值。将病例分组对比，一为双侧烟雾病组与健康组，二为单侧烟雾病患者的健侧和对侧，三为临床急性起病组与慢性起病组，四为出血型烟雾病组与缺血型烟雾病组。分别记录相应的灌注参数值，并对两组参数值间进行配对样本 t 检验，检验标准为 0.05。
结果：①以 40-49 岁为最高发，50-59 次之；②双侧烟雾病患者额颞叶、基底节区血流可见异常，与健康组比较均有统计学差异（P<0.05）；③单侧烟雾病患者患侧与健侧各参数比较均有统计学差异（P<0.05）；④急性与慢性起病组感兴趣区 MTT、TTP 时间均延长，统计学差异不明显，CBV、

CBF 对比有统计学差异；⑤CBF 缺血组较出血组有所升高，有统计学差异，余各项参数相差不明显；出血组与健康组相比较，结果均无统计学差异。
结论：①磁共振灌注成像能够直观形象的显示烟雾病患者脑血流灌注及血流动力学情况；②急性起病与慢性起病组的对照，可评价烟雾病侧支循环的代偿作用；③分别评价缺血型与出血型烟雾病的血流状态，可对烟雾病的预后疾病转归提出预测；④通过灌注成像呈现的血流状态，结合临床表现，可以为外科手术治疗的时机及术式提供可靠依据。

帕金森病大脑运动控制及调节网络的研究及临床相关性分析

王帅文
兰州大学第一医院

目的：通过独立成分分析方法(ICA)观察帕金森病例组(PD)与正常对照组(NC)之间大脑感觉运动控制与调节功能网络空间结构及时间动态功能网络连接(tdFNC)状态，比较两组之间的差异并分析空间网络结构内连接强度与临床运动评分的相关性。
方法：本研究运用西门子 3.0Tesla 磁共振扫描仪，对 30 例 PD 患者及 34 例对照组进行静息态功能成像扫描，通过独立成分分析软件将全脑分为 33 个独立成分(IC)，对双侧感觉运动功能网络、岛叶网络及双侧小脑网络各 IC 之间的空间网络结构及所选取 IC 之间的 tdFNC 行双样本 t 检验比较(p<0.05，FDR p<0.05)，观察两组空间结构变化及时间序列中各之间的动态功能连接的差异，并对各功能网络 IC 的功能连接强度与帕金森病统一评分量表运动功能部分评分做相关性分析。
结果：本研究发现 PD 组较 NC 组空间网络结构中存在双侧补充运动脑区(SMA)、左侧初级运动皮层、中央旁小叶及躯体感觉皮层功能减低，双侧小脑半球功能减低，双侧岛叶网络中发现岛叶后部较 NC 组出现功能升高改变；在 tdFNC 分析中 state 2 存在功能连接的差异性，其中感觉运动网络内存在双侧躯体感觉皮层之间连接功能减低，岛叶网络 IC30 与小脑网络 IC8 功能连接减低，同时在 state 2 出现在平均驻留时间明显升高的差异性。另外各感觉运动功能网络连接强度与帕金森统一评分运动评分量表之间相关性评价发现存在显著负相关性分别为感觉运动网络内的左侧躯体感觉皮层、感觉运动皮层及小脑网络。
结论：本研究通过对比发现 PD 组与 NC 组之间感觉动态网络空间结构的改变及动态功能网络之间的连接的差异，并通过分析得出与 PD 运动评分之间具有显著相关性的脑网络的独立成分，从脑功能网络的空间、时间网络属性等多个方面解释了 PD 所导致的感觉运动功能异常等临床症状的机制及原因并为今后该病的进一步研究及疾病的诊断提供可靠的依据和方法。

EPO-1995
Sex differences of brain cortical thickness in major depressive disorder

Jingping Mou,Lihua Qiu,Lan Mei
Yibin Second People's Hospital

Objective: Major depressive disorder(MDD) is a serious mental disease.There are significant differences in incidence rate and clinical features of male and female MDD patients. The purpose of present study was to explore the sex differences of the brain cortical thickness in MDD patients and the relationship between these differences and clinical manifestations in different gender . Methods: High-resolution T1-weighted

images was acquired from 61 MDD (25 female [F] and 36 male [M]) and 61 (25 F and 36M) healthy control (HC). The cortical thickness differences among four groups was analyzed by the two-factor ANCOVA model, and Post-hoc test was used to compare the differences of cortical thickness between every two groups. Result: The MDD groups and healthy control groups did not differ significantly in terms of age, and years of education(P＞0.05), while the illness duration of male MDD was longer than female MDD group(P＜0.05). The sex difference of cortical thickness located in left caudalmiddle frontal gyrus, right fusiform, precentral gyrus, superiorfrontal gyrus and superiorparietal gyrus. After post-hoc comparison, we found that the thickness of right fusiform and precentral gyrus of males MDD was thinner than that in the female MDD group (P＜0.05). In addition, the cortical thickness of right precentral gyrus were negatively correlated with the illness duration in male MDD patients(r=-0.444,p=0.03). Conclusion: The differences of brain cortical thickness in different gender may associate with the different clinical characteristics and morbidity in male and female MDD patients. The negative correlation between cortical thickness of right precentral gyrus and illness duration in male MDD patients may used to evaluate the illness duration.

脑结构 MRI 的多维度应用：从疾病分型、神经调控到疗效预测

路翰娜
1.香港中文大学
2.广州医科大学附属脑科医院

背景：

磁共振成像(MRI)是临床疾病诊断与脑科学研究是不可或缺的影像学技术。随着分析方法的不断革新，在皮层厚度、灰质体积等传统形态学测量的基础上，脑结构 MRI 在分辨老化与认知障碍症，以及辅助非侵入性脑刺激治疗等领域展现出多个维度的新应用。头皮-皮层距离(Scalp-to-cortex distance, SCD)，作为脑形态学的新指标 [1]，目前国际上尚未有基于大数据结构 MRI 的头皮-皮层距离及其临床应用的研究。

目的：

(1) 探索老化相关和脑区特异性 SCD。

(2) 检测脑区特异性 SCD 在认知障碍症诊断中的作用。

(3) 检测 SCD 在经颅磁刺激治疗老年抑郁症中的疗效预测作用。

方法：

(1) 基于剑桥老化研究的 MRI 数据库（N=643），我们选取临床最为常用的左侧初级运动皮层(M1)和背外侧前额叶（DLPFC）。通过头皮与皮层的重建，个体化定位左侧 M1 和 DLPFC 的 MNI 坐标，SCD 即三维空间内头皮 MNI 坐标到皮层 MNI 坐标的矢量 [2]。

(2) 在一项随机、单盲、安慰剂对照的临床试验中，我们探索神经导航下 rTMS 对老年期抑郁症状和认知的临床效用以及 SCD 的预测作用。60 名老年重症抑郁合并认知障碍症患者被随机分配至真实 rTMS 组或虚拟 rTMS 组。刺激部位为左侧 DLPFC。康奈尔痴呆抑郁量表（CSDD）用于评估抑郁症状，蒙特利尔认知量表（MoCA）用于评估认知功能。

结果：

在老化群体中年龄相关的 SCD 仅见于左侧 DLPFC，并且这一距离可以预测三年后的认知功能下降（R^2 = 0.326, p = 0.011）。TMS 的临床试验中，治疗后两组在 CSDD 和 MoCA 评分中均有明显改善（组内效应），左侧 DLPFC 的 SCD 可以预测治疗 CSDD 和 MoCA 的分数改变。

结论：

基于结构 MRI 的头皮-皮层距离属于脑形态学的个体化指标，并且可以较好地区分正常老化与认知障碍，并且在临床试验中可以作为预测疗效的指标。

EPO-1997

多发性硬化患者在 3T 磁共振动脉自旋标记技术中的灌注异常发生率

顾瑶[2,1],李咏梅[1],马晓文[2],郑桥[1],谢敏[1]
1.重庆医科大学附属第一医院
2.西安市红会医院

目的 灰质在多发性硬化（MS）中的作用越来越明显，以前很少有研究评估复发-缓解型多发性硬化（RRMS）患者灰质灌注异常的发生率。本研究的目的是确定 RRMS 患者灰质灌注异常的发生率，并评估 RRMS 患者灌注异常与临床数据的相关性。
方法 对 37 例 RRMS 患者和 50 例与之年龄、性别相匹配的健康对照组行 3T MRI 扫描，其中包括 3D 伪连续动脉自旋标记(3D pCASL)的扫描。由两名影像科医师在后处理工作站通过双盲法将患者分为灌注正常组和灌注异常组，并提取灌注异常患者异常部位的灌注值。进一步分析有或无灌注异常患者的临床参数与灌注改变之间的关系。
结果 37 例患者中，12 例出现灌注异常，其中额叶占 91.7%、顶叶占 33.3%、颞叶占 50%、枕叶占 58.3%、深部灰质占 25%、小脑占 8.3%。1 例表现为高灌注，12 例表现为低灌注。灌注异常和灌注正常患者在认知、抑郁、疲劳、病程中有统计学差异。
结论 RRMS 患者灰质存在较高的灌注异常率，主要累及额叶。灌注异常患者往往可表现出特定的症状，具有一定的临床价值。

强制戒断与美沙酮维持治疗一年对海洛因成瘾者脑功能 影响的低频振幅 fMRI 研究

刘为,陈佳杰,李强,时宏,薛久华,刘艳,李玮,朱佳,金龙,魏龙晓,王玮
空军军医大学唐都医院

[摘要] **目的** 探讨强制戒断和美沙酮维持治疗两种干预措施一年对海洛因成瘾者大脑功能影响的差异。**方法** 招募 17 名强制戒断约 1 年的海洛因成瘾者（PA 组）、16 名美沙酮维持治疗约 1 年的海洛因成瘾者（MMT 组）与 35 名正常对照组（HC 组）参加本研究，对所有受试者进行功能磁共振扫描采集静息态数据，利用低频振幅（ALFF）方法计算三组大脑局部自发性脑活动的强度，方差分析及事后分析比较 PA 组与 MMT 组脑活动变化趋势。**结果** 三组间在右侧距状回、左侧小脑上回、右侧内侧额上回、右侧辅助运动区 ALFF 值存在显著性差异；事后分析发现 PA 组在距状回与辅助运动区脑活动更趋近于正常组；MMT 组右侧内侧额上回 ALFF 值与美沙酮维持治疗时间（月）呈负相关性（r=-067，*P*=0.004），PA 组右侧距状回 ALFF 与强制戒断时间（月）呈负相关性（r=-0.54，*P*=0.02）。**结论** 经过 1 年干预后，美沙酮维持治疗者与强制戒断者在部分成瘾脑区仍存在异常，但强制戒断可能更有利于海洛因成瘾者脑功能恢复。

EPO-1999

Faster temporal resolution yields optimal BOLD sensitivity in olfactory fMRI

Hong Chen,Jianzhong Yin
Tianjin First Central Hospital

Objective: Currently, olfactory functional magnetic resonance imaging (olfactory fMRI) is applied as a non-invasive mapping technique as it is able to efficiently localize the primary and secondary olfactory area using blood oxygen levels dependent (BOLD). BOLD sensitivityin fMRI is dependent on acquisition parameters such as echo time (TE), repetition time (TR), and voxel size and magnetic field strength. The current study investigated the influence of TR on odor-induced brain response signals within the primary olfactory area (POC) and some secondary olfactory areas.
Methods: Sixteen healthy participants (age range 21 to 30 years, mean age 25 years) underwent a block-design fMRI with odor stimulation. Every subjects went throuth three times of olfactory experiment at their same time of three.days in a week. To investigate the effects of imaging resolutions on BOLD sensitivity, fMRI images were acquired during the olfactory tasks using three different TRs (500ms, 1000ms and 3000ms) by applying the recently introduced multiband (MB) or simultaneous multi-slice (SMS) EPI technique .We compared volumes and t-scores of significant activation, and evaluated performance of hemodynamic response function (HRF) of bilateral POC, amygdala, hippocampus and insula. Repeated measures analysis of variance (rmANOVA) was used to study significant changes of BOLD sensitivity across TRs. Pairwise comparisons testing with Bonferroni correction were carried out when significant changes were observed.
Results: After odor stimulus onset timing correction, results demonstrate that the BOLD sensitivity can be increased significantly with temporal resolution.With the TR time reduced, the image sampling point and brain activation of area of interest (ROI) increased and HRF tended to be more standardized and improved especially in TR=500ms. These results indicated that the improved sensitivity to neural activity of certain olfactory areas in block-design olfactory experiment could be obtained in TR=500ms.
Conclusion: Multiband EPI shortened the TR, increased temporal sampling and more comprehensive acquired brain activation information in certain olfactory areas . This shows the faster temporal resolution accompanys with robust BOLD sensitivity in olfactory fMRI.

EPO-2000
非均匀磁化转移（IhMT）在抑郁症伴自杀意念患者大脑白质结构改变中的应用研究

周智凤[1],刘霞[1],张迎黎[1],侯刚强[1],钱龙[2]
1.深圳市康宁医院（深圳市精神卫生中心）
2.GE 医疗中国总部

目的： 非均匀磁化转移（inhomogeneous magnetization transfer, IhMT）技术因其对髓鞘磷脂成像具有高度的敏感性和特异性的特点，是近年来大脑结构成像研究的新兴技术。本研究旨在探究

其在伴或不伴自杀意念的重度抑郁症（major depressive disorder, MDD）患者大脑白质结构改变中的应用价值 。
方法： 共纳入自杀意念 MDD 患者 12 例（DS 组，男 3 例；年龄 30.2±11.8 岁），无自杀意念 MDD 患者 22 例（DP 组，男 11 例；年龄 35.7±12.5 岁）及健康志愿者 25 例（HC 组，男 15 例；年龄 33.6±11.7 岁）。采用 GE 3.0 T 磁共振扫描仪采集各被试大脑 T1 结构像及 IhMT 图像，经后处理得到各被试大脑白质纤维束的定量 IhMT（qIhMT）及 IhMT 比率（IhMTR）。运用协方差分析比较三组被试 qIhMT 及 IhMTR 值的差异，结果进行 Bonferroni 校正，并对 DP 及 DS 组的 qIhMT 及 IhMTR 值分别与汉密尔顿抑郁量表（HAMD）评分进行 Pearson 相关分析， $p<0.05$ 认为差异有统计学意义。
结果： 与 HC 组相比， DP 及 DS 组胼胝体压部/双侧丘脑放射后部/左侧内囊后肢及上纵束的 qIhMT 值明显升高，左侧内囊后肢及钩束的 IhMTR 值明显升高；DP 组左侧钩束的 qIhMT 值，DS 组左侧下纵束/下额枕束的 qIhMT 值及胼胝体压部的 IhMTR 值均较 HC 组明显升高 。DP 组左侧上纵束的 qIhMT 值与 HAMD 呈显著负相关($r=-0.498, p=0.018$)，而 DS 组左侧扣带束的 IhMTR 值与 HAMD 呈显著正相关（$r=0.681, p=0.015$）。
结论： 本研究结果与既往关于 MDD 自杀相关的大脑结构研究结果基本一致，这说明 IhMT 技术在 MDD 患者大脑白质结构改变的研究中具有较大的临床应用价值，qIhMT 及 IhMTR 值有望成为大脑白质结构改变的生物学标记 。

DWI 及 SWI 在孤立性纤维性肿瘤/血管外皮细胞瘤与脑膜瘤鉴别诊断中的价值

江冰清,郑颖彦,陈潭辉,曹代荣
福建医科大学附属第一医院

目的 探讨扩散加权成像（DWI）和磁敏感加权成像（SWI）在孤立性纤维性肿瘤/血管外皮细胞瘤与脑膜瘤鉴别诊断中价值。**方法** 回顾性分析 14 例和 28 例经手术病理证实为孤立性纤维性肿瘤/血管外皮细胞瘤与脑膜瘤患者的常规影像学表现及 DWI、SWI 表现，分别测量 DWI 的表观扩散系数（ADC）值和 nADC 值、评估 SWI 的肿瘤内磁敏感信号（ITSS）分级。采用秩和检验和受试者工作特性曲线（ROC）分析各参数，并联合筛检 DWI、SWI 各自的最佳参数。**结果** 孤立性纤维性肿瘤/血管外皮细胞瘤组的 nADC 值与 ITSS 分级均高于脑膜瘤组的，差异均具有统计学意义（$P<0.05$）。ROC 曲线分析结果显示，以 nADC 值〉1.17 鉴别孤立性纤维性肿瘤/血管外皮细胞瘤和脑膜瘤时，诊断的敏感性和特异性分别为 64.29%、92.86%；以 ITSS 分级〉1.00 鉴别诊断时，诊断的敏感性和特异性分别为 71.43%、78.57%。联合 nADC 值和 ITSS 分级诊断时，敏感性和特异性分别为 71.43%、92.86%。**结论** DWI 和 SWI 在孤立性纤维性肿瘤/血管外皮细胞瘤和脑膜瘤的鉴别诊断中具有重要价值，联合应用 DWI 和 SWI 可提高诊断正确率。

EPO-2002
颈部血管 3D-TOF-MRA 图像质量与高血压患者的相关性研究

李祚钦,张树桐,王翔,黄增发
武汉市中心医院

【摘要】 目的： 探讨颈部血管 3D-TOF-MRA 图像质量与高血压患者是否存在相关性。方法： 回顾性研究我院 84 例行颈部血管 3D-TOF-MRA 的患者，分为高血压组（收缩压>140nnHg 或舒张压

>90mmHg）42 例、非高血压组(对照组)42 例，并由两名高资历阅片者分别对两组图像进行主观评价（5 分法），比较两组间的图像质量差异。结果：高血压组 3 分 8 例、2 分 21 例、1 分 13 例，平均得分 1.88:；对照组 4 分 5 例、3 分 15 例、2 分 18 例、1 分 4 例，平均得分 2.5，两组的评分差异具有统计学意义（p<0.05）。其中高血压 1 级 26 例，2 级 8 例，3 级 8 例，平均得分分别为 1.96，1.75，1.75。收缩压与图像质量呈负相关（r=-0.419，p<0.001）；舒张压与图像质量呈正相关（r=0.588，p<0.001）。结论：高血压对颈部血管 3D-TOF-MRA 图像质量有影响，容易造成信号丢失，造成误诊，且高血压分级越高图像质量越差。

EPO-2003

The relationship of functional connectivity between rest and task states

Zhenliang Xiong[1,2],Chong Tian[2],Jie Huang[2],Xianchun Zeng[2], Dongxue Li[2],Rongpin Wang[2]
1.Medical School of Guizhou University
2.Guizhou Provincial People's Hospital

Purpose: To study the functional connection relationship between resting and task state functional magnetic resonance imaging (fMRI). **Methods:** Sixteen healthy subjects were recruited to participate in this study. Each participant first undertook a 9 min resting-state (rs) run and then a 9 min task run. During the rs run, the participants were instructed to close their eyes and try not to think of anything but remain awake for the whole scan. During the task run, they performed two tasks, the first task trial consisted of rubbing five fingers of the right hand for 8 sec followed by a 22 sec rest period; and the second task trial consisted of opening the eyes for 8 sec and then closed them for the 22 sec rest period. These two task trials were repeated for 8 times, resulting in a total of 8 min task period. **Results:** Comparing to the resting state, the motor task not only substantially expanded the common FC map but also recruited several additional areas such as both the left and right anterior and posterior motor areas of the cerebellum. The common FC map of visual region was mainly limited within the visual cortex, and the areas evoked by the visual task were mainly in other cortical areas outside the visual cortex. In particular, the signal of the motion area task in the central gyrus region is missing compared with that in the resting state. **Conclusions:** A widely accepted hypothesis is that spontaneous and task-evoked brain activity is linear, but we have proved that this is not exactly the case. In addition, we also find that compared with the resting state, the motion task not only extends the common FC map greatly, but also adds several additional regions.

EPO-2004

Predicting H3K27M mutation status in diffuse midline gliomas using amide proton transfer-weighted MRI

Yu Han,Lin-Feng Yan,Wen Wang,Guang-Bin Cui
Department of Radiology & Functional and Molecular Imaging Key Lab of Shaanxi Province, Tangdu Hospital, the Military Medical University of PLA Airforce (Fourth Military Medical University)

Background: To assess the amide proton transfer-weighted (APTw) MRI features of H3K27M-wildtype and H3K27M-mutant diffuse midline gliomas (DMG) and to test the hypothesis that the APTw signal is a surrogate imaging marker for identifying H3K27Mmutation status preoperatively.
Methods: Forty-two patients with pathologically confirmed DMG and molecularly classified as H3K27M-mutant (22 subjects) and wildtype (20 subjects) who underwent APTw MRI, were retrospectively analyzed. The Mann-Whitney test was used to evaluate relationships between APTw intensities for H3K27M-mutant and H3K27M-wildtype groups, and receiver operator characteristic (ROC) analysis was used to assess the diagnostic performance of APTw parameters.
Results: The maximum and minimum APTw values, based on multiple regions of interest, as well as the whole-tumor histogram-based mean and 40th percen- tile APTw values, were significantly higher in the H3K27M-mutant DMG than in the H3K27M-wildtype groups. This corresponded to the areas under the ROC curves of 0.94, 0.76, 0.77, and 0.79, respectively, for the prediction of the H3K27M mutation status.
Conclusion:H3K27M-mutant lesions typically were associated with relatively high APTw signal intensities as compared with H3K27M-wildtype lesions. The APTw signal could be a valuable imaging biomarker by which to identify H3K27M mutation status in DMG.

EPO-2005

Susceptibility and Volume Changes of the Mammillary Bodies as a Function of Age for Healthy Individuals and Early Stage Dementia

Zhijia Jin
Ruijin Hospital

Purpose： To investigate the susceptibility and volume change of the mammillary bodies in mild cognitive impairment (MCI), Alzheimer’s Disease and healthy individuals.
Methods： Two sites were used in the QSM and T1 analysis. At site one, 171 healthy controls between 20 and 70 years old were imaged on a 1.5 Tesla GE Signa with a GRE sequence to collect magnitude and phase images with a voxel resolution of 0.46x0.46x3mm³. At site two, 16-echo GRE data and T1 data for 75 MCI subjects were collected on a 3.0 Tesla Philips Ingenia. In addition, 16-echo GRE data and T1 data for 51 age-matched healthy controls were collected on a 3.0 Tesla GE Signa HDxt scanner. All QSM data were collected with a voxel resolution of 0.86x0.86x1mm³ and T1 data were collected with a 1mm isotropic resolution.The mammillary bodies were traced on all T1 data (75 MCI, 9 AD, and 51 HC) zoomed 8x to collect volumes. The mammillary bodies were traced according to the contrast on QSM at a magnification of 8x using a full-width half maximum threshold, with manual adjustments as needed. Volumes, mean susceptibility, and maximum susceptibility were output. The correlation of susceptibility and volume values with age was applied with Pearson’s correlation analysis.

Results
For healthy individuals between 20 and 70 years old, there appears to be a slight increase in mean susceptibility and a significant increase in maximum susceptibility with age. For MCI patients, AD patients and their age-matched healthy controls, it shows a slight increase in mean susceptibility in HC group and it appears to be no change in the MCI group. A significant increase in maximum susceptibility with age in the HC group and no change in the MCI group was found. There was a slight reduction in volume with age for both MCI patients and HC. Nevertheless, there appears no statistical differences of either susceptibility or volume among AD patients, MCI patients and healthy controls.
Conclusion
There was a slight reduction in volume and increase in mean susceptibility of the mammillary bodies with age. In addition, there was a significant increase in local iron content with age in healthy individuals. These data serve as a starting point for incorporating age effects on volume and susceptibility for any future study of the mammillary bodies.

EPO-2006
基于 SCALE 序列的定量灌注技术在鉴别 WHO II/III 级别胶质瘤的应用

吴昊,张伟国
陆军军医大学大坪医院

目的：动态磁敏感增强磁共振灌注成像(DSC-MRI)作为评价脑血流动力学指标的重要手段，被广泛用于脑胶质瘤的鉴别诊断[1]。相对灌注参数（rCBF/rCBF）在鉴别 WHO II/III 级胶质瘤存在挑战[2]。定量脑磁共振灌注成像(Scale-PWI)通过获得绝对定量灌注参数（qCBV/qCBF）对脑胶质瘤血流动力学改变进行精准评价[3]。本研究目的证明 SCALE-PWI 技术在鉴别二、三级胶质瘤具有较高的临床效能。
方法：2017 年至 2018 年，前瞻性收集神经影像疑似胶质瘤患者 32 例于西门子 1.5T MR scanner 成像仪行 SCALE-PWI 扫描。其中病理验证 WHO II/III 级胶质瘤（n=8）用于进一步分析。扫描参数：TE/TR = 34/1090 ms, flip angle = 20°, *FOV= 220× 220 mm², GRAPPA 加速因子= 2, 13 层，层厚=5 mm, 50 次。参照 T1 增强图像在 qCBV 和 qCBF 图上肿瘤实质区分别画 ROI 取平均值。ROC 曲线用于鉴别诊断。Student's t-test 用于比较组间差异。*
结果：WHO II 级和 III 级胶质瘤定量灌注参数具有显著差异(II 级胶质瘤 qCBV: 2.3 ± 0.3 ml/100g , III 级胶质瘤:5.7 ± 1.1 ml/100g for grade III, $p < 0.05$). ROC 分析曲线证明 SCALE-PWI 在鉴别 WHO II/III 胶质瘤具有较高的效能（曲线下面积 AUC: qCBV, 0.978; qCBF, 0.875）
讨论：我们的研究结果表明，基于 CBV 和 CBF 的精确定量，可以精确鉴别 WHO II 级和 III 级胶质瘤。本研究的主要不足为样本量较小，qCBV / qCBF 和 rCBV / CBF 之间缺乏比较。

EPO-2007

3.0T 磁共振纤维束示踪成像对脊髓型颈椎病的诊断和预后预测价值研究

戴飞
上海市青浦区中心医院

【摘要】目的：探讨 3.0T 磁共振纤维束示踪成像对脊髓型颈椎病（cervical spondylotic myelopathy，CSM）的诊断和预后预测的应用价值。方法：选择我院在 2016 年 1 月至 2017 年 12 月期间收治的 60 例 CSM 患者作为研究对象，均行常规磁共振成像和弥散张量成像，再 DTT 成像处理。采用日本骨科学会 JOA 评分标准将患者恢复情况氛围优、良、可和差 4 个等级，根据常规 MRI 信号将患者氛围 A 级、B 级和 C 级，根据 DTT 显示的纤维束连续程度分成 1 级、2 级和 3 级。比较常规 MRI 分级、DTT 分级与术前 JOA 评分和 JOA 改善情况之间的相关性。结果：MRI 分级 A 级、B 级和 C 级各 15 例、32 例和 13 例，DTT 分级 1 级、2 级和 3 级各 14 例、33 例和 13 例。两种分级体系中，三种级别患者术前
JOA 评分比较差异显著，两两比较均有显著差异（P<0.05）。MRI 分级中，A 级患者 JOA 评分改善率显著高于 C 级（P<0.05），但与 B 级无显著差异（P>0.05）；B 级与 C 级患者 JOA 评分改善率比较，差异无统计学意义（P>0.05）。DTT 分级中，1 级和 2 级患者 JOA 评分改善率比较无显著差异（P>0.05），但均显著高于 C 级（P<0.05）。pearman 相关分析结果显示，MRI 分级与术前 JOA 评分和术后 JOA 评分改善率的相关系数分别为-0.649（P<0.05）和-0.184（P>0.05）；二 DTT 分级与术前 JOA 评分和术后 JOA 评分改善率的相关系数分别为-0.839（P<0.05）和-0.462（P<0.05）。结论：DTT 对于脊髓型颈椎病分级诊断和预后预测价值优于常规 MRI。

Spontaneous Brain Activity after Acupuncture Treatment in Chronic Tinnitus Patients: A fMRI study

Xiangyang Wang,Mingzhu Zou,Jintao Zhang,Chen Zhang,Lifang Tian,Min Chen
BEIJING HOSPITAL

Abstract

Introduction:

Patients suffered with tinnitus increased in the prevalence with age, which have the possibility of causing hearing loss, sleepless, depress and so on. Research showed tinnitus syndrome could be relieved by means of acupuncture.

We aimed to investigate the change of amplitude of low-frequency fluctuation (ALFF) in resting-state functional magnetic resonance imaging (fMRI) in patients with chronic tinnitus and in patients taking acupuncture treatment.

Material and methods

We recruited 6 healthy volunteers and 5 chronic tinnitus patients (some of them with hearing loss). All subjects were first scanned by normal sequence (T1WI, T2WI DWI) to exclude organic disease in brain, inner and outer ears. Then they accepted the Resting-state fMRI scan. 6(4 volunteers and 2 patients) of them accepted acupuncture treatment according to the same acupuncture protocol.

Resting-state fMRI data were acquired on a 3.0T magnetic resonance Scanner. All data were analyzed with ALFF based on auditory cortex mask using the software of Data Processing Assistant for Resting-State fMRI (DPARSF). Comparison and statistical analysis were performed on the ALFF maps between patients group and Healthy control group, also between Pre-acupuncture group and post-acupuncture group.

Results

Comparing to control group, the ALFF of tinnitus patients group showed a significant increase in right superior temporal gyrus, and a significant decrease in bilateral middle temporal gyrus. While comparing to Pre-acupuncture group, the post-acupuncture group showed a significant increase in right middle temporal gyrus.

Conclusion

The activation changes in auditory cortex regions of patients with chronic tinnitus indicate the potential mechanisms of the brain function remodeling. While the activation changes after the stimulation of acupuncture showed reverse brain function remodeling.

Key Words: *Tinnitus, Resting-state fMRI, BOLD, Auditory Cortex, Acupuncture, ALFF.*

Clinical Relevance/application

According to our results, Acupuncture do accelerate the spontaneous brain activity which is opposed to the effect caused by the chronic tin

EPO-2009

磁共振扩散峰度成像与磁共振灌注成像对确定脑梗死核心区的对比研究

张飞,刘连锋,蔡雷,白江涛,张媛,张涛
延安大学咸阳医院

目的：DKI 结合 PWI 在确定脑梗死核心区及评价预后的优势。

方法：收集我院 2017 年 8 月-2018 年 8 月初诊 23 例急性期脑梗死患者，行 MRI 平扫、DKI 及 PWI 扫描，分别测量 DKI、PWI 图像上病灶的体积及不匹配面积，并于 1 个月之后进行 MRI 复查，测量 T2WI 上病灶的体积大小，比较急性期各参数图病灶体积与随访最终体积的相关性。

结果：1、16 例患者复查 MRI，T2WI 显示的病灶体积与 DKI、PWI 显示的病灶体积有相关性(P 值 <0.001),与 DKI 显示病灶的体积呈高度相关,与 PWI 显示的病灶体积呈中度相关；2、DKI 相关参数 MK 值较高的区域，复查 T2WI 上更靠近病灶梗死的中心区。

结论：急性期脑梗死患者 DKI 较 PWI 能更准确的确定梗死核心区,DKI 相关参数 MK 值较高的区域，更靠近病灶梗死的中心区，因此 DKI 有助于早期预测急性脑梗死患者病灶的最终转变及预后。

Multi-parametric quantitative mapping of brain metastasis using synthetic MR: a feasibility study

Xiangyang Wang,Wenchao Wang,Weifeng Zhao,Jintao Zhang,Chen Zhang,Min Chen
BEIJING HOSPITAL

Purpose

To investigate the longitudinal relaxation R1, transverse relaxation R2, and proton density in metastasis tumors(MT), peritumoral edema area(pEA) and normal white matter (NWM) in patients with history of brain metastasis, before and after Gadolinium(Gd) contrast agent administration.

Materials and Methods

This study was approved by the local institutional review board and all patients sigMulti-parametric quantitative mapping of brain metastasis using synthetic MR: a feasibility study
ned informed consents. 30 patients with a total of 46 brain metastases which were confirmed by a long term following-up study of malignant tumors were included in this study. All subjects underwent Magnetic Resonance Image Compilation(MAGiC) sequence and conventional T1WI sequence scan before and after Gadolinium contrast agent administration on a 3.0T scanner (Signa Pioneer, Milwaukee, USA). MAGiC images were then processed on vendor supplied workstation to generate multi-parametric mappings. Metastasis tumors, peritumoral edema area, normal white matter(NWM) and cerebrospinal fluid(CSF) were identified on T1WI images, and quantitative measurements including Longitudinal relaxation R1(R1), transverse relaxationR2(R2), and proton density(PD) were obtained. Paired samples t-test was used to compare multi-parameter before and after Gd contrast agent administration and t-test was used to compare the same parameter obtained from different part of brain. All the statistical analyses were performed using SPSS software (SPSS for Windows, release 24.0.0.0, IBM).

Results

The following observations were made by comparing the quantitative measurements of different areas: R1 Value: NWM>MT>pEA>CSF(P=0.000); R2 Value: NWM>MT>pEA>CSF(P=0.000), PD value: CSF>MT>pEA>NWM(P=0.000). Comparing the quantitative measurements before and after Gd contrast agent administration: in the tumor area, R1 showed increased(P=0.000, t=7.201), R2 slightly increased (P=0.023, t=2.422) PD value slightly increase(P=0.001, t=3.668); the quantitative measures obtained in other part of the brain such as peritumoral edema area, normal white matter(NWM) and cerebrospinal fluid(CSF) showed no significant difference before and after contrast agent administration (P>0.05). Significant differences were observed in R1 (P=0.000, t=7.011) and PD (P=0.000, t=4.175) MT-to-NWM ratio, while no significant difference was observed in R2 ratio (P=0.107, t=1.668).

Conclusion

The multiple quantitative parametric mapping from synthetic MR may differentiate different components of brain metastasis, especially with the use of contrast administration.

A Clinical Relevance

Multi-parametric mapping offered by synthetic MR may have potential in assessing brain metastasis.

EPO-2011

Differentiating gliosis and low grade Astrocytoma with mean apparent propagator (MAP) MRI

Ankang Gao[1], Huiting Zhang[2], Xu Yan[3], Jie Bai[1], Jingliang Cheng[1]
1. the First Affiliated Hospital of Zhengzhou University
2. MR Scientific Marketing, Siemens Healthcare, Wuhan, China
3. MR Scientific Marketing, Siemens Healthcare, Shanghai, China

Purpose:
To differentiate gliosis and low grade Astrocytoma using High Angular Resolution Diffusion Imaging (HARDI) sequence and mean apparent propagator (MAP)-MRI model, whose parameters include the mean squared displacement (MSD), return-to-the-origin probability (RTOP), return-to-the-plane probability (RTPP), return-to-the-axis probability (RTAP), Q-space Inverse Variance (QIV) and non-Gaussianity (NG).
Methods:
Patients whose MR imaging scan and diagnosis suggested be low grade Glioma were recruited. Patients who underwent surgery after High Angular Resolution Diffusion Imaging (HARDI) scan less than one week, and pathology proved to be gliosis and WHO grade Ⅱ Astrocytoma would be included in our research. 3.0 T MR scanner (MAGNETOM Prisima, Siemens Healthcare, Erlangen, Germany) with a 64-channel head-neck coil was used. The HARDI sequence was used with following parameters: FOV = 220×220 mm^2, matrix = 128×128, slice thickness = 2.2 mm, slices = 60, TR/TE =3800/72 ms, b-value=0, 3000 sec/mm^2, diffusion model is MDDW, and 64 directions for every b value. The MAP-MRI parameters were calculated using post-processing software developed in-house, which is based on an open-resource tool DIPY (Diffusion Imaging In Python, http://nipy.org/dipy). The calculated parameters included the mean squared displacement (MSD), return to the origin probability (RTOP), return to-the plane probability (RTPP), return to the axis probability (RTAP), Q-space Inverse Variance (QIV), perpend non-Gaussianity (NG|), and parallel non-Gaussianity (NG//) and non-Gaussianity (NG). The region-of-interest (ROI) was manually drawn around the entire tumor or abnormal signal on DWI (b=0). Statistical analyses were performed using SPSS statistics software (version 21.0, IBM). Independent-samples T test was used. A value of $P < 0.05$ was considered statistically significant.
Results: There were significant differences of MSD, NG, NG|, NG//, QIV, RTPP between gliosis (n=9) and WHO grade Ⅱ Astrocytoma (n=9). Gliosis group has a higher MSD and QIV value than WHO grade Ⅱ Astrocytoma, but when it comes to NG, NG|, NG//, RTPP value the situation is reversed. RTPP has a highest AUC, sensitivity and specificity value.
Conclusions: MAP-MRI model may be a useful way to distinguish gliosis and WHO grade Ⅱ Astrocytoma, especially RTPP has a highly differential efficacy. According to histocyte pathological, there are difference between the two groups mentioned above. So MAP-MRI model may be reflect the difference of microstructure between gliosis and WHO grade Ⅱ Astrocytoma, such the density and proliferation of cell, texture of tissue and so on.

EPO-2012

Surveillance of unruptured intracranial saccular aneurysms using non-contrast 3D black blood MRI: Comparison of 3D TOF and CE-MRA with 3D DSA

Xinrui Wang[1], Jianping Lu[2]
1.General Hospital of Northern Theater Command
2.Changhai Hospital of Naval Medical University

Background and purpose: Patients with unruptured intracranial aneurysms (UIAs) routinely undergo surveillance imaging to monitor growth.Angiography is the gold standard for aneurysm diagnosis, but is invasive.This study aims to evaluate the accuracy andreproducibilityof a 3D non-contrast black-blood (BB) MR technique for UIA measurement, in comparison with 3D TOF- and CE-MRA, using 3D rotational angiography (3DRA) as a reference standard.
Methods:64 patients (age 57.3±10.9 years, 41 female) with 68 saccular UIAs were recruited. Patients underwent 3T MRI with 3D TOF-MRA, 3D BB MRI and CE-MRA, and patients had a 3DRAwithin 2 weeks. The neck, width, height of the UIAs were measured by two radiologists independently on 3DRA and three MRI sequences. The accuracy and reproducibility was evaluated by Bland-Altman plots, coefficient of variance (CV), and intra-class coefficient (ICC).
Results: 3D BB MRI demonstrates the best agreement with DSA, with the smallest limit of agreement (LOA) and measurement error (CVs range 5.87% to 7.04%). 3D TOF-MRA had the largest LOA and measurement error (CVs range 12.73% to 15.78%). The average CV was 6.26% for 3D BB MR, 7.03% for CE-MRA and 15.54% for TOF-MRA. No bias was found among three MRI sequences compared with 3DRA.All three MRI sequences had excellent inter-reader agreement (ICCs>0.95). 3D BB MRI performed the best for patients with intraluminal thrombus (n=10).
Conclusions: 3D BB MRI achieves superior accuracy for intracranial aneurysm size measurements over 3D TOF, using 3DRA as a gold standard, although all MRI measurements did not significantly differ from 3DRA.This non-contrast technique is promising for surveillance of patients with UIAs.

EPO-2013

White matter damage and cognitive deficits in ESRD patients with SHPT: A diffusion-tensor study

Yanqi Dan
Second hospital of Anhui Medical University

Objective End-stage renal disease(ESRD) patients with secondary hyperparathyroidism(SHPT) show severe metabolic disturbance which can affect cerebral function, but little is known about brain structure alternation characters. We therefore investigated white matter microstructure alternation and

cognitive deficits.**Method** ESRD patients with SHPT(N=25) and controls(N=20) underwent diffusion tensor imaging (DTI), Mini Mental State Examination (MMSE) and Montreal Cognitive Assessment (MOCA).DTI images were analyzed using tract-based spatial statistics(TBSS).**Result** ESRD patients with SHPT showed significant decreased FA and increased MD,RD in widespread regions, and significant cognitive deficits. **Conclusion** The white matter damages were symmetrical and widespread, more severer than prior research which study on ESRD patients. The axonal injury was as serious as demyelination. Expect traditional risk, its potential mechanism may involve metabolic disorders caused by elevated PTH levels.

明显肝性脑病发作对肝硬化患者行肝移植术后短期脑水肿影响的弥散峰度成像研究

李景利,程悦,张晓东,沈文
天津市第一中心医院

目的：探究明显肝性脑病发作对肝硬化患者行肝移植术后脑水肿的影响，以及弥散峰度成像(DKI)技术对于评估脑水肿的价值。

方法：共纳入拟行肝移植的肝硬化患者 44 例，依据术前有无明显肝性脑病(OHE)发作分为有 OHE 组 21 例和无 OHE 组 23 例。所有入组患者在肝移植术前及术后 1 个月进行磁共振检查，采集 DKI 序列。采用 FSL 软件进行分析，通过基于体素水平的全脑分析，计算各向异性分数(FA)、平均弥散率(MD)、径向扩散系数(RD)、轴向扩散系数(AD)、轴向扩散峰度(AK)、平均扩散峰度(MK)和径向扩散峰度(RK)，采用配对样本 t 检验比较两组术前术后各弥散指标差异，对差异结果的多重比较校正采用体素水平的 FWE 校正($p<0.05$)。

结果：与术前相比，无 OHE 组术后在右侧内侧前额叶及双侧前扣带回 AD($t=8.746\sim9.420$, $p<0.05$)、RD($t=8.427\sim10.516$, $p<0.05$)、MD($t=7.348\sim10.323$, $p<0.05$)值增高。有 OHE 组在双侧海马及海马旁回、左侧颞上回及颞中回、右侧丘脑、左侧内侧前额叶 AD($t=7.452\sim8.795$, $p<0.05$)值增高，左侧前额叶及左侧前扣带回 RD($t=7.341\sim8.781$, $p<0.05$)及 MD($t=7.225\sim8.589$, $p<0.05$)增高。其他弥散指标包括 FA、AK、MK、RK 等无组间差异($p>0.05$)。

结论：肝硬化患者行肝移植术后早期在前扣带回、额叶等脑区仍存在脑水肿情况，术前伴有明显肝性脑病发作会加重脑水肿程度，AD、RD、MD 三项指标可作为对于评价移植术后脑水肿的神经影像标记物。

皮层-纹状体-丘脑-小脑网络在癫痫分型中作用的模式分类影像学研究

谢心瑀,许强,张其锐,郝竞汝,张志强
中国人民解放军东部战区总医院

目的
全面强直阵挛发作型癫痫可分为原发性全面强直阵挛发作型性癫痫及继发全面强直阵挛发作型。由于 IGTCS 和 SGTCS 都具有全面强直阵挛发作的特点，且在常规 MRI 检查下均无脑结构异常检出，因此临床上鉴别困难。而影像分型能为这些情况提供客观证据，针对不同类型的癫痫患者，辅助进行个体化临床决策，有利于精准诊疗。因此，本研究通过 SVM 技术探讨该网络影像学指标对这两类癫痫分类诊断中的作用价值。
方法
本研究纳入 IGTCS、SGTCS 患者，及年龄性别匹配的健康志愿者各 60 例，采用 bold 及 T1 序列，用 dparsf 软件进行数据预处理和统计分析，预处理包括时间校正、头动校正、配准、平滑、滤波、协变量回归。根据 Zhang 等文章，定义皮层五个结构种子感兴趣区，并通过 AAL 模板定义了包括丘脑，基底节和小脑的皮层下结构。通过 SVM 技术，应用留一法对实验进行交叉验证，使用分类精确度、敏感性、特异性作为性能度量来量化结果。
结果
通过 SVM 分类可以得到，I-GTCS 与正常对照组，运动皮层与皮下核团准确率为 87.5%，敏感性 85%，特异性 90%，ROC 曲面下面积为 0.95，S-GTCS 与正常对照组，感觉皮层与皮下核团准确率为 83.33%，敏感性 86.67%，特异性 80%，ROC 曲面下面积为 0.92，I-GTCS 与 S-GTCS 组额叶皮层与皮下核团准确率 84.17%，敏感性 81.67%，特异性 86.67%，ROC 曲面下面积为 0.91。
结论
通过 SVM 分类技术可以鉴别原发全面性强直阵挛及继发全面性强直阵挛癫痫，为磁共振成像技术的临床转化奠定基础，有利于精准诊疗。

Disrupted intraregional brain activity and functional connectivity in unilateral acute tinnitus patients with hearing loss

Gangping Zhou[1],Xinyi Shi[1],Hengle Wei[1],Yusheng Yu[1],Lijie Qu[1],Hong Zhang[1],Xindao Yin[2],Yuejin Tao[1],Qingqing Zhou[1]
1.The Affiliated Jiangning Hospital of Nanjing Medical University
2.Nanjing First Hospital, Nanjing Medical University

Purpose: The present study combined fractional amplitude of low-frequency fluctuations (fALFF), regional homogeneity (ReHo) and functional connectivity (FC) to explore brain functional abnormalities in acute tinnitus patients (AT) with hearing loss.
Methods: We recruited twenty-eight AT patients and 31 healthy controls (HCs) and ran resting-state functional magnetic resonance imaging scans. fALFF, ReHo, and FC were conducted and compared between AT patients and HCs. After that, we calculated correlation analyses among abnormal fALFF, ReHo, FC and clinical data in AT patients.
Results: Compared with HCs, acute tinnitus patients showed increased fALFF values in the right inferior temporal gyrus (ITG). In contrast, significantly decreased ReHo values were observed in the cerebellar vermis, the right calcarine cortex, the bilateral precuneus, the right supramarginal gyrus (SMG) and the right middle frontal gyrus (MFG). Based on the differences in the fALFF and ReHo maps, the latter of which we defined as the ROIs for FC analysis, the right ITG exhibited increased connectivity with the right precentral gyrus. In addition, the right MFG demonstrated decreased

connectivity with both the bilateral anterior cingulate cortex (ACC) and the left precentral gyrus.
Conclusions: By combining ReHo, fALFF, and FC analyses, our work indicated that acute tinnitus patients with hearing loss had abnormal regional neural activity and disrupted inter-regional connectivity in several brain regions which mainly involving the partial auditory and non-auditory area, and these regions are major components of default mode network, attention network, and executive control attention network. These findings will help us enhance the understanding of the neuroimaging mechanism in tinnitus populations. Moreover, these abnormalities remind us that we should focus on the early stages of this hearing disease.

轻度认知障碍患者有氧舞蹈干预后认知功能和静息态 fMRI 低频振幅的改变

张玲
江苏省人民医院（南京医科大学第一附属医院）

目的：本研究针对于轻度认知障碍患者（MCI）采用一套自主编制有氧舞蹈进行干预，探讨其对患者认知功能和静息态 fMRI 低频振幅(ALFF)的影响。
方法：本研究中 38 例 MCI 患者随机分组：训练组（19 例）和对照组（19 例）。分别接受不同干预方式。对于训练组，给予有氧舞蹈进行干预，共 3 个月；对照组则以健康教育为主，周期与训练组相同。期间所有患者均未接受任何药物治疗。在接受干预前对所有患者进行评分，了解他们的认知情况，评估工具为认知功能量表，同时进行静息态 fMRI 扫描，干预结束后再次进行评分和扫描。了解患者脑功能活动情况，根据低频振幅图像结果进行分析。
结果：训练组干预完成后，认知功能量表结果显示训练组的简易精神状态评分、蒙特利尔认知评估量表、韦氏逻辑记忆和符号数字模式测试评分显著改善，与干预前相比差异显著。两组患者干预前后韦氏逻辑记忆评分皆发生变化，其中以训练组更为明显，相比有显著差异（$p < 0.05$）。对照组的各项认知功能量表评分均无显著差异。静息态 fMRI 扫描结果显示，训练组干预前后发生明显变化，其双侧额颞叶、前扣带回、内嗅及海马旁皮层的 ALFF 值显著增高（$p < 0.05$），而对照组 3 个月后仅右侧颞叶和后扣带回皮层的 ALFF 值显著增高（$p < 0.05$）。
结论：本套自主编制的中等强度有氧舞蹈能有效提高 MCI 患者的认知功能。静息态 fMRI 为评估有氧训练对认知功能的影响提供了一种量化方法。

EPO-2018

Feasibility of evaluating the histologic and genetic subtypes of WHO grade II-IV gliomas by diffusion-weighted imaging

Sirui Liu,Yiwei Zhang,Ziren Kong,Dachun Zhao,Yu Wang,Hui You,Wenbin Ma,Feng Feng
Peking Union Medical College Hospital

Purpose: To explore the feasibility of diffusion-weighted imaging (DWI) metrics in predicting histologic subtypes and genetic status (e.g., IDH, MGMT, TERT and concurrent genetic status) of glioma noninvasively.
Methods and Materials: One hundred and eleven patients with pathologically confirmed WHO grade II-IV gliomas were recruited retrospectively. Apparent diffusion coefficient (ADC) metrics were measured in solid parts of gliomas on co-registered T2-weighted images and were compared concerning WHO grading, single genotypes and concurrent genotypes. Receiver operating characteristic analysis were performed to assess the diagnostic performances of ADC. Subsequently, multiple linear regression was used to find independent variables affecting ADC values.
Results: The overall mean ADC (omADC) and the normalized ADC (nADC) values had statistical significance between higher grade glioma and lower grade glioma, IDH mutation and IDH wildtype, as well as TERT mutation and TERT wildtype in WHO grade II-IV gliomas. The areas under the curve (AUC) of omADC and nADC were, respectively, 0.716 and 0.749, 0.777 and 0.838, 0.617 and 0.607. The nADC could also distinguish MGMT methylation from MGMT unmethylation, with an AUC of 0.651. There were no statistical differences presented in TERT mutation-IDH mutation and TERT mutation-MGMT methylation. Only tumor grading and IDH mutation were tightly associated with ADC.
Conclusion: DWI can predict glioma grading and detect IDH mutation, TERT mutation, and MGMT methylation noninvasively. TERT mutation-IDH mutation and TERT mutation-MGMT methylation have little influence in DWI parameters.

应用平均表观传播模型磁共振成像(MAP-MRI)分析早期帕金森病患者脑深部核团的微结构变化

赵瑞琛,程敬亮,张春艳,彭媛媛
郑州大学第一附属医院

目的：探讨早期帕金森病(PD)所致脑深部核团的微结构变化[1]，为 PD 的早期诊断提供帮助。材料和方法：我们招募了 14 名早期 PD 患者(组 1)和 14 名年龄性别匹配的健康对照组(组 2)，在 MAGNETOM Prisma 3T 磁共振扫描仪上使用 64 通道头部线圈进行弥散序列扫描。使用来自 MRICron(https：/People.cas.sc.edu/Rorden/mricron/)的 dcm2nii 工具将所有扩散数据转换为 Nifti 格式。使用开放资源工具 DIPY(Python 中的扩散成像，http：/nipy.org/dipy)从弥散数据中计算 MAP-MRI 参数。从 8 个参数图中获得的 8 个参数值是 MSD，NG，NGparallel，NGperpend，QIV，RTAP，RtoP，RTPP。感兴趣区域(ROI)是双侧尾状核头部，壳核，苍白球，丘脑，红核和黑质，用 MRIcroN 在每个核团的最大截面绘制 ROI。通过双样本 t 检验分析两组参数值的差异，通过受试者操作特征(ROC)曲线评价参数值的诊断效能。结果：PD 组的左侧黑质(5.722±0.062)和右侧红核(6.601±0.061)的 RTPP 值明显低于对照组(5.982±0.087，6.907±0.100)(t=-2.419，P=0.023；t=-2.605，P=0.015)。PD 组的右侧黑质 NG parallel 值(0.106±0.003)明显低于对照组(0.120±0.004)(t=-2.635，P=0.014)。左侧黑质 RTPP 值诊断效率最高，ROC 曲线下面积(AUC)为 0.791。当阈值为 5.849 时，诊断敏感性和特异性分别为 85.7%和 78.6%。结论：MAP-MRI 弥散方法可检测到早期 PD 患者脑深部多个核团的微结构发生了改变，有助于早期诊断。

单体素与多体素¹H-MRS 在帕金森病检测中的差异性研究及价值

杨钒
1.新疆医科大学第二附属医院
2.王红

目的:评价使用单体素与多体素¹H-MRS 技术在帕金森病患者丘脑区检测的差异性，探索单体素与多体素¹H-MRS 技术在帕金森病诊断中价值。**材料与方法:**选取 30 例 PD 患者纳入研究，24 名年龄、性别等相匹配的志愿者作为对照组，两组分别使用单体素及多体素¹H-MRS 两种技术对研究对象的双侧丘脑区进行检测，获取一系列代谢物比值及相应谱线。**结果:**使用单体素与多体素¹H-MRS 对 PD 组及对照组双侧丘脑区测量均未表现出统计学差异。单体素测量 PD 组丘脑区 NAA/Cr 与 Cho/Cr 值较对照组降低（P<0.05），多体素测量 PD 组丘脑区 NAA/Cr 与 NAA/Cho 值较对照组减低（P<0.05），余指标未见明显差异。单体素及多体素对同侧丘脑区测量获取左、右侧丘脑区 Cho/Cr 值及右侧丘脑区 NAA/Cho 存在统计学差异（P<0.05）。单体素和多体素对 PD 患者症状严重侧以及对侧丘脑区测量，多体素测量所得 NAA/Cr、Cho/Cr 值表现出统计学差异（P<0.05）。**结论：**¹H-MRS 能够为帕金森病的诊断提供辅助依据；单体素与多体素¹H-MRS 对于同一感兴趣区的测量值不完全相同，测量上具有一定的差异性；多体素技术对于帕金森病临床诊断具有更好的运用前景。

EPO-2021

Local functional connectivity of patients with acute and remission multiple sclerosis: A multi-voxel KCC-ReHo and Cohe-ReHo study

Yanyan Zhu
Department of Radiology, The First Affiliated Hospital, Nanchang University

Object: Using regional homogeneity(ReHo) based on multi-Voxels(7,19,27)Kendall's coefficient of concordance(KCC-ReHo) and Coherence(CoheReHo) to explores brain functional changes of acute and remission relapsing-remitting multiple sclerosis(RRMS) associated with clinical indicators.
Methods: Resting-state functional magnetic resonance imaging and several clinical variables(EDSS,PASAT and disease duration) were acquired in 18 acute RRMS(A-RRMS),26 remission RRMS(R-RRMS) and 20 age-matched healthy controls(HC),processed in MATLAB,calculated the KCC-Reho and Cohe-ReHo values of the three groups.Identify which brain areas has changed Reho values among the three groups and analyse the relationship between the changed Reho values and the bove clinical variables.
Results: The multi-Voxels KCC-ReHo and CoHe-ReHo analyses showed that the ReHo values in the superior frontal gyrus(SFG),medial frontal gyrus(MFG) and middle occipital gyrus(MOG) were increased between the three groups:the changed Reho values between A-RRMS and R-RRMS was uncorrelated with clinical indicators;the Reho value of SFG was increased in A-RRMS and was negatively correlated with disease duration($r<-0.5, P<0.05$).compared to HC,The difference as follows:multi-Voxels KCC-ReHo analysis found the Reho values of cuneus also increased between three groups($P<0.05$,FDR correction).In A-RRMS,the Reho value of MFG was increased relative to the HC and was negatively correlated with the disease duration($r < -0.5, P < 0.05$),the difference

between R-RRMS and HC was uncorrelated with clinical indicators(r＜0.5);while CoHe-ReHo analysis showed the ReHo value of SFG in R-RRMS was increased and negatively correlated with the disease duration(r=-0.571,P=0.041) compared to HC.In addition,KCC-ReHo(7,19 voxel) analysis showed the Reho value of the SFG was increased in the A-RRMS compared with HC and was negatively correlated with EDSS score(r＜-0.5,P＜0.05).
Conclusions: Compared with R-RRMS,A-RRMS patients show more extensive changes in local functional connectivity,and this change related to disease state reflects the clinical function of patients.different Reho calculation methods(KCC-,Cohe-ReHo)can provide more useful information,and is beneficial to further explore the pathophysiology of RRMS.

EPO-2022

The Brain Network Changes Accompanied with Memory Function Decline in End-stage Renal Disease Patients before Dialysis Initiation

Xueying Ma[1,2],Dun Ding[2],Peng Li[2],Ming Zhang[2]
1.The Affiliated Hospital of Inner Mongolia Medical University
2.The First Affiliated Hospital of Xi'an Jiaotong University

Purpose This study aimed to explore the underlying neural mechanisms of memory impairment in end-stage renal disease (ESRD) patients before dialysis initiation using functional MRI techniques, in order to provide objective evidence for the medical treatment decisions and prognosis assessment.
Methods 49 ESRD patients before dialysis initiation (mean age 35.41±10.04 years) and 42 healthy volunteers (mean age 38.25±8.93 years) were included in our study. Three-dimensional T1-weighted imaging and BOLD were acquired using a GE 3.0T scanner. The MELODIC and dual regression of FSL tools were used to analyze the changes of large-scale brain networks. All the subjects were evaluated memory function by Auditory Verbal Learning Test (AVLT). We collected the laboratory blood tests in all patients.
Results Compared with the healthy controls, the functional connectivity of the medial prefrontal cortex (mPFC) which was the core region of default-mode network (DMN) was decreaed (P<0.05, FWE correction) in ESRD patients before dialysis initiation. The functional connectivity of core regions of bilateral frontoparietal networks (FPN), that was the dorsolateral prefrontal cortex (DLPFC) and the inferior parietal lobule (IPL), was decreased in ESRD patients before dialysis initiation (P<0.05, FWE correction). The correlation analysis showed the functional connectivity of mPFC, DLPFC and IPL were positively correlated with short-term delayed recall and long-term delayed recall scores in ESRD patients (P<0.05, FWE correction). The decreased functional connectivity of IPL was associated with the level of anemia (P<0.05, FWE correction).
Conclusion Our findings revealed that large-scale resting brain networks dysfunction has existed in ESRD patients before dialysis initiation. The abnormal connectivity of FPN, especially the prefrontal cortex and posterior parietal cortex, played an important role in mechanism of memory function decline in ESRD patients before

dialysis initiation. This study might help us better understand the pathophysiology of neural damage in ESRD patients.

中国人民解放军总医院海南医院

目的：采用纹理分析的方法评估颞下颌关节紊乱患者翼外肌功能变化。方法：纳入 29 例颞下颌关节功能紊乱患者，并在 3.0T 磁共振上进行扫描。根据关节盘移位将患者分为：关节盘无移位组（DWoD），关节盘可复性移位组（DDWR）及关节盘不可复性移位组（DDWoR）。在横轴位 T2WI 图像上对翼外肌进行基于灰度共生矩阵的纹理分析。纹理分析参数包括角二阶矩，对比度，自相关、逆差距及熵。结果：DDWoR 组翼外肌对比度[46.30(27.63, 152.60)] 显著低于 DWoD 组(123.88±29.31)（P value = 0.000）。DWoD(7.620±0.327)、DDWR(6.757±0.348)及 DDWoR(6.455±0.392)之间纹理参数熵显著不同(PDWoD-DDWR = 0.000, PDWoD-DDWoR = 0.000 and PDDWR-DDWoR = 0.014)。ROC 曲线分析证实熵对于 DWoD-DDWR (AUC = 0.96) and DWoD-DDWoR (AUC = 0.98)具有较好的诊断准确性。结论：纹理参数对比度及熵证实颞下颌关节紊乱患者翼外肌功能变化，可以被认为是评估其翼外肌功能变化的影像学标记物。

Cortical Alteration in Non-comorbid Drug-naïve Patients with Social Anxiety Disorder: a Surface-based Morphometry Study

Xun Zhang[1],Xun Yang[1,2],Qiyong Gong[1]
1.Huaxi MR Research Center (HMRRC), Department of Radiology, West China Hospital of Sichuan University
2.School of Public Affairs, Chongqing University

Purpose Social anxiety disorder (SAD) is a disabling psychiatric disease characterized by excessive fear in social or performance situations. Given grey matter volume (GMV) is a product of cortical thickness (CT) and cortical surface area (CSA)[1], investigation of CT and CSA respectively may offer further insight into the neurobiological mechanisms[2]. Thus, the primary aim of the present work was to explore the cortical anomaly in SAD using surface-based morphometry analysis.
Methods Thirty two non-comorbid drug-naïve SAD patients and 32 demography-matched health controls (HCs) were recruited to undergo magnetic resonance image. Morphometry indices including CT, CSA, and subcortical GMV were estimated by software Freesurfer. Then theory-driven region of interest (ROI) analysis was performed to compare aforementioned parameters. Additionally, associations between morphometric change and clinical features were assessed.
Results Compared to HCs, patients with SAD showed increased CT in bilateral postcentral, right medial orbitalfrontal cortex (mOFC), right lingual, left

rostralmiddlefrontal, and thinner cortex in right superiorfrontal, right paracenral, right inferiorparietal, right precuneus, right supramarginal, and left precentral. Besides, increased CSA of left mOFC and lower subcortical GMV of left hippocampus were also observed in SAD group (FDR corrections of $p<0.05$). Furthermore, the CSA in left mOFC was positively correlated with Liebowitz Social Anxiety score in SAD cohort. *Conclusions* To the best of our knowledge, the present study is the first to investigate the CT, CSA, and subcortical volume simultaneously in non-comorbid medication-naïve SAD patients via a ROI analysis. Our study revealed the structural abnormality in the fronto-parietal and limbic system, the crucial part related to social cognition, attention, and emotion[3], which may indicate the aberrant psychopathological underpinning of disturbed social information processing and emotion regulation in SAD.

应用基于体素的形态学测量方法与独立成分分析对聋哑儿童执行功能的研究

Chenrh,王苇
江苏省扬州大学附属医院

目的：利用功能及结构磁共振的研究方法结合行为学测试为聋哑儿童执行功能缺陷提供相关证据，进一步探讨聋哑儿童执行功能缺陷与脑结构及脑功能连接之间的关系。方法：从特殊教育学校招募 28 名聋哑儿童和 27 名人口指标匹配的健康儿童作为对照。两组儿童间人口指标同质。（年龄[t（42）=1.54；P=0.13＞0.05]、性别（ x 2=0.0452,P=0.83＞0.05））。分别选用磁共振基于体素形态学测量（VBM）方法评估聋哑儿童与听力正常儿童在脑灰质体积之间的差异、采用功能磁共振独立成分分析（ICA）的方法探究聋哑儿童与正常听力儿童脑功能连接的差异、用执行功能测试工具评价聋哑儿童各执行子功能与听力正常儿童的差异。结果：1）聋哑儿童的脑灰质体积在左侧角回（ANG.L; MIN coordinates: -48, -72, 45;700 voxels）、右侧顶上回（SPG.R; MIN coordinates: 20, -62, 57;594 voxels）和左侧枕中回（MOG.L; MIN coordinates: -32, -87, 42;782 voxels）较听力正常儿童减小；2）聋哑儿童在左侧眶部额中回/左侧额下回（ORBmid.L/IFG.L; MIN coordinates:-24, 21, 3; 54 voxels）功能连接较听力正常儿童减弱；3）在行为学测试结果中，聋哑儿童在转换功能上较正常儿童存在缺陷，并具有统计学意义[t(42)=2.02,P=0.02<0.05]。讨论：本研究首次整合脑功能及脑结构，并参考行为学测试结果揭示了聋哑儿童与听力正常儿童间的差异。聋哑儿童执行能力较差的神经机制可能与其在执行功能相关的脑区的功能连接减低与灰质体积减小相关，且结构与功能之间存在不匹配性；在行为学测试中，聋哑儿童转换功能较差。此研究为聋哑儿童执行功能的缺陷提供了多方面的证据，为进一步寻求聋哑儿童执行功能改善的研究提供了基础。

脑干综合征与磁共振成像解剖定位的系统分析

张艳秋,史大鹏,王梅云,赵翠花
河南省人民医院（河南省神经疾病影像诊断与研究重点实验室&郑州大学人民医院&河南大学人民医院）

脑干的解剖结构复杂，它包含许多脑神经核、连接脑与脊髓的纤维束、网状结构。随着 MRI 分辨率的不断提高，使得脑干解剖结构显示更加细致化，对于脑干功能解剖的深入理解将为正确认识脑干综合征提供重要信息。脑干综合征较为常见的原因包括后循环障碍或肿瘤性病变的占位效应。这些综合征影像学改变可能较为细微，容易被忽视而造成漏诊、误诊。脑干综合征按部位分为中脑综合征、桥脑综合征以及延髓综合征。中脑综合征包括 Weber 综合征、Benedikt 综合征(中脑旁中央综合征)、Claude 综合征、Parinaud 综合征(中脑背侧综合征)、Nothnagel 综合征等，桥脑综合征包括 Marie-Foix 综合征(桥脑外侧综合征)、Foville 综合征(桥脑下内侧综合征)、Locked-in 综合征(假昏迷综合征)、桥脑腹侧综合征、面神经丘综合征等，延髓综合征包括 Wallenberg 综合征(延髓外侧综合征)、Dejerine 综合征(延髓内侧综合征)、Babinski-Nageotte 综合征(半延髓综合征)、肥大性橄榄核变性等。本文将对这些综合征的功能障碍对应的 MRI 解剖定位进行系统总结，从而为影像科医师提供诊断参考依据。

Extraventricular Ependymomas: Tumor Grade Stratification Using DWI and DSC-PWI Combined with Conventional MR Imaging

Xiaofang Zhou, Zhen Xing, Dairong Cao
First Affiliated Hospital of Fujian Medical University

ABSTRACT

BACKGROUND AND PURPOSE: Anaplastic extraventricular ependymoma, an extremely rare malignant central nervous system neoplasm, have worse prognosis compared with low-grade lesions for its more aggressive biological behavior and higher risk of dissemination, metastasis and recurrence. The aim of this study was to investigate whether DWI and DSC-PWI combined with conventional MR imaging is predictive of tumor grades in this rare entity.

MATERIALS AND METHODS: 20 patients with high-grade (anaplastic) ependymoma and 9 patients with low-grade ependymoma who underwent preoperative MR imaging were enrolled in this retrospective study. Conventional MRI and DWI were performed in 26 patients (19 with anaplastic ependymoma, 7 with low-grade ependymoma); and DSC-PWI, in 15 patients (11 with anaplastic ependymoma, 4 with low-grade ependymoma). Demographics, conventional imaging characteristics (location, side, size, peritumoral edema, necrotic and cystic degeneration, enhancement, pial and cortical involvement, ependymal extension, and deep white matter invasion), minimum relative ADC ratio, and maximum relative CBV ratio were compared between the anaplastic ependymoma and low-grade groups.

RESULTS: Anaplastic ependymoma tended to have a more superficial supratentorial cerebral hemisphere location (P=.026), more frequent pial and cortical involvement (P=.028 and .013, respectively), and necrotic degeneration (P=.014). Minimum relative ADC ratio was significantly lower in anaplastic ependymoma than in low-grade ependymoma (0.8±0.2 versus 1.2±0.3, P=.002). Maximum relative CBV ratio was statistically higher in anaplastic ependymoma than in low-grade ependymoma (15.7 ±5.3 versus 9.0±4.4, P=.042).

CONCLUSIONS: A combination of conventional MR imaging, DWI, and DSC-PWI techniques may aid in the characterization and grade stratification of extraventricular ependymomas.

一种改进的定量磁化率成像多回波场图拟合算法

陈佳林[1],童睿[1],赵羽[1],王乙[1,2],李建奇[1]
1.华东师范大学物理与材料科学学院
2.康奈尔大学威尔医学院放射系

目的：开发并验证一种基于相位线性度的多回波场图拟合算法，以提高定量磁化率分布图的图像质量。
方法：本文提出了一种多回波场图拟合的改进算法，其通过场图线性拟合的残差来判断数据点相位的可靠性。采集 5 名健康被试的模图和相位图，分别采用常规算法和改进算法拟合得到场图，再经过场图解缠绕、背景场去除和磁化率反演等步骤获得磁化率分布图。选取黑质、红核、尾状核、苍白球和壳核作为感兴趣区，对比研究了两种算法得到的磁化率分布图上感兴趣区的噪声水平。
结果：采用改进的场图拟合算法后，定量磁化率图像质量得到明显提高，伪影得到明显抑制。双侧黑质、右侧红核和左侧苍白球区域的噪声水平显著下降。
结论：本文提出的一种改进的定量磁化率成像多回波场图拟合算法可以提高磁化率分布图的图像质量。

早盲青少年大脑功能连接的异常改变模式

周智凤[1],刘霞[1],侯刚强[1],李恒国[2]
1.深圳市康宁医院（深圳市精神卫生中心）
2.暨南大学附属第一医院

目的：探究早盲青少年大脑中默认网络（Default mode network, DMN）、执行控制网络（Executive control network, ECN）、背侧注意网络（Dorsal attention network, DAN）及突显网络（Silence network, SN）的功能连接改变模式。
方法：采集 30 名早盲青少年（男性 19 例，女性 11 例，年龄 14.6±1.9 岁）及 22 名视力正常青少年（男性 11 例，女性 11 例，年龄 14.6±2.5 岁）的静息态 MR 脑功能数据，分别取 8 个感兴趣区作为种子点，即后扣带回（DMN, x/y/z=0/-52/30）、双侧背外侧前额叶（ECN, x/y/z=-42/34/20, 44/36/20）、双侧顶下小叶（DAN, x/y/z=-25/-53/52, 25/-57/52）、扣带回前部（SN, x/y/z=7/33/19）及双侧前脑岛（SN, x/y/z=-32/25/-10, 35/26/-6），运用 Matlab 及 DPABI 软件计算每个被试种子点与全脑的功能连接。采用双样本 t 检验对两组被试的功能连接进行统计分析，以年龄及性别为协变量并对统计结果进行多重比较校正（false discovery rate, FDR ），$p<0.05$ 且集群体素＞50 的脑区认为差异有统计学意义。

结果：与正常青少年相比，早盲青少年右侧背外侧前额叶与右侧枕下回及左侧枕中回的功能连接增强，与右侧楔前叶的功能连接减弱， 左侧前脑岛与左侧楔叶的功能连接增强。
结论：早盲青少年双侧视觉皮层参与了执行控制网络及突显网络的神经通路，而默认网络及背侧注意网络未见明显异常改变。

Chemotherapy-induced gray matter abnormalities in cancer survivals: a voxel-wise neuroimaging meta-analysis

Running Niu[1],Mingying Du[1],Jing Ren[1],Haomiao Qing[1],Xiaodong Wang[1],Guohui Xu[1],Du Lei[2],Peng Zhou[1]
1.Department of Radiology， Sichuan Cancer Hospital & Institute， Sichuan Cancer Center， School of Medicine， University of Electronic Science and Technology of China
2.Department of Psychiatry and Behavioral Neuroscience， University of Cincinnati， Cincinnati，Ohio

INTRODUCTION:
“Chemobrain” is the term used to describe the alterations of cognitive function reflecting the central nervous system (CNS) toxic effects of systemic chemotherapy [1]. Chemobrain symptoms significantly impact multiple activities of cancer survivors such as in maintaining work performance, social interaction, and carrying out daily tasks such as cooking and driving [2, 3]. Neuroimaging findings on brain grey matter volume (GMV) changes of chemobrain are not consistent. We aimed to investigate the grey matter abnormalities in non-CNS cancer survivals treated with chemotherapy for the first time.
METHODS:
We identified studies published up to Sep 2018 that compared grey matter in non-CNS cancer survivals treated with chemotherapy (CT+, 10 data sets including 433 individuals) and cancer survivals without chemotherapy (CT-, 7 data sets including 210 individuals) or healthy controls (HC, 7 data sets including 539 individuals). All the process of this meta-analysis was according to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guides.
RESULTS
Four hundred and thirty three cancer survivals treated with chemotherapy (CT+) (mean age 51.92 years), 210 cancer survivals without chemotherapy (CT-) (mean age 49.87 years) and 539 healthy controls (HC) (mean age 56.84 years) were included. Compared with CT- and HC, CT+ groups exhibited lower GMV mainly in prefrontal- anterior cingulate cortex (ACC) pathway, including right fusiform gyrus (FG), right ACC and right superior frontal gyrus, medial orbital (SFG.med.orb) and dorsolateral part(SFG.dl). Smaller GMV in FG and prefrontal cortex were found in CT+ groups compared to CT-groups and in CT+ groups with impaired cognition. GMV in two areas were positively associated with the time since chemotherapy.
CONCLUSION
The present results suggested that non-CNS cancer survivals treated with chemotherapy exhibit widespread grey matter abnormalities in brain, especially in prefrontal-ACC pathway. This pattern of grey matter volume changes might improve our understanding of the pathophysiological nature of cognitive impairments in cancer survivals after chemotherapy.

EPO-2031
视网膜光凝术后颅内硅油异位 MR 表现和检查方法探讨

李利丰
中南大学湘雅三医院

目的　探讨视网膜光凝术后硅油注入导致颅内硅油异位的 MR 表现和检查方法。
方法　回顾性分析 1 例视网膜光凝术后硅油填充患者的临床病史、MR 表现及 MR 检查方法。
结果　本例为 45 岁女性。头晕头痛不适一个月来神经内科就诊，常规行头部 MR 检查，MR 平扫发现左侧侧脑室前角，中脑导水管及右侧眼球内小结节状异常信号灶，T1WI 病灶上部呈高信号，下部呈低信号。T2WI 呈低信号，DWI 呈低信号，性质不明，随即行增强检查后无明显强化。改变体位检查，俯卧位扫描，右侧眼球、左侧侧脑室前角及中脑导水管内病灶位置均发生明显移动。
结论　眼内硅油填充常用于治疗复杂性视网膜脱离。硅油填充的常见并发症也被人们所熟知 ,甚至眼内填充硅油进入视神经间质的报道也不少见,并且乳化的小油珠可以到达视神经周围蛛网膜下腔。但眼内硅油填充进入脑室的并发症实为罕见。本例女性患者头晕头痛不适在神经内科就诊，头部 MR 检查无意中发现脑室内异常信号灶，性质不明。行增强检查也未发现异常强化。后来追问病史，患者曾经在眼科做过视网膜光凝术硅油填充。眼内硅油填充进入脑室是比较少见。因为眼内填充硅油的患者很少进行头部的影像学检查 ,可能有些病例未被发现。我们可以得知，影像表现需要紧密结合临床病史，发现脑室内异常信号灶，由于硅油的比重要低于脑脊液，改变体位扫描，因此位置会发生移动。我们检查的思维不仅仅局限在常规检查方法，有时往往需要开拓我们的思维，才能得到更明确的诊断，从而服务于临床。

EPO-2032
联合 QSM 及 DKI 在原发性帕金森病中的研究

容云洁[1],关计添[1],徐志锋[2],祝叶[2],张仙海[2],周新韩[2],郭莉[2],高明勇[2]
1.汕头大学医学院第二附属医院
2.佛山市第一人民医院

目的：通过对帕金森病人及正常对照组基底神经节的 QSM 及 DKI 研究，定量追踪铁沉积及评估神经元丢失情况，在挖掘这两种磁共振技术在帕金森病诊疗中的价值的同时，探索帕金森病人基底神经节的病理生理改变。
方法：对来自佛山第一人民医院就诊的 35 名帕金森病患者及 40 名健康志愿者在 GE Discovery MR 750w 3.0T 超导扫描仪上进行 QSM 及 DKI 扫描。其中早期 PD 组 25 例，进展期 PD 组 10 例。右侧肢体严重者 24 例，左侧肢体严重者 11 例。QSM 及 DKI 图像后处理后分别获得 QSM 图及 DKI 参数图。于显示面积最大层面处手动测量双侧黑质、红核、尾状核、壳、苍白球、丘脑的 QSM 值及 MD、FA、MK 值。
结果：QSM 结果:早期 PD 组、进展期 PD 组相对于正常对照组黑质、红核、尾状核、壳、苍白球 QSM 值升高，均有统计学差异（$p<0.05$），其中黑质 QSM 值与疾病病程呈正相关关系($r=0.417$, $p=0.01$);右侧肢体严重者，左侧黑质、壳 QSM 值较右侧升高，有统计学差异($p<0.05$)；QSM 关于 ROC 曲线分析显示，黑质、红核、壳、苍白球诊断效能较高。DKI 结果：早期 PD 组、进展期 PD 组相对于正常对照组黑质、苍白球 MK 值下降，有统计学差异（$p<0.05$）；进展期 PD 组相对于正常对照组尾状核、红核 MK 值升高，有统计学差异（$p<0.05$）；进展期 PD 组相对于正常对照组黑质、红核、壳、尾状核、丘脑 FA 值升高,有统计学差异（$p<0.05$）；其中黑质 MK 值与疾病病程呈负相关

关系(r=-0.537，p=0.004)；DKI 关于 ROC 曲线分析显示，黑质 MK、红核 MK、红核 FA、壳 FA 诊断效能较高。
结论：QSM 及 DKI 是定性诊断 PD 的 MRI 新技术，两者的联合应用，揭示了 PD 患者多个灰质核团铁沉积现象，并且存在微观结构的改变，对于 PD 患者疾病诊断和分期具有重要意义。

EPO-2033
2 型糖尿病周围神经病变脑结构共变网络拓扑结构异常的磁共振成像研究

杨方雪,张友明,廖伟华
中南大学湘雅医院

背景及目的：2 型糖尿病的周围神经病变 (Diabetic peripheral neuropathy, DPN) 的神经影像研究已经表明包括躯体感觉皮层以及非躯体感觉皮层在内的多个脑区存在脑结构、功能的变化，提示 DPN 在中枢神经系统存在多系统受累，进而我们推测大尺度脑网络可能受累。因此，本研究基于上述研究背景探讨 DPN 患者全脑结构共变网络的拓扑结构是否异常。
方法与材料：采用 3.0 T Prisma 磁共振扫描仪对入组被试进行数据采集，包括 64 例 DPN 患者及 88 例正常健康对照 (Healthy controls, HCs) 的 3D T1 结构像数据。运用 Freesurfer 软件对所有被试 3D T1 结构像进行数据处理，得到每个脑区的平均皮层厚度，用于后续脑结构共变网络的构建。基于图论的方法构建 DPN 及 HCs 的脑结构共变网络，采用置换检验的统计学方法比较两者结构共变网络局部和全局属性的组间差异。
结果：DPN 患者与 HCs 对比，其脑结构共变网络表现为向规则脑网络 (Regularized architecture) 方向转变。具体的说，DPN 患者结构共变网络的标准化特征路径长度 (Normalized characteristic path length)、标准化聚类系数 (Normalized clustering coefcient)、小世界属性指数 (Small-world index) Sigma 及模块化 (Modularity) 显著增加，而全局效率 (Global efficiency) 显著下降。以上的研究结果表明 DPN 患者全脑的功能整合在减低而区域脑区功能分离现象在增加。
结论：本研究发现 DPN 患者存在脑结构共变网络的拓扑结构异常。脑网络局部和全局属性一致证实 DPN 患者已出现全脑功能整合和功能分离的失衡，为 DPN 的中枢发病机理提供了新的研究视角。

EPO-2034
鼻腔鼻窦横纹肌肉瘤的 MR 诊断（附 8 例报告）

苏妍
福建医科大学附属第一医院

目的：分析鼻腔鼻窦横纹肌肉瘤的 MR 图像，探讨鼻腔鼻窦横纹肌肉瘤的 MR 影像特征。方法：回顾性分析本院 2011 年 1 月至 2019 年 1 月经病理证实的 8 例鼻腔鼻窦横纹肌肉瘤患者的临床及 MR 影像特征，分析肿瘤发生的年龄及性别差异，以及通过观察肿瘤的位置、边界、MR 信号特点、邻近骨质破坏、淋巴结肿大以及病灶强化特点，回顾性分析鼻腔鼻窦横纹肌肉瘤的特征性 MR 表现。结果：8 例病例中，男性患者 5 例，占 62.5%（5/8）；女性患者 3 例，占 37.5%（3/8）。儿童或青少年 2 例，占 25%（2/8）；成人 6 例，占 75%（6/8），平均年龄 42.25。肿瘤发生于单个鼻窦 4 例（4/8），其中 2 例发生于上颌窦、2 例发生于筛窦；发生于多个鼻窦 4 例（4/8），其中同时累及上颌窦和筛窦 3 例（3/4）。肿瘤边界不清 5 例（5/8）。MR 平扫 8 例，T1WI 呈等信号 6 例（6/8），T2WI 呈高信号 8 例（8/8），信号不均匀 8 例（8/8）；MR 增强扫描 6 例，MR 增强扫描呈

不均匀强化 100%（6/6）。邻近骨质破坏 7 例（7/8）；斜坡骨质信号改变 4 例（4/8）；血管包绕 1 例（1/8）；淋巴肿大 7 例（7/8）；侵犯颅底结构 6 例（6/8）。所有患者均未出现出血及远处转移。结论：鼻腔鼻窦横纹肌肉瘤的 MR 影像表现较不具特征性，诊断该病较为困难。在 8 例鼻腔鼻窦横纹肌肉瘤患者中，男性多于女性，成人多于儿童或青少年，可发生于单个或多个鼻窦，其中最常发生于上颌窦和筛窦，多为 T1WI 等信号、T2WI 高信号，肿瘤呈不均匀强化，大多数病例存在邻近骨质破坏、淋巴结肿大以及颅底侵犯。

MRI Features of Brain Metastases of Lung Cancer with Different Pathological Types

Dongpo Wang[1,2],Erhu Jin[1]
1.Beijing Friendship Hospital, Capital Medicine University
2.Beijing Chest Hospital, Capital Medicine University

Objective: To analyze the MRI features of brain metastases with different pathological types of lung cancer, and to improve the understanding of the imaging manifestations of lung cancer brain metastases.
Methods:115 patients with primary lung cancer confirmed by histology in the Beijing chest hospital from October 2017 to September 2018 were enrolled, there were 63 males and 52 females, aged 39～80 years old, with a median age of 63 years. Clinical manifestations include cough, irritating dry cough, cough, blood in the sputum, chest tightness, fatigue, chest and back pain, discomfort, limb pain, dizziness, headache, black eyes, etc. The primary tumors were confirmed by pathology in all cases. Among them, 64 cases were confirmed by CT-guided biopsy, 28 cases were confirmed by thoracoscopic resection, 16 cases were confirmed by bronchoscopy, and 7 cases were confirmed by thoracotomy. The clinical data and MRI images of the patients were collected, two independent doctors with more than 10 years of work experience observed different MRI sequence images of the enrolled cases. and observe the image features in different MRI sequences. The size, number, degree of peritumoral edema, DWI signal and enhancement mode of brain lesions were analyzed, when the two observers disagreed, the agreement was reached after the discussion as the final data. According to the number of lesions detected in the brain, the lesions were divided into single-lesion group and multiple-lesion group. The maximum diameter d of the lesion in the brain was measured on the axial enhanced scan image, and the maximum diameter d of the lesion was divided into d<1.0cm 1.0≤d<3.0cm and d≥3.0cm three levels, expressed as I, II, III, if multiple lesions, the maximum diameter of the lesions was choosed. Combined with T2 FLAIR and Gd-DTPA enhanced scanning sequence, the peritumoral edema was revealed. Because the metastasis was easily distributed in the junction area of the cerebral cortex, the maximum diameter of the edema was subtracted from the diameter of the corresponding lesion. The maximum diameter r of the edema was divided into r=0; r<1.0cm; 1.0≤r<3.0cm; ≥ 3.0cm four grades. The enhanced form of brain metastases revealed by Gd-DTPA enhanced scan was divided into ring enhancement, nodular enhancement and irregular enhancement; DWI signal was divided into hyperintensity and isointensity/hypointensity. Statistical analysis was performed with IBM SPSS 20.0. According to different data characteristics, the count data was analyzed by χ^2 test

or non-parametric rank sum test. The measurement data were analyzed by t test, P<0.05 was considered statistically significant.
Results: A total of 115 cases were collected in the study. Among them, 2 cases of small cell lung cancer were simple meningeal metastasis in the brain, no brain parenchymal lesions, 1 case of primary lung lesions were adenosquamous carcinoma, and 1 case was sarcomatoid carcinoma, all of which were excluded. The remaining 111 patients were enrolled, 60 males and 51 females, aged 39～80 years, with a median age of 62 years. In this study, 45(40.5%) patients with 45 lesions in the single-lesion group, 66(59.5%) patients with 652 lesions in the multiple-lesion group, a total of 697 lesions were detected. 579 lesions were distributed on the cerebellum, and 118 lesions were located under the cerebellum. There was no significant difference in the number of metastases between the single-lesion group and the multiple-lesion group (χ^2=21.593, p=0.800>0.05). The multiple brain metastasis group was analyzed, and the squamous cell carcinoma group was excluded from the data. In the remaining two groups, there were 54 cases of multiple metastases in the adenocarcinoma group, the number of metastases was 2 to 43 lesions with an average of (7.79±10.51), and the multiple cell metastasis of small cell lung cancer group was 9 cases, the number of metastases detected ranged from 2 to 3 lesions, with an average of (1.57 ± 0.79). The mean number of lesions in the adenocarcinoma group was significantly greater than that in the small cell lung cancer group. The t-test analysis showed that the mean difference in the number of metastases between the two groups was statistically significant. Furthermore, with the number of metastases 12 as the boundary, the multiple components of brain metastasis of lung adenocarcinoma and small cell lung cancer were divided into a minority (2～11) and a majority (12 or more). The percentage of minority group and majority group of adenocarcinoma brain metastasis was (63.2%, 36.8%), and the percentage of brain metastasis of small cell lung cancer was (100%, 0%). The χ^2 test was performed, indicating that the difference between the two groups was statistically significant (χ^2=8.211, p=0.006<0.05), that is equivalent to brain metastasis of small cell lung cancer, brain metastasis of lung adenocarcinoma is more likely to occur 12 or more lesions. There were 42(37.8%) cases in grade I, the maximum diameter ranged from 0.3cm to 0.9cm, and the mean was (0.64±0.18) cm, including 27 cases in adenocarcinoma, 6 cases in squamous cell carcinoma, and 9 cases in small cell lung cancer. There were 60(37.8%) cases in grade II, the maximum diameter range was 1.0cm to 2.9cm, and the average value was (2.0±0.48) cm, including 51 cases in adenocarcinoma group and 9 cases in small cell lung cancer group. There were 9(8.1%) cases in grade III, the maximum diameter ranged from 3.1cm to 5.9 cm, and the mean was (4.23±0.81) cm, including 6 cases in adenocarcinoma group and 3 cases in small cell lung cancer group. Statistical analysis of the difference between the size of metastatic tumors was not statistically significant(χ^2=7.690, p=0.104>0.05).There were 48(43.2%) cases of brain metastases without peritumoral edema, including 42 cases of adenocarcinoma group and 6 cases of small cell lung cancer group, and 43(38.7%) cases of mild peritumoral edema, including 27 cases of adenocarcinoma group, 1 case of squamous cell carcinoma group and 15 cases of small cell lung cancer group. There were 7(6.3%) cases with moderate peritumoral edema, including 3 cases in adenocarcinoma group and 4 cases in squamous cell carcinoma group. There were 13(11.7%) cases with severe peritumoral edema, including 12 cases in adenocarcinoma group and 1 case in squamous cell carcinoma group. Intergroup analysis showed statistically significant differences in peritumoral edema (χ^2= 34.437, p = 0.000<0.05). Further grouped into

no edema and peritumoral edema, with no significant difference between the groups (χ^2=1.306, p=0.309>0.05). There were 55(49.5%) cases of DWI hyperintensity, a total of 98 lesions were detected, including 36 cases of adenocarcinoma group with 68 lesions, 19 cases of small cell lung cancer group with 30 lesions. There were 56(50.5%) cases with 599 lesions of isointensity/hypointensity, including 48 cases in adenocarcinoma group, 6 cases in squamous cell carcinoma group and 2 cases in small cell lung cancer group. There were 19(90.5%) cases of hyperintensity in DWI and 36(32.5%) cases of isointensity/hypointensity in DWI, after combination of adenocarcinoma and squamous cell carcinoma into non-small cell group. Then χ^2 test was performed between the two groups, indicating that the difference was statistically significant (χ^2=16.267, p=0.006<0.05). In the enhanced form, there were 46 cases of ring enhancement with 143(20.5%) lesions, 36 cases of adenocarcinoma group with 125 lesions, 4 cases of squamous cell carcinoma group with 8 lesions, 6 cases of small cell lung cancer group with 10 lesions. There were 53 cases of nodular enhancement with 332(46.3%) lesions, 45 cases of adenocarcinoma group with 323 lesions, 2 cases of squamous cell carcinoma group with 2 lesions, 6 cases of small cell lung cancer group with 7 lesions. Irregular enhancement of 57 cases with a total of 222(31.9%) lesions, 48 cases of adenocarcinoma group with 202 lesions, 9 cases of small cell lung cancer group with 20 lesions, and there were no statistically significant differences between the three enhanced forms(χ^2=21.209, p=0.171>0.05).
Conclusions: The number of brain metastases and hyperintensity of DWI have a certain correlation with the pathological type of lung cancer. There was no significant correlation between the size, the degree of peritumoral edema and the enhanced form and the pathological type of lung cancer.

EPO-2036

Brain structural alteration patterns in COPD with different levels of pulmonary function impairments and their associations with cognition deficits

Minmin Yin,Haibao Wang,Xianwei Hu,Xiaoshu Li,Guanghe Fei,Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Background: To explore patterns of brain structural alteration in chronic obstructive pulmonary disease (COPD) patients with different levels of lung function impairment and the associations of those patterns with cognitive functional deficits using voxel-based morphometry (VBM) and tract-based spatial statistics (TBSS) analyses based on high-resolution structural MRI and diffusion tensor imaging (DTI).
Methods: A total of 115 right-handed participants (26 severe, 29 moderate, and 29 mild COPD patients and a comparison group of 31 individuals without COPD) completed tests of cognitive (Montreal Cognitive Assessment [MoCA]) and pulmonary function (forced expiratory volume in 1 s [FEV1]) and underwent MRI scanning. VBM and TBSS analyses were used to identifychanges in grey matter density (GMD) and white matter (WM) integrity in COPD patients. In addition, correlation analyses between these imaging parameter changes and cognitive and pulmonary functional impairments were performed.

Results: There was no significant difference in brain structure between the comparison groups andthe mild COPD patients. Patients with moderate COPD hadatrophy of the left middle frontal gyrus and right opercular part/triangular part of the inferior frontal gyrus, and WM changes were present mainly in the superior and posterior corona radiata, corpus callosum and cingulum. Patients with severe COPD exhibited the mostextensive changes in GMD and WM. Some grey matter (GM) and WM changes were correlated with MoCA scores and FEV1.
Conclusions: These findings suggest that patients with COPD exhibit progressive structural impairments in both the GM and WM, along with impairedlevels of lung function, highlighting the importance of early clinical interventions.

Advanced MRI features of IDH1 mutation epithelioid glioblastoma coexistence with low-grade diffuse astrocytoma: a case report and literature review

Xiaolin Tang
Daping Hospital, Army Medical University

Background:
Epithelioid glioblastoma(E-GBM) as a newly revised subtype of glioblastoma in 2016 which is much less frequently found in other types of glioblastomas.A low-grade gliomas has been identified as preexisting or coexisting with an epithelioid glioblastoma in several cases,but the radiological imaging features,especially the advanced MRI manifestations of epithelioid glioblastoma with low-grade diffuse astrocytoma haven't been reported.
CASE DESCRIPTION:
We present a case of a 46-year-old female patient with an E-GBM with IDH1 mutation in her bilateral frontal lobe and corpus callosum. Advanced MRI showed the following tumor characteristics: increased perfusion on perfusion imaging;Solid part hyperintense on diffusion-weighted imaging, the white matter fiber tracts in the fractional anisotropy color map had shifted and partially damaged compared to the adjacent brain tissue, Choline showed markedly elevation, and N-acetylaspartate peak showed slightly reduction on magneticresonance spectroscopy. Postoperative pathological examination confirmed that the tumor composed of E-GBM and diffuse astrocytoma-like components, and dehydrogenase 1 (IDH1) mutation was detected in both.
Conclusion:
The conventional as well as advanced MRI manifestations of this rare tumor with two coexisting components have rarely been reported previously. In addition, Only one secondary epithelioid glioblastoma manifesting positive IDH1 immunoreactivity is known at present, this is the first case demonstrating IDH1 mutation in between primary epithelioid glioblastoma and colocalized low-grade astrocytoma.

未治疗抑郁症患者岛叶—皮层静息态功能连接研究

陈盼,陈枫,陈观茂,龚佳英,贾艳滨,钟舒明,齐张璋,赖顺凯,黄力,王颖
暨南大学附属第一医院

目的 探讨未治疗抑郁症（major depressive disorder, MDD）患者静息态岛叶功能连接特征。**方法** 选取 50 例未服药的抑郁症患者（患者组）和 51 例健康对照（对照组）进行静息态功能磁共振（resting-state functional magnetic resonance imaging, rs-fMRI）扫描，对 rs-fMRI 数据进行常规预处理并基于岛叶分区为双侧岛叶前部、双侧岛叶中部、双侧岛叶后部 6 个种子点进行全脑功能连接分析，采用双样本 t 检验比较两组间脑功能连接值的差异，经过不依赖阈值集群增强（Threshold-Free Cluster Enhancement, TFCE）的多重比较校正，并将差异有统计学意义脑区的 FC 值与 24 项汉密尔顿抑郁量表（Hamilton Depression Scale, HAMD-24）评分等临床变量进行相关分析。**结果** 双样本 t 检验分析，与对照组相比，患者组左侧岛叶前部与双侧前扣带回之间功能连接减低（$p < 0.05$，TFCE 校正），左侧岛叶前部与左侧额中回、双侧后扣带回/楔前叶之间功能连接增强（均 $p < 0.05$，TFCE 校正）。左侧岛叶前部与双侧前扣带回（$r = -0.125$，$p = 0.387$）、左侧额中回（$r = 0.149$，$p = 0.302$）、双侧后扣带回/楔前叶（$r = -0.207$，$p = 0.148$）的功能连接值与 HMAD-24 评分无相关性。**结论** 抑郁症患者左侧岛叶前部与边缘系统、额叶皮层功能连接异常。

Multi-modal MRI reveals the neurovascular coupling dysfunction in chronic migraine

Bo Hu,Ying Yu,Wen Wang,Guang-Bin Cui
Tangdu Hospital, Fourth Military Medical University

Purpose
Previous studies reported that long-term nociceptive stimulation could result in neurovascular coupling (NVC) dysfunction in brain, but these studies were based mainly on unimodal imaging biomarkers, thus could not comprehensively reflect NVC dysfunction.
Materials and Methods
We investigated the potential NVC dysfunction in chronic migraine by exploring the relationship between neuronal activity map derived from blood oxygen level dependent (BOLD) signal and cerebral perfusion maps. The Pearson correlation coefficients between these 2 maps were defined as the NVC biomarkers.
Results
NVC biomarkers in migraineurs were significantly lower in left inferior parietal gyrus (IPG), left superior marginal gyrus (SMG) and left angular gyrus (AG), but significantly higher in right superior occipital gyrus (SOG), right superior parietal gyrus (SPG), and precuneus. These brain regions were located mainly in parietal or occipital lobes. Visual language related gyri as well as sensory system and pain transmitting network related gyri were involved in neurovascular coupling dysfunction. ALFF-CBF in right SPG was positively correlated with disease history and that in right precuneus was negatively correlated with migraine persisting time. fALFF-CBF in left SMG was negatively related to headache frequency and positively related to health

condition. fALFF-CBF in left AG was negatively related to headache frequency and positively related to disease history and health condition.

Conclusion

Multi-modal MRI could be used to detect NVC dysfunction in patients with chronic migraine, which benefits to assess the impact of chronic pain to the brain.

EPO-2040

AD 患者脑核团的磁敏感值与认知功能相关性的研究

杜雷,马国林
中日友好医院

背景：阿尔茨海默病（Alzheimer’s disease，AD）患者一个重要的病理特点是深部灰质核团过多的铁沉积。定量磁敏感图（quantitative susceptibility mapping，QSM）比其他影像学为基础的铁测量方法更具特异性，并且能够非侵入性的评估组织的磁敏感值，而组织的磁敏感值与铁含量具有很好的相关性。

目的：探索轻中度阿尔茨海默病人深部灰质核团的磁敏感值与认知功能是否具有相关性。

方法：轻中度 AD 患者 30 名以及性别及年龄相匹配的健康对照者 30 名，使用美国 GE 3.0T 磁共振扫描仪进行 QSM 扫描，并通过 GE4.6 工作站进行后处理，勾画出 7 个感兴趣区，即尾状核、壳核、苍白球、丘脑、红核、黑质、齿状核，并测量其磁敏感值。认知功能采用简易精神状态量表（mini-mental state examination，MMSE）和蒙特利尔认知量表（montrealcognitive assessment，MoCA）进行评估。通过相关性分析探索各 ROI 的磁敏感值与认知功能的相关性。

结果：控制性别和年龄因素的影响，左侧尾状核增高的磁敏感值与降低的 MMSE 和 MoCA 量表分数呈显著负相关（P<0.05）。控制性别因素后，对照组中双侧壳核、双侧齿状核、右侧尾状核的磁敏感值与年龄之间呈线性相关，而 AD 组中双侧壳核、双侧齿状核、右侧丘脑、右侧红核的磁敏感值与年龄呈线性相关。左右侧大脑磁敏感值的比较结果提示，在 AD 组和对照组中尾状核、红核、黑质、齿状核的右侧磁敏感值明显高于左侧。男性和女性之间各个核团的磁敏感值均无显著性差异（P>0.05）。AD 组与对照组磁敏感值比较的结果显示，AD 组患者的双侧尾状核、壳核的磁敏感值明显高于对照组，而双侧红核的磁敏感值明显低于对照组（P< 0.05）。

结论：由 QSM 测定的左侧尾状核的磁敏感值有望成为一种新的评估轻中度 AD 患者疾病严重程度的生物标志。

3D-TOF 与 3D-FIESTA-C 序列融合技术在面神经血管减压术前的应用优势

李杨飞,泮双军,丁建荣,李欣,张忠伟,季文斌
浙江省台州医院

目的 探讨 3.0TMR 三维时间飞跃(3D-TOF)序列与三维稳态采集快速成像(3D-FIESTA-c)序列融合技术在面神经微血管减压术前评估中的应用。**方法** 回顾性分析 47 例经微血管减压术治疗的原发性面肌痉挛患者，手术前均行 3D-TOF 序列、3D-FIESTA-c 序列检查。由两位经验丰富的主治以上医师采用双盲法分别对 3D-TOF 结合 3D-FIESTA-c 序列多平面重组图像(A 组)及融合图像(B 组)显示脑池段神经血管关系的情况进行评判，以手术探查结果为金标准，采用 χ^2 检验比较 A、B 组图像血管压迫的阳性率、责任血管术前诊断符合率，P＜0.05 有统计学意义。**结果** 47 例受检者术中均见血

管压迫，发现责任血管 61 根，A 组诊断神经血管关系的阳性率、责任血管术前诊断符合率分别是 91.5%(43/47)、63.9%(39/61)，B 组诊断神经血管关系的阳性率、责任血管术前诊断符合率分别是 97.9%(46/47)、91.8%(56/61)，均高于 A 组，差异有统计学意义(P＜0.05) 。**结论** 3D-TOF 序列与 3D-FIESTA-c 序列融合图像能清晰显示面神经与周围血管的空间结构关系，在面神经微血管减压术前评估中具有一定优势。

Changes in white-matter functional network efficiency across the adult lifespan

Jiajia Zhu
The First Affiliated Hospital of Anhui Medical University

Previous studies have used resting-state functional MRI (rs-fMRI) and graph-theory approaches to investigate the lifespan trajectory of the topological organization of the gray-matter functional networks. Recent evidences have suggested that rs-fMRI data can also be used to estimate white-matter function, challenging the conventional practice of taking white-matter signals as noise or artifacts. Here, we examined the correlation between age and white-matter functional network efficiency by applying graph-theory to a large sample of rs-fMRI data of 435 participants. We found that age was correlated negatively with both global and local efficiency of the white-matter functional networks. These findings suggest decreasing white-matter functional network efficiency during the aging process, which provides a complement to conventional gray-matter functional network studies.

EPO-2043

Altered structural－functional connectome in Unilateral Sudden Sensorineural Hearing Loss

Wenliang Fan,Ziqiao Lei,Fan Yang,Jianming Yu
Department of Radiology， Union Hospital， Tongji Medical College， Huazhong University of Science and Technology

Purpose
To investigate the alterations of brain structural and functional connectome in two large samples of unilateral sudden sensorineural hearing loss (USSHL) patients within the acute period.
Methods
We constructed functional and structural connectome for USSHL patients (41 for left side and 44 for right side) and 85 healthy controls. Graph theoretical analysis was employed to evaluate the network properties of functional and structural brain connectome. Moreover, for each subject, we quantified coupling between functional and structural connectome by the correlation between functional and structural connectome edges within non-zeros structural connectivity areas. The coupling of functional-

structural brain connectome between USSHL patients and healthy controls was compared by using permutation tests. To investigate the clinical relevance of altered brain network topologies in USSHL, pearson's correlation analysis was performed between the clinical variables and the topological properties or the strength of functional-structural connectome coupling.

Results

Compared with the control groups, both groups of USSHL patients exhibited a significantly increased clustering coefficient, global efficiency, and local efficiency but a significantly decreased characteristic path length in functional brain connectome, while a significantly decrease clustering coefficient and local efficiency in structural brain connectome. In addition, the primary increased nodal strength was observed in limbic and paralimbic systems primarily as well as in the auditory network brain areas. More importantly, the coupling strength of structural-functional connectome was decreased, and exhibited a negative correlation with some USSHL clinical variables in patients.

Discussion and Conclusion

Detectable alteration of network organization already occurred in USSHL patients within the acute period at the global and regional level. The functional connectome is characterized by a shift toward small-worldization while the structural connectome is toward randomization, which may indicate a plastic reorganization procedure of the brain to compensate for the loss hearing in USSHL. Moreover, the degree of coupling between structural and functional connectome was decreased, which may reflect the pathophysiological mechanisms of USSHL.

多次静脉注射线性钆对比剂后人脑齿状核、苍白球 T1 加权信号变化的研究

孔莹,徐凯
徐州医科大学附属医院

目的 研究多次静脉注射线性钆对比剂后，齿状核、苍白球在 MRI 颅脑平扫 T1 加权图像上的信号强度变化情况。

方法 回顾分析 2011 年 1 月至 2018 年 12 月期间在徐州医科大学附属医院行磁共振增强检查（连续进行至少 4 次）的 127 例患者的临床及影像学资料。在多次增强前后的首、末次颅脑平扫 T1 加权上分别测量齿状核、脑桥、苍白球、丘脑及脑脊液的平均信号强度，计算齿状核/脑桥、齿状核/脑脊液、苍白球/丘脑及苍白球/脑脊液的信号强度比值，采用配对样本 t 检验分析每一位患者首、末次平扫 T1 加权上信号强度比之间是否存在统计学差异；采用线性回归分析方法，分析多种临床因素与首、末次颅脑平扫 T1 加权上信号强度变化之间的相关性。

结果 多次静脉注射线性钆对比剂后末次颅脑平扫 T1 加权齿状核/脑桥、齿状核/脑脊液、苍白球/丘脑及苍白球/脑脊液的信号强度比均大于增强前首次平扫 T1 加权信号强度比，差异有统计学意义[首、末次颅脑平扫 T1 加权信号比分别为 0.986±0.055、1.054±0.053；3.781±0.613、5.360±0.974；1.045±0.047、1.181±0.059；4.301±0.854、6.451±1.561；P 值均<0.001]。各信号强度比差值与 MRI 增强次数存在正相关（齿状核/脑桥 b=0.009，P<0.001；齿状核/脑脊液 b=0.090，P=0.015；苍白球/丘脑 b=0.008，P<0.003；苍白球/脑脊液 b=0.147，P=0.009）；与年

龄、性别、是否进行放化疗、肝功能是否正常及多次检查之间时间间隔长短无关（*P*值均＞0.05）。

结论 多次接受线性钆对比剂注射的患者，T1 加权齿状核、苍白球信号增高，且与 MRI 增强检查次数呈正相关，与患者的年龄、性别、是否进行放化疗、肝功能是否正常及多次检查时间间隔长短无明显相关。

磁共振多序列三维成像在显示下牙槽神经中的应用

周婕,冉启胜
陆军军医大学大坪医院

目的：磁共振成像的三维薄层扫描可以清晰显示下牙槽神经及其解剖结构与周围组织结构的关系，研究磁共振 3D-mprage 序列与 3D-TSE 序列在下牙槽神经成像的应用，对临床治疗有较大的指导价值。

方法：收集我院 20 例智齿拔除志愿患者进行颌面部磁共振成像检查，所有患者均知情同意。使用西门子 3.0T Verio 高场强超导 MRI 扫描仪，头颈部线圈，患者采用仰卧位、头先进方式，先进行常规颌面部检查序列，以下颌骨为中心扫描。常规平扫后进行 3D-mprage 序列（层厚：1.0mm，TR：2410ms，TE：4.2ms，TI：1400ms，翻转角度：10°，采集矩阵：512*512，FOV：256*256）和 3D-TSE 序列（层厚：0.9mm，TR：3800ms，TE：194ms，TI：160ms，采集矩阵 436*512，FOV：198*220）扫描，检查结束后对两序列进行多曲面重建处理，得到下牙槽神经长轴面的完整显示。由我科两名高年资医生及口腔科主任医师分析评价后处理图像，评价下牙槽神经形态结构、走行、组织关系及其连续性，并得出两种序列在显示下牙槽神经各自的意义。

结果：根据实验后处理图像所得，在 20 例智齿拔除患者中，8 例患者下牙槽神经有损伤或轻度损伤，3D-mprage 序列能够清晰地显示下牙槽神经，且较明显地显示了损伤部位，3D-TSE 序列显示下牙槽神经不如 3D-mprage 序列清晰，但 3D-TSE 序列在神经与周围组织之间的关系有较好的显示。

结论：本实验研究结果表明，磁共振多序列三维成像在显示下牙槽神经中的应用，结合两种磁共振三维薄层成像序列，可以清楚地显示下牙槽神经的形态、连续性、走行及其与周围组织关系，对下牙槽神经损伤的诊断和治疗具有重要的临床意义。

EPO-2046

Grey Matter Atrophy in Relapsing and Progressive Multiple Sclerosis Associated with Neurologic Disability and Cognitive Impairment: A Largescale MRI study

Yuan Cao,Zhiyun Jia
West China Hospital of Sichuan University

Objective: To identify the consistent findings from whole‐brain voxel‐based morphometry (VBM) studies in grey matter volume (GMV) of patients with relapsing remitting multiple sclerosis (RRMS) and primary progressive multiple sclerosis (PPMS). Methods: A systematic search was conducted based on PRISMA guidelines using the anisotropic effect-size-based algorithms (ASE-SDM). We conducted a meta-analysis of

voxel-based morphometry (VBM) studies of patients with subtypes of MS to quantitatively estimate regional GM changes.
Results: Twenty-six studies with 32 datasets comprising 1067 patients with MS and 776 healthy controls (HCs) were included. Our results revealed that compared with HCs, GMV reductions were found in the left insula, right superior temporal gyrus (STG), right median cingulate/paracingulate gyri (MCPG), right anterior thalamic nucleus (ATN) and bilateral postcentral gyri in patients with RRMS, and in the bilateral lenticular nucleus, putamen (LNP), left ATN, left anterior cingulate/paracingulate gyri (ACPG) and right precentral gyrus (PCG) in patients with PPMS. Meta-regression revealed that the expanded disability status scale (EDSS) score and smooth kernel level in patients with MS were negatively correlated with specific deep GM (dGM) regions.
Conclusions: The cingulate and thalamus may be the pivotal biomarker of neurodegeneration in both RRMS and PPMS. dGM atrophy abnormalities in PPMS patients may represent structural brain underpinnings of social cognitive disability in MS. The association between cognitive impairment and GMV reduction should be addressed in future studies.

EPO-2047

高分辨 DTI 在颈段脊髓应用

段莹星
中南大学湘雅医院

目的:比较 reslove-DTI 与 zoomit-DTI 的序列成像，探讨高分辨 DTI 在颈段脊髓中的应用价值。
材料和方法：2019 年 1 月至 3 月招募 18 名志愿者，年龄 20-23 岁（平均年龄 21.56±1.04 岁），其中 8 名男性，10 名女性。所有志愿者均排除颈椎病史，均行 reslove-DTI 和 zoomit-DTI 扫描，对图像质量进行评估，且针对各个椎间盘水平进行 FA 和 ADC 测值比较。
结果：zoomit-DTI 对颈段脊髓成像质量明显优于 reslove-DTI。且随着椎间盘水平的降低，FA 值逐渐降低 ADC 值升高，FA 值在 C2/3 与 C4/5、C5/6、C6/7 之间存在统计学差异（p＜0.05），FA 值在 C4/5 与 C5/6 之间存在统计学差异（p＜0.05）。ADC 值在各个椎间盘水平不存在统计学差异。
结论：zoomit-DTI 相较于 reslove-DTI 对颈段脊髓成像具有更大的优势，且随着椎间盘水平的降低，FA 值逐渐降低 ADC 值升高。

比较高 b 值 DWI 和标准 b 值 DWI 在胶质瘤术前评估中获得的表观弥散系数

江浩茹
山西医科大学第一医院

目的：评估从高 b 值 DWI 获得的 ADC 在术前评估分级，Ki-67 指数和胶质瘤结果方面是否更有价值。
方法：招募了 85 名患有神经胶质瘤的患者，他们接受了 3T 磁共振术前高 b 值 DWI 检查。

并获得 ADC_{1000}，ADC_{2000} and ADC_{3000}图像，进行接受者操作特征分析，为了鉴别低级别胶质瘤（LGG）和高级别胶质瘤（HGG）确定曲线下面积（AUC）。计算相关系数（R 值），以研究 Ki-67 参数之间的相关性。通过使用 Coox 回归进行生存分析。

结果：在区分 HGG 和 LGG 时，平均 ADC_{1000}值（0.760）的 AUC 低于平均 ADC_{2000}值（0.840）和平均 ADC_{3000}值（0.810）。平均 ADC_{1000}值（-0.499）的 R 值小于平均 ADC_{2000}值（-0.530）和平均 ADC_{3000}值（-0.567）。平均 ADC_{3000}值是胶质瘤的独立预后因素（p = 0.075），而平均 ADC_{1000}和 ADC_{2000}值不是。

结论：从高 b 值 DWI 获得的 ADC 值可能是胶质瘤术前评估中较好的成像生物标志物。

EPO-2049
脑胶质瘤多序列 MRI 影像学表现及其鉴别诊断价值探讨

邵华,贾文霄,姜磊
新疆医科大学第一附属医院

目的 旨在探讨脑胶质瘤多序列 MRI 影像学表现及其鉴别诊断价值。**方法** 选取我院 2016 年 1 月~2018 年 3 月收治的经病理证实的脑胶质瘤患者 65 例，患者均进行了 MRI 检查，扫描序列包括常规横断位、矢状位及冠状位 T1WI、T2WI、液体衰减反转恢复（fluid attenuated inversion recovery，FLAIR）、扩散加权成像（diffusion weighted imaging，DWI），总结不同病理类型脑胶质瘤患者 MRI 扫描各序列图像表现，以病理学检查结果为对照，计算 MRI 检查对不同类型脑胶质瘤的诊断符合率。**结果** MRI 检查对星形细胞瘤、少枝胶质瘤、室管膜瘤、髓母细胞瘤诊断符合率分别为 97.61%、100.00%、83.33%、83.33%， MRI 检查对脑胶质瘤诊断总符合率为 95.38%（62/65）；星形细胞瘤主要为水瘤型、囊型、混合型，水瘤型、囊型边缘模糊，未出现明显强化，混合型瘤体主要表现为混合密度，出现环形或结节状强化，低级星形细胞瘤 T1WI 为低信号，T2WI、FLAIR 呈现高信号，DWI 缺乏限制性弥散。少枝胶质瘤患者中，多边界较模糊、水肿程度严重，强化不均匀；室管膜瘤 MRI T1WI 序列呈现稍低信号，T2WI 序列为等信号，中度不均匀强化。髓母细胞瘤 MRI T1WI 序列呈现低信号，T2WI 序列为等或稍高信号，外观呈现类圆形，病灶常可见水肿带。**结论** MRI 多序列扫描中均可有效显示不同脑胶质瘤的影像学图像特征，鉴别诊断符合率高。

ADC 直方图在中枢神经系统淋巴瘤鉴别诊断中的价值

马桢,赵鑫,张小安
郑州大学第三附属医院河南省妇幼保健院

目的:研究 ADC 全域灰度直方图在鉴别原发性中枢神经系统淋巴瘤（Primary central nervous system lymphoma，PCNSL）与多形性胶质母细胞瘤（Glioblastoma multiform，GBM ）和单发脑转移瘤（Solitary brain metastasis，SMT)的诊断价值。**方法：**回顾性分析在我院做过脑部 MRI 检查并经病理证实的 95 例患者，其中中枢神经系统淋巴瘤 38 例（男 19 例、女 21 例，平均年龄 57.1 ± 12.5，范围 33～81 岁），胶质母细胞瘤 29 例（男 13 例、女 17 例，平均年龄 51.2 ± 14.5，范围 10～69 岁），单发转移瘤 28 例（男 15 例、女 13 例，平均年龄 59.8，范围 36～76 岁）。分别在三组 MR ADC 轴位图像上用 Mazda 软件将肿瘤的每一个层面勾画感兴趣区并进行灰度全域直方图分析，并分别对这三组直方图参数特征进行统计学分析，比较各参数的统计学意义。**结果：**经灰度直方图中分析得到的 9 个参数，即均值（Mean）、变异度（Variance）、峰度（Kurtosis）、偏度（Skewness）、第一百分位数（Perc.01%）、第 10 百分位数（Perc.10%）、

第 50 百分位数（Perc.50%）、第 90 百分位数（Perc.90%）及第 99 百分位数（Perc.99%）这 9 个参数差异有统计学意义（P 均<0.05）。**结论：**直方图分析有助于中枢神经系统淋巴瘤与胶质母细胞瘤和单发转移瘤的鉴别，均数、偏度及 Perc.50%具有较高诊断效能。

EPO-2053
3D CISS 序列在评估原发性三叉神经痛三叉神形态学中的价值

赵洪涛,章辉庆,邱晓晖
亳州市人民医院

目的 探究 3.0T MRI 三维稳态构成干扰（3D CISS）序列在原发性三叉神经痛（PTN）三叉神经形态学改变中的应用价值。**方法** 回顾性分析本院 36 例 PTN 患者的影像及临床资料，运用 3D CISS 序列及 MPR 技术，测量两侧三叉神经脑池段最大长度及面积、三叉神经-桥脑夹角及桥小脑角池截面，对其结果进行比较。**结果** 三叉神经脑池段最大长度分别为（9.87±2.71）mm（症状侧）及（9.96±2.20）mm（非症状侧），二者比较差异无统计学意义（P＞0.05）；三叉神经脑池段最大截面分别为（27.28±8.59）mm^2（症状侧）及（34.11±11.66）mm^2（非症状侧），二者比较差异有统计学意义（P＜0.05）；三叉神经-脑桥夹角分别为（41.80±8.02）°（症状侧）及（47.75±11.01）°（非症状侧），二者比较差异有统计学意义（P＜0.05）；三叉神经桥小脑角池截面分别为（204.42±8.20）mm^2（症状侧）及（229.19±58.47）mm^2（非症状侧），二者比较差异有统计学意义（P＜0.05）。**结论** 3D CISS 序列在评估 PTN 三叉神经脑池段形态学改变中，能给其定性及定量诊断；其中，三叉神经脑池段最大截面偏小、三叉神经-脑桥夹角锐利以及桥小脑角池截面狭窄时更易造成三叉神经痛的发生。

Abnormal intrinsic brain amplitude of low-frequency fluctuations in patients with tremor-dominant Parkinson’s disease

Zhi Wen,Xuefang Lu,Huangqing Ouyang,Baojun Xie
Renmin Hospital of Wuhan University

Purpose: Parkinson’s disease (PD) is one of the most common neurodegenerative disorders in the elderly and 70% patients manifest resting tremor. [1] Resting-state fMRI shows the high test-retest reliability for depicting local brain activity, especially the amplitude of low-frequency fluctuation (ALFF). This study aimed to determine alterations in intrinsic brain activity in patients with tremor-dominant PD using ALFF method.

Methods and materials: The study was approved by the local ethics committee. The written informed consent was obtained for all subjects. *Subjects:* 31 tremor-dominant PD patients (59.7±7.8 years, 20 female, righthanded) and 28 healthy controls (HCs,

57.4±5.2 years) closely matched in age, sex, and education were enrolled in the study. Participants were assessed with Mini-mental state examination (MMSE), Hoehn and Yahr disability scale, and the unified Parkinson's disease rating scale motor part (UPDRS-III). FMRI was performed on a multimodal 3.0 T MRI Scanner (GE Healthcare, Discovery 750w, Piscataway, NJ, USA) using rsfMRI (TR/TE=2000/25 ms, thickness=3.0mm, gap=1.2mm, acquisition matrix=64×64, flip angle=90°, field of view=240×240 mm^2, voxel size=3.6×3.6×3.6 mm^3, 35 axial). Data were analyzed using SPM12 (www.fil.ion.ucl.ac.uk/spm) and REST (www.restfmri.net). The ALFF method was applied to compare different intrinsic brain activities between the PD group and the HC group. (voxel-level $P < 0.01$, cluster-level $P < 0.05$) The relationship between the mean ALFF signal values of different brain regions and UPDRS-III of PD group was analyzed by Pearson correlation.

Results: Compared with HCs, PD group had significantly lower ALFF values in the left putamen and left precentral gyrus/middle frontal gyrus (BA 6,9). Moreover, the ALFF values of the left putamen showed negative relationship with the UPDRS-III ($r = -0.570$, $P = 0.021$) in PD.

Conclusions: Decreased ALFF of the left putamen is in accordance to reduced dopamine uptake among PD patients, which is the most consistent finding, indicating the striatal dysfunction. [2] The ALFF changes in the left precentral gyrus could be attributed either to the motor dysfunction, or to the right-handedness.[3] The modulation of the motor regions together with basal ganglia contributes to enhancing movement and improving the daily life activities of PD patients.

磁共振 ADC 值在鼻咽癌颅底侵犯放射治疗前的应用价值

郭晓涵,刘念龙
江苏省肿瘤医院

目的：探讨磁共振 ADC 值在鼻咽癌颅底侵犯放射治疗前的应用价值
方法：选择 2018 年 5 月起所有颅底侵犯的鼻咽癌病历材料，通过查阅患者的影像检查以及相关实验室检查资料，结合电话随访，其中有一半的患者资料显示转移或复发，定为复发组，同时选择在随访过程中各类检查一直正常的另一半病例为对照组。所有颅底侵犯的病例必须经过穿刺活检，病理诊断为鼻咽癌的初诊患者。在治疗前均要接受 CT 增强扫描、颈和鼻咽 MR 平扫和增强扫描、鼻咽镜检查及相关病理检查以明确分期及排除远处转移。对两组病例在弥散加权成像上测量其治疗前颅底表观弥散系数（ADC）值，采用 SPSS13.0 统计软件对两组进行 t 检验，研究 ADC 值在鼻咽癌颅底病变复发和转移中的临床价值。
结果：T3T4 分期与 ADC 值大小的关系，复发组 T3 期和对照组 T3 期的患者颅底受侵犯病灶 ADC 值分别为（0.816±0.024）和（0.851±0.039），两者间无统计学意义（P>0.05，t＝0.906）；复发组 T4 期和对照组 T4 期的患者颅底受侵犯病灶 ADC 值分别为（0.797±0.033）和（0.829±0.036），两者间无统计学意义（P 大于 0.05，t＝1.25）。复发组与对照组患者颅底病灶 ADC 值分别为（0.804±0.031）以及（0.813±0.035），t＝1.60，P＝0.112，两组间无明显统计学差异。并且两组间 T3T4 颅底病灶 ADC 均值的 P>0.05，两组间无意义。
结论：放疗前鼻咽癌颅底侵犯部位的 ADC 值结合常规序列和 DWI 序列可以更准确地诊断鼻咽癌颅底的侵犯情况；但其治疗前 ADC 值的高低与鼻咽癌颅底的复发或转移并无联系，与鼻咽癌的 T 分期无关联，我们不能从放疗前颅底部位的 ADC 值来判断患者的预后情况。我们也许可以这样理解，有颅

底侵犯的鼻咽癌患者，和他的 T 分期无关，只有经过科学的计划和精确的照射后，才能得到最好的结果。

EPO-2056
机器学习方法分类原发性帕金森病冻结步态的价值

阮秀杭,魏新华
广州市第一人民医院

目的：研究通过采用静息态功能磁共振（Rs-fMRI）和机器学习方法，建立分类帕金森病（PD）冻结步态（FOG）和健康对照组（HC）的个体诊断模型，并进一步推测该病的相关病理机制。
材料和方法：采集 55 名 PD 病人和 26 名 HC（平均 60.19±3.71 岁）的多模态 MR 数据（包括 Rs-fMRI 序列、高分辨 T1WI 结构像及常规 MR 序列），PD 患者根据“步态与跌倒问卷”、“冻结步态问卷”及经神经科医生评价后诊断为冻结步态（FOG+）组 25 例（平均 68.52±8.57 岁）与无冻结步态（FOG-）组 30 例（平均 60.00±10.32 岁）。采用基于 MATLAB 2013b 的 DPABI V3.0 软件进行影像数据的预处理和基于自动解剖标记模板构建全脑大尺度功能连接网络，并将其作为分类特征。然后，采用基于 MATLAB 2013b 的 LIBSVM 软件包运用 F 分值法进行特征降序排列并使用径向核函数（RBF）构造的支持向量机（SVM）模型进行分类，使用留一法交叉验证来评估该模型的性能。
结果：当取 F 分值最高的前 7 个特征时，对 FOG+、FOG-和 HC 受试者的正确区分率为 74%。本研究得到 28 个选定频率相对高的用于区分 FOG+、FOG-和 HC 的脑网络连接特征，这些连接特征主要位于背侧注意网络（左背外侧额上回、右眶部额上回、左眶部额中回、双侧眶内额上回）、默认网络（双侧角回、双侧顶下缘角回、左楔叶）、视觉网络（双侧距状裂周围皮层、右枕中回）、听觉网络（双侧颞横回、左颞中回、右颞上回）、感觉运动网络（右中央前回、右辅助运动区）的网络内部或网络之间的连接。
结论： 基于脑功能网络属性的 SVM-RBF 分类器能对 FOG+、FOG-和 HC 的进行较好的分类。PD FOG+、FOG-病人在背侧注意网络、默认网络、视觉网络、听觉网络、感觉运动网络的功能连接性方面出现异常，推测这些静息态脑网络对于判别 FOG+及 FOG-的 PD 患者具有较大的价值

EPO-2057
成人中重度 OSAHS 患者网络拓扑属性规则化的结构磁共振研究

刘婉晴
大连大学附属中山医院

目的：通过图论的方法探讨成人中重度 OSAHS 患者脑结构共变网络的拓扑属性是否发生改变及其变化规律，旨在从连接组学的角度去揭示 OSAHS 的神经影像机制。
方法：本研究从大连大学附属中山医院招募 31 例未经治疗的中重度 OSAHS 患者（41.23±8.22 岁）和 26 位性别、年龄、利手情况及教育年限相匹配的睡眠良好的对照被试（good sleeper，GS，39.50±7.92 岁）。所有被试行西门子 3.0T 核磁共振头部薄层 T1WI 扫描，然后本研究基于结构磁共振数据提取 90 个感兴趣区（ROI）的灰质体积构建大尺度结构共变网络，运用图论的方法去分析 OSAHS 结构共变网络的拓扑属性。
结果：与睡眠良好被试相比，尽管成人中重度 OSAHS 结构共变网络都符合小世界特征，但是其结构共变网络拓扑属性异常，更加趋向于规则网络特征，表现为聚类系数增高（p=0.009）、传递系数增加（p=0.029）和局部效率增高（p=0.031），最短路径长度在网络密度 0.22～0.24 增加

(p<0.05)，以及随机故障抵抗力降低（p=0.044）。此外，本研究还发现 OSAHS 和 GS 结构共变网络中的度分布满足指数截断的幂律分布。

结论：本研究结果表明成人中重度 OSAHS 结构共变网络的多项拓扑属性发生异常，这为成人中重度 OSAHS 患者认知障碍的神经生物学机制提供了新的神经影像学见解。

基于 DTI 的急性脑梗死患者基底节白质纤维束重建研究

白艳[1],谢兴佳[1,2],邵天喜[1,2],包艳森[1,2],布璟[1,2]
1.湖北省随州市中心医院
2.湖北医院学院附属随州医院

【摘要】**目的：**运用扩散张量成像（Diffusion tensor imaging, DTI）技术对急性脑梗死患者进行检查，并依据 DTI 数据对白质纤维束行三维重建，根据白质纤维束受累情况评估患者运动功能并预测患者预后。

方法：选取 2018 年 12 月至 2019 年 4 月在随州市中心医院治疗的 24 例急性脑梗死患者，对他们均进行 DTI 检查，测量每个患者梗死灶与健侧相对应区域的 FA 值，并重建出双侧白质纤维束示踪图，从三维视角观察梗死灶是否累及神经纤维束，评价纤维束受累情况，同时按照美国国立研究院卒中评分（NIHSS)标准对患者进行评分，研究 FA 值、白质纤维束受累分级与临床评分的关系，预测患者预后情况。

结果：患侧白质的平均 FA 值（0.329±0.142），明显比健侧（0.406±0.154）低 p<0.05，差异具有统计学意义；白质纤维束受累分级 2 级患者患侧白质 FA 值（0.216±0.134）低于分级 1 级（0.312±0.147）患者；白质纤维束受累分级 1 级患者患侧白质 FA 值（0.312±0.147）明显低于分级 0 级（0.432±0.149）的患者；3 个不同白质纤维束受累分级比较 p<0.05，差异具有统计学意义；白质纤维束受累越严重，NIHSS 临床评分分值数相对越高，其相关系数为 1，相关性具有统计学差异 p<0.01。

结论：基于 DTI 对急性脑梗死患者的基底节白质纤维束行三维重建，可以直接观察到基底节区白质纤维束的损伤程度同时对患者肢体功能进行 NIHSS 评分，预测患者肢体运动功能恢复情况。

EPO-2059
磁共振纹理分析在良恶性腮腺肿瘤鉴别诊断的应用价值

解婷
徐州医科大学附属医院

目的：通过对腮腺肿瘤的磁共振图像进行纹理分析，并用支持向量机 (SVM)评价纹理特征，评价纹理分析在鉴别腮腺良恶性肿瘤中的价值。方法：回顾性搜集分析徐州医科大学附属医院 50 例经病理证实腮腺肿瘤患者的磁共振图像，对提取的肿瘤的感兴趣区进行纹理分析，避免肿瘤内坏死、囊变区域。结果：利用灰度共生矩阵提取出 3 种纹理分析方法，提取 10 个纹理参数，通过进行线性判别联合 K 值最比邻法证实，基于 T1 平扫及 T1 加强图像鉴别良恶性结节准确性为 80%。10 个参数在上述两种不同类别的数据集之间具有统计学意义 (P<0.05)，对于所有不同类别的数据集，ROI 区域灰度值的方差参数均有统计学意义。讨论：纹理特征的分析可以提供更多量化信息特征，为腮腺肿瘤影像学的鉴别诊断提供了新的思路和方法。

EPO-2060
多模态 MRI 对高级别胶质瘤术后复发和假性进展的研究探讨

王兴兰,刘丹
重庆医科大学附属永川医院

【摘要】目的　探讨多模态 MRI (平扫＋增强、DWI、1H-MRS、PWI)在鉴别高级别胶质瘤术后复发与假性进展中的应用价值。资料与方法　收集我院 2016.1~2018.12 期间高级别胶质瘤复发 21 例和假性进展 17 例患者，对常规 MRI 及 DWI、1H-MRS、PWI 影像和病史采集进行分析。结果　高级别胶质瘤复发与假性进展区 rCBV 比值分别是（3.38±2.23）、（1.24±1.58），rCBF 比值是（3.55±2.28）和（1.21±1.04），差异具统计学意义（P＜0.05），而 rMTT，rTTP 均不具有统计学意义（P＞0.05）。胶质瘤术后复发和假性进展 rADC 比值分别是（1.35±0.36），（1.27±0.44），差异不具统计学意义（P＞0.05）。胶质瘤术后复发区及假性进展 Cho/NAA 比值是（3.79±2.00），（3.66±3.19）和 Cho/Cr 比值是（2.26 士 1.27）和（3.13 士 2.98），差异均无统计学意义(P>0.05)。结论　PWI 在鉴别高级别胶质瘤术后复发与假性进展中具有较高的价值，联合常规 MRI 增强及 DWI、1H-MRS 的多模态模式更能提高诊断准确性。

EPO-2061
MSDE BB 成像技术在脑微小转移瘤诊断中的应用价值

李黎明
广东省第二人民医院

目的 研究 MSDE BB 成像技术影像特点，对比其他常规 MRI 序列在脑微小转移瘤影像特点，探讨 MSDE BB 成像技术在脑微小转移瘤诊断中的应用价值。方法：回顾性分析经临床证实的脑转移瘤患者 30 例。所有病例均行 MR 常规平扫、常规 T1　WI 增强扫描及 MSDE BB 增强扫描。对比分析 MSDE BB 成像序列和其他常规序列对于脑微小转移瘤的检出差异。结果 常规 TI WI 序列检出的病灶为 86 个，所漏诊 123 病灶中，其中 73 个位于脑表面皮层区，50 个位于脑深部实质区。增强后 MSDE BB 序列共检出病灶 209 个，其中脑表面皮层区 124 个，脑深部实质区 85 个。两种增强序列在脑皮层区、脑实质区及总病灶数的检出率差异均具有统计学意义（P<0.05）。结论 增强后 MSDE BB 序列对比其他常规平扫及增强序列，对脑微小转移瘤的检出率和敏感性具有较高的优势，能够在脑转移瘤特别是微小转移瘤的诊断中提供更多的影像信息。

EPO-2062
定量脑磁共振灌注技术对颞叶癫痫患者海马灌注情况的研究

谢欢,冉启胜
陆军特色医学中心（大坪医院）

目的：研究定量磁共振灌注技术对海马的检查方法，评估颞叶癫痫海马硬化患者海马灌注血流量的变化情况以及预测颞叶癫痫海马 CBF 临界值。
方法：收集我院 2018 年 3 月-2019 年 3 月因癫痫行头颅海马 MRI 检查，并通过磁共振波谱成像证实存在海马硬化的 30 例癫痫患者作为实验组，海马正常的另外 30 例患者作为常规组。采用西门子公司 Aera 1.5T 超导型磁共振扫描仪，使用头部相控阵线圈，患者取仰卧位，平静呼吸。实验组和常规组的 30 例患者均先行常规头颅 MRI 常规检查，再行常规海马斜轴位、斜冠状位 T2_Flair 扫

描，之后行海马磁共振波普检查，最后行海马斜轴位定量磁共振灌注检查，自动生成 CBF 灌注函数图像。扫描结束后首先做波普后处理，再结合常规海马斜轴位、斜冠状位 T2_Flair 图像定位海马异常部位，最后在定量磁共振灌注 CBF 函数图像上测量海马异常部位的 CBF 灌注函数值。如果为海马正常的常规组患者，其定量磁共振灌注 CBF 函数图像的测量部位为最易发生海马硬化的海马头部。分析比较实验组和常规组海马的血流量变化情况，并通过 ROC 曲线预测 CBF 临界值。
结果：分别测量实验组、常规组全定量磁共振灌注 CBF 函数值。统计分析实验组、常规组海马 CBF 灌注函数值。实验组 CBF 灌注函数平均值为 15.15±3.17ml/(100g.min)，常规组 CBF 灌注函数平均值为 25.48±8.46ml/(100g.min)，实验组海马 CBF 灌注函数平均值低于常规组海马 CBF 灌注函数平均值。运用 ROC 曲线计算 CBF 最佳临界值为 19.60。
结论：定量磁共振灌注技术能够很好的应用于海马 CBF 的定量检测。硬化海马血流量相对于正常海马血流量有明显下降。颞叶癫痫患者海马灌注量的变化要先于影像学的改变，定量灌注定量测量海马 CBF 有助于颞叶癫痫的早期诊治。

The interhemispheric coordination and hemispheric dominance pattern in hemiparkinsonism

Jingjing Wu,Tao Guo,Cheng Zhou,Ting Gao,Xiaojun Guan,Xiaojun Xu,Peiyu Huang,Minming Zhang
The Second Affiliated Hospital of Zhejiang University

Purpose: The motor dysfunctions always affect hemi-body first in Parkinson's disease (PD). However, the interhemispheric relationships in patients with unilateral motor impairment were barely known to date. We aimed to investigate the interhemispheric coordination and hemispheric dominance pattern in hemiparkinsonism using resting-state functional Magnetic resonance imaging (RS-fMRI) for further understanding the pathogenesis of PD.
Materials and Methods: Forty-there unilateral-symptomatic PD patients (UPD, Hoehn-Yahr staging scale, H-Y: 1-1.5), and 54 age-, gender-, education-matched normal controls (NC) were recruited. All subjects underwent MRI scanning and clinical evaluations. The interhemispheric coordination (Voxel-Mirrored Homotopic Connectivity, VMHC) and hemispheric dominance pattern (laterality index of eigenvector centrality mapping, LI-ECM) were calculated. Afterwards, correlation analyses were employed to examine the relationships between each abnormal parameters and motor variables and receiver operating characteristic (ROC) curve analysis was employed to validate the discriminating ability of abnormal parameters.
Results: Compared with NC, UPD group showed significantly decreased VMHC in bilateral sensorimotor regions which was negatively correlated with the motor score. Furthermore, at the cut-off homotopic connectivity of 0.604, statistically significant ability of VMHC to discriminate UPD from NC with area under ROC curve (AUC) = 0.759, $p < 0.001$; specificity = 74.4%; sensitivity = 68.5% was observed. No difference was detected in UPD patients as for ECM and LI-ECM.
Conclusion: The disrupted interhemispheric coordination in homotopic sensorimotor regions was a potential neural basis for the hemiparkinsonism and was shown to be valuable for the diagnosis and assessment of early PD. However, the unchanged functional connectome and hemispheric dominance pattern indicating the global

functional connectivity was fairly reserved in the early stage of PD. These findings provided new insights into the pathogenesis of PD from an interhemispheric perspective.

EPO-2064
高清增强 T2Flair 纹理分析在脑胶质瘤术后放疗定位 MRI 中的应用

吴训华,孔令煜,周高峰
中南大学湘雅医院

目的：探究磁共振高清 T2flair 序列增强后纹理分析在脑胶质瘤术后放疗定位患者治疗中的意义，明确复发肿瘤信号与水肿脑实质信号范围。
方法：回顾性分析 2018 年 6 月至 2019 年 5 月脑胶质瘤术后患者在我科进行磁共振颅脑放疗定位的患者 41 例。所有病例均有我院手术及病检报告证实。所收集患者术前及术后均在 3T GE750W 磁共振上采用专用头线圈进行平扫 T2,T1，高清 T2Flair（采集次数 3 次层厚 3mm 层距 1mm 矩阵 256x256）后按患者体重进行钆造影剂（0.1ml/Kg）行增强 3DT1+C,3DLAVE+C 三维常规影像检查及与高清 T2Flair+C 扫描（扫描成像参数与平扫一致）；经 3 位影像专业高年资医生分别采用 T2Flair 高清纹理对比分析脑水肿信号与复发肿块信号，边界对比较常规 T1 增强前后的信号边界清晰明确有诊断意义,对放疗精准定位有帮助。
结果： 41 例患者术后 MRI 增强前后 T2Flair 高清纹理分析对比与常规 T1 平扫增强影像诊断 14 例患者脑胶质瘤复发，27 例术后未见明显复发影像改变手术区边缘脑实质有不同程度水肿信号。
结论：经 3 位高年资的专业影像科医生及 2 位神经外科诊断增强前后高清 T2Flair 图像纹理分析对比常规 T1 增强图像在脑胶质瘤术后复查影像诊断中有明确的磁共振信号显示优势及诊断意义；在放疗定位中有利于精准靶区放疗定位。

EPO-2065
正常人群三叉神经 RS-EPI DTI 定量参数变异范围的初步研究

徐俊峰,尹剑兵,朱建峰,何一舟,刘佳,崔磊
南通市第一人民医院

目的 通过不同 b 值的高分辨率 RS-EPI DTI 对各年龄组志愿者进行成像，旨在研究正常人群三叉神经的 DTI 定量参数的变异范围，揭示不同 b 值及不同年龄段对三叉神经定量分析指标的影响，为日后深入开展三叉神经痛（trigeminal neuralgia，TN）的诊疗做好前期准备。
方法 入组志愿者共 99 例，排除 1 例头晕症状志愿者实为急性脑梗死，余入组 98 例，其中男性 41 例，女性 57 例，共 196 侧。分为三组，低危老年组（≥60 岁），共 45 例，90 侧，记录为 A 组；高危年龄组（48-59 岁），共 29 例，58 侧，记录为 B 组；低危青年组（≤47 岁），共 24 例，48 侧，记录为 C 组。所有入组志愿者分别进行 RS-EPI DTI 及 T_2WI 序列检查，其中 RS-EPI 中 b 值分别采取（0 s/mm^2，300s/mm^2）、（0 s/mm^2，600s/mm^2）、（0 s/mm^2，900s/mm^2）三组进行扫描，记录为 DTI $_1$、DTI $_2$和 DTI $_3$。由 2 名有 5 年和 10 年神经系统诊断经验的放射科医师，在 Siemens Syngo 后处理工作站上对志愿者 RS-EPI DTI 序列不同 b 值获得图像进行 MD 值、FA 值的测量。
结果 尽管无统计学差异，但是在相同 b 值情况下，A 年龄组与 C 年龄组间存在随年龄的增大 FA 值而逐渐降低的趋势；MD 值则存在随年龄的增大而逐渐升高的趋势。b 值在 300s/mm^2、600s/mm^2

时，B 组人群 MD 值最低，仅在 b 值为 900s/mm^{2}时，MD 值随年龄的升高而增大；各年龄组内左右两侧三叉神经在相同 b 值条件下，所测得的 FA 值、MD 值均无统计学差异（P均＞0.05）。
结论　RS-EPI 对正常三叉神经进行 DTI 定量参数范围的测量是可行的；正常人群中左右两侧三叉神经 DTI 定量参数并无明显差异；各年龄组中不同 b 值测得 FA 值、MD 值均随 b 值的增大而逐渐降低。

EPO-2066
DTI 在评估 2 型糖尿病并发视网膜病变患者视路受损情况的应用

零敏,曾自三
广西医科大学第一附属医院放射学科

目的　探讨弥散张量成像技术在评估 2 型糖尿病并发视网膜病变（DR）患者视觉传导通路解剖结构受损情况的应用价值。
方法　利用 DTI 是一种利用水分子在人体不同组织中表现出的不同分子随机不规则运动特征成像的一种评估微细结构异常的技术，入选 7 名 DR 患者及 15 名年龄、性别相匹配的健康对照组，于 Simens Prisma 3.0T 磁共振行 MRI 检查（T1WI、T2WI、T2-FLAIR、3DT1、Resolve-DTI），收集血压、血糖、血脂、眼底照相、既往史等临床数据，测量视觉传导通路全程（视神经、视交叉、视束、外侧膝状体、视放射、初级视觉皮层）的各向异性分数（FA）值。
结果　对照组及 DR 组 T1WI、T2WI、T2-FLAIR 序列形态、信号未见明确异常；与对照组相比较，DR 组视神经、视交叉、视束、外侧膝状体、视放射、初级视觉皮层 FA 值均减小，其中以视束处减小明显。
结论　血糖的长期升高会导致机体出现一系列的改变，其中致盲为影响较为严重的并发症之一。视力的改变除与视网膜微血管受损有关，或与视神经等视觉传导通路的结构改变也有关系。磁共振是目前活体研究视觉传导通路的唯一技术，其中 DTI 以以水分子弥散各向异性为基础，能无创地反应病变对脑白质纤维的破坏，在评估 2 型糖尿病并发视网膜病变患者视路受损情况时有重要应用价值，FA 值可为糖尿病脑相关微观变化的研究提供客观的评价依据。

EPO-2067
Brain amplitude of low frequency fluctuation alterations in optic neuritis patients: a 3-year follow-up study

Jing Huang[1],Yunyun Duan[2],Xiong Kang[1],Jie Lu[1]
1.XUANWU hospital
2.TIANTAN hospital

The prognosis of visual acuity in optic neuritis (ON) patients varies greatly from individual to individual. Visual acuity (VA) was significantly restored by remodeling neurons of visual pathway in some patients after acute phase, but in the others, VA gradually declined until blindness. The relationship between visual prognosis and brain function alterations in ON patients remain unclear.
Purpose: The objective of this study was to investigate the potential links between brain activity amplitude alteration and VA, during a 3-year follow-up period.

Methods: A total of 43 ON patients and 44 healthy controls (HCs) were examined twice, with a 3-year interval. Based on the VA at the third years, ON patients were divided into two groups: 26 ON patients with good visual outcome (the 4m logarithm of the minimum angle of resolution (logMAR) VA<0.3), 17 ON patients with poor visual outcome (LogMAR VA>0.3). Resting-state fMRI collected to investigate the amplitude of low frequency fluctuation (ALFF) difference among the three groups. The relationship between ALFF in regions with significant group differences and VA was further explored.
Results: Significantly decreased mALFF were observed in visual cortex (left cuneus and left middle occipital gyrus), cognition-related areas (right paracentral lobule), and right anterior cingulate cortex, and bilateral middle temporal gyrus, left middle frontal gyrus in ON patients than HCs. While increased mALFF were occurred in several regions in the frontal and temporal lobes ($P < 0.001$, FDR corrected). We found positive correlations between VA and ALFF in bilateral middle temporal gyrus and significantly negatively related to ALFF in left middle frontal gyrus.
Conclusion: From this follow-up study, we found the ALFF in middle temporal gyrus and middle frontal gyrus might play important role in the prognosis of visual acuity in ON. These findings provide important insights into the underlying neural mechanisms of ON.

Decreased Cerebellum Subregions Related White Matter Integrity in Type 2 Diabetes Patients

Ying Yu,An-Ding Zhang,Jia-Cheng Han,Wen Wang,Guang-Bin Cui
Department of Radiology , Tangdu Hospital, Fourth Military Medical University

Background
Type 2 diabetes mellitus (T2DM) is a critical risk factor for mild cognitive impairment and the acceleration of MCI to dementia. Our previous study showed significantly decreased absolute neurovascular coupling (NVC) in subregions of cerebellum cortex in T2DM patients [1]. Besides, NVC coefficients were significantly positively correlated with the total score of Mini-Mental State Examination (MMSE). However, the role of cerebellum subregions in overall brain function remains unknown.
Methods
To assess the cerebellum diffusion kurtosis (DK) pattern in diabetic status, 30 T2DM patients and 30 matched healthy control subjects were prospectively enrolled. General cognition, executive and memory function were estimated respectively. Then, they underwent DK imaging to calculate the mean kurtosis (MK), radial kurtosis (RK), axial kurtosis (AK), kurtosis anisotropy (KA) between cerebellum subregions and the other cerebral voxels. Correlation analysis were also used to calculate the relationship between FCs and cognitive performance.
Results
Poorer performance was found in patients in 6 subitems of the executive and memory function. T2DM group displayed significantly decreased MK, RK, AK values in the precentral-cerebellar branch, superior frontal-cerebellar branch of corticocerebellar track and cross corticocerebellar track, respectively. Meanwhile, the MK and RK values

in the precentral-cerebellar branch were positively correlated with MMSE total scores (P< 0.05).

Conclusion

Decreased white matter integrity is significantly correlated with general cognitive performance in T2DM patients leading impaired cerebellar related white matter fiber tracts to be promising indicator for supervising the general cognitive function in T2DM patients.

动态技术在眼部 MRI 中的应用初探

孙琦
上海交通大学医学院附属第九人民医院

目的：本研究通过调节成像参数，以寻求高信噪比和高分辨率的动态成像，并在眼部运动时观察眼球运动、视神经及眼肌变化，为眼球运动的生理学提供方法和理论依据。
材料与方法：（1）志愿者扫描，在其他所有参数保持统一、单一因素改变的条件下，以需求最佳动态扫描成像的各项参数。（2）选择 2019 年 4 月来我院眼科门诊就诊的甲状腺相关性眼病患者 18 例，给予眼部常规增强扫描及横断位及矢状位动态核磁共振成像，观察眼球、视神经及眼肌运动变化，并观察其动态下相关结构变化情况。
结果：（1）动态眼部磁共振最优参数确认。患者眼球自由缓慢地分别作左右及上下移动，眼部各结构清晰显示。（2）对于健康成人的双侧视觉结构的动态图像仅在约 15 秒的成像时间内进行图像重建。（3）在 18 例甲状腺相关性眼病患者中，眼球及视神经在运动中存在伪影，眼肌显示可，三组具有显著性统计学差异。（4）眼肌运动与疾病的进展程度成反相关，眼球及视神经与疾病的进展程度没有显著性统计学差异。
结论：（1）增强后眼部动态成像显示清晰，信噪比高，可以用于辅助临床诊断。（2）眼部运动的研究为甲状腺相关性眼病的病理学的研究提供了基础。

Validation of zTE-MRA in the characterization of cerebrovascular diseases: a feasibility study

Songan Shang, Jing Ye, Xianfu Luo, Jingtao Wu
Northern Jiangsu People's Hospital

Objectives zTE-MRA is less sensitive to field heterogeneity, complex flow and acquisition noise. This study aimed to prospectively validate the feasibility of zTE-MRA for cerebrovascular diseases assessment, compared to TOF-MRA.
Materials and Methods Seventy patients suspected of having cerebrovascular disorders were recruited. Sound levels were estimated for each MRA subjectively and objectively in different modes. MRA image quality was estimated by two neuroradiologists. The degree of stenosis (Grade 0-4) and the z-diameter of aneurysms (tiny group ≤ 3mm and

large group > 3mm) were measured for further quantitative analysis. CTA was used as gold standard.
Results zTE-MRA achieved significantly lower subjective perception and objective noise reduction (37.53%). zTE-MRA images showed higher signal homogeneity (3.29±0.59 vs. 3.04±0.43) and quality of venous signal suppression (3.67±0.47 vs. 2.75±0.46). The intermodality agreement was higher for zTE-MRA than TOF-MRA (zTE, 0.90; TOF: 0.81) in grading of stenosis. zTE-MRA had a higher correlation than TOF-MRA (zTE, 0.84; TOF, 0.74) in the tiny group, and a higher consistency with CTA (intra-class correlation coefficient, 0.83; intercept, 0.7000 to 2.6133, slope -1.0344 to -0.1923) than that of TOF-MRA (intra-class correlation coefficient, 0.64; intercept, 0.7000 to 2.6133, slope -1.0344 to -0.1923). zTE-MRA and TOF-MRA were comparable in large group. zTE-MRA displayed more accurate details than TOF-MRA of AVM and Moyamoya lesions.
Conclusion Compared to TOF-MRA, zTE-MRA achieved more robust performance in depicting cerebrovascular diseases. Therefore, zTE-MRA was demonstrated to be a promising MRA technique for further routine application in the clinic in patients with cerebrovascular diseases.

EPO-2071

Volumetric assessment of glioblastoma can be the biomarkers for IDH1 mutation status

Bo Zhou,Weiguo Zhang,Haipeng Tong
Daping Hospital, Army Medical University

Purpose Mutation status of isocitrate dehydrogenase is associated with prognosis of glioblastoma, The goal of this study is to determine whether Volumetric assessment on T1-weighted magnetic resonance imaging (MRI) correlate with IDH1 mutation status.
Methods We conducted a retrospective analysis of MR images from 41 patients (28 males and 13 females) harboring a primary glioblastoma, derived from Daping hospital of Army Medical University. Preoperative MR images were scanned by Siemens(1.5T or 3.0T) All patients underwent surgery and obtained pathological tissue. The tumor necrosis, enhancement and edema area were segmented by 3Dslicer, and the necrosis-tumor ratio NTR (necrosis volume/tumor volume) , enhancing volume fraction and edema volume fraction were obtained after 3D reconstruction. The expression of IDH1 was detected by immunohistochemistry.
Results An independent t test showed that IDH1 mutation subgroup had a lower NTR than the wild subgroup(P=0.045). The enhancing volume of IDH1 mutation subgroup (22.4±18.9cm3) was also lower than the wild subgroup(43.8±15.9cm3) (P=0.011) , but there were no significant differences of the edema volume between the two subgroup(P=0.921).ROC analysis showed that area under ROC curve was 0.818 (95% CI:0.615~1.000,P=0.014) and the enhancing volume fraction (AUC=0.845,95% CI: 0.644~1.000, P=0.007), However, ROC analysis of the edema volume fraction yielded an AUC of 0.564, which was insignificantly larger than that of the guessing line (p=0.622).

Conclusions Our study found that quantitative morphological tumor characteristics on T1-weighted MRI can to a certain degree provide insights regarding IDH1 mutation status in patients with glioblastoma.

EPO-2072

Morphologic changes of lumbosacral nerve roots on MRN: diagnostic value in CIDP and correlation with electrophysiological parameters

Fei Wu,Han qiu Liu,Wei wei Wang
Department of Radiology, Huashan Hospital, Fudan University, Shanghai, China

Purpose This study aimed to determine the value of morphologic changes of lumbosacral nerve roots on magnetic resonance neurography(MRN) in the diagnosis of chronic inflammatory demyelinating polyradiculoneuropathy(CIDP) and to analyze their correlations with electrophysiological parameters.

Methods Magnetic resonance neurography of lumbosacral plexus was performed in 21 CIDP patients and 21 healthy volunteers matched by sex and age. The cross-sectional areas(CSAs) from L3 to S1 nerve roots were measured on reformatted axial images and compared between two groups. Receiver operating characteristic(ROC) curves were plotted to determine the diagnostic accuracy and optimal cutoff value. All CIDP patients also underwent nerve conduction studies(NCS). Correlations between CSAs of lumbosacral nerve roots and electrophysiological parameters were analyzed.

Results CSAs from L3 to S1 nerve root were significantly larger in CIDP patients than in healthy volunteers (L3:19.77±6.92mm^2 VS 9.95±2.54mm^2, $p<0.001$; L4: 23.05±7.28mm^2 VS 12.09±3.28mm^2, $p<0.001$; L5:32.78±12.94mm^2 VS 15.21±3.51mm^2, $p<0.001$ and S1:37.06±14.76mm^2 VS 22.37±4.17mm^2, $p<0.001$). ROC curves revealed among four nerve roots, CSA of L5 was best at distinguishing CIDP patients from healthy volunteers (AUC=0.957) and the optimal cutoff value was 19.60mm^2. CSAs of L5 and S1 nerve root correlated positively with central latency of tibial nerves ($p=0.046$ and $p=0.002$ respectively) while L5 nerve root CSA correlated negatively with conduction velocity of tibial nerve($p=0.027$).

Conclusion CIDP patients showed increased CSAs from L3 to S1 nerve roots on MR neurography, some of which correlated well with electrophysiological parameters of demyelination. ROC curves showed CSA of L5 nerve root had the best diagnostic value and its optimal value was 19.60mm^2. Quantification of lumbosacral nerve roots may assist the diagnosis of CIDP.

EPO-2073

Multimodal Quantitative Magnetic Resonance Technique in Differential Diagnosis of Different Pathological Patterns of Parotid Gland Tumor

Shun Yu
Fujian Provincial Hospital

Purpose: To study the value of diffusion kurtosis imaging (DKI) and dynamic contrast-enhanced (DCE) MRI in differential diagnosis of parotid gland tumor (PGT) among different pathological patterns, and evaluated diagnostic performance of DKI and DCE-MRI-derived parameters.
Methods: Forty-seven patients with different pathological types of PGT were enrolled and underwent routine MRI and DKI, DCE-MRI examinations. The DKI images were analyzed by using the DKE software (http://academicdepartments.musc.edu/cbi/dki/) to obtain DKI-derived parameters Dmean, Dax, Drad, Kmean, Krad, Kax and FA. The DCE-MRI images were analyzed by using the commercial software called Tissue 4D (Siemens AG, Erlangen, Germany) to obtain DCE-MRI -derived parameters Ktrans, Kep, Ve and iAUC. The characteristics of signal intensity in T1WI-TSE,T2WI-TSE and the patterns of contrast-enhanced curve between benign and malignant PGT were analyzed. The difference between benign PGT (include Parotid gland lymphoma) and malignant PGT, between benign PGT (not include PGL) and malignant PGT, parotid mixed tumor (PMT) and PGL, PMT and malignant PGT were analyzed by using Independent-Samples T test and One-way ANOVA was used to compare the difference and a bonferroni adjustment for multiple comparisons. Receiver operating characteristic (ROC) analysis was conducted to assess the cutoff values and diagnostic performance.
Results: (1) The Kmean, Krad, Kax of benign PGT (not include PGL) were significantly lower than malignant PGT ($P<0.05$). The Kmean, Krad, Kax values of PMT were significantly lower than PGL and malignant PGT ($P<0.05$). (2) The Ktrans, Kep values of benign PGT (not include PGL) were significantly lower than malignant PGT, while the value of Ve was significantly higher than malignant PGT ($P<0.05$). (3) The Ktrans, Kep values of PMT were significantly lower than malignant PGT and PGL, while the value of Ve was significantly higher than malignant PGT and PGL ($P<0.05$). ROC analysis demonstrated a high diagnosis performance among them. (4) No significant difference was found between benign and malignant PGT about the characteristic of signal intensity, the deep of invasion to surrounding tissue, the degree of cystic change and enhanced curve patterns between type C indicating benign PGT and type A, B and D which indicate the PGT was malignant ($P>0.05$).
Conclusion: Both DKI and DCE-MRI-derived parameters demonstrated high diagnostic accuracy in diagnosing different pathological PMT, especially in differential diagnosis of PMT and PGL which lack characteristic in morphology.

计算机认知功能矫正治疗改善抑郁症患者执行功能的脑机制研究

范嘉晨,冯苏洋,刘加成

东南大学附属中大医院核医学科

目的：抑郁症患者常伴随执行功能的受损，即使经过药物治疗后，仍有许多患者会持续存在执行功能异常。NBCCR（Neuroplasticity-based computerized cognitive remediation）是基于神经可塑性设计的计算机认知功能矫正程序，它可能通过激活与执行功能相关的大脑网络（包括背外侧前额叶、眶额回、背侧前扣带回）来改善抑郁症患者的执行功能，但关于 NBCCR 如何改善抑郁症患者执行功能的脑机制尚缺乏深入研究。本研究拟阐明经 NBCCR 治疗后与执行功能改善相关的脑区激活改变。
方法：收集 2018 年 6 月 1 日至 2019 年 7 月 1 日在我院精神科确诊为抑郁症的患者 23 例，排除 3 名头动过大的患者后，剩余对照组 9 人，治疗组 11 人。两组患者均在入组前及入组 4 周后接受 Philips Ingenia Ⅱ 3.0T 磁共振 BOLD 扫描、T1WI 轴位扫描。BOLD 扫描过程中，患者需要完成 stroop 范式。本研究采用一套名为“捉球”的计算机认知功能矫正程序对治疗组患者进行为期 4 周共计 30 小时的认知治疗。
结果：两组患者年龄、性别、受教育程度间无统计学差异。两组患者基线期执行一致任务的正确率、正确反应时间无统计学差异。4 周后，治疗组执行一致任务正确率为 0.9774±0.3039，正确反应时为 0.5039±0.1746；对照组执行一致任务正确率为 0.9295±0.7396，正确反应时为 0.4948±0.2241；两组正确率间存在统计学差异（Z=-2.035,p=0.042），正确反应时间无统计学差异(t=-0.118,p=0.907)。影像结果表明：在一致任务下，4 周治疗交互作用体现在右侧额叶、右侧边缘叶、右侧胼胝体、右侧扣带回前部、中部正性激活(p=0.001 ， 簇大小 20)。
结论：NBCCR 可以改善抑郁症患者执行功能，其机制可能与右侧额叶、右侧边缘叶、右侧胼胝体、右侧扣带回激活改变有关。

Differential diagnosis efficacy of thymic solid tumors with intravoxel incoherent motion diffusion-weighted MR imaging

Shijun Duan
Tangdu Hospital, the Fourth Military Medical University

PURPOSE

To retrospectively evaluate the differential diagnosis performance of intravoxel incoherent motion diffusion-weighted imaging (IVIM-DWI) for thymoma, thymic carcinoma and thymic lymphoma.

METHOD AND MATERIALS

Seventy-one subjects (49 men, 22 women; age range, 5–72 years) including thymoma (n=27), thymic carcinoma (n=16) and thymic lymphoma group (n=28) confirmed by pathological analysis underwent thoracic MRI on a 3.0-T MRI system, including conventional sequence and 9 b-value (b-value: 0 - 1,000 s/mm^2) DWI. Multi-b-value apparent diffusion coefficient (ADC_{mb}) were calculated by mono-exponential model.Pure diffusion coefficient (D), pseudo-diffusion coefficient (D*) and perfusion fraction (f) were calculated with bi-exponential model. Mean ADCmb, D, D*, and f values were compared for the differences among thymoma, thymic carcinoma and thymic lymphoma groups by one-way ANOVA, and further post hoc multiple comparisons were performed with Bonferroni test or Dunett's T3 test. ROC curve analyses were performed to determine

the efficacy and optimum thresholds for differentiating the defined groups by various parameters.

RESULTS

The mean D and D* value in thymoma were significant higher than the value from thymic carcinoma and lymphoma (D, 0.90, 0.62 and 0.49 $\times10^{-3}$ mm^2 /s; D*, 9.50, 5.56 and 3.62$\times10^{-3}$ mm^2 /s, and 10.47, 4.76 and 4.01 $\times$ 10^{-3} mm^2 /s, respectively, all P < 0.001),while there were no significant difference between the thymic carcinoma and lymphoma (P > 0.05/3). The mean ADC_{mb} value in thymic lymphoma were significantly lower than thymoma and thymic carcinoma (ADC_{mb}, 0.71, 1.32 and 0.99 $\times10^{-3}$ mm^2 /s, respectively, P<0.001), but no significant difference between the thymoma and thymic carcinoma (P > 0.05/3). As for the f value, no significant difference were found among groups (P > 0.05). The AUC and cutoff value, respectively, for differentiating thymoma from thymic lymphoma: ADC_{mb}, 0.946 and 0.872 $\times10^{-3}$ mm^2/s; D, 0.861 and 0.721$\times10^{-3}$ mm^2/s; D*, 0.878 and 4.80 $\times$ 10^{-3} mm^2/s; for differentiating thymic carcinoma from lymphoma for ADC_{mb}, D and D* were as follows: ADC_{mb}, 0.786 and 0.932$\times10^{-3}$ mm^2/s; D, 0.670 and 0.679 $\times10^{-3}$ mm^2/s; D*, 0.721 and 4.2 $\times10^{-3}$ mm^2/s.

CONCLUSION

We suggest that IVIM-DWI measurements could be used to differentiate thymic solid tumors preoperatively.

EPO-2076

快速自旋回波扩散加权成像在肺部病变应用的可行性研究

雷强
1.广东省第二人民医院
2.广州医科大学附属第一医院

目的 对比单次激发快速自旋回波扩散加权成像与平面回波扩散加权成像在肺部实性病变的图像质量，分析和评价参数 ADC 和 LSR 的测量可重复性和一致性。

方法 前瞻性收集孤立性肺部实性病变患者 27 例，27 个病灶最长径为(3.0±1.7)cm。术前均行胸部 MRI 平扫，包括常规 T1WI、常规 T2WI、TSE-DWI 及 EPI-DWI，其中 DWI 选取 2 个 b 值（b=0、600 s/mm^2）。所有 TSE-DWI 与 EPI-DWI 的原始图像经后处理软件测量并分别计算得出的参数包括变形率 DR、SNR、CNR、ADC mean 及 LSR。

结果 TSE-DWI 对应的 DR 均值明显小于 EPI-DWI（P＜0.05），SNR 及 CNR 的差异均无统计学意义。重复测量 TSE-DWI 的 ADC mean 值对应 ICC 和 WCV 为 0.9373 和 5.8568%；LSR 值对应 ICC 和 WCV 为 0.8783 和 11.8546%。EPI-DWI 的 ADC mean 值对应 ICC 和 WCV 为 0.9730 和 5.7564%；LSR 值对应 ICC 和 WCV 为 0.8061 和 16.1645%。重复扫描 TSE-DWI 对应的 ADC mean 和 LSR 值均稍高于 EPI-DWI，Kendall 系数 τ 分别为 0.590 和 0.464，其差异的 LOA 分别为-48%至 64%和-111%至 166%。

结论 TSE-DWI 在肺部实性病变的图像质量优于 EPI-DWI，其参数 ADC mean 和 LSR 测量都具有好的可重复性。TSE-DWI 对应的参数 ADC_{mean} 和 LSR 均值高于传统 EPI-DWI，其 LOA 达不到一致性的标准。

EPO-2077

肺栓塞磁共振成像：增强与非增强 MR 血管成像诊断准确性

袁思殊,夏黎明
华中科技大学同济医学院附属同济医院

目的：研究目的在于比较增强 MR 血管成像与非增强空间标记多反转脉冲序列（SLEEK）MR 血管成像诊断肺栓塞的准确性。
方法：本研究经健康保险流通与责任法案（HIPAA）以及伦理委员会审查通过。32 名 CT 血管成像诊断肺栓塞的患者（18 男 14 女，平均年龄 39.4±15.6 岁），于 CT 检查 48 小时内行 MR 成像。MR 包括两种不同的技术：增强 MR 血管成像以及非增强 SLEEK 血管成像。每个序列都由两名放射科医生分别阅片，记录栓塞的数量以及每个栓塞的血管解剖学区域。CT 血管成像由另外两名放射科医生一同评价，结果作为参考标准。计算每种 MR 技术发现肺栓塞的敏感性、特异性、阳性预测值以及阴性预测值，根据效率-积分方法（efficient-score method）计算 95%可信区间。并采用两样本 t 检验比较上述两种 MR 技术。计算加权 κ 值以评价阅片者间一致性。
结果：增强磁共振血管成像诊断肺栓塞的敏感性为 67%，特异性 95%。非增强 SLEEK MR 血管成像诊断肺栓塞的敏感性 72%，特异性 90%。结合两种 MR 方法诊断肺栓塞的敏感性提升至 84%，特异性提升至 100%。两阅片者间存在高度一致性（k = 0.87）。
结论：增强 MR 血管成像和非增强 SLEEK MR 血管成像准确性相似，结合这两种 MR 技术对评价肺栓塞可达到互补的作用。非增强 SLEEK MR 血管成像无需使用对比剂，可成为肺栓塞诊断策略中的一部分。

EPO-2078

Machine learning based computed tomography radiomic analysis for histologic subtype classification of thymic epithelial tumors

Jianping Hu,Yijing Zhao,Mengcheng Li,Dairong Cao
the First Affiliated Hospital of FujianMedical University

Objectives: To develop and validate the performance of machine learning based computed tomography (CT) radiomic analysis for distinguishing high-risk thymic epithelial tumors (TETs) from low-risk TETs according to WHO classification.
Methods and Materials: This retrospective case-control study comprised 155 patients with a histologic diagnosis of high-risk TETs (n=72) and low-risk TETs (n=83) who underwent unenhanced CT (UECT) and contrast-enhanced CT (CECT). Radiomic features were extracted from UECT and CECT of each patient at the largest cross-section of the lesion. Classification performance was evaluated by a nested cross-validation approach combining two feature selection methods (Mann–Whitney U-test and LASSO) and four classifiers: generalized linear model (GLM), k-nearest neighbor (KNN), support vector machine (SVM) and random forest (RF). Receiver operating characteristic curve (ROC) and area under the curve (AUC) were used to evaluate the performance of the classifiers.
Results: The combination of UECT and CECT radiomic features demonstrated the best performance to distinguish high-risk TETs from low-risk TETs for all four classifiers. For the combined mode of UECT and CECT, the classifier RF had the highest AUC of 0.86

in the testing set, followed by GLM (AUC = 0.85), SVM AUC = 0.84), and KNN(AUC = 0.83).
Conclusions: Machine learning based CT radiomic analysis allow for the differentiation of the high-risk TETs and the low-risk TETs with excellent performance, which can be used as a promising tool to assist in clinical decision- making in patients with TETs.

Blood Oxygenation Level-Dependent Magnetic Resonance Imaging for Assessing and Predicting Early Response of Esophageal Carcinoma Treated with Chemoradiotherapy: A Preliminary Study

Huanhuan Zheng,Song Liu
Department of Radiology, Nanjing Drum Tower Hospital, The Affiliated Hospital of Nanjing University Medical School

Objective: To explore the feasibility of blood oxygenation level-dependent (BOLD) Magnetic Resonance (MR) imaging to assess and predict the early treatment response in patients treated with definitive concurrent chemoradiotherapy (CRT) for esophageal carcinoma (EC).
Materials and Methods: 38 patients receiving CRT for inoperable EC underwent BOLD MR examinations on a 3.0-Tesla MR scanner at pre-CRT (within 5 days before CRT) and post-CRT (2 - 3 weeks after the start of CRT). The variation of R2* values at pre- and post-CRT was observed by Paired Student's t test. Independent samples t-test was used to compare differences of parameters between complete response (CR) and partial response groups (PR).
Results: The R2* values significantly increased from 34.59 ± 8.73 s^{-1} to 44.96 ± 9.06 s^{-1} at post-CRT in the overall patients ($p < 0.001$). The R2* values of the lesion at pre- and post-CRT in CR group were significantly higher than those in PR group (37.38 ± 8.18 s^{-1} vs. 29.82 ± 7.72 s^{-1}, $p = 0.008$ and 48.47 ± 7.45 s^{-1} vs. 38.94 ± 8.60 s^{-1}, $p = 0.001$, respectively).Moreover, R2* values at 2- 3 weeks post-CRT showed good prediction, yielding an AUC of 0.818 (95% CI: 0.659 - 0.978, $p < 0.001$) for identifying CR from PR.
Conclusion: BOLD MR imaging contributed to assessing tumor response to definitive concurrent CRT for inoperable EC and a high R2* value at an early stage of treatment suggested a good response after CRT.

Native T1-mapping of focal pulmonary lesions in 3.0-T magnetic resonance imaging: Display and accuracy of size estimation

Shuyi Yang[1], Qinqin Yan[1], Fei Shan[1], Yuxin Shi[1], Zhiyong Zhang[1,2], Jie Shen[1]
1. Shanghai Public Health Clinical Center
2. Zhongshan Hospital

Objective: To compare focal pulmonary lesion display and size-estimation accuracy of native T1-mapping with that of T1-star 3D-volumetric interpolated breath-hold sequence (VIBE), T2-fBLADE turbo-spin echo (TSE), and computed tomography (CT).

Materials and methods: Thirty-nine patients with CT-detected focal pulmonary lesions underwent thoracic 3.0-T MRI using axial free-breathing 3D T1-star VIBE, respiratory triggered T2-fBLADE TSE, breath-hold T1-Turbo FLASH and T1-FLASH 3D. Native T1-mapping images were generated by T1-FLASH 3D with B1-filed correction by T1-Turbo FLASH. The intraclass correlation coefficient (ICC) and Bland-Altman plots were used to evaluate intra-observer agreement and inter-method reliability of diameter measurements.

Results: Forty-five focal pulmonary lesions (3.30±1.90cm, range: 1.00-7.80cm; 27 with a range of 1.00-2.92cm) were displayed by CT, native T1-mapping, T1-star VIBE, and T2-fBLADE TSE. Four lesions showed consolidation on CT, but showed distal obstructive pulmonary atelectasis and/or pneumonia with native T1-mapping. T1-mapping-based diameter measurements yielded an ICC of 0.995 and a mean difference of -0.03 cm. Additionally, inter-method measurements were highly consistent (T1-mapping & T1-star VIBE: ICC 0.982, mean difference 0.23 cm, T1-mapping & T2-fBLADE TSE: ICC 0.978, mean difference 0.17 cm, T1-mapping & CT: ICC 0.972, mean difference 0.15 cm). For lesions < 3.00 cm, T1-mapping intra-observer (ICC 0.982, mean difference 0.01 cm) and inter-method diameter measurements were also highly consistent (T1-mapping & CT: ICC 0.823, mean difference 0.10 cm).

Conclusion: Native T1-mapping displays focal pulmonary lesions clearly (particularly when accompanying obstructive atelectasis and/or pneumonia) and enable accurate and reliable diameter measurement.

心脏磁共振延迟强化对急性心肌梗死的临床诊断价值

武佳科
中国医科大学附属盛京医院

目的 探讨心脏磁共振延迟强化(LGE)对急性心肌梗死(AMI)的临床诊断价值。**方法** 连续入选 2017 年 12 月 1 日至 2018 年 10 月 31 日于中国医科大学附属盛京医院治疗的 AMI 患者 60 例，对其临床资料进行回顾性分析。患者均在入院 5 天内行心脏磁共振检查，采用多次屏气平衡稳态自由进动快速成像(FIESTA)序列行延迟强化成像，根据检查结果将患者分为 LGE 阳性组(28 例)和 LGE 阴性组 (32 例)，对两组患者进行比较分析。 **结果** LGE 阳性组与 LGE 阴性组患者相比：年龄、性别、吸烟、高血压、糖尿病、陈旧性心梗等指标差异均无统计学意义(均 $P>0.05$)。LGE 阳性组患者的左心室射血分数显著低于 LGE 阴性组{(39.2±16.2)%比(52.3±9.1)%，$P<0.05$}。LGE 阳性组患者的梗死心肌质量与左心室收缩末期容积($r=0.726$)、左心室舒张末期容积($r=0.708$)密切相关(均 $P<0.05$)。**结论** 磁共振延迟强化能有效判断 AMI 患者心肌梗死严重程度，可在临床工作中起到重要的指导作用。

EPO-2083
T1-mapping 和细胞外容积（ECV）定量铁过载所致心肌纤维化巴马猪模型的研究

钟德琳,彭鹏
广西医科大学第一附属医院

目的：通过 T1-mapping 序列及细胞外容积（ECV）技术定量铁过载所致的弥漫性心肌纤维化。
方法：同一品系巴马小型猪共 23 头，随机分为对照组（4 头）、实验组（15 头）及验证组（4 头）；实验组和对照组每周使用右旋糖酐铁经肌肉注射一次，对照组注射相同容积生理盐水，注射 1-15 周。注射后每周抽取 1 头实验组行 MRI 扫描，对照组和验证组分别于 1、5、10、15 周后行 MRI 扫描。扫描前抽静脉血测量红细胞压积（HCT），于心脏短轴位，行 T1-mapping 平扫、增强和多回波梯度回波扫描。扫描后取扫描部位附近组织行病理分析，测量胶原容积分数（CVF）、铁沉积的半定量、心肌铁含量（CIC）；测量室间隔和血池的平扫和增强后的 T1 值，$T2^*$值，计算 ECV。采用比较不同延迟时间段测量 ECV 的差异，分析评价室间隔中部的 ECV 与注射铁剂总量、CIC、CVF、Native T1 值、$T2^*$值等指标的相关性；拟合 ECV 与 CVF 的回归方程并验证。$P<0.05$ 有统计学意义。
结果：当注射铁剂达到 1200mg/kg，CVF、EVC 开始升高。CIC、CVF、EVC 与注射铁剂量高度正相关（$P<0.05$）。病理显示胶原纤维分布不均。Native T1、$T2^*$与 CIC 高度负相关（$P<0.05$）；增强后不同时段的 ECV 差异无统计学意义（$P=0.923$）。ECV 与 CVF 高度相关，建立回归方程 Y(CVF)=0.015+0.399X(ECV)，（$R^2=0.903$，$P<0.001$）。
结论：通过注射右旋糖酐铁可获得铁过载导致的心肌纤维化动物模型。心肌纤维化的胶原纤维分布不均，病理取材可能无法准确评估纤维化程度。评估心肌纤维化时，不应单纯使用 T1-mapping，应结合 $T2^*$或 ECV 综合评估心肌纤维化。通过 ECV 可计算病理测量的 CVF，无创评估心肌纤维化。

EPO-2084

暴发性心肌炎 CMR 表现

李浩杰,夏黎明
华中科技大学同济医学院附属同济医院

目的：评估 CMR 在暴发性心肌炎应用价值。
材料与方法：回顾性分析 29 例暴发性心肌炎患者及 19 例正常志愿者临床及 CMR 资料，所有受试者均在 3.0T 进行 CMR 扫描，扫描序列包括长轴及短轴心脏电影，黑血 T2 加权成像，首过灌注及延迟强化序列。统计分析左心功能参数，心肌水肿率，延迟强化范围。
结果：暴发性心肌炎患者 hs-cTNT 及 NT-ProBNP 明显升高，与对照组相比，前者 LVEF、LVESV、LVESVi、CO 及 SV 较对照组减低，具有明显统计学差异。疾病组室间隔心肌水肿增厚，且心肌水肿率（2.6±0.7）明显高于对照组，心肌 LGE 平均质量 24.4±18.3g，占总心肌质量 35.3±21.5%。LGE 以室间隔、下壁累及较多，LGE 主要以中外层线性强化为主，38%患者 LGE 呈弥漫性分布。85%患者 CMR 上出现心包积液。
结论：心脏磁共振在暴发性心肌炎中有较高的临床应用价值。

EPO-2085

原发扩张型心肌病的左心整体功能和心肌纤维化基于心脏磁共振的相关研究

洪雪冬
合肥平安健康检测中心

目的 利用 1.5T 磁共振探讨原发扩张型心肌病的心功能和心肌纤维化的特点和相关性。**方法** 研究收集确诊为扩张性心肌病（DCM）患者 30 人为实验组，另外收集健康志愿者 35 人。所有受试者均行 1.5T 心脏磁共振（CMR）平扫和增强检查分别得出左心室整体功能指标及心肌延迟强化信息，并对部分心功能指标体表面积标准化。所测心功能指标包括：左心室收缩末容积(LVESV)、左心室舒张末容积(LVEDV)、左心室射血分数(LVEF)、左室高峰射血率(LVPER)、左室高峰充盈率(LVPFR)、左室心肌质量(LVMM)等等。所有的 30 例扩心患者均已行心脏超声检查（超声组），收集部分心功能指标。比较实验组和超声组间部分心功能指标数值差异；比较实验组和健康组两组之间各项数值的差异；根据实验组内是否出现延迟强化（DE-MRI）再分成两亚组：DE-MRI（+）组和 DE-MRI（-）组，并比较两组心功能指标差异。**结果** 1. 实验组和超声组间部分心功能指标（LVEDV、LVESV、LVEF）无明显差异。 2.DCM 实验组的 LVEDV、LVESV、LVMM 等指标明显高于健康对照组（P＜0.05），而 LVEF、LVPER、LVPFR 等则低于健康对照组（P＜0.05），都具统计学差异；3. DE-MRI（+）组 LVMM、LVESV 指标高于 DE-MRI（-）组（P＜0.05），DE-MRI（+）组 LVEF 指标低于 DE-MRI（-）组（P＜0.05），都具统计学差异。4. DCM 实验组中有 21 例(60%)出现心肌延迟强化，共计 153 个节段出现延迟强化，其中肌壁间 107 个节段（64.85%）强化特点显著，分布部位以室间隔壁 14 例（66.67%）为主。**结论** 1. 1.5T CMR 相比超声可以很好的评价心脏功能；2.1.5T CMR 可以很好评价 DCM 心功能及心肌纤维化；3.LVMM 可以初步评估 DCM 心肌纤维化(MF)。

EPO-2086

心脏磁化准备小角度激发相位敏感反转恢复序列在肥厚型心肌病患者中的应用

谢欢,冉启胜
陆军军医大学大坪医院

目的：探讨磁化准备小角度激发相位敏感反转恢复序列在肥厚型心肌病患者中的应用价值。
方法：收集到我院就诊的肥厚型心肌病患者 15 例作为研究对象，此 15 例患者均采用西门子 Aera 1.5T 超导磁共振扫描仪进行扫描，线圈采用 16 通道胸部部相控阵线圈。15 例患者均行心脏 MR 检查序列包括心脏电影成像、心肌灌注成像、心脏对比剂延迟强化成像（LGE）、磁化准备小角度激发相位敏感反转恢复序列成像（PSIR Turbo-FLASH）。心脏电影成像采用屏气真性稳态自由进动序列采集心脏左室短轴、左室长轴和四腔心层面；心肌灌注成像采用饱和恢复快速梯度回波序列采集左室短轴位层面；LGE 采用常规二维磁化准备小角度激发序列（Turbo-FLASH）采集左室短轴层面；PSIR Turbo-FLASH 序列于 LGE 成像结束后进行采集，与 LGE 采用相同的空间分辨率、FOV、层厚、层数和层间距。采集结束后，对比受检者 PSIR Turbo-FLASH 图像与 LGE 图像，分析对比两个序列图像对病变的检出率以及对病变的显示程度。
结果：对比分析 15 例患者的 PSIR Turbo-FLASH 和 LGE 两种序列图像，得出 PSIR Turbo-FLASH 序列对延迟强化的检出率为 86.7%，LGE 的检出率为 73.3%，PSIR Turbo-FLASH 序列对病灶的检出率高于 LGE 序列，且前者检出病灶的信号强度都高于后者。
结论：PSIR Turbo-FLASH 序列对肥厚型心肌病的病灶检出率高于 LGE 序列对病灶的检出率，其前者检出病灶的信号强度也高于后者检出病灶的信号强度，并且前者序列所重建的相位图对病灶的显示更为敏感。

EPO-2087
比较使用脉搏门控与心电门控对 3.0T 心脏磁共振电影扫描序列图像质量的影响

史征,杨瑞,刘继伟,冯晓刚
河南省胸科医院

目的：当心电图波形处于不理想状态时，可采用脉搏门控来代替心电门控进行心脏磁共振的电影扫描
方法：本研究连续入选 48 例心脏病患者，年龄（28~63）岁。在国产联影 770，3.0T 磁共振成像系统下，对我院 48 例不同心脏病患者，进行心脏磁共振扫描，均同时连接心电门控和脉搏门控。对心脏四腔，两腔，三腔和短轴位电影分别应用心电门控和脉搏门控扫描。图像质量由两名经验丰富的影像科诊断医生进行比对并用后处理软件进行数据测量。
结果：心电门控组 48 例患者中有 4 例心电门控模式出现 R 波低，T 波抬高，有漏触发和误触发，造成重建伪影，无法进行准确计算。脉搏门控组的 48 例脉搏门控模式扫描出来的图像，仅有一例发现重建伪影。两组图像除去 4 例心电门控有伪影患者和 1 例脉搏门控有伪影患者，其余 43 例患者的两组图像测量心肌厚度、射血分数、舒张末容积和收缩末容积均无明显差别，血池心肌对比、噪声比及图像总体质量亦无明显差别。
结论：在 3.0T 磁共振上做心脏磁共振电影扫描时，当心电图波形处于不理想状态时，采用脉搏门控可在一定程度上替代心电门控，反应心脏的运动情况并能通过后处理软件正确的测量数值。

EPO-2088

The feasibility and diagnostic value of Intravoxel Incoherent Motion Diffusion-Weighted imaging in the assessment of myocardial fibrosis in Hypertrophic Cardiomyopathy

Rui Wu,Dong-Ao-Lei An,Ruo-Yang Shi,Bing-Hua Chen,Chong-Wen Wu,Meng Jiang,Jian-Rong Xu,Jun Pu,Lian-Ming Wu
Renji Hospital, School of Medicine, Shanghai Jiao Tong Universit

Purpose: To examine the feasibility and capacity of intravoxel incoherent motion (IVIM) to investigate myocardial fibrosis in patients with hypertrophic cardiomyopathy (HCM).
Method: Fifty-five HCM patients were enrolled and underwent IVIM diffusion-weighted cardiovascular resonance imaging. Cine, T1 mapping, IVIM and late gadolinium enhancement (LGE) were performed. Strain, pre T1, extracellular volume (ECV), IVIM derived parameters (D, D* and f) and LGE were analyzed into 16 American Heart Association segments; and the relationship of these parameters were analyzed. Base on the LGE appearance and ECV quantification, abnormal segments for myocardial fibrosis were defined as: the presence of LGE (LGE+) or ECV ≥ 29.6%.
Results: D values were significantly increased in both LGE+ (1.89 ± 0.14 $\mu m^2/ms$) and ECV ≥ 29.6% (1.84 ± 0.13 $\mu m^2/ms$) group than LGE- (1.63 ± 0.12 $\mu m^2/ms$) and ECV < 29.6% (1.61 ± 0.12 $\mu m^2/ms$) group. Compared to LGE- and ECV < 29.6% group, D* (34.9 ± 6.6 $\mu m^2/m$ vs 55.2 ± 11.4 $\mu m^2/m$, $p < 0.001$;37.5 ± 6.9 $\mu m^2/m$ vs 59.6 ± 9.2 $\mu m^2/m$, $p < 0.00$, respectively) and f values (10.8 ± 1.29 % vs 12.5 ± 1.26 %, $p < 0.001$; 10.9 ± 1.1 % vs 13.00 ± 1.0 %, $p = 0.021$, respectively) were significantly decreased in both LGE+ and ECV ≥ 29.6% group. Moreover, significant correlations were demonstrated between D and ECV, as well as D* and f.
Conclusion: IVIM is proved to be ingenious to investigate myocardial fibrosis and has potential of quantitatively estimating myocardial fibrosis in patients with HCM

EPO-2089

The injury of valves and myocardium in rheumatic heart disease evaluated by CMR

Shuang Li,Jianqun Yu,Ying Liu,Chunxiao Liang,Liqing Peng
West China hospital

Introduction: Rheumatic heart disease (RHD) is a major cause of valvular heart disease and can lead to myocardial damage as well, especially in developing countries. Morphological changes of the valves can be clearly detected by echocardiograph. However, it remains a challenge to determine whether there is myocardial injury. It has been suggested cardiac magnetic resonance (CMR) as a new diagnostic imaging modality can provide evaluation of cardiac anatomy and function noninvasively and characterizations of myocardial.

Methods: We prospectively included 51 patients with RHD, 6 patients with evidence of coronary artery disease or cardiomyopathy were excluded. The 45 patients were scheduled for CMR and echocardiography. In our study echocardiography was found to be the gold standard for the diagnosis of valvular disease.
Result: A total of 45 patients (mean age, 53 years old, 71.1% female) were enrolled in our study. Multivalvular disease was manifested in all the patients. The sensibility and specificity of CMR are 86.4% and 66.7% in mitral stenosis (MS), 92.3% and 85.7% in mitral regurgitation (MR), 86.7% and 96.0% in aortic regurgitation (AR), 100% and 93.1% in aortic stenosis (AS), 89.7% and 66.7% in tricuspid regurgitation (TR), respectively.
Seventeen (37.8%) patients showed late gadolinium enhancement on CMR, six patients (35.2%) were in the left atrial wall, eight were (47.1%) in the valves, six (35.2%) were in the left ventricular wall. Patients with delayed enhancement on CMR had higher LA diameters (LA anteroposterior diameter, 5.7cm VS 5.2cm, p=0.023). Nevertheless, there was no association between myocardial contrast uptake with age, cardiac function New York Heart Association (NYHA) classification or the level of B-type natriuretic peptide (BNP).
Conclusion: Combined valvular disease shows prevalence in RHD. CMR can be complimentary to echocardiography in evaluating valvular morphological changes and it plays a significant role in evaluating cardiac function and irreplaceable in characterizing myocardial injury in RHD. Our study also implies patients with the presence of delayed enhancement on CMR may associate remodeling of LA which implaies unfavourable prognosis.
Clinical Reference/ application: At present,determining the severity of RHD is important for the timing and choosing the method of therapy. Our study compared CMR with echocardiography and find out CMR can reveal more information about cardial myocardium noninvasively with advanced cardiac software, more advanced techniques, faster imaging sequences and can be a comlementary tool in elavuating cardiac morphology , function and valvular disease.

EPO-2090
Native T1 mapping 与 LGE 在左室心肌致密化不全中的比较性研究

赵洁,雷子乔
华中科技大学同济医学院附属协和医院

目的：分别采用 Native T1 mapping 和 LGE 来检测 LVNC 中的致密层心肌纤维化的程度，并比较二者的差异。
材料与方法：纳入 40 例 LVNC 患者和 10 位健康志愿者。其中 40 例 LVNC 患者根据致密层是否有延迟强化（LGE）分为两组：A 组为 LGE 阳性 21 例，B 组为 LGE 阴性 19 例。10 例健康志愿者作为正常对照组。使用 1.5T 磁共振，心电门控 R 波触发成像，分别采用心脏电影序列、MOLLI 序列和 PSIR 序列获得动态电影图像、Native T1 mapping 图像和 LGE 图像。测量各组的 Native T1 值，应用 ANOVA 进行统计分析。使用 Logistic 回归分析 LGE 的 OR 值和 CI 值。ROC 曲线用于分析 LVNC 致密层心肌出现 LGE 时的 Native T1 阈值及其敏感性和特异性。

结果：40 例 LVNC 患者中，有 21 例致密层有 LGE（A 组），19 例没有 LGE（B 组）。正常对照组、A 组、B 组的 native T1 值分别为 1053.7±39.6ms，1162.4±43.5ms，1118.2±28.1ms，ANOVA 分析差异具有统计学意义（P＜0.001），且任一两组间均有显著性差异，A 组显著高于 B 组，B 组显著高于对照组。Logistic 回归分析，native T1 比值比（OR 值）为 2.757（95%可信区间 CI 为 1.138-7.654，P=0.019），在校正 NC/C 值、年龄、性别、体表面积后，OR 为 3.976（95%可信区间 CI 为 1.168-13.728，P=0.019）。ROC 曲线分析显示 LVNC 致密层心肌可能出现 LGE 时的 native T1 阈值为 1123.6ms，敏感性和特异性分别为 89.7%，80.3%（P＜0.001）。
结论：Native T1 值与 LGE 有显著相关性，并且在早期检测 LVNC 患者致密层心肌纤维化方面，native T1 mapping 优于传统 LGE，是一个有效评价早期纤维化的可靠指标。

EPO-2091
3.0T 磁共振 T2 Mapping 对糖尿病前期患者心肌改变的早期定量研究

胡钰,宋建勋
深圳市宝安区人民医院

目的：通过 3.0T 磁共振 T2 Mapping 对糖尿病前期患者进行心脏 MRI 扫描，并测量其数值，以探讨该序列对糖尿病前期患者心肌改变早期诊断的临床应用价值。**方法：**按照纳排标准随机选取 2018 年 6 月至 2019 年 6 月宝安区人民医院住院或门诊的 18 例糖尿病患者和 15 例糖尿病前期患者。另选取 20 例正常受试者作为对照组，经体检证实无糖尿病、高血压、冠心病、严重心律失常、心脏瓣膜病、先天性心脏病。采用 Siemens Magnetom Skyra 3.0 T MR 成像系统上对三组进行心脏磁共振 T2 Mapping 扫描，并在蓝网 PACS 系统及 Siemens 后处理工作站上观察并测量、计算心肌的 T2 值。运用 Tamhane's T2 法对三组受试者 T2 Mapping 值进行组间多重比较。**结果：**后处理分析的数据显示（1）2 型糖尿病组、糖尿病前期组及正常对照组 T2 Mapping 值差异具有统计学意义（P＜0.05）；（2）糖尿病前期组（1.382.48±65.12）T2Mapping 值高于正常对照组（1.211.38±41.32），正常对照组（1.211.38±41.32）T2Mapping 值高于 2 型糖尿病组（1007.08±14.61）。**结论：**糖尿病前期患者 T2Mapping 值升高，提示心肌水肿改变，糖尿病组 T2Mapping 值降低，提示心肌纤维化改变，可利用 3.0T 磁共振 T2Mapping 序列对糖尿病前期患者早期心肌损伤进行评价。

EPO-2092
血管壁成像评价颅内动脉粥样硬化斑块强化程度与缺血性脑卒中的关系

何洮梅
宁夏医科大学总医院

目的　探讨颅内症状性动脉粥样硬化斑块与非症状性动脉粥样硬化斑块常规高分辨磁共振成像强化特征是否存在差异，并探讨斑块强化与缺血性脑卒中的关系。
方法 收集 2018 年 1 月至 2019 年 7 月在宁夏医科大学总医院就诊并接受 HRMRI 检查的疑似症状性颅内动脉狭窄患者入组本研究，行 3.0T 常规头颅 MRI、3D-TOFMRA 及 HRMRI 扫描，比较症状性与非症状性动脉粥样硬化斑块强化特征。信号强度采用手工勾画，兴趣区置于斑块强化最明显

处。责任斑块为梗死区责任血管上管腔最窄处的斑块，非责任斑块为非责任血管上的斑块。应用二分类 Logistic 回归分析法研究斑块强化程度与责任斑块的关系。
结果　共计 57 例符合纳入和排除标准的患者入选本研究。前循环颅内动脉粥样硬化患者 41 例，其中脑梗死及短暂性脑缺血发作（ transient ischemic stroke， TIA)患者分别为 32 例和 9 例; 后循环颅内动脉粥样硬化患者 16 例， 其中脑梗死及 TIA 患者分别为 11 例和 5 例; 前后循环的脑缺血类型无统计学差异（ χ2 = 2. 282， P= 0. 131）。前后循环责任斑块分别判定为 41 个及 16 个， 斑块分布具有统计学差异（ χ2 = 26. 231， P＜0. 001）; 颅内动脉粥样硬化斑块共 118 个，其中责任斑块 57 个，非责任斑块 71 个。责任斑块组中，41 个斑块明显强化，11 个轻度强化，5 个无强化; 非责任斑块组中，6 个斑块明显强化，27 个轻度强化，38 个无强化。责任斑块组斑块强化程度(Z = － 6.823,P ＜ 0. 01)大于非责任斑块组，二分类 Logistic 回归结果显示斑块明显强化为责任斑块的独立影响因素(OR: 51.3，95% CI: 13. 0 ～ 289. 1，P ＜ 0. 01）。
结论　高分辨率磁共振血管壁成像可以评价颅内动脉粥样硬化斑块强化特征，斑块明显强化多见于责任斑块，可能是发生缺血性卒中的重要危险因素。

EPO-2093
心肌形变分析：心脏磁共振特征追踪和可变形配准算法的比较

朱兰,顾圣佳,陈炽华,严福华
上海交通大学医学院附属瑞金医院

目的 分析比较基于心脏磁共振电影序列图像的可变形配准算法（DRA）与特征跟踪（FT）算法进行心肌形变分析的可重复性。
材料与方法 2018 年 9 月至 2018 年 11 月间招募 40 名健康志愿者（60％男性，平均 49.50±8.48 岁）。所有志愿者均在飞利浦 Ingenia 3.0T 磁共振上行心脏磁共振扫描。序列包括平扫短轴、二、三腔心及四腔电影及对比剂注射后的短轴电影序列。使用基于 DRA（TrufiStrain）和 FT（Mass）算法的心肌形变分析软件评估左心室整体径向应变峰值（GPRS）、心内膜整体环向应变峰值（endoGPCS）、心肌中层整体环向应变峰值（midGPCS）及心外膜整体环向应变峰值（epiGPCS）及基底部、左心室中间部以及心尖部环向应变峰值（PCS）和径向应变峰值（PRS）。计算组内相关系数（ICC）和变异度（COV）并进行 Bland-Altman 分析和 Pearson 相关分析比较两种算法基于平扫和增强图像行心肌应变分析的可重复性。
结果 1 无论基于平扫或增强短轴电影序列进行心肌形变分析，FT 测量的 GPRS、endoGPCS、midGPCS、epiGPCS、及基底部、中间部和心尖部 PRS、PCS 均明显大于 DRA 测量相应应变参数（P 值均＜0.05）。2 DRA 基于平扫和增强序列测量应变峰值之间的相关性明显好于 FT 者。3DRA 基于平扫和增强序列测量应变峰值之间的的差异大于基于 FT 算法者。4 无论基于平扫或增强图像，DRA 测量的各应变参数的观察者内和观察者间的 ICC 均较大，COV 较小。5 与基于增强图像，DRA 算法基于平扫电影图像测量的应变参数的观察者间和观察者内的 ICC 较大，COV 更小，而 FT 算法在基于增强电影图像时表现更好。
结论 DRA 算法的测量可重复性优于 FT。此外，对比剂注射对 DRA 算法的影响大于 FT，在临床应用中应保持扫描电影序列采集方式和时间的一致性。

EPO-2094
CMR 参数定量技术对 OSAHS 患者心脏的研究

袁月,鲍海华

青海大学医学院附属医院

目的：通过心脏磁共振成像技术获取 OSAHS 患者和健康正常成人左心结构和功能相关参数、左室心肌组织的 T1 值 T2 值及 ECV 值，了解两者之间的差异性，探讨 OSAHS 患者左心功能及心肌的变化，并对心肌组织进行量化分析。方法：选择符合 2011 年修订版 OSAHS 诊断标准，且经多导睡眠图（PSG）监测后诊断为 OSAHS 的患者 20 例，平均年龄（50±7），及正常成年健康志愿者 25 例进心脏磁共振定位相扫描、快速自选回波序列 T1 对比扫描、look-locker 反转恢复（Modified Look-locker Inversion Recovery，MOLLI）序列对比剂注射前 T1mapping 扫描、T2mapping 扫描、基于梯度回波的多时相电影序列扫描、T1scout 序列扫描、对比剂注射后相位敏感反转恢复的 T1WI 序列扫描、MOLLI 序列对比剂注射后 T1mapping 扫描。获得左心结构、功能参数（左心室射血分数、左室舒张末期容积、收缩末期容积、每搏量、心输出量、心肌质量）、左室心肌 T1 值、T2 值及 ECV 值。结果：（1）结构和功能参数：OSAHS 组左室射血分数、左室舒张末期容积及左室心肌质量均高于正常对照组；收缩末期容积、每搏量、心输出量 OSAHS 组与正常对照组无统计学差异；（2）组织学参数：增强前 T1 值及 ECV 值 OSAHS 组高于对照组，但差异无统计学意义；T2 值 OSAHS 组高于对照组，差异有统计学意义。
结论：（1）心脏磁共振成像技术可以有效的评估 OSASH 患者心脏结构功能及心肌的早期改变，具有重要临床应用价值；（2）OSASH 患者的左心收缩及舒张功能均有不同程度的减低，心肌质量增加；（3）部分 OSASH 患者左心室心肌出现不同程度的炎性改变。

EPO-2095

Left Ventricular Myocardial Deformation Analysis: Study of diastolic function in Chinese male population and its relationship with fat distributions

lan zhu[1],Shengjia Gu[1],Qingrou Wang[1],Wenjie Yang[1],Xiaoyue Zhou[2],Fuhua Yan[1]
1.Department of Radiology， Ruijin Hospital， Shanghai Jiao Tong University of Medicine， China
2.Collaboration， Siemens Healthcare Ltd.， Shanghai， China

Background: Obesity has become an epidemic in China with its increased prevalence especially in male population (1). Overweight/obesity confers elevated risk for adverse health consequences (2). Therefore, early detection of cardiac abnormalities is important for treatment to reverse the progression to heart failure.
Body mass index (BMI) has been proven to be associated with obesity-related comorbidities (2). However, it is not reliable for estimating an individual’s body fat distribution (3). Nowadays, strain analysis based on cardiac magnetic resonance imaging (CMR) has been established to assess myocardial function in diverse cardiac diseases. We aimed to use the Heart Deformation Analysis (HDA)–based strain analysis to assess early subclinical diastolic dysfunction and relationship with fat distributions.
Materials and Methods: A total of 136 male participants with different BMI underwent CMR scanning using a 1.5T MAGNETOM Aera (Siemens Healthcare), 1H-MRS hepatic fat fraction, and computed tomography (CT) scan (Somatom Definition Flash; Siemens Healthcare). They were classified into three groups according to their BMIs with 23kg/m2 and 27.5kg/m2 being cutoff values. A Trufi-Strain prototype software (version 2.0, Siemens Healthcare) was used to quantify strain rate (SR) in both early and late diastole from cine images. Ratios of early and late SRs were calculated. Areas of

epicardial and pericardial adipose tissue (EAT and PAT) were measured on a single 4-chamber-view slice of cine images. Volumes of visceral and subcutaneous adipose tissue (VAT and SAT) were acquired semi-automatically from CT images using the dedicated software Cardiac Risk2.0 (Siemens Healthcare). Analysis of variance or nonparametric tests, correlation and stepwise multivariate regression analysis were applied for statistical analysis.
Results: All SR ratios of obese subgroups were lower than those of lean subgroups(all $p<0.001$). EAT instead of BMI was a significant predictor of SR ratios with β of -0.487, -0.306 and -0.165 for radial, circumferential and longitudinal directions, respectively.
Conclusion: SR ratios derived from cine images might serve as a new imaging marker of early subclinical diastolic dysfunction in obesity. Besides, EAT might be a significant predictor of diastolic dysfunction in obesity

EPO-2096

Agreement and reliability of myocardial fat content measured by m-dixon quant in young normal adults——a preliminary study

Le Qin
Shanghai Jiao Tong University Medical School Affiliated Ruijin Hospital

Purpose: Myocardial fat content could potentially reflect early myocardial diseases and metabolic disorders. Magnetic resonance spectrum is the gold standard of measurement of myocardial fat content noninvasively. However, it is poorly reproducible and demands high technique. M-dixon quant is fast and convenient for the clinical settings. To testify the agreement and reliability of myocardial fat content by the way of m-dixon quant in normal adults.
Methods: Between March 2019 and May 2019, 40 volunteers older than 18 years old without evidenced cardiovascular and metabolic diseases were enrolled in our study. All examinations were performed on a 3.0 T MRI scanner (Ingenia, Philips Healthcare, the Netherland) with ECG-gating. Scanning protocol consisted of m-dixon quant sequence including water, fat, in-phase, out-phase and fat fraction map. Scanning range included 4 chambers, apical portion of short-axial, mid portion of short-axial, and basal portion of short-axial of the heart. At first, T2-preparation pulse was added to m-dixon quant sequence (T2-pre m-dixon) in order to enhance the contrast between myocardium and blood pool. Then, m-dixon quant without T2-preparation pulse (m-dixon) was also performed. One senior cardiovascular radiologist manually drew the contour of myocardium on T2-pre m-dixon of all the 4 localizations, and then used ‘copy and paste’ function to duplicate the contour to m-dixon. Measurements of fat fraction were performed on m-dixon. Two weeks later, this senior radiologist and another cardiovascular radiologist performed the measurements again. Reliability was expressed by intraclass correlation coefficient (ICC) and agreement was expressed by standard error mean (SEM).

Results: 20 males and 20 females (mean age: 26.4±6.7 years old) were included in our study. Myocardial fat content of ventricular septum and left ventricle (LV) lateral wall measured by fat fraction map was 1.7±0.7% and 4.3±2.8%, respectively, on 4 chamber sequence. Myocardial fat content of apical ventricular septum and apical portion of LV was 2.4±1.5% and 4.7±3.1%, respectively. Intra- and inter-observer ICC was 0.978 and 0.947 for apical ventricular septum, and 0.915 and 0.971 for apical portion of LV, respectively. Intra- and inter-observer SEM was 0.3±0.06 and 0.2±0.08 for apical ventricular septum, and 0.3±0.07 and 0.4±0.09 for apical portion of LV, respectively. Myocardial fat content of mid ventricular septum and mid-portion of LV was 2.7±1.2% and 4.1±2.4%, respectively. Intra- and inter-observer ICC was 0.907 and 0.951 for mid ventricular septum, and 0.954 and 0.963 for mid-portion of LV, respectively. Intra- and inter-observer SEM was 0.6±0.14 and 0.3±0.07 for mid ventricular septum, and 0.4±0.08 and 0.4±0.05 for mid-portion of LV, respectively. Myocardial fat content of basal ventricular septum and basal portion of LV was 3.2±2.1% and 4.4±2.4%, respectively. Intra- and inter-observer ICC was 0.949 and 0.960 for basal ventricular septum, and 0.981 and 0.935 for basal portion of LV, respectively. Intra- and inter-observer SEM was 0.6±0.10 and 0.7±0.08 for basal ventricular septum, and 0.4±0.05 and 0.3±0.07 for basal portion of LV, respectively. Conclusion: Myocardial fat content measured by m-dixon quant sequence had high intra- and inter-observer reliability and agreement, and could be used in the clinical settings in the future.

EPO-2097

3. 0T 磁共振 FOCUS 扩散成像与常规平面回波扩散成像技术在直肠癌诊断中的应用对比

潘海燕,邓文明,韦素岚,龙莉,朱超凡,黄波,罗德红
中国医学科学院肿瘤医院深圳医院

目的：比较 3.0T 磁共振 FOCUS 扩散成像与常规平面回波扩散成像技术在直肠癌诊断中的应用。
方法:使用 GE 3.0T Discovery MR750 超导型 MR 系统，扫描线圈使用 16 通道相控阵腹部线圈，对 10 例原发性直肠癌患者分别进行 FOCUS 扩散成像和常规平面回波成像技术的检查。计算并比较两组图像的信号噪声比（SNR）和对比噪声比（CNR），测量两种不同视野弥散加权序列的肿瘤 ADC 值。由 2 名放射科医师独立评判两种扩散加权成像技术的主观图像质量。主观图像质量主要通过图像锐利度，图像扭曲变形，图像伪影，病变显著性以及总的图像质量来进行分析。使用 5 分评价系统，其中 1 分为最差，5 分为最好。采用配对 t 检验比较 2 种图像的噪声、SNR、CNR；两种方法成像的 DWI 图像 ADC 值比较采用配对样本 t 检验。以 Kappa 检验评估 2 名医师不同评价的一致性，并计算 Kappa 值。（P＜0.05 为差异有统计学意义）
结果:10 例原发性直肠患者的弥散图像中，在主观评价上，FOCUS DWI 序列图像空间分辨率较高，直肠图像无变形、无明显伪影，病灶显示较清晰，两者图像比较有显著性意义。
在客观评价上，FOCUS 扩散成像序列的 SNR（44. 17 ± 11. 01 vs. 34. 76 ± 13.30, P<0.001）和 CNR（7. 15 ± 2. 77 vs. 5. 39 ± 2.08, P<0.001），与常规视野弥散加权成像比较，有显著性意义；两种 DWI 序列测量的肿瘤 ADC 值没有显著性差异(0. 991 ± 0. 121 vs. 0. 100 ± 0. 126 X 10-3mmz/s, P=0. 617)。

结论:FOCUS DWI 和常规平面回波 DWI 测量得到的 ADC 值相似，但 FOCUS DWI 可以显著提高图像质量和病变清晰度，减少图像扭曲变形及伪影，提供高分辨率的弥散图像，为直肠癌的精确诊断提供帮助。

Navigator-triggered or small field-of-view breath-hold 3D MRCP with compressed sensing: An alternative method of traditional MRCP

Xiangtian Zhao[1,2], Mengyue Huang[2], Yingyu Che[2], Jingliang Cheng[2]
1. Department of Radiology, Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences, Zhongshan No.2 Road, Guangzhou 510081, China
2. Department of Magnetic resonance imaging, The First Affiliated Hospital of Zhengzhou University

Objectives: To compare the image quality and diagnostic performance of three prototypic compressed sensing (CS) accelerated 3D MRCP protocols with conventional MRCP (c-MRCP), and investigatethe effect of phase-encoding (PE) direction upon image quality of small field-of-view(sFOV)breath-hold (BH) CS-MRCP. **Methods:**128 patients prospectively underwent four protocols randomly, including navigator-triggered (NT) CS-MRCP, regular FOV (rFOV) BH-CS-MRCP, sFOV-BH-CS-MRCP in a head-feet PE direction, and c-MRCP. A subgroup of 34 patients were also scanned the sFOV protocol with a left-right PE direction. Two radiologists independently evaluated the image quality and diagnostic confidence on a 5-point scale. **Results:** Acquisition times of CS-MRCP protocols were significantly shorter than c-MRCP (all $P < 0.05$). In 128 patients who underwent the four protocols, the visualization of extrahepatic bile ducts and first-level intrahepatic bile ducts was mostly clear (all $P > 0.05$), whereas that of the second-level intrahepatic bile ducts and pancreatic duct (PD) with rFOV-BH-CS-MRCP was worst (all $P < 0.05$). Both BH-CS-MRCP presented lower background suppression than NT-CS-MRCP (both $P < 0.05$). There were no significant differences among the four protocols when detecting bile duct variants and pancreaticobiliary diseases, whereas sFOV-BH-CS-H/F-MRCP performed better than rFOV-BH-CS-MRCP ($P < 0.05$) when detecting PD variants. The overall image quality and visualization of the common bile duct with sFOV-BH-CS-L/R-MRCP were inferior to sFOV-BH-CS-H/F-MRCP (both $P < 0.05$). **Conclusions:**NT-CS-MRCP provides comparable image quality and diagnostic performance to c-MRCP with significantly shortened acquisition time. sFOV-BH-CS-MRCP can better display the small ductal structures, and the H/F PE direction is recommended.

Development and validation of an individualized nomogram to identify occult peritoneal metastasis in patients with advanced gastric cancer

Xiuhong Dan[1],Di Dong[2],Xiao Xiao Wang[1]
1.Affiliated people's hospital of Jiangsu University
2.CAS Key Laboratory of Molecular Imaging, Institute of Automation, Chinese Academy of Sciences, Beijing, 100190, China

PURPOSE
Occult peritoneal metastasis (PM) in advanced gastric cancer (AGC) patients is highly possible to be missed on CT images, and the patients have high risk to be lately detected during the subsequent laparotomy, or worse, receive improper surgery. We aimed to develop a radiomic nomogram to identify occult PMs.
METHODS
A total of 554 AGC patients from four centers were divided into a training cohort and three validation cohorts. All patients were diagnosed as free from PM by CT, but confirmed the PM status by laparoscopy (PM positive n=122, PM negative n=432). 546 quantitative image features were extracted from both the primary tumor and nearby peritoneum region on CT. Then, radiomic signatures reflecting phenotypes of primary tumor (RS1) and peritoneum (RS2) were built as predictors of PM. An individualized nomogram incorporating RS1, RS2, and clinical factors was constructed and assessed.
RESULTS
The results revealed RS1, RS2, and the clinical factor of Lauren type were significant predictors for occult PM. The nomogram combining RS1, RS2 and Lauren type had powerful predictive ability with AUCs of 0.945 (95% confidence interval [CI]: 0.906-0.985) in the training cohort, 0.880 (95% CI: 0.820-0.941), 0.883 (95% CI: 0.816-0.951) and 0.892 (95% CI: 0.821-0.964) in the three validation cohorts. Moreover, the nomogram demonstrated better diagnostic accuracy than the model with only RS1, RS2, or clinical factors (net reclassification improvement $p<0.05$). Furthermore, the stratification analysis showed that our nomogram had potential generalization ability.
CONCLUSION
CT phenotypes of both primary tumor and nearby peritoneum are significantly associated with occult PM status. A nomogram based on these CT phenotypes as well as Lauren type has an excellent predictive ability of occult PM in AGC.

基于 MRI 图像的放射组学机器学习分类前列腺癌 Gleason 评分的初步研究

王欣如,刘屹
中国医科大学附属第一医院

目的：使用 mpMRI 图像的纹理特征训练放射组学的机器学习模型，通过模型的性能评价探讨其诊断及鉴别 PCa Gleason 评分方面的价值。
材料与方法：本课题回顾性收集我院 2015 年 1 月 1 日至 2018 年 9 月 1 日进行 mpMRI 检查并经病理证实得到确切 GS 的前列腺癌患者，最终的研究人群为 219 例。得到患者的 T2WI、DWI 图像，使用 GE 软件处理 DWI 图得到 ADC 图。将 MRI 图像与组织病理学结果进行匹配，在图像上确定 PCa 大致部位。在 ITK-SNAP 软件上，沿病变边界手动逐层勾画感兴趣区（ROI）最终融合得到三维数据，即感兴趣体积（VOI）。使用 AK 软件中的 One Key 模块，提取出 396 个纹理特征。将数据分成 GS

（3+3）n=36 与 GS（>7）n=103、GS（3+4）n=43 与 GS（4+3）n=49 两组，每组按照 7:3 的比例随机分别分成训练组与验证组。随后进行特征选择并建立六种机器学习模型，为 SVM:C_SVC&LINEAR、SVM:C_SVC&RBF、SVM:C_SVC&sigmoid、Logistic 回归（LR）、K 邻近（KNN）、贝叶斯（Bayes）。同时对这些模型分类器进行训练，得到分类器的准确性、特异性、敏感性，做出 ROC 曲线，得到 ROC 曲线下面积（AUC）及 95%置信区间。

结果：使用 AK 软件自动选出最优模型，其分类性能使用 AUC 评价。AUC 值表现为从最低的 0.590 至最高的 0.915。使用 ADC 图纹理特征训练的 LR 分类器模型 AUC 值为 0.915，在鉴别 GS（3+3）与 GS（>7）组中表现出极好的分类性能；GS（3+4）与 GS（4+3）组中，基于 ADC 图的 C_SVC&RBF 分类器模型的 AUC 值为 0.661，分类性能较好。

结论：使用 mpMRI 的放射组学特征建立机器学习模型，在 PCa GS 中具有良好的分类性能。这对前列腺癌患者采取不同治疗方法及预后预测有着重大的潜力和临床价值。

Cerenkov imaging of 131I-labeled anti-PD-L1 antibody in xenografted mice model of colorectal cancer

Sheng Zhao[1],Wenbin Pan[1],Huijie Jiang[1],Rongjun Zhang[2],Hao Jiang[1]
1.The Second Affiliated Hospital of Harbin Medical University
2.Jiangsu Institute of Nuclear Medicine

Objective Antibodies blocking the interaction between programmed death-ligand 1 (PD-L1) and PD-1 exhibit impressive antitumor activity[1], but the expression of PD-L1 in colorectal cancer(CRC) is rarely studied. Our study aims to develop an ^{131}I-labeled tracer that is non-invasive to determine the expression of PD-L1 in CRC in vivo.

Method

1.cell culture

CRC cell lines LS174T, SW480 and HT29 were supplemented with 10% FBS in DMEM, in a humidified atmosphere of 5% CO_2 at 37° C.

2.Radioactive labeling

Radioactive labeling experiments were performed as previously described[2].

3.Flow cytometry

The collected cells were washed 3 times with flow cytometry buffer and stained with anti-PD-L1 antibody (BD, USA) bound to PE according to the manufacturer's plan.

4.Western blot assay

Western blot experiments were performed as previously described[3].

5. Animal models

54 female BALA/C nude mice aged 6-8 weeks weighing 16-20g were selected. All mice were kept sterile for 3 days and divided into 3 groups. Each group was subcutaneously injected with PBS 0.1 mL containing 5.0 x 10^6 LS174T, SW480 and HT29 cells, respectively. When the tumor volume reached 1 cm^3, mice were used for Cherenkov imaging and biodistribution. 3 mice in each group were examined by Cherenkov imaging (24h, 48h, 120h). 5 rats were sacrificed by cervical dislocation at 24h, 48h and 120h, respectively. The isolated organs were dissected and the distribution of ^{131}I-PD-L1-mAb in each organ was evaluated by γ-counter.

Result

The high uptake of ^{131}I-PD-L1-mAb in the liver, lung and thyroid maybe since the liver is responsible for the metabolic clearance of ^{131}I-PD-L1-mAb, while the lung is a blood-rich organ, and ^{131}I-PD-L1-
FCAS and WB results of 3 different CRC cells showed that PD-L1 was expressed on these cells, and the expression level of PD-L1 in 3 cells was LS174T > HT29 > SW480 (Fig. 2 and Fig.3).

Cherenkov imaging of different CRC models was visible(Fig.4). Over time, Cherenkov imaging at different time points showed an increase in contrast between tumors and normal tissues. The uptake level of ^{131}I-PD-L1-mAb was LS174T > HT29 > SW480.
The ratio of tumor muscle radiation intensity (T/M) in 3 tumor models is shown in Fig. 5. The result is consistent with FCAS and WB results.

Conclusion

We have developed a nove l^{131}-labeled anti-PD-L1 monoclonal antibody that demonstrates the feasibility of non-invasive monitoring of PD-L1 expression levels in vivo using Cherenkov imaging.

EPO-2102

Quantitative study of liver hemodynamic changes in rats with small-for-size syndrome by the 4D-CT perfusion technique

Peiyi Xie[1], Li Quan[1,2], Xiaochun Meng[1]
1. Department of Radiology, The Sixth Affiliated Hospital of Sun Yat-sen University, Guangzhou, China
2. Department of Radiology, The third Affiliated Hospital of Sun Yat-sen University, Guangzhou, China

Objective: The microcirculatory hemodynamic changes of small-for-size syndrome (SFSS) are still unclear. In this study, they were investigated by four-dimensional CT perfusion (4D-CTP) technique. Methods: The sham group, 50, 60, 70 and 80 % partial hepatectomy (PH) rat groups were established. At 1 hour (1 h), 1 day (1 d), 3 days (3 d) and 7 days (7 d) post-operation, serological examination, 4D-CTP scan and histopathological examination were performed. One-way analysis of variance and the Kruskal-Wallis test were used for the comparison. Results: Based on the diagnostic criteria of SFSS, the 80 % group was considered to be a successful model. In all the PH groups, portal vein perfusion and total liver perfusion peaked at 1 h and declined at 1d and 3d. Both portal vein perfusion and total liver perfusion were significantly higher in the 80 % group than the sham group, 50 and 60% groups at 1 h ($p < 0.05$), and 80 % group at 3d and 7d ($p < 0.05$). In the 50 and 60 % groups, hepatic artery perfusion decreased at 1 h and maintained at a lower level until at 7 d; whereas, in the 70 and 80% groups, it increased at 1 h, then decreased and reached the lowest level at 7 d. No significant difference appeared in hepatic artery perfusion between any two groups at any time points. At all time points, hepatic perfusion index was lower in all the PH groups than the sham group. Significant differences in hepatic

perfusion index appeared between the 80% group and the sham group at 1 h and 1 d ($p < 0.05$). Conclusions: The CTP parameters quantitatively revealed the microcirculatory hemodynamic changes in SFSS, which were further confirmed to be associated with histopathological injury. It is suggested that the hemodynamic changes in SFSS remnant liver can provide useful information for further revealing the mechanism of SFSS and may help for guiding the treatments. Advances in knowledge: By using the 4D-CTP technique, the hepatic microcirculatory hemodynamic changes could be quantitatively measured in vivo for small animal research.

EPO-2103

Tf 靶向的新型多功能纳米探针在早期前列腺癌的 MRI 分子成像研究

李亮,张洪团,张雪宁
天津医科大学第二医院

目的：通过构建集靶向特异性、成像敏感性与体内长循环特性于一体的多功能磁共振成像纳米探针，实现对前列腺癌的早期精确诊断与无创动态监测。**方法：**利用前列腺癌细胞表面高表达的转铁蛋白受体 (Transferrin receptor, TfR) 作为分子探针靶点，以超小金纳米粒子 (Gold nanoclusters, AuNCs) 作载体，将 MRI 成像组件 Gd 及体内长循环特性物质 GSH 进行多功能组装，构建转铁蛋白 (Transferrin, Tf) 靶向的高分辨精准磁共振分子成像纳米探针(Tf-Au@Gd NCs)，并明确探针的生物相容性及体内生物学分布。建立荷人前列腺癌裸鼠移植瘤模型，鼠尾静脉注射纳米探针 Tf-Au@Gd NCs，利用 MR 成像分别从细胞和在体水平监测探针在前列腺癌的分布聚集情况，通过活体动态成像测量肿瘤区 T1WI 信号强度 (Signal intensity, SI) 及对比噪声比 (Contrast to noise ratio, CNR)，评估前列腺癌的负荷和性质，并进行组织学定量分析，验证其实际功效。**结果：**本研究合成的 Tf-Au@Gd NCs 纳米探针具有良好的生物相容性，适合作为早期前列腺癌 MRI 靶向分子成像的造影剂。体外细胞实验表明，Tf-Au@Gd NCs 对前列腺癌细胞 (PC3) 有很高的亲和力；体内动态 MR 成像结果显示，荷瘤裸鼠静脉注射 Tf-Au@Gd NCs 后肿瘤组织 T1 信号强度 SI 及对比噪声比 CNR 随时间延长而显著增强，并可持续至 36 小时；组织切片免疫组化及镀银染色证实 Tf-Au@Gd NCs 在 TfR 高表达的肿瘤处明显聚集。**结论：**本研究构建的 MR 分子成像探针 Tf-Au@Gd NCs 同时具有前列腺癌靶向特异性、成像敏感性及体内长循环特性，可从多角度精准、动态分析早期前列腺癌肿瘤区域病理信息，为实现真正意义的前列腺癌分子水平早期诊断提供了科学依据和实验证据支持，在前列腺癌临床诊疗中有非常广阔的应用前景。

A TiO2/Ruthenium integrate metal-organic nanostructure: For cancer enhanced X-ray induced photodynamic therapy

DONGSHENG LI[1],CHENGCHAO CHU[1,2],GANG LIU[1]
1.State Key Laboratory of Molecular Vaccinology and Molecular Diagnostics & Center for Molecular Imaging and Translational Medicine School of Public Health, Xiamen
2.Xiamen Cardiovascular Hospital, Xiamen University

Background and purpose：In recent years, the X-ray induced ROS production was put forward to overcome the restriction of PDT, this study aimed to prepare an efficient

X-ray induced photodynamic therapy (X-PDT) nano-theranostics. **Methods:** The metal-organic nanostructure (MON) for imaging-guided X-PDT were synthesized by the solvothermal reaction, we choose the $[Ti_8Zr_2O_{12}(COO)_{16}]$ cluster reacted with the 2,2′-Bipyridine-4,4′-dicarboxylic acid and the 4,4′-dicarboxylic acid-Tris(2,2′-bipyridine) dichlororuthenium(II) co-organic ligands, preparing the TiZr-Ru MON. The MON could absorb X-ray excitation, and thus enabled the MON possessed outstanding X-PDT and X-ray CT contrast property. Furthermore, the Gd(III) ion was anchored inner the MON and the MON was then possessed unique T1-weighted MRI property. Then the hepG-2 tumor-bearing BALB/c nude mice was applied for the in vivo study. When the tumors reached 80-130 mm^3 in volume, TiZr-Gd MON (5 mg/kg), TiZr-Ru-Gd MON (5 mg/kg), or PBS was injected intravenously and irradiated by X-ray (4 gray) at 12 h post-injection. The mice injected with PBS and TiZr-Ru-Gd MON (5 mg/kg) without X-ray irradiation were selected as control. In addition, to verify good tumor elimination effect the treatments were carried 3 cycles in every three days. And, the tumor volumes and body weights for all groups were recorded every three days. **Results:** the tumors of the TiZr-Ru-Gd MON+X-ray group were exhaustively eliminated, for the PBS+X-ray and TiZr-Gd MON+X-ray groups only partially inhibit tumor growth when compared with the PBS without X-ray group. **Conclusion:** we have constructed an imaging-guided X-PDT strategy for the cancer treatment. The preparation of the MON could open an avenue for the X-PDT nano-theranostics, and fancy properties of the MON could guidance for the X-PDT clinical research.

Modified Dendrimer nanoparticles for CT imaging and therapy of osteosarcoma.

Fangfang Yin,Han Wang
Shanghai General Hospital

PURPOSE

We aim to synthesis dendrimer-entrapped gold nanoparticles (Au DENPs) modified with methotrexate (MTX) for computed tomography CT) imaging and therapy of osteosarcoma.

METHOD AND MATERIALS

At first, we improved the function of generation 5(G5)poly-amidoamine (PAMAM) dendrimers with methotrexate (MTX) moieties. Then, we synthesize Au-G5-MTX DENPs based on the above mentioned G5-MTX-PAMAM. The formed Au-G5-MTX DENPs were characterized by diversified instruments including X-ray attenuation coefficient measurements, UV-vis spectroscopy, transmission electron microscopy (TEM) and so on. A concentration range of 0~100 mM Au-G5-MTX DENPs were prepared in 1.5-mL Eppendorf tubes and placed in a self-designed scanning holder. CT scans were carried out using a clinical LightSpeed VCT CT imaging system with 80 kV, 500 mA, and a slice thickness of 0.625 mm. K7M2 WT cells were cultured in DMEM medium supplemented with 10% FBS, 100 U/mL penicillin, and 100 U/mL streptomycin at 37° C in a 5% CO_2 incubator. Inoculating K7M2 WT cells in female BALB/c mice's caudal vein and back, with cell counting 1×10^6, to establish transplanted and metastatic osteosarcoma models. The

tumor-bearing BALB/c mice established as mentioned above were anesthetized by intraperitoneal injection of pentobarbital sodium (40 mg/kg).

RESULTS

The stability Au-G5-MTX DENPs in either water or PBS solution was proved by UV-vis spectroscopy. TEM images showed that Au-G5-MTX DENPs have the uniform size and distribution. And transverse CT images demonstrated X-ray attenuation intensities increase with the concentration of the nanomaterial improves. The CT values of the transplanted tumor achieved peak value at 30min post subcutaneous injection. ICP test showed that cell uptake of the Au-G5-MTX DENPs increased with the enhancement of the concentration of Au until reach saturation point (200uM). The vitro therapy effect was confirmed by CCK-8 assay of the viability of K7M2 WT cells.

CONCLUSION

In summary, we synthesis a promising Au DENP-based theranostic nanomaterial with anticancer drug complexes. It not only can realize diagnosis of osteosarcoma but also to some extent achieve the therapy of it.

金纳米飞镖的制备及其 CT 造影效果研究

徐中胜,刘云,谷涛,孙涛,周春宇,张亮,祝梦梦,龚明福,张冬
陆军军医大学附属新桥医院放射科

一、目的

1、利用一步法制备出金纳米飞镖，其均一性分散性良好，并具有近红外 I 区特征吸收峰。

2、利用 CT 扫描，通过 CT 数值测量评价纳米飞镖金颗粒造影效果并分析其浓度对 CT 造影的影响。

二、方法

1、实验之前，将 $HAuCl_4$（0.25 M）溶于 DMF 中老化一周以上，然后将 400 μL PVP（Mw= 29000，5 wt%溶于 DMF）、80 μL DEA、35 μL $HAuCl_4$（0.25 M）依次加入 8.4 mL DMF 中，室温下搅拌 5 min，最后在 100℃ 油浴锅中搅拌 10 min。最终反应溶液通过高速离心，收集沉淀物。再重悬于去离子水中，重复三次离心操作，得到纯化的金纳米飞镖。对已制备的金纳米飞镖进行电镜扫描和紫外荧光光谱检测。

2、对金纳米飞镖进行 CT 扫描前制样，将装有 0.00、0.25、0.5、1.00、1.50 mg/L 金纳米飞镖溶液样品置于 CT 扫描床上，保持同一水平线；同时测量相同浓度的商用碘照影剂。测量样品同一层面相同面积的 CT 值，并对其进行统计分析。

三、结果

1、由 TEM 图看出金纳米颗粒呈四角飞镖结构，长度大约 180 nm，厚度 50 nm 左右，具有良好的均一性及分散性。从紫外吸收光谱图可以看出，金纳米飞镖具有两个特征吸收峰，第一个峰在 500 ~ 700 nm 之间，为横向表面等离子共振吸收峰；第二个峰在 800 ~ 1200 nm 之间，为纵向表面等离子共振吸收峰，并且第二个吸收峰有着更强的吸收强度。

2、从 CT 图像数值分析可以看出，金纳米飞镖的浓度与其 CT 值呈现良好的线性关系，随着浓度的增加，CT 值也在增加。同一浓度下，金纳米飞镖的 CT 值为商用碘照影剂的 2 倍左右。

四、结论

1、通过一步法制备了金纳米飞镖，由于金纳米飞镖尖端效应，使其在紫外吸收光谱图中具有两个吸收峰，并且第二个峰出现在近红外 I 区。

2、通过 CT 扫描成像，数据分析表明，随着金纳米飞镖浓度的增加，CT 值也随着增加；并且金纳米飞镖具有比商用碘照影剂具有更好。

靶向神经菌毛素纳米探针制备及对乳腺癌治疗的实验研究

柳东芳,滕皋军
东南大学附属中大医院

目的：神经菌毛素 1（NRP-1）与肿瘤血管生成有关，可促进肿瘤的生长和转移。研究表明，NRP-1 在乳腺癌中的过表达，与肿瘤的侵袭性密切相关。 因此，NRP-1 是乳腺癌治疗的潜在靶点。利用 NRP-1 靶向肽 CRGDK 为靶向分子制备纳米探针，研究其对小鼠乳腺癌模型的抑制作用。
方法：以树枝状聚合物（PAMAM）为载体，CRGDK 为靶向分子，通过酰胺化反应，制备靶向 NRP-1 的纳米探针。将小鼠 4T1 细胞种植在小鼠的右腋皮下，制备小鼠乳腺癌模型。
结果：体外细胞实验表明，该纳米探针能够特异性的结合在 4T1 细胞表面，并且对细胞没有明显的毒性，探针组与 4T1 细胞的结合率是对照组的 2.2 倍。体内近红外荧光成像实验结果显示，纳米探针能够特异性的聚集在肿瘤组织中。体内药效实验表明，通过靶向 NRP-1，纳米探针能够有效的抑制肿瘤生长，抑制率达到 58%。
结论：CRGDK 靶向探针能够有效的抑制乳腺癌的生长，为乳腺癌的治疗提供了另一个可能途径。

The anti-tumor growth and anti-angiogenesis of Xanthain in murine glioma dynamically evaluated by MRI and DCE-MRI

Xiaohu Li,Siqing Bi,Weishu Hou,Mengyu Fei,Yinfeng Qian,Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

PURPOSE
To investigate the suppressive effects of Xanthatin on glioma growth in nude mice xenograft model and rat orthotopic implantation model, using MRI to dynamically monitor the anti-tumor growth and evaluate the anti-angiogenesis of Xanthatin

METHOD AND MATERIALS
The nude mice xenograft tumor model and rat orthotopic implantation model were established to observe the anti-tumor effects of Xanthatin in vivo. In rat orthotopic implanted tumor model, the conventional magnetic resonance imaging (MRI) and the dynamic contrast-enhanced magnetic renasance imaging (DCE-MRI) scanning were used to dynamically monitor the anti-tumor growth effect and evaluate the anti-angiogenesis of Xanthatin, respectively. The anti-tumor effect of Xanthatin was confirmed by htoxylin wosin (HE) staining. Vascular endothelial growth factor (VEGF) expression in tumor tissue was detected by immunohistochemical method.

RESULTS

We found that Xanthatin at the dose of 0.4 mg/10g dramatically decreased the growth of xenograft tumor in nude mice. In rat orthotopic implantation model, we also found xanthatin reduced the volume of C6 glioma dynamically detected by the conventional MRI. The anti-angiogenesis of Xanthain in C6 glioma was evaluated by DCE-MRI with comparison of volume transfer constant (Ktrans) value, a parameter that reflects vessel permeability. We found Xanthain at the doses of 8 mg/kg and 16 mg/kg significantly decreased Ktrans value, which suggests that Xanthain has anti-angiogenesis. These results were confirmed by HE staining and immunohistochemistry. By detecting the expression of VEGF in tumor tissues, we found that Xanthain decreased the number of VEGF-positive cells, compared with the vehicle control.

CONCLUSION
These data demonstrate the suppressive effects of xanthatin on C6 glioma via anti-angiogenesis. Meanwhile, this study also provides an evidence for the application of the conventional MRI and the quantitative parameters of DCE-MRI in dynamically evaluating the growth of intracranial tumor and anti-angiogenesis in the experimental and clinical research

EPO-2109
基于 SPECIAL 序列检测肝糖代谢的参数优化和 LCMode 基础集制作研究

钟梓杰,沈智威,王丹,陈丽花
汕头大学医学院第二附属医院

目的：基于试管模型实验，优化 SPECIAL 序列检测活体肝脏磁共振频谱的扫描参数，制作基于上述序列，定量检测肝代谢的 LCModel 基础集，为 SPECIAL 序列增加抑脂脉冲，最后在离体肝脏上验证上述检测葡萄糖浓度的性能。
材料与方法：首先参考肝主要代谢物，配置葡萄糖（50mM）、鱼肝油（12%）、胆碱（100mM）、及以上三种代谢物混合的试管模型，调 pH 至 7.2。所有实验在 7T 磁共振上实验，分别用不同的重复时间（TR）、回波时间（TE）、混合时间（TM）、averages 等扫描参数，以及不同的抑水方法，在试管模型上得到对应的 SPECIAL 序列磁共振波谱。根据上述肝脏频谱中水峰半高宽（FWHM）、信噪比（SNR）及葡萄糖峰半高宽，优化上述扫描参数，并在离体肝脏上进行检验；然后使用 Vespa 软件制作基于 SPECIAL 序列的肝主要代谢物（脂质，胆碱，葡萄糖）的 LCModel 基础集，并在 LCModel 软件上，使用我们制作的基础集，定量分析上述谱线，得到葡萄糖浓度；最后在 7T 磁共振平台上，为 SPECIAL 序列添加 Fat Sat 抑制脂肪脉冲，抑制 1.3ppm 处的脂肪峰，优化葡萄糖检测效果，并在离体肝脏上进行检验。
结果：我们的实验证实，TR = 3500 ms、TE = 4.42 ms、TM = 20 ms、 averages = 256 时，使用 SPECIAL 序列得到的肝脏谱线具有最优信噪比，葡萄糖分辨率更高。 在 LCModel 软件上，使用自制的 SPECIAL 肝脏代谢基础集，可提高肝代谢拟合的准确性。增加抑脂脉冲的 SPECIAL 序列，配合自制基础集，可以提高 LCModel 拟合葡萄糖的准确性。
结论：使用增加抑脂脉冲的 SPECIAL 序列，在优化的采集参数下，配合自制的 LCMdoel 基础集，可以实现离体定量肝脏葡萄糖浓度，有助于实现临床检测肝脏糖代谢异常。

Varying Correlation between Inflammation and Microvascularization in Carotid Atherosclerotic Plaques with Hybrid 18F-FDG PET/MR

Yue Zhang,Hongwei Yang,Jie Ma,Haiqing Song,Qingfeng Ma,Jie Lu
Xuanwu Hospital， Capital Medical University

Objective: *Hallmarks of vulnerable atherosclerotic plaques are inflammation that can be quantitatively assessed with ^{18}F-fluorodeoxyglucose positron emission tomography (^{18}F-FDG-PET), and increased neovascularization that can be evaluated by dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI). It remains unclear whether these parameters are correlated or represent independent imaging parameters. This study determines to investigate the correlation between inflammation and neovascularization in atherosclerotic carotid plaques with hybrid ^{18}F-FDG PET/MR.*
Methods: *Twenty-five patients with transient ischemic attack or minor stroke in the carotid territory and ipsilateral carotid artery stenosis of 30% to 69% were included. All patients underwent hybrid PET/MR a median of 180 min after injection of ^{18}F-FDG. ^{18}F-FDG standard uptake values with target/background ratio (TBR) were determined. Neovascularization was quantified by transfer constant (K^{trans}). Spearman rank correlation coefficients between TBR and K^{trans} were calculated.*
Results: *The correlation between TBR and K^{trans} was only marginal in the whole study sample (r=0.25, p=0.043). The two variables correlated with each other in the symptomatic plaques (r=0.71, p=0.013), but were independent in the asymptomatic plaques (r=0.03, p=0.473). Neither TBR nor K^{trans} was significantly higher in the symptomatic plaques, but both showed inverse relationships with time since last cerebrovascular ischemic event (r=-0.92 and -0.74 for TBR and K^{trans}, respectively).*
Conclusion: *The correlation between inflammation and microvascularization in carotid atherosclerotic plaques with hybrid ^{18}F-FDG PET/MR varied with clinical conditions. Hybrid ^{18}F-FDG PET/MR systems can help to evaluate the correlation between inflammation and microvascularization in carotid atherosclerotic plaques.*

EPO-2111

Specific Soft Tissue Invasion And LMP1 Expression Are Potential Indicators of Extranodal NK/T-cell Lymphoma, Nasal Type Prognostic indicators of ENKTL-NT

Min Jiang,Chao LU,Xiuhong Shan
Department of Medical Image， Affiliated People's Hospital of Jiangsu University，212002

Background: Extranodal NK/T-cell lymphoma, nasal type (ENKTL-NT) is difficult to distinguish from nasal polyps and inverted papilloma, leading to its high misdiagnosis ratio. The aim of this study was to investigate its potential prognostic indicators.

Material and Methods: Kaplan-Meier method was adopted to calculate overall survival (OS) rate. Cox proportional-hazards regression was used to analysis risk ratios (ORs) with 95% confidence intervals (CIs).
Results: Nasal ala infiltration and the nasal floor thickness > 2.0 mm or nasal septum thickness >2.5 mm were potential prognostic factors for OS (p = 0.0323; 0.0072, respectively). Cox proportional-hazards regression indicated that high LMP1 expression and the nasal floor thickness > 2.0 mm or nasal septum thickness > 2.5 mm were the independent risk factor for poor OS rate of ENKTL-NT (HR = 3.0655, p = 0.028; HR = 2.3650, p = 0.0452, respectively). In the subgroup analysis, the OS rate was lower when the nasal floor thickness > 2.0 mm or nasal septum thickness > 2.5 mm in the patients who had high expression of LMP1 (p = 0.0651).Whereas, high LMP1 expression increased the risk of worse prognostic outcome in patients with deep infiltration thickness. Thus, high LMP1 expression may contribute to the tissue invasion of ENKTL-NT.
Conclusion: Any patient with nasal ala soft tissue invasion, nasal floor thickness > 2.0 mm/nasal septum thickness > 2.5 mm on CT imaging or high LMP1 expression should prompt to immediately consider histopathologic diagnosis to rule out ENKTL-NT in clinical.

阿尔茨海默病的可能机制：脑网络间交互作用异常

赵小虎[1],王湘彬[2],刘浩[2],李芸菲[1],胡绮莉[1]
1.复旦大学附属上海市第五人民医院
2.同济大学医学院

[摘要] **目的**：利用静息态 fMRI 探讨阿尔茨海默病(Alzheimer disease，AD)患者脑网络间交互作用异常。 **方法**：采集 27 名健康老年志愿者及 24 名阿尔茨海默病患者大脑静息态 BOLD-fMRI 数据。采用 SPM8 和 RESTplus 软件包进行数据预处理，选取属于默认网络（default network, DN）和背侧注意网络（dorsal attention network, DAN）的脑区，提取每个脑区的平均时间序列。为量化 DN 与 DAN 之间交互作用，运用功能连接分析法计算每个被试 DN 和 DAN 之间（DN-DAN）的功能连接值，对两组受试者的功能连接值进行独立样本 t 检验，计算两组受试者 DN-DAN 平均功能连接值。**结果**：正常老年人 DN-DAN 平均功能连接值为-0.133，AD 患者 DN-DAN 平均功能连接值为-0.157。与正常老年组相比，AD 患者 DN-DAN 功能连接负值增加（P=0.007）。**结论**：AD 患者 DN 与 DAN 之间交互作用存在异常，可为探寻阿尔茨海默病的发病机制提供新思路。

EPO-2113
小分子影像探针在脑胶质瘤诊断方面的应用探索

王良
武汉大学中南医院

目的 探索磁共振分子影像、活体荧光检测和荧光分子断层成像技术等分子影像学技术在脑胶质瘤诊断方面方面的应用，为胶质瘤的早期诊断、组织类型和 WHO 分期等方面的确认提供参考，帮助临床医生制定个性化的治疗方案，在更长的术后生存期和更高的生活质量之间达到平衡。

方法 首先，我们收集了 30 例术前胶质瘤病例，采集 MRI 平扫增强、MRS、DTI 与灌注方面的数据。利用高通量测序的方法检测胶质瘤与癌旁组织样本中差异表达分子信息；然后挑选其中差异性较大的分子进行组织学与细胞学验证。通过 MRI 磁共振成像和荧光断层成像观测生物体内细胞与分子水平的变化,通过图像重建提供目标物在生物体内的分布等信息,克服平面成像的局限性,有助于疾病的早期诊断。
结果 MRI 平扫增强、MRS、DTI 与灌注等检查项目在恶性胶质瘤的诊断方面具一定的参考价值，但特异性不强。胶质瘤及其癌旁组织样本高通量测序筛选出了差异表达的 miRNA 共有 211 个，EGFR 和 STAT3 等基因的表达均有明显的差异性。同时通过与团队成员的合作，充分论证了 MRI 肿瘤分子成像纳米探针的制备条件。后期将主要筛选与目标 miRNA 分子具有高亲合性、高特异性结合的核酸适配体与磁共振分子成像靶向性 Gd（Ⅲ）螯合物纳米粒子来研究 miRNA 分子的表达水平变化。
结论 MRI 平扫增强、MRS、DTI 与灌注等常规检查在胶质瘤的诊断方面具有价值，但同时存在诸多局限。IDH、EGFR 和 STAT3 及小分子 RNA 与胶质瘤的发生发展密切相关，这为胶质瘤的诊疗提供了新的靶标和不同的思路。这些研究为后期探索分子影像学技术检测体内特征分子表达量从而进行胶质瘤的诊断和预后评价提供了理论前提。

EPO-2114

The relationship between serum concentration of vitamin D, total intracranial volume, and severity of depressive symptoms in patients with major depressive disorder

Wenming Zhao
The First Affiliated Hospital of Anhui Medical University

Background: Depression has been linked to vitamin D deficiency. However, little attention was paid to the neural substrate underlying this association. Prior neuroimaging studies have demonstrated that serum vitamin D level alterations are associated with brain volume changes and patients with MDD have widespread cortical and subcortical volume abnormalities. Given these findings, one may speculate that there is an association among serum vitamin D concentration, severity of depressive symptoms, and total intracranial volume (TIV, a global and unbiased volumetric parameter) in patients with MDD. In this study, we aimed to clarify this issue and hypothesized that TIV would mediate the relationship between serum vitamin D concentration and severity of depressive symptoms.
Methods: Fifty patients with major depressive disorder (MDD) were enrolled in this study. High-resolution structural magnetic resonance imaging was performed to calculate total intracranial volume (TIV). Peripheral venous blood samples were collected to measure serum vitamin D concentration. Hamilton Rating Scale for Depression (HAMD) was used to assess severity of depression symptoms. The relationship among TIV, serum vitamin D
concentration, and HAMD score was examined using correlation, linear regression, and mediation analyses.
Results: In patients with MDD, HAMD score was negatively correlated with TIV and serum vitamin D concentration, and TIV was positively correlated with serum vitamin D concentration. Linear regression analyses showed that TIV and serum vitamin D concentration were significant predictors of HAMD score. Importantly, mediation

analysis revealed that TIV significantly mediated the relationship between serum vitamin D concentration and HAMD score.
Conclusion: Our main findings are twofold: 1) in patients with MDD, more severe depressive symptoms were related to smaller TIV and lower serum vitamin D concentration, and smaller TIV was related to lower serum vitamin D concentration; 2) TIV was a significant mediator of the association between serum vitamin D concentration and severity of depressive symptoms in the patients. This finding may help to establish TIV as a potential neural biomarker for monitoring responses to adjuvant therapy of vitamin D in patients with MDD.

EPO-2115
产后抑郁症局部神经活动变化的静息态 fMRI 研究

车凯莉,谢海柱
山东省烟台毓璜顶医院

目的：探讨产后抑郁症（postpartum depression, PPD）患者静息状态下的局部神经活动变化特征及其与抑郁程度的相关性。
方法：选取符合 DSM-5 单相抑郁的诊断标准， 24 项汉密尔顿评定量表（24-item Hamilton Rating Scale，HAMD）评分大于 20 分，爱丁堡产后抑郁量表（Edinburgh Postnatal Depression Scale，EPDS）评分>12 分的 16 例产后抑郁母亲（PPD 组）及与之年龄等相匹配的 16 名产后正常母亲（对照组），使用 3.0T 磁共振采集静息态功能磁共振（resting-state functional magnetic resonance imaging, R-fMRI）数据。 采用双样本 t 检验比较组间低频振幅(amplitude of low-frequency fluctuation，ALFF)和局部一致性（regional homogeneity，ReHo)数。将异常脑区的 ALFF 值及 ReHo 值与 HAMD、EPDS 分别进行相关性分析。
结果：与对照组相比，PPD 患者右侧小脑前叶（山顶）和左背外侧前额叶 ALFF 值增加，右顶叶 ALFF 值降低。产后抑郁症组的左侧眶部额上回、眶部额下回、额上回、额中回、楔前叶及顶下小叶的 ReHo 值比产后对照组的更高。右侧大脑（枕叶、额下回、额叶）和左侧小脑下半月小叶的 ReHo 值降低。 左背外侧前额叶的 ALFF 值与产后妇女的 HAMD 评分呈正相关（r = 0.583，p <0.05）。
结论：PPD 患者存在情绪调节区域神经元活动的改变，左背外侧前额叶的 ALFF 值越高的患者抑郁程度更严重。

超高场 7T 磁共振及平衡稳态自由进动序列助力超顺磁性纳米铁粒子标记巨噬细胞成像

沈业隆[1],闫丽荣[2],Danny JJ Wang[2]
1.山东省立医院
2.南加州大学 Keck 医学院

目的：
本研究的目的是探究超高场 7T 磁共振（MRI）及平衡稳态自由进动序列（bSSFP）对超顺磁性纳米铁粒子（Feraheme）标记的巨噬细胞的成像效果及其可能的临床应用。

材料与方法：

使用肝素+鱼精蛋白+Feraheme 组成的自组合纳米复合物标记 THP-1 分化的巨噬细胞。将不同数量的标记细胞注射入模型及小鼠脑内分别进行显微镜下及 MRI 成像。分别对约 100、1000 个标记细胞进行了成像并分析 3T 及 7T 磁共振的 SWI 及 bSSFP 序列的成像效果。分别重建出 bSSFP 序列的平均值图像、最大密度投影图像、均方根图像并计算其所得标记细胞成像的信噪比及对比信噪比。

结果：

细胞标记效率达到了 90%以上。3T 及 7T 机器均检测精度均达到约 100 个细胞水平。7T MRI 配合 bSSFP 序列达到了最佳的成像效果。并且通过显微镜图像与 MRI 图像的融合，显示出 7T MRI 比 3T MRI 成像多显示出了约 29%的细胞。由于磁敏感效应，SWI 序列显示的细胞较大，但 bSSFP 序列的图像分辨率高且信噪比高。

结论：

7T 磁共振配合 bSSFP 序列可以显示约 100 个纳米铁粒子复合物标记的巨噬细胞。本研究为细胞标记磁共振成像的临床及科研应用做了探索性研究。

Spontaneous reduction of KMnO4 with MoS2 quantum dots for targeted magnetic resonance imaging and fluorescence labeling of renal cell carcinoma

Jingjing Li
Affiliated Hospital of Xuzhou Medical University

Spontaneous reduction of $KMnO_4$ with MoS_2 quantum dots for targeted magnetic resonance imaging and fluorescence labeling of renal cell carcinoma

Jingjing Li
Affiliated Hospital of Xuzhou Medical University, Xuzhou, Jiangsu Province

Aim

A one-step method was developed to prepare MnO_2/MoS_2 nanocomplex by a spontaneous reduction of $KMnO_4$ with MoS_2 QDs as the reductive agent.

Methods

A “bottom-up” hydrothermal approach was introduced to synthesize MoS_2 QDs with $Na_2MoO_4{\cdot}2H_2O$ as molybdenum source and glutathione (GSH) as sulfur source. Different technologies such as TEM, AFM, fluorescence spectra scanning, MRI scanning were applied for the characterization and the property evaluation of the fabricated nanocomplex.

Results

The formed MnO_2/MoS_2 nancomplex presented a quenched fluorescence emission of MoS_2 QDs and a weak MRI contrast enhancement of MnO_2 NSs. However, in the presence of GSH, the reduction of MnO_2 NSs to Mn^{2+} activated the MRI signal and broke up the structure of MnO_2 NSs to light up the fluorescence emission of MnO_2 QDs. After conjugated with AS1411 aptamer, the specific *in vivo* MR imaging and fluorescence labeling of 786-O tumor cells were realized, showing their promising potential for biomedial applications.

Conclusion

In this work, we proposed a one-step method to prepare fluorescent/MR contrast agent, MnO_2/MoS_2 nanocomplex by a spontaneous reduction of $KMnO_4$ with MoS_2 QDs as the reductive

agent. The formed MnO_2/MoS_2 nancomplex presented a quenched fluorescence emission of MoS_2 QDs and a weak MRI contrast enhancement of MnO_2 NSs. However, in the presence of GSH, the reduction of MnO_2 NSs to Mn^{2+} activated the MRI signal and broke up the structure of MnO_2 NSs to light up the fluorescence emission of MnO_2 QDs. After conjugated with AS1411 aptamer, the specific in vivo MR imaging and fluorescence labelling of 786-O tumor cells were realized with AS1411-MnO_2/MoS_2 nanoprobes. With the additionally applications of MnO_2 nanosheets such as photothermal therapy, imaging-guided combined therapy and the exploration of MoS_2 QDs with longer emission wavelength as well as the utilization of photocatalytic hydrogen evolution ability and excellent optoelectronic properties of MoS_2 QDs, more promising potential applications might be realized in the near future. Particularly, the emergence of two-photon fluorescence (TPF) MoS_2 QDs, which have been applied for multiphoton fluorescence imaging under the excitation of a low power NIR laser, would further advance the bioimaging applications of MoS_2 QD-based nanomaterials.

FA-MoS2/BSA-Gd2O3 诊疗一体化纳米探针对乳腺癌的靶向诊疗研究

蔡璐璐[1],李菁菁[1,2],徐凯[1,2]
1.徐州医科大学
2.徐州医科大学附属医院

目的：构建诊疗一体化纳米探针 FA-MoS2/BSA-Gd2O3，实现乳腺癌的磁共振靶向成像及光热治疗。
方法：
1.制备 BSA-Gd2O3，并剥离出单层 MoS2/BSA-Gd2O3 纳米片及对其进行表征分析及性能测试。
2.检测 MoS2/BSA-Gd2O3 的生物相容性、对不同细胞的细胞毒性；对照观察 MoS2/BSA-Gd2O3 对活体的毒性。
3.构建 FA-MoS2/BSA-Gd2O3 诊疗一体化纳米探针并进行表征分析。
4.检测 FA-MoS2/BSA-Gd2O3 的靶向磁共振成像性能及靶向光热治疗效率。
5.构建乳腺癌载瘤裸鼠模型，探究 FA-MoS2/BSA-Gd2O3 的在体磁共振成像，观察其在裸鼠体内的分布情况及可能的代谢途径。
7.探究 FA-MoS2/BSA-Gd2O3 对乳腺癌载瘤裸鼠的在体靶向光热治疗效果。
结果：
1.成功通过一步法原位剥离制备 MoS2/BSA-Gd2O3 纳米片及构建 FA-MoS2/BSA-Gd2O3 诊疗一体化纳米探针，并通过 TEM、HRTEM、AFM、ICP-MS、UV-vis、FTIR、MRI 等对其进行表征分析及性能测试。
2.单层 MoS2/BSA-Gd2O3 的产率大于 60 wt%，弛豫效率高达 14.35±1.84 $mM^{-1}s^{-1}$。
3.细胞及动物实验证明 MoS2/BSA-Gd2O3 及 FA-MoS2/BSA-Gd2O3 具有良好的生物相容性。
4.细胞实验证明 FA-MoS2/BSA-Gd2O3(Ab(+))组与 FA-MoS2/BSA-Gd2O3(光照组)具有更好的 MR 成像效应及光热转换效率。
5.动物实验证明 FA-MoS2/BSA-Gd2O3(光照组)对 4T1 乳腺癌载瘤裸鼠的在体靶向光热治疗明显优于其他组。
结论：本研究成功构建了诊疗一体化纳米探针 FA-MoS2/BSA-Gd2O3，实现了靶向诊断和靶向治疗的目的，同时实现了乳腺癌的磁共振靶向成像及光热治疗。

Synthesis of Multifunctional Rare-earth Vanadate Nanoparticles for Magnetic Resonance Imaging and Luminescence Bioimaging

Guannan Zhu[1], Fanxin Zeng[2,3], Lei Gu[1,4], Xue Li[4], Jing Jiang[1], Min Wu[1,2,3]
1. Huaxi MR Research Center (HMRRC), Department of Radiology, West China Hospital, Sichuan University, Chengdu, 610041, China
2. Department of Clinic Medical Center, Dazhou Central Hospital, Dazhou, 635000, China
3. Department of Radiology, Molecular Imaging Program at Stanford (MIPS), Stanford University, 725 Welch Road, Stanford, California, 94305, USA
4. Laboratory of Stem Cell Biology, State Key Laboratory of Biotherapy, West China Hospital, Sichuan University, Chengdu, 610041, China

PURPOSE:
The purpose of our study is to introduce Gadolinium orthovanadate Nanoparticles containing Eu^{3+} and Bi^{3+} ions ($GdVO_4$: Eu^{3+}, Bi^{3+} NPs) and determine the *in vitro* and *in vivo* bimodal imaging characteristics of the NPs.
METHOD:
In this study, $GdVO_4$: Eu^{3+}, Bi^{3+} NPs were synthesized using polyethylenimine-assisted hydrothermal method. The uptake properties on HepG2 cells and optical properties were tested using flow cytometry and confocal laser-scanning microscopy (CLSM). A 3.0 T Magnetic resonance imaging (MRI) system was performed for exploring the MR imaging characteristics of the NPs . The liver orthotopic transplantation tumor-bearing mouse model was established for *in vivo* MRI. Additionally, the Cell Counting Kit-8 (CCK-8) assay and histology studies were conducted to test the safety of the NPs.
RESULTS:
A strong red luminescence in the interior of the cells was observed in a CLSM. The r_2/r_1 ratio of the NPs was calculated as 7.42, which is higher than the clinical value (r_2/r_1 ratio close to 1). As for signal intensity, the liver parenchyma regions showed a significant decrease about 44% and the tumor tissue showed an enhancement of 27% in T_2-weighted images (T_2WI). Furthermore, a negligible proliferation change was detected in the CCK-8 assay and no noticeable abnormalities were observed among the animals.
CONCLUSIONS:
$GdVO_4$: Eu^{3+}, Bi^{3+} NPs are multimodal imaging agents that enable effective MR T_2 imaging and downshifting luminescence (DSL) imaging. The NPs exhibit low toxicity and excellent biocompatibility, indicating the potential in clinical bioimaging applications.

基于天然黑色素的 MMP2 响应型多模态成像纳米探针

孟婷伟,张瑞平
山西医科大学

目的：制备一种新型的 PEG-Pep_{MMP2}@MNP- Gd^{3+}纳米探针，它通过感知肿瘤部位基质金属蛋白酶-2（MMP-2），引发团聚以增强 T1 的核磁共振成像相关系数。同时由于黑色素具有很好的光声特性和较好的近红外吸收，实现核磁共振和光声双模态成像。
方法：1.PEG-Pep_{MMP2}@MNP- Gd^{3+}纳米探针的构建。2.PEG-Pep_{MMP2}@MNP- Gd^{3+}纳米探针的表征及体外实验 2.1 纳米碳针取 1mg/ml,稀释一定倍数，动态光散射（DLS）测其粒径大小，TEM 观察其形貌；2.2 采用 CCK8 法检测不同浓度纳米探针的细胞毒性；2.3 利用 MRI、PAI 成像系统检测按比例稀释后探针和对照溶液的信号强度，找出最佳浓度。3.MMP-2 敏感性响应实验。4.PEG-Pep_{MMP2}@MNP- Gd^{3+}纳米探针的体内多模态成像:建立 4T1 肿瘤动物模型，尾静脉注射纳米探针，并以未连 MMP-2 溶液为对照组，在不同时间段进行 MRI、PAI 成像扫描，观察对比两种探针在肿瘤动物模型中的两种成像效果。
结果：1.制备的 PEG-Pep_{MMP2}@MNP- Gd^{3+}纳米探针水溶性好，通过 DLS 和 TEM 测量，平均粒径在 17nm 左右。2.CCK-8 实验中，当浓度低于 800ug/ml 时，基本对细胞无毒性；3.MMP-2 敏感性响应实验中，与 MMP-2 孵育后探针粒径随时间变大，且在电镜下观察到聚集；4. PEG-Pep_{MMP2}@MNP- Gd^{3+}纳米探针具有良好的 MR、PA 成像信号，且与对照组相比，信号有明显增强。
结论：制备出一种能同时实现双模态成像的新型 PEG-Pep_{MMP2}@MNP- Gd^{3+}纳米探针，其合成工艺简单，毒性低，通过肿瘤部位 MMP-2 响应性聚集，与之前构建的纳米探针相比，增强了核磁共振 T1 和光声成像相关系数。

DTPAA-Gd Functionalized Ultrasmall Au15NCs Nanohybrids for Multimodal Imaging

Minghao Wu,Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

Multimodal imaging agent has potential to overcome the shortage and incorporate the advantages of different imaging tools for extremely sensitive diagnosis. To achieve multimodal imaging, combining multiple contrast agents into a special nanostructure has become a main strategy; However, the combination of all of these functions into one nanoplatform usually requires a complicated synthetic procedure that results in heterogeneous nanostructure. In this study, using ultrasmall gold nanoclusters with 15 gold atoms (Au_{15}NCs) as the core and diethylenetriamine-pentaacetic acid dianhydride (DTPAA-Gd) as the shell, we develop a kind of good biocompatible nanohybrids as an optimized multimodal imaging probe. The Au_{15}NCs-DTPAA-Gd nanohybrids produce strong red fluorescence upon laser stimulation at 485 nm and simultaneously display a better X-ray attenuation property than conventionally used iodine-based contrast agents (e.g., Omnipaque). Meanwhile, the integrated DTPAA-Gd component not only endow the nanohybrids to produce higher T_1 relaxivity (r_1 = 21.4 mM^{-1} s^{-1}) than Omnipaque (r_1 = 3.973 $mM^{-1}s^{-1}$), but also further enhance X-ray attenuation property of Au_{15}NCs. Ultimately, the Au_{15}NCs-DTPAA-Gd nanohybrids are confirmed to be effective and applicable for near-infrared fluorescence (NIRF) imaging, X-ray computed-tomography (CT) and magnetic resonance (MR) imaging *in vivo*. The multimodal imaging based on Au_{15}NCs-DTPAA-Gd may be a promising strategy for precision medicine.

活体生物发光成像监测 JNK/c-Jun:ATF2 信号通路介导的肿瘤顺铂耐药

杨帆,李梦珠,李丹
中山大学附属第五医院

目的：探索 JNK/c-Jun:ATF2 信号通路在肿瘤顺铂耐药中的作用，进一步通过活体生物发光成像监测该通路在肿瘤顺铂治疗后的动态变化。
方法：首先，在 Hep 3B 肝癌细胞，10 μM 顺铂或 DMSO 处理 3-24 h 后，检测 p-JNK、p-c-Jun、p-ATF2 的水平，并检测 c-Jun:ATF2 结合元件 ATF 的活性以及其调控的 DNA 损伤反应（DDR）相关基因的 mRNA 水平。进一步，使用 JNK 抑制剂 SP600125 或 ATF-decoy 抑制该信号通路，检测它们能否与顺铂发挥协同杀伤 Hep 3B 细胞的作用。最后，分别将 CMV-Luc2（反映肿瘤细胞数目）和 ATF-Luc2（反映 ATF 元件的绝对活性）报告基因标记的 Hep3B 细胞种植到裸鼠皮下，腹腔注射顺铂或 PBS 后，活体生物发光成像检测 ATF 元件活性的动态变化。
结果：顺铂处理组的 p-JNK、p-c-Jun 和 p-ATF2 的水平均高于对照组；顺铂处理 12 h 后，ATF 元件活性增强；部分 DDR 相关基因 mRNA 水平在顺铂处理 12 h 或 24 h 后上调。SP600125 或 ATF-decoy 联合顺铂处理 Hep 3B 细胞 36 h 后，双链 DNA 损伤标志物（H2AX、p-H2AX）及细胞凋亡标志物（cleaved-caspase 3、cleaved-PARP）的蛋白水平增加。活体生物发光成像结果显示，药物处理 12 h 后，顺铂处理组的 ATF-Luc2/CMV-Luc2 比值（反映 ATF 元件的相对活性）是 PBS 处理组的 1.7 倍。
结论：顺铂给药导致肿瘤细胞 JNK/c-Jun:ATF2 信号通路激活、c-Jun:ATF2 结合元件 ATF 活化以及其调控的 DDR 相关基因的 mRNA 水平上调；抑制 JNK/c-Jun:ATF2 信号通路能增加肿瘤细胞对顺铂的敏感性；活体生物发光成像证实顺铂给药后肿瘤 JNK/c-Jun:ATF2 信号通路激活。

MR 成像靶向动脉粥样硬化模型转化生长因子-β1 表达的实验研究

马占龙
江苏省人民医院（南京医科大学第一附属医院）

目的：化学偶连法合成 TGF-β1 靶向的超微超顺磁性纳米氧化铁（USPIO）探针，探讨 MR 靶向 Apo E-/-小鼠主动脉动脉粥样硬化斑块中 TGF-β1 蛋白表达体内成像的可行性。
方法：将聚乙二醇（PEG）包被的 USPIO 与抗小鼠 TGF-β1 抗体结合，构建 anti-TGF-β1-USPIO 靶向探针。以单纯 USPIO 作为对照。应用透射电镜（TEM）、动态光散射法（DLS）、酶联免疫吸附间接法（ELISA）分析探针的物理及特异性特征。靶向探针组（n=10）注射 anti-TGF-β1-USPIO，对照组（n=10）注射单纯 USPIO，分别于注射前、注射后 24 h 进行 7.0T MR 成像。成像后立刻取主动脉标本进行 TGF-β1 免疫组化染色，并行普鲁士蓝染色，观察斑块内铁沉积。
结果：注射 anti-TGF-β1-USPIO 后 24 h，小鼠主动脉斑块信号明显降低，信号减低率为-19.34±0.68%；注入单纯 USPIO 后 24 h，小鼠主动脉斑块信号轻度降低，信号减低为-5.61±0.57%；差别均有统计学意义（P <0.05）。Anti-TGF-β1-USPIO 主要在斑块内膜下及斑块内分布。免疫组化染色显示这些区域 TGF-β1 高表达。普鲁士蓝染色显示斑块内铁沉积。
结论：Anti-TGF-β1-USPIO 可实现小鼠主动脉粥样硬化斑块的靶向 MR 体内成像，能够特异性显示斑块内 TGF-β1 的表达，用于监测动脉粥样硬化斑块的进展及活体评估斑块的稳定性。

F304&IR-1061@PLGA 自组装纳米探针的制备及其性能研究

蔡武[1],胡春洪[2],曾剑峰[3],范国华[1],沈钧康[1],徐亮[1]
1.苏州大学附属第二医院
2.苏州大学附属第一医院
3.苏州大学

目的 发展一种基于聚乳酸-羟基乙酸共聚物（PLGA）纳米微球的 F_3O_4& IR-1061@PLGA 自组装纳米探针（FIP NPs），评估其理化性质及细胞毒性和体外光热效应。
方法 ①采用单一乳化-溶剂挥发法及磁分离纯化法制备 FIP NPs，并对其稳定性及表征进行研究。②将不同浓度的 FIP NPs 分别与小鼠乳腺癌 4T1 细胞共孵育 24 h 后，通过噻唑蓝比色法（MTT）对 FIP NPs 进行体外细胞毒性研究。③采用 808 nm 激光照射不同浓度的 FIP NPs 进行体外光热效果测试，并采用 MTT 和 Live-Dead 实验检测 FIP NPs 光热杀伤小鼠乳腺癌 4T1 细胞的效果。
结果 ①FIP NPs 电子粒径为 98.4 nm，水合粒径为 182 nm，在水和 FBS 中的动力学尺寸和电势基本保持稳定。FIP NPs 在 700~900 nm 的范围内具有很强的紫外吸收光谱，并且其峰值在 750 nm 处；在 808 nm 激发光激发下，FIP NPs 荧光发射光谱峰值在 1095 nm 处；并且 FIP NPs 紫外和荧光光谱相比于游离 IR-1061 均发生了蓝移。②体外细胞毒性实验结果显示，较高浓度 FIP NPs 对 4T1 细胞无明显毒性作用。③体外光热性成像实验结果表明 FIP NPs 具有很好的光热转换效果及光热稳定性；同时通过细胞实验发现其对肿瘤细胞有显著的光热杀伤消融作用。
结论 FIP NPs 具有良好的胶体稳定性、光学特性和体外光热效应，且无明显的细胞毒性。

建立 CT 影像组学标签预测非小细胞肺癌 Ki-67 表达水平

顾潜彪,冯智超,梁琪,李美姣,王维,容鹏飞
中南大学湘雅三医院

目的：建立基于 CT 图像特征的影像组学标签，预测非小细胞肺癌(non-small cell lung cancer，NSCLC)的 Ki-67 表达水平。方法：回顾性收集 2014 年 1 月至 2017 年 11 月行肺部 CT 平扫及增强扫描并在检查后 2 周内经病理证
实、行 Ki-67 表达水平检测的 108 例 NSCLC 患者。在 MaZda 软件中分别手动勾画出病灶 CT 平扫及增强的三维立体结构影像，提取感兴趣区的纹理特征参数。经过多种特征选择方法[交互信息(mutual information，MI)、Fisher 系数
(fi sher coeffi cient，Fisher)、分类错误概率联合平均相关系数(classifi cation error probability combined with average correlation coefficients，POE+ACC)以及联合方法(Fisher+POE+ACC+MI，FPM)]和分析方法组合建立影像组学标签，以误判率评价其诊断效果。结果：108 例患者中 Ki-67 高表达组 50 例，Ki-67 低表达组 58 例。Ki-67 高表达与低表达两组间性别、年龄和病理类型差异均有统计学意义($P<0.05$)。基于 CT 平扫图像纹理特征的 FPM 特征选择和 NDA 特征分析方法建立的影像组学标签预测 Ki-67 表达水平效果最佳，错判率为 14.81%。基于 CT 增强图像纹理特征建立的影像组学标签错判率并未低于基于 CT 平扫图像纹理特征建立的影像组学标签错判率。结论：基于常规 CT 图像纹理特征建立的影像组学标签有助于预测 NSCLC 病灶 Ki-67 的表达水平，可为评估肿瘤侵袭性和预后情况提供一种无创性技术手段。

Noncontrast enhanced CT image-based radiomics analysis for predicting the simplified subtype of thymic epithelial tumors

Xiulong Feng[1], Yongkang Xin[1], Linfeng Yan[1], Tao Zhang[2], Dongliang Cheng[2], Tao Zhang[2], Ke Xu[2], Zhesheng Shi[2], Li Mao[3], Xiuli Li[3], Yuchuan Hu[1], Guangbin Cui[1], Wen Wang[1]
1. Tangdu Hospital, Fourth Military Medical University
2. Student Brigade, Fourth Military Medical University
3. Deepwise AI Lab, Deepwise Inc.

Objective The simplified WHO subtype of thymic epithelial tumors (TETs) plays very important role in patient treatment and prognosis but is difficult to accomplish by the radiologist's visual inspection. We aimed to establish and optimize the noncontrast enhanced CT image-based radiomics analysis for the simplified subtype of TETs.

Methods A total of 433 patients with pathologically confirmed TETs and complete NECT images in our hospital were retrospectively included in the current study from Jan 1, 2009 to May 31, 2016. Volumes of interest (VOIs) covering the whole tumor were manually segmented on preoperative NECT images. Radiomic features and clinical variables were retrieved and input to establish 14 machine learning models. The diagnostic performances were investigated with varied feature selection strategies and 10-fold cross validation, and then validated on the test set.

Results All models, except Decision Tree, built on the combined features demonstrated larger Areas Under Curve (AUC) of the receiver operating curve (ROC) in differentiating low risk thymoma (LRT), high risk thymoma (HRT) and thymic carcinoma (TC) than those on radiomics features alone. Among them, the support vector machine (SVM) model achieved the highest AUC of 0.84 on the validating set. After the outliers were removed, the best diagnostic performance was achieved using Logistic Regression (LR) model, with the AUC of 0.85, accuracy, sensitivity and specificity of 69.41%, 63.15% and 81.55% on the validating set, respectively. When the discrimination of LRT, HRT or thymic cancer (TC) was considered as a one-vs-the rest task, sensitivities of LR model were 67.49%, 60.82% and 52.78%, with the specificities of 70.00%, 72.38% and 93.95% for LRT, HRT or TC, respectively.

Conclusion The vast majority of the machine learning models are promising in predicting the simplified WHO subtypes of TETs, especially the SVM and LR models. Machine learning with NECT radiomic features may facilitate the differentiation of simplified TET subtypes.

EPO-2127

自组装多肽体系对三阴乳腺癌的诊疗及 DWI-MR 评估研究

肖泽宇[1],黄翠青[1,2],梁建业[1],张冬[1],史长征[1],罗良平[1]
1.暨南大学附属第一医院
2.广东省妇幼保健院

目的：设计及合成一种高效、全安的具有荧光成像以及三阴乳腺癌杀伤的纳米自组装多肽诊疗体系，并通过功能磁共振成像动态评估及疗效。
材料与方法：应用透射电镜、纳米粒度仪及拉曼光谱仪等方法对合成纳米多肽的形貌、粒径、结构进行表征与分析；应用 MTT 法、细胞吸收实验、流式细胞计量分析及细胞 ROS 水平检测等方法研究 Fm-KKF 多肽对三阴乳腺癌（MDA-MB-231 细胞）的抗肿瘤效果及作用机制；并通过体外、体内荧光成像验证其成像性能；应用 DWI-MRI 对荷瘤小鼠给药前及给药后 3d、7d、14d、21d 的肿瘤组织的细胞活性进行定量分析，结合形态学数据、血液指标、病理及免疫组化分析等方法，对多肽体系的活体内抗肿瘤疗效及安全性进行综合评估。
结果：电镜下呈分散性好、大小均一的条形纳米体系，自组装状态下，多肽宽度平均 9.89 ± 1.1 nm；纳米多肽体系对 MDA-MB-231 细胞具有明显杀伤和细胞吸收效率，可以明显上调 MDA -MB -231 细胞中的 ROS 水平；体外、体内具有良好的荧光成像效能；体内动物模型验证显示，Fm-KKF 多肽相比对照组具有更好的抑瘤作用，TUNEl、Ki67 阳性染色率（平均值为 65.5%、55.9%，$P< 0.05$）显著低于其他各组，Cleaved-Caspase-3 阳性染色高于其他各组；DWI-MRI 结果显示治疗组 ADC 值在治疗后第 3d 显著升高，之后各个时间点 ADC 值均高于其他组。各组小鼠体重未见明显异常改变；血液学指标显示，各组谷草转氨酶、谷丙转氨酶、肌酐、尿酸、乳酸脱氢酶以及肌酸激酶水平未见异常。
结论：本研究成功构建一种高效、安全的具有荧光成像以及三阴乳腺癌杀伤的纳米多肽诊疗体系，并应用 IVIM-DWI 技术实现从水分子弥散、微循环灌注功能成像对纳米体系抗肿瘤疗效的无创、动态、定量监测，为下一步新型自组装多肽体系在肿瘤诊疗一体化的应用提供了理论依据。

EPO-2128
扩散加权成像影像组学预测乳腺癌 Ki-67 表达水平的可行性研究

王清霖
山东省烟台毓璜顶医院

目的 探讨基于磁共振弥散加权成像的影像组学方法在术前预测乳腺癌 Ki-67 表达水平的可行性。
方法 选取在术前行 MRI 检查的乳腺癌患者的 DWI 图像，并取得检查后病理组织测定 Ki-67 表达水平，共得到 114 个病灶，其中 Ki-67 阴性表达患者 38 例，Ki-67 阳性表达患者 76 例，随机分为训练集和验证集。分别对其 DWI 图像进行影像组学特征分析，并通过 LASSO 回归模型对影像组学特征进行筛选、降维，构建影像组学标签，根据筛选出来的影像组学特征的权重，对每例患者进行影像组学评分，将患者分为 Ki-67 阳性表达和 Ki-67 阴性表达 2 组，对筛选好的特征参数联合病理学诊断检测建立评估乳腺癌 Ki-67 表达水平的预测模型，分类性能使用受试者工作特征曲线下面积（AUC）进行评估。
结果 统计得到熵值、能量和对比度等 76 个影像组学参数中 25 个参数在两组数据中均有统计学意义（P<0.05），采用 LASSO 方法在 76 个影像组学特征中选择均匀性、Haralick Correlation、inverse Difference Moment、difference Variance 4 个标签特征，得到训练集和验证集每例患者影像组学评分的分布情况，影像组学评分在两组患者中有明显的分布差异，联合病理结果进行二分类建模，其中，训练集中 AUC 为 0.83，验证集中 AUC 为 0.76。
结论 乳腺癌 Ki-67 阴性和 Ki-67 阳性在 DWI 图像的影像组学特征显著不同，DWI 的影像组学在两者鉴别方面具有可行性，有助于术前预测乳腺癌中 Ki-67 的表达水平。

EPO-2129
长海痛尺评分法在原发性肝癌行 TACE 患者中的应用效果研究

杨文文,张翠翠
江苏省徐州市传染病医院

【目的】探讨长海痛尺法在原发性肝癌行 TACE 患者中的应用效果研究
【方法】选取原发性肝癌行 TACE 患者 60 例，其中男 52 例，女 8 例。术前给予疼痛筛查及宣教，指导患者掌握“长海通尺”的用途、用法。严格采用“长海通尺”对患者的疼痛做出全面、准确的评估，同时做好疼痛的护理措施并及时评价止痛效果。（0 分属无痛，1-2 分属轻度疼痛，3-4 分属中度疼痛，5-6 分属重度疼痛，7-8 分属剧烈疼痛，9-10 分属无法忍受的疼痛），评估频次及时间，患者回病房后 30 分钟内第一次评估，≤2 分者采用非药物治疗，并继续每小时评估 1 次，连续 3 次均≤2 分后改为每 4 小时一次。评估≥3 分，遵医嘱给予药物治疗，用药后半小时（肌注）或 1 小时（口服）评估用药效果，仍≥3 分者遵医嘱给予相应级别的镇痛药，使疼痛评分≤2 分，并每 4 小时评估 1 次，持续 72 小时。
【结果】轻度疼痛 11 例占 18%，中度疼痛 34 例占 57%，重度疼痛 11 例例占 18%，剧烈疼痛 4 例例占 7%，无法忍受 0 例，经过采取有效的护理措施，疼痛均消失。
【讨论】疼痛已成为继体温、脉搏、呼吸、血压四大生命体征之后的第五生命体征，疼痛评估是规范性疼痛处理的第一步。护理人员学会正确评估疼痛并做好疼痛管理十分重要。目前国内外临床使用的疼痛评估量表种类较多，NRS 一 10 量表的刻度较为抽象；VBS-5 虽容易理解，但精确度不够，有时患者很难找出与自己的疼痛程度相对应的评分。本组患者经疼痛筛查及疼痛宣教，利用“长海痛尺”指导患者掌握痛尺的用途、用法，术毕回房后加强观察，严格采用“长海痛尺”对患者疼痛做出全面、动态的评估，对疼痛的评估更为直观，解决了部分疼痛评分法中随意性过大、精确度不够的问题，能及时了解患者疼痛程度并做出有效处理，减轻了疼痛，而且病人容易理解，医生、护士也容易掌握，疼痛管理满意度明显提高，为促进康复提供了一种有效、可靠、实用的护理方法和手段，可于临床广泛应用。

风险管理对提高放射科护理管理质量的作用

吴若男
中国科学院大学重庆医院（重庆市人民医院）

【摘要】目的: 分析放射科护理中存在的风险因素, 探讨如何通过制定相应措施进行护理风险管理, 提高护理质量, 减少护患纠纷。方法:回顾随机选取 2018 年 7 月-2018 年 12 月期间 130 例患者作为研究对象（对照组）给予常规护理方案，2019 年 1 月~6 月 130 例患者（研究组）实施风险管理护理方案，比较两组患者不良事件发生率、护理满意度和候诊时间。结果：研究组不良事件发生率明显少于对照组（ $\chi 2=6.94$，$P<0.05$）；研究组护理满意度高于对照组（ $\chi 2=5.91$，$P<0.05$）；患者的候诊时间明显比对照组短，组间差异具有统计学意义（$t=6.1$，$P<0.05$）。结论：在放射科应用风险管理，能明显缩短患者的候诊时间，降低不良事件发生率，提高护理管理质量，可在临床中推广。

CT 检查中对比剂使用后发生不良反应的种类及相对应护理方案

1 李琴
华中科技大学同济医学院附属同济医院

目的： 探讨 CT 检查中对比剂使用后发生不良反应的种类及相对应护理方案。**方法：**收集 2017 年 2 月~2019 年 3 月我院进行增强 CT 检查的患者，分析 CT 检查中对比剂使用后患者发生不良反应的情况。**结果：**100 例患者在使用对比剂后，发生一般不良反应最高，发生率为 7%，明显高于肾脏不良反应及其它不良反应，两组结果比较有差异（P<0.05）。**结论：**CT 检中对比剂使用后，患者有一定可能发生不良反应，其中以一般不良反应最高，对比剂使用前加强与患者沟通，评估患者病情、病史，使用中提高护理操作技术是有效减少对比剂相关不良反应发生的重要基础。

EPO-2132
护理干预在 CT 阴茎海绵体造影检查中的应用价值

杨秋月
华中科技大学同济医学院附属同济医院

目的 探讨护理干预在 CT 阴茎海绵体造影检查中的应用价值。**方法** 将 60 例进行 CT 阴茎海绵体造影检查的患者随机分成两组，每组 30 例。对照组采用常规护理；观察组在常规护理的基础上分别在检查前、检查中、检查后采用相应的护理干预（健康宣教、心理护理、疼痛护理、隐私保护、对比剂外预热等）。比较两组患者一次性完成检查成功率及并发症（皮下血肿及出血、对比剂外渗、对比剂不良反应等）发生率。**结果** 对照组一次性检查成功率（70%）明显低于观察组一次性检查成功率（96.7%），差异有统计学意义（χ^2=7.608,P=0.006）；对照组并发症发生率（26.7%）明显高于观察组并发症发生率（6.7%），差异有统计学意义（ χ^2=4.320,P=0.038）。**结论** 护理干预的实施，不仅提高患者一次性检查成功率、缩短检查时间、减少二次曝光、降低辐射剂量，同时减少并发症的发生，保证了患者的检查安全与舒适，具有实际应用价值，值得推广。

EPO-2133
住院肿瘤患者 CT 检查后留置针保留继续使用的效果分析

唐晓丽
四川省肿瘤医院

目的 探讨住院肿瘤患者 CT 检查后留置针保留继续使用的效果分析。**方法** 选取 2018 年 3 月-2018 年 11 月我院收治的接受 CT 检查的肿瘤患者 320 例，其中满足留置针延长留置时间的患者 281 例为研究组，其余不符合留置针延长留置的患者 39 例为对照组，分析两组患者并发症发生情况和对患者留置针留置时间造成因素进行分析。**结果** 影响患者检查后留置针留置时间的主要影响因素包含患者年龄、对于留置针相关知识的了解程度、后期所用药品有无刺激性以及有无留置针并发症，以上几项患者留置针留置天数差异显著（P＜0.05）；研究组患者并发症发生情况与对照组无明显差异（P＞0.05）。**结论** 对接受 CT 检查的肿瘤患者延长其留置针使用时间可以减少穿刺次数，降低

对患者血管的刺激，根据影响患者留置针留置时间的影响因素进行护理干预可以有效降低并发症的发生情况，临床上应当进一步推广应用。

肾脏替代疗法患者在影像检查中的护理干预

李小玲,许伟
中南大学湘雅三医院

目的　　探讨肾脏替代疗法患者在影像检查中护理干预，为患者提供最佳护理。

方法 本文对 45 例住院患者，在留置套管针、控制摄水量、对比剂的使用、预防交叉感染以及尿毒症急症方面采取针对性的护理干预。

结果 经过针对性护理干预，所有患者顺利完成了检查，未发生对比剂外渗，急症患者得到快速地检查，没有一例患者发生交叉感染。

结论 熟练的穿刺技巧，急诊绿色通道的开放，规范预约流程和碘克沙醇的使用都有利于患者快速安全地完成 CT 检查。

EPO-2138
地塞米松预防性应用在降低碘对比剂不良反应中临床实用价值

李霁川
四川省肿瘤医院影像诊治部

目的　探讨地塞米松预防性使用在降低碘对比剂不良反应发生率中的临床实用价值。**方法**　回顾性收集电子科技大学医学院附属四川省肿瘤医院 2017 年 1 月至 2019 年 4 月 接受碘海醇 CT 检查的患者资料共 325 例,根据是否预防使用地塞米松分成两组：应用组和非应用组。应用组：于静脉注射碘海醇前 30 min 静脉推注地塞米松 5mg；未应用组：不预防静脉推注地塞米松。其中应用组 136 例,未应用组 189 例。对两组患者的不良反应发生率、临床表现和不良反应严重程度进行比较分析。**结果**　药物不良反应：应用组 1 例,发生率为 0.73% ；未应用组 8 例,发生率为 4.23% 。两组不良反应率差异有统计学意义(P ＜ 0. 05) 。不良反应严重程度：应用组轻中度不良反应 1 例,严重 0 例；未应用组轻中度 6 例,严重 2 例,两组严重不良反应发生率无统计学差异(P ＞ 0. 05) 。**结论**　地塞米松预防性应用可以有效降低碘对比剂的不良反应发生率,保证用药安全。

集束化护理程序在预防静脉高压注射外渗中的应用

喻园园
陆军军医大学第二附属医院（新桥医院）

目的：探讨集束化护理程序在预防静脉高压注射对比剂外渗的应用效果。方法：将我院放射科 2018 年 5 月 1 日至 6 月 30 日经静脉高压注射高风险患者 100 人作为观察组，实施集束化护理；将 2018 年 7 月 1 日至 8 月 30 日经静脉高压注射高风险患者 100 人作为对照组，实行常规护理。观察比较两组高风险患者在经静脉高压注射对比剂过程中出现的对比剂外渗率、对比剂外渗致不良反应率、护理缺陷、患者及家属满意率。结果：观察组患者出现对比剂外渗率、对比剂外渗不良反应率较对照组明显减少，护理缺陷降低，患者及家属满意度提高，差异有统计学意义（P<0.05）。结论：使用集束化护理程序预防经静脉高压注射高风险患者对比剂外渗能有效降低对比剂外渗发生率和不良反应发生率，降低护理缺陷，提高患者及家属满意率，有效提高了整体护理质量。

EPO-2141
经导管主动脉瓣置换介入治疗的护理

白井双,黄峥,王颖
郑州大学第一附属医院

[摘要]目的 探讨经导管主动脉瓣置换术（TAVR）的风险评估、观察要点与护理措施，减少 TAVR 术后并发症的发生率。方法 收集河南省具备行主动脉瓣内科治疗的三甲医院于 2017 年 4 月-11 月间收治的严重主动脉瓣疾病的患者 50 例，根据胸外科医师协会（the Society of Thoracic Surgeons，STS）系统评估后，对于无胸外科手术禁忌的患者进行病情、身体素质、经济能力、个人意愿的综合调查和评估，最终筛选出在我省接受介入手术治疗患者。总结 TAVR 治疗的风险评估、观察要点及术后并发症的护理，通过随访追踪 TAVR 术后患者的预后情况。结果 50 例患者中主动脉瓣重度关闭不全（AR）6 例，主动脉瓣重度狭窄（AS）44 例，最终在我省成功接受治疗的患者有 7 例，其中 1 例行主动脉瓣球囊扩张（BAV），术后出现严重并发症（心力衰竭），最终病情得到控制；经导管主动脉瓣置换术（TAVR）治疗者 6 例，其中 2 例在治疗过程中出现并发症（房室传导阻滞），其余 4 例生存状况良好，根据随访其心功能分级由 IV 级恢复至 II 级。术前要对适合 TAVR 治疗的患者进行准确的风险评估，包括患者的综合身体素质，手术难度等要素，确定应急方案。护理人员要充分了解患者的术前状况、术中使用的支架瓣膜特点和具体手术过程。术者做好确切的心肌保护，做好心内排气尤其是排尽左心房和心尖的气体，避免气体进入冠状动脉引起心室颤动，损害心功能。结论 对于外科手术禁忌症的患者而言，TAVR 治疗明显优于保守治疗，但由于接

受治疗的患者大多为高龄、高危者，且手术风险大、难度高，经济花费较大，手术并发症发生率较高，因此术后护理，特别是并发症的预防、发现和处理对硬件、术者及护理人员都是挑战。医护的密切配合对患者的预后很关键，因此应进一步总结 TAVR 术后护理经验，规范化 TAVR 治疗的观察要点和护理措施，减少 TAVR 术后并发症的发生率。

全程精细化护理干预对降低 CT 增强扫描造影剂不良反应的探讨

谭清华
重庆三峡中心医院

目的：探讨 CT 增强扫描中采取全程精细化护理对降低造影剂不良反应的作用。**方法：**将 170 例行 CT 增强扫描患者随机分为常规组和试验组各 85 例，常规组实施常规护理，试验组在此基础上实施全程精细化护理。对比两组患者的造影剂不良反应及检查情况。**结果：**试验组患者不良反应发生率、检查中断情况发生率、心率异常及血压异常均明显低于常规组，差异显著，有统计学意义（P<0.05）。**结论：**全程精细化护理干预应用于 CT 增强扫描不仅能降低造影剂的不良反应发生率，还能降低患者检查的异常现象发生率，有利于患者的扫描质量的提高。

构建信息化医学影像科医疗服务模式的探索

严雯
武汉大学中南医院

摘要：目的 构建信息化医学影像科，创新医疗服务模式，利用互联网发展线上线下相结合个性化服务，为患者提供实时.便捷.优质的医疗服务。**方法** 通过微信公众号，APP 等平台采用“铁路订票”模式，进行线上登记预约检查，根据检查部位不同，实现分时段.分机器预约，患者可以根据

需求自由选择检查时间。APP 平台会为患者推送检查注意事项和准备工作的指导等。通过 APP 平台查询报告和电子版图像。**结果与结论** 优化患者检查流程，通过这种信息化的影像科医疗服务模式，使患者感受到信息化和无纸化的快捷方便，给患者带来全新的就医体验。

规范化疼痛管理在骨质疏松性椎体压缩骨折患者中的术前应用效果

胡婷业
滁州市第一人民医院

目的 探讨规范化疼痛管理在骨质疏松性椎体压缩骨折患者术前应用的效果。**方法** 按照患者的入院时间将骨质疏松性椎体压缩骨折患者分为两组，2017 年 2 月至 11 月收治的 50 例患者为对照组，2017 年 12 月至 2018 年 7 月收治的 50 例患者为观察组，2 组患者性别、年龄、骨折节段和入院时疼痛状况比较差异无统计学意义，100 例患者均接受经皮椎体成形术（Percutaneous vertebroplasty, PVP）治疗，对照组术前采用常规疼痛护理，即给予健康宣教、心理疏导、疼痛评估、非药物护理干预和药物镇痛等，研究组术前采用规范化疼痛护理，即客观、准确评估患者的疼痛并记录，加强疼痛宣教和心理护理，采用超前镇痛、适时镇痛、个体化镇痛和多模式镇痛等等，对两组患者干预后疼痛护理质量和镇痛效果进行比较，使用 SPSS19.0 统计学软件对所收集的数据进行统计学分析，$P<0.05$ 为差异有统计学意义。**结果** 两组患者术前疼痛状况的记录、镇痛药物肌内注射的病例数、疼痛对睡眠的影响程度、疼痛知识和镇痛方法选择信息的充分程度和对疼痛控制的满意度比较差异有统计学意义（$P<0.05$），但两组患者疼痛对翻身的影响和用数字评估法或描述法记录疼痛强度比较差异无统计学意义（$P>0.05$）。**结论** 实施规范化疼痛管理有助于提高骨质疏松性椎体压缩骨折患者术前疼痛护理质量和镇痛效果。

EPO-2146
“9S”管理法在导管室高值耗材管理中的应用

王哲隽
自贡市第一人民医院

【摘要】**目的**：探讨“9S”管理法在导管室高值耗材管理中的应用方法,规范导管室的耗材管理。**方法：**将"9S"管理引入导管室高值耗材管理实践,对高值耗材实施"整理、整顿、清扫、清洁、节约、安全、服务、满意、素养"的"9S"管理,比较常规管理与"9S 管理"的实施效果。**结果：**与"9S"管理实施前的常规管理比较,导管室高值耗材发放准确率显著上升、高值耗材平均发放时间与耗损的平均补充时间均显著缩短、高值耗材过期失效及报损件数明显减少、发放差错次数减少、手术医生对手术护理质量的满意度提升(P<0.05)。**结论：**实施导管室高值耗材的"9S"管理提高了导管室高值耗材的管理效能、优化了导管室的空间布局和管理流程,提高了工作效率，提升了手术医生对导管室手术护理质量的满意度，提升了导管室护士的素养。

EPO-2147
探讨造影剂外渗的原因及对策

李媛媛
合肥平安健康检测中心

目的:探讨药物外渗的预防、降低外渗的方法、外渗后的护理措施;**方法**：将我中心应用造影剂药物预防外渗采取不同的护理方法及外渗后的护理经验，针对性预防;1.造影剂外渗的表现是指在 CT 增强扫描时注射药物的静脉破裂,注射的造影剂漏出血管渗入周围组织间隙，造成相应组织的肿胀、充血甚至坏死的表现。一般表现为穿刺点的周围组织饱满、肿胀、疼痛,严重者可累及整个穿刺肢体的软组织,偶有水泡发生，并伴有严重的患肢活动受限。2.一旦发生造影剂外渗应立即停止注射。24 小时内用凉毛巾覆盖于渗漏处皮肤，亦可用切开的土豆片贴于患处，反复更换,使局部血管收缩，减少外渗，一般 10 小时左右均可恢复正常，严重者可在 24 小时后改用 50%硫酸镁浸湿纱布完全敷于渗漏处皮肤。其原理是硫酸镁为高渗液,可使局部肿胀的皮肤出现渗透性消肿。同时可抬高患肢，促进局部静脉回流，有利于外渗的吸,减少渗出。亦可配合中药外敷.增加肿止痛的效果。5 例 24 小时内恢复正常,2 例 48 小时恢复正常，**结果**:效果明显。讨论；通过积极有效的预防可减少外渗现象，50%硫酸镁湿敷，应用于造影剂外渗是一种安全、有效、廉价、方便的治疗疗方法.

EPO-2148
造影剂外渗处理流程在 CT 增强检查中的应用研究

任晓静,邵慧
中国人民解放军总医院第一医学中心

［目的］ 探讨造影剂外渗处理流程在 CT 增强检查中的应用。 **［方法］** 成立造影剂外渗处理小组，并制定处理流程，制定造影剂外渗告知单，对全科护士进行培训考核。对实施流程之后每月患者对高压注射的满意度、病区护士对高压注射的心理压力及满意度、护士对外渗处理流程的认同度及依从性进行比较分析。**［结果］**实施流程后所调查项目逐步提高。**［结论］**造影剂外渗处理流程可以有效减轻本科室护士对高压注射的心理压力，增强安全感，减轻护士长的管理压力。

EPO-2149
影像学增强注射中诱发无菌性炎症的原因与护理方法

雷嘉敏
武汉大学中南医院

目的 探讨与分析影像检查中增强造影剂静脉注射诱发的无菌性炎症的原因及护理方法。
方法 选取我院自 2017 年 4 月-2018 年 4 月门诊及住院需行静脉留置针注射给造影剂的 200 例患者，采取随机数字表分为常规护理组与专项护理组，观察与对比两种不同护理方法下诱发无菌性炎症的发生率以及两种不同护理方法下患者满意度情况。 结果 常规护理组炎症发生率 33.0%，专项护理组为 12.0%，专项护理组较常规护理组相比无菌性炎症发生率明显降低（P<0.05）。常规护理组满意度为 67%,专项护理组满意度为 98%，常规护理组较专项护理组相比满意度明显提升（P<0.05). 结论 在常规护理基础上加强专项护理，不仅可进一步提升护理质量，减少增强造影剂静脉注射的无菌性炎症，同时可提高患者以及家属的满意度，值得推广。

品管圈活动对降低非离子碘对比剂外渗率的应用研究

杜晓琳,庄丽娜
大连医科大学附属第一医院

目的：分析品管圈活动对降低放射科对比剂外渗发生率的效果。**方法：**纳入研究对象来自本院自 2018 年 6 月至 2018 年 12 月放射科行增强 CT 检查的 4234 例，比较品管圈活动改善前后对比剂外渗的发生率。**结果：**品管圈活动后，非离子碘对比剂外渗发生率由 0.98%降低到 0.38%（ $P<0.05$）。改善后对比剂外渗发生率显著低于活动前，低于目标值 0.51%。**结论：**品管圈活动可有效降低放射科非离子碘对比剂外渗的发生率，为疾病诊断提供及时有效的检查结果，减轻了患者的痛苦，提高患者满意度，提升了团队凝聚力，值得借鉴。

EPO-2152
研究聚乙烯醇载药微球相对碘油治疗原发性肝癌的护理要点

张翱
江西省肿瘤医院

摘要：目的 本研究旨在研究聚乙烯醇载药微球栓塞治疗术的护理要点，观察、对比与传统碘油栓塞术后并发症、住院时长等，延长中晚期肝癌患者的生存时间以提高其生活质量。**方法** 收集 2017 年 1 月至 2019 年 3 月在我院介入科行介入栓塞治疗的 42 例肝癌患者纳入研究对象，随机分为观察组和对照组，对照组 21 例患者用传统碘油栓塞，观察组 21 例患者用国产载药微球栓塞。**结果** 本研究显示研究组不良反应发生率明显低于对照组，研究组患者肿瘤缓解率、控制率等明显高于对照组，且研究组护理满意度明显优于对照组，表明 DEB-TACE 治疗模式可有效控制患者肿瘤进展，降低患者不良反应发生率，升护理服务质量，改善患者满意度等。**结论** 聚乙烯醇载药微球治疗原发性肝癌的疗效显著，可有效减少患者行介入治疗次数，减少术后不良反应的发生，提高患者生存质量，缓解患者痛苦，提高患者满意度，值得临床推广使用。

人体面相评估图在护生行增强 CT 检查中碘对比剂 风险评估中的应用探讨

邝晓,王秀英
重庆医科大学附属第二医院

（重庆医科大学附属第二医院放射科　400010）
［**摘要**］**目的** 探讨人体面相评估图在护生行增强 CT 检查中碘对比剂风险评估中的应用效果。**方法** 选取 2016 年 7 月—2018 年 9 月进入我院放射科科实习的 100 名护生作为研究对象，其中 2016 年 7 月—2017 年 5 月实习的 45 名护生作为对照组，2017 年 7 月—2018 年 9 月实习的 55 名护生作为观察组。对照组采用传统的单纯知识点理论授课教学模式，观察组采用人体面相评估图从人体头-颈-躯干-下肢由上到下逐一完成每个知识点及风险点进行评估。2 周 CT 岗位实习结束，对所有护生的碘对比剂风险理论知识掌握情况以及碘对比剂风险评估实践能力进行考核，收集碘对比剂风险禁忌症的漏评率、学习兴趣、沟通能力、自信心等。**结果** 观察组护生碘对比剂风险理论知识及碘对比剂风险评估实践能力考核优良率分别为 81.8%和 87.3%，均高于对照组 60%和 60%，差异有统计学意义(P<0.05)。观察组护生碘对比剂风险禁忌症漏评率为 0，低于对照组 33.3%。同时，实践能力考核也体现观察组以人体面相图的立体形象直观完成知识点的讲授调动护生学习枯燥知识点的兴趣、培养学生沟通能力、提高临床护理操作能力、提升工作自信心及自我价值彰显。**结论**人体面相评估图在护生行增强 CT 检查中碘对比剂风险评估中的应用，能调动护生学习枯燥知识点的兴趣，提高护生学习的主动性及积极性，有效掌握碘对比剂风险理论知识点和提高碘对比剂风险评估实践能力。

思维导图对初次行 CT 增强扫描患者检查效果的影响

李华玲
华中科技大学同济医学院附属同济医院

摘要：目的　探讨思维导图对初次行 CT 增强扫描患者检查效果的影响。方法　将我院 2018 年 12 月收治的 120 例初次行 CT 增强扫描的患者采用 execl2010 软件产生的随机函数分为观察组和对照组，各 60 例。对照组采用常规护理，观察组在对照组的基础上采用思维导图进行健康教育。比较

两组的生命体征变化、不良反应、依从性以及图像检查质量。结果　观察组干预后的心率、收缩压、舒张压均低于对照组，差异有统计学意义（$P<0.05$）。观察组 CT 扫描不良症状少于对照组，检查依从性高于对照组，差异有统计学意义（$P<0.05$）。观察组的 CT 增强扫描的图像质量好于对照组，差异有统计学意义（$P<0.05$）。结论　思维导图能够减少初次行 CT 增强扫描患者不良反应，促进检查的顺利进行，提高图像检查的质量。

碘造影剂过敏反应的观察预防及护理对策

张媛
合肥平安健康检测中心

探讨离子型和非离子型碘造影剂过敏反应的预防措施和处理原则。结合国内外有关造影剂相关文献，建议使用造影剂原液进行过敏试验。

轻度反应：临床表现全身热感及发痒，面部潮红，结膜充血，头痛头晕，打喷嚏，咳嗽，恶心，轻度呕吐，少数皮疹等。此类反应临床上多见。

中度反应：临床表现约占总反应的 10%。除轻度反应症状外，患者出现心慌，气急，呼吸加速，肢体发抖，全身荨麻疹等。此时若采取对症处理，反应多能减轻至逐渐消失。

重度反应:临床表现患者出现面色苍白，四肢青紫，手足厥冷，心率加快，呼吸困难，血压下降等一系列休克症状，如不及时抢救，将危及生命。

EPO-2157

颈外静脉穿刺在老年患者 CT 增强检查中的护理干预

曲利媛,沈素苗,李素兰
郑州大学第一附属医院

摘要：静脉穿刺在 CT 增强检查中是重要环节之一，对于上肢血管质量差，穿刺困难患者，对其进行颈外静脉穿刺以保证检查顺利完成尤为重要。**目的**：在颈外静脉穿刺过程中实施护理干预，减轻患者痛苦，并对护理效果进行讨论。**方法**：纳入标准：对 2019 年 1 月——2019 年 7 月 35 例实行颈外静脉穿刺患者，年龄 60 岁-85 岁，上肢静脉条件差患者，无特殊药物过敏史，无严重心功能障碍史患者纳入实验对象，随机对照组为可进行上肢静脉穿刺，其余纳入条件与实验组相同，按照护理常规进行操作。在检查前对实验组对象进行解释说明，避免其精神过度紧张，说明此处置针的各种益处， 现身说教，并请穿刺置管的病人消除其顾虑，做好配合。在检查过程中指导患者颈部注射部位拉直，避免静脉弯曲，检查结束后常规封管，根据患者意愿可带回病房继续使用。两组患者根据图像质量，患者满意舒适度，外渗率等因素综合进行评分统计。**结论**：对于上肢血管条件差老年患者通过颈外静脉穿刺及相关护理干预可提高图像质量，提高患者满意度。

结果讨论：1 老年人四肢活动度受限，穿刺肘正中时双手上举且伸直动作完成有难度，配合有困难，经颈外静脉穿刺后上肢可弯曲抱头即可;

2：图像质量与注射给药速度有关，颈外静脉粗直作为颈部的最大浅静脉，颈外静脉的管径较粗，是最佳的穿刺部位，可进行高速度注射，保证更高图像质量。据测量，其上段测定平均直径可达(o．61±0．21)cm，在穿刺时，可直接通过直视穿刺，其操作不仅便捷，同时对患者造成的痛感也较低。3：在穿刺前征求患者意见，讲解其优点，一定消除患者紧张顾虑情绪:。4：但由于颈外静脉穿刺时不扎止血带，初次接触部分护理人员经验不足，需科室统一培训操作，穿刺部位方法及穿刺手法需要练习，才能保证其穿刺成功率，前期对护理人员技术要求较高但经培训合格后操作相对容易，穿刺成功率也较上肢高。

EPO-2158
屏气训练与心理疏导在提高冠脉 CTA 检查质量中的临床应用

王伟
广东省第二人民医院

目的 探讨屏气训练与心理疏导在提高冠脉 CTA 检查质量中的应用效果。**方法** 回顾性分析经飞利浦 256 层螺旋 CT 扫描的 630 例冠脉 CTA 检查且未使用降心率药物患者，随机分为 ABC 三组(A 组及 B 组均为对照组，C 组为观察组)。分别对 A 组及 B 组患者实施屏气训练指导及心理疏导，对 C 组患者同时实施及屏气训练和心理疏导。在实施护理干预的同时监测患者心律及心率，并保证所有患者心律齐且处于心率≤80 次/分状态时接受检查。分别比较干预实施前后三组患者的平均心率下降幅度以及完成 CTA 检查的优质片所占比例。**结果** 观察组(C 组)患者平均心率下降幅度高于对照组(A 组及 B 组)患者($P<0.05$)，CTA 扫描优质片比例明显高于对照组患者($P<0.01$)，差异有统计学意义。**结论** 冠脉 CTA 扫描前对患者进行屏气训练及心理疏导能明显降低患者心率，从而有效提高检查成功率。

呼吸训练联合心理疏导对肺部磁共振增强成像影响的研究

江懿
陆军军医大学附属新桥医院放射科

目的 探讨呼吸训练联合心理疏导对肺部磁共振(magnetic resonance imaging，MRI) 增强成像的影响。方法 收集 2016 年 9 月到 2018 年 9 月接受肺部磁共振增强扫描的 65 例患者选为研究对象，随机分为 2 组，其中观察组 33 例，对照组 32 例。对照组行常规护理；观察组在对照组基础上于扫描前 30 分钟对受检患者进行呼吸训练及心理疏导。比较两组磁共振成像质量与合格率。结果 两组患者成功完成检查，观察组磁共振成像质量与合格率均优于对照组。结论 肺部磁共振增强成像检查前对患者进行呼吸训练联合心理疏导的方法，能降低患者的紧张与焦虑，提升磁共振检查的有效配合，减少患者自主性运动图像伪影，提升扫描质量与一次检查成功性，保障影像诊断安全，提升满意度。

探讨急诊脑卒中患者增强 CT 检查的急诊急救护理

郑莉,霍然,先蓉,何其舟
西南医科大学附属中医医院

摘要：目的探讨急诊脑卒中患者增强 CT 检查中急诊急救护理观察方法。方法：选择我院 2019 年 05 月-06 月进行的 114 例行急诊脑卒中增强 CT 检查的急危重症患者的临床资料，予以全程运用优质护理模式及有效急诊急救护理，包括严密观察患者生命体征及病情变化、建立多条静脉通道，备好抢救药品及器材。结果：所有患者均顺利安全的完成急诊脑卒中增强 CT 检查，且图像清晰,效果良好,检查完毕后在医务人员陪同下安全转运至相关科室接受进一步治疗。结论：优质护理模式及有效急诊急救护理是急诊脑卒中患者迅速安全地完成增强 CT 检查的有力保障，也是 CT 室护理工作的一项重要的内容，最后有效的检查结果能为患者得到良好治疗赢得时间。

EPO-2169
“一病一品”在提高深静脉血栓患者护理质量管理中的应用

于洁
南通大学附属医院

【摘要】 目的：探讨一病一品模式在深静脉血栓患者护理质量管理中的应用效果。 **方法**：（1）成立一病一品项目小组，明确各自职责。一病一品护理小组由护士长、护理组长和责任护士组成，建立科室一病一品项目小组交流群，上传学习资料、探讨学习问题、解决学习困难，分享经验和方法，构建一病一品项目内容的基本框架，制定具体的项目实施方案：确定深静脉血栓疾病作为项目主题，项目负责人对科室成员进行培训，包括：循证护理相关知识即询证护理定义和发展、证据的级别等，文献检索的知识、统计学方法的应用、系统培训与深静脉血栓疾病相关的理论知识及专科操作，并进行科室考核，（2）全程规范化护理，包括入院时、住院期间、出院时、出院随访和延申护理，护士长全程对一病一品工作小组进行指导，及时发现问题并指导，一病一品小组共同制定深静脉血栓疾病健康教育处方及各种导管标识，宣教内容体现专病化、个性化和递进化，护理健康教育单及时发放病人，以便患者学习，并利用医院官微及官网进行深静脉血栓知识的科普，在世界血栓日来临前夕开展了深静脉血栓的义诊活动，（3）制定标准化的护理内容 如制定了专科护理品牌溶栓导管 4E 计划，确保溶栓在位通畅、确保尿激酶泵入剂量百分百准确、确保溶栓导管百分百固定、确保对患者溶栓导管百分百指导到位，从而最终确保患者携管作战、畅通无阻。**结果**： 制定了数个图文并茂的护理流程，包括肢体的测量、溶栓导管的护理流程等，形成了下肢深静脉血栓专科护理框架和标准化护理方案，取代了以往的疾病护理常规。 **结论**：基于循证护理的“一病一品”项目管理模 式深化了护理专业内涵建设，让患者获得专业化、同质化的护理服务，进而塑造专科护理的品牌效应，体现了护士的专业价值。

EPO-2170
伤口一抹得用于钆对比剂外渗的临床疗效观察

邵慧,任晓静
中国人民解放军总医院第一医学中心

目的：观察伤口一抹得用于钆对比剂外渗的临床疗效。**方法**：选择某医院放射诊断科行核磁共振增强检查高压团注过程中，出现钆对比剂外渗的病人 38 例,随机分为观察组和对照组,每组 19 例。对照组给予 50%硫酸镁湿敷肿胀部位,观察组给予伤口一抹得涂擦肿胀部位,对两组病人的干预效果进行比较。**结果**：干预后 24h-72h 观察组外渗部肿胀消退程度、疼痛评分、换药次数与对照组比较，差异有统计学意义(P<0.05)。**结论**：涂擦伤口一抹得可有效缩短钆对比剂外渗肿胀时间,减轻疼痛,减少换药次数，疗效显著。

EPO-2171
增强 CT 结合结肠仿真内镜对结直肠癌的检查方法及护理

张旋,唐文娟
华中科技大学同济医学院附属协和医院

【摘要】目的：探讨增强 CT 结合仿真内镜后处理对结直肠癌的检查方法及护理。方法：回顾性分析 45 例结直肠癌患者，患者均行肠道准备及肠腔内注气后用 Definition AS+ 128 层螺旋 CT 增强扫描结合仿真内镜后处理检查，评价结直肠癌患者的临床价值。结果：45 例患者在 CT 仿真内镜检查中 40 例考虑为肿瘤性病变、3 例为正常、2 例为息肉。经手术病检结、直肠癌 42 例，炎症 3 例；结直肠癌分型为 15 例肿块型、9 例浸润型、5 例溃疡型、8 例混合型。结论：增强 CT 结合仿真内镜后处理对结直肠肿瘤的检出、定性及定位与手术病检比较准确率很高。增强 CT 结合后处理

对观察病灶周围的侵犯情况及有无远处器官和淋巴结转移的情况有很大的优势，同时还可以了解肠腔内病变的形态及病变累及肠腔的长度。

EPO-2172
基于利益诉求结果的肝癌化疗栓塞治疗患者护理诉求剖析

占媛,葛艳,陈冬萍
华中科技大学同济医学院附属协和医院放射科

目的 对肝癌化疗栓塞治疗患者的利益诉求进行调查分析，从中剖析出护理相关诉求，以期为其提供更优质的护理服务。**方法** 对某三甲医院肝癌化疗栓塞治疗患者展开问卷调查，依据其调查数据，使用因子分析及配对 T 检验进行归纳分析。**结果** 2017 年 9 月至 2018 年 4 月接受肝癌化疗栓塞治疗的 232 名患者，其利益诉求按照从强到弱顺序依次可归纳为 7 个因子：治疗效果诉求、医疗技术服务诉求、合理费用诉求、健康教育诉求、尊重患者及其权利诉求、辅助服务诉求及消费信息公示诉求,其均值分别为 4.20、4.10、3.56、3.51、3.48、3.01、2.84。**结论** 肝癌化疗栓塞治疗患者的利益诉求水平较高，为满足患者的相应措施，护士可采取的干预措施有：基于患者视觉满足患者的治疗效果诉求；努力提高护士专业技术服务水平；尽量降低患者不可报销费用并改善住院费用公示方式；加强健康教育；尊重患者及权益；改善住院环境等。

EPO-2173
围手术期强化护理在介入封堵术治疗小儿先天性心脏病的应用效果

牛广颖,赵鑫
郑州大学第三附属医院

目的：探讨围手术期强化护理在介入封堵术治疗小儿先天性心脏病的应用效果。**方法：**将 78 例小儿先天性心脏病患者随机分为 2 组，对照组 39 例患儿，行常规围手术期护理干预，观察组 39 例患儿，行围手术期强化护理干预，比较两组住院时间及术后并发症发生情况，同时自制依从性量表，比较两组患儿术后依从度。**结果**：观察组住院时间短于对照组（$P<0.05$）；观察组治疗依从度高于对照组（$P<0.05$）；两组术后并发症发生率比较差异无统计学意义（$P>0.05$）。**结论：**在小儿先天性心脏病介入封堵术期间开展围手术期强化护理干预能提高患儿治疗依从性，缩短患儿住院时间，且并发症发生率少，值得推荐。

EPO-2174
对比剂不良反应及观察与抢救流程的分析与探讨

付玲
北京大学人民医院

目的 探讨 CT 增强检查对比剂注射过程中不良反应发生情况及观察与抢救流程

方法 回顾性分析，采用单纯随机抽样方法，抽取 2018 年 1 月-12 月于我科行 CT 检查应用非离子型碘对比剂病例 11876 例，评估患者一般资料、用药类型与名称、不良反应发生时间与症状表现，观察、处理及抢救措施。

结果： 结果显示不良反应发生率为 7.9%。 其中急性 93.4%，其中 急性不良反应发生率 89.1%；迟发性不良反应发生率为 9.1%。轻中度 96.4%，重度 3.6%。不良反应临床表现及发生频率分别为皮肤、消化道、中枢神经系 统、呼吸系统、循环系统症状。经过护理观察处理及抢救后患者均转危为安，无死亡病例。

结论： 含碘对比剂所致不良反应以急性、轻中度为主，但重度不良反应发生迅速，甚至危及生命，及时有效的观察及抢救流程至关重要

EPO-2175
心理干预在恶性骨肿瘤患儿 CT 增强检查中的意义与价值

付玲
北京大学人民医院

目的：探讨心理干预对恶性骨肿瘤患儿 CT 增强检查流程及影响因素的作用。**方法**：将 152 名恶性骨肿瘤患儿随机分为干预组及对照组，采用一般资料问卷调查表、儿童抑郁评价量表（CDI）、Spence 儿童焦虑量表（SCAS）及家庭功能评定量表（FAD），对患儿及陪检家属进行问卷调查，以评价心理干预在恶性骨肿瘤患儿 CT 增强扫描中的作用。**结果**：干预组和对照组患者一般资料、检查部位、疾病诊断及 ECOG 评分、检查前抑郁、焦虑、家庭功能评分等统计结果显示，差异无统计学意义（$P>0.05$），干预组干预后儿童抑郁评价量表（CDI）、儿童焦虑量表（SCAS）、家庭功能评定量表（FAD）评分均显著降低，差异有统计学意义($P=0.007$，$P=0.015$，$P=0.014$),图像质量明显优于对照组（$P=0.002$）,不良反应发生率明显少于对照组($P=0.042$）。一次检查成功率干预组（95%）高于对照组（85%）。二元回归分析显示：低龄、化疗、无家属陪同检查是 CT 增强扫描图像质量的独立危险因素（$P<0.05$）。低龄、化疗、陪护者文化程度低、无家属陪同是对比剂注射不良反应发生率的独立危险因素($P<0.05$）。**结论**：恶性骨肿瘤患儿行 CT 增强扫描检查中，采用心理干预能缓解患儿抑郁、焦虑症状，增进家庭支持功能，提高一次性检查成功率，保证图像质量。

EPO-2176
CT 辐射剂量评估方法应用体会

徐盛威
重庆医科大学附属儿童医院

目的：CT 检查关于辐射剂量的评估是通过设备上的剂量统计表得出，常用 DLP 或 $CTDI_{vol}$ 来表示，但在涉及公众接受的辐射剂量和防护等情况时采用的又是 mSv 或 mGy 为单位，对比困难。本文旨在找寻 CT 辐射剂量评估的简易实用方法。

方法：参阅欧洲 CT 质量标准指南、美国 AAPM 第 96 份报告和中国 X 射线 CT 成年人诊断参考水平等文献。

结果：CT 辐射剂量的评估方法包含 CTDI（CT 剂量指数）、$CTDI_{FDA}$、$CTDI_{100}$、加权 $CTDI_{w}$、容积 $CTDI_{vol}$、DLP（剂量长度乘积）等，其中 $CTDI_{vol}$ 和 DLP 被更多使用。目前欧洲和美国在报告中都提到“有效剂量 E”概念，其融入潜在的生物效应，反映不同部位组织等对辐射剂量的不同敏感性，以 Sv 或 mSv 为单位。英国和德国的放射防护委员会都有相应的软件包供有效辐射剂量的计算，除此之外，通过引入转换因子 k 结合 DLP 的方式可以快速估算有效剂量，且该方法被欧洲 CT 扫描质量标准指南工作组推荐。K 的单位为 $mSv \cdot mGy^{-1} \cdot cm^{-1}$，DLP 的单位为 mGy·cm，CT 扫描后记录设备

上显示的 DLP 值，查表获得不同年龄段患者头、颈、胸、腹、盆腔的 k 值，通过 E (mSv)≈k • DLP，即可快速估算出有效辐射剂量。
结论：（1）通过 k 的应用，借助 E (mSv)≈k • DLP 可快速估算出以 mSv 为单位的有效剂量，方便放射技师与患者交流，尤其是被患者问及扫描辐射剂量或 CT 检查伤害程度时。（2）与普通非 CT 的 X 线检查项目或公众日常生活接触的辐射剂量具有了可比性。（3）欧洲和美国的报告中关于 k 值有所差异，如成人头、颈、胸的欧洲版本报告中为 0.0023、0.0054、0.017；而美国版本报告中为 0.0021、0.0059、0.014。但不影响估算使用。（4）有效剂量的估算可以辅助一线放射技师优化扫描方案，通过不同方法降低患者有效辐射剂量从而减少公众辐射。

EPO-2177
细节护理干预模式对颅脑增强 MRI 扫描患者扫描前心理状态影响分析

龚庆
陆军军医大学附属新桥医院放射科

摘要：目的：研究探讨细节护理干预模式对颅脑增强 MRI 扫描患者扫描前心理状态影响分析。**方法：**本次研究将 94 例颅脑增强 MRI 扫描患者进行随机分组，分为对照组（47 例，常规护理）和研究组（47 例，细节护理干预）。比较两组患者的心理情绪评分、护理满意度。**结果：**研究组焦虑、抑郁心理评分显著低于对照组，P＜0.05；研究组护理满意度显著高于对照组，P＜0.05。**结论：**细节护理干预模式可有效改善患者负面心理状态，提高护理满意度，具有推广价值。

EPO-2178
循证护理在老年患者 MRI 腹部检查中的应用研究

龚庆
陆军军医大学附属新桥医院放射科

目的：探讨循证护理在老年患者 MRI 腹部检查中的应用效果，为临床治疗提供相应的参考依据。方法：选取 2018 年 1 月-2019 年 1 月在本科室 MRI 腹部检查 65 岁以上的 80 例老年患者。随机分为对照组和观察组，其中对照组患者采取常规的护理模式，而观察组患者在常规护理的基础上采取循证护理干预模式，比较两组患者的心理情绪评分、检查完成时间、检查成功率、护理满意度。结果：通过分析研究，观察组焦虑、抑郁心理评分，检查完成时间显著低于对照组；观察组检查成功率、护理满意度显著高于对照组，两组具有显著性差异（P<0.05），即具有统计学意义。结论：MRI 腹部检查老年患者采取循证护理，可以缓解患者紧张、焦虑情绪，减少检查时间，提高检查成功率及护理满意度，具有较好的应用效果。

EPO-2179
介入手术室护理现状调查与分析

张峥
同济大学附属肺科医院/上海市肺科医院

目的：调查全国介入手术室护理现状，分析其相关影响因素，为介入手术室规范化护理管理提供依据。**方法：**采用介入护理专家设计的调查问卷，问卷通过微信方式发放，对全国 224 所三甲医院 224 名介入手术室的护士长或护理负责人问卷调查，收回有效问卷 224 份，有效回收率 100%。**结果：**介入手术室业务管理模式由护理部负责占 55.36%，即护理部监督管理包括人员选拔和培训；由科室负责占 44.64%，即科室负责管理介入手术室所有工作，但医院管理部门未定期进行检查和指导；大部分介入护士在本科室自行培训，但仍然存在科室内无专业培训；专业讲课和自学占多数，全国介入护理学习班与省市介入专科护士培训未超过自学的频次；介入护理会议与微信平台是获得介入护理知识的主要途径；护理人员放射假管理中显示 56.7%的护理人员未休放射假，未享有放射补贴的占 37.05%。介入手术室在全国三甲医院发展较为迅速，但很多医院还存在护理人力资源严重不足，缺乏稳定性；部分医院介入手术室护理人员理论和操作技能培训缺乏规范性，对介入护士岗位培训、准入制度和放射假管理无统一规范。**结论：**我国介入手术室介入护理人员管理、培训和放射假管理等方面还不够完善，在人力配比不足的情况下，充分发掘介入护理人力资源的潜能，稳定护理队伍。在人员配置难以到位的情况下，可以通过优化工作流程，弹性排班，减少非护理工作时间，实现护士资源最优化配置需要建立统一的人力资源管理、培训及防护管理制度。部分人员未接受过正规培训，培训内容也较局限；大部分介入护士在本科室自行培训，但仍然存在科室内无专业培训；专业讲课和自学占多数，全国介入护理学习班与省市介入专科护士培训未超过自学的频次；介入护理会议与微信平台是获得介入护理知识的主要途径。在工作中，要加强培训力度和范围，培训内容不能单一集中在本科室自行培训甚至科室内无专业培训，应扩大培训途径，将互联网、人工智能等平台利用起来。

“一站式”护理救治模式在介入治疗支气管扩张所致大咯血中的效果分析

张峥
同济大学附属肺科医院/上海市肺科医院

目的 探讨“一站式”护理救治模式在支气管扩张大咯血患者介入治疗中的应用。**方法** 将 2018 年 9 月至 2018 年 12 月收治的 55 例支气管扩张大咯血患者设为研究组，采用“一站式”护理救治模式，组成预检台、急诊室、急诊 CT 室、介入手术室、急诊监护室、介入咯血护士为一体的护理救治团队，以最佳护理资源服务患者。回顾性收集 2017 年 5 月至 2017 年 8 月经传统救治模式收治的 53 例支气管扩张大咯血患者为对照组，比较两组再咯血量、咯血发生率、术后住院时间、并发症及护理满意度。**结果** 研究组再咯血量、再咯血发生率、住院时间低于对照组，差异有统计学意义（ P＜0.05);研究组并发症发生率低于对照组，护理满意度高于对照组，差异有统计学意义（ P＜0.05).**结论** 推广“一站式”护理救治模式是目前可减少再咯血与再咯血量，缩短住院时间，减少并发症，提高护理满意度。

EPO-2181

CT 扫描低剂量影响因素及应用实践

徐盛威
重庆医科大学附属儿童医院

目的：迎合 CT 扫描 ALARA(as low as reasonably achievable，尽可能低剂量)，对影响 CT 扫描低剂量实现的影响因素及调整办法进行汇总分析，以期实现 CT 扫描进一步低剂量。

方法：基于“pubmed”、“中国知网”等数据库，查阅相关涉及 CT 低剂量扫描的文献结合应用实践，总结 CT 扫描低剂量的影响因素和实践策略。

结果：CT 扫描低剂量的影响因素及调整策略如下：
（1）X 线束的过滤，即球馆与受检者之间有软射线吸收材料以硬化射线束；
（2）射线束准直，存在于受检者与探测器之间，多探测器 CT 采用窄的射线束准直时，CTDI 会更高，因此适宜选用宽体探测器或自适动态准直技术；
（3）探测器材质的几何转换效率，即将光子信号转换为电信号的效率；
（4）技术进步，双能 CT，更低剂量，更高时间分辨率；
（5）扫描 z 轴上的范围；
（6）管电压 kVp 和管电流 mA，与剂量正相关，可采用自动管电流和自动管电压调节；
（7）机架旋转时间，最快的旋转时间被用于最小化移动模糊或伪影；
（8）层厚，与扫描部位、病变范围等匹配；
（9）螺距，有文献报道在不超过 1.5 的情况下不会遗漏病变；
（10）被检者配合程度，减少重复检查次数，不配合者建议镇静；
（11）重建算法，迭代重建算法相较于滤波反投影算法而言更有优势；
（12）噪声指数/剂量指数的调节，对于体部的扫描，儿童比成人剂量降低 4-5 个点；
（13）体位设计，对于不标准的体位需更高剂量；
（14）FOV 与矩阵，影响空间分辨率；
（15）被检者体格尺寸、发育程度、体重、年龄、受检部位等，影响其他参数调节。

结论：为实现 CT 扫描低剂量，厂商在设备硬件软件技术提升上发挥着重要作用，在病人配合的情况下，影像技师扫描时根据被检者不同情况调节相应参数（扫描范围、层厚、机架旋转时间、螺距、kVp、mA 等）可以实现 CT 扫描的更低剂量。

EPO-2182
肝癌患者持续性动脉灌注化疗后生活质量的研究与分析

黄玉娟
中山大学附属第一医院

目的 研究持续性肝动脉灌注化疗的肝癌患者生活质量。方法：选取我科肝癌行介入治疗（肝动脉灌注化疗栓塞+导管留置术）患者 28 例，应用肿瘤患者生活质量量表（QOL 量表）进行问卷调查。**结果**：持续床边肝动脉灌注化疗的肝癌患者生活质量处于较好水平。其中 10%生活质量良好，46.42%生活质量较好，生活质量一般患者占 39.29%。 得分最高维度为同事的理解与配合,其次为家庭理解与配合。得分最低为饮食状况，其次为治疗的副作用。生活质量低主要表现在食欲差方面，化疗期间恶心、呕吐患者占比达 64.58%。**结论**：肝癌患者持续性动脉灌注化疗后生活质量处于较好水平，提高患者生活质量，在住院治疗期间的营养干预仍然重要。

EPO-2183
循证护理应用于影像诊断科 CT 检查避免医患纠纷的影响研究

赵玉霞
中国医学科学院肿瘤医院

目的：运用循证护理应用于影像诊断科 CT 检查避免医患纠纷的影响因素。
方法：选取 2017 年 4 月到 5 月期间在我院进行 CT 检查就医的患者 800 例，随机分为研究组和对照组，每组各 400 例。对照组采用传统医患沟通方法实施治疗，研究组采用循证护理干预，比较分析两组患者满意度。
结果：研究组调查问卷平均得分为（89.61±5.95 分），明显高于对照组调查问卷平均得分（72.01±5.35 分）；研究组患者护理满意度为 95.1%，明显高于对照组患者满意度 87.2%，组间比有差异（P＜0.05）。
结论：循证护理能够让医患关系更加和谐，避免医患纠纷，提升影像诊断 CT 的护理满意度，值得推广及应用。

EPO-2184
肾动脉成形术治疗移植肾动脉狭窄的术中护理

肾动脉成形术治疗移植肾动脉狭窄的术中护理
华中科技大学同济医学院附属协和医院

摘要：探讨肾动脉成形术治疗移植肾动脉狭窄的术中护理配合和观察要点。 **方法：**按照随机方法选取 2011 年 2 月-2018 年 12 月期间的 46 例肝癌患者作为本次研究的对象，记录患者术中手术配合器械、各种不良反应及处理方法。**结果：**1 例患者移植肾动脉起始段高度扭曲并狭窄，导丝未能通过狭窄段；1 例患者造影时肾动脉痉挛，停止手术，三个月后再次成功 PTAS。余 44 例患者均成功行 PTAS，术中无严重并发症发生。结论：介入手术中护士必须进行细致的心理护理、熟练掌握各种器械的性能、了解手术过程和并发症和处理才能成功的完成手术。

有效沟通联合心理干预在 CT 增强检查患者中的应用

郑莉,先蓉,霍然,何其舟
西南医科大学附属中医医院

摘要：目的是探讨护理有效沟通联合心理干预在 CT 增强检查患者中，协助患者消除顾虑、减轻不良反应、配合检查的目的。方法：1. CT 增强检查前进行有效沟通联合心理干预的方式，针对不同年龄、不用文化程度、不同心理状况的患者进行沟通交流，设法创造一个舒适的检查环境，有利于消除患者紧张情绪，缓解患者的心理压力。护理人员掌握熟练穿刺技术；2. CT 增强检查中，严格执行检查操作规程，严密观察患者情绪变化及病情变化，协助患者与扫描医生有效配合，有利于患者成功完成检查；3. CT 增强检查完毕后，告知患者相关注意事宜及避免不良反应的发生。结果：通过对我院 2019 年 1 月份 198 例患者进行观察研究，均存在不同程度的焦虑紧张及恐惧心理，不利于 CT 增强检查顺利进行。结论：将护理有效沟通联合心理干预应用于患者 CT 增强检查全过程，有利于消除患者紧张情绪，缓解患者心理压力。患者均能配合扫描医生成功完成 CT 增强检查及有效提高图像质量。值得在临床中推广应用。

新型沙袋在股动脉穿刺处压迫止血的应用研究

陈爱群
南昌大学第一附属医院

【摘要】**目的** 探讨自行设计的新型沙袋在介入手术患者股动脉穿刺处压迫止血的应用效果。**方法** 采用方便抽样法，选取血管外科 136 例经股动脉穿刺行介入手术的患者作为研究对象，按照随机数字表法将患者分为实验组（68）例，对照组（68）例，实验组：介入手术后在股动脉穿刺处用新型沙袋压迫止血 24 小时后下床活动；对照组：介入手术后在股动脉穿刺处用弹力绷带加压包扎 24 小时，同时用普通沙袋压迫止血 6-8 小时，24 小时后下床活动。比较两组患者沙袋压迫的有效性、舒适度，穿刺处出血、皮肤受损等并发症的发生率。**结果** 使用新型沙袋置于股动脉穿刺处压迫止血与传统的使用弹力绷带加压包扎联合普通沙袋压迫止血相对比，压迫止血的有效性、舒适度高于对照组，穿刺处出血、皮肤受损等并发症低于对照组，差异有统计学意义（P<0.001）。**结论** 新型沙袋制作简单，能明显提高压迫止血的有效性，减少出血、皮肤受损等并发症，改善患者的舒适度。

影像专科护士核心能力评价指标的构建研究

兰芳,李雪
陆军特色医学中心（大坪医院）

目的：近年来，护理专科化发展已成为临床护理实践发展的方向，护士核心能力的培养已成为全球化的趋势。然而对于影像专科护士核心能力评价指标体系的构建尚缺乏相关研究，鉴于影像护理的发展，本文通过构建影像专科护士核心能力评价指标体系，为影像专科护士核心能力测评、培训提供客观、可量化的参考依据。
方法：第一步成立研究小组，共 6 人。主要负责编制专家函询表，选定函询专家，对函询结果进行统计分析及整理等。第二步构建指标体系框架：根据核心能力理论，采用文献检索法、专家访谈法结合影像护士能力的需求，构建影像专科护士核心能力指标体系框架，一级、二级指标涵盖了护士核心能力的共性指标，三级指标通过细化则突显出影像专科护理的个性指标。第三步进行专家函询：确定咨询专家，将构建的问卷运用德尔菲法对全国 20 名护理专家进行 2 轮函询。第四步对数据进行统计分析，运用 SPSS19.0 计算出指标的均数、标准差、满分比，以此分析专家意见的集中程度；用变异系数（CV）与协调系数对专家意见的协调程度进行分析；最后采用层次分析法统计出各指标的权重。
结果：专家积极性：2 轮专家咨询问卷的有效回收率均为 100%，总共 12 名专家提出个人建议；专家权威程度分析：判断依据系数（Ca）为 0.832，熟悉程度系数（Cs）为 0.852，专家的权威系数（Cr）为 0.836；专家意见协调程度：2 轮专家咨询 CV 均＜0.25；专家意见及修改情况最终形成了影像专科护士核心能力评价指标体系，包括 5 个一级指标、18 个二级指标和 80 个三级指标，三级指标中例如健康教育能力、影像相关知识能力、各项检查护理配合能力和检查风险评估能力等则重点突显出影像专科护士的个性指标。
结论：本研究通过德尔菲法对影像专科护士核心能力评价指标体系进行了初步的研究，各级指标条目专家意见集中，具有较高的科学性和可靠性，为影像专科护士核心能力培训提供参考。

EPO-2192
急危重症患者 CT 检查分级评估标准的构建

刘俊伶,李雪
陆军特色医学中心（大坪医院）

目的：国内外有急诊分诊依据、标准和指南，但尚无急危重患者 CT 检查分级标准，影像科护士主要沿用经验分检安排检查，尚未形成统一的分级分检标准，可能会导致延误检查与诊断，存在安全隐患。因此构建一个简便、科学、可量化的急危重症 CT 检查分级标准，使护士在评估时有章可循、有据可依，确保检查有序和患者安全。
方法： 1.成立研究小组，共 8 人。2.研究方法：采用文献分析、理论研究、质性访谈法及德尔菲专家咨询法。3.拟定函询表：调查问卷涵盖急危重患者 CT 检查分级标准分三级,一级 5 个条目包括：“级别”、“病种”、“潜在危险情况”、“分级颜色”、“响应时间”；二级 32 个条目：如“一级为急危患者”，“疑主动脉夹层评为一级”,“一级为红色”、“ 一级为 5 分钟以内”等；三级 18 个条目：如：“收缩压<80 或>200mmHg,评为一级”、“突发意识丧失，评分为 P 或 U 评为一级”等。4.函询实施:选取 20 名医疗、护理专家，采用电子邮件形式进行两轮专家咨询。专家按 Likert5 级评分法对各级指标的重要程度和权重进行评分、赋值；对不合理的描述内容进行修改。4.资料收集统计:采用 SPSS18.0 统计软件进行数据统计。对同时满足重要性赋值均数>4.0、变

异系数<0.25 的条目予以保留，根据数据统计结果以及专家意见,对部分条目进行删除、合并、修改。
结果：两轮问卷的回收率均为 100%。专家熟悉系数为 0.790，判断系数为 0.975，专家权威系数分别为 0.768、0.873。两轮咨询后，共删除二级指标条目 2 项，三级指标条目 9 项，其中修改一级指标条目 1 项、三级指标条目 2 项。各级指标的变异系数为 0～0.23，协调系数 W 为 0.376。最终形成急危重症患者 CT 检查的分级评估标准，包括一级指标 5 项、二级指标 30 项、三级指标 9 项。
结论：急危重症患者 CT 检查分级评估标准具有一定的科学性和可靠性，有待进一步的临床实践进行验证。

EPO-2193
循证护理在品管圈降低增强 CT 对比剂外渗率的应用

张晓华,李宗银
甘肃省肿瘤医院

目的：探讨循证护理在品管圈降低增强 CT 对比剂外渗率应用效果。方法：应用品管圈管理方法，对 2017 年 1-6 月发生对比剂外渗 37 例，对外渗原因进行去伪存真找出真因 5 条，针对外渗真因检索文献寻找出相关证据 13 条，经过护理实践验证，最终确定有效证据 6 条，作为降低对比剂外渗的措施。结果：应用循证护理和品管圈活动后，对比剂外渗由干预前 1.48%降低至干预后 0.52%。结论：循证护理为品管圈活动中干预对策的制定提供了科学依据，循证护理和品管圈结合，可以降低增强 CT 对比剂外渗，保证患者安全。

EPO-2194
优质护理服务在老年患者腹部 CT 增强扫描中的作用

曹靖惠
吉林大学第三医院(中日联谊医院）

目的：探讨优质护理服务对老年患者腹部 CT 增强扫描的图像质量的影响。
方法：针对 2019 年 1 月至 6 月行腹部 CT 增强 检查 60 岁-80 岁老年患者 126 例，实施优质护理服务个性化跟踪监控，同时对 2017 年 6 月至 12 月行腹部 CT 增强 检查 60 岁-80 岁老年患者 117 例行回顾性分析，对两组检查成功率和图像质量进行对比。优质护理服务细节：实施全流程跟踪，监控检查前胃肠道准备情况、检查中呼吸配合和心理疏导、对比剂使用后不良反应观察。
结果：通过对比，实施优质护理服务的老年患者，所得的图像质量和检查成功率，远比未实施优质护理服务的老年患者高。可见，针对老年患者的个性化护理干预尤为重要。
结论：CT 增强扫描对腹部疾病的诊断是一种不可缺少的检查方法，而老年患者的配合度又是干扰 CT 增强扫描效果的重要因素。通过对上百例老年患者腹部 CT 增强扫描时实施优质护理服务的分析，良好的护理服务是检查成功的重要保证。

EPO-2195
针对门诊 CT 增强患者的水化效果现状调查及管理探讨

曹靖惠
吉林大学中日联谊医院

目的：围绕如何最大程度保证门诊 CT 增强患者水化效果，展开分析与探讨，期待能够通过更多的循证依据探索更为标准、可行性高的实施办法。
方法：选取本院门诊 CT 增强患者 204 例，其中 2018 年 6 月至 9 月的 102 例作为观察组,2019 年 3 月至 6 月的 102 例作为对照组，前者针对水化给予常规宣教，后者由护士跟踪给予个性化干预，瞩增强前半小时饮水 500ml、增强后半小时饮水 500ml，之后 24 小时内大量饮水。病例有纳入及排除标准，患者基本资料等无统计学差异。两组均通过尿液颜色和不良反应发生率判断水化效果。
结果：观察组轻中度不良反应发生率明显高于对照组，观察组尿液颜色绝大部分深于对照组。
结论：有关 CT 增强检查应用碘对比剂引起不同程度的不良反应，已经引起临床医生及放射科医技护的关注和重视。如何预防和降低对比剂不良反应的发生，更是个值得重视和必须妥善处理的迫切问题。临床数据及文献显示，对比剂不良反应中轻中度占大多数，给予充分水化可以在一定程度上减少轻中度不良反应的发生。而针对门诊患者，对于水化方法和效果的实施与监控均有困难。针对门诊患者实施个性化水化干预、跟踪管理和观察，能够很好地保证水化效果，此方法易于实施、操控性较强，便于推广。

EPO-2196
优质护理在减少 CT 增强扫描对比剂不良反应发生中的应用价值

郑叔宏
广州医科大学附属第一医院

目的：研讨 CT 增强扫描患者在接受优质护理指导后对减少对比剂不良反应发生的作用。**方法**：选择 2018 年 11 月至 2019 年 3 月在我院行 CT 增强扫描的 200 例患者作为研究对象，并按检查先后顺序划入两组，A 组（n=100）接受常规护理指导，B 组（n=100）开展优质护理服务，对 A、B 组对比剂不良反应的发生情况及护理满意度做统计和评估。**结果**：B 组护理期间有 6.0%的患者出现对比剂不良反应，较 A 组的对比剂不良反应率 22.0%显著降低，P＜0.05，有统计学意义。问卷调查显示，B 组有 96.0%的患者对护理服务满意，较 A 组的护理满意度 82.0%提升更加明显，P＜0.05，有统计学意义。**结论**：在行 CT 增强扫描的患者中开展优质护理服务指导，能够有效降低对比剂不良反应的发生率，并可提升患者对护理服务工作的认可度，值得在工作中推广使用。

EPO-2197
探讨放射防护铅衣的消毒方法与效果

吴爱英,姚学会
北医三院

目的：探究应用 HaloFogger™ Hands-Free Dry-Mist Dispensing Device 过氧化氢干雾消毒机），配合使用 Sanosil S010 通用消毒&灭菌剂，用干雾发生方法，在放射防护铅衣的消毒作用和效果。
方法：选择在 CT 扫描间内正常使用的两套铅衣，分为对照组和实验组，保证两套铅衣为同等使用频率。在两组铅衣使用 24 小时后，采取擦拭法分别于两组铅衣正反面的多点位置各自采样。（以 4cm×5cm 灭菌板置于铅衣正反面取样，取样点的位置分别为铅衣正反面的中心点以及左上、左下、右上右下四个角，取样面积各为 20㎠,共 200㎠。）；之后，对照组铅衣进行紫外线灯照射消毒，时间为 60min，实验组铅衣采用过氧化氢干雾消毒，时间为 30min。消毒完毕，再次采取

擦拭法分别于铅衣的正反面各自采样，采样位置与消毒前的位置一致，采样后进行实验室细菌菌落计数，并对俩组计数结果进行比较。
结果； 使用 24 小时后的铅衣，消毒前平均菌落数：对照组 230 CFU/㎡、实验组 400CFU/㎡；消毒后，实验组平均菌落数为 1 CFU/㎡，最多 12 CFU/㎡，最少 1 CFU/㎡，对照组平均菌落数为 2 CFU/㎡，最多 5CFU/㎡，最少 1CFU/㎡，对比观察有统计学意义（p＜0.05）
结论： 采用过氧化氢干雾消毒法对放射防护铅衣进行消毒，杀菌率强，不留死角，适用于铅衣表面消毒，消毒及作用达卫生学检测标准。杀菌达标率、消毒所需时间、便捷程度优于紫外线灯照射消毒。

EPO-2198

局部手法减压联合喜辽妥软膏外敷治疗增强 CT 检查中碘对比剂外渗的效果观察

杨云鸿,初曙光,王轶彬,宗根林
上海市东方医院（同济大学附属东方医院）

目的 探讨局部手法减压联合喜辽妥软膏外敷治疗增强 CT 检查中碘对比剂外渗的临床效果。
方法 选取我院影像科接受增强 CT 检查发生碘对比剂外渗的患者 40 例作为研究对象，随机分为观察组和对照组各 20 例。观察组在发生碘对比剂外渗后立即拔除留置针，用安尔碘消毒外渗部位,并按照无菌操作挤压针眼周围, 尽可能排出渗出液后，再予以安尔碘消毒，喜辽妥软膏外敷并以无菌纱布包扎，24 h 后更换纱布；对照组在发生碘对比剂外渗后采用常规的 24 h 内用 4-7℃ 50%硫酸镁浸湿 2 层纱布后覆盖外渗部位保湿冷敷，24 h 后改用温度为 40～50℃ 50%硫酸镁纱布继续保湿热敷，2-4h 更换 1 次，保持纱布湿润，直到肿胀消除。对 2 组的治疗效果进行评价，以显效率作为指标来评价 2 组患者治疗效果。
结果 观察组显效率明显高于对照组，碘对比剂外渗后总体疗效优于对照组，差异均具有统计学意义（Ｐ＜０．０５）
结论 增强 CT 检查中碘对比剂外渗局部手法减压联合喜辽妥软膏外敷具有较好的临床疗效，可有效缩短外渗部位肿胀消退时间，减轻患者疼痛，效果立竿见影，避免外渗局部组织溃疡及坏死,有效避免并发症的发生，值得临床推广应用。

EPO-2199

探讨在 CT 增强检查中降低对比剂外渗的有效护理预防措施

吴金霞,姚 学会
北京大学第三医院

目的：探讨在 CT 增强检查中降低对比剂外渗的有效护理预防措施。方法：对 2017 年 1 月至 12 月期间 28 例对比剂外渗的案例进行分析评价，总结分析发生对比剂外渗原因，探讨有效护理预防措施，并实施于 2018 年 1 月至 2018 年 12 月所有 CT 增强检查患者。结果：2017 年 1 月至 12 月 24869 例 CT 增强检查患者中，发生对比剂外渗 28 例，外渗发生率 0.11%；2018 年 1 月至 12 月 26186 例 CT 增强检查患者中，发生对比剂外渗 11 例，外渗发生率 0.04%。结论：CT 增强检查的护理流程中，采取有效护理预防措施可明显降低对比剂外渗的发生率。

EPO-2200

介入手术室护士化疗药职业防护现状调查

毛燕君
上海同济大学附属肺科医院

[摘要]**目的：**调查全国部分三甲医院介入手术室护士化疗药职业防现状，分析其相关影响因素，为改善全国三甲医院介入护士化疗药职业防护提供真实的临床依据。**方法：**采用自行设计的调查问卷，问卷通过微信方式发放，对全国 20 余所三甲医院 446 名介入手术室的护理人员进行化疗药职业防护问卷调查。**结果：**将调查对象根据介入手术室工作年限分为两组，分别为年限＜5 年组和年限＞5 年组。化疗药物危害知晓率、防护措施知晓率、药物规范配制知晓率在两组均有明显统计学差异。年限＞5 年的介入护士，对化疗药物危害的知晓率较高（84%，P＜0.001）；对防护措施的知晓率较高（89%，P=0.007）；对药物规范配制的知晓率（85%）也高于年限＜5 年的介入护士（P=0.024）。两组在化疗药物防护态度总体赞同率都较高（P＞0.1），赞同增加防护用品及增加生物安全柜的赞同率都高于 95%，增加对护士心理影响及增加使用化疗药密闭式配置和转运系统的赞同率均超过 90%。两组在坚持穿防水防护衣的坚持率均较低，年限＜5 年组为 27%，年限＞5 年组为 17%，两组具有统计学差异（P=0.017）。但坚持佩戴护目镜的坚持率两组均较低（＜30%，P=0.101）。坚持在生物安全柜中配药、坚持在静脉药物配置中心（PIVAS）进行集中配药的两组坚持率均很低（P＞0.1），均小于 20%。**结论：**工作年限＜5 年的介入护士对化疗药物知识熟悉程度不足，需进一步加强培训；介入护士对化疗药物防护态度认真且积极，但由于介入手术室防护装备较少，导致介入护士对化疗药物防护行为的坚持率很低。因此，医院应改善介入手术室护士化疗药物职业防护的措施，安装必要的防护装备。

EPO-2201
介入手术室高值耗材的信息化管理

陈英梅,郭丽娟
中山大学肿瘤防治中心/中山大学附属肿瘤医院

目的：提高手术室的高值耗材的管理效率，规范管理流程。 方法：利用信息化管理手段，将每件物品建立院内唯一身份码，实行代销制，建立虚拟二级库，从验货、入库、保管、使用收费、质量追溯、库存盘点到财务核销结算，实现全程信息跟踪，每月按实际消耗量核销出库，做到每件物品都能全程监控和可追溯，将信息化技术融入高值耗材的日常管理管理流程。 结果：一方面使护士从繁琐的医用耗材管理工作中解脱出来，另一方面使高值耗材的管理更加精确、规范、透明。结论：通过对高值耗材的信息化管理，优化了工作流程，提高了管理水平，有效保障了医疗安全和医院经济运行的安全性。

EPO-2202
组织胶水联合免拆线缝合术在输液港植入患者中的应用及护理

吴燕燕
海军军医大学第二附属医院（上海长征医院）

目的 探讨医用组织胶水联合可吸收缝线在输液港植入术中的应用效果。**方法** 回顾性分析析 2018 年 1 月~2019 年 4 月在我院介入手术室行输液港植入术的 562 例患者的临床资料，按照手术切口闭合方法将其分为试验组（n=264）与对照组（n=298）。试验组患者使用可吸收缝线联合组织胶水闭合手术切口，对照组患者使用传统丝线缝合术。比较两组患者的手术时间、手术切口愈合情况、术

后并发症发生情况及患者满意度。**结果** 两组患者的手术时间比较，差异无统计学意义（P>0.05）；使用生物组织胶水的试验组比用传统手术缝合处理的对照组患者伤口愈合要好，美观度更甚，试验组除了 1 例因双侧乳腺切除手术操作空间不够而出现伤口开裂外，其余患者均愈合良好；试验组患者及家属满意度也显著高于对照组，差异有统计学意义(P<0.05)。两组患者术后并发症发生情况比较，差异同样具有统计学意义（P＜0.05）。**结论** 可吸收缝线联合组织胶水粘合切口简单省时、安全可行，术后并发症发生率低，患者无需来回奔波医院进行换药及拆线，大大提高肿瘤患者满意度。

EPO-2203
乳腺癌患者 MRI 检查改良体位摆置方案探讨

冯艳青,林芝
中山大学附属第一医院

目的 为提高乳腺癌患者 MRI 检查的舒适度，本文基于 MRI 乳腺检查所需摆置俯卧位的特点，探讨了改良体位摆置方案对提升患者舒适程度的有效性。
方法 本研究纳入我院 2018 年 8 月至 2019 年 4 月的 86 名新辅助化疗女性乳腺癌患者，分别采用常规体位（对照组，43 例）和改良体位（实验组，43 例）进行磁共振检查。患者年龄为 37~56 岁，体重为 50-72kg，且均意识清醒、态度配合。其中，常规体位采用俯卧位线圈、床单等辅助工具，患者头面部俯卧于线圈的头枕上，乳腺组织自然下垂并暴露于线圈中，上举双上肢至头部两侧，双下肢顺着体位架的坡度自然放在检查床上；改良体位增加使用了 U 形托手枕、踝关节垫、等辅助工具。在常规体位摆置的基础上，患者口鼻置于线圈固有的凹槽内，保证呼吸通畅。根据患者的脸型适当置入海绵垫在额、双颧受力点，调整受力面，减少患者面部局部受压。双手前伸，双肘屈曲 30 度，以不触碰磁体内壁为宜，踝关节下放入软枕，使双小腿与大腿屈曲 30°，同时避免脚尖长时间与床面碰顶造成不适。根据磁共振检查后患者的反应情况对不同体位的舒适度进行评估，包括额颧潮红、双上肢麻痹，上下肢麻痹，乳腺外上象限潮红，无不适反应 5 种反应情况。采用卡方检验对实验组和对照组反应情况的差异进行量化测量。
结果 采用改良体位的患者，其检查部位均在磁体内，暴露良好，身体各部分受力均匀，呼吸与循环等功能正常。改良体位和常规体位行 MRI 在额、颧潮红，双上肢麻痹，上下肢麻痹，乳腺外上象限潮红和无不适等反应情况的案例数分别为：36/2，43/4，7/0，9/0，0/39。对照组和实验组 5 种案例数卡方检验 P 值均小于 0.05。
结论 较常规体位而言，改良体位明显减少患者行 MRI 后的不适反应、改善患者检查舒适度。该体位摆置方案可进一步推广使用。

EPO-2204
临床护理路径在急性缺血性脑卒中患者颅内取栓术中的应用效果研究

金浙夏,章雁
浙江大学医学院附属邵逸夫医院

目的： 探讨与分析临床护理路径用于急性缺血性脑卒中患者颅内取栓术中的应用效果。
方法：选取我科导管室自 2017 年 1 月~2019 年 5 月收治的急性缺血性脑卒中患者 197 例，将其按照实施颅内取栓术的手术先后顺利排序，奇数顺序患者分为对照组，共 99 例，采用常规手术护理

模式进行手术工作，偶数顺序患者分为实验组，共 98 例，采用临床护理路径模式进行，运用卡方检验和非参数检验的统计学方法，分析并比较两组患者在到达导管室至开始置鞘时间、血管开通率、术中并发症发生率、术后肌力恢复程度及手术医生对护理工作满意度等方面的差异。
结果：（1）两组患者在年龄、性别、婚姻状况、职业、合并高血压、糖尿病、高脂血症等卒中因素、起病时间，术前 NIHSS 评分、梗塞部位等方面无统计学差异（P>0.05）。（2）实验组在到达导管室至开始置鞘时间及术中并发症发生率方面均显著低于对照组，在血管开通率，术后肌力恢复程度及手术医生对护理工作满意度方面均高于对照组。
结论：临床护理路径应用于急性缺血性脑卒中患者介入治疗中，充分调动了护理工作的循证性，能有效提高护理工作质量，改善患者预后，具有一定的积极意义，值得广泛推广。

介入手术室敏感指标的构建

付军桦,管春阳
青岛大学附属医院

构建介入手术室护理质量敏感指标，提高介入手术室护理质量。方法 成立敏感指标构建小组，通过文献回顾，采用头脑风暴法初步构建敏感指标并通过临床试用及专家咨询最终构建。最终确定 4 项指标：术前耗材准备完善率、介入手术安全核查合格率、效期管理实施合格率、介入手术室外科洗手正确率。结论：通过构建敏感指标，促进护理质量的持续有效改进，为科室护理质量管理明确了方向。

EPO-2206

应用根本原因分析法降低 CT 增强检查中静脉留置针非计划性拔管率的实践

吴金霞,姚学会
北京大学第三医院

目的：探讨根本原因分析法（RCA）在降低 CT 增强检查静脉留置针非计划性拔管中的作用。
方法：对我院 2017 年 1 月至 12 月 24869 例 CT 增强检查患者中的 415 例静脉留置针非计划性拔管的发生进行根本原因分析，针对原因制定改进措施。分析 RCA 实施前（2017 年 1 月-12 月）与实施后（2018 年 1 月-2018 年 12 月）CT 增强检查中静脉留置针非计划性拔管率。
结果：CT 增强检查静脉留置针非计划性拔管率 RCA 实施前为 1.67%（415/24869），实施后为 0.63%（169/26186）,两组拔管率差异有统计学意义（p<0.01）。
结论：运用根本原因分析法能有效找到 CT 增强检查中静脉留置针非计划性拔管的根本原因，进而给予相应的护理干预，能有效地降低非计划性拔管发生率。

穴位刺激调控法对减轻首次磁共振检查患者焦虑状况的效果评价及研究

彭莉,宋黎
华中科技大学同济医学院附属同济医院

摘要：目的 探讨穴位刺激调控法对减轻首次磁共振检查患者焦虑的效果。方法 选取某三级甲等医院 30 例首次磁共振检查的焦虑患者,随机分为试验组和对照组,每组各 15 例。试验组在首次磁共振检查前常规护理的基础上接受穴位刺激调控法,对照组接受磁共振检查常规护理。患者检查前 24 h 和检查日采用汉密尔顿焦虑量表,St.Mary 医院睡眠问卷评估患者的焦虑水平、睡眠状况,测量血压和脉率。结果两组干预前焦虑量表评分、睡眠状况、收缩压、舒张压、脉率的比较,差异均无统计学意义(P>0.05);干预后两组焦虑量表评分、睡眠状况总评分、脉率的比较,差异有统计学意义(P<0.05),收缩压、舒张压的比较,差异无统计学意义(P>0.05)。结论穴位刺激调控法可降低首次磁共振检查患者检查前焦虑水平,改善患者的睡眠状况,减缓焦虑患者的脉率,使患者顺利完成检查,提高检查成功率。

院内二维条码在介入耗材信息化管理中的应用

顾露
四川省医学科学院·四川省人民医院

目的：探讨院内二维条码在介入耗材管理中的应用效果
方法：将 2017 年 7 月-2018 年 6 月院内耗材管理未使用二维条码设为对照组，2018 年 7 月-2019 年 6 月院内耗材管理使用二维条码信息化管理设为观察组，比较院内二维条码使用前后介入耗材收费缺陷发生率和介入医生对介入护理服务质量的满意度以及耗材收费所需时间。
结果：院内二维条码使用前后，观察组收费缺陷发生率<0.01%低于对照组的 1%差异有统计学意义（$p<0.05$）；介入医生对介入护理服务满意度分别为 74%和 90%，差异有统计学意义（$p<0.05$）；院内二维条码使用前后，介入护士收取耗材费所需平均时间为 11.13±2.82 秒，低于对照组的 25.2±2.08 秒。
结论：院内二维条码在介入耗材全过程管理中，可减轻护士的收费工作量；降低了收费缺陷的发生；实现了耗材的全程追溯；提高了医生的满意度；提高了护理管理水平。

经皮肺穿活检术的临床应用与护理

付贝贝
郑州大学第一附属医院

肺部经皮针刺活检术是肺部非血管介入技术中的重要内容，1883 年，Leyden 利用此方法获取一名肺炎患者细菌学资料，1886 年，Menetrier 用此方法抽吸肿块儿组织以诊断肺癌，但随后此项技术未向前发展，未能推广应用。瑞典学者于 20 世纪 60 年代采用双向影像增强器透视导向下细针穿刺，明显提高了活检成功率，降低了并发症，此后，经皮肺穿刺活检随着影像导向技术、细针抽吸技术及细胞病理学的发展，而逐渐发展并普及应用。

EPO-2212
意识障碍患者脑部磁共振增强检查的护理配合

张丹丹
河南省人民医院

目的 由于磁共振设备的特殊性、检查时间较长，脑部磁共振增强伴意识障碍的患者意识不清、躁动等因素，做好检查前、检查中的护理配合尤为重要，探讨意识障碍患者脑部磁共振增强检查护理配合方法。**方法** 回顾性分析 2018 年 8 月-2019 年 6 月行磁共振增强检查的 41 例意识障碍患者，检查前仔细询问患者既往史和过敏史，排除检查禁忌；配合医生仔细评估患者病情及配合能力，明确无气道危险、生命体征平稳；优化常规磁共振检查流程，采用电话预约，提前送检查单，提前为患者预留时间，节约患者等待时间；建立留置针通道，患者到达磁共振室从准备、扫描、后处理等环节全部由经验丰富、训练有素的护士、技师、医生完成，缩短患者在磁共振室滞留时间，确保患者安全。检查中配合技师为患者安置正确舒适的体位，牢固固定身上的各种管道，确定留置针在位、通畅，氧气袋持续吸氧，监测患者心率、呼吸等。平扫完毕增强时，根据患者的具体情况确定

钆喷酸葡胺对比剂使用的剂量，以 0.5ml/s 的速度推注。注入对比剂时，动态观察患者心率、血压、呼吸的变化，并与注射对比剂前进行对照，有无恶心、呕吐、皮疹等不良反应，及时发现异常，并做好记录。检查中和检查后严密观察生命体征及对比剂不良反应。**结果** 41 例意识障碍患者脑部磁共振增强检查，通过注射对比剂后发现脑占位 24 例，脑炎 15 例，其他 2 例。3 例注射对比剂时心率加快（较检查前增加 8-14 次/min）呼吸加快（较检查前增加 7-13 次/min）；30 例在 12-15 分钟之内顺利完成检查，11 例因躁动配合困难，遵医嘱缓慢推注安定后行增强检查，所有病例均获得高质量的图像。未发现意识障碍患者使用对比剂后出现恶心、呕吐、皮疹等毒副反应。**结论** 脑部磁共振增强检查是脑肿瘤的早期诊断、病变的鉴别和脑炎治疗的有效诊断技术，检查前的准备、检查中的配合、检查后观察对顺利完成检查和早期正确诊断及及时有效治疗有着重要意义。

体外高频热疗治疗恶性肿瘤患者的护理体会

杨桓,渠凤凤,张艳萍
云南省肿瘤医院/昆明医学院第三附属医院

【摘要】目的：探讨体外高频热疗治疗恶性肿瘤患者的护理方法，降低体外高频热疗的治疗后的护理并发症发生，减轻患者痛苦，提高患者生存质量。方法：回顾性分析 2018 年 7 月-2019 年 6 月在我科应用珠海和佳 HG-2000 体外高频热疗仪治疗 650 例恶性肿瘤患者，机器频率为 13.56Mhz，每次温度在 42.5-43℃，治疗时间在 30～40 分钟，每周 2～3 操作次，6 次为一个疗程。操作前、中、后都有一名热疗专职技师和一名专科护士进行主机操作及全过程监测。结果：650 例恶性肿瘤患者进行了共计 3000 余次的治疗中发生烫伤 1 例，皮下脂肪硬结 2 例，呕吐 3 例。烫伤 1 例无明显疼痛，指导患者涂抹芦荟胶后，第三日皮肤恢复正常。皮下脂肪硬结 2 例，无疼痛感，8 天后作第二次疗程时皮下硬结自行消失。3 例呕吐患者均为热疗联合化疗的患者。结论：为恶性肿瘤患者进行体外高频热疗治疗的前、中、后，进行全程整体护理，能有效降低并发症发生。

EPO-2214
急性缺血性脑卒中介入治疗术中安全监测及风险管理

陈廷静
陆军军医大学大坪医院

【摘要】目的 探讨分析急性缺血性脑卒中患者介入治疗术中的风险管理分级标准及安全监测。**方法** 回顾性病历分析我院于 2017 年至 2018 年 6 月收治的 199 例急性脑卒中患者，设计专用的脑卒中患者数据统计表单，主要收集患者基础疾病、入院诊断、临床症状、术前 NIHSS 评分、手术方式、术中生命体征、术后生活质量指标等资料统计脑卒中患者的风险因素，根据统计结果对高风险因素逐一分析并进行分级处理（分为四级），针对不同风险级别采取不同的措施进行术中安全监测。**结果** 对行介入治疗的脑卒中患者基础疾病、临床症状、术前 NIHSS 评分、手术方式、术中生命体征、药物使用情况、治愈等评估建立分级标准，并针对性相应风险因素采取安全管理，提高 AIS 介入治疗术中安全性。**结论** 介入溶栓治疗术中对急性脑卒中患者进行风险分级管理，建立安全监测标准，提高脑卒中患者的手术成功率，降低了并发症发生率，值得进一步的研究与应用。

主动脉夹层患者 CTA 检查的风险管理

李新云,叶秀娟
广东省人民医院

【摘要】 目的：探讨主动脉夹层患者行 CTA 检查的风险和对策。方法：对 2019 年 1 月~7 月共 1816 例主动脉夹层患者行 CTA 检查的过程、精心的护理进行回顾总结性分析。结果：1815 例患者完成检查，其中 2 例患者检查中高压注射对比剂出现外渗，重新静脉穿刺后再次注射对比剂顺利完成检查，其余患者均一次成功顺利安全完成检查。在这组患者中 1815 例及时做出影像学诊断，1813 例得到及时救治，2 例患者因病情危重自动办理出院，1 例患者转运到达 CT 室即出现夹层破裂，返回急诊科急救。结论： 通过对主动脉夹层患者行 CTA 检查体会到：医护人员应有高度的责任心，全面评估患者的风险性，充分做好检查前的准备，与急诊科医务人员的紧密配合，将部分检查前准备工作如给与家属、病人的沟通，交代注意事项等提高患者及家属对检查的认识，签署知情同意书，静脉留针等在急诊科完成，减少患者外出的时间，尽可能的降低风险！同时 CT 室也做好相应的准备如扫描机房的环境、高压注射器、人力等方面。急诊科医务人员携带急救物品转运患者至 CT 室。检查中细致地观察病情，密切监测血压、心率的变化 ，高压注射对比剂的观察，检查后做好交接班及宣教。通过有效的护理干预从而顺利的完成 CTA 检查 ，尽早做出诊断及时给予治疗，积极提高患者的生存率。

EPO-2216

优质护理在放射造影检查中的应用

赵维彬
昆明市儿童医院

研究分析优质护理在放射造影检查中的应用效果。方法：本院于 2018 年 7 月至 2019 年 7 月收治 80 例行放射造影检查患者，遵循奇偶数分组法原则将 80 例患者分为对照组（40 例，给予常规护理）、观察组（40 例，给予优质护理），比较两组一次造影检查成功率、焦虑发生率、护理满意度评分、检查质量评分。结果：观察组的一次造影检查成功率为 95.5%（36 例）、焦虑发生率为 6.0%（4 例），对照组的一次造影检查成功率为 80.6%（28 例）、焦虑发生率为 20.9%（12 例），两组比较有显著差异（P<0.05）。观察组 40 例的护理满意度评分、检查质量评分均高于对照组（P<0.05）。结论：在放射造影检查中应用优质护理，可缓解患者的焦虑情绪，可提高一次检查成功率与检查质量，值得推广。

EPO-2217

综合医院影像专科教学路径在实习护生带教中的应用

赵丽,李雪
陆军军医大学大坪医院

目的：影像护理近几年来发展很快，部分医院影像科逐渐承担实习带教任务，但目前无影像检查护理培训教材和规范的教学方法。在进行护生带教时，由于大影像科岗位多、分散，护生采用轮转的方式培训，很难做到“一对一带教”，同时带教老师对各个知识点的讲解标准也不一致，导致培训效果差。因此，建立影像专科护生规范化教学路径，使带教老师按教学路径逐一实施教学任务，提高护生的培训效果。

方法：1.对象：89 名实习护生；2.成立教学小组：由护士长、教学组长及教员组成。3.设计教学路径：根据护生实习的时间结合教学大纲的要求，确定实习的岗位（CT、MRI、介入、胃肠室等），包括检查环境、物品、流程、健康教育及各项检查前、检查中、检查后的知识点和操作技能，编制《影像科护生实习路径手册》，掌握程度分了解、熟悉、掌握。4.教员培训：带教前参照路径手册结合《医学影像科护理工作手册》进行统一培训，提升教员的专业知识水平。5.应用：护生到科统一发放《实习路径手册》，并进行讲解，让护生熟悉不同岗位不同阶段所需了解、熟悉、掌握的知识点及重难点，护生可提前查阅文献主动学习；带教老师依据《实习路径手册》在不同的实习岗位讲解专科知识和示范专科操作，每个岗位实习结束后，护生与带教老师双签名确认，避免知识点的遗漏。

结果：（1）培训项目的完成率从 90-95%提高到 100%；（2）实习护生对我科的教学满意率从为 96.3%提升到 100%；（3）专科理论知识平均分从 85 分提高到 97 分，操作技能平均得分从 79 分提高到 88 分，合格率达到 100%；（4）考评带教老师的专业知识掌握从 90%提高到 98%。

结论：影像科护生实习路径简单、直观，培训目标明确，培训内容清晰，培训标准一致，具有一定的实用价值，可以提高影像科护生的教学效果，值得进一步应用。

EPO-2218
原发性肝癌与继发性肝癌肝动脉置管电子注药泵持续灌注化疗的观察与护理

尤国美,李含英
浙江省肿瘤医院

【摘要】目的：探讨肝动脉置管后持续灌注氟尿嘧啶（5-FU）联合奥沙利铂治疗原发性及继发性肝癌患者的观察要点与护理措施。方法：对 14 **例原发性肝癌，**21 例继发性**肝**癌患者采用肝动脉留置导管，经电子注药泵持续导管内灌注氟尿嘧啶（5-FU）治疗肝恶性肿瘤，对置管术后情况、化疗毒副反应进行观察及采用有效针对性护理。结果：35 例中 33 例患者共完成 60 次动脉置管化疗，人均 1.8±0.93 次。35 例患者中，1 例患者因身体状况无法耐受，而中途停止治疗、1 例患者因动脉导管堵塞, 输入 124ml 后拔除导管，其他 33 名患者虽在治疗过程中发生不同程度的不良反应，经积极处理后，无发生严重不良反应，顺利完成治疗。结论：肝恶性肿瘤患者在留置肝动脉导管行区域性持续灌注化疗降低了全身化疗的毒副反应，提高肿瘤局部的药物浓度，从而改善了治疗疗效。治疗过程中细致而规范的护理，为患者减轻了痛苦，提高了生活质量。

EPO-2219
阻塞性黄疸介入治疗患者围手术期的护理与体会

魏雪
郑州大学第一附属医院

经皮肝穿刺胆道造并引流管置入术（PTCD）是在 X 线或 B 超引导下，利用特制穿刺针经穿入肝内胆管，再讲造影剂直接注入胆道而使肝内外胆管迅速显影，同时通过造影管行胆道引流。此方法创伤小，回复快，为临床较多选用的方法。PTCD 是通过穿刺技术于肝内扩张的胆管内置管形成胆汁的外引流或穿越狭窄部位置管形成胆汁的内外引流，很快缓解肝内胆管的张力，明显减轻黄疸，改善症状和肝功能情况[1]。选取我院 2016 年 9 月-2017 年 12 月份收治的阻塞性黄疸患者，现报到如下。

EPO-2220
一例糖皮质激素相关骨质疏松性脊椎压缩性骨折 PVP 围术期护理

方睿,金霞,田庆华,吴春根
上海市第六人民医院东院

糖皮质激素(GC)相关骨质疏松 (glucocorticoid induced osteoporosis，GIOP)是一种因为内源或外源 GC 所致的，以骨强度下降、骨折风险性增加为特征的代谢性骨病[1]。糖皮质激素所致的骨质疏松症(GIOP)可导致椎体、肋骨、髋部等多部位骨折，严重影响患者的生活质量并增加社会负担，是 GCs 治疗的严重并发症之一[2]。因糖皮质激素引起的沿脊柱整个胸腰椎长度的骨质疏松性脊椎压缩性骨折(GIOPVCFs)的报道极少。2015 年，我院曾收治一名罕见的 GIOP 患者，在 27 个月时发生一组自发性椎骨骨折，经过我科制定详细的围术期护理计划及落实，为患者 4 次连续 PVP 手术的成功提供保障。患者最终康复出院，持续疼痛减轻，提高了生活质量。
糖皮质激素(GC)相关骨质疏松 (glucocorticoid induced osteoporosis，GIOP)是一种因为内源或外源 GC 所致的，以骨强度下降、骨折风险性增加为特征的代谢性骨病[1]。糖皮质激素所致的骨质疏松症(GIOP)可导致椎体、肋骨、髋部等多部位骨折，严重影响患者的生活质量并增加社会负担，是 GCs 治疗的严重并发症之一[2]。因糖皮质激素引起的沿脊柱整个胸腰椎长度的骨质疏松性脊椎压缩性骨折(GIOPVCFs)的报道极少。2015 年，我院曾收治一名罕见的 GIOP 患者，在 27 个月时发生一组自发性椎骨骨折，经过我科制定详细的围术期护理计划及落实，为患者 4 次连续 PVP 手术的成功提供保障。患者最终康复出院，持续疼痛减轻，提高了生活质量。

水合氯醛保留灌肠在婴幼儿磁共振检查中的镇静效果分析

陈娅
上海交通大学医学院附属第九人民医院

目的：对水合氯醛保留灌肠在婴幼儿磁共振检查中的镇静效果进行观察，并结合护理措施进行分析。
方法：选取 2014 年 9 月-2017 年 9 月接受磁共振检查的 50 名婴幼儿患者作为研究对象。所有患者均在磁共振检查前接受水合氯醛保留灌肠进行镇静，并接受相应的护理干预。对患者的入睡时间、不良反应和 MRI 图像质量进行记录评价。

结果：41 例患者入睡时间为 8min-10min，9 例患者入睡时间为 10min-30min。所有患者均顺利完成 MRI 检查，无不良反应。所有磁共振图像均无运动伪影。
结论：婴幼儿患者在进行磁共振检查前进行水合氯醛保留灌肠镇静具有很高的安全性，是保证磁共振检查获得良好图像质量的前提。同时加强患者的护理干预，可提高磁共振检查和用药的安全性。

EPO-2223

PDCA 循环在 CT 接诊中满意度调查应用

甘娟丽
中国人民解放军联勤保障部队第 940 医院（原兰州军区兰州总医院）

目的：探讨 PDCA 循环在 CT 检查接诊中满意度调查的效果应用。方法：将行 CT 检查的 204 人随机分成对照组和实验组各 102 人，对照组采取常规接诊，实验组采取 PDCA 循环的方法接诊。比较两组患者的满意度及投诉率。结果：实验组患者的满意率为 99．02%，对照组患者的满意率为 84.31%，且实验组的投诉率低于对照组，组间差异显著（P<0.5）。结论：PDCA 循环是美国质量管理专家戴明提出的一种循环管理模式［ 1］，是一种促进护理工作安全管理的有效措施，其主要目标为加强护理管理活动和护理服务行为的规范化和标准化，提高服务质量和患者满意度，树立良好的医院形象［ 2］，对于医护工作各个环节服务质量的提升具有重要作用［ 3］，能有效提高患者满意度,减少了技师的工作量，提高了检查的速度，为前来检查的患者节约了时间，同时有效减少投诉率。

气道全覆膜金属内支架介入治疗胸腔胃-气道瘘的护理

苏梦丹
郑州大学第一附属医院

目的 探讨 Y 型一体化自膨式覆膜支架[1]治疗胸腔胃-右主支气管瘘的疗效及护理体会。
方法 搜集因胸腔胃-右主支气管瘘接受双“Y”型气道全覆膜金属内支架治疗的 16 例患者的临床资料。
结果 本组 16 例患者全部一次性成功地置入了双“Y”（一大“Y”一小“Y”）型气道全覆膜金属内支架，成功率 100%，瘘口完全封堵，无对比剂溢入气道和肺部；未出现与手术有关的并发症。
结论 双“Y”型气道全覆膜金属内支架封堵胸腔胃-气道瘘，操作简单、安全、疗效可靠，是一种值得推广应用的技术。

EPO-2225

胸部病变 CT 引导下穿刺活检的护理体会

李雪波,李新云
广东省人民医院

目的 探讨胸部病变 CT 引导下穿刺活检的病情观察和预防并发症发生的护理措施。方法 回顾性分析和总结 82 例患者在 CT 定位下穿刺活检的护理过程：①术前准备及患者心理护理；②穿刺前的呼吸训练；③穿刺过程的病情观察；④与医生密切合作，缩短操作时间，减少肺组织损伤；⑤穿刺后的健康宣教。结果 82 例患者在充分完善的术前准备下 CT 穿刺活检成功，穿刺活检成功率为 100%，78 例穿刺时无气胸、血胸和肺出血等并发症发生；术后 3 例出现气胸，1 周内自行吸收；少量咯血 2 例，均在术后 1 h 内停止。结论 胸部穿刺活检虽是微创检查，出血、气胸是主要常见的并发症，而实施有效的护理能预防并发症的发生，提高穿刺活检成功率，为胸部病变的提供安全高效的诊断方式， 有利临床早期诊治。

EPO-2226
多学科护理干预在小儿磁共振检查中的应用效果

林淑娟
烟台毓璜顶医院

目的 对多学科（预约中心、儿科病房、磁共振室）综合护理干预在小儿磁共振检查中的作用效果进行分析研究。 **方法** 选取我院 2018 年 4 月至 2018 年 9 月 MRI 检查患儿（0-5 岁）178 例，随机分为实验组和对照组，实验组 91 例，对照组 87 例，其中，实验组在扫描检查中给予多学科综合护理干预，对照组在扫描检查中给予常规护理干预，观察对比两组患儿的护理干预效果。 **结果** 对照组患儿扫描检查一次成功率为 65.5%，实验组患儿扫描检查一次成功率为 85.7%，实验组患儿一次性完成扫描检查的成功率明显高于对照组。 **结论** 多学科综合护理干预应用于小儿磁共振检查中，能显著提高磁共振检查的一次成功率，有助于提高患儿及家属的满意度,值得临床推广和应用。

EPO-2227
延续性护理对肝癌 TACE 术患者治疗依从性的影响

张丽敏
河北医科大学第四医院

目的 探讨延续性护理对肝癌 TACE 术患者治疗依从性的影响。**方法** 选择符合纳入与排除标准的行肝癌 TACE 治疗的患者 120 例随机分为观察组和对照组。对照组 60 例采用责任护士在患者出院当天进行常规出院护理。观察组 60 例采用常规出院护理加延续护理，采用通过微信平台，电话随访的方式对患者进行以健康指导为主的延续护理。内容包括症状护理，心理护理，健康知识宣教。 结果 观察组护士对肝癌 TACE 术后患者实施延续护理，患者的治疗依从性与对照组比较有统计学意义（$P<0.05$），同时能改善患者再次介入的焦虑，降低治疗负效应，有效提高患者生活质量。结论 延续护理有效的降低了患者因治疗不舒适感造成的心理压力及焦虑，提高了患者的生活质量，促进身心健康，提高患者对介入治疗的依从性，同时提高了患者远期生存率。

EPO-2228
ＣＴ增强非离子型碘对比剂致过敏性休克的急救与护理体会

曹建勋
甘肃省人民医院

目的：探讨增强 CT 检查中非离子型碘对比剂致严重过敏性休克的抢救与护理。**方法：**选取我院 2016 年 10 月-2019 年 6 月期间行 C T 增强检查注射非离子型碘对比剂发生过敏性休克的 3 例病例进行回顾性分析，对过敏性休克发生的时间、临床表现、急救措施进行分析总结。**结果：**碘对比剂严重致死性不良反应发生率 0.01%，3 例病例中过敏性休克发生时间为注射碘对比剂后 2 分钟内，过敏性休克的临床表现，主要表现为神经系统、心血管系统，消化系统、皮肤症状，包括极度癫痫发作、口吐白沫、喉头水肿、呼吸困难、血压下降、意识丧失、全身抽搐、小便失禁等。经过抗过敏、抗休克对症处理，2 例患者症状缓解送往 ICU 继续治疗，1 例患者症状未缓解，立即对患者进行就地抢救，心肺复苏，经抢救 2h 无效死亡。**结论:**过敏性休克是一种严重的药物不良反应，一旦出现病情发展迅速，多系统器官同时受损，危及患者生命，需立即进行抢救。因此掌握过敏性休克的发生时间和临床表现，及时发现与迅速处理过敏症状至关重要，CT 室急救药物和器材必须随时备用，检查过程中应时刻警惕、密切观察病情变化，医务人员应熟练掌握急救技术，在发生过敏性休克最短时间内做出适当的措施。为避免突发情况处置不力引发医疗纠纷，应建立院级急救支援系统与应急预案。包括院行政部门（主管院领导、医务处、护理部等）、急诊科、ICU 及临床相关科室（心内科、呼吸科等），以此来有效协调调集最优抢救资源，为患者病情转归提供保障。

一种核磁共振及其呼吸训练配套快速装卸装置

张馨艺,曹建勋
甘肃省人民医院

目的：（核磁共振及其呼吸训练配套快速装卸装置，包括核磁设备和呼吸机）磁共振成像设备配合呼吸机进行受检，能够保证图像质量清楚诊断病情。

方法：本实用新型涉及医疗设备技术领域，特别是一种核磁共振及其呼吸训练设备配套互联系统。包括核磁设备和呼吸机，核磁设备由床体和核磁扫描线圈组成；所述床体包括支撑腿、侧撑和导向移动机构，床体架体上设有导向移动机构；将核磁共振与呼吸训练设备连接在一起。导向移动机构分为导向轨、锁扣块、核磁扫描线圈安装板和呼吸机安装板，锁扣块与核磁扫描线圈安装板和呼吸机安装板固定连接，锁扣块锁扣在导向轨上，锁扣块沿导向轨移动；通过锁扣块带动呼吸机和核磁设备一并移动。
结果：两套设备同步运动，降低对连接管线的拉扯和调整难度，呼吸机使受检者均匀被动呼吸，并适时调节呼吸频率和幅度保持稳定以保证图像质量清楚诊断病情。
结论：受检过程中整个检查过程会有呼吸的不一致性，在检查过程中常出现呼吸节律紊乱、闭气不佳、每次闭气深度不一导致图像模糊或错层等情况，会直接影响图像质量。为了克服上述技术问题现有磁共振成像设备配合呼吸机进行受检，能够保证图像质量清楚诊断病情。

精准提供氧流量的转运用小氧气筒推车的设计与应用

毛元红,刘春慧,姜小燕,吉燕,邵蓉蓉
南通市第一人民医院（南通大学第二附属医院）

目的：设计一种精准提供氧流量的转运用小氧气筒推车确保转运病人的用氧安全。方法：设计一种新型的小氧气筒推车适用于多种方式氧疗病人的转运。该小氧气筒推车有独特挂钩设计，可稳妥的将小氧气钢瓶悬挂于转运床的床头栏板上，使小氧气钢瓶保持直立状态，用于卧床氧疗病人的转

运，可提供精准的氧流量，杜绝因氧流量过高、过低对病人造成的伤害，提高转运病人用氧的安全性；妥善安置小氧气钢瓶，可杜绝使用过程中发生氧气桶的碰撞、跌落；妥善安置小氧气钢瓶，杜绝转运病人推拉小氧气筒时撞击、伤害医务人员；操作者无需弯腰、直立状态轻松的移动 10-25 公斤重的小氧气钢瓶，可用抱于怀中婴幼儿的转运；独特的挂钩设计，可大幅减少转运时人力资源的支出，提高工作效率。结果：自 2017 年 5 月至 2019 年 6 月用该小氧气筒推车转运需氧疗患者 323 例，其中男性 235 例，女性 72 例，新生儿 3 例、小儿 13 例；其中鼻吸氧 198 例，人工气道吸氧 78 例（气管插管 46 例、气管切开 32 例），人工气道辅助急救呼吸机机械通气 47 例（气管插管 13 例、气管切开 34 例）。该组病例未发生因氧流量过高或过低造成的并发症；人工气道使用急救呼吸机转运组病例，每次转运人力资源的支出降低 25-33.3%。结论：对需氧疗的患者进行转运，使用折叠式小氧气筒推车可精准地为病人提供氧流量、迅速、有效的落实氧疗措施、大大降低氧流量不精准造成的并发症，提高转运的安全性；同时降低转运时人力资源的支出，提高工作效率。该装置已申请并获二项国家实用新型专利，专利号为：ZL 201520723938.6、ZL 201621133930.5。该转运用小氧气筒推车，值得在临床推广。

护理干预在提高老年患者腹部 MRI 检查质量中的效果观察及满意度影响评价

庄丽娜
大连医科大学附属第一医院

摘要：*目的*：探讨老年患者腹部 MRI 检查中实施护理干预对检查质量的提升效果及对满意度的影响。***方法：***对影像科实施腹部 MRI 检查的 120 例老年患者（2017 年 1 月到 2018 年 12 月间）实施研究，按随机数表法将患者分为常规组（n=60）和干预组（n=60），对常规组运用常规护理，对干预组运用护理干预，分析总结患者情绪状况、检查舒适度、图像质量、检查安全性及满意度状况。***结果*：**干预组护理后 SAS、SDS 评分、不良反应发生率显著低于常规组，干预组舒适度评分、图像清晰率、满意度显著高于常规组（*P*<0.05）。***结论*：**老年患者腹部 MRI 检查中实施护理干预可提升检查质量，改善患者检查负面情绪、舒适度、安全性及满意度。

EPO-2237
农村永久性肠造口患者适应水平及相关因素的研究

李红
浙江省丽水市中心医院

调查农村地区永久性肠造口患者术后适应水平，分析相关因素。**方法** 采用自行设计的调查表和中文版造口患者社会心理适应量表（Ostomy adjustment inventory-20,OAI-20）对丽水市某三级甲等医院的 67 例永久性肠造口患者进行问卷调查。 **结果** 本组调查中，农村永久性肠造口患者的社会心理适应总分为 21-76 分，平均（45.33±8.90）分，90.9%的患者处于中低适应水平。患者的年龄、自理能力、术后时间与社会心理适应水平相关（$p<0.05$）。**结论** 农村永久性肠造口患者的适应水平为中度水平，护理人员应加强整体护理及延续护理，以提高患者适应水平，从而提高生活质量。

改良水合氯醛口服法在学龄前儿童 MRI 检查中的制动效果观察

姚红莉
华中科技大学同济医学院附属武汉儿童医院

目的：探讨改良 10%水合氯醛口服法在学龄前儿童 MRI 检查中的制动效果。
方法：以 200 例七岁以下需行 MRI 检查儿童为观察对象，服药前对家长及患儿进行心理疏导、解释用药目的、注意事项以及物品准备，运用改良口服水合氯醛法进行 MR 检查前制动。
结果：全组 200 例在行改良口服水合氯醛法后，5~10min 催眠成功 41 例，10~15min 催眠成功 68 例，15~30 min 催眠成功 87 例，服药后无效 4 例。制动效果满意。
结论：改良口服水合氯醛法，实用性强、无痛苦、安全性高家长易接受、所得图像质量清晰度高、值得临床推广应用。

一例大隐静脉曲张行射频消融术患者的个案护理

钟祥
湖南省人民医院/湖南师范大学第一附属医院

下肢静脉曲张是一组由于大隐静脉瓣膜功能不全、静脉阻塞、肌泵功能不全导致的下肢血液倒灌、回流受阻所致浅静脉曲张、静脉高压、皮肤微循环障碍的综合征。晚期常合并小腿慢性溃疡。
下肢静脉曲张为外科常见疾病，是慢性下肢静脉功能不全的最常见疾病，患病的人群也随着社会发展而趋于年轻化，许多病人因自觉无明显不适或害怕手术治疗而拒绝手术。
高位结扎包括在大隐静脉汇入股静脉处结扎大隐静脉主干，结扎旋髂浅静脉、腹壁浅静脉、阴部外静脉、股内侧静脉、股外侧静脉五大分支。本文对 1 例晚期下肢大隐静脉曲张行手术治疗患者护理过程中出现的问题进行分析，结合文献资料，提出有效护理对策。

探讨冠状动脉支架植入术的护理体会

陈日玉
海南省人民医院

冠状动脉内支架置入术是疏通狭窄或闭塞的冠脉管腔，从而改善心肌血流灌注，达到血流通畅目的的一种治疗方法。随着我国经济的发展和人民生活水平的提高，相对于传统外科开胸搭桥手术，人们越来越愿意接受损伤小恢复快的介入治疗方法。护理人员做好术前、术后护理对治疗的成功起到重大的作用。现将我院 2017 年至 2018 年期间实行的冠脉支架置入术的护理体会总结如下。

EPO-2241
6 例经导管主动脉瓣置入术治疗主动脉瓣狭窄的护理配合

余登峰
湖南省人民医院/湖南师范大学第一附属医院

目的:总结湖南省人民医院 6 例重度主动脉瓣狭窄患者实施经导管主动脉瓣置入术(Transcatheter aortic valve implantation，TAVI) 的护理经验。**方法:**回顾性分析 2019 年 1 月至 2019 年 8 月 6 例暂时不宜实施外科手术的重度主动脉狭窄患者经导管主动脉瓣置入术的临床护理经验。**结果:**6 例患者经过精心护理，术前准备充足、术中无不良事件的发生，均治愈出院。**结论:**通过术前准备好各种手术物品与仪器、术中做好生命体征观察，尽早发现和处理并发症、有效地减少相关并发症的发生，对患者的康复效果有重要意义。

放射科 CT 增强扫描时造影剂渗漏的有效预防管理措施

林雪花
仙居县人民医院

【摘要】目的：本次实验将针对放射科 CT 增强扫描时造影剂渗漏的有效预防管理措施进行讨论与归纳。**方法：**本次实验选取了 2017 年 1 月-2017 年 12 月在我院就诊的需经过 CT 增强扫描的患者为研究对象，入选的共 350 例，根据患者的入院时间分为对照组和观察组，对照组实施的常规管理，观察组实施造影剂渗漏的预防管理。**结果：**观察组的造影剂渗漏率为 1.71%，明显低于对照组的 3.43%，组间对比差异较为显著，具有统计学意义（P＜0.05）。**结论：**为了更好的应对放射科 CT 增强扫描时造影剂渗漏问题，实施积极的预防管理措施，能够降低该情况的发生率，效用显著。而 CT 增强扫描技术的不断推广与应用，能够为更多的疾病提供诊断依据，不失为安全、有效的检查手段。

超大心脏良性粘液瘤合并脑梗死患者威视派克严重过敏性休克致死 1 例

张康燕
甘肃省人民医院

碘对比剂过敏反应不可预测，难以预防，一直困扰着临床医务工作者，本文依据美国和欧洲的对比剂使用最新指南,结合相关文献分析一例威视派克注射液引起过敏性休克的原因并提出相关预防建议,以供临床参考。**临床资料：** 患者性别女，年龄 27 岁，患者自诉除韭菜外无其他过敏史。既往有脑梗死个人史，左心房良性粘液瘤，为排除肺栓塞行胸部 CTA。碘对比剂为碘克沙醇 320mgI/ml（威视派克 320mgI/ml），注射速率为 4ml/s,注射药量为 65ml，此病例过敏性休克发生时间为注射碘对比剂后 2 分钟内患者出现休克症状，主要表现为神经系统：癫痫发作、抽搐、口吐白沫、意识丧失；心血管系统：血压下降、心律失常；消化系统：呕吐；给予患者抗过敏、抗休克对症处理，患者症状未缓解，心脏骤停，立即对患者进行就地抢救，心肺复苏，气管插管等，经抢救 2h 无效死亡。**讨论：**（1）过敏性休克是一种严重的药物不良反应，一旦发生，病情发展迅速，如不及时抢救即可死亡。掌握过敏性休克的发生时间和临床表现，及时发现与迅速处理过敏症状至关重要，医务人员应熟练掌握急救技术，发生过敏性休克要在最短时间内做出适当的措施。（2）患者有超大左心房粘液瘤，大小约 4.1cm×6.5cm,血管 CTA 使用高压注射器注射碘对比剂，流速快，血管壁压力大，短时间内进入大量液体会明显加重心脏负荷，导致心肌损伤。因左心房粘液瘤质地疏松，容易脱落，易引起体循环或者肺循环动脉栓塞，危及患者生命。对于此类患者做血管 CTA 前应于临床医生沟通，高度注意粘液瘤脱落的可能性，慎做此类检查。（3）CT 室护理人员应严格掌握高危人群的用药适应症，严格执行各项医疗护理技术操作，及时正确处理药物不良反应，有利于提高医疗质量、减少医疗纠纷。

EPO-2244
幽闭恐惧症患者行磁共振成像检查的干预研究进展

梅莉
华中科技大学同济医学院附属同济医院

[摘要]：本文从幽闭恐惧症的定义与诊断，幽闭恐惧症与磁共振成像的相关性，幽闭恐惧症患者行磁共振检查可能造成的后果、产生的原因及应对措施 5 个方面来综述幽闭恐惧症患者行磁共振成像的干预研究进展，旨在帮助医技护理人员深入了解行磁共振检查的幽闭恐惧症患者，为制定针对幽闭恐惧症患者磁共振检查的预防、干预措施等提供参考。

EPO-2245
医护人员碘对比剂安全使用知信行问卷编制

许伟,李小玲
中南大学湘雅三医院

目的：编制医护人员碘对比剂安全使用调查问卷并对其进行信效度检验。方法：通过查阅国内外相关文献、专家咨询、开放式半结构式化访谈形成条目池，并通过对 185 位医护人员进行预调查，通过专家筛选法、区分度筛选法、相关系数筛选法、Cronbach's a 系数等方法进行筛选，并通过分半系数、内容效度、因子分析等方法进行问卷的信效度检验。结果：最终保留 46 个条目，问卷的分半信度为 0.724，问卷的 Cronbach's a 系数为 0.946，问卷内容效度为 0.931，问卷各条目内容效度在 0.83-1.00 之间，问卷共提取的 3 个公因子与假设一致，累计方差为 50.05%>40%，负荷值也全部大于 0.35。

知信行护理干预模式在 128 层 CT 冠状动脉血管造影的检查中的应用价值

李晶[1],周萍[1],李晶[1],周萍
1.上海市杨浦区中心医院
2.上海市杨浦区中心医院

目的 探讨知信行护理干预模式在 128 层 CT 冠状动脉血管造影的检查中的应用价值。**方法** 选择 2019 年 5-6 月本院收治的冠心病患者 200 例（年龄 55-70 岁，BMI 18.5-24.9kg/m^2）作为研究对象。将其分为对照组 100 例，平均年龄（62.4±1.0），男 54 例，女 46 例。干预组 100 例，平均年龄（61.6±1.2），男 52 例，女 48 例。**结果** 比较两组检查过程遵医行为评分，及检查成功率及图像质量。两组检查过程中的遵医嘱行为评分比较，干预组优于对照组。图像质量评分干预组为（3.85±0.21）分和对照组（3.12±0.59）分，两组图像质量差异有统计学意义（t=1.42,P<0.05）。 干预组检查成功率 100/100（100%），对照组检查成功率 92/100（92%）。

结论“知信行”护理模式其对于改善患者相关行为，配合医生顺利完成 CT 冠状动脉血管造影的检查中的有充分应用价值。

胸部 X 线正位片在 PICC 尖端定位中的应用价值

杜丽洁,郭玲彤,张贺越
山西医科大学第一医院

目的：探讨胸部正位片在 PICC 导管尖端定位中的应用价值。
方法：收集 2017.08.01-2019.07.01 在山西医科大学第一医院置管中心置管后拍摄胸片患者 363 例。
置入 PICC 前，需预测 PICC 置入长度，采用常规体外测量法，即患者取平卧位，穿刺侧手臂外展 90°，测量从穿刺点至右胸锁关节再向下反折至第 3 肋间的距离。选取前臂正中静脉或贵要静脉为穿刺点，铺设消毒巾后行穿刺操作，插入长度以上述测量长度为准，使用透明膜将其固定。完成 PICC 置管后进行 X 线正位片检查。以纵膈右缘上、下两部分交界点为腔房交界处即 CAJ 点，该点及其上方 2cm 为最佳尖端置管范围，尖端未达到该范围或越过该范围以及导管未进入上腔静脉者，为导管尖端异位。在患者知情同意下，对导管位于理想范围者进行卧位拍片。计数资料使用 n (%) 表示。测量两次拍片 CAJ 点间的距离，利用统计学工具求出平均值及标准差。
结果： 收集的 363 例患者中，尖端位于最佳置管范围者 139 例，占总例数的 38.3%，异位者 224 例，占 61.7%，其中位于上腔静脉高位者 159 例，占异位总数的 71.0%，在上腔静脉内翻折 3 例，占 1.3%，位于右心房的 11 例，占 4.9%，位于右心室的 2 例，占 0.9%，位于下腔静脉者 4 例，占 1.8%，位于颈内静脉者 7 例，占 3.1%，位于同侧头臂静脉者 19 例，占 8.4%，位于对侧头臂静脉者 5 例，占 2.2%，位于同侧锁骨下静脉内者 9 例，占 4.0%，位于对侧锁骨下静脉者 3 例，占 1.3%，位于奇静脉者 2 例，占 0.9%。

导管尖端位于理想范围内的 139 例中，49 例于卧位时，尖端在右心房内，占 35.3%。两次拍片 CAJ 点间距离的平均值为 2.6CM,标准差为 0.31。

心理护理对静脉麻醉下行肝动脉化疗栓塞手术患者的效果分析

黄宇
贵州省肿瘤医院

【摘要】 **目的：** 探讨静脉麻醉下行肝动脉化疗栓塞手术患者的心理护理。**方法：** 选择 116 例在静脉麻醉下行肝动脉化疗栓塞术的患者分为 A、B 两组，A 组进行心理护理并总结心理护理的经验。**结果**:A 组经过术前 3 d 、1 d 及术后 2 ～3 d 进行心理护理，所有患者顺利地完成介入手术，安返病房，均无不良心境产生。A 组运动伪影和图像总体质量评分(3．83±0．21)分、(3．82±0．32)分明显强于 B 组的(2．24±0．31)分和(3．39-t-0．40)分(P<0．05)，具有统计学意义。**结论：** 肝动脉化疗栓塞术前及术后有的放矢地做好麻醉患者的心理护理，能够改善、消除及预防患者的不良心境，改善疾病的预后。

EPO-2250
新生儿在消化道碘水造影的护理难点

李欢
陆军军医大学大坪医院

目的：对新生儿患者行消化道碘水造影检查的风险因素进行评估，为高质量安全完成新生儿消化道碘水造影提供临床护理依据；
方法：选取 2017-2019 年在我科行新生儿消化道碘水造影的 10 例患者，针对新生儿消化道碘水造影检查的特点及新生儿患者本身特殊性进行分析，制定新生儿患者在消化道碘水造影检查前的充分评估以及检查、抢救物品的准备。检查中严密检测新生儿的生命体征，医师与护士全程紧密配合来确保新生儿的安全。以及检查后确保新生儿的安全以及无不良反应的全程护理模式；
结果：10 例患者均安全地完成检查。新生儿患者行消化道碘水的护理前充分评估，以及检查过程中的全程护理模式可以有效保证 新生儿患者行消化道碘水造影检查的安全，为临床新生儿患者进行消化道碘水造影检查的安全提供了有力保证。
结论：消化道造影是诊断新生儿先天性消化道畸形最快捷，直观，方便的方法。经过探索与实践，由于新生儿是个特殊群体，在检查过程中，医师护士的全程配合模式和操作规范，前期的充分准备，与临床的沟通，检查过程中的密切观察是保证患者检查安全的基础，检查中护士一丝不苟的监护，以及等待过程中的巡视，家属的配合，医师掌握摄片的时间节点是检查成功的关键。

EPO-2251
347 例 CT 引导肺穿刺活检术行全流程护理管理的应用体会

张乔升,曹建勋
甘肃省人民医院

目的：探索全流程护理管理在 CT 引导穿刺活检术中应用
一般资料：选取我科 2018.01-2018.11 月行 CT 引导下肺穿刺活检的患者为研究对象，共计 347 例，其中男 213 例，女性 134 例，平均年龄 58±17.5 岁，所有患者皆通过 CT 检查存在肺结节或肿块，将全流程应用于围手术期的患者行 CT 引导下的穿刺中，术前签署知情同意书、术中的护理记录、术后并发症处理及随访。
方法：设计并持续改进全流程护理管理体系。

（1）设计表单管理体系，CT 引导穿刺活检术的护理流程包括术前宣教和心理辅导，手术室准备，手术前准备，手术配合，术后观察，术后随访等阶段，针对每一个阶段的特点，都设计相应的表单，并根据表单进行管理。有些流程制作成展板上墙，有些流程根据科室的发展，根据具体实践的问题，进行持续改进。
（2）术前准备、术中护理、术后观察随访的流程设计管理
（3）信息化管理的应用开发
将整个 CT 引导下穿刺活检的流程通过信息化的形式固定下来，使流程更加顺畅
结果：347 例患者穿刺活检成功率 100%，气胸的发生率 21%，其中需要置管的患者约 2%，咯血的发生率 5%，通过积极的护理参与，患者都得到康复。无一例死亡病例。
结论：全流程护理管理为 CT 引导穿刺活检提供了非常好的护理保障，值得推广。

电热恒温培养箱对造影剂过敏发生率的影响

尤艳
解放军总医院第一附属医院

目的：探讨电热恒温培养箱在增强 CT 检查过程中对造影剂过敏发生率的影响。
方法：我科 3000 例增强 CT 患者分为两组，实验组患者使用的造影剂为电热恒温箱加热后 37℃恒温的造影剂。对照组为室温（18℃-28℃） 注射，比较两组过敏反应发生率。
结果：实验组 1500 例中发生过敏反应 3 例占 0.2%。对照组 1500 例中发生过敏反应 8 例占 0.53%。实验组过敏反应发生率显著低于对照组（P＜0・01）。

结论：使用电热恒温培养箱可降低过敏反应的发生率。

EPO-2257
精益六西格玛管理下急诊 CTA 护理流程再造探讨

龚梦,魏露
华中科技大学同济医学院附属同济医院

目的：探讨应用精益六西格玛管理法对急诊 CTA 检查护理流程再造并分析其应用价值。

方法：回顾性分析采用精益六西格玛管理法优化急诊 CTA 检查护理流程再造前 400 例（2018 年 10 月~12 月）和流程再造后 400 例（2019 年 3 月~5 月），样本随机抽样，统计分析其检查整体时间、医患满意度。采用六西格玛方法论（DMAIC）进行护理流程再造，过程包括：界定（Define）：通过 CTQ 树图分析我科现阶段急诊 CTA 护理流程存在的缺陷，组成管理机制团队进行相关培训和制定计划。测量（Measure）：使用 PEMEA 分析法对该流程进行评估，探索其有效性，分析存在的高风险因素。分析（Analyze）：借助价值流图，头脑风暴工具分析流程中的不足，找出关键问题，建立新的流程价值流图，通过不断地完善使流程更加顺畅，效率更高。改进（Improve）：利用 7S 管理法针对关键因素寻找最佳改进方案，并证明该方案的有效性。控制（Control）：监控新的护理流程，修订标准护理流程文件，制定流程应变计划。

结果：采用 u 检验进行统计学分析，急诊 CTA 护理流程再造后放射科各项质量指标均较再造前提高，从到达检查室，检查过程，离开检查室整体时间由（30.5±5.45）缩短至（15.5±3.16），医患满意度由再造前的 80%提高至再造后的 97.14%，实施前后差异具有统计学意义（均 P＜0.05）。

结论：精益六西格玛管理下急诊 CTA 护理流程再造改进了护理工作流程，提升了放射科急诊护理质量和效率，在放射科急诊 CTA 护理中具有一定应用价值。

三期对比剂注射方案对头颈部 CTA 检查对比剂外渗率影响的对照研究

陈昉铭,马建勇
江苏省无锡市第二人民医院

目的：对比剂外渗是影像护理常见的不良事件。本研究旨在评估三期对比剂注射方案对头颈 CTA 检查对比剂外渗率的影响。**方法**：本研究采用随机对照研究方法，入组自 2016 年 4 月至 2018 年 3 月在本研究单位进行头颈 CTA 检查患者共 2763 例，平均年龄：64.87 ± 11.38 岁。病例随机分为两组。对照组使用常规头颈 CTA 检查对比剂注射方案，即首期注射 50 ml 对比剂，随后一期注射 20 ml 生理盐水。研究组使用三期对比剂注射方案，即较常规方案前置一期生理盐水注射，生理盐水使用量为 10 ml。所有病例使用对比剂为 370 mg/ml 碘普罗胺，并通过双筒高压注射器进行自动注射，注射流率为 4 ml/s。分别对比两组患者的总外渗率、女性患者外渗率、老年患者（年龄 ≥ 60 岁）外渗率及外渗高风险患者的外渗率。**结果**：本研究入组患者的总体外渗率为 0.90 %。研究

组患者总外渗率为 0.36 %，对照组患者总外渗率为 1.46 %，差别有统计学意义（P = 0.002）；研究组女性患者外渗率为 0.52%，对照组女性患者外渗率为 2.30 %，差别有统计学意义（P = 0.002）；研究组老年患者外渗率为 0.50 %，对照组老年患者外渗率为 1.82 %，差别有统计学意义（P = 0.006）；研究组外渗高风险患者外渗率为 0.40 %，对照组外渗高风险患者外渗率为 2.52 %，差别有统计学意义（P = 0.007）。**结论：** 采用本研究调整后的头颈 CTA 检查三期对比剂注射方案较常规方案降低了约 75%的总对比剂外渗率，且在常规临床实践中可容易实现。

EPO-2259

基于 FTS 理念的护理策略在脊柱转移瘤患者椎体成形术中应用研究

庞华容,甘朵 ,刘颖,杨学刚,许国辉
四川省肿瘤医院

[摘要] **目的** 探讨基于快速康复（FTS）理念的护理策略在脊柱转移瘤患者椎体成形术（PVP）围术期的应用效果。**方法** 选择我科 2016 年 2 月至 2018 年 1 月实施经皮椎体成形术的脊柱转移瘤患者 48 例作为观察对象，所有患者原发肿瘤均诊断明确，以 2016 年 2 月至 2017 年 2 月的 26 例患者为对照组，以 2017 年 3 月至 2018 年 1 月的 22 例患者作为观察组。对照组采用常规护理措施，观察组在围手术期护理过程中应用基于快速康复（FTS）理念的护理策略。采用视觉模拟评分(VAS)比较两组患者 PVP 术前 1 d，术后 1 d、3 d、1 个月、3 个月和末次随访疼痛程度、Oswestry 功能障碍指数(ODI)评估两组患者运动功能状态、并同时比较两组患者下床活动时间、住院时间、并发症发生率及患者满意度。**结果** 观察组术前 VAS 评分均明显高于术后 1 d、3 d、1 个月、3 个月和末次随访，差异有统计学意义(P 均<0.05)。术后 ODI 均较前明显降低(P 均<0.05)，患者运动功能状态得到改善。与对照组相比，观察组下床活动时间、并发症发生率、住院时间方面明显降低，差异均有统计学意义(P<0.05)；患者满意度明显升高，差异有统计学意义(P<0.05)。**结论** 基于快速康复（FTS）理念的护理策略在脊柱转移瘤患者椎体成形术（PVP）围术期的应用是可靠的，减轻患者疼痛提高了舒适度，减少了并发症，缩短了平均住院时间，加速了患者康复，值得在临床推广使用。

不同浓度的碘对比剂对患者 ADR 的影响及安全管理

苏蕾
贵州省肿瘤医院

目的：探讨如何有效控制不同浓度碘对比剂对患者药物不良反应的影响，为患者安全提供依据。方法：收集自 2018 年 3 月至 2018 年 8 月期间在本院进行东芝 80 排 160 层高端螺旋 CT Aquilion PRIME 增强患者 280 例，本研究已排除肾功能不全者；依据 CT 增强中采用的碘对比剂类型建立低浓度组试验组（碘含量：300mg/ml）和高浓度高组对照组（碘含量：370ml/mg）两个组别；低浓度组采用 22G 留置针注射速度为 2.5ML/S 进行 CT 增强扫描，扫描后对患者留观 30min 观察 并进行尿碘检测，高浓度组采用 22G 留置针注射注射速度为 2.5ML/进行 CT 增强扫描，扫描后留观 30min 观察，并进行尿碘检测。结果：低浓度尿检下含碘量＜高浓度尿检下含碘量，试验组显影速度>对照组显影速度。结论：低浓度碘造影剂 CT 增强扫描和高浓度碘造影剂 CT 增强扫描都可判断一般性质的 CT 增强检察，对诊断学都具有诊断意义，在不影响诊断结果的前提下适当选择低浓度低剂量的碘造影剂是维护患者在检查过程中发生用药安全的重要护理手段。

EPO-2261
个性化优质护理对化疗患者 CT 增强扫描检查的价值分析

黄莉,徐玉,杨凯
泸州市人民医院

前言：CT 造影是目前临床上常用的一种检查方式，用于患者的检查 和诊断。该方法由于需要在患者身体内注射造影剂【1】，因此如果准备不当，或者护理不当，就会造成患者的检查失败，不仅耽误患者的诊断时间，也会对患者的经济造成一定的压力，为后续的治疗延长了时间，并且患者也会承受一定的痛苦。而化疗患者的身体状况本身就不是很好，且因为长期化疗，血管条件很差，在这种情况下再注射造影剂，很容易使得患者出现不安和焦躁的情绪，从而影响患者的检查和诊断。因此在诊断的过程当中，需要对患者进行相应的护理干预【2】，常规的护理干预往往不能够达到理想的效果，因此个性化优质护理干预应运而生。本文旨在研究，个性化优质护理对化疗患者 CT 增强扫描检查的价值影响，方法如下文。

【摘要】目的：分析和探讨个性化优质护理对化疗患者 CT 增强扫描检查的价值影响。方法：将我院医学影像科 2019 年 1 月 1 日至 2019 年 7 月 31 日之间收治 60 例 CT 增强扫描检查化疗患者，用“随机分组法”分为对照组和观察组，每组 23 例患者，对照组患者采用常规护理干预，观察组患者在对照组的基础上，采用个性化优质护理干预，观察和对比两组患者的 CT 增强扫描检查成功率，以及患者的不良反应发生情况。结果：在检查成功率方面，观察组明显高于对照组(p 值＜0.05)；在不良反应发生概率方面，观察组明显低于对照组(p 值＜0.05)；综合满意度方面，观察组显著高于对照组(p 值＜0.05)。结论：个性化优质护理对化疗患者 CT 增强扫描检查的价值影响深远，效果显著，应用价值高，能够有效的提升患者的检查成功率，降低患者的不良反应发生概率，提高综合满意度，因此，个性化优质护理适合在临床进行推广和使用。

EPO-2262
根本原因分析法在磁共振胆道成像低血糖患者安全管理中的应用

龚梦,魏露
华中科技大学同济医学院附属同济医院

目的：探讨根本原因分析法（RCA）在磁共振胆道成像(MRCP)低血糖患者安全管理中的应用效果。

方法：回顾性分析统计我科 2018 年 6 月—12 月 RCA 实施前 MRCP 检查患者作为对照组，给予常规护理。将 2019 年 1 月—6 月 RCA 实施后 MRCP 检查患者作为观察组。统计分析两组患者的低血糖不良事件发生率，患者满意度的情况。RCA 实施过程：科室成立 MRCP 检查患者低血糖预防安全小组，在科内组织全科护士采用价值流图对其易发生低血糖进行原因分析探讨，制定相应整改措施，每月底对不良事件进行柏拉图分析，找出高风险因素，采取针对性预防措施，落实整改措施并评价效果。

结果：观察组 MRCP 检查患者低血糖不良事件发生率为 0.12%（3 例），低于对照组六个月的 0.48%（11 例），差异有统计学意义（x~2=4.302，P＜0.05），患者满意度也由 89.8%提高到 97.9%。二者比较存在统计学意义。

结论：实施 RCA 能使磁共振护理安全管理标准化，规范化，制度化，有效降低磁共振 MRCP 检查患者低血糖不良事件发生率，提高患者满意度，对提高护理安全具有重要意义。

EPO-2263
碘对比剂温度在 CT 增强检查中患者静脉血管反应的对比

邓慧莉,王文燕
贵州省肿瘤医院

目的 探讨加热对比剂的温度，减少患者血管静脉炎的发生，增加患者的舒适感。方法将我科 2450 例接受 CT 增强的患者分为两组。其中一组使用加热后的对比剂做 CT 检查（实验组），另一组采用室温中的对比剂做 CT 检查（对照组）。每组对象均为 1225 例。扫描结束后根据美国静脉输液协会（INC）静脉炎评分标准，查看两组血管反应对比。结果实验组仅为 11 例发生 1 级静脉炎反应，5 例为 2 级静脉炎反应，实验组发生率为 1.3%。对照组有 112 例发生 1 级静脉炎反应，25 例发生 2 级静脉炎反应，对照组发生率为 11%。明显高于实验组（P＜0.02）,结论加热对比剂能有效预防 CT 增强后血管\静脉炎的发生，并且也能大大增加患者的舒适度。

EPO-2264
癌症患者自我效能感和生活质量相关因素的研究和启示

钱多
苏州大学附属第一医院

目的 当前全世界癌症的发病率和病死率很高，恶性肿瘤已成为严重威胁人们生命安全的主要疾病之一，给患者本人及家庭、社会造成极大的心理、经济负担，也严重影响了患者的生活质量。当前癌症的主要治疗方法有手术、化疗、放疗、内分泌治疗、生物免疫治疗等，而且临床上往往采用综合的治疗方法来治疗癌症，使癌症患者带瘤生存期逐渐延长。自我效能指个体对自己是否有能力去实施某一行为的期望，是人们对自我行为能力的认知与评价。这一概念最早由美国斯坦福大学著名心理学家 Albert Bandura 提出的，自我效能理论的提出，首先博得了教育界的极大兴趣与重视，近年来逐渐用于护理研究中。作为一种解释人类行为的理论，自我效能理论从全新的角度揭示了人类行为的形成与维系机制，为我们分析和认识护理对象的行为开辟了新视野，也为护理行为干预的研究开启了新的思路。**方法** 根据 Bandura 的理论，自我效能水平越高，行为的采取、维系和努力程度越高。特别是在慢性病的治疗中，提高自我效能有利于将慢性病患者的健康状况、健康功能维持在一个满意的状态，使其过上独立的生活，以自我效能为理论框架的行为干预的核心就是检验自我效能理论引导下设计的自我效能训练，如认知行为干预和或自我管理教育干预，对病人自我管理效能水平、行为变化以及生活质量的改善起到一定的作用。而癌症患者也具有与慢性病患者相似的症状特征，如失眠、食欲不振、躯体疼痛、焦虑抑郁等躯体和情感障碍，因此，国内外也逐渐将自我效能理论的研究引入癌症患者的护理服务中，以更好地解决癌症患者带瘤生存期的疾病管理问题，以提高癌症患者的生活质量。本文就国内外学者对癌症患者自我效能的评估工具，生活质量的评估工具研究，以及目前国内外学者就癌症患者自我效能和生活质量相关性的研究进展展开如下综述。

EPO-2265
多媒体视频宣教在下肢静脉曲张术后早期活动中的应用与效果评价

钱多
苏州大学附属第一医院

目的 下肢深静脉血栓形成（deep venous thrombosis，DVT）是下肢静脉曲张手术严重的并发症，发生概率比预期高，近年来国内外报道发生率可达 0.54-5.3%，严重时可进展为肺栓塞（pulmonary embolism，PE），危及患者生命，术后除常规使用抗凝药物外，应鼓励患者早起活动，术后早期活动有利于改善血液循环，预防 DVT。传统的宣教多采用口头方式，由于患者年龄、学历以及社会背景不同，接受能力不同，一般达不到预期效果。随着科技的发展和手机的普及，护理工作模式也发生了改变。我院针对下肢静脉曲张患者术后活动制定了一套血管操，并制作成视频，上传至微信公众号，包括普通话版本和方言版本，因人制宜，以适应不同的患者。本文旨在探讨传统方法进行活动指导与应用多媒体视频进行活动指导的效果评价。**方法** 选择 2018 年 1 月到 2018 年 12 月在本院介入科收治并手术治疗的患者 198 例作为研究对象。198 例患者随机分为研究组（99 例）和对照组（99 例）。对照组采用书面形式和口头形式进行术后活动指导。研究组在对照组的基础上，采用对媒体视频形式代替口头宣教为患者进行术后活动指导。多媒体视频由科室护士扮演标准化病人在真实场景进行演示。比较两组的护理满意度。**结果** 研究组患者出院满意度高于对照组，差异有统计学意义（P<0.05）。**结论** 传统的宣传多采用口头和书面相结合的方式，形式刻板，内容晦涩难懂，示范操作难以理解，尤其是老年患者及低文化程度患者，易产生偏差；且护士个人表达能力不等，容易产生误解。多媒体视频将难以想象的画面用直观的短片表达出来，做到图文并茂，使宣教内容变得生动，便于理解，对老年患者及低文化程度患者是更好的选择。同时保证了宣教内容的标准化及统一化，适应优质护理理念的要求。多媒体视频便于患者接受和理解及充分配合，从而加快患者康复，减少住院时间，提高了护理满意度。

EPO-2266
1 例椎动脉狭窄行球囊扩张合并椎动脉支架植入术患者的护理

张姗姗
苏州大学附属第一医院

目的：总结了 1 例椎动脉狭窄患者行球囊扩张术合并椎动脉支架植入手术后的综合护理。椎动脉狭窄示引起后循环卒中的重要原因之一。介于后循环供血区脑组织的重要功能，其卒中具有更高的致死率和致残率。目前，单纯的药物治疗难以奏效，随着神经介入技术的进步，血管内支架植入术治疗椎动脉狭窄已成为改善重度椎动脉狭窄、缓解后循环缺血发生最重要的治疗手段[1]。椎动脉支架植入术因其具有创伤小、恢复快、并发症少，安全性高等特点，并随着技术的逐渐成熟，越来越多的患者接受了这种治疗并从中受益。方法：通过对我科收治的患者进行全面综合的护理，患者俞某男性，因“右手食指指尖及舌尖麻木半年余”于 2018 年 8 月 4 日入院。患者入院后自觉右手指及舌尖有麻木感，即行脑血管造影术，造影提示右侧椎动脉开口重度狭窄，左侧椎动脉开口闭塞，完善术前准备后于 08-10 行血管内球囊扩张术合并椎动脉支架植入术，术后患者恢复良好，经过总结和整理，该类患者的护理要点包括：术后常规护理有心理护理，体位护理，穿刺点护理，生活护理，抗凝药物治疗的护理，监测血常规、凝血功能变化，术后并发症的观察与护理，术后健康指导及随访，包括限制重体力活动，避免剧烈活动，保持情绪稳定。 养成良好的生活习惯，戒烟少酒，避免高盐、高脂饮食及过饱，多食蔬菜、水果。向患者说明抗血小板聚集治疗的重要性，严格遵医嘱服用药物。结果 通过给予患者及时、有效、全面的护理，患者快速康复出院。结论 血管内支架成形术作为一种微创的治疗方法，支架具有损伤小、血流阻断时间短、技术成功率高等优点，支架治疗颈内动脉狭窄已逐渐被应用于临床。但需认识到介入治疗仍是侵袭性操作，应客观认识到其危险性。因此，要求护士适应新技术的发展，对术后并发症进行预见性护理，及时将信息反馈给医生，积极有效治疗和处理并发症，是提高介入治疗成功的保证。

EPO-2267
综合护理干预对颈动脉支架置入术后低血压的应用效果

赵丹
苏州大学附属第一医院

目的 颈动脉支架置入术（CAS)及颈动脉内膜剥脱术（CEA ）已经成为治疗颈动脉狭窄或闭塞的一种安全有效的新技术。严重低灌注可能导致脑循环缺血产生短暂性或永久性神经系统损伤症状。因此我们在围手术期维持血流动力学稳定尤为重要 **方法** 选取我院 2014 年 10 月—2018 年 7 月在我科进行颈动脉支架置入术的患者 86 例，根据随机分组法分为观察组 43 例和对照组 43 例，对照组采取常规护理包括对照组患者采取常规住院护理主要包括：病区环境介绍、简单手术过程讲解、心理护理、完善术前检查，术区部位清洁备皮、抗凝药物管理、饮食指导、病情观察要点及康复指导等。观察组采取综合护理干预措施包括了风险因素评估、术前适应性训练、术后正确卧床宣教、急救药品、物品准备、麻醉诱导前液体治疗、术后低血压的护理。对比分析 2 组患者术后低血压的发生率、术后正确卧床配合对低血压发生时不适症状的影响、护理满意度、住院天数。**结果** 观察组低血压发生率明显高于对照组； 观察组低血压术后正确卧床配合后无不适症状明显低于对照组；观察组住院天数较对照组有效缩短；观察组护理满意度显著高于对照组，差异均具有统计学意义（$p<0.05$）。单因素分析观察组支架球囊扩张低血压发生率明显高于对照组，差异有统计学意义（$P<0.05$），然而，本研究发现使用球囊预扩张与术后出现低血压发生有着明显的相关性，有文献报道狭窄距分叉处距离≤10㎜、重度狭窄（70%～99%）也是 CAS 相关性血流动力学损害的独立危险因素，与术后发生持续性低血压有关，但本研究未予证实。**结论** 术后低血压的发生与颈动脉支架置入球囊预扩张有关，通过综合护理干预有效避免低血压发生时引起的不适症状，未发生低血压引起的并发症，提升了病人的护理满意度，缩短了住院天数。

EPO-2268
临床护理路径在急诊子宫动脉栓塞术中的应用

王霞,周容
重庆医科大学附属永川医院

【摘要】目的 探讨临床护理路径在难治性产后出血行急诊介入治疗中的应用。**方法** 将 2018 年 1 月～12 月在我科按临床护理路径实施介入手术护理的 31 例患者作为观察组。将 2017 年 1 月～12 月实施常规护理的 24 例患者作为对照组。观察两组病人的术前准备合格率、手术时间、病人及手术医生满意度进行比较。**结果** 实验组各项指标均优于对照组($P<0.05$)，差异有显著性。**结论** 临床护理路径规范了难治性产后出血患者行急诊介入治疗的围手术期护理程序，有效提高了患者与手术医生的满意度，同时保证了护理质量，值得进一步推广。

EPO-2269
中心静脉导管高压注射碘对比剂的安全性研究进展

李雪,蔡莉
陆军特色医学中心（大坪医院）

碘对比剂（Iodinated Contrast Media，ICM）是动态 CT 扫描的重要显影剂，并且随着血管成像和灌注成像的发展将变得更加关键，稳定的静脉通道是保证 CT 顺利进行和获得高质量图像的必要条件。一直以来外周静脉是注射 ICM 的主要输注通道，然而并非所有患者都有良好的外周静脉，尤其是急危重症或化疗的患者，可能会导致反复穿刺，甚至无法进行 CT 增强检查。由于 ICM 注射时采用高压力、大剂量注射，加上 ICM 本身具有高浓度、高渗透压、高粘滞度等物理特性，导致注射 ICM 时存在渗漏的风险[1-3]。基于此，通过经皮中心静脉导管（Central Venous Catheter，CVC）或经外周置入的中心静脉导管（Peripherally Inserted Central Catheter，PICC）高压注射 ICM 的安全性引起大家的关注，其观点并不一致。本文就中心静脉导管高压注射碘对比剂安全性的国内外研究进行综述，为穿刺特别困难的患者输注通道的选择提供参考依据，为下一步的深入研究提出指导性建议。

EPO-2270
非离子碘对比剂对相关风险人群甲状腺功能影响的研究进展

李雪
陆军特色医学中心（大坪医院）

碘对比剂是 CT 检查和介入治疗的首选显影剂，甲状腺疾病是使用碘对比剂的重要危险因素之一。碘对比剂对甲状腺功能的影响机制复杂，国内外关于离子碘对比剂对甲状腺疾病的影响研究基本达成共识，认为有可能影响甲状腺功能，目前已被 NICMs 所替代。 NICMs 已成为电子计算机断层扫描(Electronic computed tomography, CT)及介入的首选显影剂，虽然明显减少了对甲状腺功能的影响，提高了使用的安全性，但在使用范围日益增大的情况下，其对甲状腺功能的影响国内外尚未达成共识，临床上没有可以遵循的明确依据。有研究显示碘诱导的甲状腺功能紊乱并不一定是单一因素引起，可能与 ICMs、结节性甲状腺疾病、药物、老年人以及某些基础疾病等有关。由于甲状腺疾病种类、程度及相关影响因素的不同，使用 ICMs 后给患者带来的不良后果也可能不同。值得注意的是，对于这些风险因素可以通过早期识别和提前干预来降低风险程度，尽可能避免不良后果的发生。目前，CT 及介入对甲状腺功能亢进关注较多，而对其它甲状腺疾病及影响因素关注少。本文就 NICMs 对具有甲状腺疾病及相关风险人群甲状腺功能影响程度的国内外研究进行综述，旨在为该类患者的早期评估和可能的干预提供参考依据，为下一步的深入研究提出指导性建议。

两种检查前准备方法对多层螺旋 CT 胃周血管成像效果的影响及护理

杨艳红
中山大学附属第一医院

目的 探讨两种检查前准备方法对多层螺旋 CT 胃周血管成像效果的影响及总结护理要点，提高螺旋 CT 胃周血管成像的质量。**方法** 选取 2016 年 1 月-12 月在本院行术前腹部 64 层螺旋 CT 胃周血管成像的胃癌患者 60 例，采用随机数字表法将患者随机分为实验组与对照组，每组各 30 例。对照组患者按常规 CT 扫描前准备，实验组患者在对照组基础上扫描前禁水 6~8h，扫描前 30min 训练患者屏气，10min 前肌内注射 654-2 10mg，扫描前即刻口服 6g 产气粉+10mL 温开水。比较两组患者扫描时胃周血管解剖位置清晰度评分、胃腔充盈满意、及胃形态情况。**结果** 两组患者扫描时胃周血管解剖位置清晰度、胃腔充盈满意及胃形态情况比较，$P<0.05$，差异有统计学意义，实验组患者优于对照组。**结论** 在常规 CT 扫描前准备基础上+禁水 6~8h+训练屏气+肌内注射 654-2 口服+产气粉检查前准备，有助于提高胃周血管空间解剖关系的准确性，对临床进一步诊疗工作提供帮助。

中西医结合护理对急性冠脉综合征患者主动脉球囊反搏植入术后焦虑状态的效果观察

孔欣怡
南昌大学第二附属医院

目的 评估中医耳穴埋籽法联合传统护理方式对急性冠脉综合征（ACS）患者主动脉球囊反搏植入术后焦虑状态的缓解效果。**方法** 选取 2018 年 6 月—2019 年 8 月于南昌大学第二附属医院就诊的符合纳入标准的 ACS 患者 160 例，依据随机数字表法分为对照组和治疗组，每组 80 例。对照组

采用心理压力管理-增强自信-医护心理疏导综合护理，并耳穴贴敷安慰剂贴膏（糊精、焦糖粉、淀粉组成），模糊外观，与治疗组重量相等。治疗组在常规心理压力管理-增强自信-医护心理疏导综合护理基础上，于睡前选固定穴位，用王不留行（耳籽）贴压耳穴，1 周为 1 个疗程。对比护理前后患者焦虑评分。**结果** 对照组患者试验过程中脱落 4 例，最终完成治疗 76 例。治疗组患者实验过程中脱落 6 例，最终完成治疗 74 例。治疗前两组患者焦虑评分比较，差异无统计学意义（P＞0.05），治疗后两组患者焦虑评分均较前下降且有统计意义（P<0.05）；治疗组中经中医护理后中、重度焦虑评分明显优于对照组，差异有统计学意义（P＜0.05）；但在轻度焦虑亚组，对照治疗组比较无统计学意义（P＞0.05）。两组患者临床疗效比较治疗组患者临床疗效优于对照组。治疗组中三个亚组（UA、NSTEMI、STEMI）治疗后均较治疗前明显降低，有统计学意义（p<0.001）。**结论** 中医耳穴埋籽法联合传统护理方式可以明显减轻 ACS 患者主动脉球囊反搏植入术后的焦虑状态，有助于其更好配合临床治疗。

EPO-2275
不同年龄段动脉化疗栓塞术后肝癌患者抑郁情绪影响因素的差异性研究

钱多
苏州大学附属第一医院

目的 原发性肝癌（Primary hepatic carcinoma, PHC 以下简称肝癌）是世界上最常见的恶性肿瘤之一，其全球发病率和死亡率分别列第 5 位和第 3 位。在中国肝癌的发病率仅次于肺癌和胃癌，而其病死率则列第 2 位。原发性肝癌因其发现时大多已经属于中晚期，恶性程度高，死亡率高。国内外的多项研究调查表明，肝癌患者多存在焦虑、抑郁、恐惧等负性心理情绪，甚至丧失生活信心，进而拒绝接受患病的现实并且拒绝临床治疗。经导管肝动脉化疗栓塞术的方法已经成为了当前肝癌患者的主要治疗方法，其优点是创伤小、疗效确切、病人恢复快，在临床上已经取得了明显的效果，使更多的肝癌患者进入了比较长的带瘤生存期。探讨肝动脉化疗栓塞术后肝癌患者的抑郁状况影响因素以及差异，为临床医务人员进行干预提供依据。**方法** 方便抽取 2018 年 1 月--2018 年 12 月 153 例住院的行肝动脉化疗栓塞术后的肝癌患者，应用一般资料调查表、Zung 的抑郁自评量表、肝癌患者生活质量量表、MSAS 症状评估量表和社会支持量表进行生理、心理和社会方面的全面评估，并将患者分为青年组、中年组和老年组分别进行单因素的筛选和多因素的 logistic 回归分析，比较各组患者抑郁影响因素的差异性。**结果** 是否接受健康培训和客观支持是青年组肝癌 TACE 术后抑郁的影响因素；家庭类型、病程、ECOG 体能评分和主观支持是中年组肝癌患者抑郁的影响因素；谷丙转氨酶值、症状副作用评分和对支持利用度是老年组肝癌患者抑郁的影响因素。**结论** 本研究将不同年龄的肝癌 TACE 术后患者的抑郁情绪进行调查并分析影响因素，抑郁情绪的发生也是多因素相互作用，相互影响的结果不同年龄段肝癌患者的抑郁影响因素也不尽相同，医护人员要有针对性分析各个年龄层次的患者制定有效的政策和干预措施，才可以控制抑郁情绪的发生和发展，提高肝癌患者的生活质量，为今后的治疗和护理提供更有力的循征依据。

EPO-2276
护理专案改善缩短急性缺血性脑卒中介入治疗关键时间的应用

陈健聪,杨文才,陈利芳
暨南大学医学院第一附属医院

目的：指南建议急性缺血性卒中(AIS)取栓患者入院至穿刺和再通时间应分别在 90 与 120 分钟内。因接诊、转运、完善检查等不可避免的院内延误，取栓的黄金时间被进一步的压缩，也要求更加高效，而入室至穿刺时间和穿刺至再通时间则成为取栓的关键时间。本文目的通过护理专案改善缩短 AIS 取栓关键时间。
方法：小组调查 2018 年 1-3 月 AIS 取栓的 31 例患者现状，进行原因分析和目标制定，实施如下对策：(1)术前沟通常态化：通过社交软件加强院前沟通，获得患者姓名、年龄、预计抵达时间等信息以提前完成登记，并提前与神经介入医生了解术中耗材、镇静等需求以完善准备；(2)人员配置合理化：由传统的“1 护士+1 技术员”的配合模式调整至由 2 名具有基础影像配合能力的护士配合，共同承担术中护理；(3)业务能力高效化：定期学习新耗材的临床使用，总结术中配合要点并全科培训。分批安排护士到 ICU 轮科学习，以掌握镇静护理、急重症患者护理等业务能力；(4)约束镇静程序化：选择快捷高效的约束工具、合理的镇静评分工具，与医生制定程序化的镇静方案，并术中根据动态评估遵医嘱调整；(5)耗材管理专业化：启用 AIS 耗材机动车，保证必要耗材齐全，可推车随时随地启用，提高接诊反应效率；(6)时间记录科学化：采用客观电子时间记录，影像相关时间节点由统一的 PACS 系统记录，图像产生的同时自动生成时间；非影像相关时间节点，由护士使用带时间记录功能的录音笔进行记录，按下录音时说出时间节点即可。
结果：护理专案改善后，2018 年 10-12 月 41 名患者入室至再通平均时间为 45.3 分钟，其中入室至穿刺平均时间为 12.4 分钟，穿刺至再通平均时间为 32.9 分钟，达到了目标值。
结论：通过护理专案活动，可将 AIS 取栓患者入室-穿刺-再通的流程细化，逐项完善，制定出标准化的工作指引，并加强了全科人员的业务学习与能力培训，有效地缩短了 AIS 患者取栓的关键时间。

EPO-2277
HIMSS 信息平台联合“三查七对”有效降低患者身份识别错误率的研究

赵丽,孙峥,姚远,孙雪梅,张苗,卢洁
首都医科大学宣武医院

目的 探讨 HIMSS 信息平台联合“三查七对”在降低患者磁共振检查中身份识别错误率的应用。**方法** 选取 2017 年 1 月至 2018 年 12 月我放射科磁共振检查患者 100 例，随机分为对照组与研究组，各 50 例。应用 HIS 和 RIS 系统量化采集核对登记时间，就诊等候时间，技师复验时间以及患者身份识别正确率；再对磁共振室检查环境、登记流程以及护理服务等方面进行患者满意度分析。**结果** 研究组患者较对照组的核对登记时间，就诊等候时间，技师复验时间分别为(1.98 ±1. 03 vs. 1.63 ±0. 87，t =2.112, P <0.05)；(9. 22 ±3. 12 vs. 7. 24 ±2. 84，t =8.223, P <0.05)；(2.28 ±0. 63 vs. 1.03 ±0. 95，t =7.792, P <0.05)；结果显示联合应用 HIMSS 信息平台显著缩短患者登记等候时间。研究组患者身份识别正确率为 100%，对照组漏诊 2 例，正确率为 96%。研究组患者对磁共振室检查环境、登记流程以及护理服务等方面的满意度均显著高于对照组(P <0. 05)。**结论** 在“三查七对”患者身份识别的基础上，联合应用 HIMSS 信息平台技术有利于降低患者身份识别错误率，保证患者医疗检查安全。

Revolution CT 间接法联合直接法下肢动、静脉成像护理

陈洪亮
宜宾市第二人民医院

[摘要]**目的：**分析总结 Revolution CT 间接法联合直接法下肢动、静脉成像护理要点，并探讨临床价值。**方法：**2018 年 8 月至 2019 年 2 月采用下肢动脉间接法且同时静脉间接法联合直接法成像共 54 例患者，从检查前准备、穿刺方法、准确配制用药和高压注射器使用方面的护理经验进行分析。**结果：**本研究 54 例下肢血管成像患者，均无明显不适和对比剂过敏反应，增强扫描共发生对比剂外渗患者 2 例，其余动、静脉成功显像，动、静脉密度较高且均匀，无假充盈缺损，图像质量符合诊断要求。**结论：**采用正确的护理方法进行 Revolution CT 间接法联合直接法下肢动、静脉成像具有重要的临床意义。

EPO-2279
恶性肿瘤骨转移行经皮椎体成形术对围手术期护理干预的研究

赵裕凤
中国医科大学附属盛京医院滑翔分院

目的：椎体成形术（vertebroplasty）是将各种可注射性生物材料经椎弓根注射到病变部位来强化椎体，解除疼痛稳定脊柱。经皮椎体成形术（PVP）是通过椎弓根想椎体内注入骨水泥的方法，增强椎体强度和稳定性以缓解腰背部疼痛，甚至部分恢复椎体高度，是治疗椎体肿瘤的一种微创手术。现对 40 名椎体成形术患者分成两组。干预组，进行观察及围手术期及术后、出院指导宣教等宣教；对照组，进行观察及术后对症处理等方法，现报告如下：

1.资料与方法 1.1 资料 将我科 2018 年 1 月至 12 月收治恶性肿瘤骨转移的患者 40 例作为对象，分为两组作为对象，分为 2 组给予不同的护理措施；干预组 20 例，年龄 35-72 岁。对照组 20 例，年龄 42-68 岁。

评定项目 临床预后统计患者睡眠及进食及排便情况（睡眠指每天小于 6 小时；进食指每天需 3 餐，每餐大于 120 克；排便指 3 日未排大便）

组别	例	睡眠	进食	排便	发生率
干预组	20	1	1	0	10%
对照组	20	5	5	3	65%

讨论：椎体转移瘤可由多种恶性肿瘤发生椎体转移而引起，不仅造成顽固性疼痛，而且进一步破坏骨质，导致椎体病理性骨折，进行压迫脊椎，直至死亡。由于椎体成形术是一种新技术，尤其是特殊的手术方法会增加患者心理负担，导致睡眠、进食差及担心出血造成排便困难。对患者病情恢复极为不利的，因此在围手术期的护理是非常重要的，干预组比对照组发生率下降了 55%。所以，围手术期的护理及观察是极为重要的，充分准备，熟练观察病情，一丝不苟的监护是手术成功的重要保证。

EPO-2280
下肢制动水晶腿套在股动脉穿刺术后的应用

赵裕凤
中国医科大学附属盛京医院滑翔分院

股动脉穿刺手术已经广泛应用到临床，介入手术需穿刺股动脉（ TAE 术，TAI 术，PTA 术，UAE 术， UAI 术，支气管造影及栓塞术），穿刺股动脉易引起出血等并发症。
目的：
1.如何减少出血？除了患者的配合之外，我们还能做些什么呢？
我们在平日的护理工作中观察到，髋关节移动，屈曲会造成出血。那么如何制动髋关节就是我们需要解决的问题。穿刺点在皮肤的皱褶处，是活动最大的区域，患者在睡眠 时并不能控制。
2.如何制动髋关节？
我们通过日常的观察，发现主动制动膝关节，可间接制动髋关节移动。使患者髋关节折曲困难，减少术后出血等并发症。自制水晶腿套就是针对术后出血研制出的器具，可 以通过制动膝关节，禁止髋关节屈曲。自制下肢制动水晶腿套已成功申请实用新型专利（专利号：ZL 2015 2 0198408.4）此专利已被健康报护士频道转载。应用于临床使用下肢水晶腿套效果进行对比观察，现报告如下。
资料与方法
1.1 一般资料 选取 2018 年 1 月-2018 年 6 月股动脉穿刺病人 100 例，其中男 68 例，女 32 例。年龄（50±10）入选患者随机分为两组：
1.1.2 对照组 患者术后安返病房，对患者及家属进行相关的知识教育，告知穿刺点侧下肢肢体制动 12h，局部绷带加压包扎或压迫止血器压迫止血，指导患者采取卧位。
1.1.3 观察组 患者术后安返病房，对患者及家属进行相关的知识教育，告知穿刺点侧下肢肢体制动 12h，局部绷带加压包扎或压迫止血器压迫止血 ，指导患者采取卧位，并采用下肢自制水晶退套进行下肢的固定。
结论：
临床应用中，未用下肢制动腿套的患者 50 例，因髋关节活动不当，42%的患者出现并发症，使用下肢制动水晶腿套患者 50 例，8%患者出现并发症，其并发症比例下降 34%达到了理想效果。使用下肢制动水晶腿套取得患者的认可及较高的一致好评，同时也提高了患者的满意度。

EPO-2281
上肢制动止血舒适垫在主动脉瘤腔内修复术术后的应用

赵裕凤
中国医科大学附属盛京医院滑翔分院

目的：
随着优质护理服务的开展，减轻患者的痛苦，提高患者的舒适度和满意度成为了护理工作中不可缺少的一部分。肱动脉穿刺是指通过肱动脉为入路径进行介入手术治疗的术式 （如主动脉瘤腔内修复术等），术后患者返回病房，穿刺处的上肢经常需要制动 24 小时，医生常采用弹力绷带加压包扎或无菌纱布缠绕穿刺点进行压迫止血，由于肘关节长时间的制动，易造成患者上肢制动的不舒适，影响到患者情绪及睡眠，并且一旦患者肘部不自觉的活动，非常容易造成穿刺点处出血。因此为了解决这一问题。我们研究设计了一款上肢制动止血舒适垫。现对 2018 年 8 月-12 月期间行肱动脉介入手术的 20 例患者围手术期护理工作进行总结，报道如下。
资料与方法：
1.1 一般资料 该组患者共 20 例，其中男 13 例，女 7 例；年龄 42-72 岁。
1.12 术后护理 监测生命体征 术后返回病房，立即给予心电血压血氧监护等，监测体温、脉搏、呼吸、血压等生命体征.

1.13 体位护理　　返回病房后 给予平卧位，检查患者皮肤受压情况，及穿刺点情况，观察患者桡动脉搏动情况及皮温皮色情况。给予佩戴上肢制动止血舒适垫.
结论
在 2018 年 8 月-12 月需上肢制动患者在临床应用中，患者 10 例，因肘关节活动不当，30%的患者出现并发症；使用上肢制动止血舒适垫患者 10 例，10%的患者出现并发症，其并发症比例下降 30%达到了理想效果。使用上肢制动止血舒适垫取得患者的认可及较高的一致好评，同时也提高了患者的满意度。

EPO-2282
探讨综合性管理对介入导管室护理质量的控制效果

曹宏霞
唐山市工人医院

目的：分析探讨综合性管理方法对介入导管室护理质量控制效果。方法：随机纳入本院 2017 年 1 月至 2017 年 12 月介入导管室收治 100 例患者建立对照组，随机纳入 2018 年 1 月至 2018 年 12 月介入导管室收治 100 例患者建立管理组。对照组采用常规护理管理，管理组采用综合性管理，对比两组患者对护理质量评分情况，术间管理评分与护理失误率情况。结果：管理组患者对护理质量评分相比对照组明显更高；医生对管理组术间管理评分相比对照组明显更高（P<0.05）；管理组患者介入导管室护理失误事件发生率相比对照组明显更低（P<0.05）。结论：综合性管理可提高介入导管室的护理工作质量，患者、医生对于综合性管理的护理质量评分高，该管理方法同时可降低护理失误事件发生率。该管理方法具临床应用价值。

EPO-2283
分析冠脉介入手术（PCI）的导管室护理风险管理措施

曹宏霞
唐山市工人医院

目的：分析并探讨冠脉介入手术（PCI）导管室护理风险管理措施及效果。方法：搜集本院 2018 年 3 月至 2019 年 3 月进行 60 例 PCI 手术治疗患者作为研究对象，随机将患者分为对照组（n=30）与研究组（n=30），对照组 PCI 围术期予以常规护理管理，研究组进行导管室护理风险管理，观察比较两组患者的风险事件发生率。结果：研究组患者手术风险事件发生率为 6.67%（2/30），对照组患者手术风险事件发生率为 26.67%（8/30），研究组患者手术风险率相比对照组明显更低（P<0.05）。结论：对于进行冠脉介入手术治疗患者在导管室护理中进行护理风险管理有助于降低手术风险事件发生率，该方法值得进行临床推广与应用。

EPO-2284
风险管理对提高介入护理管理质量的影响评价

黄卫庆,陈玲带
广西医科大学第二附属医院

【摘要】目的：研究风险管理对提高介入护理管理质量的影响。**方法：**选择介入治疗患者作为本次研究病人或研究对象，并采用“电脑随机法”将 200 例介入治疗患者进行分组，主要包括两组，其中观察组、实施风险管理；对照组、实施常规管理，将两组风险事件发生情况、护理质量评分以及患者满意度进行对比。**结果:**观察组介入治疗患者患者投诉率 2.00%、护理差错率 1.00%低于对照组，差异表示为统计学意义，（P＜0.05）。两组介入治疗患者护理质量评分相比较，观察组介入治疗患者护理质量评分更高，差异有统计学意义，（P＜0.05）。观察组介入治疗患者满意度高于对照组，差异有统计学意义，P<0.05。**结论：**风险管理对提高介入护理管理质量具有重要意义，同时能够降低风险事件发生率，提高介入护理管理质量，值得研究。

EPO-2285
罗哌卡因联合利多卡因在永久性心脏起搏器术中镇痛疗效的观察

周亮
南昌大学第二附属医院

目的：观察低浓度罗哌卡因联合利多卡因行永久性心脏起搏器术中镇痛疗效的效果。方法：选取 2017 年 1 月-2017 年 8 月我院行永久性心脏起搏器患者 160 例，随机分为罗哌卡因+利多卡因组（实验组）80 例和利多卡因组（对照组）80 例，选择皮下注射局部麻醉进行手术；实验组：0．2％罗哌卡因+0．5％利多卡因局部麻醉。对照组：0．5％利多卡因局部麻醉。其中实验组 80 例中，男 56 例，女 24 例，年龄在 55-79 岁，平均（65.5±4.9）岁；对照组 80 例患者，男 42 例，女 38 例，年龄在 58-81 岁，平均（64.6±5.3）岁。排除意识障碍、手术禁忌者，本次研究经我院伦理委员会批准，两组患者基线资料均衡可比（p＞0.05）。观察并记录术中镇痛效果评分及不良反应，采用 NRS 疼痛评分表来评分。结果：评分平均实验组为（2．1±0．3）分、对照组为（4．8±0．5）分，实验组患者镇痛评分率显著低于对照组，无不良反应，p 值为 0.039%（p＜0.05），差异有统计学意义，不良反应无显著性差异。结论：观察证明两种方法均可满足临床上病人术中镇痛的需要．采用罗哌卡因+利多卡因麻醉相对有效安全，持续时间较长，可起到良好的术中镇痛作用，故罗哌卡因+利多卡因组优于利多卡因组，永久起搏器植入术中患者镇痛效果较好，从而提高术中患者舒适度和依从性，减少不良反应发生率，有助于预后，值得推广。

介绍一种改良后具有手部固定装置的 CT 头托的制作与应用

李新云
广东省人民医院

目的
介绍一种改良后具有手部固定装置的 CT 头托的制作与应用。

方法
详细阐述本改良后具有手部固定装置的 CT 头托的原理和临床应用效果。笔者改良的 CT 头托，包括 CT 手部固定托及托头座套； CT 手部固定座固定在头部容置位的旁侧。托头座套铺展在拖头座之上。头部容置位的两旁侧对应的位置上分别设置有至少两条用于固定手臂位置的第二固定带。病人进行 CT 检查时，双手举向头部，双手就可以通过手部固定装置，即 CT 手部固定托固定，从而使患者更好地进行 CT 检查及伸直肘部利于注射防外渗，外渗率由使用前的 0.118%下降至使用后的 0.043% ， 从而减轻了患者的痛苦。通过 CT 头托座套，一方面可以让患者固定双手舒适，利于检查。另一方面使头托座整洁干净，利于工作人员及时更换头托套预防病人间交叉感染，患者满意度提高。
结果
经临床应用证实改良后具有手部固定装置的 CT 头托，方便 CT 室技术员及护士的操作，增加患者的舒适度利于检查以及减少外渗的发生几率。
结论
本改良具有手部固定装置的 CT 头托具有设计合理、结构简单、使用方便、利于检查及增加患者舒适度等的优点，值得临床推广应用。

康复训练对 1 例剖宫产术后下肢深静脉血栓形成患者行介入治疗围手术期的影响分析

李喜朦,王洋
郑州大学第一附属医院（郑东院区）

[目的]探讨分析 1 例剖宫产术后下肢深静脉血栓形成的因素与预防措施。[方法]对 1 例剖宫产术后下肢深静脉血栓形成患者术后 DVT 的因素进行分析，并给予积极有效地预防深静脉血栓形成的护理措施,包括术前健康教育、心理护理、康复训练、保护下肢静脉等,术后需严密观察病情、指导并帮助患者早期进行功能锻炼等。[结果]剖宫产术后患者机体组织器官的生理性退变、外伤与手术导致静脉内膜损伤、血流缓慢及血液的高凝状态等是影响剖宫产术后下肢深静脉血栓形成的主要因素。[结论]下肢深静脉血栓形成是剖宫产患者术后较为严重的并发症之一，护理人员术后加强对患者的严密观察与护理,积极有效地预防护理干预措施可预防下肢深静脉血栓形成。

EPO-2291
风险管理对医生及护理人员手卫生依从性的影响

曹晓涛
四川大学华西医院

目的：分析风险管理对医生及护理人员手卫生依从性的影响。方法：选取 2016 年 10 月—2017 年 10 月间接受风险管理的 16 名医生和 41 名护理人员手卫生的依从性资料作为风险管理后组；另选取 2014 年 9 月—2015 年 9 月间未进行风险管理的 16 名医生和 41 名护理人员手卫生的依从性资料作为风险管理前组；比较两组医生、护理人员风险管理前后手卫生知晓率及手卫生的依从率差异情况。结果：风险管理后组医生风险管理后手卫生知识知晓率为 93.75%高于风险管理前组为 62.50%（P＜0.05），风险管理后组护理人员风险管理后手卫生知识知晓率为 100%高于风险管理前组为 63%（P＜0.05）；风险管理后组医生接触患者前手卫生依从率为 61.45%，无菌操作前为 78.13%；接触患者后手卫生依从率为 71.87% 和接触患者体液后为 92.71% 高于风险管理前组，风险管理前组医生接触受检者前、无菌操作前、接触受检者后和接触受检者体液后手卫生依从率分别为 35.42%，61.46%，41.66%和 71.88%（P＜0.05）。风险管理后组护理人员接触患者前手卫生依从率为 83.33%，无菌操作前为 86.99%；接触患者后手卫生依从率为 91.46% 和接触患者体液后为 100%高于风险管理前组，风险管理前组护理人员接触受检者前、无菌操作前、接触受检者后和接触受检者体液后手卫生依从率分别为 47.76%，51.82%，53.24%和 78.45%（P＜0.05）。结论：风险管理应用于健康管理中心的管理中的效果较为显著，强化了医生、护理人员手卫生意识，提高了手部卫生的依从率，降低及避免了院内交叉感染发生。

护患沟通实现患者心理期望值补偿在提高 CT 快速流程效益中的价值

林英,欧阳林,夏挺
中国人民解放军联勤保障部队第九〇九医院（厦门大学附属东南医院）

目的：探讨护患沟通实现患者心理期望值补偿在提高 CT 快速流程效益中的作用。
方法：横截面随机选择我院 2018 年 12 月某天上午 200 例计划 CT 检查的患者进行研究，随机均分为两组。设计两种不同的检查前护理模式，创新模式是在护患沟通中注重实现患者心理期望值补偿，入选患者为研究组；一般模式是沿用传统的轻视患者心态的强势护患沟通，入选患者为对照组。观察两组的流程效益，评价指标包括患者满意率、患者投诉率、医患吵架率、患者焦虑率、患者顺从率及检查效率。
结果：研究组患者满意率、患者顺从率及检查效率均高于对照组（95%：84.42%；79%：64.94%；100%：90.91%）； 研究组患者投诉率、医患吵架率及患者焦虑率均低于对照组（2%：14.29%；2%：12.99%；4%：16.88%）。
结论：在我国大医院 CT 检查量大的情况下，护患沟通中注重患者心理期望值补偿有利于提高 CT 快速流程效益。

25 例误诊为肺癌的肺部真菌感染的临床与影像特征分析

林燕
福建省立金山医院

摘要：目的：分析误诊为肺癌的肺部真菌感染患者的临床与影像学资料，建立基于临床与影像特征综合分析方法，从而避免影像误诊的发生。方法：回顾性分析 25 例初诊为肺恶性肿瘤，确诊为肺真菌感染的患者的临床及 CT 资料。结果：纳入研究患者平均年龄为 56.8 岁（31-80 岁）。最常见的症状为咳嗽（48%），咳痰（44%），胸痛（20%）以及发热（8%）。肿物平均大小为 36.5（10-82）mm。CT 表现包括肺小结节（52%）、肺团块状占位（36%）或者两者皆有（12%）。肿块边缘可表现为分叶状 9（36%），边界不清 5（20%）以及边缘光滑 3（12%）。其余特点包括钙化、胸膜侵犯以及胸腔淋巴结肿大等。结论：某些肺部真菌感染与肺恶性肿瘤具有相似的临床及影像学特征，难以分辨。而由于两者的治疗方式及预后大相径庭，因此建立一个确切的影像学及临床诊断流程可能有助于进一步的诊治。

淋巴结结核一例并文献复习

陈佳
贵航集团三ＯＯ医院

目的：认识淋巴结结核的影像特点及相关鉴别诊断，提高对淋巴结结核的的诊断准确率。方法：回顾分析 1 例全身淋巴结结核患者的临床资料及影像学检查，并复习相关文献。结果：患者表现为双侧颈部、右侧腋窝、锁骨上窝、纵隔、肝门区、胰头周围、腹膜后、右侧腹股沟区及左前胸壁淋巴结肿大，增强呈环形强化。结论：全身多处淋巴结肿大并呈环形强化时，首要考虑为淋巴结结核，影像上难以鉴别时需要做真菌培养或淋巴结穿刺活检明确。

EPO-2299

甲型 H1N1 流感肺炎的胸部影像表现

陈洋
海南省人民医院

目的 探讨甲型 H1N1 流感肺炎胸部 X 线及 CT 表现特点。
方法 回顾性分析经临床及病毒核酸检测确诊的甲型 H1N1 流感肺炎 15 例患者的胸部影像资料，病初均摄胸部 DR 片，11 例连续复查床边胸片，7 例同期行胸部 CT 检查，5 例复查胸部 CT。
结果 甲型 H1N1 流感肺炎根据病程、病灶分布的部位及范围分为如下 4 种类型：(1)支气管炎型：4 例，病变主要累及肺间质；(2)单纯局限型：3 例，病灶仅限于单个肺叶或肺段；(3)多灶型：5 例，病变累及多个肺叶或肺段，呈散在分布；(4)广泛弥漫型：3 例，病变累及双肺多个肺叶，广泛性分布。并发脑炎 1 例，双侧胸膜炎 6 例，气胸 1 例，心包炎 1 例，鼻窦炎 1 例。
结论 甲型 H1N1 流感肺炎的胸部 X 线及 CT 表现多种多样，以片状影及磨玻璃密度影为主，可合并肺间质性浸润，可并发胸膜炎、气胸、心包炎，具有一定特征性，与病程进展有一定关系，可作为病情观察的指标之一。

EPO-2300
Hand-foot-mouth Associated with Myelencephalitis Disease

劳群
杭州市儿童医院

Abstract In this study, the pathogeny, route of transmission and pathogenesis of the myelencephalitis associated with hand-foot-mouth disease, damage mechanism of EV71 on central nervous system, pathological change, diagnosis and differential diagnosis were described. With analyzing the existing images of children with myelencephalitis associated with hand-foot-mouth disease and reviewing the literature, the imaging characteristics of the myelencephalitis associated with hand-foot-mouth disease were summarized to improve the diagnosis and recognition of myelencephalitis associated with hand-foot-mouth disease.

EPO-2301
儿童肺炎影像诊断及鉴别诊断

劳群
杭州市儿童医院

1、新生儿床边片—肺透明膜病、肺水肿 肺出血
2、喘鸣（喉喘）--气道软化症、异物
3、各类感染—支原体、腺病毒、流感
4、先天性支气管肺发育异常
5、免疫类/遗传类—川崎病、Alagille 综合征
6、肿瘤样及肿瘤--郎格汉斯细胞组织细胞增生症（LCH）、淋巴瘤、转移
小结
1、新生儿床边片—需密切关注病情动态变化及体位因素。
2、持续喘鸣（喉喘）--哮喘、“马赛克”征如小气道、 小血管异常如 BO/PVD、支气管肺发育不良、囊性纤维化等， 还要关注主气道（气道软化、异物）及喉病变如喉蹼、 息肉、异位甲状腺等。

3、各类感染—要密切结合临床，尤其抗炎无效时，“症征” 相符要警惕腺病毒、流感等，“症征不符”支原体要关注。
4、肿瘤样及肿瘤--郎格汉斯细胞组织细胞增生症（LCH） 胸膜肺母细胞瘤、淋巴瘤、转移

5、儿童疾病谱特点—先天性/免疫性/遗传性/代谢性—川崎病

EPO-2302
小儿腺病毒影像诊断再认识

劳群
杭州市儿童医院

目的 腺病毒临床发病凶悍、死亡率高、传染性强，因此再次研究腺病毒感染特点。
方法 总结本院 2019 年 4-5 月腺病毒病例。
结果 腺病毒临床高热早于咳嗽，持续时间长，影像特征根据临床进展而不同。
结论 腺病毒影像具有一定特征性。

胸部不典型肿瘤漏诊或误诊为结核的影像学分析

黄珊
成都市公共卫生临床医疗中心

【摘要】目的：分析肺结核合并胸部肿瘤病例肿瘤漏诊及胸部早期不典型肿瘤病例误诊为结核的临床及胸部 CT 特征以及漏误诊的原因，减少漏误诊率，提高肺结核合并胸部肿瘤及不典型肿瘤的影像诊断水平，使患者得到急时的治疗。**方法**：收集经细胞学或组织病理学、病原学证实的肺结核合并胸部肿瘤病例及不典型肿瘤病例以及单纯肺结核病例各 50 例，及其临床资料。所有病例行胸部 CT 扫描，对比分析其临床及胸部 CT 特征（肺结核合并肿瘤及不典型肺部肿瘤分别与单纯肺结核比较）。**结果**：18 例肺结核合并肿瘤病例肺癌被漏诊，15 例不典型肿瘤病例误诊为结核。这些被漏误诊的病例均表现出某些与结核相似的临床及影像学特征，影像诊断存在一定的困难，但仔细分析及追踪观察发现与单纯结核的 CT 表现也有一些差异。**结论**：结核与胸部肿瘤有一定的相关性，并相互影响，影像表现与结核相似的不典型肺癌易漏诊或误诊为结核，影像诊断需谨慎，同时需结合临床资料仔细分析及追踪观察，必要时建议行纤支镜、经皮肺穿等检查，以免漏诊或误诊，延误患者的治疗。

EPO-2304
HIV 垂直感染青少年的皮层发育形态学研究

余晓
武汉大学中南医院

目的：本研究的目的是探讨 HIV 将会怎样影响青春期儿童的大脑皮层发育，有哪些易感脑区，以及这些脑结构改变与认知能力的相关性。
方法：我们使用结构性 MRI 来检查 16 名 HIV 感染儿童（年龄 13.63±1.83 岁，）和 25 名年龄性别相匹配的 HIV 暴露未感染儿童（年龄 13.32±1.62 岁）的灰质并对其中部分儿童进行每次间隔一年的重复磁共振脑部扫描。我们对每位被试进行了五项神经认知测试以评估不同领域的认知表现。
结果：横断面研究显示 HIV 感染儿童的灰质体积广泛减小（主要在双侧额颞叶等），皮层厚度改变主要发生于右侧颞叶及左侧枕叶；皮层褶皱的改变以增加为主，脑沟裂深度增加的区域主要在左侧缘上回、中央前回及额上回，减少主要在左侧梭状回、海马旁回、内嗅皮层等区域。纵向研究显示 HIV 儿童的灰质体积减小主要发生在右侧前额叶、顶叶的高级功能区及运动区，皮质变薄的脑区多为感觉运动皮层及边缘系统。我们的神经心理学测试结果表明 HIV 感染儿童在书面语言、工作记忆等方面表现正常或欠佳，但执行功能显著受影响(Wisconsin 卡片分类测试,p=0.015)，且部分脑区的改变与之有相关性。
结论：处在青春期的 HIV 儿童表现出了伴有萎缩的多个联合皮层成熟延迟（主要在左顶叶及双侧枕叶）。这种异常的大脑皮层发育模式可能是 HIV 儿童出现认知功能障碍的结构性基础。我们还需要在扩大样本量的基础上，进行长期随访来进一步细化及验证我们的研究结果。

EPO-2305
气管支气管少见原发肿瘤的影像诊断思路

汪丽娅
深圳市龙华区人民医院

目的:探讨气管支气管少见原发肿瘤的影像诊断思路。
方法:回顾性分析 20 例气管支气管少见原发肿瘤的临床及 CT 表现，并与手术病理进行对照分析。探索其 CT 影像特征与病理之间的关系，为气管支气管少见原发肿瘤的影像诊断提供参考思路。20 例病例中，14 例行 CT 平扫加增强扫描(动脉期＋静脉期)，另外 6 例仅行 CT 平扫。所有扫描均在 GE Revolution 256 排螺旋 CT 完成。
结果: 本组 20 例病例中,5 例为腺样囊性癌，以中年人多见(平均年龄 45 岁，男女无差别)；其中 4 例位于气管, 表现为宽基底结节,呈均匀的等密度，低于肌肉密度，不均匀强化，腔内外生长多见;1 例位于主支气管，呈腔内息肉样软组织肿块，无蒂，平扫密度均匀，增强后不均匀强化。6 例为黏液表皮样癌多发生于青年人(平均年龄 32 岁，其中男 4 例，女 2 例),好发于叶、段支气管,表现为腔内或腔内外结节或肿块，以腔内型多见，增强后轻度或明显强化。4 例为不典型类癌,均为老年患者(平均年龄 60 岁，其中男 3 例，女 1 例),；均位于主支气管,表现为沿支气管蔓延的肿块,呈特征性的“冰山征”,CT 增强明显均匀强化。2 例为中央型肉瘤样癌,均为老年男性，表现为支气管腔内外沿支气管蔓延的肿块,轻度强化。3 例叶支气管内含脂肪成分的病变,其中 2 例均匀脂肪密度的为脂肪瘤,1 例软组织结节合并钙化灶的为错构瘤。
结论:气管支气管少见原发肿瘤的临床及 CT 表现有一定的特征性,注意分析其影像特征及细节有助于诊断及鉴别诊断。

EPO-2306
OREM 自理理论模式与效应分析在预防老年患者导尿管相关尿路感染管理中的应用

陈蕾[1],吴晓萍[2]
1.贵州医科大学附属肿瘤医院
2.贵州医科大学附属医院

目的 探究 OREM 自理理论模式与效应分析在预防老年患者导尿管相关尿路感染管理中的应用。方法 选取 2016 年-2017 年我院住院留置导尿管患者 182 例，将患者分为管理组（观察组）和传统方法护理组（对照组），每组 91 例。对照组采用常规留置导尿管护理模式，观察组采用 OREM 模式，对比两组患者高风险系数值（RPN）及 CAUTI 发生率、护理满意度评分。结果 观察组患者 RPN 值均降低，差异有统计学意义 (P<0. 05)；观察组患者 CAUTI 发生率低于对照组，差异有统计学意义 (P<0. 05)；与对照组相比，观察组患者出院后对护理满意度评分较高，差异有统计学意义 (P<0. 05)。结论 OREM 应用于老年患者 CAUTI 管理中，能降低 CAUTI 发生率，提高护理满意度。

EPO-2307
PDCA 模式结合 CBL 及情景教学在职业防护培训中的应用

陈蕾[1],吴晓萍[2]
1.贵州医科大学附属肿瘤医院
2.贵州医科大学

目的应用 PDCA 模式探讨病例为基础的教学结合情景模拟教学在职业防护培训中的效果。**方法**选取 2016 年 60 名规培护士作为观察组，2017 年 65 名规培护士作为对照组。岗前培训过程中观察组护士运用 CBL 结合情景模拟教学进行职业防护培训，对照组护士由感染控制护士长进行职业防护讲座，两组分别于培训结束后进行书面理论考核，考核结束后进人临床工作，最后应用 PDCA 模式进行评价。**结果**观察组护士客观试题成绩为(88. 55 ±5. 56)，明显优于对照组(80. 77 ±5. 79)(P<0. 05)。观察组护士人员 1 年内职业暴露发生率、职业暴露后处理正确率分别为 11. 7%和 100. 0%，均低于对照组 30. 8%和 50%，差异有统计学意义(/值分别为 6. 723, 5. 559; P<0. 05)。**结论** PDCA 模式结合 CBL 及情景教学，能有效提高职业防护培训效果，有助于减少职业伤害。

基于数字平板胃肠机的全脊柱摄影技术

张伟,郭银许
襄樊市中心医院

目的 探讨全脊柱摄影在数字平板胃肠机上的临床应用价值。
方法 选取 20 例脊柱侧弯、后凸等畸形患者,利用数字数字胃肠机进行特殊摄影，应用长骨拼接软件,对拼接后获得的脊柱全景影像质量进行评估。
1.设备 意大利 VILLA APOLLO G100RFA 数字平板胃肠机，17 英寸 X17 英寸非晶硅碘化铯平板，可升降式诊断床，可旋转伸缩式球管立柱，最大 200CM。铅刻度每 1CM 刻度尺。东软 PACS 系统及 e-PACS 2000WS 医学影像工作站。
2.体位与方法 拍摄正位片时，患者站立背靠头部、肩部、臀部紧贴摄影床，双手自然下垂，握住扶手以固定。侧位片时，患者呈侧位站立，双臂向前伸出，屈肘，肘关节置于扶手之上，身体保持不动。
3.确定脊柱摄影范围 上缘包括 C1，下缘 S1 椎体，双肩及骨盆。
4.摄影方法 将球管立柱升至最长距离 200CM，以减小放大失真。对于身高低于 120CM，可一次曝光取得全脊柱影像；身高大于 120CM，可分 2-3 段分别摄影，然后进行拼接获得全脊柱影像。摄影时，摄影床直立保持不动相对固定，球管自上而下移动进行曝光。曝光结束后，将图像发送至随机 e-PACS 工作站，对所获图像进行密度调整，点击“拼接”按钮，进行自动拼接，并根据原图进行微调处理，使全脊柱图像对比度等趋于一致化，获得满意全脊柱图像后上传东软 PACS，并打印照片。
结果 组内 20 例全脊柱图像，经放射科及骨科医生通过阅片、工具测量均符合并能满足临床要求。所有图像均可一次性自动拼接成功，无因技术和设备原因而重摄，照片中影像无明显拼接痕迹，无运动伪影，解剖结构完整无重影，脊柱各椎体及关节细节显示清晰，对比度良好。
结论 通过运用平板胃肠机行站立位全脊柱摄像操作简单，成像速度快，自动无缝拼接，获得图像清晰、细腻，对脊柱畸形的临床诊断或手术矫形方案的制定有重要意义，与常规 DR 站立位全脊柱摄影比较有显著优势。

EPO-2309

儿童椎体结核的 MRI 与 CT 诊断

龙运祥[1],王芳[1],张巧[1],龙运祥[1],王芳[1],张巧
1.成都市妇女儿童中心医院
2.成都市妇女儿童中心医院

目的：探讨儿童椎体结核周围冷脓肿的 MRI 与 CT 表现，提高对儿童椎体结核的影像特征认识与理解。
方法：回顾性分析 20012 年 1 月至 2019 年 2 月我院经手术、活检证实及抗结核治疗痊愈后证实的儿童椎体结核周围冷脓肿 5 例 MRI 或 CT 资料。观察椎体和附件破坏的情况、椎体旁或邻近结构冷脓肿的形态、大小，脓肿壁平扫与增强表现以及硬膜囊和神经根受压的情况，分析儿童脊柱结核的特征性 MRI 与 CT 表现。
结果：5 例儿童腰骶椎结核椎体破坏均表现为以中心型破坏为主，并有不同程度边缘型椎体破坏，椎体破坏边缘见硬化带，未见明显骨膜反应及骨痂形成等征象。本组病例累及椎体 19 节，病变中央区椎体破坏最为明显（5 例）；5 例均见椎弓根及小关节破坏共计 25 处；其中 3 例见椎管内冷脓肿及硬膜囊与神经根受压，MRI 较 CT 更清楚显示椎管内冷脓肿形态及累及邻近结构关系。双侧椎旁冷脓肿 5 例；单侧 2 例，其中 1 例并腹壁冷脓肿（脓腔间见结核蔓延贯通窦道），脓肿壁内或脓腔内均见斑点样及弧形致密钙化斑。增强扫描椎旁或腹壁冷脓肿呈厚壁环形囊状强化，囊内未见强化。3 例均见主动脉旁或系膜增大淋巴结，增强扫描呈环形不均匀强化。
结论：儿童椎体并周围冷脓肿有一定特征性 MRI 与 CT 表现。中心型脊柱结核多见，多节椎体及椎弓根、小关节破坏，骨破坏边缘见硬化环；双侧或单侧椎旁、腹壁厚壁环形冷脓肿，硬膜囊和神经根受压；冷脓肿、淋巴结钙化及其环形强化等征象具一定特征性。MRI 较 CT 对椎体破坏形成的软组织肿块、周围冷脓肿、淋巴结坏死等更具优势；正确认识上述征象，合理选择检查方法有助于提高儿童椎体结核的诊断准确率。

Differentiation of intraspinal tuberculosis and metastasis using MRI

Quanjiang Li,Juan Peng
Department of Radiology， the First Affiliated Hospital of Chongqing Medical University

Purpose: The purpose of this study was to analyze the magnetic resonance imaging (MRI) findings of intraspinal tuberculosis and metastasis in order to discover differences which may be helpful in making the correct diagnosis.
Patients and methods: The clinical features and MRI findings of 15 patients with intraspinal tuberculosis and 11 patients with intraspinal metastasis were retrospectively analyzed.
Results: The mean age of patients with intraspinal tuberculosis and metastasis was 26.3 years (age range: 15 - 42 years) and 52.1 years (age range: 38 - 67 years), respectively. All cases of intraspinal tuberculosis were secondary to primary extraspinal tuberculosis as follows: tuberculous meningitis (11/15), pulmonary tuberculosis (9/15), vertebral tuberculosis (5/15), urinary tract tuberculosis (1/15), abdominal tuberculosis (1/15), cervical lymphonodus tuberculosis (1/15), and multisystem tuberculosis (9/15). Primary cancers in the intraspinal metastasis cases were breast (5/11), lung (3/11), ovarian (1/11), renal (1/11), and nasopharyngeal (1/11) in origin. Both intraspinal tuberculosis and metastasis presented with multiple intra- and extramedullary lesions throughout all regional segments of the spinal canal accompanied by irregularly thickened meninges. Intraspinal tuberculosis lesions had indistinct edges which integrated with each other, and most exhibited obvious enhancement. In contrast, the intraspinal metastasis lesions were distinctly separated with clear edges and exhibited slighter enhancement compared with the tuberculosis.
Conclusion: Combining clinical features with MRI findings may be helpful to differentiate intraspinal tuberculosis from metastasis.

The Comparison of Clinical and Imaging Characteristics between AIDS-related Diffuse Large B-cell Lymphoma and Burkitt’s Lymphoma

Ziang Pan[1], Meizhu Zheng[2], Ziyu Qi[1], Xueqin Li[3], Jinxin Liu[5], Yuxin Shi[4], Xing Wang[3], Li Li[3], Wen Ye[4], Tianli Hu[5], Shuang Xia[1], Hongjun Li[3]
1. Tianjin First Central Hospital
2. Tianjin Third Central Hospital
3. You'an Hospital Affiliated of Capital Medical University
4. Shanghai Public Health Clinical Center, Affiliated of Fudan University
5. The Eighth People's Hospital of Guangzhou

Background AIDS-related non-Hodgkin's lymphoma (AR-NHL) is one of the major causes of death in HIV-infected patients. Diffuse large B-cell lymphoma (DLBCL) and Burkitt's lymphoma (BL) are most common types.
Objective This study evaluated the clinical and imaging differences between the two pathological types.
Methods This study was a multi-center retrospective study comparing clinical and CT imaging information in 92 patients with AR-DLBCL and 41 with AR-BL. The imaging characteristics, involved sites, the progression or death time and prognosis were compared in both groups of patients.
Results Homogeneous texture was more common seen in AR-DLBCL both in plain scans (P=.004) and contrast enhancement scans (P = .027). The moderate enhancement was more common seen in AR-DLBCL than that in AR-BL (P = .011). Lesions with irregular shape, fusion tendency and extracapsular infiltration were relatively more common detected in AR-BL. Liver, pancreas, spleen and lung were more prone to be involved in AR-BL. There were no significant differences in clinical parameters and progression or death time between the two groups.
Conclusion Homogeneous texture and moderate enhancement support AR-DLBCL as heterogeneous and poor enhancement support AR-BL.

SAPHO 综合征的临床和影像学特征分析

童永秀, 张惠娟, 杜瑞宾
福建省立医院南院

目的：通过分析 SAPHO 综合征患者的临床和影像学(CT)表现，从而探讨 SAPHO 综合征患者的特点和规律，为 SAPHO 综合征的诊断提供新的思路。方法：收集符合 SAPHO 综合征诊断标准的 SAPHO 患者 12 例；所有患者均行 CT 检查；对患者的一般资料和影像学资料进行分析、总结。结果：1.临床表现：12 例 SAPHO 综合征患者中，男性 5 例、女性 7 例；年龄范围为 18-56 岁，平均年龄为 44±13 岁。12 例 SAPHO 综合征患者都存在不同程度的皮肤损害和骨关节损害，其中皮肤损害包括掌跖脓疱病、寻常型银屑病以及皮肤红斑；骨关节损害包括胸肋锁关节骨肥厚、脊柱骨质增生、外周关节病以及骶髂关节炎。2.CT 检查结果：12 例 SAPHO 综合征患者中 8 例患者表现为对称性病变，4 例患者为非对称性病变。CT 扫描影像学特点主要为骨质增生硬化、骨质破坏以及关节间隙的狭窄、关节肥厚融合；其中 3 例表现为骨质增生硬化，3 例表现为骨质破坏，2 例表现为关节间隙变窄，4 例表现为关节肥厚融合。按照 SAPHO 综合征骨骼发病部位进行分类，其中 8 例出现胸骨病变，6 例

出现锁骨病变，8 例出现胸锁关节及胸肋关节病变，5 例出现肋骨病变，1 例出现胸椎病变。结论：SAPHO 综合征是皮肤、骨以及关节异常为主要特征的疾病；CT 能够及时发现骨质变化以及关节软组织病变。通过临床表现与影像学检查可以对 SAPHO 综合征进行有效诊断和分期。

艾滋病合并非结核分支杆菌感染的胸部 CT 影像学表现分析

黎瑜,卢亦波
南宁市第四人民医院

目的：探讨艾滋病(AIDS)合并非结核分支杆菌（NTM）肺部感染的 CT 影像学特点，提高对该病认识。方法：回顾性分析 2016 年 10 月至 2018 年 2 月确诊的 35 例 AIDS 合并 NTM 肺部感染患者,所有

受检者均行胸部 CT 检查,分析 CT 影像学表现特征。结果：35 例 AIDS 合并 NTM 患者中，病变累及双侧肺 32 例（91.4%）且多叶多段分布，累及单侧肺 3 例（8.6%）；病灶形态：斑片状 26 例（占 74.3%），结节状 20 例（占 57.1%），条索状 17 例（占 48.6%），磨玻璃样 13 例（占 37.1%），大片实变 5 例（占 14.3%），团块状 1 例（占 2.9%），支气管扩张 13 例（占 37.1%），空洞 6 例（占 17.1%），其中虫蚀样空洞 1 例，肺不张 1 例（占 2.9%），肺气肿 1 例（占 2.9%），气胸 1 例（占 2.9%），合并纵膈淋巴结肿大 15 例（占 42.9%），胸腔积液或胸膜增厚 28 例（占 80%），少量心包积液 8 例(占 22.9%)，35 例患者肺部 CT 表现均未见钙化。结论：AIDS 合并 NTM 感染病变常累及双侧肺脏，分布广泛，无明显好发部位，胸部 CT 表现病灶形态多样无特异性，常见征象为斑片状、结节状、条索状、磨玻璃样及支气管扩张，常合并胸腔积液（或胸膜增厚）及纵膈淋巴结肿大，类似继发性肺结核表现，但钙化少或无，当临床抗痨治疗无效时，应考虑本病可能。

EPO-2318

胸部放线菌病的临床和 CT 表现特征

王露萍[2],贺文广[1],王小丽[1],楼海燕[1]
1.浙江省浙江大学医学院附属第一医院
2.浙江省绍兴市柯桥区妇幼保健院

目的：通过分析胸部放线菌病的临床特点及 CT 表现，探讨共性特征，提高本病诊断准确率。
方法：回顾性分析浙江大学医学院附属第一医院 2014 年 6 月 2 日至 2019 年 5 月 22 日确诊的 16 例胸部放线菌病患者的临床资料及 CT 影像，结合国内外相关文献，总结共性的临床表现和影像学征象。
结果：16 例患者中，CT 引导下肺活检(1 例)、支气管镜活检(5 例)及手术（10 例）均获得组织病理学诊断为胸部放线菌病。除 5 例患者未行胸部 CT 增强扫描，余 11 例患者均行对比剂增强扫描或血管 CTA 检查。其中男 13 例，女 3 例；年龄（57.9±6.2）岁。高血压病 4 例，乙肝 1 例，痛风 2 例。长期吸烟 8 例，长期饮酒史 6 例。临床表现：慢性咳嗽（14 例）、咳黄脓痰（4 例），痰中带血及咯血（9 例）、发热（3 例）、 胸闷（3 例）、 胸背部痛（2 例），无临床症状（1 例）。中性粒细胞比例增高（6/16）例、CRP＞8mg/dl（5/14）例。16 例放线菌病患者 CT 表现的共同特征：病变均局限于单侧肺叶，以胸膜下分布为主，紧贴胸膜或邻近胸膜改变（5 例）；病变形态以团块影（5 例）、团片影（6 例）表现为主；大小 1.6cm×2.1cm～5.3cm×5.6cm；病灶内伴坏死（7 例）、虫蚀样空洞（5 例）；支气管扩张（1 例）；纵隔及病侧肺门淋巴结肿大（5 例）。增强扫描病变均呈不均匀强化，伴无强化的坏死灶；部分病灶血管穿行其中但均未见侵犯中断（6 例）。
结论：胸部放线菌病的临床和 CT 表现有一定特征，长期吸烟、饮酒伴随慢性疾病基础的患者，CT 上出现胸膜下分布为主的团片/块影，伴灶内多发坏死、虫蚀性空洞需考虑放线菌的可能。

EPO-2319

62 例儿童脑血管病的病因及影像分析

童娟,廖欣
贵州医科大学附属医院

目的 探讨儿童脑血管病的病因及影像学特点。 **方法** 回顾性分析 62 例脑血管病患儿的临床特点及 CT、MRI 表现。**结果** 男性 38 例，女性 24 例，年龄 5 天～14 岁，起病以急性或亚急性为主（56/62，90%），62 例患儿均有明确病因。影像表现为脑梗死 9 例，病因包括先天性心脏病 1

例、颅脑损伤 1 例、颅内感染 2 例、地中海贫血 1 例、多发性大动脉炎 1 例、Moyamoya 综合征 3 例；脑静脉窦血栓形成 6 例，病因包括颅内感染 5 例、外伤 1 例；脑出血 20 例，病因包括血液系统疾病（白血病 3 例、血小板减少性紫癜 2 例）、新生儿高胆红素血症 2 例，新生儿 ABO 溶血 1 例，新生儿凝血功能障碍 3 例、窒息 2 例、颅内感染 3 例、瘤卒中 2 例、动脉瘤 2 例；脑内血管畸形 27 例，包括动静脉畸形 12 例、海绵状血管瘤 5 例、静脉畸形 5 例、Galen 静脉畸形 2 例、毛细血管扩张症 3 例。不同病因组性别和年龄差异均无统计学意义（P＞0.05）。**结论** 儿童脑血管病病因复杂、种类多，临床特点有其特殊性，借助 CT 和 MRI 等影像学手段能得到尽早诊断、及时治疗，从而改善患儿预后。

EPO-2320

上消化道出血多学科联合诊疗模式分析

吴晓萍
贵州医科大学附属医院

[摘要] **目的：**分析多学科联合诊疗模式应用于上消化道出血患者治疗中的效果。**方法：**回顾性分析我院我院 2013 年 3 月至 2015 年 12 月期间收治的 32 例上消化道出血患者的临床资料，所有患者均给予药物治疗，并给予急诊胃镜检查，胃镜检查结果显示为上消化道溃疡，对溃疡部位予以确定。同时，所有患者均给予 DSA 血管造影检查，检查结果均呈阴性。**结果：**31 例上消化道出血患者治疗成功，1 例上消化道出血患者病情进展。多学科联合诊疗模式的总有效率为 96.9%（31/32）。**结论：**多学科联合诊疗模式应用于上消化道出血患者治疗中的效果十分显著，能够在很大程度上提升上消化道出血患者的治疗成功率。

EPO-2321

AIDS 合并肺隐球菌病的 MSCT 特征分析

许传军
东南大学附属第二医院

研究背景： 目前主流观点认为 HIV 感染者合并肺隐球菌时其胸部影像学特征多表现为肺弥漫性浸润影，患者病情进展迅速，容易出现呼吸衰竭，病死率高。过去我们从少量病例中发现 HIV 相关肺隐球菌病患者其胸部 CT 出现结节性病灶并不少见。本研究将进一步探索 HIV 相关肺隐球菌病的影像学特征。**材料与方法：**回顾性分析南京市第二医院 2010 年 9 月至 2016 年 5 月感染病科收治的存在隐球菌感染证据，同时胸部 CT 提示肺部异常病灶的 HIV 感染者临床资料。实验性确诊病例定义存在肺病理或是痰培养结果支持，临床明确病例定义为肺部病灶抗隐球菌治疗有效，临床可能病例定义为肺部病灶在抗隐球菌治疗以及其他抗生素治疗的情况下改善。**结果：**共有 60 例患者纳入分析，其中位 CD4 计数为 20 个/uL（0-205 个/uL）。93.3%（56/60）的患者出现结节性病灶，这些结节性病灶常伴有空洞形成 78.6% (44/56)，以孤立空洞性结节最为常见。胸腔积液以及边界不清的炎性浸润影发生率分别为 11.6% (7/60)和 31.7% (19/60)，其中弥漫性肺浸润影见于 21.7%的病例，多同时伴有结节性病灶。对这些病灶进一步分析发现至少有 76.8% (43/56) 的结节性病灶可用隐球菌感染解释，其中 12.5% (7 /56)是实验室确诊病例，48.2% (27/56)为临床明确病例，16.1%(9/56)为临床可能病例，另外有 23.2%（13/56）的结节性病灶由于缺少足够的资料无法对肺部病变性质给予判定。85.7% (6/7)的胸腔积液为临床明确肺隐球菌病。弥漫性肺浸润影病变中，53.8% (7/13)的病例可能为肺孢子菌肺炎，至少有 38.5%的弥漫性肺浸润影可排除肺隐球菌病。**结**

论：与当前流行观点不一致的是，本研究提示肺部结节性病灶是 HIV 相关肺隐球菌病的最常见影像学特征。HIV 感染者出现肺部结节性病灶时应该将肺隐球菌病纳入重要的鉴别诊断。

EPO-2322
植入式静脉输液港在肿瘤化疗患者中的并发症原因分析及护理

宋丽芝
贵州医科大学附属肿瘤医院

【摘要】目的　分析植入式静脉输液港应用在肿瘤化疗患者中的并发症原因，并提出相应的护理对策。方法　选取我院 2013 年 12 月～2015 年 2 月收治的留置植入式静脉输液港肿瘤患者 44 例作为实验组，选取同期采用外周置入中心静脉导管进行输液的患者 10 例作为对照组，观察两组患者的导管问题、感染、局部红肿、静脉炎等并发症发生率作比较。结果　实验组并发症发生率为 9.4%，对照组并发症发生率 34.4%。结论　植入式静脉输液港应用于肿瘤患者中的并发症，积极做好防治工作，重视对患者的宣教，加强临床护理可以增强应用效果。

术后中枢神经系统感染影像学评价与临床

张劲松,张广文
空军军医大学西京医院

目的：探讨术后中枢神经系统感染的影像学表现及临床价值，提高相应疾病的临床诊治水平。**方法：**通过纵向追踪数个典型病例（包括脑外伤异物、脊柱刺伤术后、腰椎感染术后、脑出血抽吸术后等）的影像学动态变化及临床相关信息，阐明影像学在感染性疾病诊治过程中的价值。**结果：**结合中国神经外科重症患者感染诊治专家共识(2017)，分别总结不同病例在术后神经系统感染过程中影像学的表现及相关临床价值，包括：病变早期发现、早期定性，范围和程度评估，疗效和预后评估等。其中，重点分析了外伤后蛛网膜下腔感染导致的室管膜炎、化脓性炎的影像表现及临床特点，对于临床容易误诊的包裹性血肿周围水肿进行了深入分析，并紧密结合临床阐述了影像学动态评估的临床价值。**结论：**识别术后神经系统感染的相关影像学表现和临床特征，为临床诊治提供有价值的指导信息。

EPO-2324
血行播散性肺结核合并弥漫性肺泡损伤 1 例

夏青[1],何玉麟[2],张自力[1],莫本成[1]
1.湖北医药学院附属十堰市人民医院
2.南昌大学第一附属医院

病例 患者，男性，17 岁。间断性咳嗽、咳痰伴发热 10 天，体温最高 39.0℃，于当地医院治疗，给予哌拉西林钠他唑巴坦钠、更昔洛韦抗感染后症状未见好转。实验室检查血常规　WBC：6.32*10^9/L，N：69.3%（当地）；WBC：3.78*10^9/L，N：79.2%（我院）；风湿四项：抗链球菌溶血素 O 170.00U/L；C-反应蛋白 34.60mg/L；抗中性粒细胞抗体阴性；类风湿因子 <20.00U/mL；血浆中真菌 1,3-B-D 葡聚糖含<5.0000pg/mL；抗链球菌溶血素 O157.0IU/ml；

肥达氏反应全阴；甲流病毒阴性；T-SPOT 阳性；HIV 抗体阴性；病毒全套抗体检测（TORCH）均阴性。胸部 CT 表现：双肺以中下肺野为主弥漫分布的磨玻璃密度影（ground-glass opacity, GGO），胸膜下肺野可见弧形肺野透亮度相对增高区（图 1），另 GGO 背景中隐约可见细粟粒结节，以双肺尖为主（图 2），右下胸膜增厚并可见局部包裹性积液，所示肝左叶实质内可见钙化（图 3）。CT 诊断结果：双肺弥漫性间质性改变，考虑病毒性感染可能，建议结合临床相关检查。患者入院后，给予吸氧、心电监护，莫西沙星抗感染，奥司他维抗病毒，异甘草酸镁护肝及对症支持治疗，症状仍有所加重，行胸部 CT 检查发现两肺弥漫性病变较入院时外院 CT 片有所加重。鉴于入院后实验性治疗后患者病情仍有进展，与患者及其家属沟通后行 CT 引导下右下肺穿刺活检，病理结果：肉芽肿性炎，首先考虑结核。特殊染色示：抗酸染色（+），PAS（-），六胺银（-）（图 4）。

EPO-2325
布鲁氏菌病致脊柱炎诊断中 CT 造影的临床诊断价值

耿云平,曾宪强
南阳市中心医院

【目的】通过对经病理诊断的布鲁杆菌病性脊柱炎的 CT 造影征象的分析，探讨其临床应用价值。【方法】回顾性分析本院于 2012 年 1 月至 2019 年 1 月诊治的 20 例布鲁杆菌病致脊柱炎的影像资料，对比分析 CT 造影与 X 线平片对布鲁杆菌病致脊柱炎的各种征象的显示及确诊情况。【结果】CT 造影与 X 线平片对布鲁杆菌病致脊柱炎各种征象的显示情况对比发现在椎间隙变化的显示方面 X 线平片比 CT 造影更具优势，CT 造影对椎体破坏、骨质硬化、死骨的显示及韧带变化等方面比 X 线平片更具优势。【结论】对比 X 线平片诊断布鲁杆菌病致脊柱炎，CT 造影横断面扫描的密度分辨率高，可准确显示脊柱病灶的范围、内部情况和软组织异常等，三维重建技术更有利于病变显示，提高对肉芽肿、椎旁脓肿及椎间盘破坏征象的显示率。CT 造影对布鲁杆菌病致脊柱炎的确诊率较高，但需要结合 X 线平片来提高对该病的诊断价值。

EPO-2326
黄色肉芽肿性胆囊炎的误诊分析

夏青[1],何玉麟[2]
1.湖北医药学院附属十堰市人民医院
2.南昌大学第一附属医院

目的 探讨黄色肉芽肿性胆囊炎(xanthogranulomatous cholecystitis，XGC)的 CT 检查表现特点，旨在提高 XGC 的术前诊断率。**方法** 回顾性分析 38 例经手术病理证实 XGC 患者的临床表现、实验室指标及病变的超声、CT、MRI 及 MRCP 表现特点，例如，胆囊壁内结节、黏膜线、胆囊壁增厚情况及强化方式、是否合并结石、胆囊周围脂肪及邻近脏器（肝实质、结肠肝曲）是否受累以及胆道梗阻情况。**结果** 12 例患者均出现右上腹痛，11 例白细胞及粒细胞不同程度升高；7 例 CA 199 轻度升高但低于正常值 5 倍，CEA 轻度升高 1 例；超声、CT、MRI 及 MRCP 表现为胆囊壁增厚，其中弥漫性增厚 9 例，8 例见多发壁内结节，部分结节超声表现为低回声(带)、CT 为低密度、MRI 呈较长 T1 长 T2，CT 及 MRI 增强结节未见明显强化，6 例增强 CT、MRI 粘膜线完整强化，11 例病例合并胆囊结石，仅 1 例出现胆道梗阻，1 例邻近肝实质受累。**结论** 综合分析患者临床表现、实验室指标及影像学检查结果，能明显提高 XGC 诊断准确率，为手术方案选择提供有力依据。

EPO-2327
普美显增强 T1mapping 评估华支睾吸虫感染胆管损伤肝损害的研究

周忠洋
广西医科大学第一附属医院

目的：使用普美显增强 T1mapping 评估兔华支睾吸虫感染模型中肝损伤。**方法：**19 只家兔分为四组，分别为 100 囊蚴组、200 囊蚴组、300 囊蚴组和对照组，分别使用 100 只华支睾吸虫囊蚴灌胃 1 次、2 次及 3 次，每次间隔一个月，对照组用生理盐水灌胃作为对照。30 天后粪检虫卵确认感染成功，末次灌胃一个月后，获取普美显增强前及增强后 10min、15min、20min、25min、30min T1 弛豫时间。根据 ishak 肝炎评分系统对家兔肝脏炎症及纤维化评分**结果：**感染华支睾吸虫的严重程度与肝脏炎症及纤维化评分成成正相关，相关系数分别为 0.503 和 0.513，各时间点肝脏 T1 弛豫时间随着感染程度的增加而增加，使用 t 检验对各组 T1 弛豫时间两两比较，对照组与 300 囊蚴组在 10min-30 分钟扫描中差异有统计学意义，100 囊蚴组与 300 囊蚴组在 25min（p=0.021）及 30min（p=0.044）差异有统计学意义。**结论：**可以使用普美显增强 T1mapping 评估华支睾吸虫感染造成的肝损伤。

EPO-2328
Tips 治疗肝硬化门静脉高压并发症护理

黄宇
贵州省肿瘤医院

［**摘要**］**目的** 探讨经颈静脉肝内门体分流术（Tips）治疗肝硬化门静脉高压症的疗效及并发症的护理。**方法：**回顾性分析 Tips 治疗肝硬化门静脉高压症患者 259 例，监测术前术后门静脉压力、血常规、凝血功能、肝肾功能、血氨，影像学及内镜检查。定期随访，观察并发症的发生情况。结果 Tips 技术成功率 98.8%（256/259），控制出血近期有效率为 100%，门静脉压由术前（29.42±5.36）mmHg 降为术后（18.04±4.32）mmHg，差异有统计学意义（P＜0.05）。Tips 治疗后发生分流道狭窄闭塞率为 18.1%（47/259），再发生消化道出血率为 16.9%(44/259)，腹水吸收明显，肝性脑病发生率为 23.5 %（61/259），其中 34 例为Ⅰ期或Ⅱ期肝性脑病，一过性易纠正。**结论**：Tips 是治疗肝硬化门静脉高压症快速有效安全的微创方法，合理选择病人、定期复查能减少并发症提高中远期疗效。

EPO-2329
肾上腺结核的临床特征及 CT 表现

黎斌,何玉麟,余秋月,邬莺莺,朱雪超
南昌大学第一附属医院

目的:探讨肾上腺结核的临床特征及 CT 影像学特征，以提高对该病的诊断水平。 **方法:**回顾性分析临床证实 25 例肾上腺结核患者的临床资料及影像表现特征。 **结果:** 25 例中，男性 17 例，女性 8

例；年龄 19-78 岁；临床表现常见为肾上腺皮质功能减退症状，皮肤色素加深 14 例，乏力 20 例，消瘦 22 例。3 例肾上腺结核患者出现肾上腺皮质功能减退症状。10 例合并其他部位活动性结核，其中 8 例肺结核； 2 例肾结核。CT 主要影像表现为：肾上腺结核累及双侧共 20 例，单侧 5 例，肾上腺增粗 22 例，肾上腺出现钙化 20 例，肿块样改变 17 例，结节样改变 5 例。 **结论:**肾上腺结核明确诊断时常已累及双侧肾上腺，临床表现多以肾上腺皮质功能减退症状为主；肾上腺结核的 CT 主要影像学表现为肾上腺钙化、肾上腺增粗、出现肾上腺肿块样或结节改变。

1H-MRS 定量分析在脑结核瘤、弓形虫脑病与脑转移瘤鉴别诊断中的应用

高欣[1],艾尼瓦尔•吾拉木[2],张 丹[1],杨豫新[2],陈宏[1],戴国朝[3],吕新胜[4],王 俭[1]
1.新疆医科大学第一附属医院
2.新疆维吾尔自治区第六人民医院
3.新疆维吾尔自治区喀什地区第一人民医院
4.克拉玛依市中心医院

【摘要】目的 探讨[1] HMRS 技术在脑结核瘤、弓形虫脑病和脑转移瘤鉴别诊断的作用。方法 收集 2015 年－2018 年就诊于我院且符合纳入标准的弓形虫脑病和脑结核瘤患者各 15 例，脑转移瘤患者 20 例；分别进行脑 MRI 常规扫描、增强扫描和氢质子波谱扫描。观察脑结核瘤、弓形虫脑病和脑转移瘤病灶实质区、病灶水肿区及对侧相应正常部位脑实质，分别观察 N-乙酰天门冬氨酸((N-acetyl-aspartate，NAA)（2. 02 ppm)、胆碱(Choline，Cho)(3. 22 ppm)、肌酸(Creatine，Cr)(3. 02 ppm)、脂质(lipids，Lip)(0. 8-1. 5 ppm)、乳酸(Lactate，Lac)(0. 33～1. 35 ppm)、肌醇（MI）（3.56ppm）；计算 Cho/Cr、Cho/NAA、Cr/NAA、MI/Cr、(Cho+MI)/Cr 、LL/Cr 值。结果 （1）弓形虫脑病病灶实质区 Cho、MI 峰明显低于脑转移瘤，弓形虫脑病病灶实质区 Cho/Cr、Cho/NAA、(Cho+MI)/Cr 值低于脑转移瘤,差异有统计学意义。（2）脑结核瘤病灶实质区 Cho/Cr、Cho/NAA、(Cho+MI)/Cr 值低于脑转移瘤,差异有统计学意义。（3）弓形虫脑病病灶实质区 Cr、NAA、MI、LL 峰明显低于脑结核瘤，弓形虫脑病病灶实质区 Cr/NAA 值低于脑结核瘤,差异有统计学意义。（4）弓形虫脑病、脑结核瘤和脑转移瘤病灶水肿区 Cho/Cr、Cho/NAA、Cr/NAA、MI/Cr、(Cho+MI)/Cr、LL/Cr 比值均无统计学差异。 结论 [1]H-MRS 技术可以提供脑结核瘤、弓形虫脑病和脑转移瘤病灶及病灶周围水肿区组织代谢的特点，为鉴别诊断提供客观依据。

EPO-2331
关于肺结核病的医学影像诊断现状与发展趋势探讨

安娜
贵州省第二人民医院(原:贵州省安宁医院)

目的：分析当前肺结核病的医学影像诊断现状，从而讨论肺结核病诊断的发展趋势。

方法：针对几年来肺结核影像检查手段进行分析总结。

结果：对于肺结核的医学影像诊断仍主要以 X 线胸片为主，但是如有检查发现存在可疑肺结核病变，应该进一步选择 CT 进行确诊以及制定后期治疗随访计划。CT 图像特点以及用于临床诊断的有效性使其在肺结核病的临床诊断中占据着越来越重要的地位。但是由于肺结核病变存在多样性以及复杂性的表现，在必要的时候应该选择 MRI 或者 PET-CT 进行关键信息的诊断。因

此相关组织及部门应该加快制定与我国肺结核病发病情况相符合的 CT 检查规范以及诊断标准，为临床诊断提供指南。

结论：肺结核病作为一类严重传染病对人们健康有严重影响，发病率高、传染性强，以往采用的传统医学影像诊断方式已经无法满足当前日益精细的临床诊断要求。在医学技术不断进步的推动下，临床对于肺结核病的诊断开始应用更多的医学影像方法，提高肺结核病诊断准确率，发展前景广阔，相关专家学者应该继续进行深入研究，正确为肺结核病的临床诊断提供更多、更有效的方法，保障患者的生命健康。

AIDS 肺部感染的临床及影像学表现分析（附 158 例分析）

肖 榕,刘景哲
阿克苏地区第二人民医院

目的:总结艾滋病肺部感染影像学特征，以提高该病影像学诊断水平。方法：回顾分析我院 2018 年全年确诊艾滋病患者 158 例的胸部影像学资料及特点。结果：艾滋病合并肺结核 48 例，艾滋病合并淋巴结结核 22 例，艾滋病肺孢子菌肺炎 8 例，其他间质性肺炎等 80 例。结论：艾滋病合并肺结核影像学表现具有多叶、多段分布特点，具有“三多三少”特点，易发生血行播散性肺结核和继发性肺结核，多部位受累。艾滋病合并淋巴结结核分布于颈部、腋窝、纵隔等，常累及多个部位，影像学表现为淋巴结肿大。艾滋病肺孢子菌肺炎影像学表现具有特征性。结合症状，体征，实验室检查及穿刺，对临床诊断有较好的提示。

EPO-2333

艾滋病相关淋巴瘤的影像表现及病理特点

胡天丽[1],刘晋新[1]
1.广州市第八人民医院
2.广州市第八人民医院

目的 分析 AIDS 合并淋巴瘤的影像表现及病理结果，探讨其影像表现及病理特点，提高对 AIDS 相关淋巴瘤的认识。 方法 回顾分析 39 例经临床活检病理确诊为 AIDS 合并淋巴瘤患者的影像资料，总结分析 AIDS 合并淋巴瘤的影像表现及特点。 **结果** 39 例艾滋病合并淋巴瘤的病理类型均为非霍奇金淋巴瘤（NHL）；影像学表现中结内病变共 39 例，以淋巴结肿大为主，其中腋窝淋巴结肿大 16 例，颈部淋巴结肿大 9 例，纵隔及肺门淋巴结肿大 7 例，腹腔淋巴结肿大 6 例，腹股沟淋巴结肿大 1 例；结外病变 34 例，以占位性病变为主，累及部位广泛，包括软组织肿块 20 例，发生于肝 12 例，骨骼/软骨 10 例，消化道 8 例，肺 6 例，肾上腺 4 例，肾及脾各 3 例，胰腺及肌肉各 2 例，腮腺、胆囊、前列腺及精囊腺、膀胱各 1 例。 **结论** 艾滋病相关淋巴瘤主要以 NHL 为主，广泛累及淋巴结及淋巴结以外器官，淋巴结外病变发生率高、且常多脏器受累是其影像学特点，艾滋病相关淋巴瘤的影像表现与病理符合度高，但确诊仍需结合临床。

EPO-2334

登革热的胸腹部影像学研究

胡天丽[1],刘晋新[1]
1.广州市第八人民医院
2.广州市第八人民医院

目的 1、观察重症登革热的临床和实验室生化指标，检测血清学相关指标的动态变化特征，为临床诊断、治疗及预后提供重要的指导意义。
2、分析重症登革热患者的胸腹部影像学表现及特点，探讨其影像学特征，形成对该病影像表现的初步认识，为临床诊断提供影像学帮助。
资料和方法 收集经临床确诊的重症登革热患者 75 例，行胸部 X 线平片和/或胸腹部 CT 检查，总结分析重症登革热患者的胸腹部影像表现，
结 果 1、重症登革热患者常见的胸部影像征象有胸腔积液，斑片状渗出、实变、磨玻璃影（GGO），气腔结节，小叶间隔增厚及支气管血管周围间质增厚等，并且肺内病变以多种病变形式混合存在较常见。
重症登革热患者的腹部异常征象包括肝内多发低密度占位病变，肝实质密度减低，血肿（皮下/腹直肌/肾周），胆囊炎、脾大、腹水、肾病变、肝门区、腹膜后及肠系膜淋巴结轻度肿大。

结论 1、重症登革热患者的胸部影像表现以胸腔积液及肺实质病变为主，肺实质性病变以肺实变及磨玻璃影常见，小结节、小叶间隔增厚及支气管血管周围间质增厚相对较少见。
2、重症登革热患者的腹部表现以多脏器受累为主，部分可见血肿（皮下/腹直肌/肾周）。

Chest Imaging Findings of Adenovirus Pneumonia in Children

Xuebing Yan[1],Heping Xu[1,2]
1.Affiliated Hospital of Hunan Academy of Traditional Chinese Medicine
2.Hunan Children's Hospital

Objective: To explore the chest imaging manifestations of children with adenoviral pneumonia. **Methods:** The imaging and clinical data of 237 children with adenovirus pneumonia (aged from May to 13 years and 4 months, average 3 years and 4 months) were retrospectively analyzed. Among them, 93 were severe cases and 144 were critical cases. The differences of imaging manifestations between severe cases and critical cases were compared.All cases had complete chest X-ray and CT examination data. **Results:** Among 237 cases, 205 children with adenovirus pneumonia had abnormal initial chest imaging findings, including 98 cases of massive consolidation (47.80%), 41 cases of interstitial infiltration (20.00%), 66 cases of mixed type (32.20%) and 35 cases of pleural effusion. No nodular shadow, cavity and enlargement of hilar and mediastinal lymph nodes were found in all cases.In severe cases, 40.85% were lobar consolidation, 30.19% were mixed consolidation and 28.96% were interstitial infiltration. In critically ill cases, 86.67% were large leaf consolidation type, 13.33% were mixed type. **Conclusion:** Chest imaging examination is helpful to discover the pathological changes of lung in children with adenovirus pneumonia, and provides an important basis for clinical diagnosis and treatment.

肺结核治疗中病灶进展的 CT 影像学表现及临床特征分析

李敏,朱怡
苏州市第五人民医院

【摘要】目的：分析肺结核治疗过程中病灶进展的 CT 影像学表现及临床特征。方法：收集 2015 年 12 月至 2018 年 12 月间收治的病灶增多的肺结核患者 48 例，对上述患者的原发灶及进展后病灶的 CT 影像学表现及患者在病灶进展时期内的临床特征进行回顾性分析及总结。结果：总共 48 例病灶进展的肺结核患者中，增多病灶的部位与原发灶同肺段的 46 例（95.8 %），与原发灶跨段同叶分布的 14 例（29.2%），与原发灶同侧不同叶分布的 6 例（12.5%），与原发灶不同侧分布的 3 例（6.3%）。少量增多共 17 例（35.4%），中等量增多共 29 例（60.4%），大量增多者共 3 例（6.3%）。原发灶与增多病灶的形态分别为：磨玻璃影 10 例（20.8%）与 13 例（27.1%）、结节灶 42 例（87.5%）与 26 例（54.2%）、树芽征 39 例（81.3%）与 22 例（45.8%）、斑片影 43 例（89.6%）与 37 例（77.1%）、实变影 23 例（47.9%）与 20 例（41.7%）、空洞 21 例（43.8%）与 4 例（8.3%）、支气管壁增厚 40 例（84.6%）与 12 例（25%）、肿块 4 例（8.3%）与 2 例（4.2%）、肺气肿 10 例（20.8%）与 0、钙化 19 例（49.4%）与 0、支气管扩张 8 例（16.7%）与 1 例（2.1%）、条索灶 40 例（83.3%）与 4 例（8.3%）。临床症状表现为咳嗽 40 例（83.3%）、咳痰 33 例（68.8%）、发热 12 例（25%）。本组病例中结果为阳性的实验室检查为：痰找抗酸杆菌 10 例（25%），痰培养结核杆菌 10 例（25%），耐药 6 例（19.4%），白细胞指数升高 4 例（8.3%），白细胞指数减少 7 例（14.6%），真菌检测 6 例（15.4%）。结论：肺结核治疗中进展的病灶与原发灶分布关系紧密，增多的病灶形态以活动性肺结核 CT 征象为主；临床表现以咳嗽咳痰为主；实验室检查中缺乏特异性指标。

EPO-2338
肺类癌的临床特征及 CT 表现分析

余秋月,何玉麟
南昌大学第一附属医院

目的：学习和分析肺类癌的临床及影像特点，以提高其术前诊断水平。方法：回顾性分析我院 50 例经病例证实的肺类癌患者的临床资料及多层螺旋 CT 图像，包括发病年龄、性别、临床首发症状和病变的分布、大小、有无钙化、支气管血管情况等。结果：本组病例的平均发病年龄为 55.4 岁，男女比例为 31:19，男性较多发；临床上超过一半以咳嗽咳痰来就诊（27 例），咯血或痰中带血者 9 例，仅 1 例以类癌综合征来就诊。CT 图像上，肿块位于中央型 21 例（42%），其中包括 4 例为支气管内结节,3 例见跨气管内外生长，呈“冰山征”；周围型 20 例（40%），边界较光整，肺门或纵膈淋巴结一般无明显增大；未见明显结节或肿块者 5 例）（10%）；前纵隔内孤立病灶 4

例（8%）。肿块的边界多较光整，呈浅分叶状，瘤周肺实质炎性改变或阻塞性肺炎 15 例，肺不张 8 例，瘤内见钙化者 11 例，支气管阻塞或截断征 23 例，其中中央型占 19 例；周围型肺类癌可见血管贴边征（10 例）。增强瘤体一般呈轻中度强化。结论：肺类癌存在较明显的性别差异，其中央型和周围型差异不明显。中央型肺类癌气管压迫阻塞截断征象比较明显，其中气管腔内实性结节及骑跨气管的“冰山征”具有重要的诊断价值。周围型肺类癌一般为孤立性结节，边界较光整，鲜少伴有纵膈或肺门淋巴结肿大。以上临床及 CT 征象对其诊断具有一定的价值。

老年脑深部髓质静脉分布的 SWI 分析

李虹易[1],王琨华[1],段阳[2]
1.辽宁省人民医院
2.北部战区总医院

摘要：目的 应用 SWI 技术对老年脑深部髓质静脉（Deep Medullary Vein, DMV）的分布进行研究。**方法** 回顾性分析 68 例老年人和 25 例正常中年人脑部 MR 影像学资料。根据不同年龄段，进一步将老年组分为 60-70 岁、71-80 岁、81-90 岁三组，两位资深放射科医师共同判定 DMV 对称性、分别判定 DMV 分型，并对数据进行一致性检验（Kappa）。将 DMVs 与同侧脑浅层静脉（superficial cerebral vein, SCV）管径对比分三型，I 型：无 DMVs 显示；II 型：DMVs 直径小于 SCVs 直径（直径比值小于 1）；III 型：DMVs 直径等于 SCVs 直径（直径比值等于 1）。DMV 对称定义为侧脑室旁相同区域内均见 DMVs 显示且其数目差小于 5 根、扩张程度相近。**结果** 两位放射科医师对 DMV 分型数据的一致性分析 Kappa 值为 0.872。中、老年两组 DMV 对称性 X^2检验无统计学差异，X^2=0.246，P=0.620。Kruskal-Wallis 秩和检验分析得出老年组三组间 DMV 分型总体分布无统计学差异，P=0.171。Spearman 检验分析得出老年组中年龄与 DMV 分型无相关性，r_s=0.093，P=0.531。**结论** DMV 在老年人分布以对称性分布和Ⅱ型 DMV 为著。

CT diagnosis of hepatic tuberculosis

Meng Chi,Rui Yang
Henan thoracic hospital henan rehabilitation center hospital

Objective to analyze the CT manifestations of hepatic tuberculosis in order to explore its imaging characteristics. 24 cases of liver serosal type for liver, capsular thickening and subcapsular solitary or multiple hummocky low-density lesions, enhanced scanning ring improved separated sample improved or without reinforcement. 36 cases of liver parenchyma type, which is divided into millet grain type 21 cases of 10 cases of nodular type 5 cases of liver cyst type. Millet grain type of liver parenchyma multiple scattered in different sizes of millet or focal nodules, no obvious enhancement scanning reinforcement. Nodular type of intrahepatic isolation low density area, pathological substance has no obvious strengthening or circular edge strengthening. Liver cyst type characterized by sample size cyst lesions, circular or irregular shape, enhanced scan without reinforcement, state clearly. Hybrid 8 cases, at the same time with liver size film type and liver parenchyma type. All cases of combined multiple organ tuberculosis. Conclusion CT performance for millet cystic

shadow size focal low density area and isolated hepatic subcapsular hummocky low density area, merge multiple organ tuberculosis, especially in the chest more serous cavity TB, highly suggest possible hepatic tuberculosis.

晚期 NSCLC 靶向治疗伴发特异性感染对影像学评估疗效的影响：独立影像中心 v. s. 现场评估

胡晓云
无锡市人民医院

目的：探讨晚期 NSCLC 靶向治疗伴发特异性感染时，对使用 RECIST 1.1 影像学评估疗效时的影响。方法：通过某多中心晚期转移性非小细胞肺癌（NSCLC）III 期重点项目（特罗凯联合贝伐单抗对比特罗凯单药 III 期临床试验），以独立影像中心（IRC）疗效评估结果为金标准，对比现场评估的结果差异并分析其原因。共 300 个病例、7000 个访视点的阅片任务，以客观缓解率（ORR）主为研究终点，一致性主要观察末次访视点结果为主。IRC 采用双人双盲一致性阅片，不一致时采用第三人裁判阅片，并且 IRC 的阅片员均进行过项目启动前专业培训、有至少 2 年以上的 IRC 阅片经验。现场评估采用日常影像工作状态下的非盲法阅片，阅片员由 PI 所在单位指定一诊断医师进行。结果：IRC 组间评估结果一致性为 95%，IRC 与现场评估结果的一致性为 67.2%。IRC 组间阅片差性原因有靶病灶选择不一致（75.2%）、测量准确性（10.6%）、新病灶的确认（11.2%）、非靶病灶触发 PD（3.7%）、其他不可控客观原因（0.3%）；其中测量准确性差异的原因均是 NSCLC 伴发有感染（结核、真菌等）引起，导致测量两点选择不准确、不一致。现场评估结果差异原因有靶病灶测量准确性（73.3%）、新病灶的确认（19.5%）、靶病灶不全（2.1%）、非靶病灶触发 PD（5.1%），其中误为新病灶的主要原因是把继发的感染灶当作新增病灶（98.6%），其他为遗漏新病灶（1.4%）。结论：晚期 NSCLC 伴发的特异性感染是影响现场评估结果质量的最主要因素;现场评估员需专业培训方可提高 NSCLC 靶向治疗的评估水平。

脊柱结核影像诊断表现

赖兰金,汪丽娅
深圳市龙华区人民医院

目的：分析脊柱结核病的影像学特征，提高其影像诊断与鉴别诊断水平。
方法：回顾性分析 2014 年 1 月-2019 年 5 月间，在我院住院治疗的脊柱结核患者 11 例。所有患者术前均接受 X 线、CT、MRI 影像学检查，并经手术后病理结果证实。通过分析对照 X 线、CT、MRI 对该病诊断的影像学特征，提高该病的影像学诊断水平及探讨不同影像学检查对该病诊断的优势及局限性。
结果：该组病人年龄范围为 19-66 岁，中位年龄为 41 岁，其中男性 8 例，女性 3 例。病变位于胸椎 2 例，腰椎 6 例，胸腰椎 1 例 ，腰骶椎 2 例（其中 1 例病灶呈跳跃征）。11 例患者均有局部疼痛、血沉升高、CRP 升高等临床表现，2 例患者具有午后低热、盗汗、乏力症状；2 例患者有近期体重减轻表现；5 例患者合并肺结核病史；3 例患者合并下肢不全瘫。2 例患者结核杆菌培养阳性。切除病灶病理检查镜下见灶性淋巴细胞聚集及肉芽肿结节，内有少许朗格罕斯细胞；干酪样坏死灶及死骨组织，诊断为结核病。本组患者 X 线检查表现为椎体骨质密度减低 7 例、溶骨性骨质破坏 2 例，椎间隙狭窄 5 例，腰大肌影模糊 6 例。CT 扫描表现为椎体边缘溶骨性/虫蚀样骨质破坏 9

例、局部骨质密度减低 2 例，泥沙样死骨形成 4 例，椎体周围脓肿形成 10 例，椎间隙狭窄 8 例，椎管狭窄 1 例。MRI 扫描表现为椎体信号异常 11 例（T1WI 低信号、T2WI 高信号为主），椎间盘破坏 10 例，椎间隙狭窄 8 例，椎管受累 4 例，椎旁脓肿形成 10 例，窦道形成 1 例， 其中 5 例行 MRI 增强检查，表现为病变椎体明显强化，椎旁脓肿环状强化，内部干酪样坏死组织不强化。

EPO-2343

AIDS 并发骨关节感染的影像表现

李莉
首都医科大学附属北京佑安医院

目的：探讨 AIDS 并发骨关节感染的影像表现。
方法：回顾性分析我院收治的 12 例 AIDS 并发骨关节感染患者的临床和影像资料。
结果：10 例骨髓炎患者不同程度的骨质破坏，骨膜新生骨形成和死骨，受累骨周围继发溃疡、瘘管、蜂窝织炎和脓肿。2 例化脓性关节炎可见关节腔积液，虫蚀样或斑片状骨质破坏、骨皮质不连，关节周围软组织肿胀、脂肪间隙混浊等改变。9 例为金黄色葡萄球菌感染，3 例为结核分枝杆菌感染。
结论：AIDS 并发骨关节感染的影像表现缺乏特异性，诊断需要临床、影像和实验室相结合。

EPO-2344

不同来源肝转移瘤的影像特征分析

李莉,李宏军
首都医科大学附属北京佑安医院

目的：分析不同器官来源肝转移瘤的影像表现，总结其特征，以期达到精准医疗的要求。
方法：收集 2016 年 1 月至 2019 年 5 月在我院诊断的 126 例肝转移瘤患者的 CT 和 MRI 资料进行回顾性分析。
结果：126 例肝转移瘤患者中，胃肠道转移 81 例（64%），胰腺癌 10 例（8%），乳腺癌和胆管癌各 9 例（7%），泌尿生殖系统肿瘤 7 例（6%），肺癌 6 例（5%），其他 4 例（3%）；共发现转移瘤灶 192 个，其中，单发转移 35 例，多发转移 91 例；“牛眼征”78 例（62%），主要见于胃癌、结肠癌的肝转移，其瘤体的大小不同导致“牛眼征”的表现也不相同；囊变 49 例（39%），多表现为圆形或类圆形病灶，边界清或不清，门静脉来源肝转移瘤囊变率明显高于肝动脉来源，其中以直肠癌、胃癌多见；钙化 32 例（25%），门静脉来源的消化系统恶性肿瘤（胃癌、结直肠癌）肝转移瘤的钙化出现率明显高于肝动脉来源；高灌注区主要见于胰腺癌、结肠癌、胆囊癌肝转移瘤周，胃癌、结肠癌灌注区主要以瘤周环形为主，胆囊癌以片状不规则为主，胰腺癌主要以楔形及不规则为主；肺癌的肝转移瘤的平均 ADC 值明显低于胃直肠癌、乳腺癌、胰腺癌的肝转移瘤的平均 ADC 值；胰腺癌的肝转移瘤的平均 ADC 值明显高于来源于胃癌、直肠癌、乳腺癌、肺癌的肝脏转移瘤的平均 ADC 值。
结论：影像检查对不同器官来源肝转移瘤的诊断和鉴别诊断具有一定的价值，对临床治疗具有指导作用。

EPO-2345

肝脏感染性疾病影像学表现

李莉,李宏军
首都医科大学附属北京佑安医院

目的：分析不同病原体所致肝脏感染性疾病的影像表现。
方法：对肝脏感染性疾病的影像表现进行综合分析。
结果：（1）细菌性肝脓肿 CT 平扫典型表现为多发低密度病灶，增强后脓肿壁呈环形强化，“环靶”征和脓腔内出现小气泡或气-液平面是肝脓肿的特征性表现；多房脓肿病灶内可见多发线样分隔，增强后分隔在门脉期呈蜂窝状改变，即“簇状”征或“蜂窝”征。MRI 平扫 T1WI 脓腔呈低或稍高信号，脓肿壁及分隔呈低信号，T2WI 脓肿壁呈低信号，其内囊性成分呈较高信号，增强后脓肿壁呈花环状或环状强化，中心呈低信号，门脉期及延迟期持续肿块较平扫明显缩小。（2）病毒性感染多表现为肝大、肝密度减低。（3）真菌感染 CT 平扫常表现为多发圆形或类圆形低密度灶，直径多＜2cm，增强后动脉期病灶呈环形强化，周围有异常灌注，门脉期病灶缩小、数目减少；MRI 病灶呈长 T1 长 T2 信号，周边有低密度纤维环影。（4）寄生虫感染 CT 平扫病灶呈不均匀低密度，增强后门脉期病灶呈轻~中等度强化，可见蜂窝样或分隔样强化；肝包虫感染的“水中百合”征、“飘带”征，肝血吸虫感染的“蟹足状钙化”改变，肝片吸虫感染的“隧道样”结构等特征性表现有助于诊断。
结论：肝脏感染性疾病的影像表现各有其特点，CT 及 MRI 在疾病早期发现、定性和定量诊断上起着重要的作用，对于不典型的病灶，结合临床及实验室检查不难鉴别。

EPO-2346

AIDS 并发骨肌感染的影像表现

李莉,李宏军
首都医科大学附属北京佑安医院

目的：探讨 AIDS 并发骨肌感染的影像表现。
方法：回顾性分析我院收治的 20 例 AIDS 并发骨肌感染患者的临床和影像资料。
结果：10 例骨髓炎患者不同程度的骨质破坏，骨膜新生骨形成和死骨，受累骨周围继发溃疡、瘘管、蜂窝织炎和脓肿。2 例化脓性关节炎可见关节腔积液，虫蚀样或斑片状骨质破坏、骨皮质不连，关节周围软组织肿胀、脂肪间隙混浊等改变。4 例软组织脓肿表现为病灶中心呈低密度或长 T1 长 T2 信号，环形强化。2 例蜂窝织炎表现为边界模糊的软组织肿块，肌肉束和皮下脂肪间的界限消失。1 例化脓性肌炎表现为肌肉水肿，增强扫描可见肌肉内积液和脓肿。
结论：AIDS 并发骨肌感染的影像表现缺乏特异性，诊断需要临床、影像和实验室相结合。

EPO-2347

AIDS 并发软组织感染的影像表现

李莉,李宏军
首都医科大学附属北京佑安医院

目的：探讨 AIDS 并发软组织关节感染的影像表现。
方法：回顾性分析我院收治的 8 例 AIDS 并发软关节感染患者的临床和影像资料。

结果：4 例软组织脓肿表现为病灶中心呈低密度或长 T1 长 T2 信号，环形强化。2 例蜂窝织炎表现为边界模糊的软组织肿块，肌肉束和皮下脂肪间的界限消失。1 例化脓性肌炎表现为肌肉水肿，增强扫描可见肌肉内积液和脓肿。
结论：AIDS 并发软组织感染的影像表现缺乏特异性，诊断需要临床、影像和实验室相结合。

EPO-2348
苏北寄宿高中肺结核爆发初期筛查阶段的影像学表现及感染情况分析

周莹
连云港市第一人民医院

目的 描述苏北某县寄宿式高中爆发肺结核感染后初始筛查阶段的临床及影像学表现，评估 CT 对青少年肺结核感染初期的诊断价值。**方法** 以苏北某县高中一年级 20 个班在校学生作为研究对象，应用结核菌素皮肤试验（TST）结合胸部 X 线或 CT 检查识别肺结核爆发初期的感染者，采用配对 X^2 或 *Fisher* 精确检验分析胸部 X 线及 CT 检查对青少年肺结核感染初期的诊断价值。**结果** 1009 人进行了 TST 检查，阳性反应 239(23.7%)人，阴性反应 770（76.3%）人。860 人（85.2%）进行了胸部 X 线检查，163 人（16.2%）进行了胸部 CT 检查，临床诊断为活动性肺结核 48 人，疑似肺结核 15 人，潜伏结核感染（LTBI）179 人，无肺结核 767 人。73 人（7.2%）依次进行了 TST、胸部 X 线和 CT 检查，TST、X 线胸片、CT 灵敏度为 95.7%、52.2%、95.7%，特异度为 56.9%、98.0%、100.0%，阳性预测值为 50.0%、92.3%、100.0%，阴性预测值为 100.0%、81.7%、98.0%。59.3%活动性肺结核病灶位于上叶，以微结节和树芽征最常见，分别占 93.8%和 77.1%。X 线及 CT 对临床诊断疑似或活动性结核之间的差异具有统计学意义，P 值=0.001（X^2=11.275）。**结论** 寄宿式高中爆发型肺结核感染者初期多无典型肺结核症状且痰菌检查常为阴性，CT 可识别胸片不能发现的病灶，提高肺结核的检出率，加强传染源的控制。

EPO-2349
青少年早期无症状活动性肺结核 CT 征象分析

周莹
连云港市第一人民医院

目的 分析青少年肺结核爆发感染早期无症状活动性肺结核的 CT 征象，以提高对本病的认识。**方法** 回顾性分析苏北某县寄宿式高中爆发肺结核感染后，参加肺结核筛查并经临床诊断为活动性肺结核的 47 例患者的临床、胸部 X 线、CT 表现并与治疗后 CT 表现进行对照。**结果** 47 例早期无症状活动性肺结核中男性发病率高于女性，27 例胸部 X 线未发现异常病变，X 线和 CT 对早期活动性肺结核检出率的差异有统计学意义（P<0.001）。46 例胸部 CT 表现为肺实质病变，1 例表现为胸腔积液，共计 58 个肺叶 60 个肺段存在病变，35 例病变位于上叶，22 例病变位于下叶，1 例病变位于中叶，其中 CT 表现为树芽征占 68.1%，微结节占 89.4%，实变 21.3%，抗结核治疗后病灶不同程度吸收好转。**结论** CT 是诊断早期无症状活动性肺结核的最佳检查手段，青少年有肺结核接触史者胸部 CT 检查显示肺内微结节或树芽征时要首先考虑活动性肺结核。

EPO-2350

18F FDG PET/CT 联合超声、CTA 在大动脉炎中的价值

常悦,于婷婷,李萍
哈尔滨医科大学

目的：本研究旨在研究 18F FDG PET / CT、超声、18F FDG PET / CT 血管造影融合在大动脉炎早期诊断、活动度评估，疗效监测方面的应用价值。
方法：收集 2018 年 6 月至 2019 年 8 月期间 11 例大动脉炎患者临床资料，均为女性，年龄 18-62 岁，平均年龄（44.6±12.5）岁，11 例患者均行 18F FDG PET / CT 检查并测定血管壁 SUVmax；9 例行超声检查；3 例患者行 CT 血管造影检查。
结果：11 例患者中（3 例发热、3 例急性冠状动脉综合征、1 例头晕、1 例视物模糊、1 例肱动脉、桡动脉搏动减弱，1 例高血压、1 例体检发现颈总动脉闭塞）就诊发现动脉炎。超声显示 24 处血管壁增厚，PET/CT 示相应血管壁 SUVmax 1.02-3.19；8 处颈总动脉内膜增厚，最厚处 1.6-2.6mm，其中 1 处管腔闭塞伴 FDG 代谢增高；11 处锁骨下动脉内膜增厚，最厚处 1.3-2.5mm，其中 1 处管腔闭塞未见 FDG 代谢增高；2 处头臂干内膜增厚，最厚处 1.7-1.9mm，其中 1 处伴 FDG 代谢增高；3 例 CT 血管造影检查示，1 例大动脉炎治疗后多处血管闭塞，累及左侧锁骨下动脉、左侧腋动脉肠系膜上动脉、右侧髂外动脉，但未见 FDG 摄取，提示大血管炎处于静止期，治疗有效；1 例大动脉炎治疗前患者显示升主动脉扩张，周围低密度环绕，累及左侧颈总动脉及左侧锁骨下动脉，管腔重度狭窄，PET/CT 示相应部位 FDG 摄取增高，SUVmax 1.89-2.63，提示大动脉炎处于活动期；另外，PET/CT 显示 1 名治疗后患者超声、CT 血管造影均无异常的主动脉弓管壁 FDG 代谢增高灶。
结论：^{18}F FDG PET / CT 检查对血管炎患者的早期诊断、治疗效果监测有重要价值；^{18}F FDG PET / CTA 融合检查可提供主动脉及深部大血管管腔无有意义狭窄时的代谢情况从而进行早期诊断，同时通过血管壁的代谢情况判定动脉炎的活动度，对指导临床制定治疗方案有重要意义。

EPO-2351

Research on the Function of DSCT With Dual Energy Imaging in the Therapeutic Assessment of Chemotherapy of Lung Cancer

Zhoufang Zhang,Li-ya Wang
Shenzhen Longhua People Hospital

[ABSTRACT] Objective To explore the variation of CT net enhancement value、iodine value、and energy spectrum cure of dual-energy CT imaging before and after chemotherapy of lung cancer, and provide a theoretical basis for the clinical assessment of lung cancer after chemotherapy。Method To collect 22 cases with primary non-small cell lung cancer in Zhejiang Cancer Hospital from March 2014 to January 2015, and all of them cannot receive operation but chemotherapy through clinical evaluation 。Among the patients,16 cases of male, 6 cases of female ,age range41-76, mean age 61.4 years。All the cases are newly diagnosed and confirmed by pathology results, including 12 cases of adenocarcinoma, 10 cases of squamous cell carcinoma 。Applying the German SIEMENS second generation dual-energy CT to exam the chest in dual-energy mode before and after 2 cycles of chemotherapy 。The scanning time for enhancement were at the aorta peak and 100s after the injection of iodinated contrast material。Transfer the dual-energy date into Dual-energy software of the MMWP workstation and select the “Liver-VNC” mode to obtain the enhanced CT and iodine

value of lesions before and after chemotherapy, selecting the “Monoenergetic” mode to gain the CT value under different condition of Kev ,then analysis the changes of the net enhanced CT value 、iodine value ad spectrum cure of the lesions before and after chemotherapy。Results 1.After chemotherapy the net enhanced CT value and standardization iodine value in PR and SD groups reduced than before in each period of enhancement scannig (P<0.05) 。 2.The change of the net enhancement CT value and standardization iodine value was statistically significantly higher in PR groups compared with that in SD groups in each period (P<0.05) 。3.The ROC curve showed that the change of the net enhancement CT value could predict treatment response with 75% sensitivity, 92.3% specificity at the aortic peak, the area under the curve was 0.813 (P<0.05) , with 87.5% sensitivity, 92.3% specificity at the 100s, the area under the curve was 0.856 (P<0.05) 。The ROC curve showed that the change of the standardization iodine value could also predict treatment response with 100% sensitivity, 69.2% specificity at the aortic peak, the area under the curve was 0.909 (P<0.05) , with 87.5% sensitivity, 100% specificity at the 100s, the area under the curve was 0.971 (P<0.05) 。4. The standardization iodine value of PR groups were higher than SD groups before chemotherapy ,but only at the aortic peak the difference was statistically significant (P<0.05) 。5. After chemotherapy the CT value under different Kev (interval 10Kev) was lower than before ,and the difference was statistically significant (P<0.05) 。6. At aortic time , the cure of CT value in the range of 40Kev-80Kev of SD groups was decreased , and then remained relatively flat state, but in the PR groups, the curve decreased in the range of 40Kev-100Kev。A t 100s, both of the SD and PR groups in the range of 40Kev-100Kev, the cure of CT value were significantly decreased, and then remained relatively flat state 。but the difference between the two groups was that the CT value of SD groups was close before and after chemotherapy in 60Kev, but there was a vast difference in PR groups。7. The change of CT value under different Kev were compared before and after chemotherapy 。At aortic time , the curve of SD groups was decreased in the range of 40Kev-80Kev, and then remained relatively flat state, but in the PR groups, the curve kept a flat state in the range of 40Kev-60Kev, then kept upward trend。A t 100s, the curve of SD groups was decreased in the range of 40Kev-60Kev, and then remained relatively flat state; But the curve of PR groups was decreased in the range of 40Kev-100Kev, and then remained relatively flat state。8. In our experiment , the PR group included only 1 case , the net enhanced CT value、standardization iodine value and the CT value under different Kev were degreased then before。Conclusion After chemotherapy , the net enhanced CT value、standardization iodine value and the CT value under different Kev were decreased than before both in PR groups and SD groups, and the difference were statistically significant, DUCT with dual-energy imaging can be applied to therapeutic assessment of chemotherapy of lung cancer.

磁共振成像在评价肝癌射频消融术疗效中的应用及其相应影像学特征分析

刘帅
宁波市医疗中心李惠利东部医院

目的 探讨磁共振成像在肝癌射频消融术中的应用并结合影像学特征进行分析;**方法** 回顾性分析 2013 年 1 月-2017 年 12 月于本院收治行射频消融治疗患者 75 例，共 106 个病灶，收集患者经皮 RFA 术前后 MRI 表现，并将定期随访影像学资料进行分析，对病灶大小、信号变化及动态增强情况进行收集;**结果** 术后扫描 RFA 区域可见完整环形 T1WI 高信号改变，术后 96.23%病灶较术前增大，术后 12 个月 90.57%的病灶缩小。复发患者表现为 T1、T2 长改变，DWI 信号为高强度信号，增强扫描发现为结节样增强，术后 1 个月 T1WI 高信号环完整共 100 个病灶，术后 12 个月 15 个病灶复发，复发率为 15%；高信号环不完整共 6 个病灶，复发率为 66.67%，两者比较差异有统计学意义（P＜0.05），进行 DWI 动态扫描后计算的治疗前病灶区 ADC 平均值最小，正常区 ADC 值最大。对于边缘残留及复发病灶与完全消融过渡区、正常肝脏组织、消融坏死病灶的 ADC 值比较发现，边缘残留及复发病灶 ADC 值均有下降，差异有统计学意义（P＜0.05）;**结论** 核磁共振技术组织分辨率高，多序列、多方位成像，获得的诊断信息丰富。MRI 结合 DWI 及 ADC 值的测量能够更加准确定性原发性肝癌，辨别残留、复发的肿瘤组织，从而为临床尽早选择有效治疗方案提供支持。

MR-PROSET 在 1.5T 磁共振中显示下压槽神经的可行性研究

王丹
宁波市医疗中心李惠利医院东部院区

目的 探讨采用磁共振选择性水激励脂肪抑制技术（MR-PROSET）显示下牙槽神经的可行性。**方法** 采用飞利浦 Ingenia 1.5T MR 对 42 例符合入选标准的患者进行磁共振 MR-PROSET 检查，包括需拔除下牙患者 16 例、种植前定位 12 例、种植后随访 11 例、拔除下牙后仍疼痛 3 例，图像经多方位重组（MPR）后进行以下处理：对于需拔除下牙及种植前患者，在各方位图像上测量牙齿与下牙槽神经的距离，通过 HIS 系统传输至口腔科医生供手术参考；对于拔除下牙后仍疼痛及种植后患者，观察下牙槽神经的完整性。**结果** 16 例需拔除下牙及 12 例种植前定位患者的 MPR 图像清晰，测量准确，在手术过程中均未伤及下牙槽神经；11 例随访的种植后患者显示下牙槽神经完整性较好；3 例拔除下牙后仍疼痛患者的下牙槽神经均有不同程度损伤。**结论** MR-PROSET 序列显示下牙槽神经的可靠性以及稳定性较好，可为临床提供更直观的图像。

子宫动脉栓塞术在前置胎盘合并胎盘植入凶险性剖宫产术中的疗效观察

吴泽涛
李惠利东部医院

目的 探讨前置胎盘合并胎盘植入剖宫产术中行子宫动脉栓塞术对于防治剖宫产术中及术后出血的疗效分析。**方法** 对 24 例前置胎盘合并胎盘植入患者在剖宫产术中行预防性双侧子宫动脉栓塞术，观察剖宫产术中及术后出血量、并发症及保宫率等。**结果** 本组 24 例患者术中超选择性子宫动脉插管成功率 100%，术中出血量约 400ml～600ml，术后出血量约 50ml～200ml，保宫率为 100%。所有患者术后无严重并发症发生。**结论** 剖宫产术中行超选择性子宫动脉栓塞是微创、安全有效的治疗方法，能增加保宫率，可减少剖宫产术中、术后的出血量及术后并发症的发生。但对胎儿的影响仍需进行多中心大规模随机对照临床研究才能进一步证实其疗效。

EPO-2355
数字乳腺断层合成 X 线摄影在乳腺癌诊断中的应用价值

林闽江
宁波市医疗中心李惠利东部医院

目的　探讨数字乳腺断层合成 X 线摄影技术（DBT）在乳腺癌诊断中的应用价值。方法　对经手术病理证实的 80 例乳腺癌患者的 DBT 图像与数字化 X 线钼靶检查（DM）图像进行回顾性对比分析。对乳腺癌的直接影像征象：肿块或结节、分叶征或毛刺征及钙化进行分级评分。结果　DBT 与 DM 在肿块或结节、肿块分叶与毛刺征检出率差异均有统计学意义（均 P＜0.05），但恶性钙化灶的检出率差异无统计学意义（P＞0.05）。结论 DBT 能有效提高乳腺癌肿块直接影像征象的检出率，在乳腺癌的诊断中具有较高应用价值。

EPO-2356
数字乳腺断层融合 X 线成像在 c，d 两类实质构成乳腺中病灶的检出价值（付 182 例病例分析）

张信忠
李惠利东部医院

数字乳腺断层融合 x 线成像(digital breast tomosynthesis，DBT)作为一种新的成像技术，能提高少脂肪的纤维腺体类(即 c，d 两类)乳腺中病灶的检出率及病灶形态特征显示的能力：众所周知，全数字化乳腺 X 线成像(full. field digital mammography，FFDM)的应用在一定程度上可提高乳腺疾病检查的灵敏度。利用 FFDM 检查，在 a，b 类腺体中绝大多数乳腺病灶能被检出，但在 c，d 乳腺中，仍有一半乳腺病灶难以清晰显示，有研究表明，FFDM 对病灶检出存在较高比例的假阴性及假阳性，其诊断的灵敏度和特异度仍有待提高。

EPO-2357
CT 扫描联合 MRI 在原发性肝癌的诊断及介入治疗术后的评价应用

刘帅
宁波市医疗中心李惠利东部医院

目的：讨论 CT 扫描联合 MRI 对于原发性肝癌的诊断及介入治疗术后的评价中的应用。方法：回顾性分析 2015 年 11 月-2018 年 6 月于我院确诊并住院治疗的 200 例原发性肝癌患者的临床资料，根据患者接受的影像学检查方法分为对照组(n=120)和观察组(n=80)。对两组患者的影像学资料，分析两组与病理结果比较的诊断符合率与介入治疗后的疗效分析。结果：对照组患者与病理结果比较的诊断符合率为 95%，观察组患者与病理结果比较的诊断符合率为 80，观察组高于对照组，两组差异具有统计学意义（P＜0.05）。对照组随访 28 例，查出 41 个病灶，观察组随访 81 例查出 157 个病灶，观察组检出率高于对照组，两组比较差异具有统计学意义（P＜0.05）。结论：CT 联合 MRI 对诊断原发性肝癌具有一定优越性，能够具备较高的检出率，并且对于介入手术的预后评价也更为准确，具有较好的临床效果，值得临床广泛推广和应用。

PETRA 序列在肺结节检出中的初步应用

冯会,时高峰,刘辉,张宁
河北医科大学第四医院

目的：评估 3T 磁共振 PETRA 序列在肺结节检出中的能力，并与 CT 比较在肺结节检出中的应用价值。
材料与方法： 共 45 名 CT 发现肺结节的病人接受了 MRI 检查，检查序列包括 PETRA，T2-HASTE，T2-BLADE，T1-VIBE。回顾性分析 CT 和 MRI 图像，并计算肺结节的检出率（包括实性结节和亚实性结节），同时测量结节的平均直径。以 CT 图像为金标准，计算并比较各序列结节的检出率。应用 SPSS21.0 进行统计学分析。MRI 和 CT 中测量的结节的大小比较应用 Pearson 相关性检验. 计算不同序列对于结节检出的敏感性，比较不同大小、类型、部位结节的检出率。
结果：CT 检出 45 名患者的 104 个肺结节，包括 34 个实性结节，71 个亚实性结节（41 个部分实性结节，29 个磨玻璃结节），结节的平均直径约为 9.3mm。MRI 检出实性结节中的 28 个，其中小于 6mm 结节检出率 65%，大于 6mm 结节检出率 100%。亚实性结节检出 61 个，其中小于 6mm 结节检出率 50%，大于 6mm 结节检出率 100%。PETRA 序列检出率最高（85.5%），实性结节，磨玻璃结节和部分实性结节的检出率分别为 82%，74%和 95%。对于大于 6mm 的结节，PETRA 序列检出率为 97.2%，CT 值大于-600HU 的结节检出率为 88%，对于位于上叶的结节检出率高于中下叶结节，外周结节检出率高于中心结节。
结论：MRI 可以很好的检出和评估肺结节，具有高敏感性和低假阳性率。PETRA 序列可以实现自由呼吸下和亚毫米级成像，可作为肺结节患者 CT 检查和筛查可选择的有效手段。

艾滋病相关结内淋巴瘤的 CT 影像学表现及病理分析

周静如,莫移美,卢亦波
南宁市第四人民医院

目的：探讨艾滋病(AIDS)相关结内淋巴瘤的 CT 影像学表现及病理特征，提高对该病的认识。资料与方法：回顾性分析 2017 年 1 月至 2018 年 9 月本院手术病理确诊的 16 例 AIDS 相关结内淋巴瘤患者的临床病理资料及 CT 影像学表现,所有受检者均行 CT 平扫及增强扫描。结果：AIDS 相关淋巴瘤 16 例，经手术病理确诊 NHL 弥漫大 B 细胞淋巴瘤 13 例， NHL 伯基特淋巴瘤 1 例， NHL 滤泡性淋巴瘤 1 例，霍奇金淋巴瘤（淋巴细胞为主型）1 例。影像学表现以全身多部位淋巴结肿大为主，其中颈部淋巴结肿大 3 例，腋窝淋巴结肿大 3 例，腹部淋巴结肿大 4 例，累及两个及以上部位淋巴结 6 例。病灶类圆形或不规则形，短径通常大于 3cm，较大者大小约 17.5cm×11.6cm；边界清楚或不清楚；平扫密度不均匀 7 例，密度较均匀 9 例；增强扫描呈现均匀 5 例，不均匀强化 11 例，其中肿块中央出现坏死 6 例。以上病例均未出现结外淋巴瘤的表现，出现邻近器官的侵犯 3 例，出现骨转移 1 例。结论：艾滋病合并结内淋巴瘤以非霍奇金淋巴瘤（主要为弥漫大 B 细胞淋巴瘤）为主，广泛累及全身多部位淋巴结，CT 影像表现与病理符合度高，具有一定的特征性，为临床的诊断和预后的评价提供重要的依据。

EPO-2360

膝关节结核的 MRI 表现

唐光孝,李春华,吕圣秀,王惠秋
重庆市公共卫生医疗救治中心

目的 探讨膝关节结核的 MRI 表现，提高对膝关节结核的认识。**方法** 回顾性分析我院 2016 年 3 月~2018 年 12 月经手术及病理检查证实的 23 例患者的影 MRI 资料，分析其影像表现。23 例患者 26 个膝关节结核,其中单纯左膝 8 例,单纯右膝 12 例,双膝 3 例。全部病例行膝关节冠状位、矢状位、横断位 MR 平扫，12 例患者行钆贝葡胺增强扫描。**结果** 单纯滑膜结核 7 例，表现为滑膜增生，关节积液，滑膜增生在 MRI 在 T1WI 上呈较为均匀中低信号，T2WI 上呈不均匀高信号表现，增强扫描见条状及斑片状强化。滑膜结核合并半月板损伤、关节软骨损伤、交叉韧带损伤共 11 例，MRI 表现除滑膜增生外还表现为半月板损伤，以半月板后角 II° 及以上损伤为主，交叉韧带不全性损伤及水肿为主。全关节结核 14 例，表现为骨质破坏以及骨髓水肿，骨髓水肿表现为斑片及片状高信号。**结论** MRI 对膝关节结核病变范围和程度的判断及骨质破坏的早期发现有重要作用。

EPO-2361

7 例神经梅毒的 MRI 表现分析

李春华,吕圣秀,刘雪艳,王惠秋,舒伟强
重庆市公共卫生医疗救治中心

目的 分析神经梅毒的 MRI 表现，提高对神经梅毒 MRI 表现的认识。 **方法** 回顾性分析我院收治的 11 例确诊神经梅毒患者的 MRI 资料，分析其 MRI 表现。 **结果** 病变主要位于基底节区，额顶叶脑白质，小脑半球及脑干区域，呈斑片状及结节状，MRI 平扫 T1WI 病灶呈等及低信号，T2WI 呈高信号为主，T2flair 部分中心呈低信号，周围呈高信号，DWI 部分高信号，中心低信号，部分伴有邻近脑沟变窄，钆贝葡胺增强 T1WI 多数病灶无明显强化，部分病灶边缘强化，部分呈小结节状强化，部分脑膜强化。**结论** 神经梅毒的 MRI 表现多样，MRI 对病变形态和范围及治疗后疗效评价有重要价值。但确诊需要实验室检查或病理组织学检查。

EPO-2362

空腔性病变的误诊分析

马晓静,时高峰
河北医科大学第四医院

目的：空腔性病变的误诊原因分析
方法：在我院 2015-2019 年的 PACS 系统内筛选 CT 表现为空腔样结构的病例，最终病理结果不符的为恶性的，且临床及病理资料完整的共 97 例，记录其影像表现、临床及病理信息。临床资料包括年龄、性别、症状、吸烟史。病理资料包括病变类型、淋巴结转移情况。
结果：临床特点：97 个空腔性病变中，男 58 例（59.8%），女 39 例（49.2%），年龄范围为 37-76 岁，平均为(59.2±8.6)岁；有临床症状的 52 例（53.6%），无症状的 49 例（46.4%）；有吸烟史者 53 例（54.6%），无吸烟史者 44 例（45.4%）。

病理特点：97 个病人中有 80 例腺癌（82.5%），11 例鳞癌（11.3%），6 例腺鳞癌（6.2%）；行 EGFR 基因检查的共 50 例，其中基因无突变 27 个（54%），有突变 23 个（46%），且均为腺癌；患者均行淋巴结清扫，有淋巴结转移的 9 个（9.3%），无淋巴结转移的 88 个（90.7%）。
CT 征象：位于右肺 53 例，左肺 44 例，其中肺气肿患者 33 个（34%）。肿瘤最大径(2.7±1.3) cm，囊腔最大径(1.5±1.0) cm，实性成分最大径(1.6±1.2) cm。56 个病变为实性病变，亚实性 26 个，磨玻璃 13 个。中央型 9 个（9.3%），外周型 86 个（88.7%），混合型 2 个（2.1%）。形态不规则有 65 个（67%），边缘不清楚 65 个（67%），有分叶 62 个（63.9%），毛刺 38 个（39.2%），胸膜牵扯 75 个（77.3%），支气管穿行 41 个（42.2%），支气管截断 17 个（17.5%），血管集束征 83 个（85.6%）。
结论
误诊的原因包括患者症状轻微或无表现，空腔壁薄，软组织影较少，病理恶性程度低，很少有淋巴结转移等。但仍有一特征可以有助于区别良恶性，当 MSCT 中空腔性病变表现为囊壁不均匀，存在壁结节，随访病变有明显变化时高度提示为肺癌。

EPO-2363
对比研究体检中定量 CT 及超声对脂肪肝的诊断价值

赵健智
宁波市医疗中心李惠利医院东部院区

对比研究体检中定量 CT 及超声对脂肪肝的诊断价值并探究β值诊断脂肪肝的阈值。**方法** 筛选 2018 年 8 月至 2019 年 1 月在李惠利东部医院自愿行胸部低剂量 CT 联合脂肪肝定量 CT(quantitative computed tomography，QCT)检查的 500 例健康体检者。统计受检者身高与体重并计算其 BMI 值，统计受检者肝脏超声结果。利用 Mindways 公司的 QCT Pro 系统测量肝脏骨密度(bone mineraldensity，BMD)值，经公式计算得出肝脏脂肪体积百分比β值。根据常规纵膈窗测量肝脾 CT 值，计算肝/脾 CT 比值。独立样本 T 检验分析脂肪肝组与非脂肪肝组之间年龄、BMI 值、BMD 值、β值的统计学差异，并采用 Pearson 相关系数分析年龄、BMI 值、BMD 值、β值与肝/脾 CT 比值之间的相关性。通过受试者工作特征曲线（receiver operating characteristic curve，ROC）评估β值诊断脂肪肝的效能及其阈值。**结果** 脂肪肝的所占比例为 8.6%(43/500)，男性中脂肪肝所占比例为 12.6%(35/278)，明显高于女性的 3.6%(8/222)。脂肪肝组及非脂肪肝组之间年龄没有统计学差异(P>0.05)，BMI、BMD 及β值均具有统计学差异(P<0.05)。年龄与肝/脾 CT 比值之间没有相关性(P>0.05)，BMI 与肝/脾比值呈弱负相关(R=-0.397,P<0.05)，而 BMD、β值与肝/脾比值分别呈显著正相关(R=0.884,P<0.05)和显著负相关(R=-0.881,P<0.05)。β值诊断脂肪肝的 ROC 曲线下面积为 0.996，阈值为 3.13%（敏感度 100%，特异度 96.1%），高于超声的敏感度(93.0%)及特异度(81.2%)。**结论** QCT 诊断脂肪肝的效能高于超声，并且能够定量评估肝脏脂肪化程度，使脂肪肝的诊断及后期随访更佳精准化。

EPO-2364
肝细胞肝癌合并门脉癌栓的影像特征

许霄
宁波市医疗中心李惠利医院东部院区

探讨肝细胞肝癌合并门脉癌栓的影像特征。方法 收集 2016 年 2 月至 2019 年 2 月期间我院影像诊断合并门脉癌栓的肝细胞癌患者共 34 例，其中 MR20 例，CT14 例，选取同期我院 CT 及 MR 诊断未合并门脉癌栓的肝细胞肝癌患者各 20 例作为对照组。将 CT 与 MR 下两组病例原发灶的影像特征进行对比，并将相关数据行统计学分析。 **结果** 两种检查方法下的病例组与对照组相比较，病灶的分布、形态、边缘、强化方式之间均具有统计学意义 (P<0.05)。**结论** 深入了解肝细胞肝癌合并门脉癌栓的相关影像征象，能提高其诊断率，指导临床治疗计划及预后评估。

EPO-2365

PET/CT 在脊柱结核中的影像表现

于婷婷,常悦,李萍
哈尔滨医科大学附属第二医院

目的：探讨 ^{18}F-FDG PET/CT 在脊柱结核中的影像表现。
方法：回顾性分析 2017 年 9 月到 2019 年 8 月 6 例脊柱结核的 PET / CT 影像表现。6 例患者均进行了全身 PET / CT 扫描，6 例患者共 12 个病灶，4 例患者病变累及相邻两个椎体，其中 1 例为多椎体病变，2 例仅累及单个椎体。2 例颈椎，2 例胸椎，1 例胸椎及腰椎，1 例腰椎，结果均经病理证实。
结果：12 个病灶在 PET 图像上表现为高代谢，SUVmax 平均为 13（6－23.7），延时显像 SUVmax 平均为 15.3（10.1－24.5）。3 例患者有既往肺结核病史，3 例患者图像上有肺部结核病灶，5 例患者图像上纵隔及双肺门淋巴结密度较高，部分有钙化，伴代谢轻度增高。CT 主要表现为不同程度的溶骨性骨质破坏，4 处病灶出现椎旁软组织影，2 处病灶累及椎间盘出现椎间隙变窄。
结论：^{18}F-FDG PET/C 图像上清晰反映受累椎体范围,终板及椎间盘有无累及,椎管内脊髓受压情况,以及椎旁脓肿范围。延迟扫描 SUVmax 的轻度上升，可能与病灶含有大量的葡萄糖代谢旺盛的细胞有关，如郎格汉斯细胞、类上皮细胞、淋巴细胞等。脊柱结核的诊断不仅要依靠影像表现，还应该结合临床表现及结核感染病史。

EPO-2366

Evaluation of the effect of percutaneous transluminal coronary angioplasty on myocardial microcirculation disorder by first-pass myocardial perfusion imaging

Guofei Zeng
Chongqing Traditional Chinese Medicine Hospital, China

Objective To investigate the value of magnetic resonance first-pass perfusion imaging (MR-FPI) in early evaluation of percutaneous transluminal coronary angioplasty (PTCA) for myocardial microcirculation disorders.

Methods Thirty patients undergoing PTCA were enrolled. Cardiac magnetic resonance (CMR) myocardial perfusion was performed before and within one week after PTCA. The right coronary artery, left anterior descending artery and circumflex artery were taken as independent vessels. The perfusion parameters (peak time T, peak signal intensity SI,

maximum myocardial signal intensity) of each blood supply area were measured. Increasing slope Smax. The clinical trial of thrombolytic therapy (TIMI) before and after PTCA was divided into four groups: normal microcirculation group (3 points), mild disturbance group (2 points), severe disturbance group (1 point) and no reflux group (0 points). The difference of perfusion parameters was studied to evaluate the diagnosis of CMR on myocardial microcirculation disturbance. Then, the TIMI blood flow grading changes before and after PTCA were divided into microcirculation recovery group, unchanged group and aggravated group, and the difference of perfusion parameters between each group was compared to evaluate the value of CMR in the treatment of microcirculation disorders by PTCA.

Results There were 47 surgical vessels in 30 patients. The TIMI blood flow grading of 180 coronary arteries before and after PTCA showed 93 in 3 points, 63 in 2 points, 24 in 1 point and 11 in 0 points. There were significant differences in T, SI and Smax values of CMR myocardial first pass parameters among all grading groups ($P < 0.05$). Characteristic: 21 were enlarged, 15 were unchanged and 11 were decreased. There were significant differences in the first pass parameters T, SI and Smax between the two groups ($P < 0.05$).

Conclusion MR myocardial first pass perfusion imaging can detect the myocardial microcirculation disorder caused by PCI as early as possible, and it is noninvasive and specific. It can be used as a method to evaluate the efficacy of PTCA.

钆塞酸二钠增强 MR 对肝脏局灶性病变强化方式的定量评估价值

刘茂童,陆健,张学琴
南通市第三人民医院

摘要 目的 探讨钆塞酸二钠（Gd-EOB-DTPA）增强 MR 对肝脏局灶性病变强化方式的定量评估价值。**方法** 回顾性分析肝脏局灶性病变 63 例，包括肝细胞肝癌（HCC）23 例、转移瘤 9 例、局灶性结节性增生（FNH）11 例、血管瘤 20 例，经手术病理、典型影像表现及随访证实。所有患者均行上腹部平扫及 Gd-EOB-DTPA MR 增强扫描。测量平扫及增强各期（动脉期、门静脉期、移行期、10min 及 20min）肝实质及病灶的信号强度（SI）和同层面背景噪声的标准差（$SD_{噪声}$），计算病灶平扫及增强各期信号噪声比（SNR）、病灶-肝脏对比噪声比（CNR）及病灶相对强化率（RE）。采用单因素方差分析或 *Kruskal-Wallis* H 检验比较四组病变平扫及增强各期 SNR、CNR 及 RE。**结果** HCC、转移瘤、FNH 和血管瘤平扫及增强各期 SNR、CNR 及 RE 组间比较差异均有统计学意义（P<0.05）。HCC 的 SNR 自门脉期明显减低，后持续下降，转移瘤及血管瘤的 SNR 在 10min 及 20min 明显减低，FNH 的 SNR 增强后至 10min 持续上升。HCC、转移瘤和血管瘤 10min 及 20min 时 CNR 为负值，FNH 的 CNR 增强后各期均为正值。门静脉期及移行期 HCC 的 CNR 显著低于其余三组（P<0.05）。10min 与 20min 时 FNH 的 CNR 及 SNR 显著高于其余三组（P<0.05）。除 FNH 外 HCC、转移瘤和血管瘤的 RE 在 10min 及 20min 明显减低，门脉期及移行期四组病变 RE 两两比较差异均有统计学意义（P<0.05），20min 时 FNH 的 RE 显著高于其余三组（P<0.05）。**结论** 采用 GD-EOB-DTPA 增强 MR 对肝脏局灶性病变的强化方式进行定量评估有助于病变的诊断及鉴别诊断。

基于 MELD 评分探讨钆塞酸二钠增强 MRI 肝细胞分数对肝脏储备功能的评估价值

刘茂童,陆健,张学琴
南通市第三人民医院

目的：探讨钆塞酸二钠增强 MRI 肝细胞分数对肝脏储备功能的评估价值。**方法：**前瞻性收集 2017 年 2 月至 2018 年 12 月于我院 MR 室行上腹部磁共振检查的连续性患者 82 例，按照 MELD 评分进行分组，其中 MELD≤10 组 61 例，MELD＞10 组 21 例；于注射对比剂 Gd-EOB-DTPA 增强前及增强后 20min 行 T1mapping 成像，获取肝脏不同扫描时相以下参数：肝细胞分数（HeF）、摄取系数（K 值）、平扫肝脏 T1 弛豫时间（T1pre）、增强后 20min 肝脏 T1 弛豫时间（T1post）、T1 弛豫率增加值（ΔR1）和 T1 弛豫时间减低率（ΔT1），采用独立样本 t 检验比较两组间 HEF、K 值、T1pre、T1post、ΔR1 及ΔT1 值的差异；采用 Pearson 相关分析评价各参数与 MELD 评分的相关性；采用 ROC 评价各参数鉴别两组的诊断效能。采用多因素 logistic 回归分析获得 MELD 评分＞10 的重要预测因素。**结果：**HEF、K 值、ΔT1 及ΔR1 的值随肝功能受损程度增加而减低，T1pre 及 T1post 的值随肝功能受损程度增加而增加。除 T1pre 外，MELD 评分≤10 及＞10 组各参数差异均有统计学意义（p<0.05）。HEF、K 值、T1pre、T1post、ΔT1 及ΔR1 评价不同肝功能组的 ROC 曲线下面积分别为：0.765、0.844、0.638、0.754、0.746、0.766； T1pre 及 T1post 与 MELD 评分呈正相关（r 分别为 0.460 和 0.732，P均＜0.05），ΔT1、ΔR1、HEF 及 K 值与 MELD 评分呈负相关（r 分别为-0.600、-0.515、-0.730 和-0.490，P均＜0.05）。回归分析显示 K 值是 MELD 评分＞

10 的重要的预测因素。**结论:**钆塞酸二钠增强 MRI 肝细胞分数可以评价乙型肝炎肝硬化患者的肝脏储备功能，K 值具有较高的诊断效能。

EPO-2370
多模态磁共振成像研究在非酒精性脂肪性肝炎的研究应用

陈彦孜,唐湘雍,刘年元,汪丽娅,张玉忠
深圳市龙华区人民医院

目的：非酒精性脂肪肝（NAFLD）是我国第一大慢性肝病，并且是健康生化指标异常的首要原因，而其疾病机制是复杂且不明确。本研究运用了多模态 MRI 成像方法（Mdixon-Quant、FFE-R_2^*及 DTI）对早期 NAFLD 非酒精性脂肪性肝炎肝脏进行成像，探索非酒精性脂肪性肝炎的疾病机制及病理变化。

方法：本实验选取 20 名到我院就诊的患者（正常志愿者 10 名，非酒精性脂肪性肝炎 10 名）使用飞利浦 Ingenia 3.0T MR 设备进行多模态 MRI 成像扫描肝脏。测量区域选择肝右叶Ⅴ、Ⅵ段，尽可能避免血管和胆管进入选择区，以 T2WI 图像作为参考，分别测定相同位置脂肪分数(HFF)、铁含量相对值(R_2^*)及各向异性分数（FA），同时行 HFF 和 R_2^*、FA 值相关性分析。

结果：此项实验中参与者的平均年龄为 46.4±13.7 岁(25-65 岁)，正常志愿者组 HFF 值为 3.08±0.38，R_2^*值为 667.56±80.10 及 FA 值为 0.89±0.02；非酒精性脂肪性肝炎患者组 HFF 值为 18.49±7.80 %，R_2^*值为 888.45±92.09 及 FA 值为 0.78±0.12。两组间 HFF 值，R_2^*值及 FA 值差异有统计学意义（p 值＜0.05）且 HFF 值与 R_2^*呈正相关，（r=0.683，p 值＜0.05），HFF 与 FA 值呈负相关（r=0.574，p 值＜0.05）。

结论：多模态 MRI 成像方法诊断早期 NAFLD 非酒精性脂肪性肝炎具有较高价值，并且可以揭示非酒精性脂肪性肝炎的疾病病理生理机制：非酒精性脂肪性肝炎肝脏铁含量增加，可能与肝细胞铁过载相关，并且有进展为肝硬化的趋势。

EPO-2371
Pulmonary Sarcoidosis in HIV Patients: A Review

Zhiyan Lu, Sudheesh Raveendran
Zhongnan Hospital, Wuhan University

The status of the sarcoidosis outbreak, including the epidemiology, clinical presentation, radiographic findings, diagnosis and management of sarcoidosis were reviewed to present a better understanding of pulmonary sarcoidosis in HIV patients. Although diagnostic strategies and management of sarcoidosis had improved over the past few years, much is still unknown. Identifying the causes and populations at risk for the disease would not only enhance the diagnosis and management but possibly aid in prevention. While on highly active antiretroviral therapy, Sarcoidosis should consider in the differential diagnosis of patients with pulmonary symptoms. Comparison of the CD4 count and CD4/CD8 ratio in BAL versus peripheral blood may aid

in the diagnosis and management and of these patients. The fact in HIV patients was the cellular immunity is highly variable, following antiretroviral therapy start and discontinuation, with the chance of crossing the threshold of 200 CD4+/mmc several times. This fact mainly influenced by the clinical presentation and diagnosis of sarcoidosis in HIV-infected patients which is similar to that of other non-co-infected patients. Further studies have needed to evaluate the risk of pulmonary sarcoidosis in HIV patients after immunosuppressive therapy. We hope this review can aid practitioners to evaluate accurate diagnosis and follow-up therapy at the right time. Early detection and treatment of sarcoidosis is mandatory to control the mortality rate of these HIV infected populations

CT 及 MRI 在腰椎间盘突出症诊断中的应用研究

唐光孝,吕圣秀
重庆市公共卫生医疗救治中心

目的：分析在患有腰椎间盘突出症的患者具体诊断当中，患者分别接受 CT 与 MRI 诊断的具体效果。**方法：**选择我院在 2017 年 5 月至 2018 年 3 月时间段内收治的 60 例腰椎间盘突出症患者为主要对象，所有患者都分别接受 CT 与 MRI 扫描，对比患者接受这两种不同方法诊断后的检出情况。**结果：**患者接受 MRI 扫描后的病情检出例数要多于 CT 诊断，两种方法的相关数据在接受对比后存在明显意义（P＜0.05）。**结论：**在临床患有腰椎间盘突出症患者的临床诊断当中，CT 与 MRI 都是较为有效的诊断方式，但是 MRI 的检出率相对更高一些，所以，医生可以在实际应用中进行科学选择。

EPO-2373

艾滋病并发肺部巨细胞病毒肺炎的影像学与病理对照

吕圣秀,李春华,舒伟强,刘雪艳
重庆市公共卫生医疗救治中心

目的:探讨艾滋病并发肺部巨细胞病毒肺炎的 CT 表现，提高对艾滋病并发肺部巨细胞病毒感染的认识。 **方法**:回顾性分析我院 2018.1-2019.7 收治的经临床及病理证实的 15 例艾滋病并发肺部巨细胞病毒感染的 CT 资料。分析其 CT 表现。结果：CT 表现为双肺弥漫性磨玻璃密度影 12 例，伴小叶间隔增厚 5 例，胸膜下线 3 例，囊腔影 2 例，表现为小叶实变 3 例。 病变位于中内带 3 例，肺部与双肺中外部 12 例，淋巴结肿大 6 例，伴胸腔积液 1 例。结论：艾滋病并发肺部巨细胞病毒感染的 CT 表现以磨玻璃及间质性改变为主，病变分布中外的为主，具有一定特征，需与 PCP 相鉴别。

瑞金医院 2018 年 IBD-MDT 中 35 例中老年 CD 患者影像学初步总结

唐永华,陈憩
上海交通大学医学院附属瑞金医院放射科

【目的】总结 2018-3-1~2018-12 -31 在上海交大医学院附属瑞金医院炎症性肠病-MDT 中确诊的 36 例中老年 CD 患者的临床资料及影像学表现。【材料及方法】通过 MDT 会诊收集门诊患者病史及外院影像资料，其中部分在我院住院患者由 PACS 住院信息系统完成。【结果】1、临床资料：35 例患者，男 15 例，女性 20 例，男女之比 1： 1.33，年龄 50~71 岁，平均年龄 59.31 岁，发病年龄半年~20 年不等。2、临床表现：主要为腹痛 3 例，腹泻伴肛瘘 2 例，30 例表现为小肠不全梗阻，一例反复肝功能异常，入院证实合并自身免疫性硬化性胆管炎（PBC），此病人有甲状腺癌手术病史。2 例合并强直性脊柱炎伴关节疼痛，1 例左肺上叶错构瘤术后，1 例外院卵巢肿块误诊为肠道内瘘包块形成，类克治疗期间出现大量胸腔积液伴包块。本组 12 例患者有 CD 肠道手术病史，各有 3 例阑尾及肛瘘手术病史。3、影像学表现：全部患者均行小肠 CT 检查，其中 5 例表现为克罗恩病慢性伴部分活动期改变，无内瘘及渗出，20 例合并肠管及腹腔相邻脏器间隙内瘘包块形成，病变管腔纤维性狭窄，1 例表现为盆组回肠节段性炎症伴溃疡，2 例回结肠静脉血栓形成，一例合并胆道 PBC 改变。4、诊断及治疗：本组 2 例外院诊断溃结，经我院 MDT 会诊纠正。本组 4 例行类克治疗，三例治疗后病情缓解，其中一例为术后患者；2 例每周一次甲氨蝶呤 Bid 治疗有效，病情缓解控制；10 例多次手术患者术后长期不规则或中断治疗，造成病情复发、加重。【结论】中老年 CD 在我院发病率呈上升趋势，临床及影像学医师应熟悉本病常见及不典型表现，尽早给与患者个性化治疗，类克治疗前重视排除禁忌症，建议胸腹部 CT 检查。类克及或甲氨蝶呤治疗有助于中老年 CD 患者减缓病情进展，长期疗效有待进一步结合临床、内镜及影像观察。IBD-MDT 治疗模式有助提高炎症性肠病患者精准诊治。

血液病患者并发医院获得性肺炎的肺部 CT 表现

史亮
河北医科大学第四医院

目的：总结血液病患者在住院期间并发医院获得性肺炎的肺 CT 特征。方法：回顾性分析 2017 年 1 月至 2018 年 7 月间我院血液中心住院患者的肺 CT 资料和住院电子病历信息。结果：40 例血液病患者在住院期间发生了较为严重的肺内感染，其中并发细菌感染者 22 例（55.0%），CT 上表现为局灶性实变（10/22）、磨玻璃密度影（8/22）、结节及肿块（8/22）、空洞（2/22）、节段性肺蜂窝状改变（1/22），其中 2 例出现肺内空洞表现者痰培养检出金黄色葡萄球菌,；并发真菌感染 5 例（12.5%），CT 上表现为结节肿块（5/5）、空洞（1/5）、晕征（2/5）、结节伴卫星灶（1/5）、肺门端支气管受累（1/5），其中 4 例发生在肺野外带；并发肺结核 4 例，发生在非结核好发部位（3/4）、病灶伴有坏死（2/4）、胸膜受累（1/4）；发生病毒感染 3 例，CT 表现为弥漫性磨玻璃密度（2/3）、沿支气管血管束分布多发小结节（1/3）；其中 3 例痰培养同时发现真菌及阳性链球菌患者 3 例，CT 上同时出现结节、磨玻璃密度及局灶性肺实变。结论：血液病患者在治疗期间并发的肺内机遇性感染在肺 CT 上表现出一定特征性，对我们鉴别血液恶性肿瘤肺浸润以及把握激素药物使用有很大帮助。

EPO-2376

IgG4 相关性腹部疾病的影像学表现

李瑞利,李宏军
首都医科大学附属北京佑安医院

目的：回顾性分析 IgG4 相关性腹部疾病的 CT 及 MRI 表现，提高对该病的认识。
方法：回顾性分析我院 20 例 IgG4 相关性腹部疾病的影像学表现及临床特征，累及部位包括胰腺、胆道、肝脏、肾脏、输尿管、腹膜后。
结果：胰腺受累最常见，可局限性肿大，或弥漫性肿大，胰管不扩张，呈渐进性强化，动脉期强化程度低于正常胰腺，延长期略高于正常胰腺，当胰头部受累时，常有胆总管狭窄，以上肝内外胆管扩张。IgG4 相关硬化性胆管炎多累及大胆管，弥漫对称性胆管壁增厚，引起梗阻性黄疸。累及肝脏主要表现为炎性肿块，炎性假瘤，增强后呈渐进性强化。累及肾脏表现为肿块，类似肿瘤样，增强后渐进性强化。累及输尿管表现为输尿管内占位，肾积水。发生在腹膜后，主要是腹膜后腹主动脉旁纤维化。
结论：IgG4 相关性疾病对激素治疗有效，有时可表现为肿块样，常被误诊为恶性肿瘤而进行手术切除，认识其影像学特点，有助于提高诊断水平及避免不必要的过度治疗。

EPO-2377
颅脑 MR 在急性血行播散性肺结核患者中筛查结核性脑膜炎的价值探讨

侯代伦,黄麦玲
首都医科大学附属北京胸科医院

目的 探讨头颅 MR 增强扫描在急性血行播散性肺结核患者中筛查结核性脑膜炎的价值。
方法 搜集我院 2012 年 1 月至 2018 年 5 月住院的急性血行播散性肺结核 415 例患者的临床资料，筛选出进行了头颅 MR 增强扫描及脑脊液常规生化检查的患者 235 例，男：女=1.12：1，年龄 15~87 岁，平均年龄（36±18）岁，15~岁年龄组患者占 62.1%。采用 SPSS 22.0 软件进行统计分析，计数资料组间比较采用卡方检验。当总数＞40，且 1＜理论频数＜5 时采用校正卡方检验。配对计数资料的比较采用配对卡方检验，以 P＜0.05 为差异有统计学意义。**结果** 235 例急性血行播散性肺结核患者，头颅 MR 增强扫描发现的异常率（89.8%，211/235）较脑脊液常规生化高（62.9%，148/235），差异有统计学意义（McNemar 检验，P=0.000）。确诊及很可能结核性脑膜炎 219 例中，头颅 MR 增强扫描发现的异常率（96.3%，211/219）较脑脊液常规生化检查高（67.6%，148/219）高，且差异有统计学意义（McNemar 检验，P=0.000）。有中枢神经系统症状的 143 例患者中，头颅 MR 增强扫描发现的异常率（95.8%，137/143）较脑脊液常规生化发现的异常率（86.0%，126/143）高，差异有统计学意义（McNemar 检验，P=0.035）。无中枢神经系统症状的 76 例患者中，头颅 MR 增强扫描发现的异常率（97.4%，74/76）较脑脊液常规生化高（28.9%，22/76），差异有统计学意义（McNemar 检验，P=0.000）。**结论** 头颅 MR 增强扫描在急性血行播散性肺结核患者中对颅内结核病变的发现率高；特别是对于无神经系统症状的结核性脑膜炎患者，脑脊液常规生化检查发现的异常率偏低，而头颅 MR 增强扫描发现的异常率仍＞95%。

EPO-2378
能谱 CT 成像评价颈动脉粥样硬化斑块类型的临床研究

纪凤颖,张莹,王正通
哈尔滨医科大学附属第一医院

目的

回顾性分析颈动脉粥样硬化症患者的能谱 CTA 多参数数据，探讨其对颈动脉斑块成分及易损性界定的应用价值。

方法

收集 27 例拟行颈动脉内膜剥脱术患者，术前均进行超声检查（对照组）及 GE 宝石能谱 CT（GE Discovery CT 750HD）颈动脉 CTA 能谱成像扫描检查（实验组），对两种检查的斑块检出率进行对比分析。将在 70 keV 的最佳单能量水平联合 40%自适应迭代重建（ASIR）的数据传至图像后处理工作站 AW4.5，记录颈动脉斑块的数量和位置，并使用能谱成分技术（Gemstone Spectral Imaging GSI）综合分析颈动脉斑块的组织成分[1]。获得斑块各种成分的能谱曲线及有效原子序数，计算出各种成分的能谱曲线斜率。采用方差分析对斑块中各种成分参数进行统计比较。使用 Kappa 检验评价 GE 宝石能谱 CTA 与病理学切片诊断结果的一致性。

结果

27 例患者中共存在斑块 52 处，能谱 CTA 共检出斑块 49 处，超声共检出斑块 46 处。能谱 CTA 的斑块检出率为 94.23%，超声检查的斑块检出率为 88.46%。能谱 CTA 检出的 49 处斑块中包括纤维斑块 24 处，脂质斑块 18 处，斑块内出血 7 处。3 种斑块组织成分的曲线斜率及有效原子序数均存在差异。GE 宝石能谱 CTA 对颈动脉斑块成分的诊断结果与病理学切片的诊断结果一致性较高。

结论

能谱 CTA 能够准确的分析斑块的组织成分，进而能够有效的评估斑块的稳定性，以期更好的为临床颈动脉斑块治疗的选择提供帮助。

EPO-2379

The Characteristic of MR Imaging in Primary Testicular Lymphoma

zaipeng zhang,Liejun Mei,Xiaoming Gong,Ming Deng,Zhiyan Lu
Department of Radiology， Zhongnan Hospital of Wuhan University

Objective: To explore the characteristics and diagnosis value of MR imaging in primary testicular lymphoma(PTL). **Methods:**MR imaging and clinical information from six patients with PTL were retrospectively analyzed compared with clinical information from six patients diagnosed with testicular seminoma. The characteristic of lesion was analyzed with T1WI/T2WI *Plain Scan* sequences(n=6) and contrast enhanced scan(n=4) including DCE(n= 3) performed with 1.5~3.0T MRI Unit. DWI were performed in 3 cases. **Results:** The average incidence age was 65 years old. The shape of lesion was round or oval. The lesion showed T1W1 iso-intense and T2W1 low signal intensity(one with inhomogeneous signal intensity). On T2W1, there was stratified stepsize signal in lesion site,testicular tissue and hydrocele of testis. On DWI, the lesion showed hyper-intensity and lower ADC value. **Conclusion:** The MRI findings from patients with PTL showed TIW1 iso-signal nodules with gradually moderate enhancement , T2WI low signal intensity and obvious DWI diffusal restriction. The later two findings were specific for PTL.

EPO-2380

MRI 诊断脑膜型囊虫病合并肝内感染一例

顾太富

南昌大学第二附属医院

脑膜型囊虫病是脑囊虫病一种少见的形式，同时合并肝脏感染更是罕见，目前国内无相关病例报道。我们报道一例 45 岁女性，患有脑膜型囊虫病合并肝脏感染。患者因间断头痛、抽搐 4 天于 2018 年 11 月 4 日于南昌大学第二附属医院就诊，伴四肢抽搐，意识丧失，持续 20 分钟，无发热，头颅 MRI 平扫+增强示：右侧颞叶外侧皮层下白质肿胀呈长 T1 长 T2 信号，DWI 为等、低信号，增强后结节明显强化，与脑膜分界不清，右侧大脑半球脑膜增厚，呈线状强化。脑脊液生化检查：脑脊液蛋白 667.44mg/L，葡萄糖 3.07mmol/L,氯 123.40mmol/L，脑脊液结核菌涂片（-）、新型隐球菌检查（-）；结合患者血液囊虫抗体阳性，考虑囊虫病诊断。予以阿苯达挫片抗囊虫、奥卡西平抗癫痫。2018-12-17 入院复查，头颅 MRI 提示脑膜下结节缩小；同时患者肝功能异常：碱性磷酸酶：124.19U/L； 丙氨酸氨基转移酶 40.17U/L；r-谷氨酰胺转移酶：56.93U/L，腹部 CT 平扫+增强示：肝实质内多枚低密度，边界欠情，增强后呈斑片状强化，门脉期及延迟期呈相对低度。腹部 MRI 平扫+增强示肝实质内多发斑片状稍长 T1 稍长 T2 信号，DWI 高信号，增强后呈均匀轻中度强化。予以异甘草酸镁、多洗磷脂胆碱护肝降酶，2018-12-30 再次复查，肝脏病灶吸收，且右侧脑膜强化结节明显缩小，脑水肿减轻。脑囊虫病史中枢神经最常见的寄生虫感染，可分为脑实质型、脑膜型、脑室型及混合型。脑膜型囊虫病最少见，以往仅有少数病例报道，可能因为囊虫进入中枢系统时，多由血流进入脑实质，通过脉络膜丛进入脑室内的囊虫大都位于第四脑室，仅少数进入蛛网膜下腔。本例脑膜型囊虫病沿脑膜呈多发结节，并引起脑膜广泛增厚，是典型的脑膜型囊虫病表现，同时伴有肝内多发感染灶，经过抗囊虫治疗后，脑内及肝内病灶均缩小并部分消失。

EPO-2381

磁共振弥散加权成像及表面扩散系数在艾滋病相关性脑实质结核诊断中的价值

覃春乐,卢亦波,马程琳
南宁市第四人民医院

目的 探讨磁共振（MRI）弥散加权成像（DWI）及表面扩散系数（ADC）在脑实质结核诊断中的价值。**方法** 回顾分析本院 2017 年 1 月至 2018 年 12 月确诊的艾滋病相关脑实质结核患者 16 例临床资料及 MRI 表现，所有患者均行头颅 MRI 常规及弥散加权成像 DWI（b 值为 0,1000 s/mm^2）检查，测量并计算脑实质结核灶及对侧正常脑实质的 DWI 相对表观弥散系数（ADC）值，应用 SPSS19.0 统计学软件分析其差异性。**结果** 16 例艾滋病相关性脑实质结核患者 MRI 表现共 54 个病灶，其中小脑（7）、桥脑（3）、海马（2）、颞叶（2）、枕叶（12）、基底节（10）、额叶（11）、顶叶（7）。在 MRI 影像上脑实质结核灶 T1WI 呈等或稍低信号，T2WI 呈环状或结节状高信号，增强后呈环形强化（32）、结节样强化（20）、花簇样强化（2），DWI 病灶呈低信号共 44 个，ADC 值（1.265±0.281）×$10^{-3}mm^2$/s 明显高于对侧正常脑实质（0.758±0.071）×$10^{-3}mm^2$/s，差异具有统计学意义，P＜0.05。**结论** ADC 值能较准确的量化脑实质结核灶的弥散程度，结合 T1WI、T2WI,增强 MR 扫描及脑弥散成像技术联合应用，对艾滋病相关性脑实质结核的诊断具有一定的价值。

EPO-2382

平衡式稳态自由进动序列血管成像对肾动脉狭窄的诊断价值：Meta 分析

鲁植艳,李航 ,龚晓明,宋璐

武汉大学中南医院

[摘要]:**目的**采用 Meta 分析方法评价平衡式稳态自由进动序列血管成像技术（B-SSFP）对肾动脉狭窄(RAS)的诊断价值。**方法**计算机检索 PubMed、EMABASE、Cochrane Library 数据库,检索关于 B-SSFP 诊断 RAS 的英文文献。文献评价采用诊断研究评价工具 QUADAS-2。数据采用 Meta-Disc1.4 和 Stata 12.0 软件进行分析，检验异质性和发表偏倚，绘制汇总受试者工作特征(SROC)曲线并计算曲线下面积(AUC)，计算合并敏感度、特异度以及诊断比值比。**结果**共纳入 13 篇文献，Meta 分析结果显示 SROC 曲线 AUC 为 0.97，合并灵敏度、特异度分别为 0.85、0.96。**结论** B-SSFP 对 RAS 诊断具有较高的灵敏度和特异度，有望成为肾功能不全患者的首先检查。

EPO-2383

隐球菌性脑膜脑炎的影像学表现与诊断

鲁植艳,龚晓明,宋璐
武汉大学中南医院

目的: 探讨隐球菌性脑膜脑炎影像学表现特征及主要鉴别诊断。
方法:回顾性分析通过脑脊液墨汁染色或培养证实的隐球菌性脑膜脑炎 24 例,其中男 13 例,女 11 例,年龄 8~65 岁,主要症状有头痛、恶心、呕吐、发热。24 例患者均行 MR 检查，其中 14 例同时行头颅 CT 检查。
结果:21 例患者 20 例影像学检查为阳性,主要表现有、弥漫性脑水肿、轻度脑积水；亚急性期及慢性期表现为脑萎缩、脑积水、胶状假囊、脑内多灶低密度区及异常信号区、隐球菌瘤,脑膜增厚、强化,以基底池、环池、侧裂池及四叠池为著;脑内强化血管影增多。
结论: 影像表现能够反映隐球菌性脑膜脑炎的病理学特征,软脑膜强化，胶状假囊及伴发的深部脑组织病变是隐脑的常见表现。

肾脏平滑肌瘤的 CT 表现分析

余秋月,何玉麟
南昌大学第一附属医院

目的：学习及探讨肾平滑肌瘤的多排螺旋 CT 表现，以提高其术前诊断准确率。方法：回顾性分析 4 例手术病理证实的肾平滑肌瘤患者的临床及影像资料，4 例均行 CT 平扫及多期动态增强扫描。结果：4 例肾平滑肌瘤均发生于右肾下极，均为单发病灶，边界清晰，形态较规则，有包膜，CT 横断面上最大径约 1.9～7.1cm。CT 平扫以同侧肾实质为对比，4 例均为稍高密度，其中 3 例密度均匀，1 例密度不均匀，内见斑片状低密度影，周围见结节状高密度影。4 例增强皮质期强化程度均低于肾皮质，3 例实质期及肾盂期见强化程度逐渐增加，1 例肾盂期见强化程度下降。其中 2 例内见多发迂曲紊乱血管影。术前均未正确诊断。术后随访 3～49 个月（平均 26 个月）均未见复发或转移。结论：肾平滑肌瘤是罕见的肾良性肿瘤，术前容易误诊，但肾平滑肌瘤生长部位、平扫密度、强化方式及肿瘤边界等有一定的特征性，分析其 CT 特征以提高诊断水平，有助于临床选择最佳治疗方案。

颅内动脉粥样斑块 HR-MRI 信号特征-影像与病理学对照研究进展

罗琳
内蒙古科技大学包头医学院第一附属医院

随着近年来高分辨磁共振成像（High-resolution magnetic resonance imaging, HRMRI）技术的发展，以及该项技术应用于颈动脉粥样斑块（Carotid atherosclerotic plaque, CASP）的研究中得到了影像学和组织学特征的相关对应，故进一步采用该技术研究颅内动脉粥样硬化斑块（Intracranial atherosclerotic plaque, ICASP）的形态及成分，由于颅内动脉较为细小，且具有独特的组织学特征，以及斑块成分如：纤维帽、脂质核心等在不同场强中的弛豫时间不同，故二者在影像学特征表现方面存在一定的差异。

EPO-2386

AIDS 相关肝脏机会性感染的影像表现

李莉,李宏军
首都医科大学附属北京佑安医院

目的：分析相关肝脏机会性感染的影像表现，探讨其影像特征。
方法：回顾性分析 30 例经实验室检查和临床确诊的 AIDS 患者合并肝脏机会性感染病例的影像表现。
结果：30 例患者中细菌感染 22 例（73.3%），真菌感染 6 例（20.0%），病毒感染和混合性感染各 1 例（3.3%）。细菌感染多表现为多发环形强化的脓肿或弥漫的低密度病灶，其中，结核分枝杆菌多表现为粟粒状结节或肝脓肿，非结核分枝杆菌多表现为细小低密度灶；真菌感染多为环形强化的多发小脓肿、弥漫性微脓肿或脓肿样改变，马尔尼菲蓝状菌感染可见肝脾呈“筛孔状”改变；病毒感染可见弥漫分布的无明显强化的细小低密度灶；混合性感染兼有以上细菌和真菌感染的表现。
结论： AIDS 相关肝脏机会性感染的影像表现无明显特异性，确诊有赖于临床和影像检查的结合。

EPO-2387

Clinical and MRI Imaging Analysis of Neonatal Escherichia Coli Meningitis

Heping Xu,Siping He,Guangchun Wu
Hunan Children's Hospital

Objective: To explore the clinical and MRI features of neonatal Escherichia coli meningitis. **Methods**: Retrospective analysis of clinical and MRI data of 30 cases of neonatal Escherichia coli meningitis admitted from August 2013 to December 2018.Of the 30 cases, 16 were males and 14 were females, aged from 5 to 28 days, with an average of 18 days.Escherichia coli culture: 30 cases were positive in blood culture and 7 cases were positive in cerebrospinal fluid culture.All patients underwent plain and enhanced MR scans, including DWI and enhanced FLAIR scans. All patients were followed up 2-5 times with MRI. **Results**:Fever or body temperature did not rise, poor reaction, eating less or refusing to breast milk, breathing, heart rate increased as clinical

manifestations.All patients showed meningeal thickening and abnormal enhancement on MRI.Complications occurred in 15 cases, including hydrocephalus in 10 cases (3 communicating cases), ventricular empyema in 8 cases, cerebral infarction in 7 cases (1 arterial case), ependymitis in 7 cases, subdural effusion/empyema in 6 cases, venous sinus thrombosis in 2 cases, thalamic hemorrhage in 1 case.There were 10 cases with 2 or more complications. Conclusion:Atypical clinical manifestations of neonatal Escherichia coli meningitis.MRI can well display the pathological features of neonatal Escherichia coli meningitis and provide objective basis for its early diagnosis and treatment outcome evaluation.

磁共振 DWI 技术在肝脏占位性病变中的应用

任美吉
首都医科大学附属北京佑安医院

扩散加权成像技术（DWI）是利用水分子的扩散运动特性进行成像的技术，使 MRI 对人体的研究深入到分子水平，反映人体组织的微观几何结构以及细胞内外水分子的运动等变化。随着 DWI 的表面扩散系数(ADC)值的变化规律及扩散成像的量化分析、背景抑制磁共振弥散加权成像(DWIBS)等技术开发应用，该技术在肝脏占位性病变的诊断与鉴别诊断中的应用与研究越来越受到重视。现就 DWI 技术在肝脏占位性病变诊断与鉴别诊断中的相关研究予以综述。

EPO-2389

肝转移瘤的 CT 表现与病理基础分析

任美吉
首都医科大学附属北京佑安医院

目的：探讨肝转移瘤的 CT 影像表现和病理基础。**方法：**回顾分析我院 50 例肝转移瘤的 CT 和病理资料，所有病例都经手术和穿刺病理证实，均进行了腹部 CT 平扫和三期增强扫描。**结果：**CT 平扫见 42 例病灶为多发的大小不等的低密度结节影，8 例病灶为单发的低密度结节影。增强扫描后见 35 例（70%）病灶 CT 表现为门静脉期明显的环形强化，即典型的“牛眼征”；8 例（16%）病灶 CT 表现为动脉期环形强化或均匀强化；7 例（14%）病灶 CT 表现为动脉期及门静脉期均无强化。以上肝转移瘤的 CT 表现均以其病理特点为基础的，并与癌灶的大体观相一致。**结论：**肝转移瘤的原发灶以消化道为主，病理类型以腺癌为主，其特征性 CT 表现是门静脉期病灶明显的环形强化，故 CT 增强扫描对肝转移瘤的诊断与鉴别诊断有重要的意义。

EPO-2390

AIDS 合并播散型马尔尼菲青霉菌感染的胸腹部 CT 表现

任美吉
首都医科大学附属北京佑安医院

目的 探讨艾滋病（AIDS）合并播散型马尔尼菲青霉菌感染（disseminated penicillium marnefei infection, DPMI）的胸腹部 CT 表现及诊断价值。 方法 回顾性分析 16 例 AIDS 合并 DPMI 的胸部 CT 表现，9 例腹部 CT 表现。 结果 胸部 CT 示单侧或双侧肺组织片状实变影 5 例（31.25%），其中双侧 4 例，单侧 1 例，2 例可见空气支气管征；结节 5 例（31.25%），其中 2 例表现为粟粒样结节；空洞 4 例（25.00%），其中单发空洞 3 例，群聚性空洞 1 例；双肺磨玻璃样阴影 4 例（25.00%）；肺门和纵隔淋巴结肿大 3 例（18.87%）；胸腔积液 2 例（12.50%）；肿块、心包积液和腋下淋巴结肿大各 1 例（6.25%）。腹部 CT 示腹膜后及肠系膜淋巴结肿大 5 例（55.56%）；肝局灶性低密度 4 例（44.44%），其中 3 例呈局灶性分布，1 例呈弥漫性分布；肝大 4 例（44.44%）；脾低密度病灶 2 例（22.22%），其中局灶性和弥漫性分布各 1 例；腹水 2（22.22%）；肠壁增厚、脾大各 1 例（11.11%）。 结论 AIDS 合并 DPMI 的胸腹部 CT 表现多种多样。胸部 CT 主要表现为肺部片状实变、结节、空洞、磨玻璃样阴影、肺门和纵隔淋巴结肿大。腹部 CT 主要表现为腹膜后及肠系膜淋巴结肿大、肝脾大和肝脾局灶性低密度病灶。同一患者可有多种病变表现。

复发性脊柱包虫病的 MRI 特征

王飞,王俭,王金英,田慧,王宝龙,黄海燕
新疆医科大学第一附属医院

目的 通过回顾性研究探讨术后复发性脊柱包虫与原发脊柱包虫病 MRI 影像差异，阐述脊柱包虫术后复发的 MRI 特征。

方法 收集我院 2012 年 7 月～2018 年 1 月经手术及病理诊断为脊柱包虫病者 19 例，术后复发及资料完整者 9 例（男性 7 例，女性 2 例），年龄 39～62 岁，平均 48.7 岁，术后复发时间 3～12 个月（平均 6 个月）。所有患者均有牧区生活史；术前均行胸部正侧位 X 线、脊柱病变部位 X 线及 MRI 检查。采用西门子公司生产的 Avanto 1.5T 核磁共振进行扫描。主要扫描参数为：T_1WI TR：450ms ，TE ：9.5ms；T_2WI TR：3000ms，TE：98ms；FS T_2WI TR：4000ms ，TE：90ms ，FOV 320mm，矩阵：320×224，层厚 4mm，层距 0.4mm；行轴位、冠状位、矢状位 T_1序列、T_2序列检查和矢状位的脂肪抑制序列检查。

结果 与原发脊柱包虫病 MRI 表现相比，术后复发脊柱包虫 MRI 表现为：原发病灶的典型特征大部分消失，灶围无明显的外膜包裹，T_2WI 上可见“小囊泡”状高信号，但大多无明显的“葡萄串样”改变、无典型的多囊性结构；其椎体骨质破坏区及周围软组织结构显示不清，无 T_1WI、T_2WI 低信号的弧形钙化灶。复发病灶常以多发出现，多发的复发病灶未形成单处簇集状，病灶之间相距较远。椎间盘受累是一种长期被破坏的特征。

结论 复发脊柱包虫病 MRI 表现有其自身显著特点，与原发脊柱包虫病有明显的区别。MRI 检查有其突出的优点且技术成熟、应用广泛，是作为术后复查随访的首选检查。因此脊柱包虫病术后复发的 MRI 表现可为其随访监测提供全面准确的影像学诊断依据。

Primary retroperitoneal seminoma: A case report

yunqing wan[1],Nannan Shi[2],Fei Shan[2],Yuxin Shi[2]
1.The People’s Hospital of Dehong city
2.Shanghai Public Health Clinical Center

Abstract
Background: Primary retroperitoneal seminoma is extremely rare. The symptoms and the imaging features are similar to other retroperitoneal tumors, but the primary retroperitoneal seminoma is sensitive to radiotherapy which is different from others. In this paper, we presented a patient of primary retroperitoneal seminoma who was admitted to the Shanghai Public Health Clinical Center.
Case presentation: A 27 years old man had abdominal pain with low fever for a month, and recurred a week ago. His abdomen was bulging, the right upper abdomen touched a hard mass, the border was unclear, accompanied by tenderness, the testes were normal. LDH increased significantly, AFP elevated sightly. CT scan showed a retroperitoneal mass next to the right kindey, and slightly inhomogeneous enhancement. Necrosis and cystic degeneration were seen in the lesion.The mass surrounds the Inferior vena cava, the right renal artery and renal vein, partially surrounds the abdominal aorta, the right common iliac artery and inferior mesenteric artery. The lesion encroached on the ureter and resulted in hydronephrosis. MRI showed that the T1WI of the tumor was low signal, and the signal showed no significant change in the reverse phase. The T2WI was slightly high signal, and the DWI was high signal. After the enhancement, the lesion was unevenly enhanced, and the separation was enhanced.
Conclusions: When young men find a retroperitoneal soft tissue mass, push adjacent organs or surround large blood vessels, delayed enhanced of the separation, elevated β-HCG and AFP level, and OCT4 positive need to consider the possibility of seminoma.

颅内结核 MRI 表现与临床转归相关性分析

高才良,曾文兵
重庆三峡中心医院

目的 分析颅内结核患者 MRI 表现和治疗预后情况，探讨 MRI 表现与临床转归的相关性。方法 收集 2015 年 07 月至 2018 年 09 月在重庆三峡中心医院住院的确诊和临床诊断为颅内结核患者 68 例，将其住院时的 MRI 表现和其临床转归进行回顾性分析。结果 脑膜结核 20 例，临床治愈 17 例，临床治愈率为 85.0%；脑实质结核 22 例，临床治愈 17 例，临床治愈率为 77.3%；混合型颅内结核 26 例，临床治愈 18 例，临床治愈率为 69.2%，三组比较差异无统计学意义(P＞0.05)。影像学表现为脑梗死 11 例，临床治愈率 54.5%(6/11)；脑积水 15 例，临床治愈率 60.0%(9/15)；脑梗死+脑积水 4 例，临床治愈率 50.0%（2/4），三组比较差异无统计学意义(P＞0.05)。影像学表现无并发症者 51 例，临床治愈率 84.3%（43/51）；有并发症者 17 例，临床治愈率 58.8%（10/17），两组比较差异有统计学意义(P＜0.05)。结论 颅内结核 MRI 表现并发症者与临床治愈率有相关性，对病情转归评估有一定的临床价值。

EPO-2394

典型肺结核与肺癌的 CT 影像学鉴别诊断分析

高才良,曾文兵
重庆三峡中心医院

目的：分析典型肺结核与肺癌的 CT 影像学表现对两者的鉴别诊断价值。方法：收集 2014 年 06 月至 2018 年 07 月重庆三峡中心医院收治的典型肺结核患者和肺癌患者各 47 例，典型肺结核作为对

照组，肺癌作为观察组，对比分析两组患者的 CT 影像学征象和 CT 诊断结果。结果：在 CT 征象方面，对照组与观察组患者分叶、壁结节、厚壁空洞、胸膜凹陷、毛刺等影像学征象差异具有统计学意义(P＜0.05) ；在 CT 诊断结果方面，两组患者病变发生部位对比差异也具有统计学意义(P＜0.05)。结论：利用 CT 诊断能够实现典型肺结核与肺癌的有效鉴别诊断，具有较好临床参考价值。

骨质疏松症磁共振成像的展望

罗琳,赵辰昱
内蒙古科技大学包头医学院第一附属医院

骨质疏松症的特征是骨强度降低和骨折倾向增加。使用双能 X 线吸收测定法 (DXA) 进行骨骼完整性的评估是骨质疏松症的常规方法。DXA 是一种单位面积骨密度的测量方法，但不能获取所有影响骨质强度的因素。除骨量、密度和含量外，骨小梁和骨皮质的结构、矿物含量、微骨折也有助于判断骨质强度。部分特异性骨质结构信息将有更助于进一步了解增加骨折风险的因素，并影响治疗和疗效。需要花费更多的精力开发非侵入性评估骨小梁微结构的技术。
在评估松质骨结构方面的另一前景是使用磁共振成像 (MRI) 技术作为多个解剖部位骨活检的替代方法。
在未来几年内，MRI 技术与 DXA 常规测量的互补使用，在高危人群中使用 MRI 评估治疗效果，以及设计联合治疗可能对骨质疏松症领域产生相当大的影响。

Comparative study of virtual non-contrast CT compared to true non-contrast CT images of the chest: A preliminary study

Qiuzhen Xu,Yan LV
Zhongda Hospital, Southeast University

Department of Radiology, Zhongda Hospital, Southeast Universit
ABSTRACT Objective: To investigate the potential of virtual non-contrast CT(VNC) for spectral CT imaging of the chest, as an alternative to true non-contrastCT(NC). Methods: Forty-six patients with either lung cancer or clinical suspected lung cancer received CT scans, including a conventional plain scan and dual-phasic contrast-enhanced dual-energy spectral scans. Six types of VNC were reconstructed1 for analysis using a GSI viewer. Water-iodine, 140 kev-monochromatic, and material suppressed-iodine imagesfrom thearterial (WI-A,140MI-A,and MSI-A,respectively) and venous phases (WI-V, 140MI-V, and MSI-V, respectively)were compared with NC in terms of subjective scoring, noise, the contrast-noise ratio(CNR), CT value, effective radiation dose(ED)and the detect ability of lesions. Results: The mean score of each VNC was greater than 3 in a 5-point scale and each VNC achieved the basic requirements for diagnosis, and the VNC score during the venous phase was higher than 4 . The noise associated with the WI-A, 140MI-V,1 9 MSI-V and WI-V either did not differ (P>0.05) or

was less than that of NC(P<0.05).2 0 Each VNC did not differ from NC in terms of the CNR(P>0.05). MSI-A and MSI-V2 1 did not differ from NC in terms of the CT value(P>0.05). VNC and NC showed similar performances with regard to the detection of lesions, except for the small calcifications and lymph nodes near the vena cava; The ED was reduced by approximately31.2%usingVNC. Conclusion:MSI-V showed the best potential as a substitute for conventional plain scan,thusreducingtheradiationdose.

EPO-2397
糖尿病相关性肌肉感染的 CT 表现与糖尿病管理的应用研究

张笑春,兰兰,凌公豪
武汉大学中南医院

目的：探讨糖尿病相关性肌肉感染的 CT 表现与糖尿病临床处置的相关性，为糖尿病管理提供依据。**材料方法：**回顾性分析经临床证实的糖尿病肌肉感染 16 例（空腹血糖 25.9±9.8mmol/L，餐后血糖 30.8±9.7mmol/L），其中足 4 例（25.0%）、臀部 3 例（18.8%）、下肢 9 例（56.3%），分析肌肉感染的 CT 影像特点与实验室指标（T 细胞亚群计数、血常规、血肌酐浓度）、抗生素（广谱抗生素和多种抗生素使用天数）应用的关系。**结果：**肌肉溶解坏死形成脓肿 16 例，筋膜增厚强化 14 例，肌间隙增宽 16 例。CD3 降低 12 例 、CD4 降低 11 例、CD8 增加 6 例和 CD4/CD8 减低 16 例，WBC 9.67±3.6×10^9/L 、RBC 3.2±0.7×10^12/L、HGB 88±19g/L、红细胞压积 HCT 31.0±7.6%，Cr 47.0±13.5μmol/l。结论：糖尿病肌肉感染与糖尿病控制不佳、贫血和机体免疫力低下有关。

EPO-2398
糖尿病相关性气性坏疽的 CT 表现及其受累组织器官的分布特点

张笑春,凌公豪,兰兰
武汉大学中南医院

目的：探讨糖尿病相关性气性坏疽的 CT 表现与其受累组织器官分布特点。材料方法：回顾性分析经临床证实的糖尿病相关性气性坏疽 23 例，男性 15 例、53±8 岁，女性 8 例、43±6.2 岁，病史 22±6.1 年，所有病例梭状芽孢杆菌均阳性，空腹血糖 26.3±10.6mmol/L、餐后血糖 31.0±11.2mmol/L，CD4/CD8 降低 23 例、RBC 3.1±0.8×10^12/L、HGB 88±27g/L、Cr 42.3±11.6μmol/l，观察分析各组织器官的 CT 表现，并评价其关系。结果：下肢最容易受累，包括下肢 9 例、会阴和阴囊及生殖器 8 例、双足 4 例、臀部 3 例、胸腹壁及背部 3 例、肝脏、脾脏和胃壁 3 例、心包 1 例。影像学表现包括软组织肿胀 20 例、软组织坏死脓腔形成 3 例、肌间隙和生理腔隙积气 23 例（腹膜腔 3 例、包膜下 1 例、心包 1 例、纵膈 1 例、阴囊 8 例）。结论：糖尿病相关性气性坏疽的 CT 表现主要是软组织肿胀、软组织坏死脓腔形成、肌间隙和生理腔隙积气，且受累器官优势分布顺序为下肢、会阴/阴囊/生殖器、双足、臀部、胸腹壁及背部、肝脏、脾脏/胃壁和心包。结合创伤或医疗操作史、免疫力低、贫血及肾功能障碍，达到早期诊断、及时治疗、保存伤肢和挽救生命目的。

肺毛霉菌病的 CT 影像学表现及动态随诊变化

宋兰[1],周红俐[2,3]
1.中国医学科学院北京协和医院
2.南充市中心医院
3.南充市肿瘤医院

目的 探讨肺毛霉菌病的 CT 影像学特征及动态随诊变化，以提高对该病的认识。**方法** 回顾性分析 21 例北京协和医院经手术或穿刺病理证实的肺毛霉菌病患者的胸部 CT 图像。所有患者均行 MSCT 平扫，其中 12 例行增强检查。**结果** 肺毛霉菌病以双侧分布为主（14/21），2 例呈双肺弥漫分布，且无肺叶、肺段分布规律，病变单发者较少。主要表现为实变、结节、肿块影，5 例呈大片实变，16 例以“结节-实变、结节-肿块或结节-肿块-实变”的形式组合出现。16 例病变内见液化坏死；7 例（单发 5 例、多发 2 例）患者出现 12 个空洞，其中 5 例伴气液平，2 例空洞内见空气新月征；14 例病变周围伴晕征，5 例见反晕征；12 例结节或肿块周围伴毛刺征，以长毛刺为主（10/12）；6 例结节或肿块边缘分叶，浅分叶者较多（4/6）；9 例实变影中出现空泡征；5 例伴点状钙化。支气管狭窄、闭塞、局部扩张或袖套样增厚 14 例；12 例伴纵隔、肺门、腋窝或叶间裂旁淋巴结不同程度增大；12 例伴胸腔积液、2 例伴心包少量积液；9 例出现轻-中度胸膜凹陷征。12 例接受增强扫描者病变实性成分呈轻中度强化；2 例实变影中见强化的右上肺静脉穿行。治疗约 1-2 周后病灶趋向扩大、进展，内部继而出现液化坏死及空洞，结节可进展为斑片影，病灶数目可增多；治疗约 3-4 周后病灶逐渐吸收好转。5 例患者在治疗过程中停药，停药后复查 CT 病灶缩小不明显或范围增大，小结节增多，病灶较前致密。**结论：**肺毛霉菌病基线 CT 常表现为实变、结节、肿块影，周围常伴晕征，病变易液化坏死、出现空洞，易侵犯支气管，实性成分可轻中度强化，钙化、反晕征及空气新月征少见，可出现分叶、毛刺、空洞、空泡、胸膜凹陷、淋巴结肿大等恶性征象，应注意鉴别。此外，肺毛霉菌病治疗不同时期出现动态影像学变化，治疗初期易出现胸部影像学的加重，需警惕误判为疗效不佳。毛霉菌病原体顽固，治疗过程中停药可导致病变进展，临床医师应加强对该病的认识。

EPO-2400
Imaging diagnosis of fungal liver infection in children

Cuiping Guo,Qun Lao
Hangzhou Children’s Hospital

Objective: To investigate the imaging features of fungal liver infection in children in order to improve the diagnostic accuracy of the disease.
Methods:The findings of CT and MRI were retrospectively analyzed in 9 patients with clinically-confirmed fungal liver.
Results: There were 1 case with solitary lesion and 8 cases with multiple lesions. All lessions showed low or equal density on plain CT scan. In 7 cases, the liver parenchyma in outer side of most lesions showed transient abnormally hypertransfusion in arterial phase. The lesion usually did not affect the hepatic blood vessel, and blood vessel were seen in the enhanced scan.
Three patterns of lesions in three enhanced phases were observed on CT and MRI.
Type Ⅰ: The lesions displayed uneven iso-T1 and long T2 signal on MRI. Three-phase enhanced scan of CT and MRI showed ″target-ring sign ″ for uneven annular enhancement.
Type II: Delayed enhancement, lesions showed equal or low density in arterial phase and portal phase, and equal density in delayed phase.

Type III: delay ring enhancement, lesions showed equal or low density in arterial phase and portal phase, and ring enhancement in delayed phase.

After antifungal therapy, the lesion disappeared completely or decreased. Conclusion: The CT and MRI findings of fungal liver infection have some specific characteristics, which is helpful for early diagnosis and treatment, as well as detecting the therapeutic effect.

EPO-2401
肝血管周上皮样细胞瘤的 CT、MRI 特征及误诊分析

鲁梦甜[1],任莹[2]
1.咸宁市中心医院
2.中国医科大学附属盛京医院

目的 探讨肝血管周上皮样细胞瘤（PEComa）的 CT、MRI 特征并分析其误诊原因，以提高对该病的认识及术前诊断准确率。**资料与方法** 回顾性分析经病理证实的 13 例肝 PEComa 患者的临床及影像资料。6 例行肝脏 CT 增强、5 例行全腹 CT 增强、4 例行肝脏 MR 增强、1 例行肝脏 MR 平扫，其中 3 例同时行肝脏 CT 及 MR 检查。**结果** 病灶均为单发，呈圆形或类圆形，最长径 0.8cm-17.5cm（平均 7.6cm），3 例可见分隔者直径均大于 10cm。病灶多位于被膜下 12/13(92%)，边界清晰 12/13(92%)。CT 平扫病灶多呈等或稍低密度，MR 平扫多呈 T1 等低信号、T2 高-稍高信号。其中 5 例信号/密度均匀(38%)，8 例可检出脂肪成分(62%)，2 例含坏死囊变(15%)，1 例含钙化及出血(8%)。增强扫描所有病灶均血供丰富，动脉期明显强化，9 例病变中心或周边可见增粗迂曲血管影（69%）、其中 2 例为早期引流静脉；门/静脉期呈等信号/密度 11 例（73%），呈低信号/密度 3 例（20%）；延迟期呈等信号/密度 4 例（44%），呈低信号/密度 5 例（56%）；5 例可见延迟期强化假包膜。**结论** 在 CT / MRI 上，大多数原发性肝 PEComa 单发、位于被膜下、可检出脂肪成分，增强扫描动脉期病灶中心或边缘可见增粗迂曲血管影，再结合性别、年龄、病史等临床资料可提示该诊断。

EPO-2402
水蜡树果实提取物对结肠癌 HCT-15 细胞的增殖、千移及凋亡诱导因子 AIF 表达的影响

鲁梦甜[1],任莹[2]
1.咸宁市中心医院
2.中国医科大学附属盛京医院

目的：通过体外实验研究水蜡树果实提取物（Fruit of Ligustrum Obtusifolium Extract，FLOE）对结肠癌 HCT-15 细胞的增殖、迁移及凋亡诱导因子（Apoptosisi Iducing Fctor，AIF）表达的影响，探讨其可能的作用机制，为中药在结肠癌治疗中的研发及 AIF 应用于结肠癌治疗提供更多的理论依据。**方法：**体外培养结肠癌细胞株 HCT-15。将 FLOE 用不完全培养基稀释成不同浓度：0μg/ml（对照组）、2.5μg/ml、5μg/ml、10μg/ml、20μg/ml 组，并设置阴性对照（20μg/ml75%酒精）。分别处理 24h、48h、72h、96h 后，观察各组细胞形态学变化，并计算贴壁细胞数量；采用 MTS 法检测各组不同时间细胞存活率；采用集落实验检测不同浓度 FLOE 对结肠癌 HCT-15 细胞生存能力的影响；划痕实验检测在不同浓度药物处理后，对 HCT-15 细胞迁移能力的影

响；采用 Western bolt 法检测在不同浓度药物作用 48h 后，对 HC15 细胞凋亡相关蛋白及 AIF 表达的影响。**结果：** 随着 FLOE 药物浓度的增高及作用时间的延长，HCT-15 细胞伸展变差、细胞漂浮，细胞计数发现贴壁细胞也随之减少。MTS 结果表明与对照组相比 FLOE 处理后的细胞存活率降低（P＜0.05），且呈时间及浓度依赖性。划痕实验结果表明与对照组相比 FLOE 处理后的细胞划痕区域相对宽度较宽（P＜0.05）。集落实验结果表明 FLOE 处理后细胞集落形成数量明显降低。Western bolt 实验结果表明随着 FLOE 浓度的增高，Survivin、Mcl-1 蛋白表达水平明显降低，而凋亡诱导因子 AIF 表达增加。**结论：** 水蜡树果实提取物能抑制 HCT-15 细胞增殖及迁移，且呈浓度及时间依赖性。其机制可能通过下调抗凋亡蛋白的表达及上调凋亡诱导因子 AIF 的表达实现。

X 线检查对宝宝危害到底有多大

劳群
杭州市儿童医院

生活中经常会遇到孩子不小心吞了各种异物（硬币、果核、小玩具、发夹、螺丝等）、考虑孩子有肺部炎症、外伤需要排除骨折等情况，此时医生会建议做 X 线检查。一提起 X 线检查，很多妈妈就会很纠结，这个对宝宝的辐射到底有多大、究竟这种检查该不该做呢？

EPO-2404

磁共振成像对炎性肠病诊断及病情评估的价值探究

秦幸茹[1],任莹[2]
1.西安交通大学第二附属医院
2.中国医科大学附属盛京医院

目的 应用 MRI 平扫、增强 MRI 结合扩散加权成像（DWI）探究各 MRI 指标对炎性肠病（IBD）的诊断效能及其在量化评估 IBD 炎症程度中的价值。方法 选取病理确诊为 IBD 的 20 例患者及 10 例肠镜正常体检患者。分析各肠段 MRI 节段性评分（MR-score-S），测量各个肠段（直肠、乙状结肠、降结肠、横结肠、升结肠和回肠）的 ADC 值及肠壁厚度。以内镜结果为金标准，通过 ROC 曲线分析各个指标对炎性肠病的诊断效能，同时分析其与内镜分级结果的相关性。结果 本研究共分析 162 个肠段。ROC 曲线分析结果显示，MR-score-S、ADC 值和肠壁厚度诊断 IBD 的 ROC 曲线下面积分别为 0.8126，0.7654 和 0.74；MR-score-S（无增强）、MR-score-S（无 DWI）和 MR-score-S（无增强及 DWI）的 ROC 曲线下面积分别为 0.785，0.7988 和 0.7377。在 IBD 患者中，MRI 评分、ADC 值、肠壁厚度与 IBD 内镜分级结果均具有相关性，差异均具有统计学意义（P＜0.05），溃疡性结肠炎（UC）患者各指标的相关系数分别为 0.724、-0.43 和 0.519；而克罗恩病（CD）患者分别为 0.484、-0.392 和 0.331。结论 MRI 平扫结合 DWI、增强 MRI 为 IBD 特别是 UC 患者提供了一种可靠的诊断及定量评估病情的检查方法，从而更好地指导临床进行个性化治疗，改善预后。

低剂量多层螺旋 CT 三维重建诊断小儿气管支气管非金属异物的价值

尹红梅,劳群
杭州市儿童医院

目的 探讨低剂量多层螺旋 CT 三维重建诊断小儿气管支气管非金属异物的价值。
方法 经纤维支气管镜检查确诊的 21 例气管支气管非金属异物患儿均行低剂量 16 排螺旋 CT 扫描，再进行多平面重建、最小密度投影、容积再现和 CT 仿真内镜等后处理技术观察气管支气管异物的大小、形态、位置及其所致的并发症。
结果 左侧支气管异物 13 例，其中左主支气管异物 12 例，左主支气管并左下叶支气管异物 1 例；右侧支气管异物 7 例，其中右主支气管异物 4 例，右中间段支气管异物 2 例，右下叶支气管异物 1 例；气管分叉处异物 1 例。CT 图像显示的并发症有肺气肿 12 例、肺炎 3 例、肺气肿并肺炎 5 例、无明显并发症 1 例。取出的非金属异物有瓜子、核桃仁、花生、玉米粒、肉类等。
结论 低剂量多层螺旋 CT 是一种辐射剂量相对较小、安全无创、容易被小儿及其家属接受的检查方法，小儿气管支气管非金属异物在低剂量多层螺旋 CT 及其后处理技术的图像上有特征性表现，可为临床及时的诊断和治疗提供重要的依据。

Evaluation of lung nodules induced by pulmonary tuberculosis using MRI

Liya Wang[1],Zhou Liu[2],Hua Zhang[3],Yuzhong Zhang[1]
1.The People's Hospital of Longhua, Shenzhen, Guangdong, china
2.National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital & Shenzhen Hospital
3.The Third Affiliated Hospital of Nanchang University, Nanchang, Jiangxi, China

Purpose: To evaluate the potential of using MRI to evaluate lung nodules, especially calcified nodules induced by pulmonary tuberculosis.
Method: Sixty-three subjects with clinically confirmed pulmonary TB received both CT and lung MRI within 2 hours. All subjects with pulmonary TB were confirmed by Acid-Fast Bacillus (AFB) Testing or detection of mycobacterium TB. With nodules detected on routine lung CT images as references, the sensitivity of MRI was calculated for detecting non-calcified nodules, and depicting completely calcified nodules and partially calcified nodules, respectively. Chi square test was used to compare the sensitivity of detection or depiction by MRI for nodules of different size (< 0.5 cm, 0.5-1.0 cm and > 1.0 cm) with $P < 0.05$ indicating statistical difference.
Results: In total, 275 nodules were detected on CT, including 151 non-calcified nodules, 75 completely calcified nodules and 49 partially calcified nodules. Regardless of size, the detection rate of MRI was 74.2% for non-calcified nodules and dropped to 57.1% for partially calcified nodules and only 16.0% for completely calcified nodules. In terms of size, MRI had excellent performance in detecting non-calcified nodules of larger than 0.5 cm with detection rate higher than 90% but was less competent in detecting nodules of smaller than 0.5 cm with detection rate declined to only 50%. The sensitivity of MRI increased significantly in proportion to the size for detecting non-calcified nodules ($P < 0.001$), depicting completely calcified nodules ($P < 0.001$; **Figure A-C**) and partially calcified nodules ($P = 0.02$; **Figure D-F**) (Table).

Conclusion: MRI is comparable to CT in detecting non-calcified pulmonary tuberculosis-induced nodules of larger than 0.5 cm. However, for detecting tiny nodules (< 0.5 cm) and depicting nodules with calcification, the sensitivity is unsatisfactory, which needs further improvement.

EPO-2407

手足口病合并脑、脊髓炎的 MRI 诊断

毛宁,董建军,谢海柱
烟台毓璜顶医院

目的：手足口病是多种肠道病毒引起的常见传染病，以发热和手、足、口腔等部位的皮疹和疱疹为主要特征，多数患儿一周左右自愈，少数引起肺水肿、心肌炎、无菌性脑膜炎、脑脊髓炎等并发症，诊断及鉴别诊断有一定难度。通过总结手足口病合并脑、脊髓炎的病例，提高对本病的认识和诊断水平。
方法：阅读手足口病合并脑、脊髓炎相关的中外文图书及文献，收集北京市各大医院的 MR 数据，并进行总结。
结果：引起手足口病的病毒有 20 多种，Cox A16 和 EV-71 最为常见，EV-71 常侵犯神经系统，脑干是其最常侵犯的部位。脑干脑炎临床表现：中脑网状结构或脑桥被盖病变可致肌痉挛，视觉障碍、视幻觉提示中脑或脑桥病变，短暂尿潴留、过度换气、潮式呼吸提示间 脑和中脑病变。
脑干是手足口病相关病毒最常侵犯的部位，Feng Chen 等认为脑干后部对称或非对称明显高信号，预后差（13 例中 2 例死亡，7 例痊愈、4 例存在神经后遗表现），而模糊的长 T2 信号则预后较好，8 例中 6 例痊愈，2 例有轻微后遗症。
其它少见部位的病变，如海马、小脑齿状核、胼胝体压部等。
结论：脑干是手足口病相关病毒最常侵犯的部位，脊髓前角也是常见受累部位，应注意识别少见部位的病变，如海马、小脑齿状核、胼胝体等，MRI 病变范围及信号特点有助于判断病情及预后。

体素内不相干运动成像对直肠腺癌术前评估的价值

唐浩杰[1],任莹[1]
1.中国医科大学附属盛京医院
2.中国医科大学附属盛京医院

目的：探讨体素内不相干运动成像对直肠腺癌术前评估的价值。
方法：收集我院 54 例直肠腺癌患者的直肠 MRI 图像（包括 IVIM 序列）及一般资料。根据肿瘤是否突破固有肌层将肿瘤分为未突破固有肌层组（T1、T2 期）和突破固有肌层组（T3、T4 期），根据术后病理结果将肿瘤分为高、中、低分化三组。测量直肠腺癌组织的 IVIM 相关参数：标准表观扩散系数(ADC)、单纯扩散系数(D)、灌注相关扩散系数(D^*)和灌注分数(f)；比较直肠腺癌不同 T 分期及分化程度间各参数值的差异，分析相关参数与直肠腺癌 T 分期及分化程度的关系。
结果：未突破固有肌层组的 ADC、f 值分别为（1.026±0.070）×10^{-3} mm^2/s、（ 0.358±0.038），突破固有肌层组的 ADC、f 值为（0.959±0.111）×10^{-3} mm^2/s、（0.283±0.034），两组间的 ADC、f 值差异有统计学意义（$P<0.05$）；两组间的 D、D^*值无显著差异（$P>0.05$）。低、中、高分化组的 ADC 值分别为（0.799±0.105）×10^{-3} mm^2/s,（0.978±0.066）×10^{-3} mm^2/s,（1.063±0.059）×10^{-3} mm^2/s；D 值分别为（0.797±0.074） ×10^{-3} mm^2/s,（0.890±0.076）×10^{-3} mm^2/s,（1.050±0.081）×10^{-}

^{3} mm^2/s。ADC、D 值随着肿瘤分化程度的增加呈逐渐升高的趋势且组间两两比较差异均有统计学意义（$P<0.05$）；ADC、D 值与分化程度呈高度正相关（$r^{ADC}=0.676$，$P<0.05$），（$r^{D}=0.722$，$P<0.05$）。三组间的 D^*、f 值无显著差异($P>0.05$)。
结论:ADC、f 值有助于鉴别突破固有肌层组与未突破固有肌层组；ADC、D 值与分化程度呈高度正相关，有助于术前评估直肠腺癌的分化程度。

肺放线菌病的影像表现

徐秋贞,陈文达
东南大学附属中大医院

摘要：目的：通过总结肺放线菌不同临床及影像表现，提高对该病的认识，避免长时间抗结核治疗或被误诊为肺癌切除。
方法：回顾性分析多中心收集的 6 例经病理证实的肺放线菌病的临床表现、实验室检查、影像表现，及明确诊断诊断过程中曲折经历总结包括误诊分析。
结果：6 例肺放线菌病均为男性，年龄 48-66 岁，主要临床表现是咳嗽、咳痰伴或不伴发热、白痰或少许浓痰，咳嗽伴痰中带血丝或单纯咯血，单纯咯血者，量不多，约 5-10ml/日，均有 20-30 年长时间吸烟史，其中 1 例有慢性支气管扩张病史，1 例明显蛀牙牙痛病史。影像表现，局灶病变 4 例，表现为右上肺节段性实变 2 例，左上肺类似肿块样病变 1 例，右下肺 1 例段性实变 1 例，增强表现病灶中心可见低密度不强化区，周边均匀强化伴临近胸膜增厚，1 例左上肺大片实变内多发小空洞，周围磨玻璃影伴右肺多发结节影，1 例左下肺实变，增强后实变内亦见斑片低密度区，内未见气体，周围实变部分均有强化，伴多组纵隔淋巴结肿大及胸腔积液，6 例患者白细胞及中性粒细胞指标总体不高，结核指标阴性，G 实验、GM 实验正常或略偏高，肿瘤指标 CEA、AFP、细胞角蛋白正常，1 例特异性神经烯醇化酶增高，1 例 CA199 增高，6 例均在诊断过程中被抗结核、抗炎治疗 1-6 月，影像复查部分病灶一度略有缩小，再次复查后进展，其中 1 例 MRI 显示病灶内实变内低密度灶 DWI 示弥撒受限，非常独特色征像，1 例 PET-CT 表现为高摄取，误诊为肺癌被切除。
结论：肺放线菌病典型表现为节段性实变内脓腔不伴空洞形成有助于诊断，MRI 的 DWI 序列弥散受限提示脓肿，不典型表现容易被误诊误诊。

Screening of Tuberculosis in a TB Heavy-burden Large Rural Region in China with Deep Learning Multi-modality Artificial Intelligence

Xiaoyi Wang[1],Yulin He[2]
1.The 4th People's Hospital of Qinghai Province, Qinghai Province, China
2.The First Affiliated Hosipital of Nanchang University

Purpose A shortage of physicians to interpret radiological and pathological images from digital radiography and sputum smear in TB high-burden (HB) rural areas of China hinders the early diagnosis of TB. We deployed Deep-learning based Multi-modality AI (DMAI) in a TB HB large rural province, Qinhai, to assist physicians in detecting TB

in radiological and pathological images. Our study investigates the efficacy of DMAI to assist physicians in detecting TB at multiple hospitals located in Qinhai. **Material and methods** A DMAI system was installed in a central TB hospital to automatically screen for TB in radiological (DR) and pathological images received from more than 60 local hospitals via secured internet connection. DMAI classified each DR image into high-risk, low-risk, and no-TB and automatically generated heatmaps denoting abnormality in <10 sec. Junior physicians (~12.5 yr-experience) reviewed these cases with DMAI support. Senior physicians (>25 yr-experience) then reviewed results from junior physicians and DMAI to generate final diagnosis. A MRMC study compared diagnoses from DMAI, junior physicians, and senior physicians from multiple hospitals to determine the effectiveness of DMAI. **Results** Within 6 months, our DMAI system processed 105,558 radiographs and classified 77.7%, 6.4%, and 15.9% as no-TB, high-risk, and low-risk, respectively, with heatmaps in each abnormal image (Figures 1 and 2). For the high-prevalence group (age>50), DMAI classified 13% and 20% of the cases as high-risk and low-risk, respectively. DMAI and junior physicians agreed 96.3% on confirmed TB and 90.6% on non-TB cases. Compared to historical data, physicians using DMAI increased the sensitivity by 23% with similar specificity. **Conclusion** This is the first reported large-scale clinical application of DMAI for TB screening in China. DMAI's performance is similar to junior physicians'. DMAI assisted physicians in detecting more TB cases in rural areas in a shorter time period without needing more physicians.

Ｍｉｋｕｌｉｃｚ病１例

罗震
清华大学第一附属医院

目的 探讨Ｍｉｋｕｌｉｃｚ病的相关影像表现。 方法 对本院１例Ｍｉｋｕｌｉｃｚ病临床特征及影像表现进行回顾性分析。结果 发现患者左眼上睑肿 4 个月，眼球突出 3 个月，无眼红眼痛；眼科查体：左眼突出下移位，左眼上转及外转受限，余方向不受限。结膜无充血，无水肿，巩膜无黄染，角膜清，KP(-)，前房深浅正常，未见浮游物，房闪(-)，虹膜纹理清，未见新生血管。瞳孔圆，直径 3mm，对光反射灵敏，无后粘连，晶状体核性混浊，玻璃体轻度混浊，眼底视盘边界清，色苍白，C/D=0.5 ,血管走行及比例正常，视网膜未见出血及渗出，黄斑中心凹反光不见。影像学横断面 CT 可见左侧眶内泪腺区不规则团块状肿物，边界欠清，大小约 1.8cm×2.7cm×2.1cm（左右×前后×上下），与邻近上直肌分界较清，骨质未见受压变薄及破坏征象。MR 病灶表现为长 T1、短/等 T2 混杂信号，冠状面显示肿物与上直肌分界清楚，外直肌轻度受压内移；脂肪抑制序列肿块信号更清晰、边界清楚；增强扫描呈较为均匀明显强化，其内可见小斑点状低强化区。结论 熟悉Ｍｉｋｕｌｉｃｚ病的影像学表现，可以提高其检出率，但只能最为诊断的参考指标，最终诊断需要结合临床病史及病理组织学检查。

EPO-2412

皮肤神经纤维瘤病合并肺结核一例

柴清华,杨瑞,刘继伟
河南省胸科医院河南康复中心医院

患者 男 40 岁 因咽痛 1 月发热 20 天入院，喉镜可见喉部糜烂溃疡。既往：皮肤神经纤维瘤 20 年，曾于当地前后 4 次手术切除。17 年前工作时全身约 90%烫伤，于上海某医院植皮治疗 14 次，4 月前右侧颈部肿块手术切除，并左侧再次出现囊性包块。实验室检查：血常规，肝功正常；血糖正常；血沉é；抗 RF，抗 SSA，抗-SSB，抗 JO-1 均阴性；CA125,CA153 升高；曲霉半乳甘露聚糖阴性；抗中性粒细胞胞浆抗体阴性，结核分枝杆菌效应 T 细胞 170（正常 0-6）。胸部 CT：1 双肺弥漫粟粒结节；2 纵隔级右侧腋窝多发结节、团块，双侧胸壁皮下多发结节、包块；3 胸 8、9 骨质局限缺损，周围软组织肿胀。临床考虑：1 粟粒性肺结核；2 喉结核；3 皮肤纤维瘤；4 烧伤植皮后。给予抗结核、保肝治疗，并局部雾化治疗，患者症状减轻，并持续治疗中。

讨论：此患者症状严重，合并有神经纤维瘤及烧伤后植皮，免疫功能低下，易合并细菌、真菌及其他病毒等感染，本例患者经实验室检查肺结核、喉结核诊断明确，并经抗结核治疗后症状好转。

多层螺旋 CT 在肝包虫病术前诊断中的临床应用价值

安攀
空军军医大学唐都医院

目的：分析研究肝包虫病的多层螺旋 CT 影像学表现及多层螺旋 CT 在肝包虫病术前诊断中的临床应用价值。
方法：收集在我院经手术病理证实的肝包虫患者共 11 例，所有患者术前均行多层螺旋 CT 平扫及动态增强检查，分析肝包虫病的影像学征象及多层螺旋 CT 的临床应用价值。
结果：11 例患者共检出 14 个病灶，其中肝左叶 3 个、肝右叶 11 个，其中 2 例患者同时合并肺包虫；所有患者 CT 平扫均呈低密度，6 例患者囊壁可见薄壳状、弧形钙化，3 例患者囊内容物见无定形的条片状或片状钙化，3 例患者母囊内见大小和数目不一的子囊，4 例患者表现囊内分离征象；所有患者在动态增强检查中均无明显强化征象，肝包虫病的多层螺旋 CT 影像特点典型。利用多层螺旋 CT 多种后处理重建技术，分析研究病变与周围组织及邻近血管走形关系特点，为临床治疗提供参考价值。
结论：多层螺旋 CT 平扫及动态增强检查可明确显示肝包虫的影像特征，并能清晰显示患者病灶的基本情况，同时通过多层螺旋 CT 多种后处理重建技术，明确病变与周围组织及邻近血管走形关系特点，术前可精确定位并指导手术路径，为临床治疗计划提供重要的影像学信息，肝包虫患者术前行多层螺旋 CT 平扫及动态增强检查是可行的。

在 7.0T 磁共振上研究肌酸化学交换转移加权成像

唐湘雍[1],汪丽娅[1],吴仁华[2]
1.深圳市龙华区人民医院
2.汕头大学医学院第二附属医院影像科

目的：化学交换饱和转移（CEST）是基于磁化传递效应基础上发展起来的新的成像技术，能对脑内的代谢物进行成像[1]。肌酸（Cr）是脑内主要的代谢物，传统的 MRS 对肌酸的成像空间分辨率低[2]，本研究运用 CEST 成像方法对 Cr 进行成像。
方法：本研究在 7.0T 动物磁共振扫描仪上完成。配制 Cr 试管模型 （浓度：20 mM，Ph：7.0），并将 C6 胶质瘤细胞接种至 SD 大鼠右侧基底节区制作肿瘤鼠模型，再用连续波预饱和 PRESS 序列及 EPI 序列进行 Cr-CEST 加权成像扫描。
结果：试管 Z 谱结果显示在+2.0ppm 可以观察到 Cr -CEST 效应。大鼠 Z 谱显示在+2.0ppm 附近可以观察到 Cr- CEST 效应，与试管结果一致。Cr-CEST 加权图显示：大鼠胶质瘤肿瘤中心区域 Cr-CEST 效应较对侧正常脑组织低。
结论：本研究运用一种新的成像方法，实现了大鼠胶质瘤脑组织的 Cr 加权成像，得出大鼠胶质瘤肿瘤区域肌酸浓度降低[3]，与传统的 MRS 得出的结论相符合，并进一步获得其在活体组织内的浓度分布图。

ANCA-associated systemic vasculitis in lung: Pulmonary HRCT imaging characteristics.

Liang Chen,YangYang Meng
The First Hospital of JinLin University

Objective To investigate the HRCT characteristics of ANCA-associated systemic vasculitis in lung.
Method Retrospectively analysis of the clinical data and imaging findings of 62 patients with ANCA-associated pneumonia admitted to our hospital from February 2017 to August 2018, including 48 females and 14 males. The median age is 34. All the 62 patients received pulmonary HRCT scan, and image analysis was conducted by two imaging profesors with 10 years of radiological experience.
Result Among the 62 patients, there were 18 cases of Wegener granuloma (WG), 32 cases of multiple vasculitis (MPA) under microscope, and 12 cases of Churg-Strauss syndrome (CSS). The manifestation of multiple organ involvement is accompanied by varying degrees of impaired renal function, clinical symptoms such as fever, cough and

other respiratory symptoms. After 2-8 weeks of treatment, 59 cases of pulmonary lesions were completely absorbed and disappeared, and 3 cases died of multiple organ failure. 47 patients relapsed within 2-6 months.

Conclusions ANCA-associated vasculitis is a rare autoimmune disease that can lead to multiple organ damage. One of the most common organs in the lungs has no specific changes in pulmonary imaging manifestations. For patients with lung involvement, especially those with hemoptysis, if the possibility of this disease is considered, timely diagnosis should be made, hormone shock therapy should be given clinically. In the short term, it improved significantly, but it was easy to relapse.

ASL 联合 SWAN 在急性期病毒性脑炎诊断中的临床应用

周建国,孟云
连云港市中医院

目的 探讨磁共振动脉自旋标记（ASL）成像与 T2*加权血管成像（SWAN）在急性病毒性脑炎（VE）临床诊断中的应用价值。**方法** 收集研究 2016 年 1 月至 2019 年 5 月经临床证实 22 例病毒性脑炎患者，均采用 GE3.0T 超导 MRI 机行常规序列、ASL 和 SWAN 检查，通过 CBF 伪彩图测量病变区脑血流量（CBF）值，并利用 SWAN 图像观察引流静脉形态学变化。**结果** CBF 伪彩图所测病变区 CBF 值均高于正常区域，SWAN 提示较大病变区域引流静脉呈分布稀疏且管径纤细表现，差异有统计学意义（P<0.05）。 **结论** 急性病毒性脑炎患者行 ASL 及 SWAN 序列检查，可通过量化的 CBF 值以及引流静脉形态学改变反映病变区域组织细胞功能代谢状态，有助于提高急性期病毒性脑炎诊断准确性。

EPO-2418

艾滋病相关原发性中枢神经系统淋巴瘤的 MRI 表现

万云青[1],杨亚英[2],施裕新[3],黄进帮[1],张浩[1],施楠楠[3],宋凤祥[3],沈杰[3],陆阳[3],单飞[3]
1.德宏州人民医院
2.昆明医科大学第一附属医院
3.上海市公共卫生临床中心

目的 探讨获得性免疫缺陷综合征(AIDS)相关原发性中枢神经系统淋巴瘤 (PCNSL)的 MRI 表现。**方法** 回顾性分析 10 例经手术及穿刺活检病理证实的 AIDS 相关 PCNSL 患者的临床及 MRI 影像资料。**结果** 10 例 AIDS 相关 PCNSL 共 17 个病灶，以幕上单发为主，主要分布于中线附近，其中单发病灶 7 例（70%），多发病灶 3 例（30%），位于幕上 8 例（80%），幕下 2 例（20%）；T1WI 为等低信号，T2WI 信号高低不均、5 个（29.4%）病灶周围见低信号环，T2/FLAIR 大部分病灶周围见水肿，增强扫描病灶结节状强化 2 个（11.8%），团状强化 2 个（11.8%），靶状强化 1 个（5.9%），环形强化 12 个（70.5%），15 个（88.2%）病灶出现不同程度坏死，DWI 低信号 2 个（11.8%），等信号 2 个（11.8%），高信号 13 个（76.4%）；2 例患者行 MRS 检查，均显示 NAA、Cho 及 Cr 明显降低，均出现高耸的 Lac、LIip 峰。**结论** AIDS 合并 PCNSL 的 MRI 表现具有一定特异性，仔细分析 MRI 各序列信号特征，结合临床表现、$CD4^+$<50 个/ μl，有助于 PCNSL 的诊断。

EPO-2419

42 例非结核分枝杆菌肺病 CT 表现分析

张鑫,费忠亭
江苏省淮安市第四人民医院

目的 探讨非结核分枝杆菌肺病 CT 表现特点，提高对非结核分枝杆菌肺病的认识。**方法** 选取经痰、支气管冲洗液或病变组织培养并进行菌种鉴定确诊的非结核分枝杆菌肺病 42 例为观察组，同期结核菌培养阳性肺结核患者 42 例为对照组，比较两组患者的病灶分布、部位、病灶形态及性质。**结果** 观察组病变分布广泛，非结核分枝杆菌肺病组病灶累及 1 个肺叶率为 21.43%，小于肺结核组 45.24%，差异均有统计学意义（c^2=5.36,P<0.05）；非结核分枝杆菌肺病组病灶累及≥3 个肺叶率为 50.00%，大于肺结核组 26.19%，两组比较差异均有统计学意义（c^2=5.05,P<0.05）；非结核分枝杆菌肺病组病灶在中叶、舌段发现率为 78.57%，多于肺结核组 30.93%，两组比较差异有统计学意义(c^2=19.2，P<0.05)；非结核分枝杆菌肺病组支气管扩张、薄壁空洞、肺气肿肺大疱发生率分别为 54.76%、23.81%、28.57%，分别高于肺结核组 19.05%、7.14%、9.52%，差异均有统计学意义(c^2=11.50、4.46、4.94，P均<0.05)；支气管播散灶、钙化灶、磨玻璃影、胸腔积液及纵隔淋巴结肿大发生率分别为 9.52%、16.67%、9.52%、11.90%、16.67%，分别低于肺结核组 40.48%、40.48%、33.33%、30.95%、35.71%，差异均有统计学意义(c^2=10.73、5.83、7.07、4.53、3.94，P均<0.05)；厚壁空洞、浸润性病灶、增殖性结节、纤维索条两组比较无统计学意义（P>0.05）。**结论** 非结核分枝杆菌肺病的胸部 CT 表现具有分布广，双肺散在柱状扩张的支气管，以右肺中叶及左肺舌段明显，胸膜下薄壁空洞及空洞周围并柱状支气管扩张，肺气肿、肺大疱多见等特点。

艾滋病合并弓形虫脑炎的 MRI 研究进展

万云青[1],郑凌琳[2],黄进帮[1],张浩[1],曹育清[1],林玉蓉[1],李维雄[1],杨亚英[2]
1.德宏州人民医院
2.昆明医科大学第一附属医院

弓形虫脑炎（TE）是获得性免疫缺陷综合征（AIDS）患者最常见的中枢神经系统机会性感染之一，TE 病死率及复发率较高，早期诊断和及时治疗对 AIDS 患者的预后至关重要。TE 确诊依赖于脑组织活检中找到弓形虫滋养体，但在临床工作中操作性不强，血清学 IgM、IgG 阳性有一定提示意义，但帮助并不大，影像学检查对 TE 的诊断非常重要，尤其是 MRI 具有鉴别不同组织的优越性且有多种特殊成像技术，是 AIDS 合并 TE 最敏感、最重要的检查手段，随着 MR 硬件迅速发展及新技术的不断应用，在提供病变形态学信息的同时还可反映生理学功能信息，对于 AIDS 合并 TE 的诊断具有着较高的优势和潜力。

经颈静脉肝内门体分流术在肝硬化门脉高压并发症 8 例患者的临床应用分析

朱文科[1],王立非[1],高飞[2],冯凯[1],黄湘荣[1],刘文浩[1],郑广平[1],张婕[1]
1.深圳市第三人民医院

2.中山大学附属肿瘤医院

【目的】探讨覆膜支架、DIPS 术在肝硬化门脉高压并发症临床应用效果。
【材料与方法】搜集 2017-6~2019-6 期间 TIPS 或 DIPS 治疗肝硬化失代偿合并并发症的患者 8 例，均为男性，中位年龄 59 岁，其范围 47~76 岁。肝硬化原因为乙肝 5 例，酒精性 1 例，酒精并乙肝 1 例，丙肝 1 例。Child A 级 3 例，ChildB 级 5 例。有出血史或急性出血 6 例；顽固性胸水和/或腹水 2 例。合并门静脉血栓 1 例；脾切除 1 例；合并小 HCC1 例。合并脾肾分流 1 例。术后定期复查肝功能、凝血功能、彩超或肝脏 CT 扫描等，观察支架通畅性、肝性脑病等指标。
【结果】（1）8 例患者均手术成功，DIPS6 例，TIPS1 例，另 1 例行 TIPS 失败，采用 DIPS 成功；（2）均采用 8mm 直径 VIATORR 覆膜支架，其支架长度 6cm（5 例）、7cm（3 例）、8cm（1 例），其中 1 例覆膜支架 2 枚；3 例加用裸支架，其中 1 例应用 2 枚；术前门脉测压中位数为 38（31~43）cmH2O 柱，术后为 23（20~26）cmH2O 柱；胃冠状静脉栓塞 7 例，其中钢圈栓塞 6 例，NBCA 液体胶栓塞 1 例。术后随访 0.5~24 月，其中 2 例发生于 1 月内，1 例因支架成角，降压效果欠佳再次上消化道出血，通过并行 TIPS 改善；另 1 例支架通畅尚可，保守治疗随访近 2 年无再次出血；肝性脑病 1 例，饮食控制后得到改善。
【结论】采用 VIATORR 覆膜支架治疗肝硬化门脉高压并发症取得较好临床效果，特别是结合 DIPS 技术应用，但仍需大量病例进行临床观察。

EPO-2422
肝血管平滑肌脂肪瘤的影像表现与病理对照研究

刘文浩[1],蔡培强[2],王立非[1],朱文科[1]
1.深圳市第三人民医院
2.中山大学附属肿瘤医院

目的：通过研究肝血管平滑肌脂肪瘤（HAML）的临床、病理资料，提高对肝血管平滑肌脂肪瘤（HAML）的 CT 和 MRI 诊断能力。
材料与方法：回顾性分析 18 例确诊为 HAML 的临床、病理和影像学资料，男 3 例，女 15 例。年龄 23~76 岁（中位年龄 41 岁）。所有患者均行平扫和增强检查，其中 CT 检查 10 例，MRI 检查 6 例，CT 及 MRI 检查 2 例。影像分析主要包括病变部位、病变直径、早期引流静脉、密度/信号强度等。
结果：所有患者均无肝硬化表现。HAML 病理检测显示病灶包含脂肪 10 例，钙化 2 例，囊性变性 1 例。影像上均表现为清晰的、孤立的肿块，中等大小（平均直径 5.9 厘米）。平均强化程度超过 120 HU11 例（91.7%），外周强化减弱和早期出现引流静脉 15 例（83.3%），早期引流静脉全部为肝静脉，所有患者均见肿瘤迂曲血管。
结论：HAML 在 CT 和/或 MRI 上表现为富血供肿瘤，早期出现引流静脉、外周强化降低和肿瘤包膜的缺失以及甲胎蛋白正常，这些均有助于非肝硬化肝癌的鉴别诊断。

基于深度学习的多层螺旋 CT 对活动性肺结核的研发与验证

马璐瑶[1],殷小平[1],刘远明[2],李宏军[3],陆普选[4],柯晓文[2],张宇[1], 权申文[2],郭琳[2]
1.河北大学附属医院
2.深圳市智影医疗科技有限公司
3.首都医科大学附属北京佑安医院
4.深圳市慢性病防治中心

【摘要】目的:研发在多层螺旋 CT 图像中，基于深度学习人工智能（AI）自动化检测系统来简化活动性肺结核（ATB）的诊断过程并提高诊断的精度。
数据:本研究回顾性收集了河北大学附属医院 2016 年 4 月-2019 年 5 月的 846 例患者（476 例 ATB、150 例非肺结核性肺炎和 220 例正常）的 CT 图像（层厚：5mm），以结核抗酸染色阳性确认 ATB，以影像医生诊断结果确认正常和非结核性肺炎。训练数据采用了 337 例 ATB、110 例肺炎和 120 例正常人的 CT 图像来训练 AI 网络。测试数据采用了 139 例 ATB、40 例肺炎和 100 例正常人的 CT 图像进行测试。训练数据和测试数据都为相互独立样本。另基于文献资料描述耐药结核的影像特征（空洞数量≥3 个，直径≥5mm），从测试数据 ATB 筛选出 64 例可疑耐药结核。
方法:首先采用 LabelImg 软件对 ATB 病灶进行标记，然后采用 U-Net 深度学习对输入图像 ATB 区域进行分割。再采用分类网络（ResNet-50 神经网络）以降低假阳性，对分割的原图进行二次预测。最后结合分割和分类网络对检测结果有≥4 张连续病灶 CT 断层的患者定为 ATB。
结果:测试 ATB 结果准确性为 96.1%，AUC 值为 0.969，显示本算法具有很高的精度。本文还列出更多的评估指标，包括灵敏度(SS)、特异性(SP)、假阳性率(FPR)、阳性预测值(PPV)、阴性预测值(NPV)。最后还用本算法对 64 例可疑耐药结核进行测试，结果敏感度为 0.98。
结论:本研究成功地开发了胸部 CT 自动检测 ATB 的 AI 工具。本研究显示利用分类网络能很好区分开 ATB 和肺炎，并能提高诊断精度。同时，本算法显示出对耐药结核有较高敏感度，这也提示用 AI 检测耐药结核的可行性，下一步我们将用耐药结核为训练数据，进行研发 AI 耐药结核的算法。因此，本算法为下一步 AI 在 CT 诊断 ATB 应用于临床医学和研发 AI 耐药结核奠定了坚实的基础。

儿童以颅脑症状首发的全身动脉肌纤维发育不良 1 例

范沙丽,刘晶哲
北京华信医院/清华大学第一附属医院

患儿，男，2 岁，主因“抽搐后左侧肢体活动不利 2 年，发现血压升高 2 月”入院，慢性起病过程，既往有癫痫、偏瘫等病史。患儿 5 个月前接种百白破疫苗后出现抽搐，缓解后出现左侧肢体活动不利、口角左歪，当地医院诊断为脑梗死、继发性癫痫。2 月前因呼吸道感染就诊于当地医院，监测血压 222/96 mmHg。查体：患儿左侧肢体较对侧细小，肌力 4 级，肌张力稍弱，左侧肱动脉、桡动脉搏动较对侧稍弱，左侧股动脉搏动弱不可及，左侧足背动脉、胫后动脉搏动未及；右侧肢体未见明显异常。2018-9-18 头颅 MRA：左侧大脑中动脉主干次全闭塞伴分支明显减少，右侧颈内动脉海绵窦段、大脑中动脉重度狭窄伴分支减少；鞍上池及双侧基底节区多发迂曲增多的小血管影，考虑 Moyamoya 综合征。2018-10-28 头颅 MR 平扫：右脑半球及左侧顶叶脑软化、脑萎缩。2018-11-30 全主动脉 CTA 及 2018-12-07 血管造影显示：左肾动脉主干呈串珠样改变，局部扭曲伴轻度狭窄，远端略扩张，分支稀少，多数闭塞，左肾灌注极低；右肾动脉主干未见狭窄，远端分支多处呈局限性 70-90%狭窄，狭窄远端扩张，右肾灌注可；肠系膜上动脉分支呈局限性 90%狭窄；肝动脉分支迂曲狭窄；双侧髂总、髂内动脉未见狭窄，左侧髂外动脉中段呈串珠样改变，最窄处 80%狭窄，狭窄远端管腔扩张，右髂外动脉局部扭曲明显。2018-12-03 肾动态显像 DTPA：左肾血流灌注减低，肾小球滤过功能减低，GFR 19.9ml/min/1.73m2。临床诊断：动脉肌纤维发育不良，累及全身多个动脉，继发高血压，脑萎缩。

艾滋病合并肺癌的 CT 和临床特征分析

陈月华
南通市第三人民医院

摘要：目的 分析艾滋病合并肺癌患者的 CT 表现及临床特征，以加深对艾滋病患者伴发肺癌的认识。方法 收集经病理证实的 16 例艾滋病合并肺癌患者的胸部 CT 影像学检查资料及临床指标，并进行回顾性分析。结果 艾滋病患者合并肺癌多见于中老年男性，常伴有肺部感染，外周血 CD4+T 淋巴细胞计数下降，肿块有分叶、毛刺、部分有空洞、增强后不均匀强化。结论 艾滋病患者肺癌的 CT 和临床表现无特异性，当患者出现肿块且抗感染治疗无效时，应警惕肺癌的可能。

神经梅毒的 MRI 特征分析

唐小平,肖新兰,龚良庚,尹建华,应洪新
南昌大学第二附属医院

目的 分析神经梅毒 MRI 表现，探讨 MRI 在神经梅毒中的诊断价值。**方法** 回顾性分析临床与实验室检查证实 11 例神经梅毒患者的 MR 资料（包括 MRI 平扫、DWI 及增强扫描）。**结果** 4 例脑实质梅毒树胶肿患者表现为脑内占位性病灶（呈等 T1、稍短 T2 信号，DWI 呈稍低信号）并周围水肿，增强呈结节状、条片状强化；4 例脑膜血管炎梅毒患者表现缺血性脑梗死改变（大片状长 T1、长 T2 信号，DWI 高信号，增强脑回样强化）；1 例脑膜梅毒患者硬脑膜明显增厚强化：1 例脊髓梅毒患者颈髓节段性增粗，髓内异常信号结节并不均匀明显强化；1 例麻痹性痴呆患者示双侧颞叶局部脑萎缩. 伴脑内多发腔梗及缺血灶。**结论** MRI 平扫及增强是神经梅毒患者影像学检查首选技术，不同临床表型神经梅毒在 MRI 上无特征性表现，神经梅毒以脑膜血管炎多见，误诊率高；当年轻患者 M RI 表现缺血性脑梗死、脑萎缩、脑或脊髓内结节样或条片状强化、脑膜异常强化时，应考虑神经梅毒的可能。

EPO-2427

钆塞酸二钠增强 MRI 对肝功能的评估价值

张继云
南通大学附属南通第三医院

目的：探讨 Gd-EOB-DTPA 增强 MRI 评估肝功能的价值。**方法**：自 2015 年 8 月至 2018 年 8 月共收集行 Gd-EOB-DTPA 增强 MRI 检查患者 84 例，其中 15 例无慢性肝病肝功能正常者及 69 例乙型肝炎肝硬化肝功能异常者,Child-Pugh A 级（CPA 组）33 例、B 级（CPB 组）26 例、C 级（CPC 组）10 例，所有患者根据临床需要行 Gd-EOB-DTPA 增强 MRI 检查，且获取影像学检查前后一周内血清学检查指标。测得肝脏各肝段增强后 3min、10min、20min 肝脏肌肉信号比增加率（Increase rate of liver-to-muscle ratio,△LMR），肝脏各肝段△LMR 的比较应用单因素方差分析，不同肝段间的比较应用建立只考虑主效应的两因素方差分析模型；采用 ROC 曲线分析△LMR 鉴别 NLF-CPA 和 CPB-CPC 组的诊断效能；△LMR 与 Child-Pugh 评分、MELD 评分、ICG15 的相关性采用 Spearman 秩相关分析。**结果**：不同肝功能组各肝段△LMR 的比较差异均具有统计学意义；NLF、CPA、CPB 组肝脏 8 段间△LMR 的比较差异均具有统计学意义（P 值均小于 0.05），CPC 组段间比较差异没有统计学意

义（P 值均大于 0.05）；△LMR_{10min}对鉴别 NLF-CPA 和 CPB-CPC 组的诊断效能最高。△LMR 与 Child-Pugh 评分、MELD 评分、ICG15 均呈负相关，且 P 值均小于 0.05。**结论：** Gd-EOB-DTPA 增强 MRI 可以描述不同肝段肝功能，注射对比剂后 10min、20min 对不同肝段肝功能的评估效能较好。

EPO-2428

头皮 Marjolin's 溃疡 MRI 影像学诊断与鉴别

杨涛,周华,陈琦,顾静华,蔡雯靖
上海健康医学院附属周浦医院

目的 探讨头皮 Marjolin's 溃疡的 MRI 表现，旨在提高对本病的影像学认识。**方法** 回顾性分析 10 例经手术和病理证实的头皮 Marjolin's 溃疡的 MRI 特征及临床资料，并结合相关文献资料对其分析总结。**结果** 10 例均为鳞癌，MRI 表现：T1WI 均呈等、低信号，T2WI 呈高信号为主的混杂信号，边界欠清；6 例见坏死、囊变区，其内 T2WI 呈更高信号，表面见溃疡形成；4 例增强扫描：肿瘤实质明显强化，坏死、囊变区未见强化。4 例累及邻近颅板、静脉窦及硬脑膜。2 例累及颅内脑实质，形成包膜期脑脓肿，病变中心 DWI 呈特征性的高信号。**结论** MRI 是评价头皮 Marjolin's 溃疡可靠影像学方法，尤其是对本病侵犯颅板及颅内包膜期脑脓肿等具有较高临床价值。

EPO-2429

MRI 影像对慢性乳腺炎与乳腺癌鉴别诊断的应用评价

杨涛,陈琦,王伟,顾静华,蔡雯靖
上海健康医学院附属周浦医院

[摘要] **目的** 评价磁共振成像（Magnetic resonance imaging,MRI）对慢性乳腺炎与乳腺癌诊断中的应用价值。**方法** 收集 2015 年 6 月-2019 年 6 月经本院收治的手术或病理证实的 62 例慢性乳腺炎患者作为乳腺炎组，46 例乳腺癌患者作为乳腺癌组，所有患者均进行了 MRI 检查，比较两组形态学征象及动态增强表现。**结果** 两组病例中，慢性乳腺炎与乳腺癌环形强化、病灶形状及病灶周围水肿征象相比，差异有统计学意义（P<0.05）；病变呈毛刺征、腋窝淋巴结增大、乳头及皮肤增厚征象相比，差异无统计学意义（P>0.05）。慢性乳腺炎组与乳腺癌组的时间-信号曲线（TIC）相比，差异有统计学意义（P<0.05）。两组的早期强化率相比，差异无统计学意义（P>0.05）。**结论** MRI 影像学检查对慢性乳腺炎与乳腺癌的病灶形状、环形强化、病灶周围水肿、TIC 等征象具备有一定特征性，对临床有重要意义。

EPO-2430

肺炎链球菌感染的影像学表现

黄仁军,李勇刚
苏州大学附属第一医院

目的：探讨肺炎链球菌感染的 X 线及 CT 表现特征，提高临床影像诊断及鉴别诊断的能力。方法：回顾性分析我院经病原学确诊的肺炎链球菌感染患者的胸部 X 线及 CT 的影像学表现，总结其表现特点。结果：X 线表现：当表现为大叶性肺炎时，X 线胸片因其处于不同的病理时期而表现不一；

充血期：通常无异常发现，或仅表现为肺纹理局限性增多，肺野透明度有所降低；实变期：表现为大片状均匀一致的密度增高影。其形态及范围与受累肺叶及肺段一致，大片阴影中可见空气支气管征；消散期：实变区密度逐渐减低，表现为大小不一，分布不规则的斑片状阴影；炎症最终可完全吸收并消散，或仅留少量条索状影。当表现为小叶性肺炎时，X 线胸片可表现为肺纹理增粗、边缘模糊；两侧肺野内结节状、斑片状的密度增高影，沿着支气管分布，病灶大多位于两肺下野内带。CT 表现：表现为大叶性肺炎时，在不同的病理时期表现不同，分别为：（1）充血期：病变呈磨玻璃样密度影，边缘模糊；（2）实变期：可见沿大叶或肺段分布的致密实变影，内可见空气支气管征；（3）消散期：随病变的吸收，实变影密度减低，呈散在、大小不等的斑片状影，最后可完全吸收，或仅留少量条索状影。大叶性肺炎典型的影像学表现为实变起自肺叶外周、紧邻胸膜,然后向肺野中心逐渐扩散。当表现为小叶性肺炎时，由于病灶多以细支气管为中心，病变起始于细支气管，并向其周围所属肺泡蔓延，CT 上可见：沿支气管分布的斑片状、结节状密度增高阴影；阻塞性肺气肿；空洞性病变；胸腔积液。50％或更少的患者可合并脓胸。当形成“球形肺炎”时，表现为边界不清且不光整的球形高密度影，内部可见有充气支气管影。结论：胸部 X 及 CT 对于肺炎链球菌感染具有较高的诊断及鉴别诊断价值，CT 能够提供更多的信息，具有更高的价值。

EPO-2431

肝脏影像报告和数据管理系统 LR-2 类肝硬化相关结节的 MRI 纵向观察分析

邢飞
南通市第三人民医院

【摘要】目的：探讨肝脏影像报告和数据管理系统（LI-RADS）LR-2 类肝硬化相关结节的 MRI 纵向观察分析。**方法：**回顾性分析 2012 年 9 月至 2018 年 12 月期间本院 MRI 首诊为 LR-2 类肝硬化相关结节，并进行过至少 1 次 MRI 增强随访复查，期间未进行过活检、手术等，共 47 例（105 个病灶）肝硬化患者纳入观察对象。记录随访时长、影像改变及 LI-RADS 分类调整情况。采用 Kaplan-Meier 曲线分析 LR-2 类肝硬化相关结节进展至 LR≥4 的 12、24、36 个月累积发生率。**结果：**105 个 LR-2 类肝硬化相关结节，随访时长 3.0～56.3 个月，平均 20.5 个月。随访期间，5 个上调至 LR-5，1 个上调至 LR-4，3 个上调至 LR-3，78 个保持不变，19 个下调至 LR-1。LR-2 类肝硬化相关结节进展至 LR≥4 的累积发生率为 4.8%，其中 12、24、36 个月累积发生率分别为 0.9%、6.1%、8.6%，演变过程中，均表现为病灶内铁廓清、T2WI 信号增高以及动脉期富血供转变。**结论：**肝硬化背景下约 5.7%的 LR-2 类肝硬化相关结节转归为可能或明确的 HCC，铁廓清、T2WI 信号增高及动脉期富血供转变为病变多步癌演变过程重要的影像征象。

EPO-2432

Reactive Thymic Hyperplasia on CT Following Chemotherapy in Adult Patients with Lymphoma

Xiaoli Wang,Haiyan Lou,Feng Chen
First Affiliated Hospital of Zhejiang University School of Medicine

OBJECTIVES Reactive thymic hyperplasia (RTH) not only occurred in children but also in older patients receiving regular chemotherapy for lymphoma. This study was aimed to report the specific CT findings of thymic in those patients, to do the follow-up visit, and to summarize the factors to influence lymphoma’s prognosis

METHODS Thirty-five patients with malignant lymphoma presenting with RTH and 43 patients without RTH after treatment were included in the present study. The size and density of the thymus were scored by using a thymic index with a scale of 6. The clinical and CT manifestations of both groups were reviewed retrospectively and analyzed by some traditional statistical methods, such as One-Way analysis of variance, T-test, and the regression analysis.

RESULTS Fourteen patients (14/35, 40%) in RTH group presented thymic atrophy during chemotherapy and showed thymic hyperplasia after chemotherapy withdrawal. The remaining 21 patients (21/35 60%) had not experienced thymic atrophy before RTH arising. RTH occurred in 5 of 21 patients during chemotherapy, and the rest 16 patients showed RTH a median of 6 months (range 1-12 months) after the termination of chemotherapy. There were no statistically significant differences in age, sex, types, and stage of lymphoma (p= 0.096,0.682,0.929,0.323) between patients with RTH and without RTH by univariate analysis. The thymic index was a potential predictor for RTH (P=0.002) in the two groups before therapy. Logistic regression of thymic index showed that patients with a thymic index higher than 0 were more likely to develop RTH after chemotherapy (thymic index = 1, P=0.03, OR=4.96, 95%CI = 1.71-14.38, thymic index ≥ 2, P=0.02, OR=13.95, 95% CI = 2.57-75.59). In addition, the prognosis of the two groups was also statistically different, p=0.037. The survival curve of patients with reactive thymic hyperplasia was higher than that of patients without hyperplasia.

CONCLUSIONS The time for the emergence of RTH in adult patients may be different in accordance with a series of CT follow-up. Some patients will show signs of thymic atrophy before RTH. The thymic index was significantly different before treatment between patients with RTH and without RTH after chemotherapy. Patients with a higher thymic index before treatment were more likely to develop RTH after chemotherapy. Adult lymphoma patients with thymic reactive hyperplasia have a better prognosis.

EPO-2433
钆塞酸二钠增强 T1mapping 成像肝功能评估肝胆期扫描时间的研究

张学琴,陆健,张涛
南通市第三人民医院

目的：探讨钆塞酸二钠增强 T1mapping 成像评估肝功能合理的肝胆期扫描时间。**方法：**纳入 124 例肝硬化患者 [LCA 组 63 例、LCB 组 47 例、LCC 组 4 例]及 23 例健康体检者（NLF）。采用 Gd-EOB-DTPA 行上腹部平扫及增强扫描，并采用 Look-Locker 序列分别于平扫、增强后 10min、15min 及 20min 采集 T1mapping 图像。测量肝脏 T1 弛豫时间，并计算增强后 10min、15min 及 20min 肝脏 T1 弛豫时间减低率（ΔT1）及弛豫率增加值（ΔR1）。采用重复测量方差分析比较不同级别肝功能组不同时间 T1、ΔT1 及ΔR1，采用 ROC 曲线评价 T1、ΔT1 及ΔR1 鉴别 NLF-LCA 与 LCB-LCC 组的效能。**结果：**NLF、LCA、LCB 组增强后 10min、15min 及 20minT1 弛豫时间逐渐减低，ΔT1 及ΔR1 逐渐增加，LCC 组增强后 10min、15min 及 20minT1 弛豫时间逐渐增加，ΔT1 逐渐减低。不同时间点 T1 弛豫时间、ΔT1 及ΔR1 差异均有统计学意义（F=23.125，28.061，67.421，P=0.000）。不同组别 T1 弛豫时间、ΔT1 及ΔR1 差异均有统计学意义（F=82.686，49.041，70.963，P=0.000）。增强后 10min、15min 与 20min 的 T1 弛豫时间鉴别 NLF-LCA 与 LCB-LCC 组的 ROC 下面积分别为

0.959、0.949、0.952。ΔT1 鉴别两者的 ROC 下面积分别为 0.880、0.879、0.894。ΔR1 鉴别两者的 ROC 下面积分别为 0.942、0.934、0.939。增强后 10min、15min 与 20min 的 T1 弛豫时间、ΔT1 及ΔR1 ROC 下面积差异均无统计学意义（$P>0.05$）。**结论：**采用钆塞酸二钠增强 T1mapping 成像评估肝功能时，于增强后 10min 采集肝胆期图像可满足诊断需求。

EPO-2434
多模态磁共振新技术联合应用在前列腺良恶性结节鉴别诊断的作用

张惠娟
1.福建省立医院南院
2.福建省立金山医院

目的:探讨动态增强 MRI (DCE-MRI)和读段扩散加权成像(RESOLVE-DWI)在前列腺炎性结节和前列腺癌结节鉴别诊断中的应用价值。
方法:对 26 例前列腺癌患者和 29 例前列腺增生结节患者进行 dce 和 dwi 检查。计算时间信号强度曲线(TIC)类型、峰间时间(TTP)、增强峰(EP)、最大对比度增强比(MCER)、 表观扩散系数(ADC)和相对 ADC (rADC)值。两组间进行统计学分析，确定各参数的统计学意义。采用受试者工作特性(ROC)曲线分析和二元 logistic 回归分析，评价单指标和综合指标区分鉴别诊断能力。
结果:前列腺癌与前列腺增生结节的 TTP、EP、MCER、ADC、rADC 差异有统计学意义(p < 0.05)。其中 ADC 表现出最可靠的诊断性能，其次为 rADC、TTP、MCER、EP。此外，DCE-MRI 联合参数的诊断效率高于单纯 TTP、MCER 和 EP。此外，所有 DCE-MRI 和 DWI 参数联合使用，诊断效率最高(曲线下面积= 0.961)。
结论:DCE-MRI 联合 RESOLVE-DWI 对前列腺癌及前列腺增生结节有较好的鉴别效果。

EPO-2435
基于 DEC-MRI 和磁共振高分辨弥散(RESOLVE-DWI)在鉴别恶性和良性乳腺病变中的价值

张惠娟
1.福建省立医院南院
2.福建省立金山医院

基于 (DCE-MRI),和磁共振成像(RESOLVE-DWI) 区分恶性和良性乳腺病变。本回顾性分析纳入 2018 年 1 月至 2019 年 4 月在福建某医院就诊的乳腺病变女性患者。根据病理诊断将患者分为良性组和恶性组。所有患者均行常规 MRI、分辨率 dwi、EPI-DWI、TWIST DCE-T1WI 检查。变量测量包括量化参数(K,篮子和 Ve),半定量的参数(速度的对比度增强对比剂流入[w],对比衰变率的对比剂流出(W-out)和 time-to-peak 增强对比剂注射后(TTP))和表观扩散系数(ADC)值 RESOLVE-DWI 。应用 ROC 曲线分析评价各参数对乳腺良恶性病变的诊断价值。共纳入 43 例患者(良性，n = 18;恶性，n = 26)。恶性组与良性组相比，K、Kep、win 显著升高，wout、TTP、ADCe、ADCr 显著降低(均 P < .05); Ve 组间差异无统计学意义。分辨率 dwi 在显示病灶边界及形态方面优于常规的 EPI-DWI，而 ADCr 在所有患者中均明显低于 ADCe。Kep、W-out、ADCr、ADCe 对良恶性病变的鉴别诊断效率最高(基于 AUC 值)。结合 3 个参数(Kep、W-out、ADCr)的诊断效率(AUC, 0.965)高于任何单个参数，区分良恶性病变的敏感性高(92.0%)，特异性高(96.0%)，准确率高(91.9%)。结合 Kep、W-out 和 ADCr 的指标有望用于乳腺病变的鉴别诊断。

EPO-2436

重症甲型 H1N1 流感的影像学表现及动态观察

杜超
南京市第二医院

摘要 目的：探讨重症甲型 H 1N1 流感的胸部影像学表现。方法：回顾性分析 76 例重症甲型 H1N1 流感的影像学资料，将所有病例根据临床特点和病程分为三组：第 1 组（ n= 50）：门诊病例或是住院时间很短的病例；第 2 组（ n= 14）：临床上有急性呼吸衰竭但未用机械通气的病例；第 3 组（ n= 12）：急性呼吸衰竭同时需要机械通气的病例。观察所有患者平片、CT 表现，并对病变的大小、形态、数目和分布加以分析。结果：重症甲型 H 1N1 流感的主要影像学表现为双侧或单侧的磨玻璃样改变、实变或混合型病变，第 1 组以磨玻璃样改变为主，病变一般多发，可侵及所有肺叶，但主要发病部位为双肺下叶，多呈周围性分布；第 2 组以实变为主，可合并磨玻璃样改变或局灶性实变，恢复期可有少数病例呈纤维性修复；第 3 组以实变为主，可合并间质性改变，单纯磨玻璃样改变少见；少数病例可合并胸腔积液、心包积液和肺不张；第 3 组部分病例可伴有继发性气胸、纵膈气肿、皮下气肿以及霉菌感染，继发肺动脉高压、右心衰竭、肝脾淤血。结论：在不同的临床病程中患者有不同的影像学表现。轻症病例影像学表现比较轻微，恢复也比较彻底，一些重症病例可呈纤维性修复，而危重病例，尤其是需要机械性通气的病例其并发症尤其是气胸的发生概率较高，且病情变化比较反复，在病变进展期及时复查 X 线胸片以了解影像的变化，对于正确地评估病情、采取积极恰当的治疗措施将起到重要的指导作用。

EPO-2437

感染性脊柱炎的影像表现

屈晓艳,李刚锋,崔光彬
空军军医大学唐都医院

目的：探讨感染性脊柱炎的影像学征象，提高该病的影像学诊断及鉴别诊断水平。方法：回顾性分析 33 例经临床确诊的感染性脊柱炎病例资料，并对其特异性影像学征象进行分析、总结。结果：所有 33 例病例中，结核性脊柱炎 15 例、化脓性脊柱炎 11 例、布氏杆菌脊柱炎 7 例；其中 16 例行 DR 检查， 28 例行 CT 检查， 31 例行 MRI 检查。DR 可显示脊柱炎椎体终板缘骨质破坏同时伴有明显的骨质增生、硬化，相邻椎间隙改变；CT 除显示 DR 的表现外，可显示较早期的微小骨质破坏；MRI 在病变早期就可显示椎体、椎间盘及周围软组织内的异常信号，并可显示微量椎旁及腰大肌脓肿，且增强扫描可显示椎旁条状及环状强化，但对骨质增生硬化显示不敏感。脊柱结核椎体骨质破坏类型以局限性脓肿、溶通性脓肿较多见，而非特异性化脓性脊柱炎和布氏杆菌性脊柱炎椎体骨质破坏类型以肉芽肿较多见；脊柱结核多伴有椎间隙明显狭窄，而非特异性化脓性脊柱炎和布氏杆菌性脊柱炎一般椎间隙狭窄少见或仅有轻度狭窄。脊柱结核椎间盘破坏较严重，而后两者一般表现为椎间盘无或者轻度破坏。脊柱结核椎旁病变蔓延性脓肿较多见，后两者以局限性肉芽肿、局限性脓肿较多见。脊柱结核椎体塌陷较严重，而后两者一般表现为椎体无或者轻度塌陷。

结论：提高对感染性脊柱炎的特异性影像学征象的认识，结合患者的生活史、工作史以及相关实验室检查，对感染性脊柱炎的诊断及鉴别诊断具有重要的价值。

EPO-2438
初治无耐药 HIV/AIDS 合并纵隔淋巴结结核短期抗结核治疗疗效观察

宋树林,卢亦波,彭认平,张世迁
南宁市第四人民医院

摘 要： **目的** 对比分析初治无耐药 HIV/AIDS 与非 HIV/AIDS 合并纵隔淋巴结结核患者抗结核过程中淋巴结大小变化，探寻 CT 扫描对 HIV/AIDS 合并纵隔淋巴结结核疗效评价价值。**方法** 本文搜集 2016 年 1 月-2018 年 6 月南宁市第四人民医院初治无耐药艾滋病合并纵隔淋巴结结核患者的临床及 CT 扫描资料作为观察组，搜集同时期初治无耐药非艾滋病纵隔淋巴结结核患者的临床及 CT 资料作为对照组，淋巴结结核治疗采用 3HRZE/15HRE 方案。对比分析两组淋巴结结核患者化疗前临床表现及抗结核过程中（1M、2M、4M、6M、8M、12M 及以上）疗效差异。**结果** 两组纵隔淋巴结结核患者性别、年龄、治疗前痰涂片阳性率、结核分枝杆菌符合群阳性率、咳嗽、咳痰及发热差异均不具有统计学意义（P>0.05）。观察组治疗前 $CD4^+$T 淋巴细胞显著低于对照组（t=-5.965，P<0.000），治疗后观察组 $CD4^+$T 淋巴细胞上升，差异具有统计学意义（t=-5.011，P<0.000）。两组患者首次住院时间差异不具有统计学意义，观察组 7 例因发生免疫重建炎性综合征而重复住院治疗，对照组 1 例因病情变化而重复住院治疗，两组患者总住院时间差异具有统计学意义（t=3.204，p=0.004）。两组患者抗结核治疗 1M、2M、4M、6M、8M、12M 以上后疗效差异均不具有统计学意义（Fisher 精确检验，P>0.05），但观察组患者在抗结核治疗 1-2M 后淋巴结增大（38.89%，7/18）。**结论** 初治无耐结核药的 HIV/AIDS 与非 HIV/AIDS 合并纵隔淋巴结结核患者抗结核短期疗效无显著差异，但推荐 CT 扫描用于评估 HIV/AIDS 合并纵隔淋巴结结核抗结核疗效，特别是 HAART 的早期，有助于临床尽早对 TB-IRIS 作出诊断。

Investigation of Zero TE MR in preoperative planning in dentistry

Liya Wang[1],Lanjing Lai[2],Zhang Yuzhong[1]
1.The People's Hospital of Longhua, Shenzhen, Southern Medical University, Guangdong, China.
2.The Third Affiliated Hospital of Nanchang University, Nanchang, Jiangxi, China

Purpose:
To investigate the feasibility of using zero TE (zTE) imaging as an alternative to cone beam CT(CBCT) imaging for preoperative planning in dentistry.
Methods:
This prospective study was approved by the ethical committee in our hospital, and all participants gave written informed consent prior to the study. Twenty-two patients with the need of tooth extraction or planting (11 males, 11 females, age 26~65) from Zero TE imaging at 3.0T. The performance of zTE imaging was assessed by two dentists using CBCT as a gold standard in preoperative planning for tooth extraction

(qualitative classification) and implanting (quantitative dimensional measurement). Two way random intraclass correlation coefficient (ICC) with absolute agreement was used to assess the consistency between the measurements of zTE and CBCT, and the measurements between the two reviewers. ICC reflects the level of inter-observer variance to the total variance and a high ICC level (close to 1) indicates high consistency. A P<0.05 was considered as statistically significant.

Results:

Zero TE imaging showed clear delineation of the teeth and mandible, and showed better depiction of the mandible canal as compared to CBCT. In assessing the spatial relationship between the third molar and the mandibular canal, identical results were obtained from two readers based on zTE and CBCT images; in spatial measurements related to second premolar, high intraclass coefficient was obtained in all the performed measurements between zTE and CBCT (0.782 to 0.921) and in between reviewers (0.812 to 0.958). The results of Bland Altman analysis also indicated low level of bias (max -1.8%) and disagreements (max -15.1% to 11.3%) between the results of zTE and CBCT.

Conclusion:

zTE MR imaging method has been investigated for the needs of preoperative planning in dentistry for the first time. Side-by-side comparison with CBCT allowed its clinical utility to be assessed. Preliminary results were promising and with the widespread of zTE techniques, its use in dentistry imaging area may be considered in circumstances when CT imaging is undesirable. Zero TE imaging may be a potential imaging tool in preoperative planning in dentistry when CBCT is undesirable.

双分支深度网络 CT 计算机辅助诊断技术对特发性肺间质纤维化蜂窝影体积量化评估的临床应用

孟乐,汪丽娅
深圳市龙华区人民医院

目的：探讨双分支深度网络 CT 计算机辅助诊断(CAD)技术定量测量特发性肺间质纤维化患者肺部蜂窝影体积的临床应用价值。

材料与方法：收集 30 天内行胸部 HRCT 和肺呼吸功能检查的 IPF 患者 33 例（男性 27 例，女性 6 例；平均年龄 75 岁）；平均吸烟指数（支/年）284；身体质量指数:22kg/m^2。超过 80%HRCT 图像于双源 64 排 CT 机采集，取仰卧位，双手过头，深吸气后屏气。扫描范围自肺尖至肺底。扫描参数：管电压 120KV；管电流 150mAS；层厚 1mm；层间距 1mm。肺窗：窗宽 1200HU，窗位-600HU；纵隔窗：窗宽 400HU，窗位 40HU。两名放射科医生利用 PACS 手动测量气管隆突层面、右下肺静脉层面及其中间层面上蜂窝影和相应肺野面积，计算各肺野蜂窝影面积之比的平均值（MHA%）及总面积之比（HA%）。软件运用半自动切分算法，提取双肺、切除肺内支气管，切分出肺内蜂窝影，计算双肺蜂窝影与相应肺体积之比（HV%）。肺功能记录相对完善的 FVC%pred、FEV_1%pred、FEV_1/FVC、DLco%pred、DLco/VA%pred 值。用 SPSS 24.0 统计分析数据。

结果：两位放射科医生的数据之间具有较强一致性，Weighted Kappa 系数为 0.717。HV%与 MHA%、HA%具有显著正相关性（p＜0.001），与 FVC%pred（%）、FEV_1%pred（%）及 DLco%pred（%）、DLco/VA%pred 具有负相关性（P＜0.05）；HV%与 FEV_1/FVC（%）、CPI 无明显相关性（p＞0.05）。

结论：该网络 CTCAD 技术定量测量蜂窝影的体积之比与手动测量的面积之比存在显著的正相关性，具有很高的准确度。该技术定量测量蜂窝影的体积之比与 FVC%、FEV_1%、DLco%、DLco/VA% pred（%）存在负相关性，有助于评估患者的病情、治疗疗效和预后。

脾脏炎性肌纤维母细胞瘤的 CT 和 MRI 特征分析

李强[1],孙玲麟[2]
1.宁波市鄞州人民医院
2.宁波市华慈医院

目的 分析脾脏炎性肌纤维母细胞瘤（SIMF）的 CT 和 MRI 影像特征，提高对该病诊断的准确性。**方法** 回顾性分析 6 例 SIMF 患者的 CT 或 MRI 影像资料。分析指标包括病灶形态、大小、边界、包膜、密度/信号特点和强化方式等，对各影像特征进行归纳和统计。**结果** 6 例患者中行 CT 检查 5 例（增强扫描 3 例，平扫 2 例），MRI 检查 2 例（MRI 增强扫描 1 例，平扫 1 例），同时有 CT 和 MRI 两种检查 1 例。6 例 SIMF 均为单发病灶（6/6，100%）；平均直径（3.9±0.9）cm；病灶圆形或类圆形 5 枚（5/6，83.33%），葫芦状 1 枚（1/6，16.67%）；病灶边界清晰 5 枚（5/6，83.33%），边界不光整 1 枚（1/6，16.67%）；平扫密度不均匀 4 枚（4/5,80.0 %），信号不均匀 2 枚（2/2,100%）。MRI 上 3 例病灶的实质部分 T1WI 呈稍低信号，T2WI 不均匀低信号，2 例出中心现中心液化坏死区，T1WI 呈低信号，T2WI 呈高信号。CT 或 MRI 增强后病灶渐近性强化 3 枚（3/3，100%）；低密度包膜环 3 枚（3/3，100%）。6 例患者仅 1 例术前诊断正确（1/6，16.67%）。结论 SIMF 以单发病灶为主，类圆形外观、边界清晰为其常见大体表现，渐近性强化伴地图样未强化区为其主要强化特点，掌握以上征象有利于提高诊断准确率。

肝硬化背景下肝细胞癌 Gd-DTPA 和 Gd-EOB-DTPA 表现：基于 LI-RADS（ 2018 版）分类标准的对照研究

邢飞
南通市第三人民医院

【摘要】目的基于肝脏影像报告和数据系统（LI-RADS）2018 版评分系统，探讨马根维显 MRI（Gd-DTPA-MRI）与钆塞酸二钠 MRI（Gd-EOB-MRI）对肝硬化背景肝细胞癌（HCC）分类诊断中的个体内对照研究。**方法** 2014 年 2 月至 2018 年 6 月共 70 例（81 个 HCC 病灶）经病理证实的慢性肝硬化患者入组本研究，均行 Gd-DTPA 和 Gd-EOB-DTPA 检查（两项检查间隔时间＜1 个月）。由 2 位高年资放射科医师对 HCC 主要征象共同分析，参照 LI-RADS 分类标准，对 Gd-DTPA-MRI 和 Gd-EOB-MRI 分别进行评分；调整 LI-RADS-EOB 分类标准（增加 HBP 低信号为主要征象，LI-RADS-EOBa1；HBP 低信号环视为包膜，LI-RADS-EOBa2；TP 低信号视为廓清，LI-RADS-EOBa3），并重新进行评分。比较 Gd-DTPA-MRI、Gd-EOB-MRI 以及调整后的评分诊断为 LR-5 的敏感性。**结果** Gd-EOB-MRI 对廓清征象(p=0.012)和包膜征象(p=0.036)的显示率较低。在诊断 LR-5 敏感性上，LI-RADS-DTPA 高于 LI-RADS-EOB(p=0.013)和 LI-RADS-EOBa2(p=0.037)，低于 LI-RADS-EOBa1(p=0.005)，而与 LI-RADS-EOBa3(p=1)相当。**结论**调整后的 LI-RADS-EOB，如增加 HBP 低信号（主要征象）或 TP 低信号（视为廓清）能有效提高 HCC 诊断敏感性。

EPO-2443
肝硬化背景下 MRI 肝脏影像报告和数据管理系统 LR-2、LR-3、LR-4 类结节的纵向观察及分析

邢飞
南通市第三人民医院

目的探讨肝硬化背景下 MRI 肝脏影像报告及数据系统（LI-RADS v2018）LR-2、LR-3、LR-4 类结节的纵向观察分析。**方法**回顾在本院进行过至少 1 次肝脏 MRI 增强随访复查，首次 MRI 评价为 LR-2、LR-3、LR-4 类病变，且未进行过活检、手术等的 158 例（245 个病灶）肝硬化患者。LR-2 结节 105 个、LR-3 结节 97 个、LR-4 结节 43 个。记录随访时长及 LI-RADS 分类调整情况。单因素方差分析比较 LR-2、LR-3、LR-4 类病变的随访时间，Kaplan-Meier 曲线分析 LR-2、LR-3、LR-4 结节分类上调发生率，采用 Log-Rank 检验比较。**结果** LR-2、LR-3、LR-4 类病变的随访时间分别为（20.5±11.4）、（18.1±10.5）和（13.8±9.9）个月，差异有统计学意义（F=6.58，P=0.002）。LR-2 结节中，4 个进展至 LR-5，2 个上调至 LR-4，4 个上调至 LR-3，72 个保持不变，23 个下调至 LR-1。LR-3 结节中，15 个上调至 LR-5，6 个上调至 LR-4，57 个保持不变，6 个下调至 LR-2，13 个下调至 LR-1。LR-4 结节中，15 个上调至 LR-5，其中 5 个显示阈值增长，7 个显示亚阈值增长；2 个因门脉癌栓进展为 LR-TIV；23 个保持不变；3 个下调至 LR-1。LR-4 结节上调至 LR-5/-TIV 的发生率较 LR-2、LR-3 结节高（P均＜0.01），其中 3、6、12 个月进展至 LR-5-TIV 的累积发生率 LR-4 结节分别为 4.7%、11.6%、31.2%，LR-3 结节分别为 0、4.2%、6.6%，LR-2 结节均为 0。LR-3 结节进展至 LR≥4 的累积发生率高于 LR-2 结节（P＜0.01）。**结论**肝硬化背景下 LR-2、LR-3、LR-4 结节呈现不同的自然病程及转归，LI-RADS 分类较高结节进展至 LR-5/-TIV 的累积发生率越高。

钆塞酸二钠增强 STIR-DWI 与 CHESS-DWI 对肝细胞癌检出价值的比较

蔡健华[1],王秀彬[2],陆健[1],梁宏伟[1],张学琴[1],缪小芬[1],姜吉峰[1],丁丁[1],杜圣[1],黄爱娜[1]
1.南通市第三人民医院
2.南通大学附属医院

目的 比较 STIR-DWI 和 CHESS-DWI 在钆塞酸二钠(Gd-EOB-DTPA)增强 MRI 中对肝细胞癌(HCC)的检出价值。 **方法** 前瞻性纳入 37 例经病理证实的 HCC 患者,所有患者均行上腹部 Gd-EOB-DTPA 增强 MRI 扫描,并于增强后 13-15min 采集 STIR-DWI 和 CHESS-DWI 图像。测量 STIR-DWI 和 CHESS-DWI 序列肝实质的信号强度(SI)、标准差(SD)、ADC 值及 HCC 的 SI、ADC 值,计算 2 个序列肝脏的信号噪声比(SNR)、HCC 的对比噪声比(CNR),记录 STIR-DWI 和 CHESS-DWI 序列 HCC 病灶和肝脏解剖结构的显示情况。采用配对样本 t 检验或 Wilcoxon 秩和检验比较 STIR-DWI 和 CHESS-DWI 序列肝脏的 SNR、HCC 的 CNR、肝脏和 HCC 的 ADC 值、HCC 病灶的显示程度及肝脏解剖结构显示的清晰程度。 **结果** STIR-DWI 序列肝脏的 SNR(14.93±4.79)低于 CHESS-DWI 序列(22.84±7.07),STIR-DWI 序列 HCC 的 CNR(37.02±19.31)高于 CHESS-DWI 序列(30.43±21.62),差异均有统计学意义(P均<0.05)。肝脏及 HCC 的 ADC 值 STIR-DWI < CHESS-DWI,HCC 病灶的显示程度 STIR-DWI > CHESS-DWI,肝脏解剖结构的清晰程度 STIR-DWI < CHESS-DWI,差异均有统计学意义(P均<0.05)。 **结论** Gd-EOB-DTPA 增强 MRI 中,STIR-DWI 比 CHESS-DWI 更有助于 HCC 的检出。

EPO-2445
Gd-EOB-DTPA 增强 T1 mapping 成像对肝纤维化分期的评估价值

张涛
南通市第三人民医院

目的 探讨 Gd-EOB-DTPA 增强 T1mapping 成像对肝纤维化分期的评估价值。 **方法** 共 99 例患者纳入此项研究，其中对照组健康志愿者 23 例，慢性乙型肝炎肝纤维化 S1 期 13 例，S2 期 13 例，S3 期 26 例，S4 期 24 例。检查采用 Look-Locker 序列于 Gd-EOB-DTPA 增强前及增强后 20 分钟（肝胆期）采集 T1mapping 图像，并测量肝组织 T1 弛豫时间，同时计算肝胆期 T1 弛豫时间减低率。采用单因素方差分析比较增强前及增强后 20 分钟不同组别之间肝脏 T1 弛豫时间减低率及 T1 弛豫时间，并使用 ROC 曲线分析肝脏 T1 弛豫时间减低率及 T1 弛豫时间对相邻肝纤维化级别的诊断效能。 **结果** S0 组肝 T1 pre、T1HBP、ΔT1 分别为（ 777.70 ±72.40）ms、（ 230.09 ± 37.73）ms、（ 70.06 ± 6.61）% ，S1 组为（ 860.69 ± 90.14）ms、（ 310.62 ± 104.49）ms、（ 64.42 ± 13.80）% ，S2 组分别为（ 903.15 ± 80.01）ms、（ 316.38 ± 115.41）ms、（ 63.44 ± 13.56）% ，S3 组分别为（ 822.92 ± 104.59）ms、（ 554.54 ± 86.7）ms、（ 39.18 ± 11.57）% ，S4 组分别为（ 924.16 ± 99.98）ms、（ 558.69 ± 101.00）ms、 （ 38.93 ± 12.41）% 。S0、S1、S2、S3 与 S4 组 T1pre 及 T1HBP 差异均有统计学意义（ P ＜ 0.05）； T1 pre、T1HBP、ΔT1 鉴别 S0 与 S1 的 AUC 分别为 0.771、0.771、0.629，鉴别 S2 与 S3 的 AUC 分别为 0.582、0.933、0.913。 **结论** Gd-EOB-DTPA 增强 T1mapping 成像对肝纤维化的评估有一定的价值。

EPO-2446
Gd-EOB-DTPA 增强 T1 mapping 成像及扩散加权成像对肝纤维化分期的评估价值

张涛
南通市第三人民医院

探讨 Gd-EOB-DTPA 增强 T1mapping 成像及 DWI 对肝纤维化分期的评估价值。方法 ：共 99 例患者纳入此项研究，其中对照组 23 例，肝纤维化 S1 期 13 例，S2 期 13 例，S3 期 26 例，S4 期 24 例。检查采用 Look-Locker 序列于增强前及 Gd-EOB-DTPA 肝胆期采集 T1mapping 图像，并测量肝组织 T1 弛豫时间，同时计算肝胆期 T1 弛豫时间减低率（ΔT1）。测量 ADC。比较不同组别 ADC 值、肝脏 ΔT1 及 T1HBP。以肝纤维化 S≥2 和 S≥3 为阳性标准，分别对 ADC、T1HBP、ΔT1 采用受试者工作特征曲线 ROC 分析其诊断效能。采用 Spearman 相关分析评价各参数值与肝纤维化分期的相关性。结果：S0 组 ADC、T1HBP、ΔT1 分别为（1.57±0.16）×10-3 mm2/s、（ 239.08±20.63）ms、（ 69.24±4.64）% ，S1 组为（ 1.44±0.12)×10-3 mm2/s、（ 273.57±53.75）ms、（ 64.27±9.94）% ，S2 组分别为（ 1.31±0.12)×10-3 mm2/s、（ 375.74±97.86）ms、(61.14±5.61）% ，S3 组分别为（ 1.18±0.09)×10-3 ms、（ 561.59±56.55）ms、（ 38.76±6.08）% ，S4 组分别为（ 1.03±0.08)×10-3 mm2/s、（ 564.69±68.62）ms、（ 37.01±6.80）% 。诊断≥S2 期肝纤维化 ADC 值、 ΔT1 及 T1HBP 的 AUC 面积分别是 0.903,0.984,0.987；诊断≥S3 期肝纤维化 ADC 值、 ΔT1 及 T1HBP 的 AUC 面积分别是 0.817,0.847,0.930.结论： Gd-EOB-DTPA 增强 T1mapping 成像及磁共振扩散加权成像对肝纤维化的评估有一定的价值。

先天性无痛无汗症一例

翁婷,劳群
杭州市儿童医院

患者，男，11 岁，发现左足脓疱形成，破溃后出现左足红肿，活动障碍，肿胀逐渐加重，家属诉患儿既往因无痛感反复外伤，自小发现无汗，具体时间不详。
先天性无痛无汗症(congenial insensitivity to pain with anhidrosis，CIPA)Y. 称遗传性感觉和自主神经障碍Ⅳ型. 是一种罕见的常染色体隐性遗传病。
本病的临床及 X 线表现与夏科氏关节相似，但在儿童中发生夏科氏关节并有明显骨折、脱位，或有广泛性感染时应考虑本病。

EPO-2448

艾滋病颈部淋巴结结核的 CT 诊断与鉴别诊断

宋树林[1],卢亦波[1],莫移美[1],张世迁[1],黎瑜[1],彭认平[1],曾自三[2]
1.南宁市第四人民医院
2.广西医科大学第一附属医院

目的 探讨艾滋病（AIDS）患者颈部淋巴结结核（CTL）的 CT 诊断及鉴别诊断。**方法** 回顾性分析经颈部淋巴结取材活检证实病因的 AIDS 并颈部淋巴结肿大患者的颈部 CT 资料，总结 AIDS 并 CTL 的 CT 特征，提高对其 CT 诊断与鉴别诊断能力。**结果** 70 例患者中 CTL 39 例，马尔尼菲蓝状菌（TM）病 4 例，AIDS 相关性淋巴结病 4 例，慢性淋巴结炎 1 例，AIDS 相关性淋巴结病合并 CTL、TM 病 1 例，淋巴结转移瘤（LNM）10 例，非霍奇金淋巴瘤（NHL）10 例，卡波西肉瘤 1 例。AIDS 并 CTL 的病人 CT 表现多样，表现为均匀稍低密度 2 例，均匀软组织密度 8 例，均匀与不均匀共存 8 例，不均匀密度 21 例，3 例 CTL 出现钙化，2 例颈部皮肤破溃并窦道形成；增强扫描以环形强化多见，表现为均匀强化与环形强化共存 4 例，环形强化 15 例，不均匀强化 1 例，不均匀强化与环形强化共存 2 例。4 例 TM 病均表现为稍低密度淋巴结肿大，1 例患者增强扫描呈轻度均匀强化。10 例 LNM 表现为均匀软组织密度 2 例、均匀与不均匀密度共存 6 例、不均匀密度 2 例，出现均匀软组织密度淋巴结肿大较 CTL 多见（fisher 精确检验，P=0.02）；6 例行增强扫描表现为均匀强化 1 例、不均匀强化 3 例、不均匀强化与环形强化共存 2 例。10 例 NHL 表现为均匀软组织密度 2 例、不均匀密度 6 例、两者共存 2 例，6 例行增强扫描表现为均匀强化 2 例、不均匀强化 3 例，不均匀强化、环形强化共存 1 例。LNM 及 NHL 淋巴结最大径较 CTL 大，环形强化率较 CTL 低（fisher 精确检验，P＜0.01）。**结论** AIDS 并 CTL 的 CT 表现多样，增强扫描多为环形强化；肿大淋巴结的 CT 表现对 AIDS 并 CTL 的诊断及鉴别诊断具有重要作用。

Gd-EOB-DTPA 增强 MR 胆管成像定量评估肝脏储备功能的价值

陆双双,陆健
南通市第三人民医院

目的探讨钆塞酸二钠（Gd-EOB-DTPA）增强 MR 胆管成像对乙肝肝硬化患者肝脏储备功能的定量评估价值。**方法**回顾性分析 115 例乙肝肝硬化患者。根据肝功能 Child-Pugh 分级分为 3 组：Child-Pugh A 级组 55 例、B 级组 50 例和 C 级组 10 例；根据 MELD 评分分为 2 组：MELD 评分≤10 组 70 例和 MELD 评分＞10 组 45 例；根据吲哚氰绿 15min 滞留率（ICG-R15）分为 2 组：ICG-R15≤20%组 63 例和 ICG-R15＞20%组 52 例。所有受试者行上腹部增强 MR 扫描。采用单因素方差分析比较不同 Child-Pugh 分级组患者的胆总管相对信号强度（RSI），相关分析采用 Spearman 秩相关分析。采用独立样本 t 检验分别比较不同 MELD 评分和不同 ICG-R15 组患者的胆总管 RSI，相关分析采用 Pearson 相关分析。采用 ROC 评价胆总管 RSI 鉴别肝功能 Child A 级与 Child B-C 级组、MELD 评分≤10 与＞10 组及 ICG-R15≤20%与＞20%组患者的效能。采用回归分析观察胆总管 RSI 与相关实验室检查结果的关系，采用多元逐步回归筛选胆总管 RSI 的重要预测因素。**结果** Child-Pugh A 级、B 级与 C 级组胆总管 RSI 为 4.26±0.94、2.57±1.23 和 1.90±1.10, 差异有统计学意义（P＜0.01）。MELD 评分≤10 与＞10 组胆总管 RSI 为 4.10±0.95、2.10±1.15，差异有统计学意义（*P*＜0.01）。ICG-R15≤20%与＞20%组胆总管 RSI 为 4.22±0.93、2.23±1.11，差异有统计学意义（*P*＜0.01）。ICG-R15 和 MELD 评分是胆总管 RSI 的重要预测因素（*P*值＜0.01）。**结论** Gd-EOB-DTPA 增强 MR 胆管成像可以定量评估乙型肝炎肝硬化患者的肝脏储备功能，胆总管 RSI 对鉴别轻度肝功能损伤与中重度肝功能损伤有一定价值。

EPO-2450

艾滋病合并脑内弓形虫感染的影像学表现

陆普选
深圳市慢性病防治中心

摘要:依据弓形虫脑炎病灶发生的部位影像学可分为脑室型、脑实质型和混合型。影像学特点为双侧多发病灶为主，单发病灶较少见。病灶直径一般在 0.4-3.0cm 之间。病灶的好发部位以基底节区(70%-75%)多见，也可累及小脑、脑干和皮髓交界区，脑室和后颅凹亦可受侵。在头颅 CT 平扫时约 80%的病灶表现为低密度，该低密度不能明确区分感染灶和其外周水肿。ＣＴ增强后病灶呈境界清晰的环状强化，少数呈结节状，位于室管膜下，酷似浸润性病变。大剂量增强扫描 ，能发现更多结节状病灶。MRI 对艾滋病合并弓形虫脑病的诊断具有更高的敏感性 。MRI 表现特点主要有：①弓形虫脑病的发病部位以额叶、基底节及丘脑和脑干为主，而脑室、脑室管膜很少受侵；②)颅内见多发病灶，其形态以类圆形或结节状为主；③病灶的 MRI 信号主要表现为 T1WI 低信号，如果病灶 T1WI 出现高信号，考虑为病灶内少量出血的可能；T2WI 多为高信号；增强后病灶的强化形式主要表现为环形强化、花瓣样和结节样强化； MRI 病灶未见明显强化也占一定比例（大约 36%）。磁共振 T1WI 增强后的“靶征”具有一定的诊断意义，病灶的“靶征”通常至少有 3 个不同的层面组成，最内层是有强化的中心，中间是低信号的一层，最外层是高信号强化层，但是经常内层的高信号欠完整；偶尔 T1WI 上的“靶征”只有两个层面组成，内层表现为等或低信号，外层为环形强化带。利用磁共振波谱成像(MRS)、扩散加权成像(DWI)以及灌注成像(PWI)这些新技术来研究寻找弓形虫脑病的影像诊断特点有意义。有学者发现弓形虫脑病局部脑组织发生凝固性出血性坏死，病灶内的液化坏死区主要成分为炎症细胞、弓形虫及蛋白质，水分子弥散受限，ADC 值有降低。

EPO-2451

PET/CT 在肺外结核诊断中的应用价值

陆普选[1],邓莹莹[2]
1.深圳市慢性病防治中心

2.深圳市盐田区人民医院

目的 探讨肺外结核 PET-CT 影像表现及诊断方法。**方法** 回顾性分析 46 例肺外结核的 PET-CT 影像学资料，总结病变的影像学特点并结合文献复习。**结果** 46 例均经病理诊断。所有病灶均表现为 ^{18}F-FDG 不同程度摄取，SUVmax 范围为 1.3-30.0。按照发病部位大致可分为 4 大类：(1)淋巴结结核 24 例，表现为不同程度增大淋巴结影，7 例淋巴结融合，5 例见中心坏死，3 例 CT 增强可见环形强化。(2)膜性结核 14 例。累及腹膜、心包及脑膜。表现为不同程度、不均匀增厚，并伴有不同程度腹腔积液。 (3)脏器结核 13 例。累及脾，肝脏，胰腺，肠道，前列腺及精囊腺，卵巢。实质脏器主要表现为低密度影，前列腺及精囊腺 ^{18}F-FDG 异常浓聚。仅 3 例为单纯脏器结核，其它均合并其它肺外结核。(4)骨关节结核 8 例。3 例为脊柱结核，2 例累及腰椎，1 例累及胸椎，均表现为溶骨性骨质破坏，椎间隙狭窄，椎旁软组织肿胀及肿块。1 例为尺骨远端膨胀性骨质破坏，伴周围软组织肿胀。4 例为全身多发骨质破坏，软组织肿块不明显。**结论** 肺外结核的 PET-CT 表现多样化， PET-CT 对肺外结核具有一定的价值。淋巴结结核和骨结核的环形摄取为 PET 图像较为特征性表现。熟悉其 PET-CT 表现有助于该病的诊断、鉴别诊断与疗效观察，确诊仍须依靠临床病史、实验室检查及病理检查。

WHO 全球结核报告：全球与中国关键数

陆普选
深圳市慢性病防治中心.

摘要:结核病是十大死因之一。2017 年，结核病在非艾滋病人中导致 130 万人死亡，在艾滋病毒抗体阳性者中估计有 30 万人死于结核病。在全球范围内，2017 年有 1000 万人患上了结核病。而耐药结核病仍然是结核病疫情中较难控制的一环。2017 年，全世界有 55.8 万人患上了耐多药和耐利福平的结核病，其中 82% 为耐多药结核病。印度、中国和俄罗斯联邦的总和几乎占世界耐多药耐多药病例的一半。虽然在全球所有 WHO 区域和大多数国家中，结核病造成的疾病负担正在下降，但速度不够快，无法达到《终结结核病战略》的 2020 的第一个里程碑。结核病人的诊断和成功治疗每年可避免数百万人死亡 (2000-2017 年期间估计有 5400 万人)，但在检测和治疗方面仍然存在巨大的缺口。新病例的最新治疗结果数据显示，2016 年全球治疗成功率为 82%。如果不加强研究和开发，就无法实现 2035 年结束结核病战略的目标。

EPO-2453

耐药肺结核的分类与分型及影像表现

陆普选
深圳市慢性病防治中心

摘要:耐药结核病是由耐药结核分枝杆菌所引起的结核病,是目前威胁人类健康的主要呼吸道传染病。在全球范围内，2017 年 WHO 报告了 160 684 例耐多药结核病和利福平耐药结核病(MDR/RR-TB)，接受治疗的人数有 139 114 例。约有 47%的耐药结核病来自印度（24%）、中国（13%）和俄罗斯（10%）。同时，约有 23 万耐多药/利福平耐药患者死亡。为了有效地规范耐药肺结核预防、诊断和治疗，临床上依据实验室细菌学及耐药产生的原因等对结核分枝杆菌耐药分为新发耐药结核和复治耐药结核两大类，依据耐药数量和种类分为单耐药、多耐药、耐多药、广泛耐药和利福平耐药五型。本文主要就利福平耐药、耐多药和广泛耐药肺结核的影像表现进行描述，并附典型病例胸

片和 CT 图，三种耐药肺结核分别具有一些影像学特点，主要表现为肺内多发性厚壁空洞、大小不等的结节影、斑片状实变影、纤维条索状影及部分表现为淋巴结肿大和胸腔积液。病变累及范围广泛、迁延时间长并可出现毁损肺。掌握耐药肺结核的发病率、病死率、临床分型及分类，了解主要类型耐药肺结核的影像学表现特点，有利于指导临床诊断、治疗和疗效评价，降低其发病率和病死率。

艾滋病合并肺部卡波西肉瘤的临床影像分析

陆普选[1,2],施裕新[2]
1.深圳市慢性病防治中心
2.上海公共卫生中心

目的：为进一步认识艾滋病合并肺部卡波西肉瘤的影像表现。
材料与方法：收集中国七家传染病专科医院确诊的艾滋病合并肺部卡波西肉瘤的相关资料，根据纳入标准及排除标准，对满足要求的 34 例患者进行临床及影像资料整理分析,男性 33 例，女性 1 例，年龄在 20-50 岁。
结果：34 例艾滋病合并肺部卡波西肉瘤患者，79%患者的 CD4+细胞计数低于 100 个/UL，HAART 治疗有效。肺部表现肺部结节影 30 例（88%），斑片影 18 例（53%），磨玻璃影 11 例（32%），小叶间隔增厚 14 例（41%），动态观察发现 HAART 治疗前肺部结节边缘由光整到不光整、火焰状/星星状、斑片影。同时合并 5 例肝脏卡波西肉瘤，影像表现为结节、肝内胆管扩张，甲状腺 1 例表现为低密度结节，1 例肋骨及 1 例上颌骨均为溶骨性骨质破坏并周围软组织结节。

结论：艾滋病合并肺部卡波西肉瘤的影像表现主要是多形性结节病灶，即结节侵润或结节合并线性侵润进展的不同阶段的表现，同时合并的肝脏、甲状腺 KS 影像表现也是结节病灶。

脑实质结核的 MRI 影像学分型及其治疗后演变规律的 MRI 研究

丁爽,贾文霄
新疆医科大学第一附属医院

目的 分析脑实质结核的 MRI 特点，探讨脑实质结核抗结核治疗中的 MRI 影像学演变规律。**材料与方法** 对 28 例脑实质结核患者行 MRI 检查，分析脑实质结核的 MRI 表现特点；动态观察治疗前后不同时期结核病灶的 MRI 影像学特点及演变过程，采用卡方检验比较不同类型结核病灶的消失率。**结果** 脑实质结核 28 例 337 个病灶，实性均匀强化病灶 102 个，约 69.6%≤3.0mm，25.5%在 3.0mm 与 10.0mm 之间；环形强化病灶 235 个，环壁厚薄均匀、光整，约 32.34%在 3.5mm 至 5.0mm 之间，45.53%在 5.0mm 与 10.0mm 之间，22.13%≥10.0mm。治疗后 1 个月内直径≤3.0mm 病灶及直径为 3.0mm 与 10.0mm 之间病灶的消失率分别为 41.0%、15.5%，治疗后 3 个月内病灶消失率分别为 79.9%、38.4%，治疗后 6 个月内病灶消失率分别为 97.1%、52.9%。治疗不同时间段的直径≤3.0mm 病灶的消失率均高于直径为 3.0mm 与 10.0mm 之间病灶的消失率（x^2值分别为 46.130、96.156、131.856，P<0.05）；且实性强化结节的消失率高于环形强化结节（x^2值分别为 5.344、20.318、24.673，P<0.05）。治疗中 3 例出现新发病灶。**结论** 结合脑实质结核的病灶大小及强化特点可分为粟粒型（病灶直径≤3.0mm）、多发结节型（病灶直径为 3.0mm 与 10.0mm 之间）及结核瘤型（病

灶直径≥10.0mm），较符合结核结节的病理特征。准确分析脑实质结核不同 MRI 影像学分型病灶的动态变化，有利于预测及评估抗结核药物的疗效。

Gd-EOB-DTPA 在无周围胆管扩张的肿块型肝内胆管癌诊断中的应用

邢飞
南通市第三人民医院

【摘要】 目的 探讨钆塞酸二钠（Gd-EOB-DTPA）增强 MRI 在不伴有局灶胆管扩张的肿块型肝内胆管癌（MICC）诊断中的应用价值。**方法** 回顾本院 17 例经术后病理确诊为 MICC，MRI 图像未见周围胆管扩张并且行 Gd-EOB-DTPA 增强扫描的患者资料。由 2 位高年资 MR 诊断医师观察病灶影像特征，包括 T2WI、DWI、动态增强及肝胆期。**结果** 17 例均为中、低分化腺癌，其中 1 例为胆管细胞癌和肝细胞混合，6 例伴微血管浸润（MVI）。根据动脉期强化模式，将 MICC 分为两组：典型 MICC 组（n=15），动脉期表现为环形或周边强化，过渡期呈向心性延迟强化；非典型富血供 MICC 组（n=2），动脉期表现为全瘤或近乎全瘤强化，过渡期呈持续性强化。58.8%（10/17）DWI 显示“靶征”（典型 MICC 组 8 个，富血供 MICC 组 2 个）；70.6%（12/17）肝胆期病灶中央出现云絮状或片状稍高信号，即“EOB 云（EOB cloud）或假摄取现象”（典型 MICC 组 10 个，富血供 MICC 组 2 个）。**结论** 动态增强结合 DWI“靶征”或肝胆期“EOB 云”对诊断无周围胆管扩张的 MICC 尤其不典型富血供 MICC 具有重要的价值。

磁共振肝胆期对乙肝相关性肝癌的诊断价值分析

李跃明,陈建炜
福建医科大学附属第一医院

目的：探讨肝胆期相低信号在乙肝相关性肝细胞癌的临床诊断价值。
材料与方法：本研究纳入 235 例行上腹部 GD-BOPTA 增强 MRI 的慢性乙肝患者（乙型肝炎病毒感染患者或肝硬化），共 251 个病灶（113 例肝细胞癌，138 例非肝细胞癌）。以下影像标准被用于肝细胞癌的诊断：1. 动脉期高信号+门静脉期低信号；2. 动脉期高信号+门脉期和/或平衡期低信号；3. 动脉期高信号+门脉期和/或平衡期和/或肝胆期低信号；4. 标准 3+LR-1/2/M，LR1/2/M 是根据最新版 LI-RADS 对病灶进行分级得到的。计算所有标准的诊断敏感性、特异性、阳性预测值、阴性预测值、准确性，并比较这些标准的敏感性和特异性。
结果：在肝细胞癌的诊断标准中，标准 3 和标准 4 的敏感性(分别为 99.1%和 96.5%)均显著高于标准 1 和标准 2(分别为 69.9%和 87.6%)(均 $p < 0.001$)。与标准 3(54.3%)相比，标准 4(89.9%)的特异性明显提高($p < 0.001$)。此外，标准 4 的特异性与标准 1 相当(94.9%，$p = 0.065$)，并且标准 4 在这些成像标准中有最高的准确度(92.8%)。
结论：磁共振成像肝胆期低信号结合辅助征象对乙肝相关性肝细胞癌诊断具有明确的临床价值，能提高肝细胞癌诊断的敏感性和特异性。

肺内淋巴结 HRCT 特征分析

黄立强,时高峰,马晓静
河北医科大学第四医院

目的 探讨肺内淋巴结的多层螺旋 CT 影像特征，提高肺内淋巴结的诊断水平。
方法 回顾性分析 2015 年 1 月—2019 年 6 月经手术及病理检查确诊的 36 例肺内淋巴结患者的影像与临床资料。其中男 17 例,女 19 例;年龄 28 ~74(53.36 ±12.51)岁。36 例患者均行肺结节薄层 CT 扫描。观察肺内淋巴结的位置、数目、大小、影像学特点。
结果 36 例多层螺旋 CT 检查共发现 42 枚肺内淋巴结,直径 3.10 ~12.30(6.52±2.01)mm。34 枚肺内淋巴结位于右肺,其中右上叶 7 枚,中叶 15 枚,下叶 12 枚;8 枚肺内淋巴结位于左肺,均在下叶。21 枚肺内淋巴结发生在肺外带或叶间胸膜附近,病灶距离相邻胸膜的垂直距离 1-16 mm,平均 3.4 mm;21 枚紧贴胸膜。40 枚边界清晰、锐利，1 枚部分边缘毛糙。,40 枚肺内淋巴结密度为实性密度，1 枚为亚实性密度，1 枚为磨玻璃密度。其中实性密度肺内淋巴结中 3 枚可见钙化，3 枚内部可见空泡。轴位图像上 16 枚呈三角形, 14 枚肺内淋巴结呈类圆形,8 枚呈不规则形,3 枚椭圆形，1 枚半圆形。40 枚肺内淋巴结在轴位或冠矢状面重建图像上可见一条或多条均匀致密线状影与病灶相连,2 枚肺内淋巴结未见致密线状影与病灶相连。3 例肺内淋巴结有血管集束征象，39 例未见此征象。1 例肺内淋巴结有邻近胸膜凹陷，41 例未见此征象。所有肺内淋巴结均无卫星灶、毛刺及支气管截断征征象。
结论 肺内淋巴结的多层螺旋 CT 表现有一定的特征性,熟悉这些表现特点,多数可在术前做出诊断。

钆塞酸二钠增强磁共振肝胆期瘤周低信号预测肝细胞癌微血管侵犯的价值研究

陆心雨,陆健,张涛,张学琴
南通市第三人民医院

目的 探讨钆塞酸二钠（Gd-EOB-DTPA）增强 MRI 肝胆期瘤周低信号预测肝细胞癌（HCC）微血管侵犯（MVI）的价值。**方法** 回顾性分析术前行肝脏 Gd-EOB-DTPA 增强 MRI 检查的 102 位 HCC 患者的影像资料，共 102 个病灶，均由手术病理证实。两名放射科医师在对病理结果不知情的情况下评估肝胆期是否存在瘤周低信号，并采用 Kappa 检验分析其一致性。采用卡方检验分析肝胆期瘤周低信号与 HCC MVI 的关系。计算肝胆期瘤周低信号预测 HCC MVI 的灵敏度、特异度、准确度、阳性预测值（PPV）及阴性预测值（NPV）。根据肿瘤直径将病灶分为≤3cm 组及>3cm 组，采用卡方检验分析肿瘤大小与肝胆期瘤周低信号的关系。**结果** 102 个 HCC 病灶中，31 例有微血管侵犯（30.4%），存在肝胆期瘤周低信号的 26 个病灶中 20 例有微血管侵犯。57 个≤3cm 的病灶中，4 例存在瘤周低信号，其中 3 例 MVI 为阳性，45 个>3cm 的病灶中，22 例存在瘤周低信号，其中 17 例 MVI 为阳性。两名放射科医师判断肝胆期瘤周低信号时的 Kappa 值为 0.817。存在肝胆期瘤周低信号的病灶更易发现微血管侵犯，差异具有统计学意义（P<0.01）。肝胆期瘤周低信号预测 HCC MVI 的灵敏度、特异度、准确度、PPV 及 NPV 分别为 64.5%、91.5%、83.3%、76.9%及 85.5%。当肿瘤直径≤3cm 时，肝胆期瘤周低信号预测 MVI 的灵敏度、特异度分别为 37.5%、98.0%，当肿瘤直径>3cm 时，肝胆期瘤周低信号预测 MVI 的灵敏度、特异度分别为 73.9%、77.3%。当肿瘤直径大于>3cm 时，肝胆期发现瘤周低信号的可能性增加，差异具有统计学意义（P<0.01）。**结论** Gd-EOB-DTPA

增强 MRI 肝胆期瘤周低信号预测肝细胞癌微血管侵犯具有一定的价值；当肿瘤直径较大时，肝胆期更易发现瘤周低信号。

多发胸膜孤立性纤维瘤一例

罗琳,张剑男
内蒙古科技大学第一附属医院（原：包头医学院第一附属医院）

孤立性纤维瘤(solitary fibrous tumor,SFT)属于纤维母细胞/肌纤维母细胞来源的肿瘤,是一种少见的软组织肿瘤。多见于胸膜及腹膜，也发生于浆膜腔以外的部位，如纵隔等处，肺部较少见。本病例病灶定位于肺外胸膜处多发，即低度恶性多发胸膜孤立性纤维瘤。多发的胸膜孤立性纤维瘤属实罕见，而部分肿瘤可因肿瘤中心退变或坏死而呈减小趋势，此例右肺动脉下方处肿瘤体积逐年减小，系上述原因所致。

EPO-2461

儿童肺炎影像诊断思路

朴雪瑞,劳群
杭州市儿童医院

1、新生儿床边片—肺透明膜病、肺水肿 肺出血
2、喘鸣（喉喘）--气道软化症、异物
3、各类感染—支原体、腺病毒、流感
4、先天性支气管肺发育异常
5、免疫类/遗传类—川崎病、Alagille 综合征
6、肿瘤样及肿瘤--郎格汉斯细胞组织细胞增生症（LCH）、淋巴瘤、转移

肺透明膜病

1、呼吸窘迫：青紫鼻扇、三凹征胸廓塌陷 、呼吸音减弱、细湿啰音、出生时多正常
2、 生后 2～6h 出现（严重者生后即刻）
3、呼吸急促（>60 次/分）,呼气呻吟.进行性加重
4、12h 后出现，一般不考虑本病
5、病情 2、3 天病情最重，3 天后病情明显好转，3 天后 PS 的合成和分泌自然增加。
6、恢复期可能会有动脉导管开发→心力衰竭
7、常见并发症：脑室出血、肺炎，有并发症者病程长。**支原体肺炎**
1、3-5 岁好发，秋冬之交多
2、临床症状轻：干咳、肺部体征轻、生化抗支 原体抗体可阳性、冷凝集 1:3
3、影像特征—症征不符
（1）节段性肺不张（支气管充气
征）

（2）肺纹理增粗模糊-“轨道征” 、“袖口征”
（3）单侧为主，右侧为主（右：左 2:1），两 中 内带为主、两下为主，
（4）胸膜反应：胸水 30%

腺病毒感染

1、6 月-2 岁好发，母体 2 岁内抗体为主

2、临床症状重：干咳、肺部体征咳、喘、持续高热，

一般 5 天以上，累及多系统如神经、循环、消化 病毒以 3 型、7 型为主

3、影像特征—症征相符

（1）“四多”：融合灶多、大片灶多、肺气肿多、 肺纹理多

（2）“三少”：圆形灶少、肺大泡少、胸腔积液少

EPO-2462

儿童腺病毒影像诊断

付援军,劳群
杭州市儿童医院

目的 分析儿童腺病毒肺炎的临床特征及其 X 线、CT 影像学表现。提高对本病的认识.
方法 回顾性分析本院腺病毒肺炎的儿童临床资料,分析研究其胸部 X 片和胸部 CT 影像学表现。
结果 儿童腺病毒以冬季为主；年龄多在 4 月-2 岁，其中病毒类型以 III 型、VII 型为主；病理改变以肺实质呈灶性或大片灶，广泛凝固性坏死为特点。X 线改变早于肺部啰音，后期肺部啰音加重，病变以两下肺多见（130 例：左下肺 76%，右下肺 55%，右上肺 43%，极少单独出现于左上肺）；
结论 儿童腺病毒肺炎临床特征及其影像学表现有一定特点，临床可据此对腺病毒肺炎患儿进行鉴别诊断，以提高对本病认识，减低患儿死亡率。

Testicular injection of lipopolysaccharide may be a more effective mice model of orchitis

Yuan Cao,Yulin He
The First Affiliate Hospital of Nanchang University

Male infertility is a major health problem for men in clinics and its morbidity is still rising. This study was to observe the success rate of some orchitis models in Kun Ming (KM) mice and to provide a reliable model for the development of male infertility. In our study, forty adult male KM mice were randomly divided into four groups: a control group, an intraperitoneal injection of lipopolysaccharide (LPS) group, a glacial acetic acid operation group, and an LPS operation group. The changes in sperm concentration and motility were captured by using computer assisted sperm analysis (CASA), and the pathological changes of the testis were observed by hematoxylin and eosin (HE) staining. On the basis of this, the expression of caspase-1 and interleukin (IL)-1β was detected by Western blot. Compared with the control group, the activity of the spermatozoa in the experimental groups was significantly lower ($P<0.05$), with the LPS operation group having the lowest activity. Using a light microscope, we observed that the testicular morphology of the experimental groups was

distinctly changed, with the LPS operation group being the most significant. Western blot analysis showed that the expression of caspase-1 and interleukin-1 (IL-1β) in the experimental groups were up-regulated($P<0.05$), and the LPS operation group remained the most remarkable. In summary, in the three modified orchitis models, the LPS operation group was the most effective model, followed by the glacial acetic acid operation group. the inflammation mechanism of which is associated with activation of the NLRP3 inflammasome.

EPO-2464

骶髂关节结核的影像学表现（附 20 例报告）

黎斌,何玉麟,余秋月
南昌大学第一附属医院

目的 探讨骶髂关节结核的影像学表现特征，以提高对该病的诊断水平 。**方法** 收集 20 例经临床抗结核治疗有效及手术病理证实的骶髂关节结核患者的资料，对其影像学表现进行分析。**结果** 20 例中，其中 14 例均行 CT 及 MRI 扫描，2 例只行 MRI 扫描（其中 1 例行 MRI 平扫+增强扫描），4 例只行 CT 扫描；男性 11 例，女性 9 例；左侧 6 例（60%），右侧 11 例（55%），双侧 3 例(15%）。主要影像学表现：骶髂关节骨质破坏 11 例，脓肿形成 10 例，关节间隙变窄 10 例，关节间隙变宽 2 例，关节面毛糙、模糊 15 例，合并结核性腹膜炎 1 例，合并肺结核 5 例。**结论** 骶髂关节结核的影像学表现有一定特征性， 骶髂关节 CT 结合 MRI 能提高其诊断率，必要时结合增强扫描及其他部位检查可提高骶髂关节结核的诊断率。

EPO-2465

Advances in research on the regulation of tumor cell cycle by abnormal expression of NPM

Yuan Cao,Yulin He
The First Affiliate Hospital of Nanchang University

The cell cycle is a process in which the mother cell divides into two daughter cells and the genetic material is equally distributed. Nucleophosmin (NPM/B23) is a multifunctional protein that shuttles between nucleolus, nucleoplasm and cytoplasm. Nucleophosmin is involved in the synthesis of ribosomes, takes control of centrosome duplication and regulates cell proliferation and apoptosis through a variety of signaling pathways, participating in tumorigenesis. The abnormal expression of NPM includes such three forms as gene mutation, overexpression and silencing expression. This article mainly demonstrates the effect of NPM on cell proliferation or apoptosis under different forms of expression.

The results of previous studies have shown that NPM plays an important role in regulating the cell cycle. NPM mutations affect the drug resistance of tumor cells. High expression of NPM often attenuates the inhibition function of tumor cells and thus causes abnormal proliferation, suggesting the effectiveness of detecting NPM protein expression during the early period of examination, diagnosis and prognosis. Controlling the down-regulation of NPM or the knockout of NPM genes can

cause apoptosis in cancer cells or damaged cells. In addition, some new studies have shown that in response to tissue injury-induced nucleolar stress, NPM will relocalize and trigger apoptosis, similar to research findings about tumors. Moreover, in the study of the regulatory mechanisms of NPM abnormal expression on the proliferation and apoptosis of cells, we also found that the role of P53 pathway cannot be ignored, which provides ideas for controlling the process of the proliferation of cancer cells with NPM.

EPO-2466

Tumor Surveillance of RP-Mdm2-P53 Pathway

Yuan Cao,Yulin He
The First Affiliate Hospital of Nanchang University

Compared with normal cells, the prominent features of tumor cells are mainly active and sustained proliferation, evasion of growth inhibitory factors, induction of angiogenesis as well as invasion and metastasis. Among hundreds of cancers, the complexity is self-evident, but they all have one thing in common: the synthesis of proteins promoted by ribosomes is too active, which promotes tumor growth. Therefore, the ribosomal protein synthesis must be strictly monitored by cells in terms of quality and quantity. Otherwise, it can lead to tumor development and progression. With the deeper research of the structure and dynamic regulation of nucleoli, it has been widely studied in biological inheritance, central nervous system and cancer. In addition, people have begun to use nucleolar stress to fight lung cancer, breast cancer and liver cancer. Compared with articles of the same kind, this review, focusing on RP-Mdm2-P53 axis, systematically expounds the function of each RP, clarifies the mutual regulation relationship in the pathway with the reference of a large number of experimental articles and discusses the dual effects of P53. This review will contribute to provide the research direction of this pathway in the future

艾滋病合并颅内结核的 MRI 表现

张志平,刘晋新
广州市第八人民医院

目的 分析艾滋病（acquired immune deficiency syndrome , AIDS）合并颅内结核分枝杆菌(mycobacterium tuberculosis, MTB)感染的磁共振成像（magnetic resonance imaging , MRI）及临床表现特征。**方法** 对 35 例 AIDS 合并颅内 MTB 感染患者行 MRI 平扫及增强扫描，所有病例均行 $CD4^+$细胞计数检测与脑脊液检查，回顾性分析所收集病例的 MRI、临床及实验室检查资料。**结果** 35 例 AIDS 合并颅内结核患者中单纯累及脑膜 3 例（8.6%），累及脑实质 25 例（71.4%），同时侵及脑膜与脑实质共 7 例（20.0%）。伴发脑积水 6 例（17.1%），脑梗死/脑缺血灶 8 例（22.9%）。本组病例累及脑实质的病灶主要分布于脑皮质、皮质下白质、深部白质以及脑深部灰质，以幕上脑实质居多，共 26 例（74.3%），幕下脑实质 9 例（25.7%），基底节区 12 例（34.3%）。单发病灶为 8 例（22.9%），多发病灶为 27 例（77.1%）。所有病例均行脑脊液（cerebrospinal

fluid ,CSF）涂片查找 MTB，抗酸杆菌染色阳性者 2 例（5.7%）；12 例行脑脊液 MTB 培养，无 1 例（0.0%）阳性者；25 例行 MTB 抗体检测，8 例（32.0%）为阳性；23 例行 MTB-DNA 检测，5 例（21.7%）为阳性。$CD4^+$细胞计数＜50cell/μL 17 例（48.6%），50～100cell/μL 11 例（31.4%），＞100cell/μL 7 例（20.0%）。**结论** AIDS 合并颅内 MTB 感染的 MRI 主要表现为结核性脑膜炎、脑炎及脑膜脑炎，以结核性脑炎为主。颅内结核病变以多发、环形强化为主，“靶征”是脑结核瘤的特征性表现。AIDS 合并颅内结核诊断需结合临床表现、实验室检查以及 MRI 表现进行综合分析，以提高临床诊断准确率。

EPO-2468

艾滋病合并弓形虫脑病的 MRI 诊断及临床特征

张志平,刘晋新
广州市第八人民医院

目的 分析艾滋病（acquired immune deficiency syndrome , AIDS）相关性弓形虫脑病(Toxoplasmosis encephalitis , TE)的磁共振成像（magnetic resonance imaging , MRI）及临床表现特征。**方法** 对 27 例 AIDS 合并弓形虫脑病患者行 MRI 平扫及增强扫描，所有病例均行 $CD4^+$细胞计数检测、脑脊液检查及弓形虫抗体检测，回顾性分析所收集病例的 MRI、临床及实验室检查资料。**结果** 27 例 AIDS 合并弓形虫脑病患者中表现为单发病灶 4 例（14.8%），多发 23 例（85.2%），累及大脑皮层 20 例（74.1%），皮层下 15 例（55.6%），灰白质交界区 15 例（55.6%），基底节 14 例（51.9%），丘脑 7 例（25.9%），小脑 15 例（55.6%）以及脑干 4 例（14.8%）；平扫 T2WI 表现为“靶征”的共 17 例（63.0%），增强强化环壁光整 10 例（37.0%），表现为圆环状（类圆环）强化 18 例（66.7%），花环状强化 5 例（18.5%），小结节状强化 6 例（22.2%），不规则斑点或斑片状强化共 10 例（37.0%），伴发脑积水 8 例（29.6%）。所有病例均行血、脑脊液弓形虫抗体检测，其中弓形虫抗体 IgG 阳性者 12 例（44.4%），IgM 阳性者仅 2 例（7.4%）。$CD4^+$细胞计数＜50cell/μL 18 例（66.7%），＜100cell/μL 20 例（74.1%），＜200cell/μL 7 例（25.9%）。**结论** AIDS 合并弓形虫脑病的好发部位主要是大脑皮层、皮层下、灰白质交界区、基底节区以及小脑，发生于脑干少见。弓形虫脑病 MRI 主要表现为环状强化，以多发圆环或类圆环状强化为主，部分可出现花环状强化。平扫 T2WI“靶征”在一定程度上有助于提示弓形虫脑病的诊断。

胸部低辐射剂量 CT 扫描肺结核价值的探讨

江敏
成都市公共卫生临床医疗中心

目的：探讨胸部 CT 低辐射剂量扫描的临床价值。方法：收集 187 例继发性肺结核患者，分别采用 A、B 两种不同扫描参数行胸部 CT 扫描，对比分析其图像质量（密度分辨率、信噪比、图像清晰度、病变检出率等）以及患者接受的 X-线辐射剂量。A 组管电压 120KVe ，自动管电流技术 SmartmA, mA 量 50-400mA，剂量减少 20%，噪声系数 10，ASIR 设置 20-30%； B 组管电压 100KVe ，自动管电流技术 SmartmA, mA 量 50-400mA，剂量减少 20%，噪声系数 15，ASIR 设置 40-60%。结果：与 A 组相比，B 组 CT 剂量加权指数（CTDIvol）减少约 52.71%，剂量长度乘积（DLP）减少约 52.75%，有效剂量(ED)减少约 59.11%（P 值均＜0.05），有统计学意义。B 组图像信噪比略低于 A 组，但依然能清晰地显示病灶，图像清晰度和病灶检出率与 A 组无明显差异，A、B 两组图

像质量评分均在 4.5 分以上。结论：胸部低辐射剂量 CT 扫描有很大的临床价值，值得推广，特别是对于需要短时间内频繁复查的肺结核患者减少辐射剂量尤其重要，减少了患者因过多接受 X-线照射对身体产生的危害。

EPO-2470
原发性闭角型青光眼基于体素形态学的 3.0T MRI 研究

叶印泉[1],曾献军[2],左敏静[1],江菲[1]
1.南昌大学第二附属医院
2.南昌大学第一附属医院

目的：采用基于体素形态学测量（VBM）方法在比较原发性闭角型青光眼患者与正常视力组间全脑灰质体积（GMV）之间改变。
方法：选取 47 名 PACG 患者（20 名男性和 27 名女性）和 47 名正常视力对照者（20 名男性和 27 名女性）接受静息状态磁共振成像扫描。核磁共振数据是基于 SPM8 软件使用 VBM 分析方法分析。
结果：与正常视力对照组相比，PACG 患者双侧小脑后叶、左侧岛叶、右侧颞上回、左侧颞中回、右侧额中回灰质体积减小，右侧岛叶、右侧额中回灰质体积增加。
结论：PACG 患者在视觉、情感认知、情绪脑区表现出不同程度的脑结构改变，为理解 PACG 患者视功能丢失及情感、认知功能障碍神经机制提供了帮助。

EPO-2471
瑞金医院 2018 年 IBD-MDT 中 35 例中老年 CD 患者临床诊治经验初探

唐永华,缪飞,严福华
上海交通大学医学院附属瑞金医院放射科

【目的】总结 2018-3-1~2018-12 -31 在上海交大医学院附属瑞金医院炎症性肠病-MDT 中确诊的 36 例中老年 CD 患者的临床资料、临床诊治经验及教训。【材料及方法】通过 MDT 会诊收集门诊患者病史及外院影像资料，其中部分在我院住院患者由 PACS 住院信息系统完成。【结果】1、临床资料：35 例患者，男 15 例，女性 20 例，男女之比 1： 1.33，年龄 50~71 岁，平均年龄 59.31 岁，发病年龄半年~20 年不等。2、临床表现：主要为腹痛 3 例，腹泻伴肛瘘 2 例，30 例表现为小肠不全梗阻，一例反复肝功能异常，入院证实合并自身免疫性硬化性胆管炎（PBC），此病人有甲状腺癌手术病史。2 例合并强直性脊柱炎伴关节疼痛，1 例左肺上叶错构瘤术后，1 例外院卵巢肿块误诊为肠道内瘘包块形成，类克治疗期间出现大量胸腔积液伴包块。本组 12 例患者有 CD 肠道手术病史，各有 3 例阑尾及肛瘘手术病史。3、影像学表现：全部患者均行小肠 CT 检查，其中 5 例表现为克罗恩病慢性伴部分活动期改变，无内瘘及渗出，20 例合并肠管及腹腔相邻脏器间隙内瘘包块形成，病变管腔纤维性狭窄，1 例表现为盆组回肠节段性炎症伴溃疡，2 例回结肠静脉血栓形成，一例合并胆道 PBC 改变。4、诊断及治疗：本组 2 例外院诊断溃结，经我院 MDT 会诊纠正。本组 4 例行类克治疗，三例治疗后病情缓解，其中一例为术后患者；2 例每周一次甲氨蝶呤 Bid 治疗有效，病情缓解控制；10 例多次手术患者术后长期不规则或中断治疗，造成病情复发、加重。【结论】中老年 CD 在我院发病率呈上升趋势，临床及影像学医师应熟悉本病常见及不典型表现，尽早给与患者个性化治疗，类克治疗前重视排除禁忌症，建议胸腹部 CT 检查。类克及或甲氨蝶呤治疗有助于中老年 CD 患者减缓病情进展，长期疗效有待进一步结合临床、内镜及影像观察。IBD-MDT 治疗模式有助提高炎症性肠病患者精准诊治。

EPO-2472
5 例累及全身多脏器感染病例的影像学及临床分析

唐永华,严福华,杜联军
上海交通大学医学院附属瑞金医院放射科

[目的]分析我院 2012-2018 年 5 例累及全身多脏器感染病住院患者的临床及影像学资特点，提高对此类疾病临床诊治水平。[材料和方法]通过全院 PACS 系统回顾性分析上述病例的临床及影像学资料。[结果]1.临床资料（1）本组 5 例病例，男女之比 3：2，包括有 1 例老年女性糖尿病伴反复胆道感染手术后患者，1 例老年女性特发性血小板减低激素治疗患者，一例酗酒，生食猪血及生鱼片并旋毛虫感染病史，1 例糖尿病伴养殖家禽及蔬菜病史。（2）感染部位包括胸部 3 例，腹部 2 例，神经系统脑炎改变 2 例，全身骨骼感染 3 例，软组织 2 例，肾上腺 1 例。（3）影像学表现包括上述感染部位各种表现：肺结节、双侧肾上腺明显增粗伴中央坏死，右侧额叶见小斑片状异常信号灶；颈部脓肿 腹壁脓肿、示多发骨质破坏伴髂骨旁软组织肿块；肝脓肿及多发骨骼感染；右肺门淋巴结肿大，查 PET-CT 显示右侧颈深上下间隙、锁骨上、纵膈及胰头周围，腹膜后广泛肿大淋巴结并 FDG 摄取增高。双侧大脑半球、小脑、脑干内多发强化灶，两肺粟粒性改变，脾肿大。腹膜后、脾门、胰尾周围、肠系膜间多处淋巴结显示，左侧膝关节各骨骨质疏松，软组织肿胀明显；右足内外踝软组织内不均质团块，部分囊性变。（5）微生物检验证实 1 例播散性隐球菌感染、1 例粗球孢子菌感染、2 例非结核分枝杆菌感染，其中 1 例患者治疗后骨盆脓肿穿刺证实合并马尔尼菲蓝状菌感染。（6）病理：肺结节手术、肾上腺穿刺组织证实隐球菌感染，1 例脓液培养证实丝状菌生长，脓液外送 NGS 测序检出粗球孢子菌和藤黄微球菌。骶骨、髂骨病灶”活检病理证实化脓性炎伴坏死。[结论] 全身多脏器感染病例发病与某些基础疾病及免疫力下降相关，其累及各脏器影像学有一定特异性表现，建议通放射介入方法对累及胸部、骨骼及软组织病变进行病理及微生物学及体液新一代测序（NGS）检查，有力于临床提高此类病变的精准诊断水平。

EPO-2473
14 例输入结节型肺组织胞浆菌病的临床和 CT 及病理特征

谢光友,刘昌杰,张著学,王玉权,王荣品
贵州省人民医院

【摘要】 **目的：**探讨肺组织胞浆菌病的流行病学、临床、CT 及病理学特点，提高对该病的认识。**方法：**回顾性分析 14 例患者的临床、影像及病理资料，阐述肺组织胞浆菌病的流行病学特征、诊断和治疗措施。**结果：**14 例患者均为青壮年男性，免疫功能正常，在圭亚那有蝙蝠栖息的隧道内工作。12 例有流感样症状。14 例均行胸部 CT 平扫检查，5 例行胸部 CT 增强检查，14 例双肺共 233 枚结节，直径 4-15mm，边缘模糊，以下叶最多，增强结节轻度强化。14 例均行支气管镜检查术（TBLB），9 例行肺泡灌洗术（BALF），支气管粘膜均有炎症反应，3 例行六胺银染色（GMS）及 PAS 染色，均为阴性。3 例行骨髓穿刺活检，HE 染色骨髓内单核巨噬细胞增生活跃，多发肉芽肿形成，细胞内见直径 2 - 5μm 的圆形或卵圆形组织胞浆菌；PAS（+）示菌丝和孢子被染为品红色；GMS（+）示菌丝和孢子被染为黑褐色；免疫组化 CD68（+）证实病菌被单核巨噬细胞吞噬。14 例均口服伊曲康唑，症状逐渐减轻、消失，胸部 CT 复查肺内结节逐渐缩小、减少、边缘变清晰。**结论：**结节型肺组织胞浆菌病有疫区接触史，流感样症状，双肺多发结节，诊断性治疗效果好，可作出初步诊断；但病原学和病理学检查是诊断金标准。

EPO-2474
上海交大医学院附属瑞金医院 34 例 Castleman 病的 CT、MRI 特点分析

唐永华,严福华
上海交通大学医学院附属瑞金医院放射科

目的：回顾性分析 34 例 Castleman 病的临床表现、病理类型及 CT、MR 表现，分析其影像特点，以期提高对该病的影像诊断水平。材料与方法：通过住院 PACS 系统回顾性分析 2007.04~2019.01 经病理证实的 34 例患者的临床及影像学资料，其中男 13 例，女 20 例，年龄 13~75 岁，中位年龄 41.3 岁。病灶位于腹盆部 27 例，胸部 5 例，颈部 1 例，多部位 1 例。8 例表现为副肿瘤性天疱疮，3 例表现为局部压迫症状， 1 例位表现为血尿；2 例表现为脾亢症状；其余 20 例体检发现。34 例术前均行 CT 平扫及增强扫描；8 例行 MR 平扫及增强扫描。结果：经病理证实,透明血管型 28 例，浆细胞型 4 例，混合型 2 例。临床单中心型（UCD） 32 例，多中心型（MCD） 2 例。对 UCD 中孤立或较大病灶进行统计，单发孤立病灶 24 例，单发病灶伴周围子灶 5 例，多发结节病灶 3 例。圆形或椭圆形 23 例、不规则形 9 例； UCD 中，14 例病灶内见钙化，包括透明血管型 12 例和浆细胞型 2 例。5 例病灶内部可见低密度区，病灶强化方式为均匀型 7 例，延迟均匀型 19 例，不均匀型 5 例。MCD 主要表现为多部位淋巴结肿大，未见明确融合征象，增强扫描轻度均匀。8 例行 MR 检查的病灶主体表现为 T1WI 等信号或稍低信号，T2WI 高信号，DWI 呈高信号； 5 例病灶信号不均，其中 2 例病灶伴 T2WI 条形低信号，1 例伴小片状出血信号，2 例伴 T2WI 高信号囊变； MR 增强扫描均表现为明显强化。结论：CD 的影像表现与临床分型密切相关。MR 对于病灶内出血、囊变及纤维成分等的显示优于 CT，而 CT 对钙化的显示更有优势。多中心 CD 的影像表现则无特异性，常为多系统累及，预后较差。

EPO-2475
Radiographic features of Bone involvement in disseminated cryptococcosis

Shuxiang Chen,Huijuan Zhang,Ruibin Du
Fujian Province Hospital South Branch

Objective To study the clinical and imaging characteristics of disseminated cryptococcosis with bone involved and to improve diagnostic accuracy of these diseases. **Method** The clinical material and imaging findings of 5 patients(4male,1female) with disseminated cryptococcosis proved clinically were analysed retrospectively which the target tissue or organs of bone, lung and brain were involved. **Result** in 5 cases, 2 cases were confirmed by blood cryptococcus latex agglutination test which was positive. 2 cases were confirmed by lymph node biopsy and 1 case were confirmed by cerebral lesion biopsy . The CT findings in pulmonary consisted of diffuse miliary micronodules in both lungs, irregular nodules in the apical segment of the superior lobe of the left lung and patch effusion

shadow in the inferior lobe of the left lung,while 2 cases had not obvious active lesions in lung. Brain MRI showed 2 cases of soft meninges enhancement (one with hydrocephalus and a history of tuberculous meningitis 10 years ago), 1 case with multiple rim enhancementand surrounding edema in the bilateral frontal lobe and right temporal lobes which MRS hint tumor lesions that misdiagnosed as metastases,while the other case had not obvious lesions intracranial. However, the cervical spinal cord was slightly swollen with the enhancement of pia mater.Involvement of the Spinal skeletal: The vertebrae and the adjacent attachment, disc were involved with the formed of surrounding soft tissue mass in 2 patient.Two cases showed abnormal signal in the marrow of bilateral femoral .While the other case showed multiple enlargemen ring-enhanced lymph node of bilateral neck and polynodules of parotid and subcutaneous. These lesions were reduced and improved in continued treatment and still in follow-up. **Conclusion** disseminated cryptococcal can involve a wide range of whole body while patients had nomal immune function the bone was rarely affected.The radiographic appearance manifestations were diversity and lack of specificity.The misdiagnosisration is high.They should be differentiated from other neoplasms or non-neoplastic lesions such as infections. However, clinical and pathology is mandatory to confirm the diagnosis. The analysis of radiological features were helpful for the diagnosis improve the level of diagnosis and differential diagnosis. that can provide image evidences for the assessment of treatment results.

EPO-2476

淋巴结包虫病的 CT 影像表现

蒲鹏
阿坝藏族羌族自治州人民医院

C **目的：**通过对肝泡型包虫病淋巴结转移途径和 CT 影像表现特点探讨分析，进一步增进对包虫病的生物学特点认识。**资料与方法：** 回顾性分析 30 例肝泡型包虫病淋巴结转移的 CT 影像资料，观察淋巴结转移分布规律和影像特点。**结果：**泡型包虫病肝外淋巴结转移以肝十二指肠韧带淋巴结转移最常见,转移率 76.7%（23/30），其次为肝总动脉旁和肝门淋巴结转移，分别为 36.7%（11/30）和 23.3%（7/30）。90.4%的转移淋巴结内可见砂粒、结节样或环形钙化，14.8%出现液化坏死。增强 CT 扫描 84.2%转移淋巴结不强化，其中 27.8%可见“壳样”强化的炎性包膜；14.8%不均匀强化。**结论** 包虫病淋巴结转移是肝泡型包虫病血行转移外的另一种肝外转移方式，影像表现特点与肝泡型包虫病相似。

肩部韧带样纤维瘤一例

罗琳,王云玲
内蒙古科技大学包头医学院第一附属医院

韧带样纤维瘤（DF）是少见的成纤维细胞克隆性增生性病变，又称为硬纤维瘤、侵袭性纤维瘤，发病率低。病变侵袭性强，术后易复发，但是不发生转移。称为交界性软组织肿瘤。DF 按着发病部

位可分为腹内型、腹壁型及腹外型。CT、MRI 主要表现为软组织肿块，CT 软组织分辨率较低，诊断价值有限。MRI 对该病的诊断有很大价值。T2 序列及 T2 压脂序列可见病灶呈明显高信号。在 MRI 各个序列中肿块内均可见到条带状低信号是该病的影像学特点。增强扫描后该病呈明显持续强化，此外,DWI 序列为该病的正确诊断提供帮助。

The Value in Differential Diagnosis of Atypical Pulmonary Tuberculoma and Small Peripheral Lung Cancer by Magnetic Resonance Imaging

Yulin He[1],Wanling Qi[2]
1.The First Affiliated Hospital of Nanchang University
2.Jiangxi Province People Hospital

【Abstract】**Objective** The aim of this study was to investigate if magnetic resonance imaging(MRI) can be used to differentiate atypical pulmonary tuberculoma from small peripheral lung cancer. **Materials and Methods** In the study, both plain and muitiphasic contrast-enhanced MRl and DWI were performed preoperatively on a 1.5T scanner(Siemens 1.5T Avanto) in 20 patients with APT and 20 patients with SPLC. MR features were examined in detail. **Results** Atypical PT lesions accompanied by many MRI signs including: lobulation sign, vascular convergence sign and pleural indentation are 1, 2, 4. which in SPLC lesions are7, 13, 11, and the difference was statistically significant (P＜0.05). In atypical PT group, 9 cases showed isointense in T1-weighted images, 7 cases showed slightly hypointense and 4 cases showed the surrounding hyperintense, hypointense in the central area. 11 cases showed isointense in T2-weighted images, 5 cases showed hyperintense, and 4 cases showed the surrounding hyperintense, hypointense in the central area. DWI imagse showed hyperintense 13 cases and isointense 7 cases. In SPLC group, 15 cases showed slightly hypointense in T1-weighted images and 5 cases showed isointense. 12 cases showed hyperintense in T2-weighted images, 7 cases showed isointense, and 1 case showed the surrounding hyperintense, hypointense in the central area. DWI imagse showed hyperintense 15 cases and isointense 5 cases. The mean values of T2WI, ADC, peak height and enhanced increment in atypical PT(243.99±95.34, (1.616±0.422)× 10-3mm/s2, 319.13±57.16 and 92.97±65.33, respectively) were both different from the SPLC (303.98±52.41, (1.141±0.150)×10-3mm/s2, 428.11±72.95 and 224.63±47.66, respectively), and the difference was statistically significant(P＜0.05). T1WI had no significant difference (P=0.096, P>0.05). APT showed characteristic ringlike enhancement, SPLC showed homogeneous or inhomogeneous obvious enhancement. **Conclusions** MRI morphologic features, signal intensity and enhancement characteristic were contributed to differential diagnosis of APT and SPLC.

初治痰涂阴性肺结核与非结核分枝杆菌肺病的 CT 影像对比分析

史佳培,华奇峰,邬亦椒,金银华
中国科学院大学宁波华美医院（宁波市第二医院）

目的　探讨初治痰涂阴性肺结核（PTB）以及非结核分枝杆菌（NTM）肺病的 CT 影像学表现特点，提高对该病的鉴别诊断水平。**方法**　选取我院 2013 年 1 月—2018 年 12 月确诊为 NTM 肺病的患者（NTM 肺病组）53 例及同期痰涂阴性 PTB 初治的患者 60 例（PTB 组）的 CT 影像资料，比较 2 组影像学表现及病变部位的差异。**结果**　痰涂阴性 PTB 患者病灶好发于两肺上叶尖后段及下叶背段，弥漫分布者少见，病灶呈多形性改变，可见小空洞、多为单发，胸腔积液多见。NTM 肺病病灶好发于多肺段，呈簇状聚集的实性结节，并可伴有支气管扩张以及胸膜下的空洞（单发或多发），少见胸腔积液。**结论**　痰涂阴性 PTB 与 NTM 肺病的胸部 CT 影像表现相似，但亦存在差异，细致分析影像特征可为临床鉴别诊断提供一定的依据。

EPO-2481
儿童脊髓炎性病变的 MRI 诊断

徐和平
湖南省儿童医院

脊髓炎性病变包括脱髓鞘性脊髓炎、感染性脊髓炎和横贯性脊髓炎。

脱髓鞘性脊髓炎

1、急性播散性脊髓炎（ADEM）：常为单相病程，常为病毒感染、预防接种后 3 周发病，25-30%患儿脊髓受累，颈胸段多见，侵犯脊髓白质，病变范围至少超过一个椎体，脑内病变位于灰白质，多发、不对称。

2、多发性硬化（MS）：多相性病程，进行性加重，反复恶化与缓解，脊髓病变多位于脊髓周边，小于 1/2 横截面积，长度多小于 2 个椎体，与脊髓长轴一致。脑部病变位于脑室周围，多发，易累及大脑皮层。

3、视神经脊髓炎（NMO）：可表现单相病程，更多表现为复发、缓解交替的多相性病程，先后或同时出现视神经炎和横断性脊髓炎。颈胸段多见，主要累及脊髓灰质，范围常超过 3 个椎体；累及单侧或双侧视神经，常见视交叉，次为视神经，长度超过视神经眶内段 1/2；脑内病变分布在 AQP4 高表达区如下丘脑、3、4 脑室周围和脑干，不累及大脑皮层。血清中 NMO-IgG 抗体（+）。

4、格林巴利综合症 （GBS）：儿童常见周围神经病，常为单相病程，多数可完全恢复，**60%**发病前 6 周内有明显前驱感染史，双侧脊神经、马尾神经呈对称性增粗、强化；脑内常无异常表现。

感染性脊髓炎

1、手足口病脊髓炎

2、脓肿

急性横贯性脊髓炎

1、疾病相关性急性横贯性脊髓炎：主要包括脱髓鞘性疾病如 ADEM、MS、、NMO、SD、PI、副肿瘤综合征等。

2、特发性急性横贯性脊髓炎：没有明确病因。

EPO-2482

淋巴结结核 18F-FDG PET/CT 表现及误诊分析（附 7 例报告）

何玉麟[1],漆婉玲[2]
1.南昌大学第一附属医院
2.江西省人民医院

目的：探讨淋巴结结核的 ^{18}F-脱氧葡萄糖(FDG)PET/CT 表现，并分析其误诊原因。 **资料与方法：**回顾性分析 7 例经病理证实的淋巴结结核患者的临床及 ^{18}F-FDG PET/CT 资料，进行视觉及半定量分析。 **结果：**7 例均为多发淋巴结结核，均累及颈部、纵隔，其中 4 例累及腹腔，表现为多发肿大淋巴结，部分相互融合，密度均匀或不均匀，边界欠清。^{18}F-FDG PET/CT 表现摄取呈均匀或环形浓聚，SUVmax 为 16.5-21.6。术前误诊为淋巴瘤 5 例，误诊为结节病 1 例，误诊为转移 1 例。 **结论：**^{18}F-FDG PET/CT 可以准确、灵敏反映淋巴结病变的全身分布及病灶的 ^{18}F-FDG 代谢情况，但对于鉴别高 ^{18}F-FDG 摄取的淋巴结性质需结合临床相关检查。

EPO-2483

艾滋病合并肝癌的 CT 分析

甘清鑫
广州市第八人民医院

[摘要] 目的 探讨艾滋病合并肝癌的临床及 CT 表现特点，提高对艾滋病合并肝癌的认识。方法 回顾性分析 31 例 AIDS 合并肝癌患者的临床及 CT 资料。结果 31 例患者，艾滋病合并肝癌以中年男性多见，其中 25 例为巨块型肝癌（80.64%），5 例为结节型肝癌（16.13%），1 例为弥漫性肝癌（3.23%），29 例患者合并乙型肝炎（93.55%），2 例患者合并丙型肝炎（6.45%），31 例患者均为肝硬化（100%），22 例 AFP 升高（70.97%），20 例出现子灶、门静脉或肝静脉癌栓、肝动脉-门静脉瘘、淋巴结转移或远处转移（64.52%）。结论 艾滋病合并肝癌，主要发生在合并乙型肝炎或丙型肝炎感染及肝硬化基础之上，主要表现为巨块型及中、大肝癌为主，容易合并肝内子灶、门静脉或肝静脉癌栓、肝动脉-门静脉瘘、淋巴结转移或远处转移。

EPO-2484

肺结核的临床诊断及进展

马密密

滨州医学院附属医院

据 WHO 报道，全球将有 1/3 的人群感染结核杆菌，是发展中国家的高发传染病，肺结核是我国常见传染病之一。由于近来人口流动性大，药物的滥用及不合理的治疗，对于结核病的控制并不理想，但随着多排螺旋 CT 容积扫描和薄层重建等技术的广泛应用，不仅能够清楚显示肺结核的不同表现形式，还能够从血供和代谢方面显示病变的病理生理特点，从而能够使人们提高对肺结核的临床诊断水平。

EPO-2485

MRI Diagnosis of Candida Albicans Encephalitis in Premature Infants

Ting Chen,Heping Xu
Hunan Children's Hospital

Objective: To explore the diagnostic value of MRI in premature infants with candidal albicans encephalitis. **Methods**: Three premature infants with Candida albicans encephalitis confirmed by blood culture and clinical treatment were summarized and analyzed retrospectively. **Results**:Premature infants aged 31-34 weeks with birth weight of 1500-1900g. One case was the size of test tube triplets, one case was the size of twins, and two cases were cesarean section.Three cases of blood culture were infected by Candida albicans.3 patients with NRDS at birth had a history of mechanical ventilation.3 patients presented with brain abscess, including 1 case of pulmonary Candida albicans infection with meningitis, 1 case of venous cerebral infarction and subdural hemorrhage, and 1 case of subdural effusion.Three cases of brain abscess showed diffuse miliary or nodule shadow in bilateral cerebral hemisphere with a diameter of 1-10 mm and uneven distribution, mainly in paraventricular white matter. Two cases involved cerebellum. One case involved brain stem at the same time. The lesion showed a slightly short T1 signal T2 signal, FLAIR sequence showed a slightly high signal, and a slightly larger lesion showed a long T1 and long T2 in the center. After enhancement, the signal was markedly enhanced in punctate and circular shape.**Conclusion**:MRI can well display the pathological features of premature infants with Candida albicans encephalitis, and provide objective basis for its early diagnosis and evaluation of treatment outcome.

EPO-2486

艾滋病合并胸部常见真菌感染的临床 及 CT 表现分析

余成成
广州市第八人民医院

目的 通过对艾滋病（AIDS）合并肺部常见真菌感染的临床及影像学分析，探讨 AIDS 患者合并不同真菌感染时的胸部影像表现及特征，提高对艾滋病合并不同真菌感染的诊断，降低真菌感染的病死率。**研究对象与方法** 回顾性分析 2014 年 1 月至 2016 年 12 月广州市第八人民医院感染科收治的 AIDS 患者共 4102 例，筛选出经肺泡灌洗液及组织病理学证实合并真菌感染的患者共 642

例；所有患者均行胸部 CT 检查，比较分析 AIDS 合并不同真菌感染的临床及胸部影像学表现。**结果** （1）144 例 AIDS 合并常见真菌感染的患者以中壮年发病为主，临床表现多以发热、咳嗽、咳痰、体重下降为主；其中 AIDS 合并马尔尼菲蓝状菌感染的患者出现皮肤损害的概率最高；（2）AIDS 合并真菌感染的患者多发生在 CD4+T 细胞＜50/μl；（3）AIDS 合并 PM、PC、PA 的影像表现以肺内多发斑片影、结节影、团片实变影、粟粒、磨玻璃影、胸腔积液及纵隔淋巴结增大为主，部分可有空洞形成、心包积液、胸膜增厚等，（4）AIDS 合并不同真菌感染胸部 CT 的影像学表现与 CD4+T 细胞水平之间差异无统计学意义。**结论** AIDS 合并常见真菌感染多发生在 CD4+T 细胞计数＜50/μl，在 AIDS 合并马尔尼菲蓝状菌感染的患者中尤为显著。（2）艾滋病合并肺部常见真菌感染临床症状大多相似，主要表现为发热，伴或不伴畏寒、咳嗽、咳痰、体重下降；（3）艾滋病合并肺部真菌感染的影像表现复杂多样，病变范围广，多表现为 2 种或多种病变同时出现，常伴有胸腔积液
及纵隔淋巴结增大。（4）艾滋病合并真菌感染的影像表现相似，具有统计学意义的是心包积液、肺内团片状实变影及胸膜增厚；（5）CD4+T 细胞水平对肺部真菌感染损害的病理类型不会造成明显的影响。

EPO-2487
儿童闭塞性细支气管炎伴机化性肺炎的临床及影像学特点

赵萌[1],王瑞珠[1,2]
1.江苏省人民医院（南京医科大学第一附属医院）
2.南京医科大学附属南京儿童医院放射科

目的：探讨闭塞性细支气管炎伴机化性肺炎的临床及影像学特点，提高临床医师及放射科医师对该病的诊疗水平。闭塞性细支气管炎伴机化性肺炎(bronehiolitis obliterans with organizing pneumonia，BOOP)是一种以闭塞性细支气管炎、机化性肺炎和间质性肺炎、肺纤维化为主要病理特征的临床病理综合征，细支气管腔、肺泡管以及一些肺泡有肉芽组织形成，伴有间质和气管腔内淋巴细胞不同程度的浸润，受累部位Ⅱ型肺泡上皮细胞增生[1-2]。BOOP 可分为原因不明的特发性 BOOP 和继发性 BOOP。2002 年美国胸科协会和欧洲呼吸协会将特发性 BOOP 归于隐源性机化性肺炎(cryptogenie organizing pneumonia，COP)。隐源性机化性肺炎(cryptogenic organizing pneumonia，COP)是特发性间质性肺炎(idiopatic interstitial pneumonia，IIP)中的一种类型。
方法：回顾 2 例儿童患者的临床资料、影像学表现、实验室检查及诊治过程，结合文献资料总结特点。
结果：2 例患者均以咳嗽气促起病，肺功能检查表现为限制性通气功能障碍。HRCT 扫描表现为多发斑片实变影和磨玻璃影，未见结节。病变弥漫分布于双肺，胸膜下和沿支气管血管束分布。病程中复查 X 线胸片呈多发斑片实变影，肺纹理增多增粗。2 例患者肾上腺皮质激素治疗均有效。
结论： BOOP 的临床及影像特点不具有特异性，HRCT 对早期诊断及治疗随访具有价值，病理组织学检查是确诊的依据，需结合临床及影像资料达到早诊断早治疗。

1.山西医科大学第一医院
2.山西省心血管病医院
3.壶关县人民医院

目的 探讨细支气管炎的病理类型及其影像学表现，为临床诊治提供依据。方法 回顾性分析经临床资料证实的 50 例细支气管炎的影像学资料，记录各型细支气管炎的临床及影像学特点，结合文献讨论。 结果 病理上分为一、细胞性细支气管炎（47 例）和二、缩窄性细支气管炎（3 例），以前者多见。一、1、感染性细支气管炎，是最常见的类型，本组 11 例。急性主要由病毒（如呼吸道合胞体病毒、副流感病毒）、细菌（如金黄色葡萄球菌、肺炎支原体）引起；慢性常由分枝杆菌（结核性或非结核性）、细菌（如铜绿假单胞菌）引起。CT 表现为小叶中心实性或磨玻璃密度微结节、树芽征、支气管壁增厚、扩张等直接征象，间接征象为马赛克密度，呼气末屏气扫描显示典型的空气潴留。2、吸入性细支气管炎，居第二位，常误诊为感染性细支气管炎。危险因素：精神病者、神经系统疾病（脑卒中、脑损伤、帕金森病）、食管异常（如贲门失弛缓症、反流性食管炎）、胃蠕动减弱等，识别这些危险因素的影像学表现，有助于影像诊断。3、呼吸性细支气管炎，是吸烟者常见的组织学改变。大多数无症状。CT 表现：小叶中心磨玻璃密度结节，细小、淡，模糊影，MIP 有助于结节的显示。4、过敏性肺炎，临床多以胸闷、气急、哮喘等症状为主，病灶可呈一过性、游走性；嗜酸性粒细胞明显升高是其主要特征。CT 表现为广泛、弥漫小叶中心磨玻璃密度微结节，或表现为“头肉冻征“。5、滤泡性细支气管炎，是一种淋巴组织增生性疾病，多合并胶原血管性疾病，CT 表现小叶中心结节，或局限性沿着支气管血管束周围分布。6、泛细支气管炎，多见于东亚地区，尤其日本人，CT 表现无特异性。二、缩窄性细支气管炎，见于胶原血管性疾病患者，有毒气体吸入、肺移植、骨髓移植等患者，CT 表现为支气管管壁增厚、磨玻璃影和空气潴留等，而树芽征和小叶中心结节相对少见。结论 多排螺旋 CT 扫描是诊断细支气管炎最优秀的影像学检查方法。

EPO-2489

左膝关节钙化性纤维性肿瘤 1 例

高雅君,徐和平
湖南省儿童医院

女，16 岁，发现左膝肿块 14 年。患儿 2 岁时家长无意发现左腘窝有一肿块，约核桃大小，无疼痛、发热等症状，当时未予重视和特殊处理，随着患儿年龄长大，肿块逐渐增大。查：左侧腘窝见一核桃大小的肿块，质地稍硬，边界清楚，无触痛、局部无红肿，关节活动正常。平片表现为左膝关节内侧后方多个软组织肿块和结节，内见不规则条片状钙化，形态不规则，其一呈分叶状，边界清楚，MRI 信号不均匀，以长 T1 短 T2 信号为主，抑脂序列以低信号为主，内见小点片状稍高信号影，边缘见弧形钙化样信号影，增强扫描呈轻度不均匀强化，未侵及邻近骨质，未见关节囊和关节腔积液。手术见肿块位于膝关节的后内侧，拉开腓肠肌及比目鱼肌肌腱于膝关节后关节囊之间，见一枚 4cmx4cm 以及三枚 1cmx2cm 黄色质韧软组织肿块，包膜完整，与膝关节后关节囊以及周围腱膜紧密相连，质地韧，局部可扪及质硬如骨的结节。术后病理诊断为钙化性纤维性肿瘤

讨论：钙化性纤维性肿瘤（CFT）是一种罕见的良性纤维性肿瘤，为纤维母细胞 / 肌纤维母细胞肿瘤的一个新类型。其病因和发病机制尚不明了，可能与外伤或炎症反应有关。病理上多为界限清楚的肿块，表面光滑但无包膜。大小不等，切面呈灰白、实性、质韧，可有钙化伴有砂砾感，部分质硬如骨。镜下主要由大量玻璃样变的胶原纤维和少量梭形纤维母细胞组成，常含有大量的砂砾体或营养不良性钙化灶。可发生在任何年龄，男女发病率相似，大多数发生在软组织者多见于儿童及青年，而发生在内脏者一般见于成年人。多为缓慢生长无痛性肿块，较大时引起局部不适或其他检查时偶然发现，少数位于实质性或空腔脏器内病变可有相应症状。本例为 16 岁女性，病变位于左膝关节周围，平片显示多个伴钙化软组织肿块，MRI 能较好显示肿瘤软组织成分，增强后轻度不均匀强化提示肿瘤内乏血供。

鉴别诊断包括炎性肌纤维母细胞瘤、钙化性腱帽纤维瘤、纤维瘤病、色素沉着绒毛结节性滑膜炎等。

EPO-2490
艾滋病合并马尔尼菲蓝状菌的胸部空洞 CT 表现

余成成
广州市第八人民医院

目的 探讨艾滋病合并马尔尼菲蓝状菌感染的胸部空洞 CT 影像表现。**方法** 回顾性分析我院 2009 年 1 月-2015 年 12 月经临床及病理学、细菌学证实合并 PM 感染的 AIDS 患者，分析其胸部 CT 的空洞表现特征；**结果** 空洞发生于单侧肺部 53 例，双肺 10 例。发生于右肺上叶前段 4 例、尖段 13 例、后段 5 例；右肺中叶 1 例；右肺下叶背段 13 例、前基底段 2 例、外基底段 3 例；左肺上叶尖后段 13 例、舌段 3 例；左肺下叶背段 12 例，外基底段段 3 例、后基底段 2 例。空洞壁规则 40 例、不规则 34 例；厚壁空洞 66 例、薄壁空洞 8 例；内壁光整 69 例、模糊 5 例；外壁光整 6 例、模糊 68 例，所有洞壁均未见钙化；液气平 1 例。空洞直径≥1cm 的 10 例、直径≤1.0cm 有 53 例。**结论** 艾滋病合并 PM 感染的 CT 空洞表现复杂多样，以单发厚壁的小空洞多见，肺段的分布具有一定的特征性。

EPO-2491
AIDS 合并肺癌的影像表现分析

黄德扬
广州市第八人民医院

【摘要】 **目的** 探讨 AIDS 合并肺癌患者的 CT 影像学表现。**方法** 收集我院 2010 年 1 月至 2016 年 8 月间，共约 11000 名艾滋病病毒感染者的临床数据，进行回顾性分析，对其中 21 例病理确诊 AIDS 合并肺癌患者的临床资料及胸部 CT 影像表现进行分析。**结果**艾滋病合并肺癌患者中腺癌 13 例、鳞癌 3 例，小细胞癌 2 例、3 例病理未分型。CT 影像表现见实性肿物或结节 21 例；淋巴结肿大 19 例，远处转移 12 例，胸膜受侵 12 例，胸腔积液 14 例。**结论**艾滋病合并肺癌患者，肺部感染常见，易造成漏诊，CT 影像常见实性肿物或结节，胸膜受侵及淋巴结肿大较具特征性，胸膜明显增厚且合并肿块时需考虑肺癌可能。

EPO-2492
AIDS 合并卡波西肉瘤的影像表现

黄德扬,刘晋新
广州市第八人民医院

【摘要】 **目的** 探讨艾滋病合并卡波西肉瘤患者的 CT 影像学表现。**方法** 回顾性分析,12 例艾滋病合并卡波西肉瘤患者的 CT 影像学表现。结果 CT 显示肺内结节灶 9 例，累及胸膜及胸腔积液 6 例、纵隔淋巴结肿大 8 例，1 例可见骨破坏，1 例肝内见多发占位。**结论**艾滋病合并卡波西肉瘤累及肺部常见影像表现为肺内可见沿肺支气管血管周围分布的多发结节灶，可同时合并胸腔积液，纵隔淋巴结及腋窝淋巴结肿大；累及肝脏可见肝内多发低密度占位病变。

EPO-2493
艾滋病患者肺部弥漫性结节的 HRCT 诊断与鉴别诊断

李春华,吕圣秀,刘雪艳,王惠秋,杨佳
重庆市公共卫生医疗救治中心

目的 探讨艾滋病患者肺部弥漫性结节的 HRCT 影像学表现。方法 回顾性分析我院 2017.1-2019.6 收治的 87 例 AIDS 并发肺部弥漫性结节患者的影像资料，分析不同病原感染的肺部弥漫结节的 HRCT 特点，分析其病变分布、形态及伴发征象。结果 90 患者中结核分枝杆菌 45 例、真菌 38 例(马尔尼菲青霉菌 22 例、曲霉菌 8 例、肺组织胞浆菌病 7 例、毛霉菌 1 例),细菌 7 例。45 例结核病例中 37 例弥漫结节表现为随机分布，6 例为小叶中心分布,其中 4 例为随机分布与小叶中心分布并存；32 例伴纵隔淋巴结肿大，15 例并发胸腔积液。真菌感染的弥漫结节分布类型:31 例随机分布,4 例为小叶中心分布,其中 3 例为随机分布与小叶中心分布并存；肺组织胞浆菌病 7 例均为小叶中心分布，表现为结节伴周围晕征，5 例伴纵隔及肺门淋巴结肿大。6 例细菌感染的弥漫结节为小叶中心分布。22 例马尔尼菲青霉菌病中 17 例伴有腹腔淋巴结肿大，4 例纵隔淋巴结肿大。结论 艾滋病患者肺弥漫性结节可为多种病原菌感染，根据 HRCT 表现及并发征象对其诊断有一定帮助。

EPO-2494
结核性腹膜炎的影像诊断

龙运祥,申曹伟,帅永忠,王芳,李淑琴
成都市妇女儿童中心医院

目的:分析结核性腹膜炎的多排螺旋 CT 特征与其他类型腹膜炎的诊断与鉴别诊断水平。
方法:选取 2-70 岁经穿刺活检、实验室检查、病理及临床诊断为结核性腹膜炎患者 23 例，分析其多排螺旋 CT 平扫与增强影像特征,并与化脓性腹膜炎、肿瘤性腹膜炎影像特征比较。
结果:23 例结核性腹膜炎 CT 平扫与增强主要有以下表现，大量腹水 11 例；腹膜内钙化斑 15 例；腹膜均匀增厚并较均匀强化 5 例；腹膜非均匀增厚 8 例，增强扫描非均匀增厚均匀强化 3 例，非均匀强化 5 例；腹膜及肠系膜多发结节 7 例，增强扫描结节均匀强化 3 例，非均匀强化 4 例；腹膜及肠系膜内均匀分布索条与粟粒结节 3 例，增强扫描呈较均匀强化；回盲部及邻近腹膜肿块 3 例，盆腔肿块 4 例，增强扫描均呈非均匀强化，均表现为壁厚薄不均及边缘不规整之中央坏死区；腹膜及肠系膜内脂肪间隙腹膜脂肪间隙污迹样改变 13 例，增强扫描呈非均匀稍弱强化；肠系膜上动脉分支栓塞 1 例；腹膜及肠系膜内淋巴结肿大 19 例，腹膜后淋巴结肿大 17 例，上述肿大淋巴结多为椭圆形，或多个（3-5 个）椭圆形相互融合，其中 11 例中部分肿大或融合淋巴结表现为环形强化，中央坏死区无强化；腹膜或肠系膜淋巴结钙化 7 例。
结论：结核性腹膜炎是结核杆菌所致的腹膜慢性弥散性感染，主要由肺结核、泌尿生殖道结核、肠结核、和阑尾结核等通过血行或淋巴播散形成腹膜、肠系膜及淋巴结广泛感染，是较常见的肺外结核病之一。本组病例中腹水、腹膜结节与肿块、腹膜增厚、腹膜及系膜内索条及粟粒结节和污迹样改变、腹膜及系膜和腹膜后淋巴结肿大、坏死与钙化均具一定特征，具有与非特异性腹膜炎及肿瘤性腹膜炎不同 CT 平扫与强化特征，熟悉其 CT 表现，有助于提高其影像诊断准确率。

EPO-2495
卵巢扭转的 CT、MRI 影像表现与病理对照研究

王晋君,郭兴华,张晓红,郑国芳

运城市中心医院

目的 观察卵巢扭转的 CT、MR 表现，与病理结果进行对照，以提高术前影像诊断的准确性。
方法 回顾性分析 2014 年以来 34 例经手术与病理证实的卵巢扭转病人，回顾性分析卵巢扭转的 CT、MRI 资料，与手术病理结果为对照，分析卵巢扭转后 CT、MRI 表现及强化特点。
结果:
1，34 例病均有腹痛病史，其中 31 例为有较为明确的突发急性腹痛病史，本组病例平均年龄 34.09±11.50 岁，以中、青年患者居多，最小年龄 12 岁，最大年龄 63 岁。
2，手术显示，本组 34 例均合并有盆腔积液，其中 3 例为积血，5 例为积脓。卵巢扭转从 180 度到 1440 度不等，其中扭转 180 度 3 例，360 度 9 例，520 度 15 例，720 度 6 例，1440 度 1 例。术中均可见扭转的输卵管成团状以及增大淤血的卵巢呈紫褐色或黑褐色。术后病检提示单钝扭转 12 例，合并卵巢原发病变 22 例。
3，影像检查：（1），本组检查中，CT 检查 10 例，合并 CT 增强 3 例，MRI 检查共 26 例，合并增强 14 例，同时行 CT 增强及磁共振增强病例共 2 例。（2），卵巢改变：单纯卵巢增大时，CT、MRI 均可见增大的卵巢 100%，在卵巢边缘可见多发大小接近的卵泡 100%，合并原发病变时，在近输卵管侧可以显示较多的实性成份 72.7%，CT 平扫卵巢均呈高密度显示，CT 值 58±6.8，T2 加权实性部分整体或大部分呈极低信号 80.8%，相应区域，弥散及 ADC 均呈低信号。（3），输卵管改变：在增大的卵巢边缘可见扭转团块 82.35%，CT 扫描显示为高密度 80%，T2 显示为主体低信号改变 78%，内部可夹杂线样高信号，T1 扫描可见小点片样高信号 14.3%。（4），CT 还是 MR 增强扫描后发现，增大卵巢、卵巢原发合并病灶均无明显强化 88.2%，扭转成团状的输卵管有小片状强化改变 85.7%。
结论 卵巢扭转是较少见的妇科病变，在临床工作中结合病史，当出现较有特征的影像表现时，应想到输卵管扭转的可能。

EPO-2496

肾综合征出血热胸部并发症的 CT 表现分析

宋留存
郑州市第六人民医院

目的：总结肾综合征出血热(EHF)胸部并发症的 CT 表现和探讨胸部 CT 表现对肾综合征出血热的诊断价值。**方法**: 分析我院收治经 HFRS-IgM 阳性确诊的 6 例出血热合并肺部并发症的胸部多层螺旋 CT 表现。**结果**: 6 例肾综合征出血热胸部并发症病例中，肺水肿 4 例，胸腔积液 3 例，心包积液 3 例，肺水肿、胸腔积液、心包积液三者均有的 2 例，肺水肿并有肺部感染者 2 例，胸腔积液合并下肺局部膨胀不全 2 例。**结论**:出血热的胸部并发症 X 线表现主要以肺水肿、胸腔积液、心包积液为主，胸部的 CT 检查能清楚显示出血热的肺部并发症的性质及程度，对出血热病情评估及治疗方案的制定有重要价值。

EPO-2497

实验兔经淋巴结淋巴管造影与 MR 淋巴管造影的成像比较

潘海鹏[1],潘孝根[1],赵凯宇[1],李红[1],郭翠萍[1],余远曙[1],赖灿[2],费正华[3],劳群[1]
1.杭州市儿童医院
2.浙江大学医学院附属儿童医院
3.湖州市妇幼保健院

目的 对照研究正常实验兔经淋巴结淋巴管造影与 MR 淋巴管造影对中央淋巴管的成像效果，以便更全面理解淋巴管造影的正常影像表现。 **方法** 正常实验兔 10 只，随机等分为 2 组，经两侧腘窝淋巴结分别予经淋巴结淋巴管造影（Intranodal lymphangiography, INL 组）或 MR 淋巴管造影（MR lymphangiography, MRL 组）；分别评价腰淋巴干及胸导管的显示情况。 **结果** MRL 组 5 例腰淋巴干显影优秀 3 例，显影较好 2 例；5 例胸导管均显影较差。INL 组 5 例腰淋巴干及胸导管均显影优秀。腰淋巴干及腹段胸导管全程显示所需时间分别为 5.80±1.92min 和 4.60±2.75min；胸段胸导管全程显示所需时间为 1.00±0.50min；胸段胸导管全程显示所需时间与前两者存在统计学差异。胸导管管径 0.3mm~1.6mm。INL 组 5 例均有肠淋巴干返流。**结论** 经腘窝淋巴结 INL 可清晰显示正常实验兔淋巴管系统，俯卧位检查可见肠淋巴干显影。经腘窝淋巴结 MRL 对实验兔腰淋巴干显示良好，对胸导管显示欠理想；还需继续研究。

EPO-2498

TB-IGRA 阴性活动性肺结核患者肺部 HRCT 特征分析

马鑫,吴吉丽
太原市第四人民医院太原市结核病医院

[摘要]目的 TB-IGRA 阴性活动性肺结核患者肺部 HRCT 特征分析。**方法**（1）选取 2017 年 2 月至 2018 年 10 期间入住我院活动性肺结核患者 64 例，其中 TB-IGRA 阴性 23 例作为观察组，TB-IGRA 阳性 41 例作为对照组，其对照组γ-干扰素（IFN-γ）值中位数为 140.9pg/ml，将 FN-γ值＜140.9pg/ml 的划分为低值组 20 例，将 FN-γ值＞40.9pg/ml 的划分为高值组 21 例。入组标准：初治经痰菌检查涂片阳性的活动性继发性肺结核患者，其他类型肺结核或复治肺结核、合并糖尿病及其他系统免疫缺陷患者除外，且符合 TB-IGRA 判定标准，TB-IGRA 检测与 CT 扫描检查间隔时间＜1 个月。（2）根据结核感染 T 细胞检测试剂盒（体外释放酶联免疫法，北京万泰生物药业股份有限公司）的说明书进行 ELISA 检测。（3）对三组病例进行肺叶病灶分布、肺段病灶评分及 CT 影像征象评定及汇总，其影像征象分为肺实质病变征象（包括节段性小叶中心结节、树芽征、小叶样实变、大片状干酪性病变、空洞）、肺间质病变征象（包括小叶内间质增厚、小叶间隔增厚、以气道壁增厚为主的轴心间质改变）。（4）使用 SPSS22.0 软件进行统计学分析，对三组病例采用卡方检验进行两两比较得出 P 值，P＜0.05 为差异有统计学意义。**结果** 病灶呈全肺叶分布特点、大片状干酪性病变及小叶间隔增厚影像影像在观察组中均显著高于高值组，两组差异均有统计学意义（P＜0.05）；以气道管壁增厚为主的轴心间质改变在观察组中显著高于低值组及高值组，组间两两比较差异有统计学意义（P＜0.05）。**结论** 本文表明活动性肺结核患者 TB-IGRA 病灶呈广泛肺叶分布、大片状干酪性病变、小叶间隔增厚、以气道壁增厚为主轴心间质改变具有相关性，但全部病例均为痰涂片阳性肺结核患者，病灶影像学特点差异相对较小，观察组选例困难致入组人数偏少，还需扩大样本量进一步探讨。

EPO-2499

ASL 联合 SWI 对大面积脑梗死患者溶栓治疗后出血转化的预测价值的研究

薛伟,杨莹,常艳亮,王晋君,郭兴华
运城市中心医院（原：运城地区人民医院）

目的：探讨磁敏感加权成像（SWI）联合动脉自旋标记成像（ASL）在急性大面积缺血性脑卒中溶栓治疗后出血转化（HT）预测中的临床应用价值。

方法：分析 2017 年 12 月至 2019 年 3 月经临床和影像学证实的 42 例急性大面积缺血性脑卒中患者，采用西门子 3.0T 磁共振扫描仪进行常规序列、磁敏感(SWI) 和 ASL 检查，通过软件后处理获取 SWI 最小密度投影及 CBF 伪彩图。分别于溶栓治疗 3 天及一周复查头颅 CT，判断有无 PH 型脑出血。依据头颅 CT 结果分为两组，PH 型 HT 组及非 PH 型组，通过分析 SWI 最小密度投影及 CBF 伪彩图，对比两组患者大面积脑梗死区微出血点、异常静脉有无及灌注高低情况。

结果：入组患者 42 例。其中 PH 组 15 例，溶栓前经 SWI 检查发现存在异常静脉影或脑微出血点 10 例，梗死区存在高灌注区域 8 例，两者均存在 6 例。非 PH 组 27 例，梗死区域存在脑出血点或异常静脉影 7 例，存在高灌注区域 6 例，两者均有 3 例。SWI 预测 PH 型 HT 灵敏度约 67%，特异度约 74%，ASL 高灌注区域预测 PH 型脑出血灵敏度约 53%，特异度约 78%。两者联合诊断，灵敏度约 80%，特异度约 63%。两组差异均具有统计学意义（P<0.05）。

结论：急性大面积脑梗死患者溶栓治疗后 PH 的发生与梗死区高灌注状态、微出血点、异常静脉影具有相关性，SWI 与 ASL 联合应用能够提高 PH 型 HT 预测的灵敏度，更好的预测 PH 型 HT 的发生，对于临床制定合理治疗方案及预后评估具有重要价值。

EPO-2500

Gd-EOB-DTPA 增强 MR 评估肝脏储备功能初步研究

任美吉,李莉,赵晶,李宏军
首都医科大学附属北京佑安医院

目的 探索钆塞酸二钠（Gd-EOB-DTPA）增强 MRI 评价肝功能储备的价值。**方法** 回顾性分析我院 78 例接受 Gd-EOB-DTPA 增强 MRI 检查的患者的临床及影像资料。测量容积式内插值法屏气检查序列（3D-VIBE）肝胆期肝实质各叶和全肝 SNR 强化率和 CNR 强化率。依据 Child- Pugh 分级将患者分为 A 级和 B 级，依据终末期肝病模型（MELD）评分将患者分为 MELD≤10 和＞10。比较组间 SNR 强化率与 CNR 强化率差异、分析强化率与肝功能评分之间的关系。**结果** 肝脏各叶及全肝 SNR 强化率、CNR 强化率差异均无统计学意义（P 均＞0.05）。Child- Pugh 分级 A 级患者全肝 SNR 和 CNR 强化率显著高于 B 级患者（P＜0.05）。MELD≤10 患者全肝 SNR 和 CNR 强化率显著高于 MELD＞10 患者（P＜0.05）。SNR 强化率、CNR 强化率与 MELD 分值均呈负相关（r＝－0.29、0.32，P＝0.02、0.01）。**结论** 肝细胞对 Gd-EOB-DTPA 摄取量随着肝功能损害程度增加而下降，通过测量 Gd-EOB-DTPA 增强 MRI 肝胆期分叶或全肝实质强化率，可以在一定程度上反映肝功能储备情况。

EPO-2501

布氏杆菌性脊柱炎的影像学表现分析

郭会利
河南省洛阳正骨医院（河南省骨科医院）

摘要：目的 探讨布氏杆菌性脊柱炎的影像学表现特征，以提高对该病的认识水平及诊断率。**方法** 回顾性分析我院收治的 19 例经病理或实验室检查确诊的布氏杆菌性脊柱炎患者的影像学资料，所有患者均行 DR 检查，其中 15 例加行 CT 检查，17 例加行 MRI 检查，12 例加行 SPECT/CT 检查。**结果** 19 例中腰椎受累占 89.5%（17/19），以 L4/L5 椎体发病率最高。DR 显示，椎体骨质密度增高，椎体缘骨质增生，相应椎间隙变窄，部分可见骨桥形成。CT 显示，15 例均可见椎体边缘类圆形或

刀锯样骨质破坏，周围骨质增生硬化，7 例见典型的“花边椎”，3 例累及椎小关节。MRI 显示，15 例椎体边缘明显骨质破坏，呈均匀或不均匀的长 T1 长 T2 信号，脂肪抑制序列 T2WI 呈不均匀高信号，椎体缘见骨质增生硬化及周围骨髓水肿信号，椎间盘呈长 T1 信号，椎间隙变窄，其中 5 例椎旁软组织内可见局限性的脓肿，无钙化及流注现象，脓肿呈长 T1 长 T2 信号，边界清晰，脓肿壁厚薄不均，2 例椎体仅见骨髓水肿，未见明显骨质破坏。SPECT/CT 显示，12 例 SPECT 均可见病变椎体呈弥漫性放射性核素浓聚，融合后显示椎体缘骨质增生硬化，并可见破坏区显著的放射性核素浓度，椎间盘轻度浓聚。**结论** 布氏杆菌性脊柱炎的影像学表现具有一定的特征性，临床上需结合病史、实验室检查及流行病学特征进行综合诊断，以提高其诊断率。

EPO-2502
肝内胆管脓肿与非胆源性肝脓肿的影像鉴别

苏美霞,于金玉,马举铭,王昱琪,刘强
山东省医学影像学研究所

目的：分析肝内胆管脓肿及非胆源性肝脓肿的 CT、MRI 表现特征，评价影像学检查对肝内胆管脓肿的检出效能。
方法：对我院 2018.06.01 至 2019.05.31 经手术及临床抗炎治疗后复查证实的 45 例肝脓肿 CT 或 MRI 图像进行回顾性分析。其中包括各种原因引起的肝内胆管脓肿及非胆源性肝脓肿。所有影像学资料均从胆源性征象、肝脓肿征象及反映两者关联性或特异性的征象进行分析。
结果：45 例肝脓肿患者包括肝内胆管脓肿病人为 28 例，非胆源性肝脓肿 17 例，所有病例均可见肝内脓影像学特征表现（45/45，100%）。肿肝内胆管脓肿影像学表现包括肝内脓肿及各种病因（肝内胆管结石 17/28,60.7%；手术 10/28,35.7%；既往胆系炎症迁延 1/28,3.6%）引起的胆道异常，包括肝内胆管扩张（24/28,85.7%）、扩张的胆管与脓肿相通（8/28,28.6%）或相邻（10/28,35.7%）、胆道积气（3/28,10.7%）。其中，肝脓肿与胆源性征象相关的影像学表现包括肝脓肿肝脓肿与近侧扩张胆管相一致（18/28,64.3%）,肝脓肿发生于有（2/28,7.1%）或无（5/28,17.9%）胆道扩张的肝段。非胆源性肝脓肿影像学表现包括肝脓肿及各种病因的特征表现，包括经门脉感染（2/17,11.8%）、开放性损伤（2/17,11.8%）等。非胆源性肝脓肿患者有 3 例表现为脓肿远端胆系轻度扩张，近端胆管无扩张。
结论：肝内胆管脓肿影像学表现包括肝脓肿征象、胆源性征象，非胆源性肝脓肿影像学表现为肝脓肿及各种病因特征表现，肝内胆管脓肿与非胆源性肝脓肿影像学表现具有一定相关性，胆源性征象有助于二者的鉴别诊断。

EPO-2503
耐多药与药物敏感性肺结核患者肺部空洞 CT 特征分析

吴吉丽,黄姣,张睿,马鑫,王青安
太原市第四人民医院

目的 对比耐多药肺结核与药物敏感肺结核的空洞 CT 征象，以提高对耐多药肺结核的认识。**方法** 回顾性分析 2017 年 4 月 1 日至 2018 年 11 月 1 日在我院治疗的共 95 例 MDR-TB 患者，其中发生空洞的 67 例(70.5%)。另选取同期 DS-TB 患者 92 例，发生空洞的 59 例(64.1%)。比较两组患者空洞 CT 特征。**结果** （1）MDR-TB 组空洞形态上结节或肿块空洞+实变影内空洞与 DS-TB 组存在显著差异。MDR-TB 组实变影内空洞例数明显低于 DS-TB 组，差异有统计学意义（x^2=3.86，$0.01<P<0.05$）。两组间空洞数量、肺叶分布及结节或肿块内薄壁、厚壁空洞例数均未见统计学差异。

（2）MDR-TB 组薄壁空洞位于胸膜下及形态不规则者多于 DS-TB 组且差异有统计学意义（ x^2=4.40，0.01＜*P*＜0.05； x^2=3.88，0.01＜*P*＜0.05）。（3）MDR-TB 组厚壁空洞外侧壁多发粗长毛刺或浅分叶征多于 DS-TB 组且差异有统计学意义（ x^2=3.92，0.01＜*P*＜0.05）。（4）MDR-TB 组多发虫蚀样空洞患者例数较 DS-TB 少见，差异有统计学意义（x^2=8.00，0.01＜*P*＜0.05）。MDR-TB 组毁损空洞例数明显高于 DS-TB 组，差异有统计学意义（x^2=6.97，0.01＜*P*＜0.05）。MDR-TB 组多房硬壁空洞与 DS-TB 组比较无统计学意 DS-TB 组，但例数高于高于 DS-TB 组。**结论** 结节或肿块内空洞+实变影内空洞、胸膜下形态不规则薄壁空洞、边缘多发粗长毛刺或浅分叶厚壁空洞及多房硬壁空洞、毁损空洞常见于 MDR-TB 患者，巨大毁损空腔为 MDR-TB 患者特征性表现。

肠结核并发结核性腹膜炎 CT 特征分析

吴吉丽,马鑫,张睿,黄姣,王青安
太原市第四人民医院

目的 探讨肠结核（ITB）并发结核性腹膜炎（TBP）的 CT 表现，以提高 ITB 并发 TBP 的诊断准确性，减少严重并发症的发生。**方法** 回顾性分析 2017 年 1 月～2018 年 12 月我院收治的 29 例 ITB 并发 TBP 患者的临床资料及 CT 扫描图像资料，观察 CT 影像特征。**结果** （1）21 例肠管壁节段性增厚 ITB 并发 TBP 患者，ITB 发生在回盲部 14 例，多节段肠管病变 4 例，小肠 3 例，肠管壁均呈不规则增厚，其中分层增厚 15 例，单层增厚 6 例。行 CT 增强扫描的 6 例患者中 4 例增强扫描动脉期肠壁呈“环形”强化。2 例不规则增厚肠壁增强后不均匀强化。21 例患者肠管壁增厚，并肠腔狭窄 18 例，并肠腔扩张 3 例。肠管壁增厚大肠平均厚度为 1.36± 0.39cm，小肠平均厚壁为 0.88±0.33cm。2 例回盲部肠管增厚并急性肠穿孔。并发 TBP 以渗出型、粘连型为主，12 例伴腹、盆腔积液，积液量较少，15 例网膜增厚、21 例系膜增厚呈“污迹”征，程度较轻。（2）8 例肠管壁无局限性增厚 ITB 并发 TBP 患者，肠管无局限性增厚，8 例均伴发慢性肠穿孔，腹、盆腔内见巨大包裹性气液平脓肿，5 例脓肿范围从肝下达盆腔，脓肿壁厚，其内液体密度较高，并见多发小气泡影。邻近肠管受压、推移。3 例脓肿较小局限于下腹部，脓肿壁较厚，与邻近组织分界欠清。8 例患者均可见网膜、系膜区、肠间隙见多发小气泡征。并发 TBP 以粘连型、干酪型为主，8 例见腹、盆腔积液，3 例见包裹性密度较高液体影。8 例均见网膜增厚，其中 5 例见“网膜饼”形成。8 例系膜增厚呈“污迹”征。4 例伴小肠梗阻。**结论** ITB 并发 TBP，二者可相互累及，互为因果，影像表现多样，CT 扫描能够清楚显示肠管、肠周围结构、网膜、系膜及腹腔其他脏器，为 ITB 并发 TBP 的诊断提供重要信息。

EPO-2505

脊柱结核的影像学诊断价值及临床分析

郭会利
河南省洛阳正骨医院（河南省骨科医院）

摘要 ：目的 探讨脊柱结核的影像学（CR 或 DR、CT 及 MRI）诊断价值并进行临床分析。 **方法** 对 68 例经临床手术或病理证实且影像学资料完整的脊柱结核进行分析。 **结果** CR(DR)显示：椎体骨质破坏 55 例；椎间隙变窄 60 例；椎旁梭形软组织密度影 22 例；脊柱后突畸形 31 例。CT 显示：椎体穿凿样骨质破坏 46 例；椎旁软组织块影 46 例；MRI 显示：椎体呈斑片状或弥漫性长 T1、长 T2 信号影 38 例；椎旁软组织块影 38 例；椎间隙变窄 32 例；脊柱后突畸形 30 例,脊髓水肿 12 例。 **结论** 影像学对脊柱结核的诊断具有特征性，对临床治疗、评价疗效具有重要价值。

恶性疟疾的 CT 表现及其受累组织器官的分布特点

宋璐,张笑春,曾莹婷,徐海波
武汉大学中南医院

目的：探讨恶性疟疾的 CT 表现与其受累组织器官分布特点。
材料方法：回顾性分析经临床证实的恶性疟疾 25 例，观察分析各组织器官的 CT 表现，并评价其关系。
结果:肝脾最易受累，包括脾大 12 例、巨脾 7 例、脾梗死 3 例、肝脏肿大 7 例和肝内淋巴瘀滞 1 例。肺受累居第 2 位，肺水肿 8 例、其中肺泡性水肿 6 例（实变 4 例和磨玻璃密度影 2 例）和间质性肺水肿 2 例，增殖性炎变 2 例和双侧胸腔积液 10 例。脑受累居第 3 位，水肿 5 例、侧脑室出血 1 例和脑内多发低密度灶 2 例。肠道受累居第 4 位，结肠壁水肿 1 例、小肠壁水肿 2 例和腹水 3 例。肾脏受累 2 例，表现为双肾密度减低、皮髓质分界不清、实质内低密度灶。淋巴结肿大和广泛皮下水肿各 1 例。
结论：恶性疟疾的 CT 表现主要是组织器官水肿和缺血性改变，且受累气管优势分布顺序为肝脾、肺、脑、肠、肾、淋巴结和皮下组织。

Deep learning with full convolutional neural network (FCNN) for diagnosis of liver masses at computed tomography images in the patients with liver cirrhosis induced by hepatitis B virus

Juan Tong[1],Fangyan Li[1],Yong Wen[1],Fan Yang[2],Jun Jiao[1],Qinghong Duan[1],Pinggui Lei[1]
1.The Affiliated Hospital of Guizhou Medical University
2.Key Laboratory of Biology and Medical Engineering, Guizhou Medical University

Purpose: The purpose of this study was to research the diagnostic efficiency by utilizing a deep learning approach with FCNN for differentiation of liver masses at pre-contrast and post-contrast enhancement CT images.
Materials and Methods: Data of 53 patients (male 29, female 24) with liver cirrhosis induced by hepatitis B virus were retrospectively study by a deep learning with FCNN. Sixty-four nodules were detected at the pre-contrast and post-contrast enhancement CT images by using liver biopsy as the reference standard, including benign nodule (BN), regenerative nodule (RN), dysplastic nodule (DN), and hepatocellular carcinoma (HCC). We proposed a deep learning approach for evaluation of the liver nodules and a random data augmentation strategy to reduce the training time and the problem of overfitting. Forty-five nodules were used for training, and nineteen nodules were used for validation and testing. Analysis of receiver operating characteristic (ROC) curves were performed to assess the accuracy of a deep learning approach with FCNN, the area under ROC curves (AUCs) were also calculated in this study.
Results: AUCs of deep learning with FCNN for HCC vs. ≤ DN were 0.95 (95% confidence interval [CI] 0.90 to 0.99), 0.89 (95% CI 0.81 to 0.95) for ≥ DN vs. ≤ RN , 0.92 (95% CI 0.88 to 0.96) for ≥ RN vs. BN.

Conclusion: A deep learning approach revealed a high accuracy for diagnosis of liver nodules, which means that it is valuable and promising for the non-invasive accurate diagnosis of nodules in the patients with liver cirrhosis induced by hepatitis B virus.

EPO-2508

AIDS 和非 AIDS 患者并发肺孢子菌肺炎的 CT 对比分析

李莉,任美吉,李宏军
首都医科大学附属北京佑安医院

目的：探讨 AIDS 和非 AIDS 患者并发肺孢子菌肺炎的 CT 表现特点。
方法：回顾性分析 50 例经实验室检查确诊的肺孢子菌肺炎患者的 CT 表现，其中 AIDS 组 32 例，非 AIDS 组 18 例。
结果： 肺孢子菌肺炎常见的 CT 表现有双肺磨玻璃样密度影，小叶间隔增厚，肺气囊等，重症患者可发生气胸、纵隔气肿。AIDS 组以肺门为中心双肺对称分布的样密度影最为多见（26/32），其中 14 例可见月弓征；小叶间隔增厚 18 例，其中 8 例出现碎石路征；条索影 9 例；肺气囊 6 例；肺门、纵隔淋巴结肿大 5 例；实变和气胸各 4 例；纵隔气肿和胸腔积液各 3 例。非 AIDS 组主要表现为双肺弥漫分布磨玻璃样密度影（13/18）；实变 8 例，其中 3 例可见空气支气管征；条索影 7 例；小叶间隔增厚 5 例；肺门、纵隔淋巴结肿大 3 例；气纵隔气肿 2 例，气胸 1 例。
结论：肺孢子菌肺炎的 CT 表现多种多样。AIDS 和非 AIDS 患者均以双肺磨玻璃样密度影最为多见，空气支气管征仅见于非 AIDS 组。

慢性结核性脓胸并发恶性肿瘤的临床及 CT 表现分析（附 3 例报告）

刘雪艳,李春华,吕圣秀
重庆市公共卫生医疗救治中心

目的 探讨慢性结核性脓胸并发恶性肿瘤的临床特点及 CT 表现特征。**方法** 回顾性分析我中心经病理证实的 3 例慢性结核性脓胸并发恶性肿瘤病例的临床及 CT 表现，并对相关文献进行复习。**结果** 3 例患者均为男性，平均年龄 63.7 岁，均有慢性结核性胸膜炎病史，平均病程 10.3 年；临床表现均为胸痛，平均病程 2.67 个月；两例患者可触及胸壁包块。2 例患者行胸部 CT 平扫检查，1 例患者示胸部 CT 平扫+增强扫描检查。胸部 CT 示 3 例患者均为右侧胸膜增厚、钙化及包裹性脓胸，脓胸侧胸膜下出现软组织肿块，最大层面大小分别为：2.06x3.49cm，3.1x3.9cm，2.9x6.3cm，CT 值分布为 31HU，46HU，36-49HU；2 例患者出现肿块与脓胸壁连续移行，突向侧胸壁；1 例患者出现患处钙化影移位、散开；肿块密度较均匀(1 例)、欠均匀(2 例)，出现邻近肋骨破坏 2 例；3 例患者均出现胸膜下脂肪界面不清；增强扫描显示：结节影呈边缘强化。3 例患者双肺表现为斑点、结节影，边界清晰，部分病灶呈钙化改变。**结论** 慢性结核性脓胸并发恶性肿瘤的临床及 CT 表现有一定特征性，出现胸痛表现，伴脓胸侧软组织块影、胸膜钙化影形态、位置改变，邻近肋骨骨质破坏；胸膜下脂肪层界面不清，对诊断有重要提示作用。

AIDS 合并肝脏结核 CT 影像学表现

王惠秋,吕圣秀,李春华,舒伟强
重庆市公共卫生医疗救治中心

目的 回顾性分析 AIDS 合并肝脏结核增强 CT 的表现特点，以提高其诊断的准确性。**方法** 对重庆市公共卫生医疗救治中心经病理证实的 8 例 AIDS 合并肝脏结核患者的增强 CT 检查结果进行回顾性分析，观察病灶的形态、密度、数量、病灶边界、病灶 CT 增强后的表现 。**结果** 8 例 AIDS 合并肝脏结核表现为浆膜型 2 例，结节型 3 例，混合型 3 例，其中单发 3 例，多发 5 例，形态不规则 6 例；CT 平扫表现为低密度 7 例，钙化 1 例，边界均与正常肝组织分界不清，伴有腹腔其他脏器结核及结核性腹膜炎 5 例，8 例均伴有腹腔外结核；CT 增强表现为不均匀轻度强化 2 例，渐进性强化 2 例，边缘轻度强化 4 例，病灶内分隔征 6 例。**结论** AIDS 合并肝脏结核少见，易漏诊误诊，增强 CT 能显示肝脏结核病灶的一些特征性表现 。

EPO-2511
DCE-MRI 及 DWI 在输卵管结核中的诊断价值

曹新山
滨州医学院附属医院

目的：分析输卵管结核的动态增强 MRI 及 DWI 影像特点，并与病理结果进行对照，以提高对输卵管结核的认识和鉴别诊断能力。方法：对 32 例经临床手术病理证实为输卵管结核患者行 DCE-MRI 及 DWI 检查，分析图像特点。结果：其中 18 例渗出型输卵管结核为单侧，14 例为双侧，MRI 表现为输卵管增粗、边缘毛糙、呈混杂信号的 c 形及 s 形弯曲并管腔狭窄 32 例(100%)；18 例(56%)呈多房厚壁囊实、性肿块；增殖粘连型输卵管结核多见输卵管增粗，管壁肥厚，周围明显粘连，部分伴腹膜增厚黏连并腹水。MR 输卵管迂曲增粗如拇指或腊肠样 32 例(100%)，22 例(68%)有盆腔积液。病理：输卵管迂曲并扩张，可见溃疡、干酪型、粟粒结节型炎变。结论：输卵管迂曲增粗及囊壁不全间隔的囊实性肿块是输卵管结核的 MRI 特征性表现，DCE-MRI 及 DWI 检查对于输卵管结核具有较高的临床诊断价值。

EPO-2512
HIV 阳性和 HIV 阴性肺隐球菌病患者的临床及胸部 CT 表现对比分析

刘雪艳,吕圣秀,李春华,舒伟强,杨佳,戴欣
重庆市公共卫生医疗救治中心

目的 对比分析 HIV 阳性 HIV 阴性患者肺隐球菌病的临床及胸部 CT 表现。方法 回顾性分析重庆市公共卫生医疗救治中心 2015 年 01 月至 2016 年 12 月收治的 22 例经证实的肺隐球菌病的临床及胸部 CT 影像学资料，其中 HIV 阳性 17 例，HIV 阴性 4 例。从临床表现、胸部 CT 表现、预后等方面，分析两者之间的差异性。结果 临床症状方面：HIV 阴性患者临床表现轻微：无症状 1 例，咳嗽、胸痛 3 例。HIV 阳性患者临床表现较重：头痛 13 例，发热 9 例，咳嗽、咳痰 6 例，呕吐 5 例。胸部 CT 表现： HIV 阳性患者：斑片浸润型：15 例；弥漫混合型 2 例；出现囊腔影 15 例；5 例伴发胸腔积液和纵隔淋巴结肿大；15 例同时合并隐球菌性脑膜炎征象。HIV 阴性患者：结节或肿块型 4 例，病灶周围出现晕征 3 例。预后方面：HIV 阳性患者好转 12 例，无效 2 例，放弃治疗 3

例。HIV 阴性患者均好转。结论 HIV 阳性与 HIV 阴性肺隐球菌患者的临床及胸部 CT 表现存在一定差异，这些特征与它们的自身免疫功能活性有密切关系。

EPO-2513

乳腺结核的 CT 表现分析

王惠秋,吕圣秀,李春华,舒伟强,刘雪艳,杨佳
重庆市公共卫生医疗救治中心

目的 分析乳腺结核的 CT 征象，探讨其 CT 的诊断价值。**方法** 回顾分析重庆市公共卫生医疗救治中心 20 例经病理证实的乳腺结核病例。分析病变的 CT 表现及邻近组织及器官受累情况。**结果** 20 例乳腺结中 12 例发生于右乳，8 例发生于左乳。13 例为单发，7 例为多发；16 例呈类圆形结节，1 例呈团块状，3 例呈片状；病灶大小 1.0cm×1.5cm～5.1cm×3.2cm。结节型、脓肿型分别各 13、7 例。CT 平扫 11 例为等密度，9 例为稍低密度，4 例病灶内见斑点状钙化，17 例边界模糊；12 例邻近皮肤均匀增厚。增强扫描 20 例均表现为环形强化，2 例伴窦道形成；其中 13 例伴有同侧或双侧腋窝淋巴结肿大伴环形强化，5 例伴有同侧胸壁包块伴边缘强化，10 例伴肺结核。**结论** 乳腺结核的特征性 CT 表现为**环形强化，**同时常伴有同侧腋窝淋巴结及胸壁结核。

EPO-2514

艾滋病并发新型隐球菌脑膜炎临床及影像学表现分析

刘雪艳,李春华,吕圣秀,舒伟强,唐光孝
重庆市公共卫生医疗救治中心

目的：分析艾滋病并发隐球菌脑膜炎患者的临床及影像学表现，提高对该病的认识，为临床医师的诊疗工作提供依据和帮助。方法：对重庆市公共卫生医疗救治中心 2015 年 01 月至 2016 年 12 月收治的 34 例艾滋病并发隐球菌脑膜炎患者的临床及影像学资料进行回顾性分析。结果：34 例艾滋病并发隐球菌脑膜炎患者中头痛 34 例、发热 18 例、呕吐 15 例。首次脑脊液检查中：氯化物水平降低 15 例、葡萄糖水平降低 10 例、蛋白定性阳性 11 例。首诊颅内压大于 200（mmH_2O）31 例，颅内压水平正常 3 例。CD4 T 淋巴细胞计数均低于 200（cells/ul），其中低于 50（cells/ul）28 例、50~99（cells/ul）4 例、100~199（cells/ul）2 例。头颅 CT、MRI 表现主要为脑膜脑炎型 15 例、类梗塞型 8 例、梗塞型 6 例、肉芽肿型 1 例。易合并其他机会性感染，其中真菌性肺炎 17 例、细菌性肺炎 10 例、口腔念珠菌病 9 例。结论：艾滋病并发隐球菌脑膜炎患者多以颅内压增高相关症状就诊，免疫力普遍低下，易并发多种机会性感染。头颅 CT、MRI 检查在其诊疗过程中具有重要价值，确诊仍需依靠实验室病原学检查。

EPO-2515

艾滋病相关弓形虫脑炎的影像学表现及动态观察

李春华,吕圣秀,刘雪艳,王惠秋,杨佳,舒伟强,唐光孝
重庆市公共卫生医疗救治中心

目的 弓形虫是条件致病菌，易发生在免疫抑制和免疫低下者，最常累及中枢神经系统。其临床表现及影像表现与其他颅内感染有一定的相似之处，为提高对艾滋病弓形虫脑炎的影像表现的认识，为临床早诊断早治疗提供影像学依据。**方法** 回顾性分析 2018.1-2019.4 重庆市公共卫生医疗救治中心收治的 32 例弓形虫脑炎患者，分析其 CT 及 MRI 影像表现，主要观察内容有病变部位、形态、大小、密度、有无水肿、占位效应、有无脑膜改变，增强后强化特点、抗弓形虫治疗效果。**结果** 32 例患者中男性 25 例，女性 7 例，年龄 21-68 岁，平均 42 岁。CT 表现：病变位于额叶 17 例，顶叶 15 例，基底节区 16 例，颞叶 9 例，枕叶 7 例，半卵圆中心 9 例，脑干 6 例。平扫呈低密度 24 例，有高密度 7 例，病灶周围水肿 32 例，增强后发现病灶 85 个，病灶最大者 34mm×19mm，最小 4mm×3mm，环形强化 15 例，结节状强化 11 例，有壁结节 10 例，靶环征 6 例，半靶征 1 例，开环靶征 1 例，环中环征 2 例。脑膜增厚 5 例。MRI T1WI 表现为等及稍低信号,T2WI 表现为高或等低信号,增强 MRI 病灶呈环形强化及结节状强化，其中 15 个病变表现为"靶环征"，周围水肿无强化。抗弓形虫药物治疗 12-118 天后 15 例进行了 CT 复查，19 例吸收好转，6 例病灶增多，1 例治疗后无变化。**结论** 艾滋病相关弓形虫脑病在颅内分布广泛，多位于大脑半球及基底节区，病灶多为环形强化，周围水肿广泛。壁结节及靶环征是其特征表现，MRI 对疗效观察有重要作用。

EPO-2516
艾滋病合并肺结核与正常免疫肺结核的 CT 影像表现

李春华,吕圣秀,刘雪艳,舒伟强,杨佳,王惠秋
重庆市公共卫生医疗救治中心

目的 探讨艾滋病合并肺结核与正常免疫肺结核的临床影像表现，提高对艾滋病合并肺结核的认识。方法 回顾分析 2011 年 10 月～2012 年 9 月本院诊治的 142 例艾滋病合并肺结核(观察组)及 150 例非艾滋病患者肺结核（对照组）临床及胸部影像表现。结果 观察组在发热 93.7%、呼吸困难 36.6%、乏力 78.9%、纳差 79.6%、体质量下降 74.6%、头痛 18.3%、腹泻 14.8%、视物模糊 7.7%、尿路刺激征.7%，合并其他肺部感染 35.9%，合并肺外结核 29.6%，均多于对照组，两组比较差异有统计学意义<0.05）。痰图片及痰培养阳性率 16.9%，PPD 试验阳性率 10.6%，对照组分别为 38%、78.7%，两组比较差异有统计学意义（*P*<0.05）。观察组死亡率为 8.5%，对照组 2.7%，两组比较差异无统计学意义（*P*>0.05）。影像表现：观察组以 II 型（14.8）、IV 型（44.4%）、V 型（29.6%）较多，病灶位于中下肺 62.0%，累及 3 叶以上 51.4%，均多于对照组（*P*<0.05）。观察组肿大淋巴结增环形强化 35.7%（10/28），对照组环形强化 70.6%（12/17），两组比较差异有统计学意义（*P*<0.05））。结论 艾滋病合并肺结核患者病情严重，临床表现不典型，容易合并多种机会性感染，抗酸杆菌检查机 PPD 试验阳性率低，临床诊断困难，影像表现复杂多样，当艾滋病患者出现全身多发症状，CT 表现为大片实变、空洞、粟粒结节、淋巴结肿大及胸腔积液时应考虑到艾滋病合并肺结核的可能。

EPO-2517
杭州地区 5 岁以下儿童麻疹合并下呼吸道感染的多因素分析：基于胸片分级

李焕国[1],劳群[3],张敏鸣[2]
1.浙江中医药大学附属广兴医院（原:杭州市中医院浙江中医学院附属第二医院）
2.浙江大学医学院附属第二医院
3.杭州市儿童医院

目的
分析杭州地区麻疹患儿合并下呼吸道感染危险因素以及易合并感染的病原菌类型，分析不同病原菌对麻疹患儿下呼吸道感染严重程度分级的影响，并分析胸片能否鉴别麻疹患儿肺部合并的病原菌类型。
方法
选取 187 例符合条件的麻疹患儿，根据胸片表现将下呼吸道感染的严重程度分为 3 级（正常胸片为 0 级；轻-中度异常者，包括支气管壁增厚，轻微的肺部渗出改变，为 1 级；重度异常者，包括大片渗出实变、网状影，中度/重度肺不张、支气管扩张、囊腔或空洞、胸腔积液，为 2 级），并将下呼吸道感染的分级结果作为因变量，以性别、年龄（月）、生活环境、病程中最高体温、入院前病程、首发症状、喂养史、生产方式、有无早产、接种情况、有无诱因、BMI、有无合并其它疾病、有无合并其它病原菌感染 14 个临床因素作为自变量，先进行单因素分析，将 $p \leqslant 0.1$ 的临床因素进行多项有序 *logistic* 回归分析进行统计学分析。
结果
187 例麻疹患儿中合并 0 级下呼吸道感染者 74 例（39.57%），1 级下呼吸道感染者 77 例（41.18%），2 级下呼吸道感染者 36 例（19.25%）；经单因素分析，入院前病程、性别（男性）、喂养史（非母乳喂养）、首发症状（呼吸道症状）、下呼吸道合并其它病原菌感染、未接种麻疹疫苗 6 项临床因素的 $p \leqslant 0.1$，并纳入多项有序 *logistic* 回归分析，最终入院前病程（OR=1.110，95%CI：1.022～1.141）、未接种麻疹疫苗（OR=1.799，95%CI：1.060～3.053）、下呼吸道合并其它病原菌感染（OR=1.629，95%CI：1.080～2.457）具有统计学差异。
结论
影响杭州地区 5 岁以下麻疹患儿感染不同级别下呼吸道感染的危险因素有入院前病程较长、未接种麻疹疫苗、下呼吸道合并其它病原菌感染。

EPO-2518
DWI 和 MR 增强对软组织脓肿的诊断价值比较

龚晓明,鲁植艳
武汉大学中南医院

目的：对比分析 DWI 和 MR 增强联合常规 MR 扫描对软组织脓肿的诊断价值。
方法：对 119 例临床怀疑软组织脓肿患者（男性 72，女性 47， 56±16.1 岁），均行常规 MR 扫描、MR 增强扫描及 DWI（b=800）。将图像随机分为 2 组，常规 MR 扫描联合 DWI 组以及常规 MR 扫描联合 MR 增强扫描组；由 2 名副高及以上医生共同阅片，对每组图像进行单独分析。比较常规 MR 扫描联合 DWI 及常规 MR 扫描联合 MR 增强扫描对软组织脓肿的诊断价值。采用 McNeMar 检验及 AUC 曲线分析，分别获得两种方法在诊断软组织脓肿中的敏感性及特异性。
结果：119 例中 40 例证实为软组织脓肿。医生 1：常规 MR 扫描联合 DWI 诊断的敏感性和特异性分别为 90.0%和 88.6%；常规 MR 扫描联合 MR 增强扫描诊断的敏感性和特异性分别为 82.5%和 89.9%。医生 2：常规 MR 扫描联合 DWI 诊断的敏感性和特异性分别为 77.5%和 88.6%，常规 MR 扫描联合 MR 增强扫描诊断的敏感性和特异性分别为 80.0%和 84.8%。常规 MR 扫描联合 DWI 和常规 MR 扫描联合 MR 增强扫描在敏感性和特异性上没有明显的区别（医生 1：P=0.453，P=0.999，医生 2：P=0.999,P=0.453）。AUC 曲线分析常规 MR 扫描联合 DWI 和常规 MR 扫描联合 MR 增强扫描敏感性及特异性也没有明显区别（医生 1 中 P=0.53，医生 2 中 P=0.97）。2 种方法在疾病的诊断一致性方面基本相同：常规 MR 扫描联合 DWI 为 0.80；常规 MR 扫描联合 MR 增强扫描为 0.76。
结论：常规 MR 扫描联合 DWI 和常规 MR 扫描联合 MR 增强扫描在诊断软组织脓肿方面具有类似诊断价值。

双能 CT 虚拟平扫在诊断泌尿系统结石并感染中的价值

曹新山
滨州医学院附属医院

泌尿系结石（简称尿石病 Urinary stones disease）是泌尿外科最为常见的疾病之一，可发生于泌尿系的不同部位。因 CTU 直观、准确显示泌尿系结石的部位、大小、周围情况及肾脏的分泌、代谢功能等而广泛用于临床。但凡事有利有弊，扫描范围过大（肾脏上极达盆腔底部）和扫描次数过多（常规平扫、肾实质期和排泄期扫描）以致于辐射剂量过大是 CTU 的主要弊端，同时也是制约其发展的主要因素。

如何在保证图像质量的前提下降低辐射剂量已成为当前的研究热点。近年来在 CTU 检查时采取了一系列减少辐射剂量的扫描方法。其中成效最好的便是 DSCT(dual source CT，DSCT）双能量虚拟平扫(Virtual non-contrast，VNC)技术。

随着人们对 X 线辐射危害意识的提高，如何降低患者的 X 线吸收剂量成为人们越来越关注的问题。常用的降低辐射剂量的方法有降低管电压和管电流，但 CT 图像质量和 X 线吸收剂量之间存在着矛盾关系，降低管电压或管电流势必在一定程度上影响图像质量。第二代 DSCT 利用锡过滤板技术，把低能量的光子从高能量的 X 线中去除，从而提高了射线的利用率，使高能谱射线纯化，显著提高了碘成份的区分能力；而且其 B 球管直径由第一代 DSCT 的 26cm 增加到 33cm，能覆盖更大范围的腹盆部脏器，这些特性为虚拟平扫取代常规平扫提供了理论上的可能性。如果虚拟平扫能代替常规平扫，患者就可减少一期检查受照，从而降低辐射剂量。

目前双源 CT 虚拟平扫技术已经比较成熟，国内外的一些学者对虚拟平扫在颈部、胸腹部及心血管的应用进行了初步的研究，证实虚拟平扫技术有广阔的应用前景；在神经系统方面，有学者发现虚拟平扫能准确的诊断蛛网膜下腔出血；而对于利用虚拟平扫诊断泌尿系结石的研究报道较少。

指状突树突细胞肉瘤一例

王川红,周垒
江西省人民医院

目的 探讨指状突树突细胞肉瘤(interdigitating dendritic cell sarcoma，IDCS)的临床特点、病理学、影像学特征、治疗及预后。**方法** 报道 1 例发生于腹膜后 IDCS 的临床资料及文献复习。**结果** 免疫组织化学显示瘤细胞阳性表达 CD68、S-100、CD163，CD1a、CD10、Catenin-b（-），CD10（-），CK(AE1/AE3)(-)，cyclin D1(-),Galectin-3(-),Vimentin(-)均阴性。**结论** 指状突树突细胞肉瘤是一种罕见的的恶性肿瘤，病理学免疫表型是诊断本病的重要依据，完整切除肿瘤可能是治疗 IDCS 的有效手段。

EPO-2522
人感染 H7N9 禽流感的临床及影像学特征(附 1 例分析)

陈胜良,王大江,谭一静,池科承,毛廷容,陈航,田黎明,宋纯建,黄华忠,李洪兵,游绍昆,吕昌禄
遵义市余庆县人民医院

目的:是提高对人感染 H7N9 禽流感的认识，早期诊断，早期治疗，提高患者的生存率。方法：临床疑及人感染 H7N9 禽流感患者进行 CT 扫描并段时间内 CT 复查对比分析。结果：肺部磨玻璃影 3 短时间内复查病灶明显增多，并新增加另一侧肺部病灶，最后导致白肺，双侧胸腔积液从没有增加。结论：根据临床病史和影像学表现特点，早期提出疑似改变诊断，并尽早进行相关的实验室检查做出诊断，早期治疗，有利于患者的预后及早期康复。

EPO-2523
布鲁氏菌性骨关节炎的 CT 表现

江松峰
广州市第八人民医院

目的 探讨布鲁氏菌性骨关节炎的 CT 表现。**方法** 回顾性分析 6 例布鲁氏菌性骨关节炎的 CT 表现。**结果** 6 例布鲁氏菌性骨关节炎的 CT 表现：（1）脊椎炎 3 例；$L_{4、5}$病变 2 例，$L_{4、5}$及 L_5、S_1病变 1 例。CT 表现为椎体边缘见多发不规则形骨质破坏、病灶周边增生硬化，椎间隙变窄，椎体边缘骨质增生，椎旁软组织肿块、椎旁脓肿、腰大肌脓肿形成。（2）脊椎外骨关节炎 3 例；骶髂关节炎 1 例，CT 表现为髂骨关节面骨质破坏，关节面毛糙，关节间隙变窄；髋关节炎 1 例，CT 表现为关节囊肿胀、关节腔积液；踝关节炎 1 例，CT 表现为内踝、外踝和距骨骨质密度减低，周边软组织肿胀。**结论** 骨关节炎是布鲁氏菌病的常见并发症，影像检查对布鲁氏菌性骨关节炎的诊断和治疗具有重要意义。

支气管和空洞收缩率鉴别肺部良恶性空洞的价值

张华[1],汪丽娅[1,2]

1.南昌市第一医院
2.深圳市龙华区人民医院

【摘要】 目的 探讨使用双气相 CT 扫描测量支气管和空洞收缩率鉴别肺部良恶性空洞的价值。 方法 对 42 例空洞患者使用双气相 CT 扫描，分别测量空洞和空洞端支气管最大直径，再计算出空洞和支气管收缩率，对比良恶性空洞的差别，采用 t’检验比较空洞和支气管收缩率的差异，通过诊断试验 ROC 曲线，得出良恶性空洞鉴别最佳诊断临界点。 结果 良性空洞端支气管收缩率 1.504±0.349，恶性空洞端支气管收缩率 1.082±0.164，t’=4.935,P<0.001，差异有统计学意义;良性组空洞收缩率（1.29±0.25），恶性组空洞收缩率（1.02±0.06），差异有统计学意义（t’=4.603，P<0.001）。利用受试者工作特征 ROC 曲线分析，选择 Youden 指数最大值作为良恶性空洞鉴别最佳诊断临界点时，当支气管收缩率的最佳诊断临界点为 1.111 时，敏感度为 90.50%，特异度为 86.40%。当空洞收缩率的最佳诊断临界点为 1.08048 时，敏感度为 90.50%，特异度为 90.90%。 结论 使用双气相 CT 扫描支气管和空洞收缩率可以鉴别良恶性空洞。

MR 表观扩散系数在评价腰椎结核治疗效果中的价值

张旭
山东省胸科医院

目的 测量腰椎结核患者椎体结核病灶的 MR 表观扩散系数(ADC 值)，比较治疗前后的 ADC 值变化情况,探讨 ADC 值在疗效评估中的应用价值。
方法 选择 2018 年 10 月 01 日至 2019 年 07 月 01 日期间至山东省胸科医院住院治疗，经外科术中病理检查确诊为腰椎结核的患者，共 47 例，年龄 13—72 岁，男性 34 人，女性 13 人。采用 GE 3.0T 超导型磁共振扫描仪，扫描序列包括 T1WI、T2WI、FLAIR、 扩散加权成像(diffusion-weighted imaging,DWI) 序列(b＝0,1000 mm^2/sec)，经静脉团注钆喷替酸葡甲胺(Gd-DTPA) 行 T1 轴位、冠状位、矢状位增强扫描，重点观察椎体结核病灶及周围脓肿的强化区域，区分脓肿中心（无明显强化区域）及壁（强化区域），DWI 数据通过工作站表观扩散系数(ADC)分析软件进行后处理生成 ADC 图，每一病灶分为中心及周边区域，分别取 3 个直径约为 3mm 的感兴趣区，测量 ADC 值并取其平均值。经系统抗结核治疗，患者相应系统症状明显减轻后，进行复查，再次测量病灶相同部位灶的 ADC 值。将两次测量的值与正常成人相同部位 ADC 值进行对照分析。
结果 治疗前椎体结核病灶平均 ADC 值为 1.43±0.25X$10^{-3}mm^2/sec$，周围脓肿壁 ADC 值为 1.89±0.30X$10^{-3}mm^2/sec$，正常椎体平均 ADC 值为 0.48±0.16X$10^{-3}mm^2/sec$；经系统抗结核治疗后及痊愈的患者椎体 ADC 值接近正常值。
结论 MR 表观扩散系数(ADC)值可以对腰椎结核的治疗情况进行评价，为临床制定及调整更合理的治疗方案提供充分的影像学依据。

MSCT 对颈淋巴结结核的诊断价值

吕圣秀,李春华,舒伟强,刘雪艳,王惠秋,戴欣
重庆市公共卫生医疗救治中心

目的探讨颈部淋巴结结核的 CT 表现。方法回顾性分析 2015 年 12 月至 2019 年 5 月 98 例术后经病理检查证实为颈部淋巴结结核患者的 CT 影像学资料。结果 98 例患者中Ⅰ型(CT 平扫表现为密度均匀肿大淋巴结,增强后强化方式与邻近肌肉组织相近)24 例,Ⅱ型(CT 平扫也表现为密度均匀,增强后

强化不均匀、周围脂肪间隙清晰)67 例,Ⅲ型(CT 平扫密度不均匀,增强后表现为环形强化、周围脂肪间隙清晰)57 例,Ⅳ型(CT 平扫密度不均匀,增强后可见分隔样及环形强化、周围脂肪间隙消失)68 例。病灶分区:Ⅰ区 22 例 ,Ⅱ区 59 例 ,Ⅲ区 58 例 ,Ⅳ区 64 例 ,Ⅴ区 23 例 ,Ⅵ区 13 例 ,Ⅶ区 17 例 ,锁骨上区 52 例 ,共 324 个淋巴结区受累。结论颈部淋巴结结核的 CT 表现有较典型特异性改变,CT 检查能清晰显示病变部位、形态、大小和邻近结构等情况,但三维后处理同时进行更能显示病灶分布及整体情况。

EPO-2527

气道复发性多软骨炎的胸部 CT 表现

刘靖,邢俊,程爱兰
上海市东方医院同济大学附属东方医院

目的：探讨累及气道的复发性多软骨炎 CT 影像学表现。方法：对 26 例经临床及病理确诊的复发性多软骨炎患者进行 CT 扫描，并对气道进行多种技术 CT 三维重建，包括 minMIP（最小密度投影）、MPR（多平面重建）及 CPR（曲面重建）。26 例患者中 16 例出现耳廓软骨炎其中 4 例经耳廓软骨活检，8 例出现鼻软骨炎，2 例出现喉部软组织增厚，经喉镜活检证实，另有 8 例出现多关节炎，2 例出现眼炎。实验室检查：18 例患者出现红细胞沉降率(ESR)增快加快，15 例患者 C 反应蛋白(CRP)升高。全部病例符合 1976 年 McAdam 的诊断标准，同时符合 2011 年复发性多软骨炎诊断和治疗指南。结果：1.病变基本 CT 表现：气管及主支气管壁广泛均匀增厚 16 例，不均匀增厚 10 例，气道狭窄 14 例（其中气道闭塞 1 例）,气道壁钙化 2 例，气管呈刀鞘状 2 例，气道塌陷 2 例，阻塞性肺炎 2 例。2.不同呼气/吸气时相 CT 扫描对照：8 例病情严重患者，由于气管软骨破坏严重，呼气相对照吸气相气道出现塌陷，管径明显减小。3.气道三维重建检查 16 例患者，10 例表现为气管及支气管壁广泛的弥漫性增厚，5 例表现为气管-支气管不均匀增厚，另 1 例表现为局部管壁增厚，管腔闭塞。4.各种 CT 三维重建图像的比较：minMIP 可以清晰显示气管及主支气管管腔狭窄长度及范围，但无法显示管壁的增厚，并且对细小支气管显示欠佳；MPR 可以同时显示管壁增厚及管腔狭窄，但气道呈曲线，无法在一张图像上显示气道全貌。CPR 图像可以显示气管至某一支支气管的全程，但曲面重建将气管、支气管拉直，导致失真。需将 3 种重建方式结合才能全面的评估气道改变。结论：气道复发性多软骨炎 CT 表现具有一定的特征性，大多表现为较广范围的均匀或不均匀气道管壁增厚及管腔狭窄，当患者临床出现多个部位的慢性炎性反应时，应考虑复发性多软骨炎的诊断的可能，吸气/呼气相对照扫描及多种方式 CT 重建有助于全面评估气道改变。

EPO-2528

糖尿病患者合并肺结核的 CT 表现与血糖水平的关系

李春华,吕圣秀,刘雪艳,王惠秋,舒伟强
重庆市公共卫生医疗救治中心

目的 探讨糖尿病患者合并肺结核在不同血糖水平下的 CT 表现。**方法** 回顾性分析 2014 年 4 月—2015 年 3 月住院诊断的糖尿病伴发肺结核患者 78 例，均无 HIV 感染、使用糖皮质激素及免疫抑制剂及其他免疫低下情况。按最近三月平均空腹血糖＜10mmol/L 及≥10mmol/L 分为甲乙两组，分别为 37 例、41 例，其中男性 47 例，女性 31 例，年龄 17-78 岁，平均 53±11 岁，两组在性别及年龄差异无统计学意义（P＞0.05）。对两组患者的 CT 表现进行对比分析。主要观察两组病变分型，病灶分布部位、病变形态及合并肺外结核的表现情况。用统计软件 SPSS19. 0 对数据进行统计分析。**结果** 甲乙两组 III 型分别为 21 例、35 例（P＜0.05），V 型分别为 4 例，15 例（P＜

0.05）。其余各型两组差异无统计学意义（P＞0.05）（I 型分别为 3 例、5 例，II 型分别为 5 例、7 例。IV 型分别为 10 例，13 例）。 两组病变分布 3 叶以上分别为 17 例、31 例（P＜0.05），累及下叶基底段 13 例、40 例（P＜0.05）。实变分别为 15 例、34 例（P＜0.05），干酪病灶 3 例、27 例（P＜0.05），空洞 8 例、22 例（P＜0.05），结节 21 例、8 例（P＜0.05），钙化 6、3 例（P＞0.05），胸腔积液 8 例、12 例（P＞0.05），肿块 4 例、3 例（P＞0.05），树芽征 9 例、17 例（P＞0.05），纵膈淋巴结肿大 9 例、11 例（P＞0.05），肺外结核 4 例、15 例（P＜0.05）。**结论** 糖尿病合并肺结核 CT 表现与血糖水平有关，血糖越高，病变分布越广泛，非好发部位发生率越高、病变播散越多，干酪病灶、空洞及肺外结核越多。

动态 MRI 联合 MRS 及 PWI 对艾滋病局灶性脑损伤病变的鉴别

田燕,曹新山
滨州医学院附属医院

目的：艾滋病患者局灶性脑损伤的原因主要有弓形虫脑炎、原发性中枢神经系统淋巴瘤、进行性多灶性白质脑病，通过 MRI 平扫及增强联合波普分析进行鉴别。
方法：使用 GE3.0MRI 进行颅脑平扫及增强扫描并进行 MRS 及 PWI 分析，分析病变不同特点。
结果：弓形虫脑炎为脓肿性改变，多发，易发生在皮髓交界区、基底节区、小脑，T1WI 呈低信，T2WI/T2WIflair 为高、混杂信号，水肿较轻，DWI 为低信号，MRS 表现为 NAA、cho 减低，lip 峰稍高，增强呈环形强化及靶征表现，PWI 为低灌注。原发性中枢神经系统淋巴瘤，多位于幕上，胼胝体，脑室周围，室管膜周围，沿血管间隙生长，呈“袖套状”改变，T1WI 等、低信号，T2WI/T2WIflair 等、高信号，DWI 高信号，MRS 为 NAA 下降，cho 升高，lip 峰高耸，增强为“尖角征”“脐凹征”“握拳征”“裂隙征”“蝶翼征”，PWI 为低灌注。进行性多灶性白质脑病，好发于大脑皮质下白质，小脑脚，T1WI 低信号,T2WI/T2WIflair 高信号，DWI 中央低信号，周边高信号，MRS 为 NAA 下降，Cr 增高，增强不强化。
结论：MRI 联合 MRS 及 PWI 在鉴别弓形虫脑炎、原发性中枢神经系统淋巴瘤及进行性多灶性白质脑病有一定的优势。

T1mapping on Gd-EOB-DTPA-enhanced MR Imaging has perfect delay time in Predicting Liver Fibrosis Levels

Tian Qiu[1],Chunzi Shi[2],Weibo Chen[3],Yangqing Huang[1],Rengyin Zhang[1],Jian Lu[4],Wen Ye[1],Xiudong Shi[1],Zhanqing Zhang[1],Yuxin Shi[1]
1.Shanghai Public Health Clinical Center of Fudan University
2.Clinical Discipline of Chinese and Western Integrative Medicine, Shanghai University of Traditional Chinese Medicine
3.Philips Healthcare China, Shanghai, China
4.Department of Radiology, Nantong Third People's Hospital, Nantong, China

Purpose: To investigate perfect delay time of T1mapping on Gd-EOB-DTPA-enhanced MRI in predicting liver fibrosis levels.
Methods: 158 patients with chronic hepatitis B who accepted liver biopsies were enrolled. Liver pathological diagnosis referred to Scheuer-Ludwig scoring system. Non-

enhanced and Gd-EOB-DTPA-enhanced MRI by Look-Locker sequences were performed pre and post-contrast at 5, 10, 15, 20 minute after Gd-EOB-DTPA administration. The reduction rate of T1 value (ΔT1%) was measured at 5, 10, 15 and 20 minute ($\Delta T1_{5min}$%, $\Delta T1_{10min}$%, $\Delta T1_{15min}$%, $\Delta T1_{20min}$%), respectively. ROC curve was used to evaluate the performance of the ΔT1% at different time points in predicting liver fibrosis levels.

Results: ΔT1% correlated significantly with fibrosis stages (all $P<0.001$), no significant difference was found at each scanning time. ΔT1% at each scanning time significantly decreased between S1 and S2, S2 and S3, S3 and S4. AUCs of ΔT1% for diagnosing ≥ S2 were 0.907, 0.913, 0.910, 0.916, and for diagnosing ≥ S3 were 0.912, 0.920, 0.923, 0.938, and for diagnosing ≥ S4 were 0.943, 0.944, 0.947, 0.952, respectively. No significant difference was found in $\Delta T1_{10min}$% as well as $\Delta T1_{5min}$%, $\Delta T1_{15min}$%, $\Delta T1_{20min}$% for diagnosing ≥ S2, ≥ S3, ≥ S4. The Bland-Altman diagrams of $\Delta T1_{10min}$% and $\Delta T1_{5min}$%, $\Delta T1_{15min}$%, $\Delta T1_{20min}$% were 5.06%, 6.33%, 4.43% outside the 95% consistency limit, respectively.

Conclusion: To diagnose liver fibrosis of chronic hepatitis B with Child-Pugh score < 7, the result of $\Delta T1_{10min}$% is more accurate than that of $\Delta T1_{5min}$%, and more efficient than those of $\Delta T1_{15min}$%, $\Delta T1_{20min}$%. Comprehensively consider efficient and accuracy, the perfect delay time is close to 10 minute.

EPO-2531

螺旋 CT,MRI 及 MRS 对颅脑结核的诊断价值

田燕,曹新山
滨州医学院附属医院

目的
颅脑结核是由原发性结核经血缘传播所致，临床表现不典型，
易与胶质瘤相混淆。探讨螺旋 CT，MRI 以及 MRS 对病变的诊断价值。
方法
采集我院 2017 年 06 月误诊为占位性病变的患者进行回顾性分析。采用飞利浦 64 排螺旋 CT 及 GE3.0T 磁共振头颅线圈常规 propeller 序列轴位 T2WI，轴位 T1WI flair;flair 序列轴位 T2WI，失状位 T1WI;b 值为 1000 的轴位 DWI 检查。
结果
患者男性，73 岁，2017-06-14 以“颅脑占位”入住我院，查体未见阳性体征。CT 示右额叶区低密度影；MRI 平扫示颞顶叶交界区见斑片状长 T1，长 T2 信号影，T2flair 高信号， DWI 高信号；MRS 示 NAA 波峰明显降低，Cho 峰明显升高；无结核中毒症状。10-04 出院。2018-10-09 再次以“肺癌”入住我院，病理示右肺下叶肉芽肿性炎，可见干酪样坏死；痰抗酸染色阳性。抗结核治疗后，颅内病变好转。
结论
颅脑结核没有较为典型的外在表现，不易准确诊断，行螺旋 CT，MRI 及 MRS 检查，可以为诊断及鉴别诊断提供重要的依据，有助于颅脑结核的早期发现。

Standardized Training of Radiology Residents in Imaging Diagnosis: Exploration of the Training Effect Based on Structured Reporting

Chao Han[1], Min Cao[2], Yi Liu[1], Xiaochao Guo[1], He Wang[1], Xiaoying Wang[1], Suisui Zhang[3]
1. Peking University First Hospital
2. Beijing Cancer Hospital
3. Beijing Smart Tree Medical Technology Co., Ltd.

Object: We hypothesized that structured reporting would be an effective tool for standardized training of radiology residents, and in this paper, we explored the training effect of imaging diagnosis based on structured reporting in a radiology residency training program. **Methods:** The radiology residents were recruited for the 3-month training program. They were divided into a junior (training <1 year, 9 residents) and a senior (training ≥1 year, 13 residents) group. The training covered imaging diagnosis of 22 diseases (classified as vascular evaluation, descriptive diagnosis, diagnosis for classification and preoperative staging evaluation of neoplastic diseases), with 3 types of imaging modalities (X-ray, CT, and MRI). The residents were asked to attend multiple training courses and were given many cases for self-practice. At the end of the program, the residents were tested and evaluated. **Results:** The average reporting score was 74.9±8.3, and the overall pass-rate of residents was 86.4%. There was no significant difference in reporting score between the junior and senior residents (76.5±9.2 to 73.2±10.4, $P>0.05$), as well as the pass-rate (88.0% to 84.7%, $P>0.05$). The average reporting score of X-ray, CT, and MR was 62.7±10.7, 76.4±10.0 and 76.7±6.0 with significant difference ($P<0.001$); and the pass-rate was 68.2%, 88.9% and 88.2% with significant difference ($P<0.05$). The average reporting score of the 4 categories was 78.3±18.8, 76.1±18.6, 74.2±14.1 and 72.9±17.1 with no significant difference ($P>0.05$); and the pass-rate was 92.6%, 88.5%, 79.4%, and 89.5% respectively ($P>0.05$). **Conclusions:** Structured reporting was an effective tool for standardized training of radiology residents covering various diseases, suitable for both senior and junior residents, and the junior residents progressed remarkably after training.

优化对比剂注射方案对头颈部 CTA 图像质量的影响

田甜, 何其舟
西南医科大学附属中医医院

目的：比较相同碘浓度下，不同的对比剂注射方案在第二代双源 CT 血管造影(CTA)中对颅脑 CTA 图像质量的影响。
方法：将 100 例拟行颅脑 CTA 患者随机分为 2 组，A 组以 4ml/s 的速率将 60mL 对比剂一次性注入，再以相同速率注入 20ml 生理盐水。B 组以第一期 4ml/s 的速率注射 40mL，第二期以 4ml/s 的速率注入混合 50%生理盐水与 50%对比剂共 20ml，第三期以 4ml/s 的速率注入 20ml 生理盐水。两组扫描方案均采用 80KV，250mAs，螺距 Pitch0．6 。分别分析其横断位图像，MPR 图像，分别测

量主动脉弓层面，左锁骨下动脉，右颈总动脉分叉段，基底动脉，右侧大脑中动脉，窦汇的 CT 值，同时结合 VR 图像观察颈静脉的显示情况。
结果：A 组窦汇的 CT 值明显高于 B 组，(P＜0.05)各组间 CT 值存在显著差异。两组在各动脉的 CT 值无明显差别(P＞0.05)。
结论：双期混合注射碘对比剂在头颈部 CTA 扫描中静脉的干扰低于单期注射法，图像质量优于单期注射法，同时也减少了对比剂用量。

The Mechanisms of Contrast-Induced Acute Kidney Injury and Its Association with Diabetes Mellitus

Yanfei LI,Ke Ren
Department of Radiology, Xiang'an Hospital of Xiamen University

Abstract:
Contrast-induced acute kidney injury (CI-AKI) is the third most common hospital-acquired AKI after AKI induced by renal perfusion insufficiency and nephrotoxic drugs, taking great adverse effects on the prognosis and increasing hospital stay and medical cost. Diabetes mellitus (DM) with or without diabetes nephropathy (DN) is an independent risk factor for CI-AKI. The incidence of CI-AKI significantly increases in patients with renal injury, especially in DM-related nephropathy.The etiology of CI-AKI is not fully clear and researches on how DM becomes a risk factor of CI-AKI is limited.

This review describes the mechanism from three aspects. **① Pathophysiological changes of CI-AKI in kidney under high-glucose status (HGS).** HGS can improve the oxidative stress and increase ROS. It causes stronger vessel constriction and insufficient oxygen supply in kidney via vasoactive substances. HGS also aggravates some ion pump load and the latter increases oxygen consumption. CI-AKI and HGS are mutually causal, making the kidney function continue to decline. **② Immunological changes of DM promoting CI-AKI.** Some innate immune cells and pattern recognize receptors (PRRs) in DM and/or DN may respond to some damage associated molecular patterns (DAMPs) formed by CI-AKI. These effects overlap with some pathophysiological changes in hyperglycemia.**③ Signaling pathways related to both CI-AKI and DM.** These pathways involved in CI-AKI are closely associated with apoptosis, inflammation and ROS production, and some studies suggest that these pathways may be potential targets for alleviating CI-AKI.

In conclusion, the pathogenesis of CI-AKI and the mechanism of DM as a risk factor for CI-AKI, especially signaling pathways, need further investigation to provide new clinical approaches to prevent and treat CI-AKI.

学龄儿童腹部能谱检查中肝实质单能量图像的评估

李笑,杨楠
天津市儿童医院

目的：对儿童肝实质的能谱 CT 的单能量图像进行评估，得到显示正常肝脏实质的最佳单能量水平。
方法：收集 26 名因其他疾病需做腹部增强检查且肝脏正常的儿童（13 名女童和 13 男童；年龄范围 5-13 岁；平均年龄 6.85±1.97 岁）的能谱 CT 图像数据，并在 40-75keV 范围里重建了以 1keV 为间隔和在 75-140keV 的范围里重建了以 5keV 为间隔的单能量图像。测定记录肝脏实质和同层面的竖脊肌的 CT 值和标准差，并得出其信噪比和肝脏实质的噪声。首先以肝 CT 值为标准对单能量图像进行筛选；其次以噪声和信噪比为客观评估参数筛选出信噪比噪声最佳的单能量图像；最后让两位资深的诊断医师运用 5 级量表对相当于儿童 120kvp 的 65keV 单能量图像和最佳信噪比的单能量图像进行主观评估。
结果：肝脏的 SNR 从 140KeV 到 40KeV 逐渐降低（SNR:9.31-6.92）。噪声从 40KeV 到 140KeV 逐渐降低(噪声：33.33-8.22)。由于增强后的肝脏实质的 CT 值至少大于 116HU，所以根据信噪比和噪声，得出肝脏的最佳单能量为 68kev。68kev 的最佳单能量图像的主观图像质量评分、噪声和信噪比都优于相当于儿童的 120kvp 的 65keV 单能量图像(依次为：$p=0.048, p<0.05; t=-22.857, p<0.001; t=8.061, p<0.001$)。
结论：儿童腹部 GSI 增强检查中，观察肝实质的最佳单能量为 68keV。

APP/PS-1 转基因小鼠病理学改变及其对行为学的影响

李铭华
同济大学附属同济医院

目的 观察 APP/PS-1 转基因阿尔茨海默病(Alzheimer’s Disease, AD)小鼠模型脑部β-淀粉样蛋白（β-Amyloid Protein, Aβ）沉积、神经元缺失以及胶质细胞的活化、增生等情况；并比较不同月龄的 APP/PS-1 转基因小鼠和对照组学习记忆能力的差异，及其与病理学改变之间的关系。
方法 3、6、9 个月龄的 APP/PS-1 转基因小鼠各 6 只作为实验组，同龄野生型小鼠做为对照组；应用 Morris 水迷宫对小鼠进行学习与记忆能力的检测；取小鼠脑组织切片经尼氏染色、Aβ免疫组织化学染色以及铁蛋白-Aβ和神经胶质纤维酸性蛋白（Glial Fibrillary Acidic Protein, GFAP）-Aβ免疫荧光双标记；数据分析软件：采用 SPSS12.0 统计分析相关数据。
结果 6 月龄的 APP/PS-1 转基因小鼠脑部 Aβ斑块形成，而 9 月龄的 APP/PS-1 转基因小鼠皮质和海马内 Aβ沉积斑块数量增多；6、9 月龄的 APP/PS-1 转基因小鼠脑部出现神经元缺失，胶质细胞的活化、增生；随着月龄的增加，6、9 月龄 APP/PS-1 转基因小鼠的学习记忆能力下降（$p<0.01$）。
结论 Aβ的表达在 APP/PS-1 转基因小鼠的病理过程中起了重要作用；沉积的 Aβ斑块使得胶质细胞活化增生，引起神经元的缺失，由此导致了 6、9 月龄 APP/PS-1 转基因小鼠的学习记忆能力出现下降。

EPO-2537
婴幼儿磁共振头颅检查中亲属陪护方式的优化

潘云龙
四川大学华西医院

目的：探究婴幼儿 MRI 检查中亲属陪同方式的优化。**材料与方法：**收集 2017 年 12 月～2019 年 3 月到我院行头颅磁共振检查的婴幼儿 229 例，常规行口服水合氯醛镇静。按检查时亲属陪同方式可分为三组： A 组：怀抱陪护方式，亲属怀抱婴幼儿同床进入磁体；B 组：足侧陪护方式，亲属俯在婴幼儿足端与婴幼儿同床一同进入磁体；C 组：传统陪护方式，即婴幼儿单独放在检查床上，亲属站在磁体旁边监护。记录受检婴幼儿首次检查的成功率，并评价检查成功的婴儿头颅图像的优片率。采用多样本率的卡方检验与 Cruskal-Wallis 秩和检验法，比较三种陪同方式在成功率及图像质量方面的差异。**结果：**①各组的成功的率为：A 组（90.69%）及 B 组（83.72%）均高于 C 组（58.13%）（P＜0.05），但 A、B 两组之间没有统计学差异。②优片率的比较：B 组（75.3%）、C 组（88.1%）的优片率均高于 A 组（51.6%）（P ＜0.05），但 B 组与 C 组之间优片率无统计学差异。**结论：**亲属俯卧在婴幼儿足端进入磁体的方式能提高婴幼儿头颅 MRI 检查的成功率，且图像质量高，可作为常规首选。个别依赖性强的婴幼儿则可尝试怀抱陪护式。

合肥平安健康检测中心

胸腹部联合扫描在降低 CT 辐射剂量中的临床应用研究

吴畅

【摘要】
目的：探讨胸腹部联合扫描在降低 CT 辐射剂量中的应用价值。
方法：回顾性分析 130 例胸部、130 例腹部及 120 例胸腹部 CT 扫描患者的临床及影像资料，分析并比较胸腹部拆分扫描与联合扫描在 CT 辐射有效剂量中的差异。
结果：针对年龄无统计学显著差异（T-test, P＞0.05）的三组 CT 扫描患者：130 例胸部、130 例腹部及 120 例胸腹部患者，其 CT 检查总 DLP 分别是 369.52±63.09、340.28±65.62、481.05±60.12。利用欧盟委员会(CEC) 关于 CT 质量标准指南 [6] 中不同部位的转换系数乘以剂量长度乘积得出有效剂量，计算得出胸腹部拆分扫描有效剂量之和与联合扫描所受辐射有效剂量分别为 11.38604±2.05683，15.3936±1.92384。在辐射有效剂量的对比上差异具有统计学意义（T-test, P＜0.05）。
结论：胸腹部 CT 联合扫描较拆分扫描可明显降低患者所受辐射有效剂量，在此类检查中采用拆分扫描不符合辐射防护要求。

增强磁共振神经成像与常规磁共振在腰神经根受压的对比研究

洪晨卉,林光武,陈嘉艺
复旦大学附属华东医院

目的：比较常规腰椎磁共振平扫和增强磁共振神经根成像对腰神经根各段受压检出率的差异及评价受压等级的一致性。
方法：回顾性分析行常规腰椎磁共振平扫及增强磁共振神经根成像扫描的 67 例患者的临床及影像学资料，所有患者均行常规腰椎磁共振平扫、增强 T2 3D-STIR-SPACE 序列扫描。应用改良 Pfirrmann 分级系统，将神经根受压评分为 0 分、1a 分、1b 分、2 分、3 分，受压等级为 0 等级、2 等级、3 等级。将神经根分为三段进行评估，分别是神经根节前段（I 段）、神经根节段（II 段）、神经根节后段（III 段）。采用配对 x 2 检验比较两种成像方法的腰神经根分段受压检出率，Kappa 检验评价应用两种方法所得的受压等级的一致性，并进行统计学分析，P<0.05 为差异具有统计学意义。
结果：1. 应用常规腰椎磁共振平扫和增强磁共振神经根成像分别评估 L3-S1 共 1116 段神经根，左右两侧神经根受压无统计学差异（p<0.05）。两种***方法***对腰神经根各段受压检出率的比较，S1 神经根 I 段，检出率差异无统计学意义（P>0.05），L3-L5 神经根节段检出率差异均具有统计学意义（p<0.05）。常规磁共振检查受压检出率在 L3-L5 神经根 I 段和 II 高于增强磁共振神经根成像；增强磁共振神经根成像受压检出率在 L3-L5 神经根 III 段神经根高于常规磁共振检查。2. 应用两种方法评价 L3-S1 神经根各节段受压等级的一致性，差异均具有统计学意义（P<0.05），且一致性 I 段>II 段>III 段，增强磁共振神经根成像能够更好地区分受压 2 等级和 3 等级。
结论：常规腰椎磁共振平扫和增强磁共振神经根成像均能够评价腰神经根各段受压情况。两种方法结合能够更全面评估腰神经根各节段受压情况，为临床诊治提供更准确的影像学信息。

脑卒中 MR 筛查方案浅析

杨永贵
厦门医学院附属第二医院

目的：探讨 MR 新技术在脑卒中筛查的应用可行性。
方法：初级脑卒中 MR 筛查方案包括常规结构成像（T1WI、T2WI、T2 FLAIR，以横断位为主，必要时辅于矢状位和/或冠状位。）和功能与血管成像（DWI、3D TOF MRA、PLD=1.5s 的 ASL）；高级脑卒中 MR 筛查方案是在初级脑卒中 MR 筛查方案的基础上，增加观察血供代偿情况的 PLD=2.5s 的 ASL 和观察出血情况的 SWI、所有受检者均采用 GE Discovery Silent（750W） 3.0T MRI 仪进行检查。
本研究项目经过医院的伦理学委员会审查通过，所有受检者均在检查前了解了检查内容并签署了知情同意书。
结果：初级脑卒中 MR 筛查方案的特色，包括 DWI 结合 FLIAR 序列，脑脊液抑制，早期筛查小卒中；3D TOF 序列，2 分 25 秒血管成像，快速脑血管筛查；3D ASL 不打药全脑灌注成像。其优势在于经济快速，可排除大部分的脑血管病变；临床有症状，而常规结构成像、DWI 及血管成像无明显特征性病灶，PLD=1.5 ASL 可早期筛查卒中前兆病变，如：TIA 等。
高级脑卒中 MR 筛查方案特色，包括：与 PLD=1.5 的 3D ASL 对比，可有效判定血供代偿情况；SWAN 可早期筛查颅内微出血，如：脑白质淀粉样变等。其优势在于全面放心，可发现 TIA 及早期脑出血；有效地进行干预性治疗方案制定及预后评估。
结论：初、高级脑卒中 MR 筛查方案可以区分正常、隐匿性病变、慢性血管狭窄或闭塞、侧枝循环评估、TIA、脑小血管病，且可规范地为人工智能在脑卒中的应用提供数据库，将为脑卒中筛查提

供详尽的结构与功能影像信息，为临床治疗方案的制定与预后评估提供准确依据，对于脑卒中的早期筛查具有重要意义。

EPO-2541
MBIR 在 CT 血管成像中的价值：体模和临床应用研究

贾永军,于勇,段海峰
陕西中医药大学附属医院

目的 比较自适应统计迭代重建(ASIR)和基于模型的迭代重建(MBIR)2 种迭代重建对 CT 血管成像（CTA）质量的影响。
方法 （1）体模研究：CT 扫描静止状态下容纳 9 支试管的血管模型,试管内分别填满纯水、1mgI/ml、2mgI/ml、5mgI/ml、10mgI/ml、20mgI/ml、30mgI/ml 溶液（两支,一支置于中央）和 30 mgCa/ml 钙溶液,得到原始扫描数据后分别使用标准算法 ASIR40(40%ASIR 与 FBP 混合)和 MBIR 算法重建层厚 0.625 mm 的图像后进行对比分析。选取 5 个固定层面在试管中心及周围酯性基质放置感兴趣区(ROI)测量其 CT 值与标准差值(SD）,SD 代表噪声。比较各重建算法图像各支试管内不同浓度碘溶液噪声和以酯性基质为背景的对比噪声比(CNR)。（2）临床应用研究：搜集超声诊断头颈部及下肢动脉粥样硬化并行 CTA 进一步检查病例 24 例(头颈部 14 例、下肢 10 例)，客观方面通过放置 ROI 测量三种算法重建图像血管内及周围肌肉 CT 值及 SD 值，比较各重建算法图像血管内噪声和以肌肉为背景的 CNR，主观方面在图像噪声、血管分支、斑块分析方面对图像进行 4 分法主观评价。
结果 体模研究中，相比 ASIR40，MBIR 噪声下降 45.56%,CNR 升高 124.27%,差异具有统计学意义（P＜0.05），且对比剂密度越大，其噪声及 CNR 改善越明显。在头颈部及下肢 CTA 临床应用研究中，相比 ASIR,MBIR 图像噪声减低，CNR 增大,差异具有统计学意义（P＜0.05）。两位医师对临床图像主观评分一致性好（kappa 值＞0.7），MBIR 图像主观评分明显高于 ASIR,差异具有统计学意义（P＜0.05）。
结论 相比于 ASIR 重建，MBIR 有助于降低 CTA 图像噪声、提高 CNR 和粥样斑块成像质量，可为降低 CTA 辐射剂量或对比剂用量提供潜能。

EPO-2542
3.0T 弥散加权成像 ADC 值对评价肾盂癌侵袭性的价值

吕琦,郑少强,王培军
同济大学附属同济医院

目的 探讨 3.0T 磁共振弥散加权成像对肾盂癌的诊断价值及其表观弥散系数（apparent diffusion coefficient，ADC)值与病理分级及分期的关系。

方法 回顾性分析 29 例肾盂癌的临床资料，行常规 MRI 扫描及 b 值=0、800s/mm^2DWI 检查，分析并记录病灶的 DWI 信号特点，病灶区域选择一大一小 2 个感兴趣区（ROI），比较发生部位（左右）与性别间 ADC 值的差异，比较正常肾实质、尿液及病灶的 ADC 值，利用独立样本 t 检验分析比较两组不同大小 ROI 的 ADC 值的差异，分析不同病理分级、分期的 ADC 值的差异。并采用免疫组织化学方法检测 Ki67 标记指数（label index，LI）在肾盂癌的表达及其与 ADC 值的关系。

结果 b 值为 800s/mm^{2}时，利用 DWI 诊断肾盂癌的敏感性为 96.6%，特异性 89.3%，准确率 93.0%，阳性预测值 90.3%，阴性预测值 96.2%。肾盂癌与正常肾实质及尿液差异均有统计学意义（P<0.05）。不同大小 ROI 的 ADC 值间差异无统计学意义。低级别(G1-2)肿瘤的 ADC 值较高级别（G3 级）高，差异有统计学意义（P<0.01），局限于肾盂及输尿管的（Ta-2 期）较有局部侵犯（T3-4 期）及以上分期的 ADC 值高，差异有统计学意义（P<0.01），低级别(G1-2)及局限性肾盂及输尿管癌的 ADC 值较高级别及晚期（T3-4 期）的 ADC 值高（P值均为 0.000）。ADC 值与 Ki67 的表达量呈反相关(r=−0.87, P=0.000)。

结论 ROI 的大小对于尿路上皮癌的鉴别可能意义不大，在不使用造影剂的情况下，DWI 有利于术前评估肾盂及输尿管癌的组织学分级及 T 分期。

儿童放射技术及诊断的质量控制人工智能系统

王静石
大连市妇女儿童医疗中心

目的

本研究围绕儿童放射技术及诊断的质量控制，构建数据集并运用机器学习、深度学习、自然语言处理等技术，对儿童放射的检查前问询、影像、诊断报告、放射防护进行质量控制，构建儿童放射技术及诊断的质量控制人工智能系统。

方法

（1）构建检查前问询、影像、诊断报告、放射防护参数数据库

搜集 1000 例儿童 DR 正位胸片的临床资料，包括检查前问询、影像、诊断报告、DR 设备相关参数（如，体重(公斤数)、mAs、kV）。由具有资质的医生给出不同的检查前问询结果对应的质控方案，勾画影像中肺、脊柱、锁骨的轮廓，给出诊断报告的标准格式，以及 DR 设备相关参数的合理性。

（2）提出检查前问询、影像、诊断报告、放射防护的质控方案

基于步骤（1），制定质控方案：通过构建检查前问询质控模型、影像质控模型、诊断报告质控模型、放射防护质控模型完成上述环节的质量控制。

（3）基于人工智能技术构建儿童放射技术及诊断的质量控制人工智能系统

通过机器学习、深度学习、自然语言处理等技术实现步骤（2）提出的方案，并基于步骤（1）构建的数据库训练各模型。将训练完毕的模型集成为儿童放射技术及诊断的质量控制人工智能系统。

上述模型采用 K-Fold 交叉验证法进行训练，其中 K 分别取 3、5、10。训练数据集为 1000 例儿童 DR 正位胸片的临床资料：检查前问询、影像、诊断报告、DR 设备相关参数。当 K=3 时，总训练时间约为 300 个小时；当 K=5 时，总训练时间约为 230 个小时；当 K=10 时，总训练时间约为 210 个小时。

结果

K=5 时训练的模型最优，由此构建的系统可以甄别出检查前问询、影像、诊断报告、放射防护等环节的质量控制问题，并给出对应的提示，提高了医疗服务质量，有效地保护了患者的诊疗安全。

结论

本研究创新提出儿童放射技术及诊断的质量控制人工智能系统，国内尚无此类报道。首次提出了检查前问询、影像、诊断报告、放射防护的深度学习质控模型。

Utilizing Perfusion CTP Software to Measure Infract Core and Penumbra Volume in Acute Ischemic Stroke

Zhang Shi[1],Ming Yang[2],He Wang[3],Jianping Lu[1]
1.Changhai Hospital affiliated to Naval Military Medical University
2. NeuroBlem Ltd. Co., Shanghai, China
3. Institute of Science and Technology for Brain-Inspired Intelligence, Fudan University,

Purpose: To evaluate the accuracy of the various commercial computed tomographicperfusion (CTP) software packages in predicting the ischemic core and mismatch volume of patients with acute stroke.
Materials and Methods: 311 patients with acute strokes treated using CTP software between September 2017 and December 2018 were retrospectively analyzed. All CT scans were performed using a 256-slice CT scanner and CT perfusion images were processed using three different software packagesincluding Brain CT Perfusion package of IntelliSpace Portal (ISP), RAPID and F-STROKE. The ischemic core and penumbra volume were calculated and recorded by the three commercial software packages. Wilcoxon test for paired differences was used as a nonparametric test. P values of <0.05 were considered statistically significant. A volumetric agreement comparison between infarct core and penumbra volume was performed for each software using Bland-Altman plots and intra-class coefficient (ICC). Linear correlation and Bland-Altman analysis with 95% limits of agreement were used to examine the agreement of each two methods.[1]
Results:295 patients met the inclusion criteria.The infarct core volumes from ISP software were significantly larger than that from the other two software ($p<0.001$). F-STROKEyields significantly lowered infarct core volume and penumbra volumescompared with RAPID ($p<0.01$), and the infarct core volumes and penumbra volumes in RAPID were 3% and 8% larger than those in F-STROKE respectively. As the linear correlation analysis shown in Figure-1, RAPID and F-Stroke gave significant linear correlation to infarct core volume ($R^2= 0.942$) and penumbra volumes ($R^2= 0.935$). The Bland-Altman analysis shows that the infarct core and the penumbra volumes from any two of the three methods are mostly within limits of agreement. The ICC's for F-Stroke and RAPID in measuring the infarct core and the penumbra volume were 0.972 and 0.971, respectively.
Conclusion: High precision and accuracy were key characteristics for the F-STROKE and RAPID software. However, F-STROKE software had better accuracies in the removal of the cerebrospinal fluid and brain sulci, compared with the RAPID software.

EPO-2545

3.0T MRI 扩散加权成像及灌注加权成像在肾脏良恶性肿瘤鉴别诊断中的价值

许晓雯,王培军
同济大学附属同济医院

目的 评价 3.0T MRI 扩散加权成像(DWI)和灌注加权成像(PWI)在肾脏肿瘤良恶性及不同病理组织学类型间鉴别诊断的价值。

方法 15 例正常志愿者及 46 例经病理证实的肾脏肿瘤患者（肾透明细胞癌 18 例，乳头状肾细胞癌 8 例，肾嫌色细胞癌 7 例，肾血管平滑肌脂肪瘤 13 例）行 3.0T MRI DWI 及 PWI 扫描。采用单因素方差分析方法比较 PWI 所得 Ktrans、Kep、Ve，以及 DWI 所得 ADC 值在不同病理类型肾脏肿瘤之间的差异。应用 ROC 曲线比较 DWI 及 PWI 对于鉴别肾脏肿瘤良恶性的诊断价值。

结果 正常肾实质与各病理类型肾脏肿瘤之间 ADC 值、Ktrans、Kep 及 Ve 值差异均有统计学意义(P＜0.05)。肾脏良性肿瘤的 ADC 值高于各组恶性肿瘤；恶性肿瘤中，肾透明细胞癌的 ADC 值高于乳头状细胞癌及嫌色细胞癌(P＜0.05)。肾脏各组恶性肿瘤的 Ktrans 值及 Ve 值均高于良性肿瘤(P＜0.05)，恶性肿瘤中，仅肾透明细胞癌的 Kep 值高于良性肿瘤(P＜0.05)。肾透明细胞癌、肾乳头状细胞癌及肾嫌色细胞癌的 Ktrans 值逐渐减低，差异均具有统计学意义(P＜0.05)。肾透明细胞癌的 Ve 值高于肾乳头状细胞癌 Ve 值（P＜0.05)。ROC 曲线鉴别肾脏肿瘤良恶性的诊断价值，Ktrans AUC=0.937 ，灵敏度和特异度分别为 87.9%和 85.7%，临界值为 0.38/min；ADC AUC=0.823，灵敏度和特异度分别为 72.7%和 92.9%，临界值为 1.40×10-3mm2/s；Ve AUC=0.803，灵敏度和特异度分别为 78.8%和 71.4%，临界值为 0.29/min；Kep 则表现出较低的鉴别诊断价值。

结论 3.0T MRI DWI 及 PWI 能有效鉴别肾脏肿瘤良恶性及不同病理组织学类型。其中 Ktrans 值的诊断价值最高，但 ADC 值所提供的信息也是不可替代的。

EPO-2546
比较双源双能 CT（DECT）及单源双能 CT（SDECT）对于痛风患者痛风结节的显示能力

姚婧,王培军
同济大学附属同济医院

背景和目的

痛风是一种炎症性的关节病，早期表现为急性关节炎，晚期可能引起痛风结节形成、运动障碍、肾功能不全甚至心血管疾病。双能 CT 已用于痛风的诊断，并具备潜在的应用优势。既往所谓的双能 CT 是具备两个球管的双源双能 CT（DECT）。近年来，已经有研究利用传统的单球管 CT 进行双能量扫描，其发电机在单循环 0.5 毫秒内进行高低管电压的快速切换，从而获取双能量数据，即所谓的单源双能 CT（SDECT）。本研究使用双源双能 CT（DECT）及单源双能 CT（SDECT）对同一批痛风病人进行扫描，比较这两种成像方法对于痛风结节的显示能力。

资料和方法

收集 2016 年 10 月至 2017 年 2 月在复旦大学附属中山医院就诊的确诊为痛风的 21 例患者，入选者符合 2015 年 ACR/EULAR 痛风分类标准。所有病人在急性发作的一周内行 DECT 及 SDECT 的双足、踝关节/双膝关节/双腕关节扫描，两次扫描间隔时间不超过两天，无降尿酸药物影响。2 位放射科主治医师对临床数据和诊断设盲，独立阅读所有病人的 DECT 及 SDECT 图像并给予诊断。观察有无痛风结节沉积，记录痛风结节沉积部位、大小、病变关节痛风结节内的尿酸盐含量及检查的辐射剂量，当最初意见不同时，通过协商达到一致。采用 SPSS 19.0 软件,将患者的两组影像学表现进行卡方检验,P<0. 05 被认为统计学意义。

结果

两组检查对 N（痛风结节总量）的检出，尤其是 Nb1（斑点状）及 Nb2（结节状）具有统计学差异（P<0.001,P=0.038），两组检查 DLP 均值差异具有统计学意义（P<0.001）。

结论

对于痛风结节的检出，尤其是 d＜1.0cm 的痛风结节，DECT 优于 SDECT，适用于进行降尿酸治疗病人的临床监测；SDECT 辐射剂量较 DECT 小，适用于一般情况差、检查次数多等对辐射剂量有特殊要求的人群。

6.Shantou Central Hospital
7.The First Affiliated Hospital of Xinjiang Medical University
8.Shanghai Ninth People's Hospital
9.Sir Run Run Shaw Hospital
10.Qilu Hospital of Shandong University (Qingdao)

Abstract:
Objective: We compared 80-kV protocols with reduced iodine delivery rate (IDR) with a standard protocol at 100-kV in coronary and craniocervical computed tomography angiography (CTA) for image quality and radiation dose.

Methods: This was a prospective, phase IV, observational, multicenter study of 1,214 patients scheduled for coronary CTA or craniocervical CTA in 10 centers of China. All sites used the same dual-source scanner. There were 4 protocols: one at 100-kV using iopromide 370 mg I/ml with IDR of 1.48 gI/s and other three at 80-kV using iopromide 370 mg I/ml at IDR of 1.2 gI/s or iopromide 300 mg I/ml at IDRs 1.2 gI/s or 0.96 gI/s. CT values, image quality, contrast-to-noise ratio (CNR) and signal-to-noise ratio (SNR), radiation and iodine dose were compared among protocols.

Results: The 80-kV protocol with an IDR of 1.2 gI/s had the highest mean attenuation among all. All 80-kV protocols produced images of diagnostic quality, despite CNR and SNR being higher. Reduction of IDR to 0.96 gI/s at 80-kV did not lead to further enhancement in CT value and had inferior image quality. The average radiation dose and iodine dose of all 80-kV protocols was significantly lower compared to 100 kV protocol in both coronary and craniocervical CTA.

Conclusions: Coronary and craniocervical CTA at 80-kV with low IDR can obtain diagnostic image quality with lower radiation and iodine dose without significant change in SNR and CNR. A further reduction of the IDR was not beneficial. This trial is registered with ClinicalTrials.gov, number NCT02840903.

血吸虫肠病合并结直肠癌的计算机 X 线断层扫描影像学表现

张博,顾国军,沈星,王培军,张炜
同济大学附属同济医院

目的 回顾性分析血吸虫肠病合并结直肠癌的 CT 表现，提高对该病诊断的准确性。
方法 2007 年 1 月至 2012 年 12 月同济大学附属同济医院和昆山市中医院收治的 80 例经病理学检查证实为血吸虫肠病合并结直肠癌患者，均行腹部 CT 平扫十增强扫描，由两名放射科医师采用盲法阅片，对病灶部位、形态、大小，钙化特点及强化方式，有无转移进行评估；同时收集同一地区非血吸虫结直肠癌患者 20 例作为对照。
结果 80 例血吸虫肠病合并结直肠癌患者的肿瘤以降结肠、乙状结肠和直肠为主，表现为管壁不规则增厚，伴软组织团块，累及肠管长度为(21.35±4.50)cm；其中单发病灶 68 例，多发病灶 12 例，表现为多节段肠管受累；肿瘤组织均可见不同形态的钙化灶，钙化发生比例为 100.0%，主要表现为线状、斑点状及小斑片状钙化影，其中 59 例钙化边缘模糊，21 例钙化边缘较清晰；增强早期 68 例病灶明显强化，均匀强化 45 例，不均匀强化 23 例，增强晚期 73 例持续强化，坏死少见；仅 2 例伴发肝脏转移瘤，均无淋巴结转移。20 例非血吸虫结直肠癌患者肿瘤均为单发病灶，表现为肠壁不规则增厚，伴局部溃疡形成，累及肠管长度为(6. 90±3. 40)cm；肿瘤组织内均未见钙化影；均表现为增强早期病灶明显不均匀强化，可见低密度坏死区存在，增强晚期不同程度降低；4 例伴发肝脏转移瘤。与非血吸虫结直肠癌患者比较。血吸虫肠病合并结直肠癌患者多发病灶的比例较高(P=0.000)，病变管壁长度较长(P=0.000)，钙化灶发生比例较高(P=0.000)，增强早期病灶明显不均匀强化比例较低(P=0. 000)，晚期病灶持续强化比例较高(P=0.000)；肝脏转移发生比例较低(P=0.014)。
结论 血吸虫肠病合并结直肠癌在 CT 上特征性表现为瘤组织内不同形态钙化影，钙化边缘模糊，并累及多节段肠管；血道转移及淋巴道转移均少见。

The impact of adaptive statistical iterative reconstruction presets for scanning on radiation dose and image quality in chest CT: a chest phantom study

Wei Wei,Yongjun Jia,Lihua Fan,Nan Yu,Chuangbo Yang,Yong Yu,Haifeng Duan
Affiliated Hospital of Shaanxi University of Chinese Medicine

Purpose The use of adaptive statistical iterative reconstruction (ASiR-V) presets change the requirement for x-ray dose. The purpose of this study was to evaluate the effect of ASiR-V presets on radiation dose and image quality in chest CT.
Methods A chest phantom was scanned on a GE Revolution CT with tube voltage of 120kVp, automatic tube current modulation for obtaining a noise index of 14HU. The ASiR-V preset weights were 0, 20%, 40% and 60%. Images were reconstructed using ASiR-V weightings corresponding to the presets (for example, 40% ASiR-V reconstruction for scans with 40% ASIR-V preset). The dose length products of all scans were recorded, and the effective doses (ED) were calculated and compared. The CT and standard deviation (SD) values of lung tissue, paraspinal soft tissue, aorta and vertebral body were measured and used as objective indicators. Subjective evaluation included the contrast, noise and sharpness of mediastinal and chest wall structures displayed in the mediastinal window and bronchovascular bundles displayed in the lung window.

Results With the increase of the ASiR-V preset (0%-60%), ED (in mSv) decreased progressively and significantly (5.88, 4.01, 2.5 and 1.47 for presets of 0, 20, 40 and 60%, respectively). However, the SD values of the different tissues (lung tissue, paraspinal soft tissue, aorta and vertebral body) did not change significantly (P>0.05). For the subjective image quality evaluation, the scores in the lung and mediastinal windows stayed the same statistically with presets from 0 to 40% and began to decline after 40%. The subjective image scores with 60% preset at the lung (4.2±2.98) and the mediastinum window (3.2±1.76) were significantly lower than the values of (4.7±4.34 and 4.4±2.13) with 40% preset (P<0.05). ED with 40% ASiR-V preset (2.56mSv) was 56.46% lower compared with 0% ASiR-V preset (5.88mSv).
Conclusion The ASiR-V presets can be selected before CT scans to reduce radiation dose without significantly affecting image quality. ASiR-V with 40% preset was determined to ensure diagnosis needs, and reduce dose by more than 50% at the same time in chest CT.

EPO-2550
16cm 宽体探测器 CT 单次轴扫模式在成人急性脑出血患者检查中的应用

赖建东,张熙萌,朱亚男,周和平
安康市中心医院

目的：探讨 16cm 宽体探测器 CT 单次轴扫模式在成人急性脑出血患者检查中的优势。
方法：前瞻性登记 90 例成人急性脑出血患者（发病时间 1.5-10 小时），随机分为两组，第 1 组 45 例（29 名男性，16 名女性，年龄范围为 40-90 岁），在 256 排 16cm 宽体探测器 CT 上进行单次轴扫，扫描条件为 120kVp / 120mA、1.0s / r，使用 70％的 ASIR-V 重建。第 2 组 45 例（25 名男性和 20 名女性，年龄范围 41-80 岁），在 64 排 4cm 探测器 CT 上以多重轴扫扫描，条件为 120kVp / 180mA、0.5s / r，使用常规滤波反投影重建。比较两组的扫描参数（曝光时间和辐射剂量），定量图像质量（出血灶、小脑半球、半卵圆中心（背景）的 CT 值和 SD 值、信噪比（SNR）、对比噪声比（CNR））和主观图像质量。使用 SPSS 2.0 软件进行统计分析，使用独立样本 t 检验评估连续变量，使用 Mann-Whitney 秩和检验来评估图像质量。
结果：第 1 组的曝光时间为 1.0s，第 2 组的曝光时间为 10.9±1.14s，第 1 组比第 2 组曝光时间快了 90.8％；两组出血灶的 CT 值相似（p> 0.05）。第 1 组和第 2 组的辐射剂量无差异（240.82±12.33mGy vs. 233.96±21.94mGy，p> 0.05），而第 1 组的图像噪声比第 2 组明显较低（3.70±0.57HU vs. 6.35±0.58HU，半卵圆中心层面），SNR 和 CNR 值高于第 2 组（均 p <0.001）。所有图像均可用于诊断，但在运动伪影、硬化伪影、大脑灰白质的对比度、出血灶和外周水肿的对比度、整体图像质量方面，第 1 组均优于第 2 组（p <0.05）。此外，第 1 组无重复扫描病例，而第 2 组有 5 例（45 例中）由于运动伪影而重复扫描。
结论：与 64 排 CT 4cm 探测器相比，256 排 CT 16cm 宽体探测器单次轴扫可缩短急性脑出血患者的检查时间，并提高检查成功率，提高图像质量。

Gemstone spectral CT imaging in the maxillofacial and neck region: Initial Results of scanning dose and image quality compared with conventional CT

Yu Liu
Ninth People's Hospital, Shanghai Jiao Tong University School of Medicine

Purpose: To compare radiation dose and image quality between gemstone spectral imaging (GSI) at 70kev monochromatic image and conventional CT imaging at 120kV polychromatic image in the maxillofacial and neck region.
Method: 40 patients who underwent maxillofacial and neck region non-enhanced CT imaging on Discovery CT750HD were included in this study. These patients were randomly assigned to group A and B with 20 patients in each group. Group A underwent GSI scan and thenobtained70kev monochromatic images, and group B underwent conventional CT scanned obtained 120kV polychromatic images. The other scanning parameters were consistent with the same tube current (375mA), rotation time(0.7s), Scan Type (Helical) , ASIR(ss30 slice 30%);Pitch (0.984:1) and slice thickness/interval(1.25mm/1.25m).The CT attenuation values and noise of cervical muscle at the hyoid bone level were measured for 3 times with the region of interest (ROI) of 100 square mm. And the noise of the air was also measured. According to the Dose Report, Scan range(mm), CTDIvol (mGy), and DLP (mGy-cm) were recorded, and the ED was calculated by 0.059*DLP. A senior radiologist in the maxillofacial and neck region subjectively evaluated image quality. Using statistical analysis, image quality and dose were compared between group A and B by two independent samples t test.
Results: The noise of neck muscle in group A and group B respectively were6.82±1.00Hu and 5.98±1.44Hu.And the noise in group A was higher than that of group B (P<0.01). There was no significant difference in background noise of air for two groups(P>0.05). There was also no significant difference between the subjective evaluations of image quality(P>0.05). There was no significant difference in the scanning range between group A and B(P>0.05). But the CTDIvol, DLP and ED of group A were lower than those of group B. And CTDIvol in group A and group B respectively were36.73±0.00mGy and 45.69±0.49 mGy(P<0.01),DLP were 902.43±139.40mGy*cm and 1141.71±237.69mGy*cm （P<0.01）,and ED were5.32±0.82mSv and 6.74±1.40mSv（P<0.01）.
Conclusion: GSI can effectively reduce 19.6%of the radiation dose without affecting imaging diagnosis, compared with the conventional imaging.

能谱不同虚拟单能量图像影像组学对鉴别肾透明细胞癌 WHO/ISUP 分级的影响

韩冬[1,2],贺太平[1,2],马光明[1],段海峰[1],陈媛媛[1],任嘉梁[3],于勇[1,2]
1.陕西中医药大学附属医院
2.陕西中医药大学
3.GE（中国）医疗

目的：探讨能谱不同虚拟单能量图像影像组学对鉴别肾透明细胞癌 WHO/ISUP 分级的影响
方法：回顾性收集经手术或穿刺证实的肾透明细胞癌并经能谱成像增强扫描的患者图像 99 例，根据 2016 版肾癌 WHO/ISUP 病理分级标准重新诊断并分级，其中低级别 68 例（I 级及 II 级），高级别 31 例（III 级及 IV 级）。将增强扫描皮质期图像重建为 40-140keV（间隔 10keV）11 组单能量图像。手动勾画 3D-ROI 后提取影像组学特征。以 WHO/ISUP 简化分级为金标准，采用 LASSO 回归数据降维，构建每组单能量水平鉴别高低级别的影像组学风险评分。根据该风险评分绘制受试者工作特征曲线（ROC），计算曲线下面积（AUC）用于评价影像组学风险评分的区分度。采用 Hosmer-Lemeshow 检验评价各虚拟单能量图像鉴别肾透明细胞癌组织分级的校准度。采用决策曲线分析基于 11 组单能量图像鉴别模型的患者净获益情况。
结果：40-140keV 不同虚拟单能量图像鉴别高低级别 ccRCC 均有较高的区分度，各 ROC 曲线下面积（区分度）均大于 0.920。Hosmer-Lemeshow 检验显示虚拟单能量图像影像组学评分的 *p*-value 均大于 0.05，即校准度均较好。决策曲线分析中，40-140keV 虚拟单能量图像影像组学评分均在较大概率阈值范围内使患者净获益，优于将所有患者认为高级别，也优于将所有患者认为是低级别，各决策曲线走行趋势近似，并在一定保持范围内。
结论：能谱不同单能量图像影像组学对鉴别高低级别 ccRCC 无太大影响。

EPO-2553
2018 年南通市第一人民医院影像科 PI-RADS v2 成像的质量控制

王林,龚沈初,何伯圣,王泽
南通市第一人民医院（南通大学医学院第二附属医院）

目的：回顾 2018 年南通市第一人民医院影像科按 PI-RADS v2 行前列腺 MR 检查的病例，发现存在的问题并改进，提高前列腺 MR 检查水平。**材料方法：**在 PACS 中检索 2018 年 1 月-12 月行前列腺 MR 平扫+增强患者的影像资料；排除标准：无病理或非首诊者。共纳入 144 例患者。将负责 MR 采集的技师按工龄分为低年资(7 人，工龄<5 年)、高年资组(4 人，工龄≥5 年)。由 2 名诊断医/技师(10 年以上 MR 诊断/采集经验)从序列完整性(0-2 分)、图像质量(0-2 分/序列，共 16 分；<11 分为不合格，11-15 分为中等，≥15 分为优秀)、准确性、诊断信心(3 分信心较强，2 分一般，1 分较差)对前列腺影像进行评分。以病理结果为“金标准”，比较不同年资技师采集图像质量的差异及不同图像质量对诊断信心、准确性的影响。**结果：**入组影像中，缺 T_1 Tra 8 例，缺 T_2 Sag、T_2 Tra、FS-T_1、DCE 各 3 例。图像质量优秀 107 例，中等 29 例，不合格 8 例；总体均分 15.53 分，高、低年资技师均分为 15.88 分、14.95 分，两者间无统计学差异(*P*=0.11)；两者间 DW、T_2 Tra 序列的均分间无统计学差异(DW：1.94 vs 2.00，*P*=0.26；T_2：1.97 vs 1.67，*P*=0.53)。共诊断正确 110 例(76.4%)，错误 34 例(23.6%)；信心较强 60 例(41.7%)，一般 58 例(40.3%)，较差 26 例(18.0%)。诊断错误病例的图像质量均分(15.00)低于诊断正确(15.69)及总体均分(15.53)，但不同图像质量间诊断信心和准确性无统计学差异(*P*=0.53、0.67)。不同年资技师采集图像对诊断信心、诊断准确性间的差异无统计学意义(*P*=0.92、0.66)。**结论：**正确理解 PI-RADS v2 中各序列的意义和价值，严格执行扫描规范，有利于提高不同年资 MR 技师间检查质量的同质性。

EPO-2554
探讨自适应统计迭代重建（ASIR）结合自动管电流调制技术在降低胸部 CT 辐射剂量中的能力

张喜荣,陈静,于楠,贾永军,韩冬
陕西中医药大学；陕西中医药大学附属医院

目的：探讨自适应统计迭代重建（ASIR）结合自动管电流调制技术在降低胸部 CT 辐射剂量中的能力。**方法：**采用 4 种不同噪声指数（14HU、16HU、18HU、20HU）对胸部模型进行 CT 扫描，使用 GE Discovery CT750HU 机型进行扫描。扫描参数包括管电压 120 kVp，自动管电流调制，噪声指数为 14HU，16HU，18HU 和 20HU，转速 0.6 s，螺距 1.375：1，层厚 5 mm，重建厚度 0.625mm。在扫描之后，用滤波反投影法（FBP）重建（NI=14HU）的图像作为常规剂量组，用 ASIR 重建（NI=16HU、18HU、20HU）的图像作为低剂量组，ASIR 的权重使用 20％、40％、60%和 80%。测量肺实质、主动脉和背部肌肉的 CT 值和标准差（SD）值。计算每个器官的信噪比（SNR = CTartery / SDmuscle）和对比噪声比（CNR =（CTartery-CTmuscle）/ SDmuscle）。记录不同噪声指数的 CT 剂量容积指数（CTDIvol）、剂量长度乘积（DLP），并计算有效剂量（ED = k×DLP，k = 0.017）。采用单因素方差分析用于不同重建方式间 CT 值、SD、SNR 和 CNR 的比较，P <0.05 具有统计学意义。主观评分为两名经验丰富的医生使用 5 盲法进行评分，并通过 Kappa 检验比较评分的一致性。**结果：**与常规剂量相比较，低剂量组（ASIR,NI20HU）平均 ED 降低约 40.7％。在所有重建组中，当 NI 不变时，ASIR 越大，SD 值越低。当 ASIR 百分比不变时，随着 NI 的增加 SD 值增加而 SNR 值降低。当参数设置为 NI 18HU 和 ASIR 60％时，SD 值为最小，SNR 值为最高。在主观图像质量评价方面，各组差异无统计学意义（P> 0.05）。**结论：**当 NI 设定为 18HU 且 ASIR 百分比为 60％时，图像质量最佳，不仅可以满足临床诊断要求，而且还可以减少 40%的辐射剂量。

Effect of optimized CT acquisition windows on image quality and radiation dose in coronary computed tomography angiography

Zhuolu Zhang
Peking University People's Hospital

Purpose: To determine the optimal cardiac phase for reconstruction with respect to heart rate (HR) in coronary CT angiography (CCTA) and to evaluate the dose-saving potential using the optimized acquisition windows.
Materials and Methods: Retrospectively analyzed 400 CCTA exams using full acquisition windows (group A). Optimal reconstruction phases were determined for the best CCTA image quality. Based on the findings, an optimized acquisition window was centered at the mean of the optimal reconstruction phase ± 2 standard deviation (95% confidence interval). Another 400 exams were performed using the optimized acquisition windows (group B). The heart rate, signal-to-noise ratio, image quality and radiation dose were compared between the two groups. Image quality scores were defined as 1 (excellent), 2 (good), 3 (adequate), and 4 (poor).
Results: The optimized acquisition windows were at the 76±3%, 48±5% and either 44±3% or 76±3% of the R-R intervals for low HR (<61bpm, group A1), high HR (>75bpm, group A3) and intermediate HR (61-75bpm, group A2), respectively, resulted in acquisition windows of 70-82% of the R-R interval for group B1 (<61bpm), 38-58% for B3 (>75bpm), and both 38-50% and 70-82% for B2 (61-75bpm). The HR (70.54±13.06bpm in group A vs. 70.38±13.05bpm in group B), SNR (16.55±4.65 in group A vs. 15.61±3.79 in group B) and image quality (1.52±0.65 in group A vs. 1.51±0.63 in group B) were not significantly different between the two methods (P>0.05). Radiation dose were

reduced by 81% for the low HR, 70% for the high HR, and 56% for the intermediate HR patients compared with acquisitions using the entire R-R interval.
Conclusion: For low HR, optimized acquisition window was at mid-end diastole; for high HR, at end systole; and for intermediate HR, at both mid-end diastole and end systole. With optimized acquisition windows, radiation exposure to patients can be significantly reduced with preservation of image quality.

EPO-2556
磁共振前列腺波谱扫描技术及其质量控制

付丽媛,陈坚,陈建新,陈自谦
中国人民解放军联勤保障部队第九〇〇医院(原福州总医院)

目的：探讨磁共振前列腺波谱成像技术，分析影响前列腺波谱成像质量的因素，提出质量控制措施，提高前列腺波谱检查的成功率和波谱成像质量。
方法：回顾性分析 2009 年 10 月至 2015 年 12 月间 1255 例前列腺 MRS 患者资料，所有患者均有前列腺疾病临床症状，检查资料齐全且经病理证实。MRS 扫描采用多体素 3D 化学位移成像技术。扫描结束后使用 Spectroscopy 前列腺波谱专用后处理软件对 MRS 进行规范化后处理，观察 MRS 波谱质量，分析、归纳及总结前列腺波谱检查失败及波谱成像质量不满足诊断要求的原因，提出提高检查成功率及波谱成像质量的质量控制措施。
结果：1255 例患者中 1218 例患者前列腺 MRS 病人准备充分，定位准确，参数设置合理，后处理过程规范，所得谱线基线平稳，化合物位置准确。37 例患者因多种原因导致 MRS 失败或成像质量不满足诊断要求，具体为：因扫描床位模式不正确导致检查失败 1 例；因病人准备不充分，未能排尿、排便导致谱线基线不稳、波谱谱线形态差 9 例；因匀场效果不好导致谱线基线不稳、谱线杂乱 26 例；因后处理不规范导致良性疾病谱线出现恶性疾病的代谢产物 1 例。在总结失败的原因后并提出了前列腺波谱检查的质量控制措施。
结论：病人准备充分、定位规范准确、参数设置合理、匀场效果佳及规范的后处理是保证前列腺 MRS 扫描成功及结果可靠的关键，对于提高前列腺 MRS 的质量有重要意义。

EPO-2557
口腔金属固定器伪影范围对 3D-ASL 中大脑皮层 CBF 测值影响的技术研究

尹家瑜
南宁市第一人民医院

目的 研究在三维动脉自旋标记灌注成像（3D-ASL）技术中，不同口腔金属固定器伪影范围与大脑皮层 CBF 测值间的相关性。
方法 8 名健康成年人口含金属试件前行 1 次全脑 3D-ASL 扫描，分别口含 10 个不同大小金属块（左右各一次）后各进行 1 次全脑 3D-ASL 扫描，共计 168 次扫描，并对双侧大脑皮层的 CBF 测值及计算 rCBF；统计分析采用配对 t 检验、对数曲线回归以及 ROC 曲线分析。
结果 当一侧口含金属后，同侧脑叶皮层 CBF 值较对侧相应脑叶皮层 CBF 值不同程度减低，$p<0.05$，差异有统计学意义。对侧脑叶皮层 CBF 值较未含金属前相同脑叶的 CBF 值相近，$p>0.05$，差异无统计学意义。利用对数曲线回归分析显示当口腔有金属时，同侧脑叶皮层 rCBF 呈曲线相关；随着 $D_{伪影}$减小，同侧脑叶皮层 rCBF 值相应减低，$p<0.05$，差异有统计学意义；当 $D_{伪影}$大于一

定距离时，同侧脑叶皮层 rCBF 值趋于稳定；对侧相应脑叶皮层 CBF 值未受影响。左、右侧口含金属时，ROC 曲线示 $D_{伪影}$最佳临界点分别为 18.05mm、18.1mm，曲线下面积（Az）分别为 0.972、0.978，$p<0.05$，差异均有统计学意义。

结论 口腔金属固定装置对同侧脑叶皮层 CBF 测值的影响与金属伪影边缘到同侧颈内动脉间最短距离呈曲线性相关,当 $D_{伪影}$达到一定程度时，同侧脑叶皮层 CBF 值不受影响；而无论金属伪影多大，对侧脑叶皮层 CBF 值都未受影响，故 3D-ASL 技术在有口腔金属固定装置的患者上有很大的应用价值。

EPO-2558

iCT 在袖状胃切除术前规划和术后疗效价值关系初探

李俊鹏
成都市第三人民医院

摘要：

目的：探讨 256 层 iCT 在腹腔镜胃袖状切除术前规划及剩余胃容积的预估的操作方法及其价值进行研究和分析。

方法：选择 50 例袖状胃切除术患者，术前行常规上腹部 CT 扫描。检查前禁食 6 小时以上，扫描前 10min 内服用 1000ml 水作为阴性对比剂，使胃尽量充盈，行常规上腹部 CT 薄层扫描，扫描完成后将图像传至 EBW 图像后处理工作站，利用三维重建，多平面重组，曲面重建等功能，将图像调整至可显示胃小弯最大层面，并测量其胃小弯长度。通过其胃小弯长度，及植入 FR36 胃管（）的半径可估算出剩余胃容积。本研究通过此法测量 50 名肥胖患者行腹腔镜下袖状胃切除术后袖状胃容积的大小，然后观察这些患者术后第 6 月的净体重变化，进而寻找出袖状胃的大小与肥胖患者术后体重变化的相关性，以期对腹腔镜下袖状胃切除术中袖状胃大小的选择以及肥胖患者术后体重的管理提出积极的指导意见。

结果：入选患者男性 17 例，女性 33 例，平均年龄 30±2.69 岁，术前平均体重 110±7.19Kg，经测算，50 例患者胃小弯的长度平均值为 172.25±8.27mm，患者术后第 6 个月平均体重下降 40.25±5.78Kg，经 logestic 回归分析，相关系数为 0.975，标准系数—0.682，P 值为 0.025（＜0.05），胃小弯的长度与患者术后第 6 个月的体重变化呈负相关。

结论：通过 ICT 术前对胃小弯的测值，可初步判定腹腔镜袖状胃术后残胃的容积，可协助外科医生完成固定容积残胃的制作。

人工智能对肺部结节 CT 后处理质控应用价值分析

李俊,温云
重庆三峡中心医院

目的：探讨人工智能系统对肺部结节 CT 后处理质控的应用价值及效果。
方法：选取胸部 CT 发现肺部结节患者 60 例，分为实验组和对照组两组，每组 30 例，分别用人工智能和人眼观察对图像进行后处理以显示肺部结节情况，将后处理图像打印胶片经资深影像技师、诊断医师及呼吸科医师分析判断其后处理效果。
结果：实验组在显示肺部结节数目、大小、面积及发现细小结节能力、与诊断准确性均明显优越于对照组，差异有统计学意义(P<0.05)。
结论：人工智能的引入不仅能提高诊断效率，还能提高后处理质控，特别是在肺部结节 CT 后处理质控应用中具有较高的实用价值。

Roles of miRNAs in the damage and repair mechanisms of X-rays

Dong Liu,Wen zhen Zhu
Tongji Hospital, Tongji Medical College, Huazhong University of Science & Technology

Background or Purpose
From the point of view of the post-transcriptional regulation of miRNAs, This study was to explore the damage and repair mechanisms of cell lines at cellular and molecular levels when they were irradiated by X-rays, so as to bulid and perfect models of restoration following injury and provide theoretical support for radiological protection.
Methods
We selected two lymphocytoblast cell lines –T2 and TK6 which are highly sensitive to X-rays. After irradiated by X-rays of different dose, the cytobiological alterations of the two cell lines were detected with MTT and FCM assay. Then we could establish a time-dependent model of cell cycles, proliferation and apoptosis of cells under graded dosage of X-rays. Meanwhile, irradiation-related miRNAs would be screened through miRNA expression arrays and RT-PCR. And with the help of dual-luciferase reporter gene system and Western Blot, we could consrtuct the ideography of feedback regulation between miRNAs and the related target genes regarding to radiation damage.
Results
The expressions of let-7 family miRNAs, miR-103b, miR-142, miR-143, miR-146ap，miR-155，miR-15a，miR-16，miR-181a，miR-19b，miR-21，miR-22，miR-26a，miR-378，miR-423，miR-92a，miR-93 were repressed after radiation (P value≤0.05) (0 h). While, many hours later(8h, 24h, 48h, 72h), they were time-dependently overexpressed (P value≤0.05). What’ more, there were positive correlation between a group of miRNAs’ variations, such as let-7 family miRNAs, miR-143, miR-19b, etc. , and the chages of cell cycles and apotosis (P value≥0.05). Besides, the let-7 family miRNAs modulated

the process of damage and the subsequent restoration through the HIFs signaling pathway, miR-92a by means of VEGF/CD31/Tie2 pathway, miR-143 by CD44v3/HGF pathway, miR-19b with PGC-1a.

Conclusions

Many kinds of miRNAs may regulate different proteins or signaling pathways to control the restoration following injury after X-ray raditaion in our bodies.

EPO-2562

The value of exposure index in quality control of cervical spine digital radiography

Wenguang Liu,Wenzheng Li,Wei Chen,Simin Xie,Shu Li,Jiaxi Hu,Mengsi Li,Yuntian Li
XiangYa Hospital, Central South University

Purpose: 1) To investigate the correlation between exposure index (EI) and digital X-ray image quality of cervical spine; 2) to explore the range of reasonable exposure index of cervical spine anteroposterior (AP) and lateral (LAT) radiography; 3) to analyze the effect of mAs on EI value.

Materials and Methods: This study collected patients retrospectively, who underwent digital X-ray examination of the cervical spine AP and LAT. The clinic information including gender, age, neck thickness, and the imaging data including kVp, mAs, physical EI, clinical EI, dose area product (DAP) and image quality score were collected. Afterwards, according to the evaluation criteria, the images were scored and classified into three groups: Good (5 scores), Satisfactory (3-4 scores), and Poor (1-2 scores). Then, to analyze the effect of various factors on image quality and to explore the reasonable exposure index range of the cervical spine AP and LAT position radiography. In phantom study, the cervical spine AP and LAT position protocols (under the tube voltage of 68kv and 70kv) were selected respectively. The mAs was exposed according to the series of points, and the EI value displayed on the device was recorded after each exposure. Based on the phantom data, the theoretically effect of mAs on the EI value was analyzed. Finally, the clinic information and imaging data were used to analyze the effect of mAs on the actual work of EI value.

Results: A total of 767 patients who underwent digital X-ray examination of the cervical spine were enrolled in this study, including 300 males and 467 females. The average age of the patients was 49.17±12.75 years old (range 6~86 years old). The age, neck thickness, mAs and DAP were statistically significant in different image quality scores of cervical spine AP images. Gender, neck thickness, mAs and DAP had significant differences in different groups of images quality scores of cervical spine LAT images. The value of physical EI and clinical EI were statistically significant in different image quality scores of cervical spine AP and LAT (all $P<0.001$). The 95% confidence intervals for the physical EI and clinical EI value of the cervical spine AP good image quality group were 519.18 to 545.43 and 151.44 to 156.71, respectively. The 95% confidence intervals for the physical EI and clinical EI values of the cervical spine LAT good image quality group were 581.48 to 605.39 and 90.91 to 94.85, respectively. The logistic regression analysis showed that the physical and clinical EI had a high normalization coefficient, which were 0.57 and 1.36 for cervical spine

AP (P＜0.001), 0.82 and 2.45 for cervical spine LAT (P＜0.001). In the phantom study, the linear regression model of the effect of mAs on physical and clinical EI values was statistically significant (all P＜0.001, r=1.000). In clinic information and imaging data analysis, the effect of mAs on physical EI had a poor linear relationship in the cervical spine AP (P=0.005, r=0.101) and LAT (P=0.004, r=0.104), respectively. The effect of mAs on clinical EI had a good linear relationship in the cervical spine AP (P＜0.001, r=0.404) and LAT (P＜0.001, r=0.770), respectively.
Conclusion: The value of physical and clinical EI are important parameters for the evaluation of the image quality of cervical spine digital radiography. Moreover, the clinical EI value has better practicability, and the reasonable clinical EI values of cervical spine AP and LAT were 151.44 to 156.71 and 90.91 to 94.85, respectively. In addition, the exposure parameter mAs can be quantified modify according to the clinical EI value.

EPO-2563

Feasibility of high concentrated contrast media combined with monochromatic images to improve image quality with tri-low scanning in dual-layer spectral coronary CT angiography

珮 jun Liu[1], Yining Wang[1], Yan Yi[1], Cheng Xu[1], Shenghui Yu[2], Zhengyu Jin[1]
1. Peking Union Medical College Hospital
2. Philips (China) Investment

Purpose:
To evaluate the feasibility of high concentrated contrast media combined with monochromatic images to improve image quality with tri-low scanning in dual-layer spectral coronary CT angiography
Methods:
Fifty-six patients with suspected coronary artery disease was enrolled and randomly separated into two groups. All patients were scanned at 120kVp in step-and-shoot mode using a dual-layer detector CT (IQon CT, Philips). Patients were either injected with 18 ml high concentration contrast medium(400mgI/mL) at 2ml/s (group A) or 45 ml contrast medium (370mgI/mL) at 4ml/s (group B). Monoenergetic images (group A1) (40 to 100 keV with 10 keV increment) and conventional image (group A2)were reconstructed for group A, conventional polyenergetic images was reconstructed for group B. Region of interest was placed on aorta root (AO), left main artery (LM), middle segment of left anterior descending (LAD), left circumflex (LCX) and right coronary artery (RCA) to measure the attenuation and noise, contrast-to-noise ratio (CNR) and signal-to-noise ratio (SNR) were calculated. Image quality was assessed by two reviewers independently with a 4-point scale (1--undiagnostic,4 excellent).
Results:
In group A, the CT Value, CNR and SNR on 40keV were significantly higher than the other keV sets and conventional images(P<0.001), which also were superior to group B

(738.95±184.70HU vs 408.95 ± 57.92HU; 29.29±8.00 vs 14.41 ± 2.56 and 23.32±7.32vs11.30 ± 2.33) (each P<0.001). In group A, the image noise on 40keV monochromatic images was superior to group B (32.70 ± 6.64 vs 36.96±4.52, P=0.014). There is no significant difference between group A and group B on the subjective image quality (*P*>0.05).The volume CT dose index, dose length product and effective dose had no significant difference between two groups (each P>0.05).

Conclusion:

40 keV low monochromatic images derived from dual-layer spectral detect CT combined with high concentrated contrast media can provide superior image quality with 0.8mSv radiation dose in CCTA study.

EPO-2564

高权重迭代重建技术在 CTU 成像中的应用

王楠[1],郭旭[1],刘义军[1],刘爱连[1],刘静红[1],赵莹[1],李剑颖[2]
1.大连医科大学附属第一医院
2.通用电气公司

目的 Revolution CT 机(80%ASIRV)与 HD750CT 机(30%ASIR)对比，探讨高权重 ASIRV 在 CT 尿路造影(CT urography, CTU)中的应用价值。**方法**回顾性分析 2017 年 5 月和 10 月 Revolution CT 机进行 CTU 检查的患者，为 A 组；以及同时期在 HD750 CT 机进行 CTU 检查的患者，为 B 组。所有入组病例均未发现器质性病变。两台 CT 机扫描层厚/层间隔 5mm，重建层厚/层间隔 1.25mm。由两位医师(分别工作 5 年，3 年)分别选择 1.25mm 图像进行数据测量，包括两组图像的膀胱 CT 值、SD 值，两侧臀大肌 CT 值、SD 值。计算对比噪声比(CNR)、信噪比(SNR)和有效辐射剂量(effective dose, ED)，记录容积 CT 剂量指数(volume CT dose index, $CTDI_{vol}$)及平脐层面图像的长径（a）、短径（b）。由两位医师(分别工作 5 年，3 年)共同对两组图像进行主观评价。采用组内相关系数(ICC)比较两位观察者所测量数据的一致性，选择高年资医师所测数据进行后续统计学分析。膀胱 SD 值、有效辐射计量的比较采用独立样本 *t* 检验，臀大肌 SD 值、SNR、CNR 的比较采用 Mann-Whitney U 检验，*P*<0.05 具有统计学差异。**结果**两位医师测量数据一致性良好(ICC 均>0.8)。A 组的 CNR 及 SNR 均高于 B 组，差异具有统计学意义(*P*<0.05)；A、B 组的膀胱 SD 值及 $CTDI_{vol}$ 无统计学差异(*P*>0.05)。**结论** 80%ASIRV 能够保证同等辐射剂量条件下，提高 CTU 图像质量。

EPO-2565

Evaluate Upper Extremity Deep Venous Thrombosis Through Direct CT Venography in Patients with Hemodialysis

Qingxia Wu,Hongming Liu,Meiyun Wang
Henan Provincial People's Hospital

Purpose: To explore the diagnostic value of direct CT venography (CTV) for the evaluation of upper extremity deep venous thrombosis (UEDVT) in patients with hemodialysis.

Materials and Methods: Thirty-three patients with severe renal insufficiency and hemodialysis either through central venous catheters or autologous arteriovenous fistula underwent direct CTV. The contrast medium (CM) of 350 mgI/mL was diluted with saline in a 1:3 or 1:4 fashion. Forty to 80 milliliter (mL) diluted CM was injected into the superficial venous cannulas of both forearms simultaneously or each forearm respectively. CT scan was performed once or twice according to the CM injection pattern. Direct and indirect signs indicating UEDVT including luminal stenosis, heterogeneous intraluminal density, chest wall or paraspinal collateral vessels and early visualization of azygos vein (AV) were evaluated. Receiver operating characteristic curves were used to evaluate the diagnostic efficiency of every sign.
Results: The mean iodine load for direct CTV was 8.02±2.13 gram. Digital subtraction venography (DSV) of upper extremity was performed in 13 patients. Final diagnosis of UEDVT was determined according to the symptoms of reflux obstruction and DSV. Fifteen out of 33 patients (45.5%) were diagnosed as UEDVT positive, with subclavian vein thrombosis (SVT) in 4 cases, brachiaocephalic vein thrombosis (BVT) in 11 cases and superior vena cava thrombosis (SVCT) in 10 cases. Chest wall or paraspinal collateral vessels were observed in 13 cases and early visualization of AV were observed in 14 cases. The AUC, sensitivity and specificity of collateral vessels and early visualization of AV for the diagnosis of UEDVT were 0.933, 86.7%, 100% and 0.906, 86.7%, 94.4% respectively (Figure 1). As for specific subsegments, the diagnostic performance of indirect signs with collateral vessels and early visualization of AV for the diagnosis of SVT, BVT and SVCT were better than that of direct signs with luminal stenosis and heterogenous intraluminal density (Table 1). Spearman analysis showed there was no correlation between the diameter of AV and the duration of symptoms.
Conclusion: With extremely low iodine load in patients with severe renal insufficiency and hemodialysis who underwent direct CTV, the indirect signs of chest wall or paraspinal collateral vessels and early visualization of azygos vein (AV) evaluate UEDVT better than direct signs of luminal stenosis and heterogenous intraluminal density.

EPO-2566

Direct CT Venography Through Two Arms with Extremely Low Iodine Load in Patients with Renal Failure Who Underwent Hemodialysis

Qingxia Wu,Hongming Liu,Meiyun Wang
Henan Provincial People's Hospital

Purpose: To determine the feasibility and superiority of direct CT venography (CTV) with extremely low iodine load through two arms in patients with renal failure who underwent hemodialysis when compared with indirect CTV.
Materials and Methods: Ten and 9 patients underwent indirect CTV, direct CTV with once scan and simultaneous injection on both arms respectively. The contrast medium (CM) of 350 mgI/mL was diluted with saline in a 1:3 for direct CTV. The injection rate was 5mL/second. Both arms were raised up for direct CTV and put on the abdomen for

indirect CTV. CT scan was calculated to begin so that CT scan and CM injection ended at the same time for direct CTV. Venous CT phase began 50 seconds after the injection for indirect CTV. Total dose length product (DLP) was recorded. Image quality comparison was performed on both axial and volume rendering (VR) images. Lumen depiction of subclavian, brachiocephalic vein and superior vena cava was evaluated by using a five-point scale. The uniformity of intraluminal density was measured by signal noise ratio (SNR) with intraluminal CT value divided by corresponding standard deviation. The contrast to noise ratio (CNR) between deep vein and adjacent muscle was also calculated. Lumen depiction scores, lumen SNR and CNR were compared between direct and indirect CTV groups by using a Mann-Whitney U test.
Results: The mean iodine load, total DLP, lumen depiction scores, lumen SNR and CNR for the direct and indirect CTV groups were 6.81±0.58g, 588.2±167.0mGy*cm, 4.29±0.76, 18.5±14.5, 53.4±32.6 and 27.0±1.88g, 1054.6±248.3mGy*cm, 4.18±0.48, 7.73±3.01, 6.46±4.00 respectively. The p value of Mann-Whitney U test of them between the two groups were .000, .000, .720, .008 and .000 respectively.
Conclusion： Compared with indirect CTV, direct CTV with 75% iodine load and 45% radiation dose reduction provides better image quality in patients with renal failure who underwent hemodialysis.

EPO-2567
低 keV 单能量图像结合 ASIR-V 技术在提高下肢静脉 CTV 图像质量的应用研究

陈安良,刘爱连,胡帅,魏巍,刘义军
大连医科大学附属第一医院

目的 通过应用低 keV 单能量图像提高 CT 值，结合 ASIR-V 技术降低背景噪声，以期指导低浓度、低对比的下肢静脉在能谱成像 CTV 中的应用。
方法 收集于我院 2019 年 1 月至 4 月因怀疑下肢静脉疾病行下肢静脉 Revolution CT 的患者 30 例，使用能谱扫描模式，注射 150ml 浓度为 350mgI/ml 对比剂后 200s 进行下肢静脉扫描。将图像（1.25mm）载入能谱成像分析软件，测量髂总静脉（CIV）、髂外静脉（EIV）、股静脉（FV）、腘静脉（PV）、肌肉背景（B）下述组合 CT 值及肌肉背景 SD 值：70keV+40%ASIR-V（A 组），55keV+80%ASIR-V（B 组）。计算各静脉不同组合 CNR。使用配对样本 t 检验比较各静脉不同组合间 CNR 及 CT 值、肌肉背景 SD 值差异，$p<0.05$ 有统计学差异。
结果 A、B 两组合间静脉 CNR 有统计学差异（$p<0.001$），其中 B 组 CIV、EIV、FV、PV-CNR 平均值分别为 7.08±1.97、6.81±1.83、6.02±1.58、4.92±1.94，皆高于 A 组 3.08±0.78、2.95±0.78、2.66±0.69、2.13±0.84。B 组 CIV、EIV、FV、PV、B-CT value 平均值（HU）分别为 239.54±33.04、234.84±31.57、219.4±27.17、197.42±37.4，皆高于 A 组 157.87±17.97、154.87±19.83、147.4±17.09、134.17±21.68，差异有统计学意义（$p<0.001$）。B 组 B-SD 平均值（HU）为 20.64±4.09，低于 A 组 26.27±3.54，差异有统计学意义（$p<0.001$）。
结论 使用 55keV+80%ASIR-V 组合图像相对于 70keV+40%ASIR-V 组合图像，下肢静脉 CT 值及对比度可明显提高，背景噪声下降，可获得较优的下肢静脉显影。

EPO-2568

Clinical Application of Adaptive Filter Combined with Iterative Reconstruction to Reduce CT Artifacts in Emergency Patients

Wenfeng Jin,Dan Han
The First Affiliated Hospital, Kunming Medical University

Objective: To study the effects of Adaptive Filter (AF) combined with iterative reconstruction on eliminating streak artifacts in thoracic and abdominal CT imaging of emergency patients who cannot lift upper limbs.
Methods: 128-layer UIH uCT760 spiral CT was used (United-imaging, Shanghai, China), the imaging data of patients who could not lift upper limbs were selected, including 60 thoracic cases and 60 abdominal cases of CT examination. Scanning parameters: in thoracic scanning, tube voltage was 100kV, average tube current was 80mAs; in abdominal scanning, tube voltage was 100kV, average tube current was 200mAs. Tube current automatic modulation was used, tube rotation speed was 0.5s/r, pitch was 0.938.Four different reconstruction methods were used for the raw data of the same patient :(1) AF combined iteration reconstruction (KARL 3D) was used in group A;(2) AF reconstruction was used in group B;(3) iterative reconstruction was used in group C;(4) neither AF nor iterative reconstruction were used in group D. The image quality of four groups were compared by subjective score and objective indexes. The subjective score was 5 points (1 point for maximum artifact, 5 points for minimum artifact), and the display effect of lesions were compared of four groups. Objective evaluation indexes included the CT value, noise (SD) of lung tissue and descending aorta in the chest, the SNR, CNR of liver, spleen, pancreas and abdominal aorta in the abdomen.
Results :(1) Both the score of image quality in chest and abdomen were statistically different ($P<0.05$), group A> group B> group C> group D; (2) The number of lesions which was displayed clearly in group A was higher than that in group B, group B was higher than that in group C, group C was higher than that in group D in both thoracic and abdominal imaging. (3) Objective evaluation of image quality :there was no statistically significant difference in CT values among the four chest groups ($P>0.05$).The difference of SD value was statistically different ($P<0.05$), in pulmonary parenchyma group A < group B= group C=group D, in descending aorta group A<group B<group C<group D. (4) SNR in abdominal image were statistically different ($P<0.05$): liver, pancreas and abdominal aorta were group A> group B=group C > group D. The CNR values of abdominal liver, spleen, pancreas and abdominal aorta showed no significant difference in the four groups ($P>0.05$).
Conclusion: When emergency patients who cannot lift upper limb perform thoracic and abdominal CT examination, the combination of adaptive filtering and iterative reconstruction in the circumstances of low tube voltage (100kV), can effectively reduce steak artifacts, improve image quality and avoid repeated scanning.

EPO-2569

Effects of adaptive statistical iterative reconstruction-V technology on the image quality and radiation dose of unenhanced and enhanced CT scans of the piglet abdomen

xiao ying zhao[1],Lulu Li[1],Jian Song[1],Jing Chen[1],Ji Xu[2],Bin Liu[1],Xingwang Wu[1]
1.First Affiliated Hospital of Anhui Medical University
2.Huangshan People's Hospital

Purpose: In order to clarify the best AsiR-V level in children's abdomen enhanced CT, we discuss the adaptive statistical iterative reconstruction-V (ASiR-V) in piglet abdominal computed tomography (CT) volume scanning, and determine the optimal low dose needed to maintain image quality and optimize the percentage of ASiR-V pre-scanning combined with post-reconstruction. **Methods:** A total of 10 standard piglets were selected and scanned to obtain unenhanced and enhanced images under different pre-ASiR-V conditions. The corresponding images were obtained using post-ASiR-V technology. CT values, noises, the contrast noise ratio (CNR), subjective scores, and radiation doses of unenhanced and enhanced abdominal tissues were analyzed. **Results:** With the increase of pre-ASiR-V, the radiation dose in piglets gradually decreased ($P < 0.05$). In the same pre-ASiR-V group and with an increase of post-ASiR-V, the image noise was gradually reduced ($P < 0.05$). There was no statistical difference between CNR values. In unenhanced CT images, the subjective score of the images with 40% pre-ASiR-V combined with 60% post-ASiR-V levels had no statistical difference compared to 0% pre-ASiR-V combined with 60% post-ASiR-V levels, while the radiation dose decreased by 31.6%. In the enhanced images, the subjective score of the images with 60% pre-ASiR-V combined with 60% post-ASiR-V levels had no statistical difference compared to 0% pre-ASiR-V combined with 60% post-ASiR-V levels, while the radiation dose was reduced by 48.9%. **Conclusion:** ASiR-V technology significantly reduced the radiation dose without affecting image quality. The optimal level for unenhanced scans is 40% pre-ASiR-V combined with 60% post-ASiR-V, while that for enhanced scans is 60% pre-ASiR-V combined with 60% post-ASiR-V.We believe that these Asir-V levels can be used in children of abdominal CT enhancement.

EPO-2570

Image quality assessment and coronary calcified plaque stenosis quantification by virtual monoenergetic images from a dual-layer spectral detector CT

Cheng Xu,Yan Yi,Zhengyu Jin,Yining Wang
Peking Union Medical College Hospital

Purpose

To investigate the image quality of different virtual monoenergetic images (VMI) and the diagnostic performance of spectral coronary CT angiography (CCTA) on calcified plaques or mixed plaques and the best keV level using invasive coronary angiography (ICA) as reference.

Methods and Materials

72 consecutive patients with known CAD or suspected CAD who underwent both coronary CTA and ICA were enrolled. CCTA images were acquired on a dual-layer spectral detector CT. Monochromatic CT images were reconstructed from 70 to 140 keV with 10 keV increment. The image quality was qualitatively evaluated on per-vessel basis using the Likert 4 stage score. Score 1: nondiagnostic, poor image quality that precluded appropriate evaluation of the coronary arteries due to severe artifacts; score 2: adequate, reduced image quality because of artifacts but sufficient to rule out obstructive CAD; score 3: good, minor artifacts but image quality was adequate for diagnostic evaluation; and score 4: excellent, absence of artifacts and no structural discontinuity. Subjective and objective evaluation were performed for each calcified or mixed lesion for all keV levels. Optimal subjective keV level was selected and recorded by an experienced reader. The degree of stenosis was quantitatively measured at each keV level. Bland-Altman analyses were used to assess agreement of the result between different monochromatic series and ICA.

Results

122 lesions of 72 patients (49 men and 23 women; 63.7±10.2years) were analyzed. The mean image quality score of conventional 120kVp and 70 to 140 keV VMI were 3.68±0.42, 3,69±0.41, 3.69±0.4, 3.71±0.38. 3.71±0.37, 3.66±0.41, 3.6±0.43, 3.52±0.46, 3.49±0.47, respectively，there were no statistical difference. The subjective optimal keV was selected at 100 keV for 64 times (52%) and 90 keV for 39 (32%) times. The quantitative stenosis evaluation showed 100 keV images were the best keV for 50 times, which accounts for 41% of all stenosis. There was good agreement between the stenosis degree measured with 100keV and the result of ICA. Using a cut off at ≥50%, the sensitivity, specificity, positive predictive value, negative predictive value and diagnostic accuracy of 100 keV VMI were 83%, 80%, 74%,73% and 78% respectively.

Conclusion

Our results showed 100 keV monochromatic images slightly improve the image quality and improved diagnostic accuracy of coronary stenosis with calcified and mixed plaque on CCTA images.

肝脏双层光谱探测器 CT 多期虚拟平扫图像质量评价

林禹[1],张潇潇[1],吕绍茂[1],王金岸[1],曹代荣[2]
1.厦门大学附属中山医院（原:厦门中山医院）
2.福建医科大学附属第一医院

目的 评价双层光谱探测器 CT（DL-CT，IQon Spectral CT）肝脏三期增强扫描的虚拟平扫（VNC）图像质量，探讨 VNC 代替真实平扫（TNC）的可行性。**方法** 回顾性分析 36 例肝脏 TNC 及三期增强扫描的 DL-CT 影像学资料。后处理获得动脉期、门脉期、平衡期的 VNC 图像（VNC^a、VNC^p 和 VNC^e）。联合虚拟单能量（MonoE）图，测量 TNC 和 VNC 图像中肝脏和竖脊肌的 CT 值和噪声值（SD 值），计算信噪比（SNR）和对比噪声比（CNR），测算受检者有效剂量（ED）。采用 5 分法评价各期图像质量。通过单因素方差分析比较 TNC 和 VNC 图像的定量参数，采用 Bland-Altman 图评估 TNC 和 VNC 图像 CT 值的一致性。**结果** 相比于 TNC 相应参数，VNC 的 SD 值较低，而 SNR 值较高（P均＜0.05）。肝实质 VNC 与 TNC 图像 CT 值一致性良好（平均差值＜2Hu），病灶均显示清晰，肝脏 VNC^a 图像质量最佳（P＜0.05）。VNC 图像显示了 5 例 TNC 图像中的隐匿性病灶，采用

“VNC+直接增强”方案约可降低 24.65%的辐射剂量。**结论** DL-CT 三期 VNC 图像质量均符合诊断需求，具有更低的噪声、更高的 SNR 值和良好的病灶显示能力，并可替代 TNC 图像，实现影像科的“节能减排”。

Size-specific dose estimation of CT radiation dose in children patients with different age

Wenliang Fan,Xiangchuang Kong,Ziqiao Lei,Jianming Yu,Fan Yang
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose
To evaluation the radiation dose of CT scan between children of different age groups and adult patients by traditional radiation dose assessment parameters (volume CT dose Index, CTDIvol) and size specific dose estimates (SSDE).
Methods
A total of 406 cases who underwent lung CT examination were collected in this study from the Union Hospital. The cases were divided into six groups according to age (0-2 years old, 3-6 years old, 7-10 years old, 11-14 Aged, 15-18 years old, 18 years old or older). The CTDIvol and DLP values were extracted from the dicom data by an in-house software based on the MATLAB platform. The size specific dose estimation and water equivalent diameter were also calculated according to the American Association Physicists in Medicine (AAPM) 220 report. The difference of the radiation dose of CT lung scan between children and adult patients by the two means was evaluated.
Results
The CTDIvol values of all age groups were significantly lower than the SSDE values. The paired t-test results showed that the differences were statistically significant ($t=-36.36, -32.83, -30.36, -28.74, -23.89$, $P<0.05$). The SSDE value is about 137%, 94%, 79%, 57%, and 42% higher than the CTDIvol value, respectively. The CTDIvol value of the adult group was also lower than the SSDE value, and the difference was statistically significant ($t= -21.92$, $P<0.05$), and the SSDE value was about 41% higher than the CTDIvol value. With the increase of age, the CTDIvol value, DLP value, Dw value and SSDE value of children of all age groups gradually increased, and were significantly smaller than the adult group. The difference was statistically significant ($F=63.39, 203.28, 89.27, 103.44$, $P < 0.05$). The conversion coefficient f of all age groups decreased significantly with age, which was significantly higher than that of the adult group, and the difference was statistically significant ($F=109.83$, $P<0.05$).
Discussion and Conclusion
In lung CT scans, the CTDIvol value severely underestimates the radiation doses of children compared to adults. The younger patients are, the worse the situation were. The SSDE method allows for more accurate reflection of the radiation doses of different patients, taking into account differences in the subject's body size.

EPO-2575

Study of reduced field-of-view diffusion-weighted imaging (DWI) on the diagnosis of gallbladder disease.

sisi Wu,Zhen Li
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To compare image quality of reduced field-of-view (r-FOV) and full FOV(f-FOV) diffusion-weighted imaging(DWI) sequences at 3T,with apparent diffusion coefficient(ADC) values in the diagnosis of gallbladder disease .
Materials and Methods:Our study collected 511 patients with gallbladder disease who had undergone DWI scan for preoperative evaluation in Tongji Hospital from July2017 to December2018,and finally 61 patients were enrolled after excluding unqualified cases.Preoperative DWI images,including both r-FOV and f-FOV DWI sequences, of 61 patients with gallbladder disease confirmed by surgery or puncture pathology were measured by two radiologists. The ADC values of diseased region were measured , and the resolution, signal-to noise ratio(SNR) , contrast-to-noise ratio(CNR) were calculated by two radiologists independently. Meanwhile, two radiologists independently assessed subjective image quality parameters, including image sharpness, distortion, artifacts, lesion conspicuity with a 4-point scale. The weighted-K test was used to examine the consistency of the results measured by the two radiologists. Comparisons of these parameters between two groups were made by Wilcoxon's rank sum test,including image sharpness, distortion, artifacts, lesion conspicuity.Paired t-test were used to analyze differences between two groups about SNR、CNR and ADC,and then Spearman test was used to correlate the three types of gallbladder disease with ADC.
Results: 1.There was good agreement of both dates measured and image quality between two radiologists in both r-FOV DWI and f-FOV DWI(P>0.05).
Subjective score: The subjective score of image quality of r-FOV DWI was 13.84±1.10, which was higher than that of f-FOV DWI(10.36±1.13) significantly.The resolution, deformation, artifacts, and lesion conspicuity of r-FOV were 3.41, 3.36, 3.67 and 3.39, respectively, both higher than f-FOV.
3.Objective score: The CNR score of r-FOV is higher than f-FOV, and the SNR score of r-FOV is lower than f-FOV. The spatial resolution of the r-FOV image (1.56mm*1.56mm) is twice that of the f-FOV image (2.25mm*2.25mm). Comparing the two DWI images, it can be found that r-FOV can effectively reduce the deformation and artifact of f-FOV images, and has higher definition and better lesion display effect.
4.There was no difference in the ADC values measured between the r-FOV and f-FOV groups, but the ADC values of different gallbladder diseases were significantly different. (P<0.05)
Conclusions: Compared with f-FOV DWI, r-FOV DWI had a higher spatial resolution and lesion conspicuity, that also can significantly reduce susceptibility artifacts as well as image distortions.

EPO-2576

Impact of an Artificial Intelligence-based Noise Reduction Algorithm on Image Quality in Low-dose Coronary CT Angiography of Obese Patients

珮 jun Liu[1],Yining Wang[1],Min Yu[2],Zhuoheng Liu[2],Yun Wang[1],Zhengyu Jin[1]
1.Peking Union Medical College Hospital
2.CT Business Unit， Neusoft Medical System Company

This study aims to assess the impact of artificial intelligence (AI)-based noise reduction algorithm on image quality (IQ) in low-dose (LD) coronary CT angiography (CCTA) for obese patients. Forty consecutive patients with BMIs ≥ 25 kg/m^2 underwent clinically indicated CCTA examinations on a NeuViz 128 CT scanner using a step-and-shoot mode with 100 kV and automatic current modulation. Images were reconstructed with an iterative algorithm (group A) and an AI-based noise reduction algorithm (group B), respectively. Image noise, signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) were calculated on the aortic root (AO), left main artery (LM), left anterior descending artery (LAD), left circumflex artery (LCX), and right coronary artery (RCA) to evaluate IQ objectively. Subjective IQ scores were graded on a four-point scale (1: excellent, 4: poor). Image subtraction was used for judging the difference between FBP images and processed AI images. Compared to group A, group B yielded statistically significant reductions in image noise in the AO, LM, LAD, LCX and RCA of 63.97%, 38.63%, 21.29%, 24.38% and 29.99%, respectively. SNR and CNR both significantly increased in group B compared to group A (all $P < 0.001$). The subjective IQ scores in group B were superior to those in group A (1.57 ± 0.67 vs. 1.71 ± 0.67, $P < 0.001$). The effective dose was 2.3 ± 0.1mSv. The processing of AI did not change any details in images and had better efficiency in time consuming. Therefore, the AI-based noise reduction algorithm is an innovative and promising method that could effectively improve the IQ in LD CCTA for obese subjects.

EPO-2577
乳腺钨靶 X 线摄影条件对不同厚度标准型乳腺患者辐射剂量及图像质量的影响

陈晓煜,王闽,董晓蕾
四川省肿瘤医院

目的：探讨数字钨靶乳腺 X 线摄影条件对于不同厚度标准型乳腺患者辐射剂量和图像质量的影响

方法：用不同厚度的甲基丙烯酸甲酯有机玻璃模体（PMMA）模拟标准乳腺。采用钨-铑（W-Rh）、钨-银（W-Ag）不同的靶-滤过方式对厚度不同的标准型乳腺模体分别进行手动曝光、自动曝光、半自动曝光。记录乳腺腺体压迫厚度、管电压、管电流、平均腺体剂量（AGD）、入射表面剂量（ESD）、对比噪声比（CNR）并计算品质因数（FOM）及 ESD/ASD。采用 Pearson 相关分析评价不同管电压、管电流对 AGD、ESD、ESD/AGD、CNR、FOM 的影响，采用单因素方差分析评价不同厚度模体采用 2 种不同靶-滤过组合产生的 AGD、ESD、ESD/AGD、CNR、FOM 的影响。

结果：2 种靶-滤过条件下：随管电流和管电压的增加，CNR 及 FOM 均呈不同程度的增加（P≤0.05）；在一定范围内，AGD、ESD 随管电压和管电流的增大而增大（P≤0.05）。

结论：手动曝光及半自动曝光时，可适当调整管电压和管电流，可以有效降低 AGD、ESD 并且保证图像质量。W-Rh 组合比 W-Ag 组合对标准型乳腺模体在保证图像质量的前提下降低辐射剂量。

EPO-2578
FORCE CT 大螺距模式联合双低技术在左心房肺静脉成像中研究

伍瑶斌
贵州省人民医院

目的 探讨 FORCE CT 大螺距模式联合双低技术在左心房肺静脉成像（CTPV）中的可行性。
方法 将 50 例行左心房肺静脉成像（CTPV）检查的患者随机分为 2 组：A 组（25 例）采用常规模式扫描，管电压为 100kV，螺距 1.2，对比剂采用碘普罗胺（370mg/ml）；B 组（25 例）采用大螺距模式扫描，管电压为 70kv，螺距 2.0，对比剂采用碘克沙醇(320mg/ml)，两组对比剂用量均为 20ml；计算出两组患者的碘摄入量；记录两组患者扫描时的 CT 剂量指数（CTDIvol）与剂量长度乘积（DLP），计算得出有效辐射剂量（ED）；分别测量左心房最大层面、肺静脉各分支及左心房最大水平背部肌肉的 CT 值和 SD 值，计算出图像信噪比（SNR）、对比信噪比（CNR）。由两位诊断医师共同对肺静脉分支显示情况进行主观评价。采用 SPSS22.0 统计软件对计量和计数进行分析。
结果 两组图像各个感兴趣区的 CT 值差异无统计学意义(P>0.05)，各个感兴趣区 SNR 和 CNR 差异有统计学意义(P＜0.05)，B 组左心房及肺静脉的 SNR 与 CNR 均较 A 组明显提高；A 组对比剂中碘摄入量平均为 7.4g，B 组对比剂中碘摄入量平均为 6.4g，B 组碘摄入量较 A 组降低约 13.51%；两组间图像主观评分差异无统计学意义（P>0.05），A、B 两组有效辐射剂量分别为(1.920.43) mSv、（0.770.20) mSv，B 组辐射剂量较 A 组降低约 53.89%。
结论 FORCE CT 大螺距模式联合双低技术下行 CTPV 检查可以降低辐射剂量及对比剂碘摄入量，并且获得满足诊断的图像质量，值得临床推广。

EPO-2579
锡板能谱纯化技术联合高级迭代算法降低胸部 CT 辐射剂量的应用价值

张小勇,王金清,王超,石化坤,施辉友
贵州省人民医院

目的： 探讨 Force CTSn150kV 锡板能谱纯化技术联合 ADMIRE 高级迭代算法降低胸部 CT 辐射剂量的应用价值。
方法： 前瞻性收集初诊考虑肺部感染性病变的患者 50 例，治疗前后分别采用不同管电压行胸部 CT 检查，治疗前（A 组）：管电压 100kV，采用 FBP 重建；治疗后（B 组）：管电压 Sn150kV，采用 ADMIRE 重建；其余扫描参数相同，参考管电流 50mAs，开启 CARE Dose 4D，螺距 1.2。分别测量气管分叉水平气管内、升主动脉和脊柱旁肌肉的 CT 值及噪声，并且记录两次扫描的 CTDI、DLP。比较 A、B 两组方案的辐射剂量、图像质量以及诊断效能。
结果： 治疗前后两次扫描有效辐射剂量 ED 分别为（1.61±0.12）mSv、（0.86±0.07）mSv，B 组 ED 较 A 组减低约 46.6%，差异有统计学意义（P<0.05）；B 组图像的噪声、SNR、CNR 均大于 A 组，其中噪声、SNR 有统计学意义（P<0.05），两组间 CNR 及主观评分比较无明显统计学差异（P>0.05）；两组扫描方案所得图像的诊断效能无明显统计学差异（P>0.05）。

结论： 应用 Sn150kV 能谱纯化技术联合高级迭代算法行胸部 CT 扫描，保障图像质量的基础上明显降低了辐射剂量，推荐该方案常规应用于肺部疾病的筛查。

EPO-2580
双低扫描方案结合迭代重建在主动脉狭窄患者术前评估应用价值

樊敏
四川大学华西医院

目的 探讨双源炫速 CT-flash 低剂量扫描技术及低对比剂注射方案结合迭代重建 CT 血管成像在主动脉狭窄患者术前评估应用价值
方法 收集 2018 年 5 月至 2019 年 3 月在本院行 DSCT 全身血管扫描的主动脉瓣重度狭窄的患者 40 例，随机分为实验组（20 例）与对照组（20 例），分别采用双低扫描方案与常规扫描方案，记录两组患者的对比剂用量，容积 CT 剂量指数（CTDIvol）和剂量长度乘积（DLP），计算有效辐射剂量（ED）；由 2 位经验丰富的放射医师独立诊断并采用 4 分法对图像质量进行评估，对结果一致性评价采用 Kappa 检验；测量两组图像的信噪比（SNR）及对比度噪声比（CNR）。
结果 双低实验组患者的 ED 为 3.80±0.19mSv，对照组患者 ED 为 4.97±0.21mSv，差异有统计学意义（$p<0.01$）；对比剂注射剂量分别为 68.01±4.56ml 和 83.04±2.17ml，差异有统计学意义（$P<0.05$）;实验组图像质量评分 3.7±0.28，优于对照组 3.0±0.75，两组图像均符合诊断要求，差异有统计学意义（$p<0.05$）；两组图像 CNR 差异有统计学意义；实验组与对照组的诊断敏感度分别为 98.1%和 97.8%，特异度分别为 99.1%和 96.7%，诊断准确率分别为 97.8%和 96.9%，差异无统计学意义。
结论 双低扫描方案结合迭代重建技术可大大降低患者的 CT 辐射剂量与对比剂注射剂量，图像质量优于常规扫描方案，适合在临床扫描中推广运用。

EPO-2581
胸部增强 CT 扫描及重建的质量控制规范与优化

曹晖,张乐天
陆军特色医学中心（大坪医院）

目的：提高胸部增强 CT 检察图像质量，减少漏诊与误诊。减少病人辐射剂量。
方法：将胸部增强 CT 检查分为体位设计 25 分、参数设计与扫描 45 分、图像后处理重建 30 分 总分 95 以上为优
体位设计：1.呼吸训练（最为重要） 2.去除金属异物 3.体位居中左右对称 4.定位准确（减少重复扫描率，降低辐射剂量）5.病人防护（如定位足够准确，定位像中不应出现铅皮）
参数设计与扫描：1.病人闭气情况(如不能配合应再次训练) 2.扫描视野与范围 3.肺动脉 CT 值（必须超过 250，超过 300 为优） 4.降主动脉 CT 值 （大于 300 为优）5.锁骨下静脉 CT 值（分为四级） 6.图像噪声（小于 15 为最佳）
图像后处理重建：1.图像视野与范围 2.图像左右对称 3.特殊重建（小结节、纵膈病变、VR、MIP 等）
结果： 优片率极低体位设计主要问题：病人呼吸训练不足，体位随意，定位不准确。
参数设计与扫描主要问题：满足肺动脉 CT 值得同时锁骨下静脉 CT 普遍过高，病人闭气无法配合的情况依然存在。
图像重建主要问题：图像不对称，特殊疾病重建不足（申请单阅读不够，对图像理解不够）

结论：胸部平扫与增强检察作为最为常规的检查，加强质量控制后，能使我院放射科图像整体质量明显提高。
体位摆放、病人配合、重建图像规范是主要问题。大多可以通过耐心沟通，仔细看图，认真重建来解决肺动脉 CT 值不达标的人有少部分存在，但基本得到解决。
由于肺动脉达峰时间过早，降低锁骨下静脉 CT 值也过高。其解决的方案仍在研究。

EPO-2582
探讨双源 CT 下肢动脉血管造影扫描技术优化方案

王雪,何其舟
西南医科大学附属中医医院

目的:探讨西门子第二代双源 CT 下肢动脉血管造影扫描技术优化方案,以实现最佳图像质量。方法:将本院 40 例因下肢血管疾患行双源 CT 下肢动脉血管造影患者,随机分配到 A,B 两组;用相同对比剂用量和注射速率，在相同扫描条件下，A 组监测腹主动脉，B 组监测腘动脉平面进行检查,扫描延迟时间采用 Siemens bolus tracking 自动触发跟踪技术,图像重建用最大密度投影(MIP),多平面重建(MPR),和容积再现(VR)等. 分别测量髂总动脉起始段,腘动脉段及胫前动脉下端平均 CT 值、噪声(SD),计算信噪比(SNR)及腘动脉对比噪声比(DNR)并进行统计学分析. 结果:B 组图像各感兴趣区平均 CT 值、SNR 及腘动脉 DNR 高于 A 组,差异有统计学意义(P<0.05). 结论:双源 CT 下肢动脉 CTA 成像,监测腘动脉层面对显示下肢动脉图像质量更佳。

脑肿瘤综合评估行 MR 检查时患者舒适度对诊断图像质量的影响：临床工作流程管理的定量调查研究

王小博
甘肃省人民医院

MR 检查为临床常规实践中的重要的成像模式。脑肿瘤综合评估行 MR 检查通常需要 50-70 分钟才能完成，在此期间，一些因素可能会导致患者不适并进一步导致图像质量下降。本报告的目的是调查患者对成像过程的感知及其与图像质量的相关性。
方法：收集 2018 年 1 月～2019 年 7 月 50 名患者（23 名男性和 27 名女性，平均年龄 51.3 岁，被招募 22-70 岁范围患者已经被诊断患有癌症或既往有癌症史，并行 MR 系统扫描。在行 MR 扫描后回顾性地对所有患者进行问卷调查，这有九个问题来评估患者对李克特量表评分系统的扫描感觉（1-5,1 最满意）。所有行 MR 扫描图像也由两位专家独立地视觉检查以评估图像的质量。评估了六个身体部位，并使用李克特量表评分系统评估每个位置（1-5,5 为最佳质量）。Mann-Whitney U-test 用于统计分析，以检查图像质量与患者感知之间是否存在显著相关性。结果：共有 50 名患者，填写了 48 份问卷并返回进行分析。患者的特征总结在表 4 中。患者在问卷中的感知统计数据在表 5-7 中说明。MR 图像质量与患者特征/感知之间存在统计学显著相关性。
结论:我们的结果显示 MR 扫描对大多数患者来说通常是安全和舒适的。统计分析不支持不良患者的感知导致图像质量下降的假设。

Investigation of Dacomitinib onReducing Cell Necrosis and Enhancing Cell Apoptosisin C6 Glioma Rat Model by MRI

Wangsheng Chen
People’s Hospital of Hainan Province

Background:Gliomais one of the mostepidemic and obstinate types ofcancer in the central nervous systemwith poor survival rate.Dacomitinibinhibited cell viabilityand proliferationof *EGFR*-amplified glioma.In the present study, the regional effects of Dacomitinibon tumor necrosis was investigated.
Methods: A C6 rat gliomamodel was evaluated using proton magnetic resonance spectroscopy (1H-MRS), diffusion weighted imaging(DWI), morphological T2-weighted imaging (T2W).The effects ofDacomitinib on glioma cells were investigated usingmethods of immunohistochemistryand H&E staining.
Results: The obtained data indicatedthatmetabolite ratioswere significantly decreased (all $P<0.05$) in the Dacomitinib treated group compared with C6 gliomacontrol group. The ADC value of necrotic core in Dacomitinib group was significantly lower than that in controlgroup. In addition, the expression of Ki-67 in Dacomitinib-treated group (50.32±5.61) was significantly lower than that in controlgroup ($P<0.05$).The apoptotic index (AI) (28.01±2.37) in Dacomitinib-treated group was significantly higher than that in controlgroup (11.58±3.17).
Conclusion: Theresults demonstrated that theDacomitinibcould suppress gliomacell necrosis andproliferation.

CT 门静脉血管成像监测法 ROI 的选取

旷圣遇
武汉大学中南医院

目的 相对准确获取 CT 门静脉血管成像达峰时间，提高图像质量，突出目标血管密度(HU)。
方法 本研究为回顾性临床和影像资料分析。搜集我院 2018 年 8 月 1 日至 2019 年 7 月 1 日的 90 例关于西门子双源 CT 门静脉血管成像监测不同感兴趣区的临床影像资料。其中监测门静脉为 30 例 ，监测门静脉属支脾静脉为 30 例，监测门静脉属支肠系膜上静脉为 30 例。患者年龄为 26-75 岁之间，男性 50 例，女性 40 例。由一名影像技师和一名影像医师分别独立对 90 例监测图像进行评判，观察是否能在呼吸运动以及监测层面噪声和其他动脉血管的干扰下准确迅速找到目标血管。
结果 在监测门静脉的一组中，技师和医师能共同准确判断为 10 例。其中技师单独准确判断为 13 例，医师为 14 例; 在监测脾静脉的一组中，技师和医师能共同准确判断为 24 例。其中技师为 24 例，医师为 25 例； 在监测肠系膜上静脉的一组中，技师和医师能共同准确判断 为 6 例。其中技师 6 例，医师 8 例。门静脉一组中能共同判断的准确率为 33%（10/30），脾静脉一组中能共同判断的准确率为 80%（24/30）,肠系膜下静脉一组中能共同判断的准确率为 20%（6/30）,结果有统计学意义。

结论 CT 门静脉血管成像选取脾静脉为感兴趣区（ROI）能更加准确高效找到目标血管从而提高图像质量。

EPO-2586
PDCA 循环模式在改善腹部磁共振图像质量中的应用研究

舒震宇
浙江省人民医院

目的 探讨计划、执行、检查、处理(PDCA)循环模式改善腹部磁共振图像质量的运用效果。**方法** 回顾性分析腹部磁共振图像质量共 2835 例，对每例图像按优秀、良好、及格进行质量评分。其中 2018 年 1-4 月图像例数作为对照组，2019 年 1-4 月图像作为干预组，干预组应用 PDCA 循环法，即对产生图像质量差的原因进行分析、总结，并落实相应质量干预措施。最终对两组图像质量进行干预前后的分析，比较两组图像质量的优秀率、良好率、及格率及每个月的优秀率，以评估 PDCA 循环管理对腹部磁共振图像质量的改善效果。**结果** 执行 PDCA 循环法后，腹部磁共振图像优秀率从 74.56%提升到了 94.62%，差异有统计学意义（χ^2=227.896，p<0.001）。腹部磁共振图像质量及格率由 0.92%下降到 0.32%，差异有统计学意义（χ^2=222.053，p<0.001）。腹部磁共振图像质量良好率由 24.52%下降到 5.06%，差异有统计学意义（χ^2=4.302，p<0.05）。每个月的腹部磁共振图像质量的优秀率较同期未执行前比较均有统计学差异（p<0.001）。**结论** 通过实施 PDCA 循环模式，可有效改善腹部磁共振图像质量，提高诊疗效果，值得临床推广应用。

EPO-2587
“三低”在 640 层 CT 肺动脉 CTA 成像中的应用价值

徐志超,王世威,王军娜,陈海波,唐婷,夏海波
浙江中医药大学附属第一医院

目的：采用低注射速率、低对比剂总量、低管电压技术在肺动脉 CTA 成像中的应用，评价其可行性。 **材料与方法**：采集我院自 2017 年 32 月到 2019 年 2 月的肺动脉 CTA 检查者 40 例。入组标准：体重<75Kg,静脉回流无严重受阻，心功能严重不全的除外。分为 A、B 两组，每组 20 人。采用双筒高压注射器，A、B 两组对比剂和注射用水注射速率分别为 4.5mL/s、3.0mL/s，对比剂总量分别为 30mL、20mL。注射生理盐水总量均为 20mL.对比剂为碘海醇 350。采用东芝 640 层螺旋 CT 扫描，准直宽度 0.5*160，螺距 129，机架转速为 0.5 秒，扫描条件 A 组为 120kV，B 组采用 80kV,mA 均为自动调剂,采用 Surestart 软件智能触发，将两个监测点分别设在肺动脉主干的中远端，CT 值达到 70HU 后改为连续监测，A、B 两组的触发阈值为 110HU、90HU，扫描方向为自肺底向肺尖。测量肺动脉主干、右下肺动脉、左心房、背肌及上腔静脉的 CT。两位高年资医师按双盲法对图像进行评分，肺动脉图像质量分为优（0）、良（1）、中（2）、差（3），肺静脉显影分为轻微（0）、轻度（1）、中度（2）、重度（3），上腔静脉伪影分为轻微（0）、轻度（1）、中度（2）、重度（3）。评分 0-2 为优，3-4 为良，5-6 分为中，7-9 分为差。**结果**：A 组体重 62.00±9.55 公斤，BMI23.37±3.27。B 组体重 56.21±7.38 公斤，BMI21.82±3.10。两组 CT 值的比较均无统计学意义（P>0.05）。两组的优良率分别为 83%、85%，评分的一致性较好（kappa=0.894）。上腔静脉的硬化伪影 B 组明显优于 A 组。**结论**：在无严重心功能不全的情况下，静脉回流回路无严重狭窄的情况下，对于手臂静脉情况不佳的病人采用低速率的注射速度，低的对比剂总量和低管电压技术能取得较为满意的肺动脉 CTA 图像，值得推广使用。

CT Bone-Reading 软件肋骨曲面重建技术在创伤患者快速检测肋骨骨折的应用价值

吴山,王荣华,武志峰,鄂林宁
山西大医院

目的：为了评估放射科医师读取 CT 曲面建图（CPR）相比读取标准的 MPR 的肋骨图像在肋骨骨折的检出率。
方法：回顾性分析 200 位（126 位男性，74 位女性）创伤患者的经软件处理为肋骨曲面重建的 CT 资料。患者分为两组，A 组 103 名患者中和 B 组 97 例。 两个放射科医师分别阅片，A 组使用 CPR 图，B 组使用标准 MPR 图。最终由两位资深放射科医生创建一个参考标准。
结果：参考标准为 61 个病例包括 361 处肋骨骨折；A 组 CPR 阅片方案检出率 80.9 %（292/361），B 组 MPR 阅片方案 71.5 % (258/361)，A 组方案显示出显著更高的骨折检出率，P <0.001；A 组平均读片时间 31.3 s，B 组平均读片时间 60.7s；A 组阅片时间显著短于 B 组，P＜0.001。
结论：应用 CPR 曲面重组技术检测肋骨骨折可加快创伤患者胸部 CT 的阅读速度，同时与传统的 MPR 相比具有更高的整体敏感性。

EPO-2589
基于 CT 增强图像的纹理分析对术前胰腺癌分化程度的预测价值

张龙龙,韦炜
中国科学技术大学附属第一医院（安徽省立医院）

目的 增强 CT 扫描是目前诊断胰腺癌常用的检查方法，但对胰腺癌的诊断仍属于较主观的经验性诊断，而图像纹理分析可以提供客观、定量的图像描述特征，本研究旨在探讨基于 CT 增强扫描的纹理分析（CT texture analysis，CTTA）预测胰腺癌病理分化程度的可行性。**方法** 选取安徽医科大学附属省立医院经术后病理证实为胰腺癌的 83 例患者的 CT 增强图像，其中病理为中分化者 34 例，低分化者 13 例，中低分化者 36 例，选取 3 组病例 CT 增强扫描动脉期及静脉期图像肿瘤病灶最大层面，利用 ITK-Snap 软件进行手动勾画感兴趣区（Region of Interest，ROI），GE 公司 A.K 软件（GE healthcare, AnalysisKit，Version：3.2.0.R）提取 ROI 影像资料中隐藏数据生成纹理特征并进行纹理分析，进行各分化组之间的判别。**结果** 利用 AK 软件提取的 83 例患者 CT 增强图像动脉期及门静脉期的纹理特征，对提取的特征进行方差分析+相关性研究+规范化的逻辑回归 lasso 进行特征选取，得到 8 个最优特征，并得到受试者工作特征曲线曲线下面积（Area Under Curve，AUC）为 0.691；对不同病理分级的病灶将数据按照 7：3 的比例分为训练集与测试集，训练集的数据用于特征筛选，模型构建，得到的 AUC 曲线下面积动脉期分别为低分化为 1，中分化为 0.71，中-低分化为 0.71；静脉期分别为低分化为 1，中分化为 0.69，中-低分化为 0.70。**结论** 基于 CT 增强扫描图像的纹理分析可以作为胰腺癌术前评估病理分化程度的辅助手段，尤其是对低分化胰腺的评估具有较优异的评估效能。

EPO-2590
人工智能在冠状动脉 CTA 辅助诊断中的应用价值

马鸣岳,刘红生,杨想春,刘润,张宏,于海宾,邬小平
西安市中心医院

目的
探讨人工智能(artificial intelligence，AI)在冠状动脉 CTA 诊断中的应用价值。
方法
对 90 例临床疑似冠心病的患者，经 Philips 256 层 iCT 冠状动脉 CTA 扫描，将所有患者的 CTA 扫描数据分别传至 Philips Workstation 后处理工作站及数坤科技冠状动脉智能辅助诊断系统处理器,分别由两位经验丰富的高年资医生使用 Philips Workstation 提供的冠状动脉分析软件对所有 CTA 扫描图像行冠状动脉各支血管后处理并作出诊断报告，同时使用数坤科技冠状动脉智能辅助诊断系统软件对 CTA 数据行冠状动脉自动识别处理并生成诊断报告；将二者分析结果进行对比，评价 AI 对冠状动脉病变的诊断价值。
结果:
与经验丰富的高年资医生相比，AI 对冠状动脉斑块诊断的阳性预测值为 93.2%,阴性预测值为 87.3%,敏感度为 88.5%,特异度为 85.3%；AI 对冠状动脉病变定位的敏感度和特异度分别为 86.7%、81.4%；AI 对冠状动脉病变斑块定性的敏感度和特异度分别为 74.6%,86.1%；在冠状动脉斑块处管腔狭窄程度的诊断中,AI 与高年资医生对冠状动脉狭窄的总检出率分别为 36.5%、34.1%,差异无统计学意义(P＞0.05)；AI 对冠状动脉斑块管腔狭窄程度判断的敏感度和特异度分别为 60.87%,80.77%；AI 与高年资医生对冠状动脉心肌桥的检出率分别为 7.7%、0%,差异有统计学意义(P＜0.05)；AI 与高年资医生对冠状动脉发育异常的检出率分别为 3.3%、0%,差异有统计学意义(P＜0.05)。
结论
AI 辅助诊断冠状动脉斑块的准确率较高，具有很高的临床应用价值，能协助临床医师极大的提高工作效率；但 AI 对冠状动脉心肌桥及冠状动脉发育异常的检出率低，需要临床医师结合 CTA 图像自行作出诊断。

基于影像组学评估结直肠癌肝转移联合贝伐珠单抗化疗后的治疗反应

李齐英[1],刘屹[2]
1.龙岩市第一医院
2.中国医科大学附属第一医院

目的：建立并验证预测结直肠癌肝转移联合贝伐珠单抗化疗后的治疗反应的 CT 影像组学模型，比较化疗前后 CT 纹理参数的变化。
材料和方法：纳入 50 名（18 例应答组和 32 例无应答组）结直肠癌肝转移且接受联合贝伐珠单抗化疗的患者，总共选取 141 个肝转移灶，每个患者分别提取动脉期和门脉期化疗前、后的 792 个纹理特征。依次用方差分析、Spearman 相关性检验和 LASSO 回归选择纹理参数，分别用 SVM、Logistic 回归建立所选择参数的影像组学模型并验证。影像组学模型通过准确度、灵敏度、特异度、精确度及 ROC 曲线下面积进行评价。化疗前、后的 135 个病灶进行配对 t 检验，比较 CT 纹理参数的变化。
结果：12 个纹理特征的建立的 SVM 模型、Logistic 回归模型具有较高的准确度、灵敏度、特异度、精确度。两种模型的结果如下：SVM 的训练集：0.95、0.98、0.89、0.83；验证集，0.84、0.93、 0.67、0.83；Logistics 回归模型训练集：0.88、0.96、0.74、0.79；验证集 0.84、0.89、0.73、0.79。两种模型训练集的 ROC 曲线下面积分别为：0.90、0.79。化疗后应答组的 211

个纹理参数显著变化，无应答组 130 个纹理参数显著变化，其中有 62 个相同的显著变化的纹理参数。

结论：影像组学模型可以预测结直肠癌肝转移患者联合贝伐珠单抗化疗后的治疗反应，纹理分析能够评估化疗前、后的肝转移灶内部结构的变化，可以作为联合贝伐珠单抗的化疗过程的监测。

基于影像组学的前列腺癌 Gleason 评分无创性评估

徐敏[1],巩立鑫[2],虞芯仪[1],周立娟[1],董迪[2],田捷[2],方向明[2]
1.无锡市人民医院
2.中国科学院自动化研究所

研究目的
本研究的目的是将影像组学和前列腺磁共振图像结合，构建前列腺癌 Gleason 评分影像组学模型，在术前通过无创性的方法得到前列腺癌患者的病理评分。
方法与材料
本研究回顾性纳入 2008 年至 2018 年于我院就诊的前列腺癌患者，筛选后共 410 名患者入组。随机选取 328 个样本作为训练集，其他样本验证集，所有患者均有 T2 加权成像、DWI 序列、ADC 图三类磁共振图像[1]及 Gleason 评分结果。在每个序列图像上对前列腺腺体进行逐层分割[2]。利用类内相关系数(ICCs)评价特征提取的观察者内部和观察者之间的一致性，大于 0.75 的 ICC 被认为具有良好的一致性[3]。利用多元线性回归(MLR)方法[4]保留了关键的影像组学特征，并进一步建立了 Gleason 评分的预测模型。采用 ROC 曲线对预测性能进行评估，P <0.05 为差异有统计学意义。
结果：
最终共计提取 4176 个影像学特征，通过层层特征选择筛选得到三个关键特征，进一步构建了 Gleason 评分预测模型。对于亚组(GS6 vs. GS7&8)的预测，Gleason 评分预测模型在训练集和验证集中 AUC 分别为 0.827 (95% CI, 0.758-0.899)和 0.742(95% CI, 0.695-0.928)。对于亚组(GS6&7 vs. GS8)的预测，Gleason 评分预测模型在训练集和验证集中 AUC 最大，分别为 0.853 (95% CI, 0.812-0.893)和 0.888 (95% CI, 0.816-0.960)。
结论
结果表明，基于磁共振图像的影像组学特征具有潜在的前列腺癌 Gleason 评分分级能力。不同 Gleason 评分水平的患者无需进行侵入性病理检查即可得到及时、恰当的治疗，如主动监测、术前新辅助治疗等，不仅能避免有创性检查带来的不良后果，还能够改善患者的预后。

基于钆塞酸二钠增强 MRI 影像组学在肝切除术前定量评估肝硬化患者肝脏储备功能的应用价值

周玮[1],何剑[1],郑屹峰[1],严强[1],胡红杰[2],韩玉鑫[2]
1.浙江大学湖州医院（浙江省湖州市中心医院）
2.浙江大学医学院附属邵逸夫医院放射科

1.目的：本研究探讨 Gd-EOB-DTPA 增强 MRI 肝胆期图像的 Radiomics 特征与临床用于评估肝脏储备功能的 Child-Pugh 评分系统的相关性，并开发了预测模型来预测 Child-Pugh 评分级别并进行量化验证，旨在探讨其无创性精准评估肝脏储备功能的可行性及临床价值。2.**方法：**纳入本研究的肝硬化患者共 100 例，按照 7:3 的比例随机分成训练集和验证集，并应用 GE 的 AI-Kit 软件对 Child-Pugh 分级 A 级、Child-Pugh 分级 B+C 级两组患者的增强 MRI 肝胆期图像数据进行图像分割、纹理特征提取、Radiomics 特征筛选和 Radscore 评分系统构建，并创建列线图（nomogram）预测模型。利用 ROC 曲线分析其泛化效能。**3.结果：**将纳入研究的 52 例 Child-Pugh A 级患者和 48 例 Child-Pugh B+C 级患者分别按照 7:3 的比例随机分成训练集和验证集。使用 ITK-SNAP 软件将 100 例图像分割好的 ROI 文件导入 AK 软件进行纹理特征分析，共提取 396 个纹理特征参数。对训练集中 71 例患者进行 LASSO 降维筛选出 7 个有较大价值的纹理特征。使用单个 LASSO 模型通过所选择的 7 个特征的线性组合来建立 Radscore 评分系统，根据 Radscore 评分系统创建用于区分 Child-Pugh A 级和 Child-Pugh B+C 级的 nomogram 预测模型，经过 ROC 曲线分析得出：训练集中 AUC：0.88；Sensitivity：0.78；Specificity：0.97；验证集中 AUC：0.86；Sensitivity：0.80；Specificity：0.93。**4.结论：**Child-Pugh A 级和 Child-Pugh B+C 级肝硬化患者的肝胆期图像的影像组学特征之间具有显著性差异；建立 nomogram 预测模型，可以作为肝脏储备功能的准确可靠的检测工具。

基于多示例学习方法的多模态 MR 影像的 GBM 预后预测

卢笛[2],张曦[1],刘洋[1],徐肖攀[1],贺小伟[2]
1.空军军医大学
2.西北大学

目的：针对胶质母细胞瘤(GBM)异质性分析及预后预测，结合机器学习方法建立一种瘤内分割模式。但是获得的单个肿瘤的子区域数目不一定相同，导致传统预测分析方法无法建模，因此采用多示例学习(MIL)方法，通过预测 GBM 中各个子区域的标签，定位“高危”区域，实现预后预测。
方法：首先从癌症基因组图谱(TCGA)中挑选出共 104 名 GBM 患者的影像数据(57 长生存期患者和 47 名短生存期患者，包含 T1、T1 增强、T2、FLAIR 序列)作为样本集进行配准、勾画肿瘤区域、标准化等预处理操作。其次，不同于传统的肿瘤分割方法，基于 kmeans 的肿瘤异质性瘤内分割模式利用 MR 影像的多模态数据获取子区域，将所有样本的体素共同聚类，并将结果映射回独立样本的肿瘤空间，获得子区域。然后，提取子区域的影像特征包括(GLCM、GLRLM、GLSZM 和直方图特征)构建多示例包，将肿瘤区域视作“包”，其子区域视为包中的“示例”，预后好坏作为各个子区域危险程度的评价标准。最后，使用示例及示例标签训练 SVM 分类器，采用 MIL 方法更新示例标签，重复训练和更新过程直至迭代结束。利用训练好的分类器预测示例标签，依据“正包中至少含有一个正示例，负包中所有示例均为负”的原则，确定包标签，实现预后预测。
结果：结果表明，相比于仅使用 SVM 实现 GBM 预后预测的研究(准确性、灵敏度和特异性分别为 80.67%、78.45%和 83.33%)，基于 MIL 方法的预测性能可以达到较高的预测效果 (准确性、灵敏度和特异性分别为 81.82%、76.92%和 85.00%)。
结论：证明了使用 kmeans 瘤内分割方法的可行性，以及多实例学习(MIL)方法进行肿瘤预后预测的有效性。此外，较好的包预测结果可以在一定程度上表征较为准确的示例预测，预测为正的子区域隐含对预后起决定作用的“高危”因子，对 GBM 异质性分析具有一定的研究价值和临床意义。

基于 CDG 新技术结合 CTA 及 DSA 对比筛检急性心肌缺血与梗塞的探讨

欧陕兴[1,4],欧舒斐[1,2],王聪[3],李彬[1],刘盼丽[1]
1.中国人民解放军南部战区总医院
2.中国人民解放军南部战区空军医院
3.华南理工大学
4.北京大学数字中国研究院华南分院

1.目的　基于动力学建模与深度学习，探讨 CDG 及 CTA/DSA 对急性心肌缺血筛检及随访的应用价值，构建 CDG 评价分析系统。
背景：传统 ECG 对急性心肌缺血与梗塞检测效率与准确性比较低，容易导致漏诊及误治。CDG 飞机发动机故障检测技术移植到人体的生物心脏领域。核心技术：心电动力学建模与特征提取，标准 12 导联心电图 ST-T 段信号建模。提取心动 ST-T 段动态特征。三维可视化显示。确定学习算法并行化分解，实现 CDG 建模快速计算。
2.材料与方法
2.1 技术路线：1.心电动力学建模与特征提取；2. 心肌缺血与猝死检测动物实验；3. 大样本检测心肌缺血与猝死临床试验；4. 心肌缺血检测与虚拟心脏仿真；　5.心肌缺血与猝死检测机理研究包括：心肌缺血及猝死与复极时空不一致性；T 波变异性与复极时空不一致性；心电动力学图对 T 波变异性检测能力；提出 CDG 诊断机理科学解释。
2.2 时间：　2015 年 3 月-2017 年 5 月，收集临床可疑心肌缺血与急性心肌梗塞 3260 例 CDG 病例，年龄 38-78 岁，其中 126 例急性心梗与心肌缺血治疗前后,经过 CTA、CDG、DSA、CDG 对照检测。
2.3 分组：1.CTA-CDG 组；2.CTA-CDG-DSA 组;3.CDG-DSA-CDG 组;4.CTA-CDG-ECT-CDG。
3.结果　　CDG 无创检测与“预警”急性心肌缺血与梗塞：CDG 敏感度 95%、特异度 90%、准确率 88%、检出率 95%。各组别之间差异显著有统计学意义（$P<0.05$）。
4.结论：基于 CDG 与 CTA/DSA 对急性心肌缺血与梗塞对照，提示 CDG 能准确的筛检急性缺血与梗塞的三维可视化的定量方法，临床应用前景广阔。
*CDG（心电动力学图）研究获 2015 年国家重大科学仪器专项资助（编号 61527811）。

EPO-2596
急危重症的精神心理压力定量数学建模及评价系统研究

欧陕兴[1],欧舒斐[1,2],谢玉茹[1],王晓武[1],罗道首[1],李小荣[1],乔国庆[1],杨荣骞[3]
1.中国人民解放军南部战区总医院
2.中国人民解放军南部战区空军医院
3.华南理工大学

目的 研制急危重症的精神心理压力的定量评价系统装备，构建定量精神心理压力（PSA）数学建模，建立国人精神心理量化评价标准，旨在提供术后病人康复的个性化定量评价与临床指导。
背景 急诊危重症术后人体处于高应激状态、释放儿茶酚安、肾上腺素等、身心严重打击与创伤、易合并手术后并发症。干预依赖量化证据支持，相反，导致家庭、医疗和社会问题，因此，压力定量设备的研制与评价系统构建，对于指导医学康复有临床意义。
2.材料与方法
2.1 病人分组：1.胸疼三联症病人；2.腹部重大手术者；3.严重的外伤病人；4.先天性心脏病人组；5.胸部重大手术者。

2.2 方法分组：1.PSA-CDG;2.PSA-CDG-CTA;3.PSA-CDG-PSA。定量指标的计算机分析判断动态个体化指标，图像显示分类。
2.3 压力分级：1.正常；2.轻度压力；3.中度压力；4.重度压力。
2.4 平衡类型：1.交感神经平衡型；2.副交感神经平衡型；3.交感与副交感神经平衡型。
2.5 无线传输、信息采集、数学建模、个体化指标等设备与指标研究。
3.结果
1.严重胸腹部手术前后 PSA 显著升高；2.先天性心脏病手术后 PSA 稳定型；3.严重外伤 PSA 无反应型；4.PSA-CDG-PSA 组评价结果优于 PSA-CDG 组；5.交感与副交感神经平衡型组，不易在 CDG 检测急性心肌缺血改变（$p<0.05$）。
4.结论 PSA 即构建急危重症病人的精神心理压力定量评价系统，提供临床康复个性化动态数据，实现综合评价病人康复过程决策指导。
*PSA 获 2016 年广州市重大协同创新专项基金（编号 201604020107）

EPO-2597
基于非增强磁共振影像组学特征预测术前肝细胞肝癌微血管浸润的价值

武明辉,谭红娜,宁培钢,朱绍成,史大鹏
河南省人民医院

目的：术前预测肝细胞癌（HCC）患者微血管侵犯（MVI）具有重要意义。我们的目的是建立并验证基于非增强磁共振影像组学特征对术前肝细胞肝癌微血管侵犯（MVI）的预测价
值。
方法：收集我院自 2012 年至 2016 年 175 例经组织学证实的伴或不伴 MVI 的肝细胞肝癌患者进行研究，其中 120 例为训练组，55 例为验证组。所有患者均有完整术前磁共振（MRI）图像，且图像清晰，满足分析要求。人工勾画 T1 加权像（T1WI）和 T2 加权像（T2WI）图像中三维肿瘤区域，并从中提取和分析影像组学特征。在训练组中，采用 MATLAB 对于所提取的特征进行降维和特征选择，并用于验证组进行验证。
结果：训练组和验证组 MVI 阳性患者比例分别为 38.5%和 40.6%，二者差异没有统计学意义（$P>0.05$）；T1WI 和 T2WI 筛选出 16 个特征来建立 MVI 的预测模型。在训练组和验证组中，受试者操作特征曲线（AUC）下的面积、预测模型的敏感性、特异性分别为 0.87（95%可信区间（CI），0.75－0.92）、88.7%、76.5%和 0.82（95%CI，0.73－0.94）、89.1%，
74.8%。
结论：基于非增强磁共振的影像组学特征为肝癌患者 MVI 的预测提供了一个有效的模型，因此可能有助于临床医生对手术前的治疗做出精确的决定。

EPO-2598
A CT-based radiomics nomogram for differentiation of focal nodular hyperplasia from hepatocellular carcinoma in the non-cirrhotic liver

Pei Nie,Guangjie Yang
The Affiliated Hospital of Qingdao University

Purpose: The purpose of this study was to develop and validate a radiomics nomogram for preoperative differentiating focal nodular hyperplasia (FNH) from hepatocellular carcinoma (HCC) in the non-cirrhotic liver.
Methods: A total of 156 patients with FNH (n=55) and HCC (n=101) were divided into a training set (n=119) and a validation set (n=37). Radiomics features were extracted from triphasic contrast CT images. A radiomics signature was constructed with the least absolute shrinkage and selection operator algorithm and a radiomics score (Rad-score) was calculated. Clinical data (age, gender, HBV and HCV infection, and AFP level) and CT findings (maximum diameter, shape, central scar, degeneration, fat deposition, calcification, capsulelike rim, dysmorphic vessels, and enhancement pattern) were assessed to build a clinical factors model. Combined with the Rad-score and independent clinical factors, a radiomics nomogram was constructed by multivariate logistic regression analysis. Nomogram performance was assessed with respect to discrimination and clinical usefulness.
Results: 4227 features were extracted and reduced to 10 features as the most important discriminators to build the radiomics signature. The radiomics signature showed good discrimination in the training set (AUC [area under the curve], 0.964; 95% confidence interval [CI], 0.934-0.995) and the validation set (AUC, 0.865; 95% CI, 0.725-1.000). Age, HBV infection and enhancement pattern were the independent clinical factors. The radiomics nomogram, which incorporated the Rad-score and clinical factors, showed good discrimination in the training set (AUC, 0.979; 95% CI, 0.959-0.998) and the validation set (AUC, 0.917; 95% CI, 0.800-1.000), and showed better discrimination capability (P<0.001) compared with the clinical factors model (AUC, 0.799; 95% CI, 0.719-0.879) in the training set. Decision curve analysis showed the nomogram outperformed the clinical factors model in terms of clinical usefulness.
Conclusions: The CT-based radiomics nomogram, a noninvasive preoperative prediction tool that incorporates the Rad-score and clinical factors, shows favorable predictive efficacy for differentiating FNH from HCC in the non-cirrhotic liver, which might facilitate clinical decision making process.

EPO-2599
基于对比增强 CT 列线图对于肝细胞肝癌术前病理分级的预测价值

武明辉,宁培钢,李攀,文泽军,朱绍成,史大鹏
河南省人民医院

目的：研究基于对比增强 CT 列线图对于肝细胞肝癌术前病理分级的预测价值。
方法：对 165 例经组织学证实的肝癌的患者进行研究，其中 112 例为为训练集，53 例为验证集。所有患者术前均有完整的增强 CT 图像，包括动脉期（AP）、门静脉期（PVP）和延迟期（DP），术后均有详细的病理分级信息；分别从患者术前 AP、PVP 和 DP 中提取记录和放射特征，并记录患者的临床信息。放射分析包括肿瘤分割、特征提取、模型构建和模型评价，建立预测肝癌病理分级的最终列线图，并通过校准和鉴别统计对列线图的性能进行评估。
结果：在放射组学特征中，4 个 AP 特征、6 个 PVP 特征和 9 个 DP 特征对肝癌的病理分级预测有效。在验证数据集中，PVP 放射组学特征的性能优于 AP 和 DP 放射组学特征，AUC 为 0.786。在临

床模型中，肿瘤最大直径、甲胎蛋白和乙肝感染是有效的预测因子。最后的列线图集成了 PVP 放射组学签名和三个临床特征。训练数据集和验证数据集的列线图均得到了较好的校准，c 指标分别为 0.813 和 0.818。决策曲线分析表明，所提出的列线具有临床应用价值，净效益为 0.357。

结论：上述放射组学列线可以在术前预测 HCC 患者的病理分级，可能成为指导后续个性化治疗的有效临床工具。

多参数磁共振成像在鉴别前列腺良恶性结节方面的影像组学初步研究

骆俊佳
广东医科大学附属医院

目的

应用影像组学提取、分析前列腺多参数 MRI 图像的纹理特征，探讨其在鉴别前列腺良恶性结节中的价值。

方法

回顾性收集我院 2016 年 01 月 01 日至 2018 年 11 月 30 日进行 MRI 检查并且通过病理证实的前列腺癌患者和前列腺增生患者 70 例，其中前列腺癌 40 例，良性 30 例，所有患者包括完整的轴位 T2WI、DWI 和 DCE 动态增强序列。从 PACS 系统（Picture Archiving and Communication Systems）导出患者数据，包括完整的 T2WI 横轴、DWI 轴位、DCE 轴位图像。在 ITK-SNAP 软件上进行 ROI 的绘制，由两名五年以上工作经验的放射科医生根据每一病例的前列腺系统穿刺活检详细记录和病理诊断结果，对照前列腺解剖分区，在图像的穿刺活检取材位置相应部位进行感兴趣区勾画，逐层沿癌灶边缘进行勾画（尽量包括整个癌灶，但不超出癌区范围）。将勾画好的图像导入 Artificial Intelligence Kit software 软件，自动提取 396 个纹理特征。采用秩和检验进行特征数降维，相关性检验的相关程度选择 90%。建立模型，将所有收集的病例数按照 70%比 30%比例随机分成训练集和测试集，训练集用于指导 Logistic 回归模型学习，训练集随机分成十组，采用重复十次的十折交叉验证方法对分类器进行训练，得到机器学习模型。用测试集对其进行验证，得到准确率、敏感性、特异性、ROC 曲线下面积（AUC）。

结果

秩和检验分析后，前列腺癌组和前列腺增生组的 T2WI 图像有 237 个影像组学参数有明显差异，相关性筛选后剩余 17 个。Logistic 回归模型鉴别分析前列腺癌组和前列腺增生组的 AUC 值为 0.696，敏感性为 89.5%、特异性为 69.4％、准确性为 68.0％。

结论

本研究中可以看出，前列腺癌组和良性增生组间的多参数 MRI 图像纹理分析定量参数存在差异，有助于鉴别前列腺癌与良性增生。

glszm 纹理特征评估纯磨玻璃 IA 的 p-53、ki-67

马双春,李智勇,刘爱连
大连医科大学附属第一医院

目的 探讨利用 glszm 纹理分析评价纯磨玻璃 IA 的 p-53、ki-67 情况。**方法** 回顾性收集 2015 年 1 月至 2018 年 1 月期间于大连医科大学附属第一医院经手术病理证实为肺浸润性腺癌（IA），同时薄层 CT 上呈现为肺纯磨玻璃结节（pGGN）的患者总计 40 例。所有病例均为单发 IA 病灶，总计 40 个 pGGNs。回顾性采集所有研究对象的免疫组化情况：p53 突变率，ki-67 增殖指数，观察并测量薄层 CT 上 pGGN 的 glszm 纹理特征：ZoneVariance，GrayLevelNonUniformity，LargeAreaEmphasis，SmallAreaHighGrayLevelEmphasis，ZonePercentage，LargeAreaLowGrayLevelEmphasis，LargeAreaHighGrayLevelEmphasis 等。将所有患者的免疫组化指标与 glszm 纹理特征做相关性分析。**结果** p53 突变率与 glszm 纹理特征均无相关性；ki-67 增殖指数与 ZoneVariance（p=0.000，r=0.619）、LargeAreaEmphasis（p=0.000,r=0.619），LargeAreaHighGrayLevelEmphasis（p=0.001，r=0.578）呈正相关。 ki-67 增殖指数与 ZonePercentage（p=0.040，r=-0.378），LargeAreaLowGrayLevelEmphasis（p=0.003，r=-0.532）呈负相关。**结论** ki-67 增殖指数与 glszm 纹理特征具有一定相关性，其中 ZoneVariance 和 LargeAreaEmphasis 相关性最强，分析薄层 CT 上 pGGN 的 glszm 纹理特征，对评价患者肿瘤 ki-67 增殖活性有一定的临床价值。

CT 影像组学对肾透明细胞癌凝固性坏死的预测研究

李武超[1,2],王荣品[1]
1.贵州省人民医院
2.遵义医科大学附属医院

目的 探讨 CT 影像组学对术前肾透明细胞癌凝固性坏死的预测价值。
方法 分别回顾性收集贵州省人民医院肾透明细胞患者 123 例，遵义医科大学附属医院肾透明细胞患者 130 例，以贵州省人民医院病例作为训练集，遵义医科大学病例作为验证集。采用开源 pyradiomics 平台对每一个样本进行特征提取，首先过滤掉低方差和高共线性的特征，然后采用最大相关最小冗余算法（mRMR）对特征进一步筛选，最后使用 T 检验筛选出与凝固性坏死最大相关性的特征，最终建立影像组学标签。最后使用多元逻辑回归模型结合影像组学标签建立了影像组学模型，并使用受试者工作者曲线（ROC）评估该模型对肾透明细胞癌凝固性坏死的预测性能。
结果 每个病人共提取出 1479 个特征，然后使用“care”包过滤掉低方差和高共线性的特征，特征数缩减到 120 个，然后通过最大相关最小冗余算法筛选出 13 个特征，最后使用 T 检验进一步筛选，得到 1 个最有意义的特征并建立影像组学模型。影像组学模型在训练集上的 AUC=0.78，测试集的 AUC=0.85。
结论 CT 影像组学可对术前肾透明细胞癌凝固性坏死进行较好的预测，有助于肾透明细胞癌术前个性化的诊疗。

EPO-2604
CT 组学在预测乳腺癌同时性肺结节治疗转归中的研究

黄琰,肖勤,顾雅佳
复旦大学附属肿瘤医院

目的：探讨 CT 组学预测乳腺癌患者同时性肺结节在乳腺癌治疗后转归的可行性。
方法：回顾性收集我院 2013.1.1 至 2016.11.31 期间由病理证实为乳腺癌且同时胸部 CT 发现肺结节（≥5mm，数量少于 5 个）的患者。患者均接受手术切除，术后行内分泌治疗及放化疗。以治疗前胸部 CT 为基线，根据 CT 随访结果将肺结节转归分成稳定组及变化组，变化组进一步分为进展组及改善组，稳定组随访时间需超过两年。通过对肺结节基线 CT 行组学特征分析建立模型，预测肺结节在乳腺癌标准治疗后的转归。
结果： 共 80 例女性入组，中位年龄 52 岁（28-81 岁），肺结节中位大小 6mm（5-24mm）。稳定组 54 例，中位随访时间 27 个月（24-48 月）；变化组 26 例，中位变化时间 12 个月（3-36 月）。据肺结节基线 CT 图像共提取 105 种组学特征。稳定组与变化组间有 60 个组学特征有统计学差异（p<0.05），择出 90 Percentile、MA、Correlation 及 JE 四种组学特征，利用 23 种分类器建立模型，以 CGSVM 建立的模型具有最大曲线下面积，以此模型预测肺结节转归的特异度、敏感性、精准度及 AUC 分别为 100%、42%、81.3%及 0.87。变化组中有 40 个组学特征可以区分进展组与改善组，择取一种组学特征，以 CGSVM 分类器建立的模型具有最佳 AUC，预测变化组肺结节转归的特异度、敏感性、精准度及 AUC 分别为 54%、92%、71.3%及 0.88。
结论：CT 组学在预测乳腺癌同时性肺结节的治疗转归中具有一定意义，可以为临床制定个体化治疗方案提供影像学依据。

EPO-2605
Application of Radiomic features as biomarker used for distinguishing EGFR DEL19 and L858R sensitizing mutation subtype of non-small cell lung cancer

Jun Guo Hui
Lishui Municipal Central Hospital

Abstract

Purpose: The aim of this study was to establish a prediction model based on features extracted from CT images to differentiate the EGFR DEL19 and EGFR L858R sensitizing mutation in non-small cell lung cancer(NSCLC) patients.
Material: A total number of 396 CT-based phenotypic characteristics were extracted according to the intensity, shape, and texture from NSCLC preoperation images of 149 patients. A CT-based phenotypic signature was proposed using Cox regression model with LASSO penalty for the prediction of EGFR mutation. Furthermore, a joint prediction model incorporating the CT based image radiomics features and clinicopathologic characteristics was proposed for EGFR sensitizing mutation subtype prediction.
Results: Of 396 radiomic features, 4 rad-score features were generated as independent features by using cox regression with lasso penalty. Cox regression was applied and 4 clinical features were selected. We found the radiomics signature showed good discrimination performance in validation cohorts. In training set, the radiomics signature successfully discriminated the EGFR DEL19 and EGFR L858R sensitizing mutation (AUC=0.698, P<0.0001). Combining the imaging signature with a clinical feature model of EGFR status (AUC=0.778, P=0.0143) significantly improved prediction accuracy (AUC=0.874, P<0.0001). Furthermore, the intergration prediction model showed significant difference when compared to radiomic signature model alone (P=0.0041, 95%CI: 0.0558-0.296) and with good calibration.
Conclusion: Radiomics features have the potential to predict the EGFR sensitizing mutation subtype between EGFR DEL19 and EGFR L858R from CT images of non-small lung cancer cell patients . and the performance of radiomic features model are improved when combined with clinical features.
A clinical relevance statement: The imaging-based biomarkers can be used as a potential tool for differentiating EGFR DEL19 and EGFR L858R mutation subtype with high sensitivity, specificity and accuracy.

CT high resolution images-based radiomics analysis for differentiating lung cancer from tuberculosis

Chuan Tian[1],Chunchao Xia[1],Zhenlin Li[1],Xinrong Wang[2],Xin Li[2]
1.West China Hospital of Sichuan University
2.Translational Medicine Team， GE Healthcare， Shanghai， China

PURPOSE

To establish and validate a CT high resolution images-based radiomics model for differentiating lung cancer from tuberculosis

METHOD AND MATERIALS

Two hundred and forty-three patients with lung cancer and 243 patients with tuberculosis who underwent CT examinations one month before pneumocentesis biopsy were respectively included in this study. The pneumocentesis biopsy was regarded as the golden standard. ITK-SNAP was used to segment draw the region of interest and generate the 3D volume of lesion. All data was divided into training cohort (ncancer=ntuberculosis=170) and validation cohort (ncancer=ntuberculosis=73) by using

stratified sampling and 10-fold cross-validation with proportion 7:3. The texture features extracted by Artificial Intelligent Kit (A.K.) were selected by using Spearman and Support vector machine recursive feature elimination feature selection method. The remaining features were included in the model developed by logistic regression analysis and presented with a radiomics nomogram. The receiver operator characteristics (ROC) analysis was performed to validate the radiomics model curves.

RESULTS
There were a total of 696 features extracted. After data redundancy and dimension reduction, 17 features were used to develop the prediction model. A nomogram for distinguishing these two diseases, with an AUC of 0.894 (Accuracy, 0.826; Precision, 0.81; SE, 85.3%; SP, 80%) for training set and 0.856 (Accuracy, 0.767; Precision, 0.767; SE, 76.7%; SP, 76.7%) for the validation data was successfully plotted.

CONCLUSION
A CT high resolution image -based radiomics has the potential for distinctions between lung cancer and tuberculosis, indicating the radiomics could play an important role in before pneumocentesis biopsy.

EPO-2607

End-to-end screening for osteoporosis and osteopenia using deep learning applied to lumbar spine X-ray images: A retrospective, multicohort, diagnostic study

Bin Zhang,Shuixing Zhang
The first affiliated hospital of jinan university

Background: Low bone mineral density (BMD) is well-known to contribute to increased fracture risk, which is a major source of associated morbidity and mortality, particularly in postmenopausal women. The objective of this study was to use deep convolutional neural network (DCNN) models as a tool to evaluate BMD in postmenopausal women by analysing lumbar spine X-ray images.
Methods and findings: We performed a retrospective, multicohort, diagnostic study using lumbar X-ray image sets from three hospitals in China. We developed and validated the DCNN models on the training cohort, comprising 1310 lumbar spine X-ray images from 655 postmenopausal women (aged ≥ 50 to ≤ 92 years). The lumbar spine BMD measured via a dual energy X-ray absorptiometry (DXA) device was used as a reference standard. We categorized patients into three groups according to BMD T-score: normal (T ≥ -1.0), low bone mass (-2.5 <T < -1.0), and osteoporosis (T≤ -2.5). Two models were trained to perform classification (Model 1: osteoporosis vs normal and low bone mass; Model 2: normal vs low bone mass). Each model' s diagnostic performance was validated in an internal cohort (144 images from 72 patients) and two external cohorts (362 images from 181 patients; and 148 images from 74 patients). Model classification performance was assessed by receiver operating characteristic (ROC) curve analysis. We compared the performance of models based on the anteroposterior images, lateral images, and their combination. The models achieved high performance in evaluating lumbar spine

BMD in the validation cohorts tested. When tested in the internal validation cohort, Model 1 yielded area under the curves (AUCs) of 0.860 (95% confidence interval [CI]: 0.759, 0.931), 0.835 (95% CI: 0.729, 0.912), and 0.867 (95%CI: 0.766, 0.935) based on the anteroposterior, lateral, and combined images, respectively; while AUCs for Model 2 were respectively, 0.819 (95% CI: 0.695, 0.907), 0.788 (95%CI: 0.660, 0.885), and 0.828 (95%CI: 0.694, 0.921). In the Guangzhou external validation cohort, Model 1 yielded AUCs of 0.860 (95%CI: 0.759, 0.931), 0.835 (95% CI: 0.729, 0.912), and 0.867 (95% CI: 0.766, 0.935) based on the anteroposterior, lateral, and combined images, respectively; while model 2 yielded AUCs of 0.868 (95%CI: 0.810, 0.914), 0.855 (95%CI: 0.796, 0.903), and 0.910 (95%CI: 0.858, 0.947), respectively. In the Zhongshan external validation cohort, Model 1 yielded AUCs of 0.828 (95%CI: 0.723, 0.906), 0.863 (95%CI: 0.763, 0.932), and 0.841 (95%CI: 0.737, 0.915) based on the anteroposterior, lateral, and combined images, respectively; while AUCs for Model 2 were respectively 0.806 (95%CI: 0.697, 0.888), 0.793 (95%CI: 0.683, 0.878), and 0.894 (95%CI: 0.800, 0.953). No significant differences were observed between AUCs of models 1 and 2 in different image projections across different centres (for all, $P > 0.05$). Study limitations include the retrospective nature of the data collection as well as the opaque black box nature of deep learning networks.

Conclusions: Deep learning diagnostic networks can be trained to accurately assess BMD on lumbar spine radiographs with high classification performance. It is valuable and practical as a non-invasive screening tool for BMD in postmenopausal women.

EPO-2608
基于 CycleGAN 网络模型将下肢骨肉瘤 CT 图像生成伪 MRI 图像的方法及质量评价

王传彬[1],孟祥银[2],董江宁[1],裴曦[2]
1.中国科学技术大学附属第一医院西区，安徽省肿瘤医院
2.中国科学技术大学

目的：和 CT 图像相比，MR 图像具有更高的软组织对比度，但其价格昂贵，采集时间长，检查禁忌症多。本文旨在研究基于 CT 图像转化成伪 MRI（sMRI）的方法，以帮助有需要的患者无需进行 MR 扫描便可获取 MR 图像，辅助临床诊疗。

方法：数据来自中科大附属第一医院西区的 24 例下肢骨肉瘤患者。首先对原始 CT 和 MR 图像进行预处理：去噪并结合 Canny 边缘检测算子和 Otsu 阈值算法获得 ROI（Region of Interest），校正偏差场，重采样体素大小至 0.8×0.8×5mm^3，并以参考病例为基准进行直方图标准化，重设图像分辨率至 256×256；然后采用 CycleGAN 网络模型，生成器为 ResNet 网络，鉴别器为 PatchGAN 网络，使用 18 例病人的 CT 和 MR 图像进行训练，学习两者之间的映射关系。通过设置循环一致性损失，判断由输入 CT 生成的 sMRI 是否可以再转回成原输入 CT，从而增强输入 CT 与输出 sMRI 间的结构相似性，减少无效输出图像的产生；最后使用另外 6 例病人的 CT 图像进行测试。以两名主治以上高年资医师在不知 MR 真伪的情况下进行主观评分，分别评价健侧下肢解剖结构的显示以及患侧骨肉瘤瘤体信号的显示，评分标准均采取 5 分制（1 分：极差；2 分：差；3 分：一般；4 分：良好；5 分：优秀）。

结果：使用 CycleGAN 网络模型成功将 6 例测试病人的下肢 CT 图像转化成 sMR 图像，健侧下肢解剖结构显示的得分为（3.83±1.03）分，骨-软组织对比度较好，层次分明；患侧骨肉瘤瘤体信号显示的得分为（2.05±0.63）分，骨肉瘤病变能够辨识，瘤体内部信号对比度差。
结论：CycleGAN 网络模型可以有效地根据下肢骨肉瘤的 CT 图像生成质量较高的 sMRI 图像，能够帮助无法进行 MR 图像采集的患者得到更好的影像诊断及相应治疗。未来增大训练集的数量以及改进网络，可能进一步提高 sMRI 的质量以及瘤体的显示，以满足临床需求。

Noninvasive imaging biomarkers predicting radiation-induced xerostomia in patients with nasopharyngeal carcinoma using multiparametric MR radiomic features

Qiao Li,Yunyan Zhang,Yajia Gu
Shanghai Cancer Center Fudan University

Purpose: To predict the radiation-induced xerostomia prior or at the early phase of RT in patients with NPC. To investigate the value of radiomic features from multimodal MRI as noninvasive imaging biomarkers (IBMs) assessing salivary gland function.
Methods: 23 NPC patients treated with parotid-sparing RT were enrolled. Clinical xerostomia measured by RTOG criteria in all patients and salivary function was assessed by multimodal MRI prior RT (PRT), one-week post-RT (DRT) and one-year post-RT (ART) respectively. For each MR, the 3D segmentations from three different sequence images together with their original images were loaded for further texture analysis and 321 high-throughput features were extracted to construct a classification model. Finally 1605 time series related features were obtained integrating the three-time MR images.Texture extraction was applied to the multiparametric images using PyRadiomics package in Python software. All the machine learning models were conducted using the 5-fold cross validation, whereby 20% of the data were used to test the model created by the other 80% of the data. ROC analysis was employed to assess the efficiency for identifying the level of radiation-induced xerostomia.

Results: 12 patients showed mild radiation-induced xerostomia and the other 11 were severe one-year post-RT. Clinical xerostomia measured by RTOG criteria was Grade 0 before RT and Grade 2 at 1 week post-RT in all patients. In PRT group, the optimized predictive model of severe xrostomia were established using 37 features with accuracy of 84.78% (AUC=0.809) by applying quadratic discriminant, logistics regression, fine Gaussian SVM, cosine KNN or subspace discriminant. 22 or 17 features can be used to predict salivary gland function in DRT or ART group, respectively. Logistics regression, medium KNN or cubic SVM yielded the highest accuracy of 78.26% (AUC=0.746 or 0.706). The 15 time series features [including 3 first order features, 7 shape features, 2 GLSZM features, 2 NGTDM features, and 1 GLDM feature reflected the changes of salivary gland.
Conclusion: The optimal MR radiomic features extracted from multiple MR sequences can be used as the promising IBMs for predicting radiation-induced xerostomia. The time series features can describe the changes of salivary gland function during RT.

Accuracy in Predicting Nodule Consistency and Risk of Malignancy Using an AI System

Kunwei Li[1,2], Kunfeng Liu[1], Mingzhu Liang[1,2], Yuandan Wang[1], Zhengzhen Wen[1], Shuting Han[1], Rongguo Zhang[3], Xueguo Liu[1]

1. The Fifth Affiliated Hospital of Sun Yat-sen University, China
2. Guangdong Provincial Key Laboratory of Biomedical Imaging and Guangdong Provincial Engineering Research Center of Molecular Imaging
3. Infervision

PURPOSE

To evaluate the accuracy of an artificial intelligence platform (InferRead CT Lung research, ICLR) in determining property of pulmonary nodules on 490 pathologically confirmed pulmonary nodules.

METHOD AND MATERIALS

A retrospective analysis was performed on 411 subjects with 490 pulmonary nodules that underwent surgical resection in our hospital from September 2015 to November 2018. There were 92 nonsolid, 84 part-solid, 312 solid, and 2 calcified nodules in the study, including 7 AAH, 1 AIS, 17 MIA, 297 invasive adenocarcinoma, 40 other malignancy, 55 metastases, 73 benign lesions. Overall size of nodules was 20.6 mm ±13.7mm (2-78.7 mm). All cases were reviewed independently by 2 experienced radiologists (K.L., and M.L, with 17 years and 12 years of experience) to assess nodule location and consistency. For each, we recorded location, consistency, size, and the probability of malignancy, malignancy risk category (low <50%, moderate 50%~70%, high >=70%) obtained from ICLR (InferRead CT lung research). The platform applies 3D convolutional neural network (3D CNN) with DenseNet architecture as backbone to get the malignant probability of pulmonary nodules. The accuracy of determination of consistency, location, and degree of malignancy risk was calculated.

RESULTS

There were 162 sub-solid, 314 solid, and 14 calcified nodules identified by ICLR among these confirmed nodules. The accuracy of determination of non-solid, part-solid, solid and calcified nodules were 100%, 78.6%, 94.9% and 100%, respectively. Four hundreds and eigthy three nodules were available for determination of location. The accuracy of determination of location was 84.3% (407/483) with 58 misallocated segments and 18 misallocated lobes. There were 80 low-risks, 39 moderate-risks, 371 high-risk lesions identified by ICLR. Total benign and malignant predictive accuracy was 37.5% and 88.9%, respectively. The accuracy of risk determination of benign lesions, AAH, AIS, MIA, invasive adenocarcinoma, metastases and other malignancy were 41.1%, 0%, 100%, 76.5%, 95.9%, 50.9% and 95.0%, respectively.

CONCLUSION
Now available ICLR has high accuracy in determination on nodules' consistency and location. The accuracy of risk determination on adenocarcinoma and other primary lung malignancies is high, but it is low on benign lesions and metastases prediction.

Prognostic Value of Preoperative MRI Texture Features in Breast Cancer Brain Metastasis Treated with Gamma Knife Radiosurgery

Yingyan Zheng,Tonggang Yu,Wei Xia,Dejun She,Yiping Lu,Daoying Geng,Bo Yin
Huashan Hospital

Objectives To investigate the prognostic value of preoperative magnetic resonance imaging (MRI) texture features in patients with breast cancer brain metastasis (BCBM) treated with gamma knife radiosurgery (GKS).
Methods The clinical and imaging data of 60 BCBM lesions in 34 patients who received GKS therapy were retrospectively reviewed. Radiomic features were extracted from preoperative contrast-enhanced T1-weighted images (CE-T1WIs), T2-weighted images (T2WIs) and apparent diffusion coefficient (ADC) maps. Univariate and multivariate Cox proportional hazard analyses were performed to identify independent factors for progression-free survival (PFS). Furthermore, a prognostic nomogram was constructed, and its calibration ability was assessed using the bootstrap method.
Results Kurtosis derived from CE-T1WI [hazard ratio (HR), 0.707; 95% confidence interval (CI), 0.538-0.930; P = 0.013] and age (HR, 1.034; 95% CI, 1.008-1.061; P = 0.008) were independent predictors for PFS. The combination of CE-T1WI-based Kurtosis with age displayed a higher C-index (adjusted C-index, 0.684) than did CE-T1WI-based kurtosis (adjusted C-index, 0.665) or age (adjusted C-index, 0.613) alone. The nomogram based on the combinative model provided a better prognostic performance over age (P = 0.045). The calibration curve elucidated good agreement between prediction and observation for the probability of 6 -and 12-month PFS.
Conclusions Preoperative CE-T1WI-based kurtosis combined age improved prognostic ability in BCBM patients with GKS therapy.

EPO-2613

Radiomics features for prediction of lymphovascular invasion in rectal cancer

Yu Fu,Xiangchun Liu,Huimao Zhang
The First Hospital of Jilin University

Abstract

Purpose

To investigate the value of radiomics for prediction of lymphovascular invasion (LVI) status in rectal cancer based on MRI.

Materials and methods

The retrospective study included 188 patients with histologically confirmed rectal cancer and evaluated LVI status. Clinical factor and image data were collected, and radiomics features were extracted from multi-region on T2WI and DWI. Radiomics analysis included segmentation, feature extraction, model construction, and model evaluation.

Results

14 radiomics features were effective for LVI prediction in rectal cancer by Spearman correlation analysis and the LASSO algorithm to construct a predictive model. The Linear Support Vector Classification was performed best. The mean AUC in 5-fold validation dataset is 0.71, and the AUC in training dataset is 0.78.

Conclusion

The radiomoics model which we developed to demonstrate that multiregional radiomics features base on MRI is useful for preoperatively predicting lymphovascular invasion in patients with rectal cancer.

Artificial intelligence in action: binary classification of non-contrast head computed tomography(CT) scans

xiang Liu,Xiaodong Zhang,Huihui Xie,Zhaonan Sun,Xiaoying Wang
Peking University First Hospital

Purpose

To develop a fully automated deep learning framework that could detect and distinguish normal head CT images from abnormal ones based on cross sectional CT images.

Materials and methods

9350 head CT images (abnormal images:3546; normal images:5786) were retrospectively collected from 2014－2017 from our hospital. A deep convolutional neural network(CNN) was trained on 6545 images and subsequently validated on 1870 images, finally tested on 935 unseen images. The proposed algorithm first extracts features using squeezenet and then detects brain abnormality using the logistic function as the last layer of the network. Original clinical radiology report and consensus of three

independent radiologists were considered as gold standard for algorithms developing. Area under receiver operating characteristics curve (AUC) for each finding was primarily used to evaluate the algorithms discriminative performance.

Results

After training the algorithm on 6545 head CT images, the receiver operating characteristic (ROC) curve was generated using the 1870 validating datasets and 935 unseen testing datasets. Respectively, the AUC of the model was 0.976 and 0.960 for predicting the normal or abnormality. where the overall specificity and sensitivity were 0.857 and 0.965.

Conclusion

Our results show that deep learning algorithms can be trained to detect critical findings from head CT scans with good performance. The powerful performance hints the positive impact of advanced deep learning in radiology workflow optimization especially in emergency room.

A new method using radiomics and machine learning to predict EGFR mutations in NSCLC patients

Wenting Tu[1], Pengxin Yu[2], Han Kang[2], Kai Liu[1], Li Fan[1], Shiyuan Liu[1]
1. Shanghai Changzheng Hospital
2. Infervision

Purpose:

Identifying epidermal growth factor receptor (EGFR) mutation status is crucial for treatment decision making in non-small cell lung cancer (NSCLC) . Our purpose was to design and validate an efficient method combining radiomics and machine learning method to predict EGFR mutations in NSCLC patients.

Method and Materials:

A dataset consisting of 472 lung cancer patients with matching EGFR mutation status were retrospectively collected. Pulmonary lesions of them were labeled and segmented by experienced radiologists based on preoperative non-contrast chest CT. According to inclusion criteria, 381 cases were selected to train and validate our method. All selected samples were randomly split into the training and the validation cohort without patient overlap. 1132 radiomics features were extracted from the segmented tumor regions. All processes in our approach are based on the LightGBM framework. Exclusive Feature Bundling was used to automatically merge extracted feature, not lower their dimensions. Based on the use of Tree Ensemble to avoid over-fitting problem, a predictive model was built from the training cohort. The predictive performance of the model was evaluated by sensitivity, specificity, F1 Score and AUC using ROC curve analysis.

Results:

381 patients were divided into the training cohort with 301 cases (137 EGFR mutants and 164 EGFR wild types) and the validation cohort with 80 cases (39 EGFR mutants and 41 EGFR wild types). The sensitivity, specificity, F1 Score and AUC of the model predicting EGFR mutations in the training cohort were 0.766, 0.902, 0.814,

and 0.922, respectively. And those of the validation cohort were 0.743, 0.756, 0.743, and 0.748, respectively. In addition to the process of manual segmentation, the average time required to analyse one case in the training cohort was 0.1200044 seconds, and the average time required for the validation cohort was about 0.1200049 seconds.

Conclusion:

Our method combining radiomics and machine learning showed good performance on predicting EGFR mutant, providing an efficient, stable and non-invasive way to detect gene mutations.

EPO-2616

Exploration of AI-assisted diagnostic system on the detection efficiency of long-axis diameter <4 mm pulmonary nodules in fatigued intern in Radiology Department.

Di Xu,Hongyu Fan
Affiliated Zhongshan Hospital of Dalian University

PURPOSE: Previous studies have demonstrated that radiologists experience increased fatigue and decreased diagnostic accuracy for detecting pulmonary nodules after their usual workday especially for smaller nodules[1]. To explore the diagnostic efficiency improvement for fatigued intern after daily work with the help of AI-assisted pulmonary nodule detection software for small nodules less than 4mm.

METHOD AND MATERIALS: A total of 179 patients were collected. One senior radiologist with more than 10 years' experience read CT images based on the initial diagnosis of another senior radiologist with similar experience and a final decision was subsequently conducted by deputy chief radiologist with more than 15 years' experience to determine the ground truth lung nodules. Three readings were conducted by an intern (with 4 months' chest CT experience) using different methods under different conditions: an intern in daily work (not fatigued) without AI (group A) , the same fatigued intern (after routine 8 hours' working time) without AI (group B) and the fatigued intern with AI (group C).All three reading sessions had an inter-washout period of more than 15 days. The number of nodules, long-axis diameter and location were recorded. The performance of three readings regarding lung nodule detection was assessed by using sensitivity and false positive rate.

RESULTS: A total of 995 long-axis diameter <4 mm nodules were confirmed to be gold standard nodules. Group A detected 658 nodules including 525 true positive nodules and 233 false positive nodules with a sensitivity of 42.71% and a false positive rate of 1.30 per CT scan (233/179). Group B detected 531 nodules including 363 true positive nodules and 168 false positive nodules with a sensitivity of 36.48% and a false positive rate of 0.94 per CT scan (168/179). Group C detected 847 nodules including 763 true positive nodules and 84 false positive nodules with a sensitivity of 76.68% and a false positive rate of 0.47 per CT scan (84/179). Group A achieved the 6.23% higher sensitivity (42.71%) than group B (36.48%) and lower false positive rate

(p<0.05). Group C achieved the highest sensitivity (76.68%) compared with group A (42.71%) and B (36.48%) while the false positive rate is lowest (p<0.05). **CONCLUSION:** Fatigue can reduce the intern detection efficiency of long-axis diameter <4 mm pulmonary nodules. However, fatigued intern with AI could achieve much higher diagnostic efficiency than intern in daily work (not fatigued). Fatigued intern aided with AI-assisted lung nodule detection system could achieve desirable detection rate for long-axis diameter <4 mm pulmonary nodules which are easily missed due to excessive workload.

利用级联 3D U-Net 自动分割 MRI 增强扫描延迟期图像中肝脏的研究

崔应谱,孙少帅,王可,张晓东,王霄英
北京大学第一医院

目的 开发一种在 MRI 增强扫描延迟期图像上分割正常及肝硬化肝脏的算法。**材料与方法** 回顾性收集从 2017 年 6 月至 2018 年 6 月期间于我院行腹部 MR 检查并包含正常肝或诊断为肝硬化的图像。将图像分成两组：训练数据集（100）和测试数据集（30），内含等比例的正常肝或肝硬化肝的图像。所使用的图像都是增强扫描延迟期图像，并由两位经验丰富的放射科医师进行标记。算法由两个级联的 3D U-Net 构成，第一步：用原始降采样的 MR 图像训练 3D U-Net 来定位肝脏，得到肝脏所在区域。第二步：根据第一步所得肝脏分割结果对 MR 图像裁剪，得到肝脏局部图像，训练 3D U-Net 对肝脏精确进行分割。以 dice 系数来评估两步肝脏分割算法的性能。考虑到模型的大小和肝脏的形状，本研究将输入图像的大小设置为 128 * 128 * 64，以尽可能减少重采样的精度损失。**结果** 在测试集上评估正常和肝硬化肝脏的分割性能，平均骰子系数分别为 0.96 和 0.95。**结论** 构建了自动分割 MRI 增强扫描延迟期图像中正常及肝硬化肝脏的级联算法，可用于后续肝脏疾病自动分类的研究。

基于深度学习建立气象因素相关模型预测放射科急诊检查数量

李宏[1],姚丽锭[1],许多[1],谌明[2],张敏鸣[1]
1.浙江大学医学院附属第二医院
2.浙江核新同花顺网络信息股份有限公司

目的：为了有效地预测气候因素对放射科日急诊检查数量的影响，提取气象中与放射科日检查数量高相关特征因素，利用 DecompositionNet（分解网络）模型构建气候对放射科日检查数量影响的预测模型。

方法：收集自 2017 年 1 月到 2019 年 4 月我院放射科急诊检查数量及相应时间的气象因素。采用 Pearson 相关性计算放射急诊检查数量与相应时间的气象因素（包括季节、气温、天气、风力和空气质量）相关性，并分析具有高相关性特征与急诊检查人次分布的关系。将 2017 年 1 月到 2019 年 3 月的数据作为训练集，将 2019 年 4 月的数据作为测试集，把单位小时内急诊检查数量时序分解成趋势、周期及残差三部分，考虑到气象特征的滞后效应对急诊人数影响，利用提取的高相关特征及其滞后特征，采用深度学习方法 DecompositionNet 对分解时序进行预测。

结果：放射科急诊数量与季节、空气质量及气温有关。我院放射科急诊检查数量与季节有关，春冬季节人数较秋夏季节人数明显增多约 4 人(p<0.0001)，空气重度污染情况较无污染情况急诊人数增加约 6 人（p<0.006），气温低于 6℃较气温高于 30℃急诊人数明显增加约 8 人（p<0.00014），基于 DecompositionNet 方法，建立与气象因素相关模型，我们能够预测我院放射科单位小时内急诊检查数量误差在 2 人次以内，每天的预测的总人数误差在 5%的误差以内。

结论：放射科急诊检查数量与季节、空气质量及气温变化有显著关系。基于深度学习网络的预测模型能够很好预测单位时间段内急诊检查人数，将来可能为临床医疗管理决策提供潜在价值。

基于机器学习算法完成腹部增强 CT 脾脏自动分割及体积计算

廖念西[1],王祥鹏[2],刘伟鹏[2],张靖远[2],张晓东[1],王霄英[1]
1.北京大学第一医院
2.北京赛迈特锐医疗科技有限公司

目的 基于机器学习完成腹部增强 CT 图像中脾脏的自动分割及体积自动计算。
方法 回顾性收集自 2016 年 1 月 1 日~2019 年 3 月于北京大学第一医院就诊并行腹部或腹盆部增强 CT 扫描的患者基本人口学信息及扫描图像共 75 例，原始图像分辨率为 1024×1024，重建层厚为 1mm。将原始数据导出为 DICOM 文件，转化至 NiFTI 格式，调整图像的窗宽为 30HU，窗位为 300HU，应用 ITK-Snap（3.6.0）由影像科医生进行边界勾画，所有被认为是脾组织的体素均被激活，包括副脾结节；可分辨的脾门血管、膈肌及其他毗邻脏器均未被标注。通过预测结果的平均 Dice 值来评价脾脏分割模型的效果，同时由 2 名影像科医生对训练及预测结果进行再评价，主要

评价指标为医学知识角度出发判定为分割结果是否符合人眼视觉解剖学定义，包括是否标注其他脏器上的体素，边界差异是否可接受，是否有较大范围的缺损等。通过算法对计算机自动分割结果及人工标注结果进行分析，输出脾脏三维径线及总体素体积。应用 spss 20.0 软件进行统计，对比自动分割结果和人工标注结果的差异。

结果 共 75 例腹部 CT 增强扫描，包括 29918 张轴位图像，其中 6805 张为有脾实质标注的图像。分割模型的 DICE 值为 0.97，预测结果共 6840 张有脾实质标注，其中 6809 张（99.55%）无医学逻辑错误。人工标注结果计算所得的脾实质体积为 208±75.8（cm^3），模型分割结果所得为 210±75.5（cm^3），$p<0.05$，无统计学差异。

结论 通过应用传统 2D 分割模型对 75 例共 29918 张轴位增强 CT 门脉期图像及相应标注的监督学习，本研究完成了一项脾脏分割模型的训练，其 DICE 值达到 0.97，以影像科医生为基准，预测结果中 99.55%的图像无医学逻辑学错误，自动分割与人工标注的脾脏体积并无统计学差异，为脾脏相关疾病进一步研究打下了模型基础。

基于 CT 图像的影像组学对肾下盏结石行输尿管软镜术后无石率的预测价值

陈铭珍[1],寻阳[1],李聪[1],邓胡川[2],李震[1]
1.华中科技大学同济医学院附属同济医院
2.华中科技大学生命科学与技术学院

目的：探讨基于肾脏 CT 图像的影像组学特征用于预测输尿管软镜(*flexible ureteroscopy, fURS*)治疗肾下盏结石术后无结石状态（Stone-free, SF）的临床价值。

材料和方法：回顾性地分析 2014 年至 2018 年行 fURS 治疗的肾下盏结石患者 142 例，根据患者术后三个月的 KUB 复查结果分为成功组和失败组，收集每位患者的基本临床信息，包括年龄、性别、结石的负荷等。所有患者均使用 64 层 MDCT 扫描仪进行非对比增强 CT 扫描。此研究主要分为五个步骤：1）数据的预处理，应用 3D-Slicer 图像分割软件对感兴趣区域（ROI）进行逐层勾画并融合成为感兴趣区容积（VOI）； 2）特征提取，由 MATLAB 商业数学软件自动提取出 604 个纹理特征，包括直方图、灰度游程矩阵等；3）按照训练集比验证集为 7:3 的比例，将 99 例患者纳入训练集，利用 R 语言统计分析软件，经 LASSO 回归分析方法进行数据降维及特征选取，并通过所选特征的线性组合计算每个患者的放射评分（Rad 评分）；4）建立 Logistic 回归模型，放射特征累加手术者经验、患肾的积水程度以及结石的体积，绘制诺模图。5）将剩下的 43 例患者纳入验证集，用于模型诊断，ROC 曲线评价 logistics 回归模型的诊断效能。绘制校准曲线和决策曲线评估诺模图的临床应用价值。

结果：Logistic 回归模型预测 SF 的 ROC 曲线下面积在训练组和验证组分别为 0.949 和 *0.962*，敏感度分别为 93.9%和 1、特异度分别为 85.7%和 91.6%。校准曲线及决策曲线分析结果显示结合临床指标后建立的影像组学诺模图具有良好的临床应用价值。

结论：基于肾脏 CT 平扫图像的影像组学方法提取的特征，能够较好地预测单发肾下盏结石行 fURS 术后的 SF，结合临床相关指标的诺模图可以客观、定量评估手术的成功率，有望成为一种无创性的临床决策工具。

EPO-2622
基于深度学习的前列腺增生自动识别模型的初步建立

韩超[1],朱丽娜[1],刘想[1],张晓东[1],王霄英[1],刘伟鹏[2],王祥鹏[2],张靖远[2]
1.北京大学第一医院
2.北京赛迈特锐医疗科技有限公司

目的：利用深度学习，初步建立良性前列腺增生（BPH）和正常前列腺的自动二分类模型。**方法：**回顾性整理 2018 年 3 月 1 日至 2018 年 6 月 10 日于我院行前列腺多参数磁共振成像（mpMRI）患者的图像和报告资料，收集报告结果为“良性前列腺增生”和“前列腺未见异常”的患者资料并入组，共收集 BPH44 例和正常前列腺 29 例。利用本科室已实现的前列腺 U-Net（U 形全卷积神经网络）分割模型在 T2 加权图像（T2WI）上自动分割前列腺区域，一名影像专家对每一层图像进行分类，共得到 BPH412 层和正常前列腺 292 层为金标准，序贯进行二分类研究。基于一个 2D 分类的卷积神经网络，Cls2D，我们对 T2WI 图像进行预处理、扩增和标准化处理，把原像素为 512×512 图像统一处理为原图像正中 1/4 且像素为 256×256 图像。将 704 层随机分成训练集（包括训练 569 层、内部验证 67 层）和测试集 68 层，训练循坏次数为 130 次，以自动分割得到的前列腺为 mask，进行二分类模型训练。运用训练过程的损失函数（loss）曲线和外部测试集的混淆矩阵、准确性、灵敏度和特异度对此分类模型的效果进行评价。**结果：**对于训练集，loss 曲线显示训练曲线逐步收敛并稳定。测试集 68 层中：存在 BPH40 层，此分类模型成功检出 30 层；正常前列腺为 28 层，此分类模型将 4 层误判为 BPH，有 2 层未给予分类。以单层图像为单位进行评价，该模型的分类准确率为 76.5%，灵敏度和特异度分别为 75.0%和 78.6%。以每例患者为单位时，测试集共 11 例，其中金标准 BPH 为 5 例。规定每 1 例中所有层面均被模型判为正常时，此例才判为正常，此模型正确分类 10 例，只有 1 例假阳性，准确率、灵敏度和特异度分别为 90.9%、80.0%和 100.0%。**结论：**基于深度学习的良性前列腺增生和正常前列腺的自动二分类模型已建立，初步测试结果可满足临床需求。

不同人工智能肺结节筛查分类模型对磨玻璃结节检出效能的影响

刘瑞,张晓琴*,柴军
内蒙古自治区人民医院

目的 探索人工智能肺结节筛查系统中不同分类模型对磨玻璃结节检出效能的影响，进而筛选出适合临床检测磨玻璃结节的分类模型。

方法 回顾性收集 117 例胸部 CT 平扫病例数据，均为层厚为 1 至 1.25mm 的薄层扫描序列。本研究使用的金标准磨玻璃结节数由两位拥有超过 15 年胸部 CT 阅片经验的放射科专家共同制定，共 147 个。基于深度学习的 AI 肺结节筛查系统（北京推想科技有限公司）用于磨玻璃结节检测，分别记录不同分类模型 AI 系统检测到的磨玻璃结节数。模型一是在深度神经网络（CNN）基础上自主研发的算法，模型二是在模型一基础上优化、减少假阳性结节的算法，模型三则是模型二基础上优化增强磨玻璃结节敏感性的算法。通过与金标准对比，分析不同分类模型的 AI 系统检测到的真阳性结节，假阳性结节和假阴性结节的数量，计算模型检测敏感性和假阳性率（假阳性结节数/CT）。卡方检验用于比率指标的统计分析，$P<0.05$ 具有统计学意义。

结果 模型一检测到 402 个磨玻璃结节，其中 133 个是真阳性结节，假阴性结节为 14 个，检测敏感性为 90.48%；假阳性率为 2.3/CT。与此同时，模型二检测到的结节数有所减少，降至 366 个，主要体现在假阳性结节数的减少，真阳性结节没有变化仍为 133 个，检测敏感性相同，但假阳性率降低到 1.91/CT。当利用模型三进行肺结节检测时，387 个磨玻璃结节被检出，包含 136 个真阳性结节，假阴性结节数为 11 个，检测敏感性为 92.52%（$p>0.05$），假阳性率为 2.15/CT。通过比较

三组结果不难发现，三个模型间检测敏感性无显著差别，但模型二假阳性结节数较少，模型三假阴性结节（漏诊）数目较少。

结论 对比分析不同模型间敏感性，假阳性率和漏诊数的差异，模型二的综合表现最佳，因此更适合临床进行磨玻璃结节筛查使用。

EPO-2624
基于常规磁共振成像的纹理分析预测低级别胶质瘤早期恶性转换

张顺
华中科技大学同济医学院附属同济医院

目的：基于 MRI 常规成像的纹理分析可以提供额外的肉眼不可见的定量信息。本研究的目的是评估基于术前常规 MRI 图像的纹理分析是否可以预测低级别胶质瘤（WHO II 级）早期转化为高级别胶质瘤（WHO III、IV 级），并与直方图分析进行比较。
材料和方法：共 68 例低级别胶质瘤（low grage glioma, LGG）纳入本研究，经 2-12 年的随访其中 15 例转化为高级别胶质瘤（high grade glioma, HGG）。病人随机分为训练组（60%）及测试组（40%）。纹理分析同时应用于训练组及测试组的常规 MRI 图像（T2w FLAIR, ADC,T1w 及 T1w + Gd）来获得最大鉴别因子（most discriminant factor，MDF）。受试者特征曲线分析（Receiver operating characteristic，ROC）应用于训练组的 MDF 及 9 个直方图参数，获得预测低级别胶质瘤恶性转化的最佳截断值（cutoff value），并用此截断值得到其预测测试组恶性转化的准确率。
结果：对 MDF 的 ROC 分析结果显示，T2w FLAIR 的曲线下最大面积（area under the curve，AUC）为 0.90（敏感度 85%, 特异度 84%），ADC 为 0.92（86%, 94%），T1w 为 0.96（97%, 84%），T1w + Gd 为 0.82（78%, 75%）；并在测试组中分别成功预测了 93%, 100%, 93%, 92%的病例。在对星形细胞瘤的亚组分析中，T2w FLAIR 的 AUC 为 0.92(88%, 83%)，T1w + Gd 为 0.90（92%, 74%），并成功预测了测试组中 100%、92%的病例。MDF 的结果优于其它所有 9 个直方图参数。
结论：作用于术前常规 MRI 图像的纹理分析可以准确预测低级别胶质瘤向高级别胶质瘤的恶性转化，可以指导临床治疗决策。

EPO-2625
提升小波变换和 PCNN 的医学图像融合算法研究

曾琬霆
陆军军医大学大坪医院

目的：随着医学影像工程技术的迅速发展，近年来许多医疗成像设备提供了一个广泛临床诊断的多种模态影像信息。通过对多模态的医学图像进行融合，对多项医学影像进行人工处理和综合分析，重现出全新的、高品质的医学影像。实际临床的价值主要体现在三个方面：医学影像诊断方面，融合图像可以清楚地显示检查部位和相邻部位的解剖结构关系，特别是早期微小、不明显的病变，避免漏诊；在手术治疗方面，医学图像融合利用三维立体定向和图像重建技术，充分表现出组织结构的完整形态和病灶的空间相对位置，同时清晰地显示病变组织与周围正常组织的关系，对临床手术方案制定、实施手术以及手术后的观察起了重要作用；在科研方面，医学影像融合收集了多种医疗设备的特征，也反映出病理特征、解剖结构，以及功能和形态的变化，并对影像信息做出定量、定性分析，进一步为临床疾病相关研究提供了完整的医学影像数据。

方法：利用对小波变换、PCNN 和提升小波变换的医学图像融合算法，以 C T 图像和 M R I 图像为例进行医学图像融合算法的研究。主要包括以下三个部分 ： 首先，介绍了小波变换基本理论、提升小波变换的原理以及 PCNN 的基本模型；其次，经过多项资源材料的收集，介绍了多种基于小波变换和 PCNN 的不同医学图像融合的算法比较；最后，通过对各种融合算法的比较，结果表明该模型的有效性和实用性。
结果：采用图像的信息熵、交叉熵、标准差和平均梯度作为评价指标对融合图像进行客观地比较，该算法得到的融合图像的信息熵和平均梯度都是最大的。由此知本算法的融合图像携带的信息量较大，边缘细节信息较丰富，可得到更好的融合效果。
结论： 具有生物学背景的 PCNN 模拟人类视觉系统，将多个图像包含的不同特征融合与最终得到的图像中，对于图像识别具有非常重要的意义。利用小波变换和 PCNN 模型相结合可以较好地保留原始 CT 和 MRI 的边缘细节信息。是一种有效的医学图像融合方法，其有效性和实用性可见一斑。

Influences of the tube voltage on pulmonary lesion benign/malignant classification using deep learnging (DL)-based computer aided diagnostic system at dual-energy contrast-enhanced CT

lin lin, Jing Shen, Jing Yu
Affiliated Zhongshan Hospital of Dalian University

OBJECTIVE: Different tube voltages were often used to achieve the improved image qualities for diagnostic decision. The aim of the study was to evaluate the influence of different tube voltages in the detection of malignancy/benign of pulmonary nodules using a available diagnostic image processing software at dual-energy contrast-enhanced CT.

METHOD AND MATERIALS:
A total of 44 patients (mean age 60.61±11.72 years, range 37-80 years) underwent routine chest dual-energy contrast-enhanced CT scans were retrospectively collected from May 1, 2018 to February 27, 2019. 45 nodules (35 malignant and 10 benign nodules) were confirmed pathologically and reviewed by board-certified expert panel, serving as gold standard. Different tube voltages: 100kV and 140kV, were applied to produce images that were subsequently used as inputs into a DL-based diagnostic image processing system to predict the malignancy of pulmonary nodules. Receiver operation characteristic, with area under the curves (AUC) were calculated to differentiate malignant from benign nodules. Chi-square tests and Kappa score were performed to compare the difference in detection and prevision rate between 100kV and 140kV.
RESULTS:
Diagnostic accuracy for nodule characterization was higher using tube voltage of 100 kv (AUC = 0.834), compared to 140 kv (AUC = 0.740).
Tube voltage of 100kV achieved detection and precision rate of 95.6% and 86.7% (lesion-wise), while 140kV achieved detection and precision rate of 97.8% and 82.2%, respectively. However, there is no significant statistical difference between these two tube voltage (p = 0.5, kappa score = 0.831).

In addition, lesion characterization (benign or malignant) demonstrated an effect in detection and prevision rate under different tube voltage, that the system showed an improved performance in detection malignant nodules compared with benign nodules, regardless of the tube voltage.

CONCLUSION

Tube voltage of 100kV demonstrated a imporved overall performance in lesion-wise detection and classifying lesion characterization compared with 100kV at dual-energy contrast-enhanced CT, while increased sample size is needed for any statistical difference assessment.

CLINICAL RELEVANCE/APPLICATION

While DL-based computer aided diagnostic system excels at recognizing nodules in imaging data, different imaging settings like tube voltage as well as nodule characteristics could have an influence on the performance of the system that need to be addressed in the future study.

ADC 值联合基于常规 MRI 图像纹理特征分析鉴别良恶性软组织肿瘤的价值

陈东
中国科学技术大学附属第一医院（西区），安徽省肿瘤医院

摘要：目的 探讨 MR 扩散加权成像（DWI）表观扩散系数(ADC)值联合纹理特征鉴别良、恶性软组织肿瘤的应用价值。 **方法** 回顾性分析经病理证实 94 例软组织肿瘤 MRI 及 DWI 图像，其中恶性 44 例，良性 50 例；扩散敏感因子（b 值）取（0，1000 s／mm^2），尽量避开坏死、出血、钙化、瘢痕及肌间隙等部位，获取病灶的 ADC 值。在 MRI 图像上使用 ITK-SNAP 软件在 T_2WI 脂肪抑制图像

上选取显示肿瘤最大层面为中心，沿病灶边缘勾画 ROI，ROI 包括肿瘤内部的坏死、囊变及出血成分，要避开周边水肿区域；利用美国 GE 公司 A.K 软件，进行纹理分析，获得部分纹理参数。比较良恶性肿瘤的 ADC 值及纹理参数的差异，并对有统计学意义的参数绘制 ROC 曲线，分析其预测软组织良恶性肿瘤的效能。**结果** 恶性肿瘤 ADC 值（1.12±0.38）×$10^{-3}mm^2/s$ 低于良性肿瘤（1.54±0.27）×$10^{-3}mm^2/s$，差异具有统计学意义($P<0.05$)，以 ADC 值 1.46××$10^{-3}mm^2/s$ 为阈值，DWI 诊断恶性肿瘤的敏感度为 0.86，特异度为 0.83。2 组间纹理特征比较，偏度（Skewness）和频率大小（Frequency Size）具有统计学差异($P<0.05$)，且偏度（Skewness）AUC 为 0.739，灵敏度 0.818，特异度 0.68；频率大小（Frequency Size）AUC 为 0.825，灵敏度 0.745，特异度 0767，两者均有良好诊断效能；而联合纹理特征分析及 ADC 值对诊断软组织良恶性肿瘤效能最好。**结论** ADC 值联合纹理特征可以提高在术前评估软组织良恶性肿瘤的效能。

基于多参数磁共振的肾纤维化评估模型

闵淑丹[1,2],居胜红[1,2]
1.东南大学，江苏省分子影像与功能影像重点实验室
2.东南大学附属中大医院，放射科

目的：建立多参数磁共振肾纤维化评价模型。慢性肾病病情不断进展，最终发展为终末期肾病，这个过程中最关键的驱动因素是肾纤维化。但是目前肾纤维化的诊断及评估只能依靠穿刺活检，这种检查有创并且出血风险大，且取样单一。临床常用超声、CT 等组织分辨率差，诊断困难；磁共振组织分辨率高，但多为结构成像，而功能成像可以间接反映纤维化，但是通常只能进行定性，不能定量。因此，我们想要通过数据融合，构建一个基于多参数磁共振的肾纤维化定量模型，对肾纤维化负荷进行评估。

方法：将 32 只 SD 大鼠随机分为 4 组，分别为对照组(n=8)，阿霉素肾病(ADR)组(n=12)，ADR 组分为 ADR4w，ADR8w 和 ADR8w-p38 抑制剂治疗组，每组各 8 只。ADR 组通过尾静脉注射阿霉素建立肾纤维化模型，分别在注射后第 4、8 周末，进行磁共振 T1rho, ASL, BOLD, DTI, IVIM 成像。MR 扫描结束后，收集血尿标本进行实验室检查，随后切除左肾进行病理学染色。分别在各序列图像中测量相对应的参数，使用基于 R 语言的 glmnt, SIS, rms, Hmisc 等工具包与“金标准”—纤维化特异性染色（Masson 及 Sirius red 染色）所得到的纤维化面积区域百分比做回归，得到各参数的相关性，筛选其中相关性高的，建立肾纤维化定量模型，并利用 ADR8w 药物治疗组进行验证。

结果：在回归分析结果中，T1rho、RBF 及 FA 与纤维化面积百分比具有显著相关。用这 3 个参数建立了一个肾纤维化评估公式，与三个参数分开建立的公式比较，发现模型的效能更优。
以对照组、ADR4w 和 ADR8w 组为训练组，训练样本集 C-index=0.723；ADR8w-p38 抑制剂治疗组为验证组，验证样本集 C-index=0.698。

结论：建立了多参数肾纤维化评价模型，并进行独立验证，模型和金标准显著相关。

EPO-2630

膝关节炎患者 MR 影像用于预测 1-2 年后膝关节功能水平

肖峰,徐海波
武汉大学中南医院

目的：目前临床上主要采用 WOMAC 和 KOOS 量表对膝关节炎患者功能水平进行评估。对评估结果进行预测有助于医生提前判断患者病情的进展，为其预后及治疗方案的制定提供更多的参考依据。本文主要研究了膝关节 MR 图像与其功能水平之间关系，建立对应的模型用于患者 1-2 年后功能水平变化的预测。
方法：本文工作基于 NIH 公开数据库 Osteoarthritis Initiative 中的 Osteoarthritis Biomarkers Consortium FNIH Project 项目。我们提取了该项目中 600 例膝关节炎患者初次入组时（baseline）的 MR 影像数据以及 12/24 个月后患者功能评分指标（WOMAC 和 KOOS）。预测模型采用深度卷积神经网络。模型的输入为患者初次入组时膝关节 MR 图像，输入前对所有图像进行灰度归一化处理；模型输出为 1-2 年后患者功能水平评分指标（WOMAC 和 KOOS）。模型的损失函数采用均方误差，训练方法采用误差反向传播算法。400 例数据用于模型的训练，200 例数据用于模型的测试，均从 600 例数据中随机选择。反复测试 100 次，取其平均值用于评估预测模型的优劣。
结果：在 400 例的训练集和 200 例测试集数据上，针对 WOMAC/KOOS 功能指标，建立的预测模型分别获得了 1.36/3.41 和 2.22/4.75 的平均均方误差（N=100）。
结论：膝关节 MR 图像可用于评估和预测膝关节炎患者功能水平。采用深度卷积神经网络对膝关节 MR 图像进行深度挖掘后，可有效地用于预测 1-2 年后膝关节炎患者功能水平的变化。

EPO-2631
基于磁共振成像影像组学方法评估肝细胞肝癌患者病理分级

张瑞,陈峰
浙江大学医学院附属第一医院

目的：采用 MRI 影像组学技术构建肝细胞癌患者病理分级评估模型，并联合临床因素和传统影像特征构建列线图。
方法：回顾性收集 2016 年 9 月 1 日至 2018 年 9 月 1 日期间浙医一院术前 1 个月内接受过 MRI 检查的肝细胞癌患者 271 例，划分为训练集 200 例和测试集 71 例。利用美国 GE Analysis Kit(AK)软件对术前 MRI 图像逐层勾画靶区，利用 MATLAB 2017a 软件自手动勾画的肿瘤边界自动向外侧延伸 10mm，形成一个外周环。从整个肿瘤和瘤周区域提取组学特征。应用最小冗余最大关联(mRMR)算法选择特征参数和利用支持向量机 SVM 构建放射组学模型。利用多变量 logistic 回归分析分别建立临床参数模型和联合临床参数的放射组学模型，利用 Delong 检验比较三个模型的对病理分级的预测能力。最后绘制列线图，并利用校正曲线和决策曲线分别对列线图进行评估。
结果：放射组学模型具有良好的病理分级预测性能：在训练集中，AUC 为 0.798；在验证集中，AUC 为 0.731。联合临床因素后，放射组模型的预测性能有所提升，在训练集中，AUC 为 0.803；在验证集中，AUC 为 0.742。校准曲线显示拟合良好(p>0.05),决策曲线证实了其临床效用。
结论：基于 MR 图像的放射组学模型可以有效预测 HCC 患者的病理分级。结合临床参数和放射组学特征的联合模型列线图实现了较为满意的预测效果，可以帮助临床医生制定最佳治疗方案。

深度学习对 LDCT 图像检测肺结节的研究

刘凯,范丽,萧毅,刘士远
海军军医大学第二附属医院（上海长征医院）

目的

NCCN 指南推荐低剂量计算机断层扫描（LDCT）用于肺癌筛查。然而，LDCT 中的噪声和伪影可能会影响放射科医师对于结节的检出。在本文中，我们训练了深度学习（DL）模型来检测 LDCT 扫描中的肺结节。

方法和材料
我们的训练数据集包括来自 LIDC-IDRI 数据库的 888 个样本和来自中国三级甲等医院的 1,000 个扫描样本。在 1888 个样本中，超过一半是 LDCT 扫描。测试数据集由从同一家医院收集的 xxx LDCT 样本组成。与 LIDC-IDRI 数据集类似，三位放射科医师独立地标记了收集样本中的病变，最终的金标准标签遵循多数规则。测试组中共有 267 个肺结节分为以下类别：6mm 以下的实性结节，6mm 以上的实性结节，6mm 以下的亚实性结节，6mm 以上的亚实性结节和钙化结节。我们的深度学习模型通过基于区域的完全卷积网络（R-FCN）以 ResNet-101 为主来检测结节。我们测试了模型对另外两名放射科医师的检测灵敏度，他们在 LDCT 肺结节筛查方面有超过 3 年的经验。

结果
我们的模型比不同结节类型的个体放射科医师具有更高的灵敏度，特别是亚实性结节。此外，综合判断医生和模型的检测灵敏度显着高于单独任何一方的结果。最后，模型的平均检测速度为每次扫描 30 秒，这比医生快得多。

结论
通过系统比较，我们通过比较我们的 DL 模型和放射科医师，证明了机器在不同类型和大小的肺结节中的速度和灵敏度优势。此外，放射科医师的判断结合机器输出实现了最高的灵敏度，这表明结合计算机辅助诊断可以提高肺癌筛查的准确性和效率。

临床相关/应用
我们开发了一种新的深度学习方法来检测 LDCT 扫描中的肺结节，以帮助放射科医师阅读 LDCT 并缩短其阅读时间。

EPO-2633
两种不同人工智能肺结节检测系统对肺结节 Lung-RADS 分类的表现评价

贺蓓,陈敏
北京医院

目的：随着肺癌低剂量 CT 筛查的普及胸部 CT 检查数量的增多，肺结节的检出随之增加，为了对肺结节进行科学规范的处理，美国放射学院 2014 年发表了肺影像报告和数据系统（Lung Imaging Reporting and Data System，Lung-RADS）。本研究的目的在于，评价两种不同的人工智能肺结节检测系统对肺结节 Lung-RADS 分类的表现。
方法：从本院病例库随机选取 2015 年 4 月至 2019 年 1 月 85 例肺癌患者的胸部 CT，标记 104 个肺结节，由两名经过 Lung-RADS 分类训练的放射科医生对每个肺结节分别进行分类（注：这两名放射科医生事先不知道所有病例的病理结果），结果不一致时，请另外一名高年资胸部放射学专家协同得出最终分类结果，作为参考标准。将这 85 例胸部 CT 图像导入两种不同的人工智能肺结节检测系统（编号为 A 和 B）中进行运算处理，得出分类结果。其中有 2 个结节 A 系统漏检，2 个结节 B 系统漏检，由于本研究不关注对肺结节的检出率而只关注分类，因此排除这 4 个结节，最终进行统计学分析的肺结节个数为 100 个。使用 SPSS24.0 统计学软件，采用平均加权 Kappa 法分别将两种人工智能肺结节检测系统的分类结果与放射科医生的分类结果进行一致性检验。

结果：A 系统和放射科医生对 74 个肺结节的分类结果一致，加权 Kappa 系数为 0.618（95%CI 为 0.466-0.711），P 值＜0.001；B 系统和放射科医生对 27 个肺结节的分类结果一致，加权 Kappa 系数为 0.544（95%CI 为 0.433-0.656），P 值＜0.001。
结论：A 系统和 B 系统均与放射科医生比较，结果显示对于肺结节 Lung-RADS 分类，A 系统与放射科医生相比一致性较强，B 系统与放射科医生相比一致性中等。人工智能肺结节检测系统能较为可靠的进行 Lung-RADS 分类，且 A 系统的表现优于 B 系统。

复旦大学附属华东医院

目的　探讨基于术前薄层 CT 的三维影像组学在预测亚厘米磨玻璃样肺腺癌浸润程度的价值。方法　回顾性分析华东医院 2013 年　1 月-2017 年 7 月病理证实为亚厘米肺腺癌的患者 394 例，共 446 个结节。每名患者均具有完整的术前肺部薄层 CT 影像和完整的临床资料。选取 2013 年 1 月-2015 年 12 月 253 名患者的 286 个结节为验证集；2016 年 1 月-2017 年 7 月 141 名患者的 160 个结节为训练集。所有病例参照病理金标准分为浸润前病变和浸润性病变，且所有结节均具有像素级标注的体积感兴趣区 (VOI)。采用 Matlab 2016b 软件从每个 VOI 中提取 475 个影像组学特征，利用最小绝对收缩和选择算子　(LASSO)进行特征筛选，随后建立影像组学标签。采用单因素及多因素分析训练集中两组间有统计学意义的变量并建立模型，在验证集上进行模型验证。采用 ROC 曲线评价模型的预测效能。结果　经可重复分析及 LASSO 降维，最终 13 个影像组学特征被选出以建立影像组学标签。多因素分析后，影像组学标签和 CT 值被证实为预测浸润程度的独立危险因子。模型在训练集的 AUC 为 0.785，在验证集中 AUC 为 0.704。结论　基于薄层 CT 的三维影像组学特征联合临床资料建立的多因素 logistic 回归模型在预测亚厘米磨玻璃结节样肺腺癌浸润程度上具有很好的临床应用价值及发展前景。

EPO-2635
Feasibility Study of Magnetic Resonance Compressed Sensing Image Restoration Based on Denoising Convolutional Neural Network (DnCNN)

Wenliang Fan,Xiangchuang Kong,Dingxi Liu,Fan Yang
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose
Magnetic resonance compression sensing technology can significantly reduce image acquisition time. However, when the compression factor is too large, the captured image may have artifacts due to signal loss. This study explores the feasibility of

reconstructing high compression perceptual magnetic resonance images based on denoising convolutional neural networks (DnCNN).

Methods

Using the Philips 3T magnetic resonance Ingenia CX, 30 brain images of 3D-MSDE sequences with different compression perception coefficients (cs=6, 8, 10, 12, 14, 16, 18) were collected, 100 layers per person, for a total of 3000 layers. At the same time, 3D-MSDE sequence brain magnetic resonance data without using any acceleration algorithm was collected as a reference image. The mean square error, signal-to-noise ratio, and image structure similarity coefficient between the image acquired under different compression perception coefficients are calculated, and the image noise severity under different compression perception coefficients is evaluated. The denoising convolutional neural network[1] is constructed, and the 3000 layer image is divided into a 2000 layer training set, a 1000 layer test set, and the denoising convolutional neural network parameters are trained. The noise level of the image after denoising relative to the reference image is also evaluated using the mean square error, the signal to noise ratio, and the image structure similarity coefficient. Statistical analysis of the differences between the three evaluation indicators between different groups.

Results

With the increase of compression coefficient, the mean square error of the image increased significantly, and the signal-to-noise ratio and image structure similarity decreased significantly ($p<0.05$). After the compression perception coefficient reaches 10, the image quality is seriously degraded, which affects the image detail observation. The images processed by the denoising convolutional neural network were compared with the corresponding image pairs. The signal-to-noise ratio and image structure similarity were significantly increased, and the image mean square error was significantly reduced ($p<0.05$). Horizontal comparison, using the denoised convolutional neural network to process the image, even when the compression perception coefficient reaches 18, can still maintain a higher signal-to-noise ratio and structural similarity.

Discussion and Conclusion

The denoising convolutional neural network can effectively remove the magnetic resonance image noise introduced by the excessive compression perception coefficient. The denoising convolutional neural network combined with the compressed sensing technology can reduce the scanning time while ensuring the quality of the magnetic resonance image.

迭代重建技术在低管电压肾动脉血管成像中的可行性研究

任占丽[1,2,3],贺太平[1],于楠[1,2],张喜荣[1,2],贾永军[1],郭长义[2,3],于勇[1,2],段海峰[1],李豆[4],王月[2]
1.陕西中医药大学附属医院
2.陕西中医药大学
3.陕西中医药大学第二附属医院
4.长安医院

目的：探讨基于多模型迭代重建（ASIR-V）技术在 80kV 低管电压肾动脉成像中的可行性。

方法：收集我院肾动脉 CT 血管成像患者 50 例并随机分为 A、B 两组，A 组采用 120kV，对比剂用量 600mgI/kg，滤波反投影法（FBP）重建；B 组采用 80kV，对比剂用量 350mgI/kg，80%ASIR-V 重建。扫描后分别测量右肾动脉、左肾动脉及同层面右侧竖脊肌 CT 值和 SD 值，并计算肾动脉信噪比（SNR）和对比噪声比（CNR）。由两名具有五年以上工作经验的影像科医师对肾动脉图像质量采用五分法进行双盲法主观评分。分别记录两组对比剂总量，并计算有效辐射剂量（ED）。
结果：两组患者人口学特征（性别、年龄、体重、身高、BMI）间差异无显著统计学意义（P＞0.05）。B 组对比剂总量（21.10±2.86g）和有效辐射剂量（2.07±0.21mSv）较 A 组（38.50±4.14g 和 6.69±1.83mSv）分别降低约 45.2%和 69.1%，且差异均具有显著统计学意义（P＜0.05）。A 组肾动脉 CT 值稍高于 B 组，但 CT 值差异无统计学意义（P＞0.05）。A 组肾动脉 SD 值显著低于 B 组（P＜0.05），A 组 SNR 值和 CNR 值显著高于 B 组（P＜0.05）。两名医师对肾动脉图像质量主观评分具有很好一致性（kappa＞0.75，P＜0.05），B 组肾动脉图像质量主观评分显著高于 A 组（P＜0.05）。
结论：基于多模型迭代重建（ASIR-V）技术在 80kV 低管电压肾动脉成像中可以显著减少对比剂总量和有效辐射剂量，且 ASIR-V 联合 80kV 可以显著提升肾动脉血管成像图像质量。

基于多模态 MRI 放射组学特征和术前鉴别非小细胞肺癌组织学亚型的临床因素的 nomogram 模型的开发和验证

唐兴
空军军医大学西京医院

背景:术前无创、准确鉴别肺鳞状细胞肺癌(LUSC)和腺癌(LUAD)是非小细胞肺癌(NSCLC)的关键用于患者的临床管理。
目的:建立一种基于多模态 MRI 放射学特征和临床的 nomogram 术前因素、个体化鉴别 LUSC 与 LUAD。
评价:共从多模态 MRI 图像中提取 1404 个放射组学特征。与训练队列(n=100)联合使用学生 t 检验和基于支持向量机的递归特征消除方法确定最优特征，并通过训练和验证队列(n=48)估计性能。生成的 Radscore 当时使用逻辑回归算法与这些最优特性,其次是进一步结合的主要临床因素,如年龄、性别、吸烟、肿瘤位置、表观形态、长轴直径,短轴直径和癌胚抗原,radiomics-clinical 诺模图发展。利用这两组数据估计了所提出的 nomogram 的总体性能。
统计学检验:学生 t 检验、单变量和多变量回归分析、Hosmer-Lemeshow 检验。
结果:经过特征选择，13 个最优特征在训练和验证队列中都取得了良好的识别性能，曲线下面积(AUC)分别为 0.819 和 0.824。将 Radscore 与独立的临床预测因子相结合，放射学-临床 nomogram 显示出更好的鉴别能力，AUC 分别提高到 0.901 和 0.872。Hosmer-Lemeshow 检验和决策曲线分析结果进一步表明，nomogram 具有良好的预测精度和临床应用价值。
结论:所提出的放射学-临床 nomogram 方法可作为诊断本病的有效工具非小细胞肺癌(NSCLC)术前非侵袭性 LUSC 和 LUAD 的鉴别。

基于血管提取技术的人工智能对冠状动脉疾病的诊断准确性研究

陈蒙,郝光宇,王希明,胡春洪
苏州大学附属第一医院

目的：探索基于血管提取技术的人工智能评估冠状动脉疾病的诊断准确性
材料和方法：回顾性分析 124 名可疑冠状动脉狭窄患者的 CTA 图像，以 DSA 为金标准，分别评估人工智能和医生的诊断准确性。直径≥1.5mm 的分段被纳入评估。直径≥50%认为阻塞性冠状动脉疾病。分别从患者水平、血管水平、分段水平对人工智能及医生的诊断能力进行评估，运用诊断研究指标敏感度、特异度、阳性预测值、阴性预测值对诊断能力进行评估，运用 ROC 曲线下面积对诊断准确性进行定量分析。
结果：从患者水品分析，人工智能和医生诊断阻塞性冠状动脉疾病的敏感性分别 94%(95%可信区间：87 到 97)、97%(95%可信区间：92 到 99)，特异度分别为 63%(95%可信区间：36 到 84)、50%(95%可信区间：26 到 74)，阳性预测值分别为 94%(95%可信区间：88 到 98)、 93% (95%可信区间：86 到 97)，阴性预测值分别为 59%(95%可信区间：33 到 81)、73% (95%可信区间：39 到 93）,ROC 曲线下面积分别为 0.780、0.736。血管水平，ROC 曲线下面积分别为 0.868、0.913。分段水平，ROC 曲线下面积分别为 0.844、0.892。人工智能和医生完成一名患者所有分段的诊断需要的时间分别为 29.65 分钟、0.50 分钟(t=-153.46，p＜0.001)。
结论：人工智能对冠状动脉疾病有较高的诊断准确性，将诊断时间缩短至半分钟，未来将会是一种很有前途的诊断工具。

Radiomics Signature: A Biomarker for the Preoperative Distant Metastatic Prediction of Stage I Non-Small Cell Lung Cancer

Wenting Tu[1],Li Fan[1],Mengjie Fang[2],Di Dong[2],Jie Tian[2],Shiyuan Liu[1]
1.Shanghai Changzheng Hospital
2.CAS Key Laboratory of Molecular Imaging, Institute of Automation, Chinese Academy of Sciences

Objectives: To evaluate the predictive value of radiomics features on the distant metastasis of stage I non-small cell lung cancer (NSCLC) preoperatively, by comparing with clinical characteristics and CT morphological features, and to screen the important prognostic predictors.
Methods: 194 stage I NSCLC patients were retrospectively enrolled, distant metastasis free survival (DMFS) was evaluated. The consensus clustering analysis was used to build the radiomics signatures in the primary cohort and validated in the validation cohort. The univariate survival analysis was performed in clinical characteristics, CT morphological features and radiomics signatures, respectively. Cox model was performed and C-index was calculated.
Results: There were 25 patients (12.9%) with distant metastasis. The median DMFS was 15 months. 313 radiomics features were selected, then classified into 5 groups, two subtypes (I and II) with each group. The RS1 showed the best prognostic ability with C-index of 0.355(95% CI, 0.269~0.442; p < 0.001). The histological type exhibited a good prognostic ability with C-index of 0.123 (95% CI, 0.000-0.305; p < 0.001) for DMFS. Cox model showed RS1(HR 18.025, 95% CI 2.366~137.340), pleural indentation sign (HR 2.623, 95% CI 1.070~6.426) and histological type (HR 4.461, 95% CI 1.783~11.162) were the independent prognostic factors (P<0.05).
Conclusions: Radiomics provided a new modality for the distant metastatic prediction of stage I NSCLC. Patients with type II of RS1, pleural indentation sign and non-adenocarcinoma indicated the high probability of postsurgical distant metastasis.

人工智能在脑实质出血诊断中的初步应用

徐俊,武刚,黄明珠
复旦大学附属中山医院青浦分院

目的：研究 AI 检测脑实质血肿，测量体积，判断脑室狭窄、破入脑室、中线偏移的准确性。
方法：连续收集 2019 年 4-5 月因疑似脑血管意外在我院急诊颅脑 CT 检查诊断为脑出血病例，排除近期有相关脑外伤史，蛛网膜下腔、硬膜下或硬膜外血肿等。常规头颅 CT 平扫，层厚层距 5mm，使用北京推想科技脑卒中 2.0 模型，以两名高年资医师的联合诊断结果为金标准，计算 AI 检测脑实质血肿并测量血肿体积的准确性，AI 检测血肿是否破入侧脑室、是否中线偏移的准确性，AI 对出血脑区定位的准确性。采用 SPSS 21.0 进行统计分析，两组计量资料比较采用配对 t 检验，多组计量资料比较采用单因素方差分析，多组间两两比较采用 LSD 法，所有检验均为双侧假设检验（α =0.05 或 0.001）
结果：共有 304 个病例纳入研究，两名医生的诊断结果，血肿 69 例，阴性或其他非高密度病变如梗塞、软化 235 例，AI 检测血肿的灵敏度 97.10%，特异度 94.89%，准确率达 95.39%；AI 判断是否存在中线偏移的灵敏度 68.97%，特异度 69.82%，准确率仅 69.74%；AI 正确区分了所有左（n=28）、右（n=30）大脑半球和幕下（n=9）血肿，AI 判断侧脑室是否受压的灵敏度 58.33%，特异度 84.21%，准确率 65.67%，AI 判断血肿是否破入侧脑室的灵敏度 61.29%，特异度 100%，准确率 80.59%。AI 与金标准差值对比零差值没有显著差异 (P>0.05)，多田公式计算结果差值对比零差值有显著差异 (P<0.001)
结论：AI 检测血肿、测量血肿体积的准确率很高，能准确区分血肿位于左右大脑半球还是小脑幕下，但具体脑区与医生诊断的一致性较差，AI 测量血肿体积的误差率明显比多田公式小，且不受血肿形状和大小影响，AI 对血肿是否压迫侧脑室，有没有破入侧脑室以及中线偏移的判断准确性则有待提高。

基于 DCE-MRI 后处理纹理分析在预测结直肠癌肝转移瘤疗效的应用价值

徐卫玲,王景宇
吉林大学第一医院

目的:本研究的目的是确定 DCE-MRI 后处理纹理分析特征是否可以作为结直肠肝转移治疗(CRLMs)中预测化疗后反应的指标。

材料方法：研究患者包括 2015 年 7 月至 2018 年 5 月随机选取 68 例经组织学确诊的结直肠癌肝转移（CRCLM）患者，均为首次接受 FOLFOX 治疗。患者在入组前均签署知情同意书。所有患者在化疗前 1-3 天内进行 DCE-MRI 检查，根据化疗疗效分为两组：反应组或无反应组。在 slice 和 Ktrans 彩图上进行定量纹理分析，手动绘制感兴趣区域，包含病变最大横截面积。纹理分析包括五个直方图特征和五个灰度共生矩阵特征。纹理参数通过统计分析，找出两组之间的差异，以及潜在的预测参数来区分反应组和不反应组，随后进行多变量测试及逻辑回归分析。

结果　共有 47 人有反应，21 人没有反应。方差、熵、对比、ASM 与是否有反应相关性较低，IDM (P ＜ 0.05)与是否有反应具有相关性，对应 ROC 下区域化疗反应曲线(AUCs)为 0.613-0.762。当使

用多变量检测病变时逻辑回归分析时，方差(P < 0.001)及 ASM (P = 0.001)仍具有潜在的预测价值来区分反应性病变和无反应性病变。

结论 DCE-MRI 的后处理 MR 纹理特征图像具有预测结直肠肝转移治疗效果反应的潜力。

EPO-2642
胰腺神经内分泌肿瘤：基于 3.0 T 磁共振的影像表现及纹理分析预测肿瘤分级

任帅,郭凯,王中秋
南京中医药大学附属医院

目的：本研究的目的是评估 3.0 T 磁共振影像表现及纹理参数在神经内分泌肿瘤分级预测中的价值。
病人与方法：神经内分泌肿瘤可根据有丝分裂指数与 Ki-67 指数分为 G1、G2 与 G3 三级。77 例经病理证实的神经内分泌肿瘤病人符合纳入标准。对 T2 加权与弥散加权成像图像进行纹理分析。利用 Fisher 检验或 Kruskal－Wallis 检验对 3 种不同组织病理亚型的神经内分泌肿瘤病在人口统计学资料、影像学参数及纹理参数方面进行对比分析。然后，采用逻辑回归分析预测肿瘤级别。采用受试者工作特性曲线及曲线下面积来评估磁共振表现及纹理分析参数在预测肿瘤分级中的价值。
结果：共有 31 例 G1、29 例 G2 及 17 例 G3 患者。与 G1 级神经内分泌肿瘤比，G2/3 级内分泌肿瘤出现边界不清、以实性为主、局部侵犯或转移、动脉期表现为乏血供及弥散受限的频率更高。T2 加权成像的 4 个参数（逆差矩, 能量，相关性，差分熵）及弥散加权成像（相关性，对比度，逆差矩，最大密度值，熵值）的 5 个参数在神经内分泌肿瘤分级中具有显著差异性。
结论：我们的结果显示肿瘤的边界、肿瘤质地、肿瘤的强化、局部侵犯或转移以及弥散受限在内的磁共振影像表现可以帮助预测肿瘤的分级。此外，纹理参数也有助于神经内分泌肿瘤的分级。

EPO-2643
推想科技和依图科技的肺结节良恶性评估的对照性研究

张笑春,凌公豪,兰兰
武汉大学中南医院

目的:利用推想和依图评估肺结节的良恶性质进行预测性诊断,并与穿刺活检或手术病理证实，比较两种方法的诊断效能。
方法:胸部 CT 发现肺结节患者 43 例, 223 个肺结节,全部肺结节均经过手术病理证实、穿刺活检或临床治疗随访证实,其中恶性结节 154 个(占 69.1%),良性结节 69 个(占 30.9%)。男性 26 例(占 60.5%),女性 17 例(占 39.5%),年龄范围 63.2±15.2 岁。用两种方法评价所有肺结节进行 AI 自动识别，并给出结节位置、大小和良恶性百分比，与高年资影像诊断医师的阅片结果对照。结果: 推想科技与依图科技评价结节的位置、大小和良恶性概率有很好的一致性和相关性（r=0.96、0.94、0.95 偏差, -0.4、0.6、6.3%），推想科技与高年资医师评价结节的位置、大小和良恶性概率有较好的一致性和相关性（r=0.93、0.91、0.87 偏差, 0.6、0.8、13%），依图科技与高年资医师评价结节的位置、大小和良恶性概率有很好的一致性和相关性（r=0.94、0.92、0.91 偏差, 0.56、0.72、9.8%）。154 个恶性结节中, 11 个推想科技误诊为良性（7.1%），10 个医科科技误诊为良性（6.5%），3 个高年资医师误诊为良性（2.0%）；良性结节 69 个中，24 个推想科技误诊为恶性（15.6%），18 个医科科技误诊为恶性（11.7%），6 个高年资医师误诊为恶性（8.6%）。以病理结

果为金标准，推向科技、依图科技和高年资医师诊断准确率为 82.3%、84.6%、89.8%,精确度为 81.9%、83.9%、88.6%,敏感度 89.9%、91.2%、93.2%，特异度为 69.8%、70.6%、74.6%,假阳性率为 36.2%、35.9%、21.3%, AUC 值为 0.79、0.81、0.88。结论:两种 AI 方法均可以肺结节的筛查，两种方法假阳性率均高于高年资医师。

EPO-2644

肺结节规范性靶重建的应用价值

李义,章茜
中南大学湘雅医院

目的
随着 CT 扫描的不断普及，越来越多越来越小的肺结节病变能被发现，医生不得不面对评估 CT 偶然发现的肺结节进行重视，因为发现早期恶性结节可大大改善患者预后，鉴别良恶性结节可避免患者接受不必要的诊疗。
采用薄层 CT、增强 CT 和对小结节病变进行靶重建可提供结节很多重要信息，医生常根据结节形态、随访过程中的大小改变、结节边缘、钙化情况、增强方式判断良恶性。

方法 收集总结自 2018 年 7 月至 2019 年 7 月在我院进行肺部扫描检查发现有肺部病变＜3cm 的 150 病例进行 0.625mm 薄层层厚和 FOV=150mm 的靶平滑重建和高分辨肺窗重建并进行三维重组，在轴位、冠状位、矢状位选择病变位置，在该位置的最大层面平均测量长轴和短轴，最终取平均值。对其进行图像质量分析总结。
结果
所有照片都经过我科室经验丰富的副教授以上及临床医生对照片进行阅片诊断分析.
150 例病例中发现实性结节 60 例，部分实性结节 35 例，纯玻璃样结节 55 例，所有病例的图像对比常规大 FOV 均能对其病灶均能更详细的显示其大小形态及其实性密度以及周边的晕征，模糊征和通过血管和周边小支气管能够更好的显示。
结论 小结节病变经过靶结节薄层重建可以更加清晰的显示常规模糊的病变特征，结节实性成分能够较好地区分 AIS、MIA 和 IAC，为患者术前评估及手术方式的选择提供参考，同病人固定 FOV 和固定滤过函数重建和相同的窗宽窗位和固定层厚层距的后处理能对病变的实性成分大小和密度随访变化提供更好的依据。并且固定的图像数据处理能更好的应对当今智能 AI 的普及应用提供更优质的图像数据。

Radiomics model of magnetic resonance imaging for predicting differentiation degree and lymph node metastases of extrahepatic cholangiocarcinoma

Chunmei Yang[1],Meng ping Huang[1],Shu pan Li[2],Jian qiang Chen[2],Yao Yang[2],Na Qin[2],De qing Huang[2],Jian Shu[1]
1.Department of Radiology， The Affiliated Hospital of Southwest Medical University， 25 Taiping Street， Luzhou， 646000， Sichuan， People’s Republic of China.
2.The Institute of Systems Science and Technology， Southwest Jiaotong University， Chengdu 610031，China.

Purpose: To evaluate diagnostic performance of radiomics models of MRI in the detection of differentiation degree(DD) and lymph node metastases(LNM) of extrahepatic cholangiocarcinoma (ECC).
Background: The use of traditional techniques to evaluate ECC is limited by subjective assessment, variation across radiologists, and restricted data. Radiomics models may provide more accurate prediction for assessing DD and LNM ECC.
Materials and Methods: We retrospectively enrolled 100 patients with ECC confirmed by pathology from January 2011 to December 2018. Apparent diffusion coefficient (ADC) values for all lesions were measured and recorded through using the MRI workspace. Radiomics features were extracted from T1-precontrast (T1WI), T2-weighted imaging (T2WI) and diffusion weighted imaging (DWI) using imaging software (MaZda). We extracted 300 radiomics features from each region of interest(ROI), and we used MaZda to obtain 30 optimal features. Two radiomics models (model A and B) were developed by incorporating the optimal radiomics signatures, pathological characteristics and ADC values, and we used them to predict DD and LNM of ECC respectively by using random forest(RF) algorithm. The performance of the radiomics models were evaluated through the analysis of the receiver operating characteristic (ROC), positive predictive value (PPV), negative predictive value (NPV), sensitivity and specificity.
Results: The radiomics model A showed better performance in both training and testing cohorts to discriminate high and medium-low differentiation groups of ECC, with an average AUC of 0.78 and 0.80 respectively. The model B also yielded the good average AUC of 0.80 and 0.90 to predict the lymphatic status of ECC in training and testing cohorts respectively, with classification accuracy of 81.4% and 83.3% respectively.
Conclusions: The radiomics models based on MRI performed well in predicting DD and LNM of ECC and have significant potential in clinical noninvasive diagnosis and prediction of ECC.

Diagnosis of Cancer: Based on Radiomic Features in Psoas Muscle and Adipose Tissue

Yue Chen[1,2], Xin-Yu Yuan [2], Yu-Fei Zhao[1,2], Xin-Gui Peng[1,2]
1. Zhongda Hospital
2. Southeast University

Purpose: To identify the occurrence of cancer based on the characteristics of the psoas muscle and fat radiology.
Patients and Methods: The study involved 43 cases of lung cancer, 13 cases of pancreatic cancer and 50 normal cases. The two cancer patients were classified into one class, and the normal control group was used as a class (81 in the training sets and 35 in the validation sets, and the ratio of the two types in the data sets is close to 1:1. The automatic segmentation method was used to outline the the psoas muscle and the abdominopelvic fat. 91 imaging features were extracted from the psoas muscle, subcutaneous adipose tissue and visceral adipose tissue. The feature selection and classification of the three segmented images are respectively performed, and the

selected features are combined and classified and compared. During the experiment, the random forest model was selected to evaluate the feature importance, and the feature set under the better classification was selected as the selection feature set, logistic regression (LR) was used as classifier. Finally, the three image features are combined to obtain classification results.

Results: Nineteen features in the psoas muscle were selected to obtain better classification results. Accuracy was 84.38%. 28 and 17 characteristics were selected for subcutaneous fat and whole fat, respectively. The accuracy of classification was 75.0% and 56.25%. Selecting 11 features with higher importance evaluation into the selected feature set, the radiomic signatures showed accuracy was 96.88%.

Conclusion: The occurrence of cancer can be judged by the radiomic signature of the psoas muscle and fat.

DCE-MRI combined with texture features based on T2WI in prediction of stage Ⅱ cervical cancer with parametrium invasion

Xinxiang Li
West district of The First Affiliated Hospital of USTC, Division of life Sciences and Medicine, University of Science and Technology of China, Anhui Provincial Cancer Hospital

Purpose To explore the prediction value of DCE-MRI combined with texture features based on T_2WI of stage Ⅱ cervical cancer with parametrium invasion.

Meterials and Methods Eighty-four patients with stage Ⅱ cervical cancer confirmed by surgerical pathology were enrolled in our hospital, containing parametrium invasion (n=38) and parametrium non-invasion (n=46). Plain MRI and DCE-MRI were preoperatively scaned. The optimal maps were reconstructed of DCE-MRI parameters (K^{trans}, K_{ep}, V_e) and texture feature histogram (kurtosis, skewness) and gray level co-occurrence matrix (angular second moment energy, contrast, entropy value) based on T_2WI. All parameters of the two groups were analyzed by one-way anaylsis variance. The optimal cut-off values of parameters with statistical significance were acquired by receiver operator characteristic curves (ROC). Combined diagnostic prediction of DCE-MRI parameters combined with histogram parameters (D-H), DCE-MRI parameters combined with gray level co-occurrence matrix parameter (D-G), and DCE-MRI parameters combined with histogram parameters, gray level co-occurrence matrix parameters (D-H-G) with ROC curves were established.

Results There were significant differences of K^{trans}, K_{ep} and V_e values of the two groups (F=45.20, 125.42 and 85.32, $P<0.05$). Areas of K^{trans}, K_{ep} and V_e values under ROC curves in the diagnosis of cervical cancer with vaginal fornix invasion were 0.696, 0.764 and 0.785, respectively. The diagnostic threshold of them were 0.272 mm^2/s (specificity=74.2%, sensivity=75.3%), 0.554 (specificity=67.8%, sensivity=69.4%), and 0.558 (specificity=80.3%, sensivity=77.3%), respectively. There were significant differences in kurtosis, skewness, angular second moment energy, contrast, entropy value between the two groups (F values were 30.487, 6.752, 58.723, 13.931 and 8.983 respectively, $P < 0.05$). Areas of the five values under ROC curves in the diagnosis of

cervical cancer with vaginal fornix invasion were 0.694, 0.680, 0.732, 0.773 and 0.745, respectively. The diagnostic threshold of them were 4.903 (specificity=73.5%, sensivity=81.7%), 0.221 (specificity=70.7%, sensivity=82.3%), and 0.004 (specificity=77.4%, sensivity=79.4%), 16.70 (specificity=70.7%, sensivity=82.3%), 6.915(specificity=70.7%, sensivity=82.3%), respectively. Areas of the combined diagnosis of D-H, D-G, and D-H-G under ROC curves in the diagnosis of cervical cancer with vaginal fornix invasion were 0.692, 0.758 and 0.965, respectively. The specificity and sensivity of them were 74.2% and 85.7%, 67.7% and 72.4%, 97.3% and 93.6%, respectively..

Conclusion The combined prediction method of DCE-MRI parameters and texture features is helpful for the diagnosis of stage II cervical cancer with parametrium invasion, and auxiliary conventional MRI.

EPO-2648
基于 DCE-MRI 的影像组学联合机器学习 预测前列腺癌的侵袭性

刘博[1],程婕[2],曾燕[1]
1.重庆医科大学附属第三医院（捷尔医院）
2.重庆医科大学基础医学院

目的：研究基于多期动态增强（*Dynamic contrast-enhanced, DCE*）MRI 原始图像的影像组学联合机器学习以预测前列腺癌的侵袭性。

方法：收集 2016 年 1 月至 2019 年 5 月在本平台进行磁共振检查并经活检证实为前列腺癌的 60 位患者，每位患者的活检均在磁共振检查后 4 周内进行。根据时间-信号强度曲线，在原始 DCE-MRI 图像上肿瘤强化的第一期和最强一期上逐层勾画病灶，自动计算出每个病灶的 1000 个定量影像组学特征（一阶特征、形状大小特征、纹理特征及高阶特征）并构成三个数据集：数据集-F（基于肿瘤强化的第一期提取）、数据集-S（基于肿瘤强化的最强一期提取）和数据集-FS（基于第一期及最强一期提取）。然后，依次采用方差选择法、单变量选择法及最小绝对收缩和选择算子算法进行特征降维，筛选出每个数据集的最优特征子集。最后，使用 5 种分类器：逻辑回归（Logistic regression, LR）、随机森林、决策树、k-近邻和支持向量机利用 5-折交叉验证法建立预测模型，通过曲线下面积（Area under the curve, AUC）评估每个模型的预测性能。将具有最佳分类性能的特征子集与前列腺癌灶的 GS 评分（Gleason score, GS）之间进行相关性分析。

结果：经过特征降维过程，数据集-F，-S 和-FS 中分别得到了 8、4 和 16 个特征作为最优子集。在三个数据集中，基于数据集-FS 的 LR 具有最佳的预测性能（AUC = 0.93）。并且该数据集中的 10 个特征与 GS 呈正相关。同时，基于数据集-F 模型的预测性能普遍优于数据集-S。

结论：基于 DCE-MRI 肿瘤强化的第一期及最强一期原始图像的影像组学联合机器学习可以无创、准确且自动地预测前列腺癌的侵袭性。

医学影像人工智能技术评价脑出血准确性研究

吕发金,姜雪
重庆医科大学附属第一医院

目的 探讨医学影像人工智能技术在脑出血定量方面的准确性。**方法** 回顾性分析我院 2018.11-2018.12 月 50 名行头部 CT 检查确诊脑出血患者的影像资料。通过使用 PACS 系统的手动容积测量及推想公司的人工智能技术作对比研究，主要测量的指标有：脑出血部位、脑出血体积、颅脑中线结构偏移程度、最大面积的长短径、侧脑室的受压情况以及得出具体数据所花费的时间。**结果** 与 PACS 容积测量相比，AI 识别脑出血部位的准确率为 56%。PACS 容积测量脑出血体积为 15.47（7.67,33.05）ml，中线结构偏移为 0(0,5.88)mm，AI 测量脑出血体积为 12.94(6.33,31.35)ml，中线结构偏移为 0(0,2.9)mm，两者差异均有统计学意义（P＜0.001，P=0.002）。最大层面长短径的测量，PACS 容积测量与 AI 测量差异无统计学意义。脑室受压情况，PACS 容积测量显示受压者 27 例，未受压者 23 例；AI 显示受压者 18 例，未受压者 32 例，差异有统计学意义（P＜0.001）。PACS 容积测量脑出血体积时间为：112.38±113s，AI 测量为：5.27±0.71s。 **结论** 对于脑出血定量分析，AI 测量简便、快捷，但仍有较大提升空间。AI 进行脑出血定量分析后仍需诊断医师进一步审核，尤其是在脑出血部位、体积、中线结构偏移程度及脑室是否受压几个方面。

CT 纹理特征结合机器学习对膀胱尿路上皮癌 T 分期及病理级别的诊断价值

徐圆
江苏省苏北人民医院，扬州大学附属医院

摘要 目的 探讨影像组学鉴别胖膀胱癌 T 分期及病理分级的可行性。方法 回顾分析经术后病理证实的膀胱癌患者 55 例。T 分期中非肌层浸润性膀胱癌（NMIBC）31 例，肌层浸润性膀胱癌（MIBC）24 例。此外，根据病理级别分为高级别尿路上皮癌（HGUC）34 例及低级别尿路上皮癌（LGUC）21 例。运用 Mazda 软件沿 CT 增强图像病灶最大层面边缘勾画感兴趣区，通过 B11 数据包的 Fisher 系数提取特征参数。对连续变量行两独立样本 t 检验或 Wilcoxon 秩和检验。应用随机森林、支持向量机、朴素贝叶斯算法及神经网络四种不同学习算法，联合十折交叉验证进行模型构建。结果 动脉期图像纹理参数诊断效能整体优于静脉期图像。其中，朴素贝叶斯算法诊断效能最好，鉴别 NMIBC 和 MIBC 的准确率、敏感度及特异度分别为 81.73%、70.83%、84.65%。同时，该算法鉴别 HGUC 和 LGUC 的准确率、敏感度及特异度分别为 86.70%，88.24%、74.34%。结论 CT 纹理组学能有效诊断膀胱尿路上皮癌 T 分期及病理级别，动脉期图像纹理参数联合朴素贝叶斯算法诊断效能最佳

肝细胞外基质体积分数与 APRI、Forns 指数诊断肝纤维化临床价值对比研究

翟亚楠,郭顺林,雷军强,杨璐,卢世瑞
兰州大学第一医院

目的 对比研究肝细胞外基质体积分数（hepatic extracellular volume fractions，fECVs）、APRI、Forns 指数诊断肝纤维化的临床价值。**方法** 回顾性调阅肝纤维化患者 152 例，无肝纤维化患者 161 例，通过常规平扫和三期动态增强 CT 数据计算 fECV 值：fECV(%)=E_{liver} [100-Hct(%)]/E_{aorta}。基于临床常见生化指标，通过以下公式计算 APRI 和 Forns 指数：APRI=[AST(U/L)/正常值上限/PLT(10^9/L)]×100，Forns 指数=7.811-3.131×ln[PLT 计数

（×10^9/L）]＋0.781×ln[GGT（U/L）]＋3.467×ln[年龄（yrs）]－0.014×TC（mg/dL）。通过 Spearman 相关分析 fECV 值与 APRI、Forns 指数模型之间的相关性，采用受试者工作特征(ROC)曲线比较 fECV 值、APRI、Forns 指数诊断肝纤维化的临床价值。**结果** fECV 值与 APRI、Forns 指数模型之间具有相关性，相关系数分别为 0.430、0.315（P 值均小于 0.01）；fECV 值、APRI、Forns 指数诊断肝纤维化的界值、敏感性、特异性、受试者工作特征曲线下面积分别为（31.07%、0.816、0.609、0.77），（10.3, 0.757、0.776、0.83），（0.86、0.776、0.901、0.90）。**结论** 利用常规肝脏三期动态增强 CT 检查及血常规检查换算得到的 fECV 值可以无创性评估肝纤维化，fECV 值、APRI、Forns 指数诊断肝纤维化的临床应用价值为 fECV<Forns 指数<APRI，初步评估提示 fECV 可能具有中度偏下的诊断价值。

EPO-2652
基于深度学习对急诊外伤肋骨骨折检出最佳重建算法的探讨

赵艳红,张晓文,苏治祥,曹永佩,哈若水
宁夏回族自治区人民医院

目的：探讨人工智能（AI）诊断系统在不同重建算法下对急诊肋骨骨折检出效能的差异，寻求基于深度学习下肋骨骨折检出中的最佳重建算法。
资料与方法：收集急诊胸部外伤的 43 例患者，所有患者均利用 256 层螺旋 CT（Revolution，GE healthcare）进行胸部 CT 成像，管电压 100kV，扫描结束后，所有患者均利用 standard /lung/bone/soft 进行图像重建，层厚 1.25mm，利用深度学习的人工智能（AI）诊断系统（InferRead CT Bone research，Infervision, Beijing）在不同重建算法下进行肋骨骨折的检出。由两位有 15 年以上胸部诊断经验的医师结合 AI 共同讨论最终做出肋骨骨折的金标准。记录人工智能在不同算法下检出肋骨骨折的总数、真阳性数、假阳性数，计算并比较人工智能在不同重建算法下对肋骨骨折识别灵敏度及假阳性率的差异。
结果： 43 例患者中共有 1030 根肋骨（其中两根肋骨发育不全），金标准中肋骨骨折共有 202 处，AI 在 standard /lung/bone/soft 算法下分别检出骨折 170/203/195/161 处，其中真阳性骨折 158/170/176/152 根，假阳性 12/33/19/9 根。standard /lung/bone/soft 四种算法下对骨折检出的灵敏度分别为 78.22%/84.16%/87.13%/75.25%，差异均有统计学意义（P=0.009）。四种算法下的假阳性率分别为 1.45%/3.99%/2.29%/1.09%，差异有统计学意义（P<0.05）。Lung and bone 算法下 AI 对肋骨骨折检出的灵敏度高于 standard and soft。
结论：人工智能在不同重建算法下对急诊外伤骨折具有不同的诊断效能，Lung 算法和 Bone 算法对急诊外伤骨折检出的灵敏度优于 standard 算法和 soft 算法。

EPO-2653
基于深度学习的 CT 肺腺癌病理分类诊断价值研究

侯秋阳,邓克学
中国科学技术大学附属第一医院/安徽省立医院

目的：分析基于深度学习的人工智能辅助诊断系统对直径≤3cm 肺腺癌病理分类的应用价值及预测表现。
方法：回顾性分析 713 例经病理证实且病灶直径≤3cm 的肺腺癌患者的 CT 图像，按照 2：1 的比例随机分为训练组和验证组，采用一种融合全卷积网络、端到端的目标检测模型与长短期记忆网络模型的深度学习模型，由 2 名以上高年资影像医师采用盲法共同标注训练组病例，详细记录每例病灶

的边缘特征（分叶征、毛刺征）、内部特征（空泡征）、与周围组织的关系（血管集束征、胸膜凹陷征）,将数据输入模型反复训练，并根据肺腺癌浸润程度划分 5 个等级，构建模型结构。然后利用验证组数据测试该模型.按照病理结果分为浸润前病变(AAH 及 AIS)、微浸润腺癌(MIA)及浸润性腺癌(IAC)三组，分析验证组病灶的形态学征象，并自动测算出病灶的 CT 定量参数，按 1-5 级评分对肺腺癌病理类型进行预测，比较各组间参数差异。

结果：在模型判断的 CT 定量参数中，三组间三维最大长短径、体积、最大 CT 值、平均 CT 值及预测得分差异均有统计学意义（P＜0.05）；形态学征象中，分叶征、毛刺征、血管集束征、胸膜凹陷征差异均有统计学意义（P＜0.05）；最小 CT 值及空泡征差异均无统计学意义（P＞ 0.05）；以得分＞3.5 分作为诊断浸润性病变的临界点，曲线下面积（AUC）=0.873，诊断敏感度 81.9%，特异度 84.4%。

结论：基于深度学习的人工智能辅助诊断系统对鉴别≤3cm 肺腺癌的病理类型具有一定预测价值，且具有较好的可重复性，可有效提高肺腺癌病理分类的准确性。

EPO-2654
基于肺部 CT 灰度共生矩阵预测放射性肺炎的初步研究

李开
中国科学院大学附属肿瘤医院（浙江省肿瘤医院）

目的：探讨纹理分析技术在肺癌放疗后预测放射性肺炎发生的初步研究；方法：回顾性收集肺癌患者接受放疗后在三个月内发生急性放射性肺炎患者 24 例，分为无肺炎组（放疗前）和肺炎组（放疗后），将放疗前 CT 肺窗图像以及放疗中、后发生放射性肺炎的图像以 DICOM 格式导出，利用画图软件（ITK-SNAP ）人工勾画 ROI（发生肺炎区域最大处），保存好 ROI，导入纹理分析软件美国 GE 公司 AI-Kit（Artificial Intelligence Kit），进行 GLCM（灰度共生矩阵）特征纹理计算（步长为 1、4、7，角度分别为 0、45、90、135），共有 146 个纹理特征，对两组图像纹理特征进行独立样本 t 检验，找出有差异的纹理参数，对有差异的参数行 ROC 曲线分析；结果：两组有差异的纹理参数主要有三类，集群突出（Cluster Prominence）、Haralick 相关（Haralick Correlation）、惰性（Inertia），三类纹理参数各方向角度比较都有差异；ROC 曲线下的面积最大的为 Haralick 相关，面积为 0.944,敏感度为 100%、特异度为 87.5%；结论：肺癌放疗后是否发生放射性肺炎可以利用纹理分析软件进行有效预测，主要纹理参数为 Haralick 相关（Haralick Correlation），给临床提供了新的监测指标，提早干预治疗。

深度卷积神经网络在精神分裂症诊断中的应用

黎超,徐克
中国医科大学附属第一医院

【目的】 深度学习，特别是深度卷积神经网络在医学图像识别领域取得了突破性的进展。然而却极少有利用深度学习对精神疾病进行诊断的研究报道。本研究的目的是探索深度卷积神经网络对精神分裂症的诊断价值。

【方法】 本研究从两个中心共纳入 586 名被试（380/206，其中 380 数据集中有 191 个患者及 189 个正常对照，206 数据集有 106 个患者及 100 个对照）。我们采集了所有被试的静息态功能磁共振的影像数据。然后，提取每个患者 114 个脑区的平均的磁共振时间序列，并计算所有脑区间的

Pearson 相关系数，得到 114*114 的相关系数矩阵，即功能连接矩阵。我们从 380 数据集中随机选择 304 个被试（80%）作为训练集，剩下 76 个（20%）为验证集，并把另一个中心的 206 个被试作为测试集，以无偏的测试模型的泛化能力。我们设计一个 10 层的卷积神经网络。我们定义损失函数为交叉熵，并应用 Adam 优化器来更新模型参数。我们将这个对称矩阵做为卷积神经网络输入层的输入数据。

【结果】 我们发现训练出的深度卷积神经网络模型能以较高的分类性能诊断出同一中心的精神分裂症患者（76 验证集）。其精确度、敏感度、特异度以及 ROC 曲线下面积分别为：0.7895, 0.82, 0.76 以及 0.8466。将验证集最佳阈值应用于另一中心测试集，其精确度、敏感度以及特异度分别为：0.7379, 0.74 以及 0.74。

【结论】 深度卷积神经网络结合功能连接特征能以较高的分类的性能诊断精神分裂症患者。由于我们的测试集来自另一个中心，因此我们的结果也提示深度卷积神经网络有着良好的泛化能力。随着未来更多中心的数据集获取以及深度学习模型改善，有望能将机器学习早日应用于精神疾病的临床应用。

EPO-2656
CT 定量技术在慢性阻塞性肺疾病不同临床表型患者中的应用价值

代永亮[1],张元刚[1],张磊[1],苏贝贝[1],李润根[1],李艳※[2]
1.兵器工业卫生研究所(原:兵器工业五二一医院)
2.西安交通大学第一附属医院影像科

[摘要] 目的 探讨 CT 定量技术在慢性阻塞性肺疾病（chronic obstructive pulmonary disease,COPD）不同临床表型患者中的应用价值。**方法** 回顾性收集处于稳定期的 COPD 患者，包括支气管炎型 128 例、肺气肿型 120 例，所有患者行胸部 CT 检查和肺功能检查，依据《2018 年慢性肺疾病诊断、治疗及预防全球策略》GOLD 分级标准将所有患者分成 4 级。利用“数字肺”CT 定量软件测量两型 COPD 患者的肺体积、肺血管体积、%LAA-950 和平均肺密度，比较两型 COPD 患者的肺功能和 CT 定量指标的差异，并进行相关性分析。**结果** 肺气肿型 COPD 患者 BMI 值随着 GOLD 分级升高而降低，支气管炎型 COPD 患者不同 GOLD 分级间 BMI 值无明显差异。两种临床表型 COPD 患者的 FEV_1%pred、FEV_1/FVC、平均肺密度及肺气肿型患者的肺血管体积随着 GOLD 分级升高而下降，两型患者的%LAA-950 随着 GOLD 分级升高而增加。两型各 GOLD 分级患者的%LAA-950 仅与 FEV_1/FVC 紧密相关。**结论** CT 定量分析可直观显示不同临床表型不同 GOLD 分级 COPD 患者的肺气肿程度、肺小血管定量指标变化情况。肺气肿型 COPD 患者随着肺功能的不断下降对肺小血管损害程度逐渐增大，而支气管炎型 COPD 患者肺小血管受影响相对较小。

现代 CT 技术及临床应用高效下沉及推广于基层医疗机构：国家重点研发项目“云影像平台”实践经验

胡晓云[1],胡春洪[2],Peter Steiger[3],Sanjeev Kumar PS[3]
1.无锡市人民医院
2.苏州大学附属第一医院

3.Department of Medical Imaging， Parexel International Corporation， Billerica， Massachusetts，USA

目的：探讨 CT 设备在基层医疗机构的普及现状与相应人才的紧缺矛盾以及探讨如何进行社区卫生服务中心 CT 技术的临床应用、专业培训及远程诊断与管理。
方法：基于一项国家重点研发项目的子课题“远程影像诊断平台的建设”（2017YFC0114300）的实践经验，探讨以何种网络连接形式最合适远程影像诊断平台的建设从而缓解基层技术人才匮乏的问题；采用现场培训、学术交流与远程网络等形式，探讨如何将现代 CT 技术如何进行高效地下沉到基层医疗机构中。问卷与实践教学相结合，了解基层影像科最需要什么形式的培训及知识点训练。
结果：1.采用“基于 Web 模式+云存储”的远程云影像平台可实现多中心基层单位共享一平台的无缝对接，达到实时的移动阅片、核报、会诊的目的，且具有性价比的“投入与产出”效果。2.共有 5 个省市的 16 家医院实现 PACS 的云平台互联互通，包括对口支援的陕西、青海等县级医院。3.危急值及肺结节的 CT 诊断与处置策略以及 CT 增强扫描技术与对比剂使用要点是基层单位首要的训练内容，而这些知识点的 PPT 实例分析是最受欢迎的内容之一。
结论：基层单位的影像诊断人才紧缺现状是暂时难以解决的问题，但可通过 Web 模式的远程云影像平台等形式实现高端人才资源的高效下沉、实时服务基层；通过远程云影像平台可实现基层影像诊断人才的高效培训，实现现代 CT 技术在基层的普及与生根。

人工智能冠状动脉 CT 血管成像在检出及评价冠状动脉血管狭窄中的应用

李浚利,黄益龙,韩丹,刘琐,金文凤
昆明医科大学第一附属医院

目的 探讨人工智能（artificial intelligence，AI）冠状动脉 CT 血管成像（CCTA）在检出及评价冠状动脉血管狭窄中的应用。**方法** 回顾性分析 2018 年 3 月至 2019 年 3 月 110 例同时行 CCTA 及冠状动脉造影（DSA）的冠心病患者。患者纳入标准为 CCTA 图像血管边缘清晰，无伪影，主动脉根部噪声＜30HU；CT 检查图像包含 0.75mm 薄层图像；AI 软件能自动计算完成的病例。排除标准为冠状动脉支架置入术后及（或）搭桥术后；冠状动脉起源异常。按照美国心脏病学会冠状动脉树 15 段改良分段法，选取左主干、前降支近中远段、右冠状动脉近中远段、回旋支近远段、第一对角支、后降支共 11 个主要节段，对冠状动脉管腔直径≥1.5mm 节段进行冠状动脉狭窄节段检出及狭窄程度的评价，其中管腔狭窄程度分为无狭窄 0%、轻度狭窄（＞0%，＜50%）、中度狭窄（≥50%，＜70%）、重度狭窄及闭塞（≥70%）。AI 软件单独对冠状动脉狭窄节段检出及狭窄程度进行评价。以两位工作 5 年以上心内科导管医师对冠状动脉造影图像进行评价的结果作为金标准。最终 AI 软件诊断结果与金标准对比。**结果** ①AI 检出冠状动脉狭窄节段总敏感性、特异性、阳性预测值、阴性预测值分别为 88.78%、93.81%、88.36%、94.43%，与 DSA 比较一致性极好（Kappa 值 0.82），其中 AI 对 LM、mLAD、dLAD、pRCA、mRCA、pCX、dCX 节段狭窄的检出与 DSA 一致性极好（Kappa 值均大于 0.75），对 pLAD、dRCA、PDA、D 节段狭窄的检出与 DSA 一致性较好（Kappa 值分别为 0.70、0.70、0.75、0.71）。②AI 评价冠状动脉不同狭窄程度与 DSA 一致性一般（Kappa 值 0.62）。**结论** AI 对冠状动脉狭窄节段的检出与 DSA 具有较好一致性，但在评价狭窄程度上与 DSA 一致性一般。

基于磁共振 T2WI 影像组学在前列腺癌诊断中的价值

张虎[1],翟建[2],章其林[1],唐敏[1],张晓金[1],徐家军[1]
1.芜湖市第二人民医院
2.皖南医学院弋矶山医院

目的 探讨前列腺 T2WI 影像组学预测模型在前列腺癌中鉴别癌灶与非癌组织的价值。
材料与方法 收集经手术或穿刺病理证实的前列腺癌患者 60 例，将 T2WI 图像进行标准化处理，影像科 2 名经 PI-RADS V2 培训的医师运用 ITK-SNAP 3.6 软件根据多参数磁共振（包括 T1WI、T2WI、DWI、DCE-MRI）及病理结果在标准化后的 T2WI 上进行 ROI 勾画，ROI 放置于癌灶面积最大层面并在镜像区勾画 ROI 进行对照，其中一名医师 1 周后再重新勾画 ROI，共得到 120 个目标区域，按 7：3 分为训练集和验证集。运用美国 GE Analysis Kit（AK）软件进行影像组学特征提取，随后进行观测者间与观测者内一致性检验。保留一致性较高（ICC＞0.75）的影像特征,采用 spearman 相关分析和 LASSO 方法进行特征降维。在训练集中构建癌灶与非癌组织的诊断模型，在验证集中评估模型效能。
结果 共提取 396 个定量影像特征参数，经降维和去冗余后，剩余影像特征 9 个，构建基于 T2WI 的前列腺癌诊断模型。训练集的准确度为 0.7143（95% CI,0.6053-0.8076），敏感度为 0.8095，特异度为 0.6190，阳性预测值为 0.68，阴性预测值为 0.7647。验证集的准确度为 0.7222（95% CI,0.5481-0.8580），敏感度为 0.6667，特异度为 0.7778，阳性预测值为 0.75，阴性预测值为 0.7。训练集诊断前列腺癌的 ROC 曲线下面积为 0.76(0.60-*0.92)*；验证集为 0.77(0.67-*0.87)*。
结论 运用磁共振 T2WI 影像组学预测模型诊断前列腺癌的准确性较高。

EPO-2661
磁共振影像组学对直肠癌 KRAS/NRAS/BRAF 基因突变的预测价值

马晓璐,沈浮,王敏杰,陆建平
海军军医大学第一附属医院（上海长海医院）

目的：探讨基于磁共振高分辨 T2 加权成像的影像组学在预测直肠癌 KRAS/NRAS/BRAF 基因突变的应用价值。

方法：回顾性分析 2018 年 6 月至 2019 年 6 月期间，在上海长海医院经手术病理证实，术前接受 3T 磁共振成像的直肠癌患者，记录术后病理 KRAS/NRAS/BRAF 基因状态。在术前的高分辨 T2WI 图像上手动勾画病灶 VOI 后提取影像组学特征，之后采用 LASSO（least absolute shrinkage and selection operator）算法进行特征值降维，选择出对 KRAS/NRAS/BRAF 基因突变最有价值的特征。使用降维后的特征样本随机分为训练集（80%）与测试集（20%）进行机器学习，建立极限梯度增强树（extreme gradient boosting, XGBoost）分类器模型，获得 ROC（receiver operating characteristic）曲线，计算曲线下面积（area under the curve，AUC）、敏感度、特异度及 95%置信区间。
结果：纳入 190 例直肠癌患者，其中男性 114 例，女性 76 例，年龄 15～78 岁，平均年龄 57±11 岁。KRAS 基因突变型 46 例(24.2%)，NRAS 基因突变型 42 例(22.1%)，BRAF 基因突变型 28 例(14.7%)。提取得到 1409 个影像组学特征，LASSO 降维得到与基因突变相关的特征 4 个。XGBoost 分类器模型测试集对三种基因突变的 AUC 分别为：0.772、0.728、0.712 。
结论：基于磁共振高分辨 T2WI 的影像组学 XGBoost 模型对预测直肠癌 KRAS/NRAS/BRAF 基因的状态具有一定的价值。

探讨 CT 影像组学在评估胰腺癌生物学行为中的价值

顾潜彪,谭显政,刘建滨,刘鹏
湖南省人民医院/湖南师范大学第一附属医院

【摘要】目的 探讨 CT 影像组学术前无创性评估胰腺癌肿瘤生物学行为。
资料与方法 回顾性收集 2014 年 1 月至 2018 年 11 月期间我院手术病理证实的 94 例胰腺癌患者的 CT 及临床资料，将所有病例随机分为训练组和验证组。在 MaZda 软件中手动勾画肿瘤体积（VOI），并基于肿瘤体积提取 3D 影像组学特征。对影像组学特征参数进行降维，分别建立起反映肿瘤生物学行为（胰腺癌分化程度、淋巴结转移）的影像组学预测模型并计算每位患者的影像组学模型评分（Rad-score）。采用受试者操作特性曲线（ROC）评估模型的诊断效能。**结果** 年龄、性

别在胰腺癌分化程度间及淋巴结转移情况间差异均无统计学意义（P 值均>0.05），肿瘤位置在淋巴结转移阳性与阴性两组间差异具有统计学意义（P=0.02）。经特征筛选，基于 7 个影像组学特征建立的影像组学模型术前预测胰腺癌分化程度的 ROC 曲线下面积（AUC）在训练组和验证组分别为 0.78、0.64。基于 6 个影像特征建立的影像组学模型术前预测胰腺癌淋巴结转移的 AUC 在训练组和验证组分别为 0.77、0.74。**结论** CT 影像组学在无创性评估胰腺癌生物学行为中具有较大的应用前景，对术前评估胰腺癌恶性程度，进而协助临床胰腺癌的治疗决策具有一定的参考意义。

【关键字】 胰腺癌；影像组学；CT；生物学行为；淋巴结转移；分化程度

机器学习分析扩散峰度成像参数直方图在诊断前列腺癌及判定其恶性程度中的应用

汪香玉[1],李钊[3],刘朝阳[3],吴光耀[2],林帆[1],雷益[1]
1.深圳大学第一附属医院
2.深圳大学总医院
3.中国科学院武汉物理与数学研究所

目的：本文通过扩散峰度成像参数直方图的机器学习分析，找出最合适的特征及分类算法，达到提高分类效能的目的。

材料与方法：通过文献数据[2]，得到 3 类数据（BPH 37 例，低级别 PCa 37 例，高级别 PCa 37 例），包括 10 种描述 DKI 成像质量的特征参数，D_{app}和 K_{app}参数分别求得了中值、均值、标准差、偏度和峰度。根据文献的初始结论，得出 D_{app}和 K_{app}部分直方图参数对 PCa 的诊断以及其高低级别的判定有重大相关性，故选择五种参数进行分析。使用的软件为基于 python 语言的数据处理软件 sklearn[3]。将五种特征分别用 K 邻域（KNN），支持向量机（SVM），决策树和随机森林四种机器学习算法对其进行分类。对数据进行了 10 次分类，得到的平均特异性，敏感性，准确率和 ROC 曲线下面积（AUC）。

结果：D_{med}和 D_{mean}表现普遍好于 K_{med}，K_{mean}和 K_{sd}。而随机森林和决策树的效果也要好于 K 邻域和 SVM。诊断 BPH 和 PCa 的最佳分类方法是 D_{med}的随机森林分类，可以达到 0.933 的特异性和 0.953 的敏感性，此时准确率和 AUCs 达到最大值；诊断高低级别 PCa 的最佳分类方法是 D_{mean}的随机森林分类，可以达到 0.911 的特异性和 0.881 的敏感性，且此时准确率和 AUCs 也达到最大值。在用 SVM 对 K_{med}和 K_{mean}进行分类时，出现了较为严重的分类错误，这说明 SVM 对该组数据并不适用。诊断 PCa 和高、低级别 PCa 的最优分类器均为 D_{med}+D_{mean}的决策树，诊断 BPH 和 PCa 的特异性和敏感性分别为 0.973 和 0.981；诊断高低级别 PCa 的特异性和敏感性分别为 0.995 和 0.962。分类效能均比文献[2]有所提高。

结论：D_{app}与 K_{app}特征融合模型的分类效能比单个特征有显著提高，同时诊断 BPH 和 PCa 的准确率可以显著提高。决策树和随机森林在该数据集的效能要明显优于 K 邻域和 SVM。

基于基于深度学习的计算机辅助诊断系统评估脑内血肿体积

贾永军,于勇,韩冬
陕西中医药大学附属医院

目的：探索基于深度学习的计算机辅助诊断系统对脑出血各种类型血肿体积测量的准确性与实用性的临床观察。

方法：收集符合纳入标准的脑出血患者 160 例，每位患者颅脑 CT 图像采用 itk-snap 软件手工勾画和计算机辅助诊断系统进行血肿体积测量，以 itk-snap 软件手工勾画作为血肿体积的金标准，采用配对 t 检验比较各种方法测量血肿体积及判定计算机辅助诊断系统对脑内血肿体积评估的误差。

结果：120 例患者中 101 例脑内血肿（其中规则形高血压性出血 37 例，不规则形高血压性出血 58 例，脑挫裂伤后血肿 26 例），硬膜下血肿 21 例，硬膜外血肿 18 例。2 种方法对各种类型血肿的测量结果比较差异均有统计学意义（$P<0.05$）。相对于 itk-snap 软件手工勾画测得血肿的平均体积，规则高血压性脑出血测量平均误差为 0.86%，不规则高血压性脑出血测量平均误差为 7.31%，脑挫裂伤后血肿测量平均误差为 8.34%；硬膜下血肿测量平均误差为 33.58%，硬膜外血肿测量平均误差为 0.59%。

结论：基于深度学习的计算机辅助诊断系统对颅内规则形血肿及硬膜外血肿体积测量较为准确，但血肿类型影响测量误差，不规则脑内血肿及硬膜下血肿经计算机辅助诊断系统测量误差略大。

神经退行性疾病的影像组学研究

杨云竣,黄飚
广东省人民医院

目的 常规影像学方法在神经退行性疾病的检查中表现不明显，新兴的影像组学能够定量识别、分析疾病的影像学特征，并建立疾病预测模型，其有望进一步成为提升对神经退行性疾病的诊断、鉴别诊断、疾病进展和预后预测。本文就影像组学在神经系统退行性疾病诊断的研究进展予以综述。**方法** 进入 PubMed、知网、万方等数据库检索系统，采用“影像组学”、“阿尔茨海默病，影像组学或纹理分析”、“帕金森病，影像组学或纹理分析”、“亨廷顿病、肌萎缩侧索硬化，影像组学或纹理分析”为主要检索关键词，检索文献经筛选后纳入分析 31 篇，文献时间范围到从 2010 年至 2019 年。**结果** 医学影像图像蕴含着丰富的疾病相关信息，影像组学作为一个新颖的研究热点，能够高通量的提取并定量分析与疾病相关的影像图像特征，有助于提高疾病诊断准确性，其为医学影像的进一步发展注入了新的能量。目前，影像组学在肿瘤性病变中的研究广泛，发展迅速，方兴未艾，但在神经退行性疾病中鲜有研究。**结论** 影像组学在无创性研究神经退行性疾病方面具有良好的临床价值和应用前景。

气管软化实验与 CT 仿真内窥镜的应用

李征,向前
湘雅常德医院

目的：探讨气管软化实验与 CT 仿真内窥镜技术（CT virtual endoscopy,CTVE）结合对比普通 CTVE 影像差异及临床意义。
方法：扫描前训练患者深吸气后做呼气动作但不呼气，使气管支气管尽量扩张，采用 64 排 Philips 螺旋 CT 对 36 例肺部进行扫描并进行 CTVE 重建技术。选取该机型数据中 50 例已有的肺部影像进行 CTVE 重建技术并对比。
结果：采用气管软化实验后气管直径为 1.8—2.4CM，主支气管直径为 1.3—2.2CM，叶支气管直径为 0.6—1.3CM，段支气管直径为 0.3—0.8CM，而未采用气管软化实验的气管直径为 1.2—2.0CM，

主支气管直径为 0.7—1.8CM，叶支气管直径为 0.4—1.0CM，段支气管直径为 0.2—0.6CM。采用气管软化实验后小支气管可重建 CTVE 影像为 34 例（可重建率约为 94.44%），未采用器官软化实验的小支气管可重建 CTVE 影像为 42 例（可重建率约为 84.00%）。
结论：气管软化实验与 CTVE 结合后可以更好的显示气管与支气管内部情况，对显示小支气管的能力也有提升，故器官软化实验与 CTVE 的应用对气管壁和小支气管病变更敏感。

基于深度残差神经网络的磨玻璃肺结节浸润性风险预测

龚敬,郝雯,王升平,彭卫军
复旦大学附属肿瘤医院

目的：为了预测 CT 影像中磨玻璃肺结节的肺腺癌发病风险，本研究设计和开发一种基于深度学习算法的计算机辅助诊断模型。
方法：首先，本研究从 648 个患者中回顾性地搜集和整理了 826 个经病理证实的磨玻璃肺结节样本。其中，409 个病理证实为原为腺癌，290 个为微浸润性腺癌，208 个为浸润性腺癌。然后，选用一系列图像预处理技术，包括：图像重采样、尺度变换、ROI 区域剪切和数据增强等，对原始 CT 影像进行处理，生成训练样本集和测试样本。其次，运用残差学习结合和批归一化技术建立一个深度卷积神经网络模型，并利用训练集数据训练模型。最后，为了测试和评价模型地性能，本研究随机选取了 128 个磨玻璃肺结节样本，建立一个独立的测试数据集对模型进行测试，对比和分析了构建模型与两名放射科医生的诊断效果。
结果：通过实验分析，本研究所提出的深度学习模型准确率为 82.29%、F1 值为 71.05%，加权平均 F1 值为 82.29%，Matthews 相关系数为 59.69%，各项评价指标高于两名放射科医生的诊断结果。同时，与未采用残差网络的深度学习模型（AUC: 0.856）对比，新模型的曲线下面积（0.866）更高。
结论：本研究表明，基于深度残差学习的 AI 系统能够提高肺腺癌浸润性预测的准确率，在未来可以辅助医生进行快速、精准的诊断。

基于三维卷积神经网络肺结节深度学习算法模型临床效能初步评估

王祥[1],李清楚[1],邹勤[1],邵影[2],高耀宗[2],刘士远[1],萧毅[1]
1.海军军医大学第二附属医院（上海长征医院）
2.上海联影智能医疗科技有限公司

目的：为评价人工智能模型的应用价值，本研究在专家共识的基础上建立了肺结节标准测试集，对前期建立的一种基于三维卷积神经网络肺结节深度学习算法模型进行验证，评价该模型的临床效能和限度。
方法：基于胸部 CT 肺结节数据标注与质量控制专家共识建立标准测试数据集，对前期建立的基于三维卷积神经网络的肺结节深度学习算法模型及传统 CAD 系统（Siemens syngo.via VB 3.0 和 Philips ISP V8）进行检验，在肺结节检出灵敏度、精准度以及平均每例假阳性个数等多个指标方面进行优效验证。
结果：针对测试数据集中的肺结节，Syngo.via 工作站检出灵敏度 36%，精准度 69%，平均每例假阳性 1.2 个；Philips ISP 工作站肺结节检出灵敏度 34%，精准度 73%，平均每例假阳性 0.9 个；

三维卷积神经网络的肺结节深度学习算法模型检出灵敏度 90%，精准度 71%，平均每例假阳性 2.8 个。
结论：该三维卷积神经网络算法模型相较于传统 CAD 系统，在肺结节检出灵敏度上有显著提升。由于训练数据集的偏倚等问题，灵敏度仍然有进一步提升的空间。后期通过针对性地补充训练数据集，比如增加磨玻璃结节的比重，可以进一步提升肺结节检出灵敏度。改进之后的模型有望成为影像医生肺癌筛查工作的得力助手。

基于 CT 平扫纹理特征参数鉴别股骨上段肿瘤良恶性研究

龚威,查云飞,彭宙峰,陆雪芳,胡磊
武汉大学人民医院

目的：探讨基于 CT 平扫的纹理特征参数对股骨上段骨肿瘤进行良恶性鉴别诊断的价值。
方法：收集并纳入 43 例股骨上段骨肿瘤患者，均具备完整的临床病理资料及 CT 平扫图像，其中 30 例病理结果证实为良性，13 例为恶性。21 例作为训练组，22 例作为验证组，模型构建步骤为：首先通过分层抽样的方式，将数据分为训练集和测试集，所有数据采用 A.K（Artificial Intelligence Kit）进行特征提取，进一步分别采用 Spearman（SPM)、Lasso（least absolute shrinkage and selection operator）及主成分分析法（principal component analysis，PCA）三种特征选择方式进行参数降维，最后利用 logistic 回归分别构建骨肿瘤的影像组学标签，并结合临床信息进行多元分析，构建预测模型，采用 ROC 曲线下面积（ACU 值）评价模型预测效能。同时利用诺模图（nomogram）对模型进行可视化分析。
结果：利用 Lasso 回归降维并构建影像组学模型的 AUC 值最大。三种选择方式在训练组中曲线下面积分别为 0.992、0.933、0.878，敏感度分别为 86.7%、73.3%、73.3%，特异度分别为 83.3%、100%、100%。在验证组中曲线下面积分别为 0.676、0.838、0.838，敏感度分别为 40.0%、66.7%、86.7%，特异度分别为 100%、100%、71.4%。利用 nomogram 分析得到训练组良、恶性误诊率分别为 0%和 16.7%，验证组良、恶性误诊率分别为 6.7%和 0%.
结论：基于术前 CT 平扫纹理特征参数可用于鉴别股骨上段良恶性肿瘤，且利用 Lasso 回归降维并构建影像组学模型的诊断效能综合评价最佳。同时基于 Lasso 回归降维构成的诺模图（nomogram），可用于鉴别股骨上段骨肿瘤良恶性。

基于 MSCT 数据的 CAS 三维重建胰胆管合流部及毗邻结构在 Roux-en-Y 术前初步研究

郭万亮,陈伟
苏州大学附属儿童医院

目的 先天性胆总管囊肿是一种罕见的先天性胆道发育畸形,手术切除是胆总管囊肿的唯一根治方法，我们研究的目的是探讨海信计算机辅助手术系统（Hisense CAS）在胆总管囊肿患儿胰胆管合流部及毗邻结构的三维重建结果，提高患儿 Roux-en-Y 手术的精准性。
方法 回顾性分析 2016 年 1 月至 2019 年 5 月苏州大学附属儿童医院收治的 20 例先天性胆总管囊肿患儿的肝脏 CT 增强影像资料，利用海信计算机辅助手术系统（Hisense CAS）对患儿肝脏增强 CT 图像进行 CT 三维重建，根据三维重建结果分析胆总管囊肿类型、胰胆管合流部及其与毗邻结构的关系，从而制定个体化最佳手术方案。

结果 三维重建结果清晰显示胆总管囊肿的类型、胰胆管合流部及其毗邻结构的关系，可以多角度观察肝脏及其脉管系统、胆总管囊肿及胰腺的空间位置关系。20 例患者中，男童 5 例，女童 15 例，年龄 16 月至 12 岁，其中有 6 例为 Ia 型胆总管囊肿，3 例为 Ic 型胆总管囊肿,11 例为 IVa 型胆总管囊肿；1 例患儿胆总管囊肿较大，2 例患儿胰管扩张，胰胆管共同管明显增长，1 例患儿肝右动脉在囊肿前壁走行并形成压迫。
结论 海信计算机辅助手术系统（Hisense CAS）有助于研究小儿复杂的肝脏解剖，可以从任意的角度对胆总管囊肿、胰胆管合流部及其毗邻结构进行观察，了解胆总管囊肿与肝脏及其脉管系统的空间关系，使影像诊断更加精准，并且能够为手术者提供直观的解剖结构信息，从而制定个体化最佳手术方案，提高小儿 Roux-en-Y 手术的精准性。

多中心磁共振影像数据标准化技术研究

赵国桦[1,2],白洁[1],程敬亮[1]
1.郑州大学第一附属医院
2.郑州大学信息工程学院

目的：多中心影像数据的多态性限制医学影像计算的发展。针对此问题，提出一套针多中心数据预处理流程，并在脑胶质瘤磁共振影像上验证。
方法：回顾性收集本院经病理证实的脑胶质瘤患者 215 例（高级别 153 例，低级别 62 例），另纳入公开的多中心数据库 Brats2017 的 285 例脑胶质瘤患者（高级别 210 例，低级别 75 例），共计 500 例患者组建全新的多中心数据集，通过脑胶质瘤分级准确率验证本文提出的多中心预处理流程的有效性。选择 CET1 序列影像数据作为实验序列。经预处理流程的 CET1 数据做验证组，未做预处理的相同数据为对照组。影像组学方法用于实验检验。采用交叉验证、分组验证检验分级准确率的稳定性。本文提出的预处理流程包括：（1）统一数据格式；（2）由经验丰富的影像科医生做感兴趣区分割；（3）本院影像数据去颅骨；（4）所有数据统一体素范围；（5）执行基于直方图规定化的数据重映射。
结果：交叉验证中，验证组准确率、灵敏度、特异性分别为：0.9260、0.9339、0.9051，对照组准确率，灵敏度，特异性分别为：0.7760、0.7824、0.7591。分组验证中验证组准确率、灵敏度、特异性均值分别为 0.9143、0.9180、0.9050，对照组准确率，灵敏度，特异性均值分别为 0.6472、0.6509、0.6373。
结论： 多中心数据预处理流程能够有效缓解数据间差异，提高脑胶质瘤分级准确率。该流程可扩展到基于磁共振影像数据的其他疾病，对临床研究具有一定的实用价值。

EPO-2673
基于支持向量机的脑出血 CT 影像的人工智能辅助预测模型研究

瞿航,王苇
扬州大学附属医院

研究目的：在解决脑出血 CT 影像中不规则、不明显出血区域分割问题的基础上，提出基于 FCM 算法分割的脑出血量计算方法，通过支持向量机 SVM 建立血肿预测机器学习模型，评估血肿再扩大的风险因素。
研究方法：联合不同的分割方法得到出血区域，区域生长法在血肿区域选取一生长种子点，若邻接点灰度值与初始生长点灰度值差小于生长阈值，则该像素点属于颅内出血区域，该邻接点被合并。

合并后的像素点作为新的“生长起始点”，继续考察其邻接的四个点，依次类推，直至识别出整个出血区域。模糊 C-均值(FCM)聚类算法以图像像素点作为样本集，根据类内相似性、类间相离性准则对图像像素点划分归类，通过不断迭代使代价函数最小化完成聚类，本研究 FCM 聚类算法引入了成员 Unm 函数表示,第 n 个像素值与第 m 个聚类中心的模糊隶属度，通过 Matlab 工具箱函数 Zeros 生成隶属度矩阵 U,再用 rand 函数随机生成隶属度矩阵 U,利用 sum 函数计算 U 中每列元素和，然后对隶属度矩阵 U 进行归一化处理，最后调用 FCMstep 函数不断迭代，直到代价函数值接近极小值，停止迭代，根据隶属度大小，将每个像素点最终归类。将 FCM 算法分割后的脑出血 CT 影像二值化；通过 Matlab 工具箱函数 bwarea 计算出血区域像素点个数 num，再利用 Matlab 工具箱函数 numel 计算二值化后 CT 图像中所有像素点个数 total,则求得出血区域占比为：R=num/total。通过二元 logistic 分析患者血压、出血部位、血肿体积/占比、中线移位等得到血肿吸收速度快慢预测模型，再将筛选出的特征值输入 SVM 模型，采用留一法的交叉验证通过训练集建立预测模型。

结论：血肿平均吸收率预测模型 logit(P 平均率)=1.230×L1-0.057×V-1.422。SVM 预测是否再出血:Total accuracy:70%,class accuracy：68.97，70.97%。

Image Quality Evaluation using a New Low-Dose Fluoroscopy Algorithm Based on a Deep-Learning Approach

Zhiwei Wang
Peking Union Medical College Hospital

PURPOSE

Interventional treatment is widely used in clinical practice and the augmented role of these procedures raises concerns about the radiation dose to patients and operators. Howerer, dose reduction may cause the increased noise, which impacts the image quality. We aim to develop a new low-dose fluoroscopy algorithm based on a deep-learning approach to improve image quality using an in-vitro model and in-vivo patient groups.

METHOD AND MATERIALS

All image acquisitions were performed on a DSA machine (Angio30C, Neusoft, Shenyang, China). The proposed network combined De-noising Convolutional Neural Networks (DnCNN) and Visual Geometry Group (VGG)-19 architecture.The radiation dose of the low dose regimen was half that of the conventional dose. We obtained 200 noisy-free phantom images as label via averaging 100 frames in one stable sequence. Noise was added artificially to these labels with specified range of our fluoroscopy to get noisy images. Thus we used these label and noisy images as our training set. Testing set included 20 phantom images for quantitative analysis and 100 clinical patient images for subjective evaluation. Mean squared error(MSE), peak-to-noise ratio(PSNR) and structural similarity(SSIM) were determined for quantitative analysis. The image quality of subjective evaluation was graded (1, excellent; 3, poor). The results were compared with conventional model-based de-noising approaches (temporal recursive filter,TRF), which is commonly used in fluoroscopic noise reduction.

RESULTS

For the quantitative analysis of 20 phantom images, image quality was significant better based on a deep-learning approach (PSNR, SSIM, MSE) than that based on TRF. For subjective evaluation of 100 clinical patient images, image quality was also significant better based on a deep-learning approach.
CONCLUSION
Compared with traditional method, deep learning based noise reduction method showed great improvement of image quality.

基于 U-Net 对前列腺 MR 图像中腺体的自动分割和径线的自动测量：临床植入验证研究

韩超[1],朱丽娜[1],刘想[1],张晓东[1],王霄英[1],刘伟鹏[2],王祥鹏[2],张靖远[2]
1.北京大学第一医院
2.北京赛迈特锐医学科技有限公司

目的：评价基于 U 形全卷积神经网络（U-Net）的前列腺分割和径线自动测量的准确性，探索其植入临床工作流程的可行性。**方法：**回顾性收集 2018 年 10 月 7 日到 2019 年 4 月 28 日连续病例的前列腺 MR 影像和报告资料，排除前列腺癌治疗后、经尿道前列腺切除术后和数据导出失败的病例，总共纳入 129 例数据进行研究。运用前列腺 U-Net 分割模型在 T2WI 自动分割前列腺轮廓。运用最小体积包围盒的算法规则，测得前列腺的左右、前后和上下径。将实际临床工作中使用的前列腺 MR 结构式报告内医师测量的前列腺径线数据作为金标准，用配对样本 t 检验和 Bland-Altman 散点图比较分析软件自动测量和医师手工测量的前列腺径线结果。**结果：**U-Net 分割和径线测量结果可自动地返回到结构式报告中，并自动填写到报告内。运用 Bland-Altman 散点图分析显示两种测量方法得到的前列腺各经线一致性高，只有不到 5%的数据位于 95%置信区间之外。对于前列腺左右

径，软件自动测量和医师手工测量结果之间的差异无统计学意义(t=-0.637,P>0.05)，而于前列腺前后径和上下径，两种测量方法结果之间的差异均有统计学意义（前后径：t=12.248,P<0.001；上下径：t=-2.172,P=0.032）。**结论：**基于 U-Net 的前列腺分割和径线自动测量模型植入临床工作流程是可行的，其测量结果的准确性符合临床需求。

应用基于增强 CT 的放射组学模型鉴别高低级别肾透明细胞癌的研究

裴旭[1],王平[1],殷小平[3],任嘉梁[2]
1.河北大学医学院
2.上海通气药业
3.河北大学附属医院 CT/MRI 室

【摘要】目的：基于增强 CT 建立放射组学模型，并评估模型鉴别低级别和高级别肾透明细胞癌的能力。**方法：**回顾性分析河北大学附属医院 106 例经病理证实的增强 CT 肾癌病例，其中低级别肾透明细胞癌 68 例，高级别肾透明细胞癌 38 例，并应用图像分割软件对感兴趣区（ROI）进行逐层勾画并融合成为感兴趣区容积（VOI）；首先对图像进行预处理，提取 1298 个组学特征，再经过降维最终保留 15 个特征，对样本按 7：3 的比例采用分层抽样方式分为训练集和测试集，基于保留的 15 个特征建立逻辑回归(Logistic Regression,LR)模型，将此模型在训练集和测试集分别进行 ROC 曲线分析。**结果：**LR 模型在训练集 AUC 为 0.829，敏感度为 0.741,特异度为 0.792；在测试集 AUC 为 0.832，敏感度为 1，特异度为 0.75。**结论：**基于影像组学特征的逻辑回归模型在鉴别低级和高级肾透明细胞癌方面有良好的区分效能。

EPO-2678
CT 纹理分析在肾脏透明细胞癌分级的临床应用

唐彩银
泰州市人民医院

目的：探讨 CT 增强图像纹理分析为肾透明细胞癌（ccRCC）术前预测提供新的客观定量参数。方法：本文回顾性分析了 2016 年 1 月至 2018 年 12 月间我院医学影像科经病理证实的 63 例 ccRCC CT 图像。应用软件勾画出肿瘤的感兴趣区，然后计算图像纹理参数。采用两个独立的样本 t 检验（错误发现率校正）比较了 Fuhrman 低（I-II 级）和高（III-IV 级）ccRCC 的纹理特征值，并用受试者操作特征曲线（ROC）评价利用纹理特征预测 Fuhrman 高、低等级 ccRCC 的效果。
结果：熵值在皮质期和髓质期对高级别组与低级别组 ccRCC 有统计学意义（P＜0.05）；相关性在髓质期对高级别组与低级别组 ccRCC 有统计学意义（P＜0.05）；熵值在 ROC 曲线在高、低两组 ccRCC 中皮质期和髓质期的曲线下面积分别为 0.727 和 0.824；相关性在髓质期曲线下面积为 0.872；高级别组 ccRCC 病灶大小大于低级组 ccRCC，有统计学意义（*P =0.007*）。结论：CT 纹理分析特征可以预测术前患者的 Fuhrman 分级，熵、相关性是临床应用最重要的影像指标。

武汉大学中南医院

目的：呼吸运动校正是肝结节超声造影(contrast-enhanced ultrasound, CEUS)定量分析的关键步骤。超声造影机主要分为提供双模和单模造影图像。双模造影图像具有造影图像和灰度图像，大多数超声造影图像呼吸运动校正方法都是针对该模式的图像。由于呼吸运动影响，所获取的 2D 超声序列会显示平面外结节和平面内结节。基于平面外图像序列校正是无效的。校正 CEUS 序列通常选取参照图作为标准来删除平面外结节图像，具有主观性。因此，基于双模式的超声造影序列定量选择最佳参照图的方法值得探索。材料和方法：采用拉普拉斯特征映射法降维和 K-means 聚类。根据聚类图像数量较多且接近超声造影强度达到峰值的类心图像作为最佳参照图像，并从原始图像序列中选择与参照图像相近的图像校正呼吸运动，最后在 18 例兔肝 VX2 肿瘤超声造影病例上验证并评价该方法有效性。结果：校正后从各造影图像序列的感兴趣区域 ROI 中提取的时间强度曲线(TIC)变得较平滑，更利于根据血流灌注模型曲线拟合。校正前图像序列的平均结构相似度（TMSSIM）和平均互相关系数(MCC)均值分别为 0.45±0.11 和 0.67±0.16，校正后两者均明显增加（$P<0.001$），分别为 0.59±0.11 和 0.81±0.11。校正前图像序列的偏差值（DV）均值为 92.16±18.12，校正后均值下降到约为原值的 1/3。采用基于平均帧作为参照图(MBMFRI)的校正方法校正序列的 TMSSIM 和 MCC 平均值均低于所提出的校正方法($P<0.001$)，且该法的 DV 平均值明显增高($P<0.001$)。结论：兔的呼吸频率比人快的多，然而本文提出的呼吸运动校正方法能减少超声造影图像序列的呼吸影响。本文提出的呼吸运动校正方法能提高传统依靠人工选择参照面和基于 MBMFRI 方法进行超声定量分析方法的准确性。这种简单操作的方法能潜在性应用于动物研究和临床应用中。

脑胶质瘤多中心数据集消歧及预处理

吴亚平,白岩,王梅云
河南省人民医院

目的

优质的训练数据是研究的基础，由于脑胶质瘤发病率低，单个医疗机构的数据量往往难以满足模型训练的要求，通过多中心数据共享是解决数据量问题的最有效解决方案。但由于各医疗机构采用的磁共振采集设备各有不同，受到扫描参数、扫描技能以及扫描过程等多方因素的影响，获得的影像在分辨率、亮度范围、对比度等方面存在较大差异，难以直接使用。为了更好的发挥多中心数据共享的优势，本文设计了一整套针对多中心脑胶质瘤磁共振影像的消歧和预处理方法。

方法

该方法包括数据消歧和预处理两大步。数据消歧是去除影像数据形式上的差异，使消歧后的数据具有统一规格，影像预处理是缓解影像间的亮度分布差异，提升影像的可比较性。

数据消歧具体包括统一采用 NIfTI 格式进行数据存储、去除患者的隐私信息、将坐标系统同一为左后上（LPS）坐标系统、采用 FSL 的 BET 工具去除颅骨、多序列统一配准到 T1 解剖学模板、统一影响分辨率和起始位置。

数据预处理时，首先由两名经验丰富的影像科医生共同精心挑选具有代表性的影像作为参照，根据研究目标分别选择四张低级别脑胶质瘤影像和四张高级别脑胶质瘤影像，预选 30%训练数据分别根据选出的影像进行直方图规定化，选择模型性能最好的参考影像作为参考帧对训练集中所有数据进行直方图规定化，对于新到样本采用同样的参数进行规定化。

结果

对消歧和预处理前后的数据分别计算特征并进行脑胶质瘤分级模型训练，以评价消歧和预处理算法的有效性。采用九种分类器和其中特征选择算法，采用十折交叉验证进行模型训练。实验结果表明，对影像进行预处理能提升模型的预测性能，曲线下面积（AUC）、精确度、敏感性、特异性、阳性预测值和阴性预测值均能普遍提升 7%到 15%。

结论

本文提出的数据消歧方法可以统一数据规格，提高多中心数据共享的效率；通过脑胶质瘤影像结合医生经验进行直方图规定化，使得所有影像的宏观亮度分布一致，提升了影像特征的可对比性。

基于 MRI 增强扫描纹理分析评价脑膜瘤的异质性

代岳
徐州医科大学附属医院

目的：基于 MRI 增强扫描纹理分析评价脑膜瘤异质性、评估纹理分析鉴别 I/II 级与 III 级脑膜瘤的效率。

材料与方法：55 位病人行 MRI 增强扫描检查（I 级 30 个，II 级 19 个，III 级 10 个），由两位放射科医师在 MRI 增强轴位图像上逐层勾画感兴趣区，以获得整个肿瘤体积内的数据，用组内相关系数检验两位医师测量的一致性，纹理分析的相关参数用 firevoxel software 导出。异质性的相关参数“熵、峰度、偏度及不均匀性值”用单因素方差分析进行检验，最后用单样本 t 检验比较两组间的差异。

结果：两位影像科医师的异质性参数一致性较好。III 级脑膜瘤的熵和不均匀性参数值明显高于 I/II 级脑膜瘤。I 级和 II 级脑膜瘤之间的的不均匀性参数有显著性差异（$P<0.05$）。当熵值为 5.58 时，鉴别 I/II 级与 III 级脑膜瘤的灵敏度、特异性和准确性分别为 81.8%、83.3%和 83.1%。当不均匀性值为 0.192 时，鉴别的敏感性、特异性和准确性分别为 90%、77.6%和 72.9%。

结论：基于 MRI 增强扫描纹理分析可用于评价脑膜瘤的异质性，熵与不均匀性参数值和肿瘤分级有很高的相关性。

EPO-2682

基于自适应超像素的脑胶质瘤自动分割方法

吴亚平,白岩,王梅云
河南省人民医院

目的

脑胶质瘤感兴趣区的自动分割对脑胶质瘤分级模型的临床应用非常重要，基于自动分割才能够先于医生实现对脑胶质瘤的辅助分级，进而为医生提供决策建议。本章提出了一种基于超像素技术的自动分割方法，通过对每个超像素计算特征并进行分类实现对脑胶质瘤的自动分割。

方法

在磁共振序列中，T2 序列主要反映水肿区，对应的感兴趣区范围往往能够囊括其他区域，因此本文选用 T2 序列作为分割目标。该方法分为两步：

首先利用影像中左右脑大致对称的原理，以块为单位寻找疑似肿块，在影像上放置 16*16 的网格，对左右脑对应的网格计算网格相似度，通过阈值评价网格是否为肿瘤区域，通过左半脑疑似区域计算肿瘤面积比，通过疑似区域边界与面积的壁纸计算肿瘤边界复杂度，然后利用随机森林算法对超像素个数 K 进行预测，并利用 SLICO 算法进而获得高质量的超像素图；

然后针对每个超像素计算特征和标签，超像素特征包括统计学特征、纹理特征、曲率特征和分形特征四类，然后计算超像素与手工标注对应区域的 Dice 相似度系数，通过相似度系数与阈值比较来设置超像素的标签。最后，将超像素特征和标签灌入 SVM 分类器进行模型训练，针对新样本时，通过对超像素进行模型预测的方法实现对感兴趣区的分割。

结果

超像素个数 K 的预测是本方法的关键，经实验发现，拟合回归预测的 K 与手工选择的 K 的决定系数为 0.9719。经 BraTS2017 数据集测试结果表明，算法具有较好的分割性能，评价指标 Dice、Hausdorff 距离、敏感性和特异性分别为平均 0.8492、3.4697、81.47%和 99.64%；算法具有较好的稳定性，在高级别脑胶质瘤和低级别脑胶质瘤具有类似的性能指标。

结论

算法具有较好分割进度和分割稳定性，能够作为一种全自动脑胶质瘤分割算法集成到各类脑胶质瘤计算机临床辅助诊断应用中。

深度学习技术对基层医院影像科医生筛查肺结节的辅助价值初步研究

崔兆国
大连大学附属中山医院

目的：探究基层影像医生结合人工智能软件对厚层胸部 CT 中 4mm 以上结节检出效能的差异。

材料与方法:前瞻性收集 2019 年 3 月 1 日至 2019 年 3 月 31 日在大连大学附属中山医院接受常规胸部 CT 检查的 132 例患者并进行 5mm 层厚骨算法重建.由两名十年以上诊断经验主治医师和一名十五年以上诊断经验副主任医师借助人工智能软件（InferRead CT_Lung 6.0，Infervision，Beijing，China）对 132 例病例图像的肺结节制定金标准。分俩组对 132 例图像中 4mm 以上结节查找：A 组（两位基层医疗机构影像医生）和 B 组（两位基层影像医生借助 AI）。记录结节数、长轴直径、位置和标记时间。将 A 组和 B 组的正确结节、假阳性结节和假阴性结节的数量与金标准进行比较，计算敏感度、假阳性率、准确度和假阴性率。最后，采用配对样本 t 检验比较两组敏感度、假阳性率、准确度、假阴性率和标记时间的差异。并比较 A 组和 B 组之间的统计差异。P＜0.05 为有统计学差异。

结果：A 组和 B 组 4mm 以上肺结节检出总数为 172 和 293 个。其中正确结节为 112 和 171 个，假阳性结节为 60 和 122 个。敏感度分别为 0.462±0.408、0.639±0.392 ，假阳性率分别为 0.561/CT、1.140/CT ，准确度分别为 65.12%、58.36%，假阴性率分别为 0.538±0.408、0.361±0.392.B 组的敏感度高于 A 组。P＜0.05 差异有统计学意义。

结论：

与无人工智能辅助相比，配备人工智能的基层影像医生对厚层图像 4mm 以上肺结节的标记时间更短，诊断敏感度更高。

EPO-2684
基于深度学习的人工智能诊断系统对低剂量与常规剂量 CT 扫描中实性肺结节识别研究

张怀瑢,田兴仓,朱力

宁夏医科大学总医院

目的：观察基于深度学习的人工智能（AI）诊断系统对低剂量与常规剂量 CT 扫描中实性肺结节识别能力有无差异。
方法：收集 2018 年 11 月—2019 年 2 月在我院常规胸部 CT 扫描 82 例及低剂量 CT 扫描的 83 例患者，然后用标准算法（B31）进行重建。由 3 名工作满五年以上医生结合 AI 识别结果进行标注，讨论意见一致作为金标准。用人工智能（AI）肺结节诊断系统分别对常规剂量及低剂量 CT 扫描图像进行肺结节识别。分别记录实性肺结节金标准数、真阳数、假阳数，并计算 AI 对常规剂量及低剂量 CT 扫描下实性肺结节识别的敏感度，假阳比（假阳性结节数/金标准结节数）。使用 MeDcalc17.0 软件比较两组间敏感性有无统计学差异。
结果：低剂量 CT 扫描中实性肺结节金标准总数为 120 个，AI 识别实性肺结节数为 331 个，真阳数 112 个，敏感性为 88.9%，假阳比为 1.82。常规剂量 CT 扫描中实性肺结节金标准总数为 176 个，AI 识别实性肺结节数为 238 个，真阳数 165 个，敏感性为 93.8%，假阳比为 0.41。两者之间敏感性比较，P＞0.05。
结论：在低剂量与常规剂量 CT 扫描中 AI 识别实性肺结节敏感度无差别。由于低剂量扫描中 AI 识别假阳比较高，因此患者在低剂量常规检查中需加强医生筛查。

基于深度学习的人工智能诊断系统在不同重建参数下对肺结节的识别研究

张怀瑢[1],田兴仓[1]
1.宁夏医科大学总医院
2.宁夏医科大学总医院

目的：本研究旨在评估重建算法对 AI 识别肺结节的影响。
方法：收集 2018 年 11 月—2019 年 2 月我院行常规 CT 扫描的胸部病例 82 例，然后用 3 种不同重建算法（软组织算法 B10、标准算法 B31、高分辨率算 B70）获得 3 组数据。由 3 名工作满五年以上医生在标准算法（B31）的图像中参考人工智能识别结果进行结节标注，讨论意见一致作为金标准。用人工智能（AI）肺结节诊断系统分别对 3 种重建算法的图像进行肺结节识别并记录结节层数、部位、大小、密度。记录不同重建算法下肺结节总数、真阳数并计算 AI 对肺结节识别的敏感度，假阳性比（假阳性结节数/金标准结节数）。使用 MeDcalc17.0 软件比较各组间敏感性有无统计学差异。
结果：金标准肺结节总数为 276 个，B10、B31、B70 算法下识别结节总数分别 324、487、365 个，实性结节、非实性结节、钙化结节金标准分别为 176、55、46 个。AI 在 B10 算法中识别实性结节、非实性结节、钙化结节敏感度，假阳比分别为 65.3%、0.625； 58.2%、0.291； 87.0%、0.196。B31 算法下识别实性结节、非实性结节、钙化结节敏感度，假阳比分别为 93.8%、0.415；87.3%、0.691；91.3%、0.413。B70 算法下识别实性结节、非实性结节、钙化结节敏感度，假阳比分别为 72.2%、0.693；60.0%、0.436；71.7%、0.522。AI 在 B31 重建算法下识别实性肺结节的敏感度较高，达 91.3%，与 B10、B70 相比，P＜0.05. 在 B10 算法下 AI 对钙化结节识别的假阳比最低。在 B31 算法下 AI 识别≤4mm、>4mm 肺结节的敏感性与 B10、B70 之间相比，P＜0.05.
结论：基于深度学习的人工智能检测软件，对肺结节识别具有较高敏感性。不同重建算法对 AI 识别不同密度结节具有差异性。

基于 MRI 直方图纹理组学特征对子宫内膜癌病理分级的预测价值初探

唐军
中国科学技术大学附属第一医院西区 ， 安徽省肿瘤医院

目的 探讨基于 MRI 病灶全域直方图纹理组学特征对子宫内膜癌术前分级诊断的价值
方法 回顾性分析 2015 年 1 月至 2017 年 12 月安徽省肿瘤医院经手术病理证实为子宫内膜癌患者，符合入组患者 100 例。按低级别（包括 1、2 级）与高级别（3 级）分为 2 组，低级别组 67 例（1 级 19 例、2 级 48 例）、高级别组 33 例（3 级）。应用 GE Analysis Kit（AK）软件在 MRI 增强动

脉期手动逐层勾画病灶 ROI 后融合，获取病灶全域灰度直方图参数。数据预处理后按训练组数据占比为 0.69 随机分配训练组与验证组。应用 Lasso 法筛选特征参数，采用 Bayes 法构建预测模型，使用验证集数据在诊断模型上的准确性评估模型效能。
结果 训练组 69 例（低级别 46 例，高级别 23 例），验证组 31 例（低级别 21 例，高级别 10 例）。AK 软件提取病灶全域灰度直方图特征参数共 42 个，采用 Lasso 法筛选后特征参数为 6 个，分别为 uniformity、Percentile10、Percentile75、histogramEnergy、Range、Variance。基于上述 6 个直方图参数，用 Bayes 法构建评估子宫内膜癌分级的预测模型。该模型的训练集敏感性、特异性、准确性分别为 0.739、0.826、0.797，验证集敏感性、特异性、准确性分别为 0.700、0.905、0.839。
结论 基于 MRI 直方图纹理组学特征对于术前预测高、低级别子宫内膜癌有一定价值，验证集数据准确性达 83.9%。

直肠癌淋巴结转移磁共振影像组学模型的建立及比较

胡斯娴[1],彭婉琳[1],夏春潮[1],李真林[1],李昕[2],汪昕蓉[2]
1.四川大学华西医院
2.GE 药业转化医学团队

目的：通过两种特征筛选方法建立直肠癌淋巴结转移患者磁共振影像组学模型，以期辅助临床诊疗方案的制定。
材料与方法：回顾性纳入 2016 年 2 月-2018 年 2 月在我院进行术前基线磁共振扫描的患者。获取其高分辨 T2 加权(T2 weighted imaging, T2WI)、高分辨弥散加权成像(diffusion weighted imaging, DWI)和表观弥散系数图(apparent diffusion coefficient, ADC)影像。直肠癌诊断、分期及判断淋巴结是否转移的金标准为术后病理。由超过 5 年直肠癌诊断经验的医师使用 ITK-SNAP 软件勾画兴趣区(region of interest, ROI)，通过 Artificial Intelligent Kit(A.K.)软件提取影像组学特征。提取的影像组学特征通过 Spearman 和差异性检验进行数据降维和去冗余后，

剩余的特征分别使用支持向量机(support vector machine, SVM)和随机森林法建立影像组学模型。受试者特征曲线(receiver operator curve, ROC)用于评价模型准确性。
结果：本研究纳入 385 位直肠癌患者，病理组织结果证实淋巴结转移 129 位，非淋巴结转移 256 位。每位患者每个序列图像提取 396 个组学特征，共计 1188 个特征。经过特征筛选后，SVM 共选择 28 个特征、随机森林法选择 14 个特征用于模型构建。所构建的模型的 ROC 曲线下面积分别为 SVM 训练集 0.86，在测试集 0.62；随机森林法训练集 0.96，测试集 0.60。
结论：磁共振影像组学模型的建立，有助于对直肠癌淋巴结转移的评估。模型的选择对评估的准确性有一定的影响。

Develop CT-based Radiomics Model to Automatically Identify Acute Cholecystitis

Jiejin Yang,Yingpu Cui,Shuai Ma,Xiaodong Zhang,Xiaoying Wang
Peking University First Hospital

PURPOSE
Acute cholecystitis (AC) has a high prevalence and accounts for a large proportion of emergency patients in China. This paper proposes a binary radiomics model aiming to identify AC from CT images.
METHOD AND MATERIALS
1. We selected 100 abdominal CT scan images from the emergency patients as a binary predictive model training data set, including cholecystitis, simple gallstones, gallbladder adenomyosis, and normal gallbladder. These cases were classified into two groups of acute cholecystitis and non-acute cholecystitis based on the diagnosis in the previous reports. These reports were completed by two experienced radiologists. 2. Label each layer of gallbladder on thin-slice abdominal CT images using post-processing station (IntelliSpace Discovery, Philips, Best, The Netherlands) to determine the region of interest. Delineated areas include edema of the gallbladder wall and gallstones. 3. Extracting and selecting radiomics features from CT images by using Relief (Relevant Features) filter feature selection algorithm. It was designed for application to binary classification problems with discrete or numerical features. Relief calculates a feature score for each feature which can then be applied to rank and select top scoring features for feature selection. Alternatively, these scores may be applied as feature weights to guide downstream modeling. Radiomics model performance is evaluated by calculating AUC in the training test data set.
RESULTS
The model achieved an AUC of 0.89. Sensitivity=0.82, Specificity=0.89, Accuracy=0.82.
CONCLUSION AND CLINICAL RELEVANCE/APPLICATION
The established radiomics model based on small samples basically achieves the expected performance. The model can improve performance and test by further increasing training data. The final model can be used for the diagnosis of acute cholecystitis.
AC accounts for a large proportion of emergency patients in China. Automatic diagnosis and reporting of acute cholecystitis can reduce patient waiting time while reducing the pressure on the radiologists. Establishing a group model is an important part of it. Combined with the automatic segmentation algorithm of the gallbladder, artificial

intelligence can realize the automatic delineation of gallbladder on CT images, further automatically identify cholecystitis, and calculate the gallbladder, providing more information for clinical treatment.

Automated Pancreas Segmentation Based on Multi-modal Fusion of Dual-energy CT Images

Yu Wen[1],Xin Li[1],Xixi Jiang[2],Xin Yang[2]
1.Union Hospital , Tongji Medical College, Huazhong University of Science and Technology
2.Huazhong University of Science and Technology

Purpose:
Accurately segmenting pancreas from CT images remains highly challenging even using advanced deep learning techniques due to the extremely high variability in pancreas' shape and volume among patients. Our study aims to investigate the feasibility of fusing multimodal images as an effective mechanism for improving the accuracy of deep learning based pancreas segmentation.

Methods:
We collected 73 dual-energy CT scans of both the arterial and portal venous phase. For each CT scan, we generated 11 sets of portal venous phase recombinant monochromatic images from 40keV to 180keV. For those smaller than 100keV, the reconstruction stride was set to 10keV, and for those greater than 100keV the stride was 20keV. We refer to the images of different contrast as modalities. We employed the Recurrent Saliency Transformation Network (RSTN), which is a state-of-the-art deep learning network for automated pancreas segmentation. RSTN adopts a two-stage network to realize coarse-to-fine segmentation. The first-stage identifies a ROI containing the pancreas, and the second stage aims to produce accurate pancreas segmentation within the ROI. We trained the RSTN model using the 82 portal vein CT volumes from the NIH Pancreas-CT Dataset. We registered our CT images of the arterial and the venous phase via the non-rigid registration method. We applied the segmentation model to each portal venous registered CT volume of our dataset and obtain the corresponding segmentation result. We fused the segmentation results from different modalities to obtain the final results.

Results:
The average accuracy (DSC) of our conventional portal vein dataset is 81.03%. Modalities of arterial phase and 50keV, 60keV, 70keV, 80keV are found to yield more complementary information for portal vein than other keVs. By fusing portal vein and the five modalities, the accuracy of the RSTN segmentation model increases to 88.31%, which is 7.29% higher than the result of the portal vein.

Conclusion:
Multi-modalities fusion can obviously improve the segmentation accuracy of pancreas and the improvement mainly lies in the miss segmented region of the portal vein, such as the head and tail of pancreas.

EPO-2693

Prediction of pretherapeutic differentiation degree of cervical cancer using DCE-MRI radiomics model

Tingting Lin,Jiangning Dong
Department of Radiology, Anhui Provincal Cancer Hospital, West Branch of the First Affiliated Hospital of USTC, Division of Life Sciences and Medicine, University of Science and Technology of China, Hefei, Anhui, 230031, P.R. China.

Objective To explore the value of radiomics features based on DCE-MRI in Predicting the differentiation degree of cervical cancer before treatment.
Methods 97 patients pathologically confirmed cervical cancer from March 2017 to December 2018 were analyzed retrospectively.54 cases were selected as training group,including 9 cases with high differentiation,20 cases with moderate differentiation, and 25 cases with poor differentiation.The other 43 patients were included in the validation group,including 7 with high differentiation, 17 with moderate differentiation, and 19 with poor differentiation. Routine MRI and DCE-MRI scans were underwent by all patients, and the largest level measurement of the penultimate phase in the original image of DCE-MRI was selected..ITK-SNAP and R language software were used for radiomics features extraction.The LASSO regression analysis was used for features selection.Logistic regression was performed to develop models and validation.The prediction performances were evaluated with ROC analysis and AUC curve.
Results A total of 945 features were obtained and reduced to six features as the most important discriminators for differentiation degree of cervical cancer.The prediction model was developed with maximum2DDiameterRow,glcm-ClusterShade,glszm-GrayLevelVariance,wavelet.LHL-Texture-ngtdm-Busyness,wavelet.HLL-FisrtOrder-Skewness and wavelet.LLL-FisrtOrder-Kurtosis.The radiomics features of the training group were tested by the verification group. The specificity of the specific-sensitivity curve obtained by logistic regression was 71.2%, the sensitivity was 65.8%, the positive predictive value was 0.762, and the negative predictive value was 0.684. The obtained characteristics were verified by the high, middle and low differentiation groups of the validation group. The area under the ROC was 0.896, 0.700, 0.716, the average AUC was 0.765, and the specificity was 86.4%, 69.2%, 76.1% respectively , sensitivity is 68.6%, 79.5%, 81.2%.
Conclusion Radiomics features based on DCE-MRI have good repeatability and are of high value for predicting pre-treatment differentiation of cervical cancer.

application of pixel-shift technique for Cerebral Digital Subtraction Angiography Motion artifacts correction

Zhuang Nie
wuhan union hospital

Purpose:
Interventional Digital Subtraction Angiography (DSA) is a subspecialty of radiology in which minimally invasive procedures are performed with imaging guidance, and cerebral DSA is the golden standard for diagnosis of cerebral vascular diseases. Cerebral vascular anatomy is complicated which needs high image quality of cerebral angiography for diagnosis, but during this examination process motion artifact is common due to the uncompliant patients. This study was to evaluate the application of pixel-shift technique in the cerebral digital subtraction angiography for motion artifact correction.
Method:
This study was performed in an Artis zee floor Interventional Angiography System from Siemens (German). In the study, angiography images from fifteen cases of cerebral digital subtraction angiography (DSA) examination were retrospectively collected from the PACS system of our hospital for the studies; and in all these cases, there are occurrence of motion artifact in the angiography images, include angiography of carotid or Vertebral artery. Region based automatic Pixel-shift function was used to correct the motion artifact of angiography. Region based automatic Pixel-shift function need to put a region of interest (ROI) in the image before the process. During the study we put the ROI in two different places, a: the target artery and b: region outside the target artery. Group a and group b was evaluated by two experienced radiologist respectively, and the assessing results was compared. Besides, these two groups were also compared to the original images.
Results:
The angiography image with best image quality was the group a, all the image with no motion artifact of target artery, with statistical significant. Although image quality of group b is not as good as group a, it is better than the original image, with statistical significant.
Conclusion: region based automatic pixel -shift method is a feasible tool for Motion artifact correction of Cerebral Digital Subtraction Angiography, and put the region of interest in the target artery is suggested to further improve the image quality.

EPO-2695

Radiomics analysis of gadoxetic acid-enhanced MR imaging for early recurrence and microvascular invasion prediction in hepatocellular carcinoma: comparison of tumor, penumbra and liver parenchyma

Zhen Zhang,Jie Chen,Hanyu Jiang,Bin Song
West China School of Medicine, West China Hospital, Sichuan University

Purpose
We aimed to evaluate and compare the ability of gadoxetic acid-enhanced MRI-based radiomics features, derived from intratumor, peritumoral, and background liver parenchyma, for preoperative prediction of early recurrence (<1year) and microvascular invasion (MVI) in HCC patients.
Method
46 patients with surgically confirmed HCC were enrolled in this IRB-approved prospective study. Tumor segmentation was performed on multiple phases (T2-weighted, non-enhanced T1-weighted, arterial phase, portal venous phase and hepatobiliary phase images). Three different regions of interests were delineated on each phase with the combination of automatic and manual approach: 1) a region of the entire tumor (ROI_{tumor}); 2) a 1cm-wide radius surrounding the tumor boundary ($ROI_{penumbra}$); and 3) a region of liver parenchyma excluding intratumor and peritumoural region (ROI_{liver}). The least absolute shrinkage and selection operator (LASSO) regression analysis was used to select radiomics features for building radiomics model (Rad-score). Then, a radiomics nomogram incorporating the radiomics features and subjective imaging findings was constructed using multivariable logistic regression analysis. Receiver operation characteristic (ROC) analysis and Delong's test were performed to evaluate and compare the discriminative performance.
Results
For early recurrence prediction, the highest area under receiver operating characteristic curve (AUC) with a value of 0.966 were obtained from Rad-score ($ROI_{penumbra}$), followed by the Rad-score (ROI_{liver}) (AUC=0.919) and Rad-score (ROI_{tumor}) (AUC=0.865). For predicting MVI, the AUC values of Rad-score (ROI_{tumor}), Rad-score ($ROI_{penumbra}$) and Rad-score (ROI_{liver}) were 0.950, 0.944 and 0.877, respectively. The Rad-score ($ROI_{penumbra}$) (odds ratio[OR]=2.72, 95%CI[1.5,4.93]; $p=0.009$), AFP level(OR=6.8, 95%CI[1.84,25.19]; $p=0.007$) and multifocality (OR=4.5,95%CI[1.17,17.3]; $p=0.050$) were identified as independent predictors for early recurrence. After comprising three predictive factors, the integrated radiomics nomogram showed an improved predictive performance compared to the Rad-score ($ROI_{penumbra}$) (AUC, 0.972 vs.0.966, $p<0.05$).
Conclusion
Peritumoral radiomics features along with clinical-radiological features had the potential of predicting early recurrence and MVI in HCC patients, which may assist in preoperative clinical treatment decision-making.

EPO-2696

Radiomics Features of Multiparametric MRI for Prediction of Progression-Free Survival in bone metastases from prostate cancer

Yueren Wang,Zhong Fei ,Yu Bing,Guo Qiyong
Shengjing Hospital of China Medical University

PURPOSE
To identify MRI-based radiomics features as prognostic factors in patients with bone metastases from prostate cancer.

METHOD AND MATERIALS
Ninety-eight patients with bone metastases from prostate cancer were enrolled,and the data was gathered from January 2010 to January 2018. A total of 976 MRI-based texture features were extracted from axial T2-weighted (T2-w) and dynamic contrast-enhanced T1-weighted (DCE T1-w) MRI. Step regression, ridge regression and logistic regression method model was applied to select features and develop the predicting model for progression-free survival (PFS). The predictive performance of the model was evaluated in the training cohort and validated in the validation cohort using 10-fold cross-validation. The risk score was calculated, the patients were divided into low-risk and high-risk groups according to median risk score. Stratified Kaplan-Meier survival analysis was performed to estimate PFS in low-risk group and high-risk group. Nomogram discrimination was evaluated. The relative hazard ratio (HR) of MRI-based texture features and clinical data as risk factors of PFS was calculated in Cox proportional hazards model. We built clinical and MRI-based texture features nomogram to predict PFS. C-index was obtained from Cox proportional hazards regression analysis.
RESULTS
The MRI-based radiomics signatures, which consisted of 6 selected features, were significantly associated with PFS(P<0.01). The predictive performance of logistic regression model in the training cohort (accuracy=0.93) and validation cohort (accuracy=0.87) using 10-fold cross-validation showed a good agreement. Kaplan-Meier survival analysis showed that PFS was significantly lower in high-risk patients than low-risk patients(P<0.01). The MRI-based texture features derived from T2-w images yielded a C-index of 0.713. The MRI-based texture features derived from DCE T1-w images yielded a C-index of 0.658 . The nomogram integrated the radiomics signature with clinical data yielded the highest C-index, which was 0.785(95% CI:0.679-0.891). Cox proportional hazards regression analysis identified MRI-based radiomics signature as an independent risk factors (HR:1.190, 95%CI:0.602-2.351).
CONCLUSION
Multiparametric MRI-based radiomics nomograms provided improved prognostic ability in patients with bone metastases from prostate cancer.

EPO-2697

Between-network resting state functional connectivity for diagnosis of major depressive disorder with multivariate pattern analysis

xueling zhu
Department of Radiology, Xiangya Hospital, Central South University

Aim: The individual diagnose of patients with major depressive disorder (MDD) with multivariate pattern analysis (MVPA) method based on resting-state fMRI has attracted

increasing attention. However, few reports aimed at the classification between first-episode, drug-naïve MDD patients and healthy controls. The aim of the current study was to investigate the resting-state functional connectivity in first-episode, drug-naïve MDD patients for diagnosis. **Methods:** We analyzed resting state fMRI data from 31 MDD and age- and gender-matched 31 healthy controls. Then MVPA was employed to classify MDD patients from healthy controls. **Results:** The experimental results exhibited a correct classification rate of 82.25% ($P < 0.001$) with sensitivity of 83.87% and specificity of 80.64%. The consensus connections used to distinguish MDD were mainly located in between-network resting state functional connectivity in the default mode, affective, executive, visual cortex and cerebullum network. Moreover, the right supramarginal exhibit high discriminative power in classification. **Conclusions:** The current study provided evidence that between-network resting-state functional connectivity can be used as an effective tool for MDD clinical diagnosis, which may reveal the potential pathological mechanism for major depression.

人工智能肺结节技术联合肺结节 Lung-RADS 分级在孤立性肺结节中的诊断价值

马钦,马静
新疆兵团总医院

目的：探讨如何利用人工智能（artificial intelligence ，AI）肺结节技术联合肺结节 Lung-RADS 分级、CT 征象的方法提高孤立性肺结节的诊断效能。方法：回顾性分析 65 例经病理结果定性的孤立性肺小结节（良性 13 枚、恶性 52 枚），所有病灶的影像图象由两名高年资影像医生分步进行不同方式的阅片，第一步由第一名医生对每位患者的所有影像图象进行正常阅片，从阅片中寻找病灶并进行时间记录，之后由第二位医生利用人工智能肺结节技术进行寻找病灶（排除假阳性病灶）并记录所需时间，得出相应数据后进行数据对比；第二步由第一名正常阅片的医生在其筛查出的病灶中，采用肺结节 Lung-RADS 分级标准对肺结节进行良、恶性的诊断，第二位医生利用人工智能肺结节技术在人工智能肺结节系统上对筛查后的病灶智能诊断结果联合 Lung-RADS 分级对病灶良、恶性进行判断；最后在对照病理结果后对比两组数据的差异性。结果：第一组数据中，测试共 65 枚孤立性肺结节，高年资训练有素的医生共检查出 55 枚结节，其中真阳性结节 55 枚，假阳性结节 0 枚，耗时 3 小时 20 分；高年资医生在人工智能肺结节系统上检查出 65 枚结节，其中真阳性结节 65 枚，假阳性结节 0 枚，耗时 9 分 46 秒。第二组数据中，高年资训练有素的医生所检出 55 枚阳性结节中判定为良性数目为 15 枚、恶性数目为 40 枚；高年资医生在人工智能肺结节系统上所检出 65 枚阳性结节中判定为良性数目为 14 枚、恶性数目为 51 枚。结论：人工智能肺结节系统能够有效降低漏诊风险和减轻日常工作中的数据测量等负担，在结合肺结节 Lung-RADS 分级后，可明显提高孤立性肺结节的诊断效能，使我们能够有更多的精力为临床医生及患者提供更加优质、更高水平的服务。

增强 CT 对基于深度学习的计算机辅助诊断系统（DL-CAD）检测肺结节长径和体积的影响

贾永军,段海峰,于楠
陕西中医药大学附属医院

目的：探讨增强 CT 对对基于深度学习的计算机辅助诊断系统（DL-CAD）检测肺结节长径和体积的影响。

方法：回顾性分析 40 例良恶性肺结节患者的平扫及双期增强 CT 图像，扫描方法为：管电压=120kVp，管电流使用自动调节技术，NI=14，药量根据患者体重调节，动脉期、实质期分别于开始注射对比剂后 30s、60s 扫描。使用标准卷积核重建层厚为 1.25mm CT 图像。使用经过大量训练的基于深度学习的人工智能诊断系统（InferRead CT lung research, Infervision, Beijing）检测平扫、动脉期、实质期重建 CT 图像上结节的体积和最大径。采用配对 t 检验比较三组间肺结节的最大径、体积。

结果：相对于平扫 CT 图像，人工智能检测增强扫描图像上肺结节长径及体积增大（P＜0.05）（图 1），且实质期肺结节长径及体积大于动脉期，差异有统计学意义（P＞0.05）。平扫、动脉期、实质期 CT 图像经深度学习的人工智能诊断系统检测得到的结节长径和体积如表 1、图 2 所示。

结论：增强 CT 影响人工智能检测肺结节体积和最大径和体积。相对于平扫，增强扫描 CT 图像经 DL-CAD 检测得到的结节长径及体积均增大，且实质期肺结节长径及体积大于动脉期。

Automated Lesion Detection for ASPECTS assessment in Acute Ischemic Stroke using Deep Neural Network

Jincheng Wang[1],Jun Yang[2],Lei Shi[2],Wenguang He[1],Mengdi Xu[2],Feng Chen[1],Haiyan Lou[1],Sijie Chen[2]
1.The First Affiliated Hospital of Medical School of Zhejiang University
2.Hangzhou YITU Healthcare Technology Co. Ltd

PURPOSE

The Alberta Stroke Program Early CT score (ASPECTS) is applied to assess severity of early ischemic changes (EICs) in pre-defined regions of acute ischemic stroke (AIS). However, brain atrophy and pre-existing infarcts increase the difficulty for clinicians in image interpretation. This study aimed to develop an artificial intelligence-assisted system (D-ASPECTS),and to validate its performance for detecting EICs,compared with experts.

METHOD AND MATERIALS

The admission NCCTs of 255 patients within 24 hours of stroke onset were used for this study. A convolutional neural network (CNN), 3D U-net model was trained to segment the lesions on 7 consecutive slices, which included 51 pre-set points in ASPECTS subregions at basal ganglia and supra-ganglionic levels. The numbers of EIC (multiple EICs in the same region counted as one) were subtracted from the initial score of 10 to compute final ASPECTS. All patients were randomly divided into a training set (n=141) and a test set (n=114, group A). In the test set, three subgroups were divided according to normal brain (n=53, group B), pre-existing infarcts (n=37, group C) and brain atrophy (n=46, group D). Each ground truth ASPECTS was rated by a neuroradiologist and a stroke neurologist with consensus achieved. The performance of D-ASPECTS dichotomy (score >=6 and <6) was evaluated by Matthews correlation coefficient (MCC) and Cohen's kappa, and the concordances between D-ASPECTS and experts in different subgroups were measured using interclass correlation coefficient (ICC).

RESULTS

In total, 2280 ASPECTS regions of 114 patients were evaluated. Comparing with the ground truth, D-ASPECTS showed the best MCC of 0.80 in group B, while 0.62, 0.36 and 0.37 in group A, C and D, respectively. The dichotomy (ASPECTS ≥6 and <6) subgroup analysis showed kappa coefficient of group A, B, C and D was 0.60, 0.78, 0.36 and 0.37, respectively. The ICC between D-ASPECTS and experts in the group A, B, C and D was 0.77, 0.88, 0.54 and 0.65, respectively.

CONCLUSION

D-ASPECTS had substantial consistency and high reliability with experts, especially in the patients without pre-existing brain changes. Brain atrophy and pre-existing infarcts can confound the detection of true EICs, thus reducing overall scoring accuracy.

EPO-2702

深度学习模型对纯磨玻璃结节肺腺癌病理亚型的预测分析

陶雪敏[1],方瑞[1],吴重重[2],张弛[2],张荣国[2],于朋鑫[2],赵绍宏[1]
1.中国人民解放军总医院第一医学中心
2.北京推想科技有限公司

目的 利用深度学习对 CT 上表现为纯磨玻璃密度结节（pure ground-glass nodule, pGGN）的肺腺癌进行分型，并与手术病理结果对比，探讨其对病理亚型的预测价值。**方法** 收集 219 例（共 240 病灶）经病理证实且 CT 上表现为 pGGN 的肺腺癌患者的 CT 影像与病理资料，根据病理分型，将其分为 2 组：第 1 组为非浸润性腺癌组，包括浸润前病变（不典型腺瘤样增生和原位腺癌）以及微浸润腺癌；第 2 组为浸润性腺癌组。首先对 pGGN 进行勾画与标记，然后将标记好的数据按照病理类型分组随机分为两组，学习训练组（80%）及验证测试组（20%）。同时，验证测试组中的数据结果

还需与两位胸部影像专家的评估结果进行对比。**结果** 深度学习模型对 pGGN 肺腺癌病理亚型的预测取得了较高的性能。深度学习诊断的准确性、特异性（83.3%、92.9%）均高于专家组（54.2%、28.6%）（P<0.05）。专家个人前后两次诊断的一致性 Kappa 值分别为 0.939 和 0.799；专家间的一致性 Kappa 值为 0.667。**结论** 深度学习模型能相对准确地判别 pGGN 的病理类型，诊断效能优于专家组判断。

基于 CT 影像组学分类器对 Borrmann IV 型胃癌与原发性胃淋巴瘤的鉴别诊断价值

邓娇,谭一雄,容鹏飞,王维,刘晟
中南大学湘雅三医院

目的 探讨基于 CT 图像的影像组学标签鉴别原发性胃淋巴瘤与 Borrmann IV 型胃癌的可行性。**方法** 回顾性分析 2009 年 1 月至 2017 年 4 月中南大学湘雅三医院经病理证实为原发性胃淋巴瘤或 Borrmann IV 型胃癌患者，且术前进行过腹部 CT 增强扫描的 71 例患者。其中原发性胃淋巴瘤患者 28 例，Borrmann IV 型胃癌患者 43 例。采用基于 Matlab 2017a 软件的特征提取算法提取影像组学特征，并利用 logistic 回归模型进行特征筛选以建立影像组学标签。通过纳入胃周脂肪浸润、胃壁柔软性、腹部淋巴结及周围脏器转移、腹水，黏膜白线征及病灶厚度等征象，构建 CT 征象诊断模型，应用 ROC 评估两模型的分类性能。**结果** 从每个患者 CT 扫描的肿瘤区域中提取 32 个三维特征，[D1] 通过降维发现 2 个特征是最重要的鉴别诊断因子并建立了影像组学标签；CT 征象诊断模型由腹水、胃周脂肪浸润、胃壁柔软性及黏膜白线征组成。放射组学标签和 CT 征象诊断模型的 AUC 值分别为 0.964 和 0.867；准确性分别为 94.4%和 80.2%；敏感性分别为 93.0%和 74.4%；特异性分别为 96.4%和 89.3%。经 Delong 检验，影像组学标签的诊断效能（AUC=0.964）高于 CT 征象诊断模型（AUC=0.867，P<0.001）。**结论** 基于 CT 图像的影像组学标签能够较准确地鉴别 Borrmann IV 型胃癌与原发性胃淋巴瘤，为临床辅助诊断提供有利的手段。

EPO-2704
计算机辅助检测系统在 HRCT 筛查不同密度肺结节中的应用

陈丽华[1],刘爱连[1],周永新[2],李晓龙[2],刘静红[1],张婷[1],王楠[1],张小赫[2],彭亦梅[2],鞠烨[1],李烨[1]
1.大连医科大学附属第一医院
2.海纳医信（北京）软件科技有限责任公司

目的：探讨计算机辅助检测系统（computer-aided detection, CAD）作为阅片工具，帮助低年资影像医生在筛查不同密度肺结节中的能力和价值。
方法：纳入 60 例 HRCT 检查有肺部结节的患者。由 2 名具有 8 年以上诊断经验的高年资影像医生同时阅读肺部 HRCT 图像，以 2 人一致性意见为标准在 *miPlatform* 系统上标注结节，在此基础上，CAD 阅片进行二次结节标注，随后由 2 名具有 15 年以上诊断经验的影像医生对上述标注的结节进行评价，2 位医生都认为是结节的最终定义为真性结节。根据密度将结节分为实性、部分实性和非实性结节，记录每种密度真性结节的个数。由 1 名低年资（3 年诊断经验）影像医生在不知道已确定的真性结节的情况下，独立阅读 HRCT 图像，记为方法 A；然后参照 CAD 标记结果修正方法 A 中的标记结果，记为方法 B，记录两种方法检出不同密度结节的个数。分别计算 A、B 方法检出结节的敏感度和假阴性率（漏检率）。

结果：共检出真性结节 292 个（实性 149 个、部分实性 45 个、非实性分别 98 个）。低年资医生使用两种方法误诊结节的个数分别为 116 个、53 个；实性结节、部分实性结节、非实性结节的误诊率分别为 18.10%、28.45%、53.45%和 30.19%、28.30%、41.51%。
结论：CAD 作为阅片工具，对于低年资影像医生检出肺结节有帮助，可以降低结节的误诊率，尤其是非实性结节的误诊率，有较大的临床应用潜能。

Can metabolic features of magnetic resonance spectroscopy predict Neuropsychiatric Systemic Lupus Erythematosus Patients?

Yan Li[1], ZuHao Ge[2], ZhiYan Zhang[3], ZhiWei Shen[1,4], YuKai Wang[5], Teng Zhou[2], RenHua Wu[1,6]
1. Department of Medical Imaging, the 2nd Affiliated Hospital, Medical College of Shantou University, Shantou, 515041, China
2. Department of Engineering, Shantou University, Shantou 515041, China
3. Department of Medical Imaging, Huizhou Central Hospital, Huizhou, 516000, China
4. Philips healthcare, China
5. Department of Rheumatology and Immunology, Shantou Central Hospital, Shantou 515041, China
6. Provincial Key Laboratory of Medical Molecular Imaging, Guangdong, Shantou 515041, China

Objectives:
To diagnose Neuropsychiatric systemic lupus erythematosus (NPSLE) early, creating a new deep learning model of multivoxel proton magnetic resonance spectroscopy (^{1}H-MRS).
Methods:
The retrospective study included 23 confirmed NPSLE patients and 16 healthy controls (HCs), who underwent 3.0T MRI with multivoxel magnetic resonance spectroscopy. 117 metabolic features were extracted from the multivoxel ^{1}H-MRS image. Initially, the Mann-Whitney U test picked out the diverse features between NPSLE and HCs. Then, for constructing a novel support vector machine (SVM) -based Deep Stacking Network (SVM-DSN) of multivoxel^{1}H-MRS, reselection of features was fulfilled by the Recursive Feature Elimination algorithm. Considering there were a little metabolite concentration value SD >20%, but the SNR of spectra ≥10 among the 39 subjects, we removed these values and replaced with null values. Furthermore, to ensure the accuracy of our mode, all the results were under the 10-fold cross-validation.

Results:
Thirty-three metabolic features from results of the Mann-Whitney U test were considered as a statistically significant difference (p<0.05). However, the Recursive Feature Elimination algorithm sampled 26 metabolic features which were considered respective for the prediction of NPSLE. Interestingly, not all of the 26 metabolic features came from the 33 with a statistically significant difference. Although individual feature does not manifest statistics significant, the SVM-DSN can still learn to distinguish the NPSLE patients from the control one, because multiple kernels map the features into higher dimensional Hilbert space to empower the SVMs to split the samples linearly. Using the extracted features by classier, the area under the receiver operating characteristic curve (AUC), sensitivity, specificity of the SVM-DSN model in predicting NPSLE was 97.5%, 100%,95% respectively.

Conclusion:

Metabolic features of multivoxel proton magnetic resonance spectroscopy (MRS) can be used to predict NPSLE, by establishing an SVM-DSN model. Moreover, not only did the deep learning model differentiate the NPSLE patients from the control one well, but also equipped good robust, which overcame the presence of spectral artifacts, indicating it could be used as a helpful non-invasion computer-aided diagnostic tool for NPSLE.

利用 U-Net 模型在 CT 图像上实现肾实质和肾窦的分割及体积测量

孙兆男[1],崔应谱[1],林志勇[1],刘想[1],刘伟鹏[2],王祥鹏[2],张靖远[2],王霄英[1]
1.北京大学第一医院
2.北京赛迈特锐医学科技有限公司

目的 利用 U-Net 模型实现 CT 图像上肾脏分割，测量肾实质和肾窦的体积。 **方法** 回顾性收集本院 PACS 中 365 个连续病例，均为腹部 CT 增强动脉期薄层图像。根据影像和临床资料，均为“正常肾脏”者。其中 93 例用于建模，272 例用于模型效能评价。全部 365 例用于体积测量。训练用于肾实质和肾窦分割的 U-Net 模型。由两位影像专家检查模型返回的分割结果，评价结果是否可用于体积测量。以最小体积包围盒算法测量双侧肾实质、肾窦径线。以去除最小连通域方法处理图像，保留像素数计算双侧肾实质和肾窦的体积。将测量结果自动填写到结构化报告中，完成肾脏大小的定量评估。计算肾实质、肾窦体积及三维经线的 95%参考值范围，应用多元线性回归方法分析年龄、性别、身高、体重与肾实质和肾窦体积的关系。**结果** 专家评价 U-Net 模型可很好地完成双侧肾实质和肾窦的分割。测试集中分割右肾实质的 DICE 值为 0.97，分割左肾实质的 DICE 值为 0.97，分割右肾窦的 DICE 值为 0.88，分割左肾窦的 DICE 值为 0.84，总 DICE 值为 0.98。多元回归分析显示不同侧别的肾实质体积和肾窦体积均与性别、年龄、身高、体重有一定关联。模型测量结果可自动填写入结构化报告中。 **结论** 基于 U-Net 可以有效分割 CT 图像上肾实质和肾窦，并测量及径线及体积，自动完成影像报告中双肾大小的定量评估。

Use case of Critical Value- Register and Report Tuberculosis Automatically Based on Tuberculosis Structured Report

Zhaonan Sun[1], Sui sui Zhang[1,2], Xiao ying Wang[1]
1.Peking University First Hospital
2.Beijing Smart Tree Medical Technology Co. Ltd.

Objective Tuberculosis (TB) is a chronic infectious disease that threatens human health seriously. Chest X-ray and CT are the main source of information for

TB. Active TB is a critical value that needs to be treated immediately. Registering and reporting active TB promptly is important for the prognosis and helps collect the temporal and spatial distribution of TB incidence and prevalence. An automated platform is needed to accomplish this task. **Method** The TB structured report is applied to detection, classification, infection assessment, and prognosis assessment of TB. The TB structured report contains 4 sections. First, clinical evaluation such as symptomatic consultation or reexamination of active TB. Second, technical evaluation, to decide whether the image quality is eligible. Third, lesion evaluation, which begins with the measurement,counting, localization of lesions in two lungs such as nodules, fibrosis, infiltration, cavity. The edge of the lesion and the satellite lesion need to be evaluated. For diffuse lesion, the size, density, and distribution should be evaluated. Besides, the hilum, heart, pleural effusion, diaphragm and costodiaphragm angle will be evaluated in turn. Fourth, the final diagnosis which will be generated automatically based on the findings chosen before, which can be edited to adjust or add words to make the report perfectly and smoothly. Eventually, the data fortress machine packages the data and uploads it to the cloud server, and then releases it to the professional staff of the infection control center who followed the WeChat Official Aaccount. **Result** Thanks to standardized lexicon and exhaustive report elements, the TB structured report can detect infectious active TB perfectly. Registering and reporting active TB automatically can provide real-time and structured data of active TB and contribute to management of healthcare data. **Conclusion** We constructed a TB structured report that can automate the registration and reporting TB with high quality and high efficiency.

不同人工智能肺结节筛查分类模型检测实性结节的效能对比研究

张凯,张晓琴,柴军
内蒙古自治区人民医院

目的 探索不同人工智能肺结节筛查分类模型对实性结节检出效能的影响，从而遴选适合临床检测实性结节使用的模型。**方法** 回顾性收集内蒙古自治区人民医院影像医学科 117 例胸部 CT 平扫病例数据，均为层厚为 1 至 1.25mm 的薄层扫描序列。本研究使用的金标准由两位拥有超过 15 年胸部 CT 阅片经验的放射科专家共同制定，共计标注 310 个实性结节。利用基于深度学习的不同 AI 肺结节筛查系统（北京推想科技有限公司）检测入组病例中的实性结节，模型一是在深度神经网络（CNN）基础上自主研发的算法，模型二是在模型一基础上优化、减少假阳性结节的算法，模型三则是模型二基础上优化增强磨玻璃结节敏感性的算法，分别记录不同分类模型检测到的结节数。通过与金标准对比，分析不同模型检测到的真阳性结节，假阳性结节和假阴性结节的数量，计算模型检测敏感性和假阳性率（假阳性结节数/CT）。卡方检验用于统计分析，$P<0.05$ 时具有统计学意义。**结果** 在入组的 117 个病例数据中，模型一检测到 798 个实性结节，仅 274 个是真阳性结节，假阴性结节为 36 个，检测敏感性为 88.39%；假阳性率高达 4.48/CT。与针对假阳性结节改进优化的模型二相比，模型二检测到的实性结节数显著减少，降至 626 个，减少的部分主要是假阳性结节，真阳性结节为 270 个，假阴性结节为 40 个，检测敏感性为 87.1%（$p>0.05$），假阳性率降至 3.04/CT。对比模型三的效果，597 个实性结节被检出，266 个是真阳性结节，假阴性结节数为 44 个，检测敏感性为 85.81%（$p>0.05$），假阳性率为 2.83/CT。可见，三个模型在检测敏感性上无显著差别，但模型二可以在保持较高敏感性，较少漏诊的情况下，有效减少假阳性结节数。**结论** 通

过对比不同模型间检测实性结节敏感性，漏诊数和假阳性率的差异，我们发现模型二更适用于临床进行实性结节筛查。

采用 CALCNET(CNN)模型对乳腺 X 线图像进行钙化检出

宋歌声[1],李爱银[1],李翠荣[1],俞旸[2],陈琦程[2],张超仁[2]
1.山东省千佛山医院
2.北京华健蓝海医疗科技有限责任公司

目的：
乳腺钙化是指在女性乳腺组织上的微小钙沉积。乳腺钙化非常常见且通常为良性。但有些类型的钙化则可能与早期乳腺癌相关。因此，检出钙化区域并进行研究就显得非常重要。

方法：
乳腺 X 线影像共有 782 张影像有钙化病灶。每张影像由该医院医生标注出钙化区做为真值，以黑白二值图形式保存。图片大小为 4096*3328。由每张影像提取大小为 112*112 的小图片。含有钙化病灶的小图片和纯背景（不含钙化病灶）小图片有各自的位置。该位置是由医生提供的真值信息中得到的。

我们设计的 CALCNET 是一种串联模型，分两步实现钙化预测。第一步是离散小波转换（DWT）。然后执行后处理操作以检测及分类兴趣区（ROI）。在第二步中，我们训练了两个 CNN 模型将每个兴趣区归类为钙化或非钙化区。第二个分类器用背景小图片中比较难于判断的那部分做为训练数据，即在第一个分类器中误判为钙化区的那部分小图片（假阳性分类）。CNN 用不同类型的钙化兴趣区和背景区小图片训练。在进行预测时，整张的钼靶图片要切割为小图片送入 CNN。

结果：
第一个分类器对小图片分类时 F1 值为 0.95。第二个分类器对小图片分类时 F1 值为 0.92。按整张钼靶图片计算时，F1 值为 0.75，precision 值为 0.7，recall 值为 0.85。

结论：
该流程提高了钙化检查处理时间，帮助医生更快更高效地筛查乳腺 X 线影像。该新方法可以同时检测微小钙化和大钙化。尽管钙化与图片相比非常小，CALCNET 能准确地检测到并最小化假阳性。

EPO-2710
Clinical Implementation of Chest-X-ray Models - Based on Structured Report

Zhaonan Sun,Xiao dong Zhang,Xiao ying Wang
Peking University First Hospital

Objective In recent years, deep learning has been widely used for the detection and classification of abnormalities in chest X-rays. Several chest X-ray models at good performance have been developed and published in medical journals. Prospective data from real clinical practice is the best approach to validate and iterate models. So we

build a clinical data platform- chest X-ray structured report which can integrate the clinical information , model predicting result and diagnosis of radiologists. **Method** The model we developed includes a binary classification model to distinguish normal from abnormal, and a multi-classification model to detect abnormal or pathologic features showed in the following picture. Before writing the structured report, the predicting results and heat map have been automatically integrated into the structured report. Two radiologists will evaluate the chest X -ray and decide to accept , modify or reject the predicting results. Eventually, a semi-automatic and radiologist-verified chest X-ray structured report with key images is issued to the patient and clinician. **Result** For model optimization, images with radiologists' feedback and annotation will be collected in the structured database in real clinical practice, so we can retrieve and extract data easily from the structured database and added to the training set to optimize the model constantly. For radiologists, they can generate a standardized, accurate and efficient report by easy-clicking with the assistant of models. For clinicians and patients, the report with key images can eliminates the drawback of separating image and data.Thus, X -ray structured reporting facilitates communication between radiologists, clinicians, and patients. **Conclusion** We construct a chest X-ray structured report that can facilitate the clinical implementation of deep learning model.AI results and heat maps are integrated into the structured report. Radiologists accept, modify or reject the results.All feedback will be used to train the model.

The effects of image thickness on the accuracy of deep learning-based computer aided system in measuring pulmonary nodule diameter and volume : a phantom study

Tianbao Zhang,YaNan Zhu,HePing Zhou,ZhengJun Li
AnKang Central Hospital

Objective: To investigate the effects of image thickness on the accuracy of deep learning-based computer aided diagnostic system (DL-CAD) for pulmonary nodule diameter and volume measurements.

Materials and Method: In this phantom study, a total of 15 artificial pulmonary nodules with different diameters and densities (Simulated Tumors, Kyoto Kagaku, Tokyo, Japan) were randomly placed in a chest phantom (Multipurpose Chest Phantom N1 "LUNGMAN", Kyoto Kagaku, Tokyo, Japan). CT scans were then acquired on a spiral CT system (Revolution, GE healthcare) with 120 kVp and constant noise index of 14 HU. Images of each scan were reconstructed with different thicknesses, including 0.625mm, 1.25mm, and 2.5mm slice thickness. A DL-CAD system was then used to measure the diameters and volume of the nodules in the chest phantom on images of different thicknesses. In order to evaluate the measurement accuracy, the absolute percentage measurement error (APE) for measured diameters and volume were calculated by $APEd=100*(D_m-D_r)/D_r$ and $APEv=100*(V_m-V_r)/V_r$, respectively, where D_m, V_m, D_r, and

V_r represented the measured and actual values of diameters and volume. Paired t-test was used to examine the significant difference.

Result: In terms of the measurement accuracy for nodule diameters and volume, APEd and APEv were compared between images of varied thicknesses and no statistically significant difference was found among them ($p_{diameter}$=0.282, p_{volume}=0.090).

Conclusion: The measurement accuracy of DL-CAD for nodule diameters and volume was robust on image of different thicknesses.

Clinical Application: With the decent measurement accuracy for nodule diameter and volume, DL-CAD might be used to detect nodules from images of different thicknesses in lung cancer screening.

EPO-2712

The effect of tube voltage on deep learning-based computer aided system in nodule diameter and volume measurement accuracy: a phantom study

Tianbao Zhang, YaNan Zhu, HePing Zhou, ZhengJun Li
AnKang Central Hospital

Objective: To investigate the effects of different tube voltages on the accuracy of deep learning-based computer aided diagnostic system (DL-CAD) in measuring the pulmonary nodule diameter and volume.

Materials and Method: In this phantom study, a total of 15 artificial pulmonary nodules with different sizes (5 mm, 8mm, 10mm, and 12mm in diameter) and densities (Simulated Tumors, Kyoto Kagaku, Tokyo, Japan) were randomly placed in the chest phantom (Multipurpose Chest Phantom N1 "LUNGMAN", Kyoto Kagaku, Tokyo, Japan). The chest phantom were scanned on spiral CT system (Revolution, GE healthcare) with a constant NI (12HU) and different tube voltages (100 and 120 kVp); images sequences of each scan were reconstructed with a 1.25mm slice thickness. The maximum diameter and volume of the nodules in the chest phantom were measured on both 100 kVp and 120 kVp CT images by an DL-CAD system. In order to evaluate the measurement accuracy, the absolute percentage measurement error (APE) of the measured diameter and volume was calculated by APEd=100*(D_m-D_r)/D_r and APEv=100*(V_m-V_r)/V_r, respectively, where the D_m, V_m, D_r, and V_r represented the measured and actual values of diameter and volume. Paired t-test was used to examine the significant difference.

Result: In terms of the measurement accuracy, all the APEd and APEv values of groups with different diameters were slightly greater in 120 kVp images compared with the 100 kVp images, but no statistically significant difference was found between them ($p_{diameter}$=0.885, p_{volume}=0.995).

Conclusion: The measurement accuracy of DL-CAD for nodule diameter and volume was robust in images of different tube voltages.

Clinical Application: With the decent measurement accuracy for nodule diameter and volume, DL-CAD is robust and might be applied to lung cancer screening in the future.

基于 CT 影像组学术前预测≤5cm 单发肝细胞癌微血管侵犯

张亭[1,2],谭显政[1],顾潜彪[1],李红玲[1],刘建滨[1],刘鹏[1]
1.湖南省人民医院/湖南师范大学第一附属医院
2.湖南省儿童医院

目的 探讨 CT 影像组学术前预测≤5cm 单发肝细胞癌微血管侵犯(microvascular invasion; MVI)的价值。**方法** 回顾性收集我院经手术病理证实为肝细胞癌且有术前完备 CT 增强图像的患者共 185 例，按 2:1 的比例随机将病人分为训练组（n=124）和验证组（n=61）。每位患者基于肿瘤体积提取 1351 个影像组学特征。基于训练组采用 LASSO-logistics 回归进行特征筛选并构建影像组学模型，运用 Delong 检验对比影像组学模型与常规形态学参数的诊断效能。在验证组对影像组学模型的效能进行验证。**结果** 最终筛选出 10 个最优特征用于构建影像组学模型。该影像组学模型在训练和验证组中均表现出较好的辨别效能，AUC 分别为 0.724（95% CI：0.584～0.863），0.745（95% CI：0.655～0.834））；而且，其预测性能明显高于形态学特征（*P*均<0.05）。**结论** 影像组学模型在术前预测≤5cm 单发肝细胞癌微血管侵犯方面有一定价值，且预测效能高于传统形态学参数。

EPO-2714
基于 MRI 影像组学对舌鳞状细胞癌病理分化程度的预测研究

于保婷,丁军,刘硕,管玉瑶,李佟,郑雪微
吉林大学中日联谊医院新民院区

[摘要] 目的 通过影像组学的纹理分析深度解读舌鳞状细胞癌 MRI 图像，并与病理学结果进行对照分析，从而对舌鳞状细胞癌病理分化程度进行预测，指导临床选择合理的治疗方式，并最大程度上改善患者预后。**方法** 搜集吉林大学中日联谊医院 2016 年 5 月至 2018 年 5 月 40 例经病理证实为舌鳞状细胞癌的临床及影像资料（包括低、中、高分化），对所有患者的 MRI 图像进行高通量的数据采集，提取病灶的一阶特性、形状特征、纹理特征、亮度特征、灰阶运行长度矩阵、灰阶判断矩阵及相邻的灰度级，并使用树模型默认参数进行特征选择，选择后的特征再进行 Logistic 多元回归相关性分析，从而筛选出具有诊断价值且与肿瘤分化程度显著相关的影像组学特征，运用受试者工作特征（ROC）曲线对特征参数的诊断效能进行分析，最后在数据集上使用五折交叉验证对模型的预测能力进行验证。**结果** 对 MRI T2 加权成像特征选择后经 Logistic 多元回归分析筛选出影像组学相关特征，本研究预测模型最终获得 13 个特征。模型的敏感度为 87.5%，特异度为 66.7%，曲线下面积（AUC）为 0.9398。**结论** 本实验通过提取 MRI T2 加权成像中病灶的纹理特征并进行分析，具有无创、计算速度快、正确率高等优点，同时与术后病理组织学特征进行对照，找到二者之间相关性，有望对舌鳞状细胞癌病理分化程度预测提供辅助手段。

EPO-2715
Clinical Application of Artificial Intelligence in Detecting Pulmonary Nodules on Chest CT

Hongxia Zhang
Gansu Provincial Hospital of TCM

Purpose：To evaluate the application performance of artificial intelligence (AI) for lung nodule detection on chest CT .

Methods：The subject included 45 patients who underwent the non-enhanced chest CT on revolution CT from February 8, 2019 to February 17, 2019(20 males, 25 females; mean age, 64.9±15.5 years, range age, 27~93years). All the cases were subjected to AI system for automatic lung nodule detection. Meanwhile, each case was identified by3 senior thoracic radiologists. Calculating the detection accuracy and sensitivity of AI.

Results: In 45 patients, AI detected a total of 251 nodules in the right lobe (51 calcified nodules, 175 high-density nodules, and 25 ground-glass nodules).Compared with gold standard, AI misdiagnosed 47 pulmonary nodules, 11 pulmonary nodules were mislocated and 15 pulmonary nodules were not detected. AI detected a total of 176 nodules in the left lobe (36 calcified nodules, 124 high-density nodules, and21 ground-glass nodules).Compared with gold standard, AI misdiagnosed 31 pulmonary nodules, 9 pulmonary nodules were mislocated and 11 pulmonary nodules were not detected.The sensitivity and accuracy of AI in detecting pulmonary nodules were 92.7% and 72.6% respectively.

Conclution：Artificial Intelligence has extremely high sensitivity and medium accuracy in the detection of pulmonary nodules. It can be used as an auxiliary tool for detecting pulmonary nodules, thus reducing the working pressure of radiologists.

基于纹理特征客观评价 X 线双下肢拼接全长图像拼接质量的新方法

王冬翠,王笛,陈伟,谢江平,周高峰,廖伟华
中南大学湘雅医院

目的：X 线双下肢拼接全长影像是骨性或风湿性关节炎等疾病的重要诊治依据，其拼接质量直接影响到医生对疾病的诊断、治疗方案的制定以及疗效的监测等。临床上 X 线长骨拼接图像的质控常规采用主观评价法。为解决主观评价法效率低、量化难、主观性高等问题，本文创新性地提出基于纹理特征客观评价 X 线双下肢拼接全长图像拼接质量的新方法。
方法：研究素材为一例从湘雅医院 PACS 系统上抓取的 X 线双下肢拼接全长影像，其中有三幅分段式原始图像和一幅拼接图像。为考察结构错位，以拼接图像为中心，横纵坐标各自分别向正负方向错位 1~12 个像素得到一系列错位拼接图像；为考察亮度突变，以拼接图像为中心，亮度突变量以 5%为步长，分别改变至±60%，得到一系列亮度突变程度不同的拼接图像。首先运用本团队所改进的基于图像 Canny 边缘的 Harris 特征点匹配的图像配准算法计算拼接前分段式图像与拼接图像之间的变换矩阵，得到拼接前图像在拼接图像上的对应位置及重叠区域，基于以上位置标记在拼接图像上选取感兴趣区域（记为 ROI1），并对 ROI1 的图像拼接质量进行主观评分；其次，对 ROI1 分别进行逆变换得到其在原始图像上的相应位置（记为 ROI1_1 和 ROI1_2）；再次，对以上 ROI 区域分别计算灰度共生矩阵 GLCM 和等灰度游程长矩阵 GLRLM 纹理特征值及其差值；最后，以主观评分为目标变量，以标准化后的各纹理特征差值为自变量进行曲线拟合得到目标评分模型。
结果：成功构建了图像拼接质量评分的多指数模型。进一步的仿真测试结果表明，该模型的评分结果与主观感受符合度较高。

结论：本文基于纹理特征客观评价 X 线双下肢拼接全长图像拼接质量新方法的实现，进一步拓宽了纹理特征在医学影像领域的应用，且有利于 X 线长骨（含双下肢）拼接全长图像拼接质量评价的模块化、自动化和标准化，可大大节约医疗成本。

T2-Weighted Image-Based Radiomics Signature for Discriminating between Seminomas and Nonseminomas

Peipei Zhang,Xiangde Min,Liang Wang
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To evaluate the performance of a T2-weighted image (T2WI)-based radiomics signature for differentiating between seminomas and nonseminomas.
Materials and Methods: Thirty-nine patients with testicular germ-cell tumors (TGCTs) confirmed by radical orchiectomy were enrolled, including 19 cases of seminomas and 20 cases of nonseminomas. All patients underwent 3T magnetic resonance (MR) imaging before radical orchiectomy. Eight hundred fifty-one radiomics features were extracted from the T2WI of each patient. The intra- and interclass correlation coefficient was used to select features with excellent stability and repeatability. Then, we used the minimum-redundancy maximum-relevance (mRMR) and the least absolute shrinkage and selection operator (LASSO) algorithms for feature selection and radiomics signature development. Receiver operating characteristic curve analysis was used to evaluate the diagnostic performance of the radiomics signature.
Results: Five features were selected to build the radiomics signature. The radiomics signatures were significantly different between the seminomas and nonseminomas ($p<0.01$). The area under the curve (AUC), sensitivity, and specificity of the radiomics signature for discriminating between seminomas and nonseminomas were 0.979 (95% CI: 0.873 - 1.000), 90.00 (95% CI: 68.3 - 98.8), and 100.00 (95% CI: 82.4 - 100.0), respectively.
Conclusion: T2WI-based radiomics features have the potential to noninvasively discriminate between seminomas and nonseminomas.

EPO-2718

B1-mapping 技术算法在磁共振电解质成像中的应用

柳秋风,胡军武,万维佳
华中科技大学同济医学院附属同济医院

目的：探讨 B_1-mapping 技术在磁共振电解质断层成像（MREPT）中的应用。方法：射频场 B_1 的均匀性关系到磁共振图像的对比度、信噪比等信息，B_1-mapping 技术是在传统的磁共振成像技基础上，通过检测包含射频场空间分布信息的磁共振信号[1,2]，来计算得到人体组织各处 B1 场分布的成像技术。人体组织在电磁场的作用下，会呈现出一些电磁特性，电特性指的是介电常数 ε 和电导率 σ，磁特性指的是磁导率 μ。人体组织的电特性在正常组织和肿瘤组织之间差异较大，可以作为肿瘤早期诊断的有效手段。人体组织电特性磁共振断层成像（magnetic resonance electrical

properties, MR EPT）技术是在传统的质子磁共振成像技术的基础上，通过检测能够反映人体组织非均匀电特性（electrical properties, EPs）的分布的磁共振射频场（B1 场），来计算得到人体组织各处的 EPs 分布的新兴的 MR 成像技术。从麦克斯韦方程出发，可以推导出在磁共振成像模式下，人体组织介电特征与射频场之间的关系为： ，其中，B 为复数射频场， 为拉普拉斯算子，K 为复介电常数， 为劈形算子； 为角频率， 为磁导率。求该方程的解是关键问题[3,4]。本文对西门子 3.0T 的机器上 B1-mapping 序列进行改进，并用 MATLAB 编写计算 B1maps 值的程序和 EPT 算法程序，在特殊的水膜上分析了 EPT 算法的误差。结果：改进的序列和算法均可以达到实验要求，在水膜上分析，产生的误差比较小。结论：B1-mapping 技术在 MREPT 成像中起到了非常重要的作用，通过进一步算法和序列的改进，有应用于临床的潜力。

基于深度学习及 MRI 影像的腹部脂肪精准定量研究

曾凤霞,潘德润,陈卫国,秦耿耿
南方医科大学南方医院

目的：肥胖症表现为体内脂肪异常储积，可累及心血管、呼吸、骨骼、肌肉、内分泌、生殖等系统。脂肪最易贮存在腹部，腹部脏器也可见脂肪附着。磁共振成像(MRI)可以很好的显示腹部脂肪的分布，但却无法精确定量腹部脂肪。因此，本研究利用腹部 MRI 影像构建和验证用于定量计算腹部脂肪的深度学习系统，并将这些结果与人体测量学和实验室参数相关联。
方法：本研究回顾性研究包括肥胖患者 50 例（BMI＞28）和正常成年人 50 例（18.5＜BMI≤23.9），平均年龄约为 45.21 岁，其中训练组为 75 例（肥胖：正常≈1:1）,验证组 25 例（肥胖：正常≈1:1），两组病人均于 2013-2018 年接受腹部 3.0TMRI 检查，扫描范围从膈下至盆底，收集 MRI 轴位 T1 加权图像，层厚及层间距均为 5mm。以一名拥有 5 年以上腹部 MRI 诊断经验的影像医师手动勾画特定层面的内脏脂肪与皮下脂肪轮廓为金标准，基于 U-Net 架构，开发了一种用于分割内脏和皮下脂肪的深度学习方法。以 DICE 评分、根-均值误差(RMSE)评价深度学习自动定量腹部脂肪的结果与人工勾画测得腹部脂肪含量的相关性。用 Student t 检验及 Pearson 卡方检验评价皮下脂肪、内脏脂肪与腰围、甘油三酯、总胆固醇/高密度脂蛋白比值之间的相关性。
结果：DICE 评分、根-均值误差(RMSE)和相关性分析表明，通过我们的方法测量的皮下和内脏脂肪的体积与手动测量结果是高度相关的。在两组人群中，腰围与内脏脂肪体积相关（P=0.01 和 P=0.001），甘油三酯含量与脂肪百分比相关（P=0.036 和 P=0.070），在肥胖组中，总胆固醇/高密度脂蛋白比值与内脏脂肪体积百分比相关（P=0.005）。
结论：基于深度学习系统的腹部脂肪定量方法有较高的准确性较高。结果表明，腰围是肥胖患者内脏脂肪的一个较好的预测因子，内脏脂肪体积与总胆固醇/高密度脂蛋白比值相关。

Value of Radiomics Based on DCE-MRI in Predicting Luminal and non-Luminal Breast Cancer

Shike Wang,Dong Sun,Dajing Guo,Jia Liu,Chuanming Li,Linli Chen
Second Affiliated Hospital of Chongqing Medical University

Objective: To investigate the value of radiomics based on dynamic contrast enhanced magnetic resonance imaging (DCE-MRI) in predicting luminal and non-luminal breast cancer. Methods: We retrospectively analyzed images of breast DCE-MRI of 42 patients with breast cancer confirmed by pathology. The lesions were outlined by manual segmentation in the strongest enhancement phase of DCE-MRI, and radiomic features were

extracted. Then the least absolute shrinkage and selection operator (LASSO) was used to select the most important features and construct the radiomics label. All cases were divided into luminal group and non-luminal group according to the expression of estrogen receptor (ER) and progesterone receptor (PR). Classifiers were constructed based on logistic regression (LR), random forest (RF), K nearest neighbor (KNN) and support vector machine (SVM), and their prediction performance were verified by 5-fold cross validation. Results: 4 optimal features, including 1 shape feature and 3 features based wavelet, were statistically significant in separating luminal from non-luminal cancers, and 3 features, including the Original_Shape_Maximum 2D Diameter Row, Wavelet-LLH_GLCM_Idn and Wavelet-HHH_GLCM_Correlation had significant correlations with ER and PR levels. RF-based classifier has the best performance in prediction of luminal and non-luminal breast cancer, the sensitivity, specificity, accuracy, and area under curve (AUC) were 0.838, 0.900, 0.853 and 0.876, respectively. Conclusion: Radiomics based on DCE-MRI has a good application value in prediction of luminal and non-luminal breast cancer, and the RF-based classifier has the best performance.

Brain perfusion alterations on 3D pseudocontinuous arterial spin labeling MR imaging in patients with autoimmune encephalitis

Rui Li[1,2],Ma Lin[1],Lou Xin[1]
1.Department of Radiology, The first Medical Center, Chinese PLA General Hospital
2.Nankai University

Abstract
Background and purpose
Early diagnosis of autoimmune encephalitis (AE) still remains challenging as patients present with insidiously neurological symptoms. The diagnostic assessment for AE using three dimensional pseudocontinuous arterial spin labeling (3D pCASL) MR imaging has seldom been described previously. The purpose of this study was evaluate the utility of 3D pCASL in AE.
Materials and methods
The conventional MRI and 3D pCASL of 8 autoimmune encephalitis admitted to our hospital between 2015 and 2019 were retrospectively reviewed and compared to matched controls. Meanwhile, brain 18F-FDG PET/CT was also obtained in conjunction with whole-body PET in 2 cases. Clinical manifestation, neurological imaging, and follow-up feature were retrospectively analyzed.
Results
Autoantibody testing was detected in all case, including 2 with anti-NMDAR, 1 with anti-GABAaR, 1 with anti-GABAbR and 4 with anti-LGI 1. The lesions were distributed bilaterally (n=5) and unilaterally (n=3), with the most common site being hippocampus(n=7) and temporal lobe (n=5). Among these patients, on initial conventional MRI, images were shown to normal cases (n=2), minimal abnormal cases (n=2), and marked abnormal cases (n=4). Compared with control groups, all patients with AE showed remarkedly increased cerebral perfusion (Figure 1). 18F-FDG PET/CT was also viewed as having abnormal metabolism in two cases. Both 3D pCASL and PET/CT showed perfusion reduction in one case after therapy (Figure 2).
Conclusion
3D pCASL may be useful adjunct to provide valuable diagnostic information in early detecting AE when conventional MRI yields equivocal results, and it is also useful in the evaluation of the therapeutic effect of AE.

PO-002

大鼠 CO 中毒脑内谷氨酸代谢变化的 7.0T 磁共振 GluCEST 及 MRS 研究

许愿,郑文斌

汕头大学医学院第二附属医院

目的：利用谷氨酸化学交换饱和传递（GluCEST）技术及磁共振波谱（1H-MRS）技术，定量分析急性 CO 中毒后大鼠脑内谷氨酸含量的变化，结合血液中 HbCO 饱和度变化、动物行为学试验及相关病理组织学变化，探讨 GluCEST 成像技术在 CO 中毒相关神经精神病变机制研究中的应用价值。
方法：成年健康大鼠随机分为模型验证组、行为学分析组和磁共振数据采集组。各组按需随机分为染毒鼠和对照鼠，染毒鼠予以腹腔注射纯 CO 气体，对照组予以腹腔注射等剂量空气处理。模型验证组用于测定染毒前后血液中 HbCO 饱和度及制作脑切片。行为学分析组行 Morris 水迷宫实验。磁共振数据采集组于染毒前后在 7.0T 动物磁共振机上行磁共振数据采集；采集的数据主要包括 T2WI、GluCEST 及 MRS。以上所有定量结果均进行统计学分析。
结果：1.染毒大鼠的双侧海马、顶叶皮层及丘脑的 GluCEST 浓度均较对照大鼠相应部位升高（p＜0.05），且差异至少持续 21 天；1H-MRS 结果提示双侧海马、顶叶皮层的谷氨酸及其复合物浓度均较对照大鼠升高（p＜0.05），但丘脑的变化无统计学意义。
2.腹腔注射法可维持大鼠血 HbCO 浓度大于 50％约 3 小时。
3.染毒组大鼠第 2 天的平均潜伏时间和平均潜伏距离明显延长（p＜0.05）。
4.H-E 和尼氏染色均显示染毒大鼠脑内感兴趣区发生了神经细胞变性、凋亡的现象。
结论：1.结合血 HbCO 含量、水迷宫实验、脑切片的 HE 及尼氏染色结果综合分析，腹腔注射法具有一定的可靠性。
2.染毒大鼠在海马区、顶叶皮层、丘脑均发生谷氨酸含量的升高，并在组织病理学上可观察到明确的细胞变性和坏死，提示谷氨酸可能可以作为一种脑内损伤标志物。
3.GluCEST 成像能无创监测活体脑内谷氨酸含量的变化趋势，其敏感性及空间分辨率均优于 1H-MRS 技术，为 CO 中毒相关 DNS 的机制研究提供了新的影像学研究方法和研究思路。

PO-003
急性缺血性脑卒中出现 FLAIR 血管高信号征的临床及影像因素分析

韩娜,张静
兰州大学第二医院

【摘要】 目的：探讨大脑中动脉供血区急性缺血性脑卒中（Acute ischemic stroke，AIS）患者液体衰减反转恢复序列血管高信号征（FLAIR vascular hyperintense，FVH）出现的临床及影像因素。**方法：**回顾性分析 276 例 MCA 区域 AIS 患者的临床及影像资料。按是否存在 FVH 分为 FVH 阳性组和阴性组，FVH 阳性组根据 FVH 的分布情况分为 3 个级别。采用 X^2 检验和 Fisher’s 精确检验分析 FVH 发生及 FVH 级别与临床及影像因素的关系。临床因素包括年龄、性别、高血脂、高血压、高血糖、房颤、既往卒中史及出现临床症状-MR 检查时间，影像因素包括血管狭窄部位、程度、Willis 环类型及梗死面积。**结果：**FVH 阳性组和阴性组两组之间患者年龄、性别、高血脂、高血压、高血糖、房颤、既往卒中史及 Willis 环类型差异无明显统计学意义。患者出现临床症状-MR 检查时间、血管狭窄部位、程度及梗死面积差异具有统计学意义（P=0.011,P=0.011，P=0.000，P=0.000），结果显示 FVH 常见于颈内动脉颅内段、MCA 的 M1、M2 段重度狭窄及闭塞的大面积脑梗死患者，FVH 的出现率随着患者出现临床症状-MR 检查时间的延迟而逐渐下降。FVH 阳性组不同级别间患者出现临床症状-MR 检查时间、血管狭窄部位及程度差异不具有统计学意义（P=0.269，P=0.108，P=0.518），不同级别间梗死面积差异具有统计学意义（$c^2=7.026$，P=0.030），FVH 级别越高，大面积梗死患者占比越大。**结论：**患者出现临床症状-MR 检查时间、血管狭窄部位及程度是影响 FVH 出现的重要因素。出现临床症状-MR 检查时间越短、血管狭窄部位发生在颅内动脉近端及血管狭窄程度越重，FVH 发生率越高。大面积梗死患者 FVH 阳性率显著高于小面积梗死患者。

PO-004

Comparison of CT angiography collaterals for predicting target perfusion profile and clinical outcome in patients with acute ischemic stroke

shanshan lu,Xiaoquan Xu,Xuan Zhang,Yuezhou Cao,Linbo Zhao,Feiyun Wu,Qianghui Liu,Sheng Liu,Haibin Shi
The first affiliated hospital of Nanjing Medical University

Objectives: To compare collateral status on single-phase CT angiography (sCTA) and multiphase CT angiography (mCTA) and their ability to predict a target mismatch on CT perfusion (CTP) and clinical outcome in patients with acute ischemic stroke (AIS).
Methods: 73 AIS patients with stroke onset between 5 and 15 hours or with unclear onset time and occlusions in the M1/M2 segment of middle cerebral artery and/or intracranial internal carotid artery underwent head non-contrast CT and CTP. Simulated sCTA and mCTA were reconstructed from CTP data and were compared for collaterals assessment. The ability to predict target mismatch on CTP (an ischemic core < 70 ml, a mismatch ratio ≥ 1.8, and an absolute difference ≥ 15 ml) and 90-day modified Rankin Scale (mRS) score of 0-2 were compared between sCTA and mCTA by using receiver operating curve analysis.
Results: sCTA underestimated the collateral status when compared with mCTA ($P < 0.01$). The ability of mCTA to predict target mismatch (AUC = 0.902, 95% confidence interval [CI]: 0.809, 0.959) and clinical outcome (AUC = 0.771, 95% CI: 0.655, 0.864) was better than that of sCTA ($P < 0.05$ overall). A mCTA collateral score of > 3 best identified the target mismatch (sensitivity, 78.4%; specificity, 90.9%) and predicted 90-day mRS score of 0-2 (sensitivity, 84.8%; specificity, 69.4%).
Conclusions: The collaterals were better estimated by mCTA compared with sCTA. A mCTA collateral score of > 3 optimized the prediction of a target mismatch on CTP and a good clinical outcome in patients with AIS.

PO-005

酰胺质子转移成像在缺血性脑卒中的应用

张归玲,朱文珍
华中科技大学同济医学院附属同济医院

目的：探究酰胺质子转移成像在缺血性脑卒中不同时期的变化规律，并初步探索脑缺血不同时期的分子变化机制。方法：纳入本研究的缺血性脑卒中患者 37 例，其中急性期 7 例，亚急性期 19 例，慢性期 11 例，最早为发病后 1 天内接受检查，最晚为 28 天内。所有的研究对象均行常规 T1WI，T2WI，DWI 扫描，在 DWI 梗死最大面积行 CEST-APT 扫描。经手动勾画 ROI 及后处理软件计算 APTW 值及 MTR 值，用独立样本 t 检验比较缺血性脑卒中不同时期的差异，采用配对 t 检验比较相同时期梗塞侧和对侧正常脑白质的差异。结果：缺血性脑卒中发生后，APTW 值较对侧显著降低（梗塞侧：0.58±0.07，正常侧：1.43±0.04，P<0.05），在急性期、亚急性期和慢性期，APTW 值逐渐升高（三个时期 APTW 值分别为-0.21±0.15，0.68±0.05，1.34±0.11），急性期及亚急性期低于对侧正常脑实质，慢性期较对侧无明显差异，部分出现 APTW 值高于对侧正常组织。MTR 值在不同

时期的变化中无差异，但在不同时期，其值均低于正常对照组(梗塞侧/正常侧：急性期：32.16±0.4/36.18±0.54；亚急性期：30.53±0.42/34.68±0.32；慢性期：31.19±0.61/37.78±0.43)，差异均有统计学意义。结论：在脑梗塞的不同时期，尤其是急性后期，DWI 常仍表现为高信号，而 APT 变化则较 DWI 更敏感。本研究还发现，仅在慢性期部分患者会出现 APT 值高于对侧正常组织，因此在发病时间不明确的缺血性脑卒中患者或再发卒中的患者，DWI 上均表现为高信号而 APT 值与正常组织相同或略高时，可推测其处于慢性期以及鉴别同一个病人的新发梗塞灶与慢性期梗塞灶。结合 APT 值及 MT 值的变化，可反映不同时期缺血性脑卒中的变化，揭示内源性蛋白质及 PH 值在脑卒中发生后的变化规律。

PO-006

Risk factors for the growth of asymptomatic, unruptured intracranial aneurysms followed by computed tomography angiography

guang-xian wang,Dong Zhang
Department of radiology， Xinqiao Hospital， Third Military Medical University

Object: The growth of an unruptured intracranial aneurysm (IA) is associated with a higher rupture risk. The aim of this study was to identify the risk factors of the growth of asymptomatic, unruptured IAs.
Methods: Two-hundred consecutive patients with 228 asymptomatic, unruptured IAs being followed with computed tomography angiography (CTA) were reviewed retrospectively from August 2011 to December 2017. Follow-up images of the IAs were used to determine changes in IA size or shape. Patients and IAs were divided into nongrowth and growth groups. In addition to the clinical characteristics of the patients, the features of IAs (e.g., size and shape) were evaluated by CTA. Independent risk factors for IA growth were studied using multiple logistic regression analysis. The Kaplan-Meier growth-free survival curves were used to calculate the cumulative risk rates of IA growth.
Results: The average follow-up time was 16.5 (range, 3.0-72.2) months. There were 20 IAs growth events, accounting for 10% (20/200) of all the patients. The multivariate logistic regression model revealed that IA size and patients' clinical characteristics were not correlated with growth, and only irregular shape (odds ratio 6.429) influenced IA growth. Overall, the cumulative growth rates of 1, 2, and 3 year were 34.5%, 65.1%, 82.5% for IA with irregular shape, and 1.4%, 5.0%, 21.9% without irregular shape, respectively.
Conclusions: Irregular shape is a significant risk factor for IA growth. Increased attention should be paid to IAs with an irregular shape during follow-up.

PO-007

脑实质出血体积测量：ABC/2 公式与计算机辅助多层面分析技术对比

谢辉辉,马帅,张晓东,王霄英

北京大学第一医院

目的：脑实质内出血（Intracerebral hemorrhage, ICH）的出血量多少是早期血肿扩大、神经功能恶化与不良预后的独立风险因素之一，正确的测量脑出血的量有助于评价出血的严重程度，选择治疗方法，评价预后等。本研究旨在比较两种不同的 ICH 体积测量方法：椭圆公式（ABC/2，A 和 B 代指血肿最大层面最大横径与垂直最大纵径，C 代指厚度）与计算机辅助多层面分析。
方法：本研究回顾性分析了 176 例原发性 ICH 患者。两名放射科医师分别使用 ABC/2 和计算机辅助多层面分析（IntelliSpace Discovery，Philips，Best，The Netherlands）测量体积，比较两种方法所测得的体积。如果同时合并脑室内出血，则脑室内出血体积不计入血肿体积内。此外，ICH 的形状评估并记录为规则或不规则，其评估指标参考既往研究中的标准。对于体积测量和 ICH 形状的评估，利用统计学方法评估读者间的一致性， P <.05 被认为有统计学意义。
结果：与 ABC/2 方法（20.11±18.51 mL）比较，计算机辅助多层面分析所得血肿体积明显更大（23.88±21.14 mL），P <.001。 ICH 的形状在 89 名患者中是规则的，在 87 名患者中是不规则的。在具有规则形状 ICH 的患者中，通过计算机辅助多层面分析所测量的体积（15.39±14.03mL）略大于 ABC/2 方法（12.57±12.05mL），P <.001。在 ICH 形状不规则的患者中，通过计算机辅助多层面分析所测量的体积（32.57±23.61 mL）显著大于 ABC/2 方法（27.81±20.73 mL），P <.001。无论哪种测量方法形状不规则的血肿体积明显大于规则的血肿（所有 P <.001），一致性均较好。
结论：两种测量方法结果均稳定，不规则血肿体积明显大于规则血肿。 ABC/2 方法测量的血肿体积小于使用计算机辅助多层面分析所测量的血肿体积。

PO-008

Comparison of time‐of‐flight MR angiography with sparse under-sampling with TOF-MRA in Evaluation of Intracranial Aneurysm: digital subtraction angiography as a reference standard

Xu Xu,Wanlin Peng,Jinge Zhang
West China Hospital

Purpose
To compare the performance of time-of-flight with sparseunder-sampling MRA (TOFu-MRA) with time-of-flight MRA (TOF-MRA) in the evaluation of aneurysms' morphologic parameters, with digital subtraction angiography as the reference standard.
Method and materials
Twenty-four consecutive adult patients with suspected intracranialaneurysms were perspectively enrolled and underwent TOF-MRA and TOFu-MRA within one week before DSA. The signal intensities of the aneurysms ($SI_{anuerysm}$), background noise (SD) and the signal intensities of the adjacent brain tissue (SI_{brain}) were measured in the same slice of the original images and calculated the contrast-to-noise ratio (CNR) and signal-to noise (SNR).The neck, height and width of aneurysms were measured and compared on maximum intensity projection (MIP) and volume rendered (VR) images of both TOF-MRA and TOFu-MRA, respectively. With DSA as the reference, the absolute difference between TOF-MRA and DSA (dl_{neck}, dl_{height}, dl_{width}), as well as TOFu-MRA and DSA

($d2_{neck}$, $d2_{height}$, $d2_{width}$) were calculated and compared, respectively.The subjective image quality was assessed using a 4-point score scale by an experienced observer used.

Results

There were a total of 27 aneurysms. When using same acquisition time, the SNRs (155.2±90.8 vs. 45.8±10.1) , CNRs (116.6±72.0 vs. 38.6±10.1) values and noises (22.36±4.40vs.21.03±6.02) of TOFu-MRA were significantly higher than those in TOF-MRA (all P<0.01). . There were significant differences between d1 and d2 (neck: 0.68±1.00vs. 0.58±1.05, height:0.85±1.34 vs.0.81±1.22, width:2.91±3.19vs.1.74±2.49, respectively; all p＜0.05). Good interobserver agreement (κ values=0.87) was obtained between the two radiologists.The subjective image quality of was significantly improved when the sparse TOF was used (p＜0.05).

Conclusion

Compared with conventional TOF, sparse TOF could assess intracranial aneurysms more accurately with a better image quality and same acquisition time.

PO-009

Quantitative analysis of the heterogeneity of "island sign" based on non-contrast CT for predicting the early hematoma expansion

Lei Song[1],Jiangtao Wang[1],Wanbi Wang[1],Hao Ren[1],Yazhen Yang[1],Tingting Guo [2],Bo Gao[3],Guiquan Shen[3]
1.Xiangyang Central Hospital, Affiliated Hospital of Hubei University of Arts and Science
2.Department of Radiology, Xiangyang No.1 People's Hospital, Hubei University of Medicine
3.Department of Radiology, Affiliated Hospital of Guizhou Medical University

Objective: Based on the Radiological sign of non-contrast CT hematoma——"island sign", the hematoma morphology and density were quantitatively analyzed to predict the values of early hematoma expansion in patients with spontaneous intracerebral hemorrhage (ICH).

Methods: Consecutive adult patients (>18 years) with spontaneous ICH who had undergone baseline CT within 6 hours after ICH symptom onset in Xiangyang Central Hospital between June 2017 and June 2019 were enrolled for inclusion into this study, and patients with hemorrhage were screened for "island sign". According to the hematoma of island sign, morphological heterogeneity was divided into three categories: rule, irregularity and separation, which were recorded as 1 point, 2 points and 3 points respectively. Hematoma density heterogeneity was divided into 1 to 5 grades. Grade 1 was uniform hematoma density, recorded as 1 point; grade 2 was extremely uneven density, recorded as 5 points; and grade 2-4 were recorded as 2-4 points based on density differences. A follow-up CT scan was performed within 24 hours after the initial CT scan. The time to baseline and follow-up CT scan and baseline clinical and radiological variables were recorded for each participant. We defined hematoma growth as a 33% increase in hematoma volume or >6 mL at the time of the follow-up CT scan, and the hematoma expansion group and non-hematoma expansion group were respectively

evaluated. Logistic regression analysis was performed on the influencing factors of early hematoma expansion. Receiver Operating Characteristic Curve (ROC) were tested for morphology heterogeneity, density heterogeneity, and combined morphology and density heterogeneity to predict early hematoma expansion.

Results: Of the 370 patients with acute cerebral hemorrhage, 123 (33.2%) cases had "island signs", including 75 cases with hematoma expansion group (61.0%) and 48 cases with non-hematoma expansion group (39.0%).Multivariate logistic regression analysis found that island sign (OR=9.749, 95% CI=2.390-39.765, P=0.001) was an independent risk factor for early hematoma expansion. Area Under Curve (AUC) of the "island sign" hematoma morphological heterogeneity score was 0.774 (95% CI: 0.689-0.860, P < 0.001). When the hematoma morphological heterogeneity score was 2 points, the "island sign" had the highest diagnostic value (sensitivity= 0552, specificity=0.875, Youden index= 0.395). ROC analysis indicated hematoma density heterogeneity was demonstrated of the greatest AUC (0.922, 95% CI: 0.874 - 0.970, P < 0.001), the cutoff point was 2 (sensitivity= 0.880, specificity=0.875, Youden index =0.755). However, ROC analysis combined with hematoma morphology and density was demonstrated of the greatest AUC (0.951, 95% CI: 0.916 - 0.987, P < 0.001), the cutoff point was 5 (sensitivity= 0.827, specificity = 0.979, Youden index=0.801).

Conclusion: "Island sign" is an independent radiological marker based no non-contrast CT for predicting the early hematoma expansion. When the combined hematoma morphology and density heterogeneity score is 5 points, "island sign" predicts the highest values of early hematoma expansion.

PO-010

Evaluation of diffusion kurtosis imaging of leptin intervention in early hypoxic-ischemic brain edema

Xiaoning He, Juan Xiao, Peng Wu, Yuxuan Han, Juan Tian, Chao Yang
The Second Hospital of Dalian Medical University

abstract

Purpose: This study aimed to explore the diffusion kurtosis imaging (DKI) related parameters to evaluate the effect of leptin on newborn piglet hypoxic ischemic encephalopathy (HIE) model and its temporal evolution.

Materials and methods: Thirty-five healthy Yorkshire piglet born within 3-5 days were randomly divided into 3 groups: HIE group (15), leptin group (15) and control group (5). The HIE group and leptin group were ligated with bilateral common carotid artery and put into hypoxic chamber for 30 minutes. In the control group, only bilateral carotid artery dissection was performed. Leptin group was intraperitoneally injected with leptin (4mg/kg) immediately after the establishment of the model. DKI scanning

was performed in each group at different time points of 3h, 6h, 9h, 12h, 16h and 24h. After scanning, Arterial blood was extracted from 5 pigs in each group to measure Neuron-Specific Enolase (NSE) and S100 calcium-binding protein beta (S100β), 3 pigs in each group were selected for brain pathology examination.
Results: In the HIE group and leptin intervention group, DKI related parameters (mean kurtosis MK, radial kurtosis Kr, axial kurtosis Ka) in lesion area demonstrated irregular high signal, whereas relative homogeneous low signals were revealed by DTI related parameters (mean diffusion coefficient MD, radial diffusion coefficient Dr, axial diffusion coefficient Da). Compared with the control group, MK, Kr, Ka in the lesion area increased aggressively; MD, Da, Dr decreased gradually from 0.5 to 72 h ($P<0.05$) and all parameters in leptin group were significantly different from those in HIE group ($P<0.05$). Serum NSE concentration in Leptin group was lower than that in HIE group ($P<0.05$). Pathological results showed that the level of organelle injury in Leptin group was lower than that in HIE group.
Conclusion: Leptin can effectively reduce newborn piglet hypoxic ischemic cerebral edema, and DKI were found to be more sensitive than conventional diffusivity metrics to microstructural changes of HIE.

PO-011
抗 NMDA 抗体阳性重叠其他自身抗体阳性的免疫相关性脑病 7 例

杨帅,王小宜,廖伟华,唐海云,谢芳芳,郭久晴
中南大学湘雅医院

目的：观察抗 NMDA 抗体阳性重叠其他自身抗体阳性的免疫相关性脑病的临床及影像表现，加深对其理解。
方法：2014 年 3 月-2019 年 6 月间因不明原因脑病住我院且采集血清及脑脊液行多项抗体检测后抗 NMDA 抗体阳性的 75 例患者中 7 例出现重叠其他自身抗体阳性，回顾性分析该 7 例患者的临床资料、MRI 表现，观其特点。
结果：7 例患者男：女=1：6，年龄 5-28（18±7）岁，均无合并肿瘤证据。1 例合并 AQP4 抗体和抗 GD1b 抗体、GM1 抗体阳性，1 例合并 AQP4 抗体、MOG 抗体阳性，1 例合并 MOG 抗体阳性，1 例多次复发后寡克隆区带和 TPOAb、TGAb 阳性，1 例合并 TPOAb、TGAb 阳性，1 例合并抗蛋白酶 3(PR3)抗体阳性，1 例合并抗 SSA 弱阳性、抗 Ro-52 阳性。自身免疫性脑炎与 CNS 特发性炎性脱髓鞘病重叠 4 例，其中神经元表面抗体与胶质细胞表面介导抗体重叠 3 例。7 例均于首次发病时行 MRI 平扫增强，其中 6 例有随访 MRI。2 例首次 MRI 阴性，其中 1 例在 MRI 随访中新发病灶，病情进展。5 例首次 MRI 阳性，仅 1 例出现病灶环形强化，为抗 NMDA 抗体阳性合并 PR3 抗体阳性患者，后行穿刺活检术、病理证实为血管炎。5 例首次 MRI 阳性及 1 例 MRI 首次阴性、随访复查新发病灶的患者中：累及幕上 4 例，其中累及皮层 3 例、白质 1 例、基底节 3 例；累及幕下 2 例；累及脊髓 1 例；双侧受累 4 例。4 例自身免疫性脑炎与 CNS 特发性炎性脱髓鞘病重叠中 2 例在首次 MRI 出现小脑、脑干病灶，2 例在随访中均进展，并出现脑干、脊髓病灶。7 例均行免疫治疗；其中有随访 MRI 的 6 例中，3 例缓解无复发，3 例出现进展或复发-缓解。
结论：多重抗体阳性的免疫相关性脑病的临床及影像表现可变异与叠加，需结合具体情况分析。神经元表面抗体与胶质细胞表面介导抗体重叠、MRI 提示脑干、小脑、脊髓受累时，需考虑自身免疫性脑炎与 CNS 特发性炎性脱髓鞘病重叠综合征。

PO-012
脑结核治疗前后演变规律的 DCE-MRI 量化分析

丁爽,贾文霄
新疆医科大学第一附属医院

目的 探讨 DCE-MRI 量化指标在动态评价脑结核治疗前后病灶的演变规律中的应用价值。材料与方法 收集脑实质结核病患者 39 例，按照颅内结核诊疗常规对本组病例进行抗结核治疗，并予抗结核治疗前、治疗后 1 个月内、治疗后 6 个月内行 DCE-MRI 检查，选取 39 例脑结核患者中直径≥10.0mm，且在随访期间未消失的病灶进行 K^{trans} 等定量参数值的测量，并动态观察各定量参数值的变化情况；同时影像学检查前后三天内收集患者脑脊液行细胞因子 IFN-γ 含量、VEGF、MMP-9 水平测定，上述 DCE-MRI 定量指标与相关酶联免疫检查结果行相关性分析。结果 29 例患者临床表现及影像学检查趋向好转，可测量病 83 个，10 例患者临床实验室或影像学提示病情恶化，可测量病灶 56 个。 病情好转组中 K^{trans}、K_{ep}、Ve 值在治疗后≤1 个月逐渐下降，而病情恶化组中结核病灶的 K^{trans}、K_{ep} 值较治疗前有所增高，具有统计学差异；K^{trans}、K_e 值与脑脊液内细胞因子 IFN-γ 含量、VEGF、MMP-9 水平均具有相关性，Ve 值与细胞因子 IFN-γ 含量具有相关性。结论 DCE-MRI 功能成像技术中的定量指标 K^{trans}、K_{ep}、Ve 有利于反映脑结核的活动性及监测抗结核药物的效果。K^{trans} 的减低表明脑结核病灶造成血脑屏障的渗透性逐渐降低，水肿范围缩小，提示炎性反应逐渐减轻，对抗结核药物的反应逐渐增加；而在病情恶化组中，由于血脑屏障持续破坏，细胞因子表达上调可能会导致 K^{trans} 等定量参数的增加。

PO-013
DTI 对非压迫性腰椎间盘突出症所致神经根炎诊断价值

黄成燕,温志波
南方医科大学珠江医院

目的 探讨 DTI 对非压迫性腰椎间盘突出症所致神经根炎的诊断价值及感兴趣区域选择对病变神经根诊断的影响。 **方法** 前瞻性收集 2017 年 12 月至 2019 年 7 月南方医科大学珠江医院微创治疗后神经根病理转归的单侧非压迫性腰椎间盘突出症所致 L5 神经根炎患者 38 例（试验组）及健康志愿者 30 例（对照组）纳入研究。患者及健康志愿者均行常规 MRI、DTI 及 FFE 检查。采用 2 种方法选取 ROI，分别为全神经根法 **（图 1A）**和神经根中心法固定面积 6mm^2 **（图 1B）**。2 名放射科医师分别测量神经根 ADC 值、FA 值取 2 名医师测量结果的平均值作为最终结果。采用配对样本 *t* 检验评价两侧神经根测量值是否存在统计学差异，采用折线图比较患者（试验组）患侧神经根与健侧神经根椎间孔内、椎间孔处、椎间孔外测量值变化趋势。采用 ROC 曲线分析两种 ROI 方法对病变神经根检出效能的影响，采用组内相关系数（*ICC*）评价 2 名医师测量结果的一致性，Bland-Altman 法评价 2 名医师测量结果的可重复性。**结果** 患者（试验组）患侧与健侧神经根测量值存在统计学差（P=0.001）**（图 2）**，健康志愿者（对照组）两侧神经根无统计学差异（P=0.277），2 种 ROI 方法测得患者（试验组）患侧神经根椎间孔内、椎间孔处、椎间孔外 ADC 值、FA 值变化趋势较健侧更明显**（图 3）**。2 种 ROI 方法下，全神经根法的曲线下面积较大，灵敏度、特异度更佳（AUG 为 0.858，灵敏度为 80.5%，特异度为 83.3%）**（图 4）**。2 名医师采用 2 种 ROI 方法测得的 ADC 值、FA 值一致性均较好，其中全神经根法测得结果的一致性佳，*ICC* 值为 0.975。2 名医师采用全神经根法测得差值的 95%可信区间分别为-0.027~0.034，提示全神经根法的可重复性好**（图 5）**。**结论** DTI 对非压迫性腰椎间盘突出症所致神经根炎具有重要早期诊断价值，且 ROI 选择方法影响 DTI 对病变神经根的诊断。

PO-014

Non-invasive prediction of MGMT promoter methylation states by development and validation of an MRI radiomics signature in lower-grade gliomas

Guoqiang Yang,Hui Zhang
First Hospital of Shanxi Medical University

Purpose: Oxygen 6-methylguanine-DNA methyltransferase (MGMT) promoter methylation is a significant prognostic biomarker in lower-grade gliomas (LGGs), especially for temozolomide (TMZ) chemotherapy. This study was to non-invasively predict MGMT methylation status based on magnetic resonance imaging (MRI) radiomics.
Methods: This retrospective study included 206 patients histopathologically diagnosed with lower-grade gliomas from The Cancer Genome Atlas/The Cancer Imaging Archive (TCGA/TCIA) dataset (n=122) and our institution (n=84). Radiomic features (n=988) were extracted from the tumor area on both post-contrast T1-weighted (CE-T1) and T2-weighted fluid attenuation inversion recovery (T2FLAIR) MR images. The least absolute shrinkage and selection operator (LASSO) method was used to select effective features. The clinical model consisted of pertinent clinical factors, and was built using a logistic regression algorithm. A combined model, incorporating both the radiomics signature and related clinical factors, was also constructed. The receiver operating characteristics curve was used to evaluate the predictive performance.
Results: The radiomics signature was constructed as an independent predictor for differentiating MGMT promoter methylation states, which demonstrated superior performance on both the training and validation cohorts with areas under curve (AUCs) of 0.862 and 0.846, respectively. These results outperformed the clinical model (AUCs of 0.725 and 0.732 on training and validation cohorts). The AUCs of the combined model were 0.906 and 0.896 on training and validation cohorts, respectively.
Conclusion: Our study highlighted that an MRI radiomics signature can effectively identify the MGMT promoter methylation states in histopathologically diagnosed LGGs, thereby offering the potential for individualized diagnosis and treatment decision-making of LGGS.

PO-015

胶质母细胞瘤 IDH1 突变与血脑屏障破坏程度相关性的功能 MRI 评估

贾中正,耿其楠
南通大学附属医院

目的：对胶质母细胞瘤患者进行 DCE-MRI、DWI，计算肿瘤的 K^{trans} 值、Ve 值、CBV 值、CBF 值、ADC 值，分析 IDH1 突变型与 IDH1 野生型胶质母细胞瘤的各参数差异，探讨功能 MRI 评估胶质母细胞瘤 IDH1 突变与血脑屏障破坏程度的相关性。**方法：**应用 3.0T-MR 扫描仪对 55 例胶质母细胞瘤患者（均为手术后病理证实，其中男 34 例，女 21 例；年龄 24－70 岁，平均 51.3 岁）进行常规 MRI、

DWI、DCE-MRI 检查。测量每例胶质母细胞瘤的 K^{trans}、Ve、CBV、CBF、ADC 值，应用免疫组化测定胶质母细胞瘤的 IDH1 基因类型。应用 Mann－Whitney U 检验分析 IDH1 突变型与 IDH1 野生型胶质母细胞瘤的 K^{trans}值、Ve值、CBV 值、CBF 值、ADC 值的差异。应用 ROC 曲线分析各个参数值在鉴别 IDH1 突变型与 IDH1 野生型胶质母细胞瘤的最佳切峰值及敏感性与特异性。P<0.05 具有统计学意义。**结果：**1. IDH1 突变型的 K^{trans}值、Ve 值、CBV 值、CBF 值小于 IDH1 野生型胶质母细胞瘤，差异均具有统计学意义（P<0.05）；IDH1 突变型的 ADC 值大于 IDH1 野生型胶质瘤，差异具有统计学意义（P<0.05）。4.ROC 曲线显示 K^{trans}值的切峰值鉴别 IDH1 突变型与 IDH1 野生型胶质母细胞瘤具有较高的敏感性与特异性（P<0.05）。**结论：**DCE-MRI 与 DWI 有助于鉴别 IDH1 突变型与 IDH1 野生型胶质母细胞瘤，可以无创地评估胶质母细胞瘤的 IDH1 突变与血脑屏障破坏程度的相关性，对胶质母细胞瘤患者的诊疗与预后评估具有重要的参考价值。

PO-016

Noninvasively evaluating the grading and IDH mutation status of gliomas by multimodal magnetic resonance imaging

Lei Zhang,Dong Zhang
Department of Radiology， Xinqiao Hospital， The Third Military Medical University

Objective: To investigate the performance of multimodal magnetic resonance imaging (MRI) for glioma grading and noninvasive assessment of IDH mutational status.
Materials and methods: Seventy consecutive patients with histopathologically confirmed glioma were retrospectively evaluated by dynamic susceptibility-weighted contrast enhanced (DSC), diffusion kurtosis imaging (DKI), intravoxel incoherent motion diffusion-weighted imaging (IVIM DWI), and conventional MR imaging. One-way analysis of variance and Independent sample t test were used to compare the MR parameter values of between low and high grade as well as between mutant and wild-type IDH1 gliomas. Receiver operating characteristic analysis, Spearman’s correlation analysis, and Binary logistic regression analysis were used to assess their diagnostic performances.
Results: The best diagnostic performance was achieved with normalized relative cerebral blood flow (rCBV) (threshold, AUC, sensitivity, and specificity: 2.240 ml/100g, 0.844, 87.8%, 75.9% ; 3.738ml/100g, 0.734, 62.2%, 90.9%), mean kurtosis (MK) (threshold, AUC, sensitivity, and specificity: 0.471, 0.873, 92.7%, 79.3% ; 0.518, 0.794, 81.1%, 75.8%), and water molecular diffusion heterogeneity index (α ; threshold, AUC, sensitivity, and specificity: 1.064, 0.847, 79.3%, 78.0% ; 0.998, 0.771, 93.9%, 51.4%) for glioma grading and assessment of IDH mutational status. There were positive correlations between rCBV, MK, and tumor grade, and negative correlations between α and tumor grade (P<0.01), There were negative correlations between rCBV, MK, and IDH mutational status, and positive correlations between α and IDH mutational status (P<0.01). IVIM DWI had the best diagnostic accuracy; the combination of DKI and IVIM yielded a diagnostic accuracy of 91.4%; and the combination of DSC, DKI, and IVIM DWI was more accurate at predicting tumor grade and assessment of IDH mutational status.
Conclusion: The most accurate parameters were mean rCBV, MK, and α in DSC, DKI, and IVIM DWI for glioma grading and assessment of IDH mutational status. Multimodal MRI

can increase the diagnostic accuracy of differentiating low- and high- grade gliomas and assessment of IDH mutational status.

PO-017

Application Value of Radiomics Approach in Predicting Chromosomal Arms 1p/19q in Low-Grade Gliomas

Wei Wei,Lihua Fan,Nan Yu,Zhaoguo Zhang,Yong Yu
Affiliated Hospital of Shaanxi University of Chinese Medicine

Objective: To evluate the value of radiomics in predicting the 1p/19q status of Low-Grade Gliomas (LGG) based on T2-weighted MR images.
Methods: All study patients (n=159) from the Cancer Genome Atla (TCGA) data portal who had pre-operative MRI images and biopsy proven 1p/19q status consisting either no deletion (n=85) or co-deletion (n=74) were included. Patients were divided into training (n=111) and validation cohorts (n=48) in a ratio of 7:3. T2-weighted images were imported into the ITK-SNAP to manually delineate volume of interest (VOI) of the entire-tumor. Each VOI produced 396 radiomics features including Histogram, GLCM, GLSZM, RLM, Form Factor and Haralick. LASSO regression was used for feature screening. A formula was generated using a linear combination of selected features that were weighted by their respective LASSO coefficients. A radiomics score was calculated for each patient by the formula to reflect the 1p/19q status. The predictive accuracy of radiomics was quantified by the area under curve (AUC) of a ROC curve in both cohorts. The calibration degree (CD) of the radiomics was evaluated by Hosmer-Lemeshow test. The clinical usefulness of the radiomics signatures was assessed by decision curve analysis (DCA).
Result: Seven radiomics features with non-zero coefficients were chosen to build a radiomics label that that significantly correlated with the 1p/19q status with an AUC, sensitivity, specificity and CD of 0.754, 79%, 74% and 0.647 in the training cohort; and 0.757, 80%, 71% and 0.731 in the validation cohort. DCA for the radiomics label showed that if the threshold probability was between 0.14 and 0.90, using the radiomics label to predict 1p/19q status added more benefit than treating either all or no patients.
Conclusion: The radiomics label can be used as a noninvasive method to predict the 1p/19q status of LGG for clinical decision optimal therapy options.

PO-018

Comparing the values of MRI ultra-high-b-value DWI and standard DWI in grading cerebral astrocytomas and their association with aquaporin-4

Yan Tan,Hui Zhang,Xiaochun Wang,Le Wang
The first hospital of Shanxi medical university

Objective: To compare the value of MRI ultra-high-b-value DWI (UHBV-DWI) and conventional DWI in grading cerebral astrocytomas, and to analyze the correlation of

respective parameters with aquaporin (AQP).**Methods:** Forty patients with cerebral astrocytoma, including low-grade (LGA, N=15) and high-grade astrocytomas (HGA, N=25) were studied. UHBV-DWI (ultra-high-b-value apparent diffusion coefficient) parameter, conventional DWI (apparent diffusion coefficient) parameter values in the solid parts of the tumors and peritumoral edema, were compared. ADC maps were calculated from standard b-values (1000s/mm^2), while UHBV-DWI was quantified by fitting the signals at ultra-high b-values (1800-4000s/mm^2) to the mono-exponential equation. Real time PCR was used to analysis for AQP1, AQP4 and AQP9 mRNA. Receiver operating characteristic (ROC) curves were used to identify the better parameter. Spearman correlation analysis was performed to assess the correlation of AQP mRNA level with each parameter value.**Results:** ADC value was significantly lower in the solid parts of HGA, as compared to those of LGA. UHBV-ADC value was significantly higher in the solid parts of HGA than those of LGA ($P<0.01$). UHBV-ADC (0.833) had the larger area under the curve (AUC) than ADC (0.713). The level of AQP4 mRNA in the solid parts of the tumors was significantly higher in HGAs than LGAs ($P<0.01$); there was less AQP9 mRNA and had no statistical significance between two groups ($P>0.05$); there was no AQP1 mRNA in two groups. ADC negatively correlated with the level of AQP4 mRNA ($r=-0.357$; $P=0.024$). UHBV-ADC positively correlated with the level of AQP4 mRNA ($r=0.646$; $P<0.01$).**Conclusion:** Use of UHBV-DWI improved grading of cerebral astrocytomas when compared with DWI. UHBV-DWI parameters appeared to reflect the level of AQP4 mRNA in astrocytomas.

PO-019

A Promising sequence applied in diagnosis of pituitary microadenoma

Yueshuang Leng,Ping Hu,Weihua Liao
Xiangya Hospital

Objective: *ZOOMit is a brand-new sequence in MagnetomPrisma 3.0T which can achieve small range scanning to get more detailed and higher resolution images. The advantages of this technology include less distortion and blurred effects, less motion and flow artifacts, increased spatial resolution, and shortened scanning time. This research was presented to evaluate the value of ZOOMit T2 MRI in the diagnosis of pituitary microadenomas patients.*

Materials and methods: *T2 weighted, T1 enhanced and ZOOMit T2 scan of pituitary gland were performed on 21 patients with evidence of microadenomas. The evaluation of Images was interpreted in a randomized, blinded method. Notation was made of signal intensity and lesion boundary.*

Results: *For the 12 T2 hyperintensity lesions*, Zoomit T2 sequence showed better ability. 10 of 12 patients lesions(83.3%) appeared clear boundary while only 8 of 12 lesions(66.7%) was clear under standard T2 scanning. The lesions identified only on Zoomit T2 sequence in 1 patient. The Zoomit T2 demonstrates better in the smaller lesion group (<5mm) than larger lesion(>5mm) group, clear lesion boundary is observed in 5 of 11 patients (45.4%) by T2 sequence, and here this number in Zoomit T2 is 8(72.7%).

Conclusion: The ZOOMit T2 sequence was judged to be better than the standard T2 sequence for depicting T2 hyperintensity pituitary microadenomas. ZOOMit T2 MRI method is more sensitive and promising to improve the rate of lesion detection of pituitary microadenomas.

PO-020

能谱 CT 鉴别鼻腔鼻窦良恶性肿物的研究

袁欣,杨亚英,危春容,冯瑶杰,张梦梅
昆明医科大学第一附属医院

【摘要】目的：探讨双源 CT 最佳单能量 CT 值及能谱曲线斜率对鼻腔鼻窦良恶性肿物的鉴别诊断价值。
方法：收集 60 例经病理证实且直径≥1cm 的鼻腔鼻窦肿物，术前均行常规 CT 平扫及双能量 CT 双期增强扫描。根据病变的常规形态学表现判断良恶性。测量病灶实性部分的最佳 CNR 单能量 CT 值（CTose）及能谱曲线斜率（K），另测量双期融合图像病灶实性部分的 CT 值。根据病理结果分为良性组（34 例）和恶性组（26 例），评价常规形态学分析的诊断效能。比较良性组与恶性组病灶 CTose 值、K 值、CT 值，并绘制各参数的 ROC 曲线，比较曲线下面积（AUC），评估其诊断效能。结果：常规形态学诊断的敏感度、特异度及准确度分别为 61.5%、88.2%、76.7%。动脉期：良性组的 CTose 值、K 值、CT 值分别为 61.91±25.62、0.92±0.69、56.56±16.67，恶性组分别为 80.16±16.07、1.97±1.18、67.85±11.41；静脉期：良性组的各参数分别为 68.25±26.60、1.26±0.78、62.57±19.98，恶性组分别为 95.31±16.72、2.50±0.95、79.08±12.61；双期恶性组 3 参数均高于良性组（P 均＜0.05）。动脉期病灶 CTose 值、K 值、CT 值的 AUC 分别为 0.813、0.883、0.736，静脉期分别为 0.841、0.885、0.777；其中静脉期病灶 K 值的 AUC 最大（0.885），以 K=1.77 为诊断阈值，其诊断敏感度、特异度及准确度分别为 88.5%、88.2%、88.3%。 结论：双源 CT 的最佳单能量 CT 值及能谱曲线斜率可更准确的反映病变血供情况及组织差异，有助于鼻腔鼻窦良恶性肿物的鉴别诊断。

PO-021

The feasibility of Integrated PET/MR and Comparison between PET/MR and PET/CT in Assessment of Hypopharyngeal Cancer

Caiyun Huang,Junfang Xian
Beijing Tongren Hospital Capital Medical University

Purpose: Our objectives were to assess the feasibility of integrated 18F-FDG PET/MR compared with 18F-FDG PET/CT regarding to image quality, lesion manifestation, and FDG quantification in patients with hypopharyngeal cancer.
Materials and methods:18F-FDG PET/CT and integrated 18F-FDG PET/MR examinations were performed in the same day in 20 patients with hypopharyngeal cancer after a single-injection dual-imaging protocol. Fused 18F-FDG PET/CT and fused 18F-FDG PET/MR images were analyzed by two independent readers in separate sessions in random order. The score of PET/CT and PET/MR was compared by Mann-Whitney U test. The image

manifestation of primary hypopharyngeal lesions and metastatic cervical lymph nodes was qualitatively compared between PET/CT and PET/MR by McNemar test. Kappa test was adopted for the consistency test. SUVmax (standard uptake value) of the lesion was obtained in the PET images derived from PET/CT and PET/MR respectively. SUVs from the two modalities were analyzed by Spearman correlation analysis.

Results: *All PET/MR images had good or excellent quality and deemed to be clinically acceptable. Two radiologists had a good consistency in terms of the scores of PET/CT and PET/MR (Kappa=0.792 for PET/CT, and 0.765 for PET/MR). PET/MR could identify more structures in the invasion extent than PET/CT, but our study found no significant difference between them (P=0.442, 0.442). There was moderate agreement in the diagnosis of invasion extent in two radiologists (Kappa =0.694 for PET/CT, and 0.696 for PET/MR). PET/MR showed more cervical metastatic lymph nodes than PET/CT, but there was no statistically significant difference between them (P=0.754, 0.508). There was perfect agreement in the diagnosis of metastatic lymph nodes in two radiologists (Kappa=0.911 for PET/CT, and 0.978 for PET/MR). SUVmax quantification exhibited an excellent correlation on both modalities with a Spearman correlation coefficient of 0.725 (P < 0.000).*

Conclusions: *Our study illustrates the feasibility of PET/MR in patients with hypopharyngeal cancer. PET/MR provides comparable results in image quality and lesion manifestation in comparison to PET/CT. A strong correlation was observed for SUVmax between two modalities.*

PO-022
联合应用 DWI、PWI 在评价 III 期鼻咽癌立体定向放疗疗效中的应用价值

聂婷婷
湖北省肿瘤医院

目的 探讨磁共振弥散加权成像(DWI)、灌注成像(PWI)联合应用在评价 III 期鼻咽癌立体定向放疗疗效中的应用价值。

方法 回顾性分析我院 2018 年收治的 89 例首诊 III 期鼻咽癌患者，入院后先行常规 MR、MR-DWI 及 MR-PWI 检查，然后行 4 周期立体定向放疗，放疗周期完成后再行一次常规 MR、MR-DWI 及 MR-PWI 检查，对比分析放疗前、后鼻咽部肿块在不同 MR 成像方法中的不同表现。所有数据均采用 SPSS 1 8.0 软件包处理，重点对放疗前、后肿块在增强 TWI、DWI 中的 ADC 图及灌注 BV 伪彩图像上最大层面面积变化进行分析，计量资料对 比采取卡方检验，P < 0.05 认为差异有统计学意义。

结果 放疗前鼻咽肿块在 DWI 弥散受限(ADC 值较高)，PWI 血流灌注较丰富(血容量 BV 较高)，图像上显示的弥散受限区域及高灌注区域最大层面面积，均小于放疗前压脂 T1WI 增强序列肿块强化面积(P < 0.05) ，且弥散受限区域面积稍大于高灌注区域(P > 0.05)。放疗后，敏感组鼻咽肿块弥散受限区域、高灌注区域面积均明显下降，与压脂 T1WI 增强序列相比，下降更明显(P <0.05) 。同时，肿瘤放疗后复发病灶表现为弥散受限、血容量 BV 值升高，而坏死或纤维化病灶表现为弥散不受限、血容量 BV 下降(P < 0.05)。

结论 在反映鼻咽癌患者立体定向放疗前后肿瘤形态及生物学变化方面，常规 MR 结合 DWI 及 PW I 更敏感；在评价 III 期鼻咽癌放疗疗效、鉴别肿瘤放疗后进展、坏死或纤维化中，ADC 值、BV 值具有较重要的参考价值。

A comparison of readout-segmented echo-planar (RESOLVE) DWI with delayed gadolinium-enhanced T1-weighted MRI in detecting cholesteatoma

Yaru Sheng[1], Yan Sha[1], Zhongshuai Zhang[2], Rujian Hong[1], Naier Lin[1], Meng Qi[1], Yang Li[1]
1. Eye & ENT Hospital of Fudan University
2. Scientific Marketing, Siemens Healthcare

Purpose
The purpose of this study was to retrospectively compare the value of readout-segmented echo-planar (RESOLVE) diffusion-weighted imaging (DWI) with delayed gadolinium-enhanced T1-weighted magnetic resonance (MR) imaging in detecting cholesteatoma. The apparent diffusion coefficient (ADC) values for cholesteatoma and non-cholesteatoma were also measured.
Methods
In total, 531 patients suspected to have middle ear cholesteatoma were enrolled, 59 of whom had previous surgery for cholesteatoma and were suspected to have recurrent cholesteatoma.
The overall sensitivity, specificity, negative predictive value (NPV), and positive predictive value (PPV) were assessed. Moreover, the ADCs of cholesteatoma and non-cholesteatoma were measured. Furthermore, a possible ADC cut-off value was also discussed. Receiver operating characteristic (ROC) curve analysis was utilized to examine the accuracy of the ADC values.
Results
The sensitivity, specificity, NPV, and PPV of RESOLVE DWI were higher than those of delayed gadolinium-enhanced T1-weighted MRI. The ADC of cholesteatoma (852.67×10^{-6} mm^2/s) from RESOLVE DWI is significantly lower than that of non-cholesteatoma (1529.78×10^{-6} mm^2/s). The area under the ROC curve of the mean ADC is 0.98, and the optimal cut-off point is 1195×10^{-6} mm^2/s.
Conclusions
The ADC value can be used as a diagnostic tool for differentiating middle ear cholesteatoma from non-cholesteatoma. The sensitivity and specificity of the RESOLVE DWI sequence for diagnosing cholesteatoma are significantly higher than that of enhanced T1-weighted MRI. RESOLVE DWI can be an excellent tool for detecting primary cholesteatoma, is better than delayed enhanced T1-weighted imaging alone and can be used as an alternative to second-look surgery to detect residual cholesteatoma.

PO-024

CT value of papillary thyroid carcinoma combined with morphological characteristics to predict central lymph node metastasis

Rui Min, Dan Han, Wen Zhao, Junli Li, Xu Liu, Yaqian Cai

The first affiliated hospital of kunming medical university

Purpose: explore the value of using the CT value of papillary thyroid carcinoma combined with morphology to predict central group lymph node metastasis , measuring and analyzing the plain scan and enhanced CT value of single papillary thyroid carcinoma (PTC) lesions and the morphology of lesion.
Methods :340 cases of patients with single PTC and central lymph node dissection ,and the CT values of the PTC lesions in the plain, arterial and venous phases of the enhanced cervical CT scan were measured, calculate the net CT values and standardized CT values in the arterial and venous phases of the lesions.The difference of data between the group with central lymph node metastasis and the group without metastasis was compared, the ROC curve was drawn, the AUC was calculated, and the critical value of optimal sensitivity and specificity was selected.χ^2 test was used to compare the imaging morphology of PTC lesions in the central lymph node metastasis group and the non-metastasis group.
Results :postoperative pathology confirmed the central group of lymph node metastasis patients 178 cases, 162 cases of patients with central group of lymph node metastasis and venous phase of the tumors CT value, net CT value and standardized CT value differences between the central lymph node metastasis group and metastasis group were statistically significant, the critical value were107.5 HU , 53 HU, 0.761, sensitivity and specificity were 71.4%, 81.8%;76.2%, 59.1%;71.4%, 72.7%;There were statistically significant differences in the distribution of lesion diameter and capsular contact range between the two groups, and specificity of diameter >2cm and the capsular contact range ≥1/2 to predict central lymph node metastasis were highest(86.4%, 81.5%) .The sensitivity, specificity and accuracy of CT value parameters in venous phase of PTC lesion combined with image morphology to predict CLNM were 75.3%, 78.4% and 76.8%.
Conclusion:enhanced CT scan of PTC lesion in venous phase has certain value in the prediction of central lymph node metastasis.

PO-025

CT 三维重建在垂体瘤手术治疗中的应用

徐玉芝
中南大学湘雅三医院

目的：构建垂体瘤可视化 3D 打印模型，术前精准、全面地了解肿瘤生长方式及其与周围组织的关系，为垂体瘤的精确诊断及手术方式的选择提供临床依据。

方法:对垂体瘤患者进行全脑计算机断层扫描（CT），利用相关软件对采集的图像进行三维重建。将 3D 图形经打印系统生成三维甚至四维可视化模型。根据可 3D 视化模型选择手术方式，之后并随访患者术后并发症发生率、治愈率及复发率。

结果：CT 三维重建的垂体瘤 3D 模型可很好的展示肿瘤生长方式及其与周围组织的关系，手术过程安全，成功率高

结论：CT 三维重建技术能明显优化垂体瘤患者疗效，降低术后并发症发生率及复发风险。

PO-026
多参数 MRI 纹理分析结合机器学习预测口腔和口咽鳞状细胞癌组织学分级

任继亮,袁瑛,陶晓峰
上海交通大学医学院附属第九人民医院

目的 探讨常规 MRI（T2WI、增强 T1WI）及 ADC 图纹理分析结合机器学习在术前预测口腔和口咽鳞状细胞癌（OOSCC）病理分级中的价值。
方法 回顾性分析 2011 年 1 月至 2015 年 4 月本院具有明确术后病理分级资料且于 1.5T MRI 行术前检查的 25 例低级别（I 级）及 78 例高级别（II、III 级）OOSCC 患者。使用 3D 全瘤分割，从各序列中分别提取 504 个纹理参数，包括直方图、灰度共生矩阵及灰度游程矩阵特征。使用观察者间测量可重复性评估及共线性分析降低特征维度。基于原始样本及通过数据生成的合成抽样方法（SMOTE）获取的平衡样本，分别使用支持向量机结合递归特征消除（SVM-RFE）对单独及联合的三个序列特征进行机器学习。通过十折交叉验证评估不同分类器的预测效能。
结果 T2WI、增强 T1WI 及 ADC 图上分别 456 个（90%）、441 个（88%）、288 个（57%）测量可重复性极好（ICC>0.8）的特征用于机器学习。三个序列联合较各单独序列选择的最佳特征集预测 OOSCC 病理分级表现更佳，其包含 9 个特征参数（3 个 T2WI、3 个增强 T1WI 及 3 个 ADC 参数）。在原始样本中，联合模型的 AUC 值为 0.78，精确度为 0.73，灵敏度为 0.72，特异度为 0.76。在 SMOTE 获取的平衡样本中，联合模型的 AUC 值为 0.83，精确度为 0.82，灵敏度为 0.74，特异度为 0.90。
结论 多参数 MRI 纹理分析结合机器学习可较为精确的术前评估 OOSCC 病理分级。

PO-027
高场磁共振中上睑退缩的 Graves 眼病患者眼外肌与强的松治疗效果相关性研究

陈钰[1],段淼[1,2],徐冬冬[1],张竹花[1],金征宇[1]
1.中国医学科学院北京协和医院
2.北京中医医院顺义医院

目的 研究在高场（3.0T）磁共振（MRI）中上睑退缩的 Graves 眼病（GO）患者强治疗前后各眼外肌的变化，探讨其与疗效的相关性。**方法** 以上睑退缩为症状就诊的 Graves 眼病患者 41 例，在 3.0T 眼眶增强 MRI 检查结束后进行眶内强的松注射治疗，定期随访，并复查 MRI，根据上睑退缩的恢复程度将治疗效果分为 2 组：有效组、无效组。治疗前后分别在冠状位平扫 T1WI-fs、T2WI-fs 及 T1WI-fs+C 序列的图像上分别测量上睑提肌、内直肌及外直肌信号最亮处的厚度（T）及信号强度（SI），并测量同侧颞肌的信号强度，然后计算三条眼外肌的的信号强度比值 SIR（眼外肌信号强度/同侧颞肌信号强度），对两组眼外肌厚度及 SIR 进行统计学分析。**结果** 在配对 t 检验分析中，有效组中各序列中治疗前后的上睑提肌厚度差异具有统计学意义（P=0.000，P=0.000，P=0.000），有效组中 T2WI-fs 及 T1WI-fs+C 序列中治疗前后上睑提肌 SIR 差异具有统计学意义（P=0.000，P=0.000），；无效组中各序列中治疗前后上睑提肌厚度差异具有统计学意义（P=0.048，P=0.049，P=0.001），无效组中 T2WI 序列中治疗前后上睑提肌 SIR 差异具有统计学意

义（P=0.049）。**结论** 在以上睑退缩为主要症状的 GO 患者中，上睑提肌是主要有变化的肌肉；高场磁共振眼眶增强中上睑提肌的信号强度变化能更准确地反映 GO 患者强的松治疗效果。

PO-028

Establishment and Evaluation of Chronic Obstructive Pulmonary Disease Rat Models

Di Zhang,Yu Guan,Yi Xia,Xiuxiu Zhou,Wenting Tu,Li Fan,Shiyuan Liu
Changzheng Hospital， Second Military Medical University， China

Objective To evaluate and compare the COPD rat models, established by smoking, protease instillation and the combination of them, in terms of inflammation, imaging and pathology.
Methods Rat models of COPD were established with smoking, protease instillation and the combination of the two methods. There were 60 rats in the smoked group, 30 rats in the protease group, 30 rats in the protease combined smoke group and 20 rats in the control group. Rats' body weight was measured every week. At particular time points, 5 rats in the smoked group, the protease group and the protease combined smoke group and 2 rats in the control group were executed and then subjected to cytokines detection, micro-CT scanning and pathological examination, respectively.
Results The weight gain of rats in the smoked group and the protease combined smoke group was slower than that in the control group since the 7th week ($P<0.05$). The levels of IL-10 within 4 weeks of modeling were lower in the protease group and the protease combined smoke group than the control group ($P<0.05$). The concentration of MMP-9 at the 24th hour was higher in the protease group and the protease combined smoke group than the control group ($P<0.05$). Emphysema was observed for the first time on the micro-CT and pathological images at the 4th week in experiment groups.
Conclusion The rat models of COPD can be successfully established by smoking, protease instillation and the combination of them. Micro-CT can reflect the changes of lung with high sensitivity and validity.

PO-029

18F-FDG PET/CT 非典型结节病与恶性肿瘤及结核的鉴别

王欣,梁邦玉
哈尔滨医科大学附属肿瘤医院（黑龙江省肿瘤医院）

结节病是原因不明的肉芽肿性疾病；结节病的诊断通常需要满足三个条件：临床和放射学表现，非干酪性肉芽肿和没有替代疾病的证据。影像表现和临床表现共同构成结节病的临床表型，为诊断提供线索和依据；但结节病的影像表现是多种多样的，影像表现不典型者可与肺癌、转移瘤、淋巴瘤、结核相互混淆而误诊。我们选取 10 例易误诊病例进行回顾分析，从中探讨结节病与肺癌、转移瘤、结核的鉴别诊断要点，旨在提升对结节病的非典型 FDG PET/CT 表现的认识。

病例资料：不典型结节病 3 例（II 期 2 例，III 期 1 例）；临床隐匿性肺腺癌 2 例；胃低分化腺癌术后 4 年，肺及纵隔淋巴结多发转移瘤 1 例；宫颈低分化鳞癌术后 3 年，胸部淋巴结、腹膜后淋巴结转移瘤 1 例；淋巴结结核伴血行播散肺结核 1 例；单纯胸部淋巴结结核 1 例；左肺下叶肺结核伴胸部淋巴结结核 1 例。

讨论：双肺门、纵隔多组淋巴结对称性肿大，是结节病的经典表现，但结节病也可表现为不对称的淋巴结肿大、胸外淋巴结及器官的累及。淋巴结结核、淋巴瘤、来源于肺或胸外恶性肿瘤的转移瘤也可表现为双肺门、纵隔多组淋巴结肿大伴代谢增高。恶性肿瘤、淋巴结结核的 FDG 摄取强度、淋巴结的大小、形态、密度、分布，都与不典型结节病类似。不对称的淋巴结肿大，恶性肿瘤病史，肿瘤标志物检测结果阳性，都是非结节病的重要提示；活检是排除恶性肿瘤的最有效手段。

结节病肺部累及的经典表现为局限/弥漫分布的间质/淋巴管周围小结节，在 HRCT 影像上表现为支气管血管束增粗、串珠征、袖口征、胸膜下片状细密小结节；但不典型的弥漫性表现与癌性淋巴管炎不可区分，散发的结节或团块与肺转移瘤、肺结核、肺癌不可区分，相关鉴别诊断必不可缺。

结论：结节病的诊断思路，既要有正向归纳证明，又要有反向排除，二者不可偏废。在影像表现符合结节病之后，仍需组织学检查和恰当的实验室检查，以排除其他类似表现的良恶性疾病。

PO-030
双源 CT 在肺栓塞与下肢深静脉血栓形成联合成像中的应用价值

王利伟
南京医科大学附属南京医院，南京市第一医院

目的 探讨第二代双源 CT 一次性造影在肺栓塞（PE）与髂股深静脉血栓形成（DVT）联合成像中的应用价值。**方法** 共 185 例临床疑诊 PE 的患者进行了双源 CT 肺动脉造影和深静脉造影联合成像检查。肺动脉扫描采用单能量大螺距采集模式，髂股静脉扫描采用双能量技术。**结果** 185 例中 28 例（15.14%）患者同时患有 PE 及 DVT，8 例（4.32%）患者仅有 PE 而没有 DVT，7 例（3.78%）患者仅有 DVT 而没有 PE。PE 的直接征象表现为肺动脉管腔内大小不等、形态多样的充盈缺损和管腔完全阻塞影像。DVT 表现为管腔中央类圆形、长条形不均匀低密度性充盈缺损。**结论** 双源 CT 一次性联合成像在肺栓塞与髂股深静脉血栓形成中具有较高价值，适用于伴有下肢静脉循环障碍的可疑肺栓塞患者。

PO-031
下腔静脉先天变异的 CT 表现

蒋悦,孙桂芳,刘斌,刘波,刘慧
昆明医科大学附属延安医院

目的 通过回顾下腔静脉的胚胎发育特征、分析其临床 CT 表现，提高对下腔静脉先天变异的认识。**材料与方法** 回顾性收集 2015 年 1 月---2019 年 6 月因各种原因于本院行下腔静脉 CT 检查的患者，收集下腔静脉变异的患者共 21 例，男 16 例，女 5 例，年龄 7 个月~ 75 岁，所有患者均行腹部 CT 平扫及增强扫描或者胸腹部联合 CT 平扫及增强检查，于门静脉期或延迟期观察下腔静脉的走形及连接，回顾性学习下腔静脉的胚胎发育特征，分析本组病例下腔静脉先天变异的类型以及是否合并其他脏器的畸形。**结果** 下腔静脉的先天变异是由卵黄静脉、后主静脉、下主及上主静脉的

异常永存、退化和连接导致的，典型多见的先天畸形包括下腔静脉缺如、重复畸形、左侧异位、下腔静脉延续为胸部静脉和下腔静脉后输尿管等，以上变异可单独或联合存在。本组 21 例患者中，下腔静脉肝段缺如 8 例，表现为下腔静脉肝段缺如，经左下腔或奇静脉、半奇静脉回流；双下腔静脉 3 例，表现为肾静脉水平以下层面腹主动脉两侧走形下腔静脉，肾静脉水平以上下腔静脉位于脊柱右侧；左位下腔静脉 11 例，表现为肾静脉水平以下下腔静脉走形于脊柱左侧；下腔静脉延续为胸部静脉 8 例，表现为左侧下腔静脉穿膈肌延续为奇静脉，与左无名静脉汇合入上腔静脉；其中部分病例为几种变异联合存在，本组未收集到下腔静脉后输尿管病例。下腔静脉发育异常合并其他系统异常，共 10 例（10/21），其中 6 例合并先天性心脏病，另 4 例分别合并迷走右锁骨下动脉及夹层、永存左上腔静脉、多脾综合征、脾静脉与肠系膜上静脉于胰腺前方汇合形成门静脉；其他 11 例下腔静脉异常患者是因其他原因行 CT 检查偶然发现下腔静脉变异。**结论** 识别下腔静脉变异对临床操作及治疗，如静脉滤器放置的选择、介入插管等具有重要意义；因此，对影像诊断医生而言下腔静脉的观察与评价应该成为日常诊断观察模式的基本组成部分。

PO-032

慢性 Leriche's 综合征侧枝动脉开放类型的 CT 分析

关键,彭洋,钟英奎
中山大学附属第一医院

目的：分析慢性主髂动脉阻塞（Leriche’s 综合征）的 CT 表现，总结该病侧枝动脉开放类型，提高对慢性 Leriche’s 综合征的认识。
方法：收集本院 2016 年 1 月-2018 年 9 月临床确诊为慢性 Leriche’s 综合征患者 36 例。36 例患者治疗前均行主动脉 CTA 检查。24 例行主动脉-股动脉人工血管旁路移植术和 6 例行介入治疗（球囊扩张和/或支架成形术）；6 例内科治疗。
结果：36 例主髂动脉 CTA 均表现为腹主动脉-髂总动脉分叉口闭塞，根据闭塞近心端（上端）位置分 3 型:①近肾动脉旁型 16 例，②肠系膜下动脉上型 8 例，③肠系膜下动脉下型 12 例。全部病例闭塞或次全闭塞远端（下端）达单侧或双侧髂内、外动脉水平。36 例慢性 Leriche’s 综合征侧枝动脉开放类型有 5 种：①A 型（Winslow’s 路径出现率 100%，36/36），开放侧枝为双侧腹壁上动脉，通过胸廓内动脉与腹壁下动脉吻合，连接于髂外动脉。②B 型（出现率 92%，33/36）：开放侧枝为双侧下肋间动脉、肋下动脉/腰动脉，通过旋髂深动脉连接髂外动脉或股动脉。③C 型(出现率 50%，18/36）：开放侧枝为肠系膜上动脉分支（中结肠动脉），通过 Riolan 弓连接肠系膜下动脉或其分支直肠上动脉。④D 型（出现率 36%，13/36）：开放侧枝为双侧或单侧肋下动脉，通过髂腰动脉连接髂内动脉，单侧 9 例。⑤E 型（出现率 53%，19/36）：开放侧枝为直肠上动脉，通过骶动脉丛/直肠下动脉连接髂内动脉。A 型和 B 型侧枝动脉的开放可提供下腹壁和下肢动脉的血供。C 型出现于栓塞水平位于肠系膜下动脉以上的患者，以代偿肠系膜下动脉供血区的血运。D 型和 E 型为少见类型。
结论 慢性 Leriche’s 综合征侧枝动脉开放有多种类型，侧枝动脉开放与主髂动脉闭塞范围相关；正确识别和描述侧枝动脉有助于为临床提供更全面的诊断信息。

PO-033

Patients-specific computational fluid dynamics simulation in valve-related ascending aortic disease: comparison with 4D-flow MRI

Lekang Yin[1,2],Jianding Ye[1],Hong Yu[1]
1.Shanghai Chest Hospital
2.Zhongshan Hospital, Fudan University

Purpose:
All arteries grow and remodel to establish mechanical homeostasis in response to changing hemodynamic conditions. As a common and highly prevalent disease process, aortic valve disease is the main cause that seriously affects the hemodynamics of blood flow in the aorta. The resulting hemodynamic changes plays important role in the progression of valve-related ascending aortic disease. A more rapid and user-friendly hemodynamic analysis of aortic is necessary.
Materials and Methods:
Total of 20 patients were included in this study: tricuspid aortic valve(TAV) patients without valvular disease (n=5) or with aortic valve stenosis (n=5), BAV patients (n=10). Flow stream pattern, wall shear stress (WSS) map were calculated during one cardiac cycle using four-dimensional flow magnetic resonance imaging (4D flow MRI) and a patients-specific simulate method using computational fluid dynamic analysis (CFD). Patient-specific geometries and boundary conditions derived from CTA and phase contrast MRI (PC MRI) respectively. PC-MRI planes were placed at the level of the aortic annulus and pulmonary bifurcation with velocity encoding in RL, FH and AP directions. And the results were compared with 4D-flow MRI which enables a comprehensive assessment of vascular hemodynamics.
Results:
The new method only requires three times of MR scanning each lasting 2 minutes. While the 4D flow MRI sequence scan time lasting about 10 minutes which could not be interrupted. Model-simulated flow patterns agree qualitatively with those derived from 4D-flow MRI data both in TAV or BAV group. The patients with BAV showed large scale helical flow structure forms in the ascending aorta and moves through the arch. The distribution of areas with increased WSS is consistent with the result of 4D-flow MRI.
Conclusion:
The new hemodynamic analysis method used here can reproduce the flow characteristics in patients with valve-related ascending aortic disease as measured using 4D-flow MRI. What counts is that the new method can significantly shortens the time of a patient receives imaging examination and is suitable for those whose who impatient the long-time of MR scanning.

PO-034
磁共振心肌组织追踪技术评估二尖瓣反流相关的左室心肌应变率研究

文萌萌
郑州大学第一附属医院

【摘要】 目的 通过组织追踪技术评估二尖瓣反流和健康人间左心室的应变率变化。**方法** 回顾性分析我院进行过心肌磁共振（Cardiac magnetic resonance，CMR）电影成像检查并经超声证实的二尖瓣反流的患者 22 例（以轻度反流为主）以及健康对照组 38 例，分别在 cvi42 软件上对短轴位、长轴位四腔心切面及长轴位三腔心切面对两组所有人的左心室心内膜及心外膜进行半自动勾

画，运行软件得出常规左心室心功能参数及 3D 全局周向、全局径向及全局纵向应力值。并对所得的数据进行统计学分析，比较两组之间的各向应力数据是否具有统计学意义。并对各个应力参数与左心室功能参数进行相关性分析。**结果** 3D 全局径向峰值应变率（Globle peak strain radia，GPRS）、全局周向峰值应变率（Globle peak strain circumf，GPCS）及全局纵向峰值应变率（Globle peak strain rate long，GPLS）在两组间具有统计学意义（P＜0.001）。**结论** 3D 全局周向、径向及纵向峰值应变率这三个心肌力学指标对于区分瓣膜病及正常人左心室心肌功能变化具有识别意义。

PO-035

Quantification of myocardial interstitial space using dual source CT after bolus contrast injection: comparison between first pass perfusion imaging and dual energy analysis

na Li,Jie Yu,Jin Gu,Heshui Shi,Ping Han,Ming Yang
Union Hospital Affiliated to Huazhong University of Science and Technology Tongji Medical College

Purpose:
Both of extracellular extravascular volume (EEV) and extracellular volume (ECV) were proposed to quantify enlargement of myocardial interstitial space due to myocardium loss or fibrosis. This study was designed to investigate feasibility of EEV derived with only first pass perfusion imaging and ECV based on dual energy iodine quantification.
Methods:
15 patients at average 8 weeks after revascularization therapy were enrolled. After a bolus injection of contrast at 5ml/s and 0.7ml/kg followed by saline flush, all the patients underwent a low dose first pass dynamic perfusion with a SIEMENSE Somatom Force CT scanner. Before and 8min after bolus contrast injection, a standard dose scan was performed (CaScore adapSeq,120KV), immediately after delayed scan, a dual energy scan was performed(150Sn/90KV),the slice thickness of all scan protocols was 3mm . VPCT software based on Tofts model was used to calculate EEV and Heart PBV was used to calculate iodine concentration in myocardium and left ventricle, ECV by dual energy was defined as ratio of iodine concentration in myocardial and left ventricle and corrected by (1-Hematocrit). ECV by standard single energy scan was derived by conventional subtraction method:ECV=($\Delta HU_{myo}/\Delta HU_{LV}$)*（1-Hematocrit）,which was served as a reference standard.
Results:
Mean EEV within infarcted myocardium segment and remote was 14.03 ml/100ml and 15.45 ml/100ml respectively, there was no statistics significance and no significant linear correlation with conventional ECV. However, the difference of ECV derived by dual energy between myocardial infarction and remote was significant , the value has good linear relationship with conventional ECV(r=0.43,P＜0.05).
Conclusion:
Our study showed EEV using first pass perfusion data failed to differentiate myocardial infarction and remote although which has potential to shorter examine time

and obtain perfusion parameter as well, however, Dual energy CT was much more similar to conventional ECV assessment.

PO-036

探究人工智能辅助诊断系统对厚层胸部 CT 图像中＞4mm 肺结节的检出效能

汤敏,伍建林
大连大学附属中山医院

目的 由于医院 PACS 系统存储容量有限，基层医院常使用厚层胸部 CT 图像（如 5mm/7mm）进行日常影像诊断。因此，本研究探讨人工智能辅助诊断系统对厚层胸部 CT 图像中＞4mm 肺结节的检出效能。**方法** 使用第 2 代双源 CT 前瞻性收集行常规胸部 CT 检查的门诊患者共计 118 例，将扫描图像进行厚层（5mm/7mm）图像重建，利用人工智能辅助诊断软件建立的厚层（5mm/7mm）模型，检测 2 组层厚 CT 图像中＞4mm 肺结节的数目。由 1 名影像诊断专家及 2 名高年资放射科医师通过 1mm 薄层 CT 图像及人工智能辅助诊断软件最终确定＞4mm 肺结节金标准数目。使用灵敏度及假阳性率评估人工智能辅助诊断系统对厚层胸部 CT 图像中＞4mm 肺结节的检出效能。**结果** 人工智能辅助诊断软件分别在 5mm，7mm 层厚的胸部 CT 图像中检测到 318、265 个大于 4mm 的肺结节。 其中分别有 164、143 个与金标准一致，假阳性结节数分别为 154、122 个。结节检出的敏感度分别为 0.609±0.398, 0.551±0.412，差异有统计学意义（p <0.01）。 两组间假阳性率为 1.305/CT、1.034 /CT.。**结论** 人工智能辅助诊断系统对 5mm 层厚图像中＞4mm 的肺结节检出敏感度优于 7mm 组，提示对于有临床随访意义的肺结节（＞4mm），5mm 层厚图像可以实现较好的检出效能。

PO-037

原发性肺黏液腺癌 CT 表现再认识

蔡雅倩,韩丹,张正华,黄建强,李浚利,金文凤
昆明医科大学第一附属医院

目的 探讨原发性肺黏液腺癌（Primary Pulmonary Mucinous Adenocarcinoma,PPMA）CT 诊断及鉴别诊断。 方法 回顾性分析经穿刺及手术病理证实的 22 例 PPMA 患者（男 10，女 12，年龄 54.5±11.9 岁），均行胸部 CT 平扫及增强检查，分析其 CT 表现，观察病灶形态（分为肿块型和肺炎型，CT 图像上表现为软组织肿块者称为肿块型；表现为片状渗出实变者称为肺炎型）、位置（按其发生部位分为中央型和周围型）、病灶内及周边情况（浅分叶、毛刺、空洞、晕征、蜂窝征、枯枝征、血管漂浮征、空泡征及卫星灶等）、增强表现及有无淋巴结转移等。其中晕征是指病灶周围环绕的磨玻璃影；蜂窝征是多个密集的泡状或囊状低密度腔聚集在一起宛如蜂窝样改变；枯枝征是指于病灶内走行僵直、狭窄的支气管影；血管漂浮征是增强扫描时病灶内的血管在低密度背景下呈漂浮样改变。结果 22 例患者中肿块型 18 例（周围型 15 例，中央型 3 例）。4 例多发（22.2%），其中 1 例为原发灶旁出现类圆形空泡样卫星灶，其它为实性小结节灶；3 例伴发空洞（16.7%）；16 例有浅分叶（88.9%）；4 例合并短毛刺（22.2%）；4 例周围见晕征（22.2%）；增强表示 5 例无强化（27.8%），13 例轻度强化（72.2%）；7 例合并淋巴结转移（38.9%）。4 例肺炎型均可见蜂窝征、枯枝征、血管漂浮征及晕征（100.0%）。2 例主支气管管壁明显增厚（50.0%）；病灶平扫 CT 值约 10-50Hu 不等，增强扫描轻度强化 3 例（75.0%），不强化 1 例（25.0%）。说明 PPMA 平扫多呈低或等低密度，部分多发、合并空洞形成，周围多见晕征，增强无强化或轻度强化，部分合并淋巴结转移。CT 主要分两种类型，其中肺炎型易误诊，但蜂窝征、枯

枝征、血管漂浮征是诊断较具特异性征象。结论 PPMA CT 表现具有一定特异性，可为临床诊断和治疗提供依据。

PO-038
CT 动态能谱一站式扫描在肺癌病理分型中的应用

李琳,罗娅红
辽宁省肿瘤医院

目的　通过 CT 动态能谱一站式扫描对肺癌不同病理类型中血供特征的评价，探讨东芝 640 层 CT 动态能谱一站式扫描对肺癌不同病理类型中血供特征的差异，以期为临床诊断及预判提供指导。
方法　对 51 例肺癌患者进行前瞻性能谱 CT 与灌注 CT 一站式扫描，最后经病理证实鳞癌 13 例，腺癌 27 例，小细胞癌 11 例。将扫描图像在副台 Dual Energy 能谱处理程序中处理每一组能谱数据得到动态碘图，通过动态碘图测得肿瘤的碘分布值峰值；用 Dual input perfusion 程序进行肺双入口灌注分析，得到病灶的支动脉血流 AF、肺动脉血流 PF、和血流灌注指数 PI 值［PI = PF/(PF + AF)］。 采用独立样本 t 检验以及秩和检验比较定量参数，以 P ＜0.05 为差异具有统计学意义。
结果　鳞癌与腺癌之间的灌注值 AF 差异有统计学意义，P<0.05（P=0.010），灌注值 PF、PI 差异均无统计学意义。腺癌与小细胞癌之间的灌注值 AF 差异有统计学意义，P<0.05（P=0.004），灌注值 PF、PI 差异均无统计学意义。鳞癌与腺癌之间的碘值峰值差异有统计学意义，P<0.05（P=0.029），腺癌与小细胞癌，鳞癌与小细胞癌之间碘值峰值差异无统计学意义。患者的有效辐射剂量为 6.81mSv。
结论　通过 CT 动态能谱成像得到的 AF 值与碘值峰值对于肺癌分型具有临床价值，有助于对肺癌病理类型进行预判。

PO-039
CT 灌注成像在 NSCLC 中的应用及与其血管生成及淋巴结转移情况的相关性研究

陈玉珊,詹阿来
漳州市医院

目的 探讨 CT 灌注成像在 NSCLC 中的应用及与其血管生成及淋巴结转移情况的相关性。**方法** 选取我院 2013 年 1 月～2018 年 1 月期间收治的 100 例非小细胞肺癌患者作为研究对象，所有患者入组后，均进行 CT 灌注成像检查。分析不同血管生成情况、不同病理状态患者的 CT 灌注成像参数之间的差异以及相关性。**结果** 不同组织类型患者的 CT 灌注成像参数之间的差异不存在统计学意义，淋巴结转移患者的 BF 显著高于非淋巴结转移患者，淋巴结转移患者的 BV、PEI 低于非淋巴结转移患者，不同淋巴结转移患者的 MTT 之间的差异不存在统计学意义。Ⅰ-Ⅱ期患者的 BF 显著高于Ⅲ-Ⅳ期患者，其余指标之间的差异不存在统计学意义（*P*＜0.05）；不同病理组织以及淋巴转移情况患者的 MVD 之间的差异存在统计学意义（P＜0.05），不同 TNM 分期患者的 MVD 之间的差异不存在统计学意义（P＞0.05）。**结论** 患者淋巴结转移情况以及 MVD 分别与患者的 CT 灌注成像指标 BF、BV、PEI 分别呈现负相关，CT 灌注成像技术可在一定程度上反映患者的肺部毛细血管的形成情况以及肿瘤病灶的转移播散能力。

PO-040

卷积核对磨玻璃结节特征显示的影响-体模研究

王国树,吕发金
重庆医科大学附属第一医院

目的 探讨不同卷积核对肺磨玻璃结节特征显示的影响，从而寻找能显示磨玻璃结节特征的最佳卷积核。**方法** 用高分子材料按照不同比例制成 CT 为-450HU— -650HU 的肺磨玻璃结节。其中直径为 10mm 的纯磨玻璃结节 5 枚；直径为 10mm，内含空泡征的磨玻璃结节 5 枚；直径为 10mm，内含宝石症的磨玻璃结节 5 枚；最大直径为 10mm，表面分叶的磨玻璃结节 5 枚；最大直径为 10mm，表面为毛刺的磨玻璃结节 5 枚，共 25 枚。把 25 枚结节置入日本 Kyoto Kagaku 公司生产的 Lungman N1 型多用途男性胸部仿真体模内，采用 SOMATOM Perspective 128 层螺旋 CT 对该体模进行常规剂量扫描和低剂量扫描。分别采用 ADMIRE 和 FBP 两种重建方式进行重建，重建层厚均为 1.0mm。ADMIRE 迭代级别选择 3，卷积核分别为;I30、I40、I50、I70、I80；FBP 卷积核分别为;B30、B40、B50、B70、B80。将 10 组数据传入 MMWP4 后处理工作站进行数据测量。**结果** 随着卷积核增大、图像对比度会提高，但是图像噪声也会增加；随着卷积核减小，图像噪声会降低、但是图像对比度会降低、塑化感增加。主观评分显示：常规剂量扫描时，I80 得分最高，能清晰显示磨玻璃结节的边缘、毛刺征、空泡征和宝石征；低剂量扫描时，I50 得分最高，能清晰显示磨玻璃结节的边缘、毛刺征、空泡征和宝石征。常规剂量组得分高于低剂量组。客观测量显示：ADMIRE 迭代重建图像信噪比、对比噪声比均优于对应 FBP 重建，I30 具有最佳信噪比和对比噪声比。虽然 I30 具有最佳信噪比和对比噪声比，但是图像塑化感太明显，磨玻璃结节对比度较差。**结论** 通过本次实验我们发现常规剂量扫描时，I80 具有最佳图像质量。低剂量扫描时，I50 具有最佳图像质量。

PO-041

shape、glcm 及 firstorder 纹理特征评估纯磨玻璃 IA 的 p-53、ki-67

马双春,李智勇,刘爱连
大连医科大学附属第一医院

目的 探讨利用形态（shape）、灰度级共生矩阵（glcm）及一阶纹理（firstorder）纹理分析评价纯磨玻璃 IA 的 p-53、ki-67 情况。**方法** 回顾性收集 2015 年 1 月至 2018 年 1 月期间于大连医科大学附属第一医院经手术病理证实为肺浸润性腺癌（IA），同时薄层 CT 上呈现为肺纯磨玻璃结节（pGGN）的患者总计 40 例。所有病例均为单发 IA 病灶，总计 40 个 pGGNs。回顾性采集所有研究对象的免疫组化情况：p53 突变率，ki-67 增殖指数，观察并测量薄层 CT 上 pGGN 的 shape（Maximum3DDiameter、Sphericity、Elongation、Volume、SurfaceVolumeRatio、Flatness）、glcm（SumAverage、MaximumProbability、Idmn、JointEnergy、Contrast、Idn、Idm、Correlation）及 firstorder（Skewness、Uniformity、Energy、TotalEnergy、Maximum、90Percentile、10Percentile、Mean）纹理特征。将所有患者的免疫组化指标与 shape、glcm 及 firstorder 纹理特征做相关性分析。**结果** p53 突变率与 shape、glcm 及 firstorder 纹理特征均无相关性；ki-67 增殖指数与 Volume（p=0.016，r=0.437）、Idm（p=0.048，r=0.364）、TotalEnergy（p=0.007,r=0.482）呈正相关 **结论** ki-67 增殖指数与 shape、glcm 及 firstorder 纹理特征具有一定相关性，其中 TotalEnergy 相关性最强，分析薄层 CT 上 shape、glcm 及 firstorder 纹理特征，对评价患者肿瘤 ki-67 增殖活性有一定的临床价值。

PO-042

A new score system to predict recurrent laryngeal nerve lymph node metastasis in patients with esophageal squamous cancer

Bo Zhao,Ying-shi Sun
Department of Radiology， Key Laboratory of Carcinogenesis and Translational Research， Ministry of Education， Peking University Cancer Hospital and Institute

Objective: To investigate the value of CT combination clinical results to predict recurrent laryngeal nerve (RLN) lymph node metastasis in patients with esophageal squamous cancer (ESC)
Methods:
75 patients who underwent laryngectomy nerve lymph nodes dissection in ESC between 2014-2018 were retrospectively analysis. We evaluated possible related factors for lymph node metastasis: age, gender, tumor differentiation, tumor location, tumor size(length and thickness) and the larger short and long diameter of the largest RLN node, then we calculated the ratios of the tumor (length/thickness diameters, LTR) and RLN node(short/long diameters, SLR).Univariate and multivariate logistic regression analysis were used to identify independent risk factors for predicting RLN node metastasis.
Result:
RLN metastasis were positively correlated with tumor length, LTR, RLN node size, SLR (all $p<0.01$) on univariate analysis. Based on the results of logistic multivariate analysis, we constructed a new scoring system that included tumor length, short diameter and SLR.
The total risk score system was 0 to 10. The area under the receiver operating characteristic curve for predicting RLN node metastasis was 0.919(95% confidence interval, 0.860-0.978). The high-risk group (risk score>3) exhibited a significantly higher risk of RLN node metastasis than the low-risk group (risk score ≤3). The sensitivity, specificity, positive predictive value, negative predictive value were respectively 71.0%,95.4%,91.7%,82.4%.
Conclusion: We developed a risk score system which has the potential to facilitate the identification of patients with a high or low risk of RLN node metastasis in ESC patients.

PO-043

肺浸润性腺癌的能谱 CT 定量参数与 EGFR 突变相关性分析

余烨,吴华伟
上海交通大学医学院附属仁济医院

目的：探讨肺浸润性腺癌的能谱 CT 定量参数与 EGFR 突变相关性分析
方法：回顾性分析经病理证实的 98 例肺浸润性腺癌患者临床资料，所有患者均行 EGFR 基因检测，并且于术前行能谱 CT 增强扫描，包括动脉期及静脉期，分别延迟 25 s、65 s。能谱定量参数包括

标准化碘含量，标准化水含量，能谱曲线斜率，将患者分为 EGFR 突变组及 EGFR 野生组，采用 Spearman 相关法分析能谱定量参数及结节类型与 EGFR 突变的相关性。
结果：所有病例中，EGFR 突变占所有病例 66.33%，EGFR 突变与动脉期标准化碘含量及动脉期能谱曲线斜率呈正相关（P＜0.05），EGFR 突变与动脉期及静脉期的标准化水含量呈负相关（P＜0.05），磨玻璃成分与 EGFR 突变呈正相关（P＜0.05）
结论：肺浸润性腺癌能谱 CT 定量参数及磨玻璃成分与 EGFR 突变具有良好的相关性，可间接反映肿瘤细胞的增殖、分化和肿瘤血管生成情况,为肺浸润性腺癌生物学行为的术前评价提供有价值的信息
关键词：肺腺癌；EGFR；能谱 CT

PO-044
长径 5-15mm 孤立性肺结节的良恶性预测模型建立及验证

晏睿滢
云南省肿瘤医院

目的 通过分析长径 5-15mm 孤立性肺结节（*solitary pulmonary nodule, SPN*）患者的临床、实验室检查及影像学征象等资料，建立并验证其良恶性预测模型。**方法** 回顾性入组本院经手术切除且病理诊断明确的长径 5-15mmSPN 病例共 958 例，分析患者的临床特征（年龄、性别、体质指数、吸烟史、呼吸系统疾病史、恶性肿瘤病史、家族肿瘤史），实验室检查（癌胚抗原、糖类抗原 *CA125*、*CA724*、中性粒细胞淋巴细胞比值（Neutrophil to lymphocyte ratio，NLR））和影像学征象（结节位置、最大径和最小径、边缘、含 GGO 成分、空洞、空泡、空气支气管、血管集束、胸膜牵拉、钙化、肺气肿背景）。采用随机分组将患者分为训练集 670 例和验证集 288 例。通过单因素及多因素 logistic 回归分析筛选出与长径 5mm-15mmSPN 良恶性相关的独立危险因素，构建列线图预测模型。将验证集数据代入该模型进行验证，绘制受试者工作特征曲线（ROC 曲线）和校准曲线，评估模型预测价值。**结果** 分析显示年龄、空泡、血管纠集、空气支气管、胸膜牵拉、含 GGO 成分及 NLR 与长径 5mm-15mmSPN 良恶性相关（P＜0.05），用以构建的预测模型为：P=ex/（1+ex），x=-3.14282 +（0.03737×年龄）+（0.51374×空泡）+（1.87897×血管纠集）+（0.90573×空气支气管）+（1.15055×胸膜牵拉）+（1.57413×含 GGO 成分）-（0.84182×NLR）。该模型 ROC 曲线下面积为 0.860，敏感度 90.8%，特异度 68.4%，准确度 80.3%。**结论** 患者的年龄、NLR、空泡、血管纠集、空气支气管、胸膜牵拉、含 GGO 成分是预测长径 *5-15mmSPN* 良恶性的独立预测因子。本研究构建的模型具有良好的诊断效力，对临床医生判断长径 *5-15mmSPN* 的良恶性有一定帮助。

PO-045
系统性轻链型淀粉样变性心脏受累病人中 CEST 与 T1 mapping 相关性研究

黄思思[1],李潇[1],Zhengwei Zhou[2],Linda Azab[2],Zixin Deng[2],Debiao Li[2],李剑[1],王怡宁[1],金征宇[1]
1.中国医学科学院北京协和医院
2.Biomedical Imaging Research Institute， Cedars-Sinai Medical Center， Los Angeles， USA
3.西门子（深圳）磁共振有限公司

目的：探究在系统性轻链型淀粉样变性心脏受累病人中心肌 CEST 值与 T1 mapping 的相关性。

方法：40 例接受了心脏增强磁共振扫描的系统性轻链型淀粉样变病人中，将结果显示存在左心室心肌延迟强化的 28 例患者纳入此项研究，进行 CEST 磁共振扫描并测定平均心肌信号强度。

结果：CEST 值与 ECV 存在明显的相关性(R=-0.485, p=0.009)，而与 native T1 mapping 没有明显的相关性 (R=-0.253, p=0.170)。

结论：在系统性轻链型淀粉样变心脏受累的病人中，心肌 CEST 值减低与 ECV 升高有明显的相关性；CEST 心脏磁共振有望可以反映心肌疾病负荷。

PO-046

磁共振弥散加权成像全病灶直方图及纹理分析鉴别肉芽肿性小叶炎及浸润性乳腺癌

赵秋枫[1],谢天文[2],陈玲[1],王嵩[1]
1.上海中医药大学附属龙华医院
2.复旦大学附属肿瘤医院

目的：探讨磁共振弥散加权成像全病灶直方图及纹理分析在鉴别肉芽肿性小叶炎及浸润性乳腺癌中的价值。材料及方法：回顾性分析 27 例病理证实的肉芽肿性小叶炎及 31 例浸润性乳腺癌患者的乳腺磁共振资料（所有病灶磁共振上均呈非肿块强化，且无环状强化病灶）。磁共振检查使用西门子 1.5T 及 3.0T 扫描仪，弥散加权成像使用 3 个 b 值（50，400 或 500，800s／mm2）。ADC 图上将整个病灶逐层勾画、分割，并提取 11 个纹理特征。单因素及多因素分析 ADC 直方图及纹理特征在两组病灶中的差别，并绘制 ROC 曲线。结果：5%ADC 值、熵、熵差在两组间有差异。使用这三个参数绘制 ROC 曲线的 AUC 值为 0.778（95%可信区间：0.648-0.908），准确率为 79.3%，敏感度为 87.1%。多因素分析两组间各特征值未发现有差异。结论：磁共振弥散加权成像全病灶直方图及纹理分析可为肉芽肿性小叶炎及浸润性乳腺癌的鉴别诊断提供无创、可靠的方法。

哺乳期乳腺癌 MRI 表现

李明
解放军总医院第五医学中心南院区

［摘要］ **目的** 探讨乳腺动态增强 MRI 检查在哺乳期乳腺癌的诊断价值。**方法** 回顾性分析 12 例经病理证实的哺乳期乳腺癌 MRI 影像学表现，分析其特征，提高诊断率。**结果** 本组 12 例哺乳期乳癌患者中，9 例有明显哺乳期乳腺背景。10 例为浸润性导管癌（83.33%，10/12）,1 例为高级别导管内癌伴小叶癌化（8.33%，1/12），1 例为中级别导管内癌伴小叶癌化（8.33%，1/12），7 例有腋窝淋巴结转移（58.33%，7/12）。其中 4 例（33.33%，4/12）术前做钼靶检查，2 例（16.67%，2/12）漏诊；10 例（83.33%，10/12）术前做超声检查，3 例（25%，3/12）漏诊，1 例（8.33%，1/12）误诊。12 例（100%，12/12）术前均行 MRI 检查，9 例（75%，9/12）BI-RADS5 类，3 例（25%，3/12）BI-RADS4 类，其中 2 例（16.67%，2/12）倾向乳癌，1 例（8.33%，1/12）倾向炎症。7 例呈肿块样强化（58.33%，7/12），5 例呈非肿块样强化（41.67%，5/12），其中非肿块样强化病例中 2 例（16.67%，2/12）段样分布，1 例（8.33%，1/12）区域分布；2 例（16.67%，2/12）多区域分布；9 例（75%，9/12）呈不均匀强化，3 例（25%，3/12）呈簇状环形强化。DWI12 例（100%，12/12）呈均呈高信号，ADC 值均小于 1.00×10^{-3}mm/s。TIC 曲线 1 例（8.33%,1/12）呈Ⅱ型曲线，11 例（91.67%，11/12）呈Ⅲ曲线。**结论** 哺乳期病史对乳腺癌诊断有一定干扰，MRI 对其诊断均有较大优势。

PO-048
初探基于 ADC 图肿瘤全域纹理分析鉴别乳腺导管原位癌（DCIS）和 DCIS 伴微浸润的价值

田士峰,张丽娜,刘爱连
大连医科大学附属第一医院

目的 探讨基于表观扩散系数（ADC）图肿瘤全域的纹理分析鉴别乳腺导管原位癌（ductal carcinoma in situ，DCIS）和乳腺导管原位癌伴微浸润（ductal carcinoma in situ with microinvasion，DCIS-MI）的价值。**方法** 回顾性分析经手术病理证实的 10 例 DCIS 和 14 例 DCIS-MI 的患者资料，患者术前均行乳腺 DWI 序列扫描（b 值为 1000 s/mm^2），经后处理获得 ADC 图，采用 Omni-Kinetics 软件，在包含肿瘤实质的图像上沿肿瘤边缘逐层勾画 ROI，融合后获得肿瘤全域纹理参数，包括中位数、平均值、标准差、偏度、峰度、均匀性、能量、熵、惯性矩、相关性和逆差距。采用独立样本 t 检验（正态分布）或 Mann-Whitney 秩和检验（偏态分布）比较 DCIS 和 DCIS-MI 各纹理参数的差异，采用 ROC 曲线评价有统计学差异的纹理参数对 DCIS 和 DCIS-MI 的鉴别效能。**结果** DCIS 组的标准差、熵、相关性、逆差距小于 DCIS-MI 组，均匀性、能量、惯性矩大于 DCIS-MI 组，差异具有统计学意义（P 均<0.05）。两组之间的中位数、平均值、偏度、峰度差异无统计学意义（P 均>0.05）。标准差、均匀性、能量、熵、惯性矩、相关性、逆差距鉴别两组病灶的 AUC 分别为 0.993、0.986、0.857、0.936、0.736、0.736、0.836。**结论** 基于 ADC 图的肿瘤全域纹理分析有助于鉴别 DCIS 和 DCIS-MI，具有一定临床应用价值，标准差、均匀性、能量、熵、逆差距是有效鉴别参数。

PO-049
Radiomics analysis of dynamic contrast-enhanced magnetic resonance imaging for the prediction of sentinel lymph node metastasis in breast cancer

Jia Liu,Dong Sun,Linli Chen,Zheng Fang,Weixiang Song,Chuanming Li
The Second Affiliated Hospital of Chongqing Medical University

Purpose: To investigate whether a combination of radiomics and automatic machine learning applied to dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) of primary breast cancer can noninvasively predict axillary sentinel lymph node (SLN) metastasis.

Methods: Forty-two patients who received a DCE-MRI breast scan were enrolled. A total of 1029 imaging features were extracted from each volume of interest (VOI) .The least absolute shrinkage and selection operator was used to select the optimal features. Three classification models based on the logistic regression (LR), random forest (RF) and support vector machine (SVM) classifiers were constructed. Receiver operating curve (ROC) analysis and fivefold cross-validation were used to illustrate the prediction performance of the models. Spearman correlations were performed between the optimal features and the levels of estrogen receptor (ER), progesterone receptor

(PR), human epidermal growth factor receptor-2 (HER2), and proliferation marker Ki-67 of the breast tumors.

Results: Twelve optimal features were obtained for model construction. The area under the curve (AUC) values of the LR, RF and SVM models were 0.923, 0.744 and 0.914, respectively, and the mean AUC values of the fivefold cross-validation were 0.937±0.097, 0.786±0.094, and 0.934±0.073, respectively. The sensitivity, specificity, accuracy, positive predictive value (PPV) and negative predictive value (NPV) for the LR, RF and SVM models were 0.818, 0.850, 0.833, 0.857, 0.810; 0.682, 0.750, 0.714, 0.750, 0.682; and 0.864, 0.850, 0.857, 0.864, 0.850, respectively. With respect to the accuracy, sensitivity, PPV and NPV, the SVM demonstrates the highest performance. Four features, including the original_shape_Major Axis, wavelet-LLL_glcm_Correlation, wavelet-HLL_glszm_Grey Level Non Uniformity and logarithm_firstorder_Minimum, had significant correlations with the ER, PR, HER2 and Ki-67 levels.
Conclusions: We demonstrated the feasibility of combining artificial intelligence and radiomics from DCE-MRI of primary tumors to predict axillary SLN metastasis in breast cancer. This noninvasive approach could be very promising in application.

PO-050
MRI 多参数联合诊断乳腺环形强化病变的良恶性的价值

许蕾
胜利油田中心医院

[摘 要] 目的 探讨 MRI 多参数联合对乳腺动态增强扫描（DCE MRI）内部强化方式表现为环形强化病变的诊断价值。**方法** 回顾性分析经手术病理证实为乳腺病变患者行 DCE MRI、DWI 检查，参照 MRI 乳腺影像报告和数据系统对 DCE MRI 内部强化方式表现为环形强化的 67 例纳入研究。根据病理结果将 67 例病变分为良、恶性两组，采用 χ^2 检验比较两组病变在 DCE 整体形态学指标、“强化环”形态学指标、时间信号强度曲线类型、DWI 扩散受限分布位置指标的差异性。采用独立样本 t 检验比较两组病变 DCE 半定量参数指标、“强化环”多点 ADC 值的差异性。以病理结果为应变量，自变量采用上述具有统计学差异的指标，建立 Logisitc 回归模型构建新的联合参数并对参数逐步联合评价其诊断效能。**结果** 良、恶性病变在“环形强化”环壁形态（χ^2=14.19，P=0.001）及是否具有壁结节（χ^2=12.48，P=0.001）差异有统计学意义;良、恶性病变在 DWI 扩散受限分布位置指标差异有统计学意义（χ^2=19.60，P=0.003）。良、恶性病变在半定量参数早期强化率（t=2.35，P=0.02）及峰值达峰时间（t=4.66，P=0.007）差异具有统计学意义;良、恶性病变在 $ADC_{环内}$(t=1.35,P=0.001)、$ADC_{环壁}$值（t=1.05,P=0.30）差异具有均统计学意义。新构建 “强化环”形态学指标+DWI 扩散受限分布位置+Tmax+$ADC_{环内}$参数联合诊断的约登指数最高为 0.75，ROC 曲线下面积为 0.87[95% CI(0.82,0.91）]，诊断敏感度及特异度分别为 91.96%和 91.31%。**结论** 乳腺 MR 多参数信息对乳腺环形强化病变具有较高的诊断效能。

PO-051
基于 MRI 影像组学诺莫图预测乳腺癌腋窝淋巴结转移

毛宁[1],洪楠[2]
1.山东省烟台毓璜顶医院
2.北京大学人民医院

目的：建立并验证术前预测乳腺癌腋窝淋巴结转移的影像组学诺莫图。
材料与方法：148 名符合条件的乳腺癌患者被分为训练组（n=100）和验证组（n=48）。从每个病人的磁共振图像中提取影像组学特征。然后在训练集中用 LASSO 算法建立影像组学标签。结合独立的危险因素，采用多元 Logistic 回归模型建立诺莫图。诺莫图的效能在训练集中进行评估，并在验证集中进行验证。最后，结合训练和验证集进行决策曲线分析，以评估诺莫图的临床实用性。
结果：由 9 个淋巴结状态相关特征组成的影像组学标签，具有良好的预测效果。包括影像组学标签和磁共振报告的淋巴结状态的诺莫图在训练集（AUC 0.79；95%CI，0.73-0.85）和验证集（AUC 0.76；95%CI，0.69-0.84）中也显示出良好的效能。决策曲线表明了我们列线图的临床实用性。另外，诺莫图在 MR 报告的淋巴结状态为阴性的亚组（AUC 0.88；95%CI，0.83-0.94）也显示出良好的鉴别能力。
结论：影像组学诺莫图是一种非侵入性术前预测工具，结合影像组学特征和磁共振报告的淋巴结状态，对乳腺癌患者淋巴结转移具有较好的预测效能，具有良好的应用前景，需要大数据进一步提高模型的效能和多中心验证获得临床应用的高水平证据。

PO-052
基于磁共振成像乳腺癌远处转移预测模型的研究

汤加,马文娟,刘佩芳,刘君君,邵真真
天津医科大学肿瘤医院

目的： 建立基于平扫磁共振成像（magnetic resonance imaging，MRI）和动态对比增强（dynamic contrast enhanced ，DCE）-MRI 影像特征参数的乳腺癌远处转移预测模型。**方法：**回顾性分析 2011 年 1 月至 2016 年 12 月 3 032 例于天津医科大学肿瘤医院行乳腺 MRI 检查并经病理证实为乳腺浸润性癌患者的临床资料，根据纳入标准筛选出转移组 93 例和非转移组 186 例。分析转移组远处转移部位与分子分型的关系，同时对两组 MRI 影像特征进行单因素分析及多因素 Logistics 回归分析，获得独立预测因子并建立预测模型。**结果：**转移组中 Luminal 型、HER-2 过表达型、三阴性乳腺癌最常见远处转移部位分别为骨、肝脏、肺脏。单因素分析结果显示，两组间的病变类型、是否多发、T_1WI 和 T_2WI 信号均匀度及病灶最大径进行比较差异具有统计学意义（P<0.05）。多因素 Logistics 回归分析结果显示，病变类型、是否多发、T_2WI 信号均匀度及病灶最大径为独立预测因子。根据独立预测因子建立的预测模型准确率、敏感度、特异度和 AUC 分别为 82.8%、85.7%、75.0%和 0.801。**结论：**基于 MRI 影像特征的模型对预测乳腺癌远处转移具有潜在价值。

PO-053
乳腺癌新辅助化疗后 MRI 不同退缩模式对疗效评估的价值

许梅,马捷,林小慧
深圳市人民医院

目的：分析新辅助化疗（NAC）后磁共振(MRI)上乳腺肿瘤的不同退缩模式，探讨不同退缩模式对化疗疗效的评估价值。**方法**：回顾性分析本院 2016 年 8 月至 2019 年 5 月经病理证实为单侧乳腺癌，且 NAC 前及手术前均进行了 MRI 检查的 50 名女性患者。2 名医生分别阅片分析肿瘤退缩模式，退缩模式分为 3 型：向心性退缩；碎片样退缩；混合型退缩。根据病理结果，将患者分为病理完全缓解（pCR）组和非 pCR 组。记录 NAC 前经穿刺检测 ER，PR 和 HER2 和 Ki-67 的表达情况。采用 χ^2 检验及 Wilcoxon 秩和检验比较 pCR 组及非 pCR 组临床资料的差异，采用 Kappa 检验评价 2 名医师对退缩模式分类评价的一致性，χ^2 检验比较 4 种分子分型肿瘤强化模式及退缩模式是否存在差异，且比较 NAC 前肿瘤不同强化模式与 NAC 后退缩模式是否存在差异，采用 Binary logistic 回归分析疗效的相关因素。**结果**：NAC 后经病理证实，pCR 组 16 例，非-pCR 组 34 例。pCR 和非 pCR 组间，年龄、绝经状态、病灶最大径、淋巴结，T 分期，钙化，分子分型，ER,PR,Ki-67 状态、MRI 强化方式及 NAC 前 BPE 情况差异均无统计学异常（P 均>0.05）； HER2 状态及退缩模式差异有统计学意义（P 均<0.05）。2 名医师对化疗后肿瘤退缩模式评估 Kappa 值为 0.719，一致性为中等。4 种分子分型的肿瘤退缩模式及 NAC 前 MRI 肿瘤强化方式差异均无统计学意义（P 均>0.05）。不同退缩模式 NAC 前 MRI 肿瘤强化方式差异有统计学意义（P<0.05）。Logistic 多因素回归模型显示，NAC 后肿瘤退缩模式及 HER2 状态是影响疗效达到 pCR 的独立因素。**结论**：NAC 后退缩模式及 HER2 状态可作为 NAC 疗效评估的独立因素。HER2 受体阳性更容易达到 pCR，碎片样退缩及混合型退缩难达到 pCR，达 pCR 患者中更大概率为向心性退缩。

PO-054

Diagnostic and Prognostic Value of Quantitative Gaussian and Non-Gaussian Diffusion MR Imaging Parameters in Breast Lesions

Kun Sun,Weimin Chai,Fuhua Yan
Department of Radiology, Ruijin Hospital, Shanghai Jiaotong University School of Medicine

Objective: To evaluate the potential association between various diffusion parameters obtained from both Gaussian and non-Gaussian diffusion models, including diffusion-kurtosis-imaging (DKI) stretched-exponential model (SEM), and intravoxel incoherent motion (IVIM) and Diffusion weighted imaging (DWI) and breast cancer clinical-pathologic factors.
Methods: Diffusion sequences were performed in 94 patients with pathologically proven breast lesions using a 1.5 T MR scanner. The apparent diffusion coefficient (ADC), diffusion coefficient (D), pseudo-diffusion coefficient (D*), perfusion fraction (f), molecular water diffusion heterogeneity index (α), distributed diffusion coefficient (DDC) mean diffusivity (MD) and kurtosis (MK) were calculated. T-test, ROC curves and Spearman correlation were used for statistical analyses.
Results: The ADC, D, DDC and MD were significantly lower in malignant lesions than in benign lesions (P<0.0001). The α and MK were significantly higher in malignant lesions than in benign lesions (P<0.0001). In invasive breast cancer, α was positively correlated with Ki-67 (r = 0.45), whereas negatively correlated with ER and PR expression (r = -0.28 and -0.41). MK was positively correlated with Ki-67 expression and histologic grade (r = 0.62 and 0.52), MD was negatively correlated with Ki-67 expression and histologic grade (r = -0.47 and -0.30). DDC (r = 0.29) was positively correlated with tumour size, whereas negatively correlated with ER

expression (r = -0.31). D (r = 0.33) was positively correlated with c-erb-B2 expression, whereas negatively correlated with ER expression (r = -0.35).
Conclusion: Both Gaussian and non-Gaussian diffusion model could be used for breast cancer diagnosis. Non-Gaussian parameters which correlated with prognostic factors could be used to predict the aggressiveness of breast cancer.

PO-055
组织学分级 3 级的浸润性导管癌：影像学特征与病理的相关性研究

肖勤,孙轶群,顾雅佳
复旦大学附属肿瘤医院

目的：研究组织学分级为 3 级浸润性导管癌的影像学特征，并探讨与病理之间的关系。
方法：回顾性分析自 2010 年至 2015 年 76 例通过手术病理证实为浸润性导管癌，组织学分型为 3 级病例的乳腺 X 线、MRI 特点，并与免疫组化指标对照分析。
结果：76 例病例平均年龄为 48 岁，确诊时临床分期为：I 期（34 例）、II 期（39 例），III 期（3 例）。乳腺 X 线上 59 例表现为肿块，17 例表现为非肿块，共 17 例伴有可疑钙化。4 例在乳腺 X 线与 MRI 上均表现为边缘光整的肿块。在乳腺 X 线上 35 例表现为边缘浸润，在 MRI 上为 40 例；在乳腺 X 线上 12 例表现为分叶状肿块，在 MRI 上为 32 例。肿块在乳腺 X 线上呈高密度者占 61.8%。在 MRI 上，毛刺长度小于 5mm 者占 77.6%，大于 1cm 者占 1%；毛刺所占比例不超过肿块边缘 1/2 者占 73.7%。肿块毛刺的长度与 Her-2 水平相关，与 ER、PR 水平及病变确诊时临床分期不相关。肿块毛刺所占比例与 ER、PR、Her-2 水平及病变确诊时临床分期均不相关。
结论：组织学分级为 3 级的浸润性导管癌在病理上多呈膨胀性生长，在影像学上有一定特征性，肿块毛刺的长度与 Her-2 水平相关，影像学在一定程度上能够在术前预测患者 Her-2 水平。

PO-056
Correlation of Perfusion parameters on Dynamic Contrast Enhanced MRI With Biomolecular Factors and Subtypes of Breast Cancers

Li Liu[1],Weijun Peng[1],Li Liu[1],Weijun Peng
1.Department of Radiology, Shanghai Cancer Center, Fudan University
2.Department of Radiology, Shanghai Cancer Center, Fudan University

Objective This study aimed to investigate the correlation between the enhancement parameters of dynamic contrast-enhanced magnetic resonance imaging (DCE- MRI) and the molecular biological expression of breast cancers.
Material and Methods: This prospective study enrolled a total of 67 consecutive patients with breast carcinomas. DCE-MRI and routing MRI were performed in all patients before surgery.Correlations among perfusion parameters and prognostic factors, including tumor size, estrogen receptor (ER), progesterone receptor (PR), Ki67, human epidermal growth factor receptor 2 (HER-2), epidermal growth factor receptor (EGFR) expression, CK5/6 and subtypes of breast cancer were analyzed.

Results: Among these 67 lesions, the mean diameter of tumor was 4.48±1.73cm. There was no correlation between perfusion parameters and lesion size; K^{trans} and Kep were positively correlated with Ki67;The Vp values in negative and positive expression of CK5/6 were statistically different; the mean K^{trans} value of HER-2 overexpression was higher than that of Luminal A and Luminal B; The mean Kep value of HER-2 overexpressing lesions was higher than that of Luminal A.The mean Ve value of triple negative lesions was higher than that of HER-2 overexpression, Luminal A and Luminal B;The TTP value of HER-2 overexpressing lesions was lower than that of Luminal A and Luminal B; The mean MAX Conc value of triple negative lesions was higher than that of Luminal B,and the mean MAXSlope of HER-2 overexpressing was lower than that of Luminal A and Luminal B;**Conclusion:** Perfusion parameters of DCE-MRI can non-invasively evaluate the molecular biological expression and molecular subtype of breast cancer.

PO-057
乳腺癌治疗后高骨松患病率及相关因素分析

蔡思清,吴培丽
福建医科大学附属第二医院

目的 探索绝经后乳腺癌患者治疗后的骨质疏松患病率及相关影响因素。**方法** 对 147 例绝经后的乳腺癌患者的临床据资料进行回顾性分析，采用 DXA（Dual-energy x-ray absorptiometry 双能 X 线骨密度吸收仪）进行骨密度检测（包括腰椎正位(L1 -L4) 、股骨颈以及全髋的 BMD 测定），按乳腺癌受体不同表达（ER、PR、her-2）、年龄、BMI、绝经时间、术后时间、治疗方法进行分组，对影响骨密度减低的相关因素进行单因素分析及多因素 Logistic 回归分析。**结果** 147 例乳腺癌患者治疗后的骨质疏松患病率为 40.8%；年龄、BMI、绝经时间、治疗（内分泌治疗+化疗）、术后时间与骨密度减低呈显著相关（$P<0.05$），多因素 Logistic 回归分析显示年龄、BMI、术后时间是骨密度减低的主要影响因素（$P<0.05$）。**结论** 乳腺癌患者具有较高的骨质疏松患病率，乳腺癌治疗的多种因素都能够减低骨密度。雌激素是 BMD 与乳腺癌之间的关键，因为它在调节骨转换中的作用及其对乳腺癌细胞的作用。绝经后发生的生理雌激素剥夺破坏了破骨细胞-成骨细胞的活性，促进了骨密度的丧失，从而增加了骨质疏松和脆性骨折的风险，这与本次研究中绝经年限对骨质疏松的影响结果是一致的。术后化疗后的乳腺癌患者具有高骨质疏松患病率（40.8%），其影响因素与年龄、术后时间、手术时是否绝经、内分泌治疗具有相关性；雌激素与孕激素在维持女性正常骨量和骨代谢中起着很大的作用，雌激素与雌激素受体（ER）相结合，直接调节成骨细胞的骨形成和破骨细胞的骨吸收。本研究发现乳腺癌受体不同表达（ER、PR、HER-2）差异无显著性差异。因此对于治疗后的乳腺癌患者，都应当早期进行骨密度检查，定期监测骨密度，尽早对骨量丢失及骨质疏松进行干预，降低骨质疏松的患病率，提高乳腺癌患者的生活质量及生存率。

PO-058
对比分析不同类型乳腺病变钙化特征在 DBT 和 FFDM 的表现

陈穹,潘鑫,侯羽宇,王钢,虞梅
上海市徐汇区大华医院

目的 对比分析不同类型乳腺病变 DBT 与 FFDM 的良、恶性钙化特征。**资料与方法** 回顾性分析 1263 例同时行乳腺 DBT 与 FFDM 检查的患者，统计两种检查方法下不同类型乳腺良、恶性钙化的检出率及诊断效能，对恶性钙化形态、分布特征情况进行组间对比分析。**结果** 1263 例患者非致密型乳腺 240 例，良性钙化 56 例，恶性钙化 13 例；致密型乳腺 1023 例，良性钙化 356 例、恶性钙化 63 例。非致密型乳腺中，DBT 与 FFDM 对良性钙化检出率分别为 22.9%(55/240)、21.7%（52/240），χ^2值：0.108，p=0.826;恶性为 5.0%（12/240）、4.6%（11/240），χ^2值：0.046，p=1.000，差异均无统计学意义。恶性钙化形态、分布特征比较，差异均无统计学意义。致密型乳腺中，DBT 与 FFDM 对良性钙化检出率分别为 34.2%（350/1023）、31.9%（326/1023），χ^2值：1.273，p=0.280；恶性为 6.0%（61/1023）、5.2%（53/1023），χ^2值：0.595，p=0.441），差异均无统计学意义；恶性钙化的形态、分布特征比较均无统计学差异，成簇分布、细小多形性钙化检出率 DBT 高于 FFDM。乳腺钙化诊断效能比较，非致密型乳腺 DBT 模式下 ROC 曲线下面积 0.993，FFDM 模式下为 0.992，两者比较 Z=0.2，p=0.984，致密型乳腺 DBT 模式下 ROC 曲线下面积为 0.987，FFDM 模式下为 0.964，两者比较 Z=1.716，p =0.085，差异均无统计学意义。**结论** 乳腺 DBT 技术比较 FFDM，对乳腺钙化的诊断效能比较无明显差异，但在致密型乳腺中，对良性钙化及恶性钙化中的细小多形性钙化、成簇分布钙化的检出具有一定优势，可提高对乳腺钙化 BI-RADS 分类的准确率。

PO-059

Preoperative Prediction Value of Multidetector Computed Tomography for HER2 Status in Patients with Breast Cancer: Combination Analysis of Deep Learning and Handcrafted Radiomics

Xiaojun Yang
Guangdong Provincial People's Hospital

Objectives: To investigate whether handcrafted radiomics features and deep learning features combined model based on multidetector computed tomography (MDCT) can preoperatively predict the human epidermal growth factor receptor 2 (HER2) status in breast cancer.
Methods: This retrospective study enrolled 339 female patients (primary cohort, n =177; validation cohort, n =162) with pathologically confirmed breast cancer. Patients underwent immunohistochemistry (and fluorescent in situ hybridization) tests for HER2 status and contrast-enhanced MDCT before treatment. Deep and handcrafted radiomics features were extracted from arterial phase CT images. After the feature selection procedures, deep and handcrafted radiomics signatures were built. The combined model was built using multivariable logistic regression analysis. The performance of model was assessed by measures of discrimination, calibration and clinical usefulness. Finally, an independent validation cohort was used to confirm the combined model's predictive performance.
Results: The handcrafted radiomics signature demonstrated the discrimination ability with a C-index of 0.739 (95% confidence interval [CI]: 0.661-0.818) in primary cohort and 0.695(95% CI: 0.609-0.781) in validation cohort. The deep radiomics signature demonstrated discrimination ability with a C-index of 0.760(95% CI: 0.690-0.831) in primary cohort and 0.777(95% CI: 0.696-0.857) in validation cohort. The combined model

which incorporated the handcrafted radiomics features and deep radiomics features showed good discrimination ability by achieving a C-index of 0.829(95% CI: 0.767-0.890) in primary cohort and 0.809(95% CI: 0.740-0.879) in validation cohort.
Conclusions: The proposed MDCT-based combined radiomics model for HER2 status in breast cancer using the incorporation of handcrafted and deep radiomics signatures showed good predictive performance.

PO-060
影像组学：基于 BI-RADS 分类标准图像特征建立乳腺肿块型病变良恶性鉴别模型的临床应用探讨

何子龙[1],李悦[2],秦耿耿[1],曾辉[1],徐维敏[1],文婵娟[1],汪思娜[1],陆遥[2],陈卫国[1]
1.南方医科大学南方医院
2.中山大学

目的：本研究利用 BI-RADS 分类标准图像特征建立有效的特征提取器来进一步提高影像组学模型在全视野数字乳腺 X 线摄影（Full Field Digital Mammography FFDM）区分良恶性肿块型病变的能力。
材料与方法：目前，影像组学特征提取及分析已被广泛应用于全视野数字乳腺 X 线摄影中乳腺癌的诊断或者分类，但由于缺乏高特异性的临床特征和致密型乳腺腺体的影响，导致影像组学模型在分类或诊断乳腺癌病变时效能不高。为了更好的找出临床特征与影像组学特征之间的量化关系及提取更多有意义的临床相关特征，我们设计一个影像医师经验相关性高的特征提取器。首先，让 3 名高年资的乳腺影像诊断医师根据 BI-RADS 分类标准，提取每个患者图像中肿块病灶的影像学特征，分别为①形状（圆形、椭圆形、不规则形），边缘（清晰、遮蔽、模糊）、密度（高、等、低、脂肪密度）。然后，利用五种量化的质量相关特征训练了改进的深度神经网络，并在此基础上建立了临床图像特征提取器。将包含肿块的区域输入提取器，在每个肿块提取 128 维的临床-图像特征。本研究收集 220 个患者的图像，年龄 23-73 岁，2014-2017 年内进行乳腺 X 线摄影，通过病理组织学证明的单侧乳腺肿块型病变，最后共纳入 108 例良性、112 例恶性病例进行回顾性分析。我们使用两组影像组学方法对比研究（逐步回归及线性判别分析），分别对病变进行分类。对两组方法的诊断效能进行分析，获取其 AUC 值及 ROC 曲线。
结果：通过十组交叉验证，运用临床-图像特征及传统模型诊断能力较单纯传统模型的强，且有明显统计学意义，AUC = 0.95 ±0.03 vs 0.91±0.03, $p < 0.05$。
结论：利用 BI-RADS 分类标准的临床-图像特征能有效提高影像组学模型在乳腺肿块型病变的诊断能力。

PO-061
Radiomics Analysis on Cone-Beam Breast CT: Prediction of Breast Cancer Immunohistochemical Subtypes

Yue Ma,Yuwei Zhang,Aidi Liu,Yueqiang Zhu,Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

Purpose: To investigate the feasibility of Cone-Beam Breast CT (CBBCT) - based radiomics features predicting the immunohistochemical (IHC) subtypes of invasive breast cancer.
Materials and Methods: In this retrospective study, we collected female patients, aged 30 to 75 years, who underwent pretreatment CBBCT with satisfying image quality and were pathologically confirmed invasive breast cancers carrying IHC result. 866 features were extracted from each volume of lesion. Multinomial LASSO minimizing misclassification error was used to fit the optimal prediction model after removing highly colinear features. The performance of model was assessed through confusion matrix followed by accuracy, sensitivity and specificity.
Results: Of 133 lesions (28 luminal A, 71 luminal B, 21 HER-2-enriched, and 13 triple-negative) included in this study, discovering cohort was composed of 112 subjects with 28 lesions per subtype which was resampled and augmented by synthetic minority oversampling technique on account of data imbalance. The model eventually comprised 49 selected features and yielded an overall accuracy of 0.759 (95%CI: 0.677-0.829), with sensitivity of 0.9643, 0.6761, 0.7619, 0.7692, and specificity of 0.8286, 0.9032, 0.9911, 0.9417 for each subtype validated by original cohort.
Conclusion: Based on pre-treatment CBBCT data, we developed a radiomics model preforming well in breast cancer subtype prediction. Thereby, CBBCT-based radiomics signature could be an underlying IHC subtype predictor of breast cancer. As a new CT equipment, CBBCT has potential in assisting individualized treatment strategy selection and clinical outcome predicting for breast cancer patients.

PO-062
数字乳腺断层摄影（DBT）和 2D 乳腺 X 线摄影对乳腺“结构扭曲”病变诊断的对比研究

吴建萍,李卓琳,涂艳,丁莹莹
云南省肿瘤医院（昆明医科大学第三附属医院）

目的 比较乳腺数字断层摄影（DBT）和 2D 乳腺 X 线摄影对结构扭曲的显示，并确定 DBT 在鉴别结构扭曲良恶性的价值。**方法** 回顾性分析 58 例（21 例恶性和 37 例良性）乳腺 X 线摄影表现为结构扭曲的病变。比较 DBT 影像和 2D 乳腺 X 线摄影对结构扭曲的可见性，并分析结构扭曲病变的中心密度、周围纠集条索成分及钙化来鉴别良恶性，同时对乳腺 X 线摄影中乳腺密度对结构扭曲可见性的影响进行评价。**结果** 与 2D 乳腺 X 线摄影相比，DBT 对结构扭曲发现率为 100%，且不受乳腺腺体密度的影响。2D 乳腺 X 线摄影发现率为 56.7%。相较于 2D 乳腺 X 线摄影，DBT 显示结构扭曲病变中心密度的准确性提高，DBT 显示病灶中心高密度与恶性病变密切相关，二者差异有统计学意义。结构扭曲周围纠集条索的长短与病变的良恶性差异无统计学意义，但是 DBT 显示周围纠集条索明显优于 2D。2D 乳腺 X 线摄影显示结构扭曲受周围腺体密度影响，但差异无统计学意义，评价病灶中心密度较 DBT 假阳性率高。**结论** 与 2D 乳腺 X 线摄影相比，DBT 能更好地显示结构扭曲。DBT 评价结构扭曲病变的良恶性准确性明显高于 2D 乳腺 X 线摄影，DBT 能够更好的显示病变的细节，有利于良恶性病变的鉴别。

PO-063

Background Parenchymal Enhancement on Contrast-enhanced Spectral Mammography

Shuang Zhao,Xueqin Zhang,Huanhuan Zhong,Yun Qin,Juan Huang,Jianqun Yu
Sichuan University， West China Hospital

Objectives: To assess the background parenchymal enhancement (BPE) at contrast material–enhanced spectral mammography (CESM) by category and quantitative, and evaluate how these relate to age, breast density, menopausal status and menstrual cycle timing.
Methods: This was a retrospective, institutional review board–approved study. 265 subjects who underwent CESM and had menopausal status records from July 2017 to March 2019 were included. Categorize assessment of BPE level was performed subjectively. Quantitative enhancement degree was measured using a region of interest (ROI). The univariate and multivariate associations between BPE and age, breast density, menstrual status, menstrual cycle timing was examined by using corresponding statistical analysis methods.
Results: 265 subjects were included in age and breast density analysis; in which 208 subjects were included in the menopausal status analysis. The BPE categorical analysis showed a negative correlation between category and age (Kendall’s tau-b=-0.138, p =0.004), menstrual status (rs = -0.333, p < 0.001), but no correlation between breast density (p =0.586), menstrual cycle timing (p =0.094). Ordered logistic regression showed BPE category was not associated with age (p =0.406), but associated with breast density and menstrual status. The BPE quantitative analysis showed a negative correlation between age and difference value in ROI (rs=-0.157, p=0.010), a statistically significant difference between the menstrual status (U=2850, Z=-3.850, p <0.001), but no significant difference in the breast density (H= 4.869, p =0.088), menstrual cycle timing (H = 7.175, p = 0.067). The multiple linear regression results showed the difference value in ROI was related to menstrual status (p =0.001), but not related to age (p =0.486) and breast density (p =0.463).
Conclusion: BPE on CESM is higher in premenopausal than postmenopausal women, and negative correlation with age, no significantly correlation with breast density and menstrual cycle timing.

PO-064

The feasibility and capability of CT-based radiomics nomogram in predicting disease-free survival for patients with pancreatic ductal adenocarcinoma following curative resection

tiansong Xie,Xuanyi Wang,Zhengrong Zhou
Fudan university Shanghai cancer center

Purpose: The aim of this study is to develop and validate a nomogram model combining radiomics features and clinicopathological characteristics to preoperatively predict disease-free survival (DFS) for patients with pancreatic ductal adenocarcinoma (PDAC) following curative surgery.
Methods: A total of 255 PDAC patients who underwent contrast enhanced CT in Fudan university Shanghai cancer center were enrolled in this study. 147 patients were divided into the training cohort and 88 patients were divided into the validation cohort. The portal venous phase CT image was selected for radiomics features extraction. The least absolute shrinkge and selection operator (LASSO) regression was applied to features selection and radiomics score construction. The Kaplan-Meier (KM) analysis was used for subgroups survival analysis, including different TNM stage subgroups and single agent gemcitabine adjuvant chemotherapy subgroup. The multivariate Cox proportional hazards model incorporating radiomics score and clinicopathological factors was developed and was presented as the nomogram. The utility of the proposed model was evaluated by the concordance index, calibration curve, and decision curve analysis.
Results: A total of eight radiomics features were selected by LASSO regression and the radiomics score was calculated by a linear combination of selected features. The DFS prediction nomogram incorporating radiomics score and clinical data showed the better performance (training cohort: C-index = 0.78, validation cohort = 0.73) compared with the TNM staging system and clinicopathological model. The calibration curve and DCA demonstrated the clinical usefulness of the proposed nomogram.The KM analysis showed a significant difference between the survival in most of the TNM stage subgroups and gemcitabine adjuvant chemotherapy subgroup.
Conclusions: The radiomics based nomogram model could be useful in improving postoperative individualized DFS estimation in PDAC patients and to guide personalized care.

PO-065
Nonrigid subtraction technique in Multiphase enhancement liver CT

Zi Yan,Meng Wang,Shi ting Feng
The First Affiliated Hospital of Sun Yat-sen University

Objective To evaluate the quality and clinical value of nonrigid subtraction in Multiphase enhancement of liver CT. **Methods** The image data of 50 patients underwent Multiphase enhanced liver CT examination were retrospectively collected, and the subtraction images were obtained by nonrigid subtraction technique. Qualitative evaluation included image artifacts and anatomical mismatch degree. The CT values of each blood vessel (abdominal aorta, right hepatic artery, left hepatic artery, portal vein trunk, right portal vein branch, left portal vein branch) before and after the subtraction were measured quantitatively in the arterial and portal vein phases, and the dynamic change curve of the CT values was drawn to evaluate the fitting degree of the CT values between the arteries and portal veins before and after

the subtraction. **Results** The consistency of the three observers was high (ICC=0.844, P<0.001). CT value of each blood vessel before subtraction was slightly higher than that after subtraction. The 95% confidence intervals of the slopes of the two lines intersect, and the slopes of the two lines are consistent. There were no obvious artifacts caused by anatomical mismatch in the images after subtraction. The CT value curves of the arteries and portal veins before and after subtraction were consistent. **Conclusion** Nonrigid subtraction technique can be applied to Multiphase enhancement of liver CT and obtain high quality images.

PO-066

基于 ADC 和 FA 信号强度图的全肿瘤纹理特征对肿块型肝内胆管细胞癌和单发少血供 肝转移瘤的鉴别价值

赵莹[1],刘爱连[1],陈丽华[1],李烨[1],郭妍[2],李昕[2],吴艇帆[2],宋清伟[1]
1.大连医科大学附属第一医院
2.通用电气医疗

目的 探讨弥散张量成像（DTI）的表观扩散系数（ADC）和各向异性分数（FA）的全肿瘤纹理特征鉴别肿块型肝内胆管细胞癌（IMCC）和单发少血供肝转移瘤（SHHM）的价值。**材料与方法** 回顾性收集 53 例经病理或随访证实为 IMCC 或 SHHM 的患者（24 例 IMCC，29 例 SHHM）。所有患者均进行了术前 MRI 检查，包括常规扫描（T_1WI、T_2WI 和动态增强扫描）和 DTI 序列（b 值=0, 600 s/mm^2）。在 GE AW 4.6 工作站，使用 Functool 软件重建 DTI 图像，生成 ADC 及 FA 图，将其导入 Omni-Kinetics 软件（GE Healthcare）。在 ADC 和 FA 信号强度图上手动勾勒出病变各层面的感兴趣区域（ROI），自动生成覆盖全肿瘤的 ADC 和 FA 信号强度的纹理特征，包括 GLCM（能量值、熵值、惯性、相关性、逆差分矩（IDM））和 GLRL（灰度不均匀性、游程长度不均匀性）。采用 Mann-Whitney U 检验比较两组间纹理特征，采用 ROC 分析评估诊断效能。**结果** IMCC 组和 SHHM 组 ADC 信号强度的惯性、相关性、IDM、灰度不均匀性和游程长度不均匀性差异有统计学意义（*P*=0.032, 0.002, 0.038, <0.001, <0.001），两组间 FA 信号强度的能量值、灰度不均匀性和游程长度不均匀性差异有统计学意义（P=0.037, <0.001, <0.001）。其余参数差异无统计学意义。ADC 和 FA 信号强度的灰度不均匀性鉴别 IMCC 和 SHHM 的诊断效能最高，AUC 分别为 0.820 和 0.787，灵敏度和特异度分别为 79.2%（86.2%）和 70.8%（82.8%）。**结论** 基于 DTI 的纹理特征可用于术前鉴别 IMCC 和 SHHM。

PO-067

An uncommon hepatic cystic lesion: mucinous hepatic neoplasm and a review of the literature

Yan Yang,Guangxian Wang
The Second Affiliated Hospital of Army Medical University (XinQiao Hospital)

Background
Hepatic cysts are increasingly found on abdominal imaging techniques, among which simple cysts are common, while the complex hepatic cystic lesions often present a diagnostic challenge. The differential diagnosis of complex cystic lesions includes

hepatic mucinous neoplasm, biliary intraductal papillary mucinous neoplasm, atypical simple cyst, hepatic hydatid cyst, hepatic abscess, etc. Hepatic mucinous cystic neoplasm is a rare benign lesion, with propensity for local recurrence and malignant transformation.

Case presentation
A 59-year-old woman was diagnosed to have a hepatic cystic neoplasm, with enlargement in the last 2 years. Abdominal computed tomography revealed a multilocular cystic lesion of 14X11 mm in size with internal septal formoation, calcification, minimal wall thickness and a nodular component in segment IV of the liver. Magnetic resonance imaging demonstrated multiple well-defined cystic lesions with low signal intensity on TIWI and high signal intensity on T2WI inside, and septal and mural calcifications showed low signal intensity on T1WI and T2WI, while mural nodule showed high signal intensity on T2WI. The entire tumor was successfully resected with a laparoscopic approach. Histological study confirmed a mucinous hepatic cystic neoplasm.

Discussion
Complex Hepatic cysts usually present with wall thickening or irregularity, septations, calcification, mural nodule or enhancement. While ultrasonography and abdominal CT can confidently diagnose benign simple cysts, MRI can fully evaluate complex cystic lesions; however, it is difficult to make a definitive diagnosis preoperatively. Histological examination is the only way to differentiate between benign and malignant lesions.

Conclusion
We report a case of a patient diagnosed with hepatic mucinous neoplasm. The following brief review describes the radiologic features of the broad spectrum of cystic hepatic lesions.

PO-068

Early- and late-phase vascular involvement associated with acute pancreatitis: initial findings and follow-up by magnetic resonance imaging

Bo Xiao[1,2], Hai-bo Xu[1], Xiao-ming Zhang[2]
1.Department of Radiology, Zhongnan Hospital of Wuhan University
2.Sichuan Key Laboratory of Medical Imaging, Department of Radiology, Affiliated Hospital of North Sichuan Medical College

Purpose To investigate MRI findings of early- and late-phase vascular abnormalities in acute pancreatitis (AP) and correlate the prevalence of vascular involvement with AP severity based on MR severity index (MRSI) and Acute Physiology and Chronic Health Evaluation (APACHE) II score. **Methods** Retrospectively studied 301 consecutive AP patients admitted to our institution and underwent initial MRI during the early-phase of pancreatitis and one or more following MRI in the late-phase. Peripancreatic vascular conditions and pancreatitis were assessed on T1-/T2-weighted imaging and

dynamic-enhanced MRI. The association between prevalence of vascular involvement and AP severity graded by the MRSI or APACHE II was respectively analyzed by Spearman's rank correlation. **Results** Based upon initial MRI, 176 (58.5%) had edematous pancreatitis, whereas 125 (41.5%) had necrotizing pancreatitis. Mean MRSI score was 3.8 points (range, 1-10) for the 301 patients, 2.7 points for edematous pancreatitis, and 5.3 points for necrotizing pancreatitis. According to MRSI, the mild, moderate, and severe pancreatitis was 46.8% (141/301), 44.6% (134/301), and 8.6% (26/301). Among 301 AP patients, 75 (24.9%) had at least one MRI-detected vascular abnormalities. The prevalence of vascular involvement was higher in necrotizing pancreatitis than in edematous pancreatitis (43.2% [54/125] vs. 11.9% [21/176] , $x^2 = 38.2$, $p < 0.001$). The prevalence of splenic vein phlebitis, portal vein phlebitis, and splenic arterial arteritis was 24.9%, 22.3%, and 19.9% on MRI in the early-phase. Of the 75 patients with splenic vein phlebitis, 44% (33/75) of them had splenic vein stenosis with a mean diameter of 3.5 mm (range, 2-5.5 mm). Depending on MRSI, the prevalence of splenic phlebitis, portal vein phlebitis, and splenic arterial arteritis, respectively correlated with the severity of pancreatitis ($r = 0.532$, 0.487, and 0.456; all $p < 0.01$); According to APACHE II scores, the prevalence of vascular involvement significantly correlated with AP severity ($r = 0.335$, $p < 0.05$).**Conclusion** Vascular abnormalities (especially in splenic vein phlebitis and splenic arterial arteritis) on MRI are common in the early-phase of AP, which may be supplementary indicators in reflecting the severity of AP.

PO-069

Clear cell myomelanocytic tumor of the falciform ligament/ligamentum teres

Yan Tan,Hui Zhang
The first hospital of Shanxi medical university

Clear cell myomelanocytic tumors (CCMTs) of the falciform ligament/ligamentum teres are extremely rare. CCMTs are a variant of perivascular epithelioid cell tumors. We present a case of hepatic CCMT in a 54-year-old woman with abdominal pain. The patient had an 8.8 cm well-demarcated tumor in the right lobe of the liver. Contrast-enhanced computed tomography showed a heterogeneous mass that enhanced significantly in the arterial and portal venous phases, and was less enhanced in the delayed phase. The patient underwent a right hemihepatectomy and cholecystectomy. The tumor cells had clear to slightly eosinophilic cytoplasm, vesicular nuclei, and were positive for HMB-45 and smooth muscle actin. The patient had no recurrence after 36 months follow-up. A review of the literature identified 10 hepatic CCMTs. Hepatic CCMTs are usually benign tumors of young women that present as large masses located in the right lobe of the liver.

PO-070

Deep Learning-Based Radiomics Model for Predicting Early Recurrence of Hepatocellular Carcinoma

Qingqing Chen[1],Weibin Wang[2],Hongjie Hu[1],Lanfen Lin[3],Yanwei Chen[2]
1.Sir Run Run Shaw Hospital
2.Ritsumeikan University
3.College of Computer Science and Technology, Zhejiang University

Purpose:
To propose a deep-learning-based radiomics approach for predicting early recurrence of hepatocellular carcinoma using multi-phase CT images.

Methods and Material:
Consecutive 167 surgically resected and pathology confirmed HCC patients were enrolled in this retrospective study. Among them, 65 patients were early recurrence (ER) within 1 year after surgery and 102 patients were non-early recurrence (NER). The bounding box of tumor is manually outlined on non-contrast, arterial phase and portal venous phase CT images at ITK-SNAP by a 3-year experienced radiologist. In addition, traditional clinical indicators such as gender, age, tumor number, tumor size, portal vein invasion, HBV infection, ALT, AST, AKP, NLR, cirrhosis, BCLC stage, AFP level were also included in this study. We randomly divided 167 patients into 10 groups to train and test the model using 10-fold cross-validation. Four deep learning-based combined models with radiomics signatures and clinical data were built to evaluate the predictive performance. The area under ROC curves (AUC) were analyzed to compare the radiomics model and clinical model, as well as combined models A, B, C, D.

Results:
The AUCs of radiomics model with or without fine-tuning were 0.723 and. 0.678, which was inferior to the clinical model as 0.7044 for SVM and 0.7532 for random forest. Furthermore, deep radiomics model is superior than the conventional radiomics model based on hand-crafted low-level features (AUC=0.825vs.0.765). And the AUCs of combined models from A to D were 0.788,0.805,0.765,0.825, respectively.

Conclusion:
Deep learning-based radiomics model was helpful for the preoperative prediction of early recurrence of HCC. Incorporating radiomics signature and clinical factors performed better than radiomics or clinical model alone.

PO-071
钆塞酸二钠肝脏增强多动脉期 DISCO 成像技术评价动脉晚期采集和图像质量与单动脉期对比研究

唐鹤菡,魏毅,宋彬*
四川大学华西医院

目的 探讨基于笛卡尔采集的 K 空间共享三维容积快速动态成像（DISCO）多动脉期成像技术在钆塞酸二钠肝脏增强 MRI 上的应用价值。

方法 前瞻性收集 2017 年 9 月至 2018 年 3 月四川大学华西医院经超声或 CT 检查怀疑恶性局灶性肝脏病变的 56 例患者，术前均行钆塞酸二钠肝脏增强 MRI 检查。采用随机数字表法将患者分组，A 组 29 例，采用 DISCO 技术行肝脏多动脉期成像；B 组 27 例，采用 LAVA-Flex（liver acquisition with volume acceleration-flex，肝脏容积快速采集联合两点法水脂分离技术）序列行单动脉期成像，评价动脉晚期图像的显示率和动态增强图像的呼吸运动伪影。分类变量间比较采用 x^2检验，单动脉期与多动脉期间呼吸运动伪影的比较采用 Mann-Whitney U检验，多动脉期各时相间伪影评分的比较采用 Kruskal-Wallis H检验。

结果 A 组患者的 DISCO 序列中，96.6%（28/29）的患者观察到动脉晚期，高于采用 LAVA-Flex 采集的单动脉期成像[74.1%（20/27）]，差异有统计学意义（x^2=5.77，P=0.016）。在呼吸运动伪影的评价中，LAVA-Flex [3（3，4）]获得的动脉晚期图像的运动伪影较 DISCO 序列[2（2，3）]更严重，差异有统计学意义（Z=－3.250，P <0.01）。DISCO 序列 6 个期相运动伪影的评分中，第 1、2、3、4、5 和 6 期的伪影评分分别为[3（3，4）]、[2（2，3）]、[2（2，3）]、[3（2，3）]、[3（3，4）]和[3（3，4）]分，第 2、3、4 期的伪影评分明显优于第 1、5、6 期，差异有统计学意义（P＜0.05），但第 2、3、4 期间差异均无统计学意义（P＞0.05）。

结论 相较于单动脉期成像，钆塞酸二钠肝脏增强 DISCO 多动脉期采集可提高动脉晚期采集效率并减少运动伪影。

PO-072

T1 mapping on gadoxetic acid-enhanced MR imaging for preoperative prediction of microvascular invasion in hepatocellular carcinoma

Zhen Zhang, Jie Chen, Hanyu Jiang, Bin Song
West China School of Medicine, West China Hospital, Sichuan University

Purpose

The aim of our study was to explore the ability of T1 mapping on gadexetic acid-enhanced MR imaging in predicting MVI and early recurrence of HCC after curative resection.

Methods

79 patients with surgically confirmed HCC (27 MVI-positive lesions and 52 MVI-negative lesions) were prospectively examined and followed up for at least 1 year after resection. Freehand region of interests (ROIs) were outlined around the largest cross-sectional area of the tumor on pre-enhancement and hepatobiliary phase (HBP)T1 maps. Pre- and postcontrast T1 relaxation time, reduction rate of T1 relaxation time (△%), and radiologic findings (tumor margin, corona enhancement, peritumoral hyperintensity on HBP, and the signal intensity on HBP images) were then assessed. Univariate and multivariate logistic regression analyses were performed to identify the independent predictors of MVI and early recurrence. The diagnostic ability of these parameters was evaluated by receiver operation characteristic (ROC) analysis.

Results

Peritumoral hypointensity on HBP (Odds Ratio [OR]=0.308, 95% confidence interval [CI]: 0.094-1.016; p=0.053), pre-contrast T1 relaxation time (OR=1.048,95%CI: 1.001-1.070; p=0.032) and reduction rate of T1 relaxation time (OR=0.238,95%CI: 0.068-0.814; p=0.005) were independently related to MVI. Reduction rate of T1 relaxation time showed the highest area under the receiver operating characteristic curve (AUC) value of 0.702 for predicting MVI, followed by pre-contrast T1 relaxation time and peritumoral hypointensity on HBP (AUC=0.678 and 0.639, respectively). Incorporating all these independent factors, the AUC of 0.825 (95%CI: 0.727-0.923) was obtained, with sensitivity of 74.1% and specificity of 80.8%.
For early recurrence, only radiologic findings, corona enhancement (p=0.013) and signal intensity on HBP images (p=0.015), were identified as independent predictors.

Conclusion
Combined with the presence of peritumoral hypointensity on HBP, T1 mapping on gadoxetic acid enhanced MRI demonstrated great potential in the preoperative prediction of MVI.

PO-073

Spectral CT imaging of splenic arteriography and venography by using a low injection velocity and low dose contrast medium protocol before laparoscopic gastrectomy during the patients of gastric carcinoma with poor vascular condition

Jin Wei
Fujian Medical University Union Hospital

Objective To investigate the value of splenic arteriography and venography by using spectral CT imaging with a low injection velocity and low dose contrast medium protocol before laparoscopic gastrectomy during the gastric cancer patients who had relatively poor vascular condition and could not afford high injection velocity and high dose contrast medium.
Methods Totally eighty patients of gastric carcinoma weighing between 50 to 70 kg in our hospital referred to upper abdominal routine contrast-enhanced CT scans (50 mL of 320mgI and 30 mL of saline at 2 mL/s) were selected in this study. Forty cases were used GSI mode(single source dual energy fast 80/140kVp switching) and the other forties were used 120KVp scan with automatic mA modulation. All the data of arterial and venous phase were transmitted to AW4.5 workstation and optimal KeV of splenic artery was selected by using optimal CNR tool. CT value and SD value of proximal splenic artery and erector spinae were measured in every data set of keV and 120KVp images. CT values and CNRs of splenic artery and vein were calculated and compared by independent-sample t test separately. CTA images in the arterial and venous phase (3D CT arteriography) were reconstructed using the volume-rendering technique. The VR(volume rendering, VR) images quality of optimal KeV and 120 KVp data sets were evaluated by two experienced CT radiologists independently. The visibility of the

splenic artery and vein were evaluated and recorded on a five-point scale (1 for poor and 5 for excellent). And then average image score at optimal keV and 120KVp were calculated and compared by independent-sample t test.

Results The optimal keV of splenic artery enhancement was 50.85±4.04keV. The CT value and CNRs of images from optimal keV were both significant higher than those of 120KVp scan CT values were 352.99±108.03 HU(optimal keV) vs 179.63±41.49HU(120KVp) (t=8.42,P=0.00<0.05) and CNR were 12.38±6.22(optimal keV) vs 9.50±5.64(120KVp) (t=10.88, P=0.00<0.05). The VR image score of visibility of splenic artery at optimal keV(3.96±0.67) was significant higher than 120KVp(2.15±0.81) ,(t=8.72,P=0.00 <0.05). The optimal keV of splenic vein enhancement similar with routine 120KVp upper abdominal contrast-enhanced CT was 49.40±5.08keV. The CT value and CNRs of images from optimal keV were both significant higher than those of 120KVp scan CT values were 279.22±106.86 HU(optimal keV) vs 279.22±106.86HU(120KVp) (t=7.52,P=0.00<0.05) and CNR were 8.05±3.12 (optimal keV) vs 5.80±2.72HU(120KVp) (t=6.63,P=0.00<0.05). The VR image score of visibility of splenic vein at optimal keV (3.45±0.76) was significant higher than 120KVp(1.65±0.88), (t=11.57,P=0.00 <0.05).

Conclusion Monochromatic images at 50.85±4.04 and 49.40±5.08 keV provided the best visibility of splenic artery and vein than conventional 120 KVp in upper abdominal contrast-enhanced CT scan during the patients with poor vascular condition before laparoscopic gastrectomy. 50keV monochromatic images could be used routinely for reconstruction of both splenic artery and vein.

Clinical relevance /application:

Spectral monochromatic imaging is a promising method to reduce contrast dose and injection velocity substantially and provides good image quality of artery and vein especially during the gastric carcinoma patients with poor vessel condition before laparoscopic gastrectomy.

PO-074

Intravoxel incoherent motion (IVIM) imaging for differential diagnosing hepatocellular carcinoma (HCC), hepatic hemangioma (HHA) and hepatic metastasis (HM)

Ye Ju,Ailian Liu
The First Affiliated Hospital of Dalian Medical University

OBJECTIVE To compare the pure molecular diffusion, D, perfusion-relate ddiffusion, D^*, and perfusion fraction, f of the intravoxel incoherent motion(IVIM) theory in differentiating hepatocellular carcinomas (HCCs), hepatic hemangiomas (HHAs) and hepatic metastasis (HMs), for providing a valuable method for the differential diagnosis of these three parenchyma tumors of liver.

SUBJECTS AND METHODS This retrospective study was approved by our Institutional Review Board and written informed consent was waived. Seventy-one patients (40 men vs. 31 women, mean age 62 years old) with 33 hepatocellular carcinomas (HCCs), 24 hepatic hemangiomas (HHAs) and 14 hepatic metastasis (HMs) were enrolled in this study and inspected conventional MR and IVIM-MR examination with 1.5-T MR imager from January 2015 to October 2015. MRI protocol containing the routine T1WI, T2WI and 19 b values

(0, 10, 30, 50, 80, 100, 120, 150, 180, 200, 300, 500, 800, 1000, 1200, 1500, 2000, 2500 and 3000 s/mm^2) were used to evaluate diffusion and perfusion characteristics of IVIM. IVIM parameters (ADC, D, D*, and f) of HCCs, HHAs and HMs were measured by using the FuncTool on GE AW4.6 workstation. The MR images were blindly reviewed and analyzed by two observers who have 3 and 10 years' experience of MR diagnosis respectively. The SPSS17.0 statistical software has been used for the data analysis, p value less than 0.05 was considered statistically significant. Intraclass correlation coefficient (ICC) test was applied to test the consistency of two observers; compared the ADC, D, D*, and f of the three groups by Mann-Whitney test, respectively.

RESULTS The ICC values of the IVIM parameters (ADC, D, D*, and f were all greater than 0.75 in the three groups, exhibiting an amenable consistency; The ADC, D and f of the HHAs were significantly higher ($p < 0.05$) than the HMs. But the D* did not show any statistically significant difference between the HHAs and the HMs ($p > 0.05$); The ADC, D and f of HHAs were significantly higher ($p < 0.05$) than HCCs, while the D* of HHAs were significantly lower ($p < 0.05$) than HCCs; The ADC, D, D*, and f did not show any statistically significant difference between the HCC and the HMs ($p > 0.05$).

CONCLUSION According to our study, the HHAs, HCCs and HMs showed different IVIM parameters (ADC, D, D*, and f values). D and f were significantly decreased in malignant tumors. The reduction in D* reflects tumors decreased perfusion in HCCs. IVIM imaging facilitates understanding of tumor tissue characteristics of perfusion and diffusion, and it may provide more useful information to distinguish HHAs from other two malignant tumors.

PO-075

CT 影像征象及组学特征在鉴别不同分化消化系统神经内分泌肿瘤肝转移中的价值

谷小磊,李晓婷,朱海涛,崔湧
北京大学肿瘤医院

目的：探讨 CT 影像学征象及组学特征在鉴别不同分化消化系统神经内分泌瘤肝转移中的价值。**方法**：收集 2010 年 5 月至 2018 年 6 月北京大学肿瘤医院消化系统神经内分泌肿瘤肝转移患者，经病理证实且疗前有增强 CT，由两名影像医师评价 CT 征象（肝转移灶分布、形态、病灶动脉期边缘、肝动脉期强化、增强类型、囊变坏死、瘤内新生血管、瘤周动脉期一过性强化灶、血管侵犯、淋巴结转移及腹水），应用 Logistic 回归分析确定独立危险因素，计算 AUC；并用 3D Slicer 软件在门静脉期 CT 图像上勾画最大病灶的 ROI 区，应用 Radiomics 模块提取特征，包括：一阶统计特征、几何特征及纹理特征三类共 841 个，采用元转换器（Meta-transformer ）基于重要性权重（importance weights）筛选特征，利用 XGBoost 模型计算 AUC。**结果**：入组患者共 123 例，其中 G 1 与 G 2 患者 44 例，G 3 患者 79 例。CT 影像评价结果：G3 型肝转移灶动脉期边界不清比例高于 G1/2 型［83.5%（66 / 79）vs 63.6%（28 / 44），$x^2=6.22$，$P=0.01$］;G1/2 型肝转移伴淋巴结肿大比例低于 G3 型［34.1%（15 / 44） vs 75.9%（60 / 79），$x^2=20.81$，$P<0.01$］；Logistic 回归分析结果：病变动脉期边缘、瘤内新生血管、瘤周动脉期一过性强化灶及肿大淋巴结是 G3 组独立预测危险因素，具有鉴别价值（P 值分别＜0.01、＜0.01、0.03、＜0.01），根据预测值勾画 ROC 曲线，AUC 为 0.86；将临床信息、主观评价指标及 841 个影像特征纳入特征筛选，筛选出 305 个特征用于训练 XGBoost 模型，AUC 为 0.90。**结论**：CT 影像特征及组学特征联合应用在不同病理类型消化系统神经内分泌肿瘤肝转移鉴别中具有较高能力，具有临床应用价值。

PO-076

Magnetic resonance imaging for preoperative staging of pancreatic cancer based on the 8th AJCC guidelines

Yan Deng, Xiaoming Zhang
Affiliated Hospital of North Sichuan Medical College

Purpose: To determine the staging accuracy and evaluate the resectability of magnetic resonance imaging (MRI) about pancreatic cancer compared with intraoperative or pathological findings according to the 8th edition of the American Joint Committee on Cancer (AJCC) TNM staging system.
Methods: One hundred and thirty-two patients with a pathological diagnosis of pancreatic cancer underwent preoperative MRI were identified. The clinical data, MRI findings, intraoperative or pathological findings were analyzed respectively. Preoperative MRI staging and resectability evaluation compared with intraoperative or pathological findings. The accuracy of MRI for preoperative T and N stage were evaluated, the sensitivity, specificity and accuracy of MRI in evaluating the resectability were assessed. All the staging and resectability according to 8th edition of the American Joint Committee on Cancer (AJCC) TNM staging system.
Results: Analysis showed the accuracy of MRI for evaluation the T and N stages were 82.6% (109/132) and 74.2% (98/132) respectively. The sensitivity and specificity of MRI in assessment the resectability were 94.2% and 71.4% respectively. Integrated the 8th edition of the AJCC TNM stage, no significant differences were identified between the preoperative MRI findings and pathological results for the staging of pancreatic cancer (p=0.805).
Conclusions: MRI is highly accurate for T staging and moderately accurate for N staging; MRI provides important pre-operative evaluation about staging and resectability for pancreatic cancer based on the 8th edition of the AJCC TNM staging system.

PO-077

CT and MR imaging features of pancreatic adenosquamous carcinoma and their correlation with prognosis

Rui Zhao[1], Zhenyu Jia[1,2], Xiao Chen[1], Shuai Ren[1]
1. Affiliated Hospital of Nanjing University of TCM (Jiangsu Province Hospital of TCM)
2. The First Affiliated Hospital with Nanjing Medical University

Purpose: To retrospectively investigate the computed tomography (CT) and magnetic resonance (MR) imaging features of pancreatic adenosquamous carcinoma (PASC) and the association between imaging findings and prognosis.
Material and methods: CT, MR images of 26 patients with PASC were analyzed. Clinical symptoms, tumor markers, and patients' survival were recorded. Tumor attenuation,

enhancement pattern and degree, vessel involvement, adjacent tissue invasion and metastasis were evaluated. The association between imaging features and overall survival (OS) were also assessed by using Cox proportional hazards ratios model.
Results: Fourteen masses were found in the head of the pancreas and 12 in the body/tail. The mean tumor size was 4.47 ± 1.76 cm. PASC usually showed ill-defined (96.2%), lobulated (76.9%) and predominantly solid mass (92.3%). Ring enhancement in the peripheral area of the tumor was commonly seen (76.9%). Vessel invasion was seen in 17 cases (65.4%), encasement of adjacent arteries in 7 cases (26.9%), upstream main pancreatic duct (MPD) dilatation in 16 cases (61.5%) and double duct sign in 9 cases (34.6%). Multivariate Cox proportional hazards model demonstrated that patients with vessel invasion may predict a poor prognosis ($p = 0.037$).
Conclusion: PASC tends to be an ill-defined solid mass with peripheral ring enhancement, and relatively poor enhancement in the central area. PASC may also show vessel invasion, vessel encasement and upstream MPD dilatation. Vessel invasion may indicate a poor prognosis.

PO-078

Image features of splenosis

Yaqi Shen,Daoyu Hu
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology (HUST), Wuhan, Hubei, P. R. China

TEACHING POINTS
To delineate the imaging features of splenosis mimicking primary neoplasms when presented throughout different locations.
TABLE OF CONTENTS/OUTLINE
Splenosis are rare conditions of implantation of spleen in unusual anatomical sites, which may attribute to splenic trauma or splenectomy. Most of them can be diagnosed according to a similar imaging characteristics of native spleen when realized, whereas confounded diagnosis may occur in the situation of absence of native spleen or spleen under pathological condition. A serial of patients confirmed with splenosis was reviewed to specify CT and MRI imaging characteristics of splenosis. Implantation of ectopic spleen should be considered to avoid unnecessary surgical treatment or intervention.

PO-079

Preoperative prediction of hepatic malignancies with highly aggressive characteristic based on quantitative parameters derived from hepatobiliary phase

Zheng Ye,Bin Song
West China Hospital, Sichuan University

Objective
To investigate the preoperative predictive performance of quantitative parameters based on hepatobiliary phase (HBP) in hepatic malignancies with aggressive characteristic.

Material and methods
This prospective study was approved by institutional review board and informed consent were obtained from all patients. 118 patients with surgery-proven hepatic malignancies [103 patients with hepatocellular carcinoma (HCC) and 15 patients with intrahepatic cholangiocarcinoma (ICC)] were included. The signal intensity (SI) of liver, tumor and muscle were measured and termed as L_0, T_0 and M_0 on pre-contrast image and L_{20}, T_{20} and M_{20} on HBP, and quantitative parameters were calculated accordingly. The aggressive characteristic of hepatic malignancy was identified by Ki-67 labeling index(LI) and classified into low aggressive (Ki-67 LI $\leqslant$ 10%) and high aggressive (Ki-67 LI $>$ 10%) groups. Difference of quantitative parameters between the two groups were assessed and correlation between quantitative parameters and Ki-67 LI was explored. Receiver operating characteristic (ROC) analyses with area under ROC curves (AUC) were used to evaluate the predictive performance of significant parameters and combinations.

Results
The value of tumor to liver contrast ratio (TLR, T_{20}/L_{20}), tumor enhancement index [TEI, $(T_{20}/L_{20})/(T_0/L_0)$] and relative enhancement ratio [RER, $(T_{20}-T_0)/(L_{20}-L_0)$] were significantly lower in high aggressive hepatic malignancy and HCC($p<0.05$). TLR and RER were also significantly different between low and high aggressive ICC groups ($p<0.05$). The parameters that showed the best predictive performance of aggressive characteristic were TLR (AUC=0.749, 95%CI: 0.660-0.824; sensitivity=86%; specificity=56%) in hepatic malignancy, TLR+TEI (AUC=0.758, 95%CI: 0.664-0.837; sensitivity=67%; specificity=76%) in HCC and TEI(AUC=1.000, 95%CI:0.782-1.000; sensitivity=100%; specificity=100%) in ICC, respectively. Significant negative correlation was found between Ki-67 LI and TLR and RER in patients with hepatic malignant tumors, and between Ki-67 LI and TLR, TEI and RER in HCC patients.

Conclusion
Quantitative parameters based on the SI measurement of HBP could preoperatively and noninvasively predict the aggressive characteristic of hepatic malignancies.

PO-080

Study of reduced field-of-view diffusion-weighted imaging (DWI) on the diagnosis of gallbladder cancer.

sisi Wu
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To compare image quality of reduced field-of-view (r-FOV) and full FOV(f-FOV) diffusion-weighted imaging(DWI) sequences at 3T,with apparent diffusion coefficient(ADC) values in the diagnosis of gallbladder disease .

Materials and Methods: Our study collected 511 patients with gallbladder disease who had undergone DWI scan for preoperative evaluation in Tongji Hospital from July2017 to December2018,and finally 61 patients were enrolled after excluding unqualified cases.Preoperative DWI images,including both r-FOV and f-FOV DWI sequences, of 61 patients with gallbladder disease confirmed by surgery or puncture pathology were measured by two radiologists. The ADC values of diseased region were measured , and the resolution, signal-to noise ratio(SNR) , contrast-to-noise ratio(CNR) were calculated by two radiologists independently. Meanwhile, two radiologists independently assessed subjective image quality parameters, including image sharpness, distortion, artifacts, lesion conspicuity with a 4-point scale. The weighted-K test was used to examine the consistency of the results measured by the two radiologists. Comparisons of these parameters between two groups were made by Wilcoxon's rank sum test,including image sharpness, distortion, artifacts, lesion conspicuity.Paired t-test were used to analyze differences between two groups about SNR、CNR and ADC,and then Spearman test was used to correlate the three types of gallbladder disease with ADC.

Results: 1.There was good agreement of both dates measured and image quality between two radiologists in both r-FOV DWI and f-FOV DWI(P>0.05).

Subjective score: The subjective score of image quality of r-FOV DWI was 13.84±1.10, which was higher than that of f-FOV DWI(10.36±1.13) significantly.The resolution, deformation, artifacts, and lesion conspicuity of r-FOV were 3.41, 3.36, 3.67 and 3.39, respectively, both higher than f-FOV.

3.Objective score: The CNR score of r-FOV is higher than f-FOV, and the SNR score of r-FOV is lower than f-FOV. The spatial resolution of the r-FOV image (1.56mm*1.56mm) is twice that of the f-FOV image (2.25mm*2.25mm). Comparing the two DWI images, it can be found that r-FOV can effectively reduce the deformation and artifact of f-FOV images, and has higher definition and better lesion display effect.

4.There was no difference in the ADC values measured between the r-FOV and f-FOV groups, but the ADC values of different gallbladder diseases were significantly different. (P<0.05)

Conclusions: Compared with f-FOV DWI, r-FOV DWI had a higher spatial resolution and lesion conspicuity, that also can significantly reduce susceptibility artifacts as well as image distortions.

PO-081

Arterial and delayed MRI enhancement well predicts the prognosis of intrahepatic mass-forming cholangiocarcinoma.

Kaipu Jin
Zhongshan Hospital, Fudan University

Purpose

This retrospective cohort study was to explore the value of arterial and delayed enhancement MRI in predicting the prognosis of intrahepatic mass-forming cholangiocarcinoma (IMCC).

Materials and methods
Two hundred and thirty-two patients of IMCC from January 2011 to December 2015 with pre-operative contrast enhanced MRI were analyzed. Follow up recurrence and death data were recorded until October 2018. We defined a three-point scoring system for assessing arterial enhancement degree (0: no or slight enhancement, 1: intermediate, 2: hyper or dense enhancement) and delayed enhancement uniformity (0: hypo-signal over two thirds of lesion, 1: intermediate, 2: uniformly hyper or iso enhancement over two thirds of lesion). Patients were classified into two groups according to the sum of arterial and delayed scores (Group A: score<3, Group B: score >=3) . Kaplan-Meier Curve was applied for prognosis analysis. Imaging features as well as clinical-pathological data were also compared between the groups.

Results
Median recurrence/death time were 7(95%CI: 5.7,8.3) / 36(95%CI: 16.6,55.4) months (P=0.000) and 51(95%CI: 33.5,68.5) / 82 months (P=0.000) in A and B groups respectively. Group B had significantly higher 2-year event-free survival rate (17.8% vs. 69.6%) as well as 5-year survival rate (41.1% vs. 78.0%) compared with Group A.

Conclusion
Arterial and delayed MRI enhancement can well predict the prognosis of intrahepatic mass-forming cholangiocarcinoma.

Objective: To predict histopathological growth patterns (HGPs) in colorectal liver metastases (CLRMs) by a **noninvasive** radiomics model.
Material and Methods:patients who had Chemo-naive CLRMs and underwent abdominal ceMDCT followed with partial hepatectomy were included in this retrospective study between Jan 2007 and Jan 2018. H&E stained histopathologic sections of CRLMs were reviewed and HGPs were defined according to the international consensus. Radiomic features were extracted from pre- and post-contrast arterial and portal venous phases MDCT images focusing on the segmented tumor-liver interface (TLI) zones of CRLMs. Minimum redundancy maximum relevance (MRMR) and decision tree (DR) were constructed for radiomics modeling. Multivariable logistic regression analyses and the receiver operating characteristics (ROC) curves were used to assess the predictive performance of those models in differentiation of HGPs.
Results: Eighty-two CLMRs with histopathologic proved desmoplastic (n=54) and replacement (n=28) HGPs were included. The radiomics signature, which consisted of 20 selected features of each phase, was significantly associated with HGPs. The fused arterial phase with portal venous phase radiomics signature ($Signature^{AP+PP}$) showed the best predictive performance in distinguishing replacement and desmoplastic HGP, with the AUC of 0.962 and 0.870 in the training and validation cohort. The radiomics model showed good discrimination with C-index of 0.974 and 0.765 in the training and validation cohort. However, combined model with the qualitative and clinical features did not show significant improvement for the prediction.
Conclusion:radiomics model derived from MDCT could effectively predict HGPs of CRLMs, and provide basis for prognostic stratification and therapeutic strategy making.

PO-083

Liver fibrosis detection and staging: a comparative study of T1 rho MR imaging and 2D magnetic resonance elastography

qing wang
chang zhou first people hospital

Purpose: To compare the results of T1 rho MR imaging and 2D magnetic resonance elastography (MRE) for liver fibrosis detection and staging.
Methods: 120 rabbit models of CCl4-induced liver fibrosis(HF) were established and thirty untreated rabbits served as controls. Carbon tetrachloride (CCl4) injection was performed once a week at 0.1ml/kg-0.2ml/kg for 16 weeks (week 4－16) in the HF group which was divided into 5 subgroups and underwent MR examinations at weeks 4, 8, 12 and 16 respectively post the first CCl4 injection (week 1). T1 rho values and liver magnetic resonance stiffness (LS) values were measured. According to METAVIR scoring system., the stage of HF of all rabbits was classified as F0－F4. Blood samples were taken to assess the ELF score. Hepatic hydroxyproline was measured photometrically in

liver hydrolysates. All variables were checked for normal distribution. Interobserver agreement for measurement of the T1rho and LS was determined. ANOVA test was performed to compare the T1ρ values, LS values and METAVIR scoring, $p<0.05$ was considered statistically significant. Variable between two groups were compared by using the unpaired Student t test. Correlation analysis was performed among T1rho values, LS values, and fibrosis stage by using Spearman rank correlation coefficient. Pearson correlation coefficients were calculated to evaluate the relationship between T1rho values, LS values and ELF score, Hepatic hydroxyproline.For multiple comparisons, Receiver operating characteristic (ROC) analysis was performed for assessing diagnostic performance of T1rho ,LS value ELF score, Hepatic hydroxyproline in detection of substantial fibrosis (<F2) vs severe fibrosis (≥ F3).
Results: There was high positive correlation between METAVIR scoring and T1rho values (r = 0.876; 95% CI 0.291－0.754; P < 0.0001), and LS value (r = 0.816; 95% CI 0.521－0.851; P = 0.003). T1rho values showed moderate positive correlations with LS values [Spearman r = 0.693; 95% confidence interval (CI) 0.472－0.832; P < 0.0001]. ELF score was weakly correlated with native T1 rho (r = 20.36; P = .005) . No significant correlation was found between ELF score and MRE values (r = 20.11; P = .409). T1 rho values showed moderate correlations with hepatic hydroxyproline content and MRE showed no correlation with hepatic hydroxyproline. Pearson correlation coefficients were 0.645 and 0.57 between T1 rho with ELF score and hepatic hydroxyproline. Areas Under ROC (AUROCs) were 0.86 (95% CI 0.705－0.953) for MRE and 0.91 (95% CI 0.698－0.950) for T1 rho (P = 0.940), 0.67 (95% CI 0.762－0.978) for ELF and 0.849 (95% CI 0.691－0.946) for Hepatic hydroxyproline (P = 0.414) when diagnosing substantial fibrosis (<F2) vs severe fibrosis (≥ F3).Interobserver agreement was always greater than 0.70.
Conclusion: T1rho imaging has potential for liver fibrosis detection and staging with better diagnostic capability than that of magnetic resonance elastography. MR T1rho can be an imaging biomarker for monitoring liver activated hepatic stellate cells by hepatic hydroxyproline.

PO-084
脾硬化性血管瘤样结节性转化的 MRI 影像征像分析

袁振国[1,2],刁艳照[1]
1.山东省医学影像学研究所
2.山东大学附属山东省医学影像学研究所

目的：分析脾脏硬化性血管瘤样结节性转(sclerosing Angiomatoid nodular transformation，SANT)的 MR 信号及动态增强强化特征。
方法：
回顾性分析经行 MRI 检查，经手术病理证实的 9 例脾脏硬化性血管瘤样结节性转化影像特点，男性 6 例，女性 3 例，年龄 23~56 岁，平均 41 岁。MRI 扫描序列包括轴位 T1WI、T2WI，T1WI、T2WI 脂肪抑制序列，T
分析病灶的形态、大小、平扫信号特点、扩散加权成像信号特征，以及动态增强动、静脉、平衡各期的信号强化特征及强化方式。
结果：
单发 7 例，6 例为圆形、1 例类圆形肿块，边缘呈浅分叶状；多发 2 例。7 例单发病例，T1WI 呈等或低信号；T2WI 呈不均匀低信号；DWI(b=800)呈低信号，ADC 均呈不均质低信号。动态增强扫描均

见向心性、渐进性强化。其中，辐条轮状强化 4 例、结节样强化 3 例、条索状强化 2 例，内均见裂隙。2 例多发病灶，T1WI 呈略低信号；T2WI 呈低信号；DWI(b=800)呈略低信号，ADC 均呈低信号。动态增强扫描呈渐进性强化。
结论：
脾脏硬化性血管瘤样结节性转化以脾内单发肿块为主，MRI 影像特征为类圆形略长 T1WI、短 T2WI 信号结节，DWI(b=800)呈略低信号，ADC 均呈低信号。强化特点为向心性渐进性强化及辐条轮状强化，内可见星芒状裂隙。

基于磁共振成像术前预测原发性肝癌微血管侵犯

孙文杰[1],杨冠华[1],高雨佳[1],邱海静[1],陈勇[2]
1.宁夏医科大学
2.宁夏医科大学总医院放射介入科

目的：探讨 MRI 一般影像特征与弥散加权成像（DWI）表观扩散系数（ADC）术前预测原发性肝癌微血管侵犯的价值。**材料与方法**：回顾性分析本院 2017 年 1 月至 2019 年 1 月经外科切除的 82 例单发性原发性肝癌（HCC）患者 MR 影像学征象、ADC 值及临床资料，根据病理结果将其分为微血管侵犯阳性组和微血管侵犯阴性组，采用独立样本 t 检验比较两组患者的年龄、甲胎蛋白(AFP)水平及肿瘤最大直径，ADC 值采用 x^2 检验比较两组患者的性别、乙肝表面抗原、肝功能分级、肿瘤包膜、瘤周异常强化、瘤内动脉、肿瘤是否贴近肝包膜。应用 logistic 回归分析一般临床资料及影像学资料预测 MVI 的独立预测因子。**结果**：微血管侵犯 42 例，非微血管侵犯 40 例，两组间肿瘤的最大直径、肿瘤包膜是否完整、瘤内动脉、瘤周异常强化、ADC 值具有统计学意义（P<0.05）；而两组在年龄、性别、乙肝表面抗原、肝功能分级、AFP 水平、肿瘤是否贴近肝包膜比较，差异无统计学意义(P >0.05)；肿瘤最大直径、瘤周异常强化、ADC 值作为术前预测肝细胞癌 MVI 风险预测的独立预测因子［HR (95%CI) P：(> 5 cm) 1. 67 (1.22-2.25) 0.003、1.66 (1.26-2.42) 0.015 、1.95 (1.25-2.88) 0.002）、1.83（1.31-2.36）0.013］**结论**：磁共振成像术前预测肝细胞癌微血管侵犯有一定价值。

PO-086

The Utility of Apparent Diffusion Coefficient in Assessing Low-Risk Endometrial Cancer

Fajin Lv,Sheng Yijing
The First Affiliated Hospital of Chongqing Medical University

Objective: low-risk stage I endometrial cancer(EC) patients are not recommended to undergo lymphadenectomy. The aim of this study was to investigate the diagnostic value of ADC values for assessing low-risk EC and to identify an optimum ADC measurement for preoperative assessment.
Materials and method: our study consisted of 60 patients with EC who underwent unenhanced contrast MRI and diffusion-weighted imaging (DWI) procedures. The minimum and mean ADC values (minADC, meanADC) of tumors were obtained, and the relative ADC (rADC) were calculated with the equation of ADC (cancer)/ADC (reference) by using the obturator internus muscle as reference. Forty stage I EC patients were divided into

low-, intermediate- and high-risk group based on ESMO-ESGO-ESTRO classification. Mann-Whitney U test, Kruskal-Wallis test and receiver operating characteristic (ROC) were performed for statistical analysis.
Result: The meanADC、minADC and rADC for low-risk group were significantly higher than the values for intermediate-to-high risk group(1.126 versus 0.888×$10^{-3}$$mm^2$/s, 0.806 versus 0.668×$10^{-3}$$mm^2$/s，0.768 versus 0.611×$10^{-3}$$mm^2$/s, respectively). In assessments of low-risk EC patients, the AUC for meanADC, minADC and rADC were 0.872, 0.724, 0.875, respectively. The best cut-off rADC value for prediction was 0.676, the maximum Youden index, sensitivity, specificity and accuracy were 0.794 , 0.843, 0.952 and 0.900, respectively.
Conclusion: rADC is superior to meanADC and minADC measurements for preoperative evaluating the risk of stage I EC and it is presented as a useful additional method to aid in low-risk EC patients avoiding unnecessary lymphadenectomy.

PO-087
磁共振 IVIM 成像在大鼠肾脏冷缺血再灌注损伤的研究

任燕,陈丽华,沈文
天津第一中心医院

目的
探讨体素内不相干运动 IVIM 技术评价大鼠肾脏冷缺血再灌注损伤程度的价值，进一步认识其病生理机制。
方法
选取健康雄性 SD 大鼠 40 只，随机分为两组，假手术组 20 只，和冷缺血-再灌注损伤组 20 只，分别于术后 1h、1d、2d、5d 随机选取 5 只，采用 Siemens Prisma 3.0T 磁共振扫描仪和 8 通道老鼠线圈，对大鼠左肾行冠状位扫描。在工作站上对图像进行测量分析，观察部位是皮层（CO）、外髓外带（OSOM）和外髓内带（ISOM），于肾脏上极、下极及肾门平面分别放置 3 个 ROI，各区域 ROI 大小、形状保持一致。定量测量各参数值，包括 ADC 值、D 值、D^*、f 值，取平均值作为最终结果。使用 SPSS 22.0 软件进行统计学分析。对数据进行正态性检验，以均数±标准差表示。采用两独立样本 t 检验比较同一时间点两组各部位的参数值的差异。采用单因素方差分析比较各组内不同时间点各部位参数值的差异，再用 LSD-t 检验进行组间两两比较。
结果
假手术组术后 1h 的皮质、外髓外带、外髓内带的 ADC、D 值最低，显著低于 1d、2d、5d（*P* 均<0.01）。术后 1h 的皮质及外髓外带的 f 值最低，第 1d 显著升高（*P*<0.05），第 2d 较第 1d 明显减低（*P*<0.05），第 5 天略升高。冷缺血再灌注损伤组术后 1h 的皮质的 ADC 值最低，第 1d 明显升高，与第 1h 相比有统计学差异（*P*<0.01），第 2、5d 呈增高趋势。术后 1h 的皮质的 D 值最低，第 1d 稍升高（*P*>0.05），第 2d 仍升高，与第 1d 相比无显著差异，但是与第 1h 相比差异有统计学意义(*P*<0.05)。外髓外带、外髓内带的 ADC 值、外髓外带的 D 值较假手术组差异显著（*P*<0.01）。外髓内带的 D 值较假手术组有差异（*P*<0.05）。
结论
IVIM 技术能够动态监测肾脏冷缺血再灌注损伤，ADC 值和 D 值随不同时间点变化明显,损伤后皮层恢复较快，外髓外带恢复较慢。

PO-088

Noninvasive evaluation of early diabetic nephropathy using diffusion kurtosis imaging: an experimental study

Haiying Zhou,Xiaoming Zhang
Affiliated Hospital of North Sichuan Medical College

Aim: To evaluate the value of renal diffusion kurtosis imaging (DKI) in the diagnosis of early diabetic nephropathy (DN) in a rat model.
Materials and Methods: Forty male Zucker diabetic fatty (ZDF) rats which spontaneously develop T2DM were served as experimental group, and 20 age-matched control lean Zucker rats (LZR) with nondiabetic were served as the control. Kidney DKI scan and renal histology were performed to the rats in batches at the end of 4th, 8th, 12th, 16th and 20th week after the T2DM model were built. Based on the different renal histopathological appearance, the including animals were divided into three groups: control group with nondiabetic, DM group with non-DN, and early DN group with DN which were classified as Class I and II. The renal diffusion and kurtosis parameters were assessed statistically to show their associations with the renal damage.
Results: FA values and kurtosis values (MK, Ka, Kr) of the renal cortex in the control, DM and early DN group were significantly lower than in the medulla, respectively (all $P<0.05$), while the diffusion values (MD, Da and Dr) of the cortex were higher than in the medulla, respectively (all $P<0.05$). Furthermore, the kurtosis values (MK, Ka, Kr) of the renal cortex and medulla tended to increase from the control group to the early DN group, respectively, while some diffusion values (FA, MD and Dr) tended to decrease. The cut-off FA, MD, Dr, MK, Ka and Kr values of renal cortex and medulla showed different values in discriminating early DN from the controls with nondiabetic and DM with non-DN (range of Az: 0.69-0.92). Among them, the cut-off FA value of medulla of 0.36 with a sensitivity of 95.7% and a specificity of 82.4% achieved the largest Az which made it become the best parameter for discrimination of the early DN, followed by the cut-off value of medullary MK.
Conclusion: MR DKI may be valuable for noninvasive detection of early DN and monitoring the progress of DN which can provide significant benefits to guide the therapeutic strategy and get the disease under control.

PO-089
应用 Synthetic MRI 弛豫定量图对前列腺癌鉴别诊断的研究

崔亚东[1,2],林月[1,2],李春媚[1],陈敏[1,2]
1.北京医院放射科，国家老年医学中心
2.北京协和医学院研究生院

目的：本研究旨在以病理诊断为参考，初步探讨应用 synthetic MRI 弛豫定量图对前列腺癌（prostate cancer, PCa）鉴别诊断的价值。
材料与方法：本研究连续纳入于 2018 年 4 月至 10 月于我院进行前列腺 MRI 检查的 55 名临床可疑 PCa 患者。排除标准为:(1) MRI 检查后没有经穿刺或手术取得病理结果；(2)MRI 检查前接受内分泌或放射性治疗；(3) MR 检查与活检或手术间隔时间>3 个月。所有前列腺 MRI 检查均在 GE SIGNA

Pioneer 3.0T 磁共振扫描仪进行。首先进行常规前列腺 MRI 序列扫描，之后进行 synthetic MRI 序列扫描。根据穿刺或手术病理结果，在 T2WI 和 DWI 图像确定感兴趣区（region of interest, ROI）。将 ROI 放置于定量图测得组织的 T1、T2 和 PD 值。对于 PCa 患者，ROI 置于 PCa 区域。对于非 PCa 患者，ROI 放置于前列腺增生和前列腺炎区域。按照腺体成分含量将前列腺增生结节分为间质增生结节（stromal hyperplasia, SH）和腺体增生结节(glandular hyperplasia, GH)。采用 SPSS 20.0 软件进行统计学分析。应用单因素方差分析比较 PCa、SH、GH、前列腺炎的 T1、T2、PD 值的差异。

结果：最后纳入 14 例 PCa 患者和 22 例非 PCa 患者。共计 18 处 PCa 病灶、26 处 SH、25 处 GH、以及 21 处前列腺炎。PCa 的 T1 和 T2 值明显低于 GH 和前列腺炎组($p < 0.001$)。PCa 的 PD 值显著低于 GH($p < 0.01$)。但 PCa 组与前列腺炎之间 PD 值无显著统计学差异。SH 与 PCa 之间 T1、T2 及 PD 值无显著统计学差异。

结论：Synthetic MRI 驰豫定量图对前列腺癌的鉴别诊断具有一定的作用。

PO-090

Comparison between Magnetic Resonance Hysterosalpingography and Conventional Hysterosalpingography: Direct Visualization of the Fallopian Tubes Using a Novel MRI Contrast Agent Mixture

Na Duan, Zhongqiu Wang
The affiliated hospital of Nanjing University of Chinese Medicine

Background: Magnetic resonance hysterosalpingography (MR-HSG) is a promising imaging approach for tubal patency evaluation but is still limited for tubal visualization.
Purpose: To evaluate the feasibility of MR-HSG for direct visualization of the fallopian tubes and demonstration of tubal patency as an alternative to conventional HSG.
Material and Methods: This study included 33 infertile women who completed pelvic MR scanning, HSG, and MR-HSG in that order. A traditional HSG-contrast agent (iohexol) and a high viscosity MRI-contrast agent (1mL Gadopentetate dimeglumine (Gd-DTPA) blended with 100mL iohexol) were used to achieve image enhancement. Interobserver and intermodality agreements of HSG and MR-HSG exams were assessed. The results were calculated by using the kappa test. Three radiologists who were blinded to the clinical data independently reviewed MR images. Extratubal abnormalities were analyzed.
Results: A total of 62 fallopian tubes of 33 subjects were included in the study. MR-HSG imaging findings to depict tubal patency were similar to these of HSG (AUC=0.911, sensitivity=0.821, specificity=1.000, positive predictive values=1.000 and negative predictive values=0.872). Pairwise interobserver agreement among three observers, and intermodality agreement of the diagnosis were excellent (mean kappa=0.863, 0.835 respectively). In addition, 29 extratubal abnormalities in 21 patients were found on pelvic MR scanning.
Conclusion: MR-HSG and HSG demonstrated similar results in assessing tubal patency. Because it offers the comprehensive assessment of female pelvic structures, and avoids ionizing radiation, MR-HSG may be used as an alternative imaging technique for evaluation of female infertility.

PO-091

The Diagnostic Performance of new DWI models (IVIM, DKI) in Prostate Cancer in the Transtion Zone

Jie Bao,Ximing Wang,Chunhong Hu
The First Affiliated Hospital of Soochow University

Objective To explore the clinical value of quantitative parameters derived from intravoxel incoherent motion (IVIM) and diffusion kurtosis imaging (DKI) models in differentiating benign and malignant prostate lesions in the transitional zone (TZ) and identifying clinical significant prostate cancer. Further analysis was performed to evaluate the association between parameters and Gleason score (GS) of prostate cancer.

Materials and Methods A retrospective analysis was conducted on clinical data of 55 patients, whose lesions were pathologically confirmed in the prostate TZ by MRI-TRUS targeted fusion biopsy, and all cases were examined with traditional DWI (b = 0, 1400 s/mm^2), IVIM (b = 0, 50, 100, 150, 200, 700, 1400, 2100s/mm^2), and DKI (b = 0, 700, 1400s/mm^2) on a 3T scanner(MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany) before biopsy. Each lesion was manually extracted with a 3D ROI. Quantitative values of the ADC, IVIM and DKI parameter maps were measured. For diffusion parameter estimation, the generated IVIM maps, namely perfusion fraction (f), diffusivity (D) and pseudo-diffusivity (D*), were calculated using MITK (http://www.mitk.org/wiki/The_Medical_Imaging_Interaction_Toolkit_(MITK). The mean apparent diffusion for Gaussian distribution (MD), apparent kurtosis coefficient (MK) and fractional anisotropy (FA) maps were calculated by using DKE (http://academicdepartments.musc.edu/cbi/dki/results.html). Data satisfying the normal distribution assumption were subjected to independent sample t- test. Conversely, data not satisfying the assumption were analyzed using the Mann- Whitney U test. Receiver operating characteristic analysis was performed for IVIM and DKI parameters. AUC were compared using the Z-test. The correlations between the quantitative parameters and Gleason score were assessed with Spearman correlation.

Results Among the 55 patients, there were 27 cases of PCa (36 focus) in the transitional zone and 28 cases of benigh prostatic hyperplasia (BPH) (40 focus). Twenty-seven cases of PCa in TZ with age of 58-81 years (mean 69±1.54 years) and a mean prostate-specific antigen (PSA) level of 72.13±26.93 ng/ml. BPH with of 51-80 years (mean 63±1.47 years) and a mean PSA level of 12.90 ± 1.13 ng/ml were confirmed. The ADC and D of IVIM differed significantly between PCa and BPH in TZ ($p<0.05$, $p=0.007$). ADC exhibited a higher area under the curve (AUC, 0.863) compared with D with an AUC of 0.833; however, the difference was not significant ($p=0.8706$). The difference between D* and f was not significant ($p>0.05$). Values of MD, MK and FA of DKI models were significantly different ($p<0.05$, $p=0.01$, $p<0.05$) .The highest classification accuracy was achieved by the mean MD (AUC, 0.742). The AUC was 0.892, 0.884 and 0.897 for the combination of mean ADC and D, combination of mean ADC and MD, and combination of ADC, D and MD, respectively. The last 3 parameter combination showed significant higher AUC than the other two combinations. In the group of GS≧7

and BPH+(GS=6), ADC and D of IVIM model showed a significant difference ($p<0.05$, $p=0.017$), ADC had a higher AUC (0.826); the difference of D* and f was not significant ($p>0.05$). All the parameters of the DKI models were significantly different between the two groups, MD showed a higher AUC than others (AUC, 0.742). The AUC was 0.851, 0.846 and 0.856 for the combination of mean ADC and D, combination of mean ADC and MD, combination of ADC, D and MD. The last 3 parameters combination showed significant higher AUC than the other two combinations. ADC and MD showed relatively higher negativity correlations ($r=-0.586$, $r=-0.489$) with GS of PCa in TZ.

Discussion & Conclusion The IVIM and DKI models can be used to differentially diagnose prostate cancer in TZ and clinically significant prostate cancer; however, the diagnostic performances of IVIM and DKI did not perform better than the traditional ADC. Further, it is feasible to stratify the pathological grade of prostate cancer in TZ by mean ADC and MD independently.

PO-092

The Diagnostic Value of PI-RADS V2 Scoring System Combining with MRI-TRUS Fusion Targeted Biopsy for Detecting the Clinical Significant Prostate Cancer

Ximing Wang, Jie Bao, Chunhong Hu
The first affiliated hospital of SOOCHOW university

Synopsis

Transrectal ultrasound-guided systematic (TRUS) biopsy is commonly used in clinical practice to detect clinically significant prostate cancer (PCa). In this study, a more advanced biopsy, MRI-TRUS fusion targeted biopsy, is used together with MRI-derived PI-RADS V2 scoring system for the diagnosis of clinical significant PCa. The values of the two biopsy methods are compared.

Objective To evaluate the combination of multi-parametric MRI (mpMRI) derived PI-RADS V2 scoring system and MRI-TRUS fusion targeted biopsy in the diagnosis of clinical significant prostate cancer.

Materials and Methods A prospective analysis was performed in 168 patients with suspected prostate cancer from September 2015 to June 2018. Suspicious areas on mpMRI were defined and graded using PI-RADS score. The T2WI, DWI, ADC data and dynamic contrast enhancment (DCE) quantitative maps were used, and the data acquisition was performed on a 3T MR scanner (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany). All the patients received a transrectal ultrasound-guided systematic (TRUS) biopsy, 108 patients with PI-RADS V2 scores $\geqslant$ 3 had additional MRI-TRUS targeted biopsies. The detection rate of TRUS biopsy and suspicious MRI targeted biopsy in PCa and clinical significant cancer were tested by χ^2 test on the results of MRI-TRUS fusion guided biopsy.

Results All the 168 patients underwent TRUS biopsy, and 108 patients, whose PI-RADS V2 scores were $\geqslant$ 3, had MRI-TRUS fusion guided biopsy to confirm their diagnosis (two examples are shown in Figures 1 & 2). Prostate cancer was detected in 86 of 168 patients (51.19%, 86/168), and no prostate cancer were detected in the rest 82 patients (48.81%, 82/168). 78 (46.43%, 78/168) cases of PCa were detected by TRUS

biopsy, and 63(58.33%, 63/168) cases of PCa were detected by MRI-TRUS fusion guided biopsy, the difference was statistically significant between TRUS biopsy and MRI-TRUS fusion guided biopsy (χ^2=3.73, p=0.035). Further, the 168 patients were biopsied with a total of 2300 cores, including TRUS biopsy 2016 cores and MRI-TRUS fusion targeted biopsy 284 cores. Additionally, the detection rate per core obtained from MRI-TRUS fusion targeted biopsy (51.76%, 147/284) was significantly better than that from TRUS biopsy cores (19.64%, 396/2016; χ^2=142.38, p<0.05). Among patients with a positive biopsy for PCa, the number of biopsy cores for conventional TRUS biopsy and MRI-TRUS was 1032 and 214 cores, respectively. The suspicious MRI-TRUS fusion-targeted biopsy (68.69%, 147/214) detected more prostate cancers which had statistical differences compared with TRUS biopsy (38.37%, 396/1032; χ^2=66.27, p<0.05). Last but not least, MRI-TRUS fusion targeted biopsy (69.74%, 106/152) showed more significant cancer cores than that of TRUS biopsy (54.50%, 351/644; χ^2=11.67, p<0.05). *Conclusions* MRI-TRUS fusion targeted biopsy increases the positive rate markedly and improves the detection rate of clinical significant PCa in comparison with TRUS biopsy.

380 例原发性腹膜后肿瘤的 MSCT 评估价值

冯元春
北京大学国际医院

目的 总结原发性腹膜后肿瘤 MSCT，提高临床对其的识别能力。 **资料与方法** 分析经病理证实的 380 例原发性腹膜后肿瘤的常见类型、好发部位、MSCT 特点，Fishers 检验。 **结果** 380 例腹膜后肿瘤，良性 149 例：神经源性 59 例（39.6%），纤维瘤或纤维样病变 33 例，间质瘤（GIST）20 例，畸胎瘤 16 例，脂肪瘤 8 例，Castleman 病 5 例，其他 14 例（4 例血管平滑肌脂肪瘤、4 例侵袭性血管瘤、3 例间皮瘤、2 例血管瘤、1 例颗粒细胞瘤）；恶性肿瘤 231 例：脂肪肉瘤 138 例（59.7%），37 例平滑肌肉瘤，14 例淋巴瘤，6 例恶性神经源性肿瘤，6 例骨源性肿瘤（骨肉瘤和软骨肉瘤各 3 例），其他 24 例（5 例腺癌、4 例横纹肌肉瘤、3 例恶性间质瘤、3 例癌肉瘤、3 例滑膜肉瘤、2 例 MFH、2 例精原细胞瘤、1 例鳞癌和 1 例恶性间皮瘤）。MSCT MPR 对原发性腹膜后肿瘤定位准确性高（95.7%）。好发部位：73 例脂肪肉瘤在肾周间隙，占 76.8%（73/95），65 例神经源性肿瘤位于脊柱旁，占 90.3%（65/72）。MSCT 对原发性腹膜后肿瘤良恶性判断，敏感性 87.2%，特异性 82.7%，准确率 84.5%。139 例恶性肿瘤为不规则形，54 例良性肿瘤为不规则形，两者差异有统计学意义（χ^2=20.251，P＜0.001）；密度及有无强化在良恶性中差异无明显统计学意义；所有良性肿瘤对周围器官表现为推压（图 1）,82.7%（191/231）恶性肿瘤与周围器官粘连或受侵，差异有统计学意义（χ^2=247.702，P＜0.001）。MSCT 特点：脂肪瘤为低密度，病灶无强化；脂肪肉瘤内见脂肪和软组织影，除脂肪外其他成份有强化；畸胎瘤内见脂肪、软组织和钙化；神经源性肿瘤多在脊柱旁。 **结论** MSCT 对腹膜后肿瘤定位准确性非常高，在术前或穿刺活检前定性诊断符合率较高。高分化脂肪肉瘤、神经源性肿瘤、畸胎瘤、脂肪瘤 MSCT 表现有一定特征

PO-094

R2*值评价Ⅰ期子宫内膜癌脉管侵犯的价值

王成艳,孙美玉,吴雅楠,刘爱连

大连医科大学附属第一医院

子宫内膜癌是女性生殖系统常见的恶性肿瘤。目前 I 期子宫内膜癌患者是否行淋巴结清扫存在争议[1]。淋巴结清扫术不能提高子宫内膜癌患者的生存率反而导致一系列并发症。脉管侵犯是子宫内膜癌患者淋巴结转移重要的预测因素[2]，但传统的 MR 成像无法评价脉管侵犯。

目的

探讨增强 T2* 加权血管成像（ESWAN）序列的 R2* 值评价 I 期子宫内膜癌脉管侵犯的价值。

材料与方法

搜集 2013 年 1 月至 2018 年 12 月大连医科大学附属第一医院行 ESWAN 检查并经手术病理证实的子宫内膜癌患者 20 例。测量脉管侵犯组与无脉管侵犯组病灶实性成分的 R2* 值。图 1 和图 2 显示脉管侵犯组和无脉管侵犯组病灶情况。采用两独立样本 t 检验比较脉管侵犯组与无脉管侵犯组 R2* 值的差异。

结果

子宫内膜癌脉管侵犯组的 R2*值为（17.62±8.70）Hz，高于无脉管侵犯组（10.75±3.25）Hz，脉管侵犯组与无脉管侵犯组 R2*值差异有统计学意义（P<0.05），如表 1 所示。R2*值预测子宫内膜癌脉管侵犯的曲线下面积为 0.780。

结论

R2*值可作为评价子宫内膜癌脉管侵犯的定量指标，ESWAN 对术前诊断子宫内膜癌脉管侵犯有重要的补充价值。

Wash-out 指标联合形态学特征评估嗜铬细胞瘤和副神经节瘤的 CT 诊断价值

陶奉明,毛芸,吕发金,李咏梅,周印,刘梓菟,杨栋
重庆医科大学附属第一医院

目的：利用中间期（IP）及 3-min 延迟期（DP-3）的 wash-out 指标联合形态学特征对嗜铬细胞瘤和副神经节瘤 CT 诊断价值进行评估。

材料方法： 收集 2012 年 1 月 1 日至 2019 年 6 月 1 日术后病理证实并有增强 CT 资料肾上腺嗜铬细胞瘤（Ad-Phe）80 例、肾上腺腺瘤（Adeno）59 例、肾上腺转移瘤（Meta）7 例及腹膜后副神经节瘤（Re-Phe）33 例。测量、记录病灶平扫&各期 CT 值、位置、大小、轮廓、边界、囊变及坏死、钙化、出血、肿瘤血管及强化方式，并从动静脉期中选取 CT 值大的为 IP。计算绝对 wash-out 百分数（APW）及相对 wash-out 百分数（RPW），描述性分析上述影像特征并统计 APW<60%及 RPW <40%阳性率。再采用单因素 Logistic 回归分析影像特征及 APW、RPW 对 Ad-Phe 诊断预测能力，并在此结果上采用二元 Logistic 回归筛选 Ad-Phe 独立影像特征指标，建立多因素诊断模型。此外用单因素分析比较 Ad-Phe 与 Re-Phe 影像特征相似性。

结果：上述四类肿瘤形态学特征及 wash-out 指标结果见表 1，单因素分析结果见表 2。Ad-Pheo 较 Meta、Adeno 体积更大，易出现囊变坏死、出血、钙化、肿瘤血管及充填样强化，平扫&增强各期 CT 值更高，RPW 出现率高于 Meta，低于 Adeno。DP、RPW、大小、囊变坏死及充填样强化为 Adeno 影像诊断独立预测因子，且此五项联合指标诊断敏感性及特异性均为 100%（ROC 曲线见图 1）。单因素分析比较 Adeno 与 Re-Phe 影像特征的相似性无统计学差异，但 Re-Phe 体积大、形态不规则、易出血。

结论：以 DP、RPW、大小、囊变坏死及充填样强化为基础建立的多因素预测模型能有效鉴别 Adenoma 与其它肾上腺常见肿瘤。Adenoma 与 Retro-Pheo 具有相似的形态学特征及 wash-out 指标。

PO-096

A machine learning-based approach for predicting the malignant potential of T2-hyperintense uterine mesenchymal tumors by fusing T2WI features and clinical information

Tingting Wang,Jing Gong,Weijun Peng
Department of Radiology, Fudan University Shanghai Cancer Center

Objective: This study aims to develop a machine-learning method to predict the malignant potential of T2-hyperintense uterine mesenchymal tumors by fusing T2WI features and clinical information
Methods: First, we retrospectively collected 111 patients involving 64 benign leiomyomas and 47 malignant mesenchymal uterine tumors, exhibiting predominantly hyperintense (mass with >50% of its area) relative to the myometrium on T2-weighted images from Fudan university Shanghai cancer center. After segmenting tumors depicting on T2-weighted MR images, we computed and extracted radiomics features to character the tumor imaging features. Then, we used SVM machine-learning classifier to build two models by using selected imaging features and clinical features, respectively. Finally, to improve the classification performance, we fused the prediction scores generated by two models. We calculated the areas under the curve (AUCs) using receiver operating characteristic curve (ROC) to assess the performance for each model, and compared with two radiologists.
Results: The fusion model achieved the highest AUCs and can significant improve the model performance (0.87 ± 0.03, $p<0.001$), compared with T2 MR image based model (0.78 ± 0.04) and clinical information based model (0.74 ± 0.05), respectively. When two radiologists individually reviewed and diagnosed these tumors, they achieved no significant difference in AUC values (0.85 and 0.82, p=0.37). In a comparison, the fusion method based scheme yields significant higher performance comparing with the AUC values obtained by two radiologists ($p<0.001$).
Conclusions: Machine learning by fusing T2WI features and clinical information can improve the performance in predicting malignant potential of T2 hyperintense uterine mesenchymal tumors, and outperformed experienced radiologists.

PO-097

基于 MRI 评分系统诊断胎盘植入及分类的价值

何峰艺
广西医科大学第一附属医院

方法：回顾广西医科大学第一附属医院 2015 年 1 月-2018 年 3 月 43 例临床怀疑胎盘植入患者的 MRI 影像资料及临床资料；由 2 名不知晓手术与病理结果放射科医师进行诊断，确定有无植入及其分型。重点观察胎盘位置（有无完全性前置胎盘）、胎盘形态（有无结节状、浅弧形突出）、胎盘

信号（有无明显不均质）、胎盘内有无异常增多迂曲血管影、胎盘内 T2 暗带（有无形状、大小不规则低信号）、子宫下段形态（是否膨出）、有无胎盘-子宫界面低信号带消失、中断及宫旁临近器官（膀胱、直肠、腹壁等）侵犯等征象。按其有无此征象分别评 0、1 分，再综合临床指标，有无≥2 次剖宫产，最后计算总分值。
结果：本组共 43 例患者，经临床或病理诊断无胎盘植入 12 例，胎盘植入 31 例（13 例胎盘粘连 12 例胎盘植入，6 例胎盘穿透），其中 14 例经病理证实。MRI 初步诊断胎盘植入 27 例，无胎盘植入 9 例，漏诊 4 例，误诊 3 例，整体准确率、敏感度、特异度、阳性预测值、阴性预测值分别是 83.72%，87.09%，75.00%，90.00%，69.23%；粘连型敏感度 46.15%，植入型敏感度 75.00%，穿透型敏感度 66.67%。运用 MRI 评分系统，正常胎盘评分为 2.08±1.50；粘连性评分 3.38±0.74，植入型 5.16±0.99，穿透性 7.00±1.15，重型胎盘植入（胎盘植入+胎盘穿透）评分 5.78±1.36。绘制 ROC 曲线，计算各组间不同类型的评分界值；分析正常胎盘及粘连型胎盘，当评分≥2．5 分时，敏感度为 92.3%，特异度为 66.7%；分析粘连型及重型胎盘植入时，当评分≥4．5 分时，敏感度为 88．9%，特异度为 92.3%。
结论：MRI 诊断胎盘植入具有较好的诊断价值，运用 MRI 评分系统对于诊断胎盘植入具有一定的价值，有助于区分胎盘植入的类型并增加胎盘植入的诊断效能。

PO-098

Noninvasive evaluation of renal oxygenation in primary nephrotic syndrome with Blood Oxygen Level-Dependent MR imaging: initial experience

Rui Zhang, Wen-bo Xiao
The First affiliated Hospital of Zhejiang University

Objective: To evaluate the renal oxygenation in patients with primary nephrotic syndrome (PNS) using Blood Oxygen Level-Dependent (BOLD) MRI and determine the feasibility of BOLD MRI in assessing the renal function, tubulointerstitial alterations and the prognosis of PNS.
Methods: Twenty patients at the onset of PNS for the first time were selected to undergo BOLD MRI before treatment. Blood and urine samples were obtained on the day of the MRI. The pathologic grading of renal tubulointerstitial alterations was performed by using the Katafuchi criteria. All patients received corticosteroids therapy within 7 days after the MRI and followed up through 12 months.
Results: Medullary R2* (MR2*) values in PNS patients significantly decreased compared to the controls. MR2* values in PNS patients were negatively correlated with estimated glomerular filtration rates (eGFR) and positively correlated with tubulointerstitial damage scores. There was a slight tendency for higher MR2* values in individuals with poor prognosis.
Conclusion: The medullary oxygen concentration of patients with PNS compared to the controls. BOLD MRI proved to be a noninvasive method for the evaluation of renal function and tubulointerstitial impairment, as well as initial prediction of the prognosis for PNS patients.

PO-099

T2* mapping 定量评估肾脏缺血再灌注损伤动态变化的实验研究

陈沁
常州市第一人民医院

目的 通过 T2*mapping 技术对肾脏内髓、外髓和皮质进行量化分析，探索其评价肾脏缺血再灌注损伤后不同时间点的动态变化的可行性。**方法** 选取新西兰大白兔 18 只，采用无创血管夹夹闭左侧肾蒂 60 min 后松开建立 IRI 模型。分别于建模前、建模后 1 h、12 h、24 h、48 h 行左肾 MRI 扫描（包括轴位 T2WI 和 T2* mapping），在建模后 1 h、12 h、24 h 随机选取 2 只兔处死，余 10 只兔在 48 h 后处死，对病理分级进行评分。同时测量左肾内髓、外髓和皮质的 T2*值值，用重复测量方差分析比较肾脏各部位 5 个时间点间 T2*的差异，并对各时间点 T2*值与对应的病理评分进行 Spearman 相关分析。**结果** 建模前和建模后 1 h、12 h、24 h、48 h 内髓及外髓的 T2*值不同时间之间 T2*值的差异均有统计学意义（F 值分别为 3.93、5.97，P 均 < 0.05）。而皮质不同时间点之间的 T2*两两比较，建模前与 24h、48h，12h 与 48h 差异有统计学意义（P < 0.05），其余差异无明显统计学意义（P > 0.05）。细胞坏死、间质炎症和管型评分则随着 IRI 的发展逐渐增长， IRI 后外髓的 T2*值的变化与对应区域的细胞水肿、间质炎症及管型评分均呈正相关（r = 0.57、0.38、0.33；P < 0.05）；外髓 R2*值的变化与对应区域的细胞水肿呈负相关（r = -0.52；P< 0.05）。**结论** T2* mapping 可反映肾脏 IRI 后不同区带、不同时间点的动态变化，其中以外髓带最为明显，并与病理评分存在较好的一致性

PO-100

Utilization of CT-based Radiomics Random Forest Model to Predict Lymph Node Metastasis in Epithelial Ovarian Cancer

Ling Yuan,Yafei Qi,Chengyu Lin,Yonglan He,Huadan Xue,Zhengyu Jin
Peking Union Medical College Hospital

PURPOSE
Lymph node metastasis (LNM) of ovarian cancer is an important factor related to tumor staging, patient survival and disease recurrence. In this study, the purpose was to developed and validate a CT-based radiomics random forest model to predict LNM for pathologically proven ovarian cancer patients.
METHOD AND MATERIALS
A total of 101 patients with clinicopathologically confirmed epithelial ovarian cancer who underwent cytoreductive surgery were retrospectively enrolled in this study. Fifty patients were pathologically proven to have LNM, and 51 patients were negative of LNM. Radiomic features were extracted from portal phase computed tomography (CT) of primary ovarian cancer from a dedicated Radiomics Prototype (Siemens syngo.via Frontier). Two experienced radiologists double-blinded segmented the entire volume of primary ovarian cancer semi-automatically. Due to the status unbalancing for LNM, patients were first down-sampled to equivalent ratio and then divided into training (n=71) and validation cohorts (n=30). Only high producible features (ICC>0.8) were used to build the random forest method. The performance of the radiomics model was evaluated using the area under curve (AUC) of receiver operating characteristic curve within training and validation cohorts.

RESULTS
The radiomics model showed good and discrimination in the training cohort, with an AUC of 0.815 (95% CI: 0.715-0.915), sensitivity of 66.4%, specificity of 89.3% and Brier score 0.193. In the validation cohort, AUC was 0.804 (95% CI: 0.637-0.972), sensitivity, specificity and Brier score were 86.7%, 80.0% and 0.207.
CONCLUSION
This CT-based radiomics model can be used as a noninvasive method to preoperatively predict LNM in patients with epithelial ovarian cancer.

PO-101
MRI 纹理分析预测宫颈癌新辅助化疗疗效的研究

李海蛟,曹崑,朱海涛,李晓婷,孙应实
北京大学肿瘤医院

目的 探讨 MRI 纹理特征分析对宫颈癌新辅助化疗疗效的预测价值。
材料和方法 回顾性分析 2014 年 7 月至 2018 年 11 月经我院病理证实为宫颈癌，行术前新辅助化疗的晚期局限性宫颈癌患者 31 例。新辅助化疗前及化疗后各行 1 次盆腔 MRI 检查，根据实体瘤的疗效评价标准（RECIST），将患者分为有效组（包括完全缓解和部分缓解）及无效组（包括疾病稳定和疾病进展）。测量新辅助化疗前 MRI 常规参数及纹理参数，常规参数包括肿瘤长径及 ADC 值，106 个纹理特征被采集，包括 13 个形状特征，14 个灰度相关矩阵特征，24 个灰度共生矩阵特征，18 个一阶特征，16 个灰度游程矩阵特征，以及 5 个相邻灰度差矩阵的特征。采用独立样本 t 检验及非参数 Mann-Whitney U 检验比较两组之间参数的差异，并通过绘制受试者工作特征曲线（ROC）得到最佳预测参数及其诊断价值。
结果 两组之间常规参数（肿瘤长径及 ADC 值）均无显著差异（P>0.05）。6 个灰度共生矩阵特征（包括 JointEntropy, Idmn, DifferenceEntropy, Idm, SumEntropy and Id）、1 个一阶特征（Entropy）、1 个相邻灰度差矩阵的特征（Contrast）在两组之间具有统计学差异（P值均小于 0.05）。JointEntropy, Idmn, DifferenceEntropy, Idm, SumEntropy, Id, Entropy, and Contrast 的 ROC 曲线下面积分别为 0.779, 0.229, 0.779, 0.236, 0.764, 0.229, 0.771, 0.857。
结论 MRI 纹理分析对宫颈癌新辅助化疗疗效具有较好的预测价值。

PO-102
磁共振动脉自旋标记（ASL）评估血清肌酐（Scr）正常水平的糖尿病患者肾功能价值

鞠烨,刘爱连
大连医科大学附属第一医院

目的 探讨应用 1.5T 磁共振动脉自旋标记技术（ASL）评估血肌酐（Scr）正常水平的糖尿病患者肾功能的价值。
材料与方法 本院行 1.5T 磁共振成像 ASL MR 检查的 63 例患者（男 38 例，女 25 例，平均年龄 67 岁），其中 20 例糖尿病患者（糖尿病组）和 43 例健康对照组（对照组），所有检查者均进行血清肌酐检查在正常水平。MRI 使用 1.5-T MR 成像仪（GE Siga HDXT）在包含常规 T1WI、T2WI 的协议中进行，ASL 技术使用单次快速自旋回波流敏感的交替反转恢复（SSFSE-FLAG）。采用 GEOW AW 4.6 工作站对糖尿病组和对照组的 ASL 参数（肾血流量、RBF）进行测量。采用 SPSS17.0 统计软件

进行数据分析，P 值小于 0.05 被认为有统计学意义。通过 Mann Whitney 试验比较糖尿病组和对照组的 RBF 值。绘制并分析了 RBF 值的 ROC 曲线。ICC 试验检测两个观察者之间的一致性，ICC＞0.75 为好，0.75＞ICC＞0.40 为一般，ICC＜0.4 为“坏”。
结果 两组 ASL 参数的 ICC 值均大于 0.75，显示出一致性。对照组的 RBF 值（149.14±22.77 mL.100-1·min -1）显著高于糖尿病组（119.91±13.54 mL·100-1·min -1）。ROC 分析表明，RBF 值的 AUC 为 0.859，当 RBF 值为 127.4 mL·100-1·min -1 时，其敏感性和特异性分别为 86%和 80%。
结论 ASL 对非侵袭性糖尿病患者肾功能的评价是敏感的，RBF 值有助于提高其敏感性和特异性。

PO-103

Texture Analysis based on quantitative magnetic resonance imaging for evaluation of renal function

Gumuyang Zhang[1], Hao Sun[1], Lili Xu[1], Jianqing Sun[2], Jing An[3], Hailong Zhou[1], Yanhan Liu[1], Yan Liu[1], Limeng Chen[1], Zhengyu Jin[1]
1.Peking Union Medical College Hospital
2.Philips Healthcare， Shanghai， China
3.MR Collaboration， Siemens Healthcare Ltd， Beijing， China.

Purpose: To investigate the feasibility of using texture analysis based on diffusion weighted imaging (DWI), T1 and T2 mapping to evaluate renal function.
Methods:A total of 116 candidates (94 patients and 22 healthy volunteers, mean age 37.9 ± 14.9 years) underwent axial renal DWI, T1 and T2 mapping at 3T. Based on their estimated glomerular filtration rate (eGFR), the candidates were classified into normal renal function group (nRF, eGFR≥90 mL/min/1.73 m^2, n=46), mildly (mi-IRF, 60≤eGFR<90 mL/min/1.73 m^2, n=14), moderately (mo-IRF, 30≤eGFR<60 mL/min/1.73 m^2, n=27) and severely (se-IRF, eGFR<30 mL/min/1.73 m^2, n=29) impaired renal function groups. Texture features were quantified and selected to build models for classification between nRF and IRF, mi-IRF and mo-IRF, mo-IRF and se-IRF with receiver operating characteristic (ROC) analysis performed and the area under the ROC curve (AUC) calculated for each comparison.
Results: Mean, mpp, skewness and kurtosis were correlated with eGFR decline. Ten texture features were selected and combined for differentiation of nRF and IRF producing an AUC of 0.914, accuracy of 88.1%, sensitivity of 93.3%, specificity of 80.5%, negative predictive value (NPV) of 89.2% and positive predictive value (PPV) of 87.5%. Eight texture features were selected and combined for classification between mi-IRF and mo-IRF and yielded an AUC of 0.910 (95% CI: 0.846-0.962), accuracy of 87.1%, sensitivity of 87.8%, specificity of 86.5%, NPV of 88.2%, PPV of 86.0%. Fifteen texture features were selected and combined to differentiate mo-IRF and se-IRF and reached an AUC of 0.928 (95% CI: 0.845-0.990), accuracy of 87.8%, sensitivity of 96.3%, specificity of 77.3%, NPV of 94.4%, PPV of 83.9%.
Conclusions: Texture analysis based on ADC, T1 and T2 values can noninvasively evaluate renal function.

PO-104

能谱 CT 在鉴别肾癌侵犯肾盂及肾盂癌侵犯肾脏中的初步研究

丁小博
吉林大学白求恩第一医院

目的：探讨 CT 能谱成像在鉴别肾癌侵犯肾盂和肾盂癌侵犯肾脏中的应用价值。
方法：回顾性分析我院行肾脏宝石 C T 扫描患者 4 0 例，男性 22 例、女性 18 例，平均年龄 52 岁（ 2 4-78 岁），其中肾癌 30 例、肾盂癌 1 0 例，均经病理证实。增强扫描采用 GSI 扫描模式。采用 2 组重建模式，第 1 组为常规混合能量 140kvp，图像层厚和层距均为 5.00ｍｍ，第 2 组为 70keV 单能量图像， 层厚和层距均为 1.25ｍｍ，图像重建均采用标准算法。
结果：肾癌动脉期的 NIC 明显高于肾盂癌的 NIC（分别为 0.49mg/ml±0.08 和 0.23mg/ml±0.18，P<0.05），但肾癌和肾盂癌在静脉期的 NIC 没有统计学差异（分别为 0.55mg/ml±0.15 和 0.44mg/ml±0.25，P>0.05）。肾癌静脉期的 LNR 为 0.29±0.50，明显低于肾盂癌 0.70±2.29,（P<0.01）。但肾癌和肾盂癌在动脉期的 LNR 没有统计学差异（分别为 0.42±0.18 和 0.44±0.38，P>0.05）。
结论：肾癌与肾盂癌具有不同的能谱特征，我们采用 C T 能谱分析技术对肾癌及肾盂癌进行研究，发现肿瘤基物质(水与碘)散点图的分布模式、7 0keV 单能量 C T 值(HU)分布直方图模式以及能谱曲线形态差别较大，这些信息对于患者术后随访和治疗可能提供帮助。

PO-105

Quantitative assessment of diffusion kurtosis imaging depicting deep myometrial invasion: A comparative analysis with diffusion-weighted imaging

Ting Chen, Jiacheng Song
First Affiliated Hospital of Nanjing Medical University, 300 Guang Zhou Road, Nanjing, 210029, Jiangsu Province, China

Abstract:
Purpose: To investigate histogram analysis of diffusion kurtosis imaging (DKI) and conventional diffusion-weighted imaging (DWI) to distinguish between deep myometrial invasion and superficial myometrial invasion in endometrial carcinoma (EC).
Methods: A total of 118 pathologically confirmed EC patients with preoperative DWI were included. The data were postprocessed with a DKI (*b* value of 0, 700, 1400, and 2000 s/mm^2) model for quantitation of apparent diffusion values (D) and apparent kurtosis coefficient values (K) for non-Gaussian distribution. The apparent diffusion coefficient (ADC) was postprocessed with a conventional DWI model (*b* values of 0 and 800 sec/mm^2). A whole-tumor analysis approach was used. Comparisons of the histogram parameters of D, K and ADC were carried out for the deep myometrial invasion and superficial myometrial invasion subgroups. Diagnostic performance of the imaging parameters was assessed.
Results: The D_{mean}, D_{10th}, and D_{90th} in deep myometrial invasion group were significantly lower than those in superficial invasion group (p<0.001, <0.001 and =0.023, respectively), as well as the ADC_{mean}, ADC_{10th}, and ADC_{90th} (p=0.001, 0.001 and 0.042, respectively). The K_{mean} and K_{90th} were significantly higher in deep invasion group than those in superficial myometrial invasion group (p=0.002, and 0.026, respectively). The

D_{10th}, K_{mean}, and ADC_{10th} had a relatively higher area under the curve (AUC) (0.72, 0.66, and 0.71, respectively) than other parameters did for distinguishing deep myometrial invasion of EC. D_{10th} showed a relatively higher AUC than ADC_{10th} did for the differentiation of lesions with deep myometrial invasion from those with superficial myometrial invasion (0.72 vs 0.71), but the variation was not statistically significant (p=0.35).
Conclusions: Distribution of DKI and conventional DWI parameters characterized by histogram analysis may represent an indicator for deep myometrial invasion in EC. Both DKI and DWI models showed relatively equivalent efficacy.

PO-106

Application of low-dose CT scanning technique in right adrenal vein imaging

Hongyi Wu
Tianjin Medical University Cancer Institute and Hospital

Objective To analyze the value of low-dose CT scanning in right adrenal vein imaging. **Methods** A total of 123 patients who was suspected as primary aldosteronism and requiring a contrast enhanced CT examination on adrenal glands were enrolled in the study. Three patients were excluded according to the exclusion criteria, so that the rest 120 patients were averagely divided into 3 groups. Group A was a control group with conventional tube voltage of 120kV and automatic mA. It was divided into A_1, A_2 and A_3 groups according to arterial phase,venous phase and parenchymal phase. Group B was a experimental group with conventional tube voltage of 120kV and automatic mA. The arterial phase, the late arterial phase, and the portal venous phase were divided into B_1, B_2, and B_3 groups.Group C was a low-dose experimental group with a tube voltage of 100kV and a tube current of 150mA. It was divided into C_1, C_2, and C_3 groups according to the arterial phase, late arterial phase, and portal venous phase. The subjective scores of the images of groups A, B, and C were statistically analyzed, and the CT values of the right adrenal vein, the right adrenal gland, and the fat of anterior abdominal wall at different scan periods were measured, and the CT dose index (CTDIvol) and the dose length product (DLP) were recorded.Calculating and comparing the signal-to-noise ratio (SNR), contrast-to-noise ratio (CNR), and effective radiation dose (ED). **Results** The subjective scores of the two observers were consistent (*Kappa* value = 0.629); the subjective scores of the B_2 images were statistically significant (H=7.182, P<0.05). There was statistically significant difference between the B_2 and A_2 subjective scores (P<0.001 after adjustment).The CT values of RAV, SNR, and CNR of the B_2 group were higher than those of the A_2 group (t=-66.98, - 6.92, -9.02, P<0.05), and there was no significant difference in CT value of RAG and background noise between the two groups (P>0.05). The radiation dose comparison showed that the effective radiation dose (ED) was 45.52% lower in the low-dose group than the conventional dose group,which the difference was statistically significant (t=12.19, P<0.001). **Conclusion** Using MDCT scanning technique with low tube voltage and low tube current of 100kV-150mA, the detection rate of right adrenal

vein can reach 95% in the late arterial phase, and the effective radiation dose can be reduced about 45.52% on the basis of ensuring image quality.

PO-107

Diagnosing prostate cancer using Ultrafast DCE-MRI with Low-Dose Gadolinium: Observer study

Daming Zhang[1], Aritrick Chatterjee[2], Melvy Mathew[2], Tatjana Antic[2], Gregory S Karczmar[2], Zhengyu Jin[1], Ayketin Oto[2]
1.Peking Union Medical College Hospital
2.University of Chicago

Purpose: This study investigates whether administration of low doses of Gadolinium imaged using ultrafast dynamic contrast-enhanced (DCE) MRI can be as effective as a standard dose and resolution DCE-MRI in the diagnosis of prostate cancer (PCa) based on an observer study.

Material and method: Patients (n = 30) with histologically confirmed PCa underwent preoperative 3T MRI. DCE-MRI. Low dose (0.015 mmol/kg Gd) and standard dose (0.085 mmol/kg Gd close to clinical value). DCE-MRI images were acquired at ~2.2 and ~8.2 s temporal resolution using gadobentate dimeglumine bolus injection. Low dose ultrafast images were acquired for 3.5 minutes, followed by a 5-minute gap before acquiring standard dose images for 8.3 minutes. The data were analyzed qualitatively by 3 radiologists (15, 2 and 5 years' experience) to investigate whether lesions could be detected based on early focal enhancement. A confidence score (1-5) was assigned based on the confidence in accurately detecting cancer, with 5 being the highest confidence. Diagnostic performance was calculated for all cancer lesions and index lesions only.

Results: 57 PCa lesions and 30 index lesions were found. Diagnostic performance for low dose DCE-MRI was nominally lower than for standard clinical dose DCE-MRI. Low dose DCE-MRI showed lower but statistically similar diagnostic performance for detecting all PCa lesions compared to standard dose with similar sensitivity (55 vs 63%, p=0.34) and PPV (76 vs 82%, p=0.37) with similar lower confidence score (3.7±0.7 vs 3.8±0.8, p=0.417).

Low dose DCE-MRI showed similar diagnostic performance for detecting index lesions compared to standard dose with similar sensitivity (70 vs 80%, p=0.38) and PPV (70 vs 78%, p=0.51), but with lower confidence score (3.8±0.8 vs 4.1±0.6, $p<0.05$). The sensitivity and PPV was similar for 2/3 radiologists, with one even reporting confidence score using low dose images.

Conclusions: PCa diagnosis may be feasible using ultrafast DCE-MRI with lower dose of Gadolinium based on its performance to detect index lesions. However, further studies to determine optimal dose and temporal resolution DCE-MRI protocol for PCa diagnosis.

Clinical relevance: There is clinical potential application of using ultrafast DCE-MRI to diagnose PCa, which makes DCE-MRI a safer examination to patients with PCa.

PO-108

Clinical Value of CT Texture Analysis in Differentiation of Urothelial Carcinoma Based on Multi-phase CT images

Zihua Wang,Yufang He,Nianhua Wang,Ting Zhang,Hongzhen Wu,Lei Mo,Xinqing Jiang
Guanghzou First People's Hospital

Objective To explore the value of computed tomography (CT) texture analysis for the differentiation of low grade urothelial carcinoma (LGUC) and high grade urothelial carcinoma (HGUC) and their invasive property.
Methods The radiological data were analyzed retrospectively in 94 patients with urothelial carcinomas who had pathologically proven from November 2016 to April 2019. Pathological examination demonstrated that the tumors were high-grade in 43 cases and low-grade in 51cases; non-muscle-invasive (NMI) in 37 cases and muscle-invasive (MI) in 37 cases. The maximum diameter of the tumor in CT images was outlined as ROI. Three-phasic CT images were used to measure the texture parameters and compared with postoperative pathological grading and invasive results. The independent sample *t* test or the Mann-Whitney U test was used to compare the difference of the parameter. AUC (area under curve) for statistically significant parameters were used to confirm their efficacy in predicting the preoperative grade and invasive property of UC.
Result Of the 78 features were extracted from each phase CT images, with 26 (33%), 20 (26%) and 22 (28%) texture parameters were significant for differentiating LGUC from HGUC while 19 (24%), 16 (21%) and 30 (38%) texture parameters identified as being significant for differentiating non-muscle-invasive urothelial carcinoma (NMIUC) from muscle-invasive (MIUC), respectively. The optimal performance for differentiating the grading and invasive property were obtained by the Variance and Correlation on venous phase CT images, respectively.
Conclusion Texture analysis can provide more quantification information, which can be more accurately distinguishing LGUC and HGUC or NMIUC and MIUC.

PO-109

Preoperative prediction of parametrial invasion in early-stage cervical cancer with MRI-based radiomics nomogram

Tao Wang[1,3],Tingting Gao[2],Liyu Huang[2],Ming Zhang[3]
1.Department of Radiology, Shaanxi Provincial People's Hospital
2.School of Life Science and Technology, Xidian University
3.Department of Medical Imaging, First Affiliated Hospital of Xi'an Jiaotong University

Purpose: To develop and identify a magnetic resonance imaging (MRI)-based radiomics nomogram for the preoperative prediction of parametrial invasion (PMI) in patients with early-stage cervical cancer (ECC).
Methods and Materials: All 106 patients with ECC underwent T2-weighted imaging (T2WI) and diffusion-weighted imaging (DWI) scans before radical hysterectomy surgery. The

radiomics signature was calculated with the radiomics features selected by the least absolute shrinkage and selection operation regression from total features extracted from T2WI and DWI. A support vector machine (SVM) model was built using a radiomics signature to evaluate the performance of the radiomics signature for distinguishing patients with PMI and non-PMI. To predict the risk probability of PMI for the individual patient, a radiomics nomogram was drawn based on the radiomics model built using the multivariable logistic regression method, which was integrated with radiomics signature and patient age. The discrimination and calibration performance of the radiomics nomogram was estimated.
Results: The radiomics signatures from joint T2WI and DWI performed well for distinguishing PMI and non-PMI groups and yielded an AUC of 0.923 (95% CI, 0.860-0.986) and 0.938 (95% CI, 0.858-1) in the primary and validation cohorts. The radiomics nomogram integrating the radiomics signature with age showed excellent discrimination, with C-index values of 0.947 (95% CI, 0.899-0.995) and 0.911 (95% CI, 0.806-1) being obtained in the primary and validation cohorts, respectively. The calibration curve for the radiomics nomogram showed good agreement.
Conclusions: The radiomics nomogram integrating radiomics data from T2WI and DWI and clinical factors performed well for the preoperative prediction of PMI in patients with ECC and may be used as a supplementary tool to provide individualized treatment plans for patients with ECC.

PO-110

Correlations among Ki67 index, CT features, and risk stratification in gastrointestinal stromal tumors.

Caiwei Yang,Xijiao Liu,Bin Song
West China Hospital, Sichuan University

Objective: To investgate the performance significance of CT and Ki-67 index in gastrointestinal stromal tumours (GISTs),and to explore the correlation among CT subgective features, the Ki67 index, and risk stratification in gastrointestinal stromal tumours (GISTs)
Materials and Method: A total of 225 patients with postoperatively pathologically diagnosed GISTs from Febuary 2010 to April 2019 in our hosipital were enrolled. These patients had underwent surgical resection within one month after contrast-enhanced CT examination.Correlations among CT subgective features, the Ki67 index,and malignancy risk were analysed with Spearman's correlation test.
Results: The Ki67 index was positively correlated with risk stratification (r = 0.472) or mitotic index (r = 0.524). CT imaging features including size,heterogeneous enhancement, mucosal ucelration, and necrosis＞50% were associated with the Ki67 index (r = 0.349,0.217, 0.222, and 0.252, respectively). The presence of size, heterogeneous pattern of enhancement,irregular tumor contour and and necrosis＞50% were associated with risk stratification (r = 0.796,0.408, 0.318,and 0.311, respectively).
The percentage of Ki67 index>5% group was 61.3%(n=138),the percentage of Ki67 index≤5% group was 38.7%(n=87) .The multivariate logistic regression analysis

revealed that mixed growth pattern [P = 0.022 Exp (B) = 0.072] ,direct organ invasion [P = 0.014, Exp (B) = 0.095],lymphadenectasis[P = 0.018, Exp (B) = 0.076] were effective variables in distinguishing between the groups with Ki67≤5% and>5%. **Conclusions:** Our findings suggest that the Ki67 index is an effective complementation in predicting the prognosis of GISTs, and CT features may provide evidence to support the importance of preoperative assessment.These subjective CT features include size, heterogeneous enhancement, mucosal ucelration, necrosis＞50% and so on.

PO-111

CT and MRI features and diagnostic value of patients gastrointestinal stromal tumors in different risk degrees

Lingling Cai
Shanghai Ninth People's Hospital, Shanghai JiaoTong Universital School of Medicine

Objective To investigate the CT and MRI features of gastrointestinal stromal tumors (GIST) and their diagnostic value. **Methods** CT and MRI scanning features of 26 cases with GIST confirmed by surgery and pathology were retrospectively analyzed. **Results** Fourteen cases suffered from the tumors originated from stomach, with 4 high-risk cases, accounting for 28.6%; 10 cases suffered from the tumors originated from duodenum and small intestine, with 3 high-risk cases, accounting for 30%; 2 cases suffered from the parenteral tumors, with 1 high-risk case, accounting for 50%. Tumor location, strengthening degree and MRI signal characteristics showed non- specific in assessing the risk of GIST. The average diameters of tumors were respectively (3.37 ± 1.27) cm, (7.60 ± 3.71) cm, (11.15 ± 3.88) cm, and the intra- tumor necrosis conditions were respectively 0/10, 5/8, 7/8, and the apparent diffusion coefficients were respectively (1.78±0.24)×10- 3 mm2/s, (1.72±0.23)×10- 3 mm2/s, (1.24±0.11)×10- 3 mm2/s in low-risk, moderate-risk and high-risk groups. Significant differences were found in the tumor diameter, intra-tumor necrosis and apparent diffusion coefficients (P<0.05). **Conclusion** CT and MRI examination contributes to the evaluation of the predilection site of GIST and the diagnosis of benign or malignancy, instructing clinical treatment and estimating prognosis.

PO-112

Quantitative evaluation of extraserosal/mesangial infiltration in mid-lower rectal cancer with single-source dual-energy CT multi-parameter imaging

Yanan Wu,Meiyu Sun,Chengyan Wang

The First Affiliated Hospital of Dalian Medical University

Purpose: To investigate the value of single-source dual-energy CT multi-parameter imaging in evaluating the status of extraserosal/mesangial infiltration in middle and lower rectal cancer.
Materials and Methods: Thirty-eight cases of histopathologically proven middle and lower rectal adenocarcinoma underwent preoperative dual-energy enhanced CT scans and were retrospectively analyzed. Patients were divided into T2 (without infiltration, n=17) and T3 (with infiltration, n=21) groups based on the status of extraserosal / mesangial infiltration. Iodine concentration (IC), effective atomic number (Eff-Z) and the slope of energy spectral CT curve (K) (K=CT(40)-CT(100)/60)) were measured in the arterial phase (AP) and venous phase (VP) on the fat tissue surrounding the diseased intestinal segment. Measurements were averaged over 3 consecutive slices and analyzed using independent samples t-test between the two groups. The receiver operating characteristic curve (ROC) was used to evaluate the differential diagnostic efficacy of spectral CT parameters.
Results: The IC, eff-Z and K values of the fat tissue surrounding the diseased intestinal segment in the T2 group were statistically lower than those in the T3 group in both AP (IC: -4.50±9.63mg/ml vs. 7.38±12.72mg/ml, P<0.001), (eff-Z: 6.97±0.88 vs. 7.92±0.87, P<0.001), (K: -0.61±1.30 vs. 1.00±1.73, P<0.001), and VP (IC: -3.06±6.87mg/ml vs. 3.90±8.51mg/ml, P<0.001), (eff-Z: 7.19±0.61 vs. 7.75±0.62, P<0.001), (K: -0.42±0.92 vs. 0.54±1.18, P <0.001). In the arterial phase, the area under the ROC curve (AUC), sensitivity and specificity of using IC, eff-Z and K values were (0.924, 90.5% 88.2%), (0.941, 90.5%, 88.2%) and (0.927, 90.5%, 88.2%) with cutoff values of -1.29mg/ml, 7.34 and -0.16, respectively. In the venous phase, these values were (0.887, 81.0%, 87.5%), (0.896, 81.0%, 87.5%) and (0.860, 76.2%, 87.5%) with cutoff values of 1.98mg/ml, 7.64 and 0.23, respectively.
Conclusion: The multi-parameters (IC, eff-Z and K) in spectral CT imaging provide high diagnostic accuracy in evaluating the extraserosal/mesangial infiltration in middle and lower rectal cancers.
Clinical Relevance: The significance of single-source dual-energy CT multi-parameter quantitative imaging evaluate of extraserosal/mesangial infiltration in mid-lower rectal cancer is to guide clinical treatment and provide new quantitative methods.

PO-113
“起源胃壁强化征”辅助 CT 诊断胃外生型胃肠间质瘤

李佳铮,唐磊,李健,付佳,李英,李晓婷,李子禹,孙应实
北京大学肿瘤医院

目的：探讨肿瘤起源胃壁强化特征及坏死囊变成分的极性分布情况在胃外生型胃肠间质瘤（Gastrointestinal Stromal Tumor, GIST）鉴别诊断中的意义。**方法：**回顾分析经手术病理证实的胃外生型（III型）GIST 病例 18 例，对照组设置与胃壁脂肪间隙消失的邻近脏器起源肿瘤 16 例（胰腺神经内分泌肿瘤 6 例，胰腺实性假乳头状瘤 8 例,肝癌 2 例），观察记录与肿瘤贴邻的胃壁是否存在 CT“起源胃壁强化征”及“坏死囊变极性”分布的情况。同时测量肿瘤长径及动静脉期 CT 值。**结果：**GIST 肿块相邻胃壁局限高强化比例（9/15）高于其他脏器来源肿瘤（0/16），差异具有统计学意义（P＜0.05）。肿瘤坏死囊变极性分布情况，GIST 较其他脏器来源肿瘤更多偏离胃

壁侧分布，但统计学差异未出现显著性（P=0.051）。两组肿瘤的长径、动脉期及静脉期平均 CT 值差异均无统计学意义（P＞0.05）。**结论：**起源胃壁强化征可辅助 CT 鉴别诊断胃外生型胃肠间质瘤。

单源双能 CT 能谱分析定量参数预测胃间质瘤 Ki-67 表达的可行性研究

王学东,刘爱连,田士峰
大连医科大学附属第一医院

目的 探讨单源双能 CT 能谱综合分析平台多定量参数预测胃间质瘤（，GST）增值抗原 Ki-67 表达的可行性。**方法** 回顾性分析 28 例行单源双能 CT 三期增强能谱扫描，并经手术病理（免疫组化含 Ki-67）证实为 GST，按照 Ki-67 表达指数（＞6%为高表达，≤6%为低表达），将患者分为高表达组（n=11）和低表达组（n=17）。由两名观察者分别测量两组病灶实质区各期 40~70 keV 下 CT 值、碘浓度（IC）值，并计算标准化碘浓度（NIC）值。采用组内相关系数（ICC）检验两位观察者测量结果的一致性；采用独立样本 *t* 检验或 Mann-Whitney U 检验比较各参数间的差异；采用 ROC 曲线评估有统计学意义参数的鉴别诊断效能；采用 Pearson 相关分析评价有统计学差异的参数与 Ki-67 表达指数的相关性。**结果** 两位观察者测量结果的一致性均良好（ICC>0.75）。Ki-67 高表达组的动脉期 40~70 keV CT、IC、NIC 值均高于低表达组（*P*<0.05），动脉期 40~70 keV 的 CT、IC、NIC 值诊断高表达组的 AUC 分别为 0.807、0.807、0.818、0.807、0.824、0.866，与 Ki-67 表达指数呈中高相关（r=0.471、0.466、0.458、0.442、0.459、0.738；Ki-67 高表达组的静脉期 40~70 keV CT、IC、NIC 值均高于低表达组（*P*<0.05），静脉期 40~70 keV CT、IC、NIC 值诊断高表达组的 AUC 分别为 0.781、0.765、0.749、0.717、0.840、0.904，与 Ki-67 表达呈中高相关（r=0.585、0.570、0.552、0.503、0.660、0.860）。**结论** 单源双能 CT 能谱成像动、静脉期 40~70 keV CT、IC、NIC 值与 GST Ki-67 表达呈正相关，可反映 GST 肿瘤细胞增殖程度，其中静脉期的 NIC 为最佳参数。

PO-115
CT 纹理分析与淋巴结阴性结直肠癌患者伴同时性远处转移的相关性分析

房玥,王志伟,金征宇
中国医学科学院北京协和医院

目的：探讨 CT 纹理分析能否诊断淋巴结阴性的结直肠癌患者同时性远处转移的可行性研究。方法：回顾性分析 82 例淋巴结阴性结直肠癌患者的 CT 图像，12 例伴同时性远处转移，70 例不伴同时性远处转移，使用 TexRAD 软件对平扫及门脉期图像上病灶的最大层面进行分析，空间缩放因子 SSF 取 0 和 2～6 时获得 6 个纹理参数，比较两组之间各纹理参数值的差异性。结果：CT 平扫图像上，SSF=3 时的偏度值具有统计学意义（P=0.031）；CT 增强图像上，SSF=2、3、5、6 时的熵值具有统计学意义（P=0.048、0.027、0.016、0.017），SSF=2 的峰度值具有统计学意义（P=0.026）。综合分析这 6 组数值可以得出当界值取 0.636 时，诊断的敏感性为 75%、特异性为

89%。结论：CT 纹理分析技术对于诊断淋巴结阴性结直肠癌患者是否伴有同时性远处转移具有一定临床价值。

PO-116

Application of ADC maps combined with histogram analysis in mid-low risk rectal cancer

Yibo Tang[1,2,3],Mengsu Zeng[1,2,3]
1.Zhongshan Hospital， Fudan University
2.Shanghai Institute of Medical Imaging
3.Department of Medical Imaging， Shanghai Medical College， Fudan University

Objectives: The purpose of this study was to explore the feasibility of apparent diffusion coefficient (ADC) map combined with histogram analysis, to compare the differences between different stages and grades of mid-low risk rectal cancer by quantitative ADC, and to investigate the role of histogram analysis in evaluating biological behavior of mid-low risk rectal cancer.

Materials and methods:A total of 245 patients were enrolled from January 2016 to December 2018, who received rectal MRI examination and underwent operation without any neoadjuvant therapy, including 144 males and 101 females. The patients were divided into different groups according to the pathological results and MRI, including TN stage, histopathological tumor differentiation grade, perineural invasion and lymphovascular invasion (LVI). Histogram analysis was performed on MR multi-parameter analysis software. The ROI was delineated manually along the border of the low signal part of the rectal lesion on ADC image. The software automatically calculated the histogram analysis results. Thirty patients were randomly selected to test the consistency of image segmentation for rectal cancer lesions.

Results: Nine out of twelve indicators' correlation coefficients obtained from the histogram analysis were higher than 0.7. ADC histogram generated mean values were 973.22, 957.78 and 894.96 in D1, D2 and D3, respectively (P=0.025). The median values were 1035.25, 937.08 and 933.54 in T1, T2 and T3, respectively (P=0.013), and they were 958.60, 941.04 and 873.24 in D1, D2 and D3, respectively (P=0.015). The $ADC_{95\%}$values were 1272.71, 1269.34 and 1177.96 in D1, D2 and D3, respectively (P=0.038).The skewness values were 0.17, 0.54 and 0.53 in T1, T2 and T3, respectively (P=0.002). The entropy values were 2.72, 2.85 and 2.88 in T1, T2 and T3, respectively (P=0.044). The contrast value were 7.16, 6.84 and 4.79 in N0, N1 and N2, respectively (P=0.031). The tumor volume were 1.94, 4.90 and 5.47 in T1, T2 and T3 (P<0.001). In addition, $ADC_{5\%}$, Entropy and Contrast were different in LVI, they were 744.13, 2.79 and 5.87 in the LVI+ group and 701.94, 2.88 and 7.22 in the LVI- group (P=0.021, 0.022 and 0.016, respectively).

Conclusions: Whole-tumor ADC maps combined with histogram analysis can obtain a number of indicators, and distinguish the differences of different stages, grades and prognostic factors of mid-low risk rectal cancer.

PO-117

MR Enterography in Different-BMI Patients with Inflammatory Bowel Disease

Yucheng Hai,Daoyu Hu,Yaqi Shen
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

PURPOSE
To evaluate the application of MR enterography in Different-BMI patients with IBD when using the first joint ESGAR/ ESPR consensus statement on the technical performance of cross-sectional small bowel and colonic imaging.
METHOD AND MATERIALS
A total of 108 consecutive cases with IBD performed with MR enterography from our institution were retrospectively analyzed. The patient preparation and acquisition protocols were executed according to the first joint ESGAR/ ESPR consensus statement on the technical performance of cross-sectional small bowel and colonic imaging. These 108 cases were divided into three groups according to their BMI: Group A (<18.5kg/m², low-BMI),Group B (18.5-23.9kg/m², normal-BMI) and Group C (>23.9kg/m², high-BMI). Group A was subdivided into two groups according to the real ingested volume of oral contrast agent : Group A1 (1000-1200ml, low-ingestion) and Group A2 (1200-1500ml, normal-ingestion). Results were independently reviewed by two radiologists. The degree of bowel distention and the image quality were qualitatively scored on a four-point scale. Differences were evaluated by using the Kruskal-Wallis H test.
RESULTS
Distension scores of all the bowel segments between any two groups in Group A, Group B, and Group C showed no statistical difference (P>0.05). Distension scores of all the bowel segments between Group A1 and Group A2 showed no statistical difference (P>0.05).
CONCLUSION
The expert consensus recommendations are applicable in different-BMI patients with inflammatory bowel disease. For the low-BMI, ingest the lower oral contrast volume (1000-1200ml) and the bowel distension showed no significant differences compared with normal ingestion.

PO-118

MR 扩散峰度成像对 CD 活动性分级定量评估的价值

程静云,王科
武汉大学人民医院

目的：探讨扩散峰度成像（diffusion kurtosis imaging, DKI）评估克罗恩病（Crohn's disease, CD）炎症活动性的可行性。
材料与方法：总共有 51 例进行连续的肠镜、MR 及 DKI（b 值= 0-2000mm2/s）CD 患者纳入研究。小肠镜检查根据克罗恩病简化内镜活动性评分（SES-CD）将 CD 患者分为非活动组（0 - 2）、轻微活动组（3-6）及中重度活动组（≥7）。比较 DKI 和 DWI 参数区分不同活动性病变中的准确性。

结果：共 127 段肠管纳入研究，包括非活动组 15 段，轻微活动组 45 段，中-重度活动组 67 段。ADC、D_{app}、K_{app} 与 SES-CD 的相关性分别为 -0.627(P <0.001)，-0.381（P <0.001），0.641（P <0.001）。ADC、D_{app}、K_{app} 在不同活动组间均存在显著差别（所有 P 值均小于 0.001）。ROC 分析发现，当临界值为 0.865×10-3 mm2/s 时，ADC 值区分活动组与非活动组的 ROC 曲线下面积（Area under curve, AUC）最大为 0.884(P < 0.001)；当 K_{app} 临界值为 0.645 时，区分活动组与非活动组的 AUC 最大为 0.867(P < 0.001)；D_{app} 区分活动组与非活动组的最大 AUC 为 0.726（P = 0.005）。ADC 值区分非活动-轻微活动组与中重度活动组的 AUC 为 0.846（P < 0.001）;K_{app} 为 0.695 时，区分非活动-轻微活动组与中重度活动组的 AUC 为 0.843（P < 0.001）;D_{app} 的 AUC 值为 0.690（P < 0.001）.

结论：DKI 可用于评估 CD 病变活动性，与常规 DWI 的准确率方面相似。

PO-119

骨质疏松椎体血流灌注的 MRI 研究

诸静其,汤光宇
上海市第十人民医院（暨同济大学附属第十人民医院）

目的：利用定量动态增强 MRI（dynamic contrast-enhanced magnetic resonance imaging, DCE-MRI）、显微 CT（microcomputed tomography, micro-CT）以及质子 MR 波谱（proton magnetic resonance spectroscopy, ^{1}H-MRS）探讨去卵巢大鼠骨质疏松模型的腰椎椎体血流灌注、骨量与脂肪之间的时序关系。

方法：去卵巢组（n = 35）和假手术组（n = 35）大鼠在术后 0，2，6，10，14，18 以及 24 周进行腰椎椎体的 ^{1}H-MRS、定量 DCE-MRI、micro-CT 影像学检查以及腰椎椎体骨髓 CD34 免疫组化染色分析以及透射电镜观察，同时进行血清血管内皮生长因子检测。采用独立样本 t 检验比较相同时间点两组大鼠各种检查参数的差异。

结果：与假手术组比较，去卵巢组出现容积转运参数（K^{trans}）（2 周，P=0.036）和血管外细胞外容积分数（V_e）（10 周，P=0.014）下降、骨量下降（2 周，P=0.014）以及脂肪分数增加（6 周，P=0.036），同时，血清血管内皮生长因子（18-24 周，P=0.005）和骨髓微血管密度（14-24 周，P=0.018）下降。透射电镜显示去卵巢组骨髓血管内皮细胞间隙更紧密且骨髓纤维化更明显。

结论：定量 DCE-MRI 能直接反映骨髓血流灌注。K^{trans} 有望用于早期发现骨髓血流灌注降低。血管收缩活性增强和血管内皮细胞间隙紧缩可能是骨质疏松早期血流灌注下降的原因，而骨髓脂肪增多、微血管密度降低以及骨髓纤维化增多可能在骨质疏松晚期加重骨髓缺血。

PO-120

使用少量对比剂确认肩关节 MR 造影穿刺成功的 X 线征象分析

赵宇晴,袁慧书
北京大学第三医院

目的：本研究旨在通过对直接法肩关节 MR 造影过程中注射少量对比剂时，对比剂在 X 线下的分布征象进行分析，明确哪些 X 线征象对判断穿刺是否成功有更高的准确性，以避免因错误判断引起不必要调针或再穿刺。

方法与材料：研究对象为于我院放射科进行肩关节造影检查的患者。采用前方入路穿刺，记录在肩关节造影前方入路关节腔穿刺过程中，在注射约 1-2ml 对比剂时进行 X 线投照观察到的对比剂分布

征象，随后进行 MR 检查以判断是否成功。评价各 X 线征象的一致性，并计算穿刺成功病例中各征象分布情况，作为该征象判断穿刺成功的准确率。

结果：共计 669 例受试者，经 MR 证实全部穿刺成功。注射少量对比剂的 6 种 X 线征象分布（肱骨头重叠处不与针尖相连的对比剂-66.82%、腋隐窝内-64.72%、盂肱关节间隙内-93.87%、肩胛下滑囊内-69.81%、肱二头肌长头腱腱鞘内-1.94%、肱二头肌长头腱-冈上肌腱间-17.19%）一致性差（kappa＜0.2），其中“肱骨头重叠处见不与针尖相连的对比剂”与“盂肱关节间隙见对比剂”一致性最差（kappa=-0.115，p<0.01）。以“肱骨头重叠处见不与针尖相连的对比剂”或“盂肱关节间隙见对比剂”为标准时，判断准确率为 100%，高于既往文献中中作为标准的征象或征象组合（65.47%-97.01%）。

结论：在直接法前方入路肩关节造影过程中，少量注射对比剂时的各 X 线征象一致性差，临床工作中不能混淆使用。其中采用“肱骨头重叠处见不与针尖相连的对比剂”或“盂肱关节间隙见对比剂”作为注射少量对比剂时提示穿刺成功的证据，较既往文献中使用的标准准确率更高，更能有效避免不必要的调针或再穿刺，推荐在临床工作中使用。

慢性腰腿痛患者静息脑连接组的局部连接改变：基于多尺度频率相关的 KCC-和 Cohe-ReHo 的研究

周福庆
南昌大学第一附属医院

越来越多的增加表明中枢神经系统的可塑性在非特异性下腰痛患者的维持和发展中起到重要作用。然而，并不清楚中枢系统的局部或短程功能相互作用在椎间盘所致的腰腿痛患者症状维持中的作用。特别是，局部连接的多尺度自然属性在患者中的情况不清楚。因为，本研究使用体素水平的肯德尔和谐系数(KCC)和一致性(Cohe)局部一致性(ReHo)的方法，分别在典型频段(0.01 - 0.1 Hz)和 5 个特定的亚频段(slow-6 to slow-2)分析 25 例下腰腿疼患者(*duration: 36.7±9.6 months*)和 26 例健康对照组个体的全脑静息态功能磁共振扫描数据。组间比较差异证实患者组在典型频段和 5 个特定的亚频段(slow-6 to slow-2)的 KCC-和 Cohe- ReHo 显著改变分别位于右侧小脑后叶、脑干、左侧前额中部和双侧楔前叶；而疾病状态和 5 个特定亚频段的交互作用存在于包括疼痛矩阵和默认网络内数个区域(*P<0.01, Gaussian random field theory 校正*)。偏相关分析发现 5 个特定亚频段存在改变的 ReHo 和疼痛存在的时间、两点辨识度存在显著相关。这些结果将患者特定亚频段局部连接属性联系到疾病病程。在将来的疼痛相关局部脑连接组的研究中，是需要考虑整合频率段和分析方法用于更好的显著疼痛的中枢机制。

PO-122
单指数、双阶指数、拉伸指数模型 DWI 和 DKI 用于实性软组织肿瘤诊断价值的比较研究

席亚维,王绍武,赵晓宇,曾德威,戴越
大连医科大学附属第二医院

目的：探讨单指数模型、双阶指数模型、拉伸指数模型 DWI 和 DKI 技术用于术前判断实性软组织肿瘤良、恶性的应用价值，并比较那种技术对肿瘤良、恶性鉴别最优越。

材料与方法：收集发生于四肢、躯干及腹盆部的 sSTT 患者 30 例，术前均行常规 MRI、DWI、DKI 及增强检查，手动勾画 ROI，测得单指数模型 DWI Standard ADC 值；双阶单指数模型 DWI D-mono、D^*-mono、f-mono 值、双阶双指数模型 DWI D-Bi、D^*-Bi、f-Bi 值；拉伸指数模型 DWI DDC、α 值；DKI MK、MD、FA 值。采用软组织肿瘤 MRI-病理对照方法，获取病理结果。
结果：30 例 sSTT 独单指数模型 DWI Standard ADC、双阶单指数模型 DWI D-mono、拉伸指数模型 DWI DDC、DKI MD、MK 值在良恶性组间差异具有显著性（$P<0.05$）。采用 ROC 分析，单指数模型 DWI Standard ADC、双阶指数模型 DWI D-mono、拉伸指数模型 DWI DDC、DKI MK 及 MD 值的曲线下面积（AUC）分别 0.806、0.824、0.852、0.907、0.810；最佳诊断阈值分别为 $1.382\times10^{-3}mm^2/s$、$1.256\times10^{-3}mm^2/s$、$1.405\times10^{-3}mm^2/s$、0.518、$1.717\times^{-3}mm^2/s$，其鉴别良、恶性软组织肿瘤的敏感度分别为 100%、89%、100%、75%、100%，特异度分别为 67%、67%、75%，100%、67%。
结论：单指数模型 DWI Standard ADC、双阶指数模型 DWI D-mono、拉伸指数模型 DWI DDC 及 DKI MD、MK 均能鉴别良、恶性 sSTT；其中 DKI MK 值鉴别良、恶性 sSTT 的诊断效能最高。在 sSTT 的良、恶性诊断中，DKI 序列要优于单指数、双阶指数及拉伸指数模型 DWI 序列。

PO-123

Clinical-radiomics Nomogram Based on Radiographic Features to Assess Pulmonary Metastasis of Osteosarcoma of Extremities

Ping Yin,Nan Hong
Department of Radiology, Peking University People's Hospital

Background: Osteosarcoma (OS) is the most common primary malignant bone tumor in adolescents. Pulmonary metastasis (PM) occurs in more than half of patients at different stages of the disease course, which is one of the important factors affecting the long-term survival of OS.
Purpose: To develop and validate a clinical-radiomics nomogram based on Radiographic and clinical features that could predict PM of OS of extremities.
Materials and Methods: 1100 patients (PM=418, non-PM=682) with histologically proven OS of extremities were retrospectively analyzed and divided into a training set (n=770) and a validation set (n=330). Radiographic features and risk factors (sex, age, type, grade, treatment, etc.) associated with PM were evaluated. We compared the performance of models based on radiographic features, clinical data and their combination. The area under the receiver operating characteristic curve (AUC) and accuracy (ACC) were used to evaluate different models.
Results: Combined model had a relatively higher performance than individual one. Clinical-radiomics nomogram based on combined features achieved an AUC of 0.873 and ACC of 0.842, followed by radiomics model (AUC=0.821, ACC=0.790) and clinical data (AUC=0.762, ACC=0.706) in the validation set.
Conclusions: The clinical-radiomics nomogram had a good performance in predicting PM of OS of extremities, which would be helpful in clinical decision-making.

PO-124

Analysis of Histograms of ADC and Enhanced-T1WI in Differentially Diagnosing of Osteosarcoma and Ewing's sarcoma.

Chen Chen,Cui-ping Ren
The First Affiliated Hospital of Zhengzhou University

Objective: To determine if histograms of ADC and enhanced-T1WI can be used to differentiate osteosarcoma and Ewing's sarcoma.

Materials: 52 patients with confirmed histologically osteosarcoma in 32(61.54%) patients,and Ewing's sarcoma in 20(38.46%) patients were enrolled in the study,accepting MRI at 3T. The ROIs were drawn on the maximum level of ADC and enhanced-T1WI,and the histogram analysis were performed using the software named Mazda. The statistical analysis was performed on the nine histogram parameters to find out the different characteristics and the ROC curve was drawn to evaluate the diagnostic efficacy.

Results:Using ADC histogram,histogram metrics derived from Perc.01% were significantly lower in osteosarcoma than Ewing's sarcoma. Osteosarcoma was significantly higher variance,Perc.90% and Perc.99% than Ewing's sarcoma.Optimal diagnostic performance to predict Ewing's sarcoma from osteosarcoma (AUC= 0.855, sensitivity = 81.30%, specificity =82.40%) was obtained when setting variance= 391.63 as the threshold value.
Using enhanced-T1WI histogram,histogram metrics derived from mean,Perc.01%,Perc.10% and Perc.50% were significantly lower in osteosarcoma than Ewing's sarcoma. Osteosarcoma was significantly higher variance than Ewing's sarcoma. Optimal diagnostic performance to predict Ewing's sarcoma from osteosarcoma (AUC= 0.787, sensitivity = 70.60%, specificity =79.30%) was obtained when setting Perc.10%= 120.00 as the threshold value.

Conclusions:The histograms of ADC and enhanced-T1WI may help to discriminate Ewing's sarcoma and osteosarcoma and ADC histogram showed better efficacy compared to histogram of enhanced-T1WI.

扩散张量成像在腰椎间盘突出症中的临床应用价值初步研究

李明安[1],耿进朝[2],闫威[2]
1.首都医科大学附属北京友谊医院
2.中国中医科学院望京医院

[摘要]目的 利用 3.0T MRI 扩散张量成像（DTI）定量分析单纯受压而无临床压迫症状腰 5 脊神经根和伴有临床压迫症状腰 5 脊神经根，以期为临床诊断腰椎间盘突出症患者问题脊神经提供影像参考。**方法** 对 25 例（50 侧）正常对照组志愿者、14 例腰 5 脊神经压迫症状组患者、9 例腰 5 脊神经无压迫症状组患者行 3.0T 核磁共振 3D 水激发多回波合并成像序列（MEDIC）冠状位扫描和单次激发自旋回波平面成像序列（SS SE-EPI）扫描，评估腰 5 脊神经根的受压情况，测量腰 5 脊神经根的 ADC 值，均值的比较采用单因素方差分析。**结果** 腰 5 脊神经压迫症状组 ADC 值为（1.576±0.130）×$10^{-3}mm^2 \cdot s^{-1}$，小于腰 5 脊神经受压无症状组 ADC 值（1.761±0.249）×$10^{-3}mm^2 \cdot s^{-1}$及正常对照组 ADC 值（1.665±0.130）×$10^{-3}mm^2 \cdot s^{-1}$，差异有统计学意义。腰 5 脊神经受压无症状组 ADC 值与正常对照组 ADC 值差异无统计学意义。**结论** 腰椎间盘脱出症患者中腰 5 脊神经根 ADC 值大小的改变能反映腰 5 脊神经的压迫症状，并不能反映腰 5 脊神经根单纯的形态学改变。

PO-126

3.0T 磁共振扩散张量成像技术应用于腰椎间盘突出症患者的临床诊断价值

时寅
江苏省人民医院（南京医科大学第一附属医院）

目的 探究磁共振扩散张量成像技术（Diffusion Tensor Imaging，DTI）应用于腰椎间盘突出症患者的临床诊断价值。
方法 回顾分析 80 例腰椎间盘突出症患者。术前详细询问病史并进行临床查体，均行 DTI 及常规腰椎 MR 检查，术前分别记录 DTI 及 MR 的影像学诊断，根据 DTI 技术 3D MR 序列突出或脱出髓核与椎管内神经根的具体解剖关系分为肩上型，腋下型及腹侧型，根据神经纤维束成像图(Diffusion Tensor Tractography ,DTT)的神经根损伤情况分为神经根完好无损伤，神经根纤维束各向异性（FA）值降低无明显稀疏，神经根纤维束稀疏及神经根纤维束截断。术中影像结合临床查体情况验证影像学检查结果，采用 ROC 曲线分析常规 MR 检查及 DTI 技术对于神经根损伤诊断的曲线下面积（AUC）。采用卡方检验分析髓核与椎管内神经根的解剖关系与神经根损伤程度分级的具体关系。
结果 DTI 技术 3D MR 序列可显示突出或脱出髓核与神经根的具体关系，其中肩上型占 20%（16/80）,腋下型占 46.2%（37/80）,腹侧型占 33.8%（27/80）。ROC 曲线分析显示 DTI 技术对于神经根损伤诊断的 AUC 面积为 0.972，大于常规 MR 对于神经根损伤诊断的 AUC 面积 0.888，二者 ROC 曲线对比分析存在明显差异（P<0.05）。髓核与椎管内神经根的解剖关系与神经根损伤程度分级的卡方检验显示二者间差异不明显（P＞0.05）。
结论 DTI 技术相比于常规 MR 检查对于神经根损伤的诊断效能更高，不仅能明确突出或脱出髓核与椎管内神经根的具体解剖关系，有利于指导术中定位，还能对神经根损伤程度进行评估。然而髓核与神经根的具体位置关系与神经根损伤的程度无明显相关性，其损伤程度可能与具体的受压程度相关。

PO-127

多模态脊髓 MRI 在骨折伴脊髓损伤患者术前评估价值探讨

刘园,朱丰照,孔祥闯
华中科技大学同济医学院附属协和医院

目的：急性脊髓损伤致死致残率高，早期诊断和早期手术治疗是关键，MRI 在评价脊髓损伤方面具有极大优势。本研究结合多模态 MRI 技术，综合评估急性脊髓损伤患者脊髓损伤情况，指导制定最佳临床治疗方案。

实验方法：本研究数据收集平台为 Philips Ingenia，3.0T，采集数据包括常规 T2,T1, DTI, mFFE, T2mapping 等。目前已收纳患者为 22 例，其中有骨折损伤患者 8 例（2 例颈椎，5 例胸椎，1 例腰椎，本研究主要探讨重点），无骨折脊髓损伤患者 14 例。常规 T2，T1 一般只可评估脊髓有无水肿、挫裂等情况，mFFE 作为多回波 T2*序列，可准确评估脊髓损伤及出血情况，DTT 纤维束可视化可观察纤维束稀疏、移行及断裂情况。
结果：8 例骨折脊髓损伤患者中，1 例 C5 向前滑脱损伤 A 级患者因挫裂伤及脊髓出血严重放弃手术治疗；1 例 C7 骨折患者，术前评估脊髓挫伤及微出血但纤维束连续，术后 4 月由术前 B 级恢复至 D 级；1 例 T3-4 骨折患者术前评估脊髓挫伤及出血，但纤维束连续，术后三月由 A 级转为 C 级；1 例 T5 骨折患者，术前评估无显著挫裂伤及出血，纤维束连续，只存在骨性压迫，术前术后评级均为 E 级；1 例 T12-L1 爆裂骨折患者，术前评估为脊髓挫伤及出血，但纤维束未完全离断患者，以右侧为著，术前评估 A 级，术后运动功能部分恢复，左侧恢复较好；1 例 L1 爆裂骨折患者，术前评估为脊髓挫伤，无明显出血，纤维束大部分离断，术前评估 A 级，术后 A 级，暂未恢复（随访时间较短）；2 例 T5 及 T12 骨折患者术前评估挫伤及出血，并纤维束完全中断，患者术前 A 级，术后暂未见明显恢复。
结论：急性脊椎骨折患者严重程度与脊髓挫伤及出血情况极大关联，脊髓纤维束的保留对术后功能恢复至关重要。术前准确评估脊髓损伤（有无水肿、挫裂伤、出血）、纤维束走形及连续情况，不仅为临床医生提供准确诊断信息，指导治疗方案，并可提供前瞻性术前预后量化指标。

联合应用髋关节斜位扫描及 T2 Mapping 序列对髋臼早期软骨损伤的诊断价值

孟雪威,于绍楠,刘桂锋
吉林大学第三医院(中日联谊医院）

目的： 探讨联合应用髋关节斜位扫描及 T2 Mapping 序列对早期髋臼软骨损伤的诊断价值。 方法： 选取 2018 年 4 月 -2019 年 4 月本院收治的因髋关节骨性关节炎或外伤 30 例患者，分别采用核磁共振髋关节斜位联合 T2 Mapping 以及常规序列对髋关节进行诊断，将所得数据传输到工作站，进行图像后处理， 得到 30 例疑似软骨损伤患者的 T2mapping 伪彩图，调节阈值使得正常髋臼软骨的蓝色色阶，临近关节腔积液为灰色色阶，当软骨内出现损伤时呈现绿色-黄色色阶，所有 MR 图像均由两位高年资放射科医师一同阅片诊断， 测量感兴趣区的 T2 值。结果：髋臼正常软骨 T2 值及髋臼疑似软骨损伤病变区 T2 值的比较：正常平均 T2 值为 30. 755±3.321，损伤病变区 T2 值为 42.653±5.8532 ；T2 值随着软骨损伤而增高（P＜ 0.05）；结论： 在针对髋臼关节软骨损伤诊断方面，髋关节斜位扫描显示软骨更加清晰，T2 Mapping 序列的灵敏度更高，因此在髋臼早期软骨损伤的诊断中可以广泛应用斜位扫描及 T2 Mapping。
序列。

PO-129
Study on normal range of GSI energy spectrum analysis of children's pancreas based on contrast agent fixed-time injection method

Sipei Xing,Nan Yang
Tianjin Children’s Hospital

PURPOSE
This study used a fixed-time injection of iodine contrast agent based on the body mass of the child to evaluate the normal range of the analysis of the pancreatic energy spectrum of the children in the GSI spectrum enhancement examination.
METHOD AND MATERIALS
Thirty children with a body mass greater than 20 kg and a non-pancreatic lesion with abdominal CT enhancement were selected from 2019.1 to 2019.2. All patients underwent GSI spectroscopy CT enhancement examination using GE revolution CT. Four scan protocols (four groups) were scanned according to body weight , and a uniform contrast protocol was used: 300 mgI was given according to the weight of the child per ml Iodine contrast agent 1.5ml/kg, and use 24s fixed contrast injection time method. All patients underwent an image evaluation of the portal vein phase. The phase delay time was 56s after the contrast agent injection. The ROI of the head, body and tail of the pancreas was selected , and the four energy spectrum analysis values of 70KeV, iodine water value, water iodine value and atomic number were measured. The single sample statistics were drawn using SPSS software..
RESULTS
This indicates that the four energy spectrum analysis values of 70KeV, iodine water value, water iodine value and atomic number obtained are relatively fixed in children with pancreatic energy spectrum GSI enhanced CT examination using fixed-time injection of iodine contrast agent.
CONCLUSION
Contrast fixed injection time method according to different body weight to give different doses of iodine contrast agent, can ensure that children of different body weight under the contrast agent program and relatively fixed weight of iodine contrast agent, iodine contrast agent dose absorbed by human tissue Not affected by weight. Under the scanning scheme and the contrast agent scheme, the iodine dose is relatively constant, and is not affected by body weight, and the energy spectrum analysis value is relatively fixed, and the result has credibility under the scheme.
CLINICAL RELEVANCE/APPLICATION
Therefore, under this method, the energy spectrum analysis value can be used as a reference value for the normal energy spectrum analysis of the GSI enhanced CT examination of the pancreatic energy spectrum for the clinician to perform functional and component diagnosis based on the numerical value.

PO-130
能谱 CT 在儿童肾积水和单纯性肾脏囊性病变鉴别诊断中的价值

侯志彬
天津市儿童医院

目的 ：初步探讨能谱 CT 扫描在儿童肾积水与单纯性肾脏囊性病变鉴别诊断中的应用价值。**方法：**回顾性分析 2018 年 1 月至 2019 年 6 月在我院行能谱 CT 扫描的肾积水和单纯性肾脏囊性病变 30 例(肾积水 20 例，单纯性肾脏囊性病变 10 例，肾积水合并单纯性肾囊性病变 5 例)。所有患儿行能谱 CT 扫描，数据传入图像后处理工作站，获得两组病例的混合能量图像、40-140 keV 单能量图像、能谱衰减曲线图、钙-水基图、水-钙基图，比较两组病例混合能量及不同 keV 水平

下单能量图像的 CT 值差异。所得数据均进行独立样本 t 检验，绘制 ROC 曲线，比较各参数鉴别肾积水和单纯性肾脏囊性病变的敏感性和特异性。**结果**：肾积水混合能量 CT 值(9.80±2.80)HU，略大于单纯性肾脏囊性病变 CT 值(9. 55±2.56)HU，但差异无统计学意义(t =1.452，P =0. 078)。肾积水单能量图像 CT 值在低能量端(40-70Kev)大于单纯性肾脏囊性病变，差别有统计学意义，在 40 Kev 时，单能量 CT 值差别最大。肾积水的能谱曲线斜率(0.69±0.15)明显大于单纯性肾脏囊性病变(0. 28±0. 21)，差异有统计学意义(t =4.89，P =0. 000)。肾积水组水-钙浓度值(979. 30±8. 28)g/L 低于单纯性肾脏囊性病变(1000. 36±5. 81)g/L，差异无统计学意义(t = －1. 658，P =0. 059)。肾积水组钙-水浓度值(7. 76 ±2. 26)g/L 明显高于单纯性肾脏囊性病变(4.65±2. 18)g/L，差异有统计学意义(t =3. 231，P =0. 001)。**结论**：肾积水与单纯性肾脏囊性病变具有不同的能谱曲线和 CT 能谱特征参数，能谱 CT 为鉴别肾积水和单纯性肾脏囊性病变提供了一种新的、有价值的影像学检查方法。

PO-131
儿童肾母细胞瘤 Hedgehog 通路相关分子表达的临床意义及 CT 影像特征

桂婷,王丽君,储彩婷,刘明,张玉珍,李玉华,汪登斌
上海交通大学医学院附属新华医院

目的 探讨 Hedgehog 信号通路相关分子 BMI1 和 Gli1 在儿童肾母细胞瘤（NB）组织中的表达情况及其与 CT 影像、预后的关系。**方法** 收集 37 例 NB 患儿的 NB 组织及其癌旁正常组织的病理切片标本，通过免疫组织化学染色法观察 BMI1 和 Gli1 蛋白在肿瘤组织中的表达，分析其与 NB 患儿临床病理、CT 影像特征以及血清肿瘤标志物的关系。利用公共数据库，分析 BMI1 和 Gli1 mRNA 表达与 NB 患儿预后的关系。**结果** 纳入 37 例患儿，男 14 例、女 23 例，中位年龄 2 岁（3 个月~6 岁）。NB 组织中 BMI1 和 Gli1 蛋白表达均较癌旁正常组织增高，差异有统计学意义（P<0.01）。BMI1 阳性细胞在 37 例患儿肿瘤组织均被观察到，而 Gli1 阳性细胞在 16 例患儿肿瘤组织中未被检测到。22 例 BMI1 高表达的 NB 患儿更容易出现 CT 影像能观察到的远隔转移，且血清甲胎蛋白、糖类抗原-125（CA-125）表达增高，同时总体生存期也更短，差异均有统计学意义（P<0.01）；Gli1 表达增高则与 NB 患儿临床病理及 CT 影像特征或预后无相关性。**结论** Hedgehog 通路相关分子 BMI1 和 Gli1 在 NB 肿瘤组织中表达增高，BMI1 高表达患儿更早出现 CT 影像学上的远隔转移，并与预后不良正相关，可能是 NB 发展的一个重要影响因素。

PO-132
戈谢病肝脾定量影像学研究

李笛,陶晓娟,彭芸
首都医科大学附属北京儿童医院

目的 采用定量磁共振成像对戈谢病（Gaucher disease, GD)[1]肝脾系统病变进行研究，探讨肝脾系统定量成像的变化。
方法 对 40 例正在接受酶替代疗法治疗的戈谢病患者及 30 例健康者进行磁共振检查，检查采用定量非对称回波的最小二乘估算法迭代水脂分离(IDEAL-IQ)技术[2]和肝脏容积加速法(LAVA)。统计学采用双样本 t 检验，P＜0.05 代表有统计学意义。**结果** 戈谢病患者组肝脾脂肪含量分别为（3.07±3.06）%、（2.01±0.77）%，正常对照组肝脾脂肪含量为（2.87±1.37）%、（1.79±0.34）%；戈谢病患者组肝脾铁含量分别为（54.18±24.13）Hz、（39.17±26.32）Hz，

正常对照组肝脾铁含量为（49.45±7.96）Hz、（42.32±19.84）Hz。以上两组之间均没有统计学差异（P＞0.05）。戈谢病患者组和正常组的平均肝脏体积分别为（1498.34±452.94）cm³（1308.20±320.23）cm³。组间肝容积差异有统计学意义（P=0.044）。戈谢病患者组和正常组脾脏平均体积分别为(411.46±228.01)cm ^{3}和（218.74±88.57）cm ^{3}。两组脾脏体积差异有统计学意义（P<0.001）。

结论 治疗后 GD 患者肝脾体积仍略大于正常人。GD 患者肝、脾脂肪分数略高于正常组，但仍在正常范围内。ERT 对肝脾损害有一定改善作用。

PO-133

儿童 Kasabach-Merritt 现象的影像学诊断价值

周莺
上海交通大学医学院附属上海儿童医学中心

【摘要】目的：分析 Kasabach-Merritt 现象（Kasabach-Merritt phenomenon, KMP）的临床资料及影像学特点，以提高对本病的认识。**方法：**回顾性分析 19 例 KMP 病例的临床资料和影像学表现。男 14 例，女 5 例，年龄 0 天-12 月，平均 3 月。临床表现主要包括进行性增大的软组织肿胀/肿块共 10 例，皮肤瘀点瘀斑 5 例，黄疸 3 例，胸痛 1 例。治疗前 14 例病例给予 MRI 检查，5 例病例给予 CT 检查。**结果：**所有 19 例病例实验室检查均提示不同程度的血小板减少和凝血功能异常，同时发现全身不同部位有血管性病变：（1）病灶部位：胸壁、腹壁或盆壁局限或弥漫性病灶 8 例（42.1%），胸腰段脊柱旁局限或弥漫性病灶 4 例（21.0%），腹腔实性病灶 4 例（21.0%），四肢弥漫性病灶 2 例（10.5%），颈部病灶 1 例。（2）影像学特点：MRI 和 CT 能清晰显示病变，所有病灶平扫 MRI 表现为 T1W 等或者低信号，T2W 为高信号，CT 表现为等或者低密度影，增强后 CT 或 MRI 均呈明显均匀或不均匀强化。（3）16 例病例接受药物治疗，3 例为手术与药物联合治疗，经 18 个月的治疗、随访，整组病例存活率为 84.2%（16/19）。**结论：**KMP 是一种少见但致命的疾病，临床和实验室数据可以提示本病但并不能确诊，必须发现血管性病变才能诊断，MRI/CT 对病变的显示、性质的确定和范围的明确有独特的优势，并且在指导治疗和随访起了十分重要的作用。

PO-134

MRI 脂肪定量技术在 Duchenne 型肌营养不良患儿骨骼肌脂肪浸润评估的应用价值

杨学军
广西医科大学第一附属医院

【摘要】 目的 分析 Duchenne 型肌营养不良患儿骨骼肌脂肪浸润特点及其与临床的关系，探讨 HISTO、qDixon 脂肪定量技术在该疾病中的应用价值。**方法** 共 25 例经临床、病理免疫组化及基因检测确诊的 Duchenne 型肌营养不良患儿，激素治疗前均行临床肌力评分、CK 检测以及行臀部、大腿共计 19 块肌肉 MRI 检查，并采用 T1WI 脂肪浸润分级、HISTO 及 qDixon 脂肪定量技术评价肌肉脂肪浸润程度，并与肌力和 CK 值进行相关性分析。**结果** Duchenne 型肌营养不良患儿的 19 块骨骼肌中臀大肌、臀中肌、大收肌脂肪浸润程度较重，闭孔内肌、闭孔外肌、长收肌、缝匠肌、股薄肌及半腱肌相对较轻，呈回避现象。Spearman 秩相关分析显示，大收肌脂肪浸润分级与 HISTO-FF 值、qDixon-FF 值均呈显著正相关（r=0.94，P＜0.01、r=0.91，P＜0.01）；HISTO-FF 值与 qDixon-FF 值呈显著性正相关（r=0.98，P＜0.01）；部分肌肉与肌力评分呈负相关，但均无统计

学意义（r＜-0.3，P＞0.05）；CK 值与部分肌肉脂肪分数呈中度正相关性，但无统计学意义（r＞0.5，P＞0.05）。**结论** Duchenne 型肌营养不良患儿骨骼肌脂肪浸润有一定的分布特点，可为临床肌肉活检及基因检测的选择提供参考。HISTO、qDixon 脂肪定量技术可用于监测 Duchenne 型肌营养不良患儿肌肉脂肪含量，为临床治疗随访提供无创性检查手段。Duchenne 型肌营养不良患儿临床肌力评分和 CK 值与骨骼肉脂肪含量存在一定相关性。

PO-135
基于中华 05 计分法西安地区 3～12 岁汉族女童骨龄图谱的研究

王小飞[1],张增俊[1],强永乾[2]
1.西安市儿童医院
2.西安交通大学第一附属医院

目的：目前国际公认的骨龄评价方法是计分法和图谱法，两者结合使用可提高骨龄评估的准确性。我国最新的骨龄标准中华 05 只有计分法，无对应的图谱法。本研究基于中华 05 计分法制定西安地区 3～12 岁汉族女性儿童的骨龄图谱，以弥补计分法的不足，并通过分析该图谱与 G-P 图谱、顾氏图谱的差异，了解现阶段西安地区女性儿童的生长发育变化特点。
方法：采用方便抽样的方法选取 2014～2019 年西安地区 3～12 岁正常汉族女性儿童手腕部 DR 片 6800 例，经中华 05 计分法统一判读后，选取所有整岁和半岁组的骨龄样片共 19 组，每组样本量为 50 张，筛选各组的中位数片与众数片，从中选出最能代表该骨龄段各骨骺发育水平的 DR 片作为标准骨龄片，制作出基于中华 05 计分法的西安地区汉族女童骨龄图谱。通过该图谱与 G-P 图谱以及顾氏图谱相同骨龄标准片的对比分析，总结它们之间的差异。
结果:（1）制作出基于中华 05 计分法的西安地区 3～12 岁汉族女性儿童骨龄图谱标准片，并详细解释每张标准片的手腕骨发育特征。（2）在青春期生长突增之前，本研究图谱的手腕骨发育水平落后于 G-P 图谱，腕骨和尺骨尤为明显，并且随着年龄的增长差距逐渐变小，至骨龄 10.0 岁时基本一致。（3）本研究图谱几乎所有的手腕骨发育水平均高于顾氏图谱，尤其腕骨和尺骨均提前 1 岁左右。
结论：（1）制定出基于中华 05 计分法的西安地区 3～12 岁汉族女童骨龄图谱。（2）现阶段西安地区的女性儿童在青春突增期前骨发育速度落后于美国女性儿童，而在此之后，骨发育速度又快于美国女性儿童。（3）现阶段西安地区的女性儿童随着生活水平的改善，骨发育呈长期加速的趋势。（4）骨龄标准在不同时期，不同区域是有变化的，与之相配的骨龄图谱也应该根据实际情况而制定，本研究制作的骨龄图谱经统计学检验，适合于西安地区的 3～12 岁汉族女性儿童。

PO-136
首发 1 型糖尿病儿童基于静息态功能磁共振的功能连接研究

刘锟,严志汉
温州医科大学附属第二医院

目的　本研究通过比较首发 1 型糖尿病儿童与正常对照儿童之间全脑功能连接密度有无差异，并对功能连接密度与临床及认知数据进行相关性分析，以功能连接密度差异脑区作为种子点，与全脑体素做功能连接，分析两组间功能连接改变。
材料与方法　本研究共纳入首发 1 型糖尿病儿童 35 例和年龄、性别相匹配的正常对照儿童 33 例。收集人口社会学资料、临床资料及智力测评资料。所有被试的静息态功能磁共振图像采用全脑平面回波成像序列采集。同时通过 3D T1-BRAVO 序列采集高分辨三维结构图像。使用 SPM8 和 DPARSF 软

件对静息态功能磁共振成像数据进行预处理，计算每个被试全脑功能连接密度，选择具有功能连接密度组间差异结果的脑区作为种子点进行全脑功能连接计算。功能连接密度或功能连接图上体素的组间比较采用两样本 t 检验，并进行多重比较校正。人口统计学和临床资料采用两样本 t 检验进行检验。对 1 型糖尿病组提取的功能连接密度值与临床资料进行偏相关分析。P ＜ 0.05 认为具有统计学差异。 结果 糖尿病组和对照组间在年龄、性别、智商上均无统计学差异。 糖尿病组 HbA1c 和血糖水平均高于对照组，差异有统计学意义。与对照组相比，糖尿病组右侧颞下回及右侧后扣带回功能连接密度值降低。在糖尿病组，右侧颞下回及右侧后扣带回功能连接密度值与 HbA1c、检查前血糖及总智商均不相关。在糖尿病组，右侧颞下回与左侧眶部额下回间的功能连接增加，右侧后扣带回于双侧楔叶的功能连接降低。 结论 本研究发现即使在疾病起始阶段，1 型糖尿病儿童静息时部分脑区功能连接就已发生改变。1 型糖尿病儿童的行为（情绪）及认知功能（记忆力、注意力、执行功能）损伤可能与右侧颞下回、右侧后扣带回、两侧楔叶功能连接异常有关。本文从功能体系的角度为探索 1 型糖尿病行为认知损伤的神经病理生理机制提供了一个新的途径。

PO-137

DWI 对儿童不同级别脉络丛肿瘤的鉴别诊断价值

温洋[1,2],张楠[1,2],段晓岷[1,2],彭芸[1,2]
1.首都医科大学附属北京儿童医院
2.国家儿童医学中心

目的 探讨 DWI 对于不同级别的儿童脉络丛肿瘤（CPT）的鉴别价值。
材料与方法 回顾性分析经手术病理证实的 39 例儿童 CPT 的 DWI 表现及由其产生的相对 ADC 值（rADC，肿瘤实性部分最大层面 ADC/同层面脑脊液 ADC），其中脉络丛乳头状瘤（ CPP，WHO Ⅰ级）15 例，非典型脉络丛乳头状瘤（ APP，WHO Ⅱ级）16 例，脉络丛乳头状癌（ CPC，WHO Ⅲ级）8 例。
结果 15 例 CPP，女:男为 8:7，年龄 2~48 月、中位年龄 8.5 月；16 例 APP，女:男为 8:8，年龄 3~120 月、中位年龄 11.5 月；8 例 CPC, 女:男为 3:5，年龄 4 ~80 月、中位年龄 12.5 月。三组发病年龄无统计学差异（P=0.451）。
在 DWI 及 ADC 图上，CPT 实性部分信号多变。在 DWI，将高或略高信号作为一组，其余为一组，CPP 为 3:12，APP 为 3:13，CPC 为 5:3；1-2 级为一组与 3 级信号差异有意义（p=0.028），余各两级之间均无统计学差异。在 ADC，将低或略低信号作为一组，其余为一组，CPP 为 4:11，APP 为 4:12，CPC 为 5:3。各两级之间、1-2 级与 3 级之间均无统计学差异。
在 rADC 值，CPP 为 0.4470±0.1116，APP 为 0.4291±0.1017，CPC 为 0.3355±0.0747；1 级与 2 级之间无统计学差异（P=0.624）；1 级与 3 级、2 级与 3 级，以及 1-2 级与 3 级之间均有统计学差异（P= 0.016, 0.040, 0.014）。对于区别出 3 级与 1-2 级，ROC 曲线分析提示界值为 rADC≤0.3838，曲线下面积为 0.806，计算出的敏感性、特异性、阳性预测值及阴性预测值分别为 87.5%, 64.5%, 38.9%, 95.2%。
结论 在儿童脉络丛肿瘤，3 级的 rADC 值小于 1 级或 2 级，3 级绝大多数 rADC≤0.3838；在 DWI 上，3 级比 1-2 级更多地表现为高或略高信号。

PO-138

粘多糖贮积症的颅脑 MRI 表现

杨洋,袁新宇
首都儿科研究所附属儿童医院

目的 总结粘多糖贮积症（MPS）患儿的颅脑病变的 MRI 表现，并探讨不同病变与患儿智力水平的相关性。建议 MPS 患儿颅脑 MRI 检查的优化序列。方法 回顾性分析 19 例临床确诊 MPS 患儿的临床和颅脑 MRI 影像资料，对 MRI 图像中的血管外间隙增宽、脑白质异常信号、蛛网膜下腔增宽、脑室扩张、蝶鞍形态异常、枕大池增大、齿突发育不全、齿突周围软组织增厚、椎管狭窄、颈髓异常和颈椎椎体形态异常进行半定量评价。利用 t 检验探讨智力落后组与智力正常组间 MRI 征象的差异，对 MRI 各征象之间、以及各征象与患儿年龄的相关性采用 Spearman 相关分析法进行探讨。结果 19 例 MRI 图像中，各征象发生率如下：血管外间隙增宽(57.9%)、脑白质异常信号(47.4%)、蛛网膜下腔增宽(73.7%)、脑室扩张(52.6%),、蝶鞍形态异常(73.7%)、枕大池增大(52.6%)、齿突发育不全(68.4%)、齿突周围软组织增厚(26.3%)、椎管狭窄(57.9%)、颈髓异常(10.5%)和颈椎椎体形态异常(36.8%)。智力正常与落后组间白质异常信号（t=1.962, P=0.049）和脑室扩张（t=2.181,P=0.045）两个征象具有统计学差异。MRI 各征象与年龄均无显著相关性。白质异常信号与血管间隙增宽之间存在正相关（r=0.6，P=0.007），蛛网膜下腔间隙增宽分别与脑室扩张（r=0.719,P=0.001）和枕大池增大（r=0.478, P=0.038）存在正相关。而椎管狭窄与齿突发育不全和齿突周围软组织增厚之间均无显著相关性。结论 MPS 的颅脑 MRI 改变涉及范围广泛，需要进行全面评估。脑白质异常信号和脑室扩张的程度与临床智力状态相关，有助于评估病情。矢状位 T2WI 对显示脊髓受累情况具有优势。

PO-139

3.0TMRI 在胎儿后颅窝病变中的诊断探讨

殷星,赵鑫
郑州大学第三附属医院

目的 探讨 3.0TMRI 在胎儿小脑病变中的诊断价值。方法 回顾性分析胎儿小脑病变的 MRI 表现，并与超声相对比。131 例孕妇年龄 18-34 岁，平均 28 岁；孕龄 22-38 周，平均 27 周。产前常规超声检查后 24 小时内行 3.0TMR 检查，T2WI 采用半傅立叶单激励快速自旋回波序列及 T2-真快速成像，T1WI 采用二维快速小角度激励序列，行胎儿头颅三平面扫描，将产前 MRI 与超声进行对照。结果 131 例孕妇共检出胎儿 131 例。包括后颅窝池增宽 45 例，经典型 Dandy-Walker 畸形 22 例，Joubert 综合征 3 例，小脑蚓部发育不良伴旋转 6 例，Chiari 2 型 2 例，后颅窝蛛网膜囊肿 15 例，小脑脑干发育不良 3 例，阴性结果 35 例。131 例孕妇 MRI 结果进一步完善产前超声诊断 87 例，纠正超声诊断 19 例，一致 25 例。结论 MRI 在胎儿后颅窝病变诊断方面具有一定的应用价值，特别复杂畸形或合并出血时能够提供超声以外的额外信息，甚至能更正超声的诊断。目前我院正中矢状位半傅立叶单激励快速自旋回波序列约于 28 周可较明确分辨小脑原裂，这与文献报道 21 周可以分辨仍存在一定差距，需要进一步对参数进行优化。

PO-140

The testicular descent on prenatal 1.5T magnetic resonance imaging

Yan Sun
West China Second University Hospital, Sichuan University

Objective: To evaluate testicular descent in relation to gestational age in normal male fetuses on prenatal MRI.
Methods: A total of 1095 cases of male fetuses from July 2016 to March 2019 who received 1.5T fetal brain MRI examination and were diagnosed as normal or slightly congenital abnormality (mild Ventriculomegaly33.8%,mega cisterna magnal2.2%,enlargement or narrowing of the cavum septi pellucidi (CSP) 3.9%,combined with two or more minor abnormalities4.4%) in West China Second University Hospital, Sichuan University were selected, it includes 53 male fetuses from twins. The gestational age of the included fetus ranges from 19 to 38 weeks of gestation. Fetal testicular descent was evaluated on prenatal 1.5T MRI, unilateral descent and bilateral descent according to gestational age were analyzed, and the testicular descent curve based on gestational age was drawn.
Results: Testis was not observed in scrotum on prenatal 1.5T MRI prior to 23 weeks' gestation. Unilateral testicular descent was firstly observed at 24+1 weeks of pregnancy, and the earliest bilateral testicular descent showed at 25+3 weeks. The descent of testicles mainly occurred in the gestation of 25-28 weeks, 82.6% of 28-week fetuses showed bilateral descent and 93.0% showed the descent of at least one side. Bilateral descent was observed in 100% of cases at 33 weeks.
Conclusions: The time course of testicular descent evaluated by prenatal MRI is useful for prenatal diagnosis of relevant male congenital abnormalities, especially for early detection of cryptorchidism.

PO-141
1.5T 磁共振成像评价胎儿内耳发育： BTFE 序列参数优化的初步研究

白万晶,宁刚,李学胜,鲍莉
四川大学华西第二医院

目的：探讨评价胎儿内耳发育的最佳 BTFE 序列参数。
方法：选取来我院行胎儿脑部 MRI 检查的孕妇 5 例，孕周大于 29 周。在常规检查的基础上，对每 1 例胎儿双侧耳部采用 BTFE 序列，进行横断位和冠状位的薄层负间隔扫描，对薄层数据进行 MIP 后处理。5 例胎儿的扫描层厚和层间隔分别如下——（1）3mm、-0.5mm，（2）3mm、-1mm，（3）3mm、-2mm，（4）3mm、-2.5mm，（5）2mm、-1mm。请有经验的从事胎儿 MRI 诊断的高年资医师来评价图像质量和内耳的显示情况。
结果：（3）对胎儿内耳耳蜗的走行显示优于（1）（2），（4）（5）图像质量下降，反而干扰了内耳的显示。通过 MIP 得到的 3D 影像可以大致显示半规管的空间结构，但清晰度欠佳。
结论：BTFE 序列层厚、层间隔分别为 3mm、-2mm 时，能清晰显示胎儿内耳耳蜗走行，同时图像质量满足诊断要求。

PO-142
儿童大前庭导水管综合征伴内淋巴囊扩大的 3.0TMRI 与 256 排 CT 的应用价值的分析

徐守成[1],姜丹[2]
1.哈尔滨市儿童医院
2.哈尔滨医科大学附属肿瘤医院

目的 儿童大前庭导水管综合征伴内淋巴囊扩大的 3.0TMRI 与 256 排多层螺旋 CT 影像表现特点及在临床中的应用价值的分析
方法 回顾性分析我院大前庭导水管综合征 30 例共 60 耳的 MRI 及 CT 影像表现，对不同程度病例的影像特点进行分析总结，所有病例均采用 Philips 公司生产的 3.0T 超导型核磁共振仪器进行 T2WI 3D DRIVE 内耳水成像扫描.并且所有病例均进行 GE 256 排多层螺旋 CT 薄层高分辨率扫描检查。
结果 单纯前庭导水管扩张 22 例，其中一侧前庭导水管扩张 4 例，双侧前庭导水管扩张 18 例。单纯内淋巴囊扩张 6 例，其中一侧淋巴囊扩张 1 例 ，双侧内淋巴囊扩张 5 例。前庭导水管及内淋巴囊均扩张 8 例。 影像表现：MRI 在前庭导水管扩张中可清晰显示内淋巴囊与前庭的交通，呈明显细管样高信号。扩大的内淋巴囊成囊袋状高信号匍匐于岩骨内侧缘，部分病例内淋巴囊的信号不均匀，呈高及稍高的分层状信号特点。同一病例的 MRI 成像特点与 CT 进行比较发现：扩张的前庭导水管在 CT 上呈现左右对称喇叭口状表现，可实际测量前庭导水管开口的大小，与在 MRI 成像上细管状高信号所对应。扩大的内淋巴囊在 CT 显示不够理想，因与周围脑脊液的 CT 值差别不大，与 MRI 成像呈明显囊袋状高信号有所区别，但可以清晰显示扩大内淋巴囊对岩骨的压迫情况。
结论：MRI 对大前庭导水管综合征及内淋巴囊扩大病变情况均可以清晰的显示，并且可以对前庭导水管扩张的程度更清晰的显示，而 CT 对前庭导水管扩张的程度显示亦很好，但对内淋巴囊扩大的显示略逊于 MRI。综上所述，MRI 及 CT 对大前庭导水管综合征伴内淋巴囊扩大病变均可以进行准确诊断，但是如果将二者结合起来将更为准确，能够为临床提供精确的诊断依据。

PO-143
儿童鳃器畸形的影像诊断与临床对照分析

石浩,江虹,杨恒
昆明市儿童医院

目的：对照和分析影像学检查在儿童鳃器畸形术前分型诊断的价值。方法：回顾性研究。选择昆明市儿童医院 2017 年 1 月至 2018 年 12 月收治的 53 例儿童鳃器畸形患儿临床资料、术前影像学（CT、MRI、X 线造影检查及造影后 CT 检查）检查结果，根据影像学检查结果对所有鳃器畸形患儿进行术前分型，对比手术诊断及术后病理检查结果，采用 Kappa 一致性检验对术前影像检查结果与手术及术后病理结果进行一致性比较。结果：第 1 鳃器畸形 5 例，第 2 鳃器畸形 25 例，第 3 鳃器畸形 7 例，第 4 鳃器畸形 16 例。影像表现为囊肿、窦道和瘘管，伴感染时可见病灶壁增厚、环形强化及周围组织间隙内渗出，第 4 鳃器畸形病灶内可见气体及合并甲状腺左叶感染。X 线造影及造影后 CT 检查可显示瘘管及窦道的形态、位置及走行。53 例鳃器畸形患儿中有 5 例患儿术前影像检查分型与手术结果不相符，Kappa 值为 0．780。结论：术前多种影像学检查方法可清晰显示鳃器畸形的位置、结构特点及其与毗邻结构的关系，以及有无窦道和瘘管形成，并提示是否合并感染，对手术完整切除病灶、避免复发具有重要的价值。

PO-144
坏死型视网膜母细胞瘤伴眼眶蜂窝织炎的 MRI 表现

陈淑贤,李玉华,尹秋凤,桂婷
上海交通大学医学院附属新华医院

目的 探讨肿瘤坏死型视网膜母细胞瘤伴眶周蜂窝织炎的 MRI 影像表现。
方法 收集我院 2015 年-2019 年经病理证实的 14 例视网膜母细胞瘤伴眼眶周蜂窝织炎的 MRI 及病理资料，回顾性分析其影像学特征。
结果 坏死型视网膜母细胞瘤在所有视网膜母细胞瘤中发病率为 2.6%（14/539），14 例病例中，双眼发病 3 例，单眼发病 11 例，平均发病年龄 22.8 个月，临床表现为白瞳症伴眼睛发红或眼睑肿胀。MRI 表现：眼球增大 11/14(78.6%)，青光眼 5/14(36.4%)，白内障 10/14(71.4%)，晶状体剥落 10/14(71.4%)，所有眼内病灶平均最大长径为 19.75±3.69 mm；所有眼内肿瘤灶 T1WI 表现为混杂高信号、等信号为主，T2WI 表现为混杂低信号为主；T1WI 增强后所有病灶均无强化，均伴有眼环明显增厚伴强化明显，DWI 表现为高信号或部分高信号 8 例、条索状混杂高信号 3 例、低信号 3 例，平均 ADC 值为（0.974±0.263）$\times 10^{-3}mm^2/s$。球后表现：视神经增粗 2 例，视神经周围鞘膜明显强化不伴视神经增粗者 12 例；所有患眼均出现眶周斑片状、条片状强化影，伴眼睑明显肿胀。42.9% (6/14)患眼肿瘤侵犯并穿透筛板，浸润筛板后视神经。
结论：坏死型视网膜母细胞瘤伴眼眶蜂窝织炎发病率较低，其眼内表现及肿瘤影像特征与经典型不同，具有较特征的影像表现。坏死型视网膜母细胞瘤大多伴有眼内蜂窝织炎，筛板后视神经浸润发生率较高。

PO-145
第 2 代心脏运动伪影矫正算法对高心率儿童心脏增强 CT 成像效果的优化

孙记航,彭芸
首都医科大学附属北京儿童医院，国家儿童医学中心

目的：
评价第 2 代心脏运动伪影矫正算法对高心率先天性心脏病儿童增强 CT 心脏及大血管成像效果的改善能力。
资料与方法：
连续选取 42 例高心率先心患儿入组，心率 122.6±18.8 (78-151)，年龄 5d-6y，中位年龄 8m，全部患儿接受 256 排心脏增强 CT，自动选择扫描时像，回顾性心电门控自动选择最佳心动周期，重建为常规图像（standard，SD），第 1 代心脏运动伪影矫正算法图像（first-generation motion correction image，MC1），以及第 2 代心脏运动伪影矫正算法图像（second-generation motion correction image，MC2）。2 名影像医师独立应用 4 分制（1 分：无法诊断；2 分：可以观察；3 分：可以测量；4 分：完美）分别评价左侧冠脉、右侧冠脉、主动脉瓣、肺动脉瓣、二尖瓣、三尖瓣、主动脉根部、肺动脉根部、室间隔、房间隔，应用非参数检验分析比较三组图像之间的差异，以及不同方法间两两差异。
结果：
三组图像组间比较显示，除三尖瓣、室间隔、房间隔外，所有其它结构均具有组间差异，MC2 图像质量最好，MC1 次之，SD 最差。两两比较结果显示，室间隔图像质量两两比较无统计学差异，其余各项结果显示 MC2 图像质量优于 MC1 及 SD ，MC1 与 SD 比较，仅左冠、右冠、二尖瓣显示效果优化，余各项无统计学差异。
结论：
MC2 可以减少心脏运动伪影，较 MC1 可以提高冠脉图像质量外，同时大幅提高心脏、瓣膜、大血管根部的图像质量，有利于提升高心率先心病患儿心脏增强 CT 图像质量。

PO-146

儿童良性心脏肿瘤的 MRI 分析

欧阳荣珍,高伟,孙爱敏,王谦,钟玉敏
上海交通大学医学院附属上海儿童医学中心

目的：研究儿童心脏良性肿瘤的心脏磁共振特征及心脏磁共振对儿童良性肿瘤的诊断价值。
方法：回顾性分析 2006 年 9 月至 2018 年 3 月至我院进行心脏磁共振（CMR）检查的心脏良性肿瘤病例，按照纳入排除标准筛选病例。所有病例图像采集使用 1.5T 扫描仪扫描。收集整理研究病例的人口学及临床资料，并分析肿瘤在 CMR 上的特征，包括位置、大小、范围、信号特点、血流动力学改变等以及是否伴发心包、胸腔积液。
结果：研究期间共 121 例连续病例进行 CMR，纳入有病理结果的良性肿瘤或临床确诊结节性硬化伴心脏横纹肌瘤的病例 38 例。患儿年龄 0.2 个月至 155.3 个月（中位年龄 13 个月）；男孩 21 例，女孩 17 例。肿瘤发生部位多种多样，大小不一，各类肿瘤具有一定的影像学特征。所有的心脏肿瘤均能被 CMR 清晰显示，与病理结果相符的例数为 32 例， 诊断的准确性为 84.21 %。
结论：CMR 能够同时提供心脏良性肿瘤的形态学特征及组织学信号特征，对心脏良性肿瘤诊断的敏感性及准确性均较高，是评估心脏肿瘤的重要检查方式，为临床诊治提供参考价值。

PO-147

儿童难治性支原体肺炎的 CT 表现及预测

储彩婷,徐蕾,丁茗,张玉珍,李文华,汪登斌
上海交通大学医学院附属新华医院

目的：探讨儿童难治性支原体肺炎的胸部 CT 表现、并利用其 CT 征象进行预测，以便及早及合理诊治。
材料与方法：自 2014 年 1 月 1 号至 2018 年 12 月 30 号，我院收治了 7654 名上呼吸道感染或肺炎患儿，经血清学支原体 IG M 抗体阳性或咽拭子支原体 DNA 扩增阳性证实支原体肺炎 2565 例。最后 366 例患儿行胸部低计量 CT 检查并全部入组。根据难治性支原体肺炎的定义，分为普通型支原体肺炎 159 例、难治性支原体肺炎 209 例。分析其临床资料，实验室检查及胸部 CT 特征并进行了单因素分析。利用多因素分析获取有统计学价值的难治性支原体肺炎胸部 CT 征象和原始及优化模型. 利用 ROC 曲线比较模型间的诊断效能以及模型与实验指标诊断效能。最终根据优化回归模型 CT 评分对难治性支原体肺炎的患儿进行危险分组。
结果:儿童难治性支原体肺炎具有统计学价值的 CT 征象包括实变的个数、无支气管充气征的实变，双侧肺炎和胸水. 根据以上参数我们得到诊断效能高度一致原始回归模型及优化回归模型，并且原始回归模型的诊断效能明显优于实验室指标。利用优化回归模型的 ROC 曲线分析得到诊断儿童难治性支原体肺炎的准确性高达 86.6%。具有无充气管充气征实变、双侧肺炎、胸水征象患儿视为低危组，具有多叶实变征象患儿视为中危组， 具有无充气管充气征实变、双侧肺炎、胸水及多叶实变征象患儿视为高危组。
结论: 基于 CT 征象及分值，优化回归方程及危险分组能够准确诊断及预测儿童难治性支原体肺炎。CT 检查对预测儿童难治性支原体肺炎非常有价值。

PO-148
3T 磁共振运动矫正相位敏感反转恢复序列在儿童自由呼吸下心肌延迟成像中的应用价值

谢林均,郭应坤,许华燕,刘慧,李学胜,伏川
四川大学华西第二医院

目的：对比 3.0T 磁共振相位敏感反转恢复序列（PSIR）与运动矫正相位敏感反转恢复序列（PSIR MOCO）在儿童自由呼吸下心肌延迟增强中的应该价值。
方法：选择 2018 年 10 月-2019 年 6 月在我院放射科行心脏磁共振增强扫描的患儿 58 例，采集自由呼吸下相位敏感反转恢复序列（PSIR）与运动矫正相位敏感反转恢复序列（PSIR MOCO）延迟图像。对比分析两组图像的主观质量评分（5 级），并配对对比分析两组中正常心肌、异常强化心肌及左心室腔内图像的信噪比和相对信噪比。
结果：所有患儿 PSIR 序列图像质量主观评分结果：5 分、4 分、3 分、2 分和 1 分组依次占 15.5%、32.8%、37.9% 、12.1%和 1.7%。患儿 PSIR MOCO 序列图像质量主观评分为 5 分比例为 25.9%，4 分为 50.0%，均显著高于 PSIR 序列（all P <0.001）， 3 分占 20.7%，2 分占 1.7%，1 分占 1.7%。PSIR MOCO 组图像异常强化心肌与正常心肌的相对信噪比（P =0.36）、异常强化心肌与左心室血池的相对信噪比（P =0.63）及左心室血池与正常心肌的相对信噪比（P =0.76）。PSIR 序列短轴扫描时间约 17s，PSIR-MOCO 序列短轴扫描时间约 1min30s。
结论：在儿童自由呼吸下心肌延迟增强图像采集中，与 PSIR 序列相比，PSIR MOCO 序列的图像信噪比和相对信噪比没有显著差异，但图像主观质量评分，PSIR MOCO 序列的高质量图像比例比 PSIR 序列更大。但是 PSIR-MOCO 序列扫描时间较 PSIR 明显增加。因此在临床运用中，可以首先选择时间较短的 PSIR 序列扫描，如果得到的图像可以满足诊断要求，可不进行 PSIR MOCO 序列；如果 PSIR 序列扫描得到的图像质量较差，可进行 PSIR MOCO 序扫描，以获得更高质量的图像。

PO-149
肿瘤性急性胰腺炎的 CT 和 MRI 特征分析

邢海东,靳二虎,张洁,杨正汉,王振常
首都医科大学附属北京友谊医院

目的:提高对肿瘤所致急性胰腺炎 CT 和 MRI 影像特征的认识。材料与方法：对 2013 年至 2018 年住院收治的经手术及病理学检查证实的肿瘤所致急性胰腺炎（21 例）和胆源性急性胰腺炎（21 例）病人的临床和影像资料进行回顾性分析。结果：肿瘤性急性胰腺炎的疾病谱包括胰腺癌、IPMN、十二指肠乳头癌、胆管癌及胰腺神经内分泌肿瘤。肿瘤性急性胰腺炎的影像学特征如下：胰管不规则扩张、胰管截断、胆总管扩张、胆总管狭窄等。本组肿瘤所致急性胰腺炎可能的发病机制包括（1）肿瘤阻塞胰管或压迫胰管导致胰管压力升高，胰液排出受阻；（2）肿瘤细胞生长引起胰腺局部组织缺血及组织坏死，胰液与消化液渗入胰腺间质；（3）肿瘤组织激活胰酶。结论：由肿瘤引发的急性胰腺炎的 CT 和 MRI 表现具有一定特征，认识这些特征可提高对肿瘤性急性胰腺的诊断水平。

PO-150

宫颈微偏腺癌的 MRI 表现

张洁,陈雁
中国医学科学院肿瘤医院

目的 探讨宫颈微偏腺癌的磁共振成像（MRI）特点，以提高对宫颈微偏腺癌诊断的准确性。**方法** 回顾性收集 8 例确诊为宫颈微偏腺癌的 MRI 影像学资料，对肿瘤的 MRI 图像进行分析，包括肿瘤大小、肿瘤部位、肿瘤成分、信号特点、强化特点及侵犯范围。**结果** 宫颈微偏腺癌最大径为（4.36±1.46）cm，其中肿瘤最大径＞4cm 共 5 例，肿瘤最大径≤4cm 共 3 例。6 例肿瘤表现为囊实性，2 例表现为实性，弥散加权成像（DWI）肿瘤实性成分扩散受限 6 例，扩散受限不明显 2 例。多期动态增强扫描，肿瘤实性成分强化曲线表现为速升平台型共 3 例，表现为缓升型共 5 例。肿瘤局限于宫颈管 3 例，肿瘤侵犯宫颈基质深度＞1/2 共 7 例，肿瘤侵犯宫颈基质深度≤1/2 共 1 例。侵犯宫体 4 例，侵犯阴道穹窿 4 例，发生双侧卵巢转移 4 例，发生淋巴结转移 5 例。**结论** 宫颈病变 MRI 表现为多房囊性并实性成分强化，临床症状大量阴道排液，应警惕宫颈微偏腺癌，宫颈活检宜深取组织，必要时锥切，有利于早期诊断、治疗，改善预后。

PO-151

Correlation between Zonal Oblique Multislice Intravoxel Incoherent Motion and Dynamic Contrast Enhanced Magnetic Resonance Imaging parameters in endometrial cancer

Chengyu Lin[1],Yonglan He[1],Yafei Qi[1],Xiaoqi Wang[2],Hailong Zhou[1],Zhengyu Jin[1],Huadan Xue[1]
1.Peking Union Medical College Hospital
2.Philips Healthcare

Purpose: To investigate the correlation between parameters of Zonal Oblique Multislice (ZOOM) Intravoxel Incoherent Motion (IVIM) and Dynamic Contrast-Enhanced Magnetic Resonance Imaging (DCE-MRI) in patients with endometrial cancer.
Materials and Methods: Institutional review board approval and informed consents were obtained. Between December 2017 and September 2018, 36 patients pathologically confirmed of endometrial cancer were included in this prospective study. Pelvic examinations were performed in a 3.0 T MR scanner (Ingenia CX, Philips Healthcare, the Netherlands), including ZOOM IVIM with 8 b values and DCE-MRI with 3 different flip angles (5° and 15° initially; and 8° sequentially afterwards). IVIM parameters (D, Dstar, and f) and DCE-MRI parameters (time to peak, wash-in rate, wash-out rate, Ktrans, Kep) were blindly measured by two radiologists via Intellispace Portal (version 10.1.0.64190, Philips Healthcare, the Netherlands). Spearman correlation was performed and a p-value <0.05 was considered statistically significant.
Results: Interobserver measurement reproducibility was good to excellent. A moderate correlation was found between f and wash out rate (r=0.500, p=0.0019). Mild correlations were found between D and Ktans (r=0.329, p=0.0498), D and Kep (r=0.411, p=0.025), f and time to peak (r=-0.358, p=0.0319), f*Dstar and wash in rate (r=0.345, p=0.0423), and f*Dstar and wash out rate (r=0.377, p=0.0255).

Conclusion: ZOOM IVIM perfusion-related parameters demonstrated moderate-to-mild correlation with DCE-MRI quantitative parameters in endometrial cancer.

PO-152

Noninvasive assessment of Liver Fibrosis Using multi-parametric MRI and Serum Markers

Xiaopei Wang,Dawei Yang,Erhu Jin,Zhenghan Yang
Beijing Friendship Hospital, Capital Medical University

Purpose:
Liver MR elastography (MRE) and serum markers have diagnostic value for non-invasively staging liver fibrosis in patients with chronic liver diseases. To explore the diagnostic value of multi-parametric fusion model including liver and spleen stiffness measured by MR Elastography, serum markers(APRI,FIB-4) for the assessment of liver fibrosis.
Methods:
A total of 120 patients with chronic liver diseases were consecutively enrolled. All patients underwent liver and spleen MR elastography simultaneously (Discovery 750w; GE Medical Systems 3.0T). 2 independent radiologists drew regions of interest to measure liver and spleen stiffness, then to calculate the mean stiffness of liver and spleen. Using liver biopsy to staging fibrosis grade by an experienced liver pathologist blinded to the patients' clinical and radiology information in 1 week after the MR scan. Reference Standard was METAVIR system(F0-4). Collecting laboratory examination results to calculate APRI and FIB-4. The differences among different fibrosis stage were analyzed using one-way Anova. the correlation of different parameters and fibrosis stages were analyzed by Spearman coefficients and multiple regressions, ROC analysis was performed to assess the performance of liver and spleen stiffness, serum markers in different fibrosis stage.
Results:
All measurements were successful (F0: 23 F1: 22 F2:24 F3: 23 F4:28).Mean stiffness of liver and spleen in different grade were 3.09kPa/6.44 kPa , 3.29kPa/6.45 kPa, 4.37 kPa /7.64 kPa, 5.46 kPa /7.84 kPa, 7.72 kPa /9.45 kPa. The significant difference was found among the parameters in different fibrosis stage($p<0.001$). Spearman coefficients of liver stiffness, spleen stiffness, FIB-4, APRI were 0.87,0.64,0.65,0.51 respectively($p<0.001$).Compared the AUCs of the frontal four parameters and their combined models for staging F1-4, F2-4, F3-4(advanced fibrosis), F4 (cirrhosis) , combined model had highest diagnostic performance (AUC=0.91 $p<0.05$) for detecting F1-4,liver stiffness and FIB-4 also shew high performance (AUC=0.89,0.83 $p<0.05$); liver stiffness and combined model had highest diagnostic performance in stagingF2-4,F3-4,F4 (AUC=0.97,0.95,0.96 respectively $p<0.05$); spleen stiffness also showed high accuracy in staging F4 (AUC=0.87,p=0.03).
Conclusion:
Liver and spleen stiffness measured by MR elastography and FIB-4 had high correlation with liver fibrosis stage, liver stiffness had best diagnostic performance for fibrosis staging. For stage F4, spleen stiffness had high diagnostic efficacy.

PO-153

Blood Oxygen Level-Dependent Imaging and Intravoxel Incoherent Motion MRI of Early Contrast-Induced Acute Kidney Injury in a Rabbit Model

Yongfang Wang
First Hospital of Shanxi Medical University

Background: To evaluate the application of blood oxygenation level-dependent (BOLD) imaging
and intravoxel incoherent motion (IVIM) magnetic resonance imaging (MRI) on assessing early contrast-induced acute kidney injury (CIAKI). Materials: Sixty rabbits were randomly
chosen to undergo iohexol (1.0, 2.5, and 5.0 [gI/kg], respectively; n = 15 for each group) or
saline injection (n = 15). In each group, 6 rabbits underwent MRI at 24 h before injection and
after injection of iohexol or saline (1 h and 1, 2, 3, and 4 days); meanwhile, out of the remaining
9 rabbits, 3 were chosen for MRI acquisition, and then they were killed at specific time
points (1 h, 1 day, and 3 days, respectively). Results: The strong attenuation of pure molecular
diffusion (D), apparent diffusion coefficient (ADC), and perfusion fraction (f) was observed
at 1 day, while pseudodiffusion coefficient (D*) showed a significant decrease at 1 h after iohexol
injection. A distinct elevation of apparent transverse relaxation rate (R2*) reached the
maximum levels on day 1, which was consistent with the expression of hypoxia-inducible factor-1α and vascular endothelial growth factor. ADC, D, and R2* correlated well with histopathological
parameters and biochemical parameters. Conclusion: B OLD c ombined w ith
IVIM is effective to monitor renal pathophysiology associated with CIAKI.

PO-154

Using radiomics nomogram to assess the risk stratification of endometrial cancer

Bicong Yan
Jinshan Hospital of Fudan University

Abstract
Purpose: To evaluate the preoperative diagnostic performance of multi-parametric magnetic resonance imaging (MRI) combined with clinical parameters in endometrial cancer (EC) risk stratification by using radiomics nomogram, and the application of high-risk EC radiomics nomogram in diagnosis deep myometrial invasion (DMI), high-grade tumor (HGT), lymphovascular space invasion (LVSI), cervical invasion (CI) and lymphnode metastasis (LM).
Materials and Methods: Two hundred histopathologically confirmed EC patients were retrospectively included into the primary cohort (A hospital); 80 clinical diagnosis EC patients were prospectively included into the internal validation cohort (A hospital); 172 (n=43 B, n=129 C) histopathologically confirmed EC patients from another 3 multi-center were retrospectively included into the external validation cohort. All the patients underwent MR examination within 30 days before hysterectomy. A binary least absolute shrinkage and selection operator (LASSO) logistic regression method was used to select the radiomics features in diagnosis of high-risk EC, which was performed and extracted after manual delineation the tumor volume in muti-parametric MR images (T2-weighted, diffusion weighted, apparent diffusion coefficient maps and contrast enhanced images). A high-risk EC radiomics nomogram was generated by combining the selected radiomics features (radiomics signatures) with age, reproductive history and metabolic syndrome. Decisive curve and receiver operating characteristic (ROC) curve were used to evaluate the radiomics nomograms' clinical usefulness and compared with the radiologists' performance. Finally, the high-risk EC radiomics nomogram was further used to assess the DMI, HGT, LVSI, CI, and LM.
Results: From the 4728 MRI features extracted, 8 features were ultimately selected for the diagnostic of high-risk EC, using LASSO regression method. The area under curve (AUC) of primary, internal and external validation of radiomics signatures were 0.78 (A hospital), 0.73 (A hospital), 0.86 (B hospital) and 0.74 (C hospital), and for radiomics nomogram were 0.81 (A hospital), 0.76 (A hospital), 0.96 (B hospital), and 0.75 (C hospital), respectively. The diagnostic performance of high-risk EC radiomics nomogram applied in DMI, HGT, LVSI, CI, LM, with the AUC of 0.79, 0.70, 0.75, 0.70 and 0.68, respectively. The clinical decisive curves showed good clinical application of radiomics nomogram with higher diagnostic performance in DMI, CI, LM than the radiologists.
Conclusion: Multi-parametric MRI based radiomics had good diagnostic performances in assessing high risk EC. When radiomics signatures combined with clinical parameters, a more powerful radiomics nomogram could be generated to assess the high risk of EC patients with the decisive curve to justify the usefulness in clinical. And the high-risk EC radiomics nomogram shows great application in DMI, HGT, LVSI, CI, and LM.

PO-155
基于 MR 抑脂（FS）T2WI 序列的纹理分析技术在软组织肿瘤良恶性的鉴别以及复发检测中的价值

胡培安[1],周正荣[2]
1.复旦大学附属儿科医院
2.复旦大学附属肿瘤医院

目的 通过构建并验证基于 MR T2WI 脂肪抑制序列纹理特征的软组织肿瘤良性与恶性、复发与术后改变的预测模型，探讨纹理分析技术在软组织肿瘤良恶性鉴别以及复发性检测中的价值。
材料与方法 回顾性收集 2015.07.01-2015.12.31 因疑是软组织肿瘤或肿瘤复发或术后随访而行 MR 检查的病例。比较良性组与恶性组、复发组与术后改变组的 MR FS T2WI 纹理特征参数的差异。（按 7：3 比例）将各组样本随机分为训练集及测试集，利用 Lasso-Logistic 回归对纹理特征进行降维及筛选，构建良性与恶性软组织肿瘤、复发性肿瘤与肿瘤术后改变的预测模型；利用受试者工作曲线（ROC）及决策曲线分析（DCA）验证模型的效能。
结果 共收集病理证实原发性软组织肿瘤 160 例（手术 150 例，穿刺 10 例），其中良性 83 例，恶性 77 例；复发性肿瘤 58 例，术后改变 66 例（22 例病理证实，44 例超过两年 MR 随访无变化）。良性与恶性软组织肿瘤的 FS T2WI 的纹理特征之间有 14 个纹理特征参数存在显著的统计学差异，而复发性软组织肿瘤与术后改变间有 32 个纹理特征参数存在显著的统计学差异。Lasso-Logistic 回归模型预测良性及恶性的 AUC 分别为：0.65（训练集）、0.75（测试集）；预测测试集良恶性的敏感性、特异性、准确性分别为 55%、96%、76.6%。模型预测肿瘤复发与术后改变的 AUC 分别为：0.91（训练集）、0.73（测试集）；预测测试集复发与术后改变的敏感性、特异性、准确性分别为 55%、94.1%、73%。决策曲线分析显示良性与恶性预测模型、复发与术后改变的预测模型是有价值的。
结论 基于 MR FS T2WI 纹理特征的 Lasso-logistic 回归预测模型可以用来鉴别软组织肿瘤的良性与恶性、复发与术后改变。纹理分析技术可以定量的鉴别软组织肿瘤的良恶性以及检测肿瘤的复发。

PO-156
基于磁共振神经成像的椎间盘与腰骶神经解剖关系的研究

余琴琴[1,2],张晓东[2],黄文华[1]
1.南方医科大学解剖教研室
2.南方医科大学第三附属医院

背景
腰骶丛是神经病变的好发部位，并且是高致残率的疾病过程，该区域神经病变的病程和预后依赖于病因的识别和恰当的临床干预，但该区域的解剖结构复杂，依靠传统的检查手段很难对病变的位置、范围、起源等信息作出准确判断。在微创脊柱手术中，在放射控制下直接进入椎间盘。对椎间盘与神经根解剖关系不明确。
方法
纳入本院因椎间盘突出导致腰骶神经根症状病人 85 例，常规 MR 确诊椎间盘突出；根据以往研究，腰椎间盘突出最易发生于 L4/5 及 L5/S1，针对经内镜椎板间入路椎间盘切除术（PEID，Percutaneous Edoscopic Interlaminar Discectomy），利用 3.0T 高分辨率磁共振成像方法，研究 L5、S1 神经与其对应椎间盘 L4/5、L5/S1 的解剖关系。
结果
共收集 L3/4 椎间盘高度 82 例，平均高度 10.36±1.77mm；L4/5 椎间盘高度 85 例，平均高度约 10.47±2.41，L5/S1 椎间盘高度 85 例，平均高度约 9.72±2.67mm；
测得 L5 左右侧神经根自脊髓发出角度 sig0.579，＞0.05，没有统计学差异；S1 左右侧神经根自脊髓发出角度 sig0.518,＞0.05，没有统计学差异；L5 左、右侧神经根与 L5 上终板距离（正值代表神经根起自 L5 上终板上方，负值代表神经根起自 L5 上终板下方），双侧无统计学意义，sig=0.679; S1 左、右侧神经根与 S1 上终板距离（正值代表神经根起自 SI 上终板上方，负值代表神经根起自 S1 上终板下方），双侧有统计学意义，sig=0.014.
结论

正常情况下，自下位胸椎起，椎间隙有向下椎间增宽的趋势，以 L4/5 间隙最宽，而 L5/S1 间隙有变窄，我们的研究结果也证实这一结论；二是不论椎间盘突出方向如何，在本研究中，L5、S1 神经根自脊髓发出角度无统计学差异；三是存在脊神经自脊髓发出位置与相应椎间盘关系存在变异，这种变异可能是由腰椎间突出造成的。

PO-157

Three-dimensional Intra- and Extracranial Arterial Vessel Wall Joint Imaging in Patients with Cerebrovascular Disease

Lin Jia[1], Na Zhang[2], Lei Zhang[2], Jinhao Lyu[3], Hanjiaerbieke Kukun[4], Dong Liang[2], Ye Li[2], Hairong Zheng[2], Wenxiao Jia [4], Xin Liu[2]

1. The Second Affiliated Hospital of Xinjiang Medical University
2. Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences
3. Chinese PLA General Hospital
4. The First Affiliated Hospital of XinJiang Medical University

Purpose: To evaluate the clinical potential of a newly developed three-dimensional (3D) intra- and extracranial arterial vessel wall joint imaging technique at 3 Tesla using T1-weighted 3D variable-flip-angle turbo spin-echo sequence with improved cerebrospinal fluid suppression in patients with cerebrovascular disease

Materials and Methods: One hundred and twenty-two consecutive patients with clinically confirmed recent cerebrovascular symptoms were imaged using a 3D intra- and extracranial arterial vessel wall joint imaging sequence with and without contrast enhancement on a 3T magnetic resonance system. The number of plaques and culprit plaques were evaluated. The image quality score, percent stenosis, remodeling ratio, and plaque burden were measured and compared between intracranial and carotid arterial plaques, and between non-culprit and culprit plaques.

Results: Except for 23 patients (seven dissection, six Moyamoya, three vasculitis, and seven with no obvious cause of atherosclerotic plaque formation), there were 322 plaques and 111 culprit plaques detected in 96 patients with large artery atherosclerosis. Of the plaques, 278 (96 culprit plaques) and 44 (15 culprit plaques) plaques were identified in intracranial and extracranial arteries, respectively. Image quality did not differ significantly between pre- and post-contrast vessel wall magnetic resonance images. There were also no significant differences in the percent stenosis, remodeling ratio, and plaque burden between intracranial and carotid arteries, and between non-culprit and culprit plaques. The enhancement rate of culprit plaques was significantly higher than that of non-culprit plaques.

Conclusions: The described joint imaging is a promising vessel wall magnetic resonance imaging method for comprehensive diagnosis of cerebrovascular symptoms and investigation of etiology. The imaging technique is a potentially valuable means to optimize treatment.

PO-158

Prospective study of dynamic contrast-enhanced MRI on prediction of carotid artery in-stent restenosis

刘晓晟,李晓,赵辉林,许建荣
上海交通大学医学院附属仁济医院

目的：探索 3.0 T 动态增强磁共振成像（dynamic contrast-enhanced MR imaging, DCE-MRI）预测颈动脉支架置入术后再狭窄发生的能力。**材料和方法：**2016 年 6 月至 2018 年 12 月，前瞻性分析 40 位拟行颈动脉支架置入术的颈动脉粥样硬化斑块患者，术前一周内完成颈动脉血管壁磁共振成像（vessel wall MR imaging, VW-MRI）及 DCE-MRI 扫描，术后第六个月行脑血管造影复查支架位置、狭窄度等。采用单因素和多因素 Logistic 回归分析 DCE-MRI 药代动力学参数与支架内再狭窄的相关性。**结果：**该组病例支架内再狭窄发生率为 20%，再狭窄患者组 K^{trans} 和 v_p 显著高于无再狭窄组（0.14 ± 0.04 min^{-1} vs. 0.06 ± 0.26，p=0.000；7.21 ± 4.35 min^{-1} vs. 3.88 ± 2.19，p=0.037），K^{trans} 可独立预测支架内再狭窄（HR：1.12；95%CI：1.02～1.23；p=0.02），预测值为 0.09 min^{-1}（敏感性 100%, 特异性 87.5%）。**结论：**斑块内的炎症活动可能引起支架置入后的内膜过度增生，K^{trans} 可独立预测颈动脉支架术后再狭窄的发生，可作为预测支架内再狭窄的有效标记物。

PO-159

大脑深静脉系统磁共振血管成像技术对比分析

刘小艳
南通大学附属医院

目的 评估 ESWAN 技术对大脑深静脉系统的显示能力，对比、分析不同大脑深静脉磁共振血管成像技术的差异。方法　通过四种磁共振静脉成像技术（2D-TOF-MRV、3D-PC- MRV、3D-CE-MRV 及 ESWAN）对 35 例受检者的双侧大脑深部静脉进行成像，比较基底静脉、大脑内静脉、丘脑纹状体静脉、膈静脉、尾状核头静脉、尾状核静脉的显示率的差异；通过对丘脑纹状体静脉显示完整性进行评分，分析不同扫描技术的差异。测量 ESWAN 扫描所得的双侧大脑内静脉和丘脑纹状体静脉的直径，将测量值与“金标准”——DSA 所测直径值对比分析。结果　在 35 例受检者双侧大脑深静脉血管中，2D-TOF-MRV、3D-PC-MRV、3D-CE-MRV 及 ESWAN 对大脑内静脉的显示数目分别为：68 支(97.14%)、69 支(98.57%)、70 支(100%)和 70 支(100%)；对基底静脉的显示数目分别为：54 支(77.14%)、67 支(95.71%)、70 支(100%)和 70 支(100%)。

PO-160

中枢神经系统脱髓鞘性假瘤 MRI 特征与诊断价值

李志奎
哈尔滨市第五医院

摘要：目的探讨中枢神经系统脱髓鞘性假瘤磁共振成像(MRI)特征及诊断价值。方法对 2013 年 5 月-2018 年 5 月收治的 15 例中枢神经系统脱髓鞘性假瘤(均经临床或病理证实)患者的 MRI 影像学资料进行回顾性分析,总结其 MRI 平扫及增强扫描图像特征。结果 MRI 平扫特征:颅内病变 12 例(其中单发 7 例,多发 5 例),C2-C5 层面颈髓病变 3 例;单发病变直径平均(3.89±1.45)cm,颈髓病变均为条带状;不规则形态 10 例,类圆形或卵圆形 2 例;边界清晰 9 例,边界不清 6 例;病灶周边轻微水

肿 12 例。MRI 信号及增强扫描特征:长 T1 长 T2 信号 12 例,等 T1 长 T2 信号 3 例;均不存在囊变及钙化;增强后环状强化 4 例,半开环状强化 2 例("开环征"、"垂直征")。结论 "开环征"等中枢神经系统脱髓鞘性假瘤 MRI 增强扫描典型特征对疾病诊断有一定的价值。

PO-161

治疗前 MR 影像组学预测鼻咽癌无进展生存期

沈合松
重庆市肿瘤医院

目的：探讨用治疗前 MRI 影像组学预测鼻咽癌 2 年无进展生存期的可行性。
方法：共计 358 例鼻咽癌患者(训练组：239 例，验证组：119 例)进行回顾性分析。肿瘤图像分割中每一个勾画的断面为一个样本；从 T2W 和增强 T1W 图像中提取肿瘤的 2246 个影像组学特征.利用 LASSO 回归筛选组学特征。构建临床资料、影像组学、TNM 总分期、影像组学+TNM 总分期四个模型。采用 COX 风险回归进行生存分析。采用 Harrell 一致性指数(C-index)评价预后，各组间的差异比较采用对数秩和检验。
结果：临床资料、影像组学、TNM 总分期、影像组学+TNM 总分期四个模型中训练组和验证组人口学特征无统计差异，四个模型训练组 C-index 分别为 0.558(95%CI:0.473-0.642)，0.683(95%CI:0.597-0.767)，0.682(95%CI:0.604-0.761)、0.729(95%CI:0.644-0.813)；验证组 C-index 分别为 0.497(95%CI:0.385-0.610)、0.664(95%CI:0.551-0.777)、0.664(95%CI:0.563-0.766)、0.717(95%CI:0.604-0.830)。影像组学+TNM 总分期预测 2 年无进展生存期最优。
结论：治疗前 MRI 影像组学可以预测鼻咽癌 2 年无进展生存期，影像组学+TNM 总分期模型预测 2 年无进展生存期最优。

磁共振含钆造影剂脑沉积的现状及进展

汪永康
安徽医科大学第二附属医院

[摘要] 含钆造影剂是目前临床应用最广泛的磁共振造影剂，近年来大量证据表明脑深部核团的磁共振信号改变 与重复注射含钆造影剂有关，尤其是在齿状核和苍白球组织，钆沉积现象最为明显。本文主要综述了含钆造影剂脑
部沉积现象的研究现状，分析了脑部钆沉积与含钆造影剂类型的关系，并对相关政策进展进行介绍。

PO-163

主观认知下降人群脑内 β 淀粉样蛋白沉积及葡萄糖代谢改变

李轩宇[1],袁丽霞[2],臧玉峰[2],韩璎[1]
1.首都医科大学宣武医院
2.杭州师范大学心理科学研究院

目的：本研究拟通过对主观认知下降（subjective cognitive decline, SCD）人群 ^{18}F-Florbetapir（AV45）和 ^{18}F-氟代脱氧葡萄糖（fluorodeoxyglucose, FDG）数据的分析，分别观察 SCD 人群的淀粉样蛋白沉积及葡萄糖代谢改变的特点。
材料与方法：对 44 名 SCD 患者及 13 名年龄、性别匹配的健康老年人组进行 ^{18}F-AV45 和 ^{18}F-FDG 正电子发射断层扫描（positron emission tomography，PET）数据采集。对 PET 数据进行预处理后，以全小脑为参考区，分别计算 ^{18}F-AV45 和 ^{18}F-FDG 的标准摄取值比率（standardized uptake value ratio, SUVR）值。采用双样本 t 检验对 SCD 组和健康老年人组 PET 数据进行统计学分析。
结果：SCD 组与健康老年人组相比，客观认知功能检查均无统计学差异。与健康老年组比较，SCD 组在左侧楔前叶 AV45 的 SUVR 值明显增高（$p<0.05$, FDR 校正）；在双侧楔前叶，左侧旁中央小叶及左侧枕叶 FDG 的 SUVR 值明显增高（$p<0.05$,FDR 校正）。
结论：SCD 人群脑内发现局部 β 淀粉样蛋白沉积，并且与代谢增高的区域分布一致，提示早期淀粉样蛋白沉积与脑局部代谢活动升高具有相关性。虽然 SCD 人群的认知功能尚未明显受损，但已检测到阿尔兹海默早期的病理改变，将 SCD 人群作为未来 AD 早期筛查及干预的目标人群具有可行性。

PO-164
基于 MRI 的影像组学在脑成人胶质瘤分级及异柠檬酸脱氢酶分型的初步研究

冯宇宁,雷益,林帆,陈欢
深圳市第二人民医院

目的 探讨基于磁共振的影像组学在脑胶质瘤分级及异柠檬酸脱氢酶(IDH)分型的应用价值。
方法 回顾性分析 2016 年至 2018 年 66 例经手术病理证实为成人脑胶质瘤患者的 MRI 图像和临床资料，获取 T2WI 图像，病理分级和分子病理结果。在 MRI 的 T2WI 图像逐层勾画肿瘤实质部分，获得感兴趣区，对感兴趣区进行高通量数据特征采集。将 66 例数据以 7：3 随机分为训练集和测试集，分别对训练集和测试集的特征进行标准化，进行组内相关系数（ICC）分析，对相关系数高的特征进行降维处理，最后构建逻辑回归模型，采用受试者工作特征（ROC）曲线、混淆矩阵等进行模型诊断。
结果 在纳入的 66 例数据中，每例数据提取 396 个特征，筛选出 ICC≥0.75 的特征 162 个。分级应用：利用 spearman 相关性分析，在余下的 162 个特征中，去除特征间的相关系数≥0.9 的特征，剩余 44 个特征，接着 lasso 降维，剩余 12 个特征；结合筛选出来的 12 个特征，采用 softmax 构建预测模型，最后混淆矩阵进行模型诊断：准确性为 0.830。IDH 分类应用：利用 spearman 相关性分析，在余下的 162 个特征中，去除特征间的相关系数≥0.9 的特征，剩余 45 个特征，接着 lasso 降维，剩余 8 个特征；结合筛选出来的 8 个特征，采用 logistic 回归构建预测模型，采用 ROC 曲线、混淆矩阵进行模型诊断；其结果如下：ROC 曲线，截断值取 0.303，训练集的曲线下面积（AUC）为 0.872，测试集的 AUC 为 0.800；混淆矩阵，训练集的准确性、灵敏性、特异性分别为 0.787、0.724、0.889，测试集的准确性、灵敏性、特异性分别为 0.737、0.600、0.889。
结论 基于 MRI 的影像组学能够提高脑成人胶质瘤分级及 IDH 分型的预测效能，对于制定脑成人胶质瘤的诊治方案及随诊策略具有一定的临床价值。

PO-165
儿童幕上脑实质室管膜瘤 MRI 影像表现及误诊分析

王帅,刘鸿圣

广州市妇女儿童医疗中心

目的：探讨儿童幕上脑实质室管膜瘤的 MRI 与临床表现并分析误诊原因，旨在提高对其影像诊断的准确率。方法：回顾性分析我院 8 例经病理证实的儿童幕上脑实质室管膜瘤患儿的临床及 MRI 影像资料，8 例全部行 MRI 平扫及增强检查。结果：男 2 例，女 6 例，年龄 4 月~6 岁，平均年龄及中位年龄均 2 岁；病灶位于额颞顶叶 4 例，顶叶 2 例，颞叶 1 例，丘脑 1 例；主诉抽搐入院 4 例，头痛、呕吐 2 例，偏瘫 1 例，无症状来诊 1 例；病灶最大体积 15.0cm×10.2cm×7.1cm，最小体积 4.3cm×4.3cm×4.0cm，平均直径约 8cm。8 例肿瘤病灶中，4 例为囊实性肿块，实性为主 2 例，囊性为主 2 例；病灶实性部分表现为 T1WI 等或稍低信号，T2WI 等或稍高信号，FLAIR 及 DWI 信号较高，增强扫描多表现为花环状、明显强化，强化不均；囊性部分信号均匀，T1WI 信号略高于脑脊液、T2WI 呈高信号；其中 2 例可见囊性分隔，2 例病灶内并发出血、坏死，1 例病灶可见壁结节，增强扫描囊壁、分隔及壁结节明显强化。8 例病灶均有不同程度占位效应，同侧脑室均伴不同程度扩张，5 例病灶周围水肿明显，呈指压状。MRI 诊断为 PNET3 例，胶质瘤 1 例，毛细胞性星形细胞瘤 1 例，血管畸形 1 例，AT/RT1 例，诊断先天性颅内感染伴大脑半球皮层发育不全 1 例；病理诊断为间变性室管膜瘤Ⅲ级 7 例，室管膜瘤Ⅱ级 1 例。结论：对于儿童发生于幕上脑实质的囊实性占位，MRI 表现为实性部分为混杂信号，增强呈花环状强化，周围伴指压状水肿改变，囊壁、分隔及壁结节明显强化，需考虑幕上脑实质室管膜瘤的可能。

Characterization of brown adipose tissue in PCOS patients by MR Z-Spectrum Imaging (ZSI)

Li Li[1,2],Alessandro Scotti[2],WenZhen Zhu[1],Kejia Cai[2]

1.Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology. Wuhan, Hu Bei, China

2.Radiology Dept. College of Medicine, University of Illinois at Chicago, Chicago, IL, United States

PURPOSE: Given that the majority of patients with polycystic ovary syndrome (PCOS) demonstrate obesity and chronic insulin resistance and targeting brown fat represents a novel treatment strategy for metabolic diseases, the purpose of the study is to characterize brown adipose tissue (BAT) in PCOS patients in comparison to healthy subjects using MR Z-spectral imaging (ZSI).

METHODS: ZSI data were collected on 19 normal control females (NCF, 24-34 years old), 17 males (NCM, 22-35years old), and 13 PCOS patients (female, 20-33 years old) with a CEST saturation pulse of 1 μT, 200 ms long and fast spin echo readout. Z-spectral data were fitted with multiple Lorentzian curves to quantify the direct saturation of water and fat. Fat water fraction (FWF) maps were then computed based on the fitted amplitudes of water and fat direct saturation. FWF thresholds were prescribed for the differentiation and segmentation of white adipose tissue (WAT), BAT, or Muscle (Figure). At last, two parameters were extracted from the analysis: the average FWF value within the segmented BAT (FWF(BAT)) and the fraction of BAT over the total fat depot, defined as BATf=BATarea/ (BATarea+WATarea). The two parameters were compared among the 3 study groups and correlated to subjects' BMI.

RESULTS: FWF(BAT) correlated linearly with BMI in healthy subjects, whereas there was an inverse correlation between BATf and BMI (Figure). The PCOS group had higher FWF(BAT) than the NCF group (P<0.001), while the BATf of the PCOS group was smaller than the controls (P<0.001). The FWF(BAT) of the NCF group was found to be higher than the NCM group (P<0.05), while there was no significant difference between male and female in BATf (Figure).
CONCLUSION: Normal subjects with higher BMI show less BATf and have increased FWF(BAT), indicating relatively higher level of metabolic passive WAT depot and relatively reduced metabolism in their BAT depots. PCOS patients have the least BATf and the highest FWF(BAT), suggesting decreased BAT mass and function in PCOS.
CLINICAL RELEVANCE/APPLICATION: MR Z-spectral imaging has been demonstrated to noninvasively identify and characterize BAT mass and function in PCOS patients, providing insights on the comorbidities mechanism, diagnosis, and treatment of PCOS.

MRI 在非 ST 段抬高型心肌梗死患者 PCI 术前综合评估的临床应用和研究进展

周小君[1],韩丹[2]
1.云南阜外心血管医院
2.昆明医科大学第一附属医院

经皮冠状动脉介入/支架植入术是非 ST 抬高型心肌梗死患者（NSTEMI）的主要临床治疗手段，冠状动脉微血管阻塞（CMVO）是患者 PCI 术围术期常发生的不良事件，是临床要解决的重点和难点问题。心脏 MR 的 cine 模式及心肌应变评估心肌的解剖，功能；延迟成像和 T1mapping 评估心肌纤维化；心肌应激首过灌注评估心肌整体/局部心肌的血流信息，对 NSTEMI 患者 PCI 术前评估尤为重要。另外 T1mapping 也开始用于心肌应激评价冠脉微循环的研究中。总之，MR 能够提供 NSTEMI 患者 PCI 术前重要的心脏的综合参数，为临床医生在 PCI 术不同过程中的药物控制提供重要的理论支持，为改善 PCI 术疗效以及患者预后方面具有重要的临床价值和应用前景。

PO-168

The Influence of the Spatial Smoothing of Data on Small-world Properties in Patients with Alzheimer's Disease

Yunfei Li[1],Yingjie Song[1],Xiangbin Wang[2], Qian Xi[3],Min Zhang[2],Xiaowen Xu[2],Xiaohu Zhao[1],Peijun Wang[2]
1.Department of Radiology, The Fifth People's Hospital of Shanghai, Fudan University, Shanghai 200240, PR China.
2. Department of Radiology, Tongji Hospital, Tongji University School of Medicine, Shanghai 200065, PR China.
3.Department of Radiology, Shanghai East Hospital, Tongji University School of Medicine, Shanghai, 200120, PR China.

OBJECTIVES：This study aims to probe whether the small-world properties of brain functional networks in patients with Alzheimer's disease (AD) are influenced by spatial smoothing in data preprocessing.
METHODS：Thirty-three individuals with AD (AD group) and 20 individuals with normal cognition (NC group) were included in this study. Blood-oxygen-level-dependent functional magnetic resonance imaging (BOLD-fMRI) data from each individual were subjected to two types of preprocessing: with smoothing and without smoothing. The full-width half-maximum (FWHM) of the Gaussian kernel was separately set at 4 mm, 6 mm, 8 mm, 10 mm, 12 mm, and 16 mm in the smoothing process. The brain functional connectivity matrices were constructed for the 7 sets of preprocessed data. Then, two-sample t-tests were conducted to explore the changes in the relevant small-world parameters in patients with AD. A general linear model univariate analysis was carried out to explore the interactive effects of spatial smoothing and disease status on each small-world parameter.
RESULTS：The results showed that the clustering coefficient (Cp) and average shortest path (Lp) in the AD group were significantly higher than those in the NC group ($P<0.05$), regardless of whether the spatial smoothing process occurred. Furthermore, the Cp and Lp increased as the smoothing FWHM increased in both groups. These increasing trends in the AD patients were not markedly affected by spatial smoothing in the FWHM range of 0~8 mm.
CONCLUSIONS：Our results show that within approximately three voxels, the small-world properties of brain functional networks in AD patients are not affected by smoothing.

PO-169
MRI 纹理分析对治疗前鼻咽癌（III-IVb 期）患者无进展生存期的预测价值

陈国钰,沈桂权,高波
贵州医科大学附属医院

目的：探讨基于 MRI 纹理分析对治疗前鼻咽癌(III-IVb 期)患者无进展生存期(PFS)的预测价值。**方法**：本研究采用回顾性分析方法，收集了 2014~2015 年经病理诊断为 III—IVb 期鼻咽癌的病例共 206 例。由一位有经验的放射科医生在开源的 ITK-SNAP 软件上勾画感兴趣区（ROI），再由另一位高年资的放射科医生检查图像分割的准确性，无异议之后使用 MATLAB 2014b 软件对感兴趣区进行组学特征的提取。我们选取了熵、均匀度、方差、偏度、峰度等 5 个直方图特征，2 个 GLCM 特征比如聚类突出度、聚类阴影以及 1 个 GLSZM 特征——灰度不均匀性（GLN）。采用 Cox 比例风险模型分析肿瘤组织纹理特征、肿瘤体积和 TNM 分期与 PFS 的关系。找到肿瘤体积和 GLSZM-GLN 的最佳切点值并分为两组绘制 Kaplan-Meier 生存曲线以比较两组生存率的差异。最后，运用受试者工作特征(ROC)分析和 C-index 评价不同生存模型的预后预测性能。**结果**：T 分期、总分期、肿瘤体积及基于 CE-T_1WI 的 GLSZM-GLN 与 PFS 相关。在调整了可能会影响 PFS 后的多因素 Cox 回归分析显示总分期、肿瘤体积和基于 CE-T_1WI 的 GLSZM-GLN 是 PFS 的独立预测因子。Kaplan-Meier 曲线显示，肿瘤体积小于 6.587 cm^3 和基于 CE-T_1WI 的 GLSZM-GLN 小于 79.539 与 PFS 的改善有关，具有统计学意义。基于 CE-T_1WI 图像提取的 GLSZM-GLN 预测 PFS 的性能优于肿瘤体积和总分期。而基于 CE-T_1WI 的 GLSZM-GLN 与肿瘤体积及总分期三者相结合的生存模型的预测性能高于与肿瘤体积或总分期二者联合的生存模型。**结论**：对于治疗前晚期鼻咽癌患者在参考肿瘤体积及 TNM 分期的基础上，结合基于 CE-T_1WI 中提取的纹理特征 GLSZM-GLN，可提高 PFS 的预测性能。

PO-170
肺癌患者鼻粘膜上皮细胞基因表达差异的 WGCNA 探讨与实验验证

段少银,罗曼,黄倩文
厦门大学附属中山医院

背景与目的：肺癌是全球范围内癌症死亡的主要原因，加权基因共表达网络分析(WGCNA)研究支持利用鼻基因表达进行肺癌早期检测，并进行部分肺癌相关基因进行定量实验研究与验证。
材料与方法：
1.基于公共微阵列数据集进行 WGCNA 分析，使用 Limma 软件包中的 RMA、SVA 和 T-test 来筛选差异表达基因。选择不同样本表达数据，获取特征基因模块，并计算提取 10 个以上枢纽基因。
2．利用 SYBR GREEN I 法对 80 例鼻粘膜拭子的 WGCNA 分析的 12 个相关基因的表达进行定量研究，实验分为三组：正常对比组 30 例，肺癌组 32 例，肺癌术后组 18 例。获取的实验数据进行方差不齐、welch 校正与 Tamhane's T2 检验。
结果：WGCNA 数据构建了四个特定的 LC 模块，其中蓝色和棕色模块特征基因在各自模块内显示出很强的关联性。发现 HCK，NCF1，TLR8，EMR3，CSF2RB 和 DYSF 基因是棕色模块中最重要的中枢基因，而 SPEF2，ANKFN1，HYDIN，DNAH5，C12orf55，CCDC113 基因分别是按照等级排列的顶级枢纽基因。鼻粘膜荧光定量 PCR 验证显示具有显著性差异（0.05%），分布在肺癌与对照组间有 6 个基因（HCK、 NCF1、TLR8、EMR3、CSF2RB、DYSF），肺癌术后与对照组有 4 个基因（HCK、CSF2RB、SPEF2、C12orf55）；肺癌与肺癌术后组有 2 个基因（EMR3、C12orf55 ）。
结论：WGCNA 能够发现具有生物学意义的基因模块，并挖掘枢纽基因。WGCNA 与 PCR 验证基因表达量的结果具有一致性。鼻粘膜上皮细胞 HCK、NCF1、TLR8、EMR3、CSF2RB、DYSF 、SPEF2、C12orf55 八个基因表达异常可能成为肺癌检测的非侵入性生物标记物；其中 EMR3、C12orf55 二个基因表达异常可能用来观察术后肺癌的疗效。

集束化护理措施在预防影像检查中非计划性拔管的效果分析

刘平,朱静雅
陆军军医大学第二附属医院（新桥医院）

目的 探讨集束化护理措施在预防影像检查中非计划拔管的应用效果。 **方法** 回顾分析 2017 年 7 月-2018 年 6 月行影像检查的住院带管患者 1334 例，其中 2017 年 7 月至 12 月中的 664 例带管患者为对照组，2018 年 1 月至 6 月 670 例为观察组，对照组实施常规的导管受检护理方法，观察组实施集束化导管受检护理措施，比较两组患者发生非计划拔管率。**结果** 对照组与观察组非计划性拔管率分别为 1.4%，0.3%，P=0.033(P<0.05)差异有统计学意义。**结论** 集束化护理措施有效预防影像科检查期间的非计划拔管的发生，提高影像检查患者的护理质量，可在影像检查科室广泛应用。

PO-173
含碘对比剂静脉外渗风险因素 logistics 分析

毛燕君
上海同济大学附属肺科医院

目的 分析含碘对比剂静脉外渗的风险因素，为临床预防和管理提供可靠的参考依据。**方法** 回顾性收集 2017 年 5—7 月在我院放射科接受 CT 增强检查的门诊和住院患者 5837 例，发生了明显的对比剂静脉外渗的患者为外渗组，未发生对比剂静脉外渗的为非外渗组，通过医院信息中心数据库提取相关信息，比较两组患者一般情况、患者疾病情况、注射信息和注射护士情况，并对收集的因素进行非条件 logistic 回归分析。**结果** 两组患者年龄、性别、体质指数、手术史、化疗治疗史、放疗治疗史等因素差异均无统计学意义（P 均>0.05）。两组患者的年龄划分的比较，差异有统计学意义（P<0.05）。两组患者对比剂注射情况的比较，对比剂的品牌、患者穿刺部位、注射速率、造影剂剂量、盐水量等差异均无统计学意义（P 均>0.05）。留置针规格、患者血管评估之间差异有统计学意义（P<0.05）。logistic 回归分析显示，年龄划分（中年，OR=0.152，95%*CI*：0.040～0.576）为发生外渗的保护因素；有手术史（OR=3.514，95%*CI*：1.026～12.034），血管评估（差，OR=13.039，95%*CI*：1.399～121.483），留置针规格（24G，OR=9.170，95%*CI*：1.474～57.047），为发生外渗的危险因素。**结论** 患者年龄、自身静脉条件、留置针的粗细、手术史均可成为对比剂静脉外渗发生的风险因素。

PO-174
大型综合性医院影像检查专科护理质量指标构建

刘俊伶,赵丽,兰芳,李雪
陆军军医大学大坪医院

目的:在最新颁发的《全国护理事业发展规划(2016-2020 年)》中明确指出,“提高护理服务质量”是当前护理学科发展的主要任务之一,目前国内外都相继以专科或病种为对象构建护理质量评价指标体系,但尚无影像检查专科护理质量指标,因此建立切实可行的影像检查专科护理质量指标至关重要。
方法： 1.建立初步框架:成立研究小组，采用文献分析、理论研究及质性访谈法,以三维质量评价模式为指导,编制初步指标框架。2.德尔菲专家咨询:(1)函询专家入选标准：①有丰富的影像护理管理实践经验；②副高级及以上；③大专及以上；④对本研究有较高的积极性。(2)拟定函询表:包

括致专家信、专家基本信息及调查问卷 3 部分。调查问卷涵盖的影像检查专科护理质量指标分三级,一级 3 项,二级 14 项,三级 49 项。(3)函询实施:采用电子邮件形式进行两轮专家咨询。专家按 Likert5 级评分法对各级指标的重要程度和权重进行评分、赋值；对不合理的描述内容进行修改。(4)资料收集统计:采用 SPSS18.0 统计软件进行数据统计。对同时满足重要性赋值均数>4.0、变异系数<0.25 的条目予以保留，根据数据统计结果以及专家意见,对部分条目进行删除、合并、修改。

结果:(1)积极系数:两轮函询后,有效回收率分别为 92.7%和 100%。(2)权威系数:两轮分别为 0.863 和 0.889。(3)协调程度:各级指标的变异系数 CV 为 0.021-0.154。(4)修改建议:第 1 轮专家函询后，删除 1 个选择率低于 70%的二级指标和 3 个与之相对应的三级指标；修改 2 个二级指标和 4 个三级指标的表述方式。(5)最终指标体系:两轮函询后,最终形成包含 3 个一级指标、13 个二级指标和 46 个三级指标的影像检查专科护理质量指标体系。

结论：建立大型综合性医院影像检查专科护理质量指标体系,可避免长期以来护理质量评价凭经验的不合理现象,实现影像检查专科护理质量评价科学化、数据化。

乳腺 MR 专用检查服对提高患者满意度的影响研究

任晓静
中国人民解放军总医院第一医学中心

摘要：［目的］ 探讨使用乳腺 MR 专用检查服对提高乳腺增强 MR 患者对检查满意度的影响。 ［方法］ 选取解放军总医院放射诊断科门诊 MR 室乳腺增强检查患者 80 例，随机分为研究组和对照组各 40 例。对照组病人接受常规健康教育并使用总医院常规病号服， 研究组病人在常规健康教育的基础上使用乳腺 MR 专用检查服，检查后对两组患者满意度进行比较。 ［结果］常规病号服由于设计不符合 MR 检查需求，无法充分暴露检查部位，乳腺 MR 专用检查服根据检查需求合理设计，既能充分暴露检查部位，又能很好的保护患者隐私，提高患者的舒适度，使研究组患者满意度高于对照组，差异有统计学意义（Ｐ＝0.002 ）。 ［结论］使用乳腺 MR 专用检查服可以提高患者满意度。

影像护理在急诊绿色通道构建中的作用

邓虹
中山大学孙逸仙纪念医院

目的：绿色通道患者病情危重，治疗受时间窗限制，医院建立健全救治绿色通道体系尤为重要，以便优先处理和收治绿色通道患者，为绿色通道患者的早诊断、早评估、早治疗奠定基础。通过对比分析采用规范化护理措施前后，对绿色通道患者完成影像检查的时间，静脉溶栓治疗 DNT 中位数，并发症等，检验规范化影像护理的效能。**方法：**收集我院放射科 2015 年 1 月至 2019 年 1 月绿色通道患者资料，所有患者资料均录入放射科信息化系统汇总分析。我院放射科 2017 年 1 月 1 日全面实施绿色通道患者规范化护理，通过评估优化护理流程后绿色通道患者完成影像检查的时间。静脉溶栓治疗 DNT 中位数，并发症等，分析可行性及科学性。**结果：**我院放射科 2017 年 1 月至 2019 年 1 月绿色通道患者共 632 人，绿色通道患者完成影像检查的时间均少于 25 分钟，静脉溶栓率≥4%，发生并发症者 1 例，总体发生率为 0.01%。**结论：**建立规范的影像科护理流程，加强质量控

制和管理，能够大大缩短绿色通道患者影像检查时间，有效预防和控制绿色通道患者影像检查不良事件的发生和提高检查安全。

肝硬化 CT 灌注成像的临床应用研究

纪凤颖,张莹,王正通
哈尔滨医科大学附属第一医院

【摘要】目的 探讨不同程度肝硬化患者的 CT 灌注参数与肝硬化程度的关系，寻找能反映肝硬化程度的灌注参数，以期建立不同程度肝硬化的定量诊断指标。**方法** 选取 2015 年 8 月至 2017 年 12 月间接受多层螺旋 CT 肝脏灌注扫描者。其中 22 例为正常对照组，男 15 例，女 7 例，年龄 25～70 岁；25 例为肝硬化组，男 17 例，女 8 例，年龄 35～75 岁。根据肝病严重程度的 Child - Pugh 分级方法，将肝硬化病人进行分级：其中 Child-Pugh A 级 11 例；Child-Pugh B 级 10 例；Child-Pugh C 级 4 例。用肝脏灌注分析软件取得不同病变阶段肝实质的灌注参数。对所得结果采用 SPSS11.5 统计学软件进行统计学分析，对于正态分布、方差齐性的计量资料，两组间比较采用 t 检验法(配对 t 检验)，多组间比较采用单因素方差分析的方法，而后采用 SPK-q 检验法进行均数间多重比较。数据以平均值±标准差形式表示。参数间相关分析采用 Pearson 法。以 $P<0.05$ 为差异有统计学意义。**结果** 正常组与不同程度肝硬化的各灌注参数(HAP、HPP、HBF、MTT)比较，差异均存在统计学意义。**结论** MSCT 灌注成像可定量测量肝脏血流灌注参数。肝脏血流灌注参数能够反应肝硬化的程度。

PO-178

走进小儿肠套叠

劳群
杭州市儿童医院

肠套叠是婴幼儿期最常见的外科急腹症之一，家长们要是能掌握一些科普常识并警觉它，将对宝宝健康有益，有时甚至可以救宝宝一命呢。
那么，肠套叠到底是怎么回事呢？杭州市儿童医院放射科劳群主任及团队带您一起走进它。
肠套叠是指一段肠管套入与其相连的肠腔内，导致肠内容物通过障碍，引起肠梗阻。该病好发于 4 个月到 2 岁的小儿，80%的好发 1 岁以内，尤以 4-10 个月最常发生，男孩比女孩多见。由于患儿年纪小，不能表达，往往会耽误病情。

PO-179

兔非酒精性脂肪肝 IVIM 及 IDEAL-IQ 的实验研究

殷小平,戴漪思
河北大学附属医院

目的：使用高脂高胆固醇饲料饲养实验兔，模拟人体非酒精性脂肪肝病的病理生理改变。探讨 IDEAL-IQ 及 IVIM-DWI 参数对兔模型非酒精性脂肪肝的定性定量诊断价值。方法：选取健康新西兰大白兔 40 只，随机分为为对照及实验组，实验组再平均分为高脂 4 周组（G-4w）、8 周组（G-

8w）、12 周组（G-12w）、16 周组（G-16w）。饲养对应时间，实验组每只兔均进行核磁 IDEAL-IQ 及 IVIM-DWI 扫描。结果：IDEAL-IQ:对照组与实验各组 FF 值的组间差异均有统计学意义。两两比较，对照组（3.55±0.79）%分别与 G-8w 组（13.00±2.86）%、G-12w 组（13.31±2.02）%、G-16w 组（21.09±7.73）%差异有统计学意义。通过 FF 值诊断的脂肪肝分度与病理分度一致性检验，kappa 值为 0.764，有较好一致性。IVIM-DWI:随脂肪肝程度的加重,D、D^*、f 呈现不同程度的下降。将 FF 值与 D、D^*、f 值分别进行 Spearman 秩相关分析，得到 D^*与 FF 值相关性最好（r=-0.824）。结论：1、IDEAL-IQ 对于对肝脏脂肪定量诊断准确度高，与病理具有较好一致性。2、IVIM-DWI 对于反映 NAFLD 肝脏微循环灌注改变有意义，D、D^*、f 值均随其严重程度增高而降低，其中 D^*、f 值的变化较为明显。3、D^*值与 FF 值有较好的相关性。

PO-180

视神经脊髓炎谱系疾病诊断思路

刘强
山东省医学影像学研究所

●视神经脊髓炎（neuromyelitis opyica NMO），是一组主要由体液免疫参与的抗原-抗体介导的 CNS 炎性脱髓鞘疾病谱。表现为：视神经+脊髓，急性 or 亚急性
●该病由 Devic 医生于 1894 年首次报道，本病又称 Devic 病或 Devic 综合征
●2004 年梅奥医学中心 Lennon 首次发现了 NMO 特异性的水通道蛋白 4 抗体（AQP4-IgG）后，进一步的深入研究扩展了 NMO 的临床特征及其相关疾病
●2007 年 Wingerchuk 等把 NMO 及其相关疾病统一命名为视神经脊髓炎谱系疾病（neuromyelitis optica spectrum disorders，NMOSD）
●2015 年国际 NMO 诊断小组（IPND）制定了新的 NMOSD 诊断标准，取消了 NMO 的单独定义，将 NMO 整合入更广义的 NMOSD 疾病范畴中。NMO + NMOSD →→ NMOSD
Neuromyelitis Optica Spectrum Disorder (NMOSD)
2015 年版诊断标准 NMO-IgG 阳性的视神经脊髓炎谱系疾病诊断标准：
（1）至少具备 1 项核心临床特征
（2）血清 NMO-IgG 阳性
（3）排除其他诊断
●发病率：单时相：女 ≈男；复发型：女：男= 9-12 : 1；东方人 > 西方人
发病年龄：平均 30-40 岁，30% ≤ 18 岁

PO-181

探讨运动平板单次点片摄影模式在婴幼儿双下肢全长摄影的优势

彭涛,陈坊桃
四川大学华西医院

摘要：目的 ：探讨婴幼儿患者，使用运动平板进行双下肢摄影，采用单次点片式摄影，相对与 slot 全景摄影在降低辐射剂量及图像质量方面的优势。
方法：选取 50 例需进行双下肢全景摄影，1 至 2 周岁的婴幼儿患者为研究对象。采用岛津 SHIMADZU，Sonialvision Safire II，其中 25 例采用 SLOT HSfront 序列 .摄影条件 55-65kv，250mA ,摄影距离 120cm .25 例患采用单次点片摄影，摄影条件 55-65kv，250mA ,摄影距离 120cm .患者均成标准摄影体位： 患者呈站立位，两侧髂前上棘基本位于同一平面，髌骨应该置于膝关节

正中，双侧踝关节内旋 10 到 15°。均由家属陪同患者进行检查。并做好非摄影部位的辐射防护。摄影范围包括双侧髂前上棘至双足底。进行 2 组投照方式下的辐射剂量及图像质量的对比分。
结果： 采用单次点片摄影的婴幼儿患者的图像优良率（p＜0.05）明显高于 slot 摄影方式，其所接受的剂量条件也明显低于 soLt 摄影模式.
结论 ：婴幼儿患者，在双下肢摄影检查中，因自主配合差。在检查过程中，可能出现肢体移动。当采取 slot 双下肢拼接摄影，因其摄影方式为连续多次摄影，如果摄影过程中 出现肢体移动，最终经过后处理拼接合成的图像中会出现错层伪影。为医生的诊断及治疗带来困扰。而采取单次点片摄影模式，因起曝光时间短，其采集的图像可有效避免因患者不配合所造成的图像运动伪影。同时患者只需接受单次的辐射剂量摄影。采取 solt 全景摄影拼接模式，因其连续扫描方式，患者所接受的剂量条件明显高于单次摄影。因此，在婴幼儿的双下肢全景摄影检查的模式选择中，采用单次点片模式相对于连续拼接摄影模式，不仅可有效提升图像质量，在患者的所需接受的摄影剂量条件方面也得到有效降低。

PO-182
磁共振氢质子波谱成像在帕金森病早期诊断中的价值研究

王世科,罗银灯,吴伟,陈金华,白珊玮
重庆医科大学附属第二医院

帕金森病(Parkinson’s disease，PD)是中老年人常见的神经系统变性疾病，以静止性震颤、动作迟缓及减少、肌张力增高、姿势不稳等为主要特征。目前对于本病的诊断主要是靠患者的临床表现，其准确性约为 82%；当患者出现临床症状时，已经 60%～70%的黑质神经元变性，80%的纹状体多巴胺减少。如何早期诊断 PD 显得尤为重要，MR 的问世及发展为早期诊断 PD 提供了可能性。**目的**：探讨磁共振波谱成像（MRS）在帕金森病诊断中的价值。**方法**：对 2017 年 12 月至 2018 年 8 月期间在我院确诊的 20 例早期帕金森病患者（研究组）和 20 例正常志愿者（对照组）行 3.0T 磁共振氢质子波谱成像（^{1}H MRS），采用单体素空间频谱点分辨自旋回波波谱法（PRESS）扫描双侧基底节区，采用 Philips Achieva 3.0T 自带的波谱软件生成感兴趣区代谢物谱线。观察 ^{1}H MRS 谱线基线稳定性、信噪比等，选择基线平稳且信噪比较好的波谱线进行分析，比较两组 NAA、NAA/Cr 比值及 Cho/Cr 比值，探讨磁共振波谱成像在帕金森病诊断中的价值。**结果**：早期帕金森病组 NAA、NAA/Cr、Cho/Cr 比值低于正常对照组。**结论**：磁共振波谱成像对帕金森病的早期诊断有一定参考价值。

PO-183
腹腔及腹膜后富血供占位影像学诊断与鉴别诊断

余日胜
浙江大学医学院附属第二医院

目的：探讨腹腔及腹膜后富血供肿瘤与肿瘤样病变的影像学特征以及鉴别诊断
材料与方法：分析 10 类腹腔与腹膜后占位包括神经源性肿瘤（神经鞘瘤、副节瘤） 、孤立性纤维瘤、巨淋巴结增生症（透明血管型） 、韧带样瘤 、炎性肌纤维母细胞瘤、肉瘤（平滑肌肉瘤、多形性未分化肉瘤）、脉管瘤（血管瘤、静脉瘤、AVM）、神经内分泌肿瘤、异位种植脾 及转移瘤的影像学表现，概况总结其各自的 CT、MRI 特征及相应鉴别诊断。
结果：
神经鞘瘤：肾门水平椎旁或骶前、类圆形、囊变钙化、靶征、渐进性强化 。鉴别：副神经节瘤。

副神经节瘤：高血压、椎旁、极富血供伴出血、坏死囊变。鉴别：神经鞘瘤、巨淋巴结增生症。
孤立性纤维瘤：非椎旁、T2WI 低信号、极富血供、灶周及灶内粗大血管。鉴别：副神经节瘤、巨淋巴结增生症、异位副脾。
巨淋巴结增生症：女性、淋巴链、分支状钙化、极富血供、无明显坏死及裂隙征、镶边征、条纹征 。鉴别：副神经节瘤、孤立性纤维瘤、淋巴瘤。
韧带样瘤：手术史、家族性息肉、T2WI 低信号及局部轻度浸润性生长。鉴别：肉瘤、炎性肌纤维母细胞瘤。
炎性肌纤维母细胞瘤：女孩、局部病灶边缘模糊、钙化、T2WI 低信号。鉴别： 韧带样瘤、淋巴瘤。
神经内分泌肿瘤及类癌：可极富血供、小肠肿块钙化累及肠系膜及肠壁缺血水肿。鉴别：
肉瘤：平滑肌肉瘤常与下腔静脉有关；多形性未分化肉瘤-腹膜后巨大肿瘤伴坏死并累及邻近骨质。鉴别： 神经源性肿瘤
脉管瘤：动静脉瘤与相应血管相同影像特征，AVM-粗大供血动脉及引流静脉，血管瘤-静脉石及渐进性强化 。鉴别：鉴别： 神经源性肿瘤。
异位种植脾：脾切除史、脾脏相似影像特征。鉴别： 转移瘤。
转移瘤：原发富血供恶性肿瘤、多发病灶。鉴别：异位种植脾。
结论：腹腔与腹膜后富血供占位多有一定影像学特征，一般能作出明确诊断 。

PO-184

提高患儿 X 线检查成功率的探讨

信春花
吉林大学第二医院

目的：近年来由于空气质量下降等因素，导致多数幼儿在疾病高发季节相继生病、相互传染，儿科门诊患儿居高不下，儿科住院部床满为患。X 线做为一项必要的辅助检查，每天接待近百名的患儿，由于 1~3 岁的患儿处于似懂非懂的阶段，对陌生环境及医院、医护人员产生排斥而表现为哭闹不止、拒绝检查，从而导致影像的运动伪影比较严重，进而导致影像分辨率下降，影像诊断效果。灌肠做为辅助患儿完成检查的一种方式也会给患儿带来胃肠道紊乱等风险，如何在患儿不灌肠的基础上，既能减轻小患者及家属痛苦的同时，又能提高工作效率以及影像质量是我们一直研究的方向。
方法：从 2019.7.1.开始至 2019.7.10 日，每天随机选取做胸部正位 X 线摄影的患儿 20 名，一共 200 名，年龄段在 1~3 岁之间，在不对幼儿灌肠麻醉的前提下，应用西门子 X 线诊断机进行前后位摄取影像，在家属的辅助下，能达到较好的体位拍摄，固定管电压 90kv、管电流 1.0mAs，拍摄有延迟 2S。随机分成两组，100 名做为对照组，正常拍摄。100 名做为实验组，选择呼气末吸气初拍摄。记录每个小患者的拍摄时间及图像质量，最后由两名技术员及两名医生进行分析与评估。
结果：
对照组：最短拍摄时间为 1.5min，最长拍摄时间为 5min，平均拍摄时间为 3.1min。
最少拍摄次数为 1 次，最多拍摄次数为 3 次，平均次数为 1.9 次。
实验组：最短拍摄时间为 1.6min，最长拍摄时间为 4.5min，平均拍摄时间 2.5min。
最少拍摄次数为 1 次，最多拍摄次数为 2 次，平均次数为 1.3 次。

图像质量：实验组＞对照组
结论：针对 1~3 岁幼儿哭闹会产生运动伪影的情况，选择哭闹间歇的呼气末吸气初时机进行拍摄，会减少患儿的运动伪影，进而提高影像质量，提高完成 X 线检查的质量及速度。

PO-185
联影 1.5T 磁共振 T1 quick3D 和 T1 FSE 序列对盆腔肌肉增强效能对比

张中原
中国科学技术大学附属第一医院西区，安徽省肿瘤医院

目的：通过比较盆腔增强后肌肉的信噪比（SNR）和对比噪声比（CNR），探讨联影 1.5T 磁共振常规 T1 加权成像（T1 FSE）和三维容积内插快速扰相序列（T1 quick3D）对盆腔肌肉增强成像的效果，帮助选取相对最佳序列。**方法：**选取我院 2018 年 10 月至 2019 年 2 月间行盆腔磁共振增强的 120 例患者，按随机数字表法将患者分为两组，分别接受 T1 quick3D 增强扫描（n=60）和 T1 FSE 序列增强扫描（n=60）。确定增强成功后，由两位高级职称影像诊断医生运用感兴趣区（ROI）技术测量图像的信噪比、对比噪声比。采用两独立样本 t 检验进行统计学分析。**结果：**两组受检者均配合良好，分别采用 T1 quick3D 和 T1 FSE 序列扫描，增强成功率百分之百。T1 quick3D 和 T1 FSE 序列图像盆腔臀大肌的 SNR 分别为 109.87±6.65、134.31±7.53（P ＜ 0.05），T1 FSE 增强序列的 SNR 明显高于 T1 quick3D 增强序列；T1 quick3D 和 T1 FSE 序列图像盆腔臀大肌的 CNR 分别为 89.18±8.09、82.51±8.83（P ＜0.05），T1 FSE 增强序列的 CNR 略低于 T1 quick3D 增强序列。**结论：**采用两种序列对盆腔肌肉增强扫描时，增强成功率都比较高，均可获得满足临床诊断的图像质量，但 T1 quick3D 增强序列扫描无层间距，采集速度更快。

PO-186
根据腰围个体化设置腰椎间盘 CT 扫描参数的必要性

王峰,张锦,李军,张丽琴,刘涛,李海东,张俊杰,范跃星
武警山西省总队医院

目的 评价采用 CT 管电流自动曝光控制技术时是否需要根据患者的腰围个体化设置参考管电流时间乘积。**方法** 回顾性搜集 2018 年 7 月到 12 月期间 117 例临床上因腰腿部不适行腰椎间盘 CT 扫描的患者，根据腰围大小分为小腰围组（*n*=57）和大腰围组（*n*=58），比较在相同参考管电流时间乘积（190mAs）条件下不同腰围组患者的图像质量、辐射剂量以及观察者间的一致性。**结果** 大、小腰围组间性别构成无显著性差异（*P*>0.05），大腰围组年龄及腰围显著大于小腰围组（*P*<0.001），小腰围组腰 3 椎体、腰 3-4 椎间盘、硬膜囊、椎旁软组织客观图像噪声均小于大腰围组（*P*<0.001），主观图像噪声、腰 3-4 椎间盘与椎旁软组织边缘锐利度均优于大腰围组（*P*<0.05），诊断可用性均为完全能够满足诊断需要，观察者间的一致性较好或很好（kappa 值 0.795-0.930）。小腰围组的容积 CT 剂量指数、剂量长度乘积及有效辐射剂量显著低于大腰围组（*P*<0.001）。**结论** 小腰围组的图像质量较高，适当降低后仍然能够满足诊断需要，应该根据患者的腰围个体化设置参考管电流时间乘积，以减少不必要的辐射剂量。

PO-187
256 层螺旋 CT 在胸痛三联征一站式检查中的应用

贾广生,姜慧杰
哈尔滨医科大学附属第二医院

目的：探讨 Philip 256 层 iCT 在胸痛三联 CTA 一站式检查对急性胸痛患者肺动脉、主动脉及冠状动脉病变的显示能力，以评估胸痛三联 CTA 一站式检查在急性胸痛患者中推广应用的可行性。**方法：**50 例急性胸痛患者行 256 排螺旋 CT 三联 CTA 检查，对患者原始图像进行后处理，包括多平面重建(MPR)、曲面重建(CPR)、容积再现(VR)及最大密度投影(MIP)等方法显示冠状动脉、胸主动脉及肺动脉，由 2 名以上高年资放射科医师对图像进行观察、诊断。具体方法：患者右侧上肢肘正中静脉穿刺留置静脉通道，使用非离子性对比剂欧乃派克（含碘率 350mg I/ml），采用双筒高压器注射，对比剂注射速率为 4.0~5.0ml/s，对比剂总量为 1.0~1.5ml/kg，一般注射时间为 20s，对比剂注射后以相同速率注射生理盐水 30~40ml。正确合理连接电极导线，根据患者心率及心律情况，选用前瞻性心电门控或回顾性心电门控的方法。根据患者情况，检查前使用药物适当控制心率和血压。设置扫描参数：管电压 100kV 或 120kV，管电流采用自动管电流调制技术，层厚<1mm，螺距 0.2，转速 0.27s 或 0.33s，扫描范围自胸廓入口至膈下 2cm，监测降主动脉，阈值设为 120HU，达到阈值后自动触发扫描，诊断延迟时间 5.0s。使用 EBW 后处理工作站对扫描数据进行三维 VR、MIP、CPR、MRP 及二维冠状面、矢状面等图像后处理。**结果：**患者注射一次碘对比剂、一期扫描可显示冠状动脉、胸主动脉、肺动脉主干及其主要分支，并能观察肺窗、纵隔窗图像。其中肺动脉栓塞 9 例，冠状动脉斑块形成、管腔狭窄 28 例,主动脉夹层 6 例，7 例未见异常。**结论：**Philip 256 层 iCT 可用于胸痛三联征 CTA 一站式检查，即注射一次碘对比剂、一期扫描能显示冠状动脉、肺动脉以及胸主动脉，是急性胸痛病因诊断无创、可靠的检查方法。

PO-188

256 排螺旋 CT 在高心率下冠状动脉成像的研究

贾广生,姜慧杰
哈尔滨医科大学附属第二医院

目的：探讨应用 GE 256 排螺旋 CT 在患者高心率下冠状动脉成像效果。**方法：**选取 30 例心率大于 110 次/分且小于 140 次/分行冠状动脉 CTA 检查的患者，使用美国 GE Revolution 256 排螺旋 CT 机，设置扫描参数为管电压 100KV，自动管电流 400～650 mAs，噪声指数 NI 为 12，扫描层厚 0.45mm，层间距 0.45mm，螺距为 0.16，旋转时间为 0.28s/转，探测器为 256×0.625mm，重建矩阵 512×512。患者保持双手举过头顶，仰卧位足部先进，先进行正侧位定位像及冠状动脉钙化积分扫描，再记录最近心电图变化情况，最后采用阈值触发法行冠状动脉 CTA 扫描，动态监测感兴趣区为患者主肺动脉窗层面降主动脉区域内，设置触发阈值为 150HU，达到阈值之后，患者吸气后屏气，延时 5 秒自动启动一个轴位扫描，曝光时间在 0.3～0.7s。使用双筒高压注射器, 通过右侧肘前静脉留置针将碘对比剂碘海醇 (350 mgL/ml) 注入 70ml（1.0ml/kg）左右，注射速度 5.0～6.0ml/s，后以相同流率注射 40ml 的生理盐水。将图像数据传送到 AW4.7 工作站，利用 SSF 自动冻结后处理软件，重建一期最优图像，用于冠状动脉血管图像重组。如对其核心分支血管利用容积再现 (VR) 、最大密度投影 (MIP) 、多平面重建 (MPR) 、曲面重建 (CPR)等技术分析处理图像。**结果：**升主动脉 CT 值均在 300HU 以上但 8 例小于 400HU，左主干、右冠状动脉、左前降支、左回旋支显示均较清晰且均能给出明确诊断，各支成像质量由高到低为左主干、左前降支、右冠状动脉、左回旋支。**结论：**当心率为大于 110 次/分且小于 140 次/分的高心率患者，应用 GE 256 排螺旋 CT 行冠状动脉 CTA 成像可以得到满足诊断要求的图像。

基于相对封闭 linux 系统配置开源 pacs 的 DSA 数据库管理

徐强,洪泳

复旦大学附属华山医院

【摘要】目的：通过在群晖 dsm 系统配置开源 pacs，并设置主机及三维重建工作站，对 dsa 手术室 dicom 数据进行存储并调取及后处理，方便管理病人术前术后及随访的影像学资料，并可进行多融合的三维重建。**方法**：搭建开源 dicom 服务器，并配置 dsa 主机三维工作站，使 dicom 数据可便捷上传及下载回 dsa 主机或 dicom 浏览器，从而进一步进行病情的术前术后随访之比较，亦可在 dicom 浏览器上进行三维重建以观察病灶。 **结果**：通过设置好的 pacs 系统和 dsa 机器的连接，可以方便快速的备份及读取资料，便于对病人进行术前术后或随访病例进行比较及制定更优的手术方案。 **结论**：该系统在 dsa 数据的保存和读取上便捷有效，使 dsa 资料得以妥善保存并可与术前术后直观对比，有助于数字化管理病人资料并进行进一步研究应用。

PO-190
研究能谱 CT 在不同 GSI 序列下图像 CT 值与碘基值的稳定性

张中旭,谷春雨,贾永军,贺太平,于楠
陕西中医药大学附属医院

目的：探讨常规剂量和低剂量的能谱（GSI）扫描是否会对 CT 值的测量和碘基值的计算产生影响。
方法：取经消毒灭菌后的试管 9 支，分别注入蒸馏水和不同浓度的碘对比剂，分别编号 1（水）、2（1.25mgI/ml）、3（2.5mgI/ml）、4（5mgI/ml）、5（10mgI/ml）、6（15mgI/ml）、7（20mgI/ml）、8（40mgI/ml）、9（40mgI/ml），其中 9 号试管为对照试管。采用 GE Discovery 750 HD CT 机宝石能谱（GSI）GSI-44 及 GSI-15 两次扫描，重建 1.25mm 图像。分别在 S14.25、S3、I8.25、I19.5、I30.75 五个层面测 40kev-140kev 的 CT 值和碘基值，用测得的 CT 值和碘基值与试管内碘浓度做比较。采用 Pearson 相关分析及散点图相关性进行分析。
结果：两组不同能谱序列扫描的图像，CT 值的测量及物质分离计算所得碘含量与真实值之间均具有明显相关性(GSI-15 组 r=1.000，GSI-44 组 r=1.000)。GSI-15 所测得平均 CT 值（319.541±25.511），平均碘含量（13.382±2.073），GSI-44 所测得平均 CT 值（328.395±26.088），平均碘含量（14.028±2.157）.碘含量值随着碘浓度增大，差距逐渐变大；CT 值在碘浓度较低时，差别不大，随着碘浓度升高，差距逐渐变大，随着 keV 增大，CT 值差距逐渐减小。
结论：常规剂量和低剂量的能谱（GSI）扫描协议测得的 CT 值和碘基值都具有良好的线性关系，使用 GSI-15 及 GSI-44 分别重建 40-140keV 单能量图像,其所测得的 CT 值及碘基值数值相差不大，且和对应浓度碘含量的变化一致。和高剂量扫描协议相比，使用低剂量扫描，在物质浓度较低时，对 CT 值的影响不显著；随着 keV 的增大，对 CT 值的影响逐渐减小。

PO-191
非线性融合技术在穿支皮瓣术前下肢 CTA 中的应用价值

何雅坤
四川省肿瘤医院

目的：探讨双源双能量 CT 非线性融合技术在穿支皮瓣术前下肢 CTA 中的应用价值。方法:回顾性分析 200 例接受双源 CT 双能量下肢 CTA 扫描的需采用游离股前外侧皮瓣行修复术患者,分别比较 80kV(A 组)、140kV(B 组)、线性融合 0.3LB(C 组)及非线性融合 NLB(D 组)4 组图像中腹主动脉、髂外动脉、股前外侧穿支动脉 3 个部位的 CT 值、SNR、CNR,比较 4 组图像的背景噪声。主观评分比较 C、D 两组对股前外侧穿支动脉的显示情况。结果 C 组与 D 组背景噪声差异无统计学意义(P=0.67),

小于 A、B 两组;A 组与 D 组腹主动脉、髂外动脉及股前外侧穿支动脉的 CT 值差异无统计学意义(P=0.59、0.09、0.09),大于其他两组。C、D 两组股动脉及髂外动脉 SNR 差异无统计学意义(P=0.26),均大于 A、B 组(P 均<0.05);D 组股前外侧穿支动脉的 SNR 及 CNR 大于其他 3 组(P 均<0.05)。C、D 两组图像的主观评分分别为 3.49±0.38、4.57±0.63,D 组优于 C 组(P=0.02)。结论：非线性融合可提高下肢 CTA 图像质量,更清晰地显示股前外侧穿支动脉,对采用游离股前外侧皮瓣行修复术前评估血管有一定的临床价值。

PO-192

1H-MRS 及行为学综合评价神经干细胞与脑源性神经营养因子联合治疗 APP/PS-1 转基因 AD 小鼠的疗效

李铭华
同济大学附属同济医院

目的 既往研究主要依赖实验动物的行为学改变来评判神经干细胞(NSCs)移植对于阿尔茨海默病(AD)的影响，但主观性较大。本实验利用 7T 高场强 1H-磁共振波谱（1H-MRS）观察 APP/PS-1 转基因 AD 小鼠 NSCs 与脑性神经营养因子(BDNF)联合治疗后海马区的神经代谢改变，并结合行为学综合评价 NSCs 移植治疗 AD 疗效。

方法 获取胎鼠海马区的 NSCs，贴壁法体外扩增培养，增强型绿色荧光蛋白（EGFP）转染。36 只 12 月龄的 APP/PS-1 转基因 AD 小鼠分为 3 组，每组 12 只，（1）联合组：移植转染 EGFP 的 NSCs 至双侧海马 CA1 区，经侧脑室注射 BNDF；（2）NSCs 组：移植转染 EGFP 的 NSCs 至双侧海马 CA1 区；（3）对照组：注入 PBS 至海马 CA1 区。移植后 6 周，应用 7.0T 磁共振仪进行小鼠脑部海马的 1H-MRS 检测；同时应用 Morris 水迷宫定航实验测定各组小鼠的逃避潜伏期。取小鼠脑组织切片经 EGFP-Aβ 免疫荧光双标记染色。

结果 移植后联合组及 NSCs 组小鼠海马 CA1 区的 NAA/Cr 值、MI/Cr 值较对照组升高（$p<0.05, p<0.01$），并且联合组的 NAA/Cr 值亦高于 NSCs 组（$p<0.01$）。
定位航行试验中，联合组、NSCs 组及对照组小鼠逃避潜伏期差异均有差异（$p<0.05, p<0.01$），三组的逃避潜伏期逐渐延长。各组小鼠的平均逃避潜伏期与 NAA/Cr 值呈负相关（Pearson 相关系数为-0.906，$p<0.01$）。联合组、NSCs 组小鼠海马区可见移植细胞，部分分化为神经元，部分分化为胶质细胞。

结论 NSCs 和 BDNF 联合治疗较单独使用 NSCs 能更好地改善转基因 AD 小鼠的学习记忆能力。7T 高场强 1H-MRS 作为一种活体、无创的检查方法可以检测转基因 AD 小鼠的 NSCs 移植治疗后的代谢改变，结合行为学检查能够对其疗效作出更客观、有效的评价。

PO-193

The diagnostic value of 3.0T MR DWI sequences in renal masses

Qi Lv,PeiJun Wang
Tongji Hospital, Tongji University

Objective To evaluate the differential diagnostic value of renal masses on 3.0 T DWI .
Methods The MRI information,139 patients with renal tumors received breath hold DWI with b value=0,800s/mm^2 at a 3.0T scanner,were analyzed retrospectively.All tumors

were confirmed by pathology except for benign renal cystic lesion.The imaging findings of renal tumors were analyzed and compared:we calculated the sensitivity、specificity、the accurate rate、positive predictive value and negative predictive value of ADC value in differentiating benign from malignant tumors and analyzed DWI features of all lesions.ADC value of all lesions、around lesions and contralateral side of the renal parenchyma were compared.

Results LSD test showed there were significant statistical differences in ADC values among Renal cell carcinoma，renal angiomyolipoma and carcinoma of renal pelvis(P<0. 01).ADC values of Renal cell carcinoma and carcinoma of renal pelvis were significantly different from benign tumors (P<0.01), renal pelvis carcinoma had the lowest ADC value and renal angiomyolipoma had the highest value. The ADC values of benign renal cystic lesions and cystoid variation in renal cell carcinoma were significant different。LSD test showed there were significant differences among phase I and III、 IV，phase II and III、IV (P<0.01)，phase III and IV had the lowest value.

Conclusions Our preliminary results shows that DWI has high accuracy rate for differentiating benign from malignant urothelial carcinoma with high b value.The quantitative analysis ADC value could show the lesions more accurately and maybe helpful in differential diagnosis and evaluation of malignancy.

PO-194

Intravoxel incoherent motion diffusion-weighted imaging in assessing Bladder Cancer invasiveness and cell proliferation

Fang Wang,Pei-jun Wang
Tongji Hospital， Tongji University

Purpose: To investigate whether intravoxel incoherent motion (IVIM) diffusion-weighted imaging (DWI) could differentiate non-muscle invasive bladder cancer (NMIBC) from muscle invasive bladder cancer (MIBC) and to assess whether there were correlations between IVIM parameters and the Ki-67 labeling index (LI).

Materials and Methods: Thirty-six patients diagnosed with bladder cancer confirmed by histopathological findings underwent magnetic resonance imaging including DWI with 8 b-values ranged from 0 to 1000 s/mm2 before transurethral resection (TUR). Molecular diffusion coefficient (D), perfusion-related diffusion coefficient (D*), perfusion fraction (f), and apparent diffusion coefficient (ADC) were calculated by bi-exponential and mono-exponential model fits respectively. Comparisons were made between the MIBC and NMIBC group. Differences in these values were analyzed by

comparing the areas under the receiver operating characteristic curves (AUC). The correlations between these parameters and Ki-67 LI were also analyzed.
Results: ADC and D value were significantly lower in patients with MIBC compared to those suffering NMIBC ($p<0.01$). The AUC of D value (0.894) was significantly ($p<0.05$) larger than those of ADC value (0.786). The sensitivities and specificities of D and ADC value were 95% and 87.5% and 80% and 68.7%, respectively. In addition, there was a negative correlation between D value and Ki-67 LI ($r=-0.785$, $p<0.01$).
Conclusions: D value obtained from IVIM could provide better performance than conventional DWI in distinguishing NMIBC from MIBC and serve as an imaging biomarker reflecting the invasive and proliferative potential of bladder cancer.

PO-195
分段定位像配合 CARE Dose 4D 技术对 PET/CT 检查者辐射剂量的控制

王俊
四川省肿瘤医院

摘要:[目的] 在采集方式不变的情况下，比较一体式定位像（双上肢上举贴近耳侧，采集前后位定位相，长度颅顶至股骨中断）与分体式定位像（双上肢上举贴近耳侧，采集前后位定位相，长度额窦至股骨中断+双上肢置于躯干两侧，采集前后位定位相，长度颅顶至下颌）结合自动管电流调节技术(combined application reduce exposure,CARE)Dose 4D 患者单次检查所受 CT 辐射剂量的差异；[方法] 选取 2018 年 7 月---2018 年 12 月在我院 PET/CT 中心复查的患者 20 例。将 20 例患者首次检查采用一体式定位像指导采集时所受的辐射剂量作为对照组：此次复查采用分体式定位像指导采集时所受的辐射剂量作为观察组，以剂量长度乘积（DLP）和容积 CT 剂量指数（CTDIvol）作为辐射剂量评价指标，利用 t 检验比较患者两次检查所受辐射剂量的差异。[结果] 观察组患者容积 CT 剂量指数为 54.09±5.82mGy，剂量长度乘积为 1365.34±118.55mGy·cm；对照组患者容积 CT 剂量指数为 91.52±9.65mGy，剂量长度乘积为 2130.17±224.42mGy·cm。两项观察指标差异均有统计学意义，P<0.05. [结论] 分段式定位像配合 CARE Dos4D 技术能有效降低 PET/CT 全身检查者的 CT 辐射剂量。

PO-196
The texture characteristics of liver MR-enhanced three-phase images predicts microvascular invasion in hepatocellular carcinoma

Weilin Yang
Department of Radiology, West China Second University Hospital of Sichuan University

Background and purpose: Microvascular invasion (MVI) is one of the important risk factors of postoperative recurrence of hepatocellular carcinoma(HCC),at present, as one of the predictors of recurrence of HCC, MVI is diagnosed only by postoperative pathology. In the current study, the sensitivity and specific degrees of predict MVI by conventional methods of imaging examination and serological laboratory examination

are low. So if we can predict and assess MVI before operation, It will provide important reference value for clinical decision-making of HCC treatment and prognosis evaluation of patients. In recent years, due to the rapid development of magnetic resonance imaging technology and new type of contrast agent, the early diagnosis of HCC, and evaluate the prognosis of patients with postoperative efficacy, forecasting is a hotspot of current research. A series of studies by using magnetic resonance imaging technology and a new contrast agent to predict and evaluate MVI of hepatocellular carcinoma have been carried out. The common methods including morphology evaluation, texture analysis, diffusion weighted imaging, dynamic enhancement imaging, fat analysis, liver cell function imaging and comprehensive analysis.etc.

Different MRI methods have different sensitivity and specificity in evaluating MVI, and the combined application of MR has great potential in comprehensively predicting MVI of HCC. There are studies using the quantitative Apparent Diffusion Coefficient (ADC) of Diffusion Weighted Imaging (DWI) to evaluate the MVI of hepatocellular carcinoma, and there are also studies using the new diffusion model, such as intravoxel incoherent motion (IVIM) and Diffusion Kurtosis Imaging (DKI) to evaluate MVI. In terms of new contrast agents, there are studies by analyzing the magnetic resonance imaging and gadoxetic acid disodium enhanced MR to preoperative predict microvascular invasion and recurrence of HCC. These studies indicate that the development of MR imaging techniques and application of new type of contrast agent are able to provide valuable information for predicting MVI, and can further evaluate the risk of postoperative recurrence and metastasis of hepatocellular carcinoma, predict the prognosis of patients. Preoperative diagnosis of MVI will provide important reference value for surgery or other clinical treatment options.

In recent years, many researches have been made on the qualitative diagnosis of diseases through the quantitative analysis of medical images, which has gradually formed the new research field and direction—Radiomics. Texture analysis, as a research hotspot in radiomics, uses mathematical methods to analyze the gray’s quantitative value and distribution of medical images, for quantifying the heterogeneity of tissues. At present, many studies have applied it to liver fibrosis, diagnosis and differential diagnosis of liver nodule lesions, the prediction of the malignant degree of liver tumors. The purpose of this study was to investigate the feasibility of predicting microvascular invasion in hepatocellular carcinoma by analyzing the texture features of liver MRI-enhanced three-phase images.

Methods: A total of 127 patients who underwent MR-enhanced examinations at West China Hospital of Sichuan University from July 2015 to September 2018 and confirmed by surgery and pathology as HCC were retrospectively included. Subjects were excluded if they had performed interventional therapy before surgery(n=4), poor images quality with obvious artificial interference(n=5), tumor diameter less than 1 cm(n=4),imperfect pathological report, or unknown MVI status(n=4), totally 17. Consequently, 110 patients remained in the study. The postoperative pathological results were regarded as the gold standard. Patients were divided into MVI-positive group (n=52) and MVI-negative group (n=58) according to the gold standard. We collected clinical and pathological data (tumor location, tumor size and the degree of histopathological differentiation), and preoperative MR imaging signs (tumor signal, tumor capsular, Peritumoral enhancement, tumor margins). The texture characteristics of liver MRI-enhanced three-phase images of the two groups of HCC patients were

analyzed. Eleven texture parameters including mean value, standard deviation (SD), skewness, kurtosis, variance, energy, entropy, correlation, inertia, inverse difference moment, and contrast were selected from the gray histogram and the gray level co-occurrence matrix. The texture analysis software was used to calculate the above texture parameter values of the MR-enhanced images, and the obtained data were statistically analyzed.

Results: Of the 110 patients with HCC, 94 were male and 16 were female, aged from 34 to 76 years, with a median age of 52 years. Fifty-two patients with MVI-positive and 58 patients with MVI-negative were confirmed by postoperative pathology. There were statistically significant differences in tumor size, location and the degree of histopathological differentiation between the MVI positive group and the MVI negative group ($P<0.05$). The MVI positive group had larger tumor diameter, more lesions in the right lobe and caudal lobe of the liver, and lower degree of tumor differentiation. There were statistically significant differences between the MVI positive group and the MVI negative group in tumor signal on T2WI, tumor capsular, peritumoral enhancement on arterial phase and tumor margins ($P<0.05$). The MVI positive group had more heterogeneous tumor signals, with no capsule or incomplete capsule, more cases with multiple nodules type and peritumor enhancement on arterial phase. The texture characteristics of MR images after contrast enhanced showed that the entropy, correlation and inverse difference moment of MVI-positive group were significantly higher than MVI-negative group, while energy, inertia and contrast were significantly lower than MVI-negative group in T1 weighted imaging (T1WI) ($P<0.05$). In arterial phase, the kurtosis, entropy, correlation and inverse difference moment of the MVI-positive group were obviously higher than that of MVI negative-group, while the energy, inertia and contrast were obviously lower than MVI-negative group($P<0.05$). In the portal phase, the MVI-positive group had markedly higher kurtosis, entropy and inverse difference moment than the MVI-negative group, and the mean value and inertia were markedly lower than the MVI-negative group ($P<0.05$). On T1WI unenhanced scan, the area under curve (AUC) of texture parameter entropy, inverse difference moment, correlation, energy, inertia and contrast with statistical differences were 0.264, 0.301, 0.306, 0.736, 0.747 and 0.747, respectively. In arterial phase, the AUC values of texture parameters correlation, inverse difference moment, entropy, kurtosis, energy, inertia, and contrast with statistical differences were 0.241, 0.253, 0.269, 0.306, 0.773, 0.784 and 0.784, respectively. In portal venous phase, the AUC values of texture parameters inverse difference moment, entropy, peak, mean value, inertia with statistical differences were 0.259, 0.302, 0.413, 0.604 and 0.756, respectively. The AUC value of combining the signs of MR images prediction of MVI was 0.693, with sensitivity and specificity 53.8% and 82.8%, respectively. The AUC value of combining texture parameters of three-phase enhanced MR images diagnosis of MVI was 0.797 with sensitivity and specificity of 88.2% and 62.7%, respectively.

Conclusion: Signs of MR-enhanced images and texture characteristics of MR enhanced images have certain predictive effect on MVI of HCC. MR images texture analysis technology can help for diagnosis and contribute to the choice of personalized treatment plans in clinical practice.

PO-197

Noise-optimized virtual monoenergetic imaging of dual-energy CT: effect on contrast agent artifacts reduction on cervical CTA examination

Yanwei Zeng, Junyan Fu, Daoying Geng, Jun Zhang
Huashan Hospital, Fudan University

Purpose: Artifacts, produced by contrast agent in the subclavian vein on cervical CTA examination, often affect the show of cervical arteries at the corresponding level. In many previous studies, although 40keV has been recommended as the best energy level on the noise-optimized virtual monoenergetic imaging (VMI+) reconstructions for computer tomography angiography (CTA) in dual-energy CT (DECT), it often interferes with the display of calcified plaques on the wall of arteries because of the high iodine contrast. We aimed to evaluate the effects of VMI+ reconstructions on reducing the contrast agent artefacts in the vascular region of the neck, compared to traditional virtual monoenergetic imaging (VMI) and linearly blended (M_0.6) reconstructions in patients underwent the examination of CTA of cervical arteries in DECT, and recommend a suitable energy level to better show calcified plaque.
Methods: Ten patients who underwent cervical CTA in DECT were evaluated in this retrospective study. Images were reconstructed with M_0.6 and with VMI+ and VMI at 20-keV intervals from 40 keV to 140 keV. Attenuation and noise were measured in the cervical arteries at the worst level obstructed by the contrast agent artefacts of each patient. The artefact index (AI) and signal-to-noise ratio (SNR) were calculated.
Results: The AI values for the cervical arteries were lowest in the 140keV VMI+ series, which were lower compared to all the VMI and F_0.6 image (all $p<0.029$), but showed no significant differences compared to the 120keV VMI+ series ($p=0.684$). The SNR was highest in the 40keV VMI+ series, and there were no significant differences compared to the highest SNR in the VMI images and F_0.6 image ($P\geq0.529$), even compared to the 60-120keV VMI+ series ($p\geq0.052$).
Conclusions: DECT with 120keV VMI+ efficiently reduces contrast agent artefacts without affecting image quality in patients underwent the examination of CTA in neck. And the 120keV can be used as an additional energy level in the VMI+ reconstruction to better show calcified plaques in the cervical arteries affected by artifacts.

PO-198

高清 T2WI 结合 CS 在健康志愿者肾脏的应用

武敬君[1], 刘爱连[1], 王家正[2], 崔达华[1], 陈丽华[1]
1.大连医科大学附属第一医院
2.飞利浦

目的：研究高清 T2WI 结合 CS 应用于健康志愿者肾脏，对图像质量的影响。
方法：前瞻性收集 10 名健康受试者（年龄 22-35 岁，平均年龄 28.7±2.15 岁;男性 5 名，女性 5 名），所有受试者行 3.0T MR 扫描（Ingenia CX，Philips）。使用高清 T2WI 结合不同加速因子（SENSE 2，CS-SENSE 2，CS-SENSE 3.5）的序列对右侧肾脏进行扫描。三种方案的扫描时间分别

为 357 秒，357 秒和 231 秒，而所有其他参数保持相同（TR / TE 1490/90 ms，FOV 140x140 mm2，分辨率 0.6x0.6 mm2，切片厚度 4 mm）。所有图像分析均在 IntelliSpace Portal（Philips）上进行。两名放射科医师分别将 ROI 分别置于右肾的上，中，下极的肾皮质和髓质以及相同水平的腰大肌（图 1），计算信噪比(SNR)和对比噪声比(CNR)。此外，两位放射科医师根据 Likert 5 方法进行了图像质量评分。使用 Friedman 检验分析来自不同序列的图像之间的 SNR 和 CNR 值。使用 Kappa 系数分析图像质量评分的一致性。
结果：不同扫描序列间，各肾区域 SNR，CNR 和主观评分没有统计学上的显着差异（表 1 和 2）。
结论：不同加速倍数（SENSE 2，CS-SENSE 2，CS-SENSE 3.5）结合高清 T2W，对图像信噪比无影响。

PO-199

Reducing Radiation Dose and Improving Image Quality in CT Portal Venography for Thin Patients using 100kV Tube Voltage and Adaptive Statistical Iterative Reconstruction-V Algorithm

Zhanli Ren[1,3], Taiping He[1,2], Yongjun Jia[1], Xirong Zhang[1,2], Nan Yu[1,2], Yong Yu[1], Guangming Ma[1], Dou Li[4], Chao He[3], Changyi Guo[2,3]
1. Affiliated Hospital of Shaanxi University of Chinese Medicine, China
2. Shaanxi University of Chinese Medicine
3. The Second Affiliated Hospital of Shaanxi University of Chinese Medicine
4. Chang'an Hospital

Objective: To explore the feasibility of reducing radiation dose and improving image quality in CT portal venography (CTPV) for thin patients using 100kV tube voltage and adaptive statistical iterative reconstruction-V (ASIR-V) algorithm.
Methods: Sixty patients for abdominal enhanced CT were randomly collected and divided into group A and group B. Group A was scanned with conventional 120kV tube voltage, 450mgI/kg contrast agent and reconstructed with 40%ASIR, while Group B was scanned with 100kV tube voltage, 350mgI/kg contrast agent and reconstructed with ASIR-V from 40% to 100% with interval at 10%. The CT values and standard deviation (SD) of the main portal vein, left branch and right branch of portal vein were measured to calculate the signal to noise ratio (SNR) and contrast to noise ratio (CNR). The subjective scores of image quality was performed double-blindly by two experienced radiologists using a five-point system. The radiation dose, contrast agent were recorded and calculated.
Results: There was no significant difference in the patient characteristics between the two groups (P>0.05). The effective radiation dose and contrast agent in group B were significantly reduced by 46.7% and 21.2% than those in group A (P<0.05). In group B, with the increase of ASIR-V percentage, the CT values showed no significant difference, the SD values decreased gradually, while the SNR values and CNR values increased accordingly. Compared with 40%ASIR in group A, the CT values were similar between two groups with different reconstructions, while the 70%-100%ASIR-V in group B had lower SD values and higher SNR values and CNR

values(P<0.05). The subjective scores showed excellent consistency between two radiologists for CT portal venography (Kappa>0.75, P<0.05), the subjective scores with 70%-100%ASIR-V in group B were significantly higher than those of 40%ASIR in group A(P<0.05), in which 80%ASIR-V provided the highest subjective score for CTPV. **Conclusion**: In CT portal venography, 100kV tube voltage and ASIR-V algorithm can reduce radiation dose by 46.7% and contrast agent by 21.2% and improve image quality for thin patients compared with 40%ASIR using conventional 120kV, while the 80%ASIR-V provides the best image quality of portal vein.

PO-200

论影像质量控制在放射科质控工作中的实际开展

管川江
重庆三峡中心医院

图像质量评价开展
图像质量评价来自四个方面：
临床反馈：通过临床医师的反馈，记录图像质量存在的问题，扫描方案是否存在问题等，我们的初衷即是为临床解决问题，其要求是我们最终的目标，严格重视，定期组织开展“医师、技师下临床”工作，了解其需求，积极配合。解决问题，满足其要求。
诊断医师登记记录：所有的图像都经诊断医师书写报告。在书写、审签报告过程记录存在问题项目。
质控成员每月定期抽查：针对不同检查类型，X 线平片、CT、MR、后处理等，以技术检查规范为标准，具体落实到检查前准备，检查时数据采集阶段，检查后图像处理阶段。详实抽查，多人审核。
科内定期的质控总结：每季度一次，总结抽查，统计分析。以 PDCA 循环为流程，持续改进。
如何开展持续改进：
以 PDCA 为流程，计划：在抽查登记，质量评价过程中发现问题，拟定改进计划。改进实施：以计划为标准，具体实施改进，如对技师进行规范化扫描培训，扫描计划的修订，提高技师责任心教育等，根据问题，逐项改进实施。检查：对改进后的图像进行抽查，对问题登记当事人的跟踪反馈。
总结：总结经验，对存在问题的升华认识，积极主动改进，杜绝此类问题的再发生。
科室如何深化质量控制：
提高认识，在图像质量为放射科生命线上的重视上，要求人人重视，以得到优质图像为自己的使命。
全员参与，这不是部分人的工作，需要所用人参与进来，共同协作，持续改进。
抓规范化培训：①扫描标准化培训（全体人员参与）；②特色技术开展，专人负责，团队攻关，集体学习；③科内讲座培训，每周的图像质量评价会议等；④外出学习：进修+学术会，把人家的优势学习回来。
抓质量缺陷管理：有执行，才有进步，发现问题后，组织学习改进方案，定期抽查改进情况。
抓量化考核管理：①科学建立不同岗位量化等值比例关系、相对倾斜技术难度高的岗位，基本做到多劳多得，按劳分配原则；②奖惩分明，质量控制与绩效挂钩。

PO-201

Effects on Radiation Dose, Contrast Agent and Image Quality in Renal CT Angiography: The combination of 80kV

Tube Voltage and Adaptive Statistical Iterative Reconstruction-V Algorithm

Zhanli Ren[1,2,3], Taiping He[1], Yongjun Jia[1], Xirong Zhang[1,2], Nan Yu[1,2], Yong Yu[1], Guangming Ma[1], Changyi Guo[3], Dou Li[4]

1. Affiliated Hospital of Shaanxi University of Chinese Medicine, China
2. Shaanxi University of Chinese Medicine
3. The Second Affiliated Hospital of Shaanxi University of Chinese Medicine
4. Chang'an Hospital

Objective: To investigate the effects of using 80kV tube voltage and adaptive statistical iterative reconstruction-V algorithm in renal CT angiography for reducing radiation dose and reducing contrast agent and improving image quality compared with conventional 120kV.

Methods: Fifty patients with renal CT angiography in our hospital were prospectively collected and randomly divided into group A and group B. Group A was scanned with 120kV tube voltage, 600mgI/kg contrast agent and was reconstructed with 40%ASIR. Group B was scanned with 80kV tube voltage, 350mgI/kg contrast agent and was reconstructed with 80% ASIR-V. The CT values and standard deviation (SD) values of right renal artery, left renal artery and right erector spinae at the same level were measured, and the SNR values and CNR values of renal arteries were calculated. The image quality of renal arteries was subjectively scored by two experienced radiologists blindly using a 5-point system.

Results: There was no significant difference in population characteristics between the two groups ($p>0.05$). The effective radiation dose (2.07 ± 0.21mSv) and the total contrast agent (21.10 ± 2.86g) in group B were significantly lower than those in group A (6.69 ± 1.83mSv and 38.50 ± 4.14g) by 69.1% and 45.2% ($P<0.001$). The CT values of renal arteries between the two groups were similar and there was no significant difference in CT values ($P>0.05$). Compared with 40%ASIR reconstruction in group A, the SD values of renal arteries in group B were significantly lower ($P<0.001$), and the SNR values and CNR values in group B were significantly higher($P<0.001$). The subjective scores on image quality of renal arteries by two radiologists had excellent agreement (Kappa>0.80, $P<0.05$), and subjective scores in group B were significantly higher than those of group A,

Conclusion: The combination of 80kV tube voltage and adaptive statistical iterative reconstruction-V algorithm can provide better image quality with reducing radiation dose and reducing contrast agent in renal CT angiography compared with the conventional 120kV.

PO-202

Diagnostic Value of Stress Dynamic Myocardial CT Perfusion for Symptomatic Patients with Intermediate to High Risk of Coronary Artery Disease: Absolute Versus Relative Myocardial Blood Flow

Yan Yi,Cheng Xu,Yining Wang,Zhengyu Jin
Peking Union Medical College Hospital

PURPOSE
To compare the diagnostic efficiency of absolute and relative myocardial blood flow (MBF) on dynamic myocardial CT perfusion (CTP) in detecting hemodynamically significant coronary artery disease (CAD) for intermediate- to high-risk symptomatic patients.
METHOD AND MATERIALS
Sixty consecutive symptomatic patients (43 men and 17 women; 61.38±8.01 years old) who met the criteria for intermediate to high CAD risk were prospectively recruited. All patients underwent adenosine triphosphate-stress dynamic myocardial CTP examinations using third-generation dual-source CT. Polar maps with data of the endocardial layer, based on the 17-segment American Heart Association (AHA) myocardial model, were used for ischemia evaluation. Absolute and relative parameters were generated and compared through a semiautomatic quantitative analysis of the MBF value. Invasive coronary angiography and fractional flow reserve (ICA/FFR) was used as the reference standard for myocardial ischemia. Areas under the receiver operating characteristic (ROC) curves and cutoff values were calculated and compared.
RESULTS
There were 151 vessels in 60 patients finally enrolled for analysis. The sensitivity, specificity, PPV, NPV and diagnostic accuracy for the absolute MBF value and relative MBF ratio were 82.76%, 98.92%, 97.96%, 90.20%, and 92.72% and 74.14%, 93.56%, 87.76%, 85.29%, and 86.09%, respectively. The absolute MBF value was better than the relative MBF ratio in detecting ischemia (AUC, 0.955 [95% CI: 0.919-0.990] vs. 0.906 [95% CI: 0.857-0.954]) (P=0.02). For territories with both sensitivity and specificity ≤90%, the diagnostic accuracy increased from 79.1% to 88.4% when the specific data were assessed using the absolute MBF value instead of the relative MBF ratio.
CONCLUSION
A semiautomatic, quantitative assessment using the absolute MBF value from the endocardial myocardium on stress dynamic myocardial CTP showed superior diagnostic performance compared with the relative MBF ratio on the detection of myocardial ischemia for intermediate- to high-risk, symptomatic patients. The absolute MBF value provides an incremental benefit toward diagnostic performance compared with the relative MBF ratio evaluation.

PO-203
MRI 多模态成像技术在肾透明细胞癌分级诊断中的应用价值

许晓雯,王培军
同济大学附属同济医院

目的 评价 3.0T MRI 扩散加权成像(DWI)、灌注加权成像(PWI)及磁敏感加权成像(SWI)在肾透明细胞癌(ccRCC) Fuhrman 核分级诊断中的应用价值。
方法 选取 35 例经手术病理证实为 ccRCC 并进行 Fuhrman 核分级患者，均行 3.0T MRI DWI、PWI 及 SWI 扫描。采用 ANOVA 比较 DWI 所得 ADC 值、PWI 所得 Ktrans 值及 SWI 所得 ITSS 评分在 ccRCC 不

同核分级之间的差异，采用 Pearson 相关性比较 DWI、PWI 及 SWI 三种检查方法之间相关性，同时应用 ROC 曲线评价三者对于 ccRCC 高、低级别鉴别诊断的价值。
结果 35 例经病理证实 ccRCC 患者 Fuhrman 核分级(其中Ⅰ级 6 例、Ⅱ级 17 例、Ⅲ级 8 例、Ⅳ级 4 例)， III 级与 IV 级间 ADC 值差异不具有统计学意义，其他各组间差异均具有统计学意义(P＜0.05)；Ktrans 值和 ITSS 评分随着肿瘤分级的升高而逐渐增高(P<0.05)，其中 III 级与 IV 级间 ITSS 评分差异不具有统计学意义，其他各组间差异均具有统计学意义(P＜0.05)。Pearson 相关性比较发现 K^{trans} 与 ADC 之间呈强负相关(r=0.64)，K^{trans} 与 ITSS 之间呈中等正相关(r=0.55)，ADC 与 ITSS 之间呈中等负相关(r=0.57)(P＜0.05)。运用 ROC 曲线比较 ccRCC 高(I 和 II 级)、低(III 和 IV 级)级别的诊断价值， K^{trans} AUC=0.857，灵敏度和特异度分别为 89.9%和 85.7%；ADC AUC=0.723，灵敏度和特异度分别为 72.7%和 92.9%；ITSS 评分 AUC=0.763，灵敏度和特异度分别为 78.8%和 71.4%。**结论** 3.0T MRI DWI、PWI 及 SWI 分别从不同角度反映 ccRCC 的血供及细胞结构特征，三者联合为 ccRCC 的 Fuhrman 核分级诊断提供有利价值。

PO-204
A Pilot Study of Four-dimensional Flow MRI Detection of Renal Artery Hemodynamics

Bingbing Gao[1],Yanwei Miao[1],Ailian Liu[1],Jiazheng Wang[2],Zhongping Zhang[2],Renwang Pu[1],Yunan Cui[1]
1.the first affiliated hospital of Dalian medical university
2.Philips Healthcare，China

Purpose: To assess the feasibility of using four-dimensional (4D) flow MRI sequence as a noninvasive measuring method for renal artery (RA) hemodynamics.
Materials and Methods: Ten healthy subjects were involved in the study and underwent MR exam at 3.0 T scanner (Ingenia CX, Philips Healthcare, the Netherlands) with a 16-channel abdominal array coil. The MR protocol included a 2D quantitative flow sequence (axial, PC direction=RL, PC velocity=200cm/s) to measure the flow velocity in the bilateral RA as a reference for velocity encodings (VENC) and a 4D flow sequence (axial, PC direction=RL-AP-FH, SENSE =5.04) for hemodynamics quantification. VENC was set to 45 cm/s for the 4D flow sequence to slightly surpass the measured velocity and avoid phase wrapping. We performed axial scan for RA in 4D flow sequence instead of coronal view to put the entire bilateral RA trunks and branches into the FOV. The acquired images were processed in CVI42 (Circle Cardiovascular Imaging, Calgary, Canada) by a single radiologist to obtain a 3D angiogram, where three measuring planes (P1: within 5mm to the aorta, P2: the middle, P3: within 5mm to the branch) were manually placed to the initial region of right RA by two radiologists independently to measure the flow velocity, volume rate and axial-wall shear stress (WSS).We placed P1 and P3 to measure pressure changes. The intra-class correlation coefficients (ICC) for each measurement between the two radiologists was tested.
Results: The consistency of all parameters obtained by the two observers were good (0.802 to 0.977).
Conclusion: Using 4D flow MRI to detect renal artery hemodynamics is feasible.
Clinical application: 4D flow MRI sequence provides a noninvasively method to detect and evaluate vessel hemodynamics change for diseases involving cardiovascular system.

PO-205
估算儿童胸部 CT 扫描中体型特异性辐射剂量的简易方法

谭婷婷,杨楠
天津市儿童医院

目的：比较基于患者体重及容积 CT 剂量指数（$CTDI_{vol}$）计算的体型特异性辐射剂量（$SSDE_{weight}$）和基于水当量直径的扫描范围内的平均 $SSDE_{mean}$ 在估算儿童胸部 CT 辐射剂量中的差异，以求提供一种简单的 SSDE 计算方法。**方法：**回顾性选取 2019 年 1 月至 3 月在我院行胸部平扫的 80 例儿童患者，均采用 GE Revolution CT 进行扫描，使用 ICRP 认可的儿童胸部扫描协议进行平扫。记录每例患者的体重、$CTDI_{vol}$ 值。回归分析患者体重与水当量直径的关系，参考 AAPM 204 提供的方法，利用公式计算 $SSDE_{weight}$ 。平均 $SSDE_{WED}$ 则由商业软件 Radimetrics™ 自动计算。采用 SPSS 22.0 软件进行 Bland-Altman 分析，比较 $SSDE_{weight}$ 与 $SSDE_{mean}$ 之间的差异。**结果：**儿童胸部 CT 扫描患者的 $SSDE_{weight}$ 与 $SSDE_{mean}$ 分别为 4.44±0.30 mGy、4.75±0.30 mGy。$SSDE_{weight}$ 与 $SSDE_{mean}$ 的相关系数为 0.96。 Bland-Altman 分析，$SSDE_{weight}$ 与 $SSDE_{mean}$ 的偏倚均值为 0.30mGy，均方根差为 0.08mGy，可以忽略不计。LOAs 为 0.14 ~ 0.47mGy，超过 95%的数据点在此范围内，$SSDE_{weight}$ 与 $SSDE_{mean}$ 一致性较高。**结论：**利用患者体重及 $CTDI_{vol}$ 计算的 $SSDE_{weight}$ 与商业软件计算的 $SSDE_{mean}$ 相比，二者间的一致性较好。在没有自动软件计算 $SSDE_{mean}$ 的情况下，$SSDE_{weight}$ 能用于估算儿童胸部 CT 扫描患者的辐射剂量，有利于临床 SSDE 的计算与推广。

PO-206

颈椎双斜位透照技术的探讨

徐丹
甘肃中医药大学附属医院

目的:探讨颈椎双斜位最佳的投照方法，对颈椎退行性骨关节病的诊断提供可靠依据。
颈椎退行性骨关节是危害中老年人生命健康的常见病症之一，X 线是诊断该病的重要方法， 临床上常因出现相应症状而投照颈椎 X 线片，而 X 线片的质量是影响诊断的重要资料。颈 椎退行性骨关节病又以“脊神经根型”最为常见，X 线表现为椎间孔的狭窄和所属小关节的增 生性改变，临床上出现神经根受压之症状。所以，颈椎平片除常规的正侧位外，加拍颈椎双 斜位显得相当重要，重要观察、确定是否椎间孔狭窄、狭窄程度及周围结构的关系,以及增 生变形等一些病变情况，为临床治疗提供重要的参考。 颈椎常规检查临床上以颈椎正、侧、双斜位为诊断依据，常规双斜位的投照方法其效果不佳。 平常工作中不断探索和实践，采用立位颈椎左右后斜位，使颈椎椎间孔在 X 线胶片上显示 更清晰，效果更佳。
投照方法:1 患者站立或坐于立式摄影架前，双肩尽量下垂，面对 x 线球管，右或左后背靠近摄影架，被检查躯体正中矢状面与胶片成 45 度角，头转向对侧，使头部的矢状面和暗盒平行，这样才能使颈椎一二节椎间孔显示清楚，下颌略抬高，防止下颌升之支与椎体重叠。中心线向足 侧倾斜 10—20 度，对准 C4 射入胶片中心。2 投照条件:用胶片(8*10)直放，用滤线栅(+)，焦片距 150cm，条件 60—72KV,用 100mA，时间 0.8~1.0s,大小焦点均可，最好用小焦点。3.显示位置:颈椎左后斜位显示右侧椎间孔，相反颈椎右后斜位显示左侧椎间孔. 结果:经过 120 例双斜位的观察，椎间孔显示很满意，能清楚显示颈椎钩突关节骨质增生 情况，椎间孔狭窄程度和周围邻近结构的关系。合理选择大焦—片距 150cm，可以避免重 叠，使图像放大失真度变小，可提高影像清晰度。影像质量以不出现“双弧征”及“双边征”， 能清楚显示椎体及周围软组织及舌骨为佳。

PO-207

容积螺旋穿梭技术在危重患者 CT 肺动脉成像中的安全和质量控制

陈晓侠
陕西中医药大学附属医院

目的：探讨容积螺旋穿梭技术在危重患者 CT 肺动脉成像中的应用价值。 资料与方法：选取 CT 肺动脉成像危重患者 38 例为研究组（A 组）：采用容积螺旋穿梭（VHS）技术扫描，管电压 80kVp，对比剂 25mL，流速 4mL/s，于注射对比剂 6S 后扫描 4 个 pass，无法行呼吸配合者在自由呼吸状态下完成扫描，扫描结束后 4 个 pass 分别重建层厚 1.25mm、stnd、60%ASiR 图像，评估每个 pass 的价值，RLPA 、LLPA 的 CT 值＞250Hu、无明显呼吸运动伪影为可评价期相，选取一个最佳 pass 为诊断图像。常规 CT 肺动脉成像患者 38 例为对照组(B 组)：管电压 120kVp，对比剂 60mL。流速同 A 组，采用团注追踪触发技术，吸气后屏气开始扫描。扫描后重建层厚 1.25mm、stnd、40%ASiR 图像。测量 MPA 、RPA、 LPA、 RLPA 、LLPA 及竖脊肌的 CT 值及 SD 值，计算 SNR、CNR 值；上腔静脉伪影程度根据腔静脉伪影最大处 CT 值范围分类；计算成像密度差评价肺静脉污染；记录 CTDIvo、DLP，计算有效剂量(ED)。采用独立样本 T 检验对两组图像的 CT 值、SD 值、SNR、CNR、成像密度差及 ED 进行统计分析，双盲法进行主观评分。结果：A、B 组辐射剂量差异无统计学意义；A 组对比剂量较 B 组降低 58%；A 组目标血管 CT 值和 SD 值均高于 B 组（P<0.05），两组的 SNR 和 CNR 值相似（P>0.05），但 B 组 MPA 和 RPA 的 CNR 值较高（P<0.05）；两组图像质量主观评分差异无统计学意义；成像密度差及上腔静脉伪影 A 组优于 B 组（P<0.05）；A 组的可多期相诊断率为 94.7%。结论：低 kVp 容积螺旋穿梭技术 CT 肺动脉成像能够减少对比剂用量、提高安全性，并能获得多期相、宽峰值平台诊断，减轻运动伪影保证检查成功率和成像质量，适宜危重患者检查时应用。

PO-208
医学影像技术实习教学中实行“导师轮转制”的探讨

周婕,冉启胜
陆军军医大学大坪医院

目的：为了提高医学影像技术实习生的工作实践能力和科研学习能力，我院放射科根据现有的教学资源和基本条件，对其展开了“导师轮转制”的新型教学模式。
方法：导师轮转制就是不同的导师“围绕学生轮转”的教学模式，我科技术组分为 MRI、CT、DSA 和普通放射四个组，每个实习生在每个组按月轮转，每个实习生当月在该组由一位导师一对一带教，负责该实习生的学习、工作等多方面的教学，下个月在下一个组又由该组的一位导师一对一带教。影像技术专业实习生进入科室后，由教学秘书按照教学大纲负责统一安排 教学工作，根据技术各小组工作岗位实行每月依次轮转，平均分配实习生人数。实习生采取自由组合原则，教学秘书安排一切教学事由。教学实习具体工作分为：理论教学、工作指导、科研能力指导和评价考核。
结果：“一对一”的导师轮转制中，影像技术专业实习生的跟班学习，能够在最短的时间内掌握各小组大型设备的性能，了解工作流程和最快速进入工作状态，贴近一线值班，面对突发状况及时处理，在导师指导下也能独当一面，成为导师的得力助手。实习生在导师指导下可以查阅文献，充实自身，随时掌握影像技术新动态，提高了自己的科研素质。同样，对导师来说，对学生的督促作用，增强了导师的责任心，不断改进了教学方法。
结论：导师轮转制是对医学影像技术实习系统培养的一条有针对性的较好的途径。导师轮转制实现了实习生到准技师的顺利转换，提高实习生的综合素质。但是，由于导师轮转制是一种新型的教学

模式，仍需做好以下几点：（1）、进一步完善教学大纲和制度；（2）、加强实习生教学管理，提高对临床工作的认知；（3）、壮大和发展师资力量和队伍。

PO-209
成人急性阑尾炎 MSCT 平扫影像特征与病理对照研究

张晓金,汪建文,张虎,谢钊,陈立芳,过永
芜湖市第二人民医院

目的：术前精准诊断急性阑尾炎并为临床提供有更多有价值的影像资料，减少误漏诊，使患者受益。
材料与方法：搜集 2017 年 1 月至 2018 年 12 月在我院急诊外科住院治疗的急性阑尾炎患者 89 例（均经手术及病理证实）；年龄（19-83 岁，平均 42.15±18.12），男 53 例、女 36 例；另外，搜集 30 例正常阑尾进行对照，男 19 例、女 11 例，年龄（21-79 岁，平均 47.80±16.45）。所有扫描均在 Philips MX 16 Slice 扫描仪上完成，患者取仰卧位，头先进，屏气，扫描范围从膈顶至耻骨联合，所有病例均未进行肠道准备。所有图像行薄层重建，重建层厚为 1 mm，重建间隔为 1 mm，并行多平面重组(MPR) 及曲面重组(CPR)等图像后处理。阅片者对影像资料进行全面观察、测量、分析，做出诊断，并与术后病理进行对照。
结果：急性阑尾炎组阑尾显示清楚者为 77/89 例，，MSCT 正确诊断/病理结果：急性单纯性阑尾炎 19/23 例，急性化脓性阑尾炎 48/57 例，急性坏疽及穿孔性阑尾炎 3/7 例，阑尾脓肿 1/1 例，急性阑尾炎伴低级别阑尾粘液性肿瘤 0/1 例，总体符合率为 79.78%（ 95% CI，0.703-0.868）。MSCT 平扫与术后病理在阑尾腔内粪石、阑尾周围炎中差异无统计学意义；在局限性腹膜炎中差异有统计学意义，c2=13.149，P=0.000。急性阑尾炎组与正常组对照，阑尾直径、阑尾管壁厚度、阑尾腔内积液、阑尾腔内积气、周围肠系膜淋巴结增大差异均有统计学意义。
结论：成人急性阑尾炎 MSCT 平扫影像学表现具有一定的特征性，与术后病理一致性较高；MSCT 平扫结合 MPR、CPR 等图像后处理对成人急性阑尾炎有着较高的诊断价值。

PO-210
胸痛三联征一站式 CT 检查中固定注射时间的碘对比剂优化方案与图像质量关系的研究

张月英[1],华莉[2],张记清[2]
1.山西医科大学第二医院
2.山西医科大学

目的探讨胸痛三联征（TRO）一站式 CT 检查中使用固定注射时间的碘对比剂优化方案与图像质量的关系.**方法**选择我院行 TRO 一站式 CT 检查的患者。按体重指数分为 BMI≤23kg/m^2和 BMI>23kg/m^2组;每组患者按随机数字表分两组，分别给予固定注射时间的不同对比剂注射方案进行检查，对各组不同节段血管图像质量进行主观和客观评价,记录主观评分及肺动脉、主动脉、冠状动脉 CT 值和对比噪声比；同时记录检查的总体有效辐射剂量。**结果**共 92 例患者纳入分析:(1) BMI≤23kg/m^2组 44 例,接受方案 1 和方案 2 者各 22 例,BMI>23kg/m^2组 48 例，接受方案 1 和方案 2 者各 24 例.不同 BMI 组内接受不同注射方案两个亚组间有效辐射剂量比较差异无统计学意义,均 P＞0.05。(2)在 BMI≤23kg/m^2组,接受方案 2 患者肺动脉图像的 CT 值、CNR 及主观评分均明显高于接受方案 1 者,均 P＜0.05;而两种方案冠状动脉及主动脉图像质量的主观和客观评价结果比较差异无统计学意义。

（3）在 BMI>23kg/m²组,接受方案 2 患者冠状动脉及主动脉图像的 CT 值、CNR 和主观评分均明显高于接受方案 1 者,均 P＜0.05；而两种方案肺动脉图像质量的主观和客观评价结果比较差异无统计学意义。**结论**应用 RevolutionCT 完成 TRO 一站式检查有效辐射剂量相对较低。固定注射时间的小剂量对比剂应用方案可满足 TRO 一站式 CT 检查诊断需要,适用于急性胸痛患者。对于 BMI≤23kg/m² 的患者,两种均可获得优良的图像质量,为避免上腔静脉伪影的影响,推荐使用 55 mL 对比剂注射方案;对于 BMI>23kg/m²的患者,应用 60 mL 对比剂注射方案可以获得稳定优质的图像,更适合临床应用。

PO-211
不同注射速率对肝脏磁共振普美显成像检查的影响分析

谢敏,汤鸿
无锡市第二人民医院（南京医科大学附属无锡第二医院）

目的 普美显是近年研发的新型肝细胞特异性 MRI 对比剂，诊断过程中能准确提供肝脏病灶血供信息，同时具有非特异性肝细胞外对比剂和肝胆特异性对比剂的特点。普美显越来越多应用于临床，提高了肝脏病灶的检出率和诊断正确率。在肝脏普美显成像检查中，各医院常应用不同的注射流速（1.0ml/s，1.5ml/s，2.0ml/s）。本研究目的为探讨不同注射速率是否对检查过程及结果产生影响。

材料和方法 回顾性分析 132 例接受肝脏普美显检查患者临床、MRI 检查资料。按照注射速率将研究对象分为三组 1.0ml/s 44 人，1.5ml/s 44 人，2.0ml/s 44 人。所有患者进行肝脏 MRI 平扫及普美显 MRI 检查。经肘正中静脉团注，注药后进行肝动脉期（16-25s）、门静脉期（46-55s)、肝静脉期（86-100s）、动态晚期（150-180s）和肝细胞期（20min）多期动态扫描。结合最终病理结果，进行如下分析：（1）分析三组研究对象药物不良反应的发生情况(2)对获取的 MRI 图像质量进行评分(3)对 MRI 图像的伪影评估（4）分析肝脏病变检出和正确定性病变的敏感性、特异性、诊断效率、阳性预测值、阴性预测值、约登指数。统计学方法：应用 SPSS18.0 软件包进行统计学分析，分析三组研究对象药物不良反应的发生情况应用 x 检验，对获取的 MRI 图像质量进行评分应用多个样本均数比较的方差分析，对 MRI 图像的伪影评估应用多个样本比较的 Kruskal-Wallis H 检验。最终对所得全部数据进行 Topsis 法综合评优。

结果 三组普美显不同注射速率组在造影剂反应、MRI 图像质量及图像伪影显示方面无明显统计学差异，在肝脏病变检出和正确定性病变显示方面均明显优于平扫，1.5ml/s、2.0 ml/s 组发现肝脏病灶并正确诊断病灶较好且综合评价最优。**讨论** 普美显检查 1.5ml/s、2.0 ml/s 注射速率综合优于 1.0ml/s。

PO-212
Machine learning based framework for differential diagnosis between mild cognitive impairment and Alzheimer's disease using structural MRI features

Yineng Zheng,Haoming Guo,Lijuan Zhang,Fajin Lv
The First Affiliated Hospital of Chongqing Medical University

Background and objective: Mild cognitive impairment (MCI) and Alzheimer's disease (AD) could be characterized by the same syndrome of dementia. This study aims to assess whether multi-parameter features derived from structural MRI can serve as the informative biomarker for differential diagnosis of MCI and AD using machine learning.
Methods: A total of 112, of which 90 had 60 AD and 30 MCI, confirmed by two chief physicians were recruited in this study. Automated brain tissue segmentation was performed by AccuBrain tool to extract multi-parameter volumetric measurements from different brain regions. Then, totally 62 structural MRI biomarkers were addressed by dimensionality reduction and feature selection. All significantly different features between MCI and AD were selected using least absolute shrinkage and selection operator and genetic algorithm to find the optimal feature subset. Finally, differential diagnosis was carried out by employing support vector machine (SVM) classifier with linear or radial basis function (RBF) kernels to differentiate between MCI and AD. The performance of diagnostic model was validated through ten-fold cross validation.
Results: The experimental results demonstrate that SVM with RBF model achieved an encouraging performance with sensitivity (SEN), specificity (SPE) and accuracy (ACC) values of 83.33%, 85.00% and 82.22% (AUC=0. 842, 95% CI = 0.748-0.935) for the differential diagnosis between MCI and AD. It outperforms the recently reported biochemical marker such as tau protein phosphorylated at threonine 231.
Conclusions: The proposed computer-aided diagnosis method highlights the potential of combing structural MRI and machine learning to support clinical decision making in distinction of MCI vs. AD.

基于 DL 模型检测肺结节的临床效能评估

刘晶
首都医科大学附属北京同仁医院

摘要
目的:
比较深度学习(DL)模型与放射科医生使用不同患者群体和扫描参数检测肺结节的敏感性，评估在辅助使用 DL 模型时能否提高放射科医生的检测效能。
材料与方法:
采用基于 dlbased 的人工智能诊断系统(InferRead CT Lung Research, Infervision, Beijing, China)回顾性分析 2018 年 11 月至 2019 年 4 月 100 例胸部薄层 CT 扫描资料，薄层厚度为 0.625-2mm，同时 3 名 15 年以上资深影像专业医生独立对每个序列图像结果进行确认作为金标准。测试数据集根据层厚和 CT 制造商分为两组。利用 ROC 曲线分析了 DL 模型的检测性能。从这些扫描肺结节分为四种类型:实性，磨玻璃，钙化和胸膜，通过探索性数据分析比较 DL 模型与放射科医师对结节检出以及不同性质结节的敏感性。比较每个队列中 DL 模型的假阳性检出率。利用 ROC 曲线分析结节检出效能，比较了同一放射科医生在使用 DL 模型和不使用 DL 模型时的检测性能。
结果:
基于 DL 诊断系统检测到肺结节 627 个，分类阈值 0.8，其中 TP 结节 270 个，FP 结节 357 个，FN 结节 15 个，敏感性 94.7%。与手工检查肺结节相比，DL 模型显示出更高的整体敏感性。在不同层厚或 CT 制造商方面均无显著相关性。当放射科医生使用 DL 模型进行辅助时，他们的表现得到了改善，阅读时间也缩短了。
结论:

DL 对提高肺结节的鉴别和治疗有一定的价值。

PO-214
基于放射组学预测肺腺癌 EGFR 基因突变状态的研究

李扬,姚皓月,时高峰
河北医科大学第四医院

目的：基于薄层计算机断层扫描（TSCT）建立一种预测肺腺癌表皮生长因子受体（EGFR）突变状态的放射组学模型并评估其有效性。
方法：该研究包括 284 例肺腺癌患者（141 例 EGFR 突变型和 143 例 EGFR 野生型）。通过使用半自动方法（ITK-SNAP3.6.0）对每个肿瘤的感兴趣区域（ROI）进行分割，即利用阈值分割法计算机自动生成 ROI，并且放射科医师可以逐层改变病灶轮廓以精确其边界。通过使用放射组学软件 Analysis-Kit(GE Healthcare，Life Science，China)提取 396 个放射组学特征。用于建立放射组学模型的临床信息及影像特征包括性别、年龄、吸烟状况、症状以及肿瘤直径、部位、充气支气管征、胸膜牵扯征、空洞 / 空泡共 9 个特征。将 284 例患者随机分为训练组（n=199）和测试组（n=85）。通过 Multi information 法对组学特征降维、临床特征筛选后再分别对放射组学特征、临床特征、结合组学与临床特征建立模型，对比了 Logistic Regression 和 Random Forest 两种模型，最后总共得到 6 个模型。通过受试者操作特征（ROC）曲线下面积（AUC）、准确度、灵敏度、特异度、精确度、F1 及 Brier 分数对 6 个模型进行比较，并使用 ROC 曲线、混淆矩阵、DCA 曲线三种指标评估模型效能。
结果：EGFR 突变与女性、吸烟、充气支气管征显著相关（$P<0.05$），通过特征降维得到 4 个放射组学特征，均为灰度游程矩阵。使用放射组学与临床特征结合的模型预测效能高于仅用组学特征、仅用临床特征建立的模型，并且 Random Forest 模型显示 AUC 为 0.841， Logistic Regression 模型显示 AUC 为 0.729。
结论：采用 Random Forest 方法建立放射组学和临床特征结合的综合模型可以预测肺腺癌 EGFR 突变状态，改善临床实践中对患者治疗计划的管理。

Radiomics nomogram for prediction recurrence-free survival and adjuvant chemotherapy benefits in patients with resected stage I lung adenocarcinoma: A retrospective, multicenter, cohort study

Tingting Wang,Yunlang She,Dong Xie,Xiwen Sun,Chang Chen
Shanghai Pulmonary Hospital

Objective: To develop and validate a radiomics nomogram for predicting the recurrence-free survival (RFS) of patients with resected stage I lung adenocarcinoma, and further identifying the patients benefit from adjuvant chemotherapy (ACT).
Methods and materials: Using radiomics approach, we analyzed 805 patients' computed tomography images from four cohorts. Prognostic features were selected using LASSO-Cox

regression model to build a signature for RFS stratification, and a nomogram incorporating clinicopathologic factors were developed in the training cohort (n=238). We further analyzed the biological basis of the radiomics signature in the Radiogenomics cohort by gene set enrichment analysis (n=91). The prognostic accuracy of the nomogram was evaluated in the internal (n=237) and external validation cohorts (n=239). Finally, the predictive value of the nomogram for ACT benefits was evaluated.
Results: In the training cohort, the radiomics signature consisting of 9 features was generated to stratify patient's survival (hazard ratio [HR]; 95% CI, 3.606-14.636; p<0.001). The C-index of the signature of 0.782 was improved to 0.804 (p<0.001) when integrating with the clinicopathologic factors to develop the nomogram. In the validation cohorts, the nomogram also showed good performance for RFS prediction. A significant better RFS outcomes (p=0.0025) was observed in the stage IB patients with high points (>7.1) calculating by the nomogram after ACT, while patients with low points showed no significant survival benefit.
Conclusions: The constructed radiomics nomogram for patient with resected stage I lung adenocarcinoma may be used to prognostic prediction and ACT benefits identifying.

PO-216
一种新的乳腺钼靶良恶性分类深度学习模型

周娟[1],王楚然[2,3],张番栋[3],盛复庚[1]
1.中国人民解放军总医院第五医学中心南院区
2.北京大学前沿交叉学科研究院大数据研究中心
3.深睿实验室

目的：设计一种新的神经网络模型，用深度学习的方式对乳腺钼靶片进行自动的良恶性诊断。
材料与方法：我们收集了含有 1225 张乳腺钼靶片的数据集来训练和验证我们的模型。所有的病例都来自于亚洲人。数据集包括 1912 例有征象结果标注的病灶，其中病灶类型含有不对称、钙化、肿块和结构扭曲四种，分别有 328 例、501 例、1021 例和 62 例。数据集中病理为良性的病例有 1081 例，病理为恶性的病例有 831 例。我们在保证正负样本比相同的情况下按 8:1:1 的比例将数据集分为训练集、验证集和测试集。
我们提出了一种新的深度神经网络，通过学习患侧病灶征象并结合对侧特征来判断乳腺钼靶良恶性。网络结构分为两个分支，一个分支用来学习病灶的征象，比如病灶类型、钙化形态、钙化分布、肿块边缘特征、肿块密度、肿块形态等。征象是判断乳腺钼靶良恶性的重要依据，征象的学习可以有效地提高良恶性的分类效果；另一个分支用于提取健侧图像的特征，然后结合两个分支提取到的特征计算该钼靶片的良恶性概率。每个分支都以 Resnet50 网络为主干，并且提取带有丰富信息的 7x7 大小的局部特征。
结果：传统模型采用经典的深度卷积神经网络，仅利用患侧图像，以 Resnet50 网络为主干，再经过全连接层直接得到良恶性的分类结果。传统模型的分类准确率为 79.04%，AUC 为 81.46%。而我们的新模型分类准确率为 84.43%，AUC 为 86.96%。
结论：我们提出一种新的用于乳腺钼靶良恶性分类的深度模型。模型利用双侧信息和征象学习来提高分类的准确率，在私有数据集上有非常明显的效果。

PO-217
利用 MRI 动态增强纹理分析评估不同分子亚型乳腺癌异质性

基于多模态磁共振参数构建胶质瘤分级的列线图预测模型

李文菲[1],张明[2],王占秋[1],刘兰祥[1]
1.秦皇岛市第一医院
2.西安交通大学第一附属医院

背景：胶质瘤分级对于脑肿瘤患者治疗和评估预后至关重要。我们旨在利用多参数 MRI 开发影像学列线图预测胶质瘤级别。
方法：本研究涉及 182 例患者（训练组：n = 91;验证队列：n = 91），病理学检查为金标准。研究参数包含增强的 T1 加权，MRS 和 DWI 序列。提取了总共 602 个影像学征象。 统计检验：我们利用放射学特征，患者的年龄和性别，作为进行逻辑回归分析的潜在预测变量，并设计胶质瘤分级的预测模型，并使用列线图来呈现。分别用一致性系数(C-index)和校准曲线评估模型的预测性能和符合度。
结果：在试验组和验证组中，影像学特征与神经胶质瘤分级显着相关（P <0.001）。与单独采用 T1WI 增强，MRS 或 ADC 在胶质瘤分级比较，一致性系数在试验组中为 0.91,0.71,0.86，在验证组中为 0.82,0.60,0.69；而结合三个影像学特征一致性系数分别为 0.98 和 0.95。列线图模型拟合度检验和分类器校准图均显示拟合较好。
结论：我们创建并评估了一种基于多参数 MRI 的影像学学列线图，结合三个序列列线图比单一序列列线图具有临床预测价值，可以帮助临床医生更准确地对胶质瘤进行分类。

PO-219
Sports modify the trajectory of gray matter development in young divers detected by three different tools

XIA LIU[1],Zhifeng Zhou[1],Jinping Xu[2],Junbin Zhang[3],Lin Shi[3],Wentao Jiang[1]
1.Department of Radiology，Shenzhen Kangning Hospital

2.Institutes of Biomedical and Health Engineering, Shenzhen Institutes of Advanced Technology, Chinese Academy of Science
3.Department of Imaging and Interventional Radiology, The Chinese University of Hong Kong, Hong Kong, China

Objective: To investigate the features of gray matter (GM) in young divers with three different tools: voxel-based morphometry (VBM), FreeSurfer and Accubrain respectively.
Methods: A total of 20 diving athletes (DA) and 24 control subjects (NC) were collected and T1 BROVA data were acquired. After image preprocessing, GM analyses were conducted by VBM, FreeSurfer and Accubrain™ respectively.
Results: The results of VBM showed that lower GMV mainly in the bilateral superior frontal cortex, anterior cingulated gyrus (ACG), posterior cingulated gyrus (PCG), transverse temporal gyrus, insula, hippocampus etc., and the higher GMV in the bilateral cerebellum posterior lobe in the DA group ($P < 0.001$, FDR correction). The gyrification of GM in the right middle temporal gyrus (rMTG) decreased significantly, meanwhile, the GM thickness in the right middle frontal gyrus (rMFG) reduced and positively correlated with training time in the DA group ($P < 0.05$, Alphasim correction), which detected by FressSurfer. While there was no positive finding with Accubrain.
Conclusion: The reduction of GMV in multiple brain regions may be due to synaptic proliferation and pruning since they are at the age when cortex is getting thinner, and it is the professional training that might accelerate the process. Meanwhile, the decreased gyrification of GM in the rMTG might also contribute to diving training promote cortical thinning. Accubrain is considered as an automated brain structure volumetry tool and provides accurate segmentation and measurement of 40 GM brain regions, herein the GM volume did not indicate significant difference in corresponding 40 brain regions between two groups. These three tools explore features of GM from different points. Overall, professional sports training play a certain impact on the trajectory of adolescent brain development.

PO-220

Exploration on the detection capability alteration of AI assisted software in detecting pulmonary solid nodules by resident in radiology department

Tingting Sun,Jianlin Wu
The Affiliated Zhongshan Hospital of Dalian University

MOTIVATION: To evaluate the detection capability of artificial intelligence (AI) assisted lung nodule diagnostic software in the detection of pulmonary solid nodules by resident .
METHOD AND MATERIALS: A total of 159 patients were collected in our hospital. One senior radiologist with more than 10 years' experience read CT images based on the initial diagnosis of another senior radiologist with similar experience and a final decision was subsequently conducted by deputy chief radiologist with more than 15 years' experience to determine the ground truth lung nodules. All readings were

performed on 1 mm slice thickness CT images with the assistance of AI software (InferRead CT Lung Research,Infervision, Beijing, China).One resident read the images without AI software (group A) and the same resident read CT images with AI software (group B) after two weeks' washout period. The number of pulmonary solid nodules and location were recorded. The number of true positive nodules and false positive nodules in group A and B were compared with the gold standard nodules to calculate sensitivity and false positive rate.

RESULTS: Group A detected 487 nodules, including 401 true positive nodules and 86 false positive nodules, with a sensitivity of 0.473±0.33. Group B detected 692 nodules, including 652 true positive nodules and 40 false positive nodules with a sensitivity of 0.721±0.37. The sensitivity of group B was 24.8% higher than that of group A($p<0.001$).The false positive rate (per CT scan) of group A (0.484,77/159) was considerably higher than that of group B(0.252,40/159)($p<0.001$).

CONCLUSION: Compared with resident without AI software, the AI-assisted resident achieved higher detection sensitivity and greatly reduced false positive rate for solid pulmonary nodules.

CLINICAL RELEVANCE/APPLICATION:

It is recommended to use AI to assist resident who are inexperienced to achieve desirable detection rate for solid pulmonary nodules.

PO-221

肠管周围爬行脂肪 CT 值变化对克罗恩活动性的诊断价值

高赟
上海市静安区中心医院

摘要：目的：探讨克罗恩病活动性病变患者系膜根部爬行脂肪 CT 值变化的特点。方法：选取 2016 年 1 月至 2019 年 3 月上海市静安区中心医院收治的 31 例克罗恩病活动期患者为研究对象，同时随机选取年龄、性别相匹配的克罗恩病非活动期患者/健康人群作为对照。收集临床资料包括小肠 CT 增强检查、小肠镜检查及其病理结果、临床免疫抑制治疗疗效。结果：克罗恩病活动期患者 31 例（男 26 例，女 5 例），对照组 31 例（男 22 例，女 9 例）。与对照组相比，克罗恩病活动期患者系膜根部爬行脂肪密度增高，增强后随时间延长可出现持续轻度强化。结论：克罗恩病病变肠管周围的爬行脂肪于疾病活动期可出现密度增高、持续性强化的特点，因此肠管周围爬行脂肪的 CT 值变化对克罗恩病的活动性具有诊断价值。结论：克罗恩病病变肠段系膜根部的爬行脂肪于疾病活动期可出现密度增高、持续性强化，因此爬行脂肪的 CT 值变化是疾病活动期的一项重要依据。

PO-222

Evaluation of Pelvic Lymph Nodes on MR Diffusion-weighted images of Patients with PI-RADS 5 lesion Using U-Net Segmentation Algorithm

Xiang Liu[1],Chao Han[1],Lina Zhu[1],Xiaoying Wang[1],Weipeng Liu[2],Xiangpeng Wang[2],Jingyuan Zhang[2],Xiaodong Zhang[1]
1.Peking University First Hospital
2.Beijing Smart Tree Medical Technology Co. Ltd.

Purpose: To detect enlarged LNs on DWI images of suspected patients with PCa upon the application of U-Net segmentation algorithm.
Materials and methods: Pelvic DWI images of 62 patients with PI-RADS 5 lesion from two indepent MR scanners were retrospectively collected for development of U-Net model in automated LNs segmentation from January 2017 to June 2018. The LNs with short diameter over 8mm were annotated by 2 radiologists. 40 participants from August 2018 to June 2019 were automatically predicted to evaluate the accuracy of U-Net model. For the annotated areas by radiologists, DICE coefficient were adopted to evaluate U-Net segmentation performance, LNs short diameter and volume were computed to estimate segmentation accuracy by comparison with manually annotated labels.Area under the receiver operating characteristic curve (AUC) was used to assess U-Net model for per-patient in algorithm evaluation. Quantitative LNs short diameter and volume were compared between automated and manual segmentation by using Pearson correlation and Bland-Altman statistics.
Results: 62 men (mean age ± standard deviation (SD), 70.9 years ± 9.1) and 40 patients (mean age ± SD, 70.1 years ± 8.2) with PI-RADS 5 lesion were enrolled in algorithm development and evaluation respectively. The average DICE coefficient produced by U-Net segmentation model was 0.74 (95% CI: 0.61 - 0.87) in testing dataset. The LNs short diameter and volume measured with manual and automated segmentation showed a high correlation (r= 0.87 and 0.98, respectively) and close agreement. The AUC in the algorithm evaluation 0.78(95% CI:0.62-0.89).
Conclusion: The deep learning-based U-Net algorithm can achieve fully automated and accurate LNs segmentation on DWI images of patients with PI-RADS 5 lesions.

PO-223

Predicting outcomes after uterine fibroid embolization with deep learning based on MRI

Yongheng Luo[1],Harrison xiao Bai[2],Zishu Zhang[1],Richard Shlansky-Goldberg[2]
1.The Second Xiangya Hospital of Central South University
2.Hospital of the University of Pennsylvania

PURPOSE
To develop and validate a deep learning model based on routine pre-procedure MRI to predict volume reduction and clinical outcome of uterine fibroid embolization.
METHOD AND MATERIALS
Clinical data were collected on patients treated with uterine artery embolization for fibroids at a large academic center from 2007 to 2018. Only patients with both pre and post-procedure MRI were included. The fibroids for each patient was manually segmented by an abdominal radiologist on T2-weighted and post-contrast T1-weighted sequence of pre and post-procedure MRI, and fibroid size reduction was calculated as percentage change in fibroid volume after uterine fibroid embolization. A residual convolutional neural network model to predict fibroid volume reduction and clinical outcome was trained using pre-procedure magnetic resonance images.
RESULTS

The inclusion criteria were met by 727 fibroids in 409 patients. The average clinical follow up time was 116 days. Of the 727 fibroids, 76.2% (n=554) had a volume reduction of 10% or more, and 23.8% (n=173) had a volume reduction under 10% or increased in size. At clinical follow-up, 85.6% (n=350) of the 409 patients (590 of 727 fibroids, 81.1%) experienced symptom resolution or improvement, and 14.4% (n=59) patients (137 of 727 fibroids, 18.9%) no improvement or worsening symptom. The final ensemble model combining T2-weighted images, post-contrast T1-weighted images and clinical variables achieved a test accuracy of 78.1%, F1 score of 0.875, and area under the precision-recall curve of 0.865 in predicting volume reduction and a test accuracy of 84.7%, F1 score of 0.912, and area under the precision-recall curve of 0.916 in predicting clinical outcome.

CONCLUSIONS

Deep learning based on routine pre-procedure MRI has potential in predicting outcomes post uterine fibroid embolization. This will help clinicians identify patients who benefit the most from this therapy.

PO-224

Convolutional neural network for predicting postoperative liver metastasis and local recurrence in pancreatic neuroendocrine tumor based on CT imaging

Chenyu Song,Yanji Luo,Shiting Feng
The First Affiliated Hospital of Sun Yat-sen University

To establish and validate a deep convolutional neural network (DCNN) model in prediction of liver metastasis and local recurrence after surgery for pancreatic neuroendocrine tumors (PNETs) from CT imaging.

Preoperative CT imaging was acquired from 57 patients with surgical and pathologic proved PNETs. The data of liver metastasis and local recurrence was confirmed by follow up imaging from 3 months after surgery until December 2018. DCNN was performed based on CT images including arterial phase, artery and venous phase. The DCNN algorithm was evaluated by 5-fold cross-validation and the validation of the two type phases were compared. The optimal phase of DCNN model were selected to compare with CT visual findings evaluated by radiologist (location, maximum diameter, cystic component, calcification, CT ration, enhanced ratio, boundary, shape, vessel involvement, pancreatic duct dilated or cut, pancreatic atrophy, lymph node size and enhancement, fatty liver and hepatic benign lesions, splenomegaly) in predicting liver metastasis and local recurrence after surgery of PNETs.

With the DCNN model, the accuracy, sensitivity and specificity of predicting liver metastasis and local recurrence after surgery achieved 76.79%, 100%, 71.74% (AUC=0.93) in arterial phase, and 83.93%, 60.00%, 89.13% (AUC=0.77) in artery and venous phase, respectively. By CT visual findings, univariate analysis showed that the maximum diameter increased significantly in patients with liver metastasis and local recurrence after surgery ($p<0.05$). CT ratio and enhanced ratio decreased significantly in patients with liver metastasis and local recurrence after surgery ($p<0.01$). Pancreatic duct dilated or cut and pancreatic atrophy were more likely to

occur in patients with liver metastasis and local recurrence after surgery ($p<0.05$). The AUC of predicting liver metastasis and local recurrence after surgery with CT visual findings evaluated by radiologist were 0.86.
DCNN model showed high predictive performance in liver metastasis and local recurrence of PNET from CT imaging, superior to CT visual findings evaluated by radiologist.

PO-225
Radiomics Signature as a Diagnostic Factor in predicting malignant testicular lesions

Xiangde Min,Zhaoyan Feng,Peipei Zhang,Liang Wang
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, Hubei, CN 430030, China

Purpose: To evaluate the performance of a MRI-based radiomics signature for discriminating between benign and malignant testicular lesions.
Materials and methods: Seventy-seven patients with 62 testicular lesions were consecutively enrolled. Eight hundred and forty-one features were extracted from T2WI image for each patient. The minority group was balanced via the synthetic minority over-sampling technique (SMOTE) method. The maximum relevance minimum redundancy (mRMR) and least absolute shrinkage and selection operator (LASSO) logistic regression model were implemented for feature selection. Radiomics signatures were obtained with the LASSO logistic regression model. Receiver operating characteristic analysis was used to evaluate the diagnostic accuracy of the radiomic signatures. The classification performance of the radiomics signature for benign and malignant testicular lesions was evaluated by receiver operating characteristic curve analysis.
Results: Significant differences in the radiomics signature existed between the benign and malignant testicular lesions ($p<0.01$). The performance of the radiomics signature for discriminating between benign and malignant testicular lesions was good, with an AUC of 0.866, sensitivity of 0.940, and specificity of 0.660.
Conclusion
MRI-based radiomics signature have the potential to noninvasively discriminate between benign and malignant testicular lesions.

PO-226
Three-dimensional CT texture analysis to differentiate colorectal signet ring cell carcinoma and adenocarcinoma

Yali Yue,Tong Tong
Fudan University Shanghai Cancer Center

Purpose:The objective of this research was to validate the diagnostic value of texture parameters and clinical characteristicsin the differentiation of colorectal signet ring cell carcinoma (SRCC) and adenocarcinoma (AC).

Methods: We retrospectively analyzed data from 102 patients with SRCC or AC confirmed by pathology, including 51 SRCCand 51 ACpatients (from January 2010 to July 2019). CT findings and Clinical data, including age, gender, clinical symptoms, serological biomarkers, tumor size, and tumor location, were compared between SRCC and AC. CT texture features were quantified on portal phase images using three-dimensional analysis.A list of texture parameters was generated with MaZda software for the classification of tumors. The texture features, clinical data and CT findings were statistically analyzed for the discrimination ability of SRCC and AC, and the potential predictive parameters that may be used to differentiate the two groups were subsequently tested using the least absolute shrinkage and selection operator (LASSO) and logistic regression analyses. The receiver operating characteristic curve (ROC) provided a range of values for establishing the cutoff value, as well as the sensitivity and specificity of prediction for each significant variable.
Result:SRCC occurred more often in men than AC did (80.39% vs. 49.02%, P < 0.01). The patients were younger in the SRCC group than in the AC group, without a statistically significant difference(55.84 vs. 59.20 years, P = 0.216).There were no significant differences in the clinical symptoms, tumor size, or tumor location between the two groups (P=0.505, P=0.19, P=0.843, respectively). The elevation of serological biomarker CA724 was more common in SRCC than in AC (P< 0.001). Perc.01%3D, Perc.10%3D and s(1,0,0) SumAverg were lower in the SRCC group than in the AC group during the portal phase, with the areas under curve (AUCs) of 0.892-0.929, sensitivity of 76.5-84.3% and specificity of 88.2-96.1%. In the differentiation between SRCC and AC, the 1-NNminimal classification error (MCR)was 29.41%.
Conclusion: Three-dimensional texture parameters, including Perc.01%3D, Perc.10%3D and s(1,0,0) SumAverg exhibited favorable discriminatory ability to distinguish SRCC from AC.

PO-227

Building CT Radiomics-Based Models for Preoperatively Predicting Malignant Potential and Mitotic Count of Gastrointestinal Stromal Tumors

Chao Wang, Yeerfan Jiaerken,Minming Zhang
Department of Radiology, the Second Affiliated Hospital, Zhejiang University School of Medicine

PURPOSE: To build radiomic prediction models using contrast-enhanced computed tomography (CE-CT) to preoperatively predict malignant potential and mitotic count of gastrointestinal stromal tumors (GISTs). PATIENTS AND METHODS: A total of 333 GISTs patients were retrospectively included in our study. Radiomic features were extracted from the preoperative CE-CT images. According to postoperative pathology, patients were categorized by malignant potential and mitotic count, respectively. The most valuable radiomic features were chosen to build a logistic regression model to predict the malignant potential and a random forest classifier model to predict the mitotic count. The performance of radiomic models was assessed with the receiver operating characteristics curve. Our study further developed a radiomic nomogram to preoperatively predict malignant potential in a personalized way for patients with

GISTs. RESULTS: The predictive model was built to discriminate high- from low-malignant potential GISTs with an area under the curve (AUC) of 0.882 (95% CI 0.823-0.942) in the training set and 0.920 (95% CI 0.870-0.971) in the validation set. Moreover, the other radiomic model was built to differentiate high- from low-mitotic count GISTs with an AUC of 0.820 (95% CI 0.753-0.887) in the training set and 0.769 (95% CI 0.654-0.883) in the validation set. CONCLUSION: The radiomic models using CE-CT showed a good predictive performance for preoperative risk stratification of GISTs and hold great potential for personalized clinical decision making.

PO-228

The evaluation of a deep learning bone age model in Chinese children based on GP atlas and data from North America

Mei Bai,Zhongwei Qiao
Children's hospital of Fudan University

Background: The Greulic-Pyle (GP) method is a popular and wide application to assess skeletal maturation and diagnose endocrine disorders using x-ray images of the left hand. However it is based primarily on a white population and is not necessarily generalizable children of other ethnicities.

Purpose: To compare the performance of a deep-learning bone age assessment model using data from the 2017 Radiological Society of North America (RSNA) Pediatric Bone Age Machine Learning Challenge with that of Chinese radiologists.

Materials and methods: A total of 538 clinical hand radiographs and corresponding radiological reports were obtained from Children's hospital of Fudan University in China to test the model. The bone age estimates difference between the model from American children's hospital data and the radiology reports from Chinese children's hospital was evaluated by comparing the root mean square (RMS) and mean absolute difference (MAD). The difference of normal, advanced and delayed bone age assessment between the model and the radiologists was evaluated to assess the clinical significance in diagnosis change. The data were statistically analyzed by Independent-Sample T test and Chi-square test.

Results: It showed difference between AI model and radiology report in bone age estimates (AI model vs radiology report: 10.66 years vs 10.25 years, p=0.02). The mean difference between bone age estimates of model and Chinese radiologists was 0.41 years, with a mean RMSE and MAD of 1.10 years and 0.78 years, respectively. The analysis of different diagnosis (normal, advanced or delayed bone age) showed significant difference ($p<0.05$).

Conclusion: Compared with bone age estimates of Chinese radiologists, AI model from RSNA data slightly overestimate age. The difference may affect clinical diagnosis in China.

PO-229

Preliminary study of using Radiomcis to differentiate metastatic and non-metastatic lymph nodes in rectal cancer

Gesheng Song,Aiyin Li
The first hospital affiliated with Shandong first medical university(Shandong Qianfoshan Hospital)

Objective:To explore the use of Radiomcis in differentiating metastatic and non-metastatic lymph nodes of rectal cancer in high-definition axial T2WI images and build prediction models.
Methods: Forty-five patients with rectal cancer (29 males and 16 females, aged 45-91 years, with an average of 61+10.2) were retrospectively collected. All patients had pathological results of lymph node metastasis after operation. All patients underwent high-definition axial T2WI(GE HD750 3.0T, TE=102ms, TR=auto, FOV=18cm, matrix=320*288) scan within two weeks before operation, and the lymph nodes on T2 images were compared with pathological results. A total of 153 lymph nodes, 75 metastatic lymph nodes and 78 non-metastatic lymph nodes were obtained. Radcloud (Huiying Medical Technology Co., Ltd.) was used to select ROI along lymph node contour in T2 images. Two levels with the largest cross section were selected for each lymph node, and the shortest path of each lymph node was recorded. Each ROI extracts 1029 eigenvalues, and variance threshold method, K-best and LASSO were used gradually to reduce the dimension of eigenvalues. The eigenvalues obtained after dimensionality reduction were fitted to KNN, SVM and Logistics models respectively. When fitting, 80% of the samples were randomly used as training set and the remaining 20% as verification set. The prediction efficiency of the model was evaluated by ROC, AUC, sensitivity and specificity. The shortest paths of metastatic and non-metastatic lymph nodes were compared by independent sample t-test. The software used was SPSS V19, and $P < 0.05$ was considered to have statistical difference.
Results: 1. There was no significant difference in the shortest path between metastatic and non-metastatic lymph nodes ($P > 0.05$); 2. After three times of dimension reduction, the eigenvalues gradually decreased from 1029 to 612, 246 and the final 15 eigenvalues, which included Minimum, Median, Maximum 3D Diameter, GrayLevel NonUniformity, Minimum, Skewness, Entropy, Median, Kurtosis, RunLength Nonuniformity. Ity, Cluster Prominence, Flatness, SmallArea High GrayLevel Emphasis, LongRunLowGrayLevel Emphasis and Interquartile Range; 3,3 kinds of model fitting results:
For KNN training set, AUC = 0.87, 95% = 0.80-0.94, sensitivity = 0.72, specificity = 0.89; verification set, AUC = 0.82, 95% = 0.67-0.98, sensitivity = 0.73, specificity = 0.75.
For SVM training set, AUC = 0.92, 95% = 0.85-0.99, sensitivity = 0.77, specificity = 0.89; verification set, AUC = 0.81, 95% = 0.66-0.97, sensitivity = 0.73, specificity = 0.75.

For Logistic training set, AUC = 0.88, 95% = 0.81-0.96, sensitivity = 0.78, specificity = 0.82; verification set, AUC = 0.84, 95% = 0.68-0.98, sensitivity = 0.8, specificity = 0.63.
Conclusion: Using Radiomcis to analyze high-definition axial T2 lymph node images of rectal cancer, and using the obtained eigenvalues to establish KNN, SVM and Logistic models, with Logistic as the best, can make a good differential diagnosis between metastatic lymph nodes and non-metastatic lymph nodes, assist radiologists in N staging of rectal cancer, and better formulate treatment plans.

罕见膈肌炎性肌纤维母细胞瘤伴术后转移 1 例

张鹏
十堰市太和医院

LT-227

静脉性汞中毒一例

吕健,宾精文,黄光仪,朱西琪
广西壮族自治区南溪山医院

LT-228

吸烟人群呼吸性细支气管炎薄层 CT 影像与临床应用

姚龙贵,薛宙曦
福建省福清市医院

LT-229

罕见原发纵隔黑色素瘤影像学表现一例

冯煜森,刘慧
昆明医科大学附属延安医院

LT-231

尿毒症患者肺部影像学与临床的相关性

张文迪
吉林市人民医院

LT-232

床旁 CR 与床旁 DR 在胸部摄影中的对比分析

马保龙,高永斌
宁夏回族自治区人民医院

LT-233

螺旋 CT 诊断肺泡微石症的临床价值

韦建规
广西医科大学第一附属医院

LT-234

后纵隔未分化肉瘤一例并文献分析

施彪[1],乔晓春[1],沈艳[1],秦雷[2]
1.蚌埠市第一人民医院
2.蚌埠医学院第一附属医院

LT-236

肺恶性蝾螈瘤一例

刘晓曦,吕发金
重庆医科大学附属第一医院

LT-237

恶性胸膜间皮瘤的新化疗进展

崔晓, 金文凤
昆明医科大学第一附属医院

LT-238

原发性肺淋巴上皮瘤样癌 CT 及 SPECT 表现 1 例

唐琪
湖北省肿瘤医院

LT-239

肺并发肝上皮样血管内皮瘤 3 例 CT 影像表现

张莉, 李向东
中国人民解放军南部战区总医院

LT-241

肺 PEComa 1 例

王建军, 杨瑞
河南省胸科医院河南康复中心医院

LT-242

纵隔型肺癌 CT 及 MRI 的临床表现及诊断效果分析

田岳华
连云港市第一人民医院

LT-243

低剂量胸部 CT 扫描在体检中的临床应用

朱晓青, 陶晓峰, 高维青
上海交通大学医学院附属第九人民医院

LT-244

肺硬化性血管瘤的ＣＴ诊断及鉴别诊断

徐燕军
上海交通大学附属第六人民医院

LT-245

肺部混合磨玻璃结节侵袭性的 HRCT 表现

吕晓虹, 张祥林
锦州医科大学附属第一医院

LT-246

100 例肺结节的诊治体会

刘天芹
湖北医药学院附属随州医院（随州市中心医院）

LT-249

低剂量 CT 技术在肺部体检中的应用

柳秋风,万维佳,胡军武
华中科技大学同济医学院附属同济医院

LT-250

复发性多软骨炎致动力性良性中央气道狭窄的影像学特征分析：附 2 例报告

李雪娇
重庆市中医院

LT-251

纵膈及胸膜黏液纤维肉瘤的影像表现（附 3 例报道并文献复习）

王婧婧,仇俊华,徐霖,陈文
十堰市太和医院

LT-253

多层螺旋 CT 多平面重建技术对孤立性肺结节的诊断价值分析

卢蕾
陆军军医大学附属新桥医院放射科

LT-254

Kartagener 综合征 1 例并文献复习

周丽明[1],陈佳[1],孙红军[1],王学建[1],宋玲玲[2]
1.贵航集团三ＯＯ医院
2.贵州医科大学附属医院

LT-255

移动 DR 床旁胸片对心脏术后即时摄片作用评估

李兴伟
陆军军医大学附属新桥医院放射科

LT-256

肺原始神经外胚层肿瘤（Askin 瘤）1 例

程念岚,李邦国
遵义医科大学附属医院

LT-257

原发性纵隔淋巴瘤 CT 影像分析

张丽萍
广东省中山市人民医院

LT-258

肺炎性肌纤维母细胞瘤 1 例学习

彭晓勇
昆明市儿童医院

LT-259

飞利浦 256 层 iCT 常规低剂量胸部扫描在体检中对肺结节检测和诊断的应用价值

范羽
合肥平安健康检测中心

LT-262

肺支气管源性囊肿误诊为肺囊性腺瘤一例

石光耀
吉林市人民医院

LT-264

肺泡蛋白沉积症肺移植前后影像表现一例

任星煜,陈宏伟
无锡市人民医院

LT-265

CT 多平面重建在纵隔肿块性病变诊断中的价值

虞崚崴[1],范路萍[2]
1.上海交通大学医学院附属新华医院
2.云南个旧市人民医院

LT-266

原发性肺孤立性粘液腺癌误诊 1 例

高峰
内蒙古包钢医院

LT-267

辐射剂量对肺磨玻璃结节特征显示的影响—体模研究

王国树
重庆医科大学附属第一医院

LT-268

巨大淋巴结增生症肺部 MSCT 表现

谭莉平
广西民族医院

LT-269

中纵隔神经内分泌癌 CT 影像诊断

周立新,陆建常
广西民族医院

LT-273

肺间质纤维化并发周围型肺癌的 CT 征象研究

杨鹏,武志峰,鄂林宁
山西白求恩医院 山西医学科学院

LT-274

东软 NeuViz 64En CT 与 Philips Brilliance iCT 在胸部增强扫描的临床应用对比研究

严春雷
湖南省人民医院/湖南师范大学第一附属医院

LT-275

低剂量低浓度增强检查在肺结节诊断中的应用

许茜[1],解利涛[2],范雪丽[1],时高峰[1]
1.河北医科大学第四医院
2.河北医科大学第一医院

LT-278

3 例巨大纵隔肿瘤切除术的麻醉处理

王瑞
云南省肿瘤医院

LT-279

左肺下叶体动脉供血并异常段动脉夹层 1 例

唐文英,曾珍,吴硕,张体江
遵义医科大学附属医院

LT-280

老年胸椎滑膜肉瘤 1 例

徐春艳,张雪梅,李邦国
遵义医科大学附属医院

LT-281

肺泡微石症一例

熊静娴

重庆三峡中心医院

LT-282

CT 和 HRCT

焦承丽
中国人民解放军总医院第一医学中心

LT-283

低管电压（80kVp）联合后置 ASIR-V 在胸部平扫中降低辐射剂量的可行性

魏东红[1],胡智军[2]
1.西安国际医学中心
2.西安长安医院

LT-284

人工智能肺结节筛查系统对低年资医师检测磨玻璃结节检出效能的评估

韩雪
内蒙古自治区人民医院

LT-287

低剂量胸部高分辨 CT 扫描在健康体检中的应用价值

陈曦
陆军军医大学第一附属医院

LT-288

双源 CT 支气管动脉成像在肺癌诊疗中的相关研究

梅苹,史恒峰
安庆市立医院

LT-289

CT 在胸腺瘤的诊断与鉴别中的应用价值

付美先
白城中心医院

LT-290

CT 重建技术与 AI 肺结节筛选系统的联合应用在肺孤立小结节的诊断价值

李卫星,贾祯,孙兴智
新乡市中心医院

LT-291

肺肉瘤样癌 2 例并文献复习

古明高,刘书敏
黔南州医院

LT-292

CT 和磁共振成像检查对食管癌术前 TN 分期的价值分析

卢翠
湖北医药学院附属随州医院（随州市中心医院）

LT-293

肺上皮样血管内皮瘤 2 例并文献复习

莫永谦,雷益
深圳市第二人民医院

LT-294

PACS 图像后处理技术在胸部外伤肋骨隐匿性骨折应用价值

李秀涛
深圳市中医院

LT-295

人工智能辅助诊断肺结节的初步应用

曹海安,王瑞琳,陈尧,张建军
浙江医院

LT-296

指骨内表皮样囊肿 1 例

喻滔
重庆市肿瘤研究所

LT-297

周围软组织内良性神经鞘瘤的 3.0T MRI 诊断

廖茂超
贵阳市第一人民医院

LT-298

股骨颈良性纤维组织细胞瘤影像学征象分析（附 3 例）

关舒元
河南省人民医院

LT-299

腹膜后多形性横纹肌肉瘤一例及文献复习

李相文
大连医科大学第二附属医院

LT-300

骨旁脂肪瘤 1 例报告并文献复习

李梅娜[1], 郑贤应[1,2]
1.福建医科大学附属第一医院
2.福建医科大学附属第一医院

LT-301

左肩胛骨骨旁脂肪瘤一例并文献学习

赖艳梅
福建医科大学附属第一医院

LT-302

探讨韧带样型纤维瘤病（DF）的影像学特征及其病理学基础

程天明, 葛英辉, 刘太元
河南省人民医院

LT-303

孤立性纤维瘤的影像诊断及病理分析

黄晓斌, 刘浩, 张娣, 毛存南, 殷信道, 武新英
南京市第一医院

LT-304

MR 在四肢粘液性脂肪肉瘤诊断及鉴别诊断价值分析

杨健
中国科学院大学重庆医院（重庆市人民医院）

LT-305

颈椎管内外沟通性骨外尤文肉瘤一例

郭浩明, 吕发金
重庆医科大学附属第一医院

LT-306

髋关节滑膜肉瘤 1 例

刘雷雷
重庆市肿瘤医院

LT-307

骨盆骨肿瘤术前影像学评估

曲扬, 李小敏, 艾松涛, 陶晓峰

上海交通大学医学院附属第九人民医院

LT-308

膜肉瘤的影像学表现及误诊分析

陈杰云
泉州市第一医院

LT-309

股骨头坏死的影像检查及临床意义

杨赟博
滑县骨科医院

LT-310

脊柱骨软骨瘤的 MRI 诊断

许向阳
1.安溪县医院
2.福建医科大学附属第一医院

LT-311

MRI 在膝关节内侧半月板后角 ramp 病变中的诊断价值

王树
福州市第二医院

LT-313

Sudeck 骨萎缩一例

王元清[1],李永菊[2],刘志翔[3],李旭[1],王岩[1]
1.潍坊医学院
2.潍坊市益都中心医院输血科
3.潍坊医学院附属医院

LT-314

肩关节 X 线摄影的临床意义

杨吉学,周蜀川
四川大学华西医院

LT-315

急诊外伤 16 层螺旋 CT 重组技术解决口腔颌面部的临床应用价值

张炜
华中科技大学同济医学院附属协和医院

LT-316

MRI 与 Lysholm 评分对前交叉韧带术后的康复评价

冷群,常晓丹
大连大学附属中山医院

LT-317

肩关节 Y 字位的临床应用价值

冯莉
山西医科大学第一医院

LT-318

股骨髁臼撞击综合征 X 线诊断推广

侯凯
昆明市延安医院

LT-319

CT 血管造影诊断外伤性肱动脉假性动脉瘤

韦春辰,陈斯琪,李凯
广西医科大学第一附属医院

LT-320

膝关节创伤性关节积血脂症影像表现

原志娜
深圳市宝安区人民医院

LT-321

兔糖尿病合并严重肢体缺血模型股骨近端骨髓微血管渗透性的定量 MRI 研究

杨柳
武汉大学人民医院

LT-322

布氏杆菌性脊柱炎的 CT、MR 诊断

宫敬
四平市中心医院

LT-323

痛风性膝关节炎的 MR 表现及诊断价值

俞文,陈晓君,方义杰,洪国斌,李绍林
中山大学附属第五医院

LT-324

静、动态半身局部红外扫描热成像对下肢静脉曲张的分析与评估

陈伟
河南省洛阳正骨医院河南省骨科医院

LT-325

颈椎类风湿性关节炎影像学评估的临床应用

徐志伟,方庆明,吴振斌
福建中医药大学附属泉州市正骨医院 影像科

LT-326

全景卧位成像技术在全下肢静脉造影中的应用

胡安宁
南京大学医学院附属鼓楼医院

LT-328

IMAR 算法在股骨颈骨折内固定术后疗效评价的有效性研究

许斯
华中科技大学同济医学院附属协和医院

LT-329

X 线数字断层融合技术在寰枢关节脱位诊断中的应用价值

汤永刚
西安市红会医院

LT-330

针对高龄患者下肢 CTA 技术优化方案的对比研究

任蔺
西南医科大学附属中医院

LT-331

经皮脊柱内镜治疗腰椎间盘突出症的围手术期护理研究

秦丽娜,薛四倩,马海静,樊文婷,王珂,周晓霞,黄雪芳,张渭红,陈洁
兰州大学第一医院

LT-332

巨细胞修复性肉芽肿影像学表现及病理分析

唐洁
十堰市太和医院

LT-333

脊柱及下肢全长数字化 X 线成像系统(DR)拼接成像技术的临床应用

李文志,宋春仙,陈红,刘真,周颖,王晓燕,黄宇芳,申雨佳
山西长治市第二人民医院

LT-334

UTE 序列成像在正常下腰椎终板矢状位的形态学研究

王冰

湖北省人民医院

LT-335

重度青少年特发性脊柱侧凸患者椎体旋转的 CT 及 DR 观测

杨璐希
核工业四一六医院

LT-336

脊柱全长摄影技术对于诊断青少年脊柱侧凸的临床价值

张明明
北京市石景山医院

LT-337

X 线检查技术对小儿发育性髋关节脱位诊断及手术的临床意义

朱燕明
中国人民解放军总医院第一医学中心

LT-338

俯卧位脊柱全长加压 CT 定位像在脊柱后凸畸形中的临床应用价值

马培旗,袁玉山,于海洋,张旭
阜阳市人民医院
